

# New families of self-dual codes

Lin Sok\*

## Abstract

In the recent paper entitled “Explicit constructions of MDS self-dual codes” accepted in IEEE Transactions on Information Theory, doi: 10.1109/TIT.2019.2954877, the author has constructed families of MDS self-dual codes from genus zero algebraic geometry (AG) codes, where the AG codes of length  $n$  were defined using two divisors  $G$  and  $D = P_1 + \dots + P_n$ . In the present correspondence, we explore more families of optimal self-dual codes from AG codes. New families of MDS self-dual codes with odd characteristics and those of almost MDS self-dual codes are constructed explicitly from genus zero and genus one curves, respectively. More families of self-dual codes are constructed from algebraic curves of higher genus.

**Keywords:** Self-orthogonal codes, self-dual codes, MDS codes, almost MDS codes, optimal codes, algebraic curves, algebraic geometry codes, differential algebraic geometry codes

## 1 Introduction

Self-dual codes are one of the most interesting classes of linear codes that find diverse applications in cryptographic protocols (secret sharing schemes) introduced in [4, 5, 18] and combinatorics [17]. It is well-known that binary self-dual codes are asymptotically good [16].

MDS codes form an optimal family of classical codes. They are closely related to combinatorial designs [17, p. 328], and finite geometries [17, p.

326]. Due to their largest error correcting capability for given length and dimension, MDS codes are of great interest in both theory and practice. The most well-known family of MDS linear codes is that of Reed-Solomon codes. MDS linear codes exist in a very restrict condition on their lengths as the famous MDS conjecture states: for every linear  $[n, k, n - k + 1]$  MDS code over  $\mathbb{F}_q$ , if  $1 < k < q$ , then  $n \leq q + 1$ , except when  $q$  is even and  $k = 3$  or  $k = q - 1$ , in which cases  $n \leq q + 2$ . The conjecture was proved by Ball [1] for  $q$  a prime. However, for self-dual case, the conjecture may not be true.

Due to the reasons mentioned above, MDS self-dual codes have been of much interest to many researchers. As we have already known that determining the parameters of a given linear code is a challenging problem in coding theory. However, the parameters of an MDS self-dual code are completely determined by its length. Constructions of MDS self-dual codes are valuable. For classical constructions of MDS self-dual codes, we refer to [2, 8, 14, 11]. Existing families of MDS self-dual codes can be described as follows. Grassl *et al.* [10] constructed MDS codes of all lengths over  $\mathbb{F}_{2^m}$  and of all highest possible length over finite fields of odd characteristics. Jin *et al.* [13] proved the existence of MDS self-dual codes over  $\mathbb{F}_q$  in odd characteristic for  $q \equiv 1 \pmod{4}$  and for  $q$  a square of a prime for some restricted lengths. Using the same technique developed in [13], more families of MDS self-dual codes have been constructed in [24, 7]. Tong *et al.* [23] gave constructions of MDS Euclidean self-dual codes through cyclic duadic codes. The families of known MDS self-dual codes are summarized in Table 1.

The discovery of algebraic geometry codes in 1981 was due to Goppa [9], where they were also called geometric Goppa codes. Goppa showed in his paper [9] how to construct linear codes from algebraic curves over a finite field. Despite a strongly theoretical construction, algebraic geometry (AG) codes have asymptotically good parameters, and it was the first time that linear codes improved the so-called Gilbert-Vasharmov bound. Self-dual AG codes were studied by Stichtenoth [20] and Driencourt *et al.* [6], where they first characterized such codes. However, the construction of MDS self-dual AG codes with odd characteristics or almost MDS self-dual AG codes was not considered there.

On the contrary to the MDS case, almost MDS codes exist more frequently, and it is thus worth exploring families of self-dual codes in such a case and those of optimal self-dual codes. In [20], Stichtenoth gave constructions of self-orthogonal AG codes (and self-dual AG codes for some special cases) but did not consider an embedding the self-orthogonal codes into the

Table 1: Existing families of MDS self-dual codes,  $\eta$ : the quadratic character of  $\mathbb{F}_q$

$q$	$n$	References

$q = p^m, m = 2m_0$	$n = (t+1)n_0 + 2, n_0 = p^{m_0} - 1, n_0 \equiv 2 \pmod{4}, 0 < t \leq \frac{n_0}{2}$	
$q = p^m, q$ a square	$n = (t+1)n_0 + 2, n_0 = \frac{q-1}{p^r+1}$ even, $1 \leq r < m, \frac{n_0(p^r+1)}{2(p^r-1)}$ odd, $t$ odd, $1 \leq t \leq p^r$	
$q = p^m, q$ a square	$n = (t+1)n_0 + 2, n_0 = \frac{q-1}{p^r+1}$ even, $1 \leq r < m, \frac{n_0(p^r+1)}{2(p^r-1)}$ even, $1 \leq t \leq p^r$	
$q = p^m, q$ a square	$n = (t+1)n_0 + 2, n_0 = \frac{q-1}{p^r-1}$ even, $1 \leq r < m, r \frac{m}{2}, 1 \leq t \leq p^r - 2$	

self-dual ones.

In this paper, we will discover more families of optimal self-dual codes from algebraic curves over finite fields. Optimal self-dual codes are constructed from rational points on the curves and embedding their orthogonal subcodes. We improve the construction [19] and other known constructions over  $\mathbb{F}_q$  with  $q$  a prime (see Theorem 2) and also give explicit constructions of the cosets of  $\mathbb{F}_q$  with desired properties (see Lemma 10 and Lemma 11). Due to Lemma 6 and Lemma 7, new classes of self-dual codes with prescribed minimum distance are constructed. Additionally, we construct MDS self-dual codes with new parameters  $[24, 12, 13]_{37}$ ,  $[32, 16, 17]_{41}$ ,  $[26, 13, 14]_{61}$ ,  $[42, 21, 22]_{61}$ ,  $[50, 25, 26]_{73}$ ,  $[24, 12, 13]_{81}$ , almost MDS self-dual codes with new parameters  $[16, 8, 8]_9$ ,  $[16, 8, 8]_{16}$ ,  $[18, 9, 9]_{16}$ ,  $[20, 10, 10]_{16}$ ,  $[22, 11, 11]_{16}$ ,  $[24, 12, 12]_{16}$  and optimal self-dual codes with new parameters  $[28, 14, 12]_9$ ,  $[26, 13, 12]_{16}$ ,  $[28, 14, 13]_{16}$ ,  $[30, 15, 14]_{16}$ ,  $[32, 16, 15]_{16}$ .

The paper is organized as follows: Section 2 gives preliminaries and background on algebraic geometry codes. Section 3 provides explicit constructions of self-dual codes from various algebraic curves. New families of self-dual codes are presented as well some numerical examples are also given. We end up with concluding remark in Section 4.

## 2 Preliminaries

Let  $\mathbb{F}_q$  be the finite field with  $q$  elements. A linear code of length  $n$  and dimension  $k$  over  $\mathbb{F}_q$ , denoted as  $q$ -ary  $[n, k]$  code, is a  $k$ -dimensional subspace of  $\mathbb{F}_q^n$ . The (Hamming) weight  $\text{wt}(\mathbf{x})$  of a vector  $\mathbf{x} = (x_1, \dots, x_n)$  is the number of nonzero coordinates in it. The *minimum distance* (or *minimum weight*)  $d(C)$  of  $C$  is  $d(C) := \min\{\text{wt}(\mathbf{x}) \mid \mathbf{x} \in C, \mathbf{x} \neq \mathbf{0}\}$ . The parameters of an  $[n, k]$  code with minimum distance  $d$  are written  $[n, k, d]$ . If  $C$  is an  $[n, k, d]$  code, then from the Singleton bound, its minimum distance is bounded above by

$$d \leq n - k + 1.$$

A code meeting the above bound is called *Maximum Distance Separable* (MDS). A code is called *almost* MDS if its minimum distance is one unit less than the MDS case. A code is called *optimal* if it has the highest possible minimum distance for its length and dimension. The *Euclidean inner product* of  $\mathbf{x} = (x_1, \dots, x_n)$  and  $\mathbf{y} = (y_1, \dots, y_n)$  in  $\mathbb{F}_q^n$  is  $\mathbf{x} \cdot \mathbf{y} = \sum_{i=1}^n x_i y_i$ . The *dual* of  $C$ , denoted by  $C^\perp$ , is the set of vectors orthogonal to every

codeword of  $C$  under the Euclidean inner product. A linear code  $C$  is called *self-orthogonal* if  $C \subset C^\perp$  and *self-dual* if  $C = C^\perp$ . It is well-known that a self-dual code can only exist for even lengths.

We refer to Stichtenoth [21] for undefined terms related to algebraic function fields.

Let  $\mathcal{X}$  be a smooth projective curve of genus  $g$  over  $\mathbb{F}_q$ . The field of rational functions of  $\mathcal{X}$  is denoted by  $\mathbb{F}_q(\mathcal{X})$ . Function fields of algebraic curves over a finite field can be characterized as finite separable extensions of  $\mathbb{F}_q(x)$ . We identify points on the curve  $\mathcal{X}$  with places of the function field  $\mathbb{F}_q(\mathcal{X})$ . A point on  $\mathcal{X}$  is called rational if all of its coordinates belong to  $\mathbb{F}_q$ . Rational points can be identified with places of degree one. We denote the set of  $\mathbb{F}_q$ -rational points of  $\mathcal{X}$  by  $\mathcal{X}(\mathbb{F}_q)$ .

A divisor  $G$  on the curve  $\mathcal{X}$  is a formal sum  $\sum_{P \in \mathcal{X}} n_P P$  with only finitely many nonzeros  $n_P \in \mathbb{Z}$ . The support of  $G$  is defined as  $\text{supp}(G) := \{P | n_P \neq 0\}$ . The degree of  $G$  is defined by  $\deg(G) := \sum_{P \in \mathcal{X}} n_P \deg(P)$ . For two divisors  $G = \sum_{P \in \mathcal{X}} n_P P$  and  $H = \sum_{P \in \mathcal{X}} m_P P$ , we say that  $G \geq H$  if  $n_P \geq m_P$  for all places  $P \in \mathcal{X}$ .

It is well-known that a nonzero polynomial  $f(x) \in \mathbb{F}_q(x)$  can be factorized into irreducible factors as  $f(x) = \alpha \prod_{i=1}^s p_i(x)^{e_i}$ , with  $\alpha \in \mathbb{F}_q^*$ . Moreover, any irreducible polynomial  $p_i(x)$  corresponds to a place, say  $P_i$ . We define the valuation of  $f$  at  $P_i$  as  $v_{P_i}(f) := t$  if  $p_i(x)^t | f(x)$  but  $p_i(x)^{(t+1)} \nmid f(x)$ .

