

Jet quenching studies with new jet substructure and suppression measurements in ATLAS

Martin Rybar
on behalf of ATLAS collaboration

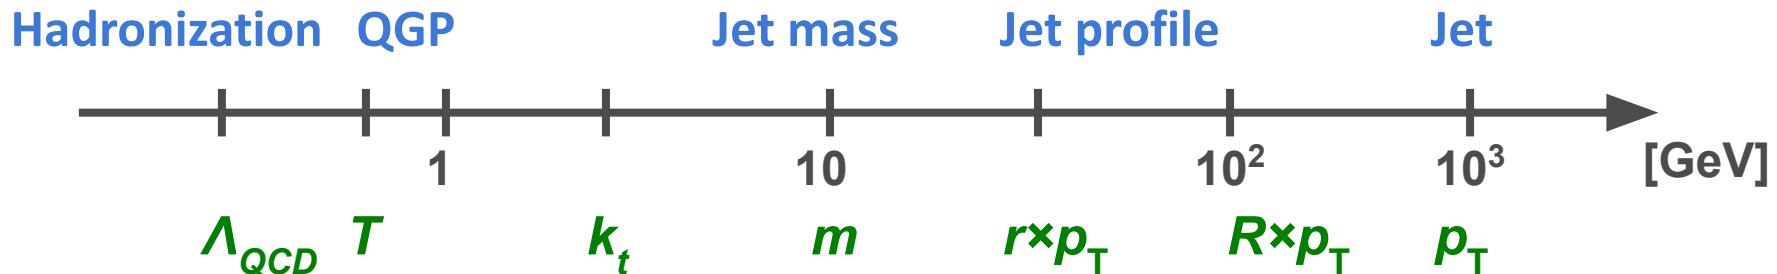

Why jet substructure?

- Jets are not point-like but complex & multiscale objects.

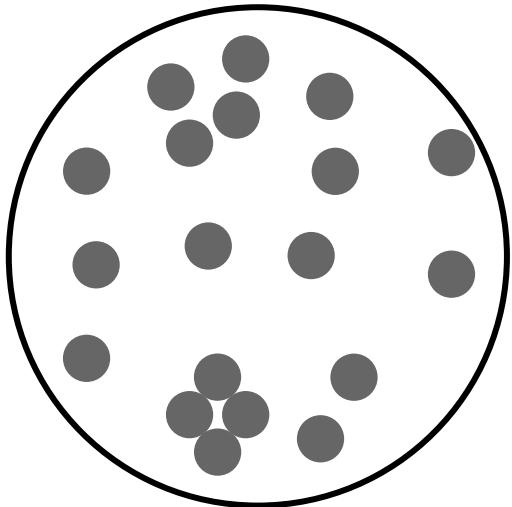

Why jet substructure in HI?

- Jets are not point-like but complex & multiscale objects.

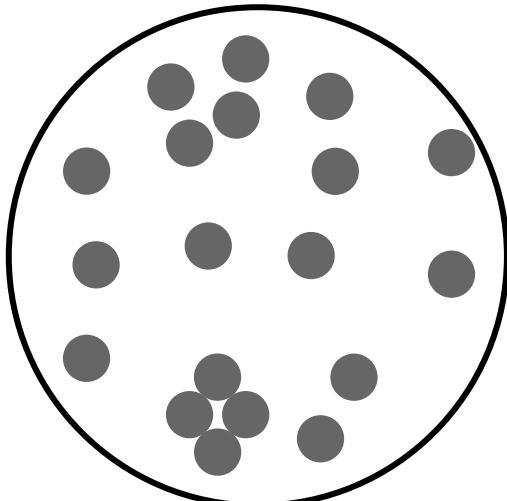

- We can use various jet substructure observables to probe different regimes.
 - What are the properties and degrees of freedom of QGP at length scales between point-like partons and hydrodynamic modes?
 - How does the color charge interact and lose energy?
 - What are the effective scales of the interactions determining the energy loss?

Re-clustered jet from smaller jets

Substructure of $R=1.0$ jets
arXiv:2301.05606

Dependence of suppression on jet structure?

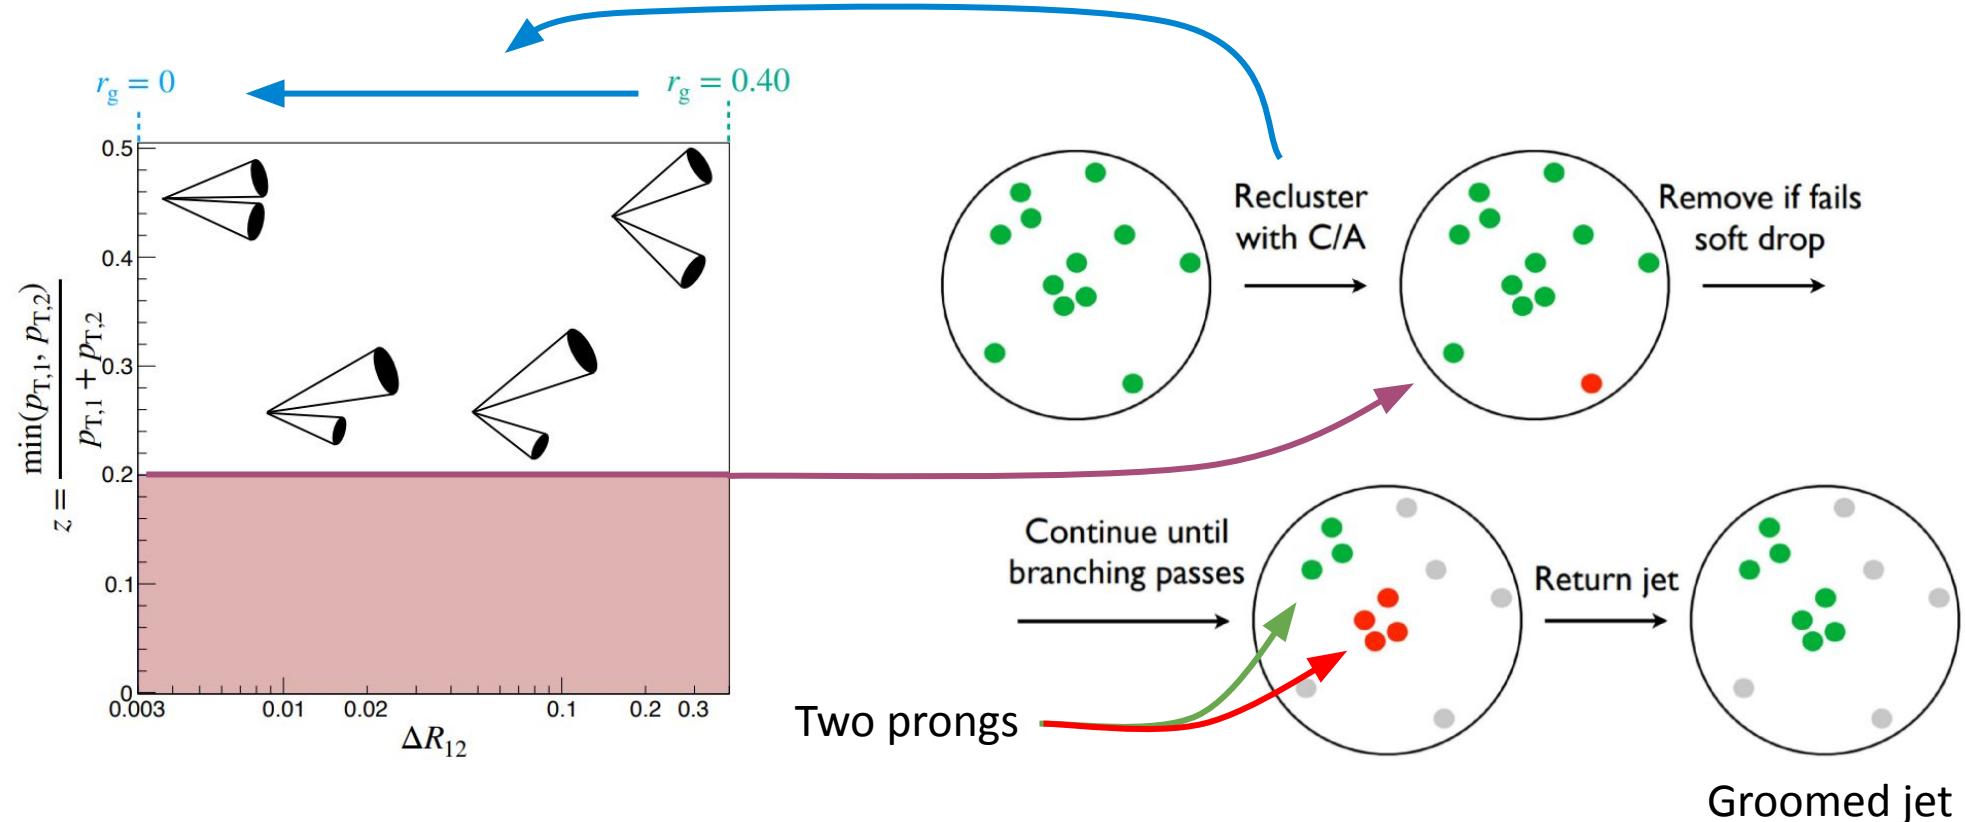

Can be addressed by measurement of jet R_{AA} as a function of their sub-structure.

