

# Search for long-lived particles decaying in the CMS endcap muon detectors in proton-proton collisions at $\sqrt{s} = 13$ TeV

The CMS Collaboration\*

## Abstract

A search for long-lived particles (LLPs) produced in decays of standard model (SM) Higgs bosons is presented. The data sample consists of  $137 \text{ fb}^{-1}$  of proton-proton collisions at  $\sqrt{s} = 13$  TeV, recorded at the LHC in 2016–2018. A novel technique is employed to reconstruct decays of LLPs in the endcap muon detectors. The search is sensitive to a broad range of LLP decay modes and to masses as low as a few GeV. No excess of events above the SM background is observed. The most stringent limits to date on the branching fraction of the Higgs boson to LLPs subsequently decaying to quarks and  $\tau^+\tau^-$  are found for proper decay lengths greater than 6, 20, and 40 m, for LLP masses of 7, 15, and 40 GeV, respectively.

*Submitted to Physical Review Letters*

Many extensions of the standard model (SM) predict the existence of neutral, weakly-coupled particles that have a long lifetime. These long-lived particles (LLPs) naturally arise in models of split supersymmetry (SUSY) [1–6], SUSY with weak  $R$ -parity violation [7–10], SUSY with gauge-mediated supersymmetry breaking [11–13], stealth SUSY [14, 15], hidden valley scenarios [16–18], baryogenesis triggered by weakly interacting massive particles [19–21], inelastic dark matter [22], and twin Higgs models [23–25].

In this Letter, we describe the first search at the LHC that uses a muon detector as a sampling calorimeter to identify showers produced by decays of LLPs. The CMS endcap muon detectors (EMD) are composed of detector planes interleaved with the steel layers of the magnet flux-return yoke. A schematic diagram of the EMD geometry is shown in Fig. 1. Decays of LLPs in the EMD induce hadronic and electromagnetic showers, giving rise to a high hit multiplicity in localized detector regions. The hadron calorimeter, solenoid magnet, and steel flux-return yoke together provide 20–27 nuclear interaction lengths of shielding, which is sufficiently large to suppress particle showers that are not fully contained (punch-through) to negligible levels.

This search has sensitivity to singly or multiply produced LLPs decaying to final states including hadrons, taus, electrons, or photons. We focus on a benchmark simplified model motivated by the twin Higgs scenario [16–18, 26–28] where the SM Higgs boson ( $H$ ) decays to a pair of neutral long-lived scalars ( $S$ ), each of which decays in turn to a pair of bottom quarks ( $b\bar{b}$ ),  $\tau$  leptons ( $\tau^+\tau^-$ ), or down quarks ( $d\bar{d}$ ). Further details of the simplified model can be found in Ref. [29]. The most stringent previous limit for mean proper decay lengths  $c\tau < 0.3$  m is based on a search for displaced jets in the CMS tracker [29]. For  $c\tau > 0.3$  m, displaced vertices in the ATLAS muon spectrometer [30, 31] set the most stringent previous limit. In the present search, the absorber material in front of the EMD suppresses backgrounds to a level that is sufficiently low to allow detection of a single LLP decay. This improves the signal acceptance and sensitivity by more than a factor of 6 over the previous best results [30, 31] for an LLP mass of 7 GeV and  $c\tau > 100$  m. Tabulated results and instructions to reproduce the signal efficiency are provided in HEPData [32].

