Note that for image and text prediction models where you are predicting 3 or more categories, you also receive the *average* F1, Accuracy, Precision, and Recall metrics. The scores for these metrics are just the metric scores average for all categories.

## Metrics for time series forecasts

The following defines the advanced metrics for time series forecasts in Amazon SageMaker Canvas and gives you information about how you can use them.

- Average Weighted Quantile Loss (wQL) – Evaluates the forecast by averaging the accuracy at the P10, P50, and P90 quantiles. A lower value indicates a more accurate model.
- Weighted Absolute Percent Error (WAPE) – The sum of the absolute error normalized by the sum of the absolute target, which measures the overall deviation of forecasted values from observed values. A lower value indicates a more accurate model, where WAPE = 0 is a model with no errors.

- **Root Mean Square Error (RMSE)** – The square root of the average squared errors. A lower RMSE indicates a more accurate model, where  $RMSE = 0$  is a model with no errors.
- **Mean Absolute Percent Error (MAPE)** – The percentage error (percent difference of the mean forecasted value versus the actual value) averaged over all time points. A lower value indicates a more accurate model, where  $MAPE = 0$  is a model with no errors.
- **Mean Absolute Scaled Error (MASE)** – The mean absolute error of the forecast normalized by the mean absolute error of a simple baseline forecasting method. A lower value indicates a more accurate model, where  $MASE < 1$  is estimated to be better than the baseline and  $MASE > 1$  is estimated to be worse than the baseline.

## Predictions with custom models

Use the custom model that you've built in SageMaker Canvas to make predictions for your data. The following sections show you how to make predictions for numeric and categorical prediction models, time series forecasts, image prediction models, and text prediction models.

Numeric and categorical prediction, image prediction, and text prediction custom models support making the following types of predictions for your data:

- **Single predictions** — A **Single prediction** is when you only need to make one prediction. For example, you have one image or passage of text that you want to classify.
- **Batch predictions** — A **Batch prediction** is when you'd like to make predictions for an entire dataset. You can make batch predictions for datasets that are 1 TB+. For example, you have a CSV file of customer reviews for which you'd like to predict the customer sentiment, or you have a folder of image files that you'd like to classify. You should make predictions with a dataset that matches your input dataset. Canvas provides you with the ability to do manual batch predictions, or you can configure automatic batch predictions that run whenever you update a dataset.

For each prediction or set of predictions, SageMaker Canvas returns the following:

- The predicted values
- The probability of the predicted value being correct

### Get started

Choose one of the following workflows to make predictions with your custom model:

- [Batch predictions in SageMaker Canvas](#)
- [Make single predictions](#)

After generating predictions with your model, you can also do the following:

- [Update your model by adding versions](#). If you want to try to improve the prediction accuracy of your model, you can build new versions of your model. You can choose to clone your original model building configuration and dataset, or you can change your configuration and select a different dataset. After adding a new version, you can review and compare versions to choose the best one.
- [Register a model version in the SageMaker AI model registry](#). You can register versions of your model to the SageMaker Model Registry, which is a feature for tracking and managing the status of model versions and machine learning pipelines. A data scientist or MLOps team user with access to the SageMaker Model Registry can review your model versions and approve or reject them before deploying them to production.
- [Send your batch predictions to Amazon QuickSight](#). In Amazon QuickSight, you can build and publish dashboards with your batch prediction datasets. This can help you analyze and share results generated by your custom model.

## Make single predictions

### Note

This section describes how to get single predictions from your model inside the Canvas application. For information about making real-time invocations in a production environment by deploying your model to an endpoint, see [Deploy your models to an endpoint](#).

Make single predictions if you want to get a prediction for a single data point. You can use this feature to get real-time predictions or to experiment with changing individual values to see how they impact the prediction outcome. Note that single predictions rely on an Asynchronous Inference endpoint, which shuts down after being idle (or not receiving any prediction requests) for two hours.

Choose one of the following procedures based on your model type.

## Make single predictions with numeric and categorical prediction models

To make a single prediction for a numeric or categorical prediction model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Single prediction**.
5. For each **Column** field, which represents the columns of your input data, you can change the **Value**. Select the dropdown menu for the **Value** you want to change. For numeric fields, you can enter a new number. For fields with labels, you can select a different label.
6. When you're ready to generate the prediction, in the right **Prediction** pane, choose **Update**.

In the right **Prediction** pane, you'll see the prediction result. You can **Copy** the prediction result chart, or you can also choose **Download** to either download the prediction result chart as an image or to download the values and prediction as a CSV file.

## Make single predictions with time series forecasting models

To make a single prediction for a time series forecasting model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. Choose **Single prediction**.
5. For **Item**, select the item for which you want to forecast values.
6. If you used a group by column to train the model, then select the group by category for the item.

The prediction result loads in the pane below, showing you a chart with the forecast for each quantile. Choose **Schema view** to see the numeric predicted values. You can also choose **Download** to download the prediction results as either an image or a CSV file.

## Make single predictions with image prediction models

To make a single prediction for a single-label image prediction model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Single prediction**.
5. Choose **Import image**.
6. You'll be prompted to upload an image. You can upload an image from your local computer or from an Amazon S3 bucket.
7. Choose **Import** to import your image and generate the prediction.

In the right **Prediction results** pane, the model lists the possible labels for the image along with a **Confidence** score for each label. For example, the model might predict the label **Sea** for an image, with a confidence score of 96%. The model may have predicted the image as a **Glacier** with only a confidence score of 4%. Therefore, you can determine that your model is fairly confident in predicting images of the sea.

### Make single predictions with text prediction models

To make a single prediction for a multi-category text prediction model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Single prediction**.
5. For the **Text field**, enter the text for which you'd like to get a prediction.
6. Choose **Generate prediction results** to get your prediction.

In the right **Prediction results** pane, you receive an analysis of your text in addition to a **Confidence** score for each possible label. For example, if you entered a good review for a product, you might get **Positive** with a confidence score of 85%, while the confidence score for **Neutral** might be 10% and the confidence score for **Negative** only 5%.

### Batch predictions in SageMaker Canvas

Make batch predictions when you have an entire dataset for which you'd like to generate predictions. Amazon SageMaker Canvas supports batch predictions for datasets up to PBs in size.

There are two types of batch predictions you can make:

- [Manual batch predictions](#) are when you have a dataset for which you want to make one-time predictions.
- *Automatic* batch predictions are when you set up a configuration that runs whenever a specific dataset is updated. For example, if you've configured weekly updates to a SageMaker Canvas dataset of inventory data, you can set up automatic batch predictions that run whenever you update the dataset. After setting up an automated batch predictions workflow, see [How to manage automations](#) for more information about viewing and editing the details of your configuration. For more information about setting up automatic dataset updates, see [Configure automatic updates for a dataset](#).

#### Note

You can only set up automatic batch predictions for datasets imported through local upload or Amazon S3. Additionally, automatic batch predictions can only run while you're logged in to the Canvas application. If you log out of Canvas, the automatic batch prediction job resumes when you log back in.

To get started, review the [Batch prediction dataset requirements](#), and then choose one of the following manual or automatic batch prediction workflows.

### Topics

- [Batch prediction dataset requirements](#)
- [Make manual batch predictions](#)
- [Make automatic batch predictions](#)
- [Edit your automatic batch prediction configuration](#)
- [Delete your automatic batch prediction configuration](#)
- [View your batch prediction jobs](#)

### Batch prediction dataset requirements

For batch predictions, make sure that your datasets meet the requirements outlined in [Create a dataset](#). If your dataset is larger than 5 GB, then Canvas uses Amazon EMR Serverless to process your data and split it into smaller batches. After your data has been split, Canvas uses SageMaker

AI Batch Transform to make predictions. You may see charges from both of these services after running batch predictions. For more information, see [Canvas pricing](#).

You might not be able to make predictions on some datasets if they have incompatible *schemas*. A *schema* is an organizational structure. For a tabular dataset, the schema is the names of the columns and the data type of the data in the columns. An incompatible schema might happen for one of the following reasons:

- The dataset that you're using to make predictions has fewer columns than the dataset that you're using to build the model.
- The data types in the columns you used to build the dataset might be different from the data types in dataset that you're using to make predictions.
- The dataset that you're using to make predictions and the dataset that you've used to build the model have column names that don't match. The column names are case sensitive. Column1 is not the same as column1.

To ensure that you can successfully generate batch predictions, match the schema of your batch predictions dataset to the dataset you used to train the model.

#### Note

For batch predictions, if you dropped any columns when building your model, Canvas adds the dropped columns back to the prediction results. However, Canvas does not add the dropped columns to your batch predictions for time series models.

## Make manual batch predictions

Choose one of the following procedures to make manual batch predictions based on your model type.

### Make manual batch predictions with numeric, categorical, and time series forecasting models

To make manual batch predictions for numeric, categorical, and time series forecasting model types, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.

3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Batch prediction**.
5. Choose **Select dataset** to pick a dataset for generating predictions.
6. From the list of available datasets, select your dataset, and then choose **Start Predictions** to get your predictions.

After the prediction job finishes running, there is an output dataset listed on the same page in the **Predictions** section. This dataset contains your results, and if you select the **More options** icon (⋮), you can choose **Preview** to preview the output data. You can see the input data matched to the prediction and the probability that the prediction is correct. Then, you can choose **Download prediction** to download the results as a file.

### Make manual batch predictions with image prediction models

To make manual batch predictions for a single-label image prediction model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Batch prediction**.
5. Choose **Select dataset** if you've already imported your dataset. If not, choose **Import new dataset**, and then you'll be directed through the import data workflow.
6. From the list of available datasets, select your dataset and choose **Generate predictions** to get your predictions.

After the prediction job finishes running, on the **Run predictions** page, you see an output dataset listed under **Predictions**. This dataset contains your results, and if you select the **More options** icon (⋮), you can choose **View prediction results** to see the output data. You can see the images along with their predicted labels and confidence scores. Then, you can choose **Download prediction** to download the results as a CSV or a ZIP file.

### Make manual batch predictions with text prediction models

To make manual batch predictions for a multi-category text prediction model, do the following:

1. In the left navigation pane of the Canvas application, choose **My models**.
2. On the **My models** page, choose your model.
3. After opening your model, choose the **Predict** tab.
4. On the **Run predictions** page, choose **Batch prediction**.
5. Choose **Select dataset** if you've already imported your dataset. If not, choose **Import new dataset**, and then you'll be directed through the import data workflow. The dataset you choose must have the same source column as the dataset with which you built the model.
6. From the list of available datasets, select your dataset and choose **Generate predictions** to get your predictions.

After the prediction job finishes running, on the **Run predictions** page, you see an output dataset listed under **Predictions**. This dataset contains your results, and if you select the **More options** icon (⋮), you can choose **Preview** to see the output data. You can see the images along with their predicted labels and confidence scores. Then, you can choose **Download prediction** to download the results.

### Make automatic batch predictions

To set up a schedule for automatic batch predictions, do the following:

1. In the left navigation pane of Canvas, choose **My models**.
2. Choose your model.
3. Choose the **Predict** tab.
4. Choose **Batch prediction**.
5. For **Generate predictions**, choose **Automatic**.
6. The **Automate batch predictions** dialog box pops up. Choose **Select dataset** and choose the dataset for which you want to automate predictions. Note that you can only select a dataset that was imported through local upload or Amazon S3.
7. After selecting a dataset, choose **Set up**.

Canvas runs a batch predictions job for the dataset after you set up the configuration. Then, every time you [Update a dataset](#), either manually or automatically, another batch predictions job runs.

After the prediction job finishes running, on the **Run predictions** page, you see an output dataset listed under **Predictions**. This dataset contains your results, and if you select the **More options** icon

() you can choose **Preview** to preview the output data. You can see the input data matched to the prediction and the probability that the prediction is correct. Then, you can choose **Download** to download the results. )

The following sections describe how to view, update, and delete your automatic batch prediction configuration through the **Datasets** page in the Canvas application. You can only set up a maximum of 20 automatic configurations in Canvas. For more information about viewing your automated batch predictions job history or making changes to your automatic configuration through the **Automations** page, see [How to manage automations](#).

### Edit your automatic batch prediction configuration

You might want to make changes to your auto update configuration for a dataset, such as changing the frequency of the updates. You might also want to turn off your automatic update configuration to pause the updates to your dataset.

When you edit a batch prediction configuration, you can change the target dataset but not the frequency (since automatic batch predictions occur whenever the dataset is updated).

To edit your auto update configuration, do the following:

1. Go to the **Predict** tab of your model.
2. Under **Predictions**, choose the **Configuration** tab.
3. Find your configuration and choose the **More options** icon () .
4. From the dropdown menu, choose **Update configuration**.
5. The **Automate batch prediction** dialog box opens. You can select another dataset and choose **Set up** to save your changes.

Your automatic batch predictions configuration is now updated.

To pause your automatic batch predictions, turn off your automatic configuration by doing the following:

1. Go to the **Predict** tab of your model.
2. Under **Predictions**, choose the **Configuration** tab.
3. Find your configuration from the list and turn off the **Auto update** toggle.

Automatic batch predictions are now paused. You can turn the toggle back on at any time to resume the update schedule.

## Delete your automatic batch prediction configuration

To learn how to delete your automatic batch prediction configuration, see [Delete an automatic configuration](#).

You can also delete your configuration by doing the following:

1. Go to the **Predict** tab of your model.
2. Under **Predictions**, choose the **Configuration** tab.
3. Find your configuration from the list and choose the **More options** icon (⋮).
4. From the dropdown menu, choose **Delete configuration**.

Your configuration should now be deleted.

## View your batch prediction jobs

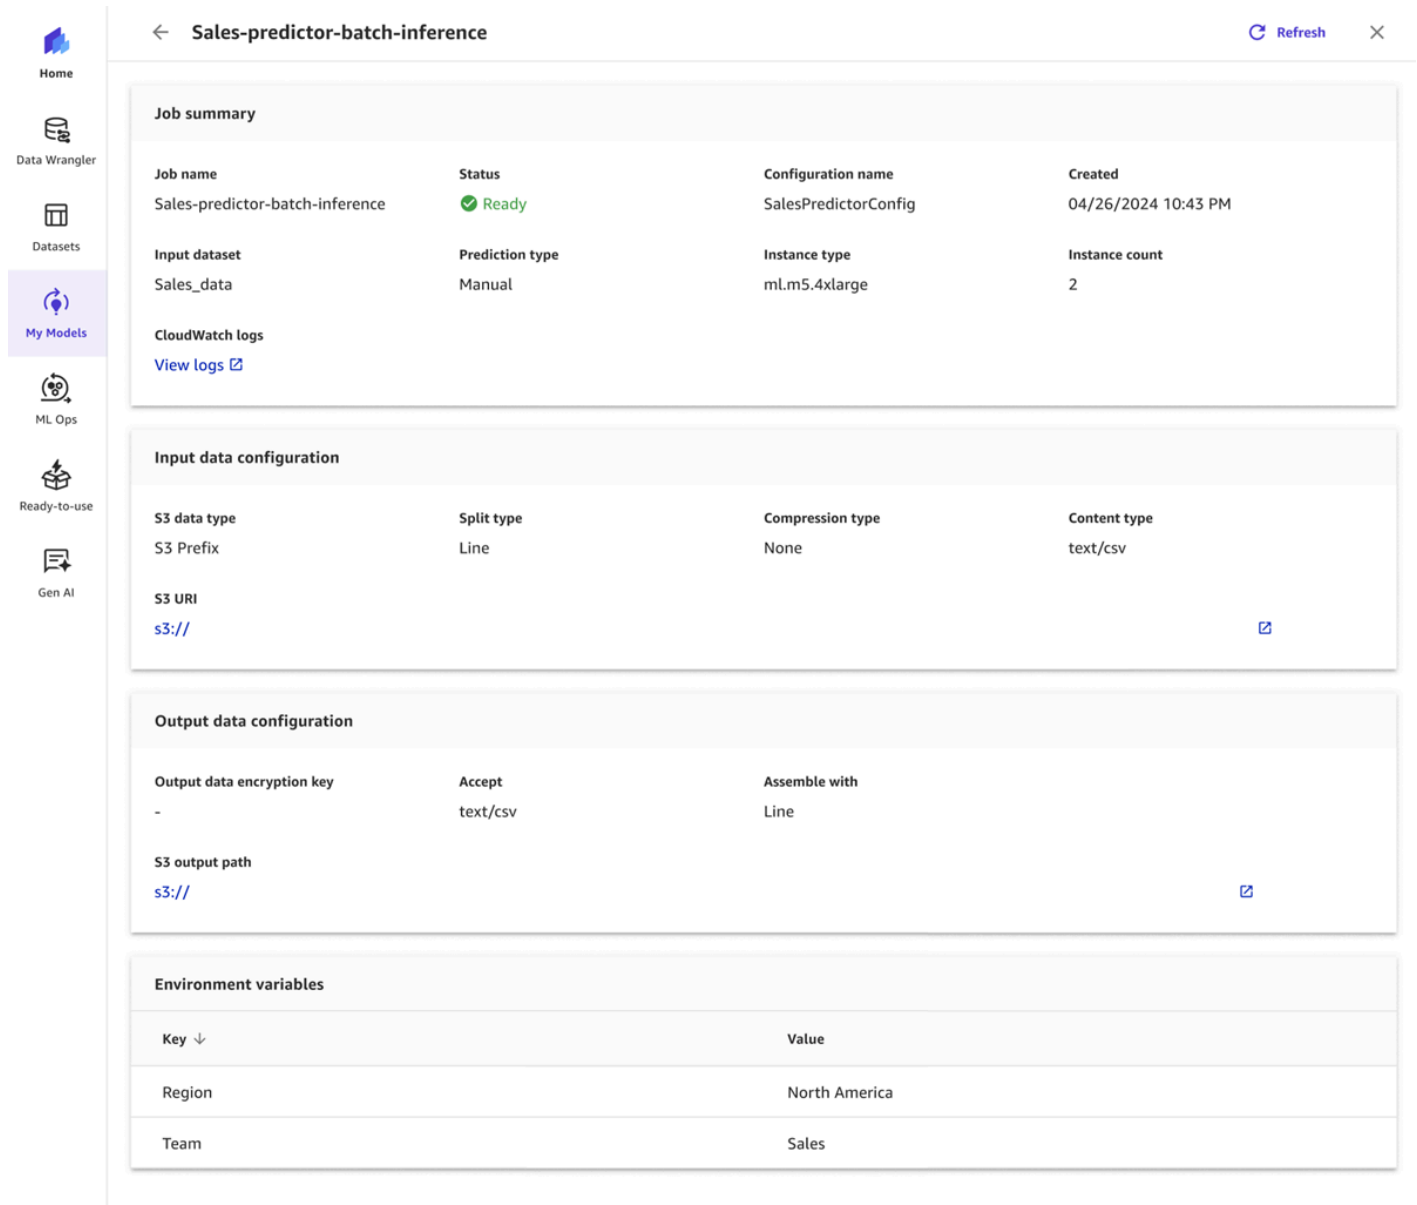

To view the statuses and history of your batch prediction jobs, go to the **Predict** tab of your model.

Each batch prediction job shows up in the **Predict** tab of your model. Under **Predictions**, you can see the **All jobs** tab and the **Configuration** tabs:

- **All jobs** – In this tab, you can see all of the manual and automatic batch prediction jobs for this model. You can filter the jobs by configuration name. For each job, you can see the following fields:
  - **Status** – The current status of your batch prediction job. If the status is **Failed** or **Partially failed**, you can hover over the status to view a more detailed error message to help you troubleshoot.
  - **Input dataset** – The name of your Canvas input dataset, including the dataset version.
  - **Prediction type** – Whether the prediction job was automatic or manual.
  - **Rows** – The number of rows predicted.
  - **Configuration name** – The name of the batch prediction job configuration.
  - **QuickSight** – Describes whether you've sent the batch predictions to Amazon QuickSight.
  - **Created** – The creation time of the batch prediction job.

If you choose the **More options** icon

() you can choose **View details**, **Preview prediction**, **Download prediction**, or **Send to Amazon QuickSight**. If you choose **View details**, a page opens that shows you the full details of the batch prediction job, including the status, the input and output data configurations, information about the instances used to complete the job and access to the Amazon CloudWatch logs. The page looks like the following screenshot.

The screenshot displays the Amazon SageMaker AI console interface for a batch prediction job. The left sidebar contains navigation options: Home, Data Wrangler, Datasets, My Models (highlighted), ML Ops, Ready-to-use, and Gen AI. The main content area shows the job details for 'Sales-predictor-batch-inference'.

**Job summary**

Job name	Status	Configuration name	Created
Sales-predictor-batch-inference	Ready	SalesPredictorConfig	04/26/2024 10:43 PM
Input dataset	Prediction type	Instance type	Instance count
Sales_data	Manual	ml.m5.4xlarge	2

CloudWatch logs  
[View logs](#)

**Input data configuration**

S3 data type	Split type	Compression type	Content type
S3 Prefix	Line	None	text/csv
S3 URI	<a href="#">s3://</a>		

**Output data configuration**

Output data encryption key	Accept	Assemble with
-	text/csv	Line
S3 output path	<a href="#">s3://</a>	

**Environment variables**

Key ↓	Value
Region	North America
Team	Sales

- **Configuration** – In this tab, you can see all of the automatic batch prediction configurations you've created for this model. For each configuration, you can see fields such as the timestamp for when it was **Created**, the **Input dataset** it

tracks for updates, and the **Next job scheduled**, which is the time when the next automatic prediction job is scheduled to start. If you choose the **More options** icon (⋮), you can choose **View all jobs** to see the job history and in progress jobs for the configuration.

## Send predictions to Amazon QuickSight

### Note

You can send batch predictions to Amazon QuickSight for numeric and categorical prediction and time series forecasting models. Single-label image prediction and multi-category text prediction models are excluded.

Once you generate batch predictions with custom tabular models in SageMaker Canvas, you can send those predictions as CSV files to Amazon QuickSight, which is a business intelligence (BI) service to build and publish predictive dashboards.

For example, if you built a 2 category prediction model to determine whether a customer will churn, you can create a visual, predictive dashboard in Amazon QuickSight to show the percentage of customers that are expected to churn. To learn more about Amazon QuickSight, see the [Amazon QuickSight User Guide](#).

The following sections show you how to send your batch predictions to Amazon QuickSight for analysis.

### Before you begin

Your user must have the necessary AWS Identity and Access Management (IAM) permissions to send your predictions to Amazon QuickSight. Your administrator can set up the IAM permissions for your user. For more information, see [Grant Your Users Permissions to Send Predictions to Amazon QuickSight](#).

Your Amazon QuickSight account must contain the default namespace, which is set up when you first create your Amazon QuickSight account. Contact your administrator to help you get access to Amazon QuickSight. For more information, see [Setting up for Amazon QuickSight](#) in the *Amazon QuickSight User Guide*.

Your Amazon QuickSight account must be created in the same Region as your Canvas application. If your Amazon QuickSight account's home Region differs from your Canvas application's Region, you must either [close](#) and recreate your Amazon QuickSight account, or [set up a Canvas application](#) in the same Region as your Amazon QuickSight account. You can check your Amazon QuickSight home Region by doing the following (assuming you already have an Amazon QuickSight account):

1. Open your [Amazon QuickSight console](#).
2. When the page loads, your Amazon QuickSight home Region is appended to the URL in the following format: `https://<your-home-region>.quicksight.aws.amazon.com/`.

You must know the usernames of the Amazon QuickSight users to whom you want to send your predictions. You can send predictions to yourself or other users who have the right permissions. Any users to whom you send predictions must be in the default [namespace](#) of your Amazon QuickSight account and have the Author or Admin role in Amazon QuickSight.

Additionally, Amazon QuickSight must have access to the SageMaker AI default Amazon S3 bucket for your domain, which is named with the following format: `sagemaker-{REGION}-{ACCOUNT_ID}`. The Region should be the same as your Amazon QuickSight account's home Region and your Canvas application's Region. To learn how to give Amazon QuickSight access to the batch predictions stored in your Amazon S3 bucket, see the topic [I can't connect to Amazon S3](#) in the *Amazon QuickSight User Guide*.

## Supported data formats

Before sending your predictions, check that the data format of your batch predictions is compatible with Amazon QuickSight.

- To learn more about the accepted data formats for timeseries data, see [Supported date formats](#) in the *Amazon QuickSight User Guide*.
- To learn more about data values that might prevent you from sending to Amazon QuickSight, see [Unsupported values in data](#) in the *Amazon QuickSight User Guide*.

Also note that Amazon QuickSight uses the character " as a text qualifier, so if your Canvas data contains any " characters, make sure that you close all matching quotes. Any mismatching quotes can cause issues with sending your dataset to Amazon QuickSight.

## Send your batch predictions to Amazon QuickSight

Use the following procedure to send your predictions to Amazon QuickSight:

1. Open the SageMaker Canvas application.
2. In the left navigation pane, choose **My models**.
3. On the **My models** page, choose your model.
4. Choose the **Predict** tab.
5. Under **Predictions**, select the dataset (or datasets) of batch predictions that you'd like to share. You can share up to 5 datasets of batch predictions at a time.
6. After you select your dataset, choose **Send to Amazon QuickSight**.

### Note

The **Send to Amazon QuickSight** button doesn't activate unless you select one or more datasets.

Alternatively, you can preview your predictions by choosing the **More options** icon

(  )

and then **View prediction results**. From the dataset preview, you can choose **Send to Amazon QuickSight**. The following screenshot shows you the **Send to Amazon QuickSight** button in a dataset preview.

Canvas\_batchInfer-Titanic\_test\_2 ×

Prediction & probability		Input dataset <span style="font-size: small;">i</span>						
Survived ↓	Probability	customerID	gender	SeniorCitizen	Partner	Dependents	tenure	PhoneService
Yes	81.4%	7892-POOKP	Female	0	Yes	No	28	Yes

Send to Amazon QuickSight
Download CSV

7. In the **Send to Amazon QuickSight** dialog box, do the following:

- a. For **QuickSight users**, enter the name of the Amazon QuickSight users to whom you want to send your predictions. If you want to send them to yourself, enter your own username. You can only send predictions to users in the default namespace of the Amazon QuickSight account, and the user must have the Author or Admin role in Amazon QuickSight.
- b. Choose **Send**.

The following screenshot shows the **Send to Amazon QuickSight** dialog box:

## Send to Amazon QuickSight ×

Gain insights into your batch predictions by creating visualizations in Amazon QuickSight. You can publish your QuickSight analyses as a dashboard to share with others. [Learn more](#) 

### Name

Canvas\_batchInfer-Titanic\_test\_4.csv

Canvas\_batchInfer-Titanic\_test\_3.csv

### QuickSight users

Add QuickSight users

Reach out to a QuickSight peer or admin for usernames.

Cancel

Send

After you send your batch predictions, the **QuickSight** field for the datasets you sent shows as Sent. In the confirmation box that confirms your predictions were sent, you can choose **Open Amazon QuickSight** to open your Amazon QuickSight application. If you're done using Canvas, you should [log out](#) of the Canvas application.

The Amazon QuickSight users that you've sent datasets to can open their Amazon QuickSight application and view the Canvas datasets that have been shared with them. Then, they can create predictive dashboards with the data. For more information, see [Getting started with Amazon QuickSight data analysis](#) in the *Amazon QuickSight User Guide*.

By default, all of the users to whom you send predictions have owner permissions for the dataset in Amazon QuickSight. Owners are able to create analyses, refresh, edit, delete, and re-share datasets. The changes that owners make to a dataset change the dataset for all users with access. To change the permissions, go to the dataset in Amazon QuickSight and manage its permissions. For more information, see [Viewing and editing the permissions users that a dataset is shared with](#) in the *Amazon QuickSight User Guide*.

## Download a model notebook

### Note

The model notebook feature is available for quick build and standard build tabular models, and fine-tuned foundation models. Model notebooks aren't supported for image prediction, text prediction, or time series forecasting models.

If you'd like to generate a model notebook for a tabular model built before this feature was launched, you must rebuild the model to generate a notebook.

For eligible models that you successfully build in Amazon SageMaker Canvas, a Jupyter notebook containing a report of all the model building steps is generated. This Jupyter notebook contains Python code that you can run locally or run in an environment like Amazon SageMaker Studio Classic to replicate the steps necessary to build your model. The notebook can be useful if you'd like to experiment with the code or see the backend details of how Canvas builds models.

To access the model notebook, do the following:

1. Open the SageMaker Canvas application.
2. In the left navigation pane, choose **My models**.
3. Choose the model and version that you built.
4. On the model version's page, choose the **More options** icon (  ) in the header.
5. From the dropdown menu, choose **View Notebook**.
6. A popup appears with the notebook content. You can choose **Download** and then do one of the following:
  - a. Choose **Download** to save the notebook content to your local device.
  - b. Choose **Copy S3 URI** to copy the Amazon S3 location where the notebook is stored. The notebook is stored in the Amazon S3 bucket specified in your **Canvas storage configuration**, which is configured in the [Prerequisites for setting up Amazon SageMaker Canvas](#) section.

You should now be able to view the notebook either locally or as an object in Amazon S3. You can upload the notebook to an IDE to edit and run the code, or you can share the notebook with others in your organization to review.

## Send your model to Amazon QuickSight

If you use Amazon QuickSight and want to leverage SageMaker Canvas in your Amazon QuickSight visualizations, you can build an Amazon SageMaker Canvas model and use it as a *predictive field* in your Amazon QuickSight dataset. A *predictive field* is a field in your Amazon QuickSight dataset that can make predictions for a given column in your dataset, similar to how Canvas users make single or batch predictions with a model. To learn more about how to integrate Canvas predictive abilities into your Amazon QuickSight datasets, see [SageMaker Canvas integration](#) in the [Amazon QuickSight User Guide](#).

The following steps explain how you can add a predictive field to your Amazon QuickSight dataset using a Canvas model:

1. Open the Canvas application and build a model with your dataset.
2. After building the model in Canvas, send the model to Amazon QuickSight. A schema file automatically downloads to your local machine when you send the model to Amazon QuickSight. You upload this schema file to Amazon QuickSight in the next step.
3. Open Amazon QuickSight and choose a dataset with the same schema as the dataset you used to build your model. Add a predictive field to the dataset and do the following:
  - a. Specify the model sent from Canvas.
  - b. Upload the schema file that was downloaded in Step 2.
4. Save and publish your changes, and then generate predictions for the new dataset. Amazon QuickSight uses the model to fill in the target column with predictions.

In order to send a model from Canvas to Amazon QuickSight, you must meet the following prerequisites:

- You must have both Canvas and Amazon QuickSight set up. Your Amazon QuickSight account must be created in the same AWS Region as your Canvas application. If your Amazon QuickSight account's home Region differs from your Canvas application's Region, you must either [close](#) and recreate your Amazon QuickSight account, or [set up a Canvas application](#) in the same Region as your Amazon QuickSight account. Your Amazon QuickSight account must also contain the

default namespace, which you set up when you first create your Amazon QuickSight account. Contact your administrator to help you get access to Amazon QuickSight. For more information, see [Setting up for Amazon QuickSight](#) in the *Amazon QuickSight User Guide*.

- Your user must have the necessary AWS Identity and Access Management (IAM) permissions to send your predictions to Amazon QuickSight. Your administrator can set up the IAM permissions for your user. For more information, see [Grant Your Users Permissions to Send Predictions to Amazon QuickSight](#).
- Amazon QuickSight must have access to the Amazon S3 bucket that you've specified for Canvas application storage. For more information, see [Configure your Amazon S3 storage](#).

## Time Series Forecasts in Amazon SageMaker Canvas

### Note

Time series forecasting models are only supported for tabular datasets.

Amazon SageMaker Canvas gives you the ability to use machine learning time series forecasts. Time series forecasts give you the ability to make predictions that can vary with time.

You can make a time series forecast for the following examples:

- Forecasting your inventory in the coming months.
- The number of items sold in the next four months.
- The effect of reducing the price on sales during the holiday season.
- Item inventory in the next 12 months.
- The number of customers entering a store in the next several hours.
- Forecasting how a 10% reduction in the price of a product affects sales over a time period.

To make a time series forecast, your dataset must have the following:

- A timestamp column with all values having the `datetime` type.
- A target column that has the values that you're using to forecast future values.
- An item ID column that contains unique identifiers for each item in your dataset, such as SKU numbers.

The datetime values in the timestamp column must use one of the following formats:

- YYYY-MM-DD HH:MM:SS
- YYYY-MM-DDTHH:MM:SSZ
- YYYY-MM-DD
- MM/DD/YY
- MM/DD/YY HH:MM
- MM/DD/YYYY
- YYYY/MM/DD HH:MM:SS
- YYYY/MM/DD
- DD/MM/YYYY
- DD/MM/YY
- DD-MM-YY
- DD-MM-YYYY

You can make forecasts for the following intervals:

- 1 min
- 5 min
- 15 min
- 30 min
- 1 hour
- 1 day
- 1 week
- 1 month
- 1 year

### **Future values in your input dataset**

Canvas automatically detects columns in your dataset that might potentially contain future values. If present, these values can enhance the accuracy of predictions. Canvas marks these specific columns with a `Future values` label. Canvas infers the relationship between the data in these

columns and the target column that you are trying to predict, and utilizes that relationship to generate more accurate forecasts.

For example, you can forecast the amount of ice cream sold by a grocery store. To make a forecast, you must have a timestamp column and a column that indicates how much ice cream the grocery store sold. For a more accurate forecast, your dataset can also include the price, the ambient temperature, the flavor of the ice cream, or a unique identifier for the ice cream.

Ice cream sales might increase when the weather is warmer. A decrease in the price of the ice cream might result in more units sold. Having a column with ambient temperature data and a column with pricing data can improve your ability to forecast the number of units of ice cream the grocery store sells.

While providing future values is optional, it helps you to perform what-if analyses directly in the Canvas application, showing you how changes in future values could alter your predictions.

## Handling missing values

You might have missing data for different reasons. The reason for your missing data might inform how you want Canvas to impute it. For example, your organization might use an automatic system that only tracks when a sale happens. If you're using a dataset that comes from this type of automatic system, you have missing values in the target column.

### Important

If you have missing values in the target column, we recommend using a dataset that doesn't have them. SageMaker Canvas uses the target column to forecast future values. Missing values in the target column can greatly reduce the accuracy of the forecast.

For missing values in the dataset, Canvas automatically imputes the missing values for you by filling the target column with 0 and other numeric columns with the median value of the column.

However, you can select your own filling logic for the target column and other numeric columns in your datasets. Target columns have different filling guidelines and restrictions than the rest of the numeric columns. Target columns are filled up to the end of the historical period, whereas numeric columns are filled across both historical and future periods all the way to the end of the forecast horizon. Canvas only fills future values in a numeric column if your data has at least one record with a future timestamp and a value for that specific column.

You can choose one of the following filling logic options to impute missing values in your data:

- `zero` – Fill with  $\emptyset$ .
- `NaN` – Fill with NaN, or not a number. This is only supported for the target column.
- `mean` – Fill with the mean value from the data series.
- `median` – Fill with the median value from the data series.
- `min` – Fill with the minimum value from the data series.
- `max` – Fill with the maximum value from the data series.

When choosing a filling logic, you should consider how your model interprets the logic. For example, in a retail scenario, recording zero sales of an available item is different from recording zero sales of an unavailable item, as the latter scenario doesn't necessarily imply a lack of customer interest in the unavailable item. In this case, filling with  $\emptyset$  in the target column of the dataset might cause the model to be under-biased in its predictions and infer a lack of customer interest in unavailable items. Conversely, filling with NaN might cause the model to ignore true occurrences of zero items being sold of available items.

## Types of forecasts

You can make one of the following types of forecasts:

- **Single item**
- **All items**

For a forecast on all the items in your dataset, SageMaker Canvas returns a forecast for the future values for each item in your dataset.

For a single item forecast, you specify the item and SageMaker Canvas returns a forecast for the future values. The forecast includes a line graph that plots the predicted values over time.

## Topics

- [Additional options for forecasting insights](#)

## Additional options for forecasting insights

In Amazon SageMaker Canvas, you can use the following optional methods to get more insights from your forecast:

- Group column
- Holiday schedule
- What-if scenario

You can specify a column in your dataset as a **Group column**. Amazon SageMaker Canvas groups the forecast by each value in the column. For example, you can group the forecast on columns containing price data or unique item identifiers. Grouping a forecast by a column lets you make more specific forecasts. For example, if you group a forecast on a column containing item identifiers, you can see the forecast for each item.

Overall sales of items might be impacted by the presence of holidays. For example, in the United States, the number of items sold in both November and December might differ greatly from the number of items sold in January. If you use the data from November and December to forecast the sales in January, your results might be inaccurate. Using a holiday schedule prevents you getting inaccurate results. You can use a holiday schedule for 251 countries.

For a forecast on a single item in your dataset, you can use what-if scenarios. A what-if scenario gives you the ability to change values in your data and change the forecast. For example, you can answer the following questions by using a what-if scenario, "What if I lowered prices? How would that affect the number of items sold?"

## Adding model versions in Amazon SageMaker Canvas

In Amazon SageMaker Canvas, you can update the models that you've built by adding *versions*. Each model that you build has a version number. The first model is version 1 or V1. You can use model versions to see changes in prediction accuracy when you update your data or use [advanced transformations](#).

When viewing your model, SageMaker Canvas shows you the model history so that you can compare all of the model versions that you built. You can also delete versions that are no longer useful to you. By creating multiple model versions and evaluating their accuracy, you can iteratively improve your model performance.

### Note

Text prediction and image prediction models only support one model version.

To add a model version, you can either clone an existing version or create a new version.

Cloning an existing version copies over the current model configuration, including the model recipe and the input dataset. Alternatively, you can create a new version if you want to configure a new model recipe or choose a different dataset.

If you create a new version and select a different dataset, you must choose a dataset with the same target column and schema as the dataset from version 1.

Before you can add a new version, you must successfully build at least one model version. Then, you can [register a model version in the SageMaker Model Registry](#). Use the registry for tracking model versions and for collaborating with Studio Classic users on production model approvals.

If you did a quick build for your first model version, you have the option to run a standard build when you add a version. Standard builds generally have higher accuracy. Therefore, if you feel confident in your quick build configuration, you can run a standard build to create a final version of your model. To learn more about the differences between quick builds and standard builds, see [How custom models work](#).

The following procedures show you how to add model versions; the procedure is different depending on whether you are adding a version of the same build type or a different build type (quick versus standard). Use the procedure **To add a new model version** to add versions of the same build type. To add a standard build model version after running a quick build, follow the procedure **To run a standard build**.

### To add a new model version

1. Open your SageMaker Canvas application. For more information, see [Getting started with using Amazon SageMaker Canvas](#).
2. In the left navigation pane, choose **My models**.
3. On the **My models** page, choose your model. To find your model, you can choose **Filter by problem type**.
4. After your model opens, choose the **Add version** button in the top panel.
5. From the dropdown menu, select one of the following options:
  - a. **Add a new version from scratch** – When you select this option, the **Build** tab opens with the draft for a new model version. You can select a different dataset (as long as the schema matches the schema of the first model version's dataset) and configure a new model recipe. For more information about building a model version, see [Build a model](#).

- b. **Clone an existing version with configurations** – A dialog box prompts you to select the version that you want to clone. After you've selected your desired version, choose **Clone**. The **Build** tab opens with the draft for a new model version. Any model recipe configurations are copied over from the cloned version. For more information about building a model version, see [Build a model](#).

### To run a standard build

1. Open your SageMaker Canvas application. For more information, see [Getting started with using Amazon SageMaker Canvas](#).
2. In the left navigation pane, choose **My models**.
3. On the **My models** page, choose your model. You can choose **Filter by problem type** to find your model more easily.
4. After your model opens, choose the **Analyze** tab.
5. Choose **Standard build**.

**Backtest** Column impact Artifacts Model leaderboard

Canvas uses backtesting to produce accuracy metrics. During backtesting, Forecast automatically splits your time-series data into the training and validation sets. The training set is used to train a model and generate forecasts for data points within the validation set. The model's accuracy can be evaluated by comparing forecasted values with observed values in the validation set.

On the model draft page that opens to the **Build** tab, you can modify your model configuration and start a build. For more information about building a model version, see [Build a model](#).

You should now have a new model version build in progress. For more information about building a model, see [How custom models work](#).

After building a model version, you can return to your model details page at any time to view all of the versions or add more versions. The following image shows the **Versions** page for a model.

My models / tabular-model [Add version](#) [Share](#) ⋮

**Versions**  Show advanced metrics

Select a version to view details

Version	Status	Created	Dataset	Model score	F1	Precision	Recall	AUC	Shared	Model Registry
V2	Ready	05/04/2023 4:59 AM	titanic.csv	79.213%	83.258%	82.143%	84.404%	0.784	--	Not Registered
V1	Ready	05/04/2023 4:57 AM	titanic.csv	83.146%	86.486%	84.956%	88.073%	0.852	--	Registered

On the **Versions** page, you can view the following information for each of your model versions:

- **Status** – This field tells you whether your model is currently building (In building), done building (Ready), failed to build (Failed), or still being edited (In draft).
- **Model score, F1, Precision, Recall, and AUC** – If you turn on the **Show advanced metrics** toggle on this page, you can see these model metrics. These metrics indicate the accuracy and performance of your model. For more information, see [Evaluate your model](#).
- **Shared** – This field states whether you shared the model version with SageMaker Studio Classic users.
- **Model registry** – This field states whether you registered the version to a model registry. For more information, see [Register a model version in the SageMaker AI model registry](#).

## MLOps

After building a model in SageMaker Canvas that you feel confident about, you might want to integrate your model with the machine learning operations (MLOps) processes in your organization. MLOps includes common tasks such as deploying a model for use in production or setting up continuous integration and continuous deployment (CI/CD) pipelines.

The following topics describe how you can use features within Canvas to use a Canvas-built model in production.

### Topics

- [Register a model version in the SageMaker AI model registry](#)
- [Deploy your models to an endpoint](#)
- [View your deployments](#)
- [Update a deployment configuration](#)
- [Test your deployment](#)

- [Invoke your endpoint](#)
- [Delete a model deployment](#)

## Register a model version in the SageMaker AI model registry

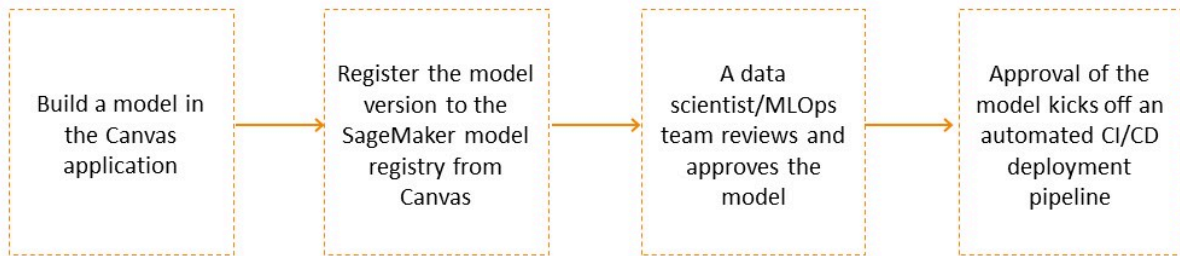

With SageMaker Canvas, you can build multiple iterations, or versions, of your model to improve it over time. You might want to build a new version of your model if you acquire better training data or if you want to attempt to improve the model's accuracy. For more information about adding versions to your model, see [Update a model](#).

After you've [built a model](#) that you feel confident about, you might want to evaluate its performance and have it reviewed by a data scientist or MLOps engineer in your organization before using it in production. To do this, you can register your model versions to the [SageMaker Model Registry](#). The SageMaker Model Registry is a repository that data scientists or engineers can use to catalog machine learning (ML) models and manage model versions and their associated metadata, such as training metrics. They can also manage and log the approval status of a model.

After you register your model versions to the SageMaker Model Registry, a data scientist or your MLOps team can access the SageMaker Model Registry through [SageMaker Studio Classic](#), which is a web-based integrated development environment (IDE) for working with machine learning models. In the SageMaker Model Registry interface in Studio Classic, the data scientist or MLOps team can evaluate your model and update its approval status. If the model doesn't perform to their requirements, the data scientist or MLOps team can update the status to Rejected. If the model does perform to their requirements, then the data scientist or MLOps team can update the status to Approved. Then, they can [deploy your model to an endpoint](#) or [automate model deployment](#) with CI/CD pipelines. You can use the SageMaker AI model registry feature to seamlessly integrate models built in Canvas with the MLOps processes in your organization.

The following diagram summarizes an example of registering a model version built in Canvas to the SageMaker Model Registry for integration into an MLOps workflow.

You can register tabular, image, and text model versions to the SageMaker Model Registry. This includes time series forecasting models and JumpStart based [fine-tuned foundation models](#).

#### **Note**

Currently, you can't register Amazon Bedrock based fine-tuned foundation models built in Canvas to the SageMaker Model Registry.

The following sections show you how to register a model version to the SageMaker Model Registry from Canvas.

### **Permissions management**

By default, you have permissions to register model versions to the SageMaker Model Registry. SageMaker AI grants these permissions for all new and existing Canvas user profiles through the [AmazonSageMakerCanvasFullAccess](#) policy, which is attached to the AWS IAM execution role for the SageMaker AI domain that hosts your Canvas application.

If your Canvas administrator is setting up a new domain or user profile, when they're setting up the domain and following the prerequisite instructions in the [Getting started guide](#), SageMaker AI turns on the model registration permissions through the **ML Ops permissions configuration** option, which is enabled by default.

The Canvas administrator can manage model registration permissions at the user profile level as well. For example, if the administrator wants to grant model registration permissions to some user profiles but remove permissions for others, they can edit the permissions for a specific user.

The following procedure shows how to turn off model registration permissions for a specific user profile:

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. From the list of domains, select the user profile's domain.
5. On the **domain details** page, choose the **User profile** whose permissions you want to edit.
6. On the **User Details** page, choose **Edit**.
7. In the left navigation pane, choose **Canvas settings**.
8. In the **ML Ops permissions configuration** section, turn off the **Enable Model Registry registration permissions** toggle.
9. Choose **Submit** to save the changes to your domain settings.

The user profile should no longer have model registration permissions.

## Register a model version to the SageMaker AI model registry

SageMaker Model Registry tracks all of the model versions that you build to solve a particular problem in a *model group*. When you build a SageMaker Canvas model and register it to SageMaker Model Registry, it gets added to a model group as a new model version. For example, if you build and register four versions of your model, then a data scientist or MLOps team working in the SageMaker Model Registry interface can view the model group and review all four versions of the model in one place.

When registering a Canvas model to the SageMaker Model Registry, a model group is automatically created and named after your Canvas model. Optionally, you can rename it to a name of your choice, or use an existing model group in the SageMaker Model Registry. For more information about creating a model group, see [Create a Model Group](#).

### Note

Currently, you can only register models built in Canvas to the SageMaker Model Registry in the same account.

To register a model version to the SageMaker Model Registry from the Canvas application, use the following procedure:

1. Open the SageMaker Canvas application.
2. In the left navigation pane, choose **My models**.
3. On the **My models** page, choose your model. You can **Filter by problem type** to find your model more easily.
4. After choosing your model, the **Versions** page opens, listing all of the versions of your model. You can turn on the **Show advanced metrics** toggle to view the advanced metrics, such as **Recall** and **Precision**, to compare your model versions and determine which one you'd like to register.
5. From the list of model versions, for the the version that you want to register, choose the **More options** icon (⋮).  
Alternatively, you can double click on the version that you need to register, and then on the version details page, choose the **More options** icon (⋮).
6. In the dropdown list, choose **Add to Model Registry**. The **Add to Model Registry** dialog box opens.
7. In the **Add to Model Registry** dialog box, do the following:
  - a. (Optional) In the **SageMaker Studio Classic model group** section, for the **Model group name** field, enter the name of the model group to which you want to register your version. You can specify the name for a new model group that SageMaker AI creates for you, or you can specify an existing model group. If you don't specify this field, Canvas registers your version to a default model group with the same name as your model.
  - b. Choose **Add**.

Your model version should now be registered to the model group in the SageMaker Model Registry. When you register a model version to a model group in the SageMaker Model Registry, all subsequent versions of the Canvas model are registered to the same model group (if you choose to register them). If you register your versions to a different model group, you need to go to the SageMaker Model Registry and [delete the model group](#). Then, you can re-register your model versions to the new model group.

To view the status of your models, you can return to the **Versions** page for your model in the Canvas application. This page shows you the **Model Registry** status of each version. If the status is Registered, then the model has been successfully registered.

If you want to view the details of your registered model version, for the **Model Registry** status, you can hover over the **Registered** field to see the **Model registry details** pop-up box. These details contain more info, such as the following:

- The **Model package group name** is the model group that your version is registered to in the SageMaker Model Registry.
- The **Approval status**, which can be Pending Approval, Approved, or Rejected. If a Studio Classic user approves or rejects your version in the SageMaker Model Registry, then this status is updated on your model versions page when you refresh the page.

The following screenshot shows the **Model registry details** box, along with an **Approval status** of Approved for this particular model version.

### Model Registry details

Model package group name ⓘ	canvas-test-cv-v1
Model Registry version ⓘ	Version 1
Model Registry account ID ⓘ	
Approval status ⓘ	 Approved

### Deploy your models to an endpoint

In Amazon SageMaker Canvas, you can deploy your models to an endpoint to make predictions. SageMaker AI provides the ML infrastructure for you to host your model on an endpoint with the compute instances that you choose. Then, you can *invoke* the endpoint (send a prediction request) and get a real-time prediction from your model. With this functionality, you can use your model in production to respond to incoming requests, and you can integrate your model with existing applications and workflows.

To get started, you should have a model that you'd like to deploy. You can deploy custom model versions that you've built, Amazon SageMaker JumpStart foundation models, and fine-tuned JumpStart foundation models. For more information about building a model in Canvas, see [How custom models work](#). For more information about JumpStart foundation models in Canvas, see [Generative AI foundation models in SageMaker Canvas](#).

Review the following **Permissions management** section, and then begin creating new deployments in the **Deploy a model** section.

## Permissions management

By default, you have permissions to deploy models to SageMaker AI Hosting endpoints. SageMaker AI grants these permissions for all new and existing Canvas user profiles through the [AmazonSageMakerCanvasFullAccess](#) policy, which is attached to the AWS IAM execution role for the SageMaker AI domain that hosts your Canvas application.

If your Canvas administrator is setting up a new domain or user profile, when they're setting up the domain and following the prerequisite instructions in the [Prerequisites for setting up Amazon SageMaker Canvas](#), SageMaker AI turns on the model deployment permissions through the **Enable direct deployment of Canvas models** option, which is enabled by default.

The Canvas administrator can manage model deployment permissions at the user profile level as well. For example, if the administrator doesn't want to grant model deployment permissions to all user profiles when setting up a domain, they can grant permissions to specific users after creating the domain.

The following procedure shows how to modify the model deployment permissions for a specific user profile:

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **Domains**.
4. From the list of domains, select the user profile's domain.
5. On the **Domain details** page, select the **User profiles** tab.
6. Choose your **User profile**.
7. On the user profile's page, select the **App Configurations** tab.
8. In the **Canvas** section, choose **Edit**.

9. In the **ML Ops configuration** section, turn on the **Enable direct deployment of Canvas models** toggle to enable deployment permissions.
10. Choose **Submit** to save the changes to your domain settings.

The user profile should now have model deployment permissions.

After granting permissions to the domain or user profile, make sure that the user logs out of their Canvas application and logs back in to apply the permission changes.

## Deploy a model

To get started with deploying your model, you create a new deployment in Canvas and specify the model version that you want to deploy along with the ML infrastructure, such as the type and number of compute instances that you would like to use for hosting the model.

Canvas suggests a default type and number of instances based on your model type, or you can learn more about the various SageMaker AI instance types on the [Amazon SageMaker pricing page](#). You are charged based on the SageMaker AI instance pricing while your endpoint is active.

When deploying JumpStart foundation models, you also have the option to specify the length of the deployment time. You can deploy the model to an endpoint indefinitely (meaning the endpoint is active until you delete the deployment). Or, if you only need the endpoint for a short period of time and would like to reduce costs, you can deploy the model to an endpoint for a specified amount of time, after which SageMaker AI shuts down the endpoint for you.

### Note

If you deploy a model for a specified amount of time, stay logged in to the Canvas application for the duration of the endpoint. If you log out of or delete the application, then Canvas is unable to shut down the endpoint at the specified time.

After your model is deployed to a SageMaker AI Hosting [real-time inference endpoint](#), you can begin making predictions by *invoking* the endpoint.

There are several different ways for you to deploy a model from the Canvas application. You can access the model deployment option through any of the following methods:

- On the **My models** page of the Canvas application, choose the model that you want to deploy. Then, from the model's **Versions** page, choose the **More options** icon

- (  )
- next to a model version and select **Deploy**.
- When on the details page for a model version, on the **Analyze** tab, choose the **Deploy** option.
  - When on the details page for a model version, on the **Predict** tab, choose the **More options** icon (  ) at the top of the page and select **Deploy**.
  - On the **ML Ops** page of the Canvas application, choose the **Deployments** tab and then choose **Create deployment**.
  - For JumpStart foundation models and fine-tuned foundation models, go to the **Ready-to-use models** page of the Canvas application. Choose **Generate, extract and summarize content**. Then, find the JumpStart foundation model or fine-tuned foundation model that you want to deploy. Choose the model, and on the model's chat page, choose the **Deploy** button.

All of these methods open the **Deploy model** side panel, where you specify the deployment configuration for your model. To deploy the model from this panel, do the following:

1. (Optional) If you're creating a deployment from the **ML Ops** page, you'll have the option to **Select model and version**. Use the dropdown menus to select the model and model version that you want to deploy.
2. Enter a name in the **Deployment name** field.
3. (For JumpStart foundation models and fine-tuned foundation models only) Choose a **Deployment length**. Select **Indefinite** to leave the endpoint active until you shut it down, or select **Specify length** and then enter the period of time for which you want the endpoint to remain active.
4. For **Instance type**, SageMaker AI detects a default instance type and number that is suitable for your model. However, you can change the instance type that you would like to use for hosting your model.

 **Note**

If you run out of the instance quota for the chosen instance type on your AWS account, you can request a quota increase. For more information about the default quotas and how to request an increase, see [Amazon SageMaker AI endpoints and quotas](#) in the *AWS General Reference guide*.

5. For **Instance count**, you can set the number of active instances that are used for your endpoint. SageMaker AI detects a default number that is suitable for your model, but you can change this number.
6. When you're ready to deploy your model, choose **Deploy**.

Your model should now be deployed to an endpoint.

## View your deployments

You might want to check the status or details of a model deployment in Amazon SageMaker Canvas. For example, if your deployment failed, you might want to check the details to troubleshoot.

You can view your Canvas model deployments from the Canvas application or from the Amazon SageMaker AI console.

To view deployment details from Canvas, choose one of the following procedures:

To view your deployment details from the **ML Ops** page, do the following:

1. Open the SageMaker Canvas application.
2. In the left navigation pane, choose **ML Ops**.
3. Choose the **Deployments** tab.
4. Choose your deployment by name from the list.

To view your deployment details from a model version's page, do the following:

1. In the SageMaker Canvas application, go to your model version's details page.
2. Choose the **Deploy** tab.
3. On the **Deployments** section that lists all of the deployment configurations associated with that model version, find your deployment.
4. Choose the **More options** icon (⋮), and then select **View details** to open the details page.

The details page for your deployment opens, and you can view information such as the time of the most recent prediction, the endpoint's status and configuration, and the model version that is currently deployed to the endpoint.

You can also view your currently active Canvas workspace instances and active endpoints from the **SageMaker AI dashboard** in the [SageMaker AI console](#). Your Canvas endpoints are listed alongside any other SageMaker AI Hosting endpoints that you've created, and you can filter them by searching for endpoints with the Canvas tag.

The following screenshot shows the SageMaker AI dashboard. In the **Canvas** section, you can see that one workspace instance is in service and four endpoints are active.

The screenshot displays the Amazon SageMaker AI Dashboard. At the top, there is a breadcrumb 'Amazon SageMaker > Dashboard' and a button 'Open SageMaker Domain'. The main section is titled 'Recent activity' and includes a filter for 'Recent activity within the Last 7 days'. The dashboard is organized into several columns representing different SageMaker components:

- Ground Truth Labeling jobs:** No recent activity.
- Notebook Notebook instances:** 6 In Service.
- Training Training jobs:** 1419 Completed, 1424 Created, 16 Completed, 17 Created.
- Inference Models:** 426 Created, 50+ In Service, 10 Created.
- Processing Processing jobs:** 541 Completed, 546 Created.
- Canvas Canvas workspace instances:** 1 In Service, 4 In Service, 5 Created.

Below the 'Recent activity' section, there are two sidebars:

- Learning Content:**
  - Amazon SageMaker How-to Blog: AWS machine learning experts showcase how to use Amazon SageMaker. [Learn more](#)
  - Amazon SageMaker 10-Minute Studio Tutorial: Step-by-step guide to getting started with Studio faster. [Learn more](#)
  - Amazon SageMaker 10-Minute Deep Learning Model Tutorial: Step-by-step guide to train and tune a deep learning model at scale. [Learn more](#)
- Feature Spotlight:**
  - Amazon SageMaker Ground Truth: Simplifying labeling workflows using Amazon SageMaker Ground Truth. [Learn more](#)
  - Predictive Maintenance using Amazon SageMaker: Automate the detection of equipment failures using machine learning. [Learn more](#)
  - Accelerate Your Training Jobs Using Amazon FSx for Lustre: Speed up training on SageMaker with high-performance storage. [Learn more](#)

## Update a deployment configuration

You can update the deployment configuration for models that you've deployed to endpoints in Amazon SageMaker Canvas. For example, you can deploy an updated model version to the

endpoint, or you can update the instance type or number of instances behind the endpoint based on your capacity needs.

There are several different ways for you to update your deployment from the Canvas application. You can use any of the following methods:

- On the **ML Ops** page of the Canvas application, you can choose the **Deployments** tab and select the deployment that you want to update. Then, choose **Update configuration**.
- When on the details page for a model version, on the **Deploy** tab, you can view the deployments for that version. Next to the deployment, choose the **More options** icon (  ) and then choose **Update configuration**.

Both of the preceding methods open the **Update configuration** side panel, where you can make changes to your deployment configuration. To update the configuration, do the following:

1. For the **Select version** dropdown menu, you can select a different model version to deploy to the endpoint.

 **Note**

When updating a deployment configuration, you can only choose a different model version to deploy. To deploy a different model, create a new deployment.

2. For **Instance type**, you can select a different instance type for hosting your model.
3. For **Instance count**, you can change the number of active instances that are used for your endpoint.
4. Choose **Save**.

Your deployment configuration should now be updated.

## Test your deployment

You can test a model deployment by invoking the endpoint, or making single prediction requests, through the Amazon SageMaker Canvas application. You can use this functionality to confirm that your endpoint responds to requests before invoking your endpoint programmatically in a production environment.

## Test a custom model deployment

You can test a custom model deployment by accessing it through the **ML Ops** page and making a single invocation, which returns a prediction along with the probability that the prediction is correct.

### Note

Execution length is an estimate of the time taken to invoke and get a response from the endpoint in Canvas. For detailed latency metrics, see [SageMaker AI Endpoint Invocation Metrics](#).

To test your endpoint through the Canvas application, do the following:

1. Open the SageMaker Canvas application.
2. In the left navigation panel, choose **ML Ops**.
3. Choose the **Deployments** tab.
4. From the list of deployments, choose the one with the endpoint that you want to invoke.
5. On the deployment's details page, choose the **Test deployment** tab.
6. On the deployment testing page, you can modify the **Value** fields to specify a new data point. For time series forecasting models, you specify the **Item ID** for which you want to make a forecast.
7. After modifying the values, choose **Update** to get the prediction result.

The prediction loads, along with the **Invocation result** fields which indicate whether or not the invocation was successful and how long the request took to process.

The following screenshot shows a prediction performed in the Canvas application on the **Test deployment** tab.

Operations: Deployment / canvas-new-deployment-10-10-2023-2-48-PM

Update configuration

Details **Test deployment**

Modify values to predict **readmitted** in real time.

Filter columns

readmitted Prediction Copy

**>30**

Average prediction

<30	8.756%
>30	48.109%
no	43.135%

Invocation result

Status	Execution length (ms)	Request time
Successful	304.728	2023-10-11 03:18:45 PM

For all model types except numeric prediction and time series forecasting, the prediction returns the following fields:

- **predicted\_label** – the predicted output
- **probability** – the probability that the predicted label is correct
- **labels** – the list of all the possible labels
- **probabilities** – the probabilities corresponding to each label (the order of this list matches the order of the labels)

For numeric prediction models, the prediction only contains the **score** field, which is the predicted output of the model, such as the predicted price of a house.

For time series forecasting models, the prediction is a graph showing the forecasts by quantile. You can choose **Schema view** to see the forecasted numeric values for each quantile.

You can continue making single predictions through the deployment testing page, or you can see the following section [Invoke your endpoint](#) to learn how to invoke your endpoint programmatically from applications.

## Test a JumpStart foundation model deployment

You can chat with a deployed JumpStart foundation model through the Canvas application to test its functionality before invoking it through code.

To chat with a deployed JumpStart foundation model, do the following:

1. Open the SageMaker Canvas application.
2. In the left navigation panel, choose **ML Ops**.
3. Choose the **Deployments** tab.
4. From the list of deployments, find the one that you want to invoke and choose its **More options** icon (⋮).
5. From the context menu, choose **Test deployment**.
6. A new **Generate, extract and summarize content** chat opens with the JumpStart foundation model, and you can begin typing prompts. Note that prompts from this chat are sent as requests to your SageMaker AI Hosting endpoint.

### Invoke your endpoint

#### Note

We recommend that you [test your model deployment in Amazon SageMaker Canvas](#) before invoking a SageMaker AI endpoint programmatically.

You can use your Amazon SageMaker Canvas models that you've deployed to a SageMaker AI endpoint in production with your applications. Invoke the endpoint programmatically the same way that you invoke any other [SageMaker AI real-time endpoint](#). Invoking an endpoint programmatically returns a response object which contains the same fields described in [Test your deployment](#).

For more detailed information about how to programmatically invoke endpoints, see [Invoke models for real-time inference](#).

The following Python examples show you how to invoke your endpoint based on the model type.

## JumpStart foundation models

The following example shows you how to invoke a JumpStart foundation model that you've deployed to an endpoint.

```
import boto3
import pandas as pd

client = boto3.client("runtime.sagemaker")
body = pd.DataFrame(
    [['feature_column1', 'feature_column2'],
     ['feature_column1', 'feature_column2']]
).to_csv(header=False, index=False).encode("utf-8")

response = client.invoke_endpoint(
    EndpointName="endpoint_name",
    ContentType="text/csv",
    Body=body,
    Accept="application/json"
)
```

## Numeric and categorical prediction models

The following example shows you how to invoke numeric or categorical prediction models.

```
import boto3
import pandas as pd

client = boto3.client("runtime.sagemaker")
body = pd.DataFrame(['feature_column1', 'feature_column2'], ['feature_column1',
 'feature_column2']).to_csv(header=False, index=False).encode("utf-8")

response = client.invoke_endpoint(
    EndpointName="endpoint_name",
    ContentType="text/csv",
    Body=body,
    Accept="application/json"
)
```

## Time series forecasting models

The following example shows you how to invoke time series forecasting models. For a complete example of how to test invoke a time series forecasting model, see [Time-Series Forecasting with Amazon SageMaker Autopilot](#).

```
import boto3
import pandas as pd

csv_path = './real-time-payload.csv'
data = pd.read_csv(csv_path)

client = boto3.client("runtime.sagemaker")

body = data.to_csv(index=False).encode("utf-8")

response = client.invoke_endpoint(
    EndpointName="endpoint_name",
    ContentType="text/csv",
    Body=body,
    Accept="application/json"
)
```

## Image prediction models

The following example shows you how to invoke image prediction models.

```
import boto3
client = boto3.client("runtime.sagemaker")
with open("example_image.jpg", "rb") as file:
    body = file.read()
    response = client.invoke_endpoint(
        EndpointName="endpoint_name",
        ContentType="application/x-image",
        Body=body,
        Accept="application/json"
    )
```

## Text prediction models

The following example shows you how to invoke text prediction models.

```
import boto3
```

```
import pandas as pd

client = boto3.client("runtime.sagemaker")
body = pd.DataFrame([["Example text 1"], ["Example text 2"]]).to_csv(header=False,
    index=False).encode("utf-8")

response = client.invoke_endpoint(
    EndpointName="endpoint_name",
    ContentType="text/csv",
    Body=body,
    Accept="application/json"
)
```

## Delete a model deployment

You can delete your model deployments from the Amazon SageMaker Canvas application. This action also deletes the endpoint from the SageMaker AI console and shuts down any endpoint-related resources.

### Note

Optionally, you can delete your endpoint through the [SageMaker AI console](#) or using the SageMaker AI DeleteEndpoint API. For more information, see [Delete Endpoints and Resources](#). However, when you delete the endpoint through the SageMaker AI console or APIs instead of the Canvas application, the list of deployments in Canvas isn't automatically updated. You must also delete the deployment from the Canvas application to remove it from the list.

To delete a deployment in Canvas, do the following:

1. Open the SageMaker Canvas application.
2. In the left navigation panel, choose **ML Ops**.
3. Choose the **Deployments** tab.
4. From the list of deployments, choose the one that you want to delete.
5. At the top of the deployment details page, choose the **More options** icon ().
6. Choose **Delete deployment**.
7. In the **Delete deployment** dialog box, choose **Delete**.

Your deployment and SageMaker AI Hosting endpoint should now be deleted from both Canvas and the SageMaker AI console.

## How to manage automations

In SageMaker Canvas, you can create automations that update your dataset or generate predictions from your model on a schedule. For example, you might receive new shipping data on a daily basis. You can set up an automatic update for your dataset and automatic batch predictions that run whenever the dataset is updated. Using these features, you can set up an automated workflow and reduce the amount of time you spend manually updating datasets and making predictions.

### Note

You can only set up a maximum of 20 automatic configurations in your Canvas application. Automations are only active while you're logged in to the Canvas application. If you log out of Canvas, your automatic jobs pause until you log back in.

The following sections describe how to view, edit, and delete configurations for existing automations. To learn how to set up automations, see the following topics:

- To set up automatic dataset updates, see [Update a dataset](#).
- To set up automatic batch predictions, see [Batch predictions in SageMaker Canvas](#).

## Topics

- [View your automations](#)
- [Edit your automatic configurations](#)
- [Delete an automatic configuration](#)

## View your automations

You can also view all of your auto update jobs by going to the left navigation pane of Canvas and choosing **ML Ops**. The **ML Operations** page combines automations for both automatic dataset updates and automatic batch predictions. On the **Automations** tab, you can see the following sub-tabs:

- **All jobs** – You can see every instance of a **Dataset update** or **Batch prediction** job that Canvas has done. For each job, you can see fields such as the associated **Input dataset**, the

**Configuration name** of the associated auto update configuration, and the **Status** showing whether the job was successful or not. You can filter the jobs by configuration name:

- For dataset update jobs, you can choose the latest version of the dataset, or the most recent job, to preview the dataset.
- For batch prediction jobs, you can choose the **More options** icon ( ⓘ ) to preview or download the predictions for that job. You can also choose **View details** to see more details about your prediction job. For more information about batch prediction job details, see [View your batch prediction jobs](#).
- **Configuration** – You can see all of the **Dataset update** and **Batch prediction** configurations you've created. For each configuration, you can see fields such as the associated **Input dataset** and the **Frequency** of the jobs. You can also turn off or turn on the **Auto update** toggle to pause or resume automatic updates. If you choose the **More options** icon ( ⓘ ) for a specific configuration, you can choose to **View all jobs** for the configuration, **Update configuration**, or **Delete configuration**.

## Edit your automatic configurations

After setting up a configuration, you might want to make changes to it. For automatic dataset updates, you can update the Amazon S3 location for Canvas to import data, the frequency of the updates, and the starting time. For automatic batch predictions, you can change the dataset that the configuration tracks for updates. You can also turn off the automation to temporarily pause updates until you choose to resume them.

The following sections show you how to update each type of configuration.

### Note

You can't change the frequency for automatic batch predictions because automatic batch predictions run every time the target dataset is updated.

## Topics

- [Edit your automatic dataset update configuration](#)
- [Edit your automatic batch prediction configuration](#)

## Edit your automatic dataset update configuration

You might want to make changes to your auto update configuration for a dataset, such as changing the frequency of the updates. You might also want to turn off your automatic update configuration to pause the updates to your dataset.

To make changes to your auto update configuration for a dataset, do the following:

1. In the left navigation pane of Canvas, choose **ML Ops**.
2. Choose the **Automations** tab.
3. Choose the **Configuration** tab.
4. For your auto update configuration, choose the **More options** icon (  ).
5. In the dropdown menu, choose **Update configuration**. You are taken to the **Auto updates** tab of the dataset.
6. Make your changes to the configuration. When you're done making changes, choose **Save**.

To pause your dataset updates, turn off your automatic configuration. One way to turn off auto updates is by doing the following:

1. In the left navigation pane of Canvas, choose **ML Ops**.
2. Choose the **Automations** tab.
3. Choose the **Configuration** tab.
4. Find your configuration from the list and turn off the **Auto update** toggle.

Automatic updates for your dataset are now paused. You can turn this toggle back on at any time to resume the update schedule.

## Edit your automatic batch prediction configuration

When you edit a batch prediction configuration, you can change the target dataset but not the frequency (since automatic batch predictions occur whenever the dataset is updated).

To make changes to your automatic batch predictions configuration, do the following:

1. In the left navigation pane of Canvas, choose **ML Ops**.
2. Choose the **Automations** tab.

3. Choose the **Configuration** tab.
4. For your auto update configuration, choose the **More options** icon (  ).
5. In the dropdown menu, choose **Update configuration**. You are taken to the **Auto updates** tab of the dataset.
6. The **Automate batch prediction** dialog box opens. You can select another dataset and choose **Set up** to save your changes.

Your automatic batch predictions configuration is now updated.

To pause your automatic batch predictions, turn off your automatic configuration. Use the following procedure to turn off your configuration:

1. In the left navigation pane of Canvas, choose **ML Ops**.
2. Choose the **Automations** tab.
3. Choose the **Configuration** tab.
4. Find your configuration from the list and turn off the **Auto update** toggle.

Automatic batch predictions for your dataset are now paused. You can turn this toggle back on at any time to resume the update schedule.

### Delete an automatic configuration

You might want to delete a configuration to stop your automated workflow in SageMaker Canvas.

To delete a configuration for automatic dataset updates or automatic batch predictions, do the following:

1. In the left navigation pane of Canvas, choose **ML Ops**.
2. Choose the **Automations** tab.
3. Choose the **Configuration** tab.
4. Find your auto update configuration, and choose the **More options** icon (  ).
5. Choose **Delete configuration**.
6. In the dialog box that pops up, choose **Delete**.

Your auto update configuration is now deleted.

## Logging out of Amazon SageMaker Canvas

After completing your work in Amazon SageMaker Canvas, you can log out or configure your application to automatically terminate the *workspace instance*. A workspace instance is dedicated for your use every time you launch a Canvas application, and you are billed for as long as the instance runs. Logging out or terminating the workspace instance stops the workspace instance billing. For more information, see [SageMaker Pricing](#).

The following sections describe how to log out of your Canvas application and how to configure your application to automatically shut down on a schedule.

### Log out of Canvas

When you log out of Canvas, your models and datasets aren't affected. Any quick or standard model builds or [large data processing jobs](#) continue running even if you log out.

To log out, choose the **Log out** button

on the left panel of the SageMaker Canvas application.

You can also log out from the SageMaker Canvas application by closing your browser tab and then [deleting the application](#) in the console.

After you log out, SageMaker Canvas tells you to relaunch in a different tab. Logging in takes around 1 minute. If you have an administrator who set up SageMaker Canvas for you, use the instructions they gave you to log back in. If don't have an administrator, see the procedure for accessing SageMaker Canvas in [Prerequisites for setting up Amazon SageMaker Canvas](#).

### Automatically shut down Canvas

If you're a Canvas administrator, you might want to regularly shut down applications to reduce costs. You can either create a schedule to shut down active Canvas applications, or you can create an automation to shut down Canvas applications as soon as they're *idle* (meaning the user hasn't been active for 2 hours).

You can create these solutions using AWS Lambda functions that call the DeleteApp API and delete Canvas applications given certain conditions. For more information about these solutions and access to AWS CloudFormation templates that you can use, see the blog [Optimizing costs for Amazon SageMaker Canvas with automatic shutdown of idle apps](#).

**Note**

You might experience missing [Amazon CloudWatch](#) metrics if there was an error when setting up your idle shut down schedule or a CloudWatch error. We recommend that you add a CloudWatch alarm that monitors for missing metrics. If you encounter this issue, reach out to Support for help.

## Limitations and troubleshooting

The following section outlines troubleshooting help and limitations that apply when using Amazon SageMaker Canvas. You can use these this topic to help troubleshoot any issues you encounter.

### Troubleshooting issues with granting permissions through the SageMaker AI console

If you're having trouble granting Canvas base permissions or Ready-to-use models permissions to your user, your user might have an AWS IAM execution role with more than one trust relationship to other AWS services. A trust relationship is a policy attached to your role that defines which principals (users, roles, accounts, or services) can assume the role. For example, you might encounter an issue granting additional Canvas permissions to your user if their execution role has a trust relationship to both Amazon SageMaker AI and Amazon Forecast.

You can fix this problem by choosing one of the following options.

#### 1. Remove all but one trusted service from the role.

This solution requires you to edit the trust relationship for your user profile's IAM role and remove all AWS services except SageMaker AI.

To edit the trust relationship for your IAM execution role, do the following:

1. Go to the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane of the IAM console, choose **Roles**. The console displays the roles for your account.
3. Choose the name of the role that you want to modify, and select the **Trust relationships** tab on the details page.
4. Choose **Edit trust policy**.

5. In the **Edit trust policy editor**, paste the following, and then choose **Update Policy**.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "sagemaker.amazonaws.com"
        ]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

You can also update this policy document using the IAM CLI. For more information, see [update-trust](#) in the *IAM Command Line Reference*.

You can now retry granting the Canvas base permissions or the Ready-to-use models permissions to your user.

## 2. Use a different role with one or fewer trusted services.

This solution requires you to specify a different IAM role for your user profile. Use this option if you already have an IAM role that you can substitute.

To specify a different execution role for your user, do the following:

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. From the list of domains, select the domain that you want to view a list of user profiles for.
5. On the **domain details** page, choose the **User profiles** tab.
6. Choose the user whose permissions you want to edit. On the **User details** page, choose **Edit**.
7. On the **General settings** page, choose the **Execution role** dropdown list and select the role that you want to use.
8. Choose **Submit** to save your changes to the user profile.

Your user should now be using an execution role with only one trusted service (SageMaker AI).

You can retry granting the Canvas base permissions or the Ready-to-use models permissions to your user.

### 3. Manually attach the AWS managed policy to the execution role instead of using the toggle in the SageMaker AI domain settings.

Instead of using the toggle in the domain or user profile settings, you can manually attach the AWS managed policies that grant a user the correct permissions.

To grant a user Canvas base permissions, attach the [AmazonSageMakerCanvasFullAccess](#) policy. To grant a user Ready-to-use models permissions, attach the [AmazonSageMakerCanvasAIServiceAccess](#) policy.

Use the following procedure to attach an AWS managed policy to your role:

1. Go to the IAM console at <https://console.aws.amazon.com/iam/>.
2. Choose **Roles**.
3. In the search box, search for the user's IAM role by name and select it.
4. On the page for the user's role, under **Permissions**, choose **Add permissions**.
5. From the dropdown menu, choose **Attach policies**.
6. Search for and select the policy or policies that you want to attach to the user's execution role:
  - a. To grant the Canvas base permissions, search for and select the [AmazonSageMakerCanvasFullAccess](#) policy.
  - b. To grant the Ready-to-use models permissions, search for and select the [AmazonSageMakerCanvasAIServiceAccess](#) policy.
7. Choose **Add permissions** to attach the policy to the role.

After attaching an AWS managed policy to the user's role through the IAM console, your user should now have the Canvas base permissions or Ready-to-use models permissions.

## Troubleshooting issues with creating a Canvas application due to space failure

When creating a new Canvas application, if you encounter an error stating Unable to create app <app-arn> because space <space-arn> is not in InService state, this indicates that the underlying Amazon SageMaker Studio space creation has failed. A Studio

*space* is the underlying storage that hosts your Canvas application data. For more general information about Studio spaces, see [Amazon SageMaker Studio spaces](#). For more information about configuring spaces in Canvas, see [Store SageMaker Canvas application data in your own SageMaker AI space](#).

To determine the root cause of your why space creation failed, you can use the [DescribeSpace](#) API to check the `FailureReason` field. For more information about the possible statuses of spaces and what they mean, see [Amazon SageMaker AI domain entities and statuses](#).

To resolve this issue, find your domain in the SageMaker AI console and delete the failed space listed in the error message you received. For detailed steps on how to find and delete a space, see the page [Stop and delete your Studio running applications and spaces](#) and follow the instructions to **Delete a Studio space**. Deleting the space also deletes any applications associated with the space. After deleting the space, you can try to create your Canvas application again. The space should now provision successfully, allowing Canvas to launch.

## Billing and cost in SageMaker Canvas

To track the costs associated with your SageMaker Canvas application, you can use the AWS Billing and Cost Management service. Billing and Cost Management provides tools to help you gather information related to your cost and usage, analyze your cost drivers and usage trends, and take action to budget your spending. For more information, see [What is AWS Billing and Cost Management?](#)

Billing in SageMaker Canvas consists of the following components:

- **Workspace instance charges** – You are charged for the number of hours that you are logged in to or using SageMaker Canvas. We recommend that you log out or create a schedule to shut down any Canvas applications that you're not actively using to reduce costs. For more information, see [Logging out of Amazon SageMaker Canvas](#).
- **AWS service charges** – You are charged for building and making predictions with custom models, or for making predictions with Ready-to-use models:
  - **Training charges** – For all model types, you are charged based on your resource usage while the model builds. These resources include any compute instances that Canvas spins up. You may see these charges on your account as Hosting, Training, Processing, or Batch Transform jobs.
  - **Prediction charges** – You are charged for the resources used to generate predictions, depending on the type of custom model that you built or the type of Ready-to-use model you used.

The [Ready-to-use models](#) in Canvas leverage other AWS services to generate predictions. When you use a Ready-to-use model, you are charged by the respective service, and their pricing conditions apply:

- For sentiment analysis, entities extraction, language detection, and personal information detection, you're charged with [Amazon Comprehend pricing](#).
- For object detection in images and text detection in images, you're charged with [Amazon Rekognition pricing](#).
- For expense analysis, identity document analysis, and document analysis, you're charged with [Amazon Textract pricing](#).

For more information, see [SageMaker Canvas pricing](#).

To help you track your costs in Billing and Cost Management, you can assign custom tags to your SageMaker Canvas app and users. You can track the costs your apps incur, and by tagging individual user profiles, you can track costs based on the user profile. For more information about tags, see [Using Cost Allocation Tags](#).

You can add tags to your SageMaker Canvas app and users by doing the following:

- If you are setting up your Amazon SageMaker AI domain and SageMaker Canvas for the first time, follow the [Getting Started](#) instructions and add tags when creating your domain or users. You can add tags either through the **General settings** in the domain console setup, or through the APIs ([CreateDomain](#) or [CreateUserProfile](#)). SageMaker AI adds the tags specified in your domain or UserProfile to any SageMaker Canvas apps or users you create after you create the domain.
- If you want to add tags to apps in an existing domain, you must add tags to either the domain or the UserProfile. You can add tags through either the console or the [AddTags](#) API. If you add tags through the console, then you must delete and relaunch your SageMaker Canvas app in order for the tags to propagate to the app. If you use the API, the tags are added directly to the app. For more information about deleting and relaunching a SageMaker Canvas app, see [Manage apps](#).

After you add tags to your domain, it might take up to 24 hours for the tags to appear in the AWS Billing and Cost Management console for activation. After they appear in the console, it takes another 24 hours for the tags to activate.

On the **Cost explorer** page, you can group and filter your costs by tags and usage types to separate your Workspace instance charges from your Training charges. The charges for each are listed as the following:

- Workspace instance charges: Charges show up under the usage type REGION-Canvas:Session-Hrs (Hrs).
- Training charges: Charges show up under the usage types for SageMaker AI Hosting, Training, Processing, or Batch Transform jobs.

## Amazon SageMaker geospatial capabilities

### Important

As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. If prior to November 30, 2023 you created a Amazon SageMaker AI domain, Studio Classic remains the default experience. domains created after November 30, 2023 default to the new Studio experience.

Amazon SageMaker geospatial features and resources are *only* available in Studio Classic. To learn more about setting up a domain and getting started with Studio, see [Getting started with Amazon SageMaker geospatial](#).

Amazon SageMaker geospatial capabilities makes it easier for data scientists and machine learning (ML) engineers to build, train, and deploy ML models faster using geospatial data. You have access to open-source and third-party data, processing, and visualization tools to make it more efficient to prepare geospatial data for ML. You can increase your productivity by using purpose-built algorithms and pre-trained ML models to speed up model building and training, and use built-in visualization tools to explore prediction outputs on an interactive map and then collaborate across teams on insights and results.

### Note

Currently, SageMaker geospatial capabilities are only supported in the US West (Oregon) Region.

If you don't see the SageMaker geospatial UI available in your current Studio Classic instance check to make sure you are currently in the US West (Oregon) Region.

## Why use SageMaker geospatial capabilities?

You can use SageMaker geospatial capabilities to make predictions on geospatial data faster than do-it-yourself solutions. SageMaker geospatial capabilities make it easier to access geospatial data from your existing customer data lakes, open-source datasets, and other SageMaker geospatial data providers. SageMaker geospatial capabilities minimize the need for building custom infrastructure and data preprocessing functions by offering purpose-built algorithms for efficient data preparation, model training, and inference. You can also create and share custom visualizations and data with your company from Amazon SageMaker Studio Classic. SageMaker geospatial capabilities offer pre-trained models for common uses in agriculture, real estate, insurance, and financial services.

## How can I use SageMaker geospatial capabilities?

You can use SageMaker geospatial capabilities in two ways.

- Through the SageMaker geospatial UI, as a part of Amazon SageMaker Studio Classic UI.
- Through a Studio Classic notebook instance that uses the **Geospatial 1.0** image.

### SageMaker AI has the following geospatial capabilities

- Use a purpose built SageMaker geospatial image that supports both CPU and GPU-based notebook instances, and also includes commonly used open-source libraries found in geospatial machine learning workflows.
- Use the Amazon SageMaker Processing and the SageMaker geospatial container to run large-scale workloads with your own datasets, including soil, weather, climate, LiDAR, and commercial aerial and satellite imagery.
- Run an [Earth Observation job](#) for raster data processing.
- Run a [Vector Enrichment job](#) to convert latitude and longitude into human readable addresses, and match noisy GPS traces to specific roads.
- Use built-in [visualization tools right in Studio Classic to interactively view geospatial data or model predictions on a map.](#)

You can also use data from a collection of geospatial data providers. Currently, the data collections available include:

- [USGS Landsat](#)

- [Sentinel-1](#)
- [Sentinel-2](#)
- [Copernicus DEM](#)
- [National Agriculture Imagery Program](#)

## Are you a first-time user of SageMaker geospatial?

As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. New domains created after November 30, 2023 default to the Studio experience. Access to SageMaker geospatial is limited to Studio Classic, to learn more see [Accessing SageMaker geospatial](#).

If you're a first-time user of AWS or Amazon SageMaker AI, we recommend that you do the following:

### 1. Create an AWS account.

To learn about setting up an AWS account and getting started with SageMaker AI, see [Complete Amazon SageMaker AI prerequisites](#).

### 2. Create a user role and execution role that work with SageMaker geospatial.

As a managed service, Amazon SageMaker geospatial capabilities performs operations on your behalf on the AWS hardware that SageMaker AI manages. A SageMaker AI execution role can perform only the operations that users grant. To work with SageMaker geospatial capabilities, you must set up a user role and an execution role. For more information, see [SageMaker geospatial capabilities roles](#).

### 3. Update your trust policy to include SageMaker geospatial.

SageMaker geospatial defines an additional service principal. To learn how to create or update your SageMaker AI execution role's trust policy, see [Adding the SageMaker geospatial service principal to an existing SageMaker AI execution role](#).

### 4. Set up an Amazon SageMaker AI domain to access Amazon SageMaker Studio Classic.

To use SageMaker geospatial, a domain is required. For domains created before November 30, 2023 the default experience is Studio Classic. domains created after November 30, 2023 default to the Studio experience. To learn more about accessing Studio Classic from Studio, see [Accessing SageMaker geospatial](#).

## 5. Remember, shut down resources.

When you have finished using SageMaker geospatial capabilities, shut down the instance it runs on to avoid incurring additional charges. For more information, see [Shut down resources from Amazon SageMaker Studio Classic](#).

## Getting started with Amazon SageMaker geospatial

SageMaker geospatial provides a purpose built **Image** and **Instance type** for Amazon SageMaker Studio Classic notebooks. You can use either CPU or GPU enabled notebooks with the SageMaker geospatial **Image**. You can also visualize your geospatial data using a purpose built visualizer. Furthermore, SageMaker geospatial also provides APIs that allow you to query raster data collections. You can also use pre-trained models to analyze geospatial data, reverse geocoding, and map matching.

### Important

As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. If prior to November 30, 2023 you created a Amazon SageMaker AI domain, Studio Classic remains the default experience. domains created after November 30, 2023 default to the new Studio experience.

To access and get started using Amazon SageMaker geospatial, do the following:

## Topics

- [Accessing SageMaker geospatial](#)
- [Create an Amazon SageMaker Studio Classic notebook using the geospatial image](#)
- [Access the Sentinel-2 raster data collection and create an earth observation job to perform land segmentation](#)

## Accessing SageMaker geospatial

### Note

Currently, SageMaker geospatial capabilities are only supported in the US West (Oregon) Region and in Studio Classic.

If you don't see the SageMaker geospatial UI available in your current Studio Classic instance check to make sure you are currently in the US West (Oregon) Region.

A domain is required to access SageMaker geospatial. If you created a domain prior to November 30, 2023 the default experience is Studio Classic.

If you created a domain after November 30, 2023 or if you have migrated to Studio, then you can use the following procedure to activate Studio Classic from within Studio to use SageMaker geospatial features.

To learn more about creating a domain, see [Onboard to Amazon SageMaker AI domain](#).

### To access Studio Classic from Studio

1. Launch Amazon SageMaker Studio.
2. Under **Applications**, choose **Studio Classic**.
3. Then, choose **Create Studio Classic space**.
4. On the **Create Studio Classic space** page, enter a **Name**.
5. Disable the **Share with my domain** option. SageMaker geospatial is not available in shared domains.
6. Then choose **Create space**.

When successful the **Status** changes to **Updating**. When your Studio Classic application is ready to be used the status changes to **Stopped**.

To start your Studio Classic application, choose **Run**.

## Create an Amazon SageMaker Studio Classic notebook using the geospatial image

### Important

As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. The following section is specific to using the Studio Classic application. For information about using the updated Studio experience, see [Amazon SageMaker Studio](#).

### Note

Currently, SageMaker geospatial is only supported in the US West (Oregon) Region. If you don't see SageMaker geospatial available in your current domain or notebook instance, make sure that you're currently in the US West (Oregon) Region.

Use the following procedure to create Studio Classic notebook with the SageMaker geospatial image. If your default studio experience is Studio, see [Accessing SageMaker geospatial](#) to learn about starting a Studio Classic application.

### To create a Studio Classic notebook with the SageMaker geospatial image

1. Launch Studio Classic
2. Choose **Home** in the menu bar.
3. Under **Quick actions**, choose **Open Launcher**.
4. When the **Launcher** dialog box opens. Choose **Change environment** under **Notebooks and compute resources**.
5. When, the **Change environment** dialog box opens. Choose the **Image** dropdown and choose or type **Geospatial 1.0**.

- Next, choose an **Instance type** from the dropdown.

SageMaker geospatial supports two types of notebook instances: CPU and GPU. The supported CPU instance is called **ml.geospatial.interactive**. Any of the G5-family of GPU instances can be used with the Geospatial 1.0 image.

**Note**

If you receive a `ResourceLimitExceeded` error when attempting to start a GPU based instance, you need to request a quota increase. To get started on a Service Quotas quota increase request, see [Requesting a quota increase](#) in the *Service Quotas User Guide*

- Choose **Select**.
- Choose **Create notebook**.

After creating a notebook, to learn more about SageMaker geospatial, try the [SageMaker geospatial tutorial](#). It shows you how to process Sentinel-2 image data and perform land segmentation on it using the earth observation jobs API.

## Access the Sentinel-2 raster data collection and create an earth observation job to perform land segmentation

This Python-based tutorial uses the SDK for Python (Boto3) and an Amazon SageMaker Studio Classic notebook. To complete this demo successfully, make sure that you have the required AWS Identity and Access Management (IAM) permissions to use SageMaker geospatial and Studio Classic. SageMaker geospatial requires that you have a user, group, or role which can access Studio Classic. You must also have a SageMaker AI execution role that specifies the SageMaker geospatial service principal, `sagemaker-geospatial.amazonaws.com` in its trust policy.

To learn more about these requirements, see [SageMaker geospatial IAM roles](#).

This tutorial shows you how to use SageMaker geospatial API to complete the following tasks:

- Find the available raster data collections with `list_raster_data_collections`.
- Search a specified raster data collection by using `search_raster_data_collection`.
- Create an earth observation job (EOJ) by using `start_earth_observation_job`.

### Using `list_raster_data_collections` to find available data collections

SageMaker geospatial supports multiple raster data collections. To learn more about the available data collections, see [Data collections](#).

This demo uses satellite data that's collected from [Sentinel-2 Cloud-Optimized GeoTIFF](#) satellites. These satellites provide global coverage of Earth's land surface every five days. In addition to collecting surface images of Earth, the Sentinel-2 satellites also collect data across a variety of spectralbands.

To search an area of interest (AOI), you need the ARN that's associated with the Sentinel-2 satellite data. To find the available data collections and their associated ARNs in your AWS Region, use the `list_raster_data_collections` API operation.

Because the response can be paginated, you must use the `get_paginator` operation to return all of the relevant data:

```
import boto3
import sagemaker
import sagemaker_geospatial_map
import json
```

```

## SageMaker Geospatial is currently only available in US-WEST-2
session = boto3.Session(region_name='us-west-2')
execution_role = sagemaker.get_execution_role()

## Creates a SageMaker Geospatial client instance
geospatial_client = session.client(service_name="sagemaker-geospatial")

# Creates a reusable Paginator for the list_raster_data_collections API operation
paginator = geospatial_client.get_paginator("list_raster_data_collections")

# Create a PageIterator from the paginator class
page_iterator = paginator.paginate()

# Use the iterator to iterate through the results of list_raster_data_collections
results = []
for page in page_iterator:
    results.append(page['RasterDataCollectionSummaries'])

print(results)

```

This is a sample JSON response from the `list_raster_data_collections` API operation. It's truncated to include only the data collection (Sentinel-2) that's used in this code example. For more details about a specific raster data collection, use `get_raster_data_collection`:

```

{
  "Arn": "arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/
public/nmqj48dcu3g7ayw8",
  "Description": "Sentinel-2a and Sentinel-2b imagery, processed to Level 2A (Surface
Reflectance) and converted to Cloud-Optimized GeoTIFFs",
  "DescriptionPageUrl": "https://registry.opendata.aws/sentinel-2-l2a-cogs",
  "Name": "Sentinel 2 L2A COGs",
  "SupportedFilters": [
    {
      "Maximum": 100,
      "Minimum": 0,
      "Name": "EoCloudCover",
      "Type": "number"
    },
    {
      "Maximum": 90,
      "Minimum": 0,
      "Name": "ViewOffNadir",
      "Type": "number"
    }
  ]
}

```

```
    },
    {
        "Name": "Platform",
        "Type": "string"
    }
],
"Tags": {},
"Type": "PUBLIC"
}
```

After running the previous code sample, you get the ARN of the Sentinel-2 raster data collection, `arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/public/nmqj48dcu3g7ayw8`. In the [next section](#), you can query the Sentinel-2 data collection using the `search_raster_data_collection` API.

### Searching the Sentinel-2 raster data collection using `search_raster_data_collection`

In the preceding section, you used `list_raster_data_collections` to get the ARN for the Sentinel-2 data collection. Now you can use that ARN to search the data collection over a given area of interest (AOI), time range, properties, and the available UV bands.

To call the `search_raster_data_collection` API you must pass in a Python dictionary to the `RasterDataCollectionQuery` parameter. This example uses `AreaOfInterest`, `TimeRangeFilter`, `PropertyFilters`, and `BandFilter`. For ease, you can specify the Python dictionary using the variable `search_rdc_query` to hold the search query parameters:

```
search_rdc_query = {
    "AreaOfInterest": {
        "AreaOfInterestGeometry": {
            "PolygonGeometry": {
                "Coordinates": [
                    [
                        # coordinates are input as longitude followed by latitude
                        [-114.529, 36.142],
                        [-114.373, 36.142],
                        [-114.373, 36.411],
                        [-114.529, 36.411],
                        [-114.529, 36.142],
                    ]
                ]
            }
        }
    }
}
```

```

    },
    "TimeRangeFilter": {
      "StartTime": "2022-01-01T00:00:00Z",
      "EndTime": "2022-07-10T23:59:59Z"
    },
    "PropertyFilters": {
      "Properties": [
        {
          "Property": {
            "EoCloudCover": {
              "LowerBound": 0,
              "UpperBound": 1
            }
          }
        }
      ],
      "LogicalOperator": "AND"
    },
    "BandFilter": [
      "visual"
    ]
  }
}

```

In this example, you query an AreaOfInterest that includes [Lake Mead](#) in Utah. Furthermore, Sentinel-2 supports multiple types of image bands. To measure the change in the surface of the water, you only need the `visual` band.

After you create the query parameters, you can use the `search_raster_data_collection` API to make the request.

The following code sample implements a `search_raster_data_collection` API request. This API does not support pagination using the `get_pagination` API. To make sure that the full API response has been gathered the code sample uses a `while` loop to check that `NextToken` exists. The code sample then uses `.extend()` to append the satellite image URLs and other response metadata to the `items_list`.

To learn more about the `search_raster_data_collection`, see [SearchRasterDataCollection](#) in the *Amazon SageMaker AI API Reference*.

```

search_rdc_response = sm_geo_client.search_raster_data_collection(
    Arn='arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/
public/nmqj48dcu3g7ayw8',

```

```

    RasterDataCollectionQuery=search_rdc_query
)

## items_list is the response from the API request.
items_list = []

## Use the python .get() method to check that the 'NextToken' exists, if null returns
None breaking the while loop
while search_rdc_response.get('NextToken'):
    items_list.extend(search_rdc_response['Items'])
    search_rdc_response = sm_geo_client.search_raster_data_collection(
        Arn='arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-
collection/public/nmqj48dcu3g7ayw8',
        RasterDataCollectionQuery=search_rdc_query,
        NextToken=search_rdc_response['NextToken']
    )

## Print the number of observation return based on the query
print (len(items_list))

```

The following is a JSON response from your query. It has been truncated for clarity. Only the **"BandFilter": ["visual"]** specified in the request is returned in the Assets key-value pair:

```

{
  'Assets': {
    'visual': {
      'Href': 'https://sentinel-cogs.s3.us-west-2.amazonaws.com/sentinel-s2-l2a-
cogs/15/T/UH/2022/6/S2A_15TUH_20220623_0_L2A/TCI.tif'
    }
  },
  'DateTime': datetime.datetime(2022, 6, 23, 17, 22, 5, 926000, tzinfo = tzlocal()),
  'Geometry': {
    'Coordinates': [
      [
        [-114.529, 36.142],
        [-114.373, 36.142],
        [-114.373, 36.411],
        [-114.529, 36.411],
        [-114.529, 36.142],
      ]
    ],
    'Type': 'Polygon'
  }
}

```

```
    },
    'Id': 'S2A_15TUH_20220623_0_L2A',
    'Properties': {
        'EoCloudCover': 0.046519,
        'Platform': 'sentinel-2a'
    }
}
```

Now that you have your query results, in the next section you can visualize the results by using `matplotlib`. This is to verify that results are from the correct geographical region.

### Visualizing your `search_raster_data_collection` using `matplotlib`

Before you start the earth observation job (EOJ), you can visualize a result from our query with `matplotlib`. The following code sample takes the first item, `items_list[0]["Assets"]` `["visual"]` `["Href"]`, from the `items_list` variable created in the previous code sample and prints an image using `matplotlib`.

```
# Visualize an example image.
import os
from urllib import request
import tiffiffile
import matplotlib.pyplot as plt

image_dir = "./images/lake_mead"
os.makedirs(image_dir, exist_ok=True)

image_dir = "./images/lake_mead"
os.makedirs(image_dir, exist_ok=True)

image_url = items_list[0]["Assets"]["visual"]["Href"]
img_id = image_url.split("/")[-2]
path_to_image = image_dir + "/" + img_id + "_TCI.tif"
response = request.urlretrieve(image_url, path_to_image)
print("Downloaded image: " + img_id)

tci = tiffiffile.imread(path_to_image)
plt.figure(figsize=(6, 6))
plt.imshow(tci)
plt.show()
```

After checking that the results are in the correct geographical region, you can start the Earth Observation Job (EOJ) in the next step. You use the EOJ to identify the water bodies from the satellite images by using a process called land segmentation.

## Starting an earth observation job (EOJ) that performs land segmentation on a series of Satellite images

SageMaker geospatial provides multiple pre-trained models that you can use to process geospatial data from raster data collections. To learn more about the available pre-trained models and custom operations, see [Types of Operations](#).

To calculate the change in the water surface area, you need to identify which pixels in the images correspond to water. Land cover segmentation is a semantic segmentation model supported by the `start_earth_observation_job` API. Semantic segmentation models associate a label with every pixel in each image. In the results, each pixel is assigned a label that's based on the class map for the model. The following is the class map for the land segmentation model:

```
{
  0: "No_data",
  1: "Saturated_or_defective",
  2: "Dark_area_pixels",
  3: "Cloud_shadows",
  4: "Vegetation",
  5: "Not_vegetated",
  6: "Water",
  7: "Unclassified",
  8: "Cloud_medium_probability",
  9: "Cloud_high_probability",
  10: "Thin_cirrus",
  11: "Snow_ice"
}
```

To start an earth observation job, use the `start_earth_observation_job` API. When you submit your request, you must specify the following:

- `InputConfig` (*dict*) – Used to specify the coordinates of the area that you want to search, and other metadata that's associated with your search.
- `JobConfig` (*dict*) – Used to specify the type of EOJ operation that you performed on the data. This example uses **LandCoverSegmentationConfig**.

- `ExecutionRoleArn` (*string*) – The ARN of the SageMaker AI execution role with the necessary permissions to run the job.
- `Name` (*string*) – A name for the earth observation job.

The `InputConfig` is a Python dictionary. Use the following variable `eojob_input_config` to hold the search query parameters. Use this variable when you make the `start_earth_observation_job` API request. w.

```
# Perform land cover segmentation on images returned from the Sentinel-2 dataset.
eojob_input_config = {
    "RasterDataCollectionQuery": {
        "RasterDataCollectionArn": "arn:aws:sagemaker-geospatial:us-
west-2:378778860802:raster-data-collection/public/nmqj48dcu3g7ayw8",
        "AreaOfInterest": {
            "AreaOfInterestGeometry": {
                "PolygonGeometry": {
                    "Coordinates": [
                        [
                            [-114.529, 36.142],
                            [-114.373, 36.142],
                            [-114.373, 36.411],
                            [-114.529, 36.411],
                            [-114.529, 36.142],
                        ]
                    ]
                }
            }
        },
        "TimeRangeFilter": {
            "StartTime": "2021-01-01T00:00:00Z",
            "EndTime": "2022-07-10T23:59:59Z",
        },
        "PropertyFilters": {
            "Properties": [{"Property": {"EoCloudCover": {"LowerBound": 0,
"UpperBound": 1}}}],
            "LogicalOperator": "AND",
        },
    }
}
```

The JobConfig is a Python dictionary that is used to specify the EOJ operation that you want performed on your data:

```
ej_config = {"LandCoverSegmentationConfig": {}}
```

With the dictionary elements now specified, you can submit your `start_earth_observation_job` API request using the following code sample:

```
# Gets the execution role arn associated with current notebook instance
execution_role_arn = sagemaker.get_execution_role()

# Starts an earth observation job
response = sm_geo_client.start_earth_observation_job(
    Name="lake-mead-landcover",
    InputConfig=ej_input_config,
    JobConfig=ej_config,
    ExecutionRoleArn=execution_role_arn,
)

print(response)
```

The `start_earth_observation_job` returns an ARN along with other metadata.

To get a list of all ongoing and current earth observation jobs use the `list_earth_observation_jobs` API. To monitor the status of a single earth observation job use the `get_earth_observation_job` API. To make this request, use the ARN created after submitting your EOJ request. To learn more, see [GetEarthObservationJob](#) in the *Amazon SageMaker AI API Reference*.

To find the ARNs associated with your EOJs use the `list_earth_observation_jobs` API operation. To learn more, see [ListEarthObservationJobs](#) in the *Amazon SageMaker AI API Reference*.

```
# List all jobs in the account
sg_client.list_earth_observation_jobs()["EarthObservationJobSummaries"]
```

The following is an example JSON response:

```
{
  'Arn': 'arn:aws:sagemaker-geospatial:us-west-2:111122223333:earth-observation-job/futg3vuq935t',
```

```

    'CreationTime': datetime.datetime(2023, 10, 19, 4, 33, 54, 21481, tzinfo =
tzlocal()),
    'DurationInSeconds': 3493,
    'Name': 'lake-mead-landcover',
    'OperationType': 'LAND_COVER_SEGMENTATION',
    'Status': 'COMPLETED',
    'Tags': {}
}, {
    'Arn': 'arn:aws:sagemaker-geospatial:us-west-2:111122223333:earth-observation-job/
wu8j9x42zw3d',
    'CreationTime': datetime.datetime(2023, 10, 20, 0, 3, 27, 270920, tzinfo =
tzlocal()),
    'DurationInSeconds': 1,
    'Name': 'mt-shasta-landcover',
    'OperationType': 'LAND_COVER_SEGMENTATION',
    'Status': 'INITIALIZING',
    'Tags': {}
}

```

After the status of your EOJ job changes to COMPLETED, proceed to the next section to calculate the change in Lake Mead's surface area.

## Calculating the change in the Lake Mead surface area

To calculate the change in Lake Mead's surface area, first export the results of the EOJ to Amazon S3 by using `export_earth_observation_job`:

```

sagemaker_session = sagemaker.Session()
s3_bucket_name = sagemaker_session.default_bucket() # Replace with your own bucket if
needed
s3_bucket = session.resource("s3").Bucket(s3_bucket_name)
prefix = "export-lake-mead-eoj" # Replace with the S3 prefix desired
export_bucket_and_key = f"s3://{s3_bucket_name}/{prefix}/"

eoj_output_config = {"S3Data": {"S3Uri": export_bucket_and_key}}
export_response = sm_geo_client.export_earth_observation_job(
    Arn="arn:aws:sagemaker-geospatial:us-west-2:111122223333:earth-observation-
job/7xgwzijebynp",
    ExecutionRoleArn=execution_role_arn,
    OutputConfig=eoj_output_config,
    ExportSourceImages=False,
)

```

To see the status of your export job, use `get_earth_observation_job`:

```
export_job_details =
    sm_geo_client.get_earth_observation_job(Arn=export_response["Arn"])
```

To calculate the changes in Lake Mead's water level, download the land cover masks to the local SageMaker notebook instance and download the source images from our previous query. In the class map for the land segmentation model, the water's class index is 6.

To extract the water mask from a Sentinel-2 image, follow these steps. First, count the number of pixels marked as water (class index 6) in the image. Second, multiply the count by the area that each pixel covers. Bands can differ in their spatial resolution. For the land cover segmentation model all bands are down sampled to a spatial resolution equal to 60 meters.

```
import os
from glob import glob
import cv2
import numpy as np
import tiffio
import matplotlib.pyplot as plt
from urllib.parse import urlparse
from botocore import UNSIGNED
from botocore.config import Config

# Download land cover masks
mask_dir = "./masks/lake_mead"
os.makedirs(mask_dir, exist_ok=True)
image_paths = []
for s3_object in s3_bucket.objects.filter(Prefix=prefix).all():
    path, filename = os.path.split(s3_object.key)
    if "output" in path:
        mask_name = mask_dir + "/" + filename
        s3_bucket.download_file(s3_object.key, mask_name)
        print("Downloaded mask: " + mask_name)

# Download source images for visualization
for tci_url in tci_urls:
    url_parts = urlparse(tci_url)
    img_id = url_parts.path.split("/")[-2]
    tci_download_path = image_dir + "/" + img_id + "_TCI.tif"
    cogs_bucket = session.resource(
        "s3", config=Config(signature_version=UNSIGNED, region_name="us-west-2")
```

```

).Bucket(url_parts.hostname.split(".")[0])
cogs_bucket.download_file(url_parts.path[1:], tci_download_path)
print("Downloaded image: " + img_id)

print("Downloads complete.")

image_files = glob("images/lake_mead/*.tif")
mask_files = glob("masks/lake_mead/*.tif")
image_files.sort(key=lambda x: x.split("SQA_")[1])
mask_files.sort(key=lambda x: x.split("SQA_")[1])
overlay_dir = "./masks/lake_mead_overlay"
os.makedirs(overlay_dir, exist_ok=True)
lake_areas = []
mask_dates = []

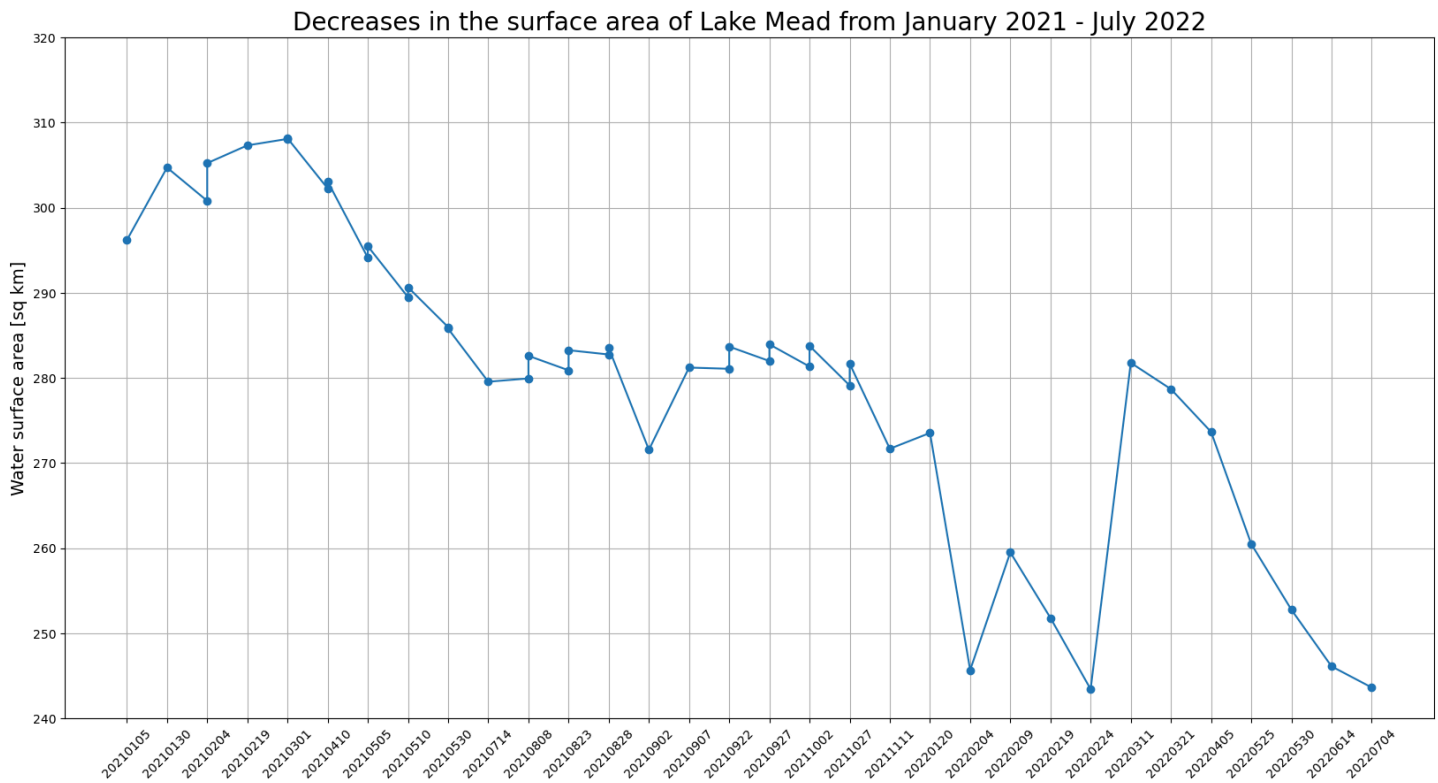

for image_file, mask_file in zip(image_files, mask_files):
    image_id = image_file.split("/")[-1].split("_TCI")[0]
    mask_id = mask_file.split("/")[-1].split(".tif")[0]
    mask_date = mask_id.split("_")[2]
    mask_dates.append(mask_date)
    assert image_id == mask_id
    image = tiffimage.imread(image_file)
    image_ds = cv2.resize(image, (1830, 1830), interpolation=cv2.INTER_LINEAR)
    mask = tiffimage.imread(mask_file)
    water_mask = np.isin(mask, [6]).astype(np.uint8) # water has a class index 6
    lake_mask = water_mask[1000:, :1100]
    lake_area = lake_mask.sum() * 60 * 60 / (1000 * 1000) # calculate the surface area
    lake_areas.append(lake_area)
    contour, _ = cv2.findContours(water_mask, cv2.RETR_TREE, cv2.CHAIN_APPROX_SIMPLE)
    combined = cv2.drawContours(image_ds, contour, -1, (255, 0, 0), 4)
    lake_crop = combined[1000:, :1100]
    cv2.putText(lake_crop, f"{mask_date}", (10,50), cv2.FONT_HERSHEY_SIMPLEX, 1.5, (0,
0, 0), 3, cv2.LINE_AA)
    cv2.putText(lake_crop, f"{lake_area} [sq km]", (10,100), cv2.FONT_HERSHEY_SIMPLEX,
1.5, (0, 0, 0), 3, cv2.LINE_AA)
    overlay_file = overlay_dir + '/' + mask_date + '.png'
    cv2.imwrite(overlay_file, cv2.cvtColor(lake_crop, cv2.COLOR_RGB2BGR))

# Plot water surface area vs. time.
plt.figure(figsize=(20,10))
plt.title('Lake Mead surface area for the 2021.02 - 2022.07 period.', fontsize=20)
plt.xticks(rotation=45)
plt.ylabel('Water surface area [sq km]', fontsize=14)
plt.plot(mask_dates, lake_areas, marker='o')

```

```
plt.grid('on')
plt.ylim(240, 320)
for i, v in enumerate(lake_areas):
    plt.text(i, v+2, "%d" %v, ha='center')
plt.show()
```

Using `matplotlib`, you can visualize the results with a graph. The graph shows that the surface area of Lake Mead decreased from January 2021–July 2022.