Suppression vs parton splittings

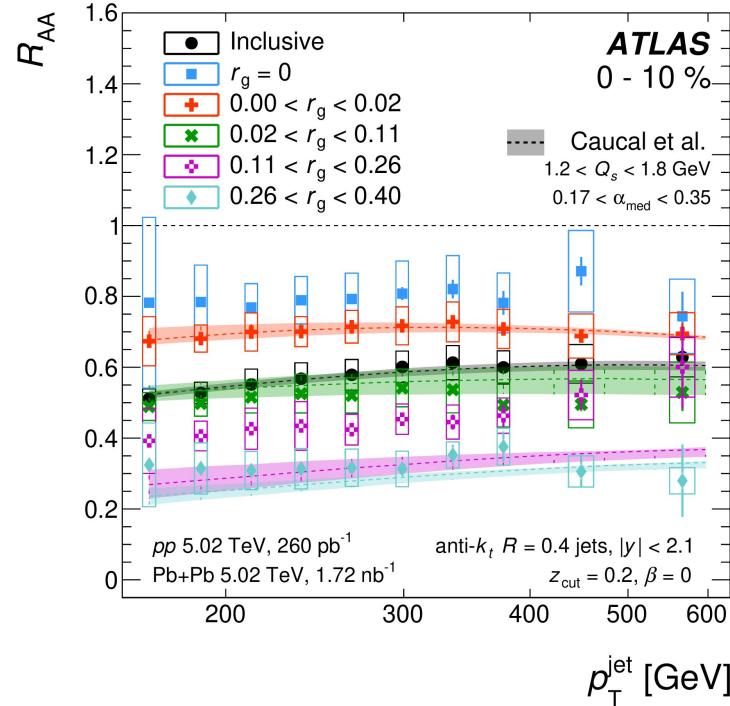

Strong dependence of jet suppression on r_g .

How can we understand the r_g vs p_T dependence?

Jet p_T dependence of the suppression

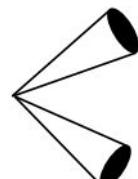

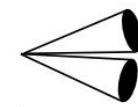

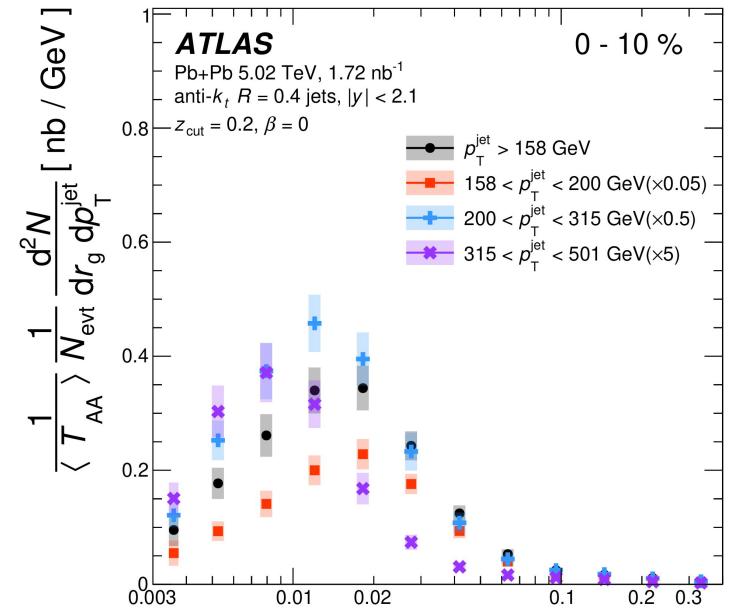

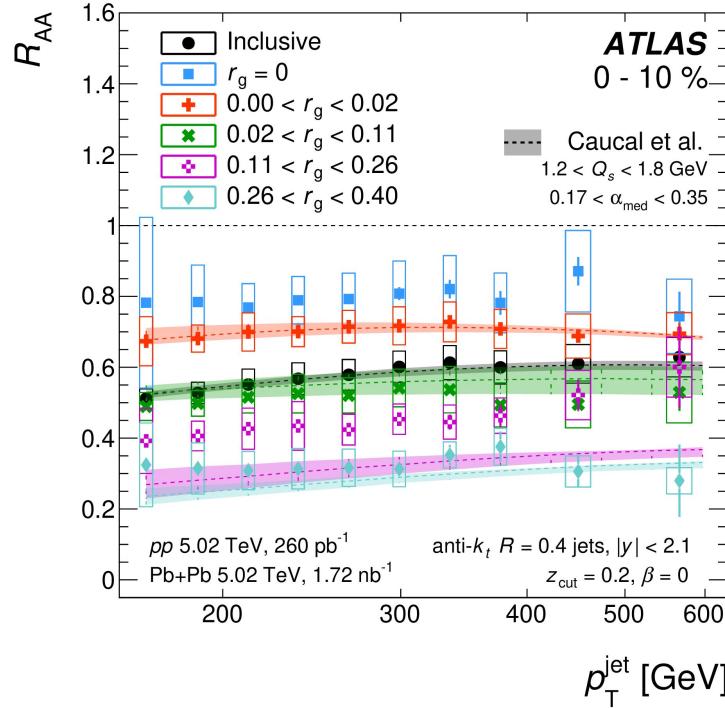

arXiv:2211.11470

Lack of p_T dependence of R_{AA} for jets with similar structure

Jet p_T dependence of the suppression

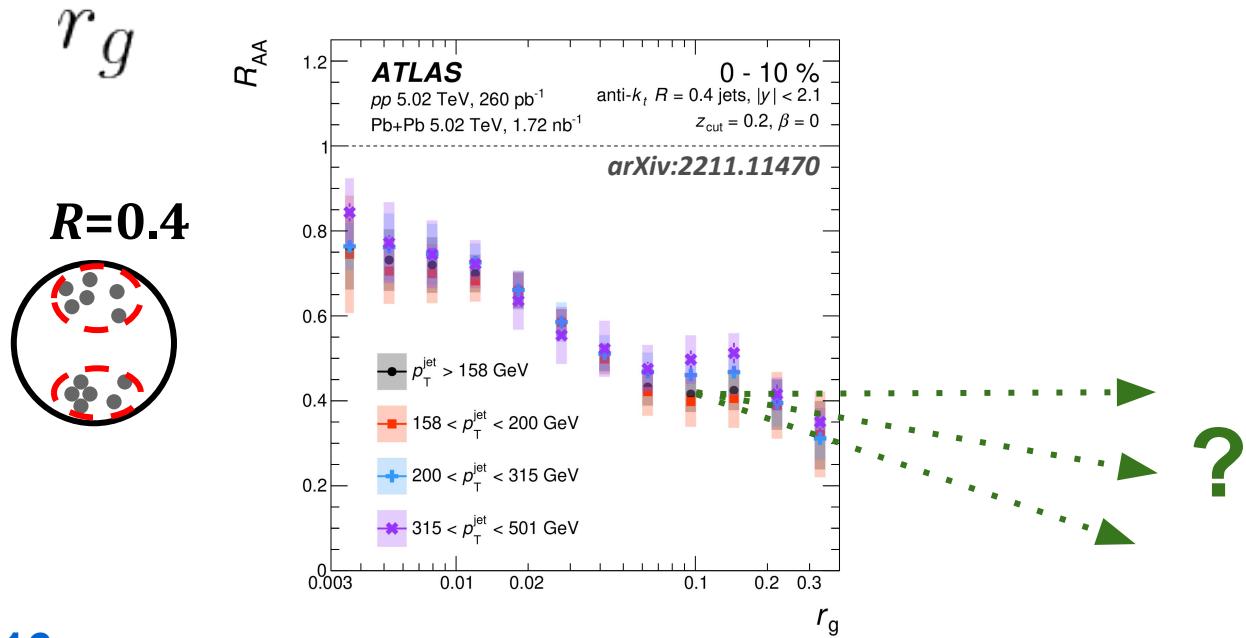

arXiv:2211.11470

Lack of p_T dependence of R_{AA} for jets with similar structure + rise of inclusive $R_{AA} \Leftrightarrow p_T$ dependence to r_g .

?

Re-clustered large- R jets

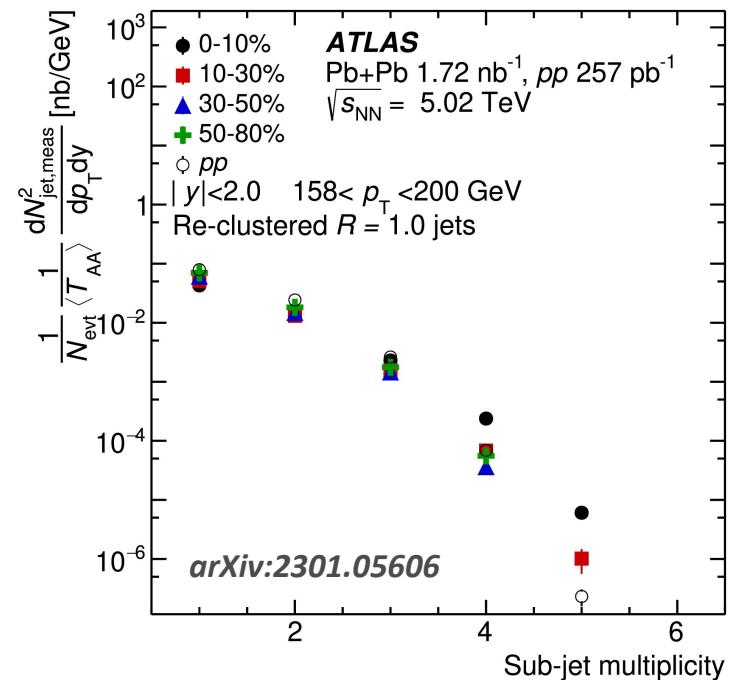

Observables and analysis procedure

- Measurement of yields of re-clustered $R=1.0$ jets as function of p_T , angular separation, and k_t splitting scale:

$$\Delta R_{12} = \sqrt{\Delta y_{12}^2 + \Delta \phi_{12}^2}, \quad \sqrt{d_{12}} = \min(p_{T1}, p_{T2}) \times \Delta R_{12}$$

- Jet suppression is evaluated using modification factor R_{AA} .

