INSTRUCTIONS

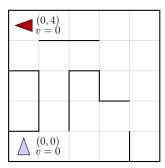

- Due: Thursday, 11 September 2025 at 10:00 PM ET. Remember that you may use up to 2 slip days for the Written Homework making the last day to submit Saturday, 13 September 2025 at 10:00 PM ET.
- Format: Write your answers in the yoursolution.tex file and latex a pdf (preferred) or you can type directly on the blank pdf. Make sure that your answers are within the dedicated regions for each question/part. If you do not follow this format, we may deduct points. You may use digital tools (e.g., an iPad) to handwrite your solutions, but make sure they are legible. We reserve the right to take points off if we can't read your solution.
- Images: To insert pictures, we recommend drawing it on PowerPoint or Google Drawings, saving it as an image and including it in your latex source.
- How to submit: Submit a pdf with your answers on Gradescope. Log in and click on our class 15-281 and click on the submission titled HW2 and upload your pdf containing your answers. Make sure each question's bounding box on Gradescope is properly aligned to your response in the pdf.
- Generative AI: As per course policy, you may use generative AI tools to better learn course content, but they may not be used to generate any part of your assignment submission. Their purpose is to assist learning, not replace it.
- Policy: See the course website for homework policies and Academic Integrity.

Q1. [23 pts] Search and Heuristics

Imagine a car-like agent wishes to exit a maze like the one shown above. The agent is directional and at all times faces some direction $d \in (N, S, E, W)$. With a single action, the agent can either move forward at an adjustable velocity v or turn.

The moving actions are faster, maintain and slower. For these actions, the agent then moves a number of squares equal to its **new** adjusted velocity. Let v denote the agent's current velocity and let v' denote the agent's new adjusted velocity.

• Faster: v' = v + 1• Slower: v' = v - 1• Maintain: v' = v

The turning actions are *left* and *right*, which change the agent's direction by 90 degrees. **Turning is only permitted** when the velocity is zero. Turning leaves the speed at zero.

- Left: change the agent's direction by 90 degrees counterclockwise
- Right: change the agent's direction by 90 degrees clockwise

For example, if the agent is currently on (0, 0) facing north with velocity 0 (as pictured) and wants to get to (2, 0) facing east with velocity 0, the sequence of actions will be: right, faster, maintain, slower.

Illegal actions include

- Any action that would result in a collision with a wall (i.e. there is a wall between the current position and the position you would be in if you took said action)
- Any action that would reduce v below 0 (slowing when v=0) or above a maximum speed V_{max}
- Maintaining a velocity of 0
- Turning when velocity $\neq 0$

The agent's goal is to find a plan which parks it (v = 0) in the goal direction on the exit square using as few actions (time steps) as possible. Note that the cost of a path is defined by the number of actions the agent takes.

(a) [3 pts] Suppose the agent wants to take the leftmost path (i.e., the one that passes through (1,2)) from the start (0,0) facing north to the goal (0,4) facing west. Write down the **shortest** sequence of actions for it to take.

Actions:

	If not, draw an example state (x, y, orientation, velocity) where this heuristic overestimates at that state, and specify: 1) the heuristic value at that state and 2) the actual cost from that state to the goal. You do not necessarily have to use the example grid above. Make sure to label your drawing, including the
	goal state (location, orientation, speed) and action sequence, and fit it into the solution box.
	Yes No
	Example State, Heuristic Value, Actual Cost:
(f)	[3 pts] Is the following heuristic admissible? Manhattan distance / V_{max} .
	If yes, state why. If not, draw an example state (x, y, orientation, velocity) where this heuristic overestimates at that state, and specify: 1) the heuristic value at that state and 2) the actual cost from that state to the goal.
	You do not necessarily have to use the example grid above. Make sure to label your drawing, including the
	goal state (location, orientation, speed) and action sequence, and fit it into the solution box. (Yes No
	Example State, Heuristic Value, Actual Cost:
(g)	[1 pt] If we used an inadmissible heuristic in A* Tree search, could it change the completeness of the search? Assume the graph is finite and the heuristic is non-negative. Yes No
(h)	[1 pt] If we used an inadmissible heuristic in A^* Tree search, could it change the optimality of the search? Assume the graph is finite and the heuristic is non-negative. Output Description:

(e) [3 pts] Is the Manhattan distance from the agent's location to the exit's location admissible?

