

# Supplementary material to reproduce the binned parameters for $D \rightarrow K^-\pi^+\pi^+\pi^-$

BESIII Collaboration  
 (Dated: February 27, 2022)

## I INTRODUCTION

The binned results of the strong-phase parameters are non-Gaussian and have correlations with each other. In order for analyses that utilise these results to benefit from the full likelihood distribution, which includes these correlations, some additional information is required to that already published in Ref. [1]. This additional information comprises the efficiency-corrected signal yields tagged with  $CP$  eigenstates and flavour modes in the  $D \rightarrow K^-\pi^+\pi^+\pi^-$  phase space bins and the migration matrices for all the tag modes. In combination with the information presented in Tables 2-7 in Ref. [1], the additional information contained here can be used to construct the full likelihood that leads to results quoted in Table 11, and the projections in Fig 10.

## II SIGNAL YIELDS

The efficiency corrected signal yields in  $D \rightarrow K^-\pi^+\pi^+\pi^-$  phase-space regions shown in Table. I are obtained with the same method described in Sec. 4.2 of Ref. [1] and corrected with the MC-determined efficiencies.

TABLE I: Efficiency-corrected signal yields for the  $CP$ -tagged  $K^-\pi^+\pi^+\pi^-$  events. The uncertainties are statistical only.

Mode	Bin	1	2	3	4
$K^-\pi^+$		94±23	21±17	37±16	102±25
$K^-\pi^+\pi^0$		310±63	190±47	156±91	245±63
$K^-\pi^+\pi^+\pi^-$	1	16±11	80±30	11±15	76±29

## III SYSTEMATIC UNCERTAINTIES AND MIGRATION MATRICES

The fit to determine the strong-phase parameters includes all the sources of systematic uncertainties associated with the detector and measurement procedures. Furthermore the external parameters are included via a Gaussian

constraint. The sources and sizes of systematic uncertainties to be considered on the binned yields in Table I are collated here in Table II from the information presented in Ref. [1].

The systematic uncertainty due to  $K/\pi$  tracking and identification is assigned independently for  $D \rightarrow K^-\pi^+$ ,  $D \rightarrow K^-\pi^+\pi^0$  and  $D \rightarrow K^-\pi^+\pi^+\pi^-$  decay modes, but correlated across the four bins of phase space. The tracking and identification uncertainties are correlated between the different tag modes, and across the four bins of phase space. The uncertainties due to  $\pi^0$  reconstruction, impact of resonance modelling on efficiency, fit method for signal yields are also correlated across the tag modes. The phase space region populated by the  $D \rightarrow K_S^0 K^-\pi^+$  decay is excluded in the measurement of the strong-phase parameters in the binned analysis and therefore doesn't contribute to the systematic uncertainty. The central values and uncertainties of the external parameters used at the time of the analysis can be found in Ref. [1].

TABLE II: Systematic uncertainties contributing to the determination of the binned hadronic parameters.

Systematics	Sizes
Size of $CP$ -tagged $D \rightarrow K^-\pi^+$ samples	See Table [3] in Ref. [1]
$K/\pi$ tracking and identification	0.7% for each track
$\pi^0$ reconstruction	1%, only contributing in $D \rightarrow K^-\pi^+\pi^0$
Impact of resonance modelling on efficiency	3% for $D \rightarrow K^-\pi^+\pi^+\pi^-$ and 3.5% for $D \rightarrow K^-\pi^+\pi^0$
Size of Monte Carlo samples	1% for each tag mode
$D \rightarrow K_S^0 K^-\pi^+$ background	Negligible as excluded by the binning scheme
Fit method for signal yields	1.5% for $D \rightarrow K^-\pi^+\pi^+\pi^-$ and 0.8% for $D \rightarrow K^-\pi^+\pi^0$
External parameters	See Table [6] in Ref. [1]

The migration effects among  $D \rightarrow K^-\pi^+\pi^+\pi^-$  phase-space bins for various tag modes are determined with dedicated MC simulation samples. The migration matrices are listed in Tables III-VI, and show that  $\gtrsim 90\%$  events are reconstructed correctly in the corresponding bins for flavour and  $CP$  tags; 70-90% events are reconstructed correctly in the corresponding bins for  $K_S^0\pi^+\pi^-$  tag. The wrongly assigned events lie mostly in the neighbouring bins. These effects are taken into account when calculating the efficiency-corrected signal yields and induce correlations among the four  $K^-\pi^+\pi^+\pi^-$  bins, which must be taken into consideration when determining the covariance matrices.
