

# EFT interpretation in top-quark sector at ATLAS

*Roman Lysák*  
*Institute of Physics, Prague*

*on behalf of the ATLAS collaboration*

# Why effective field theory (EFT) interpretations?

- At LHC, we haven't directly observed a physics beyond the Standard Model (BSM) yet  
→ even if BSM is beyond the reach of LHC, it can reveal itself indirectly

- Top quark differs from other quarks/fermions mainly by its large mass  
→ if BSM reveals through EFT searches → high chance it will be in top processes
- The effect of BSM dynamics (characterized by energy scale  $\Lambda$ ) can be parameterized at low energies  $E \ll \Lambda$   
→ effective field theory (EFT) model independent approach:

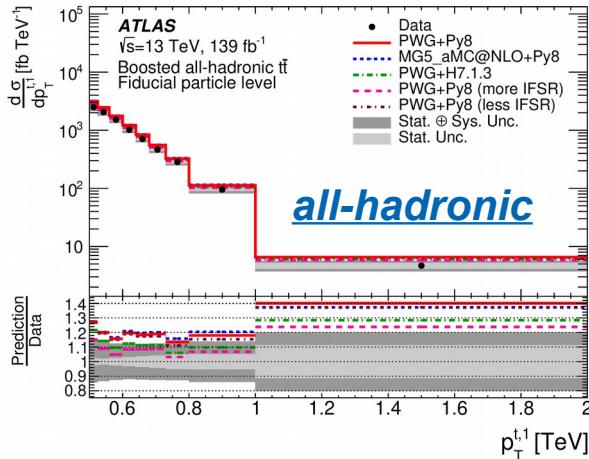

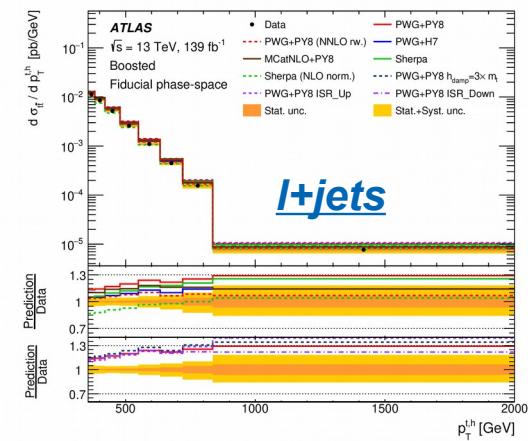

$$\mathcal{L}_{\text{eff}} = \sum_i \frac{c_i \mathcal{O}_i^D}{\Lambda_{\text{scale of dim-}D \text{ interactions}}^{D-4}}$$

*Wilson coefficients*  
*dim-D operators*

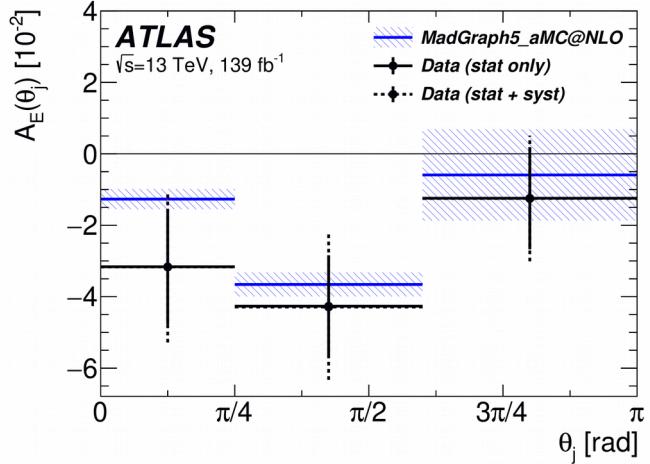

$\mathcal{O}_i$ : higher-dimension operators build from SM fields and respecting SM symmetries

# Top-quark analyses with EFT interpretation

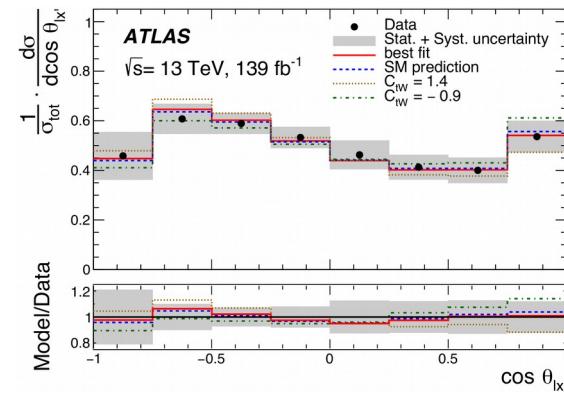

Differential cross-sections:

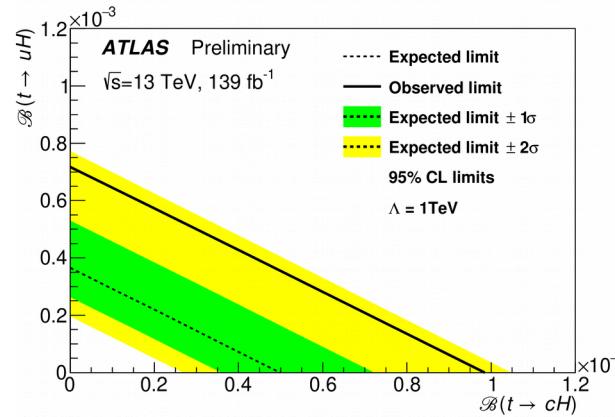

Charge / energy asymmetry:

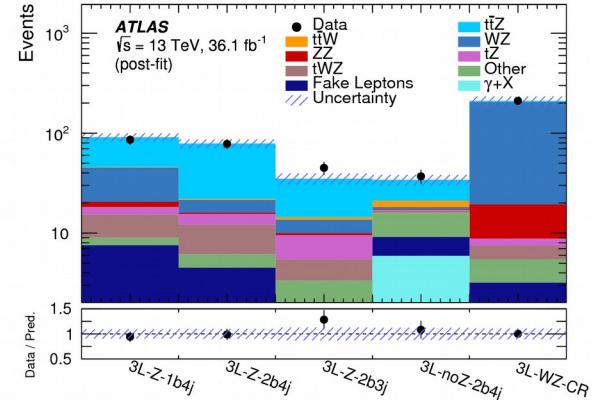

Top quark polarization

FCNC:  $tqH$ ,  $tqy$ ,  $tqg$ ,  $tqZ$

$t\bar{t} + Z$

Different measurements are sensitive to different EFT operators

# EFT ingredients in ATLAS top-quark sector

$$\mathcal{L}_{\text{SMEFT}} = \mathcal{L}_{\text{SM}} + \sum_i \frac{C_i}{\Lambda^2} O_i^{(6)} + \sum_j \frac{B_j}{\Lambda^4} O_j^{(8)} + \dots$$

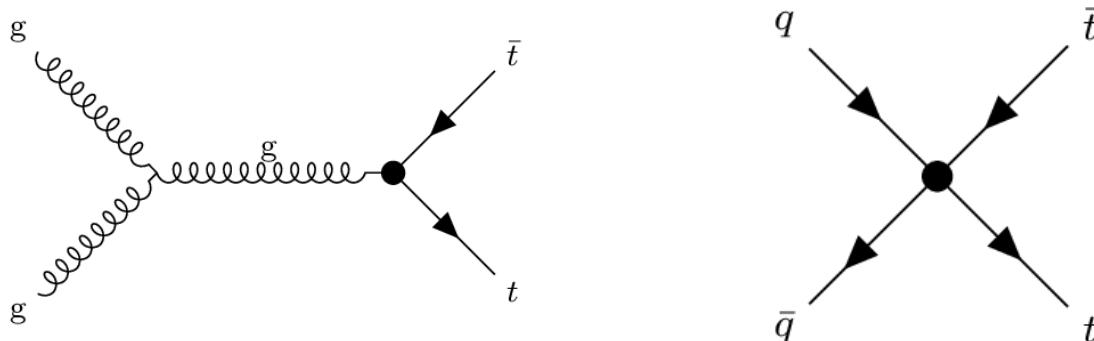

$$\begin{aligned}\sigma(C_i) &= \sigma_{\text{SM}} + \sigma_{\text{SM-EFT}} + \sigma_{\text{EFT-EFT}} \\ &= \sigma_{\text{SM}} + \frac{1}{\Lambda^2} \sum_i \alpha_i C_i + \frac{1}{\Lambda^4} \sum_i \beta_i C_i^2 + \frac{1}{\Lambda^4} \sum_{i,j,i < j} \tilde{\beta}_{ij} C_i C_j\end{aligned}$$

- We always consider only energy dimension six operators
  - compare results with linear-only ( $1/\Lambda^2$ ) and linear+quadratic terms ( $1/\Lambda^4$ )
- EFT model:
  - MG5\_aMC@NLO MC generator used to obtain parameters ( $\alpha_i$ ,  $\beta_i$ ,  $\tilde{\beta}_{ij}$ ) of the model
  - Warsaw basis used for the operators
  - different implementations of the SMEFT model are used: SMEFTatNLO, dim6top, TopFCNC
- We determine limits on Wilson coefficients (' $C_i$ '):
  - give a measure of strength of a given operator
  - 2499 coefficients for dimension six, 427 which affect top-quark in dim6top (various assumptions)
  - typically, only a few which affect a relevant vertex are measured in a given analysis

# $t\bar{t}$ differential cross-sections

- Sensitive mainly to  $C_{tG}$  and 4-quark operators:

ATLAS-TOPQ-2018-11  
ATLAS-TOPQ-2019-23

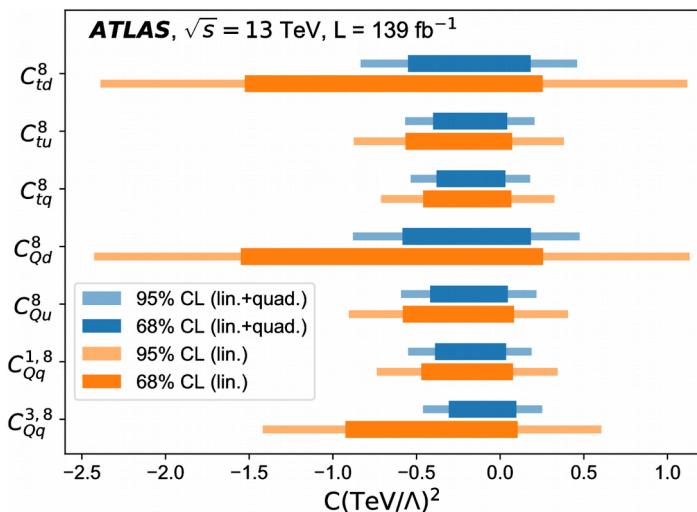

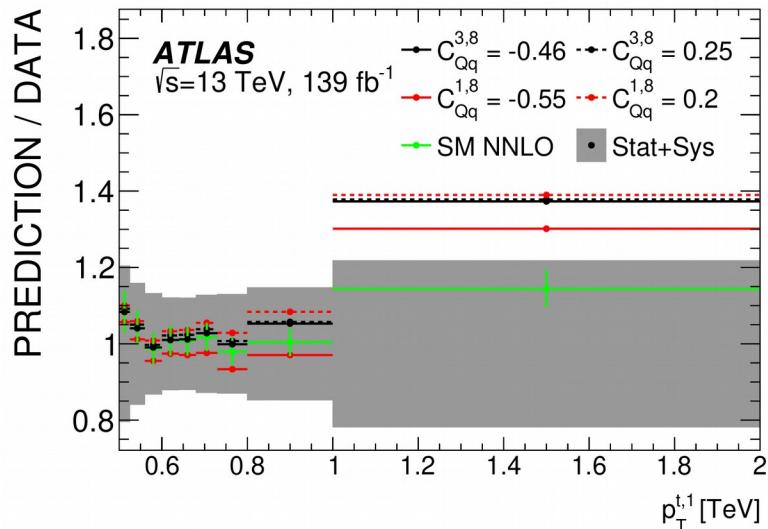

- Two measurements in boosted regime → better sensitivity at high  $p_T/m(t\bar{t})$

	I+jets	all-hadronic
Observable	Hadronic top $p_T$ (particle level)	Leading top $p_T$ (parton level)
Uncertainty	Full covariance matrix (stat+syst)	Full covariance matrix (stat+syst)
LO EFT model	SMEFTatNLO	dim6top
SM prediction ( $\sigma_{SM}$ )	NLO Powheg+Py8 reweighed to NNLO	NNLO fixed order (MATRIX)
Theory Uncertainty	NLO rew. to NNLO (scale, PDF, 6% incl.)	SM NNLO scale
Limits estimate	EFTfitter ( <a href="https://arxiv.org/abs/1605.05585">arXiv:1605.05585</a> )	EFTfitter

# $t\bar{t}$ diff. cross-section in all-hadronic channel

ATLAS-TOPQ-2018-11

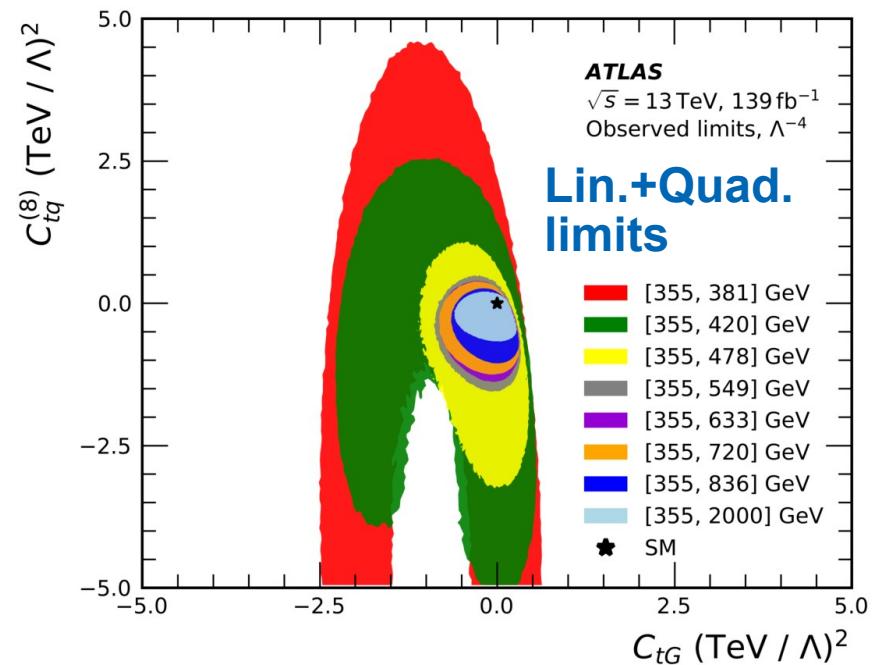

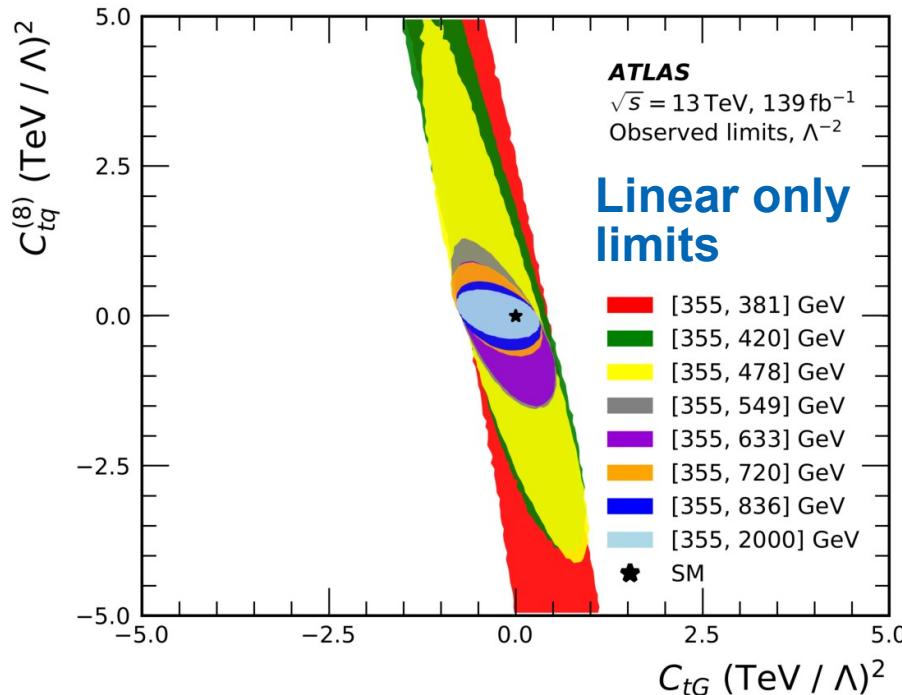

- EFT contribution affects mainly high- $p_T$  bins
- Seven 4-quark operators constrained
  - explored all 4-quark and quark-boson  $C_i$ 's
- Data a bit softer than NNLO prediction
  - limits shifted a little bit to negative values
- 3 examples of 2D limits performed

# $t\bar{t}$ differential cross-section in l+jets

ATLAS-TOPQ-2019-23

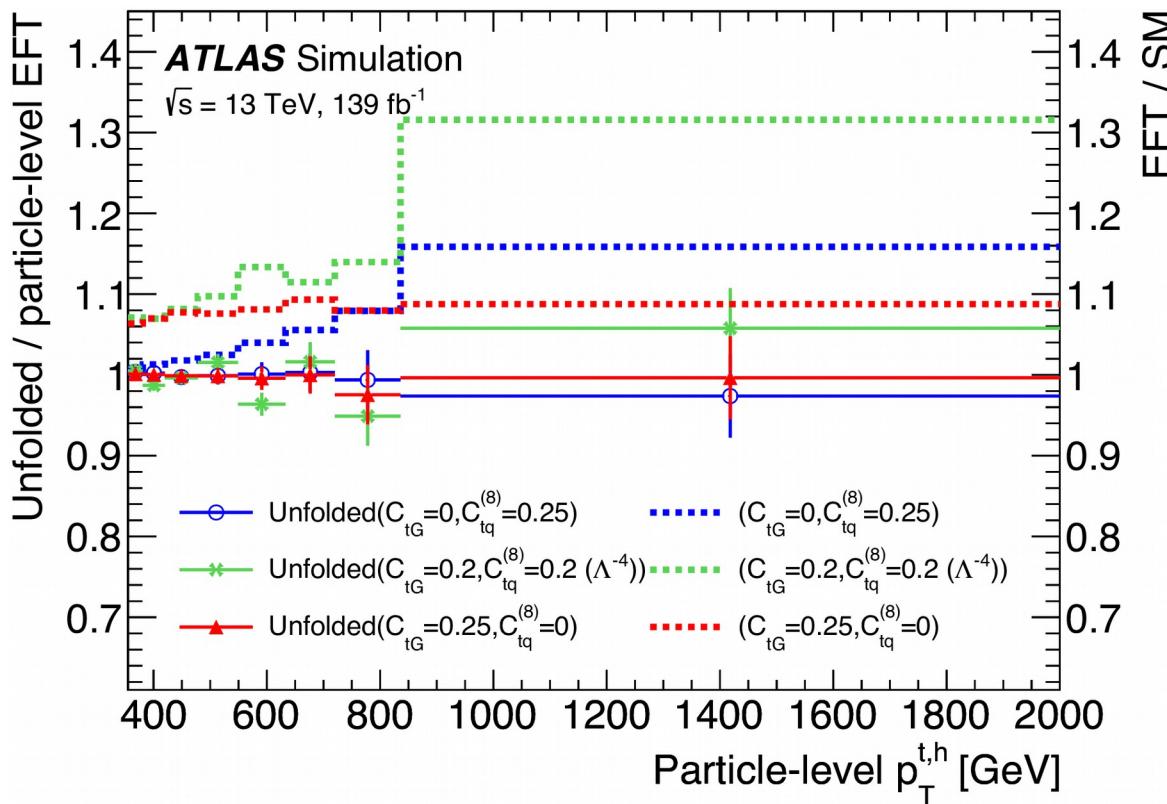

- high- $p_T$  bins have the largest effect
- Quadratic terms important for 4-quark operator  $C_{tq}^{(8)}$
- Both 1D (individual) and 2D (simultaneous) limits of two Wilson coefficients obtained:

Model	$C_i (\Lambda/\text{TeV})^2$	Marginalised 95% intervals		Individual 95% intervals	
		Expected	Observed	Expected	Observed
$\Lambda^{-4}$	$C_{tG}$	[-0.44, 0.35]	[-0.53, 0.21]	[-0.44, 0.28]	[-0.52, 0.15]
	$C_{tq}^{(8)}$	[-0.57, 0.17]	[-0.60, 0.13]	[-0.57, 0.18]	[-0.64, 0.12]
$\Lambda^{-2}$	$C_{tG}$	[-0.44, 0.44]	[-0.68, 0.21]	[-0.41, 0.42]	[-0.63, 0.20]
	$C_{tq}^{(8)}$	[-0.35, 0.35]	[-0.30, 0.36]	[-0.35, 0.36]	[-0.34, 0.27]

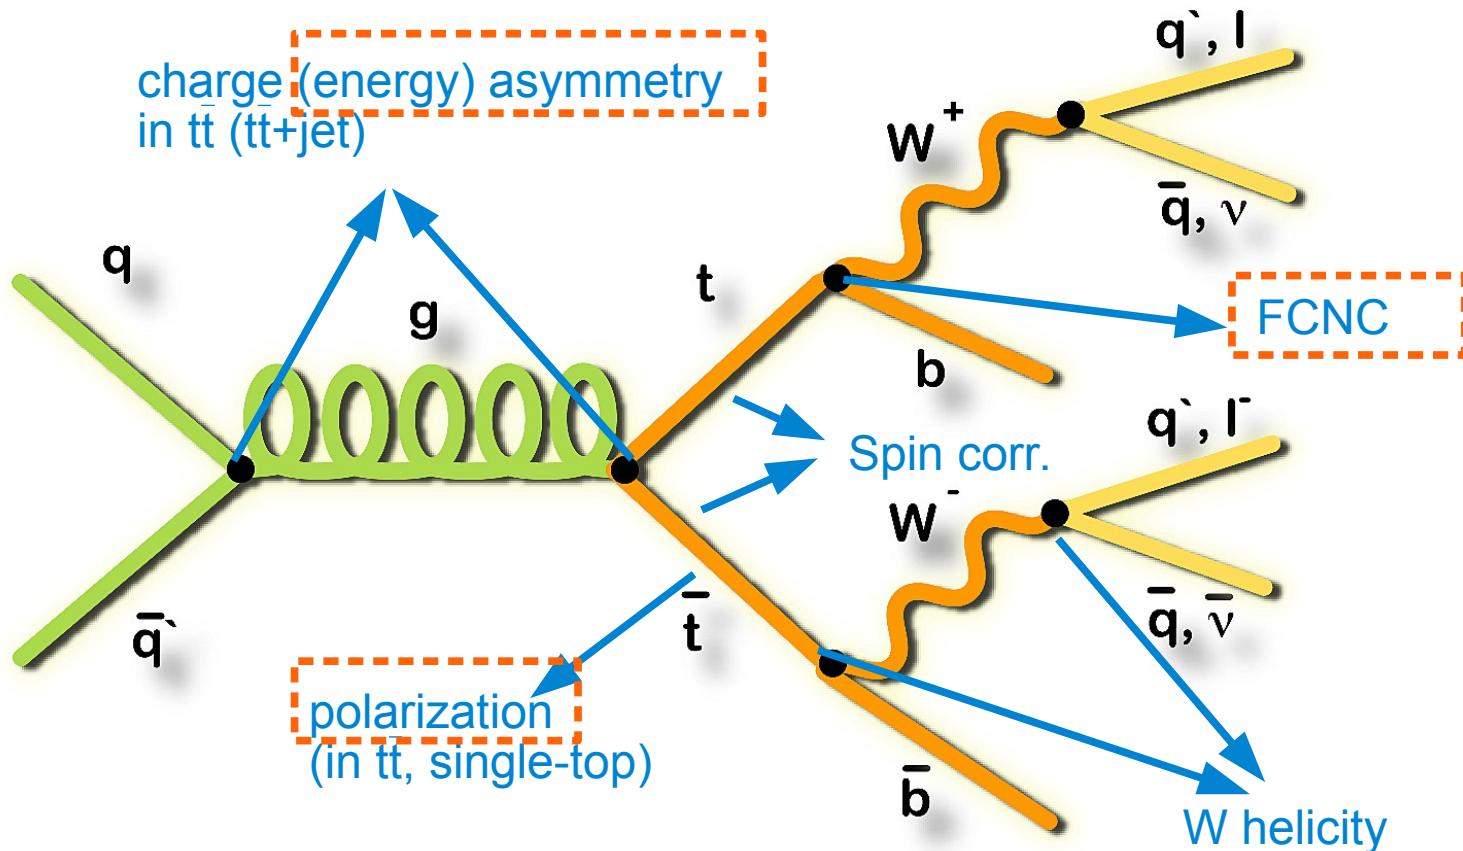

# $t\bar{t}$ differential cross-sections

ATLAS-TOPQ-2019-23

- Robustness tests performed to show that:
  - the unfolding procedure is not affected by EFT contributions
  - the background dependence on EFT contributions have overall a small effect
- Performed in l+jets and all-hadronic analysis

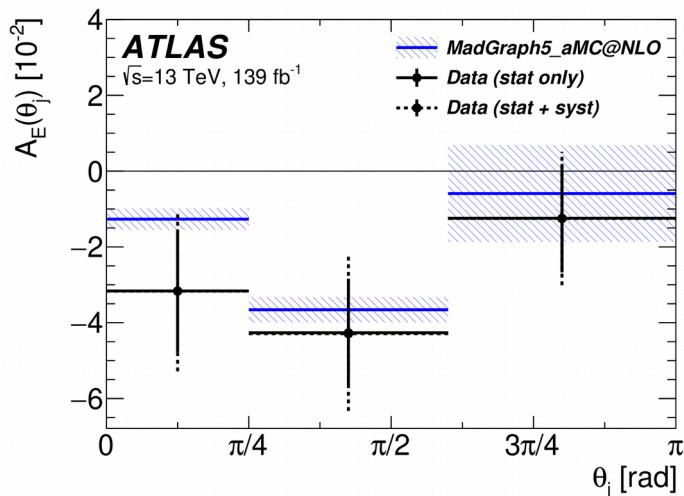

# EFT interpretation with top-quark properties

sensitivity to various EFT operators highly depends on process, vertex, observable