(i)	[3 pts] Which of the following may be a good reason to use an inadmissible heuristic over an admissible one? Select all that apply. An inadmissible heuristic may be easier to compute, leading to a faster state heuristic computation time.
	☐ An inadmissible heuristic can be a closer estimate to the actual cost (even if it's an overestimate) than an admissible heuristic, thus exploring fewer nodes.
	☐ An inadmissible heuristic will still find optimal paths when the actual costs are non-negative.
	☐ An inadmissible heuristic may be used to completely block off searching part of a graph in a search algorithm.

Q2. [15 pts] Search Nodes

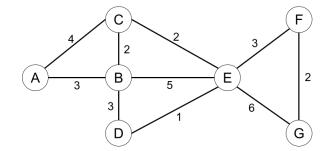

Consider the tree search (i.e. no explored set) of an arbitrary search problem with max branching factor b. Each search node n has a backward (cumulative) cost of g(n), an admissible heuristic of h(n), and a depth of d(n). Let n_c be a minimum-cost goal node, and let n_s be a shallowest goal node.

For each of the following, give an expression that characterizes the set of nodes that are explored before the search terminates. For instance, if we asked for the set of nodes with positive heuristic value, you could say: for all n, such that $h(n) \ge 0$. Don't worry about ties (so you won't need to worry about > versus \ge). If there are no nodes for which the expression is true, you must write "none."

Note that you are not required to use all the functions given, f, g, and h, in your inequality.

	Inequality: All n, such that:
(b)	[5 pts] Give an inequality in terms of the functions g , h , and d , as well as the nodes n_c and n_s defined abto describe the nodes n that are explored in a uniform cost search before terminating.
	Inequality: All n, such that:
(c)	[5 pts] Now for this question, assume the heuristic h is consistent. Give an inequality in terms of the function g , h , and d , as well as the nodes n_c and n_s defined above to describe the nodes n that are explored in an exearch before terminating.
	Inequality: All n, such that:

Q3. [22 pts] Searching a Graph

Node	h_1	h_2
A	12	11
В	6	7
С	9	6
D	3	4
E	3	5
F	2	1
G	0	0

Consider the graph shown above. A is the start state and G is the goal state. The costs for each edge are shown on the graph. The graph is bi-directional so each edge can be traversed from either direction. Please refer to the search algorithms **exactly as presented on the lecture slides** as the ordering of the actions matters.

(a) [12 pts] For each of the following **graph search** strategies, mark with an X which (if any) of the listed paths it could return. Note that for some search strategies the specific path returned might depend on tie-breaking behavior. In any such cases, make sure to mark **all** paths that could be returned under some tie-breaking scheme. If a graph search strategy returns a path not listed, **write out the correct path** in the *Other* column.

(d) [3 pts] Is h_2 admissible? Is it consistent?

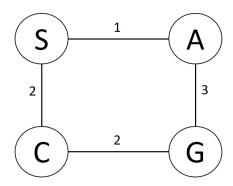

Admissible: Yes No
Consistent: Yes No

Q4. [23 pts] Search: Multiple Choice and Short Answer Questions

(a) [18 pts] Consider the following true/false questions with each question worth 2 points. For the following search problems, assume every action has a cost of at least ϵ , with $\epsilon > 0$. Assume any heuristics used are consistent.

