| <code>TimedeltaIndex.to_series([index, name])</code>        | Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index. |
| <code>TimedeltaIndex.round(freq[, ambiguous, ...])</code>   | Perform round operation on the data to the specified <i>freq</i> .                                                             |
| <code>TimedeltaIndex.floor(freq[, ambiguous, ...])</code>   | Perform floor operation on the data to the specified <i>freq</i> .                                                             |
| <code>TimedeltaIndex.ceil(freq[, ambiguous, ...])</code>    | Perform ceil operation on the data to the specified <i>freq</i> .                                                              |
| <code>TimedeltaIndex.to_frame([index, name])</code>         | Create a DataFrame with a column containing the Index.                                                                         |

## 35.7.8 PeriodIndex

|                          |                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>PeriodIndex</code> | Immutable ndarray holding ordinal values indicating regular periods in time such as particular years, quarters, months, etc. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|

### 35.7.8.1 pandas.PeriodIndex

**class** `pandas.PeriodIndex`

Immutable ndarray holding ordinal values indicating regular periods in time such as particular years, quarters, months, etc.

Index keys are boxed to Period objects which carries the metadata (eg, frequency information).

#### Parameters

**data** [array-like (1-dimensional), optional] Optional period-like data to construct index with

**copy** [bool] Make a copy of input ndarray

**freq** [string or period object, optional] One of pandas period strings or corresponding objects

**start** [starting value, period-like, optional] If data is None, used as the start point in generating regular period data.

Deprecated since version 0.24.0.

**periods** [int, optional, > 0] Number of periods to generate, if generating index. Takes precedence over end argument

Deprecated since version 0.24.0.

**end** [end value, period-like, optional] If periods is none, generated index will extend to first conforming period on or just past end argument

Deprecated since version 0.24.0.

**year** [int, array, or Series, default None]

**month** [int, array, or Series, default None]

**quarter** [int, array, or Series, default None]

**day** [int, array, or Series, default None]

**hour** [int, array, or Series, default None]

**minute** [int, array, or Series, default None]

**second** [int, array, or Series, default None]

**tz** [object, default None] Timezone for converting datetime64 data to Periods

**dtype** [str or PeriodDtype, default None]

See also:

**Index** The base pandas Index type.

**Period** Represents a period of time.

**DatetimeIndex** Index with datetime64 data.

**TimedeltaIndex** Index of timedelta64 data.

**period\_range** Create a fixed-frequency PeriodIndex.

## Notes

Creating a PeriodIndex based on *start*, *periods*, and *end* has been deprecated in favor of `period_range()`.

## Examples

```
>>> idx = pd.PeriodIndex(year=year_arr, quarter=q_arr)
```

## Attributes

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <i>day</i>           | The days of the period                                    |
| <i>dayofweek</i>     | The day of the week with Monday=0, Sunday=6               |
| <i>dayofyear</i>     | The ordinal day of the year                               |
| <i>days_in_month</i> | The number of days in the month                           |
| <i>daysinmonth</i>   | The number of days in the month                           |
| <i>freq</i>          | Return the frequency object if it is set, otherwise None. |

Table 204 – continued from previous page

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>freqstr</i>      | Return the frequency object as a string if it is set, otherwise None. |
| <i>hour</i>         | The hour of the period                                                |
| <i>is_leap_year</i> | Logical indicating if the date belongs to a leap year                 |
| <i>minute</i>       | The minute of the period                                              |
| <i>month</i>        | The month as January=1, December=12                                   |
| <i>quarter</i>      | The quarter of the date                                               |
| <i>second</i>       | The second of the period                                              |
| <i>week</i>         | The week ordinal of the year                                          |
| <i>weekday</i>      | The day of the week with Monday=0, Sunday=6                           |
| <i>weekofyear</i>   | The week ordinal of the year                                          |
| <i>year</i>         | The year of the period                                                |

**pandas.PeriodIndex.day**

`PeriodIndex.day`  
The days of the period

**pandas.PeriodIndex.dayofweek**

`PeriodIndex.dayofweek`  
The day of the week with Monday=0, Sunday=6

**pandas.PeriodIndex.dayofyear**

`PeriodIndex.dayofyear`  
The ordinal day of the year

**pandas.PeriodIndex.days\_in\_month**

`PeriodIndex.days_in_month`  
The number of days in the month

**pandas.PeriodIndex.daysinmonth**

`PeriodIndex.daysinmonth`  
The number of days in the month

**pandas.PeriodIndex.freq**

`PeriodIndex.freq`  
Return the frequency object if it is set, otherwise None.

### **pandas.PeriodIndex.freqstr**

`PeriodIndex.freqstr`

Return the frequency object as a string if it is set, otherwise None.

### **pandas.PeriodIndex.hour**

`PeriodIndex.hour`

The hour of the period

### **pandas.PeriodIndex.is\_leap\_year**

`PeriodIndex.is_leap_year`

Logical indicating if the date belongs to a leap year

### **pandas.PeriodIndex.minute**

`PeriodIndex.minute`

The minute of the period

### **pandas.PeriodIndex.month**

`PeriodIndex.month`

The month as January=1, December=12

### **pandas.PeriodIndex.quarter**

`PeriodIndex.quarter`

The quarter of the date

### **pandas.PeriodIndex.second**

`PeriodIndex.second`

The second of the period

### **pandas.PeriodIndex.week**

`PeriodIndex.week`

The week ordinal of the year

### **pandas.PeriodIndex.weekday**

`PeriodIndex.weekday`

The day of the week with Monday=0, Sunday=6

pandas.PeriodIndex.weekofyear

PeriodIndex.**weekofyear**  
The week ordinal of the year

pandas.PeriodIndex.year

PeriodIndex.**year**  
The year of the period

|            |  |
|------------|--|
| end_time   |  |
| qyear      |  |
| start_time |  |

Methods

|                                       |                                                                         |
|---------------------------------------|-------------------------------------------------------------------------|
| <i>asfreq</i> (*args, **kwargs)       | Convert the Period Array/Index to the specified frequency <i>freq</i> . |
| <i>strftime</i> (*args, **kwargs)     | Convert to Index using specified date_format.                           |
| <i>to_timestamp</i> (*args, **kwargs) | Cast to DatetimeArray/Index.                                            |

pandas.PeriodIndex.asfreq

PeriodIndex.**asfreq** (\*args, \*\*kwargs)  
Convert the Period Array/Index to the specified frequency *freq*.

Parameters

- freq** [str] a frequency
- how** [str {'E', 'S'}] 'E', 'END', or 'FINISH' for end, 'S', 'START', or 'BEGIN' for start. Whether the elements should be aligned to the end or start within pa period. January 31st ('END') vs. January 1st ('START') for example.

Returns

**new** [Period Array/Index with the new frequency]

Examples

```
>>> pidx = pd.period_range('2010-01-01', '2015-01-01', freq='A')
>>> pidx
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010, ..., 2015]
Length: 6, Freq: A-DEC

>>> pidx.asfreq('M')
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010-12, ..., 2015-12]
Length: 6, Freq: M
```

```
>>> pidx.asfreq('M', how='S')
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010-01, ..., 2015-01]
Length: 6, Freq: M
```

## pandas.PeriodIndex.strftime

`PeriodIndex.strftime(*args, **kwargs)`

Convert to Index using specified date\_format.

Return an Index of formatted strings specified by date\_format, which supports the same string format as the python standard library. Details of the string format can be found in [python string format doc](#)

### Parameters

**date\_format** [str] Date format string (e.g. “%Y-%m-%d”).

### Returns

**Index** Index of formatted strings

**See also:**

**to\_datetime** Convert the given argument to datetime.

**DatetimeIndex.normalize** Return DatetimeIndex with times to midnight.

**DatetimeIndex.round** Round the DatetimeIndex to the specified freq.

**DatetimeIndex.floor** Floor the DatetimeIndex to the specified freq.

## Examples

```
>>> rng = pd.date_range(pd.Timestamp("2018-03-10 09:00"),
...                     periods=3, freq='s')
>>> rng.strftime('%B %d, %Y, %r')
Index(['March 10, 2018, 09:00:00 AM', 'March 10, 2018, 09:00:01 AM',
       'March 10, 2018, 09:00:02 AM'],
      dtype='object')
```

## pandas.PeriodIndex.to\_timestamp

`PeriodIndex.to_timestamp(*args, **kwargs)`

Cast to DatetimeArray/Index.

### Parameters

**freq** [string or DateOffset, optional] Target frequency. The default is ‘D’ for week or longer, ‘S’ otherwise

**how** [{‘s’, ‘e’, ‘start’, ‘end’}]

### Returns

**DatetimeArray/Index**

### 35.7.8.2 Properties

|                                        |                                                                       |
|----------------------------------------|-----------------------------------------------------------------------|
| <code>PeriodIndex.day</code>           | The days of the period                                                |
| <code>PeriodIndex.dayofweek</code>     | The day of the week with Monday=0, Sunday=6                           |
| <code>PeriodIndex.dayofyear</code>     | The ordinal day of the year                                           |
| <code>PeriodIndex.days_in_month</code> | The number of days in the month                                       |
| <code>PeriodIndex.daysinmonth</code>   | The number of days in the month                                       |
| <code>PeriodIndex.end_time</code>      |                                                                       |
| <code>PeriodIndex.freq</code>          | Return the frequency object if it is set, otherwise None.             |
| <code>PeriodIndex.freqstr</code>       | Return the frequency object as a string if it is set, otherwise None. |
| <code>PeriodIndex.hour</code>          | The hour of the period                                                |
| <code>PeriodIndex.is_leap_year</code>  | Logical indicating if the date belongs to a leap year                 |
| <code>PeriodIndex.minute</code>        | The minute of the period                                              |
| <code>PeriodIndex.month</code>         | The month as January=1, December=12                                   |
| <code>PeriodIndex.quarter</code>       | The quarter of the date                                               |
| <code>PeriodIndex.qyear</code>         |                                                                       |
| <code>PeriodIndex.second</code>        | The second of the period                                              |
| <code>PeriodIndex.start_time</code>    |                                                                       |
| <code>PeriodIndex.week</code>          | The week ordinal of the year                                          |
| <code>PeriodIndex.weekday</code>       | The day of the week with Monday=0, Sunday=6                           |
| <code>PeriodIndex.weekofyear</code>    | The week ordinal of the year                                          |
| <code>PeriodIndex.year</code>          | The year of the period                                                |

#### pandas.PeriodIndex.end\_time

`PeriodIndex.end_time`

#### pandas.PeriodIndex.qyear

`PeriodIndex.qyear`

#### pandas.PeriodIndex.start\_time

`PeriodIndex.start_time`

### 35.7.8.3 Methods

|                                                        |                                                                         |
|--------------------------------------------------------|-------------------------------------------------------------------------|
| <code>PeriodIndex.asfreq(*args, **kwargs)</code>       | Convert the Period Array/Index to the specified frequency <i>freq</i> . |
| <code>PeriodIndex.strftime(*args, **kwargs)</code>     | Convert to Index using specified <code>date_format</code> .             |
| <code>PeriodIndex.to_timestamp(*args, **kwargs)</code> | Cast to DatetimeArray/Index.                                            |

{{ header }}

## 35.8 Date Offsets

### 35.8.1 DateOffset

*DateOffset*([n, normalize])

Standard kind of date increment used for a date range.

---

#### 35.8.1.1 pandas.tseries.offsets.DateOffset

**class** pandas.tseries.offsets.**DateOffset** (n=1, normalize=False, \*\*kws)

Standard kind of date increment used for a date range.

Works exactly like `relativedelta` in terms of the keyword args you pass in, use of the keyword `n` is discouraged—you would be better off specifying `n` in the keywords you use, but regardless it is there for you. `n` is needed for `DateOffset` subclasses.

`DateOffsets` work as follows. Each offset specify a set of dates that conform to the `DateOffset`. For example, `Bday` defines this set to be the set of dates that are weekdays (M-F). To test if a date is in the set of a `DateOffset` `dateOffset` we can use the `onOffset` method: `dateOffset.onOffset(date)`.

If a date is not on a valid date, the `rollback` and `rollforward` methods can be used to roll the date to the nearest valid date before/after the date.

`DateOffsets` can be created to move dates forward a given number of valid dates. For example, `Bday(2)` can be added to a date to move it two business days forward. If the date does not start on a valid date, first it is moved to a valid date. Thus pseudo code is:

```
def __add__(date): date = rollback(date) # does nothing if date is valid return date + <n number of periods>
```

When a date offset is created for a negative number of periods, the date is first rolled forward. The pseudo code is:

```
def __add__(date): date = rollforward(date) # does nothing is date is valid return date + <n number of periods>
```

Zero presents a problem. Should it roll forward or back? We arbitrarily have it rollforward:

```
date + BDay(0) == BDay.rollforward(date)
```

Since 0 is a bit weird, we suggest avoiding its use.

#### Parameters

**n** [int, default 1] The number of time periods the offset represents.

**normalize** [bool, default False] Whether to round the result of a `DateOffset` addition down to the previous midnight.

**\*\*kws** Temporal parameter that add to or replace the offset value.

Parameters that **add** to the offset (like `Timedelta`):

- years
- months
- weeks
- days
- hours
- minutes
- seconds

- microseconds
- nanoseconds

Parameters that **replace** the offset value:

- year
- month
- day
- weekday
- hour
- minute
- second
- microsecond
- nanosecond

See also:

`dateutil.relativedelta.relativedelta`

## Examples

```
>>> ts = pd.Timestamp('2017-01-01 09:10:11')
>>> ts + DateOffset(months=3)
Timestamp('2017-04-01 09:10:11')
```

```
>>> ts = pd.Timestamp('2017-01-01 09:10:11')
>>> ts + DateOffset(month=3)
Timestamp('2017-03-01 09:10:11')
```

## Attributes

*base*

Returns a copy of the calling offset object with `n=1` and all other attributes equal.

---

## `pandas.tseries.offsets.DateOffset.base`

`DateOffset.base`

Returns a copy of the calling offset object with `n=1` and all other attributes equal.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |

## Methods

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

### pandas.tseries.offsets.DateOffset.apply\_index

DateOffset.**apply\_index**

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### Parameters

**i** [DatetimeIndex]

#### Returns

**y** [DatetimeIndex]

### pandas.tseries.offsets.DateOffset.rollback

DateOffset.**rollback**(dt)

Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.DateOffset.rollforward

DateOffset.**rollforward**(dt)

Roll provided date forward to next offset only if not on offset.

|                                |  |
|--------------------------------|--|

|                             |
|-----------------------------|
| <i>DateOffset.freqstr</i>   |
| <i>DateOffset.kwds</i>      |
| <i>DateOffset.name</i>      |
| <i>DateOffset.nanos</i>     |
| <i>DateOffset.normalize</i> |
| <i>DateOffset.rule_code</i> |

#### **pandas.tseries.offsets.DateOffset.freqstr**

`DateOffset.freqstr`

#### **pandas.tseries.offsets.DateOffset.kwds**

`DateOffset.kwds`

#### **pandas.tseries.offsets.DateOffset.name**

`DateOffset.name`

#### **pandas.tseries.offsets.DateOffset.nanos**

`DateOffset.nanos`

#### **pandas.tseries.offsets.DateOffset.normalize**

`DateOffset.normalize = False`

#### **pandas.tseries.offsets.DateOffset.rule\_code**

`DateOffset.rule_code`

### **35.8.1.3 Methods**

---

*`DateOffset.apply(other)`*

---

*`DateOffset.copy`*

---

*`DateOffset.isAnchored()`*

---

*`DateOffset.onOffset(dt)`*

---

#### **pandas.tseries.offsets.DateOffset.apply**

`DateOffset.apply(other)`

#### **pandas.tseries.offsets.DateOffset.copy**

`DateOffset.copy`

#### **pandas.tseries.offsets.DateOffset.isAnchored**

`DateOffset.isAnchored()`

## pandas.tseries.offsets.DateOffset.onOffset

`DateOffset.onOffset(dt)`

## 35.8.2 BusinessDay

`BusinessDay([n, normalize, offset])`

DateOffset subclass representing possibly n business days.

---

### 35.8.2.1 pandas.tseries.offsets.BusinessDay

**class** pandas.tseries.offsets.**BusinessDay**(*n=1*, *normalize=False*, *offset=datetime.timedelta(0)*)  
DateOffset subclass representing possibly n business days.

#### Attributes

*base*

Returns a copy of the calling offset object with n=1 and all other attributes equal.

---

*offset*

Alias for self.\_offset.

---

#### pandas.tseries.offsets.BusinessDay.base

`BusinessDay.base`

Returns a copy of the calling offset object with n=1 and all other attributes equal.

#### pandas.tseries.offsets.BusinessDay.offset

`BusinessDay.offset`

Alias for self.\_offset.

|                  |  |
|------------------|--|

| <b>kwds</b>      |  |
| <b>name</b>      |  |
| <b>nanos</b>     |  |
| <b>rule_code</b> |  |

#### Methods

*rollback(dt)*

Roll provided date backward to next offset only if not on offset.

---

*rollforward(dt)*

Roll provided date forward to next offset only if not on offset.

---

**pandas.tseries.offsets.BusinessDay.rollback**

`BusinessDay.rollback(dt)`

Roll provided date backward to next offset only if not on offset.

**pandas.tseries.offsets.BusinessDay.rollforward**

`BusinessDay.rollforward(dt)`

Roll provided date forward to next offset only if not on offset.

|                          |  |

## 35.8.3 BusinessHour

|                                                               |                                                            |
|---------------------------------------------------------------|------------------------------------------------------------|
| <code>BusinessHour([n, normalize, start, end, offset])</code> | DateOffset subclass representing possibly n business days. |
|---------------------------------------------------------------|------------------------------------------------------------|

### 35.8.3.1 pandas.tseries.offsets.BusinessHour

**class** pandas.tseries.offsets.**BusinessHour** (*n=1, normalize=False, start='09:00', end='17:00', offset=datetime.timedelta(0)*)  
DateOffset subclass representing possibly n business days.  
New in version 0.16.1.

Attributes

|                  |                                                                                      |
|------------------|--------------------------------------------------------------------------------------|
| <i>base</i>      | Returns a copy of the calling offset object with n=1 and all other attributes equal. |
| <i>next_bday</i> | Used for moving to next business day.                                                |
| <i>offset</i>    | Alias for self._offset.                                                              |

pandas.tseries.offsets.BusinessHour.base

BusinessHour.**base**  
Returns a copy of the calling offset object with n=1 and all other attributes equal.

pandas.tseries.offsets.BusinessHour.next\_bday

BusinessHour.**next\_bday**  
Used for moving to next business day.

pandas.tseries.offsets.BusinessHour.offset

BusinessHour.**offset**  
Alias for self.\_offset.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |
| <b>kwds</b>      |  |
| <b>name</b>      |  |
| <b>nanos</b>     |  |
| <b>rule_code</b> |  |

Methods

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

pandas.tseries.offsets.BusinessHour.apply\_index

BusinessHour.**apply\_index**  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

Parameters

**i** [DatetimeIndex]

Returns

y [DatetimeIndex]

### **pandas.tseries.offsets.BusinessHour.rollback**

BusinessHour.**rollback**(dt)

Roll provided date backward to next offset only if not on offset.

### **pandas.tseries.offsets.BusinessHour.rollforward**

BusinessHour.**rollforward**(dt)

Roll provided date forward to next offset only if not on offset.

|                   |  |
|-------------------|--|

```

**35.8.4 CustomBusinessDay**

---

```
CustomBusinessDay([n, normalize, weekmask, DateOffset subclass representing possibly n custom  
...])                                business days, excluding holidays.
```

---

**35.8.4.1 pandas.tseries.offsets.CustomBusinessDay**

```
class pandas.tseries.offsets.CustomBusinessDay(n=1,      normalize=False,      week-  
                                              mask='Mon Tue Wed Thu Fri',  
                                              holidays=None,      calendar=None,  
                                              offset=datetime.timedelta(0))
```

*DateOffset* subclass representing possibly *n* custom business days, excluding holidays.

**Parameters**

**n** [int, default 1]

**normalize** [bool, default False] Normalize start/end dates to midnight before generating date range

**weekmask** [str, Default 'Mon Tue Wed Thu Fri'] weekmask of valid business days, passed to `numpy.busdaycalendar`

**holidays** [list] list/array of dates to exclude from the set of valid business days, passed to `numpy.busdaycalendar`

**calendar** [pd.HolidayCalendar or np.busdaycalendar]

**offset** [timedelta, default timedelta(0)]

### Attributes

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| <code>base</code>   | Returns a copy of the calling offset object with n=1 and all other attributes equal. |
| <code>offset</code> | Alias for <code>self._offset</code> .                                                |

### `pandas.tseries.offsets.CustomBusinessDay.base`

`CustomBusinessDay.base`

Returns a copy of the calling offset object with n=1 and all other attributes equal.

### `pandas.tseries.offsets.CustomBusinessDay.offset`

`CustomBusinessDay.offset`

Alias for `self._offset`.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |

### Methods

|                              |                                                                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_index(i)</code>  | Vectorized apply of DateOffset to DatetimeIndex, raises <code>NotImplementedError</code> for offsets without a vectorized implementation. |
| <code>rollback(dt)</code>    | Roll provided date backward to next offset only if not on offset.                                                                         |
| <code>rollforward(dt)</code> | Roll provided date forward to next offset only if not on offset.                                                                          |

### `pandas.tseries.offsets.CustomBusinessDay.apply_index`

`CustomBusinessDay.apply_index(i)`

Vectorized apply of DateOffset to DatetimeIndex, raises `NotImplementedError` for offsets without a vectorized implementation.

**Parameters**

**i** [DatetimeIndex]

**Returns**

**y** [DatetimeIndex]

**pandas.tseries.offsets.CustomBusinessDay.rollback**

`CustomBusinessDay.rollback(dt)`  
Roll provided date backward to next offset only if not on offset.

**pandas.tseries.offsets.CustomBusinessDay.rollforward**

`CustomBusinessDay.rollforward(dt)`  
Roll provided date forward to next offset only if not on offset.

|                         |  |
|-------------------------|--|

### 35.8.5 CustomBusinessHour

---

*`CustomBusinessHour([n, normalize, weekmask, ...])`* DateOffset subclass representing possibly n custom business days.

---

#### 35.8.5.1 `pandas.tseries.offsets.CustomBusinessHour`

**class** `pandas.tseries.offsets.CustomBusinessHour` (*n=1, normalize=False, weekmask='Mon Tue Wed Thu Fri', holidays=None, calendar=None, start='09:00', end='17:00', offset=datetime.timedelta(0)*)

DateOffset subclass representing possibly n custom business days.

New in version 0.18.1.

Attributes

|                  |                                                                                      |
|------------------|--------------------------------------------------------------------------------------|
| <i>base</i>      | Returns a copy of the calling offset object with n=1 and all other attributes equal. |
| <i>next_bday</i> | Used for moving to next business day.                                                |
| <i>offset</i>    | Alias for self._offset.                                                              |

pandas.tseries.offsets.CustomBusinessHour.base

CustomBusinessHour.**base**  
Returns a copy of the calling offset object with n=1 and all other attributes equal.

pandas.tseries.offsets.CustomBusinessHour.next\_bday

CustomBusinessHour.**next\_bday**  
Used for moving to next business day.

pandas.tseries.offsets.CustomBusinessHour.offset

CustomBusinessHour.**offset**  
Alias for self.\_offset.

|                  |  |

Methods

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

pandas.tseries.offsets.CustomBusinessHour.apply\_index

CustomBusinessHour.**apply\_index**  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

Parameters

**i** [DatetimeIndex]

Returns

y [DatetimeIndex]

### pandas.tseries.offsets.CustomBusinessHour.rollback

CustomBusinessHour.**rollback**(dt)

Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.CustomBusinessHour.rollforward

CustomBusinessHour.**rollforward**(dt)

Roll provided date forward to next offset only if not on offset.

|                   |  |

#### Methods

*rollback(dt)*

Roll provided date backward to next offset only if not on offset.

---

*rollforward(dt)*

Roll provided date forward to next offset only if not on offset.

---

**pandas.tseries.offsets.MonthEnd.rollback**

`MonthEnd.rollback(dt)`

Roll provided date backward to next offset only if not on offset.

**pandas.tseries.offsets.MonthEnd.rollforward**

`MonthEnd.rollforward(dt)`

Roll provided date forward to next offset only if not on offset.

### 35.8.11 CustomBusinessMonthEnd

---

|                                                                      |                                                                                                      |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <i>CustomBusinessMonthEnd</i> ([ <i>n</i> , <i>normalize</i> , ...]) | DateOffset subclass representing one custom business month, incrementing between end of month dates. |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|

---

#### 35.8.11.1 pandas.tseries.offsets.CustomBusinessMonthEnd

**class** pandas.tseries.offsets.**CustomBusinessMonthEnd**(*n=1*, *normalize=False*, *weekmask='Mon Tue Wed Thu Fri'*, *holidays=None*, *calendar=None*, *offset=datetime.timedelta(0)*)

DateOffset subclass representing one custom business month, incrementing between end of month dates.

##### Parameters

**n** [int, default 1]

**normalize** [bool, default False] Normalize start/end dates to midnight before generating date range

**weekmask** [str, Default 'Mon Tue Wed Thu Fri'] weekmask of valid business days, passed to `numpy.busdaycalendar`

**holidays** [list] list/array of dates to exclude from the set of valid business days, passed to `numpy.busdaycalendar`

**calendar** [pd.HolidayCalendar or np.busdaycalendar]

**offset** [timedelta, default timedelta(0)]

##### Attributes

|                   |                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------|
| <i>base</i>       | Returns a copy of the calling offset object with <i>n=1</i> and all other attributes equal. |
| <i>cbday_roll</i> | Define default roll function to be called in apply method.                                  |
| <i>month_roll</i> | Define default roll function to be called in apply method.                                  |
| <i>offset</i>     | Alias for <code>self._offset</code> .                                                       |

#### pandas.tseries.offsets.CustomBusinessMonthEnd.base

CustomBusinessMonthEnd.**base**

Returns a copy of the calling offset object with *n=1* and all other attributes equal.

**pandas.tseries.offsets.CustomBusinessMonthEnd.cbday\_roll**

CustomBusinessMonthEnd.**cbday\_roll**  
Define default roll function to be called in apply method.

**pandas.tseries.offsets.CustomBusinessMonthEnd.month\_roll**

CustomBusinessMonthEnd.**month\_roll**  
Define default roll function to be called in apply method.

**pandas.tseries.offsets.CustomBusinessMonthEnd.offset**

CustomBusinessMonthEnd.**offset**  
Alias for self.\_offset.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |
| <b>kwds</b>      |  |
| <b>m_offset</b>  |  |
| <b>name</b>      |  |

| <b>rule_code</b> |  |

**Methods**

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

**pandas.tseries.offsets.CustomBusinessMonthEnd.apply\_index**

CustomBusinessMonthEnd.**apply\_index**  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

**Parameters**

**i** [DatetimeIndex]

**Returns**

**y** [DatetimeIndex]

**pandas.tseries.offsets.CustomBusinessMonthEnd.rollback**

CustomBusinessMonthEnd.**rollback** (*dt*)  
Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.CustomBusinessMonthEnd.rollforward

`CustomBusinessMonthEnd.rollforward(dt)`  
Roll provided date forward to next offset only if not on offset.

## Methods

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

### pandas.tseries.offsets.CustomBusinessMonthBegin.apply\_index

CustomBusinessMonthBegin.**apply\_index**

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### Parameters

**i** [DatetimeIndex]

#### Returns

**y** [DatetimeIndex]

### pandas.tseries.offsets.CustomBusinessMonthBegin.rollback

CustomBusinessMonthBegin.**rollback** (*dt*)

Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.CustomBusinessMonthBegin.rollforward

CustomBusinessMonthBegin.**rollforward** (*dt*)

Roll provided date forward to next offset only if not on offset.

|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <i>WeekOfMonth</i> ( <i>n</i> , <i>normalize</i> , <i>week</i> , <i>weekday</i> ) | Describes monthly dates like “the Tuesday of the 2nd week of each month”. |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------|

**35.8.17.1 pandas.tseries.offsets.WeekOfMonth**

**class** `pandas.tseries.offsets.WeekOfMonth` (*n=1, normalize=False, week=0, weekday=0*)  
Describes monthly dates like “the Tuesday of the 2nd week of each month”.

**Parameters**

- n** [int]
- week** [{0, 1, 2, 3, ... }, default 0] 0 is 1st week of month, 1 2nd week, etc.
- weekday** [{0, 1, ..., 6}, default 0] 0: Mondays 1: Tuesdays 2: Wednesdays 3: Thursdays 4: Fridays 5: Saturdays 6: Sundays

**Attributes**

|             |                                                                                      |
|-------------|--------------------------------------------------------------------------------------|
| <i>base</i> | Returns a copy of the calling offset object with n=1 and all other attributes equal. |
|-------------|--------------------------------------------------------------------------------------|

---

### **pandas.tseries.offsets.WeekOfMonth.base**

`WeekOfMonth.base`

Returns a copy of the calling offset object with n=1 and all other attributes equal.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |

### **Methods**

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

---

### **pandas.tseries.offsets.WeekOfMonth.apply\_index**

`WeekOfMonth.apply_index`

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### **Parameters**

**i** [DatetimeIndex]

#### **Returns**

**y** [DatetimeIndex]

### **pandas.tseries.offsets.WeekOfMonth.rollback**

`WeekOfMonth.rollback(dt)`

Roll provided date backward to next offset only if not on offset.

### **pandas.tseries.offsets.WeekOfMonth.rollforward**

`WeekOfMonth.rollforward(dt)`

Roll provided date forward to next offset only if not on offset.

|                         |  |

## 35.8.18 LastWeekOfMonth

|                                                                               |                                                                                      |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <code>LastWeekOfMonth</code> ( <i>n</i> , <i>normalize</i> , <i>weekday</i> ) | Describes monthly dates in last week of month like “the last Tuesday of each month”. |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|

---

### 35.8.18.1 `pandas.tseries.offsets.LastWeekOfMonth`

**class** `pandas.tseries.offsets.LastWeekOfMonth` (*n=1*, *normalize=False*, *weekday=0*)  
 Describes monthly dates in last week of month like “the last Tuesday of each month”.

#### Parameters

**n** [int, default 1]

**weekday** [{0, 1, ..., 6}, default 0] 0: Mondays 1: Tuesdays 2: Wednesdays 3: Thursdays 4: Fridays 5: Saturdays 6: Sundays

#### Attributes

|                   |                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------|
| <code>base</code> | Returns a copy of the calling offset object with <i>n=1</i> and all other attributes equal. |
|-------------------|---------------------------------------------------------------------------------------------|

---

### `pandas.tseries.offsets.LastWeekOfMonth.base`

`LastWeekOfMonth.base`

Returns a copy of the calling offset object with *n=1* and all other attributes equal.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |
| <b>kwds</b>      |  |
| <b>name</b>      |  |
| <b>nanos</b>     |  |
| <b>rule_code</b> |  |

Methods

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

pandas.tseries.offsets.LastWeekOfMonth.apply\_index

LastWeekOfMonth.**apply\_index**  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

Parameters

**i** [DatetimeIndex]

Returns

**y** [DatetimeIndex]

pandas.tseries.offsets.LastWeekOfMonth.rollback

LastWeekOfMonth.**rollback** (*dt*)  
Roll provided date backward to next offset only if not on offset.

pandas.tseries.offsets.LastWeekOfMonth.rollforward

LastWeekOfMonth.**rollforward** (*dt*)  
Roll provided date forward to next offset only if not on offset.

|                   |  |

| <b>rule_code</b> |  |

## Methods

|                              |                                                                   |
|------------------------------|-------------------------------------------------------------------|
| <code>rollback(dt)</code>    | Roll provided date backward to next offset only if not on offset. |
| <code>rollforward(dt)</code> | Roll provided date forward to next offset only if not on offset.  |

---

### `pandas.tseries.offsets.QuarterBegin.rollback`

`QuarterBegin.rollback(dt)`  
Roll provided date backward to next offset only if not on offset.

### `pandas.tseries.offsets.QuarterBegin.rollforward`

`QuarterBegin.rollforward(dt)`  
Roll provided date forward to next offset only if not on offset.

|                          |  |

**35.8.24 YearOffset**

*YearOffset*([n, normalize, month])DateOffset that just needs a month.

---

### 35.8.24.1 pandas.tseries.offsets.YearOffset

**class** pandas.tseries.offsets.**YearOffset** (*n=1, normalize=False, month=None*)

DateOffset that just needs a month.

#### Attributes

*base*Returns a copy of the calling offset object with n=1 and all other attributes equal.

---

#### pandas.tseries.offsets.YearOffset.base

*YearOffset*.**base**

Returns a copy of the calling offset object with n=1 and all other attributes equal.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |
| <b>kwds</b>      |  |
| <b>name</b>      |  |
| <b>nanos</b>     |  |
| <b>rule_code</b> |  |

#### Methods

*rollback*(dt)

Roll provided date backward to next offset only if not on offset.

*rollforward*(dt)Roll provided date forward to next offset only if not on offset.

---

#### pandas.tseries.offsets.YearOffset.rollback

*YearOffset*.**rollback** (*dt*)

Roll provided date backward to next offset only if not on offset.

#### pandas.tseries.offsets.YearOffset.rollforward

*YearOffset*.**rollforward** (*dt*)

Roll provided date forward to next offset only if not on offset.

## 35.8.29 FY5253

---

`FY5253([n, normalize, weekday, ...])`

Describes 52-53 week fiscal year.

---

### 35.8.29.1 pandas.tseries.offsets.FY5253

**class** `pandas.tseries.offsets.FY5253` (*n=1, normalize=False, weekday=0, startingMonth=1, variation='nearest'*)

Describes 52-53 week fiscal year. This is also known as a 4-4-5 calendar.

It is used by companies that desire that their fiscal year always end on the same day of the week.

It is a method of managing accounting periods. It is a common calendar structure for some industries, such as retail, manufacturing and parking industry.

For more information see: [http://en.wikipedia.org/wiki/4-4-5\\_calendar](http://en.wikipedia.org/wiki/4-4-5_calendar)

The year may either: - end on the last X day of the Y month. - end on the last X day closest to the last day of the Y month.

X is a specific day of the week. Y is a certain month of the year

#### Parameters

**n** [int]

**weekday** [{0, 1, ..., 6}] 0: Mondays 1: Tuesdays 2: Wednesdays 3: Thursdays 4: Fridays 5: Saturdays 6: Sundays

**startingMonth** [The month in which fiscal years end. {1, 2, ..., 12}]

**variation** [str] {"nearest", "last"} for "LastOfMonth" or "NearestEndMonth"

#### Attributes

|             |                                                                                      |
|-------------|--------------------------------------------------------------------------------------|
| <i>base</i> | Returns a copy of the calling offset object with n=1 and all other attributes equal. |
|-------------|--------------------------------------------------------------------------------------|

**pandas.tseries.offsets.FY5253.base**

**FY5253.base**  
Returns a copy of the calling offset object with n=1 and all other attributes equal.

|                  |  |
|------------------|--|
| <b>freqstr</b>   |  |
| <b>kwds</b>      |  |
| <b>name</b>      |  |
| <b>nanos</b>     |  |
| <b>rule_code</b> |  |

**Methods**

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply_index</i>     | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback(dt)</i>    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward(dt)</i> | Roll provided date forward to next offset only if not on offset.                                                             |

**pandas.tseries.offsets.FY5253.apply\_index**

**FY5253.apply\_index**  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

**Parameters**

**i** [DatetimeIndex]

**Returns**

**y** [DatetimeIndex]

**pandas.tseries.offsets.FY5253.rollback**

**FY5253.rollback(dt)**  
Roll provided date backward to next offset only if not on offset.

**pandas.tseries.offsets.FY5253.rollforward**

**FY5253.rollforward(dt)**  
Roll provided date forward to next offset only if not on offset.

```
FY5253.onOffset (dt)
```

### **35.8.30 FY5253Quarter**

```
FY5253Quarter([n, normalize, weekday, ...])
```

DateOffset increments between business quarter dates for 52-53 week fiscal year (also known as a 4-4-5 calendar).

---

#### **35.8.30.1 pandas.tseries.offsets.FY5253Quarter**

```
class pandas.tseries.offsets.FY5253Quarter (n=1, normalize=False, weekday=0, startingMonth=1, qtr_with_extra_week=1, variation='nearest')
```

DateOffset increments between business quarter dates for 52-53 week fiscal year (also known as a 4-4-5 calendar).

It is used by companies that desire that their fiscal year always end on the same day of the week.

It is a method of managing accounting periods. It is a common calendar structure for some industries, such as retail, manufacturing and parking industry.

For more information see: [http://en.wikipedia.org/wiki/4-4-5\\_calendar](http://en.wikipedia.org/wiki/4-4-5_calendar)

The year may either: - end on the last X day of the Y month. - end on the last X day closest to the last day of the Y month.

X is a specific day of the week. Y is a certain month of the year

startingMonth = 1 corresponds to dates like 1/31/2007, 4/30/2007, ... startingMonth = 2 corresponds to dates like 2/28/2007, 5/31/2007, ... startingMonth = 3 corresponds to dates like 3/30/2007, 6/29/2007, ...

#### Parameters

**n** [int]

**weekday** [{0, 1, ..., 6}] 0: Mondays 1: Tuesdays 2: Wednesdays 3: Thursdays 4: Fridays 5: Saturdays 6: Sundays

**startingMonth** [The month in which fiscal years end. {1, 2, ..., 12}]

**qtr\_with\_extra\_week** [The quarter number that has the leap] or 14 week when needed. {1,2,3,4}

**variation** [str] {"nearest", "last"} for "LastOfMonth" or "NearestEndMonth"

#### Attributes

| <i>rollforward</i> (dt) | Roll provided date forward to next offset only if not on offset.                                                             |

pandas.tseries.offsets.Easter.apply\_index

Easter.apply\_index  
Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

**Parameters**

**i** [DatetimeIndex]

**Returns**

**y** [DatetimeIndex]

**pandas.tseries.offsets.Easter.rollback**

`Easter.rollback(dt)`  
Roll provided date backward to next offset only if not on offset.

**pandas.tseries.offsets.Easter.rollforward**

`Easter.rollforward(dt)`  
Roll provided date forward to next offset only if not on offset.

|                         |  |

## Methods

|                         |                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>apply</i> (other)    |                                                                                                                              |
| <i>apply_index</i>      | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback</i> (dt)    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward</i> (dt) | Roll provided date forward to next offset only if not on offset.                                                             |

### **pandas.tseries.offsets.Hour.apply**

Hour.**apply** (other)

### **pandas.tseries.offsets.Hour.apply\_index**

Hour.**apply\_index**

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### **Parameters**

**i** [DatetimeIndex]

#### **Returns**

**y** [DatetimeIndex]

### **pandas.tseries.offsets.Hour.rollback**

Hour.**rollback** (dt)

Roll provided date backward to next offset only if not on offset.

### **pandas.tseries.offsets.Hour.rollforward**

Hour.**rollforward** (dt)

Roll provided date forward to next offset only if not on offset.

| <i>apply</i> (other)    |                                                                                                                              |
| <i>apply_index</i>      | Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation. |
| <i>rollback</i> (dt)    | Roll provided date backward to next offset only if not on offset.                                                            |
| <i>rollforward</i> (dt) | Roll provided date forward to next offset only if not on offset.                                                             |

### pandas.tseries.offsets.Nano.apply

Nano.**apply** (other)

### pandas.tseries.offsets.Nano.apply\_index

Nano.**apply\_index**

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### Parameters

**i** [DatetimeIndex]

#### Returns

**y** [DatetimeIndex]

### pandas.tseries.offsets.Nano.rollback

Nano.**rollback** (dt)

Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.Nano.rollforward

Nano.**rollforward** (dt)

Roll provided date forward to next offset only if not on offset.

|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CDay.apply(other)</code>    |                                                                                                                                           |
| <code>CDay.apply_index(i)</code>  | Vectorized apply of DateOffset to DatetimeIndex, raises <code>NotImplementedError</code> for offsets without a vectorized implementation. |
| <code>CDay.copy</code>            |                                                                                                                                           |
| <code>CDay.isAnchored()</code>    |                                                                                                                                           |
| <code>CDay.onOffset(dt)</code>    |                                                                                                                                           |
| <code>CDay.rollback(dt)</code>    | Roll provided date backward to next offset only if not on offset.                                                                         |
| <code>CDay.rollforward(dt)</code> | Roll provided date forward to next offset only if not on offset.                                                                          |

### pandas.tseries.offsets.CDay.apply

`CDay.apply(other)`

### pandas.tseries.offsets.CDay.apply\_index

`CDay.apply_index(i)`

Vectorized apply of DateOffset to DatetimeIndex, raises NotImplementedError for offsets without a vectorized implementation.

#### Parameters

**i** [DatetimeIndex]

#### Returns

**y** [DatetimeIndex]

### pandas.tseries.offsets.CDay.copy

`CDay.copy`

### pandas.tseries.offsets.CDay.isAnchored

`CDay.isAnchored()`

### pandas.tseries.offsets.CDay.onOffset

`CDay.onOffset(dt)`

### pandas.tseries.offsets.CDay.rollback

`CDay.rollback(dt)`

Roll provided date backward to next offset only if not on offset.

### pandas.tseries.offsets.CDay.rollforward

`CDay.rollforward(dt)`

Roll provided date forward to next offset only if not on offset.

## 35.9 Frequencies

`to_offset(freq)`

Return DateOffset object from string or tuple representation or datetime.timedelta object

---

### 35.9.1 pandas.tseries.frequencies.to\_offset

`pandas.tseries.frequencies.to_offset` (*freq*)

Return DateOffset object from string or tuple representation or datetime.timedelta object

#### Parameters

**freq** [str, tuple, datetime.timedelta, DateOffset or None]

#### Returns

**delta** [DateOffset] None if freq is None

#### Raises

**ValueError** If freq is an invalid frequency

#### See also:

`pandas.DateOffset`

#### Examples

```
>>> to_offset('5min')
<5 * Minutes>
```

```
>>> to_offset('1D1H')
<25 * Hours>
```

```
>>> to_offset(('W', 2))
<2 * Weeks: weekday=6>
```

```
>>> to_offset((2, 'B'))
<2 * BusinessDays>
```

```
>>> to_offset(datetime.timedelta(days=1))
<Day>
```

```
>>> to_offset(Hour())
<Hour>
```

{{ header }}

## 35.10 Window

Rolling objects are returned by `.rolling` calls: `pandas.DataFrame.rolling()`, `pandas.Series.rolling()`, etc. Expanding objects are returned by `.expanding` calls: `pandas.DataFrame.expanding()`, `pandas.Series.expanding()`, etc. EWM objects are returned by `.ewm` calls: `pandas.DataFrame.ewm()`, `pandas.Series.ewm()`, etc.

### 35.10.1 Standard moving window functions

|                                                    |                                                                  |
|----------------------------------------------------|------------------------------------------------------------------|
| <i>Rolling.count()</i>                             | The rolling count of any non-NaN observations inside the window. |
| <i>Rolling.sum(*args, **kwargs)</i>                | Calculate rolling sum of given DataFrame or Series.              |
| <i>Rolling.mean(*args, **kwargs)</i>               | Calculate the rolling mean of the values.                        |
| <i>Rolling.median(**kwargs)</i>                    | Calculate the rolling median.                                    |
| <i>Rolling.var([ddof])</i>                         | Calculate unbiased rolling variance.                             |
| <i>Rolling.std([ddof])</i>                         | Calculate rolling standard deviation.                            |
| <i>Rolling.min(*args, **kwargs)</i>                | Calculate the rolling minimum.                                   |
| <i>Rolling.max(*args, **kwargs)</i>                | Calculate the rolling maximum.                                   |
| <i>Rolling.corr([other, pairwise])</i>             | Calculate rolling correlation.                                   |
| <i>Rolling.cov([other, pairwise, ddof])</i>        | Calculate the rolling sample covariance.                         |
| <i>Rolling.skew(**kwargs)</i>                      | Unbiased rolling skewness.                                       |
| <i>Rolling.kurt(**kwargs)</i>                      | Calculate unbiased rolling kurtosis.                             |
| <i>Rolling.apply(func[, raw, args, kwargs])</i>    | The rolling function's apply function.                           |
| <i>Rolling.aggregate(arg, *args, **kwargs)</i>     | Aggregate using one or more operations over the specified axis.  |
| <i>Rolling.quantile(quantile[, interpolation])</i> | Calculate the rolling quantile.                                  |
| <i>Window.mean(*args, **kwargs)</i>                | Calculate the window mean of the values.                         |
| <i>Window.sum(*args, **kwargs)</i>                 | Calculate window sum of given DataFrame or Series.               |

### 35.10.1.1 pandas.core.window.Rolling.count

`Rolling.count()`

The rolling count of any non-NaN observations inside the window.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation.

#### See also:

**pandas.Series.rolling** Calling object with Series data.

**pandas.DataFrame.rolling** Calling object with DataFrames.

**pandas.DataFrame.count** Count of the full DataFrame.

#### Examples

```
>>> s = pd.Series([2, 3, np.nan, 10])
>>> s.rolling(2).count()
0    1.0
1    2.0
2    1.0
3    1.0
dtype: float64
>>> s.rolling(3).count()
0    1.0
1    2.0
2    2.0
3    2.0
dtype: float64
>>> s.rolling(4).count()
```

(continues on next page)

(continued from previous page)

```
0    1.0
1    2.0
2    2.0
3    3.0
dtype: float64
```

### 35.10.1.2 pandas.core.window.Rolling.sum

`Rolling.sum(*args, **kwargs)`

Calculate rolling sum of given DataFrame or Series.

#### Parameters

**\*args, \*\*kwargs** For compatibility with other rolling methods. Has no effect on the computed value.

#### Returns

**Series or DataFrame** Same type as the input, with the same index, containing the rolling sum.

**See also:**

**Series.sum** Reducing sum for Series.

**DataFrame.sum** Reducing sum for DataFrame.

#### Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64
```

```
>>> s.rolling(3).sum()
0    NaN
1    NaN
2    6.0
3    9.0
4   12.0
dtype: float64
```

```
>>> s.expanding(3).sum()
0    NaN
1    NaN
2    6.0
3   10.0
4   15.0
dtype: float64
```

```
>>> s.rolling(3, center=True).sum()
0      NaN
1      6.0
2      9.0
3     12.0
4      NaN
dtype: float64
```

For DataFrame, each rolling sum is computed column-wise.

```
>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25
```

```
>>> df.rolling(3).sum()
   A    B
0  NaN  NaN
1  NaN  NaN
2  6.0 14.0
3  9.0 29.0
4 12.0 50.0
```

### 35.10.1.3 pandas.core.window.Rolling.mean

`Rolling.mean(*args, **kwargs)`

Calculate the rolling mean of the values.

#### Parameters

**\*args** Under Review.

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation.

#### See also:

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.mean** Equivalent method for Series.

**DataFrame.mean** Equivalent method for DataFrame.

#### Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0      NaN
1      NaN
2      2.0
3      3.0
dtype: float64
```

### 35.10.1.4 pandas.core.window.Rolling.median

`Rolling.median(**kwargs)`  
Calculate the rolling median.

#### Parameters

**\*\*kwargs** For compatibility with other rolling methods. Has no effect on the computed median.

#### Returns

**Series or DataFrame** Returned type is the same as the original object.

**See also:**

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.median** Equivalent method for Series.

**DataFrame.median** Equivalent method for DataFrame.

### Examples

Compute the rolling median of a series with a window size of 3.

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.rolling(3).median()
0      NaN
1      NaN
2      1.0
3      2.0
4      3.0
dtype: float64
```

### 35.10.1.5 pandas.core.window.Rolling.var

`Rolling.var(ddof=1, *args, **kwargs)`  
Calculate unbiased rolling variance.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

#### Parameters

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs** For NumPy compatibility. No additional arguments are used.

#### Returns

**Series or DataFrame** Returns the same object type as the caller of the rolling calculation.

#### See also:

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.var** Equivalent method for Series.

**DataFrame.var** Equivalent method for DataFrame.

**numpy.var** Equivalent method for Numpy array.

#### Notes

The default *ddof* of 1 used in `Series.var()` is different than the default *ddof* of 0 in `numpy.var()`.

A minimum of 1 period is required for the rolling calculation.

#### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).var()
0      NaN
1      NaN
2    0.333333
3    1.000000
4    1.000000
5    1.333333
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).var()
0      NaN
1      NaN
2    0.333333
3    0.916667
4    0.800000
5    0.700000
6    0.619048
dtype: float64
```

#### 35.10.1.6 pandas.core.window.Rolling.std

`Rolling.std(ddof=1, *args, **kwargs)`  
Calculate rolling standard deviation.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

#### Parameters

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs** For NumPy compatibility. No additional arguments are used.

#### Returns

**Series or DataFrame** Returns the same object type as the caller of the rolling calculation.

See also:

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.std** Equivalent method for Series.

**DataFrame.std** Equivalent method for DataFrame.

**numpy.std** Equivalent method for Numpy array.

#### Notes

The default *ddof* of 1 used in `Series.std` is different than the default *ddof* of 0 in `numpy.std`.

A minimum of one period is required for the rolling calculation.

#### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).std()
0      NaN
1      NaN
2    0.577350
3    1.000000
4    1.000000
5    1.154701
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).std()
0      NaN
1      NaN
2    0.577350
3    0.957427
4    0.894427
5    0.836660
6    0.786796
dtype: float64
```

#### 35.10.1.7 pandas.core.window.Rolling.min

`Rolling.min(*args, **kwargs)`  
Calculate the rolling minimum.

#### Parameters

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation.

#### See also:

**Series.rolling** Calling object with a Series.

**DataFrame.rolling** Calling object with a DataFrame.

**Series.min** Similar method for Series.

**DataFrame.min** Similar method for DataFrame.

#### Examples

Performing a rolling minimum with a window size of 3.

```
>>> s = pd.Series([4, 3, 5, 2, 6])
>>> s.rolling(3).min()
0    NaN
1    NaN
2    3.0
3    2.0
4    2.0
dtype: float64
```

#### 35.10.1.8 pandas.core.window.Rolling.max

**Rolling.max**(\*args, \*\*kwargs)  
Calculate the rolling maximum.

#### Parameters

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

#### See also:

**Series.rolling** Series rolling.

**DataFrame.rolling** DataFrame rolling.

#### 35.10.1.9 pandas.core.window.Rolling.corr

**Rolling.corr**(other=None, pairwise=None, \*\*kwargs)  
Calculate rolling correlation.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self.

**pairwise** [bool, default None] Calculate pairwise combinations of columns within a DataFrame. If *other* is not specified, defaults to *True*, otherwise defaults to *False*. Not relevant for *Series*.

**\*\*kwargs** Unused.

### Returns

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation.

See also:

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.corr** Equivalent method for Series.

**DataFrame.corr** Equivalent method for DataFrame.

**rolling.cov** Similar method to calculate covariance.

**numpy.corrcoef** NumPy Pearson's correlation calculation.

### Notes

This function uses Pearson's definition of correlation ([https://en.wikipedia.org/wiki/Pearson\\_correlation\\_coefficient](https://en.wikipedia.org/wiki/Pearson_correlation_coefficient)).

When *other* is not specified, the output will be self correlation (e.g. all 1's), except for *DataFrame* inputs with *pairwise* set to *True*.

Function will return NaN for correlations of equal valued sequences; this is the result of a 0/0 division error.

When *pairwise* is set to *False*, only matching columns between *self* and *other* will be used.

When *pairwise* is set to *True*, the output will be a MultiIndex DataFrame with the original index on the first level, and the *other* DataFrame columns on the second level.

In the case of missing elements, only complete pairwise observations will be used.

### Examples

The below example shows a rolling calculation with a window size of four matching the equivalent function call using `numpy.corrcoef()`.

```
>>> v1 = [3, 3, 3, 5, 8]
>>> v2 = [3, 4, 4, 4, 8]
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> # numpy returns a 2X2 array, the correlation coefficient
>>> # is the number at entry [0][1]
>>> print(fmt.format(np.corrcoef(v1[:-1], v2[:-1])[0][1]))
0.333333
>>> print(fmt.format(np.corrcoef(v1[1:], v2[1:])[0][1]))
0.916949
>>> s1 = pd.Series(v1)
>>> s2 = pd.Series(v2)
>>> s1.rolling(4).corr(s2)
0          NaN
```

(continues on next page)

(continued from previous page)

```

1      NaN
2      NaN
3    0.333333
4    0.916949
dtype: float64

```

The below example shows a similar rolling calculation on a DataFrame using the pairwise option.

```

>>> matrix = np.array([[51., 35.], [49., 30.], [47., 32.], [46., 31.], [50.,
↪36.]])
>>> print(np.corrcoef(matrix[:-1,0], matrix[:-1,1]).round(7))
[[1.      0.6263001]
 [0.6263001  1.      ]]
>>> print(np.corrcoef(matrix[1:,0], matrix[1:,1]).round(7))
[[1.      0.5553681]
 [0.5553681  1.      ]]
>>> df = pd.DataFrame(matrix, columns=['X', 'Y'])
>>> df
   X    Y
0 51.0 35.0
1 49.0 30.0
2 47.0 32.0
3 46.0 31.0
4 50.0 36.0
>>> df.rolling(4).corr(pairwise=True)
   X      Y
0 X    NaN NaN
  Y    NaN NaN
1 X    NaN NaN
  Y    NaN NaN
2 X    NaN NaN
  Y    NaN NaN
3 X  1.000000 0.626300
  Y  0.626300 1.000000
4 X  1.000000 0.555368
  Y  0.555368 1.000000

```

### 35.10.1.10 pandas.core.window.Rolling.cov

Rolling.**cov** (*other=None, pairwise=None, ddof=1, \*\*kwargs*)

Calculate the rolling sample covariance.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self and produce pairwise output.

**pairwise** [bool, default None] If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndexed DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - ddof$ , where  $N$  represents the number of elements.

**\*\*kwargs** Keyword arguments to be passed into func.

**Returns**

**Series or DataFrame** Return type is determined by the caller.

**See also:**

**Series.rolling** Series rolling.

**DataFrame.rolling** DataFrame rolling.

**35.10.1.11 pandas.core.window.Rolling.skew**

`Rolling.skew(**kwargs)`

Unbiased rolling skewness.

**Parameters**

**\*\*kwargs** Keyword arguments to be passed into func.

**Returns**

**Series or DataFrame** Return type is determined by the caller.

**See also:**

**Series.rolling** Series rolling.

**DataFrame.rolling** DataFrame rolling.

**35.10.1.12 pandas.core.window.Rolling.kurt**

`Rolling.kurt(**kwargs)`

Calculate unbiased rolling kurtosis.

This function uses Fisher's definition of kurtosis without bias.

**Parameters**

**\*\*kwargs** Under Review.

**Returns**

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation

**See also:**

**Series.rolling** Calling object with Series data.

**DataFrame.rolling** Calling object with DataFrames.

**Series.kurt** Equivalent method for Series.

**DataFrame.kurt** Equivalent method for DataFrame.

**scipy.stats.skew** Third moment of a probability density.

**scipy.stats.kurtosis** Reference SciPy method.

**Notes**

A minimum of 4 periods is required for the rolling calculation.

## Examples

The example below will show a rolling calculation with a window size of four matching the equivalent function call using *scipy.stats*.

```
>>> arr = [1, 2, 3, 4, 999]
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> import scipy.stats
>>> print(fmt.format(scipy.stats.kurtosis(arr[:-1], bias=False)))
-1.200000
>>> print(fmt.format(scipy.stats.kurtosis(arr[1:], bias=False)))
3.999946
>>> s = pd.Series(arr)
>>> s.rolling(4).kurt()
0      NaN
1      NaN
2      NaN
3    -1.200000
4     3.999946
dtype: float64
```

### 35.10.1.13 pandas.core.window.Rolling.apply

`Rolling.apply(func, raw=None, args=(), kwargs={})`

The rolling function's apply function.

#### Parameters

**func** [function] Must produce a single value from an ndarray input if `raw=True` or a Series if `raw=False`.

**raw** [bool, default None]

- `False` : passes each row or column as a Series to the function.
- `True` or `None` : the passed function will receive ndarray objects instead. If you are just applying a NumPy reduction function this will achieve much better performance.

The `raw` parameter is required and will show a FutureWarning if not passed. In the future `raw` will default to `False`.

New in version 0.23.0.

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into `func`.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.rolling** Series rolling.

**DataFrame.rolling** DataFrame rolling.

### 35.10.1.14 pandas.core.window.Rolling.aggregate

`Rolling.aggregate(arg, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

### Parameters

**func** [function, str, list or dict] Function to use for aggregating the data. If a function, must either work when passed a Series/Dataframe or when passed to Series/Dataframe.apply.

Accepted combinations are:

- function
- string function name
- list of functions and/or function names, e.g. `[np.sum, 'mean']`
- dict of axis labels -> functions, function names or list of such.

**\*args** Positional arguments to pass to *func*.

**\*\*kwargs** Keyword arguments to pass to *func*.

### Returns

**DataFrame, Series or scalar** if DataFrame.agg is called with a single function, returns a Series if DataFrame.agg is called with several functions, returns a DataFrame if Series.agg is called with single function, returns a scalar if Series.agg is called with several functions, returns a Series

### See also:

`pandas.Series.rolling`, `pandas.DataFrame.rolling`

### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

### Examples

```
>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'])
>>> df
```

|   | A         | B         | C         |
|---|-----------|-----------|-----------|
| 0 | -2.385977 | -0.102758 | 0.438822  |
| 1 | -1.004295 | 0.905829  | -0.954544 |
| 2 | 0.735167  | -0.165272 | -1.619346 |
| 3 | -0.702657 | -1.340923 | -0.706334 |
| 4 | -0.246845 | 0.211596  | -0.901819 |

| 3 | -0.971785 | -1.340923 |
| 4 | -0.214334 | -1.340923 |
| 5 | 1.514216  | -1.340923 |
| 6 | 1.074618  | 0.211596  |
| 7 | 2.718061  | -1.647453 |
| 8 | -0.289082 | -1.647453 |
| 9 | 0.212668  | -1.647453 |

### 35.10.1.15 pandas.core.window.Rolling.quantile

`Rolling.quantile` (*quantile*, *interpolation*='linear', *\*\*kwargs*)

Calculate the rolling quantile.

#### Parameters

**quantile** [float] Quantile to compute.  $0 \leq \text{quantile} \leq 1$ .

**interpolation** [{ 'linear', 'lower', 'higher', 'midpoint', 'nearest' }] New in version 0.23.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points  $i$  and  $j$ :

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by  $i$  and  $j$ .
- lower:  $i$ .
- higher:  $j$ .
- nearest:  $i$  or  $j$  whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**\*\*kwargs**: For compatibility with other rolling methods. Has no effect on the result.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the rolling calculation.

See also:

**pandas.Series.quantile** Computes value at the given quantile over all data in Series.

**pandas.DataFrame.quantile** Computes values at the given quantile over requested axis in DataFrame.

## Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).quantile(.4, interpolation='lower')
0      NaN
1      1.0
2      2.0
3      3.0
dtype: float64
```

```
>>> s.rolling(2).quantile(.4, interpolation='midpoint')
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

### 35.10.1.16 pandas.core.window.Window.mean

Window.**mean**(\*args, \*\*kwargs)

Calculate the window mean of the values.

#### Parameters

**\*args** Under Review.

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the window calculation.

**See also:**

**Series.window** Calling object with Series data.

**DataFrame.window** Calling object with DataFrames.

**Series.mean** Equivalent method for Series.

**DataFrame.mean** Equivalent method for DataFrame.

## Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0    NaN
1    NaN
2     2.0
3     3.0
dtype: float64
```

### 35.10.1.17 pandas.core.window.Window.sum

`Window.sum(*args, **kwargs)`

Calculate window sum of given DataFrame or Series.

#### Parameters

**\*args, \*\*kwargs** For compatibility with other window methods. Has no effect on the computed value.

#### Returns

**Series or DataFrame** Same type as the input, with the same index, containing the window sum.

**See also:**

**Series.sum** Reducing sum for Series.

**DataFrame.sum** Reducing sum for DataFrame.

#### Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64
```

```
>>> s.rolling(3).sum()
0    NaN
1    NaN
2     6.0
3     9.0
4    12.0
dtype: float64
```

```
>>> s.expanding(3).sum()
0    NaN
1    NaN
2     6.0
3    10.0
4    15.0
dtype: float64
```

```
>>> s.rolling(3, center=True).sum()
0      NaN
1       6.0
2       9.0
3      12.0
4      NaN
dtype: float64
```

For DataFrame, each window sum is computed column-wise.

```
>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25
```

```
>>> df.rolling(3).sum()
   A    B
0  NaN  NaN
1  NaN  NaN
2  6.0 14.0
3  9.0 29.0
4 12.0 50.0
```

## 35.10.2 Standard expanding window functions

|                                                      |                                                                    |
|------------------------------------------------------|--------------------------------------------------------------------|
| <i>Expanding.count(**kwargs)</i>                     | The expanding count of any non-NaN observations inside the window. |
| <i>Expanding.sum(*args, **kwargs)</i>                | Calculate expanding sum of given DataFrame or Series.              |
| <i>Expanding.mean(*args, **kwargs)</i>               | Calculate the expanding mean of the values.                        |
| <i>Expanding.median(**kwargs)</i>                    | Calculate the expanding median.                                    |
| <i>Expanding.var([ddof])</i>                         | Calculate unbiased expanding variance.                             |
| <i>Expanding.std([ddof])</i>                         | Calculate expanding standard deviation.                            |
| <i>Expanding.min(*args, **kwargs)</i>                | Calculate the expanding minimum.                                   |
| <i>Expanding.max(*args, **kwargs)</i>                | Calculate the expanding maximum.                                   |
| <i>Expanding.corr([other, pairwise])</i>             | Calculate expanding correlation.                                   |
| <i>Expanding.cov([other, pairwise, ddof])</i>        | Calculate the expanding sample covariance.                         |
| <i>Expanding.skew(**kwargs)</i>                      | Unbiased expanding skewness.                                       |
| <i>Expanding.kurt(**kwargs)</i>                      | Calculate unbiased expanding kurtosis.                             |
| <i>Expanding.apply(func[, raw, args, kwargs])</i>    | The expanding function's apply function.                           |
| <i>Expanding.aggregate(arg, *args, **kwargs)</i>     | Aggregate using one or more operations over the specified axis.    |
| <i>Expanding.quantile(quantile[, interpolation])</i> | Calculate the expanding quantile.                                  |

### 35.10.2.1 pandas.core.window.Expanding.count

`Expanding.count(**kwargs)`

The expanding count of any non-NaN observations inside the window.

**Returns**

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation.

See also:

**`pandas.Series.expanding`** Calling object with Series data.

**`pandas.DataFrame.expanding`** Calling object with DataFrames.

**`pandas.DataFrame.count`** Count of the full DataFrame.

## Examples

```
>>> s = pd.Series([2, 3, np.nan, 10])
>>> s.rolling(2).count()
0    1.0
1    2.0
2    1.0
3    1.0
dtype: float64
>>> s.rolling(3).count()
0    1.0
1    2.0
2    2.0
3    2.0
dtype: float64
>>> s.rolling(4).count()
0    1.0
1    2.0
2    2.0
3    3.0
dtype: float64
```

### 35.10.2.2 `pandas.core.window.Expanding.sum`

Expanding. **`sum`** (\*args, \*\*kwargs)

Calculate expanding sum of given DataFrame or Series.

#### Parameters

**\*args, \*\*kwargs** For compatibility with other expanding methods. Has no effect on the computed value.

#### Returns

**Series or DataFrame** Same type as the input, with the same index, containing the expanding sum.

See also:

**`Series.sum`** Reducing sum for Series.

**`DataFrame.sum`** Reducing sum for DataFrame.

## Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64
```

```
>>> s.rolling(3).sum()
0    NaN
1    NaN
2    6.0
3    9.0
4   12.0
dtype: float64
```

```
>>> s.expanding(3).sum()
0    NaN
1    NaN
2    6.0
3   10.0
4   15.0
dtype: float64
```

```
>>> s.rolling(3, center=True).sum()
0    NaN
1    6.0
2    9.0
3   12.0
4    NaN
dtype: float64
```

For DataFrame, each expanding sum is computed column-wise.

```
>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25
```

```
>>> df.rolling(3).sum()
   A    B
0  NaN  NaN
1  NaN  NaN
2  6.0 14.0
3  9.0 29.0
4 12.0 50.0
```

### 35.10.2.3 pandas.core.window.Expanding.mean

`Expanding.mean(*args, **kwargs)`

Calculate the expanding mean of the values.

#### Parameters

**\*args** Under Review.

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation.

**See also:**

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.mean** Equivalent method for Series.

**DataFrame.mean** Equivalent method for DataFrame.

#### Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0    NaN
1    1.5
2    2.5
3    3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0    NaN
1    NaN
2    2.0
3    3.0
dtype: float64
```

### 35.10.2.4 pandas.core.window.Expanding.median

`Expanding.median(**kwargs)`

Calculate the expanding median.

#### Parameters

**\*\*kwargs** For compatibility with other expanding methods. Has no effect on the computed median.

#### Returns

**Series or DataFrame** Returned type is the same as the original object.

**See also:**

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.median** Equivalent method for Series.

**DataFrame.median** Equivalent method for DataFrame.

## Examples

Compute the rolling median of a series with a window size of 3.

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.rolling(3).median()
0      NaN
1      NaN
2      1.0
3      2.0
4      3.0
dtype: float64
```

### 35.10.2.5 pandas.core.window.Expanding.var

**Expanding.var** (*ddof=1, \*args, \*\*kwargs*)

Calculate unbiased expanding variance.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

#### Parameters

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs** For NumPy compatibility. No additional arguments are used.

#### Returns

**Series or DataFrame** Returns the same object type as the caller of the expanding calculation.

See also:

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.var** Equivalent method for Series.

**DataFrame.var** Equivalent method for DataFrame.

**numpy.var** Equivalent method for Numpy array.

## Notes

The default *ddof* of 1 used in `Series.var()` is different than the default *ddof* of 0 in `numpy.var()`.

A minimum of 1 period is required for the rolling calculation.

## Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).var()
0      NaN
1      NaN
2    0.333333
3    1.000000
4    1.000000
5    1.333333
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).var()
0      NaN
1      NaN
2    0.333333
3    0.916667
4    0.800000
5    0.700000
6    0.619048
dtype: float64
```

### 35.10.2.6 pandas.core.window.Expanding.std

`Expanding.std(ddof=1, *args, **kwargs)`

Calculate expanding standard deviation.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

#### Parameters

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs** For NumPy compatibility. No additional arguments are used.

#### Returns

**Series or DataFrame** Returns the same object type as the caller of the expanding calculation.

See also:

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.std** Equivalent method for Series.

**DataFrame.std** Equivalent method for DataFrame.

**numpy.std** Equivalent method for Numpy array.

## Notes

The default *ddof* of 1 used in `Series.std` is different than the default *ddof* of 0 in `numpy.std`.

A minimum of one period is required for the rolling calculation.

## Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).std()
0      NaN
1      NaN
2    0.577350
3    1.000000
4    1.000000
5    1.154701
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).std()
0      NaN
1      NaN
2    0.577350
3    0.957427
4    0.894427
5    0.836660
6    0.786796
dtype: float64
```

### 35.10.2.7 pandas.core.window.Expanding.min

`Expanding.min(*args, **kwargs)`

Calculate the expanding minimum.

#### Parameters

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation.

**See also:**

**Series.expanding** Calling object with a Series.

**DataFrame.expanding** Calling object with a DataFrame.

**Series.min** Similar method for Series.

**DataFrame.min** Similar method for DataFrame.

## Examples

Performing a rolling minimum with a window size of 3.

```
>>> s = pd.Series([4, 3, 5, 2, 6])
>>> s.rolling(3).min()
0      NaN
1      NaN
2     3.0
3     2.0
```

(continues on next page)

(continued from previous page)

```
4      2.0
dtype: float64
```

### 35.10.2.8 pandas.core.window.Expanding.max

`Expanding.max(*args, **kwargs)`

Calculate the expanding maximum.

#### Parameters

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.expanding** Series expanding.

**DataFrame.expanding** DataFrame expanding.

### 35.10.2.9 pandas.core.window.Expanding.corr

`Expanding.corr(other=None, pairwise=None, **kwargs)`

Calculate expanding correlation.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self.

**pairwise** [bool, default None] Calculate pairwise combinations of columns within a DataFrame. If *other* is not specified, defaults to *True*, otherwise defaults to *False*. Not relevant for *Series*.

**\*\*kwargs** Unused.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation.

See also:

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.corr** Equivalent method for Series.

**DataFrame.corr** Equivalent method for DataFrame.

**expanding.cov** Similar method to calculate covariance.

**numpy.corrcoef** NumPy Pearson's correlation calculation.

## Notes

This function uses Pearson's definition of correlation ([https://en.wikipedia.org/wiki/Pearson\\_correlation\\_coefficient](https://en.wikipedia.org/wiki/Pearson_correlation_coefficient)).

When *other* is not specified, the output will be self correlation (e.g. all 1's), except for *DataFrame* inputs with *pairwise* set to *True*.

Function will return NaN for correlations of equal valued sequences; this is the result of a 0/0 division error.

When *pairwise* is set to *False*, only matching columns between *self* and *other* will be used.

When *pairwise* is set to *True*, the output will be a MultiIndex DataFrame with the original index on the first level, and the *other* DataFrame columns on the second level.

In the case of missing elements, only complete pairwise observations will be used.

## Examples

The below example shows a rolling calculation with a window size of four matching the equivalent function call using `numpy.corrcoef()`.

```
>>> v1 = [3, 3, 3, 5, 8]
>>> v2 = [3, 4, 4, 4, 8]
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> # numpy returns a 2X2 array, the correlation coefficient
>>> # is the number at entry [0][1]
>>> print(fmt.format(np.corrcoef(v1[:-1], v2[:-1])[0][1]))
0.333333
>>> print(fmt.format(np.corrcoef(v1[1:], v2[1:])[0][1]))
0.916949
>>> s1 = pd.Series(v1)
>>> s2 = pd.Series(v2)
>>> s1.rolling(4).corr(s2)
0      NaN
1      NaN
2      NaN
3    0.333333
4    0.916949
dtype: float64
```

The below example shows a similar rolling calculation on a DataFrame using the *pairwise* option.

```
>>> matrix = np.array([[51., 35.], [49., 30.], [47., 32.], [46., 31.], [50.,
↪36.]])
>>> print(np.corrcoef(matrix[:-1,0], matrix[:-1,1]).round(7))
[[1.      0.6263001]
 [0.6263001 1.      ]]
>>> print(np.corrcoef(matrix[1:,0], matrix[1:,1]).round(7))
[[1.      0.5553681]
 [0.5553681 1.      ]]
>>> df = pd.DataFrame(matrix, columns=['X', 'Y'])
>>> df
   X    Y
0 51.0 35.0
1 49.0 30.0
2 47.0 32.0
3 46.0 31.0
```

(continues on next page)

(continued from previous page)

```

4  50.0  36.0
>>> df.rolling(4).corr(pairwise=True)
      X      Y
0 X   NaN   NaN
  Y   NaN   NaN
1 X   NaN   NaN
  Y   NaN   NaN
2 X   NaN   NaN
  Y   NaN   NaN
3 X  1.000000  0.626300
  Y  0.626300  1.000000
4 X  1.000000  0.555368
  Y  0.555368  1.000000

```

### 35.10.2.10 pandas.core.window.Expanding.cov

Expanding.**cov** (*other=None*, *pairwise=None*, *ddof=1*, *\*\*kwargs*)

Calculate the expanding sample covariance.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self and produce pairwise output.

**pairwise** [bool, default None] If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndexed DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**ddof** [int, default 1] Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*\*kwargs** Keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.expanding** Series expanding.

**DataFrame.expanding** DataFrame expanding.

### 35.10.2.11 pandas.core.window.Expanding.skew

Expanding.**skew** (*\*\*kwargs*)

Unbiased expanding skewness.

#### Parameters

**\*\*kwargs** Keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.expanding** Series expanding.

**DataFrame.expanding** DataFrame expanding.

### 35.10.2.12 pandas.core.window.Expanding.kurt

**Expanding.kurt** (\*\*kwargs)

Calculate unbiased expanding kurtosis.

This function uses Fisher's definition of kurtosis without bias.

#### Parameters

**\*\*kwargs** Under Review.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation

See also:

**Series.expanding** Calling object with Series data.

**DataFrame.expanding** Calling object with DataFrames.

**Series.kurt** Equivalent method for Series.

**DataFrame.kurt** Equivalent method for DataFrame.

**scipy.stats.skew** Third moment of a probability density.

**scipy.stats.kurtosis** Reference SciPy method.

#### Notes

A minimum of 4 periods is required for the expanding calculation.

#### Examples

The example below will show an expanding calculation with a window size of four matching the equivalent function call using *scipy.stats*.

```
>>> arr = [1, 2, 3, 4, 999]
>>> import scipy.stats
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> print(fmt.format(scipy.stats.kurtosis(arr[:-1], bias=False)))
-1.200000
>>> print(fmt.format(scipy.stats.kurtosis(arr, bias=False)))
4.999874
>>> s = pd.Series(arr)
>>> s.expanding(4).kurt()
0      NaN
1      NaN
2      NaN
3    -1.200000
4     4.999874
dtype: float64
```

### 35.10.2.13 pandas.core.window.Expanding.apply

`Expanding.apply` (*func*, *raw=None*, *args=()*, *kwargs={}*)

The expanding function's apply function.

#### Parameters

**func** [function] Must produce a single value from an ndarray input if *raw=True* or a Series if *raw=False*.

**raw** [bool, default None]

- *False* : passes each row or column as a Series to the function.
- *True* or *None* : the passed function will receive ndarray objects instead. If you are just applying a NumPy reduction function this will achieve much better performance.

The *raw* parameter is required and will show a FutureWarning if not passed. In the future *raw* will default to *False*.

New in version 0.23.0.

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into *func*.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.expanding** Series expanding.

**DataFrame.expanding** DataFrame expanding.

### 35.10.2.14 pandas.core.window.Expanding.aggregate

`Expanding.aggregate` (*arg*, *\*args*, *\*\*kwargs*)

Aggregate using one or more operations over the specified axis.

#### Parameters

**func** [function, str, list or dict] Function to use for aggregating the data. If a function, must either work when passed a Series/Dataframe or when passed to Series/Dataframe.apply.

Accepted combinations are:

- function
- string function name
- list of functions and/or function names, e.g. `[np.sum, 'mean']`
- dict of axis labels -> functions, function names or list of such.

**\*args** Positional arguments to pass to *func*.

**\*\*kwargs** Keyword arguments to pass to *func*.

#### Returns

**DataFrame, Series or scalar** if `DataFrame.agg` is called with a single function, returns a Series if `DataFrame.agg` is called with several functions, returns a DataFrame if `Series.agg` is called with single function, returns a scalar if `Series.agg` is called with several functions, returns a Series

**See also:**

`pandas.DataFrame.expanding.aggregate`, `pandas.DataFrame.rolling.aggregate`,  
`pandas.DataFrame.aggregate`

**Notes**

`agg` is an alias for `aggregate`. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'])
>>> df
```

|   | A         | B         | C         |
|---|-----------|-----------|-----------|
| 0 | -2.385977 | -0.102758 | 0.438822  |
| 1 | -1.004295 | 0.905829  | -0.954544 |
| 2 | 0.735167  | -0.165272 | -1.619346 |
| 3 | -0.702657 | -1.340923 | -0.706334 |
| 4 | -0.246845 | 0.211596  | -0.901819 |
| 5 | 2.463718  | 3.157577  | -1.380906 |
| 6 | -1.142255 | 2.340594  | -0.039875 |
| 7 | 1.396598  | -1.647453 | 1.677227  |
| 8 | -0.543425 | 1.761277  | -0.220481 |
| 9 | -0.640505 | 0.289374  | -1.550670 |

```
>>> df.ewm(alpha=0.5).mean()
```

|   | A         | B         | C         |
|---|-----------|-----------|-----------|
| 0 | -2.385977 | -0.102758 | 0.438822  |
| 1 | -1.464856 | 0.569633  | -0.490089 |
| 2 | -0.207700 | 0.149687  | -1.135379 |
| 3 | -0.471677 | -0.645305 | -0.906555 |
| 4 | -0.355635 | -0.203033 | -0.904111 |
| 5 | 1.076417  | 1.503943  | -1.146293 |
| 6 | -0.041654 | 1.925562  | -0.588728 |
| 7 | 0.680292  | 0.132049  | 0.548693  |
| 8 | 0.067236  | 0.948257  | 0.163353  |
| 9 | -0.286980 | 0.618493  | -0.694496 |

**35.10.2.15 pandas.core.window.Expanding.quantile**

`Expanding.quantile` (*quantile*, *interpolation*='linear', *\*\*kwargs*)

Calculate the expanding quantile.

**Parameters**

**quantile** [float] Quantile to compute.  $0 \leq \text{quantile} \leq 1$ .

**interpolation** [{ 'linear', 'lower', 'higher', 'midpoint', 'nearest' }] New in version 0.23.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points *i* and *j*:

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by *i* and *j*.

- lower:  $i$ .
- higher:  $j$ .
- nearest:  $i$  or  $j$  whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**\*\*kwargs:** For compatibility with other expanding methods. Has no effect on the result.

#### Returns

**Series or DataFrame** Returned object type is determined by the caller of the expanding calculation.

#### See also:

**pandas.Series.quantile** Computes value at the given quantile over all data in Series.

**pandas.DataFrame.quantile** Computes values at the given quantile over requested axis in DataFrame.

#### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).quantile(.4, interpolation='lower')
0      NaN
1      1.0
2      2.0
3      3.0
dtype: float64
```

```
>>> s.rolling(2).quantile(.4, interpolation='midpoint')
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

## 35.10.3 Exponentially-weighted moving window functions

|                                          |                                          |
|------------------------------------------|------------------------------------------|
| <i>EWM.mean</i> (*args, **kwargs)        | Exponential weighted moving average.     |
| <i>EWM.std</i> ([bias])                  | Exponential weighted moving stddev.      |
| <i>EWM.var</i> ([bias])                  | Exponential weighted moving variance.    |
| <i>EWM.corr</i> ([other, pairwise])      | Exponential weighted sample correlation. |
| <i>EWM.cov</i> ([other, pairwise, bias]) | Exponential weighted sample covariance.  |

### 35.10.3.1 pandas.core.window.EWM.mean

**EWM.mean** (\*args, \*\*kwargs)

Exponential weighted moving average.

#### Parameters

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.ewm** Series ewm.

**DataFrame.ewm** DataFrame ewm.

### 35.10.3.2 pandas.core.window.EWM.std

**EWM.std** (*bias=False, \*args, \*\*kwargs*)

Exponential weighted moving stddev.

#### Parameters

**bias** [bool, default False] Use a standard estimation bias correction.

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.ewm** Series ewm.

**DataFrame.ewm** DataFrame ewm.

### 35.10.3.3 pandas.core.window.EWM.var

**EWM.var** (*bias=False, \*args, \*\*kwargs*)

Exponential weighted moving variance.

#### Parameters

**bias** [bool, default False] Use a standard estimation bias correction.

**\*args, \*\*kwargs** Arguments and keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.ewm** Series ewm.

**DataFrame.ewm** DataFrame ewm.

### 35.10.3.4 pandas.core.window.EWM.corr

**EWM.corr** (*other=None, pairwise=None, \*\*kwargs*)

Exponential weighted sample correlation.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self and produce pairwise output.

**pairwise** [bool, default None] If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**bias** [bool, default False] Use a standard estimation bias correction.

**\*\*kwargs** Keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.ewm** Series ewm.

**DataFrame.ewm** DataFrame ewm.

### 35.10.3.5 pandas.core.window.EWM.cov

**EWM.cov** (*other=None, pairwise=None, bias=False, \*\*kwargs*)

Exponential weighted sample covariance.

#### Parameters

**other** [Series, DataFrame, or ndarray, optional] If not supplied then will default to self and produce pairwise output.

**pairwise** [bool, default None] If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**bias** [bool, default False] Use a standard estimation bias correction.

**\*\*kwargs** Keyword arguments to be passed into func.

#### Returns

**Series or DataFrame** Return type is determined by the caller.

See also:

**Series.ewm** Series ewm.

**DataFrame.ewm** DataFrame ewm.

{{ header }}

## 35.11 GroupBy

GroupBy objects are returned by groupby calls: `pandas.DataFrame.groupby()`, `pandas.Series.groupby()`, etc.

### 35.11.1 Indexing, iteration

|                                             |                                                   |
|---------------------------------------------|---------------------------------------------------|
| <code>GroupBy.__iter__()</code>             | Groupby iterator.                                 |
| <code>GroupBy.groups</code>                 | Dict {group name -> group labels}.                |
| <code>GroupBy.indices</code>                | Dict {group name -> group indices}.               |
| <code>GroupBy.get_group(name[, obj])</code> | Constructs NDFrame from group with provided name. |

#### 35.11.1.1 `pandas.core.groupby.GroupBy.__iter__`

`GroupBy.__iter__()`  
Groupby iterator.

##### Returns

Generator yielding sequence of (name, subsetted object)  
for each group

#### 35.11.1.2 `pandas.core.groupby.GroupBy.groups`

`GroupBy.groups`  
Dict {group name -> group labels}.

#### 35.11.1.3 `pandas.core.groupby.GroupBy.indices`

`GroupBy.indices`  
Dict {group name -> group indices}.

#### 35.11.1.4 `pandas.core.groupby.GroupBy.get_group`

`GroupBy.get_group(name, obj=None)`  
Constructs NDFrame from group with provided name.

##### Parameters

**name** [object] the name of the group to get as a DataFrame  
**obj** [NDFrame, default None] the NDFrame to take the DataFrame out of. If it is None, the object groupby was called on will be used

##### Returns

**group** [same type as obj]

|                                                      |                                                                                |
|------------------------------------------------------|--------------------------------------------------------------------------------|
| <code>Grouper([key, level, freq, axis, sort])</code> | A Grouper allows the user to specify a groupby instruction for a target object |
|------------------------------------------------------|--------------------------------------------------------------------------------|

---

#### 35.11.1.5 `pandas.Grouper`

**class** `pandas.Grouper` (*key=None, level=None, freq=None, axis=0, sort=False*)

A Grouper allows the user to specify a groupby instruction for a target object

This specification will select a column via the key parameter, or if the level and/or axis parameters are given, a level of the index of the target object.

These are local specifications and will override ‘global’ settings, that is the parameters axis and level which are passed to the groupby itself.

#### Parameters

**key** [string, defaults to None] groupby key, which selects the grouping column of the target

**level** [name/number, defaults to None] the level for the target index

**freq** [string / frequency object, defaults to None] This will groupby the specified frequency if the target selection (via key or level) is a datetime-like object. For full specification of available frequencies, please see [here](#).

**axis** [number/name of the axis, defaults to 0]

**sort** [boolean, default to False] whether to sort the resulting labels

**additional kwargs to control time-like groupers (when ‘freq’ is passed)**

**closed** [closed end of interval; ‘left’ or ‘right’]

**label** [interval boundary to use for labeling; ‘left’ or ‘right’]

**convention** [{ ‘start’, ‘end’, ‘e’, ‘s’ }] If grouper is PeriodIndex

**base, loffset**

#### Returns

A specification for a groupby instruction

#### Examples

Syntactic sugar for `df.groupby('A')`

```
>>> df.groupby(Grouper(key='A'))
```

Specify a resample operation on the column ‘date’

```
>>> df.groupby(Grouper(key='date', freq='60s'))
```

Specify a resample operation on the level ‘date’ on the columns axis with a frequency of 60s

```
>>> df.groupby(Grouper(level='date', freq='60s', axis=1))
```

#### Attributes

|               |  |
|---------------|--|
| <b>ax</b>     |  |
| <b>groups</b> |  |

### 35.11.2 Function application

`GroupBy.apply(func, *args, **kwargs)`

Apply function *func* group-wise and combine the results together.

---

`GroupBy.agg(func, *args, **kwargs)`

---

`GroupBy.aggregate(func, *args, **kwargs)`

---

Continued on next page

Table 427 – continued from previous page

|                                                       |                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <code>GroupBy.transform(func, *args, **kwargs)</code> |                                                                                                      |
| <code>GroupBy.pipe(func, *args, **kwargs)</code>      | Apply a function <i>func</i> with arguments to this GroupBy object and return the function's result. |

### 35.11.2.1 pandas.core.groupby.GroupBy.apply

`GroupBy.apply(func, *args, **kwargs)`

Apply function *func* group-wise and combine the results together.

The function passed to *apply* must take a dataframe as its first argument and return a DataFrame, Series or scalar. *apply* will then take care of combining the results back together into a single dataframe or series. *apply* is therefore a highly flexible grouping method.

While *apply* is a very flexible method, its downside is that using it can be quite a bit slower than using more specific methods like *agg* or *transform*. Pandas offers a wide range of method that will be much faster than using *apply* for their specific purposes, so try to use them before reaching for *apply*.

#### Parameters

**func** [callable] A callable that takes a dataframe as its first argument, and returns a dataframe, a series or a scalar. In addition the callable may take positional and keyword arguments.

**args, kwargs** [tuple and dict] Optional positional and keyword arguments to pass to *func*.

#### Returns

**applied** [Series or DataFrame]

See also:

**pipe** Apply function to the full GroupBy object instead of to each group.

**aggregate** Apply aggregate function to the GroupBy object.

**transform** Apply function column-by-column to the GroupBy object.

**Series.apply** Apply a function to a Series.

**DataFrame.apply** Apply a function to each row or column of a DataFrame.

### 35.11.2.2 pandas.core.groupby.GroupBy.agg

`GroupBy.agg(func, *args, **kwargs)`

### 35.11.2.3 pandas.core.groupby.GroupBy.aggregate

`GroupBy.aggregate(func, *args, **kwargs)`

### 35.11.2.4 pandas.core.groupby.GroupBy.transform

`GroupBy.transform(func, *args, **kwargs)`

### 35.11.2.5 pandas.core.groupby.GroupBy.pipe

`GroupBy.pipe` (*func*, \**args*, \*\**kwargs*)

Apply a function *func* with arguments to this `GroupBy` object and return the function's result.

New in version 0.21.0.

Use `.pipe` when you want to improve readability by chaining together functions that expect `Series`, `DataFrames`, `GroupBy` or `Resampler` objects. Instead of writing

```
>>> h(g(f(df.groupby('group')), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.groupby('group')
...   .pipe(f)
...   .pipe(g, arg1=a)
...   .pipe(h, arg2=b, arg3=c))
```

which is much more readable.

#### Parameters

**func** [callable or tuple of (callable, string)] Function to apply to this `GroupBy` object or, alternatively, a (*callable*, *data\_keyword*) tuple where *data\_keyword* is a string indicating the keyword of *callable* that expects the `GroupBy` object.

**args** [iterable, optional] positional arguments passed into *func*.

**kwargs** [dict, optional] a dictionary of keyword arguments passed into *func*.

#### Returns

**object** [the return type of *func*.]

See also:

**pandas.Series.pipe** Apply a function with arguments to a series.

**pandas.DataFrame.pipe** Apply a function with arguments to a dataframe.

**apply** Apply function to each group instead of to the full `GroupBy` object.

#### Notes

See more [here](#)

#### Examples

```
>>> df = pd.DataFrame({'A': 'a b a b'.split(), 'B': [1, 2, 3, 4]})
>>> df
   A  B
0  a  1
1  b  2
2  a  3
3  b  4
```

To get the difference between each groups maximum and minimum value in one pass, you can do

```
>>> df.groupby('A').pipe(lambda x: x.max() - x.min())
      B
A
a     2
b     2
```

### 35.11.3 Computations / Descriptive Stats

|                                                          |                                                                                                              |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>GroupBy.all([skipna])</i>                             | Returns True if all values in the group are truthful, else False.                                            |
| <i>GroupBy.any([skipna])</i>                             | Returns True if any value in the group is truthful, else False.                                              |
| <i>GroupBy.bfill([limit])</i>                            | Backward fill the values.                                                                                    |
| <i>GroupBy.count()</i>                                   | Compute count of group, excluding missing values.                                                            |
| <i>GroupBy.cumcount([ascending])</i>                     | Number each item in each group from 0 to the length of that group - 1.                                       |
| <i>GroupBy.ffill([limit])</i>                            | Forward fill the values.                                                                                     |
| <i>GroupBy.first(**kwargs)</i>                           | Compute first of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby |
| <i>GroupBy.head([n])</i>                                 | Returns first n rows of each group.                                                                          |
| <i>GroupBy.last(**kwargs)</i>                            | Compute last of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby  |
| <i>GroupBy.max(**kwargs)</i>                             | Compute max of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby   |
| <i>GroupBy.mean(*args, **kwargs)</i>                     | Compute mean of groups, excluding missing values.                                                            |
| <i>GroupBy.median(**kwargs)</i>                          | Compute median of groups, excluding missing values.                                                          |
| <i>GroupBy.min(**kwargs)</i>                             | Compute min of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby   |
| <i>GroupBy.ngroup([ascending])</i>                       | Number each group from 0 to the number of groups - 1.                                                        |
| <i>GroupBy.nth(n[, dropna])</i>                          | Take the nth row from each group if n is an int, or a subset of rows if n is a list of ints.                 |
| <i>GroupBy.ohlc()</i>                                    | Compute sum of values, excluding missing values.                                                             |
| <i>GroupBy.prod(**kwargs)</i>                            | Compute prod of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby  |
| <i>GroupBy.rank([method, ascending, na_option, ...])</i> | Provides the rank of values within each group.                                                               |
| <i>GroupBy.pct_change([periods, fill_method, ...])</i>   | Calculate pct_change of each value to previous entry in group.                                               |
| <i>GroupBy.size()</i>                                    | Compute group sizes.                                                                                         |
| <i>GroupBy.sem([ddof])</i>                               | Compute standard error of the mean of groups, excluding missing values.                                      |
| <i>GroupBy.std([ddof])</i>                               | Compute standard deviation of groups, excluding missing values.                                              |
| <i>GroupBy.sum(**kwargs)</i>                             | Compute sum of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby   |

Continued on next page

Table 428 – continued from previous page

|                                  |                                                       |
|----------------------------------|-------------------------------------------------------|
| <code>GroupBy.var([ddof])</code> | Compute variance of groups, excluding missing values. |
| <code>GroupBy.tail([n])</code>   | Returns last n rows of each group.                    |

### 35.11.3.1 `pandas.core.groupby.GroupBy.all`

`GroupBy.all` (*skipna=True*)

Returns True if all values in the group are truthful, else False.

#### Parameters

**skipna** [bool, default True] Flag to ignore nan values during truth testing

#### See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.2 `pandas.core.groupby.GroupBy.any`

`GroupBy.any` (*skipna=True*)

Returns True if any value in the group is truthful, else False.

#### Parameters

**skipna** [bool, default True] Flag to ignore nan values during truth testing

#### See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.3 `pandas.core.groupby.GroupBy.bfill`

`GroupBy.bfill` (*limit=None*)

Backward fill the values.

#### Parameters

**limit** [integer, optional] limit of how many values to fill

#### See also:

`Series.backfill`, `DataFrame.backfill`, `Series.fillna`, `DataFrame.fillna`

### 35.11.3.4 `pandas.core.groupby.GroupBy.count`

`GroupBy.count` ()

Compute count of group, excluding missing values.

#### See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.5 `pandas.core.groupby.GroupBy.cumcount`

`GroupBy.cumcount` (*ascending=True*)

Number each item in each group from 0 to the length of that group - 1.

Essentially this is equivalent to

```
>>> self.apply(lambda x: pd.Series(np.arange(len(x)), x.index))
```

#### Parameters

**ascending** [bool, default True] If False, number in reverse, from length of group - 1 to 0.

#### See also:

**ngroup** Number the groups themselves.

#### Examples

```
>>> df = pd.DataFrame(['a'], ['a'], ['a'], ['b'], ['b'], ['a']],
...                    columns=['A'])
>>> df
   A
0  a
1  a
2  a
3  b
4  b
5  a
>>> df.groupby('A').cumcount()
0    0
1    1
2    2
3    0
4    1
5    3
dtype: int64
>>> df.groupby('A').cumcount(ascending=False)
0    3
1    2
2    1
3    1
4    0
5    0
dtype: int64
```

### 35.11.3.6 pandas.core.groupby.GroupBy.ffill

GroupBy.**ffill** (*limit=None*)

Forward fill the values.

#### Parameters

**limit** [integer, optional] limit of how many values to fill

#### See also:

Series.pad, DataFrame.pad, Series.fillna, DataFrame.fillna

### 35.11.3.7 pandas.core.groupby.GroupBy.first

GroupBy.**first** (\*\*kwargs)

Compute first of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby

### 35.11.3.8 pandas.core.groupby.GroupBy.head

GroupBy.**head** (n=5)

Returns first n rows of each group.

Essentially equivalent to `.apply(lambda x: x.head(n))`, except ignores `as_index` flag.

**See also:**

`pandas.Series.`, `pandas.DataFrame.`, `pandas.Panel.`

#### Examples

```
>>> df = pd.DataFrame([[1, 2], [1, 4], [5, 6]],
                      columns=['A', 'B'])
>>> df.groupby('A', as_index=False).head(1)
   A  B
0  1  2
2  5  6
>>> df.groupby('A').head(1)
   A  B
0  1  2
2  5  6
```

### 35.11.3.9 pandas.core.groupby.GroupBy.last

GroupBy.**last** (\*\*kwargs)

Compute last of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby

### 35.11.3.10 pandas.core.groupby.GroupBy.max

GroupBy.**max** (\*\*kwargs)

Compute max of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby

### 35.11.3.11 pandas.core.groupby.GroupBy.mean

GroupBy.**mean** (\*args, \*\*kwargs)

Compute mean of groups, excluding missing values.

**Returns**

**pandas.Series or pandas.DataFrame**

**See also:**

`pandas.Series.`, `pandas.DataFrame.`, `pandas.Panel.`

## Examples

```
>>> df = pd.DataFrame({'A': [1, 1, 2, 1, 2],
...                    'B': [np.nan, 2, 3, 4, 5],
...                    'C': [1, 2, 1, 1, 2]}, columns=['A', 'B', 'C'])
```

Groupby one column and return the mean of the remaining columns in each group.

```
>>> df.groupby('A').mean()
>>>
      B      C
A
1  3.0  1.333333
2  4.0  1.500000
```

Groupby two columns and return the mean of the remaining column.

```
>>> df.groupby(['A', 'B']).mean()
>>>
      C
A B
1  2.0  2
   4.0  1
2  3.0  1
   5.0  2
```

Groupby one column and return the mean of only particular column in the group.

```
>>> df.groupby('A')['B'].mean()
>>>
A
1    3.0
2    4.0
Name: B, dtype: float64
```

### 35.11.3.12 pandas.core.groupby.GroupBy.median

`GroupBy.median(**kwargs)`

Compute median of groups, excluding missing values.

For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.13 pandas.core.groupby.GroupBy.min

`GroupBy.min(**kwargs)`

Compute min of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby

### 35.11.3.14 pandas.core.groupby.GroupBy.ngroup

GroupBy.**ngroup** (*ascending=True*)

Number each group from 0 to the number of groups - 1.

This is the enumerative complement of `cumcount`. Note that the numbers given to the groups match the order in which the groups would be seen when iterating over the groupby object, not the order they are first observed.

New in version 0.20.2.

#### Parameters

**ascending** [bool, default True] If False, number in reverse, from number of group - 1 to 0.

**See also:**

***cumcount*** Number the rows in each group.

#### Examples

```
>>> df = pd.DataFrame({"A": list("aaabba")})
>>> df
   A
0  a
1  a
2  a
3  b
4  b
5  a
>>> df.groupby('A').ngroup()
0    0
1    0
2    0
3    1
4    1
5    0
dtype: int64
>>> df.groupby('A').ngroup(ascending=False)
0    1
1    1
2    1
3    0
4    0
5    1
dtype: int64
>>> df.groupby(["A", [1,1,2,3,2,1]]).ngroup()
0    0
1    0
2    1
3    3
4    2
5    0
dtype: int64
```

### 35.11.3.15 pandas.core.groupby.GroupBy.nth

`GroupBy.nth(n, dropna=None)`

Take the *nth* row from each group if *n* is an int, or a subset of rows if *n* is a list of ints.

If *dropna*, will take the *nth* non-null row, *dropna* is either Truthy (if a Series) or 'all', 'any' (if a DataFrame); this is equivalent to calling `dropna(how=dropna)` before the groupby.

#### Parameters

**n** [int or list of ints] a single *nth* value for the row or a list of *nth* values

**dropna** [None or str, optional] apply the specified *dropna* operation before counting which row is the *nth* row. Needs to be None, 'any' or 'all'

#### See also:

`pandas.Series.`, `pandas.DataFrame.`, `pandas.Panel.`

#### Examples

```

>>> df = pd.DataFrame({'A': [1, 1, 2, 1, 2],
...                    'B': [np.nan, 2, 3, 4, 5]}, columns=['A', 'B'])
>>> g = df.groupby('A')
>>> g.nth(0)
      B
A
1  NaN
2  3.0
>>> g.nth(1)
      B
A
1  2.0
2  5.0
>>> g.nth(-1)
      B
A
1  4.0
2  5.0
>>> g.nth([0, 1])
      B
A
1  NaN
1  2.0
2  3.0
2  5.0

```

Specifying *dropna* allows count ignoring NaN

```

>>> g.nth(0, dropna='any')
      B
A
1  2.0
2  3.0

```

NaNs denote group exhausted when using *dropna*

```
>>> g.nth(3, dropna='any')
      B
A
1 NaN
2 NaN
```

Specifying `as_index=False` in `groupby` keeps the original index.

```
>>> df.groupby('A', as_index=False).nth(1)
      A      B
1  1    2.0
4  2    5.0
```

### 35.11.3.16 pandas.core.groupby.GroupBy.ohlc

`GroupBy.ohlc()`

Compute sum of values, excluding missing values.

For multiple groupings, the result index will be a `MultiIndex`

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.17 pandas.core.groupby.GroupBy.prod

`GroupBy.prod(**kwargs)`

Compute prod of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

### 35.11.3.18 pandas.core.groupby.GroupBy.rank

`GroupBy.rank(method='average', ascending=True, na_option='keep', pct=False, axis=0)`

Provides the rank of values within each group.

#### Parameters

**method** [{‘average’, ‘min’, ‘max’, ‘first’, ‘dense’}, default ‘average’]

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like ‘min’, but rank always increases by 1 between groups

**ascending** [boolean, default True] False for ranks by high (1) to low (N)

**na\_option** [{‘keep’, ‘top’, ‘bottom’}, default ‘keep’]

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**pct** [boolean, default False] Compute percentage rank of data within each group

**axis** [int, default 0] The axis of the object over which to compute the rank.

**Returns**

—

**DataFrame with ranking of values within each group**

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.19 pandas.core.groupby.GroupBy.pct\_change

`GroupBy.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, axis=0*)

Calculate pct\_change of each value to previous entry in group.

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.20 pandas.core.groupby.GroupBy.size

`GroupBy.size` ()

Compute group sizes.

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.21 pandas.core.groupby.GroupBy.sem

`GroupBy.sem` (*ddof=1*)

Compute standard error of the mean of groups, excluding missing values.

For multiple groupings, the result index will be a MultiIndex.

**Parameters**

**ddof** [integer, default 1] degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.22 pandas.core.groupby.GroupBy.std

`GroupBy.std` (*ddof=1, \*args, \*\*kwargs*)

Compute standard deviation of groups, excluding missing values.

For multiple groupings, the result index will be a MultiIndex.

**Parameters**

**ddof** [integer, default 1] degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.23 pandas.core.groupby.GroupBy.sum

`GroupBy.sum(**kwargs)`

Compute sum of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

### 35.11.3.24 pandas.core.groupby.GroupBy.var

`GroupBy.var(ddof=1, *args, **kwargs)`

Compute variance of groups, excluding missing values.

For multiple groupings, the result index will be a `MultiIndex`.

#### Parameters

**ddof** [integer, default 1] degrees of freedom

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.25 pandas.core.groupby.GroupBy.tail

`GroupBy.tail(n=5)`

Returns last n rows of each group.

Essentially equivalent to `.apply(lambda x: x.tail(n))`, except ignores `as_index` flag.

**See also:**

`pandas.Series.`, `pandas.DataFrame.`, `pandas.Panel.`

#### Examples

```
>>> df = pd.DataFrame([[ 'a', 1], [ 'a', 2], [ 'b', 1], [ 'b', 2]],
                      columns=[ 'A', 'B'])
>>> df.groupby('A').tail(1)
   A  B
1  a  2
3  b  2
>>> df.groupby('A').head(1)
   A  B
0  a  1
2  b  1
```

The following methods are available in both `SeriesGroupBy` and `DataFrameGroupBy` objects, but may differ slightly, usually in that the `DataFrameGroupBy` version usually permits the specification of an axis argument, and often an argument indicating whether to restrict application to columns of a specific data type.

|                                              |                                                                   |
|----------------------------------------------|-------------------------------------------------------------------|
| <code>DataFrameGroupBy.all([skipna])</code>  | Returns True if all values in the group are truthful, else False. |
| <code>DataFrameGroupBy.any([skipna])</code>  | Returns True if any value in the group is truthful, else False.   |
| <code>DataFrameGroupBy.bfill([limit])</code> | Backward fill the values.                                         |

|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>DataFrameGroupBy.corr</code>                            | Compute pairwise correlation of columns, excluding NA/null values.                                                                           |
| <code>DataFrameGroupBy.count()</code>                         | Compute count of group, excluding missing values                                                                                             |
| <code>DataFrameGroupBy.cov</code>                             | Compute pairwise covariance of columns, excluding NA/null values.                                                                            |
| <code>DataFrameGroupBy.cummax([axis])</code>                  | Cumulative max for each group.                                                                                                               |
| <code>DataFrameGroupBy.cummin([axis])</code>                  | Cumulative min for each group.                                                                                                               |
| <code>DataFrameGroupBy.cumprod([axis])</code>                 | Cumulative product for each group.                                                                                                           |
| <code>DataFrameGroupBy.cumsum([axis])</code>                  | Cumulative sum for each group.                                                                                                               |
| <code>DataFrameGroupBy.describe(**kwargs)</code>              | Generate descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values. |
| <code>DataFrameGroupBy.diff</code>                            | First discrete difference of element.                                                                                                        |
| <code>DataFrameGroupBy.ffill([limit])</code>                  | Forward fill the values.                                                                                                                     |
| <code>DataFrameGroupBy.fillna</code>                          | Fill NA/NaN values using the specified method.                                                                                               |
| <code>DataFrameGroupBy.filter(func[, dropna])</code>          | Return a copy of a DataFrame excluding elements from groups that do not satisfy the boolean criterion specified by func.                     |
| <code>DataFrameGroupBy.hist</code>                            | Make a histogram of the DataFrame's.                                                                                                         |
| <code>DataFrameGroupBy.idxmax</code>                          | Return index of first occurrence of maximum over requested axis.                                                                             |
| <code>DataFrameGroupBy.idxmin</code>                          | Return index of first occurrence of minimum over requested axis.                                                                             |
| <code>DataFrameGroupBy.mad</code>                             | Return the mean absolute deviation of the values for the requested axis.                                                                     |
| <code>DataFrameGroupBy.pct_change([periods, ...])</code>      | Calculate pct_change of each value to previous entry in group.                                                                               |
| <code>DataFrameGroupBy.plot</code>                            | Class implementing the .plot attribute for groupby objects.                                                                                  |
| <code>DataFrameGroupBy.quantile</code>                        | Return values at the given quantile over requested axis.                                                                                     |
| <code>DataFrameGroupBy.rank([method, ascending, ...])</code>  | Provides the rank of values within each group.                                                                                               |
| <code>DataFrameGroupBy.resample(rule, *args, **kwargs)</code> | Provide resampling when using a TimeGrouper.                                                                                                 |
| <code>DataFrameGroupBy.shift([periods, freq, ...])</code>     | Shift each group by periods observations.                                                                                                    |
| <code>DataFrameGroupBy.size()</code>                          | Compute group sizes.                                                                                                                         |
| <code>DataFrameGroupBy.skew</code>                            | Return unbiased skew over requested axis Normalized by N-1.                                                                                  |
| <code>DataFrameGroupBy.take</code>                            | Return the elements in the given <i>positional</i> indices along an axis.                                                                    |
| <code>DataFrameGroupBy.tshift</code>                          | Shift the time index, using the index's frequency if available.                                                                              |

### 35.11.3.26 pandas.core.groupby.DataFrameGroupBy.all

`DataFrameGroupBy.all` (*skipna=True*)

Returns True if all values in the group are truthful, else False.

#### Parameters

**skipna** [bool, default True] Flag to ignore nan values during truth testing

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.27 pandas.core.groupby.DataFrameGroupBy.any

DataFrameGroupBy.**any** (*skipna=True*)

Returns True if any value in the group is truthful, else False.

#### Parameters

**skipna** [bool, default True] Flag to ignore nan values during truth testing

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.28 pandas.core.groupby.DataFrameGroupBy.bfill

DataFrameGroupBy.**bfill** (*limit=None*)

Backward fill the values.

#### Parameters

**limit** [integer, optional] limit of how many values to fill

See also:

*Series.backfill, DataFrame.backfill, Series.fillna, DataFrame.fillna*

### 35.11.3.29 pandas.core.groupby.DataFrameGroupBy.corr

DataFrameGroupBy.**corr**

Compute pairwise correlation of columns, excluding NA/null values.

#### Parameters

**method** [{ 'pearson', 'kendall', 'spearman' } or callable]

- pearson : standard correlation coefficient
- kendall : Kendall Tau correlation coefficient
- spearman : Spearman rank correlation
- **callable: callable with input two 1d ndarrays** and returning a float .. version-added:: 0.24.0

**min\_periods** [int, optional] Minimum number of observations required per pair of columns to have a valid result. Currently only available for pearson and spearman correlation

#### Returns

**y** [DataFrame]

See also:

*DataFrame.corrwith, Series.corr*

## Examples

```
>>> histogram_intersection = lambda a, b: np.minimum(a, b
... ).sum().round(decimals=1)
>>> df = pd.DataFrame([(0.2, 0.3), (0.0, 0.6), (0.6, 0.0), (0.2, 0.1)],
...                     columns=['dogs', 'cats'])
>>> df.corr(method=histogram_intersection)
      dogs cats
dogs    1.0  0.3
cats    0.3  1.0
```

### 35.11.3.30 pandas.core.groupby.DataFrameGroupBy.count

DataFrameGroupBy.**count** ()

Compute count of group, excluding missing values

### 35.11.3.31 pandas.core.groupby.DataFrameGroupBy.cov

DataFrameGroupBy.**cov**

Compute pairwise covariance of columns, excluding NA/null values.

Compute the pairwise covariance among the series of a DataFrame. The returned data frame is the **covariance matrix** of the columns of the DataFrame.

Both NA and null values are automatically excluded from the calculation. (See the note below about bias from missing values.) A threshold can be set for the minimum number of observations for each value created. Comparisons with observations below this threshold will be returned as NaN.

This method is generally used for the analysis of time series data to understand the relationship between different measures across time.

#### Parameters

**min\_periods** [int, optional] Minimum number of observations required per pair of columns to have a valid result.

#### Returns

**DataFrame** The covariance matrix of the series of the DataFrame.

See also:

**pandas.Series.cov** Compute covariance with another Series.

**pandas.core.window.EWM.cov** Exponential weighted sample covariance.

**pandas.core.window.Expanding.cov** Expanding sample covariance.

**pandas.core.window.Rolling.cov** Rolling sample covariance.

## Notes

Returns the covariance matrix of the DataFrame's time series. The covariance is normalized by N-1.

For DataFrames that have Series that are missing data (assuming that data is **missing at random**) the returned covariance matrix will be an unbiased estimate of the variance and covariance between the member Series.

However, for many applications this estimate may not be acceptable because the estimate covariance matrix is not guaranteed to be positive semi-definite. This could lead to estimate correlations having absolute values which are greater than one, and/or a non-invertible covariance matrix. See [Estimation of covariance matrices](#) for more details.

## Examples

```
>>> df = pd.DataFrame([(1, 2), (0, 3), (2, 0), (1, 1)],
...                    columns=['dogs', 'cats'])
>>> df.cov()
           dogs      cats
dogs  0.666667 -1.000000
cats -1.000000  1.666667
```

```
>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(1000, 5),
...                    columns=['a', 'b', 'c', 'd', 'e'])
>>> df.cov()
           a          b          c          d          e
a  0.998438 -0.020161  0.059277 -0.008943  0.014144
b -0.020161  1.059352 -0.008543 -0.024738  0.009826
c  0.059277 -0.008543  1.010670 -0.001486 -0.000271
d -0.008943 -0.024738 -0.001486  0.921297 -0.013692
e  0.014144  0.009826 -0.000271 -0.013692  0.977795
```

## Minimum number of periods

This method also supports an optional `min_periods` keyword that specifies the required minimum number of non-NA observations for each column pair in order to have a valid result:

```
>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(20, 3),
...                    columns=['a', 'b', 'c'])
>>> df.loc[df.index[:5], 'a'] = np.nan
>>> df.loc[df.index[5:10], 'b'] = np.nan
>>> df.cov(min_periods=12)
           a          b          c
a  0.316741      NaN -0.150812
b      NaN  1.248003  0.191417
c -0.150812  0.191417  0.895202
```

### 35.11.3.32 pandas.core.groupby.DataFrameGroupBy.cummax

DataFrameGroupBy.**cummax** (*axis=0, \*\*kwargs*)

Cumulative max for each group.

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.33 pandas.core.groupby.DataFrameGroupBy.cummin

DataFrameGroupBy.**cummin** (*axis=0, \*\*kwargs*)

Cumulative min for each group.

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.34 pandas.core.groupby.DataFrameGroupBy.cumprod

DataFrameGroupBy.**cumprod** (*axis=0, \*args, \*\*kwargs*)

Cumulative product for each group.

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.35 pandas.core.groupby.DataFrameGroupBy.cumsum

DataFrameGroupBy.**cumsum** (*axis=0, \*args, \*\*kwargs*)

Cumulative sum for each group.

See also:

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.36 pandas.core.groupby.DataFrameGroupBy.describe

DataFrameGroupBy.**describe** (*\*\*kwargs*)

Generate descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.

Analyzes both numeric and object series, as well as DataFrame column sets of mixed data types. The output will vary depending on what is provided. Refer to the notes below for more detail.

#### Parameters

**percentiles** [list-like of numbers, optional] The percentiles to include in the output. All should fall between 0 and 1. The default is `[.25, .5, .75]`, which returns the 25th, 50th, and 75th percentiles.

**include** ['all', list-like of dtypes or None (default), optional] A white list of data types to include in the result. Ignored for Series. Here are the options:

- 'all' : All columns of the input will be included in the output.
- A list-like of dtypes : Limits the results to the provided data types. To limit the result to numeric types submit `numpy.number`. To limit it instead to object columns submit the `numpy.object` data type. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To select pandas categorical columns, use `'category'`
- None (default) : The result will include all numeric columns.

**exclude** [list-like of dtypes or None (default), optional,] A black list of data types to omit from the result. Ignored for Series. Here are the options:

- A list-like of dtypes : Excludes the provided data types from the result. To exclude numeric types submit `numpy.number`. To exclude object columns submit the data type `numpy.object`. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To exclude pandas categorical columns, use `'category'`

- `None` (default) : The result will exclude nothing.

### Returns

**Series or DataFrame** Summary statistics of the Series or Dataframe provided.

See also:

**DataFrame.count** Count number of non-NA/null observations.

**DataFrame.max** Maximum of the values in the object.

**DataFrame.min** Minimum of the values in the object.

**DataFrame.mean** Mean of the values.

**DataFrame.std** Standard deviation of the observations.

**DataFrame.select\_dtypes** Subset of a DataFrame including/excluding columns based on their dtype.

### Notes

For numeric data, the result's index will include `count`, `mean`, `std`, `min`, `max` as well as lower, 50 and upper percentiles. By default the lower percentile is 25 and the upper percentile is 75. The 50 percentile is the same as the median.

For object data (e.g. strings or timestamps), the result's index will include `count`, `unique`, `top`, and `freq`. The `top` is the most common value. The `freq` is the most common value's frequency. Timestamps also include the `first` and `last` items.

If multiple object values have the highest count, then the `count` and `top` results will be arbitrarily chosen from among those with the highest count.

For mixed data types provided via a `DataFrame`, the default is to return only an analysis of numeric columns. If the dataframe consists only of object and categorical data without any numeric columns, the default is to return an analysis of both the object and categorical columns. If `include='all'` is provided as an option, the result will include a union of attributes of each type.

The *include* and *exclude* parameters can be used to limit which columns in a `DataFrame` are analyzed for the output. The parameters are ignored when analyzing a `Series`.

### Examples

Describing a numeric Series.

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
dtype: float64
```

Describing a categorical Series.

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique      3
top         a
freq        2
dtype: object
```

Describing a timestamp Series.

```
>>> s = pd.Series([
...     np.datetime64("2000-01-01"),
...     np.datetime64("2010-01-01"),
...     np.datetime64("2010-01-01")
... ])
>>> s.describe()
count              3
unique              2
top      2010-01-01 00:00:00
freq              2
first      2000-01-01 00:00:00
last       2010-01-01 00:00:00
dtype: object
```

Describing a DataFrame. By default only numeric fields are returned.

```
>>> df = pd.DataFrame({'categorical': pd.Categorical(['d', 'e', 'f']),
...                    'numeric': [1, 2, 3],
...                    'object': ['a', 'b', 'c']
... })
>>> df.describe()
      numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing all columns of a DataFrame regardless of data type.

```
>>> df.describe(include='all')
      categorical  numeric  object
count           3       3.0      3
unique          3       NaN      3
top            f       NaN      c
freq           1       NaN      1
mean          NaN       2.0     NaN
std           NaN       1.0     NaN
min           NaN       1.0     NaN
25%           NaN       1.5     NaN
50%           NaN       2.0     NaN
75%           NaN       2.5     NaN
max           NaN       3.0     NaN
```

Describing a column from a DataFrame by accessing it as an attribute.

```
>>> df.numeric.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
Name: numeric, dtype: float64
```

Including only numeric columns in a DataFrame description.

```
>>> df.describe(include=[np.number])
numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Including only string columns in a DataFrame description.

```
>>> df.describe(include=[np.object])
object
count      3
unique      3
top         c
freq        1
```

Including only categorical columns from a DataFrame description.

```
>>> df.describe(include=['category'])
category
count      3
unique      3
top         f
freq        1
```

Excluding numeric columns from a DataFrame description.

```
>>> df.describe(exclude=[np.number])
category  object
count      3      3
unique      3      3
top         f      c
freq        1      1
```

Excluding object columns from a DataFrame description.

```
>>> df.describe(exclude=[np.object])
category  numeric
count      3      3.0
unique      3      NaN
```

| 75%  | NaN | 2.5 |
| max  | NaN | 3.0 |

### 35.11.3.37 pandas.core.groupby.DataFrameGroupBy.diff

DataFrameGroupBy.**diff**

First discrete difference of element.

Calculates the difference of a DataFrame element compared with another element in the DataFrame (default is the element in the same column of the previous row).

#### Parameters

**periods** [int, default 1] Periods to shift for calculating difference, accepts negative values.

**axis** [{0 or 'index', 1 or 'columns'}, default 0] Take difference over rows (0) or columns (1).

New in version 0.16.1..

#### Returns

**diffed** [DataFrame]

See also:

**Series.diff** First discrete difference for a Series.

**DataFrame.pct\_change** Percent change over given number of periods.

**DataFrame.shift** Shift index by desired number of periods with an optional time freq.

### Examples

Difference with previous row

```
>>> df = pd.DataFrame({'a': [1, 2, 3, 4, 5, 6],
...                    'b': [1, 1, 2, 3, 5, 8],
...                    'c': [1, 4, 9, 16, 25, 36]})
>>> df
   a  b  c
0  1  1  1
1  2  1  4
2  3  2  9
3  4  3 16
4  5  5 25
5  6  8 36
```

```
>>> df.diff()
   a  b  c
0 NaN NaN NaN
```

(continues on next page)

(continued from previous page)

|   |     |     |      |
|---|-----|-----|------|
| 1 | 1.0 | 0.0 | 3.0  |
| 2 | 1.0 | 1.0 | 5.0  |
| 3 | 1.0 | 1.0 | 7.0  |
| 4 | 1.0 | 2.0 | 9.0  |
| 5 | 1.0 | 3.0 | 11.0 |

Difference with previous column

```
>>> df.diff(axis=1)
      a      b      c
0 NaN  0.0  0.0
1 NaN -1.0  3.0
2 NaN -1.0  7.0
3 NaN -1.0 13.0
4 NaN  0.0 20.0
5 NaN  2.0 28.0
```

Difference with 3rd previous row

```
>>> df.diff(periods=3)
      a      b      c
0 NaN  NaN  NaN
1 NaN  NaN  NaN
2 NaN  NaN  NaN
3 3.0  2.0 15.0
4 3.0  4.0 21.0
5 3.0  6.0 27.0
```

Difference with following row

```
>>> df.diff(periods=-1)
      a      b      c
0 -1.0  0.0 -3.0
1 -1.0 -1.0 -5.0
2 -1.0 -1.0 -7.0
3 -1.0 -2.0 -9.0
4 -1.0 -3.0 -11.0
5  NaN  NaN  NaN
```

### 35.11.3.38 pandas.core.groupby.DataFrameGroupBy.fffll

DataFrameGroupBy.fffll (limit=None)

Forward fill the values.

#### Parameters

**limit** [integer, optional] limit of how many values to fill**See also:**

Series.pad, DataFrame.pad, Series.fillna, DataFrame.fillna

### 35.11.3.39 pandas.core.groupby.DataFrameGroupBy.fillna

DataFrameGroupBy.fillna

Fill NA/NaN values using the specified method.

### Parameters

**value** [scalar, dict, Series, or DataFrame] Value to use to fill holes (e.g. 0), alternately a dict/Series/DataFrame of values specifying which value to use for each index (for a Series) or column (for a DataFrame). (values not in the dict/Series/DataFrame will not be filled). This value cannot be a list.

**method** [{ 'backfill', 'bfill', 'pad', 'ffill', None }, default None] Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**axis** [{0 or 'index', 1 or 'columns' }]

**inplace** [boolean, default False] If True, fill in place. Note: this will modify any other views on this object, (e.g. a no-copy slice for a column in a DataFrame).

**limit** [int, default None] If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled. Must be greater than 0 if not None.

**downcast** [dict, default is None] a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

### Returns

**filled** [DataFrame]

See also:

**interpolate** Fill NaN values using interpolation.

reindex, asfreq

### Examples

```
>>> df = pd.DataFrame([[np.nan, 2, np.nan, 0],
...                    [3, 4, np.nan, 1],
...                    [np.nan, np.nan, np.nan, 5],
...                    [np.nan, 3, np.nan, 4]],
...                    columns=list('ABCD'))
>>> df
   A    B    C    D
0 NaN  2.0 NaN  0
1 3.0  4.0 NaN  1
2 NaN  NaN NaN  5
3 NaN  3.0 NaN  4
```

Replace all NaN elements with 0s.

```
>>> df.fillna(0)
   A    B    C    D
0  0.0  2.0  0.0  0
1  3.0  4.0  0.0  1
2  0.0  0.0  0.0  5
3  0.0  3.0  0.0  4
```

We can also propagate non-null values forward or backward.

```
>>> df.fillna(method='ffill')
   A    B    C    D
0  NaN  2.0  NaN  0
1  3.0  4.0  NaN  1
2  3.0  4.0  NaN  5
3  3.0  3.0  NaN  4
```

Replace all NaN elements in column 'A', 'B', 'C', and 'D', with 0, 1, 2, and 3 respectively.

```
>>> values = {'A': 0, 'B': 1, 'C': 2, 'D': 3}
>>> df.fillna(value=values)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  2.0  1
2  0.0  1.0  2.0  5
3  0.0  3.0  2.0  4
```

Only replace the first NaN element.

```
>>> df.fillna(value=values, limit=1)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  NaN  1
2  NaN  1.0  NaN  5
3  NaN  3.0  NaN  4
```

### 35.11.3.40 pandas.core.groupby.DataFrameGroupBy.filter

DataFrameGroupBy.**filter** (*func*, *dropna=True*, *\*args*, *\*\*kwargs*)

Return a copy of a DataFrame excluding elements from groups that do not satisfy the boolean criterion specified by *func*.

#### Parameters

**f** [function] Function to apply to each subframe. Should return True or False.

**dropna** [Drop groups that do not pass the filter. True by default;] if False, groups that evaluate False are filled with NaNs.

#### Returns

**filtered** [DataFrame]

#### Notes

Each subframe is endowed the attribute 'name' in case you need to know which group you are working on.

#### Examples

```
>>> df = pd.DataFrame({'A' : ['foo', 'bar', 'foo', 'bar',
...                           'foo', 'bar'],
...                    'B' : [1, 2, 3, 4, 5, 6],
...                    'C' : [2.0, 5., 8., 1., 2., 9.]})
```

(continues on next page)

(continued from previous page)

```
>>> grouped = df.groupby('A')
>>> grouped.filter(lambda x: x['B'].mean() > 3.)
```

|   | A   | B | C   |
|---|-----|---|-----|
| 1 | bar | 2 | 5.0 |
| 3 | bar | 4 | 1.0 |
| 5 | bar | 6 | 9.0 |

### 35.11.3.41 pandas.core.groupby.DataFrameGroupBy.hist

DataFrameGroupBy.**hist**

Make a histogram of the DataFrame's.

A **histogram** is a representation of the distribution of data. This function calls `matplotlib.pyplot.hist()`, on each series in the DataFrame, resulting in one histogram per column.

#### Parameters

- data** [DataFrame] The pandas object holding the data.
- column** [string or sequence] If passed, will be used to limit data to a subset of columns.
- by** [object, optional] If passed, then used to form histograms for separate groups.
- grid** [boolean, default True] Whether to show axis grid lines.
- xlabelsize** [int, default None] If specified changes the x-axis label size.
- xrot** [float, default None] Rotation of x axis labels. For example, a value of 90 displays the x labels rotated 90 degrees clockwise.
- ylabelsize** [int, default None] If specified changes the y-axis label size.
- yrot** [float, default None] Rotation of y axis labels. For example, a value of 90 displays the y labels rotated 90 degrees clockwise.
- ax** [Matplotlib axes object, default None] The axes to plot the histogram on.
- sharex** [boolean, default True if ax is None else False] In case subplots=True, share x axis and set some x axis labels to invisible; defaults to True if ax is None otherwise False if an ax is passed in. Note that passing in both an ax and sharex=True will alter all x axis labels for all subplots in a figure.
- sharey** [boolean, default False] In case subplots=True, share y axis and set some y axis labels to invisible.
- figsize** [tuple] The size in inches of the figure to create. Uses the value in *matplotlib.rcParams* by default.
- layout** [tuple, optional] Tuple of (rows, columns) for the layout of the histograms.
- bins** [integer or sequence, default 10] Number of histogram bins to be used. If an integer is given, bins + 1 bin edges are calculated and returned. If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.
- \*\*kwargs** All other plotting keyword arguments to be passed to `matplotlib.pyplot.hist()`.

#### Returns

**axes** [matplotlib.AxesSubplot or numpy.ndarray of them]

See also:

`matplotlib.pyplot.hist` Plot a histogram using matplotlib.

## Examples

This example draws a histogram based on the length and width of some animals, displayed in three bins

```
>>> df = pd.DataFrame({
...     'length': [1.5, 0.5, 1.2, 0.9, 3],
...     'width': [0.7, 0.2, 0.15, 0.2, 1.1]
... }, index= ['pig', 'rabbit', 'duck', 'chicken', 'horse'])
>>> hist = df.hist(bins=3)
```

### 35.11.3.42 pandas.core.groupby.DataFrameGroupBy.idxmax

DataFrameGroupBy.**idxmax**

Return index of first occurrence of maximum over requested axis. NA/null values are excluded.

#### Parameters

**axis** [{0 or 'index', 1 or 'columns'}, default 0] 0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** [boolean, default True] Exclude NA/null values. If an entire row/column is NA, the result will be NA.

#### Returns

**idxmax** [Series]

#### Raises

**ValueError**

- If the row/column is empty

See also:

`Series.idxmax`

## Notes

This method is the DataFrame version of `ndarray.argmax`.

### 35.11.3.43 pandas.core.groupby.DataFrameGroupBy.idxmin

DataFrameGroupBy.**idxmin**

Return index of first occurrence of minimum over requested axis. NA/null values are excluded.

#### Parameters

**axis** [{0 or 'index', 1 or 'columns'}, default 0] 0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** [boolean, default True] Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**Returns****idxmin** [Series]**Raises****ValueError**

- If the row/column is empty

**See also:**`Series.idxmin`**Notes**

This method is the DataFrame version of `ndarray.argmax`.

**35.11.3.44 pandas.core.groupby.DataFrameGroupBy.mad**`DataFrameGroupBy.mad`

Return the mean absolute deviation of the values for the requested axis.

**Parameters**

**axis** [{index (0), columns (1)}] Axis for the function to be applied on.

**skipna** [bool, default True] Exclude NA/null values when computing the result.

**level** [int or level name, default None] If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series.

**numeric\_only** [bool, default None] Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**\*\*kwargs** Additional keyword arguments to be passed to the function.

**Returns****mad** [Series or DataFrame (if level specified)]**35.11.3.45 pandas.core.groupby.DataFrameGroupBy.pct\_change**`DataFrameGroupBy.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, axis=0*)

Calculate `pct_change` of each value to previous entry in group.

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

**35.11.3.46 pandas.core.groupby.DataFrameGroupBy.plot**`DataFrameGroupBy.plot`

Class implementing the `.plot` attribute for groupby objects.

### 35.11.3.47 pandas.core.groupby.DataFrameGroupBy.quantile

#### DataFrameGroupBy.quantile

Return values at the given quantile over requested axis.

##### Parameters

**q** [float or array-like, default 0.5 (50% quantile)] Value between  $0 \leq q \leq 1$ , the quantile(s) to compute.

**axis** [{0, 1, 'index', 'columns'} (default 0)] Equals 0 or 'index' for row-wise, 1 or 'columns' for column-wise.

**numeric\_only** [bool, default True] If False, the quantile of datetime and timedelta data will be computed as well.

**interpolation** [{ 'linear', 'lower', 'higher', 'midpoint', 'nearest' }] This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points  $i$  and  $j$ :

- linear:  $i + (j - i) * fraction$ , where *fraction* is the fractional part of the index surrounded by  $i$  and  $j$ .
- lower:  $i$ .
- higher:  $j$ .
- nearest:  $i$  or  $j$  whichever is nearest.
- midpoint:  $(i + j) / 2$ .

New in version 0.18.0.

##### Returns

**quantiles** [Series or DataFrame]

- If  $q$  is an array, a DataFrame will be returned where the index is  $q$ , the columns are the columns of self, and the values are the quantiles.
- If  $q$  is a float, a Series will be returned where the index is the columns of self and the values are the quantiles.

See also:

**core.window.Rolling.quantile** Rolling quantile.

**numpy.percentile** Numpy function to compute the percentile.

##### Examples

```

>>> df = pd.DataFrame(np.array([[1, 1], [2, 10], [3, 100], [4, 100]]),
...                    columns=['a', 'b'])
>>> df.quantile(.1)
a    1.3
b    3.7
Name: 0.1, dtype: float64
>>> df.quantile([.1, .5])
      a    b
0.1  1.3  3.7
0.5  2.5 55.0

```

Specifying `numeric_only=False` will also compute the quantile of datetime and timedelta data.

```
>>> df = pd.DataFrame({'A': [1, 2],
...                     'B': [pd.Timestamp('2010'),
...                           pd.Timestamp('2011')],
...                     'C': [pd.Timedelta('1 days'),
...                           pd.Timedelta('2 days')])
>>> df.quantile(0.5, numeric_only=False)
A          1.5
B    2010-07-02 12:00:00
C          1 days 12:00:00
Name: 0.5, dtype: object
```

### 35.11.3.48 pandas.core.groupby.DataFrameGroupBy.rank

`DataFrameGroupBy.rank` (*method='average', ascending=True, na\_option='keep', pct=False, axis=0*)

Provides the rank of values within each group.

#### Parameters

**method** [{‘average’, ‘min’, ‘max’, ‘first’, ‘dense’}, default ‘average’]

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like ‘min’, but rank always increases by 1 between groups

**ascending** [boolean, default True] False for ranks by high (1) to low (N)

**na\_option** [{‘keep’, ‘top’, ‘bottom’}, default ‘keep’]

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**pct** [boolean, default False] Compute percentage rank of data within each group

**axis** [int, default 0] The axis of the object over which to compute the rank.

#### Returns

—

**DataFrame with ranking of values within each group**

See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.49 pandas.core.groupby.DataFrameGroupBy.resample

`DataFrameGroupBy.resample` (*rule, \*args, \*\*kwargs*)

Provide resampling when using a TimeGrouper.

Given a grouper, the function resamples it according to a string “string” -> “frequency”.

See the *frequency aliases* documentation for more details.

**Parameters**

**rule** [str or DateOffset] The offset string or object representing target grouper conversion.

**\*args, \*\*kwargs** Possible arguments are *how*, *fill\_method*, *limit*, *kind* and *on*, and other arguments of *TimeGrouper*.

**Returns**

**Grouper** Return a new grouper with our resampler appended.

See also:

**pandas.Grouper** Specify a frequency to resample with when grouping by a key.

**DatetimeIndex.resample** Frequency conversion and resampling of time series.

**Examples**

```
>>> idx = pd.date_range('1/1/2000', periods=4, freq='T')
>>> df = pd.DataFrame(data=4 * [range(2)],
...                   index=idx,
...                   columns=['a', 'b'])
>>> df.iloc[2, 0] = 5
>>> df
```

|                     | a | b |
|---------------------|---|---|
| 2000-01-01 00:00:00 | 0 | 1 |
| 2000-01-01 00:01:00 | 0 | 1 |
| 2000-01-01 00:02:00 | 5 | 1 |
| 2000-01-01 00:03:00 | 0 | 1 |

Downsample the DataFrame into 3 minute bins and sum the values of the timestamps falling into a bin.

```
>>> df.groupby('a').resample('3T').sum()
```

|   | a                   | b   |
|---|---------------------|-----|
| a |                     |     |
| 0 | 2000-01-01 00:00:00 | 0 2 |
|   | 2000-01-01 00:03:00 | 0 1 |
| 5 | 2000-01-01 00:00:00 | 5 1 |

Upsample the series into 30 second bins.

```
>>> df.groupby('a').resample('30S').sum()
```

|   | a                   | b   |
|---|---------------------|-----|
| a |                     |     |
| 0 | 2000-01-01 00:00:00 | 0 1 |
|   | 2000-01-01 00:00:30 | 0 0 |
|   | 2000-01-01 00:01:00 | 0 1 |
|   | 2000-01-01 00:01:30 | 0 0 |
|   | 2000-01-01 00:02:00 | 0 0 |
|   | 2000-01-01 00:02:30 | 0 0 |
|   | 2000-01-01 00:03:00 | 0 1 |
| 5 | 2000-01-01 00:02:00 | 5 1 |

Resample by month. Values are assigned to the month of the period.

```
>>> df.groupby('a').resample('M').sum()
```

|  | a | b |
|--|---|---|
|--|---|---|

(continues on next page)

(continued from previous page)

```
a
0    2000-01-31    0    3
5    2000-01-31    5    1
```

Downsample the series into 3 minute bins as above, but close the right side of the bin interval.

```
>>> df.groupby('a').resample('3T', closed='right').sum()
      a  b
a
0  1999-12-31 23:57:00    0    1
   2000-01-01 00:00:00    0    2
5  2000-01-01 00:00:00    5    1
```

Downsample the series into 3 minute bins and close the right side of the bin interval, but label each bin using the right edge instead of the left.

```
>>> df.groupby('a').resample('3T', closed='right', label='right').sum()
      a  b
a
0  2000-01-01 00:00:00    0    1
   2000-01-01 00:03:00    0    2
5  2000-01-01 00:03:00    5    1
```

Add an offset of twenty seconds.

```
>>> df.groupby('a').resample('3T', loffset='20s').sum()
      a  b
a
0  2000-01-01 00:00:20    0    2
   2000-01-01 00:03:20    0    1
5  2000-01-01 00:00:20    5    1
```

### 35.11.3.50 pandas.core.groupby.DataFrameGroupBy.shift

`DataFrameGroupBy.shift` (*periods=1, freq=None, axis=0, fill\_value=None*)

Shift each group by periods observations.

#### Parameters

**periods** [integer, default 1] number of periods to shift

**freq** [frequency string]

**axis** [axis to shift, default 0]

**fill\_value** [optional] New in version 0.24.0.

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 35.11.3.51 pandas.core.groupby.DataFrameGroupBy.size

`DataFrameGroupBy.size` ()

Compute group sizes.

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 35.11.3.52 pandas.core.groupby.DataFrameGroupBy.skew

DataFrameGroupBy.**skew**

Return unbiased skew over requested axis Normalized by N-1.

#### Parameters

**axis** [{index (0), columns (1)}] Axis for the function to be applied on.

**skipna** [bool, default True] Exclude NA/null values when computing the result.

**level** [int or level name, default None] If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series.

**numeric\_only** [bool, default None] Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**\*\*kwargs** Additional keyword arguments to be passed to the function.

#### Returns

**skew** [Series or DataFrame (if level specified)]

### 35.11.3.53 pandas.core.groupby.DataFrameGroupBy.take

DataFrameGroupBy.**take**

Return the elements in the given *positional* indices along an axis.

This means that we are not indexing according to actual values in the index attribute of the object. We are indexing according to the actual position of the element in the object.

#### Parameters

**indices** [array-like] An array of ints indicating which positions to take.

**axis** [{0 or 'index', 1 or 'columns', None}, default 0] The axis on which to select elements. 0 means that we are selecting rows, 1 means that we are selecting columns.

**convert** [bool, default True] Whether to convert negative indices into positive ones. For example, -1 would map to the `len(axis) - 1`. The conversions are similar to the behavior of indexing a regular Python list.

Deprecated since version 0.21.0: In the future, negative indices will always be converted.

**is\_copy** [bool, default True] Whether to return a copy of the original object or not.

**\*\*kwargs** For compatibility with `numpy.take()`. Has no effect on the output.

#### Returns

**taken** [same type as caller] An array-like containing the elements taken from the object.

See also:

**DataFrame.loc** Select a subset of a DataFrame by labels.

**DataFrame.iloc** Select a subset of a DataFrame by positions.

**numpy.take** Take elements from an array along an axis.

## Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                     columns=['name', 'class', 'max_speed'],
...                     index=[0, 2, 3, 1])
>>> df
```

|   | name   | class  | max_speed |
|---|--------|--------|-----------|
| 0 | falcon | bird   | 389.0     |
| 2 | parrot | bird   | 24.0      |
| 3 | lion   | mammal | 80.5      |
| 1 | monkey | mammal | NaN       |

Take elements at positions 0 and 3 along the axis 0 (default).

Note how the actual indices selected (0 and 1) do not correspond to our selected indices 0 and 3. That's because we are selecting the 0th and 3rd rows, not rows whose indices equal 0 and 3.

```
>>> df.take([0, 3])
```

|   | name   | class  | max_speed |
|---|--------|--------|-----------|
| 0 | falcon | bird   | 389.0     |
| 1 | monkey | mammal | NaN       |

Take elements at indices 1 and 2 along the axis 1 (column selection).

```
>>> df.take([1, 2], axis=1)
```

|   | class  | max_speed |
|---|--------|-----------|
| 0 | bird   | 389.0     |
| 2 | bird   | 24.0      |
| 3 | mammal | 80.5      |
| 1 | mammal | NaN       |

We may take elements using negative integers for positive indices, starting from the end of the object, just like with Python lists.

```
>>> df.take([-1, -2])
```

|   | name   | class  | max_speed |
|---|--------|--------|-----------|
| 1 | monkey | mammal | NaN       |
| 3 | lion   | mammal | 80.5      |

### 35.11.3.54 pandas.core.groupby.DataFrameGroupBy.tshift

`DataFrameGroupBy.tshift`

Shift the time index, using the index's frequency if available.

#### Parameters

**periods** [int] Number of periods to move, can be positive or negative

**freq** [DateOffset, timedelta, or time rule string, default None] Increment to use from the tseries module or time rule (e.g. 'EOM')

**axis** [int or basestring] Corresponds to the axis that contains the Index

#### Returns

**shifted** [NDFrame]

## Notes

If `freq` is not specified then tries to use the `freq` or `inferred_freq` attributes of the index. If neither of those attributes exist, a `ValueError` is thrown

The following methods are available only for `SeriesGroupBy` objects.

|                                                           |                                                                  |
|-----------------------------------------------------------|------------------------------------------------------------------|
| <code>SeriesGroupBy.nlargest</code>                       | Return the largest $n$ elements.                                 |
| <code>SeriesGroupBy.nsmallest</code>                      | Return the smallest $n$ elements.                                |
| <code>SeriesGroupBy.nunique([dropna])</code>              | Returns number of unique elements in the group                   |
| <code>SeriesGroupBy.unique</code>                         | Return unique values of Series object.                           |
| <code>SeriesGroupBy.value_counts([normalize, ...])</code> |                                                                  |
| <code>SeriesGroupBy.is_monotonic_increasing</code>        | Return boolean if values in the object are monotonic_increasing. |
| <code>SeriesGroupBy.is_monotonic_decreasing</code>        | Return boolean if values in the object are monotonic_decreasing. |

### 35.11.3.55 pandas.core.groupby.SeriesGroupBy.nlargest

`SeriesGroupBy.nlargest`

Return the largest  $n$  elements.

#### Parameters

**n** [int, default 5] Return this many descending sorted values.

**keep** [{‘first’, ‘last’, ‘all’}, default ‘first’] When there are duplicate values that cannot all fit in a Series of  $n$  elements:

- `first` : take the first occurrences based on the index order
- `last` : take the last occurrences based on the index order
- `all` [keep all occurrences. This can result in a Series of] size larger than  $n$ .

#### Returns

**Series** The  $n$  largest values in the Series, sorted in decreasing order.

See also:

**Series.nsmallest** Get the  $n$  smallest elements.

**Series.sort\_values** Sort Series by values.

**Series.head** Return the first  $n$  rows.

## Notes

Faster than `.sort_values(ascending=False).head(n)` for small  $n$  relative to the size of the `Series` object.

## Examples

```
>>> countries_population = {"Italy": 59000000, "France": 65000000,
...                          "Malta": 434000, "Maldives": 434000,
...                          "Brunei": 434000, "Iceland": 337000,
...                          "Nauru": 11300, "Tuvalu": 11300,
...                          "Anguilla": 11300, "Monserat": 5200}
>>> s = pd.Series(countries_population)
>>> s
Italy          59000000
France         65000000
Malta           434000
Maldives        434000
Brunei          434000
Iceland         337000
Nauru            11300
Tuvalu           11300
Anguilla         11300
Monserat         5200
dtype: int64
```

The  $n$  largest elements where  $n=5$  by default.

```
>>> s.nlargest()
France         65000000
Italy          59000000
Malta           434000
Maldives        434000
Brunei          434000
dtype: int64
```

The  $n$  largest elements where  $n=3$ . Default *keep* value is 'first' so Malta will be kept.

```
>>> s.nlargest(3)
France         65000000
Italy          59000000
Malta           434000
dtype: int64
```

The  $n$  largest elements where  $n=3$  and keeping the last duplicates. Brunei will be kept since it is the last with value 434000 based on the index order.

```
>>> s.nlargest(3, keep='last')
France         65000000
Italy          59000000
Brunei          434000
dtype: int64
```

The  $n$  largest elements where  $n=3$  with all duplicates kept. Note that the returned Series has five elements due to the three duplicates.

```
>>> s.nlargest(3, keep='all')
France         65000000
Italy          59000000
Malta           434000
Maldives        434000
Brunei          434000
dtype: int64
```

### 35.11.3.56 pandas.core.groupby.SeriesGroupBy.nsmallest

**SeriesGroupBy.nsmallest**

Return the smallest  $n$  elements.

#### Parameters

**n** [int, default 5] Return this many ascending sorted values.

**keep** [{‘first’, ‘last’, ‘all’}, default ‘first’] When there are duplicate values that cannot all fit in a Series of  $n$  elements:

- **first** : take the first occurrences based on the index order
- **last** : take the last occurrences based on the index order
- **all** [keep all occurrences. This can result in a Series of] size larger than  $n$ .

#### Returns

**Series** The  $n$  smallest values in the Series, sorted in increasing order.

**See also:**

**Series.nlargest** Get the  $n$  largest elements.

**Series.sort\_values** Sort Series by values.

**Series.head** Return the first  $n$  rows.

#### Notes

Faster than `.sort_values().head(n)` for small  $n$  relative to the size of the Series object.

#### Examples

```
>>> countries_population = {"Italy": 59000000, "France": 65000000,
...                          "Brunei": 434000, "Malta": 434000,
...                          "Maldives": 434000, "Iceland": 337000,
...                          "Nauru": 11300, "Tuvalu": 11300,
...                          "Anguilla": 11300, "Monserat": 5200}
>>> s = pd.Series(countries_population)
>>> s
Italy      59000000
France     65000000
Brunei      434000
Malta       434000
Maldives    434000
Iceland     337000
Nauru        11300
Tuvalu       11300
Anguilla     11300
Monserat     5200
dtype: int64
```

The  $n$  largest elements where  $n=5$  by default.

```
>>> s.nsmallest()
Monserat      5200
Nauru         11300
Tuvalu        11300
Anguilla      11300
Iceland       337000
dtype: int64
```

The  $n$  smallest elements where  $n=3$ . Default *keep* value is 'first' so Nauru and Tuvalu will be kept.

```
>>> s.nsmallest(3)
Monserat      5200
Nauru         11300
Tuvalu        11300
dtype: int64
```

The  $n$  smallest elements where  $n=3$  and keeping the last duplicates. Anguilla and Tuvalu will be kept since they are the last with value 11300 based on the index order.

```
>>> s.nsmallest(3, keep='last')
Monserat      5200
Anguilla      11300
Tuvalu        11300
dtype: int64
```

The  $n$  smallest elements where  $n=3$  with all duplicates kept. Note that the returned Series has four elements due to the three duplicates.

```
>>> s.nsmallest(3, keep='all')
Monserat      5200
Nauru         11300
Tuvalu        11300
Anguilla      11300
dtype: int64
```

### 35.11.3.57 pandas.core.groupby.SeriesGroupBy.nunique

`SeriesGroupBy.nunique` (*dropna=True*)

Returns number of unique elements in the group

### 35.11.3.58 pandas.core.groupby.SeriesGroupBy.unique

`SeriesGroupBy.unique`

Return unique values of Series object.

Uniques are returned in order of appearance. Hash table-based unique, therefore does NOT sort.

#### Returns

**ndarray or ExtensionArray** The unique values returned as a NumPy array. In case of an extension-array backed Series, a new `ExtensionArray` of that type with just the unique values is returned. This includes

- Categorical
- Period

- Datetime with Timezone
- Interval
- Sparse
- IntegerNA

See also:

**unique** Top-level unique method for any 1-d array-like object.

**Index.unique** Return Index with unique values from an Index object.

## Examples

```
>>> pd.Series([2, 1, 3, 3], name='A').unique()
array([2, 1, 3])
```

```
>>> pd.Series([pd.Timestamp('2016-01-01') for _ in range(3)]).unique()
array(['2016-01-01T00:00:00.000000000'], dtype='datetime64[ns]')
```

```
>>> pd.Series([pd.Timestamp('2016-01-01', tz='US/Eastern')
...           for _ in range(3)]).unique()
<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]
```

An unordered Categorical will return categories in the order of appearance.

```
>>> pd.Series(pd.Categorical(list('baabc'))).unique()
[b, a, c]
Categories (3, object): [b, a, c]
```

An ordered Categorical preserves the category ordering.

