LISHEP 2018, 9-14 September 2018

Today's outline

- Lepton Flavour Universality
- The LHCb experiment

Introduction

Semileptonic
decays

- $R(K^*)$
- $R(K)$

Rare $b \rightarrow s ll$
decays

Conclusions

- Muonic $R(D^*)$
- Hadronic $R(D^*)$
- $R(J/\psi)$

- Conclusions
- Prospects

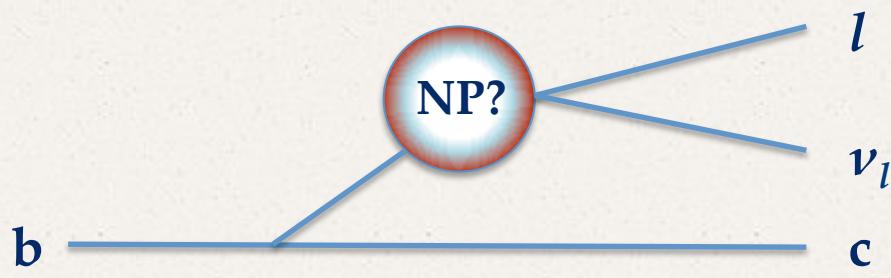

For very rare decays see Joao Coelho talk (Friday, 10:00h)

Introduction

Lepton Flavour Universality

- SM predicts **Lepton Flavour Universality (LFU)**: equal couplings between gauge bosons and the three lepton families
- Observation of violation of LFU would be sign of **new physics**
- A large class of BSM models contain new interactions that involve third generations of quarks and leptons:
 - Charged Higgs
 - Leptoquarks
 - Z'
 - W'
 - ...
- Tensions between SM expectation and experimental results:
 - Charged currents: $b \rightarrow cl\nu$
 - Neutral currents: $b \rightarrow sll$

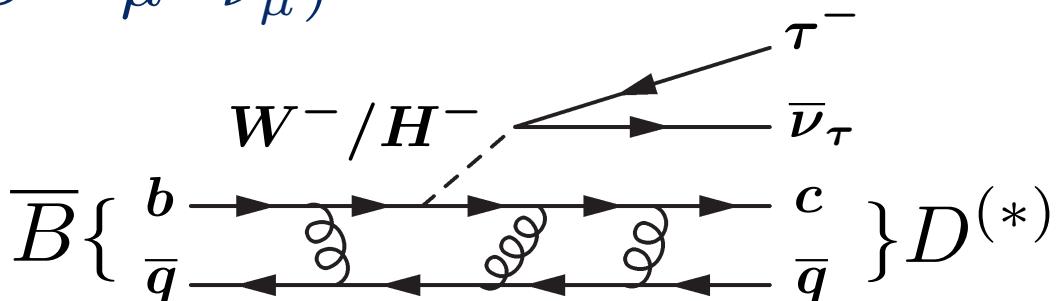

Searches for LFUV

$$R(D^{(*)}) = \frac{\mathcal{B}(B \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau)}{\mathcal{B}(B \rightarrow D^{(*)} \mu^- \bar{\nu}_\mu)}$$

[$b \rightarrow cl\nu$]

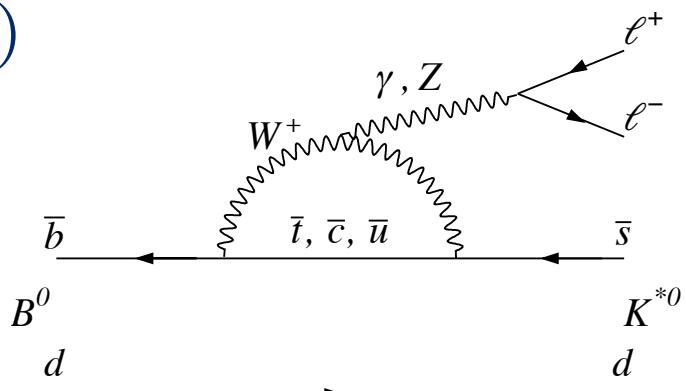

- **Tree Level**
- Potential NP that couple only to the 3rd generation

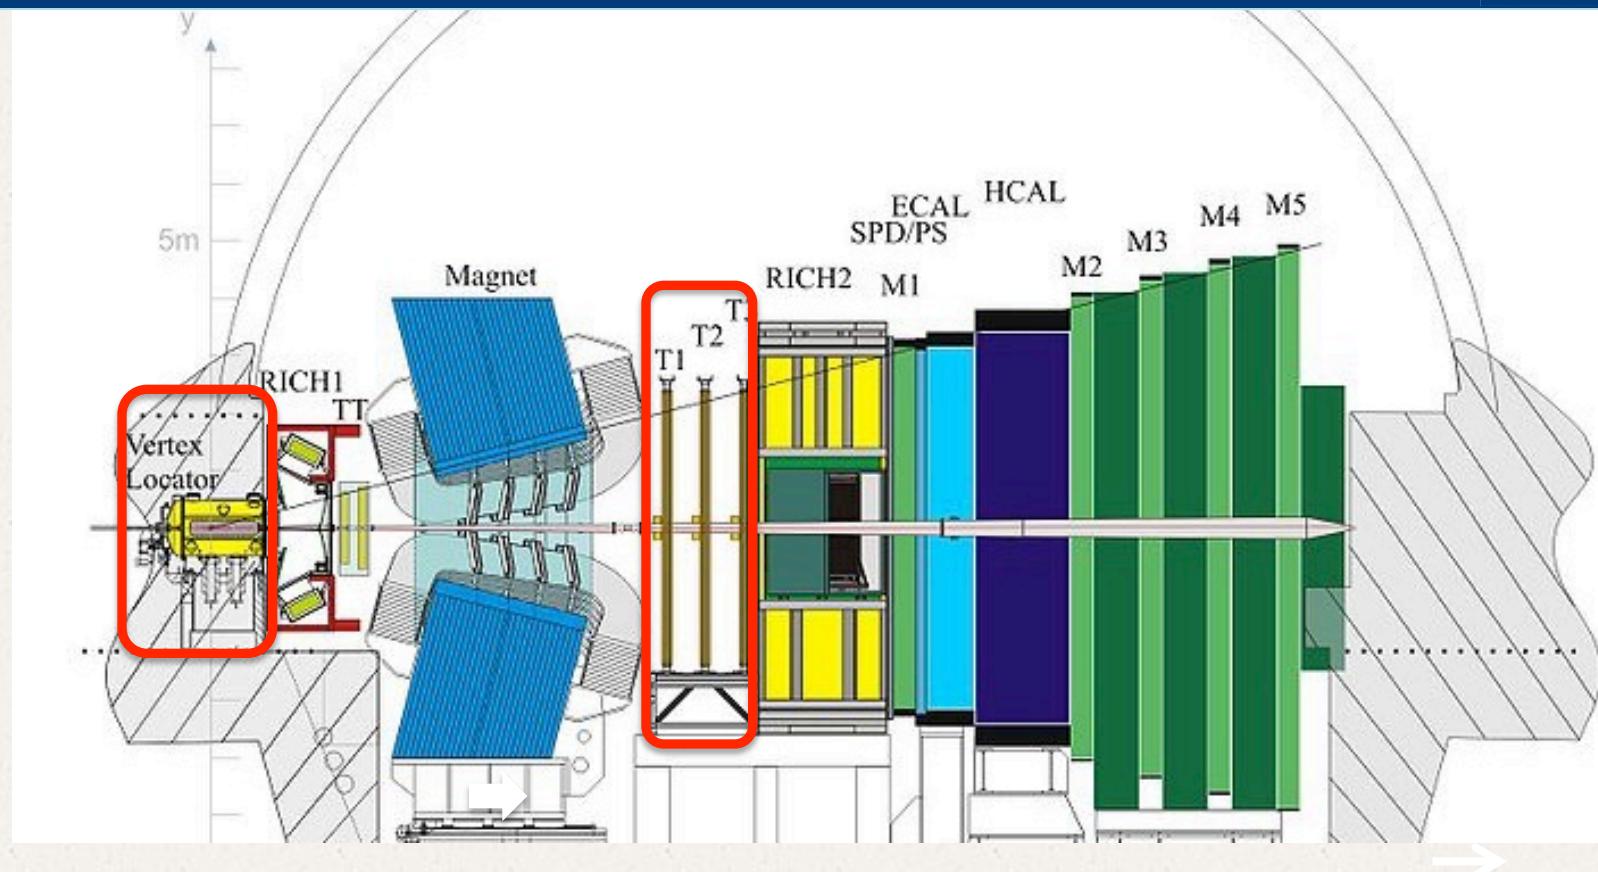

$$R(K^{(*)}) = \frac{\mathcal{B}(B \rightarrow K^{(*)} \mu^+ \mu^-)}{\mathcal{B}(B \rightarrow K^{(*)} e^+ e^-)}$$

[$b \rightarrow sll$]

- **FCNC process.** Forbidden tree level in SM
- Sensitive to either tree or loop NP contributions

