

Search for pair production of boosted Higgs bosons via vector-boson fusion in the $b\bar{b}b\bar{b}$ final state using pp collisions at $\sqrt{s} = 13$ TeV with the ATLAS detector

The ATLAS Collaboration

A search for Higgs boson pair production via vector-boson fusion is performed in the Lorentz-boosted regime, where a Higgs boson candidate is reconstructed as a single large-radius jet, using 140 fb^{-1} of proton–proton collision data at $\sqrt{s} = 13$ TeV recorded by the ATLAS detector at the Large Hadron Collider. Only Higgs boson decays into bottom quark pairs are considered. The search is particularly sensitive to the quartic coupling between two vector bosons and two Higgs bosons relative to its Standard Model prediction, κ_{2V} . This study constrains κ_{2V} to $0.55 < \kappa_{2V} < 1.49$ at 95% confidence level. The value $\kappa_{2V} = 0$ is excluded with a significance of 3.8 standard deviations with other Higgs boson couplings fixed to their Standard Model values. A search for new heavy spin-0 resonances that would mediate Higgs boson pair production via vector-boson fusion is carried out in the mass range of 1–5 TeV for the first time under several model and decay-width assumptions. No significant deviation from the Standard Model hypothesis is observed and exclusion limits at 95% confidence level are derived.

1 Introduction

The discovery of the 125 GeV Higgs boson (H) [1, 2] by the ATLAS [3] and CMS [4] Collaborations at the Large Hadron Collider (LHC) [5] has led to an extensive research programme aimed at measuring its properties, including spin and parity [6–12], natural width [7, 13–15], and couplings with other elementary particles [16–18]. All measurements to date are consistent with the predictions from the Standard Model (SM) [19–24]. However, certain properties, such as quartic couplings (g_{HHVV}) with vector bosons ($V = W, Z$) and the trilinear self-coupling of the Higgs boson (λ_{HHH}), remain unmeasured. In the SM, the former are related to the HVV couplings through the relation $g_{HHVV}^{\text{SM}} = g_{HVV}^{\text{SM}}/\nu$, and the latter is predicted to be $\lambda_{HHH}^{\text{SM}} = m_H^2/2\nu^2$, where m_H is the Higgs boson mass and ν is the vacuum expectation value of the Higgs field. Measuring if these relations are compatible with observed data will fundamentally deepen our understanding of the Higgs mechanism.

At the LHC, the coupling modifiers $\kappa_{2V} = g_{HHVV}/g_{HHVV}^{\text{SM}}$ and $\kappa_\lambda = \lambda_{HHH}/\lambda_{HHH}^{\text{SM}}$ are studied via the production of Higgs boson pairs (HH production). In the SM, the main nonresonant HH production modes are via the gluon–gluon fusion process (ggF), with a cross-section of $\sigma_{\text{ggF}}^{\text{SM}} = 31.1_{-7.2}^{+2.1}$ fb [25–35], and via the vector-boson fusion process (VBF), with a cross-section of $\sigma_{\text{VBF}}^{\text{SM}} = 1.73 \pm 0.04$ fb [36–38]. The VBF production cross-section depends critically on the value of κ_{2V} . For example, a value of $\kappa_{2V} = 0$ leads to a cross-section that is over 15 times the SM prediction. The Higgs bosons produced in non-SM κ_{2V} scenarios are expected to be more energetic and more central in the detector on average [39]. The leading-order Feynman diagrams of the ggF and VBF HH processes are shown in Figures 1(a) to 1(e). In the SM, the processes depicted in Figures 1(a) and 1(b) interfere destructively. Other coupling modifiers involved in these processes are of less interest in this analysis. The ggF HH production mode is sensitive to κ_λ while the VBF HH production mode is sensitive to both κ_λ and κ_{2V} . Heavy resonances (X) beyond the SM may contribute to resonant HH production [40, 41], as exemplified via the VBF process in Figure 1(f). The boosted VBF process provides a distinct signature for investigating these resonances, allowing exploration of uncharted phase space. These HH processes were studied with various decay final states by ATLAS and CMS, including $b\bar{b}b\bar{b}$ [42–47], $b\bar{b}\gamma\gamma$ [48–50], $b\bar{b}\tau^+\tau^-$ [51–54], $b\bar{b}WW^*$ [55], $\gamma\gamma WW^*$ [56], WW^*WW^* [57], $b\bar{b}l\bar{l}l\bar{l}$ [58], $b\bar{b}l\bar{l} + E_{\text{T}}^{\text{miss}}$ [59], and their statistical combinations [18, 60, 61]. No significant excess over the SM background was observed. The most stringent observed (expected) 95% confidence level (CL) interval for the κ_{2V} coupling modifier was found to be $0.62 < \kappa_{2V} < 1.41$ ($0.66 < \kappa_{2V} < 1.37$) by searching for nonresonant pair production of highly energetic Higgs bosons decaying into bottom quarks by the CMS Collaboration [47]. In Ref. [43], resonant VBF HH production in the mass range of 260–1000 GeV is searched for and no deviation from the background-only hypothesis is observed.

This paper reports a search for nonresonant and resonant VBF $HH \rightarrow b\bar{b}b\bar{b}$ production using the full Run 2 ATLAS proton–proton (pp) collision data sample with an integrated luminosity of 140 fb^{-1} . The search focuses on a Lorentz-boosted topology, where two high-energy Higgs bosons each form a large-radius jet, referred to as a large- R jet. This topology is particularly sensitive to non-SM values of κ_{2V} , and as such one of the goals of this analysis is to constrain κ_{2V} . Assuming the SM branching ratio of 58.2% for $H \rightarrow b\bar{b}$ [30, 62], approximately one third of HH events lead to a $b\bar{b}b\bar{b}$ final state, making it the most abundant HH final state. A machine learning-based double b -tagging technique [63, 64] uses the information from the large- R jets and their constituents to identify $H \rightarrow b\bar{b}$ decays. The VBF signature is characterised by the presence of VBF jets and provides an effective handle for background suppression. VBF jets are defined as two small- R jets with large invariant mass and rapidity separation. To maximise the sensitivity to the κ_{2V} parameter, the nonresonant analysis is combined with the resolved analysis [45] where the four b -quarks are

Figure 1: Examples of leading-order Feynman diagrams for Higgs boson pair production. For nonresonant ggF production, diagram (a) involves solely the top-quark Yukawa coupling, while diagram (b) involves the Higgs boson self-coupling. For nonresonant VBF production, diagram (c) involves the self-coupling, diagram (d) involves solely the coupling to vector bosons, and diagram (e) involves the coupling between two Higgs bosons and two vector bosons. Diagram (f) illustrates the resonant production mode.

reconstructed as small- R jets. The Higgs bosons considered in the resolved analysis have lower transverse momentum (p_T) compared to those in this boosted search. To avoid double counting events in the boosted nonresonant analysis presented in this paper, events that satisfy the resolved and boosted analysis selection are removed from the boosted analysis. For the first time, a search for a new heavy spin-0 resonance that would mediate VBF Higgs boson pair production is carried out in the mass range of 1–5 TeV.

The paper is structured as follows. Section 2 briefly introduces the ATLAS detector. Section 3 details the data and simulation samples used. Section 4 describes the analysis selection. Section 5 explains the background estimate derived from data, and Section 6 covers the multivariate discriminants used. Systematic uncertainties considered are detailed in Section 7. Results are provided in Section 8, and conclusions are given in Section 9.

2 The ATLAS experiment

The ATLAS experiment [3] at the LHC is a multipurpose particle detector with a forward–backward symmetric cylindrical geometry and a near 4π coverage in solid angle.¹ It consists of an inner tracking detector surrounded by a thin superconducting solenoid providing a 2 T axial magnetic field, electromagnetic and hadronic calorimeters, and a muon spectrometer. The inner tracking detector covers the pseudorapidity range $|\eta| < 2.5$. It consists of silicon pixel, silicon microstrip, and transition radiation tracking detectors. Lead/liquid-argon (LAr) sampling calorimeters provide electromagnetic (EM) energy measurements with high granularity within the region $|\eta| < 3.2$. A steel/scintillator-tile hadronic calorimeter covers the central pseudorapidity range ($|\eta| < 1.7$). The endcap and forward regions are instrumented with LAr calorimeters for EM and hadronic energy measurements up to $|\eta| = 4.9$. The muon spectrometer surrounds the calorimeters and is based on three large superconducting air-core toroidal magnets with eight coils each. The field integral of the toroids ranges between 2.0 and 6.0 T m across most of the detector. The muon spectrometer includes a system of precision tracking chambers up to $|\eta| = 2.7$ and fast detectors for triggering up to $|\eta| = 2.4$. The luminosity is measured mainly by the LUCID-2 [65] detector, which is located close to the beampipe. A two-level trigger system is used to select events [66]. The first-level trigger is implemented in hardware and uses a subset of the detector information to accept events at a rate below 100 kHz. This is followed by a software-based trigger that reduces the accepted event rate to 1 kHz on average depending on the data-taking conditions. A software suite [67] is used in data simulation, in the reconstruction and analysis of real and simulated data, in detector operations, and in the trigger and data acquisition systems of the experiment.