Depth-first tree-search on a finite graph is guaranteed to be complete. True False
Breadth-first tree-search on a finite graph is guaranteed to be complete. True False
Iterative deepening tree-search on a finite graph is guaranteed to be complete. True False
For all graphs without cycles, graph-search contains a larger frontier than tree-search. True False
Iterative deepening graph-search has the time complexity of BFS and the space complexity of DFS. True False
If $h_1(s)$ is a consistent heuristic and $h_2(s)$ is a consistent heuristic, then $\min(h_1(s), h_2(s))$ must be consistent

(b) [5 pts] Consider the state space graph shown below. S is the start state and G is the goal state. The costs for each edge are shown on the graph. For the following table below, fill in potential heuristic values such that the heuristic is admissible but not consistent.

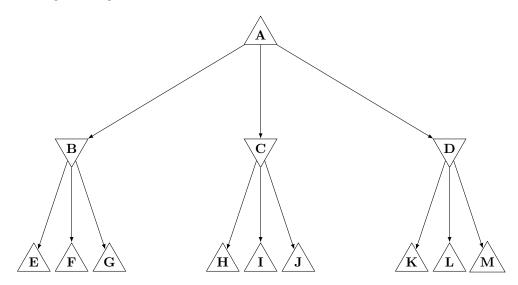

False

True

Heuristic Function

Q5. [11 pts] Alpha-Beta Pruning with Iterative Deepening

Evaluation	Function 1
State, s	f(s)
B	4
C	14
D	19
E	5
F	7
G	8
H	17
I	16
J	15
K	23
L	20
M	26

Iterative deepening may be combined with pruning in game trees to increase the pruning and speed up the search. To see how this works, we are going to prune the above fragment of a tree using the following steps:

- 1. Select the order of the min-node children, B, C, D, based on the values of the evaluation function of those states, f(B), f(C), f(D). Specifically, using the evaluation function of the children (not the grandchildren), order the children from best to worst evaluation function value, from the perspective of the parent node.
- 2. Prune the (sub-)tree using the resulting order and limiting the depth to the grandchildren(E/F/G/...), using the evaluation function on the grandchildren as their value.
- (a) [3 pts] What would the resulting order of the subtrees be?

B	then	C	then	D

()	C h	en D	then	\boldsymbol{E}
\ /	0 011		ULICII	

() D then C then B

(b) [4 pts] Prune the tree with this new ordering of the child subtrees. (Grandchildren are still visited left to right.) Write in the box below the nodes that would *NOT* be visited because of pruning. **Note:** It might be helpful to sketch a new version of tree with the child subtrees reordered.

Nodes:		

Iterative deepening would then repeat steps (a) and (b) one level deeper, but skipping any subtrees that were pruned.

(c) [4 pts] When alpha-beta pruning is applied to a minimax tree, it is guaranteed to return the same move that standard minimax without pruning would return. This is because it prunes away branches that cannot possibly influence the final decision.

Is this iterative deepening with pruning method also guaranteed to return the same move as standard minimax on the complete tree? Briefly explain your reasoning.

O Yes	O No

Explain:			

Q6. [6 pts] Ethics

- (a) [6 pts] Please review this article: This Navigation App Keeps You Out of High-crime Areas in Real Time, https://www.androidauthority.com/redzone-navigation-app-avoids-high-crime-areas-686894/.
 - (i) [2 pts] Let's assume this navigation app uses A* search with an admissible and consistent heuristic to find and return paths. Suppose you are working on this app, and your boss proposes a new heuristic. There is some crime rate metric that ranges from 0 to 5, where 5 is high crime. Your boss proposes that you add this crime rate metric to the application's current heuristic, such that the heuristic is still admissible and consistent.

Will the path **necessarily** change with the new heuristic? If so, will the new path be optimal? If not, under what conditions would the path change?

	under what conditions would the path change?
	Answer:
(ii)	[2 pts] If for some reason you choose not to adjust the heuristic, what is one way you could modify the graph structure or edge costs so that your implementation could return paths that avoid high crime areas Give your answer in one sentence.
	Answer:
iii)	[2 pts] In what ways could people and stores residing in high crime neighborhoods be impacted by change in navigation algorithms, particularly focusing on the economic and/or societal impact? Please provide 2-3 sentences.
	Answer:
