

# Search for Higgs boson decays into a $Z$ boson and a light hadronically decaying resonance using 13 TeV $pp$ collision data from the ATLAS detector

The ATLAS Collaboration

A search for Higgs boson decays into a  $Z$  boson and a light resonance in two-lepton plus jet events is performed, using a  $pp$  collision dataset with an integrated luminosity of  $139 \text{ fb}^{-1}$  collected at  $\sqrt{s} = 13 \text{ TeV}$  by the ATLAS experiment at the CERN LHC. The resonance considered is a light boson with a mass below 4 GeV from a possible extended scalar sector, or a charmonium state. Multivariate discriminants are used for the event selection and for evaluating the mass of the light resonance. No excess of events above the expected background is found. Observed (expected) 95% confidence-level upper limits are set on the Higgs boson production cross section times branching fraction to a  $Z$  boson and the signal resonance, with values in the range 17 pb to 340 pb ( $16_{-5}^{+6}$  pb to  $320_{-90}^{+130}$  pb) for the different light spin-0 boson mass and branching fraction hypotheses, and with values of 110 pb and 100 pb ( $100_{-30}^{+40}$  pb and  $100_{-30}^{+40}$  pb) for the  $\eta_c$  and  $J/\psi$  hypotheses, respectively.

The structure of the Standard Model (SM) scalar sector is the subject of intense scrutiny by the ATLAS [1] and CMS [2] collaborations at the CERN Large Hadron Collider (LHC) [3]. At the current level of precision, all of the measured properties of the Higgs boson ( $H$ ) [4, 5] are found to be consistent with their SM predictions [6–10], and no additional Higgs boson has been observed to date. However, given the small natural decay width of the Higgs boson, even small additional contributions from physics beyond the SM can lead to final states with substantial, and thus possibly detectable, branching fractions ( $\mathcal{B}$ ) [11]. This Letter presents a search for Higgs boson decays into a  $Z$  boson and a hadronically decaying light resonance in events with a same-flavor lepton pair (electrons or muons) and a jet in the ATLAS detector. Hadronic decays of an  $\eta_c$  or of a  $J/\psi$  charmonium resonance ( $Q$ ), or of a light spin-0 boson from an extended Higgs sector with a mass up to 4 GeV are considered, and are reconstructed as a single jet.

The Yukawa sector of the SM [12] does not provide an explanation for the observed fermion mass hierarchy. As a result, a wide range of new physics scenarios have been proposed, including the Froggatt–Nielsen mechanism [13] and the Higgs-dependent Yukawa couplings model [14]; for a recent overview, see Ref. [15]. The couplings of the Higgs boson to the third-generation fermions [16–21] have been observed, and a program to probe its couplings to the first- and second-generation charged leptons has been established [22–25]. For its couplings to first- and second-generation quarks, several approaches are being explored. Focusing on the Higgs boson’s coupling to the charm quark, direct searches have been performed for Higgs boson decays into charm quarks [26, 27], and for exclusive decays into a  $J/\psi$  and a photon [28, 29], with no excess observed. Constraints from differential cross section measurements of Higgs boson production versus transverse momentum ( $p_T$ ) have also been derived [30, 31]. Higgs boson decays into a gauge boson and a charmonium state, including an  $\eta_c$  or a  $J/\psi$ , have been proposed as another way to access the coupling of the Higgs boson to the charm quark [32–34], and to probe the nature of the Higgs boson [35]. This search follows the last approach, and maximizes the signal acceptance by focusing on inclusive hadronic final states of the mesons in  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$  decays, which have SM branching fractions of  $1.4 \times 10^{-5}$  and  $2.2 \times 10^{-6}$  [35], respectively.