Raw sub-jet multiplicity

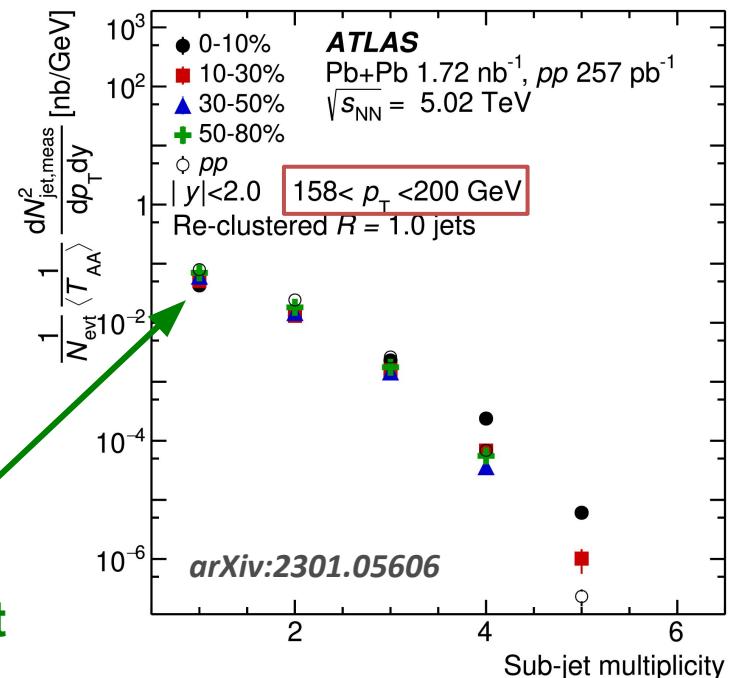

Observables and analysis procedure

- Measurement of yields of re-clustered $R=1.0$ jets as function of p_T , angular separation, and k_t splitting scale:

$$\Delta R_{12} = \sqrt{\Delta y_{12}^2 + \Delta \phi_{12}^2}, \quad \sqrt{d_{12}} = \min(p_{T1}, p_{T2}) \times \Delta R_{12}$$

- Jet suppression is evaluated using modification factor R_{AA} .

Single sub-jet

Raw sub-jet multiplicity

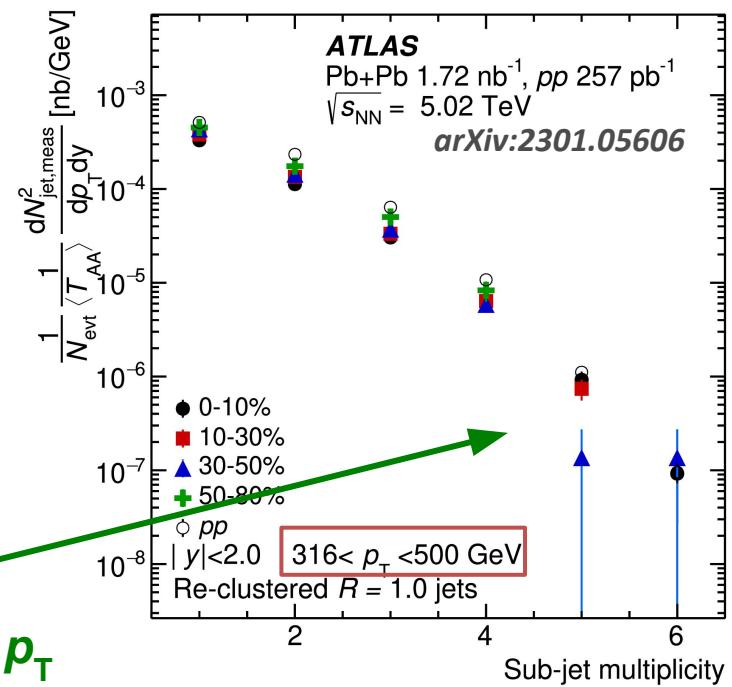

Observables and analysis procedure

- Measurement of yields of re-clustered $R=1.0$ jets as function of p_T , angular separation, and k_t splitting scale:

$$\Delta R_{12} = \sqrt{\Delta y_{12}^2 + \Delta \phi_{12}^2}, \quad \sqrt{d_{12}} = \min(p_{T1}, p_{T2}) \times \Delta R_{12}$$

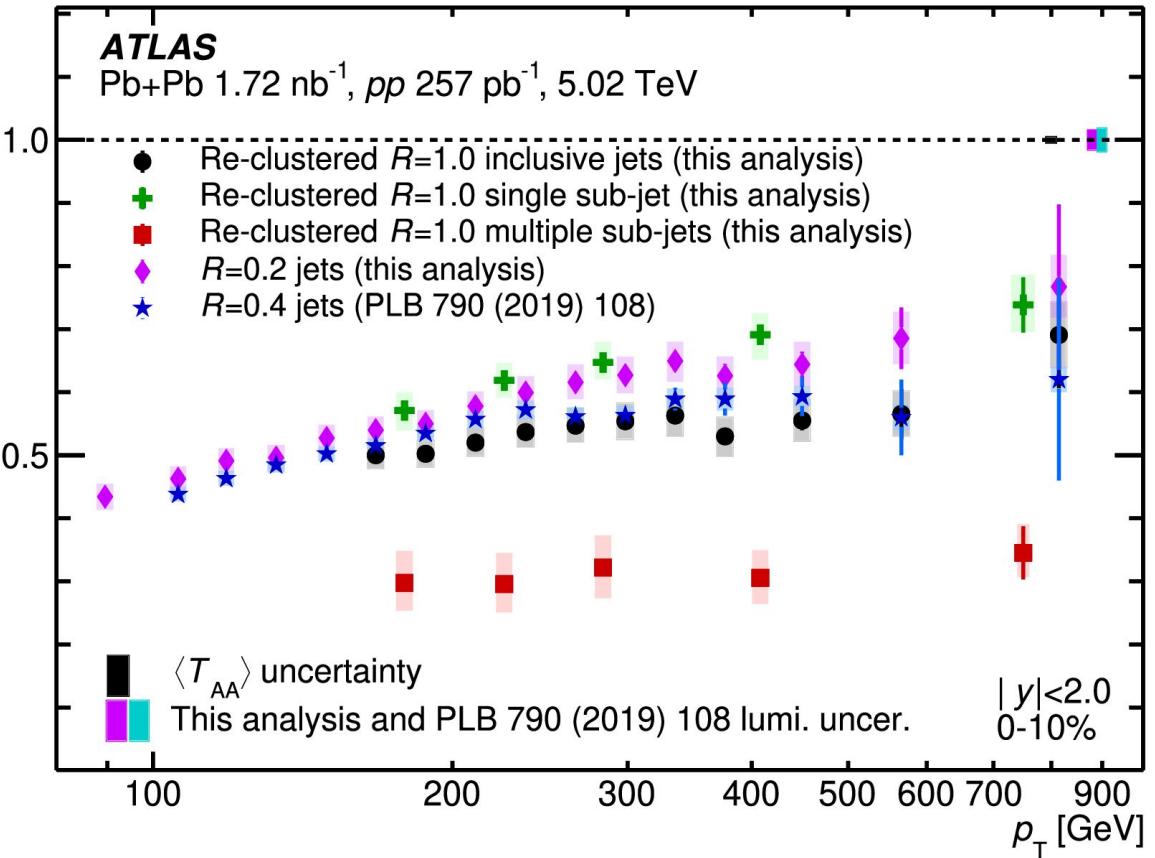

- Jet suppression is evaluated using modification factor R_{AA} .