# Energy asymmetry in $t\bar{t}+jet$ production

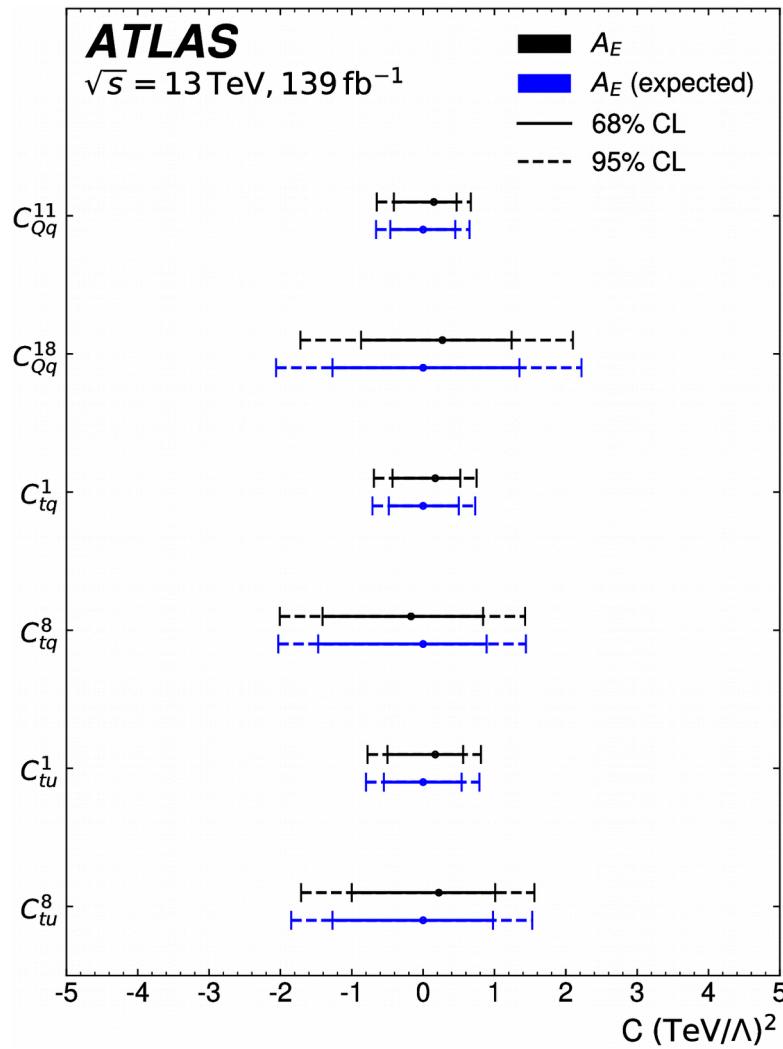

ATLAS-TOPQ-2019-28

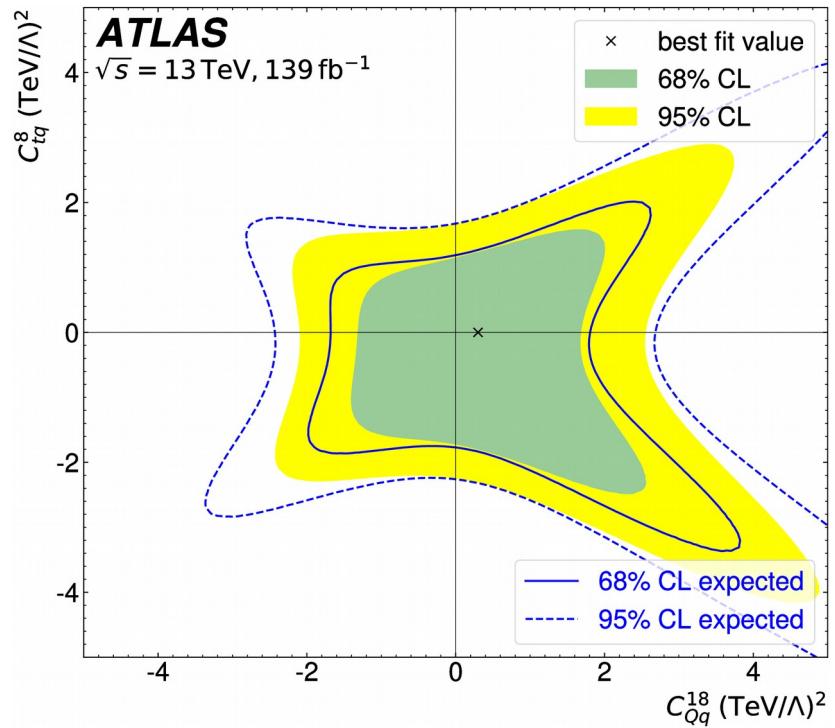

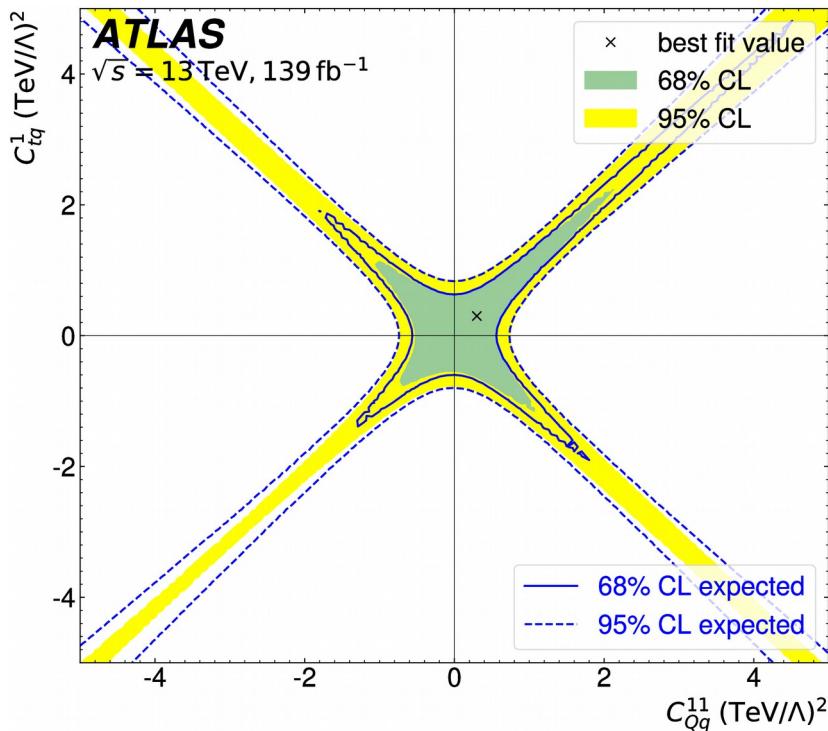

$$A_E(\theta_j) \equiv \frac{\sigma^{\text{opt}}(\theta_j | \Delta E > 0) - \sigma^{\text{opt}}(\theta_j | \Delta E < 0)}{\sigma^{\text{opt}}(\theta_j | \Delta E > 0) + \sigma^{\text{opt}}(\theta_j | \Delta E < 0)}$$

$\Delta E$ : difference between top and antitop energy  
 $\theta_j$ : jet angle w.r.t. initial parton direction in  $t\bar{t}j$  rest frame

- Manifestation of charge asymmetry in  $qg \rightarrow t\bar{t}q$
- Sensitive to chirality of top/antitop
- SMEFTatNLO @ LO
- Six 4-quark operators with different chiral/color structures measured

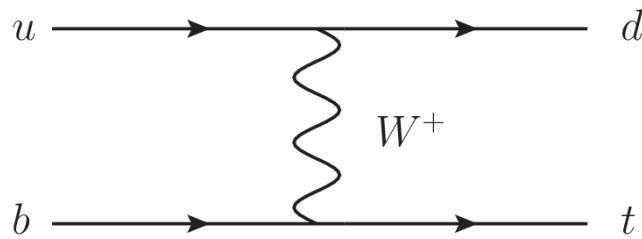

# Energy asymmetry in $t\bar{t}$ +jet (2)

- Ability to resolve new directions in parameter space  
→ combination with charge asymmetry would be useful