3 Data and simulation

The analysis is performed using Run 2 ATLAS pp collision data. The average number of interactions per proton bunch crossing (pile-up) is between 13 and 38 interactions, depending on the year [68]. After applying ATLAS data quality requirements [69], the data corresponds to an integrated luminosity of 140 fb^{-1} .

Monte Carlo (MC) simulation is used for the modelling of HH processes, top-quark pair production ($t\bar{t}$) and multijet background processes. The $t\bar{t}$ and multijet samples are used solely for event selection optimisation and are identical to those used in Ref. [45]. The final background estimate is obtained through data-driven techniques and described in Section 5. For all HH samples, the Higgs boson mass is fixed to 125 GeV. All samples are processed using the ATLAS simulation framework [70] where the detector response is simulated with GEANT4 [71]. The VBF HH samples are simulated using MADGRAPH 2.7.3 [72] at leading-order (LO) in quantum chromodynamics (QCD) with the NNPDF3.0_{NLO} parton distribution function (PDF) set [73]. Samples with coupling modifier values $(\kappa_\lambda, \kappa_{2V}, \kappa_V) = (1, 1, 1), (1, 1.5, 1), (2, 1, 1), (10, 1, 1), (1, 1, 0.5), (-5, 1, 0.5), (0, 1, 1), (1, 0, 1),$ and $(1, 3, 1)$ are explicitly generated and a linear combination [45] of the first six of the listed samples is used to determine the expected yields and distributions for any value of $(\kappa_\lambda, \kappa_{2V}, \kappa_V)$. The method is validated using the remaining simulated samples

¹ ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the centre of the detector and the z -axis along the beam pipe. The x -axis points from the IP to the centre of the LHC ring, and the y -axis points upwards. Polar coordinates (r, ϕ) are used in the transverse plane, ϕ being the azimuthal angle around the z -axis. The pseudorapidity is defined in terms of the polar angle θ as $\eta = -\ln \tan(\theta/2)$ and is equal to the rapidity $y = \frac{1}{2} \ln \left(\frac{E+p_z c}{E-p_z c} \right)$ in the relativistic limit.

Angular distance is measured in units of $\Delta R \equiv \sqrt{(\Delta y)^2 + (\Delta\phi)^2}$.

and good agreement is observed. The SM ggF HH samples are simulated using the POWHEG Box v2 generator [74–76] at next-to-leading-order (NLO) in QCD, including finite top-quark-mass effects, using the PDF4LHC15 [77] PDF set. A reweighting technique based on the particle-level invariant mass m_{HH} of the Higgs boson pair is applied to the $\kappa_\lambda = 1$ sample to determine the ggF HH yield and kinematic distributions for any value of κ_λ [78]. The ggF HH samples are considered as background processes when constraining κ_{2V} and as signal processes when deriving the results related to κ_λ .

The new heavy spin-0 resonance X that would mediate VBF HH , $pp \rightarrow X + jj \rightarrow HH + jj$, is simulated using the MADGRAPH5_AMC@NLO 2.6.1 [72] generator at LO in QCD with the NNPDF2.3LO [79] PDF set. The branching ratio of $X \rightarrow HH$ is set to 100%. Two resonance-width hypotheses are considered, where the resonance width is denoted by Γ_X : a generic narrow-width signal (Γ_X smaller than the detector resolution of 5–6% of the resonance mass) and a broad-width signal ($\Gamma_X = 20\%$ of the resonance mass) based on the Composite Higgs model [80]. These samples cover a range of resonance masses, denoted by m_X , from 1 TeV to 5 TeV, with increased spacing between the higher mass points and a different number of points between the narrow- and broad-width assumptions. For all resonant and nonresonant HH samples, parton showers and hadronisation are simulated using PYTHIA 8.244 [81] with the A14 set of tuned parameters [82] and the NNPDF2.3LO PDF set. EVTGEN 1.7.0 [83] is used to model the properties of heavy-flavour decays. The effects of multiple pp interactions in the same or nearby bunch crossings are modelled by superimposing each simulated hard-scattering event with inelastic pp events simulated using PYTHIA 8.186 [84] with the NNPDF2.3LO PDF set and the A3 set of tuned parameters [85], and is weighted to match the observed pile-up in data.

4 Event selection

Events must satisfy trigger decisions that require minimum transverse energies of the triggered large- R jet. The threshold varies between 360–420 GeV, depending on the year of data taking [66, 86, 87]. Events are required to contain two Higgs boson candidates and two VBF jets. A Higgs boson candidate is reconstructed as a large- R jet, denoted by J , using the anti- k_t algorithm [88, 89] with the radius parameter $R = 1.0$. The large- R jets are reconstructed from topological energy depositions [90] in the calorimeter and are trimmed [91, 92] to improve the jet mass resolution and to mitigate the effects of pile-up and soft radiation. A method similar to the one used in Ref. [45] is used to correct the four-momentum of large- R jets by accounting for energy lost to soft out-of-cone radiation and to muons and neutrinos in semileptonic b -hadron decays. This correction provides improved jet mass resolution. The mass of a large- R jet (m_J) is calculated using a combination of calorimeter and tracking information [93] to improve the resolution over the whole range of jet p_T . The large- R jets must satisfy $250 \text{ GeV} < p_T < 3000 \text{ GeV}$, $|\eta| < 2.0$ and $50 \text{ GeV} < m_J < 600 \text{ GeV}$, corresponding to the region where the jet calibration is valid. The two leading p_T large- R jets are considered as the Higgs boson candidates, and the leading jet p_T criterion is raised to $p_T > 450 \text{ GeV}$ to ensure that the online trigger is fully efficient. The leading (H_1) and sub-leading (H_2) Higgs boson candidates are ordered by their p_T . A double b -tagging algorithm based on a deep neural network [63, 64] is applied to the large- R jets to identify $H \rightarrow b\bar{b}$ decays. Events with two Higgs boson candidates satisfying the 60% efficiency working point are referred to as 2Pass events. This working point reduces multijet (top-quark) events by a factor of 92 (31). Events with only one Higgs boson candidate satisfying the 60% efficiency working point are referred to as 1Pass and are used for background estimation. The small- R jets, denoted by j , are reconstructed from particle-flow objects [94] using the anti- k_t algorithm with $R = 0.4$. The jet energy (E) is corrected by applying *in situ* corrections that reduce the contribution from pile-up jets [95]. The small- R jets must have $p_T > 20 \text{ GeV}$

and $|\eta| < 4.5$, and those with $p_T < 60$ GeV and $|\eta| < 2.4$ must satisfy a requirement based on the output of the multivariate jet vertex tagger algorithm [96] to reduce the effect from pile-up. To remove overlap with the Higgs boson candidates, the distance between a small- R jet and the selected Higgs boson candidates must satisfy $\Delta R(J, j) > 1.4$. The two leading p_T small- R jets are assigned as VBF jets and required to satisfy the criteria $|\Delta\eta(j, j)| > 3$ and $m_{jj} > 1$ TeV.