While the SM posits a single complex Higgs doublet field [36, 37], extended Higgs sectors are motivated [38] and provide a rich phenomenology of additional scalars. Two such models discussed here are the two-Higgs-doublet model (2HDM) [11, 39] and the 2HDM with an additional scalar singlet (2HDM+S) [11, 40]. These represent two of the simplest extensions of the scalar sector, and with their Type-II fermion couplings they are necessary to generate the masses in the minimal supersymmetric SM (MSSM) and the next-to-minimal supersymmetric SM (NMSSM), respectively [41]. Both of these models can include additional light pseudoscalars ( $a$ ) with significant  $\mathcal{B}(H \rightarrow Za)$  or  $\mathcal{B}(H \rightarrow aa)$  [11]. In the 2HDM(+S), these two  $\mathcal{B}$  values can be adjusted independently, therefore searches for  $H \rightarrow aa$  do not constrain  $\mathcal{B}(H \rightarrow Za)$  so that searches for the latter decay are required [11, 34]. Despite the Yukawa nature of the  $a$  to fermion couplings, there are large regions of parameter space depending on the mass of  $a$  and the ratio of the vacuum expectation values of the two Higgs doublet fields ( $\tan\beta$ ) [11], where these pseudoscalars decay mainly to gluons and light up-type quarks, and the decays into down-type fermions are suppressed. These experimental signatures are also relevant in axion models [42–44], models of electroweak baryogenesis [45], neutrino mass models [46], dark-matter models [46, 47], and models of grand unification [48]. Previous searches for Higgs boson decays into light scalars have been performed at the Tevatron [49] and the LHC [50–59]. However, these were mostly focused on searches for  $H \rightarrow aa$ , in final states including leptons, photons or bottom quarks. By targeting the  $H \rightarrow Za$ ,  $a \rightarrow$  hadrons decay channel, this search accesses new, previously unexplored regions of the parameter space.

Searches for hadronic decays of light resonances are challenging at the LHC due to the large multijet background. However, substantial progress has been made in the use of jet substructure techniques in

boosted final states [60], typically in searches or measurements involving heavy resonances [61, 62]. In this work, jet substructure variables enable the reconstruction of a light, boosted, hadronic final state. Information from the individual substructure variables is combined using machine learning techniques. Specifically, for event selection, a multilayer perceptron (MLP) [63] classifier is employed. Given the range of masses considered, the classifier is provided with resonance-mass-related information from a separate MLP-based mass estimator, which results in improved classification performance over the full mass range.

This search is performed using the complete Run 2  $pp$  collision dataset, produced between 2015 and 2018 at a center-of-mass energy  $\sqrt{s} = 13$  TeV by the LHC. The data were collected by the ATLAS detector [1] and correspond to an integrated luminosity of  $139 \text{ fb}^{-1}$ .

Monte Carlo (MC) samples of simulated events are used to model the signal selection efficiency. The signal samples were generated via the gluon-gluon fusion process using POWHEG-Box v2 [64–66], with the CT10 NLO parton distribution function (PDF) set [67]. Particle decays, hadronization, parton showers and the underlying event were modeled using PYTHIA v8.212 [68] and EVTGEN v1.6.0 [69], interfaced to the AZNLO [70] set of tuned parameters and the CTEQ6L1 PDF set [71]. NNLO corrections are applied to the  $p_T$  distribution of the Higgs boson. The  $a$  branching fractions were determined using PYTHIA 8 [68] with a 2HDM  $\tan \beta$  value of 1, which predicts  $a \rightarrow gg$  to be the dominant decay mode until  $a \rightarrow c\bar{c}$  becomes kinematically accessible. The signal MC samples used in this analysis have  $a$  masses of 0.5, 0.75, 1, 1.5, 2, 2.5, 3, 3.5, and 4 GeV. The  $Z$  boson is required to decay into pairs of electrons, muons or  $\tau$ -leptons, which are reconstructed from their leptonic decays.

The background is dominated by  $Z$  + jets events, which were modeled using SHERPA 2.2.1 [72] interfaced to the NNPDF 3.0 (NNLO) PDF set [73]. The inclusive production cross sections are known to NNLO in QCD [74]. The  $ZZ$ ,  $ZW$  and  $t\bar{t}$  processes contribute  $< 1\%$  of the total background in this search. The diboson backgrounds were modeled using SHERPA 2.2.1 interfaced to the NNPDF 3.0 (NNLO) PDF set, except for gluon-induced  $ZZ$  production, which was modeled using SHERPA 2.2.2 [72]. All of the SHERPA samples used a set of tuned parameters developed by the SHERPA authors. The  $t\bar{t}$  process was modeled using POWHEG-Box v2, while the subsequent decay, hadronization, parton shower and underlying event were modeled using PYTHIA v8.230 and EVTGEN v1.6.0. The NNPDF 2.3 (LO) PDF set [75] and the A14 set of tuned parameters [76] were used.