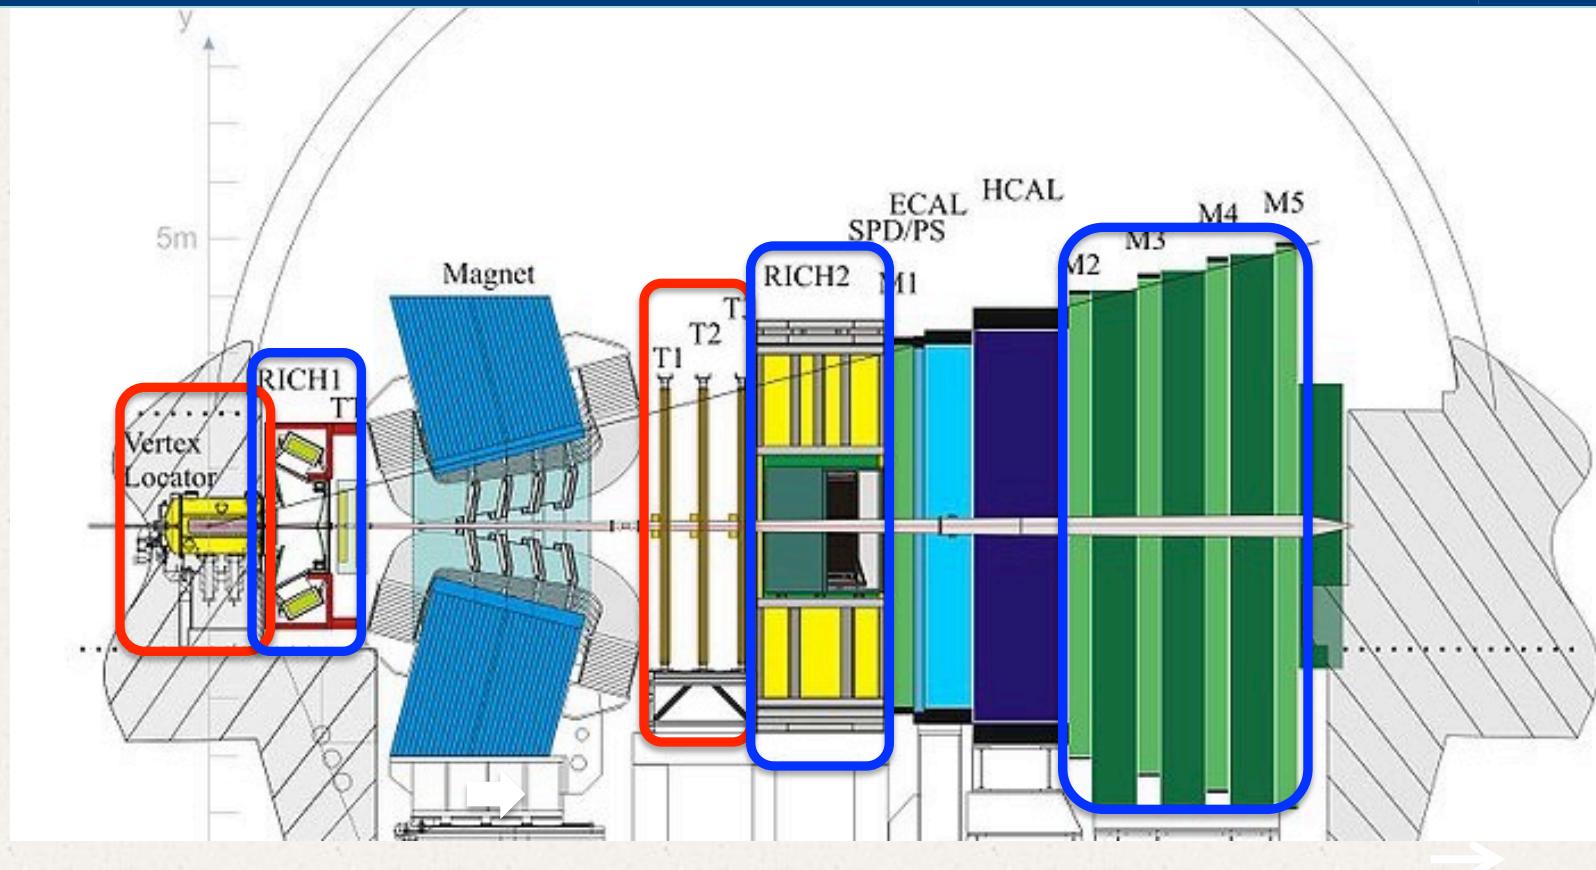

The LHCb detector

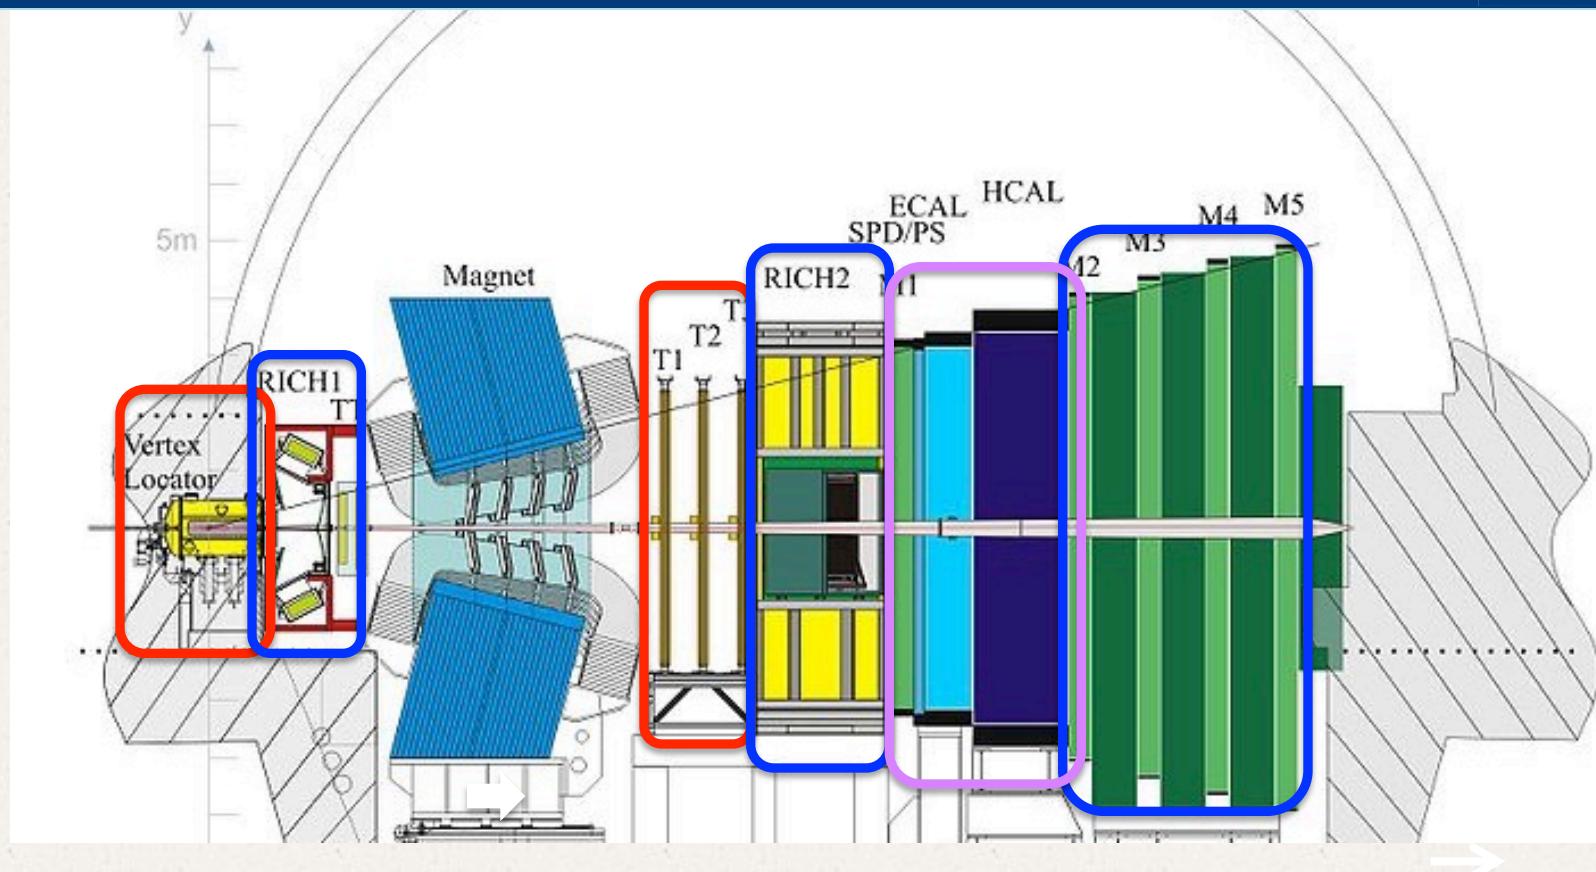

- Excellent **vertex and momentum resolution**

The LHCb detector

- Excellent **vertex and momentum resolution**
- Excellent **charged particle identification**

The LHCb detector

- Excellent **vertex and momentum resolution**
- Excellent **charged particle identification**
- Capability for **neutral particle identification**

Semileptonic decays

Why semitauonic decays?

Tree level decays in the SM, mediated by a W boson

$$R(\mathcal{H}_c) = \frac{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \tau \nu_\tau)}{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \mu \nu_\mu)}$$

$$\mathcal{H}_b = B^0, B_{(c)}^+, \Lambda_b^0 \dots$$

$$\mathcal{H}_c = D^*, D^0, D^+, D_s, \Lambda_c^{(*)}, J/\psi \dots$$

- **Clean prediction from SM**
 - Partial cancellation of form factors uncertainties in the ratio
 - **Large rate** of charged current decays $\text{BR}(B \rightarrow D^* \tau \bar{\nu}) \sim 1.2\%$ in SM
 - Deviation from unity due to different available phase space (τ, μ)
- **Sensitivity to NP** contributions at tree level

Why semitauonic decays?

Tree level decays in the SM, mediated by a W boson

$$R(\mathcal{H}_c) = \frac{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \tau \nu_\tau)}{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \mu \nu_\mu)}$$

$$\mathcal{H}_b = B^0, B_{(c)}^+, \Lambda_b^0 \dots$$

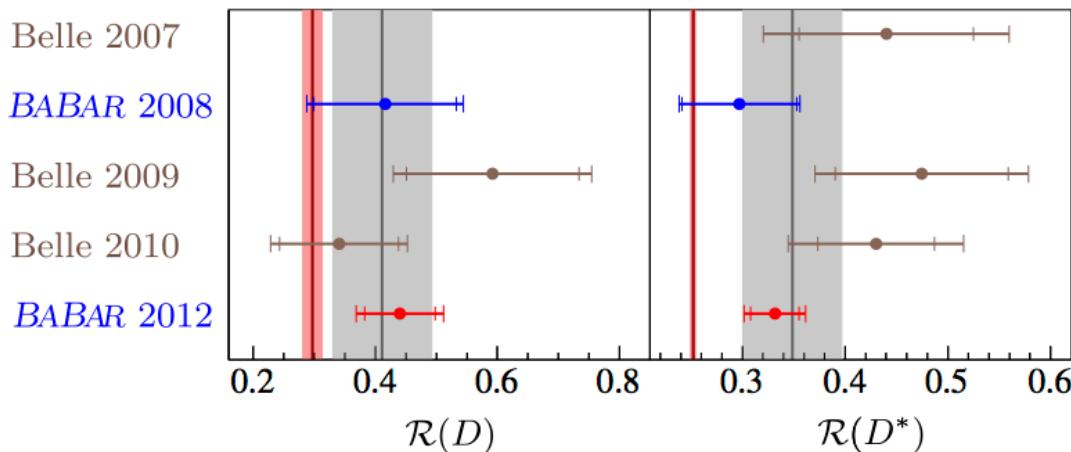

$$\mathcal{H}_c = D^*, D^0, D^+, D_s, \Lambda_c^{(*)}, J/\psi \dots$$

- **Clean prediction from SM**
 - Partial cancellation of form factors uncertainties in the ratio
 - **Large rate** of charged current decays $\text{BR}(B \rightarrow D^* \tau \bar{\nu}) \sim 1.2\%$ in SM
 - Deviation from unity due to different available phase space (τ, μ)
- **Sensitivity to NP** contributions at tree level

At LHCb...

