NF/Memo/754

11 January, 1966

To : Members of the Electronic Experiments Committee
From : Counter groups using neutral beams from target 64

=====

Various changes of the preliminary schedule, established up to the shut-down, have been requested by some of the counter users. We would like to make the following comments concerning our experiments.

- 1) 6 weeks of running were foreseen (4 in January and two probably at the end of February) at a PS energy of 19.2 GeV, a repetition rate of 2.3 sec and with a flat top of 300 msec (400 msec for the last January week). The 4 weeks in January were discussed in detail at a meeting before Christmas with the users, the PS Co-ordinator and Professor Paul and Professor Preiswerk. We planned our experiments accordingly and we would appreciate having the opportunity to discuss any foreseen changes. Another meeting of the counter users should take place if such a change is requested, before the matter is presented to the NPRC for final decision.
- 2) Changing the dates, even if the number of weeks remains constant, is also a problem especially for the visiting groups. Modifications to the schedule should be known well in advance.
- 3) It seems advisable that any special counter run should take place at the end of this period.