The simulation of the ATLAS detector [77] in GEANT4 [78] was used to model the interaction of particles with the detector in all the MC samples. Data-driven corrections are applied to the event-level trigger efficiencies, the jet vertex tagging efficiency [79], the electron [80] reconstruction, identification, and isolation efficiencies, and the muon [81] reconstruction, isolation, and track-to-vertex association efficiencies.

Events are selected by a combination of single electron or muon triggers for each data-taking period [82–85], and the online lepton reconstructed by the trigger is required to be within  $\Delta R = 0.1$  [86] of an offline reconstructed lepton. Events are required to have at least one reconstructed primary interaction vertex [87]. Electron candidates are reconstructed by matching tracks in the inner detector to topological energy clusters in the electromagnetic calorimeter [80], and must pass a likelihood-based selection which requires the shower profile to be compatible with that of an electromagnetic shower. Muons are reconstructed using tracks in the muon spectrometer, matched to tracks in the inner detector where available [88]. Electrons and muons are each required to have  $p_T > 18$  GeV, and at least one must have  $p_T > 27$  GeV. Electrons (muons) are required to be reconstructed within  $|\eta| < 2.47$  ( $|\eta| < 2.7$ ), but electrons within  $1.37 < |\eta| < 1.52$  are excluded. The transverse energy sum in a cone of size  $\Delta R = 0.2$  around the electron (muon) in the

calorimeter must be less than 20% (30%) of the lepton’s  $p_T$ , and the summed  $p_T$  of tracks within a cone of variable size  $\Delta R = \min(0.2, 10 \text{ GeV}/p_T)$  ( $\Delta R = \min(0.15, 10 \text{ GeV}/p_T)$ ) around the electron (muon) must be less than 15% of its  $p_T$ . Contributions from nearby electrons and muons are removed from these cones. If an inner detector track is present, muons must also have a longitudinal impact parameter  $|z_0 \sin \theta| < 0.5 \text{ mm}$ , and a transverse impact parameter  $|d_0| < 1 \text{ mm}$ , relative to the primary interaction vertex. At least two same-flavor opposite-sign electrons or muons are required to pass this selection, and have an invariant mass compatible with the mass of the  $Z$  boson:  $81 \text{ GeV} < m_{\ell\ell} < 101 \text{ GeV}$ . If multiple same-flavor opposite-sign lepton pairs fulfill this requirement, the pairing with an invariant mass closest to that of the  $Z$  boson is chosen.

The hadronically decaying resonance is reconstructed as a single jet using the anti- $k_t$  jet algorithm [89, 90] with a radius parameter of 0.4, formed from topological calorimeter energy clusters [91, 92] and calibrated to the electromagnetic energy scale. Jet energies are corrected for contributions from simultaneous inelastic  $pp$  interactions (pileup) using a jet-area-based technique [93, 94], and calibrated [95, 96] using  $p_T$ - and  $\eta$ -dependent correction factors determined from simulation, with residual corrections from in situ measurements applied to data and internal jet properties. Jets are required to have  $p_T > 20 \text{ GeV}$  and  $|\eta| < 2.5$ , and satisfy a jet cleaning requirement [97]. To reject jets from pileup interactions, jets with  $p_T < 60 \text{ GeV}$  and  $|\eta| < 2.4$  are required to pass a “Jet Vertex Tagger” [79] requirement. An overlap removal procedure resolves cases in which multiple electrons, muons or jets are reconstructed from the same detector signature. Higgs boson candidates are reconstructed from the lepton pair and jet system, which is required to have an invariant mass passing a loose preselection requirement:  $m_{\ell\ell j} < 250 \text{ GeV}$ . If multiple jets satisfy these requirements, the jet with the highest  $p_T$  is selected. The acceptance for this preselection, evaluated using generator-level MC samples, varies between 27% and 29% for the different  $a$  signal hypotheses.