After the preselections described above, 1Pass and 2Pass events are separately classified into signal regions (SRs), validation regions (VRs), and control regions (CRs) according to the following criteria defined in the $m_{H_1}-m_{H_2}$ plane. The SR, VR, and CR are disjoint by construction such that there is no overlap between them. Events in the SR reside in the region defined by

$$\sqrt{\left(\frac{m_{H_1} - 124 \text{ GeV}}{1500 \text{ GeV}/m_{H_1}}\right)^2 + \left(\frac{m_{H_2} - 117 \text{ GeV}}{1900 \text{ GeV}/m_{H_2}}\right)^2} < 1.6 \text{ GeV}. \quad (1)$$

Events in the VR reside in the region bounded by the SR boundary and

$$\sqrt{\left(\frac{m_{H_1} - 124 \text{ GeV}}{0.1 \ln(m_{H_1}/\text{GeV})}\right)^2 + \left(\frac{m_{H_2} - 117 \text{ GeV}}{0.1 \ln(m_{H_2}/\text{GeV})}\right)^2} < 100 \text{ GeV}, \quad (2)$$

and events in the CR reside in the region bounded by the VR outer boundary and

$$\sqrt{\left(\frac{m_{H_1} - 124 \text{ GeV}}{0.1 \ln(m_{H_1}/\text{GeV})}\right)^2 + \left(\frac{m_{H_2} - 117 \text{ GeV}}{0.1 \ln(m_{H_2}/\text{GeV})}\right)^2} < 170 \text{ GeV}. \quad (3)$$

The values of 124 GeV and 117 GeV in Eqs. (1)–(3) are chosen such that they correspond to the centres of the m_{H_1} and m_{H_2} distributions of the VBF HH events from simulation. These centres deviate from the measured Higgs boson mass of 125 GeV due to detector effects, and energy lost to neutrinos from the b -hadron decays and to out-of-cone radiation. The variables m_{H_1} and m_{H_2} in these equations are in units of GeV. The SR definition is optimised to maximise the overall S/\sqrt{B} . The signal S is the yield of $\kappa_{2V} = 0$ VBF HH events in simulation which is chosen to maximise the sensitivity to the κ_{2V} coupling as it is a representative proxy for non-SM κ_{2V} samples. The background B is the expected number of background events estimated by using the $t\bar{t}$ and multijet simulated samples. As multijet background processes preferentially populate the $m_{H_1}-m_{H_2}$ plane in the lower Higgs boson candidate mass region compared to HH processes, Eqs. (2) and (3) help reduce contributions from multijet events. The boundaries of the SR, VR, and CR in the reconstructed $m_{H_1}-m_{H_2}$ plane are shown in Figure 2 for the 1Pass and 2Pass selections of the analysis. The $m_{H_1}-m_{H_2}$ plane is smoothly falling across the Higgs boson candidate masses. Most HH events are captured by the signal region boundary; the fraction of 2Pass events in the SR is 76% (78%–55%) for nonresonant (resonant 1 TeV–5 TeV) events. The overall signal acceptance times efficiency in the 2Pass SR ranges from 1% for a representative nonresonant non-SM signal sample to 0.02% for the SM nonresonant signal sample. For the resonant signal samples, the overall acceptance times efficiency ranges from 5% to 10%, depending on the mass and width of the resonance.

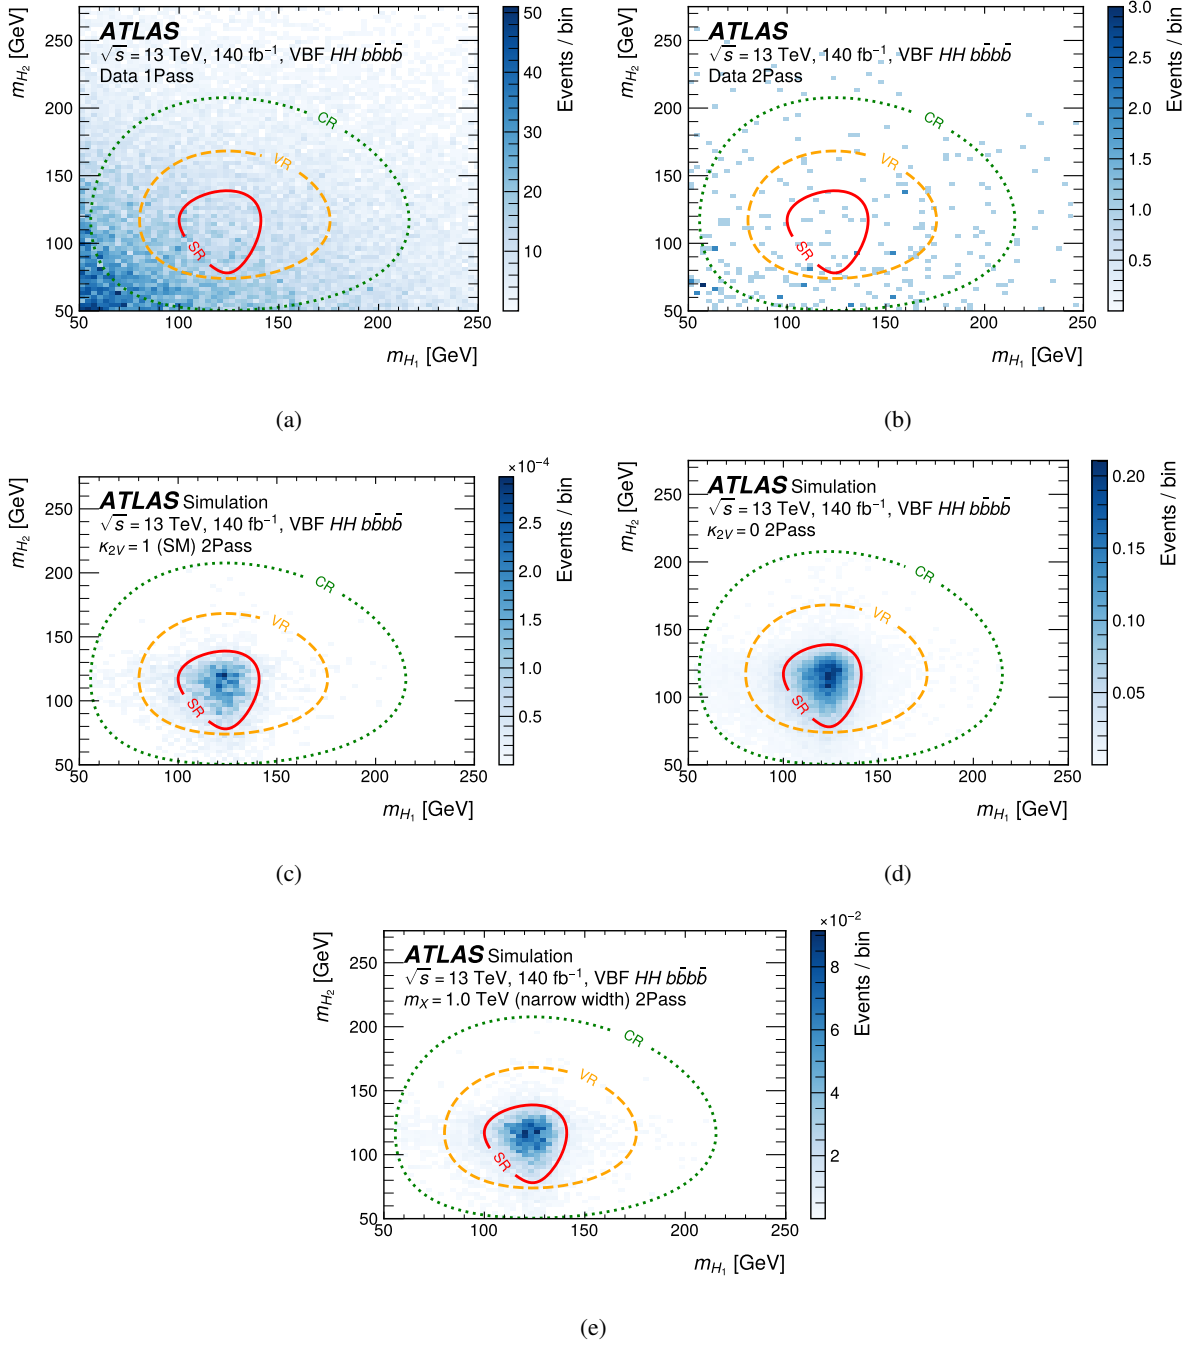

Figure 2: The mass planes of the reconstructed Higgs boson candidates for the (a) 1Pass and (b) 2Pass selections of the analysis, shown for the data events. The mass planes for the 2Pass selection of the analysis are shown for the (c) VBF SM $\kappa_{2V} = 1$ HH , (d) VBF $\kappa_{2V} = 0$ HH , and (e) $m_X = 1$ TeV spin-0 narrow-width resonance HH samples. The continuous red line describes the Signal Region (SR). The Validation Region (VR) lies between the dashed yellow line and the continuous red line. The Control Region (CR) lies between the dotted green line and the dashed yellow line. The bin sizes are 1.33 GeV by 1.33 GeV.