The search is based on proton-proton (pp) collision data at 13 TeV collected during 2016–2018 at the CERN Large Hadron Collider (LHC), corresponding to an integrated luminosity of  $137 \text{ fb}^{-1}$ . The central feature of the CMS experiment is a superconducting solenoid of 6 m internal diameter providing a magnetic field of 3.8 T. Located within the solenoid volume are a silicon pixel and strip tracker, a lead tungstate crystal electromagnetic calorimeter, and a brass and scintillator hadron calorimeter, each composed of a barrel and two endcap sections. Muons are detected in detectors embedded in the steel flux-return yoke outside the solenoid using three technologies: drift tubes (DTs) in the barrel, cathode strip chambers (CSCs) in the endcaps, and resistive-plate chambers (RPCs) in the barrel and endcaps. Further details of the CMS detector and the coordinate system definition can be found in Ref. [33]. The CSC detector, which plays a critical role for the search described in this Letter and is shown schematically in Fig 1, is composed of four “stations” in each endcap, labeled ME1 to ME4, which are located approximately 7, 8, 9.5, and 10.5 m away from the interaction point along the beamline axis ( $z$ ) on both ends of the detector, and are sandwiched between steel absorbers. Each chamber is composed of six thin layers containing cathode strips along the radial direction and anode wires perpendicular to the strips. Charged particles traversing the chambers ionize the gas molecules. The resulting electrons are accelerated towards the anode wires producing an avalanche, while the positive ions travel to the opposite end and induce signals in the cathode strips. By combining the information from signals on the anode wires and the cathode strips of each layer, we can determine the space-time coordinates of each such “hit” with a resolution of 400–500  $\mu\text{m}$  and 5 ns [34].

The CMS event reconstruction is based on a particle-flow (PF) algorithm [35], which combines information from the tracker, calorimeters, and muon detectors to identify charged and neutral hadrons, photons, electrons, and muons, known collectively as PF candidates, which are clustered into jets using the anti- $k_T$  algorithm with a distance parameter of 0.4 [36–38]. The transverse component of the negative vectorial sum of the momenta of all PF candidates is the missing transverse momentum  $\vec{p}_T^{\text{miss}}$ , and its magnitude is indicated as  $p_T^{\text{miss}}$ . The candidate vertex with the largest value of summed physics-object  $p_T^2$  is taken to be the primary pp interaction vertex. The physics objects are the jets, clustered using the jet finding algorithm [37, 38] with the tracks assigned to candidate vertices as inputs, and the associated missing transverse momentum, taken as the negative vector sum of the  $p_T$  of those jets. The average neutral energy density from overlapping pp interactions (pileup) is estimated and subtracted from the reconstructed jet energies [39].

The simulated  $H \rightarrow SS$  signal samples are generated using POWHEG 2.0 [40–43], and include gluon fusion, vector boson fusion, WH, ZH, and  $t\bar{t}H$  production modes. The Higgs boson mass is set to 125 GeV, while the S mass ( $m_S$ ) is set to 7, 15, 40, or 55 GeV. The  $c\tau$  is varied between 1 mm and 100 m. Parton showering, hadronization, and the underlying event are modeled by PYTHIA 8.205 and 8.230 [44] with parameters set by the CUETP8M1 [45] and CP5 tunes [46] used for samples simulating the 2016 and 2017/18 datasets respectively. The NNPDF 3.0 [47] and 3.1 [48] parton distribution functions are used in the generation of all simulated samples. The GEANT4 [49] package is used to model the response of the CMS detector, and simulated minimum-bias events are mixed with the hard interactions in simulated events to match the observed pileup distribution in data.

An LLP that decays after it has traversed the calorimeter systems can produce large  $p_T^{\text{miss}}$  since  $p_T^{\text{miss}}$  is calculated solely from the tracker and calorimeter information. We exploit this feature by triggering on events with  $p_T^{\text{miss}} > 120$  GeV [50], and subsequently requiring offline  $p_T^{\text{miss}} > 200$  GeV. We require at least one jet with  $p_T > 50$  GeV and pseudorapidity  $|\eta| < 2.4$ , because signal events passing the  $p_T^{\text{miss}}$  requirement are always produced together with a jet from initial-state radiation. To suppress backgrounds from W boson and top quark production, events containing an isolated electron (muon) passing loose identification criteria [51–53] with  $p_T > 35$  (25) GeV and  $|\eta| < 2.5$  (2.4) are vetoed.