- Missing momentum of neutrinos not measured: Missing kinematic constraints
- B momentum unknown: approximations
- **Two reconstruction channels for τ**
 - **Muonic mode:** $\tau \rightarrow \mu \nu_\mu \bar{\nu}_\tau$
 - **Hadronic mode:** $\tau \rightarrow \mu^- \pi^+ \pi^- (\pi^0) \bar{\nu}_\tau$

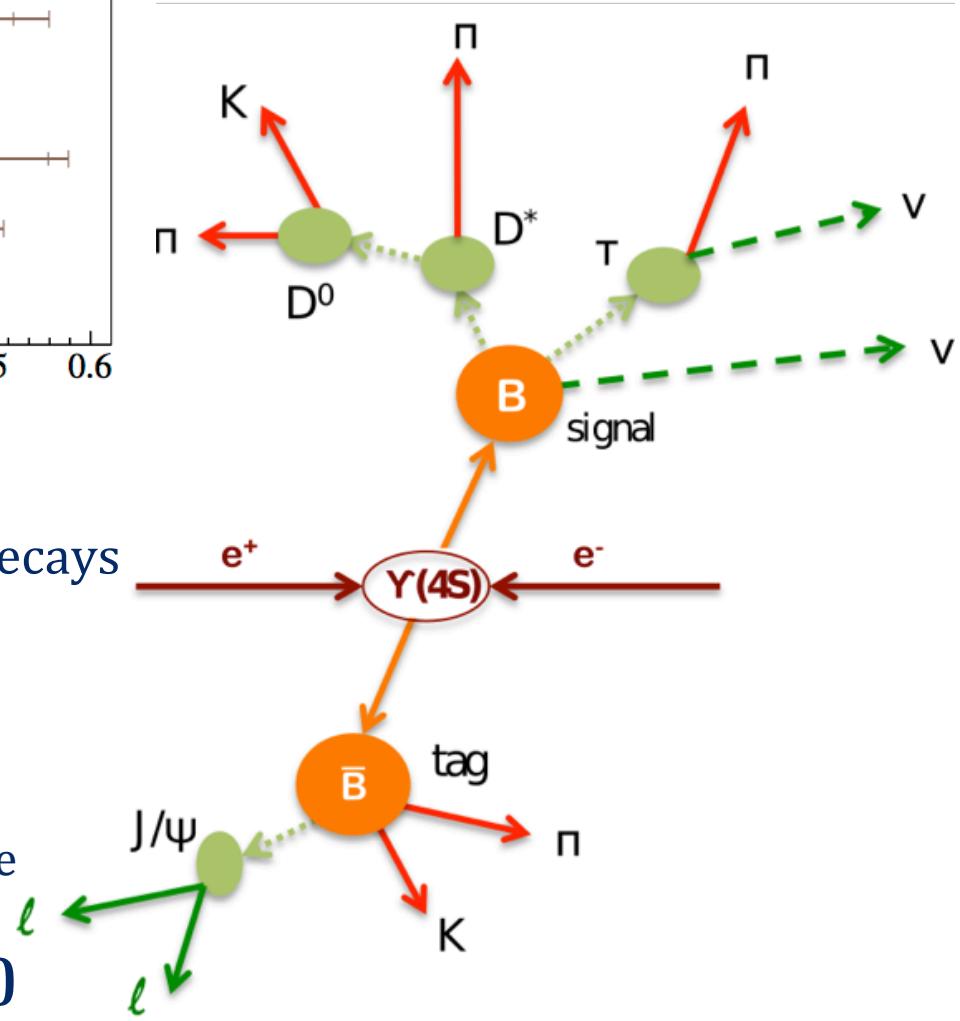

B-factories

Before LHCb...

Belle and BaBar studied semitauonic B decays at the **B-factories**

- e^+e^- collisions producing $\Upsilon(4S) \rightarrow B\bar{B}$
- Measurement of the B-signal using fully reconstructed B-tag and a constraint to the $\Upsilon(4S)$ mass
- Complementary measurement of **R(D)** and **R(D*)** yielded to **3.7 σ** from SM

R(D^{*}) muonic at LHCb

First measurement of R(D^{*}) in a hadron collider, using the muonic decay of τ

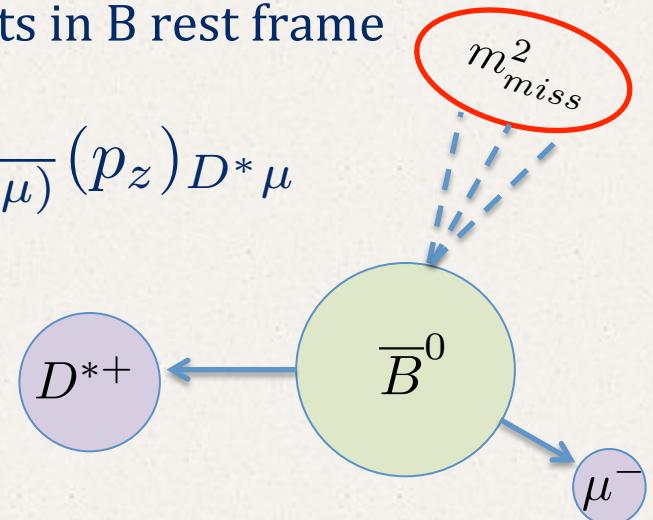

$$R(D^*) = \frac{\mathcal{B}(\bar{B}^0 \rightarrow D^{*+} \tau^- \bar{\nu}_\tau)}{\mathcal{B}(\bar{B}^0 \rightarrow D^{*+} \mu^- \bar{\nu}_\mu)} \quad \text{with } \tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau$$

Features of the analysis...

- Missing kinematic constraints. **Rest frame approximation**
- B boost along z axis \gg boost of decay products in B rest frame

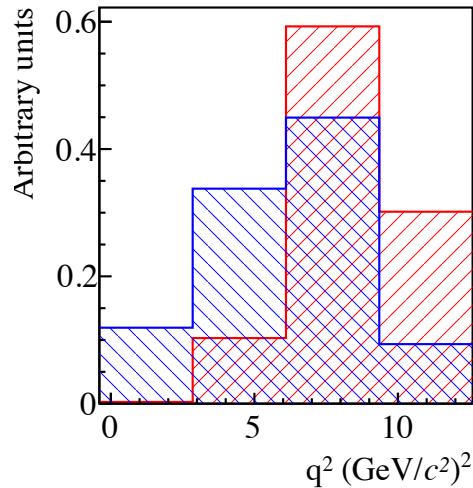

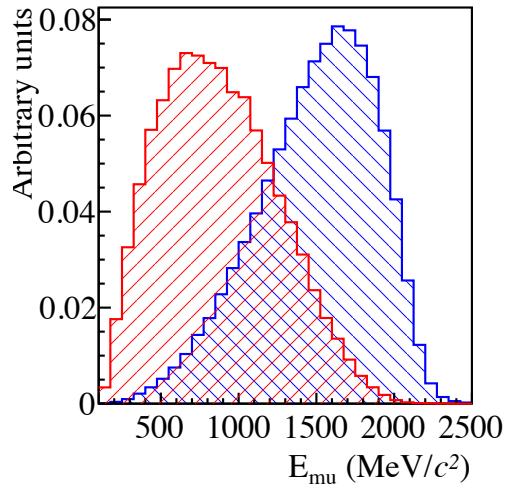

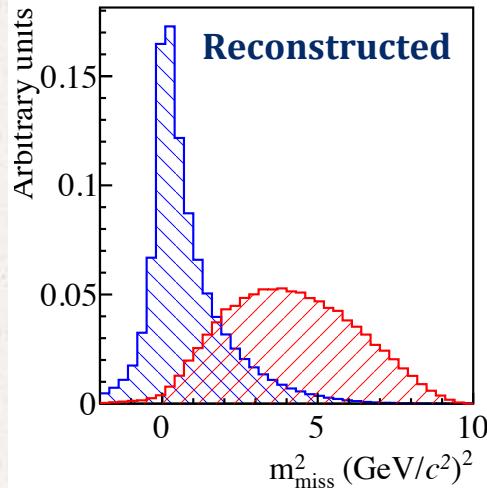

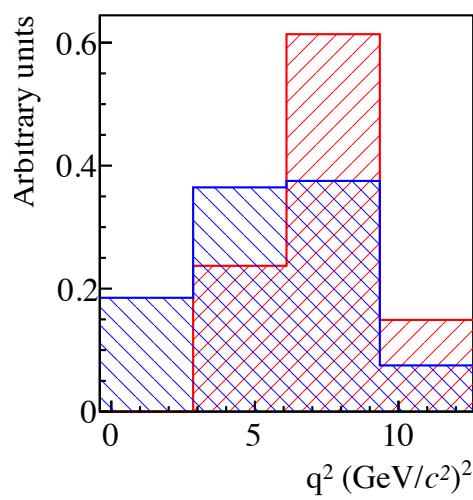

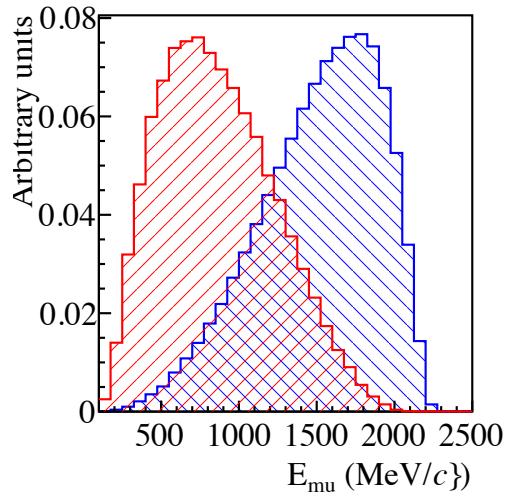

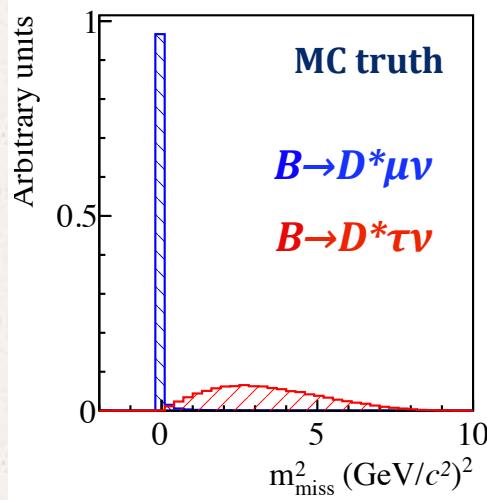

$$(\gamma \beta_z)_B = (\gamma \beta)_{D^* \mu} \Rightarrow (p_z)_B = \frac{m_B}{m(D^* \mu)} (p_z)_{D^* \mu}$$

18 % resolution on p_B , good enough to preserve signal and background discrimination

R(D^{*}) muonic at LHCb

18 % resolution on p_B , good enough to preserve signal and background discrimination

R(D^{*}) muonic at LHCb

~~LHCb~~

Result: separate τ and μ components via a **3D binned template fit** to the q^2 , m_{miss}^2 and E_μ^* distributions