Increasing
multiplicity with p_T

Jet suppression for different jet type

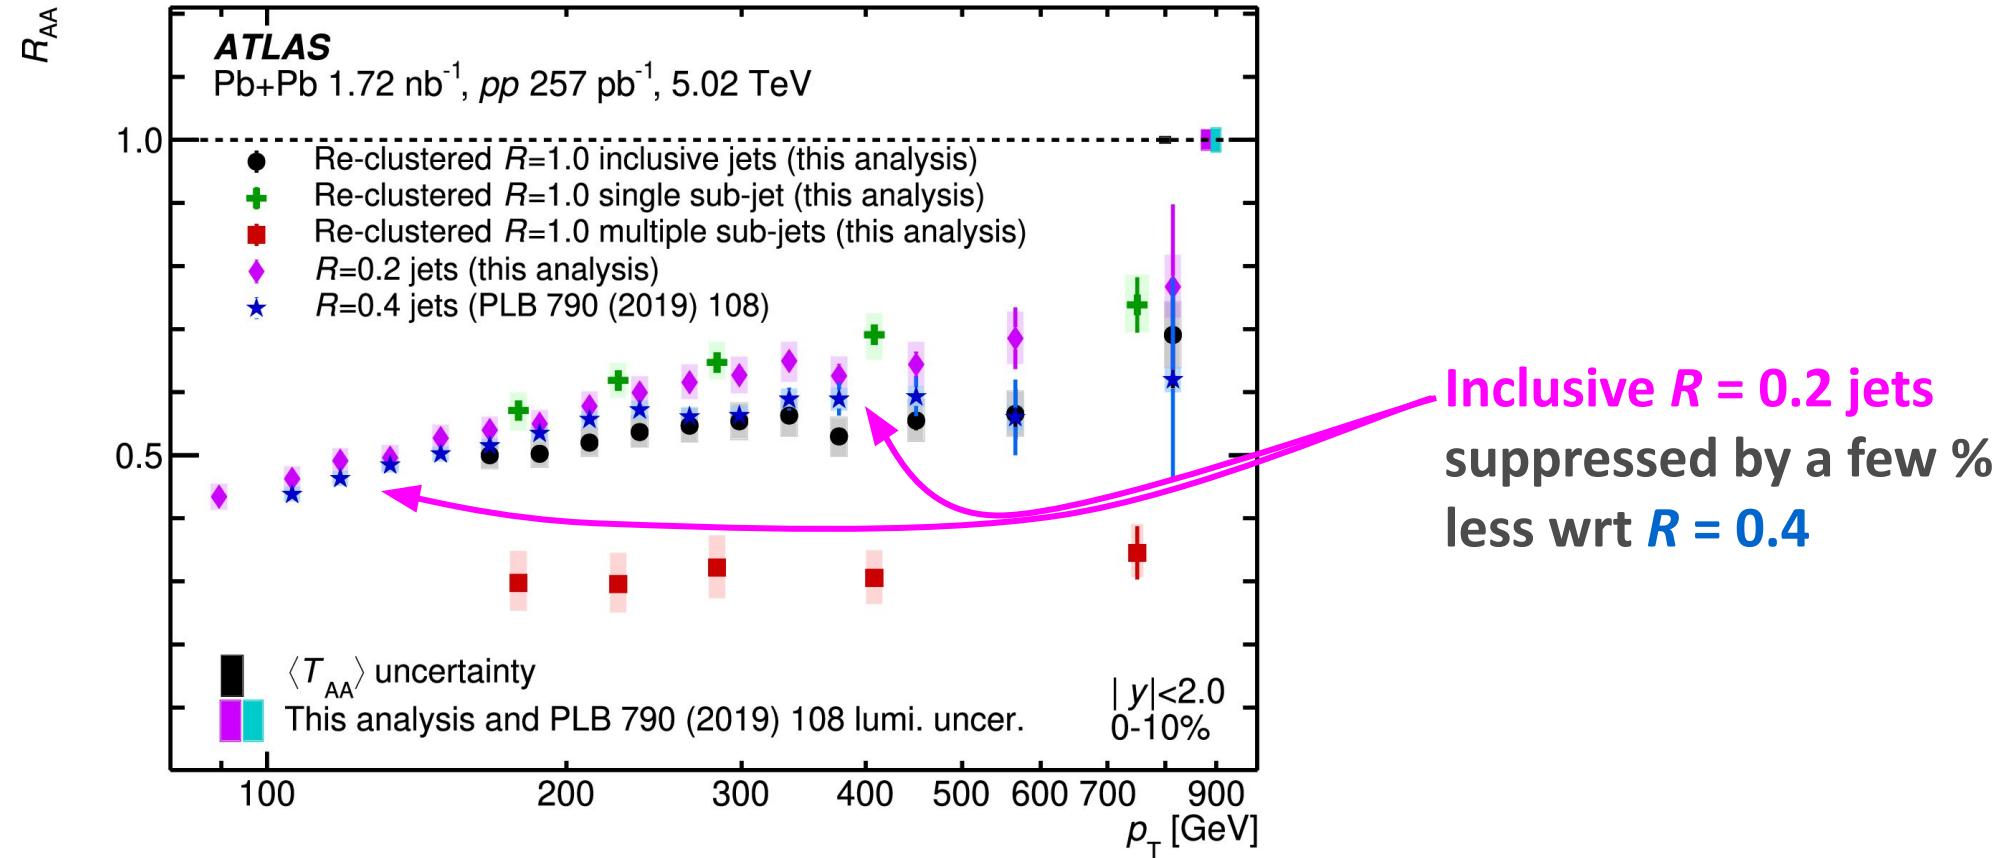

Overall jets are suppressed in by factor ~ 2 (except red points) in central Pb+Pb.