The CSC hits are clustered in  $\eta$  and the azimuthal angle  $\phi$  (in radians) using the DBSCAN algorithm [54], with a minimum of 50 hits and a “distance parameter” of 0.2. The geometric acceptance for at least one signal LLP of mass 10–55 GeV decaying in the fiducial region of the CSC detectors ranges from 10–15% for  $c\tau$  between 1–10 m, decreasing to 1–5% for  $c\tau$  of 100 m. The efficiency for the showers to be reconstructed by the DBSCAN algorithm is approximately 80% for  $b\bar{b}$  and  $d\bar{d}$  decays and 65% for  $\tau^+\tau^-$  decays. The accuracy of the simulation prediction for the cluster reconstruction efficiency relies on its ability to model correctly the response of the muon detectors in an environment with multiple particles, each producing a large number of secondary shower particles. This aspect is validated by measuring clusters produced in  $Z \rightarrow \mu^+\mu^-$  data events where one of the muons undergoes bremsstrahlung in the EMD and the associated photon produces an electromagnetic shower, and the associated systematic uncertainty is taken into account in the overall uncertainty on the reconstruction efficiency.

The main SM backgrounds include punch-through jets, muons that undergo bremsstrahlung, and decays of SM LLPs, such as the neutral kaon  $K_L^0$ . To suppress background from punch-through jets or muon bremsstrahlung, we reject clusters that have a jet or muon within a  $\Delta R = \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2} < 0.4$  cone and with jet  $p_T > 10$  GeV or muon  $p_T > 20$  GeV. We veto clusters that have any hits in the two innermost rings of the ME1 station (ME1/1 and ME1/2),

which have the least absorber material in front, or match any hit (with  $\Delta R(\text{cluster}, \text{hit}) < 0.4$ ) in the RPCs located immediately next to ME1/2. In the region where the barrel and endcap muon detectors overlap ( $0.8 < |\eta| < 1.2$ ), we veto any cluster matched to any track segment reconstructed in the innermost station of the DT detectors (MB1), or any hit in the RPCs situated in front of and behind MB1 matched to within  $\Delta R(\text{cluster}, \text{segment}/\text{hit}) < 0.4$ . Finally, to suppress the muon bremsstrahlung background, we reject clusters with  $|\eta| > 2.0$ .

The inefficiencies for the jet, ME1, MB1, and RPC hit vetoes are predominantly caused by the presence of pileup particles and random noise, and are measured by randomly sampling the  $(\eta, \phi)$  locations of clusters from the signal distribution and evaluating whether a jet or ME1/MB1/RPC hit has been observed within a  $\Delta R < 0.4$  cone about the cluster's location, using  $Z \rightarrow \mu^+ \mu^-$  data events with the two muons from the Z decay removed. The loss of efficiency due to the muon veto is also affected by muon segments produced by particles resulting from the LLP decay itself. This contribution is further validated using a control sample of clusters matched to trackless jets made to resemble the signal LLP decay by requiring the neutral energy fraction to be larger than 95%. A 10% correction is applied to the signal efficiency to account for the simulation's mismodeling of the vetoes. To suppress noncollision backgrounds, we apply filters that remove events containing beam-halo muons or calorimeter noise [55]. To suppress background from cosmic ray muon showers, which produce hits in multiple regions of the CMS detector, we reject any event in which more than a quarter of DT and CSC  $\phi$ -rings contain 50 or more hits. The efficiency for signal events to pass the ME1/1 and ME1/2 vetoes depends on the LLP decay location, and its average value is between 30–60% for the signal models considered. The efficiency for the remaining signal to pass all other vetoes is  $\sim 80\%$ .

After the veto requirements are applied, the dominant background source consists of decays of SM LLPs, which are predominantly produced by pileup interactions and are independent of the primary interaction that yielded the large  $p_T^{\text{miss}}$ . These pileup interactions can occur concurrently with the primary interaction (in-time pileup) or in adjacent bunch crossings (out-of-time or OOT pileup). Clusters produced by OOT pileup are rejected by requiring the cluster time ( $t_{\text{cluster}}$ ), defined as the average time of the hits in the cluster relative to the LHC clock, to be consistent with an in-time interaction ( $-5.0 < t_{\text{cluster}} < 12.5$  ns). A larger time window is used at positive values to capture signal clusters with longer delays from slower moving LLPs. The time window requirement suppresses the background by a factor of 5. An OOT validation region (VR) is defined by selecting events containing clusters with  $t_{\text{cluster}} \leq -5$  ns, and is used to validate the background prediction method. To reject clusters composed of hits from multiple bunch crossings, we require that the root mean square spread of a cluster's hit times is less than 20 ns.