MLPs [63] are used to select signal events passing this preselection. The MLP input variables are built using tracks matched by ghost-association [93] to the calorimeter jet and their angles from the jet axis, in order to benefit from the high resolution of the tracking detector. These tracks must have  $p_T > 500 \text{ MeV}$  and  $|\eta| < 2.5$ , and pass loose quality and track-to-vertex association requirements [98] to reject fake tracks from the reconstruction and tracks from pileup, respectively. Six dimensionless variables are constructed using these tracks: the ratio of the  $p_T$  of the highest- $p_T$  track to the  $p_T$  of the ghost-associated track system; the angular separation,  $\Delta R$ , between the highest- $p_T$  track and the calorimeter jet axis; NSubJettiness 2 [99], using exclusive- $k_t$  subjet axes with radius parameters of 0.2, and a jet axis radius parameter of 0.4; angularity(2) [100]; and  $U_1(0.7)$  and  $M_2(0.3)$ , which are modified energy correlation functions [101] designed for quark–gluon discrimination and to target two-pronged substructure, respectively. These variables primarily capitalize on the presence of a narrow resonance, or two-pronged substructure in the track system. Initially, a *regression MLP* [63], using four layers of twelve neurons, is trained using the above input variables and the  $a$  signal samples to estimate the mass of  $a$ , as shown in Figure 1(a). This estimated mass is then provided alongside the six input variables to a *classification MLP* [63], to inform the classifier about the part of the hadronic resonance mass-spectrum where the specific event lies. This classification MLP has two layers of six and five neurons, and is trained using the  $a$  signal samples and the background samples. The 0.75 GeV  $a$  signal sample is excluded from the training of the classification MLP to ensure an even spacing between the  $a$  mass hypotheses, so the training is not biased towards lower masses. Both MLPs use sigmoidal response functions with summed inputs, and are trained using back-propagation with a mean-square estimator [63], as these resulted in optimal discrimination without overtraining. The addition of the regression MLP was found to result in about a 13% improvement in the  $S/\sqrt{B}$  of the classification MLP, where  $S$  and  $B$  are the expected numbers of signal and background

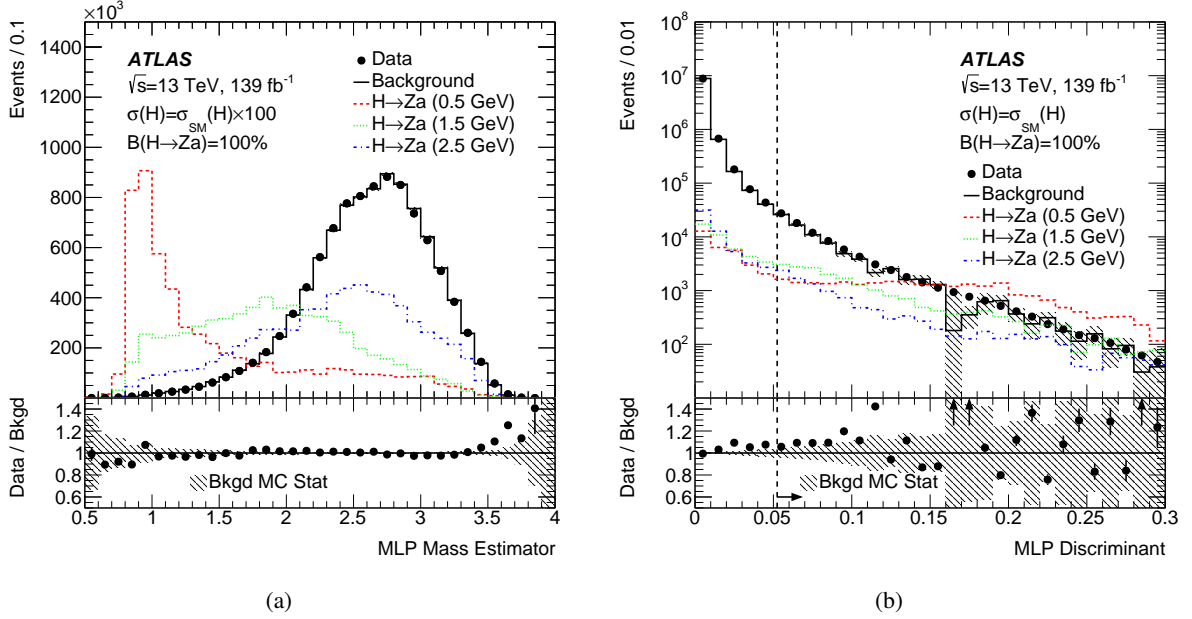

Figure 1: Output of (a) the regression and (b) the classification MLPs, for data, background and three signal hypotheses. Events are required to pass the complete event selection, including the  $120 \text{ GeV} < m_{\ell\ell j} < 135 \text{ GeV}$  requirement, but not the requirement on the classification MLP output variable. The background normalization is set equal to that of the data, and the signal normalizations assume the SM Higgs boson inclusive production cross section and  $\mathcal{B}(H \rightarrow Za) = 100\%$ , and in (a) the signal normalization is scaled up by a factor of 100. The error bars (dashed regions) represent the data (MC) sample statistical uncertainty, in both the histograms and the ratio plots. In (b) the region to the right of the dashed line is the signal region.