```
>>> pd.Series(pd.Categorical(list('baabc'), categories=list('abc'),
...                           ordered=True)).unique()
[b, a, c]
Categories (3, object): [a < b < c]
```

### 35.11.3.59 pandas.core.groupby.SeriesGroupBy.value\_counts

**SeriesGroupBy.value\_counts** (*normalize=False, sort=True, ascending=False, bins=None, dropna=True*)

### 35.11.3.60 pandas.core.groupby.SeriesGroupBy.is\_monotonic\_increasing

**SeriesGroupBy.is\_monotonic\_increasing**

Return boolean if values in the object are monotonic\_increasing.

New in version 0.19.0.

#### Returns

**is\_monotonic** [boolean]

### 35.11.3.61 pandas.core.groupby.SeriesGroupBy.is\_monotonic\_decreasing

`SeriesGroupBy.is_monotonic_decreasing`

Return boolean if values in the object are monotonic\_decreasing.

New in version 0.19.0.

#### Returns

**is\_monotonic\_decreasing** [boolean]

The following methods are available only for `DataFrameGroupBy` objects.

|                                                                |                                                                                                                                                        |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>DataFrameGroupBy.corrwith</code>                         | Compute pairwise correlation between rows or columns of <code>DataFrame</code> with rows or columns of <code>Series</code> or <code>DataFrame</code> . |
| <code>DataFrameGroupBy.boxplot([subplots, column, ...])</code> | Make box plots from <code>DataFrameGroupBy</code> data.                                                                                                |

### 35.11.3.62 pandas.core.groupby.DataFrameGroupBy.corrwith

`DataFrameGroupBy.corrwith`

Compute pairwise correlation between rows or columns of `DataFrame` with rows or columns of `Series` or `DataFrame`. `DataFrames` are first aligned along both axes before computing the correlations.

#### Parameters

**other** [`DataFrame`, `Series`]

**axis** [{0 or 'index', 1 or 'columns'}, default 0] 0 or 'index' to compute column-wise, 1 or 'columns' for row-wise

**drop** [boolean, default False] Drop missing indices from result

**method** [{ 'pearson', 'kendall', 'spearman' } or callable]

- pearson : standard correlation coefficient
- kendall : Kendall Tau correlation coefficient
- spearman : Spearman rank correlation
- callable: callable with input two 1d ndarrays and returning a float

New in version 0.24.0.

#### Returns

**correls** [`Series`]

**See Also**

**DataFrame.corr**

### 35.11.3.63 pandas.core.groupby.DataFrameGroupBy.boxplot

`DataFrameGroupBy.boxplot` (*subplots=True, column=None, fontsize=None, rot=0, grid=True, ax=None, figsize=None, layout=None, sharex=False, sharey=True, \*\*kws*)

Make box plots from `DataFrameGroupBy` data.

### Parameters

**grouped** [Grouped DataFrame]

**subplots** :

- False - no subplots will be used
- True - create a subplot for each group

**column** [column name or list of names, or vector] Can be any valid input to groupby

**fontsize** [int or string]

**rot** [label rotation angle]

**grid** [Setting this to True will show the grid]

**ax** [Matplotlib axis object, default None]

**figsize** [A tuple (width, height) in inches]

**layout** [tuple (optional)] (rows, columns) for the layout of the plot

**sharex** [bool, default False] Whether x-axes will be shared among subplots

New in version 0.23.1.

**sharey** [bool, default True] Whether y-axes will be shared among subplots

New in version 0.23.1.

**\*\*kwargs** [Keyword Arguments] All other plotting keyword arguments to be passed to matplotlib's boxplot function

### Returns

**dict of key/value = group key/DataFrame.boxplot return value**

**or DataFrame.boxplot return value in case subplots=figures=False**

### Examples

```
>>> import itertools
>>> tuples = [t for t in itertools.product(range(1000), range(4))]
>>> index = pd.MultiIndex.from_tuples(tuples, names=['lv10', 'lv11'])
>>> data = np.random.randn(len(index), 4)
>>> df = pd.DataFrame(data, columns=list('ABCD'), index=index)
>>>
>>> grouped = df.groupby(level='lv11')
>>> boxplot_frame_groupby(grouped)
>>>
>>> grouped = df.unstack(level='lv11').groupby(level=0, axis=1)
>>> boxplot_frame_groupby(grouped, subplots=False)
```

{{ header }}

## 35.12 Resampling

Resampler objects are returned by resample calls: `pandas.DataFrame.resample()`, `pandas.Series.resample()`.

### 35.12.1 Indexing, iteration

|                                               |                                                   |
|-----------------------------------------------|---------------------------------------------------|
| <code>Resampler.__iter__()</code>             | Resampler iterator.                               |
| <code>Resampler.groups</code>                 | Dict {group name -> group labels}.                |
| <code>Resampler.indices</code>                | Dict {group name -> group indices}.               |
| <code>Resampler.get_group(name[, obj])</code> | Constructs NDFrame from group with provided name. |

#### 35.12.1.1 `pandas.core.resample.Resampler.__iter__`

`Resampler.__iter__()`  
Resampler iterator.

**Returns**

Generator yielding sequence of (name, subsetted object)  
for each group

**See also:**

`GroupBy.__iter__`

#### 35.12.1.2 `pandas.core.resample.Resampler.groups`

`Resampler.groups`  
Dict {group name -> group labels}.

#### 35.12.1.3 `pandas.core.resample.Resampler.indices`

`Resampler.indices`  
Dict {group name -> group indices}.

#### 35.12.1.4 `pandas.core.resample.Resampler.get_group`

`Resampler.get_group(name, obj=None)`  
Constructs NDFrame from group with provided name.

**Parameters**

**name** [object] the name of the group to get as a DataFrame

**obj** [NDFrame, default None] the NDFrame to take the DataFrame out of. If it is None, the object groupby was called on will be used

**Returns**

**group** [same type as obj]

### 35.12.2 Function application

|                                                     |                                                                 |
|-----------------------------------------------------|-----------------------------------------------------------------|
| <code>Resampler.apply(func, *args, **kwargs)</code> | Aggregate using one or more operations over the specified axis. |
|-----------------------------------------------------|-----------------------------------------------------------------|

---

Continued on next page

Table 433 – continued from previous page

|                                                         |                                                                                                              |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>Resampler.aggregate(func, *args, **kwargs)</code> | Aggregate using one or more operations over the specified axis.                                              |
| <code>Resampler.transform(arg, *args, **kwargs)</code>  | Call function producing a like-indexed Series on each group and return a Series with the transformed values. |
| <code>Resampler.pipe(func, *args, **kwargs)</code>      | Apply a function <i>func</i> with arguments to this Resampler object and return the function's result.       |

### 35.12.2.1 pandas.core.resample.Resampler.apply

`Resampler.apply(func, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

#### Parameters

**func** [function, str, list or dict] Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to `DataFrame.apply`.

Accepted combinations are:

- function
- string function name
- list of functions and/or function names, e.g. `[np.sum, 'mean']`
- dict of axis labels -> functions, function names or list of such.

**\*args** Positional arguments to pass to *func*.

**\*\*kwargs** Keyword arguments to pass to *func*.

#### Returns

**DataFrame, Series or scalar** if `DataFrame.agg` is called with a single function, returns a Series if `DataFrame.agg` is called with several functions, returns a DataFrame if `Series.agg` is called with single function, returns a scalar if `Series.agg` is called with several functions, returns a Series

#### See also:

`pandas.DataFrame.groupby.aggregate`, `pandas.DataFrame.resample.transform`,  
`pandas.DataFrame.aggregate`

#### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

#### Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5],
                  index=pd.date_range('20130101', periods=5, freq='s'))
2013-01-01 00:00:00    1
2013-01-01 00:00:01    2
2013-01-01 00:00:02    3
2013-01-01 00:00:03    4
```

(continues on next page)

(continued from previous page)

```
2013-01-01 00:00:04    5
Freq: S, dtype: int64
```

```
>>> r = s.resample('2s')
DatetimeIndexResampler [freq=<2 * Seconds>, axis=0, closed=left,
                        label=left, convention=start, base=0]
```

```
>>> r.agg(np.sum)
2013-01-01 00:00:00    3
2013-01-01 00:00:02    7
2013-01-01 00:00:04    5
Freq: 2S, dtype: int64
```

```
>>> r.agg(['sum', 'mean', 'max'])
              sum  mean  max
2013-01-01 00:00:00    3   1.5   2
2013-01-01 00:00:02    7   3.5   4
2013-01-01 00:00:04    5   5.0   5
```

```
>>> r.agg({'result' : lambda x: x.mean() / x.std(),
          'total' : np.sum})
              total  result
2013-01-01 00:00:00    3  2.121320
2013-01-01 00:00:02    7  4.949747
2013-01-01 00:00:04    5         NaN
```

### 35.12.2.2 pandas.core.resample.Resampler.aggregate

`Resampler.aggregate(func, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

#### Parameters

**func** [function, str, list or dict] Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply.

Accepted combinations are:

- function
- string function name
- list of functions and/or function names, e.g. `[np.sum, 'mean']`
- dict of axis labels -> functions, function names or list of such.

**\*args** Positional arguments to pass to *func*.

**\*\*kwargs** Keyword arguments to pass to *func*.

#### Returns

**DataFrame, Series or scalar** if DataFrame.agg is called with a single function, returns a Series if DataFrame.agg is called with several functions, returns a DataFrame if Series.agg is called with single function, returns a scalar if Series.agg is called with several functions, returns a Series

### See also:

`pandas.DataFrame.groupby.aggregate`, `pandas.DataFrame.resample.transform`,  
`pandas.DataFrame.aggregate`

### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

### Examples

```
>>> s = pd.Series([1,2,3,4,5],
                  index=pd.date_range('20130101', periods=5, freq='s'))
2013-01-01 00:00:00    1
2013-01-01 00:00:01    2
2013-01-01 00:00:02    3
2013-01-01 00:00:03    4
2013-01-01 00:00:04    5
Freq: S, dtype: int64
```

```
>>> r = s.resample('2s')
DatetimeIndexResampler [freq=<2 * Seconds>, axis=0, closed=left,
                        label=left, convention=start, base=0]
```

```
>>> r.agg(np.sum)
2013-01-01 00:00:00    3
2013-01-01 00:00:02    7
2013-01-01 00:00:04    5
Freq: 2S, dtype: int64
```

```
>>> r.agg(['sum', 'mean', 'max'])
              sum  mean  max
2013-01-01 00:00:00    3   1.5   2
2013-01-01 00:00:02    7   3.5   4
2013-01-01 00:00:04    5   5.0   5
```

```
>>> r.agg({'result' : lambda x: x.mean() / x.std(),
          'total' : np.sum})
              total  result
2013-01-01 00:00:00    3  2.121320
2013-01-01 00:00:02    7  4.949747
2013-01-01 00:00:04    5         NaN
```

### 35.12.2.3 pandas.core.resample.Resampler.transform

`Resampler.transform(arg, *args, **kwargs)`

Call function producing a like-indexed Series on each group and return a Series with the transformed values.

#### Parameters

**func** [function] To apply to each group. Should return a Series with the same index

#### Returns

**transformed** [Series]

## Examples

```
>>> resampled.transform(lambda x: (x - x.mean()) / x.std())
```

### 35.12.2.4 pandas.core.resample.Resampler.pipe

**Resampler.pipe** (*func*, \**args*, \*\**kwargs*)Apply a function *func* with arguments to this Resampler object and return the function's result.

New in version 0.23.0.

Use *.pipe* when you want to improve readability by chaining together functions that expect Series, DataFrames, GroupBy or Resampler objects. Instead of writing

```
>>> h(g(f(df.groupby('group')), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.groupby('group')
...   .pipe(f)
...   .pipe(g, arg1=a)
...   .pipe(h, arg2=b, arg3=c))
```

which is much more readable.

#### Parameters

**func** [callable or tuple of (callable, string)] Function to apply to this Resampler object or, alternatively, a (*callable*, *data\_keyword*) tuple where *data\_keyword* is a string indicating the keyword of *callable* that expects the Resampler object.**args** [iterable, optional] positional arguments passed into *func*.**kwargs** [dict, optional] a dictionary of keyword arguments passed into *func*.

#### Returns

**object** [the return type of *func*.]

See also:

**pandas.Series.pipe** Apply a function with arguments to a series.**pandas.DataFrame.pipe** Apply a function with arguments to a dataframe.**apply** Apply function to each group instead of to the full Resampler object.

## Notes

See more [here](#)

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4]},
...                     index=pd.date_range('2012-08-02', periods=4))
>>> df
```

|            | A |
|------------|---|
| 2012-08-02 | 1 |
| 2012-08-03 | 2 |
| 2012-08-04 | 3 |
| 2012-08-05 | 4 |

To get the difference between each 2-day period's maximum and minimum value in one pass, you can do

```
>>> df.resample('2D').pipe(lambda x: x.max() - x.min())
```

|            | A |
|------------|---|
| 2012-08-02 | 1 |
| 2012-08-04 | 1 |

### 35.12.3 Upsampling

|                                                          |                                                             |
|----------------------------------------------------------|-------------------------------------------------------------|
| <i>Resampler.ffill([limit])</i>                          | Forward fill the values.                                    |
| <i>Resampler.backfill([limit])</i>                       | Backward fill the new missing values in the resampled data. |
| <i>Resampler.bfill([limit])</i>                          | Backward fill the new missing values in the resampled data. |
| <i>Resampler.pad([limit])</i>                            | Forward fill the values.                                    |
| <i>Resampler.nearest([limit])</i>                        | Resample by using the nearest value.                        |
| <i>Resampler.fillna(method[, limit])</i>                 | Fill missing values introduced by upsampling.               |
| <i>Resampler.asfreq([fill_value])</i>                    | Return the values at the new freq, essentially a reindex.   |
| <i>Resampler.interpolate([method, axis, limit, ...])</i> | Interpolate values according to different methods.          |

#### 35.12.3.1 pandas.core.resample.Resampler.fffll

`Resampler.fffll (limit=None)`

Forward fill the values.

##### Parameters

**limit** [integer, optional] limit of how many values to fill

##### Returns

an upsampled Series

See also:

`Series.fillna`, `DataFrame.fillna`

#### 35.12.3.2 pandas.core.resample.Resampler.backfill

`Resampler.backfill (limit=None)`

Backward fill the new missing values in the resampled data.

In statistics, imputation is the process of replacing missing data with substituted values [?]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency).

The backward fill will replace NaN values that appeared in the resampled data with the next value in the original sequence. Missing values that existed in the original data will not be modified.

### Parameters

**limit** [integer, optional] Limit of how many values to fill.

### Returns

**Series, DataFrame** An upsampled Series or DataFrame with backward filled NaN values.

### See also:

**bfill** Alias of backfill.

**fillna** Fill NaN values using the specified method, which can be 'backfill'.

**nearest** Fill NaN values with nearest neighbor starting from center.

**pad** Forward fill NaN values.

**pandas.Series.fillna** Fill NaN values in the Series using the specified method, which can be 'backfill'.

**pandas.DataFrame.fillna** Fill NaN values in the DataFrame using the specified method, which can be 'backfill'.

### Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...               index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64
```

```
>>> s.resample('30min').backfill()
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('15min').backfill(limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
```

### 35.12.3.3 pandas.core.resample.Resampler.bfill

Resampler.**bfill** (*limit=None*)

Backward fill the new missing values in the resampled data.

In statistics, imputation is the process of replacing missing data with substituted values [?]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency). The backward fill will replace NaN values that appeared in the resampled data with the next value in the original sequence. Missing values that existed in the original data will not be modified.

#### Parameters

**limit** [integer, optional] Limit of how many values to fill.

#### Returns

**Series, DataFrame** An upsampled Series or DataFrame with backward filled NaN values.

See also:

**bfill** Alias of backfill.

**fillna** Fill NaN values using the specified method, which can be ‘backfill’.

**nearest** Fill NaN values with nearest neighbor starting from center.

**pad** Forward fill NaN values.

**pandas.Series.fillna** Fill NaN values in the Series using the specified method, which can be ‘backfill’.

**pandas.DataFrame.fillna** Fill NaN values in the DataFrame using the specified method, which can be ‘backfill’.

## Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...               index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64
```

```
>>> s.resample('30min').backfill()
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('15min').backfill(limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 01:45:00    3.0
2018-01-01 02:00:00    3.0
Freq: 15T, dtype: float64
```

Resampling a DataFrame that has missing values:

```
>>> df = pd.DataFrame({'a': [2, np.nan, 6], 'b': [1, 3, 5]},
...                   index=pd.date_range('20180101', periods=3,
...                                       freq='h'))
>>> df
              a  b
2018-01-01 00:00:00  2.0  1
2018-01-01 01:00:00  NaN  3
2018-01-01 02:00:00  6.0  5
```

```
>>> df.resample('30min').backfill()
              a    b
2018-01-01 00:00:00  2.0  1
2018-01-01 00:30:00  NaN  3
2018-01-01 01:00:00  NaN  3
2018-01-01 01:30:00  6.0  5
2018-01-01 02:00:00  6.0  5
```

```
>>> df.resample('15min').backfill(limit=2)
              a    b
2018-01-01 00:00:00  2.0  1.0
2018-01-01 00:15:00  NaN  NaN
2018-01-01 00:30:00  NaN  3.0
2018-01-01 00:45:00  NaN  3.0
2018-01-01 01:00:00  NaN  3.0
2018-01-01 01:15:00  NaN  NaN
2018-01-01 01:30:00  6.0  5.0
2018-01-01 01:45:00  6.0  5.0
2018-01-01 02:00:00  6.0  5.0
```

#### 35.12.3.4 pandas.core.resample.Resampler.pad

`Resampler.pad` (*limit=None*)

Forward fill the values.

##### Parameters

**limit** [integer, optional] limit of how many values to fill

##### Returns

an upsampled Series

See also:

`Series.fillna`, `DataFrame.fillna`

#### 35.12.3.5 pandas.core.resample.Resampler.nearest

`Resampler.nearest` (*limit=None*)

Resample by using the nearest value.

When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency). The *nearest* method will replace NaN values that appeared in the resampled data with the value from the nearest member of the sequence, based on the index value. Missing values that existed in the original data will not be modified. If *limit* is given, fill only this many values in each direction for each of the original values.

##### Parameters

**limit** [int, optional] Limit of how many values to fill.

New in version 0.21.0.

##### Returns

**Series or DataFrame** An upsampled Series or DataFrame with NaN values filled with their nearest value.

See also:

**backfill** Backward fill the new missing values in the resampled data.

**pad** Forward fill NaN values.

### Examples

```
>>> s = pd.Series([1, 2],
...               index=pd.date_range('20180101',
...                                   periods=2,
...                                   freq='1h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
Freq: H, dtype: int64
```

```
>>> s.resample('15min').nearest()
2018-01-01 00:00:00    1
2018-01-01 00:15:00    1
2018-01-01 00:30:00    2
2018-01-01 00:45:00    2
2018-01-01 01:00:00    2
Freq: 15T, dtype: int64
```

Limit the number of upsampled values imputed by the nearest:

```
>>> s.resample('15min').nearest(limit=1)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    1.0
2018-01-01 00:30:00    NaN
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
Freq: 15T, dtype: float64
```

#### 35.12.3.6 pandas.core.resample.Resampler.fillna

`Resampler.fillna` (*method*, *limit=None*)

Fill missing values introduced by upsampling.

In statistics, imputation is the process of replacing missing data with substituted values [?]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency).

Missing values that existed in the original data will not be modified.

##### Parameters

**method** [{‘pad’, ‘backfill’, ‘fill’, ‘bfill’, ‘nearest’}] Method to use for filling holes in resampled data

- ‘pad’ or ‘fill’: use previous valid observation to fill gap (forward fill).
- ‘backfill’ or ‘bfill’: use next valid observation to fill gap.
- ‘nearest’: use nearest valid observation to fill gap.

**limit** [integer, optional] Limit of how many consecutive missing values to fill.

### Returns

**Series or DataFrame** An upsampled Series or DataFrame with missing values filled.

See also:

***backfill*** Backward fill NaN values in the resampled data.

***pad*** Forward fill NaN values in the resampled data.

***nearest*** Fill NaN values in the resampled data with nearest neighbor starting from center.

***interpolate*** Fill NaN values using interpolation.

***pandas.Series.fillna*** Fill NaN values in the Series using the specified method, which can be 'bfill' and 'ffill'.

***pandas.DataFrame.fillna*** Fill NaN values in the DataFrame using the specified method, which can be 'bfill' and 'ffill'.

### Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...               index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64
```

Without filling the missing values you get:

```
>>> s.resample("30min").asfreq()
2018-01-01 00:00:00    1.0
2018-01-01 00:30:00    NaN
2018-01-01 01:00:00    2.0
2018-01-01 01:30:00    NaN
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

```
>>> s.resample('30min').fillna("backfill")
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('15min').fillna("backfill", limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
```

(continues on next page)

(continued from previous page)

```

2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 01:45:00    3.0
2018-01-01 02:00:00    3.0
Freq: 15T, dtype: float64

```

```

>>> s.resample('30min').fillna("pad")
2018-01-01 00:00:00    1
2018-01-01 00:30:00    1
2018-01-01 01:00:00    2
2018-01-01 01:30:00    2
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64

```

```

>>> s.resample('30min').fillna("nearest")

2018-01-01 01:30:00    3.0
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

DataFrame resampling is done column-wise. All the same options are available.

```
>>> df = pd.DataFrame({'a': [2, np.nan, 6], 'b': [1, 3, 5]},
...                    index=pd.date_range('20180101', periods=3,
...                    freq='h'))
>>> df
```

|                     | a   | b |
|---------------------|-----|---|
| 2018-01-01 00:00:00 | 2.0 | 1 |
| 2018-01-01 01:00:00 | NaN | 3 |
| 2018-01-01 02:00:00 | 6.0 | 5 |

```
>>> df.resample('30min').fillna("bfill")
```

|                     | a   | b |
|---------------------|-----|---|
| 2018-01-01 00:00:00 | 2.0 | 1 |
| 2018-01-01 00:30:00 | NaN | 3 |
| 2018-01-01 01:00:00 | NaN | 3 |
| 2018-01-01 01:30:00 | 6.0 | 5 |
| 2018-01-01 02:00:00 | 6.0 | 5 |

### 35.12.3.7 pandas.core.resample.Resampler.asfreq

Resampler.**asfreq** (*fill\_value=None*)

Return the values at the new freq, essentially a reindex.

#### Parameters

**fill\_value** [scalar, optional] Value to use for missing values, applied during upsampling (note this does not fill NaNs that already were present).

New in version 0.20.0.

#### See also:

Series.asfreq, DataFrame.asfreq

### 35.12.3.8 pandas.core.resample.Resampler.interpolate

Resampler.**interpolate** (*method='linear', axis=0, limit=None, inplace=False, limit\_direction='forward', limit\_area=None, downcast=None, \*\*kwargs*)

Interpolate values according to different methods.

New in version 0.18.1.

Please note that only `method='linear'` is supported for DataFrame/Series with a MultiIndex.

#### Parameters

**method** [str, default 'linear'] Interpolation technique to use. One of:

- 'linear': Ignore the index and treat the values as equally spaced. This is the only method supported on MultiIndexes.
- 'time': Works on daily and higher resolution data to interpolate given length of interval.

- ‘index’, ‘values’: use the actual numerical values of the index.
- ‘pad’: Fill in NaNs using existing values.
- ‘nearest’, ‘zero’, ‘slinear’, ‘quadratic’, ‘cubic’, ‘spline’, ‘barycentric’, ‘polynomial’: Passed to `scipy.interpolate.interp1d`. Both ‘polynomial’ and ‘spline’ require that you also specify an *order* (int), e.g. `df.interpolate(method='polynomial', order=4)`. These use the numerical values of the index.
- ‘krogh’, ‘piecewise\_polynomial’, ‘spline’, ‘pchip’, ‘akima’: Wrappers around the SciPy interpolation methods of similar names. See *Notes*.
- ‘from\_derivatives’: Refers to `scipy.interpolate.BPoly.from_derivatives` which replaces ‘piecewise\_polynomial’ interpolation method in scipy 0.18.

New in version 0.18.1: Added support for the ‘akima’ method. Added interpolate method ‘from\_derivatives’ which replaces ‘piecewise\_polynomial’ in SciPy 0.18; backwards-compatible with SciPy < 0.18

**axis** [{0 or ‘index’, 1 or ‘columns’, None}, default None] Axis to interpolate along.

**limit** [int, optional] Maximum number of consecutive NaNs to fill. Must be greater than 0.

**inplace** [bool, default False] Update the data in place if possible.

**limit\_direction** [{‘forward’, ‘backward’, ‘both’}, default ‘forward’] If limit is specified, consecutive NaNs will be filled in this direction.

**limit\_area** [{None, ‘inside’, ‘outside’}, default None] If limit is specified, consecutive NaNs will be filled with this restriction.

- None: No fill restriction.
- ‘inside’: Only fill NaNs surrounded by valid values (interpolate).
- ‘outside’: Only fill NaNs outside valid values (extrapolate).

New in version 0.21.0.

**downcast** [optional, ‘infer’ or None, defaults to None] Downcast dtypes if possible.

**\*\*kwargs** Keyword arguments to pass on to the interpolating function.

#### Returns

**Series or DataFrame** Returns the same object type as the caller, interpolated at some or all NaN values

#### See also:

**fillna** Fill missing values using different methods.

**scipy.interpolate.Akima1DInterpolator** Piecewise cubic polynomials (Akima interpolator).

**scipy.interpolate.BPoly.from\_derivatives** Piecewise polynomial in the Bernstein basis.

**scipy.interpolate.interp1d** Interpolate a 1-D function.

**scipy.interpolate.KroghInterpolator** Interpolate polynomial (Krogh interpolator).

**scipy.interpolate.PchipInterpolator** PCHIP 1-d monotonic cubic interpolation.

**scipy.interpolate.CubicSpline** Cubic spline data interpolator.

## Notes

The ‘krogh’, ‘piecewise\_polynomial’, ‘spline’, ‘pchip’ and ‘akima’ methods are wrappers around the respective SciPy implementations of similar names. These use the actual numerical values of the index. For more information on their behavior, see the [SciPy documentation](#) and [SciPy tutorial](#).

## Examples

Filling in NaN in a *Series* via linear interpolation.

```
>>> s = pd.Series([0, 1, np.nan, 3])
>>> s
0    0.0
1    1.0
2    NaN
3    3.0
dtype: float64
>>> s.interpolate()
0    0.0
1    1.0
2    2.0
3    3.0
dtype: float64
```

Filling in NaN in a *Series* by padding, but filling at most two consecutive NaN at a time.

```
>>> s = pd.Series([np.nan, "single_one", np.nan,
...                "fill_two_more", np.nan, np.nan, np.nan,
...                4.71, np.nan])
>>> s
0      NaN
1  single_one
2      NaN
3  fill_two_more
4      NaN
5      NaN
6      NaN
7      4.71
8      NaN
dtype: object
>>> s.interpolate(method='pad', limit=2)
0      NaN
1  single_one
2  single_one
3  fill_two_more
4  fill_two_more
5  fill_two_more
6      NaN
7      4.71
8      4.71
dtype: object
```

Filling in NaN in a *Series* via polynomial interpolation or splines: Both ‘polynomial’ and ‘spline’ methods require that you also specify an `order` (int).

```
>>> s = pd.Series([0, 2, np.nan, 8])
>>> s.interpolate(method='polynomial', order=2)
0    0.000000
1    2.000000
2    4.666667
3    8.000000
dtype: float64
```

Fill the DataFrame forward (that is, going down) along each column using linear interpolation.

Note how the last entry in column 'a' is interpolated differently, because there is no entry after it to use for interpolation. Note how the first entry in column 'b' remains NaN, because there is no entry before it to use for interpolation.

```
>>> df = pd.DataFrame([(0.0, np.nan, -1.0, 1.0),
...                    (np.nan, 2.0, np.nan, np.nan),
...                    (2.0, 3.0, np.nan, 9.0),
...                    (np.nan, 4.0, -4.0, 16.0)],
...                    columns=list('abcd'))
>>> df
   a    b    c    d
0  0.0 NaN -1.0  1.0
1 NaN  2.0 NaN  NaN
2  2.0  3.0 NaN  9.0
3 NaN  4.0 -4.0 16.0
>>> df.interpolate(method='linear', limit_direction='forward', axis=0)
   a    b    c    d
0  0.0 NaN -1.0  1.0
1  1.0  2.0 -2.0  5.0
2  2.0  3.0 -3.0  9.0
3  2.0  4.0 -4.0 16.0
```

Using polynomial interpolation.

```
>>> df['d'].interpolate(method='polynomial', order=2)
0    1.0
1    4.0
2    9.0
3   16.0
Name: d, dtype: float64
```

### 35.12.4 Computations / Descriptive Stats

|                                     |                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>Resampler.count([_method])</i>   | Compute count of group, excluding missing values.                                                            |
| <i>Resampler.nunique([_method])</i> | Returns number of unique elements in the group                                                               |

|                                                   |                                                                                                                                                      |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Resampler.mean([_method])</code>            | Compute mean of groups, excluding missing values.                                                                                                    |
| <code>Resampler.median([_method])</code>          | Compute median of groups, excluding missing values.                                                                                                  |
| <code>Resampler.min([_method])</code>             | Compute min of group values See Also ——— <code>pandas.Series.groupby</code> <code>pandas.DataFrame.groupby</code> <code>pandas.Panel.groupby</code>  |
| <code>Resampler.ohlc([_method])</code>            | Compute sum of values, excluding missing values.                                                                                                     |
| <code>Resampler.prod([_method, min_count])</code> | Compute prod of group values See Also ——— <code>pandas.Series.groupby</code> <code>pandas.DataFrame.groupby</code> <code>pandas.Panel.groupby</code> |
| <code>Resampler.size()</code>                     | Compute group sizes.                                                                                                                                 |
| <code>Resampler.sem([_method])</code>             | Compute standard error of the mean of groups, excluding missing values.                                                                              |
| <code>Resampler.std([ddof])</code>                | Compute standard deviation of groups, excluding missing values.                                                                                      |
| <code>Resampler.sum([_method, min_count])</code>  | Compute sum of group values See Also ——— <code>pandas.Series.groupby</code> <code>pandas.DataFrame.groupby</code> <code>pandas.Panel.groupby</code>  |
| <code>Resampler.var([ddof])</code>                | Compute variance of groups, excluding missing values.                                                                                                |
| <code>Resampler.quantile([q])</code>              | Return value at the given quantile.                                                                                                                  |

#### 35.12.4.1 `pandas.core.resample.Resampler.count`

`Resampler.count(_method='count')`  
 Compute count of group, excluding missing values.

See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

#### 35.12.4.2 `pandas.core.resample.Resampler.nunique`

`Resampler.nunique(_method='nunique')`  
 Returns number of unique elements in the group

#### 35.12.4.3 `pandas.core.resample.Resampler.first`

`Resampler.first(_method='first', *args, **kwargs)`  
 Compute first of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

#### 35.12.4.4 `pandas.core.resample.Resampler.last`

`Resampler.last(_method='last', *args, **kwargs)`  
 Compute last of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

#### 35.12.4.5 `pandas.core.resample.Resampler.max`

`Resampler.max(_method='max', *args, **kwargs)`  
 Compute max of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

### 35.12.4.6 pandas.core.resample.Resampler.mean

`Resampler.mean(_method='mean', *args, **kwargs)`  
Compute mean of groups, excluding missing values.

#### Returns

**pandas.Series or pandas.DataFrame**

#### See also:

`pandas.Series.`, `pandas.DataFrame.`, `pandas.Panel.`

#### Examples

```
>>> df = pd.DataFrame({'A': [1, 1, 2, 1, 2],
...                    'B': [np.nan, 2, 3, 4, 5],
...                    'C': [1, 2, 1, 1, 2]}, columns=['A', 'B', 'C'])
```

Groupby one column and return the mean of the remaining columns in each group.

```
>>> df.groupby('A').mean()
>>>
   B      C
A
1  3.0  1.333333
2  4.0  1.500000
```

Groupby two columns and return the mean of the remaining column.

```
>>> df.groupby(['A', 'B']).mean()
>>>
   C
A B
1  2.0  2
   4.0  1
2  3.0  1
   5.0  2
```

Groupby one column and return the mean of only particular column in the group.

```
>>> df.groupby('A')['B'].mean()
>>>
A
1    3.0
2    4.0
Name: B, dtype: float64
```

### 35.12.4.7 pandas.core.resample.Resampler.median

`Resampler.median(_method='median', *args, **kwargs)`  
Compute median of groups, excluding missing values.

For multiple groupings, the result index will be a MultiIndex

#### See also:

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

#### 35.12.4.8 pandas.core.resample.Resampler.min

`Resampler.min(_method='min', *args, **kwargs)`

Compute min of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

#### 35.12.4.9 pandas.core.resample.Resampler.ohlc

`Resampler.ohlc(_method='ohlc', *args, **kwargs)`

Compute sum of values, excluding missing values.

For multiple groupings, the result index will be a MultiIndex

**See also:**

*`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`*

#### 35.12.4.10 pandas.core.resample.Resampler.prod

`Resampler.prod(_method='prod', min_count=0, *args, **kwargs)`

Compute prod of group values See Also ——— `pandas.Series.groupby` `pandas.DataFrame.groupby` `pandas.Panel.groupby`

#### 35.12.4.11 pandas.core.resample.Resampler.size

`Resampler.size()`

Compute group sizes.

**See also:**

*`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`*

#### 35.12.4.12 pandas.core.resample.Resampler.sem

`Resampler.sem(_method='sem', *args, **kwargs)`

Compute standard error of the mean of groups, excluding missing values.

For multiple groupings, the result index will be a MultiIndex.

**Parameters**

**ddof** [integer, default 1] degrees of freedom

**See also:**

*`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`*

#### 35.12.4.13 pandas.core.resample.Resampler.std

`Resampler.std(ddof=1, *args, **kwargs)`

Compute standard deviation of groups, excluding missing values.

**Parameters**

**ddof** [integer, default 1]

**degrees of freedom**

#### 35.12.4.14 pandas.core.resample.Resampler.sum

`Resampler.sum(_method='sum', min_count=0, *args, **kwargs)`

Compute sum of group values See Also — pandas.Series.groupby pandas.DataFrame.groupby pandas.Panel.groupby

#### 35.12.4.15 pandas.core.resample.Resampler.var

`Resampler.var(ddof=1, *args, **kwargs)`

Compute variance of groups, excluding missing values.

##### Parameters

**ddof** [integer, default 1] degrees of freedom

#### 35.12.4.16 pandas.core.resample.Resampler.quantile

`Resampler.quantile(q=0.5, **kwargs)`

Return value at the given quantile.

New in version 0.24.0.

##### Parameters

**q** [float or array-like, default 0.5 (50% quantile)]

##### See also:

`Series.quantile`, `DataFrame.quantile`, `DataFrameGroupBy.quantile`

{{ header }}

## 35.13 Style

Styler objects are returned by `pandas.DataFrame.style`.

### 35.13.1 Styler Constructor

`Styler(data[, precision, table_styles, ...])`

Helps style a DataFrame or Series according to the data with HTML and CSS.

`Styler.from_custom_template(searchpath, name)`

Factory function for creating a subclass of Styler with a custom template and Jinja environment.

#### 35.13.1.1 pandas.io.formats.style.Styler

**class** `pandas.io.formats.style.Styler` (*data*, *precision=None*, *table\_styles=None*, *uuid=None*, *caption=None*, *table\_attributes=None*, *cell\_ids=True*)

Helps style a DataFrame or Series according to the data with HTML and CSS.

##### Parameters

**data** [Series or DataFrame]

**precision** [int] precision to round floats to, defaults to `pd.options.display.precision`

**table\_styles** [list-like, default None] list of {selector: (attr, value)} dicts; see Notes

**uuid** [str, default None] a unique identifier to avoid CSS collisions; generated automatically

**caption** [str, default None] caption to attach to the table

**cell\_ids** [bool, default True] If True, each cell will have an `id` attribute in their HTML tag. The `id` takes the form `T_<uuid>_row<num_row>_col<num_col>` where `<uuid>` is the unique identifier, `<num_row>` is the row number and `<num_col>` is the column number.

**See also:**

`pandas.DataFrame.style`

## Notes

Most styling will be done by passing style functions into `Styler.apply` or `Styler.applymap`. Style functions should return values with strings containing CSS `'attr: value'` that will be applied to the indicated cells.

If using in the Jupyter notebook, `Styler` has defined a `_repr_html_` to automatically render itself. Otherwise call `Styler.render` to get the generated HTML.

CSS classes are attached to the generated HTML

- Index and Column names include `index_name` and `level<k>` where  $k$  is its level in a `MultiIndex`
- Index label cells include
  - `row_heading`
  - `row<n>` where  $n$  is the numeric position of the row
  - `level<k>` where  $k$  is the level in a `MultiIndex`
- Column label cells include `* col_heading * col<n>` where  $n$  is the numeric position of the column  
`* level<k>` where  $k$  is the level in a `MultiIndex`
- Blank cells include `blank`
- Data cells include `data`

## Attributes

|                 |                      |
|-----------------|----------------------|
| <b>env</b>      | (Jinja2 Environment) |
| <b>template</b> | (Jinja2 Template)    |
| <b>loader</b>   | (Jinja2 Loader)      |

## Methods

|                                          |                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>apply(func[, axis, subset])</code> | Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result. |
| <code>applymap(func[, subset])</code>    | Apply a function elementwise, updating the HTML representation with the result.                          |

|                                                                |                                                                                                                                                  |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>background_gradient([cmap, low, high, axis, ...])</code> | Color the background in a gradient according to the data in each column (optionally row).                                                        |
| <code>bar([subset, axis, color, width, align, ...])</code>     | Draw bar chart in the cell backgrounds.                                                                                                          |
| <code>clear()</code>                                           | Reset the styler, removing any previously applied styles.                                                                                        |
| <code>export()</code>                                          | Export the styles to applied to the current Styler.                                                                                              |
| <code>format(formatter[, subset])</code>                       | Format the text display value of cells.                                                                                                          |
| <code>from_custom_template(searchpath, name)</code>            | Factory function for creating a subclass of <code>Styler</code> with a custom template and Jinja environment.                                    |
| <code>hide_columns(subset)</code>                              | Hide columns from rendering.                                                                                                                     |
| <code>hide_index()</code>                                      | Hide any indices from rendering.                                                                                                                 |
| <code>highlight_max([subset, color, axis])</code>              | Highlight the maximum by shading the background.                                                                                                 |
| <code>highlight_min([subset, color, axis])</code>              | Highlight the minimum by shading the background.                                                                                                 |
| <code>highlight_null([null_color])</code>                      | Shade the background <code>null_color</code> for missing values.                                                                                 |
| <code>pipe(func, *args, **kwargs)</code>                       | Apply <code>func(self, *args, **kwargs)</code> , and return the result.                                                                          |
| <code>render(**kwargs)</code>                                  | Render the built up styles to HTML.                                                                                                              |
| <code>set_caption(caption)</code>                              | Set the caption on a Styler                                                                                                                      |
| <code>set_precision(precision)</code>                          | Set the precision used to render.                                                                                                                |
| <code>set_properties([subset])</code>                          | Convenience method for setting one or more non-data dependent properties or each cell.                                                           |
| <code>set_table_attributes(attributes)</code>                  | Set the table attributes.                                                                                                                        |
| <code>set_table_styles(table_styles)</code>                    | Set the table styles on a Styler.                                                                                                                |
| <code>set_uuid(uuid)</code>                                    | Set the uuid for a Styler.                                                                                                                       |
| <code>to_excel(excel_writer[, sheet_name, na_rep, ...])</code> | Write Styler to an Excel sheet.                                                                                                                  |
| <code>use(styles)</code>                                       | Set the styles on the current Styler, possibly using styles from <code>Styler.export</code> .                                                    |
| <code>where(cond, value[, other, subset])</code>               | Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function. |

**pandas.io.formats.style.Styler.apply**

`Styler.apply(func, axis=0, subset=None, **kwargs)`

Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result.

**Parameters**

**func** [function] `func` should take a Series or DataFrame (depending on `axis`), and return an object with the same shape. Must return a DataFrame with identical index and column labels when `axis=None`

**axis** [int, str or None] apply to each column (`axis=0` or `'index'`) or to each row (`axis=1` or `'columns'`) or to the entire DataFrame at once with `axis=None`

**subset** [IndexSlice] a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** [dict] pass along to `func`

**Returns**

**self** [Styler]

## Notes

The output shape of `func` should match the input, i.e. if `x` is the input row, column, or table (depending on `axis`), then `func(x).shape == x.shape` should be true.

This is similar to `DataFrame.apply`, except that `axis=None` applies the function to the entire `DataFrame` at once, rather than column-wise or row-wise.

## Examples

```
>>> def highlight_max(x):
...     return ['background-color: yellow' if v == x.max() else ''
...            for v in x]
...
>>> df = pd.DataFrame(np.random.randn(5, 2))
>>> df.style.apply(highlight_max)
```

## pandas.io.formats.style.Styler.applymap

`Styler.applymap(func, subset=None, **kwargs)`

Apply a function elementwise, updating the HTML representation with the result.

### Parameters

**func** [function] `func` should take a scalar and return a scalar

**subset** [IndexSlice] a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** [dict] pass along to `func`

### Returns

**self** [Styler]

### See also:

`Styler.where`

## pandas.io.formats.style.Styler.background\_gradient

`Styler.background_gradient(cmap='PuBu', low=0, high=0, axis=0, subset=None, text_color_threshold=0.408)`

Color the background in a gradient according to the data in each column (optionally row).

Requires matplotlib.

### Parameters

**cmap** [str or colormap] matplotlib colormap

**low, high** [float] compress the range by these values.

**axis** [int or str] 1 or 'columns' for columnwise, 0 or 'index' for rowwise

**subset** [IndexSlice] a valid slice for data to limit the style application to

**text\_color\_threshold** [float or int] luminance threshold for determining text color. Facilitates text visibility across varying background colors. From 0 to 1. 0 = all text is dark colored, 1 = all text is light colored.

New in version 0.24.0.

#### Returns

**self** [Styler]

#### Raises

**ValueError** If `text_color_threshold` is not a value from 0 to 1.

#### Notes

Set `text_color_threshold` or tune `low` and `high` to keep the text legible by not using the entire range of the color map. The range of the data is extended by `low * (x.max() - x.min())` and `high * (x.max() - x.min())` before normalizing.

### pandas.io.formats.style.Styler.bar

`Styler.bar(subset=None, axis=0, color='#d65f5f', width=100, align='left', vmin=None, vmax=None)`

Draw bar chart in the cell backgrounds.

#### Parameters

**subset** [IndexSlice, optional] A valid slice for *data* to limit the style application to.

**axis** [int, str or None, default 0] Apply to each column (*axis=0* or '*index*') or to each row (*axis=1* or '*columns*') or to the entire DataFrame at once with *axis=None*.

**color** [str or 2-tuple/list] If a str is passed, the color is the same for both negative and positive numbers. If 2-tuple/list is used, the first element is the *color\_negative* and the second is the *color\_positive* (eg: ['#d65f5f', '#5fba7d']).

**width** [float, default 100] A number between 0 or 100. The largest value will cover *width* percent of the cell's width.

**align** [{ 'left', 'zero', 'mid' }, default 'left'] How to align the bars with the cells.

- 'left' : the min value starts at the left of the cell.
- 'zero' : a value of zero is located at the center of the cell.
- 'mid' : the center of the cell is at (max-min)/2, or if values are all negative (positive) the zero is aligned at the right (left) of the cell.

New in version 0.20.0.

**vmin** [float, optional] Minimum bar value, defining the left hand limit of the bar drawing range, lower values are clipped to *vmin*. When None (default): the minimum value of the data will be used.

New in version 0.24.0.

**vmax** [float, optional] Maximum bar value, defining the right hand limit of the bar drawing range, higher values are clipped to *vmax*. When None (default): the maximum value of the data will be used.

New in version 0.24.0.

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.clear

`Styler.clear()`

Reset the styler, removing any previously applied styles. Returns None.

### pandas.io.formats.style.Styler.export

`Styler.export()`

Export the styles to applied to the current Styler.

Can be applied to a second style with `Styler.use`.

#### Returns

**styles** [list]

#### See also:

`Styler.use`

### pandas.io.formats.style.Styler.format

`Styler.format(formatter, subset=None)`

Format the text display value of cells.

New in version 0.18.0.

#### Parameters

**formatter** [str, callable, or dict]

**subset** [IndexSlice] An argument to `DataFrame.loc` that restricts which elements `formatter` is applied to.

#### Returns

**self** [Styler]

#### Notes

`formatter` is either an `a` or a dict `{column name: a}` where `a` is one of

- str: this will be wrapped in: `a.format(x)`
- callable: called with the value of an individual cell

The default display value for numeric values is the “general” (g) format with `pd.options.display.precision` precision.

#### Examples

```
>>> df = pd.DataFrame(np.random.randn(4, 2), columns=['a', 'b'])
>>> df.style.format("{:.2%}")
>>> df['c'] = ['a', 'b', 'c', 'd']
>>> df.style.format({'c': str.upper})
```

### `pandas.io.formats.style.Styler.from_custom_template`

**classmethod** `Styler.from_custom_template` (*searchpath*, *name*)

Factory function for creating a subclass of `Styler` with a custom template and Jinja environment.

#### Parameters

**searchpath** [str or list] Path or paths of directories containing the templates

**name** [str] Name of your custom template to use for rendering

#### Returns

**MyStyler** [subclass of `Styler`] has the correct `env` and `template` class attributes set.

### `pandas.io.formats.style.Styler.hide_columns`

`Styler.hide_columns` (*subset*)

Hide columns from rendering.

New in version 0.23.0.

#### Parameters

**subset** [IndexSlice] An argument to `DataFrame.loc` that identifies which columns are hidden.

#### Returns

**self** [`Styler`]

### `pandas.io.formats.style.Styler.hide_index`

`Styler.hide_index` ()

Hide any indices from rendering.

New in version 0.23.0.

#### Returns

**self** [`Styler`]

### `pandas.io.formats.style.Styler.highlight_max`

`Styler.highlight_max` (*subset=None*, *color='yellow'*, *axis=0*)

Highlight the maximum by shading the background.

#### Parameters

**subset** [IndexSlice, default None] a valid slice for `data` to limit the style application to

**color** [str, default 'yellow']

**axis** [int, str, or None; default 0] 0 or 'index' for columnwise (default), 1 or 'columns' for rowwise, or None for tablewise

**Returns**

**self** [Styler]

### **pandas.io.formats.style.Styler.highlight\_min**

**Styler.highlight\_min** (*subset=None, color='yellow', axis=0*)

Highlight the minimum by shading the background.

**Parameters**

**subset** [IndexSlice, default None] a valid slice for `data` to limit the style application to

**color** [str, default 'yellow']

**axis** [int, str, or None; default 0] 0 or 'index' for columnwise (default), 1 or 'columns' for rowwise, or None for tablewise

**Returns**

**self** [Styler]

### **pandas.io.formats.style.Styler.highlight\_null**

**Styler.highlight\_null** (*null\_color='red'*)

Shade the background `null_color` for missing values.

**Parameters**

**null\_color** [str]

**Returns**

**self** [Styler]

### **pandas.io.formats.style.Styler.pipe**

**Styler.pipe** (*func, \*args, \*\*kwargs*)

Apply `func(self, *args, **kwargs)`, and return the result.

New in version 0.24.0.

**Parameters**

**func** [function] Function to apply to the Styler. Alternatively, a (callable, keyword) tuple where `keyword` is a string indicating the keyword of callable that expects the Styler.

**\*args, \*\*kwargs** : Arguments passed to *func*.

**Returns**

**object** : The value returned by *func*.

**See also:**

**DataFrame.pipe** Analogous method for DataFrame.

***Styler.apply*** Apply a function row-wise, column-wise, or table-wise to modify the dataframe’s styling.

## Notes

Like `DataFrame.pipe()`, this method can simplify the application of several user-defined functions to a styler. Instead of writing:

```
f(g(df.style.set_precision(3), arg1=a), arg2=b, arg3=c)
```

users can write:

```
(df.style.set_precision(3)
 .pipe(g, arg1=a)
 .pipe(f, arg2=b, arg3=c))
```

In particular, this allows users to define functions that take a styler object, along with other parameters, and return the styler after making styling changes (such as calling `Styler.apply()` or `Styler.set_properties()`). Using `.pipe`, these user-defined style “transformations” can be interleaved with calls to the built-in Styler interface.

## Examples

```
>>> def format_conversion(styler):
...     return (styler.set_properties(**{'text-align': 'right'})
...             .format({'conversion': '{:.1%}'))
```

The user-defined `format_conversion` function above can be called within a sequence of other style modifications:

```
>>> df = pd.DataFrame({'trial': list(range(5)),
...                    'conversion': [0.75, 0.85, np.nan, 0.7, 0.72]})
>>> (df.style
...   .highlight_min(subset=['conversion'], color='yellow')
...   .pipe(format_conversion)
...   .set_caption("Results with minimum conversion highlighted."))
```

## pandas.io.formats.style.Styler.render

`Styler.render(**kwargs)`

Render the built up styles to HTML.

### Parameters

**`**kwargs`** [Any additional keyword arguments are passed through to “`self.template.render`”. This is useful when you need to provide additional variables for a custom template. New in version 0.20.]

### Returns

**`rendered`** [str] the rendered HTML

## Notes

Styler objects have defined the `_repr_html_` method which automatically calls `self.render()` when it's the last item in a Notebook cell. When calling `Styler.render()` directly, wrap the result in `IPython.display.HTML` to view the rendered HTML in the notebook.

Pandas uses the following keys in render. Arguments passed in `**kwargs` take precedence, so think carefully if you want to override them:

- `head`
- `cellstyle`
- `body`
- `uuid`
- `precision`
- `table_styles`
- `caption`
- `table_attributes`

### `pandas.io.formats.style.Styler.set_caption`

`Styler.set_caption(caption)`

Set the caption on a Styler

#### Parameters

**caption** [str]

#### Returns

**self** [Styler]

### `pandas.io.formats.style.Styler.set_precision`

`Styler.set_precision(precision)`

Set the precision used to render.

#### Parameters

**precision** [int]

#### Returns

**self** [Styler]

### `pandas.io.formats.style.Styler.set_properties`

`Styler.set_properties(subset=None, **kwargs)`

Convenience method for setting one or more non-data dependent properties or each cell.

#### Parameters

**subset** [IndexSlice] a valid slice for `data` to limit the style application to

**kwargs** [dict] property: value pairs to be set for each cell

**Returns****self** [Styler]**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_properties(color="white", align="right")
>>> df.style.set_properties(**{'background-color': 'yellow'})
```

**pandas.io.formats.style.Styler.set\_table\_attributes****Styler.set\_table\_attributes** (*attributes*)

Set the table attributes.

These are the items that show up in the opening &lt;table&gt; tag in addition to to automatic (by default) id.

**Parameters****attributes** [string]**Returns****self** [Styler]**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_table_attributes('class="pure-table"')
# ... <table class="pure-table"> ...
```

**pandas.io.formats.style.Styler.set\_table\_styles****Styler.set\_table\_styles** (*table\_styles*)

Set the table styles on a Styler.

These are placed in a &lt;style&gt; tag before the generated HTML table.

**Parameters**

**table\_styles** [list] Each individual table\_style should be a dictionary with *selector* and *props* keys. *selector* should be a CSS selector that the style will be applied to (automatically prefixed by the table's UUID) and *props* should be a list of tuples with (*attribute*, *value*).

**Returns****self** [Styler]**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_table_styles(
...     [{'selector': 'tr:hover',
...       'props': [('background-color', 'yellow')]}])
... )
```

### pandas.io.formats.style.Styler.set\_uuid

**Styler.set\_uuid(uuid)**  
Set the uuid for a Styler.

#### Parameters

**uuid** [str]

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.to\_excel

**Styler.to\_excel(excel\_writer, sheet\_name='Sheet1', na\_rep="", float\_format=None, columns=None, header=True, index=True, index\_label=None, startrow=0, startcol=0, engine=None, merge\_cells=True, encoding=None, inf\_rep='inf', verbose=True, freeze\_panes=None)**

Write Styler to an Excel sheet.

To write a single Styler to an Excel .xlsx file it is only necessary to specify a target file name. To write to multiple sheets it is necessary to create an *ExcelWriter* object with a target file name, and specify a sheet in the file to write to.

Multiple sheets may be written to by specifying unique *sheet\_name*. With all data written to the file it is necessary to save the changes. Note that creating an *ExcelWriter* object with a file name that already exists will result in the contents of the existing file being erased.

#### Parameters

**excel\_writer** [str or ExcelWriter object] File path or existing ExcelWriter.

**sheet\_name** [str, default 'Sheet1'] Name of sheet which will contain DataFrame.

**na\_rep** [str, default ''] Missing data representation.

**float\_format** [str, optional] Format string for floating point numbers. For example `float_format="% .2f"` will format 0.1234 to 0.12.

**columns** [sequence or list of str, optional] Columns to write.

**header** [bool or list of str, default True] Write out the column names. If a list of string is given it is assumed to be aliases for the column names.

**index** [bool, default True] Write row names (index).

**index\_label** [str or sequence, optional] Column label for index column(s) if desired. If not specified, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**startrow** [int, default 0] Upper left cell row to dump data frame.

**startcol** [int, default 0] Upper left cell column to dump data frame.

**engine** [str, optional] Write engine to use, 'openpyxl' or 'xlsxwriter'. You can also set this via the options `io.excel.xlsx.writer`, `io.excel.xls.writer`, and `io.excel.xlsm.writer`.

**merge\_cells** [bool, default True] Write MultiIndex and Hierarchical Rows as merged cells.

**encoding** [str, optional] Encoding of the resulting excel file. Only necessary for xlwt, other writers support unicode natively.

**inf\_rep** [str, default 'inf'] Representation for infinity (there is no native representation for infinity in Excel).

**verbose** [bool, default True] Display more information in the error logs.

**freeze\_panes** [tuple of int (length 2), optional] Specifies the one-based bottommost row and rightmost column that is to be frozen.

New in version 0.20.0..

#### See also:

**to\_csv** Write DataFrame to a comma-separated values (csv) file.

**ExcelWriter** Class for writing DataFrame objects into excel sheets.

**read\_excel** Read an Excel file into a pandas DataFrame.

**read\_csv** Read a comma-separated values (csv) file into DataFrame.

#### Notes

For compatibility with `to_csv()`, `to_excel` serializes lists and dicts to strings before writing.

Once a workbook has been saved it is not possible write further data without rewriting the whole workbook.

#### Examples

Create, write to and save a workbook:

```
>>> df1 = pd.DataFrame([[ 'a', 'b'], [ 'c', 'd']],
...                     index=[ 'row 1', 'row 2'],
...                     columns=[ 'col 1', 'col 2'])
>>> df1.to_excel("output.xlsx") # doctest: +SKIP
```

To specify the sheet name:

```
>>> df1.to_excel("output.xlsx",
...              sheet_name='Sheet_name_1') # doctest: +SKIP
```

If you wish to write to more than one sheet in the workbook, it is necessary to specify an `ExcelWriter` object:

```
>>> df2 = df1.copy()
>>> with pd.ExcelWriter('output.xlsx') as writer: # doctest: +SKIP
...     df1.to_excel(writer, sheet_name='Sheet_name_1')
...     df2.to_excel(writer, sheet_name='Sheet_name_2')
```

To set the library that is used to write the Excel file, you can pass the *engine* keyword (the default engine is automatically chosen depending on the file extension):

```
>>> df1.to_excel('output1.xlsx', engine='xlsxwriter') # doctest: +SKIP
```

### pandas.io.formats.style.Styler.use

**Styler.use** (*styles*)

Set the styles on the current Styler, possibly using styles from `Styler.export`.

#### Parameters

**styles** [list] list of style functions

#### Returns

**self** [Styler]

**See also:**

`Styler.export`

### pandas.io.formats.style.Styler.where

**Styler.where** (*cond*, *value*, *other=None*, *subset=None*, *\*\*kwargs*)

Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function.

New in version 0.21.0.

#### Parameters

**cond** [callable] *cond* should take a scalar and return a boolean

**value** [str] applied when *cond* returns true

**other** [str] applied when *cond* returns false

**subset** [IndexSlice] a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** [dict] pass along to *cond*

#### Returns

**self** [Styler]

**See also:**

`Styler.applymap`

## 35.13.2 Styler Properties

---

`Styler.env`

---

`Styler.template`

---

`Styler.loader`

---

### 35.13.2.1 pandas.io.formats.style.Styler.env

`Styler.env = <jinja2.environment.Environment object>`

### 35.13.2.2 pandas.io.formats.style.Styler.template

`Styler.template = <Template 'html.tpl'>`

### 35.13.2.3 pandas.io.formats.style.Styler.loader

`Styler.loader = <jinja2.loaders.PackageLoader object>`

## 35.13.3 Style Application

|                                                         |                                                                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Styler.apply(func[, axis, subset])</code>         | Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result.                                         |
| <code>Styler.applymap(func[, subset])</code>            | Apply a function elementwise, updating the HTML representation with the result.                                                                  |
| <code>Styler.where(cond, value[, other, subset])</code> | Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function. |
| <code>Styler.format(formatter[, subset])</code>         | Format the text display value of cells.                                                                                                          |
| <code>Styler.set_precision(precision)</code>            | Set the precision used to render.                                                                                                                |
| <code>Styler.set_table_styles(table_styles)</code>      | Set the table styles on a Styler.                                                                                                                |
| <code>Styler.set_table_attributes(attributes)</code>    | Set the table attributes.                                                                                                                        |
| <code>Styler.set_caption(caption)</code>                | Set the caption on a Styler                                                                                                                      |
| <code>Styler.set_properties([subset])</code>            | Convenience method for setting one or more non-data dependent properties or each cell.                                                           |
| <code>Styler.set_uuid(uuid)</code>                      | Set the uuid for a Styler.                                                                                                                       |
| <code>Styler.clear()</code>                             | Reset the styler, removing any previously applied styles.                                                                                        |
| <code>Styler.pipe(func, *args, **kwargs)</code>         | Apply <code>func(self, *args, **kwargs)</code> , and return the result.                                                                          |

## 35.13.4 Builtin Styles

|                                                            |                                                                                           |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <code>Styler.highlight_max([subset, color, axis])</code>   | Highlight the maximum by shading the background.                                          |
| <code>Styler.highlight_min([subset, color, axis])</code>   | Highlight the minimum by shading the background.                                          |
| <code>Styler.highlight_null([null_color])</code>           | Shade the background <code>null_color</code> for missing values.                          |
| <code>Styler.background_gradient([cmap, low, ...])</code>  | Color the background in a gradient according to the data in each column (optionally row). |
| <code>Styler.bar([subset, axis, color, width, ...])</code> | Draw bar chart in the cell backgrounds.                                                   |

## 35.13.5 Style Export and Import

|                                      |                                                     |
|--------------------------------------|-----------------------------------------------------|
| <code>Styler.render(**kwargs)</code> | Render the built up styles to HTML.                 |
| <code>Styler.export()</code>         | Export the styles to applied to the current Styler. |

Continued on next page

Table 441 – continued from previous page

|                                                               |                                                                                               |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>Styler.use(styles)</code>                               | Set the styles on the current Styler, possibly using styles from <code>Styler.export</code> . |
| <code>Styler.to_excel(excel_writer[, sheet_name, ...])</code> | Write Styler to an Excel sheet.                                                               |

```

## 35.14 Plotting

The following functions are contained in the `pandas.plotting` module.

|                                                               |                                                                                               |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>andrews_curves(frame, class_column[, ax, ...])</code>   | Generates a matplotlib plot of Andrews curves, for visualising clusters of multivariate data. |
| <code>bootstrap_plot(series[, fig, size, samples])</code>     | Bootstrap plot on mean, median and mid-range statistics.                                      |
| <code>deregister_matplotlib_converters()</code>               | Remove pandas' formatters and converters                                                      |
| <code>lag_plot(series[, lag, ax])</code>                      | Lag plot for time series.                                                                     |
| <code>parallel_coordinates(frame, class_column[, ...])</code> | Parallel coordinates plotting.                                                                |
| <code>radviz(frame, class_column[, ax, color, ...])</code>    | Plot a multidimensional dataset in 2D.                                                        |
| <code>register_matplotlib_converters([explicit])</code>       | Register Pandas Formatters and Converters with matplotlib                                     |
| <code>scatter_matrix(frame[, alpha, figsize, ax, ...])</code> | Draw a matrix of scatter plots.                                                               |

### 35.14.1 pandas.plotting.andrews\_curves

`pandas.plotting.andrews_curves` (*frame, class\_column, ax=None, samples=200, color=None, colormap=None, \*\*kws*)

Generates a matplotlib plot of Andrews curves, for visualising clusters of multivariate data.

Andrews curves have the functional form:

$$f(t) = x_1/\sqrt{2} + x_2 \sin(t) + x_3 \cos(t) + x_4 \sin(2t) + x_5 \cos(2t) + \dots$$

Where  $x$  coefficients correspond to the values of each dimension and  $t$  is linearly spaced between  $-\pi$  and  $+\pi$ . Each row of `frame` then corresponds to a single curve.

#### Parameters

**frame** [DataFrame] Data to be plotted, preferably normalized to (0.0, 1.0)

**class\_column** [Name of the column containing class names]

**ax** [matplotlib axes object, default None]

**samples** [Number of points to plot in each curve]

**color** [list or tuple, optional] Colors to use for the different classes

**colormap** [str or matplotlib colormap object, default None] Colormap to select colors from.  
If string, load colormap with that name from matplotlib.

**kws** [keywords] Options to pass to matplotlib plotting method

#### Returns

**ax** [Matplotlib axis object]

### 35.14.2 pandas.plotting.bootstrap\_plot

`pandas.plotting.bootstrap_plot` (*series*, *fig=None*, *size=50*, *samples=500*, *\*\*kwargs*)

Bootstrap plot on mean, median and mid-range statistics.

The bootstrap plot is used to estimate the uncertainty of a statistic by relaying on random sampling with replacement [?]. This function will generate bootstrapping plots for mean, median and mid-range statistics for the given number of samples of the given size.

#### Parameters

- series** [pandas.Series] Pandas Series from where to get the samplings for the bootstrapping.
- fig** [matplotlib.figure.Figure, default None] If given, it will use the *fig* reference for plotting instead of creating a new one with default parameters.
- size** [int, default 50] Number of data points to consider during each sampling. It must be greater or equal than the length of the *series*.
- samples** [int, default 500] Number of times the bootstrap procedure is performed.
- \*\*kwargs** : Options to pass to matplotlib plotting method.

#### Returns

- fig** [matplotlib.figure.Figure] Matplotlib figure

See also:

**`pandas.DataFrame.plot`** Basic plotting for DataFrame objects.

**`pandas.Series.plot`** Basic plotting for Series objects.

#### Examples

```
>>> s = pd.Series(np.random.uniform(size=100))
>>> fig = pd.plotting.bootstrap_plot(s) # doctest: +SKIP
```

### 35.14.3 pandas.plotting.deregister\_matplotlib\_converters

`pandas.plotting.deregister_matplotlib_converters` ()

Remove pandas' formatters and converters

Removes the custom converters added by `register()`. This attempts to set the state of the registry back to the state before pandas registered its own units. Converters for pandas' own types like `Timestamp` and `Period` are removed completely. Converters for types pandas overwrites, like `datetime.datetime`, are restored to their original value.

See also:

`deregister_matplotlib_converters`

### 35.14.4 pandas.plotting.lag\_plot

`pandas.plotting.lag_plot` (*series*, *lag=1*, *ax=None*, *\*\*kwargs*)

Lag plot for time series.

#### Parameters

**series** [Time series]

**lag** [lag of the scatter plot, default 1]

**ax** [Matplotlib axis object, optional]

**kwargs** [Matplotlib scatter method keyword arguments, optional]

#### Returns

**ax:** Matplotlib axis object

### 35.14.5 pandas.plotting.parallel\_coordinates

`pandas.plotting.parallel_coordinates` (*frame*, *class\_column*, *cols=None*, *ax=None*, *color=None*, *use\_columns=False*, *xticks=None*, *colormap=None*, *axvlines=True*, *axvlines\_kwargs=None*, *sort\_labels=False*, *\*\*kwargs*)

Parallel coordinates plotting.

#### Parameters

**frame** [DataFrame]

**class\_column** [str] Column name containing class names

**cols** [list, optional] A list of column names to use

**ax** [matplotlib.axis, optional] matplotlib axis object

**color** [list or tuple, optional] Colors to use for the different classes

**use\_columns** [bool, optional] If true, columns will be used as xticks

**xticks** [list or tuple, optional] A list of values to use for xticks

**colormap** [str or matplotlib colormap, default None] Colormap to use for line colors.

**axvlines** [bool, optional] If true, vertical lines will be added at each xtick

**axvlines\_kwargs** [keywords, optional] Options to be passed to axvline method for vertical lines

**sort\_labels** [bool, False] Sort class\_column labels, useful when assigning colors

New in version 0.20.0.

**kwargs** [keywords] Options to pass to matplotlib plotting method

#### Returns

**ax:** matplotlib axis object

#### Examples

```
>>> from matplotlib import pyplot as plt
>>> df = pd.read_csv('https://raw.githubusercontent.com/pandas-dev/pandas/master/
                    '/pandas/tests/data/iris.csv')
>>> pd.plotting.parallel_coordinates(
    df, 'Name',
    color=('556270', '4ECDC4', 'C7F464'))
>>> plt.show()
```

### 35.14.6 pandas.plotting.radviz

`pandas.plotting.radviz` (*frame*, *class\_column*, *ax=None*, *color=None*, *colormap=None*, *\*\*kws*)

Plot a multidimensional dataset in 2D.

Each Series in the DataFrame is represented as a evenly distributed slice on a circle. Each data point is rendered in the circle according to the value on each Series. Highly correlated *Series* in the *DataFrame* are placed closer on the unit circle.

RadViz allow to project a N-dimensional data set into a 2D space where the influence of each dimension can be interpreted as a balance between the influence of all dimensions.

More info available at the [original article](#) describing RadViz.

#### Parameters

**frame** [*DataFrame*] Pandas object holding the data.

**class\_column** [str] Column name containing the name of the data point category.

**ax** [*matplotlib.axes.Axes*, optional] A plot instance to which to add the information.

**color** [list[str] or tuple[str], optional] Assign a color to each category. Example: ['blue', 'green'].

**colormap** [str or *matplotlib.colors.Colormap*, default None] Colormap to select colors from. If string, load colormap with that name from matplotlib.

**kws** [optional] Options to pass to matplotlib scatter plotting method.

#### Returns

**axes** [*matplotlib.axes.Axes*]

See also:

**`pandas.plotting.andrews_curves`** Plot clustering visualization.

#### Examples

```
>>> df = pd.DataFrame({
...     'SepalLength': [6.5, 7.7, 5.1, 5.8, 7.6, 5.0, 5.4, 4.6,
...                     6.7, 4.6],
...     'SepalWidth': [3.0, 3.8, 3.8, 2.7, 3.0, 2.3, 3.0, 3.2,
...                     3.3, 3.6],
...     'PetalLength': [5.5, 6.7, 1.9, 5.1, 6.6, 3.3, 4.5, 1.4,
...                     5.7, 1.0],
...     'PetalWidth': [1.8, 2.2, 0.4, 1.9, 2.1, 1.0, 1.5, 0.2,
...                     2.1, 0.2],
...     'Category': ['virginica', 'virginica', 'setosa',
...                  'virginica', 'virginica', 'versicolor',
...                  'versicolor', 'setosa', 'virginica',
...                  'setosa']
... })
>>> rad_viz = pd.plotting.radviz(df, 'Category') # doctest: +SKIP
```

### 35.14.7 pandas.plotting.register\_matplotlib\_converters

`pandas.plotting.register_matplotlib_converters` (*explicit=True*)

Register Pandas Formatters and Converters with matplotlib

This function modifies the global `matplotlib.units.registry` dictionary. Pandas adds custom converters for

- `pd.Timestamp`
- `pd.Period`
- `np.datetime64`
- `datetime.datetime`
- `datetime.date`
- `datetime.time`

See also:

`deregister_matplotlib_converter`

### 35.14.8 pandas.plotting.scatter\_matrix

`pandas.plotting.scatter_matrix` (*frame*, *alpha=0.5*, *figsize=None*, *ax=None*, *grid=False*, *diagonal='hist'*, *marker='.'*, *density\_kwds=None*, *hist\_kwds=None*, *range\_padding=0.05*, *\*\*kwds*)

Draw a matrix of scatter plots.

#### Parameters

**frame** [DataFrame]

**alpha** [float, optional] amount of transparency applied

**figsize** [(float,float), optional] a tuple (width, height) in inches

**ax** [Matplotlib axis object, optional]

**grid** [bool, optional] setting this to True will show the grid

**diagonal** [{ 'hist', 'kde' }] pick between 'kde' and 'hist' for either Kernel Density Estimation or Histogram plot in the diagonal

**marker** [str, optional] Matplotlib marker type, default '.'

**hist\_kwds** [other plotting keyword arguments] To be passed to hist function

**density\_kwds** [other plotting keyword arguments] To be passed to kernel density estimate plot

**range\_padding** [float, optional] relative extension of axis range in x and y with respect to (x\_max - x\_min) or (y\_max - y\_min), default 0.05

**kwds** [other plotting keyword arguments] To be passed to scatter function

#### Examples

```
>>> df = pd.DataFrame(np.random.randn(1000, 4), columns=['A', 'B', 'C', 'D'])
>>> scatter_matrix(df, alpha=0.2)
```

```
{{ header }}
```

## 35.15 General utility functions

### 35.15.1 Working with options

|                                                  |                                                                                  |
|--------------------------------------------------|----------------------------------------------------------------------------------|
| <code>describe_option(pat[, _print_desc])</code> | Prints the description for one or more registered options.                       |
| <code>reset_option(pat)</code>                   | Reset one or more options to their default value.                                |
| <code>get_option(pat)</code>                     | Retrieves the value of the specified option.                                     |
| <code>set_option(pat, value)</code>              | Sets the value of the specified option.                                          |
| <code>option_context(*args)</code>               | Context manager to temporarily set options in the <i>with</i> statement context. |

#### 35.15.1.1 `pandas.describe_option`

`pandas.describe_option(pat, _print_desc=False)` = `<pandas.core.config.CallableDynamicDoc object>`

Prints the description for one or more registered options.

Call with not arguments to get a listing for all registered options.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

#### Parameters

**pat** [str] Regexp pattern. All matching keys will have their description displayed.

**\_print\_desc** [bool, default True] If True (default) the description(s) will be printed to stdout. Otherwise, the description(s) will be returned as a unicode string (for testing).

### Returns

**None by default, the description(s) as a unicode string if `_print_desc` is False**

### Notes

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** **No description available.** [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by `to_string`, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, `max_columns` is still respected, but the output will wrap-around across multiple “pages” if its width exceeds `display.width`. [default: True] [currently: True]

**display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]

**display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]

**display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]

**display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]

**display.large\_repr** ['truncate'/'info'] For DataFrames exceeding `max_rows/max_cols`, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from `df.info()` (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]

**display.latex.escape** [bool] This specifies if the `to_latex` method of a Dataframe uses escapes special characters. Valid values: False, True [default: True] [currently: True]

- display.latex.longtable** :bool This specifies if the `to_latex` method of a DataFrame uses the longtable format. Valid values: False,True [default: False] [currently: False]
- display.latex.multicolumn** [bool] This specifies if the `to_latex` method of a DataFrame uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: True] [currently: True]
- display.latex.multicolumn\_format** [bool] This specifies if the `to_latex` method of a DataFrame uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: 1] [currently: 1]
- display.latex.multirow** [bool] This specifies if the `to_latex` method of a DataFrame uses multirows to pretty-print MultiIndex rows. Valid values: False,True [default: False] [currently: False]
- display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]
- display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]
- display.max\_columns** [int] If `max_cols` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]
- display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]
- display.max\_info\_columns** [int] `max_info_columns` is used in `DataFrame.info` method to decide if per column information will be printed. [default: 100] [currently: 100]
- display.max\_info\_rows** [int or None] `df.info()` will usually show null-counts for each column. For large frames this can be quite slow. `max_info_rows` and `max_info_cols` limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]
- display.max\_rows** [int] If `max_rows` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 60]
- display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.
- If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]
- display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values True,False,’deep’ [default: True] [currently: True]
- display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]
- display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]
- display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]

- display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]
- display.show\_dimensions** [boolean or 'truncate'] Whether to print out dimensions at the end of DataFrame repr. If 'truncate' is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]
- display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for 'xls' files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for 'xlsm' files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for 'xlsx' files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to 'fixed' and append will default to 'table' [default: None] [currently: None]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: 'auto', 'pyarrow', 'fastparquet', the default is 'auto' [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 35.15.1.2 pandas.reset\_option

`pandas.reset_option(pat) = <pandas.core.config.CallableDynamicDoc object>`

Reset one or more options to their default value.

Pass “all” as argument to reset all options.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

#### Parameters

**pat** [str/regex] If specified only options matching *prefix\** will be reset. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

#### Returns

None

#### Notes

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

- display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]
- display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]
- display.column\_space** No description available. [default: 12] [currently: 12]
- display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]
- display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]
- display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by to\_string, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]
- display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, *max\_columns* is still respected, but the output will wrap-around across multiple “pages” if its width exceeds *display.width*. [default: True] [currently: True]
- display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]
- display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]
- display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]
- display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]
- display.large\_repr** ['truncate'/'info'] For DataFrames exceeding *max\_rows*/*max\_cols*, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from `df.info()` (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]
- display.latex.escape** [bool] This specifies if the `to_latex` method of a Dataframe uses escapes special characters. Valid values: False,True [default: True] [currently: True]
- display.latex.longtable** :bool This specifies if the `to_latex` method of a Dataframe uses the longtable format. Valid values: False,True [default: False] [currently: False]
- display.latex.multicolumn** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: True] [currently: True]
- display.latex.multicolumn\_format** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: l] [currently: l]
- display.latex.multirow** [bool] This specifies if the `to_latex` method of a Dataframe uses multirows to pretty-print MultiIndex rows. Valid values: False,True [default: False] [currently: False]
- display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]
- display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]
- display.max\_columns** [int] If *max\_cols* is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]

**display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]

**display.max\_info\_columns** [int] max\_info\_columns is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]

**display.max\_info\_rows** [int or None] df.info() will usually show null-counts for each column. For large frames this can be quite slow. max\_info\_rows and max\_info\_cols limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]

**display.max\_rows** [int] If max\_rows is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 60]

**display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.

If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

**display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when df.info() is called. Valid values True,False,’deep’ [default: True] [currently: True]

**display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]

**display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]

**display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]

**display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]

**display.show\_dimensions** [boolean or ‘truncate’] Whether to print out dimensions at the end of DataFrame repr. If ‘truncate’ is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]

**display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]

**display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]

**display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]

- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for ‘xls’ files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for ‘xlsm’ files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for ‘xlsx’ files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to ‘fixed’ and append will default to ‘table’ [default: None] [currently: None]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: ‘auto’, ‘pyarrow’, ‘fastparquet’, the default is ‘auto’ [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib’s units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 35.15.1.3 pandas.get\_option

`pandas.get_option(pat) = <pandas.core.config.CallableDynamicDoc object>`

Retrieves the value of the specified option.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`

- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

### Parameters

**pat** [str] Regexp which should match a single option. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

### Returns

**result** [the value of the option]

### Raises

**OptionError** [if no such option exists]

## Notes

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** No description available. [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by `to_string`, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, *max\_columns* is still respected, but the output will wrap-around across multiple “pages” if its width exceeds *display.width*. [default: True] [currently: True]

- display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]
- display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]
- display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]
- display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]
- display.large\_repr** ['truncate'/'info'] For DataFrames exceeding `max_rows/max_cols`, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from `df.info()` (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]
- display.latex.escape** [bool] This specifies if the `to_latex` method of a Dataframe uses escapes special characters. Valid values: False, True [default: True] [currently: True]
- display.latex.longtable** :bool This specifies if the `to_latex` method of a Dataframe uses the longtable format. Valid values: False, True [default: False] [currently: False]
- display.latex.multicolumn** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: True] [currently: True]
- display.latex.multicolumn\_format** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: 1] [currently: 1]
- display.latex.multirow** [bool] This specifies if the `to_latex` method of a Dataframe uses multirows to pretty-print MultiIndex rows. Valid values: False, True [default: False] [currently: False]
- display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]
- display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype "category". [default: 8] [currently: 8]
- display.max\_columns** [int] If `max_cols` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. 'None' value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals 'truncate' this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]
- display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a "..." placeholder is embedded in the output. [default: 50] [currently: 50]
- display.max\_info\_columns** [int] `max_info_columns` is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]
- display.max\_info\_rows** [int or None] `df.info()` will usually show null-counts for each column. For large frames this can be quite slow. `max_info_rows` and `max_info_cols` limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]
- display.max\_rows** [int] If `max_rows` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. 'None' value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals 'truncate' this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height.

The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 60]

**display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.

If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

**display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values True,False,'deep' [default: True] [currently: True]

**display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]

**display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]

**display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]

**display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]

**display.show\_dimensions** [boolean or ‘truncate’] Whether to print out dimensions at the end of DataFrame repr. If ‘truncate’ is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]

**display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]

**display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]

**display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]

**html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use *display.html.border* instead.)

**io.excel.xls.writer** [string] The default Excel writer engine for ‘xls’ files. Available options: auto, xlwt. [default: auto] [currently: auto]

**io.excel.xlsm.writer** [string] The default Excel writer engine for ‘xlsm’ files. Available options: auto, openpyxl. [default: auto] [currently: auto]

**io.excel.xlsx.writer** [string] The default Excel writer engine for ‘xlsx’ files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]

**io.hdf.default\_format** [format] default format writing format, if None, then put will default to ‘fixed’ and append will default to ‘table’ [default: None] [currently: None]

**io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]

**io.parquet.engine** [string] The default parquet reader/writer engine. Available options: ‘auto’, ‘pyarrow’, ‘fast-parquet’, the default is ‘auto’ [default: auto] [currently: auto]

**mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]

**mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]

**mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]

**mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)

**plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

#### 35.15.1.4 pandas.set\_option

`pandas.set_option(pat, value) = <pandas.core.config.CallableDynamicDoc object>`

Sets the value of the specified option.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

##### Parameters

**pat** [str] Regexp which should match a single option. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

**value** : new value of option.

**Returns****None****Raises****OptionError** if no such option exists**Notes**

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** **No description available.** [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by to\_string, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, *max\_columns* is still respected, but the output will wrap-around across multiple “pages” if its width exceeds *display.width*. [default: True] [currently: True]

**display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See formats.format.EngFormatter for an example. [default: None] [currently: None]

**display.html.border** [int] A border=value attribute is inserted in the <table> tag for the DataFrame HTML repr. [default: 1] [currently: 1]

**display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]

**display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]

**display.large\_repr** ['truncate'/'info'] For DataFrames exceeding max\_rows/max\_cols, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from df.info() (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]

**display.latex.escape** [bool] This specifies if the to\_latex method of a Dataframe uses escapes special characters. Valid values: False,True [default: True] [currently: True]

**display.latex.longtable** :bool This specifies if the to\_latex method of a Dataframe uses the longtable format. Valid values: False,True [default: False] [currently: False]

**display.latex.multipcolumn** [bool] This specifies if the `to_latex` method of a DataFrame uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: True] [currently: True]

**display.latex.multipcolumn\_format** [bool] This specifies if the `to_latex` method of a DataFrame uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: 1] [currently: 1]

**display.latex.multiprow** [bool] This specifies if the `to_latex` method of a DataFrame uses multirows to pretty-print MultiIndex rows. Valid values: False, True [default: False] [currently: False]

**display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]

**display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]

**display.max\_columns** [int] If `max_cols` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]

**display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]

**display.max\_info\_columns** [int] `max_info_columns` is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]

**display.max\_info\_rows** [int or None] `df.info()` will usually show null-counts for each column. For large frames this can be quite slow. `max_info_rows` and `max_info_cols` limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]

**display.max\_rows** [int] If `max_rows` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 60]

**display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.

If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

**display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values True, False, ‘deep’ [default: True] [currently: True]

**display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]

**display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]

**display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]

**display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]

- display.show\_dimensions** [boolean or 'truncate'] Whether to print out dimensions at the end of DataFrame repr. If 'truncate' is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]
- display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for 'xls' files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for 'xlsm' files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for 'xlsx' files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to 'fixed' and append will default to 'table' [default: None] [currently: None]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: 'auto', 'pyarrow', 'fastparquet', the default is 'auto' [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 35.15.1.5 pandas.option\_context

**class** `pandas.option_context` (\*args)

Context manager to temporarily set options in the *with* statement context.

You need to invoke as `option_context(pat, val, [(pat, val), ...])`.

## Examples

```
>>> with option_context('display.max_rows', 10, 'display.max_columns', 5):
...     ...
```

### 35.15.2 Testing functions

|                                                     |                      |                                                |
|-----------------------------------------------------|----------------------|------------------------------------------------|
| <code>testing.assert_frame_equal(left, ...)</code>  | <code>right[,</code> | Check that left and right DataFrame are equal. |
| <code>testing.assert_series_equal(left, ...)</code> | <code>right[,</code> | Check that left and right Series are equal.    |
| <code>testing.assert_index_equal(left, ...)</code>  | <code>right[,</code> | Check that left and right Index are equal.     |

#### 35.15.2.1 pandas.testing.assert\_frame\_equal

```
pandas.testing.assert_frame_equal(left, right, check_dtype=True, check_index_type='equiv',
                                   check_column_type='equiv', check_frame_type=True,
                                   check_less_precise=False, check_names=True,
                                   by_blocks=False, check_exact=False,
                                   check_datetimelike_compat=False,
                                   check_categorical=True, check_like=False,
                                   obj='DataFrame')
```

Check that left and right DataFrame are equal.

This function is intended to compare two DataFrames and output any differences. Is is mostly intended for use in unit tests. Additional parameters allow varying the strictness of the equality checks performed.

#### Parameters

**left** [DataFrame] First DataFrame to compare.

**right** [DataFrame] Second DataFrame to compare.

**check\_dtype** [bool, default True] Whether to check the DataFrame dtype is identical.

**check\_index\_type** [bool / string {'equiv'}, default 'equiv'] Whether to check the Index class, dtype and inferred\_type are identical.

**check\_column\_type** [bool / string {'equiv'}, default 'equiv'] Whether to check the columns class, dtype and inferred\_type are identical. Is passed as the `exact` argument of `assert_index_equal()`.

**check\_frame\_type** [bool, default True] Whether to check the DataFrame class is identical.

**check\_less\_precise** [bool or int, default False] Specify comparison precision. Only used when `check_exact` is False. 5 digits (False) or 3 digits (True) after decimal points are compared. If int, then specify the digits to compare.

**check\_names** [bool, default True] Whether to check that the `names` attribute for both the `index` and `column` attributes of the DataFrame is identical, i.e.

- `left.index.names == right.index.names`
- `left.columns.names == right.columns.names`

**by\_blocks** [bool, default False] Specify how to compare internal data. If False, compare by columns. If True, compare by blocks.

- check\_exact** [bool, default False] Whether to compare number exactly.
- check\_datetimelike\_compat** [bool, default False] Compare datetime-like which is comparable ignoring dtype.
- check\_categorical** [bool, default True] Whether to compare internal Categorical exactly.
- check\_like** [bool, default False] If True, ignore the order of index & columns. Note: index labels must match their respective rows (same as in columns) - same labels must be with the same data.
- obj** [str, default 'DataFrame'] Specify object name being compared, internally used to show appropriate assertion message.

See also:

**assert\_series\_equal** Equivalent method for asserting Series equality.

**DataFrame.equals** Check DataFrame equality.

## Examples

This example shows comparing two DataFrames that are equal but with columns of differing dtypes.

```
>>> from pandas.util.testing import assert_frame_equal
>>> df1 = pd.DataFrame({'a': [1, 2], 'b': [3, 4]})
>>> df2 = pd.DataFrame({'a': [1, 2], 'b': [3.0, 4.0]})
```

df1 equals itself. >>> assert\_frame\_equal(df1, df1)

df1 differs from df2 as column 'b' is of a different type. >>> assert\_frame\_equal(df1, df2) Traceback (most recent call last): AssertionError: Attributes are different

Attribute "dtype" are different [left]: int64 [right]: float64

Ignore differing dtypes in columns with check\_dtype. >>> assert\_frame\_equal(df1, df2, check\_dtype=False)

### 35.15.2.2 pandas.testing.assert\_series\_equal

```
pandas.testing.assert_series_equal(left, right, check_dtype=True, check_index_type='equiv',
                                   check_series_type=True, check_less_precise=False,
                                   check_names=True, check_exact=False,
                                   check_datetimelike_compat=False,
                                   check_categorical=True, obj='Series')
```

Check that left and right Series are equal.

#### Parameters

**left** [Series]

**right** [Series]

**check\_dtype** [bool, default True] Whether to check the Series dtype is identical.

**check\_index\_type** [bool / string {'equiv'}, default 'equiv'] Whether to check the Index class, dtype and inferred\_type are identical.

**check\_series\_type** [bool, default True] Whether to check the Series class is identical.

**check\_less\_precise** [bool or int, default False] Specify comparison precision. Only used when `check_exact` is False. 5 digits (False) or 3 digits (True) after decimal points are compared. If int, then specify the digits to compare.

**check\_names** [bool, default True] Whether to check the Series and Index names attribute.

**check\_exact** [bool, default False] Whether to compare number exactly.

**check\_datetimelike\_compat** [bool, default False] Compare datetime-like which is comparable ignoring dtype.

**check\_categorical** [bool, default True] Whether to compare internal Categorical exactly.

**obj** [str, default 'Series'] Specify object name being compared, internally used to show appropriate assertion message.

### 35.15.2.3 pandas.testing.assert\_index\_equal

```
pandas.testing.assert_index_equal(left, right, exact='equiv', check_names=True,
                                  check_less_precise=False, check_exact=True,
                                  check_categorical=True, obj='Index')
```

Check that left and right Index are equal.

#### Parameters

**left** [Index]

**right** [Index]

**exact** [bool / string {'equiv'}, default 'equiv'] Whether to check the Index class, dtype and `inferred_type` are identical. If 'equiv', then `RangeIndex` can be substituted for `Int64Index` as well.

**check\_names** [bool, default True] Whether to check the names attribute.

**check\_less\_precise** [bool or int, default False] Specify comparison precision. Only used when `check_exact` is False. 5 digits (False) or 3 digits (True) after decimal points are compared. If int, then specify the digits to compare

**check\_exact** [bool, default True] Whether to compare number exactly.

**check\_categorical** [bool, default True] Whether to compare internal Categorical exactly.

**obj** [str, default 'Index'] Specify object name being compared, internally used to show appropriate assertion message

### 35.15.3 Exceptions and warnings

|                                         |                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>errors.DtypeWarning</code>        | Warning raised when reading different dtypes in a column from a file.                                                             |
| <code>errors.EmptyDataError</code>      | Exception that is thrown in <code>pd.read_csv</code> (by both the C and Python engines) when empty data or header is encountered. |
| <code>errors.OutOfBoundsDatetime</code> |                                                                                                                                   |
| <code>errors.ParserError</code>         | Exception that is raised by an error encountered in <code>pd.read_csv</code> .                                                    |
| <code>errors.ParserWarning</code>       | Warning raised when reading a file that doesn't use the default 'c' parser.                                                       |

Continued on next page

Table 445 – continued from previous page

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <code>errors.PerformanceWarning</code>      | Warning raised when there is a possible performance impact.                                                                         |
| <code>errors.UnsortedIndexError</code>      | Error raised when attempting to get a slice of a MultiIndex, and the index has not been lexsorted.                                  |
| <code>errors.UnsupportedFunctionCall</code> | Exception raised when attempting to call a numpy function on a pandas object, but that function is not supported by the object e.g. |

### 35.15.3.1 pandas.errors.DtypeWarning

#### exception pandas.errors.DtypeWarning

Warning raised when reading different dtypes in a column from a file.

Raised for a dtype incompatibility. This can happen whenever `read_csv` or `read_table` encounter non-uniform dtypes in a column(s) of a given CSV file.

See also:

**pandas.read\_csv** Read CSV (comma-separated) file into a DataFrame.

**pandas.read\_table** Read general delimited file into a DataFrame.

#### Notes

This warning is issued when dealing with larger files because the dtype checking happens per chunk read.

Despite the warning, the CSV file is read with mixed types in a single column which will be an object type. See the examples below to better understand this issue.

#### Examples

This example creates and reads a large CSV file with a column that contains *int* and *str*.

```
>>> df = pd.DataFrame({'a': ([ '1' ] * 100000 + [ 'X' ] * 100000 +
...                          [ '1' ] * 100000),
...                    'b': [ 'b' ] * 300000})
>>> df.to_csv('test.csv', index=False)
>>> df2 = pd.read_csv('test.csv')
... # DtypeWarning: Columns (0) have mixed types
```

Important to notice that `df2` will contain both *str* and *int* for the same input, '1'.

```
>>> df2.iloc[262140, 0]
'1'
>>> type(df2.iloc[262140, 0])
<class 'str'>
>>> df2.iloc[262150, 0]
1
>>> type(df2.iloc[262150, 0])
<class 'int'>
```

One way to solve this issue is using the `dtype` parameter in the `read_csv` and `read_table` functions to explicit the conversion:

```
>>> df2 = pd.read_csv('test.csv', sep=',', dtype={'a': str})
```

No warning was issued.

```
>>> import os
>>> os.remove('test.csv')
```

### 35.15.3.2 pandas.errors.EmptyDataError

**exception** pandas.errors.EmptyDataError

Exception that is thrown in *pd.read\_csv* (by both the C and Python engines) when empty data or header is encountered.

### 35.15.3.3 pandas.errors.OutOfBoundsDatetime

**exception** pandas.errors.OutOfBoundsDatetime

### 35.15.3.4 pandas.errors.ParserError

**exception** pandas.errors.ParserError

Exception that is raised by an error encountered in *pd.read\_csv*.

### 35.15.3.5 pandas.errors.ParserWarning

**exception** pandas.errors.ParserWarning

Warning raised when reading a file that doesn't use the default 'c' parser.

Raised by *pd.read\_csv* and *pd.read\_table* when it is necessary to change parsers, generally from the default 'c' parser to 'python'.

It happens due to a lack of support or functionality for parsing a particular attribute of a CSV file with the requested engine.

Currently, 'c' unsupported options include the following parameters:

1. *sep* other than a single character (e.g. regex separators)
2. *skipfooter* higher than 0
3. *sep=None* with *delim\_whitespace=False*

The warning can be avoided by adding *engine='python'* as a parameter in *pd.read\_csv* and *pd.read\_table* methods.

**See also:**

**pd.read\_csv** Read CSV (comma-separated) file into DataFrame.

**pd.read\_table** Read general delimited file into DataFrame.

## Examples

Using a *sep* in `pd.read_csv` other than a single character:

```
>>> import io
>>> csv = u'''a;b;c
...         1;1,8
...         1;2,1'''
>>> df = pd.read_csv(io.StringIO(csv), sep='[;,]') # doctest: +SKIP
... # ParserWarning: Falling back to the 'python' engine...
```

Adding `engine='python'` to `pd.read_csv` removes the Warning:

```
>>> df = pd.read_csv(io.StringIO(csv), sep='[;,]', engine='python')
```

### 35.15.3.6 pandas.errors.PerformanceWarning

**exception** `pandas.errors.PerformanceWarning`

Warning raised when there is a possible performance impact.

### 35.15.3.7 pandas.errors.UnsortedIndexError

**exception** `pandas.errors.UnsortedIndexError`

Error raised when attempting to get a slice of a MultiIndex, and the index has not been lexsorted. Subclass of *KeyError*.

New in version 0.20.0.

### 35.15.3.8 pandas.errors.UnsupportedFunctionCall

**exception** `pandas.errors.UnsupportedFunctionCall`

Exception raised when attempting to call a numpy function on a pandas object, but that function is not supported by the object e.g. `np.cumsum(groupby_object)`.

## 35.15.4 Data types related functionality

|                                                            |                                                                           |
|------------------------------------------------------------|---------------------------------------------------------------------------|
| <code>api.types.union_categoricals(to_union[, ...])</code> | Combine list-like of Categorical-like, unioning categories.               |
| <code>api.types.infer_dtype</code>                         | Efficiently infer the type of a passed val, or list-like array of values. |
| <code>api.types.pandas_dtype(dtype)</code>                 | Converts input into a pandas only dtype object or a numpy dtype object.   |

### 35.15.4.1 pandas.api.types.union\_categoricals

`pandas.api.types.union_categoricals(to_union, sort_categories=False, ignore_order=False)`

Combine list-like of Categorical-like, unioning categories. All categories must have the same dtype.

New in version 0.19.0.

#### Parameters

**to\_union** [list-like of Categorical, CategoricalIndex,] or Series with dtype='category'

**sort\_categories** [boolean, default False] If true, resulting categories will be lexicographically sorted, otherwise they will be ordered as they appear in the data.

**ignore\_order** [boolean, default False] If true, the ordered attribute of the Categoricals will be ignored. Results in an unordered categorical.

New in version 0.20.0.

### Returns

**result** [Categorical]

### Raises

#### **TypeError**

- all inputs do not have the same dtype
- all inputs do not have the same ordered property
- all inputs are ordered and their categories are not identical
- sort\_categories=True and Categoricals are ordered

**ValueError** Empty list of categoricals passed

### Notes

To learn more about categories, see [link](#)

### Examples

```
>>> from pandas.api.types import union_categoricals
```

If you want to combine categoricals that do not necessarily have the same categories, *union\_categoricals* will combine a list-like of categoricals. The new categories will be the union of the categories being combined.

```
>>> a = pd.Categorical(["b", "c"])
>>> b = pd.Categorical(["a", "b"])
>>> union_categoricals([a, b])
[b, c, a, b]
Categories (3, object): [b, c, a]
```

By default, the resulting categories will be ordered as they appear in the *categories* of the data. If you want the categories to be lexicographically sorted, use *sort\_categories=True* argument.

```
>>> union_categoricals([a, b], sort_categories=True)
[b, c, a, b]
Categories (3, object): [a, b, c]
```

*union\_categoricals* also works with the case of combining two categoricals of the same categories and order information (e.g. what you could also *append* for).

```
>>> a = pd.Categorical(["a", "b"], ordered=True)
>>> b = pd.Categorical(["a", "b", "a"], ordered=True)
>>> union_categoricals([a, b])
[a, b, a, b, a]
Categories (2, object): [a < b]
```

Raises *TypeError* because the categories are ordered and not identical.

```
>>> a = pd.Categorical(["a", "b"], ordered=True)
>>> b = pd.Categorical(["a", "b", "c"], ordered=True)
>>> union_categoricals([a, b])
TypeError: to union ordered Categoricals, all categories must be the same
```

New in version 0.20.0

Ordered categoricals with different categories or orderings can be combined by using the *ignore\_ordered=True* argument.

```
>>> a = pd.Categorical(["a", "b", "c"], ordered=True)
>>> b = pd.Categorical(["c", "b", "a"], ordered=True)
>>> union_categoricals([a, b], ignore_order=True)
[a, b, c, c, b, a]
Categories (3, object): [a, b, c]
```

*union\_categoricals* also works with a *CategoricalIndex*, or *Series* containing categorical data, but note that the resulting array will always be a plain *Categorical*

```
>>> a = pd.Series(["b", "c"], dtype='category')
>>> b = pd.Series(["a", "b"], dtype='category')
>>> union_categoricals([a, b])
[b, c, a, b]
Categories (3, object): [b, c, a]
```

### 35.15.4.2 pandas.api.types.infer\_dtype

`pandas.api.types.infer_dtype()`

Efficiently infer the type of a passed val, or list-like array of values. Return a string describing the type.

#### Parameters

**value** [scalar, list, ndarray, or pandas type]

**skipna** [bool, default False] Ignore NaN values when inferring the type.

New in version 0.21.0.

#### Returns

**string describing the common type of the input data.**

**Results can include:**

- string
- unicode
- bytes
- floating
- integer
- mixed-integer
- mixed-integer-float
- decimal
- complex

- categorical
- boolean
- datetime64
- datetime
- date
- timedelta64
- timedelta
- time
- period
- mixed

#### Raises

**TypeError** if ndarray-like but cannot infer the dtype

#### Notes

- ‘mixed’ is the catchall for anything that is not otherwise specialized
- ‘mixed-integer-float’ are floats and integers
- ‘mixed-integer’ are integers mixed with non-integers

#### Examples

```
>>> infer_dtype(['foo', 'bar'])  
'string'
```

```
>>> infer_dtype(['a', np.nan, 'b'], skipna=True)  
'string'
```

```
>>> infer_dtype(['a', np.nan, 'b'], skipna=False)  
'mixed'
```

```
>>> infer_dtype([b'foo', b'bar'])  
'bytes'
```

```
>>> infer_dtype([1, 2, 3])  
'integer'
```

```
>>> infer_dtype([1, 2, 3.5])  
'mixed-integer-float'
```

```
>>> infer_dtype([1.0, 2.0, 3.5])  
'floating'
```

```
>>> infer_dtype(['a', 1])  
'mixed-integer'
```

```
>>> infer_dtype([Decimal(1), Decimal(2.0)])
'decimal'
```

```
>>> infer_dtype([True, False])
'boolean'
```

```
>>> infer_dtype([True, False, np.nan])
'mixed'
```

```
>>> infer_dtype([pd.Timestamp('20130101')])
'datetime'
```

```
>>> infer_dtype([datetime.date(2013, 1, 1)])
'date'
```

```
>>> infer_dtype([np.datetime64('2013-01-01')])
'datetime64'
```

```
>>> infer_dtype([datetime.timedelta(0, 1, 1)])
'timedelta'
```

```
>>> infer_dtype(pd.Series(list('aabc')).astype('category'))
'categorical'
```

### 35.15.4.3 pandas.api.types.pandas\_dtype

pandas.api.types.pandas\_dtype(dtype)

Converts input into a pandas only dtype object or a numpy dtype object.

#### Parameters

**dtype** [object to be converted]

#### Returns

**np.dtype or a pandas dtype**

#### Raises

**TypeError** if not a dtype

### 35.15.4.4 Dtype introspection

|                                                              |                                                                       |
|--------------------------------------------------------------|-----------------------------------------------------------------------|

## pandas.api.types.is\_bool\_dtype

`pandas.api.types.is_bool_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a boolean dtype.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

### Returns

**boolean** [Whether or not the array or dtype is of a boolean dtype.]

### Notes

An ExtensionArray is considered boolean when the `_is_boolean` attribute is set to True.

## Examples

```

>>> is_bool_dtype(str)
False
>>> is_bool_dtype(int)
False
>>> is_bool_dtype(bool)
True
>>> is_bool_dtype(np.bool)
True
>>> is_bool_dtype(np.array(['a', 'b']))
False
>>> is_bool_dtype(pd.Series([1, 2]))
False
>>> is_bool_dtype(np.array([True, False]))
True
>>> is_bool_dtype(pd.Categorical([True, False]))
True
>>> is_bool_dtype(pd.SparseArray([True, False]))
True

```

### pandas.api.types.is\_categorical\_dtype

`pandas.api.types.is_categorical_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the Categorical dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

#### Returns

**boolean** [Whether or not the array-like or dtype is] of the Categorical dtype.

## Examples

```

>>> is_categorical_dtype(object)
False
>>> is_categorical_dtype(CategoricalDtype())
True
>>> is_categorical_dtype([1, 2, 3])
False
>>> is_categorical_dtype(pd.Categorical([1, 2, 3]))
True
>>> is_categorical_dtype(pd.CategoricalIndex([1, 2, 3]))
True

```

### pandas.api.types.is\_complex\_dtype

`pandas.api.types.is_complex_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a complex dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of a complex dtype.]

**Examples**

```
>>> is_complex_dtype(str)
False
>>> is_complex_dtype(int)
False
>>> is_complex_dtype(np.complex)
True
>>> is_complex_dtype(np.array(['a', 'b']))
False
>>> is_complex_dtype(pd.Series([1, 2]))
False
>>> is_complex_dtype(np.array([1 + 1j, 5]))
True
```

**pandas.api.types.is\_datetime64\_any\_dtype**

`pandas.api.types.is_datetime64_any_dtype(arr_or_dtype)`  
Check whether the provided array or dtype is of the datetime64 dtype.

**Parameters**

**arr\_or\_dtype** [array-like] The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of the datetime64 dtype.]

**Examples**

```
>>> is_datetime64_any_dtype(str)
False
>>> is_datetime64_any_dtype(int)
False
>>> is_datetime64_any_dtype(np.datetime64) # can be tz-naive
True
>>> is_datetime64_any_dtype(DatetimeTZDtype("ns", "US/Eastern"))
True
>>> is_datetime64_any_dtype(np.array(['a', 'b']))
False
>>> is_datetime64_any_dtype(np.array([1, 2]))
False
>>> is_datetime64_any_dtype(np.array([], dtype=np.datetime64))
True
>>> is_datetime64_any_dtype(pd.DatetimeIndex([1, 2, 3],
                                              dtype=np.datetime64))
True
```

**pandas.api.types.is\_datetime64\_dtype**

`pandas.api.types.is_datetime64_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the datetime64 dtype.

**Parameters**

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

**Returns**

**boolean** [Whether or not the array-like or dtype is of] the datetime64 dtype.

**Examples**

```
>>> is_datetime64_dtype(object)
False
>>> is_datetime64_dtype(np.datetime64)
True
>>> is_datetime64_dtype(np.array([], dtype=int))
False
>>> is_datetime64_dtype(np.array([], dtype=np.datetime64))
True
>>> is_datetime64_dtype([1, 2, 3])
False
```

**pandas.api.types.is\_datetime64\_ns\_dtype**

`pandas.api.types.is_datetime64_ns_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the datetime64[ns] dtype.

**Parameters**

**arr\_or\_dtype** [array-like] The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of the datetime64[ns] dtype.]

**Examples**

```
>>> is_datetime64_ns_dtype(str)
False
>>> is_datetime64_ns_dtype(int)
False
>>> is_datetime64_ns_dtype(np.datetime64) # no unit
False
>>> is_datetime64_ns_dtype(DatetimeTZDtype("ns", "US/Eastern"))
True
>>> is_datetime64_ns_dtype(np.array(['a', 'b']))
False
>>> is_datetime64_ns_dtype(np.array([1, 2]))
False
>>> is_datetime64_ns_dtype(np.array([], dtype=np.datetime64)) # no unit
False
```

(continues on next page)

(continued from previous page)

```
>>> is_datetime64_ns_dtype(np.array([],
                                dtype="datetime64[ps]")) # wrong unit
False
>>> is_datetime64_ns_dtype(pd.DatetimeIndex([1, 2, 3],
                                dtype=np.datetime64)) # has 'ns' unit
True
```

## pandas.api.types.is\_datetime64tz\_dtype

pandas.api.types.is\_datetime64tz\_dtype(arr\_or\_dtype)

Check whether an array-like or dtype is of a DatetimeTZDtype dtype.

### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

### Returns

**boolean** [Whether or not the array-like or dtype is of] a DatetimeTZDtype dtype.

## Examples

```
>>> is_datetime64tz_dtype(object)
False
>>> is_datetime64tz_dtype([1, 2, 3])
False
>>> is_datetime64tz_dtype(pd.DatetimeIndex([1, 2, 3])) # tz-naive
False
>>> is_datetime64tz_dtype(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
```

```
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_datetime64tz_dtype(dtype)
True
>>> is_datetime64tz_dtype(s)
True
```

## pandas.api.types.is\_extension\_type

pandas.api.types.is\_extension\_type(arr)

Check whether an array-like is of a pandas extension class instance.

Extension classes include categoricals, pandas sparse objects (i.e. classes represented within the pandas library and not ones external to it like scipy sparse matrices), and datetime-like arrays.

### Parameters

**arr** [array-like] The array-like to check.

### Returns

**boolean** [Whether or not the array-like is of a pandas] extension class instance.

## Examples

```
>>> is_extension_type([1, 2, 3])
False
>>> is_extension_type(np.array([1, 2, 3]))
False
>>>
>>> cat = pd.Categorical([1, 2, 3])
>>>
>>> is_extension_type(cat)
True
>>> is_extension_type(pd.Series(cat))
True
>>> is_extension_type(pd.SparseArray([1, 2, 3]))
True
>>> is_extension_type(pd.SparseSeries([1, 2, 3]))
True
>>>
>>> from scipy.sparse import bsr_matrix
>>> is_extension_type(bsr_matrix([1, 2, 3]))
False
>>> is_extension_type(pd.DatetimeIndex([1, 2, 3]))
False
>>> is_extension_type(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
>>>
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_extension_type(s)
True
```

## pandas.api.types.is\_float\_dtype

pandas.api.types.is\_float\_dtype(arr\_or\_dtype)

Check whether the provided array or dtype is of a float dtype.

This function is internal and should not be exposed in the public API.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

### Returns

**boolean** [Whether or not the array or dtype is of a float dtype.]

## Examples

```
>>> is_float_dtype(str)
False
>>> is_float_dtype(int)
False
>>> is_float_dtype(float)
True
>>> is_float_dtype(np.array(['a', 'b']))
False
```

(continues on next page)

(continued from previous page)

```
>>> is_float_dtype(pd.Series([1, 2]))
False
>>> is_float_dtype(pd.Index([1, 2.]))
True
```

## pandas.api.types.is\_int64\_dtype

pandas.api.types.is\_int64\_dtype(arr\_or\_dtype)

Check whether the provided array or dtype is of the int64 dtype.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

### Returns

**boolean** [Whether or not the array or dtype is of the int64 dtype.]

## Notes

Depending on system architecture, the return value of *is\_int64\_dtype(int)* will be True if the OS uses 64-bit integers and False if the OS uses 32-bit integers.

## Examples

```
>>> is_int64_dtype(str)
False
>>> is_int64_dtype(np.int32)
False
>>> is_int64_dtype(np.int64)
True
>>> is_int64_dtype('int8')
False
>>> is_int64_dtype('Int8')
False
>>> is_int64_dtype(pd.Int64Dtype)
True
>>> is_int64_dtype(float)
False
>>> is_int64_dtype(np.uint64) # unsigned
False
>>> is_int64_dtype(np.array(['a', 'b']))
False
>>> is_int64_dtype(np.array([1, 2], dtype=np.int64))
True
>>> is_int64_dtype(pd.Index([1, 2])) # float
False
>>> is_int64_dtype(np.array([1, 2], dtype=np.uint32)) # unsigned
False
```

### pandas.api.types.is\_integer\_dtype

`pandas.api.types.is_integer_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of an integer dtype.

Unlike in `in_any_int_dtype`, `timedelta64` instances will return `False`.

Changed in version 0.24.0: The nullable Integer dtypes (e.g. `pandas.Int64Dtype`) are also considered as integer by this function.

#### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

#### Returns

**boolean** [Whether or not the array or dtype is of an integer dtype] and not an instance of `timedelta64`.

### Examples

```

>>> is_integer_dtype(str)
False
>>> is_integer_dtype(int)
True
>>> is_integer_dtype(float)
False
>>> is_integer_dtype(np.uint64)
True
>>> is_integer_dtype('int8')
True
>>> is_integer_dtype('Int8')
True
>>> is_integer_dtype(pd.Int8Dtype)
True
>>> is_integer_dtype(np.datetime64)
False
>>> is_integer_dtype(np.timedelta64)
False
>>> is_integer_dtype(np.array(['a', 'b']))
False
>>> is_integer_dtype(pd.Series([1, 2]))
True
>>> is_integer_dtype(np.array([], dtype=np.timedelta64))
False
>>> is_integer_dtype(pd.Index([1, 2.])) # float
False

```

### pandas.api.types.is\_interval\_dtype

`pandas.api.types.is_interval_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the Interval dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

#### Returns

**boolean** [Whether or not the array-like or dtype is] of the Interval dtype.

### Examples

```
>>> is_interval_dtype(object)
False
>>> is_interval_dtype(IntervalDtype())
True
>>> is_interval_dtype([1, 2, 3])
False
>>>
>>> interval = pd.Interval(1, 2, closed="right")
>>> is_interval_dtype(interval)
False
>>> is_interval_dtype(pd.IntervalIndex([interval]))
True
```

## pandas.api.types.is\_numeric\_dtype

pandas.api.types.**is\_numeric\_dtype**(*arr\_or\_dtype*)

Check whether the provided array or dtype is of a numeric dtype.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

### Returns

**boolean** [Whether or not the array or dtype is of a numeric dtype.]

### Examples

```
>>> is_numeric_dtype(str)
False
>>> is_numeric_dtype(int)
True
>>> is_numeric_dtype(float)
True
>>> is_numeric_dtype(np.uint64)
True
>>> is_numeric_dtype(np.datetime64)
False
>>> is_numeric_dtype(np.timedelta64)
False
>>> is_numeric_dtype(np.array(['a', 'b']))
False
>>> is_numeric_dtype(pd.Series([1, 2]))
True
>>> is_numeric_dtype(pd.Index([1, 2]))
True
>>> is_numeric_dtype(np.array([], dtype=np.timedelta64))
False
```

### pandas.api.types.is\_object\_dtype

`pandas.api.types.is_object_dtype(arr_or_dtype)`  
Check whether an array-like or dtype is of the object dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

#### Returns

**boolean** [Whether or not the array-like or dtype is of the object dtype.]

#### Examples

```
>>> is_object_dtype(object)
True
>>> is_object_dtype(int)
False
>>> is_object_dtype(np.array([], dtype=object))
True
>>> is_object_dtype(np.array([], dtype=int))
False
>>> is_object_dtype([1, 2, 3])
False
```

### pandas.api.types.is\_period\_dtype

`pandas.api.types.is_period_dtype(arr_or_dtype)`  
Check whether an array-like or dtype is of the Period dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

#### Returns

**boolean** [Whether or not the array-like or dtype is of the Period dtype.]

#### Examples

```
>>> is_period_dtype(object)
False
>>> is_period_dtype(PeriodDtype(freq="D"))
True
>>> is_period_dtype([1, 2, 3])
False
>>> is_period_dtype(pd.Period("2017-01-01"))
False
>>> is_period_dtype(pd.PeriodIndex([], freq="A"))
True
```

## pandas.api.types.is\_signed\_integer\_dtype

`pandas.api.types.is_signed_integer_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a signed integer dtype.

Unlike in `in_any_int_dtype`, `timedelta64` instances will return `False`.

Changed in version 0.24.0: The nullable Integer dtypes (e.g. `pandas.Int64Dtype`) are also considered as integer by this function.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

### Returns

**boolean** [Whether or not the array or dtype is of a signed integer dtype] and not an instance of `timedelta64`.

## Examples

```
>>> is_signed_integer_dtype(str)
False
>>> is_signed_integer_dtype(int)
True
>>> is_signed_integer_dtype(float)
False
>>> is_signed_integer_dtype(np.uint64)  # unsigned
False
>>> is_signed_integer_dtype('int8')
True
>>> is_signed_integer_dtype('Int8')
True
>>> is_signed_dtype(pd.Int8Dtype)
True
>>> is_signed_integer_dtype(np.datetime64)
False
>>> is_signed_integer_dtype(np.timedelta64)
False
>>> is_signed_integer_dtype(np.array(['a', 'b']))
False
>>> is_signed_integer_dtype(pd.Series([1, 2]))
True
>>> is_signed_integer_dtype(np.array([], dtype=np.timedelta64))
False
>>> is_signed_integer_dtype(pd.Index([1, 2]))  # float
False
>>> is_signed_integer_dtype(np.array([1, 2], dtype=np.uint32))  # unsigned
False
```

## pandas.api.types.is\_string\_dtype

`pandas.api.types.is_string_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the string dtype.

### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

#### Returns

**boolean** [Whether or not the array or dtype is of the string dtype.]

#### Examples

```
>>> is_string_dtype(str)
True
>>> is_string_dtype(object)
True
>>> is_string_dtype(int)
False
>>>
>>> is_string_dtype(np.array(['a', 'b']))
True
>>> is_string_dtype(pd.Series([1, 2]))
False
```

### pandas.api.types.is\_timedelta64\_dtype

`pandas.api.types.is_timedelta64_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the timedelta64 dtype.

#### Parameters

**arr\_or\_dtype** [array-like] The array-like or dtype to check.

#### Returns

**boolean** [Whether or not the array-like or dtype is] of the timedelta64 dtype.

#### Examples

```
>>> is_timedelta64_dtype(object)
False
>>> is_timedelta64_dtype(np.timedelta64)
True
>>> is_timedelta64_dtype([1, 2, 3])
False
>>> is_timedelta64_dtype(pd.Series([], dtype="timedelta64[ns]"))
True
>>> is_timedelta64_dtype('0 days')
False
```

### pandas.api.types.is\_timedelta64\_ns\_dtype

`pandas.api.types.is_timedelta64_ns_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the timedelta64[ns] dtype.

This is a very specific dtype, so generic ones like `np.timedelta64` will return False if passed into this function.

#### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

#### Returns

**boolean** [Whether or not the array or dtype is of the] timedelta64[ns] dtype.

#### Examples

```
>>> is_timedelta64_ns_dtype(np.dtype('m8[ns]'))
True
>>> is_timedelta64_ns_dtype(np.dtype('m8[ps]'))  # Wrong frequency
False
>>> is_timedelta64_ns_dtype(np.array([1, 2], dtype='m8[ns]'))
True
>>> is_timedelta64_ns_dtype(np.array([1, 2], dtype=np.timedelta64))
False
```

### pandas.api.types.is\_unsigned\_integer\_dtype

pandas.api.types.is\_unsigned\_integer\_dtype(arr\_or\_dtype)

Check whether the provided array or dtype is of an unsigned integer dtype.

Changed in version 0.24.0: The nullable Integer dtypes (e.g. pandas.UInt64Dtype) are also considered as integer by this function.

#### Parameters

**arr\_or\_dtype** [array-like] The array or dtype to check.

#### Returns

**boolean** [Whether or not the array or dtype is of an] unsigned integer dtype.

#### Examples

```
>>> is_unsigned_integer_dtype(str)
False
>>> is_unsigned_integer_dtype(int)  # signed
False
>>> is_unsigned_integer_dtype(float)
False
>>> is_unsigned_integer_dtype(np.uint64)
True
>>> is_unsigned_integer_dtype('uint8')
True
>>> is_unsigned_integer_dtype('UInt8')
True
>>> is_unsigned_integer_dtype(pd.UInt8Dtype)
True
>>> is_unsigned_integer_dtype(np.array(['a', 'b']))
False
>>> is_unsigned_integer_dtype(pd.Series([1, 2]))  # signed
False
>>> is_unsigned_integer_dtype(pd.Index([1, 2.]))  # float
False
```

(continues on next page)

(continued from previous page)

```
>>> is_unsigned_integer_dtype(np.array([1, 2], dtype=np.uint32))
True
```

## pandas.api.types.is\_sparse

`pandas.api.types.is_sparse(arr)`

Check whether an array-like is a 1-D pandas sparse array.

Check that the one-dimensional array-like is a pandas sparse array. Returns True if it is a pandas sparse array, not another type of sparse array.

### Parameters

**arr** [array-like] Array-like to check.

### Returns

**bool** Whether or not the array-like is a pandas sparse array.

See also:

**DataFrame.to\_sparse** Convert DataFrame to a SparseDataFrame.

**Series.to\_sparse** Convert Series to SparseSeries.

**Series.to\_dense** Return dense representation of a Series.

## Examples

Returns *True* if the parameter is a 1-D pandas sparse array.

```
>>> is_sparse(pd.SparseArray([0, 0, 1, 0]))
True
>>> is_sparse(pd.SparseSeries([0, 0, 1, 0]))
True
```

Returns *False* if the parameter is not sparse.

```
>>> is_sparse(np.array([0, 0, 1, 0]))
False
>>> is_sparse(pd.Series([0, 1, 0, 0]))
False
```

Returns *False* if the parameter is not a pandas sparse array.

```
>>> from scipy.sparse import bsr_matrix
>>> is_sparse(bsr_matrix([0, 1, 0, 0]))
False
```

Returns *False* if the parameter has more than one dimension.

```
>>> df = pd.SparseDataFrame([389., 24., 80.5, np.nan],
                             columns=['max_speed'],
                             index=['falcon', 'parrot', 'lion', 'monkey'])
>>> is_sparse(df)
False
```

(continues on next page)

(continued from previous page)

```
>>> is_sparse(df.max_speed)
True
```

### 35.15.4.5 Iterable introspection

|                                                        |                                            |
|--------------------------------------------------------|--------------------------------------------|
| <code>api.types.is_dict_like(obj)</code>               | Check if the object is dict-like.          |
| <code>api.types.is_file_like(obj)</code>               | Check if the object is a file-like object. |
| <code>api.types.is_list_like(obj[, allow_sets])</code> | Check if the object is list-like.          |
| <code>api.types.is_named_tuple(obj)</code>             | Check if the object is a named tuple.      |
| <code>api.types.is_iterator(obj)</code>                | Check if the object is an iterator.        |

#### pandas.api.types.is\_dict\_like

`pandas.api.types.is_dict_like(obj)`

Check if the object is dict-like.

##### Parameters

**obj** [The object to check]

##### Returns

**is\_dict\_like** [bool] Whether *obj* has dict-like properties.

#### Examples

```
>>> is_dict_like({1: 2})
True
>>> is_dict_like([1, 2, 3])
False
```

#### pandas.api.types.is\_file\_like

`pandas.api.types.is_file_like(obj)`

Check if the object is a file-like object.

For objects to be considered file-like, they must be an iterator AND have either a *read* and/or *write* method as an attribute.

Note: file-like objects must be iterable, but iterable objects need not be file-like.

New in version 0.20.0.

##### Parameters

**obj** [The object to check]

##### Returns

**is\_file\_like** [bool] Whether *obj* has file-like properties.

## Examples

```
>>> buffer(StringIO("data"))
>>> is_file_like(buffer)
True
>>> is_file_like([1, 2, 3])
False
```

### pandas.api.types.is\_list\_like

`pandas.api.types.is_list_like(obj, allow_sets=True)`

Check if the object is list-like.

Objects that are considered list-like are for example Python lists, tuples, sets, NumPy arrays, and Pandas Series.

Strings and datetime objects, however, are not considered list-like.

#### Parameters

**obj** [The object to check]

**allow\_sets** [boolean, default True] If this parameter is False, sets will not be considered list-like

New in version 0.24.0.

#### Returns

**is\_list\_like** [bool] Whether *obj* has list-like properties.

## Examples

```
>>> is_list_like([1, 2, 3])
True
>>> is_list_like({1, 2, 3})
True
>>> is_list_like(datetime(2017, 1, 1))
False
>>> is_list_like("foo")
False
>>> is_list_like(1)
False
>>> is_list_like(np.array([2]))
True
>>> is_list_like(np.array(2))
False
```

### pandas.api.types.is\_named\_tuple

`pandas.api.types.is_named_tuple(obj)`

Check if the object is a named tuple.

#### Parameters

**obj** [The object to check]

#### Returns

**is\_named\_tuple** [bool] Whether *obj* is a named tuple.

### Examples

```
>>> Point = namedtuple("Point", ["x", "y"])
>>> p = Point(1, 2)
>>>
>>> is_named_tuple(p)
True
>>> is_named_tuple((1, 2))
False
```

## pandas.api.types.is\_iterator

pandas.api.types.**is\_iterator** (*obj*)

Check if the object is an iterator.

For example, lists are considered iterators but not strings or datetime objects.

### Parameters

**obj** [The object to check]

### Returns

**is\_iter** [bool] Whether *obj* is an iterator.

### Examples

```
>>> is_iterator([1, 2, 3])
True
>>> is_iterator(datetime(2017, 1, 1))
False
>>> is_iterator("foo")
False
>>> is_iterator(1)
False
```

## 35.15.4.6 Scalar introspection

|                                            |                                                                                                            |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>api.types.is_bool</code>             |                                                                                                            |
| <code>api.types.is_categorical(arr)</code> | Check whether an array-like is a Categorical instance.                                                     |
| <code>api.types.is_complex</code>          |                                                                                                            |
| <code>api.types.is_datetimetz(arr)</code>  | (DEPRECATED) Check whether an array-like is a date-time array-like with a timezone component in its dtype. |
| <code>api.types.is_float</code>            |                                                                                                            |
| <code>api.types.is_hashable(obj)</code>    | Return True if hash(obj) will succeed, False otherwise.                                                    |
| <code>api.types.is_integer</code>          |                                                                                                            |
| <code>api.types.is_interval</code>         |                                                                                                            |
| <code>api.types.is_number(obj)</code>      | Check if the object is a number.                                                                           |

Continued on next page

Table 449 – continued from previous page

|                                              |                                                                    |
|----------------------------------------------|--------------------------------------------------------------------|
| <code>api.types.is_period(arr)</code>        | (DEPRECATED) Check whether an array-like is a periodical index.    |
| <code>api.types.is_re(obj)</code>            | Check if the object is a regex pattern instance.                   |
| <code>api.types.is_re_compilable(obj)</code> | Check if the object can be compiled into a regex pattern instance. |
| <code>api.types.is_scalar</code>             | Return True if given value is scalar.                              |

**pandas.api.types.is\_bool**

`pandas.api.types.is_bool()`

**pandas.api.types.is\_categorical**

`pandas.api.types.is_categorical(arr)`

Check whether an array-like is a Categorical instance.

**Parameters**

**arr** [array-like] The array-like to check.

**Returns**

**boolean** [Whether or not the array-like is of a Categorical instance.]

**Examples**

```
>>> is_categorical([1, 2, 3])
False
```

Categoricals, Series Categoricals, and CategoricalIndex will return True.

```
>>> cat = pd.Categorical([1, 2, 3])
>>> is_categorical(cat)
True
>>> is_categorical(pd.Series(cat))
True
>>> is_categorical(pd.CategoricalIndex([1, 2, 3]))
True
```

**pandas.api.types.is\_complex**

`pandas.api.types.is_complex()`

**pandas.api.types.is\_datetime64tz**

`pandas.api.types.is_datetime64tz(arr)`

Check whether an array-like is a datetime array-like with a timezone component in its dtype.

Deprecated since version 0.24.0.

**Parameters**

**arr** [array-like] The array-like to check.

#### Returns

**boolean** [Whether or not the array-like is a datetime array-like with] a timezone component in its dtype.

#### Examples

```
>>> is_datetimez([1, 2, 3])
False
```

Although the following examples are both DatetimeIndex objects, the first one returns False because it has no timezone component unlike the second one, which returns True.

```
>>> is_datetimez(pd.DatetimeIndex([1, 2, 3]))
False
>>> is_datetimez(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
```

The object need not be a DatetimeIndex object. It just needs to have a dtype which has a timezone component.

```
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_datetimez(s)
True
```

### pandas.api.types.is\_float

pandas.api.types.is\_float()

### pandas.api.types.is\_hashable

pandas.api.types.is\_hashable(obj)

Return True if hash(obj) will succeed, False otherwise.

Some types will pass a test against collections.Hashable but fail when they are actually hashed with hash().

Distinguish between these and other types by trying the call to hash() and seeing if they raise TypeError.

#### Examples

```
>>> a = ([],)
>>> isinstance(a, collections.Hashable)
True
>>> is_hashable(a)
False
```

### pandas.api.types.is\_integer

pandas.api.types.is\_integer()

### pandas.api.types.is\_interval

pandas.api.types.is\_interval()

### pandas.api.types.is\_number

pandas.api.types.is\_number(obj)

Check if the object is a number.

Returns True when the object is a number, and False if is not.

#### Parameters

**obj** [any type] The object to check if is a number.

#### Returns

**is\_number** [bool] Whether *obj* is a number or not.

See also:

**pandas.api.types.is\_integer** Checks a subgroup of numbers.

### Examples

```
>>> pd.api.types.is_number(1)
True
>>> pd.api.types.is_number(7.15)
True
```

Booleans are valid because they are int subclass.

```
>>> pd.api.types.is_number(False)
True
```

```
>>> pd.api.types.is_number("foo")
False
>>> pd.api.types.is_number("5")
False
```

### pandas.api.types.is\_period

pandas.api.types.is\_period(arr)

Check whether an array-like is a periodical index.

Deprecated since version 0.24.0.

#### Parameters

**arr** [array-like] The array-like to check.

#### Returns

**boolean** [Whether or not the array-like is a periodical index.]

## Examples

```
>>> is_period([1, 2, 3])
False
>>> is_period(pd.Index([1, 2, 3]))
False
>>> is_period(pd.PeriodIndex(["2017-01-01"], freq="D"))
True
```

## pandas.api.types.is\_re

pandas.api.types.**is\_re**(*obj*)

Check if the object is a regex pattern instance.

### Parameters

**obj** [The object to check]

### Returns

**is\_regex** [bool] Whether *obj* is a regex pattern.

## Examples

```
>>> is_re(re.compile(".*"))
True
>>> is_re("foo")
False
```

## pandas.api.types.is\_re\_compilable

pandas.api.types.**is\_re\_compilable**(*obj*)

Check if the object can be compiled into a regex pattern instance.

### Parameters

**obj** [The object to check]

### Returns

**is\_regex\_compilable** [bool] Whether *obj* can be compiled as a regex pattern.

## Examples

```
>>> is_re_compilable(".*")
True
>>> is_re_compilable(1)
False
```

**pandas.api.types.is\_scalar**`pandas.api.types.is_scalar()`

Return True if given value is scalar.

**Parameters****val** [object] This includes:

- numpy array scalar (e.g. `np.int64`)
- Python builtin numerics
- Python builtin byte arrays and strings
- None
- `datetime.datetime`
- `datetime.timedelta`
- `Period`
- `decimal.Decimal`
- `Interval`
- `DateOffset`
- `Fraction`
- `Number`

**Returns****bool** Return True if given object is scalar, False otherwise**Examples**

```
>>> dt = pd.datetime.datetime(2018, 10, 3)
>>> pd.is_scalar(dt)
True
```

```
>>> pd.api.types.is_scalar([2, 3])
False
```

```
>>> pd.api.types.is_scalar({0: 1, 2: 3})
False
```

```
>>> pd.api.types.is_scalar((0, 2))
False
```

pandas supports PEP 3141 numbers:

```
>>> from fractions import Fraction
>>> pd.api.types.is_scalar(Fraction(3, 5))
True
```

`{{ header }}`

## 35.16 Extensions

These are primarily intended for library authors looking to extend pandas objects.

|                                                         |                                                           |
|---------------------------------------------------------|-----------------------------------------------------------|
| <code>api.extensions.register_extension_dtype</code>    | Class decorator to register an ExtensionType with pandas. |
| <code>api.extensions.register_dataframe_accessor</code> | Register a custom accessor on DataFrame objects.          |
| <code>api.extensions.register_series_accessor</code>    | Register a custom accessor on Series objects.             |
| <code>api.extensions.register_index_accessor</code>     | Register a custom accessor on Index objects.              |
| <code>api.extensions.ExtensionDtype</code>              | A custom data type, to be paired with an ExtensionArray.  |
| <code>api.extensions.ExtensionArray</code>              | Abstract base class for custom 1-D array types.           |
| <code>arrays.PandasArray(values[, copy])</code>         | A pandas ExtensionArray for NumPy data.                   |

### 35.16.1 pandas.api.extensions.register\_extension\_dtype

`pandas.api.extensions.register_extension_dtype` (*cls*)

Class decorator to register an ExtensionType with pandas.

New in version 0.24.0.

This enables operations like `.astype(name)` for the name of the ExtensionDtype.

#### Examples

```
>>> from pandas.api.extensions import register_extension_dtype
>>> from pandas.api.extensions import ExtensionDtype
>>> @register_extension_dtype
... class MyExtensionDtype(ExtensionDtype):
...     pass
```

### 35.16.2 pandas.api.extensions.register\_dataframe\_accessor

`pandas.api.extensions.register_dataframe_accessor` (*name*)

Register a custom accessor on DataFrame objects.

#### Parameters

**name** [str] Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

See also:

`register_series_accessor`, `register_index_accessor`

#### Notes

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object): # noqa: E999
    ...
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```
>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values
```

## Examples

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Back in an interactive IPython session:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

### 35.16.3 pandas.api.extensions.register\_series\_accessor

`pandas.api.extensions.register_series_accessor(name)`

Register a custom accessor on Series objects.

#### Parameters

**name** [str] Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

See also:

`register_dataframe_accessor`, `register_index_accessor`

## Notes

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object): # noqa: E999
    ...
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```
>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values
```

## Examples

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Back in an interactive IPython session:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                     'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

## 35.16.4 pandas.api.extensions.register\_index\_accessor

`pandas.api.extensions.register_index_accessor(name)`

Register a custom accessor on Index objects.

### Parameters

**name** [str] Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

**See also:**

`register_dataframe_accessor`, `register_series_accessor`

**Notes**

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object): # noqa: E999
    ...
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```
>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values
```

**Examples**

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Back in an interactive IPython session:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

**35.16.5 pandas.api.extensions.ExtensionDtype**

**class** pandas.api.extensions.**ExtensionDtype**  
A custom data type, to be paired with an `ExtensionArray`.

New in version 0.23.0.

**See also:**

`pandas.api.extensions.register_extension_dtype`, `pandas.api.extensions.ExtensionArray`

## Notes

The interface includes the following abstract methods that must be implemented by subclasses:

- `type`
- `name`
- `construct_from_string`

The following attributes influence the behavior of the dtype in pandas operations

- `_is_numeric`
- `_is_boolean`

Optionally one can override `construct_array_type` for construction with the name of this dtype via the Registry. See `pandas.api.extensions.register_extension_dtype()`.

- `construct_array_type`

The `na_value` class attribute can be used to set the default NA value for this type. `numpy.nan` is used by default.

ExtensionDtypes are required to be hashable. The base class provides a default implementation, which relies on the `_metadata` class attribute. `_metadata` should be a tuple containing the strings that define your data type. For example, with `PeriodDtype` that's the `freq` attribute.

**If you have a parametrized dtype you should set the “`_metadata`” class property.**

Ideally, the attributes in `_metadata` will match the parameters to your `ExtensionDtype.__init__` (if any). If any of the attributes in `_metadata` don't implement the standard `__eq__` or `__hash__`, the default implementations here will not work.

Changed in version 0.24.0: Added `_metadata`, `__hash__`, and changed the default definition of `__eq__`.

This class does not inherit from `'abc.ABCMeta'` for performance reasons. Methods and properties required by the interface raise `pandas.errors.AbstractMethodError` and no `register` method is provided for registering virtual subclasses.

## Attributes

|              |                                                              |
|--------------|--------------------------------------------------------------|
| <i>kind</i>  | A character code (one of 'biufcmMOSUV'), default 'O'         |
| <i>name</i>  | A string identifying the data type.                          |
| <i>names</i> | Ordered list of field names, or None if there are no fields. |
| <i>type</i>  | The scalar type for the array, e.g.                          |

### 35.16.5.1 pandas.api.extensions.ExtensionDtype.kind

`ExtensionDtype.kind`

A character code (one of 'biufcmMOSUV'), default 'O'

This should match the NumPy dtype used when the array is converted to an ndarray, which is probably 'O' for object if the extension type cannot be represented as a built-in NumPy type.

**See also:**

`numpy.dtype.kind`

### 35.16.5.2 pandas.api.extensions.ExtensionDtype.name

`ExtensionDtype.name`

A string identifying the data type.

Will be used for display in, e.g. `Series.dtype`

### 35.16.5.3 pandas.api.extensions.ExtensionDtype.names

`ExtensionDtype.names`

Ordered list of field names, or None if there are no fields.

This is for compatibility with NumPy arrays, and may be removed in the future.

### 35.16.5.4 pandas.api.extensions.ExtensionDtype.type

`ExtensionDtype.type`

The scalar type for the array, e.g. `int`

It's expected `ExtensionArray[item]` returns an instance of `ExtensionDtype.type` for scalar `item`, assuming that value is valid (not NA). NA values do not need to be instances of `type`.

## Methods

|                                            |                                                  |
|--------------------------------------------|--------------------------------------------------|
| <code>construct_array_type()</code>        | Return the array type associated with this dtype |
| <code>construct_from_string(string)</code> | Attempt to construct this type from a string.    |
| <code>is_dtype(dtype)</code>               | Check if we match 'dtype'.                       |

### 35.16.5.5 pandas.api.extensions.ExtensionDtype.construct\_array\_type

**classmethod** `ExtensionDtype.construct_array_type()`

Return the array type associated with this dtype

**Returns**

`type`

### 35.16.5.6 pandas.api.extensions.ExtensionDtype.construct\_from\_string

**classmethod** `ExtensionDtype.construct_from_string(string)`

Attempt to construct this type from a string.

**Parameters****string** [str]**Returns****self** [instance of 'cls']**Raises****TypeError** If a class cannot be constructed from this 'string'.**Examples**

If the extension dtype can be constructed without any arguments, the following may be an adequate implementation.

```
>>> @classmethod
... def construct_from_string(cls, string)
...     if string == cls.name:
...         return cls()
...     else:
...         raise TypeError("Cannot construct a '{}' from "
...                          "'{}'.format(cls, string))
```

**35.16.5.7 pandas.api.extensions.ExtensionDtype.is\_dtype****classmethod** `ExtensionDtype.is_dtype(dtype)`

Check if we match 'dtype'.

**Parameters****dtype** [object] The object to check.**Returns****is\_dtype** [bool]**Notes**

The default implementation is True if

1. `cls.construct_from_string(dtype)` is an instance of `cls`.
2. `dtype` is an object and is an instance of `cls`
3. `dtype` has a `dtype` attribute, and any of the above conditions is true for `dtype.dtype`.

**35.16.6 pandas.api.extensions.ExtensionArray****class** `pandas.api.extensions.ExtensionArray`

Abstract base class for custom 1-D array types.

pandas will recognize instances of this class as proper arrays with a custom type and will not attempt to coerce them to objects. They may be stored directly inside a `DataFrame` or `Series`.

New in version 0.23.0.

## Notes

The interface includes the following abstract methods that must be implemented by subclasses:

- `_from_sequence`
- `_from_factorized`
- `__getitem__`
- `__len__`
- `dtype`
- `nbytes`
- `isna`
- `take`
- `copy`
- `_concat_same_type`

A default repr displaying the type, (truncated) data, length, and dtype is provided. It can be customized or replaced by overriding:

- `__repr__` : A default repr for the ExtensionArray.
- `_formatter` : Print scalars inside a Series or DataFrame.

Some methods require casting the ExtensionArray to an ndarray of Python objects with `self.astype(object)`, which may be expensive. When performance is a concern, we highly recommend overriding the following methods:

- `fillna`
- `dropna`
- `unique`
- `factorize / _values_for_factorize`
- `argsort / _values_for_argsort`
- `searchsorted`

The remaining methods implemented on this class should be performant, as they only compose abstract methods. Still, a more efficient implementation may be available, and these methods can be overridden.

One can implement methods to handle array reductions.

- `_reduce`

One can implement methods to handle parsing from strings that will be used in methods such as `pandas.io.parsers.read_csv`.

- `_from_sequence_of_strings`

This class does not inherit from `'abc.ABCMeta'` for performance reasons. Methods and properties required by the interface raise `pandas.errors.AbstractMethodError` and no `register` method is provided for registering virtual subclasses.

ExtensionArrays are limited to 1 dimension.

They may be backed by none, one, or many NumPy arrays. For example, `pandas.Categorical` is an extension array backed by two arrays, one for codes and one for categories. An array of IPv6 address may be backed by a NumPy structured array with two fields, one for the lower 64 bits and one for the upper 64

bits. Or they may be backed by some other storage type, like Python lists. Pandas makes no assumptions on how the data are stored, just that it can be converted to a NumPy array. The ExtensionArray interface does not impose any rules on how this data is stored. However, currently, the backing data cannot be stored in attributes called `.values` or `._values` to ensure full compatibility with pandas internals. But other names as `.data`, `._data`, `._items`,... can be freely used.

### Attributes

|               |                                                            |
|---------------|------------------------------------------------------------|
| <i>dtype</i>  | An instance of 'ExtensionDtype'.                           |
| <i>nbytes</i> | The number of bytes needed to store this object in memory. |
| <i>ndim</i>   | Extension Arrays are only allowed to be 1-dimensional.     |
| <i>shape</i>  | Return a tuple of the array dimensions.                    |

#### 35.16.6.1 pandas.api.extensions.ExtensionArray.dtype

`ExtensionArray.dtype`

An instance of 'ExtensionDtype'.

#### 35.16.6.2 pandas.api.extensions.ExtensionArray.nbytes

`ExtensionArray.nbytes`

The number of bytes needed to store this object in memory.

#### 35.16.6.3 pandas.api.extensions.ExtensionArray.ndim

`ExtensionArray.ndim`

Extension Arrays are only allowed to be 1-dimensional.

#### 35.16.6.4 pandas.api.extensions.ExtensionArray.shape

`ExtensionArray.shape`

Return a tuple of the array dimensions.

### Methods

|                                            |                                                                   |
|--------------------------------------------|-------------------------------------------------------------------|
| <i>argsort([ascending, kind])</i>          | Return the indices that would sort this array.                    |
| <i>astype(dtype[, copy])</i>               | Cast to a NumPy array with 'dtype'.                               |
| <i>copy([deep])</i>                        | Return a copy of the array.                                       |
| <i>dropna()</i>                            | Return ExtensionArray without NA values                           |
| <i>factorize([na_sentinel])</i>            | Encode the extension array as an enumerated type.                 |
| <i>fillna([value, method, limit])</i>      | Fill NA/NaN values using the specified method.                    |
| <i>isna()</i>                              | A 1-D array indicating if each value is missing.                  |
| <i>repeat(repeats[, axis])</i>             | Repeat elements of a ExtensionArray.                              |
| <i>searchsorted(value[, side, sorter])</i> | Find indices where elements should be inserted to maintain order. |

Continued on next page

Table 454 – continued from previous page

|                                                      |                                              |
|------------------------------------------------------|----------------------------------------------|
| <code>shift([periods, fill_value])</code>            | Shift values by desired number.              |
| <code>take(indices[, allow_fill, fill_value])</code> | Take elements from an array.                 |
| <code>unique()</code>                                | Compute the ExtensionArray of unique values. |

### 35.16.6.5 pandas.api.extensions.ExtensionArray.argsort

`ExtensionArray.argsort` (*ascending=True*, *kind='quicksort'*, *\*args*, *\*\*kwargs*)

Return the indices that would sort this array.

#### Parameters

**ascending** [bool, default True] Whether the indices should result in an ascending or descending sort.

**kind** [{ 'quicksort', 'mergesort', 'heapsort' }, optional] Sorting algorithm.

**\*args, \*\*kwargs:** passed through to `numpy.argsort()`.

#### Returns

**index\_array** [ndarray] Array of indices that sort `self`.

See also:

`numpy.argsort` Sorting implementation used internally.

### 35.16.6.6 pandas.api.extensions.ExtensionArray.astype

`ExtensionArray.astype` (*dtype*, *copy=True*)

Cast to a NumPy array with 'dtype'.

#### Parameters

**dtype** [str or dtype] Typecode or data-type to which the array is cast.

**copy** [bool, default True] Whether to copy the data, even if not necessary. If False, a copy is made only if the old dtype does not match the new dtype.

#### Returns

**array** [ndarray] NumPy ndarray with 'dtype' for its dtype.

### 35.16.6.7 pandas.api.extensions.ExtensionArray.copy

`ExtensionArray.copy` (*deep=False*)

Return a copy of the array.

#### Parameters

**deep** [bool, default False] Also copy the underlying data backing this array.

#### Returns

**ExtensionArray**

### 35.16.6.8 pandas.api.extensions.ExtensionArray.dropna

`ExtensionArray.dropna()`

Return ExtensionArray without NA values

#### Returns

**valid** [ExtensionArray]

### 35.16.6.9 pandas.api.extensions.ExtensionArray.factorize

`ExtensionArray.factorize (na_sentinel=-1)`

Encode the extension array as an enumerated type.

#### Parameters

**na\_sentinel** [int, default -1] Value to use in the *labels* array to indicate missing values.

#### Returns

**labels** [ndarray] An integer NumPy array that's an indexer into the original ExtensionArray.

**uniques** [ExtensionArray] An ExtensionArray containing the unique values of *self*.

---

**Note:** *uniques* will *not* contain an entry for the NA value of the ExtensionArray if there are any missing values present in *self*.

---

See also:

**pandas.factorize** Top-level factorize method that dispatches here.

#### Notes

`pandas.factorize()` offers a *sort* keyword as well.

### 35.16.6.10 pandas.api.extensions.ExtensionArray.fillna

`ExtensionArray.fillna (value=None, method=None, limit=None)`

Fill NA/NaN values using the specified method.

#### Parameters

**value** [scalar, array-like] If a scalar value is passed it is used to fill all missing values. Alternatively, an array-like 'value' can be given. It's expected that the array-like have the same length as 'self'.

**method** [{ 'backfill', 'bfill', 'pad', 'ffill', None }, default None] Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**limit** [int, default None] If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled.

**Returns**

**filled** [ExtensionArray with NA/NaN filled]

**35.16.6.11 pandas.api.extensions.ExtensionArray.isna**

`ExtensionArray.isna()`

A 1-D array indicating if each value is missing.

**Returns**

**na\_values** [Union[np.ndarray, ExtensionArray]] In most cases, this should return a NumPy ndarray. For exceptional cases like `SparseArray`, where returning an ndarray would be expensive, an `ExtensionArray` may be returned.

**Notes**

If returning an `ExtensionArray`, then

- `na_values._is_boolean` should be `True`
- `na_values` should implement `ExtensionArray._reduce()`
- `na_values.any` and `na_values.all` should be implemented

**35.16.6.12 pandas.api.extensions.ExtensionArray.repeat**

`ExtensionArray.repeat(repeats, axis=None)`

Repeat elements of a `ExtensionArray`.

Returns a new `ExtensionArray` where each element of the current `ExtensionArray` is repeated consecutively a given number of times.

**Parameters**

**repeats** [int or array of ints] The number of repetitions for each element. This should be a non-negative integer. Repeating 0 times will return an empty `ExtensionArray`.

**axis** [None] Must be `None`. Has no effect but is accepted for compatibility with `numpy`.

**Returns**

**repeated\_array** [ExtensionArray] Newly created `ExtensionArray` with repeated elements.

See also:

**Series.repeat** Equivalent function for `Series`.

**Index.repeat** Equivalent function for `Index`.

**numpy.repeat** Similar method for `numpy.ndarray`.

**ExtensionArray.take** Take arbitrary positions.

**Examples**

```

>>> cat = pd.Categorical(['a', 'b', 'c'])
>>> cat
[a, b, c]
Categories (3, object): [a, b, c]
>>> cat.repeat(2)
[a, a, b, b, c, c]
Categories (3, object): [a, b, c]
>>> cat.repeat([1, 2, 3])
[a, b, b, c, c, c]
Categories (3, object): [a, b, c]

```

### 35.16.6.13 pandas.api.extensions.ExtensionArray.searchsorted

`ExtensionArray.searchsorted` (*value*, *side*='left', *sorter*=None)

Find indices where elements should be inserted to maintain order.

New in version 0.24.0.

Find the indices into a sorted array *self* (*a*) such that, if the corresponding elements in *v* were inserted before the indices, the order of *self* would be preserved.

Assuming that *a* is sorted:

| <i>side</i> | returned index <i>i</i> satisfies           |
|-------------|---------------------------------------------|
| left        | <code>self[i-1] &lt; v &lt;= self[i]</code> |
| right       | <code>self[i-1] &lt;= v &lt; self[i]</code> |

#### Parameters

**value** [array\_like] Values to insert into *self*.

**side** [{‘left’, ‘right’}, optional] If ‘left’, the index of the first suitable location found is given. If ‘right’, return the last such index. If there is no suitable index, return either 0 or N (where N is the length of *self*).

**sorter** [1-D array\_like, optional] Optional array of integer indices that sort array *a* into ascending order. They are typically the result of `argsort`.

#### Returns

**indices** [array of ints] Array of insertion points with the same shape as *value*.

See also:

`numpy.searchsorted` Similar method from NumPy.

### 35.16.6.14 pandas.api.extensions.ExtensionArray.shift

`ExtensionArray.shift` (*periods*=1, *fill\_value*=None)

Shift values by desired number.

Newly introduced missing values are filled with `self.dtype.na_value`.

New in version 0.24.0.

#### Parameters

**periods** [int, default 1] The number of periods to shift. Negative values are allowed for shifting backwards.

**fill\_value** [object, optional] The scalar value to use for newly introduced missing values. The default is `self.dtype.na_value`

New in version 0.24.0.

#### Returns

**shifted** [ExtensionArray]

#### Notes

If `self` is empty or `periods` is 0, a copy of `self` is returned.

If `periods > len(self)`, then an array of size `len(self)` is returned, with all values filled with `self.dtype.na_value`.

### 35.16.6.15 pandas.api.extensions.ExtensionArray.take

`ExtensionArray.take` (*indices*, *allow\_fill=False*, *fill\_value=None*)

Take elements from an array.

#### Parameters

**indices** [sequence of integers] Indices to be taken.

**allow\_fill** [bool, default False] How to handle negative values in *indices*.

- False: negative values in *indices* indicate positional indices from the right (the default). This is similar to `numpy.take()`.
- True: negative values in *indices* indicate missing values. These values are set to *fill\_value*. Any other other negative values raise a `ValueError`.

**fill\_value** [any, optional] Fill value to use for NA-indices when *allow\_fill* is True. This may be `None`, in which case the default NA value for the type, `self.dtype.na_value`, is used.

For many `ExtensionArrays`, there will be two representations of *fill\_value*: a user-facing “boxed” scalar, and a low-level physical NA value. *fill\_value* should be the user-facing version, and the implementation should handle translating that to the physical version for processing the take if necessary.

#### Returns

**ExtensionArray**

#### Raises

**IndexError** When the indices are out of bounds for the array.

**ValueError** When *indices* contains negative values other than `-1` and *allow\_fill* is True.

#### See also:

`numpy.take`, `pandas.api.extensions.take`

## Notes

`ExtensionArray.take` is called by `Series.__getitem__`, `.loc`, `iloc`, when *indices* is a sequence of values. Additionally, it's called by `Series.reindex()`, or any other method that causes realignment, with a *fill\_value*.

## Examples

Here's an example implementation, which relies on casting the extension array to object dtype. This uses the helper method `pandas.api.extensions.take()`.

```
def take(self, indices, allow_fill=False, fill_value=None):
    from pandas.core.algorithms import take

    # If the ExtensionArray is backed by an ndarray, then
    # just pass that here instead of coercing to object.
    data = self.astype(object)

    if allow_fill and fill_value is None:
        fill_value = self.dtype.na_value

    # fill value should always be translated from the scalar
    # type for the array, to the physical storage type for
    # the data, before passing to take.

    result = take(data, indices, fill_value=fill_value,
                  allow_fill=allow_fill)
    return self._from_sequence(result, dtype=self.dtype)
```

### 35.16.6.16 pandas.api.extensions.ExtensionArray.unique

`ExtensionArray.unique()`

Compute the `ExtensionArray` of unique values.

#### Returns

**uniques** [`ExtensionArray`]

### 35.16.7 pandas.arrays.PandasArray

**class** `pandas.arrays.PandasArray` (*values*, *copy=False*)

A pandas `ExtensionArray` for NumPy data.

New in version 0.24.0.

This is mostly for internal compatibility, and is not especially useful on its own.

#### Parameters

**values** [`ndarray`] The NumPy `ndarray` to wrap. Must be 1-dimensional.

**copy** [`bool`, default `False`] Whether to copy *values*.

## Notes

Operations like `+` and applying ufuncs requires NumPy $\geq$ 1.13.

## Attributes

|               |                                                            |
|---------------|------------------------------------------------------------|
| <i>dtype</i>  | An instance of 'ExtensionDtype'.                           |
| <i>nbytes</i> | The number of bytes needed to store this object in memory. |
| <i>ndim</i>   | Extension Arrays are only allowed to be 1-dimensional.     |
| <i>shape</i>  | Return a tuple of the array dimensions.                    |

### 35.16.7.1 pandas.arrays.PandasArray.dtype

`PandasArray.dtype`

An instance of 'ExtensionDtype'.

### 35.16.7.2 pandas.arrays.PandasArray.nbytes

`PandasArray.nbytes`

The number of bytes needed to store this object in memory.

### 35.16.7.3 pandas.arrays.PandasArray.ndim

`PandasArray.ndim`

Extension Arrays are only allowed to be 1-dimensional.

### 35.16.7.4 pandas.arrays.PandasArray.shape

`PandasArray.shape`

Return a tuple of the array dimensions.

## Methods

|                                                 |                                                                   |
|-------------------------------------------------|-------------------------------------------------------------------|
| <i>argsort</i> ([ascending, kind])              | Return the indices that would sort this array.                    |
| <i>astype</i> (dtype[, copy])                   | Cast to a NumPy array with 'dtype'.                               |
| <i>copy</i> ([deep])                            | Return a copy of the array.                                       |
| <i>dropna</i> ()                                | Return ExtensionArray without NA values                           |
| <i>factorize</i> ([na_sentinel])                | Encode the extension array as an enumerated type.                 |
| <i>fillna</i> ([value, method, limit])          | Fill NA/NaN values using the specified method.                    |
| <i>isna</i> ()                                  | A 1-D array indicating if each value is missing.                  |
| <i>repeat</i> (repeats[, axis])                 | Repeat elements of a ExtensionArray.                              |
| <i>searchsorted</i> (value[, side, sorter])     | Find indices where elements should be inserted to maintain order. |
| <i>shift</i> ([periods, fill_value])            | Shift values by desired number.                                   |
| <i>take</i> (indices[, allow_fill, fill_value]) | Take elements from an array.                                      |
| <i>to_numpy</i> ([dtype, copy])                 | Convert the PandasArray to a <code>numpy.ndarray</code> .         |
| <i>unique</i> ()                                | Compute the ExtensionArray of unique values.                      |

#### 35.16.7.5 pandas.arrays.PandasArray.argsort

`PandasArray.argsort` (*ascending=True*, *kind='quicksort'*, *\*args*, *\*\*kwargs*)

Return the indices that would sort this array.

##### Parameters

**ascending** [bool, default True] Whether the indices should result in an ascending or descending sort.

**kind** [{ 'quicksort', 'mergesort', 'heapsort' }, optional] Sorting algorithm.

**\*args, \*\*kwargs:** passed through to `numpy.argsort()`.

##### Returns

**index\_array** [ndarray] Array of indices that sort `self`.

See also:

`numpy.argsort` Sorting implementation used internally.

#### 35.16.7.6 pandas.arrays.PandasArray.astype

`PandasArray.astype` (*dtype*, *copy=True*)

Cast to a NumPy array with 'dtype'.

##### Parameters

**dtype** [str or dtype] Typecode or data-type to which the array is cast.

**copy** [bool, default True] Whether to copy the data, even if not necessary. If False, a copy is made only if the old dtype does not match the new dtype.

##### Returns

**array** [ndarray] NumPy ndarray with 'dtype' for its dtype.

#### 35.16.7.7 pandas.arrays.PandasArray.copy

`PandasArray.copy` (*deep=False*)

Return a copy of the array.

##### Parameters

**deep** [bool, default False] Also copy the underlying data backing this array.

##### Returns

**ExtensionArray**

#### 35.16.7.8 pandas.arrays.PandasArray.dropna

`PandasArray.dropna` ()

Return ExtensionArray without NA values

##### Returns

**valid** [ExtensionArray]

### 35.16.7.9 pandas.arrays.PandasArray.factorize

`PandasArray.factorize` (*na\_sentinel=-1*)

Encode the extension array as an enumerated type.

#### Parameters

**na\_sentinel** [int, default -1] Value to use in the *labels* array to indicate missing values.

#### Returns

**labels** [ndarray] An integer NumPy array that's an indexer into the original ExtensionArray.

**uniques** [ExtensionArray] An ExtensionArray containing the unique values of *self*.

---

**Note:** *uniques* will *not* contain an entry for the NA value of the ExtensionArray if there are any missing values present in *self*.

---

#### See also:

**pandas.factorize** Top-level factorize method that dispatches here.

#### Notes

`pandas.factorize()` offers a *sort* keyword as well.

### 35.16.7.10 pandas.arrays.PandasArray.fillna

`PandasArray.fillna` (*value=None, method=None, limit=None*)

Fill NA/NaN values using the specified method.

#### Parameters

**value** [scalar, array-like] If a scalar value is passed it is used to fill all missing values. Alternatively, an array-like 'value' can be given. It's expected that the array-like have the same length as 'self'.

**method** [{ 'backfill', 'bfill', 'pad', 'ffill', None }, default None] Method to use for filling holes in reindexed Series *pad* / *ffill*: propagate last valid observation forward to next valid *backfill* / *bfill*: use NEXT valid observation to fill gap

**limit** [int, default None] If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled.

#### Returns

**filled** [ExtensionArray with NA/NaN filled]

### 35.16.7.11 pandas.arrays.PandasArray.isna

`PandasArray.isna` ()

A 1-D array indicating if each value is missing.

**Returns**

**na\_values** [Union[np.ndarray, ExtensionArray]] In most cases, this should return a NumPy ndarray. For exceptional cases like `SparseArray`, where returning an ndarray would be expensive, an `ExtensionArray` may be returned.

**Notes**

If returning an `ExtensionArray`, then

- `na_values._is_boolean` should be `True`
- `na_values` should implement `ExtensionArray._reduce()`
- `na_values.any` and `na_values.all` should be implemented

**35.16.7.12 pandas.arrays.PandasArray.repeat**

`PandasArray.repeat(repeats, axis=None)`

Repeat elements of a `ExtensionArray`.

Returns a new `ExtensionArray` where each element of the current `ExtensionArray` is repeated consecutively a given number of times.

**Parameters**

**repeats** [int or array of ints] The number of repetitions for each element. This should be a non-negative integer. Repeating 0 times will return an empty `ExtensionArray`.

**axis** [None] Must be `None`. Has no effect but is accepted for compatibility with `numpy`.

**Returns**

**repeated\_array** [`ExtensionArray`] Newly created `ExtensionArray` with repeated elements.

See also:

**Series.repeat** Equivalent function for `Series`.

**Index.repeat** Equivalent function for `Index`.

**numpy.repeat** Similar method for `numpy.ndarray`.

**ExtensionArray.take** Take arbitrary positions.

**Examples**

```
>>> cat = pd.Categorical(['a', 'b', 'c'])
>>> cat
[a, b, c]
Categories (3, object): [a, b, c]
>>> cat.repeat(2)
[a, a, b, b, c, c]
Categories (3, object): [a, b, c]
>>> cat.repeat([1, 2, 3])
[a, b, b, c, c, c]
Categories (3, object): [a, b, c]
```

### 35.16.7.13 pandas.arrays.PandasArray.searchsorted

`PandasArray.searchsorted` (*value*, *side*='left', *sorter*=None)

Find indices where elements should be inserted to maintain order.

New in version 0.24.0.

Find the indices into a sorted array *self* (*a*) such that, if the corresponding elements in *v* were inserted before the indices, the order of *self* would be preserved.

Assuming that *a* is sorted:

| <i>side</i> | returned index <i>i</i> satisfies          |
|-------------|--------------------------------------------|
| left        | $\text{self}[i-1] < v \leq \text{self}[i]$ |
| right       | $\text{self}[i-1] \leq v < \text{self}[i]$ |

#### Parameters

**value** [array\_like] Values to insert into *self*.

**side** [{‘left’, ‘right’}, optional] If ‘left’, the index of the first suitable location found is given. If ‘right’, return the last such index. If there is no suitable index, return either 0 or N (where N is the length of *self*).

**sorter** [1-D array\_like, optional] Optional array of integer indices that sort array *a* into ascending order. They are typically the result of `argsort`.

#### Returns

**indices** [array of ints] Array of insertion points with the same shape as *value*.

See also:

`numpy.searchsorted` Similar method from NumPy.

### 35.16.7.14 pandas.arrays.PandasArray.shift

`PandasArray.shift` (*periods*=1, *fill\_value*=None)

Shift values by desired number.

Newly introduced missing values are filled with `self.dtype.na_value`.

New in version 0.24.0.

#### Parameters

**periods** [int, default 1] The number of periods to shift. Negative values are allowed for shifting backwards.

**fill\_value** [object, optional] The scalar value to use for newly introduced missing values. The default is `self.dtype.na_value`

New in version 0.24.0.

#### Returns

**shifted** [ExtensionArray]

## Notes

If `self` is empty or `periods` is 0, a copy of `self` is returned.

If `periods > len(self)`, then an array of size `len(self)` is returned, with all values filled with `self.dtype.na_value`.

### 35.16.7.15 `pandas.arrays.PandasArray.take`

`PandasArray.take(indices, allow_fill=False, fill_value=None)`

Take elements from an array.

#### Parameters

**indices** [sequence of integers] Indices to be taken.

**allow\_fill** [bool, default False] How to handle negative values in *indices*.

- False: negative values in *indices* indicate positional indices from the right (the default). This is similar to `numpy.take()`.
- True: negative values in *indices* indicate missing values. These values are set to *fill\_value*. Any other other negative values raise a `ValueError`.

**fill\_value** [any, optional] Fill value to use for NA-indices when *allow\_fill* is True. This may be `None`, in which case the default NA value for the type, `self.dtype.na_value`, is used.

For many `ExtensionArrays`, there will be two representations of *fill\_value*: a user-facing “boxed” scalar, and a low-level physical NA value. *fill\_value* should be the user-facing version, and the implementation should handle translating that to the physical version for processing the take if necessary.

#### Returns

**ExtensionArray**

#### Raises

**IndexError** When the indices are out of bounds for the array.

**ValueError** When *indices* contains negative values other than `-1` and *allow\_fill* is True.

#### See also:

`numpy.take`, `pandas.api.extensions.take`

## Notes

`ExtensionArray.take` is called by `Series.__getitem__`, `.loc`, `iloc`, when *indices* is a sequence of values. Additionally, it’s called by `Series.reindex()`, or any other method that causes realignment, with a *fill\_value*.

## Examples

Here’s an example implementation, which relies on casting the extension array to object dtype. This uses the helper method `pandas.api.extensions.take()`.