There are several features that distinguish between signal and background clusters. Background clusters occur more often at larger values of  $\eta$ . Signal clusters often occupy more than one CSC station and occur more frequently in stations further away from the primary interaction point. A cluster identification algorithm was devised to take advantage of these features, and has  $\sim 80\%$  efficiency for clusters originating from S decays in simulation, while suppressing the background by a factor of 3. The events that pass the cluster identification criteria are used to define the search region, and those that fail are used as an additional in-time VR. The signal efficiency of the combined cluster reconstruction, veto, and identification selections is shown as a function of the simulated  $r$  and  $z$  decay positions of the particle S in Fig. 1. The combined efficiency averaged over the full region of the CSC detector is 15–30% for the signal models considered.

The number of hits in the cluster ( $N_{\text{hits}}$ ) and the azimuthal angle between the cluster location

Figure 1: The signal efficiency of the combined cluster reconstruction, veto, and identification selections as a function of the simulated  $r$  and  $z$  decay positions of  $S$  decaying to  $b\bar{b}$ , for a mass of 15 GeV and a uniformly distributed mixture of events with  $c\tau$  between 1–10 m. The barrel and endcap muon stations are drawn as black boxes and labeled by their station names, showing the geometry of the muon detectors. Regions occupied by the steel return yoke are shaded in gray.

and the  $\vec{p}_T^{\text{miss}}$  ( $\Delta\phi_c$ ) are used to make the final discrimination between signal and background. The distribution of  $N_{\text{hits}}$  remains high at large  $N_{\text{hits}}$  values for signal events, but for background events the distribution of  $N_{\text{hits}}$  decreases sharply with increasing  $N_{\text{hits}}$  values. For signal,  $\Delta\phi_c$  peaks near zero either because the  $\vec{p}_T^{\text{miss}}$  results from the same  $S$  decay that produced the cluster or the large  $p_T^{\text{miss}}$  requirement tends to select highly boosted Higgs bosons for which the  $S$  and  $H$  momentum vectors are spatially close to each other. For the backgrounds,  $\Delta\phi_c$  is independent of  $N_{\text{hits}}$ , enabling the use of the matrix (ABCD) method to predict the background yield in the signal-enriched bin D as  $N_D = (N_A N_C) / N_B$ , where  $N_X$  is the background event yield in each bin X. Bin A includes events with  $\Delta\phi_c \geq 0.75$  and  $N_{\text{hits}} > 130$ ; bin B includes events with  $\Delta\phi_c \geq 0.75$  and  $N_{\text{hits}} \leq 130$ ; bin C includes events with  $\Delta\phi_c < 0.75$  and  $N_{\text{hits}} \leq 130$ ; and bin D includes events with  $\Delta\phi_c < 0.75$  and  $N_{\text{hits}} > 130$ . The distributions of  $N_{\text{hits}}$  in bins C and D, and  $\Delta\phi_c$  in bins A and D are shown in Fig. 2, for the data and for the signal assuming  $S \rightarrow d\bar{d}$  decays with various  $S$  masses.

To account for a potential signal contribution to bins A, B, and C, a binned maximum likelihood fit is performed simultaneously in the four bins, with a common signal strength parameter scaling the signal yields in each bin. The background component of the fit is constrained to obey the ABCD relationship. Systematic uncertainties that affect the signal yield are missing higher order QCD corrections (21%), cluster reconstruction and identification efficiency (6%), veto efficiencies (4%), jet energy scale (4%) [56], simulation sample statistical uncertainties (3–5%), and luminosity (1.6%) [57–59]. These systematic uncertainties and the statistical uncertainty of the simulated signal samples are treated as nuisance parameters in the fit.