events passing the MLP requirement, respectively. The classification MLP output variable ( $M$ ) is shown in Figure 1(b).

The signal region (SR) for this search is defined by the requirements  $120 \text{ GeV} < m_{\ell\ell j} < 135 \text{ GeV}$  and  $M > 0.0524$ , chosen to maximize the expected  $S/\sqrt{B}$ , averaged over the various  $a$  mass hypotheses. The efficiency of this MLP requirement for events passing the preselection is  $(0.761 \pm 0.020)\%$  for the background,  $(5.89 \pm 0.24)\%$  and  $(6.66 \pm 0.26)\%$  for  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$ , respectively, and between  $(1.88 \pm 0.15)\%$  and  $(45.9 \pm 0.8)\%$  for  $H \rightarrow Za$ . The efficiencies for the complete selection are estimated using MC samples, and are  $(0.545 \pm 0.022)\%$  and  $(0.560 \pm 0.022)\%$  for  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$ , respectively, and range between  $(0.140 \pm 0.011)\%$  and  $(3.27 \pm 0.06)\%$  for  $H \rightarrow Za$ . The efficiencies are highest for the lowest  $a$  mass hypotheses, due to higher probabilities to pass the MLP requirement. The efficiency for  $H \rightarrow Z\eta_c$  events to pass the MLP requirement is lower than that of  $H \rightarrow ZJ/\psi$  events, as  $J/\psi$  decays tend to have a lower charged hadron multiplicity. Using the predicted cross section for inclusive SM Higgs boson production of  $55.7^{+3.0}_{-3.9} \text{ pb}$  [102], and  $\mathcal{B}(H \rightarrow Z(Q/a)) = 100\%$ , gives expected signal yields of 4260 and 4370 for  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$ , respectively, and between 1090 and 25600 for  $H \rightarrow Za$ .

A “modified ABCD estimate” of the total background in the SR is derived using four regions:  $A$ , defined by  $0.0341 < M < 0.0524$ , expected to contain about 10% of the total background, and  $155 \text{ GeV} < m_{\ell\ell j} < 175 \text{ GeV}$ ;  $B$ , defined by the  $m_{\ell\ell j}$  requirement of the SR and the  $M$  requirement of region  $A$ ;  $C$ , defined by the  $M$  requirement of the SR and the  $m_{\ell\ell j}$  requirement of  $A$ ; and  $D$ , which is the

SR. An initial data-driven background estimate in the SR is calculated as  $D = BC/A$ , then MC samples, reweighted to match data, are used to correct this estimate for the 13% correlation between the  $m_{\ell\ell_j}$  and  $M$  variables. This reweighting is performed in the  $p_T$  of the calorimeter jet, the number of ghost-associated tracks and  $U_1(0.7)$ . This background estimate is  $82400 \pm 2900$  events in the SR, where the uncertainty is due to the limited data and MC sample statistics. The background estimation method is found to be consistent with data within 1.7 times the total statistical and systematic uncertainty in 14 validation regions, defined in regions of the  $m_{\ell\ell_j}$  and  $M$  variables.

