Lorenzo Feligioni on behalf of the ATLAS collaboration

*BSM Models light the way out of the SM*

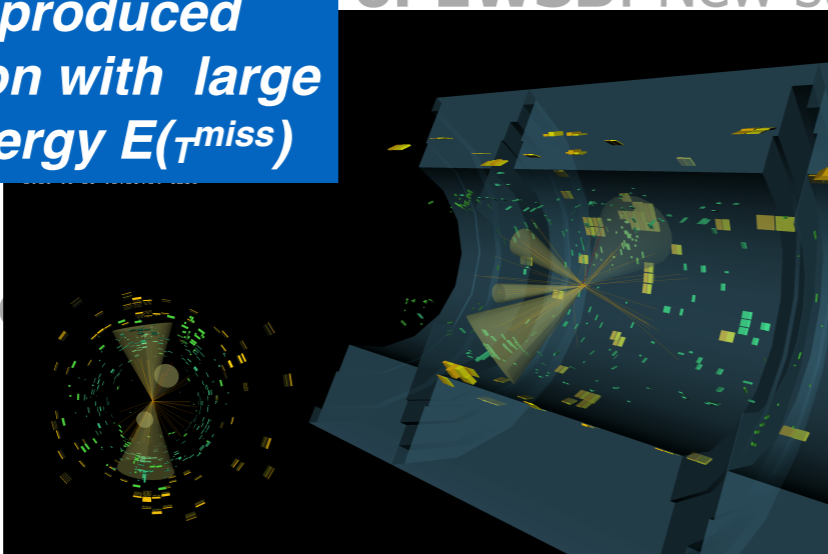

- Evolution for Run 3 :
  - New LAr Calorimeter digital trigger electronic boards
  - Improved muon Level 1 trigger thanks to NSW
  - Upgraded TDAQ
- Excellent performance of the detector
  - ~66 fb-1 of data recorded by ATLAS in Run 3
- Large effort on analyzing data
  - ~40 new results this summer

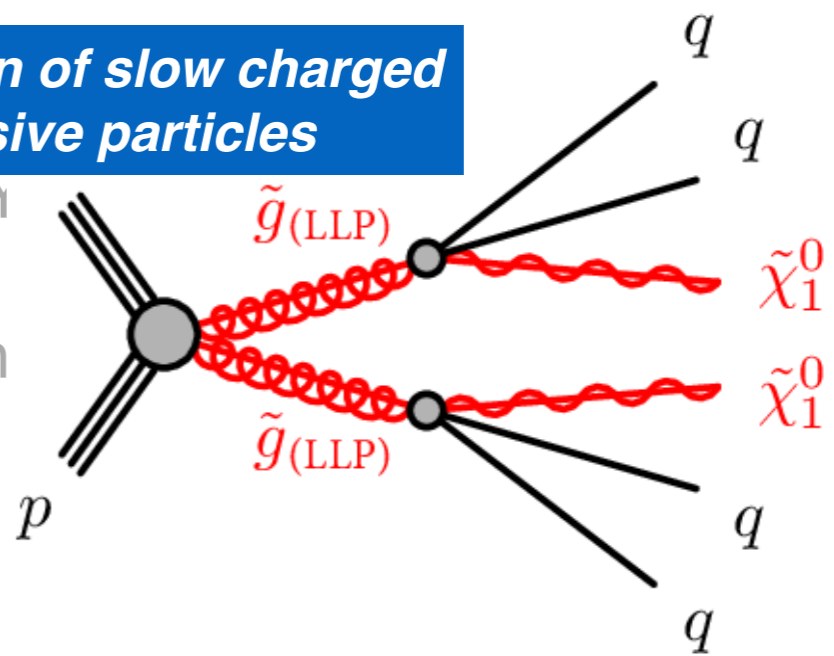

- Many new models addressing the shortcomings of the SM make predictions that can be tested at the LHC:
  - **Natural EWSB:** Supersymmetry (SUSY), large/warped extra dimensions (ADD/RS)
  - **Neutrino masses/mixing, flavor anomalies:** RPV SUSY, scalar di-quarks

**Di-Higgs produced  
In association with large  
Missing energy  $E(\tau^{miss})$**

**Production of slow charged  
massive particles**

Search for pair production of higgsinos in events with two Higgs bosons and missing transverse momentum in  $\sqrt{s} = 13$  TeV pp collisions at the ATLAS experiment ATLAS-CONF-2023-048

- Gauge Mediated Symmetry Breaking Models (GMSB)

- LSP → particle associated to the spontaneous breaking of the global supersymmetry

- High Mass Channel:

- significant**  $E_{T}^{miss}$
- background estimated with MC simulation
- BDT used to discriminate signal and background

- Low mass Channel

- ≥4 b-jets to reconstruct higgs bosons**
- QCD background estimated with ABCD method

$\tilde{\chi}_0^1$  NLSP

$h_1^{LM}$  and  $h_2^{LM}$  Higgs candidates

$$X_{hh}^{SR} = \sqrt{\left(\frac{m(h_1^{LM}) - 120 \text{ GeV}}{0.1 \cdot m(h_1^{LM})}\right)^2 + \left(\frac{m(h_2^{LM}) - 110 \text{ GeV}}{0.1 \cdot m(h_2^{LM})}\right)^2}$$