# Top-quark polarization in single-top production

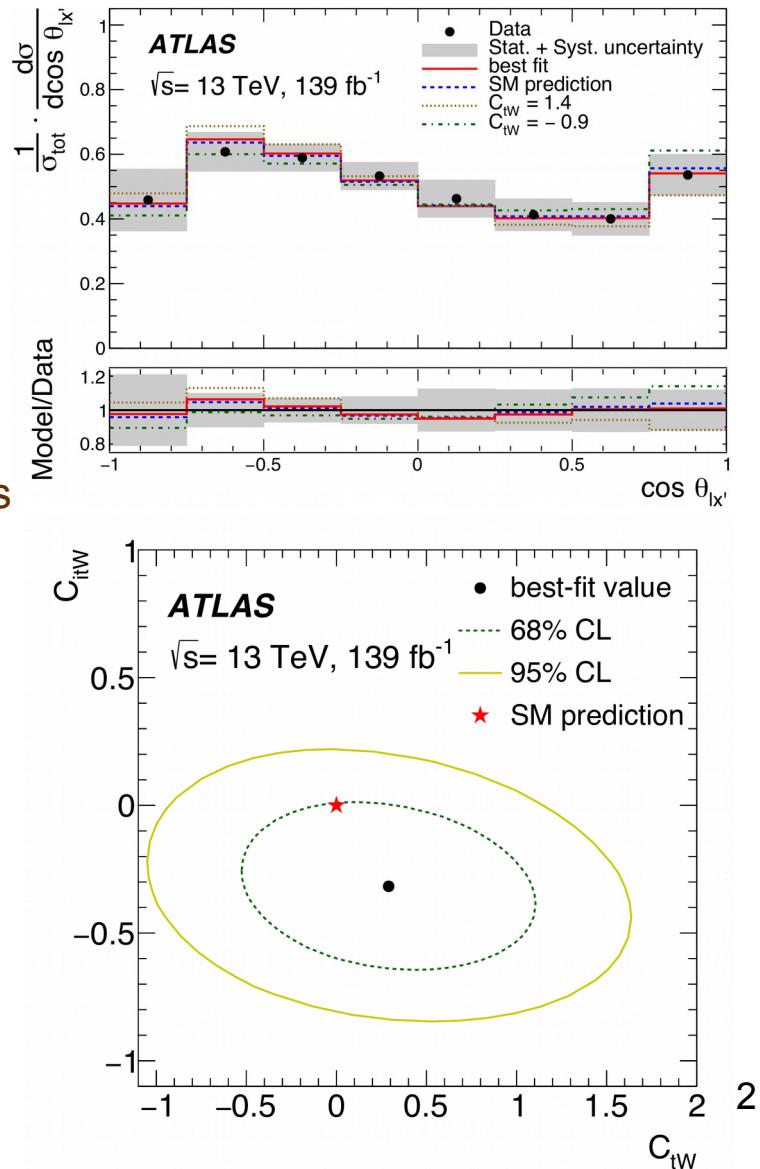

ATLAS-TOPQ-2018-10

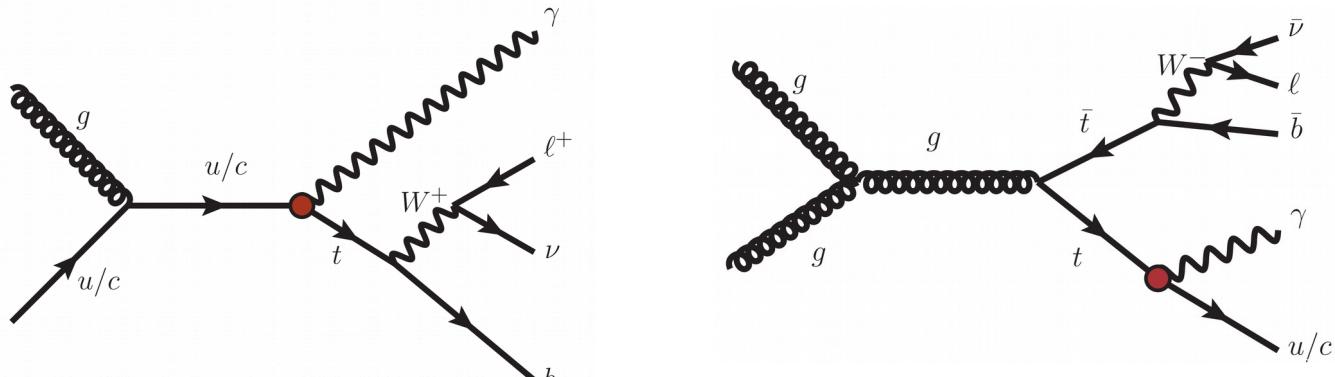

- Sensitive to operators affecting  $Wtb$  vertex  
→ bounds on complex coefficient of  $O_{tw}$
- Measured lepton angles differential cross-sections
  - $C_{tw}$  ( $C_{itw}$ ) affects x-(y-) component
- SMEFT NLO model
  - EFT operators enter both production and decay
- 1D & 2D limits of both  $C_{tw}$  and  $C_{itw}$ 
  - 1D results:

$$C_{tw} = 0.1 \pm 0.5$$

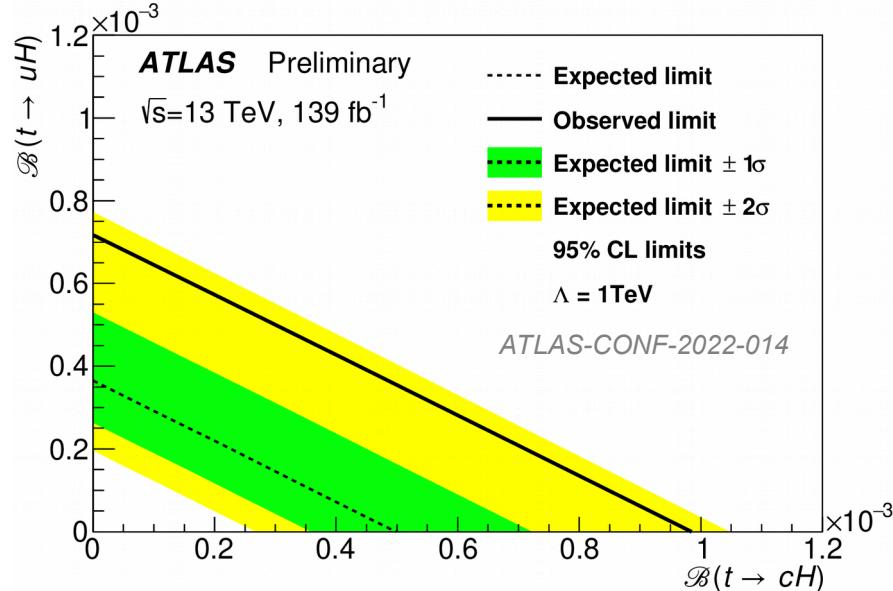

$$C_{itw} = -0.3 \pm 0.2$$

# EFT interpretation with FCNC searches

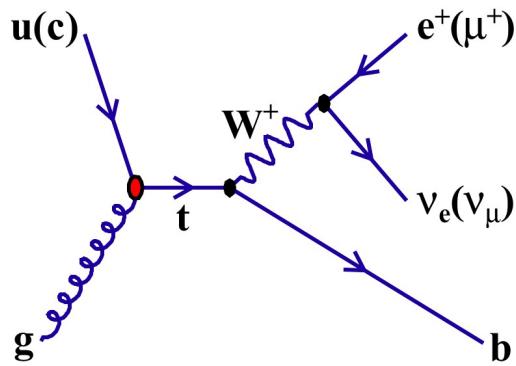

- Typically, FCNC in both production and decay of top-quark are considered
- EFT model ‘TopFCNC’ @ NLO mostly used
- Multivariate discriminants used to set limits on cross-section  
→ limits on Wilson Coefficients  
→ limits on branching ratios

# FCNC: tqg vertex

ATLAS-TOPQ-2018-06

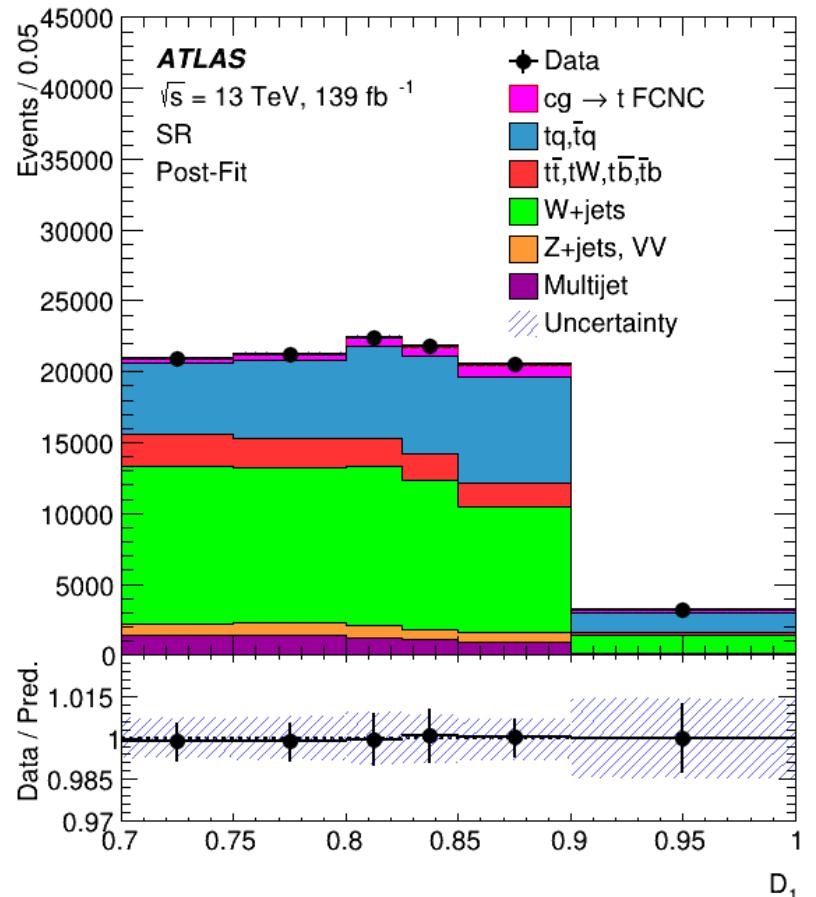

- Sensitivity to  $O_{uG}^{ut}$  and  $O_{uG}^{ct}$  operators
- FCNC cross-section dependence on EFT:
  - from MG5\_aMC@NLO generator at NLO

$$\sigma(u + g \rightarrow t) = 2773 \times \left( \frac{C_{uG}^{ut}}{\Lambda^2} \right)^2 \text{ pb TeV}^4$$

$$\sigma(c + g \rightarrow t) = 719 \times \left( \frac{C_{uG}^{ct}}{\Lambda^2} \right)^2 \text{ pb TeV}^4.$$

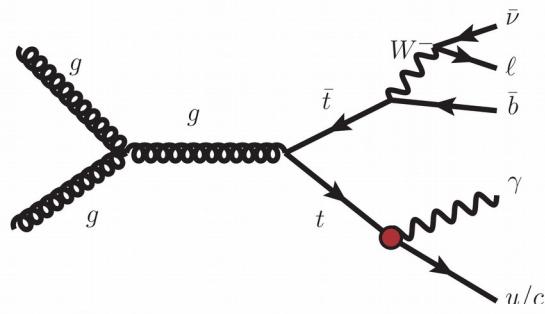

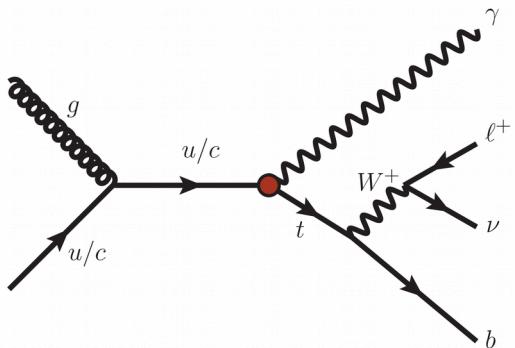

EFT 1D limits:

$$\frac{|C_{uG}^{ut}|}{\Lambda^2} < 0.057 \text{ TeV}^{-2} \quad \text{and} \quad \frac{|C_{uG}^{ct}|}{\Lambda^2} < 0.14 \text{ TeV}^{-2}$$