A measure of  $\sigma(pp \rightarrow H)\mathcal{B}(H \rightarrow Z(Q/a))$  is extracted for a given signal hypothesis using a maximum-likelihood fit [103] to the number of events observed in the SR. The systematic uncertainties are included in the likelihood fit as nuisance parameters which modify the signal efficiencies or the simulation-based correction used to calculate the expected background yield. These systematic uncertainties include uncertainties in the signal and background modeling, and experimental uncertainties. The sources of modeling uncertainty include the limited MC sample statistics, renormalization scale and choice of MC generator for the signal and background, and a signal uncertainty to account for the extrapolation from gluon-gluon fusion signal samples to the inclusive Higgs boson production cross section. The effects of factorization scale and PDF uncertainties are found to be negligible. The experimental uncertainties considered are due to the luminosity [104], pileup [105], triggers and lepton [81, 106, 107] and jet [96] reconstruction. The total uncertainty on the extracted signal yield is dominated by the background modeling uncertainties, the largest being due to limited MC sample statistics. The total uncertainty on the background in the SR is 3700 events, where the uncertainty due to the limited data and MC sample statistics is 2900 and the modeling uncertainty is 2300. The data statistical uncertainty corresponds to approximately 8% of the total uncertainty on the extracted signal yield.

The SR contains 82908 data events. This result is compatible with the SM background-only expectation, and the three-body mass distribution is shown in Figure 2. Upper limits at 95% confidence level (CL) are set on  $\sigma(pp \rightarrow H)\mathcal{B}(H \rightarrow Z(Q/a))$  for the various signal hypotheses, using the profile-likelihood test statistic [103] and the CL<sub>s</sub> technique [108]. The observed (expected) upper limits for the  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$  hypotheses are 110 pb and 100 pb ( $100^{+40}_{-30}$  pb and  $100^{+40}_{-30}$  pb), respectively, while the upper limits for the  $H \rightarrow Za$  signal hypotheses are given in Table 1. In the absence of systematic uncertainties, these limits would range between 1.9 pb and 55 pb for the different signal hypotheses. To simplify the interpretation, the upper limits are quoted for  $\mathcal{B}(a \rightarrow gg) = 100\%$  and  $\mathcal{B}(a \rightarrow s\bar{s}) = 100\%$ . Due to the Yukawa-ordering of the decays of Higgs bosons, only decays into gluon and strange quark pairs are considered. The tighter limits for the  $a \rightarrow s\bar{s}$  decays are due to a higher MLP selection efficiency. The systematic uncertainties for  $a \rightarrow gg$  and  $a \rightarrow s\bar{s}$  decay hypotheses are estimated using the inclusive decays as modeled in PUTHIA 8, which is a good approximation due to the dominance of the background modeling uncertainties. This assumption allows a limit to be set on the decay of  $a$  into  $gg$  or  $s\bar{s}$  final states, in any ratio, by using a weighted sum of the two limits.

In conclusion, a search has been performed for Higgs boson decays into a  $Z$  boson and either a  $\eta_c$  or  $J/\psi$  charmonium state, or a light spin-0 boson. No excess is found, and 95% CL upper limits are set on  $\sigma(pp \rightarrow H)\mathcal{B}(H \rightarrow Z(Q/a))$ , with values of 110 pb and 100 pb for the  $H \rightarrow Z\eta_c$  and  $H \rightarrow ZJ/\psi$  hypotheses, respectively, and with values in the range 17 pb to 340 pb for the  $H \rightarrow Za$  signal hypotheses. Assuming the SM prediction for inclusive Higgs boson production, the limits on charmonium decay modes correspond to branching fraction limits in excess of 100%. This is the first direct limit on hadronic decays of a non-SM Higgs boson with a mass below 4 GeV. Due to the large value of  $\mathcal{B}(a \rightarrow \text{hadrons})$  over the entire 2HDM(+S) parameter space, these limits represent tight, direct constraints for low (high)  $\tan \beta$  in the Type-II and Type-III (Type-VI) 2HDM+S [109].