For a nonzero rational function  $f$  on the curve  $\mathcal{X}$ , we define the ‘‘principal’’ divisor of  $f$  as

$$(f) := \sum_{P \in \mathcal{X}} v_P(f) P.$$

If  $Z(f)$  and  $N(f)$  denotes the set of zeros and poles of  $f$  respectively, we define the zero divisor and pole divisor of  $f$ , respectively by

$$(f)_0 := \sum_{P \in Z(f)} v_P(f) P,$$

$$(f)_\infty := \sum_{P \in N(f)} -v_P(f) P.$$

Then  $(f) = (f)_0 - (f)_\infty$ , and it is well-known that the principal divisor  $f$  has degree 0.

We say that two divisors  $G$  and  $H$  on the curve  $\mathcal{X}$  are equivalent if  $G = H + (z)$  for some rational function  $z \in \mathbb{F}_q(\mathcal{X})$ .

For a divisor  $G$  on the curve  $\mathcal{X}$ , we define

$$\mathcal{L}(G) := \{f \in \mathbb{F}_q(\mathcal{X}) \setminus \{0\} \mid (f) + G \geq 0\} \cup \{0\},$$

and

$$\Omega(G) := \{\omega \in \Omega \setminus \{0\} \mid (\omega) - G \geq 0\} \cup \{0\},$$

where  $\Omega := \{f dx \mid f \in \mathbb{F}_q(\mathcal{X})\}$ , the set of differential forms on  $\mathcal{X}$ . It is well-known that, for a differential form  $\omega$  on  $\mathcal{X}$ , there exists a unique a rational function  $f$  on  $\mathcal{X}$  such that

$$\omega = f dt,$$

where  $t$  is a local uniformizing parameters. In this case, we define the divisor associated to  $\omega$  by

$$(\omega) = \sum_{P \in \mathcal{X}} v_P(\omega) P,$$

where  $v_P(\omega) := v_P(f)$ .

Through out the paper, we let  $D = P_1 + \cdots + P_n$ , called the rational divisor, where  $(P_i)_{1 \leq i \leq n}$  are places of degree one, and  $G$  a divisor with  $\text{supp}(D) \cap \text{supp}(G) = \emptyset$ . Define the algebraic geometry code by

$$C_{\mathcal{L}}(D, G) := \{(f(P_1), \dots, f(P_n)) \mid f \in \mathcal{L}(G)\},$$

and the differential algebraic geometry code as

$$C_{\Omega}(D, G) := \{(\text{Res}_{P_1}(\omega), \dots, \text{Res}_{P_n}(\omega)) \mid \omega \in \Omega(G - D)\},$$

where  $\text{Res}_P(\omega)$  denotes the residue of  $\omega$  at point  $P$ .

The parameters of an algebraic geometry code  $C_{\mathcal{L}}(D, G)$  is given as follows.

**Theorem 1.** [21, Corollary 2.2.3] *Assume that  $2g - 2 < \deg(G) < n$ . Then the code  $C_{\mathcal{L}}(D, G)$  has parameters  $[n, k, d]$  satisfying*

$$k = \deg(G) - g + 1 \text{ and } d \geq n - \deg(G). \quad (1)$$

The dual of the algebraic geometry code  $C_{\mathcal{L}}(D, G)$  can be described as follows.

**Lemma 1.** [21, Theorem 2.2.8] *With above notation, the two codes  $C_{\mathcal{L}}(D, G)$  and  $C_{\Omega}(D, G)$  are dual to each other.*

Moreover, the differential code  $C_\Omega(D, G)$  is determined as follows.

**Lemma 2.** [21, Proposition 2.2.10] *With the above notation, assume that there exists a differential form  $\omega$  satisfying*

1.  $v_{P_i}(\omega) = -1, 1 \leq i \leq n$  and
2.  $\text{Res}_{P_i}(\omega) = \text{Res}_{P_j}(\omega)$  for  $1 \leq i \leq n$ .

*Then  $C_\Omega(D, G) = a \cdot C_{\mathcal{L}}(D, D - G + (\omega))$  for some  $a \in (\mathbb{F}_q^*)^n$ .*

### 3 Self-dual algebraic geometry codes

In this section, we will construct self-dual codes from algebraic geometry codes. Self-dual codes can be constructed directly from Lemma 3 or from their self-orthogonal subcodes by extending the basis of the existing codes.

**Lemma 3.** [20, Corollary 3.4] *With the above notation, assume that there exists a differential form  $\omega$  satisfying*

1.  $v_{P_i}(\omega) = -1, 1 \leq i \leq n$  and
2.  $\text{Res}_{P_i}(\omega) = \text{Res}_{P_j}(\omega) = a_i^2, 1 \leq i \leq n$ , for some  $a_i \in \mathbb{F}_q^*$ .

*Then the following statements hold.*

1. *If  $2G \leq D + (\omega)$ , then there exists a divisor  $G'$  such that  $C_{\mathcal{L}}(D, G) \sim C_{\mathcal{L}}(D, G')$ , and  $C_{\mathcal{L}}(D, G')$  is self-orthogonal.*
2. *If  $2G = D + (\omega)$ , then there exists a divisor  $G'$  such that  $C_{\mathcal{L}}(D, G) \sim C_{\mathcal{L}}(D, G')$ , and  $C_{\mathcal{L}}(D, G')$  is self-dual.*

The existence of self-dual algebraic geometry codes can be given as follows.

**Proposition 1.** [22, Corollary 3.1.49, p.292] *With the above notation, assume that  $N = |\mathcal{X}(\mathbb{F}_q)| > 2g$ . Then there exists a self-dual code with parameters  $[n, \frac{n}{2}, \geq \frac{n}{2} - g + 1]$  over  $\mathbb{F}_q$  for some  $n$  even such that  $n \geq N - 2g - 1$ .*

The following lemma will be applied many times for constructing a  $q$ -ary self-dual code of length  $n$  (if it exists for such a length).

**Lemma 4.** *Let  $n$  be an odd positive integer and  $C$  a  $q$ -ary self-orthogonal code with parameters  $[n, \frac{n-1}{2}]$ . Then there exists a self-orthogonal code  $C_0$  with parameters  $[n+1, \frac{n-1}{2}]$  and a self-dual code  $C'_0$  with parameters  $[n+1, \frac{n+1}{2}]$  such that  $C_0 \subset C'_0 \subset C_0^\perp$ .*

*Proof.* Let  $G$  be the generator matrix of  $C$  and  $C_0$  be a self-orthogonal code obtained from  $C$  by lengthening one zero coordinate. Clearly, the code  $C_0$  has parameters  $[n+1, \frac{n-1}{2}]$ , and  $C_0^\perp$  has parameters  $[n+1, \frac{n+1}{2} + 1]$ . Denote  $G_0$  the generator matrix of  $C_0$ , that is,

$$G_0 = \begin{pmatrix} & 0 \\ G & \vdots \\ & 0 \end{pmatrix}.$$

Let  $\mathbf{x}$  be a nonzero element in the quotient space  $C_0^\perp/C_0$  such that  $\mathbf{x} \cdot \mathbf{x} = 0$ . Then the code  $C'_0$  with its following generator matrix  $G'_0$  is self-dual with parameters  $[n+1, \frac{n+1}{2}]$ :

$$G'_0 = \left( \begin{array}{c} 0 \\ G \\ \vdots \\ 0 \\ \hline \mathbf{x} \end{array} \right).$$

Moreover, we have the following inclusion

$$C_0 \subset C'_0 \subset C_0^\perp.$$

□

Similarly, we have the following embedding.

**Lemma 5.** *Let  $n$  be an even positive integer and  $C$  a  $q$ -ary self-orthogonal code with parameters  $[n, \frac{n}{2} - 1]$ . Then there exists a self-dual code  $C'$  (if it exists for such a length) with parameters  $[n, \frac{n}{2}]$  such that  $C \subset C' \subset C^\perp$ .*

**Lemma 6.** *Let  $\mathcal{X}$  be a smooth projective curve having genus  $g$ . Let  $n$  be an odd positive integer and  $D = P_1 + \cdots + P_n$  be a divisor on  $\mathcal{X}$ . Assume that there exists a differential form  $\omega$  satisfying*

1.  $v_{P_i}(\omega) = -1$ , for  $i = 1, \dots, n$  and

2.  $\text{Res}_{P_i}(\omega) = \text{Res}_{P_j}(\omega) = a_i^2$  with  $a_i \in \mathbb{F}_q^*$  for  $1 \leq i, j \leq n$ .

If  $G = \frac{(2g-3+n)}{2}P_\infty$  with  $\text{supp}(G) \cap \text{supp}(D) = \emptyset$ , then there exists a self-orthogonal code  $C_{\mathcal{L}}(D, G)$  with parameters  $[n, \frac{n-1}{2}, \frac{n+3}{2} - g]$ . Moreover, the code  $C_{\mathcal{L}}(D, G)$  can be embedded into a self-dual  $[n+1, \frac{n+1}{2}, \geq \frac{n+1}{2} - g]$  code  $C'$  (if a self-dual code exists for such a length  $n$ ).

*Proof.* Choose  $U$  as a subset of  $\mathbb{F}_q$  with its size  $|U| = n$  so that  $\omega = \frac{dx}{h}$ , where  $h(x) = \prod_{\alpha \in U} (x - \alpha)$ , satisfying the above two conditions. Then the divisor  $(\omega) = (2g - 2 + n)P_\infty - D$ , and thus  $2G \leq (\omega) + D$ . From Lemma 3 and Theorem 1, there exists a self-orthogonal code  $C_{\mathcal{L}}(D, G)$  with parameters  $[n, \frac{n-1}{2}, \geq \frac{n+3}{2} - g]$ . The second assertion follows from Lemma 4. First note that

$$\begin{aligned} C_{\mathcal{L}}(D, G)^\perp &= a \cdot C_{\mathcal{L}}(D, D - G + (\omega)) \quad (\text{from Lemma 2}) \\ &= a \cdot C_{\mathcal{L}}\left(D, \frac{(2g-1+n)}{2}P_\infty\right) \end{aligned} \quad (2)$$

We now calculate the lower bound on the minimum distance of the dual code.

$$\begin{aligned} d(C_{\mathcal{L}}(D, G)^\perp) &\geq n - \frac{(2g-1+n)}{2} \quad (\text{due to (2) and Theorem 1}) \\ &= \frac{n+1}{2} - g. \end{aligned}$$

The minimum distance of  $C'$  follows from the fact that  $C' \subset C_{\mathcal{L}}^\perp(D, G)$ , and this completes the proof.  $\square$

**Lemma 7.** *Let  $\mathcal{X}$  be a smooth projective curve having genus  $g$ . Let  $n$  be an even positive integer and  $D = P_1 + \dots + P_n$  be a divisor on  $\mathcal{X}$ . Assume that there exists a differential form  $\omega$  satisfying*

1.  $v_{P_i}(\omega) = -1$ , for  $i = 1, \dots, n$  and
2.  $\text{Res}_{P_i}(\omega) = \text{Res}_{P_j}(\omega) = a_i^2$  with  $a_i \in \mathbb{F}_q^*$  for  $1 \leq i, j \leq n$ .