5 Background modelling

Background processes in the SR predominantly originate from nonresonant multijet production of multiple heavy (b/t) quarks and from jets initiated by non-heavy quarks misidentified as originating from heavy quarks. The background contribution coming from single-Higgs and diboson events were found to be negligible. The multijet background, which is composed of approximately 10% $t\bar{t}$ events, is estimated by using a data-driven method and 1Pass events. The signal contamination in the 1Pass selection is at most 1% overall, depending on the signal considered. In the most signal-like bin of the final discriminant (described in Section 6), it increases to up to 8%, which is below the statistical uncertainty of this bin. As the difference between the shape of the final discriminant in 1Pass and 2Pass events is within statistical uncertainty, as shown in Figure 3, an inclusive normalisation factor is derived from the CR and applied to the SR. The normalisation factor w is derived by calculating the ratio of the number of events in the CR 2Pass and CR 1Pass: $w = 0.0081 \pm 0.0010$.

The uncertainty is obtained by re-deriving this ratio in the VR and computing the difference between the value of w derived in the CR and the VR, and is used as an overall uncertainty in the multijet yield in the fit described in Section 8. The background estimate in the SR 2Pass is thus obtained by multiplying the relevant distribution in the SR 1Pass by w . Alternative definitions for the CR and VR boundaries, which split the nominal definitions of CR and VR into quadrants, are found to yield values of w that are consistent with the nominal estimate. To cover any potential residual shape differences, a shape uncertainty in the final discriminant is estimated by taking the relative difference between the 1Pass and 2Pass discriminant distributions in the VR and symmetrising around the background estimate.

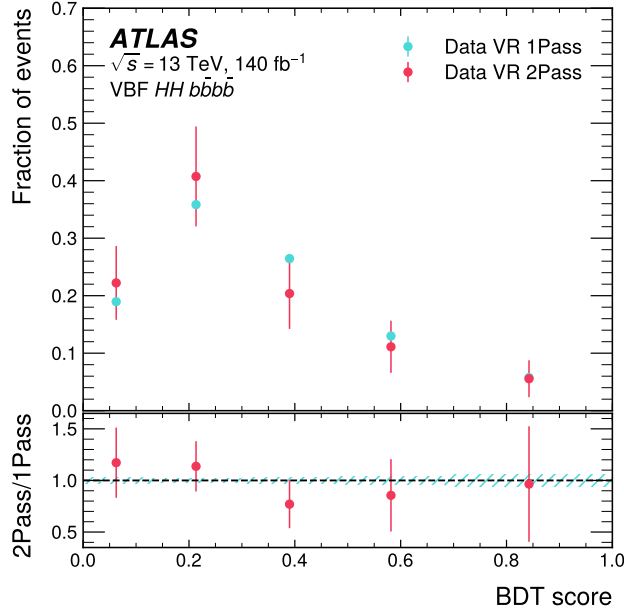

Figure 3: The BDT score (see Section 6) for data events in the VR for the 2Pass and 1Pass selections. The blue histogram is the distribution in VR 1Pass. The red histogram is the distribution in VR 2Pass. The lower panel shows the ratio of the 2Pass and 1Pass selections. The error bars on the data points represent the statistical uncertainty.

6 Multivariate discriminants

Boosted decision trees (BDTs) implemented in the XGBoost [97] library are used to separate signal events from background events in the SR. In both the nonresonant and resonant analyses, orthogonality between training, testing, and validation samples is ensured by splitting the available data by event number. Hyperparameters are optimised using the validation samples to enhance the classifier’s performance, and the kinematic variables used as input are listed in Table 1. In the nonresonant analysis, a BDT is trained to separate $\kappa_{2V} = 0$ signal events from background events consisting of the nonresonant multijet background estimate and SM ggF and VBF HH production events. The $\kappa_{2V} = 0$ signal is chosen as a representative proxy for non-SM values of κ_{2V} , allowing to maximise the sensitivity to the κ_{2V} coupling.

The resonant analysis uses a mass-parameterised BDT (pBDT) to accommodate multiple resonant signals with different mass hypotheses, inspired by parameterised neural networks [98]. In addition to the variables listed in Table 1, the pBDT includes the truth mass of the heavy resonances as an additional input parameter. Signals are composed of thirteen narrow-width MC samples with distinct hypotheses for the truth mass of the heavy resonance. The broad-width samples are not used during training. The background is taken from the data-driven estimate described in Section 5. A random value from the available signal true resonance masses m_X is assigned to each background event in the training. To ensure an adequate number of training events, the requirements on the VBF jets are removed and the double b -tagging working point requirements are relaxed to the 70% efficiency working point during training for the resonant analysis. The nominal selection is reinstated after training.

Table 1: Kinematic variables used in the BDT training in both the nonresonant and resonant analyses. Additionally, the truth mass of the resonance is used as an input variable in the resonant analysis.

Physics objects	BDT input variables
Higgs Boson Candidate ($H_i, i = 1, 2$)	$p_T^{H_i}, \eta_{H_i}$
Di-Higgs System (HH)	$p_T^{HH}, \eta_{HH}, m_{HH}$
VBF Jets ($j_i, i = 1, 2$)	$p_T^{j_i}, \eta_{j_i}, E_{j_i}$

7 Systematic uncertainties

Although the analysis is limited by statistical uncertainty, systematic uncertainties in the background and signals are evaluated. Both a normalisation and shape uncertainty are assigned to the data-driven background estimate, as described in Section 5. Uncertainties resulting from detector effects only affect signal simulation. The impact of the main sources of uncertainty in the signal yield are evaluated for various hypothesised signals. The dominant systematic uncertainty stems from the double b -tagging algorithm (20–30%). It is derived in four p_T^J bins using a $Z \rightarrow b\bar{b}$ control sample [64]. As this $Z \rightarrow b\bar{b}$ control sample is statistically limited, the systematic uncertainty coming from the double b -tagging algorithm is uncorrelated across the four p_T^J bins while correlated between the two large- R jets in each event. The uncertainty in the integrated luminosity is 0.83% [68]. The uncertainty in the pile-up modelling is $< 0.1\%$. Uncertainties affecting the final state reconstruction and identification include the energy and mass scales of the large- R jets (1–10%), the large- R jet energy resolution and mass resolution ($< 1\%$) [99, 100], and the small- R jet energy scale and resolution (1–10%) [95, 101]. The efficiency and acceptance of nonresonant

and resonant signals are also affected by theoretical modelling uncertainties, such as the parton showering (5–10%) and renormalisation and factorisation scale choices (1–5%). Theoretical uncertainties in the $H \rightarrow b\bar{b}$ branching ratio (3.5%) [30] are included. Theoretical uncertainties in the nonresonant ggF and VBF HH cross-sections arising from uncertainties in the PDF and α_s , and the choice of renormalisation scheme and the scale of the top-quark mass, are taken from Refs. [30, 31, 35]. No theoretical uncertainties in the resonant HH cross-sections are considered.

8 Results

A binned maximum-likelihood fit to the BDT distributions in the 2PASS SR is carried out with the systematic uncertainties parameterised as nuisance parameters. The BDT output binning transformation is the same as the one detailed in Ref. [102]. The observed BDT distribution of data, and the background-only fit to the distribution, is presented in Figure 4. Good agreement is found between the data and the background-only hypothesis. No data are observed in the most signal-like bin while the expectation from background contributions before the fit is 1.1 ± 0.1 events.