The background estimation procedure is validated using events in the OOT and in-time VRs, predicting  $1.3 \pm 0.6$  and  $1.4 \pm 0.6$  events respectively. In both VRs, 2 events are observed. In the signal-depleted A, B, and C bins of the search region, we observe 3, 96, and 47 events in the data, respectively. Using the fit procedure described above and assuming no signal contribution, we predict  $2.0 \pm 1.0$  background events in the signal-enriched region D, and observe 3 events. The uncertainty in the background prediction is dominated by the statistical uncertainty in the event yields of the signal-depleted A, B, and C bins. No excess of events above the SM background is observed.

Figure 2: Distributions of  $N_{\text{hits}}$  (left) and  $\Delta\phi_c$  (right) in the search region. The background predicted by the fit is shown in blue with the shaded region showing the fitted uncertainty. The expected signal with  $\mathcal{B}(H \rightarrow SS) = 1\%$ ,  $S \rightarrow d\bar{d}$ , and  $c\tau = 1$  m is shown for  $m_S$  of 7, 15, 40, and 55 GeV in various colors and dotted lines. The  $N_{\text{hits}}$  distribution includes only events in bins C and D, while the  $\Delta\phi_c$  includes only events in bins A and D. The last bin in the  $N_{\text{hits}}$  distributions includes overflow events.

We evaluate 95% confidence level (CL) limits on the branching fraction  $\mathcal{B}(H \rightarrow SS)$  using the modified frequentist criterion  $CL_s$  [60–62] with the profile likelihood ratio test statistic. The upper limits are shown in Fig. 3 for the  $S \rightarrow d\bar{d}$  and  $S \rightarrow \tau^+\tau^-$  decay modes, as a function of  $c\tau$  for a selection of values of  $m_S$ . The exclusion limits for  $S \rightarrow b\bar{b}$  are within 3% of the exclusion limits for  $S \rightarrow d\bar{d}$  for  $m_S > 2m_b$ .

In summary, proton-proton collision data at  $\sqrt{s} = 13$  TeV recorded by the CMS experiment in 2016–2018, corresponding to an integrated luminosity of  $137\text{ fb}^{-1}$ , have been used to conduct the first search for beyond the standard model (SM) long-lived particles (LLPs) using the CMS endcap muon detectors as a calorimeter. Based on a unique detector signature, the search is largely model-independent, with sensitivity to a broad range of LLP decay modes and to LLP masses as low as a few GeV. With the excellent shielding provided by the inner CMS detector, the background is suppressed to a low level and a search for a single LLP decay is possible. No significant deviation from the SM background is observed, and the most stringent limits on the branching fraction of Higgs boson to LLP decaying to  $d\bar{d}$ ,  $b\bar{b}$ , and  $\tau^+\tau^-$  are set for proper decay lengths  $c\tau > 6$ , 20, and 40 m, and LLP masses of 7, 15, and 40 GeV, respectively. For  $c\tau > 100$  m, this search outperforms the previous best limits [30, 31] by a factor of 6 (2) for an LLP mass of 7 ( $\geq 15$ ) GeV.

## Acknowledgments

We congratulate our colleagues in the CERN accelerator departments for the excellent performance of the LHC and thank the technical and administrative staffs at CERN and at other CMS institutes for their contributions to the success of the CMS effort. In addition, we gratefully acknowledge the computing centers and personnel of the Worldwide LHC Computing Grid and other centers for delivering so effectively the computing infrastructure essential to our analyses. Finally, we acknowledge the enduring support for the construction and operation

Figure 3: The 95% CL expected (dotted curves) and observed (solid curves) upper limits on the branching fraction  $\mathcal{B}(H \rightarrow SS)$  as functions of  $c\tau$  for the  $S \rightarrow d\bar{d}$  (left) and  $S \rightarrow \tau^+\tau^-$  (right) decay modes. The exclusion limits are shown for four different mass hypotheses: 7, 15, 40, and 55 GeV.