If  $G = \frac{(2g-2+n)}{2}P_\infty$  with  $\text{supp}(G) \cap \text{supp}(D) = \emptyset$ , then there exists a self-orthogonal code  $C_{\mathcal{L}}(D, G)$  with parameters  $[n, \frac{n}{2}, \frac{n}{2} + 1 - g]$ .

*Proof.* The result follows from the same reasoning as that in Lemma 6.  $\square$

### 3.1 Self-dual codes from projective lines

In this subsection, we will discover new families of MDS self-dual codes based on the work from [19]. In what follows, we let for  $a \in \mathbb{F}_q$ ,  $\eta(a) := 1$  if  $a$  is a square in  $\mathbb{F}_q$ , and  $\eta(a) := -1$  if  $a$  is not a square in  $\mathbb{F}_q$ .

The following two lemmas [19] will be used to construct self-dual codes of genus zero.

**Lemma 8.** [19, Lemma 6] *For  $G = sP_\infty$  with  $s \leq \lfloor \frac{n-2}{2} \rfloor$ , if  $(h'(P_i))_{1 \leq i \leq n}$  are squares in  $\mathbb{F}_q^*$ , then  $C_{\mathcal{L}}(D, G - (1/\sqrt{h'}))$  is an MDS self-orthogonal code.*

The following lemma is useful for constructing a self-dual code from its self-orthogonal subcode.

**Lemma 9.** [19, Lemma 7] *Let  $q \equiv 1 \pmod{4}$ . Assume that  $G = (k-1)P_\infty$ ,  $n = 2k+1$ , and  $(h'(P_i))_{1 \leq i \leq n}$  are squares in  $\mathbb{F}_q^*$ . Then the  $q$ -ary self-orthogonal code  $C_{\mathcal{L}}(D, G - (1/\sqrt{h'}))$  with parameters  $[n, k]$  can be embedded into a  $q$ -ary MDS self-dual  $[n+1, k+1]$  code.*

Now, we construct MDS self-dual codes from Lemma 8 and Lemma 9.

**Theorem 2.** *Let  $q = p^m$  be an odd prime power. If  $\eta(-1) = \eta(n) = 1$ ,  $n|(q-1)$  and  $n$  even, then there exists an  $[2n+2, n+1, n+2]$  self-dual code over  $\mathbb{F}_q$ .*

*Proof.* Let  $U_n = \{\alpha \in \mathbb{F}_q^* | \alpha^n = 1\}$ . Let  $\beta_1 \in \mathbb{F}_q^*$  such that  $\beta_1^n - 1$  is a nonzero square in  $\mathbb{F}_q$ . Put  $U = U_n \cup \beta_1 U_n \cup \{0\}$ , and write

$$h(x) = \prod_{\beta \in U} (x - \beta).$$

Then we have that

$$h'(x) = ((n+1)x^n - 1)(x^n - \beta_1^n) + nx^n(x^n - 1).$$

Consider the following quadratic equation

$$a^2 + b^2 = 1. \tag{3}$$

For any  $q$ , (3) has  $T = (q-1) - 4$  solutions, say  $(a_1, \pm b_1), \dots, (a_{\frac{T}{2}}, \pm b_{\frac{T}{2}})$ , with  $(a_i, b_i) \neq (0, \pm 1), (\pm 1, 0)$ . Take  $\beta_1 = \sqrt[n]{a_i^2}$  for some  $1 \leq i \leq t$ , ( $t < \frac{T}{2}$ ). Then we get  $1 - \beta_1^n = 1 - a_i^2 = b_i^2$  which are squares in  $\mathbb{F}_q^*$ .

We have that  $-1, n$  are squares in  $\mathbb{F}_q$ . Moreover, since  $\beta_1^n$  and  $(\beta_1^n - 1)$  are squares in  $\mathbb{F}_q^*$ , it implies that  $h'(\beta)$  is a square in  $\mathbb{F}_q^*$  for any  $\beta \in U$ . Now, the fact that all the roots of  $h(x)$  are simple gives rise to a self-orthogonal code with parameters  $[2n + 1, n, n + 2]$ . Thus, by Lemma 9, it can be embedded into a  $q$ -ary self-dual code with parameters  $[2n + 2, n + 1, n + 2]$ .  $\square$

**Example 1.** *We construct MDS self-dual codes with new parameters as follows.*

1. *Taking  $q = 37, n = 12$ , we obtain a self-dual code over  $\mathbb{F}_{37}$  with parameters  $[26, 13, 14]$ .*
2. *Taking  $q = 61, n = 12, 20$  we obtain self-dual code over  $\mathbb{F}_{61}$  with parameters  $[26, 13, 14], [42, 21, 22]$ , respectively.*
3. *Taking  $q = 73, n = 24$ , we obtain a self-dual code over  $\mathbb{F}_{73}$  with parameters  $[50, 25, 26]$ .*

**Remark 1.** *In the proof of Theorem 2, we have found many values of  $\beta_i$  such that  $1 - \beta_i^n$  is a square. Furthermore, if there exist  $\beta_1$  and  $\beta_2$  such that  $\beta_1^n - \beta_2^n$  is again a square, then we can construct an MDS self-dual code of length  $3n + 2$  over  $\mathbb{F}_q$ . For example, taking  $q = 41, n = 10$  and considering two non-zero multiplicative cosets of  $U_n$  yields a self-dual code over  $\mathbb{F}_{41}$  with parameters  $[32, 16, 17]$ . The generator matrix of the self-dual code over  $\mathbb{F}_{41}$  is given as follows.*

$$I_{16} \begin{pmatrix} 20 & 15 & 20 & 11 & 6 & 11 & 22 & 10 & 39 & 15 & 5 & 9 & 20 & 31 & 33 & 40 \\ 37 & 5 & 11 & 12 & 3 & 15 & 4 & 10 & 37 & 18 & 35 & 8 & 3 & 26 & 32 & 8 \\ 12 & 29 & 9 & 14 & 13 & 11 & 8 & 30 & 16 & 20 & 17 & 22 & 3 & 9 & 13 & 10 \\ 2 & 17 & 11 & 25 & 14 & 3 & 1 & 27 & 38 & 5 & 1 & 15 & 36 & 2 & 1 & 21 \\ 27 & 21 & 21 & 13 & 20 & 7 & 36 & 15 & 29 & 30 & 25 & 20 & 1 & 11 & 2 & 32 \\ 39 & 7 & 2 & 1 & 26 & 25 & 5 & 38 & 38 & 13 & 33 & 20 & 17 & 15 & 7 & 36 \\ 40 & 39 & 34 & 15 & 18 & 12 & 6 & 28 & 25 & 10 & 21 & 23 & 8 & 35 & 26 & 26 \\ 30 & 36 & 28 & 2 & 1 & 11 & 12 & 28 & 2 & 27 & 34 & 35 & 4 & 4 & 20 & 2 \\ 22 & 18 & 5 & 24 & 5 & 40 & 23 & 9 & 34 & 40 & 12 & 34 & 9 & 34 & 33 & 31 \\ 20 & 13 & 9 & 12 & 31 & 35 & 37 & 33 & 26 & 37 & 23 & 39 & 29 & 18 & 25 & 19 \\ 11 & 19 & 18 & 16 & 38 & 40 & 2 & 29 & 8 & 30 & 30 & 10 & 12 & 2 & 20 & 30 \\ 34 & 13 & 10 & 13 & 18 & 28 & 19 & 14 & 28 & 31 & 4 & 34 & 24 & 9 & 31 & 35 \\ 24 & 31 & 21 & 40 & 12 & 23 & 25 & 4 & 17 & 27 & 13 & 4 & 31 & 40 & 23 & 30 \\ 40 & 31 & 36 & 35 & 28 & 38 & 21 & 31 & 14 & 20 & 16 & 36 & 20 & 37 & 34 & 21 \\ 9 & 10 & 23 & 11 & 36 & 23 & 30 & 9 & 16 & 22 & 27 & 32 & 37 & 26 & 39 & 26 \\ 36 & 4 & 32 & 32 & 4 & 4 & 10 & 14 & 12 & 14 & 20 & 30 & 29 & 34 & 8 & 21 \end{pmatrix}.$$

The two following lemmas play the key role in determining whether the difference of two special elements in  $\mathbb{F}_q$  is a square or not and also in determining the number of cosets of a multiplicate subgroup of  $\mathbb{F}_q^*$ .

**Lemma 10.** Let  $q = p^m$  with  $p$  an odd prime,  $n = \frac{q-1}{p^r+1}$  and for  $\alpha_i, \alpha_j \in \mathbb{F}_q$  with  $\alpha_i \neq \alpha_j$ , denote  $\alpha_{ij} = \alpha_i^n - \alpha_j^n$ . Then for  $\omega$  a primitive element of  $\mathbb{F}_q$ , we have the following equality:

$$\alpha_{ij} = \frac{\omega^{\frac{n(p^r+1)}{2(p^r-1)}}}{\alpha_i \alpha_j}. \quad (4)$$

*Proof.* Raising  $\alpha_{ij}$  to the power  $p^r - 1$ , we get

$$\begin{aligned} \alpha_{ij}^{p^r-1} &= \frac{(\alpha_i^n - \alpha_j^n)^{p^r}}{\alpha_i^n - \alpha_j^n} = \frac{(\alpha_i^{np^r} - \alpha_j^{np^r})}{\alpha_i^n - \alpha_j^n} \\ &= \frac{(\alpha_i^{q-1-n} - \alpha_j^{q-1-n})}{\alpha_i^n - \alpha_j^n} = \frac{\frac{1}{\alpha_i^n} - \frac{1}{\alpha_j^n}}{\alpha_i^n - \alpha_j^n} \\ &= \frac{\omega^{\frac{n(p^r+1)}{2}}}{\alpha_i^n \alpha_j^n}, \end{aligned}$$

where the last equality come from the fact that  $\omega^{\frac{q-1}{2}} = -1$ .