## Using a processing jobs for custom geospatial workloads

With [Amazon SageMaker Processing](#), you can use a simplified, managed experience on SageMaker AI to run your data processing workloads with the purpose-built geospatial container.

The underlying infrastructure for a Amazon SageMaker Processing job is fully managed by SageMaker AI. During a processing job, cluster resources are provisioned for the duration of your job, and cleaned up when a job completes.

The preceding diagram shows how SageMaker AI spins up a geospatial processing job. SageMaker AI takes your geospatial workload script, copies your geospatial data from Amazon Simple Storage Service (Amazon S3), and then pulls the specified geospatial container. The underlying infrastructure for the processing job is fully managed by SageMaker AI. Cluster resources are provisioned for the duration of your job, and cleaned up when a job completes. The output of the processing job is stored in the bucket you specified.

#### **⚠ Path naming constraints**

The local paths inside a Processing jobs container must begin with **`/opt/ml/processing/`**.

SageMaker geospatial provides a purpose-built container, `081189585635.dkr.ecr.us-west-2.amazonaws.com/sagemaker-geospatial-v1-0:latest` that can be specified when running a processing job.

#### **Topics**

- [Overview: Run processing jobs using ScriptProcessor and a SageMaker geospatial container](#)
- [Using ScriptProcessor to calculate the Normalized Difference Vegetation Index \(NDVI\) using Sentinel-2 satellite data](#)

## Overview: Run processing jobs using `ScriptProcessor` and a SageMaker geospatial container

SageMaker geospatial provides a purpose-built processing container, `081189585635.dkr.ecr.us-west-2.amazonaws.com/sagemaker-geospatial-v1-0:latest`. You can use this container when running a job with Amazon SageMaker Processing. When you create an instance of the [ScriptProcessor](#) class that is available through the *Amazon SageMaker Python SDK for Processing*, specify this `image_uri`.

### Note

If you receive a `ResourceLimitExceeded` error when attempting to start a processing job, you need to request a quota increase. To get started on a Service Quotas quota increase request, see [Requesting a quota increase](#) in the *Service Quotas User Guide*

### Prerequisites for using `ScriptProcessor`

1. You have created a Python script that specifies your geospatial ML workload.
2. You have granted the SageMaker AI execution role access to any Amazon S3 buckets that are needed.
3. Prepare your data for import into the container. Amazon SageMaker Processing jobs support either setting the `s3_data_type` equal to `"ManifestFile"` or to `"S3Prefix"`.

The following procedure show you how to create an instance of `ScriptProcessor` and submit a Amazon SageMaker Processing job using the SageMaker geospatial container.

### To create a `ScriptProcessor` instance and submit a Amazon SageMaker Processing job using a SageMaker geospatial container

1. Instantiate an instance of the `ScriptProcessor` class using the SageMaker geospatial image:

```
from sagemaker.processing import ScriptProcessor, ProcessingInput, ProcessingOutput

sm_session = sagemaker.session.Session()
execution_role_arn = sagemaker.get_execution_role()

# purpose-built geospatial container
```

```

image_uri = '081189585635.dkr.ecr.us-west-2.amazonaws.com/sagemaker-geospatial-
v1-0:latest'

script_processor = ScriptProcessor(
    command=['python3'],
    image_uri=image_uri,
    role=execution_role_arn,
    instance_count=4,
    instance_type='ml.m5.4xlarge',
    sagemaker_session=sm_session
)

```

Replace *execution\_role\_arn* with the ARN of the SageMaker AI execution role that has access to the input data stored in Amazon S3 and any other AWS services that you want to call in your processing job. You can update the `instance_count` and the `instance_type` to match the requirements of your processing job.

2. To start a processing job, use the `.run()` method:

```

# Can be replaced with any S3 compliant string for the name of the folder.
s3_folder = geospatial-data-analysis

# Use .default_bucket() to get the name of the S3 bucket associated with your current
# SageMaker session
s3_bucket = sm_session.default_bucket()

s3_manifest_uri = f's3://{s3_bucket}/{s3_folder}/manifest.json'
s3_prefix_uri = f's3://{s3_bucket}/{s3_folder}/image-prefix'

script_processor.run(
    code=preprocessing.py,
    inputs=[
        ProcessingInput(
            source=s3_manifest_uri | s3_prefix_uri ,
            destination='/opt/ml/processing/input_data/',
            s3_data_type= "ManifestFile" | "S3Prefix",
            s3_data_distribution_type= "ShardedByS3Key" | "FullyReplicated"
        )
    ],
    outputs=[
        ProcessingOutput(
            source='/opt/ml/processing/output_data/',
            destination=s3_output_prefix_url

```

```

    )
  ]
)
```

- Replace `preprocessing.py` with the name of your own Python data processing script.
- A processing job supports two methods for formatting your input data. You can either create a manifest file that points to all of the input data for your processing job, or you can use a common prefix on each individual data input. If you created a manifest file set `s3_manifest_uri` equal to "ManifestFile". If you used a file prefix set `s3_manifest_uri` equal to "S3Prefix". You specify the path to your data using `source`.
- You can distribute your processing job data two ways:
  - Distribute your data to all processing instances by setting `s3_data_distribution_type` equal to `FullyReplicated`.
  - Distribute your data in shards based on the Amazon S3 key by setting `s3_data_distribution_type` equal to `ShardedByS3Key`. When you use `ShardedByS3Key` one shard of data is sent to each processing instance.

You can use a script to process SageMaker geospatial data. That script can be found in [Step 3: Writing a script that can calculate the NDVI](#). To learn more about the `.run()` API operation, see [run](#) in the *Amazon SageMaker Python SDK for Processing*.

To monitor the progress of your processing job, the `ProcessingJobs` class supports a [describe](#) method. This method returns a response from the `DescribeProcessingJob` API call. To learn more, see [DescribeProcessingJob in the Amazon SageMaker AI API Reference](#).

The next topic show you how to create an instance of the `ScriptProcessor` class using the SageMaker geospatial container, and then how to use it to calculate the Normalized Difference Vegetation Index (NDVI) with Sentinel-2 images.

## Using `ScriptProcessor` to calculate the Normalized Difference Vegetation Index (NDVI) using Sentinel-2 satellite data

The following code samples show you how to calculate the normalized difference vegetation index of a specific geographical area using the purpose-built geospatial image within a Studio Classic notebook and run a large-scale workload with Amazon SageMaker Processing using [ScriptProcessor](#) from the SageMaker AI Python SDK.

This demo also uses an Amazon SageMaker Studio Classic notebook instance that uses the geospatial kernel and instance type. To learn how to create a Studio Classic geospatial notebook instance, see [Create an Amazon SageMaker Studio Classic notebook using the geospatial image](#).

You can follow along with this demo in your own notebook instance by copying and pasting the following code snippets:

1. [Use `search\_raster\_data\_collection` to query a specific area of interest \(AOI\) over a given a time range using a specific raster data collection, Sentinel-2.](#)
2. [Create a manifest file that specifies what data will be processed during the processing job.](#)
3. [Write a data processing Python script calculating the NDVI.](#)
4. [Create a `ScriptProcessor` instance and start the Amazon SageMaker Processing job.](#)
5. [Visualizing the results of your processing job.](#)

## Query the Sentinel-2 raster data collection using `SearchRasterDataCollection`

With `search_raster_data_collection` you can query supported raster data collections. This example uses data that's pulled from Sentinel-2 satellites. The area of interest (`AreaOfInterest`) specified is rural northern Iowa, and the time range (`TimeRangeFilter`) is January 1, 2022 to December 30, 2022. To see the available raster data collections in your AWS Region use `list_raster_data_collections`. To see a code example using this API, see [ListRasterDataCollections](#) in the *Amazon SageMaker AI Developer Guide*.

In following code examples you use the ARN associated with Sentinel-2 raster data collection, `arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/public/nmqj48dcu3g7ayw8`.

A `search_raster_data_collection` API request requires two parameters:

- You need to specify an `Arn` parameter that corresponds to the raster data collection that you want to query.
- You also need to specify a `RasterDataCollectionQuery` parameter, which takes in a Python dictionary.

The following code example contains the necessary key-value pairs needed for the `RasterDataCollectionQuery` parameter saved to the `search_rdc_query` variable.

```

search_rdc_query = {
  "AreaOfInterest": {
    "AreaOfInterestGeometry": {
      "PolygonGeometry": {
        "Coordinates": [[
          [
            -94.50938680498298,
            43.22487436936203
          ],
          [
            -94.50938680498298,
            42.843474642037194
          ],
          [
            -93.86520004156142,
            42.843474642037194
          ],
          [
            -93.86520004156142,
            43.22487436936203
          ],
          [
            -94.50938680498298,
            43.22487436936203
          ]
        ]]
      }
    }
  },
  "TimeRangeFilter": {"StartTime": "2022-01-01T00:00:00Z", "EndTime":
"2022-12-30T23:59:59Z"}
}

```

To make the `search_raster_data_collection` request, you must specify the ARN of the Sentinel-2 raster data collection: `arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/public/nmqj48dcu3g7ayw8`. You also must need to pass in the Python dictionary that was defined previously, which specifies query parameters.

```

## Creates a SageMaker Geospatial client instance
sm_geo_client= session.create_client(service_name="sagemaker-geospatial")

```

```
search_rdc_response1 = sm_geo_client.search_raster_data_collection(
    Arn='arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/
public/nmqj48dcu3g7ayw8',
    RasterDataCollectionQuery=search_rdc_query
)
```

The results of this API can not be paginated. To collect all the satellite images returned by the `search_raster_data_collection` operation, you can implement a while loop. This checks for `NextToken` in the API response:

```
## Holds the list of API responses from search_raster_data_collection
items_list = []
while search_rdc_response1.get('NextToken') and search_rdc_response1['NextToken'] !=
None:
    items_list.extend(search_rdc_response1['Items'])

    search_rdc_response1 = sm_geo_client.search_raster_data_collection(
        Arn='arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/
public/nmqj48dcu3g7ayw8',
        RasterDataCollectionQuery=search_rdc_query,
        NextToken=search_rdc_response1['NextToken']
    )
```

The API response returns a list of URLs under the `Assets` key corresponding to specific image bands. The following is a truncated version of the API response. Some of the image bands were removed for clarity.

```
{
  'Assets': {
    'aot': {
      'Href': 'https://sentinel-cogs.s3.us-west-2.amazonaws.com/sentinel-s2-l2a-
cogs/15/T/UH/2022/12/S2A_15TUH_20221230_0_L2A/A0T.tif'
    },
    'blue': {
      'Href': 'https://sentinel-cogs.s3.us-west-2.amazonaws.com/sentinel-s2-l2a-
cogs/15/T/UH/2022/12/S2A_15TUH_20221230_0_L2A/B02.tif'
    },
    'swir22-jp2': {
      'Href': 's3://sentinel-s2-l2a/tiles/15/T/UH/2022/12/30/0/B12.jp2'
    },
    'visual-jp2': {
      'Href': 's3://sentinel-s2-l2a/tiles/15/T/UH/2022/12/30/0/TCI.jp2'
    }
  }
}
```

```

    },
    'wvp-jp2': {
        'Href': 's3://sentinel-s2-l2a/tiles/15/T/UH/2022/12/30/0/WVP.jp2'
    }
},
'DateTime': datetime.datetime(2022, 12, 30, 17, 21, 52, 469000, tzinfo =
tzlocal()),
'Geometry': {
    'Coordinates': [
        [
            [-95.46676936182894, 43.32623760511659],
            [-94.11293433656887, 43.347431265475954],
            [-94.09532154452742, 42.35884880571144],
            [-95.42776890002203, 42.3383710796791],
            [-95.46676936182894, 43.32623760511659]
        ]
    ],
    'Type': 'Polygon'
},
'Id': 'S2A_15TUH_20221230_0_L2A',
'Properties': {
    'EoCloudCover': 62.384969,
    'Platform': 'sentinel-2a'
}
}

```

In the [next section](#), you create a manifest file using the 'Id' key from the API response.

### Create an input manifest file using the Id key from the search\_raster\_data\_collection API response

When you run a processing job, you must specify a data input from Amazon S3. The input data type can either be a manifest file, which then points to the individual data files. You can also add a prefix to each file that you want processed. The following code example defines the folder where your manifest files will be generated.

Use SDK for Python (Boto3) to get the default bucket and the ARN of the execution role that is associated with your Studio Classic notebook instance:

```

sm_session = sagemaker.session.Session()
s3 = boto3.resource('s3')
# Gets the default execution role associated with the notebook

```

```

execution_role_arn = sagemaker.get_execution_role()

# Gets the default bucket associated with the notebook
s3_bucket = sm_session.default_bucket()

# Can be replaced with any name
s3_folder = "script-processor-input-manifest"

```

Next, you create a manifest file. It will hold the URLs of the satellite images that you wanted processed when you run your processing job later in step 4.

```

# Format of a manifest file
manifest_prefix = {}
manifest_prefix['prefix'] = 's3://' + s3_bucket + '/' + s3_folder + '/'
manifest = [manifest_prefix]

print(manifest)

```

The following code sample returns the S3 URI where your manifest files will be created.

```
[{'prefix': 's3://sagemaker-us-west-2-111122223333/script-processor-input-manifest/'}]
```

All the response elements from the `search_raster_data_collection` response are not needed to run the processing job.

The following code snippet removes the unnecessary elements 'Properties', 'Geometry', and 'DateTime'. The 'Id' key-value pair, 'Id': 'S2A\_15TUH\_20221230\_0\_L2A', contains the year and the month. The following code example parses that data to create new keys in the Python dictionary `dict_month_items`. The values are the assets that are returned from the `SearchRasterDataCollection` query.

```

# For each response get the month and year, and then remove the metadata not related to
the satellite images.
dict_month_items = {}
for item in items_list:
    # Example ID being split: 'S2A_15TUH_20221230_0_L2A'
    yyyyymm = item['Id'].split("_")[2][:6]
    if yyyyymm not in dict_month_items:
        dict_month_items[yyyyymm] = []

```

```

# Removes unneeded metadata elements for this demo
item.pop('Properties', None)
item.pop('Geometry', None)
item.pop('DateTime', None)

# Appends the response from search_raster_data_collection to newly created key
above
dict_month_items[yyyymm].append(item)

```

This code example uploads the `dict_month_items` to Amazon S3 as a JSON object using the [.upload\\_file\(\)](#) API operation:

```

## key_ is the yyyymm timestamp formatted above
## value_ is the reference to all the satellite images collected via our searchRDC
query
for key_, value_ in dict_month_items.items():
    filename = f'manifest_{key_}.json'
    with open(filename, 'w') as fp:
        json.dump(value_, fp)
    s3.meta.client.upload_file(filename, s3_bucket, s3_folder + '/' + filename)
    manifest.append(filename)
    os.remove(filename)

```

This code example uploads a parent manifest .json file that points to all the other manifests uploaded to Amazon S3. It also saves the path to a local variable: `s3_manifest_uri`. You'll use that variable again to specify the source of the input data when you run the processing job in step 4.

```

with open('manifest.json', 'w') as fp:
    json.dump(manifest, fp)
s3.meta.client.upload_file('manifest.json', s3_bucket, s3_folder + '/' +
    'manifest.json')
os.remove('manifest.json')

s3_manifest_uri = f's3://{s3_bucket}/{s3_folder}/manifest.json'

```

Now that you created the input manifest files and uploaded them, you can write a script that processes your data in the processing job. It processes the data from the satellite images, calculates the NDVI, and then returns the results to a different Amazon S3 location.

## Write a script that calculates the NDVI

Amazon SageMaker Studio Classic supports the use of the `%%writefile` cell magic command. After running a cell with this command, its contents will be saved to your local Studio Classic directory. This is code specific to calculating NDVI. However, the following can be useful when you write your own script for a processing job:

- In your processing job container, the local paths inside the container must begin with `/opt/ml/processing/`. In this example, `input_data_path = '/opt/ml/processing/input_data/'` and `processed_data_path = '/opt/ml/processing/output_data/'` are specified in that way.
- With Amazon SageMaker Processing, a script that a processing job runs can upload your processed data directly to Amazon S3. To do so, make sure that the execution role associated with your `ScriptProcessor` instance has the necessary requirements to access the S3 bucket. You can also specify an `outputs` parameter when you run your processing job. To learn more, see the [.run\(\) API operation](#) in the *Amazon SageMaker Python SDK*. In this code example, the results of the data processing are uploaded directly to Amazon S3.
- To manage the size of the Amazon EBS container attached to your processing job use the `volume_size_in_gb` parameter. The containers's default size is 30 GB. You can also optionally use the Python library [Garbage Collector](#) to manage storage in your Amazon EBS container.

The following code example loads the arrays into the processing job container. When arrays build up and fill in the memory, the processing job crashes. To prevent this crash, the following example contains commands that remove the arrays from the processing job's container.

```
%%writefile compute_ndvi.py

import os
import pickle
import sys
import subprocess
import json
import rioxarray

if __name__ == "__main__":
    print("Starting processing")

    input_data_path = '/opt/ml/processing/input_data/'
    input_files = []
```

```

for current_path, sub_dirs, files in os.walk(input_data_path):
    for file in files:
        if file.endswith(".json"):
            input_files.append(os.path.join(current_path, file))

print("Received {} input_files: {}".format(len(input_files), input_files))

items = []
for input_file in input_files:
    full_file_path = os.path.join(input_data_path, input_file)
    print(full_file_path)
    with open(full_file_path, 'r') as f:
        items.append(json.load(f))

items = [item for sub_items in items for item in sub_items]

for item in items:
    red_uri = item["Assets"]["red"]["Href"]
    nir_uri = item["Assets"]["nir"]["Href"]

    red = rioarray.open_rasterio(red_uri, masked=True)
    nir = rioarray.open_rasterio(nir_uri, masked=True)

    ndvi = (nir - red) / (nir + red)

    file_name = 'ndvi_' + item["Id"] + '.tif'
    output_path = '/opt/ml/processing/output_data'
    output_file_path = f"{output_path}/{file_name}"

    ndvi.rio.to_raster(output_file_path)
    print("Written output:", output_file_path)

```

You now have a script that can calculate the NDVI. Next, you can create an instance of the `ScriptProcessor` and run your Processing job.

### Creating an instance of the `ScriptProcessor` class

This demo uses the [ScriptProcessor](#) class that is available via the Amazon SageMaker Python SDK. First, you need to create an instance of the class, and then you can start your Processing job by using the `.run()` method.

```

from sagemaker.processing import ScriptProcessor, ProcessingInput, ProcessingOutput

```

```
image_uri = '081189585635.dkr.ecr.us-west-2.amazonaws.com/sagemaker-geospatial-  
v1-0:latest'  
  
processor = ScriptProcessor(  
    command=['python3'],  
    image_uri=image_uri,  
    role=execution_role_arn,  
    instance_count=4,  
    instance_type='ml.m5.4xlarge',  
    sagemaker_session=sm_session  
)  
  
print('Starting processing job.')
```

When you start your Processing job, you need to specify a [ProcessingInput](#) object. In that object, you specify the following:

- The path to the manifest file that you created in step 2, **s3\_manifest\_uri**. This is the source of the input data to the container.
- The path to where you want the input data to be saved in the container. This must match the path that you specified in your script.
- Use the **s3\_data\_type** parameter to specify the input as "ManifestFile".

```
s3_output_prefix_url = f"s3://{s3_bucket}/{s3_folder}/output"  
  
processor.run(  
    code='compute_ndvi.py',  
    inputs=[  
        ProcessingInput(  
            source=s3_manifest_uri,  
            destination='/opt/ml/processing/input_data/',  
            s3_data_type="ManifestFile",  
            s3_data_distribution_type="ShardedByS3Key"  
        ),  
    ],  
    outputs=[  
        ProcessingOutput(  
            source='/opt/ml/processing/output_data/',  
            destination=s3_output_prefix_url,  
            s3_upload_mode="Continuous"  
        )  
    ]  
)
```

```

    )
  ]
)

```

The following code example uses the [.describe\(\) method](#) to get details of your Processing job.

```

preprocessing_job_descriptor = processor.jobs[-1].describe()
s3_output_uri = preprocessing_job_descriptor["ProcessingOutputConfig"]["Outputs"][0]
["S3Output"]["S3Uri"]
print(s3_output_uri)

```

## Visualizing your results using matplotlib

With the [Matplotlib](#) Python library, you can plot raster data. Before you plot the data, you need to calculate the NDVI using sample images from the Sentinel-2 satellites. The following code example opens the image arrays using the `.open_rasterio()` API operation, and then calculates the NDVI using the `nir` and `red` image bands from the Sentinel-2 satellite data.

```

# Opens the python arrays
import rioarray

red_uri = items[25]["Assets"]["red"]["Href"]
nir_uri = items[25]["Assets"]["nir"]["Href"]

red = rioarray.open_rasterio(red_uri, masked=True)
nir = rioarray.open_rasterio(nir_uri, masked=True)

# Calculates the NDVI
ndvi = (nir - red) / (nir + red)

# Common plotting library in Python
import matplotlib.pyplot as plt

f, ax = plt.subplots(figsize=(18, 18))
ndvi.plot(cmap='viridis', ax=ax)
ax.set_title("NDVI for {}".format(items[25]["Id"]))
ax.set_axis_off()
plt.show()

```

The output of the preceding code example is a satellite image with the NDVI values overlaid on it. An NDVI value near 1 indicates lots of vegetation is present, and values near 0 indicate no vegetation is present.

NDVI for S2B\_11TNJ\_20220615\_0\_L2A

This completes the demo of using ScriptProcessor.

## Earth Observation Jobs

Using an Earth Observation job (EOJ), you can acquire, transform, and visualize geospatial data to make predictions. You can choose an operation based on your use case from a wide range of operations and models. You get the flexibility of choosing your area of interest, selecting the data providers, and setting time-range based and cloud-cover-percentage-based filters. After SageMaker AI creates an EOJ for you, you can visualize the inputs and outputs of the job using the visualization functionality. An EOJ has various use cases that include comparing deforestation over time and diagnosing plant health. You can create an EOJ by using a SageMaker notebook with a SageMaker geospatial image. You can also access the SageMaker geospatial UI as a part of Amazon SageMaker Studio Classic UI to view the list of all your jobs. You can also use the UI to pause or stop an ongoing job. You can choose a job from the list of available EOJ to view the **Job summary**, the **Job details** as well as visualize the **Job output**.

### Topics

- [Create an Earth Observation Job Using a Amazon SageMaker Studio Classic Notebook with a SageMaker geospatial Image](#)
- [Types of Operations](#)

## Create an Earth Observation Job Using a Amazon SageMaker Studio Classic Notebook with a SageMaker geospatial Image

To use a SageMaker Studio Classic notebook with a SageMaker geospatial image:

1. From the **Launcher**, choose **Change environment** under **Notebooks and compute resources**.
2. Next, the **Change environment** dialog opens.
3. Select the **Image** dropdown and choose **Geospatial 1.0**. The **Instance type** should be **ml.geospatial.interactive**. Do not change the default values for other settings.
4. Choose **Select**.
5. Choose **Create notebook**.

You can initiate an EOJ using a Amazon SageMaker Studio Classic notebook with a SageMaker geospatial image using the code provided below.

```
import boto3
import sagemaker
```

```
import sagemaker_geospatial_map

session = boto3.Session()
execution_role = sagemaker.get_execution_role()
sg_client = session.client(service_name="sagemaker-geospatial")
```

The following is an example showing how to create an EOJ in the in the US West (Oregon) Region.

```
#Query and Access Data
search_rdc_args = {
    "Arn": "arn:aws:sagemaker-geospatial:us-west-2:378778860802:raster-data-collection/
public/nmqj48dcu3g7ayw8", # sentinel-2 L2A COG
    "RasterDataCollectionQuery": {
        "AreaOfInterest": {
            "AreaOfInterestGeometry": {
                "PolygonGeometry": {
                    "Coordinates": [
                        [
                            [-114.529, 36.142],
                            [-114.373, 36.142],
                            [-114.373, 36.411],
                            [-114.529, 36.411],
                            [-114.529, 36.142],
                        ]
                    ]
                }
            }
        },
        "TimeRangeFilter": {
            "StartTime": "2021-01-01T00:00:00Z",
            "EndTime": "2022-07-10T23:59:59Z",
        },
        "PropertyFilters": {
            "Properties": [{"Property": {"EoCloudCover": {"LowerBound": 0,
"UpperBound": 1}}}],
            "LogicalOperator": "AND",
        },
        "BandFilter": ["visual"],
    },
}

tci_urls = []
data_manifests = []
```

```

while search_rdc_args.get("NextToken", True):
    search_result = sg_client.search_raster_data_collection(**search_rdc_args)
    if search_result.get("NextToken"):
        data_manifests.append(search_result)
    for item in search_result["Items"]:
        tci_url = item["Assets"]["visual"]["Href"]
        print(tci_url)
        tci_urls.append(tci_url)

    search_rdc_args["NextToken"] = search_result.get("NextToken")

# Perform land cover segmentation on images returned from the sentinel dataset.
eoj_input_config = {
    "RasterDataCollectionQuery": {
        "RasterDataCollectionArn": "arn:aws:sagemaker-geospatial:us-
west-2:378778860802:raster-data-collection/public/nmqj48dcu3g7ayw8",
        "AreaOfInterest": {
            "AreaOfInterestGeometry": {
                "PolygonGeometry": {
                    "Coordinates": [
                        [
                            [-114.529, 36.142],
                            [-114.373, 36.142],
                            [-114.373, 36.411],
                            [-114.529, 36.411],
                            [-114.529, 36.142],
                        ]
                    ]
                }
            }
        },
        "TimeRangeFilter": {
            "StartTime": "2021-01-01T00:00:00Z",
            "EndTime": "2022-07-10T23:59:59Z",
        },
        "PropertyFilters": {
            "Properties": [{"Property": {"EoCloudCover": {"LowerBound": 0,
"UpperBound": 1}}}],
            "LogicalOperator": "AND",
        },
    }
}
eoj_config = {"LandCoverSegmentationConfig": {}}

```

```
response = sg_client.start_earth_observation_job(
    Name="lake-mead-landcover",
    InputConfig=eoj_input_config,
    JobConfig=eoj_config,
    ExecutionRoleArn=execution_role,
)
```

After your EOJ is created, the Arn is returned to you. You use the Arn to identify a job and perform further operations. To get the status of a job, you can run `sg_client.get_earth_observation_job(Arn = response['Arn'])`.

The following example shows how to query the status of an EOJ until it is completed.

```
eojob_arn = response["Arn"]
job_details = sg_client.get_earth_observation_job(Arn=eojob_arn)
{k: v for k, v in job_details.items() if k in ["Arn", "Status", "DurationInSeconds"]}
# List all jobs in the account
sg_client.list_earth_observation_jobs()["EarthObservationJobSummaries"]
```

After the EOJ is completed, you can visualize the EOJ outputs directly in the notebook. The following example shows you how an interactive map can be rendered.

```
map = sagemaker_geospatial_map.create_map({
    'is_raster': True
})
map.set_sagemaker_geospatial_client(sg_client)
# render the map
map.render()
```

The following example shows how the map can be centered on an area of interest and the input and output of the EOJ can be rendered as separate layers within the map.

```
# visualize the area of interest
config = {"label": "Lake Mead AOI"}
aoi_layer = map.visualize_eoj_aoi(Arn=eojob_arn, config=config)

# Visualize input.
time_range_filter = {
    "start_date": "2022-07-01T00:00:00Z",
    "end_date": "2022-07-10T23:59:59Z",
}
```

```

config = {"label": "Input"}

input_layer = map.visualize_eoj_input(
    Arn=eoj_arn, config=config, time_range_filter=time_range_filter
)
# Visualize output, EOJ needs to be in completed status.
time_range_filter = {
    "start_date": "2022-07-01T00:00:00Z",
    "end_date": "2022-07-10T23:59:59Z",
}
config = {"preset": "singleBand", "band_name": "mask"}
output_layer = map.visualize_eoj_output(
    Arn=eoj_arn, config=config, time_range_filter=time_range_filter
)

```

You can use the `export_earth_observation_job` function to export the EOJ results to your Amazon S3 bucket. The export function makes it convenient to share results across teams. SageMaker AI also simplifies dataset management. We can simply share the EOJ results using the job ARN, instead of crawling thousands of files in the S3 bucket. Each EOJ becomes an asset in the data catalog, as results can be grouped by the job ARN. The following example shows how you can export the results of an EOJ.

```

sagemaker_session = sagemaker.Session()
s3_bucket_name = sagemaker_session.default_bucket() # Replace with your own bucket if
needed
s3_bucket = session.resource("s3").Bucket(s3_bucket_name)
prefix = "eoj_lakemead" # Replace with the S3 prefix desired
export_bucket_and_key = f"s3://{s3_bucket_name}/{prefix}/"

eoj_output_config = {"S3Data": {"S3Uri": export_bucket_and_key}}
export_response = sg_client.export_earth_observation_job(
    Arn=eoj_arn,
    ExecutionRoleArn=execution_role,
    OutputConfig=eoj_output_config,
    ExportSourceImages=False,
)

```

You can monitor the status of your export job using the following snippet.

```

# Monitor the export job status
export_job_details = sg_client.get_earth_observation_job(Arn=export_response["Arn"])

```

```
{k: v for k, v in export_job_details.items() if k in ["Arn", "Status",  
"DurationInSeconds"]}
```

You are not charged the storage fees after you delete the EOJ.

For an example that showcases how to run an EOJ, see this [blog post](#).

For more example notebooks on SageMaker geospatial capabilities, see this [GitHub repository](#).

## Types of Operations

When you create an EOJ, you select an operation based on your use case. Amazon SageMaker geospatial capabilities provide a combination of purpose-built operations and pre-trained models. You can use these operations to understand the impact of environmental changes and human activities over time or identify cloud and cloud-free pixels.

### Cloud Masking

Identify clouds in satellite images is an essential pre-processing step in producing high-quality geospatial data. Ignoring cloud pixels can lead to errors in analysis, and over-detection of cloud pixels can decrease the number of valid observations. Cloud masking has the ability to identify cloudy and cloud-free pixels in satellite images. An accurate cloud mask helps get satellite images for processing and improves data generation. The following is the class map for cloud masking.

```
{  
  0: "No_cloud",  
  1: "cloud"  
}
```

### Cloud Removal

Cloud removal for Sentinel-2 data uses an ML-based semantic segmentation model to identify clouds in the image. Cloudy pixels can be replaced by with pixels from other timestamps. USGS Landsat data contains landsat metadata that is used for cloud removal.

### Temporal Statistics

Temporal statistics calculate statistics for geospatial data through time. The temporal statistics currently supported include mean, median, and standard deviation. You can calculate these

statistics by using `GROUPBY` and set it to either `all` or `yearly`. You can also mention the `TargetBands`.

## Zonal Statistics

Zonal statistics performs statistical operations over a specified area on the image.

## Resampling

Resampling is used to upscale and downscale the resolution of a geospatial image. The `value` attribute in resampling represents the length of a side of the pixel.

## Geomosaic

Geomosaic allows you to stitch smaller images into a large image.

## Band Stacking

Band stacking takes more than one image band as input and stacks them into a single GeoTIFF. The `OutputResolution` attribute determines the resolution of the output image. Based on the resolutions of the input images, you can set it to `lowest`, `highest` or `average`.

## Band Math

Band Math, also known as Spectral Index, is a process of transforming the observations from multiple spectral bands to a single band, indicating the relative abundance of features of interests. For instance, Normalized Difference Vegetation Index (NDVI) and Enhanced Vegetation Index (EVI) are helpful for observing the presence of green vegetation features.

## Land Cover Segmentation

Land Cover segmentation is a semantic segmentation model that has the capability to identify the physical material, such as vegetation, water, and bare ground, at the earth surface. Having an accurate way to map the land cover patterns helps you understand the impact of environmental change and human activities over time. Land Cover segmentation is often used for region planning, disaster response, ecological management, and environmental impact assessment. The following is the class map for Land Cover segmentation.

```
{
  0: "No_data",
  1: "Saturated_or_defective",
```

```

2: "Dark_area_pixels",
3: "Cloud_shadows",
4: "Vegetation",
5: "Not_vegetated",
6: "Water",
7: "Unclassified",
8: "Cloud_medium_probability",
9: "Cloud_high_probability",
10: "Thin_cirrus",
11: "Snow_ice"
}

```

## Availability of EOJ Operations

The availability of operations depends on whether you are using the SageMaker geospatial UI or the Amazon SageMaker Studio Classic notebooks with a SageMaker geospatial image. Currently, notebooks support all functionalities. To summarize, the following geospatial operations are supported by SageMaker AI:

Operations	Description	Availability
Cloud Masking	Identify cloud and cloud-free pixels to get improved and accurate satellite imagery.	UI, Notebook
Cloud Removal	Remove pixels containing parts of a cloud from satellite imagery.	Notebook
Temporal Statistics	Calculate statistics through time for a given GeoTIFF.	Notebook
Zonal Statistics	Calculate statistics on user-defined regions.	Notebook
Resampling	Scale images to different resolutions.	Notebook
Geomosaic	Combine multiple images for greater fidelity.	Notebook

Operations	Description	Availability
Band Stacking	Combine multiple spectral bands to create a single image.	Notebook
Band Math / Spectral Index	Obtain a combination of spectral bands that indicate the abundance of features of interest.	UI, Notebook
Land Cover Segmentation	Identify land cover types such as vegetation and water in satellite imagery.	UI, Notebook

## Vector Enrichment Jobs

A Vector Enrichment Job (VEJ) performs operations on your vector data. Currently, you can use a VEJ to do reverse geocoding or map matching.

### Reverse Geocoding

With a reverse geocoding VEJ, you can convert geographic coordinates (latitude, longitude) to human-readable addresses powered by Amazon Location Service. When you upload a CSV file containing the longitude and latitude coordinates, it returns the address number, country, label, municipality, neighborhood, postal code and region of that location. The output file consists of your input data along with columns containing these values appended at the end. These jobs are optimized to accept tens of thousands of GPS traces.

### Map Matching

Map matching allows you to snap GPS coordinates to road segments. The input should be a CSV file containing the trace ID (route), longitude, latitude and the timestamp attributes. There can be multiple GPS co-ordinates per route. The input can contain multiple routes too. The output is a GeoJSON file that contains links of the predicted route. It also has the snap points provided in the input. These jobs are optimized to accept tens of thousands of drives in one request. Map matching is supported by [OpenStreetMap](#). Map matching fails if the names in the input source field don't match the ones in `MapMatchingConfig`. The error message you receive contains

the the field names present in the input file and the expected field name that is not found in `MapMatchingConfig`.

The input CSV file for a VEJ must contain the following:

- A header row
- Latitude and longitude in separate columns
- The ID and Timestamp columns can be in numeric or string format. All other column data must be in numeric format only
- No miss matching quotes

For the timestamp column, SageMaker geospatial capabilities supports epoch time in seconds and milliseconds (long integer). The string formats supported are as follows:

- "dd.MM.yyyy HH:mm:ss z"
- "yyyy-MM-dd'T'HH:mm:ss.SSS'Z'"
- "yyyy-MM-dd'T'HH:mm:ss"
- "yyyy-MM-dd hh:mm:ss a"
- "yyyy-MM-dd HH:mm:ss"
- "yyyyMMddHHmmss"

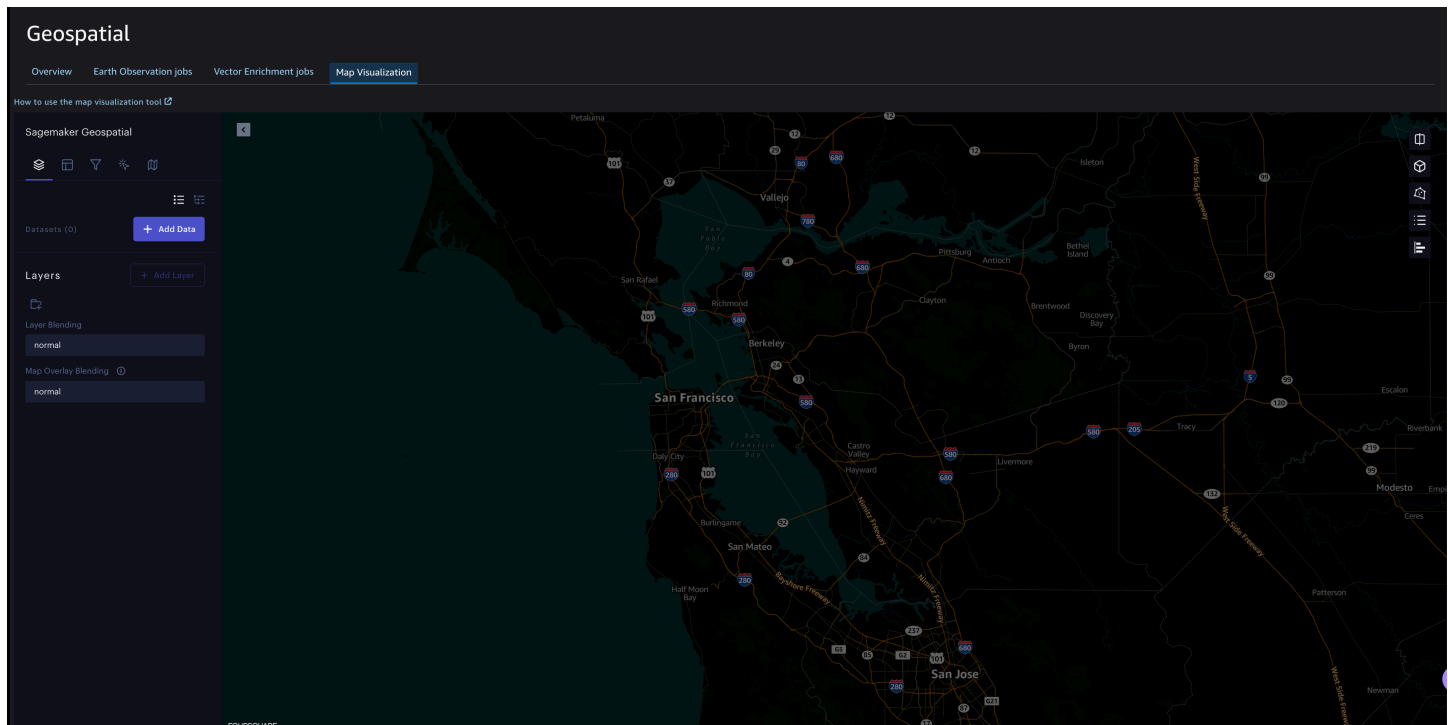

While you need to use an Amazon SageMaker Studio Classic notebook to execute a VEJ, you can view all the jobs you create using the UI. To use the visualization in the notebook, you first need to export your output to your S3 bucket. The VEJ actions you can perform are as follows.

- [StartVectorEnrichmentJob](#)
- [GetVectorEnrichmentJob](#)
- [ListVectorEnrichmentJobs](#)
- [StopVectorEnrichmentJob](#)
- [DeleteVectorEnrichmentJob](#)

## Visualization Using SageMaker geospatial capabilities

Using the visualization functionalities provided by Amazon SageMaker geospatial you can visualize geospatial data, the inputs to your EOJ or VEJ jobs as well as the outputs exported from your

Amazon S3 bucket. The visualization tool is powered by [Foursquare Studio](#). The following image depicts the visualization tool supported by SageMaker geospatial capabilities.

You can use the left navigation panel to add data, layers, filters, and columns. You can also make modifications to how you interact with the map.

## Dataset

The source of data used for visualization is called a **Dataset**. To add data for visualization, choose **Add Data** in the left navigation panel. You can either upload the data from your Amazon S3 bucket or your local machine. The data formats supported are CSV, JSON and GeoJSON. You can add multiple datasets to your map. After you upload the dataset, you can see it loaded on the map screen.

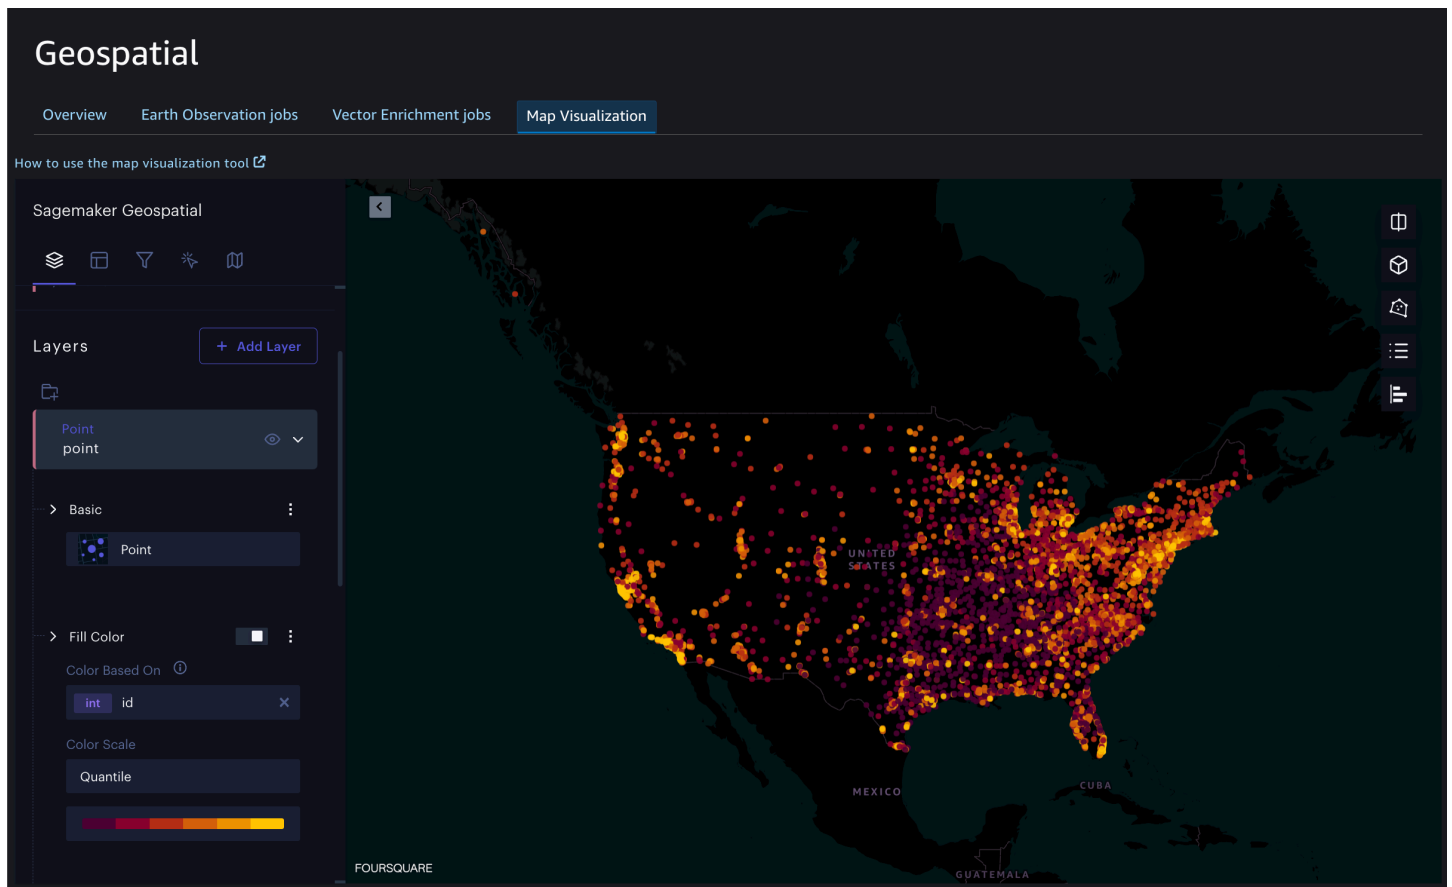

## Layers

In the layer panel, a layer is created and populated automatically when you add a dataset. If your map consists of more than one dataset, you can select which dataset belongs to a layer. You can create new layers and group them. SageMaker SageMaker geospatial capabilities support various layer types, including point, arc, icon, and polygon.

You can choose any data point in a layer to have an **Outline**. You can also further customize the data points. For example, you can choose the layer type as **Point** and then **Fill Color** based on any column of your dataset. You can also change the radius of the points.

The following image shows the layers panel supported by SageMaker geospatial capabilities.

## Columns

You can view the columns present in your dataset by using the **Columns** tab in the left navigation panel.

## Filters

You can use filters to limit the data points that display on the map.

## Interactions

In the **Interactions** panel, you can customize how you interact with the map. For example, you can choose what metrics to display when you hover the tooltip over a data point.

## Base map

Currently, SageMaker AI only supports the Amazon Dark base map.

## Split Map Modes

You can have a **Single Map**, **Dual Maps** or **Swipe Maps**. With **Dual Maps**, you can compare the same map side-by-side using different layers. Use **Swipe Maps** to overlay two maps on each other and use the sliding separator to compare them. You can choose the split map mode by choosing the **Split Mode** button on the top right corner of your map.

## Legends for EOJ in the SageMaker geospatial UI

The output visualization of an EOJ depends on the operation you choose to create it. The legend is based on the default color scale. You can view the legend by choosing the **Show legend** button on the top right corner of your map.

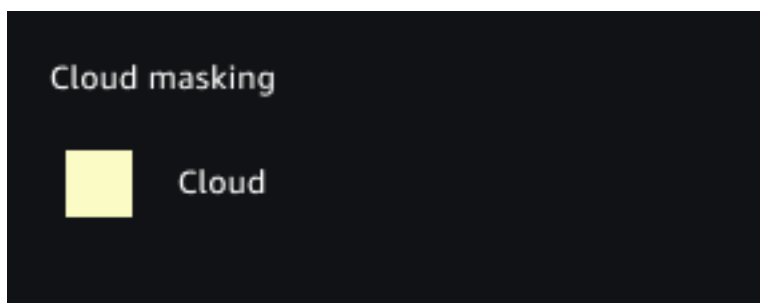

### Spectral Index

When you visualize the output for an EOJ that uses the spectral index operation, you can map the category based on the color from the legend as shown.

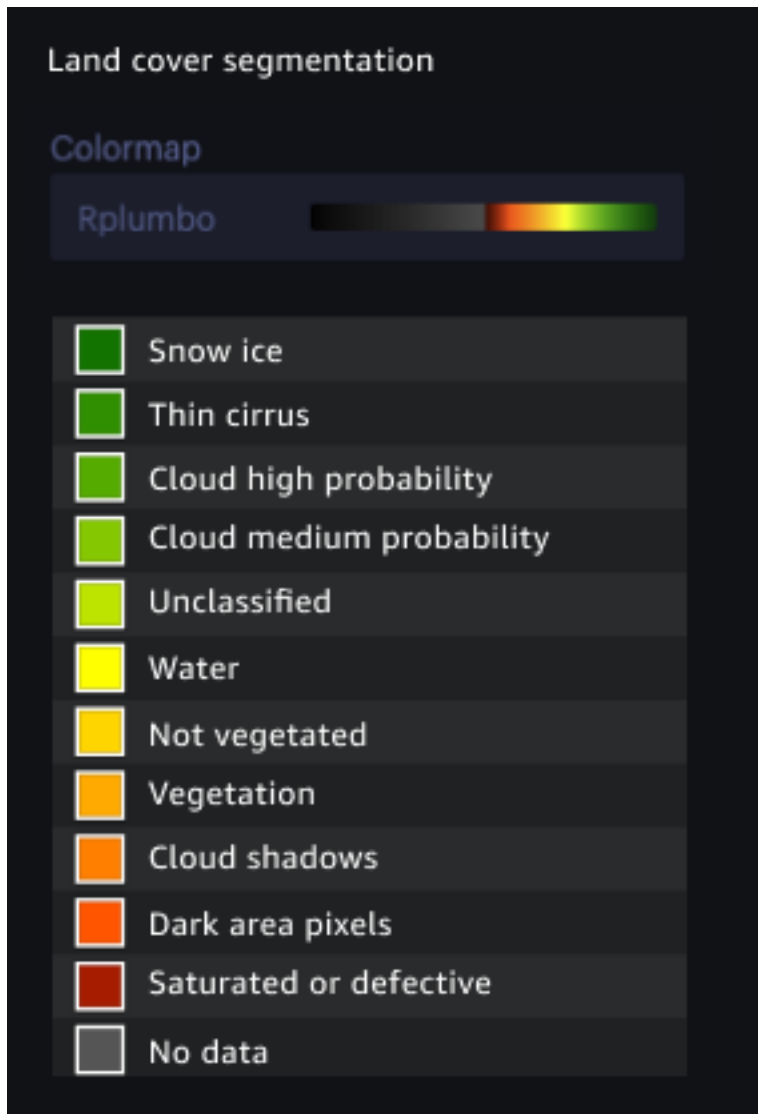

### Cloud Masking

When you visualize the output for an EOJ that uses the cloud masking operation, you can map the category based on the color from the legend as shown.

## Land Cover Segmentation

When you visualize the output for an EOJ that uses the Land Cover Segmentation operation, you can map the category based on the color from the legend as shown.

## Amazon SageMaker geospatial Map SDK

You can use Amazon SageMaker geospatial capabilities to visualize maps within the SageMaker geospatial UI as well as SageMaker notebooks with a geospatial image. These visualizations are supported by the map visualization library called [Foursquare Studio](#)

You can use the APIs provided by the SageMaker geospatial map SDK to visualize your geospatial data, including the input, output, and AoI for EOJ.

### Topics

## add\_dataset API

Adds a raster or vector dataset object to the map.

### Request syntax

```
Request =
    add_dataset(
        self,
        dataset: Union[Dataset, Dict, None] = None,
        *,
        auto_create_layers: bool = True,
        center_map: bool = True,
        **kwargs: Any,
    ) -> Optional[Dataset]
```

### Request parameters

The request accepts the following parameters.

#### Positional arguments

Argument	Type	Description
dataset	Union[Dataset, Dict, None]	Data used to create a dataset, in CSV, JSON, or GeoJSON format (for local datasets) or a UUID string.

## Keyword arguments

Argument	Type	Description
<code>auto_create_layers</code>	Boolean	Whether to attempt to create new layers when adding a dataset. Default value is <code>False</code> .
<code>center_map</code>	Boolean	Whether to center the map on the created dataset. Default value is <code>True</code> .
<code>id</code>	String	Unique identifier of the dataset. If you do not provide it, a random ID is generated.
<code>label</code>	String	Dataset label which is displayed.
<code>color</code>	Tuple[float, float, float]	Color label of the dataset.
<code>metadata</code>	Dictionary	Object containing tileset metadata (for tiled datasets).

## Response

This API returns the [Dataset](#) object that was added to the map.

## update\_dataset API

Updates an existing dataset's settings.

## Request syntax

```
Request =
    update_dataset(
        self,
        dataset_id: str,
        values: Union[_DatasetUpdateProps, dict, None] = None,
```

```

    **kwargs: Any,
) -> Dataset

```

## Request parameters

The request accepts the following parameters.

### Positional arguments

Argument	Type	Description
dataset_id	String	The identifier of the dataset to be updated.
values	Union[ <a href="#">_DatasetUpdateProps</a> , dict, None]	The values to update.

### Keyword arguments

Argument	Type	Description
label	String	Dataset label which is displayed.
color	<a href="#">RGBColor</a>	Color label of the dataset.

## Response

This API returns the updated dataset object for interactive maps, or None for non-interactive HTML environments.

## add\_layer API

Adds a new layer to the map. This function requires at least one valid layer configuration.

## Request syntax

```
Request =
```

```
add_layer(  
    self,  
    layer: Union[LayerCreationProps, dict, None] = None,  
    **kwargs: Any  
) -> Layer
```

## Request parameters

The request accepts the following parameters.

### Arguments

Argument	Type	Description
layer	Union[ <a href="#">LayerCreationProps</a> , dict, None]	A set of properties used to create a layer.

## Response

The layer object that was added to the map.

## update\_layer API

Update an existing layer with given values.

### Request syntax

```
Request =  
    update_layer(  
        self,  
        layer_id: str,  
        values: Union[LayerUpdateProps, dict, None],  
        **kwargs: Any  
    ) -> Layer
```

## Request parameters

The request accepts the following parameters.

### Arguments

Positional argument	Type	Description
layer_id	String	The ID of the layer to be updated.
values	Union[ <a href="#">LayerUpdateProps</a> , dict, None]	The values to update.

### Keyword arguments

Argument	Type	Description
type	<a href="#">LayerType</a>	The type of layer.
data_id	String	Unique identifier of the dataset this layer visualizes.
fields	Dict [string, Optional[string]]	Dictionary that maps fields that the layer requires for visualization to appropriate dataset fields.
label	String	Canonical label of this layer.
is_visible	Boolean	Whether the layer is visible or not.
config	<a href="#">LayerConfig</a>	Layer configuration specific to its type.

### Response

Returns the updated layer object.

### visualize\_eoj\_aoi API

Visualize the AoI of the given job ARN.

## Request parameters

The request accepts the following parameters.

### Arguments

Argument	Type	Description
Arn	String	The ARN of the job.
config	Dictionary config = { label: <string> custom label of the added AoI layer, default AoI }	An option to pass layer properties.

## Response

Reference of the added input layer object.

## visualize\_eoj\_input API

Visualize the input of the given EOJ ARN.

## Request parameters

The request accepts the following parameters.

### Arguments

Argument	Type	Description
Arn	String	The ARN of the job.
time_range_filter	Dictionary time_range_filter = { start_date: <string> date in ISO format	An option to provide the start and end time. Defaults to the raster data collection search start and end date.

Argument	Type	Description
	<pre>end_date: &lt;string&gt; date in ISO format  }</pre>	
config	Dictionary  <pre>config = { label: &lt;string&gt; custom label of the added output layer, default Input }</pre>	An option to pass layer properties.

## Response

Reference of the added input layer object.

## visualize\_eoj\_output API

Visualize the output of the given EOJ ARN.

## Request parameters

The request accepts the following parameters.

## Arguments

Argument	Type	Description
Arn	String	The ARN of the job.
time_range_filter	Dictionary  <pre>time_range_filter = { start_date: &lt;string&gt; date in ISO format  end_date: &lt;string&gt; date in ISO format</pre>	An option to provide the start and end time. Defaults to the raster data collection search start and end date.

Argument	Type	Description
	}	
config	Dictionary  config = {  label: <string> custom label of the added output layer, default Output  preset: <string> singleBand or trueColor,  band_name: <string>, only required for 'singleBand' preset. Allowed bands for a EOJ  }	An option to pass layer properties.

## Response

Reference of the added output Layer object.

To learn more about visualizing your geospatial data, refer to [Visualization Using Amazon SageMaker geospatial](#).

## SageMaker geospatial capabilities FAQ

Use the following FAQ items to find answers to commonly asked questions about SageMaker geospatial capabilities.

### 1. What regions are Amazon SageMaker geospatial capabilities available in?

Currently, SageMaker geospatial capabilities are only supported in the US West (Oregon) Region. To view SageMaker geospatial, choose the name of the currently displayed Region in the navigation bar of the console. Then choose the US West (Oregon) Region.

## 2. What AWS Identity and Access Management permissions and policies are required to use SageMaker geospatial?

To use SageMaker geospatial you need a user, group, or role that can access SageMaker AI. You also need to create a SageMaker AI execution role so that SageMaker geospatial can perform operations on your behalf. To learn more, see [SageMaker geospatial capabilities roles](#).

## 3. I have an existing SageMaker AI execution role. Do I need to update it?

Yes. To use SageMaker geospatial you must specify an additional service principal in your IAM trust policy: `sagemaker-geospatial.amazonaws.com`. To learn about specifying a service principal in a trust relationship, see [Adding the SageMaker geospatial service principal to an existing SageMaker AI execution role](#) in the *Amazon SageMaker AI Developer Guide*.

## 4. Can I use SageMaker geospatial capabilities through my VPC environment?

Yes, you can use SageMaker geospatial through a VPN. To learn more, see [Use Amazon SageMaker geospatial capabilities in Your Amazon Virtual Private Cloud](#).

## 5. Why can't I see the SageMaker geospatial map visualizer, image or instance type when I navigate to Amazon SageMaker Studio Classic?

Verify that you are launching Amazon SageMaker Studio Classic in the US West (Oregon) Region and that you are not using a shared space.

## 6. Why can't I see the SageMaker geospatial image or instance type when I try to create a notebook instance in Studio Classic?

Verify that you are launching Amazon SageMaker Studio Classic in the US West (Oregon) Region and that you are not using a shared space. To learn more, see [Create an Amazon SageMaker Studio Classic notebook using the geospatial image](#).

## 7. What bands supported for various raster data collections?

Use the `GetRasterDataCollection` API response and refer to the `ImageSourceBands` field to find the bands supported for that particular data collection.

# SageMaker geospatial Security and Permissions

Use the topics on this page to learn about SageMaker geospatial capabilities security features. Additionally, learn how to use SageMaker geospatial capabilities in an Amazon Virtual Private Cloud as well as protect your data at rest using encryption.

For more information about IAM users and roles, see [Identities \(Users, Groups, and Roles\)](#) in the IAM User Guide.

To learn more about using IAM with SageMaker AI, see [AWS Identity and Access Management for Amazon SageMaker AI](#).

## Topics

- [Configuration and Vulnerability Analysis in SageMaker geospatial](#)
- [Security Best Practices for SageMaker geospatial capabilities](#)
- [Use Amazon SageMaker geospatial capabilities in Your Amazon Virtual Private Cloud](#)
- [Use AWS KMS Permissions for Amazon SageMaker geospatial capabilities](#)

## Configuration and Vulnerability Analysis in SageMaker geospatial

Configuration and IT controls are a shared responsibility between AWS and you, our customer. AWS handles basic security tasks like guest operating system (OS) and database patching, firewall configuration, and disaster recovery. These procedures have been reviewed and certified by the appropriate third parties. For more details, see the following resources:

- [Shared Responsibility Model](#).
- [Amazon Web Services: Overview of Security Processes](#).

## Security Best Practices for SageMaker geospatial capabilities

Amazon SageMaker geospatial capabilities provide a number of security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don't represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

### Apply principle of least privilege

Amazon SageMaker geospatial capabilities provide granular access policy for applications using IAM roles. We recommend that the roles be granted only the minimum set of privileges required by the job. We also recommend auditing the jobs for permissions on a regular basis and upon any change to your application.

### Role-based access control (RBAC) permissions

Administrators should strictly control Role-based access control (RBAC) permissions for Amazon SageMaker geospatial capabilities.

### **Use temporary credentials whenever possible**

Where possible, use temporary credentials instead of long-term credentials, such as access keys. For scenarios in which you need IAM users with programmatic access and long-term credentials, we recommend that you rotate access keys. Regularly rotating long-term credentials helps you familiarize yourself with the process. This is useful in case you are ever in a situation where you must rotate credentials, such as when an employee leaves your company. We recommend that you use IAM access last used information to rotate and remove access keys safely. For more information, see [Rotating access keys](#) and [Security best practices in IAM](#).

### **Use AWS CloudTrail to view and log API calls**

AWS CloudTrail tracks anyone making API calls in your AWS account. API calls are logged whenever anyone uses the Amazon SageMaker geospatial capabilities API, the Amazon SageMaker geospatial capabilities console or Amazon SageMaker geospatial capabilities AWS CLI commands. Enable logging and specify an Amazon S3 bucket to store the logs.

Your trust, privacy, and the security of your content are our highest priorities. We implement responsible and sophisticated technical and physical controls designed to prevent unauthorized access to, or disclosure of, your content and ensure that our use complies with our commitments to you. For more information, see [AWS Data Privacy FAQ](#).

## **Use Amazon SageMaker geospatial capabilities in Your Amazon Virtual Private Cloud**

The following topic gives information on how to use SageMaker notebooks with a SageMaker geospatial image in a Amazon SageMaker AI domain with VPC only mode. For more information on VPCs in Amazon SageMaker Studio Classic see [Choose an Amazon VPC](#).

### **VPC only communication with the internet**

By default, SageMaker AI domain uses two Amazon VPC. One of the Amazon VPC is managed by Amazon SageMaker AI and provides direct internet access. You specify the other Amazon VPC, which provides encrypted traffic between the domain and your Amazon Elastic File System (Amazon EFS) volume.

You can change this behavior so that SageMaker AI sends all traffic over your specified Amazon VPC. If VPC only has been chosen as the network access mode during the SageMaker AI domain

creation, the following requirements need to be considered to still allow usage of SageMaker Studio Classic notebooks within the created SageMaker AI domain.

## Requirements to use VPC only mode

### Note

In order to use the visualization components of SageMaker geospatial capabilities, the browser you use to access the SageMaker Studio Classic UI needs to be connected to the internet.

When you choose `VpcOnly`, follow these steps:

1. You must use private subnets only. You cannot use public subnets in `VpcOnly` mode.
2. Ensure your subnets have the required number of IP addresses needed. The expected number of IP addresses needed per user can vary based on use case. We recommend between 2 and 4 IP addresses per user. The total IP address capacity for a Studio Classic domain is the sum of available IP addresses for each subnet provided when the domain is created. Ensure that your estimated IP address usage does not exceed the capacity supported by the number of subnets you provide. Additionally, using subnets distributed across many availability zones can aid in IP address availability. For more information, see [VPC and subnet sizing for IPv4](#).

### Note

You can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

3. Set up one or more security groups with inbound and outbound rules that together allow the following traffic:
  - [NFS traffic over TCP on port 2049](#) between the domain and the Amazon EFS volume.
  - [TCP traffic within the security group](#). This is required for connectivity between the JupyterServer app and the KernelGateway apps. You must allow access to at least ports in the range 8192-65535.
4. If you want to allow internet access, you must use a [NAT gateway](#) with access to the internet, for example through an [internet gateway](#).

5. If you don't want to allow internet access, [create interface VPC endpoints](#) (AWS PrivateLink) to allow Studio Classic to access the following services with the corresponding service names. You must also associate the security groups for your VPC with these endpoints.

 **Note**

Currently, SageMaker geospatial capabilities are only supported in the US West (Oregon) Region.

- SageMaker API : `com.amazonaws.us-west-2.sagemaker.api`
- SageMaker AI runtime: `com.amazonaws.us-west-2.sagemaker.runtime`. This is required to run Studio Classic notebooks with a SageMaker geospatial image.
- Amazon S3: `com.amazonaws.us-west-2.s3`.
- To use SageMaker Projects: `com.amazonaws.us-west-2.servicecatalog`.
- SageMaker geospatial capabilities: `com.amazonaws.us-west-2.sagemaker-geospatial`

If you use the [SageMaker Python SDK](#) to run remote training jobs, you must also create the following Amazon VPC endpoints.

- AWS Security Token Service: `com.amazonaws.region.sts`
- Amazon CloudWatch: `com.amazonaws.region.logs`. This is required to allow SageMaker Python SDK to get the remote training job status from Amazon CloudWatch.

 **Note**

For a customer working within VPC mode, company firewalls can cause connection issues with SageMaker Studio Classic or between JupyterServer and the KernelGateway. Make the following checks if you encounter one of these issues when using SageMaker Studio Classic from behind a firewall.

- Check that the Studio Classic URL is in your networks allowlist.
- Check that the websocket connections are not blocked. Jupyter uses websocket under the hood. If the KernelGateway application is InService, JupyterServer may not be able

to connect to the KernelGateway. You should see this problem when opening System Terminal as well.

## Use AWS KMS Permissions for Amazon SageMaker geospatial capabilities

You can protect your data at rest using encryption for SageMaker geospatial capabilities. By default, it uses server-side encryption with an Amazon SageMaker geospatial owned key. SageMaker geospatial capabilities also supports an option for server-side encryption with a customer managed KMS key.

### Server-Side Encryption with Amazon SageMaker geospatial managed key (Default)

SageMaker geospatial capabilities encrypts all your data, including computational results from your Earth Observation jobs (EOJ) and Vector Enrichment jobs (VEJ) along with all your service metadata. There is no data that is stored within SageMaker geospatial capabilities unencrypted. It uses a default AWS owned key to encrypt all your data.

### Server-Side Encryption with customer managed KMS key (Optional)

SageMaker geospatial capabilities supports the use of a symmetric customer managed key that you create, own, and manage to add a second layer of encryption over the existing AWS owned encryption. Because you have full control of this layer of encryption, you can perform such tasks as:

- Establishing and maintaining key policies
- Establishing and maintaining IAM policies and grants
- Enabling and disabling key policies
- Rotating key cryptographic material
- Adding tags
- Creating key aliases
- Scheduling keys for deletion

For more information, see [Customer managed keys](#) in the *AWS Key Management Service Developer Guide*.

## How SageMaker geospatial capabilities uses grants in AWS KMS

SageMaker geospatial capabilities requires a grant to use your customer managed key. When you create an EOJ or an VEJ encrypted with a customer managed key, SageMaker geospatial capabilities creates a grant on your behalf by sending a `CreateGrant` request to AWS KMS. Grants in AWS KMS are used to give SageMaker geospatial capabilities access to a KMS key in a customer account. You can revoke access to the grant, or remove the service's access to the customer managed key at any time. If you do, SageMaker geospatial capabilities won't be able to access any of the data encrypted by the customer managed key, which affects operations that are dependent on that data.

### Create a customer managed key

You can create a symmetric customer managed key by using the AWS Management Console, or the AWS KMS APIs.

### To create a symmetric customer managed key

Follow the steps for [Creating symmetric encryption KMS keys](#) in the AWS Key Management Service Developer Guide.

### Key policy

Key policies control access to your customer managed key. Every customer managed key must have exactly one key policy, which contains statements that determine who can use the key and how they can use it. When you create your customer managed key, you can specify a key policy. For more information, see [Determining access to AWS KMS keys](#) in the *AWS Key Management Service Developer Guide*.

To use your customer managed key with your SageMaker geospatial capabilities resources, the following API operations must be permitted in the key policy. The principal for these operations should be the Execution Role you provide in the SageMaker geospatial capabilities request. SageMaker geospatial capabilities assumes the provided Execution Role in the request to perform these KMS operations.

- [kms:CreateGrant](#)
- `kms:GenerateDataKey`
- `kms:Decrypt`
- `kms:GenerateDataKeyWithoutPlaintext`

The following are policy statement examples you can add for SageMaker geospatial capabilities:

## CreateGrant

```
"Statement" : [
  {
    "Sid" : "Allow access to Amazon SageMaker geospatial capabilities",
    "Effect" : "Allow",
    "Principal" : {
      "AWS" : "<Customer provided Execution Role ARN>"
    },
    "Action" : [
      "kms:CreateGrant",
      "kms:Decrypt",
      "kms:GenerateDataKey",
      "kms:GenerateDataKeyWithoutPlaintext"
    ],
    "Resource" : "*",
  },
]
```

For more information about specifying permissions in a policy, see [AWS KMS permissions](#) in the *AWS Key Management Service Developer Guide*. For more information about troubleshooting, see [Troubleshooting key access](#) in the *AWS Key Management Service Developer Guide*.

If your key policy does not have your account root as key administrator, you need to add the same KMS permissions on your execution role ARN. Here is a sample policy you can add to the execution role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "kms:CreateGrant",
        "kms:Decrypt",
        "kms:GenerateDataKey",
        "kms:GenerateDataKeyWithoutPlaintext"
      ],
      "Resource": [
        "<KMS key Arn>"
      ],
    }
  ],
}
```

```

        "Effect": "Allow"
    }
]
}

```

## Monitoring your encryption keys for SageMaker geospatial capabilities

When you use an AWS KMS customer managed key with your SageMaker geospatial capabilities resources, you can use AWS CloudTrail or Amazon CloudWatch Logs to track requests that SageMaker geospatial sends to AWS KMS.

Select a tab in the following table to see examples of AWS CloudTrail events to monitor KMS operations called by SageMaker geospatial capabilities to access data encrypted by your customer managed key.

## Types of compute instances

SageMaker geospatial capabilities offer three types of compute instances.

- **SageMaker Studio Classic geospatial notebook instances** – SageMaker geospatial supports both CPU and GPU-based notebook instances in Studio Classic. Notebook instances are used to build, train, and deploy ML models. For a list of available notebook instance types that work with the geospatial image, see [Supported notebook instance types](#).
- **SageMaker geospatial jobs instances** – Run processing jobs to transform satellite image data.
- **SageMaker geospatial model inference types** – Make predictions by using pre-trained ML models on satellite imagery.

The instance type is determined by the operations that you run.

The following table shows the available SageMaker geospatial specific operations and instance types that you can use.

Operations	Instance
Temporal Statistics	ml.geospatial.jobs
Zonal Statistics	ml.geospatial.jobs
Resampling	ml.geospatial.jobs
Geomosaic	ml.geospatial.jobs
Band Stacking	ml.geospatial.jobs
Band Math	ml.geospatial.jobs
Cloud Removal with Landsat8	ml.geospatial.jobs

Operations	Instance
Cloud Removal with Sentinel-2	ml.geospatial.models
Cloud Masking	ml.geospatial.models
Land Cover Segmentation	ml.geospatial.models

## SageMaker geospatial supported notebook instance types

SageMaker geospatial supports both CPU and GPU-based notebook instances in Studio Classic. If when starting a GPU enabled notebook instance you receive a ResourceLimitExceeded error, you need to request a quota increase. To get started on a Service Quotas quota increase request, see [Requesting a quota increase](#) in the *Service Quotas User Guide*.

Supported Studio Classic notebook instance types

Name	Instance type
ml.geospatial.interactive	CPU
ml.g5.xlarge	GPU
ml.g5.2xlarge	GPU
ml.g5.4xlarge	GPU
ml.g5.8xlarge	GPU
ml.g5.16xlarge	GPU
ml.g5.12xlarge	GPU
ml.g5.24xlarge	GPU
ml.g5.48xlarge	GPU

You are charged different rates for each type of compute instance that you use. For more information about pricing, see [Geospatial ML with Amazon SageMaker AI](#).

## SageMaker geospatial libraries

The SageMaker geospatial specific **Instance type**, `ml.geospatial.interactive` contains the following Python libraries.

Geospatial libraries available on the geospatial instance type

Library name	Version available
numpy	1.23.4
scipy	1.11.2
pandas	1.4.4
gdal	3.2.2
fiona	1.8.22
geopandas	0.11.1
shapley	1.8.4
seaborn	0.11.2
notebook	1.8.22
scikit-image	0.11.2
rasterio	6.4.12
scikit-learn	0.19.2
ipyleaflet	1.0.1
rtree	0.17.2
opencv	4.6.0.66
supy	2022.4.7
SNAP toolbox	9.0

Library name	Version available
cdsapi	0.6.1
arosics	1.8.1
rasterstats	0.18.0
rioxarray	0.14.1
pyroSAR	0.20.0
eo-learn	1.4.1
deepforest	1.2.7
scrapy	2.8.0
netCDF4	1.6.3
xarray[complete]	0.20.1
Orfeotoolbox	OTB-8.1.1
pytorch	2.0.1
pytorch-cuda	11.8
torchvision	0.15.2
torchaudio	2.0.2
pytorch-lightning	2.0.6
tensorflow	2.13.0

## Data collections

Amazon SageMaker geospatial supports the following raster data collections. Of the following data collections, you can use the USGS Landsat and the Sentinel-2 Cloud-Optimized GeoTIFF data

collections when starting an Earth Observation Job (EOJ). To learn more about the EOJs, see [Earth Observation Jobs](#).

- [Copernicus Digital Elevation Model \(DEM\) – GLO-30](#)
- [Copernicus Digital Elevation Model \(DEM\) – GLO-90](#)
- [Sentinel-2 Cloud-Optimized GeoTIFFs](#)
- [Sentinel-1](#)
- [National Agriculture Imagery Program \(NAIP\) on AWS](#)
- [USGS Landsat 8](#)

To find the list of available raster data collections in your AWS Regions, use `ListRasterDataCollections`. In the [ListRasterDataCollections response](#), you get a [RasterDataCollectionMetadata](#) object that contains details about the available raster data collections.

### Example Example – Calling the `ListRasterDataCollections` API using the AWS SDK for Python (Boto3)

When you use the SDK for Python (Boto3) and SageMaker geospatial, you must create a geospatial client, `geospatial_client`. Use the following Python snippet to make a call to the `list_raster_data_collections` API:

```
import boto3
import sagemaker
import sagemaker_geospatial_map
import json

## SageMaker Geospatial Capabilities is currently only available in US-WEST-2
session = boto3.Session(region_name='us-west-2')
execution_role = sagemaker.get_execution_role()

## Creates a SageMaker Geospatial client instance
geospatial_client = session.client(service_name="sagemaker-geospatial")

# Creates a reusable Paginator for the list_raster_data_collections API operation
paginator = geospatial_client.get_paginator("list_raster_data_collections")

# Create a PageIterator from the Paginator
page_iterator = paginator.paginate()
```

```
# Use the iterator to iterate through the results of list_raster_data_collections
results = []
for page in page_iterator:
    results.append(page['RasterDataCollectionSummaries'])

print (results)
```

In the JSON response, you will receive the following, which has been truncated for clarity:

```
{
  "Arn": "arn:aws:sagemaker-geospatial:us-west-2:555555555555:raster-data-collection/
public/dxxbpqwwu9041ny8",
  "Description": "Copernicus DEM is a Digital Surface Model which represents the
surface of the Earth including buildings, infrastructure, and vegetation. GL0-30 is
instance of Copernicus DEM that provides limited worldwide coverage at 30 meters.",
  "DescriptionPageUrl": "https://registry.opendata.aws/copernicus-dem/",
  "Name": "Copernicus DEM GL0-30",
  "Tags": {},
  "Type": "PUBLIC"
}
```

## Image band information from the USGS Landsat and Sentinel-2 data collections

Image band information from the USGS Landsat 8 and Sentinel-2 data collections are provided in the following table.

### USGS Landsat

Band name	Wave length range (nm)	Units	Valid range	Fill value	Spatial resolution
coastal	435 - 451	Unitless	1 - 65455	0 (No Data)	30m
blue	452 - 512	Unitless	1 - 65455	0 (No Data)	30m
green	533 - 590	Unitless	1 - 65455	0 (No Data)	30m
red	636 - 673	Unitless	1 - 65455	0 (No Data)	30m
nir	851 - 879	Unitless	1 - 65455	0 (No Data)	30m

Band name	Wave length range (nm)	Units	Valid range	Fill value	Spatial resolution
swir16	1566 - 1651	Unitless	1 - 65455	0 (No Data)	30m
swir22	2107 - 2294	Unitless	1 - 65455	0 (No Data)	30m
qa_aerosol	NA	Bit Index	0 - 255	1	30m
qa_pixel	NA	Bit Index	1 - 65455	1 (bit 0)	30m
qa_radsat	NA	Bit Index	1 - 65455	NA	30m
t	10600 - 11190	Scaled Kelvin	1 - 65455	0 (No Data)	30m (scaled from 100m)
atran	NA	Unitless	0 - 10000	-9999 (No Data)	30m
cdist	NA	Kilometers	0 - 24000	-9999 (No Data)	30m
drad	NA	W/(m <sup>2</sup> sr μm)/DN	0 - 28000	-9999 (No Data)	30m
urad	NA	W/(m <sup>2</sup> sr μm)/DN	0 - 28000	-9999 (No Data)	30m
trad	NA	W/(m <sup>2</sup> sr μm)/DN	0 - 28000	-9999 (No Data)	30m
emis	NA	Emissivity coefficient	1 - 10000	-9999 (No Data)	30m
emsd	NA	Emissivity coefficient	1 - 10000	-9999 (No Data)	30m

## Sentinel-2

Band name	Wave length range (nm)	Scale	Valid range	Fill value	Spatial resolution
coastal	443	0.0001	NA	0 (No Data)	60m
blue	490	0.0001	NA	0 (No Data)	10m

scl	Scene classification data	NA	1 - 11	0 (No Data)	20m

# RStudio on Amazon SageMaker AI

RStudio is an integrated development environment for R, with a console, syntax-highlighting editor that supports direct code execution, and tools for plotting, history, debugging and workspace management. Amazon SageMaker AI supports RStudio as a fully-managed integrated development environment (IDE) integrated with Amazon SageMaker AI domain through Posit Workbench. RStudio allows customers to create data science insights using an R environment. With RStudio integration, you can launch an RStudio environment in the domain to run your RStudio workflows on SageMaker AI resources. For more information about Posit Workbench, see the [Posit website](#). This page gives information about important RStudio concepts.

SageMaker AI integrates RStudio through the creation of a RStudioServerPro app.

The following are supported by RStudio on SageMaker AI.

- R developers use the RStudio IDE interface with popular developer tools from the R ecosystem. Users can launch new RStudio sessions, write R code, install dependencies from RStudio Package Manager, and publish Shiny apps using RStudio Connect.
- R developers can quickly scale underlying compute resources to run large scale data processing and statistical analysis.
- Platform administrators can set up user identities, authorization, networking, storage, and security for their data science teams through AWS IAM Identity Center and AWS Identity and Access Management integration. This includes connection to private Amazon Virtual Private Cloud (Amazon VPC) resources and internet-free mode with AWS PrivateLink.
- Integration with AWS License Manager.

For information on the onboarding steps to create a domain with RStudio enabled, see [Amazon SageMaker AI domain overview](#).

## Region availability

The following table gives information about the AWS Regions that RStudio on SageMaker AI is supported in.

Region name	Region
US East (Ohio)	us-east-2

Region name	Region
US East (N. Virginia)	us-east-1
US West (N. California)	us-west-1
US West (Oregon)	us-west-2
Asia Pacific (Mumbai)	ap-south-1
Asia Pacific (Seoul)	ap-northeast-2
Asia Pacific (Singapore)	ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2
Asia Pacific (Tokyo)	ap-northeast-1
Canada (Central)	ca-central-1
Europe (Frankfurt)	eu-central-1
Europe (Ireland)	eu-west-1
Europe (London)	eu-west-2
Europe (Paris)	eu-west-3
Europe (Stockholm)	eu-north-1
South America (São Paulo)	sa-east-1

## RStudio components

- *RStudioServerPro*: The *RStudioServerPro* app is a multiuser app that is a shared resource among all user profiles in the domain. Once an *RStudio* app is created in a domain, the admin can give permissions to users in the domain.
- *RStudio user*: *RStudio* users are users within the domain that are authorized to use the *RStudio* license.

- *RStudio admin*: An RStudio on Amazon SageMaker AI admin can access the RStudio administrative dashboard. RStudio on Amazon SageMaker AI admins differ from "stock" Posit Workbench admins because they do not have root access to the instance running the RStudioServerPro app and can't modify the RStudio configuration file.
- *RStudio Server*: The RStudio Server instance is responsible for serving the RStudio UI to all authorized Users. This instance is launched on an Amazon SageMaker AI instance.
- *RSession*: An RSession is a browser-based interface to the RStudio IDE running on an Amazon SageMaker AI instance. Users can create and interact with their RStudio projects through the RSession.
- *RSessionGateway*: The RSessionGateway app is used to support an RSession.
- *RStudio administrative dashboard*: This dashboard gives information on the RStudio users in the Amazon SageMaker AI domain and their sessions. This dashboard can only be accessed by users that have RStudio admin authorization.

## Differences from Posit Workbench

RStudio on Amazon SageMaker AI has some significant differences from [Posit Workbench](#).

- When using RStudio on SageMaker AI, users don't have access to the RStudio configuration files. Amazon SageMaker AI manages the configuration file and sets defaults. You can modify the RStudio Connect and RStudio Package Manager URLs when creating your RStudio-enabled Amazon SageMaker AI domain.
- Project sharing, realtime collaboration, and Job Launcher are not currently supported when using RStudio on Amazon SageMaker AI.
- When using RStudio on SageMaker AI, the RStudio IDE runs on Amazon SageMaker AI instances for on-demand containerized compute resources.
- RStudio on SageMaker AI only supports the RStudio IDE and does not support other IDEs supported by a Posit Workbench installation.
- RStudio on SageMaker AI only supports the RStudio version specified in [RStudio Versioning](#).

## RStudio on Amazon SageMaker AI management

The following topics give information on managing RStudio on Amazon SageMaker AI. This includes information about your RStudio environment configuration, user sessions, and necessary

resources. For information on how to use RStudio on SageMaker AI, see [RStudio on Amazon SageMaker AI user guide](#).

For information about creating a Amazon SageMaker AI domain with RStudio enabled, see [Amazon SageMaker AI domain overview](#).

For information about the AWS Regions that RStudio on SageMaker AI is supported in, see [Supported Regions and Quotas](#).

## Topics

- [Get an RStudio license](#)
- [RStudio Versioning](#)
- [Network and Storage](#)
- [RStudioServerPro instance type](#)
- [Add an RStudio Connect URL](#)
- [Update the RStudio Package Manager URL](#)
- [Create an Amazon SageMaker AI domain with RStudio using the AWS CLI](#)
- [Add RStudio support to an existing domain](#)
- [Custom images with RStudio on SageMaker AI](#)

## Get an RStudio license

RStudio on Amazon SageMaker AI is a paid product and requires that each user is appropriately licensed. Licenses for RStudio on Amazon SageMaker AI may be obtained from RStudio PBC directly, or by purchasing a subscription to Posit Workbench on AWS Marketplace. For existing customers of Posit Workbench Enterprise, licenses are issued at no additional cost. To use an

RStudio license with Amazon SageMaker AI, you must first have a valid RStudio license registered with AWS License Manager. For licenses purchased directly through RStudio PBC, a license grant for your AWS Account must be created. Contact RStudio for direct license purchases or to enable existing licenses in AWS License Manager. For more information about registering a license with AWS License Manager, see [Seller issued licenses in AWS License Manager](#).

The following topics show how to acquire and validate a license granted by RStudio PBC.

## Get an RStudio license

1. If you don't have an RStudio license, you may purchase one from the AWS Marketplace or from RStudio PBC directly.
  - To purchase a subscription from the AWS Marketplace, complete the steps to [subscribe with a SaaS contract](#) by searching for **Posit Platform (RStudio on SageMaker)**. To fulfill the license, you will be redirected to an external form outside the AWS Marketplace. You must provide additional information, including your company name and email address. If you can't access that form to provide a company name and a contact email, create a ticket with Posit Support at <https://support.posit.co/hc/en-us/requests/new> with details about your purchase.
  - To purchase from RStudio PBC directly, navigate to [RStudio Pricing](#) or contact [sales@rstudio.com](mailto:sales@rstudio.com). When buying or updating an RStudio license, you must provide the AWS Account that will host your Amazon SageMaker AI domain.

If you have an existing RStudio license, contact your RStudio Sales representative or [sales@rstudio.com](mailto:sales@rstudio.com) to add RStudio on Amazon SageMaker AI to your existing Posit Workbench Enterprise license, or to convert your Posit Workbench Standard license. The RStudio Sales representative will send you the appropriate electronic order form.

2. RStudio grants a Posit Workbench license to your AWS Account through AWS License Manager in the US East (N. Virginia) Region. Although the RStudio license is granted in the US East (N. Virginia) Region, your license can be consumed in any AWS Region that RStudio on Amazon SageMaker AI is supported in. You can expect the license grant process to complete within three business days after you share your AWS account ID with RStudio.
3. When this license is granted, you receive an email from your RStudio Sales representative with instructions to accept your license grant.

## Validate your RStudio license to be used with Amazon SageMaker AI

1. Log into the AWS License Manager console in the same region as your Amazon SageMaker AI domain. If you are using AWS License Manager for the first time, AWS License Manager prompts you to grant permission to use AWS License Manager.
2. Select **Start using AWS License manager**.
3. Select **I grant AWS License Manager the required permissions** and select **Grant Permissions**.
4. Navigate to **Granted Licenses** on the left panel.
5. Select the license grant with RSW-SageMaker as the Product name and select **View**.
6. From the license detail page, select **Accept & activate license**.

## RStudio administrative dashboard

You can use the RStudio administrative dashboard to see the number of users on the license following the steps in [Use the RStudio administrative dashboard](#).

## RStudio Versioning

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

This guide provides information about the 2024.04.2+764.pro1 version update for RStudio on SageMaker AI. Starting September 04, 2024, new domains with RStudio support are created with Posit Workbench version 2024.04.2+764.pro1. This applies to the RStudioServerPro applications and default RSessionGateway applications.

The following sections give information about the 2024.04.2+764.pro1 release.

## Latest version updates

The latest RStudio version is `2024.04.2+764.pro1`. This version includes the following changes:

- R versions supported:
  - 4.4.0
  - 4.3.3
  - 4.2.3
  - 4.2.1
  - 4.1.3
  - 4.0.2

For more information about the changes in this release, see <https://docs.posit.co/ide/news/>.

### Note

To ensure compatibility, we recommend using RSessions with a prefix that matches the current Posit Workbench version.

If you see the following warning, there is a version mismatch between the RSession and the Posit Workbench version used in RStudio on SageMaker AI. To resolve this issue, update the RStudio version for the domain. For information about updating the RStudio version, see [Upgrade to the new version](#).

```
Session version 2023.03.3-547.pro5 does not match server version
2024.04.2+764.pro1 - this is an unsupported configuration, and you may
experience unexpected issues as a result.
```

## Versioning

There are currently two versions of Posit Workbench supported by SageMaker AI.

- Latest version supported: `2024.04.2+764.pro1`
- Previous version supported: `2023.03.3-547.pro5`

**Note**

SageMaker AI will support version `2023.03.3-547.pro5` until October 2024. Version `2022.02.2-485.pro2` is deprecated and is no longer supported. We recommend updating to the latest version.

The default Posit Workbench version that SageMaker AI selects depends on the creation date of the domain.

- For domains created after September 04, 2024, version `2024.04.2+764.pro1` is the default selected version.
- For domains created after February 27, 2024 and before September 04, 2024, version `2023.03.3-547.pro5` is the default selected version. You can update your domains to the latest version (`2024.04.2+764.pro1`) by setting it as the default version for the domain. For more information, see [Upgrade to the new version](#).
- For domains created before February 27, 2024, version `2023.03.3-547.pro5` is the default selected version. You can update your domains to the latest version (`2024.04.2+764.pro1`) by setting it as the default version for the domain. For more information, see [Upgrade to the new version](#).

**Note**

The default RSessionGateway application version matches the current version of the RStudioServerPro application.

The following table lists the image ARNs for both versions for each AWS Region. These ARNs are passed as part of an `update-domain` command to set the desired version.

Region	<code>2023.03.3-547.pro5</code> Image ARN	<code>2024.04.2+764.pro1</code> Image ARN
us-east-1	arn:aws:sagemaker:us-east-1:081325390199:image/rstudio-workbench-2023.03	arn:aws:sagemaker:us-east-1:081325390199:image/rstudio-workbench-2024.04

sa-east-1	arn:aws:sagemaker:sa-east-1:782484402741:image/rstudio-workbench-2023.03	arn:aws:sagemaker:sa-east-1:782484402741:image/rstudio-workbench-2024.04

## Changes to BYOI Images

If you use a BYOI image with RStudio and update your `RStudioServerPro` version to `2024.04.2+764.pro1`, you must upgrade your custom images to use the `2024.04.2+764.pro1` release and redeploy your existing RSessions. If you attempt to load a non-compatible image in an RSession of a domain using the `2024.04.2+764.pro1` version, the RSession fails because it cannot parse parameters that it receives. To prevent failure, update all of the deployed custom images in your existing `RStudioServerPro` application.

The `RSW_VERSION` in the Dockerfile must be consistent with the Posit Workbench version used in RStudio on SageMaker AI. You can validate the current version in Posit Workbench. To do so, use the version name that's located in the lower left corner of the Posit Workbench launcher page.

```
ARG RSW_VERSION=2024.04.2+764.pro1
ENV RSTUDIO_FORCE_NON_ZERO_EXIT_CODE="1"
ARG RSW_NAME=rstudio-workbench
ARG OS_CODE_NAME=jammy
ARG RSW_DOWNLOAD_URL=https://s3.amazonaws.com/rstudio-ide-build/server/${OS_CODE_NAME}/amd64
RUN RSW_VERSION_URL=`echo -n "${RSW_VERSION}" | sed 's/+/-/g'` \
    && curl -o rstudio-workbench.deb ${RSW_DOWNLOAD_URL}/${RSW_NAME}-${RSW_VERSION_URL}-amd64.deb \
    && gdebi -n ./rstudio-workbench.deb
```

## Upgrade to the new version

Existing domains using version `2023.03.3-547.pro5` can upgrade to `2024.04.2+764.pro1` version in one of two ways:

- Create a new domain from the AWS CLI with RStudio enabled.
- Update an existing domain to use the `2024.04.2+764.pro1` version.

The following procedure shows how to delete the RStudio application for an existing domain, set the default version to `2024.04.2+764.pro1`, and then create an RStudio application.

1. Delete the `RStudioServerPro` application and all `RSessionGateway` applications associated with your existing domain. For information about how to find your domain ID, see [View domains](#). For more information about deleting applications, see [Shut down RStudio](#).

```
aws sagemaker delete-app \
```

```
--region region \  
--domain-id domainId \  
--user-profile-name domain-shared \  
--app-type RStudioServerPro \  
--app-name default
```

2. If your domain is using RStudio version `2023.03.3-547.pro5`, update the domain to set `2024.04.2+764.pro1` as the default Posit Workbench version. The `SageMakerImageArn` value in the following `update-domain` command specifies the RStudio `2024.04.2+764.pro1` version as the default. This ARN must match the Region that your domain is in. For a list of all available ARNs, see [Versioning](#).

Pass an execution role ARN for the domain that provides permissions to update the domain.

```
aws sagemaker update-domain \  
  --region region \  
  --domain-id domainId \  
  --domain-settings-for-update "{\"RStudioServerProDomainSettingsForUpdate\":  
  {\"DefaultResourceSpec\": {\"SageMakerImageArn\": \"arn-for-2024.04.2+764.pro1-  
  version\", \"InstanceType\": \"system\"}, \"DomainExecutionRoleArn\": \"execution-  
  role-arn\"}}\"
```

3. Create a new RStudioServerPro application in the existing domain.

```
aws sagemaker create-app \  
  --region region \  
  --domain-id domainId \  
  --user-profile-name domain-shared \  
  --app-type RStudioServerPro \  
  --app-name default
```

Your RStudioServerPro application is now updated to version `2024.04.2+764.pro1`. You can now relaunch your RSessionGateway applications.

### Downgrade to the existing version

You can manually downgrade the version of your existing RStudio application to the `2023.03.3-547.pro5` version.

## To downgrade to the existing version

1. Delete the RStudioServerPro application that's associated with your existing domain. For information about how to find your domain ID, see [View domains](#).

```
aws sagemaker delete-app \  
  --domain-id domainId \  
  --user-profile-name domain-shared \  
  --app-type RStudioServerPro \  
  --app-name default
```

2. Pass the corresponding `2023.03.3-547.pro5` ARN for your Region as part of the update-domain command. For a list of all available ARNs, see [Versioning](#). You must also pass an execution role ARN for the domain that provides permissions to update the domain.

```
aws sagemaker update-domain \  
  --region region \  
  --domain-id domainId \  
  --domain-settings-for-update '{"RStudioServerProDomainSettingsForUpdate\  
{\"DefaultResourceSpec\": {\"SageMakerImageArn\": \"arn-for-2023.03.3-547.pro5-version\", \"InstanceType\": \"system\"}, \"DomainExecutionRoleArn\": \"execution-role-arn\"}}'
```

3. Create a new RStudioServerPro application in the existing domain. The RStudio version defaults to `2023.03.3-547.pro5`.

```
aws sagemaker create-app \  
  --domain-id domainId \  
  --user-profile-name domain-shared \  
  --app-type RStudioServerPro \  
  --app-name default
```

Your RStudioServerPro application is now downgraded to version `2023.03.3-547.pro5`.

## Network and Storage

The following topic describes network access and data storage considerations for your RStudio instance. For general information about network access and data storage when using Amazon SageMaker AI, see [Data Protection in Amazon SageMaker AI](#).

### Amazon EFS volume

RStudio on Amazon SageMaker AI shares an Amazon EFS volume with the Amazon SageMaker Studio Classic application in the domain. When the RStudio application is added to a domain, SageMaker AI creates a folder named `shared` in the Amazon EFS directory. If this shared folder is deleted or changed manually, then the RStudio application may no longer function. For more information about the Amazon EFS volume, see [Manage Your Amazon EFS Storage Volume in SageMaker Studio Classic](#).

## Installed packages and scripts

Packages that you install from within RStudio are scoped to the user profile level. This means that the installed package persists through RSession shut down, restarts, and across RSessions for each user profile that they are installed in. R Scripts that are saved in RSessions behave the same way. Both packages and R Scripts are saved in the user's Amazon EFS volume.

## Encryption

RStudio on Amazon SageMaker AI supports encryption at rest.

## Use RStudio in VPC-only mode

RStudio on Amazon SageMaker AI supports [AWS PrivateLink](#) integration. With this integration, you can use RStudio on SageMaker AI in VPC-only mode without direct access to the internet. When you use RStudio in VPC-only mode, your security groups are automatically managed by the service. This includes connectivity between your RServer and your RSessions.

The following are required to use RStudio in VPC-only mode. For more information on selecting a VPC, see [Choose an Amazon VPC](#).

- A private subnet with either access the internet to make a call to Amazon SageMaker AI & License Manager, or Amazon Virtual Private Cloud (Amazon VPC) endpoints for both Amazon SageMaker AI & License Manager.
- The domain cannot have any more than two associated Security Groups.
- A Security Group ID for use with the domain in domain Settings. This must allow all outbound access.
- A Security Group ID for use with the Amazon VPC endpoint. This security group must allow inbound traffic from the domain Security Group ID.
- Amazon VPC Endpoint for `sagemaker . api` and AWS License Manager. This must be in the same Amazon VPC as the private subnet.

## RStudioServerPro instance type

When deciding which Amazon EC2 instance type to use for your RStudioServerPro app, the main factor to consider is bandwidth. Bandwidth is important because the RStudioServerPro instance is responsible for serving the RStudio UI to all users. This includes UI heavy workflows, such as generating figures, animations, and displaying many data rows. Therefore, there may be some UI performance degradation depending on the workload across all users. The following are the available instance types to use for your RStudioServerPro. For pricing information about these instances, see [Amazon SageMaker Pricing](#).

- `system`: This instance type is recommended for Domains with low UI use.

### Note

The `system` value is translated to `m1.t3.medium`.

- `m1.c5.4xlarge`: This instance type is recommended for Domains with moderate UI use.
- `m1.c5.9xlarge`: This instance type is recommended for Domains with heavy UI use.

## Changing RStudio instance type

To change the instance type of your RStudioServerPro, pass the new instance type as part of a call to the `update-domain` CLI command. You then need to delete the existing RStudioServerPro app using the `delete-app` CLI command and create a new RStudioServerPro app using the `create-app` CLI command.

## Add an RStudio Connect URL

RStudio Connect is a publishing platform for Shiny applications, R Markdown reports, dashboards, plots, and more. RStudio Connect makes it easy to surface machine learning and data science insights by making hosting content simple and scalable. If you have an RStudio Connect server, then you can set the server as the default place where apps are published. For more information about RStudio Connect, see [RStudio Connect](#).

When you onboard to RStudio on Amazon SageMaker AI domain, an RStudio Connect server is not created. You can create an RStudio Connect server on an Amazon EC2 instance to use Connect with Amazon SageMaker AI domain. For information about how to set up your RStudio Connect server, see [Host RStudio Connect and Package Manager for ML development in RStudio on Amazon SageMaker AI](#).

## Add an RStudio Connect URL

If you have an RStudio Connect URL, you can update the default URL so that your RStudio Users can publish to it.

1. Navigate to the **domains** page.
2. Select the desired domain.
3. Choose **domain Settings**.
4. Under **General Settings**, select **Edit**.
5. From the new page, select **RStudio Settings** on the left side.
6. Under **RStudio Connect URL**, enter the RStudio Connect URL to add.
7. Select **Submit**.

## CLI

You can set a default RStudio Connect URL when you create your domain. The only way to update your RStudio Connect URL from the AWS CLI is to delete your domain and create a new one with the updated RStudio Connect URL.

## Update the RStudio Package Manager URL

RStudio Package Manager is a repository management server used to organize and centralize packages across your organization. For more information on RStudio Package Manager, see [RStudio Package Manager](#). If you don't supply your own Package Manager URL, Amazon SageMaker AI domain uses the default Package Manager repository when you onboard RStudio following the steps in [Amazon SageMaker AI domain overview](#). For more information, see [Host RStudio Connect and Package Manager for ML development in RStudio on Amazon SageMaker AI](#). The following procedure shows how to update the Package Manager URL.

### Update Package Manager URL

You can update the Package Manager URL used for your RStudio-enabled domain as follows.

1. Navigate to the **domains** page.
2. Select the desired domain.
3. Choose **domain Settings**.
4. Under **General Settings**, select **Edit**.

5. From the new page, select **RStudio Settings** on the left side.
6. Under **RStudio Package Manager**, enter your RStudio Package Manager URL.
7. Select **Submit**.

## CLI

The only way to update your Package Manager URL from the AWS CLI is to delete your domain and create a new one with the updated Package Manager URL.

## Create an Amazon SageMaker AI domain with RStudio using the AWS CLI

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

The following topic shows how to onboard to Amazon SageMaker AI domain with RStudio enabled using the AWS CLI. To onboard using the AWS Management Console, see [Amazon SageMaker AI domain overview](#).

### Prerequisites

- Install and configure [AWS CLI version 2](#)
- Configure the [AWS CLI](#) with IAM credentials

### Create DomainExecution role

To launch the RStudio App, you must provide a DomainExecution role. This role is used to determine whether RStudio needs to be launched as part of Amazon SageMaker AI domain

creation. This role is also used by Amazon SageMaker AI to access the RStudio License and push RStudio logs.

**Note**

The `DomainExecution` role should have at least AWS License Manager permissions to access RStudio License, and CloudWatch permissions to push logs in your account.

The following procedure shows how to create the `DomainExecution` role with the AWS CLI.

1. Create a file named `assume-role-policy.json` with the following content.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": "sts:AssumeRole",
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "sagemaker.amazonaws.com"
        ]
      }
    }
  ]
}
```

2. Create the `DomainExecution` role. `<REGION>` should be the AWS Region to launch your domain in.

```
aws iam create-role --region <REGION> --role-name DomainExecution --assume-role-policy-document file://assume-role-policy.json
```

3. Create a file named `domain-setting-policy.json` with the following content. This policy allows the `RStudioServerPro` app to access necessary resources and allows Amazon SageMaker AI to automatically launch an `RStudioServerPro` app when the existing `RStudioServerPro` app is in a Deleted or Failed status.

```
{
  "Version": "2012-10-17",
```

```

    "Statement": [
      {
        "Sid": "VisualEditor0",
        "Effect": "Allow",
        "Action": [
          "license-manager:ExtendLicenseConsumption",
          "license-manager:ListReceivedLicenses",
          "license-manager:GetLicense",
          "license-manager:CheckoutLicense",
          "license-manager:CheckInLicense",
          "logs:CreateLogDelivery",
          "logs:CreateLogGroup",
          "logs:CreateLogStream",
          "logs>DeleteLogDelivery",
          "logs:Describe*",
          "logs:GetLogDelivery",
          "logs:GetLogEvents",
          "logs:ListLogDeliveries",
          "logs:PutLogEvents",
          "logs:PutResourcePolicy",
          "logs:UpdateLogDelivery",
          "sagemaker:CreateApp"
        ],
        "Resource": "*"
      }
    ]
  }

```

4. Create the domain setting policy that is attached to the DomainExecution role. Be aware of the PolicyArn from the response, you will need to enter that ARN in the following steps.

```
aws iam create-policy --region <REGION> --policy-name domain-setting-policy --
policy-document file://domain-setting-policy.json
```

5. Attach domain-setting-policy to the DomainExecution role. Use the PolicyArn returned in the previous step.

```
aws iam attach-role-policy --role-name DomainExecution --policy-arn <POLICY_ARN>
```

## Create Amazon SageMaker AI domain with RStudio App

The RStudioServerPro app is launched automatically when you create a Amazon SageMaker AI domain using the `create-domain` CLI command with the `RStudioServerProDomainSettings` parameter specified. When launching the RStudioServerPro App, Amazon SageMaker AI checks for a valid RStudio license in the account and fails domain creation if the license is not found.

The creation of a Amazon SageMaker AI domain differs based on the authentication method and the network type. These options must be used together, with one authentication method and one network connection type selected. For more information about the requirements to create a new domain, see [CreateDomain](#).

The following authentication methods are supported.

- IAM Auth
- SSO Auth

The following network connection types are supported:

- PublicInternet
- VPCOnly

### Authentication methods

#### IAM Auth Mode

The following shows how to create a Amazon SageMaker AI domain with RStudio enabled and an IAM Auth Network Type. For more information about AWS Identity and Access Management, see [What is IAM?](#)

- `DomainExecutionRoleArn` should be the ARN for the role created in the previous step.
- `ExecutionRole` is the ARN of the role given to users in the Amazon SageMaker AI domain.
- `vpc-id` should be the ID of your Amazon Virtual Private Cloud. `subnet-ids` should be a space-separated list of subnet IDs. For information about `vpc-id` and `subnet-ids`, see [VPCs and subnets](#).
- `RStudioPackageManagerUrl` and `RStudioConnectUrl` are optional and should be set to the URLs of your RStudio Package Manager and RStudio Connect server, respectively.

- `app-network-access-type` should be either `PublicInternetOnly` or `VPCOnly`.

```
aws sagemaker create-domain --region <REGION> --domain-name <DOMAIN_NAME> \
  --auth-mode IAM \
  --default-user-settings ExecutionRole=<DEFAULT_USER_EXECUTIONROLE> \
  --domain-settings
RStudioServerProDomainSettings={RStudioPackageManagerUrl=<<PACKAGE_MANAGER_URL>,RStudioConnect
\
  --vpc-id <VPC_ID> \
  --subnet-ids <SUBNET_IDS> \
  --app-network-access-type <NETWORK_ACCESS_TYPE>
```

## Authentication using IAM Identity Center

The following shows how to create a Amazon SageMaker AI domain with RStudio enabled and an SSO Auth Network Type. AWS IAM Identity Center must be enabled for the region that the domain is launched on. For more information about IAM Identity Center, see [What is AWS IAM Identity Center?](#).

- `DomainExecutionRoleArn` should be the ARN for the role created in the previous step.
- `ExecutionRole` is the ARN of the role given to users in the Amazon SageMaker AI domain.
- `vpc-id` should be the ID of your Amazon Virtual Private Cloud. `subnet-ids` should be a space-separated list of subnet IDs. For information about `vpc-id` and `subnet-ids`, see [VPCs and subnets](#).
- `RStudioPackageManagerUrl` and `RStudioConnectUrl` are optional and should be set to the URLs of your RStudio Package Manager and RStudio Connect server, respectively.
- `app-network-access-type` should be either `PublicInternetOnly` or `VPCOnly`.

```
aws sagemaker create-domain --region <REGION> --domain-name <DOMAIN_NAME> \
  --auth-mode SSO \
  --default-user-settings ExecutionRole=<DEFAULT_USER_EXECUTIONROLE> \
  --domain-settings
RStudioServerProDomainSettings={RStudioPackageManagerUrl=<<PACKAGE_MANAGER_URL>,RStudioConnect
\
  --vpc-id <VPC_ID> \
  --subnet-ids <SUBNET_IDS> \
  --app-network-access-type <NETWORK_ACCESS_TYPE>
```

## Connection types

### PublicInternet/Direct Internet network type

The following shows how to create a Amazon SageMaker AI domain with RStudio enabled and a PublicInternet Network Type.

- `DomainExecutionRoleArn` should be the ARN for the role created in the previous step.
- `ExecutionRole` is the ARN of the role given to users in the Amazon SageMaker AI domain.
- `vpc-id` should be the ID of your Amazon Virtual Private Cloud. `subnet-ids` should be a space-separated list of subnet IDs. For information about `vpc-id` and `subnet-ids`, see [VPCs and subnets](#).
- `RStudioPackageManagerUrl` and `RStudioConnectUrl` are optional and should be set to the URLs of your RStudio Package Manager and RStudio Connect server, respectively.
- `auth-mode` should be either SSO or IAM.

```
aws sagemaker create-domain --region <REGION> --domain-name <DOMAIN_NAME> \
  --auth-mode <AUTH_MODE> \
  --default-user-settings ExecutionRole=<DEFAULT_USER_EXECUTIONROLE> \
  --domain-settings
RStudioServerProDomainSettings={RStudioPackageManagerUrl=<<PACKAGE_MANAGER_URL>,RStudioConnect
\
  --vpc-id <VPC_ID> \
  --subnet-ids <SUBNET_IDS> \
  --app-network-access-type PublicInternetOnly
```

### VPCOnly mode

The following shows how to launch a Amazon SageMaker AI domain with RStudio enabled and a VPCOnly Network Type. For more information about using the VPCOnly network access type, see [Connect Studio notebooks in a VPC to external resources](#).

- `DomainExecutionRoleArn` should be the ARN for the role created in the previous step.
- `ExecutionRole` is the ARN of the role given to users in the Amazon SageMaker AI domain.
- `vpc-id` should be the ID of your Amazon Virtual Private Cloud. `subnet-ids` should be a space-separated list of subnet IDs. Your private subnet must be able to either access the internet to make a call to Amazon SageMaker AI, and AWS License Manager or have Amazon VPC endpoints for both Amazon SageMaker AI and AWS License Manager. For information about Amazon VPC

endpoints, see [Interface Amazon VPC endpoints](#) For information about `vpc-id` and `subnet-ids`, see [VPCs and subnets](#).

- `SecurityGroups` must allow outbound access to the Amazon SageMaker AI and AWS License Manager endpoints.
- `auth-mode` should be either SSO or IAM.

### Note

When using Amazon Virtual Private Cloud endpoints, the security group attached to your Amazon Virtual Private Cloud endpoints must allow inbound traffic from the security group you pass as part of the `domain-setting` parameter of the `create-domain` CLI call.