```

def take(self, indices, allow_fill=False, fill_value=None):
    from pandas.core.algorithms import take

    # If the ExtensionArray is backed by an ndarray, then
    # just pass that here instead of coercing to object.
    data = self.astype(object)

    if allow_fill and fill_value is None:
        fill_value = self.dtype.na_value

    # fill value should always be translated from the scalar
    # type for the array, to the physical storage type for
    # the data, before passing to take.

    result = take(data, indices, fill_value=fill_value,
                  allow_fill=allow_fill)
    return self._from_sequence(result, dtype=self.dtype)

```

### 35.16.7.16 pandas.arrays.PandasArray.to\_numpy

`PandasArray.to_numpy(dtype=None, copy=False)`

Convert the `PandasArray` to a `numpy.ndarray`.

By default, this requires no coercion or copying of data.

#### Parameters

**dtype** [`numpy.dtype`] The NumPy dtype to pass to `numpy.asarray()`.

**copy** [`bool`, default `False`] Whether to copy the underlying data.

#### Returns

`ndarray`

### 35.16.7.17 pandas.arrays.PandasArray.unique

`PandasArray.unique()`

Compute the `ExtensionArray` of unique values.

#### Returns

**uniques** [`ExtensionArray`]

|               |  |

## 35.24 pandas.api.extensions.ExtensionDtype.na\_value

```
ExtensionDtype.na_value = nan
```

```
{{ header }}
```

This section will focus on downstream applications of pandas.

## 36.1 Storing pandas DataFrame objects in Apache Parquet format

The [Apache Parquet](#) format provides key-value metadata at the file and column level, stored in the footer of the Parquet file:

```
5: optional list<KeyValue> key_value_metadata
```

where KeyValue is

```
struct KeyValue {  
  1: required string key  
  2: optional string value  
}
```

So that a `pandas.DataFrame` can be faithfully reconstructed, we store a pandas metadata key in the `FileMetaData` with the value stored as :

```
{'index_columns': ['__index_level_0__', '__index_level_1__', ...],  
'column_indexes': [<ci0>, <ci1>, ..., <ciN>],  
'columns': [<c0>, <c1>, ...],  
'pandas_version': $VERSION}
```

Here, `<c0>/<ci0>` and so forth are dictionaries containing the metadata for each column, *including the index columns*. This has JSON form:

```
{'name': column_name,  
'field_name': parquet_column_name,  
'pandas_type': pandas_type,  
'numpy_type': numpy_type,  
'metadata': metadata}
```

---

**Note:** Every index column is stored with a name matching the pattern `__index_level_\d+__` and its corresponding column information is can be found with the following code snippet.

Following this naming convention isn't strictly necessary, but strongly suggested for compatibility with Arrow.

Here's an example of how the index metadata is structured in pyarrow:

```
# assuming there's at least 3 levels in the index
index_columns = metadata['index_columns'] # noqa: F821
columns = metadata['columns'] # noqa: F821
ith_index = 2
assert index_columns[ith_index] == '__index_level_2__'
ith_index_info = columns[-len(index_columns):][ith_index]
ith_index_level_name = ith_index_info['name']
```

`pandas_type` is the logical type of the column, and is one of:

- Boolean: 'bool'
- Integers: 'int8', 'int16', 'int32', 'int64', 'uint8', 'uint16', 'uint32', 'uint64'
- Floats: 'float16', 'float32', 'float64'
- Date and Time Types: 'datetime', 'datetime64[ns]', 'timedelta'
- String: 'unicode', 'bytes'
- Categorical: 'categorical'
- Other Python objects: 'object'

The `numpy_type` is the physical storage type of the column, which is the result of `str(dtype)` for the underlying NumPy array that holds the data. So for `datetime64[ns]` this is `datetime64[ns]` and for categorical, it may be any of the supported integer categorical types.

The `metadata` field is `None` except for:

- `datetime64[ns]`: {'timezone': zone, 'unit': 'ns'}, e.g. {'timezone': 'America/New\_York', 'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds.
- categorical: {'num\_categories': K, 'ordered': is\_ordered, 'type': \$TYPE}
  - Here 'type' is optional, and can be a nested pandas type specification here (but not categorical)
- unicode: {'encoding': encoding}
  - The encoding is optional, and if not present is UTF-8
- object: {'encoding': encoding}. Objects can be serialized and stored in `BYTE_ARRAY` Parquet columns. The encoding can be one of:
  - 'pickle'
  - 'msgpack'
  - 'bson'
  - 'json'
- `timedelta`: {'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds. This metadata is optional altogether

For types other than these, the 'metadata' key can be omitted. Implementations can assume `None` if the key is not present.

As an example of fully-formed metadata:

```
{'index_columns': ['__index_level_0__'],
 'column_indexes': [
   {'name': None,
    'field_name': 'None',
    'pandas_type': 'unicode',
    'numpy_type': 'object',
    'metadata': {'encoding': 'UTF-8'}}
 ],
 'columns': [
   {'name': 'c0',
    'field_name': 'c0',
    'pandas_type': 'int8',
    'numpy_type': 'int8',
    'metadata': None},
   {'name': 'c1',
    'field_name': 'c1',
    'pandas_type': 'bytes',
    'numpy_type': 'object',
    'metadata': None},
   {'name': 'c2',
    'field_name': 'c2',
    'pandas_type': 'categorical',
    'numpy_type': 'int16',
    'metadata': {'num_categories': 1000, 'ordered': False}},
   {'name': 'c3',
    'field_name': 'c3',
    'pandas_type': 'datetimeetz',
    'numpy_type': 'datetime64[ns]',
    'metadata': {'timezone': 'America/Los_Angeles'}},
   {'name': 'c4',
    'field_name': 'c4',
    'pandas_type': 'object',
    'numpy_type': 'object',
    'metadata': {'encoding': 'pickle'}},
   {'name': None,
    'field_name': '__index_level_0__',
    'pandas_type': 'int64',
    'numpy_type': 'int64',
    'metadata': None}
 ],
 'pandas_version': '0.20.0'}
```

```
{{ header }}
```

## INTERNALS

This section will provide a look into some of pandas internals. It's primarily intended for developers of pandas itself.

### 37.1 Indexing

In pandas there are a few objects implemented which can serve as valid containers for the axis labels:

- `Index`: the generic “ordered set” object, an ndarray of object dtype assuming nothing about its contents. The labels must be hashable (and likely immutable) and unique. Populates a dict of label to location in Cython to do  $O(1)$  lookups.
- `Int64Index`: a version of `Index` highly optimized for 64-bit integer data, such as time stamps
- `Float64Index`: a version of `Index` highly optimized for 64-bit float data
- `MultiIndex`: the standard hierarchical index object
- `DatetimeIndex`: An `Index` object with `Timestamp` boxed elements (impl are the int64 values)
- `TimedeltaIndex`: An `Index` object with `Timedelta` boxed elements (impl are the in64 values)
- `PeriodIndex`: An `Index` object with `Period` elements

There are functions that make the creation of a regular index easy:

- `date_range`: fixed frequency date range generated from a time rule or `DateOffset`. An ndarray of Python datetime objects
- `period_range`: fixed frequency date range generated from a time rule or `DateOffset`. An ndarray of `Period` objects, representing timespans

The motivation for having an `Index` class in the first place was to enable different implementations of indexing. This means that it's possible for you, the user, to implement a custom `Index` subclass that may be better suited to a particular application than the ones provided in pandas.

From an internal implementation point of view, the relevant methods that an `Index` must define are one or more of the following (depending on how incompatible the new object internals are with the `Index` functions):

- `get_loc`: returns an “indexer” (an integer, or in some cases a slice object) for a label
- `slice_locs`: returns the “range” to slice between two labels
- `get_indexer`: Computes the indexing vector for reindexing / data alignment purposes. See the source / docstrings for more on this
- `get_indexer_non_unique`: Computes the indexing vector for reindexing / data alignment purposes when the index is non-unique. See the source / docstrings for more on this
- `reindex`: Does any pre-conversion of the input index then calls `get_indexer`

- `union, intersection`: computes the union or intersection of two Index objects
- `insert`: Inserts a new label into an Index, yielding a new object
- `delete`: Delete a label, yielding a new object
- `drop`: Deletes a set of labels
- `take`: Analogous to `ndarray.take`

### 37.1.1 MultiIndex

Internally, the `MultiIndex` consists of a few things: the **levels**, the integer **codes** (until version 0.24 named *labels*), and the level **names**:

```
In [1]: index = pd.MultiIndex.from_product([range(3), ['one', 'two']],
...:                                     names=['first', 'second'])
...:

In [2]: index
Out[2]:
MultiIndex(levels=[[0, 1, 2], ['one', 'two']],
            labels=[[0, 0, 1, 1, 2, 2], [0, 1, 0, 1, 0, 1]],
            names=['first', 'second'])

In [3]: index.levels
Out[3]:
FrozenList([[0, 1, 2], ['one', 'two']])

In [4]: index.codes
Out[4]:
FrozenList([[0, 0, 1, 1, 2, 2], [0, 1, 0, 1, 0, 1]])

In [5]: index.names
Out[5]:
FrozenList(['first', 'second'])
```

You can probably guess that the codes determine which unique element is identified with that location at each layer of the index. It's important to note that sortedness is determined **solely** from the integer codes and does not check (or care) whether the levels themselves are sorted. Fortunately, the constructors `from_tuples` and `from_arrays` ensure that this is true, but if you compute the levels and codes yourself, please be careful.

### 37.1.2 Values

Pandas extends NumPy's type system with custom types, like `Categorical` or datetimes with a timezone, so we have multiple notions of "values". For 1-D containers (Index classes and `Series`) we have the following convention:

- `cls._ndarray_values` is *always* a NumPy `ndarray`. Ideally, `_ndarray_values` is cheap to compute. For example, for a `Categorical`, this returns the codes, not the array of objects.
- `cls._values` refers to the "best possible" array. This could be an `ndarray`, `ExtensionArray`, or in Index subclass (note: we're in the process of removing the index subclasses here so that it's always an `ndarray` or `ExtensionArray`).

So, for example, `Series[category]._values` is a `Categorical`, while `Series[category]._ndarray_values` is the underlying codes.

## 37.2 Subclassing pandas Data Structures

This section has been moved to *Subclassing pandas Data Structures*. {{ header }}

## EXTENDING PANDAS

While pandas provides a rich set of methods, containers, and data types, your needs may not be fully satisfied. Pandas offers a few options for extending pandas.

### 38.1 Registering Custom Accessors

Libraries can use the decorators `pandas.api.extensions.register_dataframe_accessor()`, `pandas.api.extensions.register_series_accessor()`, and `pandas.api.extensions.register_index_accessor()`, to add additional “namespaces” to pandas objects. All of these follow a similar convention: you decorate a class, providing the name of attribute to add. The class’s `__init__` method gets the object being decorated. For example:

```
@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Now users can access your methods using the `geo` namespace:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

This can be a convenient way to extend pandas objects without subclassing them. If you write a custom accessor, make a pull request adding it to our ecosystem page.

## 38.2 Extension Types

New in version 0.23.0.

**Warning:** The `pandas.api.extensions.ExtensionDtype` and `pandas.api.extensions.ExtensionArray` APIs are new and experimental. They may change between versions without warning.

Pandas defines an interface for implementing data types and arrays that *extend* NumPy's type system. Pandas itself uses the extension system for some types that aren't built into NumPy (categorical, period, interval, datetime with timezone).

Libraries can define a custom array and data type. When pandas encounters these objects, they will be handled properly (i.e. not converted to an ndarray of objects). Many methods like `pandas.isna()` will dispatch to the extension type's implementation.

If you're building a library that implements the interface, please publicize it on *Extension Data Types*.

The interface consists of two classes.

### 38.2.1 ExtensionDtype

A `pandas.api.extensions.ExtensionDtype` is similar to a `numpy.dtype` object. It describes the data type. Implementors are responsible for a few unique items like the name.

One particularly important item is the `type` property. This should be the class that is the scalar type for your data. For example, if you were writing an extension array for IP Address data, this might be `ipaddress.IPv4Address`.

See the [extension dtype source](#) for interface definition.

New in version 0.24.0.

`pandas.api.extension.ExtensionDtype` can be registered to pandas to allow creation via a string dtype name. This allows one to instantiate `Series` and `.astype()` with a registered string name, for example `'category'` is a registered string accessor for the `CategoricalDtype`.

See the [extension dtype dtypes](#) for more on how to register dtypes.

### 38.2.2 ExtensionArray

This class provides all the array-like functionality. `ExtensionArrays` are limited to 1 dimension. An `ExtensionArray` is linked to an `ExtensionDtype` via the `dtype` attribute.

Pandas makes no restrictions on how an extension array is created via its `__new__` or `__init__`, and puts no restrictions on how you store your data. We do require that your array be convertible to a NumPy array, even if this is relatively expensive (as it is for `Categorical`).

They may be backed by none, one, or many NumPy arrays. For example, `pandas.Categorical` is an extension array backed by two arrays, one for codes and one for categories. An array of IPv6 addresses may be backed by a NumPy structured array with two fields, one for the lower 64 bits and one for the upper 64 bits. Or they may be backed by some other storage type, like Python lists.

See the [extension array source](#) for the interface definition. The docstrings and comments contain guidance for properly implementing the interface.

### 38.2.3 ExtensionArray Operator Support

New in version 0.24.0.

By default, there are no operators defined for the class `ExtensionArray`. There are two approaches for providing operator support for your `ExtensionArray`:

1. Define each of the operators on your `ExtensionArray` subclass.
2. Use an operator implementation from pandas that depends on operators that are already defined on the underlying elements (scalars) of the `ExtensionArray`.

---

**Note:** Regardless of the approach, you may want to set `__array_priority__` if you want your implementation to be called when involved in binary operations with NumPy arrays.

---

For the first approach, you define selected operators, e.g., `__add__`, `__le__`, etc. that you want your `ExtensionArray` subclass to support.

The second approach assumes that the underlying elements (i.e., scalar type) of the `ExtensionArray` have the individual operators already defined. In other words, if your `ExtensionArray` named `MyExtensionArray` is implemented so that each element is an instance of the class `MyExtensionElement`, then if the operators are defined for `MyExtensionElement`, the second approach will automatically define the operators for `MyExtensionArray`.

A mixin class, `ExtensionScalarOpsMixin` supports this second approach. If developing an `ExtensionArray` subclass, for example `MyExtensionArray`, can simply include `ExtensionScalarOpsMixin` as a parent class of `MyExtensionArray`, and then call the methods `_add_arithmetic_ops()` and/or `_add_comparison_ops()` to hook the operators into your `MyExtensionArray` class, as follows:

```
from pandas.api.extensions import ExtensionArray, ExtensionScalarOpsMixin

class MyExtensionArray(ExtensionArray, ExtensionScalarOpsMixin):
    pass

MyExtensionArray._add_arithmetic_ops()
MyExtensionArray._add_comparison_ops()
```

---

**Note:** Since pandas automatically calls the underlying operator on each element one-by-one, this might not be as performant as implementing your own version of the associated operators directly on the `ExtensionArray`.

---

For arithmetic operations, this implementation will try to reconstruct a new `ExtensionArray` with the result of the element-wise operation. Whether or not that succeeds depends on whether the operation returns a result that's valid for the `ExtensionArray`. If an `ExtensionArray` cannot be reconstructed, an `ndarray` containing the scalars returned instead.

For ease of implementation and consistency with operations between pandas and NumPy `ndarrays`, we recommend *not* handling `Series` and `Indexes` in your binary ops. Instead, you should detect these cases and return `NotImplemented`. When pandas encounters an operation like `op(Series, ExtensionArray)`, pandas will

1. unbox the array from the `Series` (`Series.array`)
2. call `result = op(values, ExtensionArray)`
3. re-box the result in a `Series`

## 38.2.4 Testing Extension Arrays

We provide a test suite for ensuring that your extension arrays satisfy the expected behavior. To use the test suite, you must provide several pytest fixtures and inherit from the base test class. The required fixtures are found in <https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/conftest.py>.

To use a test, subclass it:

```
from pandas.tests.extension import base

class TestConstructors(base.BaseConstructorsTests):
    pass
```

See [https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/base/\\_\\_init\\_\\_.py](https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/base/__init__.py) for a list of all the tests available.

## 38.3 Subclassing pandas Data Structures

**Warning:** There are some easier alternatives before considering subclassing pandas data structures.

1. Extensible method chains with *pipe*
2. Use *composition*. See [here](#).
3. Extending by *registering an accessor*
4. Extending by *extension type*

This section describes how to subclass pandas data structures to meet more specific needs. There are two points that need attention:

1. Override constructor properties.
2. Define original properties

---

**Note:** You can find a nice example in [geopandas](#) project.

---

### 38.3.1 Override Constructor Properties

Each data structure has several *constructor properties* for returning a new data structure as the result of an operation. By overriding these properties, you can retain subclasses through pandas data manipulations.

There are 3 constructor properties to be defined:

- `_constructor`: Used when a manipulation result has the same dimensions as the original.
- `_constructor_sliced`: Used when a manipulation result has one lower dimension(s) as the original, such as `DataFrame` single columns slicing.
- `_constructor_expanddim`: Used when a manipulation result has one higher dimension as the original, such as `Series.to_frame()` and `DataFrame.to_panel()`.

Following table shows how pandas data structures define constructor properties by default.

| Property Attributes                 | Series              | DataFrame |
|-------------------------------------|---------------------|-----------|
| <code>_constructor</code>           | Series              | DataFrame |
| <code>_constructor_sliced</code>    | NotImplementedError | Series    |
| <code>_constructor_expanddim</code> | DataFrame           | Panel     |

Below example shows how to define `SubclassedSeries` and `SubclassedDataFrame` overriding constructor properties.

```
class SubclassedSeries(pd.Series):

    @property
    def _constructor(self):
        return SubclassedSeries

    @property
    def _constructor_expanddim(self):
        return SubclassedDataFrame

class SubclassedDataFrame(pd.DataFrame):

    @property
    def _constructor(self):
        return SubclassedDataFrame

    @property
    def _constructor_sliced(self):
        return SubclassedSeries
```

```
>>> s = SubclassedSeries([1, 2, 3])
>>> type(s)
<class '__main__.SubclassedSeries'>

>>> to_framed = s.to_frame()
>>> type(to_framed)
<class '__main__.SubclassedDataFrame'>

>>> df = SubclassedDataFrame({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
   A  B  C
0  1  4  7
1  2  5  8
2  3  6  9

>>> type(df)
<class '__main__.SubclassedDataFrame'>

>>> sliced1 = df[['A', 'B']]
>>> sliced1
   A  B
0  1  4
1  2  5
2  3  6
```

(continues on next page)

(continued from previous page)

```

>>> type(sliced1)
<class '__main__.SubclassedDataFrame'>

>>> sliced2 = df['A']
>>> sliced2
0    1
1    2
2    3
Name: A, dtype: int64

>>> type(sliced2)
<class '__main__.SubclassedSeries'>

```

### 38.3.2 Define Original Properties

To let original data structures have additional properties, you should let pandas know what properties are added. pandas maps unknown properties to data names overriding `__getattr__`. Defining original properties can be done in one of 2 ways:

1. Define `_internal_names` and `_internal_names_set` for temporary properties which WILL NOT be passed to manipulation results.
2. Define `_metadata` for normal properties which will be passed to manipulation results.

Below is an example to define two original properties, “internal\_cache” as a temporary property and “added\_property” as a normal property

```

class SubclassedDataFrame2(pd.DataFrame):

    # temporary properties
    _internal_names = pd.DataFrame._internal_names + ['internal_cache']
    _internal_names_set = set(_internal_names)

    # normal properties
    _metadata = ['added_property']

    @property
    def _constructor(self):
        return SubclassedDataFrame2

>>> df = SubclassedDataFrame2({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
   A  B  C
0  1  4  7
1  2  5  8
2  3  6  9

>>> df.internal_cache = 'cached'
>>> df.added_property = 'property'

>>> df.internal_cache
cached
>>> df.added_property
property

```

(continues on next page)

(continued from previous page)

```
# properties defined in _internal_names is reset after manipulation
>>> df[['A', 'B']].internal_cache
AttributeError: 'SubclassedDataFrame2' object has no attribute 'internal_cache'

# properties defined in _metadata are retained
>>> df[['A', 'B']].added_property
property
```

```
{{ header }}
```

## RELEASE NOTES

This is the list of changes to pandas between each release. For full details, see the commit logs at <http://github.com/pandas-dev/pandas>. For install and upgrade instructions, see [Installation](#).

### 39.1 Version 0.24

### 39.2 Version 0.23

#### 39.2.1 What's New in 0.23.4 (August 3, 2018)

{{ header }}

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See *Plan for dropping Python 2.7* for more.

#### What's new in v0.23.4

- *Fixed Regressions*
- *Bug Fixes*
- *Contributors*

##### 39.2.1.1 Fixed Regressions

- Python 3.7 with Windows gave all missing values for rolling variance calculations ([GH21813](#))

##### 39.2.1.2 Bug Fixes

#### Groupby/Resample/Rolling

- Bug where calling `DataFrameGroupBy.agg()` with a list of functions including `ohlc` as the non-initial element would raise a `ValueError` ([GH21716](#))

- Bug in `roll_quantile` caused a memory leak when calling `.rolling(...).quantile(q)` with `q` in `(0,1)` ([GH21965](#))

#### Missing

- Bug in `Series.clip()` and `DataFrame.clip()` cannot accept list-like threshold containing `NaN` ([GH19992](#))

### 39.2.1.3 Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Jeff Reback
- MeeseeksMachine +
- Tom Augspurger
- chris-b1
- h-vetinari
- meeseeksdev[bot]

## 39.2.2 What’s New in 0.23.3 (July 7, 2018)

{{ header }}

This release fixes a build issue with the sdist for Python 3.7 ([GH21785](#)) There are no other changes.

### 39.2.2.1 Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Tom Augspurger
- meeseeksdev[bot] +

## 39.2.3 What’s New in 0.23.2 (July 5, 2018)

{{ header }}

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

---

**Note:** Pandas 0.23.2 is first pandas release that’s compatible with Python 3.7 ([GH20552](#))

---

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See *Plan for dropping Python 2.7* for more.

**What's new in v0.23.2**

- *Logical Reductions over Entire DataFrame*
- *Fixed Regressions*
- *Build Changes*
- *Bug Fixes*
- *Contributors*

**39.2.3.1 Logical Reductions over Entire DataFrame**

`DataFrame.all()` and `DataFrame.any()` now accept `axis=None` to reduce over all axes to a scalar ([GH19976](#))

```
In [1]: df = pd.DataFrame({"A": [1, 2], "B": [True, False]})
In [2]: df.all(axis=None)
Out[2]: False
```

This also provides compatibility with NumPy 1.15, which now dispatches to `DataFrame.all`. With NumPy 1.15 and pandas 0.23.1 or earlier, `numpy.all()` will no longer reduce over every axis:

```
>>> # NumPy 1.15, pandas 0.23.1
>>> np.any(pd.DataFrame({"A": [False], "B": [False]}))
A    False
B    False
dtype: bool
```

With pandas 0.23.2, that will correctly return False, as it did with NumPy < 1.15.

```
In [3]: np.any(pd.DataFrame({"A": [False], "B": [False]}))
Out[3]: False
```

**39.2.3.2 Fixed Regressions**

- Fixed regression in `to_csv()` when handling file-like object incorrectly ([GH21471](#))
- Re-allowed duplicate level names of a `MultiIndex`. Accessing a level that has a duplicate name by name still raises an error ([GH19029](#)).
- Bug in both `DataFrame.first_valid_index()` and `Series.first_valid_index()` raised for a row index having duplicate values ([GH21441](#))
- Fixed printing of DataFrames with hierarchical columns with long names ([GH21180](#))
- Fixed regression in `reindex()` and `groupby()` with a `MultiIndex` or multiple keys that contains categorical datetime-like values ([GH21390](#)).
- Fixed regression in unary negative operations with object dtype ([GH21380](#))
- Bug in `Timestamp.ceil()` and `Timestamp.floor()` when timestamp is a multiple of the rounding frequency ([GH21262](#))

- Fixed regression in `to_clipboard()` that defaulted to copying dataframes with space delimited instead of tab delimited ([GH21104](#))

### 39.2.3.3 Build Changes

- The source and binary distributions no longer include test data files, resulting in smaller download sizes. Tests relying on these data files will be skipped when using `pandas.test()`. ([GH19320](#))

### 39.2.3.4 Bug Fixes

#### Conversion

- Bug in constructing `Index` with an iterator or generator ([GH21470](#))
- Bug in `Series.nlargest()` for signed and unsigned integer dtypes when the minimum value is present ([GH21426](#))

#### Indexing

- Bug in `Index.get_indexer_non_unique()` with categorical key ([GH21448](#))
- Bug in comparison operations for `MultiIndex` where error was raised on equality / inequality comparison involving a `MultiIndex` with `nlevels == 1` ([GH21149](#))
- Bug in `DataFrame.drop()` behaviour is not consistent for unique and non-unique indexes ([GH21494](#))
- Bug in `DataFrame.duplicated()` with a large number of columns causing a ‘maximum recursion depth exceeded’ ([GH21524](#)).

#### I/O

- Bug in `read_csv()` that caused it to incorrectly raise an error when `nrows=0`, `low_memory=True`, and `index_col` was not `None` ([GH21141](#))
- Bug in `json_normalize()` when formatting the `record_prefix` with integer columns ([GH21536](#))

#### Categorical

- Bug in rendering `Series` with `Categorical` dtype in rare conditions under Python 2.7 ([GH21002](#))

#### Timezones

- Bug in `Timestamp` and `DatetimeIndex` where passing a `Timestamp` localized after a DST transition would return a datetime before the DST transition ([GH20854](#))
- Bug in comparing `DataFrame` with tz-aware `DatetimeIndex` columns with a DST transition that raised a `KeyError` ([GH19970](#))
- Bug in `DatetimeIndex.shift()` where an `AssertionError` would raise when shifting across DST ([GH8616](#))
- Bug in `Timestamp` constructor where passing an invalid timezone offset designator (`Z`) would not raise a `ValueError` ([GH8910](#))
- Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset ([GH7825](#))
- Bug in `DatetimeIndex.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` ([GH8306](#))
- Bug in `DatetimeIndex.resample()` when downsampling across a DST boundary ([GH8531](#))

#### Timedelta

- Bug in `Timedelta` where non-zero timedeltas shorter than 1 microsecond were considered False ([GH21484](#))

### 39.2.3.5 Contributors

A total of 17 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- David Krych
- Jacopo Rota +
- Jeff Reback
- Jeremy Schendel
- Joris Van den Bossche
- Kalyan Gokhale

### 39.2.4 What’s New in 0.23.1 (June 12, 2018)

{{ header }}

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See *Plan for dropping Python 2.7* for more.

#### What’s new in v0.23.1

- *Fixed Regressions*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.2.4.1 Fixed Regressions

#### Comparing Series with `datetime.date`

We've reverted a 0.23.0 change to comparing a `Series` holding datetimes and a `datetime.date` object (GH21152). In pandas 0.22 and earlier, comparing a `Series` holding datetimes and `datetime.date` objects would coerce the `datetime.date` to a `datetime` before comparing. This was inconsistent with Python, NumPy, and `DatetimeIndex`, which never consider a `datetime` and `datetime.date` equal.

In 0.23.0, we unified operations between `DatetimeIndex` and `Series`, and in the process changed comparisons between a `Series` of datetimes and `datetime.date` without warning.

We've temporarily restored the 0.22.0 behavior, so datetimes and dates may again compare equal, but restore the 0.23.0 behavior in a future release.

To summarize, here's the behavior in 0.22.0, 0.23.0, 0.23.1:

```
# 0.22.0... Silently coerce the datetime.date
>>> import datetime
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0      True
1     False
dtype: bool

# 0.23.0... Do not coerce the datetime.date
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0     False
1     False
dtype: bool

# 0.23.1... Coerce the datetime.date with a warning
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
/bin/python:1: FutureWarning: Comparing Series of datetimes with 'datetime.date'.
Currently, the
'datetime.date' is coerced to a datetime. In the future pandas will
not coerce, and the values not compare equal to the 'datetime.date'.
To retain the current behavior, convert the 'datetime.date' to a
datetime with 'pd.Timestamp'.
  #!/bin/python3
0      True
1     False
dtype: bool
```

In addition, ordering comparisons will raise a `TypeError` in the future.

#### Other Fixes

- Reverted the ability of `to_sql()` to perform multivalued inserts as this caused regression in certain cases (GH21103). In the future this will be made configurable.
- Fixed regression in the `DatetimeIndex.date` and `DatetimeIndex.time` attributes in case of timezone-aware data: `DatetimeIndex.time` returned a tz-aware time instead of tz-naive (GH21267) and `DatetimeIndex.date` returned incorrect date when the input date has a non-UTC timezone (GH21230).
- Fixed regression in `pandas.io.json.json_normalize()` when called with `None` values in nested levels in JSON, and to not drop keys with value as `None` (GH21158, GH21356).
- Bug in `to_csv()` causes encoding error when compression and encoding are specified (GH21241, GH21118).
- Bug preventing pandas from being importable with -OO optimization (GH21071).

- Bug in `Categorical.fillna()` incorrectly raising a `TypeError` when *value* the individual categories are iterable and *value* is an iterable ([GH21097](#), [GH19788](#))
- Fixed regression in constructors coercing NA values like `None` to strings when passing `dtype=str` ([GH21083](#))
- Regression in `pivot_table()` where an ordered `Categorical` with missing values for the pivot's index would give a mis-aligned result ([GH21133](#))
- Fixed regression in merging on boolean index/columns ([GH21119](#)).

#### 39.2.4.2 Performance Improvements

- Improved performance of `CategoricalIndex.is_monotonic_increasing()`, `CategoricalIndex.is_monotonic_decreasing()` and `CategoricalIndex.is_monotonic()` ([GH21025](#))
- Improved performance of `CategoricalIndex.is_unique()` ([GH21107](#))

#### 39.2.4.3 Bug Fixes

##### Groupby/Resample/Rolling

- Bug in `DataFrame.agg()` where applying multiple aggregation functions to a `DataFrame` with duplicated column names would cause a stack overflow ([GH21063](#))
- Bug in `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` where the fill within a grouping would not always be applied as intended due to the implementations' use of a non-stable sort ([GH21207](#))
- Bug in `pandas.core.groupby.GroupBy.rank()` where results did not scale to 100% when specifying `method='dense'` and `pct=True`
- Bug in `pandas.DataFrame.rolling()` and `pandas.Series.rolling()` which incorrectly accepted a 0 window size rather than raising ([GH21286](#))

##### Data-type specific

- Bug in `Series.str.replace()` where the method throws `TypeError` on Python 3.5.2 ([GH21078](#))
- Bug in `Timedelta` where passing a float with a unit would prematurely round the float precision ([GH14156](#))
- Bug in `pandas.testing.assert_index_equal()` which raised `AssertionError` incorrectly, when comparing two `CategoricalIndex` objects with param `check_categorical=False` ([GH19776](#))

##### Sparse

- Bug in `SparseArray.shape` which previously only returned the shape `SparseArray.sp_values` ([GH21126](#))

##### Indexing

- Bug in `Series.reset_index()` where appropriate error was not raised with an invalid level name ([GH20925](#))
- Bug in `interval_range()` when start/periods or end/periods are specified with float start or end ([GH21161](#))
- Bug in `MultiIndex.set_names()` where error raised for a `MultiIndex` with `nlevels == 1` ([GH21149](#))

- Bug in `IntervalIndex` constructors where creating an `IntervalIndex` from categorical data was not fully supported ([GH21243](#), [GH21253](#))
- Bug in `MultiIndex.sort_index()` which was not guaranteed to sort correctly with `level=1`; this was also causing data misalignment in particular `DataFrame.stack()` operations ([GH20994](#), [GH20945](#), [GH21052](#))

### Plotting

- New keywords (`sharex`, `sharey`) to turn on/off sharing of x/y-axis by subplots generated with `pandas.DataFrame().groupby().boxplot()` ([GH20968](#))

### I/O

- Bug in IO methods specifying `compression='zip'` which produced uncompressed zip archives ([GH17778](#), [GH21144](#))
- Bug in `DataFrame.to_stata()` which prevented exporting DataFrames to buffers and most file-like objects ([GH21041](#))
- Bug in `read_stata()` and `StataReader` which did not correctly decode utf-8 strings on Python 3 from Stata 14 files (dta version 118) ([GH21244](#))
- Bug in IO JSON `read_json()` reading empty JSON schema with `orient='table'` back to `DataFrame` caused an error ([GH21287](#))

### Reshaping

- Bug in `concat()` where error was raised in concatenating `Series` with numpy scalar and tuple names ([GH21015](#))
- Bug in `concat()` warning message providing the wrong guidance for future behavior ([GH21101](#))

### Other

- Tab completion on `Index` in IPython no longer outputs deprecation warnings ([GH21125](#))
- Bug preventing pandas being used on Windows without C++ redistributable installed ([GH21106](#))

#### 39.2.4.4 Contributors

A total of 30 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.2.5 What's new in 0.23.0 (May 15, 2018)

{{ header }}

This is a major release from 0.22.0 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- *Round-trippable JSON format with 'table' orient.*
- *Instantiation from dicts respects order for Python 3.6+.*
- *Dependent column arguments for assign.*
- *Merging / sorting on a combination of columns and index levels.*
- *Extending Pandas with custom types.*
- *Excluding unobserved categories from groupby.*
- *Changes to make output shape of DataFrame.apply consistent.*

Check the *API Changes* and *deprecations* before updating.

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See *Plan for dropping Python 2.7* for more.

### What's new in v0.23.0

- *New features*
  - *JSON read/write round-trippable with `orient='table'`*
  - *`.assign()` accepts dependent arguments*
  - *Merging on a combination of columns and index levels*
  - *Sorting by a combination of columns and index levels*
  - *Extending Pandas with Custom Types (Experimental)*
  - *New `observed` keyword for excluding unobserved categories in `groupby`*
  - *Rolling/Expanding.`apply()` accepts `raw=False` to pass a Series to the function*
  - *`DataFrame.interpolate` has gained the `limit_area` kwarg*
  - *`get_dummies` now supports `dtype` argument*
  - *`Timedelta` mod method*
  - *`.rank()` handles `inf` values when `NaN` are present*
  - *`Series.str.cat` has gained the `join` kwarg*
  - *`DataFrame.astype` performs column-wise conversion to `Categorical`*
  - *Other Enhancements*
- *Backwards incompatible API changes*
  - *Dependencies have increased minimum versions*
  - *Instantiation from dicts preserves dict insertion order for python 3.6+*
  - *Deprecate Panel*
  - *`pandas.core.common` removals*
  - *Changes to make output of `DataFrame.apply` consistent*
  - *Concatenation will no longer sort*
  - *Build Changes*
  - *Index Division By Zero Fills Correctly*
  - *Extraction of matching patterns from strings*
  - *Default value for the `ordered` parameter of `CategoricalDtype`*
  - *Better pretty-printing of DataFrames in a terminal*
  - *Datetimelike API Changes*
  - *Other API Changes*
- *Deprecations*
- *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Documentation Changes*
- *Bug Fixes*

- *Categorical*
- *Datetimelike*
- *Timedelta*
- *Timezones*
- *Offsets*
- *Numeric*
- *Strings*
- *Indexing*
- *MultiIndex*
- *I/O*
- *Plotting*
- *Groupby/Resample/Rolling*
- *Sparse*
- *Reshaping*
- *Other*
- *Contributors*

### 39.2.5.1 New features

#### JSON read/write round-trippable with `orient='table'`

A `DataFrame` can now be written to and subsequently read back via JSON while preserving metadata through usage of the `orient='table'` argument (see [GH18912](#) and [GH9146](#)). Previously, none of the available `orient` values guaranteed the preservation of dtypes and index names, amongst other metadata.

```
In [1]: df = pd.DataFrame({'foo': [1, 2, 3, 4],
...:                      'bar': ['a', 'b', 'c', 'd'],
...:                      'baz': pd.date_range('2018-01-01', freq='d', periods=4),
...:                      'qux': pd.Categorical(['a', 'b', 'c', 'c'])},
...:                      index=pd.Index(range(4), name='idx'))
...:
```

```
In [2]: df
```

```
Out[2]:
```

|     | foo | bar | baz        | qux |
|-----|-----|-----|------------|-----|
| idx |     |     |            |     |
| 0   | 1   | a   | 2018-01-01 | a   |
| 1   | 2   | b   | 2018-01-02 | b   |
| 2   | 3   | c   | 2018-01-03 | c   |
| 3   | 4   | d   | 2018-01-04 | c   |

```
[4 rows x 4 columns]
```

```
In [3]: df.dtypes
```

```
~~~~~
↪
```

(continues on next page)

(continued from previous page)

```
foo int64
bar object
baz datetime64[ns]
qux category
Length: 4, dtype: object

In [4]: df.to_json('test.json', orient='table')

In [5]: new_df = pd.read_json('test.json', orient='table')

In [6]: new_df
Out[6]:
 foo bar baz qux
idx
0 1 a 2018-01-01 a
1 2 b 2018-01-02 b
2 3 c 2018-01-03 c

qux category
Length: 4, dtype: object
```

## `.assign()` accepts dependent arguments

The `DataFrame.assign()` now accepts dependent keyword arguments for python version later than 3.6 (see also [PEP 468](#)). Later keyword arguments may now refer to earlier ones if the argument is a callable. See the *documentation here* ([GH14207](#))

```
In [13]: df = pd.DataFrame({'A': [1, 2, 3]})

In [14]: df
Out[14]:
 A
0 1
1 2
2 3

[3 rows x 1 columns]

In [15]: df.assign(B=df.A, C=lambda x: x['A'] + x['B'])
Out[15]:
 A B C
0 1 1 2
1 2 2 4
2 3 3 6

[3 rows x 3 columns]
```

**Warning:** This may subtly change the behavior of your code when you're using `.assign()` to update an existing column. Previously, callables referring to other variables being updated would get the “old” values

Previous Behavior:

```
In [2]: df = pd.DataFrame({"A": [1, 2, 3]})

In [3]: df.assign(A=lambda df: df.A + 1, C=lambda df: df.A * -1)
Out[3]:
```

|   | A | C  |
|---|---|----|
| 0 | 2 | -1 |
| 1 | 3 | -2 |
| 2 | 4 | -3 |

**New Behavior:**

```
In [16]: df.assign(A=df.A + 1, C=lambda df: df.A * -1)
Out[16]:
```

|   | A | C  |
|---|---|----|
| 0 | 2 | -2 |
| 1 | 3 | -3 |
| 2 | 4 | -4 |

```
[3 rows x 2 columns]
```

## Merging on a combination of columns and index levels

Strings passed to `DataFrame.merge()` as the `on`, `left_on`, and `right_on` parameters may now refer to either column names or index level names. This enables merging `DataFrame` instances on a combination of index levels and columns without resetting indexes. See the *Merge on columns and levels* documentation section. (GH14355)

```

In [17]: left_index = pd.Index(['K0', 'K0', 'K1', 'K2'], name='key1')

In [18]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2', 'A3'],
.....: 'B': ['B0', 'B1', 'B2', 'B3'],
.....: 'key2': ['K0', 'K1', 'K0', 'K1']},
.....: index=left_index)
.....:

In [19]: right_index = pd.Index(['K0', 'K1', 'K2', 'K2'], name='key1')

In [20]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
.....: 'D': ['D0', 'D1', 'D2', 'D3'],
.....: 'key2': ['K0', 'K0', 'K0', 'K1']},
.....: index=right_index)
.....:

In [21]: left.merge(right, on=['key1', 'key2'])
Out[21]:
 A B key2 C D
key1
K0 A0 B0 K0 C0 D0
K1 A2 B2 K0 C1 D1
K2 A3 B3 K1 C3 D3

[3 rows x 5 columns]

```

## Sorting by a combination of columns and index levels

Strings passed to `DataFrame.sort_values()` as the `by` parameter may now refer to either column names or index level names. This enables sorting `DataFrame` instances by a combination of index levels and columns without resetting indexes. See the *Sorting by Indexes and Values* documentation section. ([GH14353](#))

```

Build MultiIndex
In [22]: idx = pd.MultiIndex.from_tuples([('a', 1), ('a', 2), ('a', 2),
.....: ('b', 2), ('b', 1), ('b', 1)])
.....:

In [23]: idx.names = ['first', 'second']

Build DataFrame
In [24]: df_multi = pd.DataFrame({'A': np.arange(6, 0, -1)},
.....: index=idx)
.....:

In [25]: df_multi
Out[25]:
 first second A
a 1 6
 2 5
 2 4
b 2 3
 1 2
 1 1

```

(continues on next page)

(continued from previous page)

```
[6 rows x 1 columns]

Sort by 'second' (index) and 'A' (column)
In [26]: df_multi.sort_values(by=['second', 'A'])
////////////////////////////////////
```

|   | first | second | A |
|---|-------|--------|---|
| b | 1     | 1      | 1 |
|   |       | 1      | 2 |
| a | 1     | 6      | 6 |
| b | 2     | 3      | 3 |
| a | 2     | 4      | 4 |
|   | 2     | 5      | 5 |

```
[6 rows x 1 columns]
```

## Extending Pandas with Custom Types (Experimental)

Pandas now supports storing array-like objects that aren't necessarily 1-D NumPy arrays as columns in a DataFrame or values in a Series. This allows third-party libraries to implement extensions to NumPy's types, similar to how pandas implemented categoricals, datetimes with timezones, periods, and intervals.

As a demonstration, we'll use `cyberpandas`, which provides an `IPArray` type for storing ip addresses.

```
In [1]: from cyberpandas import IPArray

In [2]: values = IPArray([
...: 0,
...: 3232235777,
...: 42540766452641154071740215577757643572
...:])
...:
...:
```

`IPArray` isn't a normal 1-D NumPy array, but because it's a pandas *ExtensionArray*, it can be stored properly inside pandas' containers.

```
In [3]: ser = pd.Series(values)

In [4]: ser
Out[4]:
0 0.0.0.0
1 192.168.1.1
2 2001:db8:85a3::8a2e:370:7334
dtype: ip
```

Notice that the dtype is `ip`. The missing value semantics of the underlying array are respected:

```
In [5]: ser.isna()
Out[5]:
0 True
1 False
2 False
dtype: bool
```

For more, see the *extension types* documentation. If you build an extension array, publicize it on our *ecosystem page*.

### New `observed` keyword for excluding unobserved categories in `groupby`

Grouping by a categorical includes the unobserved categories in the output. When grouping by multiple categorical columns, this means you get the cartesian product of all the categories, including combinations where there are no observations, which can result in a large number of groups. We have added a keyword `observed` to control this behavior, it defaults to `observed=False` for backward-compatibility. (GH14942, GH8138, GH15217, GH17594, GH8669, GH20583, GH20902)

```
In [27]: cat1 = pd.Categorical(["a", "a", "b", "b"],
.....: categories=["a", "b", "z"], ordered=True)
.....:

In [28]: cat2 = pd.Categorical(["c", "d", "c", "d"],
.....: categories=["c", "d", "y"], ordered=True)
.....:

In [29]: df = pd.DataFrame({"A": cat1, "B": cat2, "values": [1, 2, 3, 4]})

In [30]: df['C'] = ['foo', 'bar'] * 2

In [31]: df
Out[31]:
 A B values C
0 a c 1 foo
1 a d 2 bar
2 b c 3 foo
3 b d 4 bar

[4 rows x 4 columns]
```

To show all values, the previous behavior:

```
In [32]: df.groupby(['A', 'B', 'C'], observed=False).count()
Out[32]:
 values
A B C
a c bar NaN
 foo 1.0
 d bar 1.0
 foo NaN
 y bar NaN
 foo NaN
b c bar NaN
 foo 1.0
 d bar 1.0
 foo NaN
 y bar NaN
 foo NaN
z c bar NaN
 foo NaN
 d bar NaN
 foo NaN
 y bar NaN
 foo NaN
```

(continues on next page)

(continued from previous page)

[18 rows x 1 columns]

To show only observed values:

**In [33]:** df.groupby(['A', 'B', 'C'], observed=True).count()**Out[33]:**  
values

| A | B | C   |   |
|---|---|-----|---|
| a | c | foo | 1 |
|   | d | bar | 1 |
| b | c | foo | 1 |
|   | d | bar | 1 |

[4 rows x 1 columns]

For pivoting operations, this behavior is *already* controlled by the dropna keyword:**In [34]:** cat1 = pd.Categorical(["a", "a", "b", "b"],  
.....: categories=["a", "b", "z"], ordered=True)  
.....:**In [35]:** cat2 = pd.Categorical(["c", "d", "c", "d"],  
.....: categories=["c", "d", "y"], ordered=True)  
.....:**In [36]:** df = pd.DataFrame({"A": cat1, "B": cat2, "values": [1, 2, 3, 4]})**In [37]:** df**Out[37]:**  

|   | A | B | values |
|---|---|---|--------|
| 0 | a | c | 1      |
| 1 | a | d | 2      |
| 2 | b | c | 3      |
| 3 | b | d | 4      |

[4 rows x 3 columns]

**In [38]:** pd.pivot\_table(df, values='values', index=['A', 'B'],  
.....: dropna=True)  
.....:**Out[38]:**  
values

| A | B |   |
|---|---|---|
| a | c | 1 |
|   | d | 2 |
| b | c | 3 |
|   | d | 4 |

[4 rows x 1 columns]

**In [39]:** pd.pivot\_table(df, values='values', index=['A', 'B'],  
.....: dropna=False)  
.....:

```

////////////////////////////////////

```

(continues on next page)

(continued from previous page)

```

 values
A B
a c 1.0
 d 2.0
 y NaN
b c 3.0
 d 4.0
 y NaN
z c NaN
 d NaN
 y NaN

[9 rows x 1 columns]
```

### Rolling/Expanding.apply() accepts `raw=False` to pass a `Series` to the function

`Series.rolling().apply()`, `DataFrame.rolling().apply()`, `Series.expanding().apply()`, and `DataFrame.expanding().apply()` have gained a `raw=None` parameter. This is similar to `DataFrame.apply()`. This parameter, if `True` allows one to send a `np.ndarray` to the applied function. If `False` a `Series` will be passed. The default is `None`, which preserves backward compatibility, so this will default to `True`, sending an `np.ndarray`. In a future version the default will be changed to `False`, sending a `Series`. (GH5071, GH20584)

```
In [40]: s = pd.Series(np.arange(5), np.arange(5) + 1)
```

```
In [41]: s
```

```
Out[41]:
```

```

1 0
2 1
3 2
4 3
5 4
Length: 5, dtype: int64
```

Pass a `Series`:

```
In [42]: s.rolling(2, min_periods=1).apply(lambda x: x.iloc[-1], raw=False)
```

```
Out[42]:
```

```

1 0.0
2 1.0
3 2.0
4 3.0
5 4.0
Length: 5, dtype: float64
```

Mimic the original behavior of passing a `ndarray`:

```
In [43]: s.rolling(2, min_periods=1).apply(lambda x: x[-1], raw=True)
```

```
Out[43]:
```

```

1 0.0
2 1.0
3 2.0
4 3.0
5 4.0
Length: 5, dtype: float64
```

**DataFrame.interpolate has gained the limit\_area kwarg**

DataFrame.interpolate() has gained a limit\_area parameter to allow further control of which NaN s are replaced. Use limit\_area='inside' to fill only NaNs surrounded by valid values or use limit\_area='outside' to fill only NaN s outside the existing valid values while preserving those inside. (GH16284) See the *full documentation here*.

```
In [44]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan,
.....: np.nan, 13, np.nan, np.nan])
.....:

In [45]: ser
Out[45]:
0 NaN
1 NaN
2 5.0
3 NaN
4 NaN
5 NaN
6 13.0
7 NaN
8 NaN
Length: 9, dtype: float64
```

Fill one consecutive inside value in both directions

```
In [46]: ser.interpolate(limit_direction='both', limit_area='inside', limit=1)
Out[46]:
0 NaN
1 NaN
2 5.0
3 7.0
4 NaN
5 11.0
6 13.0
7 NaN
8 NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values backward

```
In [47]: ser.interpolate(limit_direction='backward', limit_area='outside')
Out[47]:
0 5.0
1 5.0
2 5.0
3 NaN
4 NaN
5 NaN
6 13.0
7 NaN
8 NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values in both directions

```
In [48]: ser.interpolate(limit_direction='both', limit_area='outside')
Out[48]:
0 5.0
1 5.0
2 5.0
3 NaN
4 NaN
5 NaN
6 13.0
7 13.0
8 13.0
Length: 9, dtype: float64
```

### `get_dummies` now supports `dtype` argument

The `get_dummies()` now accepts a `dtype` argument, which specifies a dtype for the new columns. The default remains `uint8`. (GH18330)

```
In [49]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 4], 'c': [5, 6]})

In [50]: pd.get_dummies(df, columns=['c']).dtypes
Out[50]:
a int64
b int64
c_5 uint8
c_6 uint8
Length: 4, dtype: object

In [51]: pd.get_dummies(df, columns=['c'], dtype=bool).dtypes
Out[51]:
a int64
b int64
c_5 bool
c_6 bool
Length: 4, dtype: object
```

### `Timedelta` mod method

`mod (%)` and `divmod` operations are now defined on `Timedelta` objects when operating with either `timedelta`-like or with numeric arguments. See the *documentation here*. (GH19365)

```
In [52]: td = pd.Timedelta(hours=37)

In [53]: td % pd.Timedelta(minutes=45)
Out[53]: Timedelta('0 days 00:15:00')
```

### `.rank()` handles `inf` values when `NaN` are present

In previous versions, `.rank()` would assign `inf` elements `NaN` as their ranks. Now ranks are calculated properly. (GH6945)

```
In [54]: s = pd.Series([-np.inf, 0, 1, np.nan, np.inf])
```

```
In [55]: s
```

```
Out[55]:
0 -inf
1 0.000000
2 1.000000
3 NaN
4 inf
Length: 5, dtype: float64
```

Previous Behavior:

```
In [11]: s.rank()
```

```
Out[11]:
0 1.0
1 2.0
2 3.0
3 NaN
4 NaN
dtype: float64
```

Current Behavior:

```
In [56]: s.rank()
```

```
Out[56]:
0 1.0
1 2.0
2 3.0
3 NaN
4 4.0
Length: 5, dtype: float64
```

Furthermore, previously if you rank `inf` or `-inf` values together with `NaN` values, the calculation won't distinguish `NaN` from infinity when using 'top' or 'bottom' argument.

```
In [57]: s = pd.Series([np.nan, np.nan, -np.inf, -np.inf])
```

```
In [58]: s
```

```
Out[58]:
0 NaN
1 NaN
2 -inf
3 -inf
Length: 4, dtype: float64
```

Previous Behavior:

```
In [15]: s.rank(na_option='top')
```

```
Out[15]:
0 2.5
1 2.5
2 2.5
3 2.5
dtype: float64
```

Current Behavior:

```
In [59]: s.rank(na_option='top')
Out[59]:
0 1.5
1 1.5
2 3.5
3 3.5
Length: 4, dtype: float64
```

These bugs were squashed:

- Bug in `DataFrame.rank()` and `Series.rank()` when `method='dense'` and `pct=True` in which percentile ranks were not being used with the number of distinct observations ([GH15630](#))
- Bug in `Series.rank()` and `DataFrame.rank()` when `ascending='False'` failed to return correct ranks for infinity if NaN were present ([GH19538](#))
- Bug in `DataFrameGroupBy.rank()` where ranks were incorrect when both infinity and NaN were present ([GH20561](#))

### `Series.str.cat` has gained the `join` kwarg

Previously, `Series.str.cat()` did not – in contrast to most of pandas – align `Series` on their index before concatenation (see [GH18657](#)). The method has now gained a keyword `join` to control the manner of alignment, see examples below and [here](#).

In v.0.23 `join` will default to `None` (meaning no alignment), but this default will change to `'left'` in a future version of pandas.

```
In [60]: s = pd.Series(['a', 'b', 'c', 'd'])

In [61]: t = pd.Series(['b', 'd', 'e', 'c'], index=[1, 3, 4, 2])

In [62]: s.str.cat(t)
Out[62]:
0 ab
1 bd
2 ce
3 dc
Length: 4, dtype: object

In [63]: s.str.cat(t, join='left', na_rep='-')
Out[63]:
0 a-
1 bb
2 cc
3 dd
Length: 4, dtype: object
```

Furthermore, `Series.str.cat()` now works for `CategoricalIndex` as well (previously raised a `ValueError`; see [GH20842](#)).

### `DataFrame.astype` performs column-wise conversion to `Categorical`

`DataFrame.astype()` can now perform column-wise conversion to `Categorical` by supplying the string `'category'` or a `CategoricalDtype`. Previously, attempting this would raise a `NotImplementedError`. See the *Object Creation* section of the documentation for more details and examples. ([GH12860](#), [GH18099](#))

Supplying the string `'category'` performs column-wise conversion, with only labels appearing in a given column set as categories:

```
In [64]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd')})

In [65]: df = df.astype('category')

In [66]: df['A'].dtype
Out[66]: CategoricalDtype(categories=['a', 'b', 'c'], ordered=False)

In [67]: df['B'].dtype
Out[67]: CategoricalDtype(categories=['b', 'c', 'd'], ordered=False)
```

Supplying a `CategoricalDtype` will make the categories in each column consistent with the supplied dtype:

```
In [68]: from pandas.api.types import CategoricalDtype

In [69]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd')})

In [70]: cdt = CategoricalDtype(categories=list('abcd'), ordered=True)

In [71]: df = df.astype(cdt)

In [72]: df['A'].dtype
Out[72]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)

In [73]: df['B'].dtype
Out[73]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
```

## Other Enhancements

- Unary + now permitted for Series and DataFrame as numeric operator ([GH16073](#))
- Better support for `to_excel()` output with the `xlsxwriter` engine. ([GH16149](#))
- `pandas.tseries.frequencies.to_offset()` now accepts leading '+' signs e.g. '+1h'. ([GH18171](#))
- `MultiIndex.unique()` now supports the `level=` argument, to get unique values from a specific index level ([GH17896](#))
- `pandas.io.formats.style.Styler` now has method `hide_index()` to determine whether the index will be rendered in output ([GH14194](#))
- `pandas.io.formats.style.Styler` now has method `hide_columns()` to determine whether columns will be hidden in output ([GH14194](#))
- Improved wording of `ValueError` raised in `to_datetime()` when `unit=` is passed with a non-convertible value ([GH14350](#))
- `Series.fillna()` now accepts a Series or a dict as a value for a categorical dtype ([GH17033](#))
- `pandas.read_clipboard()` updated to use `qtpy`, falling back to `PyQt5` and then `PyQt4`, adding compatibility with Python3 and multiple python-qt bindings ([GH17722](#))
- Improved wording of `ValueError` raised in `read_csv()` when the `usecols` argument cannot match all columns. ([GH17301](#))

- `DataFrame.corrwith()` now silently drops non-numeric columns when passed a Series. Before, an exception was raised ([GH18570](#)).
- `IntervalIndex` now supports time zone aware `Interval` objects ([GH18537](#), [GH18538](#))
- `Series()` / `DataFrame()` tab completion also returns identifiers in the first level of a `MultiIndex()`. ([GH16326](#))
- `read_excel()` has gained the `nrows` parameter ([GH16645](#))
- `DataFrame.append()` can now in more cases preserve the type of the calling dataframe's columns (e.g. if both are `CategoricalIndex`) ([GH18359](#))
- `DataFrame.to_json()` and `Series.to_json()` now accept an `index` argument which allows the user to exclude the index from the JSON output ([GH17394](#))
- `IntervalIndex.to_tuples()` has gained the `na_tuple` parameter to control whether NA is returned as a tuple of NA, or NA itself ([GH18756](#))
- `Categorical.rename_categories`, `CategoricalIndex.rename_categories` and `Series.cat.rename_categories` can now take a callable as their argument ([GH18862](#))
- `Interval` and `IntervalIndex` have gained a `length` attribute ([GH18789](#))
- `Resampler` objects now have a functioning `pipe` method. Previously, calls to `pipe` were diverted to the `mean` method ([GH17905](#)).
- `is_scalar()` now returns `True` for `DateOffset` objects ([GH18943](#)).
- `DataFrame.pivot()` now accepts a list for the `values=` kwarg ([GH17160](#)).
- Added `pandas.api.extensions.register_dataframe_accessor()`, `pandas.api.extensions.register_series_accessor()`, and `pandas.api.extensions.register_index_accessor()`, accessor for libraries downstream of pandas to register custom accessors like `.cat` on pandas objects. See *Registering Custom Accessors* for more ([GH14781](#)).
- `IntervalIndex.astype` now supports conversions between subtypes when passed an `IntervalDtype` ([GH19197](#))
- `IntervalIndex` and its associated constructor methods (`from_arrays`, `from_breaks`, `from_tuples`) have gained a `dtype` parameter ([GH19262](#))
- Added `pandas.core.groupby.SeriesGroupBy.is_monotonic_increasing()` and `pandas.core.groupby.SeriesGroupBy.is_monotonic_decreasing()` ([GH17015](#))
- For subclassed `DataFrames`, `DataFrame.apply()` will now preserve the `Series` subclass (if defined) when passing the data to the applied function ([GH19822](#))
- `DataFrame.from_dict()` now accepts a `columns` argument that can be used to specify the column names when `orient='index'` is used ([GH18529](#))
- Added option `display.html.use_mathjax` so `MathJax` can be disabled when rendering tables in Jupyter notebooks ([GH19856](#), [GH19824](#))
- `DataFrame.replace()` now supports the `method` parameter, which can be used to specify the replacement method when `to_replace` is a scalar, list or tuple and `value` is `None` ([GH19632](#))
- `Timestamp.month_name()`, `DatetimeIndex.month_name()`, and `Series.dt.month_name()` are now available ([GH12805](#))
- `Timestamp.day_name()` and `DatetimeIndex.day_name()` are now available to return day names with a specified locale ([GH12806](#))

- `DataFrame.to_sql()` now performs a multi-value insert if the underlying connection supports it rather than inserting row by row. SQLAlchemy dialects supporting multi-value inserts include: `mysql`, `postgresql`, `sqlite` and any dialect with `supports_multivalues_insert`. (GH14315, GH8953)
- `read_html()` now accepts a `displayed_only` keyword argument to controls whether or not hidden elements are parsed (True by default) (GH20027)
- `read_html()` now reads all `<tbody>` elements in a `<table>`, not just the first. (GH20690)
- `quantile()` and `quantile()` now accept the `interpolation` keyword, `linear` by default (GH20497)
- zip compression is supported via `compression=zip` in `DataFrame.to_pickle()`, `Series.to_pickle()`, `DataFrame.to_csv()`, `Series.to_csv()`, `DataFrame.to_json()`, `Series.to_json()`. (GH17778)
- `WeekOfMonth` constructor now supports `n=0` (GH20517).
- `DataFrame` and `Series` now support matrix multiplication (`@`) operator (GH10259) for Python  $\geq 3.5$
- Updated `DataFrame.to_gbq()` and `pandas.read_gbq()` signature and documentation to reflect changes from the Pandas-GBQ library version 0.4.0. Adds intersphinx mapping to Pandas-GBQ library. (GH20564)
- Added new writer for exporting Stata dta files in version 117, `StataWriter117`. This format supports exporting strings with lengths up to 2,000,000 characters (GH16450)
- `to_hdf()` and `read_hdf()` now accept an `errors` keyword argument to control encoding error handling (GH20835)
- `cut()` has gained the `duplicates='raise'|'drop'` option to control whether to raise on duplicated edges (GH20947)
- `date_range()`, `timedelta_range()`, and `interval_range()` now return a linearly spaced index if start, stop, and periods are specified, but `freq` is not. (GH20808, GH20983, GH20976)

### 39.2.5.2 Backwards incompatible API changes

#### Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15184). If installed, we now require:

| Package         | Minimum Version | Required | Issue   |
|-----------------|-----------------|----------|---------|
| python-dateutil | 2.5.0           | X        | GH15184 |
| openpyxl        | 2.4.0           |          | GH15184 |
| beautifulsoup4  | 4.2.1           |          | GH20082 |
| setuptools      | 24.2.0          |          | GH20698 |

#### Instantiation from dicts preserves dict insertion order for python 3.6+

Until Python 3.6, dicts in Python had no formally defined ordering. For Python version 3.6 and later, dicts are ordered by insertion order, see [PEP 468](#). Pandas will use the dict's insertion order, when creating a `Series` or `DataFrame` from a dict and you're using Python version 3.6 or higher. (GH19884)

Previous Behavior (and current behavior if on Python  $< 3.6$ ):

```
In [16]: pd.Series({'Income': 2000,
.....: 'Expenses': -1500,
.....: 'Taxes': -200,
.....: 'Net result': 300})
Out[16]:
Expenses -1500
Income 2000
Net result 300
Taxes -200
dtype: int64
```

Note the Series above is ordered alphabetically by the index values.

New Behavior (for Python >= 3.6):

```
In [74]: pd.Series({'Income': 2000,
.....: 'Expenses': -1500,
.....: 'Taxes': -200,
.....: 'Net result': 300})
Out[74]:
Income 2000
Expenses -1500
Taxes -200
Net result 300
Length: 4, dtype: int64
```

Notice that the Series is now ordered by insertion order. This new behavior is used for all relevant pandas types (Series, DataFrame, SparseSeries and SparseDataFrame).

If you wish to retain the old behavior while using Python >= 3.6, you can use `.sort_index()`:

```
In [75]: pd.Series({'Income': 2000,
.....: 'Expenses': -1500,
.....: 'Taxes': -200,
.....: 'Net result': 300}).sort_index()
Out[75]:
Expenses -1500
Income 2000
Net result 300
Taxes -200
Length: 4, dtype: int64
```

## Deprecate Panel

Panel was deprecated in the 0.20.x release, showing as a DeprecationWarning. Using Panel will now show a FutureWarning. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the `to_frame()` or with the `xarray` package. Pandas provides a `to_xarray()` method to automate this conversion. For more details see *Deprecate Panel* documentation. (GH13563, GH18324).

```
In [76]: p = tm.makePanel()

In [77]: p
Out[77]:
<class 'pandas.core.panel.Panel'>
```

(continues on next page)

(continued from previous page)

```

Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

```

### Convert to a MultiIndex DataFrame

```

In [78]: p.to_frame()
Out[78]:

```

|            |   | ItemA     | ItemB     | ItemC     |
|------------|---|-----------|-----------|-----------|
| 2000-01-03 | A | -0.409604 | 1.371185  | -1.095589 |
|            | B | 1.076045  | -1.346637 | -0.377504 |
|            | C | -0.451413 | 0.445577  | -1.936376 |
|            | D | -0.999309 | -0.330555 | 0.037808  |
| 2000-01-04 | A | 0.440858  | -0.284146 | 0.387726  |
|            | B | 0.629678  | 0.661782  | 0.095996  |
|            | C | 2.655036  | -0.622633 | -1.461017 |
|            | D | -1.079676 | -1.419931 | 0.312835  |
| 2000-01-05 | A | 0.193610  | 0.394989  | -0.134737 |
|            | B | -0.412755 | 2.264537  | 0.040468  |
|            | C | -2.374863 | 0.317713  | 0.389994  |
|            | D | -1.007056 | 0.373832  | 0.092595  |

```

[12 rows x 3 columns]

```

### Convert to an xarray DataArray

```

In [79]: p.to_xarray()
Out[79]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
array([[-0.409604, 1.076045, -0.451413, -0.999309],
 [0.440858, 0.629678, 2.655036, -1.079676],
 [0.19361 , -0.412755, -2.374863, -1.007056]],

 [[1.371185, -1.346637, 0.445577, -0.330555],
 [-0.284146, 0.661782, -0.622633, -1.419931],
 [0.394989, 2.264537, 0.317713, 0.373832]],

 [[-1.095589, -0.377504, -1.936376, 0.037808],
 [0.387726, 0.095996, -1.461017, 0.312835],
 [-0.134737, 0.040468, 0.389994, 0.092595]])
Coordinates:
 * items (items) object 'ItemA' 'ItemB' 'ItemC'
 * major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
 * minor_axis (minor_axis) object 'A' 'B' 'C' 'D'

```

## pandas.core.common removals

The following error & warning messages are removed from `pandas.core.common` ([GH13634](#), [GH19769](#)):

- PerformanceWarning
- UnsupportedFunctionCall
- UnsortedIndexError

- `AbstractMethodError`

These are available from import from `pandas.errors` (since 0.19.0).

### Changes to make output of `DataFrame.apply` consistent

`DataFrame.apply()` was inconsistent when applying an arbitrary user-defined-function that returned a list-like with `axis=1`. Several bugs and inconsistencies are resolved. If the applied function returns a `Series`, then pandas will return a `DataFrame`; otherwise a `Series` will be returned, this includes the case where a list-like (e.g. `tuple` or `list` is returned) ([GH16353](#), [GH17437](#), [GH17970](#), [GH17348](#), [GH17892](#), [GH18573](#), [GH17602](#), [GH18775](#), [GH18901](#), [GH18919](#)).

```
In [80]: df = pd.DataFrame(np.tile(np.arange(3), 6).reshape(6, -1) + 1,
.....: columns=['A', 'B', 'C'])
.....:

In [81]: df
Out[81]:
 A B C
0 1 2 3
1 1 2 3
2 1 2 3
3 1 2 3
4 1 2 3
5 1 2 3

[6 rows x 3 columns]
```

Previous Behavior: if the returned shape happened to match the length of original columns, this would return a `DataFrame`. If the return shape did not match, a `Series` with lists was returned.

```
In [3]: df.apply(lambda x: [1, 2, 3], axis=1)
Out[3]:
 A B C
0 1 2 3
1 1 2 3
2 1 2 3
3 1 2 3
4 1 2 3
5 1 2 3

In [4]: df.apply(lambda x: [1, 2], axis=1)
Out[4]:
0 [1, 2]
1 [1, 2]
2 [1, 2]
3 [1, 2]
4 [1, 2]
5 [1, 2]
dtype: object
```

New Behavior: When the applied function returns a list-like, this will now *always* return a `Series`.

```
In [82]: df.apply(lambda x: [1, 2, 3], axis=1)
Out[82]:
0 [1, 2, 3]
```

(continues on next page)

(continued from previous page)

```
1 [1, 2, 3]
2 [1, 2, 3]
3 [1, 2, 3]
4 [1, 2, 3]
5 [1, 2, 3]
Length: 6, dtype: object
```

```
In [83]: df.apply(lambda x: [1, 2], axis=1)
```

```
0 [1, 2]
1 [1, 2]
2 [1, 2]
3 [1, 2]
4 [1, 2]
5 [1, 2]
Length: 6, dtype: object
```

To have expanded columns, you can use `result_type='expand'`

```
In [84]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='expand')
```

Out [84] :

|   | 0 | 1 | 2 |
|---|---|---|---|
| 0 | 1 | 2 | 3 |
| 1 | 1 | 2 | 3 |
| 2 | 1 | 2 | 3 |
| 3 | 1 | 2 | 3 |
| 4 | 1 | 2 | 3 |
| 5 | 1 | 2 | 3 |

```
[6 rows x 3 columns]
```

To broadcast the result across the original columns (the old behaviour for list-likes of the correct length), you can use `result_type='broadcast'`. The shape must match the original columns.

```
In [85]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='broadcast')
```

Out [85] :

|   | A | B | C |
|---|---|---|---|
| 0 | 1 | 2 | 3 |
| 1 | 1 | 2 | 3 |
| 2 | 1 | 2 | 3 |
| 3 | 1 | 2 | 3 |
| 4 | 1 | 2 | 3 |
| 5 | 1 | 2 | 3 |

```
[6 rows x 3 columns]
```

Returning a `Series` allows one to control the exact return structure and column names:

```
In [86]: df.apply(lambda x: pd.Series([1, 2, 3], index=['D', 'E', 'F']), axis=1)
```

Out [86] :

|   | D | E | F |
|---|---|---|---|
| 0 | 1 | 2 | 3 |
| 1 | 1 | 2 | 3 |
| 2 | 1 | 2 | 3 |
| 3 | 1 | 2 | 3 |

(continues on next page)

(continued from previous page)

```
4 1 2 3
5 1 2 3

[6 rows x 3 columns]
```

## Concatenation will no longer sort

In a future version of pandas `pandas.concat()` will no longer sort the non-concatenation axis when it is not already aligned. The current behavior is the same as the previous (sorting), but now a warning is issued when `sort` is not specified and the non-concatenation axis is not aligned ([GH4588](#)).

```
In [87]: df1 = pd.DataFrame({"a": [1, 2], "b": [1, 2]}, columns=['b', 'a'])

In [88]: df2 = pd.DataFrame({"a": [4, 5]})

In [89]: pd.concat([df1, df2])
Out[89]:
 a b
0 1 1.0
1 2 2.0
0 4 NaN
1 5 NaN

[4 rows x 2 columns]
```

To keep the previous behavior (sorting) and silence the warning, pass `sort=True`

```
In [90]: pd.concat([df1, df2], sort=True)
Out[90]:
 a b
0 1 1.0
1 2 2.0
0 4 NaN
1 5 NaN

[4 rows x 2 columns]
```

To accept the future behavior (no sorting), pass `sort=False`

Note that this change also applies to `DataFrame.append()`, which has also received a `sort` keyword for controlling this behavior.

## Build Changes

- Building pandas for development now requires `cython >= 0.24` ([GH18613](#))
- Building from source now explicitly requires `setuptools` in `setup.py` ([GH18113](#))
- Updated conda recipe to be in compliance with conda-build 3.0+ ([GH18002](#))

## Index Division By Zero Fills Correctly

Division operations on `Index` and subclasses will now fill division of positive numbers by zero with `np.inf`, division of negative numbers by zero with `-np.inf` and `0 / 0` with `np.nan`. This matches existing `Series` behavior.

(continued from previous page)

```
In [2]: extracted = s.str.extract(r'.*(\d\d).*')
```

```
In [3]: extracted
```

Out [3]:

|   |    |
|---|----|
| 0 | 10 |
|---|----|

|   |    |
|---|----|
| 1 | 12 |
|---|----|

```
dtype: object
```

```
In [4]: type(extracted)
```

Out [4]:

pandas.core.series.Series

**New Behavior:**

```
In [97]: s = pd.Series(['number 10', '12 eggs'])
```

```
In [98]: extracted = s.str.extract(r'.*(\d\d).*')
```

In [99]: extracted

Out [99] :

0

|   |    |
|---|----|
| 0 | 10 |
|---|----|

|   |    |
|---|----|
| 1 | 12 |
|---|----|

```
[2 rows x 1 columns]
```

```
In [100]: type(extracted)
```

```
Out[100]: pandas.core.frame.
```

→ DataFrame

To restore previous behavior, simply set `expand` to `False`:

```
In [101]: s = pd.Series(['number 10', '12 eggs'])
```

```
In [102]: extracted = s.str.extract(r'.*(\d\d).*', expand=False)
```

```
In [103]: extracted
```

Out [103] :

|   |    |
|---|----|
| 0 | 10 |
|---|----|

|   |    |
|---|----|
| 1 | 12 |
|---|----|

```
Length: 2, dtype: object
```

```
In [104]: type(extracted)
```

```
Out[104]: pandas.core.series.
```

→ Series

### Default value for the ordered parameter of CategoricalDtype

The default value of the `ordered` parameter for `CategoricalDtype` has changed from `False` to `None` to allow updating of categories without impacting `ordered`. Behavior should remain consistent for downstream objects, such as `Categorical` (GH18790)

In previous versions, the default value for the `ordered` parameter was `False`. This could potentially lead to the `ordered` parameter unintentionally being changed from `True` to `False` when users attempt to update categories if `ordered` is not explicitly specified, as it would silently default to `False`. The new behavior

for `ordered=None` is to retain the existing value of `ordered`.

New Behavior:

```
In [105]: from pandas.api.types import CategoricalDtype

In [106]: cat = pd.Categorical(list('abcaba'), ordered=True, categories=list('cba'))

In [107]: cat
Out[107]:
[a, b, c, a, b, a]
Categories (3, object): [c < b < a]

In [108]: cdt = CategoricalDtype(categories=list('cbad'))

In [109]: cat.astype(cdt)
Out[109]:
[a, b, c, a, b, a]
Categories (4, object): [c < b < a < d]
```

Notice in the example above that the converted `Categorical` has retained `ordered=True`. Had the default value for `ordered` remained as `False`, the converted `Categorical` would have become `unordered`, despite `ordered=False` never being explicitly specified. To change the value of `ordered`, explicitly pass it to the new dtype, e.g. `CategoricalDtype(categories=list('cbad'), ordered=False)`.

Note that the unintentional conversion of `ordered` discussed above did not arise in previous versions due to separate bugs that prevented `astype` from doing any type of category to category conversion ([GH10696](#), [GH18593](#)). These bugs have been fixed in this release, and motivated changing the default value of `ordered`.

## Better pretty-printing of DataFrames in a terminal

Previously, the default value for the maximum number of columns was `pd.options.display.max_columns=20`. This meant that relatively wide data frames would not fit within the terminal width, and pandas would introduce line breaks to display these 20 columns. This resulted in an output that was relatively difficult to read:

```
Terminal

[In [1]: import pandas as pd

[In [2]: import numpy as np

[In [3]: pd.DataFrame(np.random.rand(5, 10))
Out[3]:
```

|   | 0        | 1        | 2        | 3        | 4        | 5        | 6        | 7        | 8        | 9        |
|---|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| 0 | 0.146401 | 0.933153 | 0.577028 | 0.617467 | 0.195179 | 0.929250 | 0.603845 | 0.004801 | 0.659965 | 0.989170 |
| 1 | 0.670827 | 0.885104 | 0.152909 | 0.028042 | 0.016283 | 0.843786 | 0.824537 | 0.517137 | 0.673154 | 0.829435 |
| 2 | 0.261850 | 0.370457 | 0.281256 | 0.461355 | 0.094714 | 0.763125 | 0.086964 | 0.154479 | 0.463588 | 0.252917 |
| 3 | 0.789373 | 0.357872 | 0.894594 | 0.434197 | 0.266116 | 0.061527 | 0.375119 | 0.266601 | 0.146791 | 0.776635 |
| 4 | 0.256396 | 0.407358 | 0.740593 | 0.820019 | 0.962911 | 0.647236 | 0.323111 | 0.607805 | 0.209150 | 0.374892 |

```
In [4]: █
```

If Python runs in a terminal, the maximum number of columns is now determined automatically so that the printed data frame fits within the current terminal width (`pd.options.display.max_columns=0`) ([GH17023](#)). If Python runs as a Jupyter kernel (such as the Jupyter QtConsole or a Jupyter notebook, as well as in many IDEs), this value cannot be inferred automatically and is thus set to 20 as in previous versions. In a terminal, this results in a much nicer output:

A terminal window titled "Terminal" with a standard macOS-style title bar (red, yellow, green buttons). It shows a Jupyter Notebook-style prompt with three input lines and one output line. The output line displays a DataFrame with 5 rows and 10 columns of random float values. The columns are indexed 0 through 9, with an ellipsis between column 3 and column 6. The rows are indexed 0 through 4. Below the DataFrame, it says "[5 rows x 10 columns]". The prompt for the fourth input line is visible at the bottom.

```
[In [1]: import pandas as pd

[In [2]: import numpy as np

[In [3]: pd.DataFrame(np.random.rand(5, 10))
Out[3]:
```

|   | 0        | 1        | 2        | 3        | ... | 6        | 7        | 8        | 9        |
|---|----------|----------|----------|----------|-----|----------|----------|----------|----------|
| 0 | 0.107275 | 0.394007 | 0.024795 | 0.551991 | ... | 0.689395 | 0.680411 | 0.586967 | 0.293906 |
| 1 | 0.466061 | 0.402324 | 0.430669 | 0.193347 | ... | 0.621158 | 0.756752 | 0.217444 | 0.558097 |
| 2 | 0.910215 | 0.063291 | 0.192110 | 0.012359 | ... | 0.025301 | 0.185118 | 0.820985 | 0.208302 |
| 3 | 0.491853 | 0.612078 | 0.791199 | 0.588150 | ... | 0.841104 | 0.612280 | 0.025687 | 0.443693 |
| 4 | 0.171760 | 0.921853 | 0.063030 | 0.448301 | ... | 0.268901 | 0.292862 | 0.420582 | 0.608949 |

```

[5 rows x 10 columns]

In [4]: █
```

Note that if you don't like the new default, you can always set this option yourself. To revert to the old setting, you can run this line:

```
pd.options.display.max_columns = 20
```

## Datetimelike API Changes

- The default `Timedelta` constructor now accepts an ISO 8601 Duration string as an argument ([GH19040](#))
- Subtracting `NaT` from a Series with `dtype='datetime64[ns]'` returns a Series with `dtype='timedelta64[ns]'` instead of `dtype='datetime64[ns]'` ([GH18808](#))

- Addition or subtraction of NaT from TimedeltaIndex will return TimedeltaIndex instead of DatetimeIndex ([GH19124](#))
- `DatetimeIndex.shift()` and `TimedeltaIndex.shift()` will now raise `NullFrequencyError` (which subclasses `ValueError`, which was raised in older versions) when the index object frequency is `None` ([GH19147](#))
- Addition and subtraction of NaN from a Series with `dtype='timedelta64[ns]'` will raise a `TypeError` instead of treating the NaN as NaT ([GH19274](#))
- NaT division with `datetime.timedelta` will now return NaN instead of raising ([GH17876](#))
- Operations between a Series with `dtype='datetime64[ns]'` and a `PeriodIndex` will correctly raise `TypeError` ([GH18850](#))
- Subtraction of Series with timezone-aware `dtype='datetime64[ns]'` with mis-matched timezones will raise `TypeError` instead of `ValueError` ([GH18817](#))
- `Timestamp` will no longer silently ignore unused or invalid `tz` or `tzinfo` keyword arguments ([GH17690](#))
- `Timestamp` will no longer silently ignore invalid `freq` arguments ([GH5168](#))
- `CacheableOffset` and `WeekDay` are no longer available in the `pandas.tseries.offsets` module ([GH17830](#))
- `pandas.tseries.frequencies.get_freq_group()` and `pandas.tseries.frequencies.DAYS` are removed from the public API ([GH18034](#))
- `Series.truncate()` and `DataFrame.truncate()` will raise a `ValueError` if the index is not sorted instead of an unhelpful `KeyError` ([GH17935](#))
- `Series.first` and `DataFrame.first` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` ([GH20725](#)).
- `Series.last` and `DataFrame.last` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` ([GH20725](#)).
- `RestrictedDateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. ([GH17176](#), [GH18226](#)).
- `pandas.merge()` provides a more informative error message when trying to merge on timezone-aware and timezone-naive columns ([GH15800](#))
- For `DatetimeIndex` and `TimedeltaIndex` with `freq=None`, addition or subtraction of integer-dtyped array or `Index` will raise `NullFrequencyError` instead of `TypeError` ([GH19895](#))
- `Timestamp` constructor now accepts a `nanosecond` keyword or positional argument ([GH18898](#))
- `DatetimeIndex` will now raise an `AttributeError` when the `tz` attribute is set after instantiation ([GH3746](#))
- `DatetimeIndex` with a `pytz` timezone will now return a consistent `pytz` timezone ([GH18595](#))

## Other API Changes

- `Series.astype()` and `Index.astype()` with an incompatible dtype will now raise a `TypeError` rather than a `ValueError` ([GH18231](#))
- Series construction with an object dtyped tz-aware datetime and `dtype=object` specified, will now return an object dtyped Series, previously this would infer the datetime dtype ([GH18231](#))

- A Series of dtype=category constructed from an empty dict will now have categories of dtype=object rather than dtype=float64, consistently with the case in which an empty list is passed (GH18515)
- All-NaN levels in a MultiIndex are now assigned float rather than object dtype, promoting consistency with Index (GH17929).
- Levels names of a MultiIndex (when not None) are now required to be unique: trying to create a MultiIndex with repeated names will raise a ValueError (GH18872)
- Both construction and renaming of Index/MultiIndex with non-hashable name/names will now raise TypeError (GH20527)
- Index.map() can now accept Series and dictionary input objects (GH12756, GH18482, GH18509).
- DataFrame.unstack() will now default to filling with np.nan for object columns. (GH12815)
- IntervalIndex constructor will raise if the closed parameter conflicts with how the input data is inferred to be closed (GH18421)
- Inserting missing values into indexes will work for all types of indexes and automatically insert the correct type of missing value (NaN, NaT, etc.) regardless of the type passed in (GH18295)
- When created with duplicate labels, MultiIndex now raises a ValueError. (GH17464)
- Series.fillna() now raises a TypeError instead of a ValueError when passed a list, tuple or DataFrame as a value (GH18293)
- pandas.DataFrame.merge() no longer casts a float column to object when merging on int and float columns (GH16572)
- pandas.merge() now raises a ValueError when trying to merge on incompatible data types (GH9780)
- The default NA value for UInt64Index has changed from 0 to NaN, which impacts methods that mask with NA, such as UInt64Index.where() (GH18398)
- Refactored setup.py to use find\_packages instead of explicitly listing out all subpackages (GH18535)
- Rearranged the order of keyword arguments in read\_excel() to align with read\_csv() (GH16672)
- wide\_to\_long() previously kept numeric-like suffixes as object dtype. Now they are cast to numeric if possible (GH17627)
- In read\_excel(), the comment argument is now exposed as a named parameter (GH18735)
- Rearranged the order of keyword arguments in read\_excel() to align with read\_csv() (GH16672)
- The options html.border and mode.use\_inf\_as\_null were deprecated in prior versions, these will now show FutureWarning rather than a DeprecationWarning (GH19003)
- IntervalIndex and IntervalDtype no longer support categorical, object, and string subtypes (GH19016)
- IntervalDtype now returns True when compared against 'interval' regardless of subtype, and IntervalDtype.name now returns 'interval' regardless of subtype (GH18980)
- KeyError now raises instead of ValueError in drop(), drop(), drop(), drop() when dropping a non-existent element in an axis with duplicates (GH19186)
- Series.to\_csv() now accepts a compression argument that works in the same way as the compression argument in DataFrame.to\_csv() (GH18958)
- Set operations (union, difference...) on IntervalIndex with incompatible index types will now raise a TypeError rather than a ValueError (GH19329)

- `DateOffset` objects render more simply, e.g. `<DateOffset: days=1>` instead of `<DateOffset: kwds={'days': 1}>` (GH19403)
- `Categorical.fillna` now validates its value and method keyword arguments. It now raises when both or none are specified, matching the behavior of `Series.fillna()` (GH19682)
- `pd.to_datetime('today')` now returns a `datetime`, consistent with `pd.Timestamp('today')`; previously `pd.to_datetime('today')` returned a `.normalized()` `datetime` (GH19935)
- `Series.str.replace()` now takes an optional *regex* keyword which, when set to `False`, uses literal string replacement rather than regex replacement (GH16808)
- `DatetimeIndex.strftime()` and `PeriodIndex.strftime()` now return an `Index` instead of a `numpy` array to be consistent with similar accessors (GH20127)
- Constructing a `Series` from a list of length 1 no longer broadcasts this list when a longer index is specified (GH19714, GH20391).
- `DataFrame.to_dict()` with `orient='index'` no longer casts `int` columns to `float` for a `DataFrame` with only `int` and `float` columns (GH18580)
- A user-defined-function that is passed to `Series.rolling().aggregate()`, `DataFrame.rolling().aggregate()`, or its expanding cousins, will now *always* be passed a `Series`, rather than a `np.array`; `.apply()` only has the `raw` keyword, see *here*. This is consistent with the signatures of `.aggregate()` across `pandas` (GH20584)
- Rolling and Expanding types raise `NotImplementedError` upon iteration (GH11704).

### 39.2.5.3 Deprecations

- `Series.from_array` and `SparseSeries.from_array` are deprecated. Use the normal constructor `Series(...)` and `SparseSeries(...)` instead (GH18213).
- `DataFrame.as_matrix` is deprecated. Use `DataFrame.values` instead (GH18458).
- `Series.asobject`, `DatetimeIndex.asobject`, `PeriodIndex.asobject` and `TimeDeltaIndex.asobject` have been deprecated. Use `.astype(object)` instead (GH18572)
- Grouping by a tuple of keys now emits a `FutureWarning` and is deprecated. In the future, a tuple passed to `'by'` will always refer to a single key that is the actual tuple, instead of treating the tuple as multiple keys. To retain the previous behavior, use a list instead of a tuple (GH18314)
- `Series.valid` is deprecated. Use `Series.dropna()` instead (GH18800).
- `read_excel()` has deprecated the `skip_footer` parameter. Use `skipfooter` instead (GH18836)
- `ExcelFile.parse()` has deprecated `sheetname` in favor of `sheet_name` for consistency with `read_excel()` (GH20920).
- The `is_copy` attribute is deprecated and will be removed in a future version (GH18801).
- `IntervalIndex.from_intervals` is deprecated in favor of the `IntervalIndex` constructor (GH19263)
- `DataFrame.from_items` is deprecated. Use `DataFrame.from_dict()` instead, or `DataFrame.from_dict(OrderedDict())` if you wish to preserve the key order (GH17320, GH17312)
- Indexing a `MultiIndex` or a `FloatIndex` with a list containing some missing keys will now show a `FutureWarning`, which is consistent with other types of indexes (GH17758).
- The `broadcast` parameter of `.apply()` is deprecated in favor of `result_type='broadcast'` (GH18577)

- The `reduce` parameter of `.apply()` is deprecated in favor of `result_type='reduce'` (GH18577)
- The `order` parameter of `factorize()` is deprecated and will be removed in a future release (GH19727)
- `Timestamp.weekday_name`, `DatetimeIndex.weekday_name`, and `Series.dt.weekday_name` are deprecated in favor of `Timestamp.day_name()`, `DatetimeIndex.day_name()`, and `Series.dt.day_name()` (GH12806)
- `pandas.tseries.plotting.tsplot` is deprecated. Use `Series.plot()` instead (GH18627)
- `Index.summary()` is deprecated and will be removed in a future version (GH18217)
- `NDFrame.get_ftype_counts()` is deprecated and will be removed in a future version (GH18243)
- The `convert_datetime64` parameter in `DataFrame.to_records()` has been deprecated and will be removed in a future version. The NumPy bug motivating this parameter has been resolved. The default value for this parameter has also changed from `True` to `None` (GH18160).
- `Series.rolling().apply()`, `DataFrame.rolling().apply()`, `Series.expanding().apply()`, and `DataFrame.expanding().apply()` have deprecated passing an `np.array` by default. One will need to pass the new `raw` parameter to be explicit about what is passed (GH20584)
- The `data`, `base`, `strides`, `flags` and `itemsize` properties of the `Series` and `Index` classes have been deprecated and will be removed in a future version (GH20419).
- `DatetimeIndex.offset` is deprecated. Use `DatetimeIndex.freq` instead (GH20716)
- Floor division between an integer ndarray and a `Timedelta` is deprecated. Divide by `Timedelta.value` instead (GH19761)
- Setting `PeriodIndex.freq` (which was not guaranteed to work correctly) is deprecated. Use `PeriodIndex.asfreq()` instead (GH20678)
- `Index.get_duplicates()` is deprecated and will be removed in a future version (GH20239)
- The previous default behavior of negative indices in `Categorical.take` is deprecated. In a future version it will change from meaning missing values to meaning positional indices from the right. The future behavior is consistent with `Series.take()` (GH20664).
- Passing multiple axes to the `axis` parameter in `DataFrame.dropna()` has been deprecated and will be removed in a future version (GH20987)

#### 39.2.5.4 Removal of prior version deprecations/changes

- Warnings against the obsolete usage `Categorical(codes, categories)`, which were emitted for instance when the first two arguments to `Categorical()` had different dtypes, and recommended the use of `Categorical.from_codes`, have now been removed (GH8074)
- The `levels` and `labels` attributes of a `MultiIndex` can no longer be set directly (GH4039).
- `pd.tseries.util.pivot_annual` has been removed (deprecated since v0.19). Use `pivot_table` instead (GH18370)
- `pd.tseries.util.isleapyear` has been removed (deprecated since v0.19). Use `.is_leap_year` property in `Datetime`-likes instead (GH18370)
- `pd.ordered_merge` has been removed (deprecated since v0.19). Use `pd.merge_ordered` instead (GH18459)
- The `SparseList` class has been removed (GH14007)
- The `pandas.io.wb` and `pandas.io.data` stub modules have been removed (GH13735)
- `Categorical.from_array` has been removed (GH13854)

- The `freq` and `how` parameters have been removed from the `rolling/expanding/ewm` methods of `DataFrame` and `Series` (deprecated since v0.18). Instead, `resample` before calling the methods. (GH18601 & GH18668)
- `DatetimeIndex.to_datetime`, `Timestamp.to_datetime`, `PeriodIndex.to_datetime`, and `Index.to_datetime` have been removed (GH8254, GH14096, GH14113)
- `read_csv()` has dropped the `skip_footer` parameter (GH13386)
- `read_csv()` has dropped the `as_reccarray` parameter (GH13373)
- `read_csv()` has dropped the `buffer_lines` parameter (GH13360)
- `read_csv()` has dropped the `compact_ints` and `use_unsigned` parameters (GH13323)
- The `Timestamp` class has dropped the `offset` attribute in favor of `freq` (GH13593)
- The `Series`, `Categorical`, and `Index` classes have dropped the `reshape` method (GH13012)
- `pandas.tseries.frequencies.get_standard_freq` has been removed in favor of `pandas.tseries.frequencies.to_offset(freq).rule_code` (GH13874)
- The `freqstr` keyword has been removed from `pandas.tseries.frequencies.to_offset` in favor of `freq` (GH13874)
- The `Panel4D` and `PanelND` classes have been removed (GH13776)
- The `Panel` class has dropped the `to_long` and `toLong` methods (GH19077)
- The options `display.line_with` and `display.height` are removed in favor of `display.width` and `display.max_rows` respectively (GH4391, GH19107)
- The `labels` attribute of the `Categorical` class has been removed in favor of `Categorical.codes` (GH7768)
- The `flavor` parameter have been removed from `func.to_sql` method (GH13611)
- The modules `pandas.tools.hashing` and `pandas.util.hashing` have been removed (GH16223)
- The top-level functions `pd.rolling_*`, `pd.expanding_*` and `pd.ewm*` have been removed (Deprecated since v0.18). Instead, use the `DataFrame/Series` methods `rolling`, `expanding` and `ewm` (GH18723)
- Imports from `pandas.core.common` for functions such as `is_datetime64_dtype` are now removed. These are located in `pandas.api.types`. (GH13634, GH19769)
- The `infer_dst` keyword in `Series.tz_localize()`, `DatetimeIndex.tz_localize()` and `DatetimeIndex` have been removed. `infer_dst=True` is equivalent to `ambiguous='infer'`, and `infer_dst=False` to `ambiguous='raise'` (GH7963).
- When `.resample()` was changed from an eager to a lazy operation, like `.groupby()` in v0.18.0, we put in place compatibility (with a `FutureWarning`), so operations would continue to work. This is now fully removed, so a `Resampler` will no longer forward compat operations (GH20554)
- Remove long deprecated `axis=None` parameter from `.replace()` (GH20271)

### 39.2.5.5 Performance Improvements

- Indexers on `Series` or `DataFrame` no longer create a reference cycle (GH17956)
- Added a keyword argument, `cache`, to `to_datetime()` that improved the performance of converting duplicate datetime arguments (GH11665)
- `DateOffset` arithmetic performance is improved (GH18218)

- Converting a `Series` of `Timedelta` objects to days, seconds, etc... sped up through vectorization of underlying methods ([GH18092](#))
- Improved performance of `.map()` with a `Series`/dict input ([GH15081](#))
- The overridden `Timedelta` properties of days, seconds and microseconds have been removed, leveraging their built-in Python versions instead ([GH18242](#))
- `Series` construction will reduce the number of copies made of the input data in certain cases ([GH17449](#))
- Improved performance of `Series.dt.date()` and `DatetimeIndex.date()` ([GH18058](#))
- Improved performance of `Series.dt.time()` and `DatetimeIndex.time()` ([GH18461](#))
- Improved performance of `IntervalIndex.symmetric_difference()` ([GH18475](#))
- Improved performance of `DatetimeIndex` and `Series` arithmetic operations with `Business-Month` and `Business-Quarter` frequencies ([GH18489](#))
- `Series()` / `DataFrame()` tab completion limits to 100 values, for better performance. ([GH18587](#))
- Improved performance of `DataFrame.median()` with `axis=1` when `bottleneck` is not installed ([GH16468](#))
- Improved performance of `MultiIndex.get_loc()` for large indexes, at the cost of a reduction in performance for small ones ([GH18519](#))
- Improved performance of `MultiIndex.remove_unused_levels()` when there are no unused levels, at the cost of a reduction in performance when there are ([GH19289](#))
- Improved performance of `Index.get_loc()` for non-unique indexes ([GH19478](#))
- Improved performance of pairwise `.rolling()` and `.expanding()` with `.cov()` and `.corr()` operations ([GH17917](#))
- Improved performance of `pandas.core.groupby.GroupBy.rank()` ([GH15779](#))
- Improved performance of variable `.rolling()` on `.min()` and `.max()` ([GH19521](#))
- Improved performance of `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` ([GH11296](#))
- Improved performance of `pandas.core.groupby.GroupBy.any()` and `pandas.core.groupby.GroupBy.all()` ([GH15435](#))
- Improved performance of `pandas.core.groupby.GroupBy.pct_change()` ([GH19165](#))
- Improved performance of `Series.isin()` in the case of categorical dtypes ([GH20003](#))
- Improved performance of `getattr(Series, attr)` when the `Series` has certain index types. This manifested in slow printing of large `Series` with a `DatetimeIndex` ([GH19764](#))
- Fixed a performance regression for `GroupBy.nth()` and `GroupBy.last()` with some object columns ([GH19283](#))
- Improved performance of `pandas.core.arrays.Categorical.from_codes()` ([GH18501](#))

### 39.2.5.6 Documentation Changes

Thanks to all of the contributors who participated in the Pandas Documentation Sprint, which took place on March 10th. We had about 500 participants from over 30 locations across the world. You should notice that many of the *API docstrings* have greatly improved.

There were too many simultaneous contributions to include a release note for each improvement, but this [GitHub search](#) should give you an idea of how many docstrings were improved.

Special thanks to [Marc Garcia](#) for organizing the sprint. For more information, read the [NumFOCUS blogpost](#) recapping the sprint.

- Changed spelling of “numpy” to “NumPy”, and “python” to “Python”. ([GH19017](#))
- Consistency when introducing code samples, using either colon or period. Rewrote some sentences for greater clarity, added more dynamic references to functions, methods and classes. ([GH18941](#), [GH18948](#), [GH18973](#), [GH19017](#))
- Added a reference to `DataFrame.assign()` in the concatenate section of the merging documentation ([GH18665](#))

### 39.2.5.7 Bug Fixes

#### Categorical

**Warning:** A class of bugs were introduced in pandas 0.21 with `CategoricalDtype` that affects the correctness of operations like `merge`, `concat`, and indexing when comparing multiple unordered `Categorical` arrays that have the same categories, but in a different order. We highly recommend upgrading or manually aligning your categories before doing these operations.

- Bug in `Categorical.equals` returning the wrong result when comparing two unordered `Categorical` arrays with the same categories, but in a different order ([GH16603](#))
- Bug in `pandas.api.types.union_categoricals()` returning the wrong result when for unordered categoricals with the categories in a different order. This affected `pandas.concat()` with `Categorical` data ([GH19096](#)).
- Bug in `pandas.merge()` returning the wrong result when joining on an unordered `Categorical` that had the same categories but in a different order ([GH19551](#))
- Bug in `CategoricalIndex.get_indexer()` returning the wrong result when `target` was an unordered `Categorical` that had the same categories as `self` but in a different order ([GH19551](#))
- Bug in `Index.astype()` with a categorical dtype where the resultant index is not converted to a `CategoricalIndex` for all types of index ([GH18630](#))
- Bug in `Series.astype()` and `Categorical.astype()` where an existing categorical data does not get updated ([GH10696](#), [GH18593](#))
- Bug in `Series.str.split()` with `expand=True` incorrectly raising an `IndexError` on empty strings ([GH20002](#)).
- Bug in `Index` constructor with `dtype=CategoricalDtype(...)` where categories and ordered are not maintained ([GH19032](#))
- Bug in `Series` constructor with scalar and `dtype=CategoricalDtype(...)` where categories and ordered are not maintained ([GH19565](#))
- Bug in `Categorical.__iter__` not converting to Python types ([GH19909](#))
- Bug in `pandas.factorize()` returning the unique codes for the uniques. This now returns a `Categorical` with the same dtype as the input ([GH19721](#))
- Bug in `pandas.factorize()` including an item for missing values in the uniques return value ([GH19721](#))
- Bug in `Series.take()` with categorical data interpreting `-1` in *indices* as missing value markers, rather than the last element of the `Series` ([GH20664](#))

## Datetimelike

- Bug in `Series.__sub__()` subtracting a non-nanosecond `np.datetime64` object from a `Series` gave incorrect results ([GH7996](#))
- Bug in `DatetimeIndex`, `TimedeltaIndex` addition and subtraction of zero-dimensional integer arrays gave incorrect results ([GH19012](#))
- Bug in `DatetimeIndex` and `TimedeltaIndex` where adding or subtracting an array-like of `DateOffset` objects either raised (`np.array`, `pd.Index`) or broadcast incorrectly (`pd.Series`) ([GH18849](#))
- Bug in `Series.__add__()` adding `Series` with `dtype timedelta64[ns]` to a timezone-aware `DatetimeIndex` incorrectly dropped timezone information ([GH13905](#))
- Adding a `Period` object to a `datetime` or `Timestamp` object will now correctly raise a `TypeError` ([GH17983](#))
- Bug in `Timestamp` where comparison with an array of `Timestamp` objects would result in a `RecursionError` ([GH15183](#))
- Bug in `Series` floor-division where operating on a scalar `timedelta` raises an exception ([GH18846](#))
- Bug in `DatetimeIndex` where the repr was not showing high-precision time values at the end of a day (e.g., `23:59:59.999999999`) ([GH19030](#))
- Bug in `.astype()` to non-ns `timedelta` units would hold the incorrect `dtype` ([GH19176](#), [GH19223](#), [GH12425](#))
- Bug in subtracting `Series` from `NaT` incorrectly returning `NaT` ([GH19158](#))
- Bug in `Series.truncate()` which raises `TypeError` with a monotonic `PeriodIndex` ([GH17717](#))
- Bug in `pct_change()` using periods and `freq` returned different length outputs ([GH7292](#))
- Bug in comparison of `DatetimeIndex` against `None` or `datetime.date` objects raising `TypeError` for `==` and `!=` comparisons instead of all-`False` and all-`True`, respectively ([GH19301](#))
- Bug in `Timestamp` and `to_datetime()` where a string representing a barely out-of-bounds timestamp would be incorrectly rounded down instead of raising `OutOfBoundsDatetime` ([GH19382](#))
- Bug in `Timestamp.floor()` `DatetimeIndex.floor()` where time stamps far in the future and past were not rounded correctly ([GH19206](#))
- Bug in `to_datetime()` where passing an out-of-bounds `datetime` with `errors='coerce'` and `utc=True` would raise `OutOfBoundsDatetime` instead of parsing to `NaT` ([GH19612](#))
- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where name of the returned object was not always set consistently. ([GH19744](#))
- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where operations with numpy arrays raised `TypeError` ([GH19847](#))
- Bug in `DatetimeIndex` and `TimedeltaIndex` where setting the `freq` attribute was not fully supported ([GH20678](#))

## Timedelta

- Bug in `Timedelta.__mul__()` where multiplying by `NaT` returned `NaT` instead of raising a `TypeError` ([GH19819](#))
- Bug in `Series` with `dtype='timedelta64[ns]'` where addition or subtraction of `TimedeltaIndex` had results cast to `dtype='int64'` ([GH17250](#))

- Bug in Series with dtype='timedelta64[ns]' where addition or subtraction of TimedeltaIndex could return a Series with an incorrect name ([GH19043](#))
- Bug in Timedelta.\_\_floordiv\_\_() and Timedelta.\_\_rfloordiv\_\_() dividing by many incompatible numpy objects was incorrectly allowed ([GH18846](#))
- Bug where dividing a scalar timedelta-like object with TimedeltaIndex performed the reciprocal operation ([GH19125](#))
- Bug in TimedeltaIndex where division by a Series would return a TimedeltaIndex instead of a Series ([GH19042](#))
- Bug in Timedelta.\_\_add\_\_(), Timedelta.\_\_sub\_\_() where adding or subtracting a np.timedelta64 object would return another np.timedelta64 instead of a Timedelta ([GH19738](#))
- Bug in Timedelta.\_\_floordiv\_\_(), Timedelta.\_\_rfloordiv\_\_() where operating with a Tick object would raise a TypeError instead of returning a numeric value ([GH19738](#))
- Bug in Period.asfreq() where periods near datetime(1, 1, 1) could be converted incorrectly ([GH19643](#), [GH19834](#))
- Bug in Timedelta.total\_seconds() causing precision errors, for example Timedelta('30S').total\_seconds()==30.000000000000004 ([GH19458](#))
- Bug in Timedelta.\_\_rmod\_\_() where operating with a numpy.timedelta64 returned a timedelta64 object instead of a Timedelta ([GH19820](#))
- Multiplication of TimedeltaIndex by TimedeltaIndex will now raise TypeError instead of raising ValueError in cases of length mis-match ([GH19333](#))
- Bug in indexing a TimedeltaIndex with a np.timedelta64 object which was raising a TypeError ([GH20393](#))

## Timezones

- Bug in creating a Series from an array that contains both tz-naive and tz-aware values will result in a Series whose dtype is tz-aware instead of object ([GH16406](#))
- Bug in comparison of timezone-aware DatetimeIndex against NaT incorrectly raising TypeError ([GH19276](#))
- Bug in DatetimeIndex.astype() when converting between timezone aware dtypes, and converting from timezone aware to naive ([GH18951](#))
- Bug in comparing DatetimeIndex, which failed to raise TypeError when attempting to compare timezone-aware and timezone-naive datetimelike objects ([GH18162](#))
- Bug in localization of a naive, datetime string in a Series constructor with a datetime64[ns, tz] dtype ([GH174151](#))
- Timestamp.replace() will now handle Daylight Savings transitions gracefully ([GH18319](#))
- Bug in tz-aware DatetimeIndex where addition/subtraction with a TimedeltaIndex or array with dtype='timedelta64[ns]' was incorrect ([GH17558](#))
- Bug in DatetimeIndex.insert() where inserting NaT into a timezone-aware index incorrectly raised ([GH16357](#))
- Bug in DataFrame constructor, where tz-aware Datetimeindex and a given column name will result in an empty DataFrame ([GH19157](#))

- Bug in `Timestamp.tz_localize()` where localizing a timestamp near the minimum or maximum valid values could overflow and return a timestamp with an incorrect nanosecond value ([GH12677](#))
- Bug when iterating over `DatetimeIndex` that was localized with fixed timezone offset that rounded nanosecond precision to microseconds ([GH19603](#))
- Bug in `DataFrame.diff()` that raised an `IndexError` with tz-aware values ([GH18578](#))
- Bug in `melt()` that converted tz-aware dtypes to tz-naive ([GH15785](#))
- Bug in `Dataframe.count()` that raised an `ValueError`, if `Dataframe.dropna()` was called for a single column with timezone-aware values. ([GH13407](#))

## Offsets

- Bug in `WeekOfMonth` and `Week` where addition and subtraction did not roll correctly ([GH18510](#), [GH18672](#), [GH18864](#))
- Bug in `WeekOfMonth` and `LastWeekOfMonth` where default keyword arguments for constructor raised `ValueError` ([GH19142](#))
- Bug in `FY5253Quarter`, `LastWeekOfMonth` where rollback and rollforward behavior was inconsistent with addition and subtraction behavior ([GH18854](#))
- Bug in `FY5253` where `datetime` addition and subtraction incremented incorrectly for dates on the year-end but not normalized to midnight ([GH18854](#))
- Bug in `FY5253` where date offsets could incorrectly raise an `AssertionError` in arithmetic operations ([GH14774](#))

## Numeric

- Bug in `Series` constructor with an int or float list where specifying `dtype=str`, `dtype='str'` or `dtype='U'` failed to convert the data elements to strings ([GH16605](#))
- Bug in `Index` multiplication and division methods where operating with a `Series` would return an `Index` object instead of a `Series` object ([GH19042](#))
- Bug in the `DataFrame` constructor in which data containing very large positive or very large negative numbers was causing `OverflowError` ([GH18584](#))
- Bug in `Index` constructor with `dtype='uint64'` where int-like floats were not coerced to `UInt64Index` ([GH18400](#))
- Bug in `DataFrame` flex arithmetic (e.g. `df.add(other, fill_value=foo)`) with a `fill_value` other than `None` failed to raise `NotImplementedError` in corner cases where either the frame or other has length zero ([GH19522](#))
- Multiplication and division of numeric-dtyped `Index` objects with `timedelta`-like scalars returns `TimedeltaIndex` instead of raising `TypeError` ([GH19333](#))
- Bug where `NaN` was returned instead of `0` by `Series.pct_change()` and `DataFrame.pct_change()` when `fill_method` is not `None` ([GH19873](#))

## Strings

- Bug in `Series.str.get()` with a dictionary in the values and the index not in the keys, raising `KeyError` ([GH20671](#))

## Indexing

- Bug in Index construction from list of mixed type tuples ([GH18505](#))
- Bug in Index.drop() when passing a list of both tuples and non-tuples ([GH18304](#))
- Bug in DataFrame.drop(), Panel.drop(), Series.drop(), Index.drop() where no KeyError is raised when dropping a non-existent element from an axis that contains duplicates ([GH19186](#))
- Bug in indexing a datetimelike Index that raised ValueError instead of IndexError ([GH18386](#)).
- Index.to\_series() now accepts index and name kwargs ([GH18699](#))
- DatetimeIndex.to\_series() now accepts index and name kwargs ([GH18699](#))
- Bug in indexing non-scalar value from Series having non-unique Index will return value flattened ([GH17610](#))
- Bug in indexing with iterator containing only missing keys, which raised no error ([GH20748](#))
- Fixed inconsistency in .ix between list and scalar keys when the index has integer dtype and does not include the desired keys ([GH20753](#))
- Bug in \_\_setitem\_\_ when indexing a DataFrame with a 2-d boolean ndarray ([GH18582](#))
- Bug in str.extractall when there were no matches empty Index was returned instead of appropriate MultiIndex ([GH19034](#))
- Bug in IntervalIndex where empty and purely NA data was constructed inconsistently depending on the construction method ([GH18421](#))
- Bug in IntervalIndex.symmetric\_difference() where the symmetric difference with a non-IntervalIndex did not raise ([GH18475](#))
- Bug in IntervalIndex where set operations that returned an empty IntervalIndex had the wrong dtype ([GH19101](#))
- Bug in DataFrame.drop\_duplicates() where no KeyError is raised when passing in columns that don't exist on the DataFrame ([GH19726](#))
- Bug in Index subclasses constructors that ignore unexpected keyword arguments ([GH19348](#))
- Bug in Index.difference() when taking difference of an Index with itself ([GH20040](#))
- Bug in DataFrame.first\_valid\_index() and DataFrame.last\_valid\_index() in presence of entire rows of NaNs in the middle of values ([GH20499](#)).
- Bug in IntervalIndex where some indexing operations were not supported for overlapping or non-monotonic uint64 data ([GH20636](#))
- Bug in Series.is\_unique where extraneous output in stderr is shown if Series contains objects with \_\_ne\_\_ defined ([GH20661](#))
- Bug in .loc assignment with a single-element list-like incorrectly assigns as a list ([GH19474](#))
- Bug in partial string indexing on a Series/DataFrame with a monotonic decreasing DatetimeIndex ([GH19362](#))
- Bug in performing in-place operations on a DataFrame with a duplicate Index ([GH17105](#))
- Bug in IntervalIndex.get\_loc() and IntervalIndex.get\_indexer() when used with an IntervalIndex containing a single interval ([GH17284](#), [GH20921](#))
- Bug in .loc with a uint64 indexer ([GH20722](#))

## MultiIndex

- Bug in `MultiIndex.__contains__()` where non-tuple keys would return `True` even if they had been dropped ([GH19027](#))
- Bug in `MultiIndex.set_labels()` which would cause casting (and potentially clipping) of the new labels if the `level` argument is not 0 or a list like `[0, 1, ...]` ([GH19057](#))
- Bug in `MultiIndex.get_level_values()` which would return an invalid index on level of ints with missing values ([GH17924](#))
- Bug in `MultiIndex.unique()` when called on empty `MultiIndex` ([GH20568](#))
- Bug in `MultiIndex.unique()` which would not preserve level names ([GH20570](#))
- Bug in `MultiIndex.remove_unused_levels()` which would fill nan values ([GH18417](#))
- Bug in `MultiIndex.from_tuples()` which would fail to take zipped tuples in python3 ([GH18434](#))
- Bug in `MultiIndex.get_loc()` which would fail to automatically cast values between float and int ([GH18818](#), [GH15994](#))
- Bug in `MultiIndex.get_loc()` which would cast boolean to integer labels ([GH19086](#))
- Bug in `MultiIndex.get_loc()` which would fail to locate keys containing NaN ([GH18485](#))
- Bug in `MultiIndex.get_loc()` in large `MultiIndex`, would fail when levels had different dtypes ([GH18520](#))
- Bug in indexing where nested indexers having only numpy arrays are handled incorrectly ([GH19686](#))

## I/O

- `read_html()` now rewinds seekable IO objects after parse failure, before attempting to parse with a new parser. If a parser errors and the object is non-seekable, an informative error is raised suggesting the use of a different parser ([GH17975](#))
- `DataFrame.to_html()` now has an option to add an id to the leading `<table>` tag ([GH8496](#))
- Bug in `read_msgpack()` with a non-existent file is passed in Python 2 ([GH15296](#))
- Bug in `read_csv()` where a `MultiIndex` with duplicate columns was not being mangled appropriately ([GH18062](#))
- Bug in `read_csv()` where missing values were not being handled properly when `keep_default_na=False` with dictionary `na_values` ([GH19227](#))
- Bug in `read_csv()` causing heap corruption on 32-bit, big-endian architectures ([GH20785](#))
- Bug in `read_sas()` where a file with 0 variables gave an `AttributeError` incorrectly. Now it gives an `EmptyDataError` ([GH18184](#))
- Bug in `DataFrame.to_latex()` where pairs of braces meant to serve as invisible placeholders were escaped ([GH18667](#))
- Bug in `DataFrame.to_latex()` where a NaN in a `MultiIndex` would cause an `IndexError` or incorrect output ([GH14249](#))
- Bug in `DataFrame.to_latex()` where a non-string index-level name would result in an `AttributeError` ([GH19981](#))
- Bug in `DataFrame.to_latex()` where the combination of an index name and the `index_names=False` option would result in incorrect output ([GH18326](#))

- Bug in `DataFrame.to_latex()` where a `MultiIndex` with an empty string as its name would result in incorrect output ([GH18669](#))
- Bug in `DataFrame.to_latex()` where missing space characters caused wrong escaping and produced non-valid latex in some cases ([GH20859](#))
- Bug in `read_json()` where large numeric values were causing an `OverflowError` ([GH18842](#))
- Bug in `DataFrame.to_parquet()` where an exception was raised if the write destination is S3 ([GH19134](#))
- Interval now supported in `DataFrame.to_excel()` for all Excel file types ([GH19242](#))
- Timedelta now supported in `DataFrame.to_excel()` for all Excel file types ([GH19242](#), [GH9155](#), [GH19900](#))
- Bug in `pandas.io.stata.StataReader.value_labels()` raising an `AttributeError` when called on very old files. Now returns an empty dict ([GH19417](#))
- Bug in `read_pickle()` when unpickling objects with `TimedeltaIndex` or `Float64Index` created with pandas prior to version 0.20 ([GH19939](#))
- Bug in `pandas.io.json.json_normalize()` where sub-records are not properly normalized if any sub-records values are `NoneType` ([GH20030](#))
- Bug in `usecols` parameter in `read_csv()` where error is not raised correctly when passing a string. ([GH20529](#))
- Bug in `HDFStore.keys()` when reading a file with a soft link causes exception ([GH20523](#))
- Bug in `HDFStore.select_column()` where a key which is not a valid store raised an `AttributeError` instead of a `KeyError` ([GH17912](#))

## Plotting

- Better error message when attempting to plot but matplotlib is not installed ([GH19810](#)).
- `DataFrame.plot()` now raises a `ValueError` when the `x` or `y` argument is improperly formed ([GH18671](#))
- Bug in `DataFrame.plot()` when `x` and `y` arguments given as positions caused incorrect referenced columns for line, bar and area plots ([GH20056](#))
- Bug in formatting tick labels with `datetime.time()` and fractional seconds ([GH18478](#)).
- `Series.plot.kde()` has exposed the args `ind` and `bw_method` in the docstring ([GH18461](#)). The argument `ind` may now also be an integer (number of sample points).
- `DataFrame.plot()` now supports multiple columns to the `y` argument ([GH19699](#))

## Groupby/Resample/Rolling

- Bug when grouping by a single column and aggregating with a class like `list` or `tuple` ([GH18079](#))
- Fixed regression in `DataFrame.groupby()` which would not emit an error when called with a tuple key not in the index ([GH18798](#))
- Bug in `DataFrame.resample()` which silently ignored unsupported (or mistyped) options for `label`, `closed` and `convention` ([GH19303](#))
- Bug in `DataFrame.groupby()` where tuples were interpreted as lists of keys rather than as keys ([GH17979](#), [GH18249](#))

- Bug in `DataFrame.groupby()` where aggregation by `first/last/min/max` was causing timestamps to lose precision ([GH19526](#))
- Bug in `DataFrame.transform()` where particular aggregation functions were being incorrectly cast to match the `dtype(s)` of the grouped data ([GH19200](#))
- Bug in `DataFrame.groupby()` passing the `on=` kwarg, and subsequently using `.apply()` ([GH17813](#))
- Bug in `DataFrame.resample().aggregate` not raising a `KeyError` when aggregating a non-existent column ([GH16766](#), [GH19566](#))
- Bug in `DataFrameGroupBy.cumsum()` and `DataFrameGroupBy.cumprod()` when `skipna` was passed ([GH19806](#))
- Bug in `DataFrame.resample()` that dropped timezone information ([GH13238](#))
- Bug in `DataFrame.groupby()` where transformations using `np.all` and `np.any` were raising a `ValueError` ([GH20653](#))
- Bug in `DataFrame.resample()` where `ffill`, `bfill`, `pad`, `backfill`, `fillna`, `interpolate`, and `asfreq` were ignoring `loffset`. ([GH20744](#))
- Bug in `DataFrame.groupby()` when applying a function that has mixed data types and the user supplied function can fail on the grouping column ([GH20949](#))
- Bug in `DataFrameGroupBy.rolling().apply()` where operations performed against the associated `DataFrameGroupBy` object could impact the inclusion of the grouped item(s) in the result ([GH14013](#))

## Sparse

- Bug in which creating a `SparseDataFrame` from a dense `Series` or an unsupported type raised an uncontrolled exception ([GH19374](#))
- Bug in `SparseDataFrame.to_csv` causing exception ([GH19384](#))
- Bug in `SparseSeries.memory_usage` which caused segfault by accessing non sparse elements ([GH19368](#))
- Bug in constructing a `SparseArray`: if data is a scalar and index is defined it will coerce to `float64` regardless of scalar's `dtype`. ([GH19163](#))

## Reshaping

- Bug in `DataFrame.merge()` where referencing a `CategoricalIndex` by name, where the `by` kwarg would `KeyError` ([GH20777](#))
- Bug in `DataFrame.stack()` which fails trying to sort mixed type levels under Python 3 ([GH18310](#))
- Bug in `DataFrame.unstack()` which casts `int` to `float` if columns is a `MultiIndex` with unused levels ([GH17845](#))
- Bug in `DataFrame.unstack()` which raises an error if index is a `MultiIndex` with unused labels on the unstacked level ([GH18562](#))
- Fixed construction of a `Series` from a `dict` containing `NaN` as key ([GH18480](#))
- Fixed construction of a `DataFrame` from a `dict` containing `NaN` as key ([GH18455](#))
- Disabled construction of a `Series` where `len(index) > len(data) = 1`, which previously would broadcast the data item, and now raises a `ValueError` ([GH18819](#))

- Suppressed error in the construction of a `DataFrame` from a dict containing scalar values when the corresponding keys are not included in the passed index ([GH18600](#))
- Fixed (changed from `object` to `float64`) dtype of `DataFrame` initialized with axes, no data, and `dtype=int` ([GH19646](#))
- Bug in `Series.rank()` where `Series` containing `NaT` modifies the `Series` inplace ([GH18521](#))
- Bug in `cut()` which fails when using readonly arrays ([GH18773](#))
- Bug in `DataFrame.pivot_table()` which fails when the `aggfunc` arg is of type string. The behavior is now consistent with other methods like `agg` and `apply` ([GH18713](#))
- Bug in `DataFrame.merge()` in which merging using `Index` objects as vectors raised an `Exception` ([GH19038](#))
- Bug in `DataFrame.stack()`, `DataFrame.unstack()`, `Series.unstack()` which were not returning subclasses ([GH15563](#))
- Bug in timezone comparisons, manifesting as a conversion of the index to UTC in `.concat()` ([GH18523](#))
- Bug in `concat()` when concatenating sparse and dense series it returns only a `SparseDataFrame`. Should be a `DataFrame`. ([GH18914](#), [GH18686](#), and [GH16874](#))
- Improved error message for `DataFrame.merge()` when there is no common merge key ([GH19427](#))
- Bug in `DataFrame.join()` which does an outer instead of a left join when being called with multiple `DataFrames` and some have non-unique indices ([GH19624](#))
- `Series.rename()` now accepts `axis` as a kwarg ([GH18589](#))
- Bug in `rename()` where an `Index` of same-length tuples was converted to a `MultiIndex` ([GH19497](#))
- Comparisons between `Series` and `Index` would return a `Series` with an incorrect name, ignoring the `Index`'s name attribute ([GH19582](#))
- Bug in `qcut()` where datetime and timedelta data with `NaT` present raised a `ValueError` ([GH19768](#))
- Bug in `DataFrame.iterrows()`, which would infer strings not compliant to [ISO8601](#) to datetimes ([GH19671](#))
- Bug in `Series` constructor with `Categorical` where a `ValueError` is not raised when an index of different length is given ([GH19342](#))
- Bug in `DataFrame.astype()` where column metadata is lost when converting to categorical or a dictionary of dtypes ([GH19920](#))
- Bug in `cut()` and `qcut()` where timezone information was dropped ([GH19872](#))
- Bug in `Series` constructor with a `dtype=str`, previously raised in some cases ([GH19853](#))
- Bug in `get_dummies()`, and `select_dtypes()`, where duplicate column names caused incorrect behavior ([GH20848](#))
- Bug in `isna()`, which cannot handle ambiguous typed lists ([GH20675](#))
- Bug in `concat()` which raises an error when concatenating TZ-aware dataframes and all-`NaT` dataframes ([GH12396](#))
- Bug in `concat()` which raises an error when concatenating empty TZ-aware series ([GH18447](#))

## Other

- Improved error message when attempting to use a Python keyword as an identifier in a `numexpr` backed query ([GH18221](#))
- Bug in accessing a `pandas.get_option()`, which raised `KeyError` rather than `OptionError` when looking up a non-existent option key in some cases ([GH19789](#))
- Bug in `testing.assert_series_equal()` and `testing.assert_frame_equal()` for Series or DataFrames with differing unicode data ([GH20503](#))

### 39.2.5.8 Contributors

A total of 328 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.3 Version 0.22

### 39.3.1 v0.22.0 (December 29, 2017)

{{ header }}

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note (singular!).

#### 39.3.1.1 Backwards incompatible API changes

Pandas 0.22.0 changes the handling of empty and all-NA sums and products. The summary is that

- The sum of an empty or all-NA `Series` is now 0
- The product of an empty or all-NA `Series` is now 1
- We've added a `min_count` parameter to `.sum()` and `.prod()` controlling the minimum number of valid values for the result to be valid. If fewer than `min_count` non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use `min_count=1`.

Some background: In pandas 0.21, we fixed a long-standing inconsistency in the return value of all-NA series depending on whether or not bottleneck was installed. See *Sum/Prod of all-NaN or empty Series/DataFrames is now consistently NaN*. At the same time, we changed the sum and prod of an empty `Series` to also be NaN.

Based on feedback, we've partially reverted those changes.

#### Arithmetic Operations

The default sum for empty or all-NA `Series` is now 0.

*pandas 0.21.x*

```
In [1]: pd.Series([]).sum()
Out[1]: nan

In [2]: pd.Series([np.nan]).sum()
Out[2]: nan
```

*pandas 0.22.0*

```
In [1]: pd.Series([]).sum()
Out[1]: 0.0

In [2]: pd.Series([np.nan]).sum()
Out[2]: 0.0
```

The default behavior is the same as pandas 0.20.3 with bottleneck installed. It also matches the behavior of NumPy's `np.nansum` on empty and all-NA arrays.

To have the sum of an empty series return NaN (the default behavior of pandas 0.20.3 without bottleneck, or pandas 0.21.x), use the `min_count` keyword.

```
In [3]: pd.Series([]).sum(min_count=1)
Out[3]: nan
```

Thanks to the `skipna` parameter, the `.sum` on an all-NA series is conceptually the same as the `.sum` of an empty one with `skipna=True` (the default).

```
In [4]: pd.Series([np.nan]).sum(min_count=1) # skipna=True by default
Out[4]: nan
```

The `min_count` parameter refers to the minimum number of *non-null* values required for a non-NA sum or product. `Series.prod()` has been updated to behave the same as `Series.sum()`, returning 1 instead.

```
In [5]: pd.Series([]).prod()
Out[5]: 1.0

In [6]: pd.Series([np.nan]).prod()
Out[6]: 1.0

In [7]: pd.Series([]).prod(min_count=1)
Out[7]: nan
```

These changes affect `DataFrame.sum()` and `DataFrame.prod()` as well. Finally, a few less obvious places in pandas are affected by this change.

## Grouping by a Categorical

Grouping by a `Categorical` and summing now returns 0 instead of NaN for categories with no observations. The product now returns 1 instead of NaN.

*pandas 0.21.x*

```
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
```

(continues on next page)

(continued from previous page)

```
a 3.0
b NaN
dtype: float64
```

*pandas 0.22*

```
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a 3
b 0
Length: 2, dtype: int64
```

To restore the 0.21 behavior of returning NaN for unobserved groups, use `min_count>=1`.

```
In [10]: pd.Series([1, 2]).groupby(grouper).sum(min_count=1)
Out[10]:
a 3.0
b NaN
Length: 2, dtype: float64
```

## Resample

The sum and product of all-NA bins has changed from NaN to 0 for sum and 1 for product.

*pandas 0.21.x*

```
In [11]: s = pd.Series([1, 1, np.nan, np.nan],
.....: index=pd.date_range('2017', periods=4))
.....: s
Out[11]:
2017-01-01 1.0
2017-01-02 1.0
2017-01-03 NaN
2017-01-04 NaN
Freq: D, dtype: float64

In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01 2.0
2017-01-03 NaN
Freq: 2D, dtype: float64
```

*pandas 0.22.0*

```
In [11]: s = pd.Series([1, 1, np.nan, np.nan],
.....: index=pd.date_range('2017', periods=4))
.....:

In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01 2.0
2017-01-03 0.0
Freq: 2D, Length: 2, dtype: float64
```

To restore the 0.21 behavior of returning NaN, use `min_count>=1`.

```
In [13]: s.resample('2d').sum(min_count=1)
Out[13]:
2017-01-01 2.0
2017-01-03 NaN
Freq: 2D, Length: 2, dtype: float64
```

In particular, upsampling and taking the sum or product is affected, as upsampling introduces missing values even if the original series was entirely valid.

*pandas 0.21.x*

```
In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00 1.0
2017-01-01 12:00:00 NaN
2017-01-02 00:00:00 2.0
Freq: 12H, dtype: float64
```

*pandas 0.22.0*

```
In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample("12H").sum()
Out[15]:
2017-01-01 00:00:00 1
2017-01-01 12:00:00 0
2017-01-02 00:00:00 2
Freq: 12H, Length: 3, dtype: int64
```

Once again, the `min_count` keyword is available to restore the 0.21 behavior.

```
In [16]: pd.Series([1, 2], index=idx).resample("12H").sum(min_count=1)
Out[16]:
2017-01-01 00:00:00 1.0
2017-01-01 12:00:00 NaN
2017-01-02 00:00:00 2.0
Freq: 12H, Length: 3, dtype: float64
```

## Rolling and Expanding

Rolling and expanding already have a `min_periods` keyword that behaves similar to `min_count`. The only case that changes is when doing a rolling or expanding sum with `min_periods=0`. Previously this returned NaN, when fewer than `min_periods` non-NA values were in the window. Now it returns 0.

*pandas 0.21.1*

```
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0 NaN
1 NaN
dtype: float64
```

*pandas 0.22.0*

```
In [17]: s = pd.Series([np.nan, np.nan])

In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0 0.0
1 0.0
Length: 2, dtype: float64
```

The default behavior of `min_periods=None`, implying that `min_periods` equals the window size, is unchanged.

### 39.3.1.2 Compatibility

If you maintain a library that should work across pandas versions, it may be easiest to exclude pandas 0.21 from your requirements. Otherwise, all your `sum()` calls would need to check if the `Series` is empty before summing.

With `setuptools`, in your `setup.py` use:

```
install_requires=['pandas!=0.21.*', ...]
```

With `conda`, use

```
requirements:
run:
- pandas !=0.21.0, !=0.21.1
```

Note that the inconsistency in the return value for all-*NA* series is still there for pandas 0.20.3 and earlier. Avoiding pandas 0.21 will only help with the empty case.

### 39.3.1.3 Contributors

A total of 1 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.4 Version 0.21

### 39.4.1 v0.21.1 (December 12, 2017)

{{ header }}

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who implicitly relied on pandas to plot datetimes with matplotlib. See [here](#).
- Improvements to the Parquet IO functions introduced in 0.21.0. See [here](#).

**What's new in v0.21.1**

- *Restore Matplotlib datetime Converter Registration*
- *New features*
  - *Improvements to the Parquet IO functionality*
  - *Other Enhancements*
- *Deprecations*
- *Performance Improvements*
- *Bug Fixes*
  - *Conversion*
  - *Indexing*
  - *I/O*
  - *Plotting*
  - *Groupby/Resample/Rolling*
  - *Reshaping*
  - *Numeric*
  - *Categorical*
  - *String*
- *Contributors*

**39.4.1.1 Restore Matplotlib datetime Converter Registration**

Pandas implements some matplotlib converters for nicely formatting the axis labels on plots with `datetime` or `Period` values. Prior to pandas 0.21.0, these were implicitly registered with matplotlib, as a side effect of `import pandas`.

In pandas 0.21.0, we required users to explicitly register the converter. This caused problems for some users who relied on those converters being present for regular `matplotlib.pyplot` plotting methods, so we're temporarily reverting that change; pandas 0.21.1 again registers the converters on import, just like before 0.21.0.

We've added a new option to control the converters: `pd.options.plotting.matplotlib.register_converters`. By default, they are registered. Toggling this to `False` removes pandas' formatters and restore any converters we overwrote when registering them ([GH18301](#)).

We're working with the matplotlib developers to make this easier. We're trying to balance user convenience (automatically registering the converters) with import performance and best practices (importing pandas shouldn't have the side effect of overwriting any custom converters you've already set). In the future we hope to have most of the date-time formatting functionality in matplotlib, with just the pandas-specific converters in pandas. We'll then gracefully deprecate the automatic registration of converters in favor of users explicitly registering them when they want them.

**39.4.1.2 New features**

## Improvements to the Parquet IO functionality

- `DataFrame.to_parquet()` will now write non-default indexes when the underlying engine supports it. The indexes will be preserved when reading back in with `read_parquet()` (GH18581).
- `read_parquet()` now allows to specify the columns to read from a parquet file (GH18154)
- `read_parquet()` now allows to specify kwargs which are passed to the respective engine (GH18216)

## Other Enhancements

- `Timestamp.timestamp()` is now available in Python 2.7. (GH17329)
- `Grouper` and `TimeGrouper` now have a friendly repr output (GH18203).

### 39.4.1.3 Deprecations

- `pandas.tseries.register` has been renamed to `pandas.plotting.register_matplotlib_converters()` (GH18301)

### 39.4.1.4 Performance Improvements

- Improved performance of plotting large series/dataframes (GH18236).

### 39.4.1.5 Bug Fixes

#### Conversion

- Bug in `TimedeltaIndex` subtraction could incorrectly overflow when `NaT` is present (GH17791)
- Bug in `DatetimeIndex` subtracting datetimelike from `DatetimeIndex` could fail to overflow (GH18020)
- Bug in `IntervalIndex.copy()` when copying and `IntervalIndex` with non-default `closed` (GH18339)
- Bug in `DataFrame.to_dict()` where columns of datetime that are tz-aware were not converted to required arrays when used with `orient='records'`, raising `TypeError` (GH18372)
- Bug in `DateTimeIndex` and `date_range()` where mismatching tz-aware start and end timezones would not raise an err if `end.tzinfo` is `None` (GH18431)
- Bug in `Series.fillna()` which raised when passed a long integer on Python 2 (GH18159).

#### Indexing

- Bug in a boolean comparison of a `datetime.datetime` and a `datetime64[ns]` dtype Series (GH17965)
- Bug where a `MultiIndex` with more than a million records was not raising `AttributeError` when trying to access a missing attribute (GH18165)
- Bug in `IntervalIndex` constructor when a list of intervals is passed with non-default `closed` (GH18334)
- Bug in `Index.putmask` when an invalid mask passed (GH18368)
- Bug in masked assignment of a `timedelta64[ns]` dtype Series, incorrectly coerced to float (GH18493)

## I/O

- Bug in class:~`pandas.io.stata.StataReader` not converting date/time columns with display formatting addressed ([GH17990](#)). Previously columns with display formatting were normally left as ordinal numbers and not converted to datetime objects.
- Bug in `read_csv()` when reading a compressed UTF-16 encoded file ([GH18071](#))
- Bug in `read_csv()` for handling null values in index columns when specifying `na_filter=False` ([GH5239](#))
- Bug in `read_csv()` when reading numeric category fields with high cardinality ([GH18186](#))
- Bug in `DataFrame.to_csv()` when the table had `MultiIndex` columns, and a list of strings was passed in for header ([GH5539](#))
- Bug in parsing integer datetime-like columns with specified format in `read_sql` ([GH17855](#)).
- Bug in `DataFrame.to_msgpack()` when serializing data of the `numpy.bool_` datatype ([GH18390](#))
- Bug in `read_json()` not decoding when reading line delimited JSON from S3 ([GH17200](#))
- Bug in `pandas.io.json.json_normalize()` to avoid modification of meta ([GH18610](#))
- Bug in `to_latex()` where repeated `MultiIndex` values were not printed even though a higher level index differed from the previous row ([GH14484](#))
- Bug when reading NaN-only categorical columns in `HDFStore` ([GH18413](#))
- Bug in `DataFrame.to_latex()` with `longtable=True` where a latex multicolumn always spanned over three columns ([GH17959](#))

## Plotting

- Bug in `DataFrame.plot()` and `Series.plot()` with `DatetimeIndex` where a figure generated by them is not pickleable in Python 3 ([GH18439](#))

## Groupby/Resample/Rolling

- Bug in `DataFrame.resample(...).apply(...)` when there is a callable that returns different columns ([GH15169](#))
- Bug in `DataFrame.resample(...)` when there is a time change (DST) and resampling frequency is 12h or higher ([GH15549](#))
- Bug in `pd.DataFrameGroupBy.count()` when counting over a datetimelike column ([GH13393](#))
- Bug in `rolling.var` where calculation is inaccurate with a zero-valued array ([GH18430](#))

## Reshaping

- Error message in `pd.merge_asof()` for key datatype mismatch now includes datatype of left and right key ([GH18068](#))
- Bug in `pd.concat` when empty and non-empty DataFrames or Series are concatenated ([GH18178](#) [GH18187](#))
- Bug in `DataFrame.filter(...)` when unicode is passed as a condition in Python 2 ([GH13101](#))
- Bug when merging empty DataFrames when `np.seterr(divide='raise')` is set ([GH17776](#))

## Numeric

- Bug in `pd.Series.rolling.skew()` and `rolling.kurt()` with all equal values has floating issue ([GH18044](#))

## Categorical

- Bug in `DataFrame.astype()` where casting to ‘category’ on an empty `DataFrame` causes a segmentation fault ([GH18004](#))
- Error messages in the testing module have been improved when items have different `CategoricalDtype` ([GH18069](#))
- `CategoricalIndex` can now correctly take a `pd.api.types.CategoricalDtype` as its `dtype` ([GH18116](#))
- Bug in `Categorical.unique()` returning read-only codes array when all categories were `NaN` ([GH18051](#))
- Bug in `DataFrame.groupby(axis=1)` with a `CategoricalIndex` ([GH18432](#))

## String

- `Series.str.split()` will now propagate `NaN` values across all expanded columns instead of `None` ([GH18450](#))

### 39.4.2 v0.21.0 (October 27, 2017)

{{ header }}

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with [Apache Parquet](#), including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see [here](#).
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see [here](#).
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether [bottleneck](#) is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see [here](#).
- Compatibility fixes for pypy, see [here](#).
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see [here](#).
- Addition of the new methods `DataFrame.infer_objects` (see [here](#)) and `GroupBy.pipe` (see [here](#)).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a `KeyError` in a future version, see [here](#).

Check the *API Changes* and *deprecations* before updating.

### What's new in v0.21.0

- *New features*
  - *Integration with Apache Parquet file format*
  - *infer\_objects type conversion*
  - *Improved warnings when attempting to create columns*
  - *drop now also accepts index/columns keywords*
  - *rename, reindex now also accept axis keyword*
  - *CategoricalDtype for specifying categoricals*
  - *GroupBy objects now have a pipe method*
  - *Categorical.rename\_categories accepts a dict-like*
  - *Other Enhancements*
- *Backwards incompatible API changes*
  - *Dependencies have increased minimum versions*
  - *Sum/Prod of all-NaN or empty Series/DataFrames is now consistently NaN*
  - *Indexing with a list with missing labels is Deprecated*
  - *NA naming Changes*
  - *Iteration of Series/Index will now return Python scalars*
  - *Indexing with a Boolean Index*
  - *PeriodIndex resampling*
  - *Improved error handling during item assignment in pd.eval*
  - *Dtype Conversions*
  - *MultiIndex Constructor with a Single Level*
  - *UTC Localization with Series*

- *Consistency of Range Functions*
- *No Automatic Matplotlib Converters*
- *Other API Changes*
- *Deprecations*
  - *Series.select and DataFrame.select*
  - *Series.argmax and Series.argmin*
- *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Documentation Changes*
- *Bug Fixes*
  - *Conversion*
  - *Indexing*
  - *I/O*
  - *Plotting*
  - *Groupby/Resample/Rolling*
  - *Sparse*
  - *Reshaping*
  - *Numeric*
  - *Categorical*
  - *PyPy*
  - *Other*
- *Contributors*

### 39.4.2.1 New features

#### Integration with Apache Parquet file format

Integration with [Apache Parquet](#), including a new top-level `read_parquet()` and `DataFrame.to_parquet()` method, see [here](#) ([GH15838](#), [GH17438](#)).

[Apache Parquet](#) provides a cross-language, binary file format for reading and writing data frames efficiently. Parquet is designed to faithfully serialize and de-serialize `DataFrame`s, supporting all of the pandas dtypes, including extension dtypes such as datetime with timezones.

This functionality depends on either the [pyarrow](#) or [fastparquet](#) library. For more details, see [the IO docs on Parquet](#).

#### `infer_objects` type conversion

The `DataFrame.infer_objects()` and `Series.infer_objects()` methods have been added to perform dtype inference on object columns, replacing some of the functionality of the deprecated `convert_objects` method. See the documentation [here](#) for more details. ([GH11221](#))

This method only performs soft conversions on object columns, converting Python objects to native types, but not any coercive conversions. For example:

```
In [1]: df = pd.DataFrame({'A': [1, 2, 3],
...: 'B': np.array([1, 2, 3], dtype='object'),
...: 'C': ['1', '2', '3']})
...:

In [2]: df.dtypes
Out[2]:
A int64
B object
C object
Length: 3, dtype: object

In [3]: df.infer_objects().dtypes
Out[3]:
A int64
B int64
C object
Length: 3, dtype: object
```

Note that column 'C' was not converted - only scalar numeric types will be converted to a new type. Other types of conversion should be accomplished using the `to_numeric()` function (or `to_datetime()`, `to_timedelta()`).

```
In [4]: df = df.infer_objects()

In [5]: df['C'] = pd.to_numeric(df['C'], errors='coerce')

In [6]: df.dtypes
Out[6]:
A int64
B int64
C int64
Length: 3, dtype: object
```

## Improved warnings when attempting to create columns

New users are often puzzled by the relationship between column operations and attribute access on `DataFrame` instances ([GH7175](#)). One specific instance of this confusion is attempting to create a new column by setting an attribute on the `DataFrame`:

```
In [1]: df = pd.DataFrame({'one': [1., 2., 3.]})
In [2]: df.two = [4, 5, 6]
```

This does not raise any obvious exceptions, but also does not create a new column:

```
In [3]: df
Out[3]:
 one
0 1.0
1 2.0
2 3.0
```

Setting a list-like data structure into a new attribute now raises a `UserWarning` about the potential for unexpected behavior. See *Attribute Access*.

**drop now also accepts index/columns keywords**

The `drop()` method has gained `index/columns` keywords as an alternative to specifying the `axis`. This is similar to the behavior of `reindex` ([GH12392](#)).

For example:

```
In [7]: df = pd.DataFrame(np.arange(8).reshape(2, 4),
...: columns=['A', 'B', 'C', 'D'])
...:

In [8]: df
Out[8]:
 A B C D
0 0 1 2 3
1 4 5 6 7

[2 rows x 4 columns]

In [9]: df.drop(['B', 'C'], axis=1)
Out[9]:
 A D
0 0 3
1 4 7

[2 rows x 2 columns]

the following is now equivalent
In [10]: df.drop(columns=['B', 'C'])
Out[10]:
 A D
0 0 3
1 4 7

[2 rows x 2 columns]
```

**rename, reindex now also accept axis keyword**

The `DataFrame.rename()` and `DataFrame.reindex()` methods have gained the `axis` keyword to specify the axis to target with the operation ([GH12392](#)).

Here's `rename`:

```
In [11]: df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})

In [12]: df.rename(str.lower, axis='columns')
Out[12]:
 a b
0 1 4
1 2 5
2 3 6

[3 rows x 2 columns]

In [13]: df.rename(id, axis='index')
```

(continues on next page)

(continued from previous page)

```
Out [13]:
```

|                | A | B |
|----------------|---|---|
| 94534543190688 | 1 | 4 |
| 94534543190720 | 2 | 5 |
| 94534543190752 | 3 | 6 |

```
[3 rows x 2 columns]
```

And reindex:

```
In [14]: df.reindex(['A', 'B', 'C'], axis='columns')
```

Out [14]:

|   | A | B | C   |
|---|---|---|-----|
| 0 | 1 | 4 | NaN |
| 1 | 2 | 5 | NaN |
| 2 | 3 | 6 | NaN |

```
[3 rows x 3 columns]
```

```
In [15]: df.reindex([0, 1, 3], axis='index')
```

```
Out[15]:
```

|   | A   | B   |
|---|-----|-----|
| 0 | 1.0 | 4.0 |
| 1 | 2.0 | 5.0 |
| 3 | NaN | NaN |

```
[3 rows x 2 columns]
```

The “index, columns” style continues to work as before.

```
In [16]: df.rename(index=id, columns=str.lower)
```

Out[16]:

|                | a | b |
|----------------|---|---|
| 94534543190688 | 1 | 4 |
| 94534543190720 | 2 | 5 |
| 94534543190752 | 3 | 6 |

```
[3 rows x 2 columns]
```

```
In [17]: df.reindex(index=[0, 1, 3], columns=['A', 'B', 'C'])
```

|   | A   | B   | C   |
|---|-----|-----|-----|
| 0 | 1.0 | 4.0 | NaN |
| 1 | 2.0 | 5.0 | NaN |
| 3 | NaN | NaN | NaN |

```
[3 rows x 3 columns]
```

We *highly* encourage using named arguments to avoid confusion when using either style.

## CategoricalDtype for specifying categoricals

`pandas.api.types.CategoricalDtype` has been added to the public API and expanded to include the categories and ordered attributes. A `CategoricalDtype` can be used to specify the set of categories and

orderedness of an array, independent of the data. This can be useful for example, when converting string data to a Categorical ([GH14711](#), [GH15078](#), [GH16015](#), [GH17643](#)):

```
In [18]: from pandas.api.types import CategoricalDtype

In [19]: s = pd.Series(['a', 'b', 'c', 'a']) # strings

In [20]: dtype = CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)

In [21]: s.astype(dtype)
Out[21]:
0 a
1 b
2 c
3 a
Length: 4, dtype: category
Categories (4, object): [a < b < c < d]
```

One place that deserves special mention is in `read_csv()`. Previously, with `dtype={'col': 'category'}`, the returned values and categories would always be strings.

```
In [22]: data = 'A,B\ na,1\ nb,2\ nc,3'

In [23]: pd.read_csv(StringIO(data), dtype={'B': 'category'}).B.cat.categories
Out[23]: Index(['1', '2', '3'], dtype='object')
```

Notice the “object” dtype.

With a CategoricalDtype of all numerics, datetimes, or timedeltas, we can automatically convert to the correct type

```
In [24]: dtype = {'B': CategoricalDtype([1, 2, 3])}

In [25]: pd.read_csv(StringIO(data), dtype=dtype).B.cat.categories
Out[25]: Int64Index([1, 2, 3], dtype='int64')
```

The values have been correctly interpreted as integers.

The `.dtype` property of a Categorical, CategoricalIndex or a Series with categorical type will now return an instance of CategoricalDtype. While the repr has changed, `str(CategoricalDtype())` is still the string `'category'`. We’ll take this moment to remind users that the *preferred* way to detect categorical data is to use `pandas.api.types.is_categorical_dtype()`, and not `str(dtype) == 'category'`.

See the *CategoricalDtype docs* for more.

## GroupBy objects now have a pipe method

GroupBy objects now have a `pipe` method, similar to the one on DataFrame and Series, that allow for functions that take a GroupBy to be composed in a clean, readable syntax. ([GH17871](#))

For a concrete example on combining `.groupby` and `.pipe`, imagine having a DataFrame with columns for stores, products, revenue and sold quantity. We’d like to do a groupwise calculation of *prices* (i.e. revenue/quantity) per store and per product. We could do this in a multi-step operation, but expressing it in terms of piping can make the code more readable.

First we set the data:

```
In [26]: import numpy as np

In [27]: n = 1000

In [28]: df = pd.DataFrame({'Store': np.random.choice(['Store_1', 'Store_2'], n),
.....: 'Product': np.random.choice(['Product_1',
.....: 'Product_2',
.....: 'Product_3']
.....:], n),
.....: 'Revenue': (np.random.random(n) * 50 + 10).round(2),
.....: 'Quantity': np.random.randint(1, 10, size=n)})
.....:

In [29]: df.head(2)
Out[29]:
```

|   | Store   | Product   | Revenue | Quantity |
|---|---------|-----------|---------|----------|
| 0 | Store_2 | Product_3 | 41.13   | 3        |
| 1 | Store_2 | Product_2 | 45.82   | 6        |

```
[2 rows x 4 columns]
```

Now, to find prices per store/product, we can simply do:

```
In [30]: (df.groupby(['Store', 'Product'])
.....: .pipe(lambda grp: grp.Revenue.sum() / grp.Quantity.sum())
.....: .unstack().round(2))
.....:

Out[30]:
```

|         | Product_1 | Product_2 | Product_3 |
|---------|-----------|-----------|-----------|
| Store   |           |           |           |
| Store_1 | 7.23      | 6.48      | 6.65      |
| Store_2 | 6.84      | 6.99      | 7.39      |

```
[2 rows x 3 columns]
```

See the *documentation* for more.

### `Categorical.rename_categories` accepts a dict-like

`rename_categories()` now accepts a dict-like argument for `new_categories`. The previous categories are looked up in the dictionary's keys and replaced if found. The behavior of missing and extra keys is the same as in `DataFrame.rename()`.