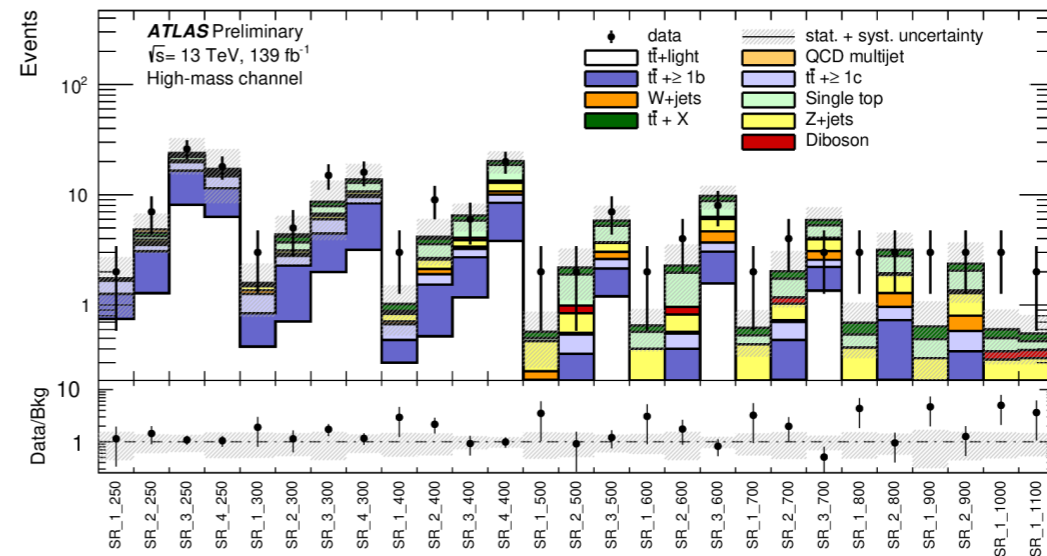

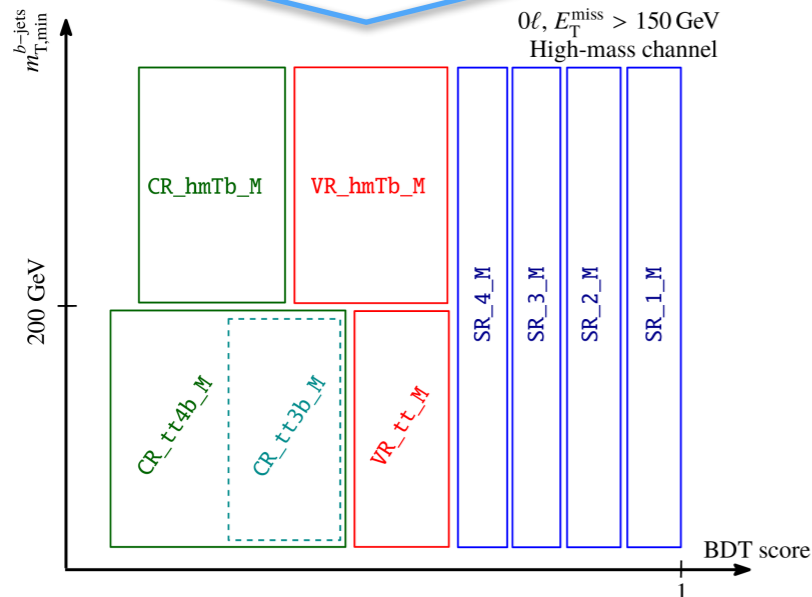

## Search for pair production of higgsinos in events with two Higgs bosons and missing transverse momentum in $\sqrt{s} = 13$ TeV pp collisions at the ATLAS experiment ATLAS-CONF-2023-048

- Low mass:

reconstruction of higgs boson masses

- High mass:

Mass dependent SR and CR function of BDT score

Search for pair production of higgsinos in events with two Higgs bosons and missing transverse momentum in  $\sqrt{s} = 13$  TeV pp collisions at the ATLAS experiment ATLAS-CONF-2023-048

- Highest mass reach of all analyses targeting GMSB models, reaching TeV scale

More EWK SUSY results in Francesco's presentation

Search for massive, long-lived charged particles with large specific ionisation and low-beta in 140 fb<sup>-1</sup> of pp collisions at  $\sqrt{s}=13$  TeV using the ATLAS experiment ATLAS-CONF-2023-044

- Searching for heavy ( $m > 100$  GeV) charged particles with  $\tau > 3$  ns\*
- Results interpreted for pair-production of different LL sparticles
- In Run 2 a  $3.3\sigma$  excess for  $m \sim 1.4$  TeV was observed