With RStudio, Amazon SageMaker AI manages security groups for you. This means that Amazon SageMaker AI manages security group rules to ensure RSessions can access RStudioServerPro Apps. Amazon SageMaker AI creates one security group rule per user profile.

```
aws sagemaker create-domain --region <REGION> --domain-name <DOMAIN_NAME> \
  --auth-mode <AUTH_MODE> \
  --default-user-settings
SecurityGroups=<USER_SECURITY_GROUP>,ExecutionRole=<DEFAULT_USER_EXECUTIONROLE> \
  --domain-settings
SecurityGroupIds=<DOMAIN_SECURITY_GROUP>,RStudioServerProDomainSettings={DomainExecutionRoleArn
\
  --vpc-id <VPC_ID> \
  --subnet-ids "<SUBNET_IDS>" \
  --app-network-access-type VPCOnly --app-security-group-management Service
```

Note: The RStudioServerPro app is launched by a special user profile named `domain-shared`. As a result, this app is not returned as part of `list-app` API calls by any other user profiles.

You may have to increase the Amazon VPC quota in your account to increase the number of users. For more information, see [Amazon VPC quotas](#).

## Verify domain creation

Use the following command to verify that your domain has been created with a Status of `InService`. Your `domain-id` is appended to the domains ARN. For example, `arn:aws:sagemaker:<REGION>:<ACCOUNT_ID>:domain/<DOMAIN_ID>`.

```
aws sagemaker describe-domain --domain-id <DOMAIN_ID> --region <REGION>
```

## Add RStudio support to an existing domain

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

If you have added an RStudio License through AWS License Manager, you can create a new Amazon SageMaker AI domain with support for RStudio on SageMaker AI. If you have an existing domain that does not support RStudio, you can add RStudio support to that domain without having to delete and recreate the domain.

The following topic outlines how to add this support.

### Prerequisites

You must complete the following steps before you update your current domain to add support for RStudio on SageMaker AI.

- Install and configure [AWS CLI version 2](#)
- Configure the [AWS CLI](#) with IAM credentials
- Create a domain execution role following the steps in [Create a SageMaker AI Domain with RStudio using the AWS CLI](#). This domain-level IAM role is required by the RStudioServerPro app. The role requires access to AWS License Manager for verifying a valid Posit Workbench license and Amazon CloudWatch Logs for publishing server logs.
- Bring your RStudio license to AWS License Manager following the steps in [RStudio license](#).

- (Optional) If you want to use RStudio in VPCOnly mode, complete the steps in [RStudio in VPC-Only](#).
- Ensure that the security groups you have configured for each [UserProfile](#) in your domain meet the account-level quotas. When configuring the default user profile during domain creation, you can use the `DefaultUserSettings` parameter of the [CreateDomain](#) API to add `SecurityGroups` that are inherited by all the user profiles created in the domain. You can also provide additional security groups for a specific user as part of the `UserSettings` parameter of the [CreateUserProfile](#) API. If you have added security groups this way, you must ensure that the total number of security groups per user profile doesn't exceed the maximum quota of 2 in VPCOnly mode and 4 in PublicInternetOnly mode. If the resulting total number of security groups for any user profile exceeds the quota, you can combine multiple security groups' rules into one security group.

## Add RStudio support to an existing domain

After you have completed the prerequisites, you can add RStudio support to your existing domain. The following steps outline how to update your existing domain to add support for RStudio.

### Step 1: Delete all apps in the domain

To add support for RStudio in your domain, SageMaker AI must update the underlying security groups for all existing user profiles. To complete this, you must delete and recreate all existing apps in the domain. The following procedure shows how to delete all of the apps.

1. List all of the apps in the domain.

```
aws sagemaker \  
  list-apps \  
  --domain-id-equals <DOMAIN_ID>
```

2. Delete each app for each user profile in the domain.

```
// JupyterServer apps  
aws sagemaker \  
  delete-app \  
  --domain-id <DOMAIN_ID> \  
  --user-profile-name <USER_PROFILE> \  
  --app-type JupyterServer \  
  --app-name <APP_NAME>
```

```
// KernelGateway apps
aws sagemaker \
  delete-app \
    --domain-id <DOMAIN_ID> \
    --user-profile-name <USER_PROFILE> \
    --app-type KernelGateway \
    --app-name <APP_NAME>
```

## Step 2 - Update all user profiles with the new list of security groups

This is a one-time action that you must complete for all of the existing user profiles in your domain when you have refactored your existing security groups. This prevents you from hitting the quota for the maximum number of security groups. The UpdateUserProfile API call fails if the user has any apps that are in [InService](#) status. Delete all apps, then call UpdateUserProfile API to update the security groups.

### Note

The following requirement for VPCOnly mode outlined in [Connect Amazon SageMaker Studio Classic Notebooks in a VPC to External Resources](#) is no longer needed when adding RStudio support because AppSecurityGroupManagement is managed by the SageMaker AI service:

["TCP traffic within the security group"](#). This is required for connectivity between the JupyterServer app and the KernelGateway apps. You must allow access to at least ports in the range 8192-65535."

```
aws sagemaker \
  update-user-profile \
    --domain-id <DOMAIN_ID>\
    --user-profile-name <USER_PROFILE> \
    --user-settings "{\"SecurityGroups\": [\"<SECURITY_GROUP>\",
  \"<SECURITY_GROUP>\"]}"
```

## Step 3 - Activate RStudio by calling the UpdateDomain API

1. Call the [UpdateDomain](#) API to add support for RStudio on SageMaker AI. The defaultusersettings parameter is only needed if you have refactored the default security groups for your user profiles.

- For VPCOnly mode:

```
aws sagemaker \
  update-domain \
  --domain-id <DOMAIN_ID> \
  --app-security-group-management Service \
  --domain-settings-for-update
RStudioServerProDomainSettingsForUpdate={DomainExecutionRoleArn=<DOMAIN_EXECUTION_ROLE_ARN>
\
  --default-user-settings "{\"SecurityGroups\": [\"<SECURITY_GROUP>\",
  \"<SECURITY_GROUP>\"]}]"
```

- For PublicInternetOnly mode:

```
aws sagemaker \
  update-domain \
  --domain-id <DOMAIN_ID> \
  --domain-settings-for-update
RStudioServerProDomainSettingsForUpdate={DomainExecutionRoleArn=<DOMAIN_EXECUTION_ROLE_ARN>
  --default-user-settings "{\"SecurityGroups\": [\"<SECURITY_GROUP>\",
  \"<SECURITY_GROUP>\"]}]"
```

2. Verify that the domain status is InService. After the domain status is InService, support for RStudio on SageMaker AI is added.

```
aws sagemaker \
  describe-domain \
  --domain-id <DOMAIN_ID>
```

3. Verify that the RStudioServerPro app's status is InService using the following command.

```
aws sagemaker list-apps --user-profile-name domain-shared
```

## Step 4 - Add RStudio access for existing users

As part of the update in Step 3, SageMaker AI marks the RStudio [AccessStatus](#) of all existing user profiles in the domain as DISABLED by default. This prevents exceeding the number of users allowed by your current license. To add access for existing users, there is a one-time opt-in step. Perform the opt-in by calling the [UpdateUserProfile](#) API with the following [RStudioServerProAppSettings](#):

- `AccessStatus = ENABLED`
- *Optional* - `UserGroup = R_STUDIO_USER` or `R_STUDIO_ADMIN`

```
aws sagemaker \  
  update-user-profile \  
    --domain-id <DOMAIN_ID>\   
    --user-profile-name <USER_PROFILE> \  
    --user-settings "{\"RStudioServerProAppSettings\": {\"AccessStatus\": \"ENABLED  
  \"}}
```

### Note

By default, the number of users that can have access to RStudio is 60.

## Step 5 – Deactivate RStudio access for new users

Unless otherwise specified when calling `UpdateDomain`, RStudio support is added by default for all new user profiles created after you have added support for RStudio on SageMaker AI. To deactivate access for a new user profile, you must explicitly set the `AccessStatus` parameter to `DISABLED` as part of the `CreateUserProfile` API call. If the `AccessStatus` parameter is not specified as part of the `CreateUserProfile` API, the default access status is `ENABLED`.

```
aws sagemaker \  
  create-user-profile \  
    --domain-id <DOMAIN_ID>\   
    --user-profile-name <USER_PROFILE> \  
    --user-settings "{\"RStudioServerProAppSettings\": {\"AccessStatus\": \"DISABLED  
  \"}}
```

## Custom images with RStudio on SageMaker AI

A SageMaker image is a file that identifies language packages and other dependencies that are required to run RStudio on Amazon SageMaker AI. SageMaker AI uses these images to create an environment where you run RStudio. Amazon SageMaker AI provides a built-in RStudio image for you to use. If you need different functionality, you can bring your own custom images. This page gives information about key concepts for using custom images with RStudio on SageMaker AI. The process to bring your own image to use with RStudio on SageMaker AI takes three steps:

1. Build a custom image from a Dockerfile and push it to a repository in Amazon Elastic Container Registry (Amazon ECR).
2. Create a SageMaker image that points to a container image in Amazon ECR and attach it to your Amazon SageMaker AI domain.
3. Launch a new session in RStudio with your custom image.

You can create images and image versions, and attach image versions to your domain, using the SageMaker AI control panel, the [AWS SDK for Python \(Boto3\)](#), and the [AWS Command Line Interface \(AWS CLI\)](#). You can also create images and image versions using the SageMaker AI console, even if you haven't onboarded to a domain.

The following topics show how to bring your own image to RStudio on SageMaker AI by creating, attaching, and launching a custom image.

## Key terminology

The following section defines key terms for bringing your own image to use with RStudio on SageMaker AI.

- **Dockerfile:** A Dockerfile is a file that identifies the language packages and other dependencies for your Docker image.
- **Docker image:** The Docker image is a built Dockerfile. This image is checked into Amazon ECR and serves as the basis of the SageMaker AI image.
- **SageMaker image:** A SageMaker image is a holder for a set of SageMaker image versions based on Docker images.
- **Image version:** An image version of a SageMaker image represents a Docker image that is compatible with RStudio and stored in an Amazon ECR repository. Each image version is immutable. These image versions can be attached to a domain and used with RStudio on SageMaker AI.

## Complete prerequisites

You must complete the following prerequisites before bringing your own image to use with RStudio on Amazon SageMaker AI.

- If you have an existing domain with RStudio that was created before April 7, 2022, you must delete your RStudioServerPro application and recreate it. For information about how to delete an application, see [Shut down and Update SageMaker Studio Classic](#).
- Install the Docker application. For information about setting up Docker, see [Orientation and setup](#).
- Create a local copy of an RStudio-compatible Dockerfile that works with SageMaker AI. For information about creating a sample RStudio dockerfile, see [Use a custom image to bring your own development environment to RStudio on Amazon SageMaker AI](#).
- Use an AWS Identity and Access Management execution role that has the [AmazonSageMakerFullAccess](#) policy attached. If you have onboarded to domain, you can get the role from the **domain Summary** section of the SageMaker AI control panel.

Add the following permissions to access the Amazon Elastic Container Registry (Amazon ECR) service to your execution role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "ecr:CreateRepository",
        "ecr:BatchGetImage",
        "ecr:CompleteLayerUpload",
        "ecr:DescribeImages",
        "ecr:DescribeRepositories",
        "ecr:UploadLayerPart",
        "ecr:ListImages",
        "ecr:InitiateLayerUpload",
        "ecr:BatchCheckLayerAvailability",
        "ecr:PutImage"
      ],
      "Resource": "*"
    }
  ]
}
```

- Install and configure AWS CLI with the following (or higher) version. For information about installing the AWS CLI, see [Installing or updating the latest version of the AWS CLI](#).

```
AWS CLI v1 >= 1.23.6
AWS CLI v2 >= 2.6.2
```

## Custom RStudio image specifications

In this guide, you'll learn custom RStudio image specifications to use when you bring your own image. There are two sets of requirements that you must satisfy with your custom RStudio image to use it with Amazon SageMaker AI. These requirements are imposed by RStudio PBC and the Amazon SageMaker Studio Classic platform. If either of these sets of requirements aren't satisfied, then your custom image won't function properly.

### RStudio PBC requirements

RStudio PBC requirements are laid out in the [Using Docker images with RStudio Workbench / RStudio Server Pro, Launcher, and Kubernetes](#) article. Follow the instructions in this article to create the base of your custom RStudio image.

For instructions about how to install multiple R versions in your custom image, see [Installing multiple versions of R on Linux](#).

### Amazon SageMaker Studio Classic requirements

Amazon SageMaker Studio Classic imposes the following set of installation requirements for your RStudio image.

- You must use an RStudio base image of at least 2023.03.2-454.pro2. For more information, see [RStudio Versioning](#).
- You must install the following packages:

```
yum install -y sudo \
openjdk-11-jdk \
libpng-dev \
&& yum clean all \
&& /opt/R/${R_VERSION}/bin/R -e "install.packages('reticulate', repos='https://
packagemanager.rstudio.com/cran/__linux__/centos7/latest')" \
&& /opt/python/${PYTHON_VERSION}/bin/pip install --upgrade \
    'boto3>1.0<2.0' \
    'awscli>1.0<2.0' \
    'sagemaker[local]<3'
```

- You must provide default values for the `RSTUDIO_CONNECT_URL` and `RSTUDIO_PACKAGE_MANAGER_URL` environment values.

```
ENV RSTUDIO_CONNECT_URL "YOUR_CONNECT_URL"
ENV RSTUDIO_PACKAGE_MANAGER_URL "YOUR_PACKAGE_MANAGER_URL"
ENV RSTUDIO_FORCE_NON_ZERO_EXIT_CODE 1
```

The following general specifications apply to the image that is represented by an RStudio image version.

## Running the image

`ENTRYPOINT` and `CMD` instructions are overridden so that the image is run as an `RSession` application.

## Stopping the image

The `DeleteApp` API issues the equivalent of a `docker stop` command. Other processes in the container won't get the `SIGKILL/SIGTERM` signals.

## File system

The `/opt/.sagemakerinternal` and `/opt/ml` directories are reserved. Any data in these directories might not be visible at runtime.

## User data

Each user in a SageMaker AI domain gets a user directory on a shared Amazon Elastic File System volume in the image. The location of the current user's directory on the Amazon Elastic File System volume is `/home/sagemaker-user`.

## Metadata

A metadata file is located at `/opt/ml/metadata/resource-metadata.json`. No additional environment variables are added to the variables defined in the image. For more information, see [Get App Metadata](#).

## GPU

On a GPU instance, the image is run with the `--gpus` option. Only the CUDA toolkit should be included in the image, not the NVIDIA drivers. For more information, see [NVIDIA User Guide](#).

## Metrics and logging

Logs from the RSession process are sent to Amazon CloudWatch in the customer's account. The name of the log group is `/aws/sagemaker/studio`. The name of the log stream is `$domainID/$userProfileName/RSession/$appName`.

## Image size

Image size is limited to 25 GB. To view the size of your image, run `docker image ls`.

## Create a custom RStudio image

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

This topic describes how you can create a custom RStudio image using the SageMaker AI console and the AWS CLI. If you use the AWS CLI, you must run the steps from your local machine. The following steps do not work from within Amazon SageMaker Studio Classic.

When you create an image, SageMaker AI also creates an initial image version. The image version represents a container image in [Amazon Elastic Container Registry \(ECR\)](#). The container image must satisfy the requirements to be used in RStudio. For more information, see [Custom RStudio image specifications](#).

For information about testing your image locally and resolving common issues, see the [SageMaker Studio Custom Image Samples repo](#).

## Topics

- [Add a SageMaker AI-compatible RStudio Docker container image to Amazon ECR](#)
- [Create a SageMaker image from the console](#)
- [Create an image from the AWS CLI](#)

## Add a SageMaker AI-compatible RStudio Docker container image to Amazon ECR

Use the following steps to add a Docker container image to Amazon ECR:

- Create an Amazon ECR repository.
- Authenticate to Amazon ECR.
- Build a SageMaker AI-compatible RStudio Docker image.
- Push the image to the Amazon ECR repository.

### Note

The Amazon ECR repository must be in the same AWS Region as your domain.

## To build and add a Docker image to Amazon ECR

1. Create an Amazon ECR repository using the AWS CLI. To create the repository using the Amazon ECR console, see [Creating a repository](#).

```
aws ecr create-repository \  
  --repository-name rstudio-custom \  
  --image-scanning-configuration scanOnPush=true
```

Response:

```
{  
  "repository": {  
    "repositoryArn": "arn:aws:ecr:us-east-2:acct-id:repository/rstudio-custom",  
    "registryId": "acct-id",  
    "repositoryName": "rstudio-custom",  
    "repositoryUri": "acct-id.dkr.ecr.us-east-2.amazonaws.com/rstudio-custom",  
    ...  
  }  
}
```

```
}  
}
```

2. Authenticate to Amazon ECR using the repository URI returned as a response from the `create-repository` command. Make sure that the Docker application is running. For more information, see [Registry Authentication](#).

```
aws ecr get-login-password | \  
  docker login --username AWS --password-stdin <repository-uri>
```

Response:

```
Login Succeeded
```

3. Build the Docker image. Run the following command from the directory that includes your Dockerfile.

```
docker build .
```

4. Tag your built image with a unique tag.

```
docker tag <image-id> "<repository-uri>:<tag>"
```

5. Push the container image to the Amazon ECR repository. For more information, see [ImagePush](#) and [Pushing an image](#).

```
docker push <repository-uri>:<tag>
```

Response:

```
The push refers to repository [<account-id>.dkr.ecr.us-east-2.amazonaws.com/  
rstudio-custom]  
r: digest: <digest> size: 3066
```

## Create a SageMaker image from the console

### To create an image

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.

3. Under **Admin configurations**, choose **Images**.
4. On the **Custom images** page, choose **Create image**.
5. For **Image source**, enter the registry path to the container image in Amazon ECR. The path is in the following format:

*acct-id.dkr.ecr.region.amazonaws.com/repo-name[:tag] or [@digest]*

6. Choose **Next**.
7. Under **Image properties**, enter the following:
  - Image name – The name must be unique to your account in the current AWS Region.
  - (Optional) Image display name – The name displayed in the domain user interface. When not provided, Image name is displayed.
  - (Optional) Description – A description of the image.
  - IAM role – The role must have the [AmazonSageMakerFullAccess](#) policy attached. Use the dropdown menu to choose one of the following options:
    - Create a new role – Specify any additional Amazon Simple Storage Service (Amazon S3) buckets that you want your notebooks users to access. If you don't want to allow access to additional buckets, choose **None**.

SageMaker AI attaches the `AmazonSageMakerFullAccess` policy to the role. The role allows your notebook users to access the Amazon S3 buckets listed next to the check marks.

  - Enter a custom IAM role ARN – Enter the Amazon Resource Name (ARN) of your IAM role.
  - Use existing role – Choose one of your existing roles from the list.
  - (Optional) Image tags – Choose **Add new tag**. You can add up to 50 tags. Tags are searchable using the SageMaker AI console or the SageMaker AI Search API.
8. Under **Image type**, select RStudio image.
9. Choose **Submit**.

The new image is displayed in the **Custom images** list and briefly highlighted. After the image has been successfully created, you can choose the image name to view its properties or choose **Create version** to create another version.

## To create another image version

1. Choose **Create version** on the same row as the image.
2. For **Image source**, enter the registry path to the Amazon ECR image. The image shouldn't be the same image as used in a previous version of the SageMaker AI image.

To use the custom image in RStudio, you must attach it to your domain. For more information, see [Attach a custom SageMaker image](#).

## Create an image from the AWS CLI

This section shows how to create a custom Amazon SageMaker image using the AWS CLI.

Use the following steps to create a SageMaker image:

- Create an Image.
- Create an ImageVersion.
- Create a configuration file.
- Create an AppImageConfig.

## To create the SageMaker image entities

1. Create a SageMaker image. The role ARN must have at least the `AmazonSageMakerFullAccessPolicy` policy attached.

```
aws sagemaker create-image \  
  --image-name rstudio-custom-image \  
  --role-arn arn:aws:iam::<acct-id>:role/service-role/<execution-role>
```

Response:

```
{  
  "ImageArn": "arn:aws:sagemaker:us-east-2:acct-id:image/rstudio-custom-image"  
}
```

2. Create a SageMaker image version from the image. Pass the unique tag value that you chose when you pushed the image to Amazon ECR.

```
aws sagemaker create-image-version \  
  --image-name rstudio-custom-image \  
  --tag <tag>
```

```
--image-name rstudio-custom-image \  
--base-image <repository-uri>:<tag>
```

Response:

```
{  
  "ImageVersionArn": "arn:aws:sagemaker:us-east-2:acct-id:image-version/rstudio-  
image/1"  
}
```

3. Check that the image version was successfully created.

```
aws sagemaker describe-image-version \  
  --image-name rstudio-custom-image \  
  --version 1
```

Response:

```
{  
  "ImageVersionArn": "arn:aws:sagemaker:us-east-2:acct-id:image-version/rstudio-  
custom-image/1",  
  "ImageVersionStatus": "CREATED"  
}
```

#### Note

If the response is "ImageVersionStatus": "CREATED\_FAILED", the response also includes the failure reason. A permissions issue is a common cause of failure. You also can check your Amazon CloudWatch Logs. The name of the log group is /aws/sagemaker/studio. The name of the log stream is \$domainID/\$UserProfileName/KernelGateway/\$appName.

4. Create a configuration file, named `app-image-config-input.json`. The app image config is used to configuration for running a SageMaker image as a Kernel Gateway application.

```
{  
  "AppImageConfigName": "rstudio-custom-config"  
}
```

5. Create the `AppImageConfig` using the file that you created in the previous step.

```
aws sagemaker create-app-image-config \  
  --cli-input-json file://app-image-config-input.json
```

Response:

```
{  
  "AppImageConfigArn": "arn:aws:sagemaker:us-east-2:acct-id:app-image-config/r-  
image-config"  
}
```

## Attach a custom SageMaker image

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

This guide shows how to attach a custom RStudio image to your Amazon SageMaker AI domain using the SageMaker AI console or the AWS Command Line Interface (AWS CLI).

To use a custom SageMaker image, you must attach a custom RStudio image to your domain. When you attach an image version, it appears in the RStudio Launcher and is available in the **Select image** dropdown list. You use the dropdown to change the image used by RStudio.

There is a limit to the number of image versions that you can attach. After you reach the limit, you must first detach a version so that you can attach a different version of the image.

## Topics

- [Attach an image version to your domain using the console](#)
- [Attach an existing image version to your domain using the AWS CLI](#)

## Attach an image version to your domain using the console

You can attach a custom SageMaker image version to your domain using the SageMaker AI console's control panel. You can also create a custom SageMaker image, and an image version, and then attach that version to your domain.

### To attach an existing image

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. Select the desired domain.
5. Choose **Environment**.
6. Under **Custom SageMaker Studio Classic images attached to domain**, choose **Attach image**.
7. For **Image source**, choose **Existing image** or **New image**.

If you select **Existing image**, choose an image from the Amazon SageMaker image store.

If you select **New image**, provide the Amazon ECR registry path for your Docker image. The path must be in the same AWS Region as the domain. The Amazon ECR repo must be in the same account as your domain, or cross-account permissions for SageMaker AI must be enabled.

8. Choose an existing image from the list.
9. Choose a version of the image from the list.
10. Choose **Next**.
11. Enter values for **Image name**, **Image display name**, and **Description**.
12. Choose the IAM role. For more information, see [Create a custom RStudio image](#).
13. (Optional) Add tags for the image.
14. (Optional) Choose **Add new tag**, then add a configuration tag.
15. For **Image type**, select **RStudio Image**.
16. Choose **Submit**.

Wait for the image version to be attached to the domain. After the version is attached, it appears in the **Custom images** list and is briefly highlighted.

### Attach an existing image version to your domain using the AWS CLI

Two methods are presented to attach the image version to your domain using the AWS CLI. In the first method, you create a new domain with the version attached. This method is simpler but you must specify the Amazon Virtual Private Cloud (Amazon VPC) information and execution role that's required to create the domain.

If you have already onboarded to the domain, you can use the second method to attach the image version to your current domain. In this case, you don't need to specify the Amazon VPC information and execution role. After you attach the version, delete all of the applications in your domain and relaunch RStudio.

### Attach the SageMaker image to a new domain

To use this method, you must specify an execution role that has the [AmazonSageMakerFullAccess](#) policy attached.

Use the following steps to create the domain and attach the custom SageMaker AI image:

- Get your default VPC ID and subnet IDs.
- Create the configuration file for the domain, which specifies the image.
- Create the domain with the configuration file.

### To add the custom SageMaker image to your domain

1. Get your default VPC ID.

```
aws ec2 describe-vpcs \  
  --filters Name=isDefault,Values=true \  
  --query "Vpcs[0].VpcId" --output text
```

Response:

```
vpc-xxxxxxxx
```

2. Get your default subnet IDs using the VPC ID from the previous step.

```
aws ec2 describe-subnets \
  --filters Name=vpc-id,Values=<vpc-id> \
  --query "Subnets[*].SubnetId" --output json
```

Response:

```
[
  "subnet-b55171dd",
  "subnet-8a5f99c6",
  "subnet-e88d1392"
]
```

3. Create a configuration file named `create-domain-input.json`. Insert the VPC ID, subnet IDs, `ImageName`, and `AppImageConfigName` from the previous steps. Because `ImageVersionNumber` isn't specified, the latest version of the image is used, which is the only version in this case. Your execution role must satisfy the requirements in [Complete prerequisites](#).

```
{
  "DomainName": "domain-with-custom-r-image",
  "VpcId": "<vpc-id>",
  "SubnetIds": [
    "<subnet-ids>"
  ],
  "DomainSettings": {
    "RStudioServerProDomainSettings": {
      "DomainExecutionRoleArn": "<execution-role>"
    }
  },
  "DefaultUserSettings": {
    "ExecutionRole": "<execution-role>",
    "RSessionAppSettings": {
      "CustomImages": [
        {
          "AppImageConfigName": "rstudio-custom-config",
          "ImageName": "rstudio-custom-image"
        }
      ]
    }
  },
  "AuthMode": "IAM"
}
```

```
}
```

#### 4. Create the domain with the attached custom SageMaker image.

```
aws sagemaker create-domain \  
  --cli-input-json file://create-domain-input.json
```

Response:

```
{  
  "DomainArn": "arn:aws:sagemaker:region:acct-id:domain/domain-id",  
  "Url": "https://domain-id.studio.region.sagemaker.aws/..."  
}
```

### Attach the SageMaker image to an existing domain

This method assumes that you've already onboarded to domain. For more information, see [Amazon SageMaker AI domain overview](#).

#### Note

You must delete all of the applications in your domain to update the domain with the new image version. For information about deleting these applications, see [Delete an Amazon SageMaker AI domain](#).

Use the following steps to add the SageMaker image to your current domain.

- Get your DomainID from the SageMaker AI console.
- Use the DomainID to get the DefaultUserSettings for the domain.
- Add the ImageName and AppImageConfig as a CustomImage to the DefaultUserSettings.
- Update your domain to include the custom image.

### To add the custom SageMaker image to your domain

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.

3. Under **Admin configurations**, choose **domains**.
4. Select the desired domain.
5. Choose **domain settings**.
6. Under **General Settings**, find the **domain ID**. The ID is in the following format: d-xxxxxxxxxxxxx.
7. Use the domain ID to get the description of the domain.

```
aws sagemaker describe-domain \
  --domain-id <d-xxxxxxxxxxxxx>
```

Response:

```
{
  "DomainId": "d-xxxxxxxxxxxxx",
  "DefaultUserSettings": {
    "KernelGatewayAppSettings": {
      "CustomImages": [
        ],
      ...
    }
  }
}
```

8. Save the `DefaultUserSettings` section of the response to a file named `update-domain-input.json`.
9. Insert the `ImageName` and `AppImageConfigName` from the previous steps as a custom image. Because `ImageVersionNumber` isn't specified, the latest version of the image is used, which is the only version in this case.

```
{
  "DefaultUserSettings": {
    "RSessionAppSettings": {
      "CustomImages": [
        {
          "ImageName": "rstudio-custom-image",
          "AppImageConfigName": "rstudio-custom-config"
        }
      ]
    }
  }
}
```

```
}  
}
```

10. Use the domain ID and default user settings file to update your domain.

```
aws sagemaker update-domain \  
  --domain-id <d-xxxxxxxxxxxx> \  
  --cli-input-json file://update-domain-input.json
```

Response:

```
{  
  "DomainArn": "arn:aws:sagemaker:region:acct-id:domain/domain-id"  
}
```

11. Delete the RStudioServerPro application. You must restart the RStudioServerPro domain-shared application for the RStudio Launcher UI to pick up the latest changes.

```
aws sagemaker delete-app \  
  --domain-id <d-xxxxxxxxxxxx> --user-profile-name domain-shared \  
  --app-type RStudioServerPro --app-name default
```

12. Create a new RStudioServerPro application. You must create this application using the AWS CLI.

```
aws sagemaker create-app \  
  --domain-id <d-xxxxxxxxxxxx> --user-profile-name domain-shared \  
  --app-type RStudioServerPro --app-name default
```

## Launch a custom SageMaker image in RStudio

You can use your custom image when launching an RStudio application from the console. After you create your custom SageMaker image and attach it to your domain, the image appears in the image selector dialog box of the RStudio Launcher. To launch a new RStudio app, follow the steps in [Launch RSessions from the RStudio Launcher](#) and select your custom image as shown in the following image.

**New Session**

Session Name

Editor

Cluster

**OPTIONS**

Instance Type

Image

## Clean up image resources

This guide shows how to clean up RStudio image resources that you created in the previous sections. To delete an image, complete the following steps using either the SageMaker AI console or the AWS CLI, as shown in this guide.

- Detach the image and image versions from your Amazon SageMaker AI domain.
- Delete the image, image version, and app image config.

After you've completed these steps, you can delete the container image and repository from Amazon ECR. For more information about how to delete the container image and repository, see [Deleting a repository](#).

## Clean up resources from the SageMaker AI console

When you detach an image from a domain, all versions of the image are detached. When an image is detached, all users of the domain lose access to the image versions.

### To detach an image

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. Select the desired domain.
5. Choose **Environment**.
6. Under **Custom images attached to domain**, choose the image and then choose **Detach**.
7. (Optional) To delete the image and all versions from SageMaker AI, select **Also delete the selected images ...** This does not delete the associated images from Amazon ECR.
8. Choose **Detach**.

## Clean up resources from the AWS CLI

### To clean up resources

1. Detach the image and image versions from your domain by passing an empty custom image list to the domain. Open the `update-domain-input.json` file that you created in [Attach the SageMaker image to your current domain](#).
2. Delete the `RSessionAppSettings` custom images and then save the file. Do not modify the `KernelGatewayAppSettings` custom images.

```
{
  "DomainId": "d-xxxxxxxxxxxx",
  "DefaultUserSettings": {
    "KernelGatewayAppSettings": {
      "CustomImages": [
      ],
      ...
    },
    "RSessionAppSettings": {
      "CustomImages": [
      ],

```

```

        "DefaultResourceSpec": {
          }
        ...
      }
    }
  }
}

```

3. Use the domain ID and default user settings file to update your domain.

```

aws sagemaker update-domain \
  --domain-id <d-xxxxxxxxxxxx> \
  --cli-input-json file://update-domain-input.json

```

Response:

```

{
  "DomainArn": "arn:aws:sagemaker:us-east-2:acct-id:domain/d-xxxxxxxxxxxx"
}

```

4. Delete the app image config.

```

aws sagemaker delete-app-image-config \
  --app-image-config-name rstudio-image-config

```

5. Delete the SageMaker image, which also deletes all image versions. The container images in Amazon ECR that are represented by the image versions are not deleted.

```

aws sagemaker delete-image \
  --image-name rstudio-image

```

## Create a user to use RStudio

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can

occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

After your RStudio-enabled Amazon SageMaker AI domain is running, you can add user profiles (UserProfiles) to the domain. The following topics show how to create user profiles that are authorized to use RStudio, as well as update an existing user profile. For information on how to delete an RStudio App, UserProfile, or domain, follow the steps in [Delete an Amazon SageMaker AI domain](#).

 **Note**

The limit for the total number of UserProfiles in a Amazon SageMaker AI domain is 60.

There are two types of users:

- **Unauthorized:** This user cannot access the RStudio app.
- **Authorized:** This user can access the RStudio app and use one of the RStudio license seats. By default, a new user is Authorized if the domain is enabled for RStudio.

Changing a user's authorization status is only valid from Unauthorized to Authorized. If a user is authorized, they can be given one of the following levels of access to RStudio.

- **RStudio User:** This is a standard RStudio user and can access RStudio.
- **RStudio Admin:** The admin of your Amazon SageMaker AI domain has the ability to create users, add existing users, and update the permissions of existing users. Admins can also access the RStudio Administrative dashboard. However, this admin is not able to update parameters that are managed by Amazon SageMaker AI.

## Methods to create a user

The following topics show how to create a user in your RStudio-enabled Amazon SageMaker AI domain.

## Create user console

To create a user in your RStudio-enabled Amazon SageMaker AI domain from the console, complete the steps in [Add user profiles](#).

## Create user CLI

The following command shows how to add users to a Amazon SageMaker AI domain with IAM authentication. A User can belong to either the R\_STUDIO\_USER or R\_STUDIO\_ADMIN User group.

```
aws sagemaker create-user-profile --region <REGION> \  
  --domain-id <DOMAIN-ID> \  
  --user-profile-name <USER_PROFILE_NAME-ID> \  
  --user-settings RStudioServerProAppSettings={UserGroup=<USER-GROUP>}
```

The following command shows how to add users to a Amazon SageMaker AI domain with authentication using IAM Identity Center. A user can belong to either the R\_STUDIO\_USER or R\_STUDIO\_ADMIN User group.

```
aws sagemaker create-user-profile --region <REGION> \  
  --domain-id <DOMAIN-ID> \  
  --user-profile-name <USER_PROFILE_NAME-ID> \  
  --user-settings RStudioServerProAppSettings={UserGroup=<USER-GROUP>} \  
  --single-sign-on-user-identifier UserName \  
  --single-sign-on-user-value <USER-NAME>
```

## Log in to RStudio as another user

The following topic demonstrates how to log in to RStudio on Amazon SageMaker AI as another user.

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. Select the domain containing the user profile.
5. Select a user name from the list of users. This opens a new page with details about the user profile and the apps that are running.
6. Select **Launch**.
7. From the dropdown, select **RStudio** to launch an RStudio instance.

## Terminate sessions for another user

The following topic demonstrates how to terminate sessions for another user in RStudio on Amazon SageMaker AI.

1. From the list of running apps, identify the app you want to delete.
2. Click the respective **Delete app** button for the app you are deleting.

## Use the RStudio administrative dashboard

This topic shows how to access and use the RStudio administrative dashboard. With the RStudio administrative dashboard, admins can manage users and RSessions, as well as view information about RStudio Server instance utilization and Amazon CloudWatch Logs.

### Launch the RStudio administrative dashboard

The `R_STUDIO_ADMIN` authorization allows the user to access the RStudio administrative dashboard. An `R_STUDIO_ADMIN` user can access the RStudio administrative dashboard by replacing `workspaces` with `admin` in their RStudio URL manually. The following shows how to modify the URL to access the RStudio administrative dashboard.

For example, the following RStudio URL:

```
https://<DOMAIN-ID>.studio.us-east-2.sagemaker.aws/rstudio/default/s/<SESSION-ID>/workspaces
```

Can be converted to:

```
https://<DOMAIN-ID>.studio.us-east-2.sagemaker.aws/rstudio/default/s/<SESSION-ID>/admin
```

### Dashboard tab

This tab gives an overview of your RStudio Server instance utilization, as well as information on the number of active RSessions.

### Sessions tab

This tab gives information on the active RSessions, such as the user that launched the RSessions, the time that the RSessions have been running, and their resource utilization.

## Users tab

This tab gives information on the RStudio authorized users in the domain, such as the time that the last RSession was launched and their resource utilization.

## Stats tab

This tab gives information on the utilization of your RStudio Server instance.

## Logs tab

This tab displays Amazon CloudWatch Logs for the RStudio Server instance. For more information about logging events with Amazon CloudWatch Logs, see [What is Amazon CloudWatch Logs?](#).

## Shut down RStudio

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#). [AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

To shut down and restart your Posit Workbench and the associated RStudioServerPro app, you must first shut down all of your existing RSessions. You can shut down the RSessionGateway apps from within RStudio. You can then shut down the RStudioServerPro app using the AWS CLI. After the RStudioServerPro app is shut down, you must reopen RStudio through the SageMaker AI console.

Any unsaved notebook information is lost in the process. The user data in the Amazon EFS volume isn't impacted.

**Note**

If you are using a custom image with RStudio, ensure that your docker image is using an RStudio version that is compatible with the version of Posit Workbench being used by SageMaker AI after you restart your RStudioServerPro app.

The following topics show how to shut down the RSessionGateway and RStudioServerPro apps and restart them.

## Suspend your RSessions

Complete the following procedure to suspend all of your RSessions.

1. From the RStudio Launcher, identify the RSession that you want to suspend.
2. Select **Suspend** for the session.
3. Repeat this for all RSessions.

## Delete your RSessions

Complete the following procedure to shut down all of your RSessions.

1. From the RStudio Launcher, identify the RSession that you want to delete.
2. Select **Quit** for the session. This opens a new **Quit Session** window.
3. From the **Quit Session** window, select **Force Quit**, to end all child processes in the session.
4. Select **Quit Session** to confirm deletion of the session.
5. Repeat this for all RSessions.

## Delete your RStudioServerPro app

Run the following commands from the AWS CLI to delete and restart your RStudioServerPro app.

1. Delete the RStudioServerPro application by using your current domain id.

```
aws sagemaker delete-app \  
  --domain-id <domainId> \  
  --user-profile-name domain-shared \  
  --
```

```
--app-type RStudioServerPro \  
--app-name default
```

## 2. Re-create the RStudioServerPro application.

```
aws sagemaker create-app \  
  --domain-id <domainId> \  
  --user-profile-name domain-shared \  
  --app-type RStudioServerPro \  
  --app-name default
```

## Billing and cost

To track the costs associated with your RStudio environment, you can use the AWS Billing and Cost Management service. AWS Billing and Cost Management provides useful tools to help you gather information related to your cost and usage, analyze your cost drivers and usage trends, and take action to budget your spending. For more information, see [What is AWS Billing and Cost Management?](#). The following describes components required to run RStudio on Amazon SageMaker AI and how each component factors into billing for your RStudio instance.

- **RStudio License** –You must purchase an RStudio license. There is no additional charge for using your RStudio license with Amazon SageMaker AI. For more information about your RStudio license, see [Get an RStudio license](#).
- **RSession** - These are RStudio working sessions launched by end users. You are charged while the RSession is running.
- **RStudio Server** - A multi-tenant server manages all the RSessions. You can choose the instance type to run RStudio Server on, and pay the related costs. The default instance, "system", is free, but you can choose to pay for higher tiers. For more information about the available instance types for your RStudio Server, see [RStudioServerPro instance type](#).

## Tracking billing at user level

To track billing at the user level using Cost Allocation Tags, see [Using Cost Allocation Tags](#).

## Diagnose issues and get support

The following sections describe how to diagnose issues with RStudio on Amazon SageMaker AI. To get support for RStudio on Amazon SageMaker AI, contact Amazon SageMaker AI support.

For help with purchasing an RStudio license or modifying the number of license seats, contact [sales@rstudio.com](mailto:sales@rstudio.com).

## Upgrade your version

If you receive a warning that there is a version mismatch between your RSession and RStudioServerPro apps, then you must upgrade the version of your RStudioServerPro app. For more information, see [RStudio Versioning](#).

## View Metrics and Logs

You can monitor your workflow performance while using RStudio on Amazon SageMaker AI. View data logs and information about metrics with the RStudio administrative dashboard or Amazon CloudWatch.

### View your RStudio logs from the RStudio administrative dashboard

You can view metrics and logs directly from the RStudio administrative dashboard.

1. Log in to your **Amazon SageMaker AI domain**.
2. Navigate to the RStudio administrative dashboard following the steps in [Use the RStudio administrative dashboard](#).
3. Select the **Logs** tab.

### View your RStudio logs from Amazon CloudWatch Logs

Amazon CloudWatch monitors your AWS resources and the applications that you run on AWS in real time. You can use Amazon CloudWatch to collect and track metrics, which are variables that you can measure for your resources and applications. To ensure that your RStudio apps have permissions for Amazon CloudWatch, you must include the permissions described in [Amazon SageMaker AI domain overview](#). You don't need to do any setup to gather Amazon CloudWatch Logs.

The following steps show how to view Amazon CloudWatch Logs for your RSession.

These logs can be found in the `/aws/sagemaker/studio` log stream from the AWS CloudWatch console.

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. Select Logs from the left side. From the dropdown menu, select Log groups.

3. On the Log groups screen, search for `aws/sagemaker/studio`. Select the Log group.
4. On the `aws/sagemaker/studio` Log group screen, navigate to the Log streams tab.
5. To find the logs for your domain, search Log streams using the following format:

```
<DomainId>/domain-shared/rstudioserverpro/default
```

## RStudio on Amazon SageMaker AI user guide

With RStudio support in Amazon SageMaker AI, you can put your production workflows in place and take advantage of SageMaker AI features. The following topics show how to launch an RStudio session and complete key workflows. For information about managing RStudio on SageMaker AI, see [RStudio on Amazon SageMaker AI management](#).

For information about the onboarding steps to create an Amazon SageMaker AI domain with RStudio enabled, see [Amazon SageMaker AI domain overview](#).

For information about the AWS Regions that RStudio on SageMaker AI is supported in, see [Supported Regions and Quotas](#).

### Topics

- [Collaborate in RStudio](#)
- [Base R image](#)
- [RSession application colocation](#)
- [Launch RSessions from the RStudio Launcher](#)
- [Suspend your RSessions](#)
- [Delete your RSessions](#)
- [RStudio Connect](#)
- [Amazon SageMaker AI feature integration with RStudio on Amazon SageMaker AI](#)

## Collaborate in RStudio

To share your RStudio project, you can connect RStudio to your Git repo. For information on setting this up, see [Version Control with Git and SVN](#).

Note: Project sharing and realtime collaboration are not currently supported when using RStudio on Amazon SageMaker AI.

## Base R image

When launching your RStudio instance, the Base R image serves as the basis of your instance. This image extends the [r-session-complete](#) Docker image.

This Base R image includes the following:

- R v4.0 or higher
- `awscli`, `sagemaker`, and `boto3` Python packages
- [Reticulate](#) package for R SDK integration

## RSession application colocation

Users can create multiple RSession applications on the same instance. Each instance type supports up to four colocated RSession applications. This applies to each user independently. For example, if two users create applications, then SageMaker AI allocates different underlying instances to each user. Each of these instances would support 4 RSession applications.

Customers only pay for the instance type used regardless of how many Rsession applications are running on the instance. If a user creates an RSession with a different associated instance type, then a new underlying instance is created.

## Launch RSessions from the RStudio Launcher

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

The following sections show how to use the RStudio Launcher to launch RSessions. They also include information about how to open the RStudio Launcher when using RStudio on Amazon SageMaker AI.

## Open RStudio Launcher

Open the RStudio launcher using the following set of procedures that matches your environment.

### Open RStudio Launcher from the Amazon SageMaker AI Console

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. From the left navigation, select **RStudio**.
3. Under **Get Started**, select the domain and user profile to launch.
4. Choose **Launch RStudio**.

### Open RStudio Launcher from Amazon SageMaker Studio

1. Navigate to Studio following the steps in [Launch Amazon SageMaker Studio](#).
2. Under **Applications**, select **RStudio**.
3. From the RStudio landing page, choose **Launch application**.

### Open RStudio Launcher from the AWS CLI

The procedure to open the RStudio Launcher using the AWS CLI differs depending on the method used to manage your users.

#### IAM Identity Center

1. Use the AWS access portal to open your Amazon SageMaker AI domain.
2. Modify the URL path to “/rstudio/default” as follows.

```
#Studio URL
https://<domain-id>.studio.<region>.sagemaker.aws/jupyter/default/lab

#modified URL
https://<domain-id>.studio.<region>.sagemaker.aws/rstudio/default
```

## IAM

To open the RStudio Launcher from the AWS CLI in IAM mode, complete the following procedure.

1. Create a presigned URL using the following command.

```
aws sagemaker create-presigned-domain-url --region <REGION> \  
--domain-id <DOMAIN-ID> \  
--user-profile-name <USER-PROFILE-NAME>
```

2. Append `&redirect=RStudioServerPro` to the generated URL.
3. Navigate to the updated URL.

## Launch RSessions

After you've launched the RStudio Launcher, you can create a new RSession.

1. Select **New Session**.
2. Enter a **Session Name**.
3. Select an instance type that your RSession runs on. This defaults to `m1.t3.medium`.
4. Select an Image that your RSession uses as the kernel.
5. Select **Start Session**.
6. After your session has been created, you can start it by selecting the name.

### Note

If you receive a warning that there is a version mismatch between your RSession and RStudioServerPro apps, then you must upgrade the version of your RStudioServerPro app. For more information, see [RStudio Versioning](#).

## Suspend your RSessions

The following procedure demonstrates how to suspend an RSession from the RStudio Launcher when using RStudio on Amazon SageMaker AI. For information about accessing the RStudio Launcher, see [Launch RSessions from the RStudio Launcher](#).

1. From the RStudio Launcher, identify the RSession that you want to suspend.
2. Select **Suspend** for the session.

## Delete your RSessions

The following procedure demonstrates how to delete an RSession from the RStudio Launcher when using RStudio on Amazon SageMaker AI. For information about accessing the RStudio Launcher, see [Launch RSessions from the RStudio Launcher](#).

1. From the RStudio Launcher, identify the RSession that you want to delete.
2. Select **Quit** for the session. This opens a new **Quit Session** window.
3. From the **Quit Session** window, select **Force Quit**, to end all child processes in the session.
4. Select **Quit Session** to confirm deletion of the session.

## RStudio Connect

RStudio Connect enables data scientists to publish insights, dashboard and web applications from RStudio on Amazon SageMaker AI. For more information, see [Host RStudio Connect and Package Manager for ML development in RStudio on Amazon SageMaker AI](#).

For more information on RStudio Connect, see the [RStudio Connect User Guide](#).

## Amazon SageMaker AI feature integration with RStudio on Amazon SageMaker AI

One of the benefits of using RStudio on Amazon SageMaker AI is the integration of Amazon SageMaker AI features. This includes integration with Amazon SageMaker Studio Classic and Reticulate. The following gives information about these integrations and examples for using them.

### Use Amazon SageMaker Studio Classic and RStudio on Amazon SageMaker AI

Your Amazon SageMaker Studio Classic and RStudio instances share the same Amazon EFS file system. This means that files that you import and create using Studio Classic can be accessed using RStudio and vice versa. This allows you to work on the same files using both Studio Classic and RStudio without having to move your files between the two. For more information on this workflow, see the [Announcing Fully Managed RStudio on Amazon SageMaker AI for Data Scientists](#) blog.

### Use Amazon SageMaker SDK with reticulate

The [reticulate](#) package is used as an R interface to [Amazon SageMaker Python SDK](#) to make API calls to Amazon SageMaker. The reticulate package translates between R and Python objects, and Amazon SageMaker AI provides a serverless data science environment to train and deploy

Machine Learning (ML) models at scale. For general information about the reticulate package, see [R Interface to Python](#).

For a blog that outlines how to use the reticulate package with Amazon SageMaker AI, see [Using R with Amazon SageMaker AI](#).

The following examples show how to use reticulate for specific use cases.

- For a notebook that describes how to use reticulate to do batch transform to make predictions, see [Batch Transform Using R with Amazon SageMaker AI](#).
- For a notebook that describes how to use reticulate to conduct hyperparameter tuning and generate predictions, see [Hyperparameter Optimization Using R with Amazon SageMaker AI](#).

## Code Editor in Amazon SageMaker Studio

Code Editor, based on [Code-OSS, Visual Studio Code - Open Source](#), helps you write, test, debug, and run your analytics and machine learning code. Code Editor extends and is fully integrated with Amazon SageMaker Studio. It also supports integrated development environment (IDE) extensions available in the [Open VSX Registry](#). The following page gives information about Code Editor and key details for using it.

Code Editor has the [AWS Toolkit for VS Code](#) extension pre-installed, which enables connections to AWS services such as [Amazon CodeWhisperer](#), a general purpose, machine learning-powered code generator that provides code recommendations in real time. For more information about extensions, see [Code Editor Connections and Extensions](#).

### Important

As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. The following section is specific to using the updated Studio experience. For information about using the Studio Classic application, see [Amazon SageMaker Studio Classic](#).

To launch Code Editor, create a Code Editor private space. The Code Editor space uses a single Amazon Elastic Compute Cloud (Amazon EC2) instance for your compute and a single Amazon Elastic Block Store (Amazon EBS) volume for your storage. Everything in your space such as your code, Git profile, and environment variables are stored on the same Amazon EBS volume. The

volume has 3000 IOPS and a throughput of 125 MBps. Your administrator has configured the default Amazon EBS storage settings for your space.

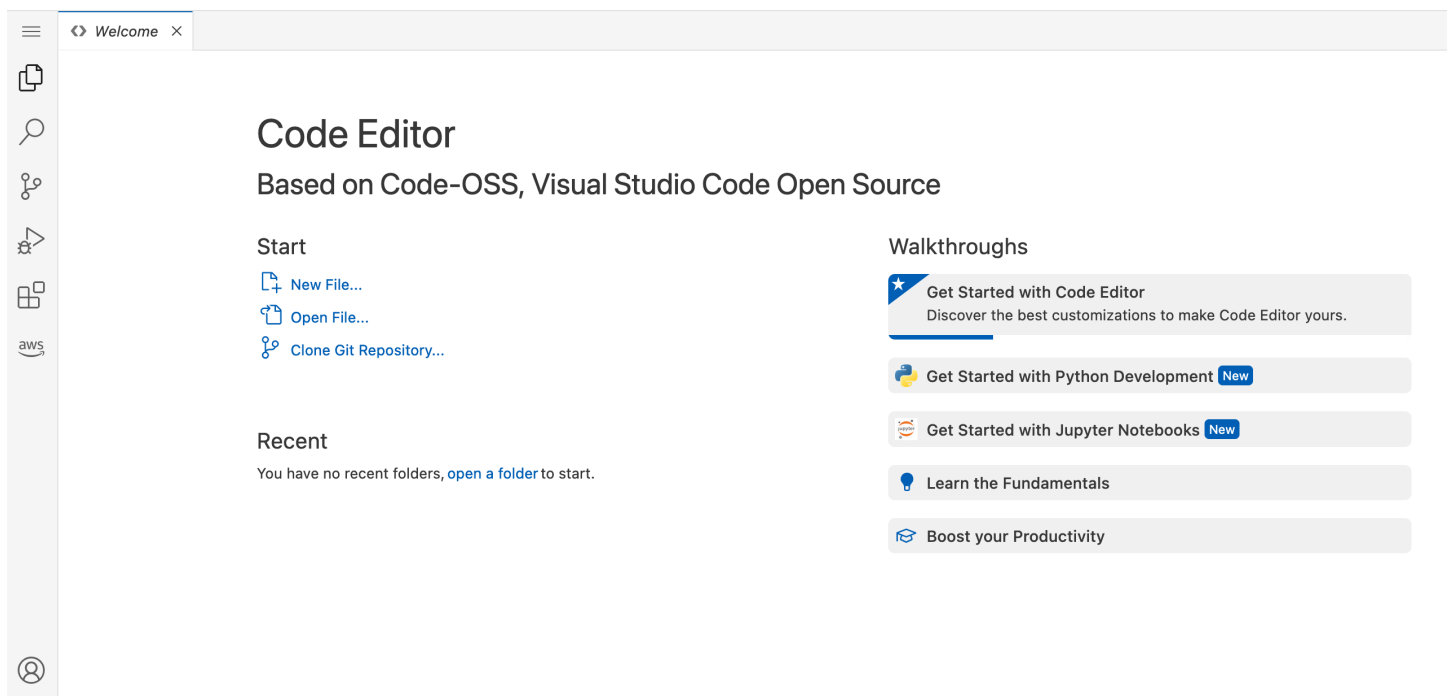

The default storage size is 5 GB, but your administrator can increase the amount of space you get. For more information, see [Change the default storage size](#).

The working directory of your users within the storage volume is `/home/sagemaker-user`. If you specify your own AWS KMS key to encrypt the volume, everything in the working directory is encrypted using your customer managed key. If you don't specify an AWS KMS key, the data inside `/home/sagemaker-user` is encrypted with an AWS managed key. Regardless of whether you specify an AWS KMS key, all of the data outside of the working directory is encrypted with an AWS Managed Key.

You can scale your compute up or down by changing the Amazon EC2 instance type that runs your Code Editor application. Before you change the associated instance type, you must first stop your Code Editor space. For more information, see [Code Editor application instances and images](#).

Your administrator might provide you with a lifecycle configuration to customize your environment. You can specify the lifecycle configuration when you create the space. For more information, see [Code Editor lifecycle configurations](#).

You can also bring your own file storage system if you have an Amazon EFS volume.

## Topics

- [Using the Code Editor](#)
- [Code Editor administrator guide](#)

## Using the Code Editor

The topics in this section provide guides for using Code Editor, including how to launch, add connections to AWS services, shut down resources, and more. After creating a Code Editor space, you can access your Code Editor session directly through the browser.

Within your Code Editor environment, you can do the following:

- Access all artifacts persisted in your home directory
- Clone your GitHub repositories and commit changes
- Access the SageMaker Python SDK

You can return to Studio to review any assets created in your Code Editor environment such as experiments, pipelines, or training jobs.

### Topics

- [Check the version of Code Editor](#)
- [Code Editor application instances and images](#)
- [Launch a Code Editor application in Studio](#)
- [Launch a Code Editor application using the AWS CLI](#)
- [Clone a repository in Code Editor](#)
- [Code Editor Connections and Extensions](#)
- [Shut down Code Editor resources](#)

## Check the version of Code Editor

The following steps show how to check the version of your Code Editor application.

### To check the Code Editor application version

1. Launch and run a Code Editor space and navigate to the Code Editor application UI. For more information, see [Launch a Code Editor application in Studio](#).

- In the upper-left corner of the Code Editor UI, choose the menu button

).

Then, choose **Help**. Then, choose **About**.

## Code Editor application instances and images

Only some instances are compatible with Code Editor applications. You can choose the instance type that is compatible with your use case from the **Instance** dropdown menu.

The **Fast launch** instances start up much faster than the other instances. For more information about fast launch instance types in Studio, [Instance types available for use with Studio Classic](#).

### Note

If you use a GPU instance type when configuring your Code Editor application, you must also use a GPU-based image. The Code Editor space UI automatically selects a compatible image when you select your instance type.

Within a space, your data is stored in an Amazon EBS volume that persists independently from the life of an instance. You won't lose your data when you change instances. If your Code Editor space is Running, you must stop your space before changing instance types.

The following table lists the ARNs of the available Code Editor CPU and GPU images for each Region.

Region	CPU	GPU
us-east-1	arn:aws:sagemaker:us-east-1:885854791233:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-east-1:885854791233:image/sagemaker-distribution-gpu
us-east-2	arn:aws:sagemaker:us-east-2:37914896644:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-east-2:37914896644:image/sagemaker-distribution-gpu

Region	CPU	GPU
us-west-1	arn:aws:sagemaker:us-west-1:053634841547:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-west-1:053634841547:image/sagemaker-distribution-gpu

cn-north-1	arn:aws:sagemaker:cn-north-1:674439102856:image/sagemaker-distribution-cpu	arn:aws:sagemaker:cn-north-1:674439102856:image/sagemaker-distribution-gpu
cn-northwest-1	arn:aws:sagemaker:cn-northwest-1:651871951035:image/sagemaker-distribution-cpu	arn:aws:sagemaker:cn-northwest-1:651871951035:image/sagemaker-distribution-gpu
us-gov-west-1	arn:aws:sagemaker:us-gov-west-1:300992924816:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-gov-west-1:300992924816:image/sagemaker-distribution-gpu
us-gov-east-1	arn:aws:sagemaker:us-gov-east-1:300993876623:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-gov-east-1:300993876623:image/sagemaker-distribution-gpu

If you encounter instance limits, contact your administrator. To get more storage and compute for a user, administrators can request an increase to a user's AWS quotas. For more information about requesting a quota increase, see [Amazon SageMaker AI endpoints and quotas](#).

## Launch a Code Editor application in Studio

To configure and access your Code Editor integrated development environment through Studio, you must create a Code Editor space. For more information about spaces in Studio, see [Amazon SageMaker Studio spaces](#).

The following procedure shows how to create and run a Code Editor space.

### To create and run a Code Editor space

1. Launch the updated Studio experience. For more information, see [Launch Amazon SageMaker Studio](#).
2. Do one of the following:
  - Within the updated Amazon SageMaker Studio UI, select **Code Editor** from the **Applications** menu.
  - Within the updated Amazon SageMaker Studio UI, choose **View Code Editor spaces** in the **Overview** section of the Studio homepage.
3. In the upper-right corner of the Code Editor landing page, choose **Create Code Editor space**.
4. Enter a name for your Code Editor space. The name must be 1–62 characters in length using letters, numbers, and dashes only.

5. Choose **Create space**.
6. After the space is created, you have some options before you choose to run the space:
  - You can edit the **Storage (GB)**, **Lifecycle Configuration**, or **Attach custom EFS file system** settings. Options for these settings are available based on administrator specification.
  - From the **Instance** dropdown menu, you can choose the instance type most compatible with your use case. From the **Image** dropdown menu, you can choose a SageMaker Distribution image or a custom image provided by your administrator.

 **Note**

Switching between sagemaker-distribution images changes the underlying version of Code Editor being used, which may cause incompatibilities due to browser caching. You should clear the browser cache when switching between images.

If you use a GPU instance type when configuring your Code Editor application, you must also use a GPU-based image. Within a space, your data is stored in an Amazon EBS volume that persists independently from the life of an instance. You won't lose your data when you change instances.

 **Important**

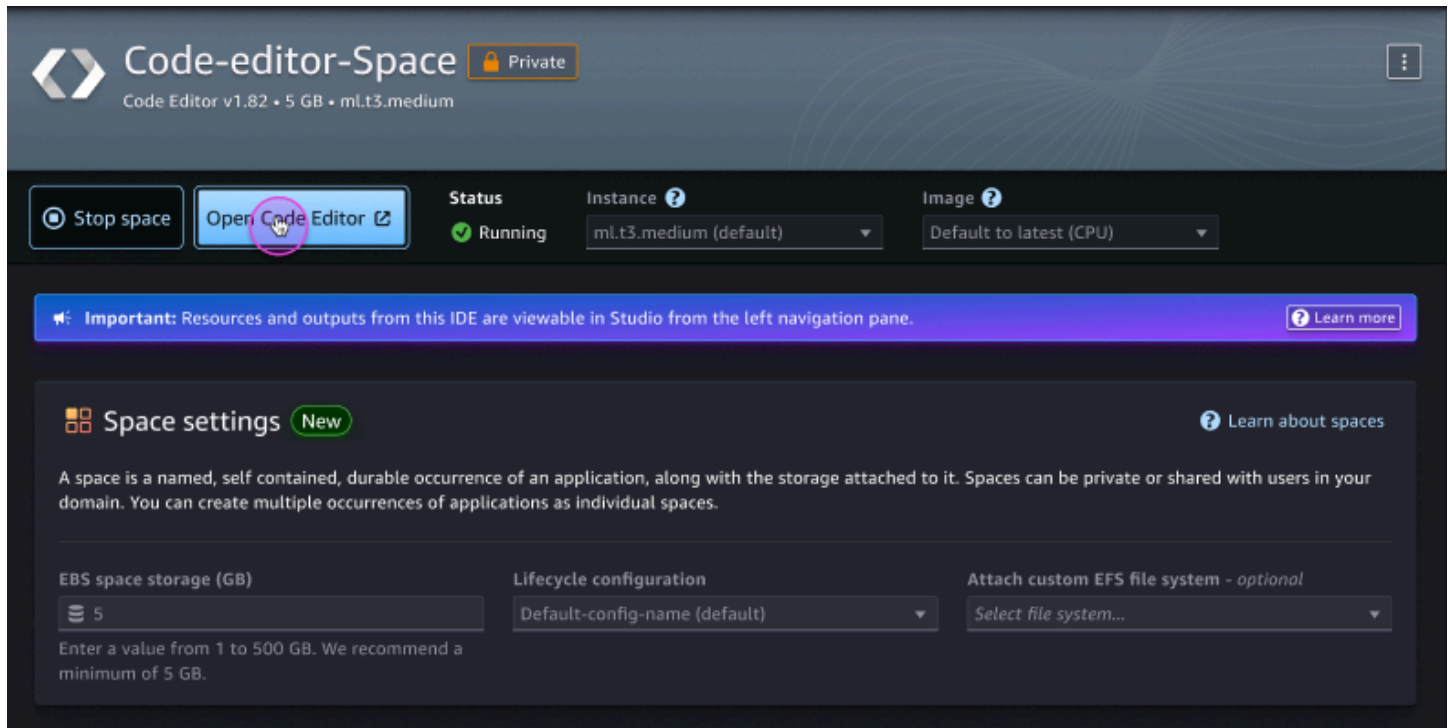

Custom IAM policies that allow Studio users to create spaces must also grant permissions to list images (`sagemaker: ListImage`) to view custom images. To add the permission, see [Add or remove identity permissions](#) in the *AWS Identity and Access Management User Guide*.

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker AI resources already include permissions to list images while creating those resources.

 **Note**

To update space settings, you must first stop your space. If your Code Editor uses an instance with NVMe instance stores, any data stored on the NVMe store is deleted when the space is stopped.

7. After updating your settings, choose **Run Space** in the space detail page.
8. After the status of the space is Running, choose **Open Code Editor** to go to your Code Editor session.

## Launch a Code Editor application using the AWS CLI

To configure and access your Code Editor integrated development environment through the AWS Command Line Interface (AWS CLI), you must create a Code Editor space. Be sure to meet the [Complete prerequisites](#) before going through the following steps. Use the following procedure to create and run a Code Editor space.

### To create and run a Code Editor space

1. Access a space using AWS Identity and Access Management (IAM) or AWS IAM Identity Center authentication. For more information about accessing spaces using the AWS CLI, see *Accessing spaces using the AWS Command Line Interface* in [Amazon SageMaker Studio spaces](#).
2. Create an application and specify CodeEditor as the app-type using the following command.

If you use a GPU instance type when creating your Code Editor application, you must also use a GPU-based image.

```
aws sagemaker create-app \  
--domain-id domain-id \  
--space-name space-name \  
--app-type CodeEditor \  
--app-name default \  
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:account-  
id:image/sagemaker-distribution-cpu"
```

For more information about available Code Editor image ARNs, see [Code Editor application instances and images](#).

3. After the Code Editor application is in service, launch the application using a presigned URL. You can use the describe-app API to check if your application is in service. Use the create-presigned-domain-url API to create a presigned URL:

```
aws sagemaker create-presigned-domain-url \  
--domain-id domain-id \  
--space-name space-name \  
--user-profile-name user-profile-name \  
--session-expiration-duration-in-seconds 43200 \  
--landing-uri app:CodeEditor:
```

4. Open the generated URL to start working in your Code Editor application.

## Clone a repository in Code Editor

You can navigate through folders and clone a repository in the **Explorer** window of the Code Editor application UI.

To clone a repository, go through the following steps:

### To clone a repository

1. Open your Code Editor application in the browser, and choose the **Exploration** button

( in the left navigation pane. )

2. Choose **Clone Repository** in the **Explorer** window. Then, provide a repository URL or pick a repository source in the prompt.

3. Choose a folder to clone your repository into. Note that the default Code Editor folder is `/home/sagemaker-user/`. Cloning your repository may take some time.
4. To open the cloned repository, choose either **Open in New Window** or **Open**.
5. To return to the Code Editor application UI homepage, choose **Cancel**.
6. Within the repository, a prompt asks if you trust the authors of the files in your new repository. You have two choices:
  - a. To trust the folder and enable all features, choose **Yes, I trust the authors**.
  - b. To browse the repository content in *restricted mode*, choose **No, I don't trust the authors**.

In restricted mode, tasks are not allowed to run, debugging is disabled, workspace settings are not applied, and extensions have limited functionality.

To exit restricted mode, trust the authors of all files in your current folder or its parent folder, and enable all features, choose **Manage** in the **Restricted Mode** banner.

## Code Editor Connections and Extensions

Code Editor supports IDE connections to AWS services as well as extensions available in the [Open VSX Registry](#).

### Connections to AWS

Code Editor environments are integrated with the [AWS Toolkit for VS Code](#) to add connections to AWS services. To get started with connections to AWS services, you must have valid AWS Identity and Access Management (IAM) credentials. For more information, see [Authentication and access for the AWS Toolkit for Visual Studio Code](#).

Within your Code Editor environment, you can add connections to:

- [AWS Explorer](#) – View, modify, and deploy AWS resources in Amazon S3, CloudWatch, and more.

Accessing certain features within AWS Explorer requires certain AWS permissions. For more information, see [Authentication and access for the AWS Toolkit for Visual Studio Code](#).

- [Amazon CodeWhisperer](#) – Build applications faster with AI-powered code suggestions.

To use Amazon CodeWhisperer with Code Editor, you must add the following permissions to your SageMaker AI execution role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "CodeWhispererPermissions",
      "Effect": "Allow",
      "Action": ["codewhisperer:GenerateRecommendations"],
      "Resource": "*"
    }
  ]
}
```

For more information, see [Creating IAM policies](#) and [Adding and removing IAM identity permissions](#) in the *IAM User Guide*.

## Extensions

Code Editor supports IDE extensions available in the [Open VSX Registry](#).

To get started with extensions in your Code Editor environment, choose the **Extensions** icon

in the left navigation pane. Here, you can configure connections to AWS by installing the AWS Toolkit. For more information, see [Installing the AWS Toolkit for Visual Studio Code](#).

In the search bar, you can search directly for additional extensions through the [Open VSX Registry](#), such as the AWS Toolkit, Jupyter, Python, and more.

## Shut down Code Editor resources

When you're finished using a Code Editor space, you can use Studio to stop it. That way, you stop incurring costs for the space.

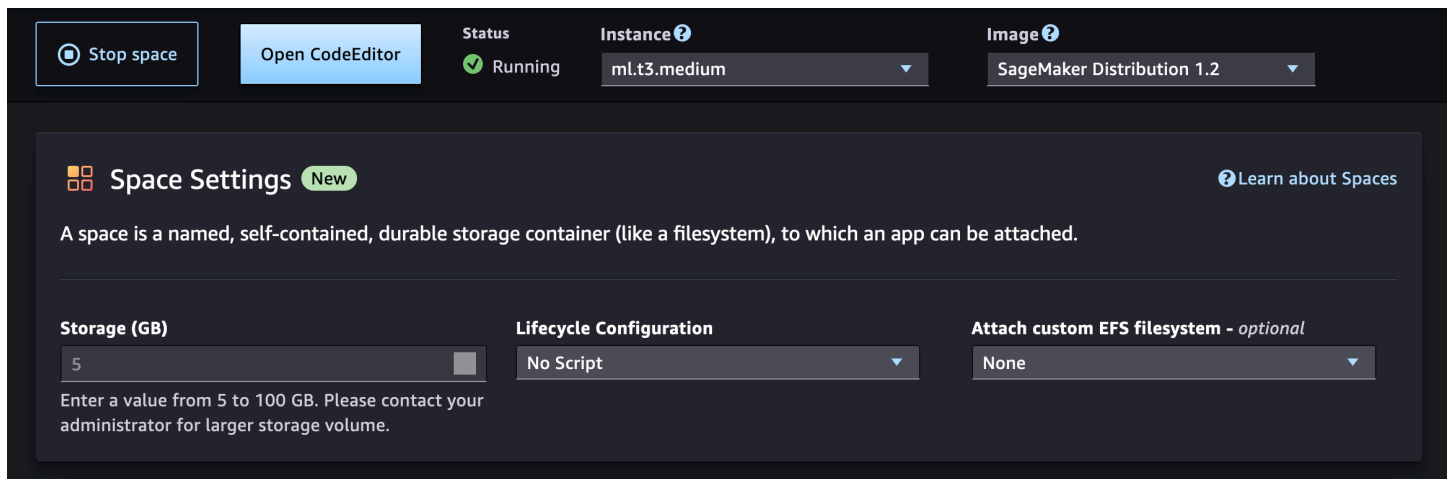

Alternatively, you can delete unused Code Editor resources by using the AWS CLI.

## Stop your Code Editor space using Studio

To stop your Code Editor space in Studio use the following steps:

## To stop your Code Editor space in Studio

1. Return to the Code Editor landing page by doing one of the following:
  - a. In the navigation bar in the upper-left corner, choose **Code Editor**.
  - b. Alternatively, in the left navigation pane, choose **Code Editor** in the **Applications** menu.
2. Find the name of the Code Editor space you created. If the status of your space is **Running**, choose **Stop** in the **Action** column. You can also stop your space directly in the space detail page by choosing **Stop space**. The space may take some time to stop.

Additional resources such as SageMaker AI endpoints, Amazon EMR (Amazon EMR) clusters and Amazon Simple Storage Service (Amazon S3) buckets created from Studio are not automatically deleted when your space instance shuts down. To stop accruing charges from resources, delete any additional resources. For more information, see [Delete unused resources](#).

## Delete Code Editor resources using the AWS CLI

You can delete your Code Editor application and space using the AWS Command Line Interface (AWS CLI).

- [DeleteApp](#)
- [DeleteSpace](#)

## Code Editor administrator guide

You can use Code Editor with an On-Demand Instance for faster start-up time, and configurable storage. You can launch a Code Editor application through Amazon SageMaker Studio or through the AWS CLI. You can also edit Code Editor default settings within the domain console. For more information, see [Edit domain settings](#). The following topics outline how administrators can configure Code Editor, based on Code-OSS, Visual Studio Code - Open Source by changing storage options, customizing environments, and managing user access, as well as giving information about the prerequisites needed to use Code Editor.

### Topics

- [Complete prerequisites](#)
- [Give your users access to private spaces](#)
- [Change the default storage size](#)
- [Code Editor lifecycle configurations](#)
- [Environment customization using custom images](#)

### Complete prerequisites

To use Code Editor, based on Code-OSS, Visual Studio Code - Open Source, you must complete the following prerequisites.

1. You must first onboard to Amazon SageMaker AI domain and create a user profile. For more information, see [Amazon SageMaker AI domain overview](#).
2. If you are interacting with your Code Editor application using the AWS CLI, you must also complete the following prerequisites.
  - a. Update the AWS CLI by following the steps in [Installing the current AWS CLI Version](#).
  - b. From your local machine, run `aws configure` and provide your AWS credentials. For information about AWS credentials, see [Understanding and getting your AWS credentials](#).
3. (Optional) To get more storage and compute for your application, you can request an increase to your AWS quotas. For more information about requesting a quota increase, see [Amazon SageMaker AI endpoints and quotas](#).

## Give your users access to private spaces

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

This section provides a policy that grants user access to private spaces. You can also use the policy to restrict private spaces and applications that are associated with them to the owner associated with the user profile.

You must provide your users with permissions to the following:

- Private spaces
- The user profile required for access to the private spaces

To provide permissions, attach the following policy to the IAM roles of your users.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateApp",
        "sagemaker>DeleteApp"
      ],
      "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:app/*",
      "Condition": {
```

```

    "Null": {
      "sagemaker:OwnerUserProfileArn": "true"
    }
  },
  {
    "Sid": "SMStudioCreatePresignedDomainUrlForUserProfile",
    "Effect": "Allow",
    "Action": [
      "sagemaker:CreatePresignedDomainUrl"
    ],
    "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:user-profile/
${sagemaker:DomainId}/${sagemaker:UserProfileName}"
  },
  {
    "Sid": "SMStudioAppPermissionsListAndDescribe",
    "Effect": "Allow",
    "Action": [
      "sagemaker:ListApps",
      "sagemaker:ListDomains",
      "sagemaker:ListUserProfiles",
      "sagemaker:ListSpaces",
      "sagemaker:DescribeApp",
      "sagemaker:DescribeDomain",
      "sagemaker:DescribeUserProfile",
      "sagemaker:DescribeSpace"
    ],
    "Resource": "*"
  },
  {
    "Sid": "SMStudioAppPermissionsTagOnCreate",
    "Effect": "Allow",
    "Action": [
      "sagemaker:AddTags"
    ],
    "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:*/*",
    "Condition": {
      "Null": {
        "sagemaker:TaggingAction": "false"
      }
    }
  },
  {
    "Sid": "SMStudioRestrictSharedSpacesWithoutOwners",

```

```

    "Effect": "Allow",
    "Action": [
      "sagemaker:CreateSpace",
      "sagemaker:UpdateSpace",
      "sagemaker>DeleteSpace"
    ],
    "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:space/
    ${sagemaker:DomainId}/*",
    "Condition": {
      "Null": {
        "sagemaker:OwnerUserProfileArn": "true"
      }
    }
  },
  {
    "Sid": "SMStudioRestrictSpacesToOwnerUserProfile",
    "Effect": "Allow",
    "Action": [
      "sagemaker:CreateSpace",
      "sagemaker:UpdateSpace",
      "sagemaker>DeleteSpace"
    ],
    "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:space/
    ${sagemaker:DomainId}/*",
    "Condition": {
      "ArnLike": {
        "sagemaker:OwnerUserProfileArn": "arn:aws:sagemaker:$AWS Region:
    $111122223333:user-profile/${sagemaker:DomainId}/${sagemaker:UserProfileName}"
      },
      "StringEquals": {
        "sagemaker:SpaceSharingType": [
          "Private",
          "Shared"
        ]
      }
    }
  },
  {
    "Sid": "SMStudioRestrictCreatePrivateSpaceAppsToOwnerUserProfile",
    "Effect": "Allow",
    "Action": [
      "sagemaker>CreateApp",
      "sagemaker>DeleteApp"
    ],
  },

```

```

    "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:app/
    ${sagemaker:DomainId}/*",
    "Condition": {
      "ArnLike": {
        "sagemaker:OwnerUserProfileArn": "arn:aws:sagemaker:
    ${aws:Region}:${aws:PrincipalAccount}:user-profile/${sagemaker:DomainId}/
    ${sagemaker:UserProfileName}"
      },
      "StringEquals": {
        "sagemaker:SpaceSharingType": [
          "Private"
        ]
      }
    }
  },
]
}

```

## Change the default storage size

You can change the default storage settings of your users. You can also change the default storage settings based on your organizational requirements and the needs of your users.

To change the storage size of your users, do the following:

1. Update the Amazon EBS storage settings in the domain.
2. Create a user profile and specify the storage settings within it.

Use the following AWS Command Line Interface (AWS CLI) command to update the domain.

```

aws --region $REGION sagemaker update-domain \
--domain-id $DOMAIN_ID \
--default-user-settings '{
  "SpaceStorageSettings": {
    "DefaultEbsStorageSettings":{
      "DefaultEbsVolumeSizeInGb":5,
      "MaximumEbsVolumeSizeInGb":100
    }
  }
}'

```

Use the following AWS CLI command to create the user profile and specify the default storage settings.

```
aws --region $REGION sagemaker create-user-profile \
--domain-id $DOMAIN_ID \
--user-profile-name $USER_PROFILE_NAME \
--user-settings '{
  "SpaceStorageSettings": {
    "DefaultEbsStorageSettings":{
      "DefaultEbsVolumeSizeInGb":5,
      "MaximumEbsVolumeSizeInGb":100
    }
  }
}'
```

Use the following AWS CLI commands to update the default storage settings in the user profile.

```
aws --region $REGION sagemaker update-user-profile \
--domain-id $DOMAIN_ID \
--user-profile-name $USER_PROFILE_NAME \
--user-settings '{
  "SpaceStorageSettings": {
    "DefaultEbsStorageSettings":{
      "DefaultEbsVolumeSizeInGb":25,
      "MaximumEbsVolumeSizeInGb":200
    }
  }
}'
```

## Code Editor lifecycle configurations

You can use Code Editor lifecycle configurations to automate customization for your Studio environment. This customization includes installing custom packages, configuring extensions, preloading datasets, and setting up source code repositories

The following instructions use the AWS Command Line Interface (AWS CLI) to create, attach, debug, and detach lifecycle configurations for the CodeEditor application type:

- [Create and attach lifecycle configurations in Studio](#)
- [Debug lifecycle configurations in Studio](#)
- [Detach lifecycle configurations in Studio](#)

## Create and attach lifecycle configurations in Studio

The following section provides AWS CLI commands to create a lifecycle configuration, attach a lifecycle configuration when creating a new user profile, and attach a lifecycle configuration when updating a user profile. For prerequisites and general steps on creating and attaching lifecycle configurations in Studio, see [Lifecycle configuration creation](#).

When creating your Studio lifecycle configuration with the `create-studio-lifecycle-config` command, be sure to specify that the `studio-lifecycle-config-app-type` is `CodeEditor`. The following example shows how to create a new Studio lifecycle configuration for your Code Editor application.

```
aws sagemaker create-studio-lifecycle-config \  
--studio-lifecycle-config-name my-code-editor-lcc \  
--studio-lifecycle-config-content $LCC_CONTENT \  
--studio-lifecycle-config-app-type CodeEditor
```

Note the ARN of the newly created lifecycle configuration that is returned. When attaching a lifecycle configuration, provide this ARN within the `LifecycleConfigArns` list of `CodeEditorAppSettings`.

You can attach a lifecycle configuration when creating a user profile or domain. The following example shows how to create a new user profile with the lifecycle configuration attached. You can also create a new domain with a lifecycle configuration attached by using the [create-domain](#) command.

```
# Create a new UserProfile  
aws sagemaker create-user-profile \  
--domain-id domain-id \  
--user-profile-name user-profile-name \  
--user-settings '{  
"CodeEditorAppSettings": {  
  "LifecycleConfigArns":  
    [lifecycle-configuration-arn-list]  
  }  
}'
```

You can alternatively attach a lifecycle configuration when updating a user profile or domain. The following example shows how to update a user profile with the lifecycle configuration attached.

You can also update a new domain with a lifecycle configuration attached by using the [update-domain](#) command.

```
# Update a UserProfile
aws sagemaker update-user-profile \
  --domain-id domain-id \
  --user-profile-name user-profile-name \
  --user-settings '{
  "CodeEditorAppSettings": {
    "LifecycleConfigArns":
      [lifecycle-configuration-arn-list]
  }
}'
```

## Debug lifecycle configurations in Studio

To debug lifecycle configuration scripts for Code Editor, you must use Studio. For instructions about debugging lifecycle configurations in Studio, see [Debug lifecycle configurations](#). To find the logs for a specific application, search the log streams using the following format:

```
domain-id/space-name/CodeEditor/default/LifecycleConfigOnStart
```

## Detach lifecycle configurations in Studio

To detach lifecycle configurations for Code Editor, you can use either the console or the AWS CLI. For steps on detaching lifecycle configurations from the Studio console, see [Detach lifecycle configurations](#).

To detach a lifecycle configuration using the AWS CLI, remove the desired lifecycle configuration from the list of lifecycle configurations attached to the resource. Then pass the list as part of the respective command:

- [update-user-profile](#)
- [update-domain](#)

For example, the following command removes all lifecycle configurations for the Code Editor application attached to the domain.

```
aws sagemaker update-domain --domain-id domain-id \
```

```
--default-user-settings '{
"CodeEditorAppSettings": {
  "LifecycleConfigArns":
    []
}
}'
```

## Create a lifecycle configuration to clone repositories into a Code Editor application

This section shows how to clone a repository and create a Code Editor application with the lifecycle configuration attached.

1. From your local machine, create a file named `my-script.sh` with the following content:

```
#!/bin/bash
set -eux
```

2. Clone the repository of your choice in your lifecycle configuration script.

```
export REPOSITORY_URL="https://github.com/aws-samples/sagemaker-studio-lifecycle-
config-examples.git"
git -C /home/sagemaker-user clone $REPOSITORY_URL
```

3. After finalizing your script, create and attach your lifecycle configuration. For more information, see [Create and attach lifecycle configurations in Studio](#).
4. Create your Code Editor application with the lifecycle configuration attached.

```
aws sagemaker create-app \
--domain-id domain-id \
--space-name space-name \
--app-type CodeEditor \
--app-name default \
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:image-account-
id:image/sagemaker-distribution-
cpu,LifecycleConfigArn=arn:aws:sagemaker:region:user-account-id:studio-lifecycle-
config/my-code-editor-lcc,InstanceType=ml.t3.large"
```

For more information about available Code Editor image ARNs, see [Code Editor application instances and images](#).

## Create a lifecycle configuration to install Code Editor extensions

This section shows how to create a lifecycle configuration to install extensions from the [Open VSX Registry](#) in your Code Editor environment.

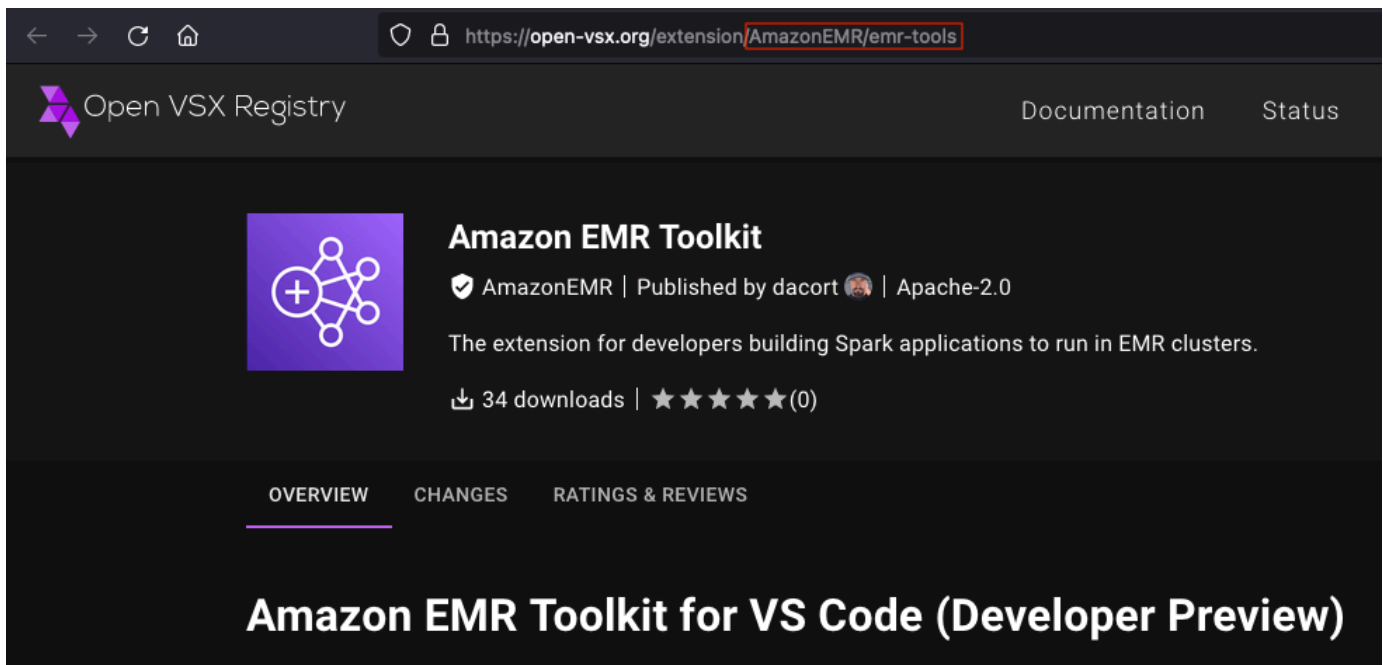

1. From your local machine, create a file named `my-script.sh` with the following content:

```
#!/bin/bash
set -eux
```

2. Within the script, install the [Open VSX Registry](#) extension of your choice:

```
sagemaker-code-editor --install-extension AmazonEMR.emr-tools --extensions-dir /
opt/amazon/sagemaker/sagemaker-code-editor-server-data/extensions
```

You can retrieve the extension name from the URL of the extension in the [Open VSX Registry](#). The extension name to use in the `sagemaker-code-editor` command should contain all text that follows `https://open-vsx.org/extension/` in the URL. Replace all instances of a slash (/) with a period (.). For example, `AmazonEMR/emr-tools` should be `AmazonEMR.emr-tools`.

The screenshot shows a web browser window with the URL `https://open-vsx.org/extension/AmazonEMR/emr-tools`. The page displays the Open VSX Registry logo and navigation links for "Documentation" and "Status". The main content area features a purple icon with a plus sign and a network diagram, representing the "Amazon EMR Toolkit". Below the icon, the text reads "Amazon EMR Toolkit", "AmazonEMR | Published by dacort | Apache-2.0", and "The extension for developers building Spark applications to run in EMR clusters." It also shows "34 downloads" and a star rating of "(0)". At the bottom, there are tabs for "OVERVIEW", "CHANGES", and "RATINGS & REVIEWS". A large heading at the bottom of the page reads "Amazon EMR Toolkit for VS Code (Developer Preview)".

3. After finalizing your script, create and attach your lifecycle configuration. For more information, see [Create and attach lifecycle configurations in Studio](#).
4. Create your Code Editor application with the lifecycle configuration attached:

```
aws sagemaker create-app \  
--domain-id domain-id \  
--space-name space-name \  
--app-type CodeEditor \  
--app-name default \  
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:image-account-id:image/sagemaker-distribution-cpu,LifecycleConfigArn=arn:aws:sagemaker:region:user-account-id:studio-lifecycle-config/my-code-editor-lcc,InstanceType=ml.t3.large"
```

For more information about available Code Editor image ARNs, see [Code Editor application instances and images](#). For more information about connections and extensions, see [Code Editor Connections and Extensions](#).

## Environment customization using custom images

If you need functionality that is different than what's provided by SageMaker distribution, you can bring your own image with your custom extensions and packages. You can also use it to personalize the Code Editor UI for your own branding or compliance needs.

For requirements for your image, see [Dockerfile specifications](#).

For a tutorial that helps you create an image that your users can access to run their Code Editor environment, see [Provide users with access to custom images](#).

### Topics

- [Dockerfile specifications](#)
- [Provide users with access to custom images](#)

## Dockerfile specifications

The image that you specify in your Dockerfile must match the specifications in the following sections to create the image successfully.

### Running the image

- **Entrypoint** – We recommend embedding the entry point into the image using the Docker `CMD` or `Entrypoint` instructions. You can also configure `ContainerEntrypoint` and

ContainerArguments that are passed to the container at runtime. For more information, see [CodeEditorAppImageConfig](#).

- EnvVariables – With Studio, you can configure ContainerEnvironment variables that are made available to a container. The environment variable is overwritten with the environment variables from SageMaker AI. To provide you with a better experience, the environment variables are usually AWS\_ and SageMaker AI\_namespaced to give priority to platform environments.

The following are the environment variables:

- AWS\_REGION
- AWS\_DEFAULT\_REGION
- AWS\_CONTAINER\_CREDENTIALS\_RELATIVE\_URI
- SAGEMAKER\_SPACE\_NAME

## Specifications for the user and file system

- WorkingDirectory – The Amazon EBS volume for your space is mounted on the path /home/sagemaker-user. You can't change the mount path. Use the WORKDIR instruction to set the working directory of your image to a folder within /home/sagemaker-user.
- UID – The user ID of the Docker container. UID=1000 is a supported value. You can add sudo access to your users. The IDs are remapped to prevent a process running in the container from having more privileges than necessary.
- GID – The group ID of the Docker container. GID=100 is a supported value. You can add sudo access to your users. The IDs are remapped to prevent a process running in the container from having more privileges than necessary.
- Meta data directories – The /opt/.sagemakerinternal and /opt/ml directories that are used by AWS. The meta data file in /opt/ml contains meta data about resources such as DomainId.

Use the following command to show the file system contents:

```
cat /opt/ml/metadata/resource-metadata.json
{"AppType":"CodeEditor","DomainId":"example-domain-id","UserProfileName":"example-user-profile-name","ResourceArn":"arn:aws:sagemaker:AWS Region:111122223333;:app/domain-ID/user-ID/CodeEditor/default","ResourceName":"default","AppImageVersion":"current"}
```

- Logging directories – `/var/log/studio` are reserved for the logging directories of Code Editor and the extensions associated with it. We recommend that you don't use the folders in creating your image.

## Health check and URL for applications

- Base URL – The base URL for the BYOI application must be `codeeditor/default`. You can only have one application and it must always be named `default`.
- Health check endpoint – You must host your Code Editor server at `0.0.0.0` port `8888` for SageMaker AI to detect it.
- Authentication – You must pass `--without-connection-token` when opening `sagemaker-code-editor` to allow SageMaker AI to authenticate your users.

### Note

If you are using Amazon SageMaker Distribution as the base image, these requirements are already taken care of as part of the included `entrypoint-code-editor` script.

## Dockerfile samples

The following is a sample Dockerfile that meets the specifications listed in the previous sections to create an image from scratch using a [micromamba](#) base environment:

```
FROM mambaorg/micromamba:latest
ARG NB_USER="sagemaker-user"
ARG NB_UID=1000
ARG NB_GID=100

USER root

RUN micromamba install -y --name base -c conda-forge sagemaker-code-editor

USER $NB_UID

CMD eval "$(micromamba shell hook --shell=bash)"; \
  micromamba activate base; \
  sagemaker-code-editor --host 0.0.0.0 --port 8888 \
    --without-connection-token \
```

```
--base-path "/CodeEditor/default"
```

The following is a sample Dockerfile that meets the specifications listed in the previous sections to create an image based on [Amazon SageMaker AI Distribution](#):

```
FROM public.ecr.aws/sagemaker/sagemaker-distribution:latest-cpu
ARG NB_USER="sagemaker-user"
ARG NB_UID=1000
ARG NB_GID=100
ENV MAMBA_USER=$NB_USER

USER root

# install scrapy in the base environment
RUN micromamba install -y --name base -c conda-forge scrapy

# download VSCodeVim
RUN \
  wget https://github.com/VSCodeVim/Vim/releases/download/v1.27.2/vim-1.27.2.vsix \
  -P /tmp/exts/ --no-check-certificate

# Install the extension
RUN \
  extensionloc=/opt/amazon/sagemaker/sagemaker-code-editor-server-data/extensions \
  && sagemaker-code-editor \
  --install-extension "/tmp/exts/vim-1.27.2.vsix" \
  --extensions-dir "${extensionloc}"

USER $MAMBA_USER
ENTRYPOINT ["entrypoint-code-editor"]
```

## Provide users with access to custom images

This documentation provides step-by-step instructions to provide your users with access to custom images for their Code Editor environments. You can use the information on this page to create custom environments for your user's workflows. The process involves utilizing:

- Docker
- AWS Command Line Interface
- Amazon Elastic Container Registry
- Amazon SageMaker AI AWS Management Console

After following the guidance on this page, Code Editor users on the Amazon SageMaker AI domain will have access to the custom image and environment from their Code Editor spaces to empower their machine learning workflows.

### Important

This page assumes that you have the AWS Command Line Interface and Docker installed on your local machine.

To have your users successfully run their image within Code Editor, you must do the following:

### To have your users successfully run the image

1. Create the Dockerfile
2. Build the image from the Dockerfile
3. Upload the image to Amazon Elastic Container Registry
4. Attach the image to your Amazon SageMaker AI domain
5. Have your users access the image from their Code Editor space

### Step 1: Create the Dockerfile

Create a Dockerfile to define the steps needed to create the environment needed to run the application in your user's container.

### Important

Your Dockerfile must meet the specifications provided in [Dockerfile specifications](#).

For sample Dockerfiles in the correct format, see [Dockerfile samples](#).

### Step 2: Build the image

In the same directory as your Dockerfile, build your image using the following command:

```
docker build -t username/imagename:tag your-account-id.dkr.ecr.AWS  
Region.amazonaws.com/your-repository-name:tag
```

**⚠ Important**

Your image must be tagged in the following format: `123456789012.dkr.ecr.your-region.amazonaws.com/your-repository-name:tag`

You won't be able to push it to an Amazon Elastic Container Registry repository otherwise.

**Step 3: Push the image to the Amazon Elastic Container Registry repository**

After you've built your image, log in to your Amazon ECR repository using the following command:

```
aws ecr get-login-password --region AWS Region | docker login --username AWS --password-stdin 123456789012.dkr.ecr.AWS Region.amazonaws.com
```

After you've logged in, push your Dockerfile using the following command:

```
docker push 123456789012.dkr.ecr.AWS Region.amazonaws.com/your-repository-name:tag
```

**Step 4: Attach image to the Amazon SageMaker AI domain of your users**

After you've pushed the image, you must access it from your Amazon SageMaker AI domain using either the SageMaker AI console or the AWS CLI.

**Attach the image using the SageMaker AI console**

Use the following procedure to attach the image to a SageMaker domain through the SageMaker AI console :

1. Open the [SageMaker AI console](#).
2. Under **Admin configurations**, choose **Domains**.
3. From the list of **domains**, select a domain.
4. Open the **Environment** tab.
5. For **Custom images for personal Studio apps**, choose **Attach image**.
6. Specify the image source. You can create a new image or choose an existing image.
7. Choose **Next**.
8. Choose **Code Editor** as the application type.

## 9. Choose **Submit**.

### Attach the image using the AWS CLI

Use the following procedure to attach the image to a SageMaker domain through the AWS CLI :

1. Create a SageMaker image. The `AmazonSageMakerFullAccess` policy must be attached to your role as you use the following AWS CLI commands.

```
aws sagemaker create-image \  
  --image-name code-editor-custom-image \  
  --role-arn arn:aws:iam::account-id:role/service-role/execution-role
```

2. Create a SageMaker image version from the image. Pass the unique tag value that you chose when you pushed the image to Amazon ECR.

```
aws sagemaker create-image-version \  
  --image-name code-editor-custom-image \  
  --base-image repository-uri:tag
```

3. Create a configuration file called `app-image-config-input.json`. The application image configuration is used as configuration for running a SageMaker image as a Code Editor application. You may also specify your [ContainerConfig](#) arguments here.

```
{  
  "AppImageConfigName": "code-editor-app-image-config",  
  "CodeEditorAppImageConfig":  
  {  
    "ContainerConfig":  
    {}  
  }  
}
```

4. Create the `AppImageConfig` using the application image configuration file that you created.

```
aws sagemaker create-app-image-config \  
  --cli-input-json file://app-image-config-input.json
```

5. Create a configuration file, named `updateDomain.json`. Be sure to specify your domain ID.

```
{
```

```
"DomainId": "domain-id",
"DefaultUserSettings": {
  "CodeEditorAppSettings": {
    "CustomImages": [
      {
        "ImageName": "code-editor-custom-image",
        "AppImageConfigName": "code-editor-app-image-config"
      }
    ]
  }
}
```

6. Call the `UpdateDomain` command with the configuration file as input.

### Note

You must delete all of the applications in your domain before updating the domain with the new image. Note that you only need to delete applications; you **do not** need to delete user profiles or shared spaces. For instructions on deleting applications, choose one of the following options.

- If you use the SageMaker AI console, run through Step 1 to 5d and Step 6 to 7d of the [Delete a domain \(Console\)](#) section.
- If you use the AWS CLI, run through Step 1 to 3 of the [Delete a domain \(AWS CLI\)](#) section.

```
aws sagemaker update-domain --cli-input-json file://updateDomain.json
```

## Step 5: Have your users access the image from their Code Editor space

Your users can now select the image that you've attached to their domain from their Code Editor space.

For more information on selecting a custom image, see [Launch a Code Editor application in Studio](#).

# Amazon SageMaker HyperPod

SageMaker HyperPod helps you provision resilient clusters for running machine learning (ML) workloads and developing state-of-the-art models such as large language models (LLMs), diffusion models, and foundation models (FMs). It accelerates development of FMs by removing undifferentiated heavy-lifting involved in building and maintaining large-scale compute clusters powered by thousands of accelerators such as AWS Trainium and NVIDIA A100 and H100 Graphical Processing Units (GPUs). When accelerators fail, the resiliency features of SageMaker HyperPod monitor the cluster instances automatically detect and replace the faulty hardware on the fly so that you can focus on running ML workloads.

To get started, check [the section called “Prerequisites”](#), set up [the section called “IAM for HyperPod”](#), and choose one of the following orchestrator options supported by SageMaker HyperPod.

## Slurm support in SageMaker HyperPod

SageMaker HyperPod provides support for running machine learning workloads on resilient clusters by integrating with Slurm, an open-source workload manager. Slurm support in SageMaker HyperPod enables seamless cluster orchestration through Slurm cluster configuration, allowing you to set up head, login, and worker nodes on the SageMaker HyperPod clusters. This integration also facilitates Slurm-based job scheduling for running ML workloads on the cluster, as well as direct access to cluster nodes for job scheduling. With HyperPod's lifecycle configuration support, you can customize the computing environment of the clusters to meet your specific requirements. Additionally, by leveraging the Amazon SageMaker AI distributed training libraries, you can optimize the clusters' performance on AWS computing and network resources. To learn more, see [the section called “Orchestrating HyperPod clusters with Slurm”](#).

## Amazon EKS support in SageMaker HyperPod

SageMaker HyperPod also integrates with Amazon EKS to enable large-scale training of foundation models on long-running and resilient compute clusters. This allows cluster admin users to provision HyperPod clusters and attach them to an EKS control plane, enabling dynamic capacity management, direct access to cluster instances, and resiliency capabilities. For data scientists, Amazon EKS support in HyperPod allows running containerized workloads for training foundation models, inference on the EKS cluster, and leveraging the job auto-resume capability for Kubeflow PyTorch training. The architecture involves a 1-to-1 mapping between an EKS cluster (control plane) and a HyperPod cluster (worker nodes) within a VPC, providing a tightly integrated solution

for running large-scale ML workloads. To learn more, see [the section called “Orchestrating HyperPod clusters with Amazon EKS”](#).

## AWS Regions supported by SageMaker HyperPod

SageMaker HyperPod is available in the following AWS Regions.

- us-east-1
- us-east-2
- us-west-1
- us-west-2
- eu-central-1
- eu-north-1
- eu-west-1
- eu-west-2
- ap-south-1
- ap-southeast-1
- ap-southeast-2
- ap-southeast-4
- ap-northeast-1
- sa-east-1

### Topics

- [Prerequisites for using SageMaker HyperPod](#)
- [AWS Identity and Access Management for SageMaker HyperPod](#)
- [SageMaker HyperPod recipes](#)
- [Orchestrating SageMaker HyperPod clusters with Slurm](#)
- [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#)
- [HyperPod in Studio](#)
- [SageMaker HyperPod references](#)
- [Amazon SageMaker HyperPod release notes](#)
- [Amazon SageMaker HyperPod AMI releases](#)

## Prerequisites for using SageMaker HyperPod

The following sections walk you through prerequisites before getting started with SageMaker HyperPod.

### Topics

- [SageMaker HyperPod quotas](#)
- [Setting up SageMaker HyperPod with a custom Amazon VPC](#)
- [Setting up SageMaker HyperPod clusters across multiple AZs](#)
- [Setting up AWS Systems Manager and Run As for cluster user access control](#)
- [\(Optional\) Setting up SageMaker HyperPod with Amazon FSx for Lustre](#)

### SageMaker HyperPod quotas

You can create SageMaker HyperPod clusters given the quotas for *cluster usage* in your AWS account.

#### Important

To learn more about SageMaker HyperPod pricing, see [the section called “SageMaker HyperPod pricing”](#) and [Amazon SageMaker Pricing](#).

### View Amazon SageMaker HyperPod quotas using the AWS Management Console

Look up the default and applied values of a *quota*, also referred to as a *limit*, for *cluster usage*, which is used for SageMaker HyperPod.

1. Open the [Service Quotas console](#).
2. In the left navigation pane, choose **AWS services**.
3. From the **AWS services** list, search for and select **Amazon SageMaker AI**.
4. In the **Service quotas** list, you can see the service quota name, applied value (if it's available), AWS default quota, and whether the quota value is adjustable.
5. In the search bar, type **cluster usage**. This shows quotas for cluster usage, applied quotas, and the default quotas.

## Request a Amazon SageMaker HyperPod quota increase using the AWS Management Console

Increase your quotas at the account or resource level.

1. To increase the quota of instances for *cluster usage*, select the quota that you want to increase.
2. If the quota is adjustable, you can request a quota increase at either the account level or resource level based on the value listed in the **Adjustability** column.
3. For **Increase quota value**, enter the new value. The new value must be greater than the current value.
4. Choose **Request**.
5. To view any pending or recently resolved requests in the console, navigate to the **Request history** tab from the service's details page, or choose **Dashboard** from the navigation pane. For pending requests, choose the status of the request to open the request receipt. The initial status of a request is **Pending**. After the status changes to **Quota requested**, you see the case number with AWS Support. Choose the case number to open the ticket for your request.

To learn more about requesting a quota increase in general, see [Requesting a Quota Increase](#) in the *AWS Service Quotas User Guide*.

## Setting up SageMaker HyperPod with a custom Amazon VPC

To set up a SageMaker HyperPod cluster with a custom Amazon VPC, review the following prerequisites.

### Note

VPC configuration is mandatory for Amazon EKS orchestration. For Slurm orchestration, VPC setup is optional.

- Validate [Elastic Network Interface](#) (ENI) capacity in your AWS account before creating a SageMaker HyperPod cluster with a custom VPC. The ENI limit is controlled by Amazon EC2 and varies by AWS Region. SageMaker HyperPod cannot automatically request quota increases.

### To verify your current ENI quota:

1. Open the [Service Quotas console](#).
2. In the **Manage quotas** section, use the **AWS Services** drop-down list to search for **VPC**.

3. Choose to view the quotas of **Amazon Virtual Private Cloud (Amazon VPC)**.
4. Look for the service quota **Network interfaces per Region** or the **Quota code L-DF5E4CA3**.

If your current ENI limit is insufficient for your SageMaker HyperPod cluster needs, request a quota increase. Ensuring adequate ENI capacity beforehand helps prevent cluster deployment failures.

- When using a custom VPC to connect a SageMaker HyperPod cluster with AWS resources, provide the VPC name, ID, AWS Region, subnet IDs, and security group IDs during cluster creation.

### Note

When your Amazon VPC and subnets support IPv6 in the [VPCConfig](#) of the cluster or at the Instance group level using the `OverrideVPCConfig` attribute of [ClusterInstanceGroupSpecification](#), network communications differ based on the cluster orchestration platform:

- Slurm-orchestrated clusters automatically configure nodes with dual IPv6 and IPv4 addresses, allowing immediate IPv6 network communications. No additional configuration is required beyond the `VPCConfig` IPv6 settings.
- In EKS-orchestrated clusters, nodes receive dual-stack addressing, but pods can only use IPv6 when the Amazon EKS cluster is explicitly IPv6-enabled. You must create a new IPv6 Amazon EKS cluster - existing IPv4 Amazon EKS clusters cannot be converted to IPv6. For information about deploying an IPv6 Amazon EKS cluster, see [Amazon EKS IPv6 Cluster Deployment](#).

Additional resources for IPv6 configuration:

- For information about adding IPv6 support to your VPC, see to [IPv6 Support for VPC](#).
- For information about creating a new IPv6-compatible VPC, see [Amazon VPC Creation Guide](#).
- To configure SageMaker HyperPod with a custom Amazon VPC, see [Custom Amazon VPC setup for SageMaker HyperPod](#).

- Make sure that all resources are deployed in the same AWS Region as the SageMaker HyperPod cluster. Configure security group rules to allow inter-resource communication within the VPC. For example, when creating a VPC in `us-west-2`, provision subnets across one or more Availability Zones (such as `us-west-2a` or `us-west-2b`), and create a security group allowing intra-group traffic.

**Note**

SageMaker HyperPod supports multi-Availability Zone deployment. For more information, see [the section called “Setting up SageMaker HyperPod clusters across multiple AZs”](#).

- Establish Amazon Simple Storage Service (Amazon S3) connectivity for VPC-deployed SageMaker HyperPod instance groups by creating a VPC endpoint. Without internet access, instance groups cannot store or retrieve lifecycle scripts, training data, or model artifacts. We recommend that you create a custom IAM policy restricting Amazon S3 bucket access to the private VPC. For more information, see [Endpoints for Amazon S3](#) in the *AWS PrivateLink Guide*.
- For HyperPod clusters using Elastic Fabric Adapter (EFA)-enabled instances, configure the security group to allow all inbound and outbound traffic to and from the security group itself. Specifically, avoid using `0.0.0.0/0` for outbound rules, as this may cause EFA health check failures. For more information about EFA security group preparation guidelines, see [Step 1: Prepare an EFA-enabled security group](#) in the *Amazon EC2 User Guide*.

## Setting up SageMaker HyperPod clusters across multiple AZs

You can configure your SageMaker HyperPod clusters across multiple Availability Zones (AZs) to improve reliability and availability.

**Note**

Elastic Fabric Adapter (EFA) traffic cannot cross AZs or VPCs. This does not apply to normal IP traffic from the ENA device of an EFA interface. For more information, see [EFA limitations](#).

**Default behavior**

HyperPod deploys all cluster instances in a single Availability Zone. The VPC configuration determines the deployment AZ:

- For Slurm-orchestrated clusters, VPC configuration is optional. When no VPC configuration is provided, HyperPod defaults to one subnet from the platform VPC.
- For EKS-orchestrated clusters, VPC configuration is required.

- For both Slurm and EKS orchestrators, when [VpcConfig](#) is provided, HyperPod selects a subnet from the provided VpcConfig's subnet list. All instance groups inherit the subnet's AZ.

 **Note**

Once you create a cluster, you cannot modify its VpcConfig settings.

To learn more about configuring VPCs for HyperPod clusters, see the preceding section, [Setting up SageMaker HyperPod with a custom Amazon VPC](#).

- **Multi-AZ configuration**

You can set up your HyperPod cluster across multiple AZs when creating a cluster or when adding a new instance group to an existing cluster. To configure multi-AZ deployments, you can override the default VPC settings of the cluster by specifying different subnets and security groups, potentially across different Availability Zones, for individual instance groups within your cluster.

SageMaker HyperPod API users can use the `OverrideVpcConfig` property within the [ClusterInstanceGroupSpecification](#) when working with the [CreateCluster](#) or [UpdateCluster](#) APIs.

The `OverrideVpcConfig` field:

- Cannot be modified after the instance group is created.
- Is optional. If not specified, the cluster level [VpcConfig](#) is used as default.
- For Slurm-orchestrated clusters, can only be specified when cluster level VpcConfig is provided. If no VpcConfig is specified at cluster level, `OverrideVpcConfig` cannot be used for any instance group.
- Contains two required fields:
  - `Subnets` - accepts between 1 and 16 subnet IDs
  - `SecurityGroupIds` - accepts between 1 and 5 security group IDs

For more information about creating or updating a SageMaker HyperPod cluster using the SageMaker HyperPod console UI or the AWS CLI:

- Slurm orchestration: See [Operating Slurm-orchestrated HyperPod clusters](#).
- EKS orchestration. See [Operating EKS-orchestrated HyperPod clusters](#).

**Note**

When running workloads across multiple AZs, be aware that network communication between AZs introduces additional latency. Consider this impact when designing latency-sensitive applications.

## Setting up AWS Systems Manager and Run As for cluster user access control

[the section called "SageMaker HyperPod DLAMI"](#) comes with [AWS Systems Manager](#) (SSM) out of the box to help you manage access to your SageMaker HyperPod cluster instance groups. This section describes how to create operating system (OS) users in your SageMaker HyperPod clusters and associate them with IAM users and roles. This is useful to authenticate SSM sessions using the credentials of the OS user account.

**Note**

Granting users access to HyperPod cluster nodes allows them to install and operate user-managed software on the nodes. Ensure that you maintain the principle of least-privilege permissions for users.

### Enabling Run As in your AWS account

As an AWS account admin or a cloud administrator, you can manage access to SageMaker HyperPod clusters at an IAM role or user level by using the [Run As feature in SSM](#). With this feature, you can start each SSM session using the OS user associated to the IAM role or user.

To enable Run As in your AWS account, follow the steps in [Turn on Run As support for Linux and macOS managed nodes](#). If you already created OS users in your cluster, make sure that you associate them with IAM roles or users by tagging them as guided in **Option 2** of step 5 under **To turn on Run As support for Linux and macOS managed nodes**.

### (Optional) Setting up SageMaker HyperPod with Amazon FSx for Lustre

To start using SageMaker HyperPod and mapping data paths between the cluster and your FSx for Lustre file system, select one of the AWS Regions supported by SageMaker HyperPod. After choosing the AWS Region you prefer, you also should determine which Availability Zone (AZ) to use.

If you use SageMaker HyperPod compute nodes in AZs different from the AZs where your FSx for Lustre file system is set up within the same AWS Region, there might be communication and network overhead. We recommend that you to use the same physical AZ as the one for the SageMaker HyperPod service account to avoid any cross-AZ traffic between SageMaker HyperPod clusters and your FSx for Lustre file system. Also, make sure that you have configured it with your VPC. If you want to use Amazon FSx as the main file system for storage, you must configure SageMaker HyperPod clusters with your VPC.

## AWS Identity and Access Management for SageMaker HyperPod

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Amazon EKS resources. IAM is an AWS service that you can use with no additional charge.

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#). [AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

Let's assume that there are two main layers of SageMaker HyperPod users: *cluster admin users* and *data scientist users*.

- **Cluster admin users** – Are responsible for creating and managing SageMaker HyperPod clusters. This includes configuring the HyperPod clusters and managing user access to them.
  - Create and configure SageMaker HyperPod clusters with Slurm or Amazon EKS.
  - Create and configure IAM roles for data scientist users and HyperPod cluster resources.

- For SageMaker HyperPod orchestration with Amazon EKS, create and configure [EKS access entries](#), [role-based access control \(RBAC\)](#), and Pod Identity to fulfill data science use cases.
- **Data scientist users** – Focus on ML model training. They use the open-source orchestrator or the SageMaker HyperPod CLI to submit and manage training jobs.
  - Assume and use the IAM Role provided by cluster admin users.
  - Interact with the open-source orchestrator CLIs supported by SageMaker HyperPod (Slurm or Kubernetes) or the SageMaker HyperPod CLI to check clusters capacity, connect to cluster, and submit workloads.

Set up IAM roles for cluster admins by attaching the right permissions or policies to operate SageMaker HyperPod clusters. Cluster admins also should create IAM roles to provide to SageMaker HyperPod resources to assume to run and communicate with necessary AWS resources, such as Amazon S3, Amazon CloudWatch, and AWS Systems Manager (SSM). Finally, the AWS account admin or the cluster admins should grant scientists permissions to access the SageMaker HyperPod clusters and run ML workloads.

Depending on which orchestrator you choose, permissions needed for the cluster admin and scientists may vary. You can also control the scope of permissions for various actions in the roles using the condition keys per service. Use the following Service Authorization References for adding detailed scope for the services related to SageMaker HyperPod.

- [Amazon Elastic Compute Cloud](#)
- [Amazon Elastic Container Registry](#) (for SageMaker HyperPod cluster orchestration with Amazon EKS)
- [Amazon Elastic Kubernetes Service](#) (for SageMaker HyperPod cluster orchestration with Amazon EKS)
- [Amazon FSx](#)
- [AWS IAM Identity Center \(successor to AWS Single Sign-On\)](#)
- [AWS Identity and Access Management \(IAM\)](#)
- [Amazon Simple Storage Service](#)
- [Amazon SageMaker AI](#)
- [AWS Systems Manager](#)

## Topics

- [IAM users for cluster admin](#)
- [IAM users for scientists](#)
- [IAM role for SageMaker HyperPod](#)

## IAM users for cluster admin

Cluster administrators (admins) operate and configure SageMaker HyperPod clusters, performing the tasks in [the section called “SageMaker HyperPod operation”](#). The following policy example includes the minimum set of permissions for cluster administrators to run the SageMaker HyperPod core APIs and manage SageMaker HyperPod clusters within your AWS account.

### Slurm

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateCluster",
        "sagemaker:ListClusters"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker>DeleteCluster",
        "sagemaker:DescribeCluster",
        "sagemaker:DescribeClusterNode",
        "sagemaker:ListClusterNodes",
        "sagemaker:UpdateCluster",
        "sagemaker:UpdateClusterSoftware",
        "sagemaker:BatchDeleteClusterNodes"
      ],
      "Resource": "arn:aws:sagemaker:region:account-id:cluster/*"
    }
  ]
}
```

## Amazon EKS

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": <execution-role-arn>
    },
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateCluster",
        "sagemaker>DeleteCluster",
        "sagemaker:DescribeCluster",
        "sagemaker:DescribeClusterNode",
        "sagemaker>ListClusterNodes",
        "sagemaker>ListClusters",
        "sagemaker:UpdateCluster",
        "sagemaker:UpdateClusterSoftware",
        "sagemaker:BatchDeleteClusterNodes",
        "eks:DescribeCluster",
        "eks:CreateAccessEntry",
        "eks:DescribeAccessEntry",
        "eks>DeleteAccessEntry",
        "eks:AssociateAccessPolicy",
        "iam:CreateServiceLinkedRole"
      ],
      "Resource": "*"
    }
  ]
}
```

To grant permissions to access the SageMaker AI console, use the sample policy provided at [Permissions required to use the Amazon SageMaker AI console](#).

To grant permissions to access the Amazon EC2 Systems Manager console, use the sample policy provided at [Using the AWS Systems Manager console](#) in the *AWS Systems Manager User Guide*.

You might also consider attaching the [AmazonSageMakerFullAccess](#) policy to the role; however, note that the `AmazonSageMakerFullAccess` policy grants permissions to the entire SageMaker API calls, features, and resources.

For guidance on IAM users in general, see [IAM users](#) in the *AWS Identity and Access Management User Guide*.

## IAM users for scientists

Scientists log into and run ML workloads on SageMaker HyperPod cluster nodes provisioned by cluster admins. For scientists in your AWS account, you should grant the permission `"ssm:StartSession"` to run the SSM `start-session` command. The following is a policy example for IAM users.

### Slurm

Add the following policy to grant SSM session permissions to connect to an SSM target for all resources. This allows you to access HyperPod clusters.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ssm:StartSession",
        "ssm:TerminateSession"
      ],
      "Resource": "*"
    }
  ]
}
```

### Amazon EKS

Grant the following IAM role permissions for data scientists to run `hyperpod list-clusters` and `hyperpod connect-cluster` commands among the HyperPod CLI commands. To learn more about the HyperPod CLI, see [the section called "Running jobs on HyperPod clusters"](#). It also includes SSM session permissions to connect to an SSM target for all resources. This allows you to access HyperPod clusters.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "DescribeHyperpodClusterPermissions",
      "Effect": "Allow",
      "Action": [
        "sagemaker:DescribeCluster"
      ],
      "Resource": "<hyperpod-cluster-arn>"
    },
    {
      "Sid": "UseEksClusterPermissions",
      "Effect": "Allow",
      "Action": [
        "eks:DescribeCluster",
      ],
      "Resource": "<eks-cluster-arn>"
    },
    {
      "Sid": "ListClustersPermission",
      "Effect": "Allow",
      "Action": [
        "sagemaker:ListClusters"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ssm:StartSession",
        "ssm:TerminateSession"
      ],
      "Resource": "*"
    }
  ]
}

```

To grant data scientists IAM users or roles access to Kubernetes APIs in the cluster, see also [Grant IAM users and roles access to Kubernetes APIs](#) in the *Amazon EKS User Guide*.

## IAM role for SageMaker HyperPod

For SageMaker HyperPod clusters to run and communicate with necessary AWS resources, you need create an IAM role for HyperPod cluster to assume.

Start with attaching the managed role [the section called “AmazonSageMakerHyperPodServiceRolePolicy”](#). Given this AWS managed policy, SageMaker HyperPod cluster instance groups assume the role to communicate with Amazon CloudWatch, Amazon S3, and AWS Systems Manager Agent (SSM Agent). This managed policy is the minimum requirement for SageMaker HyperPod resources to run properly, so you must provide an IAM role with this policy to all instance groups.

### Tip

Depending on your preference on designing the level of permissions for multiple instance groups, you can also set up multiple IAM roles and attach them to different instance groups. When you set up your cluster user access to specific SageMaker HyperPod cluster nodes, the nodes assume the role with the selective permissions you manually attached. When you set up the access for scientists to specific cluster nodes through [AWS Systems Manager](#) (see also [the section called “Setting up AWS Systems Manager and Run As for cluster user access control”](#)), the cluster nodes assume the role with the selective permissions you manually attach.

After you are done with creating IAM roles, make notes of their names and ARNs. You use the roles when creating a SageMaker HyperPod cluster, granting the correct permissions required for each instance group to communicate with necessary AWS resources.

### Slurm

For HyperPod orchestrated with Slurm, you must attach the following managed policy to the SageMaker HyperPod IAM role.

- [AmazonSageMakerClusterInstanceRolePolicy](#)

### **(Optional) Additional permissions for using SageMaker HyperPod with Amazon Virtual Private Cloud**

If you want to use your own Amazon Virtual Private Cloud (VPC) instead of the default SageMaker AI VPC, you should add the following additional permissions to the IAM role for SageMaker HyperPod.