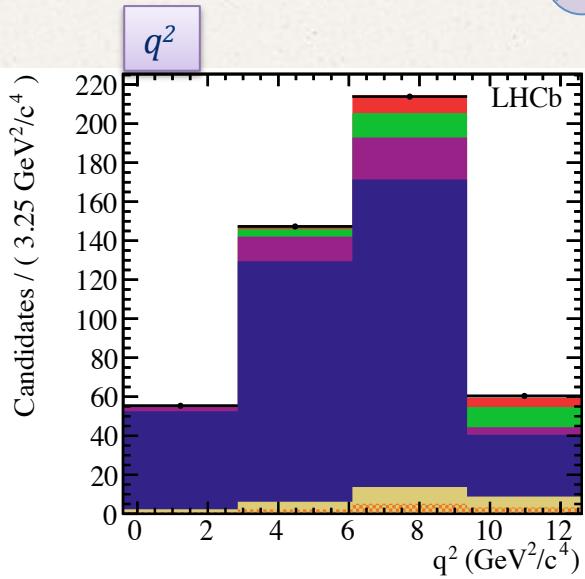

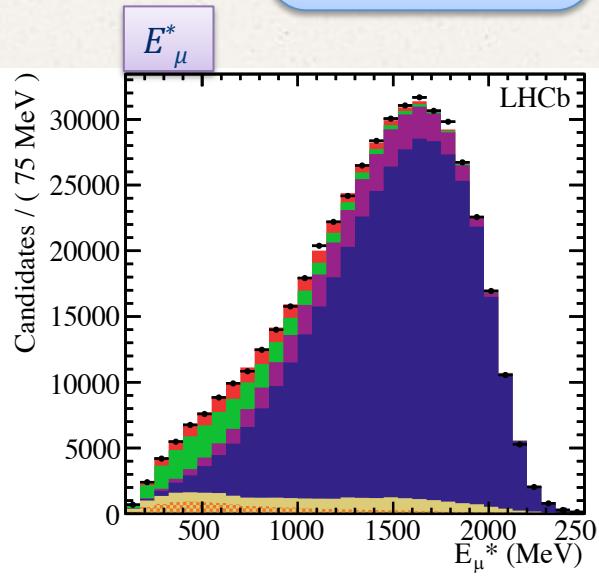

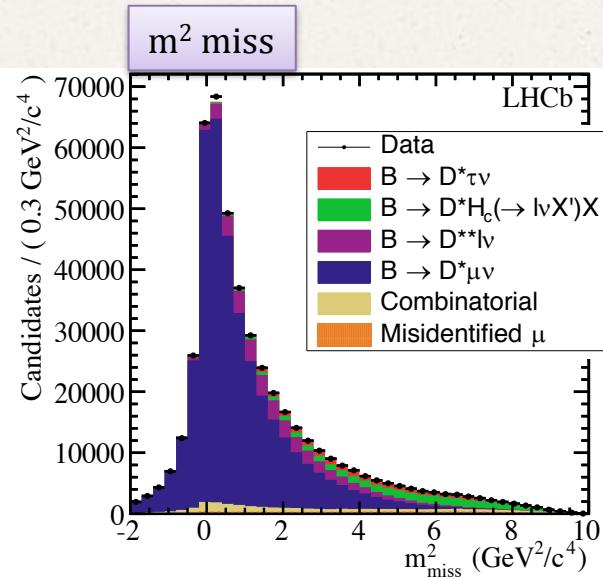

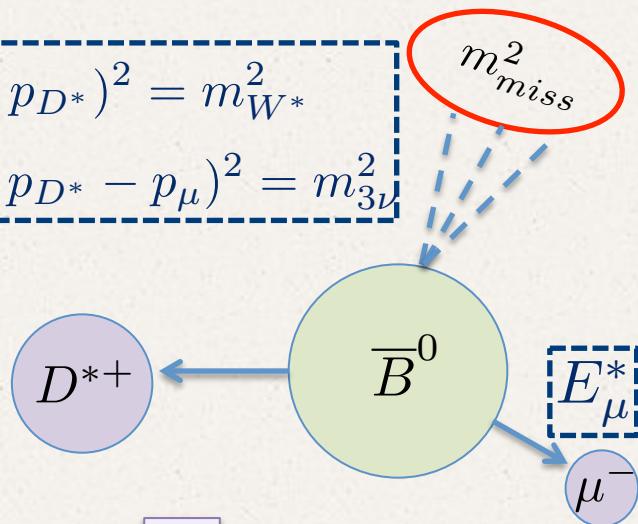

$$R(D^*) = 0.336 \pm 0.027(stat) \pm 0.030(syst)$$

$$q^2 = (p_B - p_{D^*})^2 = m_{W^*}^2$$

$$m_{miss}^2 = (p_B - p_{D^*} - p_\mu)^2 = m_{3\nu}^2$$

[Run 1 data]

$\sim 2.1 \sigma$ from SM

R(D*) muonic at LHCb

Systematics:

| Model uncertainties | Absolute size ($\times 10^{-2}$) |
|---|------------------------------------|
| Simulated sample size | 2.0 |
| Misidentified μ template shape | 1.6 |
| $\bar{B}^0 \rightarrow D^{*+}(\tau^-/\mu^-)\bar{\nu}$ form factors | 0.6 |
| $\bar{B} \rightarrow D^{*+}H_c(\rightarrow \mu\nu X')X$ shape corrections | 0.5 |
| $\mathcal{B}(\bar{B} \rightarrow D^{**}\tau^-\bar{\nu}_\tau)/\mathcal{B}(\bar{B} \rightarrow D^{**}\mu^-\bar{\nu}_\mu)$ | 0.5 |
| $\bar{B} \rightarrow D^{**}(\rightarrow D^*\pi\pi)\mu\nu$ shape corrections | 0.4 |
| Corrections to simulation | 0.4 |
| Combinatorial background shape | 0.3 |
| $\bar{B} \rightarrow D^{**}(\rightarrow D^{*+}\pi)\mu^-\bar{\nu}_\mu$ form factors | 0.3 |
| $\bar{B} \rightarrow D^{*+}(D_s \rightarrow \tau\nu)X$ fraction | 0.1 |
| Total model uncertainty | 2.8 |
| Normalization uncertainties | Absolute size ($\times 10^{-2}$) |
| Simulated sample size | 0.6 |
| Hardware trigger efficiency | 0.6 |
| Particle identification efficiencies | 0.3 |
| Form-factors | 0.2 |
| $\mathcal{B}(\tau^- \rightarrow \mu^-\bar{\nu}_\mu\nu_\tau)$ | < 0.1 |
| Total normalization uncertainty | 0.9 |
| Total systematic uncertainty | 3.0 |

R(D*) hadronic at LHCb

- First measurement of R(D*) using the hadronic τ decay with $\tau^- \rightarrow \pi^- \pi^+ \pi^- (\pi^0) \nu_\tau$
- What is measured:

$$R_{had}(D^{*-}) = \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \tau^+ \nu_\mu)}{\mathcal{B}(B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+)} = \frac{N_{sig}}{N_{norm}} \times \frac{\epsilon_{norm}}{\epsilon_{sig}} \times \frac{1}{\mathcal{B}(\tau^+ \rightarrow \pi^+ \pi^- \pi^+ (\pi^0) \bar{\nu}_\tau)}$$

Overlapping signal
decay mode

- Approximations are done to reconstruct the B and τ momentum. Good precision obtained
- Signal and normalization same visible state: $D^{*-} \pi^- \pi^+ \pi^-$
- Most of the theoretical and experimental uncertainties cancel out in the ratio
- $R(D^{*-})$ obtained from:

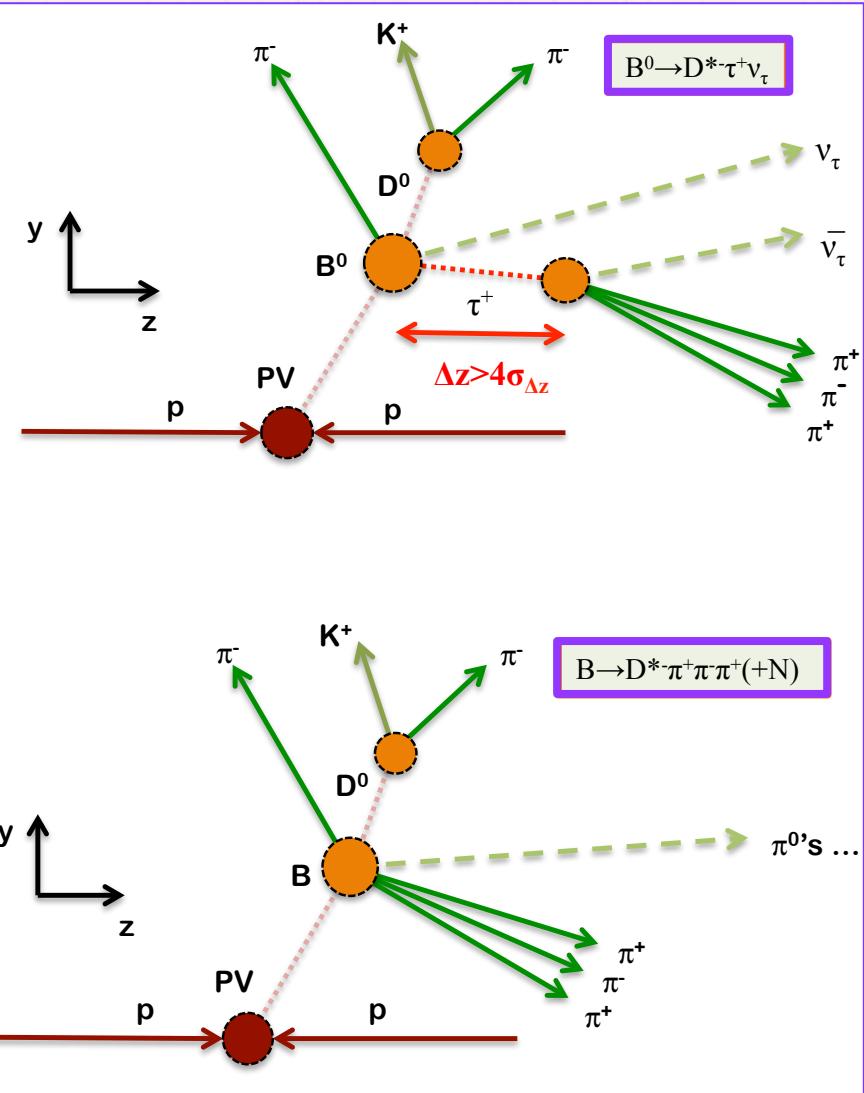

| τ decay mode | BR (%) [PDG-2017] |
|---|-----------------------------------|
| $\tau \rightarrow \mu \nu_\mu \nu_\tau$ | 17.39 ± 0.04 |
| $\tau \rightarrow e \nu_\mu \nu_\tau$ | 17.82 ± 0.04 |
| $\tau \rightarrow \pi^- \pi^+ \pi^- \nu_\tau$ | 9.31 ± 0.05 |
| $\tau \rightarrow \pi^- \pi^+ \pi^- \pi^0 \nu_\tau$ | 4.62 ± 0.05 |
| $\tau \rightarrow \pi^- \nu_\tau$ | 10.82 ± 0.05 |
| $\tau \rightarrow \rho^- \nu_\tau$ | 25.49 ± 0.09 |

$$R(D^{*-}) = R_{had}(D^{*-}) \times \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+)}{\mathcal{B}(B^0 \rightarrow D^{*-} \mu^+ \nu_\mu)}$$