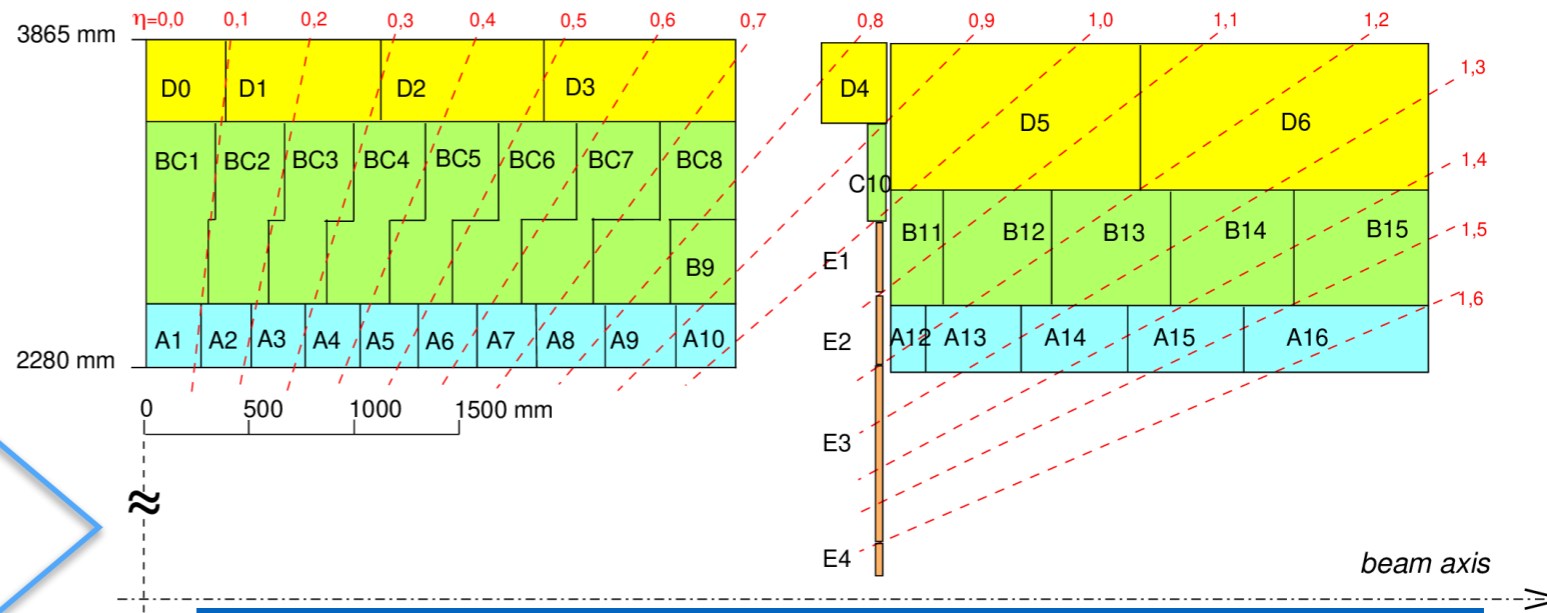

**Staus pair production**

**R-hadrons**

**TileCal cell layout and  $|\eta|$  acceptance**

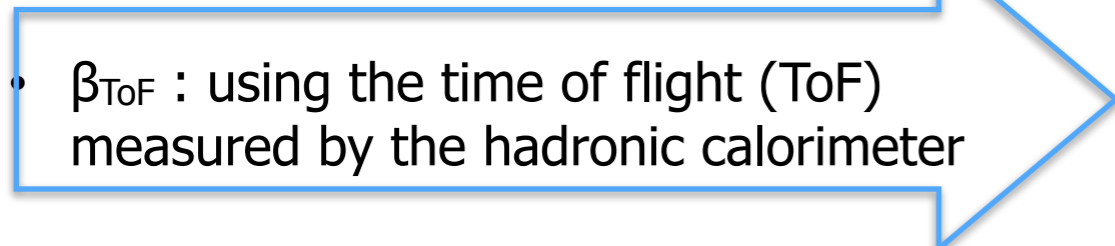

$\sigma(\beta_{\text{ToF}}) \equiv$  the cell time resolution, defined in  $\eta$  slices

• **Main idea:**  $m \equiv p/\beta\gamma$  from two independent determinations of  $\beta\gamma$ :

•  $\beta_{dE/dx}$  : Bethe-Bloch to go from  $dE/dx$  measured by the pixel detector to  $\beta\gamma$

•  $\beta_{\text{ToF}}$  : using the time of flight (ToF) measured by the hadronic calorimeter