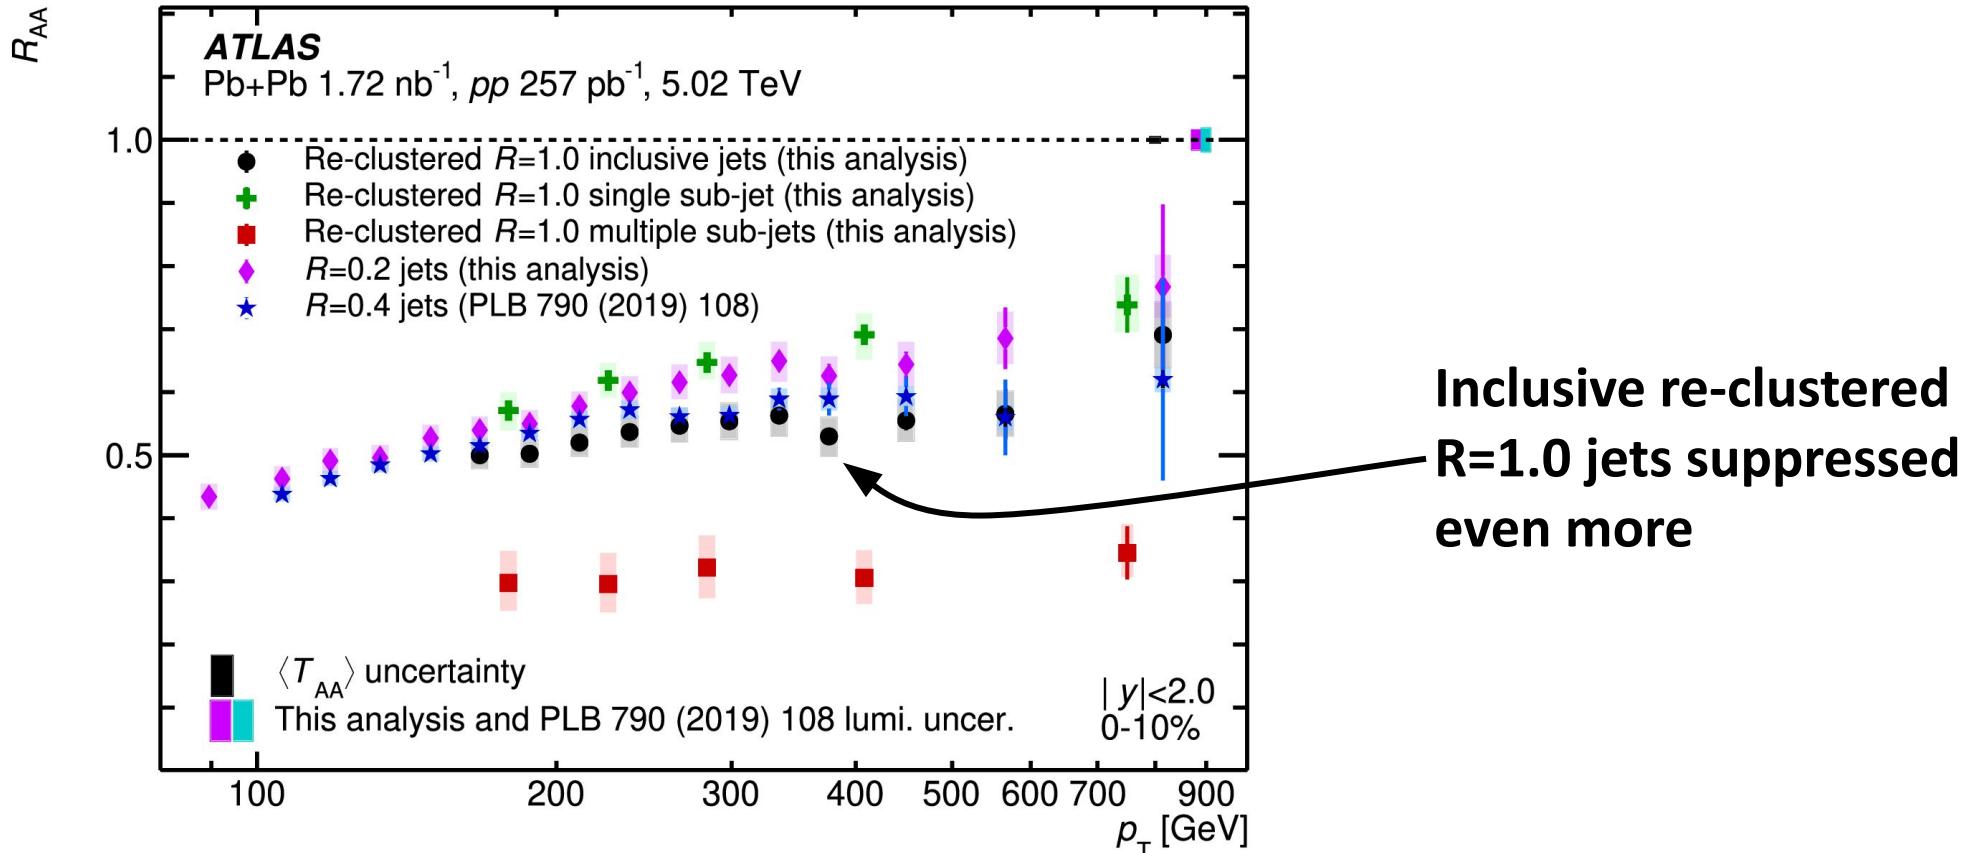

Jet suppression for different jet type

Jet suppression for different jet type

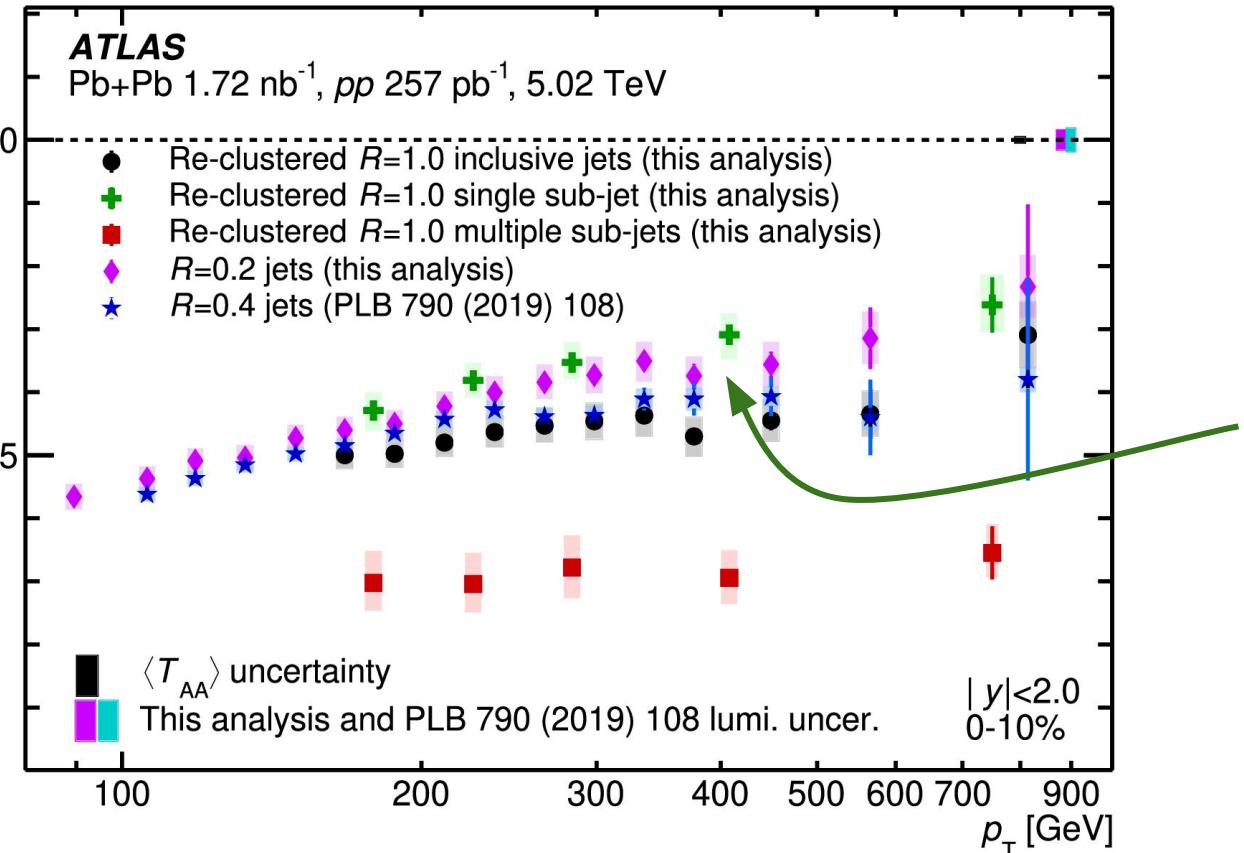

Jet suppression for different jet type

Jet suppression for different jet type

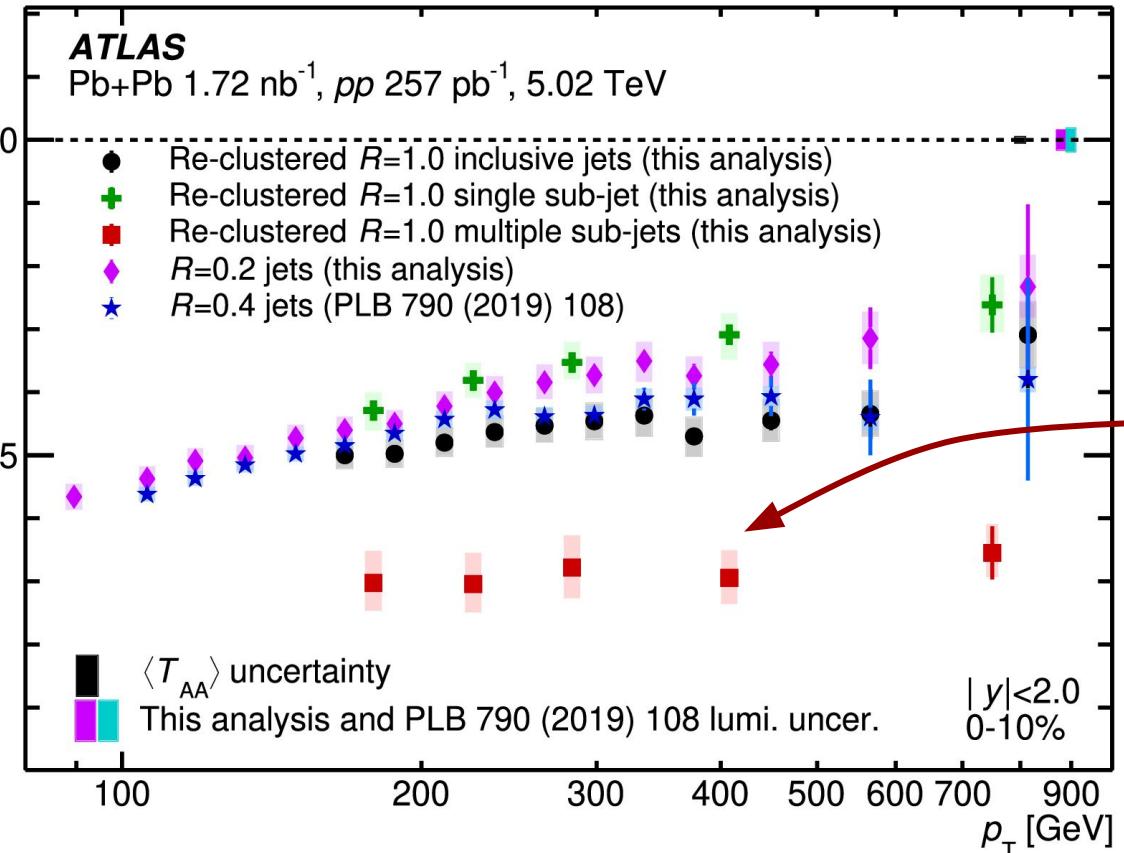

R_{AA}

Two components:
single sub-jet $R=1.0$
suppressed the least

Jet suppression for different jet type

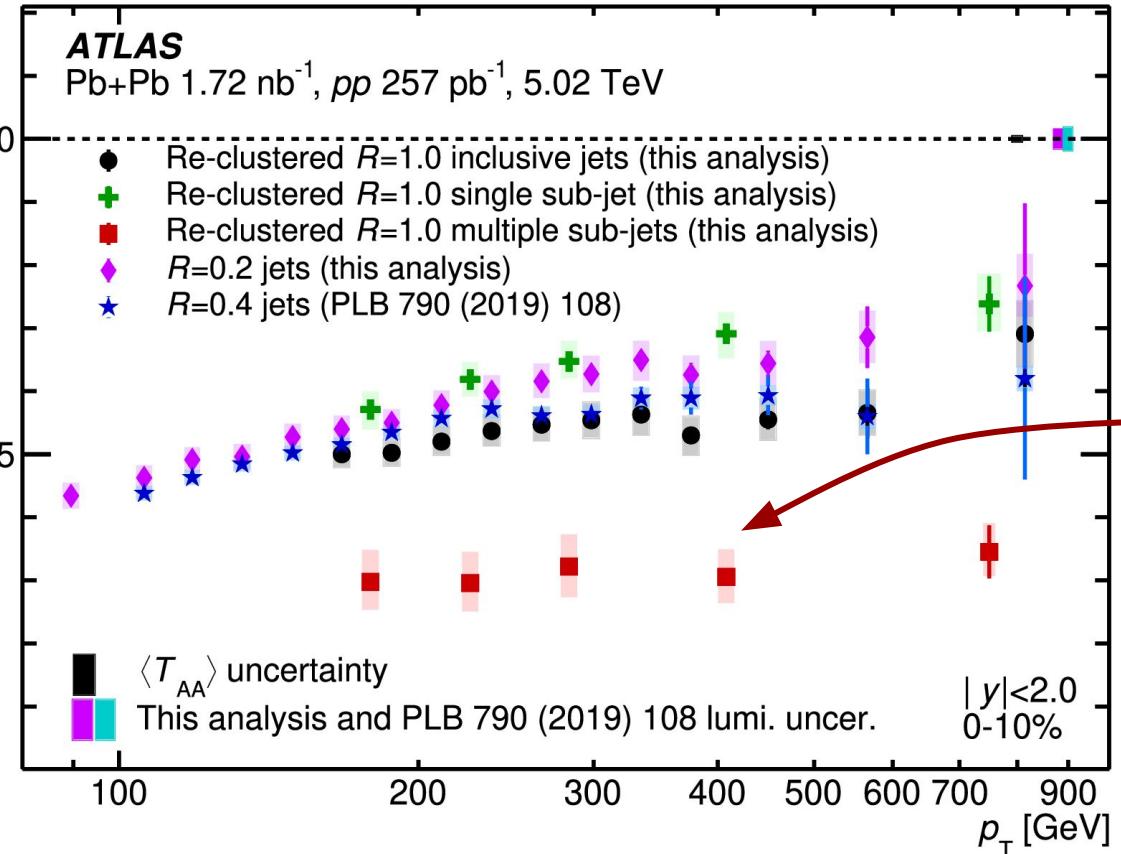

R_{AA}

Two components:
multiple sub-jet $R=1.0$
suppressed of the largest
suppression

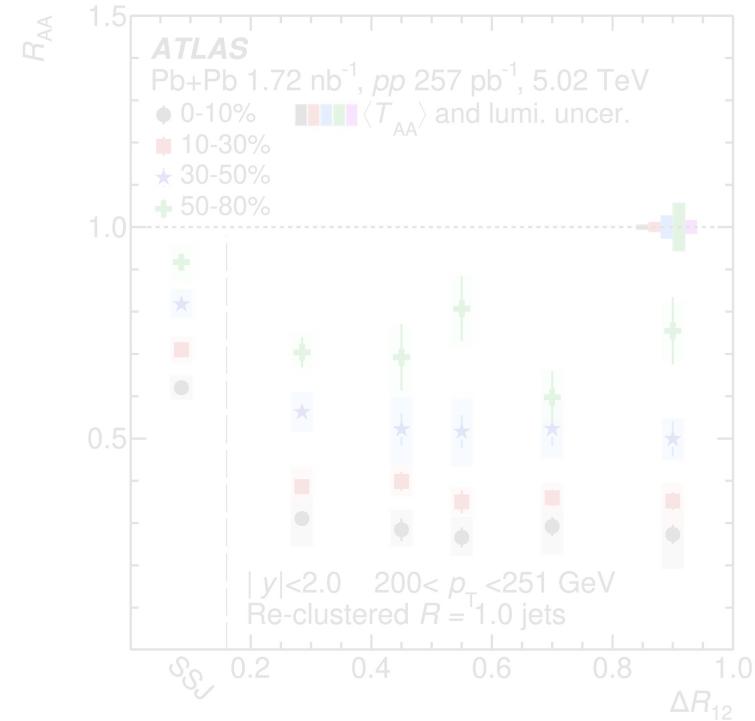

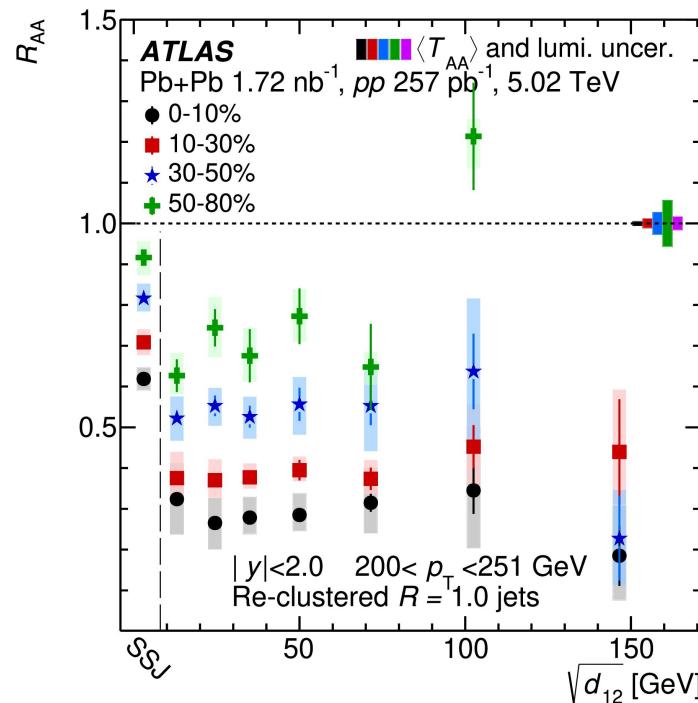

Jet suppression for different jet type