By taking the  $(p^r - 1)$ -th root, the result follows.  $\square$

**Lemma 11.** Let  $q = p^m$  with  $p$  an odd prime,  $r|m$ ,  $n = \frac{q-1}{p^r-1}$  and for  $\alpha_i, \alpha_j \in \mathbb{F}_q$  with  $\alpha_i \neq \alpha_j$ , denote  $\alpha_{ij} = \alpha_i^n - \alpha_j^n$ . Then for  $\omega$  a primitive element of  $\mathbb{F}_q$ , we have the following:

$$\alpha_{ij} \in \mathbb{F}_{p^r}. \quad (5)$$

*Proof.* Raising  $\alpha_{ij}$  to the power  $p^r$ , we get

$$\alpha_{ij}^{p^r} = (\alpha_i^{np^r} - \alpha_j^{np^r}) = (\alpha_i^{q-1+n} - \alpha_j^{q-1+n}) = \alpha_i^n - \alpha_j^n = \alpha_{ij}.$$

Thus the result follows.  $\square$

**Theorem 3.** Let  $q = p^m$  be an odd square and  $n$  even. Put  $s = (t+1)n$ .

1. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is even, then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r+1}$ , for  $1 \leq t \leq p^r$ .
2. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is odd, then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r+1}$ , for  $t$  odd and  $1 \leq t \leq p^r$ .
3. There exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r-1}$ ,  $r|\frac{m}{2}$ , for  $1 \leq t \leq p^r - 2$ .

*Proof.* Let  $U_n$  be a multiplicative subgroup of  $\mathbb{F}_q^*$  of order  $n$ , say  $U_n = \{u_1, \dots, u_n\}$ . Let  $\alpha_1 U_n, \dots, \alpha_t U_n$  be  $t$  nonzero cosets of  $U_n$ , where  $(\alpha_i)_{1 \leq i \leq t}$  will be determined later. Put  $U = U_n \cup \left( \bigcup_{i=1}^t \alpha_i U_n \right)$ , and write

$$h(x) = \prod_{\alpha \in U} (x - \alpha).$$

Clearly, all the roots of  $h(x)$  are simple. The derivative of  $h(x)$  is given by

$$h'(x) = nx^{n-1} \prod_{i=1}^t (x^n - \alpha_i^n) + nx^{n-1} (x^n - 1) \left( \sum_{i=1}^t \prod_{j=1, j \neq i}^t (x^n - \alpha_j^n) \right).$$

For  $1 \leq j \leq t, 1 \leq s \leq n$ , we have

$$\begin{aligned} h'(u_s) &= nu_s^{n-1} (\alpha_j^n - 1) \prod_{i=1, i \neq j}^t (1 - \alpha_i^n), \\ h'(\alpha_j u_s) &= n(\alpha_j u_s)^{n-1} (\alpha_j^n - 1) \prod_{i=1, i \neq j}^t (\alpha_j^n - \alpha_i^n). \end{aligned}$$

For  $1 \leq i, j \leq t$  and  $n = \frac{q-1}{p^r+1}$ , we have from (4)

$$\alpha_{ij} = \alpha_i^n - \alpha_j^n = \frac{\omega^{\frac{n(p^r+1)}{2(p^r-1)}}}{\alpha_i \alpha_j},$$

where  $\omega$  is a primitive element of  $\mathbb{F}_q$ .

Fixing  $j$  and taking all the product of  $\alpha_{ij}$  for  $1 \leq i \leq t, i \neq j$ , we get that

$$\prod_{i=1, i \neq j}^t (\alpha_j^n - \alpha_i^n) = \prod_{i=1, i \neq j}^n \frac{\omega^{\frac{n(p^r+1)}{2(p^r-1)}}}{\alpha_i \alpha_j}.$$

Obviously,  $n$  and  $(u_s)_{1 \leq s \leq n}$  are squares in  $\mathbb{F}_q$  for  $q$  a square. Now, the squareness of  $h'(u_s)$  and  $h'(\alpha_j u_s)$  depend on the parity of  $T = \frac{n(p^r+1)}{2(p^r-1)}$ .

If  $T$  is even, then  $\alpha_i$  is chosen to be a square element in  $\mathbb{F}_q$ , and thus  $(1 - \alpha_i^n)$  and  $(\alpha_j^n - \alpha_i^n)$  are square elements in  $\mathbb{F}_q$  due to (4) of Lemma 10.

If  $T$  is odd, then  $\alpha_i$  is chosen to be a non-square element in  $\mathbb{F}_q$ , and thus  $(1 - \alpha_i^n)$  and  $(\alpha_j^n - \alpha_i^n)$  are again square elements in  $\mathbb{F}_q$  due to (4).

In conclusion, we have

1. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is even, then  $h'(u_s)$  and  $h'(\alpha_j u_s)$  are squares in  $\mathbb{F}_q^*$  for  $1 \leq s \leq n$  and  $1 \leq j \leq t$  with  $t \in \{1, \dots, p^r\}$ .
2. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is odd, then  $h'(u_s)$  and  $h'(\alpha_j u_s)$  are squares in  $\mathbb{F}_q^*$  for  $1 \leq s \leq n$  and  $1 \leq j \leq t$  with  $t$  odd and  $t \in \{1, \dots, p^r\}$ .

For  $1 \leq i, j \leq t$  and  $n = \frac{q-1}{p^r-1}$ , from (5) in Lemma 11, we get that  $\alpha_{ij} = \alpha_i^n - \alpha_j^n \in \mathbb{F}_{p^r}$ , and hence it is a square if  $r | \frac{m}{2}$ . We have shown that  $h'(\alpha)$  is a nonzero square in  $\mathbb{F}_q$  for any  $\alpha \in U$ , and thus the constructed code is self-dual by Lemma 8.  $\square$

**Example 2.** Taking  $q = 9^2$ ,  $n = \frac{9^2-1}{9+1} = 8$ ,  $t = 2$ , we get an MDS self-dual with parameters  $[24, 12, 13]$ . These parameters are new. The generator matrix of the code is given as follows.

$$I_{12} \begin{pmatrix} w^{48} & w^{20} & w^{72} & w^{77} & w^{19} & w^{16} & w^{44} & w^{10} & w^{37} & w^{76} & w^{47} & w^{56} \\ w^{20} & w^{26} & w^{73} & w^{56} & 2 & w^{26} & w^{60} & w^{55} & w^{65} & w^{47} & w^{41} & w^{47} \\ w^{32} & w^{33} & w^{34} & w^{14} & w^{54} & w^2 & w^7 & w^{26} & w^{65} & w^{75} & w^{47} & w^{76} \\ w^{37} & w^{16} & w^{14} & w^{16} & w^{53} & w^{59} & w^{53} & w^{43} & w^8 & w^{25} & w^{25} & w^{77} \\ w^{19} & 2 & w^{14} & w^{13} & w^4 & w^5 & w^{57} & w^9 & w^{43} & w^{66} & w^{15} & w^{50} \\ w^{16} & w^{26} & w^{42} & w^{19} & w^5 & 2 & w^9 & w^{17} & w^{13} & w^7 & w^{60} & w^{44} \\ w^4 & w^{20} & w^7 & w^{53} & w^{17} & w^{49} & 2 & w^{45} & w^{19} & w^2 & w^{26} & w^{16} \\ w^{10} & w^{55} & w^{66} & w^3 & w^9 & w^{17} & w^5 & w^{44} & w^{13} & w^{54} & 2 & w^{19} \\ w^{37} & w^{65} & w^{25} & w^{48} & w^{43} & w^{13} & w^{59} & w^{13} & w^{16} & w^{54} & w^{16} & w^{37} \\ w^{36} & w^7 & w^{75} & w^{25} & w^{26} & w^{47} & w^2 & w^{14} & w^{14} & w^{74} & w^{33} & w^{32} \\ w^{47} & w^{41} & w^7 & w^{65} & w^{15} & w^{60} & w^{66} & 2 & w^{16} & w^{73} & w^{66} & w^{60} \\ w^{56} & w^{47} & w^{36} & w^{37} & w^{50} & w^{44} & w^{56} & w^{19} & w^{37} & w^{72} & w^{60} & w^8 \end{pmatrix}.$$

**Theorem 4.** Let  $q$  be an odd prime power with  $q \equiv 1 \pmod{4}$ ,  $1 \leq r < m, r | \frac{m}{2}$  and  $n$  even with  $\eta(n) = 1$ . Put  $s = (t+1)n$ .

1. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is odd, then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r+1}$ , for  $t$  odd and  $1 \leq t \leq p^r$ .
2. If  $\frac{n(p^r+1)}{2(p^r-1)}$  is even, then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r+1}$ , for  $1 \leq t \leq p^r$ .
3. There exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[s, \frac{s}{2}, \frac{s}{2} + 1]$ , with  $n = \frac{q-1}{p^r-1}$ ,  $r | \frac{m}{2}$ , for  $1 \leq t \leq p^r - 2$ .

*Proof.* The proof follows from that of Theorem 3.  $\square$

Table 2: Numbers of rational points of elliptic curves

Elliptic curve $\mathcal{E}_{1,b,c}$	$m$	$\#\mathcal{E}_{1,b,c}(\mathbb{F}_{2^m})$

### 3.2 Self-dual codes from elliptic curves and hyper-elliptic curves

In this subsection, we will consider elliptic curves and hyper-elliptic curves over  $\mathbb{F}_q$ ,  $q$  even.

First, we will consider elliptic curves in Weierstrass form to construct self-dual codes. Let  $q = p^m$  and an elliptic curve defined by the equation

$$\mathcal{E}_{a,b,c} : y^2 + ay = x^3 + bx + c, \quad (6)$$

where  $a, b, c \in \mathbb{F}_q$ . Let  $S$  be the set of  $x$ -components of the affine points of  $\mathcal{E}_{a,b,c}$  over  $\mathbb{F}_q$ , that is,

$$S_{a,b,c} := \{\alpha \in \mathbb{F}_q \mid \exists \beta \in \mathbb{F}_q \text{ such that } \beta^2 + a\beta = \alpha^2 + b\alpha + c\}. \quad (7)$$

For  $q = 2^m$ , any  $\alpha \in S_{1,b,c}$  gives exactly two points with  $x$ -component  $\alpha$ , and we denote these two points corresponding to  $\alpha$  by  $P_\alpha^{(1)}$  and  $P_\alpha^{(2)}$ . Then the set of all rational points of  $\mathcal{E}_{1,b,c}$  over  $\mathbb{F}_q$  is  $\{P_\alpha^{(1)} \mid \alpha \in S_{1,b,c}\} \cup \{P_\alpha^{(2)} \mid \alpha \in S_{1,b,c}\} \cup \{P_\infty\}$ . The numbers of rational points of elliptic curves  $\mathcal{E}$  over  $\mathbb{F}_q$  are given in Table 2.