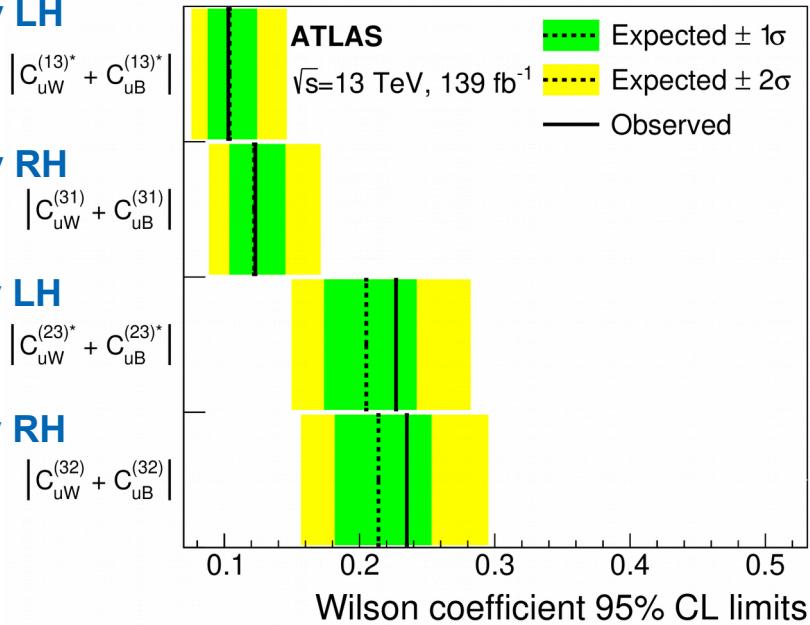

# FCNC: tq $\gamma$ vertex

ATLAS-TOPQ-2019-19

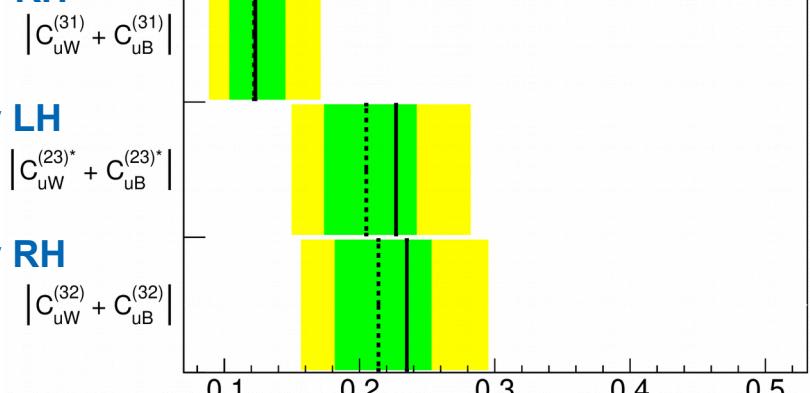

- Sensitivity to  $O_{uB}$  and  $O_{uW}$  operators
  - Different for LH and RH production
  - Different for 'u'- and 'c'-quarks

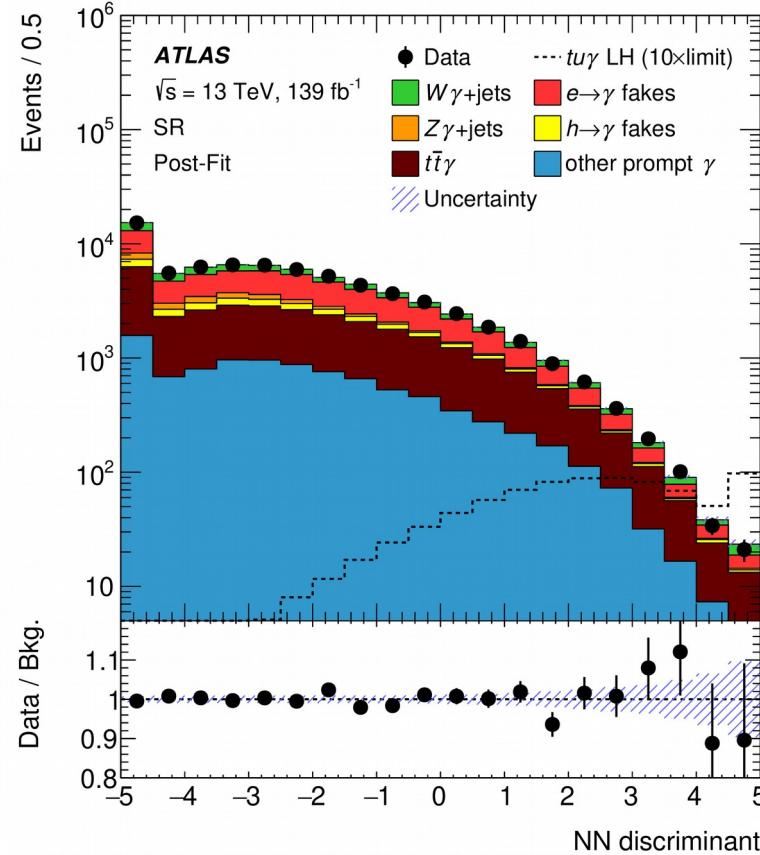

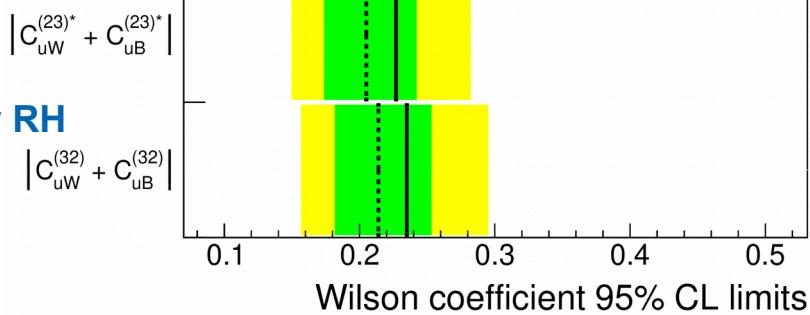

tuy LH

tuy RH

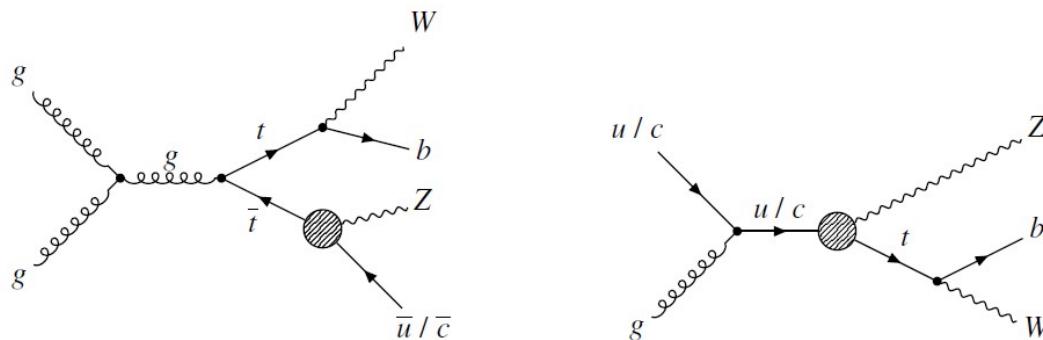

tcy LH

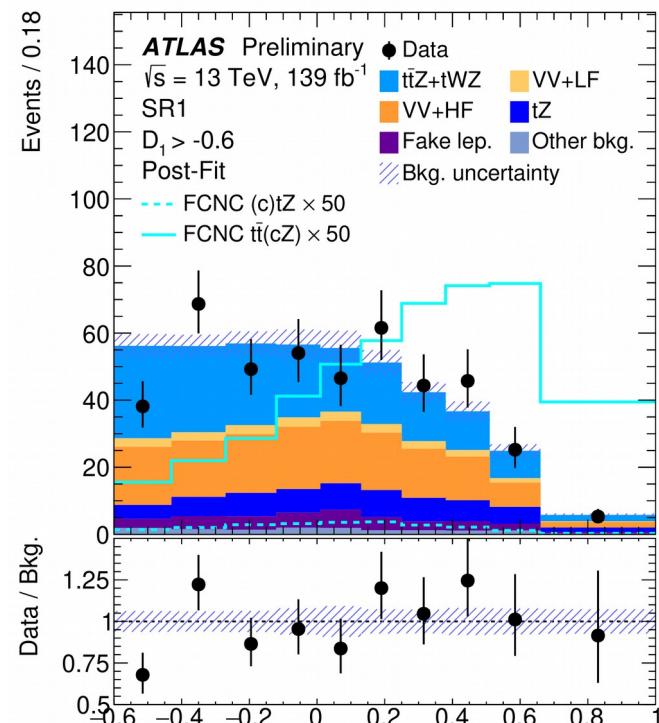

# FCNC: tqZ vertex

ATLAS-CONF-2021-049

- Sensitivity to  $O_{uB}$  and  $O_{uW}$  operators
  - Different for LH and RH production
  - Different for 'u'- and 'c'-quark

Observable	Vertex	Coupling	Observed	Expected
$ C_{uW}^{(13)*} $ and $ C_{uB}^{(13)*} $	$tZu$	LH	0.15	$0.13^{+0.03}_{-0.02}$
$ C_{uW}^{(31)} $ and $ C_{uB}^{(31)} $	$tZu$	RH	0.16	$0.14^{+0.03}_{-0.02}$
$ C_{uW}^{(23)*} $ and $ C_{uB}^{(23)*} $	$tZc$	LH	0.22	$0.20^{+0.04}_{-0.03}$
$ C_{uW}^{(32)} $ and $ C_{uB}^{(32)} $	$tZc$	RH	0.21	$0.19^{+0.04}_{-0.03}$