In the nonresonant search, a combination with the ggF and VBF categories of the resolved analysis [45] is additionally performed to improve the sensitivity to κ_{2V} . Uncertainties stemming from common sources in both the analyses are correlated. The values of twice the negative-logarithm of the profile likelihood ratio ($-2 \ln \Lambda$) as a function of κ_{2V} are shown in Figure 5 for the resolved and boosted analyses, and their combination. The best-fit κ_{2V} value obtained from the fit to the data is $1.01^{+0.24}_{-0.23}$ for the boosted result and $1.01^{+0.23}_{-0.22}$ for the combined result. The boosted result provides an observed (expected) constraint of $0.52 < \kappa_{2V} < 1.52$ ($0.32 < \kappa_{2V} < 1.71$) at 95% CL. The combined observed (expected) constraints obtained are $0.55 < \kappa_{2V} < 1.49$ ($0.37 < \kappa_{2V} < 1.67$) at 95% CL. The allowed range of κ_{2V} values is reduced by a factor of two compared with previous ATLAS publications [45]. The Higgs coupling $\kappa_{2V} = 0$ is excluded with an observed (expected) significance of 3.4 (2.9) standard deviations. When combining the boosted and resolved results, the Higgs coupling $\kappa_{2V} = 0$ is excluded with an observed (expected) significance of 3.8 (3.3) standard deviations. These results are obtained assuming κ_λ and all other coupling values are as predicted by the SM. The exclusion constraints in the two-dimensional κ_λ - κ_{2V} coupling modifier space are presented in Figure 6. The resolved and boosted analyses are sensitive to complementary coupling parameters; the κ_λ sensitivity is driven by the resolved analysis, while the κ_{2V} sensitivity is dominated by the boosted analysis.

Upper limits on the cross-section for the narrow- and broad-width resonance assumptions are set in each available signal hypothesis using the asymptotic formula [103] based on the CL_s method [104]. The observed pBDT distributions of data, together with a signal + background fit, are shown in Figure 7 for certain narrow-width resonances. The results are shown in Figure 8 for narrow- and broad-width resonances, which have masses in the range of $1 \text{ TeV} \leq m_X \leq 5 \text{ TeV}$ and $1.2 \text{ TeV} \leq m_X \leq 2 \text{ TeV}$, respectively. The loss in sensitivity at high mass values is attributed to the smaller efficiency of the double b -tagging algorithm in the highly boosted regime. The observed limits at 1.6 TeV (1.8 TeV) and above drop for the narrow-width (broad-width) resonance assumption since no data are observed in the most signal-like bin of these high mass pBDT distributions, as shown in Figure 7. In the narrow-width assumption, the observed (expected) limit range spans from 4.6 fb (3.1 fb) for $m_X = 1 \text{ TeV}$ to 1.9 fb (3.0 fb) for $m_X = 5 \text{ TeV}$ and extends to 0.7 fb (1.2 fb) for $m_X = 1.8 \text{ TeV}$. In the broad-width assumption, the observed (expected) limit range decreases from 2.5 fb (2.1 fb) for $m_X = 1.2 \text{ TeV}$ to 0.8 fb (1.3 fb) for $m_X = 2 \text{ TeV}$.