**Lemma 12** (Hilbert's Theorem 90). *Let  $q = p^m$ . The equation  $y^p - y = k$  has solutions over  $\mathbb{F}_q$  if and only if  $Tr_{\mathbb{F}_q/\mathbb{F}_p}(k) = 0$ .*

**Lemma 13.** *Let  $q_0 = 2^m$ ,  $m \geq 2$  and  $q = q_0^2$ . If  $\alpha$  is an element in  $\mathbb{F}_{q_0}$ , then  $\text{Tr}_{\mathbb{F}_q/\mathbb{F}_2}(\alpha) = 0$ , and  $\text{Tr}_{\mathbb{F}_q/\mathbb{F}_2}(\alpha + \alpha^3) = 0$ .*

*Proof.* For any  $\alpha \in \mathbb{F}_{q_0}$ , we have

$$\begin{aligned} \text{Tr}_{\mathbb{F}_q/\mathbb{F}_2}(\alpha) &= \text{Tr}_{\mathbb{F}_{q_0}/\mathbb{F}_2}(\text{Tr}_{\mathbb{F}_q/\mathbb{F}_{q_0}}(\alpha)) \\ &= \text{Tr}_{\mathbb{F}_{q_0}/\mathbb{F}_2}(\alpha + \alpha^{q_0}) \\ &= \text{Tr}_{\mathbb{F}_{q_0}/\mathbb{F}_2}(\alpha) + \text{Tr}_{\mathbb{F}_{q_0}/\mathbb{F}_2}(\alpha^{q_0}) \\ &= 0, \end{aligned}$$

where the first and second equality come from the properties of the trace function and the last one from the fact that  $\alpha \in \mathbb{F}_{q_0}$ . Since  $\mathbb{F}_{q_0}^*$  is a multiplicative group, the second part follows.  $\square$

**Proposition 2.** *Let  $q_0 = 2^m$  and  $q = q_0^2$ . Then there exists a  $[2q_0, q_0, d \geq q_0]$  self-dual code over  $\mathbb{F}_q$ .*

*Proof.* Consider the elliptic curve defined by

$$\mathcal{E}_{1,1,0} : y^2 + y = x^3 + x.$$

From Lemma 13, we get that  $\mathbb{F}_{q_0}$  is a subset of  $S_{1,1,0}$ . Put  $U = \mathbb{F}_{q_0}$  and  $h(x) = \prod_{\alpha \in U} (x - \alpha)$ . Then the residue  $\text{Res}_{P_\alpha}(\omega) = \frac{1}{h'(P_\alpha)}$  is a square for any  $\alpha \in U$ , and by Lemma 3, the constructed code  $a \cdot C_{\mathcal{L}}(D, G)$  is self-dual, where  $a_i^2 = \text{Res}_{P_i}(\omega)$ .  $\square$

**Theorem 5.** *Let  $q = 2^m$  and  $U = \{\alpha \in \mathbb{F}_q \mid \text{Tr}(\alpha^3 + \alpha) = 0\}$ . Then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[2n, n, d \geq n]$  for  $1 \leq n \leq |U|$ .*

*Proof.* Let  $U$  be defined as in the theorem. Put

$$h(x) = \prod_{\alpha \in U} (x - \alpha).$$

Since any element in  $\mathbb{F}_q$  ( $q$  even) is a square in  $\mathbb{F}_q$ , we conclude that  $h'(\alpha)$  is a nonzero square in  $\mathbb{F}_q$  for any  $\alpha \in U$ .

Consider the elliptic curve defined by

$$\mathcal{E}_{1,1,0} : y^2 + y = x^3 + x.$$

From Lemma 12, we get that  $U$  is a subset of  $S_{1,1,0}$ . Put

$$D = \sum_{\alpha \in U_0 \subset U} (P_\alpha^{(1)} + P_\alpha^{(2)}) = P_1 + \cdots + P_s, s = 2|U_0|, G = \frac{s}{2}P_\infty, \omega = \frac{dx}{h}.$$

Then the residue  $\text{Res}_{P_\alpha}(\omega) = \frac{1}{h'(P_\alpha)}$  is a square for any  $\alpha \in U_0$ , and by Lemma 3, the constructed code  $a \cdot C_{\mathcal{L}}(D, G)$  is self-dual, where  $a_i^2 = \text{Res}_{P_i}(\omega)$ .  $\square$

**Example 3.** *The elliptic curve*

$$\mathcal{E}_{1,1,0}: y^2 + y = x^3 + x,$$

has rational points in the set  $\{P_\infty = (1 : 0 : 0), (1 : 0 : 1), (1 : 1 : 1), (w^3 : w^7 : 1), (w^3 : w^9 : 1), (w^6 : w^3 : 1), (w^6 : w^{14} : 1), (w^{12} : w^6 : 1), (w^{12} : w^{13} : 1), (w^{10} : w : 1), (w^{10} : w^4 : 1), (w^{11} : w : 1), (w^{11} : w^4 : 1), (w^5 : w^2 : 1), (w^5 : w^8 : 1), (w^7 : w^2 : 1), (w^7 : w^8 : 1), (w^{13} : w^2 : 1), (w^{13} : w^8 : 1)\}$ . Put  $D = P_1 + \cdots + P_{18}, G = 9P_\infty$ . The code  $C_{\mathcal{L}}(D, G)$  is self-dual. The set  $\{\frac{x^i y^j}{z^{i+j}} | (i, j) \in \{(0, 0), (0, 1), (0, 2), (0, 3), (1, 0), (1, 1), (1, 2), (2, 0), (2, 1)\}\}$  is a basis for  $C_{\mathcal{L}}(D, G)$ , and thus its generator matrix is given by

$$\mathcal{G} = \begin{pmatrix} 1111111111111111 & \\ 01w^7w^9w^3w^{14}w^6w^{13}ww^4ww^4w^2w^8w^2w^8w^2w^8 & \\ 01w^{14}w^3w^6w^{13}w^{12}w^{11}w^2w^8w^2w^8w^4ww^4ww^4w & \\ 01w^6w^{12}w^9w^{12}w^3w^9w^3w^{12}w^3w^{12}w^6w^9w^6w^9w^6w^9 & \\ 11w^3w^3w^6w^6w^{12}w^{12}w^{10}w^{10}w^{11}w^{11}w^5w^5w^7w^7w^{13}w^{13} & \\ 01w^{10}w^{12}w^9w^5w^3w^{10}w^{11}w^{14}w^{12}1w^7w^{13}w^911w^6 & \\ 01w^2w^6w^{12}w^4w^9w^8w^{12}w^3w^{13}w^4w^9w^6w^{11}w^8w^2w^{14} & \\ 11w^6w^6w^{12}w^{12}w^9w^9w^5w^5w^7w^7w^{10}w^{10}w^{14}w^{14}w^{11}w^{11} & \\ 01w^{13}11w^{11}1w^7w^6w^9w^8w^{11}w^{12}w^3ww^7w^{13}w^4 & \end{pmatrix}.$$

By Magma [3], the code with generator matrix  $a \cdot \mathcal{G}$  is self-dual, and it has parameters  $[18, 9, 9]$  over  $\mathbb{F}_{16}$ , where  $a = (w^5, w^5, w^{12}, w^{12}, w^7, w^7, 1, 1, w^2, w^2, w^{14}, w^{14}, w^4, w^4, w^9, w^9, w^{10}, w^{10})$ .

This code is an almost MDS code. We also find almost MDS self-dual codes over  $\mathbb{F}_{16}$  with parameters  $[20, 10, 10]$ ,  $[22, 11, 11]$ ,  $[24, 12, 12]$ .

**Corollary 1.** *Let  $q = 2^m$  and  $U = \{\alpha \in \mathbb{F}_q | \text{Tr}(\alpha^3) = 0\}$ . Then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[2n, n, d \geq n]$  for  $1 \leq n \leq |U|$ .*

**Theorem 6.** *Let  $q = 2^m, m \geq 3$  and  $U = \{\alpha \in \mathbb{F}_q | \text{Tr}(\alpha^5) = 0\}$ . Then there exists a self-dual code over  $\mathbb{F}_q$  with parameters  $[2n, n, d \geq n - 1]$  for  $1 \leq n \leq |U|$ .*

*Proof.* Let  $U$  be defined as in the theorem. Put

$$h(x) = \prod_{\alpha \in U} (x - \alpha).$$

Since any element in  $\mathbb{F}_q$  ( $q$  even) is a square in  $\mathbb{F}_q$ , we conclude that  $h'(\alpha)$  is a nonzero square in  $\mathbb{F}_q$  for any  $\alpha \in U$ .

Consider the hyper-elliptic curve defined by

$$\mathcal{X} : y^2 + y = x^5. \quad (8)$$

From Lemma 12, we get that  $U$  is a subset of the solution to (8). Put  $D = \sum_{\alpha \in U_0 \subset U} (P_\alpha^{(1)} + P_\alpha^{(2)}) = P_1 + \cdots + P_s$ ,  $s = 2|U_0|$ ,  $G = (\frac{s}{2} + 1)P_\infty$  and  $\omega = \frac{dx}{h}$ . Then the residue  $\text{Res}_{P_\alpha}(\omega) = \frac{1}{h'(P_\alpha)}$  is a square for any  $\alpha \in U_0$ , and by Lemma 3, the constructed code  $a \cdot C_{\mathcal{L}}(D, G)$  is a  $[s, \frac{s}{2}, d \geq \frac{s}{2} - 1]$  self-dual code, where  $a_i^2 = \text{Res}_{P_i}(\omega)$ . □

