
UNIT 9A

Randomness in Computation: Random Number Generators

Course Announcements

- The help hours on Sunday October 21 will be in rooms GHC 4211 and GHC 4215.
- We want your feedback on the course assistants. Please fill out the form at http://goo.gl/wZ8MH.
- Tutoring by our CAs. Visit the calendar at http://goo.gl/0i87D.

Randomness in Computing

- Determinism -- in all algorithms and programs we have seen so far, given an input and a sequence of steps, we get a unique answer. The result is predictable.
- However, some computations need steps that have unpredictable outcomes
  - Games, cryptography, modeling and simulation, selecting samples from large data sets
- We use the word "randomness" for unpredictability, having no pattern

3

Defining Randomness

- Philosophical question
  - Are there any events that are really random?
  - Does randomness represent lack of knowledge of the exact conditions that would lead to a certain outcome?

4

Obtaining Random Sequences

- Definition we adopt: A sequence is random if, for any value in the sequence, the next value in the sequence is totally independent of the current value.
- If we need random values in a computation, how can we obtain them?

Obtaining Random Sequences

- Precomputed random sequences. For example, *A Million Random Digits with 100,00 Normal Deviates (1955)*: A 400 page reference book by the RAND corporation
  - 2500 random digits on each page
  - Generated from random electronic pulses
- True Random Number Generators (TRNG)
  - Extract randomness from physical phenomena such as atmospheric noise, times for radioactive decay
- Pseudo-random Number Generators (PRNG)
  - Use a formula to generate numbers in a deterministic way but the numbers appear to be random

Random numbers in Ruby

- To generate random numbers in Ruby, we can use the **`rand`** function.
- The **`rand`** function take a positive integer argument (n) and returns an integer between 0 and n-1.

```
>> rand(15110)
=> 1239
>> rand(15110)
=> 7320
>> rand(15110)
=> 84
```

Is **`rand`** truly random?

- The function **`rand`** uses some algorithm to determine the next integer to return.
- If we knew what the algorithm was, then the numbers generated would not be truly random.
- We call **`rand`** a pseudo-random number generator (PRNG) since it generates numbers that appear random but are not truly random.

Creating a PRNG

- Consider a pseudo-random number generator **`prng1`** that takes an argument specifying the length of a random number sequence and returns an array with that many "random" numbers.

```
>> prng1(9)
=> [0, 7, 2, 9, 4, 11, 6, 1, 8]
```

- Does this sequence look random to you?

Creating a PRNG

- Let's run **`prng1`** again:

```
>> prng1(15)
=> [0, 7, 2, 9, 4, 11, 6, 1, 8, 3,
    10, 5, 0, 7, 2]
```

- Now does this sequence look random to you?
- What do you think the 16th number in the sequence is?

Another PRNG

- Let's try another PRNG function:

```
=> prng2(15)
>> [0, 8, 4, 0, 8, 4, 0, 8, 4, 0,
    8, 4, 0, 8, 4]
```

- Does this sequence appear random to you?
- What do you think is the 16th number in this sequence?

PRNG Period

- Let's define the PRNG period as the number of values in a pseudo-random number generator sequence before the sequence repeats.

```
[0, 7, 2, 9, 4, 11, 6, 1, 8, 3,
 10, 5, 0, 7, 2]
```

period = 12

next number = (last number + 7) mod 12

```
[0, 8, 4, 0, 8, 4, 0, 8, 4, 0,
 8, 4, 0, 8, 4]
```

period = 3

next number = (last number + 8) mod 12

Looking at **prng1**

```
def prng1(n)
  seq = [0]          ; seed (starting value)
  for i in 1..n-1 do
     seq << (seq.last + 7) % 12
  end
  return seq
end

>> prng1(15)
=> [0, 7, 2, 9, 4, 11, 6, 1, 8, 3,
      10, 5, 0, 7, 2]
```

Looking at **prng2**

```
def prng2(n)
  seq = [0]          ; seed (starting value)
  for i in 1..n-1 do
     seq << (seq.last + 8) % 12
  end
  return seq
end

>> prng2(15)
=> [0, 8, 4, 0, 8, 4, 0, 8, 4, 0,
    8, 4, 0, 8, 4]
```

Linear Congruential Generator (LCG)

- A more general version of the PRNG used in these examples is called a linear congruential generator.
- Given the current value x_i of PRNG using the linear congruential generator method, we can compute the next value in the sequence, x_{i+1}, using the formula
  $x_{i+1} = (a\ x_i + c)$ modulo m where a, c, and m are pre-determined constants.
  - **`prng1`**: a = 1, c = 7, m = 12
  - **`prng2`**: a = 1, c = 8, m = 12

Picking the constants a, c, m

- If we choose a large value for m, and appropriate values for a and c that work with this m, then we can generate a very long sequence before numbers begin to repeat.
  - Ideally, we could generate a sequence with a maximum period of m.

Picking the constants a, c, m

- The LCG will have a period of m for all seed values if and only if:
  - c and m are *relatively prime* (i.e. the only positive integer that divides both c and m is 1)
  - a-1 is divisible by all prime factors of m
  - if m is a multiple of 4 , then a-1 is also a multiple of 4
- Example: prng1 (a = 1, c = 7, m = 12)
  - Factors of c: 1, 7 Factors of m: 1, 2, 3, 4, 6, 12
  - 0 is divisible by all prime factors of 12 → true
  - if 12 is a multiple of 4 , then 0 is also a multiple of 4 → true

Example

$x_{i+1} = (a\ x_i + c)$ modulo m

$x_0 = 4$ a = 5 c = 3 m = 8

- Compute x_1, x_2, ..., for this LCG formula.
- What is the period of this formula?
  - If the period is maximum, does it satisfy the three properties for maximal LCM?

LCMs in the Real World

- glibc (used by the c compiler gcc):
  a =1103515245, c = 12345, m = 2^{32}
- *Numerical Recipes* (popular book on numerical methods and analysis):
  a = 1664525, c= 1013904223, m = 2^{32}
- Random class in Java:
  a = 25214903917, c = 11, m = 2^{48}
- The PRNG built into Ruby has a period of 2^{19937}.

Using RubyLabs for Random Numbers

```
>> include RandomLab
=> Object
>> p = PRNG.new(1, 7, 12)
=> #<RandomLab::PRNG a: 1 c: 7 m: 12>
>> p.seed(0)
=> 0
>> p.advance
=> 7
>> p.advance
=> 2
>> p.state
=> 2
```

A seed is a number used to initialize a pseudorandom number generator. Its choice is critical in some applications.

Visualizing the Output of a PRNG

```
>> include RandomLab
=> Object
>> p = PRNG.new(5, 3, 8)
=> #<RandomLab::PRNG a: 5 c: 3 m: 8>
>> p.seed(Time.now.to_i)
=> Returns the integer representation of current time
>> view_numberline(8)
=> Creates a window with a number line for values 0 to 7
>> 8.times {j = p.advance; tick_mark(j)}
=> For 8 times, advances to the next pseudo random number
in sequence and marks it on the numberline
```

Every number less than 8 seems to be generated exactly once in a period of 8.

Rest of the Week

- Uses of PRNG in games
- Cellular automata and psedorandomness