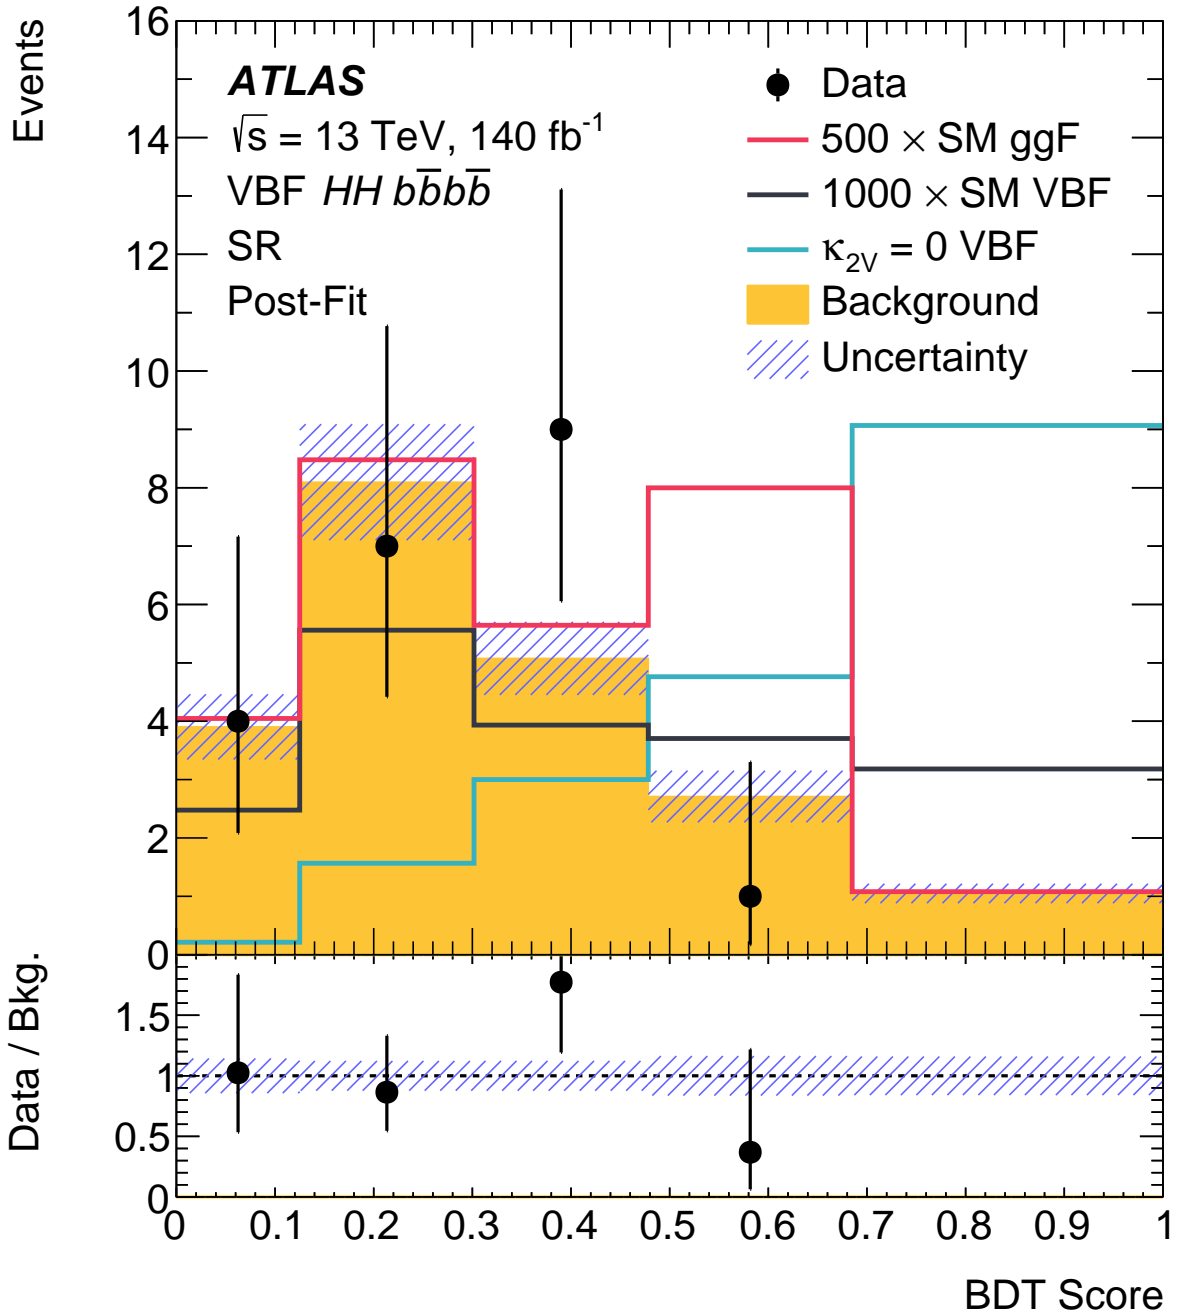

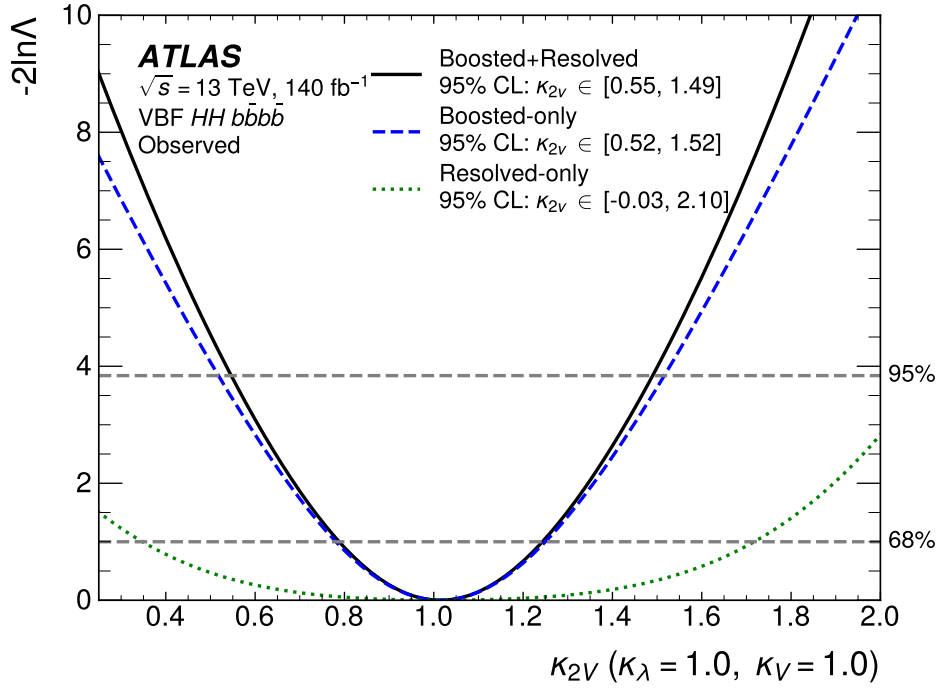

Figure 4: The distribution of the BDT score used in the nonresonant analysis after a background-only fit to the data in the signal region. The distributions corresponding to the SM ggF HH , SM VBF HH , and $\kappa_{2V} = 0$ VBF HH samples are also shown, in some cases scaled by a factor for visibility. The lower panel shows the ratio of data to the total background prediction, with its uncertainty represented by the shaded band. The error bars on the data points represent the statistical uncertainty.

(a)

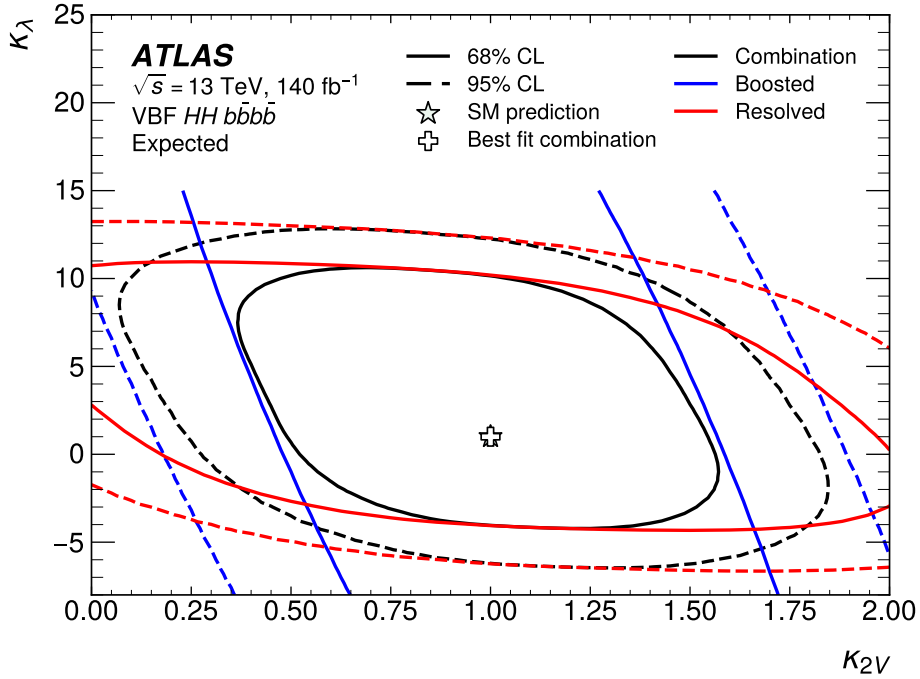

(b)

Figure 5: Observed (a) and expected (b) values of $-2 \ln \Lambda$ as a function of κ_{2V} for the resolved (dotted green) and boosted (dashed blue) analyses, and their combination (solid black), with all other coupling modifiers fixed to their SM predictions.

(a)

(b)

Figure 6: Observed (a) and expected (b) likelihood contours at 68% (solid line) and 95% (dashed line) CL in the κ_λ - κ_{2V} plane. The red, blue, and black colours represent the resolved-only, boosted-only, and boosted+resolved combination results, respectively. All other coupling modifiers are fixed to their SM predictions. The SM prediction is indicated by the star, while the best-fit value is denoted by the cross. The shift in the observed value from the SM prediction is driven by the resolved analysis. The observed constraint on κ_λ values from the combination is less stringent than the constraint from the resolved-only fit due to the different best-fit values of the κ_{2V} modifier. The result for κ_λ values above 15 is not plotted for clarity.