**Example 4.** *The hyper-elliptic curve defined by*

$$y^2 + y = x^5,$$

*has rational points in the set  $\{P_\infty = (1 : 0 : 0), (w^{12} : 0 : 1), (w^{12} : 1 : 1), (w^3 : 0 : 1), (w^3 : 1 : 1), (w^6 : 0 : 1), (w^6 : 1 : 1), (w^9 : 0 : 1), (w^9 : 1 : 1), (w^{11} : w : 1), (w^{11} : w^4 : 1), (w^2 : w : 1), (w^2 : w^4 : 1), (w^5 : w : 1), (w^5 : w^4 : 1), (w^8 : w : 1), (w^8 : w^4 : 1), (w : w^2 : 1), (w : w^8 : 1), (w^{13} : w^2 : 1), (w^{13} : w^8 : 1), (w^4 : w^2 : 1), (w^4 : w^8 : 1), (w^7 : w^2 : 1), (w^7 : w^8 : 1), (w^{10} : w^2 : 1), (w^{10} : w^8 : 1)\}$ . Put  $D = P_1 + \cdots + P_{26}$ ,  $G = 14P_\infty$ . The set  $\{\frac{x^i y^j}{z^{i+j}} | (i, j) \in \{(0, 0), (0, 1), (0, 2), (1, 0), (1, 1), (1, 2), (2, 0), (2, 1), (2, 2), (3, 0), (3, 1), (4, 0), (4, 1)\}\}$  is a basis for  $C_{\mathcal{L}}(D, G)$ , and thus its generator matrix  $\mathcal{G}$  is given by*

$$\mathcal{G} = \begin{pmatrix} 11111111111111111111111111111111 \\ 01010101ww^4ww^4ww^4w^2w^8w^2w^8w^2w^8w^2w^8w^2w^8 \\ 01010101w^2w^8w^2w^8w^2w^8w^2w^8w^4ww^4ww^4ww^4w \\ w^{12}w^{12}w^3w^3w^6w^6w^9w^9w^{11}w^{11}w^2w^2w^5w^5w^8w^8www^{13}w^{13}w^4w^4w^7w^7w^{10}w^{10} \\ 0w^{12}0w^30w^60w^9w^{12}1w^3w^6w^9w^9w^{12}w^3w^91w^6w^6w^{12}w^91w^{12}w^3 \\ 0w^{12}0w^30w^60w^9w^{13}w^4w^4w^{10}w^7w^{13}w^{10}ww^5w^2w^2w^{14}w^8w^5w^{11}w^8w^{14}w^{11} \\ w^9w^9w^6w^6w^{12}w^{12}w^3w^3w^7w^7w^4w^4w^{10}w^{10}www^2w^2w^{11}w^{11}w^8w^8w^{14}w^{14}w^5w^5 \\ 0w^90w^60w^{12}0w^3w^8w^{11}w^5w^8w^{11}w^{14}w^2w^5w^4w^{10}w^{13}w^4w^{10}www^7w^7w^{13} \\ 0w^90w^60w^{12}0w^3w^91w^6w^{12}w^{12}w^3w^3w^9w^6w^31w^{12}w^{12}w^9w^31w^9w^6 \\ w^6w^6w^9w^9w^3w^3w^{12}w^{12}w^3w^3w^6w^611w^9w^9w^3w^3w^9w^9w^{12}w^{12}w^6w^611 \\ 0w^60w^90w^30w^{12}w^4w^7w^7w^{10}ww^4w^{10}w^{13}w^5w^{11}w^{11}w^2w^{14}w^5w^8w^{14}w^2w^8 \\ w^3w^3w^{12}w^{12}w^9w^9w^6w^6w^{14}w^{14}w^8w^8w^5w^5w^2w^2w^4w^4w^7w^7www^{13}w^{13}w^{10}w^{10} \\ 0w^30w^{12}0w^90w^61w^3w^9w^{12}w^6w^9w^3w^6w^6w^{12}w^91w^3w^91w^6w^{12}w^3 \\ 11111111w^{10}w^{10}w^{10}w^{10}w^{10}w^{10}w^{10}w^{10}w^5w^5w^5w^5w^5w^5w^5w^5w^5w^5 \\ w^{12}w^{12}w^3w^3w^6w^6w^9w^9w^6w^6w^{12}w^{12}11w^3w^3w^6w^6w^3w^3w^9w^9w^{12}w^{12}11 \\ w^9w^9w^6w^6w^{12}w^{12}w^3w^3w^2w^2w^{14}w^{14}w^5w^5w^{11}w^{11}w^7w^7www^{13}w^{13}w^4w^4w^{10}w^{10} \end{pmatrix}.$$

By Magma [3], the code with generator matrix  $a \cdot \mathcal{G}$  is self-dual, and it has parameters [26, 13, 12] over  $\mathbb{F}_{16}$ , where  $a = (w^{14}, w^{14}, w, w, w^6, w^6, w^{10}, w^{10}, w^9, w^9, w^4, w^4, w^6, w^6, w^8, w^8, w^6, w^6, w^3, w^3, w^7, w^7, w, w, w^{13}, w^{13})$ . We also find self-dual codes over  $\mathbb{F}_{16}$  with parameters [28, 14, 13], [30, 15, 14], [32, 16, 15].

Next, we will consider hyper-elliptic curves over  $\mathbb{F}_q$ ,  $q = p^m$  with  $p$  an odd prime.

**Theorem 7.** *Let  $q = p^m$  and  $t$  be a positive odd integer such that  $\gcd(t, q - 1) = 1$ . If  $\eta(n) = 1$  and  $4n | (q - 1)$ , then there exists a self-dual code with parameters  $[2n, n, d \geq n + \frac{t-3}{2}]$ .*

*Proof.* Denote  $C_j = \{j \times i \pmod{q-1} | i = 0, 1, \dots\}$ . For  $\theta$  a primitive element of  $\mathbb{F}_q$ , let  $U_n = \{\theta^i | i \in C_{\frac{q-1}{n}}\}$ , and label the elements of  $U_n$  as  $\alpha_1, \dots, \alpha_n$ . Under the condition  $4n | (q - 1)$ , the set  $U_n$  is a multiplicative subgroup of  $\mathbb{F}_q^*$  of order  $n$ . Put

$$h(x) = \prod_{\alpha \in U_n} (x - \alpha).$$

Clearly, all the roots of  $h(x)$  are simple, and the derivative  $h'(x) = nx^{n-1}$ , and thus for any  $\alpha \in U_n$ , we have that  $h'(\alpha)$  is a square. Consider the elliptic curve defined by

$$\mathcal{X} : y^2 = x^t.$$

Since  $\gcd(t, q-1) = 1$ , the set  $\{x^t | x \in \mathbb{F}_q\}$  is in bijection with  $\mathbb{F}_q$ . For any  $\alpha \in U_n$ , there are two places, say  $P_\alpha^{(1)}$  and  $P_\alpha^{(2)}$ , arising from  $x$ -component  $\alpha$ . Put  $D = \sum_{\alpha \in U_n} P_\alpha^{(1)} + P_\alpha^{(2)} = P_1 + \cdots + P_s$ ,  $s = 2n$ ,  $G = nP_\infty$  and  $\omega = \frac{dx}{h}$ . With the choice of  $\alpha_i \in U_n$  and  $\beta_i^2 = \alpha_i^t$ , the residue  $\text{Res}_{P_{\alpha_i}}(\omega) = \frac{1}{\beta_i h'(\alpha_i)}$  is a square for any  $\alpha_i \in U_n$ , and by Lemma 3, the constructed code  $a \cdot C_{\mathcal{L}}(D, G)$  is self-dual, where  $a_i^2 = \text{Res}_{P_i}(\omega)$ .  $\square$

**Corollary 2.** *Let  $q = p^m$ . Then we have the following:*

1. *if  $\gcd(3, q-1) = 1$ ,  $\eta(n) = 1$  and  $4n|(q-1)$ , then there exists a self-dual code with parameters  $[2n, n, d \geq n]$ ;*
2. *If  $\gcd(5, q-1) = 1$ ,  $\eta(n) = 1$  and  $4n|(q-1)$ , then there exists a self-dual code with parameters  $[2n, n, d \geq n-1]$ .*

**Example 5.** *The hyper-elliptic curve over  $\mathbb{F}_{25}$  defined by*

$$y^2 = x^5,$$

*has rational points in the set  $\{P_\infty = (1 : 0 : 0), (1 : 1 : 1), (1 : 4 : 1), (w^{20} : w^2 : 1), (w^{20} : w^{14} : 1), (w^{16} : w^4 : 1), (w^{16} : w^{16} : 1), (4 : 2 : 1), (4 : 3 : 1), (w^8 : w^8 : 1), (w^8 : w^{20} : 1), (w^4 : w^{10} : 1), (w^4 : w^{22})\}$ . Put  $D = P_1 + \cdots + P_{12}$  and  $G = 7P_\infty$ . The set  $\{\frac{x^i y^j}{z^{i+j}} | (i, j) \in \{(0, 0), (0, 1), (1, 0), (1, 1), (2, 0), (3, 0)\}\}$  is a basis for  $C_{\mathcal{L}}(D, G)$ , and thus its generator matrix is given by*

$$\mathcal{G} = \begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 4 & w^2 & w^{14} & w^4 & w^{16} & 2 & 3 & w^8 & w^{20} & w^{10} & w^{22} \\ 1 & 1 & w^{20} & w^{20} & w^{16} & w^{16} & 4 & 4 & w^8 & w^8 & w^4 & w^4 \\ 1 & 4 & w^{22} & w^{10} & w^{20} & w^8 & 3 & 2 & w^{16} & w^4 & w^{14} & w^2 \\ 1 & 1 & w^{16} & w^{16} & w^8 & w^8 & 1 & 1 & w^{16} & w^{16} & w^8 & w^8 \\ 1 & 1 & 4 & 4 & 1 & 1 & 4 & 4 & 1 & 1 & 4 & 4 \end{pmatrix}.$$

*By Magma [3], the code with generator matrix  $a \cdot \mathcal{G}$  is self-dual, and it has parameters  $[12, 6, 5]$  over  $\mathbb{F}_{25}$ , where  $a = (1, 3, w^{21}, w^{15}, 3, 1, w^{15}, w^{21}, 1, 3, w^{21}, w^{15})$ .*

By considering curves in higher genus, we can release the gcd condition in Theorem 7.

**Theorem 8.** *Let  $q = p^m$  with  $p$  an odd prime.*

1. *If  $n$  is odd,  $\eta(n) = 1$  and  $4n|(q-1)$ , then there exists a self-dual code with parameters  $[2n, n, d \geq \frac{n}{2} + 2]$ .*
2. *If  $n$  is even,  $\eta(n) = 1$  and  $2n|(q-1)$ , then there exists a self-dual code with parameters  $[2n, n, d \geq \frac{n}{2} + 2]$ .*

*Proof.* Assume that  $n$  is odd. Let  $U_n$  and  $h(x)$  be defined as in Theorem 7. Consider an algebraic curve given by

$$\mathcal{X} : y^2 = x^n.$$

Take  $\omega = \frac{dx}{h}$  and  $G = \frac{3n-4}{2}P_\infty$ . Then by Lemma 3, the code  $a \cdot C_{\mathcal{L}}(D, G)$ , where  $a_i = \text{Res}_{P_i}(\omega)$ , is self-dual with parameters  $[2n, n, \frac{n}{2} + 2]$ , and this proves point 1).

