Vumacam

Vumacam operates one of South Africa's largest urban CCTV networks, linking thousands of high-definition cameras to a cloud platform called Proof. The system uses IntelexVision's iSentry AI engine to watch every feed in real time and automatically flag incidents. Vumacam also uses License Plate Recognition (LPR) technology to identify and track vehicles.

Provincial and municipal authorities, including the Gauteng Provincial Government, tap into Vumacam's live feeds and analytics for policing purposes.

Vumacam is owned by Vumatel, one of South Africa's biggest fibre internet providers.

The tag is: *misp-galaxy:surveillance-vendor="Vumacam"*

Vupen Security

Vupen Security was a French information security company founded in 2004 and based in Montpellier with a U.S. branch based in Annapolis, Maryland. Its specialty was in discovering zero-day vulnerabilities in software from major vendors in order to sell them to law enforcement and intelligence agencies which use them to achieve cyber operations. One of the company's co-founders, Chaouki Bekrar, is also the founder of Zerodium, a cybersecurity company known for its controversial business model of purchasing zero-day vulnerabilities and exploits from security researchers and then selling them to government agencies and private entities, including law enforcement and intelligence agencies.

Watrix Technology

Watrix Technology is a Chinese AI company that develops advanced computer vision and large scale video data analysis products. Founded in 2016, Watrix has developed a proprietary gait recognition system capable of identifying individuals based on their walking patterns from distances up to 50 meters, including when their face is obscured or turned away. Chinese police forces in cities like Beijing and Shanghai have utilized Watrix's gait recognition system to monitor public spaces and identify individuals without relying on facial recognition.

In 2022, it was reported that Watrix and another Chinese surveillance firm, GEOAI, used Nvidia chips to train AI patrol drones and systems designed to identify people by their walk.

The tag is: *misp-galaxy:surveillance-vendor="Watrix Technology"*

Wayout

Wayout Group is a discreet Israeli company founded in 2018 by Gil Dolev, whose sister Shiri Dolev was NSO's head of operations. The company operated as a subsidiary of the NSO Group after an acquisition in the range of $20 million, and was later sold to Goatilev, a company controlled by NorthPole, the financial vehicle of Novalpina Capital, which also oversees Q Cyber Technologies (of which NSO Group is a registered subsidiary.)

The company develops tools that compromise routers and intercepts Internet of Things (IoT) data, providing law enforcement and intelligence agencies with the ability to covertly gather information from connected devices. Its team is composed largely of former officers from Israel's Unit 8100 and Unit 8200.

Whooster

Whooster Inc. is a Texas-based company that provides monitoring solutions to law enforcement, government agencies, and private sector clients. Its services are designed to deliver real-time intelligence by integrating public, private, and open source data. In 2023, Whooster partnered with Cobwebs Technologies, an Israeli surveillance company, by integrating Cobwebs' AI-driven intelligence platform. The company has secured multiple contracts with U.S. law enforcement and federal agencies to provide widespread monitoring and surveillance services, including with the U.S. Immigration and Customs Enforcement (ICE) and the Department of Homeland Security (DHS).

Xinjiang Lianhai Chuangzhi

Xinjiang Lianhai Chuangzhi Information Technology Co., Ltd. is a wholly-owned subsidiary of the China Electronics Technology Group Corporation (CETC), a large state-owned military contractor. The company supplies the Integrated Joint Operations Platform (IJOP) system, which is a major component in the region's surveillance infrastructure. The IJOP is described in multiple reports as a "system of systems" that aggregates data from many sources: facial recognition cameras, CCTV, checkpoints, and a wide range of apps.

The company has built AI-powered checkpoint systems that can detect and track individuals, particularly Uyghurs, as they move around cities. These systems integrate facial recognition, cameras, and other biometric monitoring.

The U.S. Department of Commerce added the company to its Entity List on July 9, 2021, along with 13 other Chinese companies which were sanctioned for their involvement in human rights abuses and surveillance activities in Xinjiang.

Xloong

Xloong is a Beijing-based augmented reality startup that develops surveillance smart glasses and helmets primarily for Chinese police and military forces. The surveillance glasses are equipped with cameras and embedded computer chips that enable sophisticated facial recognition capabilities. Officers wearing these devices can cross-reference faces in real-time against China's national database. The augmented reality technology superimposes virtual images and information directly onto the wearer's visual field, providing immediate alerts when matches are detected.

XRVision

XRVision, a company founded by Yaacov Apelbaum and Guy Ron, is a provider of AI-driven facial recognition and video analytics tools. The company has secured contracts with government agencies including the US Customs and Border Protection in 2019 to deploy its facial recognition technology at the US border. Services for that contract include: "software for wearable devices, mobile phones, tablets, and laptops, namely, software for matching human face images; Computer application software for wearable devices, mobile phones, tablets, and laptops for video analytics, namely, software for matching human faces and performing face recognition."

XRVision is also backed by Boundary Holding, a Luxembourg-based private equity firm led by Rajat Khare, who has a history of cyber-espionage through his firm Appin Security.

Apelbaum, XRVision's co-founder, has deep ties to the surveillance and intelligence industries. He previously served as Chief Technology Officer at AGT International, a Swiss-based firm that developed the Falcon Eye surveillance system for the UAE authorities.

Xtend

Xtend is an Israeli drone manufacturer. Their Xtender is a miniature indoor drone controlled via virtual reality goggles, allowing operators to conduct intrusive surveillance missions. Their Scorpio drone is also designed for surveillance and combat. Equipped with cameras, sensors, and even lethal payloads, these drones use Xtend's OSX operating system for human-assisted autonomy, enabling automated navigation and multi-drone coordination. The company works closely with the U.S Department of Defense as well as the Israeli military.

Xuexi Qiangguo

Xuexi Qiangguo, translated as "Study the Great Nation," is a mobile application launched by the Chinese government in early 2019. While initially promoted as an educational tool to promote Xi Jinping Thought and Party ideology, Xuexi Qiangguo has evolved into a multifaceted platform that also serves as a surveillance and monitoring tool. Beyond tracking user activities within the app, Xuexi Qiangguo also collects personal data to create detailed profiles of users for surveillance purposes. The app's gamified structure ties into China's broader social credit system, where positive engagement with Party propaganda content can contribute to a higher social credit score. Negative activities or associations can result in penalties, restrictions or imprisonment. The app was developed in collaboration with the Chinese tech giant Alibaba.

YITU

YITU is a Chinese company that specializes in surveillance technology. The company has gained recognition for its advanced capabilities in facial recognition, so much so that it won first place in a 2017 facial recognition algorithm contest held by the United States government's Office of the Director of National Intelligence. Yitu provides high-tech surveillance in the UAE, where it maintains an office in Abu Dhabi. Yitu Limited owns or controls, directly or indirectly, Shanghai Yitu Technology Co., Ltd. (Yitu), an entity that operates or has operated in the surveillance technology sector of the economy of the PRC. Yitu has been involved in developing facial recognition technology that looks exclusively for Uyghurs and has been integrated into China's rapidly expanding networks of surveillance cameras. In addition, Yitu has established an overseas office to export its surveillance technology to foreign law enforcement agencies. Yitu has gained wide recognition for its Dragonfly Eye System, a facial scanning platform that can identify a person

from a database of at least 2 billion people in a matter of seconds.

The tag is: *misp-galaxy:surveillance-vendor="YITU"*

Zencity

Zencity is an Israeli data analytics company that helps local governments monitor public sentiment by analyzing social media, message boards, local news, and other public data sources. Serving over 200 agencies across the United States, its platform is used by U.S cities like Phoenix, New Orleans, and Pittsburgh to track public reactions to topics. It also enables police agencies to track negative sentiment toward law enforcement without residents' knowledge or consent.

The lack of public oversight in contracts with Zencity, often approved without city council input, has led to criticism that usage of the tool prioritizes surveillance over genuine community engagement.

The tag is: *misp-galaxy:surveillance-vendor="Zencity"*

Zenith Technologies

Zenith Technologies is a developer of AI-powered surveillance products. The company showcased its AI EagleEye Intelligent Patrol, integrated with Saudi Arabia's first Lucid police patrol vehicle, at the World Defense Show in Riyadh in 2024. This platform features six embedded AI cameras, providing 360-degree situational awareness, real-time streaming, Automatic Number Plate Recognition (ANPR), facial recognition, and other AI-powered data analytics designed for law enforcement. It also develops an AI-enabled drone, which extends surveillance capabilities from the patrol vehicle, and streams live footage and other data to a central command operated by police agencies.

The company deploys its tools to various agencies in the Gulf region, including Dubai Police and Ajman Police in the UAE, where it also has a regional office.

ZeroEyes

ZeroEyes is a AI-powered gun detection technology founded in 2018 by a team of Navy SEALs. The system integrates with existing security cameras to monitor video feeds 24/7, scanning for visible firearms. If a firearm is detected, the system sends human-verified alerts within 3-5 seconds to school administrators and law enforcement. The technology has been widely adopted in schools across nearly 40 U.S. states.

ZeroEyes was involved in a false alarm incident at a Texas high school, where its AI system incorrectly identified a threat and triggered a lockdown.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the

attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

Grayling

Grayling activity was first observed in early 2023, when a number of victims were identified with distinctive malicious DLL side-loading activity. Grayling appears to target organisations in Asia, however one unknown organisation in the United States was also targeted. Industries targeted include Biomedical, Government and Information Technology. Grayling use a variety of tools during their attacks, including well known tools such as Cobalt Strike and Havoc and also some others.

Storm-2603

The group Microsoft tracks as Storm-2603 is assessed with medium confidence to be a China-based threat actor. Microsoft has not identified links between Storm-2603 and other known Chinese threat actors. Microsoft tracks this threat actor in association with attempts to steal MachineKeys via the on-premises SharePoint vulnerabilities. Although Microsoft has observed this threat actor deploying Warlock and Lockbit ransomware in the past, Microsoft is currently unable to confidently assess the threat actor's objectives. Additional actors may use these exploits to target unpatched on-premises SharePoint systems, further emphasizing the need for organizations to implement mitigations and security updates immediately.

APT16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

HURRICANE PANDA

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an 'eval()' command, which is then used to

provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via 'net use' and 'wmic' commands executed through the webshell terminal.

APT14

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

IMPERSONATING PANDA

The tag is: *misp-galaxy:threat-actor="IMPERSONATING PANDA"*

APT20

We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain

victims, “th3bug” is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.

The tag is: *misp-galaxy:threat-actor="APT20"*

APT20 is also known as:

- VIOLIN PANDA
- TH3Bug
- Crawling Taurus

APT33

Our analysis reveals that APT33 is a capable group that has carried out cyber espionage operations since at least 2013. We assess APT33 works at the behest of the Iranian government.

The tag is: *misp-galaxy:threat-actor="APT33"*

APT33 is also known as:

- APT 33
- Elfin
- MAGNALLIUM
- Refined Kitten
- HOLMIUM
- COBALT TRINITY

- G0064
- ATK35
- Peach Sandstorm
- TA451

APT29

A 2015 report by F-Secure describe APT29 as: 'The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States;Asian, African, and Middle Eastern governments;organizations associated with Chechen extremism;and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large - scale spear - phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash - and - grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible.If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long - term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss). '

Turla

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much - documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took.Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantecs Gavin O' Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.'

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

The tag is: *misp-galaxy:threat-actor="Sandworm"*

TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it's not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: *misp-galaxy:threat-actor="TeamSpy Crew"*

TeamSpy Crew is also known as:

- TeamSpy
- Team Bear
- Anger Bear
- IRON LYRIC

BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles ($25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

The tag is: *misp-galaxy:threat-actor="BuhTrap"*

WOLF SPIDER

FIN4 is a financially-motivated threat group that has targeted confidential information related to the public financial market, particularly regarding healthcare and pharmaceutical companies, since at least 2013. FIN4 is unique in that they do not infect victims with typical persistent malware, but rather they focus on capturing credentials authorized to access email and other non-public correspondence.

The tag is: *misp-galaxy:threat-actor="WOLF SPIDER"*

WOLF SPIDER is also known as:

- FIN4
- G0085

Silent Chollima

Andariel is a threat actor that primarily targets South Korean corporations and institutions. They are believed to collaborate with or operate as a subsidiary organization of the Lazarus threat group. WHOIS utilizes spear phishing attacks, watering hole attacks, and supply chain attacks for initial access. They have been known to exploit vulnerabilities and use malware such as Infostealer and TigerRAT.

The tag is: *misp-galaxy:threat-actor="Silent Chollima"*

Silent Chollima is also known as:

- OperationTroy
- Guardian of Peace
- GOP
- WHOis Team
- Andariel
- Subgroup: Andariel
- Onyx Sleet
- PLUTONIUM

Lazarus Group

Since 2009, HIDDEN COBRA actors have leveraged their capabilities to target and compromise a range of victims; some intrusions have resulted in the exfiltration of data while others have been disruptive in nature. Commercial reporting has referred to this activity as Lazarus Group and Guardians of Peace. Tools and capabilities used by HIDDEN COBRA actors include DDoS botnets, keyloggers, remote access tools (RATs), and wiper malware. Variants of malware and tools used by HIDDEN COBRA actors include Destover, Duuzer, and Hangman.

VICEROY TIGER

VICEROY TIGER is an adversary with a nexus to India that has historically targeted entities throughout multiple sectors. Older activity targeted multiple sectors and countries; however, since 2015 this adversary appears to focus on entities in Pakistan with a particular focus on government and security organizations. This adversary consistently leverages spear phishing emails containing malicious Microsoft Office documents, malware designed to target the Android mobile platform, and phishing activity designed to harvest user credentials. In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT's attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization's new attack activity, confirmed and exposed the gang's targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization.

SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been **the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies**. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to ‘Sauron’ in the Lua scripts.

OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their

operations. Such maturities involve:

-Organized evasion testing used the during development of their tools. -Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. -Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

Volatile Cedar

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive.

The tag is: *misp-galaxy:threat-actor="Volatile Cedar"*

Volatile Cedar is also known as:

- Lebanese Cedar
- DeftTorero

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: *misp-galaxy:threat-actor="Packrat"*

Cadelle

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it's likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

The tag is: *misp-galaxy:threat-actor="Cadelle"*

PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with

continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term 'PassCV' to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We'd like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they've begun development on.

The tag is: *misp-galaxy:threat-actor="PassCV"*

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research

shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: *misp-galaxy:threat-actor="Gamaredon Group"*

Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line5with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

The tag is: *misp-galaxy:threat-actor="Infy"*

Infy is also known as:

- Operation Mermaid
- Prince of Persia

- Foudre

Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch's (HRW) Emergencies Director, requesting that they read an article about Iran pressing Afghanr efugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director's biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address to how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

Longhorn

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural

resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

APT32

Cyber espionage actors, now designated by FireEye as APT32 (OceanLotus Group), are carrying out intrusions into private sector companies across multiple industries and have also targeted foreign governments, dissidents, and journalists. FireEye assesses that APT32 leverages a unique suite of fully-featured malware, in conjunction with commercially-available tools, to conduct targeted operations that are aligned with Vietnamese state interests.

WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: *misp-galaxy:threat-actor="WildNeutron"*

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website

compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

APT5

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies

The tag is: *misp-galaxy:threat-actor="APT5"*

APT5 is also known as:

Tick

Tick is a cyber espionage group with likely Chinese origins that has been active since at least 2008. The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. This threat actor targets organizations in the critical infrastructure, heavy industry, manufacturing, and international relations sectors for espionage purposes. The attacks appear to be centered on political, media, and engineering sectors. STALKER PANDA has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States.

Madi

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as 'Snake Wine'. The

Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" ("Ugly Face" or “Mask”) which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date.What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

APT6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,”Deepen said.

The tag is: *misp-galaxy:threat-actor="APT6"*

APT6 is also known as:

- 1.php Group

AridViper

AridViper is a state-sponsored APT primarily targeting military personnel, journalists, and dissidents in the Middle East, with a focus on Israel and Palestine. The group employs custom-developed mobile malware, including variants like AridSpy, GnatSpy, and Micropsia, often delivered through spear-phishing emails and deceptive applications. Their operations involve sophisticated social engineering tactics, including the use of fake social media profiles and weaponized apps masquerading as legitimate services. AridViper's activities are characterized by a blend of technical sophistication and psychological manipulation, aiming to exfiltrate sensitive data from compromised systems.

The tag is: *misp-galaxy:threat-actor="AridViper"*

AridViper is also known as:

- Desert Falcon
- Arid Viper
- APT-C-23
- Bearded Barbie
- Two-tailed Scorpion

White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively

rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

MoneyTaker

In less than two years, this group has conducted over 20 successful attacks on financial institutions and legal firms in the USA, UK and Russia. The group has primarily been targeting card processing systems, including the AWS CBR (Russian Interbank System) and purportedly SWIFT (US). Given the wide usage of STAR in LATAM, financial institutions in LATAM could have particular exposure to a potential interest from the MoneyTaker group.

Dark Caracal

Lookout and Electronic Frontier Foundation (EFF) have discovered Dark Caracal, a persistent and prolific actor, who at the time of writing is believed to be administered out of a building belonging to the Lebanese General Security Directorate in Beirut. At present, we have knowledge of hundreds of gigabytes of exfiltrated data, in 21+ countries, across thousands of victims. Stolen data includes enterprise intellectual property and personally identifiable information.

Nexus Zeta

Nexus Zeta is no stranger when it comes to implementing SOAP related exploits. The threat actor has already been observed in implementing two other known SOAP related exploits, CVE-2014–8361 and CVE-2017–17215 in his Satori botnet project. A third SOAP exploit, TR-069 bug has also been observed previously in IoT botnets. This makes EDB 38722 the fourth SOAP related exploit which is discovered in the wild by IoT botnets.

APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: *misp-galaxy:threat-actor="APT35"*

APT35 is also known as:

Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known

victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

https://unit42.paloaltonetworks.com/atoms/rancortaurus/

The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed 'Big Bang' due to the attacker's fondness for the 'Big Bang Theory' TV show, after which some of the malware's modules are named.

The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor="The Gorgon Group"*

The Gorgon Group is also known as:

- Gorgon Group
- Subaat
- ATK92
- G0078
- Pasty Gemini

DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor="DarkHydrus"*

DarkHydrus is also known as:

Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard

and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

MUSTANG PANDA

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless,

malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

The tag is: *misp-galaxy:threat-actor="MUSTANG PANDA"*

MUSTANG PANDA is also known as:

PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: *misp-galaxy:threat-actor="PowerPool"*

PowerPool is also known as:

- IAmTheKing

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

Roaming Mantis

According to new research by Kaspersky's GReAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since 2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The

targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it’s clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor’s infrastructure and TTPs, we haven’t been able to connect them with any other campaign or actor that’s been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let’s Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don’t know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

The tag is: *misp-galaxy:threat-actor="DNSpionage"*

DNSpionage is also known as:

- COBALT EDGEWATER

Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (http://www.p2f.ru), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as "Operation Poison Needles", considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group's 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter's numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware's capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a 'loader' delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

Silence group

a relatively new threat actor that's been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group's activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts' hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: *misp-galaxy:threat-actor="Silence group"*

Silence group is also known as:

- Silence
- WHISPER SPIDER

APT39

APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

The tag is: *misp-galaxy:threat-actor="APT39"*

APT39 is also known as:

- Chafer
- REMIX KITTEN
- COBALT HICKMAN

Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

The tag is: *misp-galaxy:threat-actor="Siesta"*

Table 15008. Table References

Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: *misp-galaxy:threat-actor="Gallmaker"*

Table 15009. Table References

PINCHY SPIDER

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

The tag is: *misp-galaxy:threat-actor="PINCHY SPIDER"*

Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters' MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

The tag is: *misp-galaxy:threat-actor="Operation ShadowHammer"*

Table 15025. Table References

Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.

Silent Librarian

Last Friday, Deputy Attorney General Rod Rosenstein announced the indictment of nine Iranians who worked for an organization named the Mabna Institute. According to prosecutors, the defendants stole more than 31 terabytes of data from universities, companies, and government agencies around the world. The cost to the universities alone reportedly amounted to approximately $3.4 billion. The information stolen from these universities was used by the Islamic Revolutionary Guard Corps (IRGC) or sold for profit inside Iran. PhishLabs has been tracking this same threat group since late-2017, designating them Silent Librarian. Since discovery, we have been working with the FBI, ISAC partners, and other international law enforcement agencies to help understand and mitigate these attacks.

The tag is: *misp-galaxy:threat-actor="Silent Librarian"*

Silent Librarian is also known as:

- COBALT DICKENS
- Mabna Institute
- TA407

APT31

FireEye characterizes APT31 as an actor specialized on intellectual property theft, focusing on data and projects that make a particular organization competetive in its field. Based on available data (April 2016), FireEye assesses that APT31 conducts network operations at the behest of the Chinese Government. Also according to Crowdstrike, this adversary is suspected of continuing to target upstream providers (e.g., law firms and managed service providers) to support additional intrusions against high-profile assets. In 2018, CrowdStrike observed this adversary using spear-phishing, URL “web bugs” and scheduled tasks to automate credential harvesting.

Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.

The tag is: *misp-galaxy:threat-actor="Blackgear"*

BlackTech

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech's campaigns are likely designed to steal their target's technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations. PLEAD's toolset includes the self-named PLEAD backdoor and the DRIGO exfiltration tool. PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router's VPN feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

https://attack.mitre.org/groups/G0053/

FIN1

FireEye first identified this activity during a recent investigation at an organization in the financial industry. They identified the presence of a financially motivated threat group that they track as FIN1, whose activity at the organization dated back several years. The threat group deployed numerous malicious files and utilities, all of which were part of a malware ecosystem referred to as 'Nemesis' by the malware developer(s), and used this malware to access the victim environment and steal cardholder data. FIN1, which may be located in Russia or a Russian-speaking country based on language settings in many of their custom tools, is known for stealing data that is easily monetized from financial services organizations such as banks, credit unions, ATM operations, and financial transaction processing and financial business services companies.

The tag is: *misp-galaxy:threat-actor="FIN1"*

Table 15034. Table References

Links
https://www.fireeye.com/blog/threat-research/2015/12/fin1-targets-boot-record.html

FIN10

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations' networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

The tag is: *misp-galaxy:threat-actor="FIN10"*

FIN10 is also known as:

- G0051

GhostNet

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information. Attacks on the Dalai Lama's Private Office The OHHDL started to suspect it was under surveillance while setting up meetings be-tween His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat's office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)

GozNym

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB malware. It appears that the operators of Nymaim have recompiled its source code with part of the Gozi ISFB source code, creating a combination that is being actively used in attacks against more than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to create a powerful Trojan. From the Nymaim malware, it leverages the dropper's stealth and persistence; the Gozi ISFB parts add the banking Trojan's capabilities to facilitate fraud via infected Internet browsers. The end result is a new banking Trojan in the wild.

Group5

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past

Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

The tag is: *misp-galaxy:threat-actor="Honeybee"*

Honeybee is also known as:

- G0072

Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the

victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a 'shotgun' like approach, copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous.ænThe attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.

RTM

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals' use of simple backdoors to gain a foothold in their targets' networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

The tag is: *misp-galaxy:threat-actor="RTM"*

RTM is also known as:

- G0048

Table 15041. Table References

Shadow Network

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows' attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People's Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

Slingshot

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named 'Slingshot', part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the

time of this analysis (February 2018).

The tag is: *misp-galaxy:threat-actor="Slingshot"*

Taidoor

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control. As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers' activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

[Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note -most of the leaks are posted on Telegram channels that were created specifically for this purpose. Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym ("The people whose lips are stitched and sealed" –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group's name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The documents were related to Iranian attack groups' activity.

DUNGEON SPIDER

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky, which has been active since February 2016 and was last observed in late 2017. Locky is a ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

Fxmsp

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

The tag is: *misp-galaxy:threat-actor="Fxmsp"*

Gnosticplayers

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

The tag is: *misp-galaxy:threat-actor="Gnosticplayers"*

Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team's resumed operations came six months later – a new sample of Hacking Team's Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team's shareholder structure, with Tablem Limited taking 20% of Hacking Team's shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay US$250,000 in exchange for the 1.5 terabytes' worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as "Game of Thrones," "Girls," and "Ballers." This is not the first time that OurMine has claimed responsibility for hacking high- profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology

companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

Pacha Group

Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.

The tag is: *misp-galaxy:threat-actor="Pacha Group"*

[Vault 7/8]

An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virgina. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA's global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft's Windows and even Samsung TVs, which are turned into covert microphones.

ZOMBIE SPIDER

On April 7, 2017, Pytor Levashov — who predominantly used the alias Severa or Peter Severa and

whom Falcon Intelligence tracks as ZOMBIE SPIDER — was arrested in an international law enforcement operation led by the FBI. ZOMBIE SPIDER's specialty was large-scale spam distribution, a fundamental component of cybercrime operations. Levashov was the primary threat actor behind a botnet known as Kelihos and its predecessors, Waledac and Storm. In addition to Levashov's arrest, there was a technical operation conducted by Falcon Intelligence to seize control of the Kelihos botnet.

ViceLeaker

In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information. During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost. Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation "ViceLeaker", because of strings and variables in its code.

SWEED

Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to a threat actor we're calling "SWEED," including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access trojans. SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments.

While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that's been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we've seen in the past in the way that it is packed, as well as how it infects the system. In this post, we'll run down each campaign we're able to connect to SWEED, and talk about some of the actor's tactics, techniques and procedures (TTPs).

The tag is: *misp-galaxy:threat-actor="SWEED"*

TA428

Proofpoint researchers have identified a targeted APT campaign that utilized malicious RTF documents to deliver custom malware to unsuspecting victims. We dubbed this campaign "Operation LagTime IT" based on entities that were targeted and the distinctive domains registered to C&C IP infrastructure. Beginning in early 2019, these threat actors targeted a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. We determined that the infection vector observed in this campaign was spear phishing, with emails originating from both free email accounts and compromised user accounts. Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. Based on infrastructure overlaps, post-exploitation techniques, and historic TTPs utilized in this operation, Proofpoint analysts attribute this activity to the Chinese APT group tracked internally as TA428. Researchers believe that this activity has an operational and tactical resemblance to the Maudi Surveillance Operation which was previously reported in 2013.

POISON CARP

Between November 2018 and May 2019, senior members of Tibetan groups received malicious links in individually tailored WhatsApp text exchanges with operators posing as NGO workers, journalists, and other fake personas. The links led to code designed to exploit web browser vulnerabilities to install spyware on iOS and Android devices, and in some cases to OAuth phishing pages. This campaign was carried out by what appears to be a single operator that we call POISON CARP.

The tag is: *misp-galaxy:threat-actor="POISON CARP"*

POISON CARP is also known as:

- Evil Eye
- Red Dev 16

TA410

Early in August 2019, Proofpoint described what appeared to be state-sponsored activity targeting the US utilities sector with malware that we dubbed “Lookback”. Between August 21 and August 29, 2019, several spear phishing emails were identified targeting additional US companies in the utilities sector. The phishing emails originated from what appears to be an actor-controlled

domain: globalenergycertification[.]net. This domain, like those used in previous campaigns, impersonated a licensing body related to the utilities sector. In this case, it masqueraded as the legitimate domain for Global Energy Certification ("GEC"). The emails include a GEC examination-themed body and a malicious Microsoft Word attachment that uses macros to install and run LookBack. (Note confusion between Malware, Campaign and ThreatActor)

The tag is: *misp-galaxy:threat-actor="TA410"*

Operation WizardOpium

We are calling these attacks Operation WizardOpium. So far, we have been unable to establish a definitive link with any known threat actors. There are certain very weak code similarities with Lazarus attacks, although these could very well be a false flag. The profile of the targeted website is more in line with earlier DarkHotel attacks that have recently deployed similar false flag attacks.

The tag is: *misp-galaxy:threat-actor="Operation WizardOpium"*

Calypso

For the first time, the activity of the Calypso group was detected by specialists of PT Expert Security Center in March 2019, during the work to detect cyber threats. As a result, many malware samples of this group were obtained, affected organizations and control servers of intruders were identified. According to our data, the group has been active since at least September 2016. The main goal of the group is to steal confidential data, the main victims are government agencies from Brazil, India, Kazakhstan, Russia, Thailand, Turkey. Our data suggest that the group has Asian roots. Description translated from Russian.

The tag is: *misp-galaxy:threat-actor="Calypso"*

Calypso is also known as:

TA2101

Proofpoint researchers detected campaigns from a relatively new actor, tracked internally as TA2101, targeting German companies and organizations to deliver and install backdoor malware. The actor initiated their campaigns impersonating the Bundeszentralamt fur Steuern, the German Federal Ministry of Finance, with lookalike domains, verbiage, and stolen branding in the emails. For their campaigns in Germany, the actor chose Cobalt Strike, a commercially licensed software tool that is generally used for penetration testing and emulates the type of backdoor framework used by Metasploit, a similar penetration testing tool. Proofpoint researchers have also observed this actor distributing Maze ransomware, employing similar social engineering techniques to those it uses for Cobalt Strike, while also targeting organizations in Italy and impersonating the Agenzia Delle Entrate, the Italian Revenue Agency. We have also recently observed the actor targeting organizations in the United States using the IcedID banking Trojan while impersonating the United States Postal Service (USPS).

The tag is: *misp-galaxy:threat-actor="TA2101"*

TA2101 is also known as:

APT-C-34

As reported by ZDNet, Chinese cyber-security vendor Qihoo 360 published a report on 2019-11-29 exposing an extensive hacking operation targeting the country of Kazakhstan. Targets included individuals and organizations involving all walks of life, such as government agencies, military personnel, foreign diplomats, researchers, journalists, private companies, the educational sector, religious figures, government dissidents, and foreign diplomats alike. The campaign, Qihoo 360 said, was broad, and appears to have been carried by a threat actor with considerable resources, and one who had the ability to develop their private hacking tools, buy expensive spyware off the surveillance market, and even invest in radio communications interception hardware.

Operation Wocao

Operation Wocao (□□, “W□ cāo”, used as “shit” or “damn”) is the name that Fox-IT uses to describe the hacking activities of a Chinese based hacking group. This report details the profile of a publicly underreported threat actor that Fox-IT has dealt with over the past two years. Fox-IT assesses with high confidence that the actor is a Chinese group and that they are likely working to support the interests of the Chinese government and are tasked with obtaining information for espionage purposes. With medium confidence, Fox-IT assesses that the tools, techniques and procedures are those of the actor referred to as APT20 by industry partners. We have identified victims of this actor in more than 10 countries, in government entities, managed service providers and across a wide variety of industries, including Energy, Health Care and High-Tech.

The tag is: *misp-galaxy:threat-actor="Operation Wocao"*

DOPPEL SPIDER

In June 2019, CrowdStrike Intelligence observed a source code fork of BitPaymer and began tracking the new ransomware strain as DoppelPaymer. Further technical analysis revealed an increasing divergence between two versions of Dridex, with the new version dubbed DoppelDridex. Based on this evidence, CrowdStrike Intelligence assessed with high confidence that a new group split off from INDRIK SPIDER to form the adversary DOPPEL SPIDER. Following DOPPEL SPIDER's inception, CrowdStrike Intelligence observed multiple BGH incidents attributed to the group, with the largest known ransomware demand being 250 BTC. Other demands were not nearly as high, suggesting that the group conducts network reconnaissance to determine the value of the victim organization.

The tag is: *misp-galaxy:threat-actor="DOPPEL SPIDER"*

DOPPEL SPIDER is also known as:

- GOLD HERON

VENOM SPIDER

VENOM SPIDER is the developer of a large toolset that includes SKID, VenomKit and Taurus Loader. Under the moniker 'badbullzvenom', the adversary has been an active member of Russian underground forums since at least 2012, specializing in the identification of vulnerabilities and the subsequent development of tools for exploitation, as well as for gaining and maintaining access to victim machines and carding services. Recent advertisements for the malware indicate that VENOM SPIDER limits the sale and use of its tools, selling modules only to trusted affiliates. This preference can be seen in the fact that adversaries observed using the tools include the targeted criminal adversary COBALT SPIDER and BGH adversaries WIZARD SPIDER and PINCHY SPIDER.

The tag is: *misp-galaxy:threat-actor="VENOM SPIDER"*

VENOM SPIDER is also known as:

- badbullzvenom
- badbullz

Nazar

This actor was identified by Juan Andres Guerrero-Saade from the SIG37 cluster as published in the ShadowBrokers' 'Lost in Translation' leak. Earliest known sighting potentially dates back to as far as 2008 with a confirmed center of activity around 2010-2013. The actor name is derived from a PDB debug string fragment: 'khzer'. Victimology indicates targeting of Iran, assessed with low confidence based on VT file submission locations. Nazar employs a modular toolkit where a main dropper silently registers multiple DLLs as OLE controls in the Windows registry. Functionality includes keylogging, sound and screen grabbing, as well as traffic capture using the MicroOlap Packet Sniffer library.

The tag is: *misp-galaxy:threat-actor="Nazar"*

Nazar is also known as:

- SIG37

COBALT JUNO

COBALT JUNO has operated since at least 2013 and focused on targets located in the Middle East including Iran, Jordan, Egypt & Lebanon. COBALT JUNO custom spyware families SABER1 and SABER2, include surveillance functionality and masquerade as legitimate software utilities such as Adobe Updater, StickyNote and ASKDownloader. CTU researchers assess with moderate confidence that COBALT JUNO operated the ZooPark Android spyware since at least mid-2015. ZooPark was

publicly exposed in 2018 in both vendor reporting and a high profile leak of C2 server data. COBALT JUNO is linked to a private security company in Iran and outsources aspects of tool development work to commercial software developers. CTU researchers have observed the group using strategic web compromises to deliver malware. CTU researchers' discovery of new C2 domains in 2019 suggest the group is still actively performing operations.

The tag is: *misp-galaxy:threat-actor="COBALT JUNO"*

COBALT JUNO is also known as:

- APT-C-38 (QiAnXin)
- SABER LION
- TG-2884 (SCWX CTU)

Table 15091. Table References

https://www.secureworks.com/research/threat-profiles/cobalt-juno

COBALT KATANA

COBALT KATANA has been active since at least March 2018, and it focuses many of its operations on organizations based in or associated with Kuwait. The group has targeted government, logistics, and shipping organizations. The threat actors gain initial access to targets using DNS hijacking, strategic web compromise with SMB forced authentication, and password brute force attacks. COBALT KATANA operates a custom platform referred to as the Sakabota Framework, also referred to as Sakabota Core, with a complimentary set of modular backdoors and accessory tools including Gon, Hisoka, Hisoka Netero, Killua, Diezen, and Eye. The group has implemented DNS tunnelling in its malware and malicious scripts and also operates the HyphenShell web shell to strengthen post-intrusion access. CTU researchers assess with moderate confidence that COBALT KATANA operates on behalf of Iran, and elements of its operations such as overlapping infrastructure, use of DNS hijacking, implementation of DNS-based C2 channels in malware and web shell security mechanisms suggest connections to COBALT GYPSY and COBALT EDGEWATER.

The tag is: *misp-galaxy:threat-actor="COBALT KATANA"*

COBALT KATANA is also known as:

XDSpy

Rare is the APT group that goes largely undetected for nine years, but XDSpy is just that; a previously undocumented espionage group that has been active since 2011. It has attracted very little public attention, with the exception of an advisory from the Belarusian CERT in February 2020. In the interim, the group has compromised many government agencies and private companies in Eastern Europe and the Balkans.

The tag is: *misp-galaxy:threat-actor="XDSpy"*

Evil Corp

Evil Corp is an internaltional cybercrime network. In December of 2019 the US Federal Government offered a $5M bounty for information leading to the arrest and conviction of Maksim V. Yakubets for allegedly orchestrating Evil Corp operations. Responsible for stealing over $100M from businesses and consumers. The Evil Corp organization is known for utilizing custom strains of malware such as JabberZeus, Bugat and Dridex to steal banking credentials.

The tag is: *misp-galaxy:threat-actor="Evil Corp"*

Evil Corp is also known as:

- GOLD DRAKE

TRACER KITTEN

In April 2020, Crowstrike Falcon OverWatch discovered Iran-based adversary TRACER KITTEN conducting malicious interactive activity against multiple hosts at a telecommunications company

in the Europe, Middle East and Africa (EMEA) region. The actor was found operating under valid user accounts, using custom backdoors in combination with SSH tunnels for C2. The adversary leveraged their foothold to conduct a variety of reconnaissance activities, undertake credential harvesting and prepare for data exfiltration.

The tag is: *misp-galaxy:threat-actor="TRACER KITTEN"*

FIN11

FIN11 is a well-established financial crime group that has recently focused its operations on ransomware and extortion. The group has been active since 2017 and has been tracked under UNC902 and later on as TEMP.Warlok. In some ways, FIN11 is reminiscent of APT1; they are notable not for their sophistication, but for their sheer volume of activity.(FireEye) Mandiant has also responded to numerous FIN11 intrusions, but we've only observed the group successfully monetize access in few instances. This could suggest that the actors cast a wide net during their phishing operations, then choose which victims to further exploit based on characteristics such as sector, geolocation or perceived security posture. Recently, FIN11 has deployed CLOP ransomware and threatened to publish exfiltrated data to pressure victims into paying ransom demands. The group's shifting monetization methods—from point-of-sale (POS) malware in 2018, to ransomware in 2019, and hybrid extortion in 2020—is part of a larger trend in which criminal actors have increasingly focused on post-compromise ransomware deployment and data theft extortion. Notably, FIN11 includes a subset of the activity security researchers call TA505, Graceful Spider, Gold Evergreen, but we do not attribute TA505's early operations to FIN11 and caution against using the names interchangeably. Attribution of both historic TA505 activity and more recent FIN11 activity is complicated by the actors' use of criminal service providers. Like most financially motivated actors, FIN11 doesn't operate in a vacuum. We believe that the group has used services that provide anonymous domain registration, bulletproof hosting, code signing certificates, and private or semi-private malware. Outsourcing work to these criminal service providers likely enables FIN11 to increase the scale and sophistication of their operations.

The tag is: *misp-galaxy:threat-actor="FIN11"*

UNC1878

UNC1878 is a financially motivated threat actor that monetizes network access via the deployment of RYUK ransomware. Earlier this year, Mandiant published a blog on a fast-moving adversary deploying RYUK ransomware, UNC1878. Shortly after its release, there was a significant decrease in observed UNC1878 intrusions and RYUK activity overall almost completely vanishing over the summer. But beginning in early fall, Mandiant has seen a resurgence of RYUK along with TTP overlaps indicating that UNC1878 has returned from the grave and resumed their operations.

Red Charon

Throughout 2019, multiple companies in the Taiwan high-tech ecosystem were victims of an advanced persistent threat (APT) attack. Due to these APT attacks having similar behavior profiles (similar adversarial techniques, tactics, and procedures or TTP) with each other and previously documented cyberattacks, CyCraft assess with high confidence these new attacks were conducted by the same foreign threat actor. During their investigation, they dubbed this threat actor Chimera. “Chimera” stands for the synthesis of hacker tools that they’ve seen the group use, such as the skeleton key malware that contained code extracted from both Dumpert and Mimikatz — hence Chimera. Their operation — the entirety of the new attacks utilizing the Skeleton Key attack (described below) from late 2018 to late 2019, CyCraft have dubbed Operation Skeleton Key.

UNC2452

Reporting regarding activity related to the SolarWinds supply chain injection has grown quickly since initial disclosure on 13 December 2020. A significant amount of press reporting has focused on the identification of the actor(s) involved, victim organizations, possible campaign timeline, and potential impact. The US Government and cyber community have also provided detailed information on how the campaign was likely conducted and some of the malware used. MITRE's ATT&CK team — with the assistance of contributors — has been mapping techniques used by the actor group, referred to as UNC2452/Dark Halo by FireEye and Volexity respectively, as well as SUNBURST and TEARDROP malware.

TeamTNT

In early Febuary, 2021 TeamTNT launched a new campaign against Docker and Kubernetes environments. Using a collection of container images that are hosted in Docker Hub, the attackers are targeting misconfigured docker daemons, Kubeflow dashboards, and Weave Scope, exploiting these environments in order to steal cloud credentials, open backdoors, mine cryptocurrency, and launch a worm that is looking for the next victim. They're linked to the First Crypto-Mining Worm to Steal AWS Credentials and Hildegard Cryptojacking malware. TeamTNT is a relatively recent addition to a growing number of threats targeting the cloud. While they employ some of the same tactics as similar groups, TeamTNT stands out with their social media presence and penchant for self-promotion. Tweets from the TeamTNT's account are in both English and German although it is unknown if they are located in Germany.

The tag is: *misp-galaxy:threat-actor="TeamTNT"*

TeamTNT is also known as:

- Adept Libra

HAFNIUM

HAFNIUM primarily targets entities in the United States across a number of industry sectors, including infectious disease researchers, law firms, higher education institutions, defense contractors, policy think tanks, and NGOs. Microsoft Threat Intelligence Center (MSTIC) attributes this campaign with high confidence to HAFNIUM, a group assessed to be state-sponsored and operating out of China, based on observed victimology, tactics and procedures. HAFNIUM has previously compromised victims by exploiting vulnerabilities in internet-facing servers, and has used legitimate open-source frameworks, like Covenant, for command and control. Once they've gained access to a victim network, HAFNIUM typically exfiltrates data to file sharing sites like MEGA.In campaigns unrelated to these vulnerabilities, Microsoft has observed HAFNIUM interacting with victim Office 365 tenants. While they are often unsuccessful in compromising customer accounts, this reconnaissance activity helps the adversary identify more details about their targets' environments. HAFNIUM operates primarily from leased virtual private servers (VPS) in the United States.

OUTLAW SPIDER

On May 7, 2019, Mayor Bernard “Jack” Young confirmed that the network for the U.S. City of Baltimore (CoB) was infected with ransomware, which was announced via Twitter1. This infection was later confirmed to be conducted by OUTLAW SPIDER, which is the actor behind the RobbinHood ransomware. The actor demanded to be paid 3 BTC (approximately $17,600 USD at the time) per infected system, or 13 BTC (approximately $76,500 USD at the time) for all infected systems to recover the city’s files.

GOLD BURLAP

GOLD BURLAP is a group of financially motivated criminals responsible for the development of the Pysa ransomware, also referred to as Mespinoza. Pysa is a cross-platform ransomware with known versions written in C++ and Python. As of December 2020, approximately 50 organizations had reportedly been targeted in Pysa ransomware attacks. The operators leverage 'name and shame' tactics to apply additional pressure to victims. As of January 2021, CTU researchers had found no Pysa advertisements on underground forums, which likely indicates that it is not operated as ransomware as a service (RaaS).

The tag is: *misp-galaxy:threat-actor="GOLD BURLAP"*

GOLD BURLAP is also known as:

- CYBORG SPIDER

GOLD CABIN

GOLD CABIN is a financially motivated cybercriminal threat group operating a malware distribution service on behalf of numerous customers since 2018. GOLD CABIN uses malicious documents, often contained in password-protected archives, delivered through email to download and execute payloads. The second-stage payloads are most frequently Gozi ISFB (Ursnif) or IcedID (Bokbot), sometimes using intermediary malware like Valak. GOLD CABIN infrastructure relies on artificial appearing and frequently changing URLs created with a domain generation algorithm (DGA). The URLs host a PHP object that returns the malware as a DLL file.

The tag is: *misp-galaxy:threat-actor="GOLD CABIN"*

GOLD CABIN is also known as:

- Shakthak
- TA551

- ATK236
- G0127
- Monster Libra

GOLD FAIRFAX

GOLD FAIRFAX is a financially motivated cybercriminal threat group responsible for the creation, distribution, and operation of the Ramnit botnet. Ramnit, the phonetic spelling of RMNet, the internal name of the core module, began operation in April 2010 and became widespread in July 2010. A particularly virulent file-infecting component of early Ramnit variants that spreads by modifying executables and HTML files has resulted in the continued prevalence of those early variants. Currently, Ramnit remains an actively maintained and distributed threat. The intent of Ramnit is to intercept and manipulate online financial transactions through modification of web browser behavior ('man-in-the-browser').

The tag is: *misp-galaxy:threat-actor="GOLD FAIRFAX"*

Table 15125. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-fairfax

GOLD FLANDERS

GOLD FLANDERS is a financially motivated group responsible for distributed denial of service (DDOS) attacks linked to extortion emails demanding between 5 and 30 bitcoins. The attacks consist mostly of fragmented UDP packets (DNS and NTP reflection) as well as other traffic that can vary per victim. The arrival of the extortion email is timed to coincide with a DDOS attack consisting of traffic between 20 Gbps and 200 Gbps and 12-15 million packets per second, lasting between 20 and 70 minutes targeted at a particular Autonomous System Number (ASN) or group of IP addresses. In some cases victim organisations have replied to these extortion emails and received personal replies from GOLD FLANDERS operators within 20 minutes.

The tag is: *misp-galaxy:threat-actor="GOLD FLANDERS"*

GOLD GALLEON

GOLD GALLEON is a financially motivated cybercriminal threat group comprised of at least 20 criminal associates that collectively carry out business email compromise (BEC) and spoofing (BES) campaigns. The group appears to specifically target maritime organizations and their customers. CTU researchers have observed GOLD GALLEON targeting firms in South Korea, Japan, Singapore, Philippines, Norway, U.S., Egypt, Saudi Arabia, and Colombia. The threat actors leverage tools, tactics, and procedures that are similar to those used by other BEC/BES groups CTU researchers have previously investigated, such as GOLD SKYLINE. The groups have used the same caliber of publicly available malware (inexpensive and commodity remote access trojans), crypters, and email lures.

The tag is: *misp-galaxy:threat-actor="GOLD GALLEON"*

GOLD GARDEN

GOLD GARDEN was a financially motivated cybercriminal threat group that authored and operated the GandCrab ransomware from January 2018 through May 2019. GandCrab was operated as a ransomware-as-a-service operation whereby numerous affiliates distributed the malware and split ransom payments with the core operators. GOLD GARDEN maintained exclusive control of the development of GandCrab and associated command and control (C2) infrastructure. Individual affiliates, of which there were frequently more than a dozen in operation simultaneously, coordinated the distribution of GandCrab through spam emails, web exploit kits, pay-per-install botnets, and scan-and-exploit style attacks. On May 31, 2019 the operators announced they have halted operations with no intent to resume for unknown reasons. In April 2019 the operators of GOLD GARDEN transferred the source code of GandCrab to GOLD SOUTHFIELD who used it as the foundation of the REvil ransomware operation. GOLD SOUTHFIELD operates a similar affiliate program comprised largely of former GandCrab users and other groups recruited from underground forums.

The tag is: *misp-galaxy:threat-actor="GOLD GARDEN"*

Table 15128. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-garden

GOLD MANSARD

GOLD MANSARD is a financially motivated cybercriminal threat group that operated the Nemty

ransomware from August 2019. The threat actor behind Nemty is known on Russian underground forums as 'jsworm'. Nemty was operated as a ransomware as a service (RaaS) affiliate program and featured a 'name and shame' website where exfiltrated victim data was leaked. In April 2020, jsworm appeared to acquire new partners and retired the Nemty ransomware. This was followed by the introduction of Nefilim ransomware, which does not operate as an affiliate model. Nefilim has been used in post-intrusion ransomware attacks against organizations in logistics, telecommunications, energy and other sectors.

The tag is: *misp-galaxy:threat-actor="GOLD MANSARD"*

Table 15129. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-mansard

GOLD NORTHFIELD

Operational since at least October 2020, GOLD NORTHFIELD is a financially motivated cybercriminal threat group that leverages GOLD SOUTHFIELD's REvil ransomware in their attacks. To do this, the threat actors replace the configuration of the REvil ransomware binary with their own in an effort to repurpose the ransomware for their operations. GOLD NORTHFIELD has given this modified REvil ransomware variant the name 'LV ransomware'.

The tag is: *misp-galaxy:threat-actor="GOLD NORTHFIELD"*

GOLD RIVERVIEW

GOLD RIVERVIEW was a financially motivated cybercriminal group that facilitated the distribution of malware- and scam-laden spam email on behalf of its customers. This threat group authored and sold the Necurs rootkit beginning in early 2014, including to GOLD EVERGREEN who integrated it into Gameover Zeus. GOLD RIVERVIEW also operated a global botnet that was colloquially known as Necurs (CraP2P) and was a major source of spam email from 2016 through 2018. Necurs distributed malware such as GOLD DRAKE's Dridex (Bugat v5), GOLD BLACKBURN's TrickBot, and other families like Locky and FlawedAmmy. Necurs also distributed a large volume of email pushing securities 'pump and dump' scams, rogue pharmacies, and fraudulent dating sites. On March 4, 2019 all three active segments of the Necurs botnet ceased operation and have not since resumed. On March 10, 2020 Microsoft took civil action against GOLD RIVERVIEW and made technical steps that would complicate the threat actors' ability to reconstitute the botnet.

The tag is: *misp-galaxy:threat-actor="GOLD RIVERVIEW"*

Table 15131. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-riverview

GOLD SKYLINE

GOLD SKYLINE is a financially motivated cybercriminal threat group operating from Nigeria engaged in high-value wire fraud facilitated by business email compromise (BEC) and spoofing (BES). Also known as Wire-Wire Group 1 (WWG1), GOLD SKYLINE has been active since at least 2016 and relies heavily on compromised email accounts, social engineering, and increasingly malware to divert inter-organization funds transfers.

The tag is: *misp-galaxy:threat-actor="GOLD SKYLINE"*

Table 15132. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-skyline

GOLD SOUTHFIELD

GOLD SOUTHFIELD is a financially motivated cybercriminal threat group that authors and operates the REvil (aka Sodinokibi) ransomware on behalf of various affiliated threat groups. Operational since April 2019, the group obtained the GandCrab source code from GOLD GARDEN, the operators of GandCrab that voluntarily withdrew their ransomware from underground markets in May 2019. GOLD SOUTHFIELD is responsible for authoring REvil and operating the backend infrastructure used by affiliates (also called partners) to create malware builds and to collect ransom payments from victims. CTU researchers assess with high confidence that GOLD SOUTHFIELD is a former GandCrab affiliate and continues to work with other former GandCrab affiliates.

The tag is: *misp-galaxy:threat-actor="GOLD SOUTHFIELD"*

GOLD SYMPHONY

GOLD SYMPHONY is a financially motivated cybercrime group, likely based in Russia, that is responsible for the development and sale on underground forums of the Buer Loader malware. First discovered around August 2019, Buer Loader is offered as a malware-as-a-service (MasS) and

has been advertised by a threat actor using the handle 'memeos'. Customers include GOLD BLACKBURN, the operators of the TrickBot malware. In addition to TrickBot, Buer Loader has been reported to download Cobalt Strike and other tools for use in post-intrusion ransomware attacks.

The tag is: *misp-galaxy:threat-actor="GOLD SYMPHONY"*

Table 15134. Table References

Links
http://www.secureworks.com/research/threat-profiles/gold-symphony

GOLD WATERFALL

GOLD WATERFALL is a group of financially motivated cybercriminals responsible for the creation, distribution, and operation of the Darkside ransomware. Active since August 2020, GOLD WATERFALL uses a variety of tactics, techniques, and procedures (TTPs) to infiltrate and move laterally within targeted organizations to deploy Darkside ransomware to its most valuable resources. Among these TTPs are using malicious documents delivered by email to establish a foothold and using stolen credentials to access victims' remote access services. In November 2020, the 'darksupp' persona was observed advertising an affiliate program on several semi-exclusive underground forums, marking GOLD WATERFALL's entry into the ransomware-as-a-service (RaaS) landscape.

The tag is: *misp-galaxy:threat-actor="GOLD WATERFALL"*

GOLD WINTER

GOLD WINTER are a financially motivated group, likely based in Russia, who operate the Hades ransomware. Hades activity was first identified in December 2020 and its lack of presence on underground forums and marketplaces leads CTU researchers to conclude that it is not operated under a ransomware as a service affiliate model. GOLD WINTER do employ name-and-shame tactics, where data is stolen and used as additional leverage over victims, but rather than a single centralized leak site CTU researchers have observed the group using Tor sites customized for each victim that include a Tox chat ID for communication, which also appears to be unique for each victim.

The tag is: *misp-galaxy:threat-actor="GOLD WINTER"*

Table 15136. Table References

FIN13

Since 2017, Mandiant has been tracking FIN13, an industrious and versatile financially motivated threat actor conducting long-term intrusions in Mexico with an activity timeframe stretching back as early as 2016. Although their operations continue through the present day, in many ways FIN13's intrusions are like a time capsule of traditional financial cybercrime from days past. Instead of today's prevalent smash-and-grab ransomware groups, FIN13 takes their time to gather information to perform fraudulent money transfers. Rather than relying heavily on attack frameworks such as Cobalt Strike, the majority of FIN13 intrusions involve heavy use of custom passive backdoors and tools to lurk in environments for the long haul.

The tag is: *misp-galaxy:threat-actor="FIN13"*

FIN13 is also known as:

- TG2003
- Elephant Beetle

Antlion

Antlion is a Chinese state-backed advanced persistent threat (APT) group, who has been targeting financial institutions in Taiwan. This persistent campaign has lasted over the course of at least 18 months.

The tag is: *misp-galaxy:threat-actor="Antlion"*

Table 15143. Table References

Links

https://symantec-enterprise-blogs.security.com/blogs/threat-intelligence/china-apt-antlion-taiwan-financial-attacks

TA2541

Persistent cybercrime threat actor targeting aviation, aerospace, transportation, manufacturing, and defense industries for years. This threat actor consistently uses remote access trojans (RATs) that can be used to remotely control compromised machines. This threat actor uses consistent themes related to aviation, transportation, and travel. The threat actor has used similar themes and targeting since 2017.

The tag is: *misp-galaxy:threat-actor="TA2541"*

Table 15144. Table References

Links
https://www.proofpoint.com/us/blog/threat-insight/charting-ta2541s-flight

TA516

This actor typically distributes instances of the SmokeLoader intermediate downloader, which, in turn, downloads additional malware of the actor's choice — often banking Trojans. Figure 3 shows a lure document from a November campaign in which TA516 distributed fake resumes with malicious macros that, if enabled, launch a PowerShell script that downloads SmokeLoader. In this instance, we observed SmokeLoader downloading a Monero coinminer. Since the middle of 2017, TA516 has used similar macro-laden documents as well as malicious JavaScript hosted on Google Drive to distribute both Panda Banker and a coinminer executable via SmokeLoader, often in the same campaigns.

The tag is: *misp-galaxy:threat-actor="TA516"*

Table 15145. Table References

Links
https://www.thaicert.or.th/downloads/files/Threat_Group_Cards_v2.0.pdf

TA547

TA547 is responsible for many other campaigns since at least November 2017. The other campaigns by the actor were often localized to countries such as Australia, Germany, the United Kingdom, and Italy. Delivered malware included ZLoader (a.k.a. Terdot), Gootkit, Ursnif, Corebot, Panda Banker, Atmos, Mazar Bot, and Red Alert Android malware.

The tag is: *misp-galaxy:threat-actor="TA547"*

Table 15146. Table References

Links

https://www.thaicert.or.th/downloads/files/Threat_Group_Cards_v2.0.pdf

TA554

Since May 2018, Proofpoint researchers have observed email campaigns using a new downloader called sLoad. sLoad is a PowerShell downloader that most frequently delivers Ramnit banker and includes noteworthy reconnaissance features. The malware gathers information about the infected system including a list of running processes, the presence of Outlook, and the presence of Citrix-related files. sLoad can also take screenshots and check the DNS cache for specific domains (e.g., targeted banks), as well as load external binaries. While initial versions of sLoad appeared in May 2018, we began tracking the campaigns from this actor (internally named TA554) since at least the beginning of 2017.

The tag is: *misp-galaxy:threat-actor="TA554"*

TA554 is also known as:

- TH-163

Table 15147. Table References

Links
https://www.thaicert.or.th/downloads/files/Threat_Group_Cards_v2.0.pdf

TA555

Beginning in May 2018, Proofpoint researchers observed a previously undocumented downloader dubbed AdvisorsBot appearing in malicious email campaigns. The campaigns appear to primarily target hotels, restaurants, and telecommunications, and are distributed by an actor we track as TA555. To date, we have observed AdvisorsBot used as a first-stage payload, loading a fingerprinting module that, as with Marap, is presumably used to identify targets of interest to further infect with additional modules or payloads. AdvisorsBot is under active development and we have also observed another version of the malware completely rewritten in PowerShell and .NET.

The tag is: *misp-galaxy:threat-actor="TA555"*

Table 15148. Table References

Links
https://www.thaicert.or.th/downloads/files/Threat_Group_Cards_v2.0.pdf

TA800

This attacker is an affiliate distributor of the The Trick, also known as Trickbot, and BazaLoader. (For more on how affiliates work, see the description of TA573). TA800 has targeted a wide range of industries in North America, infecting victims with banking Trojans and malware loaders (malware designed to download other malware onto a compromised device). Malicious emails have often

included recipients' names, titles and employers along with phishing pages designed to look like the targeted company. Lures have included hard-to-resist subjects such as related to payment, meetings, termination, bonuses and complaints in the subject line or body of the email.

The tag is: *misp-galaxy:threat-actor="TA800"*

UNC3524

Mandiant observed this group operating since December 2019. Its techniques partially overlap with multiple Russian-based espionage actors (APT28 and APT29). They are described as having a high level of operational security, low malware footprint, adept evasive skills, and a large Internet of Things (IoT) device botnet at their disposal.

The tag is: *misp-galaxy:threat-actor="UNC3524"*

Curious Gorge

Curious Gorge, a group TAG attributes to China's PLA SSF, has conducted campaigns against government and military organizations in Ukraine, Russia, Kazakhstan, and Mongolia. The actor has remained active against government, military, logistics and manufacturing organizations in Ukraine, Russia and Central Asia. In Russia, long running campaigns against multiple government organizations have continued, including the Ministry of Foreign Affairs. Over the past week, TAG identified additional compromises impacting multiple Russian defense contractors and manufacturers and a Russian logistics company.

The tag is: *misp-galaxy:threat-actor="Curious Gorge"*

Curious Gorge is also known as:

- UNC3742

Red Menshen

Since 2021, Red Menshen, a China based threat actor, which has been observed targeting telecommunications providers across the Middle East and Asia, as well as entities in the government, education, and logistics sectors using a custom backdoor referred as BPFDoor. This threat actor uses a variety of tools in its post-exploitation phase. This includes custom variants of the shared tool Mangzamel (including Golang variants), custom variants of Gh0st, and open source tools like Mimikatz and Metasploit to aid in its lateral movement across Windows systems. Also, They have been seen sending commands to BPFDoor victims via Virtual Privat Servers (VPSs) hosted at a well-known provider, and that these VPSs, in turn, are administered via compromised

routers based in Taiwan, which the threat actor uses as VPN tunnels. Most Red Menshen activity that has been observed took place between Monday to Friday (with none observed on the weekends), with most communication taking place between 01:00 and 10:00 UTC.131 This pattern suggests a consistent 8 to 9-hour activity window for the threat actor, with realistic probability of it aligning to local working hours.

The tag is: *misp-galaxy:threat-actor="Red Menshen"*

Red Menshen is also known as:

- Red Dev 18
- Earth Bluecrow

EXOTIC LILY

EXOTIC LILY is a resourceful, financially motivated group whose activities appear to be closely linked with data exfiltration and deployment of human-operated ransomware such as Conti and Diavol. In early September 2021, the group has been obeserved exploiting a 0day in Microsoft MSHTML (CVE-2021-40444). Investigation lead researchers to believe that they are an Initial Access Broker (IAB) who appear to be working with the Russian cyber crime gang known as FIN12 (Mandiant, FireEye) / WIZARD SPIDER (CrowdStrike). This threat actor deploys tactics, techniques and procedures (TTPs) that are traditionally associated with more targeted attacks, like spoofing companies and employees as a means of gaining trust of a targeted organization through email campaigns that are believed to be sent by real human operators using little-to-no automation. Additionally and rather uniquely, they leverage legitimate file-sharing services like WeTransfer, TransferNow and OneDrive to deliver the payload, namely BUMBLEEBEE and BAZARLOADER, further evading detection mechanisms. This level of human-interaction is rather unusual for cyber crime groups focused on mass scale operations.

The tag is: *misp-galaxy:threat-actor="EXOTIC LILY"*

EXOTIC LILY is also known as:

- DEV-0413

Earth Wendigo

Earth Wendigo is a threat actor from China that has been targeting several organizations — including government organizations, research institutions, and universities in Taiwan — since May 2019, aiming to exfiltrate emails from targeted organizations via the injection of JavaScript backdoors to a webmail system that is widely used in Taiwan. The threat actor also sent spear-phishing emails embedded with malicious links to multiple individuals, including politicians and activists, who support movements in Tibet, the Uyghur region, or Hong Kong.

The tag is: *misp-galaxy:threat-actor="Earth Wendigo"*

Table 15175. Table References

BRONZE EDGEWOOD

In early 2021 CTU researchers observed BRONZE EDGEWOOD exploiting the Microsoft Exchange Server of an organization in Southeast Asia. The threat group deployed a China Chopper webshell and ran the Nishang Invoke-PowerShellTcp.ps1 script to connect back to C2 infrastructure. The threat group is publicly linked to malware families Chinoxy, PCShare and FunnyDream. CTU researchers have discovered that BRONZE EDGEWOOD also leverages Cobalt Strike in its intrusion activity. BRONZE EDGEWOOD has been active since at least 2018 and targets government and private enterprises across Southeast Asia. CTU researchers assess with moderate confidence that BRONZE EDGEWOOD operates on behalf the Chinese government and has a remit that covers political espionage.

The tag is: *misp-galaxy:threat-actor="BRONZE EDGEWOOD"*

BRONZE EDGEWOOD is also known as:

- Red Hariasa

APT9

APT9 engages in cyber operations where the goal is data theft, usually focusing on the data and projects that make a particular organization competitive within its field. APT9 was historically very active in the pharmaceuticals and biotechnology industry. We have observed this actor use spearphishing, valid accounts, as well as remote services for Initial Access. On at least one occasion, Mandiant observed APT9 at two companies in the biotechnology industry and suspect that APT9 actors may have gained initial access to one of the companies by using a trusted relationship between the two companies. APT9 use a wide range of backdoors, including publicly available backdoors, as well as backdoors that are believed to be custom, but are used by multiple APT groups.

The tag is: *misp-galaxy:threat-actor="APT9"*

APT9 is also known as:

- NIGHTSHADE PANDA
- Red Pegasus
- Group 27

BRONZE SPRING

BRONZE SPRING is a threat group that CTU researchers assess with high confidence operates on behalf of China in the theft of intellectual property from defense, engineering, pharmaceutical and technology companies. The threat group typically uses scan-and-exploit for initial access, deploys the China Chopper webshell for remote execution and persistence, and creates RAR archives with a '.jpg' file extension for data exfiltration. In July 2020 the U.S. Department of Justice indicted two Chinese hackers CTU researchers assess are members of the BRONZE SPRING threat group. The Department of Justice allege these hackers were responsible for compromising networks of hundreds of organisations and individuals in the U.S. and abroad since 2009, and that exfiltrated data would be passed to the Chinese Ministry of State Security or sold for financial gain.

The tag is: *misp-galaxy:threat-actor="BRONZE SPRING"*

BRONZE SPRING is also known as:

- UNC302

BRONZE STARLIGHT

BRONZE STARLIGHT has been active since mid 2021 and targets organizations globally across a range of industry verticals. The group leverages HUI Loader to load Cobalt Strike and PlugX

payloads for command and control. CTU researchers have observed BRONZE STARLIGHT deploying ransomware to compromised networks as part of name-and-shame ransomware schemes, and posted victim names to leak sites. CTU researchers assess with moderate confidence that BRONZE STARLIGHT is located in China based on observed tradecraft, including the use of HUI Loader and PlugX which are associated with China-based threat group activity. It is plausible that BRONZE STARLIGHT deploys ransomware as a smokescreen rather than for financial gain, with the underlying motivation of stealing intellectual property theft or conducting espionage.

The tag is: *misp-galaxy:threat-actor="BRONZE STARLIGHT"*

BRONZE STARLIGHT is also known as:

- SLIME34
- DEV-0401
- Cinnamon Tempest
- Emperor Dragonfly

BRONZE SPIRAL

In December 2020, the IT management software provider SolarWinds announced that an unidentified threat actor had exploited a vulnerability in their Orion Platform software to deploy a web shell dubbed SUPERNOVA. CTU researchers track the operators of the SUPERNOVA web shell as BRONZE SPIRAL and assess with low confidence that the group is of Chinese origin. SUPERNOVA was likely deployed through exploitation of CVE-2020-10148, and CTU researchers observed post-exploitation reconnaissance commands roughly 30 minutes before the web shell was deployed. This may have been indicative of the threat actor conducting scan-and-exploit activity and then triaging for victims of particular interest, before deploying SUPERNOVA and attempting to dump credentials and move laterally.

BRONZE SPIRAL has been associated with previous intrusions involving the targeting of ManageEngine servers, maintenance of long-term access to periodically harvest credentials and exfiltrate data, and espionage or theft of intellectual property. The threat group makes extensive use of native system tools and 'living off the land' techniques.

The tag is: *misp-galaxy:threat-actor="BRONZE SPIRAL"*

BRONZE VAPOR

BRONZE VAPOR is a targeted threat group assessed with moderate confidence to be of Chinese origin. Artefacts from tools associated with this group and open source reporting on related incidents indicate that BRONZE VAPOR have operated since at least 2017. The group conducts espionage against multiple industries including semiconductors, aviation and telecommunications. CTU researchers assess BRONZE VAPOR's intent to be information theft, with operations focused on intellectual property (semiconductors) and personally identifiable information such as traveller records (aviation). Compromise of telecommunications companies can yield personally identifiable information and meta data on client communications such as Call Data Records (CDR).

Prior to 2019 their operational focus, with some exceptions, revolved around targets in East Asia particularity Taiwan with it's thriving semiconductor industry. In 2021 details emerged in open source of attacks on at least one European semiconductor company believed to date back to 2017. In 2019 BRONZE VAPOR attacked one of more entities in the European airlines sector. The group gains initial access via VPN services, may use spearphishing with 'Letter of Appointment' themed lures, and deploys Cobalt Strike along with custom data exfiltration tools to target organizations. Post-intrusion activity involves living-of-the-land using legitimate tools and commands available within victim environment as well as using AceHash for credential harvesting, WATERCYCLE for data exfiltration and STOCKPIPE for proxying information through Microsoft Exchange servers over email.

BRONZE VAPOR uses a set of tactics that, although not individually unique, when viewed in aggregate create a relatively distinct playbook. Intrusions begin with credential based attacks against an existing remote access solution (Citrix, VPN etc.) or B2B network access. Cobalt Strike is deployed into the environment and further access is then conducted via Cobalt Strike Beacon and other features of the platform. Sharphound is deployed to map out the victim's Active Directory infrastructure and and collect critical information about the domain including important account names. Command and control infrastructure is hosted on subdomains of Azure and Appspot services to blend in with legitimate traffic. The threat actor also registers their own domains for command and control, often with a "sync" or "update" related theme. WinRAR is commonly used for compressing data prior to exfiltration. Filenames for these archives often involve a string of numbers and variations of the word "update". Data is exfiltrated using WATERCYCLE to cloud based platforms such as OneDrive and GoogleDrive.

Vicious Panda

Check Point Research discovered a new campaign against the Mongolian public sector, which takes advantage of the current Coronavirus scare, in order to deliver a previously unknown malware implant to the target. A closer look at this campaign allowed us to tie it to other operations which were carried out by the same anonymous group, dating back to at least 2016. Over the years, these operations targeted different sectors in multiple countries, such as Ukraine, Russia, and Belarus.

The tag is: *misp-galaxy:threat-actor="Vicious Panda"*

Vicious Panda is also known as:

- SixLittleMonkeys

Pickaxe

Prying Libra, also known as Pickaxe, is a threat actor active since at least August 2017, and continues to remain active to this day. The adversary's goal is to install and maintain a popular cryptocurrency miner on the victim's machine. The miner in question is an open-source tool named XMRig that generates the Monero cryptocurrency. Malware is delivered via downloads through the popular Adfly advertisement platform. Users are often mislead into clicking on a malicious advertisement that results in the payload being delivered to the victim. Once installed, the malware leverages VBS scripts and redirection services, such as bitly, to ultimately download and execute XMRig. Over 15 million confirmed victims have been discovered to be infected in recent campaigns, with actual numbers likely to be between 30-45 million victims. The victims are found across the globe, with high concentrations in Thailand, Vietnam, Egypt, Indonesia, and Turkey.

TA558

Since 2018, security researchers tracked a financially-motivated cybercrime actor, TA558, targeting hospitality, travel, and related industries located in Latin America and sometimes North America, and western Europe. The actor sends malicious emails written in Portuguese, Spanish, and sometimes English. The emails use reservation-themed lures with business-relevant themes such as hotel room bookings. The emails may contain malicious attachments or URLs aiming to distribute

one of at least 15 different malware payloads.

The tag is: *misp-galaxy:threat-actor="TA558"*

PARINACOTA

One actor that has emerged in this trend of human-operated attacks is an active, highly adaptive group that frequently drops Wadhrama as payload. PARINACOTA impacts three to four organizations every week and appears quite resourceful: during the 18 months that we have been monitoring it, we have observed the group change tactics to match its needs and use compromised machines for various purposes, including cryptocurrency mining, sending spam emails, or proxying for other attacks. The group's goals and payloads have shifted over time, influenced by the type of compromised infrastructure, but in recent months, they have mostly deployed the Wadhrama ransomware. The group most often employs a smash-and-grab method, whereby they attempt to infiltrate a machine in a network and proceed with subsequent ransom in less than an hour. There are outlier campaigns in which they attempt reconnaissance and lateral movement, typically when they land on a machine and network that allows them to quickly and easily move throughout the environment. PARINACOTA's attacks typically brute forces their way into servers that have Remote Desktop Protocol (RDP) exposed to the internet, with the goal of moving laterally inside a network or performing further brute-force activities against targets outside the network. This allows the group to expand compromised infrastructure under their control. Frequently, the group targets built-in local administrator accounts or a list of common account names. In other instances, the group targets Active Directory (AD) accounts that they compromised or have prior knowledge of, such as service accounts of known vendors. The group adopted the RDP brute force technique that the older ransomware called Samas (also known as SamSam) infamously used. Other malware families like GandCrab, MegaCortext, LockerGoga, Hermes, and RobbinHood have also used this method in targeted ransomware attacks. PARINACOTA, however, has also been observed to adapt to any path of least resistance they can utilize. For instance, they sometimes discover unpatched systems and use disclosed vulnerabilities to gain initial access or elevate privileges.

Red Dev 17

In 2021, PwC started tracking a series of intrusions under the moniker of Red Dev 17 that they assess were highly likely conducted by a China-based threat actor. Their analysis suggests Red Dev 17 has been active since at least 2017. Red Dev 17's observed targets are mainly in India, and include the Indian military, a multinational India-based technology company, and a state energy company. They assess that it is highly probable that the threat actor behind intrusions associated with Red Dev 17 is also responsible for the campaign known in open source as Operation NightScout. Red Dev 17 is a user of the 8.t document weaponisation framework (also known as RoyalRoad), and abuses benign utilities such as Logitech or Windows Defender binaries to sideload and execute Chinoxy or PoisonIvy variants on victim systems. They identified capability and infrastructure links between Red Dev 17 and the threat actor they call Red Hariasa (aka FunnyDream APT), as well as infrastructure overlaps with Red Wendigo (aka Icefog, RedFoxtrot), and with ShadowPad C2 servers. At this time, they do not have sufficient evidence to directly link Red Dev 17 to any of these threat actors. However, They assess with realistic probability that Red Dev 17 operates within a cluster of threat actors that share tools and infrastructure, as well as a strong targeting focus on Southeast Asia and Central Asia.

The tag is: *misp-galaxy:threat-actor="Red Dev 17"*

Aoqin Dragon

SentinelLabs has uncovered a cluster of activity beginning at least as far back as 2013 and continuing to the present day, primarily targeting organizations in Southeast Asia and Australia. They assess that the threat actor's primary focus is espionage and relates to targets in Australia, Cambodia, Hong Kong, Singapore, and Vietnam. We track this activity as 'Aoqin Dragon'. The threat actor has a history of using document lures with pornographic themes to infect users and makes heavy use of USB shortcut techniques to spread the malware and infect additional targets. Attacks attributable to Aoqin Dragon typically drop one of two backdoors, Mongall and a modified version of the open source Heyoka project.

The tag is: *misp-galaxy:threat-actor="Aoqin Dragon"*

DangerousSavanna

Malicious campaign called DangerousSavanna has been targeting multiple major financial service groups in French-speaking Africa for the last two years. The threat actors behind this campaign use spear-phishing as a means of initial infection, sending emails with malicious attachments to the employees of financial institutions in at least five different French-speaking countries: Ivory Coast, Morocco, Cameroon, Senegal, and Togo. DangerousSavanna tends to install relatively unsophisticated software tools in the infected environments. These tools are both self-written and based on open-source projects such as Metasploit, PoshC2, DWservice, and AsyncRAT. The threat actors' creativity is on display in the initial infection stage, as they persistently pursue the employees of the targeted companies, constantly changing infection chains that utilize a wide range of malicious file types, from self-written executable loaders and malicious documents, to ISO, LNK, JAR and VBE files in various combinations. The evolving infection chains by the threat actor reflect the changes in the threat landscape seen over the past few years as infection vectors became more and more sophisticated and diverse.

TA575

TA575 is a Dridex affiliate tracked by Proofpoint since late 2020. This group distributes malware such as Dridex, Qakbot, and WastedLocker via malicious URLs, Office attachments, and password-protected files. On average, TA575 distributes almost 4,000 messages per campaign impacting hundreds of organizations.

APT43

- APT43 is a prolific cyber operator that supports the interests of the North Korean regime. The group combines moderately-sophisticated technical capabilities with aggressive social engineering tactics, especially against South Korean and U.S.-based government organizations, academics, and think tanks focused on Korean peninsula geopolitical issues.
- In addition to its espionage campaigns, we believe APT43 funds itself through cybercrime operations to support its primary mission of collecting strategic intelligence.
- The group creates numerous spoofed and fraudulent personas for use in social engineering, as well as cover identities for purchasing operational tooling and infrastructure.
- APT43 has collaborated with other North Korean espionage operators on multiple operations, underscoring the major role APT43 plays in the regime's cyber apparatus.

The tag is: *misp-galaxy:threat-actor="APT43"*

https://www.dragos.com/threat/voltzite/

SmugX

The campaign, called SmugX, overlaps with previously reported activity by Chinese APT actors RedDelta and Mustang Panda. Although those two correlate to some extent with Camaro Dragon, there is insufficient evidence to link the SmugX campaign to the Camaro Dragon group.

The campaign uses new delivery methods to deploy (most notably – HTML Smuggling) a new variant of PlugX, an implant commonly associated with a wide variety of Chinese threat actors. Although the payload itself remains similar to the one found in older PlugX variants, its delivery methods results in low detection rates, which until recently helped the campaign fly under the radar.

The tag is: *misp-galaxy:threat-actor="SmugX"*

Table 15224. Table References

Links
https://research.checkpoint.com/2023/chinese-threat-actors-targeting-europe-in-smugx-campaign/

RedDelta

Likely Chinese state-sponsored threat activity group RedDelta targeting organizations within Europe and Southeast Asia using a customized variant of the PlugX backdoor. Since at least 2019, RedDelta has been consistently active within Southeast Asia, particularly in Myanmar and Vietnam, but has also routinely adapted its targeting in response to global geopolitical events. This is historically evident through the group's targeting of the Vatican and other Catholic organizations in the lead-up to 2021 talks between Chinese Communist Party (CCP) and Vatican officials, as well as throughout 2022 through the group's shift towards increased targeting of European government and diplomatic entities following Russia's invasion of Ukraine.

During the 3-month period from September through November 2022, RedDelta has regularly used an infection chain employing malicious shortcut (LNK) files, which trigger a dynamic-link library (DLL) search-order-hijacking execution chain to load consistently updated PlugX versions. Throughout this period, the group repeatedly employed decoy documents specific to government and migration policy within Europe. Of note, we identified a European government department focused on trade communicating with RedDelta command-and-control (C2) infrastructure in early August 2022. This activity commenced on the same day that a RedDelta PlugX sample using this C2 infrastructure and featuring an EU trade-themed decoy document surfaced on public malware repositories. We also identified additional probable victim entities within Myanmar and Vietnam regularly communicating with RedDelta C2 infrastructure.

RedDelta closely overlaps with public industry reporting under the aliases BRONZE PRESIDENT, Mustang Panda, TA416, Red Lich, and HoneyMyte.

The tag is: *misp-galaxy:threat-actor="RedDelta"*

View relationships graph

RedDelta has relationships with:

- overlaps: misp-galaxy:threat-actor="MUSTANG PANDA" with estimative-language:likelihood-probability="likely"
- overlaps: misp-galaxy:mitre-intrusion-set="Mustang Panda - G0129" with estimative-language:likelihood-probability="likely"

Scattered Canary

When the first member of Scattered Canary, who, for the purposes of this report, we call Alpha, began his operations, he was a lone wolf—working mostly Craigslist scams as he learned the tricks of the trade from a mentor. However, within a few years, he had honed his craft enough to expand into romance scams, where he met his first “employee,” Beta. Once they had secured enough mules via their romance scams to launder their stolen money, they shifted from targeting individuals to targeting enterprises, and the group’s BEC operation was born.

AtlasCross

NSFOCUS Security Labs recently discovered a new attack process based on phishing documents in their daily threat-hunting operations. Delving deeper into this finding through extensive research, they confirmed two new Trojan horse programs and many rare attack techniques and tactics. NSFOCUS Security Labs believes that this new attack process comes from a new APT attacker, who has a high technical level and cautious attack attitude. The phishing attack activity captured this time is part of the attacker's targeted strike on specific targets and is its main means to achieve in-domain penetration. NSFOCUS Security Labs validated the high-level threat attributes of AtlasCross in terms of development technology and attack strategy through an in-depth analysis of its attack metrics. At this current stage, AtlasCross has a relatively limited scope of activity, primarily focusing on targeted attacks against specific hosts within a network domain. However, the attack processes they employ are highly robust and mature. NSFOCUS Security Labs deduce that this attacker is highly likely to deploy this attack process into larger-scale network attack operations.

Xiaoqiying

Xiaoqiying is a primarily Chinese-speaking threat group that is most well known for conducting website defacement and data exfiltration attacks on more than a dozen South Korean research and academic institutions in late-January 2023. Research from Recorded Futures Insikt Group has found that the groups affiliated threat actors have signaled a new round of cyberattacks against organizations in Japan and Taiwan. Although it shows no clear ties to the Chinese government, Xiaoqiying is staunchly pro-China and vows to target NATO countries as well as any country or region that is deemed hostile to China.

The tag is: *misp-galaxy:threat-actor="Xiaoqiying"*

Xiaoqiying is also known as:

- Genesis Day
- Teng Snake

UNC3890

A suspected Iranian threat activity cluster has been linked to attacks aimed at Israeli shipping, government, energy, and healthcare organizations, in a campaign stretching back to late 2020. Researchers believe that the data harvested during the campaign could be used to support various activities. UNC3890, the threat actor behind the attacks, deployed two proprietary pieces of malware – a backdoor named “SUGARUSH” and a browser credential stealer called “SUGARDUMP”, which exfiltrates password information to email addresses registered with Gmail, ProtonMail, Yahoo and Yandex email services. The threat actor also employs a network of C&C servers that host fake login pages impersonating legitimate platforms such as Office 365, LinkedIn and Facebook. These servers are designed to communicate with the targets and also with a watering hole hosted on the login page of a legitimate Israeli shipping company.

The tag is: *misp-galaxy:threat-actor="UNC3890"*

DustSquad

Prodaft researchers have published a report on Paperbug, a cyber-espionage campaign carried out by suspected Russian-speaking group Nomadic Octopus and which targeted entities in Tajikistan. According to Prodaft, known compromised victims included high-ranking government officials, telcos, and public service infrastructures. Compromised devices also included OT devices, besides your typical computers, servers, and mobile devices. In typical Prodaft fashion, the company also gained access to one of the group's C&C server backend panels.

KromSec

KromSec is a hacktivist group that claims to be composed of hackers, activists, writers, and journalists. The group has been involved in a number of high-profile cyberattacks, including a cyber offensive against Iran in September 2022 and the sale of the database of the Iran Ministry of Industries and Mines on a hacker forum in November 2023. KromSec's attacks have been met with mixed reactions, but the group has quickly made a name for itself as a significant threat to governments and organizations around the world.

ShroudedSnooper

In September 2023, Cisco Talos identified a new malware family that it calls ‘HTTPSnoop’ being deployed against telecommunications providers in the Middle East. They also discovered a sister implant to 'HTTPSnoop,’ that they are naming ‘PipeSnoop,’ which can accept arbitrary shellcode from a named pipe and execute it on the infected endpoint. Based on these findings, the

researchers assess with high confidence that both implants belong to a new intrusion set that it named ‘ShroudedSnooper.’

Xcatze

Cloud security company Lacework says it discovered a threat actor group named Xcatze that uses a Python named AndroxGh0st to take over AWS servers and send out massive email spam campaigns. Lacework says the malware operates by scanning web apps written in the Laravel PHP framework for exposed configuration files to identify and steal server credentials. Researchers said AndroxGh0st specifically searches for AWS, SendGrid, and Twilio credentials, which it uses to take control of email servers and accounts and send out the spam campaigns.

The tag is: *misp-galaxy:threat-actor="Xcatze"*

Table 15288. Table References

Water Labbu

Trend Micro discovered a threat actor they named Water Labbu that was targeting cryptocurrency scam websites. Typically, cryptocurrency scammers use social engineering techniques, interacting with victims to gain their trust and then manipulating them into providing the permissions needed

to transfer cryptocurrency assets. While Water Labbu managed to steal cryptocurrencies via a similar method by obtaining access permissions and token allowances from their victim's wallets, unlike other similar campaigns, they did not use any kind of social engineering — at least not directly. Instead, Water Labbu lets other scammers use their social engineering tricks to scam unsuspecting victims.

The tag is: *misp-galaxy:threat-actor="Water Labbu"*

Bohrium

Bohrium is an Iranian threat actor that has been involved in spear-phishing operations targeting organizations in the US, Middle East, and India. They often create fake social media profiles, particularly posing as recruiters, to trick victims into running malware on their computers. Microsoft’s Digital Crimes Unit has taken legal action and seized 41 domains used by Bohrium to disrupt their activities. The group has shown a particular interest in sectors such as technology, transportation, government, and education.

The tag is: *misp-galaxy:threat-actor="Bohrium"*

Bohrium is also known as:

- Smoke Sandstorm
- BOHRIUM
- IMPERIAL KITTEN

KAX17

KAX17 is a sophisticated threat actor that has been active since at least 2017. They have operated hundreds of malicious servers within the Tor network, primarily as entry and middle points. Their main objective appears to be collecting information on Tor users and mapping their routes within the network. Despite efforts to remove their servers, KAX17 has shown resilience and continues to operate.

The tag is: *misp-galaxy:threat-actor="KAX17"*

MirrorFace

MirrorFace is a Chinese-speaking advanced persistent threat group that has been targeting high-value organizations in Japan, including media, government, diplomatic, and political entities. They have been conducting spear-phishing campaigns, utilizing malware such as LODEINFO and MirrorStealer to steal credentials and exfiltrate sensitive data. While there is speculation about their connection to APT10, ESET currently track them as a separate entity.

The tag is: *misp-galaxy:threat-actor="MirrorFace"*

MirrorFace is also known as:

- Earth Kasha

FusionCore

The CYFIRMA research team has identified a new up-and-coming European threat actor group known as FusionCore. Running Malware-as-a-service, along with the hacker-for- hire operation, they have a wide variety of tools and services that are being offered on their website, making it a one-stop-shop for threat actors looking to purchase cost- effective yet customizable malware. The operators have started a ransomware affiliate program that equips the attackers with the ransomware and affiliate software to manage victims. FusionCore typically provides sellers with a detailed set of instructions for any service or product being sold, enabling individuals with minimal experience to carry out complex attacks.

The tag is: *misp-galaxy:threat-actor="FusionCore"*

LightBasin

UNC1945 is an APT group that has been targeting telecommunications companies globally. They use Linux-based implants to maintain long-term access in compromised networks. UNC1945 has demonstrated advanced technical abilities, utilizing various tools and techniques to evade detection and move laterally through networks. They have also been observed targeting other industries, such as financial and professional consulting, and have been linked to other threat actors, including MustangPanada and RedDelta.

The tag is: *misp-galaxy:threat-actor="LightBasin"*

LightBasin is also known as:

- UNC1945
- CL-CRI-0025

Red-Lili

RED-LILI is an active threat actor that has been identified by Checkmarx SCS research team. They have been publishing malicious packages on NPM and PyPi platforms, and have recently automated the process of creating NPM users for package publication. The Checkmarx team has detected around 1500 malicious packages associated with RED-LILI and has continuously disclosed their findings to the respective security teams.

The tag is: *misp-galaxy:threat-actor="Red-Lili"*

Table 15340. Table References

https://checkmarx.com/blog/a-beautiful-factory-for-malicious-packages/

WildCard

Wildcard is a threat actor that initially targeted Israel's educational sector with the SysJoker malware. They have since expanded their operations and developed additional malware variants, disguised as legitimate software, including one written in the Rust programming language called RustDown. Their precise identity remains unknown, but they have shown advanced capabilities and a focus on critical sectors within Israel.

The tag is: *misp-galaxy:threat-actor="WildCard"*

https://intezer.com/blog/research/wildcard-evolution-of-sysjoker-cyber-threat/

WildPressure

WildPressure is a threat actor that targets industrial-related entities in the Middle East. They use a variety of programming languages, including C++, VBScript, and Python, to develop their malware. They have been observed using virtual private servers and compromised servers, particularly WordPress websites, in their infrastructure. While there are some minor similarities with other threat actors in the region, there is not enough evidence to make any attribution.

The tag is: *misp-galaxy:threat-actor="WildPressure"*

Table 15342. Table References

https://securelist.com/wildpressure-targets-industrial-in-the-middle-east/96360/

TunnelSnake

The TunnelSnake campaign demonstrates the activity of a sophisticated actor that invests significant resources in designing an evasive toolset and infiltrating networks of high-profile organizations. By leveraging Windows drivers, covert communications channels and proprietary malware, the group behind it maintains a considerable level of stealth. That said, some of its TTPs, like the usage of a commodity webshell and open-source legacy code for loading unsigned drivers, may get detected and in fact were flagged by Kaspersky's product, giving them visibility into the group's operation.

The tag is: *misp-galaxy:threat-actor="TunnelSnake"*

ScamClub

ScamClub is a threat actor involved in malvertising activities since 2018. They target the Mobile Web market segment, particularly on iOS devices, where security software is often lacking.

ScamClub utilizes obfuscation techniques and real-time bidding integration with ad exchanges to push malicious JavaScript payloads, leading to forced redirects and various scams such as phishing and gift card scams.

The tag is: *misp-galaxy:threat-actor="ScamClub"*

Daixin Team

Daixin is a threat actor group that has been active since at least June 2022. They primarily target the healthcare and public health sector with ransomware attacks, stealing sensitive data and threatening to release it if a ransom is not paid. They have successfully targeted various industries, including healthcare, aerospace, automotive, and packaged foods. Daixin gains initial access through VPN servers and exploits vulnerabilities or uses phishing attacks to obtain credentials. They have been responsible for cyberattacks on organizations such as the North Texas Municipal Water District and TransForm Shared Service Org, impacting their networks and stealing customer and patient information.

The tag is: *misp-galaxy:threat-actor="Daixin Team"*

UNC2717

UNC2717 is a threat actor that engages in espionage activities aligned with Chinese government priorities. They demonstrate advanced tradecraft and take measures to avoid detection, making it challenging for network defenders to identify their tools and intrusion methods. UNC2717, along with other Chinese APT actors, has been observed stealing credentials, email communications, and intellectual property. They have targeted global government agencies using malware such as HARDPULSE, QUIETPULSE, and PULSEJUMP.

The tag is: *misp-galaxy:threat-actor="UNC2717"*

Table 15346. Table References

UNC2659

UNC2659 has been active since at least January 2021. We have observed the threat actor move through the whole attack lifecycle in under 10 days. UNC2659 is notable given their use of an exploit in the SonicWall SMA100 SSL VPN product, which has since been patched by SonicWall. The threat actor appeared to download several tools used for various phases of the attack lifecycle directly from those tools' legitimate public websites.

The tag is: *misp-galaxy:threat-actor="UNC2659"*

Table 15347. Table References

AeroBlade

AeroBlade is a previously unknown threat actor that has been targeting an aerospace organization in the United States. Their objective appears to be conducting commercial and competitive cyber espionage. They employ spear-phishing as a delivery mechanism, using weaponized documents with embedded remote template injection techniques and malicious VBA macro code. The attacks have been ongoing since September 2022, with multiple phases identified in the attack chain. The origin and precise objective of AeroBlade remain unknown.

The tag is: *misp-galaxy:threat-actor="AeroBlade"*

Table 15348. Table References

WIP19

WIP19 is a Chinese-speaking threat group involved in espionage targeting the Middle East and Asia. They utilize a stolen certificate to sign their malware, including SQLMaggie, ScreenCap, and a credential dumper. The group has been observed targeting telecommunications and IT service providers, using toolsets authored by WinEggDrop. WIP19's activities suggest they are after specific

information and are part of the broader Chinese espionage landscape.

The tag is: *misp-galaxy:threat-actor="WIP19"*

UNC215

UNC215 is a Chinese nation-state threat actor that has been active since at least 2014. They have targeted organizations in various sectors, including government, technology, telecommunications, defense, finance, entertainment, and healthcare. UNC215 has been observed using tools such as Mimikatz, FOCUSFJORD, and HYPERBRO for initial access and post-compromise activities. They have demonstrated a focus on evading detection and have employed tactics such as using trusted third parties, minimizing forensic evidence, and incorporating false flags. UNC215's targets are located globally, with a particular focus on the Middle East, Europe, Asia, and North America.

The tag is: *misp-galaxy:threat-actor="UNC215"*

DEV-0569

DEV-0569, also known as Storm-0569, is a threat actor group that has been observed deploying the Royal ransomware. They utilize malicious ads and phishing techniques to distribute malware and gain initial access to networks. The group has been linked to the distribution of payloads such as Batloader and has forged relationships with other threat actors. DEV-0569 has targeted various sectors, including healthcare, communications, manufacturing, and education in the United States and Brazil.

The tag is: *misp-galaxy:threat-actor="DEV-0569"*

DEV-0569 is also known as:

- Storm-0569

UAC-0118

From Russia with Love, is a threat actor group that emerged during the Russia-Ukraine war in 2022. They primarily engage in DDoS attacks and have targeted critical infrastructure, media, energy, and government entities. FRwL has been linked to the use of the Somnia ransomware, which they employ as a wiper rather than for financial gain. While there is no direct evidence linking FRwL to the Russian Main Intelligence Directorate, it is possible that they coordinate activities with state-aligned hacktivist groups.

The tag is: *misp-galaxy:threat-actor="UAC-0118"*

UAC-0118 is also known as:

- FRwL
- FromRussiaWithLove

UAC-0050

UAC-0050 is a threat actor that has been active since 2020, targeting government agencies in Ukraine. They have been distributing the Remcos RAT malware through phishing campaigns, using tactics such as impersonating the Security Service of Ukraine and sending emails with malicious attachments. The group has also been linked to other hacking collectives, such as UAC-0096, and has previously used remote administration tools like Remote Utilities. The motive behind their attacks is likely espionage.

Sandman APT

First disclosed in 2023, the Sandman APT is likely associated with suspected China-based threat clusters known for using the KEYPLUG backdoor, specifically STORM-0866/Red Dev 40. Sandman is tracked as a distinct cluster, pending additional conclusive information. A notable characteristic is its use of the LuaDream backdoor. LuaDream is based on the Lua platform, a relatively rare occurrence in the cyberespionage domain, historically associated with APTs considered Western or Western-aligned.

The tag is: *misp-galaxy:threat-actor="Sandman APT"*

BiBiGun

A pro-Hamas hacktivist group developed a wiper called BiBi-Linux to target and destroy data on Israeli systems. The malware impersonates ransomware but operates solely to corrupt and delete files, indicating no data theft. A Windows variant, BiBi-Windows, was also discovered, sharing similarities with BiBi-Linux but targeting all files except executables. ESET researchers have named the group behind the wipers BiBiGun. The group's TTPs have shown overlaps with Moses Staff, which is believed to have an Iran nexus.

The tag is: *misp-galaxy:threat-actor="BiBiGun"*

Storm-1283

Storm-1283 is a threat actor that targeted Microsoft Azure cloud platform. They gained access to user accounts and created OAuth applications using stolen credentials, allowing them to control resources and deploy virtual machines for cryptomining. The targeted organizations incurred significant financial losses ranging from $10,000 to $1.5 million. Storm-1283 utilized compromised accounts and subscriptions to carry out their illicit activities.

UNC4736

UNC4736 is a North Korean threat actor that has been involved in supply chain attacks targeting software chains of 3CX and X_TRADER. They have used malware strains such as TAXHAUL, Coldcat, and VEILEDSIGNAL to compromise Windows and macOS systems. UNC4736 has been linked to financially motivated cybercrime operations, particularly focused on cryptocurrency and fintech-related services. They have also demonstrated infrastructure overlap with other North Korean and APT43 activity.

The tag is: *misp-galaxy:threat-actor="UNC4736"*

Table 15359. Table References

Storm-1113

Storm-1113 is a threat actor that acts both as an access broker focused on malware distribution through search advertisements and as an “as-a-service” entity providing malicious installers and landing page frameworks. In Storm-1113 malware distribution campaigns, users are directed to landing pages mimicking well-known software that host installers, often MSI files, that lead to the installation of malicious payloads. Storm-1113 is also the developer of EugenLoader, a commodity malware first observed around November 2022.

The tag is: *misp-galaxy:threat-actor="Storm-1113"*

Storm-1113 is also known as:

- APOTHECARY SPIDER

Water Curupira

With its emergence in 2022, Water Curupira has established itself as a persistent threat actor targeting organizations primarily in South America and Europe. Their modus operandi involves a combination of social engineering tactics and a diversified malware arsenal, including ransomware variants like Black Basta and credential stealers like Cobalt Strike. This multifaceted approach enables them to gain unauthorized access to victim systems, steal sensitive data, and ultimately extort victims through ransomware demands. It has been actively using Pikabot, a loader malware with similarities to Qakbot, in spam campaigns throughout 2023.

The tag is: *misp-galaxy:threat-actor="Water Curupira"*

Table 15371. Table References

TAG-28

TAG-28 is a Chinese state-sponsored threat actor that has been targeting Indian organizations, including media conglomerates and government agencies. They have been using the Winnti malware, which is commonly shared among Chinese state-sponsored groups. TAG-28's main objective is to gather intelligence on Indian targets, potentially for espionage purposes.

The tag is: *misp-galaxy:threat-actor="TAG-28"*

Flax Typhoon

Flax Typhoon is a Chinese state-sponsored threat actor that primarily targets organizations in Taiwan. They conduct espionage campaigns and focus on gaining and maintaining long-term access to networks using minimal malware. Flax Typhoon relies on tools built into the operating system and legitimate software to remain undetected. They exploit vulnerabilities in public-facing servers, use living-off-the-land techniques, and deploy a VPN connection to maintain persistence and move laterally within compromised networks.

The tag is: *misp-galaxy:threat-actor="Flax Typhoon"*

Flax Typhoon is also known as:

- Ethereal Panda
- Storm-0919

Cyber Partisans

The Cyber Partisans, a hacktivist group based in Belarus, has been involved in various cyber-attacks targeting organizations and infrastructure in Belarus and Ukraine. They have hacked and wiped the network of the Belarusian Telegraph Agency, targeted the Belarusian Red Cross, and conducted ransomware attacks on the Belarusian Railway and Belarusian State University. The group aims to expose alleged crimes committed by pro-government organizations and disrupt operations supporting the Russian military operation against Ukraine. They have also leaked stolen data to journalists and expressed support for Ukraine.

The tag is: *misp-galaxy:threat-actor="Cyber Partisans"*

Caliente Bandits

Caliente Bandits is a highly active threat group that targets multiple industries, including finance and entertainment. They distribute the Bandook remote access trojan using Spanish-language lures through low-volume email campaigns. The group primarily impacts individuals with Spanish surnames and conducts reconnaissance to obtain employee data. They masquerade as companies in South America and use Hotmail or Gmail email addresses.

The tag is: *misp-galaxy:threat-actor="Caliente Bandits"*

Caliente Bandits is also known as:

- TA2721

Blackwood

Blackwood is a China-aligned APT group that has been active since at least 2018. They primarily engage in cyberespionage operations targeting individuals and companies in China, Japan, and the United Kingdom. Blackwood utilizes sophisticated techniques such as adversary-in-the-middle attacks to deliver their custom implant, NSPX30, through updates of legitimate software. They also have the capability to hide the location of their command and control servers by intercepting traffic generated by the implant.

Mustard Tempest

Mustard Tempest is a threat actor that primarily uses malvertising as their main technique to gain access to and profile networks. They deploy FakeUpdates, disguised as browser updates or software packages, to lure targets into downloading a ZIP file containing a JavaScript file. Once executed, the JavaScript framework acts as a loader for other malware campaigns, often Cobalt Strike payloads. Mustard Tempest has been associated with the cybercrime syndicate Mustard Tempest, also known as EvilCorp, and has been involved in ransomware attacks using payloads such as WastedLocker, PhoenixLocker, and Macaw.

The tag is: *misp-galaxy:threat-actor="Mustard Tempest"*

Mustard Tempest is also known as:

Raspberry Typhoon

Microsoft has tracked Raspberry Typhoon (RADIUM) as the primary threat group targeting nations that ring the South China Sea. Raspberry Typhoon consistently targets government ministries, military entities, and corporate entities connected to critical infrastructure, particularly telecoms. Since January 2023, Raspberry Typhoon has been particularly persistent. When targeting government ministries or infrastructure, Raspberry Typhoon typically conducts intelligence collection and malware execution. In many countries, targets vary from defense and intelligence-related ministries to economic and trade-related ministries

Storm-0530

H0lyGh0st is a North Korean threat actor that has been active since June 2021. They are responsible for developing and deploying the H0lyGh0st ransomware, which targets small-to-medium businesses in various sectors. The group employs "double extortion" tactics, encrypting data and threatening to publish it if the ransom is not paid. There are connections between H0lyGh0st and the PLUTONIUM APT group, indicating a possible affiliation.

The tag is: *misp-galaxy:threat-actor="Storm-0530"*

Storm-0530 is also known as:

- DEV-0530
- H0lyGh0st

Storm-0539

Storm-0539 is a financially motivated threat actor that has been active since at least 2021. They primarily target retail organizations for gift card fraud and theft. Their tactics include phishing via emails or SMS to distribute malicious links that redirect users to phishing pages designed to steal credentials and session tokens. Once access is gained, Storm-0539 registers a device for secondary authentication prompts, bypassing multi-factor authentication and gaining persistence in the environment. They also collect emails, contact lists, and network configurations for further attacks against the same organizations.

The tag is: *misp-galaxy:threat-actor="Storm-0539"*

Table 15406. Table References

Storm-1152

Storm-1152, a cybercriminal group, was recently taken down by Microsoft for illegally reselling Outlook accounts. They operated by creating approximately 750 million fraudulent Microsoft accounts and earned millions of dollars in illicit revenue. Storm-1152 also offered CAPTCHA-solving services and was connected to ransomware and extortion groups. Microsoft obtained a court order to seize their infrastructure and domains, disrupting their operations.

The tag is: *misp-galaxy:threat-actor="Storm-1152"*

Storm-1567

Storm-1567 is the threat actor behind the Ransomware-as-a-Service Akira. They attacked Swedish organizations in March 2023. This ransomware utilizes the ChaCha encryption algorithm, PowerShell, and Windows Management Instrumentation (WMI). Microsoft's Defender for Endpoint successfully blocked a large-scale hacking campaign carried out by Storm-1567, highlighting the effectiveness of their security solution.

The tag is: *misp-galaxy:threat-actor="Storm-1567"*

Storm-1567 is also known as:

- Akira
- PUNK SPIDER
- GOLD SAHARA

Storm-1674

Storm-1674 is an access broker known for using tools based on the publicly available TeamsPhisher tool to distribute DarkGate malware. Storm-1674 campaigns have typically relied on phishing lures sent over Teams with malicious attachments, such as ZIP files containing a LNK file that ultimately drops DarkGate and Pikabot. In September 2023, Microsoft observed handoffs from Storm-1674 to ransomware operators that have led to Black Basta ransomware deployment.

The tag is: *misp-galaxy:threat-actor="Storm-1674"*

Storm-0835

Cybercriminals have launched a phishing campaign targeting senior executives in U.S. firms, using the EvilProxy phishing toolkit for credential harvesting and account takeover attacks. This campaign, initiated in July 2023, primarily targets sectors such as banking, financial services, insurance, property management, real estate, and manufacturing. The attackers exploit an open redirection vulnerability on the job search platform "indeed.com," redirecting victims to malicious phishing pages impersonating Microsoft. EvilProxy functions as a reverse proxy, intercepting credentials, two-factor authentication codes, and session cookies to hijack accounts. The threat actors, known as Storm-0835 by Microsoft, have hundreds of customers who pay monthly fees for their services, making attribution difficult. The attacks involve sending phishing emails with deceptive links to Indeed, redirecting victims to EvilProxy pages for credential harvesting.

The tag is: *misp-galaxy:threat-actor="Storm-0835"*

Table 15411. Table References

TA2552

Since January 2020, Proofpoint researchers have tracked an actor abusing Microsoft Office 365 (O365) third-party application (3PA) access, with suspected activity dating back to August 2019. The actor, known as TA2552, uses well-crafted Spanish language lures that leverage a narrow range of themes and brands. The lures entice users to click a link in the message, taking them to the legitimate Microsoft third-party apps consent page. There they are prompted to grant a third-party application read-only user permissions to their O365 account via OAuth2 or other token-based authorization methods. TA2552 seeks access to specific account resources like the user's contacts and mail. Requesting read-only permissions for such account resources could be used to conduct account reconnaissance, silently steal data, or to intercept password reset messages from other accounts such as those at financial institutions. While organizations with global presence have received messages from this group, they appear to choose recipients who are likely Spanish speakers.

The tag is: *misp-galaxy:threat-actor="TA2552"*

Table 15413. Table References

TA2722

TA2722 is a highly active threat actor that targets various industries including Shipping/Logistics, Manufacturing, Business Services, Pharmaceutical, and Energy. They primarily focus on organizations in North America, Europe, and Southeast Asia. This threat actor impersonates Philippine government entities and uses themes related to the government to gain remote access to

target computers. Their objectives include information gathering, installing follow-on malware, and engaging in business email compromise activities.

The tag is: *misp-galaxy:threat-actor="TA2722"*

TA2722 is also known as:

- Balikbayan Foxes

Table 15414. Table References

https://www.proofpoint.com/us/blog/threat-insight/new-threat-actor-spoofs-philippine-government-covid-19-health-data-widespread

TA2719

In late March 2020, Proofpoint researchers began tracking a new actor with a penchant for using NanoCore and later AsyncRAT, popular commodity remote access trojans (RATs). Dubbed TA2719 by Proofpoint, the actor uses localized lures with colorful images that impersonate local banks, law enforcement, and shipping services. Proofpoint has observed this actor send low volume campaigns to recipients in Austria, Chile, Greece, Hungary, Italy, North Macedonia, Netherlands, Spain, Sweden, Taiwan, United States, and Uruguay.

The tag is: *misp-galaxy:threat-actor="TA2719"*

Table 15415. Table References

Karkadann

Karkadann is a threat actor that has been active since at least October 2020, targeting government bodies and news outlets in the Middle East. They have been involved in watering hole attacks, compromising high-profile websites to inject malicious JavaScript code. The group has been linked to another commercial spyware company called Candiru, suggesting they may utilize multiple spyware technologies. There are similarities in the infrastructure and tactics used by Karkadann in their campaigns.

The tag is: *misp-galaxy:threat-actor="Karkadann"*

Karkadann is also known as:

- Piwiks

Storm-0473

Storm-0473 (Tomiris) is a threat actor that has been active since at least 2019. They primarily target government and diplomatic entities in the Commonwealth of Independent States region, with occasional victims in other regions being foreign representations of CIS countries. Tomiris uses a wide variety of malware implants, including downloaders, backdoors, and file stealers, developed in different programming languages. They employ various attack vectors such as spear-phishing, DNS hijacking, and exploitation of vulnerabilities. There are potential ties between Tomiris and Turla, but they are considered separate threat actors with distinct targeting and tradecraft by Kaspersky.

The tag is: *misp-galaxy:threat-actor="Storm-0473"*

Storm-0473 is also known as:

- UNC2849

RevengeHotels

RevengeHotels is a targeted cybercrime campaign that has been active since 2015, primarily targeting hotels, hostels, and tourism companies. The threat actor uses remote access Trojan malware to infiltrate hotel front desks and steal credit card data from guests and travelers. The campaign has impacted hotels in multiple countries, including Brazil, Argentina, Chile, and Mexico. The threat actor employs social engineering techniques and sells credentials from infected systems to other cybercriminals for remote access.

The tag is: *misp-galaxy:threat-actor="RevengeHotels"*

Operation Triangulation

Operation Triangulation is an ongoing APT campaign targeting iOS devices with zero-click iMessage exploits. The threat actor behind the campaign has been active since at least 2019 and continues to operate. The attack chain involves the delivery of a malicious iMessage attachment that launches a series of exploits, ultimately leading to the deployment of the TriangleDB implant. Kaspersky

researchers have discovered and reported multiple vulnerabilities used in the campaign, with patches released by Apple.

The tag is: *misp-galaxy:threat-actor="Operation Triangulation"*

Operation Ghoul

Operation Ghoul is a profit-driven threat actor that targeted over 130 organizations in 30 countries, primarily in the industrial and engineering sectors. They employed high-quality social engineering techniques, such as spear-phishing emails disguised as payment advice from a UAE bank, to distribute malware. The group's main motivation is financial gain through the sale of stolen intellectual property and business intelligence, as well as attacks on banking accounts. Their attacks were effective, particularly against companies that were unprepared to detect them.

The tag is: *misp-galaxy:threat-actor="Operation Ghoul"*

CardinalLizard

CardinalLizard, a cyber threat actor linked to China, has targeted entities in Asia since 2018. Their methods include spear-phishing, custom malware with anti-detection features, and potentially shared infrastructure with other actors.

The tag is: *misp-galaxy:threat-actor="CardinalLizard"*

Table 15424. Table References

Links
https://securelist.com/apt-review-of-the-year/89117/

Ferocious Kitten

Ferocious Kitten is an APT group that has been active against Persian-speaking individuals since 2015 and appears to be based in Iran. Although it has been active over a large timespan, the group has mostly operated under the radar until a lure document was uploaded to VirusTotal and was brought to public knowledge by researchers on Twitter. Subsequently, one of its implants was analyzed by a Chinese intelligence firm. Kaspersky then expanded some of the findings on the group and provided insights on additional variants. The malware dropped from the aforementioned document is dubbed MarkiRAT and is used to record keystrokes and clipboard content, provide file download and upload capabilities as well as the ability to execute arbitrary commands on the victims machine. Kaspersky were able to trace the implant back to at least 2015, along with variants intended to hijack the execution of the Telegram and Chrome applications as a persistence method. Interestingly, some of the TTPs used by this threat actor are reminiscent of other groups operating in the domain of dissident surveillance. For example, it used the same C2 domains across its implants for years, which was witnessed in the activity of Domestic Kitten. In the same vein, the Telegram execution hijacking technique observed in this campaign by Ferocious Kitten was also observed being used by Rampant Kitten, as covered by Check Point.

The tag is: *misp-galaxy:threat-actor="Ferocious Kitten"*

Table 15425. Table References

Links
https://securelist.com/ferocious-kitten-6-years-of-covert-surveillance-in-iran/102806/

Operation Red Signature

The threat actors compromised the update server of a remote support solutions provider to deliver a remote access tool called 9002 RAT to their targets of interest through the update process. They carried this out by first stealing the company's certificate then using it to sign the malware. They also configured the update server to only deliver malicious files if the client is located in the range of IP addresses of their target organisations.

The tag is: *misp-galaxy:threat-actor="Operation Red Signature"*

Table 15426. Table References

https://www.trendmicro.com/en_my/research/18/h/supply-chain-attack-operation-red-signature-targets-south-korean-organizations.html

Earth Yako

Earth Yako is a threat actor that has been actively targeting researchers in academic organizations

and think tanks in Japan. They use spearphishing emails with malicious attachments to gain initial access to their targets' systems. Earth Yako's objectives and patterns suggest a possible connection to a Chinese APT group, but conclusive proof of their nationality is lacking. They have been observed using various malware delivery methods and techniques, such as the use of Winword.exe for DLL Hijacking.

The tag is: *misp-galaxy:threat-actor="Earth Yako"*

Earth Yako is also known as:

- Operation RestyLink
- Enelink

Table 15427. Table References

Links
https://www.trendmicro.com/en_us/research/23/b/invitation-to-secret-event-uncovering-earth-yako-campaigns.html

Urpage

What sets Urpage attacks apart is its targeting of InPage, a word processor for Urdu and Arabic languages. However, its Delphi backdoor component, which it has in common with Confucius and Patchwork, and its apparent use of Bahamut-like malware, is what makes it more intriguing as it connects Urpage to these other known threats. Trend Micro covered the Delphi component in the context of the Confucius and Patchwork connection. They mentioned Urpage as a third unnamed threat actor connected to the two.

The tag is: *misp-galaxy:threat-actor="Urpage"*

Table 15428. Table References

Operation Emmental

Operation Emmental, also known as the Retefe gang, is a threat actor group that has been active since at least 2012. They primarily target customers of banks in countries such as Austria, Sweden, Switzerland, and Japan. The group has developed sophisticated malware, including a Mac alternative called Dok, to bypass two-factor authentication and hijack network traffic. They have also been observed using phishing emails to spread their malware. The group is believed to be Russian-speaking and has continuously improved their malicious codes over the years.

The tag is: *misp-galaxy:threat-actor="Operation Emmental"*

Operation Emmental is also known as:

- Retefe Gang
- Retefe Group

Table 15429. Table References

Blackatom

Recent campaigns suggest Hamas-linked actors may be advancing their TTPs to include intricate social engineering lures specially crafted to appeal to a niche group of high value targets. In September 2023, a Palestine-based group likely linked to Hamas targeted Israeli software engineers using an elaborate social engineering ruse that ultimately installed malware and stole cookies. The attackers, which Google's Threat Analysis Group (TAG) tracks as BLACKATOM, posed as employees of legitimate companies and reached out via LinkedIn to invite targets to apply for software development freelance opportunities. Targets included software engineers in the Israeli military, as well as Israel's aerospace and defense industry

The tag is: *misp-galaxy:threat-actor="Blackatom"*

ProCC

ProCC is a threat actor targeting the hospitality sector with remote access Trojan malware. They use email attachments to exploit vulnerabilities like CVE-2017-0199 and deploy customized versions of RATs such as RevengeRAT, NjRAT, NanoCoreRAT, and 888 RAT. ProCC's malware is capable of collecting data from the clipboard and printer spooler, as well as capturing screenshots on infected machines.

The tag is: *misp-galaxy:threat-actor="ProCC"*

Table 15433. Table References

Links
https://securelist.com/revengehotels/95229/

ResumeLooters

Since the beginning of 2023, ResumeLooters have been able to compromise at least 65 websites. The group employs a variety of simple techniques, including SQL injection and XSS. The threat actor attempted to insert XSS scripts into all available forms, aiming to execute it on the administrators' device to obtain admin credentials. While the group was able to execute the XSS script on some visitors' devices with administrative access, allowing ResumeLooters to steal the HTML code of the pages the victims were visiting, Group-IB did not find any confirmation of admin credential thefts.

The tag is: *misp-galaxy:threat-actor="ResumeLooters"*

GoldFactory

GoldFactory is a threat actor group attributed to developing sophisticated mobile banking malware targeting victims primarily in the Asia-Pacific region, specifically Vietnam and Thailand. They utilize social engineering to deliver malware to victims' devices and have close connections to the Gigabud malware family. GoldFactory's Trojans, such as GoldPickaxe and GoldDigger, employ tactics like smishing, phishing, and fake login screens to compromise victims' phones and steal sensitive information. Their evolving malware suite demonstrates a high level of operational maturity and ingenuity, requiring a proactive and multi-faceted cybersecurity approach to detect and mitigate their threats.

The tag is: *misp-galaxy:threat-actor="GoldFactory"*

SPIKEDWINE

SPIKEDWINE is a threat actor targeting European officials with a new backdoor called WINELOADER. They use a bait PDF document posing as an invitation letter from the Ambassador of India to lure diplomats. The attack is characterized by advanced tactics, techniques, and procedures in the malware and command and control infrastructure. The motivation behind the attacks seems to be exploiting the geopolitical relations between India and European nations.

The tag is: *misp-galaxy:threat-actor="SPIKEDWINE"*

UAC-0184

UAC-0184 is a threat actor targeting Ukrainian organizations in Finland, using the Remcos Remote Access Trojan in their attacks. They have been observed utilizing steganographic image files and the IDAT Loader to deliver the malware. The group has targeted the Armed Forces of Ukraine and impersonated military recruitment processes to infect systems with the Remcos RAT.

The tag is: *misp-galaxy:threat-actor="UAC-0184"*

UNC1549

UNC1549 is an Iranian threat actor linked to Tortoiseshell and potentially the IRGC. They have been active since at least June 2022, targeting entities worldwide with a focus on the Middle East. UNC1549 uses spear-phishing and credential harvesting for initial access, deploying custom malware like MINIBIKE and MINIBUS backdoors. They have also been observed using evasion techniques and a tunneler named LIGHTRAIL in their operations.

The tag is: *misp-galaxy:threat-actor="UNC1549"*

Table 15441. Table References

Mogilevich

Mogilevich is a ransomware group known for claiming to breach organizations like Epic Games and Ireland's Department of Foreign Affairs, offering stolen data for sale without providing proof of the attacks. They operate as an extortion group, targeting high-profile victims and demanding payment for the data they claim to have stolen. Despite their claims, security researchers have noted that Mogilevich's tactics and website design suggest they may not be a sophisticated threat actor.

The tag is: *misp-galaxy:threat-actor="Mogilevich"*

UNC5325

UNC5325 is a suspected Chinese cyber espionage operator that exploited CVE-2024-21893 to compromise Ivanti Connect Secure appliances. UNC5325 leveraged code from open-source projects, installed custom malware, and modified the appliance's settings in order to evade detection and attempt to maintain persistence. UNC5325 has been observed deploying LITTLELAMB.WOOLTEA, PITSTOP, PITDOG, PITJET, and PITHOOK. Mandiant identified TTPs and malware code overlaps in LITTLELAMB.WOOLTEA and PITHOOK with malware leveraged by UNC3886. Mandiant assesses with moderate confidence that UNC5325 is associated with UNC3886.

The tag is: *misp-galaxy:threat-actor="UNC5325"*

Earth Kapre

Earth Kapre is an APT group specializing in cyberespionage. They target organizations in various countries through phishing campaigns using malicious attachments to infect machines. Earth Kapre employs techniques like abusing PowerShell, curl, and Program Compatibility Assistant to execute malicious commands and evade detection within targeted networks. The group has been active since at least 2018 and has been linked to multiple incidents involving data theft and espionage.

The tag is: *misp-galaxy:threat-actor="Earth Kapre"*

Earth Kapre is also known as:

- RedCurl
- Red Wolf

UNC5174

UNC5174, a Chinese state-sponsored threat actor, has been identified by Mandiant for exploiting critical vulnerabilities in F5 BIG-IP and ScreenConnect. They have been linked to targeting research and education institutions, businesses, charities, NGOs, and government organizations in Southeast Asia, the U.S., and the UK. UNC5174 is believed to have connections to China's Ministry of State Security and has been observed using custom tooling and the SUPERSHELL framework in their operations. The actor has shown indications of transitioning from hacktivist collectives to working as a contractor for Chinese intelligence agencies.

The tag is: *misp-galaxy:threat-actor="UNC5174"*

UNC5174 is also known as:

- Uteus

Smishing Triad

The Smishing Triad is a Chinese-speaking threat group known for targeting postal services and their customers globally through smishing campaigns. They leverage compromised Apple iMessage accounts to send fraudulent messages warning of undeliverable packages, aiming to collect personally identifying information and payment credentials. The group offers smishing kits for sale on platforms like Telegram, enabling other cybercriminals to launch independent attacks. "Smishing Triad" has expanded its operations to target UAE citizens, using geo-filtering to focus on victims in the Emirates.

The tag is: *misp-galaxy:threat-actor="Smishing Triad"*

CoralRaider

CoralRaider is a financially motivated threat actor of Vietnamese origin, targeting victims in Asian and Southeast Asian countries since at least 2023. They use the RotBot loader family and XClient stealer to steal victim information, with hardcoded Vietnamese words in their payloads. CoralRaider operates from Hanoi, Vietnam, and uses a Telegram bot as a C2 channel for their malicious campaigns. Their activities include system reconnaissance, data exfiltration, and targeting victims in multiple countries in the region.

The tag is: *misp-galaxy:threat-actor="CoralRaider"*

Starry Addax

Starry Addax is a threat actor targeting human rights activists associated with the Sahrawi Arab Democratic Republic using a novel mobile malware called FlexStarling. They conduct phishing attacks to trick targets into installing malicious Android applications and serve credential-harvesting pages to Windows-based targets. Their infrastructure targets both Windows and Android users, with the campaign starting with spear-phishing emails containing requests to install specific mobile apps or related themes. The campaign is in its early stages, with potential for additional malware variants and infrastructure development.

https://cloud.google.com/blog/topics/threat-intelligence/ivanti-post-exploitation-lateral-movement

UNC5330

UNC5330 is a suspected China-nexus espionage actor. UNC5330 has been observed chaining CVE-2024-21893 and CVE-2024-21887 to compromise Ivanti Connect Secure VPN appliances as early as Feb. 2024. Post-compromise activity by UNC5330 includes deployment of PHANTOMNET and TONERJAM. UNC5330 has employed Windows Management Instrumentation (WMI) to perform reconnaissance, move laterally, manipulate registry entries, and establish persistence. Mandiant observed UNC5330 operating a server since Dec. 6, 2021, which the group used as a GOST proxy to help facilitate malicious tool deployment to endpoints. The default certificate for GOST proxy was observed from Sept. 1, 2022 through Jan. 1, 2024. UNC5330 also attempted to download Fast Reverse Proxy (FRP) from this server on Feb. 3, 2024, from a compromised Ivanti Connect Secure device. Given the SSH key reuse in conjunction with the temporal proximity of these events, Mandiant assesses with moderate confidence UNC5330 has been operating through this server since at least 2021.

The tag is: *misp-galaxy:threat-actor="UNC5330"*

View relationships graph

UNC5330 has relationships with:

- deploys: misp-galaxy:backdoor="PHANTOMNET" with estimative-language:likelihood-probability="likely"
- deploys: misp-galaxy:tool="TONERJAM" with estimative-language:likelihood-probability="likely"
- uses: misp-galaxy:tool="GOST" with estimative-language:likelihood-probability="likely"

Table 15463. Table References

Earth Freybug

Earth Freybug, identified as a subset of APT41, is a cyberthreat group active since at least 2012, engaging in espionage and financially motivated activities across various sectors worldwide. The tactics, techniques, and procedures (TTPs) used in this campaign are similar to the ones from a campaign (Operation CuckooBees) described in an article published by Cybereason. They employ a diverse toolkit, including LOLBins and custom malware, to execute sophisticated cyberespionage attacks. The group's recent tactics involve DLL hijacking and API unhooking through a newly discovered malware named UNAPIMON, which prevents child processes from being monitored. This technique was observed in a vmtoolsd.exe process creating remote tasks to deploy malicious batch files for reconnaissance and backdoor access. UNAPIMON's simplicity and use of Microsoft Detours for defense evasion highlight the group's evolving methods and the need for vigilant security measures, such as restricting admin privileges and adhering to the principle of least privilege. Earth Freybug's persistence and creativity in refining their techniques underscore the ongoing threat they pose and the importance of proactive cybersecurity practices.

The tag is: *misp-galaxy:threat-actor="Earth Freybug"*

ArcaneDoor

ArcaneDoor is a campaign that is the latest example of state-sponsored actors targeting perimeter network devices from multiple vendors. Coveted by these actors, perimeter network devices are the perfect intrusion point for espionage-focused campaigns. As a critical path for data into and out of the network, these devices need to be routinely and promptly patched; using up-to-date hardware and software versions and configurations; and be closely monitored from a security perspective. Gaining a foothold on these devices allows an actor to directly pivot into an organization, reroute or modify traffic and monitor network communications. In the past two years, we have seen a dramatic and sustained increase in the targeting of these devices in areas such as telecommunications providers and energy sector organizations — critical infrastructure entities that are likely strategic targets of interest for many foreign governments.

The tag is: *misp-galaxy:threat-actor="ArcaneDoor"*

Table 15471. Table References

Links

https://blog.talosintelligence.com/arcanedoor-new-espionage-focused-campaign-found-targeting-perimeter-network-devices/

Storm-1849

UAT4356 is a state-sponsored threat actor that targeted government networks globally through a campaign named ArcaneDoor. They exploited two zero-day vulnerabilities in Cisco Adaptive Security Appliances to deploy custom malware implants called "Line Runner" and "Line Dancer." The actor demonstrated a deep understanding of Cisco systems, utilized anti-forensic measures, and took deliberate steps to evade detection. UAT4356's sophisticated attack chain allowed them to conduct malicious actions such as configuration modification, reconnaissance, network traffic capture/exfiltration, and potentially lateral movement on compromised devices.

The tag is: *misp-galaxy:threat-actor="Storm-1849"*

Storm-1849 is also known as:

- UAT4356

Void Manticore

Void Manticore is an Iranian APT group affiliated with MOIS, known for conducting destructive wiping attacks and influence operations. They collaborate with Scarred Manticore, sharing targets and conducting disruptive operations using custom wipers. Void Manticore's TTPs involve manual file deletion, lateral movement via RDP, and the deployment of custom wipers like the BiBi wiper. The group utilizes online personas like 'Karma' and 'Homeland Justice' to leak information and amplify the impact of their attacks.

The tag is: *misp-galaxy:threat-actor="Void Manticore"*

Alpha Spider

ALPHA SPIDER is a threat actor known for developing and operating the Alphv ransomware as a service. They have been observed using novel offensive techniques, such as exploiting software vulnerabilities and leveraging legitimate administration tools for malicious activities. ALPHA SPIDER affiliates have demonstrated persistence in exfiltrating data and have shown the ability to bypass security measures like DNS-based filtering and multifactor authentication. Despite lacking specific operational security measures, defenders have opportunities to detect and respond to ALPHA SPIDER's operations effectively.

The tag is: *misp-galaxy:threat-actor="Alpha Spider"*

Alpha Spider is also known as:

- ALPHV Ransomware Group

View relationships graph

Alpha Spider has relationships with:

- similar: misp-galaxy:threat-actor="Velvet Tempest" with estimative-language:likelihood-probability="likely"

RansomHub

RansomHub is a rapidly growing ransomware group believed to be an updated version of the older Knight ransomware. They have been linked to attacks exploiting the Zerologon vulnerability to gain

initial access. RansomHub has attracted former affiliates of the ALPHV ransomware group and operates as a Ransomware-as-a-Service with a unique affiliate prepayment model. The group has been active in extorting victims and leaking sensitive data to pressure for ransom payments.

The tag is: *misp-galaxy:threat-actor="RansomHub"*

Unfading Sea Haze

Unfading Sea Haze is a threat actor focused on espionage, targeting government and military organizations in the South China Sea region since 2018. They employ spear-phishing emails with malicious attachments to gain initial access, followed by the deployment of custom malware such as Gh0st RAT variants and SharpJSHandler. The group utilizes scheduled tasks and manipulates local administrator accounts for persistence, while also incorporating Remote Monitoring and Management tools into their attacks. Unfading Sea Haze demonstrates a sophisticated and patient approach, remaining undetected for years and showing adaptability through evolving exfiltration tactics and malware arsenal.

The tag is: *misp-galaxy:threat-actor="Unfading Sea Haze"*

StucxTeam

Stucx is a threat actor known for targeting Israeli systems, including SCADA systems and the Red Alert missile protection system. Stucx Team has also developed a mobile application called MyOPECS for coordinating attacks, which includes features like DDoS attacks and is expected to add more capabilities in the future. Additionally, they have been observed using VPNs and proxy software to conceal their activities and have a history of making threats against those who cooperate with Israel.

The tag is: *misp-galaxy:threat-actor="StucxTeam"*

LilacSquid

LilacSquid is an APT actor targeting a variety of industries worldwide since at least 2021. They use tactics such as exploiting vulnerabilities and compromised RDP credentials to gain access to victim organizations. Their post-compromise activities involve deploying MeshAgent and a customized version of QuasarRAT known as PurpleInk to maintain control over infected systems. LilacSquid has been observed using tools like Secure Socket Funneling for data exfiltration.