R_{AA}

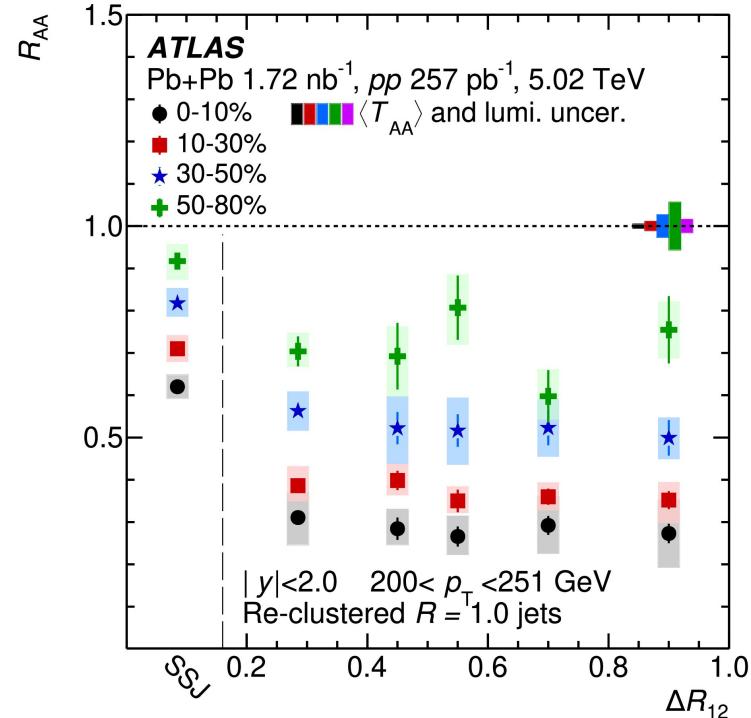

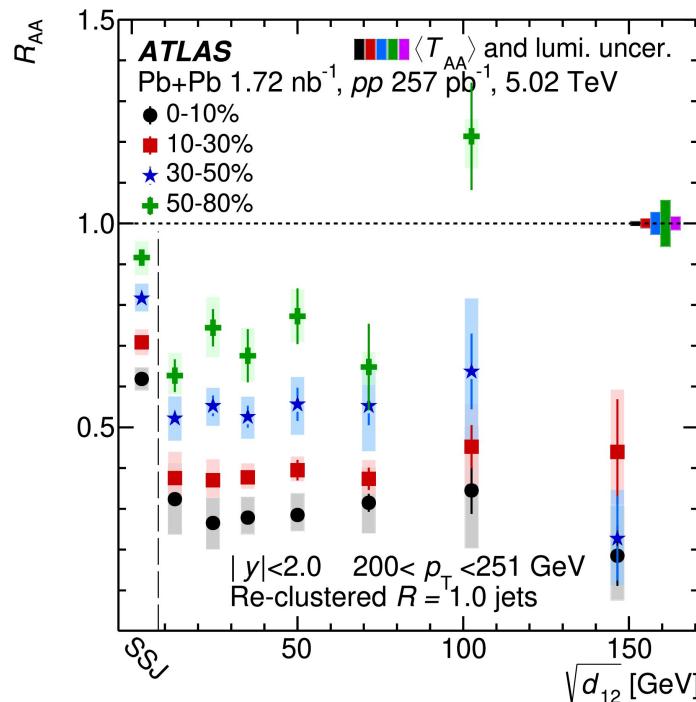

Two components:
multiple sub-jet $R=1.0$
flat $R_{AA} \Leftrightarrow$ increased
multiplicity with p_T &/II
different spectral shape

Re-clustered jets vs substructure

- Significant change of the R_{AA} magnitude between jets with single sub-jet and those with more complex substructure.
- The R_{AA} sharply decreases followed by flattening.

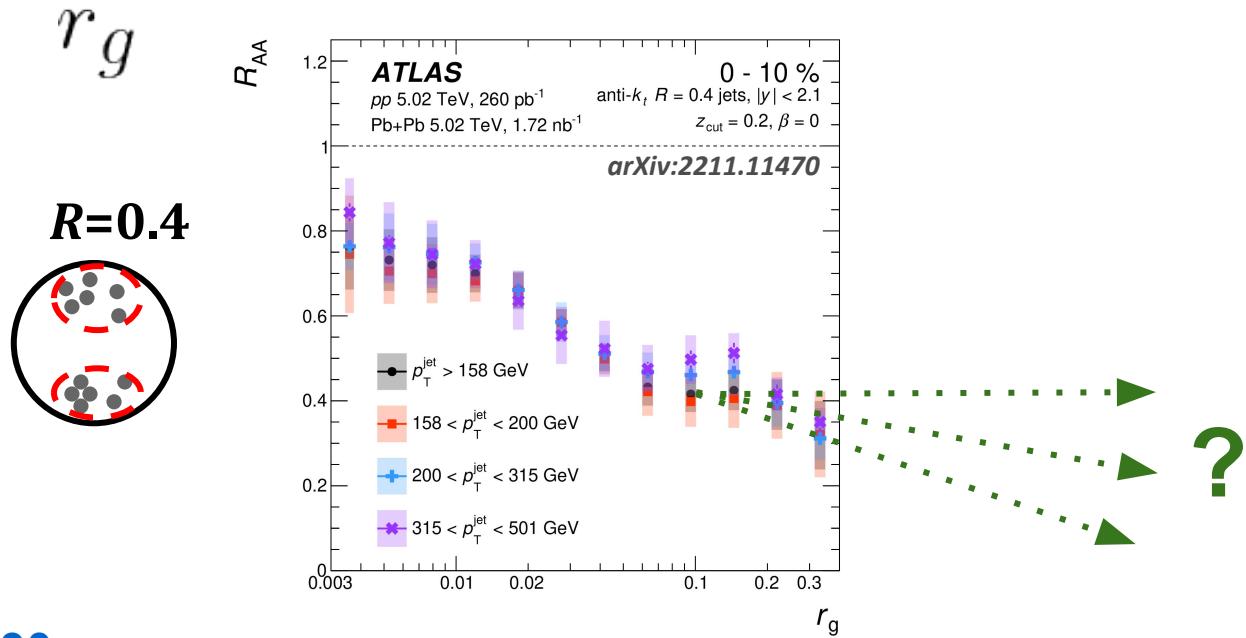

Re-clustered jets vs substructure

- The R_{AA} sharply decreases followed by flattening.
- Similar observation for suppression as function of angular separation.