For point 2), we put  $U_n = \{a^2 | a \in \mathbb{F}_q, a^n = 1\}$ . The rest follows from the same reasoning as the first part.  $\square$

### 3.3 Self-dual codes from other curves

In this subsection, we will construct self-dual codes over  $\mathbb{F}_q$  from algebraic curves of high genus.

Let  $q_0 = p^m$ ,  $q = q_0^2$  and  $\mathcal{X}$  be the Hermitian curve over  $\mathbb{F}_q$  defined by

$$\mathcal{X} : y^{q_0} + y = x^{q_0+1}.$$

The Hermitian curve  $\mathcal{X}$  has genus  $g = \frac{q_0(q_0-1)}{2}$ , and for any  $\alpha \in \mathbb{F}_q$ ,  $x - \alpha$  has  $q$  zeros of degree one in  $\mathcal{X}$ . All rational points of the curve  $\mathcal{X}$  different from the point at infinity are obtained in this way. Self-orthogonal AG codes from Hermitian curves were already considered in [20]. In what follows, we embed those codes into the self-dual ones and provide the parameters of the latter codes. We also construct new families of self-dual codes from this curve.

**Theorem 9.** *Let  $p$  be an odd prime,  $q_0 = p^m$ ,  $q = q_0^2$ ,  $g = \frac{q_0(q_0-1)}{2}$ . Put  $d_0 = \frac{s}{2} + 1 - g$ ,  $s' = s + 1$ ,  $d'_0 = \frac{s'}{2} - g$ .*

1. *If  $p|n$ ,  $(n-1)|(q-1)$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$  (resp.  $[s', \frac{s'}{2}, d \geq d'_0]$ ), where  $s = q_0n$  with  $n$  even (resp.  $n$  odd).*

2. If  $r|m$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0 p^r$ .
3. If  $(n-1)|(q-1)$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(2n-1)$ .
4. If  $n|\frac{q-1}{2}$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$  (resp.  $[s', \frac{s'}{2}, d \geq d'_0]$ ), where  $s = q_0 n$  with  $n$  even (resp.  $n$  odd).
5. If  $1 \leq r < m$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(2p^r - 1)$ .
6. If  $n = q_0 - 1, n \equiv 0 \pmod{4}$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(n(t+1) + 1)$ , for  $t$  odd,  $0 \leq t \leq \frac{n}{2} + 1$ .
7. If  $n = q_0 - 1, n \equiv 2 \pmod{4}$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(n(t+1) + 1)$ ,  $0 \leq t \leq \frac{n}{2}$ .
8. If  $1 \leq r < m$  and  $\frac{n(p^r+1)}{2(p^r-1)}$  is odd, then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$  (resp.  $[s', \frac{s'}{2}, d \geq d'_0]$ ), where  $s = q_0(t+1)n$  (resp.  $s = q_0((t+1)n + 1) + 1$ ),  $n = \frac{q-1}{p^r+1}$ , for  $t$  odd,  $1 \leq t \leq p^r$ .
9. If  $1 \leq r < m$  and  $\frac{n(p^r+1)}{2(p^r-1)}$  is even, then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$  (resp.  $[s', \frac{s'}{2}, d \geq d'_0]$ ), where  $s = q_0(t+1)n$  (resp.  $s = q_0((t+1)n + 1) + 1$ ),  $n = \frac{q-1}{p^r+1}$ , for  $1 \leq t \leq p^r$ .
10. If  $1 \leq r < m$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$  (resp.  $[s', \frac{s'}{2}, d \geq d'_0]$ ), where  $s = q_0(t+1)n$  (resp.  $s = q_0((t+1)n + 1) + 1$ ),  $n = \frac{q-1}{p^r-1}, r|\frac{m}{2}$ , for  $1 \leq t \leq p^r - 2$ .
11. If  $t$  is even such that  $1 \leq t \leq q_0$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$ , where  $s = q_0(q_0 t)$ .
12. If  $t$  is odd such that  $1 \leq t \leq q_0$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(q_0 t)$ .
13. If  $r = p^k, k|m, 0 \leq \ell < m/k, 1 \leq t \leq (r-1)/2$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$ , where  $s = q_0(2tr^\ell)$ .

14. If  $0 \leq \ell < 2m$ , then there exists a  $q$ -ary self-dual code with parameters  $[s, \frac{s}{2}, d \geq d_0]$ , where  $s = q_0(2p^\ell)$ .
15. If  $r = p^k, k|m, 0 \leq \ell < m/k, 0 \leq t \leq (r-1)/2$  or  $(\ell, t) = (m/k, 0)$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0(2t+1)r^\ell$ .
16. If  $0 \leq \ell < 2m$ , then there exists a  $q$ -ary self-dual code with parameters  $[s', \frac{s'}{2}, d \geq d'_0]$ , where  $s = q_0p^\ell$ .

*Proof.* It should be noted that each  $x$ -component  $\alpha \in \mathbb{F}_q$  gives  $q$  places of degree one. Let  $U$  be a subset of  $\{\alpha \in \mathbb{F}_q | \beta^{q_0} + \beta = \alpha^{q_0+1}\}$  such that  $q|U| = s$ . Put

$$h(x) = \prod_{\alpha \in U} (x - \alpha) \text{ and } \omega = \frac{dx}{h}.$$

For each case, it is enough to prove that the residue  $\text{Res}_{P_\alpha}(\omega)$  of  $\omega$  at place  $P_\alpha$  is a nonzero square for any  $\alpha \in U$ , that is,  $h'(\alpha)$  is a nonzero square in  $\mathbb{F}_q$ . Take  $U$  as follows.

- for 1),  $U = \{\alpha \in \mathbb{F}_q | \alpha^n = \alpha\}$ ,
- for 2),  $U = \{\alpha \in \mathbb{F}_q | \alpha^{p^r} = \alpha\}$ ,
- for 3),  $U = U_{n-1} \cup \alpha_1 U_{n-1}$ , where  $U_{n-1} = \{\alpha \in \mathbb{F}_q | \alpha^{n-1} = 1\}$  and  $\alpha_1 \in \mathbb{F}_q \setminus U_{n-1}$  such that  $1 - \alpha_1^{n-1}$  is a square,
- for 4),  $U = \{\alpha \in \mathbb{F}_q | \alpha^n = 1\}$ ,
- for 5),  $U = U_n \cup \alpha_1 U_n \cup \{0\}$ , where  $n = p^r - 1, U_n = \{\alpha \in \mathbb{F}_q | \alpha^n = 1\}$  and  $\alpha_1 \in \mathbb{F}_q \setminus U_n$  such that  $1 - \alpha_1^n$  is a square,
- for 6)–10), take  $U = \{0\} \cup V$  or  $U = V$ , where  $V = U_n \cup \alpha_1 U_n \cup \dots \cup \alpha_t U_n, U_n = \{\alpha \in \mathbb{F}_q | \alpha^n = 1\}$  and  $\alpha_1, \dots, \alpha_t \in \mathbb{F}_q \setminus U_n$  as in Theorem 3,
- for 10)–12), label the elements of  $\mathbb{F}_{q_0}$  as  $a_1, \dots, a_{q_0}$ . For some fixed element  $\beta \in \mathbb{F}_q \setminus \mathbb{F}_{q_0}$ , take  $U = \{a_k \beta + a_j | 1 \leq k, j \leq q_0\}$ ,
- for 13)–16), label the element of  $\mathbb{F}_r$  as  $a_0, \dots, a_{r-1}$ , take  $H$  as an  $\mathbb{F}_r$ -subspace and set  $H_i = H + a_i \beta$  for some fixed element  $\beta \in \mathbb{F}_q \setminus \mathbb{F}_r$ . Put  $U = H_0 \cup \dots \cup H_{2t-1}$  or  $U = H_0 \cup \dots \cup H_{2t}$ .

For 1)–5), it can be easily checked that  $h'(\alpha)$  is a square for any  $\alpha \in U$ .

For 6)–10), it has been already checked, in Theorem 3, that  $h'(\alpha)$  is a square for any  $\alpha \in U$ .

For 11)–12), it was proved in [24, Theorem 2] that  $h'(\alpha)$  is a square for any  $\alpha \in U$ .

For 13)–16), it was proved in [7, Theorem 4] that  $h'(\alpha)$  is a square for any  $\alpha \in U$ .  $\square$

**Example 6.** *The Hermitian curve defined over  $\mathbb{F}_9$  has all rational points in the set  $\{P_\infty = (1 : 0 : 0), (0 : 0 : 1), (0 : w^2 : 1), (0 : w^6 : 1), (1 : w : 1), (1 : w^3 : 1), (1 : 2 : 1), (w^2 : w : 1), (w^2 : w^3 : 1), (w^2 : 2 : 1), (2 : w : 1), (2 : w^3 : 1), (2 : 2 : 1), (w^6 : w : 1), (w^6 : w^3 : 1), (w^6 : 2 : 1), (w : 1 : 1), (w : w^5 : 1), (w : w^7 : 1), (w^3 : 1 : 1), (w^3 : w^5 : 1), (w^3 : w^7 : 1), (w^5 : 1 : 1), (w^5 : w^5 : 1), (w^5 : w^7 : 1), (w^7 : 1 : 1), (w^7 : w^5 : 1), (w^7 : w^7 : 1)\}$ . Put  $D = P_1 + \dots + P_{27}, G = 15P_\infty$ . The code  $C_{\mathcal{L}}(D, G)$  has parameters [27, 13, 12]. The set  $\{\frac{x^i y^j}{z^{i+j}} \mid (i, j) \in \{(0, 0), (0, 1), (0, 2), (0, 3), (1, 0), (1, 1), (1, 2), (1, 3), (2, 0), (2, 1), (2, 2), (3, 0), (3, 1)\}\}$  is a basis for the code  $C_{\mathcal{L}}(D, G)$ , and thus its generator matrix is given by*

$$G = \begin{pmatrix} 11111111111111111111111111111111 \\ 0w^2w^6ww^32ww^32ww^321w^5w^71w^5w^71w^5w^71w^5w^7 \\ 022w^2w^61w^2w^61w^2w^611w^2w^61w^2w^61w^2w^61w^2w^6 \\ 0w^6w^2w^3w^2w^3w^2w^3w^21w^7w^51w^7w^51w^7w^51w^7w^5 \\ 000111w^2w^2w^222w^6w^6w^6wwww^3w^3w^3w^5w^5w^5w^7w^7w^7 \\ 000ww^32w^3w^5w^5w^5w^71w^7ww^2ww^61w^31w^2w^5w^22w^72w^6 \\ 000w^2w^6121w^2w^6w^2212w^6ww^3w^7w^3w^5ww^5w^7w^3w^7ww^5 \\ 000w^3w^2w^5w^3w^6w^7w^51ww^7w^2w1w^6w^3w^21w^52w^2w^7w^62 \\ 000111222111222w^2w^2w^2w^6w^6w^6w^2w^2w^2w^6w^6w^6 \\ 000ww^32w^5w^71ww^32w^5w^71w^2w^7ww^6w^3w^5w^2w^7ww^6w^3w^5 \\ 000w^2w^61w^6w^22w^2w^61w^6w^22w^221w^612w^221w^612 \\ 000111w^6w^6w^6222w^2w^2w^2w^3w^3w^3wwww^7w^7w^7w^5w^5w^5 \\ 000ww^32w^7ww^2w^5w^71w^3w^5w^6w^31w^2ww^61w^72w^6w^5w^22 \end{pmatrix}.$$

