

First test beam insights for ATLAS ITk strip modules with Cold Noise

Yajun He (DESY) on behalf of the ATLAS ITk collaboration
12th beam telescopes and test beams workshop
April 15-19, 2024, Edinburgh, UK

• ATLAS detector for the HL-LHC:

- More interactions per bunch crossing ($\langle \mu \rangle \approx 50 \rightarrow 200$).
- Higher trigger rate (100 kHz \rightarrow 1 MHz).
- Worse radiation damage (up to $2 \times 10^{16} n_{eq}/cm^2$).

• Inner Tracker (ITk):

- 180 m² of n⁺ in p silicon.
- **Strip modules** in outer layers.
- Pixel layers in inner layers.

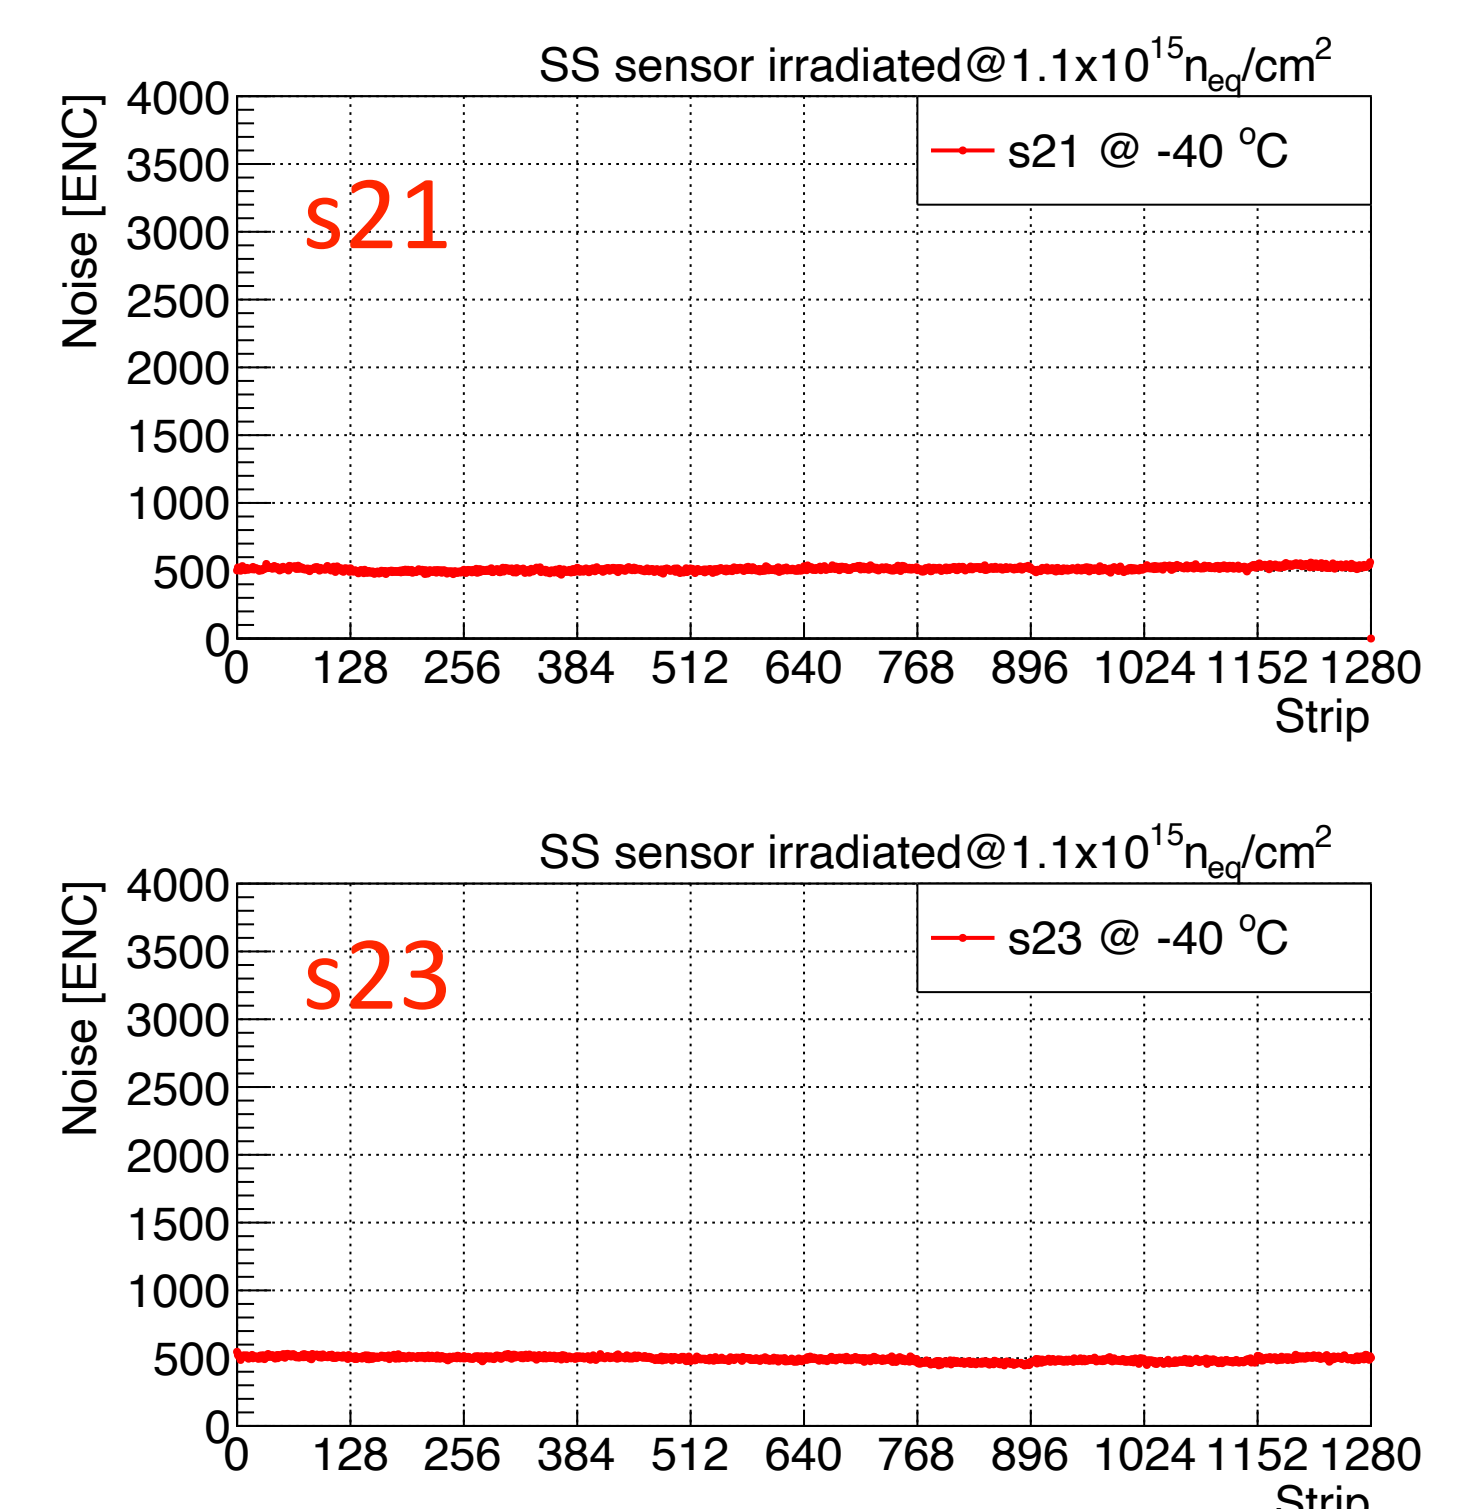

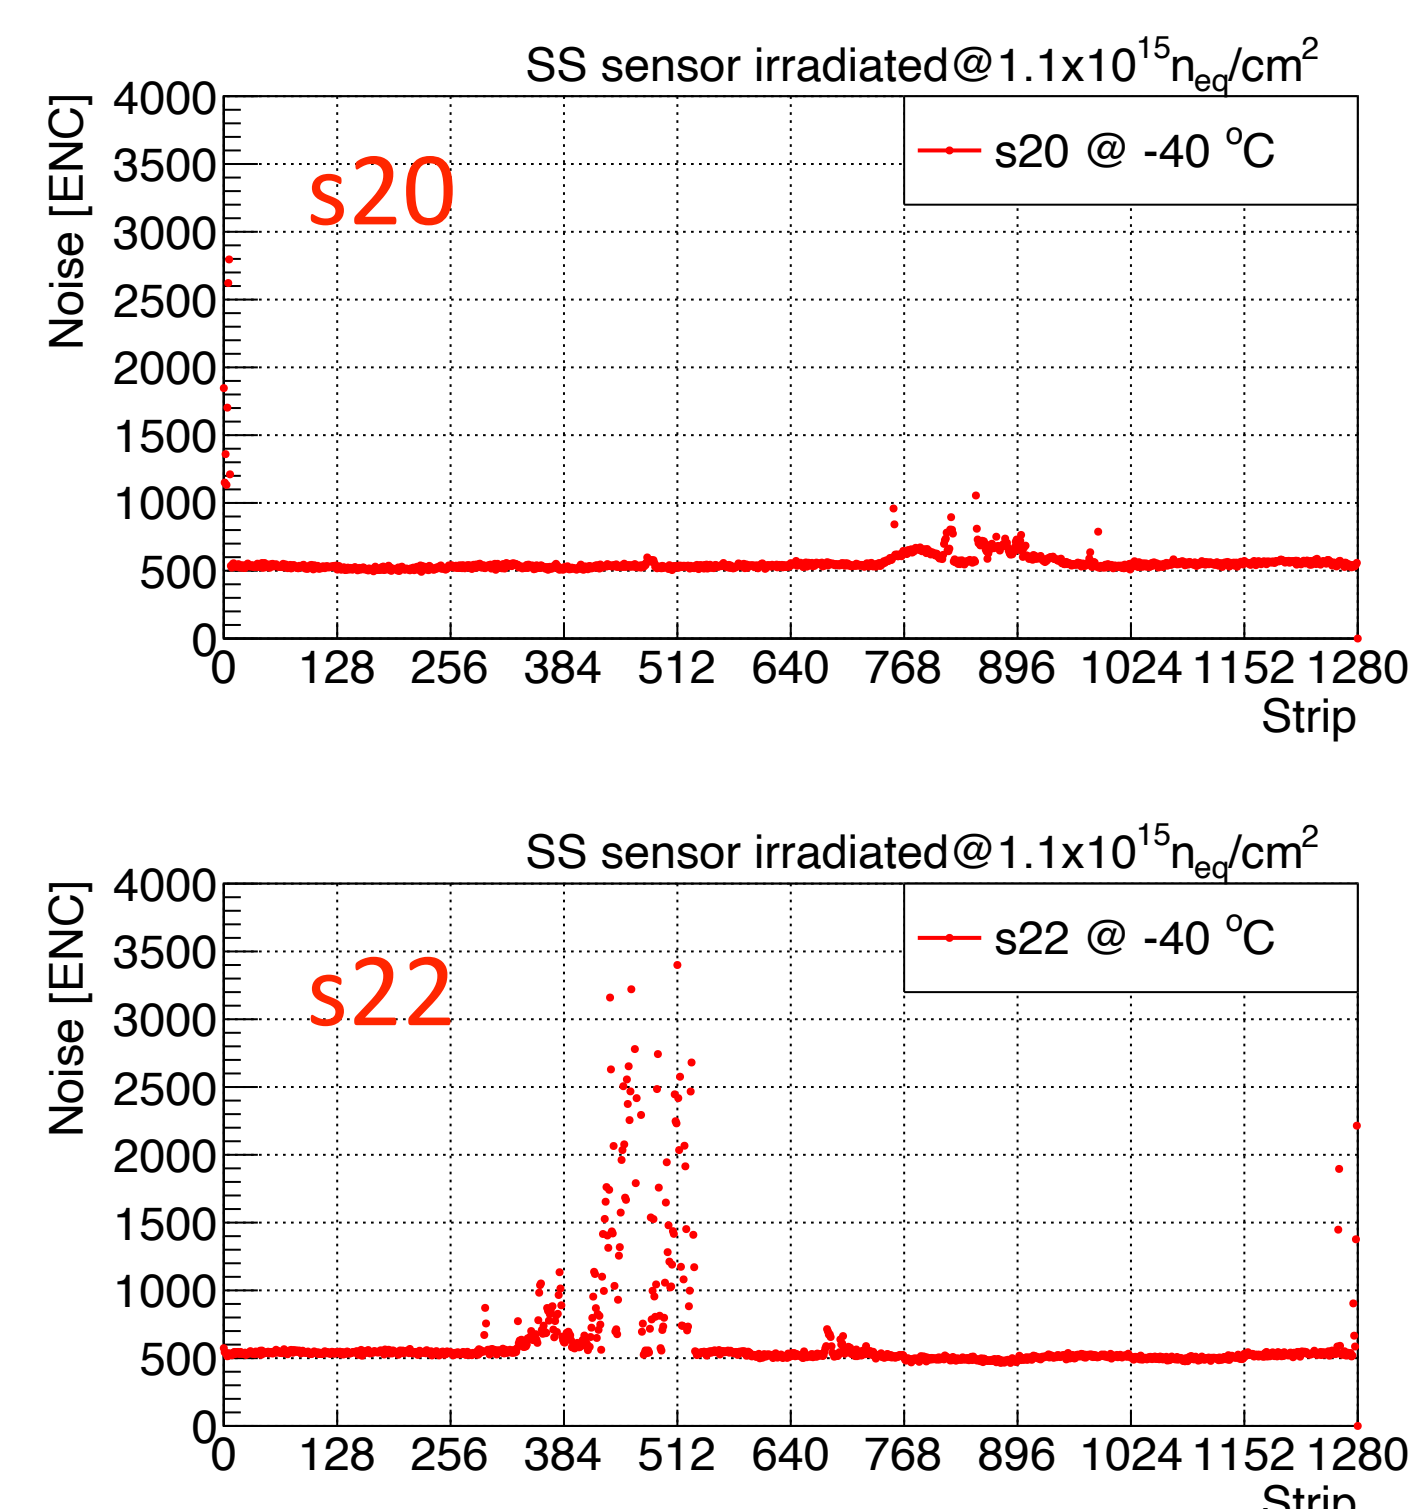

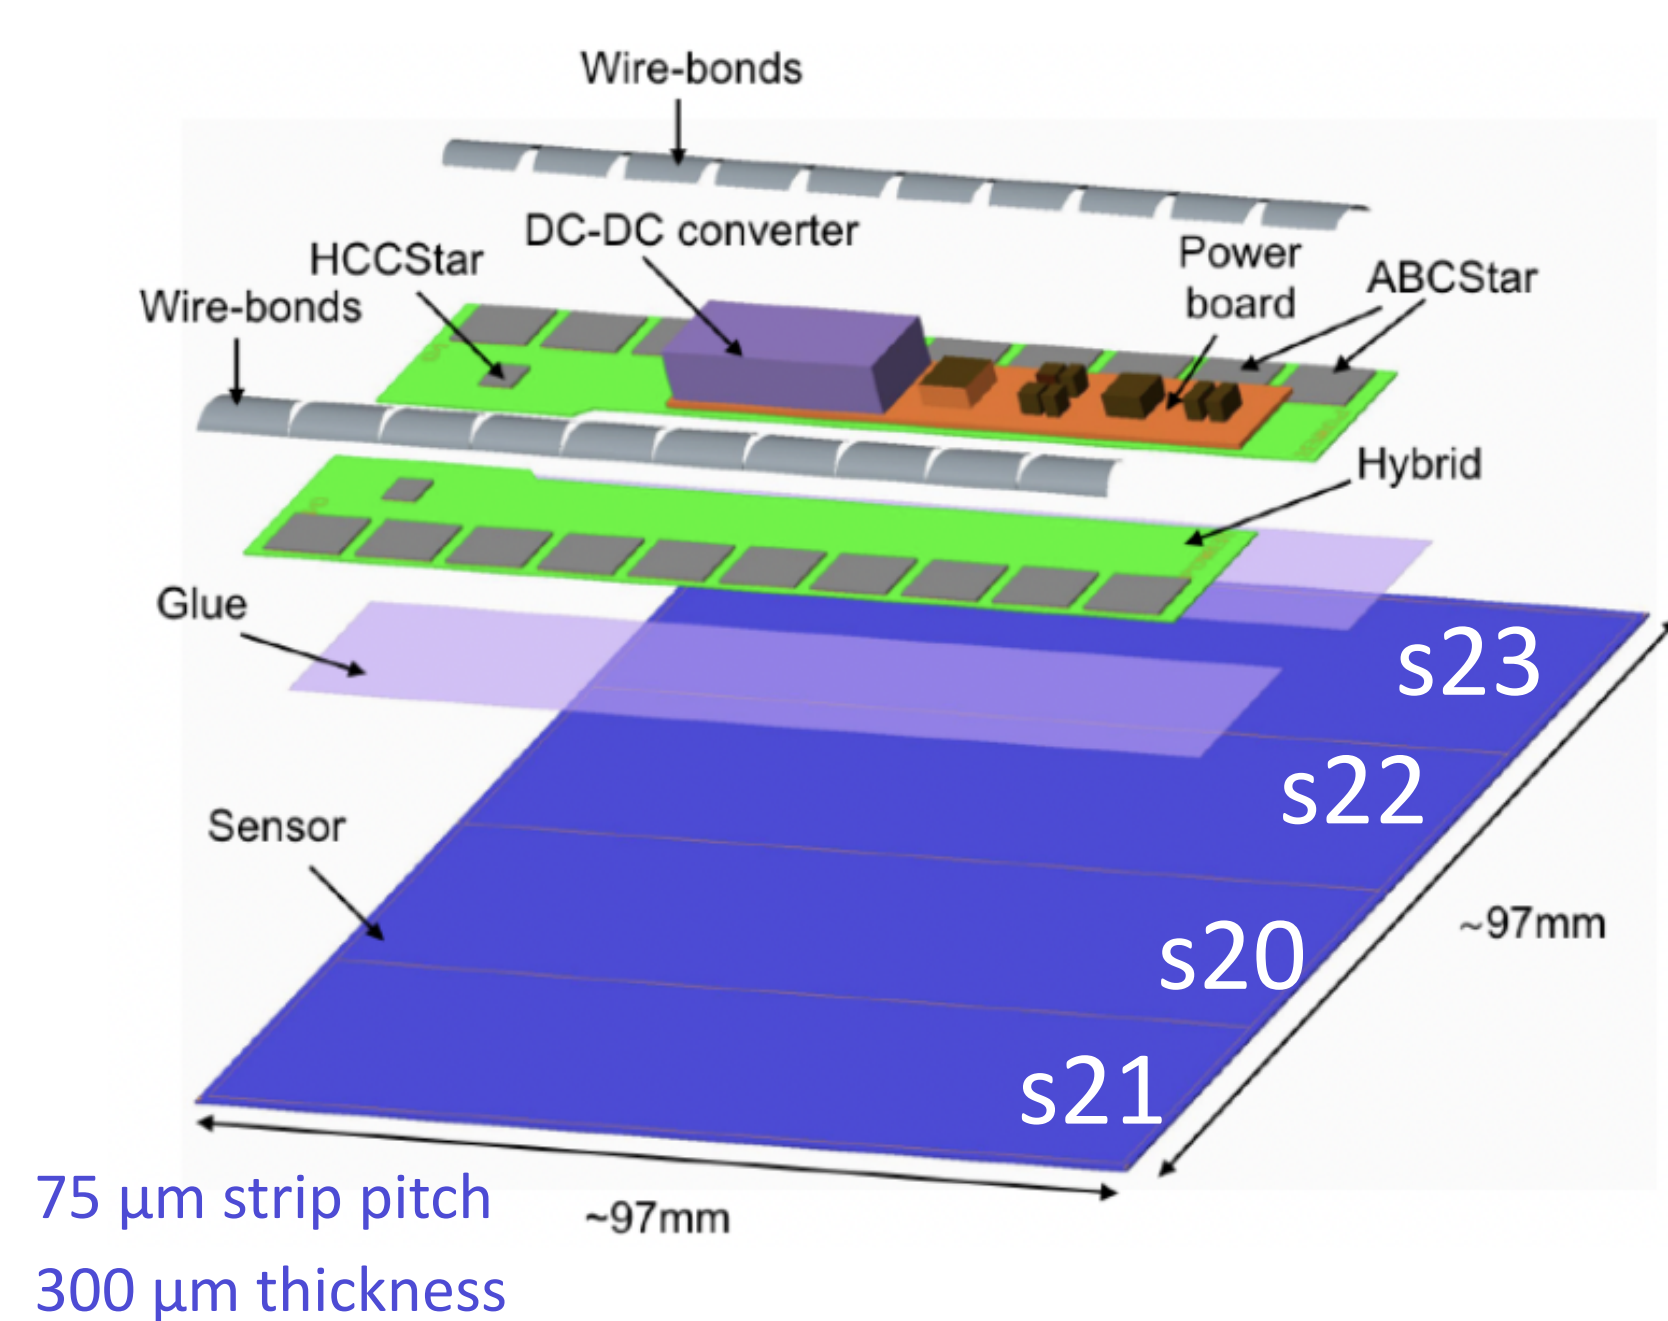

Strip barrel stave

Strip endcap petal

Short strip barrel module and cold noise

Test beam setup @DESY [1]