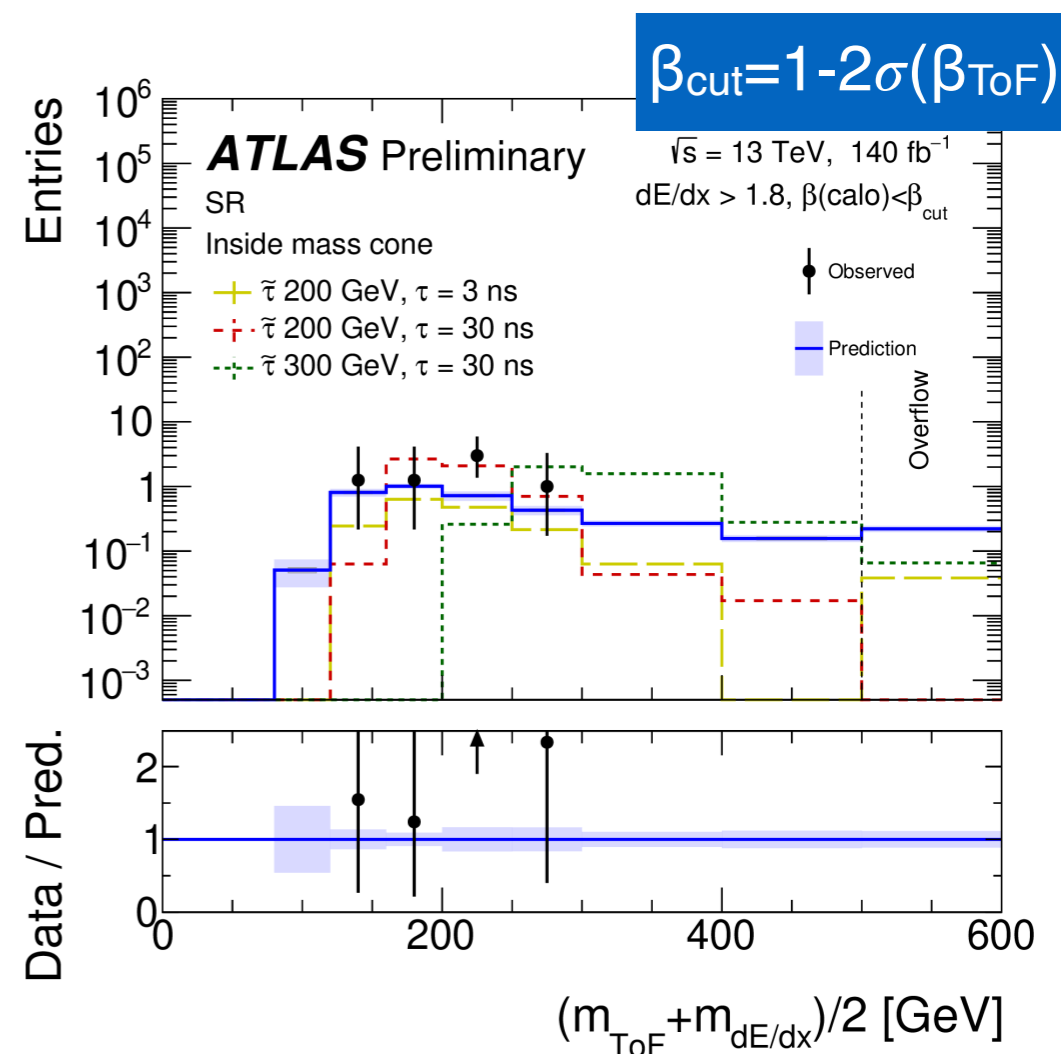

\* to allow the particle to reach the calorimeter

Search for massive, long-lived charged particles with large specific ionisation and low-beta in 140 fb<sup>-1</sup> of pp collisions at  $\sqrt{s}=13$  TeV using the ATLAS experiment ATLAS-CONF-2023-044

- The search is performed in the ( $m_{dE/dx}$ ,  $m_{ToF}$ ) plane with trapezoidal mass windows
- 9 events ( $5.1 \pm 0.5$ ) observed (exp)  $5.1 \pm 0.5$  in SR
  - 6 in the compatibility cone (expected  $3.7 \pm 0.4$ )

- Many new models addressing the shortcomings of the SM make predictions that can be tested at the LHC:

*Massive new resonances*

- Natural** *decaying into lepton + quark* (SUSY), large/warped extra dimensions (ADD/RS)

$$uu \rightarrow dl^+$$

- Neutrino masses/mixing, flavor anomalies:** RPV SUSY, scalar di-quarks

$$ud \rightarrow ul$$

$$\bar{d}\bar{d} \rightarrow dl^+$$

- Dynamic explanation of EWSB:** New strong dynamics

- Unification of all forces:** magnetic monopoles,

- Dark matter:** Axion-Like particles, Dark Sectors,

*Heavy resonances decaying into multi-jets*

Search for quantum black hole production in lepton+jet final states using proton-proton collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2307.14967

- QBHs are produced near the scale of quantum gravity  $M_D$ .
- Global symmetries (B and L) not necessarily conserved in strong-gravity interactions  $\rightarrow$  striking lepton + jet resonances
- New particles should be visible on the reconstructed lepton+jet invariant mass

$$uu \rightarrow \bar{d}l^+$$

$$ud \rightarrow \bar{u}l^+$$

$$\bar{d}\bar{d} \rightarrow dl^+$$

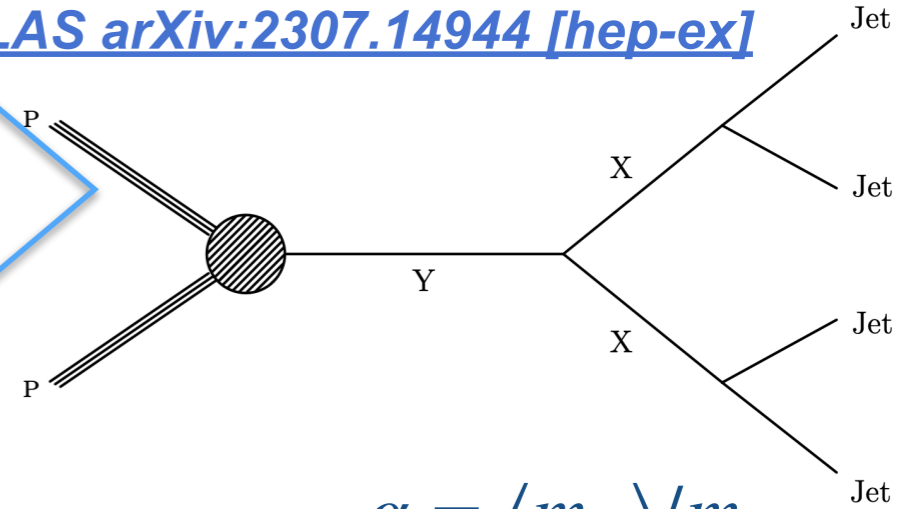

Search for quantum black hole production in lepton+jet final states using proton-proton collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2307.14967

- No evidence found, limits are set quantum black holes decaying to a lepton and a quark
- The resulting lower mass threshold limits in the **ADD (RS1)** models with **six (one)** extra dimensions are **9.2 (6.8) TeV**

## Pursuit of paired dijet resonances in the Run 2 dataset with ATLAS arXiv:2307.14944 [hep-ex]

- Search for a generic massive resonance Y decaying into pairs of intermediate resonance X

- Paired minimizing**  $\Delta R = |\Delta R_{AB} - 0.8| + |\Delta R_{cd} - 0.8|$