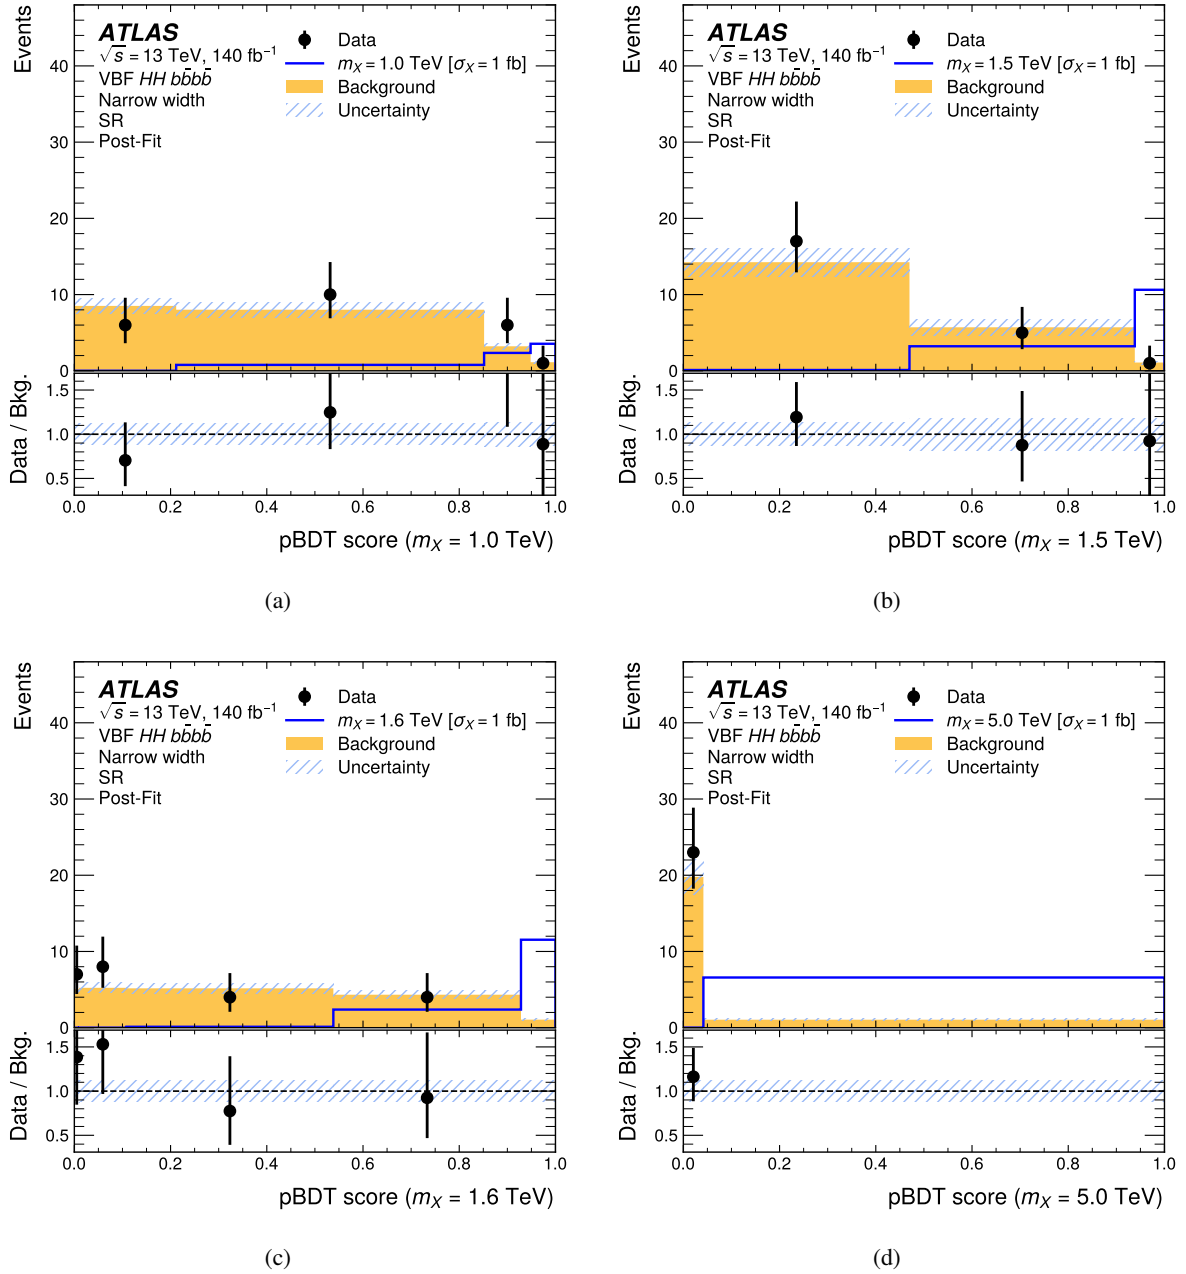

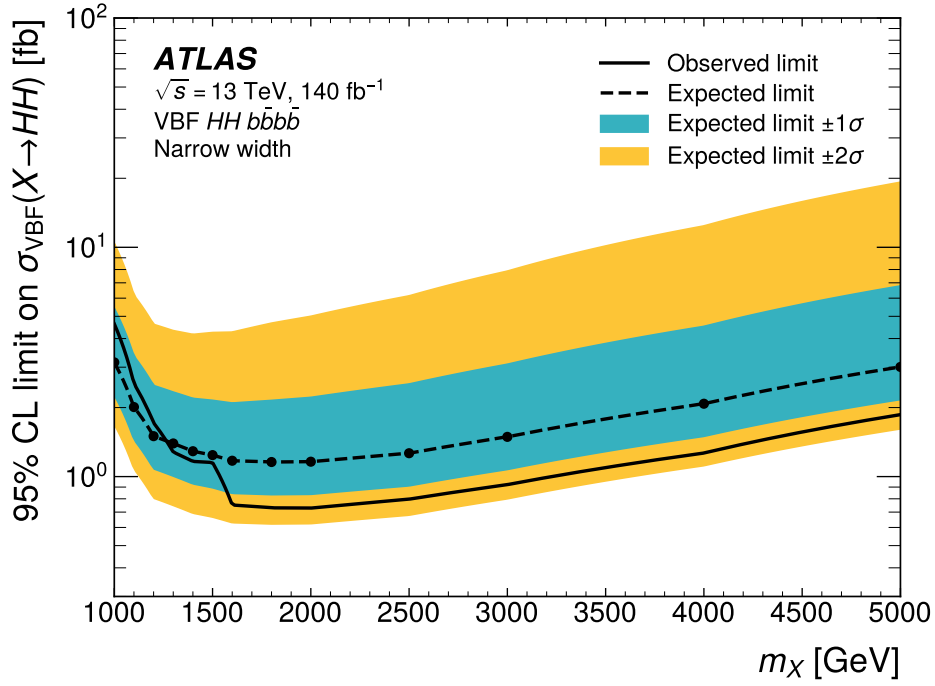

Figure 7: The distributions of the mass-parameterised BDT score after a background-only fit to the data in the signal region. The truth mass used as input to the mass-parameterised BDT corresponds to (a) $m_X = 1.0$ TeV, (b) $m_X = 1.5$ TeV, (c) $m_X = 1.6$ TeV, and (d) $m_X = 5.0$ TeV. The narrow-width signal of the corresponding mass hypothesis, normalised to a cross-section of 1 fb, is shown. No events are observed in the rightmost bin for $m_X \geq 1.6$ TeV. The lower panel shows the ratio of data to the total prediction, with its uncertainty represented by the shaded band. The error bars on the data points represent the statistical uncertainty.

(a)

(b)

Figure 8: Expected (dashed black lines) and observed (solid black lines) 95% CL upper limits on the cross-section of spin-0 heavy resonances with (a) narrow-width and (b) broad-width assumptions. The SM $H \rightarrow b\bar{b}$ branching ratio is assumed in both cases. The $\pm 1\sigma$ and $\pm 2\sigma$ uncertainty ranges for the expected limits are shown as coloured bands. The theoretical prediction for the Composite Higgs model calculated at leading-order [80] under the $\Gamma_X/m_X = 20\%$ assumption is shown as the solid red line.

9 Conclusion

A search for the production of Higgs boson pairs via VBF production in the four b -quark final state is presented. The analysis is based on 140 fb^{-1} of pp collision data recorded with the ATLAS detector at the LHC, and focuses on the Lorentz-boosted regime where each Higgs boson is reconstructed as a large- R jet. This regime yields particular sensitivity to anomalous κ_{2V} values that give rise to energetic Higgs bosons. A machine learning-based double b -tagging technique is employed to enhance the analysis sensitivity, and boosted decision trees are used to discriminate signal from background. The data are found to agree with the background-only hypothesis. The observed (expected) constraints obtained are $0.55 < \kappa_{2V} < 1.49$ ($0.37 < \kappa_{2V} < 1.67$) at 95% CL. The allowed range of κ_{2V} values is reduced by a factor of two compared with previous ATLAS publications. A value of $\kappa_{2V} = 0$ is excluded with an observed (expected) significance of 3.8 (3.3) standard deviations. A search is also performed for the first time for a new heavy spin-0 resonance that would mediate VBF HH production in a mass range between 1 TeV and 5 TeV. No significant excess is observed and exclusion limits are set on the production cross-section.

Acknowledgements

We thank CERN for the very successful operation of the LHC and its injectors, as well as the support staff at CERN and at our institutions worldwide without whom ATLAS could not be operated efficiently.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF/SFU (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [105].

We gratefully acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; ANID, Chile; CAS, MOST and NSFC, China; Minciencias, Colombia; MEYS CR, Czech Republic; DNRf and DNSRC, Denmark; IN2P3-CNRS and CEA-DRF/IRFU, France; SRNSFG, Georgia; BMBF, HGF and MPG, Germany; GSRI, Greece; RGC and Hong Kong SAR, China; ISF and Benozziyo Center, Israel; INFN, Italy; MEXT and JSPS, Japan; CNRST, Morocco; NWO, Netherlands; RCN, Norway; MNiSW, Poland; FCT, Portugal; MNE/IFA, Romania; MESTD, Serbia; MSSR, Slovakia; ARRS and MIZŠ, Slovenia; DSI/NRF, South Africa; MICINN, Spain; SRC and Wallenberg Foundation, Sweden; SERI, SNSF and Cantons of Bern and Geneva, Switzerland; MOST, Taipei; TENMAK, Türkiye; STFC, United Kingdom; DOE and NSF, United States of America.

- ⁸⁵KEK, High Energy Accelerator Research Organization, Tsukuba; Japan.
- ⁸⁶Graduate School of Science, Kobe University, Kobe; Japan.
- ⁸⁷(^a) AGH University of Krakow, Faculty of Physics and Applied Computer Science, Krakow; (^b) Marian Smoluchowski Institute of Physics, Jagiellonian University, Krakow; Poland.
- ⁸⁸Institute of Nuclear Physics Polish Academy of Sciences, Krakow; Poland.
- ⁸⁹Faculty of Science, Kyoto University, Kyoto; Japan.
- ⁹⁰Research Center for Advanced Particle Physics and Department of Physics, Kyushu University, Fukuoka ; Japan.
- ⁹¹L2IT, Université de Toulouse, CNRS/IN2P3, UPS, Toulouse; France.
- ⁹²Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata; Argentina.
- ⁹³Physics Department, Lancaster University, Lancaster; United Kingdom.
- ⁹⁴Oliver Lodge Laboratory, University of Liverpool, Liverpool; United Kingdom.
- ⁹⁵Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana; Slovenia.
- ⁹⁶School of Physics and Astronomy, Queen Mary University of London, London; United Kingdom.
- ⁹⁷Department of Physics, Royal Holloway University of London, Egham; United Kingdom.
- ⁹⁸Department of Physics and Astronomy, University College London, London; United Kingdom.
- ⁹⁹Louisiana Tech University, Ruston LA; United States of America.
- ¹⁰⁰Fysiska institutionen, Lunds universitet, Lund; Sweden.
- ¹⁰¹Departamento de Física Teórica C-15 and CIAFF, Universidad Autónoma de Madrid, Madrid; Spain.
- ¹⁰²Institut für Physik, Universität Mainz, Mainz; Germany.
- ¹⁰³School of Physics and Astronomy, University of Manchester, Manchester; United Kingdom.
- ¹⁰⁴CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.
- ¹⁰⁵Department of Physics, University of Massachusetts, Amherst MA; United States of America.
- ¹⁰⁶Department of Physics, McGill University, Montreal QC; Canada.
- ¹⁰⁷School of Physics, University of Melbourne, Victoria; Australia.
- ¹⁰⁸Department of Physics, University of Michigan, Ann Arbor MI; United States of America.
- ¹⁰⁹Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- ¹¹⁰Group of Particle Physics, University of Montreal, Montreal QC; Canada.
- ¹¹¹Fakultät für Physik, Ludwig-Maximilians-Universität München, München; Germany.
- ¹¹²Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München; Germany.
- ¹¹³Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya; Japan.
- ¹¹⁴(^a) Department of Physics, Nanjing University, Nanjing; (^b) School of Science, Shenzhen Campus of Sun Yat-sen University; (^c) University of Chinese Academy of Science (UCAS), Beijing; China.
- ¹¹⁵Department of Physics and Astronomy, University of New Mexico, Albuquerque NM; United States of America.
- ¹¹⁶Institute for Mathematics, Astrophysics and Particle Physics, Radboud University/Nikhef, Nijmegen; Netherlands.
- ¹¹⁷Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam;

Netherlands.

¹¹⁸Department of Physics, Northern Illinois University, DeKalb IL; United States of America.

¹¹⁹^(a)New York University Abu Dhabi, Abu Dhabi; ^(b)United Arab Emirates University, Al Ain; United Arab Emirates.

¹²⁰Department of Physics, New York University, New York NY; United States of America.

¹²¹Ochanomizu University, Otsuka, Bunkyo-ku, Tokyo; Japan.

¹²²Ohio State University, Columbus OH; United States of America.

¹²³Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK; United States of America.

¹²⁴Department of Physics, Oklahoma State University, Stillwater OK; United States of America.

¹²⁵Palacký University, Joint Laboratory of Optics, Olomouc; Czech Republic.

¹²⁶Institute for Fundamental Science, University of Oregon, Eugene, OR; United States of America.

¹²⁷Graduate School of Science, Osaka University, Osaka; Japan.

¹²⁸Department of Physics, University of Oslo, Oslo; Norway.

¹²⁹Department of Physics, Oxford University, Oxford; United Kingdom.

¹³⁰LPNHE, Sorbonne Université, Université Paris Cité, CNRS/IN2P3, Paris; France.

¹³¹Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.

¹³²Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.

¹³³^(a)Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa; ^(b)Departamento de Física, Faculdade de Ciências, Universidade de Lisboa, Lisboa; ^(c)Departamento de Física, Universidade de Coimbra, Coimbra; ^(d)Centro de Física Nuclear da Universidade de Lisboa, Lisboa; ^(e)Departamento de Física, Universidade do Minho, Braga; ^(f)Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain); ^(g)Departamento de Física, Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.

¹³⁴Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.

¹³⁵Czech Technical University in Prague, Prague; Czech Republic.

¹³⁶Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.

¹³⁷Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.

¹³⁸IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.

¹³⁹Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.

¹⁴⁰^(a)Departamento de Física, Pontificia Universidad Católica de Chile, Santiago; ^(b)Millennium Institute for Subatomic physics at high energy frontier (SAPHIR), Santiago; ^(c)Instituto de Investigación Multidisciplinario en Ciencia y Tecnología, y Departamento de Física, Universidad de La Serena; ^(d)Universidad Andres Bello, Department of Physics, Santiago; ^(e)Instituto de Alta Investigación, Universidad de Tarapacá, Arica; ^(f)Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.

¹⁴¹Department of Physics, University of Washington, Seattle WA; United States of America.

¹⁴²Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.

¹⁴³Department of Physics, Shinshu University, Nagano; Japan.

¹⁴⁴Department Physik, Universität Siegen, Siegen; Germany.

¹⁴⁵Department of Physics, Simon Fraser University, Burnaby BC; Canada.

¹⁴⁶SLAC National Accelerator Laboratory, Stanford CA; United States of America.

¹⁴⁷Department of Physics, Royal Institute of Technology, Stockholm; Sweden.

¹⁴⁸Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.

- ¹⁴⁹Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁵⁰School of Physics, University of Sydney, Sydney; Australia.
- ¹⁵¹Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ¹⁵²^(a)E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi; ^(b)High Energy Physics Institute, Tbilisi State University, Tbilisi; ^(c)University of Georgia, Tbilisi; Georgia.
- ¹⁵³Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁵⁴Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁵⁵Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁵⁶International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁵⁷Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁵⁸Department of Physics, University of Toronto, Toronto ON; Canada.
- ¹⁵⁹^(a)TRIUMF, Vancouver BC; ^(b)Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁶⁰Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.
- ¹⁶¹Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁶²Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.
- ¹⁶³University of Sharjah, Sharjah; United Arab Emirates.
- ¹⁶⁴Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.
- ¹⁶⁵Department of Physics, University of Illinois, Urbana IL; United States of America.
- ¹⁶⁶Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- ¹⁶⁷Department of Physics, University of British Columbia, Vancouver BC; Canada.
- ¹⁶⁸Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- ¹⁶⁹Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- ¹⁷⁰Department of Physics, University of Warwick, Coventry; United Kingdom.
- ¹⁷¹Waseda University, Tokyo; Japan.
- ¹⁷²Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.
- ¹⁷³Department of Physics, University of Wisconsin, Madison WI; United States of America.
- ¹⁷⁴Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.
- ¹⁷⁵Department of Physics, Yale University, New Haven CT; United States of America.
- ^a Also Affiliated with an institute covered by a cooperation agreement with CERN.
- ^b Also at An-Najah National University, Nablus; Palestine.
- ^c Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- ^d Also at Center for Interdisciplinary Research and Innovation (CIRI-AUTH), Thessaloniki; Greece.
- ^e Also at Centro Studi e Ricerche Enrico Fermi; Italy.
- ^f Also at CERN, Geneva; Switzerland.
- ^g Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.
- ^h Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.
- ⁱ Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- ^j Also at Department of Physics, California State University, Sacramento; United States of America.
- ^k Also at Department of Physics, King's College London, London; United Kingdom.
- ^l Also at Department of Physics, Stanford University, Stanford CA; United States of America.

- ^m Also at Department of Physics, Stellenbosch University; South Africa.
- ⁿ Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.
- ^o Also at Department of Physics, University of Thessaly; Greece.
- ^p Also at Department of Physics, Westmont College, Santa Barbara; United States of America.
- ^q Also at Hellenic Open University, Patras; Greece.
- ^r Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.
- ^s Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.
- ^t Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia; Bulgaria.
- ^u Also at Institute of Applied Physics, Mohammed VI Polytechnic University, Ben Guerir; Morocco.
- ^v Also at Institute of Particle Physics (IPP); Canada.
- ^w Also at Institute of Physics and Technology, Mongolian Academy of Sciences, Ulaanbaatar; Mongolia.
- ^x Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.
- ^y Also at Institute of Theoretical Physics, Ilia State University, Tbilisi; Georgia.
- ^z Also at Lawrence Livermore National Laboratory, Livermore; United States of America.
- ^{aa} Also at National Institute of Physics, University of the Philippines Diliman (Philippines); Philippines.
- ^{ab} Also at Technical University of Munich, Munich; Germany.
- ^{ac} Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing; China.
- ^{ad} Also at TRIUMF, Vancouver BC; Canada.
- ^{ae} Also at Università di Napoli Parthenope, Napoli; Italy.
- ^{af} Also at University of Colorado Boulder, Department of Physics, Colorado; United States of America.
- ^{ag} Also at Washington College, Chestertown, MD; United States of America.
- ^{ah} Also at Yeditepe University, Physics Department, Istanbul; Türkiye.