```
In [31]: c = pd.Categorical(['a', 'a', 'b'])

In [32]: c.rename_categories({"a": "eh", "b": "bee"})
Out[32]:
```

```
[eh, eh, bee]
Categories (2, object): [eh, bee]
```

**Warning:** To assist with upgrading pandas, `rename_categories` treats `Series` as list-like. Typically, `Series` are considered to be dict-like (e.g. in `.rename`, `.map`). In a future version of pandas `rename_categories` will change to treat them as dict-like. Follow the warning message's recommendations for writing future-proof code.

```
In [33]: c.rename_categories(pd.Series([0, 1], index=['a', 'c']))
FutureWarning: Treating Series 'new_categories' as a list-like and using the values.
In a future version, 'rename_categories' will treat Series like a dictionary.
For dict-like, use 'new_categories.to_dict()'
For list-like, use 'new_categories.values'.
Out [33]:
[0, 0, 1]
Categories (2, int64): [0, 1]
```

## Other Enhancements

### New functions or methods

- `nearest()` is added to support nearest-neighbor upsampling ([GH17496](#)).
- `Index` has added support for a `to_frame` method ([GH15230](#)).

### New keywords

- Added a `skipna` parameter to `infer_dtype()` to support type inference in the presence of missing values ([GH17059](#)).
- `Series.to_dict()` and `DataFrame.to_dict()` now support an `into` keyword which allows you to specify the `collections.Mapping` subclass that you would like returned. The default is `dict`, which is backwards compatible. ([GH16122](#))
- `Series.set_axis()` and `DataFrame.set_axis()` now support the `inplace` parameter. ([GH14636](#))
- `Series.to_pickle()` and `DataFrame.to_pickle()` have gained a `protocol` parameter ([GH16252](#)). By default, this parameter is set to `HIGHEST_PROTOCOL`
- `read_feather()` has gained the `nthreads` parameter for multi-threaded operations ([GH16359](#))
- `DataFrame.clip()` and `Series.clip()` have gained an `inplace` argument. ([GH15388](#))
- `crosstab()` has gained a `margins_name` parameter to define the name of the row / column that will contain the totals when `margins=True`. ([GH15972](#))
- `read_json()` now accepts a `chunksize` parameter that can be used when `lines=True`. If `chunksize` is passed, `read_json` now returns an iterator which reads in `chunksize` lines with each iteration. ([GH17048](#))
- `read_json()` and `to_json()` now accept a `compression` argument which allows them to transparently handle compressed files. ([GH17798](#))

### Various enhancements

- Improved the import time of pandas by about 2.25x. ([GH16764](#))
- Support for [PEP 519 – Adding a file system path protocol](#) on most readers (e.g. `read_csv()`) and writers (e.g. `DataFrame.to_csv()`) ([GH13823](#)).
- Added a `__fspath__` method to `pd.HDFStore`, `pd.ExcelFile`, and `pd.ExcelWriter` to work properly with the file system path protocol ([GH13823](#)).

- The `validate` argument for `merge()` now checks whether a merge is one-to-one, one-to-many, many-to-one, or many-to-many. If a merge is found to not be an example of specified merge type, an exception of type `MergeError` will be raised. For more, see [here](#) (GH16270)
- Added support for [PEP 518](#) (`pyproject.toml`) to the build system (GH16745)
- `RangeIndex.append()` now returns a `RangeIndex` object when possible (GH16212)
- `Series.rename_axis()` and `DataFrame.rename_axis()` with `inplace=True` now return `None` while renaming the axis inplace. (GH15704)
- `api.types.infer_dtype()` now infers decimals. (GH15690)
- `DataFrame.select_dtypes()` now accepts scalar values for include/exclude as well as list-like. (GH16855)
- `date_range()` now accepts 'YS' in addition to 'AS' as an alias for start of year. (GH9313)
- `date_range()` now accepts 'Y' in addition to 'A' as an alias for end of year. (GH9313)
- `DataFrame.add_prefix()` and `DataFrame.add_suffix()` now accept strings containing the '%' character. (GH17151)
- Read/write methods that infer compression (`read_csv()`, `read_table()`, `read_pickle()`, and `to_pickle()`) can now infer from path-like objects, such as `pathlib.Path`. (GH17206)
- `read_sas()` now recognizes much more of the most frequently used date (datetime) formats in SAS7BDAT files. (GH15871)
- `DataFrame.items()` and `Series.items()` are now present in both Python 2 and 3 and is lazy in all cases. (GH13918, GH17213)
- `pandas.io.formats.style.Styler.where()` has been implemented as a convenience for `pandas.io.formats.style.Styler.applymap()`. (GH17474)
- `MultiIndex.is_monotonic_decreasing()` has been implemented. Previously returned `False` in all cases. (GH16554)
- `read_excel()` raises `ImportError` with a better message if `xlrd` is not installed. (GH17613)
- `DataFrame.assign()` will preserve the original order of `**kwargs` for Python 3.6+ users instead of sorting the column names. (GH14207)
- `Series.reindex()`, `DataFrame.reindex()`, `Index.get_indexer()` now support list-like argument for tolerance. (GH17367)

### 39.4.2.2 Backwards incompatible API changes

#### Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15206, GH15543, GH15214). If installed, we now require:

| Package    | Minimum Version | Required |
|------------|-----------------|----------|
| Numpy      | 1.9.0           | X        |
| Matplotlib | 1.4.3           |          |
| Scipy      | 0.14.0          |          |
| Bottleneck | 1.0.0           |          |

Additionally, support has been dropped for Python 3.4 (GH15251).

## Sum/Prod of all-NaN or empty Series/DataFrames is now consistently NaN

**Note:** The changes described here have been partially reverted. See the *v0.22.0 Whatsnew* for more.

The behavior of `sum` and `prod` on all-NaN Series/DataFrames no longer depends on whether `bottleneck` is installed, and return value of `sum` and `prod` on an empty Series has changed ([GH9422](#), [GH15507](#)).

Calling `sum` or `prod` on an empty or all-NaN Series, or columns of a DataFrame, will result in NaN. See the *docs*.

```
In [33]: s = pd.Series([np.nan])
```

Previously WITHOUT `bottleneck` installed:

```
In [2]: s.sum()
Out[2]: np.nan
```

Previously WITH `bottleneck`:

```
In [2]: s.sum()
Out[2]: 0.0
```

New Behavior, without regard to the `bottleneck` installation:

```
In [34]: s.sum()
Out[34]: 0.0
```

Note that this also changes the sum of an empty Series. Previously this always returned 0 regardless of a `bottleneck` installation:

```
In [1]: pd.Series([]).sum()
Out[1]: 0
```

but for consistency with the all-NaN case, this was changed to return NaN as well:

```
In [35]: pd.Series([]).sum()
Out[35]: 0.0
```

## Indexing with a list with missing labels is Deprecated

Previously, selecting with a list of labels, where one or more labels were missing would always succeed, returning NaN for missing labels. This will now show a `FutureWarning`. In the future this will raise a `KeyError` ([GH15747](#)). This warning will trigger on a DataFrame or a Series for using `.loc[]` or `[][]` when passing a list-of-labels with at least 1 missing label. See the *deprecation docs*.

```
In [36]: s = pd.Series([1, 2, 3])

In [37]: s
Out[37]:
0 1
1 2
2 3
Length: 3, dtype: int64
```

### Previous Behavior

```
In [4]: s.loc[[1, 2, 3]]
Out[4]:
1 2.0
2 3.0
3 NaN
dtype: float64
```

### Current Behavior

```
In [4]: s.loc[[1, 2, 3]]
Passing list-likes to .loc or [] with any missing label will raise
KeyError in the future, you can use .reindex() as an alternative.

See the documentation here:
http://pandas.pydata.org/pandas-docs/stable/indexing.html#deprecate-loc-reindex-
↳listlike

Out[4]:
1 2.0
2 3.0
3 NaN
dtype: float64
```

The idiomatic way to achieve selecting potentially not-found elements is via `.reindex()`

```
In [38]: s.reindex([1, 2, 3])
Out[38]:
1 2.0
2 3.0
3 NaN
Length: 3, dtype: float64
```

Selection with all keys found is unchanged.

```
In [39]: s.loc[[1, 2]]
Out[39]:
1 2
2 3
Length: 2, dtype: int64
```

## NA naming Changes

In order to promote more consistency among the pandas API, we have added additional top-level functions `isna()` and `notna()` that are aliases for `isnull()` and `notnull()`. The naming scheme is now more consistent with methods like `.dropna()` and `.fillna()`. Furthermore in all cases where `.isnull()` and `.notnull()` methods are defined, these have additional methods named `.isna()` and `.notna()`, these are included for classes `Categorical`, `Index`, `Series`, and `DataFrame`. (GH15001).

The configuration option `pd.options.mode.use_inf_as_null` is deprecated, and `pd.options.mode.use_inf_as_na` is added as a replacement.

## Iteration of Series/Index will now return Python scalars

Previously, when using certain iteration methods for a Series with dtype int or float, you would receive a numpy scalar, e.g. `np.int64`, rather than a Python int. Issue (GH10904) corrected this for `Series.tolist()` and `list(Series)`. This change makes all iteration methods consistent, in particular, for `__iter__()` and `.map()`; note that this only affects int/float dtypes. (GH13236, GH13258, GH14216).

```
In [40]: s = pd.Series([1, 2, 3])

In [41]: s
Out[41]:
0 1
1 2
2 3
Length: 3, dtype: int64
```

Previously:

```
In [2]: type(list(s)[0])
Out[2]: numpy.int64
```

New Behaviour:

```
In [42]: type(list(s)[0])
Out[42]: int
```

Furthermore this will now correctly box the results of iteration for `DataFrame.to_dict()` as well.

```
In [43]: d = {'a': [1], 'b': ['b']}

In [44]: df = pd.DataFrame(d)
```

Previously:

```
In [8]: type(df.to_dict()['a'][0])
Out[8]: numpy.int64
```

New Behaviour:

```
In [45]: type(df.to_dict()['a'][0])
Out[45]: int
```

## Indexing with a Boolean Index

Previously when passing a boolean Index to `.loc`, if the index of the Series/DataFrame had boolean labels, you would get a label based selection, potentially duplicating result labels, rather than a boolean indexing selection (where `True` selects elements), this was inconsistent how a boolean numpy array indexed. The new behavior is to act like a boolean numpy array indexer. (GH17738)

Previous Behavior:

```
In [46]: s = pd.Series([1, 2, 3], index=[False, True, False])

In [47]: s
Out[47]:
```

(continues on next page)

(continued from previous page)

```
False 1
True 2
False 3
Length: 3, dtype: int64
```

```
In [59]: s.loc[pd.Index([True, False, True])]
Out[59]:
True 2
False 1
False 3
True 2
dtype: int64
```

#### Current Behavior

```
In [48]: s.loc[pd.Index([True, False, True])]
Out[48]:
False 1
False 3
Length: 2, dtype: int64
```

Furthermore, previously if you had an index that was non-numeric (e.g. strings), then a boolean Index would raise a `KeyError`. This will now be treated as a boolean indexer.

#### Previously Behavior:

```
In [49]: s = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [50]: s
Out[50]:
a 1
b 2
c 3
Length: 3, dtype: int64
```

```
In [39]: s.loc[pd.Index([True, False, True])]
KeyError: "None of [Index([True, False, True], dtype='object')] are in the [index]"
```

#### Current Behavior

```
In [51]: s.loc[pd.Index([True, False, True])]
Out[51]:
a 1
c 3
Length: 2, dtype: int64
```

### PeriodIndex resampling

In previous versions of pandas, resampling a `Series/DataFrame` indexed by a `PeriodIndex` returned a `DatetimeIndex` in some cases ([GH12884](#)). Resampling to a multiplied frequency now returns a `PeriodIndex` ([GH15944](#)). As a minor enhancement, resampling a `PeriodIndex` can now handle `NaT` values ([GH13224](#)).

#### Previous Behavior:

```

In [1]: pi = pd.period_range('2017-01', periods=12, freq='M')

In [2]: s = pd.Series(np.arange(12), index=pi)

In [3]: resampled = s.resample('2Q').mean()

In [4]: resampled
Out[4]:
2017-03-31 1.0
2017-09-30 5.5
2018-03-31 10.0
Freq: 2Q-DEC, dtype: float64

In [5]: resampled.index
Out[5]: DatetimeIndex(['2017-03-31', '2017-09-30', '2018-03-31'], dtype=
↳ 'datetime64[ns]', freq='2Q-DEC')

```

New Behavior:

```

In [52]: pi = pd.period_range('2017-01', periods=12, freq='M')

In [53]: s = pd.Series(np.arange(12), index=pi)

In [54]: resampled = s.resample('2Q').mean()

In [55]: resampled
Out[55]:
2017Q1 2.5
2017Q3 8.5
Freq: 2Q-DEC, Length: 2, dtype: float64

In [56]: resampled.index
\\Out[56]:
↳ PeriodIndex(['2017Q1', '2017Q3'], dtype='period[2Q-DEC]', freq='2Q-DEC')

```

Upsampling and calling `.ohlc()` previously returned a Series, basically identical to calling `.asfreq()`. OHLC upsampling now returns a DataFrame with columns open, high, low and close ([GH13083](#)). This is consistent with downsampling and `DatetimeIndex` behavior.

Previous Behavior:

```

In [1]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)

In [2]: s = pd.Series(np.arange(10), index=pi)

In [3]: s.resample('H').ohlc()
Out[3]:
2000-01-01 00:00 0.0
...
2000-01-10 23:00 NaN
Freq: H, Length: 240, dtype: float64

In [4]: s.resample('M').ohlc()
Out[4]:
 open high low close
2000-01 0 9 0 9

```

New Behavior:

```
In [57]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
```

```
In [58]: s = pd.Series(np.arange(10), index=pi)
```

```
In [59]: s.resample('H').ohlc()
```

```
Out [59]:
```

|                  | open | high | low | close |

### Improved error handling during item assignment in pd.eval

`eval()` will now raise a `ValueError` when item assignment malfunctions, or inplace operations are specified, but there is no item assignment in the expression ([GH16732](#))

```
In [61]: arr = np.array([1, 2, 3])
```

Previously, if you attempted the following expression, you would get a not very helpful error message:

```

In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...
IndexError: only integers, slices (`:`), ellipsis (`...`), numpy.newaxis (`None`)
and integer or boolean arrays are valid indices

```

This is a very long way of saying numpy arrays don't support string-item indexing. With this change, the error message is now this:

```

In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...
ValueError: Cannot assign expression output to target

```

It also used to be possible to evaluate expressions inplace, even if there was no item assignment:

```

In [4]: pd.eval("1 + 2", target=arr, inplace=True)
Out[4]: 3

```

However, this input does not make much sense because the output is not being assigned to the target. Now, a `ValueError` will be raised when such an input is passed in:

```

In [4]: pd.eval("1 + 2", target=arr, inplace=True)
...
ValueError: Cannot operate inplace if there is no assignment

```

## Dtype Conversions

Previously assignments, `.where()` and `.fillna()` with a `bool` assignment, would coerce to same the type (e.g. `int / float`), or raise for datetimelikes. These will now preserve the bools with `object` dtypes. (GH16821).

```
In [62]: s = pd.Series([1, 2, 3])
```

```
In [5]: s[1] = True
```

```
In [6]: s
Out[6]:
0 1
1 1
2 3
dtype: int64
```

### New Behavior

```
In [63]: s[1] = True
```

```
In [64]: s
Out[64]:
0 1
1 True
2 3
Length: 3, dtype: object
```

Previously, as assignment to a datetimelike with a non-datetimelike would coerce the non-datetime-like item being assigned (GH14145).

```
In [65]: s = pd.Series([pd.Timestamp('2011-01-01'), pd.Timestamp('2012-01-01')])
```

```
In [1]: s[1] = 1
```

```
In [2]: s
Out[2]:
0 2011-01-01 00:00:00.000000000
1 1970-01-01 00:00:00.000000001
dtype: datetime64[ns]
```

These now coerce to `object` dtype.

```
In [66]: s[1] = 1
```

```
In [67]: s
Out[67]:
0 2011-01-01 00:00:00
1 1
Length: 2, dtype: object
```

- Inconsistent behavior in `.where()` with datetimelikes which would raise rather than coerce to `object` (GH16402)
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype (GH14001)

## MultIndex Constructor with a Single Level

The `MultiIndex` constructors no longer squeezes a `MultiIndex` with all length-one levels down to a regular `Index`. This affects all the `MultiIndex` constructors. (GH17178)

Previous behavior:

```
In [2]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[2]: Index(['a', 'b'], dtype='object')
```

Length 1 levels are no longer special-cased. They behave exactly as if you had length 2+ levels, so a `MultiIndex` is always returned from all of the `MultiIndex` constructors:

```
In [68]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[68]:
MultiIndex(levels=[['a', 'b']],
 labels=[[0, 1]])
```

## UTC Localization with Series

Previously, `to_datetime()` did not localize datetime Series data when `utc=True` was passed. Now, `to_datetime()` will correctly localize Series with a `datetime64[ns, UTC]` dtype to be consistent with how list-like and `Index` data are handled. (GH6415).

Previous Behavior

```
In [69]: s = pd.Series(['20130101 00:00:00'] * 3)
```

```
In [12]: pd.to_datetime(s, utc=True)
Out[12]:
0 2013-01-01
1 2013-01-01
2 2013-01-01
dtype: datetime64[ns]
```

New Behavior

```
In [70]: pd.to_datetime(s, utc=True)
Out[70]:
0 2013-01-01 00:00:00+00:00
1 2013-01-01 00:00:00+00:00
2 2013-01-01 00:00:00+00:00
Length: 3, dtype: datetime64[ns, UTC]
```

Additionally, `DataFrames` with datetime columns that were parsed by `read_sql_table()` and `read_sql_query()` will also be localized to UTC only if the original SQL columns were timezone aware datetime columns.

## Consistency of Range Functions

In previous versions, there were some inconsistencies between the various range functions: `date_range()`, `bdate_range()`, `period_range()`, `timedelta_range()`, and `interval_range()`. (GH17471).

One of the inconsistent behaviors occurred when the `start`, `end` and `period` parameters were all specified, potentially leading to ambiguous ranges. When all three parameters were passed, `interval_range` ignored the `period`

parameter, `period_range` ignored the `end` parameter, and the other range functions raised. To promote consistency among the range functions, and avoid potentially ambiguous ranges, `interval_range` and `period_range` will now raise when all three parameters are passed.

Previous Behavior:

```
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3]]
 closed='right',
 dtype='interval[int64]')

In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]: PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
 dtype='period[Q-DEC]', freq='Q-DEC')
```

New Behavior:

```
In [2]: pd.interval_range(start=0, end=4, periods=6)

ValueError: Of the three parameters: start, end, and periods, exactly two must be
specified

In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')

ValueError: Of the three parameters: start, end, and periods, exactly two must be
specified
```

Additionally, the endpoint parameter `end` was not included in the intervals produced by `interval_range`. However, all other range functions include `end` in their output. To promote consistency among the range functions, `interval_range` will now include `end` as the right endpoint of the final interval, except if `freq` is specified in a way which skips `end`.

Previous Behavior:

```
In [4]: pd.interval_range(start=0, end=4)
Out[4]:
IntervalIndex([(0, 1], (1, 2], (2, 3]]
 closed='right',
 dtype='interval[int64]')
```

New Behavior:

```
In [71]: pd.interval_range(start=0, end=4)
Out[71]:
IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4]]
 closed='right',
 dtype='interval[int64]')
```

## No Automatic Matplotlib Converters

Pandas no longer registers our date, time, datetime, datetime64, and Period converters with matplotlib when pandas is imported. Matplotlib plot methods (`plt.plot`, `ax.plot`, ...), will not nicely format the x-axis for `DatetimeIndex` or `PeriodIndex` values. You must explicitly register these methods:

Pandas built-in `Series.plot` and `DataFrame.plot` *will* register these converters on first-use ([GH17710](#)).

---

**Note:** This change has been temporarily reverted in pandas 0.21.1, for more details see *here*.

---

## Other API Changes

- The Categorical constructor no longer accepts a scalar for the `categories` keyword. (GH16022)
- Accessing a non-existent attribute on a closed `HDFStore` will now raise an `AttributeError` rather than a `ClosedFileError` (GH16301)
- `read_csv()` now issues a `UserWarning` if the `names` parameter contains duplicates (GH17095)
- `read_csv()` now treats 'null' and 'n/a' strings as missing values by default (GH16471, GH16078)
- `pandas.HDFStore`'s string representation is now faster and less detailed. For the previous behavior, use `pandas.HDFStore.info()`. (GH16503).
- Compression defaults in HDF stores now follow pytables standards. Default is no compression and if `complib` is missing and `complevel > 0` `zlib` is used (GH15943)
- `Index.get_indexer_non_unique()` now returns a `ndarray` indexer rather than an `Index`; this is consistent with `Index.get_indexer()` (GH16819)
- Removed the `@slow` decorator from `pandas.util.testing`, which caused issues for some downstream packages' test suites. Use `@pytest.mark.slow` instead, which achieves the same thing (GH16850)
- Moved definition of `MergeError` to the `pandas.errors` module.
- The signature of `Series.set_axis()` and `DataFrame.set_axis()` has been changed from `set_axis(axis, labels)` to `set_axis(labels, axis=0)`, for consistency with the rest of the API. The old signature is deprecated and will show a `FutureWarning` (GH14636)
- `Series.argmax()` and `Series.argmin()` will now raise a `TypeError` when used with object dtypes, instead of a `ValueError` (GH13595)
- `Period` is now immutable, and will now raise an `AttributeError` when a user tries to assign a new value to the `ordinal` or `freq` attributes (GH17116).
- `to_datetime()` when passed a `tz-aware origin=` kwarg will now raise a more informative `ValueError` rather than a `TypeError` (GH16842)
- `to_datetime()` now raises a `ValueError` when `format` includes `%W` or `%U` without also including day of the week and calendar year (GH16774)
- Renamed non-functional `index` to `index_col` in `read_stata()` to improve API consistency (GH16342)
- Bug in `DataFrame.drop()` caused boolean labels `False` and `True` to be treated as labels 0 and 1 respectively when dropping indices from a numeric index. This will now raise a `ValueError` (GH16877)
- Restricted `DateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176).

### 39.4.2.3 Deprecations

- `DataFrame.from_csv()` and `Series.from_csv()` have been deprecated in favor of `read_csv()` (GH4191)
- `read_excel()` has deprecated `sheetname` in favor of `sheet_name` for consistency with `.to_excel()` (GH10559).

- `read_excel()` has deprecated `parse_cols` in favor of `usecols` for consistency with `read_csv()` (GH4988)
- `read_csv()` has deprecated the `tupleize_cols` argument. Column tuples will always be converted to a `MultiIndex` (GH17060)
- `DataFrame.to_csv()` has deprecated the `tupleize_cols` argument. `MultiIndex` columns will be always written as rows in the CSV file (GH17060)
- The `convert` parameter has been deprecated in the `.take()` method, as it was not being respected (GH16948)
- `pd.options.html.border` has been deprecated in favor of `pd.options.display.html.border` (GH15793).
- `SeriesGroupBy.nth()` has deprecated `True` in favor of `'all'` for its kwarg `dropna` (GH11038).
- `DataFrame.as_blocks()` is deprecated, as this is exposing the internal implementation (GH17302)
- `pd.TimeGrouper` is deprecated in favor of `pandas.Grouper` (GH16747)
- `cdate_range` has been deprecated in favor of `bdate_range()`, which has gained `weekmask` and `holidays` parameters for building custom frequency date ranges. See the *documentation* for more details (GH17596)
- passing categories or ordered kwargs to `Series.astype()` is deprecated, in favor of passing a *CategoricalDtype* (GH17636)
- `.get_value` and `.set_value` on `Series`, `DataFrame`, `Panel`, `SparseSeries`, and `SparseDataFrame` are deprecated in favor of using `.iat[]` or `.at[]` accessors (GH15269)
- Passing a non-existent column in `.to_excel(..., columns=)` is deprecated and will raise a `KeyError` in the future (GH17295)
- `raise_on_error` parameter to `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()` is deprecated, in favor of `errors=` (GH14968)
- Using `DataFrame.rename_axis()` and `Series.rename_axis()` to alter index or column *labels* is now deprecated in favor of using `.rename`. `rename_axis` may still be used to alter the name of the index or columns (GH17833).
- `reindex_axis()` has been deprecated in favor of `reindex()`. See *here* for more (GH17833).

## Series.select and DataFrame.select

The `Series.select()` and `DataFrame.select()` methods are deprecated in favor of using `df.loc[labels.map(crit)]` (GH12401)

```
In [72]: df = pd.DataFrame({'A': [1, 2, 3]}, index=['foo', 'bar', 'baz'])
```

```
In [3]: df.select(lambda x: x in ['bar', 'baz'])
```

```
FutureWarning: select is deprecated and will be removed in a future release. You can
↳ use .loc[crit] as a replacement
```

```
Out [3]:
```

```
 A
bar 2
baz 3
```

```
In [73]: df.loc[df.index.map(lambda x: x in ['bar', 'baz'])]
Out[73]:
 A
bar 2
baz 3

[2 rows x 1 columns]
```

### Series.argmax and Series.argmin

The behavior of `Series.argmax()` and `Series.argmin()` have been deprecated in favor of `Series.idxmax()` and `Series.idxmin()`, respectively ([GH16830](#)).

For compatibility with NumPy arrays, `pd.Series` implements `argmax` and `argmin`. Since pandas 0.13.0, `argmax` has been an alias for `pandas.Series.idxmax()`, and `argmin` has been an alias for `pandas.Series.idxmin()`. They return the *label* of the maximum or minimum, rather than the *position*.

We've deprecated the current behavior of `Series.argmax` and `Series.argmin`. Using either of these will emit a `FutureWarning`. Use `Series.idxmax()` if you want the label of the maximum. Use `Series.values.argmax()` if you want the position of the maximum. Likewise for the minimum. In a future release `Series.argmax` and `Series.argmin` will return the position of the maximum or minimum.

#### 39.4.2.4 Removal of prior version deprecations/changes

- `read_excel()` has dropped the `has_index_names` parameter ([GH10967](#))
- The `pd.options.display.height` configuration has been dropped ([GH3663](#))
- The `pd.options.display.line_width` configuration has been dropped ([GH2881](#))
- The `pd.options.display.mpl_style` configuration has been dropped ([GH12190](#))
- `Index` has dropped the `.sym_diff()` method in favor of `.symmetric_difference()` ([GH12591](#))
- `Categorical` has dropped the `.order()` and `.sort()` methods in favor of `.sort_values()` ([GH12882](#))
- `eval()` and `DataFrame.eval()` have changed the default of `inplace` from `None` to `False` ([GH11149](#))
- The function `get_offset_name` has been dropped in favor of the `.freqstr` attribute for an offset ([GH11834](#))
- pandas no longer tests for compatibility with hdf5-files created with pandas < 0.11 ([GH17404](#)).

#### 39.4.2.5 Performance Improvements

- Improved performance of instantiating `SparseDataFrame` ([GH16773](#))
- `Series.dt` no longer performs frequency inference, yielding a large speedup when accessing the attribute ([GH17210](#))
- Improved performance of `set_categories()` by not materializing the values ([GH17508](#))
- `Timestamp.microsecond` no longer re-computes on attribute access ([GH17331](#))
- Improved performance of the `CategoricalIndex` for data that is already categorical dtype ([GH17513](#))
- Improved performance of `RangeIndex.min()` and `RangeIndex.max()` by using `RangeIndex` properties to perform the computations ([GH17607](#))

### 39.4.2.6 Documentation Changes

- Several NaT method docstrings (e.g. `NaT.ctime()`) were incorrect ([GH17327](#))
- The documentation has had references to versions < v0.17 removed and cleaned up ([GH17442](#), [GH17442](#), [GH17404](#) & [GH17504](#))

### 39.4.2.7 Bug Fixes

#### Conversion

- Bug in assignment against datetime-like data with `int` may incorrectly convert to datetime-like ([GH14145](#))
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype ([GH14001](#))
- Fixed the return type of `IntervalIndex.is_non_overlapping_monotonic` to be a Python `bool` for consistency with similar attributes/methods. Previously returned a `numpy.bool_`. ([GH17237](#))
- Bug in `IntervalIndex.is_non_overlapping_monotonic` when intervals are closed on both sides and overlap at a point ([GH16560](#))
- Bug in `Series.fillna()` returns frame when `inplace=True` and value is dict ([GH16156](#))
- Bug in `Timestamp.weekday_name` returning a UTC-based weekday name when localized to a timezone ([GH17354](#))
- Bug in `Timestamp.replace` when replacing `tzinfo` around DST changes ([GH15683](#))
- Bug in `Timedelta` construction and arithmetic that would not propagate the `Overflow` exception ([GH17367](#))
- Bug in `astype()` converting to object dtype when passed extension type classes (`DatetimeTZDtype`, `CategoricalDtype`) rather than instances. Now a `TypeError` is raised when a class is passed ([GH17780](#)).
- Bug in `to_numeric()` in which elements were not always being coerced to numeric when `errors='coerce'` ([GH17007](#), [GH17125](#))
- Bug in `DataFrame` and `Series` constructors where `range` objects are converted to `int32` dtype on Windows instead of `int64` ([GH16804](#))

#### Indexing

- When called with a null slice (e.g. `df.iloc[:]`), the `.iloc` and `.loc` indexers return a shallow copy of the original object. Previously they returned the original object. ([GH13873](#)).
- When called on an unsorted `MultiIndex`, the `loc` indexer now will raise `UnsortedIndexError` only if proper slicing is used on non-sorted levels ([GH16734](#)).
- Fixes regression in 0.20.3 when indexing with a string on a `TimedeltaIndex` ([GH16896](#)).
- Fixed `TimedeltaIndex.get_loc()` handling of `np.timedelta64` inputs ([GH16909](#)).
- Fix `MultiIndex.sort_index()` ordering when ascending argument is a list, but not all levels are specified, or are in a different order ([GH16934](#)).
- Fixes bug where indexing with `np.inf` caused an `OverflowError` to be raised ([GH16957](#))
- Bug in reindexing on an empty `CategoricalIndex` ([GH16770](#))
- Fixes `DataFrame.loc` for setting with alignment and tz-aware `DatetimeIndex` ([GH16889](#))

- Avoids `IndexError` when passing an `Index` or `Series` to `.iloc` with older numpy ([GH17193](#))
- Allow unicode empty strings as placeholders in multilevel columns in Python 2 ([GH17099](#))
- Bug in `.iloc` when used with inplace addition or assignment and an int indexer on a `MultiIndex` causing the wrong indexes to be read from and written to ([GH17148](#))
- Bug in `.isin()` in which checking membership in empty `Series` objects raised an error ([GH16991](#))
- Bug in `CategoricalIndex` reindexing in which specified indices containing duplicates were not being respected ([GH17323](#))
- Bug in intersection of `RangeIndex` with negative step ([GH17296](#))
- Bug in `IntervalIndex` where performing a scalar lookup fails for included right endpoints of non-overlapping monotonic decreasing indexes ([GH16417](#), [GH17271](#))
- Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` when no valid entry ([GH17400](#))
- Bug in `Series.rename()` when called with a callable, incorrectly alters the name of the `Series`, rather than the name of the `Index`. ([GH17407](#))
- Bug in `String.str_get()` raises `IndexError` instead of inserting NaNs when using a negative index. ([GH17704](#))

## I/O

- Bug in `read_hdf()` when reading a timezone aware index from `fixed` format `HDFStore` ([GH17618](#))
- Bug in `read_csv()` in which columns were not being thoroughly de-duplicated ([GH17060](#))
- Bug in `read_csv()` in which specified column names were not being thoroughly de-duplicated ([GH17095](#))
- Bug in `read_csv()` in which non integer values for the header argument generated an unhelpful / unrelated error message ([GH16338](#))
- Bug in `read_csv()` in which memory management issues in exception handling, under certain conditions, would cause the interpreter to segfault ([GH14696](#), [GH16798](#)).
- Bug in `read_csv()` when called with `low_memory=False` in which a CSV with at least one column > 2GB in size would incorrectly raise a `MemoryError` ([GH16798](#)).
- Bug in `read_csv()` when called with a single-element list header would return a `DataFrame` of all NaN values ([GH7757](#))
- Bug in `DataFrame.to_csv()` defaulting to 'ascii' encoding in Python 3, instead of 'utf-8' ([GH17097](#))
- Bug in `read_stata()` where value labels could not be read when using an iterator ([GH16923](#))
- Bug in `read_stata()` where the index was not set ([GH16342](#))
- Bug in `read_html()` where import check fails when run in multiple threads ([GH16928](#))
- Bug in `read_csv()` where automatic delimiter detection caused a `TypeError` to be thrown when a bad line was encountered rather than the correct error message ([GH13374](#))
- Bug in `DataFrame.to_html()` with `notebook=True` where `DataFrames` with named indices or non-`MultiIndex` indices had undesired horizontal or vertical alignment for column or row labels, respectively ([GH16792](#))
- Bug in `DataFrame.to_html()` in which there was no validation of the `justify` parameter ([GH17527](#))
- Bug in `HDFStore.select()` when reading a contiguous mixed-data table featuring `VLAarray` ([GH17021](#))

- Bug in `to_json()` where several conditions (including objects with unprintable symbols, objects with deep recursion, overlong labels) caused segfaults instead of raising the appropriate exception ([GH14256](#))

## Plotting

- Bug in plotting methods using `secondary_y` and `fontsize` not setting secondary axis font size ([GH12565](#))
- Bug when plotting `timedelta` and `datetime` dtypes on y-axis ([GH16953](#))
- Line plots no longer assume monotonic x data when calculating xlimits, they show the entire lines now even for unsorted x data. ([GH11310](#), [GH11471](#))
- With matplotlib 2.0.0 and above, calculation of x limits for line plots is left to matplotlib, so that its new default settings are applied. ([GH15495](#))
- Bug in `Series.plot.bar` or `DataFrame.plot.bar` with `y` not respecting user-passed color ([GH16822](#))
- Bug causing `plotting.parallel_coordinates` to reset the random seed when using random colors ([GH17525](#))

## Groupby/Resample/Rolling

- Bug in `DataFrame.resample(...).size()` where an empty `DataFrame` did not return a `Series` ([GH14962](#))
- Bug in `infer_freq()` causing indices with 2-day gaps during the working week to be wrongly inferred as business daily ([GH16624](#))
- Bug in `.rolling(...).quantile()` which incorrectly used different defaults than `Series.quantile()` and `DataFrame.quantile()` ([GH9413](#), [GH16211](#))
- Bug in `groupby.transform()` that would coerce boolean dtypes back to float ([GH16875](#))
- Bug in `Series.resample(...).apply()` where an empty `Series` modified the source index and did not return the name of a `Series` ([GH14313](#))
- Bug in `.rolling(...).apply(...)` with a `DataFrame` with a `DatetimeIndex`, a window of a `timedelta`-convertible and `min_periods >= 1` ([GH15305](#))
- Bug in `DataFrame.groupby` where index and column keys were not recognized correctly when the number of keys equaled the number of elements on the groupby axis ([GH16859](#))
- Bug in `groupby.nunique()` with `TimeGrouper` which cannot handle `NaT` correctly ([GH17575](#))
- Bug in `DataFrame.groupby` where a single level selection from a `MultiIndex` unexpectedly sorts ([GH17537](#))
- Bug in `DataFrame.groupby` where spurious warning is raised when `Grouper` object is used to override ambiguous column name ([GH17383](#))
- Bug in `TimeGrouper` differs when passes as a list and as a scalar ([GH17530](#))

## Sparse

- Bug in `SparseSeries` raises `AttributeError` when a dictionary is passed in as data ([GH16905](#))
- Bug in `SparseDataFrame.fillna()` not filling all NaNs when frame was instantiated from SciPy sparse matrix ([GH16112](#))

- Bug in `SparseSeries.unstack()` and `SparseDataFrame.stack()` ([GH16614](#), [GH15045](#))
- Bug in `make_sparse()` treating two numeric/boolean data, which have same bits, as same when array dtype is object ([GH17574](#))
- `SparseArray.all()` and `SparseArray.any()` are now implemented to handle `SparseArray`, these were used but not implemented ([GH17570](#))

## Reshaping

- Joining/Merging with a non unique `PeriodIndex` raised a `TypeError` ([GH16871](#))
- Bug in `crosstab()` where non-aligned series of integers were casted to float ([GH17005](#))
- Bug in merging with categorical dtypes with datetimelikes incorrectly raised a `TypeError` ([GH16900](#))
- Bug when using `isin()` on a large object series and large comparison array ([GH16012](#))
- Fixes regression from 0.20, `Series.aggregate()` and `DataFrame.aggregate()` allow dictionaries as return values again ([GH16741](#))
- Fixes dtype of result with integer dtype input, from `pivot_table()` when called with `margins=True` ([GH17013](#))
- Bug in `crosstab()` where passing two `Series` with the same name raised a `KeyError` ([GH13279](#))
- `Series.argmin()`, `Series.argmax()`, and their counterparts on `DataFrame` and `groupby` objects work correctly with floating point data that contains infinite values ([GH13595](#)).
- Bug in `unique()` where checking a tuple of strings raised a `TypeError` ([GH17108](#))
- Bug in `concat()` where order of result index was unpredictable if it contained non-comparable elements ([GH17344](#))
- Fixes regression when sorting by multiple columns on a `datetime64` dtype `Series` with `NaT` values ([GH16836](#))
- Bug in `pivot_table()` where the result's columns did not preserve the categorical dtype of columns when `dropna` was `False` ([GH17842](#))
- Bug in `DataFrame.drop_duplicates` where dropping with non-unique column names raised a `ValueError` ([GH17836](#))
- Bug in `unstack()` which, when called on a list of levels, would discard the `fillna` argument ([GH13971](#))
- Bug in the alignment of range objects and other list-likes with `DataFrame` leading to operations being performed row-wise instead of column-wise ([GH17901](#))

## Numeric

- Bug in `.clip()` with `axis=1` and a list-like for `threshold` is passed; previously this raised `ValueError` ([GH15390](#))
- `Series.clip()` and `DataFrame.clip()` now treat NA values for upper and lower arguments as `None` instead of raising `ValueError` ([GH17276](#)).

## Categorical

- Bug in `Series.isin()` when called with a categorical ([GH16639](#))
- Bug in the categorical constructor with empty values and categories causing the `.categories` to be an empty `Float64Index` rather than an empty `Index` with object dtype ([GH17248](#))
- Bug in categorical operations with `Series.cat` not preserving the original Series' name ([GH17509](#))
- Bug in `DataFrame.merge()` failing for categorical columns with boolean/int data types ([GH17187](#))
- Bug in constructing a `Categorical/CategoricalDtype` when the specified categories are of categorical type ([GH17884](#)).

## PyPy

- Compatibility with PyPy in `read_csv()` with `usecols=[<unsorted ints>]` and `read_json()` ([GH17351](#))
- Split tests into cases for CPython and PyPy where needed, which highlights the fragility of index matching with `float('nan')`, `np.nan` and `NAT` ([GH17351](#))
- Fix `DataFrame.memory_usage()` to support PyPy. Objects on PyPy do not have a fixed size, so an approximation is used instead ([GH17228](#))

## Other

- Bug where some inplace operators were not being wrapped and produced a copy when invoked ([GH12962](#))
- Bug in `eval()` where the `inplace` parameter was being incorrectly handled ([GH16732](#))

### 39.4.2.8 Contributors

A total of 206 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.5 Version 0.20

### 39.5.1 v0.20.3 (July 7, 2017)

{{ header }}

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

#### What's new in v0.20.3

- *Bug Fixes*
  - *Conversion*
  - *Indexing*
  - *I/O*
  - *Plotting*
  - *Reshaping*
  - *Categorical*
- *Contributors*

#### 39.5.1.1 Bug Fixes

- Fixed a bug in failing to compute rolling computations of a column-MultiIndexed DataFrame ([GH16789](#), [GH16825](#))
- Fixed a pytest marker failing downstream packages' tests suites ([GH16680](#))

## Conversion

- Bug in pickle compat prior to the v0.20.x series, when UTC is a timezone in a Series/DataFrame/Index ([GH16608](#))
- Bug in Series construction when passing a Series with dtype='category' ([GH16524](#)).
- Bug in DataFrame.astype() when passing a Series as the dtype kwarg. ([GH16717](#)).

## Indexing

- Bug in Float64Index causing an empty array instead of None to be returned from .get(np.nan) on a Series whose index did not contain any NaNs ([GH8569](#))
- Bug in MultiIndex.isin causing an error when passing an empty iterable ([GH16777](#))
- Fixed a bug in a slicing DataFrame/Series that have a TimedeltaIndex ([GH16637](#))

## I/O

- Bug in read\_csv() in which files weren't opened as binary files by the C engine on Windows, causing EOF characters mid-field, which would fail ([GH16039](#), [GH16559](#), [GH16675](#))
- Bug in read\_hdf() in which reading a Series saved to an HDF file in 'fixed' format fails when an explicit mode='r' argument is supplied ([GH16583](#))
- Bug in DataFrame.to\_latex() where bold\_rows was wrongly specified to be True by default, whereas in reality row labels remained non-bold whatever parameter provided. ([GH16707](#))
- Fixed an issue with DataFrame.style() where generated element ids were not unique ([GH16780](#))
- Fixed loading a DataFrame with a PeriodIndex, from a format='fixed' HDFStore, in Python 3, that was written in Python 2 ([GH16781](#))

## Plotting

- Fixed regression that prevented RGB and RGBA tuples from being used as color arguments ([GH16233](#))
- Fixed an issue with DataFrame.plot.scatter() that incorrectly raised a KeyError when categorical data is used for plotting ([GH16199](#))

## Reshaping

- PeriodIndex / TimedeltaIndex.join was missing the sort= kwarg ([GH16541](#))
- Bug in joining on a MultiIndex with a category dtype for a level ([GH16627](#)).
- Bug in merge() when merging/joining with multiple categorical columns ([GH16767](#))

## Categorical

- Bug in DataFrame.sort\_values not respecting the kind parameter with categorical data ([GH16793](#))

### 39.5.1.2 Contributors

A total of 20 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.5.2 v0.20.2 (June 4, 2017)

{{ header }}

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

#### What's new in v0.20.2

- *Enhancements*
- *Performance Improvements*
- *Bug Fixes*
  - *Conversion*
  - *Indexing*
  - *I/O*

- *Plotting*
- *Groupby/Resample/Rolling*
- *Sparse*
- *Reshaping*
- *Numeric*
- *Categorical*
- *Other*
- *Contributors*

### 39.5.2.1 Enhancements

- Unblocked access to additional compression types supported in pytables: ‘blosc:blosclz’, ‘blosc:lz4’, ‘blosc:lz4hc’, ‘blosc:snappy’, ‘blosc:zlib’, ‘blosc:zstd’ ([GH14478](#))
- `Series` provides a `to_latex` method ([GH16180](#))
- A new groupby method `ngroup()`, parallel to the existing `cumcount()`, has been added to return the group order ([GH11642](#)); see *here*.

### 39.5.2.2 Performance Improvements

- Performance regression fix when indexing with a list-like ([GH16285](#))
- Performance regression fix for MultiIndexes ([GH16319](#), [GH16346](#))
- Improved performance of `.clip()` with scalar arguments ([GH15400](#))
- Improved performance of groupby with categorical groupers ([GH16413](#))
- Improved performance of `MultiIndex.remove_unused_levels()` ([GH16556](#))

### 39.5.2.3 Bug Fixes

- Silenced a warning on some Windows environments about “tput: terminal attributes: No such device or address” when detecting the terminal size. This fix only applies to python 3 ([GH16496](#))
- Bug in using `pathlib.Path` or `py.path.local` objects with io functions ([GH16291](#))
- Bug in `Index.symmetric_difference()` on two equal `MultiIndex`’s, results in a `TypeError` ([GH13490](#))
- Bug in `DataFrame.update()` with `overwrite=False` and `NaN` values ([GH15593](#))
- Passing an invalid engine to `read_csv()` now raises an informative `ValueError` rather than `UnboundLocalError`. ([GH16511](#))
- Bug in `unique()` on an array of tuples ([GH16519](#))
- Bug in `cut()` when labels are set, resulting in incorrect label ordering ([GH16459](#))
- Fixed a compatibility issue with IPython 6.0’s tab completion showing deprecation warnings on `Categoricals` ([GH16409](#))

## Conversion

- Bug in `to_numeric()` in which empty data inputs were causing a segfault of the interpreter ([GH16302](#))
- Silence numpy warnings when broadcasting DataFrame to Series with comparison ops ([GH16378](#), [GH16306](#))

## Indexing

- Bug in `DataFrame.reset_index(level=)` with single level index ([GH16263](#))
- Bug in partial string indexing with a monotonic, but not strictly-monotonic, index incorrectly reversing the slice bounds ([GH16515](#))
- Bug in `MultiIndex.remove_unused_levels()` that would not return a MultiIndex equal to the original. ([GH16556](#))

## I/O

- Bug in `read_csv()` when `comment` is passed in a space delimited text file ([GH16472](#))
- Bug in `read_csv()` not raising an exception with nonexistent columns in `usecols` when it had the correct length ([GH14671](#))
- Bug that would force importing of the clipboard routines unnecessarily, potentially causing an import error on startup ([GH16288](#))
- Bug that raised `IndexError` when HTML-rendering an empty DataFrame ([GH15953](#))
- Bug in `read_csv()` in which tarfile object inputs were raising an error in Python 2.x for the C engine ([GH16530](#))
- Bug where `DataFrame.to_html()` ignored the `index_names` parameter ([GH16493](#))
- Bug where `pd.read_hdf()` returns numpy strings for index names ([GH13492](#))
- Bug in `HDFStore.select_as_multiple()` where start/stop arguments were not respected ([GH16209](#))

## Plotting

- Bug in `DataFrame.plot` with a single column and a list-like `color` ([GH3486](#))
- Bug in `plot` where `NaT` in `DatetimeIndex` results in `Timestamp.min` ([GH12405](#))
- Bug in `DataFrame.boxplot` where `figsize` keyword was not respected for non-grouped boxplots ([GH11959](#))

## Groupby/Resample/Rolling

- Bug in creating a time-based rolling window on an empty DataFrame ([GH15819](#))
- Bug in `rolling.cov()` with offset window ([GH16058](#))
- Bug in `.resample()` and `.groupby()` when aggregating on integers ([GH16361](#))

## Sparse

- Bug in construction of `SparseDataFrame` from `scipy.sparse.dok_matrix` (GH16179)

## Reshaping

- Bug in `DataFrame.stack` with unsorted levels in `MultiIndex` columns (GH16323)
- Bug in `pd.wide_to_long()` where no error was raised when `i` was not a unique identifier (GH16382)
- Bug in `Series.isin(..)` with a list of tuples (GH16394)
- Bug in construction of a `DataFrame` with mixed dtypes including an all-`NaT` column. (GH16395)
- Bug in `DataFrame.agg()` and `Series.agg()` with aggregating on non-callable attributes (GH16405)

## Numeric

- Bug in `.interpolate()`, where `limit_direction` was not respected when `limit=None` (default) was passed (GH16282)

## Categorical

- Fixed comparison operations considering the order of the categories when both categoricals are unordered (GH16014)

## Other

- Bug in `DataFrame.drop()` with an empty-list with non-unique indices (GH16270)

### 39.5.2.4 Contributors

### 39.5.3 v0.20.1 (May 5, 2017)

{{ header }}

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- New `.agg()` API for Series/DataFrame similar to the groupby-rolling-resample API’s, see [here](#)
- Integration with the feather-format, including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see [here](#).
- The `.ix` indexer has been deprecated, see [here](#)
- Panel has been deprecated, see [here](#)
- Addition of an `IntervalIndex` and `Interval` scalar type, see [here](#)
- Improved user API when grouping by index levels in `.groupby()`, see [here](#)

- Improved support for `UInt64` dtypes, see [here](#)
- A new orient for JSON serialization, `orient='table'`, that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see [here](#)
- Experimental support for exporting styled DataFrames (`DataFrame.style`) to Excel, see [here](#)
- Window binary corr/cov operations now return a `MultiIndexed DataFrame` rather than a `Panel`, as `Panel` is now deprecated, see [here](#)
- Support for S3 handling now uses `s3fs`, see [here](#)
- Google BigQuery support now uses the `pandas-gbq` library, see [here](#)

**Warning:** Pandas has changed the internal structure and layout of the code base. This can affect imports that are not from the top-level `pandas.*` namespace, please see the changes [here](#).

Check the *API Changes* and *deprecations* before updating.

**Note:** This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas' `utils` routines. ([GH16250](#))

#### What's new in v0.20.0

- *New features*
  - *agg API for DataFrame/Series*
  - *dtype keyword for data IO*
  - *.to\_datetime() has gained an origin parameter*
  - *Groupby Enhancements*
  - *Better support for compressed URLs in read\_csv*
  - *Pickle file I/O now supports compression*
  - *UInt64 Support Improved*
  - *GroupBy on Categoricals*
  - *Table Schema Output*
  - *SciPy sparse matrix from/to SparseDataFrame*
  - *Excel output for styled DataFrames*
  - *IntervalIndex*
  - *Other Enhancements*
- *Backwards incompatible API changes*
  - *Possible incompatibility for HDF5 formats created with pandas < 0.13.0*
  - *Map on Index types now return other Index types*
  - *Accessing datetime fields of Index now return Index*
  - *pd.unique will now be consistent with extension types*

- *S3 File Handling*
- *Partial String Indexing Changes*
- *Concat of different float dtypes will not automatically upcast*
- *Pandas Google BigQuery support has moved*
- *Memory Usage for Index is more Accurate*
- *DataFrame.sort\_index changes*
- *Groupby Describe Formatting*
- *Window Binary Corr/Cov operations return a MultiIndex DataFrame*
- *HDFStore where string comparison*
- *Index.intersection and inner join now preserve the order of the left Index*
- *Pivot Table always returns a DataFrame*
- *Other API Changes*
- *Reorganization of the library: Privacy Changes*
  - *Modules Privacy Has Changed*
  - *pandas.errors*
  - *pandas.testing*
  - *pandas.plotting*
  - *Other Development Changes*
- *Deprecations*
  - *Deprecate .ix*
  - *Deprecate Panel*
  - *Deprecate groupby.agg() with a dictionary when renaming*
  - *Deprecate .plotting*
  - *Other Deprecations*
- *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Bug Fixes*
  - *Conversion*
  - *Indexing*
  - *I/O*
  - *Plotting*
  - *Groupby/Resample/Rolling*
  - *Sparse*
  - *Reshaping*
  - *Numeric*

### 39.5.3.1 New features

#### agg API for DataFrame/Series

Series & DataFrame have been enhanced to support the aggregation API. This is a familiar API from groupby, window operations, and resampling. This allows aggregation operations in a concise way by using `agg()` and `transform()`. The full documentation is *here* ([GH1623](#)).

Here is a sample

```
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
...: index=pd.date_range('1/1/2000', periods=10))
...:

In [2]: df.iloc[3:7] = np.nan

In [3]: df
Out[3]:
```

|            | A         | B         | C         |
|------------|-----------|-----------|-----------|
| 2000-01-01 | -1.392054 | 1.153922  | 1.181944  |
| 2000-01-02 | 0.391371  | -0.881047 | 0.295080  |
| 2000-01-03 | 1.863801  | -1.712274 | -1.407085 |
| 2000-01-04 | NaN       | NaN       | NaN       |
| 2000-01-05 | NaN       | NaN       | NaN       |
| 2000-01-06 | NaN       | NaN       | NaN       |
| 2000-01-07 | NaN       | NaN       | NaN       |
| 2000-01-08 | 1.076541  | 0.363177  | 1.893680  |
| 2000-01-09 | -0.485753 | 0.387674  | 0.023558  |
| 2000-01-10 | -0.660230 | -0.318685 | -0.722662 |

```
[10 rows x 3 columns]
```

One can operate using string function names, callables, lists, or dictionaries of these.

Using a single function is equivalent to `.apply`.

```
In [4]: df.agg('sum')
Out[4]:
```

|   |           |
|---|-----------|
| A | 0.793677  |
| B | -1.007232 |
| C | 1.264515  |

```
Length: 3, dtype: float64
```

Multiple aggregations with a list of functions.

```
In [5]: df.agg(['sum', 'min'])
Out[5]:
```

|     | A         | B         | C         |
|-----|-----------|-----------|-----------|
| sum | 0.793677  | -1.007232 | 1.264515  |
| min | -1.392054 | -1.712274 | -1.407085 |

```
[2 rows x 3 columns]
```

Using a dict provides the ability to apply specific aggregations per column. You will get a matrix-like output of all of the aggregators. The output has one column per unique function. Those functions applied to a particular column will be NaN:

```
In [6]: df.agg({'A': ['sum', 'min'], 'B': ['min', 'max']})
Out[6]:
```

|     | A         | B         |
|-----|-----------|-----------|
| max | NaN       | 1.153922  |
| min | -1.392054 | -1.712274 |
| sum | 0.793677  | NaN       |

```
[3 rows x 2 columns]
```

The API also supports a `.transform()` function for broadcasting results.

```
In [7]: df.transform(['abs', lambda x: x - x.min()])
Out[7]:
```

|            | A        |          | B        |          | C        |          |
|------------|----------|----------|----------|----------|----------|----------|
|            | abs      | <lambda> | abs      | <lambda> | abs      | <lambda> |
| 2000-01-01 | 1.392054 | 0.000000 | 1.153922 | 2.866196 | 1.181944 | 2.589029 |
| 2000-01-02 | 0.391371 | 1.783426 | 0.881047 | 0.831227 | 0.295080 | 1.702165 |
| 2000-01-03 | 1.863801 | 3.255855 | 1.712274 | 0.000000 | 1.407085 | 0.000000 |
| 2000-01-04 | NaN      | NaN      | NaN      | NaN      | NaN      | NaN      |
| 2000-01-05 | NaN      | NaN      | NaN      | NaN      | NaN      | NaN      |
| 2000-01-06 | NaN      | NaN      | NaN      | NaN      | NaN      | NaN      |
| 2000-01-07 | NaN      | NaN      | NaN      | NaN      | NaN      | NaN      |
| 2000-01-08 | 1.076541 | 2.468595 | 0.363177 | 2.075451 | 1.893680 | 3.300764 |
| 2000-01-09 | 0.485753 | 0.906301 | 0.387674 | 2.099948 | 0.023558 | 1.430642 |
| 2000-01-10 | 0.660230 | 0.731825 | 0.318685 | 1.393589 | 0.722662 | 0.684422 |

```
[10 rows x 6 columns]
```

When presented with mixed dtypes that cannot be aggregated, `.agg()` will only take the valid aggregations. This is similar to how `groupby .agg()` works. (GH15015)

```
In [8]: df = pd.DataFrame({'A': [1, 2, 3],
...: 'B': [1., 2., 3.],
...: 'C': ['foo', 'bar', 'baz'],
...: 'D': pd.date_range('20130101', periods=3)})
...:

In [9]: df.dtypes
Out[9]:
```

|   |                |
|---|----------------|
| A | int64          |
| B | float64        |
| C | object         |
| D | datetime64[ns] |

```
Length: 4, dtype: object
```

```
In [10]: df.agg(['min', 'sum'])
Out[10]:
```

|     | A | B   | C         | D          |
|-----|---|-----|-----------|------------|
| min | 1 | 1.0 | bar       | 2013-01-01 |
| sum | 6 | 6.0 | foobarbaz | NaT        |

```
[2 rows x 4 columns]
```

## dtype keyword for data IO

The 'python' engine for `read_csv()`, as well as the `read_fwf()` function for parsing fixed-width text files and `read_excel()` for parsing Excel files, now accept the `dtype` keyword argument for specifying the types of specific columns ([GH14295](#)). See the *io docs* for more information.

```
In [11]: data = "a b\n1 2\n3 4"

In [12]: pd.read_fwf(StringIO(data)).dtypes
Out[12]:
a int64
b int64
Length: 2, dtype: object

In [13]: pd.read_fwf(StringIO(data), dtype={'a': 'float64', 'b': 'object'}).dtypes
Out[13]:
a float64
b object
Length: 2, dtype: object
```

## .to\_datetime() has gained an origin parameter

`to_datetime()` has gained a new parameter, `origin`, to define a reference date from where to compute the resulting timestamps when parsing numerical values with a specific unit specified. ([GH11276](#), [GH11745](#))

For example, with 1960-01-01 as the starting date:

```
In [14]: pd.to_datetime([1, 2, 3], unit='D', origin=pd.Timestamp('1960-01-01'))
Out[14]: DatetimeIndex(['1960-01-02', '1960-01-03', '1960-01-04'], dtype=
 <object> 'datetime64[ns]', freq=None)
```

The default is set at `origin='unix'`, which defaults to 1970-01-01 00:00:00, which is commonly called 'unix epoch' or POSIX time. This was the previous default, so this is a backward compatible change.

```
In [15]: pd.to_datetime([1, 2, 3], unit='D')
Out[15]: DatetimeIndex(['1970-01-02', '1970-01-03', '1970-01-04'], dtype=
 <object> 'datetime64[ns]', freq=None)
```

## Groupby Enhancements

Strings passed to `DataFrame.groupby()` as the `by` parameter may now reference either column names or index level names. Previously, only column names could be referenced. This allows to easily group by a column and index level at the same time. ([GH5677](#))

```
In [16]: arrays = [['bar', 'bar', 'baz', 'baz', 'foo', 'foo', 'qux', 'qux'],
 : ['one', 'two', 'one', 'two', 'one', 'two', 'one', 'two']]
 :

In [17]: index = pd.MultiIndex.from_arrays(arrays, names=['first', 'second'])

In [18]: df = pd.DataFrame({'A': [1, 1, 1, 1, 2, 2, 3, 3],
 : 'B': np.arange(8)},
 : index=index)
 :
```

(continues on next page)

(continued from previous page)

```

In [19]: df
Out[19]:
 first second A B
bar one 1 0
 two 1 1
baz one 1 2
 two 1 3
foo one 2 4
 two 2 5
qux one 3 6
 two 3 7

[8 rows x 2 columns]

In [20]: df.groupby(['second', 'A']).sum()
///
↪
 B
second A
one 1 2
 2 4
 3 6
two 1 4
 2 5
 3 7

[6 rows x 1 columns]

```

### Better support for compressed URLs in `read_csv`

The compression code was refactored (GH12688). As a result, reading dataframes from URLs in `read_csv()` or `read_table()` now supports additional compression methods: `xz`, `bz2`, and `zip` (GH14570). Previously, only `gzip` compression was supported. By default, compression of URLs and paths are now inferred using their file extensions. Additionally, support for `bz2` compression in the python 2 C-engine improved (GH14874).

```

In [21]: url = ('https://github.com/{repo}/raw/{branch}/{path}'
.....: .format(repo='pandas-dev/pandas',
.....: branch='master',
.....: path='pandas/tests/io/parser/data/salaries.csv.bz2'))
.....:

default, infer compression
In [22]: df = pd.read_csv(url, sep='\t', compression='infer')

explicitly specify compression
In [23]: df = pd.read_csv(url, sep='\t', compression='bz2')

In [24]: df.head(2)
Out[24]:
 S X E M
0 13876 1 1 1
1 11608 1 3 0

```

(continues on next page)

(continued from previous page)

[2 rows x 4 columns]

### Pickle file I/O now supports compression

`read_pickle()`, `DataFrame.to_pickle()` and `Series.to_pickle()` can now read from and write to compressed pickle files. Compression methods can be an explicit parameter or be inferred from the file extension. See [the docs here](#).

```
In [25]: df = pd.DataFrame({'A': np.random.randn(1000),
.....: 'B': 'foo',
.....: 'C': pd.date_range('20130101', periods=1000, freq='s')})
.....:
```

#### Using an explicit compression type

```
In [26]: df.to_pickle("data.pkl.compress", compression="gzip")

In [27]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")

In [28]: rt.head()
Out[28]:
```

|   | A        | B   | C                   |
|---|----------|-----|---------------------|
| 0 | 0.177387 | foo | 2013-01-01 00:00:00 |
| 1 | 0.983513 | foo | 2013-01-01 00:00:01 |
| 2 | 0.023505 | foo | 2013-01-01 00:00:02 |
| 3 | 0.553777 | foo | 2013-01-01 00:00:03 |
| 4 | 0.353769 | foo | 2013-01-01 00:00:04 |

[5 rows x 3 columns]

The default is to infer the compression type from the extension (`compression='infer'`):

```
In [29]: df.to_pickle("data.pkl.gz")

In [30]: rt = pd.read_pickle("data.pkl.gz")

In [31]: rt.head()
Out[31]:
```

|   | A        | B   | C                   |
|---|----------|-----|---------------------|
| 0 | 0.177387 | foo | 2013-01-01 00:00:00 |
| 1 | 0.983513 | foo | 2013-01-01 00:00:01 |
| 2 | 0.023505 | foo | 2013-01-01 00:00:02 |
| 3 | 0.553777 | foo | 2013-01-01 00:00:03 |
| 4 | 0.353769 | foo | 2013-01-01 00:00:04 |

[5 rows x 3 columns]

```
In [32]: df["A"].to_pickle("s1.pkl.bz2")

In [33]: rt = pd.read_pickle("s1.pkl.bz2")

In [34]: rt.head()
Out[34]:
```

|   |          |
|---|----------|
| 0 | 0.177387 |
|---|----------|

(continues on next page)

(continued from previous page)

```

1 0.983513

3 0.553777
4 0.353769
Name: A, Length: 5, dtype: float64

```

## UInt64 Support Improved

Pandas has significantly improved support for operations involving unsigned, or purely non-negative, integers. Previously, handling these integers would result in improper rounding or data-type casting, leading to incorrect results. Notably, a new numerical index, `UInt64Index`, has been created ([GH14937](#))

```

In [35]: idx = pd.UInt64Index([1, 2, 3])

In [36]: df = pd.DataFrame({'A': ['a', 'b', 'c']}, index=idx)

In [37]: df.index
Out [37]: UInt64Index([1, 2, 3], dtype='uint64')

```

- Bug in converting object elements of array-like objects to unsigned 64-bit integers ([GH4471](#), [GH14982](#))
- Bug in `Series.unique()` in which unsigned 64-bit integers were causing overflow ([GH14721](#))
- Bug in `DataFrame` construction in which unsigned 64-bit integer elements were being converted to objects ([GH14881](#))
- Bug in `pd.read_csv()` in which unsigned 64-bit integer elements were being improperly converted to the wrong data types ([GH14983](#))
- Bug in `pd.unique()` in which unsigned 64-bit integers were causing overflow ([GH14915](#))
- Bug in `pd.value_counts()` in which unsigned 64-bit integers were being erroneously truncated in the output ([GH14934](#))

## GroupBy on Categoricals

In previous versions, `.groupby(..., sort=False)` would fail with a `ValueError` when grouping on a categorical series with some categories not appearing in the data. ([GH13179](#))

```

In [38]: chromosomes = np.r_[np.arange(1, 23).astype(str), ['X', 'Y']]

In [39]: df = pd.DataFrame({
.....: 'A': np.random.randint(100),
.....: 'B': np.random.randint(100),
.....: 'C': np.random.randint(100),
.....: 'chromosomes': pd.Categorical(np.random.choice(chromosomes, 100),
.....: categories=chromosomes,
.....: ordered=True)})

In [40]: df
Out [40]:
 A B C chromosomes
0 64 56 54 1
1 64 56 54 Y

```

```

**Table Schema Output**

The new orient 'table' for `DataFrame.to_json()` will generate a [Table Schema](#) compatible string representation of the data.

```

In [42]: df = pd.DataFrame(
.....: {'A': [1, 2, 3],
.....: 'B': ['a', 'b', 'c'],
.....: 'C': pd.date_range('2016-01-01', freq='d', periods=3)},
.....: index=pd.Index(range(3), name='idx'))
.....:

```

(continues on next page)

(continued from previous page)

```

In [43]: df
Out[43]:
 A B C
idx
0 1 a 2016-01-01
1 2 b 2016-01-02
2 3 c 2016-01-03

[3 rows x 3 columns]

In [44]: df.to_json(orient='table')
////////////////////////////////////
↪ '{"schema": {"fields": [{"name": "idx", "type": "integer"}, {"name": "A", "type": "integer"},
↪ {"name": "B", "type": "string"}, {"name": "C", "type": "datetime"}], "primaryKey": ["idx"],
↪ "pandas_version": "0.20.0"}, "data": [{"idx": 0, "A": 1, "B": "a", "C": "2016-01-
↪ 01T00:00:00.000Z"}, {"idx": 1, "A": 2, "B": "b", "C": "2016-01-02T00:00:00.000Z"}, {"idx": 2,
↪ "A": 3, "B": "c", "C": "2016-01-03T00:00:00.000Z"}]}'

```

See *IO: Table Schema* for more information.

Additionally, the repr for DataFrame and Series can now publish this JSON Table schema representation of the Series or DataFrame if you are using IPython (or another frontend like `interact` using the Jupyter messaging protocol). This gives frontends like the Jupyter notebook and `interact` more flexibility in how they display pandas objects, since they have more information about the data. You must enable this by setting the `display.html.table_schema` option to `True`.

## SciPy sparse matrix from/to SparseDataFrame

Pandas now supports creating sparse dataframes directly from `scipy.sparse.spmatrix` instances. See the *documentation* for more information. ([GH4343](#))

All sparse formats are supported, but matrices that are not in `COOrdinate` format will be converted, copying data as needed.

```

In [45]: from scipy.sparse import csr_matrix

In [46]: arr = np.random.random(size=(1000, 5))

In [47]: arr[arr < .9] = 0

In [48]: sp_arr = csr_matrix(arr)

In [49]: sp_arr
Out[49]:
<1000x5 sparse matrix of type '<class 'numpy.float64'>'
 with 491 stored elements in Compressed Sparse Row format>

In [50]: sdf = pd.SparseDataFrame(sp_arr)

In [51]: sdf
Out[51]:
 0 1 2 3 4
0 NaN 0.979140 NaN NaN NaN
1 NaN NaN NaN NaN NaN

```

[1000 rows x 5 columns]

```

To convert a `SparseDataFrame` back to sparse SciPy matrix in COO format, you can use:

```

In [52]: sdf.to_coo()
Out [52]:
<1000x5 sparse matrix of type '<class 'numpy.float64'>'
 with 491 stored elements in COOrdinate format>

```

## Excel output for styled DataFrames

Experimental support has been added to export `DataFrame.style` formats to Excel using the `openpyxl` engine. (GH15530)

For example, after running the following, `styled.xlsx` renders as below:

```

In [53]: np.random.seed(24)

In [54]: df = pd.DataFrame({'A': np.linspace(1, 10, 10)})

In [55]: df = pd.concat([df, pd.DataFrame(np.random.RandomState(24).randn(10, 4),
 : columns=list('BCDE'))],
 : axis=1)

In [56]: df.iloc[0, 2] = np.nan

In [57]: df
Out [57]:
 A B C D E
0 1.0 1.329212 NaN -0.316280 -0.990810
1 2.0 -1.070816 -1.438713 0.564417 0.295722
2 3.0 -1.626404 0.219565 0.678805 1.889273

8 9.0 1.686583 -1.325963 1.428984 -2.089354
9 10.0 -0.129820 0.631523 -0.586538 0.290720

[10 rows x 5 columns]

In [58]: styled = (df.style
 : .applymap(lambda val: 'color: %s' % 'red' if val < 0 else 'black')
 : .highlight_max())
 :

In [59]: styled.to_excel('styled.xlsx', engine='openpyxl')

```

(continued from previous page)

```
closed='right',
dtype='interval[float64]')
```

Furthermore, this allows one to bin *other* data with these same bins, with NaN representing a missing value similar to other dtypes.

```
In [63]: pd.cut([0, 3, 5, 1], bins=c.categories)
Out[63]:
[(-0.003, 1.5], (1.5, 3.0], NaN, (-0.003, 1.5]]
Categories (2, interval[float64]): [(-0.003, 1.5] < (1.5, 3.0]]
```

An IntervalIndex can also be used in Series and DataFrame as the index.

```
In [64]: df = pd.DataFrame({'A': range(4),
.....: 'B': pd.cut([0, 3, 1, 1], bins=c.categories)
.....: }).set_index('B')
.....:

In [65]: df
Out[65]:
```

|               | A |
|---------------|---|
| B             |   |
| (-0.003, 1.5] | 0 |
| (1.5, 3.0]    | 1 |
| (-0.003, 1.5] | 2 |
| (-0.003, 1.5] | 3 |

```
[4 rows x 1 columns]
```

Selecting via a specific interval:

```
In [66]: df.loc[pd.Interval(1.5, 3.0)]
Out[66]:
```

| A |
|---|
| 1 |

```
Name: (1.5, 3.0], Length: 1, dtype: int64
```

Selecting via a scalar value that is contained *in* the intervals.

```
In [67]: df.loc[0]
Out[67]:
```

| A |
|---|
| 0 |
| 2 |
| 3 |

```
[3 rows x 1 columns]
```

## Other Enhancements

- `DataFrame.rolling()` now accepts the parameter `closed='right'|'left'|'both'|'neither'` to choose the rolling window-endpoint closedness. See the *documentation* ([GH13965](#))
- Integration with the feather-format, including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see *here*.

- `Series.str.replace()` now accepts a callable, as replacement, which is passed to `re.sub` (GH15055)
- `Series.str.replace()` now accepts a compiled regular expression as a pattern (GH15446)
- `Series.sort_index` accepts parameters `kind` and `na_position` (GH13589, GH14444)
- `DataFrame` and `DataFrame.groupby()` have gained a `nunique()` method to count the distinct values over an axis (GH14336, GH15197).
- `DataFrame` has gained a `melt()` method, equivalent to `pd.melt()`, for unpivoting from a wide to long format (GH12640).
- `pd.read_excel()` now preserves sheet order when using `sheetname=None` (GH9930)
- Multiple offset aliases with decimal points are now supported (e.g. `0.5min` is parsed as `30s`) (GH8419)
- `.isnull()` and `.notnull()` have been added to `Index` object to make them more consistent with the `Series` API (GH15300)
- New `UnsortedIndexError` (subclass of `KeyError`) raised when indexing/slicing into an unsorted `MultiIndex` (GH11897). This allows differentiation between errors due to lack of sorting or an incorrect key. See [here](#)
- `MultiIndex` has gained a `.to_frame()` method to convert to a `DataFrame` (GH12397)
- `pd.cut` and `pd.qcut` now support `datetime64` and `timedelta64` dtypes (GH14714, GH14798)
- `pd.qcut` has gained the `duplicates='raise'|'drop'` option to control whether to raise on duplicated edges (GH7751)
- `Series` provides a `to_excel` method to output Excel files (GH8825)
- The `usecols` argument in `pd.read_csv()` now accepts a callable function as a value (GH14154)
- The `skiprows` argument in `pd.read_csv()` now accepts a callable function as a value (GH10882)
- The `nrows` and `chunksize` arguments in `pd.read_csv()` are supported if both are passed (GH6774, GH15755)
- `DataFrame.plot` now prints a title above each subplot if `suplots=True` and `title` is a list of strings (GH14753)
- `DataFrame.plot` can pass the `matplotlib` 2.0 default color cycle as a single string as `color` parameter, see [here](#). (GH15516)
- `Series.interpolate()` now supports `timedelta` as an index type with `method='time'` (GH6424)
- Addition of a `level` keyword to `DataFrame/Series.rename` to rename labels in the specified level of a `MultiIndex` (GH4160).
- `DataFrame.reset_index()` will now interpret a tuple `index.name` as a key spanning across levels of columns, if this is a `MultiIndex` (GH16164)
- `Timedelta.isoformat` method added for formatting `Timedeltas` as an [ISO 8601 duration](#). See the [Timedelta docs](#) (GH15136)
- `.select_dtypes()` now allows the string `datetimez` to generically select datetimes with `tz` (GH14910)
- The `.to_latex()` method will now accept `multicolumn` and `multirow` arguments to use the accompanying LaTeX enhancements
- `pd.merge_asof()` gained the option `direction='backward'|'forward'|'nearest'` (GH14887)
- `Series/DataFrame.asfreq()` have gained a `fill_value` parameter, to fill missing values (GH3715).

- `Series/DataFrame.resample.asfreq` have gained a `fill_value` parameter, to fill missing values during resampling (GH3715).
- `pandas.util.hash_pandas_object()` has gained the ability to hash a `MultiIndex` (GH15224)
- `Series/DataFrame.squeeze()` have gained the `axis` parameter. (GH15339)
- `DataFrame.to_excel()` has a new `freeze_panes` parameter to turn on Freeze Panes when exporting to Excel (GH15160)
- `pd.read_html()` will parse multiple header rows, creating a `MultiIndex` header. (GH13434).
- HTML table output skips `colspan` or `rowspan` attribute if equal to 1. (GH15403)
- `pandas.io.formats.style.Styler` template now has blocks for easier extension, see the *example notebook* (GH15649)
- `Styler.render()` now accepts `**kwargs` to allow user-defined variables in the template (GH15649)
- Compatibility with Jupyter notebook 5.0; `MultiIndex` column labels are left-aligned and `MultiIndex` row-labels are top-aligned (GH15379)
- `TimedeltaIndex` now has a custom date-tick formatter specifically designed for nanosecond level precision (GH8711)
- `pd.api.types.union_categoricals` gained the `ignore_ordered` argument to allow ignoring the ordered attribute of unioned categoricals (GH13410). See the *categorical union docs* for more information.
- `DataFrame.to_latex()` and `DataFrame.to_string()` now allow optional header aliases. (GH15536)
- Re-enable the `parse_dates` keyword of `pd.read_excel()` to parse string columns as dates (GH14326)
- Added `.empty` property to subclasses of `Index`. (GH15270)
- Enabled floor division for `Timedelta` and `TimedeltaIndex` (GH15828)
- `pandas.io.json.json_normalize()` gained the option `errors='ignore'|'raise'`; the default is `errors='raise'` which is backward compatible. (GH14583)
- `pandas.io.json.json_normalize()` with an empty list will return an empty `DataFrame` (GH15534)
- `pandas.io.json.json_normalize()` has gained a `sep` option that accepts `str` to separate joined fields; the default is “.”, which is backward compatible. (GH14883)
- `MultiIndex.remove_unused_levels()` has been added to facilitate *removing unused levels*. (GH15694)
- `pd.read_csv()` will now raise a `ParserError` error whenever any parsing error occurs (GH15913, GH15925)
- `pd.read_csv()` now supports the `error_bad_lines` and `warn_bad_lines` arguments for the Python parser (GH15925)
- The `display.show_dimensions` option can now also be used to specify whether the length of a `Series` should be shown in its repr (GH7117).
- `parallel_coordinates()` has gained a `sort_labels` keyword argument that sorts class labels and the colors assigned to them (GH15908)
- Options added to allow one to turn on/off using `bottleneck` and `numexpr`, see *here* (GH16157)
- `DataFrame.style.bar()` now accepts two more options to further customize the bar chart. Bar alignment is set with `align='left'|'mid'|'zero'`, the default is “left”, which is backward compatible; You can now pass a list of `color=[color_negative, color_positive]`. (GH14757)

### 39.5.3.2 Backwards incompatible API changes

#### Possible incompatibility for HDF5 formats created with pandas < 0.13.0

`pd.TimeSeries` was deprecated officially in 0.17.0, though has already been an alias since 0.13.0. It has been dropped in favor of `pd.Series`. ([GH15098](#)).

This *may* cause HDF5 files that were created in prior versions to become unreadable if `pd.TimeSeries` was used. This is most likely to be for pandas < 0.13.0. If you find yourself in this situation. You can use a recent prior version of pandas to read in your HDF5 files, then write them out again after applying the procedure below.

```
In [2]: s = pd.TimeSeries([1, 2, 3], index=pd.date_range('20130101', periods=3))

In [3]: s
Out[3]:
2013-01-01 1
2013-01-02 2
2013-01-03 3
Freq: D, dtype: int64

In [4]: type(s)
Out[4]: pandas.core.series.TimeSeries

In [5]: s = pd.Series(s)

In [6]: s
Out[6]:
2013-01-01 1
2013-01-02 2
2013-01-03 3
Freq: D, dtype: int64

In [7]: type(s)
Out[7]: pandas.core.series.Series
```

#### Map on Index types now return other Index types

`map` on an Index now returns an Index, not a numpy array ([GH12766](#))

```
In [68]: idx = pd.Index([1, 2])

In [69]: idx
Out[69]: Int64Index([1, 2], dtype='int64')

In [70]: mi = pd.MultiIndex.from_tuples([(1, 2), (2, 4)])

In [71]: mi
Out[71]:
MultiIndex(levels=[[1, 2], [2, 4]],
 labels=[[0, 1], [0, 1]])
```

Previous Behavior:

```
In [5]: idx.map(lambda x: x * 2)
Out[5]: array([2, 4])
```

(continues on next page)

(continued from previous page)

```
In [6]: idx.map(lambda x: (x, x * 2))
Out[6]: array([(1, 2), (2, 4)], dtype=object)

In [7]: mi.map(lambda x: x)
Out[7]: array([(1, 2), (2, 4)], dtype=object)

In [8]: mi.map(lambda x: x[0])
Out[8]: array([1, 2])
```

New Behavior:

```
In [72]: idx.map(lambda x: x * 2)
Out[72]: Int64Index([2, 4], dtype='int64')

In [73]: idx.map(lambda x: (x, x * 2))
\\Out[73]:
MultiIndex(levels=[[1, 2], [2, 4]],
 labels=[[0, 1], [0, 1]])

In [74]: mi.map(lambda x: x)
\\
↪
MultiIndex(levels=[[1, 2], [2, 4]],
 labels=[[0, 1], [0, 1]])

In [75]: mi.map(lambda x: x[0])
\\
↪Int64Index([1, 2], dtype='int64')
```

map on a Series with datetime64 values may return int64 dtypes rather than int32

```
In [76]: s = pd.Series(pd.date_range('2011-01-02T00:00', '2011-01-02T02:00', freq='H')
.....: .tz_localize('Asia/Tokyo'))
.....:

In [77]: s
Out[77]:
0 2011-01-02 00:00:00+09:00
1 2011-01-02 01:00:00+09:00
2 2011-01-02 02:00:00+09:00
Length: 3, dtype: datetime64[ns, Asia/Tokyo]
```

Previous Behavior:

```
In [9]: s.map(lambda x: x.hour)
Out[9]:
0 0
1 1
2 2
dtype: int32
```

New Behavior:

```
In [78]: s.map(lambda x: x.hour)
Out[78]:
```

(continues on next page)

(continued from previous page)

```
0 0
1 1
2 2
Length: 3, dtype: int64
```

## Accessing datetime fields of Index now return Index

The datetime-related attributes (see *here* for an overview) of `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex` previously returned numpy arrays. They will now return a new Index object, except in the case of a boolean field, where the result will still be a boolean ndarray. (GH15022)

Previous behaviour:

```
In [1]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [2]: idx.hour
Out[2]: array([0, 10, 20, 6, 16], dtype=int32)
```

New Behavior:

```
In [79]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [80]: idx.hour
Out[80]: Int64Index([0, 10, 20, 6, 16], dtype='int64')
```

This has the advantage that specific Index methods are still available on the result. On the other hand, this might have backward incompatibilities: e.g. compared to numpy arrays, Index objects are not mutable. To get the original ndarray, you can always convert explicitly using `np.asarray(idx.hour)`.

## pd.unique will now be consistent with extension types

In prior versions, using `Series.unique()` and `pandas.unique()` on Categorical and tz-aware data-types would yield different return types. These are now made consistent. (GH15903)

- Datetime tz-aware

Previous behaviour:

```
Series
In [5]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
...: pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[5]: array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
↳dtype=object)

In [6]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
...: pd.Timestamp('20160101', tz='US/Eastern')]))
Out[6]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')

Index
In [7]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
...: pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[7]: DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/
↳Eastern]', freq=None)
```

(continues on next page)

(continued from previous page)

```
In [8]: pd.unique([pd.Timestamp('20160101', tz='US/Eastern'),
....: pd.Timestamp('20160101', tz='US/Eastern')])
Out [8]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')
```

**New Behavior:**

```
Series, returns an array of Timestamp tz-aware
In [81]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
....: pd.Timestamp('20160101', tz='US/Eastern')]).unique()
....:
Out [81]:
<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

In [82]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
....: pd.Timestamp('20160101', tz='US/Eastern')]))
....:
~~~~~
↪
<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

# Index, returns a DatetimeIndex
In [83]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
....:             pd.Timestamp('20160101', tz='US/Eastern')]).unique()
....:
~~~~~
↪ DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]',
↪ freq=None)

In [84]: pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
....: pd.Timestamp('20160101', tz='US/Eastern')]))
....:
~~~~~
↪ DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]',
↪ freq=None)
```

- **Categoricals**

**Previous behaviour:**

```
In [1]: pd.Series(list('baabc'), dtype='category').unique()
Out [1]:
[b, a, c]
Categories (3, object): [b, a, c]

In [2]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out [2]: array(['b', 'a', 'c'], dtype=object)
```

**New Behavior:**

```
# returns a Categorical
In [85]: pd.Series(list('baabc'), dtype='category').unique()
Out [85]:
[b, a, c]
```

(continues on next page)

(continued from previous page)

```
Categories (3, object): [b, a, c]

In [86]: pd.unique(pd.Series(list('baabc'), dtype='category'))
\\Out [86]:
[b, a, c]
Categories (3, object): [b, a, c]
```

## S3 File Handling

pandas now uses `s3fs` for handling S3 connections. This shouldn't break any code. However, since `s3fs` is not a required dependency, you will need to install it separately, like `botocore` in prior versions of pandas. ([GH11915](#)).

## Partial String Indexing Changes

*DatetimeIndex Partial String Indexing* now works as an exact match, provided that string resolution coincides with index resolution, including a case when both are seconds ([GH14826](#)). See *Slice vs. Exact Match* for details.

```
In [87]: df = pd.DataFrame({'a': [1, 2, 3]}, pd.DatetimeIndex(['2011-12-31 23:59:59',
.....:                                                         '2012-01-01 00:00:00',
.....:                                                         '2012-01-01 00:00:01
↪']))
.....:
```

Previous Behavior:

```
In [4]: df['2011-12-31 23:59:59']
Out[4]:
           a
2011-12-31 23:59:59    1

In [5]: df['a']['2011-12-31 23:59:59']
Out[5]:
2011-12-31 23:59:59    1
Name: a, dtype: int64
```

New Behavior:

```
In [4]: df['2011-12-31 23:59:59']
KeyError: '2011-12-31 23:59:59'

In [5]: df['a']['2011-12-31 23:59:59']
Out[5]: 1
```

## Concat of different float dtypes will not automatically upcast

Previously, concat of multiple objects with different float dtypes would automatically upcast results to a dtype of float64. Now the smallest acceptable dtype will be used ([GH13247](#))

```
In [88]: df1 = pd.DataFrame(np.array([1.0], dtype=np.float32, ndmin=2))

In [89]: df1.dtypes
```

(continues on next page)

(continued from previous page)

```

Out [89]:
0    float32
Length: 1, dtype: object

In [90]: df2 = pd.DataFrame(np.array([np.nan], dtype=np.float32, ndmin=2))

In [91]: df2.dtypes
Out [91]:
0    float32
Length: 1, dtype: object

```

Previous Behavior:

```

In [7]: pd.concat([df1, df2]).dtypes
Out [7]:
0    float64
dtype: object

```

New Behavior:

```

In [92]: pd.concat([df1, df2]).dtypes
Out [92]:
0    float32
Length: 1, dtype: object

```

## Pandas Google BigQuery support has moved

pandas has split off Google BigQuery support into a separate package `pandas-gbq`. You can `conda install pandas-gbq -c conda-forge` or `pip install pandas-gbq` to get it. The functionality of `read_gbq()` and `DataFrame.to_gbq()` remain the same with the currently released version of `pandas-gbq=0.1.4`. Documentation is now hosted [here](#) (GH15347)

## Memory Usage for Index is more Accurate

In previous versions, showing `.memory_usage()` on a pandas structure that has an index, would only include actual index values and not include structures that facilitated fast indexing. This will generally be different for `Index` and `MultiIndex` and less-so for other index types. (GH15237)

Previous Behavior:

```

In [8]: index = pd.Index(['foo', 'bar', 'baz'])

In [9]: index.memory_usage(deep=True)
Out [9]: 180

In [10]: index.get_loc('foo')
Out [10]: 0

In [11]: index.memory_usage(deep=True)
Out [11]: 180

```

New Behavior:

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 260
```

### DataFrame.sort\_index changes

In certain cases, calling `.sort_index()` on a MultiIndexed DataFrame would return the *same* DataFrame without seeming to sort. This would happen with a lexicographically sorted, but non-monotonic levels. ([GH15622](#), [GH15687](#), [GH14015](#), [GH13431](#), [GH15797](#))

This is *unchanged* from prior versions, but shown for illustration purposes:

```
In [93]: df = pd.DataFrame(np.arange(6), columns=['value'],
.....:                    index=pd.MultiIndex.from_product([list('BA'), range(3)]))
.....:
In [94]: df
Out[94]:
   value
B 0     0
  1     1
  2     2
A 0     3
  1     4
  2     5

[6 rows x 1 columns]
```

```
In [95]: df.index.is_lexsorted()
Out[95]: False
In [96]: df.index.is_monotonic
Out[96]: False
```

Sorting works as expected

```
In [97]: df.sort_index()
Out[97]:
   value
A 0     3
  1     4
  2     5
B 0     0
  1     1
  2     2

[6 rows x 1 columns]
```

```
In [98]: df.sort_index().index.is_lexsorted()
Out[98]: True
```

```
In [99]: df.sort_index().index.is_monotonic
Out[99]: True
```

However, this example, which has a non-monotonic 2nd level, doesn't behave as desired.

```
In [100]: df = pd.DataFrame({'value': [1, 2, 3, 4]},
.....:                      index=pd.MultiIndex([[ 'a', 'b'], [ 'bb', 'aa']],
.....:                      [[0, 0, 1, 1], [0, 1, 0, 1]]))
.....:
```

```
In [101]: df
Out[101]:
```

```
      value
a bb      1
  aa      2
b bb      3
  aa      4

[4 rows x 1 columns]
```

Previous Behavior:

```
In [11]: df.sort_index()
Out[11]:
      value
a bb      1
  aa      2
b bb      3
  aa      4

In [14]: df.sort_index().index.is_lexsorted()
Out[14]: True

In [15]: df.sort_index().index.is_monotonic
Out[15]: False
```

New Behavior:

```
In [102]: df.sort_index()
Out[102]:
      value
a aa      2
  bb      1
b aa      4
  bb      3

[4 rows x 1 columns]

In [103]: df.sort_index().index.is_lexsorted()
Out[103]: True

In [104]: df.sort_index().index.is_monotonic
Out[104]: True
```

## Groupby Describe Formatting

The output formatting of `groupby.describe()` now labels the `describe()` metrics in the columns instead of the index. This format is consistent with `groupby.agg()` when applying multiple functions at once. (GH4792)

Previous Behavior:

```
In [1]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})
```

```
In [2]: df.groupby('A').describe()
```

Out [2] :

| A |       | B        |
|---|-------|----------|
| 1 | count | 2.000000 |
|   | mean  | 1.500000 |
|   | std   | 0.707107 |
|   | min   | 1.000000 |
|   | 25%   | 1.250000 |
|   | 50%   | 1.500000 |
|   | 75%   | 1.750000 |
|   | max   | 2.000000 |
| 2 | count | 2.000000 |
|   | mean  | 3.500000 |
|   | std   | 0.707107 |
|   | min   | 3.000000 |
|   | 25%   | 3.250000 |
|   | 50%   | 3.500000 |
|   | 75%   | 3.750000 |
|   | max   | 4.000000 |

```
In [3]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
```

Out [3] :

|   | B    |          |      |      |
|---|------|----------|------|------|
|   | mean | std      | amin | amax |
| A |      |          |      |      |
| 1 | 1.5  | 0.707107 | 1    | 2    |
| 2 | 3.5  | 0.707107 | 3    | 4    |

**New Behavior:**

```
In [105]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})
```

```
In [106]: df.groupby('A').describe()
```

Out [106] :

| A | B     |      |          |     |      |     |      |     |
|---|-------|------|----------|-----|------|-----|------|-----|
|   | count | mean | std      | min | 25%  | 50% | 75%  | max |
| 1 | 2.0   | 1.5  | 0.707107 | 1.0 | 1.25 | 1.5 | 1.75 | 2.0 |
| 2 | 2.0   | 3.5  | 0.707107 | 3.0 | 3.25 | 3.5 | 3.75 | 4.0 |

```
[2 rows x 8 columns]
```

```
In [107]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
```

[illegible]

```

      ↪
      B
mean      std amin amax
A

```

(continues on next page)

(continued from previous page)

```
1  1.5  0.707107    1    2
2  3.5  0.707107    3    4

[2 rows x 4 columns]
```

## Window Binary Corr/Cov operations return a MultiIndex DataFrame

A binary window operation, like `.corr()` or `.cov()`, when operating on a `.rolling(...)`, `.expanding(...)`, or `.ewm(...)` object, will now return a 2-level MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see [here](#). These are equivalent in function, but a MultiIndexed DataFrame enjoys more support in pandas. See the section on *Windowed Binary Operations* for more information. ([GH15677](#))

```
In [108]: np.random.seed(1234)

In [109]: df = pd.DataFrame(np.random.rand(100, 2),
.....:                      columns=pd.Index(['A', 'B'], name='bar'),
.....:                      index=pd.date_range('20160101',
.....:                      periods=100, freq='D', name='foo'))

In [110]: df.tail()
Out[110]:
bar                A                B
foo
2016-04-05  0.640880  0.126205
2016-04-06  0.171465  0.737086
2016-04-07  0.127029  0.369650
2016-04-08  0.604334  0.103104
2016-04-09  0.802374  0.945553

[5 rows x 2 columns]
```

### Previous Behavior:

```
In [2]: df.rolling(12).corr()
Out[2]:
<class 'pandas.core.panel.Panel'>
Dimensions: 100 (items) x 2 (major_axis) x 2 (minor_axis)
Items axis: 2016-01-01 00:00:00 to 2016-04-09 00:00:00
Major_axis axis: A to B
Minor_axis axis: A to B
```

### New Behavior:

```
In [111]: res = df.rolling(12).corr()

In [112]: res.tail()
Out[112]:
bar                A                B
foo  bar
2016-04-07 B  -0.132090  1.000000
2016-04-08 A   1.000000 -0.145775
                B  -0.145775  1.000000
2016-04-09 A   1.000000  0.119645
```

(continues on next page)

(continued from previous page)

```
      B      0.119645  1.000000  
[5 rows x 2 columns]
```

#### Retrieving a correlation matrix for a cross-section

```
In [113]: df.rolling(12).corr().loc['2016-04-07']  
Out[113]:  
bar      A      B  
foo      bar  
2016-04-07 A      1.00000 -0.13209  
          B     -0.13209  1.00000  
[2 rows x 2 columns]
```

### HDFStore where string comparison

In previous versions most types could be compared to string column in a `HDFStore` usually resulting in an invalid comparison, returning an empty result frame. These comparisons will now raise a `TypeError` ([GH15492](#))

```
In [114]: df = pd.DataFrame({'unparsed_date': ['2014-01-01', '2014-01-01']})  
In [115]: df.to_hdf('store.h5', 'key', format='table', data_columns=True)  
In [116]: df.dtypes  
Out[116]:  
unparsed_date    object  
Length: 1, dtype: object
```

#### Previous Behavior:

```
In [4]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')  
File "<string>", line 1  
      (unparsed_date > 1970-01-01 00:00:01.388552400)  
              ^  
SyntaxError: invalid token
```

#### New Behavior:

```
In [18]: ts = pd.Timestamp('2014-01-01')  
In [19]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')  
TypeError: Cannot compare 2014-01-01 00:00:00 of  
type <class 'pandas.tslib.Timestamp'> to string column
```

### Index.intersection and inner join now preserve the order of the left Index

`Index.intersection()` now preserves the order of the calling Index (left) instead of the other Index (right) ([GH15582](#)). This affects inner joins, `DataFrame.join()` and `merge()`, and the `.align` method.

- `Index.intersection`

```
In [117]: left = pd.Index([2, 1, 0])

In [118]: left
Out[118]: Int64Index([2, 1, 0], dtype='int64')

In [119]: right = pd.Index([1, 2, 3])

In [120]: right
Out[120]: Int64Index([1, 2, 3], dtype='int64')
```

Previous Behavior:

```
In [4]: left.intersection(right)
Out[4]: Int64Index([1, 2], dtype='int64')
```

New Behavior:

```
In [121]: left.intersection(right)
Out[121]: Int64Index([2, 1], dtype='int64')
```

- `DataFrame.join` and `pd.merge`

```
In [122]: left = pd.DataFrame({'a': [20, 10, 0]}, index=[2, 1, 0])

In [123]: left
Out[123]:
   a
2  20
1  10
0   0

[3 rows x 1 columns]

In [124]: right = pd.DataFrame({'b': [100, 200, 300]}, index=[1, 2, 3])

In [125]: right
Out[125]:
   b
1  100
2  200
3  300

[3 rows x 1 columns]
```

Previous Behavior:

```
In [4]: left.join(right, how='inner')
Out[4]:
   a    b
1  10  100
2  20  200
```

New Behavior:

```
In [126]: left.join(right, how='inner')
Out[126]:
   a    b
```

(continues on next page)

(continued from previous page)

```
2  20  200
1  10  100

[2 rows x 2 columns]
```

## Pivot Table always returns a DataFrame

The documentation for `pivot_table()` states that a `DataFrame` is *always* returned. Here a bug is fixed that allowed this to return a `Series` under certain circumstance. (GH4386)

```
In [127]: df = pd.DataFrame({'col1': [3, 4, 5],
.....:                      'col2': ['C', 'D', 'E'],
.....:                      'col3': [1, 3, 9]})
.....:

In [128]: df
Out[128]:
   col1 col2 col3
0     3    C     1
1     4    D     3
2     5    E     9

[3 rows x 3 columns]
```

Previous Behavior:

```
In [2]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[2]:
col3 col2
1     C     3
3     D     4
9     E     5
Name: col1, dtype: int64
```

New Behavior:

```
In [129]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[129]:
      col1
col3 col2
1     C     3
3     D     4
9     E     5

[3 rows x 1 columns]
```

## Other API Changes

- `numexpr` version is now required to be  $\geq 2.4.6$  and it will not be used at all if this requisite is not fulfilled (GH15213).
- `CParserError` has been renamed to `ParserError` in `pd.read_csv()` and will be removed in the future (GH12665)

- `SparseArray.cumsum()` and `SparseSeries.cumsum()` will now always return `SparseArray` and `SparseSeries` respectively (GH12855)
- `DataFrame.applymap()` with an empty `DataFrame` will return a copy of the empty `DataFrame` instead of a `Series` (GH8222)
- `Series.map()` now respects default values of dictionary subclasses with a `__missing__` method, such as `collections.Counter` (GH15999)
- `.loc` has compat with `.ix` for accepting iterators, and `NamedTuples` (GH15120)
- `interpolate()` and `fillna()` will raise a `ValueError` if the `limit` keyword argument is not greater than 0. (GH9217)
- `pd.read_csv()` will now issue a `ParserWarning` whenever there are conflicting values provided by the `dialect` parameter and the user (GH14898)
- `pd.read_csv()` will now raise a `ValueError` for the C engine if the quote character is larger than one byte (GH11592)
- inplace arguments now require a boolean value, else a `ValueError` is thrown (GH14189)
- `pandas.api.types.is_datetime64_ns_dtype` will now report `True` on a tz-aware dtype, similar to `pandas.api.types.is_datetime64_any_dtype`
- `DataFrame.asof()` will return a null filled `Series` instead the scalar `NaN` if a match is not found (GH15118)
- Specific support for `copy.copy()` and `copy.deepcopy()` functions on `NDFrame` objects (GH15444)
- `Series.sort_values()` accepts a one element list of bool for consistency with the behavior of `DataFrame.sort_values()` (GH15604)
- `.merge()` and `.join()` on category dtype columns will now preserve the category dtype when possible (GH10409)
- `SparseDataFrame.default_fill_value` will be 0, previously was nan in the return from `pd.get_dummies(..., sparse=True)` (GH15594)
- The default behaviour of `Series.str.match` has changed from extracting groups to matching the pattern. The extracting behaviour was deprecated since pandas version 0.13.0 and can be done with the `Series.str.extract` method (GH5224). As a consequence, the `as_indexer` keyword is ignored (no longer needed to specify the new behaviour) and is deprecated.
- `NaT` will now correctly report `False` for datetimelike boolean operations such as `is_month_start` (GH15781)
- `NaT` will now correctly return `np.nan` for `Timedelta` and `Period` accessors such as `days` and `quarter` (GH15782)
- `NaT` will now returns `NaT` for `tz_localize` and `tz_convert` methods (GH15830)
- `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `PandasError`, if called with scalar inputs and not axes (GH15541)
- `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `pandas.core.common.PandasError`, if called with scalar inputs and not axes; The exception `PandasError` is removed as well. (GH15541)
- The exception `pandas.core.common.AmbiguousIndexError` is removed as it is not referenced (GH15541)

### 39.5.3.3 Reorganization of the library: Privacy Changes

#### Modules Privacy Has Changed

Some formerly public python/c/c++/cython extension modules have been moved and/or renamed. These are all removed from the public API. Furthermore, the `pandas.core`, `pandas.compat`, and `pandas.util` top-level modules are now considered to be PRIVATE. If indicated, a deprecation warning will be issued if you reference these modules. ([GH12588](#))

Some new subpackages are created with public functionality that is not directly exposed in the top-level namespace: `pandas.errors`, `pandas.plotting` and `pandas.testing` (more details below). Together with `pandas.api.types` and certain functions in the `pandas.io` and `pandas.tseries` submodules, these are now the public subpackages.

Further changes:

- The function `union_categoricals()` is now importable from `pandas.api.types`, formerly from `pandas.types.concat` ([GH15998](#))
- The type `import pandas.tslib.NaTType` is deprecated and can be replaced by using `type(pandas.NaT)` ([GH16146](#))
- The public functions in `pandas.tools.hashing` deprecated from that locations, but are now importable from `pandas.util` ([GH16223](#))
- The modules in `pandas.util`: `decorators`, `print_versions`, `doctools`, `validators`, `depr_module` are now private. Only the functions exposed in `pandas.util` itself are public ([GH16223](#))

### pandas.errors

We are adding a standard public module for all pandas exceptions & warnings `pandas.errors`. (GH14800). Previously these exceptions & warnings could be imported from `pandas.core.common` or `pandas.io.common`. These exceptions and warnings will be removed from the `*`.`common` locations in a future release. (GH15541)

The following are now part of this API:

```
['DtypeWarning',
 'EmptyDataError',
 'OutOfBoundsDatetime',
 'ParserError',
 'ParserWarning',
 'PerformanceWarning',
 'UnsortedIndexError',
 'UnsupportedFunctionCall']
```

### pandas.testing

We are adding a standard module that exposes the public testing functions in `pandas.testing` (GH9895). Those functions can be used when writing tests for functionality using pandas objects.

The following testing functions are now part of this API:

- `testing.assert_frame_equal()`
- `testing.assert_series_equal()`
- `testing.assert_index_equal()`

### pandas.plotting

A new public `pandas.plotting` module has been added that holds plotting functionality that was previously in either `pandas.tools.plotting` or in the top-level namespace. See the *deprecations sections* for more details.

## Other Development Changes

- Building pandas for development now requires `cython >= 0.23` (GH14831)
- Require at least 0.23 version of cython to avoid problems with character encodings (GH14699)
- Switched the test framework to use `pytest` (GH13097)
- Reorganization of tests directory layout (GH14854, GH15707).

### 39.5.3.4 Deprecations

#### Deprecate `.ix`

The `.ix` indexer is deprecated, in favor of the more strict `.iloc` and `.loc` indexers. `.ix` offers a lot of magic on the inference of what the user wants to do. To wit, `.ix` can decide to index *positionally* OR via *labels*, depending on the data type of the index. This has caused quite a bit of user confusion over the years. The full indexing documentation is *here*. (GH14218)

The recommended methods of indexing are:

- `.loc` if you want to *label* index
- `.iloc` if you want to *positionally* index.

Using `.ix` will now show a `DeprecationWarning` with a link to some examples of how to convert code *here*.

```
In [130]: df = pd.DataFrame({'A': [1, 2, 3],
.....:                      'B': [4, 5, 6]},
.....:                      index=list('abc'))
.....:

In [131]: df
Out[131]:
   A  B
a  1  4
b  2  5
c  3  6

[3 rows x 2 columns]
```

Previous Behavior, where you wish to get the 0th and the 2nd elements from the index in the 'A' column.

```
In [3]: df.ix[[0, 2], 'A']
Out[3]:
a    1
c    3
Name: A, dtype: int64
```

Using `.loc`. Here we will select the appropriate indexes from the index, then use *label* indexing.

```
In [132]: df.loc[df.index[[0, 2]], 'A']
Out[132]:
a    1
c    3
Name: A, Length: 2, dtype: int64
```

Using `.iloc`. Here we will get the location of the 'A' column, then use *positional* indexing to select things.

```
In [133]: df.iloc[[0, 2], df.columns.get_loc('A')]
Out[133]:
a    1
c    3
Name: A, Length: 2, dtype: int64
```

## Deprecate Panel

Panel is deprecated and will be removed in a future version. The recommended way to represent 3-D data are with a `MultiIndex` on a `DataFrame` via the `to_frame()` or with the `xarray` package. Pandas provides a `to_xarray()` method to automate this conversion. For more details see *Deprecate Panel* documentation. (GH13563).

```
In [134]: p = tm.makePanel()

In [135]: p
Out[135]:
<class 'pandas.core.panel.Panel'>
```

(continues on next page)

(continued from previous page)

```

Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

```

### Convert to a MultiIndex DataFrame

```

In [136]: p.to_frame()
Out[136]:

```

|            |   | ItemA     | ItemB     | ItemC     |
|------------|---|-----------|-----------|-----------|
| 2000-01-03 | A | 0.628776  | -1.409432 | 0.209395  |
|            | B | 0.988138  | -1.347533 | -0.896581 |
|            | C | -0.938153 | 1.272395  | -0.161137 |
|            | D | -0.223019 | -0.591863 | -1.051539 |
| 2000-01-04 | A | 0.186494  | 1.422986  | -0.592886 |
|            | B | -0.072608 | 0.363565  | 1.104352  |

|            | D | 0.122273  | -1.425795 | -0.619993 |

```

[12 rows x 3 columns]

```

### Convert to an xarray DataArray

```

In [137]: p.to_xarray()
Out[137]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
array([[[ 0.628776,  0.988138, -0.938153, -0.223019],
        [ 0.186494, -0.072608, -1.239072,  2.123692],
        [ 0.952478, -0.550603,  0.139683,  0.122273]],

       [[-1.409432, -1.347533,  1.272395, -0.591863],
        [ 1.422986,  0.363565, -1.449567, -0.414505],
        [-2.147855, -0.014752, -1.195524, -1.425795]],

       [[ 0.209395, -0.896581, -0.161137, -1.051539],
        [-0.592886,  1.104352,  0.889157, -0.319561],
        [-1.473116, -0.43155 ,  0.288377, -0.619993]]])
Coordinates:
  * items      (items) object 'ItemA' 'ItemB' 'ItemC'
  * major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
  * minor_axis (minor_axis) object 'A' 'B' 'C' 'D'

```

### Deprecate `groupby.agg()` with a dictionary when renaming

The `.groupby(...).agg(...)`, `.rolling(...).agg(...)`, and `.resample(...).agg(...)` syntax can accept a variable of inputs, including scalars, list, and a dict of column names to scalars or lists. This provides a useful syntax for constructing multiple (potentially different) aggregations.

However, `.agg(...)` can *also* accept a dict that allows ‘renaming’ of the result columns. This is a complicated and confusing syntax, as well as not consistent between `Series` and `DataFrame`. We are deprecating this ‘renaming’ functionality.

- We are deprecating passing a dict to a grouped/rolled/resampled `Series`. This allowed one to rename the resulting aggregation, but this had a completely different meaning than passing a dictionary to a grouped `DataFrame`, which accepts column-to-aggregations.
- We are deprecating passing a dict-of-dicts to a grouped/rolled/resampled `DataFrame` in a similar manner.

This is an illustrative example:

```
In [138]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2],
.....:                      'B': range(5),
.....:                      'C': range(5)})
.....:
```

```
In [139]: df
```

```
Out[139]:
```

|   | A | B | C |
|---|---|---|---|
| 0 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |
| 2 | 1 | 2 | 2 |
| 3 | 2 | 3 | 3 |
| 4 | 2 | 4 | 4 |

```
[5 rows x 3 columns]
```

Here is a typical useful syntax for computing different aggregations for different columns. This is a natural, and useful syntax. We aggregate from the dict-to-list by taking the specified columns and applying the list of functions. This returns a `MultiIndex` for the columns (this is *not* deprecated).

```
In [140]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

```
Out[140]:
```

|   | B | C |
|---|---|---|
| A |   |   |
| 1 | 3 | 0 |
| 2 | 7 | 3 |

```
[2 rows x 2 columns]
```

Here's an example of the first deprecation, passing a dict to a grouped `Series`. This is a combination aggregation & renaming:

```
In [6]: df.groupby('A').B.agg({'foo': 'count'})
```

FutureWarning: using a dict on a Series for aggregation is deprecated and will be removed in a future version

```
Out[6]:
```

|   | foo |
|---|-----|
| A |     |
| 1 | 3   |
| 2 | 2   |

You can accomplish the same operation, more idiomatically by:

```
In [141]: df.groupby('A').B.agg(['count']).rename(columns={'count': 'foo'})
```

```
Out[141]:
```

|   | foo |
|---|-----|
| A |     |
| 1 | 3   |
| 2 | 2   |

(continues on next page)

(continued from previous page)

```
[2 rows x 1 columns]
```

Here's an example of the second deprecation, passing a dict-of-dict to a grouped DataFrame:

```
In [23]: (df.groupby('A')
...:      .agg({'B': {'foo': 'sum'}, 'C': {'bar': 'min'}})
...: )
```

FutureWarning: using a dict with renaming is deprecated and will be removed in a future version

```
Out[23]:
      B    C
      foo bar
A
1     3    0
2     7    3
```

You can accomplish nearly the same by:

```
In [142]: (df.groupby('A')
...:      .agg({'B': 'sum', 'C': 'min'})
...:      .rename(columns={'B': 'foo', 'C': 'bar'})
...:      )
```

```
Out[142]:
      foo  bar
A
1       3    0
2       7    3
```

```
[2 rows x 2 columns]
```

## Deprecate .plotting

The `pandas.tools.plotting` module has been deprecated, in favor of the top level `pandas.plotting` module. All the public plotting functions are now available from `pandas.plotting` ([GH12548](#)).

Furthermore, the top-level `pandas.scatter_matrix` and `pandas.plot_params` are deprecated. Users can import these from `pandas.plotting` as well.

Previous script:

```
pd.tools.plotting.scatter_matrix(df)
pd.scatter_matrix(df)
```

Should be changed to:

```
pd.plotting.scatter_matrix(df)
```

## Other Deprecations

- `SparseArray.to_dense()` has deprecated the `fill` parameter, as that parameter was not being respected ([GH14647](#))

- `SparseSeries.to_dense()` has deprecated the `sparse_only` parameter ([GH14647](#))
- `Series.repeat()` has deprecated the `reps` parameter in favor of `repeats` ([GH12662](#))
- The `Series` constructor and `.astype` method have deprecated accepting timestamp dtypes without a frequency (e.g. `np.datetime64`) for the `dtype` parameter ([GH15524](#))
- `Index.repeat()` and `MultiIndex.repeat()` have deprecated the `n` parameter in favor of `repeats` ([GH12662](#))
- `Categorical.searchsorted()` and `Series.searchsorted()` have deprecated the `v` parameter in favor of `value` ([GH12662](#))
- `TimedeltaIndex.searchsorted()`, `DatetimeIndex.searchsorted()`, and `PeriodIndex.searchsorted()` have deprecated the `key` parameter in favor of `value` ([GH12662](#))
- `DataFrame.astype()` has deprecated the `raise_on_error` parameter in favor of `errors` ([GH14878](#))
- `Series.sortlevel` and `DataFrame.sortlevel` have been deprecated in favor of `Series.sort_index` and `DataFrame.sort_index` ([GH15099](#))
- importing `concat` from `pandas.tools.merge` has been deprecated in favor of imports from the `pandas` namespace. This should only affect explicit imports ([GH15358](#))
- `Series/DataFrame/Panel consolidate()` been deprecated as a public method. ([GH15483](#))
- The `as_indexer` keyword of `Series.str.match()` has been deprecated (ignored keyword) ([GH15257](#)).
- The following top-level pandas functions have been deprecated and will be removed in a future version ([GH13790](#), [GH15940](#))
  - `pd.pnow()`, replaced by `Period.now()`
  - `pd.Term`, is removed, as it is not applicable to user code. Instead use in-line string expressions in the `where` clause when searching in `HDFStore`
  - `pd.Expr`, is removed, as it is not applicable to user code.
  - `pd.match()`, is removed.
  - `pd.groupby()`, replaced by using the `.groupby()` method directly on a `Series/DataFrame`
  - `pd.get_store()`, replaced by a direct call to `pd.HDFStore(...)`
- `is_any_int_dtype`, `is_floating_dtype`, and `is_sequence` are deprecated from `pandas.api.types` ([GH16042](#))

### 39.5.3.5 Removal of prior version deprecations/changes

- The `pandas.rpy` module is removed. Similar functionality can be accessed through the `rpy2` project. See the *R interfacing docs* for more details.
- The `pandas.io.ga` module with a `google-analytics` interface is removed ([GH11308](#)). Similar functionality can be found in the `Google2Pandas` package.
- `pd.to_datetime` and `pd.to_timedelta` have dropped the `coerce` parameter in favor of `errors` ([GH13602](#))
- `pandas.stats.fama_macbeth`, `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var`, as well as the top-level `pandas.fama_macbeth` and `pandas.ols` routines are removed. Similar functionality can be found in the `statsmodels` package. ([GH11898](#))
- The `TimeSeries` and `SparseTimeSeries` classes, aliases of `Series` and `SparseSeries`, are removed ([GH10890](#), [GH15098](#)).

- `Series.is_time_series` is dropped in favor of `Series.index.is_all_dates` (GH15098)
- The deprecated `irow`, `icol`, `iget` and `iget_value` methods are removed in favor of `iloc` and `iat` as explained *here* (GH10711).
- The deprecated `DataFrame.iterkv()` has been removed in favor of `DataFrame.iteritems()` (GH10711)
- The Categorical constructor has dropped the `name` parameter (GH10632)
- Categorical has dropped support for NaN categories (GH10748)
- The `take_last` parameter has been dropped from `duplicated()`, `drop_duplicates()`, `nlargest()`, and `nsmallest()` methods (GH10236, GH10792, GH10920)
- `Series`, `Index`, and `DataFrame` have dropped the `sort` and `order` methods (GH10726)
- Where clauses in `pytables` are only accepted as strings and expressions types and not other data-types (GH12027)
- `DataFrame` has dropped the `combineAdd` and `combineMult` methods in favor of `add` and `mul` respectively (GH10735)

### 39.5.3.6 Performance Improvements

- Improved performance of `pd.wide_to_long()` (GH14779)
- Improved performance of `pd.factorize()` by releasing the GIL with `object` dtype when inferred as strings (GH14859, GH16057)
- Improved performance of timeseries plotting with an irregular `DatetimeIndex` (or with `compat_x=True`) (GH15073).
- Improved performance of `groupby().cummin()` and `groupby().cummax()` (GH15048, GH15109, GH15561, GH15635)
- Improved performance and reduced memory when indexing with a `MultiIndex` (GH15245)
- When reading buffer object in `read_sas()` method without specified format, filepath string is inferred rather than buffer object. (GH14947)
- Improved performance of `.rank()` for categorical data (GH15498)
- Improved performance when using `.unstack()` (GH15503)
- Improved performance of `merge/join` on category columns (GH10409)
- Improved performance of `drop_duplicates()` on bool columns (GH12963)
- Improve performance of `pd.core.groupby.GroupBy.apply` when the applied function used the `.name` attribute of the group `DataFrame` (GH15062).
- Improved performance of `iloc` indexing with a list or array (GH15504).
- Improved performance of `Series.sort_index()` with a monotonic index (GH15694)
- Improved performance in `pd.read_csv()` on some platforms with buffered reads (GH16039)

### 39.5.3.7 Bug Fixes

## Conversion

- Bug in `Timestamp.replace` now raises `TypeError` when incorrect argument names are given; previously this raised `ValueError` ([GH15240](#))
- Bug in `Timestamp.replace` with `compat` for passing long integers ([GH15030](#))
- Bug in `Timestamp` returning UTC based time/date attributes when a timezone was provided ([GH13303](#), [GH6538](#))
- Bug in `Timestamp` incorrectly localizing timezones during construction ([GH11481](#), [GH15777](#))
- Bug in `TimedeltaIndex` addition where overflow was being allowed without error ([GH14816](#))
- Bug in `TimedeltaIndex` raising a `ValueError` when boolean indexing with `loc` ([GH14946](#))
- Bug in catching an overflow in `Timestamp + Timedelta/Offset` operations ([GH15126](#))
- Bug in `DatetimeIndex.round()` and `Timestamp.round()` floating point accuracy when rounding by milliseconds or less ([GH14440](#), [GH15578](#))
- Bug in `astype()` where `inf` values were incorrectly converted to integers. Now raises error now with `astype()` for `Series` and `DataFrames` ([GH14265](#))
- Bug in `DataFrame(...).apply(to_numeric)` when values are of type `decimal.Decimal`. ([GH14827](#))
- Bug in `describe()` when passing a numpy array which does not contain the median to the percentiles keyword argument ([GH14908](#))
- Cleaned up `PeriodIndex` constructor, including raising on floats more consistently ([GH13277](#))
- Bug in using `__deepcopy__` on empty `NDFrame` objects ([GH15370](#))
- Bug in `.replace()` may result in incorrect dtypes. ([GH12747](#), [GH15765](#))
- Bug in `Series.replace` and `DataFrame.replace` which failed on empty replacement dicts ([GH15289](#))
- Bug in `Series.replace` which replaced a numeric by string ([GH15743](#))
- Bug in `Index` construction with `NaN` elements and integer dtype specified ([GH15187](#))
- Bug in `Series` construction with a `datetimez` ([GH14928](#))
- Bug in `Series.dt.round()` inconsistent behaviour on `NaT` 's with different arguments ([GH14940](#))
- Bug in `Series` constructor when both `copy=True` and `dtype` arguments are provided ([GH15125](#))
- Incorrect dtyped `Series` was returned by comparison methods (e.g., `lt`, `gt`, ...) against a constant for an empty `DataFrame` ([GH15077](#))
- Bug in `Series.ffill()` with mixed dtypes containing tz-aware datetimes. ([GH14956](#))
- Bug in `DataFrame.fillna()` where the argument `downcast` was ignored when `fillna` value was of type `dict` ([GH15277](#))
- Bug in `.asfreq()`, where frequency was not set for empty `Series` ([GH14320](#))
- Bug in `DataFrame` construction with nulls and datetimes in a list-like ([GH15869](#))
- Bug in `DataFrame.fillna()` with tz-aware datetimes ([GH15855](#))
- Bug in `is_string_dtype`, `is_timedelta64_ns_dtype`, and `is_string_like_dtype` in which an error was raised when `None` was passed in ([GH15941](#))
- Bug in the return type of `pd.unique` on a `Categorical`, which was returning an `ndarray` and not a `Categorical` ([GH15903](#))

- Bug in `Index.to_series()` where the index was not copied (and so mutating later would change the original), ([GH15949](#))
- Bug in indexing with partial string indexing with a len-1 `DataFrame` ([GH16071](#))
- Bug in `Series` construction where passing invalid dtype didn't raise an error. ([GH15520](#))

## Indexing

- Bug in `Index` power operations with reversed operands ([GH14973](#))
- Bug in `DataFrame.sort_values()` when sorting by multiple columns where one column is of type `int64` and contains `NaT` ([GH14922](#))
- Bug in `DataFrame.reindex()` in which method was ignored when passing columns ([GH14992](#))
- Bug in `DataFrame.loc` with indexing a `MultiIndex` with a `Series` indexer ([GH14730](#), [GH15424](#))
- Bug in `DataFrame.loc` with indexing a `MultiIndex` with a numpy array ([GH15434](#))
- Bug in `Series.asof` which raised if the series contained all `np.nan` ([GH15713](#))
- Bug in `.at` when selecting from a tz-aware column ([GH15822](#))
- Bug in `Series.where()` and `DataFrame.where()` where array-like conditionals were being rejected ([GH15414](#))
- Bug in `Series.where()` where TZ-aware data was converted to float representation ([GH15701](#))
- Bug in `.loc` that would not return the correct dtype for scalar access for a `DataFrame` ([GH11617](#))
- Bug in output formatting of a `MultiIndex` when names are integers ([GH12223](#), [GH15262](#))
- Bug in `Categorical.searchsorted()` where alphabetical instead of the provided categorical order was used ([GH14522](#))
- Bug in `Series.iloc` where a `Categorical` object for list-like indexes input was returned, where a `Series` was expected. ([GH14580](#))
- Bug in `DataFrame.isin` comparing datetimelike to empty frame ([GH15473](#))
- Bug in `.reset_index()` when an all `NaN` level of a `MultiIndex` would fail ([GH6322](#))
- Bug in `.reset_index()` when raising error for index name already present in `MultiIndex` columns ([GH16120](#))
- Bug in creating a `MultiIndex` with tuples and not passing a list of names; this will now raise `ValueError` ([GH15110](#))
- Bug in the HTML display with with a `MultiIndex` and truncation ([GH14882](#))
- Bug in the display of `.info()` where a qualifier (+) would always be displayed with a `MultiIndex` that contains only non-strings ([GH15245](#))
- Bug in `pd.concat()` where the names of `MultiIndex` of resulting `DataFrame` are not handled correctly when `None` is presented in the names of `MultiIndex` of input `DataFrame` ([GH15787](#))
- Bug in `DataFrame.sort_index()` and `Series.sort_index()` where `na_position` doesn't work with a `MultiIndex` ([GH14784](#), [GH16604](#))
- Bug in in `pd.concat()` when combining objects with a `CategoricalIndex` ([GH16111](#))
- Bug in indexing with a scalar and a `CategoricalIndex` ([GH16123](#))

## I/O

- Bug in `pd.to_numeric()` in which float and unsigned integer elements were being improperly casted ([GH14941](#), [GH15005](#))
- Bug in `pd.read_fwf()` where the `skiprows` parameter was not being respected during column width inference ([GH11256](#))
- Bug in `pd.read_csv()` in which the `dialect` parameter was not being verified before processing ([GH14898](#))
- Bug in `pd.read_csv()` in which missing data was being improperly handled with `usecols` ([GH6710](#))
- Bug in `pd.read_csv()` in which a file containing a row with many columns followed by rows with fewer columns would cause a crash ([GH14125](#))
- Bug in `pd.read_csv()` for the C engine where `usecols` were being indexed incorrectly with `parse_dates` ([GH14792](#))
- Bug in `pd.read_csv()` with `parse_dates` when multi-line headers are specified ([GH15376](#))
- Bug in `pd.read_csv()` with `float_precision='round_trip'` which caused a segfault when a text entry is parsed ([GH15140](#))
- Bug in `pd.read_csv()` when an index was specified and no values were specified as null values ([GH15835](#))
- Bug in `pd.read_csv()` in which certain invalid file objects caused the Python interpreter to crash ([GH15337](#))
- Bug in `pd.read_csv()` in which invalid values for `nrows` and `chunksize` were allowed ([GH15767](#))
- Bug in `pd.read_csv()` for the Python engine in which unhelpful error messages were being raised when parsing errors occurred ([GH15910](#))
- Bug in `pd.read_csv()` in which the `skipfooter` parameter was not being properly validated ([GH15925](#))
- Bug in `pd.to_csv()` in which there was numeric overflow when a timestamp index was being written ([GH15982](#))
- Bug in `pd.util.hashing.hash_pandas_object()` in which hashing of categoricals depended on the ordering of categories, instead of just their values. ([GH15143](#))
- Bug in `.to_json()` where `lines=True` and contents (keys or values) contain escaped characters ([GH15096](#))
- Bug in `.to_json()` causing single byte ascii characters to be expanded to four byte unicode ([GH15344](#))
- Bug in `.to_json()` for the C engine where rollover was not correctly handled for case where `frac` is odd and `diff` is exactly 0.5 ([GH15716](#), [GH15864](#))
- Bug in `pd.read_json()` for Python 2 where `lines=True` and contents contain non-ascii unicode characters ([GH15132](#))
- Bug in `pd.read_msgpack()` in which Series categoricals were being improperly processed ([GH14901](#))
- Bug in `pd.read_msgpack()` which did not allow loading of a dataframe with an index of type `CategoricalIndex` ([GH15487](#))
- Bug in `pd.read_msgpack()` when deserializing a `CategoricalIndex` ([GH15487](#))
- Bug in `DataFrame.to_records()` with converting a `DatetimeIndex` with a timezone ([GH13937](#))
- Bug in `DataFrame.to_records()` which failed with unicode characters in column names ([GH11879](#))
- Bug in `.to_sql()` when writing a `DataFrame` with numeric index names ([GH15404](#)).

- Bug in `DataFrame.to_html()` with `index=False` and `max_rows` raising in `IndexError` (GH14998)
- Bug in `pd.read_hdf()` passing a `Timestamp` to the `where` parameter with a non date column (GH15492)
- Bug in `DataFrame.to_stata()` and `StataWriter` which produces incorrectly formatted files to be produced for some locales (GH13856)
- Bug in `StataReader` and `StataWriter` which allows invalid encodings (GH15723)
- Bug in the `Series` repr not showing the length when the output was truncated (GH15962).

## Plotting

- Bug in `DataFrame.hist` where `plt.tight_layout` caused an `AttributeError` (use `matplotlib >= 2.0.1`) (GH9351)
- Bug in `DataFrame.boxplot` where `fontsize` was not applied to the tick labels on both axes (GH15108)
- Bug in the date and time converters pandas registers with `matplotlib` not handling multiple dimensions (GH16026)
- Bug in `pd.scatter_matrix()` could accept either `color` or `c`, but not both (GH14855)

## Groupby/Resample/Rolling

- Bug in `.groupby(...).resample()` when passed the `on=` kwarg. (GH15021)
- Properly set `__name__` and `__qualname__` for `Groupby.*` functions (GH14620)
- Bug in `GroupBy.get_group()` failing with a categorical grouper (GH15155)
- Bug in `.groupby(...).rolling(...)` when `on` is specified and using a `DatetimeIndex` (GH15130, GH13966)
- Bug in groupby operations with `timedelta64` when passing `numeric_only=False` (GH5724)
- Bug in `groupby.apply()` coercing object dtypes to numeric types, when not all values were numeric (GH14423, GH15421, GH15670)
- Bug in `resample`, where a non-string `loffset` argument would not be applied when resampling a timeseries (GH13218)
- Bug in `DataFrame.groupby().describe()` when grouping on `Index` containing tuples (GH14848)
- Bug in `groupby().nunique()` with a `datetimelike-grouper` where bins counts were incorrect (GH13453)
- Bug in `groupby.transform()` that would coerce the resultant dtypes back to the original (GH10972, GH11444)
- Bug in `groupby.agg()` incorrectly localizing timezone on `datetime` (GH15426, GH10668, GH13046)
- Bug in `.rolling/expanding()` functions where `count()` was not counting `np.Inf`, nor handling object dtypes (GH12541)
- Bug in `.rolling()` where `pd.Timedelta` or `datetime.timedelta` was not accepted as a window argument (GH15440)
- Bug in `Rolling.quantile` function that caused a segmentation fault when called with a quantile value outside of the range `[0, 1]` (GH15463)
- Bug in `DataFrame.resample().median()` if duplicate column names are present (GH14233)

## Sparse

- Bug in `SparseSeries.reindex` on single level with list of length 1 ([GH15447](#))
- Bug in repr-formatting a `SparseDataFrame` after a value was set on (a copy of) one of its series ([GH15488](#))
- Bug in `SparseDataFrame` construction with lists not coercing to dtype ([GH15682](#))
- Bug in sparse array indexing in which indices were not being validated ([GH15863](#))

## Reshaping

- Bug in `pd.merge_asof()` where `left_index` or `right_index` caused a failure when multiple `by` was specified ([GH15676](#))
- Bug in `pd.merge_asof()` where `left_index/right_index` together caused a failure when `tolerance` was specified ([GH15135](#))
- Bug in `DataFrame.pivot_table()` where `dropna=True` would not drop all-NaN columns when the columns was a category dtype ([GH15193](#))
- Bug in `pd.melt()` where passing a tuple value for `value_vars` caused a `TypeError` ([GH15348](#))
- Bug in `pd.pivot_table()` where no error was raised when values argument was not in the columns ([GH14938](#))
- Bug in `pd.concat()` in which concatenating with an empty dataframe with `join='inner'` was being improperly handled ([GH15328](#))
- Bug with `sort=True` in `DataFrame.join` and `pd.merge` when joining on indexes ([GH15582](#))
- Bug in `DataFrame.nsmallest` and `DataFrame.nlargest` where identical values resulted in duplicated rows ([GH15297](#))
- Bug in `pandas.pivot_table()` incorrectly raising `UnicodeError` when passing unicode input for `margins` keyword ([GH13292](#))

## Numeric

- Bug in `.rank()` which incorrectly ranks ordered categories ([GH15420](#))
- Bug in `.corr()` and `.cov()` where the column and index were the same object ([GH14617](#))
- Bug in `.mode()` where mode was not returned if was only a single value ([GH15714](#))
- Bug in `pd.cut()` with a single bin on an all 0s array ([GH15428](#))
- Bug in `pd.qcut()` with a single quantile and an array with identical values ([GH15431](#))
- Bug in `pandas.tools.utils.cartesian_product()` with large input can cause overflow on windows ([GH15265](#))
- Bug in `.eval()` which caused multi-line evals to fail with local variables not on the first line ([GH15342](#))

## Other

- Compat with SciPy 0.19.0 for testing on `.interpolate()` ([GH15662](#))
- Compat for 32-bit platforms for `.qcut/cut`; bins will now be `int64` dtype ([GH14866](#))

- Bug in interactions with Qt when a `QtApplication` already exists ([GH14372](#))
- Avoid use of `np.finfo()` during `import pandas` removed to mitigate deadlock on Python GIL misuse ([GH14641](#))

## **39.6 Version 0.19**

### **39.6.1 v0.19.2 (December 24, 2016)**

{{ header }}

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Compatibility with Python 3.6
- Added a [Pandas Cheat Sheet](#). (GH13202).

#### What's new in v0.19.2

- *Enhancements*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.6.1.1 Enhancements

The `pd.merge_asof()`, added in 0.19.0, gained some improvements:

- `pd.merge_asof()` gained `left_index/right_index` and `left_by/right_by` arguments (GH14253)
- `pd.merge_asof()` can take multiple columns in `by` parameter and has specialized dtypes for better performance (GH13936)

### 39.6.1.2 Performance Improvements

- Performance regression with `PeriodIndex` (GH14822)
- Performance regression in indexing with `getitem` (GH14930)
- Improved performance of `.replace()` (GH12745)
- Improved performance `Series` creation with a datetime index and dictionary data (GH14894)

### 39.6.1.3 Bug Fixes

- Compat with python 3.6 for pickling of some offsets (GH14685)
- Compat with python 3.6 for some indexing exception types (GH14684, GH14689)
- Compat with python 3.6 for deprecation warnings in the test suite (GH14681)
- Compat with python 3.6 for Timestamp pickles (GH14689)
- Compat with `dateutil==2.6.0`; segfault reported in the testing suite (GH14621)
- Allow nanoseconds in `Timestamp.replace` as a kwarg (GH14621)
- Bug in `pd.read_csv` in which aliasing was being done for `na_values` when passed in as a dictionary (GH14203)
- Bug in `pd.read_csv` in which column indices for a dict-like `na_values` were not being respected (GH14203)

- Bug in `pd.read_csv` where reading files fails, if the number of headers is equal to the number of lines in the file ([GH14515](#))
- Bug in `pd.read_csv` for the Python engine in which an unhelpful error message was being raised when multi-char delimiters were not being respected with quotes ([GH14582](#))
- Fix bugs ([GH14734](#), [GH13654](#)) in `pd.read_sas` and `pandas.io.sas.sas7bdat.SAS7BDATReader` that caused problems when reading a SAS file incrementally.
- Bug in `pd.read_csv` for the Python engine in which an unhelpful error message was being raised when `skipfooter` was not being respected by Python's CSV library ([GH13879](#))
- Bug in `.fillna()` in which timezone aware `datetime64` values were incorrectly rounded ([GH14872](#))
- Bug in `.groupby(..., sort=True)` of a non-lexsorted `MultiIndex` when grouping with multiple levels ([GH14776](#))
- Bug in `pd.cut` with negative values and a single bin ([GH14652](#))
- Bug in `pd.to_numeric` where a 0 was not unsigned on a `downcast='unsigned'` argument ([GH14401](#))
- Bug in plotting regular and irregular timeseries using shared axes (`sharex=True` or `ax.twinx()`) ([GH13341](#), [GH14322](#)).
- Bug in not propagating exceptions in parsing invalid datetimes, noted in python 3.6 ([GH14561](#))
- Bug in resampling a `DatetimeIndex` in local TZ, covering a DST change, which would raise `AmbiguousTimeError` ([GH14682](#))
- Bug in indexing that transformed `RecursionError` into `KeyError` or `IndexingError` ([GH14554](#))
- Bug in `HDFStore` when writing a `MultiIndex` when using `data_columns=True` ([GH14435](#))
- Bug in `HDFStore.append()` when writing a `Series` and passing a `min_itemsize` argument containing a value for the index ([GH11412](#))
- Bug when writing to a `HDFStore` in table format with a `min_itemsize` value for the index and without asking to append ([GH10381](#))
- Bug in `Series.groupby().nunique()` raising an `IndexError` for an empty `Series` ([GH12553](#))
- Bug in `DataFrame.nlargest` and `DataFrame.nsmallest` when the index had duplicate values ([GH13412](#))
- Bug in clipboard functions on linux with python2 with unicode and separators ([GH13747](#))
- Bug in clipboard functions on Windows 10 and python 3 ([GH14362](#), [GH12807](#))
- Bug in `.to_clipboard()` and Excel compat ([GH12529](#))
- Bug in `DataFrame.combine_first()` for integer columns ([GH14687](#)).
- Bug in `pd.read_csv()` in which the `dtype` parameter was not being respected for empty data ([GH14712](#))
- Bug in `pd.read_csv()` in which the `nrows` parameter was not being respected for large input when using the C engine for parsing ([GH7626](#))
- Bug in `pd.merge_asof()` could not handle timezone-aware `DatetimeIndex` when a tolerance was specified ([GH14844](#))
- Explicit check in `to_stata` and `StataWriter` for out-of-range values when writing doubles ([GH14618](#))
- Bug in `.plot(kind='kde')` which did not drop missing values to generate the KDE Plot, instead generating an empty plot. ([GH14821](#))
- Bug in `unstack()` if called with a list of column(s) as an argument, regardless of the dtypes of all columns, they get coerced to object ([GH11847](#))

#### 39.6.1.4 Contributors

A total of 33 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.6.2 v0.19.1 (November 3, 2016)

{{ header }}

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

### What's new in v0.19.1

- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.6.2.1 Performance Improvements

- Fixed performance regression in factorization of `Period` data ([GH14338](#))
- Fixed performance regression in `Series.asof(where)` when `where` is a scalar ([GH14461](#))
- Improved performance in `DataFrame.asof(where)` when `where` is a scalar ([GH14461](#))
- Improved performance in `.to_json()` when `lines=True` ([GH14408](#))
- Improved performance in certain types of *loc* indexing with a `MultiIndex` ([GH14551](#)).

### 39.6.2.2 Bug Fixes

- Source installs from PyPI will now again work without `cython` installed, as in previous versions ([GH14204](#))
- Compat with Cython 0.25 for building ([GH14496](#))
- Fixed regression where user-provided file handles were closed in `read_csv(c engine)` ([GH14418](#)).
- Fixed regression in `DataFrame.quantile` when missing values were present in some columns ([GH14357](#)).
- Fixed regression in `Index.difference` where the `freq` of a `DatetimeIndex` was incorrectly set ([GH14323](#))
- Added back `pandas.core.common.array_equivalent` with a deprecation warning ([GH14555](#)).
- Bug in `pd.read_csv` for the C engine in which quotation marks were improperly parsed in skipped rows ([GH14459](#))
- Bug in `pd.read_csv` for Python 2.x in which Unicode quote characters were no longer being respected ([GH14477](#))
- Fixed regression in `Index.append` when categorical indices were appended ([GH14545](#)).
- Fixed regression in `pd.DataFrame` where constructor fails when given dict with `None` value ([GH14381](#))
- Fixed regression in `DatetimeIndex._maybe_cast_slice_bound` when index is empty ([GH14354](#)).
- Bug in localizing an ambiguous timezone when a boolean is passed ([GH14402](#))
- Bug in `TimedeltaIndex` addition with a `Datetime`-like object where addition overflow in the negative direction was not being caught ([GH14068](#), [GH14453](#))
- Bug in string indexing against data with object `Index` may raise `AttributeError` ([GH14424](#))

- Correctly raise `ValueError` on empty input to `pd.eval()` and `df.query()` (GH13139)
- Bug in `RangeIndex.intersection` when result is a empty set (GH14364).
- Bug in groupby-transform broadcasting that could cause incorrect dtype coercion (GH14457)
- Bug in `Series.__setitem__` which allowed mutating read-only arrays (GH14359).
- Bug in `DataFrame.insert` where multiple calls with duplicate columns can fail (GH14291)
- `pd.merge()` will raise `ValueError` with non-boolean parameters in passed boolean type arguments (GH14434)
- Bug in `Timestamp` where dates very near the minimum (1677-09) could underflow on creation (GH14415)
- Bug in `pd.concat` where names of the keys were not propagated to the resulting `MultiIndex` (GH14252)
- Bug in `pd.concat` where axis cannot take string parameters 'rows' or 'columns' (GH14369)
- Bug in `pd.concat` with dataframes heterogeneous in length and tuple keys (GH14438)
- Bug in `MultiIndex.set_levels` where illegal level values were still set after raising an error (GH13754)
- Bug in `DataFrame.to_json` where `lines=True` and a value contained a `}` character (GH14391)
- Bug in `df.groupby` causing an `AttributeError` when grouping a single index frame by a column and the index level (GH14327)
- Bug in `df.groupby` where `TypeError` raised when `pd.Grouper(key=...)` is passed in a list (GH14334)
- Bug in `pd.pivot_table` may raise `TypeError` or `ValueError` when index or columns is not scalar and values is not specified (GH14380)

### 39.6.2.3 Contributors

A total of 30 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.6.3 v0.19.0 (October 2, 2016)

{{ header }}

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `merge_asof()` for asof-style time-series joining, see [here](#)
- `.rolling()` is now time-series aware, see [here](#)
- `read_csv()` now supports parsing Categorical data, see [here](#)
- A function `union_categorical()` has been added for combining categoricals, see [here](#)
- `PeriodIndex` now has its own `period` dtype, and changed to be more consistent with other `Index` classes. See [here](#)
- Sparse data structures gained enhanced support of `int` and `bool` dtypes, see [here](#)
- Comparison operations with `Series` no longer ignores the index, see [here](#) for an overview of the API changes.
- Introduction of a pandas development API for utility functions, see [here](#).
- Deprecation of `Panel4D` and `PanelND`. We recommend to represent these types of n-dimensional data with the [xarray](#) package.
- Removal of the previously deprecated modules `pandas.io.data`, `pandas.io.wb`, `pandas.tools.rplot`.

|                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------|
| <b>Warning:</b> pandas >= 0.19.0 will no longer silence numpy ufunc warnings upon import, see <a href="#">here</a> . |
|----------------------------------------------------------------------------------------------------------------------|

**What's new in v0.19.0**

- *New features*
  - *merge\_asof* for asof-style time-series joining
  - *.rolling()* is now time-series aware
  - *read\_csv* has improved support for duplicate column names
  - *read\_csv* supports parsing *Categorical* directly
  - *Categorical Concatenation*
  - *Semi-Month Offsets*
  - *New Index methods*
  - *Google BigQuery Enhancements*
  - *Fine-grained numpy errstate*
  - *get\_dummies* now returns integer dtypes
  - *Downcast values to smallest possible dtype in to\_numeric*
  - *pandas development API*
  - *Other enhancements*
- *API changes*
  - *Series.tolist()* will now return Python types
  - *Series operators for different indexes*
    - \* *Arithmetic operators*
    - \* *Comparison operators*
    - \* *Logical operators*
    - \* *Flexible comparison methods*
  - *Series type promotion on assignment*
  - *.to\_datetime()* changes
  - *Merging changes*
  - *.describe()* changes
  - *Period changes*
    - \* *PeriodIndex* now has period dtype
    - \* *Period('NaT')* now returns *pd.NaT*
    - \* *PeriodIndex.values* now returns array of *Period* object
  - *Index + / - no longer used for set operations*
  - *Index.difference* and *.symmetric\_difference* changes
  - *Index.unique* consistently returns *Index*
  - *MultiIndex constructors, groupby and set\_index* preserve categorical dtypes
  - *read\_csv* will progressively enumerate chunks

- *Sparse Changes*
  - \* *int64 and bool support enhancements*
  - \* *Operators now preserve dtypes*
  - \* *Other sparse fixes*
- *Indexer dtype changes*
- *Other API Changes*
- *Deprecations*
- *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.6.3.1 New features

#### merge\_asof for asof-style time-series joining

A long-time requested feature has been added through the `merge_asof()` function, to support asof style joining of time-series ([GH1870](#), [GH13695](#), [GH13709](#), [GH13902](#)). Full documentation is [here](#).

The `merge_asof()` performs an asof merge, which is similar to a left-join except that we match on nearest key rather than equal keys.

```
In [1]: left = pd.DataFrame({'a': [1, 5, 10],
...:                        'left_val': ['a', 'b', 'c']})
...:
...:

In [2]: right = pd.DataFrame({'a': [1, 2, 3, 6, 7],
...:                          'right_val': [1, 2, 3, 6, 7]})
...:
...:
```

```
In [3]: left
```

```
Out[3]:
```

```
   a left_val
0   1        a
1   5        b
2  10        c
```

```
[3 rows x 2 columns]
```

```
In [4]: right
```

```
Out[4]:
   a right_val
0   1         1
1   2         2
2   3         3
3   6         6
4   7         7
```

(continues on next page)

(continued from previous page)

[5 rows x 2 columns]

We typically want to match exactly when possible, and use the most recent value otherwise.

```
In [5]: pd.merge_asof(left, right, on='a')
```

```
Out[5]:
```

|   | a  | left_val | right_val |
|---|----|----------|-----------|
| 0 | 1  | a        | 1         |
| 1 | 5  | b        | 3         |
| 2 | 10 | c        | 7         |

[3 rows x 3 columns]

We can also match rows ONLY with prior data, and not an exact match.

```
In [6]: pd.merge_asof(left, right, on='a', allow_exact_matches=False)
```

```
Out[6]:
```

|   | a  | left_val | right_val |
|---|----|----------|-----------|
| 0 | 1  | a        | NaN       |
| 1 | 5  | b        | 3.0       |
| 2 | 10 | c        | 7.0       |

[3 rows x 3 columns]

In a typical time-series example, we have trades and quotes and we want to asof-join them. This also illustrates using the `by` parameter to group data before merging.

```
In [7]: trades = pd.DataFrame({
...:     'time': pd.to_datetime(['20160525 13:30:00.023',
...:                             '20160525 13:30:00.038',
...:                             '20160525 13:30:00.048',
...:                             '20160525 13:30:00.048',
...:                             '20160525 13:30:00.048']),
...:     'ticker': ['MSFT', 'MSFT',
...:                'GOOG', 'GOOG', 'AAPL'],
...:     'price': [51.95, 51.95,
...:               720.77, 720.92, 98.00],

An asof merge joins on the `on`, typically a datetimelike field, which is ordered, and in this case we are using a grouper in the `by` field. This is like a left-outer join, except that forward filling happens automatically taking the most recent non-NaN value.

```
In [11]: pd.merge_asof(trades, quotes,
```

```

....:             on='time',
....:             by='ticker')
....:

```

```
Out [11]:
```

|   |            | time         | ticker | price  | quantity | bid    | ask    |
|---|------------|--------------|--------|--------|----------|--------|--------|
| 0 | 2016-05-25 | 13:30:00.023 | MSFT   | 51.95  | 75       | 51.95  | 51.96  |
| 1 | 2016-05-25 | 13:30:00.038 | MSFT   | 51.95  | 155      | 51.97  | 51.98  |
| 2 | 2016-05-25 | 13:30:00.048 | GOOG   | 720.77 | 100      | 720.50 | 720.93 |
| 3 | 2016-05-25 | 13:30:00.048 | GOOG   | 720.92 | 100      | 720.50 | 720.93 |
| 4 | 2016-05-25 | 13:30:00.048 | AAPL   | 98.00  | 100      | NaN    | NaN    |

```
[5 rows x 6 columns]
```

This returns a merged DataFrame with the entries in the same order as the original left passed DataFrame (`trades` in this case), with the fields of the quotes merged.

### `.rolling()` is now time-series aware

`.rolling()` objects are now time-series aware and can accept a time-series offset (or convertible) for the window argument ([GH13327](#), [GH12995](#)). See the full documentation [here](#).

[5 rows x 2 columns]
```

### read\_csv has improved support for duplicate column names

Duplicate column names are now supported in `read_csv()` whether they are in the file or passed in as the names parameter (GH7160, GH9424)

```
In [24]: data = '0,1,2\n3,4,5'
```

```
In [25]: names = ['a', 'b', 'a']
```

#### Previous behavior:

```
In [2]: pd.read_csv(StringIO(data), names=names)
```

```
Out[2]:
```

```

   a  b  a
0  2  1  2
1  5  4  5

```

The first a column contained the same data as the second a column, when it should have contained the values [0, 3].

#### New behavior:

```
In [26]: pd.read_csv(StringIO(data), names=names)
```

```
Out[26]:
```

```

   a  b  a.1
0  0  1    2
1  3  4    5

```

```
[2 rows x 3 columns]
```

### read\_csv supports parsing Categorical directly

The `read_csv()` function now supports parsing a `Categorical` column when specified as a dtype (GH10153). Depending on the structure of the data, this can result in a faster parse time and lower memory usage compared to converting to `Categorical` after parsing. See the *io docs* [here](#).

```
In [27]: data = 'col1,col2,col3\na,b,1\na,b,2\nc,d,3'
```

```
In [28]: pd.read_csv(StringIO(data))
```

Out [28]:

| col1 | col2 | col3 |
|------|------|------|
|------|------|------|

|   |   |   |   |
|---|---|---|---|
| 0 | a | b | 1 |
|---|---|---|---|

|   |   |   |   |
|---|---|---|---|
| 1 | a | b | 2 |
|---|---|---|---|

|   |   |   |   |
|---|---|---|---|
| 2 | c | d | 3 |
|---|---|---|---|

```
[3 rows x 3 columns]
```

```
In [29]: pd.read_csv(StringIO(data)).dtypes
```

---

| col1 | object |
|------|--------|
|------|--------|

|      |        |
|------|--------|
| col2 | object |
|------|--------|

|      |       |
|------|-------|
| col3 | int64 |
|------|-------|

```
Length: 3, dtype: object
```

```
In [30]: pd.read_csv(StringIO(data), dtype='category').dtypes
```

| col1 | category |
|------|----------|
|------|----------|

|      |          |
|------|----------|
| col2 | category |
|------|----------|

|      |          |
|------|----------|
| col3 | category |
|------|----------|

```
Length: 3, dtype: object
```

Individual columns can be parsed as a `Categorical` using a dict specification

```
In [31]: pd.read_csv(StringIO(data), dtype={'col1': 'category'}).dtypes
```

Out [31]:

| col1 | category |
|------|----------|
|------|----------|

|      |        |
|------|--------|
| col2 | object |
|------|--------|

|      |       |
|------|-------|
| col3 | int64 |
|------|-------|

```
Length: 3, dtype: object
```

**Note:** The resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can be converted using the `to_numeric()` function, or as appropriate, another converter such as `to_datetime()`.

```
In [32]: df = pd.read_csv(StringIO(data), dtype='category')
```

```
In [33]: df.dtypes
```

Out [33]:

| col1 | category |
|------|----------|
|------|----------|

|      |          |
|------|----------|
| col2 | category |
|------|----------|

|      |          |
|------|----------|
| col3 | category |
|------|----------|

```
Length: 3, dtype: object
```

```
In [34]: df['col3']
```

```
Name: col3, Length: 3, dtype: category
```

```
Categories (3, object): [1, 2, 3]
```

(continues on next page)

(continued from previous page)

```
In [35]: df['col3'].cat.categories = pd.to_numeric(df['col3'].cat.categories)

In [36]: df['col3']
Out[36]:
0      1
1      2
2      3
Name: col3, Length: 3, dtype: category
Categories (3, int64): [1, 2, 3]
```

## Categorical Concatenation

- A function `union_categoricals()` has been added for combining categoricals, see *Unioning Categoricals* (GH13361, GH13763, GH13846, GH14173)

```
In [37]: from pandas.api.types import union_categoricals

In [38]: a = pd.Categorical(["b", "c"])

In [39]: b = pd.Categorical(["a", "b"])

In [40]: union_categoricals([a, b])
Out[40]:
[b, c, a, b]
Categories (3, object): [b, c, a]
```

- `concat` and `append` now can concat category dtypes with different categories as object dtype (GH13524)

```
In [41]: s1 = pd.Series(['a', 'b'], dtype='category')

In [42]: s2 = pd.Series(['b', 'c'], dtype='category')
```

### Previous behavior:

```
In [1]: pd.concat([s1, s2])
ValueError: incompatible categories in categorical concat
```

### New behavior:

```
In [43]: pd.concat([s1, s2])
Out[43]:
0      a
1      b
0      b
1      c
Length: 4, dtype: object
```

## Semi-Month Offsets

Pandas has gained new frequency offsets, `SemiMonthEnd` ('SM') and `SemiMonthBegin` ('SMS'). These provide date offsets anchored (by default) to the 15th and end of month, and 15th and 1st of month respectively. (GH1543)

```
In [44]: from pandas.tseries.offsets import SemiMonthEnd, SemiMonthBegin
```

#### SemiMonthEnd:

```
In [45]: pd.Timestamp('2016-01-01') + SemiMonthEnd()
Out[45]: Timestamp('2016-01-15 00:00:00')

In [46]: pd.date_range('2015-01-01', freq='SM', periods=4)
Out[46]: DatetimeIndex(['2015-01-15', '2015-01-31', '2015-02-15', '2015-02-28'], dtype='datetime64[ns]', freq='SM-15')
```

#### SemiMonthBegin:

```
In [47]: pd.Timestamp('2016-01-01') + SemiMonthBegin()
Out[47]: Timestamp('2016-01-15 00:00:00')

In [48]: pd.date_range('2015-01-01', freq='SMS', periods=4)
Out[48]: DatetimeIndex(['2015-01-01', '2015-01-15', '2015-02-01', '2015-02-15'], dtype='datetime64[ns]', freq='SMS-15')
```

Using the anchoring suffix, you can also specify the day of month to use instead of the 15th.

```
In [49]: pd.date_range('2015-01-01', freq='SMS-16', periods=4)
Out[49]: DatetimeIndex(['2015-01-01', '2015-01-16', '2015-02-01', '2015-02-16'], dtype='datetime64[ns]', freq='SMS-16')

In [50]: pd.date_range('2015-01-01', freq='SM-14', periods=4)
Out[50]: DatetimeIndex(['2015-01-14', '2015-01-31', '2015-02-14', '2015-02-28'], dtype='datetime64[ns]', freq='SM-14')
```

## New Index methods

The following methods and options are added to Index, to be more consistent with the Series and DataFrame API.