- No deviations observed  $\rightarrow$  limits set for different  $m_{Y/X}$  scenarios

$$\alpha = \langle m_{2j} \rangle / m_{4j}$$

1.98  $\sigma$

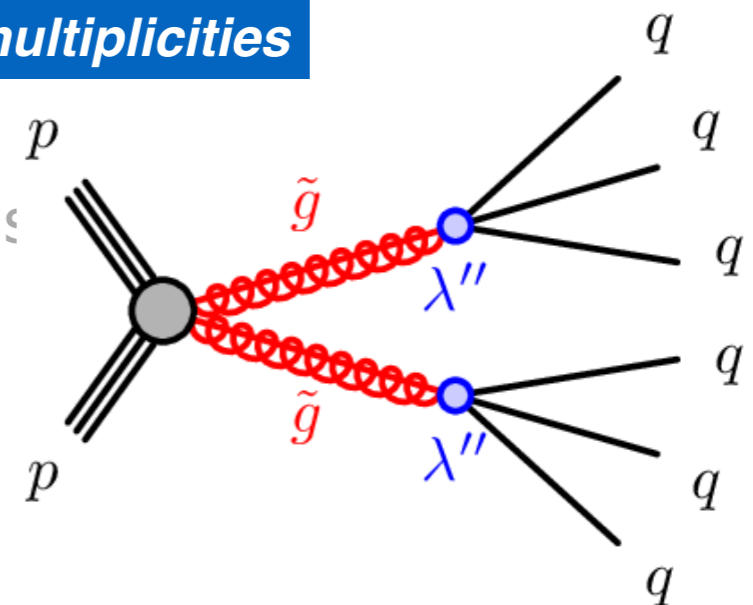

0.53  $\sigma$

- Many new models addressing the shortcomings of the SM make predictions that can be tested at the LHC:
  - **Natural EWSB:** Supersymmetry (SUSY), large/warped extra dimensions (ADD/RS)
  - **Neutrino masses/mixing, flavor anomalies:** RPV SUSY, scalar di-quarks
  - **Dynamic explanation of EWSB:** New strong dynamics
  - **Unification of all forces:** magnetic monopoles, ...
  - **Dark matter:** Axion-Like particles, Dark Sectors, SUSY, ...

*Resonances with large jet multiplicities*

A search for R-parity-violating supersymmetry in final states containing many jets in  $\sqrt{s} = 13$  TeV pp collisions with the ATLAS detector ATLAS-CONF-2023-049

- **R-parity violation:** UDD RPV coupling leads SUSY particles to decay to quarks

Jet counting analysis: define single-bin signal regions (SR) requiring high jet multiplicity

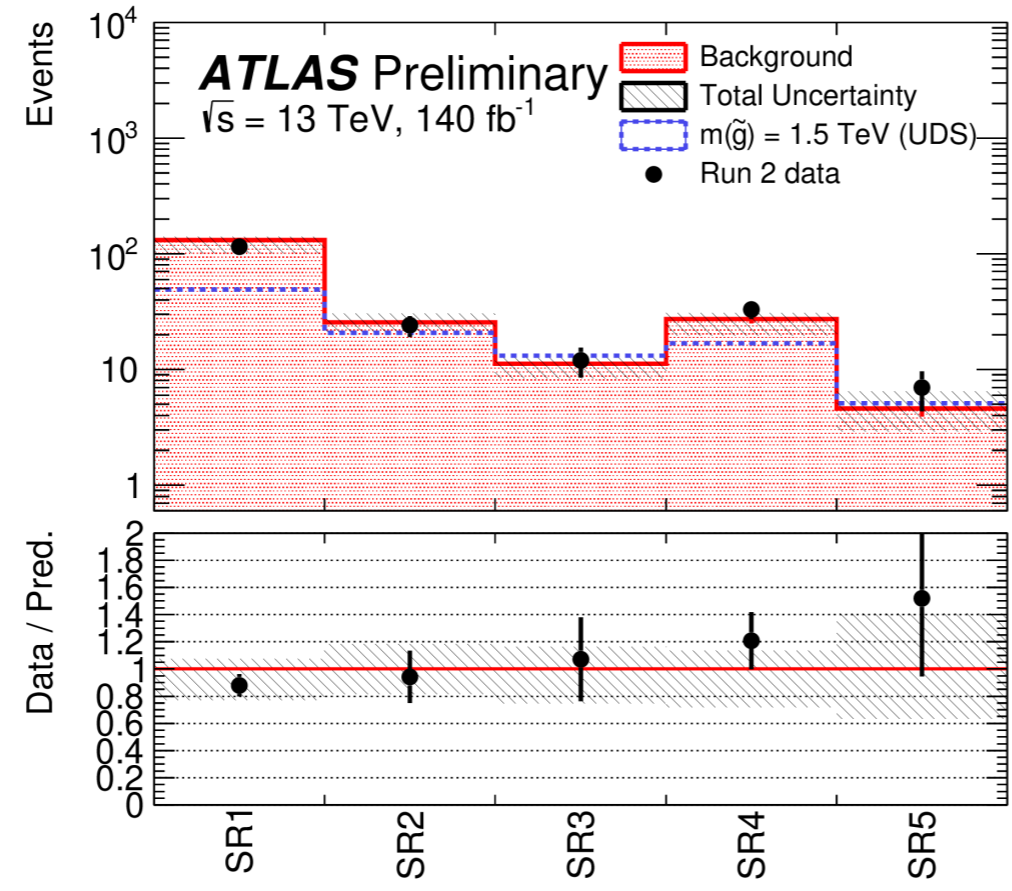

- Mass resonance analysis: NN based on attention mechanism to predict probability for jet to be assigned to each  $\tilde{g}$