# FCNC: tqH vertex

ATLAS-CONF-2022-014

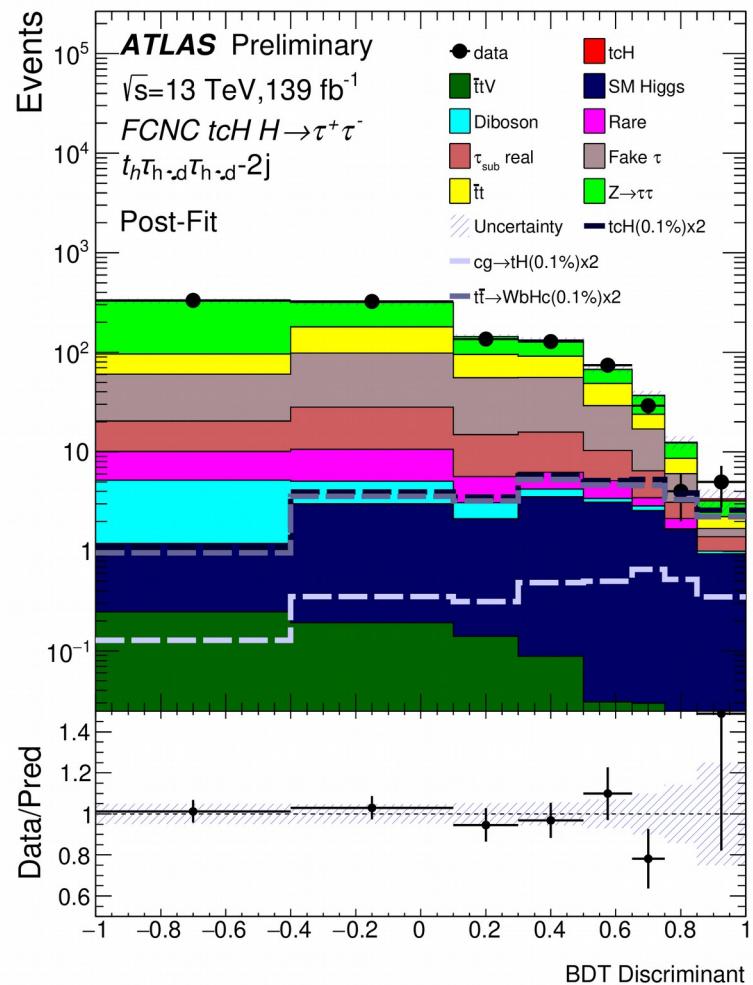

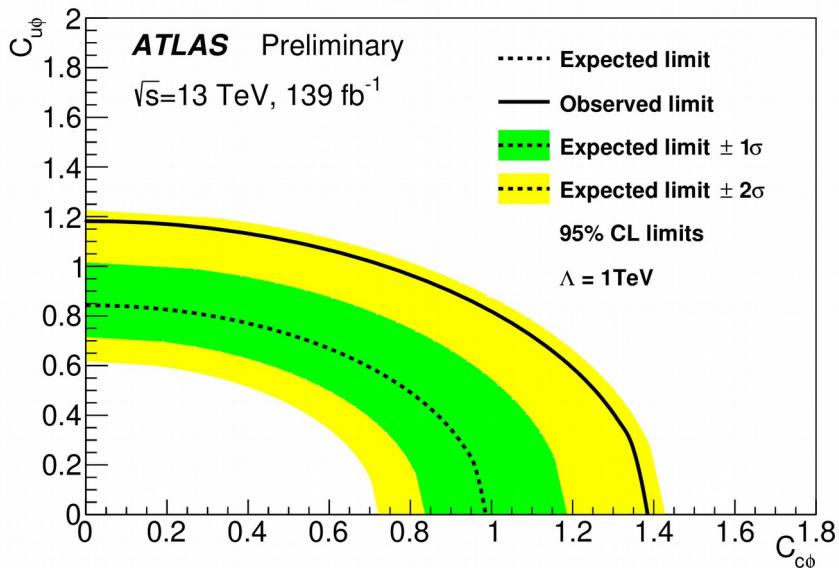

- Sensitivity to  $C_{c\phi}$  and  $C_{u\phi}$  coefficients
- Limits on  $\text{BR}(t \rightarrow qH)$  translated to EFT limits:
  - $\text{BR}(t \rightarrow qH) = \Gamma(t \rightarrow qH) / \Gamma(t \rightarrow Wb) \rightarrow$

$$C_{q\phi} = \sqrt{1946.6 \mathcal{B}(t \rightarrow qH)}$$

$$C_{q\phi} = \sqrt{(C_{q\phi}^{i3})^2 + (C_{q\phi}^{3i})^2}$$

- Combines LH (i3) and RH (3i) combinations
- i=1(2) for u- (c-) quark

Both 1D and 2D limits provided:

1D limits:

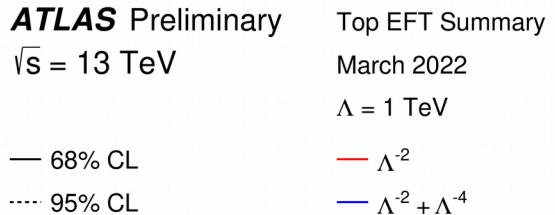

$$C_{c\phi} < 1.38 \quad C_{u\phi} < 1.18$$

# ATLAS EFT Summary

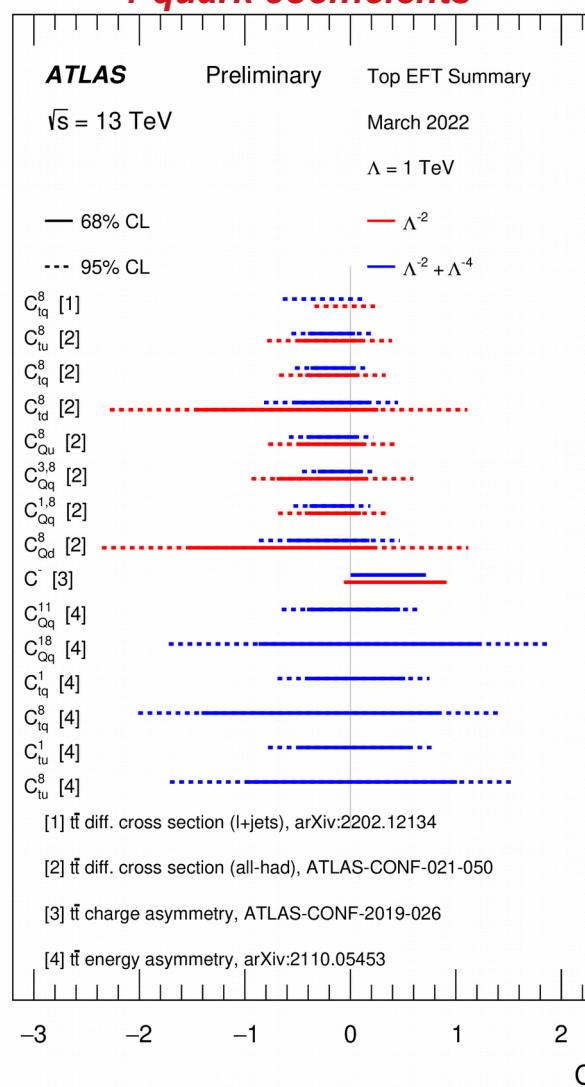

ATL-PHYS-PUB-2022-014

## 4-quark coefficients

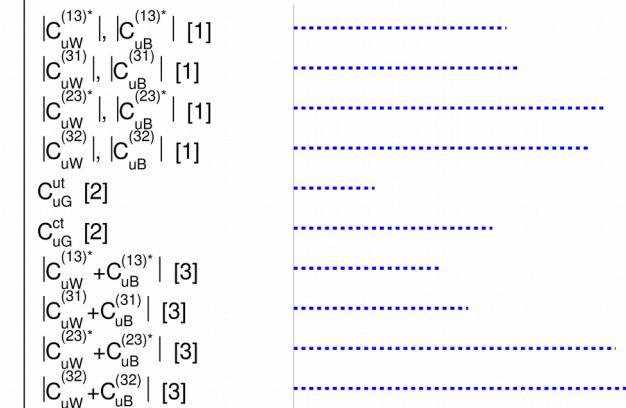

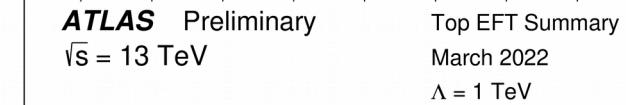

### Top-boson coefficients

- [1] Single top polarisation, arXiv:2202.11382
- [2]  $t\bar{t}Z$  cross section, Phys. Rev. D 99 (2019) 072009
- [3]  $t\bar{t}$  diff. cross section (l+jets, boosted), arXiv:2202.12134

### FCNC coefficients

- [1] FCNC  $t\bar{t}Z$ , ATLAS-CONF-2021-049
- [2] FCNC top-gluon, arXiv:2112.01302
- [3] FCNC  $t\bar{t}\gamma$ , ATLAS-CONF-2022-003

- Typically, limits are about the same or better than from existing global fits
- Papers which superseded CONF notes are already available:
  - ATLAS-CONF-2021-050 → ATLAS-TOPQ-2018-11, ATLAS-CONF-2022-003 → ATLAS-TOPQ-2019-19

# Conclusions

- Effective field theory interpretation a powerful tool to look for BSM physics
  - Becomes a standard in top-quark sector at ATLAS
  - Plan to harmonize various aspects of interpretation
- Different analyses constraining various single or pairs of Wilson coefficients
- Combining EFT interpretations in top-quark sector should be a future goal
  - Will allow simultaneous determination of Wilson coefficients ('global fit')
  - Will remove blind directions
  - Eventually, should do a global EFT ATLAS and LHC fit