```
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2>DeleteNetworkInterface",
    "ec2>DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups",
    "ec2:DetachNetworkInterface"
  ],
  "Resource": "*"
}
{
  "Effect": "Allow",
  "Action": "ec2:CreateTags",
  "Resource": [
    "arn:aws:ec2:*:*:network-interface/*"
  ]
}
```

The following list breaks down which permissions are needed to enable SageMaker HyperPod cluster functionalities when you configure the cluster with your own Amazon VPC.

- The following ec2 permissions are required to enable configuring a SageMaker HyperPod cluster with your VPC.

```
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2>DeleteNetworkInterface",
    "ec2>DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
```

```

    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ],
  "Resource": "*"
}

```

- The following ec2 permission is required to enable the [SageMaker HyperPod auto-resume functionality](#).

```

{
  "Effect": "Allow",
  "Action": [
    "ec2:DetachNetworkInterface"
  ],
  "Resource": "*"
}

```

- The following ec2 permission allows SageMaker HyperPod to create tags on the network interfaces within your account.

```

{
  "Effect": "Allow",
  "Action": "ec2:CreateTags",
  "Resource": [
    "arn:aws:ec2:*:*:network-interface/*"
  ]
}

```

## Amazon EKS

For HyperPod orchestrated with Amazon EKS, you must attach the following managed policies to the SageMaker HyperPod IAM role.

- [AmazonSageMakerClusterInstanceRolePolicy](#)

In addition to the managed policies, attach the following permission policy to the role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:AssignPrivateIpAddresses",
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2>DeleteNetworkInterface",
        "ec2>DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups",
        "ec2:DetachNetworkInterface",
        "ec2:ModifyNetworkInterfaceAttribute",
        "ec2:UnassignPrivateIpAddresses",
        "ecr:BatchGetImage",
        "ecr:GetAuthorizationToken",
        "ecr:GetDownloadUrlForLayer",
        "eks-auth:AssumeRoleForPodIdentity"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ec2:CreateTags"
      ],
      "Resource": [
        "arn:aws:ec2:*:*:network-interface/*"
      ]
    }
  ]
}
```

**Note**

The "eks-auth:AssumeRoleForPodIdentity" permission is optional. It's required if you plan to use EKS Pod identity.

## SageMaker HyperPod service-linked role

For Amazon EKS support in SageMaker HyperPod, HyperPod creates a service-linked role with [the section called “AmazonSageMakerHyperPodServiceRolePolicy”](#) to monitor and support resiliency on your EKS cluster such as replacing nodes and restarting jobs.

## IAM policies for Amazon EKS

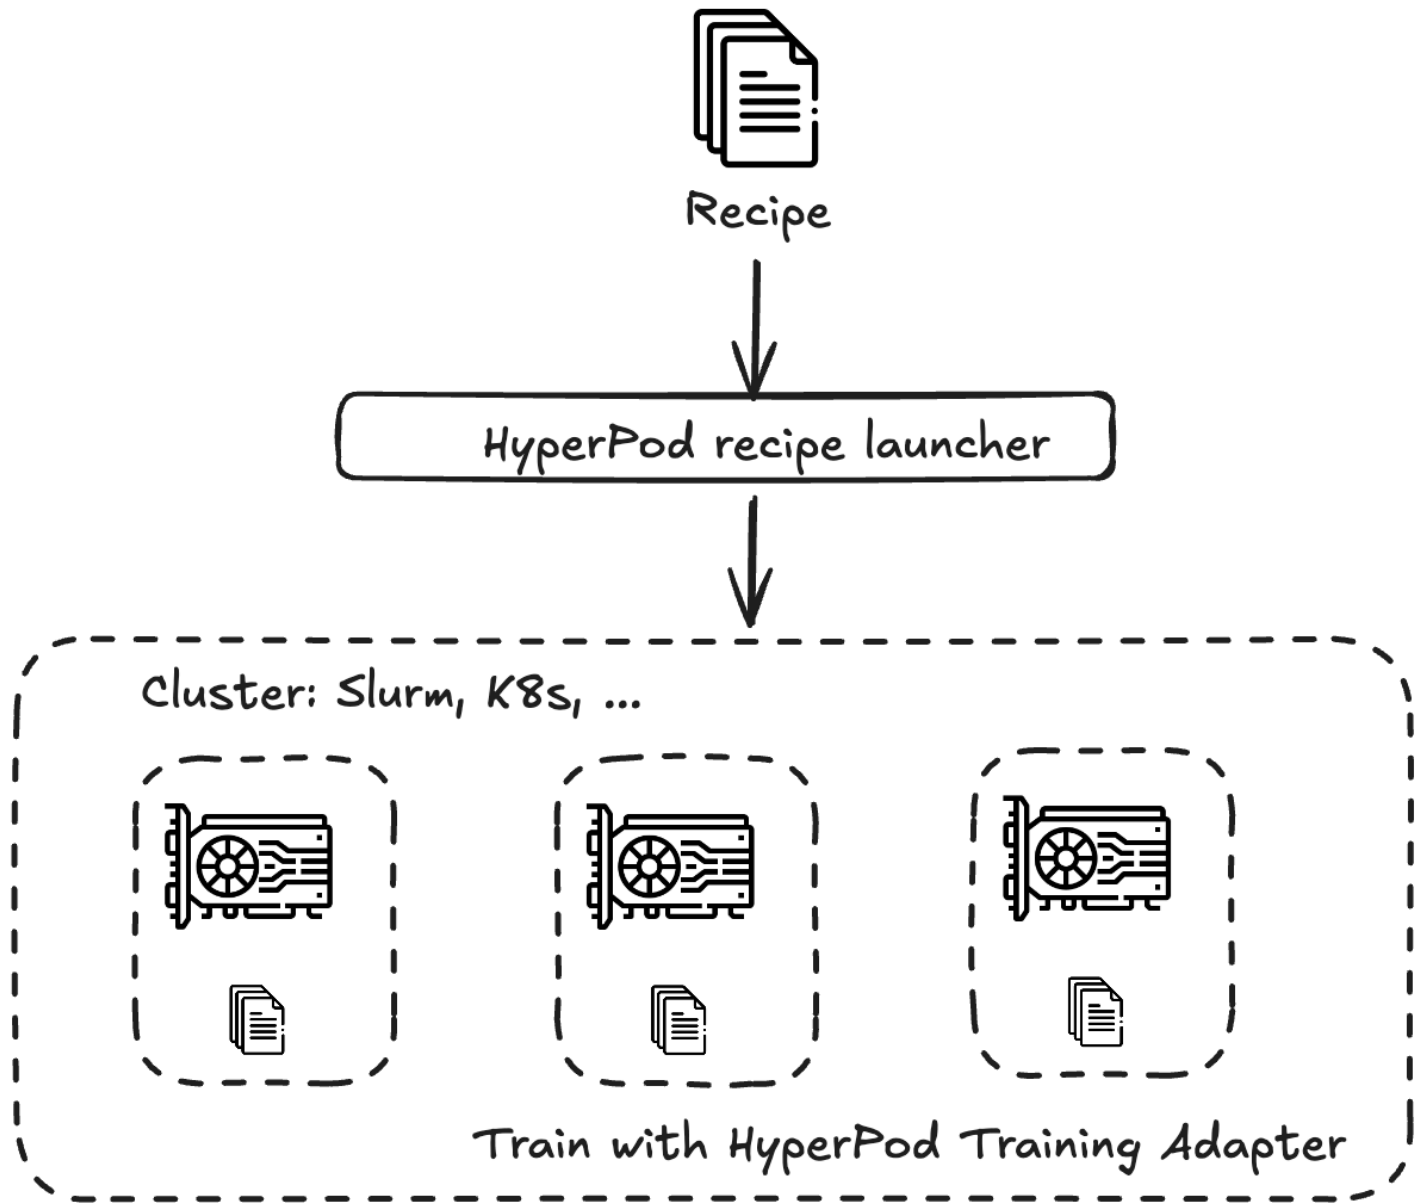

## SageMaker HyperPod recipes

Use Amazon SageMaker HyperPod recipes to get started with training and fine-tuning publicly available foundation models. To view the available recipes, see [SageMaker HyperPod recipes](#).

The recipes are pre-configured training configurations for the following model families:

- [Llama 3.1](#)
- [Llama 3.2](#)
- [Mistral](#)
- [Mixtral](#)

You can run recipes within SageMaker HyperPod or as SageMaker training jobs. You use the Amazon SageMaker HyperPod training adapter as the framework to help you run end-to-end training workflows. The training adapter is built on the [NVIDIA NeMo framework](#) and [Neuronx Distributed Training package](#). If you're familiar with using NeMo, the process of using the training adapter is the same. The training adapter runs the recipe on your cluster.

You can also train your own model by defining your own custom recipe.

The following tables outline the predefined recipes and launch scripts that SageMaker HyperPod currently supports.

## Available pre-training models, recipes, and launch scripts

Model	Size	Sequence	Nodes	Instance	Accelerator	Recipe	Script
Llama3.2	11b	8192	4	ml.p5.48xlarge	Nvidia H100	<a href="#">link</a>	<a href="#">link</a>

  - [SageMaker training jobs pre-training tutorial \(GPU\)](#)
  - [Trainium SageMaker training jobs pre-training tutorial](#)

### HyperPod Slurm cluster pre-training tutorial (GPU)

The following tutorial sets up Slurm environment and starts a training job on a Llama 8 billion parameter model.

#### Prerequisites

Before you start setting up your environment to run the recipe, make sure you have:

- Set up a HyperPod GPU Slurm cluster.
  - Your HyperPod Slurm cluster must have Nvidia Enroot and Pyxis enabled (these are enabled by default).

- A shared storage location. It can be an Amazon FSx file system or an NFS system that's accessible from the cluster nodes.
- Data in one of the following formats:
  - JSON
  - JSONGZ (Compressed JSON)
  - ARROW
- (Optional) You must get a HuggingFace token if you're using the model weights from HuggingFace for pre-training or fine-tuning. For more information about getting the token, see [User access tokens](#).

## HyperPod GPU Slurm environment setup

To initiate a training job on a HyperPod GPU Slurm cluster, do the following:

1. SSH into the head node of your Slurm cluster.
2. After you log in, set up the virtual environment. Make sure you're using Python 3.9 or greater.

```
#set up a virtual environment
python3 -m venv ${PWD}/venv
source venv/bin/activate
```

3. Clone the SageMaker HyperPod recipes and SageMaker HyperPod adapter repositories to a shared storage location.

```
git clone https://github.com/aws/sagemaker-hyperpod-training-adapter-for-nemo.git
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

4. Create a squash file using Enroot. To find the most recent release of the SMP container, see [Release notes for the SageMaker model parallelism library](#). To gain a deeper understanding of how to use the Enroot file, see [Build AWS-optimized Nemo-Launcher image](#).

```
REGION="<region>"
IMAGE="658645717510.dkr.ecr._${REGION}.amazonaws.com/smdistributed-
modelparallel:2.4.1-gpu-py311-cu121"
aws ecr get-login-password --region _${REGION} | docker login --username AWS --
password-stdin 658645717510.dkr.ecr._${REGION}.amazonaws.com
```

```
enroot import -o $PWD/smdistributed-modelparallel.sqsh dockerd://${IMAGE}
mv $PWD/smdistributed-modelparallel.sqsh "/fsx/<any-path-in-the-shared-filesystem>"
```

- To use the Enroot squash file to start training, use the following example to modify the `recipes_collection/config.yaml` file.

```
container: /fsx/path/to/your/smdistributed-modelparallel.sqsh
```

## Launch the training job

After you install the dependencies, start a training job from the `sagemaker-hyperpod-recipes/launcher_scripts` directory. You get the dependencies by cloning the [SageMaker HyperPod recipes repository](#):

First, pick your training recipe from Github, the model name is specified as part of the recipe. We use the `launcher_scripts/llama/run_hf_llama3_8b_seq16k_gpu_p5x16_pretrain.sh` script to launch a Llama 8b with sequence length 8192 pre-training recipe, `llama/hf_llama3_8b_seq16k_gpu_p5x16_pretrain`, in the following example.

- IMAGE: The container from the environment setup section.
- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
recipes.model.hf_access_token=<your_hf_token>
```

```
#!/bin/bash
IMAGE="${YOUR_IMAGE}"
SAGEMAKER_TRAINING_LAUNCHER_DIR="${SAGEMAKER_TRAINING_LAUNCHER_DIR:-${PWD}}"

TRAIN_DIR="${YOUR_TRAIN_DIR}" # Location of training dataset
VAL_DIR="${YOUR_VAL_DIR}" # Location of validation dataset

# experiment output directory
EXP_DIR="${YOUR_EXP_DIR}"

HYDRA_FULL_ERROR=1 python3 "${SAGEMAKER_TRAINING_LAUNCHER_DIR}/main.py" \
  recipes=training/llama/hf_llama3_8b_seq16k_gpu_p5x16_pretrain \
  base_results_dir="${SAGEMAKER_TRAINING_LAUNCHER_DIR}/results" \
  recipes.run.name="hf_llama3_8b" \
```

```
recipes.exp_manager.exp_dir="$EXP_DIR" \  
recipes.model.data.train_dir="$TRAIN_DIR" \  
recipes.model.data.val_dir="$VAL_DIR" \  
container="${IMAGE}" \  
+cluster.container_mounts.0="/fsx:/fsx"
```

After you've configured all the required parameters in the launcher script, you can run the script using the following command.

```
bash launcher_scripts/llama/run_hf_llama3_8b_seq16k_gpu_p5x16_pretrain.sh
```

For more information about the Slurm cluster configuration, see [Run a training job on HyperPod Slurm](#).

## HyperPod Slurm cluster PEFT-Lora tutorial (GPU)

The following tutorial sets up Slurm environment and starts a parameter-efficient fine-tuning (PEFT) job on a Llama 8 billion parameter model.

### Prerequisites

Before you start setting up your environment, make sure you have:

- Set up HyperPod GPU Slurm cluster
  - Your HyperPod Slurm cluster must have Nvidia Enroot and Pyxis enabled (these are enabled by default).
- A shared storage location. It can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.
- Data in one of the following formats:
  - JSON
  - JSONGZ (Compressed JSON)
  - ARROW
- (Optional) If you need the pre-trained weights from HuggingFace or if you're training a Llama 3.2 model, you must get the HuggingFace token before you start training. For more information about getting the token, see [User access tokens](#).

## Set up the HyperPod GPU Slurm environment

To initiate a training job on a Slurm cluster, do the following:

- SSH into the head node of your Slurm cluster.
- After you log in, set up the virtual environment. Make sure you're using Python 3.9 or greater.

```
#set up a virtual environment
python3 -m venv ${PWD}/venv
source venv/bin/activate
```

- Clone the SageMaker HyperPod recipes and SageMaker HyperPod adapter repositories to a shared storage location. The shared storage location can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.

```
git clone https://github.com/aws/sagemaker-hyperpod-training-adapter-for-nemo.git
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

- Create a squash file using Enroot. To find the most recent release of the SMP container, see [Release notes for the SageMaker model parallelism library](#). For more information about using the Enroot file, see [Build AWS-optimized Nemo-Launcher image](#).

```
REGION="<region>"
IMAGE="658645717510.dkr.ecr.${REGION}.amazonaws.com/smdistributed-
modelparallel:2.4.1-gpu-py311-cu121"
aws ecr get-login-password --region ${REGION} | docker login --username AWS --
password-stdin 658645717510.dkr.ecr.${REGION}.amazonaws.com
enroot import -o $PWD/smdistributed-modelparallel.sqsh dockerd://${IMAGE}
mv $PWD/smdistributed-modelparallel.sqsh "/fsx/<any-path-in-the-shared-filesystem>"
```

- To use the Enroot squash file to start training, use the following example to modify the `recipes_collection/config.yaml` file.

```
container: /fsx/path/to/your/smdistributed-modelparallel.sqsh
```

## Launch the training job

To launch a PEFT job for the Llama 8 billion parameter model with a sequence length of 8192 on a single Slurm compute node, set the launch script, `launcher_scripts/llama/run_hf_llama3_8b_seq8k_gpu_lora.sh`, to the following:

- **IMAGE:** The container from the environment setup section.
- **HF\_MODEL\_NAME\_OR\_PATH:** Define the name or the path of the pre-trained weights in the `hf_model_name_or_path` parameter of the recipe.
- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
recipes.model.hf_access_token=${HF_ACCESS_TOKEN}
```

```
#!/bin/bash
IMAGE="${YOUR_IMAGE}"
SAGEMAKER_TRAINING_LAUNCHER_DIR="${SAGEMAKER_TRAINING_LAUNCHER_DIR:-${PWD}}"

TRAIN_DIR="${YOUR_TRAIN_DIR}" # Location of training dataset
VAL_DIR="${YOUR_VAL_DIR}" # Location of validation dataset

# experiment output directory
EXP_DIR="${YOUR_EXP_DIR}"
HF_ACCESS_TOKEN="${YOUR_HF_TOKEN}"
HF_MODEL_NAME_OR_PATH="${YOUR_HF_MODEL_NAME_OR_PATH}"

# Add hf_model_name_or_path and turn off synthetic_data
HYDRA_FULL_ERROR=1 python3 ${SAGEMAKER_TRAINING_LAUNCHER_DIR}/main.py \
  recipes=fine-tuning/llama/hf_llama3_8b_seq8k_gpu_lora \
  base_results_dir=${SAGEMAKER_TRAINING_LAUNCHER_DIR}/results \
  recipes.run.name="hf_llama3_lora" \
  recipes.exp_manager.exp_dir="$EXP_DIR" \
  recipes.model.data.train_dir="$TRAIN_DIR" \
  recipes.model.data.val_dir="$VAL_DIR" \
  recipes.model.hf_model_name_or_path="$HF_MODEL_NAME_OR_PATH" \
  container="${IMAGE}" \
  +cluster.container_mounts.0="/fsx:/fsx" \
  recipes.model.hf_access_token="${HF_ACCESS_TOKEN}"
```

After you've configured all the required parameters in the preceding script, you can initiate the training job by running it.

```
bash launcher_scripts/llama/run_hf_llama3_8b_seq8k_gpu_lora.sh
```

For more information about the Slurm cluster configuration, see [Run a training job on HyperPod Slurm](#).

## Trainium Slurm cluster pre-training tutorial

The following tutorial sets up a Trainium environment on a Slurm cluster and starts a training job on a Llama 8 billion parameter model.

### Prerequisites

Before you start setting up your environment, make sure you have:

- Set up a SageMaker HyperPod Trainium Slurm cluster.
- A shared storage location. It can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.
- Data in one of the following formats:
  - JSON
  - JSONGZ (Compressed JSON)
  - ARROW
- (Optional) You must get a HuggingFace token if you're using the model weights from HuggingFace for pre-training or fine-tuning. For more information about getting the token, see [User access tokens](#).

## Set up the Trainium environment on the Slurm Cluster

To initiate a training job on a Slurm cluster, do the following:

- SSH into the head node of your Slurm cluster.
- After you log in, set up the Neuron environment. For information about setting up Neuron, see [Neuron setup steps](#). We recommend relying on the Deep learning AMI's that come pre-installed with Neuron's drivers, such as [Ubuntu 20 with DLAMI Pytorch](#).

- Clone the SageMaker HyperPod recipes repository to a shared storage location in the cluster. The shared storage location can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.

```
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

- Go through the following tutorial: [HuggingFace Llama3-8B Pretraining](#)
- Prepare a model configuration. The model configurations available in the Neuron repo. For the model configuration used in this tutorial, see [llama3 8b model config](#)

## Launch the training job in Trainium

To launch a training job in Trainium, specify a cluster configuration and a Neuron recipe. For example, to launch a llama3 8b pre-training job in Trainium, set the launch script, `launcher_scripts/llama/run_hf_llama3_8b_seq8k_trn1x4_pretrain.sh`, to the following:

- `MODEL_CONFIG`: The model config from the environment setup section
- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
recipes.model.hf_access_token=<your_hf_token>
```

```
#!/bin/bash

#Users should set up their cluster type in /recipes_collection/config.yaml

SAGEMAKER_TRAINING_LAUNCHER_DIR=${SAGEMAKER_TRAINING_LAUNCHER_DIR:-"$(pwd)"}

COMPILE=0
TRAIN_DIR="${TRAIN_DIR}" # Location of training dataset
MODEL_CONFIG="${MODEL_CONFIG}" # Location of config.json for the model

HYDRA_FULL_ERROR=1 python3 "${SAGEMAKER_TRAINING_LAUNCHER_DIR}/main.py" \
  base_results_dir="${SAGEMAKER_TRAINING_LAUNCHER_DIR}/results" \
  instance_type="trn1.32xlarge" \
  recipes.run.compile="${COMPILE}" \
```

```
recipes.run.name="hf-llama3-8b" \  
recipes.trainer.num_nodes=4 \  
recipes=training/llama/hf_llama3_8b_seq8k_trn1x4_pretrain \  
recipes.data.train_dir="$TRAIN_DIR" \  
recipes.model.model_config="$MODEL_CONFIG"
```

To launch the training job, run the following command:

```
bash launcher_scripts/llama/run_hf_llama3_8b_seq8k_trn1x4_pretrain.sh
```

For more information about the Slurm cluster configuration, see [Run a training job on HyperPod Slurm](#).

## Kubernetes cluster pre-training tutorial (GPU)

There are two ways to launch a training job in a GPU Kubernetes cluster:

- (Recommended) [HyperPod command-line tool](#)
- The NeMo style launcher

### Prerequisites

Before you start setting up your environment, make sure you have:

- A HyperPod GPU Kubernetes cluster is setup properly.
- A shared storage location. It can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.
- Data in one of the following formats:
  - JSON
  - JSONGZ (Compressed JSON)
  - ARROW
- (Optional) You must get a HuggingFace token if you're using the model weights from HuggingFace for pre-training or fine-tuning. For more information about getting the token, see [User access tokens](#).

## GPU Kubernetes environment setup

To set up a GPU Kubernetes environment, do the following:

- Set up the virtual environment. Make sure you're using Python 3.9 or greater.

```
python3 -m venv ${PWD}/venv
source venv/bin/activate
```

- Install dependencies using one of the following methods:
  - (Recommended): [HyperPod command-line tool](#) method:

```
# install HyperPod command line tools
git clone https://github.com/aws/sagemaker-hyperpod-cli
cd sagemaker-hyperpod-cli
pip3 install .
```

- SageMaker HyperPod recipes method:

```
# install SageMaker HyperPod Recipes.
git clone --recursive git@github.com:aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

- [Set up kubectl and eksctl](#)
- [Install Helm](#)
- Connect to your Kubernetes cluster

```
aws eks update-kubeconfig --region "${CLUSTER_REGION}" --name "${CLUSTER_NAME}"
hyperpod connect-cluster --cluster-name "${CLUSTER_NAME}" [--region
"${CLUSTER_REGION}"] [--namespace <namespace>]
```

## Launch the training job with the SageMaker HyperPod CLI

We recommend using the SageMaker HyperPod command-line interface (CLI) tool to submit your training job with your configurations. The following example submits a training job for the hf\_llama3\_8b\_seq16k\_gpu\_p5x16\_pretrain model.

- `your_training_container`: A Deep Learning container. To find the most recent release of the SMP container, see [Release notes for the SageMaker model parallelism library](#).

- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
"recipes.model.hf_access_token": "<your_hf_token>"
```

```
hyperpod start-job --recipe training/llama/hf_llama3_8b_seq16k_gpu_p5x16_pretrain \
--persistent-volume-claims fsx-claim:data \
--override-parameters \
'{
"recipes.run.name": "hf-llama3-8b",
"recipes.exp_manager.exp_dir": "/data/<your_exp_dir>",
"container": "658645717510.dkr.ecr.<region>.amazonaws.com/smdistributed-
modelparallel:2.4.1-gpu-py311-cu121",
"recipes.model.data.train_dir": "<your_train_data_dir>",
"recipes.model.data.val_dir": "<your_val_data_dir>",
"cluster": "k8s",
"cluster_type": "k8s"
}'
```

After you've submitted a training job, you can use the following command to verify if you submitted it successfully.

```
kubectl get pods
```

NAME	READY	STATUS	RESTARTS	AGE
hf-llama3-<your-alias>-worker-0	0/1	running	0	36s

If the STATUS is PENDING or ContainerCreating, run the following command to get more details.

```
kubectl describe pod <name of pod>
```

After the job STATUS changes to Running, you can examine the log by using the following command.

```
kubectl logs <name of pod>
```

The STATUS becomes Completed when you run `kubectl get pods`.

## Launch the training job with the recipes launcher

Alternatively, you can use the SageMaker HyperPod recipes to submit your training job. Using the recipes involves updating `k8s.yaml`, `config.yaml`, and running the launch script.

- In `k8s.yaml`, update `persistent_volume_claims`. It mounts the Amazon FSx claim to the `/data` directory of each computing pod

```
persistent_volume_claims:
  - claimName: fsx-claim
    mountPath: data
```

- In `config.yaml`, update `repo_url_or_path` under `git`.

```
git:
  repo_url_or_path: <training_adapter_repo>
  branch: null
  commit: null
  entry_script: null
  token: null
```

- Update `launcher_scripts/llama/run_hf_llama3_8b_seq16k_gpu_p5x16_pretrain.sh`
- `your_container`: A Deep Learning container. To find the most recent release of the SMP container, see [Release notes for the SageMaker model parallelism library](#).
- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
recipes.model.hf_access_token=<your_hf_token>
```

```
#!/bin/bash
#Users should setup their cluster type in /recipes_collection/config.yaml
REGION="<region>"
IMAGE="658645717510.dkr.ecr.${REGION}.amazonaws.com/smdistributed-
modelparallel:2.4.1-gpu-py311-cu121"
SAGEMAKER_TRAINING_LAUNCHER_DIR=${SAGEMAKER_TRAINING_LAUNCHER_DIR:-"$(pwd)"}
EXP_DIR="<your_exp_dir>" # Location to save experiment info including logging,
  checkpoints, ect
TRAIN_DIR="<your_training_data_dir>" # Location of training dataset
VAL_DIR="<your_val_data_dir>" # Location of talidation dataset
```

```
HYDRA_FULL_ERROR=1 python3 "${SAGEMAKER_TRAINING_LAUNCHER_DIR}/main.py" \  
  recipes=training/llama/hf_llama3_8b_seq8k_gpu_p5x16_pretrain \  
  base_results_dir="${SAGEMAKER_TRAINING_LAUNCHER_DIR}/results" \  
  recipes.run.name="hf-llama3" \  
  recipes.exp_manager.exp_dir="$EXP_DIR" \  
  cluster=k8s \  
  cluster_type=k8s \  
  container="${IMAGE}" \  
  recipes.model.data.train_dir=$TRAIN_DIR \  
  recipes.model.data.val_dir=$VAL_DIR
```

- **Launch the training job**

```
bash launcher_scripts/llama/run_hf_llama3_8b_seq16k_gpu_p5x16_pretrain.sh
```

After you've submitted the training job, you can use the following command to verify if you submitted it successfully.

```
kubectl get pods
```

NAME	READY	STATUS	RESTARTS	AGE		
hf-llama3-<your-alias>-worker-0	0/1	running	0	36s		

If the STATUS is PENDING or ContainerCreating, run the following command to get more details.

```
kubectl describe pod <name-of-pod>
```

After the job STATUS changes to Running, you can examine the log by using the following command.

```
kubectl logs <name of pod>
```

The STATUS will turn to Completed when you run `kubectl get pods`.

For more information about the k8s cluster configuration, see [Run a training job on HyperPod k8s](#).

## Trainium Kubernetes cluster pre-training tutorial

You can use one of the following methods to start a training job in a Trainium Kubernetes cluster.

- (Recommended) [HyperPod command-line tool](#)
- The NeMo style launcher

### Prerequisites

Before you start setting up your environment, make sure you have:

- Set up a HyperPod Trainium Kubernetes cluster
- A shared storage location that can be an Amazon FSx file system or NFS system that's accessible from the cluster nodes.
- Data in one of the following formats:
  - JSON
  - JSONGZ (Compressed JSON)
  - ARROW
- (Optional) You must get a HuggingFace token if you're using the model weights from HuggingFace for pre-training or fine-tuning. For more information about getting the token, see [User access tokens](#).

## Set up your Trainium Kubernetes environment

To set up the Trainium Kubernetes environment, do the following:

1. Complete the steps in the following tutorial: [HuggingFace Llama3-8B Pretraining](#) starting from **Download the dataset**.
2. Prepare a model configuration. They're available in the Neuron repo. For this tutorial, you can use the llama3 8b model config.
3. Virtual environment setup. Make sure you're using Python 3.9 or greater.

```
python3 -m venv ${PWD}/venv
source venv/bin/activate
```

4. Install the dependencies

- (Recommended) Use the following HyperPod command-line tool

```
# install HyperPod command line tools
git clone https://github.com/aws/sagemaker-hyperpod-cli
cd sagemaker-hyperpod-cli
pip3 install .
```

- If you're using SageMaker HyperPod recipes, specify the following

```
# install SageMaker HyperPod Recipes.
git clone --recursive git@github.com:aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

## 5. [Set up kubectl and eksctl](#)

## 6. [Install Helm](#)

## 7. Connect to your Kubernetes cluster

```
aws eks update-kubeconfig --region "${CLUSTER_REGION}" --name "${CLUSTER_NAME}"
hyperpod connect-cluster --cluster-name "${CLUSTER_NAME}" [--region
"${CLUSTER_REGION}"] [--namespace <namespace>]
```

## 8. Container: The [Neuron container](#)

### Launch the training job with the SageMaker HyperPod CLI

We recommend using the SageMaker HyperPod command-line interface (CLI) tool to submit your training job with your configurations. The following example submits a training job for the hf\_llama3\_8b\_seq8k\_trn1x4\_pretrain Trainium model.

- `your_neuron_container`: The [Neuron container](#).
- `your_model_config`: The model configuration from the environment setup section
- (Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
"recipes.model.hf_access_token": "<your_hf_token>"
```

```
hyperpod start-job --recipe training/llama/hf_llama3_8b_seq8k_trn1x4_pretrain \
--persistent-volume-claims fsx-claim:data \
--override-parameters \
'{
  "cluster": "k8s",
  "cluster_type": "k8s",
  "container": "<your_neuron_contrainer>",
  "recipes.run.name": "hf-llama3",
  "recipes.run.compile": 0,
  "recipes.model.model_config": "<your_model_config>",
  "instance_type": "trn1.32xlarge",
  "recipes.data.train_dir": "<your_train_data_dir>"
}'
```

After you've submitted a training job, you can use the following command to verify if you submitted it successfully.

```
kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
hf-llama3-<your-alias>-worker-0     0/1     running   0          36s
```

If the STATUS is PENDING or ContainerCreating, run the following command to get more details.

```
kubectl describe pod <name of pod>
```

After the job STATUS changes to Running, you can examine the log by using the following command.

```
kubectl logs <name of pod>
```

The STATUS will turn to Completed when you run `kubectl get pods`.

## Launch the training job with the recipes launcher

Alternatively, use SageMaker HyperPod recipes to submit your training job. To submit the training job using a recipe, update `k8s.yaml` and `config.yaml`. Run the bash script for the model to launch it.

- In `k8s.yaml`, update `persistent_volume_claims` to mount the Amazon FSx claim to the `/data` directory in the compute nodes

```
persistent_volume_claims:
  - claimName: fsx-claim
    mountPath: data
```

- Update `launcher_scripts/llama/run_hf_llama3_8b_seq8k_trn1x4_pretrain.sh`
- `your_neuron_container`: The container from the environment setup section
- `your_model_config`: The model config from the environment setup section

(Optional) You can provide the HuggingFace token if you need pre-trained weights from HuggingFace by setting the following key-value pair:

```
recipes.model.hf_access_token=<your_hf_token>
```

```
#!/bin/bash
#Users should set up their cluster type in /recipes_collection/config.yaml
IMAGE="<your_neuron_container>"
MODEL_CONFIG="<your_model_config>"
SAGEMAKER_TRAINING_LAUNCHER_DIR=${SAGEMAKER_TRAINING_LAUNCHER_DIR:-"$(pwd)"}
TRAIN_DIR="<your_training_data_dir>" # Location of training dataset
VAL_DIR="<your_val_data_dir>" # Location of talidation dataset

HYDRA_FULL_ERROR=1 python3 "${SAGEMAKER_TRAINING_LAUNCHER_DIR}/main.py" \
  recipes=training/llama/hf_llama3_8b_seq8k_trn1x4_pretrain \
  base_results_dir="${SAGEMAKER_TRAINING_LAUNCHER_DIR}/results" \
  recipes.run.name="hf-llama3-8b" \
  instance_type=trn1.32xlarge \
  recipes.model.model_config="$MODEL_CONFIG" \
  cluster=k8s \
  cluster_type=k8s \
  container="${IMAGE}" \
  recipes.data.train_dir=$TRAIN_DIR \
  recipes.data.val_dir=$VAL_DIR
```

- Launch the job

```
bash launcher_scripts/llama/run_hf_llama3_8b_seq8k_trn1x4_pretrain.sh
```

After you've submitted a training job, you can use the following command to verify if you submitted it successfully.

```
kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
hf-llama3-<your-alias>-worker-0    0/1    running   0           36s
```

If the STATUS is at PENDING or ContainerCreating, run the following command to get more details.

```
kubectl describe pod <name of pod>
```

After the job STATUS changes to Running, you can examine the log by using the following command.

```
kubectl logs <name of pod>
```

The STATUS will turn to Completed when you run `kubectl get pods`.

For more information about the k8s cluster configuration, see [Trainium Kubernetes cluster pre-training tutorial](#).

## SageMaker training jobs pre-training tutorial (GPU)

This tutorial guides you through the process of setting up and running a pre-training job using SageMaker training jobs with GPU instances.

- Set up your environment
- Launch a training job using SageMaker HyperPod recipes

Before you begin, make sure you have following prerequisites.

### Prerequisites

Before you start setting up your environment, make sure you have:

- Amazon FSx file system or an Amazon S3 bucket where you can load the data and output the training artifacts.
- Requested a Service Quota for 1x ml.p4d.24xlarge and 1x ml.p5.48xlarge on Amazon SageMaker AI. To request a service quota increase, do the following:
  1. On the AWS Service Quotas console, navigate to AWS services,

2. Choose **Amazon SageMaker AI**.
  3. Choose one ml.p4d.24xlarge and one ml.p5.48xlarge instance.
- Create an AWS Identity and Access Management(IAM) role with the following managed policies to give SageMaker AI permissions to run the examples.
    - AmazonSageMakerFullAccess
    - AmazonEC2FullAccess
  - Data in one of the following formats:
    - JSON
    - JSONGZ (Compressed JSON)
    - ARROW
  - (Optional) You must get a HuggingFace token if you're using the model weights from HuggingFace for pre-training or fine-tuning. For more information about getting the token, see [User access tokens](#).

## GPU SageMaker training jobs environment setup

Before you run a SageMaker training job, configure your AWS credentials and preferred region by running the `aws configure` command. As an alternative to the `configure` command, you can provide your credentials through environment variables such as `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`, and `AWS_SESSION_TOKEN`. For more information, see [SageMaker AI Python SDK](#).

We strongly recommend using a SageMaker AI Jupyter notebook in SageMaker AI JupyterLab to launch a SageMaker training job. For more information, see [SageMaker JupyterLab](#).

- (Optional) Set up the virtual environment and dependencies. If you are using a Jupyter notebook in Amazon SageMaker Studio, you can skip this step. Make sure you're using Python 3.9 or greater.

```
# set up a virtual environment
python3 -m venv ${PWD}/venv
source venv/bin/activate
# install dependencies after git clone.

git clone --recursive git@github.com:aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
```

```
pip3 install -r requirements.txt
# Set the aws region.

aws configure set <your_region>
```

- **Install SageMaker AI Python SDK**

```
pip3 install --upgrade sagemaker
```

- **Container:** The GPU container is set automatically by the SageMaker AI Python SDK. You can also provide your own container.

**Note**

If you're running a Llama 3.2 multi-modal training job, the `transformers` version must be `4.45.2` or greater.

Append `transformers==4.45.2` to `requirements.txt` in `source_dir` only when you're using the SageMaker AI Python SDK. For example, append it if you're using it in a notebook in SageMaker AI JupyterLab.

If you are using HyperPod recipes to launch using cluster type `sm_jobs`, this will be done automatically.

## Launch the training job using a Jupyter Notebook

You can use the following Python code to run a SageMaker training job with your recipe. It leverages the PyTorch estimator from the [SageMaker AI Python SDK](#) to submit the recipe. The following example launches the `llama3-8b` recipe on the SageMaker AI Training platform.

```
import os
import sagemaker,boto3
from sagemaker.debugger import TensorBoardOutputConfig

from sagemaker.pytorch import PyTorch

sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()
```

```

bucket = sagemaker_session.default_bucket()
output = os.path.join(f"s3://{bucket}", "output")
output_path = "<s3-URI"

overrides = {
    "run": {
        "results_dir": "/opt/ml/model",
    },
    "exp_manager": {
        "exp_dir": "",
        "explicit_log_dir": "/opt/ml/output/tensorboard",
        "checkpoint_dir": "/opt/ml/checkpoints",
    },
    "model": {
        "data": {
            "train_dir": "/opt/ml/input/data/train",
            "val_dir": "/opt/ml/input/data/val",
        },
    },
}

tensorboard_output_config = TensorBoardOutputConfig(
    s3_output_path=os.path.join(output, 'tensorboard'),
    container_local_output_path=overrides["exp_manager"]["explicit_log_dir"]
)

estimator = PyTorch(
    output_path=output_path,
    base_job_name=f"llama-recipe",
    role=role,
    instance_type="ml.p5.48xlarge",
    training_recipe="training/llama/hf_llama3_8b_seq8k_gpu_p5x16_pretrain",
    recipe_overrides=recipe_overrides,
    sagemaker_session=sagemaker_session,
    tensorboard_output_config=tensorboard_output_config,
)

estimator.fit(inputs={"train": "s3 or fsx input", "val": "s3 or fsx input"}, wait=True)

```

The preceding code creates a PyTorch estimator object with the training recipe and then fits the model using the `fit()` method. Use the `training_recipe` parameter to specify the recipe you want to use for training.

**Note**

If you're running a Llama 3.2 multi-modal training job, the transformers version must be 4.45.2 or greater.

Append `transformers==4.45.2` to `requirements.txt` in `source_dir` only when you're using SageMaker AI Python SDK directly. For example, you must append the version to the text file when you're using a Jupyter notebook.

When you deploy the endpoint for a SageMaker training job, you must specify the image URI that you're using. If don't provide the image URI, the estimator uses the training image as the image for the deployment. The training images that SageMaker HyperPod provides don't contain the dependencies required for inference and deployment. The following is an example of how an inference image can be used for deployment:

```
from sagemaker import image_uris
container=image_uris.retrieve(framework='pytorch',region='us-
west-2',version='2.0',py_version='py310',image_scope='inference',
instance_type='ml.p4d.24xlarge')
predictor =
estimator.deploy(initial_instance_count=1,instance_type='ml.p4d.24xlarge',image_uri=container)
```

**Note**

Running the preceding code on Sagemaker notebook instance might need more than the default 5GB of storage that SageMaker AI JupyterLab provides. If you run into space not available issues, create a new notebook instance where you use a different notebook instance and increase the storage of the notebook.

## Launch the training job with the recipes launcher

Update the `./recipes_collection/cluster/sm_jobs.yaml` file to look like the following:

```
sm_jobs_config:
  output_path: <s3_output_path>
  tensorboard_config:
    output_path: <s3_output_path>
```

```

    container_logs_path: /opt/ml/output/tensorboard # Path to logs on the container
    wait: True # Whether to wait for training job to finish
    inputs: # Inputs to call fit with. Set either s3 or file_system, not both.
      s3: # Dictionary of channel names and s3 URIs. For GPUs, use channels for train
and validation.
        train: <s3_train_data_path>
        val: null
    additional_estimator_kwargs: # All other additional args to pass to estimator. Must
be int, float or string.
      max_run: 180000
      enable_remote_debug: True
    recipe_overrides:
      exp_manager:
        explicit_log_dir: /opt/ml/output/tensorboard
      data:
        train_dir: /opt/ml/input/data/train
      model:
        model_config: /opt/ml/input/data/train/config.json
      compiler_cache_url: "<compiler_cache_url>"

```

Update `./recipes_collection/config.yaml` to specify `sm_jobs` in the cluster and `cluster_type`.

```

defaults:
  - _self_
  - cluster: sm_jobs # set to `slurm`, `k8s` or `sm_jobs`, depending on the desired
cluster
  - recipes: training/llama/hf_llama3_8b_seq8k_trn1x4_pretrain
cluster_type: sm_jobs # bcm, bcp, k8s or sm_jobs. If bcm, k8s or sm_jobs, it must
match - cluster above.

```

Launch the job with the following command

```
python3 main.py --config-path recipes_collection --config-name config
```

For more information about configuring SageMaker training jobs, see [Run a training job on SageMaker training jobs](#).

## Trainium SageMaker training jobs pre-training tutorial

This tutorial guides you through the process of setting up and running a pre-training job using SageMaker training jobs with AWS Trainium instances.

- Set up your environment
- Launch a training job

Before you begin, make sure you have the following prerequisites.

### Prerequisites

Before you start setting up your environment, make sure you have:

- Amazon FSx file system or S3 bucket where you can load the data and output the training artifacts.
- Request a Service Quota for the `ml.trn1.32xlarge` instance on Amazon SageMaker AI. To request a service quota increase, do the following:

#### To request a service quota increase for `ml.trn1.32xlarge` instance

1. Navigate to the AWS Service Quotas console.
  2. Choose AWS services.
  3. Select JupyterLab.
  4. Specify one instance for `ml.trn1.32xlarge`.
- Create an AWS Identity and Access Management (IAM) role with the `AmazonSageMakerFullAccess` and `AmazonEC2FullAccess` managed policies. These policies provide Amazon SageMaker AI with permissions to run the examples.
  - Data in one of the following formats:
    - JSON
    - JSONGZ (Compressed JSON)
    - ARROW
  - (Optional) If you need the pre-trained weights from HuggingFace or if you're training a Llama 3.2 model, you must get the HuggingFace token before you start training. For more information about getting the token, see [User access tokens](#).

## Set up your environment for Trainium SageMaker training jobs

Before you run a SageMaker training job, use the `aws configure` command to configure your AWS credentials and preferred region . As an alternative, you can also provide your credentials through environment variables such as the `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`, and `AWS_SESSION_TOKEN`. For more information, see [SageMaker AI Python SDK](#).

We strongly recommend using a SageMaker AI Jupyter notebook in SageMaker AI JupyterLab to launch a SageMaker training job. For more information, see [SageMaker JupyterLab](#).

- (Optional) If you are using Jupyter notebook in Amazon SageMaker Studio, you can skip running the following command. Make sure to use a version `>= python 3.9`

```
# set up a virtual environment
python3 -m venv ${PWD}/venv
source venv/bin/activate
# install dependencies after git clone.

git clone --recursive git@github.com:aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

- Install SageMaker AI Python SDK

```
pip3 install --upgrade sagemaker
```

- If you are running a llama 3.2 multi-modal training job, the `transformers` version must be 4.45.2 or greater.
  - Append `transformers==4.45.2` to `requirements.txt` in `source_dir` only when you're using the SageMaker AI Python SDK.
  - If you are using HyperPod recipes to launch using `sm_jobs` as the cluster type, you don't have to specify the `transformers` version.
- Container: The Neuron container is set automatically by SageMaker AI Python SDK.

## Launch the training job with a Jupyter Notebook

You can use the following Python code to run a SageMaker training job using your recipe. It leverages the PyTorch estimator from the [SageMaker AI Python SDK](#) to submit the recipe. The following example launches the llama3-8b recipe as a SageMaker AI Training Job.

- `compiler_cache_url`: Cache to be used to save the compiled artifacts, such as an Amazon S3 artifact.

```
import os
import sagemaker,boto3
from sagemaker.debugger import TensorBoardOutputConfig

from sagemaker.pytorch import PyTorch

sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()

recipe_overrides = {
    "run": {
        "results_dir": "/opt/ml/model",
    },
    "exp_manager": {
        "explicit_log_dir": "/opt/ml/output/tensorboard",
    },
    "data": {
        "train_dir": "/opt/ml/input/data/train",
    },
    "model": {
        "model_config": "/opt/ml/input/data/train/config.json",
    },
    "compiler_cache_url": "<compiler_cache_url>"
}

tensorboard_output_config = TensorBoardOutputConfig(
    s3_output_path=os.path.join(output, 'tensorboard'),
    container_local_output_path=overrides["exp_manager"]["explicit_log_dir"]
)

estimator = PyTorch(
    output_path=output_path,
    base_job_name=f"llama-trn",
    role=role,
    instance_type="ml.trn1.32xlarge",
    sagemaker_session=sagemaker_session,
    training_recipe="training/llama/hf_llama3_70b_seq8k_trn1x16_pretrain",
    recipe_overrides=recipe_overrides,
)
```

```
estimator.fit(inputs={"train": "your-inputs"}, wait=True)
```

The preceding code creates a PyTorch estimator object with the training recipe and then fits the model using the `fit()` method. Use the `training_recipe` parameter to specify the recipe you want to use for training.

### Launch the training job with the recipes launcher

- Update `./recipes_collection/cluster/sm_jobs.yaml`
  - `compiler_cache_url`: The URL used to save the artifacts. It can be an Amazon S3 URL.

```
sm_jobs_config:
  output_path: <s3_output_path>
  wait: True
  tensorboard_config:
    output_path: <s3_output_path>
    container_logs_path: /opt/ml/output/tensorboard # Path to logs on the container
    wait: True # Whether to wait for training job to finish
  inputs: # Inputs to call fit with. Set either s3 or file_system, not both.
    s3: # Dictionary of channel names and s3 URIs. For GPUs, use channels for train
    and validation.
      train: <s3_train_data_path>
      val: null
  additional_estimator_kwargs: # All other additional args to pass to estimator.
  Must be int, float or string.
  max_run: 180000
  image_uri: <your_image_uri>
  enable_remote_debug: True
  py_version: py39
  recipe_overrides:
    model:
      exp_manager:
        exp_dir: <exp_dir>
      data:
        train_dir: /opt/ml/input/data/train
        val_dir: /opt/ml/input/data/val
```

- Update `./recipes_collection/config.yaml`

```
defaults:
- _self_
```

```
- cluster: sm_jobs
- recipes: training/llama/hf_llama3_8b_seq8k_trn1x4_pretrain
cluster_type: sm_jobs # bcm, bcp, k8s or sm_jobs. If bcm, k8s or sm_jobs, it must
match - cluster above.

instance_type: ml.trn1.32xlarge
base_results_dir: ~/sm_job/hf_llama3_8B # Location to store the results, checkpoints
and logs.
```

- Launch the job with `main.py`

```
python3 main.py --config-path recipes_collection --config-name config
```

For more information about configuring SageMaker training jobs, see [SageMaker training jobs pre-training tutorial \(GPU\)](#).

## Default Configurations

This section outlines the essential components and settings required to initiate and customize your Large Language Model (LLM) training processes using SageMaker HyperPod. This section covers the key repositories, configuration files, and recipe structures that form the foundation of your training jobs. Understanding these default configurations is crucial for effectively setting up and managing your LLM training workflows, whether you're using pre-defined recipes or customizing them to suit your specific needs.

### Topics

- [Github Repositories](#)
- [General configuration](#)

### Github Repositories

To launch a training job, you utilize files from two distinct GitHub repositories:

- [SageMaker HyperPod recipes](#)
- [SageMaker HyperPod training adapter for NeMo](#)

These repositories contain essential components for initiating, managing, and customizing Large Language Model (LLM) training processes. You use the scripts from the repositories to set up and run the training jobs for your LLMs.

## SageMaker HyperPod recipe repository

Use the [SageMaker HyperPod recipes](#) repository to get a recipe.

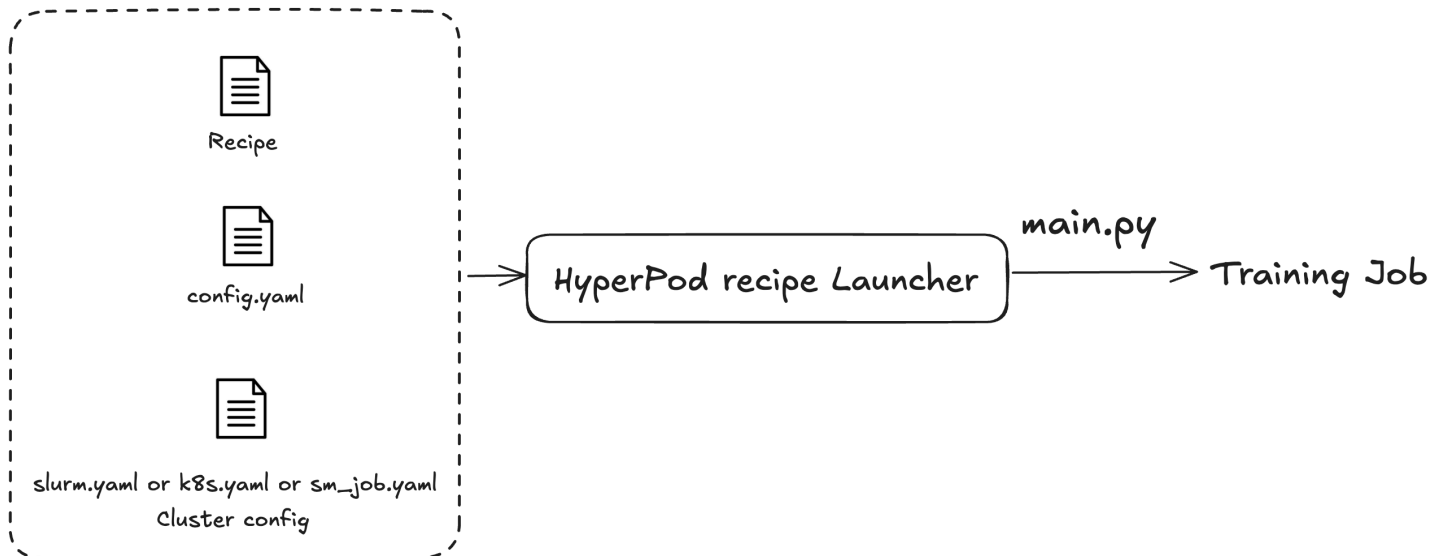

1. `main.py`: This file serves as the primary entry point for initiating the process of submitting a training job to either a cluster or a SageMaker training job.
2. `launcher_scripts`: This directory contains a collection of commonly used scripts designed to facilitate the training process for various Large Language Models (LLMs).
3. `recipes_collection`: This folder houses a compilation of pre-defined LLM recipes provided by the developers. Users can leverage these recipes in conjunction with their custom data to train LLM models tailored to their specific requirements.

You use the SageMaker HyperPod recipes to launch training or fine-tuning jobs. Regardless of the cluster you're using, the process of submitting the job is the same. For example, you can use the same script to submit a job to a Slurm or Kubernetes cluster. The launcher dispatches a training job based on three configuration files:

1. **General Configuration (`config.yaml`)**: Includes common settings such as the default parameters or environment variables used in the training job.
2. **Cluster Configuration (`cluster`)**: For training jobs using clusters only. If you're submitting a training job to a Kubernetes cluster, you might need to specify information such as volume, label, or restart policy. For Slurm clusters, you might need to specify the Slurm job name. All the parameters are related to the specific cluster that you're using.
3. **Recipe (`recipes`)**: Recipes contain the settings for your training job, such as the model types, sharding degree, or dataset paths. For example, you can specify Llama as your training model and train it using model or data parallelism techniques like Fully Sharded Distributed Parallel (FSDP) across eight machines. You can also specify different checkpoint frequencies or paths for your training job.

After you've specified a recipe, you run the launcher script to specify an end-to-end training job on a cluster based on the configurations through the `main.py` entry point. For each recipe that you use, there are accompanying shell scripts located in the `launcher_scripts` folder. These examples guide you through submitting and initiating training jobs. The following figure illustrates how a

SageMaker HyperPod recipe launcher submits a training job to a cluster based on the preceding. Currently, the SageMaker HyperPod recipe launcher is built on top of the Nvidia NeMo Framework Launcher. For more information, see [NeMo Launcher Guide](#).

## SageMaker HyperPod recipe adapter

The SageMaker HyperPod training adapter is a training framework. You can use it to manage the entire lifecycle of your training jobs. Use the adapter to distribute the pre-training or fine-tuning of your models across multiple machines. The adaptor uses different parallelism techniques to distribute the training. It also handles the implementation and management of saving the checkpoints. For more details, see [Advanced Settings](#).

Use the [SageMaker HyperPod recipe adapter repository](#) to use the recipe adapter.

1. `src`: This directory contains the implementation of Large-scale Language Model (LLM) training, encompassing various features such as model parallelism, mixed-precision training, and checkpointing management.
2. `examples`: This folder provides a collection of examples demonstrating how to create an entry point for training an LLM model, serving as a practical guide for users.

## General configuration

The `config.yaml` file specifies the training recipe and the cluster. It also includes runtime configurations such as environment variables for the training job.

```
defaults:
```

```
- _self_  
- cluster: slurm  
- recipes: training/llama/hf_llama3_8b_seq8192_gpu  
instance_type: p5.48xlarge  
git:  
  repo_url_or_path: null  
  branch: null  
  commit: null  
  entry_script: null  
  token: null  
env_vars:  
  NCCL_DEBUG: WARN
```

You can modify the following parameters in `config.yaml`:

1. `defaults`: Specify your default settings, such as the default cluster or default recipes.
2. `instance_type`: Modify the Amazon EC2 instance type to match the instance type that you're using.
3. `git`: Specify the location of the SageMaker HyperPod recipe adapter repository for the training job.
4. `env_vars`: You can specify the environment variables to be passed into your runtime training job. For example, you can adjust the logging level of NCCL by specifying the `NCCL_DEBUG` environment variable.

The recipe is the core configuration that defines your training job architecture. This file includes many important pieces of information for your training job, such as the following:

- Whether to use model parallelism
- The source of your datasets
- Mixed precision training
- Checkpointing-related configurations

You can use the recipes as-is. You can also use the following information to modify them.

## run

The following is the basic run information for running your training job.

```
run:
  name: llama-8b
  results_dir: ${base_results_dir}/${.name}
  time_limit: "6-00:00:00"
  model_type: hf
```

1. **name:** Specify the name for your training job in the configuration file.
2. **results\_dir:** You can specify the directory where the results of your training job are stored.
3. **time\_limit:** You can set a maximum training time for your training job to prevent it from occupying hardware resources for too long.
4. **model\_type:** You can specify the type of model you are using. For example, you can specify `hf` if your model is from HuggingFace.

## exp\_manager

The `exp_manager` configures the experiment. With the `exp_manager`, you can specify fields such as the output directory or checkpoint settings. The following is an example of how you can configure the `exp_manager`.

```
exp_manager:
  exp_dir: null
  name: experiment
  create_tensorboard_logger: True
```

1. **exp\_dir:** The experiment directory includes the standard output and standard error files for your training job. By default, it uses your current directory.
2. **name:** The experiment name used to identify your experiment under the `exp_dir`.
3. **create\_tensorboard\_logger:** Specify `True` or `False` to enable or disable the TensorBoard logger.

## Checkpointing

Here are three types of checkpointing we support:

- Auto checkpointing

- Manual checkpointing
- Full checkpointing

## Auto checkpointing

If you're saving or loading checkpoints that are automatically managed by the SageMaker HyperPod recipe adapter, you can enable `auto_checkpoint`. To enable `auto_checkpoint`, set `enabled` to `True`. You can use auto checkpointing for both training and fine-tuning. You can use auto checkpointing for both shared file systems and Amazon S3.

```
exp_manager
  checkpoint_dir: ${recipes.exp_manager.exp_dir}/checkpoints/
  auto_checkpoint:
    enabled: True
```

Auto checkpoint is saving the `local_state_dict` asynchronously with an automatically computed optimal saving interval.

### Note

Under this checkpointing mode, the auto saved checkpointing doesn't support re-sharding between training runs. To resume from the latest auto saved checkpoint, you must preserve the same shard degrees. You don't need to specify extra information to auto resume.

## Manual checkpointing

You can modify `checkpoint_callback_params` to asynchronously save an intermediate checkpoint in `shared_state_dict`. For example, you can specify the following configuration to enable sharded checkpointing every 10 steps and keep the latest 3 checkpoints.

Sharded checkpointing allows you to change the shard degrees between training runs and load the checkpoint by setting `resume_from_checkpoint`.

### Note

- If is a PEFT fine tuning, sharded checkpointing doesn't support Amazon S3.
- Auto and manual checkpointing are mutually exclusive.

- Only FSDP shard degrees and replication degrees changes are allowed.

```
exp_manager:
  checkpoint_callback_params:
    # Set save_top_k = 0 to disable sharded checkpointing
    save_top_k: 3
    every_n_train_steps: 10
    monitor: "step"
    mode: "max"
    save_last: False
  resume_from_checkpoint: ${recipes.exp_manager.exp_dir}/checkpoints/
```

To learn more about checkpointing, see [Checkpointing using SMP](#).

## Full checkpointing

The exported `full_state_dict` checkpoint can be used for inference or fine tuning. You can load a full checkpoint through `hf_model_name_or_path`. Under this mode, only the model weights are saved.

To export the `full_state_dict` model, you can set the following parameters.

### Note

Currently, full checkpointing isn't supported for Amazon S3 checkpointing. You can't set the S3 path for `exp_manager.checkpoint_dir` if you're enabling full checkpointing. However, you can set `exp_manager.export_full_model.final_export_dir` to a specific directory on your local filesystem while setting `exp_manager.checkpoint_dir` to an Amazon S3 path.

```
exp_manager:
  export_full_model:
    # Set every_n_train_steps = 0 to disable full checkpointing
    every_n_train_steps: 0
    save_last: True
    final_export_dir : null
```

## model

Define various aspects of your model architecture and training process. This includes settings for model parallelism, precision, and data handling. Below are the key components you can configure within the model section:

### model parallelism

After you've specified the recipe, you define the model that you're training. You can also define the model parallelism. For example, you can define `tensor_model_parallel_degree`. You can enable other features like training with FP8 precision. For example, you can train a model with tensor parallelism and context parallelism:

```
model:
  model_type: llama_v3
  # Base configs
  train_batch_size: 4
  val_batch_size: 1
  seed: 12345
  grad_clip: 1.0

  # Model parallelism
  tensor_model_parallel_degree: 4
  expert_model_parallel_degree: 1
  context_parallel_degree: 2
```

To gain a better understanding of different types of model parallelism techniques, you can refer to the following approaches:

1. [the section called "Tensor parallelism"](#)
2. [the section called "Expert parallelism"](#)
3. [the section called "Context parallelism"](#)
4. [the section called "Hybrid sharded data parallelism"](#)

## FP8

To enable FP8 (8-bit floating-point precision), you can specify the FP8-related configuration in the following example:

```
model:
```

```
# FP8 config
fp8: True
fp8_amax_history_len: 1024
fp8_amax_compute_algo: max
```

It's important to note that the FP8 data format is currently supported only on the P5 instance type. If you are using an older instance type, such as P4, disable the FP8 feature for your model training process. For more information about FP8, see [Mixed precision training](#).

## data

You can specify your custom datasets for your training job by adding the data paths under `data`. The data module in our system supports the following data formats:

1. JSON
2. JSONGZ (Compressed JSON)
3. ARROW

However, you are responsible for preparing your own pre-tokenized dataset. If you're an advanced user with specific requirements, there is also an option to implement and integrate a customized data module. For more information on HuggingFace datasets, see [Datasets](#).

```
model:
  data:
    train_dir: /path/to/your/train/data
    val_dir: /path/to/your/val/data
    dataset_type: hf
    use_synthetic_data: False
```

You can specify how you're training the model. By default, the recipe uses pre-training instead of fine-tuning. The following example configures the recipe to run a fine-tuning job with LoRA (Low-Rank Adaptation).

```
model:
  # Fine tuning config
  do_finetune: True
  # The path to resume from, needs to be HF compatible
  hf_model_name_or_path: null
  hf_access_token: null
  # PEFT config
```

```
peft:
  peft_type: lora
  rank: 32
  alpha: 16
  dropout: 0.1
```

For information about the recipes, see [SageMaker HyperPod recipes](#).

## Cluster-Specific Configurations

SageMaker HyperPod offers flexibility in running training jobs across different cluster environments. Each environment has its own configuration requirements and setup process. This section outlines the steps and configurations needed for running training jobs in SageMaker HyperPod Slurm, SageMaker HyperPod k8s, and SageMaker training jobs. Understanding these configurations is crucial for effectively leveraging the power of distributed training in your chosen environment.

You can use a recipe in the following cluster environments:

- SageMaker HyperPod Slurm Orchestration
- SageMaker HyperPod Amazon Elastic Kubernetes Service Orchestration
- SageMaker training jobs

To launch a training job in a cluster, set and install the corresponding cluster configuration and environment.

### Topics

- [Run a training job on HyperPod Slurm](#)
- [Run a training job on HyperPod k8s](#)
- [Run a SageMaker training job](#)

## Run a training job on HyperPod Slurm

SageMaker HyperPod Recipes supports submitting a training job to a GPU/Trainium slurm cluster. Before you submit the training job, update the cluster configuration. Use one of the following methods to update the cluster configuration:

- Modify `slurm.yaml`

- Override it through the command line

After you've updated the cluster configuration, install the environment.

## Configure the cluster

To submit a training job to a Slurm cluster, specify the Slurm-specific configuration. Modify `slurm.yaml` to configure the Slurm cluster. The following is an example of a Slurm cluster configuration. You can modify this file for your own training needs:

```
job_name_prefix: 'sagemaker-'
slurm_create_submission_file_only: False
stderr_to_stdout: True
srun_args:
  # - "--no-container-mount-home"
slurm_docker_cfg:
  docker_args:
    # - "--runtime=nvidia"
  post_launch_commands:
container_mounts:
  - "/fsx:/fsx"
```

1. `job_name_prefix`: Specify a job name prefix to easily identify your submissions to the Slurm cluster.
2. `slurm_create_submission_file_only`: Set this configuration to True for a dry run to help you debug.
3. `stderr_to_stdout`: Specify whether you're redirecting your standard error (stderr) to standard output (stdout).
4. `srun_args`: Customize additional srun configurations, such as excluding specific compute nodes. For more information, see the srun documentation.
5. `slurm_docker_cfg`: The SageMaker HyperPod recipe launcher launches a Docker container to run your training job. You can specify additional Docker arguments within this parameter.
6. `container_mounts`: Specify the volumes you're mounting into the container for the recipe launcher, for your training jobs to access the files in those volumes.

## Run a training job on HyperPod k8s

SageMaker HyperPod Recipes supports submitting a training job to a GPU/Trainium Kubernetes cluster. Before you submit the training job do one of the following:

- Modify the `k8s.yaml` cluster configuration file
- Override the cluster configuration through the command line

After you've done either of the preceding steps, install the corresponding environment.

### Configure the cluster using `k8s.yaml`

To submit a training job to a Kubernetes cluster, you specify Kubernetes-specific configurations. The configurations include the cluster namespace or the location of the persistent volume.

```
pullPolicy: Always
restartPolicy: Never
namespace: default
persistent_volume_claims:
  - null
```

1. `pullPolicy`: You can specify the pull policy when you submit a training job. If you specify "Always," the Kubernetes cluster always pulls your image from the repository. For more information, see [Image pull policy](#).
2. `restartPolicy`: Specify whether to restart your training job if it fails.
3. `namespace`: You can specify the Kubernetes namespace where you're submitting the training job.
4. `persistent_volume_claims`: You can specify a shared volume for your training job for all training processes to access the files in the volume.

## Run a SageMaker training job

SageMaker HyperPod Recipes supports submitting a SageMaker training job. Before you submit the training job, you must update the cluster configuration, `sm_job.yaml`, and install corresponding environment.

## Use your recipe as a SageMaker training job

You can use your recipe as a SageMaker training job if you aren't hosting a cluster. You must modify the SageMaker training job configuration file, `sm_job.yaml`, to run your recipe.

```
sm_jobs_config:
  output_path: null
  tensorboard_config:
    output_path: null
    container_logs_path: null
  wait: True
  inputs:
    s3:
      train: null
      val: null
    file_system:
      directory_path: null
  additional_estimator_kwargs:
    max_run: 1800
```

1. `output_path`: You can specify where you're saving your model to an Amazon S3 URL.
2. `tensorboard_config`: You can specify a TensorBoard related configuration such as the output path or TensorBoard logs path.
3. `wait`: You can specify whether you're waiting for the job to be completed when you submit your training job.
4. `inputs`: You can specify the paths for your training and validation data. The data source can be from a shared filesystem such as Amazon FSx or an Amazon S3 URL.
5. `additional_estimator_kwargs`: Additional estimator arguments for submitting a training job to the SageMaker training job platform. For more information, see [Algorithm Estimator](#).

## Special Considerations

When you're using a Amazon SageMaker HyperPod recipes, there are some factors that can impact the process of model training.

- The `transformers` version must be 4.45.2 or greater for Llama 3.2. If you're using a Slurm or K8s workflow, the version is automatically updated.
- Mixtral does not support 8-bit floating point precision (FP8)

- Amazon EC2 p4 instance does not support FP8

## Advanced Settings

The SageMaker HyperPod recipe adapter is built on top of the Nvidia Nemo and Pytorch-lightning frameworks. If you've already used these frameworks, integrating your custom models or features into the SageMaker HyperPod recipe adapter is a similar process. In addition to modifying the recipe adapter, you can change your own pre-training or fine-tuning script. For guidance on writing your custom training script, see [examples](#).

### Use the SageMaker HyperPod adapter to create your own model

Within the recipe adapter, you can customize the following files in the following locations:

1. `collections/data`: Contains a module responsible for loading datasets. Currently, it only supports datasets from HuggingFace. If you have more advanced requirements, the code structure allows you to add custom data modules within the same folder.
2. `collections/model`: Includes the definitions of various language models. Currently, it supports common large language models like Llama, Mixtral, and Mistral. You have the flexibility to introduce your own model definitions within this folder.
3. `collections/parts`: This folder contains strategies for training models in a distributed manner. One example is the Fully Sharded Data Parallel (FSDP) strategy, which allows for sharding a large language model across multiple accelerators. Additionally, the strategies support various forms of model parallelism. You also have the option to introduce your own customized training strategies for model training.
4. `utils`: Contains various utilities aimed at facilitating the management of a training job. It serves as a repository where for your own tools. You can use your own tools for tasks such as troubleshooting or benchmarking. You can also add your own personalized PyTorch Lightning callbacks within this folder. You can use PyTorch Lightning callbacks to seamlessly integrate specific functionalities or operations into the training lifecycle.
5. `conf`: Contains the configuration schema definitions used for validating specific parameters in a training job. If you introduce new parameters or configurations, you can add your customized schema to this folder. You can use the customized schema to define the validation rules. You can validate data types, ranges, or any other parameter constraint. You can also define you own custom schema to validate the parameters.

## Appendix

Use the following information to get information about monitoring and analyzing training results.

### Monitor training results

Monitoring and analyzing training results is essential for developers to assess convergence and troubleshoot issues. SageMaker HyperPod recipes offer Tensorboard integration to analyze training behavior. To address the challenges of profiling large distributed training jobs, these recipes also incorporate VizTracer. VizTracer is a low-overhead tool for tracing and visualizing Python code execution. For more information about VizTracer, see [VizTracer](#).

The following sections guide you through the process of implementing these features in your SageMaker HyperPod recipes.

### Tensorboard

Tensorboard is a powerful tool for visualizing and analyzing the training process. To enable Tensorboard, modify your recipe by setting the following parameter:

```
exp_manager:  
  exp_dir: null  
  name: experiment  
  create_tensorboard_logger: True
```

After you enable the Tensorboard logger, the training logs are generated and stored within the experiment directory. The experiment directory is defined in `exp_manager.exp_dir`. To access and analyze these logs locally, use the following procedure:

### To access and analyze logs

1. Download the Tensorboard experiment folder from your training environment to your local machine.
2. Open a terminal or command prompt on your local machine.
3. Navigate to the directory containing the downloaded experiment folder.
4. Launch Tensorboard with the following the command.

```
tensorboard --port=<port> --bind_all --logdir experiment.
```

5. Open your web browser and visit `http://localhost:8008`.

You can now see the status and visualizations of your training jobs within the Tensorboard interface. Seeing the status and visualizations helps you monitor and analyze the training process. Monitoring and analyzing the training process helps you gain insights into the behavior and performance of your models. For more information about how you monitor and analyze the training with Tensorboard, see the [NVIDIA NeMo Framework User Guide](#).

## VizTracer

To enable VizTracer, you can modify your recipe by setting the `model.viztracer.enabled` parameter to true. For example, you can update your llama recipe to enable VizTracer by adding the following configuration:

```
model:
  viztracer:
    enabled: true
```

After the training has completed, your VizTracer profile is in the experiment folder `exp_dir/result.json`. To analyze your profile, you can download it and open it using the `vizviewer` tool:

```
vizviewer --port <port> result.json
```

This command launches the `vizviewer` on port 9001. You can view your VizTracer by specifying `http://localhost:<port>` in your browser. After you open VizTracer, you begin analyzing the training. For more information about using VizTracer, see [VizTracer documentation](#).

## SageMaker JumpStart versus SageMaker HyperPod

While SageMaker JumpStart provides fine-tuning capabilities, the SageMaker HyperPod recipes provide the following:

- Additional fine-grained control over the training loop
- Recipe customization for your own models and data
- Support for model parallelism

Use the SageMaker HyperPod recipes when you need access to the model's hyperparameters, multi-node training, and customization options for the training loop.

For more information about fine-tuning your models in SageMaker JumpStart, see [Fine-tune publicly available foundation models with the `JumpStartEstimator` class](#)

## Orchestrating SageMaker HyperPod clusters with Slurm

Slurm support in SageMaker HyperPod helps you provision resilient clusters for running machine learning (ML) workloads and developing state-of-the-art models such as large language models (LLMs), diffusion models, and foundation models (FMs). It accelerates development of FMs by removing undifferentiated heavy-lifting involved in building and maintaining large-scale compute clusters powered by thousands of accelerators such as AWS Trainium and NVIDIA A100 and H100 Graphical Processing Units (GPUs). When accelerators fail, the resiliency features of SageMaker HyperPod monitors the cluster instances automatically detect and replace the faulty hardware on the fly so that you can focus on running ML workloads. Additionally, with lifecycle configuration support in SageMaker HyperPod, you can customize your computing environment to best suit your needs and configure it with the Amazon SageMaker AI distributed training libraries to achieve optimal performance on AWS.

### Operating clusters

You can create, configure, and maintain SageMaker HyperPod clusters graphically through the console user interface (UI) and programmatically through the AWS command line interface (CLI) or AWS SDK for Python (Boto3). With Amazon VPC, you can secure the cluster network and also take advantage of configuring your cluster with resources in your VPC, such as Amazon FSx for Lustre, which offers the fastest throughput. You can also give different IAM roles to cluster instance groups, and limit actions that your cluster resources and users can operate. To learn more, see [the section called “SageMaker HyperPod operation”](#).

### Configuring your ML environment

SageMaker HyperPod runs [the section called “SageMaker HyperPod DLAMI”](#), which sets up an ML environment on the HyperPod clusters. You can configure additional customizations to the DLAMI by providing lifecycle scripts to support your use case. To learn more about how to set up lifecycle scripts, see [the section called “Getting started with SageMaker HyperPod”](#) and [the section called “Customize SageMaker HyperPod clusters using lifecycle scripts”](#).

### Scheduling jobs

After you successfully create a HyperPod cluster, cluster users can log into the cluster nodes (such as head or controller node, log-in node, and worker node) and schedule jobs for running machine learning workloads. To learn more, see [the section called “Jobs on HyperPod clusters”](#).

### Resiliency against hardware failures

SageMaker HyperPod runs health checks on cluster nodes and provides a workload auto-resume functionality. With the cluster resiliency features of HyperPod, you can resume your workload from the last checkpoint you saved, after faulty nodes are replaced with healthy ones in clusters with more than 16 nodes. To learn more, see [the section called “Cluster resiliency”](#).

## Logging and managing clusters

You can find SageMaker HyperPod resource utilization metrics and lifecycle logs in Amazon CloudWatch, and manage SageMaker HyperPod resources by tagging them. Each `CreateCluster` API run creates a distinct log stream, named in `<cluster-name>-<timestamp>` format. In the log stream, you can check the host names, the name of failed lifecycle scripts, and outputs from the failed scripts such as `stdout` and `stderr`. For more information, see [the section called “Cluster management”](#).

## Compatible with SageMaker AI tools

Using SageMaker HyperPod, you can configure clusters with AWS optimized collective communications libraries offered by SageMaker AI, such as the [SageMaker AI distributed data parallelism \(SMDDP\) library](#). The SMDDP library implements the `AllGather` operation optimized to the AWS compute and network infrastructure for the most performant SageMaker AI machine learning instances powered by NVIDIA A100 GPUs. To learn more, see [the section called “Run distributed training workloads with Slurm on HyperPod”](#).

## Tutorial for getting started with SageMaker HyperPod

Get started with creating your first SageMaker HyperPod cluster and learn the cluster operation functionalities of SageMaker HyperPod. You can create a SageMaker HyperPod cluster through

the SageMaker AI console UI or the AWS CLI commands. This tutorial shows how to create a new SageMaker HyperPod cluster with Slurm, which is a popular workload scheduler software. After you go through this tutorial, you will know how to log into the cluster nodes using the AWS Systems Manager commands (`aws ssm`). After you complete this tutorial, see also [the section called “SageMaker HyperPod operation”](#) to learn more about the SageMaker HyperPod basic operations, and [the section called “Jobs on HyperPod clusters”](#) to learn how to schedule jobs on the provisioned cluster.

### Tip

To find practical examples and solutions, see also the [SageMaker HyperPod workshop](#).

## Topics

- [Using the AWS CLI commands for the SageMaker HyperPod APIs](#)

## Using the SageMaker HyperPod console UI

Create your first SageMaker HyperPod cluster using the SageMaker HyperPod console UI.

### Create your first SageMaker HyperPod cluster with Slurm

The following tutorial demonstrates how to create a new SageMaker HyperPod cluster and set it up with Slurm through the SageMaker AI console UI. Following the tutorial, you'll create a HyperPod cluster with three Slurm nodes, `my-controller-group`, `my-login-group`, and `worker-group-1`.

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose **HyperPod Clusters** in the left navigation pane and then **Cluster Management**.
3. On the **SageMaker HyperPod Clusters** page, choose **Create cluster**.
4. In **Step 1: Cluster settings**, specify a name for the new cluster. Skip the **Tags** section.
5. In **Step 2: Instance groups**, add instance groups. Each instance group can be configured differently, and you can create a heterogeneous cluster that consists of multiple instance groups with various instance types. For lifecycle configuration scripts to run on the instance group during cluster creation, you can start with using the sample lifecycle scripts provided in the [Awesome Distributed Training GitHub repository](#).

- a. For **Instance group name**, specify a name for the instance group. For this tutorial, create three instance groups named `my-controller-group`, `my-login-group`, and `worker-group-1`.
- b. For **Select instance type**, choose the instance for the instance group. For this tutorial, select `m1.c5.xlarge` for `my-controller-group`, `m1.m5.4xlarge` for `my-login-group`, and `m1.trn1.32xlarge` for `worker-group-1`.

Ensure that you choose the instance type with sufficient quotas in your account, or request additional quotas by following at [the section called “SageMaker HyperPod quotas”](#).

- c. For **Quantity**, specify an integer not exceeding the instance quota for cluster usage. For this tutorial, enter **1** for all three groups.
- d. For **S3 path to lifecycle script files**, enter the Amazon S3 path in which your lifecycle scripts are stored. If you don't have lifecycle scripts, go through the following substeps to use the base lifecycle scripts provided by the SageMaker HyperPod service team.
  - i. Clone the [Awesome Distributed Training GitHub repository](#).

```
git clone https://github.com/aws-samples/awesome-distributed-training/
```

- ii. Under [1.architectures/5.sagemaker\\_hyperpods/LifecycleScripts/base-config](#), you can find a set of base lifecycle scripts. To learn more about the lifecycle scripts, see also [the section called “Customize SageMaker HyperPod clusters using lifecycle scripts”](#).
- iii. Write a Slurm configuration file and save it as `provisioning_params.json`. In the file, specify basic Slurm configuration parameters to properly assign Slurm nodes to the SageMaker HyperPod cluster instance groups. For example, the `provisioning_params.json` should be similar to the following based on the HyperPod cluster instance group configured through the previous steps 5a, 5b, and 5c.

```
{
  "version": "1.0.0",
  "workload_manager": "slurm",
  "controller_group": "my-controller-group",
  "login_group": "my-login-group",
  "worker_groups": [
    {
```

```

        "instance_group_name": "worker-group-1",
        "partition_name": "partition-1"
    }
]
}

```

- iv. Upload the scripts to your Amazon S3 bucket. Create an S3 bucket with a path in the following format: `s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src`. You can create this bucket using the Amazon S3 console.

#### Note

You must prefix `sagemaker-` to the S3 bucket path, because the `???` with `AmazonSageMakerClusterInstanceRolePolicy` only allows principals to access S3 buckets with this specific prefix.

- e. For **Directory path to your on-create lifecycle script**, enter the file name of the lifecycle script under **S3 path to lifecycle script files**.
  - f. For **IAM role**, choose the IAM role you created using the `AmazonSageMakerClusterInstanceRolePolicy` from the section [the section called "IAM role for SageMaker HyperPod"](#).
  - g. Under **Advanced configuration**, you can set up the following optional configurations.
    - i. (Optional) For **Threads per core**, specify 1 for disabling multi-threading and 2 for enabling multi-threading. To find which instance type supports multi-threading, see the reference table of [CPU cores and threads per CPU core per instance type](#) in the *Amazon Elastic Compute Cloud User Guide*.
    - ii. (Optional) For **Additional instance storage configs**, specify an integer between 1 and 16384 to set the size of an additional Elastic Block Store (EBS) volume in gigabytes (GB). The EBS volume is attached to each instance of the instance group. The default mount path for the additional EBS volume is `/opt/sagemaker`. After the cluster is successfully created, you can SSH into the cluster instances (nodes) and verify if the EBS volume is mounted correctly by running the `df -h` command. Attaching an additional EBS volume provides stable, off-instance, and independently persisting storage, as described in the [Amazon EBS volumes](#) section in the *Amazon Elastic Block Store User Guide*.
6. In **Step 3: Advanced configuration**, set up network settings within, and in and out of, the cluster. Select your own VPC if you already have one that gives SageMaker AI access to your

VPC. If you don't have one but want to create a new VPC, follow the instructions at [Create a VPC](#) in the *Amazon Virtual Private Cloud User Guide*. You can leave it as **no VPC** to use the default SageMaker AI VPC.

7. In **Step 4: Review and create**, review the configuration you've set from step 1 to 3 and finish submitting the cluster creation request.
8. The new cluster should appear under **Clusters** in the main pane of the SageMaker HyperPod console. You can check the status of it displayed under the **Status** column.
9. After the status of the cluster turns to InService, you can start logging into the cluster nodes. To access the cluster nodes and start running ML workloads, see [the section called "Jobs on HyperPod clusters"](#).

## Delete the cluster and clean resources

After you have successfully tested creating a SageMaker HyperPod cluster, it continues running in the InService state until you delete the cluster. We recommend that you delete any clusters created using on-demand SageMaker AI instances when not in use to avoid incurring continued service charges based on on-demand pricing. In this tutorial, you have created a cluster that consists of two instance groups. One of them uses a C5 instance, so make sure you delete the cluster by following the instructions at [the section called "Delete a SageMaker HyperPod cluster"](#).

However, if you have created a cluster with reserved compute capacity, the status of the clusters does not affect service billing.

To clean up the lifecycle scripts from the S3 bucket used for this tutorial, go to the S3 bucket you used during cluster creation and remove the files entirely.

If you have tested running any workloads on the cluster, make sure if you have uploaded any data or if your job saved any artifacts to different S3 buckets or file system services such as Amazon FSx for Lustre and Amazon Elastic File System. To prevent any incurring charges, delete all artifacts and data from the storage or file system.

## Using the AWS CLI commands for the SageMaker HyperPod APIs

Create your first SageMaker HyperPod cluster using the AWS CLI commands for HyperPod.

### Create your first SageMaker HyperPod cluster with Slurm

The following tutorial demonstrates how to create a new SageMaker HyperPod cluster and set it up with Slurm through the [AWS CLI commands for SageMaker HyperPod](#). Following the tutorial, you'll

create a HyperPod cluster with three Slurm nodes, `my-controller-group`, `my-login-group`, and `worker-group-1`.

1. First, prepare and upload lifecycle scripts to an Amazon S3 bucket. During cluster creation, HyperPod runs them in each instance group. Upload lifecycle scripts to Amazon S3 using the following command.

```
aws s3 sync \  
  ~/local-dir-to-lifecycle-scripts/* \  
  s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src
```

**Note**

The S3 bucket path should start with a prefix `sagemaker-`, because the `AmazonSageMakerClusterInstanceRolePolicy` only allows access to Amazon S3 buckets that starts with the specific prefix.

If you are starting from scratch, use sample lifecycle scripts provided in the [Awesome Distributed Training GitHub repository](#). The following sub-steps show how to download, what to modify, and how to upload the sample lifecycle scripts to an Amazon S3 bucket.

- a. Download a copy of the lifecycle script samples to a directory on your local computer.

```
git clone https://github.com/aws-samples/awesome-distributed-training/
```

- b. Go into the directory [1.architectures/5.sagemaker\\_hyperpods/LifecycleScripts/base-config](#), where you can find a set of lifecycle scripts.

```
cd awesome-distributed-training/1.architectures/5.sagemaker_hyperpods/  
LifecycleScripts/base-config
```

To learn more about the lifecycle script samples, see [the section called “Customize SageMaker HyperPod clusters using lifecycle scripts”](#).

- c. Write a Slurm configuration file and save it as `provisioning_params.json`. In the file, specify basic Slurm configuration parameters to properly assign Slurm nodes to the SageMaker HyperPod cluster instance groups. In this tutorial, set up three Slurm nodes

named `my-controller-group`, `my-login-group`, and `worker-group-1`, as shown in the following example configuration `provisioning_params.json`.

```
{
  "version": "1.0.0",
  "workload_manager": "slurm",
  "controller_group": "my-controller-group",
  "login_group": "my-login-group",
  "worker_groups": [
    {
      "instance_group_name": "worker-group-1",
      "partition_name": "partition-1"
    }
  ]
}
```

- d. Upload the scripts to `s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src`. You can do so by using the Amazon S3 console, or by running the following AWS CLI Amazon S3 command.

```
aws s3 sync \
  ~/local-dir-to-lifecycle-scripts/* \
  s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src
```

2. Prepare a [CreateCluster](#) request file in JSON format and save as `create_cluster.json`. The following request template aligns with the Slurm node configuration defined in the `provisioning_params.json` in Step 1.c. For `ExecutionRole`, provide the ARN of the IAM role you created with the managed `AmazonSageMakerClusterInstanceRolePolicy` in [the section called "Prerequisites"](#).

```
{
  // Required: Specify the name of the cluster.
  "ClusterName": "my-hyperpod-cluster",
  // Required: Configure instance groups to be launched in the cluster
  "InstanceGroups": [
    {
      // Required: Specify the basic configurations to set up a controller
      node.
      "InstanceGroupName": "my-controller-group",
      "InstanceType": "ml.c5.xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
```

```

        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
        "OnCreate": "on_create.sh"
    },
    "ExecutionRole": "#{ROLE}",
    // Optional: Configure an additional storage per instance group.
    "InstanceStorageConfigs": [
        {
            // Attach an additional EBS volume to each instance within the
instance group.
            // The default mount path for the additional EBS volume is /opt/
sagemaker.
            "EbsVolumeConfig": {
                // Specify an integer between 1 and 16384 in gigabytes (GB).
                "VolumeSizeInGB": integer,
            }
        }
    ],
},
{
    "InstanceGroupName": "my-login-group",
    "InstanceType": "m1.m5.4xlarge",
    "InstanceCount": 1,
    "LifecycleConfig": {
        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
        "OnCreate": "on_create.sh"
    },
    "ExecutionRole": "#{ROLE}"
},
{
    "InstanceGroupName": "worker-group-1",
    "InstanceType": "m1.trn1.32xlarge",
    "InstanceCount": 1,
    "LifecycleConfig": {
        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
        "OnCreate": "on_create.sh"
    },
    "ExecutionRole": "#{ROLE}"
}
]
}

```

### 3. Run the following command to create the cluster.

```
aws sagemaker create-cluster --cli-input-json file://complete/path/to/  
create_cluster.json
```

This should return the ARN of the created cluster.

If you receive an error due to resource limits, ensure that you change the instance type to one with sufficient quotas in your account, or request additional quotas by following at [the section called "SageMaker HyperPod quotas"](#).

### 4. Run `describe-cluster` to check the status of the cluster.

```
aws sagemaker describe-cluster --cluster-name my-hyperpod-cluster
```

After the status of the cluster turns to **InService**, proceed to the next step.

### 5. Run `list-cluster-nodes` to check the details of the cluster nodes.

```
aws sagemaker list-cluster-nodes --cluster-name my-hyperpod-cluster
```

This returns a response, and the InstanceId is what your cluster users need for logging (aws ssm) into them. For more information about logging into the cluster nodes and running ML workloads, see [the section called "Jobs on HyperPod clusters"](#).

## Delete the cluster and clean resources

After you have successfully tested creating a SageMaker HyperPod cluster, it continues running in the InService state until you delete the cluster. We recommend that you delete any clusters created using on-demand SageMaker AI capacity when not in use to avoid incurring continued service charges based on on-demand pricing. In this tutorial, you have created a cluster that consists of two instance groups. One of them uses a C5 instance, so make sure you delete the cluster by running the following command.

```
aws sagemaker delete-cluster --cluster-name my-hyperpod-cluster
```

To clean up the lifecycle scripts from the Amazon S3 bucket used for this tutorial, go to the Amazon S3 bucket you used during cluster creation and remove the files entirely.

If you have tested running any model training workloads on the cluster, also check if you have uploaded any data or if your job has saved any artifacts to different Amazon S3 buckets or file system services such as Amazon FSx for Lustre and Amazon Elastic File System. To prevent incurring charges, delete all artifacts and data from the storage or file system.

## SageMaker HyperPod operation

This section provides guidance on managing SageMaker HyperPod through the SageMaker AI console UI or the AWS Command Line Interface (CLI). You'll learn how to perform various tasks related to SageMaker HyperPod, whether you prefer a visual interface or working with commands.

### Topics

- [Using the SageMaker HyperPod console UI](#)
- [Using the AWS CLI](#)

### Using the SageMaker HyperPod console UI

The following topics provide guidance on how to manage SageMaker HyperPod through the console UI.

### Topics

- [Create a SageMaker HyperPod cluster](#)
- [Browse your SageMaker HyperPod clusters](#)
- [View details of each SageMaker HyperPod cluster](#)
- [Edit a SageMaker HyperPod cluster](#)
- [Delete a SageMaker HyperPod cluster](#)

### Create a SageMaker HyperPod cluster

See the following instructions on creating a new SageMaker HyperPod cluster through the SageMaker HyperPod console UI.

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose **HyperPod Clusters** in the left navigation pane and then **Cluster Management**.
3. In the SageMaker HyperPod landing page, choose **Create HyperPod cluster**.
4. From the drop-down menu of **Create HyperPod cluster**, choose **Orchestrated by Slurm**.

5. In **Step 1: Cluster settings**, set up basic information for the cluster.
  - a. For **Cluster name**, specify a name for the new cluster.
  - b. For **Tags**, add key and value pairs to the new cluster and manage the cluster as an AWS resource. To learn more, see [Tagging your AWS resources](#).
6. In **Step 2: Advanced configuration**, configure optional network settings within the cluster and in-and-out of the cluster. Select your own VPC if you already have one that gives SageMaker AI access to your resources under the VPC. If you want to create a new VPC, see [Create a default VPC](#) or [Create a VPC](#) in the *Amazon Virtual Private Cloud User Guide*. If you don't make any selections, SageMaker automatically uses the default VPC associated with your account.

 **Note**

If you want to use your own VPC, you should add additional permissions to the IAM role for SageMaker HyperPod clusters. To learn more, see [the section called "Setting up SageMaker HyperPod with a custom Amazon VPC"](#).

7. In **Step 3: Instance groups**, choose **Create instance group**. Each instance group can be configured differently, and you can create a heterogeneous cluster that consists of multiple instance groups with various instance types. In the **Create an instance group** configuration pop-up window, fill the instance group configuration information.
  - a. For **Instance group name**, specify a name for the instance group.
  - b. For **Select instance type**, choose the instance for the instance group.
  - c. For **Quantity**, specify an integer not exceeding the instance quota for cluster usage. To view your current quotas or request a quota increase, see [the section called "SageMaker HyperPod quotas"](#).
  - d. For **S3 path to lifecycle script files**, enter the Amazon S3 path in which your lifecycle scripts are stored or use the **Browse S3** option.
  - e. For **Directory path to your on-create lifecycle script**, enter the file name of the lifecycle script under **S3 path to lifecycle script files**.
  - f. For IAM role, choose the IAM role you have created for SageMaker HyperPod resources, following the section [the section called "IAM for HyperPod"](#).
  - g. Under **Advanced configuration**, you can set up the following optional configurations.

- i. (Optional) For **Threads per core**, specify 1 for disabling multi-threading and 2 for enabling multi-threading. To find which instance type supports multi-threading, see the reference table of [CPU cores and threads per CPU core per instance type](#) in the *Amazon EC2 User Guide*.
  - ii. (Optional) For **Additional instance storage configs**, specify an integer between 1 and 16384 to set the size of an additional Elastic Block Store (EBS) volume in gigabytes (GB). The EBS volume is attached to each instance of the instance group. The default mount path for the additional EBS volume is `/opt/sagemaker`. After the cluster is successfully created, you can SSH into the cluster instances (nodes) and verify if the EBS volume is mounted correctly by running the `df -h` command. Attaching an additional EBS volume provides stable, off-instance, and independently persisting storage, as described in the [Amazon EBS volumes](#) section in the *Amazon Elastic Block Store User Guide*.
8. In **Step 4: Review and create**, review the configuration you have set from **Step 1** to **Step 3** and finish submitting the cluster creation request.
  9. After the status of the cluster turns to `InService`, you can start logging into the cluster nodes. To access the cluster nodes and start running ML workloads, see [the section called "Jobs on HyperPod clusters"](#).

## Browse your SageMaker HyperPod clusters

Under **Clusters** in the main pane of the SageMaker HyperPod console on the SageMaker HyperPod console main page, all created clusters should appear listed under the **Clusters** section, which provides a summary view of clusters, their ARNs, status, and creation time.

## View details of each SageMaker HyperPod cluster

Under **Clusters** on the console main page, the cluster **Names** are activated as links. Choose the cluster name link to see details of each cluster.

## Edit a SageMaker HyperPod cluster

1. Under **Clusters** in the main pane of the SageMaker HyperPod console, choose the cluster you want to update.
2. Select your cluster, and choose **Edit**.

3. In the **Edit <your-cluster>** page, you can edit the configurations of existing instance groups, add more instance groups, delete instance groups, and change tags for the cluster. After making changes, choose **Submit**.
  - a. In the **Configure instance groups** section, you can add more instance groups by choosing **Create instance group**.
  - b. In the **Configure instance groups** section, you can choose **Edit** to change its configuration or **Delete** to remove the instance group permanently.

 **Important**

When deleting an instance group, consider the following points:

- Your SageMaker HyperPod cluster must always maintain at least one instance group.
- Ensure all critical data is backed up before removal
- The removal process cannot be undone.

 **Note**

Deleting an instance group will terminate all compute resources associated with that group.

- c. In the **Tags** section, you can update tags for the cluster.

## Delete a SageMaker HyperPod cluster

1. Under **Clusters** in the main pane of the SageMaker HyperPod console, choose the cluster you want to delete.
2. Select your cluster, and choose **Delete**.
3. In the pop-up window for cluster deletion, review the cluster information carefully to confirm that you chose the right cluster to delete.
4. After you reviewed the cluster information, choose **Yes, delete cluster**.
5. In the text field to confirm this deletion, type **delete**.
6. Choose **Delete** on the lower right corner of the pop-up window to finish sending the cluster deletion request.

## Using the AWS CLI

The following topics provide guidance on writing SageMaker HyperPod API request files in JSON format and run them using the AWS CLI commands.

### Topics

- [Create a new cluster](#)
- [Describe a cluster](#)
- [List details of cluster nodes](#)
- [Describe details of a cluster node](#)
- [List clusters](#)
- [Update cluster configuration](#)
- [Update the SageMaker HyperPod platform software of a cluster](#)
- [Scale down a cluster](#)
- [Delete a cluster](#)

### Create a new cluster

1. Prepare lifecycle configuration scripts and upload them to an S3 bucket, such as `s3://sagemaker-amzn-s3-demo-bucket/lifecycle-script-directory/src/`. The following step 2 assumes that there's an entry point script named `on_create.sh` in the specified S3 bucket.

#### Important

Make sure that you set the S3 path to start with `s3://sagemaker-`. The [the section called "IAM role for SageMaker HyperPod"](#) has the managed [AmazonSageMakerClusterInstanceRolePolicy](#) attached, which allows access to S3 buckets with the specific prefix `sagemaker-`.

2. Prepare a [CreateCluster](#) API request file in JSON format. You should configure instance groups to match with the Slurm cluster you design in the `provisioning_params.json` file that'll be used during cluster creating as part of running a set of lifecycle scripts. To learn more, see [the section called "Customize SageMaker HyperPod clusters using lifecycle scripts"](#). The following template has two instance groups to meet the minimum requirement for a Slurm cluster: one controller (head) node and one compute (worker)

node. For ExecutionRole, provide the ARN of the IAM role you created with the managed AmazonSageMakerClusterInstanceRolePolicy from the section [the section called "IAM role for SageMaker HyperPod"](#).

```
// create_cluster.json
{
  "ClusterName": "your-hyperpod-cluster",
  "InstanceGroups": [
    {
      "InstanceGroupName": "controller-group",
      "InstanceType": "ml.m5.xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://amzn-s3-demo-bucket-sagemaker/lifecycle-
script-directory/src/",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster",
      // Optional: Configure an additional storage per instance group.
      "InstanceStorageConfigs": [
        {
          // Attach an additional EBS volume to each instance within the
instance group.
          // The default mount path for the additional EBS volume is /opt/
sagemaker.
          "EbsVolumeConfig":{
            // Specify an integer between 1 and 16384 in gigabytes (GB).
            "VolumeSizeInGB": integer,
          }
        }
      ],
    },
    {
      "InstanceGroupName": "worker-group-1",
      "InstanceType": "ml.p4d.xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://amzn-s3-demo-bucket-sagemaker/lifecycle-
script-directory/src/",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster"
    }
  ]
}
```

```
    ],
    // Optional
    "Tags": [
      {
        "Key": "string",
        "Value": "string"
      }
    ],
    // Optional
    "VpcConfig": {
      "SecurityGroupIds": [ "string" ],
      "Subnets": [ "string" ]
    }
  }
}
```

Depending on how you design the cluster structure through your lifecycle scripts, you can configure up to 20 instance groups under the InstanceGroups parameter.

For the Tags request parameter, you can add custom tags for managing the SageMaker HyperPod cluster as an AWS resource. You can add tags to your cluster in the same way you add them in other AWS services that support tagging. To learn more about tagging AWS resources in general, see [Tagging AWS Resources User Guide](#).

For the VpcConfig request parameter, specify the information of a VPC you want to use. For more information, see [the section called "Setting up SageMaker HyperPod with a custom Amazon VPC"](#).

3. Run the [create-cluster](#) command as follows.

```
aws sagemaker create-cluster \  
  --cli-input-json file://complete/path/to/create_cluster.json
```

This should return the ARN of the new cluster.

## Describe a cluster

Run [describe-cluster](#) to check the status of the cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster --cluster-name your-hyperpod-cluster
```

After the status of the cluster turns to **InService**, proceed to the next step. Using this API, you can also retrieve failure messages from running other HyperPod API operations.

### List details of cluster nodes

Run [list-cluster-nodes](#) to check the key information of the cluster nodes.

```
aws sagemaker list-cluster-nodes --cluster-name your-hyperpod-cluster
```

This returns a response, and the InstanceId is what you need to use for logging (using `aws ssm`) into them.

### Describe details of a cluster node

Run [describe-cluster-node](#) to retrieve details of a cluster node. You can get the cluster node ID from `list-cluster-nodes` output. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster-node \  
  --cluster-name your-hyperpod-cluster \  
  --node-id i-111222333444555aa
```

### List clusters

Run [list-clusters](#) to list all clusters in your account.

```
aws sagemaker list-clusters
```

You can also add additional flags to filter the list of clusters down. To learn more about what this command runs at low level and additional flags for filtering, see the [ListClusters](#) API reference.

### Update cluster configuration

Run [update-cluster](#) to update the configuration of a cluster.

#### Note

You can use the `UpdateCluster` API to scale down or remove entire instance groups from your SageMaker HyperPod cluster. For additional instructions on how to scale down or delete instance groups, see [the section called "Scale down a cluster"](#).

1. Create an `UpdateCluster` request file in JSON format. Make sure that you specify the right cluster name and instance group name to update. You can change the instance type, the number of instances, the lifecycle configuration entrypoint script, and the path to the script.
  - a. For `ClusterName`, specify the name of the cluster you want to update.
  - b. For `InstanceGroupName`
    - i. To update an existing instance group, specify the name of the instance group you want to update.
    - ii. To add a new instance group, specify a new name not existing in your cluster.
  - c. For `InstanceType`
    - i. To update an existing instance group, you must match the instance type you initially specified to the group.
    - ii. To add a new instance group, specify an instance type you want to configure the group with.
  - d. For `InstanceCount`
    - i. To update an existing instance group, specify an integer that corresponds to your desired number of instances. You can provide a higher or lower value (down to 0) to scale the instance group up or down.
    - ii. To add a new instance group, specify an integer greater or equal to 1.
  - e. For `LifeCycleConfig`, you can change both `SourceS3Uri` and `OnCreate` values as you want to update the instance group.
  - f. For `ExecutionRole`
    - i. For updating an existing instance group, keep using the same IAM role you attached during cluster creation.
    - ii. For adding a new instance group, specify an IAM role you want to attach.
  - g. For `TreadsPerCore`
    - i. For updating an existing instance group, keep using the same value you specified during cluster creation.
    - ii. For adding a new instance group, you can choose any value from the allowed options per instance type. For more information, search the instance type and see the **Valid treads per core** column in the reference table at [CPU cores and threads per CPU core per instance type](#) in the *Amazon EC2 User Guide*.

The following code snippet is a JSON request file template you can use. For more information about the request syntax and parameters of this API, see the [UpdateCluster](#) API reference.

```
// update_cluster.json
{
  // Required
  "ClusterName": "name-of-cluster-to-update",
  // Required
  "InstanceGroups": [
    {
      "InstanceGroupName": "name-of-instance-group-to-update",
      "InstanceType": "ml.m5.xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://amzn-s3-demo-bucket-sagemaker/lifecycle-script-directory/src/",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster",
      // Optional: Configure an additional storage per instance group.
      "InstanceStorageConfigs": [
        {
          // Attach an additional EBS volume to each instance within the
          instance group.
          // The default mount path for the additional EBS volume is /opt/
          sagemaker.
          "EbsVolumeConfig": {
            // Specify an integer between 1 and 16384 in gigabytes (GB).
            "VolumeSizeInGB": integer,
          }
        }
      ]
    },
    // add more blocks of instance groups as needed
    { ... }
  ]
}
```

2. Run the following `update-cluster` command to submit the request.

```
aws sagemaker update-cluster \
  --cli-input-json file://complete/path/to/update_cluster.json
```

## Update the SageMaker HyperPod platform software of a cluster

Run [update-cluster-software](#) to update existing clusters with software and security patches provided by the SageMaker HyperPod service. For `--cluster-name`, specify either the name or the ARN of the cluster to update.