	$n_{\text{jets}}$	$p_T(j)$ [GeV]	$C$	$n_{b\text{-jets}}$
SR1	$\geq 7$	180	$\geq 0.90$	-
SR2	$\geq 7$	220	$\geq 0.90$	-
SR3	$\geq 7$	240	$\geq 0.90$	-
SR4	$\geq 8$	180	$\geq 0.85$	-
SR5	$\geq 8$	210	$\geq 0.85$	-
SR1bj	$\geq 7$	180	$\geq 0.85$	$\geq 2$
SR2bj	$\geq 8$	180	$\geq 0.85$	$\geq 2$

**direct decay**

**cascade decay**

A search for R-parity-violating supersymmetry in final states containing many jets in  $\sqrt{s} = 13$  TeV pp collisions with the ATLAS detector ATLAS-CONF-2023-049

- Limits greatly improved by current analysis: event shape, ML, luminosity
- **direct decay model**  $m(\tilde{g}) < 1800$  GeV excluded at 95% CL.
- In the **cascade decay model**,  $m(\tilde{g}) < 2340$  GeV excluded for  $m(\tilde{\chi}_0^1) = 1250$  GeV.

## Heavy resonances decaying to top quarks

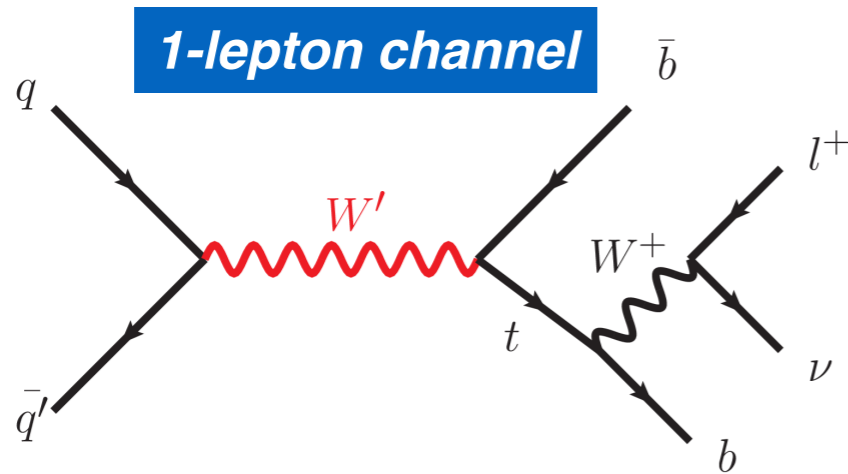

## ..and to b-jets

- **Dynamic explanation of EWSB:** New strong dynamics
- **Unification of all forces:** magnetic monopoles, SUSY
- **Dark matter:** Axion-Like particles, Dark Sectors, SUSY, scalar mediators

Search for vector-boson resonances decaying into a top quark and a bottom quark using pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

Search for vector-boson resonances decaying into a top quark and a bottom quark using pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

- $m(W') > 4.6$  (4.2) TeV excluded for right-(left-)handed  $W'$  and coupling value of  $g'/g = 1.0$

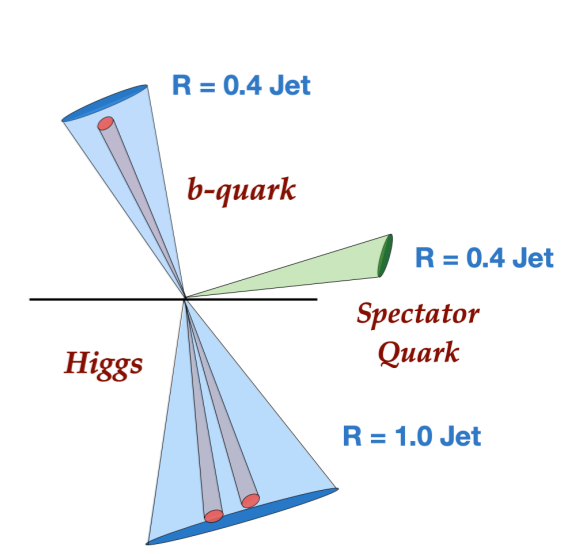

Search for single vector-like B quark production and decay via  $B \rightarrow bH(bb)$  in pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.02595

- New strong interaction predicts VLQs, new spin-1/2 bound states
- Extensively searched at the LHC in pair production
- Single VLQ production may overtake at high masses depending on the strengths of couplings ( $\kappa$ )

- Experimental signature:
- 3 high-pT b-quarks
  - Boosted Higgs system

## Search for single vector-like $B$ quark production and decay via $B \rightarrow bH(bb)$ in $pp$ collisions at $\sqrt{s}=13$ TeV with the ATLAS detector arXiv:2308.02595

- No excess found, results interpreted in terms of upper limits on the  $B$  production cross-section
- Different values of the coupling strength  $\kappa$  and the mass in either the singlet or doublet state excluded

- Many new models addressing the shortcomings of the SM make predictions that can be tested
- **Detection of High Electric Charged Objects (HECO) compatible in the detector**
- **Natural EWSB: Supersymmetry (SUSY)**
- **Neutrino masses/mixing, flavor anomalies**
- **Dynamic explanation of EWSB: New strong dynamics**
- **Unification of all forces: magnetic monopoles, SUSY**
- **Dark matter: Axion-Like particles, Dark Sectors, SUSY, scalar mediators**

Search for magnetic monopoles and stable particles with high electric charges in 13 TeV proton–proton collisions with the ATLAS detector arXiv:2308.04835

**Dirac's quantization condition**

$$g_D = \frac{2}{2\alpha} \approx 68.5e$$

- Magnetic monopole: isolated magnetic charge, restores the broken electric–magnetic dual symmetry in Maxwell's equations
- Highly Ionizing Particles (HIP):
  - **Large number of TRT hits** in a region aligned with a **narrow high-energy deposit in the EM calorimeter.**