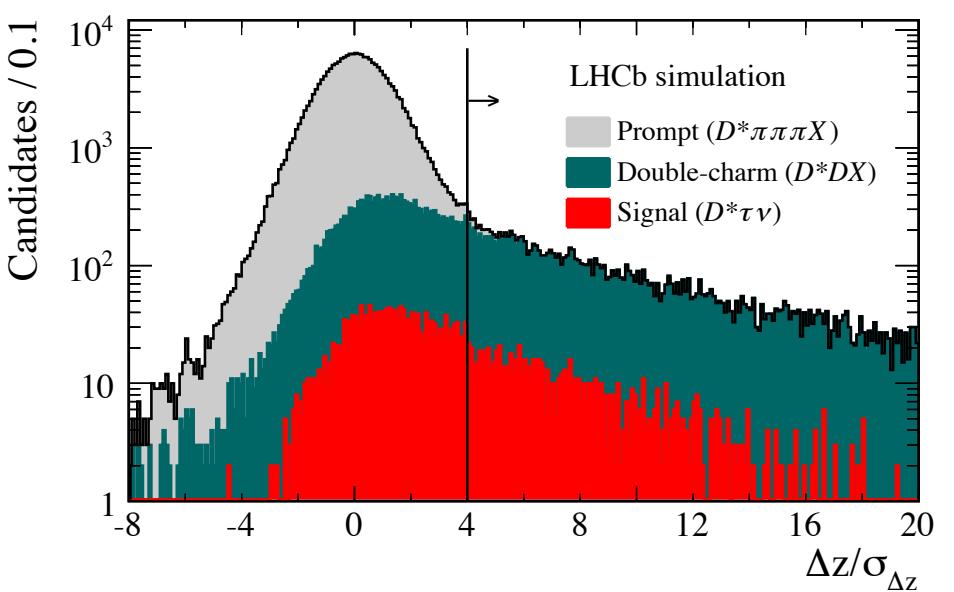

[4.0 % precision]

[2.2 % precision]

R(D*) hadronic at LHCb

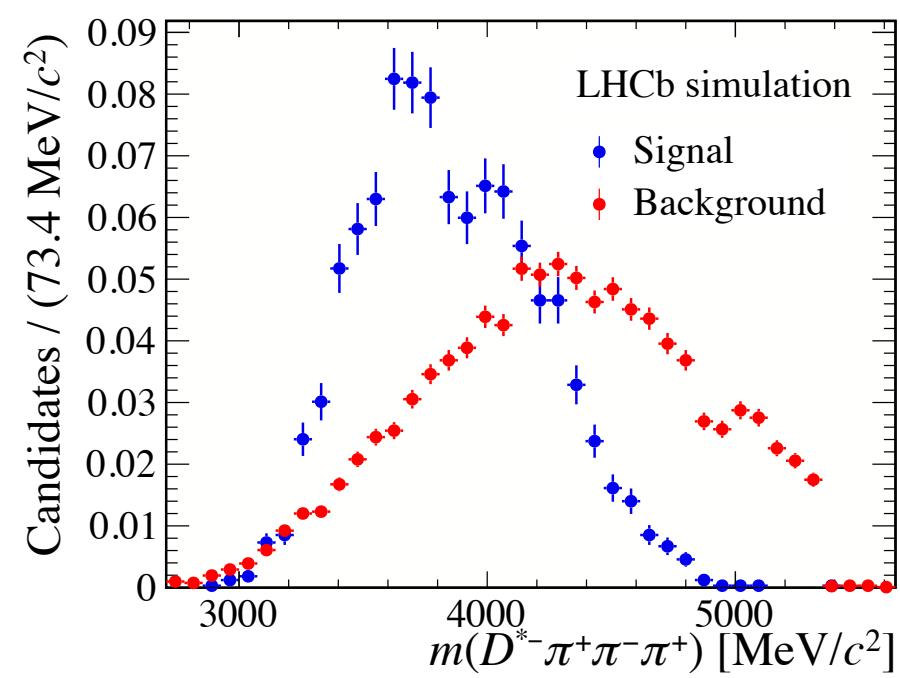

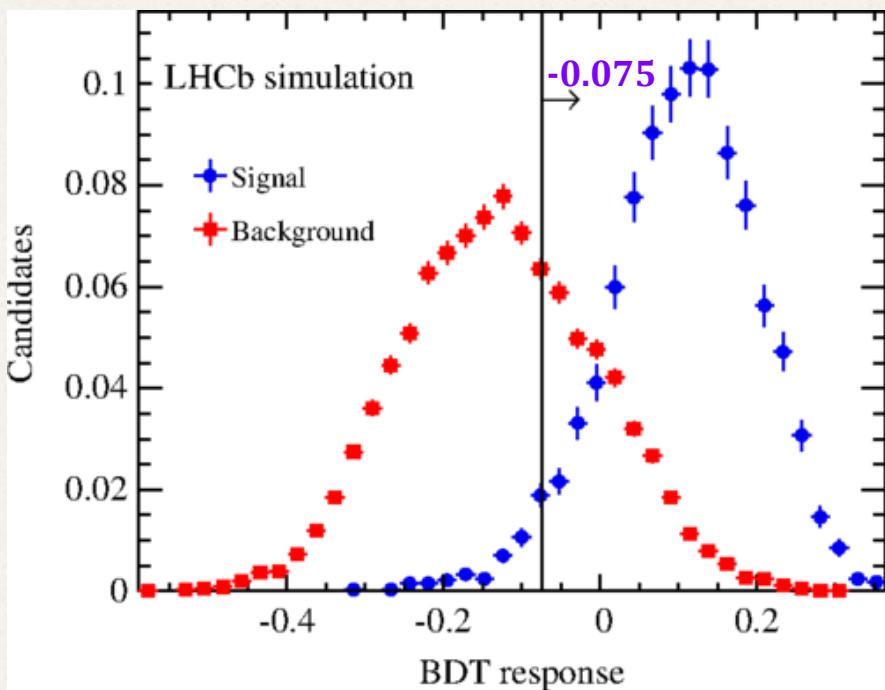

- Largest background due to $B \rightarrow D^* \pi^+ \pi^- \pi^+ X$ (neutrals), where 3 pions come from the B vertex (100 higher than the signal)
 - Requirement: decay topology with minimum distance between B and τ vertices: $\Delta z > 4 \sigma_{\Delta z}$
 - **Suppressed by 3 orders of magnitude**
- 2nd largest background is the double charm $B \rightarrow D^* D_s^+ X$: Multivariate Analysis

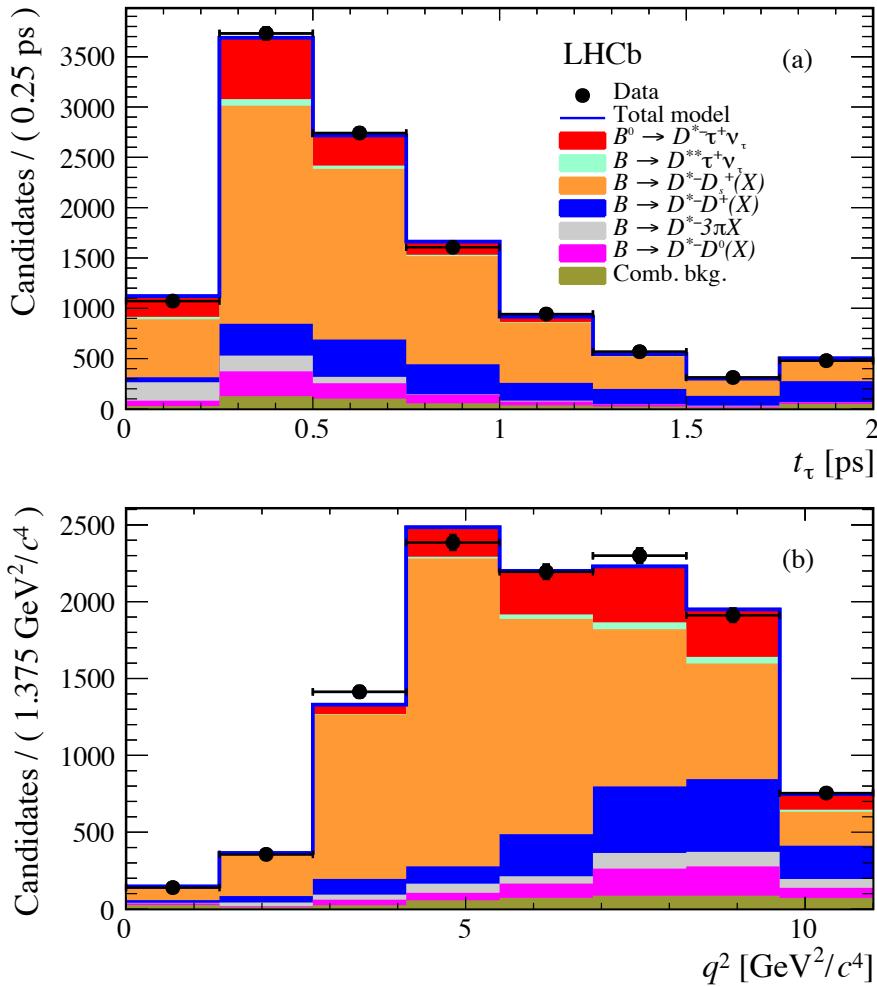

R(D*) hadronic at LHCb

- Most important background after the inversion cut comes from $B \rightarrow D^* D_s^+ X$
- Multivariate Analysis: 18 variables combined in a **BDT**:
 - 3 π variables
 - $D^* 3\pi$ dynamics
 - Neutral isolation variables

BDT used as variable in the fit to extract signal yield

$R(D^*)$ hadronic at LHCb

Result Run 1 data:

- $N(B^0 \rightarrow D^* \pi^+ \pi^- \pi^+)$ unbinned likelihood fit to $M(D^* \pi^+ \pi^- \pi^+)$
- $N(B^0 \rightarrow D^* \tau^+ \nu_\tau)$ three dimensional binned fit to data

Variables: τ decay time, q^2 , BDT output

$$R(D^*) = 0.291 \pm 0.019(\text{stat}) \pm 0.026(\text{syst}) \pm 0.013(\text{ext})$$