Index now supports the `.where()` function for same shape indexing ([GH13170](#))

```
In [51]: idx = pd.Index(['a', 'b', 'c'])
In [52]: idx.where([True, False, True])
Out[52]: Index(['a', nan, 'c'], dtype='object')
```

Index now supports `.dropna()` to exclude missing values ([GH6194](#))

```
In [53]: idx = pd.Index([1, 2, np.nan, 4])
In [54]: idx.dropna()
Out[54]: Float64Index([1.0, 2.0, 4.0], dtype='float64')
```

For MultiIndex, values are dropped if any level is missing by default. Specifying `how='all'` only drops values where all levels are missing.

```
In [55]: midx = pd.MultiIndex.from_arrays([[1, 2, np.nan, 4],
.....:                                     [1, 2, np.nan, np.nan]])
```

(continues on next page)

(continued from previous page)

[illegible]

Index now supports `.str.extractall()` which returns a DataFrame, see the *docs here* ([GH10008](#), [GH13156](#))

```
In [59]: idx = pd.Index(["ala2", "b1", "c1"])

In [60]: idx.str.extractall(r"[ab](?P<digit>\d)")
Out[60]:
```

|       |   | digit |
|-------|---|-------|
| match |   |       |
| 0     | 0 | 1     |
|       | 1 | 2     |
| 1     | 0 | 1     |

```
[3 rows x 1 columns]
```

`Index.astype()` now accepts an optional boolean argument `copy`, which allows optional copying if the requirements on `dtype` are satisfied ([GH13209](#))

## Google BigQuery Enhancements

- The `read_gbq()` method has gained the `dialect` argument to allow users to specify whether to use BigQuery's legacy SQL or BigQuery's standard SQL. See the [docs](#) for more details ([GH13615](#)).
- The `to_gbq()` method now allows the DataFrame column order to differ from the destination table schema ([GH11359](#)).

## Fine-grained numpy errstate

Previous versions of pandas would permanently silence numpy's ufunc error handling when pandas was imported. Pandas did this in order to silence the warnings that would arise from using numpy ufuncs on missing data, which are usually represented as NaN s. Unfortunately, this silenced legitimate warnings arising in non-pandas code in the application. Starting with 0.19.0, pandas will use the `numpy.errstate` context manager to silence these warnings in a more fine-grained manner, only around where these operations are actually used in the pandas code base. (GH13109, GH13145)

After upgrading pandas, you may see *new* `RuntimeWarnings` being issued from your code. These are likely legitimate, and the underlying cause likely existed in the code when using previous versions of pandas that simply silenced the warning. Use `numpy.errstate` around the source of the `RuntimeWarning` to control how these conditions are handled.

### **get\_dummies now returns integer dtypes**

The `pd.get_dummies` function now returns dummy-encoded columns as small integers, rather than floats ([GH8725](#)). This should provide an improved memory footprint.

#### **Previous behavior:**

```
In [1]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[1]:
a      float64
b      float64
c      float64
dtype: object
```

#### **New behavior:**

```
In [61]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[61]:
a      uint8
b      uint8
c      uint8
Length: 3, dtype: object
```

### **Downcast values to smallest possible dtype in to\_numeric**

`pd.to_numeric()` now accepts a `downcast` parameter, which will downcast the data if possible to smallest specified numerical dtype ([GH13352](#))

```
In [62]: s = ['1', 2, 3]

In [63]: pd.to_numeric(s, downcast='unsigned')
Out[63]: array([1, 2, 3], dtype=uint8)

In [64]: pd.to_numeric(s, downcast='integer')
Out[64]: array([1, 2, 3], dtype=int8)
```

### **pandas development API**

As part of making pandas API more uniform and accessible in the future, we have created a standard sub-package of pandas, `pandas.api` to hold public API's. We are starting by exposing type introspection functions in `pandas.api.types`. More sub-packages and officially sanctioned API's will be published in future versions of pandas ([GH13147](#), [GH13634](#))

The following are now part of this API:

```

In [65]: import pprint

In [66]: from pandas.api import types

In [67]: funcs = [f for f in dir(types) if not f.startswith('_')]

In [68]: pprint.pprint(funcs)
['CategoricalDtype',
 'DatetimeTZDtype',
 'IntervalDtype',
 'PeriodDtype',
 'infer_dtype',
 'is_array_like',
 'is_bool',
 'is_bool_dtype',
 'is_categorical',
 'is_categorical_dtype',
 'is_complex',
 'is_complex_dtype',
 'is_datetime64_any_dtype',
 'is_datetime64_dtype',
 'is_datetime64_ns_dtype',
 'is_datetime64tz_dtype',
 'is_datetimetz',
 'is_dict_like',
 'is_dtype_equal',
 'is_extension_type',
 'is_file_like',
 'is_float',
 'is_float_dtype',
 'is_hashable',
 'is_int64_dtype',
 'is_integer',
 'is_integer_dtype',
 'is_interval',
 'is_interval_dtype',
 'is_iterator',
 'is_list_like',
 'is_named_tuple',
 'is_number',
 'is_numeric_dtype',
 'is_object_dtype',
 'is_period',
 'is_period_dtype',
 'is_re',
 'is_re_compilable',
 'is_scalar',
 'is_signed_integer_dtype',
 'is_sparse',
 'is_string_dtype',
 'is_timedelta64_dtype',
 'is_timedelta64_ns_dtype',
 'is_unsigned_integer_dtype',
 'pandas_dtype',
 'union_categoricals']

```

**Note:** Calling these functions from the internal module `pandas.core.common` will now show a

DeprecationWarning (GH13990)

## Other enhancements

- Timestamp can now accept positional and keyword parameters similar to `datetime.datetime()` (GH10758, GH11630)

```
In [69]: pd.Timestamp(2012, 1, 1)
Out[69]: Timestamp('2012-01-01 00:00:00')

In [70]: pd.Timestamp(year=2012, month=1, day=1, hour=8, minute=30)
Out[70]: Timestamp('2012-01-01 08:30:00')
```

- The `.resample()` function now accepts a `on=` or `level=` parameter for resampling on a datetimelike column or MultiIndex level (GH13500)

```
In [71]: df = pd.DataFrame({'date': pd.date_range('2015-01-01', freq='W',
↳ periods=5),
    ....:                  'a': np.arange(5)},
    ....:                  index=pd.MultiIndex.from_arrays([[1, 2, 3, 4, 5],
    ....:                                                    pd.date_range('2015-
↳ 01-01',
    ....:                                                    freq='W
↳ ',
    ....:                                                    ],
    ....:                                                    names=['v', 'd']))
↳ periods=5)

In [72]: df
Out[72]:
```

|   |            | date       | a |
|---|------------|------------|---|
| v | d          |            |   |
| 1 | 2015-01-04 | 2015-01-04 | 0 |
| 2 | 2015-01-11 | 2015-01-11 | 1 |
| 3 | 2015-01-18 | 2015-01-18 | 2 |
| 4 | 2015-01-25 | 2015-01-25 | 3 |
| 5 | 2015-02-01 | 2015-02-01 | 4 |

```
[5 rows x 2 columns]

In [73]: df.resample('M', on='date').sum()
Out[73]:
```

|            | a |
|------------|---|
| date       |   |
| 2015-01-31 | 6 |
| 2015-02-28 | 4 |

```
[2 rows x 1 columns]

In [74]: df.resample('M', level='d').sum()
Out[74]:
```

(continues on next page)

(continued from previous page)

```

      a
d
2015-01-31  6
2015-02-28  4

[2 rows x 1 columns]
```

- The `.get_credentials()` method of `GbqConnector` can now first try to fetch the [application default credentials](#). See the docs for more details ([GH13577](#)).
- The `.tz_localize()` method of `DatetimeIndex` and `Timestamp` has gained the `errors` keyword, so you can potentially coerce nonexistent timestamps to `NaT`. The default behavior remains to raising a `NonExistentTimeError` ([GH13057](#)).
- `.to_hdf/read_hdf()` now accept path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path ([GH11773](#)).
- The `pd.read_csv()` with `engine='python'` has gained support for the `decimal` ([GH12933](#)), `na_filter` ([GH13321](#)) and the `memory_map` option ([GH13381](#)).
- Consistent with the Python API, `pd.read_csv()` will now interpret `+inf` as positive infinity ([GH13274](#)).
- The `pd.read_html()` has gained support for the `na_values`, `converters`, `keep_default_na` options ([GH13461](#)).
- `Categorical.astype()` now accepts an optional boolean argument `copy`, effective when `dtype` is categorical ([GH13209](#)).
- `DataFrame` has gained the `.asof()` method to return the last non-`NaN` values according to the selected subset ([GH13358](#)).
- The `DataFrame` constructor will now respect key ordering if a list of `OrderedDict` objects are passed in ([GH13304](#)).
- `pd.read_html()` has gained support for the `decimal` option ([GH12907](#)).
- `Series` has gained the properties `.is_monotonic`, `.is_monotonic_increasing`, `.is_monotonic_decreasing`, similar to `Index` ([GH13336](#)).
- `DataFrame.to_sql()` now allows a single value as the SQL type for all columns ([GH11886](#)).
- `Series.append` now supports the `ignore_index` option ([GH13677](#)).
- `.to_stata()` and `StataWriter` can now write variable labels to Stata dta files using a dictionary to make column names to labels ([GH13535](#), [GH13536](#)).
- `.to_stata()` and `StataWriter` will automatically convert `datetime64[ns]` columns to Stata format `%tc`, rather than raising a `ValueError` ([GH12259](#)).
- `read_stata()` and `StataReader` raise with a more explicit error message when reading Stata files with repeated value labels when `convert_categoricals=True` ([GH13923](#)).
- `DataFrame.style` will now render sparsified `MultiIndexes` ([GH11655](#)).
- `DataFrame.style` will now show column level names (e.g. `DataFrame.columns.names`) ([GH13775](#)).
- `DataFrame` has gained support to re-order the columns based on the values in a row using `df.sort_values(by='...', axis=1)` ([GH10806](#)).

```

In [75]: df = pd.DataFrame({'A': [2, 7], 'B': [3, 5], 'C': [4, 8]},
.....:                    index=['row1', 'row2'])
.....:
```

(continues on next page)

(continued from previous page)

```

In [76]: df
Out[76]:
   A  B  C
row1 2  3  4
row2 7  5  8

[2 rows x 3 columns]

In [77]: df.sort_values(by='row2', axis=1)
Out[77]:
   B  A  C
row1 3  2  4
row2 5  7  8

[2 rows x 3 columns]

```

- Added documentation to *I/O* regarding the perils of reading in columns with mixed dtypes and how to handle it ([GH13746](#))
- `to_html()` now has a `border` argument to control the value in the opening `<table>` tag. The default is the value of the `html.border` option, which defaults to 1. This also affects the notebook HTML repr, but since Jupyter's CSS includes a border-width attribute, the visual effect is the same. ([GH11563](#)).
- Raise `ImportError` in the `sql` functions when `sqlalchemy` is not installed and a connection string is used ([GH11920](#)).
- Compatibility with `matplotlib` 2.0. Older versions of `pandas` should also work with `matplotlib` 2.0 ([GH13333](#))
- `Timestamp`, `Period`, `DatetimeIndex`, `PeriodIndex` and `.dt` accessor have gained a `.is_leap_year` property to check whether the date belongs to a leap year. ([GH13727](#))
- `astype()` will now accept a dict of column name to data types mapping as the `dtype` argument. ([GH12086](#))
- The `pd.read_json` and `DataFrame.to_json` has gained support for reading and writing json lines with `lines` option see *Line delimited json* ([GH9180](#))
- `read_excel()` now supports the `true_values` and `false_values` keyword arguments ([GH13347](#))
- `groupby()` will now accept a scalar and a single-element list for specifying `level` on a non-`MultiIndex` grouper. ([GH13907](#))
- Non-convertible dates in an excel date column will be returned without conversion and the column will be `object` dtype, rather than raising an exception ([GH10001](#)).
- `pd.Timedelta(None)` is now accepted and will return `NaT`, mirroring `pd.Timestamp` ([GH13687](#))
- `pd.read_stata()` can now handle some format 111 files, which are produced by SAS when generating Stata dta files ([GH11526](#))
- `Series` and `Index` now support `divmod` which will return a tuple of series or indices. This behaves like a standard binary operator with regards to broadcasting rules ([GH14208](#)).

### 39.6.3.2 API changes

### Series.tolist() will now return Python types

Series.tolist() will now return Python types in the output, mimicking NumPy .tolist() behavior (GH10904)

```
In [78]: s = pd.Series([1, 2, 3])
```

#### Previous behavior:

```
In [7]: type(s.tolist()[0])
Out[7]:
<class 'numpy.int64'>
```

#### New behavior:

```
In [79]: type(s.tolist()[0])
Out[79]: int
```

### Series operators for different indexes

Following Series operators have been changed to make all operators consistent, including DataFrame (GH1134, GH4581, GH13538)

- Series comparison operators now raise ValueError when index are different.
- Series logical operators align both index of left and right hand side.

**Warning:** Until 0.18.1, comparing Series with the same length, would succeed even if the .index are different (the result ignores .index). As of 0.19.0, this will raises ValueError to be more strict. This section also describes how to keep previous behavior or align different indexes, using the flexible comparison methods like .eq.

As a result, Series and DataFrame operators behave as below:

### Arithmetic operators

Arithmetic operators align both index (no changes).

```
In [80]: s1 = pd.Series([1, 2, 3], index=list('ABC'))
In [81]: s2 = pd.Series([2, 2, 2], index=list('ABD'))
In [82]: s1 + s2
Out[82]:
A    3.0
B    4.0
C     NaN
D     NaN
Length: 4, dtype: float64

In [83]: df1 = pd.DataFrame([1, 2, 3], index=list('ABC'))
In [84]: df2 = pd.DataFrame([2, 2, 2], index=list('ABD'))
```

(continues on next page)

(continued from previous page)

```
In [85]: df1 + df2
Out[85]:
      0
A    3.0
B    4.0
C    NaN
D    NaN

[4 rows x 1 columns]
```

## Comparison operators

Comparison operators raise `ValueError` when `.index` are different.

**Previous Behavior** (Series):

Series compared values ignoring the `.index` as long as both had the same length:

```
In [1]: s1 == s2
Out[1]:
A    False
B     True
C    False
dtype: bool
```

**New behavior** (Series):

```
In [2]: s1 == s2
Out[2]:
ValueError: Can only compare identically-labeled Series objects
```

---

**Note:** To achieve the same result as previous versions (compare values based on locations ignoring `.index`), compare both `.values`.

```
In [86]: s1.values == s2.values
Out[86]: array([False,  True, False], dtype=bool)
```

If you want to compare Series aligning its `.index`, see flexible comparison methods section below:

```
In [87]: s1.eq(s2)
Out[87]:
A    False
B     True
C    False
D    False
Length: 4, dtype: bool
```

---

**Current Behavior** (DataFrame, no change):

```
In [3]: df1 == df2
Out[3]:
ValueError: Can only compare identically-labeled DataFrame objects
```

## Logical operators

Logical operators align both `.index` of left and right hand side.

**Previous behavior** (Series), only left hand side index was kept:

```
In [4]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [5]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [6]: s1 & s2
Out[6]:
A      True
B     False
C     False
dtype: bool
```

**New behavior** (Series):

```
In [88]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [89]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [90]: s1 & s2
Out[90]:
A      True
B     False
C     False
D     False
Length: 4, dtype: bool
```

**Note:** Series logical operators fill a NaN result with False.

**Note:** To achieve the same result as previous versions (compare values based on only left hand side index), you can use `reindex_like`:

```
In [91]: s1 & s2.reindex_like(s1)
Out[91]:
A      True
B     False
C     False
Length: 3, dtype: bool
```

**Current Behavior** (DataFrame, no change):

```
In [92]: df1 = pd.DataFrame([True, False, True], index=list('ABC'))
In [93]: df2 = pd.DataFrame([True, True, True], index=list('ABD'))
In [94]: df1 & df2
Out[94]:
0
A      True
B     False
C      NaN
D      NaN
```

(continues on next page)

(continued from previous page)

```
[4 rows x 1 columns]
```

## Flexible comparison methods

Series flexible comparison methods like `eq`, `ne`, `le`, `lt`, `ge` and `gt` now align both index. Use these operators if you want to compare two Series which has the different index.

```
In [95]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [96]: s2 = pd.Series([2, 2, 2], index=['b', 'c', 'd'])
In [97]: s1.eq(s2)
Out[97]:
a    False
b     True
c    False
d    False
Length: 4, dtype: bool

In [98]: s1.ge(s2)
Out[98]:
a    False
b     True
c     True
d    False
Length: 4, dtype: bool
```

Previously, this worked the same as comparison operators (see above).

## Series type promotion on assignment

A Series will now correctly promote its dtype for assignment with incompat values to the current dtype ([GH13234](#))

```
In [99]: s = pd.Series()
```

### Previous behavior:

```
In [2]: s["a"] = pd.Timestamp("2016-01-01")
In [3]: s["b"] = 3.0
TypeError: invalid type promotion
```

### New behavior:

```
In [100]: s["a"] = pd.Timestamp("2016-01-01")
In [101]: s["b"] = 3.0
In [102]: s
Out[102]:
a    2016-01-01 00:00:00
b                      3
```

(continues on next page)

(continued from previous page)

```
Length: 2, dtype: object
```

```
In [103]: s.dtype
```

```
Out[103]: dtype('O')
```

### `.to_datetime()` changes

Previously if `.to_datetime()` encountered mixed integers/floats and strings, but no datetimes with `errors='coerce'` it would convert all to `NaT`.

#### Previous behavior:

```
In [2]: pd.to_datetime([1, 'foo'], errors='coerce')
Out[2]: DatetimeIndex(['NaT', 'NaT'], dtype='datetime64[ns]', freq=None)
```

#### Current behavior:

This will now convert integers/floats with the default unit of `ns`.

```
In [104]: pd.to_datetime([1, 'foo'], errors='coerce')
Out[104]: DatetimeIndex(['1970-01-01 00:00:00.000000001', 'NaT'], dtype='datetime64[ns]', freq=None)
```

Bug fixes related to `.to_datetime()`:

- Bug in `pd.to_datetime()` when passing integers or floats, and no unit and `errors='coerce'` ([GH13180](#)).
- Bug in `pd.to_datetime()` when passing invalid data types (e.g. `bool`); will now respect the `errors` keyword ([GH13176](#))
- Bug in `pd.to_datetime()` which overflowed on `int8`, and `int16` dtypes ([GH13451](#))
- Bug in `pd.to_datetime()` raise `AttributeError` with `NaN` and the other string is not valid when `errors='ignore'` ([GH12424](#))
- Bug in `pd.to_datetime()` did not cast floats correctly when unit was specified, resulting in truncated datetime ([GH13834](#))

### Merging changes

Merging will now preserve the dtype of the join keys ([GH8596](#))

```
In [105]: df1 = pd.DataFrame({'key': [1], 'v1': [10]})

In [106]: df1
Out[106]:
   key  v1
0    1  10

[1 rows x 2 columns]

In [107]: df2 = pd.DataFrame({'key': [1, 2], 'v1': [20, 30]})
```

(continues on next page)

(continued from previous page)

```
In [108]: df2
Out[108]:
```

|   | key | v1 |
|---|-----|----|
| 0 | 1   | 20 |
| 1 | 2   | 30 |

```
[2 rows x 2 columns]
```

**Previous behavior:**

```
In [5]: pd.merge(df1, df2, how='outer')
Out[5]:
   key    v1
0  1.0  10.0
1  1.0  20.0
2  2.0  30.0

In [6]: pd.merge(df1, df2, how='outer').dtypes
Out[6]:
key    float64
v1     float64
dtype: object
```

**New behavior:**

We are able to preserve the join keys

```
In [109]: pd.merge(df1, df2, how='outer')
Out[109]:
   key  vl
0    1  10
1    1  20
2    2  30

[3 rows x 2 columns]

In [110]: pd.merge(df1, df2, how='outer').dtypes
Out[110]:
key      int64
vl      int64
Length: 2, dtype: object
```

Of course if you have missing values that are introduced, then the resulting dtype will be upcast, which is unchanged from previous.

```
In [111]: pd.merge(df1, df2, how='outer', on='key')
Out[111]:
```

|   | key | v1_x | v1_y |
|---|-----|------|------|
| 0 | 1   | 10.0 | 20   |
| 1 | 2   | NaN  | 30   |

```
[2 rows x 3 columns]
```

```
In [112]: pd.merge(df1, df2, how='outer', on='key').dtypes
```

```

key      object
v1_x     float64
v1_y     float64
dtype: object

```

(continues on next page)

(continued from previous page)

```

key          int64
vl_x         float64
vl_y         int64
Length: 3, dtype: object

```

**.describe() changes**

Percentile identifiers in the index of a `.describe()` output will now be rounded to the least precision that keeps them distinct ([GH13104](#))

```

In [113]: s = pd.Series([0, 1, 2, 3, 4])
In [114]: df = pd.DataFrame([0, 1, 2, 3, 4])

```

**Previous behavior:**

The percentiles were rounded to at most one decimal place, which could raise `ValueError` for a data frame if the percentiles were duplicated.

```

In [3]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[3]:
count      5.000000
mean       2.000000
std        1.581139
min        0.000000
0.0%       0.000400
0.1%       0.002000
0.1%       0.004000
50%        2.000000
99.9%      3.996000
100.0%     3.998000
100.0%     3.999600
max        4.000000

99.99%     3.999600
max        4.000000

[12 rows x 1 columns]
```

Furthermore:

- Passing duplicated percentiles will now raise a `ValueError`.
- Bug in `.describe()` on a `DataFrame` with a mixed-dtype column index, which would previously raise a `TypeError` ([GH13288](#))

## Period changes

### PeriodIndex now has period dtype

`PeriodIndex` now has its own period dtype. The period dtype is a pandas extension dtype like `category` or the *timezone aware dtype* (`datetime64[ns, tz]`) ([GH13941](#)). As a consequence of this change, `PeriodIndex` no longer has an integer dtype:

**Previous behavior:**

```

In [1]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')

In [2]: pi
Out[2]: PeriodIndex(['2016-08-01'], dtype='int64', freq='D')

In [3]: pd.api.types.is_integer_dtype(pi)
Out[3]: True

In [4]: pi.dtype
Out[4]: dtype('int64')
```

**New behavior:**

```

In [117]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')

In [118]: pi
```

(continues on next page)

(continued from previous page)

```

Out [118]: PeriodIndex(['2016-08-01'], dtype='period[D]', freq='D')

In [119]: pd.api.types.is_integer_dtype(pi)
\\Out [119]: False

In [120]: pd.api.types.is_period_dtype(pi)
\\Out [120]: True
↪True

In [121]: pi.dtype
\\Out [121]: period[D]
↪period[D]

In [122]: type(pi.dtype)
\\Out [122]: pandas.core.dtypes.dtypes.PeriodDtype
↪pandas.core.dtypes.dtypes.PeriodDtype

```

**Period('NaT') now returns pd.NaT**

Previously, Period has its own Period('NaT') representation different from pd.NaT. Now Period('NaT') has been changed to return pd.NaT. (GH12759, GH13582)

**Previous behavior:**

```

In [5]: pd.Period('NaT', freq='D')
Out [5]: Period('NaT', 'D')

```

**New behavior:**

These result in pd.NaT without providing freq option.

```

In [123]: pd.Period('NaT')
Out [123]: NaT

In [124]: pd.Period(None)
\\Out [124]: NaT

```

To be compatible with Period addition and subtraction, pd.NaT now supports addition and subtraction with int. Previously it raised ValueError.

**Previous behavior:**

```

In [5]: pd.NaT + 1
...
ValueError: Cannot add integral value to Timestamp without freq.

```

**New behavior:**

```

In [125]: pd.NaT + 1
Out [125]: NaT

In [126]: pd.NaT - 1
\\Out [126]: NaT

```

### PeriodIndex.values now returns array of Period object

.values is changed to return an array of Period objects, rather than an array of integers ([GH13988](#)).

**Previous behavior:**

```
In [6]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [7]: pi.values
Out[7]: array([492, 493])
```

**New behavior:**

```
In [127]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [128]: pi.values
Out[128]: array([Period('2011-01', 'M'), Period('2011-02', 'M')], dtype=object)
```

### Index + / - no longer used for set operations

Addition and subtraction of the base Index type and of DatetimeIndex (not the numeric index types) previously performed set operations (set union and difference). This behavior was already deprecated since 0.15.0 (in favor using the specific .union() and .difference() methods), and is now disabled. When possible, + and - are now used for element-wise operations, for example for concatenating strings or subtracting datetimes ([GH8227](#), [GH14127](#)).

**Previous behavior:**

```
In [1]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
FutureWarning: using '+' to provide set union with Indexes is deprecated, use '|' or .
↳union()
Out[1]: Index(['a', 'b', 'c'], dtype='object')
```

**New behavior:** the same operation will now perform element-wise addition:

```
In [129]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
Out[129]: Index(['aa', 'bc'], dtype='object')
```

Note that numeric Index objects already performed element-wise operations. For example, the behavior of adding two integer Indexes is unchanged. The base Index is now made consistent with this behavior.

```
In [130]: pd.Index([1, 2, 3]) + pd.Index([2, 3, 4])
Out[130]: Int64Index([3, 5, 7], dtype='int64')
```

Further, because of this change, it is now possible to subtract two DatetimeIndex objects resulting in a TimedeltaIndex:

**Previous behavior:**

```
In [1]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
...: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
FutureWarning: using '-' to provide set differences with datetimelike Indexes is
↳deprecated, use .difference()
Out[1]: DatetimeIndex(['2016-01-01'], dtype='datetime64[ns]', freq=None)
```

**New behavior:**

```
In [131]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
...: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
```

(continues on next page)

(continued from previous page)

```
Out[131]: TimedeltaIndex(['-1 days', '-1 days'], dtype='timedelta64[ns]', freq=None)
```

## Index.difference and .symmetric\_difference changes

`Index.difference` and `Index.symmetric_difference` will now, more consistently, treat NaN values as any other values. (GH13514)

```
In [132]: idx1 = pd.Index([1, 2, 3, np.nan])
```

```
In [133]: idx2 = pd.Index([0, 1, np.nan])
```

**Previous behavior:**

```
In [3]: idx1.difference(idx2)
```

```
Out[3]: Float64Index([nan, 2.0, 3.0], dtype='float64')
```

```
In [4]: idx1.symmetric_difference(idx2)
```

```
Out[4]: Float64Index([0.0, nan, 2.0, 3.0], dtype='float64')
```

**New behavior:**

```
In [134]: idx1.difference(idx2)
```

```
Out[134]: Float64Index([2.0, 3.0], dtype='float64')
```

```
In [135]: idx1.symmetric_difference(idx2)
```

```
Out[135]: Float64Index([0.0, 2.0, 3.0], dtype='float64')
```

## Index.unique consistently returns Index

`Index.unique()` now returns unique values as an `Index` of the appropriate dtype. (GH13395). Previously, most `Index` classes returned `np.ndarray`, and `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex` returned `Index` to keep metadata like `timezone`.

**Previous behavior:**

```
In [1]: pd.Index([1, 2, 3]).unique()
```

```
Out[1]: array([1, 2, 3])
```

[illegible]

Out [2] :

```
DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
               '2011-01-03 00:00:00+09:00'],
              dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

**New behavior:**

```
In [136]: pd.Index([1, 2, 3]).unique()
```

```
Out [136]: Int64Index([1, 2, 3], dtype='int64')
```

```
In [137]: pd.DatetimeIndex(['2011-01-01', '2011-01-02', '2011-01-03'],
```

(continues on next page)

(continued from previous page)

```
.....: tz='Asia/Tokyo').unique()
.....:
```

```
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\Out[137]:
DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
              '2011-01-03 00:00:00+09:00'],
              dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

### MultiIndex constructors, groupby and set\_index preserve categorical dtypes

`MultiIndex.from_arrays` and `MultiIndex.from_product` will now preserve categorical dtype in `MultiIndex` levels ([GH13743](#), [GH13854](#)).

```
In [138]: cat = pd.Categorical(['a', 'b'], categories=list("bac"))
In [139]: lvl1 = ['foo', 'bar']
In [140]: midx = pd.MultiIndex.from_arrays([cat, lvl1])
In [141]: midx
Out[141]:
MultiIndex(levels=[['b', 'a', 'c'], ['bar', 'foo']],
            labels=[[1, 0], [1, 0]])
```

**Previous behavior:**

```
In [4]: midx.levels[0]
Out[4]: Index(['b', 'a', 'c'], dtype='object')

In [5]: midx.get_level_values[0]
Out[5]: Index(['a', 'b'], dtype='object')
```

**New behavior:** the single level is now a `CategoricalIndex`:

```
In [142]: midx.levels[0]
Out[142]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False,
↳ dtype='category')

In [143]: midx.get_level_values(0)
\\////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////\\
↳ CategoricalIndex(['a', 'b'], categories=['b', 'a', 'c'], ordered=False, dtype=
↳ 'category')
```

An analogous change has been made to `MultiIndex.from_product`. As a consequence, `groupby` and `set_index` also preserve categorical dtypes in indexes

```
In [144]: df = pd.DataFrame({'A': [0, 1], 'B': [10, 11], 'C': cat})
In [145]: df_grouped = df.groupby(by=['A', 'C']).first()
In [146]: df_set_idx = df.set_index(['A', 'C'])
```

**Previous behavior:**

```

In [11]: df_grouped.index.levels[1]
Out[11]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [12]: df_grouped.reset_index().dtypes
Out[12]:
A      int64
C      object
B     float64
dtype: object

In [13]: df_set_idx.index.levels[1]
Out[13]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [14]: df_set_idx.reset_index().dtypes
Out[14]:
A      int64
C      object
B      int64
dtype: object

```

**New behavior:**

```

In [147]: df_grouped.index.levels[1]
Out[147]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False,
↳ name='C', dtype='category')

In [148]: df_grouped.reset_index().dtypes
////////////////////////////////////
↳
A      int64
C     category
B     float64
Length: 3, dtype: object

In [149]: df_set_idx.index.levels[1]
////////////////////////////////////
↳ CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, name='C
↳ ', dtype='category')

In [150]: df_set_idx.reset_index().dtypes
////////////////////////////////////
↳
A      int64
C     category
B      int64
Length: 3, dtype: object

```

**read\_csv will progressively enumerate chunks**

When `read_csv()` is called with `chunksize=n` and without specifying an index, each chunk used to have an independently generated index from 0 to `n-1`. They are now given instead a progressive index, starting from 0 for the first chunk, from `n` for the second, and so on, so that, when concatenated, they are identical to the result of calling `read_csv()` without the `chunksize=` argument ([GH12185](#)).

```
In [151]: data = 'A,B\n0,1\n2,3\n4,5\n6,7'
```

**Previous behavior:**

```
In [2]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[2]:
   A  B
0  0  1
1  2  3
0  4  5
1  6  7
```

#### New behavior:

```
In [152]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[152]:
   A  B
0  0  1
1  2  3
2  4  5
3  6  7

[4 rows x 2 columns]
```

## Sparse Changes

These changes allow pandas to handle sparse data with more dtypes, and for work to make a smoother experience with data handling.

### int64 and bool support enhancements

Sparse data structures now gained enhanced support of int64 and bool dtype ([GH667](#), [GH13849](#)).

Previously, sparse data were float64 dtype by default, even if all inputs were of int or bool dtype. You had to specify dtype explicitly to create sparse data with int64 dtype. Also, fill\_value had to be specified explicitly because the default was np.nan which doesn't appear in int64 or bool data.

```
In [1]: pd.SparseArray([1, 2, 0, 0])
Out[1]:
[1.0, 2.0, 0.0, 0.0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

# specifying int64 dtype, but all values are stored in sp_values because
# fill_value default is np.nan
In [2]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
Out[2]:
[1, 2, 0, 0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

In [3]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64, fill_value=0)
Out[3]:
[1, 2, 0, 0]
Fill: 0
IntIndex
Indices: array([0, 1], dtype=int32)
```

As of v0.19.0, sparse data keeps the input dtype, and uses more appropriate `fill_value` defaults (0 for `int64` dtype, False for `bool` dtype).

```
In [153]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
Out[153]:
[1, 2, 0, 0]
Fill: 0
IntIndex
Indices: array([0, 1], dtype=int32)

In [154]: pd.SparseArray([True, False, False, False])
Out[154]:
[True, False, False, False]
Fill: False
IntIndex
Indices: array([0], dtype=int32)
```

See the *docs* for more details.

## Operators now preserve dtypes

- Sparse data structure now can preserve dtype after arithmetic ops ([GH13848](#))

```
In [155]: s = pd.SparseSeries([0, 2, 0, 1], fill_value=0, dtype=np.int64)
In [156]: s.dtype
Out[156]: Sparse[int64, 0]

In [157]: s + 1
Out[157]:
0    1
1    3
2    1
3    2
Length: 4, dtype: Sparse[int64, 1]
BlockIndex
Block locations: array([1, 3], dtype=int32)
Block lengths: array([1, 1], dtype=int32)
```

- Sparse data structure now support `astype` to convert internal dtype ([GH13900](#))

```
In [158]: s = pd.SparseSeries([1., 0., 2., 0.], fill_value=0)
In [159]: s
Out[159]:
0    1.0
1    0.0
2    2.0
3    0.0
Length: 4, dtype: Sparse[float64, 0]
BlockIndex
Block locations: array([0, 2], dtype=int32)
Block lengths: array([1, 1], dtype=int32)

In [160]: s.astype(np.int64)
```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////
↪
0      1
1      0
2      2
3      0
Length: 4, dtype: Sparse[int64, 0]
BlockIndex
Block locations: array([0, 2], dtype=int32)
Block lengths: array([1, 1], dtype=int32)

```

`astype` fails if data contains values which cannot be converted to specified `dtype`. Note that the limitation is applied to `fill_value` which default is `np.nan`.

```

In [7]: pd.SparseSeries([1., np.nan, 2., np.nan], fill_value=np.nan).astype(np.int64)
Out [7]:
ValueError: unable to coerce current fill_value nan to int64 dtype

```

## Other sparse fixes

- Subclassed `SparseDataFrame` and `SparseSeries` now preserve class types when slicing or transposing. ([GH13787](#))
- `SparseArray` with `bool` `dtype` now supports logical (`bool`) operators ([GH14000](#))
- Bug in `SparseSeries` with `MultiIndex []` indexing may raise `IndexError` ([GH13144](#))
- Bug in `SparseSeries` with `MultiIndex []` indexing result may have normal `Index` ([GH13144](#))
- Bug in `SparseDataFrame` in which `axis=None` did not default to `axis=0` ([GH13048](#))
- Bug in `SparseSeries` and `SparseDataFrame` creation with `object` `dtype` may raise `TypeError` ([GH11633](#))
- Bug in `SparseDataFrame` doesn't respect passed `SparseArray` or `SparseSeries` 's `dtype` and `fill_value` ([GH13866](#))
- Bug in `SparseArray` and `SparseSeries` don't apply `ufunc` to `fill_value` ([GH13853](#))
- Bug in `SparseSeries.abs` incorrectly keeps negative `fill_value` ([GH13853](#))
- Bug in single row slicing on multi-type `SparseDataFrame` s, types were previously forced to `float` ([GH13917](#))
- Bug in `SparseSeries` slicing changes integer `dtype` to `float` ([GH8292](#))
- Bug in `SparseDataFrame` comparison ops may raise `TypeError` ([GH13001](#))
- Bug in `SparseDataFrame.isnull` raises `ValueError` ([GH8276](#))
- Bug in `SparseSeries` representation with `bool` `dtype` may raise `IndexError` ([GH13110](#))
- Bug in `SparseSeries` and `SparseDataFrame` of `bool` or `int64` `dtype` may display its values like `float64` `dtype` ([GH13110](#))
- Bug in sparse indexing using `SparseArray` with `bool` `dtype` may return incorrect result ([GH13985](#))
- Bug in `SparseArray` created from `SparseSeries` may lose `dtype` ([GH13999](#))
- Bug in `SparseSeries` comparison with dense returns normal `Series` rather than `SparseSeries` ([GH13999](#))

## Indexer dtype changes

**Note:** This change only affects 64 bit python running on Windows, and only affects relatively advanced indexing operations

Methods such as `Index.get_indexer` that return an indexer array, coerce that array to a “platform int”, so that it can be directly used in 3rd party library operations like `numpy.take`. Previously, a platform int was defined as `np.int_` which corresponds to a C integer, but the correct type, and what is being used now, is `np.intp`, which corresponds to the C integer size that can hold a pointer ([GH3033](#), [GH13972](#)).

These types are the same on many platform, but for 64 bit python on Windows, `np.int_` is 32 bits, and `np.intp` is 64 bits. Changing this behavior improves performance for many operations on that platform.

### Previous behavior:

```
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int32')
```

### New behavior:

```
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int64')
```

## Other API Changes

- `Timestamp.to_pydatetime` will issue a `UserWarning` when `warn=True`, and the instance has a non-zero number of nanoseconds, previously this would print a message to stdout ([GH14101](#)).
- `Series.unique()` with `datetime` and `timezone` now returns return array of `Timestamp` with `timezone` ([GH13565](#)).
- `Panel.to_sparse()` will raise a `NotImplementedError` exception when called ([GH13778](#)).
- `Index.reshape()` will raise a `NotImplementedError` exception when called ([GH12882](#)).
- `.filter()` enforces mutual exclusion of the keyword arguments ([GH12399](#)).
- `eval`’s upcasting rules for `float32` types have been updated to be more consistent with NumPy’s rules. New behavior will not upcast to `float64` if you multiply a pandas `float32` object by a scalar `float64` ([GH12388](#)).
- An `UnsupportedFunctionCall` error is now raised if NumPy ufuncs like `np.mean` are called on groupby or resample objects ([GH12811](#)).
- `__setitem__` will no longer apply a callable rhs as a function instead of storing it. Call where directly to get the previous behavior ([GH13299](#)).
- Calls to `.sample()` will respect the random seed set via `numpy.random.seed(n)` ([GH13161](#)).
- `Styler.apply` is now more strict about the outputs your function must return. For `axis=0` or `axis=1`, the output shape must be identical. For `axis=None`, the output must be a `DataFrame` with identical columns and index labels ([GH13222](#)).
- `Float64Index.astype(int)` will now raise `ValueError` if `Float64Index` contains `NaN` values ([GH13149](#)).

- `TimedeltaIndex.astype(int)` and `DatetimeIndex.astype(int)` will now return `Int64Index` instead of `np.array` (GH13209)
- Passing `Period` with multiple frequencies to normal `Index` now returns `Index` with object dtype (GH13664)
- `PeriodIndex.fillna` with `Period` has different freq now coerces to object dtype (GH13664)
- Faceted boxplots from `DataFrame.boxplot(by=col)` now return a `Series` when `return_type` is not `None`. Previously these returned an `OrderedDict`. Note that when `return_type=None`, the default, these still return a 2-D NumPy array (GH12216, GH7096).
- `pd.read_hdf` will now raise a `ValueError` instead of `KeyError`, if a mode other than `r`, `r+` and `a` is supplied. (GH13623)
- `pd.read_csv()`, `pd.read_table()`, and `pd.read_hdf()` raise the builtin `FileNotFoundError` exception for Python 3.x when called on a nonexistent file; this is back-ported as `IOError` in Python 2.x (GH14086)
- More informative exceptions are passed through the csv parser. The exception type would now be the original exception type instead of `CParserError` (GH13652).
- `pd.read_csv()` in the C engine will now issue a `ParserWarning` or raise a `ValueError` when `sep` encoded is more than one character long (GH14065)
- `DataFrame.values` will now return `float64` with a `DataFrame` of mixed `int64` and `uint64` dtypes, conforming to `np.find_common_type` (GH10364, GH13917)
- `.groupby.groups` will now return a dictionary of `Index` objects, rather than a dictionary of `np.ndarray` or lists (GH14293)

### 39.6.3.3 Deprecations

- `Series.reshape` and `Categorical.reshape` have been deprecated and will be removed in a subsequent release (GH12882, GH12882)
- `PeriodIndex.to_datetime` has been deprecated in favor of `PeriodIndex.to_timestamp` (GH8254)
- `Timestamp.to_datetime` has been deprecated in favor of `Timestamp.to_pydatetime` (GH8254)
- `Index.to_datetime` and `DatetimeIndex.to_datetime` have been deprecated in favor of `pd.to_datetime` (GH8254)
- `pandas.core.datetools` module has been deprecated and will be removed in a subsequent release (GH14094)
- `SparseList` has been deprecated and will be removed in a future version (GH13784)
- `DataFrame.to_html()` and `DataFrame.to_latex()` have dropped the `colSpace` parameter in favor of `col_space` (GH13857)
- `DataFrame.to_sql()` has deprecated the `flavor` parameter, as it is superfluous when `SQLAlchemy` is not installed (GH13611)
- Deprecated `read_csv` keywords:
  - `compact_ints` and `use_unsigned` have been deprecated and will be removed in a future version (GH13320)
  - `buffer_lines` has been deprecated and will be removed in a future version (GH13360)
  - `as_reccarray` has been deprecated and will be removed in a future version (GH13373)

- `skip_footer` has been deprecated in favor of `skipfooter` and will be removed in a future version ([GH13349](#))
- top-level `pd.ordered_merge()` has been renamed to `pd.merge_ordered()` and the original name will be removed in a future version ([GH13358](#))
- `Timestamp.offset` property (and named arg in the constructor), has been deprecated in favor of `freq` ([GH12160](#))
- `pd.tseries.util.pivot_annual` is deprecated. Use `pivot_table` as alternative, an example is *here* ([GH736](#))
- `pd.tseries.util.isleapyear` has been deprecated and will be removed in a subsequent release. `Datetime`-likes now have a `.is_leap_year` property ([GH13727](#))
- `Panel4D` and `PanelND` constructors are deprecated and will be removed in a future version. The recommended way to represent these types of n-dimensional data are with the [xarray package](#). Pandas provides a `to_xarray()` method to automate this conversion ([GH13564](#)).
- `pandas.tseries.frequencies.get_standard_freq` is deprecated. Use `pandas.tseries.frequencies.to_offset(freq).rule_code` instead ([GH13874](#))
- `pandas.tseries.frequencies.to_offset`'s `freqstr` keyword is deprecated in favor of `freq` ([GH13874](#))
- `Categorical.from_array` has been deprecated and will be removed in a future version ([GH13854](#))

#### 39.6.3.4 Removal of prior version deprecations/changes

- The `SparsePanel` class has been removed ([GH13778](#))
- The `pd.sandbox` module has been removed in favor of the external library `pandas-qt` ([GH13670](#))
- The `pandas.io.data` and `pandas.io.wb` modules are removed in favor of the [pandas-datareader package](#) ([GH13724](#)).
- The `pandas.tools.rplot` module has been removed in favor of the [seaborn package](#) ([GH13855](#))
- `DataFrame.to_csv()` has dropped the `engine` parameter, as was deprecated in 0.17.1 ([GH11274](#), [GH13419](#))
- `DataFrame.to_dict()` has dropped the `outtype` parameter in favor of `orient` ([GH13627](#), [GH8486](#))
- `pd.Categorical` has dropped setting of the `ordered` attribute directly in favor of the `set_ordered` method ([GH13671](#))
- `pd.Categorical` has dropped the `levels` attribute in favor of `categories` ([GH8376](#))
- `DataFrame.to_sql()` has dropped the `mysql` option for the `flavor` parameter ([GH13611](#))
- `Panel.shift()` has dropped the `lags` parameter in favor of `periods` ([GH14041](#))
- `pd.Index` has dropped the `diff` method in favor of `difference` ([GH13669](#))
- `pd.DataFrame` has dropped the `to_wide` method in favor of `to_panel` ([GH14039](#))
- `Series.to_csv` has dropped the `nanRep` parameter in favor of `na_rep` ([GH13804](#))
- `Series.xs`, `DataFrame.xs`, `Panel.xs`, `Panel.major_xs`, and `Panel.minor_xs` have dropped the `copy` parameter ([GH13781](#))
- `str.split` has dropped the `return_type` parameter in favor of `expand` ([GH13701](#))

- Removal of the legacy time rules (offset aliases), deprecated since 0.17.0 (this has been alias since 0.8.0) ([GH13590](#), [GH13868](#)). Now legacy time rules raises `ValueError`. For the list of currently supported offsets, see *here*.
- The default value for the `return_type` parameter for `DataFrame.plot.box` and `DataFrame.boxplot` changed from `None` to `"axes"`. These methods will now return a matplotlib axes by default instead of a dictionary of artists. See *here* ([GH6581](#)).
- The `tquery` and `uquery` functions in the `pandas.io.sql` module are removed ([GH5950](#)).

### 39.6.3.5 Performance Improvements

- Improved performance of sparse `IntIndex.intersect` ([GH13082](#))
- Improved performance of sparse arithmetic with `BlockIndex` when the number of blocks are large, though recommended to use `IntIndex` in such cases ([GH13082](#))
- Improved performance of `DataFrame.quantile()` as it now operates per-block ([GH11623](#))
- Improved performance of float64 hash table operations, fixing some very slow indexing and groupby operations in python 3 ([GH13166](#), [GH13334](#))
- Improved performance of `DataFrameGroupBy.transform` ([GH12737](#))
- Improved performance of `Index` and `Series.duplicated` ([GH10235](#))
- Improved performance of `Index.difference` ([GH12044](#))
- Improved performance of `RangeIndex.is_monotonic_increasing` and `is_monotonic_decreasing` ([GH13749](#))
- Improved performance of datetime string parsing in `DatetimeIndex` ([GH13692](#))
- Improved performance of hashing `Period` ([GH12817](#))
- Improved performance of `factorize` of datetime with `timezone` ([GH13750](#))
- Improved performance of by lazily creating indexing hashtables on larger `Indexes` ([GH14266](#))
- Improved performance of `groupby.groups` ([GH14293](#))
- Unnecessary materializing of a `MultiIndex` when introspecting for memory usage ([GH14308](#))

### 39.6.3.6 Bug Fixes

- Bug in `groupby().shift()`, which could cause a segfault or corruption in rare circumstances when grouping by columns with missing values ([GH13813](#))
- Bug in `groupby().cumsum()` calculating `cumprod` when `axis=1`. ([GH13994](#))
- Bug in `pd.to_timedelta()` in which the `errors` parameter was not being respected ([GH13613](#))
- Bug in `io.json.json_normalize()`, where non-ascii keys raised an exception ([GH13213](#))
- Bug when passing a not-default-indexed `Series` as `xerr` or `yerr` in `.plot()` ([GH11858](#))
- Bug in area plot draws legend incorrectly if subplot is enabled or legend is moved after plot (matplotlib 1.5.0 is required to draw area plot legend properly) ([GH9161](#), [GH13544](#))
- Bug in `DataFrame` assignment with an object-dtyped `Index` where the resultant column is mutable to the original object. ([GH13522](#))
- Bug in matplotlib `AutoDataFormatter`; this restores the second scaled formatting and re-adds micro-second scaled formatting ([GH13131](#))

- Bug in selection from a `HDFStore` with a fixed format and `start` and/or `stop` specified will now return the selected range ([GH8287](#))
- Bug in `Categorical.from_codes()` where an unhelpful error was raised when an invalid ordered parameter was passed in ([GH14058](#))
- Bug in `Series` construction from a tuple of integers on windows not returning default dtype (`int64`) ([GH13646](#))
- Bug in `TimedeltaIndex` addition with a `Datetime`-like object where addition overflow was not being caught ([GH14068](#))
- Bug in `.groupby(...).resample(...)` when the same object is called multiple times ([GH13174](#))
- Bug in `.to_records()` when index name is a unicode string ([GH13172](#))
- Bug in calling `.memory_usage()` on object which doesn't implement ([GH12924](#))
- Regression in `Series.quantile` with nans (also shows up in `.median()` and `.describe()`); furthermore now names the `Series` with the quantile ([GH13098](#), [GH13146](#))
- Bug in `SeriesGroupBy.transform` with datetime values and missing groups ([GH13191](#))
- Bug where empty `Series` were incorrectly coerced in datetime-like numeric operations ([GH13844](#))
- Bug in `Categorical` constructor when passed a `Categorical` containing datetimes with timezones ([GH14190](#))
- Bug in `Series.str.extractall()` with `str` index raises `ValueError` ([GH13156](#))
- Bug in `Series.str.extractall()` with single group and quantifier ([GH13382](#))
- Bug in `DatetimeIndex` and `Period` subtraction raises `ValueError` or `AttributeError` rather than `TypeError` ([GH13078](#))
- Bug in `Index` and `Series` created with `NaN` and `NaT` mixed data may not have `datetime64` dtype ([GH13324](#))
- Bug in `Index` and `Series` may ignore `np.datetime64('nat')` and `np.timedelta64('nat')` to infer dtype ([GH13324](#))
- Bug in `PeriodIndex` and `Period` subtraction raises `AttributeError` ([GH13071](#))
- Bug in `PeriodIndex` construction returning a `float64` index in some circumstances ([GH13067](#))
- Bug in `.resample(...)` with a `PeriodIndex` not changing its `freq` appropriately when empty ([GH13067](#))
- Bug in `.resample(...)` with a `PeriodIndex` not retaining its type or name with an empty `DataFrame` appropriately when empty ([GH13212](#))
- Bug in `groupby(...).apply(...)` when the passed function returns scalar values per group ([GH13468](#)).
- Bug in `groupby(...).resample(...)` where passing some keywords would raise an exception ([GH13235](#))
- Bug in `.tz_convert` on a tz-aware `DatetimeIndex` that relied on index being sorted for correct results ([GH13306](#))
- Bug in `.tz_localize` with `dateutil.tz.tzlocal` may return incorrect result ([GH13583](#))
- Bug in `DatetimeTZDtype` dtype with `dateutil.tz.tzlocal` cannot be regarded as valid dtype ([GH13583](#))
- Bug in `pd.read_hdf()` where attempting to load an HDF file with a single dataset, that had one or more categorical columns, failed unless the `key` argument was set to the name of the dataset. ([GH13231](#))
- Bug in `.rolling()` that allowed a negative integer window in construction of the `Rolling()` object, but would later fail on aggregation ([GH13383](#))

- Bug in `Series` indexing with tuple-valued data and a numeric index ([GH13509](#))
- Bug in printing `pd.DataFrame` where unusual elements with the `object` dtype were causing segfaults ([GH13717](#))
- Bug in ranking `Series` which could result in segfaults ([GH13445](#))
- Bug in various index types, which did not propagate the name of passed index ([GH12309](#))
- Bug in `DatetimeIndex`, which did not honour the `copy=True` ([GH13205](#))
- Bug in `DatetimeIndex.is_normalized` returns incorrectly for normalized `date_range` in case of local timezones ([GH13459](#))
- Bug in `pd.concat` and `.append` may coerces `datetime64` and `timedelta` to `object` dtype containing python built-in `datetime` or `timedelta` rather than `Timestamp` or `Timedelta` ([GH13626](#))
- Bug in `PeriodIndex.append` may raises `AttributeError` when the result is `object` dtype ([GH13221](#))
- Bug in `CategoricalIndex.append` may accept normal list ([GH13626](#))
- Bug in `pd.concat` and `.append` with the same timezone get reset to UTC ([GH7795](#))
- Bug in `Series` and `DataFrame.append` raises `AmbiguousTimeError` if data contains `datetime` near DST boundary ([GH13626](#))
- Bug in `DataFrame.to_csv()` in which float values were being quoted even though quotations were specified for non-numeric values only ([GH12922](#), [GH13259](#))
- Bug in `DataFrame.describe()` raising `ValueError` with only boolean columns ([GH13898](#))
- Bug in `MultiIndex` slicing where extra elements were returned when level is non-unique ([GH12896](#))
- Bug in `.str.replace` does not raise `TypeError` for invalid replacement ([GH13438](#))
- Bug in `MultiIndex.from_arrays` which didn't check for input array lengths matching ([GH13599](#))
- Bug in `cartesian_product` and `MultiIndex.from_product` which may raise with empty input arrays ([GH12258](#))
- Bug in `pd.read_csv()` which may cause a segfault or corruption when iterating in large chunks over a stream/file under rare circumstances ([GH13703](#))
- Bug in `pd.read_csv()` which caused errors to be raised when a dictionary containing scalars is passed in for `na_values` ([GH12224](#))
- Bug in `pd.read_csv()` which caused BOM files to be incorrectly parsed by not ignoring the BOM ([GH4793](#))
- Bug in `pd.read_csv()` with `engine='python'` which raised errors when a numpy array was passed in for `usecols` ([GH12546](#))
- Bug in `pd.read_csv()` where the index columns were being incorrectly parsed when parsed as dates with a `thousands` parameter ([GH14066](#))
- Bug in `pd.read_csv()` with `engine='python'` in which `NaN` values weren't being detected after data was converted to numeric values ([GH13314](#))
- Bug in `pd.read_csv()` in which the `nrows` argument was not properly validated for both engines ([GH10476](#))
- Bug in `pd.read_csv()` with `engine='python'` in which infinities of mixed-case forms were not being interpreted properly ([GH13274](#))
- Bug in `pd.read_csv()` with `engine='python'` in which trailing `NaN` values were not being parsed ([GH13320](#))

- Bug in `pd.read_csv()` with `engine='python'` when reading from a `tempfile.TemporaryFile` on Windows with Python 3 (GH13398)
- Bug in `pd.read_csv()` that prevents `usecols` kwarg from accepting single-byte unicode strings (GH13219)
- Bug in `pd.read_csv()` that prevents `usecols` from being an empty set (GH13402)
- Bug in `pd.read_csv()` in the C engine where the NULL character was not being parsed as NULL (GH14012)
- Bug in `pd.read_csv()` with `engine='c'` in which NULL quotechar was not accepted even though quoting was specified as None (GH13411)
- Bug in `pd.read_csv()` with `engine='c'` in which fields were not properly cast to float when quoting was specified as non-numeric (GH13411)
- Bug in `pd.read_csv()` in Python 2.x with non-UTF8 encoded, multi-character separated data (GH3404)
- Bug in `pd.read_csv()`, where aliases for utf-xx (e.g. UTF-xx, UTF\_xx, utf\_xx) raised `UnicodeDecodeError` (GH13549)
- Bug in `pd.read_csv`, `pd.read_table`, `pd.read_fwf`, `pd.read_stata` and `pd.read_sas` where files were opened by parsers but not closed if both `chunksize` and `iterator` were None. (GH13940)
- Bug in `StataReader`, `StataWriter`, `XportReader` and `SAS7BDATReader` where a file was not properly closed when an error was raised. (GH13940)
- Bug in `pd.pivot_table()` where `margins_name` is ignored when `aggfunc` is a list (GH13354)
- Bug in `pd.Series.str.zfill`, `center`, `ljust`, `rjust`, and `pad` when passing non-integers, did not raise `TypeError` (GH13598)
- Bug in checking for any null objects in a `TimedeltaIndex`, which always returned `True` (GH13603)
- Bug in `Series` arithmetic raises `TypeError` if it contains datetime-like as object dtype (GH13043)
- Bug `Series.isnull()` and `Series.notnull()` ignore `Period('NaT')` (GH13737)
- Bug `Series.fillna()` and `Series.dropna()` don't affect to `Period('NaT')` (GH13737)
- Bug in `.fillna(value=np.nan)` incorrectly raises `KeyError` on a category dtyped `Series` (GH14021)
- Bug in extension dtype creation where the created types were not is/identical (GH13285)
- Bug in `.resample(...)` where incorrect warnings were triggered by IPython introspection (GH13618)
- Bug in `NaT - Period` raises `AttributeError` (GH13071)
- Bug in `Series` comparison may output incorrect result if rhs contains `NaT` (GH9005)
- Bug in `Series` and `Index` comparison may output incorrect result if it contains `NaT` with object dtype (GH13592)
- Bug in `Period` addition raises `TypeError` if `Period` is on right hand side (GH13069)
- Bug in `Period` and `Series` or `Index` comparison raises `TypeError` (GH13200)
- Bug in `pd.set_eng_float_format()` that would prevent `NaN` and `Inf` from formatting (GH11981)
- Bug in `.unstack` with `Categorical` dtype resets `.ordered` to `True` (GH13249)
- Clean some compile time warnings in datetime parsing (GH13607)
- Bug in `factorize` raises `AmbiguousTimeError` if data contains datetime near DST boundary (GH13750)

- Bug in `.set_index` raises `AmbiguousTimeError` if new index contains DST boundary and multi levels ([GH12920](#))
- Bug in `.shift` raises `AmbiguousTimeError` if data contains datetime near DST boundary ([GH13926](#))
- Bug in `pd.read_hdf()` returns incorrect result when a `DataFrame` with a categorical column and a query which doesn't match any values ([GH13792](#))
- Bug in `.iloc` when indexing with a non lexsorted `MultiIndex` ([GH13797](#))
- Bug in `.loc` when indexing with date strings in a reverse sorted `DatetimeIndex` ([GH14316](#))
- Bug in Series comparison operators when dealing with zero dim NumPy arrays ([GH13006](#))
- Bug in `.combine_first` may return incorrect dtype ([GH7630](#), [GH10567](#))
- Bug in `groupby` where `apply` returns different result depending on whether first result is `None` or not ([GH12824](#))
- Bug in `groupby(...).nth()` where the group key is included inconsistently if called after `.head()` / `.tail()` ([GH12839](#))
- Bug in `.to_html`, `.to_latex` and `.to_string` silently ignore custom datetime formatter passed through the `formatters` key word ([GH10690](#))
- Bug in `DataFrame.iterrows()`, not yielding a `Series` subclasse if defined ([GH13977](#))
- Bug in `pd.to_numeric` when `errors='coerce'` and input contains non-hashable objects ([GH13324](#))
- Bug in invalid `Timedelta` arithmetic and comparison may raise `ValueError` rather than `TypeError` ([GH13624](#))
- Bug in invalid datetime parsing in `to_datetime` and `DatetimeIndex` may raise `TypeError` rather than `ValueError` ([GH11169](#), [GH11287](#))
- Bug in `Index` created with tz-aware `Timestamp` and mismatched `tz` option incorrectly coerces timezone ([GH13692](#))
- Bug in `DatetimeIndex` with nanosecond frequency does not include timestamp specified with `end` ([GH13672](#))
- Bug in `Series` when setting a slice with a `np.timedelta64` ([GH14155](#))
- Bug in `Index` raises `OutOfBoundsDatetime` if datetime exceeds `datetime64[ns]` bounds, rather than coercing to object dtype ([GH13663](#))
- Bug in `Index` may ignore specified `datetime64` or `timedelta64` passed as dtype ([GH13981](#))
- Bug in `RangeIndex` can be created without no arguments rather than raises `TypeError` ([GH13793](#))
- Bug in `.value_counts()` raises `OutOfBoundsDatetime` if data exceeds `datetime64[ns]` bounds ([GH13663](#))
- Bug in `DatetimeIndex` may raise `OutOfBoundsDatetime` if input `np.datetime64` has other unit than `ns` ([GH9114](#))
- Bug in `Series` creation with `np.datetime64` which has other unit than `ns` as object dtype results in incorrect values ([GH13876](#))
- Bug in `resample` with `timedelta` data where data was casted to float ([GH13119](#)).
- Bug in `pd.isnull()` `pd.notnull()` raise `TypeError` if input datetime-like has other unit than `ns` ([GH13389](#))
- Bug in `pd.merge()` may raise `TypeError` if input datetime-like has other unit than `ns` ([GH13389](#))
- Bug in `HDFStore/read_hdf()` discarded `DatetimeIndex.name` if `tz` was set ([GH13884](#))

- Bug in `Categorical.remove_unused_categories()` changes `.codes` dtype to platform int (GH13261)
- Bug in `groupby` with `as_index=False` returns all NaN's when grouping on multiple columns including a categorical one (GH13204)
- Bug in `df.groupby(...)[...]` where `getitem` with `Int64Index` raised an error (GH13731)
- Bug in the CSS classes assigned to `DataFrame.style` for index names. Previously they were assigned `"col_heading level<n> col<c>"` where `n` was the number of levels + 1. Now they are assigned `"index_name level<n>"`, where `n` is the correct level for that `MultiIndex`.
- Bug where `pd.read_gbq()` could throw `ImportError: No module named discovery` as a result of a naming conflict with another python package called `apiclient` (GH13454)
- Bug in `Index.union` returns an incorrect result with a named empty index (GH13432)
- Bugs in `Index.difference` and `DataFrame.join` raise in Python3 when using mixed-integer indexes (GH13432, GH12814)
- Bug in subtract tz-aware `datetime.datetime` from tz-aware `datetime64` series (GH14088)
- Bug in `.to_excel()` when `DataFrame` contains a `MultiIndex` which contains a label with a NaN value (GH13511)
- Bug in invalid frequency offset string like "D1", "-2-3H" may not raise `ValueError` (GH13930)
- Bug in `concat` and `groupby` for hierarchical frames with `RangeIndex` levels (GH13542).
- Bug in `Series.str.contains()` for `Series` containing only NaN values of object dtype (GH14171)
- Bug in `agg()` function on `groupby` dataframe changes dtype of `datetime64[ns]` column to `float64` (GH12821)
- Bug in using NumPy `ufunc` with `PeriodIndex` to add or subtract integer raise `IncompatibleFrequency`. Note that using standard operator like `+` or `-` is recommended, because standard operators use more efficient path (GH13980)
- Bug in operations on `NaT` returning `float` instead of `datetime64[ns]` (GH12941)
- Bug in `Series` flexible arithmetic methods (like `.add()`) raises `ValueError` when `axis=None` (GH13894)
- Bug in `DataFrame.to_csv()` with `MultiIndex` columns in which a stray empty line was added (GH6618)
- Bug in `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex.equals()` may return `True` when input isn't `Index` but contains the same values (GH13107)
- Bug in assignment against `datetime` with `timezone` may not work if it contains `datetime` near DST boundary (GH14146)
- Bug in `pd.eval()` and `HDFStore` query truncating long float literals with python 2 (GH14241)
- Bug in `Index` raises `KeyError` displaying incorrect column when column is not in the `df` and columns contains duplicate values (GH13822)
- Bug in `Period` and `PeriodIndex` creating wrong dates when frequency has combined offset aliases (GH13874)
- Bug in `.to_string()` when called with an integer `line_width` and `index=False` raises an `UnboundLocalError` exception because `idx` referenced before assignment.
- Bug in `eval()` where the `resolvers` argument would not accept a list (GH14095)

- Bugs in `stack`, `get_dummies`, `make_axis_dummies` which don't preserve categorical dtypes in (multi)indexes ([GH13854](#))
- `PeriodIndex` can now accept list and array which contains `pd.NaT` ([GH13430](#))
- Bug in `df.groupby` where `.median()` returns arbitrary values if grouped dataframe contains empty bins ([GH13629](#))
- Bug in `Index.copy()` where `name` parameter was ignored ([GH14302](#))

### 39.6.3.7 Contributors

A total of 117 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.7 Version 0.18

### 39.7.1 v0.18.1 (May 3, 2016)

{{ header }}

This is a minor bug-fix release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(...)`, `.expanding(...)` and `.resample(...)` per group, see [here](#)
- `pd.to_datetime()` has gained the ability to assemble dates from a `DataFrame`, see [here](#)
- Method chaining improvements, see [here](#).
- Custom business hour offset, see [here](#).
- Many bug fixes in the handling of sparse, see [here](#)
- Expanded the *Tutorials section* with a feature on modern pandas, courtesy of [@TomAugsburger](#). ([GH13045](#)).

#### What's new in v0.18.1

- *New features*

- *Custom Business Hour*
- *.groupby(..) syntax with window and resample operations*
- *Method chaining improvements*
  - \* *.where() and .mask()*
  - \* *.loc[], .iloc[], .ix[]*
  - \* *[] indexing*
- *Partial string indexing on DateTimeIndex when part of a MultiIndex*
- *Assembling Datetimes*
- *Other Enhancements*
- *Sparse changes*
- *API changes*
  - *.groupby(..).nth() changes*
  - *numpy function compatibility*
  - *Using .apply on groupby resampling*
  - *Changes in read\_csv exceptions*
  - *to\_datetime error changes*
  - *Other API changes*
  - *Deprecations*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.7.1.1 New features

#### Custom Business Hour

The `CustomBusinessHour` is a mixture of `BusinessHour` and `CustomBusinessDay` which allows you to specify arbitrary holidays. For details, see *Custom Business Hour* ([GH11514](#))

```
In [1]: from pandas.tseries.offsets import CustomBusinessHour
In [2]: from pandas.tseries.holiday import USFederalHolidayCalendar
In [3]: bhour_us = CustomBusinessHour(calendar=USFederalHolidayCalendar())
```

Friday before MLK Day

```
In [4]: import datetime
In [5]: dt = datetime.datetime(2014, 1, 17, 15)
In [6]: dt + bhour_us
Out[6]: Timestamp('2014-01-17 16:00:00')
```

Tuesday after MLK Day (Monday is skipped because it's a holiday)

```
In [7]: dt + bhour_us * 2
Out [7]: Timestamp('2014-01-20 09:00:00')
```

### `.groupby(...)` syntax with window and resample operations

`.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(...)`, `.expanding(...)` and `.resample(...)` per group, see ([GH12486](#), [GH12738](#)).

You can now use `.rolling(...)` and `.expanding(...)` as methods on groupbys. These return another deferred object (similar to what `.rolling()` and `.expanding()` do on ungrouped pandas objects). You can then operate on these `RollingGroupby` objects in a similar manner.

Previously you would have to do this to get a rolling window mean per-group:

```
In [8]: df = pd.DataFrame({'A': [1] * 20 + [2] * 12 + [3] * 8,
...:                      'B': np.arange(40)})
...:
```

```
In [9]: df
```

```
Out [9]:
```

|    | A | B  |
|----|---|----|
| 0  | 1 | 0  |
| 1  | 1 | 1  |
| 2  | 1 | 2  |
| 3  | 1 | 3  |
| 4  | 1 | 4  |
| 5  | 1 | 5  |
| 6  | 1 | 6  |
| 7  | 1 | 7  |
| 8  | 1 | 8  |
| 9  | 1 | 9  |
| 10 | 1 | 10 |
| 11 | 1 | 11 |
| 12 | 1 | 12 |
| 13 | 1 | 13 |
| 14 | 1 | 14 |
| 15 | 1 | 15 |
| 16 | 1 | 16 |
| 17 | 1 | 17 |
| 18 | 1 | 18 |
| 19 | 1 | 19 |
| 20 | 2 | 20 |
| 21 | 2 | 21 |
| 22 | 2 | 22 |
| 23 | 2 | 23 |
| 24 | 2 | 24 |
| 25 | 2 | 25 |
| 26 | 2 | 26 |
| 27 | 2 | 27 |
| 28 | 2 | 28 |
| 29 | 2 | 29 |
| 30 | 2 | 30 |
| 31 | 2 | 31 |
| 32 | 3 | 32 |
| 33 | 3 | 33 |

   31     29.5
3  32      NaN
   33      NaN
   34      NaN
   35     33.5
   36     34.5
   37     35.5
   38     36.5
   39     37.5
```

```
Name: B, Length: 40, dtype: float64
```

For `.resample(...)` type of operations, previously you would have to:

```
In [12]: df = pd.DataFrame({'date': pd.date_range(start='2016-01-01',
.....:                                             periods=4,
.....:                                             freq='W'),
.....:                      'group': [1, 1, 2, 2],
.....:                      'val': [5, 6, 7, 8]}).set_index('date')
```

```
In [13]: df
```

```
Out[13]:
```

|            | group | val |
|------------|-------|-----|
| 2016-01-01 | 1     | 5   |
| 2016-01-08 | 1     | 6   |
| 2016-01-15 | 2     | 7   |
| 2016-01-22 | 2     | 8   |

(continues on next page)

(continued from previous page)

```

      2016-01-10      1      6
2      2016-01-17      2      7
      2016-01-18      2      7
      2016-01-19      2      7
      2016-01-20      2      7
      2016-01-21      2      7
      2016-01-22      2      7
      2016-01-23      2      7
      2016-01-24      2      8

[16 rows x 2 columns]
```

## Method chaining improvements

The following methods / indexers now accept a callable. It is intended to make these more useful in method chains, see the *documentation*. ([GH11485](#), [GH12533](#))

- `.where()` and `.mask()`
- `.loc[], iloc[]` and `.ix[]`
- `[]` indexing

### `.where()` and `.mask()`

These can accept a callable for the condition and other arguments.

```
In [16]: df = pd.DataFrame({'A': [1, 2, 3],
.....:                    'B': [4, 5, 6],
.....:                    'C': [7, 8, 9]})
.....:

In [17]: df.where(lambda x: x > 4, lambda x: x + 10)
Out[17]:
```

|   | A  | B  | C |
|---|----|----|---|
| 0 | 11 | 14 | 7 |
| 1 | 12 | 5  | 8 |
| 2 | 13 | 6  | 9 |

```
[3 rows x 3 columns]
```

### `.loc[], .iloc[], .ix[]`

These can accept a callable, and a tuple of callable as a slicer. The callable can return a valid boolean indexer or anything which is valid for these indexer's input.

```
# callable returns bool indexer
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
```

|   | B | C |
|---|---|---|
| 1 | 5 | 8 |
| 2 | 6 | 9 |

```
[2 rows x 2 columns]

# callable returns list of labels
In [19]: df.loc[lambda x: [1, 2], lambda x: ['A', 'B']]
Out[19]:
```

|   | A | B |
|---|---|---|
| 1 | 2 | 5 |
| 2 | 3 | 6 |

```
[2 rows x 2 columns]
```

## [ ] indexing

Finally, you can use a callable in [ ] indexing of Series, DataFrame and Panel. The callable must return a valid input for [ ] indexing depending on its class and index type.

```
In [20]: df[lambda x: 'A']
Out[20]:
0      1
1      2
2      3
Name: A, Length: 3, dtype: int64
```

Using these methods / indexers, you can chain data selection operations without using temporary variable.

```
In [21]: bb = pd.read_csv('data/baseball.csv', index_col='id')

In [22]: (bb.groupby(['year', 'team'])
.....:      .sum()
.....:      .loc[lambda df: df.r > 100])
.....:
Out[22]:
```

|      |      | stint | g    | ab   | r    | h    | X2b | X3b | hr | rbi | sb    | cs   | bb  | so  |       |     |

## Partial string indexing on DateTimeIndex when part of a MultiIndex

Partial string indexing now matches on DateTimeIndex when part of a MultiIndex ([GH10331](#))

```
In [23]: dft2 = pd.DataFrame(
.....:      np.random.randn(20, 1),
.....:      columns=['A'],
.....:      index=pd.MultiIndex.from_product([pd.date_range('20130101',
.....:                                                         periods=10,
.....:                                                         freq='12H'),
.....:                                       ['a', 'b']]))
.....:
```

## Assembling Datetimes

`pd.to_datetime()` has gained the ability to assemble datetimes from a passed in DataFrame or a dict. (GH8158).

```

In [30]: df = pd.DataFrame({'year': [2015, 2016],
.....:                     'month': [2, 3],
.....:                     'day': [4, 5],
.....:                     'hour': [2, 3]})
.....:

```

```
In [31]: df
```

```

Out[31]:
   year  month  day  hour
0  2015     2    4     2
1  2016     3    5     3

```

```
[2 rows x 4 columns]
```

Assembling using the passed frame.

```
In [32]: pd.to_datetime(df)
```

```

Out[32]:
0    2015-02-04 02:00:00
1    2016-03-05 03:00:00
Length: 2, dtype: datetime64[ns]

```

You can pass only the columns that you need to assemble.

```

In [33]: pd.to_datetime(df[['year', 'month', 'day']])
Out[33]:

```

(continues on next page)

(continued from previous page)

```
0    2015-02-04
1    2016-03-05
Length: 2, dtype: datetime64[ns]
```

## Other Enhancements

- `pd.read_csv()` now supports `delim_whitespace=True` for the Python engine (GH12958)
- `pd.read_csv()` now supports opening ZIP files that contains a single CSV, via extension inference or explicit `compression='zip'` (GH12175)
- `pd.read_csv()` now supports opening files using xz compression, via extension inference or explicit `compression='xz'` is specified; xz compressions is also supported by `DataFrame.to_csv` in the same way (GH11852)
- `pd.read_msgpack()` now always gives writeable ndarrays even when compression is used (GH12359).
- `pd.read_msgpack()` now supports serializing and de-serializing categoricals with msgpack (GH12573)
- `.to_json()` now supports NDframes that contain categorical and sparse data (GH10778)
- `interpolate()` now supports `method='akima'` (GH7588).
- `pd.read_excel()` now accepts path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path, in line with other `read_*` functions (GH12655)
- Added `.weekday_name` property as a component to `DatetimeIndex` and the `.dt` accessor. (GH11128)
- `Index.take` now handles `allow_fill` and `fill_value` consistently (GH12631)

```
In [34]: idx = pd.Index([1., 2., 3., 4.], dtype='float')

# default, allow_fill=True, fill_value=None
In [35]: idx.take([2, -1])
Out[35]: Float64Index([3.0, 4.0], dtype='float64')

In [36]: idx.take([2, -1], fill_value=True)
Out[36]: Float64Index([3.0,
nan], dtype='float64')
```

- `Index` now supports `.str.get_dummies()` which returns `MultiIndex`, see *Creating Indicator Variables* (GH10008, GH10103)

```
In [37]: idx = pd.Index(['a|b', 'a|c', 'b|c'])

In [38]: idx.str.get_dummies('|')
Out[38]:
MultiIndex(levels=[[0, 1], [0, 1], [0, 1]],
            labels=[[1, 1, 0], [1, 0, 1], [0, 1, 1]],
            names=['a', 'b', 'c'])
```

- `pd.crosstab()` has gained a `normalize` argument for normalizing frequency tables (GH12569). Examples in the updated docs *here*.
- `.resample(...).interpolate()` is now supported (GH12925)
- `.isin()` now accepts passed sets (GH12988)

### 39.7.1.2 Sparse changes

These changes conform sparse handling to return the correct types and work to make a smoother experience with indexing.

`SparseArray.take` now returns a scalar for scalar input, `SparseArray` for others. Furthermore, it handles a negative indexer with the same rule as `Index` ([GH10560](#), [GH12796](#))

```
s = pd.SparseArray([np.nan, np.nan, 1, 2, 3, np.nan, 4, 5, np.nan, 6])
s.take(0)
s.take([1, 2, 3])
```

- Bug in `SparseSeries[]` indexing with Ellipsis raises `KeyError` ([GH9467](#))
- Bug in `SparseArray[]` indexing with tuples are not handled properly ([GH12966](#))
- Bug in `SparseSeries.loc[]` with list-like input raises `TypeError` ([GH10560](#))
- Bug in `SparseSeries.iloc[]` with scalar input may raise `IndexError` ([GH10560](#))
- Bug in `SparseSeries.loc[], .iloc[]` with slice returns `SparseArray`, rather than `SparseSeries` ([GH10560](#))
- Bug in `SparseDataFrame.loc[], .iloc[]` may results in dense `Series`, rather than `SparseSeries` ([GH12787](#))
- Bug in `SparseArray` addition ignores `fill_value` of right hand side ([GH12910](#))
- Bug in `SparseArray` mod raises `AttributeError` ([GH12910](#))
- Bug in `SparseArray` pow calculates `1 ** np.nan` as `np.nan` which must be 1 ([GH12910](#))
- Bug in `SparseArray` comparison output may incorrect result or raise `ValueError` ([GH12971](#))
- Bug in `SparseSeries.__repr__` raises `TypeError` when it is longer than `max_rows` ([GH10560](#))
- Bug in `SparseSeries.shape` ignores `fill_value` ([GH10452](#))
- Bug in `SparseSeries` and `SparseArray` may have different `dtype` from its dense values ([GH12908](#))
- Bug in `SparseSeries.reindex` incorrectly handle `fill_value` ([GH12797](#))
- Bug in `SparseArray.to_frame()` results in `DataFrame`, rather than `SparseDataFrame` ([GH9850](#))
- Bug in `SparseSeries.value_counts()` does not count `fill_value` ([GH6749](#))
- Bug in `SparseArray.to_dense()` does not preserve `dtype` ([GH10648](#))
- Bug in `SparseArray.to_dense()` incorrectly handle `fill_value` ([GH12797](#))
- Bug in `pd.concat()` of `SparseSeries` results in dense ([GH10536](#))
- Bug in `pd.concat()` of `SparseDataFrame` incorrectly handle `fill_value` ([GH9765](#))
- Bug in `pd.concat()` of `SparseDataFrame` may raise `AttributeError` ([GH12174](#))
- Bug in `SparseArray.shift()` may raise `NameError` or `TypeError` ([GH12908](#))

### 39.7.1.3 API changes

#### `.groupby(...).nth()` changes

The index in `.groupby(...).nth()` output is now more consistent when the `as_index` argument is passed ([GH11039](#)):

```
In [39]: df = pd.DataFrame({'A': ['a', 'b', 'a'],
.....:                    'B': [1, 2, 3]})
.....:

In [40]: df
Out[40]:
   A  B
0  a  1
1  b  2
2  a  3

[3 rows x 2 columns]
```

**Previous Behavior:**

```
In [3]: df.groupby('A', as_index=True)['B'].nth(0)
Out[3]:
0    1
1    2
Name: B, dtype: int64

In [4]: df.groupby('A', as_index=False)['B'].nth(0)
Out[4]:
0    1
1    2
Name: B, dtype: int64
```

**New Behavior:**

```
In [41]: df.groupby('A', as_index=True)['B'].nth(0)
Out[41]:
A
a    1
b    2
Name: B, Length: 2, dtype: int64

In [42]: df.groupby('A', as_index=False)['B'].nth(0)
Out[42]:
0    1
1    2
Name: B, Length: 2, dtype: int64
```

Furthermore, previously, a `.groupby` would always sort, regardless if `sort=False` was passed with `.nth()`.

```
In [43]: np.random.seed(1234)

In [44]: df = pd.DataFrame(np.random.randn(100, 2), columns=['a', 'b'])

In [45]: df['c'] = np.random.randint(0, 4, 100)
```

**Previous Behavior:**

```
In [4]: df.groupby('c', sort=True).nth(1)
Out[4]:
      a      b
c
0 -0.334077  0.002118
```

(continues on next page)

(continued from previous page)

```
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524
```

```
In [5]: df.groupby('c', sort=False).nth(1)
Out[5]:
```

```
      a      b
c
0 -0.334077  0.002118
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524
```

New Behavior:

```
In [46]: df.groupby('c', sort=True).nth(1)
Out[46]:
```

```
      a      b
c
0 -0.334077  0.002118
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524
```

```
[4 rows x 2 columns]
```

```
In [47]: df.groupby('c', sort=False).nth(1)
```

```
////////////////////////////////////
```

```
↪
```

```
      a      b
c
2 -0.720589  0.887163
3  0.859588 -0.636524
0 -0.334077  0.002118
1  0.036142 -2.074978
```

```
[4 rows x 2 columns]
```

## numpy function compatibility

Compatibility between pandas array-like methods (e.g. `sum` and `take`) and their `numpy` counterparts has been greatly increased by augmenting the signatures of the pandas methods so as to accept arguments that can be passed in from `numpy`, even if they are not necessarily used in the pandas implementation ([GH12644](#), [GH12638](#), [GH12687](#))

- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a `sorter` argument to maintain compatibility with `numpy`'s `searchsorted` function ([GH12238](#))
- Bug in `numpy` compatibility of `np.round()` on a `Series` ([GH12600](#))

An example of this signature augmentation is illustrated below:

```
In [48]: sp = pd.SparseDataFrame([1, 2, 3])
```

```
In [49]: sp
```

```
Out[49]:
0
```

(continues on next page)

(continued from previous page)

```
0  1
1  2
2  3

[3 rows x 1 columns]
```

Previous behaviour:

```
In [2]: np.cumsum(sp, axis=0)
...
TypeError: cumsum() takes at most 2 arguments (4 given)
```

New behaviour:

```
In [50]: np.cumsum(sp, axis=0)
Out[50]:
    0
0  1
1  3
2  6

[3 rows x 1 columns]
```

## Using `.apply` on groupby resampling

Using `apply` on resampling groupby operations (using a `pd.TimeGrouper`) now has the same output types as similar `apply` calls on other groupby operations. ([GH11742](#)).

```
In [51]: df = pd.DataFrame({'date': pd.to_datetime(['10/10/2000', '11/10/2000']),
...:                        'value': [10, 13]})
...:
...:

In [52]: df
Out[52]:
   date      value
0 2000-10-10      10
1 2000-11-10      13

[2 rows x 2 columns]
```

Previous behavior:

```
In [1]: df.groupby(pd.TimeGrouper(key='date',
...:                               freq='M')).apply(lambda x: x.value.sum())
Out[1]:
...
TypeError: cannot concatenate a non-NDFrame object

# Output is a Series
In [2]: df.groupby(pd.TimeGrouper(key='date',
...:                               freq='M')).apply(lambda x: x[['value']].sum())
Out[2]:
date
2000-10-31  value      10
```

(continues on next page)

(continued from previous page)

```
2000-11-30  value      13
dtype: int64
```

**New Behavior:**

```
# Output is a Series
In [55]: df.groupby(pd.TimeGrouper(key='date',
...:                               freq='M')).apply(lambda x: x.value.sum())
Out [55]:
date
2000-10-31      10
2000-11-30      13
Freq: M, dtype: int64

# Output is a DataFrame
In [56]: df.groupby(pd.TimeGrouper(key='date',
...:                               freq='M')).apply(lambda x: x[['value']].sum())
Out [56]:
      value
date
2000-10-31      10
2000-11-30      13
```

**Changes in read\_csv exceptions**

In order to standardize the read\_csv API for both the c and python engines, both will now raise an EmptyDataError, a subclass of ValueError, in response to empty columns or header ([GH12493](#), [GH12506](#))

**Previous behaviour:**

```
In [1]: import io

In [2]: df = pd.read_csv(io.StringIO(''), engine='c')
...
ValueError: No columns to parse from file

In [3]: df = pd.read_csv(io.StringIO(''), engine='python')
...
StopIteration
```

**New behaviour:**

```
In [1]: df = pd.read_csv(io.StringIO(''), engine='c')
...
pandas.io.common.EmptyDataError: No columns to parse from file

In [2]: df = pd.read_csv(io.StringIO(''), engine='python')
...
pandas.io.common.EmptyDataError: No columns to parse from file
```

In addition to this error change, several others have been made as well:

- CParserError now sub-classes ValueError instead of just a Exception ([GH12551](#))
- A CParserError is now raised instead of a generic Exception in read\_csv when the c engine cannot parse a column ([GH12506](#))

- A `ValueError` is now raised instead of a generic `Exception` in `read_csv` when the `c` engine encounters a `NaN` value in an integer column ([GH12506](#))
- A `ValueError` is now raised instead of a generic `Exception` in `read_csv` when `true_values` is specified, and the `c` engine encounters an element in a column containing unencodable bytes ([GH12506](#))
- `pandas.parser.OverflowError` exception has been removed and has been replaced with Python's built-in `OverflowError` exception ([GH12506](#))
- `pd.read_csv()` no longer allows a combination of strings and integers for the `usecols` parameter ([GH12678](#))

### to\_datetime error changes

Bugs in `pd.to_datetime()` when passing a unit with convertible entries and `errors='coerce'` or non-convertible with `errors='ignore'`. Furthermore, an `OutOfBoundsDatetime` exception will be raised when an out-of-range value is encountered for that unit when `errors='raise'`. ([GH11758](#), [GH13052](#), [GH13059](#))

Previous behaviour:

```
In [27]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[27]: NaT

In [28]: pd.to_datetime(11111111, unit='D', errors='ignore')
OverflowError: Python int too large to convert to C long

In [29]: pd.to_datetime(11111111, unit='D', errors='raise')
OverflowError: Python int too large to convert to C long
```

New behaviour:

```
In [2]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[2]: Timestamp('2014-12-31 16:31:00')

In [3]: pd.to_datetime(11111111, unit='D', errors='ignore')
Out[3]: 11111111

In [4]: pd.to_datetime(11111111, unit='D', errors='raise')
OutOfBoundsDatetime: cannot convert input with unit 'D'
```

### Other API changes

- `.swaplevel()` for `Series`, `DataFrame`, `Panel`, and `MultiIndex` now features defaults for its first two parameters `i` and `j` that swap the two innermost levels of the index. ([GH12934](#))
- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a `sorter` argument to maintain compatibility with `numpy's searchsorted` function ([GH12238](#))
- `Period` and `PeriodIndex` now raises `IncompatibleFrequency` error which inherits `ValueError` rather than raw `ValueError` ([GH12615](#))
- `Series.apply` for category dtype now applies the passed function to each of the `.categories` (and not the `.codes`), and returns a category dtype if possible ([GH12473](#))
- `read_csv` will now raise a `TypeError` if `parse_dates` is neither a boolean, list, or dictionary (matches the doc-string) ([GH5636](#))

- The default for `.query()/.eval()` is now `engine=None`, which will use `numexpr` if it's installed; otherwise it will fallback to the `python` engine. This mimics the pre-0.18.1 behavior if `numexpr` is installed (and which, previously, if `numexpr` was not installed, `.query()/.eval()` would raise). (GH12749)
- `pd.show_versions()` now includes `pandas_datareader` version (GH12740)
- Provide a proper `__name__` and `__qualname__` attributes for generic functions (GH12021)
- `pd.concat(ignore_index=True)` now uses `RangeIndex` as default (GH12695)
- `pd.merge()` and `DataFrame.join()` will show a `UserWarning` when merging/joining a single- with a multi-leveled dataframe (GH9455, GH12219)
- Compat with `scipy > 0.17` for deprecated `piecewise_polynomial` interpolation method; support for the replacement `from_derivatives` method (GH12887)

## Deprecations

- The method name `Index.sym_diff()` is deprecated and can be replaced by `Index.symmetric_difference()` (GH12591)
- The method name `Categorical.sort()` is deprecated in favor of `Categorical.sort_values()` (GH12882)

### 39.7.1.4 Performance Improvements

- Improved speed of SAS reader (GH12656, GH12961)
- Performance improvements in `.groupby(...).cumcount()` (GH11039)
- Improved memory usage in `pd.read_csv()` when using `skiprows=an_integer` (GH13005)
- Improved performance of `DataFrame.to_sql` when checking case sensitivity for tables. Now only checks if table has been created correctly when table name is not lower case. (GH12876)
- Improved performance of `Period` construction and time series plotting (GH12903, GH11831).
- Improved performance of `.str.encode()` and `.str.decode()` methods (GH13008)
- Improved performance of `to_numeric` if input is numeric dtype (GH12777)
- Improved performance of sparse arithmetic with `IntIndex` (GH13036)

### 39.7.1.5 Bug Fixes

- `usecols` parameter in `pd.read_csv` is now respected even when the lines of a CSV file are not even (GH12203)
- Bug in `groupby.transform(...)` when `axis=1` is specified with a non-monotonic ordered index (GH12713)
- Bug in `Period` and `PeriodIndex` creation raises `KeyError` if `freq="Minute"` is specified. Note that "Minute" freq is deprecated in v0.17.0, and recommended to use `freq="T"` instead (GH11854)
- Bug in `.resample(...).count()` with a `PeriodIndex` always raising a `TypeError` (GH12774)
- Bug in `.resample(...)` with a `PeriodIndex` casting to a `DatetimeIndex` when empty (GH12868)
- Bug in `.resample(...)` with a `PeriodIndex` when resampling to an existing frequency (GH12770)
- Bug in printing data which contains `Period` with different `freq` raises `ValueError` (GH12615)

- Bug in Series construction with Categorical and dtype='category' is specified (GH12574)
- Bugs in concatenation with a coercible dtype was too aggressive, resulting in different dtypes in output formatting when an object was longer than display.max\_rows (GH12411, GH12045, GH11594, GH10571, GH12211)
- Bug in float\_format option with option not being validated as a callable. (GH12706)
- Bug in GroupBy.filter when dropna=False and no groups fulfilled the criteria (GH12768)
- Bug in \_\_name\_\_ of .cum\* functions (GH12021)
- Bug in .astype() of a Float64Index/Int64Index to an Int64Index (GH12881)
- Bug in round tripping an integer based index in .to\_json()/read\_json() when orient='index' (the default) (GH12866)
- Bug in plotting Categorical dtypes cause error when attempting stacked bar plot (GH13019)
- Compat with >= numpy 1.11 for NaT comparisons (GH12969)
- Bug in .drop() with a non-unique MultiIndex. (GH12701)
- Bug in .concat of datetime tz-aware and naive DataFrames (GH12467)
- Bug in correctly raising a ValueError in .resample(...).fillna(...) when passing a non-string (GH12952)
- Bug fixes in various encoding and header processing issues in pd.read\_sas() (GH12659, GH12654, GH12647, GH12809)
- Bug in pd.crosstab() where would silently ignore aggfunc if values=None (GH12569).
- Potential segfault in DataFrame.to\_json when serialising datetime.time (GH11473).
- Potential segfault in DataFrame.to\_json when attempting to serialise 0d array (GH11299).
- Segfault in to\_json when attempting to serialise a DataFrame or Series with non-ndarray values; now supports serialization of category, sparse, and datetime64[ns, tz] dtypes (GH10778).
- Bug in DataFrame.to\_json with unsupported dtype not passed to default handler (GH12554).
- Bug in .align not returning the sub-class (GH12983)
- Bug in aligning a Series with a DataFrame (GH13037)
- Bug in ABCPanel in which Panel4D was not being considered as a valid instance of this generic type (GH12810)
- Bug in consistency of .name on .groupby(...).apply(...) cases (GH12363)
- Bug in Timestamp.\_\_repr\_\_ that caused pprint to fail in nested structures (GH12622)
- Bug in Timedelta.min and Timedelta.max, the properties now report the true minimum/maximum timedeltas as recognized by pandas. See the *documentation*. (GH12727)
- Bug in .quantile() with interpolation may coerce to float unexpectedly (GH12772)
- Bug in .quantile() with empty Series may return scalar rather than empty Series (GH12772)
- Bug in .loc with out-of-bounds in a large indexer would raise IndexError rather than KeyError (GH12527)
- Bug in resampling when using a TimedeltaIndex and .asfreq(), would previously not include the final fencepost (GH12926)
- Bug in equality testing with a Categorical in a DataFrame (GH12564)

- Bug in `GroupBy.first()`, `.last()` returns incorrect row when `TimeGrouper` is used ([GH7453](#))
- Bug in `pd.read_csv()` with the `c` engine when specifying `skiprows` with newlines in quoted items ([GH10911](#), [GH12775](#))
- Bug in `DataFrame` `timezone` lost when assigning tz-aware datetime Series with alignment ([GH12981](#))
- Bug in `.value_counts()` when `normalize=True` and `dropna=True` where nulls still contributed to the normalized count ([GH12558](#))
- Bug in `Series.value_counts()` loses name if its `dtype` is category ([GH12835](#))
- Bug in `Series.value_counts()` loses `timezone` info ([GH12835](#))
- Bug in `Series.value_counts(normalize=True)` with `Categorical` raises `UnboundLocalError` ([GH12835](#))
- Bug in `Panel.fillna()` ignoring `inplace=True` ([GH12633](#))
- Bug in `pd.read_csv()` when specifying `names`, `usecols`, and `parse_dates` simultaneously with the `c` engine ([GH9755](#))
- Bug in `pd.read_csv()` when specifying `delim_whitespace=True` and `lineterminator` simultaneously with the `c` engine ([GH12912](#))
- Bug in `Series.rename`, `DataFrame.rename` and `DataFrame.rename_axis` not treating Series as mappings to relabel ([GH12623](#)).
- Clean in `.rolling.min` and `.rolling.max` to enhance `dtype` handling ([GH12373](#))
- Bug in `groupby` where complex types are coerced to float ([GH12902](#))
- Bug in `Series.map` raises `TypeError` if its `dtype` is category or tz-aware datetime ([GH12473](#))
- Bugs on 32bit platforms for some test comparisons ([GH12972](#))
- Bug in index coercion when falling back from `RangeIndex` construction ([GH12893](#))
- Better error message in window functions when invalid argument (e.g. a float window) is passed ([GH12669](#))
- Bug in slicing subclassed `DataFrame` defined to return subclassed `Series` may return normal `Series` ([GH11559](#))
- Bug in `.str` accessor methods may raise `ValueError` if input has name and the result is `DataFrame` or `MultiIndex` ([GH12617](#))
- Bug in `DataFrame.last_valid_index()` and `DataFrame.first_valid_index()` on empty frames ([GH12800](#))
- Bug in `CategoricalIndex.get_loc` returns different result from regular `Index` ([GH12531](#))
- Bug in `PeriodIndex.resample` where name not propagated ([GH12769](#))
- Bug in `date_range` closed keyword and timezones ([GH12684](#)).
- Bug in `pd.concat` raises `AttributeError` when input data contains tz-aware datetime and `timedelta` ([GH12620](#))
- Bug in `pd.concat` did not handle empty Series properly ([GH11082](#))
- Bug in `.plot.bar` alignment when `width` is specified with `int` ([GH12979](#))
- Bug in `fill_value` is ignored if the argument to a binary operator is a constant ([GH12723](#))
- Bug in `pd.read_html()` when using `bs4` flavor and parsing table with a header and only one column ([GH9178](#))

- Bug in `.pivot_table` when `margins=True` and `dropna=True` where nulls still contributed to margin count ([GH12577](#))
- Bug in `.pivot_table` when `dropna=False` where table index/column names disappear ([GH12133](#))
- Bug in `pd.crosstab()` when `margins=True` and `dropna=False` which raised ([GH12642](#))
- Bug in `Series.name` when name attribute can be a hashable type ([GH12610](#))
- Bug in `.describe()` resets categorical columns information ([GH11558](#))
- Bug where `loffset` argument was not applied when calling `resample().count()` on a timeseries ([GH12725](#))
- `pd.read_excel()` now accepts column names associated with keyword argument names ([GH12870](#))
- Bug in `pd.to_numeric()` with `Index` returns `np.ndarray`, rather than `Index` ([GH12777](#))
- Bug in `pd.to_numeric()` with datetime-like may raise `TypeError` ([GH12777](#))
- Bug in `pd.to_numeric()` with scalar raises `ValueError` ([GH12777](#))

### 39.7.2 v0.18.0 (March 13, 2016)

{{ header }}

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.18.0 no longer supports compatibility with Python version 2.6 and 3.3 ([GH7718](#), [GH11273](#))

**Warning:** numexpr version 2.4.4 will now show a warning and not be used as a computation back-end for pandas because of some buggy behavior. This does not affect other versions (>= 2.1 and >= 2.4.6). ([GH12489](#))

Highlights include:

- Moving and expanding window functions are now methods on Series and DataFrame, similar to `.groupby`, see [here](#).
- Adding support for a RangeIndex as a specialized form of the Int64Index for memory savings, see [here](#).
- API breaking change to the `.resample` method to make it more `.groupby` like, see [here](#).
- Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a `TypeError`, see [here](#).
- The `.to_xarray()` function has been added for compatibility with the [xarray](#) package, see [here](#).
- The `read_sas` function has been enhanced to read `sas7bdat` files, see [here](#).
- Addition of the `.str.extractall()` method, and API changes to the `.str.extract()` method and `.str.cat()` method.
- `pd.test()` top-level nose test runner is available ([GH4327](#)).

Check the *API Changes* and *deprecations* before updating.

#### What's new in v0.18.0

- *New features*
  - Window functions are now methods
  - Changes to rename
  - Range Index
  - Changes to `str.extract`
  - Addition of `str.extractall`
  - Changes to `str.cat`

- *Datetimelike rounding*
- *Formatting of Integers in FloatIndex*
- *Changes to dtype assignment behaviors*
- *to\_xarray*
- *Latex Representation*
- *pd.read\_sas() changes*
- *Other enhancements*
- *Backwards incompatible API changes*
  - *NaT and Timedelta operations*
  - *Changes to msgpack*
  - *Signature change for .rank*
  - *Bug in QuarterBegin with n=0*
  - *Resample API*
    - \* *Downsampling*
    - \* *Upsampling*
    - \* *Previous API will work but with deprecations*
  - *Changes to eval*
  - *Other API Changes*
  - *Deprecations*
  - *Removal of deprecated float indexers*
  - *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.7.2.1 New features

#### Window functions are now methods

Window functions have been refactored to be methods on `Series/DataFrame` objects, rather than top-level functions, which are now deprecated. This allows these window-type functions, to have a similar API to that of `.groupby`. See the full documentation [here](#) ([GH11603](#), [GH12373](#))

```
In [1]: np.random.seed(1234)

In [2]: df = pd.DataFrame({'A': range(10), 'B': np.random.randn(10)})

In [3]: df
Out[3]:
```

| A | B         |
|---|-----------|
| 0 | 0.174497  |
| 1 | 1.560308  |
| 2 | 0.871212  |
| 3 | 0.601123  |
| 4 | -0.542560 |
| 5 | 0.423655  |
| 6 | 0.559866  |
| 7 | -0.782580 |
| 8 | 0.832443  |
| 9 | 0.292329  |

(continues on next page)

(continued from previous page)

```

0  0  0.471435
1  1 -1.190976
2  2  1.432707
3  3 -0.312652
4  4 -0.720589
5  5  0.887163
6  6  0.859588
7  7 -0.636524
8  8  0.015696
9  9 -2.242685

```

[10 rows x 2 columns]

**Previous Behavior:**

```

In [8]: pd.rolling_mean(df, window=3)
FutureWarning: pd.rolling_mean is deprecated for DataFrame and will be
removed in a future version, replace with
DataFrame.rolling(window=3,center=False).mean()

```

**Out [8]:**

```

      A      B
0 NaN    NaN
1 NaN    NaN
2  1  0.237722
3  2 -0.023640
4  3  0.133155
5  4 -0.048693
6  5  0.342054
7  6  0.370076
8  7  0.079587
9  8 -0.954504

```

**New Behavior:**

```

In [4]: r = df.rolling(window=3)

```

These show a descriptive repr

```

In [5]: r
Out[5]: Rolling [window=3,center=False,axis=0]

```

with tab-completion of available methods and properties.

```

In [9]: r.<TAB> # noqa E225, E999
r.A      r.agg      r.apply      r.count      r.exclusions  r.max      r.
↳median  r.name      r.skew      r.sum
r.B      r.aggregate  r.corr      r.cov      r.kurt      r.mean      r.
↳min     r.quantile    r.std      r.var

```

The methods operate on the Rolling object itself

```

In [6]: r.mean()
Out[6]:
      A      B
0 NaN    NaN
1 NaN    NaN

```

(continues on next page)

(continued from previous page)

```
2  1.0  0.237722
3  2.0 -0.023640
4  3.0  0.133155
5  4.0 -0.048693
6  5.0  0.342054
7  6.0  0.370076
8  7.0  0.079587
9  8.0 -0.954504
```

```
[10 rows x 2 columns]
```

They provide `getitem` accessors

```
In [7]: r['A'].mean()
```

```
Out[7]:
```

```
0    NaN
1    NaN
2     1.0
3     2.0
4     3.0
5     4.0
6     5.0
7     6.0
8     7.0
9     8.0
```

```
Name: A, Length: 10, dtype: float64
```

And multiple aggregations

```
In [8]: r.agg({'A': ['mean', 'std'],
...:          'B': ['mean', 'std']})
```

```
Out[8]:
```

|   | A    |     | B         |          |
|---|------|-----|-----------|----------|
|   | mean | std | mean      | std      |
| 0 | NaN  | NaN | NaN       | NaN      |
| 1 | NaN  | NaN | NaN       | NaN      |
| 2 | 1.0  | 1.0 | 0.237722  | 1.327364 |
| 3 | 2.0  | 1.0 | -0.023640 | 1.335505 |
| 4 | 3.0  | 1.0 | 0.133155  | 1.143778 |
| 5 | 4.0  | 1.0 | -0.048693 | 0.835747 |
| 6 | 5.0  | 1.0 | 0.342054  | 0.920379 |
| 7 | 6.0  | 1.0 | 0.370076  | 0.871850 |
| 8 | 7.0  | 1.0 | 0.079587  | 0.750099 |
| 9 | 8.0  | 1.0 | -0.954504 | 1.162285 |

```
[10 rows x 4 columns]
```

## Changes to rename

`Series.rename` and `NDFrame.rename_axis` can now take a scalar or list-like argument for altering the Series or axis *name*, in addition to their old behaviors of altering labels. ([GH9494](#), [GH11965](#))

```
In [9]: s = pd.Series(np.random.randn(5))
```

(continues on next page)

(continued from previous page)

```
In [10]: s.rename('newname')
Out[10]:
0    1.150036
1    0.991946
2    0.953324
3   -2.021255
4   -0.334077
Name: newname, Length: 5, dtype: float64
```

```
In [11]: df = pd.DataFrame(np.random.randn(5, 2))

In [12]: (df.rename_axis("indexname")
....:      .rename_axis("columns_name", axis="columns"))
....:
Out[12]:
columns_name      0      1
indexname
0      0.002118  0.405453
1      0.289092  1.321158
2     -1.546906 -0.202646
3     -0.655969  0.193421
4      0.553439  1.318152

[5 rows x 2 columns]
```

The new functionality works well in method chains. Previously these methods only accepted functions or dicts mapping a *label* to a new label. This continues to work as before for function or dict-like values.

## Range Index

A `RangeIndex` has been added to the `Int64Index` sub-classes to support a memory saving alternative for common use cases. This has a similar implementation to the python `range` object (`xrange` in python 2), in that it only stores the start, stop, and step values for the index. It will transparently interact with the user API, converting to `Int64Index` if needed.

This will now be the default constructed index for `NDFrame` objects, rather than previous an `Int64Index`. ([GH939](#), [GH12070](#), [GH12071](#), [GH12109](#), [GH12888](#))

Previous Behavior:

```
In [3]: s = pd.Series(range(1000))

In [4]: s.index
Out[4]:
Int64Index([ 0,  1,  2,  3,  4,  5,  6,  7,  8,  9,
...
          990, 991, 992, 993, 994, 995, 996, 997, 998, 999], dtype='int64',
↪length=1000)

In [6]: s.index.nbytes
Out[6]: 8000
```

New Behavior:

[illegible]

## Changes to str.extract

The `.str.extract` method takes a regular expression with capture groups, finds the first match in each subject string, and returns the contents of the capture groups ([GH11386](#)).

In v0.18.0, the `expand` argument was added to `extract`.

- `expand=False`: it returns a `Series`, `Index`, or `DataFrame`, depending on the subject and regular expression pattern (same behavior as pre-0.18.0).
- `expand=True`: it always returns a `DataFrame`, which is more consistent and less confusing from the perspective of a user.

Currently the default is `expand=None` which gives a `FutureWarning` and uses `expand=False`. To avoid this warning, please explicitly specify `expand`.

```
In [1]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'[ab](\d)', expand=None)
FutureWarning: currently extract(expand=None) means expand=False (return Index/Series/
↳DataFrame)
but in a future version of pandas this will be changed to expand=True (return_
↳DataFrame)

Out[1]:
0      1
1      2
2     NaN
dtype: object
```

Extracting a regular expression with one group returns a Series if `expand=False`.

```
In [16]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'[ab](\d)', expand=False)
Out[16]:
0      1
1      2
2     NaN
Length: 3, dtype: object
```

It returns a DataFrame with one column if `expand=True`.

```
In [17]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'[ab](\d)', expand=True)
Out[17]:
      0
0     1
1     2
2  NaN

[3 rows x 1 columns]
```

Calling on an `Index` with a regex with exactly one capture group returns an `Index` if `expand=False`.

```
In [18]: s = pd.Series(["a1", "b2", "c3"], ["A11", "B22", "C33"])
In [19]: s.index
Out[19]: Index(['A11', 'B22', 'C33'], dtype='object')

In [20]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=False)
Out[20]: Index(['A', 'B', 'C'], dtype='object', name='letter')
```

It returns a DataFrame with one column if `expand=True`.

```
In [21]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=True)
Out[21]:
  letter
0      A
1      B
2      C

[3 rows x 1 columns]
```

Calling on an `Index` with a regex with more than one capture group raises `ValueError` if `expand=False`.

```
>>> s.index.str.extract("(?P<letter>[a-zA-Z]) ([0-9]+)", expand=False)
ValueError: only one regex group is supported with Index
```

It returns a DataFrame if `expand=True`.

```
In [22]: s.index.str.extract("(?P<letter>[a-zA-Z]) ([0-9]+)", expand=True)
Out [22]:
```

|   | letter |    |
|---|--------|----|
| 0 | A      | 11 |
| 1 | B      | 22 |
| 2 | C      | 33 |

```
[3 rows x 2 columns]
```

In summary, `extract (expand=True)` always returns a `DataFrame` with a row for every subject string, and a column for every capture group.

### Addition of str.extractall

The `.str.extractall` method was added ([GH11386](#)). Unlike `extract`, which returns only the first match.

```
In [23]: s = pd.Series(["a1a2", "b1", "c1"], ["A", "B", "C"])

In [24]: s
Out[24]:
A    a1a2
B      b1
C      c1
Length: 3, dtype: object

In [25]: s.str.extract(r"(?P<letter>[ab]) (?P<digit>\d)", expand=False)
\\Out[25]:
    letter digit
A      a      1
```

(continues on next page)

(continued from previous page)

```

B      b      1
C     NaN     NaN

[3 rows x 2 columns]

```

The `extractall` method returns all matches.

```

In [26]: s.str.extractall(r"(?P<letter>[ab]) (?P<digit>\d) ")
Out[26]:
      letter digit
match
A 0          a      1
  1          a      2
B 0          b      1

[3 rows x 2 columns]

```

## Changes to `str.cat`

The method `.str.cat()` concatenates the members of a `Series`. Before, if `NaN` values were present in the `Series`, calling `.str.cat()` on it would return `NaN`, unlike the rest of the `Series.str.*` API. This behavior has been amended to ignore `NaN` values by default. (GH11435).

A new, friendlier `ValueError` is added to protect against the mistake of supplying the `sep` as an arg, rather than as a kwarg. (GH11334).

```

In [27]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ')
Out[27]: 'a b c'

In [28]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ', na_rep='?')
Out[28]: 'a b ? c'

```

```

In [2]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(' ')
ValueError: Did you mean to supply a `sep` keyword?

```

## Datetimelike rounding

`DatetimeIndex`, `Timestamp`, `TimedeltaIndex`, `Timedelta` have gained the `.round()`, `.floor()` and `.ceil()` method for datetimelike rounding, flooring and ceiling. (GH4314, GH11963)

Naive datetimes

```

In [29]: dr = pd.date_range('20130101 09:12:56.1234', periods=3)

In [30]: dr
Out[30]:
DatetimeIndex(['2013-01-01 09:12:56.123400', '2013-01-02 09:12:56.123400',
              '2013-01-03 09:12:56.123400'],
              dtype='datetime64[ns]', freq='D')

In [31]: dr.round('s')
Out[31]:

In addition, `.round()`, `.floor()` and `.ceil()` will be available through the `.dt` accessor of `Series`.

[illegible]

## Formatting of Integers in FloatIndex

Integers in `FloatIndex`, e.g. 1., are now formatted with a decimal point and a 0 digit, e.g. 1.0 ([GH11713](#)) This change not only affects the display to the console, but also the output of IO methods like `.to_csv` or `.to_html`.

Previous Behavior:

```
In [2]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [3]: s
Out[3]:
0    1
1    2
2    3
dtype: int64

In [4]: s.index
Out[4]: Float64Index([0.0, 1.0, 2.0], dtype='float64')

In [5]: print(s.to_csv(path=None))
0,1
1,2
2,3
```

**New Behavior:**

```
In [45]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [46]: s
Out[46]:
0.0    1
1.0    2
2.0    3
Length: 3, dtype: int64

In [47]: s.index
Out[47]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
```

(continues on next page)

(continued from previous page)

```
In [48]: print(s.to_csv(path_or_buf=None, header=False))
```

```
////////////////////////////////////
↪0,1
1.0,2
2.0,3
```

## Changes to dtype assignment behaviors

When a DataFrame's slice is updated with a new slice of the same dtype, the dtype of the DataFrame will now remain the same. (GH10503)

Previous Behavior:

```
In [5]: df = pd.DataFrame({'a': [0, 1, 1],
                           'b': pd.Series([100, 200, 300], dtype='uint32')})

In [7]: df.dtypes
Out[7]:
a      int64
b      uint32
dtype: object

In [8]: ix = df['a'] == 1

In [9]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [11]: df.dtypes
Out[11]:
a      int64
b      int64
dtype: object
```

New Behavior:

```
In [49]: df = pd.DataFrame({'a': [0, 1, 1],
        ....:                'b': pd.Series([100, 200, 300], dtype='uint32')})
        ....:

In [50]: df.dtypes
Out[50]:
a      int64
b      uint32
Length: 2, dtype: object

In [51]: ix = df['a'] == 1

In [52]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [53]: df.dtypes
Out[53]:
a      int64
b      uint32
Length: 2, dtype: object
```

When a DataFrame's integer slice is partially updated with a new slice of floats that could potentially be down-casted to integer without losing precision, the dtype of the slice will be set to float instead of integer.

Previous Behavior:

```
In [4]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                           columns=list('abc'),
                           index=[[4,4,8], [8,10,12]])

In [5]: df
Out[5]:
```

|      | a | b | c |
|------|---|---|---|
| 4 8  | 1 | 2 | 3 |
| 10   | 4 | 5 | 6 |
| 8 12 | 7 | 8 | 9 |

```
In [7]: df.ix[4, 'c'] = np.array([0., 1.])

In [8]: df
Out[8]:
```

|      | a | b | c |
|------|---|---|---|
| 4 8  | 1 | 2 | 0 |
| 10   | 4 | 5 | 1 |
| 8 12 | 7 | 8 | 9 |

New Behavior:

```
In [54]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
.....:                     columns=list('abc'),
.....:                     index=[[4,4,8], [8,10,12]])
.....:

In [55]: df
Out[55]:
```

|      | a | b | c |
|------|---|---|---|
| 4 8  | 1 | 2 | 3 |
| 10   | 4 | 5 | 6 |
| 8 12 | 7 | 8 | 9 |

[3 rows x 3 columns]

```
In [56]: df.loc[4, 'c'] = np.array([0., 1.])

In [57]: df
Out[57]:
```

|      | a | b | c   |
|------|---|---|-----|
| 4 8  | 1 | 2 | 0.0 |
| 10   | 4 | 5 | 1.0 |
| 8 12 | 7 | 8 | 9.0 |

[3 rows x 3 columns]

## to\_xarray

In a future version of pandas, we will be deprecating Panel and other > 2 ndim objects. In order to provide for continuity, all NDFrame objects have gained the `.to_xarray()` method in order to convert to xarray objects, which has a pandas-like interface for > 2 ndim. ([GH11972](#))

See the [xarray full-documentation](#) here.

```
In [1]: p = Panel(np.arange(2*3*4).reshape(2,3,4))

In [2]: p.to_xarray()
Out[2]:
<xarray.DataArray (items: 2, major_axis: 3, minor_axis: 4)>
array([[[ 0,  1,  2,  3],
        [ 4,  5,  6,  7],
        [ 8,  9, 10, 11]],

       [[12, 13, 14, 15],
        [16, 17, 18, 19],
        [20, 21, 22, 23]]])
Coordinates:
  * items          (items) int64 0 1
  * major_axis     (major_axis) int64 0 1 2
  * minor_axis     (minor_axis) int64 0 1 2 3
```

## Latex Representation

DataFrame has gained a `._repr_latex_()` method in order to allow for conversion to latex in a ipython/jupyter notebook using nbconvert. (GH11778)

Note that this must be activated by setting the option `pd.display.latex.repr=True` (GH12182)

For example, if you have a jupyter notebook you plan to convert to latex using nbconvert, place the statement `pd.display.latex.repr=True` in the first cell to have the contained DataFrame output also stored as latex.

The options `display.latex.escape` and `display.latex.longtable` have also been added to the configuration and are used automatically by the `to_latex` method. See the *available options docs* for more info.

## pd.read\_sas() changes

`read_sas` has gained the ability to read SAS7BDAT files, including compressed files. The files can be read in entirety, or incrementally. For full details see *here*. (GH4052)

## Other enhancements

- Handle truncated floats in SAS xport files (GH11713)
- Added option to hide index in `Series.to_string` (GH11729)
- `read_excel` now supports s3 urls of the format `s3://bucketname/filename` (GH11447)
- add support for `AWS_S3_HOST` env variable when reading from s3 (GH12198)
- A simple version of `Panel.round()` is now implemented (GH11763)
- For Python 3.x, `round(DataFrame)`, `round(Series)`, `round(Panel)` will work (GH11763)
- `sys.getsizeof(obj)` returns the memory usage of a pandas object, including the values it contains (GH11597)
- `Series` gained an `is_unique` attribute (GH11946)
- `DataFrame.quantile` and `Series.quantile` now accept interpolation keyword (GH10174).
- Added `DataFrame.style.format` for more flexible formatting of cell values (GH11692)

- `DataFrame.select_dtypes` now allows the `np.float16` type code (GH11990)
- `pivot_table()` now accepts most iterables for the `values` parameter (GH12017)
- Added Google BigQuery service account authentication support, which enables authentication on remote servers. (GH11881, GH12572). For further details see [here](#)
- `HDFStore` is now iterable: `for k in store` is equivalent to `for k in store.keys()` (GH12221).
- Add missing methods/fields to `.dt` for `Period` (GH8848)
- The entire code base has been PEP-ified (GH12096)

### 39.7.2.2 Backwards incompatible API changes

- the leading white spaces have been removed from the output of `.to_string(index=False)` method (GH11833)
- the `out` parameter has been removed from the `Series.round()` method. (GH11763)
- `DataFrame.round()` leaves non-numeric columns unchanged in its return, rather than raises. (GH11885)
- `DataFrame.head(0)` and `DataFrame.tail(0)` return empty frames, rather than `self`. (GH11937)
- `Series.head(0)` and `Series.tail(0)` return empty series, rather than `self`. (GH11937)
- `to_msgpack` and `read_msgpack` encoding now defaults to `'utf-8'`. (GH12170)
- the order of keyword arguments to text file parsing functions (`.read_csv()`, `.read_table()`, `.read_fwf()`) changed to group related arguments. (GH11555)
- `NaTType.isoformat` now returns the string `'NaT'` to allow the result to be passed to the constructor of `Timestamp`. (GH12300)

### NaT and Timedelta operations

`NaT` and `Timedelta` have expanded arithmetic operations, which are extended to `Series` arithmetic where applicable. Operations defined for `datetime64[ns]` or `timedelta64[ns]` are now also defined for `NaT` (GH11564).

`NaT` now supports arithmetic operations with integers and floats.

```
In [58]: pd.NaT * 1
Out[58]: NaT

In [59]: pd.NaT * 1.5
\\Out[59]: NaT

In [60]: pd.NaT / 2
\\Out[60]: NaT

In [61]: pd.NaT * np.nan
\\Out[61]: NaT
```

`NaT` defines more arithmetic operations with `datetime64[ns]` and `timedelta64[ns]`.

```
In [62]: pd.NaT / pd.NaT
Out[62]: nan

In [63]: pd.Timedelta('1s') / pd.NaT
\\Out[63]: nan
```

NaT may represent either a `datetime64[ns]` null or a `timedelta64[ns]` null. Given the ambiguity, it is treated as a `timedelta64[ns]`, which allows more operations to succeed.

```
In [64]: pd.NaT + pd.NaT
Out[64]: NaT

# same as
In [65]: pd.Timedelta('1s') + pd.Timedelta('1s')
Out[65]: Timedelta('0 days 00:00:02')
```

as opposed to

```
In [3]: pd.Timestamp('19900315') + pd.Timestamp('19900315')
TypeError: unsupported operand type(s) for +: 'Timestamp' and 'Timestamp'
```

However, when wrapped in a `Series` whose `dtype` is `datetime64[ns]` or `timedelta64[ns]`, the `dtype` information is respected.

```
In [1]: pd.Series([pd.NaT], dtype='<M8[ns]') + pd.Series([pd.NaT], dtype='<M8[ns]')
TypeError: can only operate on a datetimes for subtraction,
        but the operator [__add__] was passed
```

```
In [66]: pd.Series([pd.NaT], dtype='<m8[ns]') + pd.Series([pd.NaT], dtype='<m8[ns]')
Out[66]:
0      NaT
Length: 1, dtype: timedelta64[ns]
```

Timedelta division by floats now works.

```
In [67]: pd.Timedelta('1s') / 2.0
Out[67]: Timedelta('0 days 00:00:00.500000')
```

### Subtraction by Timedelta in a Series by a Timestamp works (GH11925)

```
In [68]: ser = pd.Series(pd.timedelta_range('1 day', periods=3))

In [69]: ser
Out[69]:
0    1 days
1    2 days
2    3 days
Length: 3, dtype: timedelta64[ns]

In [70]: pd.Timestamp('2012-01-01') - ser
Out[70]:
0    2011-12-31
1    2011-12-30
2    2011-12-29
Length: 3, dtype: datetime64[ns]
```

`NaT.isoformat()` now returns `'NaT'`. This change allows `pd.Timestamp` to rehydrate any timestamp like object from its isoformat ([GH12300](#)).

## Changes to msgpack

Forward incompatible changes in `msgpack` writing format were made over 0.17.0 and 0.18.0; older versions of `pandas` cannot read files packed by newer versions ([GH12129](#), [GH10527](#))

Bugs in `to_msgpack` and `read_msgpack` introduced in 0.17.0 and fixed in 0.18.0, caused files packed in Python 2 unreadable by Python 3 ([GH12142](#)). The following table describes the backward and forward compat of msgpacks.

**Warning:**

| Packed with         | Can be unpacked with                                                                                    |
|---------------------|---------------------------------------------------------------------------------------------------------|
| pre-0.17 / Python 2 | any                                                                                                     |
| pre-0.17 / Python 3 | any                                                                                                     |
| 0.17 / Python 2     | <ul style="list-style-type: none"> <li>• ==0.17 / Python 2</li> <li>• &gt;=0.18 / any Python</li> </ul> |
| 0.17 / Python 3     | >=0.18 / any Python                                                                                     |
| 0.18                | >= 0.18                                                                                                 |

0.18.0 is backward-compatible for reading files packed by older versions, except for files packed with 0.17 in Python 2, in which case only they can only be unpacked in Python 2.

## Signature change for .rank

Series.rank and DataFrame.rank now have the same signature (GH11759)

Previous signature

```
In [3]: pd.Series([0,1]).rank(method='average', na_option='keep',
                                ascending=True, pct=False)

Out[3]:
0    1
1    2
dtype: float64

In [4]: pd.DataFrame([0,1]).rank(axis=0, numeric_only=None,
                                   method='average', na_option='keep',
                                   ascending=True, pct=False)

Out[4]:
0
0  1
1  2
```

New signature

[illegible]

(continues on next page)

(continued from previous page)

```
0  1.0
1  2.0

[2 rows x 1 columns]
```

### Bug in QuarterBegin with n=0

In previous versions, the behavior of the `QuarterBegin` offset was inconsistent depending on the date when the `n` parameter was 0. (GH11406)

The general semantics of anchored offsets for `n=0` is to not move the date when it is an anchor point (e.g., a quarter start date), and otherwise roll forward to the next anchor point.

```
In [73]: d = pd.Timestamp('2014-02-01')

In [74]: d
Out[74]: Timestamp('2014-02-01 00:00:00')

In [75]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[75]: Timestamp('2014-02-01 00:00:00')

In [76]: d + pd.offsets.QuarterBegin(n=0, startingMonth=1)
Out[76]: Timestamp('2014-04-01 00:00:00')
```

For the `QuarterBegin` offset in previous versions, the date would be rolled *backwards* if date was in the same month as the quarter start date.

```
In [3]: d = pd.Timestamp('2014-02-15')

In [4]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[4]: Timestamp('2014-02-01 00:00:00')
```

This behavior has been corrected in version 0.18.0, which is consistent with other anchored offsets like `MonthBegin` and `YearBegin`.

```
In [77]: d = pd.Timestamp('2014-02-15')

In [78]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[78]: Timestamp('2014-05-01 00:00:00')
```

### Resample API

Like the change in the window functions API *above*, `.resample(...)` is changing to have a more groupby-like API. (GH11732, GH12702, GH12202, GH12332, GH12334, GH12348, GH12448).

```
In [79]: np.random.seed(1234)

In [80]: df = pd.DataFrame(np.random.rand(10,4),
.....:                    columns=list('ABCD'),
.....:                    index=pd.date_range('2010-01-01 09:00:00',
.....:                                       periods=10, freq='s'))
```

(continues on next page)

(continued from previous page)

```
In [81]: df
Out [81]:
```

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.191519 | 0.622109 | 0.437728 | 0.785359 |
| 2010-01-01 09:00:01 | 0.779976 | 0.272593 | 0.276464 | 0.801872 |
| 2010-01-01 09:00:02 | 0.958139 | 0.875933 | 0.357817 | 0.500995 |
| 2010-01-01 09:00:03 | 0.683463 | 0.712702 | 0.370251 | 0.561196 |
| 2010-01-01 09:00:04 | 0.503083 | 0.013768 | 0.772827 | 0.882641 |

```
[10 rows x 4 columns]
```

**Previous API:**

You would write a resampling operation that immediately evaluates. If a `how` parameter was not provided, it would default to `how='mean'`.

```
In [6]: df.resample('2s')
Out [6]:
```

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.485748 | 0.447351 | 0.357096 | 0.793615 |
| 2010-01-01 09:00:02 | 0.820801 | 0.794317 | 0.364034 | 0.531096 |
| 2010-01-01 09:00:04 | 0.433985 | 0.314582 | 0.424104 | 0.625733 |
| 2010-01-01 09:00:06 | 0.624988 | 0.609738 | 0.633165 | 0.612452 |
| 2010-01-01 09:00:08 | 0.510470 | 0.534317 | 0.573201 | 0.806949 |

You could also specify a `how` directly

```
In [7]: df.resample('2s', how='sum')
Out [7]:
```

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.971495 | 0.894701 | 0.714192 | 1.587231 |
| 2010-01-01 09:00:02 | 1.641602 | 1.588635 | 0.728068 | 1.062191 |
| 2010-01-01 09:00:04 | 0.867969 | 0.629165 | 0.848208 | 1.251465 |
| 2010-01-01 09:00:06 | 1.249976 | 1.219477 | 1.266330 | 1.224904 |
| 2010-01-01 09:00:08 | 1.020940 | 1.068634 | 1.146402 | 1.613897 |

**New API:**

Now, you can write `.resample(...)` as a 2-stage operation like `.groupby(...)`, which yields a `Resampler`.

```
In [82]: r = df.resample('2s')

In [83]: r
Out [83]: DatetimeIndexResampler [freq=<2 * Seconds>, axis=0, closed=left, label=left,
↳ convention=start, base=0]
```

**Downsampling**

You can then use this object to perform operations. These are downsampling operations (going from a higher frequency to a lower one).

**In [84]:** r.mean()**Out [84]:**

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.485748 | 0.447351 | 0.357096 | 0.793615 |
| 2010-01-01 09:00:02 | 0.820801 | 0.794317 | 0.364034 | 0.531096 |
| 2010-01-01 09:00:04 | 0.433985 | 0.314582 | 0.424104 | 0.625733 |
| 2010-01-01 09:00:06 | 0.624988 | 0.609738 | 0.633165 | 0.612452 |
| 2010-01-01 09:00:08 | 0.510470 | 0.534317 | 0.573201 | 0.806949 |

[5 rows x 4 columns]

**In [85]:** r.sum()**Out [85]:**

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.971495 | 0.894701 | 0.714192 | 1.587231 |
| 2010-01-01 09:00:02 | 1.641602 | 1.588635 | 0.728068 | 1.062191 |
| 2010-01-01 09:00:04 | 0.867969 | 0.629165 | 0.848208 | 1.251465 |
| 2010-01-01 09:00:06 | 1.249976 | 1.219477 | 1.266330 | 1.224904 |
| 2010-01-01 09:00:08 | 1.020940 | 1.068634 | 1.146402 | 1.613897 |

[5 rows x 4 columns]

Furthermore, `resample` now supports `getitem` operations to perform the `resample` on specific columns.

**In [86]:** r[['A', 'C']].mean()**Out [86]:**

|                     | A        | C        |
|---------------------|----------|----------|
| 2010-01-01 09:00:00 | 0.485748 | 0.357096 |
| 2010-01-01 09:00:02 | 0.820801 | 0.364034 |
| 2010-01-01 09:00:04 | 0.433985 | 0.424104 |
| 2010-01-01 09:00:06 | 0.624988 | 0.633165 |
| 2010-01-01 09:00:08 | 0.510470 | 0.573201 |

[5 rows x 2 columns]

and `.aggregate` type operations.

**In [87]:** r.agg({'A' : 'mean', 'B' : 'sum'})**Out [87]:**

|                     | A        | B        |
|---------------------|----------|----------|
| 2010-01-01 09:00:00 | 0.485748 | 0.894701 |
| 2010-01-01 09:00:02 | 0.820801 | 1.588635 |
| 2010-01-01 09:00:04 | 0.433985 | 0.629165 |
| 2010-01-01 09:00:06 | 0.624988 | 1.219477 |
| 2010-01-01 09:00:08 | 0.510470 | 1.068634 |

[5 rows x 2 columns]

These accessors can of course, be combined

**In [88]:** r[['A', 'B']].agg(['mean', 'sum'])**Out [88]:**

|                     | A        |          | B        |          |
|---------------------|----------|----------|----------|----------|
|                     | mean     | sum      | mean     | sum      |
| 2010-01-01 09:00:00 | 0.485748 | 0.971495 | 0.447351 | 0.894701 |
| 2010-01-01 09:00:02 | 0.820801 | 1.641602 | 0.794317 | 1.588635 |
| 2010-01-01 09:00:04 | 0.433985 | 0.867969 | 0.314582 | 0.629165 |

(continues on next page)

(continued from previous page)

[5 rows x 4 columns]
```

## Upsampling

Upsampling operations take you from a lower frequency to a higher frequency. These are now performed with the Resampler objects with `backfill()`, `ffill()`, `fillna()` and `asfreq()` methods.

```
In [89]: s = pd.Series(np.arange(5, dtype='int64'),
.....:                 index=pd.date_range('2010-01-01', periods=5, freq='Q'))
.....:

In [90]: s
Out[90]:
2010-03-31    0
2010-06-30    1
2010-09-30    2
2010-12-31    3
2011-03-31    4
Freq: Q-DEC, Length: 5, dtype: int64
```

## Previously

```
In [6]: s.resample('M', fill_method='ffill')
Out[6]:
2010-03-31    0
2010-04-30    0
2010-05-31    0
2010-06-30    1
2010-07-31    1
2010-08-31    1
2010-09-30    2
2010-10-31    2
2010-11-30    2
2010-12-31    3
2011-01-31    3
2011-02-28    3
2011-03-31    4
Freq: M, dtype: int64
```

## New API

```
In [91]: s.resample('M').ffill()
Out[91]:
2010-03-31    0
2010-04-30    0
2010-05-31    0
2010-06-30    1
2010-07-31    1
2010-08-31    1
2010-09-30    2
2010-10-31    2
2010-11-30    2
```

(continues on next page)

(continued from previous page)

```

2010-12-31    3
2011-01-31    3
2011-02-28    3
2011-03-31    4
Freq: M, Length: 13, dtype: int64

```

**Note:** In the new API, you can either downsample OR upsample. The prior implementation would allow you to pass an aggregator function (like `mean`) even though you were upsampling, providing a bit of confusion.

### Previous API will work but with deprecations

**Warning:** This new API for `resample` includes some internal changes for the prior-to-0.18.0 API, to work with a deprecation warning in most cases, as the `resample` operation returns a deferred object. We can intercept operations and just do what the (pre 0.18.0) API did (with a warning). Here is a typical use case:

```
In [4]: r = df.resample('2s')
```

```
In [6]: r*10
```

```

pandas/tseries/resample.py:80: FutureWarning: .resample() is now a deferred_
↪operation
use .resample(...).mean() instead of .resample(...)

```

```
Out [6]:
```

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 4.857476 | 4.473507 | 3.570960 | 7.936154 |
| 2010-01-01 09:00:02 | 8.208011 | 7.943173 | 3.640340 | 5.310957 |
| 2010-01-01 09:00:04 | 4.339846 | 3.145823 | 4.241039 | 6.257326 |
| 2010-01-01 09:00:06 | 6.249881 | 6.097384 | 6.331650 | 6.124518 |
| 2010-01-01 09:00:08 | 5.104699 | 5.343172 | 5.732009 | 8.069486 |

However, getting and assignment operations directly on a `Resampler` will raise a `ValueError`:

```
In [7]: r.iloc[0] = 5
```

```

ValueError: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)

```

There is a situation where the new API can not perform all the operations when using original code. This code is intending to resample every 2s, take the mean AND then take the min of those results.

```
In [4]: df.resample('2s').min()
```

```
Out [4]:
```

```

A    0.433985
B    0.314582
C    0.357096
D    0.531096
dtype: float64

```

The new API will:

```
In [92]: df.resample('2s').min()
```

```
Out [92]:
```

|                     | A        | B        | C        | D        |
|---------------------|----------|----------|----------|----------|
| 2010-01-01 09:00:00 | 0.191519 | 0.272593 | 0.276464 | 0.785359 |
| 2010-01-01 09:00:02 | 0.683463 | 0.712702 | 0.357817 | 0.500995 |
| 2010-01-01 09:00:04 | 0.364886 | 0.013768 | 0.075381 | 0.368824 |
| 2010-01-01 09:00:06 | 0.316836 | 0.568099 | 0.397203 | 0.436173 |
| 2010-01-01 09:00:08 | 0.218792 | 0.143767 | 0.442141 | 0.704581 |

The good news is the return dimensions will differ between the new API and the old API, so this should loudly raise an exception.

To replicate the original operation

```
In [93]: df.resample('2s').mean().min()
Out[93]:
A    0.433985
B    0.314582
C    0.357096
D    0.531096
Length: 4, dtype: float64
```

## Changes to eval

In prior versions, new columns assignments in an `eval` expression resulted in an inplace change to the `DataFrame`. (GH9297, GH8664, GH10486)

```
In [94]: df = pd.DataFrame({'a': np.linspace(0, 10, 5), 'b': range(5)})

In [95]: df
Out[95]:
   a  b
0  0.0  0
1  2.5  1
2  5.0  2
3  7.5  3
4 10.0  4

[5 rows x 2 columns]
```

```
In [12]: df.eval('c = a + b')
FutureWarning: eval expressions containing an assignment currently default to
↳operating inplace.
This will change in a future version of pandas, use inplace=True to avoid this
↳warning.

In [13]: df
Out[13]:
   a  b    c
0  0.0  0  0.0
1  2.5  1  3.5
2  5.0  2  7.0
3  7.5  3 10.5
4 10.0  4 14.0
```

In version 0.18.0, a new `inplace` keyword was added to choose whether the assignment should be done inplace or return a copy.

```
In [96]: df
Out[96]:
   a  b    c
0  0.0  0  0.0
1  2.5  1  3.5
2  5.0  2  7.0
```

(continues on next page)

(continued from previous page)

```
3    7.5  3   10.5
4   10.0  4   14.0
```

```
[5 rows x 3 columns]
```

```
In [97]: df.eval('d = c - b', inplace=False)
```

```

↪
   a  b    c    d
0  0.0  0  0.0  0.0
1  2.5  1  3.5  2.5
2  5.0  2  7.0  5.0
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
```

```
[5 rows x 4 columns]
```

```
In [98]: df
```

```

↪
   a  b    c
0  0.0  0  0.0
1  2.5  1  3.5
2  5.0  2  7.0
3  7.5  3 10.5
4 10.0  4 14.0
```

```
[5 rows x 3 columns]
```

```
In [99]: df.eval('d = c - b', inplace=True)
```

```
In [100]: df
```

```
Out[100]:
```

```

   a  b    c    d
0  0.0  0  0.0  0.0
1  2.5  1  3.5  2.5
2  5.0  2  7.0  5.0
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
```

```
[5 rows x 4 columns]
```

**Warning:** For backwards compatibility, `inplace` defaults to `True` if not specified. This will change in a future version of pandas. If your code depends on an inplace assignment you should update to explicitly set `inplace=True`

The `inplace` keyword parameter was also added the `query` method.

```
In [101]: df.query('a > 5')
```

```
Out[101]:
```

```

   a  b    c    d
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
```

(continues on next page)

(continued from previous page)

```
[2 rows x 4 columns]

In [102]: df.query('a > 5', inplace=True)

In [103]: df
Out[103]:
```

|   | a    | b | c    | d    |
|---|------|---|------|------|
| 3 | 7.5  | 3 | 10.5 | 7.5  |
| 4 | 10.0 | 4 | 14.0 | 10.0 |

```
[2 rows x 4 columns]
```

**Warning:** Note that the default value for `inplace` in a query is `False`, which is consistent with prior versions.

`eval` has also been updated to allow multi-line expressions for multiple assignments. These expressions will be evaluated one at a time in order. Only assignments are valid for multi-line expressions.

```
In [104]: df
Out[104]:
```

|   | a    | b | c    | d    |
|---|------|---|------|------|
| 3 | 7.5  | 3 | 10.5 | 7.5  |
| 4 | 10.0 | 4 | 14.0 | 10.0 |

```
[2 rows x 4 columns]

In [105]: df.eval("""
.....: e = d + a
.....: f = e - 22
.....: g = f / 2.0""", inplace=True)
.....:

In [106]: df
Out[106]:
```

|   | a    | b | c    | d    | e    | f    | g    |
|---|------|---|------|------|------|------|------|
| 3 | 7.5  | 3 | 10.5 | 7.5  | 15.0 | -7.0 | -3.5 |
| 4 | 10.0 | 4 | 14.0 | 10.0 | 20.0 | -2.0 | -1.0 |

```
[2 rows x 7 columns]
```

## Other API Changes

- `DataFrame.between_time` and `Series.between_time` now only parse a fixed set of time strings. Parsing of date strings is no longer supported and raises a `ValueError`. ([GH11818](#))

```
In [107]: s = pd.Series(range(10), pd.date_range('2015-01-01', freq='H',
↳ periods=10))

In [108]: s.between_time("7:00am", "9:00am")
Out[108]:
```

|                     |   |
|---------------------|---|
| 2015-01-01 07:00:00 | 7 |
| 2015-01-01 08:00:00 | 8 |
| 2015-01-01 09:00:00 | 9 |

```
Freq: H, Length: 3, dtype: int64
```

This will now raise.

```
In [2]: s.between_time('20150101 07:00:00', '20150101 09:00:00')
ValueError: Cannot convert arg ['20150101 07:00:00'] to a time.
```

- `.memory_usage()` now includes values in the index, as does `memory_usage` in `.info()` (GH11597)
- `DataFrame.to_latex()` now supports non-ascii encodings (eg `utf-8`) in Python 2 with the parameter `encoding` (GH7061)
- `pandas.merge()` and `DataFrame.merge()` will show a specific error message when trying to merge with an object that is not of type `DataFrame` or a subclass (GH12081)
- `DataFrame.unstack` and `Series.unstack` now take `fill_value` keyword to allow direct replacement of missing values when an unstack results in missing values in the resulting `DataFrame`. As an added benefit, specifying `fill_value` will preserve the data type of the original stacked data. (GH9746)
- As part of the new API for *window functions* and *resampling*, aggregation functions have been clarified, raising more informative error messages on invalid aggregations. (GH9052). A full set of examples are presented in *groupby*.
- Statistical functions for `NDFrame` objects (like `sum()`, `mean()`, `min()`) will now raise if non-numpy-compatible arguments are passed in for `**kwargs` (GH12301)
- `.to_latex` and `.to_html` gain a decimal parameter like `.to_csv`; the default is `'.'` (GH12031)
- More helpful error message when constructing a `DataFrame` with empty data but with indices (GH8020)
- `.describe()` will now properly handle `bool` dtype as a categorical (GH6625)
- More helpful error message with an invalid `.transform` with user defined input (GH10165)
- Exponentially weighted functions now allow specifying `alpha` directly (GH10789) and raise `ValueError` if parameters violate  $0 < \alpha \leq 1$  (GH12492)

## Deprecations

- The functions `pd.rolling_*`, `pd.expanding_*`, and `pd.ewm*` are deprecated and replaced by the corresponding method call. Note that the new suggested syntax includes all of the arguments (even if default) (GH11603)

```
In [1]: s = pd.Series(range(3))

In [2]: pd.rolling_mean(s, window=2, min_periods=1)
FutureWarning: pd.rolling_mean is deprecated for Series and
will be removed in a future version, replace with
Series.rolling(min_periods=1, window=2, center=False).mean()

Out[2]:
0    0.0
1    0.5
2    1.5
dtype: float64

In [3]: pd.rolling_cov(s, s, window=2)
FutureWarning: pd.rolling_cov is deprecated for Series and
will be removed in a future version, replace with
Series.rolling(window=2).cov(other=<Series>)

Out[3]:
0    NaN
```

(continues on next page)

(continued from previous page)

```

1    0.5
2    0.5
dtype: float64

```

- The `freq` and `how` arguments to the `.rolling`, `.expanding`, and `.ewm` (new) functions are deprecated, and will be removed in a future version. You can simply resample the input prior to creating a window function. (GH11603).

For example, instead of `s.rolling(window=5, freq='D').max()` to get the max value on a rolling 5 Day window, one could use `s.resample('D').mean().rolling(window=5).max()`, which first resamples the data to daily data, then provides a rolling 5 day window.

- `pd.tseries.frequencies.get_offset_name` function is deprecated. Use offset's `.freqstr` property as alternative (GH11192)
- `pandas.stats.fama_macbeth` routines are deprecated and will be removed in a future version (GH6077)
- `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var` routines are deprecated and will be removed in a future version (GH6077)
- show a `FutureWarning` rather than a `DeprecationWarning` on using long-time deprecated syntax in `HDFStore.select`, where the `where` clause is not a string-like (GH12027)
- The `pandas.options.display.mpl_style` configuration has been deprecated and will be removed in a future version of pandas. This functionality is better handled by matplotlib's [style sheets](#) (GH11783).

## Removal of deprecated float indexers

In GH4892 indexing with floating point numbers on a non-Float64Index was deprecated (in version 0.14.0). In 0.18.0, this deprecation warning is removed and these will now raise a `TypeError`. (GH12165, GH12333)

```

In [109]: s = pd.Series([1, 2, 3], index=[4, 5, 6])

In [110]: s
Out[110]:
4    1
5    2
6    3
Length: 3, dtype: int64

In [111]: s2 = pd.Series([1, 2, 3], index=list('abc'))

In [112]: s2
Out[112]:
a    1
b    2
c    3
Length: 3, dtype: int64

```

### Previous Behavior:

```

# this is label indexing
In [2]: s[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not
↪floating point
Out[2]: 2

```

(continues on next page)

(continued from previous page)

```
# this is positional indexing
In [3]: s.iloc[1.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not_
↳floating point
Out[3]: 2

# this is label indexing
In [4]: s.loc[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not_
↳floating point
Out[4]: 2

# .ix would coerce 1.0 to the positional 1, and index
In [5]: s2.ix[1.0] = 10
FutureWarning: scalar indexers for index type Index should be integers and not_
↳floating point

In [6]: s2
Out[6]:
a      1
b     10
c       3
dtype: int64
```

**New Behavior:**

For iloc, getting & setting via a float scalar will always raise.

```
In [3]: s.iloc[2.0]
TypeError: cannot do label indexing on <class 'pandas.indexes.numeric.Int64Index'>_
↳with these indexers [2.0] of <type 'float'>
```

Other indexers will coerce to a like integer for both getting and setting. The FutureWarning has been dropped for .loc, .ix and [].

```
In [113]: s[5.0]
Out[113]: 2

In [114]: s.loc[5.0]
\\\\\\\\\\\\\\\\\\\\Out[114]: 2
```

**and setting**

```
In [115]: s_copy = s.copy()

In [116]: s_copy[5.0] = 10

In [117]: s_copy
Out[117]:
4      1
5     10
6       3
Length: 3, dtype: int64

In [118]: s_copy = s.copy()
```

(continues on next page)

(continued from previous page)

```
In [119]: s_copy.loc[5.0] = 10

In [120]: s_copy
Out[120]:
4      1
5     10
6      3
Length: 3, dtype: int64
```

Positional setting with `.ix` and a float indexer will ADD this value to the index, rather than previously setting the value by position.

```
In [3]: s2.ix[1.0] = 10
In [4]: s2
Out[4]:
a      1
b      2
c      3
1.0    10
dtype: int64
```

Slicing will also coerce integer-like floats to integers for a non-Float64Index.

```
In [121]: s.loc[5.0:6]
Out[121]:
5      2
6      3
Length: 2, dtype: int64
```

Note that for floats that are NOT coercible to ints, the label based bounds will be excluded

```
In [122]: s.loc[5.1:6]
Out[122]:
6      3
Length: 1, dtype: int64
```

Float indexing on a Float64Index is unchanged.

```
In [123]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [124]: s[1.0]
Out[124]: 2

In [125]: s[1.0:2.5]
Out[125]:
1.0      2
2.0      3
Length: 2, dtype: int64
```

## Removal of prior version deprecations/changes

- Removal of `rolling_corr_pairwise` in favor of `.rolling().corr(pairwise=True)` ([GH4950](#))
- Removal of `expanding_corr_pairwise` in favor of `.expanding().corr(pairwise=True)` ([GH4950](#))

- Removal of `DataMatrix` module. This was not imported into the pandas namespace in any event ([GH12111](#))
- Removal of `cols` keyword in favor of `subset` in `DataFrame.duplicated()` and `DataFrame.drop_duplicates()` ([GH6680](#))
- Removal of the `read_frame` and `frame_query` (both aliases for `pd.read_sql`) and `write_frame` (alias of `to_sql`) functions in the `pd.io.sql` namespace, deprecated since 0.14.0 ([GH6292](#)).
- Removal of the `order` keyword from `.factorize()` ([GH6930](#))

### 39.7.2.3 Performance Improvements

- Improved performance of `andrews_curves` ([GH11534](#))
- Improved huge `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex`'s ops performance including `NaT` ([GH10277](#))
- Improved performance of `pandas.concat` ([GH11958](#))
- Improved performance of `StataReader` ([GH11591](#))
- Improved performance in construction of `Categoricals` with `Series` of datetimes containing `NaT` ([GH12077](#))
- Improved performance of ISO 8601 date parsing for dates without separators ([GH11899](#)), leading zeros ([GH11871](#)) and with white space preceding the time zone ([GH9714](#))

### 39.7.2.4 Bug Fixes

- Bug in `GroupBy.size` when data-frame is empty. ([GH11699](#))
- Bug in `Period.end_time` when a multiple of time period is requested ([GH11738](#))
- Regression in `.clip` with tz-aware datetimes ([GH11838](#))
- Bug in `date_range` when the boundaries fell on the frequency ([GH11804](#), [GH12409](#))
- Bug in consistency of passing nested dicts to `.groupby(...).agg(...)` ([GH9052](#))
- Accept unicode in `Timedelta` constructor ([GH11995](#))
- Bug in value label reading for `StataReader` when reading incrementally ([GH12014](#))
- Bug in vectorized `DateOffset` when `n` parameter is 0 ([GH11370](#))
- Compat for numpy 1.11 w.r.t. `NaT` comparison changes ([GH12049](#))
- Bug in `read_csv` when reading from a `StringIO` in threads ([GH11790](#))
- Bug in not treating `NaT` as a missing value in datetimelikes when factorizing & with `Categoricals` ([GH12077](#))
- Bug in `getitem` when the values of a `Series` were tz-aware ([GH12089](#))
- Bug in `Series.str.get_dummies` when one of the variables was 'name' ([GH12180](#))
- Bug in `pd.concat` while concatenating tz-aware `NaT` series. ([GH11693](#), [GH11755](#), [GH12217](#))
- Bug in `pd.read_stata` with version  $\leq 108$  files ([GH12232](#))
- Bug in `Series.resample` using a frequency of `Nano` when the index is a `DatetimeIndex` and contains non-zero nanosecond parts ([GH12037](#))
- Bug in resampling with `.unique` and a sparse index ([GH12352](#))

- Removed some compiler warnings ([GH12471](#))
- Work around compat issues with `boto` in python 3.5 ([GH11915](#))
- Bug in NaT subtraction from `Timestamp` or `DatetimeIndex` with timezones ([GH11718](#))
- Bug in subtraction of `Series` of a single tz-aware `Timestamp` ([GH12290](#))
- Use compat iterators in PY2 to support `.next()` ([GH12299](#))
- Bug in `Timedelta.round` with negative values ([GH11690](#))
- Bug in `.loc` against `CategoricalIndex` may result in normal `Index` ([GH11586](#))
- Bug in `DataFrame.info` when duplicated column names exist ([GH11761](#))
- Bug in `.copy` of datetime tz-aware objects ([GH11794](#))
- Bug in `Series.apply` and `Series.map` where `timedelta64` was not boxed ([GH11349](#))
- Bug in `DataFrame.set_index()` with tz-aware `Series` ([GH12358](#))
- Bug in subclasses of `DataFrame` where `AttributeError` did not propagate ([GH11808](#))
- Bug groupby on tz-aware data where selection not returning `Timestamp` ([GH11616](#))
- Bug in `pd.read_clipboard` and `pd.to_clipboard` functions not supporting Unicode; upgrade included `pyperclip` to v1.5.15 ([GH9263](#))
- Bug in `DataFrame.query` containing an assignment ([GH8664](#))
- Bug in `from_msgpack` where `__contains__()` fails for columns of the unpacked `DataFrame`, if the `DataFrame` has object columns. ([GH11880](#))
- Bug in `.resample` on categorical data with `TimedeltaIndex` ([GH12169](#))
- Bug in timezone info lost when broadcasting scalar datetime to `DataFrame` ([GH11682](#))
- Bug in `Index` creation from `Timestamp` with mixed tz coerces to UTC ([GH11488](#))
- Bug in `to_numeric` where it does not raise if input is more than one dimension ([GH11776](#))
- Bug in parsing timezone offset strings with non-zero minutes ([GH11708](#))
- Bug in `df.plot` using incorrect colors for bar plots under `matplotlib` 1.5+ ([GH11614](#))
- Bug in the groupby plot method when using keyword arguments ([GH11805](#)).
- Bug in `DataFrame.duplicated` and `drop_duplicates` causing spurious matches when setting `keep=False` ([GH11864](#))
- Bug in `.loc` result with duplicated key may have `Index` with incorrect dtype ([GH11497](#))
- Bug in `pd.rolling_median` where memory allocation failed even with sufficient memory ([GH11696](#))
- Bug in `DataFrame.style` with spurious zeros ([GH12134](#))
- Bug in `DataFrame.style` with integer columns not starting at 0 ([GH12125](#))
- Bug in `.style.bar` may not rendered properly using specific browser ([GH11678](#))
- Bug in rich comparison of `Timedelta` with a `numpy.array` of `Timedelta` that caused an infinite recursion ([GH11835](#))
- Bug in `DataFrame.round` dropping column index name ([GH11986](#))
- Bug in `df.replace` while replacing value in mixed dtype `Dataframe` ([GH11698](#))
- Bug in `Index` prevents copying name of passed `Index`, when a new name is not provided ([GH11193](#))

- Bug in `read_excel` failing to read any non-empty sheets when empty sheets exist and `sheetname=None` (GH11711)
- Bug in `read_excel` failing to raise `NotImplemented` error when keywords `parse_dates` and `date_parser` are provided (GH11544)
- Bug in `read_sql` with `pymysql` connections failing to return chunked data (GH11522)
- Bug in `.to_csv` ignoring formatting parameters `decimal`, `na_rep`, `float_format` for float indexes (GH11553)
- Bug in `Int64Index` and `Float64Index` preventing the use of the modulo operator (GH9244)
- Bug in `MultiIndex.drop` for not lexsorted `MultiIndexes` (GH12078)
- Bug in `DataFrame` when masking an empty `DataFrame` (GH11859)
- Bug in `.plot` potentially modifying the `colors` input when the number of columns didn't match the number of series provided (GH12039).
- Bug in `Series.plot` failing when index has a `CustomBusinessDay` frequency (GH7222).
- Bug in `.to_sql` for `datetime.time` values with `sqlite` fallback (GH8341)
- Bug in `read_excel` failing to read data with one column when `squeeze=True` (GH12157)
- Bug in `read_excel` failing to read one empty column (GH12292, GH9002)
- Bug in `.groupby` where a `KeyError` was not raised for a wrong column if there was only one row in the dataframe (GH11741)
- Bug in `.read_csv` with `dtype` specified on empty data producing an error (GH12048)
- Bug in `.read_csv` where strings like `'2E'` are treated as valid floats (GH12237)
- Bug in building *pandas* with debugging symbols (GH12123)
- Removed `millisecond` property of `DatetimeIndex`. This would always raise a `ValueError` (GH12019).
- Bug in `Series` constructor with read-only data (GH11502)
- Removed `pandas.util.testing.choice()`. Should use `np.random.choice()`, instead. (GH12386)
- Bug in `.loc` setitem indexer preventing the use of a TZ-aware `DatetimeIndex` (GH12050)
- Bug in `.style` indexes and `MultiIndexes` not appearing (GH11655)
- Bug in `to_msgpack` and `from_msgpack` which did not correctly serialize or deserialize `NaT` (GH12307).
- Bug in `.skew` and `.kurt` due to roundoff error for highly similar values (GH11974)
- Bug in `Timestamp` constructor where microsecond resolution was lost if `HHMMSS` were not separated with `'.'` (GH10041)
- Bug in `buffer_rd_bytes` `src->buffer` could be freed more than once if reading failed, causing a segfault (GH12098)
- Bug in `crosstab` where arguments with non-overlapping indexes would return a `KeyError` (GH10291)
- Bug in `DataFrame.apply` in which reduction was not being prevented for cases in which `dtype` was not a numpy `dtype` (GH12244)
- Bug when initializing categorical series with a scalar value. (GH12336)
- Bug when specifying a UTC `DatetimeIndex` by setting `utc=True` in `.to_datetime` (GH11934)

- Bug when increasing the buffer size of CSV reader in `read_csv` ([GH12494](#))
- Bug when setting columns of a `DataFrame` with duplicate column names ([GH12344](#))

### 39.7.2.5 Contributors

A total of 101 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.8 Version 0.17

### 39.8.1 v0.17.1 (November 21, 2015)

{{ header }}

**Note:** We are proud to announce that *pandas* has become a sponsored project of the (NumFOCUS organization). This will help ensure the success of development of *pandas* as a world-class open-source project.