### Important

Note that you must back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see [the section called “Use the backup script provided by SageMaker HyperPod”](#).

```
aws sagemaker update-cluster-software --cluster-name your-hyperpod-cluster
```

This command calls the [UpdateClusterSoftware](#) API. After the API call, SageMaker HyperPod updates the cluster instances to use the latest [the section called “SageMaker HyperPod DLAMI”](#) and runs your lifecycle scripts in the S3 bucket that you specified during cluster creation or update. The SageMaker HyperPod service team regularly rolls out new [the section called “SageMaker HyperPod DLAMI”](#)s for enhancing security and improving user experiences. We recommend that you always keep updating to the latest SageMaker HyperPod DLAMI. For future SageMaker HyperPod DLAMI updates for security patching, follow up with [the section called “HyperPod release notes”](#).

### Tip

If the security patch fails, you can retrieve failure messages by running the [DescribeCluster](#) API as instructed at [the section called “Describe a cluster”](#).

### Note

You can only run this API programmatically. The patching functionality is not implemented in the SageMaker HyperPod console UI.

## Use the backup script provided by SageMaker HyperPod

SageMaker HyperPod provides a script to back up and restore your data at [1.architectures/5.sagemaker-hyperpod/patching-backup.sh](#) in the *Awesome Distributed Training GitHub repository*. The script provides the following two functions.

### To back up data to an S3 bucket before patching

```
sudo bash patching-backup.sh --create <s3-backup-bucket-path>
```

After you run the command, the script checks squeue if there are queued jobs, stops Slurm if there's no job in the queue, backs up mariadb, and copies local items on disc defined under LOCAL\_ITEMS. You can add more files and directories to LOCAL\_ITEMS.

```
# Define files and directories to back up.
LOCAL_ITEMS=(
  "/var/spool/slurmd"
  "/var/spool/slurmctld"
  "/etc/systemd/system/slurmctld.service"
  "/home/ubuntu/backup_slurm_acct_db.sql"
  # ... Add more items as needed
)
```

Also, you can add custom code to the provided script to back up any applications for your use case.

### To restore data from an S3 bucket after patching

```
sudo bash patching-backup.sh --restore <s3-backup-bucket-path>
```

## Scale down a cluster

You can scale down the number of instances or delete instance groups in your SageMaker HyperPod cluster to optimize resource allocation or reduce costs.

You scale down by either using the `UpdateCluster` API operation to randomly terminate instances from your instance group down to a specified number, or by terminating specific instances using the `BatchDeleteClusterNodes` API operation. You can also completely remove entire instance groups using the `UpdateCluster` API. For more information about how to scale down using these methods, see [Scale down a SageMaker HyperPod cluster](#).

**Note**

You cannot remove instances that are configured as Slurm controller nodes. Attempting to delete a Slurm controller node results in a validation error with the error code `NODE_ID_IN_USE`.

**Delete a cluster**

Run [delete-cluster](#) to delete a cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker delete-cluster --cluster-name your-hyperpod-cluster
```

**Customize SageMaker HyperPod clusters using lifecycle scripts**

SageMaker HyperPod offers always up-and-running compute clusters, which are highly customizable as you can write lifecycle scripts to tell SageMaker HyperPod how to set up the cluster resources. The following topics are best practices for preparing lifecycle scripts to set up SageMaker HyperPod clusters with open source workload manager tools.

The following topics discuss in-depth best practices for preparing lifecycle scripts to set up Slurm configurations on SageMaker HyperPod.

**High-level overview**

The following procedure is the main flow of provisioning a HyperPod cluster and setting it up with Slurm. The steps are put in order of a **bottom-up** approach.

1. Plan how you want to create Slurm nodes on a HyperPod cluster. For example, if you want to configure two Slurm nodes, you'll need to set up two instance groups in a HyperPod cluster.
2. Prepare a `provisioning_parameters.json` file, which is a [the section called "Configuration form for provisioning Slurm nodes on HyperPod"](#). `provisioning_parameters.json` should contain Slurm node configuration information to be provisioned on the HyperPod cluster. This should reflect the design of Slurm nodes from Step 1.
3. Prepare a set of lifecycle scripts to set up Slurm on HyperPod to install software packages and set up an environment in the cluster for your use case. You should structure the lifecycle scripts to collectively run in order in a central Python script (`lifecycle_script.py`), and write an entrypoint shell script (`on_create.sh`) to run the Python script. The entrypoint shell script is what you need to provide to a HyperPod cluster creation request later in Step 5.

Also, note that you should write the scripts to expect `resource_config.json` that will be generated by HyperPod during cluster creation. `resource_config.json` contains HyperPod cluster resource information such as IP addresses, instance types, and ARNs, and is what you need to use for configuring Slurm.

4. Collect all the files from the previous steps into a folder.

```
### lifecycle_files // your local folder

### provisioning_parameters.json
### on_create.sh
### lifecycle_script.py
### ... // more setup scripts to be fed into lifecycle_script.py
```

5. Upload all the files to an S3 bucket. Copy and keep the S3 bucket path. Note that you should create an S3 bucket path starting with `sagemaker-` because you need to choose an [the section called “IAM role for SageMaker HyperPod”](#) attached with [AmazonSageMakerClusterInstanceRolePolicy](#), which only allows S3 bucket paths starting with the prefix `sagemaker-`. The following command is an example command to upload all the files to an S3 bucket.

```
aws s3 cp --recursive ./lifecycle_files s3://sagemaker-hyperpod-lifecycle/src
```

6. Prepare a HyperPod cluster creation request.
  - Option 1: If you use the AWS CLI, write a cluster creation request in JSON format (`create_cluster.json`) following the instructions at [the section called “Create a new cluster”](#).
  - Option 2: If you use the SageMaker AI console UI, fill the **Create a cluster** request form in the HyperPod console UI following the instructions at [the section called “Create a SageMaker HyperPod cluster”](#).

At this stage, make sure that you create instance groups in the same structure that you planned in Step 1 and 2. Also, make sure that you specify the S3 bucket from Step 5 in the request forms.

7. Submit the cluster creation request. HyperPod provisions a cluster based on the request, and then creates a `resource_config.json` file in the HyperPod cluster instances, and sets up Slurm on the cluster running the lifecycle scripts.

The following topics walk you through and dive deep into details on how to organize configuration files and lifecycle scripts to work properly during HyperPod cluster creation.

## Topics

- [Start with base lifecycle scripts provided by HyperPod](#)
- [What particular configurations HyperPod manages in Slurm configuration files](#)
- [Mount Amazon FSx for Lustre to a HyperPod cluster](#)
- [Validate the JSON configuration files before creating a Slurm cluster on HyperPod](#)
- [Validate runtime before running production workloads on a Slurm cluster on HyperPod](#)
- [Develop lifecycle scripts interactively on a HyperPod cluster node](#)
- [Update a cluster with new or updated lifecycle scripts](#)

## Start with base lifecycle scripts provided by HyperPod

This section walks you through every component of the basic flow of setting up Slurm on HyperPod in a **top-down** approach. It starts from preparing a HyperPod cluster creation request to run the `CreateCluster` API, and dives deep into the hierarchical structure down to lifecycle scripts. Use the sample lifecycle scripts provided in the [Awesome Distributed Training GitHub repository](#). Clone the repository by running the following command.

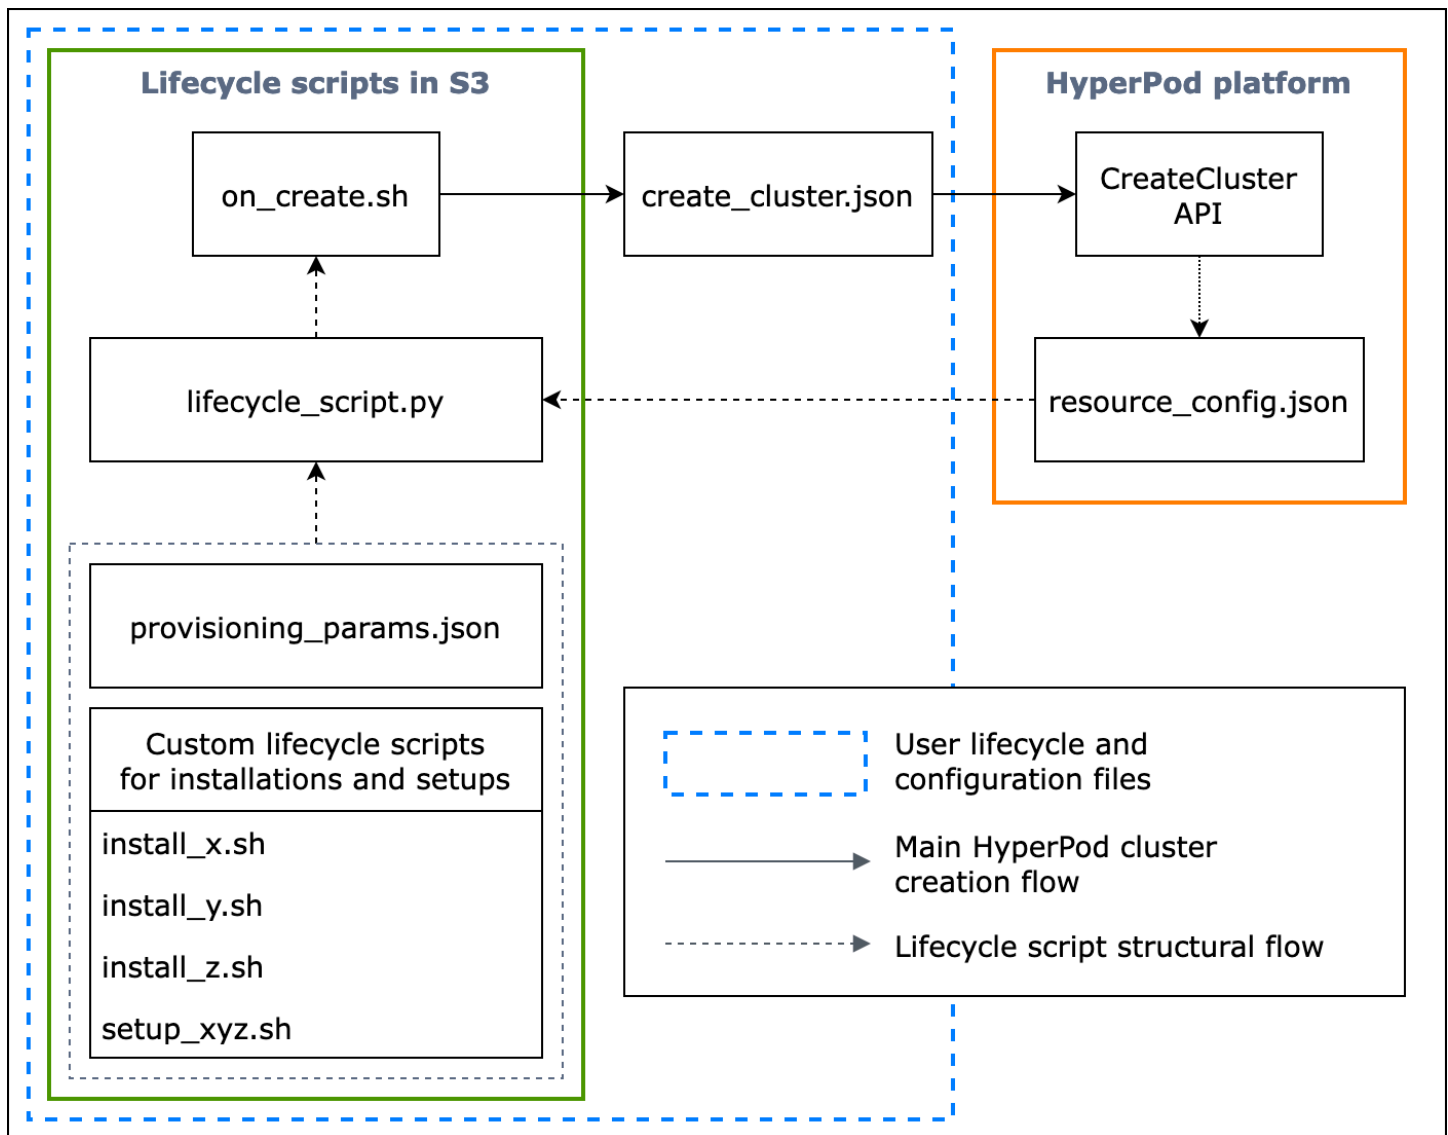

```
git clone https://github.com/aws-samples/awesome-distributed-training/
```

The base lifecycle scripts for setting up a Slurm cluster on SageMaker HyperPod are available at [1.architectures/5.sagemaker\\_hyperpods/LifecycleScripts/base-config](#).

```
cd awesome-distributed-training/1.architectures/5.sagemaker_hyperpods/LifecycleScripts/  
base-config
```

The following flowchart shows a detailed overview of how you should design the base lifecycle scripts. The descriptions below the diagram and the procedural guide explain how they work during the HyperPod `CreateCluster` API call.

**Figure:** A detailed flow chart of HyperPod cluster creation and the structure of lifecycle scripts. (1) The dashed arrows are directed to where the boxes are "called into" and shows the flow of configuration files and lifecycle scripts preparation. It starts from preparing `provisioning_parameters.json` and lifecycle scripts. These are then coded in `lifecycle_script.py` for a collective execution in order. And the execution of the `lifecycle_script.py` script is done by the `on_create.sh` shell script, which to be run in the HyperPod instance terminal. (2) The solid arrows show the main HyperPod cluster creation flow and how the boxes are "called into" or "submitted to". `on_create.sh` is required for cluster creation request, either in `create_cluster.json` or the **Create a cluster** request form in the console UI. After you submit the request, HyperPod runs the `CreateCluster` API based on the given configuration information from the request and the lifecycle scripts. (3) The dotted arrow indicates that the HyperPod platform creates `resource_config.json` in the cluster instances during cluster

*resource provisioning. resource\_config.json contains HyperPod cluster resource information such as the cluster ARN, instance types, and IP addresses. It is important to note that you should prepare the lifecycle scripts to expect the resource\_config.json file during cluster creation. For more information, see the procedural guide below.*

The following procedural guide explains what happens during HyperPod cluster creation and how the base lifecycle scripts are designed.

1. `create_cluster.json` – To submit a HyperPod cluster creation request, you prepare a `CreateCluster` request file in JSON format. In this best practices example, we assume that the request file is named `create_cluster.json`. Write `create_cluster.json` to provision a HyperPod cluster with instance groups. The best practice is to add the same number of instance groups as the number of Slurm nodes you plan to configure on the HyperPod cluster. Make sure that you give distinctive names to the instance groups that you'll assign to Slurm nodes you plan to set up.

Also, you are required to specify an S3 bucket path to store your entire set of configuration files and lifecycle scripts to the field name `InstanceGroups.LifeCycleConfig.SourceS3Uri` in the `CreateCluster` request form, and specify the file name of an entrypoint shell script (assume that it's named `on_create.sh`) to `InstanceGroups.LifeCycleConfig.OnCreate`.

 **Note**

If you are using the **Create a cluster** submission form in the HyperPod console UI, the console manages filling and submitting the `CreateCluster` request on your behalf, and runs the `CreateCluster` API in the backend. In this case, you don't need to create `create_cluster.json`; instead, make sure that you specify the correct cluster configuration information to the **Create a cluster** submission form.

2. `on_create.sh` – For each instance group, you need to provide an entrypoint shell script, `on_create.sh`, to run commands, run scripts to install software packages, and set up the HyperPod cluster environment with Slurm. The two things you need to prepare are a `provisioning_parameters.json` required by HyperPod for setting up Slurm and a set of lifecycle scripts for installing software packages. This script should be written to find and run the following files as shown in the sample script at [on\\_create.sh](#).

**Note**

Make sure that you upload the entire set of lifecycle scripts to the S3 location you specify in `create_cluster.json`. You should also place your `provisioning_parameters.json` in the same location.

- a. `provisioning_parameters.json` – This is a [the section called “Configuration form for provisioning Slurm nodes on HyperPod”](#). The `on_create.sh` script finds this JSON file and defines environment variable for identifying the path to it. Through this JSON file, you can configure Slurm nodes and storage options such as Amazon FSx for Lustre for Slurm to communicate with. In `provisioning_parameters.json`, make sure that you assign the HyperPod cluster instance groups using the names you specified in `create_cluster.json` to the Slurm nodes appropriately based on how you plan to set them up.

The following diagram shows an example of how the two JSON configuration files `create_cluster.json` and `provisioning_parameters.json` should be written to assign HyperPod instance groups to Slurm nodes. In this example, we assume a case of setting up three Slurm nodes: controller (management) node, log-in node (which is optional), and compute (worker) node.

**Tip**

To help you validate these two JSON files, the HyperPod service team provides a validation script, [validate-config.py](#). To learn more, see [the section called “Validate the JSON configuration files before creating a Slurm cluster on HyperPod”](#).

```

create_cluster.json for HyperPod cluster resource config
{
  "ClusterName": "your-hyperpod-cluster",
  "InstanceGroups": [
    {
      "InstanceGroupName": "controller-machine",
      "InstanceType": "ml.c5.xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "${ROLE}",
      "ThreadsPerCore": 1
    },
    {
      "InstanceGroupName": "login-group",
      "InstanceType": "ml.m5.4xlarge",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "${ROLE}",
      "ThreadsPerCore": 1
    },
    {
      "InstanceGroupName": "compute-nodes",
      "InstanceType": "ml.trn1.32xlarge",
      "InstanceCount": 4,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
        "OnCreate": "on_create.sh"
      },
      "ExecutionRole": "${ROLE}",
      "ThreadsPerCore": 1
    }
  ],
  "VpcConfig": {
    "SecurityGroupIds": [ "string" ],
    "Subnets": [ "string" ]
  }
}

provisioning_params.json for Slurm config
{
  "version": "1.0.0",
  "workload_manager": "slurm",
  "controller_group": "controller-machine",
  "login_group": "login-group",
  "worker_groups": [{
    "instance_group_name": "compute-nodes",
    "partition_name": "dev"
  }],
  "fsx_dns_name": "fs-12345678a90b01cde.
    fsx.us-west-2.amazonaws.com ",
  "fsx_mountname": "1abcdefg"
}

```

**Figure:** Direct comparison between `create_cluster.json` for HyperPod cluster creation and `provisioning_params.json` for Slurm configuration. The number of instance groups in `create_cluster.json` should match with the number of nodes you want to configure as Slurm nodes. In case of the example in the figure, three Slurm nodes will be configured on a HyperPod cluster of three instance groups. You should assign the HyperPod cluster instance groups to Slurm nodes by specifying the instance group names accordingly.

- b. `resource_config.json` – During cluster creation, the `lifecycle_script.py` script is written to expect a `resource_config.json` file from HyperPod. This file contains information about the cluster, such as instance types and IP addresses.

When you run the `CreateCluster` API, HyperPod creates a resource configuration file at `/opt/ml/config/resource_config.json` based on the `create_cluster.json` file. The file path is saved to the environment variable named `SAGEMAKER_RESOURCE_CONFIG_PATH`.

**⚠ Important**

The `resource_config.json` file is auto-generated by the HyperPod platform, and you DO NOT need to create it. The following code is to show an example of `resource_config.json` that would be created from the cluster creation based on `create_cluster.json` in the previous step, and to help you understand what happens in the backend and how an auto-generated `resource_config.json` would look.

```
{
  "ClusterConfig": {
    "ClusterArn": "arn:aws:sagemaker:us-west-2:111122223333:cluster/
abcde01234yz",
    "ClusterName": "your-hyperpod-cluster"
  },
  "InstanceGroups": [
    {
      "Name": "controller-machine",
      "InstanceType": "ml.c5.xlarge",
      "Instances": [
        {
          "InstanceName": "controller-machine-1",
          "AgentIpAddress": "111.222.333.444",
          "CustomerIpAddress": "111.222.333.444",
          "InstanceId": "i-12345abcdefg67890"
        }
      ]
    },
    {
      "Name": "login-group",
      "InstanceType": "ml.m5.xlarge",
      "Instances": [
        {
          "InstanceName": "login-group-1",
          "AgentIpAddress": "111.222.333.444",
          "CustomerIpAddress": "111.222.333.444",
          "InstanceId": "i-12345abcdefg67890"
        }
      ]
    }
  ]
}
```

```

    ]
  },
  {
    "Name": "compute-nodes",
    "InstanceType": "ml.trn1.32xlarge",
    "Instances": [
      {
        "InstanceName": "compute-nodes-1",
        "AgentIpAddress": "111.222.333.444",
        "CustomerIpAddress": "111.222.333.444",
        "InstanceId": "i-12345abcedfg67890"
      },
      {
        "InstanceName": "compute-nodes-2",
        "AgentIpAddress": "111.222.333.444",
        "CustomerIpAddress": "111.222.333.444",
        "InstanceId": "i-12345abcedfg67890"
      },
      {
        "InstanceName": "compute-nodes-3",
        "AgentIpAddress": "111.222.333.444",
        "CustomerIpAddress": "111.222.333.444",
        "InstanceId": "i-12345abcedfg67890"
      },
      {
        "InstanceName": "compute-nodes-4",
        "AgentIpAddress": "111.222.333.444",
        "CustomerIpAddress": "111.222.333.444",
        "InstanceId": "i-12345abcedfg67890"
      }
    ]
  }
]
}

```

- c. `lifecycle_script.py` – This is the main Python script that collectively runs lifecycle scripts setting up Slurm on the HyperPod cluster while being provisioned. This script reads in `provisioning_parameters.json` and `resource_config.json` from the paths that are specified or identified in `on_create.sh`, passes the relevant information to each lifecycle script, and then runs the lifecycle scripts in order.

Lifecycle scripts are a set of scripts that you have a complete flexibility to customize to install software packages and set up necessary or custom configurations during

cluster creation, such as setting up Slurm, creating users, installing Conda or Docker. The sample [lifecycle\\_script.py](#) script is prepared to run other base lifecycle scripts in the repository, such as launching Slurm daemons ([start\\_slurm.sh](#)), mounting Amazon FSx for Lustre ([mount\\_fsx.sh](#)), and setting up MariaDB accounting ([setup\\_mariadb\\_accounting.sh](#)) and RDS accounting ([setup\\_rds\\_accounting.sh](#)). You can also add more scripts, package them under the same directory, and add code lines to `lifecycle_script.py` to let HyperPod run the scripts. For more information about the base lifecycle scripts, see also [3.1 Lifecycle scripts](#) in the *Awsome Distributed Training GitHub repository*.

**Note**

HyperPod runs [the section called “SageMaker HyperPod DLAMI”](#) on each instance of a cluster, and the AMI has pre-installed software packages complying compatibilities between them and HyperPod functionalities. Note that if you reinstall any of the pre-installed packages, you are responsible for installing compatible packages and note that some HyperPod functionalities might not work as expected.

In addition to the default setups, more scripts for installing the following software are available under the [utils](#) folder. The `lifecycle_script.py` file is already prepared to include code lines for running the installation scripts, so see the following items to search those lines and uncomment to activate them.

- i. The following code lines are for installing [Docker](#), [Enroot](#), and [Pyxis](#). These packages are required to run Docker containers on a Slurm cluster.

To enable this installation step, set the `enable_docker_enroot_pyxis` parameter to `True` in the [config.py](#) file.

```
# Install Docker/Enroot/Pyxis
if Config.enable_docker_enroot_pyxis:
    ExecuteBashScript("./utils/install_docker.sh").run()
    ExecuteBashScript("./utils/install_enroot_pyxis.sh").run(node_type)
```

- ii. You can integrate your HyperPod cluster with [Amazon Managed Service for Prometheus](#) and [Amazon Managed Grafana](#) to export metrics about the HyperPod cluster and cluster nodes to Amazon Managed Grafana dashboards. To export metrics and use the [Slurm dashboard](#), the [NVIDIA DCGM Exporter dashboard](#), and the [EFA Metrics dashboard](#) on

Amazon Managed Grafana, you need to install the [Slurm exporter for Prometheus](#), the [NVIDIA DCGM exporter](#), and the [EFA node exporter](#). For more information about installing the exporter packages and using Grafana dashboards on an Amazon Managed Grafana workspace, see [the section called "HyperPod cluster resources monitoring"](#).

To enable this installation step, set the `enable_observability` parameter to `True` in the [config.py](#) file.

```
# Install metric exporting software and Prometheus for observability

if Config.enable_observability:
    if node_type == SlurmNodeType.COMPUTE_NODE:
        ExecuteBashScript("./utils/install_docker.sh").run()
        ExecuteBashScript("./utils/install_dcgm_exporter.sh").run()
        ExecuteBashScript("./utils/install_efa_node_exporter.sh").run()

    if node_type == SlurmNodeType.HEAD_NODE:
        wait_for_scontrol()
        ExecuteBashScript("./utils/install_docker.sh").run()
        ExecuteBashScript("./utils/install_slurm_exporter.sh").run()
        ExecuteBashScript("./utils/install_prometheus.sh").run()
```

3. Make sure that you upload all configuration files and setup scripts from **Step 2** to the S3 bucket you provide in the `CreateCluster` request in **Step 1**. For example, assume that your `create_cluster.json` has the following.

```
"LifecycleConfig": {
    "SourceS3URI": "s3://sagemaker-hyperpod-lifecycle/src",
    "OnCreate": "on_create.sh"
}
```

Then, your `s3://sagemaker-hyperpod-lifecycle/src` should contain `on_create.sh`, `lifecycle_script.py`, `provisioning_parameters.json`, and all other setup scripts. Assume that you have prepared the files in a local folder as follows.

```
### lifecycle_files // your local folder
### provisioning_parameters.json
### on_create.sh
### lifecycle_script.py
```

```
### ... // more setup scripts to be fed into lifecycle_script.py
```

To upload the files, use the S3 command as follows.

```
aws s3 cp --recursive ./lifecycle_scripts s3://sagemaker-hyperpod-lifecycle/src
```

## What particular configurations HyperPod manages in Slurm configuration files

When you create a Slurm cluster on HyperPod, the HyperPod agent sets up the [slurm.conf](#) and [gres.conf](#) files at /opt/slurm/etc/ to manage the Slurm cluster based on your HyperPod cluster creation request and lifecycle scripts. The following list shows which specific parameters the HyperPod agent handles and overwrites.

### Important

We strongly recommend that you **do not** change these parameters managed by HyperPod.

- In [slurm.conf](#), HyperPod sets up the following basic parameters: ClusterName, SlurmctlHost, PartitionName, and NodeName.

Also, to enable the [the section called "Auto-resume"](#) functionality, HyperPod requires the TaskPlugin and SchedulerParameters parameters set as follows. The HyperPod agent sets up these two parameters with the required values by default.

```
TaskPlugin=task/none  
SchedulerParameters=permit_job_expansion
```

- In [gres.conf](#), HyperPod manages NodeName for GPU nodes.

## Mount Amazon FSx for Lustre to a HyperPod cluster

To mount an Amazon FSx for Lustre shared file system to your HyperPod cluster, set up the following.

1. Use your Amazon VPC.

- a. For HyperPod cluster instances to communicate within your VPC, make sure that you attach the [the section called "Setting up SageMaker HyperPod with a custom Amazon VPC"](#) to the IAM role for SageMaker HyperPod.
- b. In `create_cluster.json`, include the following VPC information.

```
"VpcConfig": {  
  "SecurityGroupIds": [ "string" ],  
  "Subnets": [ "string" ]  
}
```

For more tips about setting up Amazon VPC, see [the section called "Prerequisites"](#).

2. To finish configuring Slurm with Amazon FSx for Lustre, specify the Amazon FSx DNS name and Amazon FSx mount name in `provisioning_parameters.json` as shown in the figure in the [the section called "Start with base lifecycle scripts provided by HyperPod"](#) section. You can find the Amazon FSx information either from the Amazon FSx for Lustre console in your account or by running the following AWS CLI command, `aws fsx describe-file-systems`.

```
"fsx_dns_name": "fs-12345678a90b01cde.fsx.us-west-2.amazonaws.com",  
"fsx_mountname": "1abcdefg"
```

## Validate the JSON configuration files before creating a Slurm cluster on HyperPod

To validate the JSON configuration files before submitting a cluster creation request, use the configuration validation script [validate-config.py](#). This script parses and compares your HyperPod cluster configuration JSON file and Slurm configuration JSON file, and identifies if there's any resource misconfiguration between the two files and also across Amazon EC2, Amazon VPC, and Amazon FSx resources. For example, to validate the `create_cluster.json` and `provisioning_parameters.json` files from the [the section called "Start with base lifecycle scripts provided by HyperPod"](#) section, run the validation script as follows.

```
python3 validate-config.py --cluster-config create_cluster.json --provisioning-  
parameters provisioning_parameters.json
```

The following is an example output of a successful validation.

```
## Validated instance group name worker-group-1 is correct ...
```

```
## Validated subnet subnet-012345abcdef67890 ...
## Validated security group sg-012345abcdef67890 ingress rules ...
## Validated security group sg-012345abcdef67890 egress rules ...
## Validated FSx Lustre DNS name fs-012345abcdef67890.fsx.us-east-1.amazonaws.com
## Validated FSx Lustre mount name abcdefgh
# Cluster Validation succeeded
```

## Validate runtime before running production workloads on a Slurm cluster on HyperPod

To check the runtime before running any production workloads on a Slurm cluster on HyperPod, use the runtime validation script [hyperpod-precheck.py](#). This script checks if the Slurm cluster has all packages installed for running Docker, if the cluster has a properly mounted FSx for Lustre file system and a user directory sharing the file system, and if the Slurm daemon is running on all compute nodes.

To run the script on multiple nodes at once, use `srun` as shown in the following example command of running the script on a Slurm cluster of 8 nodes.

```
# The following command runs on 8 nodes
srun -N 8 python3 hyperpod-precheck.py
```

### Note

To learn more about the validation script such as what runtime validation functions the script provides and guidelines to resolve issues that don't pass the validations, see [Runtime validation before running workloads](#) in the *Awsome Distributed Training GitHub repository*.

## Develop lifecycle scripts interactively on a HyperPod cluster node

This section explains how you can interactively develop lifecycle scripts without repeatedly creating and deleting a HyperPod cluster.

1. Create a HyperPod cluster with the base lifecycle scripts.
2. Log in to a cluster node.
3. Develop a script (`configure_xyz.sh`) by editing and running it repeatedly on the node.
  - a. HyperPod runs the lifecycle scripts as the root user, so we recommend that you run the `configure_xyz.sh` as the root user while developing to make sure that the script is tested under the same condition while run by HyperPod.

4. Integrate the script into `lifecycle_script.py` by adding a code line similar to the following.

```
ExecuteBashScript("./utils/configure_xyz.sh").run()
```

5. Upload the updated lifecycle scripts to the S3 bucket that you initially used for uploading the base lifecycle scripts.
6. Test the integrated version of `lifecycle_script.py` by creating a new HyperPod cluster.

## Update a cluster with new or updated lifecycle scripts

There are three ways to update the HyperPod cluster software.

- The `UpdateClusterSoftware` API for patching the HyperPod software re-runs the lifecycle scripts on the entire instance group.
- The `UpdateCluster` API only runs the lifecycle scripts for new instance groups.
- You can also run lifecycle scripts directly in the HyperPod instances.

### Note

HyperPod runs [the section called "SageMaker HyperPod DLAMI"](#) on each instance of a cluster, and the AMI has pre-installed software packages complying compatibilities between them and HyperPod functionalities. Note that if you reinstall any of the pre-installed packages, you are responsible for installing compatible packages and note that some HyperPod functionalities might not work as expected.

## Jobs on SageMaker HyperPod clusters

The following topics provide procedures and examples of accessing compute nodes and running ML workloads on provisioned SageMaker HyperPod clusters. Depending on how you have set up the environment on your HyperPod cluster, there are many ways to run ML workloads on HyperPod clusters. Examples of running ML workloads on HyperPod clusters are also provided in the [Awesome Distributed Training GitHub repository](#). The following topics walk you through how to log in to the provisioned HyperPod clusters and get you started with running sample ML workloads.

**Tip**

To find practical examples and solutions, see also the [SageMaker HyperPod workshop](#).

**Topics**

- [Access your SageMaker HyperPod cluster nodes](#)
- [Schedule a Slurm job on a SageMaker HyperPod cluster](#)
- [Run Docker containers on a Slurm compute node on HyperPod](#)
- [Run distributed training workloads with Slurm on HyperPod](#)

**Access your SageMaker HyperPod cluster nodes**

You can access your **InService** cluster through AWS Systems Manager (SSM) by running the AWS CLI command `aws ssm start-session` with the SageMaker HyperPod cluster host name in format of `sagemaker-cluster:[cluster-id]_[instance-group-name]-[instance-id]`. You can retrieve the cluster ID, the instance ID, and the instance group name from the [SageMaker HyperPod console](#) or by running `describe-cluster` and `list-cluster-nodes` from the [AWS CLI commands for SageMaker HyperPod](#). For example, if your cluster ID is `aa11bbbb222`, the cluster node name is `controller-group`, and the cluster node ID is `i-111222333444555aa`, the SSM `start-session` command should be the following.

**Note**

Granting users access to HyperPod cluster nodes allows them to install and operate user-managed software on the nodes. Ensure that you maintain the principle of least-privilege permissions for users.

If you haven't set up AWS Systems Manager, follow the instructions provided at [the section called "Setting up AWS Systems Manager and Run As for cluster user access control"](#).

```
$ aws ssm start-session \  
  --target sagemaker-cluster:aa11bbbb222_controller-group-i-111222333444555aa \  
  --region us-west-2  
Starting session with SessionId: s0011223344aabbccdd  
root@ip-111-22-333-444:/usr/bin#
```

Note that this initially connects you as the root user. Before running jobs, switch to the ubuntu user by running the following command.

```
root@ip-111-22-333-444:/usr/bin# sudo su - ubuntu
ubuntu@ip-111-22-333-444:/usr/bin#
```

For advanced settings for practical use of HyperPod clusters, see the following topics.

## Topics

- [Additional tips for accessing your SageMaker HyperPod cluster nodes](#)
- [Set up a multi-user environment through the Amazon FSx shared space](#)
- [Set up a multi-user environment by integrating HyperPod clusters with Active Directory](#)

## Additional tips for accessing your SageMaker HyperPod cluster nodes

### Use the `easy-ssh.sh` script provided by HyperPod for simplifying the connection process

To make the previous process into a single line command, the HyperPod team provides the [easy-ssh.sh](#) script that retrieves your cluster information, aggregates them into the SSM command, and connects to the compute node. You don't need to manually look for the required HyperPod cluster information as this script runs `describe-cluster` and `list-cluster-nodes` commands and parses the information needed for completing the SSM command. The following example commands show how to run the [easy-ssh.sh](#) script. If it runs successfully, you'll be connected to the cluster as the root user. It also prints a code snippet to set up SSH by adding the HyperPod cluster as a remote host through an SSM proxy. By setting up SSH, you can connect your local development environment such as Visual Studio Code with the HyperPod cluster.

```
$ chmod +x easy-ssh.sh
$ ./easy-ssh.sh -c <node-group> <cluster-name>
Cluster id: <cluster_id>
Instance id: <instance_id>
Node Group: <node-group>
Add the following to your ~/.ssh/config to easily connect:

$ cat <<EOF >> ~/.ssh/config
Host <cluster-name>
  User ubuntu
```

```
ProxyCommand sh -c "aws ssm start-session --target sagemaker-
cluster:<cluster_id>_<node-group>-<instance_id> --document-name AWS-StartSSHSession --
parameters 'portNumber=%p'"
EOF
```

Add your ssh keypair and then you can do:

```
$ ssh <cluster-name>
```

```
aws ssm start-session --target sagemaker-cluster:<cluster_id>_<node-
group>-<instance_id>
```

```
Starting session with SessionId: s0011223344aabbccdd
root@ip-111-22-333-444:/usr/bin#
```

Note that this initially connects you as the root user. Before running jobs, switch to the ubuntu user by running the following command.

```
root@ip-111-22-333-444:/usr/bin# sudo su - ubuntu
ubuntu@ip-111-22-333-444:/usr/bin#
```

## Set up for easy access with SSH by using the HyperPod compute node as a remote host

To further simplify access to the compute node using SSH from a local machine, the `easy-ssh.sh` script outputs a code snippet of setting up the HyperPod cluster as a remote host as shown in the previous section. The code snippet is auto-generated to help you directly add to the `~/.ssh/config` file on your local device. The following procedure shows how to set up for easy access using SSH through the SSM proxy, so that you or your cluster users can directly run `ssh <cluster-name>` to connect to the HyperPod cluster node.

1. On your local device, add the HyperPod compute node with a user name as a remote host to the `~/.ssh/config` file. The following command shows how to append the auto-generated code snippet from the `easy-ssh.sh` script to the `~/.ssh/config` file. Make sure that you copy it from the auto-generated output of the `easy-ssh.sh` script that has the correct cluster information.

```
$ cat <<EOF >> ~/.ssh/config
Host <cluster-name>
  User ubuntu
```

```
ProxyCommand sh -c "aws ssm start-session --target sagemaker-
cluster:<cluster_id>_<node-group>-<instance_id> --document-name AWS-StartSSHSession
--parameters 'portNumber=%p'"
EOF
```

2. On the HyperPod cluster node, add the public key on your local device to the `~/.ssh/authorized_keys` file on the HyperPod cluster node.
  - a. Print the public key file on your local machine.

```
$ cat ~/.ssh/id_rsa.pub
```

This should return your key. Copy the output of this command.

(Optional) If you don't have a public key, create one by running the following command.

```
$ ssh-keygen -t rsa -q -f "$HOME/.ssh/id_rsa" -N ""
```

- b. Connect to the cluster node and switch to the user to add the key. The following command is an example of accessing as the `ubuntu` user. Replace `ubuntu` to the user name for which you want to set up the easy access with SSH.

```
$ ./easy-ssh.sh -c <node-group> <cluster-name>
$ sudo su - ubuntu
ubuntu@ip-111-22-333-444:/usr/bin#
```

- c. Open the `~/.ssh/authorized_keys` file and add the public key at the end of the file.

```
ubuntu@ip-111-22-333-444:/usr/bin# vim ~/.ssh/authorized_keys
```

After you finish setting up, you can connect to the HyperPod cluster node as the user by running a simplified SSH command as follows.

```
$ ssh <cluster-name>
ubuntu@ip-111-22-333-444:/usr/bin#
```

Also, you can use the host for remote development from an IDE on your local device, such as [Visual Studio Code Remote - SSH](#).

## Set up a multi-user environment through the Amazon FSx shared space

You can use the Amazon FSx shared space to manage a multi-user environment in a Slurm cluster on SageMaker HyperPod. If you have configured your Slurm cluster with Amazon FSx during the HyperPod cluster creation, this is a good option for setting up workspace for your cluster users. Create a new user and setup the home directory for the user on the Amazon FSx shared file system.

### Tip

To allow users to access your cluster through their user name and dedicated directories, you should also associate them with IAM roles or users by tagging them as guided in **Option 2** of step 5 under the procedure **To turn on Run As support for Linux and macOS managed nodes** provided at [Turn on Run As support for Linux and macOS managed nodes](#) in the AWS Systems Manager User Guide. See also [the section called "Setting up AWS Systems Manager and Run As for cluster user access control"](#).

## To set up a multi-user environment while creating a Slurm cluster on SageMaker HyperPod

The SageMaker HyperPod service team provides a script [add\\_users.sh](#) as part of the base lifecycle script samples.

1. Prepare a text file named `shared_users.txt` that you need to create in the following format. The first column is for user names, the second column is for unique user IDs, and the third column is for the user directories in the Amazon FSx shared space.

```
username1,uid1,/fsx/username1
username2,uid2,/fsx/username2
...
```

2. Make sure that you upload the `shared_users.txt` and [add\\_users.sh](#) files to the S3 bucket for HyperPod lifecycle scripts. While the cluster creation, cluster update, or cluster software update is in progress, the [add\\_users.sh](#) reads in the `shared_users.txt` and sets up the user directories properly.

## To create new users and add to an existing Slurm cluster running on SageMaker HyperPod

1. On the head node, run the following command to save a script that helps create a user. Make sure that you run this with `sudo` permissions.

```

$ cat > create-user.sh << EOL
#!/bin/bash

set -x

# Prompt user to get the new user name.
read -p "Enter the new user name, i.e. 'sean':
" USER

# create home directory as /fsx/<user>
# Create the new user on the head node
sudo useradd \${USER} -m -d /fsx/\${USER} --shell /bin/bash;
user_id=\$(id -u \${USER})

# add user to docker group
sudo usermod -aG docker \${USER}

# setup SSH Keypair
sudo -u \${USER} ssh-keygen -t rsa -q -f "/fsx/\${USER}/.ssh/id_rsa" -N ""
sudo -u \${USER} cat /fsx/\${USER}/.ssh/id_rsa.pub | sudo -u \${USER} tee /fsx/\${USER}/.ssh/
authorized_keys

# add user to compute nodes
read -p "Number of compute nodes in your cluster, i.e. 8:
" NUM_NODES
srun -N \${NUM_NODES} sudo useradd -u \${user_id} \${USER} -d /fsx/\${USER} --shell /bin/
bash;

# add them as a sudoer
read -p "Do you want this user to be a sudoer? (y/N):
" SUDO
if [ "\${SUDO}" = "y" ]; then
    sudo usermod -aG sudo \${USER}
    sudo srun -N \${NUM_NODES} sudo usermod -aG sudo \${USER}
    echo -e "If you haven't already you'll need to run:\n\nsudo visudo /
etc/sudoers\n\nChange the line:\n\n%sudo    ALL=(ALL:ALL) ALL\n\nTo\n\n%sudo
ALL=(ALL:ALL) NOPASSWD: ALL\n\n0n each node."
fi
EOL

```

2. Run the script with the following command. You'll be prompted for adding the name of a user and the number of compute nodes that you want to allow the user to access.

```
$ bash create-user.sh
```

3. Test the user by running the following commands.

```
$ sudo su - <user> && ssh $(srun hostname)
```

4. Add the user information to the `shared_users.txt` file, so the user will be created on any new compute nodes or new clusters.

## Set up a multi-user environment by integrating HyperPod clusters with Active Directory

In practical use cases, HyperPod clusters are typically used by multiple users: machine learning (ML) researchers, software engineers, data scientists, and cluster administrators. They edit their own files and run their own jobs without impacting each other's work. To set up a multi-user environment, use the Linux user and group mechanism to statically create multiple users on each instance through lifecycle scripts. However, the drawback to this approach is that you need to duplicate user and group settings across multiple instances in the cluster to keep a consistent configuration across all instances when you make updates such as adding, editing, and removing users.

To solve this, you can use [Lightweight Directory Access Protocol \(LDAP\)](#) and [LDAP over TLS/SSL \(LDAPS\)](#) to integrate with a directory service such as [AWS Directory Service for Microsoft Active Directory](#). To learn more about setting up Active Directory and a multi-user environment in a HyperPod cluster, see the blog post [Integrate HyperPod clusters with Active Directory for seamless multi-user login](#).

## Schedule a Slurm job on a SageMaker HyperPod cluster

You can launch training jobs using the standard Slurm `sbatch` or `srun` commands. For example, to launch an 8-node training job, you can run `srun -N 8 --exclusive train.sh SageMaker`. HyperPod supports training in a range of environments, including `conda`, `venv`, `docker`, and `enroot`. You can configure an ML environment by running lifecycle scripts on your SageMaker HyperPod clusters. You also have an option to attach a shared file system such as Amazon FSx, which can also be used as a virtual environment.

The following example shows how to run a job for training Llama-2 with the Fully Sharded Data Parallelism (FSDP) technique on a SageMaker HyperPod cluster with an Amazon FSx shared file system. You can also find more examples from the [Awsome Distributed Training GitHub repository](#).

**Tip**

All SageMaker HyperPod examples are available in the `3.test_cases` folder of the [Awesome Distributed Training GitHub repository](#).

1. Clone the [Awesome Distributed Training GitHub repository](#), and copy the training job examples to your Amazon FSx file system.

```
$ TRAINING_DIR=/fsx/users/my-user/fsdp
$ git clone https://github.com/aws-samples/awesome-distributed-training/
```

2. Run the [create\\_conda\\_env.sh](#) script. This creates a conda environment on your Amazon FSx file system. Make sure that the file system is accessible to all nodes in the cluster.
3. Build the virtual Conda environment by launching a single node slurm job as follows.

```
$ srun -N 1 /path_to/create_conda_env.sh
```

4. After the environment is built, you can launch a training job by pointing to the environment path on the shared volume. You can launch both single-node and multi-node training jobs with the same setup. To launch a job, create a job launcher script (also called an entry point script) as follows.

```
#!/usr/bin/env bash
set -ex

ENV_PATH=/fsx/users/my_user/pytorch_env
TORCHRUN=$ENV_PATH/bin/torchrun
TRAINING_SCRIPT=/fsx/users/my_user/pt_train.py

WORLD_SIZE_JOB=$SLURM_NTASKS
RANK_NODE=$SLURM_NODEID
PROC_PER_NODE=8
MASTER_ADDR=(`scontrol show hostnames \${SLURM_JOB_NODELIST} | head -n 1`)
MASTER_PORT=$(expr 10000 + $(echo -n \${SLURM_JOBID} | tail -c 4))

DIST_ARGS="--nproc_per_node=$PROC_PER_NODE \
          --nnodes=$WORLD_SIZE_JOB \
          --node_rank=$RANK_NODE \
          --master_addr=$MASTER_ADDR \
          --master_port=$MASTER_PORT \
```

```
"  
$TORCHRUN $DIST_ARGS $TRAINING_SCRIPT
```

### Tip

If you want to make your training job more resilient against hardware failures by using the auto-resume capability of SageMaker HyperPod, you need to properly set up the environment variable `MASTER_ADDR` in the entrypoint script. To learn more, see [the section called “Auto-resume”](#).

This tutorial assumes that this script is saved as `/fsx/users/my_user/train.sh`.

5. With this script in the shared volume at `/fsx/users/my_user/train.sh`, run the following `srun` command to schedule the Slurm job.

```
$ cd /fsx/users/my_user/  
$ srun -N 8 train.sh
```

## Run Docker containers on a Slurm compute node on HyperPod

To run Docker containers with Slurm on SageMaker HyperPod, you need to use [Enroot](#) and [Pyxis](#). The Enroot package helps convert Docker images into a runtime that Slurm can understand, while the Pyxis enables scheduling the runtime as a Slurm job through an `srun --container-image=docker/image:tag`.

### Tip

The Docker, Enroot, and Pyxis packages should be installed during cluster creation as part of running the lifecycle scripts as guided in [the section called “Start with base lifecycle scripts provided by HyperPod”](#). Use the [base lifecycle scripts](#) provided by the HyperPod service team when creating a HyperPod cluster. Those base scripts are set up to install the packages by default. In the [config.py](#) script, there's the `Config` class with the boolean type parameter for installing the packages set to `True` (`enable_docker_enroot_pyxis=True`). This is called by and parsed in the [lifecycle\\_script.py](#) script, which calls `install_docker.sh` and `install_enroot_pyxis.sh` scripts from the [utils](#) folder. The installation scripts are

where the actual installations of the packages take place. Additionally, the installation scripts identify if they can detect NVMe store paths from the instances they are run on and set up the root paths for Docker and Enroot to `/opt/dlami/nvme`. The default root volume of any fresh instance is mounted to `/tmp` only with a 100GB EBS volume, which runs out if the workload you plan to run involves training of LLMs and thus large size Docker containers. If you use instance families such as P and G with local NVMe storage, you need to make sure that you use the NVMe storage attached at `/opt/dlami/nvme`, and the installation scripts take care of the configuration processes.

## To check if the root paths are set up properly

On a compute node of your Slurm cluster on SageMaker HyperPod, run the following commands to make sure that the lifecycle script worked properly and the root volume of each node is set to `/opt/dlami/nvme/*`. The following commands shows examples of checking the Enroot runtime path and the data root path for 8 compute nodes of a Slurm cluster.

```
$ srun -N 8 cat /etc/enroot/enroot.conf | grep "ENROOT_RUNTIME_PATH"
ENROOT_RUNTIME_PATH      /opt/dlami/nvme/tmp/enroot/user-$(id -u)
... // The same or similar lines repeat 7 times
```

```
$ srun -N 8 cat /etc/docker/daemon.json
{
  "data-root": "/opt/dlami/nvme/docker/data-root"
}
... // The same or similar lines repeat 7 times
```

After you confirm that the runtime paths are properly set to `/opt/dlami/nvme/*`, you're ready to build and run Docker containers with Enroot and Pyxis.

## To test Docker with Slurm

1. On your compute node, try the following commands to check if Docker and Enroot are properly installed.

```
$ docker --help
$ enroot --help
```

2. Test if Pyxis and Enroot installed correctly by running one of the [NVIDIA CUDA Ubuntu](#) images.

```

$ srun --container-image=nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY nvidia-smi
pyxis: importing docker image: nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY
pyxis: imported docker image: nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY
DAY MMM DD HH:MM:SS YYYY
+-----+
| NVIDIA-SMI 470.141.03   Driver Version: 470.141.03   CUDA Version: XX.YY   |

## To run a test Slurm job with Docker

After you have completed setting up Slurm with Docker, you can bring any pre-built Docker images and run using Slurm on SageMaker HyperPod. The following is a sample use case that walks you through how to run a training job using Docker and Slurm on SageMaker HyperPod. It shows an example job of model-parallel training of the Llama 2 model with the SageMaker AI model parallelism (SMP) library.

1. If you want to use one of the pre-built ECR images distributed by SageMaker AI or DLC, make sure that you give your HyperPod cluster the permissions to pull ECR images through the [the section called "IAM role for SageMaker HyperPod"](#). If you use your own or an open source Docker image, you can skip this step. Add the following permissions to the [the section called "IAM role for SageMaker HyperPod"](#). In this tutorial, we use the [SMP Docker image](#) pre-packaged with the SMP library .

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ecr:BatchCheckLayerAvailability",
        "ecr:BatchGetImage",
        "ecr-public:*",
        "ecr:GetDownloadUrlForLayer",
        "ecr:GetAuthorizationToken",
        "sts:*"
      ]
    }
  ]
}

```

```

    ],
    "Resource": "*"
  }
]
}

```

2. On the compute node, clone the repository and go to the folder that provides the example scripts of training with SMP.

```

$ git clone https://github.com/aws-samples/awesome-distributed-training/
$ cd awesome-distributed-training/3.test_cases/17.SM-modelparallelv2

```

3. In this tutorial, run the sample script [docker\\_build.sh](#) that pulls the SMP Docker image, build the Docker container, and runs it as an Enroot runtime. You can modify this as you want.

```

$ cat docker_build.sh
#!/usr/bin/env bash

region=us-west-2
dlc_account_id=658645717510
aws ecr get-login-password --region $region | docker login --username AWS --password-stdin $dlc_account_id.dkr.ecr.$region.amazonaws.com

docker build -t smpv2 .
enroot import -o smpv2.sqsh dockerd://smpv2:latest

```

```

$ bash docker_build.sh

```

4. Create a batch script to launch a training job using sbatch. In this tutorial, the provided sample script [launch\\_training\\_enroot.sh](#) launches a model-parallel training job of the 70-billion-parameter Llama 2 model with a synthetic dataset on 8 compute nodes. A set of training scripts are provided at [3.test\\_cases/17.SM-modelparallelv2/scripts](#), and `launch_training_enroot.sh` takes `train_external.py` as the entrypoint script.

### Important

To use the a Docker container on SageMaker HyperPod, you must mount the `/var/log` directory from the host machine, which is the HyperPod compute node in this case, onto the `/var/log` directory in the container. You can set it up by adding the following variable for Enroot.

```
"${HYPERPOD_PATH:="/var/log/aws/clusters":"/var/log/aws/clusters}]"
```

```
$ cat launch_training_enroot.sh
#!/bin/bash

# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: MIT-0

#SBATCH --nodes=8 # number of nodes to use, 2 p4d(e) = 16 A100 GPUs
#SBATCH --job-name=smpv2_llama # name of your job

To find the downloadable code examples, see [Run a model-parallel training job using the SageMaker AI model parallelism library, Docker and Enroot with Slurm](#) in the *Awsome Distributed Training GitHub repository*. For more information about distributed training with a Slurm cluster on SageMaker HyperPod, proceed to the next topic at [the section called “Run distributed training workloads with Slurm on HyperPod”](#).

## Run distributed training workloads with Slurm on HyperPod

SageMaker HyperPod is specialized for workloads of training large language models (LLMs) and foundation models (FM). These workloads often require the use of multiple parallelism techniques and optimized operations for ML infrastructure and resources. Using SageMaker HyperPod, you can use the following SageMaker AI distributed training frameworks:

- The [SageMaker AI distributed data parallelism \(SMDDP\) library](#) that offers collective communication operations optimized for AWS.
- The [SageMaker AI model parallelism \(SMP\) library](#) that implements various model parallelism techniques.

## Topics

- [Using SMDDP on a SageMaker HyperPod](#)

- [Using SMP on a SageMaker HyperPod cluster](#)

## Using SMDDP on a SageMaker HyperPod

The [SMDDP library](#) is a collective communication library that improves compute performance of distributed data parallel training. The SMDDP library works with the following open source distributed training frameworks:

- [PyTorch distributed data parallel \(DDP\)](#)
- [PyTorch fully sharded data parallelism \(FSDP\)](#)
- [DeepSpeed](#)
- [Megatron-DeepSpeed](#)

The SMDDP library addresses communications overhead of the key collective communication operations by offering the following for SageMaker HyperPod.

- The library offers `AllGather` optimized for AWS. `AllGather` is a key operation used in sharded data parallel training, which is a memory-efficient data parallelism technique offered by popular libraries. These include the SageMaker AI model parallelism (SMP) library, DeepSpeed Zero Redundancy Optimizer (ZeRO), and PyTorch Fully Sharded Data Parallelism (FSDP).
- The library performs optimized node-to-node communication by fully utilizing the AWS network infrastructure and the SageMaker AI ML instance topology.

## To run sample data-parallel training jobs

Explore the following distributed training samples implementing data parallelism techniques using the SMDDP library.

- [awesome-distributed-training/3.test\\_cases/12.SM-dataparallel-FSDP](#)
- [awesome-distributed-training/3.test\\_cases/13.SM-dataparallel-deepspeed](#)

## To set up an environment for using the SMDDP library on SageMaker HyperPod

The following are training environment requirements for using the SMDDP library on SageMaker HyperPod.

- PyTorch v2.0.1 and later

- CUDA v11.8 and later
- libstdc++ runtime version greater than 3
- Python v3.10.x and later
- `m1.p4d.24xlarge` and `m1.p4de.24xlarge`, which are supported instance types by the SMDDP library
- `imdsv2` enabled on training host

Depending on how you want to run the distributed training job, there are two options to install the SMDDP library:

- A direct installation using the SMDDP binary file.
- Using the SageMaker AI Deep Learning Containers (DLCs) pre-installed with the SMDDP library.

Docker images pre-installed with the SMDDP library or the URLs to the SMDDP binary files are listed at [Supported Frameworks](#) in the SMDDP library documentation.

### To install the SMDDP library on the SageMaker HyperPod DLAMI

- `pip install --no-cache-dir https://smdataparallel.s3.amazonaws.com/binary/pytorch/<pytorch-version>/cuXYZ/YYYY-MM-DD/smdistributed_dataparallel-X.Y.Z-cp310-cp310-linux_x86_64.whl`

#### Note

If you work in a Conda environment, ensure that you install PyTorch using `conda install` instead of `pip`.

```
conda install pytorch==X.Y.Z torchvision==X.Y.Z torchaudio==X.Y.Z pytorch-cuda=X.Y.Z -c pytorch -c nvidia
```

### To use the SMDDP library on a Docker container

- The SMDDP library is pre-installed on the SageMaker AI Deep Learning Containers (DLCs). To find the list of SageMaker AI framework DLCs for PyTorch with the SMDDP library, see [Supported Frameworks](#) in the SMDDP library documentation. You can also bring your own Docker container

with required dependencies installed to use the SMDDP library. To learn more about setting up a custom Docker container to use the SMDDP library, see also [the section called “Create your own docker container with the library”](#).

### **⚠ Important**

To use the SMDDP library in a Docker container, mount the `/var/log` directory from the host machine onto `/var/log` in the container. This can be done by adding the following option when running your container.

```
docker run <OTHER_OPTIONS> -v /var/log:/var/log ...
```

To learn how to run data-parallel training jobs with SMDDP in general, see [the section called “Distributed training with the SMDDP library”](#).

## **Using SMP on a SageMaker HyperPod cluster**

The [SageMaker AI model parallelism \(SMP\) library](#) offers various [state-of-the-art model parallelism techniques](#), including:

- fully sharded data parallelism
- expert parallelism
- mixed precision training with FP16/BF16 and FP8 data types
- tensor parallelism

The SMP library is also compatible with open source frameworks such as PyTorch FSDP, NVIDIA Megatron, and NVIDIA Transformer Engine.

## **To run a sample model-parallel training workload**

The SageMaker AI service teams provide sample training jobs implementing model parallelism with the SMP library at [awesome-distributed-training/3.test\\_cases/17.SM-modelparallelv2](#).

## SageMaker HyperPod cluster resources monitoring

To achieve comprehensive observability into your SageMaker HyperPod cluster resources and software components, integrate the cluster with [Amazon Managed Service for Prometheus](#) and [Amazon Managed Grafana](#). The integration with Amazon Managed Service for Prometheus enables the export of metrics related to your HyperPod cluster resources, providing insights into their performance, utilization, and health. The integration with Amazon Managed Grafana enables the visualization of these metrics through various Grafana dashboards that offer intuitive interface for monitoring and analyzing the cluster's behavior. By leveraging these services, you gain a centralized and unified view of your HyperPod cluster, facilitating proactive monitoring, troubleshooting, and optimization of your distributed training workloads.

### Tip

To find practical examples and solutions, see also the [SageMaker HyperPod workshop](#).

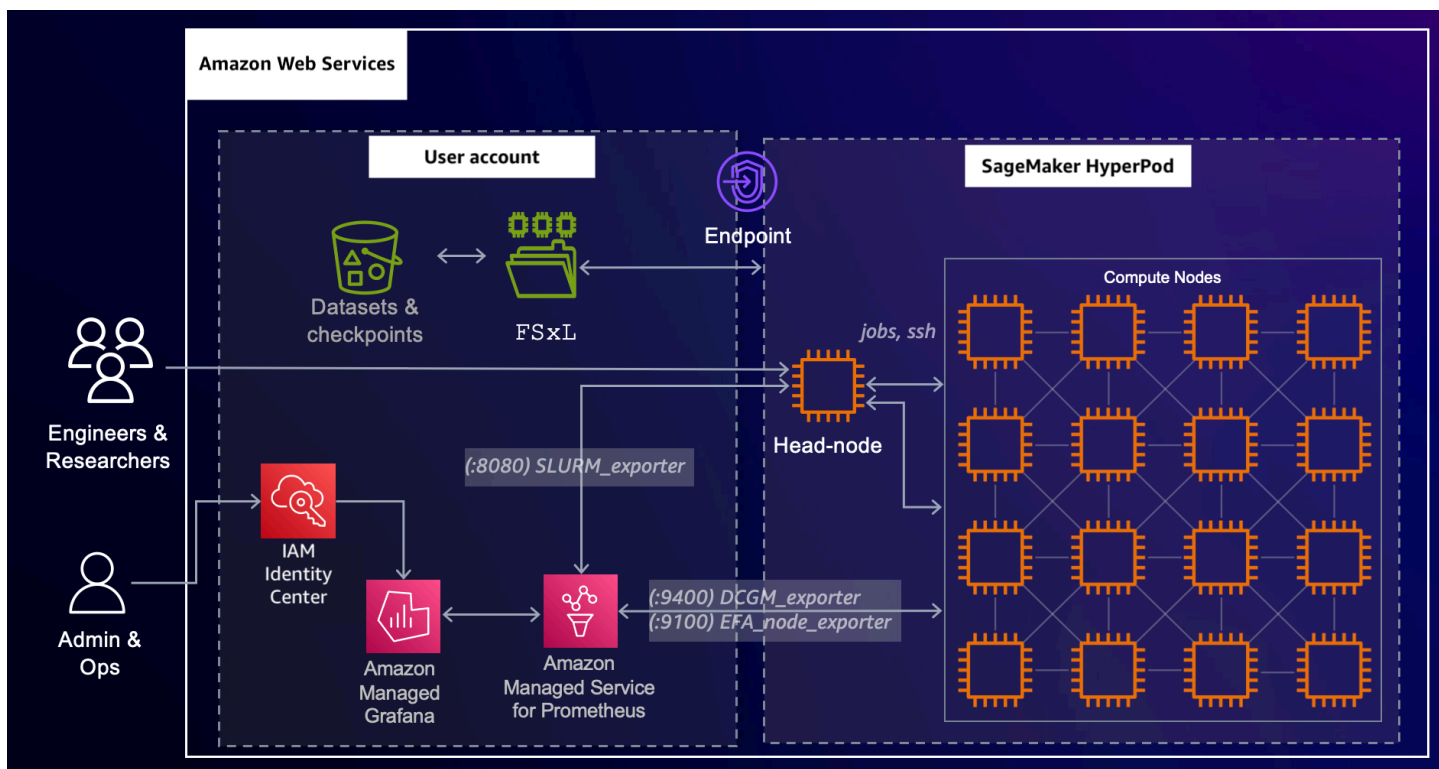

Figure: This architecture diagram shows an overview of configuring SageMaker HyperPod with Amazon Managed Service for Prometheus and Amazon Managed Grafana.

Proceed to the following topics to set up for SageMaker HyperPod cluster observability.

## Topics

- [Complete prerequisites for SageMaker HyperPod cluster observability](#)
- [Install metrics exporter packages on your HyperPod cluster](#)
- [Validate Prometheus setup on the head node of a HyperPod cluster](#)
- [Set up an Amazon Managed Grafana workspace](#)
- [Exported metrics reference](#)
- [Amazon SageMaker HyperPod Slurm metrics](#)

### Complete prerequisites for SageMaker HyperPod cluster observability

Before proceeding with the steps to [the section called “Install metrics exporter packages on your HyperPod cluster”](#), ensure that the following prerequisites are met.

#### Enable IAM Identity Center

To enable observability for your SageMaker HyperPod cluster, you must first enable IAM Identity Center. This is a prerequisite for deploying an AWS CloudFormation stack that sets up the Amazon Managed Grafana workspace and Amazon Managed Service for Prometheus. Both of these services also require the IAM Identity Center for authentication and authorization, ensuring secure user access and management of the monitoring infrastructure.

For detailed guidance on enabling IAM Identity Center, see the [Enabling IAM Identity Center](#) section in the *AWS IAM Identity Center User Guide*.

After successfully enabling IAM Identity Center, set up a user account that will serve as the administrative user throughout the following configuration procedures.

#### Create and deploy an AWS CloudFormation stack for SageMaker HyperPod observability

Create and deploy a CloudFormation stack for SageMaker HyperPod observability to monitor HyperPod cluster metrics in real time using Amazon Managed Service for Prometheus and Amazon Managed Grafana. To deploy the stack, note that you also should enable your [IAM Identity Center](#) beforehand.

Use the sample CloudFormation script [cluster-observability.yaml](#) that helps you set up Amazon VPC subnets, Amazon FSx for Lustre file systems, Amazon S3 buckets, and IAM roles required to create a HyperPod cluster observability stack.

## Install metrics exporter packages on your HyperPod cluster

In the [base configuration lifecycle scripts](#) that the SageMaker HyperPod team provides also includes installation of various metric exporter packages. To activate the installation step, the only thing you need to do is to set the parameter `enable_observability=True` in the [config.py](#) file. The lifecycle scripts are designed to bootstrap your cluster with the following open-source metric exporter packages.

Name	Script deployment target node	Exporter description
<a href="#">Slurm exporter for Prometheus</a>	Head (controller) node	Exports Slurm Accounting metrics.
<a href="#">Elastic Fabric Adapter (EFA) node exporter</a>	Compute node	Exports metrics from cluster nodes and EFA. The package is a fork of the <a href="#">Prometheus node exporter</a> .
<a href="#">NVIDIA Data Center GPU Management (DCGM) exporter</a>	Compute node	Exports NVIDIA DCGM metrics about health and performance of NVIDIA GPUs.

With `enable_observability=True` in the [config.py](#) file, the following installation step is activated in the [lifecycle\\_script.py](#) script.

```
# Install metric exporting software and Prometheus for observability
if Config.enable_observability:
    if node_type == SlurmNodeType.COMPUTE_NODE:
        ExecuteBashScript("./utils/install_docker.sh").run()
        ExecuteBashScript("./utils/install_dcg_m_exporter.sh").run()
        ExecuteBashScript("./utils/install_efa_node_exporter.sh").run()

    if node_type == SlurmNodeType.HEAD_NODE:
        wait_for_scontrol()
        ExecuteBashScript("./utils/install_docker.sh").run()
        ExecuteBashScript("./utils/install_slurm_exporter.sh").run()
        ExecuteBashScript("./utils/install_prometheus.sh").run()
```

On the compute nodes, the script installs the NVIDIA Data Center GPU Management (DCGM) exporter and the Elastic Fabric Adapter (EFA) node exporter. The DCGM exporter is an exporter for Prometheus that collects metrics from NVIDIA GPUs, enabling monitoring of GPU usage, performance, and health. The EFA node exporter, on the other hand, gathers metrics related to the EFA network interface, which is essential for low-latency and high-bandwidth communication in HPC clusters.

On the head node, the script installs the Slurm exporter for Prometheus and the [Prometheus open-source software](#). The Slurm exporter provides Prometheus with metrics related to Slurm jobs, partitions, and node states.

Note that the lifecycle scripts are designed to install all the exporter packages as docker containers, so the Docker package also should be installed on both the head and compute nodes. The scripts for these components are conveniently provided in the [utils](#) folder of the *Awsome Distributed Training GitHub repository*.

After you have successfully set up your HyperPod cluster installed with the exporter packages, proceed to the next topic to finish setting up Amazon Managed Service for Prometheus and Amazon Managed Grafana.

## Validate Prometheus setup on the head node of a HyperPod cluster

After you have successfully set up your HyperPod cluster installed with the exporter packages, check if Prometheus is properly set up on the head node of your HyperPod cluster.

1. Connect to the head node of your cluster. For instructions on accessing a node, see [the section called "Access your SageMaker HyperPod cluster nodes"](#).
2. Run the following command to verify the Prometheus config and service file created by the lifecycle script `install_prometheus.sh` is running on the controller node. The output should show the Active status as **active (running)**.

```
$ sudo systemctl status prometheus
• prometheus service - Prometheus Exporter
Loaded: loaded (/etc/systemd/system/prometheus.service; enabled; preset:disabled)
Active: active (running) since DAY YYYY-MM-DD HH:MM:SS UTC; Ss ago
Main PID: 12345 (prometheus)
Tasks: 7 (limit: 9281)
Memory: 35M
CPU: 234ms
CGroup: /system.slice/prometheus.service
```

```
-12345 /usr/bin/prometheus--config.file=/etc/prometheus/prometheus.yml
```

3. Validate the Prometheus configuration file as follows. The output must be similar to the following, with three exporter configured with the right compute node IP addresses.

```
$ cat /etc/prometheus/prometheus.yml
global:
  scrape_interval: 15s
  evaluation_interval: 15s
  scrape_timeout: 15s

scrape_configs:
  - job_name: 'slurm_exporter'
    static_configs:
      - targets:
          - 'localhost:8080'
  - job_name: 'dcmg_exporter'
    static_configs:
      - targets:
          - '<ComputeNodeIP>:9400'
          - '<ComputeNodeIP>:9400'
  - job_name: 'efa_node_exporter'
    static_configs:
      - targets:
          - '<ComputeNodeIP>:9100'
          - '<ComputeNodeIP>:9100'

remote_write:
  - url: <AMPReoteWriteURL>
    queue_config:
      max_samples_per_send: 1000
      max_shards: 200
      capacity: 2500
    sigv4:
      region: <Region>
```

4. To test if Prometheus is exporting Slurm, DCGM, and EFA metrics properly, run the following `curl` command for Prometheus on port `:9090` on the head node.

```
$ curl -s http://localhost:9090/metrics | grep -E 'slurm|dcmg|efa'
```

With the metrics exported to Amazon Managed Service for Prometheus Workspace through the Prometheus remote write configuration from the controller node, you can proceed to the next topic to set up Amazon Managed Grafana dashboards to display the metrics.

## Set up an Amazon Managed Grafana workspace

Create a new Amazon Managed Grafana workspace or update an existing Amazon Managed Grafana workspace with Amazon Managed Service for Prometheus as the data source.

### Topics

- [Create a Grafana workspace and set Amazon Managed Service for Prometheus as a data source](#)
- [Open the Grafana workspace and finish setting up the data source](#)
- [Import open-source Grafana dashboards](#)

## Create a Grafana workspace and set Amazon Managed Service for Prometheus as a data source

To visualize metrics from Amazon Managed Service for Prometheus, create an Amazon Managed Grafana workspace and set it up to use Amazon Managed Service for Prometheus as a data source.

1. To create a Grafana workspace, follow the instructions at [Creating a workspace](#) in the *Amazon Managed Service for Prometheus User Guide*.
  - a. In Step 13, select Amazon Managed Service for Prometheus as the data source.
  - b. In Step 17, you can add the admin user and also other users in your IAM Identity Center.

For more information, see also the following resources.

- [Set up Amazon Managed Grafana for use with Amazon Managed Service for Prometheus](#) in the *Amazon Managed Service for Prometheus User Guide*
- [Use AWS data source configuration to add Amazon Managed Service for Prometheus as a data source](#) in the *Amazon Managed Grafana User Guide*

## Open the Grafana workspace and finish setting up the data source

After you have successfully created or updated an Amazon Managed Grafana workspace, select the workspace URL to open the workspace. This prompts you to enter a user name and the password

of the user that you have set up in IAM Identity Center. You should log in using the admin user to finish setting up the workspace.

1. In the workspace **Home** page, choose **Apps**, **AWS Data Sources**, and **Data sources**.
2. In the **Data sources** page, and choose the **Data sources** tab.
3. For **Service**, choose Amazon Managed Service for Prometheus.
4. In the **Browse and provision data sources** section, choose the AWS region where you provisioned an Amazon Managed Service for Prometheus workspace.
5. From the list of data sources in the selected Region, choose the one for Amazon Managed Service for Prometheus. Make sure that you check the resource ID and the resource alias of the Amazon Managed Service for Prometheus workspace that you have set up for HyperPod observability stack.

## Import open-source Grafana dashboards

After you've successfully set up your Amazon Managed Grafana workspace with Amazon Managed Service for Prometheus as the data source, you'll start collecting metrics to Prometheus, and then should start seeing the various dashboards showing charts, information, and more. The Grafana open source software provides various dashboards, and you can import them into Amazon Managed Grafana.

### To import open-source Grafana dashboards to Amazon Managed Grafana

1. In the **Home** page of your Amazon Managed Grafana workspace, choose **Dashboards**.
2. Choose the drop down menu button with the UI text **New**, and select **Import**.
3. Paste the URL to the [Slurm Dashboard](https://grafana.com/grafana/dashboards/4323-slurm-dashboard/).

```
https://grafana.com/grafana/dashboards/4323-slurm-dashboard/
```

4. Select **Load**.
5. Repeat the previous steps to import the following dashboards.
  - a. [Node Exporter Full Dashboard](https://grafana.com/grafana/dashboards/1860-node-exporter-full/)

```
https://grafana.com/grafana/dashboards/1860-node-exporter-full/
```

- b. [NVIDIA DCGM Exporter Dashboard](https://grafana.com/grafana/dashboards/1860-nvidia-dcgm-exporter/)

```
https://grafana.com/grafana/dashboards/12239-nvidia-dcgm-exporter-dashboard/
```

c. [EFA Metrics Dashboard](#)

```
https://grafana.com/grafana/dashboards/20579-efa-metrics-dev/
```

d. [FSx for Lustre Metrics Dashboard](#)

```
https://grafana.com/grafana/dashboards/20906-fsx-lustre/
```

## Exported metrics reference

The following sections present comprehensive lists of metrics exported from SageMaker HyperPod to Amazon Managed Service for Prometheus upon the successful configuration of the AWS CloudFormation stack for SageMaker HyperPod observability. You can start monitoring these metrics visualized in the Amazon Managed Grafana dashboards.

### Slurm exporter dashboard

Provides visualized information of Slurm clusters on SageMaker HyperPod.

#### Types of metrics

- **Cluster Overview:** Displaying the total number of nodes, jobs, and their states.
- **Job Metrics:** Visualizing job counts and states over time.
- **Node Metrics:** Showing node states, allocation, and available resources.
- **Partition Metrics:** Monitoring partition-specific metrics such as CPU, memory, and GPU utilization.
- **Job Efficiency:** Calculating job efficiency based on resources utilized.

#### List of metrics

Metric name	Description
slurm_job_count	Total number of jobs in the Slurm cluster

Metric name	Description
slurm_job_state_count	Count of jobs in each state (e.g., running, pending, completed)
slurm_node_count	Total number of nodes in the Slurm cluster
slurm_node_state_count	Count of nodes in each state (e.g., idle, alloc, mix)
slurm_partition_node_count	Count of nodes in each partition
slurm_partition_job_count	Count of jobs in each partition
slurm_partition_alloc_cpus	Total number of allocated CPUs in each partition
slurm_partition_free_cpus	Total number of available CPUs in each partition
slurm_partition_alloc_memory	Total allocated memory in each partition
slurm_partition_free_memory	Total available memory in each partition
slurm_partition_alloc_gpus	Total allocated GPUs in each partition
slurm_partition_free_gpus	Total available GPUs in each partition

## Node exporter dashboard

Provides visualized information of system metrics collected by the [Prometheus node exporter](#) from the HyperPod cluster nodes.

### Types of metrics

- **System overview:** Displaying CPU load averages and memory usage.
- **Memory metrics:** Visualizing memory utilization including total memory, free memory, and swap space.
- **Disk usage:** Monitoring disk space utilization and availability.

- **Network traffic:** Showing network bytes received and transmitted over time.
- **File system metrics:** Analyzing file system usage and availability.
- **Disk I/O metrics:** Visualizing disk read and write activity.

## List of metrics

For a complete list of metrics exported, see the [Node exporter](#) and [procfs](#) GitHub repositories. The following table shows a subset of the metrics that provides insights into system resource utilization such as CPU load, memory usage, disk space, and network activity.

Metric name	Description
node_load1	1-minute load average
node_load5	5-minute load average
node_load15	15-minute load average
node_memory_MemTotal	Total system memory
node_memory_MemFree	Free system memory
node_memory_MemAvailable	Available memory for allocation to processes
node_memory_Buffers	Memory used by the kernel for buffering
node_memory_Cached	Memory used by the kernel for caching file system data
node_memory_SwapTotal	Total swap space available
node_memory_SwapFree	Free swap space
node_memory_SwapCached	Memory that once was swapped out, is swapped back in but still in swap
node_filesystem_avail_bytes	Available disk space in bytes
node_filesystem_size_bytes	Total disk space in bytes

Metric name	Description
node_filesystem_free_bytes	Free disk space in bytes
node_network_receive_bytes	Network bytes received
node_network_transmit_bytes	Network bytes transmitted
node_disk_read_bytes	Disk bytes read
node_disk_written_bytes	Disk bytes written

## NVIDIA DCGM exporter dashboard

Provides visualized information of NVIDIA GPU metrics collected by the [NVIDIA DCGM exporter](#).

### Types of metrics

- **GPU Overview:** Displaying GPU utilization, temperatures, power usage, and memory usage.
- **Temperature Metrics:** Visualizing GPU temperatures over time.
- **Power Usage:** Monitoring GPU power draw and power usage trends.
- **Memory Utilization:** Analyzing GPU memory usage including used, free, and total memory.
- **Fan Speed:** Showing GPU fan speeds and variations.
- **ECC Errors:** Tracking GPU memory ECC errors and pending errors.

### List of metrics

The following table shows a list of the metrics that provides insights into the NVIDIA GPU health and performance, including clock frequencies, temperatures, power usage, memory utilization, fan speeds, and error metrics.

Metric name	Description
DCGM_FI_DEV_SM_CLOCK	SM clock frequency (in MHz)
DCGM_FI_DEV_MEM_CLOCK	Memory clock frequency (in MHz)
DCGM_FI_DEV_MEMORY_TEMP	Memory temperature (in C)

Metric name	Description
DCGM_FI_DEV_GPU_TEMP	GPU temperature (in C)
DCGM_FI_DEV_POWER_USAGE	Power draw (in W)
DCGM_FI_DEV_TOTAL_ENERGY_CONSUMPTION	Total energy consumption since boot (in mJ)
DCGM_FI_DEV_PCIE_REPLAY_COUNTER	Total number of PCIe retries
DCGM_FI_DEV_MEM_COPY_UTIL	Memory utilization (in %)
DCGM_FI_DEV_ENC_UTIL	Encoder utilization (in %)
DCGM_FI_DEV_DEC_UTIL	Decoder utilization (in %)
DCGM_FI_DEV_XID_ERRORS	Value of the last XID error encountered
DCGM_FI_DEV_FB_FREE	Frame buffer memory free (in MiB)
DCGM_FI_DEV_FB_USED	Frame buffer memory used (in MiB)
DCGM_FI_DEV_NVLINK_BANDWIDTH_TOTAL	Total number of NVLink bandwidth counters for all lanes
DCGM_FI_DEV_VGPU_LICENSE_STATUS	vGPU License status
DCGM_FI_DEV_UNCORRECTABLE_REMAPPED_ROWS	Number of remapped rows for uncorrectable errors
DCGM_FI_DEV_CORRECTABLE_REMAPPED_ROWS	Number of remapped rows for correctable errors
DCGM_FI_DEV_ROW_REMAP_FAILURE	Whether remapping of rows has failed

## EFA metrics dashboard

Provides visualized information of the metrics from [Amazon Elastic Fabric Adapter \(EFA\)](#) equipped on P instances collected by the [EFA node exporter](#).

## Types of metrics

- **EFA error metrics:** Visualizing errors such as allocation errors, command errors, and memory map errors.
- **EFA network traffic:** Monitoring received and transmitted bytes, packets, and work requests.
- **EFA RDMA performance:** Analyzing RDMA read and write operations, including bytes transferred and error rates.
- **EFA port lifespan:** Displaying the lifespan of EFA ports over time.
- **EFA keep-alive packets:** Tracking the number of keep-alive packets received.

## List of metrics

The following table shows a list of the metrics that provides insights into various aspects of EFA operation, including errors, completed commands, network traffic, and resource utilization.

Metric name	Description
node_amazonefa_info	Non-numeric data from /sys/class/infinib and/, value is always 1.
node_amazonefa_lifespan	Lifespan of the port
node_amazonefa_rdma_read_bytes	Number of bytes read with RDMA
node_amazonefa_rdma_read_resp_bytes	Number of read response bytes with RDMA
node_amazonefa_rdma_read_wr_err	Number of read write errors with RDMA
node_amazonefa_rdma_read_wrs	Number of read rs with RDMA
node_amazonefa_rdma_write_bytes	Number of bytes written with RDMA
node_amazonefa_rdma_write_recv_bytes	Number of bytes written and received with RDMA
node_amazonefa_rdma_write_wr_err	Number of bytes written with error RDMA
node_amazonefa_rdma_write_wrs	Number of bytes written wrs RDMA

Metric name	Description
node_amazonefa_recv_bytes	Number of bytes received
node_amazonefa_recv_wrs	Number of bytes received wrs
node_amazonefa_rx_bytes	Number of bytes received
node_amazonefa_rx_drops	Number of packets dropped
node_amazonefa_rx_pkts	Number of packets received
node_amazonefa_send_bytes	Number of bytes sent
node_amazonefa_send_wrs	Number of wrs sent
node_amazonefa_tx_bytes	Number of bytes transmitted
node_amazonefa_tx_pkts	Number of packets transmitted

## FSx for Lustre metrics dashboard

Provides visualized information of the [metrics from Amazon FSx for Lustre](#) file system collected by [Amazon CloudWatch](#).

### Note

The Grafana FSx for Lustre dashboard utilizes Amazon CloudWatch as its data source, which differs from the other dashboards that you have configured to use Amazon Managed Service for Prometheus. To ensure accurate monitoring and visualization of metrics related to your FSx for Lustre file system, configure the FSx for Lustre dashboard to use Amazon CloudWatch as the data source, specifying the same AWS Region where your FSx for Lustre file system is deployed.

## Types of metrics

- **DataReadBytes:** The number of bytes for file system read operations.
- **DataWriteBytes:** The number of bytes for file system write operations.

- **DataReadOperations:** The number of read operations.
- **DataWriteOperations:** The number of write operations.
- **MetadataOperations:** The number of meta data operations.
- **FreeDataStorageCapacity:** The amount of available storage capacity.

## Amazon SageMaker HyperPod Slurm metrics

Amazon SageMaker HyperPod provides a set of Amazon CloudWatch metrics that you can use to monitor the health and performance of your HyperPod clusters. These metrics are collected from the Slurm workload manager running on your HyperPod clusters and are available in the `/aws/sagemaker/Clusters` CloudWatch namespace.

### Cluster level metrics

The following cluster-level metrics are available for HyperPod. These metrics use the `ClusterId` dimension to identify the specific HyperPod cluster.

CloudWatch metric name	Notes	Amazon EKS Container Insights metric name
<code>cluster_node_count</code>	Total number of nodes in the cluster	<code>cluster_node_count</code>
<code>cluster_idle_node_count</code>	Number of idle nodes in the cluster	N/A
<code>cluster_failed_node_count</code>	Number of failed nodes in the cluster	<code>cluster_failed_node_count</code>
<code>cluster_cpu_count</code>	Total CPU cores in the cluster	<code>node_cpu_limit</code>
<code>cluster_idle_cpu_count</code>	Number of idle CPU cores in the cluster	N/A
<code>cluster_gpu_count</code>	Total GPUs in the cluster	<code>node_gpu_limit</code>
<code>cluster_idle_gpu_count</code>	Number of idle GPUs in the cluster	N/A

CloudWatch metric name	Notes	Amazon EKS Container Insights metric name
cluster_running_task_count	Number of running Slurm jobs in the cluster	N/A
cluster_pending_task_count	Number of pending Slurm jobs in the cluster	N/A
cluster_preempted_task_count	Number of preempted Slurm jobs in the cluster	N/A
cluster_avg_task_wait_time	Average wait time for Slurm jobs in the cluster	N/A
cluster_max_task_wait_time	Maximum wait time for Slurm jobs in the cluster	N/A

### Instance level metrics

The following instance-level metrics are available for HyperPod. These metrics also use the `ClusterId` dimension to identify the specific HyperPod cluster.

CloudWatch metric name	Notes	Amazon EKS Container Insights metric name
node_gpu_utilization	Average GPU utilization across all instances	node_gpu_utilization
node_gpu_memory_utilization	Average GPU memory utilization across all instances	node_gpu_memory_utilization
node_cpu_utilization	Average CPU utilization across all instances	node_cpu_utilization
node_memory_utilization	Average memory utilization across all instances	node_memory_utilization

## SageMaker HyperPod cluster resiliency

SageMaker HyperPod provides the following cluster resiliency features.

### Topics

- [Cluster health check](#)
- [Auto-resume](#)
- [How to replace a faulty node not being auto-resumed by HyperPod](#)

### Cluster health check

This section describes the set of health checks that SageMaker HyperPod uses to regularly monitor cluster instance health for issues with devices such as accelerators (GPU and Trainium cores) and networking (EFA).

Category	Utility name	Instance type compatibility	Description
Accelerator	DCGM policies	GPU	Each instance in the cluster continuously monitors all GPU-related policies including XID errors with <a href="#">NVIDIA DCGM</a> .
Accelerator	NVIDIA SMI	GPU	<a href="#">nvidia-smi</a> utility is a well-known CLI to manage and monitor GPUs. The built-in health checker parses the output from <code>nvidia-smi</code> to determine the health of the instance.
Accelerator	Neuron sysfs	Trainium	For Trainium-powered instances

Category	Utility name	Instance type compatibility	Description
			, the health of the Neuron devices is determined by reading counters from <a href="#">Neuron sysfs</a> propagated directly by the Neuron driver.
Network	EFA	GPU and Trainium	To aid in the diagnostic of Elastic Fabric Adaptor (EFA) devices, the EFA health checker runs a series of connectivity tests using all available EFA cards within the instance.
Stress	<a href="#">DCGM diagnostics</a> level 2	GPU	<a href="#">DCGM diagnostics</a> level 2 is used to exercise the GPUs in the system and put them under pressure to get a thorough insight of the health.
Stress	CPU stress	GPU and Trainium	CPU health is determined using the <a href="#">Linux stress</a> tool, which runs multiple threads to achieve 100% CPU utilization and perform I/O operations.

## Auto-resume

This section describes how to run a training job with the SageMaker HyperPod auto-resume functionality, which provides a zero-touch resiliency infrastructure to automatically recover a training job from the last saved checkpoint in the event of a hardware failure for clusters with more than 16 nodes.

With the auto-resume functionality, if a job fails due to a hardware failure or any transient issues in-between training, SageMaker HyperPod auto-resume starts the node replacement workflow and restarts the job after the faulty nodes are replaced.

### Note

When [Generic Resources \(GRES\)](#) are attached to a Slurm node, Slurm typically doesn't permit changes in the node allocation, such as replacing nodes, and thus doesn't allow to resume a failed job. Unless explicitly forbidden, the HyperPod auto-resume functionality automatically re-queues any faulty job associated with the GRES-enabled nodes. This process involves stopping the job, placing it back into the job queue, and then restarting the job from the beginning.

## Using the SageMaker HyperPod auto-resume functionality with Slurm

When you use SageMaker HyperPod auto-resume with Slurm, you should run the job inside an exclusive allocation acquired either by using `salloc` or `sbatch`. In any case, you need to modify the entrypoint script to make sure that all setup steps run in a single `srun` command when resuming the job. Through the entrypoint script, it is important to set up the environment on the replaced node to be consistent with the environment that the job step was running before it was stopped. The following procedure shows how to prepare an entrypoint script to keep the environment consistent and run it as a single `srun` command.

### Tip

If you use `sbatch`, you can keep the batch script simple by creating a separate script for setting up the environment and using a single `srun` command.

1. Create a script using the following code example and save it as `train_auto_resume.sh`. This script deploys training environment setups assuming that there is no manual configuration

previously made to the replaced node. This ensures that the environment is node-agnostic, so that when a node is replaced, the same environment is provisioned on the node before resuming the job.

### Note

The following code example shows how to discover the Slurm node list associated with the job. Do not use the `$SLURM_JOB_NODELIST` environment variable provided by Slurm, because its value might be outdated after SageMaker HyperPod auto-resumes the job. The following code example shows how to define a new `NODE_LIST` variable to replace `SLURM_JOB_NODELIST`, and then set up the `MASTER_NODE` and `MASTER_ADDR` variables off of the `NODE_LIST` variable.

```
#!/bin/bash

# Filename: train_auto_resume.sh
# Sample containerized script to launch a training job with a single srun which can
# be auto-resumed.

# Place your training environment setup here.
# Example: Install conda, docker, activate virtual env, etc.

# Get the list of nodes for a given job
NODE_LIST=$(scontrol show jobid=$SLURM_JOBID | \ # Show details of the SLURM job
            awk -F= '/NodeList=/{print $2}' | \ # Extract NodeList field
            grep -v Exc)                        # Exclude nodes marked as excluded

# Determine the master node from the node list
MASTER_NODE=$(scontrol show hostname $NODE_LIST | \ # Convert node list to hostnames
              head -n 1)                            # Select the first hostname as
master node

# Get the master node address
MASTER_ADDR=$(scontrol show node=$MASTER_NODE | \ # Show node information
              awk -F= '/NodeAddr=/{print $2}' | \ # Extract NodeAddr
              awk '{print $1}')                    # Print the first part of NodeAddr

# Torchrun command to launch the training job
torchrun_cmd="torchrun --nnodes=$SLURM_NNODES \
```

```

--nproc_per_node=1 \
--node_rank=$SLURM_NODE \
--master-addr=$MASTER_ADDR \
--master_port=1234 \
<your_training_script.py>"

```

```

# Execute the torchrun command in the 'pytorch' Conda environment,
# streaming output live
/opt/conda/bin/conda run --live-stream -n pytorch $torchrun_cmd

```

### Tip

You can use the preceding script to add more commands for installing any additional dependencies for your job. However, we recommend that you keep the dependency installation scripts to the [set of lifecycle scripts](#) that are used during cluster creation. If you use a virtual environment hosted on a shared directory, you can also utilize this script to activate the virtual environment.

2. Launch the job with SageMaker HyperPod auto-resume enabled by adding the flag `--auto-resume=1` to indicate that the `srun` command should be automatically retried in case of hardware failure.

### Note

If you have set up a resource allocation using `sbatch` or `salloc`, you can run multiple `srun` commands within the allocation. In the event of a failure, the SageMaker HyperPod auto-resume functionality only operates in the current [job step](#) of the `srun` command with the flag `--auto-resume=1`. In other words, activating auto-resume in an `srun` command doesn't apply to other `srun` commands launched within a resource allocation session.

The following are `srun` command examples with `auto-resume` enabled.

## Using `sbatch`

Because most of the logic for setting up the environment is already in `train_auto_resume.sh`, the batch script should be simple and similar to the following code example. Assume that the following batch script is saved as `batch.sh`.

```
#!/bin/bash
#SBATCH --nodes 2
#SBATCH --exclusive
srun --auto-resume=1 train_auto_resume.sh
```

Run the preceding batch script using the following command.

```
sbatch batch.sh
```

## Using salloc

Start by acquiring an exclusive allocation, and run the `srun` command with the `--auto-resume` flag and the entrypoint script.

```
salloc -N 2 --exclusive
srun --auto-resume=1 train_auto_resume.sh
```

## How to replace a faulty node not being auto-resumed by HyperPod

The HyperPod auto-resume functionality monitors if the state of your Slurm nodes turns to `fail` or `down`. You can check the state of Slurm nodes by running `sinfo`.

If you have a node stuck with an issue but not being fixed by the HyperPod auto-resume functionality, we recommend you to run the following command to change the state of the node to `fail`.

```
scontrol update node=<ip-ipv4> state=fail reason="Action:Replace"
```

In the preceding command example, replace `<ip-ipv4>` with the Slurm node name (host name) of the faulty instance you want to replace.

After running this command, the node should go into the `fail` state, waits for the currently running jobs to finish, is replaced with a healthy instance, and is recovered with the same host name. This process takes time depending on the available instances in your Availability Zone and the time it takes to run your lifecycle scripts. During the update and replacement processes, avoid changing the state of the node manually again or restarting the Slurm controller; doing so can lead

to a replacement failure. If the node does not get recovered nor turn to the `idle` state after a long time, contact [AWS Support](#).

If the faulty node is continuously stuck in the `fail` state, the last resort you might try is to manually force change the node state to `down`. This requires administrator privileges (sudo permissions).

### **Warning**

Proceed carefully before you run the following command as it forces kill all jobs, and you might lose all unsaved work.

```
scontrol update node=<ip-ipv4> state=down reason="Action:Replace"
```

## SageMaker HyperPod cluster management

The following topics discuss logging and managing SageMaker HyperPod clusters.

### Logging SageMaker HyperPod events

All events and logs from SageMaker HyperPod are saved to Amazon CloudWatch under the log group name `/aws/sagemaker/Clusters/[ClusterName]/[ClusterID]`. Every call to the `CreateCluster` API creates a new log group. The following list contains all of the available log streams collected in each log group.

Log Group Name	Log Stream Name
<code>/aws/sagemaker/Clusters/[ClusterName]/[ClusterID]</code>	<code>LifecycleConfig/[instance-group-name]/[instance-id]</code>

### Logging SageMaker HyperPod at instance level

You can access the `LifecycleScript` logs published to CloudWatch during cluster instance configuration. Every instance within the created cluster generates a separate log stream, distinguishable by the `LifecycleConfig/[instance-group-name]/[instance-id]` format.

All logs that are written to `/var/log/provision/provisioning.log` are uploaded to the preceding CloudWatch stream. Sample `LifecycleScripts` at

[1.architectures/5.sagemaker\\_hyperpods/LifecycleScripts/base-config](#) redirect their stdout and stderr to this location. If you are using your custom scripts, write your logs to the `/var/log/provision/provisioning.log` location for them to be available in CloudWatch.

## Tagging resources

AWS Tagging system helps manage, identify, organize, search for, and filter resources. SageMaker HyperPod supports tagging, so you can manage the clusters as an AWS resource. During cluster creation or editing an existing cluster, you can add or edit tags for the cluster. To learn more about tagging in general, see [Tagging your AWS resources](#).

### Using the SageMaker HyperPod console UI

When you are [creating a new cluster](#) and [editing a cluster](#), you can add, remove, or edit tags.

### Using the SageMaker HyperPod APIs

When you write a [CreateCluster](#) or [UpdateCluster](#) API request file in JSON format, edit the Tags section.

### Using the AWS CLI tagging commands for SageMaker AI

#### To tag a cluster

Use [aws sagemaker add-tags](#) as follows.

```
aws sagemaker add-tags --resource-arn cluster_ARN --tags Key=string,Value=string
```

#### To untag a cluster

Use [aws sagemaker delete-tags](#) as follows.

```
aws sagemaker delete-tags --resource-arn cluster_ARN --tag-keys "tag_key"
```

#### To list tags for a resource

Use [aws sagemaker list-tags](#) as follows.

```
aws sagemaker list-tags --resource-arn cluster_ARN
```

## SageMaker HyperPod FAQ

Use the following frequently asked questions to troubleshoot problems with using SageMaker HyperPod.

### Q. Why can I not find log groups of my SageMaker HyperPod cluster in Amazon CloudWatch?

By default, agent logs and instance start-up logs are sent to the HyperPod platform account's CloudWatch. In case of user lifecycle scripts, lifecycle configuration logs are sent to your account's CloudWatch.

If you use the [sample lifecycle scripts](#) provided by the HyperPod service team, you can expect to find the lifecycle configuration logs written to `/var/log/provision/provisioning.log`, and you wouldn't encounter this problem.

However, if you use custom paths for collecting logs from lifecycle provisioning and can't find the log groups appearing in your account's CloudWatch, it might be due to mismatches in the log file paths specified in your lifecycle scripts and what the CloudWatch agent running on the HyperPod cluster instances looks for. In this case, it means that you need to properly set up your lifecycle scripts to send logs to the CloudWatch agent, and also set up the CloudWatch agent configuration accordingly. To resolve the problem, choose one of the following options.

- **Option 1:** Update your lifecycle scripts to write logs to `/var/log/provision/provisioning.log`.
- **Option 2:** Update the CloudWatch agent to look for your custom paths for logging lifecycle provisioning.

1. Each HyperPod cluster instance contains a CloudWatch agent configuration file in JSON format at `/opt/aws/amazon-cloudwatch-agent/sagemaker_cwagent_config.json`. In the configuration file, find the field name `logs.logs_collected.files.collect_list.file_path`. With the default setup by HyperPod, the key-value pair should be `"file_path": "/var/log/provision/provisioning.log"` as documented at [the section called "Logging SageMaker HyperPod at instance level"](#). The following code snippet shows how the JSON file looks with the HyperPod default configuration.

```
"logs": {
  "logs_collected": {
    "files": {
```

```

        "collect_list": [
            {
                "file_path": "/var/log/provision/provisioning.log",
                "log_group_name": "/aws/sagemaker/Clusters/[ClusterName]/
[ClusterID]",
                "log_stream_name": "LifecycleConfig/[InstanceGroupName]/
{instance_id}",
                "retention_in_days": -1
            }
        ]
    },
    "force_flush_interval": 3
}

```

2. Replace the value for the "file\_path" field name with the custom path you use in your lifecycle scripts. For example, if you have set up your lifecycle scripts to write to `/var/log/custom-provision/custom-provisioning.log`, update the value to match with it as follows.

```
"file_path": "/var/log/custom-provision/custom-provisioning.log"
```

3. Restart the CloudWatch agent with the configuration file to finish applying the custom path. For example, the following CloudWatch command shows how to restart the CloudWatch agent with the CloudWatch agent configuration file from step 1. For more information, see also [Troubleshooting the CloudWatch agent](#).

```

sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl \
-a fetch-config -m ec2 -s -c \
file:/opt/aws/amazon-cloudwatch-agent/sagemaker_cwagent_config.json

```

### Q. What particular configurations does HyperPod manage in Slurm configuration files such as `slurm.conf` and `gres.conf`?

When you create a Slurm cluster on HyperPod, the HyperPod agent sets up the [slurm.conf](#) and [gres.conf](#) files at `/opt/slurm/etc/` to manage the Slurm cluster based on your HyperPod cluster creation request and lifecycle scripts. The following list shows what specific parameters the HyperPod agent handles and overwrites.

**⚠ Important**

We strongly recommend that you DON'T change these parameters managed by HyperPod.

- In [slurm.conf](#), HyperPod sets up the following basic parameters: ClusterName, SlurmctldHost, PartitionName, and NodeName.

Also, to enable the [the section called "Auto-resume"](#) functionality, HyperPod requires the TaskPlugin and SchedulerParameters parameters set as follows. The HyperPod agent sets up these two parameters with the required values by default.

```
TaskPlugin=task/none
SchedulerParameters=permit_job_expansion
```

- In [gres.conf](#), HyperPod manages NodeName for GPU nodes.

**Q. How do I run Docker on Slurm nodes on HyperPod?**

To help you run Docker on your Slurm nodes running on HyperPod, the HyperPod service team provides setup scripts that you can include as part of the lifecycle configuration for cluster creation. To learn more, see [the section called "Start with base lifecycle scripts provided by HyperPod"](#) and [the section called "Run Docker containers on a Slurm compute node on HyperPod"](#).

**Q. Why does my parallel training job fail when I use NVIDIA Collective Communications Library (NCCL) on SageMaker HyperPod platform on the Slurm framework?**

By default, the Linux OS sets the #RemoveIPC=yes flag. Slurm and mpirun jobs that use NCCL generate inter-process communication (IPC) resources under non-root user sessions. These user sessions might log out during the job process.

When you run jobs with Slurm or mpirun, if systemd detects that the user isn't logged in, it cleans up the IPC resources. Slurm and mpirun jobs can run without the user being logged in, but that requires that you disable cleanup at the systemd level and set it up at the Slurm level instead. For more information, see [Systemd in the NCCL documentation](#).

To disable cleanup at the systemd level, complete the following steps.

1. Set the flag #RemoveIPC=no in the file /etc/systemd/logind.conf if you're running training jobs that use Slurm and NCCL.

2. By default, Slurm doesn't clean up shared resources. We recommend that you set up a Slurm epilog script to clean up shared resources. This cleanup is useful when you have a lot of shared resources and want to clean them up after training jobs. The following is an example script.

```
#!/bin/bash
: <<'SUMMARY'
Script: epilog.sh
```

Use this script with caution, as it can potentially delete unnecessary resources and cause issues if you don't use it correctly.

Note: You must save this script in a shared location that is accessible to all nodes in the cluster, such as /fsx volume.

Workers must be able to access the script to run the script after jobs.

SUMMARY

```
# Define the log directory and create it if it doesn't exist
LOG_DIR="/<PLACEHOLDER>/epilogue" #NOTE: Update PLACEHOLDER to be a shared value
path, such as /fsx/epilogue.
mkdir -p "$LOG_DIR"

# Name the log file using the Slurm job name and job ID
log_file="$LOG_DIR/epilogue-${SLURM_JOB_NAME}_${SLURM_JOB_ID}.log"

logging() {
    echo "[$(date)] $1" | tee -a "$log_file"
}

# Slurm epilogue script to clean up IPC resources
logging "Starting IPC cleanup for Job $SLURM_JOB_ID"

# Clean up shared memory segments by username
for seg in $(ipcs -m | awk -v owner="$SLURM_JOB_USER" '$3 == owner {print $2}'); do
    if ipcrm -m "$seg"; then
        logging "Removed shared memory segment $seg"
    else
        logging "Failed to remove shared memory segment $seg"
    fi
done

# Clean up semaphores by username
for sem in $(ipcs -s | awk -v user="$SLURM_JOB_USER" '$3 == user {print $2}'); do
```

```

    if ipcrm -s "$sem"; then
        logging "Removed semaphore $sem"
    else
        logging "Failed to remove semaphore $sem"
    fi
done

# Clean up NCCL IPC
NCCL_IPC_PATH="/dev/shm/nccl-*"
for file in $NCCL_IPC_PATH; do
    if [ -e "$file" ]; then
        if rm "$file"; then
            logging "Removed NCCL IPC file $file"
        else
            logging "Failed to remove NCCL IPC file $file"
        fi
    fi
done
logging "IPC cleanup completed for Job $SLURM_JOB_ID"
exit 0

```

For more information about the Epilog parameter, see [Slurm documentation](#).

3. In the `slurm.conf` file from the controller node, add in a line to point to the epilog script you created.

```
Epilog="/path/to/epilog.sh" #For example: /fsx/epilogue/epilog.sh
```

4. Run the following commands to change permissions of the script and to make it executable.

```
chown slurm:slurm /path/to/epilog.sh
chmod +x /path/to/epilog.sh
```

5. To apply all of your changes, run `scontrol reconfigure`.

## Q. How do I use local NVMe store of P instances for launching Docker or Enroot containers with Slurm?

Because the default root volume of your head node usually is limited by 100GB EBS volume, you need to set up Docker and Enroot to use local NVMe instance store. To learn how to set up NVMe store and use it for launching Docker containers, see [the section called "Run Docker containers on a Slurm compute node on HyperPod"](#).

## Q. How to set up EFA security groups?

If you want to create a HyperPod cluster with EFA-enabled instances, make sure that you set up a security group to allow all inbound and outbound traffic to and from the security group itself. To learn more, see [Step 1: Prepare an EFA-enabled security group](#) in the *Amazon EC2 User Guide*.

## Q. How do I monitor my HyperPod cluster nodes? Is there any CloudWatch metrics exported from HyperPod?

To gain observability into the resource utilization of your HyperPod cluster, we recommend that you integrate the HyperPod cluster with Amazon Managed Grafana and Amazon Managed Service for Prometheus. With various open-source Grafana dashboards and exporter packages, you can export and visualize metrics related to the HyperPod cluster resources. To learn more about setting up SageMaker HyperPod with Amazon Managed Grafana and Amazon Managed Service for Prometheus, see [the section called "HyperPod cluster resources monitoring"](#). Note that SageMaker HyperPod currently doesn't support the exportation of system metrics to Amazon CloudWatch.

## Q. Can I add an additional storage to the HyperPod cluster nodes? The cluster instances have limited local instance store.

If the default instance storage is insufficient for your workload, you can configure additional storage per instance. Starting from the [release on June 20, 2024](#), you can add an additional Amazon Elastic Block Store (EBS) volume to each instance in your SageMaker HyperPod cluster. Note that this capability cannot be applied to existing instance groups of SageMaker HyperPod clusters created before June 20, 2024. You can utilize this capability by patching existing SageMaker HyperPod clusters created before June 20, 2024 and adding new instance groups to them. This capability is fully effective for any SageMaker HyperPod clusters created after June 20, 2024.

## Orchestrating SageMaker HyperPod clusters with Amazon EKS

SageMaker HyperPod is a SageMaker AI-managed service that enables large-scale training of foundation models on long-running and resilient compute clusters, integrating with Amazon EKS for orchestrating the HyperPod compute resources. You can run uninterrupted training jobs spanning weeks or months at scale using Amazon EKS clusters with HyperPod resiliency features that check for various hardware failures and automatically recover faulty nodes.

Key features for cluster admin users include the following.

- Provisioning resilient HyperPod clusters and attaching them to an EKS control plane

- Enabling dynamic capacity management, such as adding more nodes, updating software, and deleting clusters
- Enabling access to the cluster instances directly through `kubectl` or SSM/SSH
- Offering [resiliency capabilities](#), including basic health checks, deep health checks, a health-monitoring agent, and support for PyTorch job auto-resume
- Integrating with observability tools such as [Amazon CloudWatch Container Insights](#), [Amazon Managed Service for Prometheus](#), and [Amazon Managed Grafana](#)

For data scientist users, EKS support in HyperPod enables the following.

- Running containerized workloads for training foundation models on the HyperPod cluster
- Running inference on the EKS cluster, leveraging the integration between HyperPod and EKS
- Leveraging the job auto-resume capability for [Kubeflow PyTorch training \(PyTorchJob\)](#)

#### Note

Amazon EKS enables user-managed orchestration of tasks and infrastructure on SageMaker HyperPod through the Amazon EKS Control Plane. Ensure that user access to the cluster through the Kubernetes API Server endpoint follows the principle of least-privilege, and that network egress from the HyperPod cluster is secured.

To learn more about securing access to the Amazon EKS API Server, see [Control network access to cluster API server endpoint](#).

To learn more about securing network access on HyperPod, see [Setting up SageMaker HyperPod with a custom Amazon VPC](#).

The high-level architecture of Amazon EKS support in HyperPod involves a 1-to-1 mapping between an EKS cluster (control plane) and a HyperPod cluster (worker nodes) within a VPC, as shown in the following diagram.

## Managing SageMaker HyperPod clusters orchestrated by Amazon EKS

This section provides guidance on managing SageMaker HyperPod through the SageMaker AI console UI or the AWS Command Line Interface (CLI). It explains how to perform various tasks related to SageMaker HyperPod, whether you prefer a visual interface or working with commands.

### Topics

- [Getting started with Amazon EKS support in SageMaker HyperPod](#)
- [Install packages on the Amazon EKS cluster using Helm](#)

- [Setting up Kubernetes role-based access control](#)
- [Managing SageMaker HyperPod clusters using the SageMaker HyperPod console UI](#)
- [Managing SageMaker HyperPod clusters using the AWS CLI](#)
- [Configure storage for SageMaker HyperPod clusters orchestrated by Amazon EKS](#)

## Getting started with Amazon EKS support in SageMaker HyperPod

In addition to the general [the section called “Prerequisites”](#) for SageMaker HyperPod, check the following requirements and considerations for orchestrating SageMaker HyperPod clusters using Amazon EKS.

### Requirements

#### Note

Before creating a HyperPod cluster, you need a running Amazon EKS cluster configured with VPC and installed using Helm.

- If using the SageMaker AI console, you can create an Amazon EKS cluster within the HyperPod cluster console page. For more information, see [the section called “Create a SageMaker HyperPod cluster”](#).
- If using AWS CLI, you should create an Amazon EKS cluster before creating a HyperPod cluster to associate with. For more information, see [Create an Amazon EKS cluster](#) in the Amazon EKS User Guide.

When provisioning your Amazon EKS cluster, consider the following:

#### 1. Kubernetes version support

- SageMaker HyperPod supports Kubernetes versions 1.28, 1.29, 1.30, and 1.31.

#### 2. Amazon EKS cluster authentication mode

- The authentication mode of an Amazon EKS cluster supported by SageMaker HyperPod are API and API\_AND\_CONFIG\_MAP.

#### 3. Networking

- SageMaker HyperPod requires the Amazon VPC Container Network Interface (CNI) plug-in version 1.18.3 or later.

**Note**

[AWS VPC CNI plugin for Kubernetes](#) is the only CNI supported by SageMaker HyperPod.

- The [type of the subnet](#) in your VPC must be private for HyperPod clusters.

#### 4. IAM roles

- Ensure the necessary IAM roles for HyperPod are set up as guided in the [the section called “IAM for HyperPod”](#) section.

#### 5. Amazon EKS cluster add-ons

- You can continue using the various add-ons provided by Amazon EKS such as [Kube-proxy](#), [CoreDNS](#), the [Amazon VPC Container Network Interface \(CNI\)](#) plugin, Amazon EKS pod identity, the GuardDuty agent, the Amazon FSx Container Storage Interface (CSI) driver, the Mountpoint for Amazon S3 CSI driver, the AWS Distro for OpenTelemetry, and the CloudWatch Observability agent.

### Considerations for configuring SageMaker HyperPod clusters with Amazon EKS

- You must use distinct IAM roles based on the type of your nodes. For HyperPod nodes, use a role based on [IAM role for SageMaker HyperPod](#). For Amazon EKS nodes, see [Amazon EKS node IAM role](#).
- You can't mount additional EBS volumes directly to Pods running on HyperPod cluster nodes. Instead, you need to utilize [InstanceStorageConfigs](#) to provision and mount additional EBS volumes to the HyperPod nodes. It's important to note that you can only attach additional EBS volumes to new instance groups while creating or updating a HyperPod cluster. Once you have configured instance groups with these additional EBS volumes, in your Amazon EKS Pod configuration file, you'll need to set the [local path](#) to `/opt/sagemaker` to properly mount the volumes to your Amazon EKS Pods.
- You can deploy the [Amazon EBS CSI \(Container Storage Interface\)](#) controller on HyperPod nodes. However, the Amazon EBS CSI node DaemonSet, which facilitates the mounting and unmounting of EBS volumes, can only run on non-HyperPod instances.
- If you use instance-type labels for defining scheduling constraints, ensure that you use the SageMaker AI ML instance types prefixed with `m1`.. For example, for P5 instances, use `m1.p5.48xlarge` instead of `p5.48xlarge`.