r_g

$R=0.4$

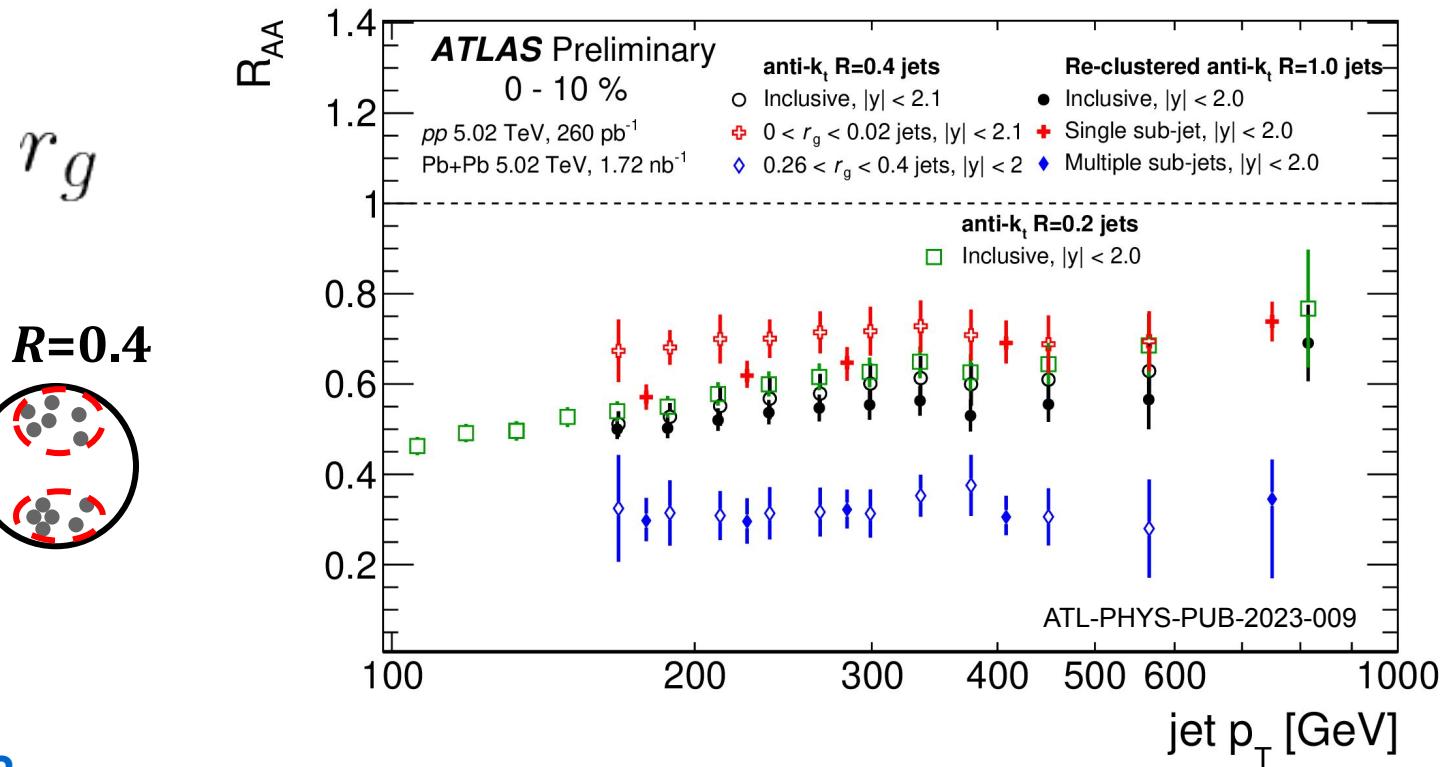

$$\Delta R_{12} = \sqrt{\Delta y_{12}^2 + \Delta \phi_{12}^2}$$

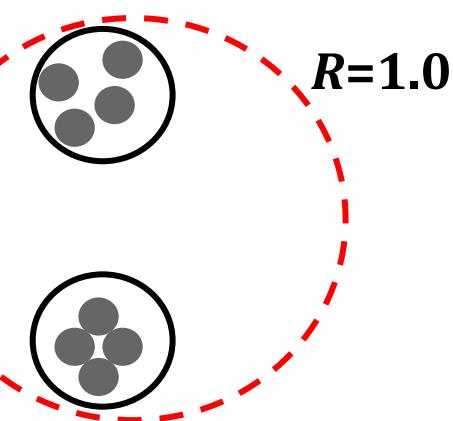

Full picture: small & large jets

- Addressing transition from color-coherence to decoherence...

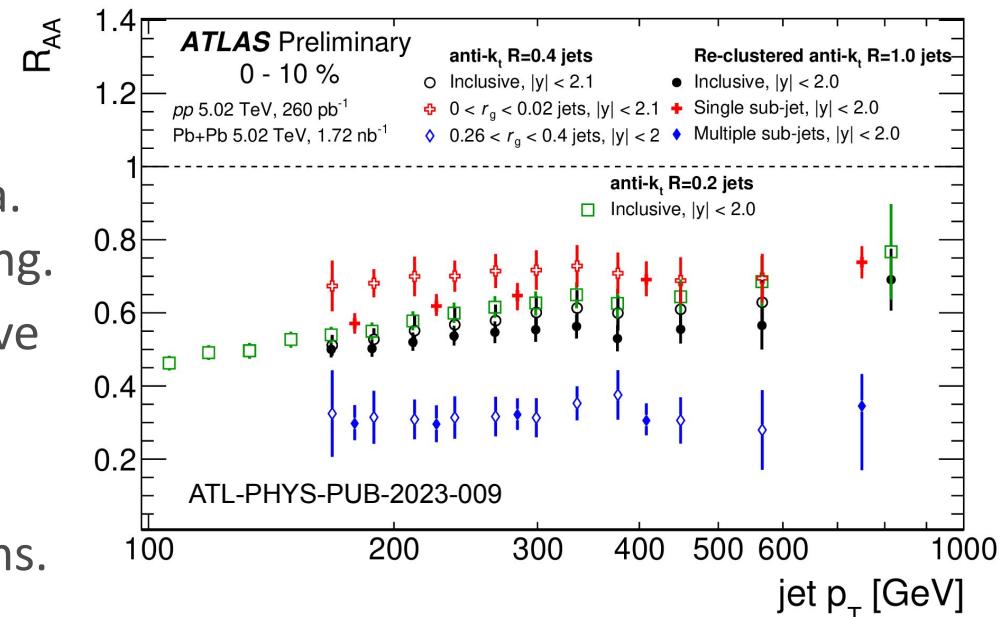

$$\Delta R_{12} = \sqrt{\Delta y_{12}^2 + \Delta \phi_{12}^2}$$

Summary

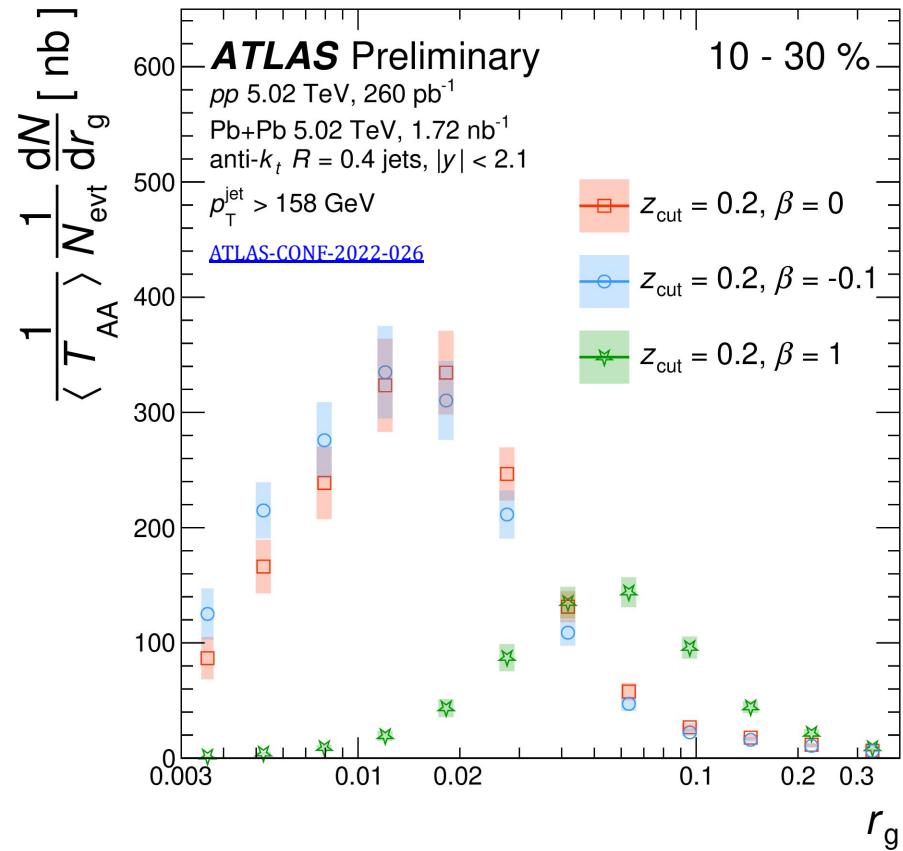

- Jet substructure in HI is a rapidly developing area
- Two new complementary measurement by ATLAS
 - Jet suppression depends significantly on jet substructure.
 - Probing role on angular scale from distance 0.003 up to 1.0 \Leftrightarrow should help addressing color coherence phenomena.
 - Testing role of p_T scale of hardest splitting.
 - Addresses the p_T dependence of inclusive suppression.
 - Run 3 data should allow similar measurements in photon-tagged systems.
- All data including yields & cross-section are available.