R(D^{*}) hadronic at LHCb

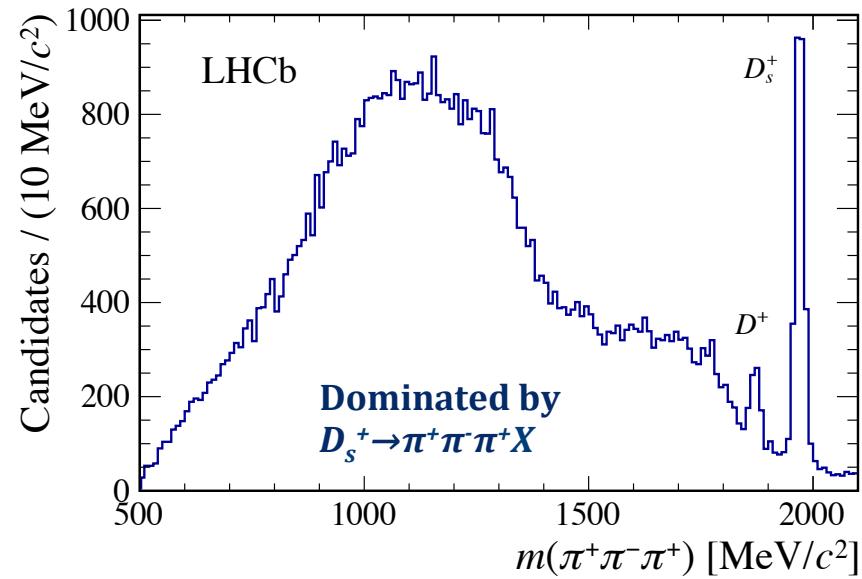

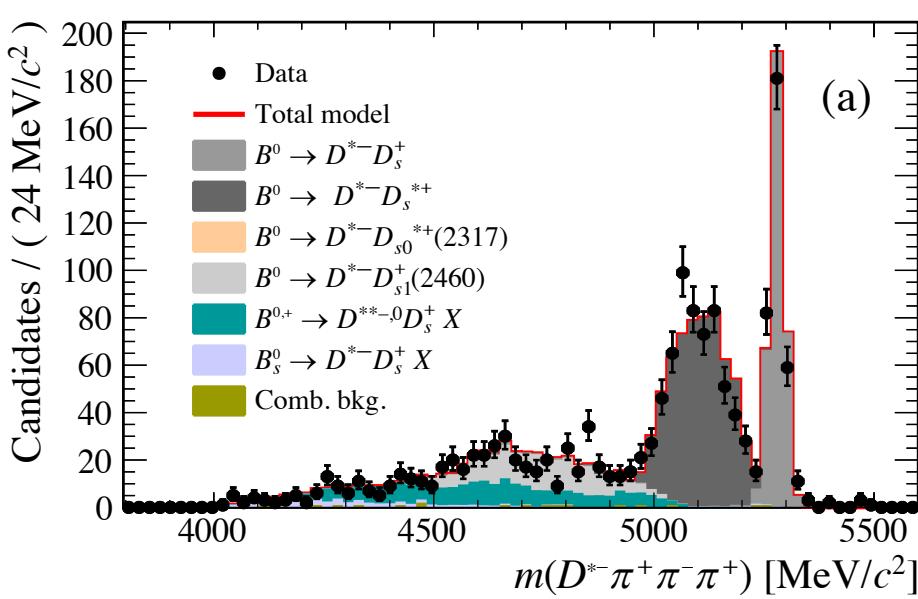

Systematics:

| Contribution | Value in % |
|--|------------|
| $\mathcal{B}(\tau^+ \rightarrow 3\pi\bar{\nu}_\tau)/\mathcal{B}(\tau^+ \rightarrow 3\pi(\pi^0)\bar{\nu}_\tau)$ | 0.7 |
| Form factors (template shapes) | 0.7 |
| τ polarization effects | 0.4 |
| Other τ decays | 1.0 |
| $B \rightarrow D^{**}\tau^+\nu_\tau$ | 2.3 |
| $B_s^0 \rightarrow D_s^{**}\tau^+\nu_\tau$ feed-down | 1.5 |
| $D_s^+ \rightarrow 3\pi X$ decay model | 2.5 |
| D_s^+, D^0 and D^+ template shape | 2.9 |
| $B \rightarrow D^{*-}D_s^+(X)$ and $B \rightarrow D^{*-}D^0(X)$ decay model | 2.6 |
| $D^{*-}3\pi X$ from B decays | 2.8 |
| Combinatorial background (shape + normalization) | 0.7 |
| Bias due to empty bins in templates | 1.3 |
| Size of simulation samples | 4.1 |
| Trigger acceptance | 1.2 |
| Trigger efficiency | 1.0 |
| Online selection | 2.0 |
| Offline selection | 2.0 |
| Charged-isolation algorithm | 1.0 |
| Normalization channel | 1.0 |
| Particle identification | 1.3 |
| Signal efficiencies (size of simulation samples) | 1.7 |
| Normalization channel efficiency (size of simulation samples) | 1.6 |
| Normalization channel efficiency (modeling of $B^0 \rightarrow D^{*-}3\pi$) | 2.0 |
| Form factors (efficiency) | 1.0 |
| Total uncertainty | 9.1 |

R(D*) hadronic at LHCb

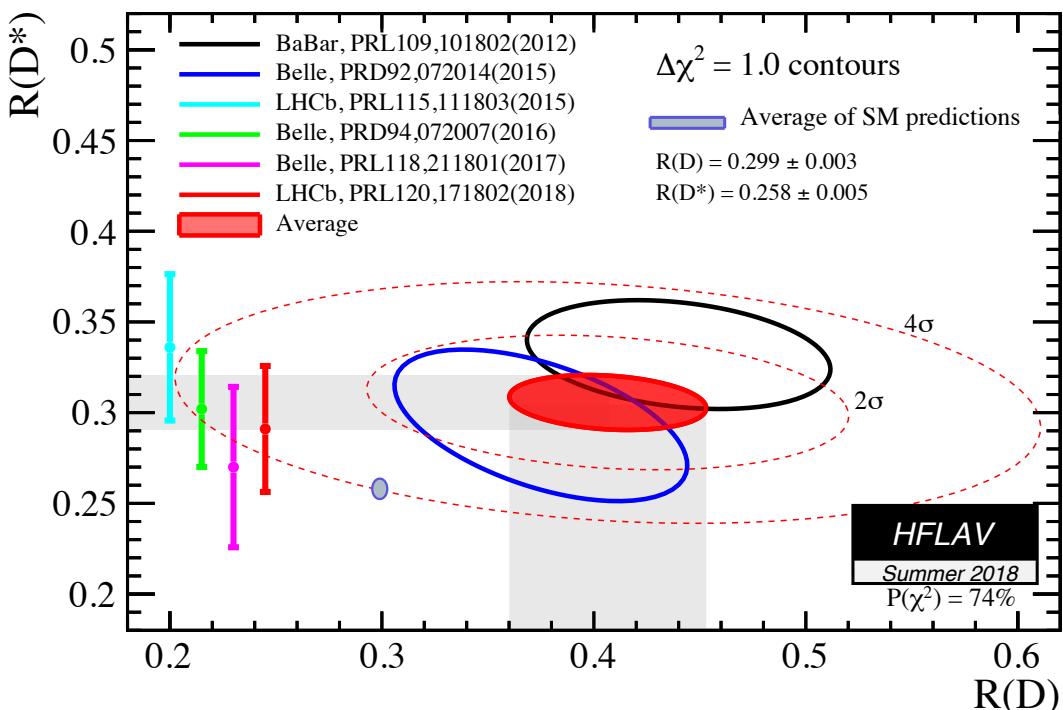

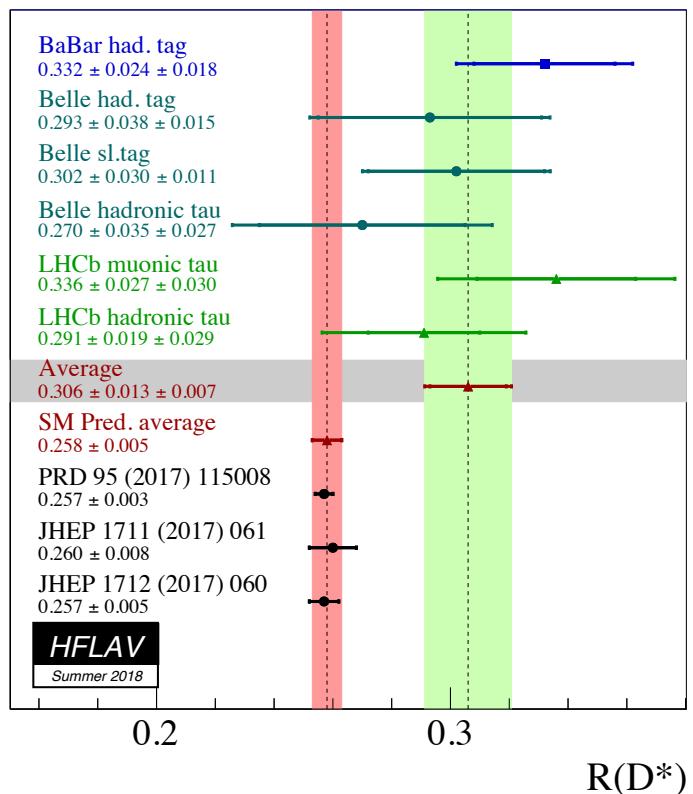

Main systematic uncertainties due to:

- Size of **simulated sample**
- Shape of the **background $B \rightarrow D^* D_s^+ X$**
- $D_{(s)}^+ \rightarrow \pi^+ \pi^- \pi^+ X$ decay mode. **BESII** future measurement will reduce this uncertainty. Improvement as well of the upgraded ECAL
- Branching fraction of normalisation mode $B^0 \rightarrow D^* \pi^+ \pi^- \pi^+$ known with $\sim 4\%$ precision. **Belle II** can measure it precisely