## A The CMS Collaboration

### Yerevan Physics Institute, Yerevan, Armenia

A. Tumasyan

### Institut für Hochenergiephysik, Wien, Austria

W. Adam, J.W. Andrejkovic, T. Bergauer, S. Chatterjee, M. Dragicevic, A. Escalante Del Valle, R. Frühwirth<sup>1</sup>, M. Jeitler<sup>1</sup>, N. Krammer, L. Lechner, D. Liko, I. Mikulec, P. Paulitsch, F.M. Pitters, J. Schieck<sup>1</sup>, R. Schöfbeck, D. Schwarz, S. Templ, W. Waltenberger, C.-E. Wulz<sup>1</sup>

### Institute for Nuclear Problems, Minsk, Belarus

V. Chekhovsky, A. Litomin, V. Makarenko

### Universiteit Antwerpen, Antwerpen, Belgium

M.R. Darwish<sup>2</sup>, E.A. De Wolf, T. Janssen, T. Kello<sup>3</sup>, A. Lelek, H. Rejeb Sfar, P. Van Mechelen, S. Van Putte, N. Van Remortel

### Vrije Universiteit Brussel, Brussel, Belgium

F. Blekman, E.S. Bols, J. D'Hondt, M. Delcourt, H. El Faham, S. Lowette, S. Moortgat, A. Morton, D. Müller, A.R. Sahasransu, S. Tavernier, W. Van Doninck, P. Van Mulders

### Université Libre de Bruxelles, Bruxelles, Belgium

D. Beghin, B. Bilin, B. Clerbaux, G. De Lentdecker, L. Favart, A. Grebenyuk, A.K. Kalsi, K. Lee, M. Mahdavihorrani, I. Makarenko, L. Moureaux, L. Pétré, A. Popov, N. Postiau, E. Starling, L. Thomas, M. Vanden Bemden, C. Vander Velde, P. Vanlaer, L. Wezenbeek

### Ghent University, Ghent, Belgium

T. Cornelis, D. Dobur, J. Knolle, L. Lambrecht, G. Mestdach, M. Niedziela, C. Roskas, A. Samalan, K. Skovpen, M. Tytgat, B. Vermassen, M. Vit

### Université Catholique de Louvain, Louvain-la-Neuve, Belgium

A. Benecke, A. Bethani, G. Bruno, F. Bury, C. Caputo, P. David, C. Delaere, I.S. Donertas, A. Giammanco, K. Jaffel, Sa. Jain, V. Lemaitre, K. Mondal, J. Prisciandaro, A. Taliencio, M. Teklishyn, T.T. Tran, P. Vischia, S. Wertz

### Centro Brasileiro de Pesquisas Físicas, Rio de Janeiro, Brazil

G.A. Alves, C. Hensel, A. Moraes

### Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

W.L. Aldá Júnior, M. Alves Gallo Pereira, M. Barroso Ferreira Filho, H. Brandao Malbouisson, W. Carvalho, J. Chinellato<sup>4</sup>, E.M. Da Costa, G.G. Da Silveira<sup>5</sup>, D. De Jesus Damiao, S. Fonseca De Souza, D. Matos Figueiredo, C. Mora Herrera, K. Mota Amarilo, L. Mundim, H. Nogima, P. Rebello Teles, A. Santoro, S.M. Silva Do Amaral, A. Sznajder, M. Thiel, F. Torres Da Silva De Araujo, A. Vilela Pereira

### Universidade Estadual Paulista <sup>a</sup>, Universidade Federal do ABC <sup>b</sup>, São Paulo, Brazil

C.A. Bernardes<sup>a,a,5</sup>, L. Calligaris<sup>a</sup>, T.R. Fernandez Perez Tomei<sup>a</sup>, E.M. Gregores<sup>a,b</sup>, D.S. Lemos<sup>a</sup>, P.G. Mercadante<sup>a,b</sup>, S.F. Novaes<sup>a</sup>, Sandra S. Padula<sup>a</sup>