## Considerations for configuring network for SageMaker HyperPod clusters with Amazon EKS

- Each HyperPod cluster instance supports one Elastic Network Interface (ENI). For the maximum number of Pods per instance type, refer to the following table.

Instance type	Max number of pods
ml.p4d.24xlarge	49
ml.p4de.24xlarge	49
ml.p5.48xlarge	49
ml.trn1.32xlarge	49
ml.trn1n.32xlarge	49
ml.g5.xlarge	14
ml.g5.2xlarge	14
ml.g5.4xlarge	29
ml.g5.8xlarge	29
ml.g5.12xlarge	49
ml.g5.16xlarge	29
ml.g5.24xlarge	49
ml.g5.48xlarge	49
ml.c5.large	9
ml.c5.xlarge	14
ml.c5.2xlarge	14
ml.c5.4xlarge	29
ml.c5.9xlarge	29

<b>Instance type</b>	<b>Max number of pods</b>
ml.c5.12xlarge	29
ml.c5.18xlarge	49
ml.c5.24xlarge	49
ml.c5n.large	9
ml.c5n.2xlarge	14
ml.c5n.4xlarge	29
ml.c5n.9xlarge	29
ml.c5n.18xlarge	49
ml.m5.large	9
ml.m5.xlarge	14
ml.m5.2xlarge	14
ml.m5.4xlarge	29
ml.m5.8xlarge	29
ml.m5.12xlarge	29
ml.m5.16xlarge	49
ml.m5.24xlarge	49
ml.t3.medium	5
ml.t3.large	11
ml.t3.xlarge	14
ml.t3.2xlarge	14

<b>Instance type</b>	<b>Max number of pods</b>
ml.g6.xlarge	14
ml.g6.2xlarge	14
ml.g6.4xlarge	29
ml.g6.8xlarge	29
ml.g6.12xlarge	29
ml.g6.16xlarge	49
ml.g6.24xlarge	49
ml.g6.48xlarge	49
ml.gr6.4xlarge	29
ml.gr6.8xlarge	29
ml.g6e.xlarge	14
ml.g6e.2xlarge	14
ml.g6e.4xlarge	29
ml.g6e.8xlarge	29
ml.g6e.12xlarge	29
ml.g6e.16xlarge	49
ml.g6e.24xlarge	49
ml.g6e.48xlarge	49
ml.p5e.48xlarge	49

- Only Pods with `hostNetwork = true` have access to the Amazon EC2 Instance Metadata Service (IMDS) by default. Use the Amazon EKS Pod identity or the [IAM roles for service accounts \(IRSA\)](#) to manage access to the AWS credentials for Pods.
- EKS-orchestrated HyperPod clusters support dual IP addressing modes, allowing configuration with IPv4 or IPv6 for IPv6 Amazon EKS clusters in IPv6-enabled VPC and subnet environments. For more information, see [the section called "Setting up SageMaker HyperPod with a custom Amazon VPC"](#).

## Considerations for using the HyperPod cluster resiliency features

- Node auto-replacement is not supported for CPU instances.
- The HyperPod health monitoring agent needs to be installed for node auto-recovery to work. The agent can be installed using Helm. For more information, see [the section called "Install packages on the Amazon EKS cluster using Helm"](#).
- The HyperPod deep health check and health monitoring agent supports GPU and Trn instances.
- SageMaker AI applies the following taint to nodes when they are undergoing deep health checks:

```
effect: NoSchedule
key: sagemaker.amazonaws.com/node-health-status
value: Unschedulable
```

### Note

You cannot add custom taints to nodes in instance groups with `DeepHealthChecks` turned on.

Once your Amazon EKS cluster is running, configure your cluster using the Helm package manager as instructed in [the section called "Install packages on the Amazon EKS cluster using Helm"](#) before creating your HyperPod cluster.

## Install packages on the Amazon EKS cluster using Helm

Before creating a SageMaker HyperPod cluster and attaching it to an Amazon EKS cluster, you should install packages using [Helm](#), a package manager for Kubernetes. Helm is an open-source tool for setting up a installation process for Kubernetes clusters. It enables the automation and

streamlining of dependency installations and simplifies various setups needed for preparing the Amazon EKS cluster as the orchestrator (control plane) for a SageMaker HyperPod cluster.

The SageMaker HyperPod service team provides a Helm chart package, which bundles key dependencies such as device/EFA plug-ins, plug-ins, [Kubeflow Training Operator](#), and associated permission configurations.

### Important

This helm installation step is a required step. Failure to configure your Amazon EKS cluster using the provided Helm chart may result in the SageMaker HyperPod cluster not functioning correctly or the creation process failing entirely. The `aws-hyperpod` namespace name cannot be modified.

1. [Install Helm](#) on your local machine.
2. Download the Helm charts provided by SageMaker HyperPod located at `helm_chart/HyperPodHelmChart` in the [SageMaker HyperPod CLI repository](#).

```
git clone https://github.com/aws/sagemaker-hyperpod-cli.git
cd sagemaker-hyperpod-cli/helm_chart
```

3. Update the dependencies of the Helm chart, preview the changes that will be made to your Kubernetes cluster, and install the Helm chart.

```
helm dependencies update HyperPodHelmChart
```

```
helm install hyperpod-dependencies HyperPodHelmChart --dry-run
```

```
helm install hyperpod-dependencies HyperPodHelmChart
```

In summary, the Helm installation sets up various components for your Amazon EKS cluster, including job scheduling and queueing (Kueue), storage management, MLflow integration, and Kubeflow. Additionally, the charts install the following components for integrating with the SageMaker HyperPod cluster resiliency features, which are required components.

- **Health monitoring agent** – This installs the health-monitoring agent provided by SageMaker HyperPod. This is required if you want to get your HyperPod cluster be monitored. Health-monitoring agents are provided as Docker images as follows. In the provided values .yaml in the Helm charts, the image is preset. The agent support GPU-based instances and Trainium-accelerator-based instances (trn1, trn1n, inf2). It is installed to the aws-hyperpod namespace.

```
590183648699.dkr.ecr.us-west-2.amazonaws.com/hyperpod-health-monitoring-agent:1.0.230.0_1.0.19.0
```

- **Deep health check** – This sets up a ClusterRole, a ServiceAccount (deep-health-check-service-account) in the aws-hyperpod namespace, and a ClusterRoleBinding to enable the SageMaker HyperPod deep health check feature. For more information about the Kubernetes RBAC file for deep health check, see the configuration file [deep-health-check-rbac.yaml](#) in the SageMaker HyperPod CLI GitHub repository.
- **job-auto-restart** - This sets up a ClusterRole, a ServiceAccount (job-auto-restart) in the aws-hyperpod namespace, and a ClusterRoleBinding, to enable the auto-restart feature for PyTorch training jobs in SageMaker HyperPod. For more information about the Kubernetes RBAC file for job-auto-restart, see the configuration file [job-auto-restart-rbac.yaml](#) in the SageMaker HyperPod CLI GitHub repository.
- **Kubeflow MPI operator** – The [MPI Operator](#) is a Kubernetes operator that simplifies running distributed Machine Learning (ML) and High-Performance Computing (HPC) workloads using the Message Passing Interface (MPI) on Kubernetes clusters. It installs MPI Operator v0.5. It is installed to the mpi-operator namespace.
- **nvidia-device-plugin** – This is a Kubernetes device plug-in that allows you to automatically expose NVIDIA GPUs for consumption by containers in your Amazon EKS cluster. It allows Kubernetes to allocate and provide access to the requested GPUs for that container. Required when using an instance type with GPU.
- **neuron-device-plugin** – This is a Kubernetes device plug-in that allows you to automatically expose AWS Inferentia chips for consumption by containers in your Amazon EKS cluster. It allows Kubernetes to access and utilize the AWS Inferentia chips on the cluster nodes. Required when using a Neuron instance type.
- **aws-efa-k8s-device-plugin** – This is a Kubernetes device plug-in that enables the use of AWS Elastic Fabric Adapter (EFA) on Amazon EKS clusters. EFA is a network device that provides low-latency and high-throughput communication between instances in a cluster. Required when using an EFA supported instance type.

For more information about the installation procedure using the provided Helm charts, see the [README file in the SageMaker HyperPod CLI repository](#).

## Setting up Kubernetes role-based access control

Cluster admin users also need to set up [Kubernetes role-based access control \(RBAC\)](#) for data scientist users to use the [SageMaker HyperPod CLI](#) to run workloads on HyperPod clusters orchestrated with Amazon EKS.

### Option 1: Set up RBAC using Helm chart

The SageMaker HyperPod service team provides a Helm sub-chart for setting up RBAC. To learn more, see [the section called “Install packages on the Amazon EKS cluster using Helm”](#).

### Option 2: Set up RBAC manually

Create `ClusterRole` and `ClusterRoleBinding` with the minimum privilege, and create `Role` and `RoleBinding` with mutation permissions.

#### To create `ClusterRole` & `ClusterRoleBinding` for data scientist IAM role

Create a cluster-level configuration file `cluster_level_config.yaml` as follows.

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: hyperpod-scientist-user-cluster-role
rules:
- apiGroups: [""]
  resources: ["pods"]
  verbs: ["list"]
- apiGroups: [""]
  resources: ["nodes"]
  verbs: ["list"]
---
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRoleBinding
metadata:
  name: hyperpod-scientist-user-cluster-role-binding
subjects:
- kind: Group
  name: hyperpod-scientist-user-cluster-level
  apiGroup: rbac.authorization.k8s.io
roleRef:
```

```
kind: ClusterRole
name: hyperpod-scientist-user-cluster-role # this must match the name of the Role or
ClusterRole you wish to bind to
apiGroup: rbac.authorization.k8s.io
```

Apply the configuration to the EKS cluster.

```
kubectl apply -f cluster_level_config.yaml
```

## To create Role and RoleBinding in namespace

This is the namespace training operator that run training jobs and Resiliency will monitor by default. Job auto-resume can only support in kubeflow namespace or namespace prefixed aws-hyperpod.

Create a role configuration file `namespace_level_role.yaml` as follows. This example creates a role in the kubeflow namespace

```
kind: Role
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  namespace: kubeflow
  name: hyperpod-scientist-user-namespace-level-role
###
# 1) add/list/describe/delete pods
# 2) get/list/watch/create/patch/update/delete/describe kubeflow pytorch job
# 3) get pod log
###
rules:
- apiGroups: [""]
  resources: ["pods"]
  verbs: ["create", "get"]
- apiGroups: [""]
  resources: ["nodes"]
  verbs: ["get", "list"]
- apiGroups: [""]
  resources: ["pods/log"]
  verbs: ["get", "list"]
- apiGroups: [""]
  resources: ["pods/exec"]
  verbs: ["get", "create"]
- apiGroups: ["kubeflow.org"]
```

```

resources: ["pytorchjobs", "pytorchjobs/status"]
verbs: ["get", "list", "create", "delete", "update", "describe"]
- apiGroups: [""]
  resources: ["configmaps"]
  verbs: ["create", "update", "get", "list", "delete"]
- apiGroups: [""]
  resources: ["secrets"]
  verbs: ["create", "get", "list", "delete"]
---
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
  namespace: kubeflow
  name: hyperpod-scientist-user-namespace-level-role-binding
subjects:
- kind: Group
  name: hyperpod-scientist-user-namespace-level
  apiGroup: rbac.authorization.k8s.io
roleRef:
  kind: Role
  name: hyperpod-scientist-user-namespace-level-role # this must match the name of the
  Role or ClusterRole you wish to bind to
  apiGroup: rbac.authorization.k8s.io

```

Apply the configuration to the EKS cluster.

```
kubectl apply -f namespace_level_role.yaml
```

## Create an access entry for Kubernetes groups

After you have set up RBAC using one of the two options above, use the following sample command replacing the necessary information.

```

aws eks create-access-entry \
  --cluster-name <eks-cluster-name> \
  --principal-arn arn:aws:iam::<AWS_ACCOUNT_ID_SCIENTIST_USER>:role/ScientistUserRole
\
  --kubernetes-groups '["hyperpod-scientist-user-namespace-level","hyperpod-
scientist-user-cluster-level"]'

```

For the `principal-arn` parameter, you need to use the [the section called "IAM users for scientists"](#).

## Managing SageMaker HyperPod clusters using the SageMaker HyperPod console UI

The following topics provide guidance on how to manage SageMaker HyperPod in the SageMaker AI console.

### Topics

- [Create a SageMaker HyperPod cluster](#)
- [Browse, view, and edit SageMaker HyperPod clusters](#)
- [SageMaker HyperPod task governance](#)
- [Delete a SageMaker HyperPod cluster](#)

### Create a SageMaker HyperPod cluster

See the following instructions on creating a new SageMaker HyperPod cluster using the SageMaker HyperPod console UI.

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose **HyperPod Clusters** in the left navigation pane and then **Cluster Management**.
3. In the SageMaker HyperPod landing page, choose **Create HyperPod cluster**.
4. From the drop-down menu of **Create HyperPod cluster**, choose **Orchestrated by Amazon EKS**.
5. From the Amazon EKS cluster list, choose the EKS cluster with which you want to configure the new HyperPod cluster.
  1. If you need to create a new EKS cluster, choose **Create EKS cluster**. You can create it from the EKS cluster list page without having to open the Amazon EKS console.

#### Note

The VPC subnet you choose for HyperPod has to be private.

2. After submitting a new EKS cluster creation request, wait until the EKS cluster becomes Active.
3. Install the Helm chart as instructed in [the section called "Install packages on the Amazon EKS cluster using Helm"](#).

4. After the EKS cluster creation has completed, choose **Create HyperPod cluster** and then **Orchestrated by EKS** again. You should be able to find and select the new EKS cluster. To proceed, choose **Select**.
6. On the **Configure a new HyperPod cluster** page, set up the basic information for the cluster such as name, options to enable the HyperPod cluster resiliency features, and tags.
7. For **Cluster name**, specify a name for the new cluster.
8. For **Cluster resiliency - node recovery**, specify `Automatic` to enable automatic node recovery. SageMaker HyperPod replaces or reboots instances (nodes) when issues are found by the health-monitoring agent.
9. For **Tags**, add key and value pairs to the new cluster and manage the cluster as an AWS resource. To learn more, see [Tagging your AWS resources](#).
10. In **Step 2: Advanced configuration**, configure network settings within the cluster and in-and-out of the cluster. For orchestration of SageMaker HyperPod cluster with Amazon EKS, the VPC is automatically set to the one configured with the EKS cluster you selected.
11. In **Step 3: Configure instance groups**, choose **Create instance group**. Each instance group can be configured differently, and you can create a heterogeneous cluster that consists of multiple instance groups with various instance types. In the **Create an instance group** configuration pop-up window, fill the instance group configuration information.

Create an instance group pop-up page, configure a new instance group following the UI guidance.

- a. For **Instance group name**, specify a name for the instance group.
- b. For **Select instance type**, choose the instance for the instance group.
- c. For **Quantity**, specify an integer not exceeding the instance quota for cluster usage.
- d. Prepare a lifecycle configuration script and upload to an Amazon S3 bucket, such as `s3://amzn-s3-demo-bucket/Lifecycle-scripts/base-config/`.

For a quick start, download the sample script [on\\_create.sh](#) from the AWSome Distributed Training GitHub repository, and upload it to the S3 bucket. This script sets up the logging file `/var/log/provision/provisioning.log` required for CloudWatch to gather logs from Pod containers. You can also include additional setup instructions, a series of setup scripts, or commands to be executed during the HyperPod cluster provisioning stage.

- e. For **S3 bucket URI for lifecycle scripts**, enter the Amazon S3 path in which the lifecycle scripts are stored.
  - f. For **Directory path to the entrypoint script in the base Amazon S3 path**, enter the file name of the lifecycle script under **Amazon S3 path to lifecycle script files**. If you use the provided sample script, enter `on_create.sh`.
  - g. For IAM role, choose the IAM role you have created for SageMaker HyperPod resources, following the section [the section called "IAM role for SageMaker HyperPod"](#).
  - h. Under **Advanced configuration**, you can set up the following optional configurations.
    - i. (Optional) For **Threads per core**, specify 1 for disabling multi-threading and 2 for enabling multi-threading. To find which instance type supports multi-threading, see the reference table of [CPU cores and threads per CPU core per instance type](#) in the *Amazon EC2 User Guide*.
    - ii. (Optional) For **Additional instance storage configs**, specify an integer between 1 and 16384 to set the size of an additional Elastic Block Store (EBS) volume in gigabytes (GB). The EBS volume is attached to each instance of the instance group. The default mount path for the additional EBS volume is `/opt/sagemaker`. After the cluster is successfully created, you can SSH into the cluster instances (nodes) and verify if the EBS volume is mounted correctly by running the `df -h` command. Attaching an additional EBS volume provides stable, off-instance, and independently persisting storage, as described in the [Amazon EBS volumes](#) section in the *Amazon Elastic Block Store User Guide*.
12. For **Deep health check**, select the advanced health checks you want to run on the instances. To learn more, see [the section called "Deep health checks"](#).
  13. In **Step 4: Review and create**, review the configuration you have set from **Step 1** to **Step 3** and finish submitting the cluster creation request.
  14. After the status of the cluster turns to `InService`, you can start logging into the cluster nodes. To access the cluster nodes and start running ML workloads, see [the section called "Jobs on HyperPod clusters"](#).

## Browse, view, and edit SageMaker HyperPod clusters

Use the following instructions to browse, view, and edit SageMaker HyperPod clusters orchestrated by Amazon EKS in the SageMaker AI console.

### Topics

- [To browse your SageMaker HyperPod clusters](#)
- [To view details of each SageMaker HyperPod cluster](#)
- [To edit a SageMaker HyperPod cluster](#)

## To browse your SageMaker HyperPod clusters

Under **Clusters** on the SageMaker HyperPod page in the SageMaker AI console, all created clusters should be listed under the **Clusters** section, which provides a summary view of clusters, their ARNs, status, and creation time.

## To view details of each SageMaker HyperPod cluster

Under **Clusters** on the SageMaker HyperPod page in the SageMaker AI console, the cluster names are activated as links. Choose the cluster name link to see details of each cluster.

## To edit a SageMaker HyperPod cluster

1. Under **Clusters** in the main pane of the SageMaker HyperPod console, choose the cluster you want to update.
2. Select your cluster, and choose **Edit**.
3. In the **Edit <your-cluster>** page, you can edit the configurations of existing instance groups, add more instance groups, delete instance groups, and change tags for the cluster. After making changes, choose **Submit**.
  - a. In the **Configure instance groups** section, you can add more instance groups by choosing **Create instance group**.
  - b. In the **Configure instance groups** section, you can choose **Edit** to change its configuration or **Delete** to remove the instance group permanently.

### Important

When deleting an instance group, consider the following points:

- Your SageMaker HyperPod cluster must always maintain at least one instance group.
- Ensure all critical data is backed up before removal.
- The removal process cannot be undone.

**Note**

Deleting an instance group will terminate all compute resources associated with that group.

c. In the **Tags** section, you can update tags for the cluster.

## SageMaker HyperPod task governance

SageMaker HyperPod task governance is a robust management system designed to streamline resource allocation and ensure efficient utilization of compute resources across teams and projects for your Amazon EKS clusters. This provides administrators with the capability to set:

- Priority levels for various tasks
- Compute allocation for each team
- How each team lends and borrows idle compute
- If a team preempts their own tasks

HyperPod task governance also provides Amazon EKS cluster Observability, offering real-time visibility into cluster capacity. This includes compute availability and usage, team allocation and utilization, and task run and wait time information, setting you up for informed decision-making and proactive resource management.

The following sections cover how to set up, understand key concepts, and use HyperPod task governance for your Amazon EKS clusters.

### Topics

- [Setup for SageMaker HyperPod task governance](#)
- [Dashboard](#)
- [Tasks](#)
- [Policies](#)
- [Example HyperPod task governance AWS CLI commands](#)
- [Troubleshoot](#)
- [Attribution document for Amazon SageMaker HyperPod task governance](#)

## Setup for SageMaker HyperPod task governance

The following section provides information on how to get set up with the Amazon CloudWatch Observability EKS and SageMaker HyperPod task governance add-ons.

If you have not already done so, see [IAM users for cluster admin](#) for the example minimum permission policy for HyperPod cluster administrators. This includes permissions run the SageMaker HyperPod core APIs and manage SageMaker HyperPod clusters within your AWS account, performing the tasks in [SageMaker HyperPod operation](#).

### Topics

- [Dashboard setup](#)
- [Task governance setup](#)

### Dashboard setup

Use the following information to get set up with Amazon SageMaker HyperPod Amazon CloudWatch Observability EKS add-on. This sets you up with a detailed visual dashboard that provides a view into metrics for your EKS cluster hardware, team allocation, and tasks.

If you are having issues setting up, please see [Troubleshoot](#) for known troubleshooting solutions.

### Topics

- [HyperPod Amazon CloudWatch Observability EKS add-on prerequisites](#)
- [HyperPod Amazon CloudWatch Observability EKS add-on setup](#)

### HyperPod Amazon CloudWatch Observability EKS add-on prerequisites

The following section includes the prerequisites needed before installing the Amazon EKS Observability add-on.

- If you have not already done so, follow the instructions in [IAM users for cluster admin](#) to ensure that you have the minimum permission for HyperPod cluster administrative tasks.
- Attach the `CloudWatchAgentServerPolicy` IAM policy to your worker nodes. To do so, enter the following command. Replace *my-worker-node-role* with the IAM role used by your Kubernetes worker nodes.

```
aws iam attach-role-policy \
```

```
--role-name my-worker-node-role \  
--policy-arn arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy
```

## HyperPod Amazon CloudWatch Observability EKS add-on setup

Use the following options to set up the Amazon SageMaker HyperPod Amazon CloudWatch Observability EKS add-on.

Setup using the SageMaker AI console

The following permissions are required for setup and visualizing the HyperPod task governance dashboard. This section expands upon the permissions listed in [IAM users for cluster admin](#).

To manage task governance, use the sample policy:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "sagemaker:ListClusters",  
        "sagemaker:DescribeCluster",  
        "sagemaker:ListComputeQuotas",  
        "sagemaker:CreateComputeQuota",  
        "sagemaker:UpdateComputeQuota",  
        "sagemaker:DescribeComputeQuota",  
        "sagemaker>DeleteComputeQuota",  
        "sagemaker:ListClusterSchedulerConfigs",  
        "sagemaker:DescribeClusterSchedulerConfig",  
        "sagemaker:CreateClusterSchedulerConfig",  
        "sagemaker:UpdateClusterSchedulerConfig",  
        "sagemaker>DeleteClusterSchedulerConfig",  
        "eks:ListAddons",  
        "eks:CreateAddon",  
        "eks:DescribeAddon",  
        "eks:DescribeCluster",  
        "eks:DescribeAccessEntry",  
        "eks:ListAssociatedAccessPolicies",  
        "eks:AssociateAccessPolicy",  
        "eks:DisassociateAccessPolicy"  
      ],  
    },  
  ],  
}
```

```

    "Resource": "*"
  }
]
}

```

To grant permissions to manage Amazon CloudWatch Observability Amazon EKS and view the HyperPod cluster dashboard through the SageMaker AI console, use the sample policy below:

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "eks:ListAddons",
        "eks:CreateAddon",
        "eks:UpdateAddon",
        "eks:DescribeAddon",
        "eks:DescribeAddonVersions",
        "sagemaker:DescribeCluster",
        "sagemaker:DescribeClusterNode",
        "sagemaker:ListClusterNodes",
        "sagemaker:ListClusters",
        "sagemaker:ListComputeQuotas",
        "sagemaker:DescribeComputeQuota",
        "sagemaker:ListClusterSchedulerConfigs",
        "sagemaker:DescribeClusterSchedulerConfig",
        "eks:DescribeCluster",
        "cloudwatch:GetMetricData",
        "eks:AccessKubernetesApi"
      ],
      "Resource": "*"
    }
  ]
}

```

Navigate to the **Dashboard** tab in the SageMaker HyperPod console to install the Amazon CloudWatch Observability EKS. To ensure task governance related metrics are included in the **Dashboard**, enable the Kueue metrics checkbox. Enabling the Kueue metrics enables CloudWatch **Metrics** costs, after free-tier limit is reached. For more information, see **Metrics** in [Amazon CloudWatch Pricing](#).

## Setup using the EKS AWS CLI

Use the following EKS AWS CLI command to install the add-on:

```
aws eks create-addon --cluster-name cluster-name
--addon-name amazon-cloudwatch-observability
--configuration-values "configuration json"
```

Below is an example of the JSON of the configuration values:

```
{
  "agent": {
    "config": {
      "logs": {
        "metrics_collected": {
          "kubernetes": {
            "kueue_container_insights": true,
            "enhanced_container_insights": true
          },
          "application_signals": { }
        }
      },
      "traces": {
        "traces_collected": {
          "application_signals": { }
        }
      }
    },
  },
}
```

## Setup using the EKS Console UI

1. Navigate to the [EKS console](#).
2. Choose your cluster.
3. Choose **Add-ons**.
4. Find the **Amazon CloudWatch Observability** add-on and install. Install version  $\geq$  2.4.0 for the add-on.
5. Include the following JSON, Configuration values:

```
{
```

```
"agent": {
  "config": {
    "logs": {
      "metrics_collected": {
        "kubernetes": {
          "kueue_container_insights": true,
          "enhanced_container_insights": true
        },
        "application_signals": { }
      },
    },
    "traces": {
      "traces_collected": {
        "application_signals": { }
      }
    }
  },
},
},
```

Once the EKS Observability add-on has been successfully installed, you can view your EKS cluster metrics under the HyperPod console **Dashboard** tab.

## Task governance setup

This section includes information on how to set up the Amazon SageMaker HyperPod task governance EKS add-on. This includes granting permissions that allows you to set task prioritization, compute allocation for teams, how idle compute is shared, and task preemption for teams.

If you are having issues setting up, please see [Troubleshoot](#) for known troubleshooting solutions.

## Topics

- [Kueue Settings](#)
- [HyperPod Task governance prerequisites](#)
- [HyperPod task governance setup](#)

## Kueue Settings

HyperPod task governance EKS add-on installs [Kueue](#) for your HyperPod EKS clusters. Kueue is a kubernetes-native system that manages quotas and how jobs consume them.

EKS HyperPod task governance add-on version	Version of Kueue that is installed as part of the add-on	Version of kube-rbac-proxy that is installed as part of the add-on
v1.0.0	v0.8.1	v0.18.1

HyperPod task governance leverages Kueue for Kubernetes-native job queueing, scheduling, and quota management, and is installed with the HyperPod task governance EKS add-on. When installed, HyperPod creates and modifies SageMaker AI-managed Kubernetes resources such as `KueueManagerConfig`, `ClusterQueues`, `LocalQueues`, `WorkloadPriorityClasses`, `ResourceFlavors`, and `ValidatingAdmissionPolicies`. While Kubernetes administrators have the flexibility to modify the state of these resources, it is possible that any changes made to a SageMaker AI-managed resource may be updated and overwritten by the service.

The following information outlines the configuration settings utilized by the HyperPod task governance add-on for setting up Kueue.

```
apiVersion: config.kueue.x-k8s.io/v1beta1
kind: Configuration
health:
  healthProbeBindAddress: :8081
metrics:
  bindAddress: :8080
  enableClusterQueueResources: true
webhook:
  port: 9443
manageJobsWithoutQueueName: false
leaderElection:
  leaderElect: true
  resourceName: c1f6bfd2.kueue.x-k8s.io
controller:
  groupKindConcurrency:
    Job.batch: 5
    Pod: 5
    Workload.kueue.x-k8s.io: 5
```

```

    LocalQueue.kueue.x-k8s.io: 1
    ClusterQueue.kueue.x-k8s.io: 1
    ResourceFlavor.kueue.x-k8s.io: 1
clientConnection:
  qps: 50
  burst: 100
integrations:
  frameworks:
  - "batch/job"
  - "kubeflow.org/mpijob"
  - "ray.io/rayjob"
  - "ray.io/raycluster"
  - "jobset.x-k8s.io/jobset"
  - "kubeflow.org/mxjob"
  - "kubeflow.org/paddlejob"
  - "kubeflow.org/pytorchjob"
  - "kubeflow.org/tfjob"
  - "kubeflow.org/xgboostjob"
  - "pod"
podOptions:
  namespaceSelector:
    matchExpressions:
    - key: kubernetes.io/metadata.name
      operator: NotIn
      values: [ kube-system, kueue-system ]
fairSharing:
  enable: true
  preemptionStrategies: [LessThan0rEqualToFinalShare, LessThanInitialShare]
resources:
  excludeResourcePrefixes: []

```

For more information about each configuration entry, see [Configuration](#) in the Kueue documentation.

### HyperPod Task governance prerequisites

- If you have not already done so, see [IAM users for cluster admin](#) for the example minimum permission policy for HyperPod cluster administrators. This includes permissions run the SageMaker HyperPod core APIs and manage SageMaker HyperPod clusters within your AWS account, performing the tasks in [SageMaker HyperPod operation](#).
- You will need to have your Kubernetes version  $\geq 1.30$ . For instructions, see [Update existing clusters to the new Kubernetes version](#).

- If you already have Kueue installed in their clusters, uninstall Kueue before installing the EKS add-on.
- A HyperPod node must already exist in the EKS cluster before installing the HyperPod task governance add-on.

## HyperPod task governance setup

The following provides information on how to get set up with HyperPod task governance.

### Setup using the SageMaker AI console

The following provides information on how to get set up with HyperPod task governance using the SageMaker HyperPod console.

You already have all of the following permissions attached if you have already granted permissions to manage Amazon CloudWatch Observability EKS and view the HyperPod cluster dashboard through the SageMaker AI console in the [HyperPod Amazon CloudWatch Observability EKS add-on setup](#). If you have not set this up, use the sample policy below to grant permissions to manage the HyperPod task governance add-on and view the HyperPod cluster dashboard through the SageMaker AI console.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "eks:ListAddons",
        "eks:CreateAddon",
        "eks:UpdateAddon",
        "eks:DescribeAddon",
        "eks:DescribeAddonVersions",
        "sagemaker:DescribeCluster",
        "sagemaker:DescribeClusterNode",
        "sagemaker:ListClusterNodes",
        "sagemaker:ListClusters",
        "eks:DescribeCluster",
        "eks:AccessKubernetesApi"
      ],
      "Resource": "*"
    }
  ]
}
```

```
]
}
```

Navigate to the **Dashboard** tab in the SageMaker HyperPod console to install the Amazon SageMaker HyperPod task governance Add-on.

### Setup using the Amazon EKS AWS CLI

Use the example [create-addon](#) EKS AWS CLI command to set up the HyperPod task governance Amazon EKS API and console UI using the AWS CLI:

```
aws eks create-addon --region region --cluster-name cluster-name --addon-name
amazon-sagemaker-hyperpod-taskgovernance
```

You can view the **Policies** tab in the HyperPod SageMaker AI console if the install was successful. You can also use the following example [describe-addon](#) EKS AWS CLI command to check the status.

```
aws eks describe-addon --region region --cluster-name cluster-name --addon-name amazon-
sagemaker-hyperpod-taskgovernance
```

## Dashboard

Amazon SageMaker HyperPod task governance provides a comprehensive dashboard view of your Amazon EKS cluster utilization metrics, including hardware, team, and task metrics. The following provides information on your HyperPod EKS cluster dashboard.

The dashboard provides a comprehensive view of cluster utilization metrics, including hardware, team, and task metrics. You will need to install the EKS add-on to view the dashboard. For more information, see [Dashboard setup](#).

In the [Amazon SageMaker AI console](#), under **HyperPod Clusters**, you can navigate to the HyperPod console and view your list of HyperPod clusters in your Region. Choose your cluster and navigate to the **Dashboard** tab. The dashboard contains the following metrics. You can download the data for a section by choosing the corresponding **Export**.

## Utilization

Provides health of the EKS cluster point-in-time and trend-based metrics for critical compute resources. By default, **All Instance Groups** are shown. Use the dropdown menu to filter your instance groups. The metrics included in this section are:

- Number of total, running, and pending recovery instances. The number of pending recovery instances refer to the number of instances that need attention for recovery.
- GPUs, GPU memory, vCPUs, and vCPUs memory.
- GPU utilization, GPU memory utilization, vCPU utilization, and vCPU memory utilization.
- An interactive graph of your GPU and vCPU utilization.

## Teams

Provides information into team-specific resource management. This includes:

- Instance and GPU allocation.
- GPU utilization rates.
- Borrowed GPU statistics.
- Task status (running or pending).
- A bar chart view of GPU utilization versus compute allocation across teams.
- Team detailed GPU and vCPU-related information. By default, the information displayed includes **All teams**. You can filter by team and instances by choosing the dropdown menus. In the interactive plot you can filter by time.

## Tasks

### Note

To view your HyperPod EKS cluster tasks in the dashboard:

- Configure Kubernetes Role-Based Access Control (RBAC) for data scientist users in the designated HyperPod namespace to authorize task execution on Amazon EKS-orchestrated clusters. Namespaces follow the format `hyperpod-ns-team-name`. To establish RBAC permissions, refer to the [team role creation instructions](#).

- Ensure that your job is submitted with the appropriate namespace and priority class labels. For a comprehensive example, see [Submit a job to SageMaker AI-managed queue and namespace](#).

Provides information on task-related metrics. This includes number of running, pending, and preempted tasks, and run and wait time statistics. By default, the information displayed includes **All teams**. You can filter by team by choosing the dropdown menu. In the interactive plot you can filter by time.

## Tasks

The following provides information on Amazon SageMaker HyperPod EKS cluster tasks. Tasks are operations or jobs that are sent to the cluster. These can be machine learning operations, like training, running experiments, or inference. The viewable task details list include status, run time, and how much compute is being used per task.

In the [Amazon SageMaker AI console](#), under **HyperPod Clusters**, you can navigate to the HyperPod console and view your list of HyperPod clusters in your Region. Choose your cluster and navigate to the **Tasks** tab.

For the **Tasks** tab to be viewable from anyone besides the administrator, the administrator needs to [add an access entry to the EKS cluster for the IAM role](#).

### Note

To view your HyperPod EKS cluster tasks in the dashboard:

- Configure Kubernetes Role-Based Access Control (RBAC) for data scientist users in the designated HyperPod namespace to authorize task execution on Amazon EKS-orchestrated clusters. Namespaces follow the format `hyperpod-ns-team-name`. To establish RBAC permissions, refer to the [team role creation instructions](#).
- Ensure that your job is submitted with the appropriate namespace and priority class labels. For a comprehensive example, see [Submit a job to SageMaker AI-managed queue and namespace](#).

For EKS clusters, kubeflow (PyTorch, MPI, TensorFlow) tasks are shown. By default, PyTorch tasks are shown. You can filter for PyTorch, MPI, TensorFlow tasks by choosing the dropdown menu or

using the search field. The information that is shown for each task includes the task name, status, namespace, priority class, and creation time.

## Policies

Amazon SageMaker HyperPod task governance simplifies how your Amazon EKS cluster resources are allocated and how tasks are prioritized. The following provides information on HyperPod EKS cluster policies. For information on how to set up task governance, see [Task governance setup](#).

The policies are divided up into **Compute prioritization** and **Compute allocation**. The policy concepts below will be organized in the context of these policies.

**Compute prioritization**, or cluster policy, determines how idle compute is borrowed and how tasks are prioritized by teams.

- **Idle compute allocation** defines how idle compute is allocated across teams. That is, how unused compute can be borrowed from teams. When choosing an **Idle compute allocation**, you can choose between:
  - **First-come first-serve**: When applied, teams are not prioritized against each other and each incoming task is equally likely to obtain over-quota resources. Tasks are prioritized based on order of submission. This means a user may be able to use 100% of the idle compute if they request it first.
  - **Fair-share**: When applied, teams borrow idle compute based on their assigned **Fair-share weight**. These weights are defined in **Compute allocation**. For more information on how this can be used, see [Sharing idle compute resources examples](#).
- **Task prioritization** defines how tasks are queued as compute becomes available. When choosing a **Task prioritization**, you can choose between:
  - **First-come first-serve**: When applied, tasks are queued in the order they are requested.
  - **Task ranking**: When applied, tasks are queued in the order defined by their prioritization. If this option is chosen, you must add priority classes along with the weights at which they should be prioritized. Tasks of the same priority class will be executed on a first-come first-serve basis. When enabled in Compute allocation, tasks are preempted from lower priority tasks by higher priority tasks within the team.

When data scientists submit jobs to the cluster, they use the priority class name in the YAML file. The priority class is in the format *priority-class-name*-priority. For an example, see [Submit a job to SageMaker AI-managed queue and namespace](#).

- **Priority classes:** These classes establish a relative priority for tasks when borrowing capacity. When a task is running using borrowed quota, it may be preempted by another task of higher priority than it, if no more capacity is available for the incoming task. If **Preemption** is enabled in the **Compute allocation**, a higher priority task may also preempt tasks within its own team.

**Compute allocation**, or compute quota, defines a team's compute allocation and what weight (or priority level) a team is given for fair-share idle compute allocation.

- **Team name:** The team name. A corresponding **Namespace** will be created, of type `hyperpod-ns-team-name`.
- **Members:** Members of the team namespace. You will need to set up a Kubernetes role-based access control (RBAC) for data scientist users that you want to be part of this team, to run tasks on HyperPod clusters orchestrated with Amazon EKS. To set up a Kubernetes RBAC, use the instructions in [create team role](#).
- **Fair-share weight:** This is the level of prioritization assigned to the team when **Fair-share** is applied for **Idle compute allocation**. The highest priority has a weight of 100 and the lowest priority has a weight of 0. Higher weight enables a team to access unutilized resources within shared capacity sooner. A zero weight signifies the lowest priority, implying this team will always be at a disadvantage compared to other teams.

The fair-share weight provides a comparative edge to this team when vying for available resources against others. Admission prioritizes scheduling tasks from teams with the highest weights and the lowest borrowing. For example, if Team A has a weight of 10 and Team B has a weight of 5, Team A would have priority in accessing unutilized resources as in would have jobs that are scheduled earlier than Team B.

- **Task preemption:** Compute is taken over from a task based on priority. By default, the team loaning idle compute will preempt tasks from other teams.
- **Lending and borrowing:** How idle compute is being lent by the team and if the team can borrow from other teams.
  - **Borrow limit:** The limit of idle compute that a team is allowed to borrow. A team can borrow up to 500% of allocated compute. The value you provide here is interpreted as a percentage. For example, a value of 500 will be interpreted as 500%.

For information on how these concepts are used, such as priority classes and name spaces, see [Example HyperPod task governance AWS CLI commands](#).

## Sharing idle compute resources examples

The total reserved quota should not surpass the cluster's available capacity for that resource, to ensure proper quota management. For example, if a cluster comprises 20 `m1.c5.2xlarge` instances, the cumulative quota assigned to teams should remain under 20.

If the **Compute allocation** policies for teams allow for **Lend and Borrow** or **Lend**, the idle capacity is shared between these teams. For example, Team A and Team B have **Lend and Borrow** enabled. Team A has a quota of 6 but is using only 2 for its jobs, and Team B has a quota of 5 and is using 4 for its jobs. A job that is submitted to Team B requiring 4 resources. 3 will be borrowed from Team A.

If any team's **Compute allocation** policy is set to **Don't Lend**, the team would not be able to borrow any additional capacity beyond its own allocations.

To maintain a pool or a set of resources that all teams can borrow from, you can set up a dedicated team with resources that bridge the gap between other teams' allocations and the total cluster capacity. Ensure that this cumulative resource allocation includes the appropriate instance types and does not exceed the total cluster capacity. To ensure that these resources can be shared among teams, enable the participating teams to have their compute allocations set to **Lend and Borrow** or **Lend** for this common pool of resources. Every time new teams are introduced, quota allocations are changed, or there are any changes to the cluster capacity, revisit the quota allocations of all the teams and ensure the cumulative quota remains at or below cluster capacity.

### Topics

- [Create policies](#)
- [Edit policies](#)

### Create policies

You can create your **Cluster policy** and **Compute allocation** configurations in the **Policies** tab. For following provides instructions on how to create the following configurations.

- Create your **Cluster policy** to update how tasks are prioritized and idle compute is allocated.
- Create **Compute allocation** to create a new compute allocation policy for a team.

**Note**

When you create a **Compute allocation** you will need to set up a Kubernetes role-based access control (RBAC) for data scientist users in the corresponding namespace to run tasks on HyperPod clusters orchestrated with Amazon EKS. The namespaces have the format `hyperpod-ns-team-name`. To set up a Kubernetes RBAC, use the instructions in [create team role](#).

For information about the HyperPod task governance EKS cluster policy concepts, see [Policies](#).

### Create HyperPod task governance policies

This procedure assumes that you have already created an Amazon EKS cluster set up with HyperPod. If you have not already done so, see [Create a SageMaker HyperPod cluster](#).

1. Navigate to the [Amazon SageMaker AI console](#).
2. On the left navigation pane, under **HyperPod Clusters**, choose **Cluster Management**.
3. Choose your Amazon EKS cluster listed under **SageMaker HyperPod clusters**.
4. Choose the **Policies** tab.
5. To create your **Cluster policy**:
  - a. Choose the corresponding **Edit** to update how tasks are prioritized and idle compute is allocated.
  - b. After you have made your changes, choose **Submit**.
6. To create a **Compute allocation**:
  - a. Choose the corresponding **Create**. This takes you to the compute allocation creation page.
  - b. After you have made your changes, choose **Submit**.

### Edit policies

You can edit your **Cluster policy** and **Compute allocation** configurations in the **Policies** tab. For following provides instructions on how to edit the following configurations.

- Edit your **Cluster policy** to update how tasks are prioritized and idle compute is allocated.
- Edit **Compute allocation** to create a new compute allocation policy for a team.

**Note**

When you create a **Compute allocation** you will need to set up a Kubernetes role-based access control (RBAC) for data scientist users in the corresponding namespace to run tasks on HyperPod clusters orchestrated with Amazon EKS. The namespaces have the format `hyperpod-ns-team-name`. To set up a Kubernetes RBAC, use the instructions in [create team role](#).

For more information about the HyperPod task governance EKS cluster policy concepts, see [Policies](#).

### Edit HyperPod task governance policies

This procedure assumes that you have already created an Amazon EKS cluster set up with HyperPod. If you have not already done so, see [Create a SageMaker HyperPod cluster](#).

1. Navigate to the [Amazon SageMaker AI console](#).
2. On the left navigation pane, under **HyperPod Clusters**, choose **Cluster Management**.
3. Choose your Amazon EKS cluster listed under **SageMaker HyperPod clusters**.
4. Choose the **Policies** tab.
5. To create your **Cluster policy**:
  - a. Choose the corresponding **Edit** to update how tasks are prioritized and idle compute is allocated.
  - b. After you have made your changes, choose **Submit**.
6. To edit your **Compute allocation**:
  - a. Choose the configuration you wish to edit under **Compute allocation**. This takes you to the configuration details page.
  - b. If you wish to edit these configurations, choose **Edit**.
  - c. After you have made your changes, choose **Submit**.

### Example HyperPod task governance AWS CLI commands

You can use HyperPod with EKS through Kubectl or through HyperPod custom CLI. You can use these commands through Studio or AWS CLI. The following provides SageMaker HyperPod task

governance examples, on how to view cluster details using the HyperPod AWS CLI commands. For more information, including how to install, see the [HyperPod CLI Github repository](#).

## Topics

- [Get cluster accelerator device quota information](#)
- [Submit a job to SageMaker AI-managed queue and namespace](#)
- [List jobs](#)
- [Get job detailed information](#)
- [Suspend and unsuspend jobs](#)
- [Debugging jobs](#)

## Get cluster accelerator device quota information

The following example command gets the information on the cluster accelerator device quota.

```
hyperpod get-clusters -n hyperpod-ns-test-team
```

The namespace in this example, `hyperpod-ns-test-team`, is created in Kubernetes based on the team name provided, `test-team`, when the compute allocation is created. For more information, see [Edit policies](#).

Example response:

```
[
  {
    "Cluster": "hyperpod-eks-test-cluster-id",
    "InstanceType": "ml.g5.xlarge",
    "TotalNodes": 2,
    "AcceleratorDevicesAvailable": 1,
    "NodeHealthStatus=Schedulable": 2,
    "DeepHealthCheckStatus=Passed": "N/A",
    "Namespaces": {
      "hyperpod-ns-test-team": {
        "TotalAcceleratorDevices": 1,
        "AvailableAcceleratorDevices": 1
      }
    }
  }
]
```

## Submit a job to SageMaker AI-managed queue and namespace

The following example command submits a job to your HyperPod cluster. If you have access to only one team, the HyperPod AWS CLI will automatically assign the queue for you in this case. Otherwise if multiple queues are discovered, we will display all viable options for you to select.

```
hyperpod start-job --job-name hyperpod-cli-test --job-kind kubeflow/PyTorchJob --image
  docker.io/kubeflowkatib/pytorch-mnist-cpu:v1beta1-bc09cfd --entry-script /opt/pytorch-
  mnist/mnist.py --pull-policy IfNotPresent --instance-type ml.g5.xlarge --node-count 1
  --tasks-per-node 1 --results-dir ./result --priority training-priority
```

The priority classes are defined in the **Cluster policy**, which defines how tasks are prioritized and idle compute is allocated. When a data scientist submits a job, they use one of the priority class names with the format *priority-class-name*-priority. In this example, *training-priority* refers to the priority class named "training". For more information on policy concepts, see [Policies](#).

If a priority class is not specified, the job is treated as a low priority job, with a task ranking value of 0.

If a priority class is specified, but does not correspond to one of the priority classes defined in the **Cluster policy**, the submission fails and an error message provides the defined set of priority classes.

You can also submit the job using a YAML configuration file using the following command:

```
hyperpod start-job --config-file ./yaml-configuration-file-name.yaml
```

The following is an example YAML configuration file that is equivalent to submitting a job as discussed above.

```
defaults:
  - override hydra/job_logging: stdout
hydra:
  run:
    dir: .
    output_subdir: null
training_cfg:
  entry_script: /opt/pytorch-mnist/mnist.py
  script_args: []
  run:
```

```

name: hyperpod-cli-test
nodes: 1
ntasks_per_node: 1
cluster:
  cluster_type: k8s
  instance_type: ml.g5.xlarge
  custom_labels:
    kueue.x-k8s.io/priority-class: training-priority
  cluster_config:
    label_selector:
      required:
        sagemaker.amazonaws.com/node-health-status:
          - Schedulable
      preferred:
        sagemaker.amazonaws.com/deep-health-check-status:
          - Passed
    weights:
      - 100
    pullPolicy: IfNotPresent
base_results_dir: ./result
container: docker.io/kubeflowkatib/pytorch-mnist-cpu:v1beta1-bc09cfd
env_vars:
  NCCL_DEBUG: INFO

```

Alternatively, you can submit a job using `kubectl` to ensure the task appears in the **Dashboard** tab. The following is an example `kubectl` command.

```
kubectl apply -f ./yaml-configuration-file-name.yaml
```

When submitting the job, include your queue name and priority class labels. For example, with the queue name `hyperpod-ns-team-name-localqueue` and priority class `priority-class-name-priority`, you must include the following labels:

- `kueue.x-k8s.io/queue-name: hyperpod-ns-team-name-localqueue`
- `kueue.x-k8s.io/priority-class: priority-class-name-priority`

The following YAML configuration snippet demonstrates how to add labels to your original configuration file to ensure your task appears in the **Dashboard** tab:

```

metadata:
  name: job-name

```

```
namespace: hyperpod-ns-team-name
labels:
  kueue.x-k8s.io/queue-name: hyperpod-ns-team-name-localqueue
  kueue.x-k8s.io/priority-class: priority-class-name-priority
```

## List jobs

The following command lists the jobs and their details.

```
hyperpod list-jobs
```

Example response:

```
{
  "jobs": [
    {
      "Name": "hyperpod-cli-test",
      "Namespace": "hyperpod-ns-test-team",
      "CreationTime": "2024-11-18T21:21:15Z",
      "Priority": "training",
      "State": "Succeeded"
    }
  ]
}
```

## Get job detailed information

The following command provides a job's details. If no namespace is specified, HyperPod AWS CLI will fetch a namespace managed by SageMaker AI that you have access to.

```
hyperpod get-job --job-name hyperpod-cli-test
```

Example response:

```
{
  "Name": "hyperpod-cli-test",
  "Namespace": "hyperpod-ns-test-team",
  "Label": {
    "app": "hyperpod-cli-test",
    "app.kubernetes.io/managed-by": "Helm",
    "kueue.x-k8s.io/priority-class": "training"
  },
}
```

```

"CreationTimestamp": "2024-11-18T21:21:15Z",
"Status": {
  "completionTime": "2024-11-18T21:25:24Z",

```

```
}
```

## Suspend and unsuspend jobs

If you want to remove some submitted job from the scheduler, HyperPod AWS CLI provides suspend command to temporarily remove the job from orchestration. The suspended job will no longer be scheduled unless the job is manually unsuspended by the unsuspend command

To temporarily suspend a job:

```
hyperpod patch-job suspend --job-name hyperpod-cli-test
```

To add a job back to the queue:

```
hyperpod patch-job unsuspend --job-name hyperpod-cli-test
```

## Debugging jobs

The HyperPod AWS CLI also provides other commands for you to debug job submission issues. For example `list-pods` and `get-logs` in the HyperPod AWS CLI Github repository.

## Troubleshoot

The following page contains known solutions for troubleshooting your HyperPod EKS clusters.

### Topics

- [Dashboard tab](#)
- [Tasks tab](#)
- [Policies](#)

### Dashboard tab

#### The EKS add-on fails to install

For the EKS add-on installation to succeed, you will need to have a Kubernetes version  $\geq 1.30$ . To update, see [Update Kubernetes version](#).

For the EKS add-on installation to succeed, all of the nodes need to be in **Ready** status and all of the pods need to be in **Running** status.

To check the status of your nodes, use the [list-cluster-nodes](#) AWS CLI command or navigate to your EKS cluster in the [EKS console](#) and view the status of your nodes. Resolve the issue for each node or reach out to your administrator. If the node status is **Unknown**, delete the node. Once all nodes statuses are **Ready**, retry installing the EKS add-on in HyperPod from the [Amazon SageMaker AI console](#).

To check the status of your pods, use the [Kubernetes CLI](#) command `kubectl get pods -n cloudwatch-agent` or navigate to your EKS cluster in the [EKS console](#) and view the status of your pods with the namespace `cloudwatch-agent`. Resolve the issue for the pods or reach out to your administrator to resolve the issues. Once all pod statuses are **Running**, retry installing the EKS add-on in HyperPod from the [Amazon SageMaker AI console](#).

For more troubleshooting, see [Troubleshooting the Amazon CloudWatch Observability EKS add-on](#).

## Tasks tab

If you see the error message about how the **Custom Resource Definition (CRD) is not configured on the cluster**, grant `EKSAdminViewPolicy` and `ClusterAccessRole` policies to your domain execution role.

- For information on how to get your execution role, see [Get your execution role](#).
- To learn how to attach policies to an IAM user or group, see [Adding and removing IAM identity permissions](#).

## Policies

The following lists solutions to errors relating to policies using the HyperPod APIs or console.

- If the policy is in `CreateFailed` or `CreateRollbackFailed` status, you need to delete the failed policy and create a new one.
- If the policy is in `UpdateFailed` status, retry the update with the same policy ARN.
- If the policy is in `UpdateRollbackFailed` status, you need to delete the failed policy and then create a new one.
- If the policy is in `DeleteFailed` or `DeleteRollbackFailed` status, retry the delete with the same policy ARN.
  - If you ran into an error while trying to delete the **Compute prioritization**, or cluster policy, using the HyperPod console, try to delete the `cluster-scheduler-config` using the API. To check the status of the resource, go to the details page of a compute allocation.

To see more details into the failure, use the describe API.

## Attribution document for Amazon SageMaker HyperPod task governance

In the following you can learn about attributions and third-party licenses for material used in Amazon SageMaker HyperPod task governance.

### 1. Definitions

#### 1.1. "Contributor"

means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.

#### 1.2. "Contributor Version"

means the combination of the Contributions of others (if any) used by a Contributor and that particular Contributor's Contribution.

#### 1.3. "Contribution"

means Covered Software of a particular Contributor.

#### 1.4. "Covered Software"

means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.

#### 1.5. "Incompatible With Secondary Licenses"

means

- a. that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or
- b. that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.

#### 1.6. "Executable Form"

means any form of the work other than Source Code Form.

#### 1.7. "Larger Work"

means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.

#### 1.8. "License"

means this document.

#### 1.9. "Licensable"

means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.

#### 1.10. "Modifications"

means any of the following:

- a. any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or
- b. any new file in Source Code Form that contains any Covered Software.

#### 1.11. "Patent Claims" of a Contributor

means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.

#### 1.12. "Secondary License"

means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.

#### 1.13. "Source Code Form"

means the form of the work preferred for making modifications.

#### 1.14. "You" (or "Your")

means an individual or a legal entity exercising rights under this License. For legal entities, "You" includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

## 2. License Grants and Conditions

## 2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

- a. under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
- b. under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version.

## 2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution.

## 2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted by a Contributor:

- a. for any code that a Contributor has removed from Covered Software; or
- b. for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or
- c. under Patent Claims infringed by Covered Software in the absence of its Contributions.

This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

## 2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

## 2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

## 2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

## 2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

## 3. Responsibilities

### 3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

### 3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

- a. such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely manner, at a charge no more than the cost

of distribution to the recipient; and

- b. You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form under this License.

### 3.3. Distribution of a Larger Work

You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

### 3.4. Notices

You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

### 3.5. Application of Additional Terms

You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

## 4. Inability to Comply Due to Statute or Regulation

If it is impossible for You to comply with any of the terms of this License

with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

## 5. Termination

5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

## 6. Disclaimer of Warranty

Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software

is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

## 7. Limitation of Liability

Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special, incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal injury resulting from such party's negligence to the extent applicable law prohibits such limitation. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to You.

## 8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a party's ability to bring cross-claims or counter-claims.

## 9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor.

## 10. Versions of the License

### 10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

## 10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward.

## 10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License).

## 10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached.

### Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this file, You can obtain one at <http://mozilla.org/MPL/2.0/>.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

### Exhibit B - "Incompatible With Secondary Licenses" Notice

This Source Code Form is "Incompatible With Secondary Licenses", as defined by the Mozilla Public License, v. 2.0.

## Delete a SageMaker HyperPod cluster

Use the following instructions to delete SageMaker HyperPod clusters orchestrated by Amazon EKS in the SageMaker AI console.

1. Under **Clusters** in the main pane of the SageMaker HyperPod console, choose the cluster you want to delete.
2. Select your cluster, and choose **Delete**.
3. In the pop-up window for cluster deletion, review the cluster information carefully to confirm that you chose the right cluster to delete.
4. After you reviewed the cluster information, choose **Yes, delete cluster**.
5. In the text field to confirm this deletion, type **delete**.
6. Choose **Delete** on the lower right corner of the pop-up window to finish sending the cluster deletion request.

## Managing SageMaker HyperPod clusters using the AWS CLI

The following topics provide guidance on writing SageMaker HyperPod API request files in JSON format and run them using the AWS CLI commands.

### Topics

- [Create a SageMaker HyperPod cluster](#)
- [Retrieve SageMaker HyperPod cluster details](#)
- [Update SageMaker HyperPod cluster configuration](#)
- [Update the SageMaker HyperPod platform software](#)
- [Access SageMaker HyperPod cluster nodes](#)
- [Scale down a SageMaker HyperPod cluster](#)
- [Delete a SageMaker HyperPod cluster](#)

## Create a SageMaker HyperPod cluster

Learn how to create SageMaker HyperPod clusters orchestrated by Amazon EKS using the AWS CLI.

1. Before creating an SageMaker HyperPod cluster:
  - a. Ensure that you have an existing Amazon EKS cluster up and running. For detailed instructions about how to set up an Amazon EKS cluster, see [Create an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.
  - b. Install the Helm chart as instructed in [the section called “Install packages on the Amazon EKS cluster using Helm”](#).
2. Prepare a lifecycle configuration script and upload to an Amazon S3 bucket, such as `s3://amzn-s3-demo-bucket/Lifecycle-scripts/base-config/`.

For a quick start, download the sample script [on\\_create.sh](#) from the AWSome Distributed Training GitHub repository, and upload it to the S3 bucket. This script sets up the logging file `/var/log/provision/provisioning.log` required for CloudWatch to gather logs from Pod containers. You can also include additional setup instructions, a series of setup scripts, or commands to be executed during the HyperPod cluster provisioning stage.

### Important

If you create an [the section called “IAM role for SageMaker HyperPod”](#) attaching only the managed `AmazonSageMakerClusterInstanceRolePolicy`, your cluster has access to Amazon S3 buckets with the specific prefix `sagemaker-`.

3. Prepare a [CreateCluster](#) API request file in JSON format. For `ExecutionRole`, provide the ARN of the IAM role you created with the managed `AmazonSageMakerClusterInstanceRolePolicy` from the section [the section called “IAM role for SageMaker HyperPod”](#).

### Note

Ensure that your SageMaker HyperPod cluster is deployed within the same Virtual Private Cloud (VPC) as your Amazon EKS cluster. The subnets and security groups specified in the SageMaker HyperPod cluster configuration must allow network connectivity and communication with the Amazon EKS cluster's API server endpoint.

```
// create_cluster.json
{
  "ClusterName": "string",
  "InstanceGroups": [{
    "InstanceGroupName": "string",
    "InstanceType": "string",
    "InstanceCount": number,
    "LifecycleConfig": {
      "SourceS3Uri": "s3://amzn-s3-demo-bucket-sagemaker/<lifecycle-script-
directory>/src/",
      "OnCreate": "on_create.sh"
    },
    "ExecutionRole": "string",
    "ThreadsPerCore": number,
    "OnStartDeepHealthChecks": [
      "InstanceStress", "InstanceConnectivity"
    ]
  }],
  "VpcConfig": {
    "SecurityGroupIds": ["string"],
    "Subnets": ["string"]
  },
  "Tags": [{
    "Key": "string",
    "Value": "string"
  }],
  "Orchestrator": {
    "Eks": {
      "ClusterArn": "string",
    }
  },
  "NodeRecovery": "Automatic"
}
```

Note the following when configuring to create a new SageMaker HyperPod cluster associating with an EKS cluster.

- You can configure up to 20 instance groups under the InstanceGroups parameter.
- For `Orchestrator.Eks.ClusterArn`, specify the ARN of the EKS cluster you want to use as the orchestrator.

- For `OnStartDeepHealthChecks`, add `InstanceStress` and `InstanceConnectivity` to enable [the section called “Deep health checks”](#).
  - For `NodeRecovery`, specify `Automatic` to enable automatic node recovery. SageMaker HyperPod replaces or reboots instances (nodes) when issues are found by the health-monitoring agent.
  - For the `Tags` parameter, you can add custom tags for managing the SageMaker HyperPod cluster as an AWS resource. You can add tags to your cluster in the same way you add them in other AWS services that support tagging. To learn more about tagging AWS resources in general, see [Tagging AWS Resources User Guide](#).
  - For the `VpcConfig` parameter, specify the information of the VPC used in the EKS cluster. The subnets must be private.
4. Run the [create-cluster](#) command as follows.

### Important

When running the `create-cluster` command with the `--cli-input-json` parameter, you must include the `file://` prefix before the complete path to the JSON file. This prefix is required to ensure that the AWS CLI recognizes the input as a file path. Omitting the `file://` prefix results in a parsing parameter error.

```
aws sagemaker create-cluster \  
  --cli-input-json file://complete/path/to/create_cluster.json
```

This should return the ARN of the new cluster.

## Retrieve SageMaker HyperPod cluster details

Learn how to retrieve SageMaker HyperPod cluster details using the AWS CLI.

### Describe a cluster

Run [describe-cluster](#) to check the status of the cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster --cluster-name your-hyperpod-cluster
```

After the status of the cluster turns to **InService**, proceed to the next step. Using this API, you can also retrieve failure messages from running other HyperPod API operations.

### List details of cluster nodes

Run [list-cluster-nodes](#) to check the key information of the cluster nodes.

```
aws sagemaker list-cluster-nodes --cluster-name your-hyperpod-cluster
```

This returns a response, and the InstanceId is what you need to use for logging (using `aws ssm`) into them.

### Describe details of a cluster node

Run [describe-cluster-node](#) to retrieve details of a cluster node. You can get the cluster node ID from `list-cluster-nodes` output. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster-node \  
  --cluster-name your-hyperpod-cluster \  
  --node-id i-111222333444555aa
```

### List clusters

Run [list-clusters](#) to list all clusters in your account.

```
aws sagemaker list-clusters
```

You can also add additional flags to filter the list of clusters down. To learn more about what this command runs at low level and additional flags for filtering, see the [ListClusters](#) API reference.

### Update SageMaker HyperPod cluster configuration

Run [update-cluster](#) to update the configuration of a cluster.

#### Note

Important considerations:

- You cannot change the EKS cluster information that your HyperPod cluster is associated after the cluster is created.

- If deep health checks are running on the cluster, this API will not function as expected. You might encounter an error message stating that deep health checks are in progress. To update the cluster, you should wait until the deep health checks finish.

1. Create an [UpdateCluster](#) API request file in JSON format. Make sure that you specify the right cluster name and instance group name to update. For each instance group, you can change the instance type, the number of instances, the lifecycle configuration entrypoint script, and the path to the script.

 **Note**

You can use the `UpdateCluster` to scale down or remove entire instance groups from your SageMaker HyperPod cluster. For additional instructions on how to scale down or delete instance groups, see [the section called “Scale down a SageMaker HyperPod cluster”](#).

- a. For `ClusterName`, specify the name of the cluster you want to update.
- b. For `InstanceGroupName`
  - i. To update an existing instance group, specify the name of the instance group you want to update.
  - ii. To add a new instance group, specify a new name not existing in your cluster.
- c. For `InstanceType`
  - i. To update an existing instance group, you must match the instance type you initially specified to the group.
  - ii. To add a new instance group, specify an instance type you want to configure the group with.
- d. For `InstanceCount`
  - i. To update an existing instance group, specify an integer that corresponds to your desired number of instances. You can provide a higher or lower value (down to 0) to scale the instance group up or down.
  - ii. To add a new instance group, specify an integer greater or equal to 1.
- e. For `LifeCycleConfig`, you can change the values for both `SourceS3Uri` and `OnCreate` as you want to update the instance group.

- f. For `ExecutionRole`
  - i. For updating an existing instance group, keep using the same IAM role you attached during cluster creation.
  - ii. For adding a new instance group, specify an IAM role you want to attach.
- g. For `ThreadsPerCore`
  - i. For updating an existing instance group, keep using the same value you specified during cluster creation.
  - ii. For adding a new instance group, you can choose any value from the allowed options per instance type. For more information, search the instance type and see the **Valid threads per core** column in the reference table at [CPU cores and threads per CPU core per instance type](#) in the *Amazon EC2 User Guide*.
- h. For `OnStartDeepHealthChecks`, add `InstanceStress` and `InstanceConnectivity` to enable [the section called "Deep health checks"](#).
- i. For `NodeRecovery`, specify `Automatic` to enable automatic node recovery. SageMaker HyperPod replaces or reboots instances (nodes) when issues are found by the health-monitoring agent.

The following code snippet is a JSON request file template you can use. For more information about the request syntax and parameters of this API, see the [UpdateCluster](#) API reference.

```
// update_cluster.json
{
  // Required
  "ClusterName": "name-of-cluster-to-update",
  // Required
  "InstanceGroups": [{
    "InstanceGroupName": "string",
    "InstanceType": "string",
    "InstanceCount": number,
    "LifecycleConfig": {
      "SourceS3Uri": "string",
      "OnCreate": "string"
    },
    "ExecutionRole": "string",
    "ThreadsPerCore": number,
    "OnStartDeepHealthChecks": [
      "InstanceStress", "InstanceConnectivity"
    ]
  }
}
```

```
  }],  
  "NodeRecovery": "Automatic"  
}
```

2. Run the following `update-cluster` command to submit the request.

```
aws sagemaker update-cluster \  
  --cli-input-json file://complete/path/to/update_cluster.json
```

## Update the SageMaker HyperPod platform software

When you create your SageMaker HyperPod cluster, SageMaker HyperPod selects an Amazon Machine Image (AMI) corresponding to the Kubernetes version of your Amazon EKS cluster.

Run [update-cluster-software](#) to update existing clusters with software and security patches provided by the SageMaker HyperPod service. For `--cluster-name`, specify either the name or the ARN of the cluster to update.

### Important

- When this API is called, SageMaker HyperPod doesn't drain or redistribute the jobs (Pods) running on the nodes. Make sure to check if there are any jobs running on the nodes before calling this API.
- The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance root volume to Amazon S3 or Amazon FSx for Lustre.
- All cluster nodes experience downtime (nodes appear as `<NotReady>` in the output of `kubectl get node`) while the patching is in progress. We recommend that you terminate all workloads before patching and resume them after the patch completes.

If the security patch fails, you can retrieve failure messages by running the [DescribeCluster](#) API as instructed at [the section called "Describe a cluster"](#).

```
aws sagemaker update-cluster-software --cluster-name your-hyperpod-cluster
```

When calling the `UpdateClusterSoftware` API, SageMaker HyperPod updates the Kubernetes version of the nodes by selecting the latest [the section called “SageMaker HyperPod DLAMI”](#) based on the Kubernetes version of your Amazon EKS cluster. It then runs the lifecycle scripts in the Amazon S3 bucket that you specified during the cluster creation or update.

You can verify the kubelet version of a node by running the `kubectl describe node` command.

The Kubernetes version of SageMaker HyperPod cluster nodes does not automatically update when you update your Amazon EKS cluster version. After updating the Kubernetes version for your Amazon EKS cluster, you must use the `UpdateClusterSoftware` API to update your SageMaker HyperPod cluster nodes to the same Kubernetes version.

It is recommended to update your SageMaker HyperPod cluster after updating your Amazon EKS nodes, and avoid having more than one version difference between the Amazon EKS cluster version and the SageMaker HyperPod cluster nodes version.

The SageMaker HyperPod service team regularly rolls out new [the section called “SageMaker HyperPod DLAMI”](#)s for enhancing security and improving user experiences. We recommend that you always keep updating to the latest SageMaker HyperPod DLAMI. For future SageMaker HyperPod DLAMI updates for security patching, follow up with [the section called “HyperPod release notes”](#).

#### Note

You can only run this API programmatically. The patching functionality is not implemented in the SageMaker HyperPod console UI.

## Access SageMaker HyperPod cluster nodes

You can directly access the nodes of a SageMaker HyperPod cluster in service using the AWS CLI commands for AWS Systems Manager (SSM). Run `aws ssm start-session` with the host name of the node in format of `sagemaker-cluster:[cluster-id]_[instance-group-name]-[instance-id]`. You can retrieve the cluster ID, the instance ID, and the instance group name from the [SageMaker HyperPod console](#) or by running `describe-cluster` and `list-cluster-nodes` from the [AWS CLI commands for SageMaker HyperPod](#). For example, if your cluster ID is `aa11bbbb222`, the cluster node name is `controller-group`, and the cluster node ID is `i-111222333444555aa`, the SSM `start-session` command should be the following.

**Note**

If you haven't set up AWS Systems Manager, follow the instructions provided at [the section called "Setting up AWS Systems Manager and Run As for cluster user access control"](#).

```
$ aws ssm start-session \  
  --target sagemaker-cluster:aa11bbbb222_controller-group-i-111222333444555aa \  
  --region us-west-2  
Starting session with SessionId: s0011223344aabbccdd  
root@ip-111-22-333-444:/usr/bin#
```

## Scale down a SageMaker HyperPod cluster

You can scale down the number of instances running on your Amazon SageMaker HyperPod cluster. You might want to scale down a cluster for various reasons, such as reduced resource utilization or cost optimization.

The following page outlines two main approaches to scaling down:

- **Scale down at the instance group level:** This approach uses the `UpdateCluster` API, with which you can:
  - Scale down the instance counts for specific instance groups independently. SageMaker AI handles the termination of nodes in a way that reaches the new target instance counts you've set for each group. See [the section called "Scale down an instance group"](#).
  - Completely delete instance groups from your cluster. See [the section called "Delete instance groups"](#).
- **Scale down at the instance level:** This approach uses the `BatchDeleteClusterNodes` API, with which you can specify the individual nodes you want to terminate. See [the section called "Scale down at the instance level"](#).

**Note**

When scaling down at the instance level with `BatchDeleteClusterNodes`, you can only terminate a maximum of 99 instances at a time. `UpdateCluster` supports terminating any number of instances.

## Important considerations

- When scaling down a cluster, you should ensure that the remaining resources are sufficient to handle your workload and that any necessary data migration or rebalancing is properly handled to avoid disruptions.
- Make sure to back up your data to Amazon S3 or an FSx for Lustre file system before invoking the API on a worker node group. This can help prevent any potential data loss from the instance root volume. For more information about backup, see [Use the backup script provided by SageMaker HyperPod](#).
- To invoke this API on an existing cluster, you must first patch the cluster by running the [UpdateClusterSoftware](#) API. For more information about patching a cluster, see [Update the SageMaker HyperPod platform software of a cluster](#).
- Metering/billing for on-demand instances will automatically be stopped after scale down. To stop metering for scaled-down reserved instances, you should reach out to your AWS account team for support.
- You can use the released capacity from the scaled-down reserved instances to scale up another SageMaker HyperPod cluster.

## Scale down at the instance group level

The [UpdateCluster](#) operation allows you to make changes to the configuration of your SageMaker HyperPod cluster, such as scaling down the number of instances of an instance group or removing entire instance groups. This can be useful when you want to adjust the resources allocated to your cluster based on changes in your workload, optimize costs, or change the instance type of an instance group.

## Scale down an instance group

Use this approach when you have an instance group that is idle and it's safe to terminate any of the instances for scaling down. When you submit an `UpdateCluster` request to scale down, HyperPod randomly chooses instances for termination and scales down to the specified number of nodes for the instance group.

### Note

When you scale the number of instances in an instance group down to 0, all the instances within that group will be terminated. However, the instance group itself will still exist as

part of the SageMaker HyperPod cluster. You can scale the instance group back up at a later time, using the same instance group configuration.

Alternatively, you can choose to remove an instance group permanently. For more information, see [the section called "Delete instance groups"](#).

## To scale down with UpdateCluster

1. Follow the steps outlined in [Update SageMaker HyperPod cluster configuration](#). When you reach step **1.d** where you specify the **InstanceCount** field, enter a number that is smaller than the current number of instances to scale down the cluster.
2. Run the [update-cluster](#) AWS CLI command to submit your request.

The following is an example of an UpdateCluster JSON object. Consider the case where your instance group currently has 2 running instances. If you set the **InstanceCount** field to 1, as shown in the example, then HyperPod randomly selects one of the instances and terminates it.

```
{
  "ClusterName": "name-of-cluster-to-update",
  "InstanceGroups": [
    {
      "InstanceGroupName": "training-instances",
      "InstanceType": "instance-type",
      "InstanceCount": 1,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://amzn-s3-demo-bucket/training-script.py",
        "OnCreate": "s3://amzn-s3-demo-bucket/setup-script.sh"
      },
      "ExecutionRole": "arn:aws:iam::123456789012:role/SageMakerRole",
      "ThreadsPerCore": number-of-threads,
      "OnStartDeepHealthChecks": [
        "InstanceStress",
        "InstanceConnectivity"
      ]
    }
  ],
  "NodeRecovery": "Automatic"
}
```

## Delete instance groups

You can use the [UpdateCluster](#) operation to remove entire instance groups from your SageMaker HyperPod cluster when they are no longer needed. This goes beyond simple scaling down, allowing you to completely eliminate specific instance groups from your cluster's configuration.

### Note

When removing an instance group:

- All instances within the targeted group are terminated.
- The entire group configuration is deleted from the cluster.
- Any workloads running on that instance group are stopped.

## To delete instance groups with UpdateCluster

1. When following the steps outlined in [Update SageMaker HyperPod cluster configuration](#):
  - a. Set the optional InstanceGroupsToDelete parameter in your UpdateCluster JSON and pass the comma-separated list of instance group names that you want to delete.
  - b. When you specify the InstanceGroups list, ensure that the specifications of the instance groups you are removing are no longer listed in the InstanceGroups list.
2. Run the [update-cluster](#) AWS CLI command to submit your request.

### Important

- Your SageMaker HyperPod cluster must always maintain at least one instance group.
- Ensure all critical data is backed up before removal.
- The removal process cannot be undone.

The following is an example of an UpdateCluster JSON object. Consider the case where a cluster currently has 3 instance groups, a *training*, a *prototype-training*, and an *inference-serving* group. You want to delete the *prototype-training* group.

```
{
  "ClusterName": "name-of-cluster-to-update",
  "InstanceGroups": [
    {
      "InstanceGroupName": "training",
      "InstanceType": "instance-type",
      "InstanceCount": ,
      "LifecycleConfig": {
        "SourceS3Uri": "s3://amzn-s3-demo-bucket/training-script.py",
        "OnCreate": "s3://amzn-s3-demo-bucket/setup-script.sh"
      },
      "ExecutionRole": "arn:aws:iam::123456789012:role/SageMakerRole",
      "ThreadsPerCore": number-of-threads,
      "OnStartDeepHealthChecks": [
        "InstanceStress",
        "InstanceConnectivity"
      ]
    },
    {
      "InstanceGroupName": "inference-serving",
      "InstanceType": "instance-type",
      "InstanceCount": 2,
      [...]
    }
  ],
  "InstanceGroupsToDelete": [ "prototype-training" ],
  "NodeRecovery": "Automatic"
}
```

## Scale down at the instance level

The `BatchDeleteClusterNodes` operation allows you to scale down a SageMaker HyperPod cluster by specifying the individual nodes you want to terminate. `BatchDeleteClusterNodes` provides more granular control for targeted node removal and cluster optimization. For example, you might use `BatchDeleteClusterNodes` to delete targeted nodes for maintenance, rolling upgrades, or rebalancing resources geographically.

## API request and response

When you submit a `BatchDeleteClusterNodes` request, SageMaker HyperPod deletes nodes by their instance IDs. The API accepts a request with the cluster name and a list of node IDs to be deleted.

The response includes two sections:

- **Failed:** A list of errors of type [BatchDeleteClusterNodesError](#) - one per instance ID.
- **Successful:** The list of instance IDs successfully terminated.

## Validation and error handling

The API performs various validations, such as:

- Verifying the node ID format (prefix of `i-` and Amazon EC2 instance ID structure).
- Checking the node list length, with a limit of 99 or fewer node IDs in a single `BatchDeleteClusterNodes` request.
- Ensuring a valid SageMaker HyperPod cluster with the input cluster-name is present and that no cluster-level operations (update, system update, patching, or deletion) are in progress.
- Handling cases where instances are not found, have invalid status, or are in use.

## API Response Codes

- The API returns a `200` status code for successful (e.g., all input nodes succeeded validation) or partially successful requests (e.g., some input nodes fail validation).
- If all of these validations fail (e.g., all input nodes fail validation), the API will return a `400` Bad Request response with the appropriate error messages and error codes.

## Example

The following is an example of **scaling down a cluster at the instance level** using the AWS CLI:

```
aws sagemaker batch-delete-cluster-nodes --cluster-name "cluster-name" --node-ids '["i-111112222233333", "i-111112222233333"]'
```

## Delete a SageMaker HyperPod cluster

Run [delete-cluster](#) to delete a cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker delete-cluster --cluster-name your-hyperpod-cluster
```

This API only cleans up the SageMaker HyperPod resources and doesn't delete any resources of the associated EKS cluster. This includes the Amazon EKS cluster, EKS Pod identities, Amazon

FSx volumes, and EKS add-ons. This also includes the initial configuration you added to your EKS cluster. If you want to clean up all resources, make sure that you also clean up the EKS resources separately.

Make sure that you first delete the SageMaker HyperPod resources, followed by the EKS resources. Performing the deletion in the reverse order may result in lingering resources.

### Important

When this API is called, SageMaker HyperPod doesn't drain or redistribute the jobs (Pods) running on the nodes. Make sure to check if there are any jobs running on the nodes before calling this API.

## Configure storage for SageMaker HyperPod clusters orchestrated by Amazon EKS

Cluster admin needs to configure storage for data scientist users to manage input and output data and storing checkpoints during training on SageMaker HyperPod clusters.

### Handling large datasets (input/output data)

- **Data access and management:** Data scientists often work with large datasets that are required for training machine learning models. Specifying storage parameters in the job submission allows them to define where these datasets are located (e.g., Amazon S3 buckets, persistent volumes in Kubernetes) and how they are accessed during the job execution.
- **Performance optimization:** The efficiency of accessing input data can significantly impact the performance of the training job. By optimizing storage parameters, data scientists can ensure that data is read and written efficiently, reducing I/O bottlenecks.

### Storing checkpoints

- **Checkpointing in training:** During long-running training jobs, it's common practice to save checkpoints—intermediate states of the model. This allows data scientists to resume training from a specific point in case of a failure, rather than starting from scratch.
- **Data recovery and experimentation:** By specifying the storage location for checkpoints, data scientists can ensure that these checkpoints are securely stored, potentially in a distributed storage system that offers redundancy and high availability. This is crucial for recovering from interruptions and for experimenting with different training strategies.

**Tip**

For a hands-on experience and guidance on how to set up storage for SageMaker HyperPod cluster orchestrated with Amazon EKS, see the following sections in the [Amazon EKS Support in SageMaker HyperPod workshop](#).

- [Set up Amazon FSx for Lustre on SageMaker HyperPod](#)
- [Set up Amazon S3 on SageMaker HyperPod](#) using [Mountpoint for Amazon S3](#)

## Cluster resiliency features for SageMaker HyperPod cluster orchestration with Amazon EKS

SageMaker HyperPod provides the following cluster resiliency features.

### Topics

- [SageMaker HyperPod health-monitoring agent](#)
- [Basic health checks](#)
- [Deep health checks](#)
- [Automatic node recovery](#)
- [Resilience-related Kubernetes labels by SageMaker HyperPod](#)
- [Manually quarantine, replace, or reboot a node](#)
- [Suggested resilience configurations](#)

### SageMaker HyperPod health-monitoring agent

SageMaker HyperPod health-monitoring agent continuously monitors the health status of each GPU-based or Trainium-based instances. When it detects any instance or GPU failures, the agent marks the instance as unhealthy.

### Health checks done by the SageMaker HyperPod health-monitoring agent

The SageMaker HyperPod health-monitoring agent checks the following.

#### NVIDIA GPUs

- [DCGM policy violation notifications](#)

- Errors in the `nvidia-smi` output
- Various errors in the logs generated by the Amazon Elastic Compute Cloud (EC2) platform

## AWS Trainium

- Errors in the output from the [AWS Neuron monitor](#)
- Outputs generated by the Neuron node problem detector (For more information about the AWS Neuron node problem detector, see [Node problem detection and recovery for AWS Neuron nodes within Amazon EKS clusters.](#))
- Various errors in the logs generated by the Amazon EC2 platform

## Logs generated by the SageMaker HyperPod health-monitoring agent

The SageMaker HyperPod health-monitoring agent is an out-of-the-box health check feature and continuously runs on all HyperPod clusters. The health monitoring agent publishes detected health events on GPU or Trn instances to CloudWatch under the Cluster log group `/aws/sagemaker/Clusters/`.

The detection logs from the HyperPod health monitoring agent are created as separate log streams named `SagemakerHealthMonitoringAgent` for each node. You can query the detection logs using CloudWatch log insights as follows.

```
fields @timestamp, @message
| filter @message like /HealthMonitoringAgentDetectionEvent/
```

This should return an output similar to the following.

```
2024-08-21T11:35:35.532-07:00
  {"level":"info","ts":"2024-08-21T18:35:35Z","msg":"NPD caught event: %v","details:
":
{"severity":"warn","timestamp":"2024-08-22T20:59:29Z","reason":"XidHardwareFailure","message":
condition NvidiaErrorReboot is now: True, reason: XidHardwareFailure,
message: \"NVRM: Xid (PCI:0000:b9:00): 71, pid=<unknown>, name=<unknown>,
NVLink: fatal error detected on link 6(0x10000, 0x0, 0x0, 0x0, 0x0, 0x0,
0x0)\",\"HealthMonitoringAgentDetectionEvent\":\"HealthEvent\"}
2024-08-21T11:35:35.532-07:00
  {"level":"info","ts":"2024-08-21T18:35:35Z","msg":"NPD caught event: %v","details:
":
{"severity":"warn","timestamp":"2024-08-22T20:59:29Z","reason":"XidHardwareFailure","message":
```

```
condition NvidiaErrorReboot is now: True, reason: XidHardwareFailure,
message: \"NVRM: Xid (PCI:0000:b9:00): 71, pid=<unknown>, name=<unknown>,
NVLink: fatal error detected on link 6(0x10000, 0x0, 0x0, 0x0, 0x0, 0x0,
0x0)\", \"HealthMonitoringAgentDetectionEvent\": \"HealthEvent\"}
```

## Basic health checks

SageMaker HyperPod performs a set of *basic health checks* on cluster instances during the creation and update of HyperPod clusters. These basic health checks are orchestrator-agnostic, so these checks are applicable regardless of the underlying orchestration platforms supported by SageMaker HyperPod (Amazon EKS or Slurm).

The basic health checks monitor cluster instances for issues related to devices such as accelerators (GPU and Trainium cores) and network devices (Elastic Fabric Adapter, or EFA). To find the list of basic cluster health checks, see [Cluster health checks](#).

## Deep health checks

SageMaker HyperPod performs *deep health checks* on cluster instances during the creation and update of HyperPod clusters. The deep health checks ensure the reliability and stability of the SageMaker HyperPod clusters by thoroughly testing the underlying hardware and infrastructure components before allowing the clusters to be used for training machine learning models. This proactive approach helps identify and mitigate potential issues early in the cluster lifecycle.

### List of deep health checks done by SageMaker HyperPod

SageMaker HyperPod runs the following deep health checks.

#### Instance-level deep health checks

Category	Utility name	Instance type compatibility	Description
Accelerator	GPU/NVLink count	GPU	Verifies GPU/NVLink counts.
Accelerator	<a href="#">DCGM diagnostics</a> level 4	GPU	Assesses the health and functionality of NVIDIA GPUs by running DCGM

Category	Utility name	Instance type compatibility	Description
			(NVIDIA Data Center GPU Manager) diagnostics at level 4, including additional memory tests.
Accelerator	Neuron sysfs	Trainium	For Trainium-powered instances, the health of the Neuron devices is determined by reading counters from <a href="#">Neuron sysfs</a> propagated directly by the Neuron driver.
Accelerator	Neuron hardware check	Trainium	Runs a training workload to produce numbers. it then verifies aiming to test the hardware.
Accelerator	NCCOM local test	Trainium	Evaluates the performance of collective communication operations on single Trainium nodes
Network	EFA	GPU and Trainium	Runs latency and bandwidth benchmarking on the attached EFA device.

## Cluster-level deep health checks

Category	Utility name	Instance type compatibility	Description
Accelerator	NCCL test	GPU	Verifies the performance of collective communication operations on multiple NVIDIA GPUs
Accelerator	NCCOM cluster test	Trainium	Verifies the performance of collective communication operations on multiple Trainium nodes

## Logs from the deep health checks

The following are example logs from the SageMaker HyperPod deep health checks.

### Cluster-level logs

The cluster-level deep health check logs are stored in your CloudWatch log group at `/aws/sagemaker/Clusters/<cluster_name>/<cluster_id>`

The log streams are logged at `DeepHealthCheckResults/<log_stream_id>`.

As an example shown below, the deep health check output logs show the instance ID that failed the checks with the cause of the failure.

```
{
  "level": "error",
  "ts": "2024-06-18T21:15:22Z",
  "msg": "Encountered FaultyInstance. Replace the Instance. Region: us-west-2, InstanceType: p4d.24xlarge. ERROR:Bandwidth has less than threshold: Expected minimum threshold :80,NCCL Test output Bw: 30"
}
```

## Instance-level logs

The instance-level deep health check logs are stored at `/var/log/aws/clusterscat/sagemaker-deep-health-check.log` on each node. SSH into the node and open the log file by running the following command.

```
cat /var/log/aws/clusterscat/sagemaker-deep-health-check.log
```

The following is an example output of the hardware stress, [NVIDIA DCGM](#) stress, and EFA connectivity test.

```
# Hardware Stress Test output

2024-08-20T21:53:58Z info Executing Hardware stress check with command: stress-ng, and
args: [--cpu 32 --vm 2 --hdd 1 --fork 8 --switch 4 --timeout 60 --metrics]

2024-08-20T21:54:58Z info stress-ng success

2024-08-20T21:54:58Z    info    GpuPci Count check success

# DCGM Stress Test

2024-08-20T22:25:02Z    info    DCGM diagnostic health summary: dcgmCheckLevel:

## Automatic node recovery

During cluster creation or update, cluster admin users can select the node (instance) recovery option between `Automatic (Recommended)` and `None` at the cluster level. If set to `Automatic`, SageMaker HyperPod reboots or replaces faulty nodes automatically.

### Important

We recommend setting the `Automatic` option.

Automatic node recovery runs when issues are found from health-monitoring agent, basic health checks, and deep health checks. If set to `None`, the health monitoring agent will label the instances when a fault is detected, but it will not automatically initiate any repair or recovery actions on the affected nodes. This option is not recommended.

## Resilience-related Kubernetes labels by SageMaker HyperPod

*Labels* are key-value pairs that are attached to [Kubernetes objects](#). SageMaker HyperPod introduces the following labels for the health checks it provides.

### Node health status labels

The `node-health-status` labels represent the status of the node health and to be used as part of node selector filter in healthy nodes.

Label	Description
<code>sagemaker.amazonaws.com/node-health-status: Schedulable</code>	The node has passed basic health checks and is available for running workloads. This health check is the same as the <a href="#">currently available SageMaker HyperPod resiliency features for Slurm clusters</a> .
<code>sagemaker.amazonaws.com/node-health-status: Unschedulable</code>	The node is running deep health checks and is not available for running workloads.
<code>sagemaker.amazonaws.com/node-health-status: UnschedulablePendingReplacement</code>	The node has failed deep health checks or health-monitoring agent checks and requires a replacement. If automatic node recovery is enabled, the node will be automatically replaced by SageMaker HyperPod.
<code>sagemaker.amazonaws.com/node-health-status: UnschedulablePendingReboot</code>	The node has failed deep health checks or health-monitoring agent checks and requires a reboot. If automatic node recovery is enabled, the node will be automatically rebooted by SageMaker HyperPod.

### Deep health check labels

The `deep-health-check-status` labels represent the progress of deep health check on a specific node. Helpful for Kubernetes users to quickly filter for progress of overall deep health checks.

Label	Description
<code>sagemaker.amazonaws.com/deep-health-check-status: InProgress</code>	The node is running deep health checks and is not available for running workloads.
<code>sagemaker.amazonaws.com/deep-health-check-status: Passed</code>	The node has successfully completed deep health checks and health-monitoring agent checks, and is available for running workloads.
<code>sagemaker.amazonaws.com/deep-health-check-status: Failed</code>	The node has failed deep health checks or health-monitoring agent checks and requires a reboot or replacement. If automatic node recovery is enabled, the node will be automatically rebooted or replaced by SageMaker HyperPod.

## Fault type and reason labels

The following describes the `fault-type` and `fault-reason` labels.

- `fault-type` labels represent high-level fault categories when health checks fail. These are populated for failures identified during both deep health and health-monitoring agent checks.
- `fault-reason` labels represent the detailed fault reason associated with a `fault-type`.

## How SageMaker HyperPod labels

The following topics cover how labeling is done depending on various cases.

### Topics

- [When a node is added to a SageMaker HyperPod cluster with deep health check config disabled](#)
- [When a node is added to a SageMaker HyperPod cluster with deep health check config enabled](#)
- [When there are any compute failures on nodes](#)

## When a node is added to a SageMaker HyperPod cluster with deep health check config disabled

When a new node added into cluster, and if deep health check is not enabled for the instance group, SageMaker HyperPod runs the same health checks as the [currently available SageMaker HyperPod health checks for Slurm clusters](#).

If the health check passes, the nodes will be marked with the following label.

```
sagemaker.amazonaws.com/node-health-status: Schedulable
```

If the health check doesn't pass, the nodes will be terminated and replaced. This behavior is the same as the way SageMaker HyperPod health check works for Slurm clusters.

## When a node is added to a SageMaker HyperPod cluster with deep health check config enabled

When a new node is added into a SageMaker HyperPod cluster, and if the deep health check test is enabled for the instance group, HyperPod first taints the node and starts the ~2-hour deep health check/stress test on the node. There are 3 possible outputs of the node labels after the deep health check.

### 1. When the deep health check test passes

```
sagemaker.amazonaws.com/node-health-status: Schedulable
```

### 2. When the deep health check test fails, and the instance needs to be replaced

```
sagemaker.amazonaws.com/node-health-status: UnschedulablePendingReplacement
```

### 3. When the deep health check test fails, and the instance needs to be rebooted to rerun the deep health check

```
sagemaker.amazonaws.com/node-health-status: UnschedulablePendingReboot
```

If an instance fails the deep health check test, the instance will always be replaced. If the deep health check tests succeeds, the taint on the node will be removed.

## When there are any compute failures on nodes

The SageMaker HyperPod health monitor agent also continuously monitors the health status of each node. When it detects any failures (such as GPU failure and driver crash), the agent marks the node with one of the following labels.

### 1. When the node is unhealthy and needs to be replaced

```
sagemaker.amazonaws.com/node-health-status: UnscheduleablePendingReplacement
```

### 2. When the node is unhealthy and needs to be rebooted

```
sagemaker.amazonaws.com/node-health-status: UnscheduleablePendingReboot
```

The health monitor agent also taints the node when it detects any node health issues.

## Manually quarantine, replace, or reboot a node

Learn how to manually quarantine, replace, and reboot a faulty node in SageMaker HyperPod clusters orchestrated with Amazon EKS.

### To quarantine a node and force delete a training pod

```
kubectl cordon <node-name>
```

After quarantine, force ejecting the Pod. This is useful when you see a pod is stuck in termination for more than 30min or `kubectl describe pod` shows 'Node is not ready' in Events

```
kubectl delete pods <pod-name> --grace-period=0 --force
```

### To replace a node

Label the node to replace with `sagemaker.amazonaws.com/node-health-status=UnscheduleablePendingReplacement`, which triggers the SageMaker HyperPod [the section called "Automatic node recovery"](#). Note that you also need to activate automatic node recovery during cluster creation or update.

```
kubectl label nodes <node-name> \
  sagemaker.amazonaws.com/node-health-status=UnscheduleablePendingReplacement
```

## To reboot a node

Label the node to reboot with `sagemaker.amazonaws.com/node-health-status=UnschedulablePendingReboot`, which triggers the SageMaker HyperPod [the section called "Automatic node recovery"](#). Note that you also need to activate automatic node recovery during cluster creation or update.

```
kubectl label nodes <node-name> \
  sagemaker.amazonaws.com/node-health-status=UnschedulablePendingReboot
```

After the labels `UnschedulablePendingReplacement` or `UnschedulablePendingReboot` are applied, you should be able to see the node is terminated or reboot in few minutes.

### Suggested resilience configurations

When the deep health checks are enabled, whenever a new instance is added to the HyperPod cluster (either during create-cluster or through automatic node replacement), the new instance goes through the deep health check process (instance level stress tests) for about a couple of hours. The following are suggested resilience config combinations depending on possible cases.

1. **Case:** When you have additional spare nodes within a cluster as back-up resources (not using the full capacity), or if you can wait for about 2 hours for the deep health check process to get the less error-prone instances.

**Recommendation:** Enable the deep health check config throughout the cluster lifecycle. Node auto-recovery config is enabled by default.

2. **Case:** When you don't have additional backup nodes (capacity is fully used for some training load). You want to get the replacement nodes as soon as possible to resume the training job.

**Recommendation:** Enable the deep health check during cluster creation, then turn-off the deep health check config after the cluster is created. Node auto recovery config is enabled by default.

3. **Case:** When you don't have additional backup nodes, and you don't want to wait for the ~2 hour deep health check process (small clusters).

**Recommendation:** disable the deep health check config throughout the cluster life cycle. Node auto recovery config is enabled by default.

If you want to resume the training job from a failure immediately, make sure that you have additional spare nodes as backup resources in the cluster.

## Running jobs on SageMaker HyperPod clusters orchestrated by Amazon EKS

The following topics provide procedures and examples of accessing compute nodes and running ML workloads on provisioned SageMaker HyperPod clusters orchestrated with Amazon EKS. Depending on how you have set up the environment on your HyperPod cluster, there are many ways to run ML workloads on HyperPod clusters.

### Tip

For a hands-on experience and guidance on how to set up and use a SageMaker HyperPod cluster orchestrated with Amazon EKS, we recommend taking this [Amazon EKS Support in SageMaker HyperPod](#) workshop.

Data scientist users can train foundational models using the EKS cluster set as the orchestrator for the SageMaker HyperPod cluster. Scientists leverage the [SageMaker HyperPod CLI](#) and the native `kubectl` commands to find available SageMaker HyperPod clusters, submit training jobs (Pods), and manage their workloads. The SageMaker HyperPod CLI enables job submission using a training job schema file, and provides capabilities for job listing, description, cancellation, and execution. Scientists can use [Kubeflow Training Operator](#) according to compute quotas managed by HyperPod, and [SageMaker AI-managed MLflow](#) to manage ML experiments and training runs.

### Topics

- [Install the SageMaker HyperPod CLI](#)
- [SageMaker HyperPod CLI commands](#)
- [Run jobs using the SageMaker HyperPod CLI](#)
- [Run jobs using kubectl](#)

### Install the SageMaker HyperPod CLI

SageMaker HyperPod provides the [SageMaker HyperPod command line interface](#) (CLI) package.

1. Check if the version of Python on your local machine is between 3.8 and 3.11.
2. Check the prerequisites in the README markdown file in the [SageMaker HyperPod CLI](#) package.
3. Clone the SageMaker HyperPod CLI package from GitHub.

```
git clone https://github.com/aws/sagemaker-hyperpod-cli.git
```

#### 4. Install the SageMaker HyperPod CLI.

```
cd sagemaker-hyperpod-cli && pip install .
```

#### 5. Test if the SageMaker HyperPod CLI is successfully installed by running the following command.

```
hyperpod --help
```

#### Note

If you are a data scientist and want to use the SageMaker HyperPod CLI, make sure that your IAM role is set up properly by your cluster admins following the instructions at [the section called “IAM users for scientists”](#) and [the section called “Setting up Kubernetes role-based access control”](#).

### SageMaker HyperPod CLI commands

The following table summarizes the SageMaker HyperPod CLI commands.

#### Note

For a complete CLI reference, see [README](#) in the [SageMaker HyperPod CLI GitHub repository](#).

SageMaker HyperPod CLI command	Entity	Description
hyperpod get-clusters	cluster/access	Lists all clusters to which the user has been enabled with IAM permissions to submit training workloads Gives the current snapshot of whole available instances which are not running any workloads or jobs along with maximum

SageMaker HyperPod CLI command	Entity	Description
		capacity, grouping by health check statuses (ex: BurnInPassed)
hyperpod connect-cluster	cluster/access	Configures kubectl to operate on the specified HyperPod cluster and namespace
hyperpod start-job	job	Submits the job to targeted cluster-Job name will be unique at namespace level-Users will be able to override yaml spec by passing them as CLI arguments
hyperpod get-job	job	Display metadata of the submitted job
hyperpod list-jobs	job	Lists all jobs in the connected cluster/namespace to which the user has been added with IAM permissions to submit training workloads
hyperpod cancel-job	job	Stops and deletes the job and gives up underlying compute resources. This job cannot be resumed again. A new job needs to be started, if needed.
hyperpod list-pods	pod	Lists all the pods in the given job in a namespace

SageMaker HyperPod CLI command	Entity	Description
<code>hyperpod get-log</code>	pod	Retrieves the logs of a particular pod in a specified job
<code>hyperpod exec</code>	pod	Run the bash command in the shell of the specified pod(s) and publishes the output
<code>hyperpod --help</code>	utility	lists all supported commands

## Run jobs using the SageMaker HyperPod CLI

To run jobs, make sure that you installed Kubeflow Training Operator in the EKS clusters. For more information, see [the section called “Install packages on the Amazon EKS cluster using Helm”](#).

Run the `hyperpod get-cluster` command to get the list of available HyperPod clusters.

```
hyperpod get-clusters
```

Run the `hyperpod connect-cluster` to configure the SageMaker HyperPod CLI with the EKS cluster orchestrating the HyperPod cluster.

```
hyperpod connect-cluster --cluster-name <hyperpod-cluster-name>
```

Use the `hyperpod start-job` command to run a job. The following command shows the command with required options.

```
hyperpod start-job \  
  --job-name <job-name>  
  --image <docker-image-uri>  
  --entry-script <entrypoint-script>  
  --instance-type <ml.instance.type>  
  --node-count <integer>
```

The `hyperpod start-job` command also comes with various options such as job auto-resume and job scheduling.

## Enabling job auto-resume

The `hyperpod start-job` command also has the following options to specify job auto-resume. For enabling job auto-resume to work with the SageMaker HyperPod node resiliency features, you must set the value for the `restart-policy` option to `OnFailure`. The job must be running under the `kubeflow` namespace or a namespace prefixed with `hyperpod`.

- `[--auto-resume <bool>]` #Optional, enable job auto resume after fails, default is false
- `[--max-retry <int>]` #Optional, if auto-resume is true, max-retry default value is 1 if not specified
- `[--restart-policy <enum>]` #Optional, PyTorchJob restart policy. Available values are `Always`, `OnFailure`, `Never` or `ExitCode`. The default value is `OnFailure`.

```
hyperpod start-job \  
  ... // required options \  
  --auto-resume true \  
  --max-retry 3 \  
  --restart-policy OnFailure
```

## Running jobs with scheduling options

The `hyperpod start-job` command has the following options to set up the job with queuing mechanisms.

### Note

You need [Kueue](#) installed in the EKS cluster. If you haven't installed, follow the instructions in [Setup for SageMaker HyperPod task governance](#).

- `[--scheduler-type <enum>]` #Optional, Specify the scheduler type. The default is `Kueue`.
- `[--queue-name <string>]` #Optional, Specify the name of the [Local Queue](#) or [Cluster Queue](#) you want to submit with the job. The queue should be created by cluster admins using `CreateComputeQuota`.
- `[--priority <string>]` #Optional, Specify the name of the [Workload Priority Class](#), which should be created by cluster admins.

```
hyperpod start-job \  
  ... // required options \  
  --scheduler-type Kueue \  
  --queue-name my-queue \  
  --priority my-priority-class
```

```
... // required options
--scheduler-type Kueue \
--queue-name high-priority-queue \
--priority high
```

## Running jobs from a configuration file

As an alternative, you can create a job configuration file containing all the parameters required by the job and then pass this config file to the `hyperpod start-job` command using the `--config-file` option. In this case:

1. Create your job configuration file with the required parameters. Refer to the job configuration file in the SageMaker HyperPod CLI GitHub repository for a [baseline configuration file](#).
2. Start the job using the configuration file as follows.

```
hyperpod start-job --config-file /path/to/test_job.yaml
```

### Tip

For a complete list of parameters of the `hyperpod start-job` command, see the [Submitting a Job](#) section in the `README.md` of the SageMaker HyperPod CLI GitHub repository.

## Run jobs using `kubectl`

### Note

Training job auto resume requires Kubeflow Training Operator release version `1.7.0`, `1.8.0`, or `1.8.1`.

Note that you should install Kubeflow Training Operator in the clusters using a Helm chart. For more information, see [the section called “Install packages on the Amazon EKS cluster using Helm”](#). Verify if the Kubeflow Training Operator control plane is properly set up by running the following command.

```
kubectl get pods -n kubeflow
```

This should return an output similar to the following.

NAME	READY	STATUS	RESTARTS	AGE
training-operator-658c68d697-46zmn	1/1	Running	0	90s

### To submit a training job

To run a training jobs, prepare the job configuration file and run the [kubect1 apply](#) command as follows.

```
kubect1 apply -f /path/to/training_job.yaml
```

### To describe a training job

To retrieve the details of the job submitted to the EKS cluster, use the following command. It returns job information such as the job submission time, completion time, job status, configuration details.

```
kubect1 get -o yaml training-job -n kubeflow
```

### To stop a training job and delete EKS resources

To stop a training job, use `kubect1 delete`. The following is an example of stopping the training job created from the configuration file `pytorch_job_simple.yaml`.

```
kubect1 delete -f /path/to/training_job.yaml
```

This should return the following output.

```
pytorchjob.kubeflow.org "training-job" deleted
```

### To enable job auto-resume

SageMaker HyperPod supports job auto-resume functionality for Kubernetes jobs, integrating with the Kubeflow Training Operator control plane.

Ensure that there are sufficient nodes in the cluster that have passed the SageMaker HyperPod health check. The nodes should have the taint `sagemaker.amazonaws.com/node-health-status` set to `Schedulable`. It is recommended to include a node selector in the job YAML file to select nodes with the appropriate configuration as follows.

[sagemaker.amazonaws.com/node-health-status](https://sagemaker.amazonaws.com/node-health-status): Schedulable

The following code snippet is an example of how to modify a Kubeflow PyTorch job YAML configuration to enable the job auto-resume functionality. You need to add two annotations and set `restartPolicy` to `OnFailure` as follows.

```
apiVersion: "kubeflow.org/v1"
kind: PyTorchJob
metadata:
  name: pytorch-simple
  namespace: kubeflow
  annotations: { // config for job auto resume
    sagemaker.amazonaws.com/enable-job-auto-resume: "true"
    sagemaker.amazonaws.com/job-max-retry-count: "2"
  }
spec:
  pytorchReplicaSpecs:
    .....
  Worker:
    replicas: 10
    restartPolicy: OnFailure
    template:
      spec:
        nodeSelector:
          sagemaker.amazonaws.com/node-health-status: Schedulable
```

## To check the job auto-resume status

Run the following command to check the status of job auto-resume.

```
kubectl describe pytorchjob -n kubeflow <job-name>
```

Depending on the failure patterns, you might see two patterns of Kubeflow training job restart as follows.

### Pattern 1:

```
Start Time:    2024-07-11T05:53:10Z
```

```
Events:
```

Type	Reason	Age	From
Message			

```

## Observability for SageMaker HyperPod cluster orchestrated by Amazon EKS

To achieve comprehensive observability into your SageMaker HyperPod cluster resources and software components, integrate the cluster with [Amazon CloudWatch Container Insights](#), [Amazon Managed Service for Prometheus](#), and [Amazon Managed Grafana](#).

The integration with Amazon Managed Service for Prometheus enables the export of metrics related to your HyperPod cluster resources, providing insights into their performance, utilization, and health. The integration with Amazon Managed Grafana enables the visualization of these metrics through various Grafana dashboards that offer intuitive interface for monitoring and analyzing the cluster's behavior. By leveraging these services, you gain a centralized and unified view of your HyperPod cluster, facilitating proactive monitoring, troubleshooting, and optimization of your distributed training workloads.

**Tip**

To find practical examples and solutions, see also the [Observability](#) section in the [Amazon EKS Support in SageMaker HyperPod workshop](#).

Proceed to the following topics to set up for SageMaker HyperPod cluster observability.

**Topics**

- [Model observability for training jobs on SageMaker HyperPod clusters orchestrated by Amazon EKS](#)
- [Cluster observability](#)

**Model observability for training jobs on SageMaker HyperPod clusters orchestrated by Amazon EKS**

SageMaker HyperPod clusters orchestrated with Amazon EKS can integrate with the [MLflow application on Amazon SageMaker Studio](#). Cluster admins set up the MLflow server and connect it with the SageMaker HyperPod clusters. Data scientists can gain insights into the model

**To set up an MLflow server using AWS CLI**

An MLflow tracking server should be created by cluster admin.

1. Create a SageMaker AI MLflow tracking server, following the instructions at [Create a tracking server using the AWS CLI](#).
2. Make sure that the [eks-auth:AssumeRoleForPodIdentity](#) permission exists in the IAM execution role for SageMaker HyperPod.
3. If the `eks-pod-identity-agent` add-on is not already installed on your EKS cluster, install the add-on on the EKS cluster.

```
aws eks create-addon \
  --cluster-name <eks_cluster_name> \
  --addon-name eks-pod-identity-agent \
  --addon-version vx.y.z-eksbuild.1
```

#### 4. Create a trust-relationship.json file for a new role for Pod to call MLflow APIs.

```
cat >trust-relationship.json <<EOF
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowEksAuthToAssumeRoleForPodIdentity",
      "Effect": "Allow",
      "Principal": {
        "Service": "pods.eks.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
        "sts:TagSession"
      ]
    }
  ]
}
EOF
```

Run the following code to create the role and attach the trust relationship.

```
aws iam create-role --role-name hyperpod-mlflow-role \
  --assume-role-policy-document file://trust-relationship.json \
  --description "allow pods to emit mlflow metrics and put data in s3"
```

#### 5. Create the following policy that grants Pod access to call all sagemaker-mlflow operations and to put model artifacts in S3. S3 permission already exists within the tracking server but if the model artifacts is too big direct call to s3 is made from the MLflow code to upload the artifacts.

```
cat >hyperpod-mlflow-policy.json <<EOF
{
  "Version": "2012-10-17",
```

```
"Statement": [
  {
    "Effect": "Allow",
    "Action": [
      "sagemaker-mlflow:AccessUI",
      "sagemaker-mlflow:CreateExperiment",
      "sagemaker-mlflow:SearchExperiments",
      "sagemaker-mlflow:GetExperiment",
      "sagemaker-mlflow:GetExperimentByName",
      "sagemaker-mlflow>DeleteExperiment",
      "sagemaker-mlflow:RestoreExperiment",
      "sagemaker-mlflow:UpdateExperiment",
      "sagemaker-mlflow:CreateRun",
      "sagemaker-mlflow>DeleteRun",
      "sagemaker-mlflow:RestoreRun",
      "sagemaker-mlflow:GetRun",
      "sagemaker-mlflow:LogMetric",
      "sagemaker-mlflow:LogBatch",
      "sagemaker-mlflow:LogModel",
      "sagemaker-mlflow:LogInputs",
      "sagemaker-mlflow:SetExperimentTag",
      "sagemaker-mlflow:SetTag",
      "sagemaker-mlflow>DeleteTag",
      "sagemaker-mlflow:LogParam",
      "sagemaker-mlflow:GetMetricHistory",
      "sagemaker-mlflow:SearchRuns",
      "sagemaker-mlflow:ListArtifacts",
      "sagemaker-mlflow:UpdateRun",
      "sagemaker-mlflow:CreateRegisteredModel",
      "sagemaker-mlflow:GetRegisteredModel",
      "sagemaker-mlflow:RenameRegisteredModel",
      "sagemaker-mlflow:UpdateRegisteredModel",
      "sagemaker-mlflow>DeleteRegisteredModel",
      "sagemaker-mlflow:GetLatestModelVersions",
      "sagemaker-mlflow:CreateModelVersion",
      "sagemaker-mlflow:GetModelVersion",
      "sagemaker-mlflow:UpdateModelVersion",
      "sagemaker-mlflow>DeleteModelVersion",
      "sagemaker-mlflow:SearchModelVersions",
      "sagemaker-mlflow:GetDownloadURIForModelVersionArtifacts",
      "sagemaker-mlflow:TransitionModelVersionStage",
      "sagemaker-mlflow:SearchRegisteredModels",
      "sagemaker-mlflow:SetRegisteredModelTag",
      "sagemaker-mlflow>DeleteRegisteredModelTag",
```

```

        "sagemaker-mlflow:DeleteModelVersionTag",
        "sagemaker-mlflow:DeleteRegisteredModelAlias",
        "sagemaker-mlflow:SetRegisteredModelAlias",
        "sagemaker-mlflow:GetModelVersionByAlias"
    ],
    "Resource": "arn:aws:sagemaker:us-west-2:111122223333:mlflow-tracking-
server/<ml tracking server name>"
    },
    {
        "Effect": "Allow",
        "Action": [
            "s3:PutObject"
        ],
        "Resource": "arn:aws:s3:::<mlflow-s3-bucket_name>"
    }
]
}
EOF

```

### Note

The ARNs should be the one from the MLflow server and the S3 bucket set up with the MLflow server during the server you created following the instructions [Set up MLflow infrastructure](#).

6. Attach the `mlflow-metrics-emit-policy` policy to the `hyperpod-mlflow-role` using the policy document saved in the previous step.