$R(D^*)$ global picture

- $R(D^*)$ world average is in tension with the SM at the level of 3.0σ

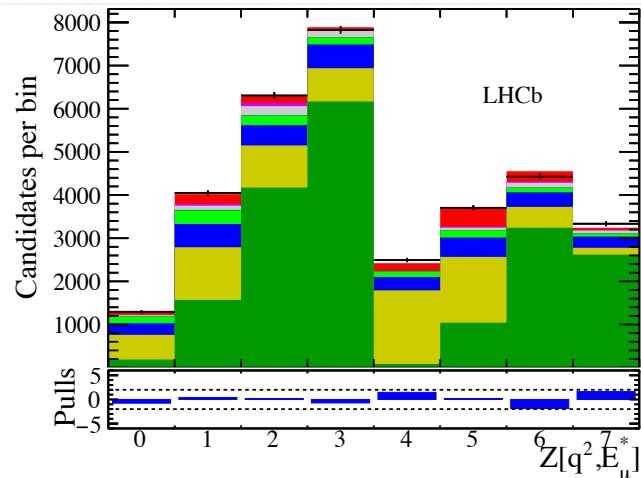

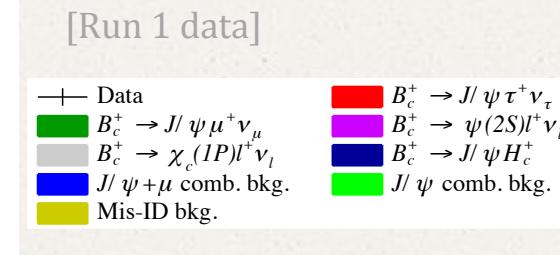

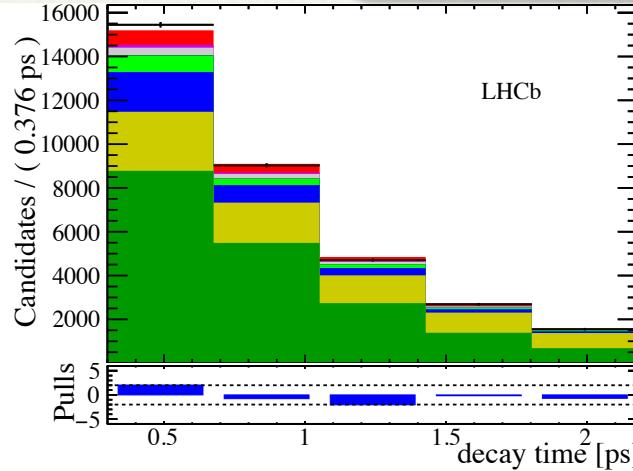

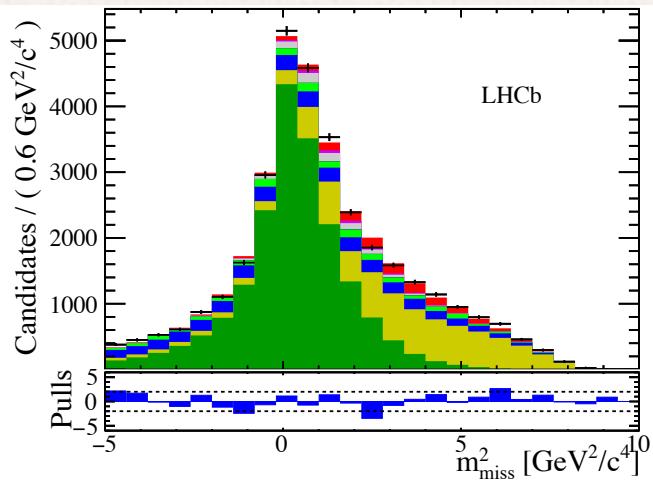

- WA combination of $R(D)$ and $R(D^*)$ is in tension with SM at the **3.8σ level**

R(J/ψ) in LHCb

Generalization of R(D^*) in the B_c sector

$$R(J/\psi) = \frac{\mathcal{B}(B_c^+ \rightarrow J/\psi \tau^+ \nu_\tau)}{\mathcal{B}(B_c^+ \rightarrow J/\psi \mu^+ \nu_\mu)}$$

with $\tau^+ \rightarrow \mu^+ \nu_\mu \bar{\nu}_\tau$

- Form factors unconstrained experimentally.
Poorly calculated from theory

Result: 3D binned maximum likelihood fit to data.

Variables: decay time, m^2_{miss} , $Z(E_\mu^* q^2)$

$$R(J/\psi) = 0.71 \pm 0.17(\text{stat}) \pm 0.18(\text{syst})$$

$$R_{SM}(J/\psi) \in [0.25, 0.28]$$

~2σ from SM

R(J/ψ) in LHCb

Systematics:

| Source of uncertainty | Size ($\times 10^{-2}$) |
|--|---------------------------|
| Finite simulation size | 8.0 |
| $B_c^+ \rightarrow J/\psi$ form factors | 12.1 |
| $B_c^+ \rightarrow \psi(2S)$ form factors | 3.2 |
| Fit bias correction | 5.4 |
| Z binning strategy | 5.6 |
| Mis-ID background strategy | 5.6 |
| combinatorial background cocktail | 4.5 |
| combinatorial J/ψ background scaling | 0.9 |
| $B_c^+ \rightarrow J/\psi H_c X$ contribution | 3.6 |
| $\psi(2S)$ and χ_c feed-down | 0.9 |
| Weighting of simulation samples | 1.6 |
| Efficiency ratio | 0.6 |
| $\mathcal{B}(\tau^+ \rightarrow \mu^+ \nu_\mu \bar{\nu}_\tau)$ | 0.2 |
| Systematic uncertainty | 17.7 |
| Statistical uncertainty | 17.3 |

Rare $b \rightarrow sll$ decays

A horizontal bar at the bottom of the slide, consisting of a thick green line followed by a thinner white line.

Rare $b \rightarrow sll$ decays

Flavour Changing Neutral Current transitions. Proceed via loop diagrams.

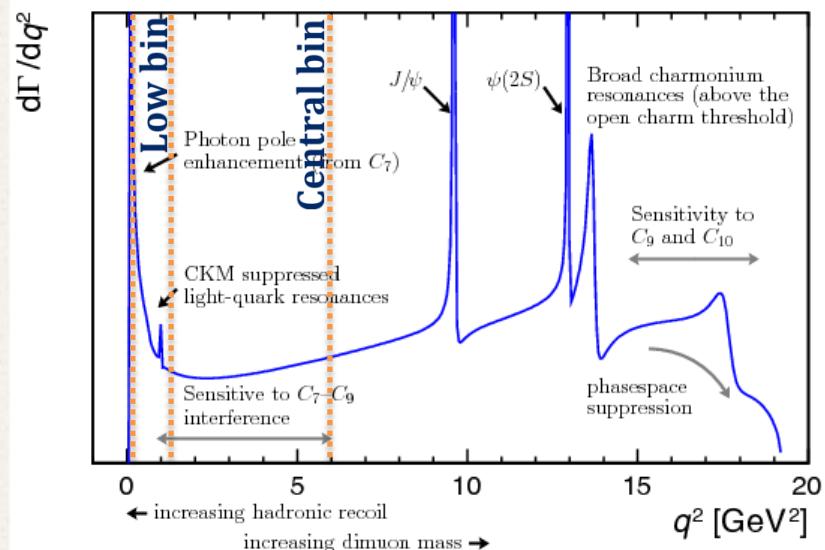

Within a given range of the dilepton mass squared, q^2 :

$$R_X[q_{min}^2, q_{max}^2] = \frac{\int_{q_{min}^2}^{q_{max}^2} dq^2 \frac{d\Gamma(B \rightarrow X \mu^+ \mu^-)}{dq^2}}{\int_{q_{min}^2}^{q_{max}^2} dq^2 \frac{d\Gamma(B \rightarrow X e^+ e^-)}{dq^2}} \quad \text{with } X = K, K^*, \phi \dots$$

- **SM expectation $R_x=1$,** neglecting lepton masses
 - Partial cancellation of hadronic uncertainties in theoretical predictions
- **Suppressed in SM:** more sensitive to NP

At LHCb...

- Extremely challenging due to significant differences in the way μ and e interact with the detector:
Bremsstrahlung, trigger
- **LHCb published measurements:**
 - R_K
 - R_{K^*}

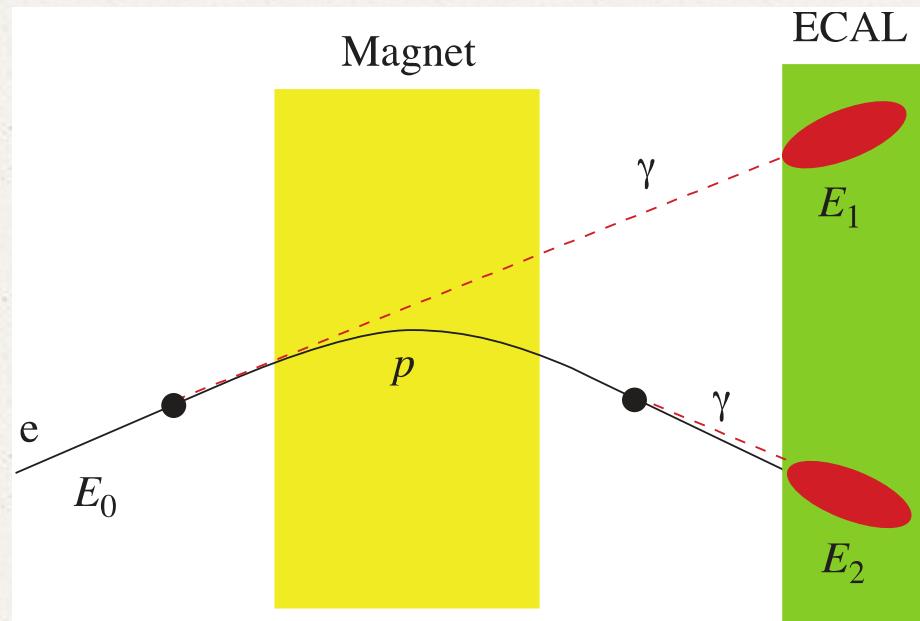

R(K*) at LHCb

LHCb measured **R(K*)** for $q^2 \in [0.045, 1.1]$ and $[1.1, 6.0]$ GeV $^2/c^4$, with $K^{*0} \rightarrow K^+ \pi^-$
 Double ratio to reduce systematics:

$$R(K^*) = \frac{\mathcal{B}(B^0 \rightarrow K^{*0} \mu^+ \mu^-)}{\mathcal{B}(B^0 \rightarrow K^{*0} J/\psi(\rightarrow (\mu^+ \mu^-)))} / \frac{\mathcal{B}(B^0 \rightarrow K^{*0} e^+ e^-)}{\mathcal{B}(B^0 \rightarrow K^{*0} J/\psi(\rightarrow (e^+ e^-)))}$$

Bremsstrahlung effects: two reconstruction strategies

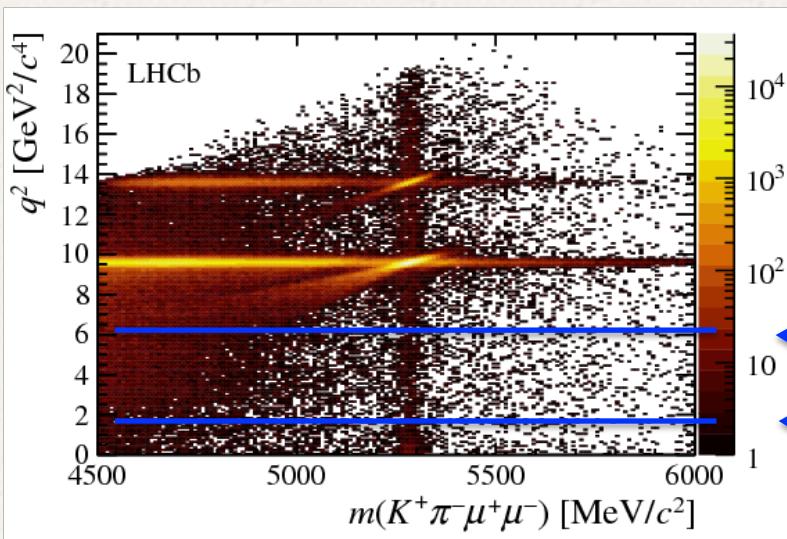

- Downstream of the magnet: Photon energy is likely to be in the same calorimeter cell as the electron
- Upstream of the magnet: Photon energy is likely to be in different calorimeter cell than electron