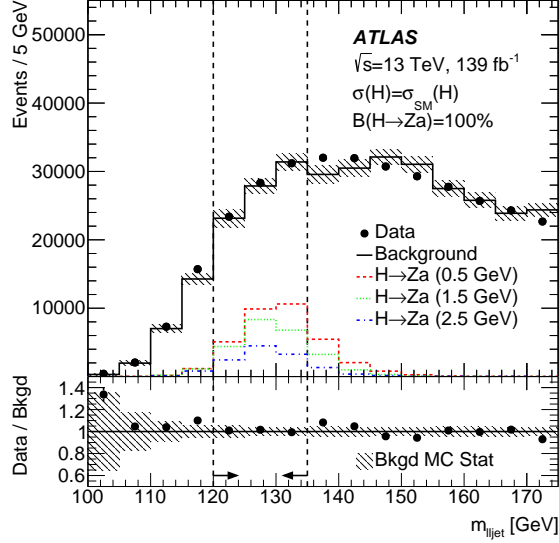

Figure 2: Invariant mass of the lepton pair plus jet system, for data, background and three signal hypotheses. Events are required to pass the complete event selection, including the MLP output variable requirement, but not the  $120 \text{ GeV} < m_{\ell\ell j} < 135 \text{ GeV}$  requirement. The background normalization is defined by the background estimate in the signal region, and the signal normalizations assume the SM Higgs boson inclusive production cross section and  $\mathcal{B}(H \rightarrow Za) = 100\%$ . The error bars (dashed regions) represent the data (MC) sample statistical uncertainty, in both the histograms and the ratio plots. The region between the dashed lines is the signal region.

Table 1: Expected and observed 95% CL upper limits on  $\sigma(pp \rightarrow H)\mathcal{B}(H \rightarrow Za)/\text{pb}$ . These results are quoted for  $\mathcal{B}(a \rightarrow gg) = 100\%$  and  $\mathcal{B}(a \rightarrow s\bar{s}) = 100\%$  for each signal sample.

$a$ mass [GeV]	$a \rightarrow gg$		$a \rightarrow s\bar{s}$

- [86] ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the centre of the detector and the  $z$ -axis along the beam pipe. The  $x$ -axis points from the IP to the centre of the LHC ring, and the  $y$ -axis points upward. Cylindrical coordinates  $(r, \phi)$  are used in the transverse plane,  $\phi$  being the azimuthal angle around the  $z$ -axis. The pseudorapidity is defined in terms of the polar angle  $\theta$  as  $\eta = -\ln \tan(\theta/2)$ .

- <sup>133</sup>Department of Physics, University of Oslo, Oslo; Norway.
- <sup>134</sup>Department of Physics, Oxford University, Oxford; United Kingdom.
- <sup>135</sup>LPNHE, Sorbonne Université, Université de Paris, CNRS/IN2P3, Paris; France.
- <sup>136</sup>Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.
- <sup>137</sup>Konstantinov Nuclear Physics Institute of National Research Centre "Kurchatov Institute", PNPI, St. Petersburg; Russia.
- <sup>138</sup>Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.
- <sup>139</sup>(<sup>a</sup>) Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa; (<sup>b</sup>) Departamento de

Física, Faculdade de Ciências, Universidade de Lisboa, Lisboa;<sup>(c)</sup>Departamento de Física, Universidade de Coimbra, Coimbra;<sup>(d)</sup>Centro de Física Nuclear da Universidade de Lisboa, Lisboa;<sup>(e)</sup>Departamento de Física, Universidade do Minho, Braga;<sup>(f)</sup>Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain);<sup>(g)</sup>Dep Física and CEFITEC of Faculdade de Ciências e Tecnologia, Universidade Nova de Lisboa, Caparica;<sup>(h)</sup>Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.

<sup>140</sup>Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.

<sup>141</sup>Czech Technical University in Prague, Prague; Czech Republic.

<sup>142</sup>Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.

<sup>143</sup>Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.

<sup>144</sup>IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.

<sup>145</sup>Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.

<sup>146</sup><sup>(a)</sup>Departamento de Física, Pontificia Universidad Católica de Chile, Santiago;<sup>(b)</sup>Universidad Andres Bello, Department of Physics, Santiago;<sup>(c)</sup>Instituto de Alta Investigación, Universidad de Tarapacá;<sup>(d)</sup>Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.

<sup>147</sup>Department of Physics, University of Washington, Seattle WA; United States of America.

<sup>148</sup>Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.

<sup>149</sup>Department of Physics, Shinshu University, Nagano; Japan.

<sup>150</sup>Department Physik, Universität Siegen, Siegen; Germany.

<sup>151</sup>Department of Physics, Simon Fraser University, Burnaby BC; Canada.

<sup>152</sup>SLAC National Accelerator Laboratory, Stanford CA; United States of America.

<sup>153</sup>Physics Department, Royal Institute of Technology, Stockholm; Sweden.

<sup>154</sup>Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.

<sup>155</sup>Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.

<sup>156</sup>School of Physics, University of Sydney, Sydney; Australia.

<sup>157</sup>Institute of Physics, Academia Sinica, Taipei; Taiwan.