The tag is: *misp-galaxy:threat-actor="LilacSquid"*

Table 15484. Table References

UAC-0020

Vermin is a threat actor group linked to the Luhansk People’s Republic and believed to be acting on behalf of the Kremlin. They have targeted Ukrainian government infrastructure using malware like Spectr and legitimate tools like SyncThing for data exfiltration. Vermin has been active since at least 2018, using custom-made RATs like Vermin and open-source tools like Quasar for cyber-espionage. The group has resurfaced after periods of inactivity to conduct espionage operations against Ukraine’s military and defense sectors.

The tag is: *misp-galaxy:threat-actor="UAC-0020"*

UAC-0020 is also known as:

- Vermin
- SickSync

Void Arachne

Void Arachne is a threat actor group targeting Chinese-speaking users with malicious MSI files containing legitimate software installers for AI software. They exploit public interest in VPN technology and AI software to distribute malware through SEO poisoning and Chinese-language-themed Telegram channels. The group's campaign includes bundling malicious Winos payloads with deepfake pornography-generating AI software and voice-and-face-swapping AI software. Void Arachne also promotes AI technologies for virtual kidnapping and uses AI voice-alternating technology to pressure victims into paying ransom.

The tag is: *misp-galaxy:threat-actor="Void Arachne"*

Void Arachne is also known as:

- Silver Fox

Table 15493. Table References

JuiceLedger

JuiceLedger is a threat actor known for infostealing through their JuiceStealer .NET assembly. They have evolved from spreading fraudulent applications to conducting supply chain attacks, targeting PyPI contributors with phishing campaigns and typosquatting. Their malicious packages contain a code snippet that downloads and executes JuiceStealer, which has evolved to support additional browsers and Discord. Victims of JuiceLedger attacks are advised to reset passwords and report any suspicious activity to security@pypi.org.

The tag is: *misp-galaxy:threat-actor="JuiceLedger"*

RedJuliett

RedJuliett is a likely Chinese state-sponsored threat actor targeting government, academic,

technology, and diplomatic organizations in Taiwan. They exploit vulnerabilities in network edge devices for initial access and use SQL injection and directory traversal exploits against web and SQL applications. The group operates from Fuzhou, China, and aims to support Beijing's intelligence collection on Taiwan's economic and diplomatic relations. RedJuliett has also expanded its operations to compromise organizations in other countries such as Hong Kong, Malaysia, and the United States.

The tag is: *misp-galaxy:threat-actor="RedJuliett"*

Table 15497. Table References

Links

BlueHornet

BlueHornet is an advanced persistent threat group targeting government organizations in China, North Korea, Iran, and Russia. They have compromised and leaked data from other APT groups like Kryptonite Panda and Lazarus Group. BlueHornet has been involved in campaigns such as Operation Renminbi, Operation Ruble, and Operation EUSec, focusing on exfiltrating region-specific data and selling it on the dark web. They have also been known to collaborate with different threat actors and have recently disclosed a zero-day exploit in NGINX 1.18.

The tag is: *misp-galaxy:threat-actor="BlueHornet"*

BlueHornet is also known as:

- APT49
- AgainstTheWest

Lifting Zmiy

Rostelecom's security team has discovered a new APT group that is breaching companies via industrial PLCs. Named Lifting Zmiy, the group's first attacks were traced back to October 2023. The group targeted PLCs from Russian company Tech-Automatics usually used with elevators and which were still using their default passwords. Rostelecom has linked the group to intrusions at a Russian government contractor, two telecom operators, and an IT company. The company says the group collected and exfiltrated data and then destroyed the victim's infrastructure. Rostelecom says Lifting Zmiy uses Starlink infrastructure for attacks and appears to operate out of Eastern Europe.

Stargazer Goblin

Stargazer Goblin is a threat actor group that operates the Stargazers Ghost Network on GitHub, distributing malware and malicious links through multiple accounts. They utilize compromised and created accounts to evade detection and quickly replace banned components to continue their operations. The group has been estimated to have earned approximately $100,000 from their malicious activities, offering a Distribution as a Service platform for other threat actors to distribute their malware. Stargazer Goblin has been involved in distributing various malware families, including Atlantida Stealer, Rhadamanthys, RisePro, Lumma Stealer, and RedLine.

The tag is: *misp-galaxy:threat-actor="Stargazer Goblin"*

UAC-0102

UAC-0102 is a threat actor group targeting UKR.NET users through phishing attacks. They distribute emails with HTML file attachments that redirect users to a fraudulent website to steal authentication data. Security teams can use Sigma rules to detect their phishing campaigns and leverage IOCs provided by CERT-UA to hunt for their activity in SIEM or EDR environments.

APT45

APT45 is a North Korean cyber threat actor that has been active since at least 2009. They have conducted espionage campaigns targeting government agencies and defense industries, as well as financially-motivated operations, including ransomware development. APT45 has targeted critical infrastructure, financial organizations, nuclear research facilities, and healthcare and pharmaceutical companies. They use a mix of publicly available tools, modified malware, and custom malware families in their operations.

The tag is: *misp-galaxy:threat-actor="APT45"*

TA4903

TA4903 is a financially motivated threat actor known for conducting credential phishing and business email compromise campaigns. They target organizations in the U.S. across various sectors, spoofing government entities and private businesses. The actor has been observed using techniques such as QR codes in phishing campaigns and spoofing supplier domains to prompt victims to provide banking information. TA4903's activities typically involve stealing corporate credentials to facilitate follow-on BEC activities.

The tag is: *misp-galaxy:threat-actor="TA4903"*

Storm-0506

Storm-0506 (DEV-0506) is a financially motivated cybercriminal group operating as a core affiliate within the Black Basta ransomware-as-a-service (RaaS) ecosystem, having switched from deploying Conti ransomware around April 2022. This actor's operational model is distinguished by its strategic reliance on a dynamic network of initial access brokers, showcasing a division of labor common in RaaS operations. Throughout its history, Storm-0506 has leveraged access obtained through various brokers: initially Storm-0450/0464 via Qakbot infections (pre-September 2023), then expanding to include Storm-1674 delivering DarkGate, Pikabot, and IcedID (September 2023), and later employing Storm-1674's Microsoft Teams vishing campaigns (October 2024) and Storm-0569's SEO poisoning leading to BATLOADER and Cobalt Strike (December 2023). Following successful initial compromise, Storm-0506 employs a range of post-exploitation tools, including Cobalt Strike Beacon, SystemBC, and Brute Ratel C4 backdoors, and notably, often utilizes command-and-control (C2) infrastructure established by Storm-0365, indicating close collaboration or shared resources. This actor is characterized by hands-on-keyboard activity, culminating in the deployment of Black Basta ransomware. A resurgence in activity observed in October 2024, directly linked to Storm-1674's vishing, underscores the ongoing and adaptive threat that Storm-0506 represents within the ransomware landscape.

The tag is: *misp-galaxy:threat-actor="Storm-0506"*

UNC4393

UNC4393 is a financially motivated threat actor primarily using BASTA ransomware. They have been active since early 2022 and have targeted over 40 organizations across various industries. UNC4393 has shown a willingness to cooperate with other threat clusters for initial access and has evolved from using existing tools to developing custom malware. They focus on efficient data exfiltration and multi-faceted extortion, often utilizing tools like COGSCAN and RCLONE for reconnaissance and data theft.

The tag is: *misp-galaxy:threat-actor="UNC4393"*

UNC4393 is also known as:

- Storm-1811
- CURLY SPIDER
- STAC5777
- Cardinal

Hive0137

Being one of the most active malware distributors, Hive0137 demonstrates a willingness to explore new payloads and technologies such as GenAI. They have quickly moved onto the same level as other high-profile distributors such as TA577, and will likely be responsible for future phishing campaigns, facilitating initial access for ransomware affiliates. Hive0137's combination of intent, capabilities and relationships with other groups presents a direct threat to organizations all over the world. As threat actors pick up the pace and increasingly adopt AI technologies for malicious purposes, it is important that organizations are aware of the most recent threats and their capabilities to maintain a strong security posture.

The tag is: *misp-galaxy:threat-actor="Hive0137"*

UNC4540

UNC4540 is a suspected Chinese threat actor targeting unpatched SonicWall Secure Mobile Access appliances to deploy custom malware that establishes long-term persistence for cyber espionage. The malware is designed to steal hashed credentials, provide shell access, and persist through firmware upgrades, utilizing a variant of the TinyShell backdoor. Mandiant has tracked UNC4540's activities back to 2021, noting their focus on maintaining access to compromised devices. The group's tactics are consistent with patterns observed in other Chinese threat actor campaigns targeting network devices for zero-day exploits.

The tag is: *misp-galaxy:threat-actor="UNC4540"*

Table 15521. Table References

Actor240524

Actor240524 is a newly identified APT group that targeted Azerbaijani and Israeli diplomats through spear-phishing emails to steal sensitive data. The group employs a Trojan program known as ABCloader and ABCsync, demonstrating capabilities to steal secrets and modify file data. Their operations appear to focus on undermining the cooperative relationship between Azerbaijan and Israel. Actor240524 utilizes various countermeasures to obscure their attack tactics and techniques.

The tag is: *misp-galaxy:threat-actor="Actor240524"*

ZeroSevenGroup

ZeroSevenGroup is a threat actor that claims to have breached a U.S. branch of Toyota, stealing 240GB of sensitive data, including employee and customer information, contracts, and financial details. They have also allegedly gained full network access to critical Israeli infrastructure, with access to 80TB of sensitive data across various sectors. The group has threatened to use the stolen data for malicious activities, including ransomware attacks. Their operations involve exploiting vulnerabilities, as indicated by their reference to manipulating memory through buffer overflow techniques.

The tag is: *misp-galaxy:threat-actor="ZeroSevenGroup"*

UNC2970

UNC2970 is a North Korean threat actor that primarily targets organizations through spear-phishing emails with job recruitment themes, often utilizing fake LinkedIn accounts to engage victims. The group employs the PLANKWALK backdoor and other malware families, leveraging

compromised WordPress sites for command and control. They have been observed using BYOVD techniques to exploit vulnerable drivers for evading detection. Mandiant has noted a shift in UNC2970's targeting strategy, including a focus on security researchers and advancements in their operational capabilities against EDR tools.

UNC4536

UNC4536 is a threat actor that distributes malware, including ICEDID, REDLINESTEALER, and CARBANAK, primarily through malvertising and trojanized MSIX installers masquerading as popular software. They utilize SEO poisoning tactics to direct victims to malicious sites that mimic legitimate software hosting platforms, facilitating the download of compromised installers. The actor employs a PowerShell script known as NUMOZYLOD to deliver tailored payloads, such as the CARBANAK backdoor, to their partners. Additionally, UNC4536 has been linked to campaigns that distribute NetSupport RAT, targeting IT administrators through fake sites promoted via Google Ads.

The tag is: *misp-galaxy:threat-actor="UNC4536"*

UAC-0154

UAC-0154 is a threat actor orchestrating the STARK#VORTEX phishing campaign, specifically targeting Ukraine's military. They employ a Microsoft Help file containing obfuscated JavaScript as a lure, disguised as a manual for Pilot-in-Command Drones, to deliver the MerlinAgent malware. This PowerShell-based RAT is heavily obfuscated and downloads a payload from a remote server, enabling full control over compromised systems. The group initially targeted Ukrainian entities using military-themed documents sent via email to @ukr.net addresses.

The tag is: *misp-galaxy:threat-actor="UAC-0154"*

IRLeaks

IRLeaks is a threat actor known for significant cyberattacks targeting Iranian organizations, including a major breach of SnappFood, where they exfiltrated 3TB of sensitive data from 20 million user profiles. They have also compromised data from 23 leading Iranian insurance companies, offering over 160 million records for sale. Their operations involve extortion tactics, as seen in the ransom negotiations with Tosan, and they utilize malware such as StealC for data extraction. IRLeaks communicates primarily in Persian and has been active in selling stolen data on cybercriminal marketplaces.

Storm-1679

Storm-1679 is a Russian disinformation group believed to be a spinoff of the Internet Research Agency, actively engaged in influence operations targeting the International Olympic Committee and the 2024 Olympic Games. The group has employed AI-generated content, including deepfake videos and fabricated narratives about violence, to discredit the IOC and instill fear among potential attendees. Their campaigns have been identified across multiple languages and platforms, utilizing techniques such as impersonation of media outlets and the creation of disinformation websites. Microsoft attributes significant disinformation activities related to the Olympics to Storm-1679, highlighting their focus on spreading falsehoods and promoting anti-Olympics messaging.

The tag is: *misp-galaxy:threat-actor="Storm-1679"*

Fail0verflow

Fail0verflow is a hacking group known for exploiting vulnerabilities in gaming consoles, notably the Nintendo Wii and PlayStation 3. They utilized techniques such as RAM shorting, buffer overflow, and a signing bug to achieve code execution and develop the Homebrew Channel for the Wii. In 2010, they compromised an ECDSA key for the PS3, and later announced the retrieval of PS5 symmetric root keys, enabling the potential for custom firmware and homebrew software. Their exploits often involve kernel access and have raised concerns about the implications for piracy and litigation in the gaming community.

The tag is: *misp-galaxy:threat-actor="Fail0verflow"*

Fail0verflow is also known as:

- Team Twiizer

UNC1860

UNC1860 is a persistent and opportunistic Iranian state-sponsored threat actor that is likely affiliated with Iran's Ministry of Intelligence and Security (MOIS). A key feature of UNC1860 is its collection of specialized tooling and passive backdoors that Mandiant believes supports several objectives, including its role as a probable initial access provider and its ability to gain persistent access to high-priority networks, such as those in the government and telecommunications space throughout the Middle East.

The tag is: *misp-galaxy:threat-actor="UNC1860"*

SkidSec

SkidSec is a threat group that has engaged in operations targeting exposed printers in South Korea to disseminate North Korean propaganda, utilizing techniques such as printer exploitation and social engineering for evidence collection. The group has also experienced a leadership change following the loss of their leader, Govadmin, while continuing to mobilize their followers for various missions. They have humorously solicited financial support for their activities, framing it as a means to support their cause. Additionally, they have been noted for their potential to leak sensitive information from compromised devices.

The tag is: *misp-galaxy:threat-actor="SkidSec"*

SkidSec is also known as:

- SkidSec Leaks

Awaken Likho

Awaken Likho is an APT group that has targeted Russian government agencies and industrial enterprises, employing techniques such as information gathering via search engines and using MeshCentral for remote access. The group has been active since at least December 2021 and has ramped up its activities following the Russo-Ukrainian conflict. Recent reports indicate that they are focusing on espionage against critical infrastructure in the defense and energy sectors. Analysis of their malware reveals a new version that is still in development, suggesting ongoing operational capabilities.

The tag is: *misp-galaxy:threat-actor="Awaken Likho"*

Awaken Likho is also known as:

- Core Werewolf

CeranaKeeper

CeranaKeeper is a China-aligned APT that has been active since at least early 2022, primarily targeting governmental institutions in Asian countries. The group employs custom backdoors like TONESHELL and OneDoor, leveraging cloud services such as Dropbox and OneDrive for data exfiltration. CeranaKeeper utilizes techniques like side-loading, brute-force attacks, and the deployment of BAT scripts to extend its reach within compromised networks. Their operations are characterized by a relentless pursuit of sensitive data, adapting their toolset and methods to evade detection.

The tag is: *misp-galaxy:threat-actor="CeranaKeeper"*

SongXY

SongXY is a Chinese APT group that employs phishing tactics to initiate cyberespionage campaigns. They utilize the Royal Road RTF builder, exploiting the CVE-2018-0798 vulnerability in Microsoft Equation Editor. In one instance, they sent a document containing a link to an attacker-controlled server, which automatically triggered upon opening, allowing them to gather information about the target's system configuration.

The tag is: *misp-galaxy:threat-actor="SongXY"*

TaskMasters

TaskMasters is a state-sponsored Chinese APT that has been active since at least 2010, primarily targeting industrial, energy, and government sectors in Russia and the CIS. The group has been linked to the Webdav-O Trojan, which employs techniques to bypass network defenses by connecting to legitimate services. Investigations suggest that TaskMasters may have been involved in attacks against Russian federal executive authorities in 2020, potentially alongside another Chinese group, TA428. Additionally, the group has been associated with the BackDoor.RemShell.24 malware, indicating a diverse toolkit in their operations.

The tag is: *misp-galaxy:threat-actor="TaskMasters"*

TaskMasters is also known as:

- BlueTraveller

Anonymous64

Anonymous 64 is a group accused by China's national security ministry of attempting to gain control of web portals, outdoor electronic screens, and network television. The Ministry of State Security claims that Anonymous 64 is linked to a cyber unit within Taiwan's defense ministry and identifies three active-duty military personnel as its members. The MSS alleges that the group is involved in an influence operation within China, using hacktivism as a cover. The accusations suggest that Anonymous 64 engages in sabotage activities, prompting authorities to call for public reporting of such actions.

The tag is: *misp-galaxy:threat-actor="Anonymous64"*

Anonymous64 is also known as:

- Anonymous 64

Asnarök

Asnarök is a threat actor that exploited CVE-2020-12271 and utilized command injection privilege escalation to gain root access to devices and install the Asnarök Trojan and demonstrated significant changes in TTPs, including the deployment of a web shell that did not reach out to external C2 for commands. X-Ops identified a patient-zero device linked to the attack and observed the use of an IC.sh script that stole local user account data. The actor's activities were linked to a broader pattern of malicious exploit research and targeted vulnerabilities disclosed by bug bounty researchers.

The tag is: *misp-galaxy:threat-actor="Asnarök"*

Asnarök is also known as:

- Personal Panda

Shahid Hemmat

Shahid Hemmat is an IRGC-CEC affiliated hacking group linked to cyberattacks targeting U.S. critical infrastructure, including the defense industry and international transportation sectors. The group has been implicated in the hack of a booster station at the Municipal Water Authority in Aliquippa,

Pennsylvania, which disrupted drinking water supply. Key figures within Shahid Hemmat include Manouchehr Akbari, Amir Hossein Hoseini, Mohammad Hossein Moradi, and Mohammad Reza Rafatnejad. The U.S. government is offering a $10 million reward for information on these individuals.

RipperSec

RipperSec is a pro-Palestinian, likely Malaysian hacktivist group created in June 2023, known for conducting DDoS attacks, data breaches, and defacements primarily targeting government and educational websites, as well as organizations perceived to support Israel. The group has claimed 196 DDoS attacks, with a significant portion directed at Israel, and utilizes a tool called MegaMedusa for their operations. RipperSec operates on Telegram, where it has amassed over 2,000 members, and collaborates with various like-minded hacktivist groups. Their attack strategy relies heavily on community involvement rather than sophisticated infrastructure.

The tag is: *misp-galaxy:threat-actor="RipperSec"*

LulzSec Black

LulzSec Black is a hacktivist group that has claimed responsibility for coordinated DDoS attacks against Cyprus' government and critical infrastructure in response to the country’s support for Israel. They have also announced cyberattacks targeting the UAE, including breaches of a government website and Alfa Electronics, asserting these actions are in support of Palestine. The group has indicated intentions for further attacks and has not provided independently verifiable evidence of their claims. Their operations reflect a focus on disrupting services and compromising data as part of their political agenda.

UNC5820

UNC5820 is a threat actor exploiting the CVE-2024-47575 vulnerability in Fortinet's FortiManager, allowing them to bypass authentication and execute arbitrary commands. They have been observed exfiltrating configuration data, user information, and FortiOS256-hashed passwords from managed FortiGate devices. While the actor has staged and exfiltrated sensitive data, there is currently no evidence of lateral movement or further compromise of additional environments. Mandiant has not determined whether UNC5820 is state-sponsored or identified its geographic location.

The tag is: *misp-galaxy:threat-actor="UNC5820"*

Table 15557. Table References

UAC-0215

UAC-0215 is an APT group that has orchestrated a phishing campaign targeting public institutions, major industries, and military units in Ukraine, utilizing rogue RDP files to gain unauthorized access. The malicious emails are designed to appear legitimate, enticing recipients to open attachments that connect their systems to the attacker's server, allowing extensive access to local resources. CERT-UA has identified this activity as high-risk and has advised organizations to block RDP files at mail gateways and restrict RDP connection capabilities. The campaign's geographical footprint suggests a potential for broader cyberattacks beyond Ukraine.

The tag is: *misp-galaxy:threat-actor="UAC-0215"*

IcePeony

IcePeony is a China-nexus APT group that has been active since at least 2023, targeting government agencies, academic institutions, and political organizations in countries such as India, Mauritius, and Vietnam. They primarily employ SQL injection techniques to exploit vulnerabilities in publicly accessible web servers, subsequently installing web shells or executing malware like IceCache to facilitate credential theft. IcePeony operates under harsh work conditions, potentially adhering to the 996 working hour system, and shows a particular interest in the governments of Indian Ocean countries. Their activities suggest alignment with China's national interests, possibly related to maritime strategy.

Blackmeta

BLACKMETA is a pro-Palestinian hacktivist group that has claimed responsibility for a series of DDoS attacks and data breaches targeting organizations perceived as supportive of Israel, including the Internet Archive and various entities in the UAE and Saudi Arabia. The group employs DDoS attacks, website defacement, and data exfiltration, with motivations rooted in political ideology and retribution for perceived injustices against Palestinians. Their operations have been linked to a Telegram channel, where they publicize their activities and collaborate with other hacktivist groups. Additionally, they have been attributed to significant cyber disruptions, including a 100-hour DDoS campaign against a UAE bank, showcasing their operational capabilities.

Storm-2077

TAG-100 is a cyber-espionage APT that targets government and private sector organizations globally, exploiting vulnerabilities in internet-facing devices such as Citrix NetScaler and F5 BIG-IP for initial access. The group employs open-source tools like Pantegana and SparkRAT for persistence and post-exploitation activities, including credential theft and email data exfiltration. TAG-100 has compromised entities in at least ten countries, including two Asia-Pacific intergovernmental organizations, and focuses on sectors like education, finance, and local government. Their operations highlight the challenges of attribution due to the use of off-the-shelf tools and techniques that overlap with other state-sponsored groups.

The tag is: *misp-galaxy:threat-actor="Storm-2077"*

Storm-2077 is also known as:

- TAG-100
- RedNovember

INDOHAXSEC TEAM

INDOHAXSEC TEAM is an Indonesian group that claims to have developed a web-based version of WannaCry, asserting the ability to encrypt websites and demand Bitcoin as ransom. However, their technical capabilities remain uncertain, as creating ransomware of this scale requires significant expertise. The group's claims may be exaggerated for attention, and verified evidence is needed to assess their true capabilities.

The tag is: *misp-galaxy:threat-actor="INDOHAXSEC TEAM"*

Massgrave

Massgrave is a hacking group that has developed a method to bypass Microsoft's software licensing for Windows and Office, enabling permanent activation of versions from Windows Vista to Windows 11. They are known for creating effective scripts for software activation, which are distributed through an unofficial repository at massgrave.dev. The group claims their exploit supports volume activation via the Key Management Services model and has gained traction within the piracy scene. Reports indicate that their tools may be used by unauthorized individuals, including Microsoft support agents, raising legal and security concerns.

The tag is: *misp-galaxy:threat-actor="Massgrave"*

FunkSec

Funksec is a newly identified extortion group that has claimed 11 victims across various sectors, including media, IT, and education, operating a Tor-based DLS to centralize its ransomware activities. The group advertises a free DDoS tool and may develop its own ransomware binary, indicating significant technical capability. The DLS was likely created in late November to early

December 2024, with the first advertisement titled “Funksec Ransomware” posted on 3 December 2024. Currently, there is limited publicly available information on Funksec’s TTPs, and it is not known to be associated with any other threat groups.

The tag is: *misp-galaxy:threat-actor="FunkSec"*

Storm-0940

Storm-0940 is a Chinese threat actor active since at least 2021, known for gaining initial access through password spray and brute-force attacks, as well as exploiting network edge applications. Microsoft has observed Storm-0940 utilizing valid credentials obtained from CovertNetwork-1658’s password spray operations, indicating a close operational relationship between the two. Once inside a victim environment, Storm-0940 has been seen leveraging compromised credentials for further malicious activities. Additionally, Storm-0940 has employed botnets, such as Quad7, to facilitate password spraying attacks.

The tag is: *misp-galaxy:threat-actor="Storm-0940"*

Storm-0940 is also known as:

- CovertNetwork-1658
- ORB07

Anonymous KSA

Anonymous KSA is a Saudi hacking group that has executed cyber attacks targeting Indian institutions, including a significant breach of UIDAI’s data storage units, leading to access to sensitive information and system disruption. The group claims these actions are in response to India’s normalization of ties with Israel and its treatment of Palestinians. They have called for support for the Palestinian cause and accountability for the damage caused by their operations. The group’s TTPs include targeting government agencies and leveraging public sentiment to justify their actions.

The tag is: *misp-galaxy:threat-actor="Anonymous KSA"*

Aggressive Inventory Zombies

Aggressive Inventory Zombies is a threat actor involved in a large-scale phishing and pig-butchering network targeting retail brands and cryptocurrency users. They create fraudulent sites using a popular website template that scrapes product details from legitimate e-commerce platforms and integrate chat services for phishing. Financial ties to India have been identified, and collaboration with Stark Industries has led to the dismantling of parts of their infrastructure, revealing the network's breadth. AIZ is also linked to Entropy ransomware infections, which were preceded by detections of Cobalt Strike beacons and Dridex malware.

The tag is: *misp-galaxy:threat-actor="Aggressive Inventory Zombies"*

Aggressive Inventory Zombies is also known as:

- AIZ

Table 15588. Table References

UNC2465

UNC2465 is a threat actor known for deploying the SMOKEDHAM .NET backdoor and DARKSIDE ransomware, utilizing TTPs such as phishing, Trojanized software installers, and supply chain attacks. They have employed the NGROK utility to expose internal services and facilitate lateral movement within victim environments. UNC2465 has also leveraged tools like UltraVNC, Cobalt Strike BEACON, and conducted credential harvesting via LSASS memory dumping. Their operations have included extortion tactics through a leaks website over TOR, applying pressure on victims by releasing stolen data.

The tag is: *misp-galaxy:threat-actor="UNC2465"*

LIMINAL PANDA

LIMINAL PANDA is a China-nexus APT that targets telecommunications entities, employing custom malware and publicly available tools for covert access, C2, and data exfiltration. The adversary demonstrates extensive knowledge of telecom networks, utilizing GSM protocols to retrieve mobile subscriber information and call metadata. LIMINAL PANDA exploits trust relationships and security gaps between providers to access core infrastructure, indicating a focus on SIGINT collection rather than financial gain. Their intrusion activity has primarily affected telecom providers in southern Asia and Africa, with potential for broader targeting based on network configurations.

The tag is: *misp-galaxy:threat-actor="LIMINAL PANDA"*

Table 15590. Table References

Links
https://www.crowdstrike.com/en-us/blog/liminal-panda-telecom-sector-threats/

Altoufan Team

ALTOUFAN TEAM is a politically motivated hacktivist group with anti-Zionism, anti-monarchy, and pro-14-February movement sentiments. They have targeted government agencies and organizations in Bahrain and Israel, claiming to support political causes in the region. The group has employed techniques such as credential theft to compromise systems, as demonstrated by their attack on Bahrain's Social Insurance Organization. ALTOUFAN maintains a presence on social media platforms to disseminate their messages and showcase their activities.

The tag is: *misp-galaxy:threat-actor="Altoufan Team"*

UAC-0185

UAC-0185 has been active since at least 2022, primarily targeting Ukrainian defense organizations through credential theft via messaging apps like Signal, Telegram, and WhatsApp, as well as military systems such as DELTA, TENETA, and Kropyva. The group employs phishing attacks, often impersonating the Ukrainian Union of Industrialists and Entrepreneurs (UUIE), to gain unauthorized access to the PCs of defense sector employees. They utilize custom tools, including MESHAGENT and UltraVNC, to facilitate their operations. Their activities are mapped to MITRE ATT&CK, focusing on tactics related to credential theft and remote access.

The tag is: *misp-galaxy:threat-actor="UAC-0185"*

UAC-0185 is also known as:

- UNC4221

https://cert.gov.ua/article/6281632

Wassonite

WASSONITE is a North Korea-linked APT that has targeted industrial sectors, including electric generation, nuclear energy, manufacturing, and research entities in India, South Korea, and Japan since at least 2018. The group employs DTrack RAT for remote access, Mimikatz for credential capture, and various system tools for lateral movement and file transfers. WASSONITE has been observed using nuclear energy-themed spear phishing lures to deploy the AppleSeed backdoor, which can take screenshots, log keystrokes, and execute commands from a C2 server. Their operations focus on initial access, reconnaissance, and data collection without demonstrating disruptive capabilities.

The tag is: *misp-galaxy:threat-actor="Wassonite"*

Natohub

Natohub is a hacker who claimed to have stolen 42,000 documents from the UN's International Civil Aviation Organization and is offering the data for sale on underground forums. The compromised documents allegedly contain personal records of ICAO staff and others associated with the agency. While ICAO is investigating the potential breach, Natohub has also made unverified claims about accessing personal data on thousands of UN delegates. The actor's track record of leaks is limited, raising questions about the credibility of their assertions.

The tag is: *misp-galaxy:threat-actor="Natohub"*

CoughingDown

CoughingDown is a threat group attributed to various cyber campaigns, including the deployment of the EAGERBEE backdoor, which utilizes service manipulation and privilege escalation techniques. The group has been linked to malware infrastructure that abuses legitimate services

like MSDTC, IKEEXT, and SessionEnv to load malicious DLLs, including oci.dll. Analysis of supply-chain attacks, particularly involving Trojanized packages, has revealed similarities between CoughingDown malware and post-compromise tools used in these incidents. Evidence such as consistent service creation and C2 domain overlap further supports the connection between EAGERBEE and CoughingDown.

The tag is: *misp-galaxy:threat-actor="CoughingDown"*

Table 15595. Table References

https://securelist.com/eagerbee-backdoor/115175/

EC2 Grouper

EC2 Grouper is a prolific threat actor known for leveraging AWS tools for PowerShell to conduct automated attacks in cloud environments. They typically utilize the CreateSecurityGroup API to establish remote access and exhibit a consistent security group naming convention. Credential acquisition is believed to stem from compromised cloud access keys, often sourced from public code repositories. Notably, their activities do not include calls to AuthorizeSecurityGroupIngress, suggesting a selective approach to escalation.

The tag is: *misp-galaxy:threat-actor="EC2 Grouper"*

Table 15596. Table References

https://www.fortinet.com/blog/threat-research/catching-ec2-grouper-no-indicators-required

Codefinger

Codefinger is a ransomware group that targets Amazon S3 buckets by exploiting AWS's Server-Side Encryption with Customer Provided Keys to encrypt victim data. They utilize compromised AWS credentials to gain access and demand Bitcoin ransoms for the decryption keys, threatening to delete files if negotiations fail. The group has been observed abusing publicly disclosed AWS keys with permissions to read and write S3 objects, making recovery impossible without their cooperation. Halcyon has documented multiple incidents linked to Codefinger's data extortion campaign against organizations with unsecured infrastructure.