This is a minor bug-fix release from 0.17.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Support for Conditional HTML Formatting, see *here*
- Releasing the GIL on the csv reader & other ops, see *here*
- Fixed regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values (GH11376)

#### What's new in v0.17.1

- *New features*
  - *Conditional HTML Formatting*
- *Enhancements*
- *API changes*
  - *Deprecations*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

#### 39.8.1.1 New features

##### Conditional HTML Formatting

**Warning:** This is a new feature and is under active development. We'll be adding features and possibly making breaking changes in future releases. Feedback is [welcome](#).

We've added *experimental* support for conditional HTML formatting: the visual styling of a `DataFrame` based on the data. The styling is accomplished with HTML and CSS. Accesses the styler class with the `pandas.DataFrame.style` attribute, an instance of `Styler` with your data attached.

Here's a quick example:

```
In [8]: pd.Index([1, np.nan, 3]).fillna(2)
Out[8]: Float64Index([1.0, 2.0, 3.0], dtype='float64')
```

- Series of type `category` now make `.str.<...>` and `.dt.<...>` accessor methods / properties available, if the categories are of that type. (GH10661)

```
In [9]: s = pd.Series(list('aabb')).astype('category')

In [10]: s
Out[10]:
0    a
1    a
2    b
3    b
Length: 4, dtype: category
Categories (2, object): [a, b]

In [11]: s.str.contains("a")
↪
0    True
1    True
2   False
3   False
Length: 4, dtype: bool

In [12]: date = pd.Series(pd.date_range('1/1/2015', periods=5)).astype('category')

In [13]: date
Out[13]:
0    2015-01-01
1    2015-01-02
2    2015-01-03
3    2015-01-04
4    2015-01-05
Length: 5, dtype: category
Categories (5, datetime64[ns]): [2015-01-01, 2015-01-02, 2015-01-03, 2015-01-04, ↪
↪2015-01-05]

In [14]: date.dt.day
↪
0    1
1    2
2    3
3    4
4    5
Length: 5, dtype: int64
```

- `pivot_table` now has a `margins_name` argument so you can use something other than the default of 'All' (GH3335)
- Implement export of `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH11411)
- Pretty printing sets (e.g. in DataFrame cells) now uses set literal syntax (`{x, y}`) instead of Legacy Python syntax (`set([x, y])`) (GH11215)
- Improve the error message in `pandas.io.gbq.to_gbq()` when a streaming insert fails (GH11285) and when the DataFrame does not match the schema of the destination table (GH11359)

### 39.8.1.3 API changes

- raise `NotImplementedError` in `Index.shift` for non-supported index types (GH8038)
- `min` and `max` reductions on `datetime64` and `timedelta64` dtyped series now result in `NaT` and not `nan` (GH11245).
- Indexing with a null key will raise a `TypeError`, instead of a `ValueError` (GH11356)
- `Series.ptp` will now ignore missing values by default (GH11163)

### Deprecations

- The `pandas.io.ga` module which implements google-analytics support is deprecated and will be removed in a future version (GH11308)
- Deprecate the `engine` keyword in `.to_csv()`, which will be removed in a future version (GH11274)

### 39.8.1.4 Performance Improvements

- Checking monotonic-ness before sorting on an index (GH11080)
- `Series.dropna` performance improvement when its `dtype` can't contain `NaN` (GH11159)
- Release the GIL on most datetime field operations (e.g. `DatetimeIndex.year`, `Series.dt.year`), normalization, and conversion to and from `Period`, `DatetimeIndex.to_period` and `PeriodIndex.to_timestamp` (GH11263)
- Release the GIL on some rolling algos: `rolling_median`, `rolling_mean`, `rolling_max`, `rolling_min`, `rolling_var`, `rolling_kurt`, `rolling_skew` (GH11450)
- Release the GIL when reading and parsing text files in `read_csv`, `read_table` (GH11272)
- Improved performance of `rolling_median` (GH11450)
- Improved performance of `to_excel` (GH11352)
- Performance bug in repr of Categorical categories, which was rendering the strings before chopping them for display (GH11305)
- Performance improvement in `Categorical.remove_unused_categories`, (GH11643).
- Improved performance of `Series` constructor with no data and `DatetimeIndex` (GH11433)
- Improved performance of `shift`, `cumprod`, and `cumsum` with `groupby` (GH4095)

### 39.8.1.5 Bug Fixes

- `SparseArray.__iter__()` now does not cause `PendingDeprecationWarning` in Python 3.5 (GH11622)
- Regression from 0.16.2 for output formatting of long floats/nan, restored in (GH11302)
- `Series.sort_index()` now correctly handles the `inplace` option (GH11402)
- Incorrectly distributed `.c` file in the build on PyPi when reading a csv of floats and passing `na_values=<a scalar>` would show an exception (GH11374)
- Bug in `.to_latex()` output broken when the index has a name (GH10660)

- Bug in `HDFStore.append` with strings whose encoded length exceeded the max unencoded length ([GH11234](#))
- Bug in merging `datetime64[ns, tz]` dtypes ([GH11405](#))
- Bug in `HDFStore.select` when comparing with a numpy scalar in a where clause ([GH11283](#))
- Bug in using `DataFrame.ix` with a `MultiIndex` indexer ([GH11372](#))
- Bug in `date_range` with ambiguous endpoints ([GH11626](#))
- Prevent adding new attributes to the accessors `.str`, `.dt` and `.cat`. Retrieving such a value was not possible, so error out on setting it. ([GH10673](#))
- Bug in tz-conversions with an ambiguous time and `.dt` accessors ([GH11295](#))
- Bug in output formatting when using an index of ambiguous times ([GH11619](#))
- Bug in comparisons of Series vs list-likes ([GH11339](#))
- Bug in `DataFrame.replace` with a `datetime64[ns, tz]` and a non-compatible `to_replace` ([GH11326](#), [GH11153](#))
- Bug in `isnull` where `numpy.datetime64('NaT')` in a `numpy.array` was not determined to be null ([GH11206](#))
- Bug in list-like indexing with a mixed-integer Index ([GH11320](#))
- Bug in `pivot_table` with `margins=True` when indexes are of Categorical dtype ([GH10993](#))
- Bug in `DataFrame.plot` cannot use hex strings colors ([GH10299](#))
- Regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values ([GH11376](#))
- Bug in `pd.eval` where unary ops in a list error ([GH11235](#))
- Bug in `squeeze()` with zero length arrays ([GH11230](#), [GH8999](#))
- Bug in `describe()` dropping column names for hierarchical indexes ([GH11517](#))
- Bug in `DataFrame.pct_change()` not propagating `axis` keyword on `.fillna` method ([GH11150](#))
- Bug in `.to_csv()` when a mix of integer and string column names are passed as the `columns` parameter ([GH11637](#))
- Bug in indexing with a range, ([GH11652](#))
- Bug in inference of numpy scalars and preserving dtype when setting columns ([GH11638](#))
- Bug in `to_sql` using unicode column names giving `UnicodeEncodeError` with ([GH11431](#)).
- Fix regression in setting of `xticks` in plot ([GH11529](#)).
- Bug in `holiday.dates` where observance rules could not be applied to holiday and doc enhancement ([GH11477](#), [GH11533](#))
- Fix plotting issues when having plain `Axes` instances instead of `SubplotAxes` ([GH11520](#), [GH11556](#)).
- Bug in `DataFrame.to_latex()` produces an extra rule when `header=False` ([GH7124](#))
- Bug in `df.groupby(...).apply(func)` when a func returns a Series containing a new datetimelike column ([GH11324](#))
- Bug in `pandas.json` when file to load is big ([GH11344](#))
- Bugs in `to_excel` with duplicate columns ([GH11007](#), [GH10982](#), [GH10970](#))
- Fixed a bug that prevented the construction of an empty series of dtype `datetime64[ns, tz]` ([GH11245](#)).

- Bug in `read_excel` with `MultiIndex` containing integers ([GH11317](#))
- Bug in `to_excel` with `openpyxl` 2.2+ and merging ([GH11408](#))
- Bug in `DataFrame.to_dict()` produces a `np.datetime64` object instead of `Timestamp` when only `datetime` is present in data ([GH11327](#))
- Bug in `DataFrame.corr()` raises exception when computes Kendall correlation for `DataFrames` with boolean and not boolean columns ([GH11560](#))
- Bug in the link-time error caused by `C inline` functions on FreeBSD 10+ (with `clang`) ([GH10510](#))
- Bug in `DataFrame.to_csv` in passing through arguments for formatting `MultiIndexes`, including `date_format` ([GH7791](#))
- Bug in `DataFrame.join()` with `how='right'` producing a `TypeError` ([GH11519](#))
- Bug in `Series.quantile` with empty list results has `Index` with `object dtype` ([GH11588](#))
- Bug in `pd.merge` results in empty `Int64Index` rather than `Index(dtype=object)` when the merge result is empty ([GH11588](#))
- Bug in `Categorical.remove_unused_categories` when having `NaN` values ([GH11599](#))
- Bug in `DataFrame.to_sparse()` loses column names for `MultiIndexes` ([GH11600](#))
- Bug in `DataFrame.round()` with non-unique column index producing a Fatal Python error ([GH11611](#))
- Bug in `DataFrame.round()` with `decimals` being a non-unique indexed `Series` producing extra columns ([GH11618](#))

### 39.8.1.6 Contributors

A total of 63 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.8.2 v0.17.0 (October 9, 2015)

{{ header }}

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.17.0 will no longer support compatibility with Python version 3.2 ([GH9118](#))

**Warning:** The `pandas.io.data` package is deprecated and will be replaced by the `pandas-datareader` package. This will allow the data modules to be independently updated to your pandas installation. The API for `pandas-datareader v0.1.1` is exactly the same as in `pandas v0.17.0` ([GH8961](#), [GH10861](#)).

After installing `pandas-datareader`, you can easily change your imports:

```
from pandas.io import data, wb
```

becomes

```
from pandas_datareader import data, wb
```

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the `.plot` accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a `datetime64[ns]` with timezones as a first-class dtype, see [here](#)
- The default for `to_datetime` will now be to `raise` when presented with unparseable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for `dropna` in `HDFStore` has changed to `False`, to store by default all rows even if they are all NaN, see [here](#)

- Datetime accessor (`dt`) now supports `Series.dt.strftime` to generate formatted strings for datetime-likes, and `Series.dt.total_seconds` to generate each duration of the `timedelta` in seconds. See [here](#)
- `Period` and `PeriodIndex` can handle multiplied freq like `3D`, which corresponding to 3 days span. See [here](#)
- Development installed versions of pandas will now have PEP440 compliant version strings ([GH9518](#))
- Development support for benchmarking with the [Air Speed Velocity](#) library ([GH8361](#))
- Support for reading SAS xport files, see [here](#)
- Documentation comparing SAS to *pandas*, see [here](#)
- Removal of the automatic `TimeSeries` broadcasting, deprecated since 0.8.0, see [here](#)
- Display format with plain text can optionally align with Unicode East Asian Width, see [here](#)
- Compatibility with Python 3.5 ([GH11097](#))
- Compatibility with matplotlib 1.5.0 ([GH11111](#))

Check the *API Changes* and *deprecations* before updating.

### What's new in v0.17.0

- *New features*
  - *Datetime with TZ*
  - *Releasing the GIL*
  - *Plot submethods*
  - *Additional methods for `dt` accessor*
    - \* *`strftime`*
    - \* *`total_seconds`*
  - *Period Frequency Enhancement*
  - *Support for SAS XPORT files*
  - *Support for Math Functions in `.eval()`*
  - *Changes to Excel with `MultiIndex`*
  - *Google BigQuery Enhancements*
  - *Display Alignment with Unicode East Asian Width*
  - *Other enhancements*
- *Backwards incompatible API changes*
  - *Changes to sorting API*
  - *Changes to `to_datetime` and `to_timedelta`*
    - \* *Error handling*
    - \* *Consistent Parsing*
  - *Changes to Index Comparisons*
  - *Changes to Boolean Comparisons vs. `None`*
  - *HDFStore dropna behavior*

- *Changes to `display.precision` option*
- *Changes to `Categorical.unique`*
- *Changes to `bool` passed as header in `Parsers`*
- *Other API Changes*
- *Deprecations*
- *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.8.2.1 New features

#### Datetime with TZ

We are adding an implementation that natively supports datetime with timezones. A `Series` or a `DataFrame` column previously *could* be assigned a datetime with timezones, and would work as an object dtype. This had performance issues with a large number rows. See the *docs* for more details. ([GH8260](#), [GH10763](#), [GH11034](#)).

The new implementation allows for having a single-timezone across all rows, with operations in a performant manner.

```
In [1]: df = pd.DataFrame({'A': pd.date_range('20130101', periods=3),
...:                      'B': pd.date_range('20130101', periods=3, tz='US/Eastern'),
...:                      'C': pd.date_range('20130101', periods=3, tz='CET')})
...:
```

```
In [2]: df
```

```
Out [2]:
```

|   | A                                    | B                         | C |
|---|--------------------------------------|---------------------------|---|
| 0 | 2013-01-01 2013-01-01 00:00:00-05:00 | 2013-01-01 00:00:00+01:00 |   |
| 1 | 2013-01-02 2013-01-02 00:00:00-05:00 | 2013-01-02 00:00:00+01:00 |   |
| 2 | 2013-01-03 2013-01-03 00:00:00-05:00 | 2013-01-03 00:00:00+01:00 |   |

```
[3 rows x 3 columns]
```

```
In [3]: df.dtypes
```

```

////////////////////////////////////
A          datetime64[ns]
B    datetime64[ns, US/Eastern]
C    datetime64[ns, CET]
Length: 3, dtype: object
```

```
In [4]: df.B
```

```
Out [4]:
```

|   |                           |
|---|---------------------------|
| 0 | 2013-01-01 00:00:00-05:00 |
| 1 | 2013-01-02 00:00:00-05:00 |
| 2 | 2013-01-03 00:00:00-05:00 |

Name: B, Length: 3, dtype: datetime64[ns, US/Eastern]

```
In [5]: df.B.dt.tz_localize(None)
```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////
↪
0    2013-01-01
1    2013-01-02
2    2013-01-03
Name: B, Length: 3, dtype: datetime64[ns]

```

This uses a new-dtype representation as well, that is very similar in look-and-feel to its numpy cousin `datetime64[ns]`

```

In [6]: df['B'].dtype
Out[6]: datetime64[ns, US/Eastern]

In [7]: type(df['B'].dtype)
////////////////////////////////////Out[7]: pandas.core.dtypes.dtypes.DatetimeTZDtype

```

**Note:** There is a slightly different string repr for the underlying `DatetimeIndex` as a result of the dtype changes, but functionally these are the same.

Previous Behavior:

```

In [1]: pd.date_range('20130101', periods=3, tz='US/Eastern')
Out[1]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                        '2013-01-03 00:00:00-05:00'],
                        dtype='datetime64[ns]', freq='D', tz='US/Eastern')

In [2]: pd.date_range('20130101', periods=3, tz='US/Eastern').dtype
Out[2]: dtype('<M8[ns]')

```

New Behavior:

```

In [8]: pd.date_range('20130101', periods=3, tz='US/Eastern')
Out[8]:
DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                '2013-01-03 00:00:00-05:00'],
                dtype='datetime64[ns, US/Eastern]', freq='D')

In [9]: pd.date_range('20130101', periods=3, tz='US/Eastern').dtype
////////////////////////////////////
↪datetime64[ns, US/Eastern]

```

## Releasing the GIL

We are releasing the global-interpreter-lock (GIL) on some cython operations. This will allow other threads to run simultaneously during computation, potentially allowing performance improvements from multi-threading. Notably `groupby`, `nsmallest`, `value_counts` and some indexing operations benefit from this. ([GH8882](#))

For example the `groupby` expression in the following code will have the GIL released during the factorization step, e.g. `df.groupby('key')` as well as the `.sum()` operation.

```

N = 1000000
ngroups = 10
df = DataFrame({'key': np.random.randint(0, ngroups, size=N),

```

(continues on next page)

(continued from previous page)

```
'data': np.random.randn(N) })
df.groupby('key')['data'].sum()
```

Releasing of the GIL could benefit an application that uses threads for user interactions (e.g. [QT](#)), or performing multi-threaded computations. A nice example of a library that can handle these types of computation-in-parallel is the [dask](#) library.

## Plot submethods

The Series and DataFrame `.plot()` method allows for customizing *plot types* by supplying the `kind` keyword arguments. Unfortunately, many of these kinds of plots use different required and optional keyword arguments, which makes it difficult to discover what any given plot kind uses out of the dozens of possible arguments.

To alleviate this issue, we have added a new, optional plotting interface, which exposes each kind of plot as a method of the `.plot` attribute. Instead of writing `series.plot(kind=<kind>, ...)`, you can now also use `series.plot.<kind>(...)`:

```
In [10]: df = pd.DataFrame(np.random.rand(10, 2), columns=['a', 'b'])
In [11]: df.plot.bar()
```

As a result of this change, these methods are now all discoverable via tab-completion:

```
In [12]: df.plot.<TAB> # noqa: E225, E999
df.plot.area      df.plot.barh      df.plot.density  df.plot.hist      df.plot.line
df.plot.scatter
df.plot.bar       df.plot.box       df.plot.hexbin   df.plot.kde       df.plot.pie
```

Each method signature only includes relevant arguments. Currently, these are limited to required arguments, but in the future these will include optional arguments, as well. For an overview, see the new *Plotting API* documentation.

## Additional methods for `dt` accessor

(continued from previous page)

```

In [20]: s
Out[20]:
0    0 days 00:01:00
1    1 days 00:01:00
2    2 days 00:01:00
3    3 days 00:01:00
Length: 4, dtype: timedelta64[ns]

In [21]: s.dt.total_seconds()
Out[21]:
0         60.0
1    86460.0
2   172860.0
3   259260.0
Length: 4, dtype: float64

```

## Period Frequency Enhancement

Period, PeriodIndex and period\_range can now accept multiplied freq. Also, Period.freq and PeriodIndex.freq are now stored as a DateOffset instance like DatetimeIndex, and not as str (GH7811)

A multiplied freq represents a span of corresponding length. The example below creates a period of 3 days. Addition and subtraction will shift the period by its span.

```

In [22]: p = pd.Period('2015-08-01', freq='3D')

In [23]: p
Out[23]: Period('2015-08-01', '3D')

In [24]: p + 1
Out[24]: Period('2015-08-04', '3D')

In [25]: p - 2
Out[25]: Period('2015-07-26', '3D')

In [26]: p.to_timestamp()
Out[26]: Timestamp('2015-08-01 00:00:00')

In [27]: p.to_timestamp(how='E')
Out[27]: Timestamp('2015-08-03 23:59:59.999999999')

```

You can use the multiplied freq in PeriodIndex and period\_range.

```

In [28]: idx = pd.period_range('2015-08-01', periods=4, freq='2D')

In [29]: idx
Out[29]: PeriodIndex(['2015-08-01', '2015-08-03', '2015-08-05', '2015-08-07'], dtype=
    'period[2D]', freq='2D')

```

(continues on next page)

(continued from previous page)

```
j 1    1  2  3  4
   k    5  6  7  8

[2 rows x 4 columns]

In [33]: df.to_excel('test.xlsx')

In [34]: df = pd.read_excel('test.xlsx', header=[0, 1], index_col=[0, 1])

In [35]: df
Out[35]:
col1  foo    bar
col2   a  b    a  b
i1 i2
j 1    1  2  3  4
   k    5  6  7  8

[2 rows x 4 columns]
```

Previously, it was necessary to specify the `has_index_names` argument in `read_excel`, if the serialized data had index names. For version 0.17.0 the output format of `to_excel` has been changed to make this keyword unnecessary - the change is shown below.

#### Old

|   | A                   | B        | C        | D        | E        | F |
|---|---------------------|----------|----------|----------|----------|---|
| 1 |                     | A        | B        | C        | D        |   |
| 2 | idx_name            |          |          |          |          |   |
| 3 | 2000-01-07 00:00:00 | 0.968129 | 0.906529 | 0.05343  | 0.02619  |   |

| 7 | 2000-01-14 00:00:00 | -0.66344 | 0.073188 | 1.583482 | 0.735205 |  |
| 8 | 2000-01-17 00:00:00 | 0.716635 | -2.07952 | 1.760536 | 0.970309 |  |
| 9 | 2000-01-18 00:00:00 | 0.727638 | 2.22267  | 2.706276 | 0.681843 |  |

**Warning:** Excel files saved in version 0.16.2 or prior that had index names will still be able to be read in, but the `has_index_names` argument must be specified to `True`.

## Google BigQuery Enhancements

- Added ability to automatically create a table/dataset using the `pandas.io.gbq.to_gbq()` function if the destination table/dataset does not exist. (GH8325, GH11121).
- Added ability to replace an existing table and schema when calling the `pandas.io.gbq.to_gbq()` function via the `if_exists` argument. See the [docs](#) for more details (GH8325).
- `InvalidColumnOrder` and `InvalidPageToken` in the `gbq` module will raise `ValueError` instead of `IOError`.
- The `generate_bq_schema()` function is now deprecated and will be removed in a future version (GH11121)
- The `gbq` module will now support Python 3 (GH11094).

## Display Alignment with Unicode East Asian Width

**Warning:** Enabling this option will affect the performance for printing of `DataFrame` and `Series` (about 2 times slower). Use only when it is actually required.

Some East Asian countries use Unicode characters its width is corresponding to 2 alphabets. If a `DataFrame` or `Series` contains these characters, the default output cannot be aligned properly. The following options are added to enable precise handling for these characters.

- `display.unicode.east_asian_width`: Whether to use the Unicode East Asian Width to calculate the display text width. (GH2612)
- `display.unicode.ambiguous_as_wide`: Whether to handle Unicode characters belong to Ambiguous as Wide. (GH11102)

```
In [36]: df = pd.DataFrame({'u': ['UK', u''], u': ['Alice', u'']})
```

```
In [37]: df;
```

```
>>> df = pd.DataFrame({'u'国籍': ['UK', u'日本'], u'名前': ['Alice', u'しのぶ']})
>>> df
   名前  国籍
0  Alice  UK
1   し の ぶ  日本
```

```
In [38]: pd.set_option('display.unicode.east_asian_width', True)
```

```
In [39]: df;
```

```
>>> pd.set_option('display.unicode.east_asian_width', True)
>>> df
   名前  国籍
0  Alice  UK
1   し の ぶ  日本
```

For further details, see *here*

## Other enhancements

- Support for `openpyxl >= 2.2`. The API for style support is now stable ([GH10125](#))
- `merge` now accepts the argument `indicator` which adds a Categorical-type column (by default called `_merge`) to the output object that takes on the values ([GH8790](#))

| Observation Origin              | <code>_merge</code> value |
|---------------------------------|---------------------------|
| Merge key only in 'left' frame  | <code>left_only</code>    |
| Merge key only in 'right' frame | <code>right_only</code>   |
| Merge key in both frames        | <code>both</code>         |

```
In [40]: df1 = pd.DataFrame({'coll':[0,1], 'col_left':['a','b']})
In [41]: df2 = pd.DataFrame({'coll':[1,2,2], 'col_right':[2,2,2]})
In [42]: pd.merge(df1, df2, on='coll', how='outer', indicator=True)
Out[42]:
   coll col_left col_right  _merge
0     0        a        NaN  left_only
1     1        b         2.0    both
2     2        NaN         2.0  right_only
3     2        NaN         2.0  right_only

[4 rows x 4 columns]
```

For more, see the *updated docs*

- `pd.to_numeric` is a new function to coerce strings to numbers (possibly with coercion) ([GH11133](#))
- `pd.merge` will now allow duplicate column names if they are not merged upon ([GH10639](#)).
- `pd.pivot` will now allow passing index as `None` ([GH3962](#)).
- `pd.concat` will now use existing Series names if provided ([GH10698](#)).

```
In [43]: foo = pd.Series([1, 2], name='foo')
In [44]: bar = pd.Series([1, 2])
In [45]: baz = pd.Series([4, 5])
```

Previous Behavior:

```
In [1]: pd.concat([foo, bar, baz], 1)
Out[1]:
   0  1  2
0  1  1  4
1  2  2  5
```

New Behavior:

```
In [46]: pd.concat([foo, bar, baz], 1)
Out[46]:
```

(continues on next page)

DataFrame has gained the `nlargest` and `nsmallest` methods ([GH10393](#))

Add a `limit_direction` keyword argument that works with `limit` to enable interpolate to fill NaN values forward, backward, or both ([GH9218](#), [GH10420](#), [GH11115](#))

Added a `DataFrame.round` method to round the values to a variable number of decimal places ([GH10568](#)).

(continues on next page)

(continued from previous page)

```
[3 rows x 3 columns]
```

- `drop_duplicates` and `duplicated` now accept a `keep` keyword to target first, last, and all duplicates. The `take_last` keyword is deprecated, see [here](#) (GH6511, GH8505)

```
In [53]: s = pd.Series(['A', 'B', 'C', 'A', 'B', 'D'])

In [54]: s.drop_duplicates()
Out[54]:
0    A
1    B
2    C
5    D
Length: 4, dtype: object

In [55]: s.drop_duplicates(keep='last')
Out[55]:
2    C
3    A
4    B
5    D
Length: 4, dtype: object

In [56]: s.drop_duplicates(keep=False)
Out[56]:
2    C
5    D
Length: 2, dtype: object
```

- `Reindex` now has a `tolerance` argument that allows for finer control of *Limits on filling while reindexing* (GH10411):

```
In [57]: df = pd.DataFrame({'x': range(5),
.....:                     't': pd.date_range('2000-01-01', periods=5)})

In [58]: df.reindex([0.1, 1.9, 3.5],
.....:               method='nearest',
.....:               tolerance=0.2)
Out[58]:
      x      t
0.1  0.0 2000-01-01
1.9  2.0 2000-01-03
3.5  NaN      NaT

[3 rows x 2 columns]
```

When used on a `DatetimeIndex`, `TimedeltaIndex` or `PeriodIndex`, `tolerance` will be coerced into a `Timedelta` if possible. This allows you to specify tolerance with a string:

```
In [59]: df = df.set_index('t')

In [60]: df.reindex(pd.to_datetime(['1999-12-31']),
```

(continues on next page)

(continued from previous page)

```

.....:         method='nearest',
.....:         tolerance='1 day')
.....:
Out [60]:
           x
1999-12-31  0

[1 rows x 1 columns]
```

tolerance is also exposed by the lower level `Index.get_indexer` and `Index.get_loc` methods.

- Added functionality to use the base argument when resampling a `TimeDeltaIndex` (GH10530)
- `DatetimeIndex` can be instantiated using strings contains `NaT` (GH7599)
- `to_datetime` can now accept the `yearfirst` keyword (GH7599)
- `pandas.tseries.offsets` larger than the `Day` offset can now be used with a `Series` for addition/subtraction (GH10699). See the *docs* for more details.
- `pd.Timedelta.total_seconds()` now returns `Timedelta` duration to ns precision (previously microsecond precision) (GH10939)
- `PeriodIndex` now supports arithmetic with `np.ndarray` (GH10638)
- Support pickling of `Period` objects (GH10439)
- `.as_blocks` will now take a `copy` optional argument to return a copy of the data, default is to copy (no change in behavior from prior versions), (GH9607)
- `regex` argument to `DataFrame.filter` now handles numeric column names instead of raising `ValueError` (GH10384).
- Enable reading gzip compressed files via URL, either by explicitly setting the compression parameter or by inferring from the presence of the HTTP Content-Encoding header in the response (GH8685)
- Enable writing Excel files in *memory* using `StringIO/BytesIO` (GH7074)
- Enable serialization of lists and dicts to strings in `ExcelWriter` (GH8188)
- SQL io functions now accept a `SQLAlchemy` connectable. (GH7877)
- `pd.read_sql` and `to_sql` can accept database URI as `con` parameter (GH10214)
- `read_sql_table` will now allow reading from views (GH10750).
- Enable writing complex values to `HDFStores` when using the `table` format (GH10447)
- Enable `pd.read_hdf` to be used without specifying a key when the HDF file contains a single dataset (GH10443)
- `pd.read_stata` will now read Stata 118 type files. (GH9882)
- `msgpack` submodule has been updated to 0.4.6 with backward compatibility (GH10581)
- `DataFrame.to_dict` now accepts `orient='index'` keyword argument (GH10844).
- `DataFrame.apply` will return a `Series` of dicts if the passed function returns a dict and `reduce=True` (GH8735).
- Allow passing *kwargs* to the interpolation methods (GH10378).
- Improved error message when concatenating an empty iterable of `Dataframe` objects (GH9157)

- `pd.read_csv` can now read bz2-compressed files incrementally, and the C parser can read bz2-compressed files from AWS S3 ([GH11070](#), [GH11072](#)).
- In `pd.read_csv`, recognize `s3n://` and `s3a://` URLs as designating S3 file storage ([GH11070](#), [GH11071](#)).
- Read CSV files from AWS S3 incrementally, instead of first downloading the entire file. (Full file download still required for compressed files in Python 2.) ([GH11070](#), [GH11073](#))
- `pd.read_csv` is now able to infer compression type for files read from AWS S3 storage ([GH11070](#), [GH11074](#)).

### 39.8.2.2 Backwards incompatible API changes

#### Changes to sorting API

The sorting API has had some longtime inconsistencies. ([GH9816](#), [GH8239](#)).

Here is a summary of the API **PRIOR** to 0.17.0:

- `Series.sort` is **INPLACE** while `DataFrame.sort` returns a new object.
- `Series.order` returns a new object
- It was possible to use `Series/DataFrame.sort_index` to sort by **values** by passing the `by` keyword.
- `Series/DataFrame.sortlevel` worked only on a `MultiIndex` for sorting by index.

To address these issues, we have revamped the API:

- We have introduced a new method, `DataFrame.sort_values()`, which is the merger of `DataFrame.sort()`, `Series.sort()`, and `Series.order()`, to handle sorting of **values**.
- The existing methods `Series.sort()`, `Series.order()`, and `DataFrame.sort()` have been deprecated and will be removed in a future version.
- The `by` argument of `DataFrame.sort_index()` has been deprecated and will be removed in a future version.
- The existing method `.sort_index()` will gain the `level` keyword to enable level sorting.

We now have two distinct and non-overlapping methods of sorting. A \* marks items that will show a `FutureWarning`.

To sort by the **values**:

| Previous                                   | Replacement                                   |
|--------------------------------------------|-----------------------------------------------|
| * <code>Series.order()</code>              | <code>Series.sort_values()</code>             |
| * <code>Series.sort()</code>               | <code>Series.sort_values(inplace=True)</code> |
| * <code>DataFrame.sort(columns=...)</code> | <code>DataFrame.sort_values(by=...)</code>    |

To sort by the **index**:

| Previous                                    | Replacement                                  |
|---------------------------------------------|----------------------------------------------|
| <code>Series.sort_index()</code>            | <code>Series.sort_index()</code>             |
| <code>Series.sortlevel(level=...)</code>    | <code>Series.sort_index(level=...)</code>    |
| <code>DataFrame.sort_index()</code>         | <code>DataFrame.sort_index()</code>          |
| <code>DataFrame.sortlevel(level=...)</code> | <code>DataFrame.sort_index(level=...)</code> |
| * <code>DataFrame.sort()</code>             | <code>DataFrame.sort_index()</code>          |

We have also deprecated and changed similar methods in two Series-like classes, `Index` and `Categorical`.

| Previous                           | Replacement                            |
|------------------------------------|----------------------------------------|
| <code>* Index.order()</code>       | <code>Index.sort_values()</code>       |
| <code>* Categorical.order()</code> | <code>Categorical.sort_values()</code> |

## Changes to `to_datetime` and `to_timedelta`

### Error handling

The default for `pd.to_datetime` error handling has changed to `errors='raise'`. In prior versions it was `errors='ignore'`. Furthermore, the `coerce` argument has been deprecated in favor of `errors='coerce'`. This means that invalid parsing will raise rather than return the original input as in previous versions. ([GH10636](#))

Previous Behavior:

```
In [2]: pd.to_datetime(['2009-07-31', 'asd'])
Out[2]: array(['2009-07-31', 'asd'], dtype=object)
```

New Behavior:

```
In [3]: pd.to_datetime(['2009-07-31', 'asd'])
ValueError: Unknown string format
```

Of course you can coerce this as well.

```
In [61]: pd.to_datetime(['2009-07-31', 'asd'], errors='coerce')
Out[61]: DatetimeIndex(['2009-07-31', 'NaT'], dtype='datetime64[ns]', freq=None)
```

To keep the previous behavior, you can use `errors='ignore'`:

```
In [62]: pd.to_datetime(['2009-07-31', 'asd'], errors='ignore')
Out[62]: Index(['2009-07-31', 'asd'], dtype='object')
```

Furthermore, `pd.to_timedelta` has gained a similar API, of `errors='raise' | 'ignore' | 'coerce'`, and the `coerce` keyword has been deprecated in favor of `errors='coerce'`.

### Consistent Parsing

The string parsing of `to_datetime`, `Timestamp` and `DatetimeIndex` has been made consistent. ([GH7599](#))

Prior to v0.17.0, `Timestamp` and `to_datetime` may parse year-only datetime-string incorrectly using today's date, otherwise `DatetimeIndex` uses the beginning of the year. `Timestamp` and `to_datetime` may raise `ValueError` in some types of datetime-string which `DatetimeIndex` can parse, such as a quarterly string.

Previous Behavior:

```
In [1]: pd.Timestamp('2012Q2')
Traceback
...
ValueError: Unable to parse 2012Q2

# Results in today's date.
In [2]: pd.Timestamp('2014')
Out [2]: 2014-08-12 00:00:00
```

v0.17.0 can parse them as below. It works on `DatetimeIndex` also.

New Behavior:

```
In [63]: pd.Timestamp('2012Q2')
Out[63]: Timestamp('2012-04-01 00:00:00')

In [64]: pd.Timestamp('2014')
Out[64]: Timestamp('2014-01-01 00:00:00')

In [65]: pd.DatetimeIndex(['2012Q2', '2014'])
Out[65]: DatetimeIndex(['2012-04-01', '2014-01-01'], dtype='datetime64[ns]', freq=None)
```

---

**Note:** If you want to perform calculations based on today's date, use `Timestamp.now()` and `pandas.tseries.offsets`.

```
In [66]: import pandas.tseries.offsets as offsets

In [67]: pd.Timestamp.now()
Out[67]: Timestamp('2019-01-11 16:40:26.147617')

In [68]: pd.Timestamp.now() + offsets.DateOffset(years=1)
Out[68]: Timestamp('2020-01-11 16:40:26.148525')
```

---

## Changes to Index Comparisons

Operator equal on Index should behavior similarly to Series ([GH9947](#), [GH10637](#))

Starting in v0.17.0, comparing Index objects of different lengths will raise a `ValueError`. This is to be consistent with the behavior of Series.

Previous Behavior:

```
In [2]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[2]: array([ True, False, False], dtype=bool)

In [3]: pd.Index([1, 2, 3]) == pd.Index([2])
Out[3]: array([False,  True, False], dtype=bool)

In [4]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
Out[4]: False
```

New Behavior:

```
In [8]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[8]: array([ True, False, False], dtype=bool)

In [9]: pd.Index([1, 2, 3]) == pd.Index([2])
ValueError: Lengths must match to compare

In [10]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
ValueError: Lengths must match to compare
```

Note that this is different from the numpy behavior where a comparison can be broadcast:

```
In [69]: np.array([1, 2, 3]) == np.array([1])
Out[69]: array([ True, False, False], dtype=bool)
```

or it can return False if broadcasting can not be done:

```
In [70]: np.array([1, 2, 3]) == np.array([1, 2])
Out[70]: False
```

## Changes to Boolean Comparisons vs. None

Boolean comparisons of a Series vs None will now be equivalent to comparing with `np.nan`, rather than raise `TypeError`. (GH1079).

```
In [71]: s = pd.Series(range(3))

In [72]: s.iloc[1] = None

In [73]: s
Out[73]:
0    0.0
1    NaN
2    2.0
Length: 3, dtype: float64
```

Previous Behavior:

```
In [5]: s == None
TypeError: Could not compare <type 'NoneType'> type with Series
```

New Behavior:

```
In [74]: s == None
Out[74]:
0    False
1    False
2    False
Length: 3, dtype: bool
```

Usually you simply want to know which values are null.

```
In [75]: s.isnull()
Out[75]:
0    False
1     True
2    False
Length: 3, dtype: bool
```

**Warning:** You generally will want to use `isnull/notnull` for these types of comparisons, as `isnull/notnull` tells you which elements are null. One has to be mindful that `nan`'s don't compare equal, but `None`'s do. Note that Pandas/numpy uses the fact that `np.nan != np.nan`, and treats `None` like `np.nan`.

```
In [76]: None == None
Out[76]: True
```

```
In [77]: np.nan == np.nan
Out[77]: False
```

## HDFStore dropna behavior

The default behavior for HDFStore write functions with `format='table'` is now to keep rows that are all missing. Previously, the behavior was to drop rows that were all missing save the index. The previous behavior can be replicated using the `dropna=True` option. (GH9382)

Previous Behavior:

```
In [78]: df_with_missing = pd.DataFrame({'col1': [0, np.nan, 2],
....:                                   'col2': [1, np.nan, np.nan]})
....:

In [79]: df_with_missing
Out[79]:
   col1  col2
0    0.0    1.0
1    NaN    NaN
2    2.0    NaN

[3 rows x 2 columns]
```

```
In [27]:
df_with_missing.to_hdf('file.h5',
                       'df_with_missing',
                       format='table',
                       mode='w')

In [28]: pd.read_hdf('file.h5', 'df_with_missing')

Out [28]:
   col1  col2
0     0     1
2     2    NaN
```

New Behavior:

```
In [80]: df_with_missing.to_hdf('file.h5',
....:                             'df_with_missing',
....:                             format='table',
....:                             mode='w')
....:

In [81]: pd.read_hdf('file.h5', 'df_with_missing')
Out[81]:
   col1  col2
0    0.0    1.0
1    NaN    NaN
2    2.0    NaN

[3 rows x 2 columns]
```

See the *docs* for more details.

(continued from previous page)

```

.....:
.....:
categories=['A', 'B', 'C'])

In [88]: cat
Out[88]:
[C, A, B, C]
Categories (3, object): [A, B, C]

In [89]: cat.unique()
Out[89]:
[C, A, B]
Categories (3, object): [C, A, B]

```

## Changes to bool passed as header in Parsers

In earlier versions of pandas, if a bool was passed the header argument of `read_csv`, `read_excel`, or `read_html` it was implicitly converted to an integer, resulting in `header=0` for False and `header=1` for True (GH6113)

A `bool` input to `header` will now raise a `TypeError`

```
In [29]: df = pd.read_csv('data.csv', header=False)
TypeError: Passing a bool to header is invalid. Use header=None for no header or
header=int or list-like of ints to specify the row(s) making up the column names
```

## Other API Changes

- Line and kde plot with `subplots=True` now uses default colors, not all black. Specify `color='k'` to draw all lines in black ([GH9894](#))
- Calling the `.value_counts()` method on a Series with a categorical dtype now returns a Series with a CategoricalIndex ([GH10704](#))
- The metadata properties of subclasses of pandas objects will now be serialized ([GH10553](#)).
- `groupby` using Categorical follows the same rule as `Categorical.unique` described above ([GH10508](#))
- When constructing DataFrame with an array of complex64 dtype previously meant the corresponding column was automatically promoted to the complex128 dtype. Pandas will now preserve the itemsize of the input for complex data ([GH10952](#))
- some numeric reduction operators would return `ValueError`, rather than `TypeError` on object types that includes strings and numbers ([GH11131](#))
- Passing currently unsupported `chunksize` argument to `read_excel` or `ExcelFile.parse` will now raise `NotImplementedError` ([GH8011](#))
- Allow an `ExcelFile` object to be passed into `read_excel` ([GH11198](#))
- `DatetimeIndex.union` does not infer `freq` if `self` and the input have `None` as `freq` ([GH11086](#))
- `NaT`'s methods now either raise `ValueError`, or return `np.nan` or `NaT` ([GH9513](#))

| Behavior                                 | Methods                                                         |
|------------------------------------------|-----------------------------------------------------------------|
| <code>return np.nan</code>               | <code>weekday, isoweekday</code>                                |
| <code>return NaT</code>                  | <code>date, now, replace, to_datetime, today</code>             |
| <code>return np.datetime64('NaT')</code> | <code>to_datetime64</code> (unchanged)                          |
| <code>raise ValueError</code>            | All other public methods (names not beginning with underscores) |

## Deprecations

- For `Series` the following indexing functions are deprecated ([GH10177](#)).

| Deprecated Function         | Replacement                                   |
|-----------------------------|-----------------------------------------------|
| <code>.irow(i)</code>       | <code>.iloc[i]</code> or <code>.iat[i]</code> |
| <code>.iget(i)</code>       | <code>.iloc[i]</code> or <code>.iat[i]</code> |
| <code>.iget_value(i)</code> | <code>.iloc[i]</code> or <code>.iat[i]</code> |

- For `DataFrame` the following indexing functions are deprecated ([GH10177](#)).

| Deprecated Function            | Replacement                                         |
|--------------------------------|-----------------------------------------------------|
| <code>.irow(i)</code>          | <code>.iloc[i]</code>                               |
| <code>.iget_value(i, j)</code> | <code>.iloc[i, j]</code> or <code>.iat[i, j]</code> |
| <code>.icol(j)</code>          | <code>.iloc[:, j]</code>                            |

---

**Note:** These indexing function have been deprecated in the documentation since 0.11.0.

---

- `Categorical.name` was deprecated to make `Categorical` more `numpy.ndarray` like. Use `Series(cat, name="whatever")` instead ([GH10482](#)).
- Setting missing values (NaN) in a `Categorical`'s categories will issue a warning ([GH10748](#)). You can still have missing values in the values.
- `drop_duplicates` and `drop_duplicates`'s `take_last` keyword was deprecated in favor of `keep`. ([GH6511](#), [GH8505](#))
- `Series.nsmallest` and `nlargest`'s `take_last` keyword was deprecated in favor of `keep`. ([GH10792](#))
- `DataFrame.combineAdd` and `DataFrame.combineMult` are deprecated. They can easily be replaced by using the `add` and `mul` methods: `DataFrame.add(other, fill_value=0)` and `DataFrame.mul(other, fill_value=1.)` ([GH10735](#)).
- `TimeSeries` deprecated in favor of `Series` (note that this has been an alias since 0.13.0), ([GH10890](#))
- `SparsePanel` deprecated and will be removed in a future version ([GH11157](#)).
- `Series.is_time_series` deprecated in favor of `Series.index.is_all_dates` ([GH11135](#))
- Legacy offsets (like `'A@JAN'`) are deprecated (note that this has been alias since 0.8.0) ([GH10878](#))
- `WidePanel` deprecated in favor of `Panel`, `LongPanel` in favor of `DataFrame` (note these have been aliases since < 0.11.0), ([GH10892](#))
- `DataFrame.convert_objects` has been deprecated in favor of type-specific functions `pd.to_datetime`, `pd.to_timestamp` and `pd.to_numeric` (new in 0.17.0) ([GH11133](#)).

## Removal of prior version deprecations/changes

- Removal of `na_last` parameters from `Series.order()` and `Series.sort()`, in favor of `na_position`. (GH5231)
- Remove of `percentile_width` from `.describe()`, in favor of percentiles. (GH7088)
- Removal of `colSpace` parameter from `DataFrame.to_string()`, in favor of `col_space`, circa 0.8.0 version.
- Removal of automatic time-series broadcasting (GH2304)

```
In [90]: np.random.seed(1234)

In [91]: df = pd.DataFrame(np.random.randn(5, 2),
.....:                    columns=list('AB'),
.....:                    index=pd.date_range('2013-01-01', periods=5))
.....:

In [92]: df
Out[92]:
```

|            | A         | B         |
|------------|-----------|-----------|
| 2013-01-01 | 0.471435  | -1.190976 |
| 2013-01-02 | 1.432707  | -0.312652 |
| 2013-01-03 | -0.720589 | 0.887163  |

```
[5 rows x 2 columns]
```

- Remove `table` keyword in `HDFStore.put/append`, in favor of using `format=` (GH4645)
- Remove `kind` in `read_excel/ExcelFile` as its unused (GH4712)
- Remove `infer_type` keyword from `pd.read_html` as its unused (GH4770, GH7032)
- Remove `offset` and `timeRule` keywords from `Series.tshift/shift`, in favor of `freq` (GH4853, GH4864)
- Remove `pd.load/pd.save` aliases in favor of `pd.to_pickle/pd.read_pickle` (GH3787)

### 39.8.2.3 Performance Improvements

- Development support for benchmarking with the `Air Speed Velocity` library (GH8361)
- Added `vbench` benchmarks for alternative `ExcelWriter` engines and reading Excel files (GH7171)
- Performance improvements in `Categorical.value_counts` (GH10804)
- Performance improvements in `SeriesGroupBy.nunique` and `SeriesGroupBy.value_counts` and `SeriesGroupby.transform` (GH10820, GH11077)
- Performance improvements in `DataFrame.drop_duplicates` with integer dtypes (GH10917)
- Performance improvements in `DataFrame.duplicated` with wide frames. (GH10161, GH11180)
- 4x improvement in `timedelta` string parsing (GH6755, GH10426)
- 8x improvement in `timedelta64` and `datetime64` ops (GH6755)
- Significantly improved performance of indexing `MultiIndex` with slicers (GH10287)
- 8x improvement in `iloc` using list-like input (GH10791)
- Improved performance of `Series.isin` for `datetimelike`/integer Series (GH10287)
- 20x improvement in `concat` of `Categoricals` when categories are identical (GH10587)
- Improved performance of `to_datetime` when specified format string is `ISO8601` (GH10178)
- 2x improvement of `Series.value_counts` for float dtype (GH10821)
- Enable `infer_datetime_format` in `to_datetime` when date components do not have 0 padding (GH11142)
- Regression from 0.16.1 in constructing `DataFrame` from nested dictionary (GH11084)
- Performance improvements in addition/subtraction operations for `DateOffset` with `Series` or `DatetimeIndex` (GH10744, GH11205)

### 39.8.2.4 Bug Fixes

- Bug in incorrect computation of `.mean()` on `timedelta64[ns]` because of overflow (GH9442)
- Bug in `.isin` on older `numpys` (GH11232)
- Bug in `DataFrame.to_html(index=False)` renders unnecessary name row (GH10344)
- Bug in `DataFrame.to_latex()` the `column_format` argument could not be passed (GH9402)
- Bug in `DatetimeIndex` when localizing with `NaT` (GH10477)
- Bug in `Series.dt` ops in preserving meta-data (GH10477)
- Bug in preserving `NaT` when passed in an otherwise invalid `to_datetime` construction (GH10477)

- Bug in `DataFrame.apply` when function returns categorical series. (GH9573)
- Bug in `to_datetime` with invalid dates and formats supplied (GH10154)
- Bug in `Index.drop_duplicates` dropping name(s) (GH10115)
- Bug in `Series.quantile` dropping name (GH10881)
- Bug in `pd.Series` when setting a value on an empty `Series` whose index has a frequency. (GH10193)
- Bug in `pd.Series.interpolate` with invalid order keyword values. (GH10633)
- Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
- Bug in `Index` construction with a mixed list of tuples (GH10697)
- Bug in `DataFrame.reset_index` when index contains `NaT`. (GH10388)
- Bug in `ExcelReader` when worksheet is empty (GH6403)
- Bug in `BinGrouper.group_info` where returned values are not compatible with base class (GH10914)
- Bug in clearing the cache on `DataFrame.pop` and a subsequent inplace op (GH10912)
- Bug in indexing with a mixed-integer `Index` causing an `ImportError` (GH10610)
- Bug in `Series.count` when index has nulls (GH10946)
- Bug in pickling of a non-regular freq `DatetimeIndex` (GH11002)
- Bug causing `DataFrame.where` to not respect the `axis` parameter when the frame has a symmetric shape. (GH9736)
- Bug in `Table.select_column` where name is not preserved (GH10392)
- Bug in `offsets.generate_range` where start and end have finer precision than offset (GH9907)
- Bug in `pd.rolling_*` where `Series.name` would be lost in the output (GH10565)
- Bug in `stack` when index or columns are not unique. (GH10417)
- Bug in setting a `Panel` when an axis has a `MultiIndex` (GH10360)
- Bug in `USFederalHolidayCalendar` where `USMemorialDay` and `USMartinLutherKingJr` were incorrect (GH10278 and GH9760)
- Bug in `.sample()` where returned object, if set, gives unnecessary `SettingWithCopyWarning` (GH10738)
- Bug in `.sample()` where weights passed as `Series` were not aligned along axis before being treated positionally, potentially causing problems if weight indices were not aligned with sampled object. (GH10738)
- Regression fixed in (GH9311, GH6620, GH9345), where `groupby` with a datetime-like converting to float with certain aggregators (GH10979)
- Bug in `DataFrame.interpolate` with `axis=1` and `inplace=True` (GH10395)
- Bug in `io.sql.get_schema` when specifying multiple columns as primary key (GH10385).
- Bug in `groupby(sort=False)` with datetime-like `Categorical` raises `ValueError` (GH10505)
- Bug in `groupby(axis=1)` with `filter()` throws `IndexError` (GH11041)
- Bug in `test_categorical` on big-endian builds (GH10425)
- Bug in `Series.shift` and `DataFrame.shift` not supporting categorical data (GH9416)
- Bug in `Series.map` using categorical `Series` raises `AttributeError` (GH10324)

- Bug in `MultiIndex.get_level_values` including `Categorical` raises `AttributeError` ([GH10460](#))
- Bug in `pd.get_dummies` with `sparse=True` not returning `SparseDataFrame` ([GH10531](#))
- Bug in `Index` subtypes (such as `PeriodIndex`) not returning their own type for `.drop` and `.insert` methods ([GH10620](#))
- Bug in `algos.outer_join_indexer` when right array is empty ([GH10618](#))
- Bug in `filter` (regression from 0.16.0) and `transform` when grouping on multiple keys, one of which is datetime-like ([GH10114](#))
- Bug in `to_datetime` and `to_timedelta` causing `Index` name to be lost ([GH10875](#))
- Bug in `len(DataFrame.groupby)` causing `IndexError` when there's a column containing only NaNs ([GH11016](#))
- Bug that caused segfault when resampling an empty `Series` ([GH10228](#))
- Bug in `DatetimeIndex` and `PeriodIndex.value_counts` resets name from its result, but retains in result's `Index`. ([GH10150](#))
- Bug in `pd.eval` using `numexpr` engine coerces 1 element numpy array to scalar ([GH10546](#))
- Bug in `pd.concat` with `axis=0` when column is of dtype `category` ([GH10177](#))
- Bug in `read_msgpack` where input type is not always checked ([GH10369](#), [GH10630](#))
- Bug in `pd.read_csv` with kwargs `index_col=False`, `index_col=['a', 'b']` or dtype ([GH10413](#), [GH10467](#), [GH10577](#))
- Bug in `Series.from_csv` with `header` kwarg not setting the `Series.name` or the `Series.index.name` ([GH10483](#))
- Bug in `groupby.var` which caused variance to be inaccurate for small float values ([GH10448](#))
- Bug in `Series.plot(kind='hist')` Y Label not informative ([GH10485](#))
- Bug in `read_csv` when using a converter which generates a `uint8` type ([GH9266](#))
- Bug causes memory leak in time-series line and area plot ([GH9003](#))
- Bug when setting a `Panel` sliced along the major or minor axes when the right-hand side is a `DataFrame` ([GH11014](#))
- Bug that returns `None` and does not raise `NotImplementedError` when operator functions (e.g. `.add`) of `Panel` are not implemented ([GH7692](#))
- Bug in line and kde plot cannot accept multiple colors when `subplots=True` ([GH9894](#))
- Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters ([GH10387](#))
- Bug in left and right align of `Series` with `MultiIndex` may be inverted ([GH10665](#))
- Bug in left and right join of with `MultiIndex` may be inverted ([GH10741](#))
- Bug in `read_stata` when reading a file with a different order set in columns ([GH10757](#))
- Bug in `Categorical` may not representing properly when category contains `tz` or `Period` ([GH10713](#))
- Bug in `Categorical.__iter__` may not returning correct datetime and `Period` ([GH10713](#))
- Bug in indexing with a `PeriodIndex` on an object with a `PeriodIndex` ([GH4125](#))
- Bug in `read_csv` with `engine='c'`: EOF preceded by a comment, blank line, etc. was not handled correctly ([GH10728](#), [GH10548](#))

- Reading “famafrrench” data via `DataReader` results in HTTP 404 error because of the website url is changed ([GH10591](#)).
- Bug in `read_msgpack` where `DataFrame` to decode has duplicate column names ([GH9618](#))
- Bug in `io.common.get_filepath_or_buffer` which caused reading of valid S3 files to fail if the bucket also contained keys for which the user does not have read permission ([GH10604](#))
- Bug in vectorised setting of timestamp columns with `python datetime.date` and `numpy datetime64` ([GH10408](#), [GH10412](#))
- Bug in `Index.take` may add unnecessary `freq` attribute ([GH10791](#))
- Bug in merge with empty `DataFrame` may raise `IndexError` ([GH10824](#))
- Bug in `to_latex` where unexpected keyword argument for some documented arguments ([GH10888](#))
- Bug in indexing of large `DataFrame` where `IndexError` is uncaught ([GH10645](#) and [GH10692](#))
- Bug in `read_csv` when using the `nrows` or `chunksize` parameters if file contains only a header line ([GH9535](#))
- Bug in serialization of `category` types in HDF5 in presence of alternate encodings. ([GH10366](#))
- Bug in `pd.DataFrame` when constructing an empty `DataFrame` with a string dtype ([GH9428](#))
- Bug in `pd.DataFrame.diff` when `DataFrame` is not consolidated ([GH10907](#))
- Bug in `pd.unique` for arrays with the `datetime64` or `timedelta64` dtype that meant an array with object dtype was returned instead the original dtype ([GH9431](#))
- Bug in `Timedelta` raising error when slicing from 0s ([GH10583](#))
- Bug in `DatetimeIndex.take` and `TimedeltaIndex.take` may not raise `IndexError` against invalid index ([GH10295](#))
- Bug in `Series([np.nan]).astype('M8[ms]')`, which now returns `Series([pd.NaT])` ([GH10747](#))
- Bug in `PeriodIndex.order` reset `freq` ([GH10295](#))
- Bug in `date_range` when `freq` divides `end` as `nanos` ([GH10885](#))
- Bug in `iloc` allowing memory outside bounds of a `Series` to be accessed with negative integers ([GH10779](#))
- Bug in `read_msgpack` where encoding is not respected ([GH10581](#))
- Bug preventing access to the first index when using `iloc` with a list containing the appropriate negative integer ([GH10547](#), [GH10779](#))
- Bug in `TimedeltaIndex` formatter causing error while trying to save `DataFrame` with `TimedeltaIndex` using `to_csv` ([GH10833](#))
- Bug in `DataFrame.where` when handling `Series` slicing ([GH10218](#), [GH9558](#))
- Bug where `pd.read_gbq` throws `ValueError` when Bigquery returns zero rows ([GH10273](#))
- Bug in `to_json` which was causing segmentation fault when serializing 0-rank `ndarray` ([GH9576](#))
- Bug in plotting functions may raise `IndexError` when plotted on `GridSpec` ([GH10819](#))
- Bug in plot result may show unnecessary minor ticklabels ([GH10657](#))
- Bug in `groupby` incorrect computation for aggregation on `DataFrame` with `NaT` (E.g `first`, `last`, `min`). ([GH10590](#), [GH11010](#))
- Bug when constructing `DataFrame` where passing a dictionary with only scalar values and specifying columns did not raise an error ([GH10856](#))

- Bug in `.var()` causing roundoff errors for highly similar values (GH10242)
- Bug in `DataFrame.plot(subplots=True)` with duplicated columns outputs incorrect result (GH10962)
- Bug in `Index` arithmetic may result in incorrect class (GH10638)
- Bug in `date_range` results in empty if `freq` is negative annually, quarterly and monthly (GH11018)
- Bug in `DatetimeIndex` cannot infer negative `freq` (GH11018)
- Remove use of some deprecated numpy comparison operations, mainly in tests. (GH10569)
- Bug in `Index` dtype may not applied properly (GH11017)
- Bug in `io.gbq` when testing for minimum google api client version (GH10652)
- Bug in `DataFrame` construction from nested dict with `timedelta` keys (GH11129)
- Bug in `.fillna` against may raise `TypeError` when data contains `datetime` dtype (GH7095, GH11153)
- Bug in `.groupby` when number of keys to group by is same as length of index (GH11185)
- Bug in `convert_objects` where converted values might not be returned if all null and `coerce` (GH9589)
- Bug in `convert_objects` where `copy` keyword was not respected (GH9589)

### 39.8.2.5 Contributors

A total of 112 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.9 Version 0.16

### 39.9.1 v0.16.2 (June 12, 2015)

{{ header }}

This is a minor bug-fix release from 0.16.1 and includes a a large number of bug fixes along some new features (`pipe()` method), enhancements, and performance improvements.

We recommend that all users upgrade to this version.

Highlights include:

- A new `pipe` method, see *here*
- Documentation on how to use `numba` with *pandas*, see *here*

#### What's new in v0.16.2

- *New features*
  - *Pipe*

– Other Enhancements

- API Changes
- Performance Improvements
- Bug Fixes
- Contributors

### 39.9.1.1 New features

#### Pipe

We've introduced a new method `DataFrame.pipe()`. As suggested by the name, `pipe` should be used to pipe data through a chain of function calls. The goal is to avoid confusing nested function calls like

```
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(g(h(df), arg1=1), arg2=2, arg3=3) # noqa F821
```

The logic flows from inside out, and function names are separated from their keyword arguments. This can be rewritten as

```
(df.pipe(h)
    .pipe(g, arg1=1)
    .pipe(f, arg2=2, arg3=3)
)
```

Now both the code and the logic flow from top to bottom. Keyword arguments are next to their functions. Overall the code is much more readable.

In the example above, the functions `f`, `g`, and `h` each expected the `DataFrame` as the first positional argument. When the function you wish to apply takes its data anywhere other than the first argument, pass a tuple of `(function, keyword)` indicating where the `DataFrame` should flow. For example:

```
In [1]: import statsmodels.formula.api as sm

In [2]: bb = pd.read_csv('data/baseball.csv', index_col='id')

# sm.ols takes (formula, data)
In [3]: (bb.query('h > 0')
...:     .assign(ln_h=lambda df: np.log(df.h))
...:     .pipe((sm.ols, 'data'), 'hr ~ ln_h + year + g + C(lg)')
...:     .fit()
...:     .summary()
...: )
...:
```

Out[3]:

```
<class 'statsmodels.iolib.summary.Summary'>
"""

Skew:                    0.537    Prob(JB):                   0.000175
Kurtosis:                5.225    Cond. No.                   1.49e+07
=====

Warnings:
[1] Standard Errors assume that the covariance matrix of the errors is correctly
    specified.
[2] The condition number is large, 1.49e+07. This might indicate that there are
    strong multicollinearity or other numerical problems.
"""

```

The pipe method is inspired by unix pipes, which stream text through processes. More recently `dplyr` and `magrittr` have introduced the popular `(%>%)` pipe operator for R.

See the *documentation* for more. (GH10129)

## Other Enhancements

- Added `rsplit` to Index/Series StringMethods (GH10303)
- Removed the hard-coded size limits on the DataFrame HTML representation in the IPython notebook, and leave this to IPython itself (only for IPython v3.0 or greater). This eliminates the duplicate scroll bars that appeared in the notebook with large frames (GH10231).

Note that the notebook has a `toggle output scrolling` feature to limit the display of very large frames (by clicking left of the output). You can also configure the way DataFrames are displayed using the pandas options, see here *here*.

- `axis` parameter of `DataFrame.quantile` now accepts also `index` and `column`. (GH9543)

### 39.9.1.2 API Changes

- `Holiday` now raises `NotImplementedError` if both `offset` and `observance` are used in the constructor instead of returning an incorrect result (GH10217).

### 39.9.1.3 Performance Improvements

- Improved `Series.resample` performance with `dtype=datetime64[ns]` (GH7754)

- Increase performance of `str.split` when `expand=True` ([GH10081](#))

#### 39.9.1.4 Bug Fixes

- Bug in `Series.hist` raises an error when a one row `Series` was given ([GH10214](#))
- Bug where `HDFStore.select` modifies the passed columns list ([GH7212](#))
- Bug in `Categorical repr` with `display.width` of `None` in Python 3 ([GH10087](#))
- Bug in `to_json` with certain `orients` and a `CategoricalIndex` would segfault ([GH10317](#))
- Bug where some of the `nan` functions do not have consistent return dtypes ([GH10251](#))
- Bug in `DataFrame.quantile` on checking that a valid axis was passed ([GH9543](#))
- Bug in `groupby.apply` aggregation for `Categorical` not preserving categories ([GH10138](#))
- Bug in `to_csv` where `date_format` is ignored if the `datetime` is fractional ([GH10209](#))
- Bug in `DataFrame.to_json` with mixed data types ([GH10289](#))
- Bug in cache updating when consolidating ([GH10264](#))
- Bug in `mean()` where integer dtypes can overflow ([GH10172](#))
- Bug where `Panel.from_dict` does not set `dtype` when specified ([GH10058](#))
- Bug in `Index.union` raises `AttributeError` when passing array-likes. ([GH10149](#))
- Bug in `Timestamp`'s `'microsecond'`, `'quarter'`, `'dayofyear'`, `'week'` and `'daysinmonth'` properties return `np.int` type, not built-in `int`. ([GH10050](#))
- Bug in `NaT` raises `AttributeError` when accessing to `daysinmonth`, `dayofweek` properties. ([GH10096](#))
- Bug in `Index repr` when using the `max_seq_items=None` setting ([GH10182](#)).
- Bug in getting `timezone` data with `dateutil` on various platforms ( [GH9059](#), [GH8639](#), [GH9663](#), [GH10121](#))
- Bug in displaying `datetimes` with mixed frequencies; display `'ms'` `datetimes` to the proper precision. ([GH10170](#))
- Bug in `setitem` where type promotion is applied to the entire block ([GH10280](#))
- Bug in `Series` arithmetic methods may incorrectly hold names ([GH10068](#))
- Bug in `GroupBy.get_group` when grouping on multiple keys, one of which is categorical. ([GH10132](#))
- Bug in `DatetimeIndex` and `TimedeltaIndex` names are lost after `timedelta` arithmetics ( [GH9926](#))
- Bug in `DataFrame` construction from nested dict with `datetime64` ([GH10160](#))
- Bug in `Series` construction from dict with `datetime64` keys ([GH9456](#))
- Bug in `Series.plot(label="LABEL")` not correctly setting the label ([GH10119](#))
- Bug in `plot` not defaulting to `matplotlib axes.grid` setting ([GH9792](#))
- Bug causing strings containing an exponent, but no decimal to be parsed as `int` instead of `float` in `engine='python'` for the `read_csv` parser ([GH9565](#))
- Bug in `Series.align` resets name when `fill_value` is specified ([GH10067](#))
- Bug in `read_csv` causing index name not to be set on an empty `DataFrame` ([GH10184](#))
- Bug in `SparseSeries.abs` resets name ([GH10241](#))
- Bug in `TimedeltaIndex` slicing may reset `freq` ([GH10292](#))

- Bug in `GroupBy.get_group` raises `ValueError` when group key contains `NaT` ([GH6992](#))
- Bug in `SparseSeries` constructor ignores input data name ([GH10258](#))
- Bug in `Categorical.remove_categories` causing a `ValueError` when removing the `NaN` category if underlying dtype is floating-point ([GH10156](#))
- Bug where `infer_freq` infers time rule (WOM-5XXX) unsupported by `to_offset` ([GH9425](#))
- Bug in `DataFrame.to_hdf()` where table format would raise a seemingly unrelated error for invalid (non-string) column names. This is now explicitly forbidden. ([GH9057](#))
- Bug to handle masking empty `DataFrame` ([GH10126](#)).
- Bug where MySQL interface could not handle numeric table/column names ([GH10255](#))
- Bug in `read_csv` with a `date_parser` that returned a `datetime64` array of other time resolution than `[ns]` ([GH10245](#))
- Bug in `Panel.apply` when the result has `ndim=0` ([GH10332](#))
- Bug in `read_hdf` where `auto_close` could not be passed ([GH9327](#)).
- Bug in `read_hdf` where open stores could not be used ([GH10330](#)).
- Bug in adding empty `DataFrames`, now results in a `DataFrame` that `.equals` an empty `DataFrame` ([GH10181](#)).
- Bug in `to_hdf` and `HDFStore` which did not check that complib choices were valid ([GH4582](#), [GH8874](#)).

### 39.9.1.5 Contributors

A total of 34 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.9.2 v0.16.1 (May 11, 2015)

{{ header }}

This is a minor bug-fix release from 0.16.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Support for a `CategoricalIndex`, a category based index, see [here](#)
- New section on how-to-contribute to *pandas*, see [here](#)
- Revised “Merge, join, and concatenate” documentation, including graphical examples to make it easier to understand each operations, see [here](#)
- New method `sample` for drawing random samples from Series, DataFrames and Panels. See [here](#)
- The default `Index` printing has changed to a more uniform format, see [here](#)
- `BusinessHour` `datetime`-offset is now supported, see [here](#)
- Further enhancement to the `.str` accessor to make string operations easier, see [here](#)

#### What’s new in v0.16.1

- *Enhancements*
  - *CategoricalIndex*
  - *Sample*

- *String Methods Enhancements*
- *Other Enhancements*
- *API changes*
  - *Deprecations*
- *Index Representation*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

**Warning:** In pandas 0.17.0, the sub-package `pandas.io.data` will be removed in favor of a separately installable package ([GH8961](#)).

### 39.9.2.1 Enhancements

#### CategoricalIndex

We introduce a `CategoricalIndex`, a new type of index object that is useful for supporting indexing with duplicates. This is a container around a `Categorical` (introduced in v0.15.0) and allows efficient indexing and storage of an index with a large number of duplicated elements. Prior to 0.16.1, setting the index of a `DataFrame`/`Series` with a `category` dtype would convert this to regular object-based `Index`.

```
In [1]: df = pd.DataFrame({'A': np.arange(6),
...:                      'B': pd.Series(list('aabbca'))
...:                      .astype('category', categories=list('cab'))
...:                      })
...:

In [2]: df
Out[2]:
   A  B
0  0  a
1  1  a
2  2  b
3  3  b
4  4  c
5  5  a

In [3]: df.dtypes
Out[3]:
A      int64
B    category
dtype: object

In [4]: df.B.cat.categories
Out[4]: Index(['c', 'a', 'b'], dtype='object')
```

setting the index, will create a `CategoricalIndex`

```
In [5]: df2 = df.set_index('B')
```

```
In [6]: df2.index
```

```
Out [6]: CategoricalIndex(['a', 'a', 'b', 'b', 'c', 'a'], categories=['c', 'a', 'b'],
↳ordered=False, name='B', dtype='category')
```

indexing with `__getitem__/.iloc/.loc/.ix` works similarly to an Index with duplicates. The indexers MUST be in the category or the operation will raise.

```
In [7]: df2.loc['a']
```

```
Out [7]:
```

```
  A
B
a  0
a  1
a  5
```

and preserves the CategoricalIndex

```
In [8]: df2.loc['a'].index
```

```
Out [8]: CategoricalIndex(['a', 'a', 'a'], categories=['c', 'a', 'b'], ordered=False,
↳name='B', dtype='category')
```

sorting will order by the order of the categories

```
In [9]: df2.sort_index()
```

```
Out [9]:
```

```
  A
B
c  4
a  0
a  1
a  5
b  2
b  3
```

groupby operations on the index will preserve the index nature as well

```
In [10]: df2.groupby(level=0).sum()
```

```
Out [10]:
```

```
  A
B
c  4
a  6
b  5
```

```
In [11]: df2.groupby(level=0).sum().index
```

```
Out [11]: CategoricalIndex(['c', 'a', 'b'], categories=['c', 'a', 'b'], ordered=False,
↳name='B', dtype='category')
```

reindexing operations, will return a resulting index based on the type of the passed indexer, meaning that passing a list will return a plain-old-Index; indexing with a Categorical will return a CategoricalIndex, indexed according to the categories of the PASSED Categorical dtype. This allows one to arbitrarily index these even with values NOT in the categories, similarly to how you can reindex ANY pandas index.

```
In [12]: df2.reindex(['a', 'e'])
```

```
Out [12]:
```

(continues on next page)

(continued from previous page)

```

      A
B
a  0.0
a  1.0
a  5.0
e  NaN

In [13]: df2.reindex(['a', 'e']).index
Out[13]: pd.Index(['a', 'a', 'a', 'e'], dtype='object', name='B')

In [14]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde')))
Out[14]:
      A
B
a  0.0
a  1.0
a  5.0
e  NaN

In [15]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde'))).index
Out[15]: pd.CategoricalIndex(['a', 'a', 'a', 'e'],
                             categories=['a', 'b', 'c', 'd', 'e'],
                             ordered=False, name='B',
                             dtype='category')
```

See the *documentation* for more. ([GH7629](#), [GH10038](#), [GH10039](#))

## Sample

Series, DataFrames, and Panels now have a new method: `sample()`. The method accepts a specific number of rows or columns to return, or a fraction of the total number of rows or columns. It also has options for sampling with or without replacement, for passing in a column for weights for non-uniform sampling, and for setting seed values to facilitate replication. ([GH2419](#))

```

In [1]: example_series = pd.Series([0, 1, 2, 3, 4, 5])

# When no arguments are passed, returns 1
In [2]: example_series.sample()
Out[2]:
1      1
Length: 1, dtype: int64

# One may specify either a number of rows:
In [3]: example_series.sample(n=3)
Out[3]:
4      4
5      5
2      2
Length: 3, dtype: int64

# Or a fraction of the rows:
In [4]: example_series.sample(frac=0.5)
Out[4]:
↪
1      1
```

(continues on next page)

(continued from previous page)

```

4      4
3      3
Length: 3, dtype: int64

# weights are accepted.
In [5]: example_weights = [0, 0, 0.2, 0.2, 0.2, 0.4]

In [6]: example_series.sample(n=3, weights=example_weights)
Out[6]:
3      3
5      5
4      4
Length: 3, dtype: int64

# weights will also be normalized if they do not sum to one,
# and missing values will be treated as zeros.
In [7]: example_weights2 = [0.5, 0, 0, 0, None, np.nan]

In [8]: example_series.sample(n=1, weights=example_weights2)
Out[8]:
0      0
Length: 1, dtype: int64

```

When applied to a DataFrame, one may pass the name of a column to specify sampling weights when sampling from rows.

```

In [9]: df = pd.DataFrame({'coll': [9, 8, 7, 6],
...:                      'weight_column': [0.5, 0.4, 0.1, 0]})
...:

In [10]: df.sample(n=3, weights='weight_column')
Out[10]:
   coll  weight_column
0     9             0.5
2     7             0.1
1     8             0.4

[3 rows x 2 columns]

```

## String Methods Enhancements

Continuing from v0.16.0, the following enhancements make string operations easier and more consistent with standard python string operations.

- Added StringMethods (`.str` accessor) to Index ([GH9068](#))

The `.str` accessor is now available for both Series and Index.

```

In [11]: idx = pd.Index([' jack', 'jill ', ' jesse ', 'frank'])

In [12]: idx.str.strip()
Out[12]: Index(['jack', 'jill', 'jesse', 'frank'], dtype='object')

```

One special case for the `.str` accessor on Index is that if a string method returns `bool`, the `.str` accessor will return a `np.array` instead of a boolean Index ([GH8875](#)). This enables the following expression to work naturally:

```

In [13]: idx = pd.Index(['a1', 'a2', 'b1', 'b2'])

In [14]: s = pd.Series(range(4), index=idx)

In [15]: s
Out[15]:
a1    0
a2    1
b1    2
b2    3
Length: 4, dtype: int64

In [16]: idx.str.startswith('a')
Out[16]:
array([ True,  True, False, False], dtype=bool)

In [17]: s[s.index.str.startswith('a')]
Out[17]:
a1    0
a2    1
Length: 2, dtype: int64

```

- The following new methods are accessible via `.str` accessor to apply the function to each values. ([GH9766](#), [GH9773](#), [GH10031](#), [GH10045](#), [GH10052](#))

|                           |                         | Methods                  |                          |                           |
|---------------------------|-------------------------|--------------------------|--------------------------|---------------------------|
| <code>capitalize()</code> | <code>swapcase()</code> | <code>normalize()</code> | <code>partition()</code> | <code>rpartition()</code> |
| <code>index()</code>      | <code>rindex()</code>   | <code>translate()</code> |                          |                           |

- `split` now takes `expand` keyword to specify whether to expand dimensionality. `return_type` is deprecated. ([GH9847](#))

```

In [18]: s = pd.Series(['a,b', 'a,c', 'b,c'])

# return Series
In [19]: s.str.split(',')
Out[19]:
0    [a, b]
1    [a, c]
2    [b, c]
Length: 3, dtype: object

# return DataFrame
In [20]: s.str.split(',', expand=True)
Out[20]:
   0 1
0  a b
1  a c
2  b c

[3 rows x 2 columns]

In [21]: idx = pd.Index(['a,b', 'a,c', 'b,c'])

# return Index

```

(continues on next page)

(continued from previous page)

```

In [22]: idx.str.split(',')
Out[22]: Index([[ 'a', 'b'], [ 'a', 'c'], [ 'b', 'c']], dtype='object')

# return MultiIndex
In [23]: idx.str.split(',', expand=True)
Out[23]:
MultiIndex(levels=[[ 'a', 'b'], [ 'b', 'c']],
            labels=[[0, 0, 1], [0, 1, 1]])

```

- Improved `extract` and `get_dummies` methods for `Index.str` (GH9980)

## Other Enhancements

- `BusinessHour` offset is now supported, which represents business hours starting from 09:00 - 17:00 on `BusinessDay` by default. See [Here](#) for details. (GH7905)

```

In [24]: pd.Timestamp('2014-08-01 09:00') + pd.tseries.offsets.BusinessHour()
Out[24]: Timestamp('2014-08-01 10:00:00')

In [25]: pd.Timestamp('2014-08-01 07:00') + pd.tseries.offsets.BusinessHour()
Out[25]: Timestamp('2014-08-01 10:00:00')

In [26]: pd.Timestamp('2014-08-01 16:30') + pd.tseries.offsets.BusinessHour()
Out[26]: Timestamp('2014-08-04 09:30:00')

```

- `DataFrame.diff` now takes an `axis` parameter that determines the direction of differencing (GH9727)
- Allow `clip`, `clip_lower`, and `clip_upper` to accept array-like arguments as thresholds (This is a regression from 0.11.0). These methods now have an `axis` parameter which determines how the Series or DataFrame will be aligned with the threshold(s). (GH6966)
- `DataFrame.mask()` and `Series.mask()` now support same keywords as `where` (GH8801)
- `drop` function can now accept `errors` keyword to suppress `ValueError` raised when any of label does not exist in the target data. (GH6736)

```

In [27]: df = pd.DataFrame(np.random.randn(3, 3), columns=['A', 'B', 'C'])

In [28]: df.drop(['A', 'X'], axis=1, errors='ignore')
Out[28]:
   B      C
0  0.177111 -1.072051
1 -0.797814  0.092248
2  0.423834 -0.779439

[3 rows x 2 columns]

```

- Add support for separating years and quarters using dashes, for example 2014-Q1. (GH9688)
- Allow conversion of values with dtype `datetime64` or `timedelta64` to strings using `astype(str)` (GH9757)
- `get_dummies` function now accepts `sparse` keyword. If set to `True`, the return DataFrame is sparse, e.g. `SparseDataFrame`. (GH8823)

- `Period` now accepts `datetime64` as value input. (GH9054)
- Allow `timedelta` string conversion when leading zero is missing from time definition, ie `0:00:00` vs `00:00:00`. (GH9570)
- Allow `Panel.shift` with `axis='items'` (GH9890)
- Trying to write an excel file now raises `NotImplementedError` if the `DataFrame` has a `MultiIndex` instead of writing a broken Excel file. (GH9794)
- Allow `Categorical.add_categories` to accept `Series` or `np.array`. (GH9927)
- Add/delete `str/dt/cat` accessors dynamically from `__dir__`. (GH9910)
- Add `normalize` as a `dt` accessor method. (GH10047)
- `DataFrame` and `Series` now have `_constructor_expanddim` property as overridable constructor for one higher dimensionality data. This should be used only when it is really needed, see [here](#)
- `pd.lib.infer_dtype` now returns `'bytes'` in Python 3 where appropriate. (GH10032)

### 39.9.2.2 API changes

- When passing in an `ax` to `df.plot(..., ax=ax)`, the `sharex` kwarg will now default to `False`. The result is that the visibility of `xlabels` and `xticklabels` will not anymore be changed. You have to do that by yourself for the right axes in your figure or set `sharex=True` explicitly (but this changes the visible for all axes in the figure, not only the one which is passed in!). If pandas creates the subplots itself (e.g. no passed in `ax` kwarg), then the default is still `sharex=True` and the visibility changes are applied.
- `assign()` now inserts new columns in alphabetical order. Previously the order was arbitrary. (GH9777)
- By default, `read_csv` and `read_table` will now try to infer the compression type based on the file extension. Set `compression=None` to restore the previous behavior (no decompression). (GH9770)

### Deprecations

- `Series.str.split`'s `return_type` keyword was removed in favor of `expand` (GH9847)

### 39.9.2.3 Index Representation

The string representation of `Index` and its sub-classes have now been unified. These will show a single-line display if there are few values; a wrapped multi-line display for a lot of values (but less than `display.max_seq_items`; if lots of items (`> display.max_seq_items`) will show a truncated display (the head and tail of the data). The formatting for `MultiIndex` is unchanged (a multi-line wrapped display). The display width responds to the option `display.max_seq_items`, which is defaulted to 100. (GH6482)

#### Previous Behavior

```
In [2]: pd.Index(range(4), name='foo')
Out[2]: Int64Index([0, 1, 2, 3], dtype='int64')

In [3]: pd.Index(range(104), name='foo')
Out[3]: Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18,
↪19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39,
↪40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60,
↪61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81,
↪82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, ...], dtype=
↪'int64')
```

(continues on next page)

(continued from previous page)

```
In [4]: pd.date_range('20130101', periods=4, name='foo', tz='US/Eastern')
Out[4]:
<class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-01-04 00:00:00-05:00]
Length: 4, Freq: D, Timezone: US/Eastern

In [5]: pd.date_range('20130101', periods=104, name='foo', tz='US/Eastern')
Out[5]:
<class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-04-14 00:00:00-04:00]
Length: 104, Freq: D, Timezone: US/Eastern
```

## New Behavior

```
In [29]: pd.set_option('display.width', 80)

In [30]: pd.Index(range(4), name='foo')
Out[30]: RangeIndex(start=0, stop=4, step=1, name='foo')
```

---

```
In [31]: pd.Index(range(30), name='foo')
////////////////////////////////////\Out[31]: RangeIndex(start=0,

```

### 39.9.2.4 Performance Improvements

- Improved csv write performance with mixed dtypes, including datetimes by up to 5x ([GH9940](#))
- Improved csv write performance generally by 2x ([GH9940](#))
- Improved the performance of `pd.lib.max_len_string_array` by 5-7x ([GH10024](#))

### 39.9.2.5 Bug Fixes

- Bug where labels did not appear properly in the legend of `DataFrame.plot()`, passing `label=` arguments works, and Series indices are no longer mutated. ([GH9542](#))
- Bug in json serialization causing a segfault when a frame had zero length. ([GH9805](#))
- Bug in `read_csv` where missing trailing delimiters would cause segfault. ([GH5664](#))

- Bug in retaining index name on appending ([GH9862](#))
- Bug in `scatter_matrix` draws unexpected axis ticklabels ([GH5662](#))
- Fixed bug in `StataWriter` resulting in changes to input `DataFrame` upon save ([GH9795](#)).
- Bug in `transform` causing length mismatch when null entries were present and a fast aggregator was being used ([GH9697](#))
- Bug in `equals` causing false negatives when block order differed ([GH9330](#))
- Bug in grouping with multiple `pd.Grouper` where one is non-time based ([GH10063](#))
- Bug in `read_sql_table` error when reading postgres table with timezone ([GH7139](#))
- Bug in `DataFrame` slicing may not retain metadata ([GH9776](#))
- Bug where `TimedeltaIndex` were not properly serialized in fixed `HDFStore` ([GH9635](#))
- Bug with `TimedeltaIndex` constructor ignoring name when given another `TimedeltaIndex` as data ([GH10025](#)).
- Bug in `DataFrameFormatter._get_formatted_index` with not applying `max_colwidth` to the `DataFrame` index ([GH7856](#))
- Bug in `.loc` with a read-only `ndarray` data source ([GH10043](#))
- Bug in `groupby.apply()` that would raise if a passed user defined function either returned only `None` (for all input). ([GH9685](#))
- Always use temporary files in `pytables` tests ([GH9992](#))
- Bug in plotting continuously using `secondary_y` may not show legend properly. ([GH9610](#), [GH9779](#))
- Bug in `DataFrame.plot(kind="hist")` results in `TypeError` when `DataFrame` contains non-numeric columns ([GH9853](#))
- Bug where repeated plotting of `DataFrame` with a `DatetimeIndex` may raise `TypeError` ([GH9852](#))
- Bug in `setup.py` that would allow an incompat cython version to build ([GH9827](#))
- Bug in plotting `secondary_y` incorrectly attaches `right_ax` property to secondary axes specifying itself recursively. ([GH9861](#))
- Bug in `Series.quantile` on empty `Series` of type `Datetime` or `Timedelta` ([GH9675](#))
- Bug in `where` causing incorrect results when upcasting was required ([GH9731](#))
- Bug in `FloatArrayFormatter` where decision boundary for displaying “small” floats in decimal format is off by one order of magnitude for a given `display.precision` ([GH9764](#))
- Fixed bug where `DataFrame.plot()` raised an error when both `color` and `style` keywords were passed and there was no color symbol in the style strings ([GH9671](#))
- Not showing a `DeprecationWarning` on combining list-likes with an `Index` ([GH10083](#))
- Bug in `read_csv` and `read_table` when using `skip_rows` parameter if blank lines are present. ([GH9832](#))
- Bug in `read_csv()` interprets `index_col=True` as 1 ([GH9798](#))
- Bug in index equality comparisons using `==` failing on `Index/MultiIndex` type incompatibility ([GH9785](#))
- Bug in which `SparseDataFrame` could not take `nan` as a column name ([GH8822](#))
- Bug in `to_msgpack` and `read_msgpack` `zlib` and `blosc` compression support ([GH9783](#))
- Bug `GroupBy.size` doesn’t attach index name properly if grouped by `TimeGrouper` ([GH9925](#))

- Bug causing an exception in slice assignments because `length_of_indexer` returns wrong results (GH9995)
- Bug in csv parser causing lines with initial white space plus one non-space character to be skipped. (GH9710)
- Bug in C csv parser causing spurious NaNs when data started with newline followed by white space. (GH10022)
- Bug causing elements with a null group to spill into the final group when grouping by a Categorical (GH9603)
- Bug where `.iloc` and `.loc` behavior is not consistent on empty dataframes (GH9964)
- Bug in invalid attribute access on a `TimedeltaIndex` incorrectly raised `ValueError` instead of `AttributeError` (GH9680)
- Bug in unequal comparisons between categorical data and a scalar, which was not in the categories (e.g. `Series(Categorical(list("abc")), ordered=True) > "d"`. This returned `False` for all elements, but now raises a `TypeError`. Equality comparisons also now return `False` for `==` and `True` for `!=`. (GH9848)
- Bug in `DataFrame.__setitem__` when right hand side is a dictionary (GH9874)
- Bug in where when `dtype` is `datetime64/timedelta64`, but `dtype` of other is not (GH9804)
- Bug in `MultiIndex.sortlevel()` results in unicode level name breaks (GH9856)
- Bug in which `groupby.transform` incorrectly enforced output dtypes to match input dtypes. (GH9807)
- Bug in `DataFrame` constructor when `columns` parameter is set, and `data` is an empty list (GH9939)
- Bug in bar plot with `log=True` raises `TypeError` if all values are less than 1 (GH9905)
- Bug in horizontal bar plot ignores `log=True` (GH9905)
- Bug in PyTables queries that did not return proper results using the index (GH8265, GH9676)
- Bug where dividing a dataframe containing values of type `Decimal` by another `Decimal` would raise. (GH9787)
- Bug where using DataFrames `asfreq` would remove the name of the index. (GH9885)
- Bug causing extra index point when `resample` BM/BQ (GH9756)
- Changed caching in `AbstractHolidayCalendar` to be at the instance level rather than at the class level as the latter can result in unexpected behaviour. (GH9552)
- Fixed latex output for `MultiIndexed` dataframes (GH9778)
- Bug causing an exception when setting an empty range using `DataFrame.loc` (GH9596)
- Bug in hiding ticklabels with subplots and shared axes when adding a new plot to an existing grid of axes (GH9158)
- Bug in `transform` and `filter` when grouping on a categorical variable (GH9921)
- Bug in `transform` when groups are equal in number and `dtype` to the input index (GH9700)
- Google BigQuery connector now imports dependencies on a per-method basis.(GH9713)
- Updated BigQuery connector to no longer use deprecated `oauth2client.tools.run()` (GH8327)
- Bug in subclassed `DataFrame`. It may not return the correct class, when slicing or subsetting it. (GH9632)
- Bug in `.median()` where non-float null values are not handled correctly (GH10040)
- Bug in `Series.fillna()` where it raises if a numerically convertible string is given (GH10092)

### 39.9.2.6 Contributors

A total of 58 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.9.3 v0.16.0 (March 22, 2015)

{{ header }}

This is a major release from 0.15.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `DataFrame.assign` method, see *here*
- `Series.to_coo/from_coo` methods to interact with `scipy.sparse`, see *here*
- Backwards incompatible change to `Timedelta` to conform the `.seconds` attribute with `datetime.timedelta`, see *here*
- Changes to the `.loc` slicing API to conform with the behavior of `.ix` see *here*

- Changes to the default for ordering in the `Categorical` constructor, see [here](#)
- Enhancement to the `.str` accessor to make string operations easier, see [here](#)
- The `pandas.tools.rplot`, `pandas.sandbox.qtpandas` and `pandas.rpy` modules are deprecated. We refer users to external packages like [seaborn](#), [pandas-qt](#) and [rpy2](#) for similar or equivalent functionality, see [here](#)

Check the *API Changes* and *deprecations* before updating.

#### What's new in v0.16.0

- *New features*
  - *DataFrame Assign*
  - *Interaction with `scipy.sparse`*
  - *String Methods Enhancements*
  - *Other enhancements*
- *Backwards incompatible API changes*
  - *Changes in `Timedelta`*
  - *Indexing Changes*
  - *Categorical Changes*
  - *Other API Changes*
  - *Deprecations*
  - *Removal of prior version deprecations/changes*
- *Performance Improvements*
- *Bug Fixes*
- *Contributors*

### 39.9.3.1 New features

#### DataFrame Assign

Inspired by `dplyr`'s `mutate` verb, `DataFrame` has a new `assign()` method. The function signature for `assign` is simply `**kwargs`. The keys are the column names for the new fields, and the values are either a value to be inserted (for example, a `Series` or `NumPy` array), or a function of one argument to be called on the `DataFrame`. The new values are inserted, and the entire `DataFrame` (with all original and new columns) is returned.

```
In [1]: iris = pd.read_csv('data/iris.data')

In [2]: iris.head()
Out[2]:
```

|   | SepalLength | SepalWidth | PetalLength | PetalWidth | Name        |
|---|-------------|------------|-------------|------------|-------------|
| 0 | 5.1         | 3.5        | 1.4         | 0.2        | Iris-setosa |
| 1 | 4.9         | 3.0        | 1.4         | 0.2        | Iris-setosa |
| 2 | 4.7         | 3.2        | 1.3         | 0.2        | Iris-setosa |
| 3 | 4.6         | 3.1        | 1.5         | 0.2        | Iris-setosa |

(continues on next page)

(continued from previous page)

```

4          5.0          3.6          1.4          0.2  Iris-setosa

[5 rows x 5 columns]

In [3]: iris.assign(sepal_ratio=iris['SepalWidth'] / iris['SepalLength']).head()
///////////////////////////////////////////////////
↪
   SepalLength  SepalWidth  PetalLength  PetalWidth      Name  sepal_ratio
0          5.1          3.5          1.4          0.2  Iris-setosa    0.686275
1          4.9          3.0          1.4          0.2  Iris-setosa    0.612245
2          4.7          3.2          1.3          0.2  Iris-setosa    0.680851
3          4.6          3.1          1.5          0.2  Iris-setosa    0.673913
4          5.0          3.6          1.4          0.2  Iris-setosa    0.720000

[5 rows x 6 columns]

```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.

```

In [4]: iris.assign(sepal_ratio=lambda x: (x['SepalWidth']
...:                                     / x['SepalLength'])).head()
...:
Out [4]:
   SepalLength  SepalWidth  PetalLength  PetalWidth      Name  sepal_ratio
0          5.1          3.5          1.4          0.2  Iris-setosa    0.686275
1          4.9          3.0          1.4          0.2  Iris-setosa    0.612245
2          4.7          3.2          1.3          0.2  Iris-setosa    0.680851
3          4.6          3.1          1.5          0.2  Iris-setosa    0.673913
4          5.0          3.6          1.4          0.2  Iris-setosa    0.720000

[5 rows x 6 columns]

```

The power of `assign` comes when used in chains of operations. For example, we can limit the DataFrame to just those with a Sepal Length greater than 5, calculate the ratio, and plot

```

In [5]: iris = pd.read_csv('data/iris.data')

In [6]: (iris.query('SepalLength > 5')
...:      .assign(SepalRatio=lambda x: x.SepalWidth / x.SepalLength,
...:              PetalRatio=lambda x: x.PetalWidth / x.PetalLength)
...:      .plot(kind='scatter', x='SepalRatio', y='PetalRatio'))
...:
Out [6]: <matplotlib.axes._subplots.AxesSubplot at 0x7fd500b6a320>

```

See the *documentation* for more. (GH9229)

## Interaction with scipy.sparse

Added `SparseSeries.to_coo()` and `SparseSeries.from_coo()` methods ([GH8048](#)) for converting to and from `scipy.sparse.coo_matrix` instances (see [here](#)). For example, given a `SparseSeries` with `MultiIndex` we can convert to a `scipy.sparse.coo_matrix` by specifying the row and column labels as index levels:

```
In [7]: s = pd.Series([3.0, np.nan, 1.0, 3.0, np.nan, np.nan])

In [8]: s.index = pd.MultiIndex.from_tuples([(1, 2, 'a', 0),
...:                                     (1, 2, 'a', 1),
...:                                     (1, 1, 'b', 0),
...:                                     (1, 1, 'b', 1),
...:                                     (2, 1, 'b', 0),
...:                                     (2, 1, 'b', 1)],
...:                                     names=['A', 'B', 'C', 'D'])

In [9]: s
Out[9]:
A  B  C  D
1  2  a  0    3.0
      1    NaN
      1  b  0    1.0
      1    3.0
2  1  b  0    NaN
      1    NaN
Length: 6, dtype: float64

# SparseSeries
In [10]: ss = s.to_sparse()

In [11]: ss
Out[11]:
A  B  C  D
1  2  a  0    3.0
      1    NaN
      1  b  0    1.0
      1    3.0
2  1  b  0    NaN
      1    NaN
Length: 6, dtype: Sparse[float64, nan]
BlockIndex
Block locations: array([0, 2], dtype=int32)
Block lengths: array([1, 2], dtype=int32)

In [12]: A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
...:                                column_levels=['C', 'D'],
...:                                sort_labels=False)

In [13]: A
Out[13]:
<3x4 sparse matrix of type '<class 'numpy.float64'>'
      with 3 stored elements in COOrdinate format>

In [14]: A.todense()
```

(continues on next page)

(continued from previous page)

```
matrix([[ 3.,  0.,  0.,  0.],
        [ 0.,  0.,  1.,  3.],
        [ 0.,  0.,  0.,  0.]])
```

```
In [15]: rows
```

$\searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow \searrow$

$\hookrightarrow [(1, 2), (1, 1), (2, 1)]$

```
In [16]: columns
```

[illegible]

The `from_coo` method is a convenience method for creating a `SparseSeries` from a `scipy.sparse.coo_matrix`:

```
In [17]: from scipy import sparse
```

```
In [18]: A = sparse.coo_matrix((([3.0, 1.0, 2.0], ([1, 0, 0], [0, 2, 3])),
.....:                          shape=(3, 4))
```

In [19]: A

```
Out[19]:
<3x4 sparse matrix of type '<class 'numpy.float64''>'
      with 3 stored elements in COOrdinate format>
```

```
In [20]: A.todense()
```

```
matrix([[ 0.,  0.,  1.,  2.],  
        [ 3.,  0.,  0.,  0.],  
        [ 0.,  0.,  0.,  0.]])
```

```
In [21]: ss = pd.SparseSeries.from_coo(A)
```

```
In [22]: ss
```

Out [22] :

|   |   |     |
|---|---|-----|
| 0 | 2 | 1.0 |
|---|---|-----|

|   |     |
|---|-----|
| 3 | 2.0 |
|---|-----|

|   |   |     |
|---|---|-----|
| 1 | 0 | 3.0 |
|---|---|-----|

```
Length: 3, dtype: Sparse[float64, nan]
```

BlockIndex

```
Block locations: array([0], dtype=int32)
```

```
Block lengths: array([3], dtype=int32)
```

## String Methods Enhancements

- Following new methods are accessible via `.str` accessor to apply the function to each values. This is intended to make it more consistent with standard methods on strings. ([GH9282](#), [GH9352](#), [GH9386](#), [GH9387](#), [GH9439](#))

|           |           | Methods   |             |             |
|-----------|-----------|-----------|-------------|-------------|
| isalnum() | isalpha() | isdigit() | isdigit()   | isspace()   |
| islower() | isupper() | istitle() | isnumeric() | isdecimal() |
| find()    | rfind()   | ljust()   | rjust()     | zfill()     |

```
In [23]: s = pd.Series(['abcd', '3456', 'EFGH'])

In [24]: s.str.isalpha()
Out[24]:
0      True
1     False
2      True
Length: 3, dtype: bool

In [25]: s.str.find('ab')
Out[25]:
0      0
1     -1
2     -1
Length: 3, dtype: int64
```

- `Series.str.pad()` and `Series.str.center()` now accept `fillchar` option to specify filling character (GH9352)

```
In [26]: s = pd.Series(['12', '300', '25'])

In [27]: s.str.pad(5, fillchar='_')
Out[27]:
0    __12
1    __300
2    __25
Length: 3, dtype: object
```

- Added `Series.str.slice_replace()`, which previously raised `NotImplementedError` (GH8888)

```
In [28]: s = pd.Series(['ABCD', 'EFGH', 'IJK'])

In [29]: s.str.slice_replace(1, 3, 'X')
Out[29]:
0    AXD
1    EXH
2     IX
Length: 3, dtype: object

# replaced with empty char
In [30]: s.str.slice_replace(0, 1)
Out[30]:
0    BCD
1    FGH
2     JK
Length: 3, dtype: object
```

## Other enhancements

- Reindex now supports `method='nearest'` for frames or series with a monotonic increasing or decreasing index (GH9258):

```
In [31]: df = pd.DataFrame({'x': range(5)})

In [32]: df.reindex([0.2, 1.8, 3.5], method='nearest')
```

(continues on next page)

(continued from previous page)

```
Out [32]:
      x
0.2  0
1.8  2
3.5  4

[3 rows x 1 columns]
```

This method is also exposed by the lower level `Index.get_indexer` and `Index.get_loc` methods.

- The `read_excel()` function's *sheetname* argument now accepts a list and `None`, to get multiple or all sheets respectively. If more than one sheet is specified, a dictionary is returned. (GH9450)

```
# Returns the 1st and 4th sheet, as a dictionary of DataFrames.
pd.read_excel('path_to_file.xls', sheetname=['Sheet1', 3])
```

- Allow Stata files to be read incrementally with an iterator; support for long strings in Stata files. See the docs *here* (GH9493:).
- Paths beginning with `~` will now be expanded to begin with the user's home directory (GH9066)
- Added time interval selection in `get_data_yahoo` (GH9071)
- Added `Timestamp.to_datetime64()` to complement `Timedelta.to_timedelta64()` (GH9255)
- `tsseries.frequencies.to_offset()` now accepts `Timedelta` as input (GH9064)
- Lag parameter was added to the autocorrelation method of `Series`, defaults to lag-1 autocorrelation (GH9192)
- `Timedelta` will now accept `nanoseconds` keyword in constructor (GH9273)
- SQL code now safely escapes table and column names (GH8986)
- Added auto-complete for `Series.str.<tab>`, `Series.dt.<tab>` and `Series.cat.<tab>` (GH9322)
- `Index.get_indexer` now supports `method='pad'` and `method='backfill'` even for any target array, not just monotonic targets. These methods also work for monotonic decreasing as well as monotonic increasing indexes (GH9258).
- `Index.asof` now works on all index types (GH9258).
- A `verbose` argument has been augmented in `io.read_excel()`, defaults to `False`. Set to `True` to print sheet names as they are parsed. (GH9450)
- Added `days_in_month` (compatibility alias `daysinmonth`) property to `Timestamp`, `DatetimeIndex`, `Period`, `PeriodIndex`, and `Series.dt` (GH9572)
- Added `decimal` option in `to_csv` to provide formatting for non-',' decimal separators (GH781)
- Added `normalize` option for `Timestamp` to normalized to midnight (GH8794)
- Added example for `DataFrame` import to R using HDF5 file and `rhdf5` library. See the *documentation* for more (GH9636).

### 39.9.3.2 Backwards incompatible API changes

#### Changes in Timedelta

In v0.15.0 a new scalar type `Timedelta` was introduced, that is a sub-class of `datetime.timedelta`. Mentioned *here* was a notice of an API change w.r.t. the `.seconds` accessor. The intent was to provide a user-friendly set of

accessors that give the ‘natural’ value for that unit, e.g. if you had a `Timedelta('1 day, 10:11:12')`, then `.seconds` would return 12. However, this is at odds with the definition of `datetime.timedelta`, which defines `.seconds` as `10 * 3600 + 11 * 60 + 12 == 36672`.

So in v0.16.0, we are restoring the API to match that of `datetime.timedelta`. Further, the component values are still available through the `.components` accessor. This affects the `.seconds` and `.microseconds` accessors, and removes the `.hours`, `.minutes`, `.milliseconds` accessors. These changes affect `TimedeltaIndex` and the Series `.dt` accessor as well. (GH9185, GH9139)

## Previous Behavior

```
In [2]: t = pd.Timedelta('1 day, 10:11:12.100123')
```

```
In [3]: t.days
```

Out [3]: 1

```
In [4]: t.seconds
```

Out [4]: 12

```
In [5]: t.microseconds
```

Out [5]: 123

## New Behavior

```
In [33]: t = pd.Timedelta('1 day, 10:11:12.100123')
```

```
In [34]: t.days
```

Out [34]: 1

```
In [35]: t.seconds
```

```
\\\\\\\\\\\\\\\\\\\\Out[35]: 36672
```

```
In [36]: t.microseconds
```

```
\Out[36]: 100123
```

Using `.components` allows the full component access

```
In [37]: t.components
```

```
Out [37]: Components(days=1, hours=10, minutes=11, seconds=12, milliseconds=100,
↳ microseconds=123, nanoseconds=0)
```

```
In [38]: t.components.seconds
```

\\ \\ \\ \\

→ 12

## Indexing Changes

The behavior of a small sub-set of edge cases for using `.loc` have changed ([GH8613](#)). Furthermore we have improved the content of the error messages that are raised:

- Slicing with `.loc` where the start and/or stop bound is not found in the index is now allowed; this previously would raise a `KeyError`. This makes the behavior the same as `.ix` in this case. This change is only for slicing, not when indexing with a single label.

```
In [39]: df = pd.DataFrame(np.random.randn(5, 4),
.....:                      columns=list('ABCD'),
```

(continues on next page)

(continued from previous page)

```

.....:
.....:
index=pd.date_range('20130101', periods=5))

In [40]: df
Out[40]:
           A           B           C           D
2013-01-01 -0.514828 -0.783298 -0.437862 -0.416504
2013-01-02  1.359259 -1.009646  0.390752 -0.401598
2013-01-03 -0.604382 -0.521809  2.803465  1.119624
2013-01-04 -0.024081 -2.451672 -0.222126 -0.277255
2013-01-05  0.508994  0.371498  0.939652  0.296555

[5 rows x 4 columns]

In [41]: s = pd.Series(range(5), [-2, -1, 1, 2, 3])

In [42]: s
Out[42]:
-2    0
-1    1
 1    2
 2    3
 3    4
Length: 5, dtype: int64

```

### Previous Behavior

```
In [4]: df.loc['2013-01-02':'2013-01-10']
KeyError: 'stop bound [2013-01-10] is not in the [index]'
```

```
In [6]: s.loc[-10:3]
KeyError: 'start bound [-10] is not the [index]'
```

### New Behavior

```
In [43]: df.loc['2013-01-02':'2013-01-10']
Out[43]:
```

|            | A         | B         | C         | D         |
|------------|-----------|-----------|-----------|-----------|
| 2013-01-02 | 1.359259  | -1.009646 | 0.390752  | -0.401598 |
| 2013-01-03 | -0.604382 | -0.521809 | 2.803465  | 1.119624  |
| 2013-01-04 | -0.024081 | -2.451672 | -0.222126 | -0.277255 |
| 2013-01-05 | 0.508994  | 0.371498  | 0.939652  | 0.296555  |

```
[4 rows x 4 columns]
```

```
In [44]: s.loc[-10:3]
```

```
=====
```

```
↔
```

```
-2      0
```

```
-1      1
```

```
1       2
```

```
2       3
```

```
3       4
```

```
Length: 5, dtype: int64
```

- Allow slicing with float-like values on an integer index for `.ix`. Previously this was only enabled for `.loc`:

### Previous Behavior

```
In [8]: s.ix[-1.0:2]
TypeError: the slice start value [-1.0] is not a proper indexer for this index
↪ type (Int64Index)
```

#### New Behavior

```
In [2]: s.ix[-1.0:2]
Out[2]:
-1    1
 1    2
 2    3
dtype: int64
```

- Provide a useful exception for indexing with an invalid type for that index when using `.loc`. For example trying to use `.loc` on an index of type `DatetimeIndex` or `PeriodIndex` or `TimedeltaIndex`, with an integer (or a float).

#### Previous Behavior

```
In [4]: df.loc[2:3]
KeyError: 'start bound [2] is not the [index]'
```

#### New Behavior

```
In [4]: df.loc[2:3]
TypeError: Cannot do slice indexing on <class 'pandas.tseries.index.DatetimeIndex'> with <type 'int'> keys
```

## Categorical Changes

In prior versions, Categoricals that had an unspecified ordering (meaning no `ordered` keyword was passed) were defaulted as ordered Categoricals. Going forward, the `ordered` keyword in the `Categorical` constructor will default to `False`. Ordering must now be explicit.

Furthermore, previously you *could* change the `ordered` attribute of a `Categorical` by just setting the attribute, e.g. `cat.ordered=True`; This is now deprecated and you should use `cat.as_ordered()` or `cat.as_unordered()`. These will by default return a **new** object and not modify the existing object. (GH9347, GH9190)

#### Previous Behavior

```
In [3]: s = pd.Series([0, 1, 2], dtype='category')

In [4]: s
Out[4]:
0    0
1    1
2    2
dtype: category
Categories (3, int64): [0 < 1 < 2]

In [5]: s.cat.ordered
Out[5]: True

In [6]: s.cat.ordered = False
```

(continues on next page)

(continued from previous page)

```
In [7]: s
Out[7]:
0      0
1      1
2      2
dtype: category
Categories (3, int64): [0, 1, 2]
```

### New Behavior

```
In [45]: s = pd.Series([0, 1, 2], dtype='category')

In [46]: s
Out[46]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0, 1, 2]

In [47]: s.cat.ordered
Out[47]:
False

In [48]: s = s.cat.as_ordered()

In [49]: s
Out[49]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [50]: s.cat.ordered
Out[50]:
True

# you can set in the constructor of the Categorical
In [51]: s = pd.Series(pd.Categorical([0, 1, 2], ordered=True))

In [52]: s
Out[52]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [53]: s.cat.ordered
Out[53]:
True
```

For ease of creation of series of categorical data, we have added the ability to pass keywords when calling `astype()`. These are passed directly to the constructor.

```

In [54]: s = pd.Series(["a", "b", "c", "a"]).astype('category', ordered=True)

In [55]: s
Out[55]:
0      a
1      b
2      c
3      a
dtype: category
Categories (3, object): [a < b < c]

In [56]: s = (pd.Series(["a", "b", "c", "a"])
....:         .astype('category', categories=list('abcdef'), ordered=False))

In [57]: s
Out[57]:
0      a
1      b
2      c
3      a
dtype: category
Categories (6, object): [a, b, c, d, e, f]

```

## Other API Changes

- `Index.duplicated` now returns `np.array(dtype=bool)` rather than `Index(dtype=object)` containing `bool` values. (GH8875)
- `DataFrame.to_json` now returns accurate type serialisation for each column for frames of mixed dtype (GH9037)

Previously data was coerced to a common dtype before serialisation, which for example resulted in integers being serialised to floats:

```

In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
Out[2]: '{"f":{"0":3.0,"1":4.2},"i":{"0":1.0,"1":2.0}}'

```

Now each column is serialised using its correct dtype:

```

In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
Out[2]: '{"f":{"0":3.0,"1":4.2},"i":{"0":1,"1":2}}'

```

- `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex.summary` now output the same format. (GH9116)
- `TimedeltaIndex.freqstr` now output the same string format as `DatetimeIndex`. (GH9116)
- Bar and horizontal bar plots no longer add a dashed line along the info axis. The prior style can be achieved with matplotlib's `axhline` or `axvline` methods (GH9088).
- Series accessors `.dt`, `.cat` and `.str` now raise `AttributeError` instead of `TypeError` if the series does not contain the appropriate type of data (GH9617). This follows Python's built-in exception hierarchy more closely and ensures that tests like `hasattr(s, 'cat')` are consistent on both Python 2 and 3.
- Series now supports bitwise operation for integral types (GH9016). Previously even if the input dtypes were integral, the output dtype was coerced to `bool`.

Previous Behavior

```
In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd'))
Out[2]:
a      True
b      True
c      True
d      True
dtype: bool
```

**New Behavior.** If the input dtypes are integral, the output dtype is also integral and the output values are the result of the bitwise operation.

```
In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd'))
Out[2]:
a      4
b      5
c      6
d      7
dtype: int64
```

- During division involving a `Series` or `DataFrame`, `0/0` and `0//0` now give `np.nan` instead of `np.inf`. (GH9144, GH8445)

## Previous Behavior

```
In [2]: p = pd.Series([0, 1])

In [3]: p / 0
Out[3]:
0      inf
1      inf
dtype: float64

In [4]: p // 0
Out[4]:
0      inf
1      inf
dtype: float64
```

### New Behavior

```
In [54]: p = pd.Series([0, 1])

In [55]: p / 0
Out[55]:
0      NaN
1      inf
Length: 2, dtype: float64

In [56]: p // 0
Out[56]:
0      NaN
1      inf
Length: 2, dtype: float64
```

- `Series.values_counts` and `Series.describe` for categorical data will now put NaN entries at the end. ([GH9443](#))

- `Series.describe` for categorical data will now give counts and frequencies of 0, not NaN, for unused categories ([GH9443](#))
- Due to a bug fix, looking up a partial string label with `DatetimeIndex.asof` now includes values that match the string, even if they are after the start of the partial string label ([GH9258](#)).

Old behavior:

```
In [4]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[4]: Timestamp('2000-01-31 00:00:00')
```

Fixed behavior:

```
In [57]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[57]: Timestamp('2000-02-28 00:00:00')
```

To reproduce the old behavior, simply add more precision to the label (e.g., use `2000-02-01` instead of `2000-02`).

## Deprecations

- The `rplot` trellis plotting interface is deprecated and will be removed in a future version. We refer to external packages like `seaborn` for similar but more refined functionality ([GH3445](#)). The documentation includes some examples how to convert your existing code using `rplot` to `seaborn`: *rplot docs*.
- The `pandas.sandbox.qtpandas` interface is deprecated and will be removed in a future version. We refer users to the external package `pandas-qt`. ([GH9615](#))
- The `pandas.rpy` interface is deprecated and will be removed in a future version. Similar functionality can be accessed through the `rpy2` project ([GH9602](#))
- Adding `DatetimeIndex/PeriodIndex` to another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to a `TypeError` in a future version. `.union()` should be used for the union set operation. ([GH9094](#))
- Subtracting `DatetimeIndex/PeriodIndex` from another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to an actual numeric subtraction yielding a `TimeDeltaIndex` in a future version. `.difference()` should be used for the differencing set operation. ([GH9094](#))

## Removal of prior version deprecations/changes

- `DataFrame.pivot_table` and `crosstab`'s `rows` and `cols` keyword arguments were removed in favor of `index` and `columns` ([GH6581](#))
- `DataFrame.to_excel` and `DataFrame.to_csv` `cols` keyword argument was removed in favor of `columns` ([GH6581](#))
- Removed `convert_dummies` in favor of `get_dummies` ([GH6581](#))
- Removed `value_range` in favor of `describe` ([GH6581](#))

### 39.9.3.3 Performance Improvements

- Fixed a performance regression for `.loc` indexing with an array or list-like ([GH9126](#)).
- `DataFrame.to_json` 30x performance improvement for mixed dtype frames. ([GH9037](#))

- Performance improvements in `MultiIndex.duplicated` by working with labels instead of values ([GH9125](#))
- Improved the speed of `nunique` by calling `unique` instead of `value_counts` ([GH9129](#), [GH7771](#))
- Performance improvement of up to 10x in `DataFrame.count` and `DataFrame.dropna` by taking advantage of homogeneous/heterogeneous dtypes appropriately ([GH9136](#))
- Performance improvement of up to 20x in `DataFrame.count` when using a `MultiIndex` and the `level` keyword argument ([GH9163](#))
- Performance and memory usage improvements in `merge` when key space exceeds `int64` bounds ([GH9151](#))
- Performance improvements in multi-key `groupby` ([GH9429](#))
- Performance improvements in `MultiIndex.sortlevel` ([GH9445](#))
- Performance and memory usage improvements in `DataFrame.duplicated` ([GH9398](#))
- Cythonized `Period` ([GH9440](#))
- Decreased memory usage on `to_hdf` ([GH9648](#))

#### 39.9.3.4 Bug Fixes

- Changed `.to_html` to remove leading/trailing spaces in table body ([GH4987](#))
- Fixed issue using `read_csv` on s3 with Python 3 ([GH9452](#))
- Fixed compatibility issue in `DatetimeIndex` affecting architectures where `numpy.int_` defaults to `numpy.int32` ([GH8943](#))
- Bug in Panel indexing with an object-like ([GH9140](#))
- Bug in the returned `Series.dt.components` index was reset to the default index ([GH9247](#))
- Bug in `Categorical.__getitem__`/`__setitem__` with listlike input getting incorrect results from indexer coercion ([GH9469](#))
- Bug in partial setting with a `DatetimeIndex` ([GH9478](#))
- Bug in `groupby` for integer and `datetime64` columns when applying an aggregator that caused the value to be changed when the number was sufficiently large ([GH9311](#), [GH6620](#))
- Fixed bug in `to_sql` when mapping a `Timestamp` object column (datetime column with timezone info) to the appropriate sqlalchemy type ([GH9085](#)).
- Fixed bug in `to_sql` `dtype` argument not accepting an instantiated SQLAlchemy type ([GH9083](#)).
- Bug in `.loc` partial setting with a `np.datetime64` ([GH9516](#))
- Incorrect dtypes inferred on datetimelike looking `Series` & on `.xs` slices ([GH9477](#))
- Items in `Categorical.unique()` (and `s.unique()` if `s` is of dtype `category`) now appear in the order in which they are originally found, not in sorted order ([GH9331](#)). This is now consistent with the behavior for other dtypes in pandas.
- Fixed bug on big endian platforms which produced incorrect results in `StataReader` ([GH8688](#)).
- Bug in `MultiIndex.has_duplicates` when having many levels causes an indexer overflow ([GH9075](#), [GH5873](#))
- Bug in `pivot` and `unstack` where `nan` values would break index alignment ([GH4862](#), [GH7401](#), [GH7403](#), [GH7405](#), [GH7466](#), [GH9497](#))
- Bug in `left join` on `MultiIndex` with `sort=True` or null values ([GH9210](#)).

- Bug in `MultiIndex` where inserting new keys would fail (GH9250).
- Bug in `groupby` when key space exceeds `int64` bounds (GH9096).
- Bug in `unstack` with `TimedeltaIndex` or `DatetimeIndex` and nulls (GH9491).
- Bug in `rank` where comparing floats with tolerance will cause inconsistent behaviour (GH8365).
- Fixed character encoding bug in `read_stata` and `StataReader` when loading data from a URL (GH9231).
- Bug in adding offsets. `Nano` to other offsets raises `TypeError` (GH9284)
- Bug in `DatetimeIndex` iteration, related to (GH8890), fixed in (GH9100)
- Bugs in `resample` around DST transitions. This required fixing offset classes so they behave correctly on DST transitions. (GH5172, GH8744, GH8653, GH9173, GH9468).
- Bug in binary operator method (eg `.mul()`) alignment with integer levels (GH9463).
- Bug in `boxplot`, `scatter` and `hexbin` plot may show an unnecessary warning (GH8877)
- Bug in subplot with `layout` kw may show unnecessary warning (GH9464)
- Bug in using grouper functions that need passed through arguments (e.g. `axis`), when using wrapped function (e.g. `fillna`), (GH9221)
- `DataFrame` now properly supports simultaneous `copy` and `dtype` arguments in constructor (GH9099)
- Bug in `read_csv` when using `skiprows` on a file with CR line endings with the `c` engine. (GH9079)
- `isnull` now detects `NaT` in `PeriodIndex` (GH9129)
- Bug in `groupby .nth()` with a multiple column `groupby` (GH8979)
- Bug in `DataFrame.where` and `Series.where` coerce numerics to string incorrectly (GH9280)
- Bug in `DataFrame.where` and `Series.where` raise `ValueError` when string list-like is passed. (GH9280)
- Accessing `Series.str` methods on with non-string values now raises `TypeError` instead of producing incorrect results (GH9184)
- Bug in `DatetimeIndex.__contains__` when index has duplicates and is not monotonic increasing (GH9512)
- Fixed division by zero error for `Series.kurt()` when all values are equal (GH9197)
- Fixed issue in the `xlsxwriter` engine where it added a default 'General' format to cells if no other format was applied. This prevented other row or column formatting being applied. (GH9167)
- Fixes issue with `index_col=False` when `usecols` is also specified in `read_csv`. (GH9082)
- Bug where `wide_to_long` would modify the input stub names list (GH9204)
- Bug in `to_sql` not storing `float64` values using double precision. (GH9009)
- `SparseSeries` and `SparsePanel` now accept zero argument constructors (same as their non-sparse counterparts) (GH9272).
- Regression in merging `Categorical` and `object` dtypes (GH9426)
- Bug in `read_csv` with buffer overflows with certain malformed input files (GH9205)
- Bug in `groupby MultiIndex` with missing pair (GH9049, GH9344)
- Fixed bug in `Series.groupby` where grouping on `MultiIndex` levels would ignore the `sort` argument (GH9444)

- Fix bug in `DataFrame.Groupby` where `sort=False` is ignored in the case of Categorical columns. (GH8868)
- Fixed bug with reading CSV files from Amazon S3 on python 3 raising a `TypeError` (GH9452)
- Bug in the Google BigQuery reader where the 'jobComplete' key may be present but False in the query results (GH8728)
- Bug in `Series.values_counts` with excluding NaN for categorical type Series with `dropna=True` (GH9443)
- Fixed missing `numeric_only` option for `DataFrame.std/var/sem` (GH9201)
- Support constructing `Panel` or `Panel4D` with scalar data (GH8285)
- Series text representation disconnected from `max_rows/max_columns` (GH7508).
- Series number formatting inconsistent when truncated (GH8532).

#### Previous Behavior

```
In [2]: pd.options.display.max_rows = 10
In [3]: s = pd.Series([1,1,1,1,1,1,1,1,1,1,0.9999,1,1]*10)
In [4]: s
Out[4]:
0      1
1      1
2      1
...
127    0.9999
128    1.0000
129    1.0000
Length: 130, dtype: float64
```

#### New Behavior

```
0      1.0000
1      1.0000
2      1.0000
3      1.0000
4      1.0000
...
125    1.0000
126    1.0000
127    0.9999
128    1.0000
129    1.0000
dtype: float64
```

- A Spurious `SettingWithCopy Warning` was generated when setting a new item in a frame in some cases (GH8730)

The following would previously report a `SettingWithCopy Warning`.

```
In [58]: df1 = pd.DataFrame({'x': pd.Series(['a', 'b', 'c']),
.....:                      'y': pd.Series(['d', 'e', 'f'])})
.....:

In [59]: df2 = df1[['x']]

In [60]: df2['y'] = ['g', 'h', 'i']
```

## **39.10 Version 0.15**

### **39.10.1 v0.15.2 (December 12, 2014)**

{{ header }}

This is a minor release from 0.15.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. A small number of API changes were necessary to fix existing bugs. We recommend that all users upgrade to this version.

- *Enhancements*

- *API Changes*
- *Performance Improvements*
- *Bug Fixes*

### 39.10.1.1 API changes

- Indexing in `MultiIndex` beyond lex-sort depth is now supported, though a lexically sorted index will have a better performance. (GH2646)

```
In [1]: df = pd.DataFrame({'jim':[0, 0, 1, 1],
...:                       'joe':['x', 'x', 'z', 'y'],
...:                       'jolie':np.random.rand(4)}).set_index(['jim', 'joe'])
...:
```

```
In [2]: df
```

Out [2] :

|     |     |          |
|-----|-----|----------|
|     |     | jolie    |
| jim | joe |          |
| 0   | x   | 0.823868 |
|     | x   | 0.400987 |
| 1   | z   | 0.310430 |
|     | y   | 0.142428 |

```
[4 rows x 1 columns]
```

```
In [3]: df.index.lexsort_depth
```

$$\begin{array}{c} \backslash \backslash \backslash \\ \hookrightarrow 1 \end{array}$$

```
# in prior versions this would raise a KeyError
# will now show a PerformanceWarning
```

```
In [4]: df.loc[(1, 'z')]
```

```
jim joe      jolie
1    z      0.31043
```

```
[1 rows x 1 columns]
```

```
# lexically sorting
```

```
In [5]: df2 = df.sort_index()
```

```
In [6]: df2
```

Out [6] :

|     |     | jolie    |
|-----|-----|----------|
| jim | joe |          |
| 0   | x   | 0.823868 |
|     | x   | 0.400987 |
| 1   | y   | 0.142428 |
|     | z   | 0.310430 |

```
[4 rows x 1 columns]
```

```
In [7]: df2.index.lexsort_depth
```

↪ 2

(continues on next page)

(continued from previous page)

```
In [8]: df2.loc[(1, 'z')]
////////////////////////////////////
↩
      jolie
jim joe
1    z    0.31043

[1 rows x 1 columns]
```

- Bug in `unique` of Series with `category` dtype, which returned all categories regardless whether they were “used” or not (see [GH8559](#) for the discussion). Previous behaviour was to return all categories:

```
In [3]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])

In [4]: cat
Out[4]:
[a, b, a]
Categories (3, object): [a < b < c]

In [5]: cat.unique()
Out[5]: array(['a', 'b', 'c'], dtype=object)
```

Now, only the categories that do effectively occur in the array are returned:

```
In [9]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
In [10]: cat.unique()
Out[10]:
[a, b]
Categories (2, object): [a, b]
```

- `Series.all` and `Series.any` now support the `level` and `skipna` parameters. `Series.all`, `Series.any`, `Index.all`, and `Index.any` no longer support the `out` and `keepdims` parameters, which existed for compatibility with `ndarray`. Various index types no longer support the `all` and `any` aggregation functions and will now raise `TypeError`. (GH8302).
- Allow equality comparisons of `Series` with a categorical dtype and object dtype; previously these would raise `TypeError` (GH8938)
- Bug in `NDFrame`: conflicting attribute/column names now behave consistently between getting and setting. Previously, when both a column and attribute named `y` existed, `data.y` would return the attribute, while `data.y = z` would update the column (GH8994)

```
In [11]: data = pd.DataFrame({'x': [1, 2, 3]})

In [12]: data.y = 2

In [13]: data['y'] = [2, 4, 6]

In [14]: data
Out[14]:
```

|   | x | y |
|---|---|---|
| 0 | 1 | 2 |
| 1 | 2 | 4 |
| 2 | 3 | 6 |

(continues on next page)

(continued from previous page)

```
[3 rows x 2 columns]

# this assignment was inconsistent
In [15]: data.y = 5
```

Old behavior:

```
In [6]: data.y
Out[6]: 2

In [7]: data['y'].values
Out[7]: array([5, 5, 5])
```

New behavior:

```
In [16]: data.y
Out[16]: 5

In [17]: data['y'].values
Out[17]: array([2, 4, 6])
```

- `Timestamp('now')` is now equivalent to `Timestamp.now()` in that it returns the local time rather than UTC. Also, `Timestamp('today')` is now equivalent to `Timestamp.today()` and both have `tz` as a possible argument. (GH9000)
- Fix negative step support for label-based slices (GH8753)

Old behavior:

```
In [1]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])
Out[1]:
a    0
b    1
c    2
dtype: int64

In [2]: s.loc['c':'a':-1]
Out[2]:
c    2
dtype: int64
```

New behavior:

```
In [18]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])

In [19]: s.loc['c':'a':-1]
Out[19]:
c    2
b    1
a    0
Length: 3, dtype: int64
```

### 39.10.1.2 Enhancements

Categorical enhancements:

- Added ability to export Categorical data to Stata ([GH8633](#)). See *here* for limitations of categorical variables exported to Stata data files.
- Added flag `order_categoricals` to `StataReader` and `read_stata` to select whether to order imported categorical data ([GH8836](#)). See *here* for more information on importing categorical variables from Stata data files.
- Added ability to export Categorical data to to/from HDF5 ([GH7621](#)). Queries work the same as if it was an object array. However, the `category` dtyped data is stored in a more efficient manner. See *here* for an example and caveats w.r.t. prior versions of pandas.
- Added support for `searchsorted()` on *Categorical* class ([GH8420](#)).

Other enhancements:

- Added the ability to specify the SQL type of columns when writing a `DataFrame` to a database ([GH8778](#)). For example, specifying to use the sqlalchemy `String` type instead of the default `Text` type for string columns:

```
from sqlalchemy.types import String
data.to_sql('data_dtype', engine, dtype={'Col_1': String}) # noqa F821
```

- `Series.all` and `Series.any` now support the `level` and `skipna` parameters ([GH8302](#)):

```
In [20]: s = pd.Series([False, True, False], index=[0, 0, 1])

In [21]: s.any(level=0)
Out[21]:
0      True
1     False
Length: 2, dtype: bool
```

- `Panel` now supports the `all` and `any` aggregation functions. ([GH8302](#)):

```
In [22]: p = pd.Panel(np.random.rand(2, 5, 4) > 0.1)

In [23]: p.all()
Out[23]:
      0      1      2      3
0  True  True  False  True
1  True  True   True  True
2  True  True   True  True
3  True  True   True  True
4  True  True  False  False

[5 rows x 4 columns]
```

- Added support for `utcfromtimestamp()`, `fromtimestamp()`, and `combine()` on *Timestamp* class ([GH5351](#)).
- Added Google Analytics (*pandas.io.ga*) basic documentation ([GH8835](#)). See *here*.
- `Timedelta` arithmetic returns `NotImplemented` in unknown cases, allowing extensions by custom classes ([GH8813](#)).
- `Timedelta` now supports arithmetic with `numpy.ndarray` objects of the appropriate dtype (numpy 1.8 or newer only) ([GH8884](#)).
- Added `Timedelta.to_timedelta64()` method to the public API ([GH8884](#)).
- Added `gbq.generate_bq_schema()` function to the `gbq` module ([GH8325](#)).
- `Series` now works with map objects the same way as generators ([GH8909](#)).

- Added context manager to `HDFStore` for automatic closing ([GH8791](#)).
- `to_datetime` gains an `exact` keyword to allow for a format to not require an exact match for a provided format string (if its `False`). `exact` defaults to `True` (meaning that exact matching is still the default) ([GH8904](#))
- Added `axvlines` boolean option to `parallel_coordinates` plot function, determines whether vertical lines will be printed, default is `True`
- Added ability to read table footers to `read_html` ([GH8552](#))
- `to_sql` now infers data types of non-NA values for columns that contain NA values and have dtype object ([GH8778](#)).

### 39.10.1.3 Performance

- Reduce memory usage when `skiprows` is an integer in `read_csv` ([GH8681](#))
- Performance boost for `to_datetime` conversions with a passed `format=`, and the `exact=False` ([GH8904](#))

### 39.10.1.4 Bug Fixes

- Bug in `concat` of Series with `category` dtype which were coercing to object. ([GH8641](#))
- Bug in `Timestamp-Timestamp` not returning a `Timedelta` type and `datelike-datelike` ops with timezones ([GH8865](#))
- Made consistent a timezone mismatch exception (either `tz` operated with `None` or incompatible timezone), will now return `TypeError` rather than `ValueError` (a couple of edge cases only), ([GH8865](#))
- Bug in using a `pd.Grouper(key=...)` with no level/axis or level only ([GH8795](#), [GH8866](#))
- Report a `TypeError` when invalid/no parameters are passed in a `groupby` ([GH8015](#))
- Bug in packaging pandas with `py2app/cx_Freeze` ([GH8602](#), [GH8831](#))
- Bug in `groupby` signatures that didn't include `*args` or `**kwargs` ([GH8733](#)).
- `io.data.Options` now raises `RemoteDataError` when no expiry dates are available from Yahoo and when it receives no data from Yahoo ([GH8761](#)), ([GH8783](#)).
- Unclear error message in `csv` parsing when passing `dtype` and `names` and the parsed data is a different data type ([GH8833](#))
- Bug in slicing a `MultiIndex` with an empty list and at least one boolean indexer ([GH8781](#))
- `io.data.Options` now raises `RemoteDataError` when no expiry dates are available from Yahoo ([GH8761](#)).
- `Timedelta` kwargs may now be numpy ints and floats ([GH8757](#)).
- Fixed several outstanding bugs for `Timedelta` arithmetic and comparisons ([GH8813](#), [GH5963](#), [GH5436](#)).
- `sql_schema` now generates dialect appropriate `CREATE TABLE` statements ([GH8697](#))
- `slice` string method now takes `step` into account ([GH8754](#))
- Bug in `BlockManager` where setting values with different type would break block integrity ([GH8850](#))
- Bug in `DatetimeIndex` when using `time` object as key ([GH8667](#))
- Bug in `merge` where `how='left'` and `sort=False` would not preserve left frame order ([GH7331](#))
- Bug in `MultiIndex.reindex` where reindexing at level would not reorder labels ([GH4088](#))

- Bug in certain operations with dateutil timezones, manifesting with dateutil 2.3 (GH8639)
- Regression in DatetimeIndex iteration with a Fixed/Local offset timezone (GH8890)
- Bug in `to_datetime` when parsing a nanoseconds using the `%f` format (GH8989)
- `io.data.Options` now raises `RemoteDataError` when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
- Fix: The font size was only set on x axis if vertical or the y axis if horizontal. (GH8765)
- Fixed division by 0 when reading big csv files in python 3 (GH8621)
- Bug in outputting a MultiIndex with `to_html, index=False` which would add an extra column (GH8452)
- Imported categorical variables from Stata files retain the ordinal information in the underlying data (GH8836).
- Defined `.size` attribute across `NDFrame` objects to provide compat with numpy `>= 1.9.1`; buggy with `np.array_split` (GH8846)
- Skip testing of histogram plots for matplotlib `<= 1.2` (GH8648).
- Bug where `get_data_google` returned object dtypes (GH3995)
- Bug in `DataFrame.stack(..., dropna=False)` when the `DataFrame`'s columns is a `MultiIndex` whose labels do not reference all its levels. (GH8844)
- Bug in that Option context applied on `__enter__` (GH8514)
- Bug in `resample` that causes a `ValueError` when resampling across multiple days and the last offset is not calculated from the start of the range (GH8683)
- Bug where `DataFrame.plot(kind='scatter')` fails when checking if an `np.array` is in the `DataFrame` (GH8852)
- Bug in `pd.infer_freq/DataFrame.inferred_freq` that prevented proper sub-daily frequency inference when the index contained DST days (GH8772).
- Bug where index name was still used when plotting a series with `use_index=False` (GH8558).
- Bugs when trying to stack multiple columns, when some (or all) of the level names are numbers (GH8584).
- Bug in `MultiIndex` where `__contains__` returns wrong result if index is not lexically sorted or unique (GH7724)
- BUG CSV: fix problem with trailing white space in skipped rows, (GH8679), (GH8661), (GH8983)
- Regression in `Timestamp` does not parse 'Z' zone designator for UTC (GH8771)
- Bug in `StataWriter` the produces writes strings with 244 characters irrespective of actual size (GH8969)
- Fixed `ValueError` raised by `cummin/cummax` when `datetime64 Series` contains `NaT`. (GH8965)
- Bug in `DataReader` returns object dtype if there are missing values (GH8980)
- Bug in plotting if `sharex` was enabled and index was a timeseries, would show labels on multiple axes (GH3964).
- Bug where passing a unit to the `TimedeltaIndex` constructor applied the to nano-second conversion twice. (GH9011).
- Bug in plotting of a period-like array (GH9012)

### 39.10.1.5 Contributors

A total of 49 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.10.2 v0.15.1 (November 9, 2014)

{{ header }}

This is a minor bug-fix release from 0.15.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- *Enhancements*
- *API Changes*
- *Bug Fixes*

#### 39.10.2.1 API changes

- `s.dt.hour` and other `.dt` accessors will now return `np.nan` for missing values (rather than previously `-1`), ([GH8689](#))

```
In [1]: s = pd.Series(pd.date_range('20130101', periods=5, freq='D'))
In [2]: s.iloc[2] = np.nan
In [3]: s
Out[3]:
0    2013-01-01
1    2013-01-02
2             NaT
3    2013-01-04
4    2013-01-05
Length: 5, dtype: datetime64[ns]
```

previous behavior:

```
In [6]: s.dt.hour
Out[6]:
0      0
1      0
2     -1
3      0
4      0
dtype: int64
```

current behavior:

```
In [4]: s.dt.hour
Out[4]:
0      0.0
1      0.0
2      NaN
3      0.0
4      0.0
Length: 5, dtype: float64
```

- `groupby` with `as_index=False` will not add erroneous extra columns to result ([GH8582](#)):

```
In [5]: np.random.seed(2718281)

In [6]: df = pd.DataFrame(np.random.randint(0, 100, (10, 2)),
...:                      columns=['jim', 'joe'])
...:

In [7]: df.head()
Out[7]:
   jim  joe
0    61   81
1    96   49
2    55   65
3    72   51
4    77   12

[5 rows x 2 columns]

In [8]: ts = pd.Series(5 * np.random.randint(0, 3, 10))
```

previous behavior:

```
In [4]: df.groupby(ts, as_index=False).max()
Out[4]:
   NaN  jim  joe
0     0   72   83
1     5   77   84
2    10   96   65
```

current behavior:

```
In [9]: df.groupby(ts, as_index=False).max()
Out[9]:
   jim  joe
0    72   83
1    77   84
```

(continues on next page)

(continued from previous page)

```
2    96    65

[3 rows x 2 columns]
```

- `groupby` will not erroneously exclude columns if the column name conflicts with the grouper name ([GH8112](#)):

```
In [10]: df = pd.DataFrame({'jim': range(5), 'joe': range(5, 10)})

In [11]: df
Out[11]:
   jim  joe
0     0     5
1     1     6
2     2     7
3     3     8
4     4     9

[5 rows x 2 columns]

In [12]: gr = df.groupby(df['jim'] < 2)
```

previous behavior (excludes 1st column from output):

```
In [4]: gr.apply(sum)
Out[4]:
      joe
jim
False   24
True    11
```

current behavior:

```
In [13]: gr.apply(sum)
Out[13]:
      jim  joe
jim
False     9   24
True      1   11

[2 rows x 2 columns]
```

- Support for slicing with monotonic decreasing indexes, even if start or stop is not found in the index ([GH7860](#)):

```
In [14]: s = pd.Series(['a', 'b', 'c', 'd'], [4, 3, 2, 1])

In [15]: s
Out[15]:
4    a
3    b
2    c
1    d
Length: 4, dtype: object
```

previous behavior:

```
In [8]: s.loc[3.5:1.5]
KeyError: 3.5
```

current behavior:

```
In [16]: s.loc[3.5:1.5]
Out[16]:
3      b
2      c
Length: 2, dtype: object
```

- `io.data.Options` has been fixed for a change in the format of the Yahoo Options page ([GH8612](#)), ([GH8741](#))

**Note:** As a result of a change in Yahoo's option page layout, when an expiry date is given, `Options` methods now return data for a single expiry date. Previously, methods returned all data for the selected month.

The `month` and `year` parameters have been undeprecated and can be used to get all options data for a given month.

If an expiry date that is not valid is given, data for the next expiry after the given date is returned.

Option data frames are now saved on the instance as `callsYYMMDD` or `putsYYMMDD`. Previously they were saved as `callsSMMYY` and `putsSMMYY`. The next expiry is saved as `calls` and `puts`.

New features:

- The expiry parameter can now be a single date or a list-like object containing dates.
- A new property `expiry_dates` was added, which returns all available expiry dates.

Current behavior:

```
In [17]: from pandas.io.data import Options

In [18]: aapl = Options('aapl', 'yahoo')

In [19]: aapl.get_call_data().iloc[0:5, 0:1]
Out[19]:
```

| Strike | Expiry     | Type | Symbol              | Last  |
|--------|------------|------|---------------------|-------|
| 80     | 2014-11-14 | call | AAPL141114C00080000 | 29.05 |
| 84     | 2014-11-14 | call | AAPL141114C00084000 | 24.80 |
| 85     | 2014-11-14 | call | AAPL141114C00085000 | 24.05 |
| 86     | 2014-11-14 | call | AAPL141114C00086000 | 22.76 |
| 87     | 2014-11-14 | call | AAPL141114C00087000 | 21.74 |

```

In [20]: aapl.expiry_dates
Out[20]:
[datetime.date(2014, 11, 14),
 datetime.date(2014, 11, 22),
 datetime.date(2014, 11, 28),

 datetime.date(2014, 12, 12),
 datetime.date(2014, 12, 20),
 datetime.date(2015, 1, 17),
 datetime.date(2015, 2, 20),
 datetime.date(2015, 4, 17),

```

(continues on next page)

(continued from previous page)

```
datetime.date(2015, 7, 17),
datetime.date(2016, 1, 15),
datetime.date(2017, 1, 20)]
```

```
In [21]: aapl.get_near_stock_price(expiry=aapl.expiry_dates[0:3]).iloc[0:5, 0:1]
```

```
Out [21]:
```

|     | Strike     | Expiry | Type                | Symbol | Last |
|-----|------------|--------|---------------------|--------|------|
| 109 | 2014-11-22 | call   | AAPL141122C00109000 | 1.48   |      |
|     | 2014-11-28 | call   | AAPL141128C00109000 | 1.79   |      |
| 110 | 2014-11-14 | call   | AAPL141114C00110000 | 0.55   |      |
|     | 2014-11-22 | call   | AAPL141122C00110000 | 1.02   |      |
|     | 2014-11-28 | call   | AAPL141128C00110000 | 1.32   |      |

- pandas now also registers the `datetime64` dtype in matplotlib's units registry to plot such values as datetimes. This is activated once pandas is imported. In previous versions, plotting an array of `datetime64` values will have resulted in plotted integer values. To keep the previous behaviour, you can do `del matplotlib.units.registry[np.datetime64]` (GH8614).

### 39.10.2.2 Enhancements

- `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

```
In [17]: from collections import deque
```

```
In [18]: df1 = pd.DataFrame([1, 2, 3])
```

```
In [19]: df2 = pd.DataFrame([4, 5, 6])
```

previous behavior:

```
In [7]: pd.concat(deque((df1, df2)))
TypeError: first argument must be a list-like of pandas objects, you passed an_
↪object of type "deque"
```

current behavior:

```
In [20]: pd.concat(deque((df1, df2)))
```

```
Out [20]:
```

```
0
0 1
1 2
2 3
0 4
1 5
2 6

[6 rows x 1 columns]
```

- Represent `MultiIndex` labels with a dtype that utilizes memory based on the level size. In prior versions, the memory usage was a constant 8 bytes per element in each level. In addition, in prior versions, the *reported* memory usage was incorrect as it didn't show the usage for the memory occupied by the underlying data array. (GH8456)

```
In [21]: dfi = pd.DataFrame(1, index=pd.MultiIndex.from_product([['a'],
.....:                                     range(1000)]), columns=['A'])
.....:
```

previous behavior:

```
# this was underreported in prior versions
In [1]: dfi.memory_usage(index=True)
Out[1]:
Index      8000 # took about 24008 bytes in < 0.15.1
A          8000
dtype: int64
```

current behavior:

```
In [22]: dfi.memory_usage(index=True)
Out[22]:
Index      52080
A          8000
Length: 2, dtype: int64
```

- Added Index properties *is\_monotonic\_increasing* and *is\_monotonic\_decreasing* (GH8680).
- Added option to select columns when importing Stata files (GH7935)
- Qualify memory usage in `DataFrame.info()` by adding + if it is a lower bound (GH8578)
- Raise errors in certain aggregation cases where an argument such as `numeric_only` is not handled (GH8592).
- Added support for 3-character ISO and non-standard country codes in `io.wb.download()` (GH8482)
- World Bank data requests now will warn/raise based on an `errors` argument, as well as a list of hard-coded country codes and the World Bank's JSON response. In prior versions, the error messages didn't look at the World Bank's JSON response. Problem-inducing input were simply dropped prior to the request. The issue was that many good countries were cropped in the hard-coded approach. All countries will work now, but some bad countries will raise exceptions because some edge cases break the entire response. (GH8482)
- Added option to `Series.str.split()` to return a `DataFrame` rather than a `Series` (GH8428)
- Added option to `df.info(null_counts=None|True|False)` to override the default display options and force showing of the null-counts (GH8701)

### 39.10.2.3 Bug Fixes

- Bug in unpickling of a `CustomBusinessDay` object (GH8591)
- Bug in coercing `Categorical` to a records array, e.g. `df.to_records()` (GH8626)
- Bug in `Categorical` not created properly with `Series.to_frame()` (GH8626)
- Bug in coercing in `astype` of a `Categorical` of a passed `pd.Categorical` (this now raises `TypeError` correctly), (GH8626)
- Bug in `cut/qcut` when using `Series` and `retbins=True` (GH8589)
- Bug in writing `Categorical` columns to an SQL database with `to_sql` (GH8624).
- Bug in comparing `Categorical` of datetime raising when being compared to a scalar datetime (GH8687)
- Bug in selecting from a `Categorical` with `.iloc` (GH8623)
- Bug in groupby-transform with a `Categorical` (GH8623)

- Bug in duplicated/drop\_duplicates with a Categorical (GH8623)
- Bug in Categorical reflected comparison operator raising if the first argument was a numpy array scalar (e.g. np.int64) (GH8658)
- Bug in Panel indexing with a list-like (GH8710)
- Compat issue is DataFrame.dtypes when options.mode.use\_inf\_as\_null is True (GH8722)
- Bug in read\_csv, dialect parameter would not take a string (GH8703)
- Bug in slicing a MultiIndex level with an empty-list (GH8737)
- Bug in numeric index operations of add/sub with Float/Index Index with numpy arrays (GH8608)
- Bug in setitem with empty indexer and unwanted coercion of dtypes (GH8669)
- Bug in ix/loc block splitting on setitem (manifests with integer-like dtypes, e.g. datetime64) (GH8607)
- Bug when doing label based indexing with integers not found in the index for non-unique but monotonic indexes (GH8680).
- Bug when indexing a Float64Index with np.nan on numpy 1.7 (GH8980).
- Fix shape attribute for MultiIndex (GH8609)
- Bug in GroupBy where a name conflict between the grouper and columns would break groupby operations (GH7115, GH8112)
- Fixed a bug where plotting a column y and specifying a label would mutate the index name of the original DataFrame (GH8494)
- Fix regression in plotting of a DatetimeIndex directly with matplotlib (GH8614).
- Bug in date\_range where partially-specified dates would incorporate current date (GH6961)
- Bug in Setting by indexer to a scalar value with a mixed-dtype Panel4d was failing (GH8702)
- Bug where DataReader's would fail if one of the symbols passed was invalid. Now returns data for valid symbols and np.nan for invalid (GH8494)
- Bug in get\_quote\_yahoo that wouldn't allow non-float return values (GH5229).

#### 39.10.2.4 Contributors

A total of 23 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Aaron Staple +
- Andrew Rosenfeld
- Anton I. Sipos
- Artemy Kolchinsky

### 39.10.3 v0.15.0 (October 18, 2014)

{{ header }}

This is a major release from 0.14.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas  $\geq$  0.15.0 will no longer support compatibility with NumPy versions  $< 1.7.0$ . If you want to use the latest versions of pandas, please upgrade to NumPy  $\geq 1.7.0$  ([GH7711](#))

- Highlights include:
  - The `Categorical` type was integrated as a first-class pandas type, see [here](#)
  - New scalar type `Timedelta`, and a new index type `TimedeltaIndex`, see [here](#)
  - New datetimelike properties accessor `.dt` for Series, see *Datetimelike Properties*
  - New DataFrame default display for `df.info()` to include memory usage, see *Memory Usage*
  - `read_csv` will now by default ignore blank lines when parsing, see [here](#)
  - API change in using Indexes in set operations, see [here](#)
  - Enhancements in the handling of timezones, see [here](#)
  - A lot of improvements to the rolling and expanding moment functions, see [here](#)
  - Internal refactoring of the `Index` class to no longer sub-class `ndarray`, see *Internal Refactoring*
  - dropping support for `PyTables` less than version 3.0.0, and `numexpr` less than version 2.1 ([GH7990](#))
  - Split indexing documentation into *Indexing and Selecting Data* and *MultiIndex / Advanced Indexing*
  - Split out string methods documentation into *Working with Text Data*
- Check the *API Changes* and *deprecations* before updating
- *Other Enhancements*

- *Performance Improvements*
- *Bug Fixes*

**Warning:** In 0.15.0 `Index` has internally been refactored to no longer sub-class `ndarray` but instead subclass `PandasObject`, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (See the *Internal Refactoring*)

**Warning:** The refactoring in *Categorical* changed the two argument constructor from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use *Categorical* directly, please audit your code before updating to this pandas version and change it to use the `from_codes()` constructor. See more on *Categorical* [here](#)

### 39.10.3.1 New features

#### Categoricals in Series/DataFrame

*Categorical* can now be included in *Series* and *DataFrames* and gained new methods to manipulate. Thanks to Jan Schulz for much of this API/implementation. (GH3943, GH5313, GH5314, GH7444, GH7839, GH7848, GH7864, GH7914, GH7768, GH8006, GH3678, GH8075, GH8076, GH8143, GH8453, GH8518).

For full docs, see the *categorical introduction* and the *API documentation*.

```
In [1]: df = pd.DataFrame({"id": [1, 2, 3, 4, 5, 6],
...:                      "raw_grade": ['a', 'b', 'b', 'a', 'a', 'e']})
...:

In [2]: df["grade"] = df["raw_grade"].astype("category")

In [3]: df["grade"]
Out[3]:
0    a
1    b
2    b
3    a
4    a
5    e
Name: grade, Length: 6, dtype: category
Categories (3, object): [a, b, e]

# Rename the categories
In [4]: df["grade"].cat.categories = ["very good", "good", "very bad"]

# Reorder the categories and simultaneously add the missing categories
In [5]: df["grade"] = df["grade"].cat.set_categories(["very bad", "bad",
...:                                                  "medium", "good", "very good"])
...:

In [6]: df["grade"]
Out[6]:
0    very good
```

(continues on next page)

(continued from previous page)

```

1      good
2      good
3  very good
4  very good
5  very bad
Name: grade, Length: 6, dtype: category
Categories (5, object): [very bad, bad, medium, good, very good]

```

```
In [7]: df.sort_values("grade")
```

```

↪
   id raw_grade  grade
5   6         e  very bad
1   2         b    good
2   3         b    good
0   1         a  very good
3   4         a  very good
4   5         a  very good

```

```
[6 rows x 3 columns]
```

```
In [8]: df.groupby("grade").size()
```

```

↪
grade
very bad    1
bad         0
medium      0
good        2
very good   3
Length: 5, dtype: int64

```

- `pandas.core.group_agg` and `pandas.core.factor_agg` were removed. As an alternative, construct a dataframe and use `df.groupby(<group>).agg(<func>)`.
- Supplying “codes/labels and levels” to the *Categorical* constructor is not supported anymore. Supplying two arguments to the constructor is now interpreted as “values and levels (now called ‘categories’)”. Please change your code to use the `from_codes()` constructor.
- The `Categorical.labels` attribute was renamed to `Categorical.codes` and is read only. If you want to manipulate codes, please use one of the *API methods on Categoricals*.
- The `Categorical.levels` attribute is renamed to `Categorical.categories`.

## TimedeltaIndex/Scalar

We introduce a new scalar type `Timedelta`, which is a subclass of `datetime.timedelta`, and behaves in a similar manner, but allows compatibility with `np.timedelta64` types as well as a host of custom representation, parsing, and attributes. This type is very similar to how `Timestamp` works for datetimes. It is a nice-API box for the type. See the *docs*. ([GH3009](#), [GH4533](#), [GH8209](#), [GH8187](#), [GH8190](#), [GH7869](#), [GH7661](#), [GH8345](#), [GH8471](#))

**Warning:** `Timedelta` scalars (and `TimedeltaIndex`) component fields are *not the same* as the component fields on a `datetime.timedelta` object. For example, `.seconds` on a `datetime.timedelta` object returns the total number of seconds combined between hours, minutes and seconds. In contrast, the pandas

Timedelta breaks out hours, minutes, microseconds and nanoseconds separately.

```
# Timedelta accessor
In [9]: tds = pd.Timedelta('31 days 5 min 3 sec')

In [10]: tds.minutes
Out[10]: 5L

In [11]: tds.seconds
Out[11]: 3L

# datetime.timedelta accessor
# this is 5 minutes * 60 + 3 seconds
In [12]: tds.to_pytimedelta().seconds
Out[12]: 303
```

**Note:** this is no longer true starting from v0.16.0, where full compatibility with `datetime.timedelta` is introduced. See the *0.16.0 whatsnew* entry

**Warning:** Prior to 0.15.0 `pd.to_timedelta` would return a `Series` for list-like/`Series` input, and a `np.timedelta64` for scalar input. It will now return a `TimedeltaIndex` for list-like input, `Series` for `Series` input, and `Timedelta` for scalar input.

The arguments to `pd.to_timedelta` are now `(arg, unit='ns', box=True, coerce=False)`, previously were `(arg, box=True, unit='ns')` as these are more logical.

Construct a scalar

```
In [9]: pd.Timedelta('1 days 06:05:01.00003')
Out[9]: Timedelta('1 days 06:05:01.000030')

In [10]: pd.Timedelta('15.5us')
Out[10]: Timedelta('0 days 00:00:00.000015')

In [11]: pd.Timedelta('1 hour 15.5us')
Out[11]: Timedelta('0 days 01:00:00.000015')

# negative Timedeltas have this string repr
# to be more consistent with datetime.timedelta conventions
In [12]: pd.Timedelta('-1us')
Out[12]: Timedelta('-1 days +23:59:59.999999')

# a NaT
In [13]: pd.Timedelta('nan')
Out[13]: NaT
```

Access fields for a `Timedelta`

```
In [14]: td = pd.Timedelta('1 hour 3m 15.5us')

In [15]: td.seconds
```

(continues on next page)

(continued from previous page)

```

1 days 00:00:02    2
1 days 00:00:03    3
1 days 00:00:04    4
Freq: S, Length: 5, dtype: int64

```

You can select with partial string selections

```

In [23]: s['1 day 00:00:02']
Out[23]: 2

In [24]: s['1 day':'1 day 00:00:02']
Out[24]:
\\\\\\\\\\\\\\\\\\\\
1 days 00:00:00    0
1 days 00:00:01    1
1 days 00:00:02    2
Freq: S, Length: 3, dtype: int64

```

Finally, the combination of `TimedeltaIndex` with `DatetimeIndex` allow certain combination operations that are NaT preserving:

```

In [25]: tdi = pd.TimedeltaIndex(['1 days', pd.NaT, '2 days'])

In [26]: tdi.tolist()
Out[26]: [Timedelta('1 days 00:00:00'), NaT, Timedelta('2 days 00:00:00')]

In [27]: dti = pd.date_range('20130101', periods=3)

In [28]: dti.tolist()
Out[28]:
[Timestamp('2013-01-01 00:00:00', freq='D'),
 Timestamp('2013-01-02 00:00:00', freq='D'),
 Timestamp('2013-01-03 00:00:00', freq='D')]

In [29]: (dti + tdi).tolist()
Out[29]:
[Timestamp('2013-01-02 00:00:00'), NaT, Timestamp('2013-01-05 00:00:00')]

In [30]: (dti - tdi).tolist()
Out[30]:
[Timestamp('2012-12-31 00:00:00'), NaT, Timestamp('2013-01-01 00:00:00')]

```

- iteration of a Series e.g. `list(Series(...))` of `timedelta64[ns]` would prior to v0.15.0 return `np.timedelta64` for each element. These will now be wrapped in `Timedelta`.

## Memory Usage

Implemented methods to find memory usage of a `DataFrame`. See the *FAQ* for more. ([GH6852](#)).

A new display option `display.memory_usage` (see options) sets the default behavior of the `memory_usage` argument in the `df.info()` method. By default `display.memory_usage` is `True`.

```

In [31]: dtypes = ['int64', 'float64', 'datetime64[ns]', 'timedelta64[ns]',
.....:             'complex128', 'object', 'bool']
.....:

```

(continues on next page)

(continued from previous page)

```

In [32]: n = 5000

In [33]: data = {t: np.random.randint(100, size=n).astype(t) for t in dtypes}

In [34]: df = pd.DataFrame(data)

In [35]: df['categorical'] = df['object'].astype('category')

In [36]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
int64          5000 non-null int64
float64        5000 non-null float64
datetime64[ns] 5000 non-null datetime64[ns]
timedelta64[ns] 5000 non-null timedelta64[ns]
complex128     5000 non-null complex128
object         5000 non-null object
bool           5000 non-null bool
categorical    5000 non-null category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
→object(1), timedelta64[ns](1)
memory usage: 289.1+ KB

```

Additionally `memory_usage()` is an available method for a dataframe object which returns the memory usage of each column.

```

In [37]: df.memory_usage(index=True)
Out[37]:
Index          80
int64          40000
float64        40000
datetime64[ns] 40000
timedelta64[ns] 40000
complex128     80000
object         40000
bool           5000
categorical    10920
Length: 9, dtype: int64

```

### .dt accessor

Series has gained an accessor to succinctly return datetime like properties for the *values* of the Series, if its a datetime/period like Series. (GH7207) This will return a Series, indexed like the existing Series. See the *docs*

```

# datetime
In [38]: s = pd.Series(pd.date_range('20130101 09:10:12', periods=4))

In [39]: s
Out[39]:
0    2013-01-01 09:10:12
1    2013-01-02 09:10:12
2    2013-01-03 09:10:12
3    2013-01-04 09:10:12
Length: 4, dtype: datetime64[ns]

```

(continues on next page)

(continued from previous page)

```
In [40]: s.dt.hour
```

|   |   |
|---|---|
| 0 | 9 |
| 1 | 9 |
| 2 | 9 |
| 3 | 9 |

```
Length: 4, dtype: int64
```

```
In [41]: s.dt.second
```

|   |    |
|---|----|
| 0 | 12 |
| 1 | 12 |
| 2 | 12 |
| 3 | 12 |

```
Length: 4, dtype: int64
```

```
In [42]: s.dt.day
```

|   |   |
|---|---|
| 0 | 1 |
| 1 | 2 |
| 2 | 3 |
| 3 | 4 |

```
Length: 4, dtype: int64
```

```
In [43]: s.dt.freq
```

→ 'D'

This enables nice expressions like this:

```
In [44]: s[s.dt.day == 2]
```

Out [44]:

```
1 2013-01-02 09:10:12
```

```
Length: 1, dtype: datetime64[ns]
```

You can easily produce tz aware transformations:

```
In [45]: stz = s.dt.tz_localize('US/Eastern')
```

```
In [46]: stz
```

Out [46] :

|   |            |                |
|---|------------|----------------|
| 0 | 2013-01-01 | 09:10:12-05:00 |
| 1 | 2013-01-02 | 09:10:12-05:00 |
| 2 | 2013-01-03 | 09:10:12-05:00 |
| 3 | 2013-01-04 | 09:10:12-05:00 |

```
Length: 4, dtype: datetime64[ns, US/Eastern]
```

```
In [47]: stz.dt.tz
```

```
→<DstTzInfo 'US/Eastern' LMT-1 day, 19:04:00 STD>
```

You can also chain these types of operations:

(continued from previous page)

Length: 4, dtype: int64

## Timezone handling improvements

- `tz_localize(None)` for `tz-aware Timestamp` and `DatetimeIndex` now removes timezone holding local time, previously this resulted in `Exception` or `TypeError` ([GH7812](#))

**In [58]:** ts = pd.Timestamp('2014-08-01 09:00', tz='US/Eastern')**In [59]:** ts**Out[59]:** Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')**In [60]:** ts.tz\_localize(None)

```

////////////////////////////////////\Out[60]:

```

```

↪Timestamp('2014-08-01 09:00:00')

```

```

In [61]: didx = pd.DatetimeIndex(start='2014-08-01 09:00', freq='H',
    ....:                          periods=10, tz='US/Eastern')
    ....:

```

**In [62]:** didx**Out[62]:**

```

DatetimeIndex(['2014-08-01 09:00:00-04:00', '2014-08-01 10:00:00-04:00',
               '2014-08-01 11:00:00-04:00', '2014-08-01 12:00:00-04:00',
               '2014-08-01 13:00:00-04:00', '2014-08-01 14:00:00-04:00',
               '2014-08-01 15:00:00-04:00', '2014-08-01 16:00:00-04:00',
               '2014-08-01 17:00:00-04:00', '2014-08-01 18:00:00-04:00'],
              dtype='datetime64[ns, US/Eastern]', freq='H')

```

**In [63]:** didx.tz\_localize(None)

```

////////////////////////////////////

```

```

↪

```

```

DatetimeIndex(['2014-08-01 09:00:00', '2014-08-01 10:00:00',

               '2014-08-01 13:00:00', '2014-08-01 14:00:00',

```

(continues on next page)

(continued from previous page)

```
'2014-08-01 15:00:00', '2014-08-01 16:00:00',
'2014-08-01 17:00:00', '2014-08-01 18:00:00'],
dtype='datetime64[ns]', freq='H')
```

- `tz_localize` now accepts the ambiguous keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, 'NaT' for setting transition times to NaT, 'infer' for inferring DST/non-DST, and 'raise' (default) for an `AmbiguousTimeError` to be raised. See *the docs* for more details ([GH7943](#))
- `DataFrame.tz_localize` and `DataFrame.tz_convert` now accepts an optional `level` argument for localizing a specific level of a `MultiIndex` ([GH7846](#))
- `Timestamp.tz_localize` and `Timestamp.tz_convert` now raise `TypeError` in error cases, rather than `Exception` ([GH8025](#))
- a timeseries/index localized to UTC when inserted into a `Series/DataFrame` will preserve the UTC timezone (rather than being a naive `datetime64[ns]`) as object `dtype` ([GH8411](#))
- `Timestamp.__repr__` displays `dateutil.tz.tzoffset` info ([GH7907](#))

## Rolling/Expanding Moments improvements

- `rolling_min()`, `rolling_max()`, `rolling_cov()`, and `rolling_corr()` now return objects with all NaN when `len(arg) < min_periods <= window` rather than raising. (This makes all rolling functions consistent in this behavior). ([GH7766](#))

Prior to 0.15.0

```
In [64]: s = pd.Series([10, 11, 12, 13])
```

```
In [15]: pd.rolling_min(s, window=10, min_periods=5)
ValueError: min_periods (5) must be <= window (4)
```

New behavior

```
In [4]: pd.rolling_min(s, window=10, min_periods=5)
Out[4]:
0    NaN
1    NaN
2    NaN
3    NaN
dtype: float64
```

- `rolling_max()`, `rolling_min()`, `rolling_sum()`, `rolling_mean()`, `rolling_median()`, `rolling_std()`, `rolling_var()`, `rolling_skew()`, `rolling_kurt()`, `rolling_quantile()`, `rolling_cov()`, `rolling_corr()`, `rolling_corr_pairwise()`, `rolling_window()`, and `rolling_apply()` with `center=True` previously would return a result of the same structure as the input `arg` with NaN in the final  $(window-1)/2$  entries.

Now the final  $(window-1)/2$  entries of the result are calculated as if the input `arg` were followed by  $(window-1)/2$  NaN values (or with shrinking windows, in the case of `rolling_apply()`). ([GH7925](#), [GH8269](#))

Prior behavior (note final value is NaN):

```
In [7]: pd.rolling_sum(Series(range(4)), window=3, min_periods=0, center=True)
Out[7]:
```

(continues on next page)

(continued from previous page)

```

0      1
1      3
2      6
3     NaN
dtype: float64

```

New behavior (note final value is 5 = `sum([2, 3, NaN])`):

```

In [7]: pd.rolling_sum(pd.Series(range(4)), window=3,
....:                  min_periods=0, center=True)
Out[7]:
0      1
1      3
2      6
3      5
dtype: float64

```

- `rolling_window()` now normalizes the weights properly in rolling mean mode (`mean=True`) so that the calculated weighted means (e.g. 'triang', 'gaussian') are distributed about the same means as those calculated without weighting (i.e. 'boxcar'). See *the note on normalization* for further details. (GH7618)

```

In [65]: s = pd.Series([10.5, 8.8, 11.4, 9.7, 9.3])

```

Behavior prior to 0.15.0:

```

In [39]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[39]:
0      NaN
1    6.583333
2    6.883333
3    6.683333
4      NaN
dtype: float64

```

New behavior

```

In [10]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[10]:
0      NaN
1    9.875
2    10.325
3    10.025
4      NaN
dtype: float64

```

- Removed `center` argument from all `expanding_*` functions (see *list*), as the results produced when `center=True` did not make much sense. (GH7925)
- Added optional `ddof` argument to `expanding_cov()` and `rolling_cov()`. The default value of 1 is backwards-compatible. (GH8279)
- Documented the `ddof` argument to `expanding_var()`, `expanding_std()`, `rolling_var()`, and `rolling_std()`. These functions' support of a `ddof` argument (with a default value of 1) was previously undocumented. (GH8064)
- `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now interpret `min_periods` in the same manner that the `rolling_*` and `expanding_*` functions do: a given result entry will be

NaN if the (expanding, in this case) window does not contain at least `min_periods` values. The previous behavior was to set to NaN the `min_periods` entries starting with the first non- NaN value. (GH7977)

Prior behavior (note values start at index 2, which is `min_periods` after index 0 (the index of the first non-empty value)):

```
In [66]: s = pd.Series([1, None, None, None, 2, 3])
```

```
In [51]: ewma(s, com=3., min_periods=2)
```

```
Out [51]:
0      NaN
1      NaN
2    1.000000
3    1.000000
4    1.571429
5    2.189189
dtype: float64
```

New behavior (note values start at index 4, the location of the 2nd (since `min_periods=2`) non-empty value):

```
In [2]: pd.ewma(s, com=3., min_periods=2)
```

```
Out [2]:
0      NaN
1      NaN
2      NaN
3      NaN
4    1.759644
5    2.383784
dtype: float64
```

- `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `adjust` argument, just like `ewma()` does, affecting how the weights are calculated. The default value of `adjust` is `True`, which is backwards-compatible. See *Exponentially weighted moment functions* for details. (GH7911)
- `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `ignore_na` argument. When `ignore_na=False` (the default), missing values are taken into account in the weights calculation. When `ignore_na=True` (which reproduces the pre-0.15.0 behavior), missing values are ignored in the weights calculation. (GH7543)

```
In [7]: pd.ewma(pd.Series([None, 1., 8.]), com=2.)
```

```
Out [7]:
0      NaN
1     1.0
2     5.2
dtype: float64
```

```
In [8]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
.....:          ignore_na=True) # pre-0.15.0 behavior
```

```
Out [8]:
0     1.0
1     1.0
2     5.2
dtype: float64
```

```
In [9]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
.....:          ignore_na=False) # new default
```

```
Out [9]:
0    1.000000
```

(continues on next page)

(continued from previous page)

```
1    1.000000
2    5.846154
dtype: float64
```

**Warning:** By default (`ignore_na=False`) the `ewm*()` functions' weights calculation in the presence of missing values is different than in pre-0.15.0 versions. To reproduce the pre-0.15.0 calculation of weights in the presence of missing values one must specify explicitly `ignore_na=True`.

- Bug in `expanding_cov()`, `expanding_corr()`, `rolling_cov()`, `rolling_cor()`, `ewmcov()`, and `ewmcorr()` returning results with columns sorted by name and producing an error for non-unique columns; now handles non-unique columns and returns columns in original order (except for the case of two DataFrames with `pairwise=False`, where behavior is unchanged) (GH7542)
- Bug in `rolling_count()` and `expanding_*()` functions unnecessarily producing error message for zero-length data (GH8056)
- Bug in `rolling_apply()` and `expanding_apply()` interpreting `min_periods=0` as `min_periods=1` (GH8080)
- Bug in `expanding_std()` and `expanding_var()` for a single value producing a confusing error message (GH7900)
- Bug in `rolling_std()` and `rolling_var()` for a single value producing 0 rather than NaN (GH7900)
- Bug in `ewmstd()`, `ewmvol()`, `ewmvar()`, and `ewmcov()` calculation of de-biasing factors when `bias=False` (the default). Previously an incorrect constant factor was used, based on `adjust=True`, `ignore_na=True`, and an infinite number of observations. Now a different factor is used for each entry, based on the actual weights (analogous to the usual  $N / (N-1)$  factor). In particular, for a single point a value of NaN is returned when `bias=False`, whereas previously a value of (approximately) 0 was returned.

For example, consider the following pre-0.15.0 results for `ewmvar(..., bias=False)`, and the corresponding debiasing factors:

```
In [67]: s = pd.Series([1., 2., 0., 4.])
```

```
In [89]: ewmvar(s, com=2., bias=False)
Out[89]:
0    -2.775558e-16
1     3.000000e-01
2     9.556787e-01
3     3.585799e+00
dtype: float64

In [90]: ewmvar(s, com=2., bias=False) / ewmvar(s, com=2., bias=True)
Out[90]:
0     1.25
1     1.25
2     1.25
3     1.25
dtype: float64
```

Note that entry 0 is approximately 0, and the debiasing factors are a constant 1.25. By comparison, the following 0.15.0 results have a NaN for entry 0, and the debiasing factors are decreasing (towards 1.25):

```
In [14]: pd.ewmvar(s, com=2., bias=False)
Out[14]:
0      NaN
1    0.500000
2    1.210526
3    4.089069
dtype: float64

In [15]: pd.ewmvar(s, com=2., bias=False) / pd.ewmvar(s, com=2., bias=True)
Out[15]:
0      NaN
1    2.083333
2    1.583333
3    1.425439
dtype: float64
```

See *Exponentially weighted moment functions* for details. ([GH7912](#))

## Improvements in the sql io module

- Added support for a `chunksize` parameter to `to_sql` function. This allows `DataFrame` to be written in chunks and avoid packet-size overflow errors ([GH8062](#)).
- Added support for a `chunksize` parameter to `read_sql` function. Specifying this argument will return an iterator through chunks of the query result ([GH2908](#)).
- Added support for writing `datetime.date` and `datetime.time` object columns with `to_sql` ([GH6932](#)).
- Added support for specifying a `schema` to read from/write to with `read_sql_table` and `to_sql` ([GH7441](#), [GH7952](#)). For example:

```
df.to_sql('table', engine, schema='other_schema') # noqa F821
pd.read_sql_table('table', engine, schema='other_schema') # noqa F821
```

- Added support for writing `NaN` values with `to_sql` ([GH2754](#)).
- Added support for writing `datetime64` columns with `to_sql` for all database flavors ([GH7103](#)).

### 39.10.3.2 Backwards incompatible API changes

#### Breaking changes

API changes related to `Categorical` (see [here](#) for more details):

- The `Categorical` constructor with two arguments changed from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use `Categorical` directly, please audit your code by changing it to use the `from_codes()` constructor.

An old function call like (prior to 0.15.0):

```
pd.Categorical([0,1,0,2,1], levels=['a', 'b', 'c'])
```

will have to adapted to the following to keep the same behaviour:

```
In [2]: pd.Categorical.from_codes([0,1,0,2,1], categories=['a', 'b', 'c'])
Out[2]:
[a, b, a, c, b]
Categories (3, object): [a, b, c]
```

API changes related to the introduction of the Timedelta scalar (see *above* for more details):

- Prior to 0.15.0 `to_timedelta()` would return a `Series` for list-like/`Series` input, and a `np.timedelta64` for scalar input. It will now return a `TimedeltaIndex` for list-like input, `Series` for `Series` input, and `Timedelta` for scalar input.

For API changes related to the rolling and expanding functions, see detailed overview *above*.

Other notable API changes:

- Consistency when indexing with `.loc` and a list-like indexer when no values are found.

```
In [68]: df = pd.DataFrame([[ 'a'], [ 'b']], index=[1, 2])

In [69]: df
Out[69]:
0
1  a
2  b

[2 rows x 1 columns]
```

In prior versions there was a difference in these two constructs:

- `df.loc[[3]]` would return a frame reindexed by 3 (with all `np.nan` values)
- `df.loc[[3], :]` would raise `KeyError`.

Both will now raise a `KeyError`. The rule is that *at least 1* indexer must be found when using a list-like and `.loc` ([GH7999](#))

Furthermore in prior versions these were also different:

- `df.loc[[1, 3]]` would return a frame reindexed by [1,3]
- `df.loc[[1, 3], :]` would raise `KeyError`.

Both will now return a frame reindex by [1,3]. E.g.

```
In [3]: df.loc[[1, 3]]
Out[3]:
0
1  a
3 NaN

In [4]: df.loc[[1, 3], :]
Out[4]:
0
1  a
3 NaN
```

This can also be seen in multi-axis indexing with a `Panel`.

```
In [70]: p = pd.Panel(np.arange(2 * 3 * 4).reshape(2, 3, 4),
.....:                items=['ItemA', 'ItemB'],
.....:                major_axis=[1, 2, 3],
```

(continues on next page)

The following would raise `KeyError` prior to 0.15.0:

Assigning values to `None` now considers the dtype when choosing an ‘empty’ value ([GH7941](#)).

(continues on next page)

[illegible]

(continued from previous page)

```
1    2.0
2    3.0
Length: 3, dtype: float64
```

NaT is now used similarly for datetime containers.

For object containers, we now preserve `None` values (previously these were converted to NaN values).

```
In [78]: s = pd.Series(["a", "b", "c"])
In [79]: s.loc[0] = None
In [80]: s
Out[80]:
0    None
1      b
2      c
Length: 3, dtype: object
```

To insert a NaN, you must explicitly use `np.nan`. See the *docs*.

- In prior versions, updating a pandas object inplace would not reflect in other python references to this object. (GH8511, GH5104)

```
In [81]: s = pd.Series([1, 2, 3])
In [82]: s2 = s
In [83]: s += 1.5
```

Behavior prior to v0.15.0

```
# the original object
In [5]: s
Out[5]:
0    2.5
1    3.5
2    4.5
dtype: float64

# a reference to the original object
In [7]: s2
Out[7]:
0    1
1    2
2    3
dtype: int64
```

This is now the correct behavior

```
# the original object
In [84]: s
Out[84]:
0    2.5
1    3.5
2    4.5
```

(continues on next page)

(continued from previous page)

```

Length: 3, dtype: float64

# a reference to the original object
In [85]: s2
Out[85]:
0    2.5
1    3.5
2    4.5
Length: 3, dtype: float64

```

- Made both the C-based and Python engines for `read_csv` and `read_table` ignore empty lines in input as well as white space-filled lines, as long as `sep` is not white space. This is an API change that can be controlled by the keyword parameter `skip_blank_lines`. See *the docs* ([GH4466](#))
- A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone and inserted as `object` dtype rather than being converted to a naive `datetime64[ns]` ([GH8411](#)).
- Bug in passing a `DatetimeIndex` with a timezone that was not being retained in `DataFrame` construction from a dict ([GH7822](#))

In prior versions this would drop the timezone, now it retains the timezone, but gives a column of `object` dtype:

```

In [86]: i = pd.date_range('1/1/2011', periods=3, freq='10s', tz='US/Eastern')

In [87]: i
Out[87]:
DatetimeIndex(['2011-01-01 00:00:00-05:00', '2011-01-01 00:00:10-05:00',
              '2011-01-01 00:00:20-05:00'],
              dtype='datetime64[ns, US/Eastern]', freq='10S')

In [88]: df = pd.DataFrame({'a': i})

In [89]: df
Out[89]:
           a
0 2011-01-01 00:00:00-05:00
1 2011-01-01 00:00:10-05:00
2 2011-01-01 00:00:20-05:00

[3 rows x 1 columns]

In [90]: df.dtypes
Out[90]:
a    datetime64[ns, US/Eastern]
Length: 1, dtype: object

```

Previously this would have yielded a column of `datetime64` dtype, but without timezone info.

The behaviour of assigning a column to an existing dataframe as `df['a'] = i` remains unchanged (this already returned an `object` column with a timezone).

- When passing multiple levels to `stack()`, it will now raise a `ValueError` when the levels aren't all level names or all level numbers ([GH7660](#)). See *Reshaping by stacking and unstacking*.
- Raise a `ValueError` in `df.to_hdf` with 'fixed' format, if `df` has non-unique columns as the resulting file will be broken ([GH7761](#))

- `SettingWithCopy` raise/warnings (according to the option `mode.chained_assignment`) will now be issued when setting a value on a sliced mixed-dtype DataFrame using chained-assignment. ([GH7845](#), [GH7950](#))

```
In [1]: df = pd.DataFrame(np.arange(0, 9), columns=['count'])

In [2]: df['group'] = 'b'

In [3]: df.iloc[0:5]['group'] = 'a'
/usr/local/bin/ipython:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: http://pandas.pydata.org/pandas-docs/stable/
indexing.html#indexing-view-versus-copy
```

- `merge`, `DataFrame.merge`, and `ordered_merge` now return the same type as the `left` argument ([GH7737](#)).
- Previously an enlargement with a mixed-dtype frame would act unlike `.append` which will preserve dtypes (related [GH2578](#), [GH8176](#)):

```
In [91]: df = pd.DataFrame([[True, 1], [False, 2]],
.....:                      columns=["female", "fitness"])
.....:

In [92]: df
Out[92]:
   female  fitness
0    True         1
1   False         2

[2 rows x 2 columns]

In [93]: df.dtypes
Out[93]:
female      bool
fitness    int64
Length: 2, dtype: object

# dtypes are now preserved
In [94]: df.loc[2] = df.loc[1]

In [95]: df

1   False         2
2   False         2

[3 rows x 2 columns]

In [96]: df.dtypes
Out[96]:
female      bool
fitness    int64
Length: 2, dtype: object
```

- `Series.to_csv()` now returns a string when `path=None`, matching the behaviour of `DataFrame.to_csv()` (GH8215).
- `read_hdf` now raises `IOError` when a file that doesn't exist is passed in. Previously, a new, empty file was created, and a `KeyError` raised (GH7715).
- `DataFrame.info()` now ends its output with a newline character (GH8114)
- Concatenating no objects will now raise a `ValueError` rather than a bare `Exception`.
- Merge errors will now be sub-classes of `ValueError` rather than raw `Exception` (GH5080)
- `DataFrame.plot` and `Series.plot` keywords are now have consistent orders (GH8037)

## Internal Refactoring

In 0.15.0 `Index` has internally been refactored to no longer sub-class `ndarray` but instead subclass `PandasObject`, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (GH5080, GH7439, GH7796, GH8024, GH8367, GH7997, GH8522):

- you may need to unpickle pandas version < 0.15.0 pickles using `pd.read_pickle` rather than `pickle.load`. See *pickle docs*
- when plotting with a `PeriodIndex`, the matplotlib internal axes will now be arrays of `Period` rather than a `PeriodIndex` (this is similar to how a `DatetimeIndex` passes arrays of datetimes now)
- `MultiIndex`es will now raise similarly to other pandas objects w.r.t. truth testing, see *here* (GH7897).
- When plotting a `DatetimeIndex` directly with matplotlib's `plot` function, the axis labels will no longer be formatted as dates but as integers (the internal representation of a `datetime64`). **UPDATE** This is fixed in 0.15.1, see *here*.

## Deprecations

- The attributes `Categorical.labels` and `levels` attributes are deprecated and renamed to `codes` and `categories`.
- The `outtype` argument to `pd.DataFrame.to_dict` has been deprecated in favor of `orient`. (GH7840)
- The `convert_dummies` method has been deprecated in favor of `get_dummies` (GH8140)
- The `infer_dst` argument in `tz_localize` will be deprecated in favor of `ambiguous` to allow for more flexibility in dealing with DST transitions. Replace `infer_dst=True` with `ambiguous='infer'` for the same behavior (GH7943). See *the docs* for more details.
- The top-level `pd.value_range` has been deprecated and can be replaced by `.describe()` (GH8481)
- The `Index` set operations `+` and `-` were deprecated in order to provide these for numeric type operations on certain index types. `+` can be replaced by `.union()` or `|`, and `-` by `.difference()`. Further the method name `Index.diff()` is deprecated and can be replaced by `Index.difference()` (GH8226)

```
# +
pd.Index(['a', 'b', 'c']) + pd.Index(['b', 'c', 'd'])

# should be replaced by
pd.Index(['a', 'b', 'c']).union(pd.Index(['b', 'c', 'd']))
```

```
# -
pd.Index(['a', 'b', 'c']) - pd.Index(['b', 'c', 'd'])

# should be replaced by
pd.Index(['a', 'b', 'c']).difference(pd.Index(['b', 'c', 'd']))
```

- The `infer_types` argument to `read_html()` now has no effect and is deprecated (GH7762, GH7032).

## Removal of prior version deprecations/changes

- Remove `DataFrame.delevel` method in favor of `DataFrame.reset_index`

### 39.10.3.3 Enhancements

Enhancements in the importing/exporting of Stata files:

- Added support for `bool`, `uint8`, `uint16` and `uint32` data types in `to_stata` (GH7097, GH7365)
- Added conversion option when importing Stata files (GH8527)
- `DataFrame.to_stata` and `StataWriter` check string length for compatibility with limitations imposed in dta files where fixed-width strings must contain 244 or fewer characters. Attempting to write Stata dta files with strings longer than 244 characters raises a `ValueError`. (GH7858)
- `read_stata` and `StataReader` can import missing data information into a `DataFrame` by setting the argument `convert_missing` to `True`. When using this options, missing values are returned as `StataMissingValue` objects and columns containing missing values have object data type. (GH8045)

Enhancements in the plotting functions:

- Added `layout` keyword to `DataFrame.plot`. You can pass a tuple of (`rows`, `columns`), one of which can be `-1` to automatically infer (GH6667, GH8071).
- Allow to pass multiple axes to `DataFrame.plot`, `hist` and `boxplot` (GH5353, GH6970, GH7069)
- Added support for `c`, `colormap` and `colorbar` arguments for `DataFrame.plot` with `kind='scatter'` (GH7780)
- Histogram from `DataFrame.plot` with `kind='hist'` (GH7809), See *the docs*.
- Boxplot from `DataFrame.plot` with `kind='box'` (GH7998), See *the docs*.

Other:

- `read_csv` now has a keyword parameter `float_precision` which specifies which floating-point converter the C engine should use during parsing, see *here* (GH8002, GH8044)
- Added `searchsorted` method to `Series` objects (GH7447)
- `describe()` on mixed-types `DataFrames` is more flexible. Type-based column filtering is now possible via the `include/exclude` arguments. See *the docs* (GH8164).

```
In [97]: df = pd.DataFrame({'catA': ['foo', 'foo', 'bar'] * 8,
.....:                    'catB': ['a', 'b', 'c', 'd'] * 6,
.....:                    'numC': np.arange(24),
.....:                    'numD': np.arange(24.) + .5})
.....:

In [98]: df.describe(include=["object"])
```

(continues on next page)

(continued from previous page)

**Out [98]:**

```

      catA catB
count    24   24
unique     2    4

[11 rows x 4 columns]
```

Without those arguments, describe will behave as before, including only numerical columns or, if none are, only categorical columns. See also the *docs*

- Added split as an option to the orient argument in `pd.DataFrame.to_dict`. ([GH7840](#))
- The `get_dummies` method can now be used on DataFrames. By default only categorical columns are encoded as 0's and 1's, while other columns are left untouched.

```

In [101]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['c', 'c', 'b'],
.....:                        'C': [1, 2, 3]})
.....:
```

(continues on next page)

(continued from previous page)

```
In [102]: pd.get_dummies(df)
Out[102]:
```

|   | C | A_a | A_b | B_b | B_c |
|---|---|-----|-----|-----|-----|
| 0 | 1 | 1   | 0   | 0   | 1   |
| 1 | 2 | 0   | 1   | 0   | 1   |
| 2 | 3 | 1   | 0   | 1   | 0   |

```
[3 rows x 5 columns]
```

- `PeriodIndex` supports resolution as the same as `DatetimeIndex` ([GH7708](#))
- `pandas.tseries.holiday` has added support for additional holidays and ways to observe holidays ([GH7070](#))
- `pandas.tseries.holiday.Holiday` now supports a list of offsets in Python3 ([GH7070](#))
- `pandas.tseries.holiday.Holiday` now supports a `days_of_week` parameter ([GH7070](#))
- `GroupBy.nth()` now supports selecting multiple `nth` values ([GH7910](#))

```
In [103]: business_dates = pd.date_range(start='4/1/2014', end='6/30/2014', freq=
→ 'B')

In [104]: df = pd.DataFrame(1, index=business_dates, columns=['a', 'b'])

# get the first, 4th, and last date index for each month
In [105]: df.groupby([df.index.year, df.index.month]).nth([0, 3, -1])

Out[105]:
```

|      |   | a | b |
|------|---|---|---|
| 2014 | 4 | 1 | 1 |
|      | 4 | 1 | 1 |

Out[112]:
PeriodIndex(['2014-10', '2014-11', '2014-12', '2015-01', '2015-02'], dtype=
            'period[M]', freq='M')

```

- Added experimental compatibility with openpyxl for versions  $\geq 2.0$ . The `DataFrame.to_excel` method engine keyword now recognizes openpyxl1 and openpyxl2 which will explicitly require openpyxl v1 and v2 respectively, failing if the requested version is not available. The openpyxl engine is now a meta-engine that automatically uses whichever version of openpyxl is installed. (GH7177)
- `DataFrame.fillna` can now accept a `DataFrame` as a fill value (GH8377)
- Passing multiple levels to `stack()` will now work when multiple level numbers are passed (GH7660). See *Reshaping by stacking and unstacking*.
- `set_names()`, `set_labels()`, and `set_levels()` methods now take an optional `level` keyword argument to all modification of specific level(s) of a `MultiIndex`. Additionally `set_names()` now accepts a scalar string value when operating on an `Index` or on a specific level of a `MultiIndex` (GH7792)

```

In [113]: idx = pd.MultiIndex.from_product(['a', range(3), list("pqr")],
            .....:                        names=['foo', 'bar', 'baz'])
            .....:

In [114]: idx.set_names('qux', level=0)
Out[114]:
MultiIndex(levels=[['a'], [0, 1, 2], ['p', 'q', 'r']],
            labels=[[0, 0, 0, 0, 0, 0, 0, 0, 0], [0, 0, 0, 1, 1, 1, 2, 2, 2], [0,
            1, 2, 0, 1, 2, 0, 1, 2]],
            names=['qux', 'bar', 'baz'])

In [115]: idx.set_names(['qux', 'corge'], level=[0, 1])
Out[115]:
MultiIndex(levels=[['a'], [0, 1, 2], ['p', 'q', 'r']],
            labels=[[0, 0, 0, 0, 0, 0, 0, 0, 0], [0, 0, 0, 1, 1, 1, 2, 2, 2], [0,
            1, 2, 0, 1, 2, 0, 1, 2]],
            names=['qux', 'corge', 'baz'])

In [116]: idx.set_levels(['a', 'b', 'c'], level='bar')
Out[116]:
MultiIndex(levels=[['a', 'b', 'c'], [0, 1, 2], ['p', 'q', 'r']],
            labels=[[0, 0, 0, 0, 0, 0, 0, 0, 0], [0, 0, 0, 1, 1, 1, 2, 2, 2], [0,
            1, 2, 0, 1, 2, 0, 1, 2]],
            names=['a', 'bar', 'baz'])

```

(continues on next page)

(continued from previous page)

```

↪1, 2, 0, 1, 2, 0, 1, 2]],
            names=['foo', 'bar', 'baz'])
```

- `Index.isin` now supports a `level` argument to specify which index level to use for membership tests ([GH7892](#), [GH7890](#))

```
In [1]: idx = pd.MultiIndex.from_product([[0, 1], ['a', 'b', 'c']])

In [2]: idx.values
Out[2]: array([(0, 'a'), (0, 'b'), (0, 'c'), (1, 'a'), (1, 'b'), (1, 'c')],
↪dtype=object)

In [3]: idx.isin(['a', 'c', 'e'], level=1)
Out[3]: array([ True, False,  True,  True, False,  True], dtype=bool)
```

- `Index` now supports duplicated and `drop_duplicates`. ([GH4060](#))

```
In [118]: idx = pd.Index([1, 2, 3, 4, 1, 2])

In [119]: idx
Out[119]: Int64Index([1, 2, 3, 4, 1, 2], dtype='int64')

In [120]: idx.duplicated()
////////////////////////////////////\Out[120]: array([False,
↪False, False, False,  True,  True], dtype=bool)

In [121]: idx.drop_duplicates()
////////////////////////////////////
↪Int64Index([1, 2, 3, 4], dtype='int64')
```

- add `copy=True` argument to `pd.concat` to enable pass through of complete blocks ([GH8252](#))
- Added support for numpy 1.8+ data types (`bool_`, `int_`, `float_`, `string_`) for conversion to R dataframe ([GH8400](#))

### 39.10.3.4 Performance

- Performance improvements in `DatetimeIndex.__iter__` to allow faster iteration ([GH7683](#))
- Performance improvements in `Period` creation (and `PeriodIndex.setitem`) ([GH5155](#))
- Improvements in `Series.transform` for significant performance gains (revised) ([GH6496](#))
- Performance improvements in `StataReader` when reading large files ([GH8040](#), [GH8073](#))
- Performance improvements in `StataWriter` when writing large files ([GH8079](#))
- Performance and memory usage improvements in `multi-key groupby` ([GH8128](#))

- Performance improvements in `groupby .agg` and `.apply` where builtins `max/min` were not mapped to `numpy/cythonized` versions ([GH7722](#))
- Performance improvement in writing to `sql (to_sql)` of up to 50% ([GH8208](#)).
- Performance benchmarking of `groupby` for large value of `ngroups` ([GH6787](#))
- Performance improvement in `CustomBusinessDay`, `CustomBusinessMonth` ([GH8236](#))
- Performance improvement for `MultiIndex.values` for multi-level indexes containing `datetimes` ([GH8543](#))

### 39.10.3.5 Bug Fixes

- Bug in `pivot_table`, when using `margins` and a `dict aggfunc` ([GH8349](#))
- Bug in `read_csv` where `squeeze=True` would return a view ([GH8217](#))
- Bug in checking of table name in `read_sql` in certain cases ([GH7826](#)).
- Bug in `DataFrame.groupby` where `Grouper` does not recognize level when frequency is specified ([GH7885](#))
- Bug in `multiindexes dtypes` getting mixed up when `DataFrame` is saved to `SQL table` ([GH8021](#))
- Bug in `Series 0-division` with a `float` and `integer operand dtypes` ([GH7785](#))
- Bug in `Series.astype("unicode")` not calling `unicode` on the values correctly ([GH7758](#))
- Bug in `DataFrame.as_matrix()` with mixed `datetime64[ns]` and `timedelta64[ns]` dtypes ([GH7778](#))
- Bug in `HDFStore.select_column()` not preserving `UTC timezone info` when selecting a `DatetimeIndex` ([GH7777](#))
- Bug in `to_datetime` when `format='%Y%m%d'` and `coerce=True` are specified, where previously an object array was returned (rather than a coerced time-series with `NaT`), ([GH7930](#))
- Bug in `DatetimeIndex` and `PeriodIndex` in-place addition and subtraction cause different result from normal one ([GH6527](#))
- Bug in adding and subtracting `PeriodIndex` with `PeriodIndex` raise `TypeError` ([GH7741](#))
- Bug in `combine_first` with `PeriodIndex` data raises `TypeError` ([GH3367](#))
- Bug in `MultiIndex` slicing with missing indexers ([GH7866](#))
- Bug in `MultiIndex` slicing with various edge cases ([GH8132](#))
- Regression in `MultiIndex` indexing with a non-scalar type object ([GH7914](#))
- Bug in `Timestamp` comparisons with `==` and `int64 dtype` ([GH8058](#))
- Bug in `pickles` contains `DateOffset` may raise `AttributeError` when `normalize attribute` is referred internally ([GH7748](#))
- Bug in `Panel` when using `major_xs` and `copy=False` is passed (deprecation warning fails because of missing warnings) ([GH8152](#)).
- Bug in `pickle deserialization` that failed for pre-0.14.1 containers with `dup items` trying to avoid ambiguity when matching `block` and `manager items`, when there's only one `block` there's no ambiguity ([GH7794](#))
- Bug in putting a `PeriodIndex` into a `Series` would convert to `int64 dtype`, rather than object of `Periods` ([GH7932](#))
- Bug in `HDFStore` iteration when passing a `where` ([GH8014](#))

- Bug in `DataFrameGroupby.transform` when transforming with a passed non-sorted key (GH8046, GH8430)
- Bug in repeated timeseries line and area plot may result in `ValueError` or incorrect kind (GH7733)
- Bug in inference in a `MultiIndex` with `datetime.date` inputs (GH7888)
- Bug in `get` where an `IndexError` would not cause the default value to be returned (GH7725)
- Bug in `offsets.apply`, `rollforward` and `rollback` may reset nanosecond (GH7697)
- Bug in `offsets.apply`, `rollforward` and `rollback` may raise `AttributeError` if `Timestamp` has `dateutil.tzinfo` (GH7697)
- Bug in sorting a `MultiIndex` frame with a `Float64Index` (GH8017)
- Bug in inconsistent panel setitem with a rhs of a `DataFrame` for alignment (GH7763)
- Bug in `is_superperiod` and `is_subperiod` cannot handle higher frequencies than S (GH7760, GH7772, GH7803)
- Bug in 32-bit platforms with `Series.shift` (GH8129)
- Bug in `PeriodIndex.unique` returns `int64 np.ndarray` (GH7540)
- Bug in `groupby.apply` with a non-affecting mutation in the function (GH8467)
- Bug in `DataFrame.reset_index` which has `MultiIndex` contains `PeriodIndex` or `DatetimeIndex` with `tz` raises `ValueError` (GH7746, GH7793)
- Bug in `DataFrame.plot` with `subplots=True` may draw unnecessary minor xticks and yticks (GH7801)
- Bug in `StataReader` which did not read variable labels in 117 files due to difference between Stata documentation and implementation (GH7816)
- Bug in `StataReader` where strings were always converted to 244 characters-fixed width irrespective of underlying string size (GH7858)
- Bug in `DataFrame.plot` and `Series.plot` may ignore `rot` and `fontsize` keywords (GH7844)
- Bug in `DatetimeIndex.value_counts` doesn't preserve `tz` (GH7735)
- Bug in `PeriodIndex.value_counts` results in `Int64Index` (GH7735)
- Bug in `DataFrame.join` when doing left join on index and there are multiple matches (GH5391)
- Bug in `GroupBy.transform()` where int groups with a transform that didn't preserve the index were incorrectly truncated (GH7972).
- Bug in `groupby` where callable objects without name attributes would take the wrong path, and produce a `DataFrame` instead of a `Series` (GH7929)
- Bug in `groupby` error message when a `DataFrame` grouping column is duplicated (GH7511)
- Bug in `read_html` where the `infer_types` argument forced coercion of date-likes incorrectly (GH7762, GH7032).
- Bug in `Series.str.cat` with an index which was filtered as to not include the first item (GH7857)
- Bug in `Timestamp` cannot parse nanosecond from string (GH7878)
- Bug in `Timestamp` with string offset and `tz` results incorrect (GH7833)
- Bug in `tslib.tz_convert` and `tslib.tz_convert_single` may return different results (GH7798)
- Bug in `DatetimeIndex.intersection` of non-overlapping timestamps with `tz` raises `IndexError` (GH7880)

- Bug in alignment with TimeOps and non-unique indexes ([GH8363](#))
- Bug in `GroupBy.filter()` where fast path vs. slow path made the filter return a non scalar value that appeared valid but wasn't ([GH7870](#)).
- Bug in `date_range()/DatetimeIndex()` when the timezone was inferred from input dates yet incorrect times were returned when crossing DST boundaries ([GH7835](#), [GH7901](#)).
- Bug in `to_excel()` where a negative sign was being prepended to positive infinity and was absent for negative infinity ([GH7949](#))
- Bug in area plot draws legend with incorrect alpha when `stacked=True` ([GH8027](#))
- `Period` and `PeriodIndex` addition/subtraction with `np.timedelta64` results in incorrect internal representations ([GH7740](#))
- Bug in `Holiday` with no offset or observance ([GH7987](#))
- Bug in `DataFrame.to_latex` formatting when columns or index is a `MultiIndex` ([GH7982](#)).
- Bug in `DateOffset` around Daylight Savings Time produces unexpected results ([GH5175](#)).
- Bug in `DataFrame.shift` where empty columns would throw `ZeroDivisionError` on numpy 1.7 ([GH8019](#))
- Bug in installation where `html_encoding/* .html` wasn't installed and therefore some tests were not running correctly ([GH7927](#)).
- Bug in `read_html` where bytes objects were not tested for in `_read` ([GH7927](#)).
- Bug in `DataFrame.stack()` when one of the column levels was a datelike ([GH8039](#))
- Bug in broadcasting numpy scalars with `DataFrame` ([GH8116](#))
- Bug in `pivot_table` performed with nameless index and columns raises `KeyError` ([GH8103](#))
- Bug in `DataFrame.plot(kind='scatter')` draws points and errorbars with different colors when the color is specified by `c` keyword ([GH8081](#))
- Bug in `Float64Index` where `iat` and `at` were not testing and were failing ([GH8092](#)).
- Bug in `DataFrame.boxplot()` where y-limits were not set correctly when producing multiple axes ([GH7528](#), [GH5517](#)).
- Bug in `read_csv` where line comments were not handled correctly given a custom line terminator or `delim_whitespace=True` ([GH8122](#)).
- Bug in `read_html` where empty tables caused a `StopIteration` ([GH7575](#))
- Bug in casting when setting a column in a same-dtype block ([GH7704](#))
- Bug in accessing groups from a `GroupBy` when the original grouper was a tuple ([GH8121](#)).
- Bug in `.at` that would accept integer indexers on a non-integer index and do fallback ([GH7814](#))
- Bug with kde plot and NaNs ([GH8182](#))
- Bug in `GroupBy.count` with float32 data type where nan values were not excluded ([GH8169](#)).
- Bug with stacked barplots and NaNs ([GH8175](#)).
- Bug in resample with non evenly divisible offsets (e.g. '7s') ([GH8371](#))
- Bug in interpolation methods with the `limit` keyword when no values needed interpolating ([GH7173](#)).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` ([GH8230](#)).

- Bug with `DatetimeIndex.asof` incorrectly matching partial strings and returning the wrong date (GH8245).
- Bug in plotting methods modifying the global matplotlib rcParams (GH8242).
- Bug in `DataFrame.__setitem__` that caused errors when setting a dataframe column to a sparse array (GH8131)
- Bug where `Dataframe.boxplot()` failed when entire column was empty (GH8181).
- Bug with messed variables in `radviz` visualization (GH8199).
- Bug in interpolation methods with the `limit` keyword when no values needed interpolating (GH7173).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
- Bug in `to_clipboard` that would clip long column data (GH8305)
- Bug in `DataFrame` terminal display: Setting `max_column/max_rows` to zero did not trigger auto-resizing of dfs to fit terminal width/height (GH7180).
- Bug in OLS where running with “cluster” and “nw\_lags” parameters did not work correctly, but also did not throw an error (GH5884).
- Bug in `DataFrame.dropna` that interpreted non-existent columns in the subset argument as the ‘last column’ (GH8303)
- Bug in `Index.intersection` on non-monotonic non-unique indexes (GH8362).
- Bug in masked series assignment where mismatching types would break alignment (GH8387)
- Bug in `NDFrame.equals` gives false negatives with `dtype=object` (GH8437)
- Bug in assignment with indexer where type diversity would break alignment (GH8258)
- Bug in `NDFrame.loc` indexing when row/column names were lost when target was a list/ndarray (GH6552)
- Regression in `NDFrame.loc` indexing when rows/columns were converted to `Float64Index` if target was an empty list/ndarray (GH7774)
- Bug in `Series` that allows it to be indexed by a `DataFrame` which has unexpected results. Such indexing is no longer permitted (GH8444)
- Bug in item assignment of a `DataFrame` with `MultiIndex` columns where right-hand-side columns were not aligned (GH7655)
- Suppress `FutureWarning` generated by NumPy when comparing object arrays containing NaN for equality (GH7065)
- Bug in `DataFrame.eval()` where the dtype of the `not` operator (`~`) was not correctly inferred as `bool`.

## 39.11 Version 0.14

### 39.11.1 v0.14.1 (July 11, 2014)

{{ header }}

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - New methods `select_dtypes()` to select columns based on the dtype and `sem()` to calculate the standard error of the mean.
  - Support for dateutil timezones (see *docs*).
  - Support for ignoring full line comments in the `read_csv()` text parser.
  - New documentation section on *Options and Settings*.
  - Lots of bug fixes.
- *Enhancements*
- *API Changes*
- *Performance Improvements*
- *Experimental Changes*
- *Bug Fixes*

#### 39.11.1.1 API changes

- Openpyxl now raises a `ValueError` on construction of the openpyxl writer instead of warning on pandas import ([GH7284](#)).
- For `StringMethods.extract`, when no match is found, the result - only containing NaN values - now also has `dtype=object` instead of `float` ([GH7242](#)).
- `Period` objects no longer raise a `TypeError` when compared using `==` with another object that *isn't* a `Period`. Instead when comparing a `Period` with another object using `==` if the other object isn't a `Period` `False` is returned. ([GH7376](#))
- Previously, the behaviour on resetting the time or not in `offsets.apply`, `rollforward` and `rollback` operations differed between offsets. With the support of the `normalize` keyword for all offsets (see below) with a default value of `False` (preserve time), the behaviour changed for certain offsets (`BusinessMonthBegin`, `MonthEnd`, `BusinessMonthEnd`, `CustomBusinessMonthEnd`, `BusinessYearBegin`, `LastWeekOfMonth`, `FY5253Quarter`, `LastWeekOfMonth`, `Easter`):

```
In [6]: from pandas.tseries import offsets

In [7]: d = pd.Timestamp('2014-01-01 09:00')

# old behaviour < 0.14.1
In [8]: d + offsets.MonthEnd()
Out[8]: pd.Timestamp('2014-01-31 00:00:00')
```

Starting from 0.14.1 all offsets preserve time by default. The old behaviour can be obtained with `normalize=True`

```
# new behaviour
In [1]: d + offsets.MonthEnd()
Out[1]: Timestamp('2014-01-31 09:00:00')

In [2]: d + offsets.MonthEnd(normalize=True)
Out[2]: Timestamp('2014-01-31 00:00:00')
```

Note that for the other offsets the default behaviour did not change.

- Add back `#N/A` `N/A` as a default NA value in text parsing, (regression from 0.12) ([GH5521](#))
- Raise a `TypeError` on inplace-setting with a `.where` and a non `np.nan` value as this is inconsistent with a set-item expression like `df[mask] = None` ([GH7656](#))

### 39.11.1.2 Enhancements

- Add `dropna` argument to `value_counts` and `nunique` ([GH5569](#)).
- Add `select_dtypes()` method to allow selection of columns based on dtype ([GH7316](#)). See *the docs*.
- All offsets supports the `normalize` keyword to specify whether `offsets.apply`, `rollforward` and `rollback` resets the time (hour, minute, etc) or not (default `False`, preserves time) ([GH7156](#)):

```
import pandas.tseries.offsets as offsets

day = offsets.Day()
day.apply(pd.Timestamp('2014-01-01 09:00'))

day = offsets.Day(normalize=True)
day.apply(pd.Timestamp('2014-01-01 09:00'))
```

- `PeriodIndex` is represented as the same format as `DatetimeIndex` ([GH7601](#))
- `StringMethods` now work on empty Series ([GH7242](#))
- The file parsers `read_csv` and `read_table` now ignore line comments provided by the parameter `comment`, which accepts only a single character for the C reader. In particular, they allow for comments before file data begins ([GH2685](#))
- Add `NotImplementedError` for simultaneous use of `chunksize` and `nrows` for `read_csv()` ([GH6774](#)).
- Tests for basic reading of public S3 buckets now exist ([GH7281](#)).
- `read_html` now sports an `encoding` argument that is passed to the underlying parser library. You can use this to read non-ascii encoded web pages ([GH7323](#)).
- `read_excel` now supports reading from URLs in the same way that `read_csv` does. ([GH6809](#))

- Support for dateutil timezones, which can now be used in the same way as pytz timezones across pandas. ([GH4688](#))

```
In [3]: rng = pd.date_range('3/6/2012 00:00', periods=10, freq='D',
...:                       tz='dateutil/Europe/London')
...:
...:
In [4]: rng.tz
Out[4]: tzfile('/usr/share/zoneinfo/Europe/London')
```

See the docs.

- Implemented `sem` (standard error of the mean) operation for `Series`, `DataFrame`, `Panel`, and `Groupby` ([GH6897](#))
- Add `nlargest` and `nsmallest` to the `Series` groupby whitelist, which means you can now use these methods on a `SeriesGroupBy` object ([GH7053](#)).
- All offsets apply, `rollforward` and `rollback` can now handle `np.datetime64`, previously results in `ApplyTypeError` ([GH7452](#))
- `Period` and `PeriodIndex` can contain `NaT` in its values ([GH7485](#))
- Support pickling `Series`, `DataFrame` and `Panel` objects with non-unique labels along *item* axis (index, columns and items respectively) ([GH7370](#)).
- Improved inference of `datetime/timedelta` with mixed null objects. Regression from 0.13.1 in interpretation of an object `Index` with all null elements ([GH7431](#))

### 39.11.1.3 Performance

- Improvements in dtype inference for numeric operations involving yielding performance gains for dtypes: `int64`, `timedelta64`, `datetime64` ([GH7223](#))
- Improvements in `Series.transform` for significant performance gains ([GH6496](#))
- Improvements in `DataFrame.transform` with `ufuncs` and built-in grouper functions for significant performance gains ([GH7383](#))
- Regression in groupby aggregation of `datetime64` dtypes ([GH7555](#))
- Improvements in `MultiIndex.from_product` for large iterables ([GH7627](#))

### 39.11.1.4 Experimental

- `pandas.io.data.Options` has a new method, `get_all_data` method, and now consistently returns a `MultiIndexed DataFrame` ([GH5602](#))
- `io.gbq.read_gbq` and `io.gbq.to_gbq` were refactored to remove the dependency on the Google `bq.py` command line client. This submodule now uses `httplib2` and the Google `apiclient` and `oauth2client` API client libraries which should be more stable and, therefore, reliable than `bq.py`. See the docs. ([GH6937](#)).

### 39.11.1.5 Bug Fixes

- Bug in `DataFrame.where` with a symmetric shaped frame and a passed other of a `DataFrame` ([GH7506](#))
- Bug in `Panel` indexing with a `MultiIndex` axis ([GH7516](#))

- Regression in datetimelike slice indexing with a duplicated index and non-exact end-points ([GH7523](#))
- Bug in setitem with list-of-lists and single vs mixed types ([GH7551](#));)
- Bug in time ops with non-aligned Series ([GH7500](#))
- Bug in timedelta inference when assigning an incomplete Series ([GH7592](#))
- Bug in groupby .nth with a Series and integer-like column name ([GH7559](#))
- Bug in Series.get with a boolean accessor ([GH7407](#))
- Bug in value\_counts where NaT did not qualify as missing (NaN) ([GH7423](#))
- Bug in to\_timedelta that accepted invalid units and misinterpreted 'm/h' ([GH7611](#), [GH6423](#))
- Bug in line plot doesn't set correct xlim if secondary\_y=True ([GH7459](#))
- Bug in grouped hist and scatter plots use old figsize default ([GH7394](#))
- Bug in plotting subplots with DataFrame.plot, hist clears passed ax even if the number of subplots is one ([GH7391](#)).
- Bug in plotting subplots with DataFrame.boxplot with by kw raises ValueError if the number of subplots exceeds 1 ([GH7391](#)).
- Bug in subplots displays ticklabels and labels in different rule ([GH5897](#))
- Bug in Panel.apply with a MultiIndex as an axis ([GH7469](#))
- Bug in DatetimeIndex.insert doesn't preserve name and tz ([GH7299](#))
- Bug in DatetimeIndex.asobject doesn't preserve name ([GH7299](#))
- Bug in MultiIndex slicing with datetimelike ranges (strings and Timestamps), ([GH7429](#))
- Bug in Index.min and max doesn't handle nan and NaT properly ([GH7261](#))
- Bug in PeriodIndex.min/max results in int ([GH7609](#))
- Bug in resample where fill\_method was ignored if you passed how ([GH2073](#))
- Bug in TimeGrouper doesn't exclude column specified by key ([GH7227](#))
- Bug in DataFrame and Series bar and barh plot raises TypeError when bottom and left keyword is specified ([GH7226](#))
- Bug in DataFrame.hist raises TypeError when it contains non numeric column ([GH7277](#))
- Bug in Index.delete does not preserve name and freq attributes ([GH7302](#))
- Bug in DataFrame.query()/eval where local string variables with the @ sign were being treated as temporaries attempting to be deleted ([GH7300](#)).
- Bug in Float64Index which didn't allow duplicates ([GH7149](#)).
- Bug in DataFrame.replace() where truthy values were being replaced ([GH7140](#)).
- Bug in StringMethods.extract() where a single match group Series would use the matcher's name instead of the group name ([GH7313](#)).
- Bug in isnull() when mode.use\_inf\_as\_null == True where isnull wouldn't test True when it encountered an inf/-inf ([GH7315](#)).
- Bug in inferred\_freq results in None for eastern hemisphere timezones ([GH7310](#))
- Bug in Easter returns incorrect date when offset is negative ([GH7195](#))
- Bug in broadcasting with .div, integer dtypes and divide-by-zero ([GH7325](#))

- Bug in `CustomBusinessDay.apply` raises `NameError` when `np.datetime64` object is passed (GH7196)
- Bug in `MultiIndex.append`, `concat` and `pivot_table` don't preserve timezone (GH6606)
- Bug in `.loc` with a list of indexers on a single-multi index level (that is not nested) (GH7349)
- Bug in `Series.map` when mapping a dict with tuple keys of different lengths (GH7333)
- Bug all `StringMethods` now work on empty `Series` (GH7242)
- Fix delegation of `read_sql` to `read_sql_query` when query does not contain 'select' (GH7324).
- Bug where a string column name assignment to a `DataFrame` with a `Float64Index` raised a `TypeError` during a call to `np.isnan` (GH7366).
- Bug where `NDFrame.replace()` didn't correctly replace objects with `Period` values (GH7379).
- Bug in `.ix` getitem should always return a `Series` (GH7150)
- Bug in `MultiIndex` slicing with incomplete indexers (GH7399)
- Bug in `MultiIndex` slicing with a step in a sliced level (GH7400)
- Bug where negative indexers in `DatetimeIndex` were not correctly sliced (GH7408)
- Bug where `NaT` wasn't repr'd correctly in a `MultiIndex` (GH7406, GH7409).
- Bug where bool objects were converted to nan in `convert_objects` (GH7416).
- Bug in `quantile` ignoring the axis keyword argument (GH7306)
- Bug where `nanops._maybe_null_out` doesn't work with complex numbers (GH7353)
- Bug in several `nanops` functions when `axis==0` for 1-dimensional nan arrays (GH7354)
- Bug where `nanops.nanmedian` doesn't work when `axis==None` (GH7352)
- Bug where `nanops._has_infs` doesn't work with many dtypes (GH7357)
- Bug in `StataReader.data` where reading a 0-observation dta failed (GH7369)
- Bug in `StataReader` when reading Stata 13 (117) files containing fixed width strings (GH7360)
- Bug in `StataWriter` where encoding was ignored (GH7286)
- Bug in `DatetimeIndex` comparison doesn't handle `NaT` properly (GH7529)
- Bug in passing input with `tzinfo` to some offsets `apply`, `rollforward` or `rollback` resets `tzinfo` or raises `ValueError` (GH7465)
- Bug in `DatetimeIndex.to_period`, `PeriodIndex.asobject`, `PeriodIndex.to_timestamp` doesn't preserve name (GH7485)
- Bug in `DatetimeIndex.to_period` and `PeriodIndex.to_timestamp` handle `NaT` incorrectly (GH7228)
- Bug in `offsets.apply`, `rollforward` and `rollback` may return normal datetime (GH7502)
- Bug in `resample` raises `ValueError` when target contains `NaT` (GH7227)
- Bug in `Timestamp.tz_localize` resets nanosecond info (GH7534)
- Bug in `DatetimeIndex.asobject` raises `ValueError` when it contains `NaT` (GH7539)
- Bug in `Timestamp.__new__` doesn't preserve nanosecond properly (GH7610)
- Bug in `Index.astype(float)` where it would return an object dtype `Index` (GH7464).
- Bug in `DataFrame.reset_index` loses `tz` (GH3950)

- Bug in `DatetimeIndex.freqstr` raises `AttributeError` when `freq` is `None` (GH7606)
- Bug in `GroupBy.size` created by `TimeGrouper` raises `AttributeError` (GH7453)
- Bug in single column bar plot is misaligned (GH7498).
- Bug in area plot with tz-aware time series raises `ValueError` (GH7471)
- Bug in non-monotonic `Index.union` may preserve name incorrectly (GH7458)
- Bug in `DatetimeIndex.intersection` doesn't preserve timezone (GH4690)
- Bug in `rolling_var` where a window larger than the array would raise an error (GH7297)
- Bug with last plotted timeseries dictating `xlim` (GH2960)
- Bug with `secondary_y` axis not being considered for timeseries `xlim` (GH3490)
- Bug in `Float64Index` assignment with a non scalar indexer (GH7586)
- Bug in `pandas.core.strings.str_contains` does not properly match in a case insensitive fashion when `regex=False` and `case=False` (GH7505)
- Bug in `expanding_cov`, `expanding_corr`, `rolling_cov`, and `rolling_corr` for two arguments with mismatched index (GH7512)
- Bug in `to_sql` taking the boolean column as text column (GH7678)
- Bug in grouped `hist` doesn't handle `rot` kw and `sharex` kw properly (GH7234)
- Bug in `.loc` performing fallback integer indexing with `object` dtype indices (GH7496)
- Bug (regression) in `PeriodIndex` constructor when passed `Series` objects (GH7701).

### 39.11.1.6 Contributors

A total of 46 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 39.11.2 v0.14.0 (May 31 , 2014)

{{ header }}

This is a major release from 0.13.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - Officially support Python 3.4
  - SQL interfaces updated to use `sqlalchemy`, See [Here](#).
  - Display interface changes, See [Here](#)
  - MultiIndexing Using Slicers, See [Here](#).
  - Ability to join a singly-indexed DataFrame with a MultiIndexed DataFrame, see [Here](#)
  - More consistency in groupby results and more flexible groupby specifications, See [Here](#)
  - Holiday calendars are now supported in `CustomBusinessDay`, see [Here](#)
  - Several improvements in plotting functions, including: hexbin, area and pie plots, see [Here](#).
  - Performance doc section on I/O operations, See [Here](#)
- *Other Enhancements*
- *API Changes*
- *Text Parsing API Changes*
- *Groupby API Changes*
- *Performance Improvements*
- *Prior Deprecations*
- *Deprecations*
- *Known Issues*
- *Bug Fixes*

**Warning:** In 0.14.0 all `NDFrame` based containers have undergone significant internal refactoring. Before that each block of homogeneous data had its own labels and extra care was necessary to keep those in sync with the parent container's labels. This should not have any visible user/API behavior changes ([GH6745](#))

### 39.11.2.1 API changes

- `read_excel` uses 0 as the default sheet ([GH6573](#))
- `iloc` will now accept out-of-bounds indexers for slices, e.g. a value that exceeds the length of the object being indexed. These will be excluded. This will make pandas conform more with python/numpy indexing of out-of-bounds values. A single indexer that is out-of-bounds and drops the dimensions of the object will still raise `IndexError` ([GH6296](#), [GH6299](#)). This could result in an empty axis (e.g. an empty DataFrame being returned)

```
In [1]: df1 = pd.DataFrame(np.random.randn(5, 2), columns=list('AB'))
In [2]: df1
Out [2]:
```

|   | A         | B         |
|---|-----------|-----------|
| 0 | 0.846663  | -0.234736 |
| 1 | -0.074109 | 0.245140  |
| 2 | 0.445040  | -0.129468 |
| 3 | 0.393679  | -0.573685 |

(continues on next page)

```
[5 rows x 2 columns]
```

.....

Index: [0, 1, 2, 3, 4]

---

```
[5 rows x 1 columns]
```

[illegible]

```
[1 rows x 2 columns]
```

```
>>> df1.iloc[[4, 5, 6]]
IndexError: positional indexers are out-of-bounds
```

```
>>> dfl.iloc[:, 4]
IndexError: single positional indexer is out-of-bounds
```

- Slicing with negative start, stop & step values handles corner cases better ([GH6531](#)):
  - `df.iloc[: -len(df)]` is now empty
  - `df.iloc[len(df) :: -1]` now enumerates all elements in reverse
- The `DataFrame.interpolate()` keyword `downcast` default has been changed from `infer` to `None`. This is to preserve the original dtype unless explicitly requested otherwise ([GH6290](#)).
- When converting a dataframe to HTML it used to return *Empty DataFrame*. This special case has been removed, instead a header with the column names is returned ([GH6062](#)).
- `Series` and `Index` now internally share more common operations, e.g. `factorize()`, `nunique()`, `value_counts()` are now supported on `Index` types as well. The `Series.weekday` property from is removed from `Series` for API consistency. Using a `DatetimeIndex/PeriodIndex` method on a `Series` will now raise a `TypeError`. ([GH4551](#), [GH4056](#), [GH5519](#), [GH6380](#), [GH7206](#)).
- Add `is_month_start`, `is_month_end`, `is_quarter_start`, `is_quarter_end`.

`is_year_start`, `is_year_end` accessors for `DateTimeIndex` / `Timestamp` which return a boolean array of whether the timestamp(s) are at the start/end of the month/quarter/year defined by the frequency of the `DateTimeIndex` / `Timestamp` (GH4565, GH6998)

- Local variable usage has changed in `pandas.eval()`/`DataFrame.eval()`/`DataFrame.query()` (GH5987). For the `DataFrame` methods, two things have changed
  - Column names are now given precedence over locals
  - Local variables must be referred to explicitly. This means that even if you have a local variable that is *not* a column you must still refer to it with the '@' prefix.
  - You can have an expression like `df.query('@a < a')` with no complaints from pandas about ambiguity of the name `a`.
  - The top-level `pandas.eval()` function does not allow you use the '@' prefix and provides you with an error message telling you so.
  - `NameResolutionError` was removed because it isn't necessary anymore.
- Define and document the order of column vs index names in query/eval (GH6676)
- `concat` will now concatenate mixed Series and DataFrames using the Series name or numbering columns as needed (GH2385). See the docs
- Slicing and advanced/boolean indexing operations on `Index` classes as well as `Index.delete()` and `Index.drop()` methods will no longer change the type of the resulting index (GH6440, GH7040)

```
In [6]: i = pd.Index([1, 2, 3, 'a', 'b', 'c'])

In [7]: i[[0, 1, 2]]
Out[7]: Index([1, 2, 3], dtype='object')

In [8]: i.drop(['a', 'b', 'c'])
Out[8]: Index([1, 2, 3], dtype='object')
```

Previously, the above operation would return `Int64Index`. If you'd like to do this manually, use `Index.astype()`

```
In [9]: i[[0, 1, 2]].astype(np.int_)
Out[9]: Int64Index([1, 2, 3], dtype='int64')
```

- `set_index` no longer converts `MultiIndex` to an `Index` of tuples. For example, the old behavior returned an `Index` in this case (GH6459):

```
# Old behavior, casted MultiIndex to an Index
In [10]: tuple_ind
Out[10]: Index([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')], dtype='object')

In [11]: df_multi.set_index(tuple_ind)
Out[11]:
↪
```

|        | 0         | 1         |
|--------|-----------|-----------|
| (a, c) | 0.471435  | -1.190976 |
| (a, d) | 1.432707  | -0.312652 |
| (b, c) | -0.720589 | 0.887163  |
| (b, d) | 0.859588  | -0.636524 |

```
[4 rows x 2 columns]
```

(continues on next page)

(continued from previous page)

```
# New behavior
In [12]: mi
MultiIndex(levels=[['a', 'b'], ['c', 'd']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]])

In [13]: df_multi.set_index(mi)

      0      1
a c  0.471435 -1.190976
   d  1.432707 -0.312652
b c -0.720589  0.887163
   d  0.859588 -0.636524

[4 rows x 2 columns]
```

This also applies when passing multiple indices to `set_index`:

```
# Old output, 2-level MultiIndex of tuples
In [14]: df_multi.set_index([df_multi.index, df_multi.index])
Out[14]:
      0      1
(a, c) (a, c)  0.471435 -1.190976
(a, d) (a, d)  1.432707 -0.312652
(b, c) (b, c) -0.720589  0.887163
(b, d) (b, d)  0.859588 -0.636524

[4 rows x 2 columns]

# New output, 4-level MultiIndex
In [15]: df_multi.set_index([df_multi.index, df_multi.index])
Out[15]:
      0      1
a c a c  0.471435 -1.190976
   d a d  1.432707 -0.312652
b c b c -0.720589  0.887163
   d b d  0.859588 -0.636524

[4 rows x 2 columns]
```

- `pairwise` keyword was added to the statistical moment functions `rolling_cov`, `rolling_corr`, `ewmcorr`, `ewmcorr`, `expanding_cov`, `expanding_corr` to allow the calculation of moving window covariance and correlation matrices ([GH4950](#)). See *Computing rolling pairwise covariances and correlations* in the docs.

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4), columns=list('ABCD'))

In [4]: covs = pd.rolling_cov(df[['A', 'B', 'C']],
.....:                        df[['B', 'C', 'D']],
.....:                        5,
.....:                        pairwise=True)

In [5]: covs[df.index[-1]]
```

(continues on next page)

(continued from previous page)

```
Out [5]:
```

|   | B         | C         | D         |
|---|-----------|-----------|-----------|
| A | 0.035310  | 0.326593  | -0.505430 |
| B | 0.137748  | -0.006888 | -0.005383 |
| C | -0.006888 | 0.861040  | 0.020762  |

- `Series.iteritems()` is now lazy (returns an iterator rather than a list). This was the documented behavior prior to 0.14. (GH6760)
- Added `nunique` and `value_counts` functions to `Index` for counting unique elements. (GH6734)
- `stack` and `unstack` now raise a `ValueError` when the `level` keyword refers to a non-unique item in the `Index` (previously raised a `KeyError`). (GH6738)
- drop unused `order` argument from `Series.sort`; args now are in the same order as `Series.order`; add `na_position` arg to conform to `Series.order` (GH6847)
- default sorting algorithm for `Series.order` is now `quicksort`, to conform with `Series.sort` (and `numpy` defaults)
- add `inplace` keyword to `Series.order/sort` to make them inverses (GH6859)
- `DataFrame.sort` now places NaNs at the beginning or end of the sort according to the `na_position` parameter. (GH3917)
- accept `TextFileReader` in `concat`, which was affecting a common user idiom (GH6583), this was a regression from 0.13.1
- Added `factorize` functions to `Index` and `Series` to get indexer and unique values (GH7090)
- `describe` on a `DataFrame` with a mix of `Timestamp` and string like objects returns a different `Index` (GH7088). Previously the index was unintentionally sorted.
- Arithmetic operations with **only** `bool` dtypes now give a warning indicating that they are evaluated in Python space for `+`, `-`, and `*` operations and raise for all others (GH7011, GH6762, GH7015, GH7210)

```
>>> x = pd.Series(np.random.rand(10) > 0.5)
>>> y = True
>>> x + y # warning generated: should do x | y instead
UserWarning: evaluating in Python space because the '+' operator is not
supported by numexpr for the bool dtype, use '|' instead
>>> x / y # this raises because it doesn't make sense
NotImplementedError: operator '/' not implemented for bool dtypes
```

- In `HDFStore`, `select_as_multiple` will always raise a `KeyError`, when a key or the selector is not found (GH6177)
- `df['col'] = value` and `df.loc[:, 'col'] = value` are now completely equivalent; previously the `.loc` would not necessarily coerce the dtype of the resultant series (GH6149)
- `dtypes` and `ftypes` now return a series with `dtype=object` on empty containers (GH5740)
- `df.to_csv` will now return a string of the CSV data if neither a target path nor a buffer is provided (GH6061)
- `pd.infer_freq()` will now raise a `TypeError` if given an invalid `Series/Index` type (GH6407, GH6463)
- A tuple passed to `DataFrame.sort_index` will be interpreted as the levels of the index, rather than requiring a list of tuple (GH4370)
- all offset operations now return `Timestamp` types (rather than `datetime`), `Business/Week` frequencies were incorrect (GH4069)

- `to_excel` now converts `np.inf` into a string representation, customizable by the `inf_rep` keyword argument (Excel has no native inf representation) (GH6782)
- Replace `pandas.compat.scipy.scoreatpercentile` with `numpy.percentile` (GH6810)
- `.quantile` on a `datetime[ns]` series now returns `Timestamp` instead of `np.datetime64` objects (GH6810)
- change `AssertionError` to `TypeError` for invalid types passed to `concat` (GH6583)
- Raise a `TypeError` when `DataFrame` is passed an iterator as the `data` argument (GH5357)

### 39.11.2.2 Display Changes

- The default way of printing large `DataFrames` has changed. `DataFrames` exceeding `max_rows` and/or `max_columns` are now displayed in a centrally truncated view, consistent with the printing of a `pandas.Series` (GH5603).

In previous versions, a `DataFrame` was truncated once the dimension constraints were reached and an ellipse (...) signaled that part of the data was cut off.

```
In [1]: import pandas as pd
```

```
In [2]: import numpy as np
```

```
In [3]: pd.options.display.max_rows = 6
```

```
In [4]: pd.options.display.max_columns = 6
```

```
In [5]: index = pd.DatetimeIndex(start='20010101', freq='D', periods=10)
```

```
In [6]: pd.DataFrame(np.arange(10*10).reshape((10,10)), index=index)
```

```
Out[6]:
```

|            | 0   | 1   | 2   | 3   | 4   | 5      |
|------------|-----|-----|-----|-----|-----|--------|
| 2001-01-01 | 0   | 1   | 2   | 3   | 4   | 5 ...  |
| 2001-01-02 | 10  | 11  | 12  | 13  | 14  | 15 ... |
| 2001-01-03 | 20  | 21  | 22  | 23  | 24  | 25 ... |
| 2001-01-04 | 30  | 31  | 32  | 33  | 34  | 35 ... |
| 2001-01-05 | 40  | 41  | 42  | 43  | 44  | 45 ... |
| 2001-01-06 | 50  | 51  | 52  | 53  | 54  | 55 ... |
|            | ... | ... | ... | ... | ... | ...    |

```
[10 rows x 10 columns]
```

In the current version, large `DataFrames` are centrally truncated, showing a preview of head and tail in both dimensions.

is now `None` by default. This will follow the global setting in `display.max_info_columns`. The global setting can be overridden with `verbose=True` or `verbose=False`.

- Fixed a bug with the `info` repr not honoring the `display.max_info_columns` setting (GH6939)
- Offset/freq info now in Timestamp `__repr__` (GH4553)

### 39.11.2.3 Text Parsing API Changes

`read_csv()/read_table()` will now be noisier w.r.t invalid options rather than falling back to the `PythonParser`.

- Raise `ValueError` when `sep` specified with `delim_whitespace=True` in `read_csv()/read_table()` (GH6607)
- Raise `ValueError` when `engine='c'` specified with unsupported options in `read_csv()/read_table()` (GH6607)
- Raise `ValueError` when fallback to python parser causes options to be ignored (GH6607)
- Produce `ParserWarning` on fallback to python parser when no options are ignored (GH6607)
- Translate `sep='\s+'` to `delim_whitespace=True` in `read_csv()/read_table()` if no other C-unsupported options specified (GH6607)

### 39.11.2.4 Groupby API Changes

More consistent behaviour for some groupby methods:

- groupby `head` and `tail` now act more like `filter` rather than an aggregation:

```
In [19]: df = pd.DataFrame([[1, 2], [1, 4], [5, 6]], columns=['A', 'B'])
In [20]: g = df.groupby('A')

In [21]: g.head(1)  # filters DataFrame
Out[21]:
   A  B
0  1  2
2  5  6

[2 rows x 2 columns]

In [22]: g.apply(lambda x: x.head(1))  # used to simply fall-through
Out[22]:
   A  B
1  0  1  2
5  2  5  6

[2 rows x 2 columns]
```

- groupby `head` and `tail` respect column selection:

```
In [23]: g[['B']].head(1)
Out[23]:
   B
0  2
```

(continues on next page)

(continued from previous page)

```
2 6
[2 rows x 1 columns]
```

- `groupby` `nth` now reduces by default; filtering can be achieved by passing `as_index=False`. With an optional `dropna` argument to ignore NaN. See *the docs*.

## Reducing

```
In [24]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6]], columns=['A', 'B'])
```

```
In [25]: g = df.groupby('A')
```

```
In [26]: g.nth(0)
```

Out [26] :

B

A

|   |     |
|---|-----|
| 1 | NaN |
|---|-----|

|   |     |
|---|-----|
| 5 | 6.0 |
|---|-----|

```
[2 rows x 1 columns]
```

```
# this is equivalent to g.first()
```

```
In [27]: g.nth(0, dropna='any')
```

```
\\Out [27]:
```

B

A

|   |     |
|---|-----|
| 1 | 4.0 |
|---|-----|

|   |     |
|---|-----|
| 5 | 6.0 |
|---|-----|

```
[2 rows x 1 columns]
```

```
# this is equivalent to g.last()
```

```
In [28]: g.nth(-1, dropna='any')
```

B

A

|   |     |
|---|-----|
| 1 | 4.0 |
|---|-----|

|   |     |
|---|-----|
| 5 | 6.0 |
|---|-----|

```
[2 rows x 1 columns]
```

## Filtering

```
In [29]: gf = df.groupby('A', as_index=False)
```

```
In [30]: gf.nth(0)
```

Out [30] :

| A | B   |
|---|-----|
| 1 | 1   |
| 1 | 2   |
| 1 | 3   |
| 1 | 4   |
| 1 | 5   |

```

```
\\Out[31]:
```

(continues on next page)

groupby will now not return the grouped column for non-cython functions ([GH5610](#), [GH5614](#), [GH6732](#)), as its already the index

passing `as_index` will leave the grouped column in-place (this is not change in 0.14.0)

(continues on next page)

(continued from previous page)

```

1    2.0  5.0  0.0  5.0  5.0  5.0  5.0  5.0  2.0  7.0  1.414214  6.0  6.5  7.0  7.
↪5    8.0

[2 rows x 16 columns]
```

- Allow specification of a more complex groupby via `pd.Grouper`, such as grouping by a Time and a string field simultaneously. See *the docs*. ([GH3794](#))
- Better propagation/preservation of Series names when performing groupby operations:
  - `SeriesGroupBy.agg` will ensure that the name attribute of the original series is propagated to the result ([GH6265](#)).
  - If the function provided to `GroupBy.apply` returns a named series, the name of the series will be kept as the name of the column index of the DataFrame returned by `GroupBy.apply` ([GH6124](#)). This facilitates `DataFrame.stack` operations where the name of the column index is used as the name of the inserted column containing the pivoted data.

### 39.11.2.5 SQL

The SQL reading and writing functions now support more database flavors through SQLAlchemy ([GH2717](#), [GH4163](#), [GH5950](#), [GH6292](#)). All databases supported by SQLAlchemy can be used, such as PostgreSQL, MySQL, Oracle, Microsoft SQL server (see documentation of SQLAlchemy on [included dialects](#)).

The functionality of providing DBAPI connection objects will only be supported for sqlite3 in the future. The 'mysql' flavor is deprecated.

The new functions `read_sql_query()` and `read_sql_table()` are introduced. The function `read_sql()` is kept as a convenience wrapper around the other two and will delegate to specific function depending on the provided input (database table name or sql query).

In practice, you have to provide a SQLAlchemy engine to the sql functions. To connect with SQLAlchemy you use the `create_engine()` function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For an in-memory sqlite database:

```

In [40]: from sqlalchemy import create_engine

# Create your connection.
In [41]: engine = create_engine('sqlite:///memory:')
```

This engine can then be used to write or read data to/from this database:

```

In [42]: df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'c']})

In [43]: df.to_sql('db_table', engine, index=False)
```

You can read data from a database by specifying the table name:

```

In [44]: pd.read_sql_table('db_table', engine)
Out[44]:
   A  B
0  1  a
1  2  b
2  3  c

[3 rows x 2 columns]
```

or by specifying a sql query:

```
In [45]: pd.read_sql_query('SELECT * FROM db_table', engine)
Out[45]:
   A  B
0  1  a
1  2  b
2  3  c

[3 rows x 2 columns]
```

Some other enhancements to the sql functions include:

- support for writing the index. This can be controlled with the `index` keyword (default is `True`).
- specify the column label to use when writing the index with `index_label`.
- specify string columns to parse as datetimes with the `parse_dates` keyword in `read_sql_query()` and `read_sql_table()`.

**Warning:** Some of the existing functions or function aliases have been deprecated and will be removed in future versions. This includes: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

**Warning:** The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines ([GH6900](#)).

### 39.11.2.6 MultiIndexing Using Slicers

In 0.14.0 we added a new way to slice MultiIndexed objects. You can slice a MultiIndex by providing multiple indexers.

You can provide any of the selectors as if you are indexing by label, see *Selection by Label*, including slices, lists of labels, labels, and boolean indexers.

You can use `slice(None)` to select all the contents of *that* level. You do not need to specify all the *deeper* levels, they will be implied as `slice(None)`.

As usual, **both sides** of the slicers are included as this is label indexing.

See *the docs* See also issues ([GH6134](#), [GH4036](#), [GH3057](#), [GH2598](#), [GH5641](#), [GH7106](#))

**Warning:**

You should specify all axes in the `.loc` specifier, meaning the indexer for the **index** and for the **columns**. There are some ambiguous cases where the passed indexer could be mis-interpreted as indexing *both* axes, rather than into say the MultiIndex for the rows.

You should do this:

```
>>> df.loc[(slice('A1', 'A3'), ...), :] # noqa: E901
```

rather than this:

```
>>> df.loc[(slice('A1', 'A3'), ...)] # noqa: E901
```

**Warning:** You will need to make sure that the selection axes are fully lexsorted!

```
In [46]: def mklbl(prefix, n):
.....:     return ["%s%s" % (prefix, i) for i in range(n)]
.....:

In [47]: index = pd.MultiIndex.from_product([mklbl('A', 4),
.....:                                     mklbl('B', 2),
.....:                                     mklbl('C', 4),
.....:                                     mklbl('D', 2)])
.....:

In [48]: columns = pd.MultiIndex.from_tuples([('a', 'foo'), ('a', 'bar'),
.....:                                     ('b', 'foo'), ('b', 'bah')],
.....:                                     names=['lv10', 'lv11'])
.....:

In [49]: df = pd.DataFrame(np.arange(len(index) * len(columns)).reshape((len(index),
.....:                                     len(columns))),
.....:                     index=index,
.....:                     columns=columns).sort_index().sort_index(axis=1)
.....:

In [50]: df
Out[50]:
```

### 39.11.2.7 Plotting

- Hexagonal bin plots from `DataFrame.plot` with `kind='hexbin'` ([GH5478](#)), See the docs.
- `DataFrame.plot` and `Series.plot` now supports area plot with specifying `kind='area'` ([GH6656](#)), See the docs
- Pie plots from `Series.plot` and `DataFrame.plot` with `kind='pie'` ([GH6976](#)), See the docs.
- Plotting with Error Bars is now supported in the `.plot` method of `DataFrame` and `Series` objects ([GH3796](#), [GH6834](#)), See the docs.
- `DataFrame.plot` and `Series.plot` now support a `table` keyword for plotting `matplotlib.Table`, See the docs. The `table` keyword can receive the following values.

- `False`: Do nothing (default).
  - `True`: Draw a table using the `DataFrame` or `Series` called `plot` method. Data will be transposed to meet matplotlib's default layout.
  - `DataFrame` or `Series`: Draw `matplotlib.table` using the passed data. The data will be drawn as displayed in `print` method (not transposed automatically). Also, helper function `pandas.tools.plotting.table` is added to create a table from `DataFrame` and `Series`, and add it to an `matplotlib.Axes`.
- `plot(legend='reverse')` will now reverse the order of legend labels for most plot kinds. (GH6014)
  - Line plot and area plot can be stacked by `stacked=True` (GH6656)
  - Following keywords are now acceptable for `DataFrame.plot()` with `kind='bar'` and `kind='barh'`:
    - `width`: Specify the bar width. In previous versions, static value 0.5 was passed to matplotlib and it cannot be overwritten. (GH6604)
    - `align`: Specify the bar alignment. Default is `center` (different from matplotlib). In previous versions, pandas passes `align='edge'` to matplotlib and adjust the location to `center` by itself, and it results `align` keyword is not applied as expected. (GH4525)
    - `position`: Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1(right/top-end). Default is 0.5 (center). (GH6604)

Because of the default `align` value changes, coordinates of bar plots are now located on integer values (0.0, 1.0, 2.0...). This is intended to make bar plot be located on the same coordinates as line plot. However, bar plot may differs unexpectedly when you manually adjust the bar location or drawing area, such as using `set_xlim`, `set_ylim`, etc. In this cases, please modify your script to meet with new coordinates.

- The `parallel_coordinates()` function now takes argument `color` instead of `colors`. A `FutureWarning` is raised to alert that the old `colors` argument will not be supported in a future release. (GH6956)
- The `parallel_coordinates()` and `andrews_curves()` functions now take positional argument `frame` instead of `data`. A `FutureWarning` is raised if the old `data` argument is used by name. (GH6956)
- `DataFrame.boxplot()` now supports `layout` keyword (GH6769)
- `DataFrame.boxplot()` has a new keyword argument, `return_type`. It accepts `'dict'`, `'axes'`, or `'both'`, in which case a `namedtuple` with the matplotlib axes and a dict of matplotlib Lines is returned.

### 39.11.2.8 Prior Version Deprecations/Changes

There are prior version deprecations that are taking effect as of 0.14.0.

- Remove `DateRange` in favor of `DatetimeIndex` (GH6816)
- Remove `column` keyword from `DataFrame.sort` (GH4370)
- Remove `precision` keyword from `set_eng_float_format()` (GH395)
- Remove `force_unicode` keyword from `DataFrame.to_string()`, `DataFrame.to_latex()`, and `DataFrame.to_html()`; these function encode in unicode by default (GH2224, GH2225)
- Remove `nanRep` keyword from `DataFrame.to_csv()` and `DataFrame.to_string()` (GH275)
- Remove `unique` keyword from `HDFStore.select_column()` (GH3256)
- Remove `inferTimeRule` keyword from `Timestamp.offset()` (GH391)
- Remove `name` keyword from `get_data_yahoo()` and `get_data_google()` (commit b921d1a)

- Remove `offset` keyword from `DatetimeIndex` constructor ( [commit 3136390](#) )
- Remove `time_rule` from several rolling-moment statistical functions, such as `rolling_sum()` ([GH1042](#))
- Removed `neg` – boolean operations on numpy arrays in favor of `inv ~`, as this is going to be deprecated in numpy 1.9 ([GH6960](#))

### 39.11.2.9 Deprecations

- The `pivot_table()/DataFrame.pivot_table()` and `crosstab()` functions now take arguments `index` and `columns` instead of `rows` and `cols`. A `FutureWarning` is raised to alert that the old `rows` and `cols` arguments will not be supported in a future release ([GH5505](#))
- The `DataFrame.drop_duplicates()` and `DataFrame.duplicated()` methods now take argument `subset` instead of `cols` to better align with `DataFrame.dropna()`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release ([GH6680](#))
- The `DataFrame.to_csv()` and `DataFrame.to_excel()` functions now takes argument `columns` instead of `cols`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release ([GH6645](#))
- Indexers will warn `FutureWarning` when used with a scalar indexer and a non-floating point `Index` ([GH4892](#), [GH6960](#))

```
# non-floating point indexes can only be indexed by integers / labels
In [1]: pd.Series(1, np.arange(5))[3.0]
pandas/core/index.py:469: FutureWarning: scalar indexers for index type_
↳Int64Index should be integers and not floating point
Out[1]: 1

In [2]: pd.Series(1, np.arange(5)).iloc[3.0]
pandas/core/index.py:469: FutureWarning: scalar indexers for index type_
↳Int64Index should be integers and not floating point
Out[2]: 1

In [3]: pd.Series(1, np.arange(5)).iloc[3.0:4]
pandas/core/index.py:527: FutureWarning: slice indexers when using iloc_
↳should be integers and not floating point
Out[3]:
      3      1
dtype: int64

# these are Float64Indexes, so integer or floating point is acceptable
In [4]: pd.Series(1, np.arange(5.))[3]
Out[4]: 1

In [5]: pd.Series(1, np.arange(5.))[3.0]
Out[6]: 1
```

- Numpy 1.9 compat w.r.t. deprecation warnings ([GH6960](#))
- `Panel.shift()` now has a function signature that matches `DataFrame.shift()`. The old positional argument `lags` has been changed to a keyword argument `periods` with a default value of 1. A `FutureWarning` is raised if the old argument `lags` is used by name. ([GH6910](#))
- The `order` keyword argument of `factorize()` will be removed. ([GH6926](#)).
- Remove the `copy` keyword from `DataFrame.xs()`, `Panel.major_xs()`, `Panel.minor_xs()`. A view will be returned if possible, otherwise a copy will be made. Previously the user could think that `copy=False` would ALWAYS return a view. ([GH6894](#))

- The `parallel_coordinates()` function now takes argument `color` instead of `colors`. A `FutureWarning` is raised to alert that the old `colors` argument will not be supported in a future release. (GH6956)
- The `parallel_coordinates()` and `andrews_curves()` functions now take positional argument `frame` instead of `data`. A `FutureWarning` is raised if the old `data` argument is used by name. (GH6956)
- The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).
- The following `io.sql` functions have been deprecated: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.
- The `percentile_width` keyword argument in `describe()` has been deprecated. Use the `percentiles` keyword instead, which takes a list of percentiles to display. The default output is unchanged.
- The default return type of `boxplot()` will change from a dict to a matplotlib Axes in a future release. You can use the future behavior now by passing `return_type='axes'` to `boxplot`.

### 39.11.2.10 Known Issues

- OpenPyXL 2.0.0 breaks backwards compatibility (GH7169)

### 39.11.2.11 Enhancements

- `DataFrame` and `Series` will create a `MultiIndex` object if passed a tuples dict, See *the docs* (GH3323)

```
In [65]: pd.Series({'a', 'b'): 1, ('a', 'a'): 0,
.....:           ('a', 'c'): 2, ('b', 'a'): 3, ('b', 'b'): 4})
.....:
Out[65]:
a b    1
  a    0
  c    2
b a    3
  b    4
Length: 5, dtype: int64

In [66]: pd.DataFrame({'a', 'b'): {'(A', 'B)': 1, ('A', 'C)': 2},
.....:                ('a', 'a'): {'(A', 'C)': 3, ('A', 'B)': 4},
.....:                ('a', 'c'): {'(A', 'B)': 5, ('A', 'C)': 6},
.....:                ('b', 'a'): {'(A', 'C)': 7, ('A', 'B)': 8},
.....:                ('b', 'b'): {'(A', 'D)': 9, ('A', 'B)': 10}})
.....:
Out[66]:
↪
```

|   |   | a   |     | b   |     |
|---|---|-----|-----|-----|-----|
|   |   | b   | a   | c   | a   |
| A | B | 1.0 | 4.0 | 5.0 | 8.0 |
|   | C | 2.0 | 3.0 | 6.0 | 7.0 |
|   | D | NaN | NaN | NaN | 9.0 |

```

[3 rows x 5 columns]
```

- Added the `sym_diff` method to `Index` (GH5543)
- `DataFrame.to_latex` now takes a `longtable` keyword, which if `True` will return a table in a `longtable` environment. (GH6617)

- Add option to turn off escaping in `DataFrame.to_latex` (GH6472)
- `pd.read_clipboard` will, if the keyword `sep` is unspecified, try to detect data copied from a spreadsheet and parse accordingly. (GH6223)
- Joining a singly-indexed `DataFrame` with a `MultiIndexed DataFrame` (GH3662)

See *the docs*. Joining `MultiIndex DataFrame`s on both the left and right is not yet supported ATM.

```
In [67]: household = pd.DataFrame({'household_id': [1, 2, 3],
.....:                             'male': [0, 1, 0],

- `quotechar`, `doublequote`, and `escapechar` can now be specified when using `DataFrame.to_csv` ([GH5414](#), [GH4528](#))
- Partially sort by only the specified levels of a `MultiIndex` with the `sort_remaining` boolean kwarg. ([GH3984](#))
- Added `to_julian_date` to `TimeStamp` and `DatetimeIndex`. The Julian Date is used primarily in astronomy and represents the number of days from noon, January 1, 4713 BC. Because nanoseconds are used to define the time in pandas the actual range of dates that you can use is 1678 AD to 2262 AD. ([GH4041](#))
- `DataFrame.to_stata` will now check data for compatibility with Stata data types and will upcast when needed. When it is not possible to losslessly upcast, a warning is issued ([GH6327](#))
- `DataFrame.to_stata` and `StataWriter` will accept keyword arguments `time_stamp` and `data_label` which allow the time stamp and dataset label to be set when creating a file. ([GH6545](#))
- `pandas.io.gbq` now handles reading unicode strings properly. ([GH5940](#))
- *Holidays Calendars* are now available and can be used with the `CustomBusinessDay` offset ([GH6719](#))
- `Float64Index` is now backed by a `float64` dtype ndarray instead of an object dtype array ([GH6471](#)).
- Implemented `Panel.pct_change` ([GH6904](#))
- Added `how` option to rolling-moment functions to dictate how to handle resampling; `rolling_max()` defaults to max, `rolling_min()` defaults to min, and all others default to mean ([GH6297](#))
- `CustomBuisnessMonthBegin` and `CustomBusinessMonthEnd` are now available ([GH6866](#))
- `Series.quantile()` and `DataFrame.quantile()` now accept an array of quantiles.
- `describe()` now accepts an array of percentiles to include in the summary statistics ([GH4196](#))
- `pivot_table` can now accept `Groupby` by index and columns keywords ([GH6913](#))

```

(continues on next page)

- Improve performance of DataFrame construction with certain offsets, by removing faulty caching (e.g. MonthEnd, BusinessMonthEnd), (GH6479)
- Improve performance of CustomBusinessDay (GH6584)
- improve performance of slice indexing on Series with string keys (GH6341, GH6372)
- Performance improvement for DataFrame.from\_records when reading a specified number of rows from an iterable (GH6700)
- Performance improvements in timedelta conversions for integer dtypes (GH6754)
- Improved performance of compatible pickles (GH6899)
- Improve performance in certain reindexing operations by optimizing take\_2d (GH6749)
- GroupBy.count() is now implemented in Cython and is much faster for large numbers of groups (GH7016).

### 39.11.2.13 Experimental

There are no experimental changes in 0.14.0

### 39.11.2.14 Bug Fixes

- Bug in Series ValueError when index doesn't match data (GH6532)
- Prevent segfault due to MultiIndex not being supported in HDFStore table format (GH1848)
- Bug in pd.DataFrame.sort\_index where mergesort wasn't stable when ascending=False (GH6399)
- Bug in pd.tseries.frequencies.to\_offset when argument has leading zeros (GH6391)
- Bug in version string gen. for dev versions with shallow clones / install from tarball (GH6127)
- Inconsistent tz parsing Timestamp / to\_datetime for current year (GH5958)
- Indexing bugs with reordered indexes (GH6252, GH6254)
- Bug in .xs with a Series multiindex (GH6258, GH5684)
- Bug in conversion of a string types to a DatetimeIndex with a specified frequency (GH6273, GH6274)
- Bug in eval where type-promotion failed for large expressions (GH6205)
- Bug in interpolate with inplace=True (GH6281)
- HDFStore.remove now handles start and stop (GH6177)
- HDFStore.select\_as\_multiple handles start and stop the same way as select (GH6177)
- HDFStore.select\_as\_coordinates and select\_column works with a where clause that results in filters (GH6177)
- Regression in join of non\_unique\_indexes (GH6329)
- Issue with groupby agg with a single function and a a mixed-type frame (GH6337)
- Bug in DataFrame.replace() when passing a non-bool to\_replace argument (GH6332)
- Raise when trying to align on different levels of a MultiIndex assignment (GH3738)
- Bug in setting complex dtypes via boolean indexing (GH6345)
- Bug in TimeGrouper/resample when presented with a non-monotonic DatetimeIndex that would return invalid results. (GH4161)

- Bug in index name propagation in TimeGrouper/resample (GH4161)
- TimeGrouper has a more compatible API to the rest of the groupers (e.g. groups was missing) (GH3881)
- Bug in multiple grouping with a TimeGrouper depending on target column order (GH6764)
- Bug in `pd.eval` when parsing strings with possible tokens like `'&'` (GH6351)
- Bug correctly handle placements of `-inf` in Panels when dividing by integer 0 (GH6178)
- `DataFrame.shift` with `axis=1` was raising (GH6371)
- Disabled clipboard tests until release time (run locally with `nosetests -A disabled`) (GH6048).
- Bug in `DataFrame.replace()` when passing a nested dict that contained keys not in the values to be replaced (GH6342)
- `str.match` ignored the `na` flag (GH6609).
- Bug in `take` with duplicate columns that were not consolidated (GH6240)
- Bug in `interpolate` changing dtypes (GH6290)
- Bug in `Series.get`, was using a buggy access method (GH6383)
- Bug in `hdfstore` queries of the form `where=[('date', '>=', datetime(2013,1,1)), ('date', '<=', datetime(2014,1,1))]` (GH6313)
- Bug in `DataFrame.dropna` with duplicate indices (GH6355)
- Regression in chained `getitem` indexing with embedded list-like from 0.12 (GH6394)
- `Float64Index` with `nans` not comparing correctly (GH6401)
- `eval/query` expressions with strings containing the `@` character will now work (GH6366).
- Bug in `Series.reindex` when specifying a method with some `nan` values was inconsistent (noted on a `resample`) (GH6418)
- Bug in `DataFrame.replace()` where nested dicts were erroneously depending on the order of dictionary keys and values (GH5338).
- Performance issue in concatenating with empty objects (GH3259)
- Clarify sorting of `sym_diff` on `Index` objects with `NaN` values (GH6444)
- Regression in `MultiIndex.from_product` with a `DatetimeIndex` as input (GH6439)
- Bug in `str.extract` when passed a non-default index (GH6348)
- Bug in `str.split` when passed `pat=None` and `n=1` (GH6466)
- Bug in `io.data.DataReader` when passed `"F-F_Momentum_Factor"` and `data_source="famafrench"` (GH6460)
- Bug in `sum` of a `timedelta64[ns]` series (GH6462)
- Bug in `resample` with a `timezone` and certain offsets (GH6397)
- Bug in `iat/iloc` with duplicate indices on a `Series` (GH6493)
- Bug in `read_html` where `nan`'s were incorrectly being used to indicate missing values in text. Should use the empty string for consistency with the rest of pandas (GH5129).
- Bug in `read_html` tests where redirected invalid URLs would make one test fail (GH6445).
- Bug in multi-axis indexing using `.loc` on non-unique indices (GH6504)
- Bug that caused `_ref_locs` corruption when slice indexing across columns axis of a `DataFrame` (GH6525)

- Regression from 0.13 in the treatment of numpy `datetime64` non-ns dtypes in Series creation ([GH6529](#))
- `.names` attribute of `MultiIndex`es passed to `set_index` are now preserved ([GH6459](#)).
- Bug in `setitem` with a duplicate index and an alignable rhs ([GH6541](#))
- Bug in `setitem` with `.loc` on mixed integer `Indexes` ([GH6546](#))
- Bug in `pd.read_stata` which would use the wrong data types and missing values ([GH6327](#))
- Bug in `DataFrame.to_stata` that lead to data loss in certain cases, and could be exported using the wrong data types and missing values ([GH6335](#))
- `StataWriter` replaces missing values in string columns by empty string ([GH6802](#))
- Inconsistent types in `Timestamp` addition/subtraction ([GH6543](#))
- Bug in preserving frequency across `Timestamp` addition/subtraction ([GH4547](#))
- Bug in empty list lookup caused `IndexError` exceptions ([GH6536](#), [GH6551](#))
- `Series.quantile` raising on an object dtype ([GH6555](#))
- Bug in `.xs` with a nan in level when dropped ([GH6574](#))
- Bug in `fillna` with `method='bfill/ffill'` and `datetime64[ns]` dtype ([GH6587](#))
- Bug in sql writing with mixed dtypes possibly leading to data loss ([GH6509](#))
- Bug in `Series.pop` ([GH6600](#))
- Bug in `iloc` indexing when positional indexer matched `Int64Index` of the corresponding axis and no re-ordering happened ([GH6612](#))
- Bug in `fillna` with `limit` and `value` specified
- Bug in `DataFrame.to_stata` when columns have non-string names ([GH4558](#))
- Bug in `compat` with `np.compress`, surfaced in ([GH6658](#))
- Bug in binary operations with a rhs of a `Series` not aligning ([GH6681](#))
- Bug in `DataFrame.to_stata` which incorrectly handles nan values and ignores `with_index` keyword argument ([GH6685](#))
- Bug in `resample` with extra bins when using an evenly divisible frequency ([GH4076](#))
- Bug in consistency of `groupby` aggregation when passing a custom function ([GH6715](#))
- Bug in `resample` when `how=None` resample freq is the same as the axis frequency ([GH5955](#))
- Bug in downcasting inference with empty arrays ([GH6733](#))
- Bug in `obj.blocks` on sparse containers dropping all but the last items of same for dtype ([GH6748](#))
- Bug in unpickling `NaT` (`NaTType`) ([GH4606](#))
- Bug in `DataFrame.replace()` where regex meta characters were being treated as regex even when `regex=False` ([GH6777](#)).
- Bug in `timedelta` ops on 32-bit platforms ([GH6808](#))
- Bug in setting a tz-aware index directly via `.index` ([GH6785](#))
- Bug in `expressions.py` where `numexpr` would try to evaluate arithmetic ops ([GH6762](#)).
- Bug in `Makefile` where it didn't remove Cython generated C files with `make clean` ([GH6768](#))
- Bug with numpy < 1.7.2 when reading long strings from `HDFStore` ([GH6166](#))

- Bug in `DataFrame._reduce` where non bool-like (0/1) integers were being converted into bools. (GH6806)
- Regression from 0.13 with `fillna` and a Series on datetime-like (GH6344)
- Bug in adding `np.timedelta64` to `DatetimeIndex` with timezone outputs incorrect results (GH6818)
- Bug in `DataFrame.replace()` where changing a dtype through replacement would only replace the first occurrence of a value (GH6689)
- Better error message when passing a frequency of 'MS' in `Period` construction (GH5332)
- Bug in `Series.__unicode__` when `max_rows=None` and the Series has more than 1000 rows. (GH6863)
- Bug in `groupby.get_group` where a datelike wasn't always accepted (GH5267)
- Bug in `groupBy.get_group` created by `TimeGrouper` raises `AttributeError` (GH6914)
- Bug in `DatetimeIndex.tz_localize` and `DatetimeIndex.tz_convert` converting NaT incorrectly (GH5546)
- Bug in arithmetic operations affecting NaT (GH6873)
- Bug in `Series.str.extract` where the resulting Series from a single group match wasn't renamed to the group name
- Bug in `DataFrame.to_csv` where setting `index=False` ignored the header kwarg (GH6186)
- Bug in `DataFrame.plot` and `Series.plot`, where the legend behave inconsistently when plotting to the same axes repeatedly (GH6678)
- Internal tests for patching `__finalize__` / bug in merge not finalizing (GH6923, GH6927)
- accept `TextFileReader` in `concat`, which was affecting a common user idiom (GH6583)
- Bug in C parser with leading white space (GH3374)
- Bug in C parser with `delim_whitespace=True` and `\r`-delimited lines
- Bug in python parser with explicit `MultiIndex` in row following column header (GH6893)
- Bug in `Series.rank` and `DataFrame.rank` that caused small floats ( $<1e-13$ ) to all receive the same rank (GH6886)
- Bug in `DataFrame.apply` with functions that used `*args` or `**kwargs` and returned an empty result (GH6952)
- Bug in `sum/mean` on 32-bit platforms on overflows (GH6915)
- Moved `Panel.shift` to `NDFrame.slice_shift` and fixed to respect multiple dtypes. (GH6959)
- Bug in enabling `subplots=True` in `DataFrame.plot` only has single column raises `TypeError`, and `Series.plot` raises `AttributeError` (GH6951)
- Bug in `DataFrame.plot` draws unnecessary axes when enabling `subplots` and `kind=scatter` (GH6951)
- Bug in `read_csv` from a filesystem with non-utf-8 encoding (GH6807)
- Bug in `iloc` when setting / aligning (GH6766)
- Bug causing `UnicodeEncodeError` when `get_dummies` called with unicode values and a prefix (GH6885)
- Bug in timeseries-with-frequency plot cursor display (GH5453)
- Bug surfaced in `groupby.plot` when using a `Float64Index` (GH7025)
- Stopped tests from failing if options data isn't able to be downloaded from Yahoo (GH7034)

- Bug in `parallel_coordinates` and `radviz` where reordering of class column caused possible color/class mismatch ([GH6956](#))
- Bug in `radviz` and `andrews_curves` where multiple values of 'color' were being passed to plotting method ([GH6956](#))
- Bug in `Float64Index.isin()` where containing `nan`s would make indices claim that they contained all the things ([GH7066](#)).
- Bug in `DataFrame.boxplot` where it failed to use the axis passed as the `ax` argument ([GH3578](#))
- Bug in the `XlsxWriter` and `XlwtWriter` implementations that resulted in datetime columns being formatted without the time ([GH7075](#)) were being passed to plotting method
- `read_fwf()` treats `None` in `colspec` like regular python slices. It now reads from the beginning or until the end of the line when `colspec` contains a `None` (previously raised a `TypeError`)
- Bug in cache coherence with chained indexing and slicing; add `_is_view` property to `NDFrame` to correctly predict views; mark `is_copy` on `xs` only if its an actual copy (and not a view) ([GH7084](#))
- Bug in `DatetimeIndex` creation from string ndarray with `dayfirst=True` ([GH5917](#))
- Bug in `MultiIndex.from_arrays` created from `DatetimeIndex` doesn't preserve `freq` and `tz` ([GH7090](#))
- Bug in `unstack` raises `ValueError` when `MultiIndex` contains `PeriodIndex` ([GH4342](#))
- Bug in `boxplot` and `hist` draws unnecessary axes ([GH6769](#))
- Regression in `groupby.nth()` for out-of-bounds indexers ([GH6621](#))
- Bug in `quantile` with datetime values ([GH6965](#))
- Bug in `Dataframe.set_index`, `reindex` and `pivot` don't preserve `DatetimeIndex` and `PeriodIndex` attributes ([GH3950](#), [GH5878](#), [GH6631](#))
- Bug in `MultiIndex.get_level_values` doesn't preserve `DatetimeIndex` and `PeriodIndex` attributes ([GH7092](#))
- Bug in `Groupby` doesn't preserve `tz` ([GH3950](#))
- Bug in `PeriodIndex` partial string slicing ([GH6716](#))
- Bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the `large_repr` set to 'info' ([GH7105](#))
- Bug in `DatetimeIndex` specifying `freq` raises `ValueError` when passed value is too short ([GH7098](#))
- Fixed a bug with the `info` repr not honoring the `display.max_info_columns` setting ([GH6939](#))
- Bug `PeriodIndex` string slicing with out of bounds values ([GH5407](#))
- Fixed a memory error in the hashtable implementation/factorizer on resizing of large tables ([GH7157](#))
- Bug in `isnull` when applied to 0-dimensional object arrays ([GH7176](#))
- Bug in `query/eval` where global constants were not looked up correctly ([GH7178](#))
- Bug in recognizing out-of-bounds positional list indexers with `iloc` and a multi-axis tuple indexer ([GH7189](#))
- Bug in `setitem` with a single value, `MultiIndex` and integer indices ([GH7190](#), [GH7218](#))
- Bug in expressions evaluation with reversed ops, showing in series-dataframe ops ([GH7198](#), [GH7192](#))
- Bug in multi-axis indexing with `> 2` ndim and a `MultiIndex` ([GH7199](#))
- Fix a bug where invalid eval/query operations would blow the stack ([GH5198](#))

### 39.11.2.15 Contributors

## 39.12 Version 0.13

### 39.12.1 v0.13.1 (February 3, 2014)

{{ header }}

This is a minor release from 0.13.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Added `infer_datetime_format` keyword to `read_csv/to_datetime` to allow speedups for homogeneously formatted datetimes.
- Will intelligently limit display precision for datetime/timedelta formats.

- Enhanced Panel `apply()` method.
- Suggested tutorials in new *Tutorials* section.
- Our pandas ecosystem is growing, We now feature related projects in a new *Pandas Ecosystem* section.
- Much work has been taking place on improving the docs, and a new *Contributing* section has been added.
- Even though it may only be of interest to devs, we <3 our new CI status page: [ScatterCI](#).

**Warning:** 0.13.1 fixes a bug that was caused by a combination of having numpy < 1.8, and doing chained assignment on a string-like array. Please review *the docs*, chained indexing can have unexpected results and should generally be avoided.

This would previously segfault:

```
In [1]: df = pd.DataFrame({'A': np.array(['foo', 'bar', 'bah', 'foo', 'bar'])})
In [2]: df['A'].iloc[0] = np.nan
In [3]: df
Out[3]:
   A
0 NaN
1 bar
2 bah
3 foo
4 bar
```

The recommended way to do this type of assignment is:

```
In [4]: df = pd.DataFrame({'A': np.array(['foo', 'bar', 'bah', 'foo', 'bar'])})
In [5]: df.loc[0, 'A'] = np.nan
In [6]: df
Out[6]:
   A
0 NaN
1 bar
2 bah
3 foo
4 bar
```

### 39.12.1.1 Output Formatting Enhancements

- `df.info()` view now display dtype info per column ([GH5682](#))
- `df.info()` now honors the option `max_info_rows`, to disable null counts for large frames ([GH5974](#))

```
In [7]: max_info_rows = pd.get_option('max_info_rows')

In [8]: df = pd.DataFrame({'A': np.random.randn(10),
...:                      'B': np.random.randn(10),
...:                      'C': pd.date_range('20130101', periods=10)
...:                      })
...:
```

(continues on next page)

(continued from previous page)

```
In [9]: df.iloc[3:6, [0, 2]] = np.nan
```

```
# set to not display the null counts
In [10]: pd.set_option('max_info_rows', 0)

In [11]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
A      float64
B      float64
C      datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 320.0 bytes
```

```
# this is the default (same as in 0.13.0)
In [12]: pd.set_option('max_info_rows', max_info_rows)

In [13]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
A      7 non-null float64
B     10 non-null float64
C      7 non-null datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 320.0 bytes
```

- Add `show_dimensions` display option for the new `DataFrame` repr to control whether the dimensions print.

```
In [14]: df = pd.DataFrame([[1, 2], [3, 4]])

In [15]: pd.set_option('show_dimensions', False)

In [16]: df
Out[16]:
   0  1
0  1  2
1  3  4

In [17]: pd.set_option('show_dimensions', True)

In [18]: df
Out[18]:
   0  1
0  1  2
1  3  4

[2 rows x 2 columns]
```

- The `ArrayFormatter` for `datetime` and `timedelta64` now intelligently limit precision based on the values in the array ([GH3401](#))

Previously output might look like:

|   | age                 |  | today               |  | diff                |
|---|---------------------|--|---------------------|--|---------------------|
| 0 | 2001-01-01 00:00:00 |  | 2013-04-19 00:00:00 |  | 4491 days, 00:00:00 |
| 1 | 2004-06-01 00:00:00 |  | 2013-04-19 00:00:00 |  | 3244 days, 00:00:00 |

Now the output looks like:

```
In [19]: df = pd.DataFrame([pd.Timestamp('20010101'),
.....:                      pd.Timestamp('20040601')], columns=['age'])
.....:

In [20]: df['today'] = pd.Timestamp('20130419')

In [21]: df['diff'] = df['today'] - df['age']

In [22]: df
Out[22]:
```

|   | age        |  | today      |  | diff      |
|---|------------|--|------------|--|-----------|
| 0 | 2001-01-01 |  | 2013-04-19 |  | 4491 days |
| 1 | 2004-06-01 |  | 2013-04-19 |  | 3244 days |

```
[2 rows x 3 columns]
```

### 39.12.1.2 API changes

- Add `-NaN` and `-nan` to the default set of NA values ([GH5952](#)). See *NA Values*.
- Added `Series.str.get_dummies` vectorized string method ([GH6021](#)), to extract dummy/indicator variables for separated string columns:

```
In [23]: s = pd.Series(['a', 'a|b', np.nan, 'a|c'])

In [24]: s.str.get_dummies(sep='|')
Out[24]:
```

|   | a | b | c |
|---|---|---|---|
| 0 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 |
| 2 | 0 | 0 | 0 |
| 3 | 1 | 0 | 1 |

```
[4 rows x 3 columns]
```

- Added the `NDFrame.equals()` method to compare if two `NDFrames` are equal have equal axes, dtypes, and values. Added the `array_equivalent` function to compare if two `ndarrays` are equal. NaNs in identical locations are treated as equal. ([GH5283](#)) See also *the docs* for a motivating example.

```
df = pd.DataFrame({'col': ['foo', 0, np.nan]})
df2 = pd.DataFrame({'col': [np.nan, 0, 'foo']}, index=[2, 1, 0])
df.equals(df2)
df.equals(df2.sort_index())
```

- `DataFrame.apply` will use the `reduce` argument to determine whether a `Series` or a `DataFrame` should be returned when the `DataFrame` is empty ([GH6007](#)).

Previously, calling `DataFrame.apply` an empty `DataFrame` would return either a `DataFrame` if there were no columns, or the function being applied would be called with an empty `Series` to guess whether a `Series` or `DataFrame` should be returned:

```
In [32]: def applied_func(col):
....:     print("Apply function being called with: ", col)
....:     return col.sum()
....:

In [33]: empty = DataFrame(columns=['a', 'b'])

In [34]: empty.apply(applied_func)
Apply function being called with: Series([], Length: 0, dtype: float64)
Out[34]:
a    NaN
b    NaN
Length: 2, dtype: float64
```

Now, when `apply` is called on an empty `DataFrame`: if the `reduce` argument is `True` a `Series` will be returned, if it is `False` a `DataFrame` will be returned, and if it is `None` (the default) the function being applied will be called with an empty series to try and guess the return type.

```
In [35]: empty.apply(applied_func, reduce=True)
Out[35]:
a    NaN
b    NaN
Length: 2, dtype: float64

In [36]: empty.apply(applied_func, reduce=False)
Out[36]:
Empty DataFrame
Columns: [a, b]
Index: []

[0 rows x 2 columns]
```

### 39.12.1.3 Prior Version Deprecations/Changes

There are no announced changes in 0.13 or prior that are taking effect as of 0.13.1

### 39.12.1.4 Deprecations

There are no deprecations of prior behavior in 0.13.1

### 39.12.1.5 Enhancements

- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexical for suggesting and @danbirken for rapidly implementing. (GH5490, GH6021)

If `parse_dates` is enabled and this flag is set, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.

```
# Try to infer the format for the index column
df = pd.read_csv('foo.csv', index_col=0, parse_dates=True,
                 infer_datetime_format=True)
```

- `date_format` and `datetime_format` keywords can now be specified when writing to excel files ([GH4133](#))
- `MultiIndex.from_product` convenience function for creating a `MultiIndex` from the cartesian product of a set of iterables ([GH6055](#)):

```
In [25]: shades = [ 'light', 'dark' ]

In [26]: colors = [ 'red', 'green', 'blue' ]

In [27]: pd.MultiIndex.from_product([shades, colors], names=['shade', 'color'])
Out[27]:
MultiIndex(levels=[['dark', 'light'], ['blue', 'green', 'red']],
            labels=[[1, 1, 1, 0, 0, 0], [2, 1, 0, 2, 1, 0]],
            names=['shade', 'color'])
```

- Panel `apply()` will work on non-ufuncs. See *the docs*.

```
In [28]: import pandas.util.testing as tm

In [29]: panel = tm.makePanel(5)

In [30]: panel
Out[30]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D

In [31]: panel['ItemA']
\\repeated characters\\
↪
      A      B      C      D
2000-01-03  0.245972  1.392047  1.503565 -2.170629
2000-01-04  0.319442  0.769914 -1.328035 -0.270630
2000-01-05  1.378512 -2.472300  1.023958 -1.685677
2000-01-06  0.292502 -0.611151  0.660103 -0.440747
2000-01-07  0.329791  1.044829  1.236475 -0.115070

[5 rows x 4 columns]
```

### Specifying an `apply` that operates on a Series (to return a single element)

```
In [32]: panel.apply(lambda x: x.dtype, axis='items')
Out[32]:
```

|            | A       | B       | C       | D       |
|------------|---------|---------|---------|---------|
| 2000-01-03 | float64 | float64 | float64 | float64 |
| 2000-01-04 | float64 | float64 | float64 | float64 |
| 2000-01-05 | float64 | float64 | float64 | float64 |
| 2000-01-06 | float64 | float64 | float64 | float64 |
| 2000-01-07 | float64 | float64 | float64 | float64 |

```
[5 rows x 4 columns]
```

A similar reduction type operation

This is equivalent to

A transformation operation that returns a Panel, but is computing the z-score across the `major_axis`

- Panel `apply()` operating on cross-sectional slabs. (GH1148)

```
In [38]: def f(x):
....:     return ((x.T - x.mean(1)) / x.std(1)).T
....:

In [39]: result = panel.apply(f, axis=['items', 'major_axis'])

In [40]: result
```

(continued from previous page)

```
Out[40]:
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 5 (major_axis) x 3 (minor_axis)
Items axis: A to D
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: ItemA to ItemC

In [41]: result.loc[:, :, 'ItemA']
////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
↪

```

|            | A         | B         | C         | D         |
|------------|-----------|-----------|-----------|-----------|
| 2000-01-03 | 1.137238  | 1.003249  | 1.089744  | -1.091210 |

2000-01-07  0.540084  1.154167  0.586830  0.836330

[5 rows x 4 columns]
```

### 39.12.1.6 Performance

## Performance improvements for 0.13.1

- Series datetime/timedelta binary operations ([GH5801](#))
- DataFrame count/dropna for axis=1
- Series.str.contains now has a *regex=False* keyword which can be faster for plain (non-regex) string patterns. ([GH5879](#))
- Series.str.extract ([GH5944](#))
- dtypes/ftypes methods ([GH5968](#))

- indexing with object dtypes (GH5968)
- `DataFrame.apply` (GH6013)
- Regression in JSON IO (GH5765)
- Index construction from Series (GH6150)

### 39.12.1.7 Experimental

There are no experimental changes in 0.13.1

### 39.12.1.8 Bug Fixes

- Bug in `io.wb.get_countries` not including all countries (GH6008)
- Bug in Series replace with timestamp dict (GH5797)
- `read_csv/read_table` now respects the *prefix* kwarg (GH5732).
- Bug in selection with missing values via `.ix` from a duplicate indexed DataFrame failing (GH5835)
- Fix issue of boolean comparison on empty DataFrames (GH5808)
- Bug in `isnull` handling NaT in an object array (GH5443)
- Bug in `to_datetime` when passed a `np.nan` or integer datelike and a format string (GH5863)
- Bug in groupby dtype conversion with datetimelike (GH5869)
- Regression in handling of empty Series as indexers to Series (GH5877)
- Bug in internal caching, related to (GH5727)
- Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
- Bug when assigning to `.ix[tuple(...)]` (GH5896)
- Bug in fully reindexing a Panel (GH5905)
- Bug in `idxmin/max` with object dtypes (GH5914)
- Bug in `BusinessDay` when adding `n` days to a date not on offset when `n>5` and `n%5==0` (GH5890)
- Bug in assigning to chained series with a series via `ix` (GH5928)
- Bug in creating an empty DataFrame, copying, then assigning (GH5932)
- Bug in `DataFrame.tail` with empty frame (GH5846)
- Bug in propagating metadata on `resample` (GH5862)
- Fixed string-representation of NaT to be “NaT” (GH5708)
- Fixed string-representation for Timestamp to show nanoseconds if present (GH5912)
- `pd.match` not returning passed sentinel
- `Panel.to_frame()` no longer fails when `major_axis` is a `MultiIndex` (GH5402).
- Bug in `pd.read_msgpack` with inferring a `DateTimeIndex` frequency incorrectly (GH5947)
- Fixed `to_datetime` for array with both Tz-aware datetimes and NaT’s (GH5961)
- Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
- Bug in `scipy.interpolate` methods with a datetime index (GH5975)

- Bug in NaT comparison if a mixed datetime/np.datetime64 with NaT were passed ([GH5968](#))
- Fixed bug with `pd.concat` losing dtype information if all inputs are empty ([GH5742](#))
- Recent changes in IPython cause warnings to be emitted when using previous versions of pandas in QtConsole, now fixed. If you're using an older version and need to suppress the warnings, see ([GH5922](#)).
- Bug in merging `timedelta` dtypes ([GH5695](#))
- Bug in `plotting.scatter_matrix` function. Wrong alignment among diagonal and off-diagonal plots, see ([GH5497](#)).
- Regression in Series with a MultiIndex via `ix` ([GH6018](#))
- Bug in `Series.xs` with a MultiIndex ([GH6018](#))
- Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) ([GH6028](#))
- Possible segfault when chained indexing with an object array under NumPy 1.7.1 ([GH6026](#), [GH6056](#))
- Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list), ([GH6043](#))
- `to_sql` did not respect `if_exists` ([GH4110](#) [GH4304](#))
- Regression in `.get (None)` indexing from 0.12 ([GH5652](#))
- Subtle `iloc` indexing bug, surfaced in ([GH6059](#))
- Bug with insert of strings into `DatetimeIndex` ([GH5818](#))
- Fixed unicode bug in `to_html/HTML` repr ([GH6098](#))
- Fixed missing arg validation in `get_options_data` ([GH6105](#))
- Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) ([GH6120](#))
- Bug in propagating `_ref_locs` during construction of a `DataFrame` with dups index/columns ([GH6121](#))
- Bug in `DataFrame.apply` when using mixed datelike reductions ([GH6125](#))
- Bug in `DataFrame.append` when appending a row with different columns ([GH6129](#))
- Bug in `DataFrame` construction with `recarray` and non-ns datetime dtype ([GH6140](#))
- Bug in `.loc` setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike ([GH6152](#))
- Fixed a bug in `query/eval` during lexicographic string comparisons ([GH6155](#)).
- Fixed a bug in `query` where the index of a single-element `Series` was being thrown away ([GH6148](#)).
- Bug in `HDFStore` on appending a dataframe with MultiIndexed columns to an existing table ([GH6167](#))
- Consistency with dtypes in setting an empty `DataFrame` ([GH6171](#))
- Bug in selecting on a MultiIndex `HDFStore` even in the presence of under specified column spec ([GH6169](#))
- Bug in `nanops.var` with `ddof=1` and 1 elements would sometimes return `inf` rather than `nan` on some platforms ([GH6136](#))
- Bug in Series and DataFrame bar plots ignoring the `use_index` keyword ([GH6209](#))
- Bug in groupby with mixed str/int under python3 fixed; `argsort` was failing ([GH6212](#))

### 39.12.1.9 Contributors

A total of 52 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### **39.12.2 v0.13.0 (January 3, 2014)**

{{ header }}

This is a major release from 0.12.0 and includes a number of API changes, several new features and enhancements along with a large number of bug fixes.

Highlights include:

- support for a new index type `Float64Index`, and other Indexing enhancements
- `HDFStore` has a new string based syntax for query specification
- support for new methods of interpolation
- updated `timedelta` operations
- a new string manipulation method `extract`
- Nanosecond support for Offsets
- `isin` for DataFrames

Several experimental features are added, including:

- new `eval/query` methods for expression evaluation
- support for `msgpack` serialization
- an i/o interface to Google's `BigQuery`

There are several new or updated docs sections including:

- *Comparison with SQL*, which should be useful for those familiar with SQL but still learning pandas.
- *Comparison with R*, idiom translations from R to pandas.
- *Enhancing Performance*, ways to enhance pandas performance with `eval/query`.

**Warning:** In 0.13.0 `Series` has internally been refactored to no longer sub-class `ndarray` but instead subclass `NDFrame`, similar to the rest of the pandas containers. This should be a transparent change with only very limited API implications. See *Internal Refactoring*

### 39.12.2.1 API changes

- `read_excel` now supports an integer in its `sheetname` argument giving the index of the sheet to read in (GH4301).
- Text parser now treats anything that reads like `inf` ("`inf`", "`Inf`", "`-Inf`", "`iNf`", etc.) as infinity. (GH4220, GH4219), affecting `read_table`, `read_csv`, etc.
- pandas now is Python 2/3 compatible without the need for `2to3` thanks to @jtratrner. As a result, pandas now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson's `six` library into `compat`. (GH4384, GH4375, GH4372)
- `pandas.util.compat` and `pandas.util.py3compat` have been merged into `pandas.compat`. `pandas.compat` now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of `range`, `filter`, `map` and `zip`, plus other necessary elements for Python 3 compatibility. `lmap`, `lzip`, `lrange` and `lfilter` all produce lists instead of iterators, for compatibility with `numpy`, subscripting and pandas constructors. (GH4384, GH4375, GH4372)
- `Series.get` with negative indexers now returns the same as `[]` (GH4390)
- Changes to how `Index` and `MultiIndex` handle metadata (`levels`, `labels`, and `names`) (GH4039):

```
# previously, you would have set levels or labels directly
>>> pd.index.levels = [[1, 2, 3, 4], [1, 2, 4, 4]]

# now, you use the set_levels or set_labels methods
>>> index = pd.index.set_levels([[1, 2, 3, 4], [1, 2, 4, 4]])

# similarly, for names, you can rename the object
# but setting names is not deprecated
>>> index = pd.index.set_names(["bob", "cranberry"])

# and all methods take an inplace kwarg - but return None
>>> pd.index.set_names(["bob", "cranberry"], inplace=True)
```

- **All** division with `NDFrame` objects is now *truedivision*, regardless of the future import. This means that operating on pandas objects will by default use *floating point* division, and return a floating point dtype. You can use `//` and `floordiv` to do integer division.

Integer division

```
In [3]: arr = np.array([1, 2, 3, 4])

In [4]: arr2 = np.array([5, 3, 2, 1])
```

(continues on next page)

(continued from previous page)

```
In [5]: arr / arr2
Out[5]: array([0, 0, 1, 4])

In [6]: pd.Series(arr) // pd.Series(arr2)
Out[6]:
0    0
1    0
2    1
3    4
dtype: int64
```

### True Division

```
In [7]: pd.Series(arr) / pd.Series(arr2)  # no future import required
Out[7]:
0    0.200000
1    0.666667
2    1.500000
3    4.000000
dtype: float64
```

- Infer and downcast dtype if `downcast='infer'` is passed to `fillna/ffill/bfill` ([GH4604](#))
- `__nonzero__` for all NDFrame objects, will now raise a `ValueError`, this reverts back to ([GH1073](#), [GH4633](#)) behavior. See *gotchas* for a more detailed discussion.

This prevents doing boolean comparison on *entire* pandas objects, which is inherently ambiguous. These all will raise a `ValueError`.

```
>>> df = pd.DataFrame({'A': np.random.randn(10),
...                    'B': np.random.randn(10),
...                    'C': pd.date_range('20130101', periods=10)
...                    })
...
>>> if df:
...     pass
...
Traceback (most recent call last):
...
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty,
a.bool(), a.item(), a.any() or a.all().

>>> df1 = df
>>> df2 = df
>>> df1 and df2
Traceback (most recent call last):
...
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty,
a.bool(), a.item(), a.any() or a.all().

>>> d = [1, 2, 3]
>>> s1 = pd.Series(d)
>>> s2 = pd.Series(d)
>>> s1 and s2
Traceback (most recent call last):
...
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty,
```

(continues on next page)

(continued from previous page)

```
a.bool(), a.item(), a.any() or a.all().
```

Added the `.bool()` method to `NDFrame` objects to facilitate evaluating of single-element boolean Series:

```
In [1]: pd.Series([True]).bool()
Out[1]: True

In [2]: pd.Series([False]).bool()
Out[2]: False

In [3]: pd.DataFrame([[True]]).bool()
Out[3]: True

In [4]: pd.DataFrame([[False]]).bool()
Out[4]: False
```

- All non-Index `NDFrames` (`Series`, `DataFrame`, `Panel`, `Panel4D`, `SparsePanel`, etc.), now support the entire set of arithmetic operators and arithmetic flex methods (add, sub, mul, etc.). `SparsePanel` does not support `pow` or `mod` with non-scalars. (GH3765)
- `Series` and `DataFrame` now have a `mode()` method to calculate the statistical mode(s) by axis/Series. (GH5367)
- Chained assignment will now by default warn if the user is assigning to a copy. This can be changed with the option `mode.chained_assignment`, allowed options are `raise/warn/None`. See *the docs*.

```
In [5]: dfc = pd.DataFrame({'A': ['aaa', 'bbb', 'ccc'], 'B': [1, 2, 3]})

In [6]: pd.set_option('chained_assignment', 'warn')
```

The following warning / exception will show if this is attempted.

```
In [7]: dfc.loc[0]['A'] = 1111
```

```
Traceback (most recent call last)
...
SettingWithCopyWarning:
  A value is trying to be set on a copy of a slice from a DataFrame.
  Try using .loc[row_index,col_indexer] = value instead
```

Here is the correct method of assignment.

```
In [8]: dfc.loc[0, 'A'] = 11

In [9]: dfc
Out[9]:
   A  B
0  11  1
1  bbb  2
2  ccc  3
```

- `Panel.reindex` has the following call signature `Panel.reindex(items=None, major_axis=None, minor_axis=None)` to conform with other `NDFrame` objects. See *Internal Refactoring* for more information.
- `Series.argmax` and `Series.argmin` are now aliased to `Series.idxmax` and `Series.idxmin`. These return the index of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element. (GH6214)

### 39.12.2.2 Prior Version Deprecations/Changes

These were announced changes in 0.12 or prior that are taking effect as of 0.13.0

- Remove deprecated `Factor` (GH3650)
- Remove deprecated `set_printoptions/reset_printoptions` (GH3046)
- Remove deprecated `_verbose_info` (GH3215)
- Remove deprecated `read_clipboard/to_clipboard/ExcelFile/ExcelWriter` from `pandas.io.parsers` (GH3717) These are available as functions in the main pandas namespace (e.g. `pd.read_clipboard`)
- default for `tupleize_cols` is now `False` for both `to_csv` and `read_csv`. Fair warning in 0.12 (GH3604)
- default for `display.max_seq_len` is now 100 rather than `None`. This activates truncated display (“...”) of long sequences in various places. (GH3391)

### 39.12.2.3 Deprecations

Deprecated in 0.13.0

- deprecated `iterkv`, which will be removed in a future release (this was an alias of `iteritems` used to bypass 2to3’s changes). (GH4384, GH4375, GH4372)
- deprecated the string method `match`, whose role is now performed more idiomatically by `extract`. In a future release, the default behavior of `match` will change to become analogous to `contains`, which returns a boolean indexer. (Their distinction is strictness: `match` relies on `re.match` while `contains` relies on `re.search`.) In this release, the deprecated behavior is the default, but the new behavior is available through the keyword argument `as_indexer=True`.

### 39.12.2.4 Indexing API Changes

Prior to 0.13, it was impossible to use a label indexer (`.loc/.ix`) to set a value that was not contained in the index of a particular axis. (GH2578). See *the docs*

In the `Series` case this is effectively an appending operation

```
In [10]: s = pd.Series([1, 2, 3])

In [11]: s
Out[11]:
0    1
1    2
2    3
dtype: int64

In [12]: s[5] = 5.

In [13]: s
Out[13]:
0    1.0
1    2.0
2    3.0
5    5.0
dtype: float64
```

```
In [14]: dfi = pd.DataFrame(np.arange(6).reshape(3, 2),
.....:                      columns=['A', 'B'])
.....:

In [15]: dfi
Out[15]:
   A  B
0  0  1
1  2  3
2  4  5
```

This would previously KeyError

```
In [16]: dfi.loc[:, 'C'] = dfi.loc[:, 'A']

In [17]: dfi
Out[17]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4
```

This is like an append operation.

```
In [18]: dfi.loc[3] = 5

In [19]: dfi
Out[19]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4
3  5  5  5
```

A Panel setting operation on an arbitrary axis aligns the input to the Panel

```
In [20]: p = pd.Panel(np.arange(16).reshape(2, 4, 2),
.....:                 items=['Item1', 'Item2'],
.....:                 major_axis=pd.date_range('2001/1/12', periods=4),
.....:                 minor_axis=['A', 'B'], dtype='float64')
.....:

In [21]: p
Out[21]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to B

In [22]: p.loc[:, :, 'C'] = pd.Series([30, 32], index=p.items)

In [23]: p
Out[23]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item2
```

(continues on next page)

(continued from previous page)

```
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to C
```

```
In [24]: p.loc[:, :, 'C']
```

|            | Item1 | Item2 |
|------------|-------|-------|
| 2001-01-12 | 30.0  | 32.0  |
| 2001-01-13 | 30.0  | 32.0  |
| 2001-01-14 | 30.0  | 32.0  |
| 2001-01-15 | 30.0  | 32.0  |

### 39.12.2.5 Float64Index API Change

- Added a new index type, `Float64Index`. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes `[]`, `ix`, `loc` for scalar indexing and slicing work exactly the same. See *the docs*, ([GH263](#))

Construction is by default for floating type values.

```
In [25]: index = pd.Index([1.5, 2, 3, 4.5, 5])

In [26]: index
Out[26]: Float64Index([1.5, 2.0, 3.0, 4.5, 5.0], dtype='float64')

In [27]: s = pd.Series(range(5), index=index)

In [28]: s
Out[28]:
1.5    0
2.0    1
3.0    2
4.5    3
5.0    4
dtype: int64
```

Scalar selection for `[]`, `.ix`, `.loc` will always be label based. An integer will match an equal float index (e.g. 3 is equivalent to 3.0)

```
In [29]: s[3]
Out[29]: 2

In [30]: s.loc[3]
Out[30]: 2
```

The only positional indexing is via `iloc`

```
In [31]: s.iloc[3]
Out[31]: 3
```

A scalar index that is not found will raise `KeyError`

Slicing is ALWAYS on the values of the index, for `[]`, `ix`, `loc` and ALWAYS positional with `iloc`

```

In [32]: s[2:4]
Out[32]:
2.0    1
3.0    2
dtype: int64

In [33]: s.loc[2:4]
Out[33]:
2.0    1
3.0    2
dtype: int64

In [34]: s.iloc[2:4]
Out[34]:
3.0    2
4.5    3
dtype: int64

```

In float indexes, slicing using floats are allowed

```

In [35]: s[2.1:4.6]
Out[35]:
3.0    2
4.5    3
dtype: int64

In [36]: s.loc[2.1:4.6]
Out[36]:
3.0    2
4.5    3
dtype: int64

```

- Indexing on other index types are preserved (and positional fallback for `[]`, `ix`), with the exception, that floating point slicing on indexes on non `Float64Index` will now raise a `TypeError`.

```

In [1]: pd.Series(range(5))[3.5]
TypeError: the label [3.5] is not a proper indexer for this index type
Int64Index

In [1]: pd.Series(range(5))[3.5:4.5]
TypeError: the slice start [3.5] is not a proper indexer for this index type
Int64Index

```

Using a scalar float indexer will be deprecated in a future version, but is allowed for now.

```

In [3]: pd.Series(range(5))[3.0]
Out[3]: 3

```

### 39.12.2.6 HDFStore API Changes

- Query Format Changes. A much more string-like query format is now supported. See *the docs*.

```

In [37]: path = 'test.h5'

In [38]: dfq = pd.DataFrame(np.random.randn(10, 4),

```

(continues on next page)

(continued from previous page)

```

.....:             columns=list('ABCD'),
.....:             index=pd.date_range('20130101', periods=10))
.....:
In [39]: dfq.to_hdf(path, 'dfq', format='table', data_columns=True)

```

Use boolean expressions, with in-line function evaluation.

```

In [40]: pd.read_hdf(path, 'dfq',
.....:             where="index>Timestamp('20130104') & columns=['A', 'B']")
.....:
Out[40]:
           A          B
2013-01-05 -0.039750  0.532007
2013-01-06 -0.339250  1.608700
2013-01-07  1.777837  0.942452
2013-01-08  0.568376  0.225935
2013-01-09 -0.055289 -0.360853
2013-01-10  0.208927  0.292058

```

Use an inline column reference

```

In [41]: pd.read_hdf(path, 'dfq',
.....:             where="A>0 or C>0")
.....:
Out[41]:
           A          B          C          D
2013-01-02 -0.314399 -0.860626  0.370397 -1.761442
2013-01-03 -0.899454  0.768159  0.225441  0.543294
2013-01-04  0.771931 -0.968145 -1.176383 -3.192716
2013-01-05 -0.039750  0.532007  0.282734 -0.730255
2013-01-07  1.777837  0.942452  0.131803  1.963349
2013-01-08  0.568376  0.225935  0.367932 -0.463752
2013-01-09 -0.055289 -0.360853  0.728197  1.326768
2013-01-10  0.208927  0.292058 -2.019610 -0.021763

```

- the format keyword now replaces the table keyword; allowed values are fixed(f) or table(t) the same defaults as prior < 0.13.0 remain, e.g. put implies fixed format and append implies table format. This default format can be set as an option by setting `io.hdf.default_format`.

```

In [42]: path = 'test.h5'

In [43]: df = pd.DataFrame(np.random.randn(10, 2))

In [44]: df.to_hdf(path, 'df_table', format='table')

In [45]: df.to_hdf(path, 'df_table2', append=True)

In [46]: df.to_hdf(path, 'df_fixed')

In [47]: with pd.HDFStore(path) as store:
.....:     print(store)
.....:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

```

- Significant table writing performance improvements

- handle a passed Series in table format ([GH4330](#))
- can now serialize a `timedelta64[ns]` dtype in a table ([GH3577](#)), See *the docs*.
- added an `is_open` property to indicate if the underlying file handle is `is_open`; a closed store will now report 'CLOSED' when viewing the store (rather than raising an error) ([GH4409](#))
- a close of a `HDFStore` now will close that instance of the `HDFStore` but will only close the actual file if the ref count (by `PyTables`) w.r.t. all of the open handles are 0. Essentially you have a local instance of `HDFStore` referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise `ClosedFileError`

```
In [48]: path = 'test.h5'

In [49]: df = pd.DataFrame(np.random.randn(10, 2))

In [50]: store1 = pd.HDFStore(path)

In [51]: store2 = pd.HDFStore(path)

In [52]: store1.append('df', df)

In [53]: store2.append('df2', df)

In [54]: store1
Out[54]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [55]: store2
Out[55]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [56]: store1.close()

In [57]: store2
Out[57]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [58]: store2.close()

In [59]: store2
Out[59]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5
```

- removed the `_quiet` attribute, replace by a `DuplicateWarning` if retrieving duplicate rows from a table ([GH4367](#))
- removed the `warn` argument from `open`. Instead a `PossibleDataLossError` exception will be raised if you try to use `mode='w'` with an OPEN file handle ([GH4367](#))
- allow a passed locations array or mask as a `where` condition ([GH4467](#)). See *the docs* for an example.
- add the keyword `dropna=True` to `append` to change whether ALL nan rows are not written to the store (default is `True`, ALL nan rows are NOT written), also settable via the option `io.hdf.dropna_table` ([GH4625](#))

- pass through store creation arguments; can be used to support in-memory stores

### 39.12.2.7 DataFrame repr Changes

The HTML and plain text representations of `DataFrame` now show a truncated view of the table once it exceeds a certain size, rather than switching to the short info view ([GH4886](#), [GH5550](#)). This makes the representation more consistent as small `DataFrames` get larger.

|            |       |       |       |       |           |       |
|------------|-------|-------|-------|-------|-----------|-------|
| 2010-03-29 | 13.70 | 13.88 | 13.39 | 13.57 | 158225000 | 12.98 |
| 2010-03-30 | 13.55 | 13.64 | 13.18 | 13.28 | 142055200 | 12.70 |
|            | ...   | ...   | ...   | ...   | ...       | ...   |

771 rows × 6 columns

To get the info view, call `DataFrame.info()`. If you prefer the info view as the repr for large `DataFrames`, you can set this by running `set_option('display.large_repr', 'info')`.

### 39.12.2.8 Enhancements

- `df.to_clipboard()` learned a new `excel` keyword that let's you paste df data directly into excel (enabled by default). ([GH5070](#)).
- `read_html` now raises a `URLError` instead of catching and raising a `ValueError` ([GH4303](#), [GH4305](#))
- Added a test for `read_clipboard()` and `to_clipboard()` ([GH4282](#))
- Clipboard functionality now works with PySide ([GH4282](#))
- Added a more informative error message when plot arguments contain overlapping color and style arguments ([GH4402](#))
- `to_dict` now takes records as a possible out type. Returns an array of column-keyed dictionaries. ([GH4936](#))
- NaN handling in `get_dummies` ([GH4446](#)) with `dummy_na`

```
# previously, nan was erroneously counted as 2 here
# now it is not counted at all
In [60]: pd.get_dummies([1, 2, np.nan])
Out [60]:
   1.0  2.0
0    1    0
1    0    1
2    0    0

# unless requested
In [61]: pd.get_dummies([1, 2, np.nan], dummy_na=True)
Out [61]:
   1.0  2.0  NaN
0    1    0    0
1    0    1    0
2    0    0    1
```

- `timedelta64[ns]` operations. See *the docs*.

**Warning:** Most of these operations require `numpy >= 1.7`

Using the new top-level `to_timedelta`, you can convert a scalar or array from the standard `timedelta` format (produced by `to_csv`) into a `timedelta` type (`np.timedelta64` in nanoseconds).

```
In [62]: pd.to_timedelta('1 days 06:05:01.00003')
Out[62]: Timedelta('1 days 06:05:01.000030')

In [63]: pd.to_timedelta('15.5us')
Out[63]: Timedelta('0 days 00:00:00.000015')

In [64]: pd.to_timedelta(['1 days 06:05:01.00003', '15.5us', 'nan'])
Out[64]: TimedeltaIndex(['1 days 06:05:01.000030', '0 days 00:00:00.000015', NaT], dtype='timedelta64[ns]', freq=None)

In [65]: pd.to_timedelta(np.arange(5), unit='s')
Out[65]: TimedeltaIndex(['00:00:00', '00:00:01', '00:00:02', '00:00:03', '00:00:04'], dtype='timedelta64[ns]', freq=None)

In [66]: pd.to_timedelta(np.arange(5), unit='d')
Out[66]: TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'], dtype='timedelta64[ns]', freq=None)
```

A Series of dtype `timedelta64[ns]` can now be divided by another `timedelta64[ns]` object, or astyped to yield a `float64` typed Series. This is frequency conversion. See *the docs* for the docs.

```
In [67]: import datetime

In [68]: td = pd.Series(pd.date_range('20130101', periods=4)) - pd.Series(
.....:     pd.date_range('20121201', periods=4))
.....:

In [69]: td[2] += np.timedelta64(datetime.timedelta(minutes=5, seconds=3))

In [70]: td[3] = np.nan

In [71]: td
Out[71]:
0    31 days 00:00:00
1    31 days 00:00:00
2    31 days 00:05:03
3              NaT
dtype: timedelta64[ns]

# to days
In [72]: td / np.timedelta64(1, 'D')
Out[72]:
0    31.000000
1    31.000000
2    31.003507
3           NaN
```

(continues on next page)

(continued from previous page)

```
dtype: float64

In [73]: td.astype('timedelta64[D]')
//////////
```

```
↪
0      31.0
1      31.0
2      31.0
3       NaN
dtype: float64
```

```
# to seconds
```

```
In [74]: td / np.timedelta64(1, 's')
```

```
//////////
↪
0      2678400.0
1      2678400.0
2      2678703.0
3           NaN
dtype: float64
```

```
In [75]: td.astype('timedelta64[s]')
```

```
//////////
↪
0      2678400.0
1      2678400.0
2      2678703.0
3           NaN
dtype: float64
```

Dividing or multiplying a `timedelta64[ns]` Series by an integer or integer Series

```
In [76]: td * -1
```

```
Out[76]:
```

```
0      -31 days +00:00:00
1      -31 days +00:00:00
2      -32 days +23:54:57
3           NaT
dtype: timedelta64[ns]
```

```
In [77]: td * pd.Series([1, 2, 3, 4])
```

```
//////////
↪
0      31 days 00:00:00
1      62 days 00:00:00
2      93 days 00:15:09
3           NaT
dtype: timedelta64[ns]
```

Absolute `DateOffset` objects can act equivalently to `timedeltas`

```
In [78]: from pandas import offsets
```

```
In [79]: td + offsets.Minute(5) + offsets.Milli(5)
```

```
Out[79]:
```

```
0      31 days 00:05:00.005000
1      31 days 00:05:00.005000
```

(continues on next page)

(continued from previous page)

[illegible]

## Fillna is now supported for timedeltas

```
In [80]: td.fillna(0)
Out[80]:
0    31 days 00:00:00
1    31 days 00:00:00
2    31 days 00:05:03
3         0 days 00:00:00
dtype: timedelta64[ns]

In [81]: td.fillna(datetime.timedelta(days=1, seconds=5))
//////////
↪
0    31 days 00:00:00
1    31 days 00:00:00
2    31 days 00:05:03
3         1 days 00:00:05
dtype: timedelta64[ns]
```

You can do numeric reduction operations on `timedeltas`.

```
In [82]: td.mean()
Out[82]: Timedelta('31 days 00:01:41')

In [83]: td.quantile(.1)
Out[83]: Timedelta('31 days 00:00:00')
```

- `plot(kind='kde')` now accepts the optional parameters `bw_method` and `ind`, passed to `scipy.stats.gaussian_kde()` (for `scipy >= 0.11.0`) to set the bandwidth, and to `gkde.evaluate()` to specify the indices at which it is evaluated, respectively. See [scipy docs](#). (GH4298)
- `DataFrame` constructor now accepts a numpy masked record array (GH3478)
- The new vectorized string method `extract` return regular expression matches more conveniently.

```
In [84]: pd.Series(['a1', 'b2', 'c3']).str.extract('([ab](\\d)')
Out[84]:
0
0    1
1    2
2  NaN
```

Elements that do not match return `NaN`. Extracting a regular expression with more than one group returns a `DataFrame` with one column per group.

```
In [85]: pd.Series(['a1', 'b2', 'c3']).str.extract('([ab])(\d)')
Out[85]:
```

|   | 0   | 1   |
|---|-----|-----|
| 0 | a   | 1   |
| 1 | b   | 2   |
| 2 | NaN | NaN |

Elements that do not match return a row of NaN. Thus, a Series of messy strings can be *converted* into a like-indexed Series or DataFrame of cleaned-up or more useful strings, without necessitating `get()` to access tuples

or `re.match` objects.

Named groups like

```
In [86]: pd.Series(['a1', 'b2', 'c3']).str.extract(
.....:      '(?P<letter>[ab])(?P<digit>\\d)')
.....:
Out[86]:
   letter digit
0      a      1
1      b      2
2     NaN    NaN
```

and optional groups can also be used.