**Drell-Yan**

**Photon Fusion**

$f_{HT}$  = fraction of all the TRT hits in the road exceed the high threshold

## Search for magnetic monopoles and stable particles with high electric charges in 13 TeV proton–proton collisions with the ATLAS detector arXiv:2308.04835

### Dirac's quantization condition

$$g_D = \frac{2}{2\alpha} \approx 68.5e$$

- Magnetic monopole: isolated magnetic charge, restores the broken electric–magnetic dual symmetry in Maxwell's equations
- Highly Ionizing Particles (HIP):
  - **Large number of TRT hits** in a region aligned with a **narrow high-energy deposit in the EM calorimeter.**

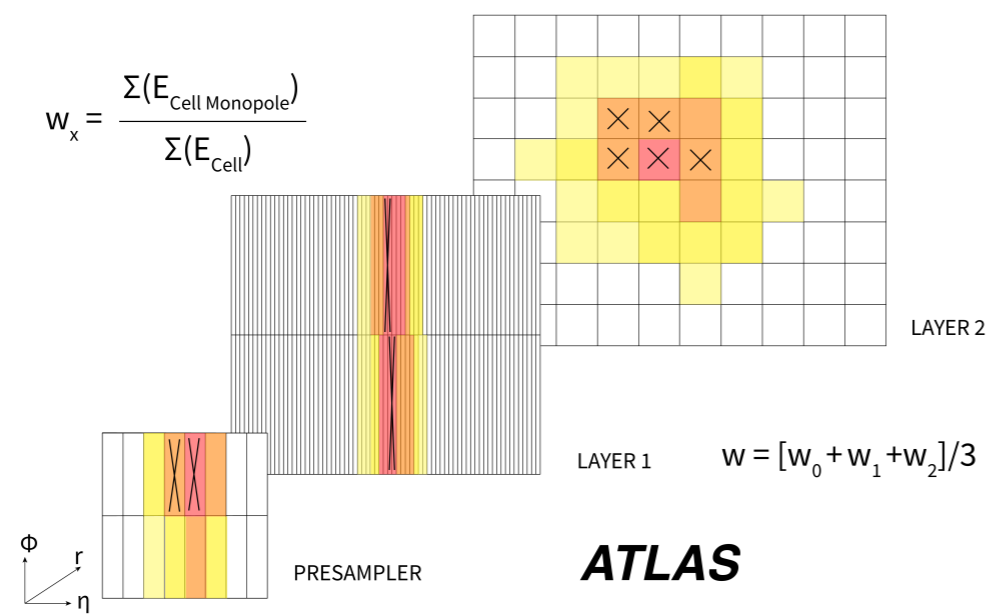

### Drell-Yan

### Photon Fusion

$w_0, w_1$  and  $w_2$ : fractions of EM cluster energy ( $E_i$ ) contained in the most energetic cells

Search for magnetic monopoles and stable particles with high electric charges in 13 TeV proton–proton collisions with the ATLAS detector arXiv:2308.04835

- Background estimated using ABCD method: two-dimensional distribution of  $f_{HT}$  and  $W$

## Search for magnetic monopoles and stable particles with high electric charges in 13 TeV proton–proton collisions with the ATLAS detector arXiv:2308.04835

- Consistent with the bkg expectation, **no event observed in SR**
  - exclusion limits set on spin 0 and 1/2 for DY and PF signal models
  - A factor of  $\sim 3$  improvement from added luminosity and improved background estimate uncertainties

Photon pairs produced in association with forward protons  
more on Olivera's talk

Multi-lepton production from the decay of dark photons  
more on Olivera's talk

$t\bar{t}$  production with large missing energy  
more on Francesco's talk

- **Unification of all forces:** magnetic monopoles, SUSY
- **Dark matter:** Axion-Like particles, Dark Sectors, SUSY, scalar mediators

***More on Dark Matter on Francesco and Olivera's talk this afternoon***

Search for vector-boson resonances decaying into a top quark and a bottom quark using pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

- Search for new heavy  $W'$  gauge bosons
- Search for resonance in the  $tb$  invariant mass spectrum ( $m_{tb}$ )

**0-lepton channel**

- 1 top-tagged large-R jet formed by 0/1 b-tagged small-R jets
- top candidate with b-quark form  $W'$  candidate
- Signal, control and validation regions function of top- and b-tagging NN scores

Search for vector-boson resonances decaying into a top quark and a bottom quark using pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

- Search for new heavy  $W'$  gauge bosons
- Search for resonance in the  $tb$  invariant mass spectrum ( $m_{tb}$ )

1-lepton channel

- 1 isolated lepton,  $\geq 2$  jets and large  $E_T^{\text{miss}}$
- $W'$  mass from reconstruction of  $p_z(\nu)$
- Events categorized based on number of jets,  $b$ -tagged jets, and other kinematic variables.