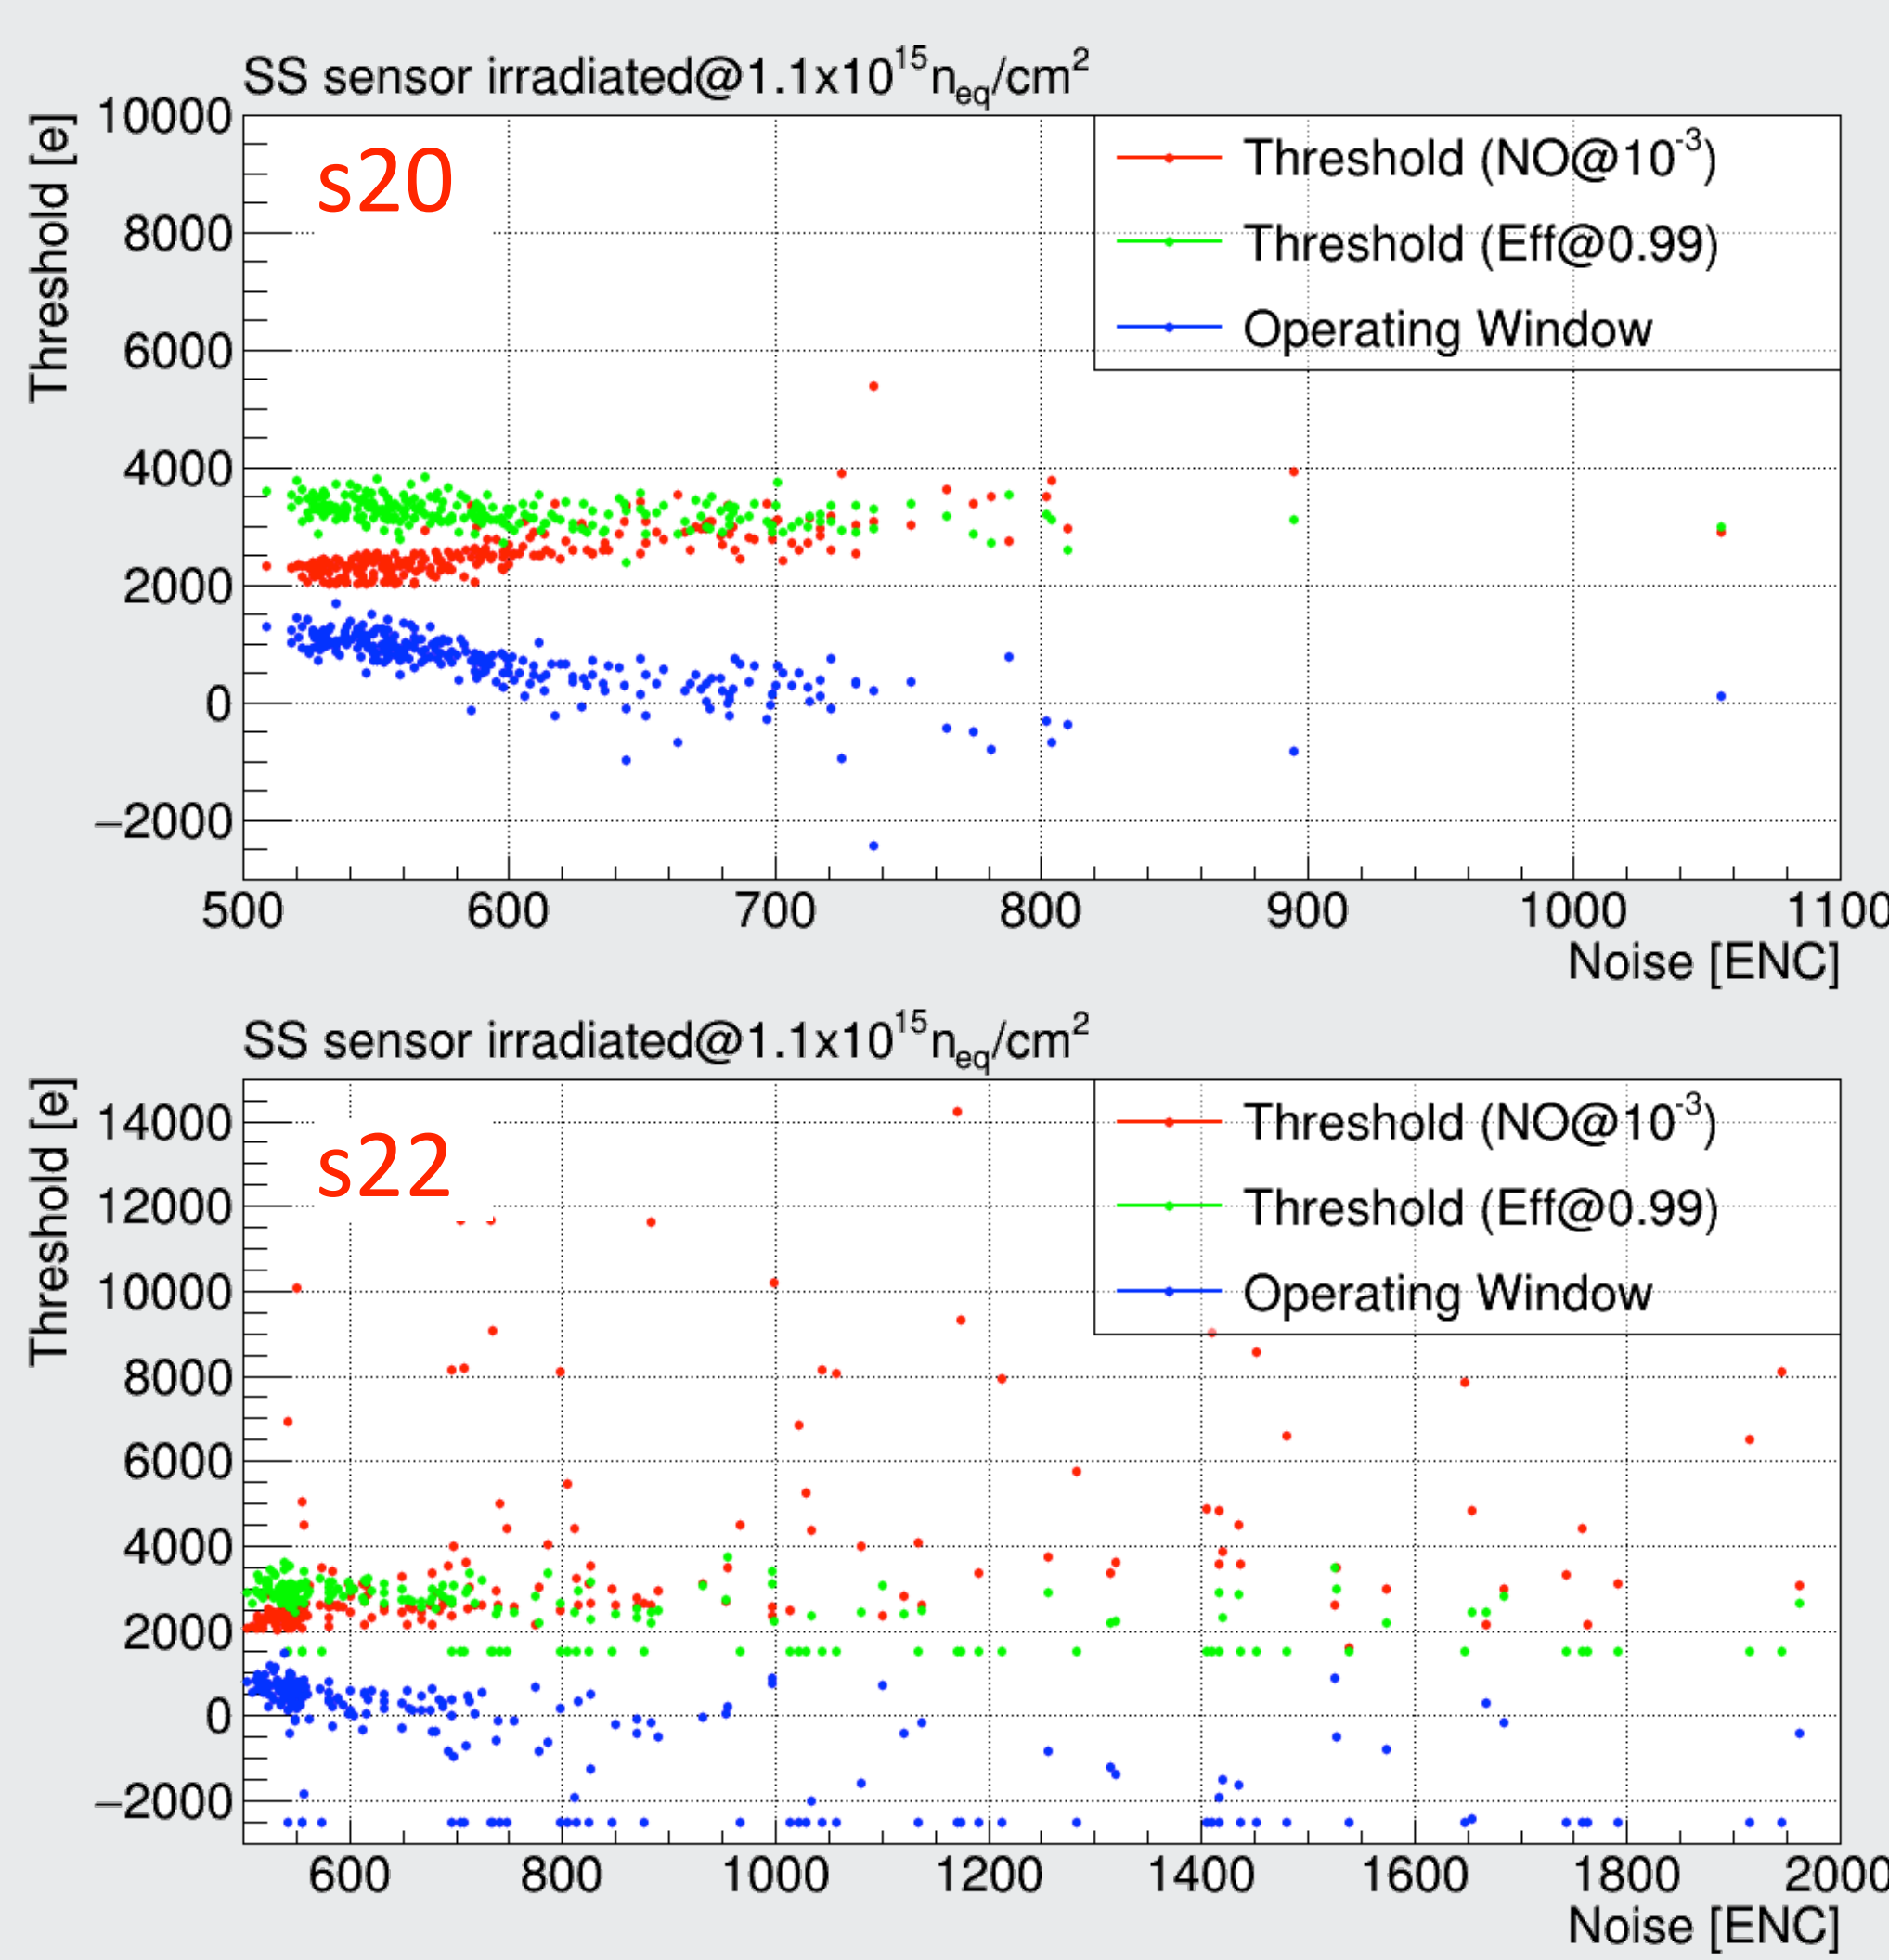

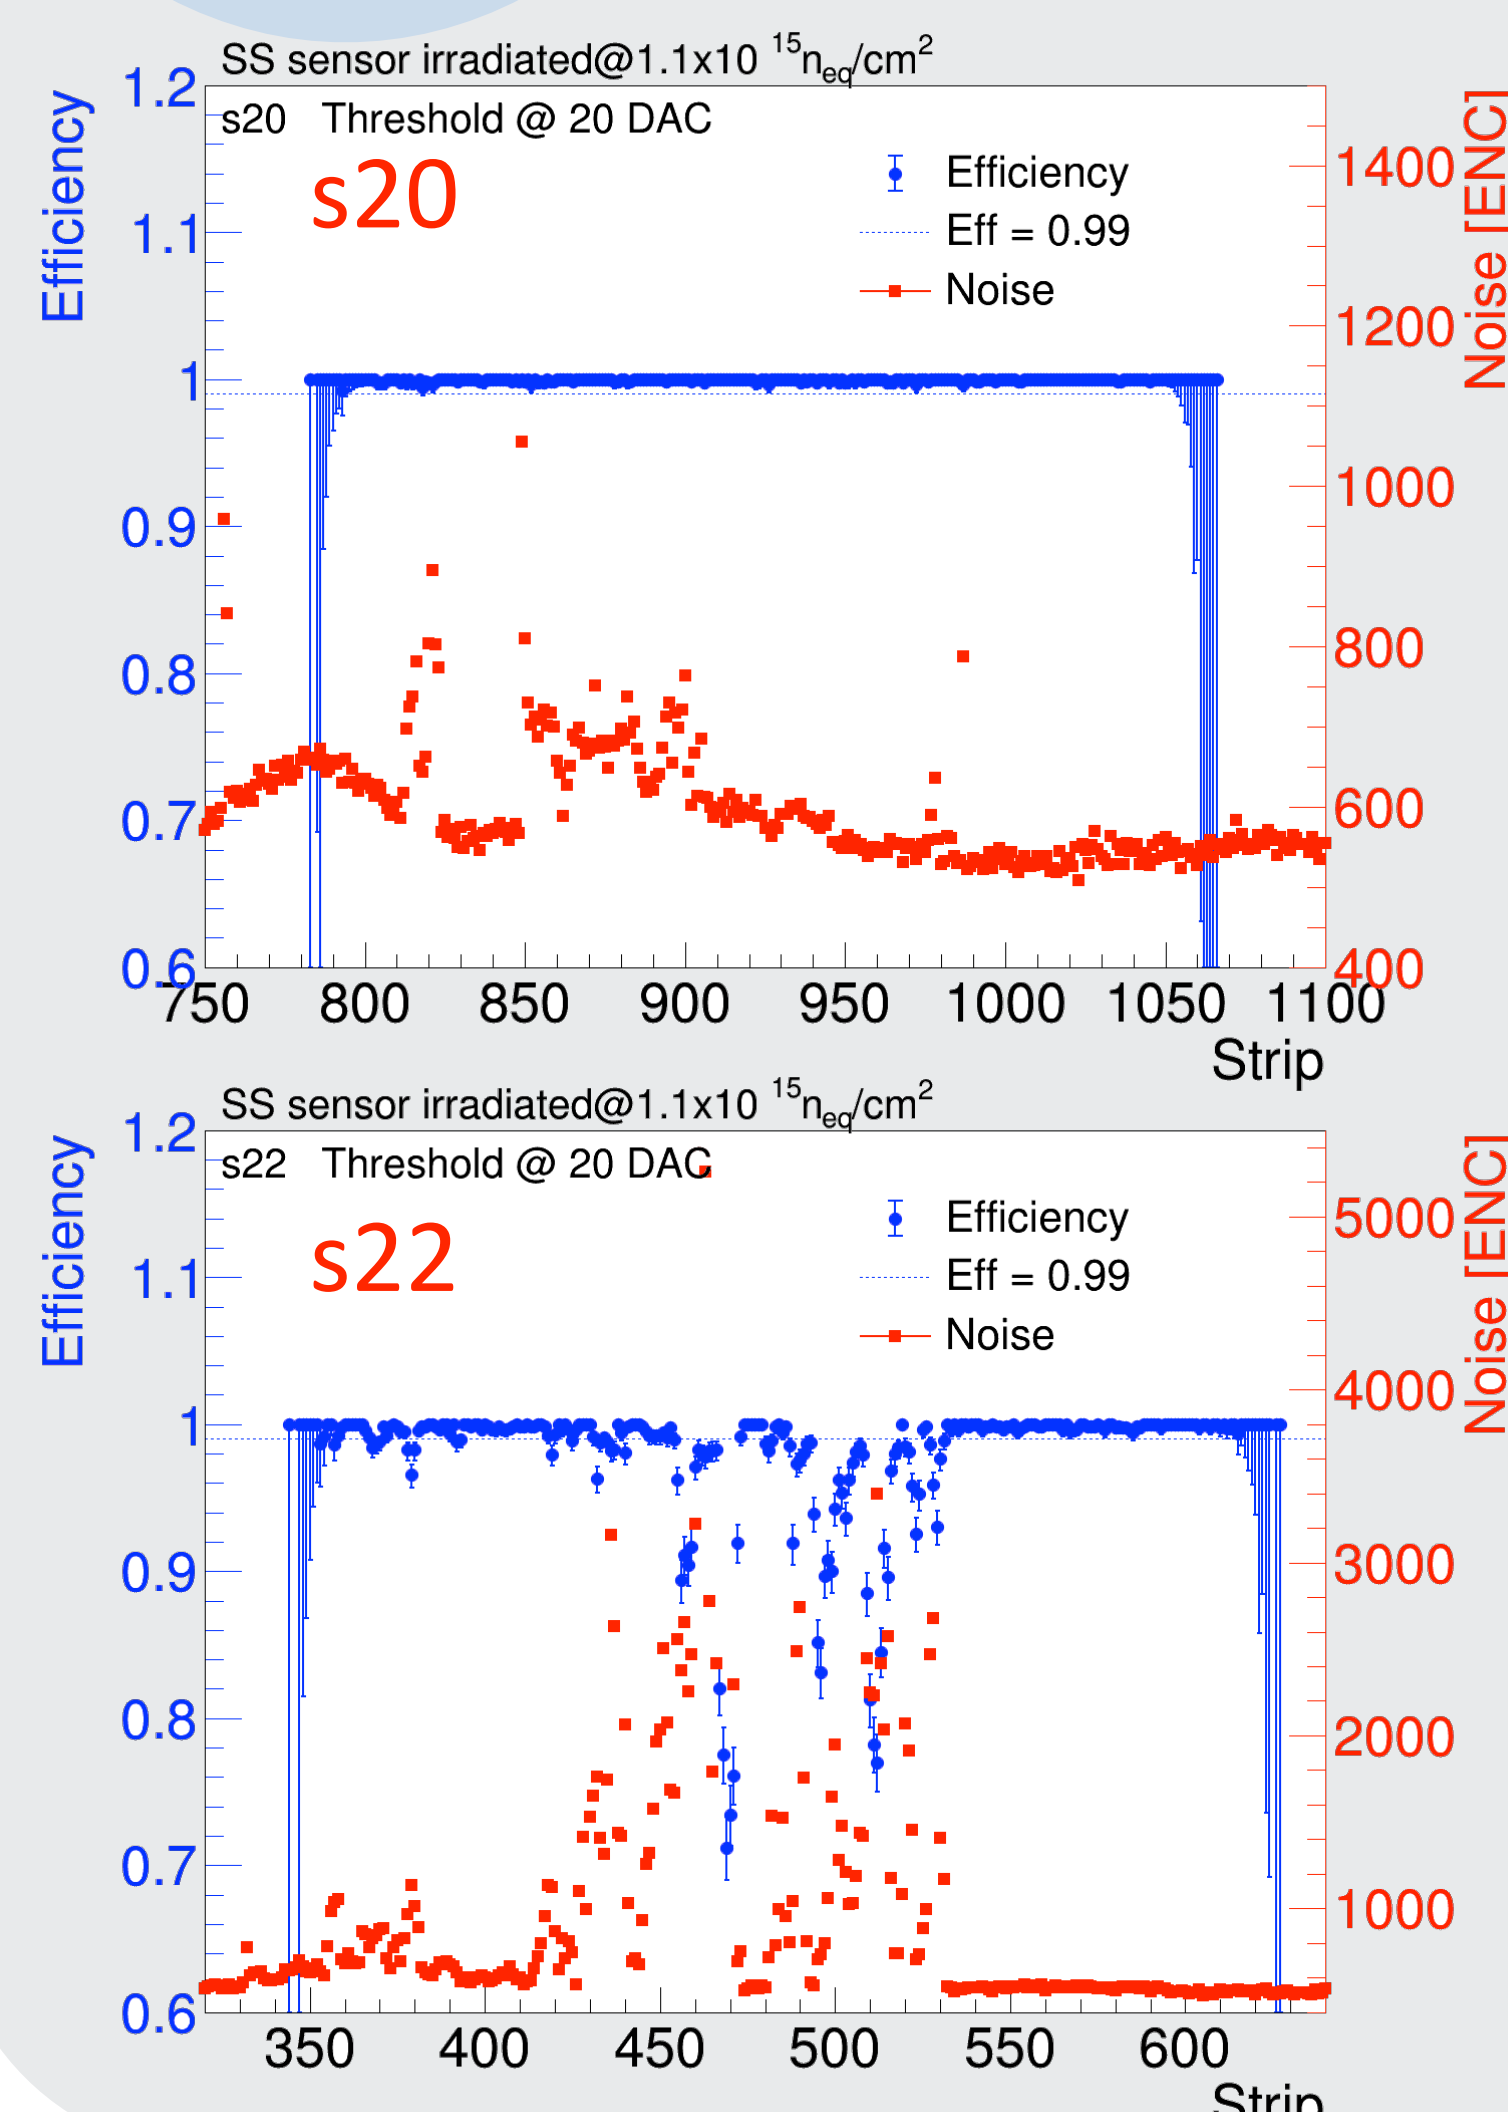

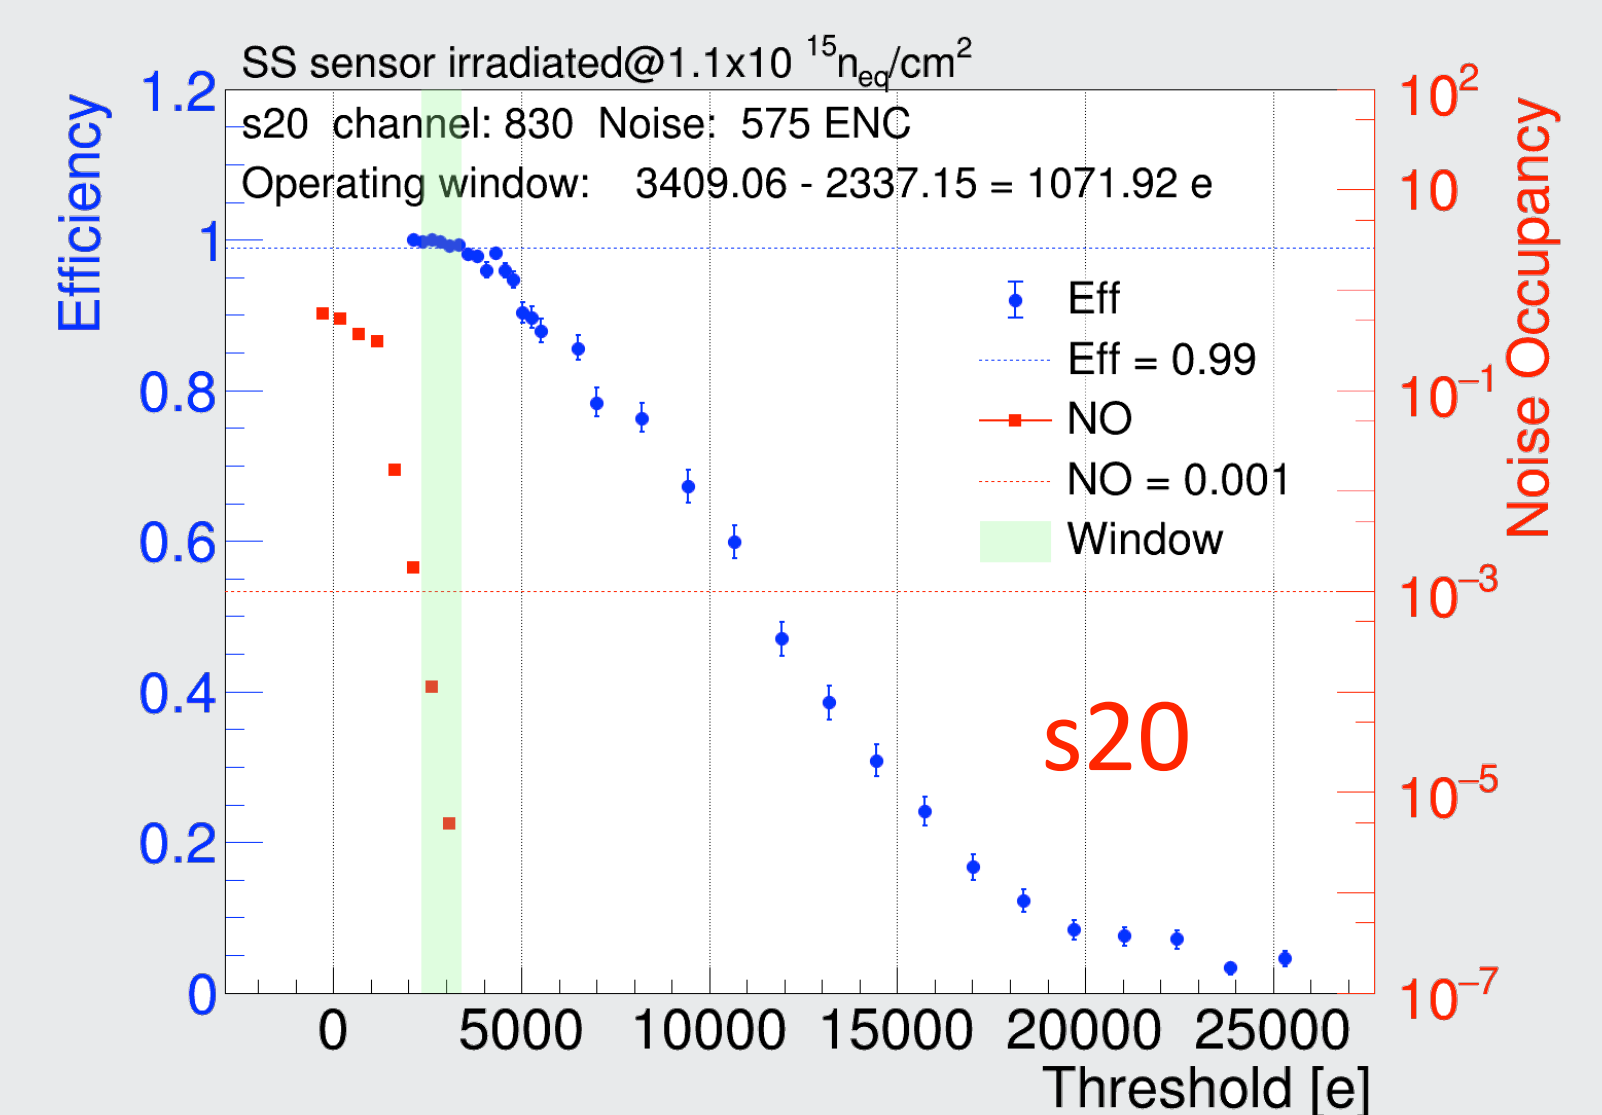

- Adenium telescope [2]
- Telepix timing plane [3]
- Scintillator trigger signal
- DUT cooling box
- DUT

- Noise level growing at low temperature under hybrids & PB.
- Correlated with glue under hybrids.
- Correlated to the DC-DC converter: switching @ 2MHz.
- **Mechanical wave couples into sensor (via glue) & travels.**

Studies of design modifications to reduce or eliminate cold noise are ongoing.

Test beam results

- Data reconstruction using Corryvreckan [4]
- **Operating window** =
threshold (efficiency@99%) -
threshold (noise occupancy@10⁻³)
- If max efficiency < 99%, for plotting use:
 - threshold set as 1500e;
 - operating window set as -2500e.

Summary

These results help us understand how much cold noise must be reduced to have proper tracking at end of lifetime.

More results will also be coming to have more understandings about cold noise.