### Institute for Nuclear Research and Nuclear Energy, Bulgarian Academy of Sciences, Sofia, Bulgaria

A. Aleksandrov, G. Antchev, R. Hadjiiska, P. Iaydjiev, M. Misheva, M. Rodozov, M. Shopova, G. Sultanov

### University of Sofia, Sofia, Bulgaria

†: Deceased

1: Also at TU Wien, Wien, Austria

2: Also at Institute of Basic and Applied Sciences, Faculty of Engineering, Arab Academy for Science, Technology and Maritime Transport, Alexandria, Egypt, Alexandria, Egypt

3: Also at Université Libre de Bruxelles, Bruxelles, Belgium

4: Also at Universidade Estadual de Campinas, Campinas, Brazil

5: Also at Federal University of Rio Grande do Sul, Porto Alegre, Brazil

6: Also at University of Chinese Academy of Sciences, Beijing, China

7: Also at Department of Physics, Tsinghua University, Beijing, China, Beijing, China

8: Also at UFMS, Nova Andradina, Brazil

9: Also at Nanjing Normal University Department of Physics, Nanjing, China

10: Now at The University of Iowa, Iowa City, USA

11: Also at Institute for Theoretical and Experimental Physics named by A.I. Alikhanov of NRC 'Kurchatov Institute', Moscow, Russia

12: Also at Joint Institute for Nuclear Research, Dubna, Russia

13: Also at Helwan University, Cairo, Egypt

14: Now at Zewail City of Science and Technology, Zewail, Egypt

15: Now at British University in Egypt, Cairo, Egypt

16: Also at Purdue University, West Lafayette, USA

17: Also at Université de Haute Alsace, Mulhouse, France

18: Also at Erzincan Binali Yildirim University, Erzincan, Turkey

19: Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland

20: Also at RWTH Aachen University, III. Physikalisches Institut A, Aachen, Germany

21: Also at University of Hamburg, Hamburg, Germany

22: Also at Department of Physics, Isfahan University of Technology, Isfahan, Iran, Isfahan, Iran

23: Also at Brandenburg University of Technology, Cottbus, Germany

24: Also at Forschungszentrum Jülich, Juelich, Germany

25: Also at Physics Department, Faculty of Science, Assiut University, Assiut, Egypt

26: Also at Karoly Robert Campus, MATE Institute of Technology, Gyongyos, Hungary

27: Also at Institute of Physics, University of Debrecen, Debrecen, Hungary, Debrecen, Hungary

28: Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary

29: Also at MTA-ELTE Lendület CMS Particle and Nuclear Physics Group, Eötvös Loránd University, Budapest, Hungary, Budapest, Hungary