Search for vector-boson resonances decaying into a top quark and a bottom quark using pp collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

- $m(W') > 4.6$  (4.2) TeV excluded for right-(left-)handed  $W'$  and coupling value of  $g'/g = 1.0$

Search for singly produced vector-like top partners in multilepton final states with 139 fb<sup>-1</sup> of pp collision data at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2307.07584

- Single T are produced the  $s$ - and  $t$ -channel topologies: WTZt (singlet) and ZTZt (doublet)
- Analysis performed in 2l opposite-sign and 3 lepton final states
- 2L analysis:
  - Invariant mass of leptons compatible with Z
  - Large hadronic "top-jet"

WTZt

ZTZt

Search for singly produced vector-like top partners in multilepton final states with 139 fb<sup>-1</sup> of pp collision data at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2307.07584

- Single T are produced the  $s$ - and  $t$ -channel topologies: WTZt (singlet) and ZTZt (doublet)
- Analysis performed in 2l opposite-sign and 3 lepton final states
- 3L analysis:
  - Invariant mass of leptons compatible with Z
  - Large angular separation between  $T$ , the  $Z$  boson decay products

WTZt

ZTZt

Search for singly produced vector-like top partners in multilepton final states with 139 fb<sup>-1</sup> of pp collision data at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2307.07584

- p<sub>T</sub>(ll) used as a final discriminant
- Results are interpreted in terms of limits on the T mass and coupling for different electroweak representations and branching ratio scenarios.

A search for R-parity-violating supersymmetry in final states containing many jets in  $\sqrt{s} = 13$  TeV pp collisions with the ATLAS detector ATLAS-CONF-2023-049

**B: Barion number, L: Lepton number, S: Spin**

- R-parity:  $R = (-1)^{3(B-L)+2s} \rightarrow R = +(-)1$  for SM particles (superpartners)
- SUSY allows for B and L violation if R-parity violation (RPV) is admitted
  - LSP possibly not stable  $\rightarrow$  signals with large number of SM particles in the final state
  - UDD RPV coupling leads SUSY particles to decay to quarks

**direct decay**

**cascade decay**

## Search for single vector-like B quark production and decay via $B \rightarrow bH(bb)$ in pp collisions at $\sqrt{s}=13$ TeV with the ATLAS detector arXiv:2308.02595

- ABCD data driven background estimation

- Kinematic variables used to discriminate against background
  - $\Delta R^*$  = ratio  $\Delta R$  between track jets and effective radii
  - $p_T^{HC}/m_B$  : reject events where jets have large distance between large radius and small radius jets

A search for R-parity-violating supersymmetry in final states containing many jets in  $\sqrt{s} = 13$  TeV pp collisions with the ATLAS detector ATLAS-CONF-2023-049

**Jet counting analysis:** define single-bin signal regions (SR) requiring high jet multiplicity

**Mass resonance analysis:** NN based on attention mechanism to predict probability for jet to be assigned to each  $\tilde{g}$

	$n_{\text{jets}}$	$p_T(j)$ [GeV]	$C$	$n_{b\text{-jets}}$

Pursuit of paired dijet resonances in the Run 2 dataset with ATLAS arXiv:2307.14944 [hep-ex]

• Search for a generic massive resonance Y decaying into pairs of intermediate resonance X

- Scalar di-quarks and colorons possible candidates
- **CMS observed excess**  $2.5\sigma$  at  $m_{4j} \sim 8$  TeV

A  
B  
C  
D

## [Pursuit of paired dijet resonances in the Run 2 dataset with ATLAS arXiv:2307.14944 \[hep-ex\]](#)

- Event reconstruction exploits production of **same mass** resonances
- Hadronic jets collimated but still forming four anti- $k_t$   $R=0.4$  jets
  - Paired minimizing  $\Delta R = |\Delta R_{AB} - 0.8| + |\Delta R_{cd} - 0.8|$
- Reconstructed resonance mass ratio  $\alpha = \langle m_{2j} \rangle / m_{4j}$  used to de-correlate  $m_{4j}$  and  $m_{2j}$

Pursuit of paired dijet resonances in the Run 2 dataset with ATLAS arXiv:2307.14944 [hep-ex]

- Multijet background fitted with 4 parameter function:  $f(x) = p_1(1 - x)^{p_2}x^{p_3+p_4} \ln(x)+p_5 \ln(x)^2$
- No deviations observed  $\rightarrow$  model dependent and independent limits set for different  $m_{Y/X}$  scenarios

Search for vector-boson resonances decaying into a top quark and a bottom quark using  $pp$  collisions at  $\sqrt{s}=13$  TeV with the ATLAS detector arXiv:2308.08521

- 1 isolated lepton,  $\geq 2$  jets and large  $E_T^{\text{miss}}$
- $W'$  mass from reconstruction of  $p_z(\nu)$
- Events categorized based on number of jets,  $b$ -tagged jets, and other kinematic variables.

- 1 top-tagged large-R jet formed by 0/1  $b$ -tagged small-R jets
- top candidate with  $b$ -quark form  $W'$  candidate
- Signal, control and validation regions function of top- and  $b$ -tagging NN scores

## Search for massive, long-lived charged particles with large specific ionisation and low-beta in 140 fb<sup>-1</sup> of pp collisions at $\sqrt{s}=13$ TeV using the ATLAS experiment ATLAS-CONF-2023-044

- $m(\tilde{g}) < 2.3$  TeV excluded for  $\tau=30$  ns and  $m(\tilde{\chi}_0^1)=100$  GeV.
- $280 < m(\tilde{\tau}) < 420$  GeV excluded for lifetimes of 10 ns.
- Mass limits for  $\tilde{\tau}$  extend up to 100 ns, lower mass limit constant in 10–100 ns range

more on LLP on Olivera's talk

- Many new models addressing the shortcomings of the SM make predictions that can be tested at the LHC:
  - **Natural EWSB:** Supersymmetry (SUSY), large/warped extra dimensions (ADD/RS)
  - **Neutrino masses/mixing, flavor anomalies:** RPV SUSY, scalar di-quarks
  - **Dynamic explanation of EWSB:** New strong dynamics
  - **Unification of all forces:** magnetic monopoles, SUSY
  - **Dark matter:** Axion-Like particles, Dark Sectors, SUSY, scalar mediators