# EFT limits from $t\bar{t}$ charge asymmetry

ATLAS-CONF-2019-026

- sensitive to seven 4-fermion operators in Warsav basis

- reduced to 4 operators by using a flavour-specific linear combination:

$$C_u^1 = C_{qq}^{(8,1)} + C_{qq}^{(8,3)} + C_{ut}^{(8)}$$

$$C_u^2 = C_{qu}^{(1)} + C_{qt}^{(1)}$$

$$C_d^1 = C_{qq}^{(8,1)} - C_{qq}^{(8,3)} + C_{dt}^{(8)}$$

$$C_d^2 = C_{qd}^{(1)} + C_{qt}^{(1)}$$

- reduced further by assumption of equal couplings to up- and down-type quarks:

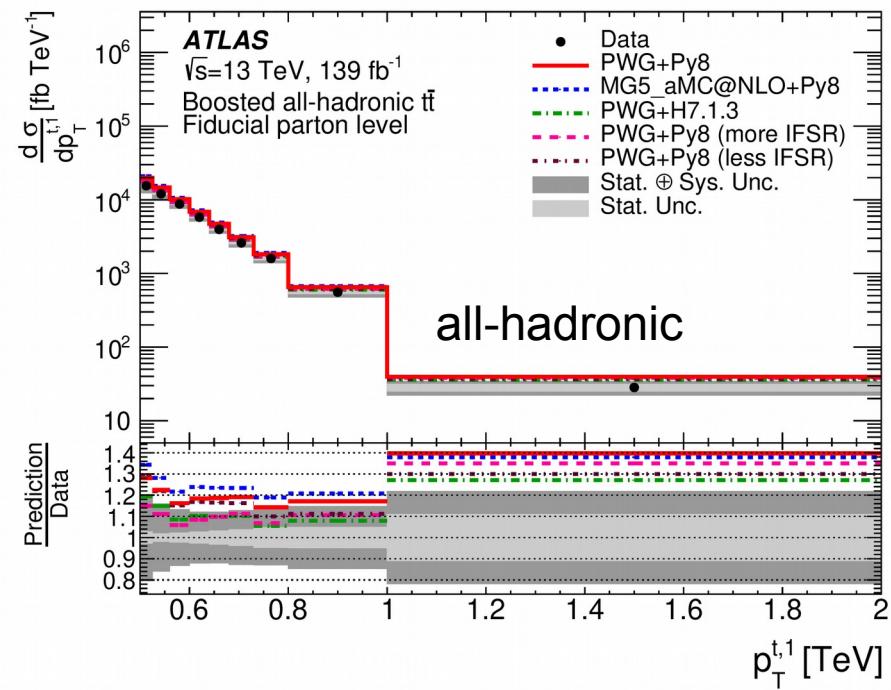

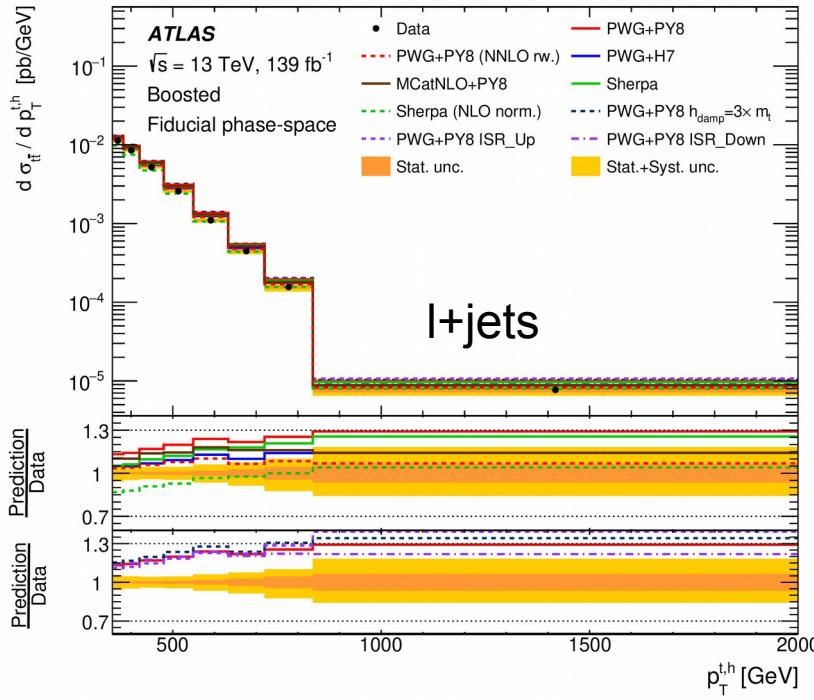

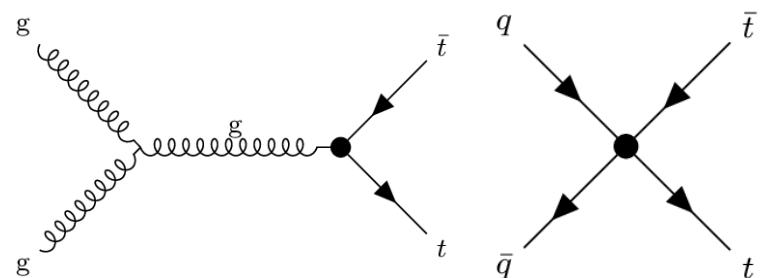

$$C_u^1 = C_d^1 = C^1 \quad C_u^2 = C_d^2 = C^2$$

- charge asymmetry is affected by the difference:  $C^- = C^1 - C^2$
- SM prediction used: NNLO QCD + NLO EW

# $t\bar{t}$ differential cross-sections

check performed in all-hadronic channel:

- Unfolding recovers truth distribution within 1% even when EFT effects included on both signal and background

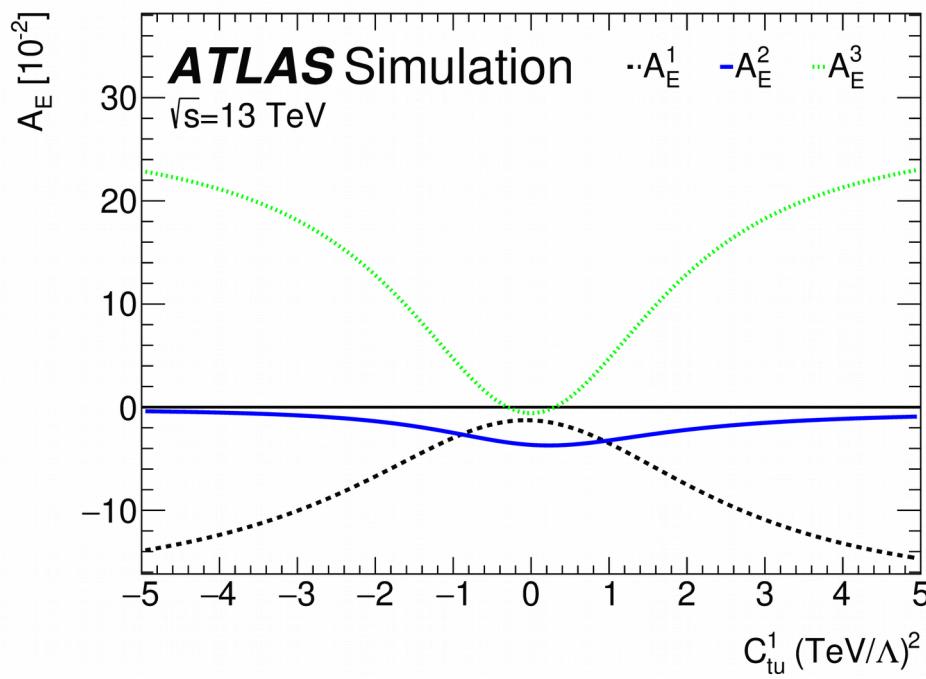

# EFT from top-quark properties

	Top polarization	Energy asymmetry
Observable	Unfolded lepton angles (normalized)	Unfolded differential energy asymmetry as a function of jet angle
Uncertainty	Full covariance matrix	Full covariance matrix (stat+syst)
EFT model	SMEFT at NLO	SMEFTatNLO @ LO
SM prediction ( $\sigma_{\text{SM}}$ )	NLO MG5+Py8	NLO SM (tt+j)
Theory Uncertainty	stat. uncert. of the parametrisation	SM NLO+ LO EFT scale uncertainties + MC sample size
Limits estimate	Likelihood	Chi2 fit

# Sensitivity of energy asym. to EFT coefficients

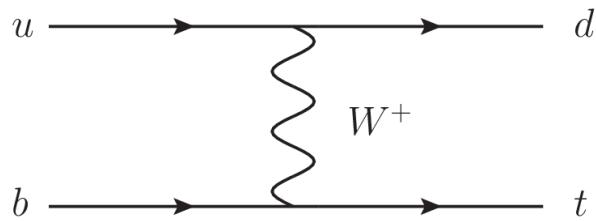

ATLAS-TOPQ-2019-28

- Both linear and linear+quadratic limits provided
  - Limits dominated by quadratic terms

# Top-quark polarization in single-top production

ATLAS-TOPQ-2018-10

- Sensitive (affect Wtb vertex) to  $O_{\phi q}$ ,  $O_{qq}$ ,  $O_{tw}$  at tree level
  - $O_{\phi q}$  affects just a cross-section, no effect on shape
  - $O_{qq}$ : negligible effect on angular distributions  
→ placing limit only on  $O_{tw}$
- Tests: unfolding recovers non-zero EFT coefficients, effects on background negligible
- Morphing technique used to interpolate MC EFT samples in order to describe angular distribution
- $C_{itw}$ : non-zero value could be hint of non-SM CP violation in Wtb vertex

# Top quark FCNC summary plot