```

aws iam put-role-policy \
  --role-name hyperpod-mlflow-role \
  --policy-name mlflow-metrics-emit-policy \
  --policy-document file://hyperpod-mlflow-policy.json

```

7. Create a Kubernetes service account for Pod to access the MLflow server.

```

cat >mlflow-service-account.yaml <<EOF
apiVersion: v1
kind: ServiceAccount
metadata:
  name: mlflow-service-account
  namespace: kubeflow

```

```
EOF
```

Run the following command to apply to the EKS cluster.

```
kubectl apply -f mlflow-service-account.yaml
```

## 8. Create a Pod identity association.

```
aws eks create-pod-identity-association \  
  --cluster-name EKS_CLUSTER_NAME \  
  --role-arn arn:aws:iam::111122223333:role/hyperpod-mlflow-role \  
  --namespace kubeflow \  
  --service-account mlflow-service-account
```

## To collect metrics from training jobs to the MLflow server

Data scientists need to set up the training script and docker image to emit metrics to the MLflow server.

### 1. Add the following lines at the beginning of your training script.

```
import mlflow  
  
# Set the Tracking Server URI using the ARN of the Tracking Server you created  
mlflow.set_tracking_uri(os.environ['MLFLOW_TRACKING_ARN'])  
# Enable autologging in MLflow  
mlflow.autolog()
```

### 2. Build a Docker image with the training script and push to Amazon ECR. Get the ARN of the ECR container. For more information about building and pushing a Docker image, see [Pushing a Docker image](#) in the *ECR User Guide*.

#### Tip

Make sure that you add installation of `mlflow` and `sagemaker-mlflow` packages in the Docker file. To learn more about the installation of the packages, requirements, and compatible versions of the packages, see [Install MLflow and the SageMaker AI MLflow plugin](#).

3. Add a service account in the training job Pods to give them access to hyperpod-mlflow-role. This allows Pods to call MLflow APIs. Run the following SageMaker HyperPod CLI job submission template. Create this with file name `mlflow-test.yaml`.

```
defaults:
  - override hydra/job_logging: stdout

hydra:
  run:
    dir: .
    output_subdir: null

training_cfg:
  entry_script: ./train.py
  script_args: []
  run:
    name: test-job-with-mlflow # Current run name
    nodes: 2 # Number of nodes to use for current training
    # ntasks_per_node: 1 # Number of devices to use per node
cluster:
  cluster_type: k8s # currently k8s only
  instance_type: ml.c5.2xlarge
  cluster_config:
    # name of service account associated with the namespace
    service_account_name: mlflow-service-account
    # persistent volume, usually used to mount FSx
    persistent_volume_claims: null
    namespace: kubeflow
    # required node affinity to select nodes with SageMaker HyperPod
    # labels and passed health check if burn-in enabled
    label_selector:
      required:
        sagemaker.amazonaws.com/node-health-status:
          - Schedulable
      preferred:
        sagemaker.amazonaws.com/deep-health-check-status:
          - Passed
    weights:
      - 100
    pullPolicy: IfNotPresent # policy to pull container, can be Always, IfNotPresent
    and Never
    restartPolicy: OnFailure # restart policy
```

```
base_results_dir: ./result # Location to store the results, checkpoints and logs.
container: 111122233333.dkr.ecr.us-west-2.amazonaws.com/tag # container to use

env_vars:
  NCCL_DEBUG: INFO # Logging level for NCCL. Set to "INFO" for debug information
  MLFLOW_TRACKING_ARN: arn:aws:sagemaker:us-west-2:111122233333:mlflow-tracking-server/
  tracking-server-name
```

4. Start the job using the YAML file as follows.

```
hyperpod start-job --config-file /path/to/mlflow-test.yaml
```

5. Generate a pre-signed URL for the MLflow tracking server. You can open the link on your browser and start tracking your training job.

```
aws sagemaker create-presigned-mlflow-tracking-server-url \
  --tracking-server-name "tracking-server-name" \
  --session-expiration-duration-in-seconds 1800 \
  --expires-in-seconds 300 \
  --region region
```

## Cluster observability

To gain visibility into the cluster resource utilization, set up Amazon CloudWatch Container Insights and Amazon Managed Grafana to extract metrics and visualize them on various dashboards.

### Topics

- [Amazon CloudWatch Container Insights](#)
- [Set up an Amazon Managed Grafana workspace](#)

## Amazon CloudWatch Container Insights

Use [Amazon CloudWatch Container Insights](#) to collect, aggregate, and summarize metrics and logs from the containerized applications and micro-services on the EKS cluster associated with a HyperPod cluster.

Amazon CloudWatch Insights collects metrics for compute resources, such as CPU, memory, disk, and network. Container Insights also provides diagnostic information, such as container restart

failures, to help you isolate issues and resolve them quickly. You can also set CloudWatch alarms on metrics that Container Insights collects.

To find a complete list of metrics, see [Amazon EKS and Kubernetes Container Insights metrics](#) in the *Amazon EKS User Guide*.

## Install CloudWatch Container Insights

Cluster admin users should set up CloudWatch Container Insights following the instructions at [Install the CloudWatch agent by using the Amazon CloudWatch Observability EKS add-on or the Helm chart](#) in the *CloudWatch User Guide*. For more information about Amazon EKS add-on, see also [Install the Amazon CloudWatch Observability EKS add-on](#) in the *Amazon EKS User Guide*.

After the installation has completed, verify that the CloudWatch Observability add-on is visible in the EKS cluster add-on tab. It might take about a couple of minutes until the dashboard loads.

### Note

SageMaker HyperPod requires the CloudWatch Insight v2.0.1-eksbuild.1 or later.

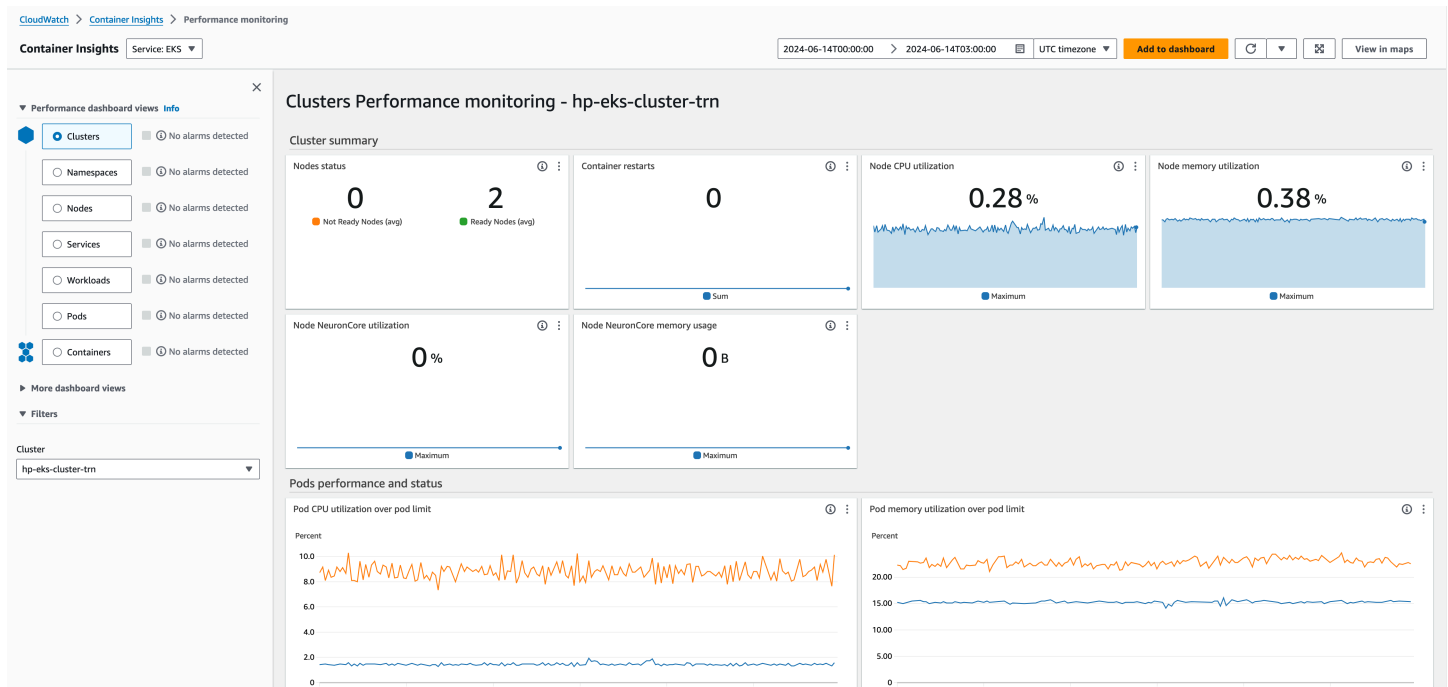

#### Amazon CloudWatch Observability

Install CloudWatch Agent and enable Container Insights and Application Signals within your cluster.

Category	Status	Version	IAM role for service account (IRSA)
observability	Creating	v2.0.1-eksbuild.1	Not set

## Access CloudWatch container insights dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. Choose **Insights**, and then choose **Container Insights**.
3. Select the EKS cluster set up with the HyperPod cluster you're using.
4. View the Pod/Cluster level metrics.

## Access CloudWatch container insights logs

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. Choose **Logs**, and then choose **Log groups**.

When you have the HyperPod clusters integrated with Amazon CloudWatch Container Insights, you can access the relevant log groups in the following format: `/aws/containerinsights /<eks-cluster-name>/*`. Within this log group, you can find and explore various types of logs such as Performance logs, Host logs, Application logs, and Data plane logs.

## Set up an Amazon Managed Grafana workspace

You can integrate SageMaker HyperPod with Amazon Managed Grafana and Amazon Managed Service for Prometheus to gain comprehensive cluster observability and visualize in various Grafana dashboards: the Kubernetes cluster monitoring dashboard, the NVIDIA DCGM exporter dashboard, and the FSx for Lustre metrics dashboard, and the EFA metrics dashboard.

## HyperPod in Studio

You can launch machine learning workloads on Amazon SageMaker HyperPod clusters and view HyperPod cluster information in Amazon SageMaker Studio. The increased visibility into cluster

details and hardware metrics can help your team identify the right candidate for your pre-training or fine-tuning workloads.

A set of commands are available to help you get started when you launch Studio IDEs on a HyperPod cluster. You can work on your training scripts, use Docker containers for the training scripts, and submit jobs to the cluster, all from within the Studio IDEs. The following sections provide information on how to set this up, how to discover clusters and monitor their tasks, how to view cluster information, and how to connect to HyperPod clusters in IDEs within Studio.

## Topics

- [Set up HyperPod in Studio](#)
- [HyperPod tabs in Studio](#)
- [Connect to HyperPod clusters and submit tasks to clusters](#)
- [Troubleshoot](#)

## Set up HyperPod in Studio

You need to set up the clusters depending on your choice of the cluster orchestrator to access your clusters through Amazon SageMaker Studio. In the following sections, choose the setup that matches with your orchestrator.

The instructions assume that you already have your cluster set up. For information on the cluster orchestrators and how to set up, start with the HyperPod orchestrator pages:

- [Orchestrating SageMaker HyperPod clusters with Slurm](#)
- [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#)

## Topics

- [Set up a Slurm cluster in Studio](#)
- [Set up an Amazon EKS cluster in Studio](#)

## Set up a Slurm cluster in Studio

The following instructions describe how to set up a HyperPod Slurm cluster in Studio.

1. Create a domain or have one ready. For information on creating a domain, see [Guide to getting set up with Amazon SageMaker AI](#).

2. (Optional) Create and attach a custom FSx for Lustre volume to your domain.
  - a. Ensure that your FSx Lustre file system exists in the same VPC as your intended domain, and is in one of the subnets present in the domain.
  - b. You can follow the instructions in [Adding a custom file system to a domain](#).
3. (Optional) We recommend that you add tags to your clusters to ensure a more smooth workflow. For information on how to add tags, see [Edit a SageMaker HyperPod cluster](#) to update your cluster using the SageMaker AI console.
  - a. Tag your FSx for Lustre file system to your Studio domain. This will help you identify the file system while launching your Studio spaces. To do so, add the following tag to your cluster to identify it with the FSx filesystem ID, fs-id.

Tag Key = "hyperpod-cluster-filesystem", Tag Value = "fs-id".

- b. Tag your [Amazon Managed Grafana](#) workspace to your Studio domain. This will be used to quickly link to your Grafana workspace directly from your cluster in Studio. To do so, add the following tag to your cluster to identify it with your Grafana workspace ID, ws-id.

Tag Key = "grafana-workspace", Tag Value = "ws-id".

4. Add the following permission to your execution role.

For information on SageMaker AI execution roles and how to edit them, see [Understanding domain space permissions and execution roles](#).

To learn how to attach policies to an IAM user or group, see [Adding and removing IAM identity permissions](#).

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ssm:StartSession",
        "ssm:TerminateSession"
      ],
      "Resource": "*"
    }
  ],
  {
```

```

        "Effect": "Allow",
        "Action": [
            "sagemaker:CreateCluster",
            "sagemaker:ListClusters"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": [
            "cloudwatch:PutMetricData",
            "cloudwatch:GetMetricData"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": [
            "sagemaker:DescribeCluster",
            "sagemaker:DescribeClusterNode",
            "sagemaker:ListClusterNodes",
            "sagemaker:UpdateCluster",
            "sagemaker:UpdateClusterSoftware"
        ],
        "Resource": "arn:aws:sagemaker:region:account-id:cluster/*"
    }
]
}

```

5. Add a tag to this IAM role, with Tag Key = "SSMSessionRunAs" and Tag Value = "os user". The os user here is the same user that you setup for the Slurm cluster. Manage access to SageMaker HyperPod clusters at an IAM role or user level by using the Run As feature in [AWS Systems Manager Agent \(SSM Agent\)](#). With this feature, you can start each SSM session using the operating system (OS) user associated to the IAM role or user.

For information on how to add tags to your execution role, see [Tag IAM roles](#).

6. [Turn on Run As support for Linux and macOS managed nodes](#). The Run As settings are account wide and is required for all SSM sessions to start successfully.
7. (Optional) [Restrict task view in Studio for Slurm clusters](#). For information on viewable tasks in Studio, see [Tasks](#).

In Amazon SageMaker Studio you can navigate to view your clusters in HyperPod clusters (under Compute).

## Restrict task view in Studio for Slurm clusters

You can restrict users to view Slurm tasks that are authorized to view, without requiring manual input of namespaces or additional permissions checks. The restriction is applied based on the users' IAM role, providing a streamlined and secure user experience. The following section provides information on how to restrict task view in Studio for Slurm clusters. For information on viewable tasks in Studio, see [Tasks](#).

All Studio users can view, manage, and interact with all Slurm cluster tasks by default. To restrict this, you can manage access to SageMaker HyperPod clusters at an IAM role or user level by using the **Run As** feature in [AWS Systems Manager Agent \(SSM Agent\)](#).

You can do this by tagging IAM roles with specific identifiers, such as their username or group. When a user accesses Studio, the Session Manager uses the Run As feature to execute commands as a specific Slurm user account that matches their IAM role tags. The Slurm configuration can be set up to limit task visibility based on the user account. The Studio UI will automatically filter tasks visible to that specific user account when commands are executed through the Run As feature. Once set up, each user assuming the role with the specified identifiers will have those Slurm tasks filtered based on the Slurm configuration. For information on how to add tags to your execution role, see [Tag IAM roles](#).

## Set up an Amazon EKS cluster in Studio

The following instructions describe how to set up an Amazon EKS cluster in Studio.

1. Create a domain or have one ready. For information on creating a domain, see [Guide to getting set up with Amazon SageMaker AI](#).
2. Add the following permission to your execution role.

For information on SageMaker AI execution roles and how to edit them, see [Understanding domain space permissions and execution roles](#).

To learn how to attach policies to an IAM user or group, see [Adding and removing IAM identity permissions](#).

```
{
  "Version": "2012-10-17",
  "Statement": [
```

```

    {
      "Sid": "DescribeHyperpodClusterPermissions",
      "Effect": "Allow",
      "Action": [
        "sagemaker:DescribeCluster"
      ],
      "Resource": "hyperpod-cluster-arn"
    },
    {
      "Effect": "Allow",
      "Action": "ec2:Describe*",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecr:CompleteLayerUpload",
        "ecr:GetAuthorizationToken",
        "ecr:UploadLayerPart",
        "ecr:InitiateLayerUpload",
        "ecr:BatchCheckLayerAvailability",
        "ecr:PutImage"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "cloudwatch:GetMetricData"
      ],
      "Resource": "*"
    },
    {
      "Sid": "UseEksClusterPermissions",
      "Effect": "Allow",
      "Action": [
        "eks:DescribeCluster",
        "eks:AccessKubernetesApi",
        "eks:DescribeAddon"
      ],
      "Resource": "eks-cluster-arn"
    },
    {

```

```

        "Sid": "ListClustersPermission",
        "Effect": "Allow",
        "Action": [
            "sagemaker:ListClusters"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": [
            "ssm:StartSession",
            "ssm:TerminateSession"
        ],
        "Resource": "*"
    }
]
}

```

### 3. [Grant IAM users access to Kubernetes with EKS access entries.](#)

- a. Navigate to the Amazon EKS cluster associated with your HyperPod cluster.
  - b. Choose the **Access** tab and [create an access entry](#) for the execution role you created.
    - i. In step 1, Select the execution role you created above in the **IAM** principal dropdown.
    - ii. In step 2, select a policy name and select an access scope that you want the users to have access to.
4. (Optional) To ensure a more smooth experience, we recommend that you add tags to your clusters. For information on how to add tags, see [Edit a SageMaker HyperPod cluster](#) to update your cluster using the SageMaker AI console.
- Tag your [Amazon Managed Grafana](#) workspace to your Studio domain. This will be used to quickly link to your Grafana workspace directly from your cluster in Studio. To do so, add the following tag to your cluster to identify it with your Grafana workspace ID, `ws-id`.

Tag Key = "grafana-workspace", Tag Value = "ws-id".

5. (Optional) [Restrict task view in Studio for EKS clusters](#). For information on viewable tasks in Studio, see [Tasks](#).

## Restrict task view in Studio for EKS clusters

You can restrict Kubernetes namespace permissions for users, so that they will only have access to view tasks belonging to a specified namespace. The following provides information on how to restrict the task view in Studio for EKS clusters. For information on viewable tasks in Studio, see [Tasks](#).

Users will have visibility to all EKS cluster tasks by default. You can restrict users' visibility for EKS cluster tasks to specified namespaces, ensuring that users can access the resources they need while maintaining strict access controls. You will need to provide the namespace for the user to display jobs of that namespace once the following is set up.

Once the restriction is applied, you will need to provide the namespace to the users assuming the role. Studio will only display the jobs of the namespace once the user provides inputs namespace they have permissions to view in the **Tasks** tab.

The following configuration allows administrators to grant specific, limited access to data scientists for viewing tasks within the cluster. This configuration grants the following permissions:

- List and get pods
- List and get events
- Get Custom Resource Definitions (CRDs)

### YAML Configuration

```
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
  name: pods-events-crd-cluster-role
rules:
- apiGroups: [""]
  resources: ["pods"]
  verbs: ["get", "list"]
- apiGroups: [""]
  resources: ["events"]
  verbs: ["get", "list"]
- apiGroups: ["apiextensions.k8s.io"]
  resources: ["customresourcedefinitions"]
  verbs: ["get"]
---
```

```
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRoleBinding
metadata:
  name: pods-events-crd-cluster-role-binding
subjects:
- kind: Group
  name: pods-events-crd-cluster-level
  apiGroup: rbac.authorization.k8s.io
roleRef:
  kind: ClusterRole
  name: pods-events-crd-cluster-role
  apiGroup: rbac.authorization.k8s.io
```

1. Save the YAML configuration to a file named `cluster-role.yaml`.
2. Apply the configuration using [kubectl](#):

```
kubectl apply -f cluster-role.yaml
```

3. Verify the configuration:

```
kubectl get clusterrole pods-events-crd-cluster-role
kubectl get clusterrolebinding pods-events-crd-cluster-role-binding
```

4. Assign users to the `pods-events-crd-cluster-level` group through your identity provider or IAM.

## HyperPod tabs in Studio

In Amazon SageMaker Studio you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view your list of clusters. The displayed clusters contain information like tasks, hardware metrics, settings, and metadata details. This visibility can help your team identify the right candidate for your pre-training or finetuning workloads. The following sections provide information on each type of information.

### Tasks

Amazon SageMaker HyperPod provides a view of your cluster tasks. Tasks are operations or jobs that are sent to the cluster. These can be machine learning operations, like training, running experiments, or inference. The following section provides information on your HyperPod cluster tasks.

In Amazon SageMaker Studio, you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view the **Tasks** information on your cluster. If you are having any issues with viewing tasks, see [Troubleshoot](#).

The task table includes:

#### For Slurm clusters

For Slurm clusters, the tasks currently in the Slurm job scheduler queue are shown in the table. The information shown for each task includes the task name, status, job ID, partition, run time, nodes, created by, and actions.

For a list and details about past jobs, use the [sacct](#) command in JupyterLab or a Code Editor terminal. The `sacct` command is used to view *historical information* about jobs that have *finished* or are *complete* in the system. It provides accounting information, including job resources usage like memory and exit status.

By default, all Studio users can view, manage, and interact with all available Slurm tasks. To restrict the viewable tasks to Studio users, see [Restrict task view in Studio for Slurm clusters](#).

#### For Amazon EKS clusters

For Amazon EKS clusters, kubeflow (PyTorch, MPI, TensorFlow) tasks are shown in the table. PyTorch tasks are shown by default. You can sort for PyTorch, MPI, and TensorFlow under **Task type**. The information that is shown for each task includes the task name, status, namespace, priority class, and creation time.

By default, all users can view jobs across all namespaces. To restrict the viewable Kubernetes namespaces available to Studio users, see [Restrict task view in Studio for EKS clusters](#). If a user cannot view the tasks and is asked to provide a namespace, they need to get that information from the administrator.

## Metrics

Amazon SageMaker HyperPod provides a view of your Slurm or Amazon EKS cluster utilization metrics. The following provides information on your HyperPod cluster metrics.

You will need to install the Amazon EKS add-on to view the following metrics. For more information, see [Install the Amazon CloudWatch Observability EKS add-on](#).

In Amazon SageMaker Studio, you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view the **Metrics** details on your cluster. Metrics provides a comprehensive view of cluster utilization metrics, including hardware, team, and task metrics. This includes compute availability and usage, team allocation and utilization, and task run and wait time information.

## Settings

Amazon SageMaker HyperPod provides a view of your cluster settings. The following provides information on your HyperPod cluster settings.

In Amazon SageMaker Studio you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view the **Settings** information on your cluster. The information includes the following:

- **Instances** details, including instance ID, status, instance type, and instance group
- **Instance groups** details, including instance group name, type, counts, and compute information
- **Orchestration** details, including the orchestrator, version, and certification authority
- **Cluster resiliency** details
- **Security** details, including subnets and security groups

## Details

Amazon SageMaker HyperPod provides a view of your cluster metadata details. The following paragraph provides information on how to get your HyperPod cluster details.

In Amazon SageMaker Studio, you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view the **Details** on your cluster. This includes the tags, logs, and metadata.

## Connect to HyperPod clusters and submit tasks to clusters

You can launch machine learning workloads on HyperPod clusters within Amazon SageMaker Studio IDEs. When you launch Studio IDEs on a HyperPod cluster, a set of commands are available to help you get started. You can work on your training scripts, use Docker containers for the training scripts, and submit jobs to the cluster, all from within the Studio IDEs. The following section provides information on how to connect your cluster to Studio IDEs.

In Amazon SageMaker Studio you can navigate to one of your clusters in **HyperPod clusters** (under **Compute**) and view your list of clusters. You can connect your cluster to an IDE listed under **Actions**.

You can also choose your custom file system from the list of options. For information on how to get this set up, see [Set up HyperPod in Studio](#).

Alternatively, you can create a space and launch an IDE using the AWS CLI. Use the following commands to do so. The following example creates a Private JupyterLab space for *user-profile-name* with the *fs-id* FSx for Lustre file system attached.

1. Create a space using the [create-space](#) AWS CLI.

```
aws sagemaker create-space \  
--region your-region \  
--ownership-settings "OwnerUserProfileName=user-profile-name" \  
--space-sharing-settings "SharingType=Private" \  
--space-settings  
"AppType=JupyterLab,CustomFileSystems=[{FSxLustreFileSystem={FileSystemId=fs-id}}]"
```

2. Create the app using the [create-app](#) AWS CLI.

```
aws sagemaker create-app \  
--region your-region \  
--space-name space-name \  
--resource-spec '{"ec2InstanceType":"","instance-type":"","appEnvironmentArn":"","image-arn"}'
```

Once you have your applications open, you can submit tasks directly to the clusters you are connected to.

## Troubleshoot

The following section lists troubleshooting solutions for HyperPod in Studio.

### Topics

- [Tasks tab](#)
- [Metrics tab](#)

### Tasks tab

If you get Custom Resource Definition (CRD) is not configured on the cluster while in the **Tasks** tab.

- Grant `EKSAdminViewPolicy` and `ClusterAccessRole` policies to your domain execution role.

For information on how to add tags to your execution role, see [Tag IAM roles](#).

To learn how to attach policies to an IAM user or group, see [Adding and removing IAM identity permissions](#).

If the tasks grid for Slurm metrics doesn't stop loading in the **Tasks** tab.

- Ensure that RunAs enabled in your [AWS Session Manager](#) preferences and the role you are using has the `SSMSessionRunAs` tag attached.
  - To enable RunAs, navigate to the **Preference** tab in the [Systems Manager console](#).
  - [Turn on Run As support for Linux and macOS managed nodes](#)

For restricted task view in Studio for EKS clusters:

- If your execution role doesn't have permissions to list namespaces for EKS clusters.
  - See [Restrict task view in Studio for EKS clusters](#).
- If users are experiencing issues with access for EKS clusters.
  1. Verify RBAC is enabled by running the following AWS CLI command.

```
kubectl api-versions | grep rbac
```

This should return `rbac.authorization.k8s.io/v1`.

2. Check if the `ClusterRole` and `ClusterRoleBinding` exist by running the following commands.

```
kubectl get clusterrole pods-events-crd-cluster-role  
kubectl get clusterrolebinding pods-events-crd-cluster-role-binding
```

3. Verify user group membership. Ensure the user is correctly assigned to the `pods-events-crd-cluster-level` group in your identity provider or IAM.
- If user can't see any resources.
    - Verify group membership and ensure the `ClusterRoleBinding` is correctly applied.
  - If users can see resources in all namespaces.

- If namespace restriction is required, consider using `Role` and `RoleBinding` instead of `ClusterRole` and `ClusterRoleBinding`.
- If configuration appears correct, but permissions aren't applied.
  - Check if there are any `NetworkPolicies` or `PodSecurityPolicies` interfering with access.

## Metrics tab

If there are no Amazon CloudWatch metrics are displayed in the **Metrics** tab.

- The `Metrics` section of HyperPod cluster details uses CloudWatch to fetch the data. In order to see the metrics in this section, you need to have enabled [Cluster observability](#). Contact your administrator to configure metrics.

## SageMaker HyperPod references

Find more information and references about using SageMaker HyperPod in the following topics.

### Topics

- [SageMaker HyperPod pricing](#)
- [SageMaker HyperPod APIs](#)
- [SageMaker HyperPod forms](#)
- [SageMaker HyperPod DLAMI](#)
- [SageMaker HyperPod API permissions reference](#)
- [SageMaker HyperPod commands in AWS CLI](#)
- [SageMaker HyperPod Python modules in AWS SDK for Python \(Boto3\)](#)

## SageMaker HyperPod pricing

The following topics provide information about SageMaker HyperPod pricing. To find more details on price per hour for using SageMaker HyperPod instances, see also [Amazon SageMaker Pricing](#).

### Capacity requests

You can allocate on-demand or reserved compute capacity with SageMaker AI for use on SageMaker HyperPod. On-demand cluster creation allocates available capacity from the SageMaker AI on-demand capacity pool. Alternatively, you can request reserved capacity to ensure access by submitting a ticket for a quota increase. Inbound capacity requests are prioritized by SageMaker AI and you receive an estimated time for capacity allocation.

## Service billing

When you provision a compute capacity on SageMaker HyperPod, you are billed for the duration of the capacity allocation. SageMaker HyperPod billing appears in your anniversary bills with a line item for the type of capacity allocation (on-demand, reserved), the instance type, and the time spent on using the instance.

To submit a ticket for a quota increase, see [the section called “SageMaker HyperPod quotas”](#).

## SageMaker HyperPod APIs

The following list is a full set of SageMaker HyperPod APIs for submitting action requests in JSON format to SageMaker AI through AWS CLI or AWS SDK for Python (Boto3).

- [BatchDeleteClusterNodes](#)
- [CreateCluster](#)
- [DeleteCluster](#)
- [DescribeCluster](#)
- [DescribeClusterNode](#)
- [ListClusterNodes](#)
- [ListClusters](#)
- [UpdateCluster](#)
- [UpdateClusterSoftware](#)

## SageMaker HyperPod forms

To configure the Slurm workload manager tool on HyperPod, you should create a Slurm configuration file required by HyperPod using the provided form.

## Configuration form for provisioning Slurm nodes on HyperPod

The following code is the Slurm configuration form you should prepare to properly set up Slurm nodes on your HyperPod cluster. You should complete this form and upload it as part of a set of lifecycle scripts during cluster creation. To learn how this form should be prepared throughout HyperPod cluster creation processes, see [the section called “Customize SageMaker HyperPod clusters using lifecycle scripts”](#).

```
// Save as provisioning_params.json.
{
  "version": "1.0.0",
  "workload_manager": "slurm",
  "controller_group": "string",
  "login_group": "string",
  "worker_groups": [
    {
      "instance_group_name": "string",
      "partition_name": "string"
    }
  ],
  "fsx_dns_name": "string",
  "fsx_mountname": "string"
}
```

- `version` – Required. This is the version of the HyperPod provisioning parameter form. Keep it to `1.0.0`.
- `workload_manager` – Required. This is for specifying which workload manager to be configured on the HyperPod cluster. Keep it to `slurm`.
- `controller_group` – Required. This is for specifying the name of the HyperPod cluster instance group you want to assign to Slurm controller (head) node.
- `login_group` – Optional. This is for specifying the name of the HyperPod cluster instance group you want to assign to Slurm login node.
- `worker_groups` – Required. This is for setting up Slurm worker (compute) nodes on the HyperPod cluster.
  - `instance_group_name` – Required. This is for specifying the name of the HyperPod instance group you want to assign to Slurm worker (compute) node.
  - `partition_name` – Required. This is for specifying the partition name to the node.

- `fsx_dns_name` – Optional. If you want to set up your Slurm nodes on the HyperPod cluster to communicate with Amazon FSx, specify the FSx DNS name.
- `fsx_mountname` – Optional. If you want to set up your Slurm nodes on the HyperPod cluster to communicate with Amazon FSx, specify the FSx mount name.

## SageMaker HyperPod DLAMI

SageMaker HyperPod runs a DLAMI based on:

- [AWS Deep Learning Base GPU AMI \(Ubuntu 20.04\)](#) for orchestration with Slurm.
- Amazon Linux 2 based AMI for orchestration with Amazon EKS.

The SageMaker HyperPod DLAMI is bundled with additional packages to support open source tools such as Slurm, Kubernetes, dependencies, and SageMaker HyperPod cluster software packages to support resiliency features such as cluster health check and auto-resume. To follow up with HyperPod software updates that the HyperPod service team distributes through DLAMIs, see [the section called “HyperPod release notes”](#).

## SageMaker HyperPod API permissions reference

### Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see [Provide permissions for tagging SageMaker AI resources](#).

[AWS managed policies for Amazon SageMaker AI](#) that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

When you are setting up access control for allowing to run SageMaker HyperPod API operations and writing a permissions policy that you can attach to IAM users for cloud administrators, use the following table as a reference.

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
CreateCluster	sagemaker:CreateCluster	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
DeleteCluster	sagemaker>DeleteCluster	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
DescribeCluster	sagemaker:DescribeCluster	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
DescribeClusterNode	sagemaker:DescribeClusterNode	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
ListClusterNodes	sagemaker>ListClusterNodes	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
ListClusters	sagemaker>ListClusters	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>
UpdateCluster	sagemaker:UpdateCluster	arn:aws:sagemaker: <i>region</i> : <i>account-id</i> :cluster/ <i>cluster-id</i>

`UpdateClusterSoftware``sagemaker:UpdateCl  
usterSoftware``arn:aws:sagemaker:  
 region:account-i  
d :cluster/ cluster-i  
d`

For a complete list of permissions and resource types for SageMaker APIs, see [Actions, resources, and condition keys for Amazon SageMaker AI](#) in the *AWS Service Authorization Reference*.

## SageMaker HyperPod commands in AWS CLI

The following are the AWS CLI commands for SageMaker HyperPod to run the core [HyperPod API operations](#).

- [batch-delete-cluster-nodes](#)
- [create-cluster](#)
- [delete-cluster](#)
- [describe-cluster](#)
- [describe-cluster-node](#)
- [list-cluster-nodes](#)
- [list-clusters](#)
- [update-cluster](#)
- [update-cluster-software](#)

## SageMaker HyperPod Python modules in AWS SDK for Python (Boto3)

The following are the methods of the AWS SDK for Python (Boto3) client for SageMaker AI to run the core [HyperPod API operations](#).

- [batch\\_delete\\_cluster\\_nodes](#)
- [create\\_cluster](#)
- [delete\\_cluster](#)
- [describe\\_cluster](#)
- [describe\\_cluster\\_node](#)
- [list\\_cluster\\_nodes](#)

- [list\\_clusters](#)
- [update\\_cluster](#)
- [update\\_cluster\\_software](#)

## Amazon SageMaker HyperPod release notes

This topic covers release notes that track update, fixes, and new features for Amazon SageMaker HyperPod. If you are looking for general feature releases, updates, and improvements for Amazon SageMaker HyperPod, you might find this page helpful.

The HyperPod AMI releases are documented separately to include information of the key components including general AMI releases, versions, and dependencies. If you are looking for these information related to HyperPod AMI releases, see [the section called "HyperPod AMI releases"](#).

### SageMaker HyperPod release notes: February 20, 2025

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Slurm](#) and [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#).

#### New features and improvements

- Added support for deleting instance groups from your SageMaker HyperPod cluster. For more information, see [the section called "Delete instance groups"](#) from EKS-orchestrated clusters and [the section called "Scale down a cluster"](#) for Slurm-orchestrated clusters.

### SageMaker HyperPod release notes: February 18, 2025

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Slurm](#) and [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#).

#### New features

- This release of SageMaker HyperPod incorporates a security update from the Nvidia container toolkit (from version 1.17.3 to version 1.17.4). For more information, see [v1.17.4 release note](#).

**Note**

For all container workloads in the Nvidia container toolkit version 1.17.4, the mounting of CUDA compatibility libraries is now disabled. To ensure compatibility with multiple CUDA versions on container workflows, update your LD\_LIBRARY\_PATH to include your CUDA compatibility libraries. You can find the specific steps in [???](#).

For information about related AMI releases, see [the section called “February 18, 2025”](#) and [the section called “February 18, 2025”](#).

**SageMaker HyperPod release notes: February 06, 2025**

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Slurm](#) and [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#).

**New features and improvements**

- Enhanced SageMaker HyperPod multi-AZ support: You can specify different subnets and security groups, cutting across different Availability Zones, for individual instance groups within your cluster. For more information about SageMaker HyperPod multi-AZ support, see [the section called “Setting up SageMaker HyperPod clusters across multiple AZs”](#).

**SageMaker HyperPod release notes: January 22, 2025****AMI releases**

- [???](#)

**SageMaker HyperPod release notes: January 09, 2025**

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

**New features and improvements**

- Added IPv6 support: Clusters can use IPv6 addressing when configured with IPv6-enabled VPC and subnets. For more information, see [the section called “Setting up SageMaker HyperPod with a custom Amazon VPC”](#).

## SageMaker HyperPod release notes: December 21, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

### New features

- SageMaker HyperPod now supports the following instance types for both Slurm and Amazon EKS clusters.
  - New instance types: C6gn, C6i, M6i, R6i.
  - New Trainium instance types: Trn1 and Trn1n.

### Improvements

- Enhanced error logging visibility when Slurm interrupts jobs, and prevented unnecessary job step termination during Slurm-initiated job cancellations.
- Updated base DLAMI for p5en for both Slurm and Amazon EKS clusters.

### AMI releases

- [???](#)
- [???](#)

## SageMaker HyperPod release notes: December 13, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

### New feature

- SageMaker HyperPod releases a set of Amazon CloudWatch metrics to monitor the health and performance of SageMaker HyperPod Slurm clusters. These metrics are related to CPU, GPU, memory utilization, and cluster instance information such as node counts and failed nodes. This

monitoring feature is enabled by default, and the metrics can be accessed under the `/aws/sagemaker/Clusters` CloudWatch namespace. You can also set up CloudWatch alarms based on these metrics to proactively detect and address potential issues within their Slurm-based HyperPod clusters. For more information, see [the section called “Amazon SageMaker HyperPod Slurm metrics”](#).

## AMI releases

- [the section called “December 13, 2024”](#)

## SageMaker HyperPod release notes: November 24, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

## New features

- Added support for configuring SageMaker HyperPod clusters across multiple Availability Zones. For more information about SageMaker HyperPod multi-AZ support, see [Setting up SageMaker HyperPod clusters across multiple AZs](#).

## AMI releases

- [the section called “November 24, 2024”](#)
- [the section called “November 24, 2024”](#)

## SageMaker HyperPod release notes: November 15, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#). For more information, see and [the section called “November 15, 2024”](#).

## New features and improvements

- Added support for `trn1` and `trn1n` instance types for both Amazon EKS and Slurm orchestrated clusters.
- Improved log management for Slurm clusters:

- Implemented log rotation: weekly or daily based on size.
- Set log retention to 3 weeks.
- Compressed logs to reduce storage impact.
- Continued uploading logs to CloudWatch for long-term retention.

**Note**

Some logs are still stored in syslog.

- Adjusted Fluent Bit settings to prevent tracking issues with files containing long lines.

**Bug fixes**

- Prevented unintended truncation with Slurm controller node updates in configuration file `slurm.config`.

**AMI releases**

- [the section called “November 15, 2024”](#)
- [the section called “November 15, 2024”](#)

**SageMaker HyperPod release notes: November 11, 2024**

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

**New feature**

- SageMaker HyperPod AMI now supports G6e instance types.

**AMI releases**

- [the section called “November 11, 2024”](#)
- [the section called “November 11, 2024”](#)

## SageMaker HyperPod release notes: October 31, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

### New features

- Added scaling down SageMaker HyperPod clusters at the instance group level and instance level for both Amazon EKS and Slurm orchestrated clusters. For more information about scaling down Amazon EKS clusters, see [Scale down a SageMaker HyperPod cluster](#). For more information about scaling down Slurm clusters, see *Scale down a cluster* in [Using the AWS CLI](#).
- SageMaker HyperPod now supports the P5e instance type for both Amazon EKS and Slurm orchestrated clusters.

## SageMaker HyperPod release notes: October 21, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

### New feature

- SageMaker HyperPod now supports the P5e[n], G6, Gr6, and Trn2[n] instance types for both Slurm and Amazon EKS clusters.

### AMI releases

- [the section called "October 21, 2024"](#)
- [the section called "October 21, 2024"](#)

## SageMaker HyperPod release notes: September 10, 2024

SageMaker HyperPod releases the following for [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#) and [Orchestrating SageMaker HyperPod clusters with Slurm](#).

### New features

- Added Amazon EKS support in SageMaker HyperPod. To learn more, see [the section called "Orchestrating HyperPod clusters with Amazon EKS"](#).

- Added support for managing SageMaker HyperPod clusters through AWS CloudFormation and Terraform. For more information about managing HyperPod clusters through AWS CloudFormation, see [CloudFormation documentation for AWS :: SageMaker :: Cluster](#). To learn about managing HyperPod clusters through Terraform, see [Terraform documentation for awssc\\_sagemaker\\_cluster](#).

## AMI releases

- [the section called "September 10, 2024"](#)
- [the section called "September 10, 2024"](#)

## SageMaker HyperPod release notes: August 20, 2024

SageMaker HyperPod releases the following for [the section called "Orchestrating HyperPod clusters with Slurm"](#).

### New features

- Enhanced the [SageMaker HyperPod auto-resume functionality](#), extending the resiliency capability for Slurm nodes attached with Generic RESources (GRES).

When [Generic Resources \(GRES\)](#) are attached to a Slurm node, Slurm typically doesn't permit changes in the node allocation, such as replacing nodes, and thus doesn't allow to resume a failed job. Unless explicitly forbidden, the HyperPod auto-resume functionality automatically re-queues any faulty job associated with the GRES-enabled nodes. This process involves stopping the job, placing it back into the job queue, and then restarting the job from the beginning.

### Other changes

- Pre-packaged [slurmrestd](#) in the SageMaker HyperPod AMI.
- Changed the default values for ResumeTimeout and UnkillableStepTimeout from 60 seconds to 300 seconds in `slurm.conf` to improve system responsiveness and job handling.
- Made minor improvements on health checks for NVIDIA Data Center GPU Manager (DCGM) and The NVIDIA System Management Interface (`nvidia-smi`).

### Bug fixes

- The HyperPod auto-resume plug-in can use idle nodes to resume a job.

## SageMaker HyperPod release notes: June 20, 2024

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### New features

- Added a new capability of attaching additional storage to SageMaker HyperPod cluster instances. With this capability, you can configure supplementary storage at the instance group configuration level during the cluster creation or update processes, either through the SageMaker HyperPod console or the [CreateCluster](#) and [UpdateCluster](#) APIs. The additional EBS volume is attached to each instance within a SageMaker HyperPod cluster and mounted to `/opt/sagemaker`. To learn more about implementing it in your SageMaker HyperPod cluster, see the updated documentation on the following pages.
  - [the section called “Getting started with SageMaker HyperPod”](#)
  - [the section called “SageMaker HyperPod operation”](#)

Note that you need to update the HyperPod cluster software to use this capability. After patching the HyperPod cluster software, you can utilize this capability for existing SageMaker HyperPod clusters created before June 20, 2024 by adding new instance groups. This capability is fully effective for any SageMaker HyperPod clusters created after June 20, 2024.

### Upgrade steps

- Run the following command to call the [UpdateClusterSoftware](#) API to update your existing HyperPod clusters with the latest HyperPod DLAMI. To find more instructions, see [the section called “Update the SageMaker HyperPod platform software of a cluster”](#).

#### Important

Back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see [the section called “Use the backup script provided by SageMaker HyperPod”](#).

```
aws sagemaker update-cluster-software --cluster-name your-cluster-name
```

### Note

Note that you should run the AWS CLI command to update your HyperPod cluster. Updating the HyperPod software through SageMaker HyperPod console UI is currently not available.

## SageMaker HyperPod release notes: April 24, 2024

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### Bug fixes

- Fixed a bug with the `ThreadsPerCore` parameter in the [ClusterInstanceGroupSpecification](#) API. With the fix, the [CreateCluster](#) and [UpdateCluster](#) APIs properly take and apply the user input through `ThreadsPerCore`. This fix is effective on HyperPod clusters created after April 24, 2024. If you had issues with this bug and want to get this fix applied to your cluster, you need to create a new cluster. Make sure that you back up and restore your work while moving to a new cluster following the instructions at [the section called “Use the backup script provided by SageMaker HyperPod”](#).

## SageMaker HyperPod release notes: March 27, 2024

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### HyperPod software patch

The HyperPod service team distributes software patches through [the section called “SageMaker HyperPod DLAMI”](#). See the following details about the latest HyperPod DLAMI.

- In this release of the HyperPod DLAMI, Slurm is built with REST service (`slurmd`) with JSON, YAML, and JWT support.
- Upgraded [Slurm](#) to v23.11.3.

## Improvements

- Increased auto-resume service timeout to 60 minutes.
- Improved instance replacement process to not restart the Slurm controller.
- Improved error messages from running lifecycle scripts, such as download errors and instance health check errors on instance start-up.

## Bug fixes

- Fixed a bug with chrony service that caused an issue with time synchronization.
- Fixed a bug with parsing `slurm.conf`.
- Fixed an issue with [NVIDIA go-dcgm](#) library.

## SageMaker HyperPod release notes: March 14, 2024

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### Improvements

- HyperPod now properly supports passing partition names provided through `provisioning_params.json` and creates partitions appropriately based on provided inputs. For more information about `provisioning_params.json`, see [the section called “SageMaker HyperPod forms”](#) and [the section called “Customize SageMaker HyperPod clusters using lifecycle scripts”](#).

### AMI releases

- [the section called “March 14, 2024”](#)

## SageMaker HyperPod release notes: February 15, 2024

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### New features

- Added a new `UpdateClusterSoftware` API for SageMaker HyperPod security patching. When security patches become available, we recommend you to update existing SageMaker HyperPod clusters in your account by running `aws sagemaker update-cluster-software --cluster-name your-cluster-name`. To follow up with future security patches, keep tracking this Amazon SageMaker HyperPod release notes page. To learn how the `UpdateClusterSoftware` API works, see [the section called “Update the SageMaker HyperPod platform software of a cluster”](#).

## SageMaker HyperPod release notes: November 29, 2023

SageMaker HyperPod releases the following for [the section called “Orchestrating HyperPod clusters with Slurm”](#).

### New features

- Launched Amazon SageMaker HyperPod at AWS re:Invent 2023.

### AMI releases

- [the section called “November 29, 2023”](#)

## Amazon SageMaker HyperPod AMI releases

Amazon SageMaker HyperPod Amazon Machine Images (AMIs) are specialized machine images for distributed machine learning workloads and high-performance computing. These AMIs enhance base images with essential components including GPU drivers and AWS Neuron accelerator support.

Key components added to HyperPod AMIs include:

- Advanced orchestration tools:
  - [Orchestrating SageMaker HyperPod clusters with Slurm](#)
  - [Orchestrating SageMaker HyperPod clusters with Amazon EKS](#)
- Cluster management dependencies
- Built-in resiliency features:
  - cluster health check

- auto-resume capabilities
- Support for HyperPod cluster management and configuration

These enhancements are built upon the following base Deep Learning AMIs (DLAMIs):

- [AWS Deep Learning AMIs Base GPU AMI \(Ubuntu 20.04\)](#) for orchestration with Slurm.
- Amazon Linux 2 based AMI for orchestration with Amazon EKS.

Choose your HyperPod AMIs based on your orchestration preference:

- For Slurm orchestration, see [the section called “AMI releases for Slurm”](#).
- For Amazon EKS orchestration, see [the section called “AMI releases for Amazon EKS”](#).

For information about Amazon SageMaker HyperPod feature releases, see [the section called “HyperPod release notes”](#).

## SageMaker HyperPod AMI releases for Slurm

The following release notes track the latest updates for Amazon SageMaker HyperPod AMI releases for Slurm orchestration. These HyperPod AMIs are built upon [AWS Deep Learning Base GPU AMI \(Ubuntu 20.04\)](#). The HyperPod service team distributes software patches through [the section called “SageMaker HyperPod DLAMI”](#). For HyperPod AMI releases for Amazon EKS orchestration, see [the section called “AMI releases for Amazon EKS”](#). For information about Amazon SageMaker HyperPod feature releases, see [the section called “HyperPod release notes”](#).

### Note

To update existing HyperPod clusters with the latest DLAMI, see [the section called “Update the SageMaker HyperPod platform software of a cluster”](#).

## SageMaker HyperPod AMI releases for Slurm: February 18, 2025

### Improvements for Slurm

- Upgraded Slurm version to 24.11.
- Upgraded Elastic Fabric Adapter (EFA) version from 1.37.0 to 1.38.0.

- The EFA now includes the AWS OFI NCCL plugin. You can find this plugin in the `/opt/amazon/ofi-nccl` directory, rather than the original `/opt/aws-ofi-nccl/` location. If you need to update your `LD_LIBRARY_PATH` environment variable, make sure to modify the path to point to the new `/opt/amazon/ofi-nccl` location for the OFI NCCL plugin.
- Removed the emacs package from these DLAMIs. You can install emacs from GNU emacs.

## Amazon SageMaker HyperPod DLAMI for Slurm support

Installed the latest version of neuron SDK 2.19

- **aws-neuronx-collectives/unknown:** 2.23.135.0-3e70920f2 amd64
- **aws-neuronx-dkms/unknown:** 2.19.64.0 amd64
- **aws-neuronx-runtime-lib/unknown:** 2.23.112.0-9b5179492 amd64
- **aws-neuronx-tools/unknown:** 2.20.204.0 amd64

## SageMaker HyperPod AMI releases for Slurm: December 21, 2024

### SageMaker HyperPod DLAMI for Slurm support

Deep Learning Slurm AMI

- **NVIDIA driver:** 550.127.05
- **EFA driver:** 2.13.0-1
- Installed the latest version of AWS Neuron SDK
  - **aws-neuronx-collectives:** 2.22.33.0
  - **aws-neuronx-dkms:** 2.18.20.0
  - **aws-neuronx-oci-hook:** 2.5.8.0
  - **aws-neuronx-runtime-lib:** 2.22.19.0
  - **aws-neuronx-tools:** 2.19.0.0

## SageMaker HyperPod AMI releases for Slurm: November 24, 2024

### AMI general updates

- Released in MEL (Melbourne) Region.

- Updated SageMaker HyperPod base DLAMI to the following versions:
  - Slurm: 2024-11-22.

## SageMaker HyperPod AMI releases for Slurm: November 15, 2024

### AMI general updates

- Installed latest `libnvidia-nscq-xxx` package.

## SageMaker HyperPod DLAMI for Slurm support

### Deep Learning Slurm AMI

- **NVIDIA driver:** 550.127.05
- **EFA driver:** 2.13.0-1
- Installed the latest version of AWS Neuron SDK
  - **aws-neuronx-collectives:** v2.22.33.0-d2128d1aa
  - **aws-neuronx-dkms:** v2.17.17.0
  - **aws-neuronx-oci-hook:** v2.4.4.0
  - **aws-neuronx-runtime-lib:** v2.21.41.0
  - **aws-neuronx-tools:** v2.18.3.0

## SageMaker HyperPod AMI releases for Slurm: November 11, 2024

### AMI general updates

- Updated SageMaker HyperPod base DLAMI to the following version:
  - Slurm: 2024-10-23.

## SageMaker HyperPod AMI releases for Slurm: October 21, 2024

### AMI general updates

- Updated SageMaker HyperPod base DLAMI to the following versions:
  - Slurm: 2024-09-27.

## SageMaker HyperPod AMI releases for Slurm: September 10, 2024

### SageMaker HyperPod DLAMI for Slurm support

#### Deep Learning Slurm AMI

- Installed the NVIDIA driver v550.90.07
- Installed the EFA driver v2.10
- Installed the latest version of AWS Neuron SDK
  - **aws-neuronx-collectives:** v2.21.46.0
  - **aws-neuronx-dkms:** v2.17.17.0
  - **aws-neuronx-oci-hook:** v2.4.4.0
  - **aws-neuronx-runtime-lib:** v2.21.41.0
  - **aws-neuronx-tools:** v2.18.3.0

## SageMaker HyperPod AMI releases for Slurm: March 14, 2024

### HyperPod DLAMI for Slurm software patch

- Upgraded [Slurm](#) to v23.11.1
- Added [OpenPMIx](#) v4.2.6 for enabling [Slurm with PMIx](#).
- Built upon the [AWS Deep Learning Base GPU AMI \(Ubuntu 20.04\)](#) released on 2023-10-26
- A complete list of pre-installed packages in this HyperPod DLAMI in addition to the base AMI
  - [Slurm](#): v23.11.1
  - [OpenPMIx](#) : v4.2.6
  - Munge: v0.5.15
  - aws-neuronx-dkms: v2.\*
  - aws-neuronx-collectives: v2.\*
  - aws-neuronx-runtime-lib: v2.\*
  - aws-neuronx-tools: v2.\*
  - SageMaker HyperPod software packages to support features such as cluster health check and auto-resume

### Upgrade steps

- Run the following command to call the [UpdateClusterSoftware](#) API to update your existing HyperPod clusters with the latest HyperPod DLAMI. To find more instructions, see [the section called “Update the SageMaker HyperPod platform software of a cluster”](#).

### Important

Back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see [the section called “Use the backup script provided by SageMaker HyperPod”](#).

```
aws sagemaker update-cluster-software --cluster-name your-cluster-name
```

### Note

Note that you should run the AWS CLI command to update your HyperPod cluster. Updating the HyperPod software through SageMaker HyperPod console UI is currently not available.

## SageMaker HyperPod AMI release for Slurm: November 29, 2023

### HyperPod DLAMI for Slurm software patch

The HyperPod service team distributes software patches through [the section called “SageMaker HyperPod DLAMI”](#). See the following details about the latest HyperPod DLAMI.

- Built upon the [AWS Deep Learning Base GPU AMI \(Ubuntu 20.04\)](#) released on 2023-10-18
- A complete list of pre-installed packages in this HyperPod DLAMI in addition to the base AMI
  - [Slurm](#): v23.02.3
  - Munge: v0.5.15
  - `aws-neuronx-dkms`: v2.\*
  - `aws-neuronx-collectives`: v2.\*
  - `aws-neuronx-runtime-lib`: v2.\*

- `aws-neuronx-tools`: v2.\*
- SageMaker HyperPod software packages to support features such as cluster health check and auto-resume

## SageMaker HyperPod AMI releases for Amazon EKS

The following release notes track the latest updates for Amazon SageMaker HyperPod AMI releases for Amazon EKS orchestration. Each release note includes a summarized list of packages pre-installed or pre-configured in the SageMaker HyperPod DLAMIs for Amazon EKS support. Each DLAMI is built on Amazon Linux 2 (AL2) and supports a specific Kubernetes version. For HyperPod DLAMI releases for Slurm orchestration, see [the section called “AMI releases for Slurm”](#). For information about Amazon SageMaker HyperPod feature releases, see [the section called “HyperPod release notes”](#).

### SageMaker HyperPod AMI releases for Amazon EKS: February 18, 2025

#### Improvements for K8s

- Upgraded Nvidia container toolkit from version 1.17.3 to version 1.17.4.
- Fixed the issue where customers were unable to connect to nodes after a reboot.
- Upgraded Elastic Fabric Adapter (EFA) version from 1.37.0 to 1.38.0.
- The EFA now includes the AWS OFI NCCL plugin, which is located in the `/opt/amazon/ofi-ncc1` directory instead of the original `/opt/aws-ofi-ncc1/` path. If you need to update your `LD_LIBRARY_PATH` environment variable, make sure to modify the path to point to the new `/opt/amazon/ofi-ncc1` location for the OFI NCCL plugin.
- Removed the emacs package from these DLAMIs. You can install emacs from GNU emacs.

### SageMaker HyperPod DLAMI for Amazon EKS support

Installed the latest version of neuron SDK

- `aws-neuronx-dkms.noarch`: 2.19.64.0-dkms @neuron
- `aws-neuronx-oci-hook.x86_64`: 2.4.4.0-1 @neuron
- `aws-neuronx-tools.x86_64`: 2.18.3.0-1 @neuron
- `aws-neuronx-collectives.x86_64`: 2.23.135.0\_3e70920f2-1 neuron
- `aws-neuronx-gpsimd-customop.x86_64`: 0.2.3.0-1 neuron

- **aws-neuronx-gpsimd-customop-lib.x86\_64**
- **aws-neuronx-gpsimd-tools.x86\_64**: 0.13.2.0\_94ba34927-1 neuron
- **aws-neuronx-k8-plugin.x86\_64**: 2.23.45.0-1 neuron
- **aws-neuronx-k8-scheduler.x86\_64**: 2.23.45.0-1 neuron
- **aws-neuronx-runtime-lib.x86\_64**: 2.23.112.0\_9b5179492-1 neuron
- **aws-neuronx-tools.x86\_64**: 2.20.204.0-1 neuron
- **tensorflow-model-server-neuronx.x86\_64**

## SageMaker HyperPod AMI releases for Amazon EKS: January 22, 2025

### AMI general updates

- New SageMaker HyperPod AMI for Amazon EKS 1.31.2.

### SageMaker HyperPod DLAMI for Amazon EKS support

The AMIs include the following:

#### Deep Learning EKS AMI 1.31

- **Amazon EKS Components**
  - Kubernetes Version: 1.31.2
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent**: 3.3.987
- **Linux Kernel**: 5.10.230
- **OSS Nvidia driver**: 550.127.05
- **NVIDIA CUDA**: 12.4
- **EFA Installer**: 1.37.0
- **GDRCopy**: 2.4.1-1
- **Nvidia container toolkit**: 1.17.3
- **AWS OFI NCCL**: 1.13.0

- **aws-neuronx-tools:** 2.18.3
- **aws-neuronx-runtime-lib:** 2.23.112.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.23.133.0

## SageMaker HyperPod AMI releases for Amazon EKS: December 21, 2024

### SageMaker HyperPod DLAMI for Amazon EKS support

The AMIs include the following:

K8s v1.28

- **Amazon EKS Components**
  - Kubernetes Version: 1.28.15
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent:** 3.3.987
- **Linux Kernel:** 5.10.228
- **OSS NVIDIA driver:** 550.127.05
- **NVIDIA CUDA:** 12.4
- **EFA Installer:** 1.37.0
- **GDRCopy:** 2.4
- **NVIDIA container toolkit:** 1.17.3
- **AWS OFI NCCL:** 1.13.0
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.23.112.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.23.135.0

## K8s v1.29

- **Amazon EKS Components**
  - Kubernetes Version: 1.29.10
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent:** 3.3.987
- **Linux Kernel:** 5.15.0
- **OSS Nvidia driver:** 550.127.05
- **NVIDIA CUDA:** 12.4
- **EFA Installer:** 1.37.0
- **GDRCopy:** 2.4
- **Nvidia container toolkit:** 1.17.3
- **AWS OFI NCCL:** 1.13.0
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.23.112.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.23.135.0

## K8s v1.30

- **Amazon EKS Components**
  - Kubernetes Version: 1.30.6
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent:** 3.3.987.0
- **Linux Kernel:** 5.10.228
- **OSS Nvidia driver:** 550.127.05

- **NVIDIA CUDA:** 12.4
- **EFA Installer:** 1.37.0
- **GDRCopy:** 2.4
- **Nvidia container toolkit:** 1.17.3
- **AWS OFI NCCL:** 1.13.0
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.23.112.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.23.135.0

### **SageMaker HyperPod AMI releases for Amazon EKS: December 13, 2024**

#### **SageMaker HyperPod DLAMI for Amazon EKS upgrade**

- Updated SSM Agent to version 3.3.1311.0.

### **SageMaker HyperPod AMI releases for Amazon EKS: November 24, 2024**

#### **AMI general updates**

- Released in MEL (Melbourne) Region.
- Updated SageMaker HyperPod base DLAMI to the following versions:
  - Kubernetes: 2024-11-01.

### **SageMaker HyperPod AMI releases for Amazon EKS: November 15, 2024**

#### **SageMaker HyperPod DLAMI for Amazon EKS support**

The AMIs include the following:

##### **Deep Learning EKS AMI 1.28**

- **Amazon EKS Components**
  - Kubernetes Version: 1.28.15

- Containerd Version: 1.7.23
- Runc Version: 1.1.14
- AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent: 3.3.987**
- **Linux Kernel: 5.10.228**
- **OSS NVIDIA driver: 550.127.05**
- **NVIDIA CUDA: 12.4**
- **EFA Installer: 1.34.0**
- **GDRCopy: 2.4**
- **NVIDIA container toolkit: 1.17.3**
- **AWS OFI NCCL: 1.11.0**
- **aws-neuronx-tools: 2.18.3.0-1**
- **aws-neuronx-runtime-lib: 2.22.19.0**
- **aws-neuronx-oci-hook: 2.4.4.0-1**
- **aws-neuronx-dkms: 2.18.20.0**
- **aws-neuronx-collectives: 2.22.33.0**

## Deep Learning EKS AMI 1.29

- **Amazon EKS Components**
  - Kubernetes Version: 1.29.10
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent: 3.3.987**
- **Linux Kernel: 5.10.228**
- **OSS Nvidia driver: 550.127.05**
- **NVIDIA CUDA: 12.4**
- **EFA Installer: 1.34.0**
- **GDRCopy: 2.4**
- **Nvidia container toolkit: 1.17.3**

- **AWS OFI NCCL:** 1.11.0
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.22.19.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.22.33.0

## Deep Learning EKS AMI 1.30

- **Amazon EKS Components**
  - Kubernetes Version: 1.30.6
  - Containerd Version: 1.7.23
  - Runc Version: 1.1.14
  - AWS IAM Authenticator: 0.6.26
- **Amazon SSM Agent:** 3.3.987
- **Linux Kernel:** 5.10.228
- **OSS Nvidia driver:** 550.127.05
- **NVIDIA CUDA:** 12.4
- **EFA Installer:** 1.34.0
- **GDRCopy:** 2.4
- **Nvidia container toolkit:** 1.17.3
- **AWS OFI NCCL:** 1.11.0
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.22.19.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.18.20.0
- **aws-neuronx-collectives:** 2.22.33.0

## SageMaker HyperPod AMI releases for Amazon EKS: November 11, 2024

### AMI general updates

- Updated SageMaker HyperPod DLAMI with Amazon EKS versions 1.28.13, 1.29.8, 1.30.4.

## SageMaker HyperPod AMI releases for Amazon EKS: October 21, 2024

### AMI general updates

- Updated SageMaker HyperPod base DLAMI to the following versions:
  - Amazon EKS: 1.28.11, 1.29.6, 1.30.2.

## SageMaker HyperPod AMI releases for Amazon EKS: September 10, 2024

### SageMaker HyperPod DLAMI for Amazon EKS support

The AMIs include the following:

#### Deep Learning EKS AMI 1.28

- **Amazon EKS Components**
  - Kubernetes Version: 1.28.11
  - Containerd Version: 1.7.20
  - Runc Version: 1.1.11
  - AWS IAM Authenticator: 0.6.21
- **Amazon SSM Agent:** 3.3.380
- **Linux Kernel:** 5.10.223
- **OSS NVIDIA driver:** 535.183.01
- **NVIDIA CUDA:** 12.2
- **EFA Installer:** 1.32.0
- **GDRCopy:** 2.4
- **NVIDIA container toolkit:** 1.16.1
- **AWS OFI NCCL:** 1.9.1
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.21.41.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.17.17.0
- **aws-neuronx-collectives:** 2.21.46.0

## Deep Learning EKS AMI 1.29

- **Amazon EKS Components**
  - Kubernetes Version: 1.29.6
  - Containerd Version: 1.7.20
  - Runc Version: 1.1.11
  - AWS IAM Authenticator: 0.6.21
- **Amazon SSM Agent:** 3.3.380
- **Linux Kernel:** 5.10.223
- **OSS Nvidia driver:** 535.183.01
- **NVIDIA CUDA:** 12.2
- **EFA Installer:** 1.32.0
- **GDRCopy:** 2.4
- **Nvidia container toolkit:** 1.16.1
- **AWS OFI NCCL:** 1.9.1
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.21.41.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.17.17.0
- **aws-neuronx-collectives:** 2.21.46.0

## Deep Learning EKS AMI 1.30

- **Amazon EKS Components**
  - Kubernetes Version: 1.30.2
  - Containerd Version: 1.7.20
  - Runc Version: 1.1.11
  - AWS IAM Authenticator: 0.6.21
- **Amazon SSM Agent:** 3.3.380
- **Linux Kernel:** 5.10.223
- **OSS Nvidia driver:** 535.183.01
- **NVIDIA CUDA:** 12.2

- **EFA Installer:** 1.32.0
- **GDRCopy:** 2.4
- **Nvidia container toolkit:** 1.16.1
- **AWS OFI NCCL:** 1.9.1
- **aws-neuronx-tools:** 2.18.3.0-1
- **aws-neuronx-runtime-lib:** 2.21.41.0
- **aws-neuronx-oci-hook:** 2.4.4.0-1
- **aws-neuronx-dkms:** 2.17.17.0
- **aws-neuronx-collectives:** 2.21.46.0

## Generative AI in SageMaker notebook environments

[Jupyter AI](#) is an open-source extension of JupyterLab integrating generative AI capabilities into Jupyter notebooks. Through the Jupyter AI chat interface and magic commands, users experiment with code generated from natural language instructions, explain existing code, ask questions about their local files, generate entire notebooks, and more. The extension connects Jupyter notebooks with large language models (LLMs) that users can use to generate text, code, or images, and to ask questions about their own data. Jupyter AI supports generative model providers such as AI21, Anthropic, AWS (JumpStart and Amazon Bedrock), Cohere, and OpenAI.

You can also use Amazon Q Developer as an out of the box solution. Instead of having to manually set up a connection to a model, you can start using Amazon Q Developer with minimal configuration. When you enable Amazon Q Developer, it becomes the default solution provider within Jupyter AI. For more information about using Amazon Q Developer, see [SageMaker JupyterLab](#).

The extension's package is included in [Amazon SageMaker Distribution version 1.2 and onwards](#). Amazon SageMaker Distribution is a Docker environment for data science and scientific computing used as the default image of JupyterLab notebook instances. Users of different IPython environments can install Jupyter AI manually.

In this section, we provide an overview of Jupyter AI capabilities and demonstrate how to configure models provided by JumpStart or Amazon Bedrock from [JupyterLab](#) or [Studio Classic](#) notebooks. For more in-depth information on the Jupyter AI project, refer to its [documentation](#). Alternatively, you can refer to the blog post [Generative AI in Jupyter](#) for an overview and examples of key Jupyter AI capabilities.

Before using Jupyter AI and interacting with your LLMs, make sure that you satisfy the following prerequisites:

- For models hosted by AWS, you should have the ARN of your SageMaker AI endpoint or have access to Amazon Bedrock. For other model providers, you should have the API key used to authenticate and authorize requests to your model. Jupyter AI supports a wide range of model providers and language models, refer to the list of its [supported models](#) to stay updated on the latest available models. For information on how to deploy a model in JumpStart, see [Deploy a Model](#) in the JumpStart documentation. You need to request access to [Amazon Bedrock](#) to use it as your model provider.
- Ensure that Jupyter AI libraries are present in your environment. If not, install the required package by following the instructions in [Jupyter AI installation](#).
- Familiarize yourself with the capabilities of Jupyter AI in [Access Jupyter AI Features](#).
- Configure the target models you wish to use by following the instructions in [Configure your model provider](#).

After completing the prerequisite steps, you can proceed to [Use Jupyter AI in JupyterLab or Studio Classic](#).

## Topics

- [Jupyter AI installation](#)
- [Access Jupyter AI Features](#)
- [Configure your model provider](#)
- [Use Jupyter AI in JupyterLab or Studio Classic](#)

## Jupyter AI installation

To use Jupyter AI, you must first install the Jupyter AI package. For [Amazon SageMaker AI Distribution](#) users, we recommend selecting the SageMaker Distribution image version 1.2 or later. No further installation is necessary. Users of JupyterLab in Studio can choose the version of their Amazon SageMaker Distribution when creating a space.

For users of other IPython environments, the version of the recommended Jupyter AI package depends on the version of JupyterLab they are using.

The Jupyter AI distribution consists of two packages.

- `jupyter_ai`: This package provides a JupyterLab extension and a native chat user interface (UI). It acts as a conversational assistant using the large language model of your choice.
- `jupyter_ai_magics`: This package provides the IPython `%%ai` and `%ai` magic commands with which you can invoke a large language model (LLM) from your notebook cells.

### Note

Installing `jupyter_ai` also installs `jupyter_ai_magics`. However, you can install `jupyter_ai_magics` independently without JupyterLab or `jupyter_ai`. The magic commands `%%ai` and `%ai` work in any IPython kernel environment. If you only install `jupyter_ai_magics`, you can't use the chat UI.

For users of JupyterLab 3, in particular Studio Classic users, we recommend installing `jupyter-ai` [version 1.5.x](#) or any later 1.x version. However, we highly recommend using Jupyter AI with JupyterLab 4. The `jupyter-ai` version compatible with JupyterLab 3 may not allow users to set additional model parameters such as temperature, top-k and top-p sampling, max tokens or max length, or user acceptance license agreements.

For users of JupyterLab 4 environments that do not use SageMaker Distribution, we recommend installing `jupyter-ai` [version 2.5.x](#) or any later 2.x version.

See the installation instructions in the *Installation* section of [Jupyter AI documentation](#).

## Access Jupyter AI Features

You can access Jupyter AI capabilities through two distinct methods: using the chat UI or using magic commands within notebooks.

### From the chat user interface AI assistant

The chat interface connects you with JupyterLab, a conversational agent that uses the language model of your choice.

After launching a JupyterLab application installed with Jupyter AI, you can access the chat interface by choosing the chat icon

in the left navigation panel. First-time users are prompted to configure their model. See [Configure your model provider in the chat UI](#) for configuration instructions.

### Using the chat UI, you can:

- **Answer questions:** For instance, you can ask JupyterLab to create a Python function that adds CSV files to an Amazon S3 bucket. Subsequently, you can refine your answer with a follow-up question, such as adding a parameter to the function to choose the path where the files are written.
- **Interact with files in JupyterLab:** You can include a portion of your notebook in your prompt by selecting it. Then, you can either replace it with the model's suggested answer or manually copy the answer to your clipboard.
- **Generate entire notebooks** from prompts: By starting your prompt with `/generate`, you trigger a notebook generation process in the background without interrupting your use of JupyterLab. A message containing the link to the new file is displayed upon completion of the process.
- **Learn from and ask questions about local files:** Using the `/learn` command, you can teach an embedding model of your choice about local files and then ask questions about those files using the `/ask` command. Jupyter AI stores the embedded content in a local [FAISS vector database](#), then uses retrieval-augmented generation (RAG) to provide answers based on what it has learned. To erase all previously learned information from your embedding model, use `/learn -d`.

#### Note

Amazon Q developer doesn't have the capability to generate notebooks from scratch.

For a complete list of features and detailed instructions on their usage, see the [Jupyter AI chat interface](#) documentation. To learn about how to configure access to a model in JupyterLab, see [Configure your model provider in the chat UI](#).

## From notebook cells

Using `%ai` and `ai` magic commands, you can interact with the language model of your choice from your notebook cells or any IPython command line interface. The `%ai` command applies your instructions to the entire cell, whereas `ai` apply them to the specific line.

The following example illustrates an `%%ai` magic command invoking an Anthropic Claude model to output an HTML file containing the image of a white square with black borders.

```
%%ai anthropic:claude-v1.2 -f html
Create a square using SVG with a black border and white fill.
```

To learn about the syntax of each command, use `%ai help`. To list the providers and models supported by the extension, run `%ai list`.

For a complete list of features and detailed instructions on their usage, see the Jupyter AI [magic commands](#) documentation. In particular, you can customize the output format of your model using the `-f` or `--format` parameter, allow variable interpolation in prompts, including special In and Out variables, and more.

To learn about how to configure the access to a model, see [Configure your model provider in a notebook](#).

## Configure your model provider

### Note

In this section, we assume that the language and embedding models that you plan to use are already deployed. For models provided by AWS, you should already have the ARN of your SageMaker AI endpoint or access to Amazon Bedrock. For other model providers, you should have the API key used to authenticate and authorize requests to your model. Jupyter AI supports a wide range of model providers and language models, refer to the list of its [supported models](#) to stay updated on the latest available models. For information on how to deploy a model provided by JumpStart, see [Deploy a Model](#) in the JumpStart documentation. You need to request access to [Amazon Bedrock](#) to use it as your model provider.

The configuration of Jupyter AI varies depending on whether you are using the chat UI or magic commands.

## Configure your model provider in the chat UI

### Note

You can configure several LLMs and embedding models following the same instructions. However, you must configure at least one **Language model**.

### To configure your chat UI

1. In JupyterLab, access the chat interface by choosing the chat icon

in the left navigation panel.

2. Choose the configuration icon

in the top right corner of the left pane. This opens the Jupyter AI configuration panel.

3. Fill out the fields related to your service provider.

- **For models provided by JumpStart or Amazon Bedrock**

- In the **language model** dropdown list, select `sagemaker-endpoint` for models deployed with JumpStart or `bedrock` for models managed by Amazon Bedrock.
- The parameters differ based on whether your model is deployed on SageMaker AI or Amazon Bedrock.
  - For models deployed with JumpStart:
    - Enter the name of your endpoint in **Endpoint name**, and then the AWS Region in which your model is deployed in **Region name**. To retrieve the ARN of the SageMaker AI endpoints, navigate to <https://console.aws.amazon.com/sagemaker/> and then choose **Inference** and **Endpoints** in the left menu.
    - Paste the JSON of the **Request schema** tailored to your model, and the corresponding **Response path** for parsing the model's output.

**Note**

You can find the request and response format of various of JumpStart foundation models in the following [example notebooks](#). Each notebook is named after the model it demonstrates.

- For models managed by Amazon Bedrock: Add the AWS profile storing your AWS credentials on your system (optional), and then the AWS Region in which your model is deployed in [Region name](#).

- (Optional) Select an [embedding model](#) to which you have access. Embedding models are used to capture additional information from local documents, enabling the text generation model to respond to questions within the context of those documents.

- Choose **Save Changes** and navigate to the left arrow icon

in the top left corner of the left pane. This opens the Jupyter AI chat UI. You can start interacting with your model.

- **For models hosted by third-party providers**

- In the **language model** dropdown list, select your provider ID. You can find the details of each provider, including their ID, in Jupyter AI [list of model providers](#).

- (Optional) Select an [embedding model](#) to which you have access. Embedding models are used to capture additional information from local documents, enabling the text generation model to respond to questions within the context of those documents.

- Insert your models' API keys.

- Choose **Save Changes** and navigate to the left arrow icon

in the top left corner of the left pane. This opens the Jupyter AI chat UI. You can start interacting with your model.

The following snapshot is an illustration of the chat UI configuration panel set to invoke a Flan-t5-small model provided by JumpStart and deployed in SageMaker AI.

## Language model

Language model

SageMaker endpoint :: \*

Endpoint name

hf-text2text-flan-t5-small

Specify an endpoint name as the model ID. In addition, you must specify a region name, request schema, and response path. For more information, see the documentation about [SageMaker endpoints deployment](#) and about [using magic commands with SageMaker endpoints](#).

Region name (required)

us-west-2

Request schema (required)

```
{"inputs": "<prompt>"}
```

Response path (required)

```
[0].["generated_text"]
```

## Embedding model

Embedding model

None

## API Keys

### Input

When writing a message, press Enter to:

- Send the message
- Start a new line (use Shift+Enter to send)

Save Changes

## Pass extra model parameters and custom parameters to your request

Your model may need extra parameters, like a customized attribute for user agreement approval or adjustments to other model parameters such as temperature or response length. We recommend configuring these settings as a start up option of your JupyterLab application using a Lifecycle Configuration. For information on how to create a Lifecycle Configuration and attach it to your domain, or to a user profile from the [SageMaker AI console](#), see [Create and associate a lifecycle configuration](#). You can choose your LCC script when creating a space for your JupyterLab application.

Use the following JSON schema to configure your [extra parameters](#):

```
{
  "AiExtension": {
    "model_parameters": {
      "<provider_id>:<model_id>": { Dictionary of model parameters which is unpacked
and passed as-is to the provider.}
    }
  }
}
```

The following script is an example of a JSON configuration file that you can use when creating a JupyterLab application LCC to set the maximum length of an [AI21 Labs Jurassic-2 model](#) deployed on Amazon Bedrock. Increasing the length of the model's generated response can prevent the systematic truncation of your model's response.

```
#!/bin/bash
set -eux

mkdir -p /home/sagemaker-user/.jupyter

json='{"AiExtension": {"model_parameters": {"bedrock:ai21.j2-mid-v1": {"model_kwargs":
{"maxTokens": 200}}}}}'
# equivalent to %ai bedrock:ai21.j2-mid-v1 -m {"model_kwargs":{"maxTokens":200}}

# File path
file_path="/home/sagemaker-user/.jupyter/jupyter_jupyter_ai_config.json"

#jupyter --paths
```

```
# Write JSON to file
echo "$json" > "$file_path"

# Confirmation message
echo "JSON written to $file_path"

restart-jupyter-server

# Waiting for 30 seconds to make sure the Jupyter Server is up and running
sleep 30
```

The following script is an example of a JSON configuration file for creating a JupyterLab application LCC used to set additional model parameters for an [Anthropic Claude model](#) deployed on Amazon Bedrock.

```
#!/bin/bash
set -eux

mkdir -p /home/sagemaker-user/.jupyter

json='{ "AiExtension": { "model_parameters": { "bedrock:anthropic.claude-v2":
{ "model_kwargs": { "temperature":0.1, "top_p":0.5, "top_k":25
0, "max_tokens_to_sample":2} } } } }'
# equivalent to %%ai bedrock:anthropic.claude-v2 -m { "model_kwargs":
{ "temperature":0.1, "top_p":0.5, "top_k":250, "max_tokens_to_sample":2000} }

# File path
file_path="/home/sagemaker-user/.jupyter/jupyter_jupyter_ai_config.json"

#jupyter --paths

# Write JSON to file
echo "$json" > "$file_path"

# Confirmation message
echo "JSON written to $file_path"

restart-jupyter-server

# Waiting for 30 seconds to make sure the Jupyter Server is up and running
sleep 30
```

Once you have attached your LCC to your domain, or user profile, add your LCC to your space when launching your JupyterLab application. To ensure that your configuration file is updated by the LCC, run `more ~/.jupyter/jupyter_jupyter_ai_config.json` in a terminal. The content of the file should correspond to the content of the JSON file passed to the LCC.

## Configure your model provider in a notebook

### To invoke a model via Jupyter AI within JupyterLab or Studio Classic notebooks using the `%%ai` and `%ai` magic commands

1. Install the client libraries specific to your model provider in your notebook environment. For example, when using OpenAI models, you need to install the `openai` client library. You can find the list of the client libraries required per provider in the *Python package(s)* column of the Jupyter AI [Model providers list](#).

#### Note

For models hosted by AWS, `boto3` is already installed in the SageMaker AI Distribution image used by JupyterLab, or any Data Science image used with Studio Classic.

#### 2. • **For models hosted by AWS**

Ensure that your execution role has the permission to invoke your SageMaker AI endpoint for models provided by JumpStart or that you have access to Amazon Bedrock.

#### • **For models hosted by third-party providers**

Export your provider's API key in your notebook environment using environment variables. You can use the following magic command. Replace the `provider_API_key` in the command by the environment variable found in the *Environment variable* column of the Jupyter AI [Model providers list](#) for your provider.

```
%env provider_API_key=your_API_key
```

## Use Jupyter AI in JupyterLab or Studio Classic

You can use Jupyter AI in JupyterLab or Studio Classic by invoking language models from either the chat UI or from notebook cells. The following sections give information about the steps needed to complete this.

## Use language models from the chat UI

Compose your message in the chat UI text box to start interacting with your model. To clear the message history, use the `/clear` command.

### Note

Clearing the message history does not erase the chat context with the model provider.

## Use language models from notebook cells

Before using the `%%ai` and `%ai` commands to invoke a language model, load the IPython extension by running the following command in a JupyterLab or Studio Classic notebook cell.

```
%load_ext jupyter_ai_magics
```

- **For models hosted by AWS:**

- To invoke a model deployed in SageMaker AI, pass the string `sagemaker-endpoint:endpoint-name` to the `%%ai` magic command with the required parameters below, then add your prompt in the following lines.

The following table lists the required and optional parameters when invoking models hosted by SageMaker AI or Amazon Bedrock.

Parameter Name	Parameter	Short Version	Description
Request schema	<code>--request-schema</code>	<code>-q</code>	<b>Required:</b> The JSON object the endpoint expects, with the prompt being substituted into any value that matches the string literal <code>&lt;prompt&gt;</code> .

Parameter Name	Parameter	Short Version	Description
Region name	<code>--region-name</code>	<code>-n</code>	<b>Required:</b> The AWS Region where the model is deployed.
Response path	<code>--response-path</code>	<code>-p</code>	<b>Required:</b> A JSONPath string used to extract the language model's output from the JSON response of the endpoint.

Parameter Name	Parameter	Short Version	Description
Extra model parameters	<code>--model-parameters</code>	<code>-m</code>	<b>Optional:</b> A JSON value specifying additional parameters to be passed to the model. The accepted value is parsed into a dictionary, unpacked, and directly passed to the provider class. This is useful when the endpoint or the model requires custom parameters. For example, in Llama 2 models when accepting the End User License Agreement (EULA) is necessary, you can pass the EULA acceptance to the endpoint using <code>-m {"endpoint_kwargs": {"CustomAttributes": "accept_eula=true"}}</code> . Alternatively, you can use the <code>-m</code> parameter to pass extra model

Parameter Name	Parameter	Short Version	Description
			parameters, such as setting the maximum number of tokens for a model's generated response. For example, when working with an AI21 Labs Jurassic model: -m {"model_kwargs":{"maxTokens":256}} .
Output format	--format	-f	<b>Optional:</b> The IPython display used to render the output. It can be any of the following values [code   html   image   json   markdown   math   md   text], provided that the invoked model supports the specified format.

The following command invokes a [Llama2-7b](#) model hosted by SageMaker AI.

```
%ai sagemaker-endpoint:jumpstart-dft-meta-textgeneration-llama-2-7b -q
{"inputs":"<prompt>","parameters":
{"max_new_tokens":64,"top_p":0.9,"temperature":0.6,"return_full_text":false}}
```

```
-n us-east-2 -p [0].generation -m {"endpoint_kwargs":
{"CustomAttributes":"accept_eula=true"}} -f text
Translate English to French:
sea otter => loutre de mer
peppermint => menthe poivrée
plush girafe => girafe peluche
cheese =>
```

The following example invokes a Flan-t5-small model hosted by SageMaker AI.

```
%ai sagemaker-endpoint:hf-text2text-flan-t5-small --request-
schema={"inputs":"<prompt>","parameters":{"num_return_sequences":4}} --region-
name=us-west-2 --response-path=[0]["generated_text"] -f text
What is the atomic number of Hydrogen?
```

- To invoke a model deployed in Amazon Bedrock, pass the string `bedrock: model-name` to the `%ai` magic command with any optional parameter defined in the list of [parameters for invoking models hosted by JumpStart or Amazon Bedrock](#), then add your prompt in the following lines.

The following example invokes an [AI21 Labs Jurassic-2 model](#) hosted by Amazon Bedrock.

```
%ai bedrock:ai21.j2-mid-v1 -m {"model_kwargs":{"maxTokens":256}} -f code
Write a function in python implementing a bubble sort.
```

- **For models hosted by third-party providers**

To invoke a model hosted by third-party providers, pass the string `provider-id: model-name` to the `%ai` magic command with an optional [Output format](#), then add your prompt in the following lines. You can find the details of each provider, including their ID, in the Jupyter AI [list of model providers](#).

The following command asks an Anthropic Claude model to output an HTML file containing the image of a white square with black borders.

```
%ai anthropic:claude-v1.2 -f html
Create a square using SVG with a black border and white fill.
```

# Amazon Q Developer

Amazon Q Developer is a generative AI conversational assistant that helps you write better code. Amazon Q Developer is available in the following IDEs within Amazon SageMaker Studio:

- JupyterLab
- Code Editor, based on Code-OSS, Visual Studio Code - Open Source

Use the following sections to set up Amazon Q Developer and use it within your environment.

## Topics

- [Set up Amazon Q Developer for your users](#)
- [Use Amazon Q to Expedite Your Machine Learning Workflows](#)

## Set up Amazon Q Developer for your users

Amazon Q Developer is a generative AI conversational assistant. You can set up Amazon Q Developer within a new domain or an existing domain. Use the following information to set up Amazon Q Developer.

With Amazon Q Developer, your users can:

- Receive step-by-step guidance on using SageMaker AI features independently or in combination with other AWS services.
- Get sample code to get started on your ML tasks such as data preparation, training, inference, and MLOps.
- Receive troubleshooting assistance to debug and resolve errors encountered while running code.

### Note

Amazon Q Developer in Studio doesn't use user content to improve the service, regardless of whether you use the Free-tier or Pro-tier subscription. For IDE-level telemetry sharing, Amazon Q might track your users' usage, such as the number of questions asked and whether recommendations were accepted or rejected. This telemetry data doesn't include

personally identifiable information such as the users' IP address. For more information on data protection and instructions for opting out, see [Opt out of data sharing in the IDE](#).

You can set up Amazon Q Developer with either a Pro or Free tier subscription. The Pro tier is a paid subscription service with higher usage limits and other features. For more information about the differences between the tiers, see [Understanding tiers of service for Amazon Q Developer](#).

### Important

Code Editor, based on Code-OSS, Visual Studio Code - Open Source only supports using a Free tier subscription.

For information about subscribing to Amazon Q Developer Pro, see [Subscribing to Amazon Q Developer Pro](#).

## Set up instructions for Amazon Q Developer Free Tier:

To set up Amazon Q Developer Free Tier, use the following procedure:

### To set up Amazon Q Developer Free Tier

1. Add the following policy to the IAM role that you've used to create your JupyterLab or Code Editor space:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "q:SendMessage"
      ],
      "Resource": [
        "*"
      ]
    }
  ],
  "Sid": "AmazonQDeveloperPermissions",
  "Effect": "Allow",
```

```
"Action": [  
  "codewhisperer:GenerateRecommendations"  
],  
"Resource": "*" ]  
}
```

2. Navigate to Amazon SageMaker Studio.
3. Open your JupyterLab or Code Editor space.
4. Navigate to the **Launcher** and choose **Terminal**.
5. In JupyterLab, do the following:
  - a. Specify `restart-jupyter-server`.
  - b. Restart your browser and navigate back to Amazon SageMaker Studio.

### Set up instructions for Amazon Q Developer Pro tier:

#### Prerequisites

To set up Amazon Q Pro, you must have:

- An Amazon SageMaker AI domain set up for your organization with IAM Identity Center configured as the means of access.
- An Amazon Q Developer Pro subscription.

If you're updating a domain that you've already set up for your organization, you need to update it to use Amazon Q Developer. You can use either the AWS Management Console or the AWS Command Line Interface to update a domain.

You must use the ARN of your Amazon Q Developer profile. You can find the Q Profile ARN on the [Q Developer Settings](#) page.

You can use the following AWS Command Line Interface command to update your domain:

```
aws --region AWS Region sagemaker update-domain --domain-id domain-id --domain-  
settings-for-update "AmazonQSettings={Status=ENABLED,QProfileArn=Q-Profile-ARN}"
```

You can also use the following procedure to update the domain within the AWS Management Console.

1. Navigate to the [Amazon SageMaker AI](#) console.
2. Choose domains.
3. Select **App Configurations**.
4. For **Amazon Q Developer for SageMaker AI Applications**, choose **Edit**.
5. Select **Enable Amazon Q Developer on this domain**.
6. Provide the Q Profile ARN.
7. Choose **Submit**.

You must use the ARN of your Amazon Q Developer profile. You can find the ARN of the Q Profile on the **Amazon Q account details** page of the [Amazon Q Developer](#) console.

The **Set up for organizations** is an advanced setup for the Amazon SageMaker AI domain that lets you use IAM Identity Center. For information about how you can set up the domain and information about setting up IAM Identity Center, see [Use custom setup for Amazon SageMaker AI](#).

When setting up Amazon Q Developer in a new domain, you can either use the AWS Management Console or the following AWS Command Line Interface command from your local machine:

```
aws --region AWS Region sagemaker create-domain --domain-id domain-  
id --domain-name "example-domain-name" --vpc-id example-vpc-id --  
subnet-ids example-subnet-ids --auth-mode SS0 --default-user-settings  
"ExecutionRole=arn:aws:iam::111122223333:role/IAM-role",--domain-settings  
"AmazonQSettings={status=ENABLED,qProfileArn=Q-profile-ARN" --query example-domain-  
ARN--output text
```

You can use the following AWS CLI command to disable Amazon Q Developer:

```
aws --region AWS Region sagemaker update-domain --domain-id domain-id --domain-  
settings-for-update "AmazonQSettings={Status=DISABLED,QProfileArn=Q-Profile-ARN}"
```

You can set up Amazon Q Developer within a new domain or an existing domain. Use the following information to set up Amazon Q Developer.

We recommend using the latest version of the AWS Command Line Interface. For information about updating the AWS CLI, see [Install or update to the latest version of the AWS Command Line Interface](#).

If you need to establish a connection between Amazon Q Developer and your VPC, see [Creating an interface VPC endpoint for Amazon Q](#).

### Note

Amazon Q Developer has the following limitations:

- It doesn't support shared spaces.
- Amazon Q Developer detects whether a code suggestion might be too similar to publicly available code. The reference tracker can flag suggestions with repository URLs and licenses, or filter them out. This allows you to review the referenced code and its usage before you adopt it. All references are logged for you to review later to ensure that your code flow is not disturbed and that you can keep coding without interruption.

For more information about code references, see [Using code references - Amazon Q Developer](#) and [AI Coding Assistant - Amazon Q Developer FAQs](#).

- Amazon Q processes all user interaction data within the US East (N. Virginia) AWS Region. For more information about how Amazon Q processes data and the AWS Regions it supports, see [Supported Regions for Amazon Q Developer](#).
- Amazon Q only works within Amazon SageMaker Studio. It is not supported within Amazon SageMaker Studio Classic.
- On JupyterLab, Amazon Q works within SageMaker AI Distribution Images version 2.0 and above. On Code Editor, Amazon Q works within SageMaker AI Distribution Images version 2.2.1 and above.

- Amazon Q Developer in JupyterLab works within the Jupyter AI extension. You can't use other 3P models within the extension while you're using Amazon Q.

## Use Amazon Q to Expedite Your Machine Learning Workflows

Amazon Q Developer is your AI-powered companion for machine learning development. With Amazon Q Developer, you can:

- Receive step-by-step guidance on using SageMaker AI features independently or in combination with other AWS services.
- Get sample code to get started on your ML tasks such as data preparation, training, inference, and MLOps.

To use Amazon Q Developer, choose the **Q** from the left-hand navigation of your JupyterLab or Code Editor environment.

If you don't see the **Q** icon, your administrator needs to set it up for you. For more information about setting up Amazon Q Developer, see [Set up Amazon Q Developer for your users](#).

Amazon Q automatically provides suggestions to help you write your code. You can also ask for suggestions through the chat interface.

## Amazon SageMaker Partner AI Apps overview

With Amazon SageMaker Partner AI Apps, users get access to generative AI and machine learning (ML) development applications built, published, and distributed by industry-leading application providers. Partner AI Apps are certified to run on SageMaker AI. With Partner AI Apps, users can accelerate and improve how they build solutions based on foundation models (FM) and classic ML models without compromising the security of their sensitive data. The data stays completely within their trusted security configuration and is never shared with a third party.

### How it works

Partner AI Apps are full application stacks that include an Amazon Elastic Kubernetes Service cluster and an array of accompanying services that can include Application Load Balancer, Amazon Relational Database Service, Amazon Simple Storage Service buckets, Amazon Simple Queue Service queues, and Redis caches.

These service applications can be shared across all users in a SageMaker AI domain and are provisioned by an admin. After provisioning the application by purchasing a subscription through the AWS Marketplace, the admin can give users in the SageMaker AI domain permissions to access the Partner AI App directly from Amazon SageMaker Studio, Amazon SageMaker Unified Studio (preview), or using a pre-signed URL. For information about launching an application from Studio, see [Launch Amazon SageMaker Studio](#).

Partner AI Apps offers the following benefits for administrators and users.

- Administrators use the SageMaker AI console to browse, discover, select, and provision the Partner AI Apps for use by their data science and ML teams. After the Partner AI Apps are deployed, SageMaker AI runs them on service-managed AWS accounts. This significantly reduces the operational overhead associated with building and operating these applications, and contributes to the security and privacy of customer data.
- Data scientists and ML developers can access Partner AI Apps from within their ML development environment in Amazon SageMaker Studio or Amazon SageMaker Unified Studio (preview). They can use the Partner AI Apps to analyze their data, experiments, and models created on SageMaker AI. This minimizes context switching and helps accelerate building foundation models and bringing new generative AI capabilities to market.

## Integration with AWS services

Partner AI Apps uses the existing AWS Identity and Access Management (IAM) configuration for authorization and authentication. As a result, users don't need to provide separate credentials to access each Partner AI App from Amazon SageMaker Studio. For more information about authorization and authentication with Partner AI Apps, see [Set up Partner AI Apps](#).

Partner AI Apps also integrates with Amazon CloudWatch to provide operational monitoring and management. Customers can also browse Partner AI Apps, and get details about them, such as features, customer experience, and pricing, from the AWS Management Console. For information about Amazon CloudWatch, see [How Amazon CloudWatch works](#).

## Supported types

Partner AI Apps support the following types:

- Comet
- Deepchecks

- Fiddler
- Lakera Guard

When the admin launches a Partner AI App, they must select the configuration of the instance cluster that the Partner AI App is launched with. This configuration is known as the Partner AI App's tier. A Partner AI App's tier can be one of the following values:

- `small`
- `medium`
- `large`

The following sections give information about each of the Partner AI App types, and details about the Partner AI App's tier values.

### Comet overview

Comet provides an end-to-end model evaluation platform for AI developers, with LLM evaluations, experiment tracking, and production monitoring.

We recommend the following Partner AI App tiers based on the workload:

- `small` – Recommended for up to 5 users and 20 running jobs.
- `medium` – Recommended for up to 50 users and 100 running jobs.
- `large` – Recommended for up to 500 users and more than 100 running jobs.

#### Note

SageMaker AI does not support viewing the Comet UI as part of the output of a Jupyter notebook.

### Deepchecks overview

AI application developers and stakeholders can use Deepchecks to continuously validate LLM-based applications including characteristics, performance metrics, and potential pitfalls throughout the entire lifecycle from pre-deployment and internal experimentation to production.

We recommend the following Partner AI App tiers based on the speed desired for the workload:

- `small` – Processes 200 tokens per second.
- `medium` – Processes 500 tokens per second.
- `large` – Processes 1300 tokens per second.

### **Fiddler overview**

The Fiddler AI Observability Platform facilitates validating, monitoring, and analyzing ML models in production, including tabular, deep learning, computer vision, and natural language processing models.

We recommend the following Partner AI App tiers based on the speed desired for the workload:

- `small` – Processing 10MM events across 5 models, 100 features, and 20 iterations takes about 53 minutes.
- `medium` – Processing 10MM events across 5 models, 100 features, and 20 iterations takes about 23 minutes.
- `large` – Processing 10MM events across 5 models, 100 features, and 100 iterations takes about 27 minutes.

### **Lakera Guard overview**

Lakera Guard is a low-latency AI application firewall to secure generative AI applications from gen AI-specific threats.

We recommend the following Partner AI App tiers based on the workload:

- `small` – Recommended for up to 20 Robotic Process Automations (RPAs).
- `medium` – Recommended for up to 100 RPAs.
- `large` – Recommended for up to 200 RPAs.

## **Set up Partner AI Apps**

The following topics describe the permissions needed to start using Amazon SageMaker Partner AI Apps. The permissions required are split into two parts, depending on the user permissions level:

- **Administrative permissions** – Permissions for administrators setting up data scientist and machine learning (ML) developer environments.
  - AWS Marketplace
  - Partner AI Apps management
  - AWS License Manager
- **User permissions** – Permissions for data scientists and machine learning developers.
  - User authorization
  - Identity propagation
  - SDK access

## Prerequisites

Admins can complete the following prerequisites to set up Partner AI Apps.

- (Optional) Onboard to a SageMaker AI domain. Partner AI Apps can be accessed directly from a SageMaker AI domain. For more information, see [Amazon SageMaker AI domain overview](#).
- If using Partner AI Apps in a SageMaker AI domain in VPC-only mode, admins must create an endpoint with the following format to connect to the Partner AI Apps. For more information about using Studio in VPC-only mode, see [Connect Amazon SageMaker Studio in a VPC to External Resources](#).

```
aws.sagemaker.region.partner-app
```

- (Optional) If admins are interacting with the domain using the AWS CLI, they must also complete the following prerequisites.
  1. Update the AWS CLI by following the steps in [Installing the current AWS CLI Version](#).
  2. From the local machine, run `aws configure` and provide AWS credentials. For information about AWS credentials, see [Understanding and getting your AWS credentials](#).

## Administrative permissions

The administrator must add the following permissions to enable Partner AI Apps in SageMaker AI.

- Permission to complete AWS Marketplace subscription for Partner AI Apps
- Set up Partner AI App execution role

## AWS Marketplace subscription for Partner AI Apps

Admins must complete the following steps to add permissions for AWS Marketplace. For information about using AWS Marketplace, see [Getting started as a buyer using AWS Marketplace](#).

1. Grant permissions for AWS Marketplace. Partner AI Apps administrators require these permissions to purchase subscriptions to Partner AI Apps from AWS Marketplace. To get access to AWS Marketplace, admins must attach the `AWSMarketplaceManageSubscriptions` managed policy to the IAM role that they're using to access the SageMaker AI console and purchase the app. For details about the `AWSMarketplaceManageSubscriptions` managed policy, see [AWS managed policies for AWS Marketplace buyers](#). For information about attaching managed policies, see [Adding and removing IAM identity permissions](#).
2. Grant permissions for SageMaker AI to run operations on the admins behalf using other AWS services. Admins must grant SageMaker AI permissions to use these services and the resources that they act upon. The following policy definition demonstrates how to grant the required Partner AI Apps permissions. These permissions are needed in addition to the existing permissions for the admin role. For more information, see [How to use SageMaker AI execution roles](#).

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreatePartnerApp",
        "sagemaker>DeletePartnerApp",
        "sagemaker:UpdatePartnerApp",
        "sagemaker:DescribePartnerApp",
        "sagemaker:ListPartnerApps",
        "sagemaker:CreatePartnerAppPresignedUrl",
        "sagemaker:CreatePartnerApp",
        "sagemaker:AddTags",
        "sagemaker:ListTags",
        "sagemaker>DeleteTags"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
```

```

        "iam:PassRole"
    ],
    "Resource": "arn:aws:iam::*:role/*",
    "Condition": {
        "StringEquals": {
            "iam:PassedToService": "sagemaker.amazonaws.com"
        }
    }
}
]
}

```

## Set up Partner AI App execution role

1. Partner AI Apps require an execution role to interact with resources in the AWS account. Admins can create this execution role using the AWS CLI. The Partner AI App uses this role to complete actions related to Partner AI App functionality.

```

aws iam create-role --role-name PartnerAiAppExecutionRole --assume-role-policy-
document '{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "sagemaker.amazonaws.com"
        ]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}'

```

2. Create the AWS License Manager service-linked role by following the steps in [Create a service-linked role for License Manager](#).
3. Grant permissions for the Partner AI App to access License Manager using the AWS CLI. These permissions are required to access the licenses for Partner AI App. This allows the Partner AI App to verify access to the Partner AI App license.

```
aws iam put-role-policy --role-name PartnerAiAppExecutionRole --policy-name
LicenseManagerPolicy --policy-document '{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": [
      "license-manager:CheckoutLicense",
      "license-manager:CheckInLicense",
      "license-manager:ExtendLicenseConsumption",
      "license-manager:GetLicense",
      "license-manager:GetLicenseUsage"
    ],
    "Resource": "*"
  }
}'
```

4. If the Partner AI App requires access to an Amazon S3 bucket, then add Amazon S3 permissions to the execution role. For more information, see [Required permissions for Amazon S3 API operations](#).

## User permissions

After admins have completed the administrative permissions settings, they must make sure that users have the permissions needed to access the Partner AI Apps.

1. Grant permissions for SageMaker AI to run operations on your behalf using other AWS services. Admins must grant SageMaker AI permissions to use these services and the resources that they act upon. Admins grant SageMaker AI these permissions using an IAM execution role. For more information about IAM roles, see [IAM roles](#). The following policy definition demonstrates how to grant the required Partner AI Apps permissions. This policy can be added to the execution role of the user profile. For more information, see [How to use SageMaker AI execution roles](#).

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:DescribePartnerApp",
```

```

        "sagemaker:ListPartnerApps",
        "sagemaker:CreatePartnerAppPresignedUrl"
    ],
    "Resource": "arn:aws:sagemaker:*:*:partner-app/app-*"
}
]
}

```

2. (Optional) If launching Partner AI Apps from Studio, add the `sts:TagSession` trust policy to the role used to launch Studio or the Partner AI Apps directly as follows. This makes sure that the identity can be propagated properly.

```

{
  "Effect": "Allow",
  "Principal": {
    "Service": "sagemaker.amazonaws.com"
  },
  "Action": [
    "sts:AssumeRole",
    "sts:TagSession"
  ]
}

```

3. (Optional) If using the SDK of a Partner AI App to access functionality in SageMaker AI, add the following `CallPartnerAppApi` permission to the role used to run the SDK code. If running the SDK code from Studio, add the permission to the Studio execution role. If running the code from anywhere other than Studio, add the permission to the IAM role used with the notebook. This gives the user access the Partner AI App functionality from the Partner AI App's SDK.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Statement1",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CallPartnerAppApi"
      ],
      "Resource": [
        "arn:aws:sagemaker:region:account:partner-app/app"
      ]
    }
  ]
}

```

```
    }  
  ]  
}
```

## Manage user authorization and authentication

To provide access to Partner AI Apps to members of their team, admins must make sure that the identity of their users is propagated to the Partner AI Apps. This propagation makes sure users can properly access the Partner AI Apps' UI and perform authorized Partner AI App actions.

Partner AI Apps support the following identity sources:

- AWS IAM Identity Center
- External identity providers (IdPs)
- IAM Session-based identity

The following sections give information about the identity sources that Partner AI Apps support, as well as important details related to that identity source.

### IAM Identity Center

If a user is authenticated into Studio using IAM Identity Center and launches an application from Studio, the IAM Identity Center `UserName` is automatically propagated as the user identity for a Partner AI App. This is not the case if the user launches the Partner AI App directly using the `CreatePartnerAppPresignedUrl` API.

### External identity providers (IdPs)

If using SAML for AWS account federation, admins have two options to carry over the IdP identity as the user identity for a Partner AI App. For information about setting up AWS account federation, see [How to Configure SAML 2.0 for AWS account Federation](#).

- **Principal Tag** – Admins can configure the IdP-specific IAM Identity Center application to pass identity information from the landing session using the AWS session `PrincipalTag` with the following `Name` attribute. When using SAML, the landing role session uses an IAM role. To use the `PrincipalTag`, admins must add the `sts:TagSession` permission to this landing role, as well as the Studio execution role. For more information about `PrincipalTag`, see [Configure SAML assertions for the authentication response](#).

```
https://aws.amazon.com/SAML/Attributes/PrincipalTag:SageMakerPartnerAppUser
```

- **Landing session name** – Admins can propagate the landing session name as the identity for the Partner AI App. To do this, they must set the `EnableIamSessionBasedIdentity` opt-in flag for each Partner AI App. For more information, see [EnableIamSessionBasedIdentity](#).

## IAM session-based identity

### Important

We do not recommend using this method for production accounts. For production accounts, use an identity provider for increased security.

SageMaker AI supports the following options for identity propagation when using an IAM session-based identity. All of the options, except using a session tag with AWS STS, require setting the `EnableIamSessionBasedIdentity` opt-in flag for each application. For more information, see [EnableIamSessionBasedIdentity](#).

When propagating identities, SageMaker AI verifies whether an AWS STS Session tag is being used. If one is not used, then SageMaker AI propagates the IAM username or AWS STS session name.

- **AWS STS Session tag** – Admins can set a `SageMakerPartnerAppUser` session tag for the launcher IAM session. When admins launch a Partner AI App using the SageMaker AI console or the AWS CLI, the `SageMakerPartnerAppUser` session tag is automatically passed as the user identity for the Partner AI App. The following example shows how to set the `SageMakerPartnerAppUser` session tag using the AWS CLI. The value of the key is added as a principal tag.

```
aws sts assume-role \  
  --role-arn arn:aws:iam::account:role/iam-role-used-to-launch-partner-ai-app \  
  --role-session-name session_name \  
  --tags Key=SageMakerPartnerAppUser,Value=user-name
```

When giving users access to a Partner AI App using `CreatePartnerAppPresignedUrl`, we recommend verifying the value for the `SageMakerPartnerAppUser` key. This helps to prevent unintended access to Partner AI App resources. The following trust policy verifies that the session

tag exactly matches the associated IAM user. Admins can use any principal tag for this purpose. It should be configured on the role that is launching Studio or the Partner AI App.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RoleTrustPolicyRequireUsernameForSessionName",
      "Effect": "Allow",
      "Action": [
        "sts:AssumeRole",
        "sts:TagSession"
      ],
      "Principal": {
        "AWS": "arn:aws:iam::account:root"
      },
      "Condition": {
        "StringLike": {
          "aws:RequestTag/SageMakerPartnerAppUser": "${aws:username}"
        }
      }
    }
  ]
}
```

- **Authenticated IAM user** – The username of the user is automatically propagated as the Partner AI App user.
- **AWS STS session name** – If no SageMakerPartnerAppUser session tag is configured when using AWS STS, SageMaker AI returns an error when users launch a Partner AI App. To avoid this error, admins must set the EnableIamSessionBasedIdentity opt-in flag for each Partner AI App. For more information, see [EnableIamSessionBasedIdentity](#).

When the EnableIamSessionBasedIdentity opt-in flag is enabled, use the [IAM role trust policy](#) to make sure that the IAM session name is or contains the IAM username. This makes sure that users don't gain access by impersonating other users. The following trust policy verifies that the session name exactly matches the associated IAM user. Admins can use any principal tag for this purpose. It should be configured on the role that is launching Studio or the Partner AI App.

```
{
  "Version": "2012-10-17",
  "Statement": [
```

```

    {
      "Sid": "RoleTrustPolicyRequireUsernameForSessionName",
      "Effect": "Allow",
      "Action": "sts:AssumeRole",
      "Principal": {
        "AWS": "arn:aws:iam::account:root"
      },
      "Condition": {
        "StringEquals": {
          "sts:RoleSessionName": "${aws:username}"
        }
      }
    }
  ]
}

```

Admins must also add the `sts:TagSession` trust policy to the role that is launching Studio or the Partner AI App. This makes sure that the identity can be propagated properly.