The tag is: *misp-galaxy:threat-actor="Codefinger"*

Table 15597. Table References

Operation DRBControl

Operation DRBControl is a cyberespionage campaign targeting gambling companies in Southeast Asia, first identified in 2019. The operation involves the use of HyperBro malware and SysUpdate variants, with evidence of customer database and source code exfiltration. The threat actor has employed domain spoofing for command and control and has shown a consistent interest in the gambling industry. Trend Micro's analysis linked multiple tools and malware families to this campaign, indicating a sophisticated and evolving threat landscape.

The tag is: *misp-galaxy:threat-actor="Operation DRBControl"*

Table 15598. Table References

Belsen Group

The Belsen Group has exploited the CVE-2022-40684 vulnerability in Fortinet devices to compromise over 15,000 FortiGate firewalls, releasing detailed configurations and plaintext VPN credentials. Their leaked data, organized by country and IP address, primarily consists of configurations from FortiOS 7.0.6 and 7.2.1, which were the last vulnerable versions before patches were issued. Security researcher Kevin Beaumont confirmed that the group leveraged this vulnerability to gain unauthorized access and warned of potential exploitation of CVE-2024-55591 by similar threat actors. Fortinet has stated that the leaked data originates from older campaigns and not from any recent incidents.

The tag is: *misp-galaxy:threat-actor="Belsen Group"*

Table 15599. Table References

ExCobalt

ExCobalt is an APT group that has been active since at least 2016 and is believed to be linked to the notorious Cobalt Gang. The group primarily targets Russian organizations across sectors—including metallurgy, telecommunications, mining, information technology, government, and software development by exploiting supply chain weaknesses and compromised contractors for initial access. ExCobalt's toolkit features a custom Golang-based backdoor, GoRed, which enables remote command execution, credential harvesting, and detailed system reconnaissance, while the group also employs established tools such as Spark RAT, Mimikatz, and multiple Linux privilege escalation exploits. Researchers note that ExCobalt continually evolves its tactics and even modifies standard utilities to bypass security controls and maintain persistent access, underscoring its commitment to

sophisticated cyberespionage and data theft operations.

The tag is: *misp-galaxy:threat-actor="ExCobalt"*

Table 15600. Table References

Links
https://global.ptsecurity.com/analytics/pt-esc-threat-intelligence/excobalt-gored-the-hidden-tunnel-technique

UNC3973

UNC3973 is a financially motivated threat actor tracked by Mandiant, distinguished from the broader BASTA ransomware ecosystem (primarily tracked as UNC4393) due to its unique operational characteristics and TTPs. This actor has demonstrated a specific focus on supply chain compromises, as evidenced by their June campaign targeting credit unions in western Canada via a compromised managed service provider (MSP). UNC3973 leverages unauthorized service accounts with elevated privileges, specifically domain administrator accounts shared between the compromised MSP and the target organizations, to gain initial access.This actor's post-exploitation activity includes attempts to disable security controls and deploy the SYSTEMBC tunneler for command and control (C2) communication, followed by attempts to deploy BASTA ransomware. While their attempts to deploy both SYSTEMBC and BASTA have been observed, these were thankfully thwarted by endpoint security solutions in observed instances. The targeted, supply chain-enabled nature of UNC3973's intrusions, coupled with its use of privileged shared accounts and attempts at deploying BASTA, all suggest that it is an exclusive group, perhaps even affiliates working closely with or possibly operating under the direct control, BASTA ransomware operators. This group's ability to exploit centralized access points, like MSPs, represents a significant threat to organizations reliant on third-party providers.

The tag is: *misp-galaxy:threat-actor="UNC3973"*

Storm-0826

Storm-0826 is a financially motivated cybercriminal group operating as an affiliate within the Black Basta ransomware-as-a-service (RaaS) ecosystem. This actor's primary known method of obtaining initial access is through handoffs from Storm-0464, a known distributor of the Qakbot malware

The tag is: *misp-galaxy:threat-actor="Storm-0826"*

Table 15602. Table References

Links

STAC5143

STAC5143 is a threat actor group tracked by Sophos, notable for its sophisticated use of Microsoft Office 365's legitimate services to conduct ransomware and data extortion campaigns. Unlike FIN7, which typically targets larger organizations through phishing and malicious Google Ads, STAC5143 focuses on smaller victims across diverse business sectors. Their operations begin with overwhelming targeted individuals with email bombing, followed by Microsoft Teams messages impersonating tech support to initiate a remote screen control session. Utilizing Microsoft's Quick Assist or direct Teams screen sharing, they deploy malware, including Java Archive (JAR) files and Python-based backdoors, from external SharePoint file stores. This cluster exploits legitimate services within the Microsoft Office 365 platform, using a Java-based proxy to execute PowerShell commands and download malicious payloads. While employing publicly available tools like RPivot, their obfuscation methods and the use of side-loaded DLLs for command and control, combined with the deployment of Black Basta ransomware in one instance, indicate a sophisticated and evolving threat actor adapting known techniques for their specific objectives.

The tag is: *misp-galaxy:threat-actor="STAC5143"*

Table 15603. Table References

Links

GOLD REBELLION

GOLD REBELLION is a financially motivated cybercriminal threat group that operates the Black Basta name-and-shame ransomware. The group posted its first victim to its leak site in April 2022 and has continued to publish victim names at a rate of around 15 a month since then. GOLD REBELLION has not openly advertised or appeared to recruit for an affiliate program but the variety of tactics, techniques and procedures (TTP) observed in Black Basta intrusions suggests that multiple individuals are engaged in the ransomware scheme.Several security vendors and independent researchers have suggested the distributors of Black Basta may be former affiliates of GOLD ULRICK's Conti operation. Technical artifacts analyzed by CTU researchers suggest that Black Basta has been under development since at least early February 2022, several weeks before extensive public leaks detailed GOLD ULRICK's Conti operation. In November 2022, researchers at SentinelOne linked custom tooling used by GOLD REBELLION to the GOLD NIAGARA (FIN7) threat group. CTU researchers have not made independent observations corroborating a relationship between these threat groups or any others.GOLD REBELLION appear to have been a key customer of GOLD LAGOON's Qakbot: CTU researchers observed multiple incidents where Black Basta was distributed through it as an initial access vector (IAV), leading to Cobalt Strike and further lateral movement into the victim network. Following the takedown of Qakbot in August 2023, GOLD REBELLION explored new methods of delivery, including DarkGate and Pikabot. In one incident, CTU researchers observed a threat actor gain access to a victim network through a managed

security services provider (MSSP). In October 2024, GOLD REBELLION likely exploited a vulnerability in a Sonic Wall VPN device for access. Also in 2024, CTU researchers observed multiple instances of the group using social engineering to convince victims to download remote management and monitoring tools like AnyDesk and Quick Assist. After spamming inboxes with multiple emails, the threat actors approached the affected users via Teams, purporting to be IT Support or Help Desk employees offering assistance with email inbox issues.Other tools members of the group have used include the SystemBC back connect malware, PsExec for remote execution, RDP for lateral movement, batch files to delete their own tools and disable anti-virus programs for defense evasion, and both Rclone and MegaSync for data exfiltration.

The tag is: *misp-galaxy:threat-actor="GOLD REBELLION"*

GOLD REBELLION is also known as:

- WANDERING SPIDER
- White Dev 115
- Dark Scorpius

JavaGhost

JavaGhost is a threat actor group that has targeted cloud environments, particularly AWS, for phishing campaigns without engaging in data theft for extortion. They exploit overly permissive IAM permissions and utilize long-term access keys to gain initial access, employing the GetFederationToken API to acquire temporary credentials for console access. JavaGhost has

demonstrated advanced evasion techniques, avoiding common detection methods by not using the GetCallerIdentity API call. Their activities generate detectable logging footprints in CloudTrail, allowing organizations to identify and respond to their tactics.

The tag is: *misp-galaxy:threat-actor="JavaGhost"*

Storm-2372

Storm-2372 is a suspected nation-state actor aligned with Russian interests, engaging in device code phishing campaigns targeting governments, NGOs, and various industries across Europe, North America, Africa, and the Middle East. The actor employs tactics that involve impersonating prominent individuals through third-party messaging services like WhatsApp and Signal to gain rapport before sending phishing invitations. These invitations lure users into completing device code authentication requests, granting Storm-2372 initial access to victim accounts and enabling Graph API data collection activities, including email harvesting. Microsoft has observed the actor utilizing keyword searches within compromised accounts to exfiltrate sensitive information.

The tag is: *misp-galaxy:threat-actor="Storm-2372"*

GamaCopy

GamaCopy is a threat actor first discovered in June 2023, known for launching cyberattacks against Russia's defense and critical infrastructure sectors by mimicking the TTPs of Gamaredon. The organization has been active since at least August 2021 and primarily uses Russian-language bait documents related to military facilities. Analysis of attack samples shows considerable overlap in code structure and tactics, including the use of 7z-SFX documentation to install UltraVNC and connecting via port 443. GamaCopy employs open-source tools to obfuscate its activities while targeting sensitive information in the context of the Russia-Ukraine conflict.

The tag is: *misp-galaxy:threat-actor="GamaCopy"*

Mora_001

Mora_001 is a threat actor exhibiting a distinct operational signature that combines opportunistic attacks with ties to the LockBit ecosystem. The actor has been observed exploiting CVE-2024-55591 and CVE-2025-24472 vulnerabilities affecting Fortinet devices. The ransom note associated with Mora_001 includes the same TOX ID used by LockBit, indicating a potential affiliation or shared communication channels. Their post-exploitation patterns suggest a structured playbook that differentiates them from other ransomware operators, including LockBit affiliates.

The tag is: *misp-galaxy:threat-actor="Mora_001"*

LinkC Pub

Linkc is a newly emerged ransomware group that operates an onion-based data leak site and has claimed one victim, a U.S.-based AI and cloud service provider, H2O.ai, which was attacked on January 29, 2025. The group demanded a ransom of $15 million for data decryption and removal, showcasing access to sensitive information, including GPT model source code and customer data. Linkc's DLS is well-constructed and quick to load, indicating potential for future victim listings. However, there is currently no public acknowledgment from the victim, and the group has not engaged in discussions on cybercrime forums.

The tag is: *misp-galaxy:threat-actor="LinkC Pub"*

LinkC Pub is also known as:

- LinkC

ScreamedJungle

ScreamedJungle is a threat actor that exploits vulnerabilities in outdated Magento e-commerce platforms to inject malicious JavaScript code, specifically Bablosoft JS, into compromised websites. This actor has harvested millions of browser fingerprints by leveraging vulnerabilities such as CVE-2024-34102 and CVE-2024-20720. ScreamedJungle utilizes PerfectCanvas technology to ensure pixel-perfect replication of legitimate user fingerprints. Group-IB analysts estimate that over 115 e-commerce sites have been impacted by this fingerprint theft campaign.

The tag is: *misp-galaxy:threat-actor="ScreamedJungle"*

Storm-0249

Storm-0249 is an access broker active since 2021, known for distributing BazaLoader, IcedID, Bumblebee, and Emotet malware. The actor primarily employs phishing emails to deliver malware payloads, as evidenced by a campaign involving tax-themed emails that aimed to distribute BRc4 and Latrodectus malware. Storm-0249 has facilitated initial access for other threat actors, such as Storm-0501, by leveraging compromised credentials and exploiting known vulnerabilities in public-facing servers. Microsoft has detected malicious PDF attachments associated with Storm-0249's phishing campaigns.

The tag is: *misp-galaxy:threat-actor="Storm-0249"*

Storm-0249 is also known as:

- DEV-0249

Table 15622. Table References

GOFFEE

GOFFEE is a threat actor that has targeted entities in the Russian Federation since early 2022, employing spear phishing emails with malicious attachments, including modified Owowa and patched explorer.exe. They have utilized PowerTaskel, a non-public Mythic agent in PowerShell, and introduced a new implant called "PowerModul" for attacks against sectors such as media, telecommunications, and government. GOFFEE has increasingly shifted to a binary Mythic agent for lateral movement and has incorporated Word documents with malicious VBA scripts in their infection chains. The group has demonstrated a consistent evolution in their TTPs while maintaining identifiable characteristics that attribute their campaigns with high confidence.

The tag is: *misp-galaxy:threat-actor="GOFFEE"*

Table 15623. Table References

https://securelist.com/goffee-apt-new-attacks/116139/

UAT-5918

UAT-5918 is an APT group that targets entities in Taiwan, primarily in telecommunications, healthcare, and IT sectors, to establish long-term access for information theft. They exploit N-day vulnerabilities in unpatched web and application servers to gain initial access and utilize web shells, credential harvesting tools like Mimikatz and LaZagne, and red-teaming tools for post-compromise activities. UAT-5918 conducts network reconnaissance to pivot across endpoints, harvesting credentials and sensitive data, including database backups. Their operations show significant overlap with other APT groups in terms of TTPs and targeted industries.

The tag is: *misp-galaxy:threat-actor="UAT-5918"*

Table 15624. Table References

https://blog.talosintelligence.com/uat-5918-targets-critical-infra-in-taiwan/

Jabaroot

JabaRoot is an Algerian hacker group that has targeted Moroccan government systems, successfully exfiltrating sensitive data from the Ministry of Economic Inclusion and the National Social Security Fund (CNSS). The group has claimed responsibility for the breach, which has raised concerns among cybersecurity experts regarding its scale and impact on citizens' privacy. The motives behind the attack remain unclear, but it has been noted as one of Morocco's most significant cyber-attacks affecting multiple victims. Resecurity has identified the group's activities as part of a broader trend of APT targeting government entities in the region.

The tag is: *misp-galaxy:threat-actor="Jabaroot"*

Jabaroot is also known as:

- Jabaroot DZ

Storm-2460

Storm-2460 is a threat actor that has exploited elevation of privilege vulnerabilities to deploy PipeMagic malware and ransomware, enabling them to escalate access within compromised environments. They have been observed using the certutil utility to download malware from compromised legitimate third-party websites. Ransomware activity associated with Storm-2460 includes file encryption and the deployment of a ransom note named !*READ_ME_REXX2*!.txt. Microsoft recommends prioritizing security updates for elevation of privilege vulnerabilities to mitigate the impact of this actor's activities.

The tag is: *misp-galaxy:threat-actor="Storm-2460"*

HollowQuill

SEQRITE Labs APT-Team has been tracking and has uncovered a campaign targeting the Baltic State Technical University, a well-known institution for various defense, aerospace, and advanced engineering programs that contribute to Russia's military-industrial complex. Tracked as Operation HollowQuill, the campaign leverages weaponized decoy documents masquerading as official research invitations to infiltrate academic, governmental, and defense-related networks. The threat entity delivers a malicious RAR file which contains a .NET malware dropper, which further drops

other Golang based shellcode loader along with legitimate OneDrive application and a decoy-based PDF with a final Cobalt Strike payload.

The tag is: *misp-galaxy:threat-actor="HollowQuill"*

Table 15627. Table References

DieNet

DieNet is a hacktivist group that emerged in March 2025, known for conducting DDoS attacks targeting entities associated with political figures, such as Trump businesses. The group has claimed responsibility for disabling ten significant Iraqi websites, framing the action as support for their affiliates in the “Shiite Harvest.” Their operations suggest motivations rooted in sectarian dynamics, with a coordinated effort indicated by the use of hashtags like #DieNet and #Shiite_Harvest. This reflects the use of cyber offensives as tools for political and ideological expression, mirroring offline sectarian tensions.

The tag is: *misp-galaxy:threat-actor="DieNet"*

DieNet is also known as:

- Shiite_Harvest

REF7707

REF7707 is a cyber campaign targeting government entities, particularly a foreign ministry in South America, utilizing malware families such as FinalDraft, GuidLoader, and PathLoader for persistence and lateral movement. The threat actor employs the Microsoft Graph API for C2 communication, blending malicious traffic with legitimate activity to evade detection. Despite their technical sophistication, REF7707 operators exhibited poor operational security, leading to the exposure of their infrastructure and malware. Their tactics enable the extraction of sensitive data, including passwords and Active Directory information, facilitating ongoing espionage activities.

The tag is: *misp-galaxy:threat-actor="REF7707"*

REF7707 is also known as:

- CL-STA-0049

UAC-0219

UAC-0219 is a hacking group observed conducting cyber-espionage operations targeting Ukrainian critical sectors, primarily utilising WRECKSTEEL malware for file exfiltration in both VBScript and PowerShell variants. Their activities focus on gathering intelligence from military innovation hubs, armed forces, law enforcement, and regional government institutions. CERT-UA has linked multiple cyber-attacks against government agencies and critical infrastructure in Ukraine to UAC-0219, emphasizing their reliance on specialized malware for sensitive information theft. The group's operations are characterized by stealthy access and data exfiltration tactics, consistent with state-sponsored APT behavior.

The tag is: *misp-galaxy:threat-actor="UAC-0219"*

Table 15630. Table References

Operation ForumTroll

Operation ForumTroll is a sophisticated cyber espionage campaign discovered by Kaspersky in mid-March 2025. The attack exploited a zero-day vulnerability in Google Chrome, identified as CVE-2025-2783, which allowed attackers to bypass the browser's security features. Victims were infected by clicking on personalized phishing links in emails, allegedly from the organizers of the "Primakov Readings" forum, targeting media outlets, educational institutions, and government organizations in Russia. The goal of the attack appears to be espionage, and the campaign is believed to be the work of a state-sponsored APT group. Google quickly released an update to fix the vulnerability after being notified by Kaspersky.

The tag is: *misp-galaxy:threat-actor="Operation ForumTroll"*

Table 15631. Table References

Links
https://securelist.com/operation-forumtroll/115989/

Earth Alux

Earth Alux is a China-linked APT group known for conducting cyberespionage attacks across various sectors, including government, technology, and telecommunications. They primarily exploit vulnerable services in exposed servers to gain initial access, implanting web shells like GODZILLA

and deploying backdoors such as VARGEIT and COBEACON. The group employs tools like RSBINJECT and MASQLOADER for lateral movement and network discovery, while also utilizing RAILSETTER for persistence through mspaint injection. Their operations have predominantly targeted the APAC region and have extended to Latin America, with a focus on exfiltrating sensitive information to attacker-controlled cloud storage.

The tag is: *misp-galaxy:threat-actor="Earth Alux"*

Water Gamayun

Water Gamayun exploits the MSC EvilTwin zero-day vulnerability to compromise systems and exfiltrate data, utilizing custom payloads and advanced data exfiltration techniques. Their arsenal includes backdoors like SilentPrism and DarkWisp, as well as information stealers such as Stealc and Rhadamanthys. They employ delivery methods like provisioning malicious payloads through signed Microsoft Installer files and leveraging LOLBins to maintain persistence and control over infected systems. Comprehensive analysis of their command-and-control infrastructure reveals sophisticated evasion techniques and dynamic control capabilities.

JINX-0126

Wiz Threat Research identified a new variant of an ongoing malicious campaign targeting misconfigured and publicly exposed PostgreSQL servers. In the observed attack, the threat actor (tracked by Wiz as JINX-0126) abuses exposed PostgreSQL instances, configured with weak and guessable login credentials, to gain access and to deploy XMRig-C3 cryptominers. This campaign was first documented by Aqua Security, but the threat actor has since evolved, implementing defense evasion techniques such as deploying binaries with a unique hash per target and executing the miner payload filelessly—likely to evade detection by CWPP solutions that rely solely on file hash reputation.

The tag is: *misp-galaxy:threat-actor="JINX-0126"*

Table 15634. Table References

puNK-003

puNK-003 is a North Korean APT group known for deploying the Lilith RAT, a sophisticated C++ remote access trojan, and its AutoIt variant, CURKON, which functions as a downloader. The group primarily distributes malware through targeted phishing attacks using malicious LNK files. Analysis indicates that puNK-003 shares similarities with the KONNI group, particularly in the use of AutoIt scripts and specific coding functions. Key indicators of infection include unusual network activity and system slowdowns, with removal methods involving specialized antivirus software and manual techniques.

The tag is: *misp-galaxy:threat-actor="puNK-003"*

UAC-0226

UAC-0226 is a cyber-espionage group targeting Ukrainian military, law enforcement, and local government entities—particularly near the eastern border—since February 2025. Initial access is achieved via phishing emails containing malicious .xlsm documents that decode and execute base64-encoded payloads stored in spreadsheet cells. Two main tools are used: a .NET-based reverse shell leveraging PowerShell code from a public GitHub repository (https://github.com/tihanyin/PSSW100AVB), and GIFTEDCROOK, a C/C++ stealer that extracts browser data (cookies, history, credentials), archives it with PowerShell, and exfiltrates via Telegram. The group often abuses compromised webmail accounts for delivery, underlining the importance of detailed email and web server logging. Their activity shows a mix of low development overhead and high operational targeting, consistent with state-aligned espionage.

The tag is: *misp-galaxy:threat-actor="UAC-0226"*

Table 15636. Table References

Links

HIVE-0145

Hive0145 is a financially motivated initial access broker that has been active since late 2022, primarily utilizing Strela Stealer malware to target email credentials. The group has evolved its tactics from generic phishing emails to using stolen legitimate emails with real invoice attachments, focusing on victims in Spain, Germany, and Ukraine. Strela Stealer is configured to extract data from Microsoft Outlook and Mozilla Thunderbird, and the group's operations have shown increased complexity and automation. Threat intelligence indicates that Hive0145's campaigns are

characterized by credential theft and espionage-driven activities.

The tag is: *misp-galaxy:threat-actor="HIVE-0145"*

HIVE-0145 is also known as:

- Hive0145

Reckless Rabbit

Reckless Rabbit lures victims into investment scams through malicious Facebook advertisements that lead to fake news articles with embedded web forms for personal information collection. They create domains using RDGA patterns, including random characters and English words, and configure wildcard DNS responses to obscure their active subdomains. The actor employs validation checks to filter out traffic from specific countries, enhancing their operational security. Their investment scam platforms often feature fake endorsements to increase credibility among potential victims.

The tag is: *misp-galaxy:threat-actor="Reckless Rabbit"*

Table 15638. Table References

Links
https://blogs.infoblox.com/threat-intelligence/uncovering-actor-ttp-patterns-and-the-role-of-dns-in-investment-scams/

Ruthless Rabbit

Ruthless Rabbit has been running investment scam campaigns since November 2022, primarily targeting users in Russia, Poland, Romania, and Kazakhstan. The actor utilizes RDGA patterns to create over 2,600 domains, hosted on multiple dedicated IPs, and employs a cloaking service for validation checks on user leads. Their campaigns have included themes such as Baltic Pipe financial scams and spoofing well-known platforms like WhatsApp and Google Finance. The most prevalent campaign theme involves a spoofed news article from "Channel One" promoting the "GazInvest" platform with promises of high returns.

The tag is: *misp-galaxy:threat-actor="Ruthless Rabbit"*

PurpleHaze

PurpleHaze is a China-nexus threat actor tracked by SentinelLABS, linked to APT15, known for targeting critical infrastructure sectors such as telecommunications and government organizations. The actor has been associated with reconnaissance attempts against SentinelOne and has utilized ShadowPad, a modular backdoor platform, for cyberespionage and potential ransomware deployment. Investigations are ongoing to determine overlaps between ShadowPad intrusions and PurpleHaze activity, highlighting the extensive sharing of malware and operational practices among Chinese threat groups. The targeting of third-party service providers has raised significant concerns regarding operational security and supply chain monitoring.

Molatori

Molatori is a threat actor group identified by Malwarebytes researchers, known for utilizing malicious ScreenConnect clients hosted on domains like atmolatori.icu and gomolatori.cyou. They employ phishing tactics, masquerading as communications from the Social Security Administration to lure targets into installing the client. Once installed, the ScreenConnect client allows the actors to remotely access the victim's computer, facilitating the exfiltration of sensitive information such as banking details and personal identification numbers. The primary objective of the Molatori group is financial fraud, leveraging the stolen data for identity theft and other malicious activities.

The tag is: *misp-galaxy:threat-actor="Molatori"*

Hive0117

Hive0117 is a financially motivated cybercriminal group that conducts phishing campaigns to deliver the fileless malware DarkWatchman, which is capable of keylogging and collecting system information. The group targets individuals in the energy, finance, transport, and software security sectors across Russia, Kazakhstan, Latvia, and Estonia, often imitating official Russian government communications to induce urgency. Their operations leverage emergent policies related to conscription and utilize a UID string for identification, with malware capable of querying for smartcard readers, indicating a focus on higher security targets. The malware's fileless nature and ability to erase traces of its presence suggest moderate sophistication in their TTPs.

The tag is: *misp-galaxy:threat-actor="Hive0117"*

UTA0355

UTA0355 is a Russian threat actor that conducts phishing campaigns targeting individuals and organizations associated with Ukraine. The actor initiates contact via email, inviting targets to a video conference, and follows up through Signal or WhatsApp to enhance legitimacy. After establishing communication, UTA0355 prompts victims to log in via a malicious M365 URL, subsequently requesting approval for a 2FA authentication to access email data. Volexity assesses with high confidence that UTA0355 successfully registered devices and downloaded email data from compromised accounts.

The tag is: *misp-galaxy:threat-actor="UTA0355"*

Table 15653. Table References

UTA0352

UTA0352 is a Russian threat actor attributed to phishing campaigns that exploit Microsoft OAuth 2.0 authentication workflows, often impersonating government officials to lure targets into providing sensitive information. The actor has been observed using malicious URLs disguised as legitimate services, such as a Romanian government authentication system. UTA0352 has also targeted Microsoft Teams and employed social engineering tactics via messaging platforms like Signal and WhatsApp. Volexity assesses with medium confidence that UTA0352 is involved in operations themed around Ukraine, targeting individuals and organizations historically associated with Russian threat activities.

The tag is: *misp-galaxy:threat-actor="UTA0352"*

Table 15654. Table References

Void Blizzard

Void Blizzard's cyberespionage operations tend to be highly targeted at specific organizations of interest to the Russian government, including in government, defense, transportation, media, non-governmental organizations (NGOs), and healthcare sectors primarily in Europe and North America. The threat actor uses stolen credentials—which are likely procured from commodity infostealer ecosystems—and collects a high volume of email and files from compromised organizations.

The tag is: *misp-galaxy:threat-actor="Void Blizzard"*

Void Blizzard is also known as:

- LAUNDRY BEAR

Table 15655. Table References

UNC6395

The actor systematically exported large volumes of data from numerous corporate Salesforce instances. GTIG assesses the primary intent of the threat actor is to harvest credentials. After the data was exfiltrated, the actor searched through the data to look for secrets that could be potentially used to compromise victim environments. GTIG observed UNC6395 targeting sensitive credentials such as Amazon Web Services (AWS) access keys (AKIA), passwords, and Snowflake-related access tokens. UNC6395 demonstrated operational security awareness by deleting query jobs, however logs were not impacted and organizations should still review relevant logs for evidence of data exposure.

The tag is: *misp-galaxy:threat-actor="UNC6395"*

UNK_FistBump

Between March and June 2025, Proofpoint identified multiple China-aligned threat actors specifically targeting Taiwanese organizations within the semiconductor industry. This included a China-aligned threat actor tracked as UNK_FistBump targeting semiconductor design, manufacturing, and supply chain organizations in employment-themed phishing campaigns resulting in the delivery of Cobalt Strike or the custom Voldemort backdoor. Additionally, Proofpoint observed another China-aligned threat actor tracked as UNK_DropPitch targeting individuals in multiple major investment firms who specialize in investment analysis specifically within the Taiwanese semiconductor industry. This UNK_DropPitch targeting is exemplary of intelligence collection priorities spanning less obvious areas of the semiconductor ecosystem beyond just design and manufacturing entities. Finally, we also observed an actor tracked as UNK_SparkyCarp conducting credential phishing activity against a Taiwanese semiconductor company using a custom Adversary in the Middle (AiTM) phishing kit.

The tag is: *misp-galaxy:threat-actor="UNK_FistBump"*

Crimson Collective

The Crimson Collective is a cybercrime group that claimed to have compromised Red Hat's private GitHub repositories in September 2025. The group asserted it had stolen 570GB of data from Red Hat's private GitHub repositories, including 28,000 projects and approximately 800 Customer Engagement Reports (CERs) containing sensitive network data. CERs often contain sensitive information including infrastructure details, configurations, and tokens that attackers could exploit to target customers' networks. The group shared proof of the breach on a Telegram channel, including a full file tree, CER list, and screenshots. The U.S.-based multinational software company confirmed the data breach but did not verify the Crimson Collective's claims. The group also claimed to have gained access to some of Red Hat's client infrastructure and stated they had warned the company but were ignored.

2023 Increased Truebot Activity

In July 2023, U.S. authorities released joint Cybersecurity Advisory AA23-187A, which detailed increased observations of new variants of the Truebot botnet malware infecting organizations in the United States and Canada. Authorities assessed that Truebot infections are primarily motivated around collection and exfiltration of sensitive victim data for financial gain. Officials also assessed that actors were using both spearphishing emails containing malicious hyperlinks and exploitation of CVE-2022-31199 in the IT system auditing application Netwrix Auditor to deliver Truebot during these attacks. Additional tools associated with the attacks included Raspberry Robin for initial infections, FlawedGrace and Cobalt Strike for various post-exploitation activities, and Teleport, a custom tool for data exfiltration.^{[[U.S. CISA Increased Truebot Activity July 6 2023](/references/6f9b8f72-c55f-4268-903e-1f8a82efa5bb)]}

The Advisory did not provide specific impacted victim sectors. The Advisory referred to activity taking place “in recent months” prior to July 2023 but did not provide an estimated date when the

summarized activity began. A public threat report referenced in the Advisory reported an observed increase in Truebot infections beginning in August 2022, including several compromises involving education sector organizations.^{[[U.S. CISA Increased Truebot Activity July 6 2023](/references/6f9b8f72-c55f-4268-903e-1f8a82efa5bb)]}^{[[Cisco Talos Blog December 08 2022](/references/bcf92374-48a3-480f-a679-9fd34b67bcdd)]}

Related Vulnerabilities: CVE-2022-31199^{[[U.S. CISA Increased Truebot Activity July 6 2023](/references/6f9b8f72-c55f-4268-903e-1f8a82efa5bb)]}

2023 Ivanti EPMM APT Vulnerability Exploits

In August 2023, U.S. Cybersecurity & Infrastructure Security Agency (CISA) and Norwegian National Cyber Security Centre (NCSC-NO) authorities released Cybersecurity Advisory AA23-213A, which detailed observed exploitation of two vulnerabilities, CVE-2023-35078 and CVE-2023-35081, affecting Ivanti Endpoint Manager Mobile (EPMM), a solution which provides elevated access to an organization's mobile devices. According to the Advisory, authorities observed unspecified advanced persistent threat (APT) actors exploiting CVE-2023-35078 as a zero-day from at least April 2023 in order to gather information from unspecified organizations in Norway, and to gain initial access to a Norwegian government agency.

Ivanti released a CVE-2023-35078 patch on July 23, but then determined that CVE-2023-35081 could be chained together with the first vulnerability, a process which can enable arbitrary upload and execution of actor files, such as web shells. Ivanti released a CVE-2023-35081 patch on July 28. The Advisory provided mitigation recommendations, vulnerability and compromise identification methods, and incident response guidance, which can be found in the [source report]([U.S. CISA CVE-2023-35078 Exploits](/references/62305b8a-76c8-49ec-82dc-6756643ccf7a)]</sup>

Related Vulnerabilities: CVE-2023-35078^{[[U.S. CISA CVE-2023-35078 Exploits](/references/62305b8a-76c8-49ec-82dc-6756643ccf7a)]}, CVE-2023-35081^{[[U.S. CISA CVE-2023-35078 Exploits](/references/62305b8a-76c8-49ec-82dc-6756643ccf7a)]}

The tag is: *misp-galaxy:campaigns="2023 Ivanti EPMM APT Vulnerability Exploits"*

2023 Zoho ManageEngine APT Exploits

In September 2023, U.S. cybersecurity authorities released Cybersecurity Advisory AA23-250A, which detailed multiple intrusions in early 2023 involving an aeronautical sector organization and attributed to multiple unspecified "nation-state advanced persistent threat (APT) actors". As early as January, one set of actors exploited CVE-2022-47966, a vulnerability in the Zoho ManageEngine ServiceDesk Plus IT service management application that allows remote code execution, to access the organization's public-facing web servers. A separate set of actors was also observed exploiting CVE-2022-42475, a vulnerability in Fortinet, Inc.'s FortiOS SSL-VPN that also allows remote code execution, to gain access to the organization's firewall devices.