<sup>158</sup><sup>(a)</sup>E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi;<sup>(b)</sup>High Energy Physics Institute, Tbilisi State University, Tbilisi; Georgia.

<sup>159</sup>Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.

<sup>160</sup>Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.

<sup>161</sup>Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.

<sup>162</sup>International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.

<sup>163</sup>Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo; Japan.

<sup>164</sup>Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.

<sup>165</sup>Tomsk State University, Tomsk; Russia.

<sup>166</sup>Department of Physics, University of Toronto, Toronto ON; Canada.

<sup>167</sup><sup>(a)</sup>TRIUMF, Vancouver BC;<sup>(b)</sup>Department of Physics and Astronomy, York University, Toronto ON; Canada.

<sup>168</sup>Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.

<sup>169</sup>Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.

<sup>170</sup>Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.

<sup>171</sup>Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.

- <sup>172</sup>Department of Physics, University of Illinois, Urbana IL; United States of America.
- <sup>173</sup>Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- <sup>174</sup>Department of Physics, University of British Columbia, Vancouver BC; Canada.
- <sup>175</sup>Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- <sup>176</sup>Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- <sup>177</sup>Department of Physics, University of Warwick, Coventry; United Kingdom.
- <sup>178</sup>Waseda University, Tokyo; Japan.
- <sup>179</sup>Department of Particle Physics, Weizmann Institute of Science, Rehovot; Israel.
- <sup>180</sup>Department of Physics, University of Wisconsin, Madison WI; United States of America.
- <sup>181</sup>Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.
- <sup>182</sup>Department of Physics, Yale University, New Haven CT; United States of America.
- <sup>a</sup> Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- <sup>b</sup> Also at Centro Studi e Ricerche Enrico Fermi; Italy.
- <sup>c</sup> Also at CERN, Geneva; Switzerland.
- <sup>d</sup> Also at CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.
- <sup>e</sup> Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.
- <sup>f</sup> Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.
- <sup>g</sup> Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- <sup>h</sup> Also at Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- <sup>i</sup> Also at Department of Physics and Astronomy, University of Louisville, Louisville, KY; United States of America.
- <sup>j</sup> Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva; Israel.
- <sup>k</sup> Also at Department of Physics, California State University, East Bay; United States of America.
- <sup>l</sup> Also at Department of Physics, California State University, Fresno; United States of America.
- <sup>m</sup> Also at Department of Physics, California State University, Sacramento; United States of America.
- <sup>n</sup> Also at Department of Physics, King's College London, London; United Kingdom.
- <sup>o</sup> Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg; Russia.
- <sup>p</sup> Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.
- <sup>q</sup> Also at Dipartimento di Matematica, Informatica e Fisica, Università di Udine, Udine; Italy.
- <sup>r</sup> Also at Faculty of Physics, M.V. Lomonosov Moscow State University, Moscow; Russia.
- <sup>s</sup> Also at Graduate School of Science, Osaka University, Osaka; Japan.
- <sup>t</sup> Also at Hellenic Open University, Patras; Greece.
- <sup>u</sup> Also at IJCLab, Université Paris-Saclay, CNRS/IN2P3, 91405, Orsay; France.
- <sup>v</sup> Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.
- <sup>w</sup> Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.
- <sup>x</sup> Also at Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen; Netherlands.
- <sup>y</sup> Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia; Bulgaria.
- <sup>z</sup> Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest; Hungary.
- <sup>aa</sup> Also at Institute of Particle Physics (IPP), Vancouver; Canada.
- <sup>ab</sup> Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.

- ac* Also at Instituto de Fisica Teorica, IFT-UAM/CSIC, Madrid; Spain.
- ad* Also at Joint Institute for Nuclear Research, Dubna; Russia.
- ae* Also at Louisiana Tech University, Ruston LA; United States of America.
- af* Also at Moscow Institute of Physics and Technology State University, Dolgoprudny; Russia.
- ag* Also at National Research Nuclear University MEPhI, Moscow; Russia.
- ah* Also at Physics Department, An-Najah National University, Nablus; Palestine.
- ai* Also at Physikalisches Institut, Albert-Ludwigs-Universität Freiburg, Freiburg; Germany.
- aj* Also at The City College of New York, New York NY; United States of America.
- ak* Also at TRIUMF, Vancouver BC; Canada.
- al* Also at Università di Napoli Parthenope, Napoli; Italy.