30: Also at Wigner Research Centre for Physics, Budapest, Hungary

31: Also at IIT Bhubaneswar, Bhubaneswar, India, Bhubaneswar, India

32: Also at Institute of Physics, Bhubaneswar, India

33: Also at G.H.G. Khalsa College, Punjab, India

34: Also at Shoolini University, Solan, India

35: Also at University of Hyderabad, Hyderabad, India

36: Also at University of Visva-Bharati, Santiniketan, India

37: Also at Indian Institute of Technology (IIT), Mumbai, India

38: Also at Deutsches Elektronen-Synchrotron, Hamburg, Germany

- 
- 39: Also at Sharif University of Technology, Tehran, Iran
- 40: Also at Department of Physics, University of Science and Technology of Mazandaran, Behshahr, Iran
- 41: Now at INFN Sezione di Bari <sup>a</sup>, Università di Bari <sup>b</sup>, Politecnico di Bari <sup>c</sup>, Bari, Italy
- 42: Also at Italian National Agency for New Technologies, Energy and Sustainable Economic Development, Bologna, Italy
- 43: Also at Centro Siciliano di Fisica Nucleare e di Struttura Della Materia, Catania, Italy
- 44: Also at Università di Napoli 'Federico II', NAPOLI, Italy
- 45: Also at Consiglio Nazionale delle Ricerche - Istituto Officina dei Materiali, PERUGIA, Italy
- 46: Also at Riga Technical University, Riga, Latvia, Riga, Latvia
- 47: Also at Consejo Nacional de Ciencia y Tecnología, Mexico City, Mexico
- 48: Also at IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette, France
- 49: Also at Institute for Nuclear Research, Moscow, Russia
- 50: Now at National Research Nuclear University 'Moscow Engineering Physics Institute' (MEPhI), Moscow, Russia
- 51: Also at Institute of Nuclear Physics of the Uzbekistan Academy of Sciences, Tashkent, Uzbekistan
- 52: Also at St. Petersburg State Polytechnical University, St. Petersburg, Russia
- 53: Also at University of Florida, Gainesville, USA
- 54: Also at Imperial College, London, United Kingdom
- 55: Also at P.N. Lebedev Physical Institute, Moscow, Russia
- 56: Also at California Institute of Technology, Pasadena, USA
- 57: Also at Budker Institute of Nuclear Physics, Novosibirsk, Russia
- 58: Also at Faculty of Physics, University of Belgrade, Belgrade, Serbia
- 59: Also at Trincomalee Campus, Eastern University, Sri Lanka, Nilaveli, Sri Lanka
- 60: Also at INFN Sezione di Pavia <sup>a</sup>, Università di Pavia <sup>b</sup>, Pavia, Italy, Pavia, Italy
- 61: Also at National and Kapodistrian University of Athens, Athens, Greece
- 62: Also at Ecole Polytechnique Fédérale Lausanne, Lausanne, Switzerland
- 63: Also at Universität Zürich, Zurich, Switzerland
- 64: Also at Stefan Meyer Institute for Subatomic Physics, Vienna, Austria, Vienna, Austria
- 65: Also at Laboratoire d'Annecy-le-Vieux de Physique des Particules, IN2P3-CNRS, Annecy-le-Vieux, France
- 66: Also at Şırnak University, Şırnak, Turkey
- 67: Also at Near East University, Research Center of Experimental Health Science, Nicosia, Turkey
- 68: Also at Konya Technical University, Konya, Turkey
- 69: Also at Istanbul University - Cerrahpasa, Faculty of Engineering, Istanbul, Turkey
- 70: Also at Piri Reis University, Istanbul, Turkey
- 71: Also at Adiyaman University, Adiyaman, Turkey
- 72: Also at Ozyegin University, Istanbul, Turkey
- 73: Also at Izmir Institute of Technology, Izmir, Turkey
- 74: Also at Necmettin Erbakan University, Konya, Turkey
- 75: Also at Bozok Universitetesi Rektörlüğü, Yozgat, Turkey, Yozgat, Turkey
- 76: Also at Marmara University, Istanbul, Turkey
- 77: Also at Milli Savunma University, Istanbul, Turkey
- 78: Also at Kafkas University, Kars, Turkey
- 79: Also at Istanbul Bilgi University, Istanbul, Turkey
- 80: Also at Hacettepe University, Ankara, Turkey
- 81: Also at Vrije Universiteit Brussel, Brussel, Belgium

82: Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom

83: Also at Rutherford Appleton Laboratory, Didcot, United Kingdom

84: Also at IPPP Durham University, Durham, United Kingdom

85: Also at Monash University, Faculty of Science, Clayton, Australia

86: Also at Università di Torino, TORINO, Italy

87: Also at Bethel University, St. Paul, Minneapolis, USA, St. Paul, USA

88: Also at Karamanoğlu Mehmetbey University, Karaman, Turkey

89: Also at Ain Shams University, Cairo, Egypt

90: Also at Bingol University, Bingol, Turkey

91: Also at Georgian Technical University, Tbilisi, Georgia

92: Also at Sinop University, Sinop, Turkey

93: Also at Erciyes University, KAYSERI, Turkey

94: Also at Texas A&M University at Qatar, Doha, Qatar

95: Also at Kyungpook National University, Daegu, Korea, Daegu, Korea