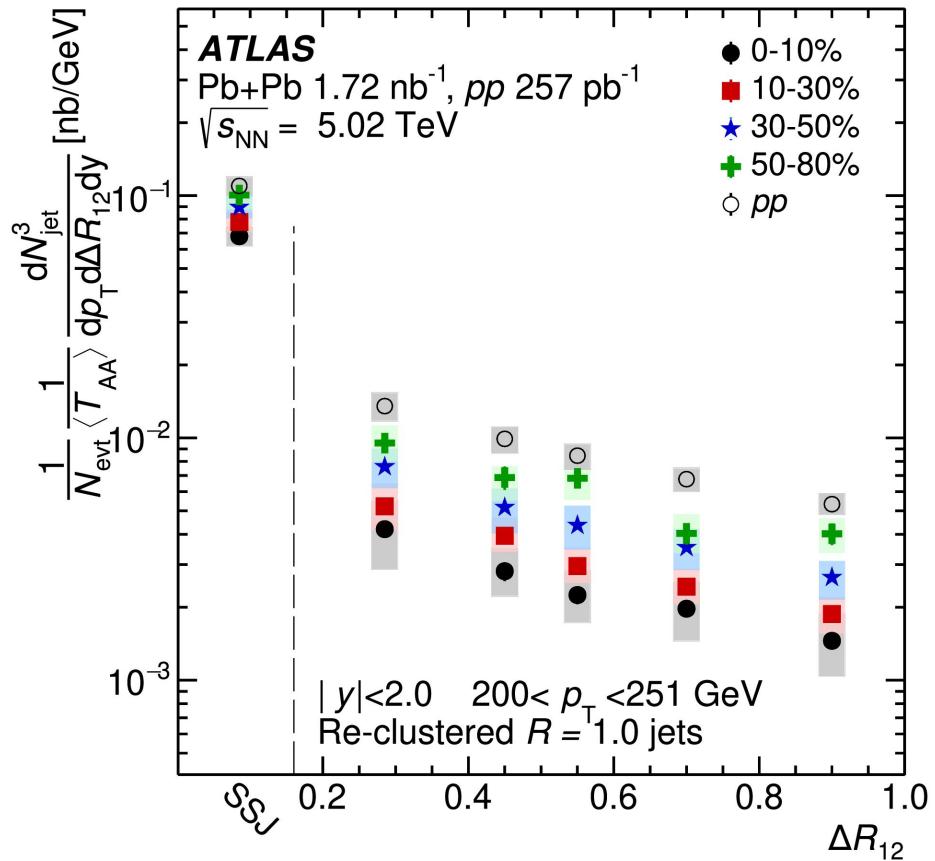

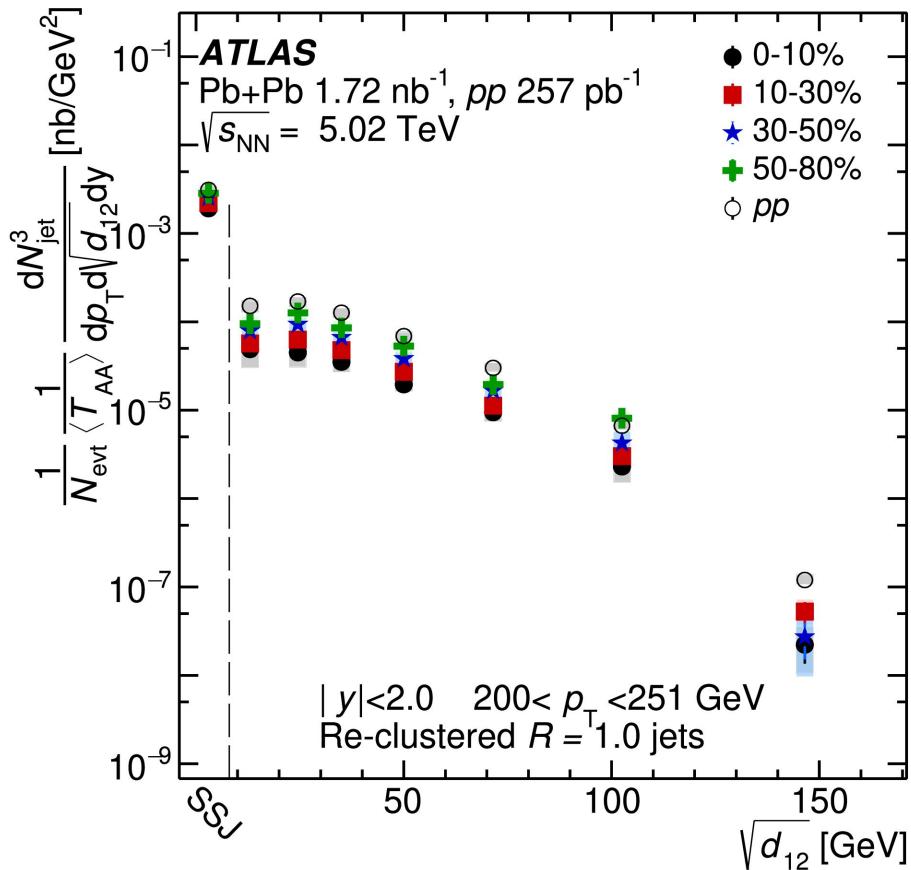

Backup

Challenges in jet structure measurements

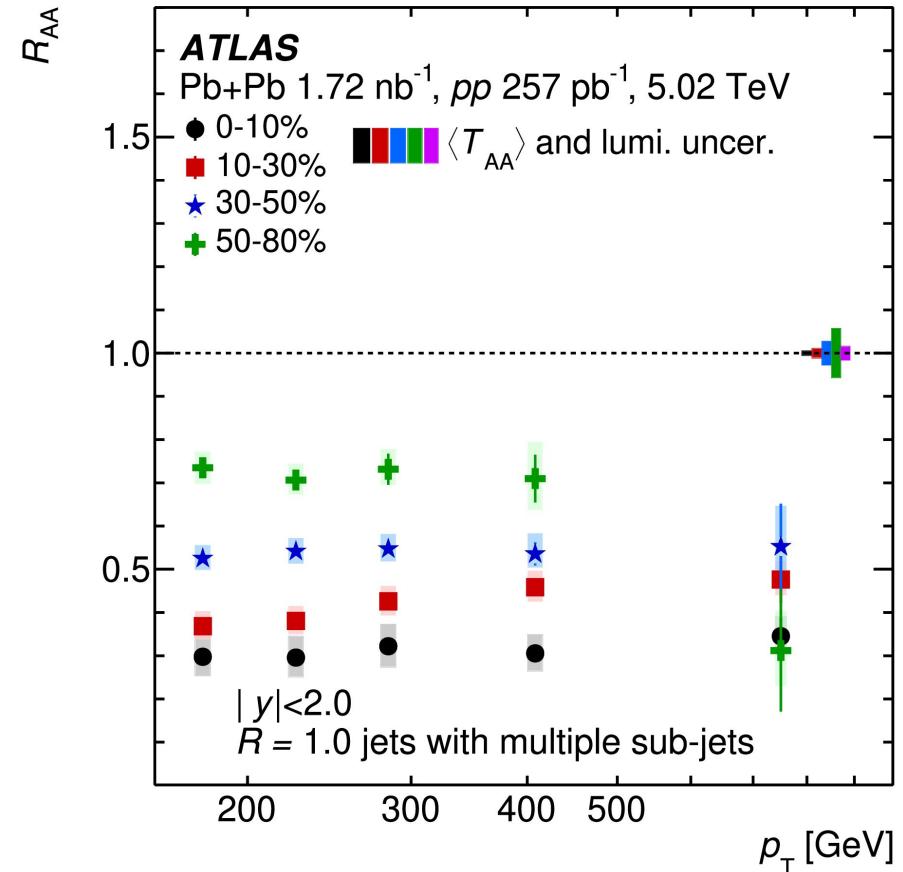

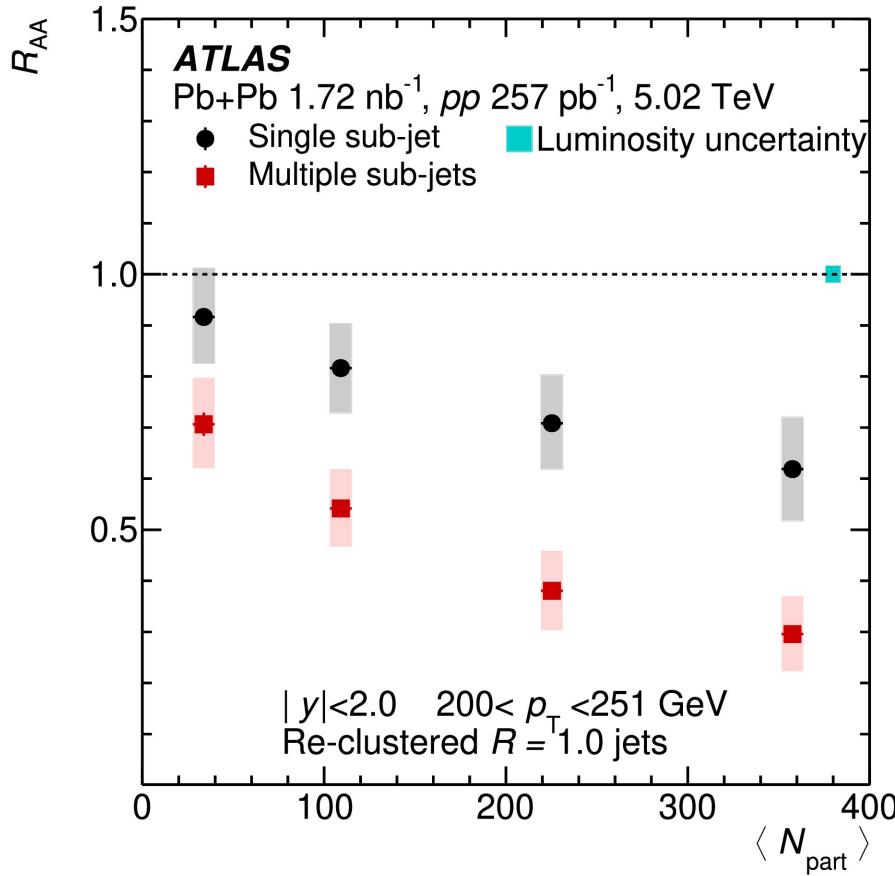

- Push towards larger phase space: lower energy and various/larger radius.
- Large UE contribution from soft particles.
- Combinatorial background from independent hard scatterings.
- For calorimetric measurement:
 - Jet energy calibration and uncertainties for every new jet “collection”.... different radius, subjects, and constituents.
- Role of ISR@FSR
- Choice of setting in grooming...
 - Sensitive to modeling and subtraction.
 - Need to understand biases we introduce.