R(K*) at LHCb

Bremsstrahlung effects

- Recovery procedure → improvement momentum resolution, B mass resolution
 - Worse separation of partially reconstructed backgrounds
 - Background from the J/ψ and $\psi(2S)$ contaminate the signal region
- [Run 1 data]

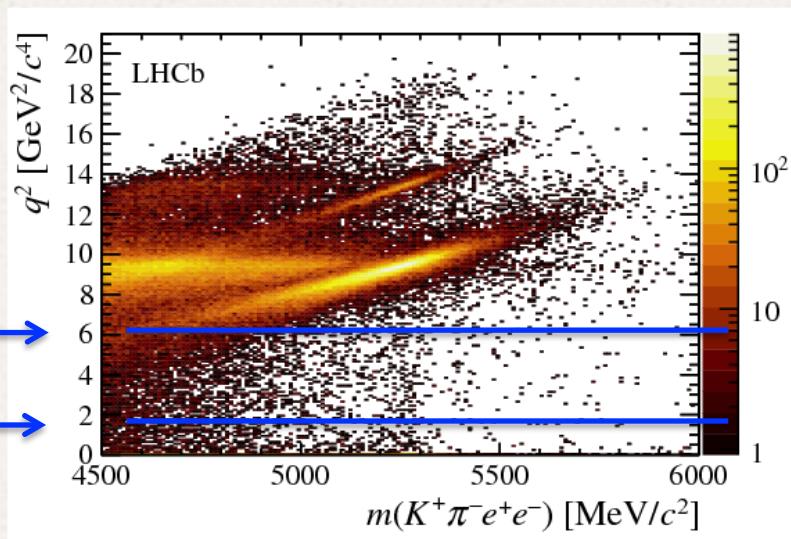

$\Psi(2S)$

J/ψ

Central bin

Low bin

- Electron sample is separated in **3 Bremsstrahlung categories** (0γ , 1γ , $\geq 2\gamma$)
- **3 types of trigger:** electrons (L0E), hadrons (L0H) and signal independence (L0I)

Maximize the electron sample size

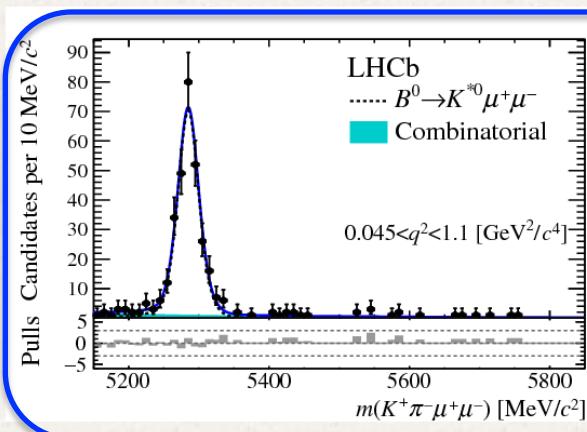

R(K*) at LHCb

Result: Fit to B mass distribution in lower and central q^2 bin

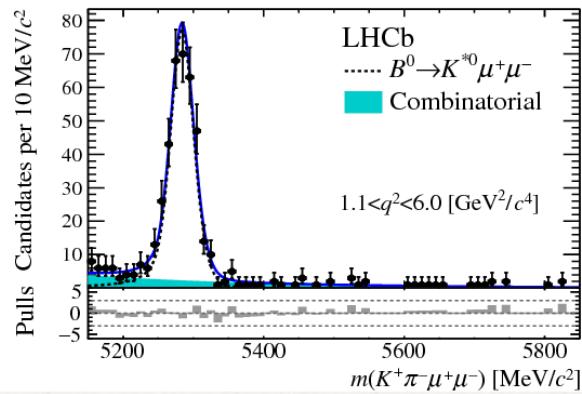

[Run 1 data]

Simultaneous fit $M(K^+\pi^-\ell^+\ell^-)$ to the J/ψ and non-resonant channels

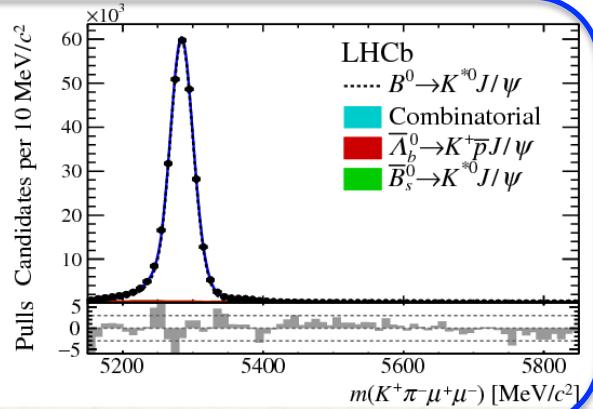

Low q^2 bin

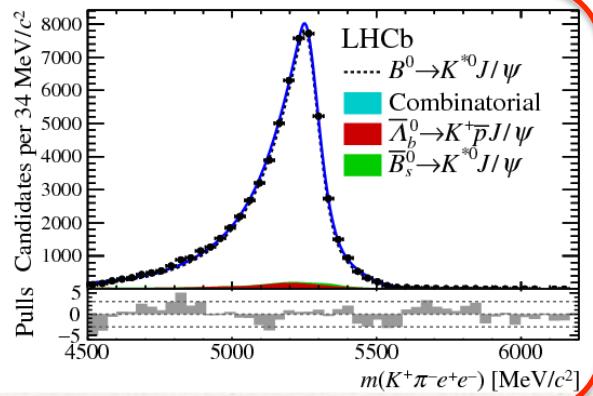

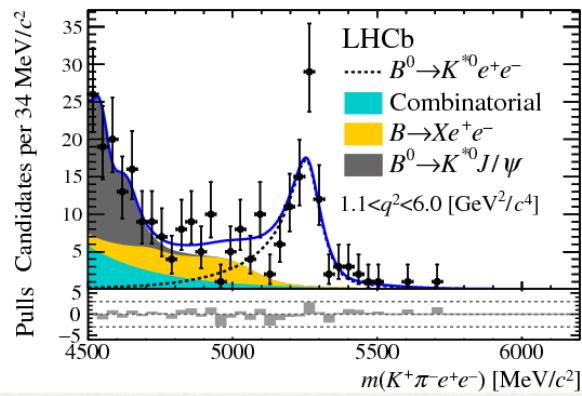

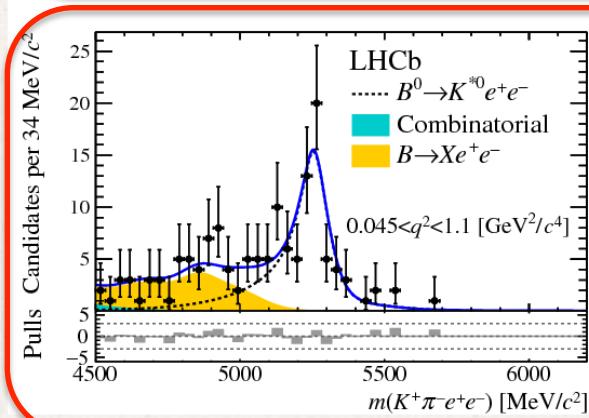

Central q^2 bin

Normalization channel

$B^0 \rightarrow K^{*0} \mu^+ \mu^-$

R(K*) at LHCb

[BaBar: PRD 86, 032012](#)

[Belle: PRL 103, 171801](#)

LHCb
THCP

In 2014, LHCb measured **R(K)** for $q^2 \in [1, 6] \text{ GeV}^2/c^4$

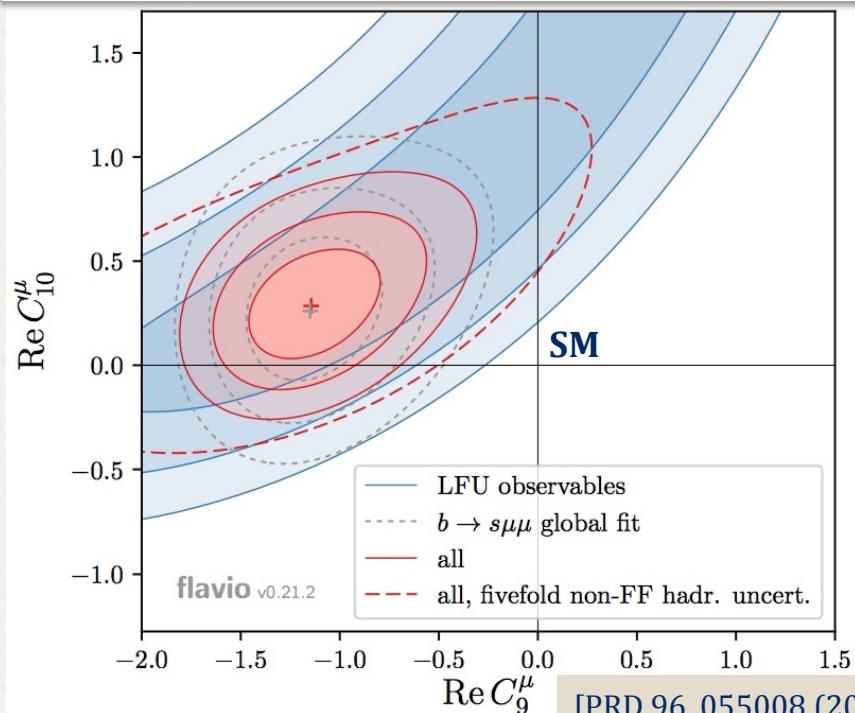

- Double ratio of rare J/ψ channel used to reduce the systematic uncertainties
- Low efficiency for electrons: Bremsstrahlung effects
- Signal extracted via **invariant mass fits**
- Dominant source of systematic uncertainty are due to the parametrization $B^+ \rightarrow J/\psi (\rightarrow e^+e^-)K^+$ mass distribution and trigger efficiencies. Both contribute $\sim 3\%$ to the value of R(K)

$$R(K) = 0.755^{+0.090}_{-0.074}(\text{stat}) \pm 0.036(\text{syst})$$

$$R_{SM}(K) = 1 \pm \mathcal{O}(10^{-2}) \quad \text{2.6 } \sigma \text{ from SM}$$

Global fit. NP preferred over SM by $\sim 4\sigma$

[PRD 96, 055008 (2017)]

Conclusions

Conclusions

LFUV road to new physics!

Semileptonic B decays hint anomalies with respect to the SM at both tree and loop levels

- All measurements presented were performed using Run 1 data and are dominated by statistical uncertainties
- $\sim 9\text{fb}^{-1}$ expected at the end of Run 2
- Run 2 LHCb data: Exciting program ahead! Updates and new analysis: Statistical and systematic uncertainties will be reduced

Ongoing and planned

Any question?

Backup slides

Angular analysis of $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

- $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ exhibits rich angular structure
- Optimized angular observable P'_5
 - The differential decay width can be parametrised in terms of this observable
 - Aim to reduce dependence on hadronic form factors

- LHCb measurement is in tension at the 3.4σ
- Global picture at q^2 bins [4,6] and [6,8] GeV^2/c^4 is in tension with the SM at the level of 2.8σ and 3σ