Take  $\mathcal{G}' = \begin{pmatrix} \mathcal{G} & 0 \\ & g_{14} \end{pmatrix}$ , where  $g_{14} = (0, 1, 1, 2, 2, 1, 2, 2, 1, 2, 2, 1, 2, 2, 1, 1, 2, 2, 1, 2, 2, 1, 2, 2, 1, 2, 2, 1)$ . By Magma [3], the code with generator matrix  $a \cdot \mathcal{G}'$  is an optimal [28, 14, 12] self-dual code with new parameters, where  $a_i = w^6, 1 \leq i \leq 28$ . Other parameters from different constructions in Theorem 9 are given in Table 3.

**Theorem 10.** *Let  $q_0 = p^m, q = q_0^2$  be an odd prime power,  $g = \frac{(q_0-1)^2}{4}$  and  $s = q_0 \frac{q_0+1}{2}$ . Then,*

1. *there exists a  $[s, \frac{s}{2}, d \geq \frac{s}{2} - g + 1]$  self-dual code if  $s$  is even, and*
2. *there exists a  $[s + 1, \frac{s+1}{2}, d \geq \frac{s+1}{2} - g]$  self-dual code if  $s$  is odd.*

Table 3: Self-dual codes of length  $s$  from Hermitian curves defined over  $\mathbb{F}_9$

Theorem 9	Length $s$	Distance	Lower bound	Extended length	Distance	Lower bound
1)	3.3	3	3	10	3	2
	3.9	12	12	28	12	11
2)	3.3	3	3	10	3	2
3)	$3(2.3 - 1)$	6	6	16	6	5
4)	3.2	3	1	–	–	–
	3.4	4	4	–	–	–
5)	$3(1+1)2$	4	4	–	–	–
6)	$3((1+1)2+1)$	6	6	16	6	5
11)	$3(3.2)$	7	7	–	–	–

*Proof.* Consider an algebraic curve defined by

$$\mathcal{X} : y^{q_0} + y = x^{\frac{q_0+1}{2}}.$$

The curve has genus  $g = \frac{(q_0-1)^2}{4}$ . Put

$$U = \{\alpha \in \mathbb{F}_q \mid \exists \beta \in \mathbb{F}_q \text{ such that } \beta^{q_0} + \beta = \alpha^{\frac{q_0+1}{2}}\}.$$

The set  $U$  is the set of  $x$ -component solutions to the Hermitian curve whose elements are squares in  $\mathbb{F}_q$ . There are  $\frac{q_0^2+1}{2}$  square elements in  $\mathbb{F}_q$ , and this gives rise to  $q_0 \frac{q_0^2+1}{2}$  rational places. Write

$$h(x) = \prod_{\alpha \in U} (x - \alpha) \text{ and } \omega = \frac{dx}{h}.$$

Then  $h(x) = x^n - x$ , where  $n = \frac{q_0^2+1}{2}$ , and thus  $h'(x) = nx^{n-1} - 1$ . Since  $q$  is a square, we have that  $h'(\alpha) = n - 1$  is a square for any  $\alpha \in U \setminus \{0\}$ . Put  $D = \sum_{\alpha \in U} (P_\alpha^{(1)} + \cdots + P_\alpha^{(q_0)}) = P_1 + \cdots + P_s$ ,  $s = q_0 \frac{q_0^2+1}{2}$ . Set

$$G = \begin{cases} (g - 1 + \frac{s}{2})P_\infty & \text{if } s \text{ is even,} \\ (g - 1 + \frac{s-1}{2})P_\infty & \text{if } s \text{ is odd.} \end{cases}$$

Then the residue  $\text{Res}_{P_\alpha}(\omega) = \frac{1}{h'(P_\alpha)}$  is a square for any  $\alpha \in U$ , and by Lemma 3, the constructed code  $a \cdot C_{\mathcal{L}}(D, G)$  is self-orthogonal, where  $a_i^2 = \text{Res}_{P_i}(\omega)$ . If  $s$  is even, then point 1) follows, otherwise the self-orthogonal code can be embedded into a self-dual code using Lemma 6, and thus point 2) follows.  $\square$

**Example 7.** *There exist self-dual codes with parameters  $[16, 8, \geq 7]_{3^2}$ ,  $[66, 33, \geq 29]_{5^2}$ ,  $[176, 88, \geq 79]_{7^2}$ ,  $[370, 185, \geq 169]_{9^2}$ ,  $[672, 336, \geq 311]_{11^2}$ ,  $[1106, 553, \geq 517]_{13^2}$ ,  $[2466, 1233, \geq 1169]_{17^2}$ ,  $[3440, 1720, \geq 1639]_{19^2}$ ,  $[7826, 3913, \geq 3769]_{25^2}$ . We now calculate the exact distance of the self-dual code over  $\mathbb{F}_{3^2}$ . The algebraic curve over  $\mathbb{F}_9$  defined by*

$$y^3 + y = x^2$$

*has all rational points in the set  $\{P_\infty = (1 : 0 : 0), (0 : 0 : 1), (0 : w^2 : 1), (0 : w^6 : 1), (1 : w : 1), (1 : w^3 : 1), (1 : 2 : 1), (2 : w : 1), (2 : w^3 : 1), (2 : 2 : 1), (w^2 : 1 : 1), (w^2 : w^5 : 1), (w^2 : w^7 : 1), (w^6 : 1 : 1), (w^6 : w^5 : 1), (w^6 : w^7 : 1)\}$ . Put  $D = P_1 + \dots + P_{15}$ ,  $G = 7P_\infty$ . The code  $C_{\mathcal{L}}(D, G)$  has parameters  $[15, 7, 8]$ .*

*The set  $\{\frac{x^i y^j}{z^{i+j}} | (i, j) \in \{(0, 0), (0, 1), (0, 2), (0, 3), (1, 0), (1, 1), (1, 2)\}\}$  is a basis for the code  $C_{\mathcal{L}}(D, G)$ , and thus its generator matrix is given by*

$$\mathcal{G} = \begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & w^2 & w^6 & w & w^3 & 2 & w & w^3 & 2 & 1 & w^5 & w^7 & 1 & w^5 & w^7 \\ 0 & 2 & 2 & w^2 & w^6 & 1 & w^2 & w^6 & 1 & 1 & w^2 & w^6 & 1 & w^2 & w^6 \\ 0 & w^6 & w^2 & w^3 & w & 2 & w^3 & w & 2 & 1 & w^7 & w^5 & 1 & w^7 & w^5 \\ 0 & 0 & 0 & 1 & 1 & 1 & 2 & 2 & 2 & w^2 & w^2 & w^2 & w^6 & w^6 & w^6 \\ 0 & 0 & 0 & w & w^3 & 2 & w^5 & w^7 & 1 & w^2 & w^7 & w & w^6 & w^3 & w^5 \\ 0 & 0 & 0 & w^2 & w^6 & 1 & w^6 & w^2 & 2 & w^2 & 2 & 1 & w^6 & 1 & 2 \end{pmatrix}.$$

Take

$$\mathcal{G}' = \begin{pmatrix} a \cdot \mathcal{G} & 0 \\ & g_8 \end{pmatrix},$$

where  $a = (w^6, w^6, w^6, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1)$ ,  $g_8 = (0, w, 0, 0, 0, 0, 0, 0, w^7, 0, w^5, w^2, w^5, w^7, w^7, 2)$ . By Magma [3], the code with generator matrix  $\mathcal{G}'$  is a  $[16, 8, 8]$  self-dual code, which is optimal and has new parameters.

**Theorem 11.** *Let  $q_0 = p^m$ ,  $q = q_0^2$  be an odd prime power,  $g = \frac{(q_0-1)^2}{4}$  and  $s = q_0 \frac{q_0-1}{2}$ . Then,*

1. *there exists a  $[s, \frac{s}{2}, d \geq \frac{s}{2} - g + 1]$  self-dual code if  $s$  is even, and*
2. *there exists a  $[s + 1, \frac{s+1}{2}, d \geq \frac{s+1}{2} - g]$  self-dual code if  $s$  is odd.*

*Proof.* Consider the same setting as the proof of Theorem 10. Take  $U' = U \setminus \{0\}$ , and write

$$h(x) = \prod_{\alpha \in U'} (x - \alpha) \text{ and } \omega = \frac{dx}{h}.$$

The rest follows with the same reasoning as that in Theorem 10.  $\square$

**Example 8.** *There exist self-dual codes with parameters*  $[12, 6, 6]_{3^2}$ ,  $[60, 30, \geq 27]_{5^2}$ ,  $[168, 84, \geq 76]_{7^2}$ ,  $[360, 180, \geq 165]_{9^2}$ ,  $[660, 330, \geq 306]_{11^2}$ ,  $[1092, 546, \geq 511]_{13^2}$ ,  $[2448, 1224, \geq 1161]_{17^2}$ ,  $[3420, 1710, \geq 1630]_{19^2}$ ,  $[7800, 3900, \geq 3757]_{25^2}$ .

We update parameters of MDS self-dual codes from the previous constructions in Table 4.

## 4 Conclusion

In this correspondence, we have constructed new families of optimal  $q$ -ary Euclidean self-dual codes from algebraic curves. With the same spirit, constructing more families of Euclidean self-dual codes from genus zero and genus one curves (over  $\mathbb{F}_q$  with  $q$  a prime) is worth considering. Characterization and constructions of Hermitian self-dual codes from algebraic geometry codes are also valuable.