```
In [87]: pd.Series(['a1', 'b2', '3']).str.extract(
.....:      '(?P<letter>[ab])?(?P<digit>\\d)')
.....:
Out[87]:
   letter digit
0      a      1
1      b      2
2     NaN      3
```

- `read_stata` now accepts Stata 13 format ([GH4291](#))
- `read_fwf` now infers the column specifications from the first 100 rows of the file if the data has correctly separated and properly aligned columns using the delimiter provided to the function ([GH4488](#)).
- support for nanosecond times as an offset

**Warning:** These operations require `numpy >= 1.7`

Period conversions in the range of seconds and below were reworked and extended up to nanoseconds. Periods in the nanosecond range are now available.

```
In [88]: pd.date_range('2013-01-01', periods=5, freq='5N')
Out[88]:
DatetimeIndex([
                '2013-01-01 00:00:00',
                '2013-01-01 00:00:00.000000005',
                '2013-01-01 00:00:00.000000010',
                '2013-01-01 00:00:00.000000015',
                '2013-01-01 00:00:00.000000020'],
              dtype='datetime64[ns]', freq='5N')
```

or with frequency as offset

```
In [89]: pd.date_range('2013-01-01', periods=5, freq=pd.offsets.Nano(5))
Out[89]:
DatetimeIndex([
                '2013-01-01 00:00:00',
                '2013-01-01 00:00:00.000000005',
                '2013-01-01 00:00:00.000000010',
                '2013-01-01 00:00:00.000000015',
                '2013-01-01 00:00:00.000000020'],
              dtype='datetime64[ns]', freq='5N')
```

Timestamps can be modified in the nanosecond range

```
In [90]: t = pd.Timestamp('20130101 09:01:02')

In [91]: t + pd.tseries.offsets.Nano(123)
Out[91]: Timestamp('2013-01-01 09:01:02.000000123')
```

- A new method, `isin` for DataFrames, which plays nicely with boolean indexing. The argument to `isin`, what we're comparing the DataFrame to, can be a DataFrame, Series, dict, or array of values. See *the docs* for more.

To get the rows where any of the conditions are met:

```
In [92]: dfi = pd.DataFrame({'A': [1, 2, 3, 4], 'B': ['a', 'b', 'f', 'n']})

In [93]: dfi
Out[93]:
   A  B
0  1  a
1  2  b
2  3  f
3  4  n

In [94]: other = pd.DataFrame({'A': [1, 3, 3, 7], 'B': ['e', 'f', 'f', 'e']})

In [95]: mask = dfi.isin(other)

In [96]: mask
Out[96]:
      A      B
0  True  False
1  False False
2  True   True
3  False False

In [97]: dfi[mask.any(1)]
Out[97]:
   A  B
0  1  a
2  3  f
```

- Series now supports a `to_frame` method to convert it to a single-column DataFrame (GH5164)
- All R datasets listed here <http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html> can now be loaded into Pandas objects

```
# note that pandas.rpy was deprecated in v0.16.0
import pandas.rpy.common as com
com.load_data('Titanic')
```

- `tz_localize` can infer a fall daylight savings transition based on the structure of the unlocalized data (GH4230), see *the docs*
- `DatetimeIndex` is now in the API documentation, see *the docs*
- `json_normalize()` is a new method to allow you to create a flat table from semi-structured JSON data. See *the docs* (GH1067)
- Added PySide support for the `qtpandas DataFrameModel` and `DataFrameWidget`.
- Python csv parser now supports `usecols` (GH4335)

- Frequencies gained several new offsets:
  - LastWeekOfMonth ([GH4637](#))
  - FY5253, and FY5253Quarter ([GH4511](#))
- DataFrame has a new interpolate method, similar to Series ([GH4434](#), [GH1892](#))

```
In [98]: df = pd.DataFrame({'A': [1, 2.1, np.nan, 4.7, 5.6, 6.8],
.....:                      'B': [.25, np.nan, np.nan, 4, 12.2, 14.4]})
.....:

In [99]: df.interpolate()
Out[99]:
```

|   | A   | B     |
|---|-----|-------|
| 0 | 1.0 | 0.25  |
| 1 | 2.1 | 1.50  |
| 2 | 3.4 | 2.75  |
| 3 | 4.7 | 4.00  |
| 4 | 5.6 | 12.20 |
| 5 | 6.8 | 14.40 |

Additionally, the method argument to `interpolate` has been expanded to include 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'piecewise\_polynomial', 'pchip', 'polynomial', 'spline'. The new methods require `scipy`. Consult the [Scipy reference guide](#) and [documentation](#) for more information about when the various methods are appropriate. See *the docs*.

`Interpolate` now also accepts a `limit` keyword argument. This works similar to `fillna`'s `limit`:

```
In [100]: ser = pd.Series([1, 3, np.nan, np.nan, np.nan, 11])

In [101]: ser.interpolate(limit=2)
Out[101]:
```

|   |      |
|---|------|
| 0 | 1.0  |
| 1 | 3.0  |
| 2 | 5.0  |
| 3 | 7.0  |
| 4 | NaN  |
| 5 | 11.0 |

dtype: float64

- Added `wide_to_long` panel data convenience function. See *the docs*.

```
In [102]: np.random.seed(123)

In [103]: df = pd.DataFrame({"A1970" : {0 : "a", 1 : "b", 2 : "c"},
.....:                      "A1980" : {0 : "d", 1 : "e", 2 : "f"},
.....:                      "B1970" : {0 : 2.5, 1 : 1.2, 2 : .7},
.....:                      "B1980" : {0 : 3.2, 1 : 1.3, 2 : .1},
.....:                      "X"      : dict(zip(range(3), np.random.randn(3)))
.....:                      })

In [104]: df["id"] = df.index

In [105]: df
Out[105]:
```

|   | A1970 | A1980 | B1970 | B1980 | X        | id |
|---|-------|-------|-------|-------|----------|----|
| 0 | a     | d     | 2.5   | 3.2   | 0.765434 | 0  |
| 1 | b     | e     | 1.2   | 1.3   | 1.061930 | 1  |
| 2 | c     | f     | 0.7   | 0.1   | 0.526085 | 2  |

(continues on next page)

(continued from previous page)

```

0    a    d    2.5    3.2 -1.085631    0
1    b    e    1.2    1.3  0.997345    1
2    c    f    0.7    0.1  0.282978    2

```

```
In [106]: pd.wide_to_long(df, ["A", "B"], i="id", j="year")
```

```

////////////////////////////////////
↪
           X  A    B
id year
0  1970 -1.085631  a  2.5
1  1970  0.997345  b  1.2
2  1970  0.282978  c  0.7
0  1980 -1.085631  d  3.2
1  1980  0.997345  e  1.3
2  1980  0.282978  f  0.1

```

- `to_csv` now takes a `date_format` keyword argument that specifies how output datetime objects should be formatted. Datetimes encountered in the index, columns, and values will all have this formatting applied. (GH4313)
- `DataFrame.plot` will scatter plot `x` versus `y` by passing `kind='scatter'` (GH2215)
- Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. (GH5271)

### 39.12.2.9 Experimental

- The new `eval()` function implements expression evaluation using `numexpr` behind the scenes. This results in large speedups for complicated expressions involving large DataFrames/Series. For example,

```
In [107]: nrows, ncols = 20000, 100
```

```
In [108]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols))
.....:                                for _ in range(4)]
.....:
```

```
# eval with NumExpr backend
```

```
In [109]: %timeit pd.eval('df1 + df2 + df3 + df4')
7.49 ms +- 531 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

```
# pure Python evaluation
```

```
In [110]: %timeit df1 + df2 + df3 + df4
17.3 ms +- 2.4 ms per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

For more details, see the *the docs*

- Similar to `pandas.eval`, `DataFrame` has a new `DataFrame.eval` method that evaluates an expression in the context of the `DataFrame`. For example,

```
In [111]: df = pd.DataFrame(np.random.randn(10, 2), columns=['a', 'b'])
```

```
In [112]: df.eval('a + b')
```

```
Out[112]:
0    -0.685204
1     1.589745
2     0.325441

```

(continues on next page)

(continued from previous page)

```

3    -1.784153
4    -0.432893
5     0.171850
6     1.895919
7     3.065587
8    -0.092759
9     1.391365
dtype: float64

```

- `query()` method has been added that allows you to select elements of a `DataFrame` using a natural query syntax nearly identical to Python syntax. For example,

```

In [113]: n = 20

In [114]: df = pd.DataFrame(np.random.randint(n, size=(n, 3)), columns=['a', 'b',
↳ 'c'])

In [115]: df.query('a < b < c')
Out[115]:
   a  b  c
11  1  5  8
15  8 16 19

```

selects all the rows of `df` where `a < b < c` evaluates to `True`. For more details see *the docs*.

- `pd.read_msgpack()` and `pd.to_msgpack()` are now a supported method of serialization of arbitrary pandas (and python objects) in a lightweight portable binary format. See *the docs*

**Warning:** Since this is an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future release.

```

In [116]: df = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))

In [117]: df.to_msgpack('foo.msg')

In [118]: pd.read_msgpack('foo.msg')
Out[118]:
   A      B
0  0.251082  0.017357

```

- `pandas.io.gbq` provides a simple way to extract from, and load data into, Google's BigQuery Data Sets by way of pandas DataFrames. BigQuery is a high performance SQL-like database service, useful for performing ad-hoc queries against extremely large datasets. *See the docs*

```

from pandas.io import gbq

# A query to select the average monthly temperatures in the
# in the year 2000 across the USA. The dataset,
# publicdata:samples.gsod, is available on all BigQuery accounts,
# and is based on NOAA gsod data.

query = """SELECT station_number as STATION,
month as MONTH, AVG(mean_temp) as MEAN_TEMP
FROM publicdata:samples.gsod
WHERE YEAR = 2000
GROUP BY STATION, MONTH
ORDER BY STATION, MONTH ASC"""

# Fetch the result set for this query

# Your Google BigQuery Project ID
# To find this, see your dashboard:
# https://console.developers.google.com/iam-admin/projects?authuser=0
projectid = 'xxxxxxxxx'
df = gbq.read_gbq(query, project_id=projectid)

# Use pandas to process and reshape the dataset

df2 = df.pivot(index='STATION', columns='MONTH', values='MEAN_TEMP')
df3 = pd.concat([df2.min(), df2.mean(), df2.max()],
                axis=1, keys=["Min Tem", "Mean Temp", "Max Temp"])

```

The resulting DataFrame is:

```
> df3
      Min Tem  Mean Temp  Max Temp
MONTH
1    -53.336667  39.827892   89.770968
2    -49.837500  43.685219   93.437932
3    -77.926087  48.708355   96.099998
4    -82.892858  55.070087   97.317240
5    -92.378261  61.428117  102.042856
6    -77.703334  65.858888  102.900000
7    -87.821428  68.169663  106.510714
8    -89.431999  68.614215  105.500000
9    -86.611112  63.436935  107.142856
10   -78.209677  56.880838   92.103333
11   -50.125000  48.861228   94.996428
12   -50.332258  42.286879   94.396774
```

**Warning:** To use this module, you will need a BigQuery account. See <https://cloud.google.com/products/big-query> for details.

As of 10/10/13, there is a bug in Google's API preventing result sets from being larger than 100,000 rows. A patch is scheduled for the week of 10/14/13.

### 39.12.2.10 Internal Refactoring

In 0.13.0 there is a major refactor primarily to subclass `Series` from `NDFrame`, which is the base class currently for `DataFrame` and `Panel`, to unify methods and behaviors. `Series` formerly subclassed directly from `ndarray`. ([GH4080](#), [GH3862](#), [GH816](#))

**Warning:** There are two potential incompatibilities from < 0.13.0

- Using certain numpy functions would previously return a Series if passed a Series as an argument. This seems only to affect `np.ones_like`, `np.empty_like`, `np.diff` and `np.where`. These now return `ndarrays`.

```
In [123]: s = pd.Series([1, 2, 3, 4])
```

## Numpy Usage

```
In [124]: np.ones_like(s)
Out[124]: array([1, 1, 1, 1])
```

```
In [125]: np.diff(s)
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\Out[125]: array([1, 1, 1])
```

```
In [126]: np.where(s > 1, s, np.nan)
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\Out[126]: array([ nan,
↪      2.,    3.,    4.] )
```

## Pandonic Usage

```

In [127]: pd.Series(1, index=s.index)
Out [127]:
0      1
1      1
2      1
3      1
dtype: int64

In [128]: s.diff()
Out [128]:
0      NaN
1      1.0
2      1.0
3      1.0
dtype: float64

In [129]: s.where(s > 1)
Out [129]:
0      NaN
1      2.0
2      3.0
3      4.0
dtype: float64

```

- Passing a Series directly to a cython function expecting an ndarray type will no longer work directly, you must pass `Series.values`, See *Enhancing Performance*
- `Series(0.5)` would previously return the scalar `0.5`, instead this will return a 1-element Series
- This change breaks rpy2<=2.3.8. an Issue has been opened against rpy2 and a workaround is detailed in [GH5698](#). Thanks @JanSchulz.

- Pickle compatibility is preserved for pickles created prior to 0.13. These must be unpickled with `pd.read_pickle`, see *Pickling*.
- Refactor of `series.py/frame.py/panel.py` to move common code to `generic.py`
  - added `_setup_axes` to create generic NDFrame structures
  - moved methods
    - \* `from_axes, _wrap_array, axes, ix, loc, iloc, shape, empty, swapaxes, transpose, pop`
    - \* `__iter__, keys, __contains__, __len__, __neg__, __invert__`
    - \* `convert_objects, as_blocks, as_matrix, values`
    - \* `__getstate__, __setstate__` (compat remains in frame/panel)
    - \* `__getattr__, __setattr__`
    - \* `_indexed_same, reindex_like, align, where, mask`
    - \* `fillna, replace` (Series `replace` is now consistent with DataFrame)
    - \* `filter` (also added axis argument to selectively filter on a different axis)
    - \* `reindex, reindex_axis, take`
    - \* `truncate` (moved to become part of NDFrame)

- These are API changes which make Panel more consistent with DataFrame
  - `swapaxes` on a Panel with the same axes specified now return a copy
  - support attribute access for setting
  - `filter` supports the same API as the original DataFrame `filter`
- `Reindex` called with no arguments will now return a copy of the input object
- `TimeSeries` is now an alias for `Series`. the property `is_time_series` can be used to distinguish (if desired)
- Refactor of Sparse objects to use `BlockManager`
  - Created a new block type in internals, `SparseBlock`, which can hold multi-dtypes and is non-consolidatable. `SparseSeries` and `SparseDataFrame` now inherit more methods from there hierarchy (`Series/DataFrame`), and no longer inherit from `SparseArray` (which instead is the object of the `SparseBlock`)
  - Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
  - Operations on sparse structures within DataFrames should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
  - enable `setitem` on `SparseSeries` for boolean/integer/slices
  - `SparsePanels` implementation is unchanged (e.g. not using `BlockManager`, needs work)
- added `ftypes` method to `Series/DataFrame`, similar to `dtypes`, but indicates if the underlying is sparse/dense (as well as the dtype)
- All `NDFrame` objects can now use `__finalize__()` to specify various values to propagate to new objects from an existing one (e.g. `name` in `Series` will follow more automatically now)
- Internal type checking is now done via a suite of generated classes, allowing `isinstance(value, klass)` without having to directly import the class, courtesy of @jtratrner
- Bug in `Series` update where the parent frame is not updating its cache based on changes ([GH4080](#)) or types ([GH3217](#)), `fillna` ([GH3386](#))
- Indexing with dtype conversions fixed ([GH4463](#), [GH4204](#))
- Refactor `Series.reindex` to `core/generic.py` ([GH4604](#), [GH4618](#)), allow `method=` in reindexing on a `Series` to work
- `Series.copy` no longer accepts the `order` parameter and is now consistent with `NDFrame` copy
- Refactor `rename` methods to `core/generic.py`; fixes `Series.rename` for ([GH4605](#)), and adds `rename` with the same signature for `Panel`
- Refactor `clip` methods to `core/generic.py` ([GH4798](#))
- Refactor of `_get_numeric_data/_get_bool_data` to `core/generic.py`, allowing `Series/Panel` functionality
- `Series` (for index) / `Panel` (for items) now allow attribute access to its elements ([GH1903](#))

```
In [130]: s = pd.Series([1, 2, 3], index=list('abc'))

In [131]: s.b
Out[131]: 2

In [132]: s.a = 5
```

(continues on next page)

(continued from previous page)

```
In [133]: s
Out[133]:
a      5
b      2
c      3
dtype: int64
```

### 39.12.2.11 Bug Fixes

- HDFStore
  - raising an invalid `TypeError` rather than `ValueError` when appending with a different block ordering ([GH4096](#))
  - `read_hdf` was not respecting `as` passed mode ([GH4504](#))
  - appending a 0-len table will work correctly ([GH4273](#))
  - `to_hdf` was raising when passing both arguments `append` and `table` ([GH4584](#))
  - reading from a store with duplicate columns across dtypes would raise ([GH4767](#))
  - Fixed a bug where `ValueError` wasn't correctly raised when column names weren't strings ([GH4956](#))
  - A zero length series written in Fixed format not deserializing properly. ([GH4708](#))
  - Fixed decoding perf issue on py3 ([GH5441](#))
  - Validate levels in a `MultiIndex` before storing ([GH5527](#))
  - Correctly handle `data_columns` with a `Panel` ([GH5717](#))
- Fixed bug in `tslib.tz_convert(vals, tz1, tz2)`: it could raise `IndexError` exception while trying to access `trans[pos + 1]` ([GH4496](#))
- The `by` argument now works correctly with the `layout` argument ([GH4102](#), [GH4014](#)) in `*.hist` plotting methods
- Fixed bug in `PeriodIndex.map` where using `str` would return the `str` representation of the index ([GH4136](#))
- Fixed test failure `test_time_series_plot_color_with_empty_kwargs` when using custom matplotlib default colors ([GH4345](#))
- Fix running of stata IO tests. Now uses temporary files to write ([GH4353](#))
- Fixed an issue where `DataFrame.sum` was slower than `DataFrame.mean` for integer valued frames ([GH4365](#))
- `read_html` tests now work with Python 2.6 ([GH4351](#))
- Fixed bug where network testing was throwing `NameError` because a local variable was undefined ([GH4381](#))
- In `to_json`, raise if a passed `orient` would cause loss of data because of a duplicate index ([GH4359](#))
- In `to_json`, fix date handling so milliseconds are the default timestamp as the docstring says ([GH4362](#)).
- `as_index` is no longer ignored when doing `groupby apply` ([GH4648](#), [GH3417](#))
- JSON NaT handling fixed, NaTs are now serialized to `null` ([GH4498](#))
- Fixed JSON handling of escapable characters in JSON object keys ([GH4593](#))

- Fixed passing `keep_default_na=False` when `na_values=None` ([GH4318](#))
- Fixed bug with `values` raising an error on a `DataFrame` with duplicate columns and mixed dtypes, surfaced in ([GH4377](#))
- Fixed bug with duplicate columns and type conversion in `read_json` when `orient='split'` ([GH4377](#))
- Fixed JSON bug where locales with decimal separators other than `'.'` threw exceptions when encoding / decoding certain values. ([GH4918](#))
- Fix `.iat` indexing with a `PeriodIndex` ([GH4390](#))
- Fixed an issue where `PeriodIndex` joining with self was returning a new instance rather than the same instance ([GH4379](#)); also adds a test for this for the other index types
- Fixed a bug with all the dtypes being converted to object when using the CSV cparser with the `usecols` parameter ([GH3192](#))
- Fix an issue in merging blocks where the resulting `DataFrame` had partially set `_ref_locs` ([GH4403](#))
- Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API ([GH4408](#))
- Fixed a bug where calling `Series.astype(str)` would truncate the string ([GH4405](#), [GH4437](#))
- Fixed a py3 compat issue where bytes were being repr'd as tuples ([GH4455](#))
- Fixed Panel attribute naming conflict if item is named `'a'` ([GH3440](#))
- Fixed an issue where duplicate indexes were raising when plotting ([GH4486](#))
- Fixed an issue where `cumsum` and `cumprod` didn't work with bool dtypes ([GH4170](#), [GH4440](#))
- Fixed Panel slicing issued in `xs` that was returning an incorrect dimmed object ([GH4016](#))
- Fix resampling bug where custom reduce function not used if only one group ([GH3849](#), [GH4494](#))
- Fixed Panel assignment with a transposed frame ([GH3830](#))
- Raise on set indexing with a Panel and a Panel as a value which needs alignment ([GH3777](#))
- frozenset objects now raise in the `Series` constructor ([GH4482](#), [GH4480](#))
- Fixed issue with sorting a duplicate `MultiIndex` that has multiple dtypes ([GH4516](#))
- Fixed bug in `DataFrame.set_values` which was causing name attributes to be lost when expanding the index. ([GH3742](#), [GH4039](#))
- Fixed issue where individual `names`, `levels` and `labels` could be set on `MultiIndex` without validation ([GH3714](#), [GH4039](#))
- Fixed ([GH3334](#)) in `pivot_table`. Margins did not compute if values is the index.
- Fix bug in having a rhs of `np.timedelta64` or `np.offsets.DateOffset` when operating with date-times ([GH4532](#))
- Fix arithmetic with series/datetimeindex and `np.timedelta64` not working the same ([GH4134](#)) and buggy `timedelta` in NumPy 1.6 ([GH4135](#))
- Fix bug in `pd.read_clipboard` on windows with PY3 ([GH4561](#)); not decoding properly
- `tslib.get_period_field()` and `tslib.get_period_field_arr()` now raise if code argument out of range ([GH4519](#), [GH4520](#))
- Fix boolean indexing on an empty series loses index names ([GH4235](#)), `infer_dtype` works with empty arrays.
- Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue ([GH3317](#))

- Fixed issue where `DataFrame.apply` was reraising exceptions incorrectly (causing the original stack trace to be truncated).
- Fix selection with `ix/loc` and `non_unique` selectors ([GH4619](#))
- Fix assignment with `iloc/loc` involving a dtype change in an existing column ([GH4312](#), [GH5702](#)) have internal `setitem_with_indexer` in `core/indexing` to use `Block.setitem`
- Fixed bug where thousands operator was not handled correctly for floating point numbers in `csv_import` ([GH4322](#))
- Fix an issue with `CacheableOffset` not properly being used by many `DateOffset`; this prevented the `DateOffset` from being cached ([GH4609](#))
- Fix boolean comparison with a `DataFrame` on the lhs, and a list/tuple on the rhs ([GH4576](#))
- Fix error/dtype conversion with `setitem` of `None` on `Series/DataFrame` ([GH4667](#))
- Fix decoding based on a passed in non-default encoding in `pd.read_stata` ([GH4626](#))
- Fix `DataFrame.from_records` with a plain-vanilla `ndarray`. ([GH4727](#))
- Fix some inconsistencies with `Index.rename` and `MultiIndex.rename`, etc. ([GH4718](#), [GH4628](#))
- Bug in using `iloc/loc` with a cross-sectional and duplicate indices ([GH4726](#))
- Bug with using `QUOTE_NONE` with `to_csv` causing `Exception`. ([GH4328](#))
- Bug with `Series` indexing not raising an error when the right-hand-side has an incorrect length ([GH2702](#))
- Bug in `MultiIndexing` with a partial string selection as one part of a `MultiIndex` ([GH4758](#))
- Bug with reindexing on the index with a non-unique index will now raise `ValueError` ([GH4746](#))
- Bug in setting with `loc/ix` a single indexer with a `MultiIndex` axis and a `NumPy` array, related to ([GH3777](#))
- Bug in concatenation with duplicate columns across dtypes not merging with `axis=0` ([GH4771](#), [GH4975](#))
- Bug in `iloc` with a slice index failing ([GH4771](#))
- Incorrect error message with no colspecs or width in `read_fwf`. ([GH4774](#))
- Fix bugs in indexing in a `Series` with a duplicate index ([GH4548](#), [GH4550](#))
- Fixed bug with reading compressed files with `read_fwf` in Python 3. ([GH3963](#))
- Fixed an issue with a duplicate index and assignment with a dtype change ([GH4686](#))
- Fixed bug with reading compressed files in as `bytes` rather than `str` in Python 3. Simplifies bytes-producing file-handling in Python 3 ([GH3963](#), [GH4785](#)).
- Fixed an issue related to `ticklocs/ticklabels` with log scale bar plots across different versions of `matplotlib` ([GH4789](#))
- Suppressed `DeprecationWarning` associated with internal calls issued by `repr()` ([GH4391](#))
- Fixed an issue with a duplicate index and duplicate selector with `.loc` ([GH4825](#))
- Fixed an issue with `DataFrame.sort_index` where, when sorting by a single column and passing a list for `ascending`, the argument for `ascending` was being interpreted as `True` ([GH4839](#), [GH4846](#))
- Fixed `Panel.tshift` not working. Added `freq` support to `Panel.shift` ([GH4853](#))
- Fix an issue in `TextFileReader` w/ Python engine (i.e. `PythonParser`) with thousands `!= “,”` ([GH4596](#))
- Bug in `getitem` with a duplicate index when using `where` ([GH4879](#))
- Fix `Type` inference code coerces float column into `datetime` ([GH4601](#))

- Fixed `_ensure_numeric` does not check for complex numbers ([GH4902](#))
- Fixed a bug in `Series.hist` where two figures were being created when the `by` argument was passed ([GH4112](#), [GH4113](#)).
- Fixed a bug in `convert_objects` for `> 2` ndims ([GH4937](#))
- Fixed a bug in `DataFrame/Panel` cache insertion and subsequent indexing ([GH4939](#), [GH5424](#))
- Fixed string methods for `FrozenNDArray` and `FrozenList` ([GH4929](#))
- Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios ([GH4940](#))
- Tests for `fillna` on empty `Series` ([GH4346](#)), thanks @immerrr
- Fixed `copy()` to shallow copy axes/indices as well and thereby keep separate metadata. ([GH4202](#), [GH4830](#))
- Fixed `skiprows` option in Python parser for `read_csv` ([GH4382](#))
- Fixed bug preventing `cut` from working with `np.inf` levels without explicitly passing labels ([GH3415](#))
- Fixed wrong check for overlapping in `DatetimeIndex.union` ([GH4564](#))
- Fixed conflict between thousands separator and date parser in `csv_parser` ([GH4678](#))
- Fix appending when dtypes are not the same (error showing mixing float/np.datetime64) ([GH4993](#))
- Fix repr for `DateOffset`. No longer show duplicate entries in `kwds`. Removed unused offset fields. ([GH4638](#))
- Fixed wrong index name during `read_csv` if using `usecols`. Applies to `c` parser only. ([GH4201](#))
- `Timestamp` objects can now appear in the left hand side of a comparison operation with a `Series` or `DataFrame` object ([GH4982](#)).
- Fix a bug when indexing with `np.nan` via `iloc/loc` ([GH5016](#))
- Fixed a bug where low memory `c` parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. ([GH3866](#))
- Fix a bug where reshaping a `Series` to its own shape raised `TypeError` ([GH4554](#)) and other reshaping issues.
- Bug in setting with `ix/loc` and a mixed int/string index ([GH4544](#))
- Make sure series-series boolean comparisons are label based ([GH4947](#))
- Bug in multi-level indexing with a `Timestamp` partial indexer ([GH4294](#))
- Tests/fix for `MultiIndex` construction of an all-nan frame ([GH4078](#))
- Fixed a bug where `read_html()` wasn't correctly inferring values of tables with commas ([GH5029](#))
- Fixed a bug where `read_html()` wasn't providing a stable ordering of returned tables ([GH4770](#), [GH5029](#)).
- Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` ([GH5066](#)).
- Fixed a bug where `read_html()` was incorrectly inferring the type of headers ([GH5048](#)).
- Fixed a bug where `DatetimeIndex` joins with `PeriodIndex` caused a stack overflow ([GH3899](#)).
- Fixed a bug where `groupby` objects didn't allow plots ([GH5102](#)).
- Fixed a bug where `groupby` objects weren't tab-completing column names ([GH5102](#)).
- Fixed a bug where `groupby.plot()` and `friends` were duplicating figures multiple times ([GH5102](#)).
- Provide automatic conversion of `object` dtypes on `fillna`, related ([GH5103](#))
- Fixed a bug where default options were being overwritten in the option parser cleaning ([GH5121](#)).

- Treat a list/ndarray identically for `iloc` indexing with list-like (GH5006)
- Fix `MultiIndex.get_level_values()` with missing values (GH5074)
- Fix bound checking for `Timestamp()` with `datetime64` input (GH4065)
- Fix a bug where `TestReadHtml` wasn't calling the correct `read_html()` function (GH5150).
- Fix a bug with `NDFrame.replace()` which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
- Fix better error message for `to_datetime` (GH4928)
- Made sure different locales are tested on travis-ci (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
- Fixed segfault on `isnull(MultiIndex)` (now raises an error instead) (GH5123, GH5125)
- Allow duplicate indices when performing operations that align (GH5185, GH5639)
- Compound dtypes in a constructor raise `NotImplementedError` (GH5191)
- Bug in comparing duplicate frames (GH4421) related
- Bug in describe on duplicate frames
- Bug in `to_datetime` with a format and `coerce=True` not raising (GH5195)
- Bug in `loc` setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206)
- Fixed bug where inplace setting of levels or labels on `MultiIndex` would not clear cached values property and therefore return wrong values. (GH5215)
- Fixed bug where filtering a grouped `DataFrame` or `Series` did not maintain the original ordering (GH4621).
- Fixed `Period` with a business date freq to always roll-forward if on a non-business date. (GH5203)
- Fixed bug in Excel writers where frames with duplicate column names weren't written correctly. (GH5235)
- Fixed issue with `drop` and a non-unique index on `Series` (GH5248)
- Fixed segfault in C parser caused by passing more names than columns in the file. (GH5156)
- Fix `Series.isin` with date/time-like dtypes (GH5021)
- C and Python Parser can now handle the more common `MultiIndex` column format which doesn't have a row for index names (GH4702)
- Bug when trying to use an out-of-bounds date as an object dtype (GH5312)
- Bug when trying to display an embedded `PandasObject` (GH5324)
- Allows operating of Timestamps to return a datetime if the result is out-of-bounds related (GH5312)
- Fix return value/type signature of `initObjToJSON()` to be compatible with numpy's `import_array()` (GH5334, GH5326)
- Bug when renaming then `set_index` on a `DataFrame` (GH5344)
- Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarikoptic!)
- Fixed html tests on win32. (GH4580)
- Make sure that `head/tail` are `iloc` based, (GH5370)
- Fixed bug for `PeriodIndex` string representation if there are 1 or 2 elements. (GH5372)

- The GroupBy methods `transform` and `filter` can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620)
- Fix empty series not printing name in repr (GH4651)
- Make tests create temp files in temp directory by default. (GH5419)
- `pd.to_timedelta` of a scalar returns a scalar (GH5410)
- `pd.to_timedelta` accepts NaN and NaT, returning NaT instead of raising (GH5437)
- performance improvements in `isnull` on larger size pandas objects
- Fixed various setitem with 1d ndarray that does not have a matching length to the indexer (GH5508)
- Bug in getitem with a MultiIndex and `iloc` (GH5528)
- Bug in delitem on a Series (GH5542)
- Bug fix in apply when using custom function and objects are not mutated (GH5545)
- Bug in selecting from a non-unique index with `loc` (GH5553)
- Bug in groupby returning non-consistent types when user function returns a None, (GH5592)
- Work around regression in numpy 1.7.0 which erroneously raises `IndexError` from `ndarray.item` (GH5666)
- Bug in repeated indexing of object with resultant non-unique index (GH5678)
- Bug in fillna with Series and a passed series/dict (GH5703)
- Bug in groupby transform with a datetime-like grouper (GH5712)
- Bug in MultiIndex selection in PY3 when using certain keys (GH5725)
- Row-wise concat of differing dtypes failing in certain cases (GH5754)

## 39.13 Version 0.12

### 39.13.1 v0.12.0 (July 24, 2013)

{{ header }}

This is a major release from 0.11.0 and includes several new features and enhancements along with a large number of bug fixes.

Highlights include a consistent I/O API naming scheme, routines to read html, write MultiIndexes to csv files, read & write STATA data files, read & write JSON format files, Python 3 support for HDFStore, filtering of groupby expressions via `filter`, and a revamped `replace` routine that accepts regular expressions.

### 39.13.1.1 API changes

- The I/O API is now much more consistent with a set of top level reader functions accessed like `pd.read_csv()` that generally return a pandas object.

```
- read_csv
- read_excel
- read_hdf
- read_sql
- read_json
- read_html
- read_stata
- read_clipboard
```

The corresponding writer functions are object methods that are accessed like `df.to_csv()`

```
- to_csv
- to_excel
- to_hdf
- to_sql
- to_json
- to_html
- to_stata
- to_clipboard
```

- Fix modulo and integer division on Series, DataFrames to act similarly to float dtypes to return `np.nan` or `np.inf` as appropriate ([GH3590](#)). This correct a numpy bug that treats integer and float dtypes differently.

```
In [1]: p = pd.DataFrame({'first': [4, 5, 8], 'second': [0, 0, 3]})

In [2]: p % 0
Out[2]:
   first  second
0    NaN    NaN
1    NaN    NaN
2    NaN    NaN

In [3]: p % p
Out[3]:
   first  second
0    0.0    NaN
1    0.0    NaN
2    0.0    0.0

In [4]: p / p
Out[4]:
   first  second
```

(continues on next page)

(continued from previous page)

```

0    1.0    NaN
1    1.0    NaN
2    1.0    1.0

```

```
In [5]: p / 0
```

```

////////////////////////////////////
↪
   first  second
0     inf     NaN
1     inf     NaN
2     inf     inf

```

- Add `squeeze` keyword to `groupby` to allow reduction from `DataFrame` -> `Series` if groups are unique. This is a Regression from 0.10.1. We are reverting back to the prior behavior. This means `groupby` will return the same shaped objects whether the groups are unique or not. Revert this issue ([GH2893](#)) with ([GH3596](#)).

```

In [6]: df2 = pd.DataFrame([{"val1": 1, "val2": 20},
...:                        {"val1": 1, "val2": 19},
...:                        {"val1": 1, "val2": 27},
...:                        {"val1": 1, "val2": 12}])
...:

In [7]: def func(dataf):
...:     return dataf["val2"] - dataf["val2"].mean()
...:

# squeezing the result frame to a series (because we have unique groups)
In [8]: df2.groupby("val1", squeeze=True).apply(func)
Out[8]:
0    0.5
1   -0.5
2    7.5
3   -7.5
Name: 1, dtype: float64

# no squeezing (the default, and behavior in 0.10.1)
In [9]: df2.groupby("val1").apply(func)
Out[9]:
val2    0    1    2    3
val1
1      0.5 -0.5  7.5 -7.5

```

- Raise on `iloc` when boolean indexing with a label based indexer mask e.g. a boolean `Series`, even with integer labels, will raise. Since `iloc` is purely positional based, the labels on the `Series` are not alignable ([GH3631](#))

This case is rarely used, and there are plenty of alternatives. This preserves the `iloc` API to be *purely* positional based.

```

In [10]: df = pd.DataFrame(lrange(5), list('ABCDE'), columns=['a'])

In [11]: mask = (df.a % 2 == 0)

In [12]: mask
Out[12]:
A    True
B   False
C    True

```

(continues on next page)

(continued from previous page)

```

D    False
E     True
Name: a, dtype: bool

# this is what you should use
In [13]: df.loc[mask]
Out[13]:
↪
a
A    0
C    2
E    4

# this will work as well
In [14]: df.iloc[mask.values]
Out[14]:
↪
a
A    0
C    2
E    4

```

`df.iloc[mask]` will raise a `ValueError`

- The `raise_on_error` argument to plotting functions is removed. Instead, plotting functions raise a `TypeError` when the dtype of the object is `object` to remind you to avoid object arrays whenever possible and thus you should cast to an appropriate numeric dtype if you need to plot something.
- Add `colormap` keyword to `DataFrame` plotting methods. Accepts either a matplotlib colormap object (ie, `matplotlib.cm.jet`) or a string name of such an object (ie, `'jet'`). The colormap is sampled to select the color for each column. Please see *Colormaps* for more information. (GH3860)
- `DataFrame.interpolate()` is now deprecated. Please use `DataFrame.fillna()` and `DataFrame.replace()` instead. (GH3582, GH3675, GH3676)
- the `method` and `axis` arguments of `DataFrame.replace()` are deprecated
- `DataFrame.replace`'s `infer_types` parameter is removed and now performs conversion by default. (GH3907)
- Add the keyword `allow_duplicates` to `DataFrame.insert` to allow a duplicate column to be inserted if `True`, default is `False` (same as prior to 0.12) (GH3679)
- Implement `__nonzero__` for `NDFrame` objects (GH3691, GH3696)
- IO api
  - added top-level function `read_excel` to replace the following, The original API is deprecated and will be removed in a future version

```

from pandas.io.parsers import ExcelFile
xls = ExcelFile('path_to_file.xls')
xls.parse('Sheet1', index_col=None, na_values=['NA'])

```

With

```

import pandas as pd
pd.read_excel('path_to_file.xls', 'Sheet1', index_col=None, na_values=['NA'])

```

- added top-level function `read_sql` that is equivalent to the following

```
from pandas.io.sql import read_frame
read_frame(...)
```

- `DataFrame.to_html` and `DataFrame.to_latex` now accept a path for their first argument ([GH3702](#))
- Do not allow astypes on `datetime64[ns]` except to object, and `timedelta64[ns]` to object/int ([GH3425](#))
- The behavior of `datetime64` dtypes has changed with respect to certain so-called reduction operations ([GH3726](#)). The following operations now raise a `TypeError` when performed on a `Series` and return an *empty* `Series` when performed on a `DataFrame` similar to performing these operations on, for example, a `DataFrame` of slice objects:
  - `sum`, `prod`, `mean`, `std`, `var`, `skew`, `kurt`, `corr`, and `cov`
- `read_html` now defaults to `None` when reading, and falls back on `bs4` + `html5lib` when `lxml` fails to parse. a list of parsers to try until success is also valid
- The internal pandas class hierarchy has changed (slightly). The previous `PandasObject` now is called `PandasContainer` and a new `PandasObject` has become the base class for `PandasContainer` as well as `Index`, `Categorical`, `GroupBy`, `SparseList`, and `SparseArray` (+ their base classes). Currently, `PandasObject` provides string methods (from `StringMixin`). ([GH4090](#), [GH4092](#))
- New `StringMixin` that, given a `__unicode__` method, gets python 2 and python 3 compatible string methods (`__str__`, `__bytes__`, and `__repr__`). Plus string safety throughout. Now employed in many places throughout the pandas library. ([GH4090](#), [GH4092](#))

### 39.13.1.2 I/O Enhancements

- `pd.read_html()` can now parse HTML strings, files or urls and return `DataFrames`, courtesy of [@cpcloud](#). ([GH3477](#), [GH3605](#), [GH3606](#), [GH3616](#)). It works with a *single* parser backend: `BeautifulSoup4` + `html5lib` See *the docs*

You can use `pd.read_html()` to read the output from `DataFrame.to_html()` like so

```
In [15]: df = pd.DataFrame({'a': range(3), 'b': list('abc')})
In [16]: print(df)
   a  b
0  0  a
1  1  b
2  2  c

In [17]: html = df.to_html()

In [18]: alist = pd.read_html(html, index_col=0)

In [19]: print(df == alist[0])
   a  b
0  True True
1  True True
2  True True
```

Note that `alist` here is a Python list so `pd.read_html()` and `DataFrame.to_html()` are not inverses.

- `pd.read_html()` no longer performs hard conversion of date strings ([GH3656](#)).

- Iterator support via `read_hdf` that automatically opens and closes the store when iteration is finished. This is only for *tables*

```
In [25]: path = 'store_iterator.h5'

In [26]: pd.DataFrame(np.random.randn(10, 2)).to_hdf(path, 'df', table=True)

In [27]: for df in pd.read_hdf(path, 'df', chunksize=3):
.....:     print(df)
.....:
      0      1
0  0.713216 -0.778461
1 -0.661062  0.862877
2  0.344342  0.149565
      0      1
3 -0.626968 -0.875772
4 -0.930687 -0.218983
5  0.949965 -0.442354
      0      1
6 -0.402985  1.111358
7 -0.241527 -0.670477
8  0.049355  0.632633
      0      1
9 -1.502767 -1.225492
```

- `read_csv` will now throw a more informative error message when a file contains no columns, e.g., all newline characters

### 39.13.1.3 Other Enhancements

- `DataFrame.replace()` now allows regular expressions on contained `Series` with object dtype. See the examples section in the regular docs *Replacing via String Expression*

For example you can do

```
In [25]: df = pd.DataFrame({'a': list('ab..'), 'b': [1, 2, 3, 4]})

In [26]: df.replace(regex=r'\s*\.\s*', value=np.nan)
Out[26]:
      a  b
0     a  1
1     b  2
2  NaN  3
3  NaN  4
```

to replace all occurrences of the string `'.'` with zero or more instances of surrounding white space with `NaN`.

Regular string replacement still works as expected. For example, you can do

```
In [27]: df.replace('.', np.nan)
Out[27]:
      a  b
0     a  1
1     b  2
2  NaN  3
3  NaN  4
```

to replace all occurrences of the string `'.'` with `NaN`.

- `pd.melt()` now accepts the optional parameters `var_name` and `value_name` to specify custom column names of the returned DataFrame.
- `pd.set_option()` now allows N option, value pairs ([GH3667](#)).

Let's say that we had an option 'a.b' and another option 'b.c'. We can set them at the same time:

```
In [28]: pd.get_option('a.b')
Out[28]: 2

In [29]: pd.get_option('b.c')
Out[29]: 3

In [30]: pd.set_option('a.b', 1, 'b.c', 4)

In [31]: pd.get_option('a.b')
Out[31]: 1

In [32]: pd.get_option('b.c')
Out[32]: 4
```

- The `filter` method for group objects returns a subset of the original object. Suppose we want to take only elements that belong to groups with a group sum greater than 2.

```
In [33]: sf = pd.Series([1, 1, 2, 3, 3, 3])

In [34]: sf.groupby(sf).filter(lambda x: x.sum() > 2)
Out[34]:
3    3
4    3
5    3
dtype: int64
```

The argument of `filter` must a function that, applied to the group as a whole, returns True or False.

Another useful operation is filtering out elements that belong to groups with only a couple members.

```
In [35]: dff = pd.DataFrame({'A': np.arange(8), 'B': list('aabbbbcc')})

In [36]: dff.groupby('B').filter(lambda x: len(x) > 2)
Out[36]:
   A  B
2  2  b
3  3  b
4  4  b
5  5  b
```

Alternatively, instead of dropping the offending groups, we can return a like-indexed objects where the groups that do not pass the filter are filled with NaNs.

```
In [37]: dff.groupby('B').filter(lambda x: len(x) > 2, dropna=False)
Out[37]:
   A  B
0 NaN NaN
1 NaN NaN
2  2.0 b
3  3.0 b
4  4.0 b
```

(continues on next page)

(continued from previous page)

|   |     |     |
|---|-----|-----|
| 5 | 5.0 | b   |
| 6 | NaN | NaN |
| 7 | NaN | NaN |

- Series and DataFrame hist methods now take a `figsize` argument ([GH3834](#))
- DatetimeIndexes no longer try to convert mixed-integer indexes during join operations ([GH3877](#))
- Timestamp.min and Timestamp.max now represent valid Timestamp instances instead of the default date-time.min and datetime.max (respectively), thanks @SleepingPills
- `read_html` now raises when no tables are found and BeautifulSoup==4.2.0 is detected ([GH4214](#))

### 39.13.1.4 Experimental Features

- Added experimental `CustomBusinessDay` class to support `DateOffsets` with custom holiday calendars and custom weekmasks. ([GH2301](#))

---

**Note:** This uses the `numpy.busdaycalendar` API introduced in Numpy 1.7 and therefore requires Numpy 1.7.0 or newer.

---

```
In [38]: from pandas.tseries.offsets import CustomBusinessDay

In [39]: from datetime import datetime

# As an interesting example, let's look at Egypt where
# a Friday-Saturday weekend is observed.
In [40]: weekmask_egypt = 'Sun Mon Tue Wed Thu'

# They also observe International Workers' Day so let's
# add that for a couple of years
In [41]: holidays = ['2012-05-01', datetime(2013, 5, 1), np.datetime64('2014-05-01
↪')]

In [42]: bday_egypt = CustomBusinessDay(holidays=holidays, weekmask=weekmask_
↪egypt)

In [43]: dt = datetime(2013, 4, 30)

In [44]: print(dt + 2 * bday_egypt)
2013-05-05 00:00:00

In [45]: dts = pd.date_range(dt, periods=5, freq=bday_egypt)

In [46]: print(pd.Series(dts.weekday, dts).map(pd.Series('Mon Tue Wed Thu Fri Sat_
↪Sun'.split()))))
2013-04-30    Tue
2013-05-02    Thu
2013-05-05    Sun
2013-05-06    Mon
2013-05-07    Tue
Freq: C, dtype: object
```

### 39.13.1.5 Bug Fixes

- Plotting functions now raise a `TypeError` before trying to plot anything if the associated objects have a `dtype` of `object` ([GH1818](#), [GH3572](#), [GH3911](#), [GH3912](#)), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.
- `fillna` methods now raise a `TypeError` if the `value` parameter is a list or tuple.
- `Series.str` now supports iteration ([GH3638](#)). You can iterate over the individual elements of each string in the `Series`. Each iteration yields a `Series` with either a single character at each index of the original `Series` or `NaN`. For example,

```
In [47]: strs = 'go', 'bow', 'joe', 'slow'
```

```
In [48]: ds = pd.Series(strs)
```

```
In [49]: for s in ds.str:
.....:     print(s)
.....:
```

```
0    g
1    b
2    j
3    s
```

```
dtype: object
```

```
0    o
1    o
2    o
3    l
```

```
dtype: object
```

```
0    NaN
1    w
2    e
3    o
```

```
dtype: object
```

```
0    NaN
1    NaN
2    NaN
3    w
```

```
dtype: object
```

```
In [50]: s
```

```

////////////////////////////////////
↪
```

```
0    NaN
1    NaN
2    NaN
3    w
```

```
dtype: object
```

```
In [51]: s.dropna().values.item() == 'w'
```

```

////////////////////////////////////
↪True
```

The last element yielded by the iterator will be a `Series` containing the last element of the longest string in the `Series` with all other elements being `NaN`. Here since `'slow'` is the longest string and there are no other strings with the same length `'w'` is the only non-null string in the yielded `Series`.

- HDFStore

- will retain index attributes (freq,tz,name) on recreation ([GH3499](#))
  - will warn with a `AttributeConflictWarning` if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as `data_columns` ([GH2852](#))
- Non-unique index support clarified ([GH3468](#)).
  - Fix assigning a new index to a duplicate index in a `DataFrame` would fail ([GH3468](#))
  - Fix construction of a `DataFrame` with a duplicate index
  - `ref_locs` support to allow duplicative indices across dtypes, allows `iget` support to always find the index (even across dtypes) ([GH2194](#))
  - `applymap` on a `DataFrame` with a non-unique index now works (removed warning) ([GH2786](#)), and fix ([GH3230](#))
  - Fix `to_csv` to handle non-unique columns ([GH3495](#))
  - Duplicate indexes with `getitem` will return items in the correct order ([GH3455](#), [GH3457](#)) and handle missing elements like unique indices ([GH3561](#))
  - Duplicate indexes with and empty `DataFrame.from_records` will return a correct frame ([GH3562](#))
  - Concat to produce a non-unique columns when duplicates are across dtypes is fixed ([GH3602](#))
  - Allow insert/delete to non-unique columns ([GH3679](#))
  - Non-unique indexing with a slice via `loc` and friends fixed ([GH3659](#))
  - Allow insert/delete to non-unique columns ([GH3679](#))
  - Extend `reindex` to correctly deal with non-unique indices ([GH3679](#))
  - `DataFrame.itertuples()` now works with frames with duplicate column names ([GH3873](#))
  - Bug in non-unique indexing via `iloc` ([GH4017](#)); added `takeable` argument to `reindex` for location-based taking
  - Allow non-unique indexing in series via `.ix/.loc` and `__getitem__` ([GH4246](#))
  - Fixed non-unique indexing memory allocation issue with `.ix/.loc` ([GH4280](#))
- `DataFrame.from_records` did not accept empty recarrays ([GH3682](#))
- `read_html` now correctly skips tests ([GH3741](#))
- Fixed a bug where `DataFrame.replace` with a compiled regular expression in the `to_replace` argument wasn't working ([GH3907](#))
- Improved `network` test decorator to catch `IOError` (and therefore `URLError` as well). Added `with_connectivity_check` decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new `optional_args` decorator factory for decorators. ([GH3910](#), [GH3914](#))
- Fixed testing issue where too many sockets were open thus leading to a connection reset issue ([GH3982](#), [GH3985](#), [GH4028](#), [GH4054](#))
- Fixed failing tests in `test_yahoo`, `test_google` where symbols were not retrieved but were being accessed ([GH3982](#), [GH3985](#), [GH4028](#), [GH4054](#))
- `Series.hist` will now take the figure from the current environment if one is not passed
- Fixed bug where a 1xN `DataFrame` would barf on a 1xN mask ([GH4071](#))

- Fixed running of `to_x` under python3 where the pickle import was getting rewritten in an incompatible way (GH4062, GH4063)
- Fixed bug where `sharex` and `sharey` were not being passed to `grouped_hist` (GH4089)
- Fixed bug in `DataFrame.replace` where a nested dict wasn't being iterated over when `regex=False` (GH4115)
- Fixed bug in the parsing of microseconds when using the `format` argument in `to_datetime` (GH4152)
- Fixed bug in `PandasAutoDateLocator` where `invert_xaxis` triggered incorrectly `MilliSecondLocator` (GH3990)
- Fixed bug in plotting that wasn't raising on invalid colormap for matplotlib 1.1.1 (GH4215)
- Fixed the legend displaying in `DataFrame.plot(kind='kde')` (GH4216)
- Fixed bug where Index slices weren't carrying the name attribute (GH4226)
- Fixed bug in initializing `DatetimeIndex` with an array of strings in a certain time zone (GH4229)
- Fixed bug where `html5lib` wasn't being properly skipped (GH4265)
- Fixed bug where `get_data_famafrench` wasn't using the correct file edges (GH4281)

See the *full release notes* or issue tracker on GitHub for a complete list.

### 39.13.1.6 Contributors

A total of 50 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Andy Hayden
- Chang She

## 39.14 Version 0.11

### 39.14.1 v0.11.0 (April 22, 2013)

{{ header }}

This is a major release from 0.10.1 and includes many new features and enhancements along with a large number of bug fixes. The methods of Selecting Data have had quite a number of additions, and Dtype support is now full-fledged. There are also a number of important API changes that long-time pandas users should pay close attention to.

There is a new section in the documentation, *10 Minutes to Pandas*, primarily geared to new users.

There is a new section in the documentation, *Cookbook*, a collection of useful recipes in pandas (and that we want contributions!).

There are several libraries that are now *Recommended Dependencies*

#### 39.14.1.1 Selection Choices

Starting in 0.11.0, object selection has had a number of user-requested additions in order to support more explicit location based indexing. Pandas now supports three types of multi-axis indexing.

- `.loc` is strictly label based, will raise `KeyError` when the items are not found, allowed inputs are:
  - A single label, e.g. 5 or 'a', (note that 5 is interpreted as a *label* of the index. This use is **not** an integer position along the index)
  - A list or array of labels ['a', 'b', 'c']
  - A slice object with labels 'a' : 'f', (note that contrary to usual python slices, **both** the start and the stop are included!)
  - A boolean array

See more at *Selection by Label*

- `.iloc` is strictly integer position based (from 0 to `length-1` of the axis), will raise `IndexError` when the requested indices are out of bounds. Allowed inputs are:
  - An integer e.g. 5
  - A list or array of integers [4, 3, 0]
  - A slice object with ints 1 : 7
  - A boolean array

See more at *Selection by Position*

- `.ix` supports mixed integer and label based access. It is primarily label based, but will fallback to integer positional access. `.ix` is the most general and will support any of the inputs to `.loc` and `.iloc`, as well as support for floating point label schemes. `.ix` is especially useful when dealing with mixed positional and label based hierarchical indexes.

As using integer slices with `.ix` have different behavior depending on whether the slice is interpreted as position based or label based, it's usually better to be explicit and use `.iloc` or `.loc`.

See more at *Advanced Indexing* and *Advanced Hierarchical*.

### 39.14.1.2 Selection Deprecations

Starting in version 0.11.0, these methods *may* be deprecated in future versions.

- `irow`
- `icol`
- `iget_value`

See the section *Selection by Position* for substitutes.

### 39.14.1.3 Dtypes

Numeric dtypes will propagate and can coexist in DataFrames. If a dtype is passed (either directly via the `dtype` keyword, a passed `ndarray`, or a passed `Series`, then it will be preserved in DataFrame operations. Furthermore, different numeric dtypes will **NOT** be combined. The following example will give you a taste.

```
In [1]: df1 = pd.DataFrame(np.random.randn(8, 1), columns=['A'], dtype='float32')
```

```
In [2]: df1
```

```
Out[2]:
      A
0  0.864326
1 -0.139016
2  0.341852
3 -0.547515
4 -0.180901
5 -0.355934
6 -1.313090
7  0.784062
```

```
In [3]: df1.dtypes
```

```

////////////////////////////////////
↪
A      float32
dtype: object
```

```
In [4]: df2 = pd.DataFrame({'A': pd.Series(np.random.randn(8), dtype='float16'),
...:                       'B': pd.Series(np.random.randn(8)),
...:                       'C': pd.Series(range(8), dtype='uint8')})
...:
```

```
In [5]: df2
```

```
Out[5]:
      A      B  C
0 -0.329834  0.891384  0
1 -1.819336 -0.438346  1
2  0.334473 -1.269083  2
3  1.936523  0.649958  3
4 -1.120117 -0.350875  4
5 -0.377930  1.498596  5
6  0.097168  0.088944  6
7  0.534668  0.175965  7
```

```
In [6]: df2.dtypes
```

```

////////////////////////////////////
↪
```

(continues on next page)

(continued from previous page)

```
A      float16
B      float64
C      uint8
dtype: object

# here you get some upcasting
In [7]: df3 = df1.reindex_like(df2).fillna(value=0.0) + df2

In [8]: df3
Out[8]:
```

|   | A         | B         | C   |
|---|-----------|-----------|-----|
| 0 | 0.534492  | 0.891384  | 0.0 |
| 1 | -1.958352 | -0.438346 | 1.0 |
| 2 | 0.676325  | -1.269083 | 2.0 |
| 3 | 1.389008  | 0.649958  | 3.0 |
| 4 | -1.301018 | -0.350875 | 4.0 |
| 5 | -0.733864 | 1.498596  | 5.0 |
| 6 | -1.215922 | 0.088944  | 6.0 |
| 7 | 1.318730  | 0.175965  | 7.0 |

```
In [9]: df3.dtypes
//////////
A      float32
B      float64
C      float64
dtype: object
```

#### 39.14.1.4 Dtype Conversion

This is lower-common-denominator upcasting, meaning you get the dtype which can accommodate all of the types

```
In [10]: df3.values.dtype
Out[10]: dtype('float64')
```

## Conversion

```
In [11]: df3.astype('float32').dtypes
Out[11]:
A      float32
B      float32
C      float32
dtype: object
```

## Mixed Conversion

```
In [12]: df3['D'] = '1.'

In [13]: df3['E'] = '1'

In [14]: df3.convert_objects(convert_numeric=True).dtypes
Out[14]:
A    float32
B    float64
C    float64
```

(continues on next page)

(continued from previous page)

```

D      float64
E      int64
dtype: object

# same, but specific dtype conversion
In [15]: df3['D'] = df3['D'].astype('float16')

In [16]: df3['E'] = df3['E'].astype('int32')

In [17]: df3.dtypes
Out[17]:
A      float32
B      float64
C      float64
D      float16
E      int32
dtype: object

```

#### Forcing Date coercion (and setting NaT when not datelike)

```

In [18]: import datetime

In [19]: s = pd.Series([datetime.datetime(2001, 1, 1, 0, 0), 'foo', 1.0, 1,
.....:                  pd.Timestamp('20010104'), '20010105'], dtype='O')
.....:

In [20]: s.convert_objects(convert_dates='coerce')
Out[20]:
0    2001-01-01
1              NaT
2              NaT
3              NaT
4    2001-01-04
5    2001-01-05
dtype: datetime64[ns]

```

### 39.14.1.5 Dtype Gotchas

#### Platform Gotchas

Starting in 0.11.0, construction of DataFrame/Series will use default dtypes of `int64` and `float64`, *regardless of platform*. This is not an apparent change from earlier versions of pandas. If you specify dtypes, they *WILL* be respected, however ([GH2837](#))

The following will all result in `int64` dtypes

```

In [21]: pd.DataFrame([1, 2], columns=['a']).dtypes
Out[21]:
a      int64
dtype: object

In [22]: pd.DataFrame({'a': [1, 2]}).dtypes
Out[22]:
a      int64
dtype: object

```

(continues on next page)

(continued from previous page)

```
In [23]: pd.DataFrame({'a': 1}, index=range(2)).dtypes
Out[23]:
a      int64
dtype: object
```

Keep in mind that `DataFrame(np.array([1,2]))` **WILL** result in `int32` on 32-bit platforms!

## Upcasting Gotchas

Performing indexing operations on integer type data can easily upcast the data. The dtype of the input data will be preserved in cases where `nans` are not introduced.

```
In [24]: dfi = df3.astype('int32')

In [25]: dfi['D'] = dfi['D'].astype('int64')
```

```
In [26]: dfi
Out[26]:
```

|   | A  | B  | C | D | E |
|---|----|----|---|---|---|
| 0 | 0  | 0  | 0 | 1 | 1 |
| 1 | -1 | 0  | 1 | 1 | 1 |
| 2 | 0  | -1 | 2 | 1 | 1 |
| 3 | 1  | 0  | 3 | 1 | 1 |
| 4 | -1 | 0  | 4 | 1 | 1 |
| 5 | 0  | 1  | 5 | 1 | 1 |
| 6 | -1 | 0  | 6 | 1 | 1 |
| 7 | 1  | 0  | 7 | 1 | 1 |

```
In [27]: dfi.dtypes
```

```
↪
A      int32
B      int32
C      int32
D      int64
E      int32
dtype: object
```

```
In [28]: casted = dfi[dfi > 0]
```

```
In [29]: casted
```

```
Out [29]:
```

|   | A   | B   | C   | D | E |
|---|-----|-----|-----|---|---|
| 0 | NaN | NaN | NaN | 1 | 1 |
| 1 | NaN | NaN | 1.0 | 1 | 1 |
| 2 | NaN | NaN | 2.0 | 1 | 1 |
| 3 | 1.0 | NaN | 3.0 | 1 | 1 |
| 4 | NaN | NaN | 4.0 | 1 | 1 |
| 5 | NaN | 1.0 | 5.0 | 1 | 1 |
| 6 | NaN | NaN | 6.0 | 1 | 1 |
| 7 | 1.0 | NaN | 7.0 | 1 | 1 |

```
In [30]: casted.dtypes
```

```

A    float64
B    float64
```

(continues on next page)

While float dtypes are unchanged.

```
In [31]: df4 = df3.copy()

In [32]: df4['A'] = df4['A'].astype('float32')

In [33]: df4.dtypes
Out[33]:
A      float32
B      float64
C      float64
D      float16
E         int32
dtype: object
```

```
In [34]: casted = df4[df4 > 0]

In [35]: casted
Out[35]:
```

|   | A        | B        | C   | D   | E |
|---|----------|----------|-----|-----|---|
| 0 | 0.534492 | 0.891384 | NaN | 1.0 | 1 |
| 1 | NaN      | NaN      | 1.0 | 1.0 | 1 |
| 2 | 0.676325 | NaN      | 2.0 | 1.0 | 1 |
| 3 | 1.389008 | 0.649958 | 3.0 | 1.0 | 1 |
| 4 | NaN      | NaN      | 4.0 | 1.0 | 1 |
| 5 | NaN      | 1.498596 | 5.0 | 1.0 | 1 |
| 6 | NaN      | 0.088944 | 6.0 | 1.0 | 1 |
| 7 | 1.318730 | 0.175965 | 7.0 | 1.0 | 1 |

```
In [36]: casted.dtypes
```

```

A      float32
B      float64
C      float64
D      float16
E      int32
dtype: object

```

### 39.14.1.6 Datetimes Conversion

`Datetime64[ns]` columns in a `DataFrame` (or a `Series`) allow the use of `np.nan` to indicate a nan value, in addition to the traditional `NaT`, or not-a-time. This allows convenient nan setting in a generic way. Furthermore `datetime64[ns]` columns are created by default, when passed datetimelike objects (*this change was introduced in 0.10.1*) ([GH2809](#), [GH2810](#))

```
In [37]: df = pd.DataFrame(np.random.randn(6, 2), pd.date_range('20010102',
↳ periods=6),
    .....:                  columns=['A', ' B'])
    .....:
```

(continues on next page)

(continued from previous page)

```

In [38]: df['timestamp'] = pd.Timestamp('20010103')

In [39]: df
Out[39]:
```

|            | A         | B         | timestamp  |
|------------|-----------|-----------|------------|
| 2001-01-02 | 0.315016  | 2.593186  | 2001-01-03 |
| 2001-01-03 | -0.336016 | 0.153366  | 2001-01-03 |
| 2001-01-04 | 0.402341  | 0.157685  | 2001-01-03 |
| 2001-01-05 | -0.120190 | -0.997170 | 2001-01-03 |
| 2001-01-06 | 0.178300  | -0.625006 | 2001-01-03 |
| 2001-01-07 | -0.372354 | -0.765653 | 2001-01-03 |

```

# datetime64[ns] out of the box
In [40]: df.get_dtype_counts()
Out[40]:
dtype: object
float64      2
datetime64[ns] 1
dtype: int64

# use the traditional nan, which is mapped to NaT internally
In [41]: df.loc[df.index[2:4], ['A', 'timestamp']] = np.nan

In [42]: df
Out[42]:
```

|            | A         | B         | timestamp  |
|------------|-----------|-----------|------------|
| 2001-01-02 | 0.315016  | 2.593186  | 2001-01-03 |
| 2001-01-03 | -0.336016 | 0.153366  | 2001-01-03 |
| 2001-01-04 | NaN       | 0.157685  | NaT        |
| 2001-01-05 | NaN       | -0.997170 | NaT        |
| 2001-01-06 | 0.178300  | -0.625006 | 2001-01-03 |
| 2001-01-07 | -0.372354 | -0.765653 | 2001-01-03 |

Astyping conversion on datetime64[ns] to object, implicitly converts NaT to np.nan

```

In [43]: s = pd.Series([datetime.datetime(2001, 1, 2, 0, 0) for i in range(3)])

In [44]: s.dtype
Out[44]: dtype('<M8[ns]')

In [45]: s[1] = np.nan

In [46]: s
Out[46]:
```

| 0 | 2001-01-02 |
|---|------------|
| 1 | NaT        |
| 2 | 2001-01-02 |

```

dtype: datetime64[ns]

In [47]: s.dtype
Out[47]: dtype('<M8[ns]')

In [48]: s = s.astype('O')

In [49]: s
```

(continues on next page)

(continued from previous page)

Out [49] :

```
0    2001-01-02 00:00:00  
1                                     NaT  
2    2001-01-02 00:00:00  
dtype: object
```

```
In [50]: s.dtypes
```

```
dtype('O')
```

### 39.14.1.7 API changes

- Added to `_series()` method to indices, to facilitate the creation of indexers ([GH3275](#))
- `HDFStore`
  - added the method `select_column` to select a single column from a table as a `Series`.
  - deprecated the `unique` method, can be replicated by `select_column(key, column).unique()`
  - `min_itemsize` parameter to `append` will now automatically create `data_columns` for passed keys

### 39.14.1.8 Enhancements

- Improved performance of `df.to_csv()` by up to 10x in some cases. ([GH3059](#))
- `Numexpr` is now a *Recommended Dependencies*, to accelerate certain types of numerical and boolean operations
- `Bottleneck` is now a *Recommended Dependencies*, to accelerate certain types of `nan` operations
- `HDFStore`
  - support `read_hdf/to_hdf` API similar to `read_csv/to_csv`

```
In [51]: df = pd.DataFrame({'A': lrange(5), 'B': lrange(5)})

In [52]: df.to_hdf('store.h5', 'table', append=True)

In [53]: pd.read_hdf('store.h5', 'table', where=['index > 2'])
Out[53]:
```

|   | A | B |
|---|---|---|
| 3 | 3 | 3 |
| 4 | 4 | 4 |

- provide dotted attribute access to get from stores, e.g. `store.df == store['df']`
- new keywords `iterator=boolean`, and `chunksize=number_in_a_chunk` are provided to support iteration on `select` and `select_as_multiple` ([GH3076](#))
- You can now select timestamps from an *unordered* timeseries similarly to an *ordered* timeseries ([GH2437](#))
- You can now select with a string from a DataFrame with a datelike index, in a similar way to a Series ([GH3070](#))

```
In [54]: idx = pd.date_range("2001-10-1", periods=5, freq='M')
In [55]: ts = pd.Series(np.random.rand(len(idx)), index=idx)
In [56]: ts['2001']
```

(continues on next page)

|            | A        |
|------------|----------|
| 2001-10-31 | 0.396953 |
| 2001-11-30 | 0.256120 |
| 2001-12-31 | 0.945650 |

- Squeeze to possibly remove length 1 dimensions from an object.

```
Out [60]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 4 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2001-01-02 00:00:00 to 2001-01-05 00:00:00
Minor_axis axis: A to D
```

```
In [61]: p.reindex(items=['ItemA']).squeeze()
```

|            | A         | B         | C         | D         |
|------------|-----------|-----------|-----------|-----------|
| 2001-01-02 | -0.589005 | -1.070678 | -1.681101 | 0.403776  |
| 2001-01-03 | 0.609862  | 0.387936  | 1.815066  | 0.705200  |
| 2001-01-04 | -0.668049 | 0.242501  | 0.313421  | 0.120930  |
| 2001-01-05 | -0.210518 | -0.931184 | 0.240647  | -0.027462 |

```
In [62]: p.reindex(items=['ItemA'], minor=['B']).squeeze()
```

[illegible]

- In `pd.io.data.Options`,
  - Fix bug when trying to fetch data for the current month when already past expiry.
  - Now using `lxml` to scrape `html` instead of `BeautifulSoup` (`lxml` was faster).
  - New instance variables for calls and puts are automatically created when a method that creates them is called. This works for current month where the instance variables are simply `calls` and `puts`. Also works for future expiry months and save the instance variable as `callsMMYY` or `putsMMYY`, where `MMYY` are, respectively, the month and year of the option's expiry.

- `Options.get_near_stock_price` now allows the user to specify the month for which to get relevant options data.
- `Options.get_forward_data` now has optional kwargs `near` and `above_below`. This allows the user to specify if they would like to only return forward looking data for options near the current stock price. This just obtains the data from `Options.get_near_stock_price` instead of `Options.get_xxx_data()` (GH2758).
- Cursor coordinate information is now displayed in time-series plots.
- added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
- added option `display.chop_threshold` to control display of small numerical values. (GH2739)
- added option `display.max_info_rows` to prevent verbose\_info from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)
- `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).
- `DataFrame.from_records` now accepts not only dicts but any instance of the collections.Mapping ABC.
- added option `display.mpl_style` providing a sleeker visual style for plots. Based on <https://gist.github.com/huyng/816622> (GH3075).
- Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)
- `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes `&`, in addition to `<` and `>`. (GH2919)

See the *full release notes* or issue tracker on GitHub for a complete list.

## 39.15 Version 0.10

### 39.15.1 v0.10.1 (January 22, 2013)

```
{{ header }}
```

This is a minor release from 0.10.0 and includes new features, enhancements, and bug fixes. In particular, there is substantial new HDFStore functionality contributed by Jeff Reback.

An undesired API breakage with functions taking the `inplace` option has been reverted and deprecation warnings added.

#### 39.15.1.1 API changes

- Functions taking an `inplace` option return the calling object as before. A deprecation message has been added
- Groupby aggregations Max/Min no longer exclude non-numeric data ([GH2700](#))
- Resampling an empty DataFrame now returns an empty DataFrame instead of raising an exception ([GH2640](#))
- The file reader will now raise an exception when NA values are found in an explicitly specified integer column instead of converting the column to float ([GH2631](#))
- `DatetimeIndex.unique` now returns a `DatetimeIndex` with the same name and
- `timezone` instead of an array ([GH2563](#))

#### 39.15.1.2 New features

- MySQL support for database (contribution from Dan Allan)

#### 39.15.1.3 HDFStore

You may need to upgrade your existing data files. Please visit the **compatibility** section in the main docs.

You can designate (and index) certain columns that you want to be able to perform queries on a table, by passing a list to `data_columns`

```
In [1]: store = pd.HDFStore('store.h5')

In [2]: df = pd.DataFrame(np.random.randn(8, 3),
...:                      index=pd.date_range('1/1/2000', periods=8),
...:                      columns=['A', 'B', 'C'])
...:

In [3]: df['string'] = 'foo'

In [4]: df.loc[df.index[4:6], 'string'] = np.nan

In [5]: df.loc[df.index[7:9], 'string'] = 'bar'

In [6]: df['string2'] = 'cool'

In [7]: df
Out[7]:
```

|  | A | B | C | string | string2 |
|--|---|---|---|--------|---------|
|--|---|---|---|--------|---------|

(continues on next page)

(continued from previous page)

```

2000-01-01  2.423905  0.121108  0.266916  foo  cool
2000-01-02  0.843826 -0.222540  2.021981  foo  cool
2000-01-03 -0.716789 -2.224485 -1.061137  foo  cool
2000-01-04 -0.232825  0.430793 -0.665478  foo  cool
2000-01-05  1.829807 -1.406509  1.078248  NaN  cool
2000-01-06  0.322774  0.200324  0.890024  NaN  cool
2000-01-07  0.194813  0.351633  0.448881  foo  cool
2000-01-08 -0.197915  0.965714 -1.522909  bar  cool

```

```
# on-disk operations
```

```
In [8]: store.append('df', df, data_columns=['B', 'C', 'string', 'string2'])
```

```
In [9]: store.select('df', "B>0 and string=='foo'")
```

```
Out [9]:
```

```

          A          B          C string string2
2000-01-01  2.423905  0.121108  0.266916  foo  cool
2000-01-04 -0.232825  0.430793 -0.665478  foo  cool
2000-01-07  0.194813  0.351633  0.448881  foo  cool

```

```
# this is in-memory version of this type of selection
```

```
In [10]: df[(df.B > 0) & (df.string == 'foo')]
```

```

////////////////////////////////////
↪
          A          B          C string string2
2000-01-01  2.423905  0.121108  0.266916  foo  cool
2000-01-04 -0.232825  0.430793 -0.665478  foo  cool
2000-01-07  0.194813  0.351633  0.448881  foo  cool

```

Retrieving unique values in an indexable or data column.

```

# note that this is deprecated as of 0.14.0
# can be replicated by: store.select_column('df', 'index').unique()
store.unique('df', 'index')
store.unique('df', 'string')

```

You can now store datetime64 in data columns

```
In [11]: df_mixed = df.copy()
```

```
In [12]: df_mixed['datetime64'] = pd.Timestamp('20010102')
```

```
In [13]: df_mixed.loc[df_mixed.index[3:4], ['A', 'B']] = np.nan
```

```
In [14]: store.append('df_mixed', df_mixed)
```

```
In [15]: df_mixed1 = store.select('df_mixed')
```

```
In [16]: df_mixed1
```

```
Out [16]:
```

```

          A          B          C string string2 datetime64
2000-01-01  2.423905  0.121108  0.266916  foo  cool 2001-01-02
2000-01-02  0.843826 -0.222540  2.021981  foo  cool 2001-01-02
2000-01-03 -0.716789 -2.224485 -1.061137  foo  cool 2001-01-02
2000-01-04      NaN      NaN -0.665478  foo  cool 2001-01-02
2000-01-05  1.829807 -1.406509  1.078248  NaN  cool 2001-01-02

2000-01-07  0.194813  0.351633  0.448881  foo  cool 2001-01-02

```

(continues on next page)

(continued from previous page)

```
2000-01-08 -0.197915  0.965714 -1.522909    bar    cool 2001-01-02
```

```
In [17]: df_mixed1.get_dtype_counts()
```

```

////////////////////////////////////
↪
float64      3
object       2
datetime64[ns] 1
dtype: int64

```

You can pass columns keyword to select to filter a list of the return columns, this is equivalent to passing a `Term('columns', list_of_columns_to_filter)`

```
In [18]: store.select('df', columns=['A', 'B'])
```

```
Out[18]:
```

|            | A         | B         |
|------------|-----------|-----------|
| 2000-01-01 | 2.423905  | 0.121108  |
| 2000-01-02 | 0.843826  | -0.222540 |
| 2000-01-03 | -0.716789 | -2.224485 |
| 2000-01-04 | -0.232825 | 0.430793  |
| 2000-01-05 | 1.829807  | -1.406509 |
| 2000-01-06 | 0.322774  | 0.200324  |
| 2000-01-07 | 0.194813  | 0.351633  |
| 2000-01-08 | -0.197915 | 0.965714  |

HDFStore now serializes MultiIndex dataframes when appending tables.

```
In [19]: index = pd.MultiIndex(levels=[['foo', 'bar', 'baz', 'qux'],
.....:                                ['one', 'two', 'three']],
.....:                        labels=[[0, 0, 0, 1, 1, 2, 2, 3, 3, 3],
.....:                               [0, 1, 2, 0, 1, 1, 2, 0, 1, 2]],
.....:                        names=['foo', 'bar'])
.....:
```

```
In [20]: df = pd.DataFrame(np.random.randn(10, 3), index=index,
.....:                    columns=['A', 'B', 'C'])
.....:
```

```
In [21]: df
```

```
Out[21]:
```

|         | A         | B         | C         |
|---------|-----------|-----------|-----------|
| foo bar |           |           |           |
| foo one | -0.116619 | 0.295575  | -1.047704 |

```

## Enhancements

- HDFStore now can read native PyTables table format tables
- You can pass `nan_rep = 'my_nan_rep'` to `append`, to change the default nan representation on disk (which converts to/from `np.nan`), this defaults to `nan`.
- You can pass `index` to `append`. This defaults to `True`. This will automatically create indices on the *indexables* and *data columns* of the table
- You can pass `chunksize=an integer` to `append`, to change the writing chunksize (default is 50000). This will significantly lower your memory usage on writing.
- You can pass `expectedrows=an integer` to the first `append`, to set the TOTAL number of expected rows that PyTables will expected. This will optimize read/write performance.
- `Select` now supports passing `start` and `stop` to provide selection space limiting in selection.
- Greatly improved ISO8601 (e.g., yyyy-mm-dd) date parsing for file parsers ([GH2698](#))
- Allow `DataFrame.merge` to handle combinatorial sizes too large for 64-bit integer ([GH2690](#))
- `Series` now has unary negation (`-series`) and inversion (`~series`) operators ([GH2686](#))
- `DataFrame.plot` now includes a `logx` parameter to change the x-axis to log scale ([GH2327](#))
- `Series` arithmetic operators can now handle constant and `ndarray` input ([GH2574](#))
- `ExcelFile` now takes a `kind` argument to specify the file type ([GH2613](#))
- A faster implementation for `Series.str` methods ([GH2602](#))

## Bug Fixes

- `HDFStore` tables can now store `float32` types correctly (cannot be mixed with `float64` however)
- Fixed Google Analytics prefix when specifying request segment ([GH2713](#)).
- Function to reset Google Analytics token store so users can recover from improperly setup client secrets ([GH2687](#)).
- Fixed `groupby` bug resulting in segfault when passing in `MultiIndex` ([GH2706](#))

- Fixed bug where passing a Series with datetime64 values into `to_datetime` results in bogus output values (GH2699)
- Fixed bug in `pattern` in `HDFStore` expressions when `pattern` is not a valid regex (GH2694)
- Fixed performance issues while aggregating boolean data (GH2692)
- When given a boolean mask key and a Series of new values, Series `__setitem__` will now align the incoming values with the original Series (GH2686)
- Fixed `MemoryError` caused by performing counting sort on sorting `MultiIndex` levels with a very large number of combinatorial values (GH2684)
- Fixed bug that causes plotting to fail when the index is a `DatetimeIndex` with a fixed-offset timezone (GH2683)
- Corrected business day subtraction logic when the offset is more than 5 bdays and the starting date is on a weekend (GH2680)
- Fixed C file parser behavior when the file has more columns than data (GH2668)
- Fixed file reader bug that misaligned columns with data in the presence of an implicit column and a specified `usecols` value
- `DataFrames` with numerical or datetime indices are now sorted prior to plotting (GH2609)
- Fixed `DataFrame.from_records` error when passed columns, index, but empty records (GH2633)
- Several bug fixed for Series operations when `dtype` is `datetime64` (GH2689, GH2629, GH2626)

See the *full release notes* or issue tracker on GitHub for a complete list.

#### 39.15.1.4 Contributors

A total of 17 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.15.2 v0.10.0 (December 17, 2012)

```
{{ header }}
```

This is a major release from 0.9.1 and includes many new features and enhancements along with a large number of bug fixes. There are also a number of important API changes that long-time pandas users should pay close attention to.

### 39.15.2.1 File parsing new features

The delimited file parsing engine (the guts of `read_csv` and `read_table`) has been rewritten from the ground up and now uses a fraction the amount of memory while parsing, while being 40% or more faster in most use cases (in some cases much faster).

There are also many new features:

- Much-improved Unicode handling via the `encoding` option.
- Column filtering (`usecols`)
- Dtype specification (`dtype` argument)
- Ability to specify strings to be recognized as True/False
- Ability to yield NumPy record arrays (`as_reccarray`)
- High performance `delim_whitespace` option
- Decimal format (e.g. European format) specification
- Easier CSV dialect options: `escapechar`, `lineterminator`, `quotechar`, etc.
- More robust handling of many exceptional kinds of files observed in the wild

### 39.15.2.2 API changes

#### Deprecated DataFrame BINOP TimeSeries special case behavior

The default behavior of binary operations between a DataFrame and a Series has always been to align on the DataFrame's columns and broadcast down the rows, **except** in the special case that the DataFrame contains time series. Since there are now method for each binary operator enabling you to specify how you want to broadcast, we are phasing out this special case (Zen of Python: *Special cases aren't special enough to break the rules*). Here's what I'm talking about:

```
In [1]: import pandas as pd

In [2]: df = pd.DataFrame(np.random.randn(6, 4),
...:                      index=pd.date_range('1/1/2000', periods=6))
...:

In [3]: df
Out[3]:
```

|            | 0         | 1         | 2         | 3        |
|------------|-----------|-----------|-----------|----------|
| 2000-01-01 | 1.474071  | -0.064034 | -1.282782 | 0.781836 |

2000-01-06  0.0  0.673365  0.942776  0.291820

```

You will get a deprecation warning in the 0.10.x series, and the deprecated functionality will be removed in 0.11 or later.

### Altered resample default behavior

The default time series resample binning behavior of daily D and *higher* frequencies has been changed to `closed='left', label='left'`. Lower frequencies are unaffected. The prior defaults were causing a great deal of confusion for users, especially resampling data to daily frequency (which labeled the aggregated group with the end of the interval: the next day).

```
In [1]: dates = pd.date_range('1/1/2000', '1/5/2000', freq='4h')
```

```
In [2]: series = pd.Series(np.arange(len(dates)), index=dates)
```

```
In [3]: series
```

```

```

- Infinity and negative infinity are no longer treated as NA by `isnull` and `notnull`. That they ever were was a relic of early pandas. This behavior can be re-enabled globally by the `mode.use_inf_as_null` option:

```
In [6]: s = pd.Series([1.5, np.inf, 3.4, -np.inf])
```

```
In [7]: pd.isnull(s)
```

```
Out[7]:
```

```

0    False
1    False
2    False
3    False
Length: 4, dtype: bool

```

```
In [8]: s.fillna(0)
```

```
Out[8]:
```

```

0    1.500000

```

(continues on next page)

(continued from previous page)

```
In [12]: pd.reset_option('use_inf_as_null')
```

- Methods with the `inplace` option now all return `None` instead of the calling object. E.g. code written like `df = df.fillna(0, inplace=True)` may stop working. To fix, simply delete the unnecessary variable assignment.
- `pandas.merge` no longer sorts the group keys (`sort=False`) by default. This was done for performance reasons: the group-key sorting is often one of the more expensive parts of the computation and is often unnecessary.
- The default column names for a file with no header have been changed to the integers  $0$  through  $N - 1$ . This is to create consistency with the `DataFrame` constructor with no columns specified. The v0.9.0 behavior (names `X0, X1, ...`) can be reproduced by specifying `prefix='X'`:

```
In [10]: pd.read_csv(io.StringIO(data), header=None, prefix='X')
```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////Out[10]:
↪
   X0  X1 X2
0   a   b  c
1   1 Yes  2
2   3  No  4

```

- Values like 'Yes' and 'No' are not interpreted as boolean by default, though this can be controlled by new `true_values` and `false_values` arguments:

```

In [11]: print(data)
a,b,c
1,Yes,2
3,No,4

In [12]: pd.read_csv(io.StringIO(data))
////////////////////////////////Out[12]:
   a   b  c
0   1 Yes  2
1   3  No  4

In [13]: pd.read_csv(io.StringIO(data), true_values=['Yes'], false_values=['No'])
////////////////////////////////Out[13]:
   a   b  c
0   1  True  2
1   3 False  4

```

- The file parsers will not recognize non-string values arising from a converter function as NA if passed in the `na_values` argument. It's better to do post-processing using the `replace` function instead.
- Calling `fillna` on Series or DataFrame with no arguments is no longer valid code. You must either specify a fill value or an interpolation method:

```

In [14]: s = pd.Series([np.nan, 1., 2., np.nan, 4])

In [15]: s
Out[15]:
0    NaN
1    1.0
2    2.0
3    NaN
4    4.0
dtype: float64

In [16]: s.fillna(0)
////////////////////////////////Out[16]:
0    0.0
1    1.0
2    2.0
3    0.0
4    4.0
dtype: float64

In [17]: s.fillna(method='pad')
////////////////////////////////
↪
0    NaN

```

(continues on next page)

(continued from previous page)

```
1      1.0
2      2.0
3      2.0
4      4.0
dtype: float64
```

Convenience methods `ffill` and `bfill` have been added:

```
In [18]: s.ffill()
Out[18]:
0      NaN
1      1.0
2      2.0
3      2.0
4      4.0
dtype: float64
```

- `Series.apply` will now operate on a returned value from the applied function, that is itself a series, and possibly upcast the result to a DataFrame

```
In [19]: def f(x):
...:     return pd.Series([x, x**2], index=['x', 'x^2'])
...:
```

```
In [20]: s = pd.Series(np.random.rand(5))
```

```
In [21]: s
Out[21]:
0    0.123872
1    0.924168
2    0.325076
3    0.303746
4    0.116822
dtype: float64
```

```
In [22]: s.apply(f)
```

|   | x        | x^2      |
|---|----------|----------|
| 0 | 0.123872 | 0.015344 |
| 1 | 0.924168 | 0.854086 |
| 2 | 0.325076 | 0.105674 |
| 3 | 0.303746 | 0.092262 |
| 4 | 0.116822 | 0.013647 |

- New API functions for working with pandas options ([GH2097](#)):

- `get_option / set_option` - get/set the value of an option. Partial names are accepted.
- `reset_option` - reset one or more options to their default value. Partial names are accepted.
- `describe_option` - print a description of one or more options. When called with no arguments, print all registered options.

Note: `set_printoptions/ reset_printoptions` are now deprecated (but functioning), the print options now live under “`display.XYZ`”. For example:

```
In [23]: pd.get_option("display.max_rows")
Out[23]: 60
```

- `to_string()` methods now always return unicode strings ([GH2224](#)).

### 39.15.2.3 New features

### 39.15.2.4 Wide DataFrame Printing

Instead of printing the summary information, pandas now splits the string representation across multiple rows by default:

```
In [24]: wide_frame = pd.DataFrame(np.random.randn(5, 16))

In [25]: wide_frame
Out[25]:
```

|          | 0         | 1         | 2         | 3         | 4         | 5         | 6         | 7         |     |
|----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----|
| ↪ 8      |           | 9         | 10        | 11        | 12        | 13        | 14        | 15        |     |
| 0        | -0.711411 | -2.122599 | 1.962935  | 1.672027  | -0.880984 | 0.997289  | -1.693316 | -0.179129 | -1. |
| ↪ 598062 | 0.936914  | 0.912560  | -1.003401 | 1.632781  | -0.724626 | 0.178219  | 0.310610  |           |     |
| 1        | -0.108002 | -0.974226 | -1.147708 | -2.281374 | 0.760010  | -0.742532 | 1.533318  | 2.495362  | -0. |
| ↪ 432771 | -0.068954 | 0.043520  | 0.112246  | 0.871721  | -0.816064 | -0.784880 | 1.030659  |           |     |
| 2        | 0.187483  | -1.933946 | 0.377312  | 0.734122  | 2.141616  | -0.011225 | 0.048869  | -1.360687 | -0. |
| ↪ 479010 | -0.859661 | -0.231595 | -0.527750 | -1.296337 | 0.150680  | 0.123836  | 0.571764  |           |     |
| 3        | 1.555563  | -0.823761 | 0.535420  | -1.032853 | 1.469725  | 1.304124  | 1.449735  | 0.203109  | -1. |
| ↪ 032011 | 0.969818  | -0.962723 | 1.382083  | -0.938794 | 0.669142  | -0.433567 | -0.273610 |           |     |
| 4        | 0.680433  | -0.308450 | -0.276099 | -1.821168 | -1.993606 | -1.927385 | -2.027924 | 1.624972  | 0.  |
| ↪ 551135 | 3.059267  | 0.455264  | -0.030740 | 0.935716  | 1.061192  | -2.107852 | 0.199905  |           |     |

The old behavior of printing out summary information can be achieved via the ‘`expand_frame_repr`’ print option:

```
In [26]: pd.set_option('expand_frame_repr', False)

In [27]: wide_frame
Out[27]:
```

|          | 0         | 1         | 2         | 3         | 4         | 5         | 6         | 7         |     |
|----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----|
| ↪ 8      |           | 9         | 10        | 11        | 12        | 13        | 14        | 15        |     |
| 0        | -0.711411 | -2.122599 | 1.962935  | 1.672027  | -0.880984 | 0.997289  | -1.693316 | -0.179129 | -1. |
| ↪ 598062 | 0.936914  | 0.912560  | -1.003401 | 1.632781  | -0.724626 | 0.178219  | 0.310610  |           |     |
| 1        | -0.108002 | -0.974226 | -1.147708 | -2.281374 | 0.760010  | -0.742532 | 1.533318  | 2.495362  | -0. |
| ↪ 432771 | -0.068954 | 0.043520  | 0.112246  | 0.871721  | -0.816064 | -0.784880 | 1.030659  |           |     |
| 2        | 0.187483  | -1.933946 | 0.377312  | 0.734122  | 2.141616  | -0.011225 | 0.048869  | -1.360687 | -0. |
| ↪ 479010 | -0.859661 | -0.231595 | -0.527750 | -1.296337 | 0.150680  | 0.123836  | 0.571764  |           |     |
| 3        | 1.555563  | -0.823761 | 0.535420  | -1.032853 | 1.469725  | 1.304124  | 1.449735  | 0.203109  | -1. |
| ↪ 032011 | 0.969818  | -0.962723 | 1.382083  | -0.938794 | 0.669142  | -0.433567 | -0.273610 |           |     |
| 4        | 0.680433  | -0.308450 | -0.276099 | -1.821168 | -1.993606 | -1.927385 | -2.027924 | 1.624972  | 0.  |
| ↪ 551135 | 3.059267  | 0.455264  | -0.030740 | 0.935716  | 1.061192  | -2.107852 | 0.199905  |           |     |

The width of each line can be changed via ‘`line_width`’ (80 by default):

```
pd.set_option('line_width', 40)

wide_frame
```

### 39.15.2.5 Updated PyTables Support

*Docs* for PyTables Table format & several enhancements to the api. Here is a taste of what to expect.

```

In [28]: store = pd.HDFStore('store.h5')

In [29]: df = pd.DataFrame(np.random.randn(8, 3),
.....:                    index=pd.date_range('1/1/2000', periods=8),
.....:                    columns=['A', 'B', 'C'])
.....:

```

(continues on next page)

(continued from previous page)

[illegible]

## Enhancements

- added ability to hierarchical keys

```
In [45]: store.put('foo/bar/bah', df)

In [46]: store.append('food/orange', df)

In [47]: store.append('food/apple', df)

In [48]: store
Out[48]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

# remove all nodes under this level
In [49]: store.remove('food')

In [50]: store
Out[50]:
<class 'pandas.io.pytables.HDFStore'>
```

(continues on next page)

(continued from previous page)

```
File path: store.h5
```

- added mixed-dtype support!

```
In [51]: df['string'] = 'string'

In [52]: df['int'] = 1

In [53]: store.append('df', df)

In [54]: df1 = store.select('df')

In [55]: df1
Out[55]:
```

|            | A         | B         | C         | string | int |
|------------|-----------|-----------|-----------|--------|-----|
| 2000-01-01 | 0.323586  | -0.641630 | -0.587514 | string | 1   |
| 2000-01-02 | 0.053897  | 0.194889  | -0.381994 | string | 1   |
| 2000-01-03 | 0.318587  | 2.089075  | -0.728293 | string | 1   |

| 2000-01-06 | -0.542749 | -0.305384 | -0.479195 | string | 1   |
| 2000-01-07 | 0.095031  | -0.270099 | -0.707140 | string | 1   |
| 2000-01-08 | -0.773882 | 0.229453  | 0.304418  | string | 1   |

```
In [56]: df1.get_dtype_counts()
//////////
↪
float64      3
object       1
int64        1
dtype: int64
```

- performance improvements on table writing
- support for arbitrarily indexed dimensions
- `SparseSeries` now has a `density` property ([GH2384](#))
- enable `Series.str.strip/lstrip/rstrip` methods to take an input argument to strip arbitrary characters ([GH2411](#))
- implement `value_vars` in `melt` to limit values to certain columns and add `melt` to pandas namespace ([GH2412](#))

## Bug Fixes

- added `Term` method of specifying where conditions ([GH1996](#)).
- `del store['df']` now call `store.remove('df')` for store deletion
- deleting of consecutive rows is much faster than before
- `min_itemsize` parameter can be specified in table creation to force a minimum size for indexing columns (the previous implementation would set the column size based on the first append)
- indexing support via `create_table_index` (requires PyTables >= 2.3) ([GH698](#)).
- appending on a store would fail if the table was not first created via `put`
- fixed issue with missing attributes after loading a pickled dataframe ([GH2431](#))
- minor change to `select` and `remove`: require a table **ONLY** if where is also provided (and not `None`)

## Compatibility

0.10 of HDFStore is backwards compatible for reading tables created in a prior version of pandas, however, query terms using the prior (undocumented) methodology are unsupported. You must read in the entire file and write it out using the new format to take advantage of the updates.

### 39.15.2.6 N Dimensional Panels (Experimental)

Adding experimental support for Panel4D and factory functions to create n-dimensional named panels. Here is a taste of what to expect.

```
In [58]: p4d = Panel4D(randn(2, 2, 5, 4),
....:      labels=['Label1','Label2'],
....:      items=['Item1', 'Item2'],
....:      major_axis=date_range('1/1/2000', periods=5),
....:      minor_axis=['A', 'B', 'C', 'D'])
....:

In [59]: p4d
Out[59]:
<class 'pandas.core.panelnd.Panel4D'>
Dimensions: 2 (labels) x 2 (items) x 5 (major_axis) x 4 (minor_axis)
Labels axis: Label1 to Label2
Items axis: Item1 to Item2

## 39.16 Version 0.9

### 39.16.1 v0.9.1 (November 14, 2012)

{{ header }}

This is a bug fix release from 0.9.0 and includes several new features and enhancements along with a large number of bug fixes. The new features include by-column sort order for DataFrame and Series, improved NA handling for the rank method, masking functions for DataFrame, and intraday time-series filtering for DataFrame.

#### 39.16.1.1 New features

- *Series.sort*, *DataFrame.sort*, and *DataFrame.sort\_index* can now be specified in a per-column manner to support multiple sort orders ([GH928](#))

```
In [2]: df = pd.DataFrame(np.random.randint(0, 2, (6, 3)),
...:                      columns=['A', 'B', 'C'])
```

```
In [3]: df.sort(['A', 'B'], ascending=[1, 0])
```

Out [3]:

|   | A | B | C |
|---|---|---|---|
| 3 | 0 | 1 | 1 |
| 4 | 0 | 1 | 1 |
| 2 | 0 | 0 | 1 |
| 0 | 1 | 0 | 0 |
| 1 | 1 | 0 | 0 |
| 5 | 1 | 0 | 0 |

- *DataFrame.rank* now supports additional argument values for the *na\_option* parameter so missing values can be assigned either the largest or the smallest rank ([GH1508](#), [GH2159](#))

```
In [1]: df = pd.DataFrame(np.random.randn(6, 3), columns=['A', 'B', 'C'])

In [2]: df.loc[2:4] = np.nan

In [3]: df.rank()
Out[3]:
```

|   | A   | B   | C   |
|---|-----|-----|-----|
| 0 | 2.0 | 3.0 | 1.0 |
| 1 | 1.0 | 2.0 | 3.0 |
| 2 | NaN | NaN | NaN |
| 3 | NaN | NaN | NaN |
| 4 | NaN | NaN | NaN |
| 5 | 3.0 | 1.0 | 2.0 |

```
[6 rows x 3 columns]

In [4]: df.rank(na_option='top')
=====
↪
```

|   | A   | B   | C   |
|---|-----|-----|-----|
| 0 | 5.0 | 6.0 | 4.0 |
| 1 | 4.0 | 5.0 | 6.0 |
| 2 | 2.0 | 2.0 | 2.0 |
| 3 | 2.0 | 2.0 | 2.0 |
| 4 | 2.0 | 2.0 | 2.0 |
| 5 | 6.0 | 4.0 | 5.0 |

```
[6 rows x 3 columns]

In [5]: df.rank(na_option='bottom')
=====
↪
```

|   | A   | B   | C   |
|---|-----|-----|-----|
| 0 | 2.0 | 3.0 | 1.0 |
| 1 | 1.0 | 2.0 | 3.0 |
| 2 | 5.0 | 5.0 | 5.0 |
| 3 | 5.0 | 5.0 | 5.0 |
| 4 | 5.0 | 5.0 | 5.0 |
| 5 | 3.0 | 1.0 | 2.0 |

```
[6 rows x 3 columns]
```

- DataFrame has new *where* and *mask* methods to select values according to a given boolean mask ([GH2109](#), [GH2151](#))

DataFrame currently supports slicing via a boolean vector the same length as the DataFrame (inside the `[]`). The returned DataFrame has the same number of columns as the original, but is sliced on its index.

```
In [6]: df = DataFrame(np.random.randn(5, 3), columns = ['A', 'B', 'C'])
In [7]: df
Out[7]:
```

|   | A        | B         | C         |
|---|----------|-----------|-----------|
| 0 | 0.934688 | 0.485284  | -1.468614 |
| 1 | 0.488440 | 0.422746  | 0.114905  |
| 2 | 1.008408 | -0.366746 | 0.288288  |

(continues on next page)

(continued from previous page)

```
3  0.890991 -0.575582 -0.275275
4  0.388707  2.163463  0.812216
```

```
[5 rows x 3 columns]
```

```
In [8]: df[df['A'] > 0]
```

|   | A        | B         | C         |
|---|----------|-----------|-----------|
| 0 | 0.934688 | 0.485284  | -1.468614 |
| 1 | 0.488440 | 0.422746  | 0.114905  |
| 2 | 1.008408 | -0.366746 | 0.288288  |
| 3 | 0.890991 | -0.575582 | -0.275275 |
| 4 | 0.388707 | 2.163463  | 0.812216  |

```
[5 rows x 3 columns]
```

If a `DataFrame` is sliced with a `DataFrame` based boolean condition (with the same size as the original `DataFrame`), then a `DataFrame` the same size (index and columns) as the original is returned, with elements that do not meet the boolean condition as `NaN`. This is accomplished via the new method `DataFrame.where`. In addition, `where` takes an optional `other` argument for replacement.

```
In [9]: df[df>0]
```

Out [9] :

|   | A        | B        | C        |
|---|----------|----------|----------|
| 0 | 0.934688 | 0.485284 | NaN      |
| 1 | 0.488440 | 0.422746 | 0.114905 |
| 2 | 1.008408 | NaN      | 0.288288 |
| 3 | 0.890991 | NaN      | NaN      |
| 4 | 0.388707 | 2.163463 | 0.812216 |

```
[5 rows x 3 columns]
```

```
In [10]: df.where(df>0)
```

|   | A        | B        | C        |
|---|----------|----------|----------|
| 0 | 0.934688 | 0.485284 | NaN      |
| 1 | 0.488440 | 0.422746 | 0.114905 |
| 2 | 1.008408 | NaN      | 0.288288 |
| 3 | 0.890991 | NaN      | NaN      |
| 4 | 0.388707 | 2.163463 | 0.812216 |

```
[5 rows x 3 columns]
```

```
In [11]: df.where(df>0,-df)
```

|   | A        | B        | C        |
|---|----------|----------|----------|
| 0 | 0.934688 | 0.485284 | 1.468614 |
| 1 | 0.488440 | 0.422746 | 0.114905 |
| 2 | 1.008408 | 0.366746 | 0.288288 |
| 3 | 0.890991 | 0.575582 | 0.275275 |
| 4 | 0.388707 | 2.163463 | 0.812216 |

```
[5 rows x 3 columns]
```

Furthermore, *where* now aligns the input boolean condition (ndarray or DataFrame), such that partial selection with setting is possible. This is analogous to partial setting via *.ix* (but on the contents rather than the axis labels)

```
In [12]: df2 = df.copy()

In [13]: df2[ df2[1:4] > 0 ] = 3

In [14]: df2
Out[14]:
```

|   | A        | B         | C         |
|---|----------|-----------|-----------|
| 0 | 0.934688 | 0.485284  | -1.468614 |
| 1 | 3.000000 | 3.000000  | 3.000000  |
| 2 | 3.000000 | -0.366746 | 3.000000  |
| 3 | 3.000000 | -0.575582 | -0.275275 |
| 4 | 0.388707 | 2.163463  | 0.812216  |

[5 rows x 3 columns]

*DataFrame.mask* is the inverse boolean operation of *where*.

```
In [15]: df.mask(df<=0)
Out[15]:
```

|   | A        | B        | C        |
|---|----------|----------|----------|
| 0 | 0.934688 | 0.485284 | NaN      |
| 1 | 0.488440 | 0.422746 | 0.114905 |
| 2 | 1.008408 | NaN      | 0.288288 |
| 3 | 0.890991 | NaN      | NaN      |
| 4 | 0.388707 | 2.163463 | 0.812216 |

[5 rows x 3 columns]

- Enable referencing of Excel columns by their column names ([GH1936](#))

```
In [16]: x1 = pd.ExcelFile('data/test.xls')

In [17]: x1.parse('Sheet1', index_col=0, parse_dates=True,
.....:           parse_cols='A:D')
.....:
Out[17]:
```

|            | A         | B         | C         | D         |
|------------|-----------|-----------|-----------|-----------|
| 2000-01-03 | 0.980269  | 3.685731  | -0.364217 | -1.159738 |
| 2000-01-04 | 1.047916  | -0.041232 | -0.161812 | 0.212549  |
| 2000-01-05 | 0.498581  | 0.731168  | -0.537677 | 1.346270  |
| 2000-01-06 | 1.120202  | 1.567621  | 0.003641  | 0.675253  |
| 2000-01-07 | -0.487094 | 0.571455  | -1.611639 | 0.103469  |
| 2000-01-10 | 0.836649  | 0.246462  | 0.588543  | 1.062782  |
| 2000-01-11 | -0.157161 | 1.340307  | 1.195778  | -1.097007 |

[7 rows x 4 columns]

- Added option to disable pandas-style tick locators and formatters using *series.plot(x\_compat=True)* or *pandas.plot\_params['x\_compat'] = True* ([GH2205](#))
- Existing TimeSeries methods *at\_time* and *between\_time* were added to DataFrame ([GH2149](#))
- DataFrame.dot can now accept ndarrays ([GH2042](#))
- DataFrame.drop now supports non-unique indexes ([GH2101](#))

- `Panel.shift` now supports negative periods ([GH2164](#))
- `DataFrame` now support unary `~` operator ([GH2110](#))

### 39.16.1.2 API changes

- Upsampling data with a `PeriodIndex` will result in a higher frequency `TimeSeries` that spans the original time window

```
In [1]: prng = pd.period_range('2012Q1', periods=2, freq='Q')

In [2]: s = pd.Series(np.random.randn(len(prng)), prng)

In [4]: s.resample('M')
Out[4]:
2012-01    -1.471992
2012-02         NaN
2012-03         NaN
2012-04    -0.493593
2012-05         NaN
2012-06         NaN
Freq: M, dtype: float64
```

- `Period.end_time` now returns the last nanosecond in the time interval ([GH2124](#), [GH2125](#), [GH1764](#))

```
In [18]: p = pd.Period('2012')

In [19]: p.end_time
Out[19]: Timestamp('2012-12-31 23:59:59.999999999')
```

- File parsers no longer coerce to float or bool for columns that have custom converters specified ([GH2184](#))

```
In [20]: import io

In [21]: data = ('A,B,C\n'
.....:         '00001,001,5\n'
.....:         '00002,002,6')
.....:

In [22]: pd.read_csv(io.StringIO(data), converters={'A': lambda x: x.strip()})
Out[22]:
   A  B  C
0 00001 1  5
1 00002 2  6

[2 rows x 3 columns]
```

See the *full release notes* or issue tracker on GitHub for a complete list.

## 39.16.2 v0.9.0 (October 7, 2012)

This is a major release from 0.8.1 and includes several new features and enhancements along with a large number of bug fixes. New features include vectorized unicode encoding/decoding for *Series.str*, *to\_latex* method to *DataFrame*, more flexible parsing of boolean values, and enabling the download of options data from Yahoo! Finance.

### 39.16.2.1 New features

- Add `encode` and `decode` for unicode handling to *vectorized string processing methods* in *Series.str* ([GH1706](#))
- Add *DataFrame.to\_latex* method ([GH1735](#))
- Add convenient expanding window equivalents of all `rolling_* ops` ([GH1785](#))
- Add *Options* class to *pandas.io.data* for fetching options data from Yahoo! Finance ([GH1748](#), [GH1739](#))
- More flexible parsing of boolean values (Yes, No, TRUE, FALSE, etc) ([GH1691](#), [GH1295](#))
- Add `level` parameter to *Series.reset\_index*
- *TimeSeries.between\_time* can now select times across midnight ([GH1871](#))
- *Series* constructor can now handle generator as input ([GH1679](#))
- *DataFrame.dropna* can now take multiple axes (tuple/list) as input ([GH924](#))
- Enable `skip_footer` parameter in *ExcelFile.parse* ([GH1843](#))

### 39.16.2.2 API changes

- The default column names when `header=None` and no columns names passed to functions like `read_csv` has changed to be more Pythonic and amenable to attribute access:

```
In [1]: import io

In [2]: data = ('0,0,1\n'
...:          '1,1,0\n'
...:          '0,1,0')
...:

In [3]: df = pd.read_csv(io.StringIO(data), header=None)
```

(continues on next page)

(continued from previous page)

```
In [4]: df
Out[4]:
   0  1  2
0  0  0  1
1  1  1  0
2  0  1  0

[3 rows x 3 columns]
```

- Creating a Series from another Series, passing an index, will cause reindexing to happen inside rather than treating the Series like an ndarray. Technically improper usages like `Series(df[col1], index=df[col2])` that worked before “by accident” (this was never intended) will lead to all NA Series in some cases. To be perfectly clear:

```
In [5]: s1 = pd.Series([1, 2, 3])

In [6]: s1
Out[6]:
0    1
1    2
2    3
Length: 3, dtype: int64

In [7]: s2 = pd.Series(s1, index=['foo', 'bar', 'baz'])

In [8]: s2
Out[8]:
foo    NaN
bar    NaN
baz    NaN
Length: 3, dtype: float64
```

- Deprecated `day_of_year` API removed from `PeriodIndex`, use `dayofyear` ([GH1723](#))
- Don’t modify NumPy suppress printoption to True at import time
- The internal HDF5 data arrangement for DataFrames has been transposed. Legacy files will still be readable by `HDFStore` ([GH1834](#), [GH1824](#))
- Legacy cruft removed: `pandas.stats.misc.quantileTS`
- Use ISO8601 format for Period repr: monthly, daily, and on down ([GH1776](#))
- Empty DataFrame columns are now created as object dtype. This will prevent a class of TypeErrors that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) ([GH1783](#))
- Setting parts of DataFrame/Panel using ix now aligns input Series/DataFrame ([GH1630](#))
- `first` and `last` methods in GroupBy no longer drop non-numeric columns ([GH1809](#))
- Resolved inconsistencies in specifying custom NA values in text parser. `na_values` of type dict no longer override default NAs unless `keep_default_na` is set to false explicitly ([GH1657](#))
- `DataFrame.dot` will not do data alignment, and also work with Series ([GH1915](#))

See the *full release notes* or issue tracker on GitHub for a complete list.

## 39.17 Version 0.8

### 39.17.1 v0.8.1 (July 22, 2012)

{{ header }}

This release includes a few new features, performance enhancements, and over 30 bug fixes from 0.8.0. New features include notably NA friendly string processing functionality and a series of new plot types and options.

### 39.17.1.1 New features

- Add *vectorized string processing methods* accessible via `Series.str` (GH620)
- Add option to disable adjustment in EWMA (GH1584)
- *Radviz plot* (GH1566)
- *Parallel coordinates plot*
- *Bootstrap plot*
- Per column styles and secondary y-axis plotting (GH1559)
- New datetime converters millisecond plotting (GH1599)
- Add option to disable “sparse” display of hierarchical indexes (GH1538)
- `Series/DataFrame`’s `set_index` method can *append levels* to an existing `Index/MultiIndex` (GH1569, GH1577)

### 39.17.1.2 Performance improvements

- Improved implementation of rolling min and max (thanks to [Bottleneck](#) !)
- Add accelerated 'median' `GroupBy` option (GH1358)
- Significantly improve the performance of parsing ISO8601-format date strings with `DatetimeIndex` or `to_datetime` (GH1571)
- Improve the performance of `GroupBy` on single-key aggregations and use with Categorical types
- Significant datetime parsing performance improvements

### 39.17.1.3 Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Chang She
- Skipper Seabold
- Todd DeLuca +
- Vytutas Jancauskas
- Wes McKinney

## 39.17.2 v0.8.0 (June 29, 2012)

{{ header }}

This is a major release from 0.7.3 and includes extensive work on the time series handling and processing infrastructure as well as a great deal of new functionality throughout the library. It includes over 700 commits from more than 20 distinct authors. Most pandas 0.7.3 and earlier users should not experience any issues upgrading, but due to the migration to the NumPy `datetime64` dtype, there may be a number of bugs and incompatibilities lurking. Lingering incompatibilities will be fixed ASAP in a 0.8.1 release if necessary. See the *full release notes* or issue tracker on GitHub for a complete list.

### 39.17.2.1 Support for non-unique indexes

All objects can now work with non-unique indexes. Data alignment / join operations work according to SQL join semantics (including, if application, index duplication in many-to-many joins)

### 39.17.2.2 NumPy datetime64 dtype and 1.6 dependency

Time series data are now represented using NumPy's datetime64 dtype; thus, pandas 0.8.0 now requires at least NumPy 1.6. It has been tested and verified to work with the development version (1.7+) of NumPy as well which includes some significant user-facing API changes. NumPy 1.6 also has a number of bugs having to do with nanosecond resolution data, so I recommend that you steer clear of NumPy 1.6's datetime64 API functions (though limited as they are) and only interact with this data using the interface that pandas provides.

See the end of the 0.8.0 section for a “porting” guide listing potential issues for users migrating legacy code bases from pandas 0.7 or earlier to 0.8.0.

Bug fixes to the 0.7.x series for legacy NumPy < 1.6 users will be provided as they arise. There will be no more further development in 0.7.x beyond bug fixes.

### 39.17.2.3 Time series changes and improvements

---

**Note:** With this release, legacy scikits.timeseries users should be able to port their code to use pandas.

---

---

**Note:** See *documentation* for overview of pandas timeseries API.

---

- New datetime64 representation **speeds up join operations and data alignment, reduces memory usage**, and improve serialization / deserialization performance significantly over datetime.datetime
- High performance and flexible **resample** method for converting from high-to-low and low-to-high frequency. Supports interpolation, user-defined aggregation functions, and control over how the intervals and result labeling are defined. A suite of high performance Cython/C-based resampling functions (including Open-High-Low-Close) have also been implemented.
- Revamp of *frequency aliases* and support for **frequency shortcuts** like ‘15min’, or ‘1h30min’
- New *DatetimeIndex* class supports both fixed frequency and irregular time series. Replaces now deprecated *DateRange* class
- New *PeriodIndex* and *Period* classes for representing *time spans* and performing **calendar logic**, including the *12 fiscal quarterly frequencies* `<timeseries.quarterly>`. This is a partial port of, and a substantial enhancement to, elements of the scikits.timeseries code base. Support for conversion between *PeriodIndex* and *DatetimeIndex*
- New Timestamp data type subclasses *datetime.datetime*, providing the same interface while enabling working with nanosecond-resolution data. Also provides *easy time zone conversions*.
- Enhanced support for *time zones*. Add `tz_convert` and `tz_localize` methods to *TimeSeries* and *DataFrame*. All timestamps are stored as UTC; Timestamps from *DatetimeIndex* objects with time zone set will be localized to local time. Time zone conversions are therefore essentially free. User needs to know very little about pytz library now; only time zone names as strings are required. Time zone-aware timestamps are equal if and only if their UTC timestamps match. Operations between time zone-aware time series with different time zones will result in a UTC-indexed time series.
- Time series **string indexing conveniences** / shortcuts: slice years, year and month, and index values with strings

- Enhanced time series **plotting**; adaptation of scikits.timeseries matplotlib-based plotting code
- New `date_range`, `bdate_range`, and `period_range` *factory functions*
- Robust **frequency inference** function `infer_freq` and `inferred_freq` property of `DatetimeIndex`, with option to infer frequency on construction of `DatetimeIndex`
- `to_datetime` function efficiently **parses array of strings** to `DatetimeIndex`. `DatetimeIndex` will parse array or list of strings to `datetime64`
- **Optimized** support for `datetime64-dtype` data in `Series` and `DataFrame` columns
- New `NaT` (Not-a-Time) type to represent **NA** in timestamp arrays
- Optimize `Series.asof` for looking up “**as of**” values for arrays of timestamps
- Milli, Micro, Nano date offset objects
- Can index time series with `datetime.time` objects to select all data at particular **time of day** (`TimeSeries.at_time`) or **between two times** (`TimeSeries.between_time`)
- Add `tshift` method for leading/lagging using the frequency (if any) of the index, as opposed to a naive lead/lag using `shift`

#### 39.17.2.4 Other new features

- New `cut` and `qcut` functions (like R’s `cut` function) for computing a categorical variable from a continuous variable by binning values either into value-based (`cut`) or quantile-based (`qcut`) bins
- Rename `Factor` to `Categorical` and add a number of usability features
- Add `limit` argument to `fillna/reindex`
- More flexible multiple function application in `GroupBy`, and can pass list (name, function) tuples to get result in particular order with given names
- Add flexible `replace` method for efficiently substituting values
- Enhanced `read_csv/read_table` for reading time series data and converting multiple columns to dates
- Add `comments` option to parser functions: `read_csv`, etc.
- Add `dayfirst` option to parser functions for parsing international DD/MM/YYYY dates
- Allow the user to specify the CSV reader *dialect* to control quoting etc.
- Handling *thousands* separators in `read_csv` to improve integer parsing.
- Enable unstacking of multiple levels in one shot. Alleviate `pivot_table` bugs (empty columns being introduced)
- Move to klib-based hash tables for indexing; better performance and less memory usage than Python’s `dict`
- Add `first`, `last`, `min`, `max`, and `prod` optimized `GroupBy` functions
- New `ordered_merge` function
- Add flexible `comparison` instance methods `eq`, `ne`, `lt`, `gt`, etc. to `DataFrame`, `Series`
- Improve `scatter_matrix` plotting function and add histogram or kernel density estimates to diagonal
- Add ‘`kde`’ plot option for density plots
- Support for converting `DataFrame` to R `data.frame` through `rpy2`
- Improved support for complex numbers in `Series` and `DataFrame`

- Add *pct\_change* method to all data structures
- Add *max\_colwidth* configuration option for DataFrame console output
- *Interpolate* Series values using index values
- Can select multiple columns from GroupBy
- Add *update* methods to Series/DataFrame for updating values in place
- Add *any* and *all* method to DataFrame

### 39.17.2.5 New plotting methods

`Series.plot` now supports a `secondary_y` option:

```
In [1]: plt.figure()
Out[1]: <Figure size 640x480 with 0 Axes>

In [2]: fx['FR'].plot(style='g')
Out[2]: <matplotlib.axes._subplots.
↳ AxesSubplot at 0x7fd4fb114b70>

In [3]: fx['IT'].plot(style='k--', secondary_y=True)
Out[3]: <matplotlib.axes._subplots.AxesSubplot at 0x7fd4fad0b00>
```

Vytautas Jancauskas, the 2012 GSOC participant, has added many new plot types. For example, 'kde' is a new option:

```
In [4]: s = pd.Series(np.concatenate((np.random.randn(1000),
...:                                np.random.randn(1000) * 0.5 + 3)))

In [5]: plt.figure()
Out[5]: <Figure size 640x480 with 0 Axes>

In [6]: s.hist(density=True, alpha=0.2)
Out[6]: <matplotlib.axes._subplots.
↳ AxesSubplot at 0x7fd4fadf7d30>

In [7]: s.plot(kind='kde')
Out[7]: <matplotlib.axes._subplots.AxesSubplot at 0x7fd4fadf7d30>
```

See the [plotting page](#) for much more.

### 39.17.2.6 Other API changes

- Deprecation of `offset`, `time_rule`, and `timeRule` arguments names in time series functions. Warnings will be printed until pandas 0.9 or 1.0.

### 39.17.2.7 Potential porting issues for pandas <= 0.7.3 users

The major change that may affect you in pandas 0.8.0 is that time series indexes use NumPy's `datetime64` data type instead of `dtype=object` arrays of Python's built-in `datetime.datetime` objects. `DateRange` has been replaced by `DatetimeIndex` but otherwise behaved identically. But, if you have code that converts `DateRange`

or Index objects that used to contain `datetime.datetime` values to plain NumPy arrays, you may have bugs lurking with code using scalar values because you are handing control over to NumPy:

```
In [8]: import datetime

In [9]: rng = pd.date_range('1/1/2000', periods=10)

In [10]: rng[5]
Out[10]: Timestamp('2000-01-06 00:00:00', freq='D')

In [11]: isinstance(rng[5], datetime.datetime)
\\Out[11]: True

In [12]: rng_asarray = np.asarray(rng)

In [13]: scalar_val = rng_asarray[5]

In [14]: type(scalar_val)
Out[14]: numpy.datetime64
```

pandas's `Timestamp` object is a subclass of `datetime.datetime` that has nanosecond support (the nanosecond field store the nanosecond value between 0 and 999). It should substitute directly into any code that used `datetime.datetime` values before. Thus, I recommend not casting `DatetimeIndex` to regular NumPy arrays.

If you have code that requires an array of `datetime.datetime` objects, you have a couple of options. First, the `astype(object)` method of `DatetimeIndex` produces an array of `Timestamp` objects:

```
In [15]: stamp_array = rng.astype(object)

In [16]: stamp_array
Out[16]:
Index([2000-01-01 00:00:00, 2000-01-02 00:00:00, 2000-01-03 00:00:00,
       2000-01-04 00:00:00, 2000-01-05 00:00:00, 2000-01-06 00:00:00,
       2000-01-07 00:00:00, 2000-01-08 00:00:00, 2000-01-09 00:00:00,
       2000-01-10 00:00:00],
      dtype='object')

In [17]: stamp_array[5]
\\Timestamp('2000-01-06 00:00:00', freq='D')
```

To get an array of proper `datetime.datetime` objects, use the `to_pydatetime` method:

```
In [18]: dt_array = rng.to_pydatetime()

In [19]: dt_array
Out[19]:
array([datetime.datetime(2000, 1, 1, 0, 0),
       datetime.datetime(2000, 1, 2, 0, 0),
       datetime.datetime(2000, 1, 3, 0, 0),
       datetime.datetime(2000, 1, 4, 0, 0),
       datetime.datetime(2000, 1, 5, 0, 0),
       datetime.datetime(2000, 1, 6, 0, 0),
       datetime.datetime(2000, 1, 7, 0, 0),
       datetime.datetime(2000, 1, 8, 0, 0),
       datetime.datetime(2000, 1, 9, 0, 0),
       datetime.datetime(2000, 1, 10, 0, 0)], dtype=object)
```

(continues on next page)

(continued from previous page)

```
In [20]: dt_array[5]
//
↳datetime.datetime(2000, 1, 6, 0, 0)
```

matplotlib knows how to handle `datetime.datetime` but not `Timestamp` objects. While I recommend that you plot time series using `TimeSeries.plot`, you can either use `to_pydatetime` or register a converter for the `Timestamp` type. See [matplotlib documentation](#) for more on this.

**Warning:** There are bugs in the user-facing API with the nanosecond `datetime64` unit in NumPy 1.6. In particular, the string version of the array shows garbage values, and conversion to `dtype=object` is similarly broken.

```
In [21]: rng = pd.date_range('1/1/2000', periods=10)

In [22]: rng
Out [22]:
DatetimeIndex(['2000-01-01', '2000-01-02', '2000-01-03', '2000-01-04',
               '2000-01-05', '2000-01-06', '2000-01-07', '2000-01-08',
               '2000-01-09', '2000-01-10'],
              dtype='datetime64[ns]', freq='D')

In [23]: np.asarray(rng)
//
↳
array(['2000-01-01T00:00:00.000000000', '2000-01-02T00:00:00.000000000',
       '2000-01-03T00:00:00.000000000', '2000-01-04T00:00:00.000000000',
       '2000-01-05T00:00:00.000000000', '2000-01-06T00:00:00.000000000',
       '2000-01-07T00:00:00.000000000', '2000-01-08T00:00:00.000000000',
       '2000-01-09T00:00:00.000000000', '2000-01-10T00:00:00.000000000'], dtype=
↳'datetime64[ns]')

In [24]: converted = np.asarray(rng, dtype=object)

In [25]: converted[5]
Out [25]: Timestamp('2000-01-06 00:00:00', freq='D')
```

**Trust me: don't panic.** If you are using NumPy 1.6 and restrict your interaction with `datetime64` values to pandas's API you will be just fine. There is nothing wrong with the data-type (a 64-bit integer internally); all of the important data processing happens in pandas and is heavily tested. I strongly recommend that you **do not work directly with `datetime64` arrays in NumPy 1.6** and only use the pandas API.

**Support for non-unique indexes:** In the latter case, you may have code inside a `try:... catch:` block that failed due to the index not being unique. In many cases it will no longer fail (some method like `append` still check for uniqueness unless disabled). However, all is not lost: you can inspect `index.is_unique` and raise an exception explicitly if it is `False` or go to a different code branch.

### 39.17.2.8 Contributors

## 39.18 Version 0.7

### 39.18.1 v.0.7.3 (April 12, 2012)

{{ header }}

This is a minor release from 0.7.2 and fixes many minor bugs and adds a number of nice new features. There are also a couple of API changes to note; these should not affect very many users, and we are inclined to call them “bug fixes” even though they do constitute a change in behavior. See the *full release notes* or issue tracker on GitHub for a complete list.

### 39.18.1.1 New features

- New *fixed width file reader*, `read_fwf`
- New `scatter_matrix` function for making a scatter plot matrix

```
from pandas.tools.plotting import scatter_matrix
scatter_matrix(df, alpha=0.2)           # noqa F821
```

- Add `stacked` argument to `Series` and `DataFrame`'s `plot` method for *stacked bar plots*.

```
df.plot(kind='bar', stacked=True)      # noqa F821
```

```
df.plot(kind='barh', stacked=True) # noqa F821
```

- Add log x and y *scaling options* to `DataFrame.plot` and `Series.plot`
- Add kurt methods to `Series` and `DataFrame` for computing kurtosis

### 39.18.1.2 NA Boolean Comparison API Change

Reverted some changes to how NA values (represented typically as `NaN` or `None`) are handled in non-numeric `Series`:

```
In [1]: series = pd.Series(['Steve', np.nan, 'Joe'])
In [2]: series == 'Steve'
Out[2]:
0      True
1     False
```

(continues on next page)

(continued from previous page)

```

2    False
Length: 3, dtype: bool

In [3]: series != 'Steve'
Out[3]:
0    False
1     True
2     True
Length: 3, dtype: bool

```

In comparisons, NA / NaN will always come through as `False` except with `!=` which is `True`. *Be very careful* with boolean arithmetic, especially negation, in the presence of NA data. You may wish to add an explicit NA filter into boolean array operations if you are worried about this:

```

In [4]: mask = series == 'Steve'

In [5]: series[mask & series.notnull()]
Out[5]:
0    Steve
Length: 1, dtype: object

```

While propagating NA in comparisons may seem like the right behavior to some users (and you could argue on purely technical grounds that this is the right thing to do), the evaluation was made that propagating NA everywhere, including in numerical arrays, would cause a large amount of problems for users. Thus, a “practicality beats purity” approach was taken. This issue may be revisited at some point in the future.

### 39.18.1.3 Other API Changes

When calling `apply` on a grouped Series, the return value will also be a Series, to be more consistent with the `groupby` behavior with DataFrame:

```

In [6]: df = pd.DataFrame({'A': ['foo', 'bar', 'foo', 'bar',
...:                             'foo', 'bar', 'foo', 'foo'],
...:                      'B': ['one', 'one', 'two', 'three',
...:                             'two', 'two', 'one', 'three'],
...:                      'C': np.random.randn(8), 'D': np.random.randn(8)})

In [7]: df
Out[7]:
   A      B      C      D
0  foo  one  0.138409  0.063859
1  bar  one  0.226778 -0.359946
2  foo  two -1.563284 -0.472185
3  bar three -0.836589  0.452133
4  foo  two -0.023459  2.955107
5  bar  two  0.290357 -1.611526
6  foo  one -0.906076  1.505261
7  foo three -0.323920  0.179236

[8 rows x 4 columns]

In [8]: grouped = df.groupby('A')['C']

In [9]: grouped.describe()

```

(continues on next page)

(continued from previous page)

```

Out [9]:
      count      mean      std      min      25%      50%      75%      max
A
bar      3.0 -0.106485  0.633088 -0.836589 -0.304905  0.226778  0.258568  0.290357
foo      5.0 -0.535666  0.699066 -1.563284 -0.906076 -0.323920 -0.023459  0.138409

[2 rows x 8 columns]

In [10]: grouped.apply(lambda x: x.sort_values()[-2:])      # top 2 values
//////////////////////////////////////////////////
↪
A
bar  1      0.226778
     5      0.290357
foo  4     -0.023459
     0      0.138409
Name: C, Length: 4, dtype: float64

```

### 39.18.1.4 Contributors

A total of 15 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Abraham Flaxman +
- Adam Klein
- Andreas H. +
- Chang She
- Dieter Vandenbussche
- Jacques Kvam +

### 39.18.2 v.0.7.2 (March 16, 2012)

{{ header }}

This release targets bugs in 0.7.1, and adds a few minor features.

### 39.18.2.1 New features

- Add additional tie-breaking methods in `DataFrame.rank` (GH874)
- Add ascending parameter to rank in Series, DataFrame (GH875)
- Add `coerce_float` option to `DataFrame.from_records` (GH893)
- Add `sort_columns` parameter to allow unsorted plots (GH918)
- Enable column access via attributes on `GroupBy` (GH882)
- Can pass dict of values to `DataFrame.fillna` (GH661)
- Can select multiple hierarchical groups by passing list of values in `.ix` (GH134)
- Add `axis` option to `DataFrame.fillna` (GH174)
- Add `level` keyword to `drop` for dropping values from a level (GH159)

### 39.18.2.2 Performance improvements

- Use `khash` for `Series.value_counts`, add `raw` function to `algorithms.py` (GH861)
- Intercept `__builtin__.sum` in `groupby` (GH885)

### 39.18.2.3 Contributors

A total of 12 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Benjamin Gross +
- Dan Birken +
- Dieter Vandenbussche
- Josh +
- Thomas Kluyver
- Travis N. Vaught +
- Wes McKinney
- Wouter Overmeire
- claudiobertoldi +

- joshuaar +

## 39.18.3 v.0.7.1 (February 29, 2012)

{{ header }}

This release includes a few new features and addresses over a dozen bugs in 0.7.0.

### 39.18.3.1 New features

- Add `to_clipboard` function to pandas namespace for writing objects to the system clipboard ([GH774](#))
- Add `itertuples` method to `DataFrame` for iterating through the rows of a dataframe as tuples ([GH818](#))
- Add ability to pass `fill_value` and method to `DataFrame` and `Series` `align` method ([GH806](#), [GH807](#))
- Add `fill_value` option to `reindex`, `align` methods ([GH784](#))
- Enable `concat` to produce `DataFrame` from `Series` ([GH787](#))
- Add `between` method to `Series` ([GH802](#))
- Add HTML representation hook to `DataFrame` for the IPython HTML notebook ([GH773](#))
- Support for reading Excel 2007 XML documents using `openpyxl`

### 39.18.3.2 Performance improvements

- Improve performance and memory usage of `fillna` on `DataFrame`
- Can concatenate a list of `Series` along `axis=1` to obtain a `DataFrame` ([GH787](#))

### 39.18.3.3 Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Brian Granger +
- Chang She
- Dieter Vandenbussche
- Josh Klein
- Steve +
- Wes McKinney
- Wouter Overmeire
- Yaroslav Halchenko

## 39.18.4 v.0.7.0 (February 9, 2012)

{{ header }}

### 39.18.4.1 New features

- New unified *merge function* for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains ([GH220](#), [GH249](#), [GH267](#))
- New *unified concatenation function* for concatenating `Series`, `DataFrame` or `Panel` objects along an axis. Can form union or intersection of the other axes. Improves performance of `Series.append` and `DataFrame.append` ([GH468](#), [GH479](#), [GH273](#))

- Can pass multiple DataFrames to `DataFrame.append` to concatenate (stack) and multiple Series to `Series.append` too
- Can pass list of dicts (e.g., a list of JSON objects) to DataFrame constructor ([GH526](#))
- You can now *set multiple columns* in a DataFrame via `__getitem__`, useful for transformation ([GH342](#))
- Handle differently-indexed output values in `DataFrame.apply` ([GH498](#))

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4))
```

```
In [2]: df.apply(lambda x: x.describe())
```

```
Out[2]:
```

|       | 0         | 1         | 2         | 3         |
|-------|-----------|-----------|-----------|-----------|
| count | 10.000000 | 10.000000 | 10.000000 | 10.000000 |
| mean  | -0.356503 | -0.387573 | 0.237703  | -0.468199 |
| std   | 0.998462  | 0.824360  | 0.801992  | 0.863480  |
| min   | -2.560983 | -2.018922 | -0.938586 | -1.566671 |
| 25%   | -0.700126 | -0.842326 | -0.300167 | -0.994033 |
| 50%   | -0.298671 | -0.482535 | 0.215516  | -0.747353 |
| 75%   | 0.018686  | 0.252450  | 0.656758  | 0.268237  |
| max   | 1.236955  | 0.731919  | 1.818034  | 0.900345  |

```
[8 rows x 4 columns]
```

- Add `reorder_levels` method to Series and DataFrame ([GH534](#))
- Add dict-like `get` function to DataFrame and Panel ([GH521](#))
- Add `DataFrame.iterrows` method for efficiently iterating through the rows of a DataFrame
- Add `DataFrame.to_panel` with code adapted from `LongPanel.to_long`
- Add `reindex_axis` method added to DataFrame
- Add `level` option to binary arithmetic functions on DataFrame and Series
- Add `level` option to the `reindex` and `align` methods on Series and DataFrame for broadcasting values across a level ([GH542](#), [GH552](#), others)
- Add attribute-based item access to Panel and add IPython completion ([GH563](#))
- Add `logy` option to `Series.plot` for log-scaling on the Y axis
- Add `index` and `header` options to `DataFrame.to_string`
- Can pass multiple DataFrames to `DataFrame.join` to join on index ([GH115](#))
- Can pass multiple Panels to `Panel.join` ([GH115](#))
- Added `justify` argument to `DataFrame.to_string` to allow different alignment of column headers
- Add `sort` option to `GroupBy` to allow disabling sorting of the group keys for potential speedups ([GH595](#))
- Can pass `MaskedArray` to Series constructor ([GH563](#))
- Add Panel item access via attributes and IPython completion ([GH554](#))
- Implement `DataFrame.lookup`, fancy-indexing analogue for retrieving values given a sequence of row and column labels ([GH338](#))
- Can pass a *list of functions* to aggregate with `groupby` on a DataFrame, yielding an aggregated result with hierarchical columns ([GH166](#))
- Can call `cummin` and `cummax` on Series and DataFrame to get cumulative minimum and maximum, respectively ([GH647](#))

- `value_range` added as utility function to get min and max of a dataframe ([GH288](#))
- Added `encoding` argument to `read_csv`, `read_table`, `to_csv` and `from_csv` for non-ascii text ([GH717](#))
- *Added* `abs` method to pandas objects
- *Added* `crosstab` function for easily computing frequency tables
- *Added* `isin` method to index objects
- *Added* `level` argument to `xs` method of `DataFrame`.

### 39.18.4.2 API Changes to integer indexing

One of the potentially riskiest API changes in 0.7.0, but also one of the most important, was a complete review of how **integer indexes** are handled with regard to label-based indexing. Here is an example:

```
In [3]: s = pd.Series(np.random.randn(10), index=range(0, 20, 2))
```

In [4]: S

Out [4] :

|    |           |
|----|-----------|
| 0  | -1.576909 |
| 2  | 1.213976  |
| 4  | 0.249242  |
| 6  | 0.858404  |
| 8  | -1.822956 |
| 10 | -0.686706 |
| 12 | 1.064505  |
| 14 | -0.760189 |
| 16 | 0.379973  |
| 18 | 1.423475  |

```
Length: 10, dtype: float64
```

```
In [5]: s[0]
```

$\frac{1}{\sqrt{e}}$

```
In [6]: s[2]
```

1.2139756752197537

```
In [7]: s[4]
```

0.24924248081176129

This is all exactly identical to the behavior before. However, if you ask for a key **not** contained in the Series, in versions 0.6.1 and prior, Series would *fall back* on a location-based lookup. This now raises a `KeyError`:

```
In [2]: s[1]
```

```
KeyError: 1
```

This change also has the same impact on DataFrame:

```
In [3]: df = pd.DataFrame(np.random.randn(8, 4), index=range(0, 16, 2))
```

```
In [4]: df
```

0                      1                      2                      3

(continues on next page)

(continued from previous page)

```

0    0.88427  0.3363 -0.1787  0.03162
2    0.14451 -0.1415  0.2504  0.58374
4   -1.44779 -0.9186 -1.4996  0.27163
6   -0.26598 -2.4184 -0.2658  0.11503
8   -0.58776  0.3144 -0.8566  0.61941
10   0.10940 -0.7175 -1.0108  0.47990
12  -1.16919 -0.3087 -0.6049 -0.43544
14  -0.07337  0.3410  0.0424 -0.16037

```

```

In [5]: df.ix[3]
KeyError: 3

```

In order to support purely integer-based indexing, the following methods have been added:

| Method                                  | Description                                            |
|-----------------------------------------|--------------------------------------------------------|
| <code>Series.iget_value(i)</code>       | Retrieve value stored at location <i>i</i>             |
| <code>Series.iget(i)</code>             | Alias for <code>iget_value</code>                      |
| <code>DataFrame.irow(i)</code>          | Retrieve the <i>i</i> -th row                          |
| <code>DataFrame.icol(j)</code>          | Retrieve the <i>j</i> -th column                       |
| <code>DataFrame.iget_value(i, j)</code> | Retrieve the value at row <i>i</i> and column <i>j</i> |

### 39.18.4.3 API tweaks regarding label-based slicing

Label-based slicing using `ix` now requires that the index be sorted (monotonic) **unless** both the start and endpoint are contained in the index:

```

In [1]: s = pd.Series(np.random.randn(6), index=list('gmkaec'))

In [2]: s
Out[2]:
g   -1.182230
m   -0.276183
k   -0.243550
a    1.628992
e    0.073308
c   -0.539890
dtype: float64

```

Then this is OK:

```

In [3]: s.ix['k':'e']
Out[3]:
k   -0.243550
a    1.628992
e    0.073308
dtype: float64

```

But this is not:

```

In [12]: s.ix['b':'h']
KeyError 'b'

```

If the index had been sorted, the “range selection” would have been possible:

```
In [4]: s2 = s.sort_index()
```

```
In [5]: s2
```

```
Out[5]:
a      1.628992
c     -0.539890
e      0.073308
g     -1.182230
k     -0.243550
m     -0.276183
dtype: float64
```

```
In [6]: s2.ix['b':'h']
```

```
Out[6]:
c     -0.539890
e      0.073308
g     -1.182230
dtype: float64
```

#### 39.18.4.4 Changes to Series [] operator

As as notational convenience, you can pass a sequence of labels or a label slice to a Series when getting and setting values via [] (i.e. the `__getitem__` and `__setitem__` methods). The behavior will be the same as passing similar input to `ix` **except in the case of integer indexing**:

```
In [8]: s = pd.Series(np.random.randn(6), index=list('acegkm'))
```

```
In [9]: s
```

```
Out[9]:
a     -0.790944
c     -1.105145
e      0.204697
g      1.032010
k     -0.907834
m      0.487778
Length: 6, dtype: float64
```

```
In [10]: s[['m', 'a', 'c', 'e']]
```

```

////////////////////////////////////
↪
m      0.487778
a     -0.790944
c     -1.105145
e      0.204697
Length: 4, dtype: float64
```

```
In [11]: s['b':'l']
```

```

////////////////////////////////////
↪
c     -1.105145
e      0.204697
g      1.032010
k     -0.907834
Length: 4, dtype: float64
```

```
In [12]: s['c':'k']
```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////
↪
c    -1.105145
e     0.204697
g     1.032010
k    -0.907834
Length: 4, dtype: float64

```

In the case of integer indexes, the behavior will be exactly as before (shadowing ndarray):

```

In [13]: s = pd.Series(np.random.randn(6), index=range(0, 12, 2))

In [14]: s[[4, 0, 2]]
Out[14]:
4    -0.048214
0     1.016330
2     1.119930
Length: 3, dtype: float64

In [15]: s[1:5]
Out[15]:
↪
2     1.119930
4    -0.048214
6    -0.234294
8    -0.656291
Length: 4, dtype: float64

```

If you wish to do indexing with sequences and slicing on an integer index with label semantics, use `ix`.

### 39.18.4.5 Other API Changes

- The deprecated `LongPanel` class has been completely removed
- If `Series.sort` is called on a column of a `DataFrame`, an exception will now be raised. Before it was possible to accidentally mutate a `DataFrame`'s column by doing `df[col].sort()` instead of the side-effect free method `df[col].order()` ([GH316](#))
- Miscellaneous renames and deprecations which will (harmlessly) raise `FutureWarning`
- `drop` added as an optional parameter to `DataFrame.reset_index` ([GH699](#))

### 39.18.4.6 Performance improvements

- *Cythonized GroupBy aggregations* no longer presort the data, thus achieving a significant speedup ([GH93](#)). `GroupBy` aggregations with Python functions significantly sped up by clever manipulation of the ndarray data type in Cython ([GH496](#)).
- Better error message in `DataFrame` constructor when passed column labels don't match data ([GH497](#))
- Substantially improve performance of multi-`GroupBy` aggregation when a Python function is passed, reuse ndarray object in Cython ([GH496](#))
- Can store objects indexed by tuples and floats in `HDFStore` ([GH492](#))
- Don't print length by default in `Series.to_string`, add `length` option ([GH489](#))
- Improve Cython code for multi-groupby to aggregate without having to sort the data ([GH93](#))

- Improve MultiIndex reindexing speed by storing tuples in the MultiIndex, test for backwards unpickling compatibility
- Improve column reindexing performance by using specialized Cython take function
- Further performance tweaking of Series.\_\_getitem\_\_ for standard use cases
- Avoid Index dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
- Friendlier error message in setup.py if NumPy not installed
- Use common set of NA-handling operations (sum, mean, etc.) in Panel class also ([GH536](#))
- Default name assignment when calling `reset_index` on DataFrame with a regular (non-hierarchical) index ([GH476](#))
- Use Cythonized groupers when possible in Series/DataFrame stat ops with `level` parameter passed ([GH545](#))
- Ported skiplist data structure to C to speed up `rolling_median` by about 5-10x in most typical use cases ([GH374](#))

#### 39.18.4.7 Contributors

A total of 18 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

## 39.19 Version 0.6

### 39.19.1 v.0.6.1 (December 13, 2011)

#### 39.19.1.1 New features

- Can *append single rows* (as Series) to a DataFrame
- Add Spearman and Kendall rank *correlation* options to Series.corr and DataFrame.corr (GH428)
- *Added* get\_value and set\_value methods to Series, DataFrame, and Panel for very low-overhead access (>2x faster in many cases) to scalar elements (GH437, GH438). set\_value is capable of producing an enlarged object.
- Add PyQt table widget to sandbox (GH435)
- DataFrame.align can *accept Series arguments* and an *axis option* (GH461)
- Implement new *SparseArray* and *SparseList* data structures. SparseSeries now derives from SparseArray (GH463)
- *Better console printing options* (GH453)
- Implement fast *data ranking* for Series and DataFrame, fast versions of scipy.stats.rankdata (GH428)
- Implement *DataFrame.from\_items* alternate constructor (GH444)
- DataFrame.convert\_objects method for *inferring better dtypes* for object columns (GH302)
- Add *rolling\_corr\_pairwise* function for computing Panel of correlation matrices (GH189)
- Add *margins* option to *pivot\_table* for computing subgroup aggregates (GH114)
- Add Series.from\_csv function (GH482)
- *Can pass* DataFrame/DataFrame and DataFrame/Series to rolling\_corr/rolling\_cov (GH #462)
- MultiIndex.get\_level\_values can *accept the level name*

#### 39.19.1.2 Performance improvements

- Improve memory usage of *DataFrame.describe* (do not copy data unnecessarily) (PR #425)
- Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
- Fix performance regression in cross-sectional count in DataFrame, affecting DataFrame.dropna speed
- Column deletion in DataFrame copies no data (computes views on blocks) (GH #158)

#### 39.19.1.3 Contributors

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Dieter Vandenbussche
- Fernando Perez +
- Jev Kuznetsov +
- Joon Ro

- Ralph Bean +
- Wes McKinney

## 39.19.2 v.0.6.0 (November 25, 2011)

{{ header }}

### 39.19.2.1 New Features

- *Added* `melt` function to `pandas.core.reshape`
- *Added* `level` parameter to `group by` level in Series and DataFrame descriptive statistics ([GH313](#))
- *Added* `head` and `tail` methods to Series, analogous to to DataFrame ([GH296](#))
- *Added* `Series.isin` function which checks if each value is contained in a passed sequence ([GH289](#))
- *Added* `float_format` option to `Series.to_string`
- *Added* `skip_footer` ([GH291](#)) and `converters` ([GH343](#)) options to `read_csv` and `read_table`
- *Added* `drop_duplicates` and `duplicated` functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively ([GH319](#))
- *Implemented* operators `'&'`, `'|'`, `'^'`, `'-'` on DataFrame ([GH347](#))
- *Added* `Series.mad`, mean absolute deviation
- *Added* `QuarterEnd` `DateOffset` ([GH321](#))
- *Added* `dot` to DataFrame ([GH65](#))
- *Added* `orient` option to `Panel.from_dict` ([GH359](#), [GH301](#))
- *Added* `orient` option to `DataFrame.from_dict`
- *Added* passing list of tuples or list of lists to `DataFrame.from_records` ([GH357](#))
- *Added* multiple levels to `groupby` ([GH103](#))
- *Allow* multiple columns in `by` argument of `DataFrame.sort_index` ([GH92](#), [GH362](#))
- *Added* fast `get_value` and `put_value` methods to DataFrame ([GH360](#))
- *Added* `cov` instance methods to Series and DataFrame ([GH194](#), [GH362](#))
- *Added* `kind='bar'` option to `DataFrame.plot` ([GH348](#))
- *Added* `idxmin` and `idxmax` to Series and DataFrame ([GH286](#))
- *Added* `read_clipboard` function to parse DataFrame from clipboard ([GH300](#))
- *Added* `nunique` function to Series for counting unique elements ([GH297](#))
- *Made* DataFrame constructor use Series name if no columns passed ([GH373](#))
- *Support* regular expressions in `read_table/read_csv` ([GH364](#))
- *Added* `DataFrame.to_html` for writing DataFrame to HTML ([GH387](#))
- *Added* support for `MaskedArray` data in DataFrame, masked values converted to `NaN` ([GH396](#))
- *Added* `DataFrame.boxplot` function ([GH368](#))

- Can pass extra args, kwds to `DataFrame.apply` (GH376)
- Implement `DataFrame.join` with vector on argument (GH312)
- Added legend boolean flag to `DataFrame.plot` (GH324)
- Can pass multiple levels to `stack` and `unstack` (GH370)
- Can pass multiple values columns to `pivot_table` (GH381)
- Use Series name in `GroupBy` for result index (GH363)
- Added `raw` option to `DataFrame.apply` for performance if only need ndarray (GH309)
- Added proper, tested weighted least squares to standard and panel OLS (GH303)

### 39.19.2.2 Performance Enhancements

- VBENCH Cythonized `cache_readonly`, resulting in substantial micro-performance enhancements throughout the code base (GH361)
- VBENCH Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than `np.apply_along_axis` (GH309)
- VBENCH Improved performance of `MultiIndex.from_tuples`
- VBENCH Special Cython matrix iterator for applying arbitrary reduction operations
- VBENCH + DOCUMENT Add `raw` option to `DataFrame.apply` for getting better performance when
- VBENCH Faster cythonized count by level in Series and DataFrame (GH341)
- VBENCH? Significant GroupBy performance enhancement with multiple keys with many “empty” combinations
- VBENCH New Cython vectorized function `map_infer` speeds up `Series.apply` and `Series.map` significantly when passed elementwise Python function, motivated by (GH355)
- VBENCH Significantly improved performance of `Series.order`, which also makes `np.unique` called on a Series faster (GH327)
- VBENCH Vastly improved performance of GroupBy on axes with a MultiIndex (GH299)

### 39.19.2.3 Contributors

A total of 8 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein +
- Chang She +
- Dieter Vandenbussche
- Jeff Hammerbacher +
- Nathan Pinger +
- Thomas Kluyver
- Wes McKinney
- Wouter Overmeire +

## 39.20 Version 0.5

### 39.20.1 v.0.5.0 (October 24, 2011)

{{ header }}

#### 39.20.1.1 New Features

- *Added* `DataFrame.align` method with standard join options
- *Added* `parse_dates` option to `read_csv` and `read_table` methods to optionally try to parse dates in the index columns
- *Added* `nrows`, `chunksize`, and `iterator` arguments to `read_csv` and `read_table`. The last two return a new `TextParser` class capable of lazily iterating through chunks of a flat file ([GH242](#))
- *Added* ability to join on multiple columns in `DataFrame.join` ([GH214](#))
- *Added* private `_get_duplicates` function to `Index` for identifying duplicate values more easily ([ENH5c](#))
- *Added* column attribute access to `DataFrame`.
- *Added* Python tab completion hook for `DataFrame` columns. ([GH233](#), [GH230](#))
- *Implemented* `Series.describe` for `Series` containing objects ([GH241](#))
- *Added* inner join option to `DataFrame.join` when joining on key(s) ([GH248](#))
- *Implemented* selecting `DataFrame` columns by passing a list to `__getitem__` ([GH253](#))
- *Implemented* `&` and `|` to intersect / union `Index` objects, respectively ([GH261](#))
- *Added* `pivot_table` convenience function to pandas namespace ([GH234](#))
- *Implemented* `Panel.rename_axis` function ([GH243](#))
- `DataFrame` will show index level names in console output ([GH334](#))
- *Implemented* `Panel.take`
- *Added* `set_eng_float_format` for alternate `DataFrame` floating point string formatting ([ENH61](#))
- *Added* convenience `set_index` function for creating a `DataFrame` index from its existing columns
- *Implemented* `groupby` hierarchical index level name ([GH223](#))
- *Added* support for different delimiters in `DataFrame.to_csv` ([GH244](#))
- TODO: DOCS ABOUT TAKE METHODS

#### 39.20.1.2 Performance Enhancements

- VBENCH Major performance improvements in file parsing functions `read_csv` and `read_table`
- VBENCH Added Cython function for converting tuples to `ndarray` very fast. Speeds up many `MultiIndex`-related operations
- VBENCH Refactored merging / joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance ([GH211](#))
- VBENCH Improved speed of `DataFrame.xs` on mixed-type `DataFrame` objects by about 5x, regression from 0.3.0 ([GH215](#))

- VBENCH With new `DataFrame.align` method, speeding up binary operations between differently-indexed `DataFrame` objects by 10-25%.
- VBENCH Significantly sped up conversion of nested dict into `DataFrame` ([GH212](#))
- VBENCH Significantly speed up `DataFrame.__repr__` and `count` on large mixed-type `DataFrame` objects

### 39.20.1.3 Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Aman Thakral +
- Luca Beltrame +
- Nick Pentreath +
- Skipper Seabold
- Thomas Kluyver +

## 39.21 Version 0.4

### 39.21.1 v0.4.1 through v0.4.3 (September 25 - October 9, 2011)

{{ header }}

#### 39.21.1.1 New Features

- Added Python 3 support using 2to3 ([GH200](#))
- *Added* `name` attribute to `Series`, now prints as part of `Series.__repr__`
- *Added* instance methods `isnull` and `notnull` to `Series` ([GH209](#), [GH203](#))
- *Added* `Series.align` method for aligning two series with choice of join method ([ENH56](#))
- *Added* method `get_level_values` to `MultiIndex` ([GH188](#))
- Set values in mixed-type `DataFrame` objects via `.ix` indexing attribute ([GH135](#))
- Added new `DataFrame` *methods* `get_dtype_counts` and property `dtypes` ([ENHdc](#))
- Added `ignore_index` option to `DataFrame.append` to stack `DataFrames` ([ENH1b](#))
- `read_csv` tries to *sniff* delimiters using `csv.Sniffer` ([GH146](#))
- `read_csv` can *read* multiple columns into a `MultiIndex`; `DataFrame`’s `to_csv` method writes out a corresponding `MultiIndex` ([GH151](#))
- `DataFrame.rename` has a new `copy` parameter to *rename* a `DataFrame` in place ([ENHed](#))
- *Enable* unstacking by name ([GH142](#))

- *Enable* `sortlevel` to work by level ([GH141](#))

### 39.21.1.2 Performance Enhancements

- Altered binary operations on differently-indexed `SparseSeries` objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks ([GH205](#))
- Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
- Improved performance of `isnull` and `notnull`, a regression from v0.3.0 ([GH187](#))
- Refactored code related to `DataFrame.join` so that intermediate aligned copies of the data in each `DataFrame` argument do not need to be created. Substantial performance increases result ([GH176](#))
- Substantially improved performance of generic `Index.intersection` and `Index.union`
- Implemented `BlockManager.take` resulting in significantly faster `take` performance on mixed-type `DataFrame` objects ([GH104](#))
- Improved performance of `Series.sort_index`
- Significant `groupby` performance enhancement: removed unnecessary integrity checks in `DataFrame` internals that were slowing down slicing operations to retrieve groups
- Optimized `_ensure_index` function resulting in performance savings in type-checking `Index` objects
- Wrote fast time series merging / joining methods in Cython. Will be integrated later into `DataFrame.join` and related functions

### 39.21.1.3 Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Thomas Kluyver +
- Wes McKinney