After gaining access, the actors downloaded malware, performed network discovery, collected administrator credentials, and moved laterally, but according to the advisory, unclear data storage

records inhibited insight into whether any proprietary information was accessed, altered, or exfiltrated. A common behavior among both sets of actors was log deletion from critical servers and the use of disabled, legitimate administrator credentials, which in one case belonged to a previously employed contractor (the organization confirmed the credentials were disabled before the observed threat activity).^{[[U.S. CISA Zoho Exploits September 7 2023](/references/6bb581e8-ed0e-41fe-bf95-49b5d11b4e6b)]}

In addition to behavioral observations and indicators of compromise, the Advisory provided detection and mitigation guidance, which can be found in the [source report](https://www.cisa.gov/news-events/cybersecurity-advisories/aa23-250a).

Related Vulnerabilities: CVE-2022-47966, CVE-2022-42475, CVE-2021-44228^{[[U.S. CISA Zoho Exploits September 7 2023](/references/6bb581e8-ed0e-41fe-bf95-49b5d11b4e6b)]}

Actor-Claimed Compromise & Exfiltration from Oracle Cloud Servers

Note: This object includes Technique relationships related to the original alleged server compromise activity as well as related to unconfirmed follow-on behavior. Note too that most details here are based on threat actor claims (as well as research based on those claims).

On March 20, 2025, the threat actor with the BreachForums username "rose87168" claimed to have compromised Oracle Cloud federated SSO login servers and offered 6 million data records for sale, which the actor allegedly exfiltrated from the compromised servers. Oracle representatives denied that a breach occurred or that a sample of credentials leaked by the actor are associated with Oracle Cloud.^{[[BleepingComputer March 21 2025](/references/cd23fb70-d507-4b22-8254-6f0f39ea54c1)]}

The actor claimed to have stolen encrypted SSO passwords and key files from compromised servers.^{[[BleepingComputer March 21 2025](/references/cd23fb70-d507-4b22-8254-6f0f39ea54c1)]} Researchers indicated that the actor likely accessed servers via an exploit of CVE-2021-35587 in Oracle Access Manager (OpenSSO Agent) software. They also suggested that more than 140,000 Oracle Cloud customer tenants were affected.^{[[CloudSEK March 21 2025](/references/3689def4-9eb1-4e74-b7f0-c2873252eb25)]}

The tag is: *misp-galaxy:campaigns="Actor-Claimed Compromise & Exfiltration from Oracle Cloud Servers"*

AMBERSQUID

AMBERSQUID is a "cloud-native" financially motivated threat operation that specifically leverages AWS services. Researchers estimated that AMBERSQUID cryptojacking activity could cost its victims more than $10,000 per day.^{[[Sysdig AMBERSQUID September 18 2023](/references/7ffa880f-5854-4b8a-83f5-da42c1c39345)]}

The tag is: *misp-galaxy:campaigns="AMBERSQUID"*

Andariel Espionage Activity

In July 2024, U.S. cybersecurity authorities and international partners published Cybersecurity Advisory AA24-207A, which detailed North Korean state-sponsored cyber espionage activity likely intended to support the regime’s military and nuclear development programs. The advisory focused on an actor group tracked as Andariel, Onyx Sleet, and APT45 and highlighted how this group has shifted from conducting destructive attacks to carrying out espionage operations that have been funded through ransomware. Where past destructive operations mainly targeted U.S. and South Korean entities, recent espionage attacks targeted various defense, aerospace, nuclear, and engineering organizations, while ransomware attacks targeted U.S. healthcare entities.

Andariel actors gain initial access especially by exploiting software vulnerabilities, use widely available tools for discovery and privilege escalation, and leverage a wide range of custom as well as commodity malware. The advisory does not clearly identify the timeframe in which malicious

activities were observed, although it discusses actors' exploits of vulnerabilities disclosed in 2017, 2019, and especially 2021, 2022, and 2023 and referenced public threat reporting published from March 2021 through May 2024.^{[[U.S. CISA Andariel July 25 2024](/references/b615953e-3c6c-4201-914c-4b75e45bb9ed)]}

The tag is: *misp-galaxy:campaigns="Andariel Espionage Activity"*

April 2024 FIN7 Malvertising Campaign

Threat actors, believed to be associated with the FIN7 financially motivated adversary group, stood up malicious hosting websites impersonating prominent brands in the financial services, technology/SaaS, and media sectors, then used paid web search advertisements to direct victims to these sites. Victims were then tricked into downloading malicious binaries, which ultimately led to the ingress of the NetSupport RAT and/or DiceLoader (aka Lizar) malware (these latter tools are known to be used for a range of persistent access and malware ingress purposes).^{[[Esentire 5 8 2024](/references/67c3a7ed-e2e2-4566-aca7-61e766f177bf)]}

The tag is: *misp-galaxy:campaigns="April 2024 FIN7 Malvertising Campaign"*

APT28 Cisco Router Exploits

In April 2023, U.S. and UK cybersecurity authorities released joint Cybersecurity Advisory AA23-108, which detailed a campaign by Russia-backed APT28 to compromise vulnerable routers running Cisco Internetworking Operating System (IOS). Actors collected device information and conducted further network reconnaissance on victims “worldwide”, including U.S. government institutions, 250 Ukrainian entities, and “a small number” of victims elsewhere in Europe. Adversary activity occurred over an unspecified timeframe in 2021.

Actors exploited CVE-2017-6742, a Simple Network Management Protocol (SNMP) vulnerability for which Cisco released a patch in 2017, and used default authentication strings to gain initial access to devices and subsequently gather router information, such as router interface details. In some cases, authorities observed actors deploying Jaguar Tooth, a malicious software bundle consisting of a series of payloads and patches. Jaguar Tooth deployments allowed actors to collect further device information via execution of Cisco IOS Command Line Interface commands, discover other network devices, and achieve unauthenticated, backdoor access to victim systems.^{[[U.S. CISA APT28 Cisco Routers April 18 2023](/references/c532a6fc-b27f-4240-a071-3eaa866bce89)]}

In addition to behavioral observations, the Advisory also provided mitigation recommendations and indicators of compromise, which can be found in the [source report](https://www.cisa.gov/news-events/cybersecurity-advisories/aa23-108).

Related Vulnerabilities: CVE-2017-6742^{[[U.S. CISA APT28 Cisco Routers April 18 2023](/references/c532a6fc-b27f-4240-a071-3eaa866bce89)]}

APT29 TeamCity Exploits

Operationalize this intelligence by pivoting to relevant defensive resources via the Techniques below. Alternatively, use the Add to Matrix button above, then overlay entire sets of capabilities from your own defensive stack to identify threat overlaps & potential gaps (watch a [60-second tutorial here](https://www.youtube.com/watch?v=4jBo3XLO01E)).

In December 2023, U.S. cybersecurity authorities and international partners released Cybersecurity Advisory AA23-347A, which detailed large-scale observed exploitation of CVE-2023-42793 since September 2023 by cyber threat actors associated with Russia's Foreign Intelligence Service (SVR). According to the advisory, these actors are also known as APT29, the Dukes, CozyBear, and NOBELIUM/Midnight Blizzard.

CVE-2023-42793 is an authentication bypass vulnerability in the JetBrains TeamCity software development program. After exploiting the vulnerability to gain access into victim networks, SVR actors were then observed escalating privileges, moving laterally, and deploying additional backdoors in an apparent effort to maintain long-term persistent access to victim environments. The advisory noted how SVR actors used access gained during the 2020 compromise of SolarWinds, another software company, to conduct supply chain operations affecting SolarWinds customers, but it also noted that such activity has not been observed in this case to date.

JetBrains released a patch for CVE-2023-42793 in September 2023. The advisory indicated that the compromises observed to date appear to be opportunistic, impacting unpatched, internet-accessible TeamCity servers. "A few dozen" compromised entities have been identified so far (companies in disparate sectors in the United States, Europe, Asia, and Australia), but authorities assess that this tally does not represent the full number of compromised victims. Indicators of compromise, mitigation guidance, and detection resources – including Sigma and YARA rules – can be found in the [source report]([U.S. CISA SVR TeamCity Exploits December 2023](/references/5f66f864-58c2-4b41-8011-61f954e04b7e)]</sup>

APT40 Recent Tradecraft (Deprecated)

We are no longer maintaining this object in favor of a similar object subsequently published by MITRE: "Leviathan Australian Intrusions" (Campaign). All relevant Tidal content extensions (e.g. additional Technique and Object relationships and metadata) have been added to the MITRE-authored object.

On July 8, 2024, international authorities published an advisory (CISA Alert AA24-190A) that detailed recent activity associated with APT40, a Chinese state-sponsored cyber espionage group. The advisory covers observed attacks on Australian organizations, but the group has been recently active elsewhere (Tidal metadata shows observed activity historically across East/Southeast Asia,

the Middle East, Europe, and North America). The advisory emphasized that the recently published TTPs are relevant for defenders at organizations “globally”.

The advisory spotlighted the group’s efforts to compromise outdated small-office/home-office (SOHO) routers via vulnerability exploits, using the routers as infrastructure to carry out further attacks. However, the advisory also summarized a range of other Techniques not previously associated with APT40, which were used at phases across the attack chain, including for persistence, credential access, lateral movement, collection, and exfiltration.^{[[U.S. CISA APT40 July 8 2024](/references/3bf90a48-caf6-4b9d-adc2-3d1176f49ffc)]}

ArcaneDoor (Deprecated)

We are no longer maintaining this object in favor of a similar object subsequently published by MITRE: "ArcaneDoor" (Campaign). All relevant Tidal content extensions (e.g. additional Technique and Object relationships and metadata) have been added to the MITRE-authored object.

ArcaneDoor was a campaign, which likely ran from November 2023 until around February 2024, that targeted Cisco Adaptive Security Appliances (ASAs). ASAs are network devices that combine firewall, VPN, and other functionality. The campaign targeted unspecified government institutions around the world and was believed to have been conducted for espionage purposes.^{[[Cisco Talos ArcaneDoor April 24 2024](/references/531c3f6f-2d2b-4774-b069-e2b7a13602c1)]}

Researchers attributed the campaign to UAT4356 (aka Storm-1849), a possible China-linked adversary.^{[[Wired ArcaneDoor April 24 2024](/references/05a8afd3-0173-41ca-b23b-196ea0f3b1c1)]} The initial access vector for the ArcaneDoor attacks remains unclear. After gaining a foothold, actors used the Line Dancer tool to upload Line Runner, a persistence and arbitrary code execution capability, to compromised ASAs (Cisco assigned two vulnerabilities, CVE-2024-20359 and CVE-2024-20353, to these activities). Responders observed various actions on objectives during the attacks, including device configuration modification, network traffic capture, and possible lateral movement.^{[[Cisco Talos ArcaneDoor April 24 2024](/references/531c3f6f-2d2b-4774-b069-e2b7a13602c1)]}

Cleo File Transfer Software Zero-Day Exploits (CVE-2024-50623 & CVE-2024-55956)

Security researchers and incident responders observed actors exploiting vulnerabilities in the Cleo managed file transfer ("MFT") products LexiCom, VLTrader, and Harmony. Recent reports indicate that actors exploited CVE-2024-55956 in December 2024, while a similar vulnerability in the same products (CVE-2024-50623) had been exploited in October 2024.^{[[AttackerKB December 16 2024](/references/b8970cef-ddda-4a72-94ed-e2c911a20e18)]} This Campaign object includes ATT&CK Technique relationships related to both sets of exploit activity.

Actors were observed writing and executing various code to ultimately ingress and execute payloads that included web shells and a modular tool with the ability to read and transfer files.^{[[AttackerKB December 16 2024](/references/b8970cef-ddda-4a72-94ed-e2c911a20e18)]}^{[[Binary Defense December 10 2024](/references/3fc33142-b596-46e9-b829-5c62734cdc3e)]}News reports described the CVE-2024-50623 exploit activity as zero-day exploitation and linked attacks to Termite ransomware operators, while researchers drew parallels

to Clop ransomware operators, who used a zero-day exploit to compromise a different vendor's MFT solution in mid-2023.^{[[DarkReading Termite Cleo December 10 2024](/references/e854ae37-3137-4cdd-a464-7e2328b1246e)]}^{[[U.S. CISA CL0P CVE-2023-34362 Exploitation](/references/07e48ca8-b965-4234-b04a-dfad45d58b22)]} Reports indicate that Cleo software is used by more than 4,000 customers in a variety of industries, underscoring the size of the potential attack surface related to the latest campaigns.^{[[DarkReading Termite Cleo December 10 2024](/references/e854ae37-3137-4cdd-a464-7e2328b1246e)]}

Clop MOVEit Transfer Vulnerability Exploitation

In June 2023, U.S. authorities released Cybersecurity Advisory AA23-158A, which detailed observed exploits of a zero-day SQL injection vulnerability (CVE-2023-34362) affecting Progress Software's managed file transfer (MFT) solution, MOVEit Transfer. According to the Advisory, exploit activity began on May 27, 2023, as threat actors, which the Advisory attributed to "CL0P Ransomware Gang, also known as TA505", began compromising internet-facing MOVEit Transfer web applications. Actors deployed web shells, dubbed LEMURLOOT, on compromised MOVEit applications, which enabled persistence, discovery of files and folders stored on MOVEit servers, and staging and exfiltration of compressed victim data. Authorities indicated they expected to see "widespread exploitation of unpatched software services in both private and public networks".^{[[U.S. CISA CL0P CVE-2023-34362 Exploitation](/references/07e48ca8-b965-4234-b04a-dfad45d58b22)]} Progress Software acknowledged the vulnerability and issued guidance on known affected versions, software upgrades, and patching.^{[[Progress Software MOVEit Transfer Critical Vulnerability](/references/9f364e22-b73c-4f3a-902c-a3f0eb01a2b9)]}

Related Vulnerabilities: CVE-2023-34362^{[[U.S. CISA CL0P CVE-2023-34362 Exploitation](/references/07e48ca8-b965-4234-b04a-dfad45d58b22)]}

Defense Sector Supply Chain Compromise by North Korea-Linked Actors

German and South Korean cybersecurity authorities published an advisory highlighting recent attempts by North Korea-linked cyber actors to target enterprises and research centers in the defense sector. The advisory detailed a supply chain attack, attributed to an unnamed threat group, in which actors compromised a company that maintained a defense sector research center’s web servers, then used stolen SSH credentials to remotely access the research center’s network. The actors then used various methods to evade defenses, including impersonating security staff, deployed malware via a patch management system, and stole account information and email contents before being evicted from the network.^{[[BfV North Korea February 17 2024](/references/cc76be15-6d9d-40b2-b7f3-196bb0a7106a)]}

The tag is: *misp-galaxy:campaigns="Defense Sector Supply Chain Compromise by North Korea-Linked Actors"*

DragonForce SimpleHelp Vulnerabilities MSP Attack

Attackers are believed to have leveraged three vulnerabilities (CVE-2024-57727, CVE-2024-57728,

and CVE-2024-57726) in the SimpleHelp remote monitoring and management tool ("RMM") to compromise SimpleHelp instances managed by an unnamed Managed Service Provider ("MSP"). The actors then used compromised RMM instances to deploy "DragonForce ransomware" to multiple endpoints managed by the MSP. The attackers also used unspecified means to exfiltrate victim data and attempted to extort targets into paying a ransom.^{[[Sophos DragonForce Attack May 27 2025](/references/edb4359f-f12a-4ab1-9116-9c4b3220120d)]}

FamousSparrow/GhostEmperor Vulnerability Exploit and Post-Compromise Activity

ESET researchers observed cyberespionage activity that they linked to the FamousSparrow group, where actors used ProxyLogon and other vulnerability exploits to compromise hotel, legal, and other organizations worldwide and install a backdoor dubbed SparrowDoor, among other post-exploit tools.^{[[ESET FamousSparrow September 23 2021](/references/f91d6d8e-22a4-4851-9444-7a066e6b7aa5)]}

At a similar time, Kaspersky researchers reported activity they linked to the GhostEmperor group, where ProxyLogon was also exploited and similar post-exploit tools were deployed, as well as a rootkit dubbed Demodex. The researchers further indicated that one of the command and control servers identified during their investigation correlated to the FamousSparrow activity that ESET had reported.^{[[Kaspersky September 30 2021](/references/8851f554-05c6-4fb0-807e-2ef0bc28e131)]}

The tag is: *misp-galaxy:campaigns="FamousSparrow/GhostEmperor Vulnerability Exploit and Post-Compromise Activity"*

FIN12 March 2023 Hospital Center Intrusion

In September 2023, French cybersecurity authorities released advisory CERTFR-2023-CTI-007, which detailed a network intrusion of the Regional and University Hospital Center of Brest, in northwestern France. Actors used valid credentials belonging to a healthcare professional to connect to a remote desktop service exposed to the Internet, then installed Cobalt Strike and SystemBC to provide backdoor network access. Authorities indicated that the credentials were likely compromised via unspecified infostealer malware.

The actors used multiple third-party tools for credential access and discovery, and they attempted to exploit at least five vulnerabilities for privilege escalation and lateral movement. Authorities worked with hospital personnel to isolate affected systems and disrupt the intrusion before suspected data exfiltration and encryption could take place. Based on infrastructural and behavioral overlaps with other incidents, officials attributed the intrusion to the FIN12 financially motivated actor group and indicated the same actors are responsible for dozens of attacks on French victims in recent years.

Additional details, indicators of compromise, and the observed Cobalt Strike configuration can be found in the [source report]([CERTFR-2023-CTI-007(/references/0f4a03c5-79b3-418e-a77d-305d5a32caca)]</sup>

Related Vulnerabilities: CVE-2023-21746, CVE-2022-24521, CVE-2021-34527, CVE-2019-0708, CVE-2020-1472^{[[CERTFR-2023-CTI-007](/references/0f4a03c5-79b3-418e-a77d-305d5a32caca)]}

FLORAHOX Activity

[FLORAHOX Activity](https://app.tidalcyber.com/campaigns/1c244c55-d0f7-5d58-8bc3-59b15a92bf3a) is conducted using a hybrid operational relay box (ORB) network, which combines two types of infrastructure: compromised devices and leased Virtual Private Servers (VPS). The compromised devices include end-of-life routers and IoT devices, while VPS space is commercially leased and managed by ORB network administrators. This hybrid ORB network allows adversaries to proxy and obscure malicious traffic, making the source of the traffic more difficult to trace.

The FLORAHOX ORB network has been leveraged by multiple cyber threat actors, including China-nexus actors like [ZIRCONIUM](https://app.tidalcyber.com/groups/5e34409e-2f55-4384-b519-80747d02394c). These adversaries conduct espionage campaigns through [FLORAHOX Activity](https://app.tidalcyber.com/campaigns/1c244c55-d0f7-5d58-8bc3-59b15a92bf3a), relying on the ORB network's ability to funnel traffic through [Tor](https://app.tidalcyber.com/software/8c70d85b-b06d-423c-8bab-ecff18f332d6) nodes, provisioned VPS servers, and compromised routers to obfuscate malicious traffic.^{[[ORB Mandiant](https://app.tidalcyber.com/references/3852fe26-53ad-504f-9328-7e249d121ebd)]}

Healthcare Social Engineering & Payment Diversion Activity

U.S. cybersecurity authorities released an advisory that warned of recent attacks targeting healthcare entities and providers, which leveraged social engineering techniques for initial access and ultimately led to financial theft. The attacks used voice phishing and phishing domains, and sometimes bypassed multi-factor authentication measures, to gain footholds. Actors often used information gathered through extensive reconnaissance to facilitate these efforts.

Actors then used "living off the land" (LOTL) techniques to persist stealthily in compromised environments. Ultimately, actors sought to modify patient automated clearinghouse (ACH) account information to divert payments to actor-controlled bank accounts. The advisory did not attribute the recent campaign to a named adversary group.^{[[FBI Social Engineering Attacks June 24 2024](/references/527ac41a-a65e-4cf9-a9c9-194443b37c5b)]}

Iranian APT Credential Harvesting & Cryptomining Activity

In November 2022, U.S. cybersecurity authorities released Cybersecurity Advisory AA22-320A, which detailed an incident response engagement at an unspecified U.S. Federal Civilian Executive Branch organization. Authorities assessed that the network compromise was carried out by unspecified Iranian government-sponsored advanced persistent threat (APT) actors. The actors achieved initial network access by exploiting the Log4Shell vulnerability in an unpatched VMware Horizon server. Post-exploit activities included installing XMRig crypto mining software and executing Mimikatz to harvest credentials, as well as moving laterally to the domain controller and implanting Ngrok reverse proxies on multiple hosts to maintain persistence.

Additional details, including incident response guidance and relevant mitigations, can be found in the [source report]([U.S. CISA Advisory November 25 2022(/references/daae1f54-8471-4620-82d5-023d04144acd)]</sup>

Related Vulnerabilities: CVE-2021-44228^{[[U.S. CISA Advisory November 25 2022](/references/daae1f54-8471-4620-82d5-023d04144acd)]}

The tag is: *misp-galaxy:campaigns="Iranian APT Credential Harvesting & Cryptomining Activity"*

Iranian APT Targeting U.S. Voter Data

In November 2020, U.S. cybersecurity authorities released joint Cybersecurity Advisory AA20-304A, which detailed efforts by an unspecified Iranian advanced persistent threat (APT) actor to target U.S. state websites, including election-related sites, with the goal of obtaining voter registration data. The actors used a legitimate vulnerability scanner, Acunetix, to scan state election websites, and they attempted to exploit sites with directory traversal, SQL injection, and web shell upload attacks. Authorities confirmed the actors successfully obtained voter registration data in at least one state – after abusing a website misconfiguration, they used a cURL-based scripting tool to iterate through and retrieve voter records. Officials assessed that the actor behind the website attacks is responsible for mass dissemination of intimidation emails to U.S. citizens and a disinformation campaign featuring a U.S. election-related propaganda video in mid-October 2020. Authorities furthermore assessed that information obtained during the website attacks was featured in the propaganda video.^{[[U.S. CISA Iran Voter Data November 3 2020](/references/be89be75-c33f-4c58-8bf0-979c1debaad7)]}

The tag is: *misp-galaxy:campaigns="Iranian APT Targeting U.S. Voter Data"*

Iranian Cyber Actors Compromise Critical Infrastructure Organizations

On October 16, 2024, U.S., Canadian, and Australian cybersecurity authorities released joint Cybersecurity Advisory AA24-290A, which detailed attacks by unspecified "Iranian cyber actors", who used brute forcing and other credential access techniques to compromise various critical infrastructure entities, including organizations in the healthcare and public health (HPH), government, information technology, engineering, and energy sectors. The advisory indicated that the actors likely carried out the attacks in order to ultimately sell harvested credentials and victim network information "to enable access to cybercriminals".^{[[U.S. CISA Iranian Actors Critical Infrastructure October 16 2024](/references/a70a4487-eaae-43b3-bfe0-0677fd911959)]}

The tag is: *misp-galaxy:campaigns="Iranian Cyber Actors Compromise Critical Infrastructure Organizations"*

Iranian IRGC Data Extortion Operations

In September 2022, U.S., Canadian, United Kingdom, and Australian cybersecurity authorities released joint Cybersecurity Advisory AA22-257A, which detailed malicious cyber activity attributed to advanced persistent threat (APT) actors affiliated with the Iranian government’s Islamic Revolutionary Guard Corps (IRGC). The advisory updated a previous alert (AA21-321A), published in November 2021, and summarized recent activities linked to the actors. Since at least March 2021, the actors were observed targeting victims in a wide range of U.S. critical infrastructure sectors, including transportation and healthcare, and victims in unspecified sectors in Australia, Canada, and the United Kingdom.

The actors typically exploited vulnerabilities to gain initial network access. They were observed exploiting vulnerabilities in Microsoft Exchange servers (ProxyShell) and Fortinet devices in 2021, and VMware Horizon (Log4j) in 2022. After gaining access, the actors typically evaluated the

perceived value of data held within a victim network and either encrypted it for ransom and/or exfiltrated it. The actors are believed to have sold some exfiltrated data or used it as leverage to further pressure victims into paying a ransom.

In addition to behavioral observations and indicators of compromise, the advisories provided detection and mitigation guidance, which can be found in the source reports [here](https://www.cisa.gov/news-events/cybersecurity-advisories/aa22-257a) and [here](https://www.cisa.gov/news-events/cybersecurity-advisories/aa21-321a).

Ivanti Cloud Service Application Zero-Day Vulnerability Exploits

On January 22, 2025, U.S. cybersecurity authorities released a joint Cybersecurity Advisory (AA25-022A), which detailed threat actors' exploitation of multiple vulnerabilities in Ivanti Cloud Service Appliances ("CSAs"): CVE-2024-8963, CVE-2024-9379, CVE-2024-8190, and CVE-2024-9380. Citing Ivanti’s advisories, actors exploited these vulnerabilities as "zero days" and "chained" exploits together to achieve initial access, remotely execute code, install webshells, and harvest credentials, some of which were exfiltrated for later offline decryption. The advisory detailed exploitation activity that occurred at an unspecified point in September 2024.^{[[U.S. CISA Ivanti Vulnerabilities January 22 2025](/references/aeb3a9ad-2214-40dc-bfd5-f832a4eaf168)]} A vendor threat report attributed the activity to unspecified suspected nation-state actors.^{[[Fortinet Ivanti Vulnerabilities January 22 2025](/references/7cc64109-8b40-4075-9637-46c0de35df7d)]}

The tag is: *misp-galaxy:campaigns="Ivanti Cloud Service Application Zero-Day Vulnerability Exploits"*

Ivanti VPN Zero-Day Exploit Activity (CVE-2025-0282)

Google Cloud security researchers announced that they observed active exploitation of Ivanti Connect Secure VPN appliances. On January 8, Ivanti disclosed disclosed two vulnerabilities in the products, CVE-2025-0282 and CVE-2025-0283, and researchers revealed that they had identified "zero-day" exploitation of one of the vulnerabilities (CVE-2025-0282) since "mid-December" 2024. The researchers attributed the exploitation activity to a "China-nexus" actor dubbed UNC5337, which possibly operates as a subcomponent of UNC5221, a broader actor group believed to be behind exploits of two other vulnerabilities in Ivanti VPN and network access control appliances (CVE-2023-46805 and CVE-2024-21887) one year prior.^{[[Google Cloud January 8 2025](/references/d34943fb-4a7a-4cda-bbe5-3c1f5c00b8a9)]}

June 2023 Citrix Vulnerability Exploitation

In July 2023, U.S. Cybersecurity & Infrastructure Security Agency authorities released Cybersecurity Advisory AA23-201A, which detailed an observed exploit of a zero-day vulnerability (CVE-2023-3519) affecting NetScaler (formerly Citrix) Application Delivery Controller ("ADC") and NetScaler Gateway appliances. According to the Advisory, the exploitation activity occurred in June 2023, and the victim (an undisclosed entity in the critical infrastructure sector) reported it in July 2023.^{[[U.S. CISA CVE-2023-3519 Exploits](/references/021c4caa-7a7a-4e49-9c5c-6eec176bf923)]} Citrix acknowledged the reported exploit of the vulnerability, which enables unauthenticated remote code execution, and released a patch on July 18, 2023.^{[[Citrix Bulletin CVE-2023-3519](/references/245ef1b7-778d-4df2-99a9-b51c95c57580)]}

After achieving initial access via exploit of CVE-2023-3519, threat actors dropped a web shell on the vulnerable ADC appliance, which was present on a non-production environment. The web shell enabled subsequent information discovery on the victim’s Active Directory ("AD"), followed by

collection and exfiltration of AD-related data. The actors also attempted lateral movement to a domain controller, but the Advisory indicated that network segementation controls for the ADC appliance blocked this attempted activity.^{[[U.S. CISA CVE-2023-3519 Exploits](/references/021c4caa-7a7a-4e49-9c5c-6eec176bf923)]} Separately, in a blog on CVE-2023-3519 exploit investigations released the day after the CISA Advisory, Mandiant indicated that the type of activity observed is "consistent with previous operations by China-nexus actors".^{[[Mandiant CVE-2023-3519 Exploitation](/references/4404ed65-3020-453d-8c51-2885018ba03b)]}

LockBit Affiliate Citrix Bleed Exploits

In November 2023, U.S. cybersecurity authorities and international partners released Cybersecurity Advisory AA23-325A, which detailed observed exploitation of CVE-2023-4966 (known colloquially as the “Citrix Bleed” vulnerability) by threat actors believed to be affiliated with the LockBit ransomware operation.

Citrix Bleed is a vulnerability in Citrix NetScaler web application delivery control (“ADC”) and NetScaler Gateway appliances, which allows adversaries to bypass password requirements and multifactor authentication, enabling hijacking of legitimate user sessions and subsequent credential harvesting, lateral movement, and data or resource access. Authorities indicated that they expected “widespread” Citrix Bleed exploitation on unpatched services due to the ease of carrying out the exploit.

After successful Citrix Bleed exploitation, LockBit affiliates were observed using a variety of follow-on TTPs and using a range of software, including abuse of native utilities and popular legitimate remote management and monitoring (“RMM”) tools. Indicators of compromise associated with recent intrusions and further incident response and mitigation guidance can be found in the [source report]([U.S. CISA LockBit Citrix Bleed November 21 2023(/references/21f56e0c-9605-4fbb-9cb1-f868ba6eb053)]</sup> Public reporting suggested that actors associated with the Medusa and Qilin ransomware operations, plus other unknown ransomware and uncategorized actors, had also exploited Citrix Bleed as part of their operations.^{[[Malwarebytes Citrix Bleed November 24 2023](/references/fdc86cea-0015-48d1-934f-b22244de6306)]}^{[[Cybernews Yanfeng Qilin November 2023](/references/93c89ca5-1863-4ee2-9fff-258f94f655c4)]}

Okta Customer Support Security Incident

According to details published by Okta Security, threat actors gained unauthorized access to Okta's customer support management system from September 28 to October 17, 2023. Initial access to the system was believed to have been achieved after an employee signed into a personal cloud account on their Okta-managed laptop and saved the legitimate credentials for an Okta service account into that cloud profile. Okta Security believes the personal cloud account was most likely compromised (through unspecified means), exposing the Okta service account credentials.

After gaining access to the Okta customer support management system using the valid service account credentials, the threat actor accessed HTTP Archive (HAR) files provided by Okta customers, which can contain cookies and session tokens. Okta indicated that the threat actor used session tokens compromised during the incident to hijack the legitimate Okta sessions of at least five customers. The threat actor is also believed to have run and downloaded a report that contained the names and email addresses of all Okta customer support system users. Considering that customers' names and email addresses were downloaded, Okta Security indicated that they assessed there is an increased risk of phishing and social engineering attacks directed at those users following the incident.^{[[Okta HAR Files Incident Notice](/references/14855034-494e-477d-8c91-fc534fd7790d)]}^{[[Okta HAR Files RCA](/references/742d095c-9bd1-4f4a-8bc6-16db6d15a9f4)]}^{[[Okta HAR Files Incident Update](/references/5e09ab9c-8cb2-49f5-b65f-fd5447e71ef4)]}

Operation Dream Job

[Operation Dream Job](https://app.tidalcyber.com/campaigns/9a94e646-cbe5-54a1-8bf6-70ef745e641b) was a cyber espionage operation likely conducted by [Lazarus Group](https://app.tidalcyber.com/groups/0bc66e95-de93-4de7-b415-4041b7191f08) that targeted the defense, aerospace, government, and other sectors in the United States, Israel, Australia, Russia, and India. In at least one case, the cyber actors tried to monetize their network access to conduct a business email compromise (BEC) operation. In 2020, security researchers noted overlapping TTPs, to include fake job lures and code similarities, between [Operation Dream Job](https://app.tidalcyber.com/campaigns/9a94e646-cbe5-54a1-8bf6-70ef745e641b), Operation North Star, and Operation Interception; by 2022 security researchers described [Operation Dream Job](https://app.tidalcyber.com/campaigns/9a94e646-cbe5-54a1-8bf6-70ef745e641b) as an umbrella term covering both Operation Interception and Operation North Star.^{[[ClearSky Lazarus Aug 2020](https://app.tidalcyber.com/references/2827e6e4-8163-47fb-9e22-b59e59cd338f)]}^{[[McAfee Lazarus Jul 2020](https://app.tidalcyber.com/references/43581a7d-d71a-4121-abb6-127483a49d12)]}^{[[ESET Lazarus Jun 2020](https://app.tidalcyber.com/references/b16a0141-dea3-4b34-8279-7bc1ce3d7052)]}^{[[The Hacker News Lazarus Aug 2022](https://app.tidalcyber.com/references/8ae38830-1547-5cc1-83a4-87c3a7c82aa6)]}

Operation Dust Storm

[Operation Dust Storm](https://app.tidalcyber.com/campaigns/af0c0f55-dc4f-4cb5-9350-3a2d7c07595f) was a long-standing persistent cyber espionage campaign that targeted multiple industries in Japan, South Korea, the United States, Europe, and several Southeast Asian countries. By 2015, the [Operation Dust Storm](https://app.tidalcyber.com/campaigns/af0c0f55-dc4f-4cb5-9350-3a2d7c07595f) threat actors shifted from government and defense-related intelligence targets to Japanese companies or Japanese subdivisions of larger foreign organizations supporting Japan's critical infrastructure, including electricity generation, oil and natural gas, finance, transportation, and construction.^{[[Cylance Dust Storm](https://app.tidalcyber.com/references/001dd53c-74e6-4add-aeb7-da76b0d2afe8)]}

[Operation Dust Storm](https://app.tidalcyber.com/campaigns/af0c0f55-dc4f-4cb5-9350-3a2d7c07595f) threat actors also began to use Android backdoors in their operations by 2015, with all identified victims at the time residing in Japan or South Korea.^{[[Cylance Dust Storm](https://app.tidalcyber.com/references/001dd53c-74e6-4add-aeb7-da76b0d2afe8)]}

The tag is: *misp-galaxy:campaigns="Operation Dust Storm"*

Operation Ghost

[Operation Ghost](https://app.tidalcyber.com/campaigns/1fcfe949-5f96-578e-86ad-069ba123c867) was an [APT29](https://app.tidalcyber.com/groups/4c3e48b9-4426-4271-a7af-c3dfad79f447) campaign starting in 2013 that included operations against ministries of foreign affairs in Europe and the Washington, D.C. embassy of a European Union country. During [Operation Ghost](https://app.tidalcyber.com/campaigns/1fcfe949-5f96-578e-86ad-069ba123c867), [APT29](https://app.tidalcyber.com/groups/4c3e48b9-4426-4271-a7af-c3dfad79f447) used new families of malware and leveraged web services, steganography, and unique C2 infrastructure for each victim.^{[[ESET Dukes October 2019](https://app.tidalcyber.com/references/fbc77b85-cc5a-4c65-956d-b8556974b4ef)]}

The tag is: *misp-galaxy:campaigns="Operation Ghost"*

Operation Honeybee

[Operation Honeybee](https://app.tidalcyber.com/campaigns/f741ed36-2d52-40ae-bbdc-70722f4071c7) was a campaign that targeted humanitarian aid and inter-Korean affairs organizations from at least late 2017 through early 2018. [Operation Honeybee](https://app.tidalcyber.com/campaigns/f741ed36-2d52-40ae-bbdc-70722f4071c7) initially targeted South Korea, but expanded to include Vietnam, Singapore, Japan, Indonesia, Argentina, and Canada. Security researchers assessed the threat actors were likely Korean speakers based on metadata used in both lure documents and executables, and named the campaign "Honeybee" after the author name discovered in malicious Word documents.^{[[McAfee Honeybee](https://app.tidalcyber.com/references/e6f0f7b5-01fe-437f-a9c9-2ea054e7d69d)]}

The tag is: *misp-galaxy:campaigns="Operation Honeybee"*

Operation In(ter)ception

Operation In(ter)ception refers to a series of threat activities attributed to Lazarus Group dating back to at least late 2019. Operation In(ter)ception campaigns are considered a sub-component of broader Lazarus Group espionage activities known as Operation Dream Job. Operation In(ter)ception attacks typically feature social engineering lures containing fake job vacany announcements for cryptocurrency companies. They are designed to ultimately infect targets with macOS malware.^{[[SentinelOne 9 26 2022](/references/973a110c-f1cd-46cd-b92b-5c7d8e7492b1)]}

The tag is: *misp-galaxy:campaigns="Operation In(ter)ception"*

Operation Lunar Peek (CVE-2024-0012 & CVE-2024-9474 Exploitation Activity)

Pacific Rim Network Device Targeting Campaigns

On October 31, 2024, Sophos X-Ops researchers published details of a wide-reaching, five-year-long investigation they carried out into China-based threat groups using botnets, novel vulnerability exploits, and custom malware to target "perimeter devices" such as Sophos firewalls. This Campaign object reflects the various MITRE ATT&CK® Techniques referenced in the "Pacific Rim timeline" article within the reporting series.^{[[Sophos Pacific Rim Timeline October 31 2024](/references/77146036-d207-465e-a987-3e9e527ea927)]}

Considering inherent challenges in securing network devices, such as telemetry collection and detection tuning, this extensive set of TTPs could be useful for identifying post-exploit opportunities for detection or mitigation, allowing layering of defenses against sophisticated network device campaigns such as Pacific Rim.

The tag is: *misp-galaxy:campaigns="Pacific Rim Network Device Targeting Campaigns"*

PaperCut Vulnerability Exploitation

In May 2023, U.S. Cybersecurity & Infrastructure Security Agency (CISA) and Federal Bureau of Investigation (FBI) authorities released Cybersecurity Advisory AA23-131A, which detailed observed exploits of a vulnerability, CVE-2023-27350, affecting certain versions of PaperCut NG and PaperCut MF, software applications for print management. PaperCut released a patch for the vulnerability in March 2023.^{[[PaperCut MF/NG vulnerability bulletin](/references/d6e71b45-fc91-40f4-8201-2186994ae42a)]} According to the Advisory, authorities observed unspecified threat actors exploiting the vulnerability in mid-April 2023, followed by exploitation by the self-identified Bl00dy Ransomware Gang the following month.^{[[U.S. CISA PaperCut May 2023](/references/b5ef2b97-7cc7-470b-ae97-a45dc4af32a6)]}

CVE-2023-27350 allows a remote actor to bypass authentication and remotely execute code on servers running affected versions of PaperCut software. In May, U.S. authorities observed Bl00dy Ransomware Gang actors exploiting the vulnerability to achieve initial access into education sector entities' networks and ingressing both legitimate remote management and maintenance (RMM) tools and several other command and control-related malware, including Lizar, Truebot, and Cobalt Strike. In some cases, the actors ultimately exfiltrated victim data and encrypted files, demanding payment in order to decrypt affected systems (the Advisory did not indicate how precisely actors encrypted data). The Advisory indicated that the "Education Facilities Subsector" maintains nearly 70% of exposed (but not necessarily vulnerable) U.S.-based PaperCut servers.^{[[U.S. CISA PaperCut May 2023](/references/b5ef2b97-7cc7-470b-ae97-a45dc4af32a6)]}

The Advisory instructed defenders to focus CVE-2023-27350 detection efforts on three areas: network traffic signatures, system monitoring, and server settings and log files. More details and resources for detection can be found in the [source report](https://www.cisa.gov/news-events/cybersecurity-advisories/aa23-131a).

Related Vulnerabilities: CVE-2023-27350^{[[U.S. CISA PaperCut May 2023](/references/b5ef2b97-7cc7-470b-ae97-a45dc4af32a6)]}

Pikabot Distribution Campaigns 2023

Operationalize this intelligence by pivoting to relevant defensive resources via the Techniques below. Alternatively, use the Add to Matrix button above, then overlay entire sets of capabilities from your own defensive stack to identify threat overlaps & potential gaps (watch a [60-second tutorial here](https://www.youtube.com/watch?v=4jBo3XLO01E)).

This is a single object to represent the initial access and delivery methods observed with Pikabot distribution in the first year after its discovery. Distribution campaigns have been linked to the TA577 threat actor (previously known for distributing payloads including QakBot, IcedID, SystemBC, and Cobalt Strike)^{[[Malwarebytes Pikabot December 15 2023](/references/50b29ef4-7ade-4672-99b6-fdf367170a5b)]}^{[[Unit42 Malware Roundup December 29 2023](/references/a18e19b5-9046-4c2c-bd94-2cd5061064bf)]}; however, the Technique- and Procedure level intelligence associated with these campaigns that is provided below was not explicitly linked to that group, so we are providing this intelligence to users in this Campaign form. The Water Curupira intrusion set (affiliated with the Black Basta ransomware operation) has also been observed distributing Pikabot.^{[[Trend Micro Pikabot January 9 2024](/references/dc7d882b-4e83-42da-8e2f-f557b675930a)]}

The tag is: *misp-galaxy:campaigns="Pikabot Distribution Campaigns 2023"*

Pikabot Distribution February 2024

[Pikabot](https://app.tidalcyber.com/software/fb1b0624-3290-5977-abbc-bc9609b51f8d) was distributed in [Pikabot Distribution February 2024](https://app.tidalcyber.com/campaigns/6e6fa0e4-18b3-5700-803d-b821dcdcd787) using malicious emails with embedded links leading to malicious ZIP archives requiring user interaction for follow-on infection. The version of [Pikabot](https://app.tidalcyber.com/software/fb1b0624-3290-5977-abbc-bc9609b51f8d) distributed featured significant changes over the 2023 variant, including reduced code complexity and simplified obfuscation mechanisms.^{[[Elastic Pikabot 2024](https://app.tidalcyber.com/references/6c222f33-f588-513c-9149-4c2308e05319)]}^{[[Zscaler Pikabot 2024](https://app.tidalcyber.com/references/9c1edd25-0fd0-5b5d-8091-68074da52593)]}

The tag is: *misp-galaxy:campaigns="Pikabot Distribution February 2024"*

PowerShell User Execution Social Engineering Campaign (TA571, ClearFake, ClickFix)

Researchers observed a campaign, with activity occurring between March and at least June 2024, where multiple discrete threat actor clusters used similar social engineering techniques to trick users into copying and executing PowerShell scripts, which ultimately led to malware deployment on the victim's system. Payloads included droppers, RATs, and information stealer malware.

Initial contact with the victim occurred through both malspam email campaigns and web browser injects, which would trigger a popup claiming an error occurred when trying to open a document

or webpage. The popup would prompt the user to run a script in the PowerShell terminal or Windows Run dialog box. Researchers attributed these campaigns to TA571, an initial access broker, a known intrusion set (ClearFake), and a newer group dubbed ClickFix.^{[[Proofpoint June 17 2024](/references/a65d7492-04a4-46d4-85ed-134786c6828b)]}^{[[BleepingComputer Fake Chrome Errors June 17 2024](/references/6efa70e3-d8eb-4260-b0ab-62335681e6fd)]}

Unit 26165 Russian Military Cyber Activity

In May 2025, U.S. cybersecurity authorities, along with more than 20 domestic and international

partner agencies, released joint cybersecurity advisory AA25-141A, which detailed a long-running espionage campaign tied to Russian state-sponsored actors targeting "Western" logistics entities and technology companies associated with the supply of foreign assistance to Ukraine. The actors, attributed to Unit 26165 of the Russian General Staff Main Intelligence Directorate (GRU) military organization, used a range of behaviors to surveil and harvest data from entities "across virtually all transportation modes" and even targeted Internet-exposed cameras on Ukraine's border to monitor and track aid shipments.^{[[U.S. CISA Russian GRU Targeting May 21 2025](/references/fb2f8efe-1e54-42c3-90eb-b1acba8f55b3)]}

Unit 29155 Russian Military Cyber Activity

On September 5, 2024, international authorities published joint Cybersecurity Advisory AA24-249A, which detailed recent activity linked to cyber actors affiliated with the 161st Specialist Training Center (aka Unit 29155) of the Russian General Staff Main Intelligence Directorate (GRU), the foreign military intelligence agency of Russia's armed forces. The advisory highlighted Unit 29155 espionage, sabotage, and reputational cyber attacks carried out against targets around the world since 2020.

While Unit 29155 had been previously linked to influence, interference, and physical sabotage operations, the advisory noted how the group has expanded its tradecraft to now include offensive cyber operations. The advisory indicated that several groups tracked by the cybersecurity community relate to Unit 29155 cyber actors but may not be directly synonyms with all parts of the Unit (or each other), including: Cadet Blizzard, DEV-0586, Ember Bear, Bleeding Bear, Frozenvista, UNC2589, and UAC-0056.^{[[U.S. CISA Unit 29155 September 5 2024](/references/9631a46d-3e0a-4f25-962b-0b2501c47926)]}

Velvet Ant Cisco Network Switches Exploit Activity (CVE-2024-20399)

Researchers observed suspected "China-nexus" actor Velvet Ant exploiting CVE-2024-20399 in Cisco Nexus network switch devices in order to upload and execute "previously unknown custom malware" on the devices' operating systems. Researchers first observed "zero-day" exploit activity in the wild at an undisclosed point "during the past year", and after they shared the findings, Cisco acknowledged the vulnerability in an advisory published on July 1, 2024.

The vulnerability's overall risk is mitigated by the fact that it requires valid administrator-level credentials and network access to the target switch for successful exploitation. However, researchers highlighted how sophisticated threat groups are increasingly targeting network appliances as means of network access and persistence, since those appliances "are often not sufficiently protected and monitored". This exploit campaign was discovered as part of a larger investigation into Velvet Ant, which was previously observed targeting F5 load balancer devices for persistence.^{[[The Hacker News Velvet Ant Cisco July 2 2024](/references/e3949201-c949-4126-9e02-34bfad4713c0)]}^{[[Sygnia Velvet Ant July 1 2024](/references/a0cfeeb6-4617-4dea-80d2-290eaf2bcf5b)]}

8Base Ransomware Actors

This object represents the behaviors associated with operators of 8Base ransomware, who may or may not operate as a cohesive unit. Behaviors associated with samples of 8Base ransomware are represented in the "8Base Ransomware" Software object.

The 8Base ransomware operation began claiming significant numbers of victims on its data leak site in June 2023, including organizations in a range of sectors. Researchers have observed considerable similarities between aspects of 8Base's operations and those of other ransomware groups, leading them to suspect that 8Base may be an evolution or offshoot of existing operations. The language in 8Base's ransom notes is similar to the language seen in RansomHouse's notes, and there is strong overlap between the code of Phobos ransomware and 8Base.^{[[VMWare 8Base June 28 2023](/references/573e9520-6181-4535-9ed3-2338688a8e9f)]}^{[[Acronis 8Base July 17 2023](/references/c9822477-1578-4068-9882-41e4d6eaee3f)]}

AnonGhost

AnonGhost is an apparent hacktivist collective. In October 2023, following a series of air- and land-based attacks in the Gaza Strip, AnonGhost was one of several hacktivist groups that claimed responsibility for disruptive attacks against computer networks in Israel. Researchers indicated that they observed AnonGhost actors exploit an undisclosed API vulnerability in Red Alert, an application that provides warning of projectile attacks in Israel, using Python scripts to intercept web requests and send spam messages to the app's users.^{[[Group-IB Threat Intelligence Tweet October 9 2023](/references/2df546ed-6577-44b2-9b26-0a17c3622df7)]}

The tag is: *misp-galaxy:groups="AnonGhost"*

Anonymous (Collective)

Anonymous is a decentralized international group of hacktivists known for carrying out cyber attacks against government bodies and corporations worldwide. Their activities often include distributed denial-of-service (DDoS) attacks, website defacements, and data leaks, primarily motivated by opposition to internet censorship, control, and various geopolitical issues.^{[[Cyber Security Agency of Singapore March 9 2022](/references/382b5b53-8f24-4e20-9493-ccc8187fef51)]}

APT42 (Deprecated)

We are no longer maintaining this object in favor of a similar object subsequently published by MITRE: "APT42" (Group). All relevant Tidal content extensions (e.g. additional Technique and Object relationships and metadata) have been added to the MITRE-authored object.

APT42 is an Iranian state-sponsored espionage group believed to operate on behalf of the Islamic Revolutionary Guard Corps (IRGC) Intelligence Organization (IRGC-IO). APT42 primarily focuses on collecting information on and surveilling its targets, mainly individuals and organizations with strategic significance to Iran's government. The group's operations are characterized by targeted spear-phishing attacks and surveillance activity. Mandiant researchers acknowledged overlaps between APT42 and APT35, which both likely operate on behalf of the IRGC, but noted that the groups display "substantial differences" in targeting patterns and TTPs.^{[[Mandiant Crooked Charms August 12 2022](/references/53bab956-be5b-4d8d-b553-9926bc5d9fee)]}

BlackCat Ransomware Actors & Affiliates

This object represents the BlackCat/ALPHV Ransomware-as-a-Service ("RaaS") apex group and the behaviors associated with its various affiliate ransomware operators. Specific affiliate operations defined by the research community will be tracked as separate objects.

Researchers first observed BlackCat ransomware (AKA ALPHV or Noberus) in November 2021. An April 2022 U.S. FBI advisory linked BlackCat's developers and money launderers to the defunct

Blackmatter and Darkside ransomware operations (the latter was responsible for the major 2021 Colonial Pipeline incident).^{[[FBI BlackCat April 19 2022](/references/2640b58c-8413-4691-80e1-33aec9b6c7f6)]} As of September 2023, BlackCat is believed to be responsible for attacking organizations globally and in virtually every major sector, and it consistently claims some of the highest victim tallies of any RaaS. According to data collected by the [ransomwatch project](https://github.com/joshhighet/ransomwatch) and analyzed by Tidal, BlackCat actors publicly claimed 233 victims in 2022, the third most of any ransomware operation in the dataset (considerably below Clop (558) but well above Hive (181)), and it already surpassed that number by July of 2023.^{[[GitHub ransomwatch](/references/62037959-58e4-475a-bb91-ff360d20c1d7)]} Like many RaaS, BlackCat actors threaten to leak exfiltrated victim data, but they also threaten to carry out denial of service attacks if victims do not pay timely ransoms.^{[[BlackBerry BlackCat Threat Overview](/references/59f98ae1-c62d-460f-8d2a-9ae287b59953)]}

BlackCat developers have regularly evolved the namesake ransomware over time, and collaboration with affiliates means that a large number and variety of tools & TTPs are observed during intrusions involving BlackCat. BlackCat became the first prominent ransomware family to transition to the Rust programming language in 2022, which researchers assess provides greater customization and defense evasion capabilities and faster performance.^{[[X-Force BlackCat May 30 2023](/references/b80c1f70-9d05-4f4b-bdc2-6157c6837202)]}^{[[FBI BlackCat April 19 2022](/references/2640b58c-8413-4691-80e1-33aec9b6c7f6)]} A BlackCat variant named Sphynx emerged in early 2023, featuring multiple defense evasion-focused enhancements. In Q3 2023, public reports suggested that Scattered Spider (AKA 0ktapus or UNC3944), a group attributed to several prominent intrusions involving telecommunications, technology, and casino entities, had begun to use BlackCat/Sphynx ransomware during its operations.^{[[Caesars Scattered Spider September 13 2023](/references/6915c003-7c8b-451c-8fb1-3541f00c14fb)]}^{[[BushidoToken Scattered Spider August 16 2023](/references/621a8320-0e3c-444f-b82a-7fd4fdf9fb67)]}

Daixin Team

Daixin Team is a ransomware- and data extortion-focused threat group first observed in mid-2022. Daixin Team is known to publicly extort its victims to pressure them into paying a ransom. It has used ransomware (believed to be based on the leaked source code for Babuk Locker) to encrypt victim data and has also exfiltrated sensitive data from victim environments and threatened to publicly leak that data.

Many of Daixin Team's victims belong to critical infrastructure sectors, especially the Healthcare and Public Health ("HPH") sector. An October 2022 joint Cybersecurity Advisory noted Daixin Team attacks on multiple U.S. HPH organizations.^{[[U.S. CISA Daixin Team October 2022](/references/cbf5ecfb-de79-41cc-8250-01790ff6e89b)]} Alleged victims referenced on the threat group's extortion website belong to the healthcare, utilities, transportation (airline), automobile manufacturing, information technology, retail, and media sectors in the United States, Europe, and Asia.^{[[GitHub ransomwatch](/references/62037959-58e4-475a-bb91-ff360d20c1d7)]}

FIN12

FIN12 is a financially motivated threat actor group believed to be responsible for multiple high-profile ransomware attacks since 2018. The group has attacked victims in various sectors and

locations, including multiple attacks on healthcare entities. An October 2021 Mandiant assessment indicated 85% of the group's victims were U.S.-based, and the large majority of them were large enterprises with more than $300 million in annual revenue. The report also assessed that initial access brokers partnering with FIN12 target a wider range of organizations and allow FIN12 actors to select victims for further malicious activity.^{[[Mandiant FIN12 Group Profile October 07 2021](/references/7af84b3d-bbd6-449f-b29b-2f14591c9f05)]}

FIN12's toolset has reportedly shifted over time. Cobalt Strike has been observed in most intrusions. While TrickBot and Empire were common post-exploitation tools historically, French authorities observed the group using SystemBC alongside Cobalt Strike during a March 2023 hospital center intrusion. Ryuk, and to a lesser degree Conti, were traditionally used ransomware payloads, with the former used in a series of attacks on U.S. healthcare entities in 2020. However, a French CERT assessment published in 2023 linked the group to multiple more recent incidents it investigated and analyzed, which featured deployment of various ransomware families, including Hive, Nokoyawa, Play, Royal, and BlackCat, along with Emotet and BazarLoader malware for initial footholds.^{[[Mandiant FIN12 Group Profile October 07 2021](/references/7af84b3d-bbd6-449f-b29b-2f14591c9f05)]}^{[[CERTFR-2023-CTI-007](/references/0f4a03c5-79b3-418e-a77d-305d5a32caca)]}

Related Vulnerabilities: CVE-2023-21746, CVE-2022-24521, CVE-2021-34527, CVE-2019-0708, CVE-2020-1472^{[[CERTFR-2023-CTI-007](/references/0f4a03c5-79b3-418e-a77d-305d5a32caca)]}

Killnet

Killnet is an apparent hacktivist collective that has primarily used distributed denial of service (DDoS) attacks in support of its ideology, which appears to largely align with Russian state interests. The group emerged in October 2021, initially offering DDoS capabilities as a for-hire service. However, after the February 2022 Russian invasion of Ukraine, Killnet explicitly pledged allegiance to Russia and began to threaten and claim responsibility for attacks on targets in Ukraine and in countries perceived to support Ukraine. To date, the group has claimed and is believed to be responsible for a considerable number of DDoS attacks on government and private sector targets in a range of sectors, using a variety of discrete techniques to carry them out. It is also believed to be behind a smaller number of data exfiltration-focused attacks, and it has promoted the use of defacement tools in its communication channels with supporters.^{[[Flashpoint Glossary Killnet](/references/502cc03b-350b-4e2d-9436-364c43a0a203)]}

In October 2023, following a series of air- and land-based attacks in the Gaza Strip, researchers observed Killnet claiming responsibility for disruptive attacks against computer networks in Israel and pledging explicit support for Palestinian interests.^{[[RyanW3stman Tweet October 10 2023](/references/cfd0ad64-54b2-446f-9624-9c90a9a94f52)]}

LockBit Ransomware Actors & Affiliates

This object represents the LockBit Ransomware-as-a-Service ("RaaS") apex group and the behaviors associated with its various affiliate ransomware operators. Specific affiliate operations defined by the research community will be tracked as separate objects.

Ransomware labeled "LockBit" was first observed in 2020. LockBit developers have introduced multiple versions of the LockBit encryption tool. According to the U.S. Cybersecurity and Infrastructure Security Agency ("CISA"), the following major LockBit variants have been observed (first-observed dates in parentheses): ABCD (LockBit malware's predecessor; September 2019), LockBit (January 2020), LockBit 2.0 (June 2021), LockBit Linux-ESXi Locker (October 2021), LockBit 3.0 (March 2022), LockBit Green (a variant that incorporates source code from Conti ransomware; January 2023), and variants capable of targeting macOS environments (April 2023). As of June 2023, CISA reported that the web panel that offers affiliates access to LockBit malware explicitly listed the LockBit 2.0, LockBit 3.0, LockBit Green, and LockBit Linux-ESXi Locker variants.^{[[U.S. CISA Understanding LockBit June 2023](/references/9c03b801-2ebe-4c7b-aa29-1b7a3625964a)]}

Since emerging in 2020, the LockBit group and its affiliates have carried out a very large number of attacks involving a wide range of victims around the world. In June 2023, the U.S. Federal Bureau of Investigation reported it had identified 1,700 LockBit attacks since 2020.^{[[U.S. CISA Understanding LockBit June 2023](/references/9c03b801-2ebe-4c7b-aa29-1b7a3625964a)]} According to data collected by the [ransomwatch project](https://github.com/joshhighet/ransomwatch) and analyzed by Tidal, LockBit actors publicly claimed 970 victims in 2022 (576 associated with the LockBit 2.0 variant and 394 associated with LockBit 3.0), the most of any extortion threat that year. Through April 2023, LockBit had claimed 406 victims, more than double the number of the next threat (Clop, with 179 victims).^{[[GitHub ransomwatch](/references/62037959-58e4-475a-bb91-ff360d20c1d7)]} CISA reported in June 2023 that U.S. ransoms paid to LockBit since January 2020 totaled $91 million.^{[[U.S. CISA Understanding LockBit June 2023](/references/9c03b801-2ebe-4c7b-aa29-1b7a3625964a)]}

LockBit affiliate operators are known to use a wide variety of techniques during their attacks. Initial access for LockBit infections has occurred via most methods (including a number of vulnerability exploits), and operators are known to abuse a range of free and open-source software tools for a variety of post-exploitation activities. In addition to victim data encryption, LockBit actors routinely exfiltrate victim data and threaten to leak this data for extortion purposes.

This object represents the behaviors associated with operators of Rhysida ransomware, which is licensed on a ransomware-as-a-service ("RaaS") basis. Various affiliated ransomware operators likely do not operate as a cohesive unit. The Rhysida RaaS operation has been active since May 2023, claiming attacks on multiple sectors in several countries in North and South America, Western Europe, and Australia. Many alleged victims are education sector entities. Security researchers have observed TTP and victimology overlaps with the Vice Society extortion group.^{[[HC3 Analyst Note Rhysida Ransomware August 2023](/references/3f6e2821-5073-4382-b5dd-08676eaa2240)]}

Related Vulnerabilities: CVE-2020-1472^{[[U.S. CISA Rhysida Ransomware November 15 2023](/references/6d902955-d9a9-4ec1-8dd4-264f7594605e)]}

Royal Ransomware Actors

Royal is a ransomware group believed to be responsible for hundreds of attacks on victims worldwide, including those in critical infrastructure sectors including manufacturing, communications, healthcare, and education. The actors that comprise the Royal ransomware operation are believed to be former members of other cybercriminal groups linked to Roy/Zeon ransomware, Conti ransomware, and TrickBot. Unlike many of the other most prominent ransomware groups in recent years, the developers of Royal ransomware are not known to lease the malware to affiliates as a service.^{[[Kroll Royal Deep Dive February 2023](/references/dcdcc965-56d0-58e6-996b-d8bd40916745)]}

The Royal group often pressures victims into paying ransom demands by threatening to leak data exfiltrated during intrusions. While public data from the [ransomwatch project](https://github.com/

joshhighet/ransomwatch) suggest the group has claimed roughly 200 victims since Q4 2022, a November 2023 U.S. government advisory indicated that Royal “has targeted over 350 known victims worldwide” since September 2022, with extortion demands at times exceeding $250 million.^{[[GitHub ransomwatch](/references/62037959-58e4-475a-bb91-ff360d20c1d7)]}^{[[CISA Royal AA23-061A March 2023](/references/81baa61e-13c3-51e0-bf22-08383dbfb2a1)]}

Velvet Ant (Deprecated)

We are no longer maintaining this object in favor of a similar object subsequently published by MITRE: "Velvet Ant" (Group). All relevant Tidal content extensions (e.g. additional Technique and Object relationships and metadata) have been added to the MITRE-authored object.

Velvet Ant is a suspected "China-nexus" espionage group that has notably targeted network devices as part of its operations. In one case involving an unspecified victim located in East Asia, the group

was seen abusing a legacy, internet-exposed F5 BIG-IP load balancer appliance as a command-and-control mechanism, managing to maintain network persistence for a period of three years. As part of the broader investigation into the group, researchers also observed cases of zero-day exploitation of CVE-2024-20399 in Cisco Nexus network switch devices, which allowed actors to upload and execute previously unknown, custom malware. The researchers highlighted how sophisticated threat groups are increasingly targeting network appliances as means of network access and persistence, since those appliances "are often not sufficiently protected and monitored".^{[[Sygnia Velvet Ant June 17 2024](/references/5c313af4-61a8-449d-a6c7-f7ead6c72e19)]}^{[[Sygnia Velvet Ant July 1 2024](/references/a0cfeeb6-4617-4dea-80d2-290eaf2bcf5b)]}

Vice Society

Vice Society is an extortion-focused threat actor group first observed in mid-2021. The group gained notoriety after targeting a considerable number of educational institutions, especially lower education institutions. Although the education sector accounts for a disproportionate amount of the group's victims, Vice Society has claimed victims in multiple other industries too, including the healthcare, retail, financial, insurance, and public services sectors. The group regularly pressures victims into paying a ransom by threatening to leak data exfiltrated during its intrusions. Vice Society is not known to have developed its own ransomware, instead deploying other existing families, including HELLOKITTY/FIVEHANDS and Zeppelin.^{[[U.S. CISA Vice Society September 2022](/references/0a754513-5f20-44a0-8cea-c5d9519106c8)]}

Zloader Threat Actors

This object reflects the TTPs used by threat actors to distribute and deploy the Zloader trojan malware. Researchers have observed actors distributing Zloader in campaigns without attributing the activity to named adversaries, such as the operations described by ESET researchers cited in the References.^{[[WeLiveSecurity April 19 2022](/references/f86845b9-03c4-446b-845f-b31b79b247ee)]}

TTPs associated with Zloader binaries themselves can be found in the separate "Zloader" Software object.

The tag is: *misp-galaxy:groups="Zloader Threat Actors"*