```

{
  "Effect": "Allow",
  "Principal": {
    "Service": "sagemaker.amazonaws.com"
  },
  "Action": [
    "sts:AssumeRole",
    "sts:TagSession"
  ]
}

```

After setting the credentials, admins can give their users access to Studio or the Partner AI App from the AWS CLI using either the `CreatePresignedDomainUrl` or `CreatePartnerAppPresignedUrl` API calls, respectively.

Users can also then launch Studio from the SageMaker AI console, and launch Partner AI Apps from Studio.

### EnableIamSessionBasedIdentity

`EnableIamSessionBasedIdentity` is an opt-in flag. When the `EnableIamSessionBasedIdentity` flag is set, SageMaker AI passes IAM session information

as the Partner AI App user identity. For more information about AWS STS sessions, see [Use temporary credentials with AWS resources](#).

## Access control

To control access to Partner AI Apps, use an IAM policy attached to the user profile's execution role. To launch a Partner AI App directly from Studio or using the AWS CLI, the user profile's execution role must have a policy that gives permissions for the `CreatePartnerAppPresignedUrl` API. Remove this permission from the user profile's execution role to make sure they can't launch Partner AI Apps.

## Root admin users

The Comet and Fiddler Partner AI Apps require at least one root admin user. Root admin users have permissions to add both normal and admin users and manage resources. The usernames provided as root admin users must be consistent with the usernames from the identity source.

While root admin users are persisted in SageMaker AI, normal admin users are not and exist only within the Partner AI App until the Partner AI App is terminated.

Admins can update root admin users using the `UpdatePartnerApp` API call. When root admin users are updated, the updated list of root admin users is passed to the Partner AI App. The Partner AI App makes sure that all usernames in the list are granted root admin privileges. If a root admin user is removed from the list, the user still retains normal admin permissions until either:

- The user is removed from the application.
- Another admin user revokes admin permissions for the user.

### Note

Fiddler doesn't support updating admin users. Only Comet supports updates to root admin users.

To delete a root admin user, you must first update the list of root admin users using the `UpdatePartnerApp` API. Then, remove or revoke the admin permissions through the Partner AI App's UI.

If you remove a root admin user from the Partner AI App's UI without updating the list of root admin users with the `UpdatePartnerApp` API, the change is temporary. When SageMaker AI

sends the next Partner AI App update request, SageMaker AI sends the root admin list that still includes the user to the Partner AI App. This overrides the deletion completed from the Partner AI App UI.

## Partner AI App provisioning

After admins have set up the required permissions, they can explore and provision Amazon SageMaker Partner AI Apps for users in the domain.

Admins can view all of the available Partner AI Apps, as well as the Partner AI Apps that they have provisioned from the [Amazon SageMaker AI console](#). From the **Partner AI Apps** page, admins can view details about the pricing model for each Partner AI App and make them available to users. Admins can make them available by navigating to the AWS Marketplace to subscribe to that Partner AI App.

Admins can provision new apps from the Partner AI Apps page. They can also view the Partner AI Apps that they have already provisioned from the **My Apps** tab.

### Note

Applications that admins provision can be accessed by all users that admins give proper permissions to in an AWS account. Partner AI Apps are not restricted to a specific domain or user.

## Status

When admins view a Partner AI App that they have provisioned, they can also see the status of their application with one of the following values.

- **Deployed** – The application is ready for use. Admins can update the application configuration and delete the application.
- **Error** – There was an issue with the application deployment. Admins can troubleshoot and configure the application again to deploy it.
- **Not deployed** – The application has been subscribed to, but not deployed. Admins can configure the application to deploy it.

## Options

When admins configure an application, they can decide the following options:

- **App name** – A unique name for the application.
- **App maintenance schedule** – Partner AI Apps undergo maintenance on a weekly basis. With this option, admins choose both the day of the week and the time that this maintenance happens.
- **STS identity propagation** – Use this option to pass the AWS Security Token Service (AWS STS) launcher IAM session name as the Partner AI App user identity. For more information, see [Set up Partner AI Apps](#).
- **Admin management** – Some Partner AI Apps support adding up to five admins that have full rights to manage the Partner AI App functionality. This only applies to Comet and Fiddler. For more information, see [Set up Partner AI Apps](#).
- **Execution role** – The role that the Partner AI App uses to access resources and perform actions. For more information, see [Set up Partner AI Apps](#).
- **App version** – The version of the Partner AI App that admins want to use.
- **Tier selection** – The infrastructure deployment tier for the Partner AI App. The tier size impacts the speed and capabilities of the application. For more information, see [Set up Partner AI Apps](#).
- **Lakera S3 bucket policy** – This is only required by the Lakera-guard app to access an Amazon S3 bucket.

## Set up the Amazon SageMaker Partner AI Apps SDKs

The following topic outlines the process needed to install and use the application-specific SDKs with Amazon SageMaker Partner AI Apps. To install and use SDKs for applications, you must specify environment variables specific to Partner AI Apps, so the application's SDK can pick up environment variables and trigger authorization. The following sections give information about the steps needed to complete this for each of the supported application types.

### Comet

Comet offers two products:

- Opik is an source LLM evaluation framework.
- Comet's ML platform can be used to track, compare, explain, and optimize models across the complete ML lifecycle.

Comet supports the use of two different SDKs based on the product that you are interacting with. Complete the following procedure to install and use the Comet or Opik SDKs. For more information about the Comet SDK, see [Quickstart](#). For more information about the Opik SDK, see [Open source LLM evaluation framework](#).

1. Launch the environment that you are using the Comet or Opik SDKs with Partner AI Apps in. For information about launching a JupyterLab application, see [Create a space](#). For information about launching a Code Editor, based on Code-OSS, Visual Studio Code - Open Source application, see [Launch a Code Editor application in Studio](#).
2. Launch a Jupyter notebook or Code Editor space.
3. From the development environment, install the compatible Comet, Opik, and SageMaker Python SDK versions. To be compatible:
  - The SageMaker Python SDK version must be at least 2.237.0.
  - The Comet SDK version must be the latest version.
  - The Opik SDK version must match the version used by your Opik application. Verify the Opik version used in the Opik web application UI. The exception to this is that the Opik SDK version must be at least 1.2.0 when the Opik application version is 1.1.5.

 **Note**

SageMaker JupyterLab comes with SageMaker Python SDK installed. However, you may need to upgrade the SageMaker Python SDK if the version is lower than 2.237.0.

```
%pip install sagemaker>=2.237.0 comet_ml

##or

%pip install sagemaker>=2.237.0 opik=<compatible-version>
```

4. Set the following environment variables for the application resource ARN. These environment variables are used to communicate with the Comet and Opik SDKs. To retrieve these values, navigate to the details page for the application in Amazon SageMaker Studio.

```
os.environ['AWS_PARTNER_APP_AUTH'] = 'true'
os.environ['AWS_PARTNER_APP_ARN'] = '<partner-app-ARN>'
```

- For the Comet application, the SDK URL is automatically included as part of the API key set in the following step. You may instead set the `COMET_URL_OVERRIDE` environment variable to manually override the SDK URL.

```
os.environ['COMET_URL_OVERRIDE'] = '<comet-url>'
```

- For the Opik application, the SDK URL is automatically included as part of the API key set in the following step. You may instead set the `OPIK_URL_OVERRIDE` environment variable to manually override the SDK URL. To get the Opik workspace name, see the Opik application and navigate to the user's workspace.

```
os.environ['OPIK_URL_OVERRIDE'] = '<opik-url>'
os.environ['OPIK_WORKSPACE'] = '<workspace-name>'
```

- Set the environment variable that identifies the API key for Comet or Opik. This is used to verify the connection from SageMaker to the application when the Comet and Opik SDKs are used. This API key is application-specific and is not managed by SageMaker. To get this key, you must log into the application and retrieve the API key. The Opik API key is the same as the Comet API key.

```
os.environ['COMET_API_KEY'] = '<API-key>'
os.environ["OPIK_API_KEY"] = os.environ["COMET_API_KEY"]
```

## Fiddler

Complete the following procedure to install and use the Fiddler Python Client. For information about the Fiddler Python Client, see [About Client 3.x](#).

- Launch the notebook environment that you are using the Fiddler Python Client with Partner AI Apps in. For information about launching a JupyterLab application, see [Create a space](#). For information about launching a Code Editor, based on Code-OSS, Visual Studio Code - Open Source application, see [Launch a Code Editor application in Studio](#).
- Launch a Jupyter notebook or Code Editor space.
- From the development environment, install the Fiddler Python Client and SageMaker Python SDK versions. To be compatible:
  - The SageMaker Python SDK version must be at least `2.237.0`.

- The Fiddler Python Client version must be compatible with the version of Fiddler used in the application. After verifying the Fiddler version from the UI, see the Fiddler [Compatibility Matrix](#) for the compatible Fiddler Python Client version.

### Note

SageMaker JupyterLab comes with SageMaker Python SDK installed. However, you may need to upgrade the SageMaker Python SDK if the version is lower than 2.237.0.

```
%pip install sagemaker>=2.237.0 fiddler-client=<compatible-version>
```

4. Set the following environment variables for the application resource ARN and the SDK URL. These environment variables are used to communicate with the Fiddler Python Client. To retrieve these values, navigate to the details page for the Fiddler application in Amazon SageMaker Studio.

```
os.environ['AWS_PARTNER_APP_AUTH'] = 'true'  
os.environ['AWS_PARTNER_APP_ARN'] = '<partner-app-ARN>  
os.environ['AWS_PARTNER_APP_URL'] = '<partner-app-URL>
```

5. Set the environment variable that identifies the API key for the Fiddler application. This is used to verify the connection from SageMaker to the Fiddler application when the Fiddler Python Client is used. This API key is application-specific and is not managed by SageMaker. To get this key, you must log into the Fiddler application and retrieve the API key.

```
os.environ['FIDDLER_KEY'] = '<API-key>
```

## Deepchecks

Complete the following procedure to install and use Deepchecks Python SDK.

1. Launch the notebook environment that you are using the Deepchecks Python SDK with Partner AI Apps in. For information about launching a JupyterLab application, see [Create a space](#). For information about launching a Code Editor, based on Code-OSS, Visual Studio Code - Open Source application, see [Launch a Code Editor application in Studio](#).
2. Launch a Jupyter notebook or Code Editor space.

- From the development environment, install the compatible Deepchecks Python SDK and SageMaker Python SDK versions. Partner AI Apps is running version 0.21.15 of Deepchecks. To be compatible:
  - The SageMaker Python SDK version must be at least 2.237.0.
  - The Deepchecks Python SDK must use the minor version 0.21.

**Note**

SageMaker JupyterLab comes with SageMaker Python SDK installed. However, you may need to upgrade the SageMaker Python SDK if the version is lower than 2.237.0.

```
%pip install sagemaker>=2.237.0 deepchecks-llm-client>=0.21,<0.22
```

- Set the following environment variables for the application resource ARN and the SDK URL. These environment variables are used to communicate with the Deepchecks Python SDK. To retrieve these values, navigate to the details page for the application in Amazon SageMaker Studio.

```
os.environ['AWS_PARTNER_APP_AUTH'] = 'true'  
os.environ['AWS_PARTNER_APP_ARN'] = '<partner-app-ARN>  
os.environ['AWS_PARTNER_APP_URL'] = '<partner-app-URL>
```

- Set the environment variable that identifies the API key for the Deepchecks application. This is used to verify the connection from SageMaker to the Deepchecks application when the Deepchecks Python SDK is used. This API key is application-specific and is not managed by SageMaker. To get this key, see [Setup: Python SDK Installation & API Key Retrieval](#).

```
os.environ['DEEPCHECKS_API_KEY'] = '<API-key>
```

## Lakera

Lakera does not offer an SDK. Instead, you can interact with the Lakera Guard API through HTTP requests to the available endpoints in any programming language. For more information, see [Lakera Guard API](#).

To use the SageMaker Python SDK with Lakera, complete the following steps:

1. Launch the environment that you are using Partner AI Apps in. For information about launching a JupyterLab application, see [Create a space](#). For information about launching a Code Editor, based on Code-OSS, Visual Studio Code - Open Source application, see [Launch a Code Editor application in Studio](#).
2. Launch a Jupyter notebook or Code Editor space.
3. From the development environment, install the compatible SageMaker Python SDK version. The SageMaker Python SDK version must be at least 2.237.0

#### Note

SageMaker JupyterLab comes with SageMaker Python SDK installed. However, you may need to upgrade the SageMaker Python SDK if the version is lower than 2.237.0.

```
%pip install sagemaker>=2.237.0
```

4. Set the following environment variables for the application resource ARN and the SDK URL. To retrieve these values, navigate to the details page for the application in Amazon SageMaker Studio.

```
os.environ['AWS_PARTNER_APP_ARN'] = '<partner-app-ARN>'
os.environ['AWS_PARTNER_APP_URL'] = '<partner-app-URL>'
```

## Partner AI Apps in Studio

After the admin has added the required permissions and authorized users, users can view the Amazon SageMaker Partner AI App in Amazon SageMaker Studio. From Studio, users can launch apps that have been approved for use by their administrator.

### Browsing and selecting

To browse the available Partner AI Apps, users must navigate to Studio. For information about launching Studio, see [Launch Amazon SageMaker Studio](#).

After users have launched Studio, they can view all of the available Partner AI Apps by selecting the **Partner AI Apps** section in the left navigation. The **Partner AI Apps** page lists all of the Partner

AI Apps, and gives information about whether the Partner AI Apps have been deployed by the admin. If the desired Partner AI Apps haven't been deployed, users can reach out to the admin to request that they deploy the Partner AI Apps for use in the SageMaker AI domain.

If the application has been deployed, users can open the Partner AI App UI to start using it or view details of the Partner AI App.

When users view the details of the application, they see the value of the following.

- ARN – This is the resource ARN of the Partner AI App.
- SDK URL – This is the URL of the Partner AI App that the Partner AI App SDK uses to support app-specific tasks such as logging model experiment tracking data from a JupyterLab notebook in Studio.

Users can use these values to write code that uses the Partner AI App SDK for app-specific tasks.

Each Partner AI App's details page includes a sample notebook. To get started, users can launch the sample notebook in a JupyterLab space in the Studio environment.

# Data labeling with a human-in-the-loop

To train a machine learning model, you need a large, high-quality, labeled dataset. You can label your data using Amazon SageMaker Ground Truth. Choose from one of the Ground Truth [built-in task types](#) or create your own [custom labeling workflow](#). To improve the accuracy of your data labels and reduce the total cost of labeling your data, use Ground Truth enhanced data labeling features like [automated data labeling](#) and [annotation consolidation](#).

## Topics

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Use Amazon SageMaker Ground Truth Plus to Label Data](#)
- [Workforces](#)
- [Crowd HTML Elements Reference](#)
- [Using Amazon Augmented AI for Human Review](#)

## Training data labeling using humans with Amazon SageMaker Ground Truth

To train a machine learning model, you need a large, high-quality, labeled dataset. Ground Truth helps you build high-quality training datasets for your machine learning models. With Ground Truth, you can use workers from either Amazon Mechanical Turk, a vendor company that you choose, or an internal, private workforce along with machine learning to enable you to create a labeled dataset. You can use the labeled dataset output from Ground Truth to train your own models. You can also use the output as a training dataset for an Amazon SageMaker AI model.

Depending on your ML application, you can choose from one of the Ground Truth built-in task types to have workers generate specific types of labels for your data. You can also build a custom labeling workflow to provide your own UI and tools to workers labeling your data. To learn more about the Ground Truth built in task types, see [Built-in Task Types](#). To learn how to create a custom labeling workflow, see [Custom labeling workflows](#).

In order to automate labeling your training dataset, you can optionally use *automated data labeling*, a Ground Truth process that uses machine learning to decide which data needs to be labeled by humans. Automated data labeling may reduce the labeling time and manual effort

required. For more information, see [Automate data labeling](#). To create a custom labeling workflow, see [Custom labeling workflows](#).

Use either pre-built or custom tools to assign the labeling tasks for your training dataset. A *labeling UI template* is a webpage that Ground Truth uses to present tasks and instructions to your workers. The SageMaker AI console provides built-in templates for labeling data. You can use these templates to get started, or you can build your own tasks and instructions by using our HTML 2.0 components. For more information, see [Custom labeling workflows](#).

Use the workforce of your choice to label your dataset. You can choose your workforce from:

- The Amazon Mechanical Turk workforce of over 500,000 independent contractors worldwide.
- A private workforce that you create from your employees or contractors for handling data within your organization.
- A vendor company that you can find in the AWS Marketplace that specializes in data labeling services.

For more information, see [Workforces](#).

You store your datasets in Amazon S3 buckets. The buckets contain three things: The data to be labeled, an input manifest file that Ground Truth uses to read the data files, and an output manifest file. The output file contains the results of the labeling job. For more information, see [Use input and output data](#).

Events from your labeling jobs appear in Amazon CloudWatch under the `/aws/sagemaker/LabelingJobs` group. CloudWatch uses the labeling job name as the name for the log stream.

## Are You a First-time User of Ground Truth?

If you are a first-time user of Ground Truth, we recommend that you do the following:

1. Read [Getting started: Create a bounding box labeling job with Ground Truth](#)—This section walks you through setting up your first Ground Truth labeling job.
2. **Explore other topics**—Depending on your needs, do the following:
  - **Explore built-in task types**— Use built-in task types to streamline the process of creating a labeling job. See [Built-in Task Types](#) to learn more about Ground Truth built-in task types.
  - **Manage your labeling workforce**—Create new work teams and manage your existing workforce. For more information, see [Workforces](#).

- **Learn about streaming labeling jobs**— Create a streaming labeling job and send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously receive new data objects to label as long as the labeling job is active and new objects are being sent to it. To learn more, see [Ground Truth streaming labeling jobs](#).
3. To learn more about available operations to automate Ground Truth operations, see the [SageMaker AI service API reference](#).

## Getting started: Create a bounding box labeling job with Ground Truth

To get started using Amazon SageMaker Ground Truth, follow the instructions in the following sections. The sections here explain how to use the console to create a bounding box labeling job, assign a public or private workforce, and send the labeling job to your workforce. You can also learn how to monitor the progress of a labeling job.

This video shows you how to setup and use Amazon SageMaker Ground Truth. (Length: 9:37)

If you want to create a custom labeling workflow, see [Custom labeling workflows](#) for instructions.

Before you create a labeling job, you must upload your dataset to an Amazon S3 bucket. For more information, see [Use input and output data](#).

### Topics

- [Before You Begin](#)
- [Create a Labeling Job](#)
- [Select Workers](#)
- [Configure the Bounding Box Tool](#)
- [Monitoring Your Labeling Job](#)

### Before You Begin

Before you begin using the SageMaker AI console to create a labeling job, you must set up the dataset for use. Do this:

1. Save two images at publicly available HTTP URLs. The images are used when creating instructions for completing a labeling task. The images should have an aspect ratio of around 2:1. For this exercise, the content of the images is not important.

2. Create an Amazon S3 bucket to hold the input and output files. The bucket must be in the same Region where you are running Ground Truth. Make a note of the bucket name because you use it during step 2.

Ground Truth requires all S3 buckets that contain labeling job input image data have a CORS policy attached. To learn more about this change, see [CORS Requirement for Input Image Data](#).

3. You can create an IAM role or let SageMaker AI create a role with the [AmazonSageMakerFullAccess](#) IAM policy. Refer to [Creating IAM roles](#) and assign the following permissions policy to the user that is creating the labeling job:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "sagemakergroundtruth",
      "Effect": "Allow",
      "Action": [
        "cognito-idp:CreateGroup",
        "cognito-idp:CreateUserPool",
        "cognito-idp:CreateUserPoolDomain",
        "cognito-idp:AdminCreateUser",
        "cognito-idp:CreateUserPoolClient",
        "cognito-idp:AdminAddUserToGroup",
        "cognito-idp:DescribeUserPoolClient",
        "cognito-idp:DescribeUserPool",
        "cognito-idp:UpdateUserPool"
      ],
      "Resource": "*"
    }
  ]
}
```

## Create a Labeling Job

In this step you use the console to create a labeling job. You tell Amazon SageMaker Ground Truth the Amazon S3 bucket where the manifest file is stored and configure the parameters for the job. For more information about storing data in an Amazon S3 bucket, see [Use input and output data](#).

## To create a labeling job

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. From the left navigation, choose **Labeling jobs**.
3. Choose **Create labeling job** to start the job creation process.
4. In the **Job overview** section, provide the following information:
  - **Job name** – Give the labeling job a name that describes the job. This name is shown in your job list. The name must be unique in your account in an AWS Region.
  - **Label attribute name** – Leave this unchecked as the default value is the best option for this introductory job.
  - **Input data setup** – Select **Automated data setup**. This option allows you to automatically connect to your input data in S3.
  - **S3 location for input datasets** – Enter the S3 location where you added the images in step 1.
  - **S3 location for output datasets** – The location where your output data is written in S3.
  - **Data type** – Use the drop down menu to select **Image**. Ground Truth will use all images found in the S3 location for input datasets as input for your labeling job.
  - **IAM role** – Create or choose an IAM role with the AmazonSageMakerFullAccess IAM policy attached.
5. In the **Task type** section, for the **Task category** field, choose **Image**.
6. In the **Task selection** choose **Bounding box**.
7. Choose **Next** to move on to configuring your labeling job.

## Select Workers

In this step you choose a workforce for labeling your dataset. It is recommended that you create a private workforce to test Amazon SageMaker Ground Truth. Use email addresses to invite the members of your workforce. If you create a private workforce in this step you won't be able to import your Amazon Cognito user pool later. If you want to create a private workforce using an Amazon Cognito user pool, see [Manage a Private Workforce \(Amazon Cognito\)](#) and use the Mechanical Turk workforce instead in this tutorial.

**Tip**

To learn about the other workforce options you can use with Ground Truth, see [Workforces](#).

**To create a private workforce:**

1. In the **Workers** section, choose **Private**.
2. If this is your first time using a private workforce, in the **Email addresses** field, enter up to 100 email addresses. The addresses must be separated by a comma. You should include your own email address so that you are part of the workforce and can see data object labeling tasks.
3. In the **Organization name** field, enter the name of your organization. This information is used to customize the email sent to invite a person to your private workforce. You can change the organization name after the user pool is created through the console.
4. In the **Contact email** field enter an email address that members of the workforce use to report problems with the task.

If you add yourself to the private workforce, you will receive an email that looks similar to the following. **Amazon, Inc.** is replaced by the organization you enter in step 3 of the preceding procedure. Select the link in the email to log in using the temporary password provided. If prompted, change your password. When you successfully log in, you see the worker portal where your labeling tasks appear.

**[EXTERNAL] You're invited by Amazon, Inc. to work on a labeling project.**

no-reply@verificationemail.com &lt;no-reply@verificationemail.com&gt;

Thursday, February 11, 2021 at 10:34 AM

To: [Redacted]

**CAUTION:** This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

**You're invited to work on a labeling project.**

You will need this user name and temporary password to log in the first time.

User name: [yourname@amazon.com](mailto:yourname@amazon.com)

Temporary password: [\[Redacted\]](#)

Open the link below to log in:

<https://23mg2763m.labeling.us-east-1.sagemaker.aws>

After you log in with your temporary password, you are required to create a new one. If you have any questions, please contact [yourname@amazon.com](mailto:yourname@amazon.com).

**Tip**

You can find the link to your private workforce's worker portal in the **Labeling workforces** section of the Ground Truth area of the SageMaker AI console. To see the link, select the **Private** tab. The link is under the **Labeling portal sign-in URL** header in **Private workforce summary**.

If you choose to use the Amazon Mechanical Turk workforce to label the dataset, you are charged for labeling tasks completed on the dataset.

## To use the Amazon Mechanical Turk workforce:

1. In the **Workers** section, choose **Public**.
2. Set a **Price per task**.
3. If applicable, choose **The dataset does not contain adult content** to acknowledge that the sample dataset has no adult content. This information enables Amazon SageMaker Ground Truth to warn external workers on Mechanical Turk that they might encounter potentially offensive content in your dataset.
4. Choose the check box next to the following statement to acknowledge that the sample dataset does not contain any personally identifiable information (PII). This is a requirement to use Mechanical Turk with Ground Truth. If your input data does contain PII, use the private workforce for this tutorial.

**You understand and agree that the Amazon Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information or protected health information with this workforce.**

## Configure the Bounding Box Tool

Finally you configure the bounding box tool to give instructions to your workers. You can configure a task title that describes the task and provides high-level instructions for the workers. You can provide both quick instructions and full instructions. Quick instructions are displayed next to the image to be labeled. Full instructions contain detailed instructions for completing the task. In this example, you only provide quick instructions. You can see an example of full instructions by choosing **Full instructions** at the bottom of the section.

### To configure the bounding box tool

1. In the **Task description** field type in brief instructions for the task. For example:

**Draw a box around any *objects* in the image.**

Replace *objects* with the name of an object that appears in your images.

2. In the **Labels** field, type a category name for the objects that the worker should draw a bounding box around. For example, if you are asking the worker to draw boxes around football players, you could use "Football Player" in this field.

3. The **Short instructions** section enables you to create instructions that are displayed on the page with the image that your workers are labeling. We suggest that you include an example of a correctly drawn bounding box and an example of an incorrectly drawn box. To create your own instructions, use these steps:
  - a. Select the text between **GOOD EXAMPLE** and the image placeholder. Replace it with the following text:

**Draw the box around the object with a small border.**
  - b. Select the first image placeholder and delete it.
  - c. Choose the image button and then enter the HTTPS URL of one of the images that you created in step 1. It is also possible to embed images directly in the short instructions section, however this section has a quota of 100 kilobytes (including text). If your images and text exceed 100 kilobytes, you receive an error.
  - d. Select the text between **BAD EXAMPLE** and the image placeholder. Replace it with the following text:

**Don't make the bounding box too large or cut into the object.**
  - e. Select the second image placeholder and delete it.
  - f. Choose the image button and then enter the HTTPS URL of the other image that you created in step 1.
4. Select **Preview** to preview the worker UI. The preview opens in a new tab, and so if your browser blocks pop ups you may need to manually enable the tab to open. When you add one or more annotations to the preview and then select **Submit** you can see a preview of the output data your annotation would created.
5. After you have configured and verified your instructions, select **Create** to create the labeling job.

If you used a private workforce, you can navigate to the worker portal that you logged into in [Select Workers](#) of this tutorial to see your labeling tasks. The tasks may take a few minutes to appear.

Now that you've created a labeling job, you can [monitor it, or stop it](#).

## Monitoring Your Labeling Job

After you create your labeling job, you see a list of all the jobs that you have created. You can use this list to monitor that status of your labeling jobs. The list has the following fields:

- **Name** – The name that you assigned the job when you created it.
- **Status** – The completion status of the job. The status can be one of Complete, Failed, In progress, or Stopped.
- **Labeled objects/total** – Shows the total number of objects in the labeling job and how many of them have been labeled.
- **Creation time** – The date and time that you created the job.

You can also clone, chain, or stop a job. Select a job and then select one of the following from the **Actions** menu:

- **Clone** – Creates a new labeling job with the configuration copied from the selected job. You can clone a job when you want to change to the job and run it again. For example, you can clone a job that was sent to a private workforce so that you can send it to the Amazon Mechanical Turk workforce. Or you can clone a job to rerun it against a new dataset stored in the same location as the original job.
- **Chain** – Creates a new labeling job that can build upon the data and models (if any) of a stopped, failed, or completed job. For more information about the use cases and how to use it, see [Chaining labeling jobs](#).
- **Stop** – Stops a running job. You cannot restart a stopped job. You can clone a job to start over or chain the job to continue from where it left off. Labels for any already labeled objects are written to the output file location. For more information, see [Labeling job output data](#).

## Label Images

Use Ground Truth to label images. Select one of the following built in task types to learn more about that task type. Each page includes instructions to help you create a labeling job using that task type.

### Tip

To learn more about supported file types and input data quotas, see [Input data](#).

## Topics

- [Classify image objects using a bounding box](#)
- [Identify image contents using semantic segmentation](#)
- [Auto-Segmentation Tool](#)
- [Create an image classification job \(Single Label\)](#)
- [Create an image classification job \(Multi-label\)](#)
- [Image Label Verification](#)

## Classify image objects using a bounding box

The images used to train a machine learning model often contain more than one object. To classify and localize one or more objects within images, use the Amazon SageMaker Ground Truth bounding box labeling job task type. In this context, localization means the pixel-location of the bounding box. You create a bounding box labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

### Important

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see [Input data](#).

## Creating a Bounding Box Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a bounding box labeling job in the SageMaker AI console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Bounding box** as the task type.

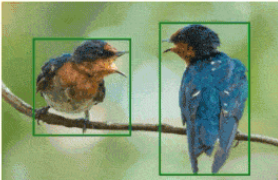

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and up to 50 labels that workers can choose from.

Instructions Shortcuts Select a category from the list and draw a box around each object that this category applies to.

**Instructions** X

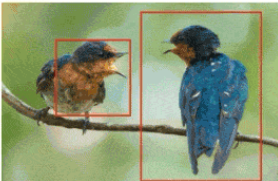

**Good example**

Fit each box tightly around the boundaries of the object.

**Bad example**

Boxes should not overlap with the boundaries of objects.

[More Instructions](#)

**Labels** X

Search labels

- bird 1
- plane 2
- kite 3

Nothing to label Submit

## Create a Bounding Box Labeling Job (API)

To create a bounding box labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-BoundingBox`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-BoundingBox`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```

response = client.create_labeling_job(
    LabelingJobName='example-bounding-box-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
BoundingBox',
        'TaskKeywords': [
            'Bounding Box',
        ],
        'TaskTitle': 'Bounding Box task',
        'TaskDescription': 'Draw bounding boxes around objects in an image',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {

```

```

        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-BoundingBox'
    }
},
Tags=[
    {
        'Key': 'string',
        'Value': 'string'
    },
]
)

```

## Provide a Template for Bounding Box Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header. Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="please draw box"
    labels="{{ task.input.labels | to_json | escape }}"
  >

  <full-instructions header="Bounding box instructions">
    <ol><li><strong>Inspect</strong> the image</li><li><strong>Determine</strong>
    if the specified label is/are visible in the picture.</li>
    <li><strong>Outline</strong> each instance of the specified label in the image
    using the provided "Box" tool.</li></ol>
    <ul><li>Boxes should fit tight around each object</li>
    <li>Do not include parts of the object are overlapping or that cannot be seen,
    even though you think you can interpolate the whole shape.</li>
    <li>Avoid including shadows.</li>
    <li>If the target is off screen, draw the box up to the edge of the image.</li>

  </full-instructions>

  <short-instructions>
    <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>

```

```
<p>Enter description of a correct bounding box label and add images</p>
<h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
<p>Enter description of an incorrect bounding box label and add images</p>
</short-instructions>

</crowd-bounding-box>
</crowd-form>
```

## Bounding Box Output Data

Once you have created a bounding box labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

For example, the output manifest file of a successfully completed single-class bounding box task will contain the following:

```
[
  {
    "boundingBox": {
      "boundingBoxes": [
        {
          "height": 2832,
          "label": "bird",
          "left": 681,
          "top": 599,
          "width": 1364
        }
      ],
      "inputImageProperties": {
        "height": 3726,
        "width": 2662
      }
    }
  }
]
```

The `boundingBoxes` parameter identifies the location of the bounding box drawn around an object identified as a "bird" relative to the top-left corner of the image which is taken to be the (0,0) pixel-coordinate. In the previous example, **left** and **top** identify the location of the pixel in the top-left corner of the bounding box relative to the top-left corner of the

image. The dimensions of the bounding box are identified with **height** and **width**. The `inputImageProperties` parameter gives the pixel-dimensions of the original input image.

When you use the bounding box task type, you can create single- and multi-class bounding box labeling jobs. The output manifest file of a successfully completed multi-class bounding box will contain the following:

```
[
  {
    "boundingBox": {
      "boundingBoxes": [
        {
          "height": 938,
          "label": "squirrel",
          "left": 316,
          "top": 218,
          "width": 785
        },
        {
          "height": 825,
          "label": "rabbit",
          "left": 1930,
          "top": 2265,
          "width": 540
        },
        {
          "height": 1174,
          "label": "bird",
          "left": 748,
          "top": 2113,
          "width": 927
        },
        {
          "height": 893,
          "label": "bird",
          "left": 1333,
          "top": 847,
          "width": 736
        }
      ],
      "inputImageProperties": {
        "height": 3726,
        "width": 2662
      }
    }
  }
]
```

```
    }  
  }  
}  
]
```

To learn more about the output manifest file that results from a bounding box labeling job, see [Bounding box job output](#).

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

## Identify image contents using semantic segmentation

To identify the contents of an image at the pixel level, use an Amazon SageMaker Ground Truth semantic segmentation labeling task. When assigned a semantic segmentation labeling job, workers classify pixels in the image into a set of predefined labels or classes. Ground Truth supports single and multi-class semantic segmentation labeling jobs. You create a semantic segmentation labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

Images that contain large numbers of objects that need to be segmented require more time. To help workers (from a private or vendor workforce) label these objects in less time and with greater accuracy, Ground Truth provides an AI-assisted auto-segmentation tool. For information, see [Auto-Segmentation Tool](#).

### Important

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see [Input data](#).

## Creating a Semantic Segmentation Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a semantic segmentation labeling job in the SageMaker AI console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Semantic segmentation** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

The screenshot shows the worker UI for labeling a photo. It consists of three main panels:

- Instructions Panel (Left):** Contains a close button (X), links for "View full instructions", "View tool guide", and "How to use the Auto-segment tool". It also includes a "Good example" section with text: "All pixels in the image that are part of an animal have been colored with the appropriate label color." and a "Bad example" section with text: "Some animals in the image have not been colored in completely." and "The color for a given animal extends beyond the boundaries of the animal."
- Image Panel (Center):** Displays a photo of a colorful bird perched on a branch. The bird's body is mostly green and blue, with a yellowish-brown head. The background is a blurred green.
- Labels Panel (Right):** Contains a close button (X) and a list of labels:
 

Label	Count
squirrel	1
rabbit	2
bird	3

At the bottom of the UI is a toolbar with icons for: Auto-segment, Polygon, Brush, Eraser, Dimmer, Undo, Redo, Zoom in, Zoom out, Move, and Fit image. On the far right of the toolbar, there is a "Nothing to label" checkbox and a "Submit" button.

## Create a Semantic Segmentation Labeling Job (API)

To create a semantic segmentation labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-SemanticSegmentation`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-SemanticSegmentation`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-semantic-segmentation-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
SemanticSegmentation,
        'TaskKeywords': [
            'Semantic Segmentation',
        ],
        'TaskTitle': 'Semantic segmentation task',
        'TaskDescription': 'For each category provided, segment out each relevant
object using the color associated with that category',
        'NumberOfHumanWorkersPerDataObject': 123,
```

```

    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-SemanticSegmentation'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Provide a Template for Semantic Segmentation Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-semantic-segmentation
    name="crowd-semantic-segmentation"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please segment out all pedestrians."
    labels="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Segmentation instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate label that best suits an object and
paint that object using the tools provided.</li></ol>
    </full-instructions>
    <short-instructions>
      <h2><span style="color: rgb(0, 138, 0);">Good example</span></h2>
      <p>Enter description to explain a correctly done segmentation</p>
      <p><br></p><h2><span style="color: rgb(230, 0, 0);">Bad example</span></h2>
      <p>Enter description of an incorrectly done segmentation</p>

```

```
</short-instructions>  
</crowd-semantic-segmentation>  
</crowd-form>
```

## Semantic Segmentation Output Data

Once you have created a semantic segmentation labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of an output manifest file for a semantic segmentation labeling job, see [3D point cloud semantic segmentation output](#).

## Auto-Segmentation Tool

Image segmentation is the process of dividing an image into multiple segments, or sets of labeled pixels. In Amazon SageMaker Ground Truth, the process of identifying all pixels that fall under a given label involves applying a colored filler, or "mask", over those pixels. Some labeling job tasks contain images with a large numbers of objects that need to be segmented. To help workers label these objects in less time and with greater accuracy, Ground Truth provides an auto-segmentation tool for segmentation tasks assigned to private and vendor workforces. This tool uses a machine learning model to automatically segment individual objects in the image with minimal worker input. Workers can refine the mask generated by the auto-segmentation tool using other tools found in the worker console. This helps workers complete image segmentation tasks faster and more accurately, resulting in lower cost and higher label quality. The following page gives information about the tool and its availability.

### Note

The auto-segmentation tool is available for segmentation tasks that are sent to a private workforce or vendor workforce. It isn't available for tasks sent to the public workforce (Amazon Mechanical Turk).

## Tool Preview

When workers are assigned a labeling job that provides the auto-segmentation tool, they are provided with detailed instructions on how to use the tool. For example, a worker might see the following in the worker console:

Workers can use **View full instructions** to learn how to use the tool. Workers will need to place a point on four extreme-points ( top-most, bottom-most, left-most, and right-most points ) of the object of interest, and the tool will automatically generate a mask for the object. Workers can further-refine the mask using the other tools provided, or by using the auto-segment tool on smaller portions of the object that were missed.

## Tool Availability

The auto-segmentation tool automatically appears in your workers' consoles if you create a semantic segmentation labeling job using the Amazon SageMaker AI console. While creating a semantic segmentation job in the SageMaker AI console, you will be able to preview the tool while

creating worker instructions. To learn how to create a semantic segmentation labeling job in the SageMaker AI console, see [Getting started: Create a bounding box labeling job with Ground Truth](#).

If you are creating a custom instance segmentation labeling job in the SageMaker AI console or creating an instance- or semantic-segmentation labeling job using the Ground Truth API, you need to create a custom task template to design your worker console and instructions. To include the auto-segmentation tool in your worker console, ensure that the following conditions are met in your custom task template:

- For semantic segmentation labeling jobs created using the API, the `<crowd-semantic-segmentation>` is present in the task template. For custom instance segmentation labeling jobs, the `<crowd-instance-segmentation>` tag is present in the task template.
- The task is assigned to a private workforce or vendor workforce.
- The images to be labeled are Amazon Simple Storage Service (Amazon S3) objects that have been pre-signed for the Worker so that they can access it. This is true if the task template includes the `grant_read_access` filter. For information about the `grant_read_access` filter, see [Adding automation with Liquid](#).

The following is an example of a custom task template for a custom instance segmentation labeling job, which includes the `<crowd-instance-segmentation/>` tag and the `grant_read_access` Liquid filter.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation
    name="crowd-instance-segmentation"
    src="{ task.input.taskObject | grant_read_access }"
    labels="['Car', 'Road']"
  <full-instructions header="Segmentation instructions">
    Segment each instance of each class of objects in the image.
  </full-instructions>

  <short-instructions>
    <p>Segment each instance of each class of objects in the image.</p>

    <h3 style="color: green;">GOOD EXAMPLES</h3>
    
    <p>Good because A, B, C.</p>

    <h3 style="color: red;">BAD EXAMPLES</h3>
```

```

  <p>Bad because X, Y, Z.</p>
</short-instructions>
</crowd-instance-segmentation>
</crowd-form>
```

## Create an image classification job (Single Label)

Use an Amazon SageMaker Ground Truth image classification labeling task when you need workers to classify images using predefined labels that you specify. Workers are shown images and are asked to choose one label for each image. You can create an image classification labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

### Important

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see [Input data](#).

## Create an Image Classification Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a image classification labeling job in the SageMaker AI console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Image Classification (Single Label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

**Instructions** ×

Please identify the image by selecting the appropriate label on the right.

[View full instructions](#)

[View tool guide](#)

You must select one label for each image. Once you have selected a label, click **Submit**.

## Create an Image Classification Labeling Job (API)

To create an image classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-ImageMultiClass`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).

- Annotation-consolidation Lambda functions for this task type end with ACS-ImageMultiClass. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-ImageMultiClass,
        'TaskKeywords': [
            'Image classification',
```

```

    ],
    'TaskTitle': Image classification task,
    'TaskDescription': 'Carefully inspect the image and classify it by selecting
one label from the categories provided.',
    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-ImageMultiClass'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Provide a Template for Image Classification Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="{ task.input.taskObject | grant_read_access }"
    header="please classify"
    categories="{ task.input.labels | to_json | escape }"
  >
    <full-instructions header="Image classification instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate label that best suits the image.</
li></ol>
    </full-instructions>

```

```
<short-instructions>
  <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
  <p>Enter description to explain the correct label to the workers</p>
  <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3><p>Enter
description of an incorrect label</p>
</short-instructions>
</crowd-image-classifier>
</crowd-form>
```

## Image Classification Output Data

Once you have created an image classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of an output manifest file from an image classification labeling job, see [Classification job output](#).

## Create an image classification job (Multi-label)

Use an Amazon SageMaker Ground Truth multi-label image classification labeling task when you need workers to classify multiple objects in an image. For example, the following image features a dog and a cat. You can use multi-label image classification to associate the labels "dog" and "cat" with this image. The following page gives information about creating an image classification job.

When working on a multi-label image classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label-categories.

When creating a labeling job in the console, Ground Truth doesn't provide a "none" category for when none of the labels applies to an image. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label image classification job.

To restrict workers to choosing a single label for each image, use the [Create an image classification job \(Single Label\)](#) task type.

### Important

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each image file in Amazon S3 that you want labeled. For more information, see [Input data](#).

## Create a Multi-Label Image Classification Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a multi-label image classification labeling job in the SageMaker AI console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Image Classification (Multi-label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels that workers can choose from.

**Instructions** ×

[View full instructions](#)

[View tool guide](#)

You must select at least one label for each image.

If multiple labels apply to the image, select multiple labels.

Please read each label and select all of those that apply to this image.

## Create a Multi-Label Image Classification Labeling Job (API)

To create a multi-label image classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-ImageMultiClassMultiLabel`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-ImageMultiClassMultiLabel`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-ImageMultiClassMultiLabel',
        'TaskKeywords': [
            'Image Classification',
        ],
        'TaskTitle': 'Multi-label image classification task',
        'TaskDescription': 'Select all labels that apply to the images shown',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
```

```

    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-ImageMultiClassMultiLabel'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Provide a Template for Multi-label Image Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier-multi-select
    name="crowd-image-classifier-multi-select"
    src="{ task.input.taskObject | grant_read_access }"
    header="Please identify all classes in image"
    categories="{ task.input.labels | to_json | escape }"
  >
    <full-instructions header="Multi Label Image classification instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate labels that best suit the image.</
li></ol>
    </full-instructions>
    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description to explain the correct label to the workers</p>
      <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
      <p>Enter description of an incorrect label</p>
    </short-instructions>

```

```
</crowd-image-classifier-multi-select>  
</crowd-form>
```

## Multi-label Image Classification Output Data

Once you have created a multi-label image classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of output manifest files for multi-label image classification labeling job, see [Multi-label classification job output](#).

## Image Label Verification

Building a highly accurate training dataset for your machine learning (ML) algorithm is an iterative process. Typically, you review and continuously adjust your labels until you are satisfied that they accurately represent the ground truth, or what is directly observable in the real world. You can use an Amazon SageMaker Ground Truth image label verification task to direct workers to review a dataset's labels and improve label accuracy. Workers can indicate if the existing labels are correct or rate label quality. They can also add comments to explain their reasoning. Amazon SageMaker Ground Truth supports label verification for [Classify image objects using a bounding box](#) and [Identify image contents using semantic segmentation](#) labels. You create an image label verification labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

Ground Truth provides a worker console similar to the following for labeling tasks. When you create the labeling job with the console, you can modify the images and content that are shown. To learn how to create a labeling job using the Ground Truth console, see [Create a Labeling Job \(Console\)](#).

You can create a label verification labeling job using the SageMaker AI console or API. To learn how to create a labeling job using the Ground Truth API operation `CreateLabelingJob`, see [Create a Labeling Job \(API\)](#).

## Text labeling with Ground Truth

Use Ground Truth to label text. Ground Truth supports labeling text for named entity recognition, single label text classification, and multi-label text classification. The following topics give information about these built-in task types, as well as instructions to help you create a labeling job using that task type.

### i Tip

To learn more about supported file types and input data quotas, see [Input data](#).

## Topics

- [Extract text information using named entity recognition](#)
- [Categorize text with text classification \(Single Label\)](#)
- [Categorize text with text classification \(Multi-label\)](#)

## Extract text information using named entity recognition

To extract information from unstructured text and classify it into predefined categories, use an Amazon SageMaker Ground Truth named entity recognition (NER) labeling task. Traditionally, NER involves sifting through text data to locate noun phrases, called *named entities*, and categorizing each with a label, such as "person," "organization," or "brand." You can broaden this task to label longer spans of text and categorize those sequences with predefined labels that you specify. You can create a named entity recognition labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

When tasked with a named entity recognition labeling job, workers apply your labels to specific words or phrases within a larger text block. They choose a label, then apply it by using the cursor to highlight the part of the text to which the label applies. The Ground Truth named entity recognition tool supports overlapping annotations, in-context label selection, and multi-label selection for a single highlight. Also, workers can use their keyboards to quickly select labels.

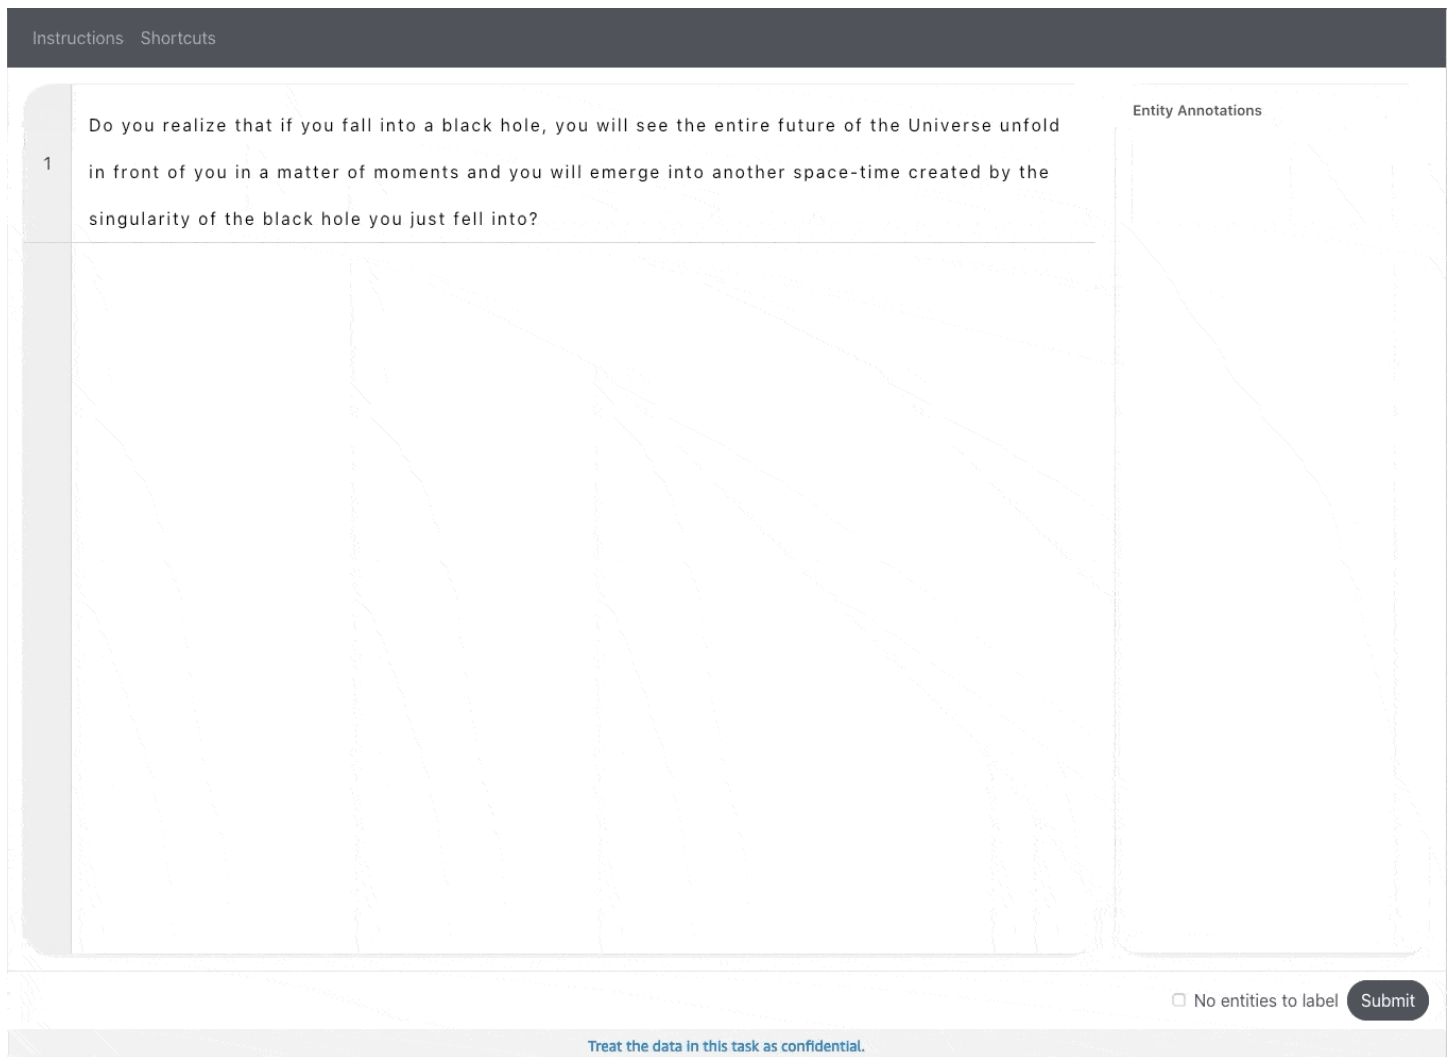

### Important

If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see [Input data](#).

## Create a Named Entity Recognition Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a named entity recognition labeling job in the SageMaker AI console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Named entity recognition** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

The screenshot shows the Amazon SageMaker AI interface. At the top, there are tabs for "Instructions" and "Shortcuts". Below this is a text input field containing the question: "Do you realize that if you fall into a black hole, you will see the entire future of the Universe unfold in front of you in a matter of moments and you will emerge into another space-time created by the singularity of the black hole you just fell into?". To the right of the input field is an "Entity Annotations" output field, which is currently empty. At the bottom right of the interface, there is a checkbox labeled "No entities to label" and a "Submit" button. At the bottom center, there is a small text label: "Treat the data in this task as confidential."

## Create a Named Entity Recognition Labeling Job (API)

To create a named entity recognition labeling job, using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-NamedEntityRecognition`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-NamedEntityRecognition`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

- You must provide the following ARN for [HumanTaskUiArn](#):

```
arn:aws:sagemaker:aws-region:394669845002:human-task-ui/NamedEntityRecognition
```

Replace *aws-region* with the AWS Region you use to create the labeling job. For example, use `us-west-1` if you create a labeling job in US West (N. California).

- Provide worker instructions in the label category configuration file using the `instructions` parameter. You can use a string, or HTML markup language in the `shortInstruction` and `fullInstruction` fields. For more details, see [Provide Worker Instructions in a Label Category Configuration File](#).

```
"instructions": {"shortInstruction": "<h1>Add header</h1><p>Add Instructions</p>",  
"fullInstruction": "<p>Add additional instructions.</p>"}
```

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(  
    LabelingJobName='example-ner-labeling-job',  
    LabelAttributeName='label',  
    InputConfig={  
        'DataSource': {  
            'S3DataSource': {  
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'  
            }  
        },  
        'DataAttributes': {  
            'ContentClassifiers': [  
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',  
            ]  
        }  
    },  
    OutputConfig={  
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',  
        'KmsKeyId': 'string'  
    },  
    RoleArn='arn:aws:iam::*:role/*',  
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',  
    StoppingConditions={
```

```

        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn': 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
NamedEntityRecognition'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
NamedEntityRecognition',
        'TaskKeywords': [
            'Named entity Recognition',
        ],
        'TaskTitle': 'Named entity Recognition task',
        'TaskDescription': 'Apply the labels provided to specific words or phrases
within the larger text block.',
        'NumberOfHumanWorkersPerDataObject': 1,
        'TaskTimeLimitInSeconds': 28800,
        'TaskAvailabilityLifetimeInSeconds': 864000,
        'MaxConcurrentTaskCount': 1000,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-NamedEntityRecognition'
        },
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ],
]
)

```

## Provide Worker Instructions in a Label Category Configuration File

You must provide worker instructions in the label category configuration file you identify with the `LabelCategoryConfigS3Uri` parameter in `CreateLabelingJob`. You can use these instructions to provide details about the task you want workers to perform and help them use the tool efficiently.

You provide short and long instructions using `shortInstruction` and `fullInstruction` in the `instructions` parameter, respectively. To learn more about these instruction types, see [Create instruction pages](#).

The following is an example of a label category configuration file with instructions that can be used for a named entity recognition labeling job.

```
{
  "document-version": "2018-11-28",
  "labels": [
    {
      "label": "label1",
      "shortDisplayName": "L1"
    },
    {
      "label": "label2",
      "shortDisplayName": "L2"
    },
    {
      "label": "label3",
      "shortDisplayName": "L3"
    },
    {
      "label": "label4",
      "shortDisplayName": "L4"
    },
    {
      "label": "label5",
      "shortDisplayName": "L5"
    }
  ],
  "instructions": {
    "shortInstruction": "<p>Enter description of the labels that workers have to choose from</p><br><p>Add examples to help workers understand the label</p>",
    "fullInstruction": "<ol>
      <li><strong>Read</strong> the text carefully.</li>
      <li><strong>Highlight</strong> words, phrases, or sections of the text.</li>
      <li><strong>Choose</strong> the label that best matches what you have highlighted.</li>
      <li>To <strong>change</strong> a label, choose highlighted text and select a new label.</li>
      <li>To <strong>remove</strong> a label from highlighted text, choose the X next to the abbreviated label name on the highlighted text.</li>
    </ol>"
  }
}
```

```
        <li>You can select all of a previously highlighted text, but  
not a portion of it.</li>  
    </ol>"  
}  
}
```

## Named Entity Recognition Output Data

Once you have created a named entity recognition labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

## Categorize text with text classification (Single Label)

To categorize articles and text into predefined categories, use text classification. For example, you can use text classification to identify the sentiment conveyed in a review or the emotion underlying a section of text. Use Amazon SageMaker Ground Truth text classification to have workers sort text into categories that you define. You create a text classification labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

### Important

If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see [Input data](#).

## Create a Text Classification Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a text classification labeling job in the SageMaker AI console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Text Classification (Single Label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

Hello, chopt@amazon.com Customer ID: 68852047... Task description: Categorize text into specific... Task time: 0:16 of 5 Min

Decline task Release task Stop and resume later

Instructions Shortcuts Categorize the text by selecting a single label.

Jen purchased 10 shares of the stock on January 1st, 2020.

Submit

Treat the data in this task as confidential.

## Create a Text Classification Labeling Job (API)

To create a text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClass`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClass`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```

response = client.create_labeling_job(
    LabelingJobName='example-text-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
TextMultiClass,
        'TaskKeywords': [
            'Text classification',
        ],
        'TaskTitle': 'Text classification task',
        'TaskDescription': 'Carefully read and classify this text using the categories
provided.',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {

```

```

        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-TextMultiClass'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ],
]
)

```

## Provide a Template for Text Classification Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="crowd-classifier"
    categories="{{ task.input.labels | to_json | escape }}"
    header="classify text"
  >
    <classification-target style="white-space: pre-wrap">
      {{ task.input.taskObject }}
    </classification-target>
    <full-instructions header="Classifier instructions">
      <ol><li><strong>Read</strong> the text carefully.</li>
      <li><strong>Read</strong> the examples to understand more about the options.</li>
      <li><strong>Choose</strong> the appropriate labels that best suit the text.</
li></ol>
    </full-instructions>
    <short-instructions>
      <p>Enter description of the labels that workers have to choose from</p>
      <p><br></p><p><br></p><p>Add examples to help workers understand the label</p>
      <p><br></p><p><br></p><p><br></p><p><br></p><p><br></p>
    </short-instructions>
  </crowd-classifier>
</crowd-form>

```

## Text Classification Output Data

Once you have created a text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of an output manifest files from a text classification labeling job, see [Classification job output](#).

## Categorize text with text classification (Multi-label)

To categorize articles and text into multiple predefined categories, use the multi-label text classification task type. For example, you can use this task type to identify more than one emotion conveyed in text. The following sections give information about how to create a multi-label text classification task from the console and API.

When working on a multi-label text classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label categories.

Amazon SageMaker Ground Truth doesn't provide a "none" category for when none of the labels applies. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label text classification job.

To restrict workers to choosing a single label for each document or text selection, use the [Categorize text with text classification \(Single Label\)](#) task type.

### Important

If you manually create an input manifest file, use "source" to identify the text that you want labeled. For more information, see [Input data](#).

## Create a Multi-Label Text Classification Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) to learn how to create a multi-label text classification labeling job in the Amazon SageMaker AI console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Text Classification (Multi-label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.

The screenshot displays the worker UI for a labeling task. At the top, it shows the user's email (Hello, chopt@amazon.com), Customer ID (6885204...), Task description (Categorize text into multipl...), and Task time (0:25 of 5 Min). There are buttons for 'Decline task', 'Release task', and 'Stop and resume later'. Below this, there are tabs for 'Instructions' and 'Shortcuts', with the instruction 'Read the text and select all labels that categorize the text.' The main area contains a text box with instructions: 'To train a machine learning model, you need a large, high-quality, labeled dataset. Ground Truth helps you build high-quality training datasets for your machine learning models.' To the right, there is a section titled 'Select appropriate categories' with a list of categories and their corresponding numbers: Technology (1), Finance (2), Review (3), Recipe (4), Complex (5), and Simple (6). A 'Submit' button is located at the bottom right. At the bottom of the interface, there is a footer that says 'Treat the data in this task as confidential.'

## Create a Multi-Label Text Classification Labeling Job (API)

To create a multi-label text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClassMultiLabel`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClassMultiLabel`. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-text-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/custom-worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda::function:PRE-
TextMultiClassMultiLabel,
        'TaskKeywords': [
            'Text Classification',
        ],
        'TaskTitle': 'Multi-label text classification task',
        'TaskDescription': 'Select all labels that apply to the text shown',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
```

```

    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-TextMultiClassMultiLabel'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Create a Template for Multi-label Text Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the [short-instructions](#), [full-instructions](#), and header.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier-multi-select
    name="crowd-classifier-multi-select"
    categories="{{ task.input.labels | to_json | escape }}"
    header="Please identify all classes in the below text"
  >
    <classification-target style="white-space: pre-wrap">
      {{ task.input.taskObject }}
    </classification-target>
    <full-instructions header="Classifier instructions">
      <ol><li><strong>Read</strong> the text carefully.</li>
      <li><strong>Read</strong> the examples to understand more about the options.</li>
      <li><strong>Choose</strong> the appropriate labels that best suit the text.</
li></ol>
    </full-instructions>
    <short-instructions>
      <p>Enter description of the labels that workers have to choose from</p>
      <p><br></p>
      <p><br></p><p>Add examples to help workers understand the label</p>
      <p><br></p><p><br></p><p><br></p><p><br></p>

```

```
</short-instructions>  
</crowd-classifier-multi-select>  
</crowd-form>
```

To learn how to create a custom template, see [Custom labeling workflows](#).

## Multi-label Text Classification Output Data

Once you have created a multi-label text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of output manifest files for multi-label text classification labeling job, see [Multi-label classification job output](#).

## Videos and video frame labeling

You can use Ground Truth to classify videos and annotate video frames (still images extracted from videos) using one of the three built-in video task types. These task types streamline the process of creating video and video frame labeling jobs using the Amazon SageMaker AI console, API, and language-specific SDKs.

- Video clip classification – Enable workers to classify videos into categories you specify. For example, you can use this task type to have workers categorize videos into topics like sports, comedy, music, and education. To learn more, see [Classify videos](#).
- Video frame labeling jobs – Enable workers to annotate video frames extracted from a video using bounding boxes, polylines, polygons or keypoint annotation tools. Ground Truth offers two built-in task types to label video frames:
  - *Video frame object detection*: Enable workers to identify and locate objects in video frames.
  - *Video frame object tracking*: Enable workers to track the movement of objects across video frames.
  - *Video frame adjustment jobs*: Have workers adjust labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.
  - *Video frame verification jobs*: Have workers verify labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.

If you have video files, you can use the Ground Truth automatic frame extraction tool to extract video frames from your videos. To learn more, see [Video Frame Input Data](#).

**Tip**

To learn more about supported file types and input data quotas, see [Input data](#).

## Topics

- [Classify videos](#)
- [Video frames](#)
- [Worker Instructions](#)

## Classify videos

Use an Amazon SageMaker Ground Truth video classification labeling task when you need workers to classify videos using predefined labels that you specify. Workers are shown videos and are asked to choose one label for each video. You create a video classification labeling job using the Ground Truth section of the Amazon SageMaker AI console or the [CreateLabelingJob](#) operation.

Your video files must be encoded in a format that is supported by the browser used by the work team that labels your data. It is recommended that you verify that all video file formats in your input manifest file display correctly using the worker UI preview. You can communicate supported browsers to your workers using worker instructions. To see supported file formats, see [Supported data formats](#).

**Important**

For this task type, if you create your own manifest file, use "source-ref" to identify the location of each video file in Amazon S3 that you want labeled. For more information, see [Input data](#).

## Create a Video Classification Labeling Job (Console)

You can follow the instructions in [Create a Labeling Job \(Console\)](#) to learn how to create a video classification labeling job in the SageMaker AI console. In step 10, choose **Video** from the **Task category** dropdown list, and choose **Video Classification** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels from which workers can choose.

**Instructions** ×

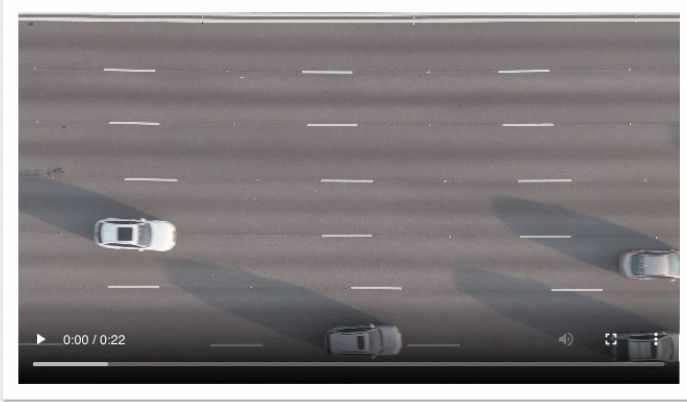

[View full instructions](#)

[View tool guide](#)

Select a single label that best describes this video clip.  
Select none of the above if none of the other labels apply.

Select Submit when you are done.

Watch and then classify this video clip by selecting a single label.

Select an option

highway	1
city	2
small town	3
none of the above	4

## Create a Video Classification Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

Follow the instructions on [Create a Labeling Job \(API\)](#) and do the following while you configure your request:

- Use a pre-annotation Lambda function that ends with `PRE-VideoClassification`. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#).

- Use an annotation-consolidation Lambda function that ends with ACS-VideoClassification. To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-VideoClassification',
        'TaskKeywords': [
            'Video Classification',
        ],
    },
)
```

```

    'TaskTitle': 'Video classification task',
    'TaskDescription': 'Select a label to classify this video',
    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoClassification'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Provide a Template for Video Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template by modifying the short-instructions, full-instructions, and header. Upload this template to Amazon S3, and provide the Amazon S3 URI to this file in `UiTemplateS3Uri`.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

    <crowd-form>
        <crowd-classifier
            name="crowd-classifier"
            categories="{ task.input.labels | to_json | escape }"
            header="Please classify video"
        >
            <classification-target>
                <video width="100%" controls/>
                    <source src="{ task.input.taskObject | grant_read_access }"
type="video/mp4"/>
                    <source src="{ task.input.taskObject | grant_read_access }"
type="video/webm"/>
                    <source src="{ task.input.taskObject | grant_read_access }"
type="video/ogg"/>
                    Your browser does not support the video tag.
                </video>
            </classification-target>
        </crowd-classifier>
    </crowd-form>

```

```

        </classification-target>
        <full-instructions header="Video classification instructions">
            <ol><li><strong>Read</strong> the task carefully and inspect the
video.</li>
                <li><strong>Read</strong> the options and review the examples
provided to understand more about the labels.</li>
                <li><strong>Choose</strong> the appropriate label that best
suits the video.</li></ol>
        </full-instructions>
        <short-instructions>
            <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
            <p>Enter description to explain the correct label to the
workers</p>
            <p></p>
            <h3><span style="color: rgb(230, 0, 0);">Bad example</span></
h3>
            <p>Enter description of an incorrect label</p>
            <p></p>
        </short-instructions>
    </crowd-classifier>
</crowd-form>

```

## Video Classification Output Data

Once you have created a video classification labeling job, your output data is located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see [Labeling job output data](#).

To see an example of output manifest files for video classification labeling jobs, see [Classification job output](#).

## Video frames

You can use Ground Truth built-in video frame task types to have workers annotate video frames using bounding boxes, polylines, polygons or keypoints. A *video frame* is a sequence of images that have been extracted from a video.

If you do not have video frames, you can provide video files (MP4 files) and use the Ground Truth automated frame extraction tool to extract video frames. To learn more, see [Provide Video Files](#).

You can use the following built-in video task types to create video frame labeling jobs using the Amazon SageMaker AI console, API, and language-specific SDKs.

- **Video frame object detection** – Use this task type when you want workers to identify and locate objects in sequences of video frames. You provide a list of categories, and workers can select one category at a time and annotate objects which the category applies to in all frames. For example, you can use this task to ask workers to identify and localize various objects in a scene, such as cars, bikes, and pedestrians.
- **Video frame object tracking** – Use this task type when you want workers to track the movement of instances of objects across sequences of video frames. When a worker adds an annotation to a single frame, that annotation is associated with a unique instance ID. The worker adds annotations associated with the same ID in all other frames to identify the same object or person. For example, a worker can track the movement of a vehicle across a sequences of video frames by drawing bounding boxes associated with the same ID around the vehicle in each frame that it appears.

Use the following topics to learn more about these built-in task types and to how to create a labeling job using each task type. See [Task types](#) to learn more about the annotations tools (bounding boxes, polylines, polygons and keypoints) available for these task types.

Before you create a labeling job, we recommend that you review [Video frame labeling job reference](#).

### Topics

- [Identify objects using video frame object detection](#)
- [Track objects in video frames using video frame object tracking](#)
- [Video frame labeling job reference](#)

## Identify objects using video frame object detection

You can use the video frame object detection task type to have workers identify and locate objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons or keypoint *annotation tools*. The tool you choose defines the video frame task type you create. For example, you can use a bounding box video frame object detection task type workers to identify and localize various objects in a series of video frames, such as cars, bikes, and pedestrians. You can create a video frame object detection labeling job using the Amazon SageMaker AI Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see [Create a Video Frame Object Detection Labeling Job](#) and select your preferred method. See [Task types](#) to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: [Preview the Worker UI](#).

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see [Create Video Frame Object Detection Adjustment or Verification Labeling Job](#).

### Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object detection annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object detection tasks:

- For all tasks, workers can use the **Copy to next** and **Copy to all** features to copy an annotation to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a **Predict next** feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same label in all other frames. Workers can then make adjustments to correct predicted box locations.

## Create a Video Frame Object Detection Labeling Job

You can create a video frame object detection labeling job using the SageMaker AI console or the [CreateLabelingJob](#) API operation.

This section assumes that you have reviewed the [Video frame labeling job reference](#) and have chosen the type of input data and the input dataset connection you are using.

### Create a Labeling Job (Console)

You can follow the instructions in [Create a Labeling Job \(Console\)](#) to learn how to create a video frame object tracking job in the SageMaker AI console. In step 10, choose **Video - Object detection** from the **Task category** dropdown list. Select the task type you want by selecting one of the cards in **Task selection**.

## Task type [Info](#)

### Task category

Select the type of data being labeled to view available task templates for it or select 'Custom' to create your own.

Video - Object detection

### Task selection

Select the task that a human worker will perform to label objects in your dataset.

#### Bounding box

Get workers to draw bounding boxes around specified objects in your video. [Info](#)

#### Polygon

Get workers to draw polygons around specified objects in your video. [Info](#)

#### Polyline

Get workers to draw polyline around specified objects in your video. [Info](#)

#### Key point

Get workers to draw key points around specified objects in your video. [Info](#)

## Create a Labeling Job (API)

You create an object detection labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

[Create a Labeling Job \(API\)](#) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectDetection`. Replace `<region>` with the AWS Region in which you are creating the labeling job.

Do not include an entry for the `UiTemplateS3Uri` parameter.

- Your `LabelAttributeName` must end in `-ref`. For example, `video-od-labels-ref`.
- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker AI console, or create it manually and upload it to Amazon S3. For more information, see [Input Data Setup](#).
- You can only use private or vendor work teams to create video frame object detection labeling jobs.
- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see [Labeling category configuration file with label category and frame attributes reference](#) to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectDetection`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectDetection`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-od-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://amzn-s3-demo-bucket/path/video-frame-sequence-
input-manifest.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://amzn-s3-demo-bucket/prefix/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/prefix/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn': 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
VideoObjectDetection'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
VideoObjectDetection',
        'TaskKeywords': [
            'Video Frame Object Detection',
        ],
        'TaskTitle': 'Video frame object detection task',
        'TaskDescription': 'Classify and identify the location of objects and people in
video frames',
    },
)
```

```

    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoObjectDetection'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Create Video Frame Object Detection Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see [Label verification and adjustment](#).

### Output Data Format

When you create a video frame object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object detection output data format, see [Video frame object detection output](#). If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format.

### Track objects in video frames using video frame object tracking

You can use the video frame object tracking task type to have workers track the movement of objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons or keypoint *annotation tools*. The tool you choose defines the video frame task type you create. For example, you can use a bounding box video frame object tracking task type to ask workers to track the movement of objects, such as cars, bikes, and pedestrians by drawing boxes around them.

You provide a list of categories, and each annotation that a worker adds to a video frame is identified as an *instance* of that category using an instance ID. For example, if you provide the label category car, the first car that a worker annotates will have the instance ID car:1. The second car

the worker annotates will have the instance ID `car:2`. To track an object's movement, the worker adds annotations associated with the same instance ID around to object in all frames.

You can create a video frame object tracking labeling job using the Amazon SageMaker AI Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see [Create a Video Frame Object Detection Labeling Job](#) and select your preferred method. See [Task types](#) to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: [Preview the Worker UI](#).

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see [Create Video Frame Object Detection Adjustment or Verification Labeling Job](#).

## Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object tracking annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object tracking tasks:

- For all tasks, workers can use the **Copy to next** and **Copy to all** features to copy an annotation with the same unique ID to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a **Predict next** feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same unique ID in all other frames. Workers can then make adjustments to correct predicted box locations.

## Create a Video Frame Object Tracking Labeling Job

You can create a video frame object tracking labeling job using the SageMaker AI console or the [CreateLabelingJob](#) API operation.

This section assumes that you have reviewed the [Video frame labeling job reference](#) and have chosen the type of input data and the input dataset connection you are using.

## Create a Labeling Job (Console)

You can follow the instructions in [Create a Labeling Job \(Console\)](#) to learn how to create a video frame object tracking job in the SageMaker AI console. In step 10, choose **Video - Object tracking** from the **Task category** dropdown list. Select the task type you want by selecting one of the cards in **Task selection**.

### Task type [Info](#)

#### Task category

Select the type of data being labeled to view available task templates for it or select 'Custom' to create your own.

Video - Object tracking

#### Task selection

Select the task that a human worker will perform to label objects in your dataset.

##### Bounding box

Get workers to track specific instances of objects in your video across multiple frames in your bounding boxes. [Info](#)

##### Polygon

Get workers to track specific instances of objects in your video across multiple frames in your polygons. [Info](#)

##### Polyline

Get workers to track specific instances of objects in your video across multiple frames in your polylines. [Info](#)

##### Key point

Get workers to draw key points around specified objects in your video. [Info](#)

## Create a Labeling Job (API)

You create an object tracking labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

[Create a Labeling Job \(API\)](#) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectTracking`. Replace `<region>` with the AWS Region in which you are creating the labeling job.

Do not include an entry for the `UiTemplateS3Uri` parameter.

- Your `LabelAttributeName` must end in `-ref`. For example, `ot-labels-ref`.
- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker AI console, or create it manually and upload it to Amazon S3. For more information, see [Input Data Setup](#). If you create a streaming labeling job, the input manifest file is optional.
- You can only use private or vendor work teams to create video frame object detection labeling jobs.
- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see [Labeling category configuration file with label category and frame attributes reference](#) to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectTracking`.

- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-ot-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://amzn-s3-demo-bucket/path/video-frame-sequence-
input-manifest.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://amzn-s3-demo-bucket/prefix/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/prefix/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1:*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn': 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
VideoObjectTracking'
```

```

    },
    'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
VideoObjectTracking',
    'TaskKeywords': [
        'Video Frame Object Tracking',
    ],
    'TaskTitle': 'Video frame object tracking task',
    'TaskDescription': 'Tracking the location of objects and people across video
frames',
    'NumberOfHumanWorkersPerDataObject': 123,
    'TaskTimeLimitInSeconds': 123,
    'TaskAvailabilityLifetimeInSeconds': 123,
    'MaxConcurrentTaskCount': 123,
    'AnnotationConsolidationConfig': {
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoObjectTracking'
    },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)

```

## Create a Video Frame Object Tracking Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see [Label verification and adjustment](#).

### Output Data Format

When you create a video frame object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object tracking output data format, see [Video frame object tracking output](#). If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format.

### Video frame labeling job reference

Use this page to learn about the object detection and object tracking video frame labeling jobs. The information on this page applies to both of these built-in task types.

The video frame labeling job is unique because of the following:

- You can either provide data objects that are ready to be annotated (video frames), or you can provide video files and have Ground Truth automatically extract video frames.
- Workers have the ability to save work as they go.
- You cannot use the Amazon Mechanical Turk workforce to complete your labeling tasks.
- Ground Truth provides a worker UI, as well as assistive and basic labeling tools, to help workers complete your tasks. You do not need to provide a worker task template.

Use the following topics to learn more about video frame labeling jobs.

## Topics

- [Input data](#)
- [Job completion times](#)
- [Task types](#)
- [Workforces](#)
- [Worker user interface \(UI\)](#)
- [Video frame job permission requirements](#)

## Input data

The video frame labeling job uses *sequences* of video frames. A single sequence is a series of images that have been extracted from a single video. You can either provide your own sequences of video frames, or have Ground Truth automatically extract video frame sequences from your video files. To learn more, see [Provide Video Files](#).

Ground Truth uses sequence files to identify all images in a single sequence. All of the sequences that you want to include in a single labeling job are identified in an input manifest file. Each sequence is used to create a single worker task. You can automatically create sequence files and an input manifest file using Ground Truth automatic data setup. To learn more, see [Set up Automated Video Frame Input Data](#).

To learn how to manually create sequence files and an input manifest file, see [Create a Video Frame Input Manifest File](#).

## Job completion times

Video and video frame labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

We strongly recommend that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth saves their work every 15 minutes.

When using the SageMaker AI `CreateLabelingJob` API operation, set the total time a task is available to workers in the `TaskTimeLimitInSeconds` parameter of `HumanTaskConfig`.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

## Task types

When you create a video object tracking or video object detection labeling job, you specify the type of annotation that you want workers to create while working on your labeling task. The annotation type determines the type of output data Ground Truth returns and defines the *task type* for your labeling job.

If you are creating a labeling job using the API operation [CreateLabelingJob](#), you specify the task type using the label category configuration file parameter `annotationType`. To learn more, see [Labeling category configuration file with label category and frame attributes reference](#).

The following task types are available for both video object tracking or video object detection labeling jobs:

- **Bounding box** – Workers are provided with tools to create bounding box annotations. A bounding box is a box that a worker draws around an objects to identify the pixel-location and label of that object in the frame.
- **Polyline** – Workers are provided with tools to create polyline annotations. A polyline is defined by the series of ordered x, y coordinates. Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines.
- **Polygon** – Workers are provided with tools to create polygon annotations. A polygon is a closed shape defined by a series of ordered x, y coordinates. Each point added to the polygon

is connected to the previous point by a line and there are no restrictions on the angles formed between lines. Two lines (sides) of the polygon cannot cross. The start and end point of a polygon must be the same.

- **Keypoint** – Workers are provided with tools to create keypoint annotations. A keypoint is a single point associated with an x, y coordinate in the video frame.

## Workforces

When you create a video frame labeling job, you need to specify a work team to complete your annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for video frame labeling jobs.

To learn more about vendor workforces, see [Subscribe to vendor workforces](#).

To learn how to create and manage a private workforce, see [Private workforce](#).

## Worker user interface (UI)

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your video labeling tasks. You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter [HumanTaskUiArn](#) to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker AI [RenderUiTemplate](#) API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, attributes that workers can use to provide more information about labels and video frames. These attributes are referred to as label category attributes and frame attributes respectively. They are all displayed in the worker UI.

## Label category and frame attributes

When you create a video object tracking or video object detection labeling job, you can add one or more *label category attributes* and *frame attributes*:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to provide metadata about a label.

- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each video frame a worker is sent to annotate. It is used by workers to provide metadata about video frames.

Additionally, you can use label and frame attributes to have workers verify labels in a video frame label verification job.

Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the **Create Labeling Job** sections on the [task type page](#) of your choice.

### Label category attributes

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a *global label category attribute*.

For example, if you add the label category *car*, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute *occluded* to the car label category, you can assign *partial*, *completely*, *no* to the *occluded* attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

### Frame level attributes

Add frame attributes to give workers the ability to provide more information about individual video frames. Each frame attribute you add appears on all frames.

For example, you can add a number-frame attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide an answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a video frame.

## Worker instructions

You can provide worker instructions to help your workers complete your video frame labeling tasks. You might want to cover the following topics when writing your instructions:

- Best practices and things to avoid when annotating objects.
- The label category attributes provided (for object detection and object tracking tasks) and how to use them.
- How to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker AI console while creating a labeling job. If you create a labeling job using the API operation `CreateLabelingJob`, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on [Worker Instructions](#).

## Declining tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object ([NumberOfHumanWorkersPerDataObject](#)) decline the task, the data object is marked as expired and will not be sent to additional workers.

## Video frame job permission requirements

When you create a video frame labeling job, in addition to the permission requirements found in [Assign IAM Permissions to Use Ground Truth](#), you must add a CORS policy to your S3 bucket that contains your input manifest file.

## CORS permission policy for your S3 bucket

When you create a video frame labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

## JSON

```
[
  {
    "AllowedHeaders": [
      "*"
    ],
    "AllowedMethods": [
      "GET",
      "HEAD",
      "PUT"
    ],
    "AllowedOrigins": [
      "*"
    ],
    "ExposeHeaders": [
      "Access-Control-Allow-Origin"
    ],
    "MaxAgeSeconds": 3000
  }
]
```

## XML

```
<?xml version="1.0" encoding="UTF-8"?>
<CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
<CORSRule>
  <AllowedOrigin>*</AllowedOrigin>
  <AllowedMethod>GET</AllowedMethod>
  <AllowedMethod>HEAD</AllowedMethod>
  <AllowedMethod>PUT</AllowedMethod>
  <MaxAgeSeconds>3000</MaxAgeSeconds>
  <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
  <AllowedHeader>*</AllowedHeader>
</CORSRule>
</CORSConfiguration>
```

To learn how to add a CORS policy to an S3 bucket, see [How do I add cross-domain resource sharing with CORS?](#) in the Amazon Simple Storage Service User Guide.

## Worker Instructions

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your video frame labeling task. First, select the type of task you are working on from **Topics**.

### Important

It is recommended that you complete your task using a Google Chrome or Firefox web browser.

For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.

### Topics

- [Navigate the UI](#)
- [Bulk Edit Label and Frame Attributes](#)
- [Tool Guide](#)
- [Icons Guide](#)
- [Shortcuts](#)
- [Understand Release, Stop and Resume, and Decline Task Options](#)
- [Saving Your Work and Submitting](#)
- [Video Frame Object Tracking Tasks](#)
- [Video Frame Object Detection Tasks](#)

### Navigate the UI

You can navigate between video frames using the navigation bar in the bottom-left corner of your UI.

Use the play button to automatically move through the entire sequence of frames.

Use the next frame and previous frame buttons to move forward or back one frame at a time. You can also input a frame number to navigate to that frame.

You can zoom in to and out of all video frames. Once you have zoomed into a video frame, you can move around in that frame using the move icon. When you set a new view in a single video frame by zooming and moving within that frame, all video frames are set to the same view. You can reset all video frames to their original view using the fit screen icon. For additional view options, see [Icons Guide](#).

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task. Additionally, select **More instructions** and review these instructions.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate video frames and use the tools provided.
- **Help** – Use this option to refer back to this documentation.

### Bulk Edit Label and Frame Attributes

You can bulk edit label attributes and frame attributes (attributes).

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify *must* contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you *must* specify the desired value for the attribute first. For example, if you want to change an attribute from *Yes* to *No*, you must select *No*, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

#### To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (-) in the text box. For example, if you want to apply the edit to frames one through ten, enter 1-10. If you want to apply the edit to frames two to five, eight to ten and twenty enter 2-5, 8-10, 20.
3. Select **Confirm**.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

## Tool Guide

Your task will include one or more tools. The tool provided dictates the type of annotations you will create to identify and track objects. Use the following table to learn more about each tool provided.

Tool	Icon	Action	Description
Bounding box		Add a bounding box annotation.	Choose this icon to add a bounding box. Each bounding box you add is associated with the category you choose from the Label category drop down menu. Select the bounding box or its associated label to adjust it.
Predict next		Predict bounding boxes in the next frame.	Select a bounding box, and then choose this icon to predict the location of that box in the next frame. You can select the icon multiple times in a row to automatically detect the location of box in multiple frames. For example, select

Tool	Icon	Action	Description
			this icon 5 times to predict the location of a bounding box in the next 5 frames.
Keypoint		Add a keypoint annotation.	<p>Choose this icon to add a keypoint. Click on an object the image to place the keypoint at that location.</p> <p>Each keypoint you add is associated with the category you choose from the Label category drop down menu. Select a keypoint or its associated label to adjust it.</p>

Tool	Icon	Action	Description
Polyline	 The icon for the Polyline tool, showing a dark square with a white geometric shape consisting of three connected line segments forming a 'W' or zigzag pattern.	Add a polyline annotation.	<p>Choose this icon to add a polyline. To add a polyline, continuously click around the object of interest to add new points. To stop drawing a polyline, select the last point that you placed a second time (this point will be green), or press <b>Enter</b> on your keyboard.</p> <p>Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines.</p> <p>Each polyline you add is associated with the category you choose from the Label category drop down menu. Select</p>

Tool	Icon	Action	Description
			the polyline or its associated label to adjust it.

Tool	Icon	Action	Description
Polygon		Add a polygon annotation.	<p>Choose this icon to add a polygon. To add a polygon, continuously click around the object of interest to add new points. To stop drawing the polygon, select the start point (this point will be green).</p> <p>A polygon is a closed shape defined by a series of points that you place. Each point added to the polygon is connected to the previous point by a line and there are no restrictions on the angles formed between lines. The start and end point must be the same.</p> <p>Each polygon you add is associated with the category you choose from the Label category drop down menu. Select the polygon or its associated label to adjust it.</p>

Tool	Icon	Action	Description
Copy to Next		Copy annotations to the next frame.	If one or more annotations are selected in the current frame, those annotations are copied to the next frame. If no annotations are selected, all annotations in the current frame will be copied to the next frame.
Copy to All		Copy annotations to all subsequent frames.	If one or more annotations are selected in the current frame, those annotations are copied to all subsequent frames. If no annotations are selected, all annotations in the current frame will be copied to all subsequent frames.

## Icons Guide

Use this table to learn about the icons you see in your UI. You can automatically select some of these icons using the keyboard shortcuts found in the **Shortcuts** menu.

Icon	Action	Description
	brightness	Choose this icon to adjust the brightness of all video frames.
	contrast	Choose this icon to adjust the contrast of all video frames.
	zoom in	Choose this icon to zoom into all of the video frames.
	zoom out	Choose this icon to zoom out of all of the video frames.
	move screen	After you've zoomed into a video frame, choose this icon to move around in that video frame. You can move around the video frame using your mouse by clicking and dragging the frame in the direction you want it to move. This will change the view in all view frames.
	fit screen	Reset all video frames to their original position.
	undo	Undo an action. You can use this icon to remove a bounding box that you just added, or to undo an adjustment you made to a bounding box.
	redo	Redo an action that was undone using the undo icon.
	delete label	Delete a label. This will delete the bounding box associated with the label in a single frame.
	show or hide label	Select this icon to show a label that has been hidden. If this icon has a slash through it, select it to hide the label.

Icon	Action	Description
	edit label	Select this icon to open the <b>Edit instance</b> menu. Use this menu to edit a label category, ID, and to add or edit label attributes.

## Shortcuts

The keyboard shortcuts listed in the **Shortcuts** menu can help you quickly select icons, undo and redo annotations, and use tools to add and edit annotations. For example, once you add a bounding box, you can use **P** to quickly predict the location of that box in subsequent frames.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

## Understand Release, Stop and Resume, and Decline Task Options

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task:** You should only decline a task if something is wrong with the task, such as unclear video frame images or an issue with the UI. If you decline a task, you will not be able to return to the task.
- **Release Task:** Use this option to release a task and allow others to work on it. When you release a task, you lose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later:** You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time

limit, it will expire and your work will not be submitted. Contact your administrator for more information.

## Saving Your Work and Submitting

You should periodically save your work using the **Save** button. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

## Video Frame Object Tracking Tasks

Video frame object tracking tasks require you to track the movement of objects across video frames. A video frame is a still image from a video scene. You can use the worker UI to navigate between video frames and use the tools provided to identify unique objects and track their movement from one frame to the next. Use the following topics to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome or Firefox web browser.

### Important

If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

## Topics

- [Your Task](#)

## Your Task

When you work on a video frame object tracking task, you need to select a category from the **Label category** menu on the right side of your worker portal to start annotating. After you've chosen a category, use the tools provided to annotate the objects that the category applies to. This annotation will be associated with a unique label ID that should only be used for that object. Use this same label ID to create additional annotations for the same object in all of the video frames that it appears in. Refer to [Tool Guide](#) to learn more about the tools provided.

After you've added a label, you may see a downward pointing arrow next to the label in the **Labels** menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the **Labels** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.

Frame 1 attributes [-] [↔]

**Is the point cloud clearly visible?**  
Visible: frame attribute that applies to all frames

Yes No

**Describe Issues**  
Issues: frame attribute that applies to all frames

**Number of Cars Labeled**  
Cars labeled: frame attribute that applies to all frames

After you've added a label, you can quickly add and edit a label category attribute value by using the downward pointing arrow next to the label in the **Labels** menu. If you select the pencil icon next to the label in the **Labels** menu, the **Edit instance** menu will appear. You can edit the label ID, label category, and label category attributes using this menu.

To edit an annotation, select the label of the annotation that you want to edit in the **Labels** menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a

single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.

After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the **Copy to next** and **Copy to all** tools to copy your annotations to the next or all frames respectively.

## Video Frame Object Detection Tasks

Video frame object detection tasks required you to classify and identify the location of objects in video frames using annotations. A video frame is a still image from a video scene. You can use the worker UI to navigate between video frames and create annotations to identify objects of interest. Use the following topics to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome web browser.

### Important

If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

## Topics

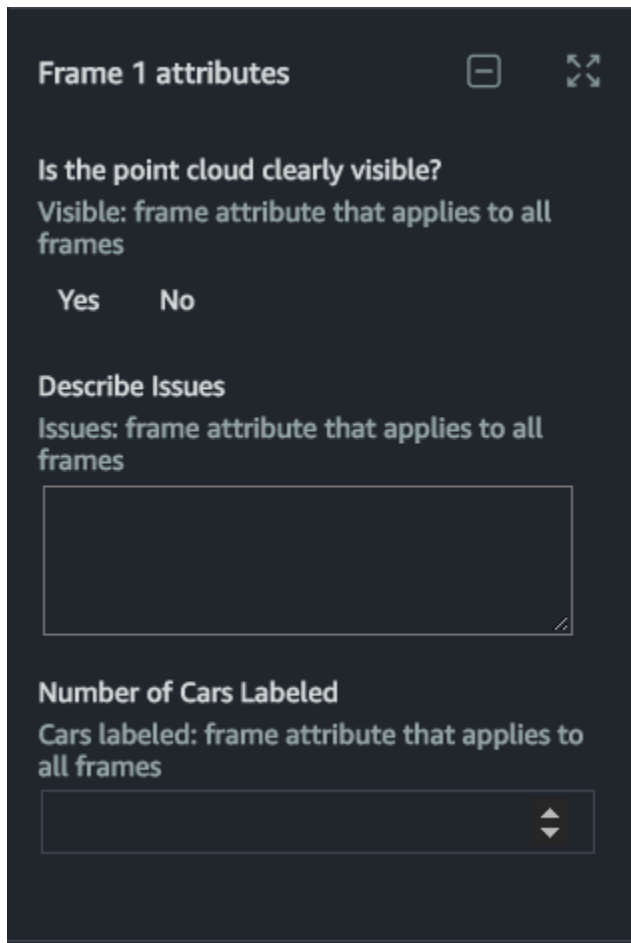

- [Your Task](#)

## Your Task

When you work on a video frame object detection task, you need to select a category from the **Label category** menu on the right side of your worker portal to start annotating. After you've chosen a category, draw annotations around objects that this category applies to. To learn more about the tools you see in your worker UI, refer to the [Tool Guide](#).

After you've added a label, you may see a downward pointing arrow next to the label in the **Labels** menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the **Labels** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.

**Frame 1 attributes**

**Is the point cloud clearly visible?**  
Visible: frame attribute that applies to all frames

Yes No

**Describe Issues**  
Issues: frame attribute that applies to all frames

**Number of Cars Labeled**  
Cars labeled: frame attribute that applies to all frames

To edit an annotation, select the label of the annotation that you want to edit in the **Labels** menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.

**Note**

The predict next feature will not overwrite manually created annotations. It will only add annotations. If you use predict next and as a result have more than one bounding box

around a single object, delete all but one box. Each object should only be identified with a single box.

After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the **Copy to next** and **Copy to all** tools to copy your annotations to the next or all frames respectively.

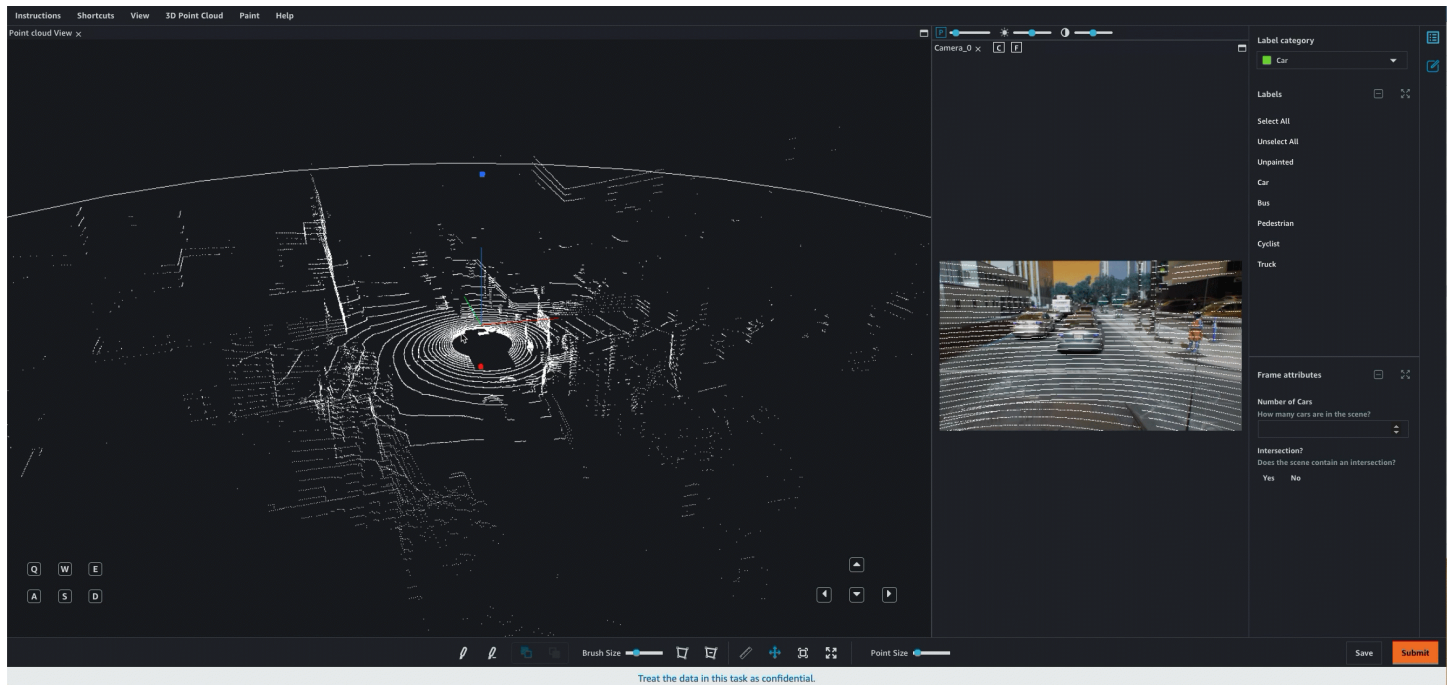

## Use Ground Truth to Label 3D Point Clouds

Create a 3D point cloud labeling job to have workers label objects in 3D point clouds generated from 3D sensors like Light Detection and Ranging (LiDAR) sensors and depth cameras, or generated from 3D reconstruction by stitching images captured by an agent like a drone.

### 3D Point Clouds

Point clouds are made up of three-dimensional (3D) visual data that consists of points. Each point is described using three coordinates, typically  $x$ ,  $y$ , and  $z$ . To add color or variations in point intensity to the point cloud, points may be described with additional attributes, such as  $i$  for intensity or values for the red ( $r$ ), green ( $g$ ), and blue ( $b$ ) 8-bit color channels. When you create a Ground Truth 3D point cloud labeling job, you can provide point cloud and, optionally, sensor fusion data.

The following image shows a single, 3D point cloud scene rendered by Ground Truth and displayed in the semantic segmentation worker UI.

## LiDAR

A Light Detection and Ranging (LiDAR) sensor is a common type of sensor used to collect measurements that are used to generate point cloud data. LiDAR is a remote sensing method that uses light in the form of a pulsed laser to measure the distances of objects from the sensor. You can provide 3D point cloud data generated from a LiDAR sensor for a Ground Truth 3D point cloud labeling job using the raw data formats described in [Accepted Raw 3D Data Formats](#).

## Sensor Fusion

Ground Truth 3D point cloud labeling jobs include a sensor fusion feature that supports video camera sensor fusion for all task types. Some sensors come with multiple LiDAR devices and video cameras that capture images and associate them with a LiDAR frame. To help annotators visually complete your tasks with high confidence, you can use the Ground Truth sensor fusion feature to project annotations (labels) from a 3D point cloud to 2D camera images and vice versa using 3D scanner (such as LiDAR) extrinsic matrix and camera extrinsic and intrinsic matrices. To learn more, see [Sensor Fusion](#).

## Label 3D Point Clouds

Ground Truth provides a user interface (UI) and tools that workers use to label or *annotate* 3D point clouds. When you use the object detection or semantic segmentation task types, workers can

annotate a single point cloud frame. When you use object tracking, workers annotate a sequence of frames. You can use object tracking to track object movement across all frames in a sequence.

The following demonstrates how a worker would use the Ground Truth worker portal and tools to annotate a 3D point cloud for an object detection task. For similar visual examples of other task types, see [3D Point Cloud Task types](#).

## Assistive Labeling Tools for Point Cloud Annotation

Ground Truth offers assistive labeling tools to help workers complete your point cloud annotation tasks faster and with more accuracy. For details about assistive labeling tools that are included in the worker UI for each task type, [select a task type](#) and refer to the **View the Worker Task Interface** section of that page.

## Next Steps

You can create six types of tasks when you use Ground Truth 3D point cloud labeling jobs. Use the topics in [3D Point Cloud Task types](#) to learn more about these *task types* and to learn how to create a labeling job using the task type of your choice.

The 3D point cloud labeling job is different from other Ground Truth labeling modalities. Before creating a labeling job, we recommend that you read [3D point cloud labeling jobs overview](#). Additionally, review input data quotas in [3D Point Cloud and Video Frame Labeling Job Quotas](#).

For an end-to-end demo using the SageMaker API and AWS Python SDK (boto 3) to create a 3D point cloud labeling job, see [create-3D-pointcloud-labeling-job.ipynb](#) in the [SageMaker AI Examples notebook tab](#).

### Important

If you use a notebook instance created before June 5th, 2020 to run this notebook, you must stop and restart that notebook instance for the notebook to work.

## Topics

- [3D Point Cloud Task types](#)
- [3D point cloud labeling jobs overview](#)
- [Worker instructions](#)

## 3D Point Cloud Task types

You can use Ground Truth 3D point cloud labeling modality for a variety of use cases. The following list briefly describes each 3D point cloud task type. For additional details and instructions on how to create a labeling job using a specific task type, select the task type name to see its task type page.

- [3D point cloud object detection](#) – Use this task type when you want workers to locate and classify objects in a 3D point cloud by adding and fitting 3D cuboids around objects.
- [3D point cloud object tracking](#) – Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across a sequence of 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.
- [3D point cloud semantic segmentation](#) – Use this task type when you want workers to create a point-level semantic segmentation mask by painting objects in a 3D point cloud using different colors where each color is assigned to one of the classes you specify.
- 3D point cloud adjustment task types – Each of the task types above has an associated *adjustment* task type that you can use to audit and adjust annotations generated from a 3D point cloud labeling job. Refer to the task type page of the associated type to learn how to create an adjustment labeling job for that task.

## Classify objects in a 3D point cloud with object detection

Use this task type when you want workers to classify objects in a 3D point cloud by drawing 3D cuboids around objects. For example, you can use this task type to ask workers to identify different types of objects in a point cloud, such as cars, bikes, and pedestrians. The following page gives important information about the labeling job, as well as steps to create one.

For this task type, the *data object* that workers label is a single point cloud frame. Ground Truth renders a 3D point cloud using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects.

Ground Truth provides workers with tools to annotate objects with 9 degrees of freedom (x,y,z,rx,ry,rz,l,w,h) in three dimensions in both 3D scene and projected side views (top, side, and back). If you provide sensor fusion information (like camera data), when a worker adds a cuboid to identify an object in the 3D point cloud, the cuboid shows up and can be modified in the 2D images. After a cuboid has been added, all edits made to that cuboid in the 2D or 3D scene are projected into the other view.

You can create a job to adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object detection adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review [3D point cloud labeling jobs overview](#). This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

### Topics

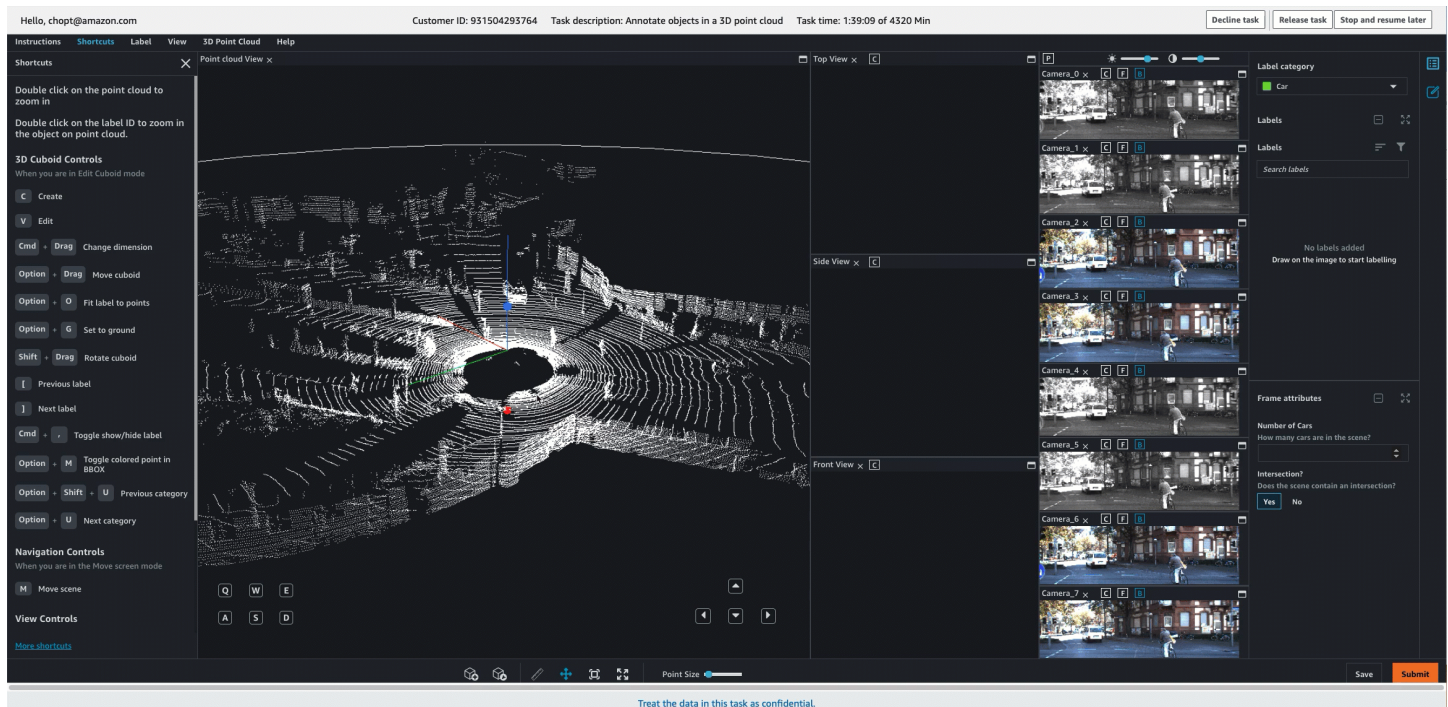

- [View the Worker Task Interface](#)
- [Create a 3D Point Cloud Object Detection Labeling Job](#)
- [Create a 3D Point Cloud Object Detection Adjustment or Verification Labeling Job](#)
- [Output Data Format](#)

### View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object detection annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth worker UI in the `HumanTaskUiArn` parameter. When you

create a labeling job using this task type in the console, this worker UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object detection worker task interface. If you provide camera data for sensor fusion in the world coordinate system, images are matched up with scenes in the point cloud frame. These images appear in the worker portal as shown in the following GIF.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboid in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.

Additional view options and features are available in the **View** menu in the worker UI. See the [worker instruction page](#) for a comprehensive overview of the Worker UI.

## Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object.
- **Set to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side panel displays front, side, and top perspectives to help the worker adjust the cuboid tightly around the object. In all of these views, the cuboid includes an arrow that indicates the orientation, or heading of the object. When the worker adjusts the cuboid, the adjustment will appear in real time on all of the views (that is, 3D, top, side, and front).

- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time. Additionally, workers will have the option to view the direction the camera is facing and the camera frustum.
- **View options** – Enables workers to easily hide or view cuboids, label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

## Create a 3D Point Cloud Object Detection Labeling Job

You can create a 3D point cloud labeling job using the SageMaker AI console or API operation, [CreateLabelingJob](#). To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see [Create a Point Cloud Frame Input Manifest File](#). If you are a new user of Ground Truth 3D point cloud labeling modalities, you may also want to review [Accepted Raw 3D Data Formats](#).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for video frame labeling jobs. To learn how to create workforces and work teams, see [Workforces](#).

Additionally, make sure that you have reviewed and satisfied the [Assign IAM Permissions to Use Ground Truth](#).

Use one of the following sections to learn how to create a labeling job using the console or an API.

### Create a Labeling Job (Console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) in order to learn how to create a 3D point cloud object detection labeling job in the SageMaker AI console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see [Create a Point Cloud Frame Input Manifest File](#).
- Optionally, you can provide label category and frame attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute *occluded* to have workers identify when an object is partially obstructed.
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.

- 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

## Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

[Create a Labeling Job \(API\)](#), provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectDetection`. Replace `<region>` with the AWS Region you are creating the labeling job in.

There should not be an entry for the `UiTemplateS3Uri` parameter.

- Your input manifest file must be a single-frame manifest file. For more information, see [Create a Point Cloud Frame Input Manifest File](#).
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. To learn how to create this file, see [Labeling category configuration file with label category and frame attributes reference](#).
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in `us-east-1`, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:PRE-3DPointCloudObjectDetection`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in `us-east-1`, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:ACS-3DPointCloudObjectDetection`.

- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

## Create a 3D Point Cloud Object Detection Adjustment or Verification Labeling Job

You can create an adjustment or verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see [Label verification and adjustment](#).

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.

Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y'-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x''-axis (roll).

## Output Data Format

When you create a 3D point cloud object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status ([LabelingJobStatus](#)) is `Completed`.

If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see [3D point cloud object detection output](#).

## Understand the 3D point cloud object tracking task type

Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.

For this task type, the data object that workers label is a sequence of point cloud frames. A *sequence* is defined as a temporal series of point cloud frames. Ground Truth renders a series of 3D point cloud visualizations using a sequence you provide and workers can switch between these 3D point cloud frames in the worker task interface.

Ground Truth provides workers with tools to annotate objects with 9 degrees of freedom (x,y,z,rx,ry,rz,l,w,h) in three dimensions in both 3D scene and projected side views (top, side, and back). When a worker draws a cuboid around an object, that cuboid is given a unique ID, for example Car : 1 for one car in the sequence and Car : 2 for another. Workers use that ID to label the same object in multiple frames.

You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects. When a worker adds a 3D cuboid to identify an object in either the 2D image or the 3D point cloud, and the cuboid shows up in the other view.

You can adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object tracking adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review [3D point cloud labeling jobs overview](#). This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

The following topics explain how to create a 3D point cloud object tracking job, show what the worker task interface looks like (what workers see when they work on this task), and provide an overview of the output data you get when workers complete their tasks. The final topic provides useful information for creating object tracking adjustment or verification labeling jobs.

## Topics

- [Create a 3D point cloud object tracking labeling job](#)
- [View the worker task interface for a 3D point cloud object tracking task](#)
- [Output data for a 3D point cloud object tracking labeling job](#)
- [Information for creating a 3D point cloud object tracking adjustment or verification labeling job](#)

## Create a 3D point cloud object tracking labeling job

You can create a 3D point cloud labeling job using the SageMaker AI console or API operation, [CreateLabelingJob](#). To create a labeling job for this task type you need the following:

- A sequence input manifest file. To learn how to create this type of manifest file, see [Create a Point Cloud Sequence Input Manifest](#). If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review [Accepted Raw 3D Data Formats](#).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see [Workforces](#).

Additionally, make sure that you have reviewed and satisfied the [Assign IAM Permissions to Use Ground Truth](#).

To learn how to create a labeling job using the console or an API, see the following sections.

### Create a labeling job (console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) in order to learn how to create a 3D point cloud object tracking labeling job in the SageMaker AI console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a sequence manifest file. For more information, see [Create a Point Cloud Sequence Input Manifest](#).
- Optionally, you can provide label category attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute *occluded* to have workers identify when an object is partially obstructed.
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

### Create a labeling job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see

a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

[Create a Labeling Job \(API\)](#) provides an overview of the CreateLabelingJob operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for HumanTaskUiArn. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectTracking`. Replace `<region>` with the AWS Region you are creating the labeling job in.

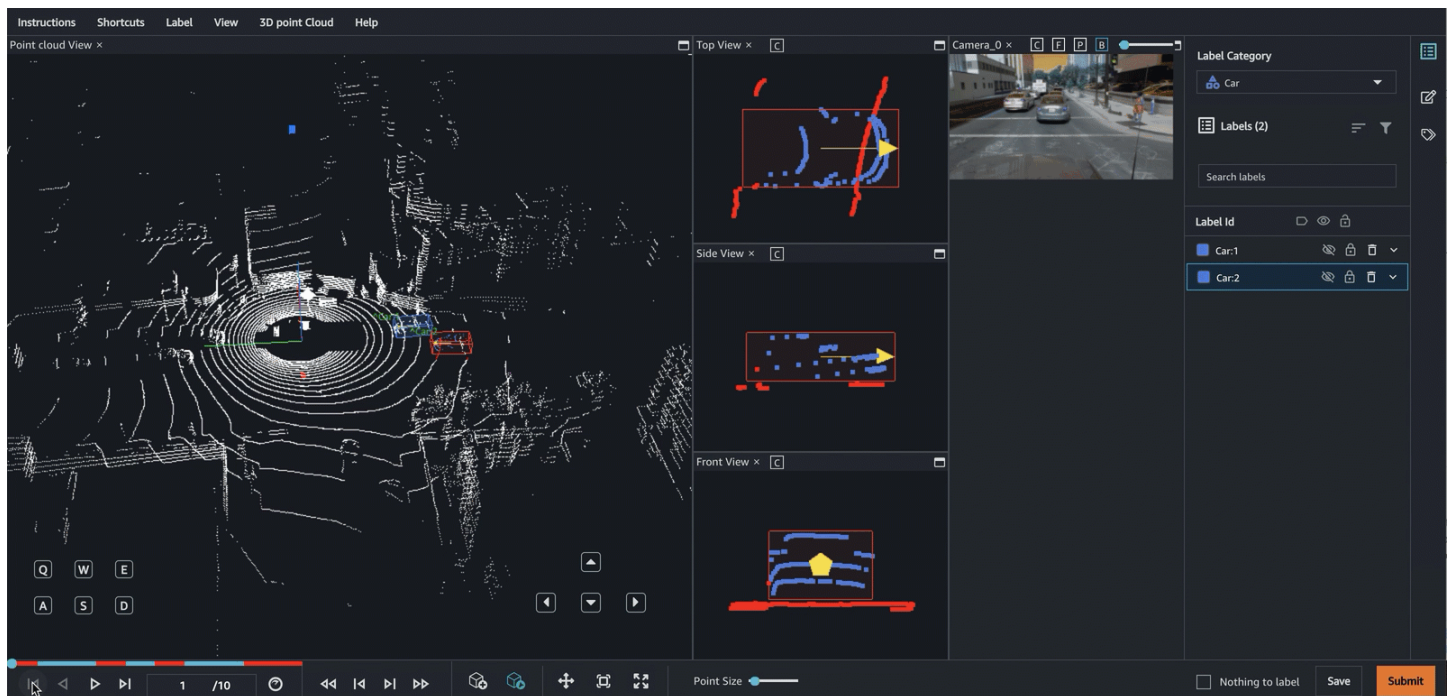

There should not be an entry for the UiTemplateS3Uri parameter.

- Your [LabelAttributeName](#) must end in `-ref`. For example, `ot-labels-ref`.
- Your input manifest file must be a point cloud frame sequence manifest file. For more information, see [Create a Point Cloud Sequence Input Manifest](#).
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. For more information, see [Labeling category configuration file with label category and frame attributes reference](#) to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN that ends with `PRE-3DPointCloudObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN that ends with `ACS-3DPointCloudObjectTracking`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

## View the worker task interface for a 3D point cloud object tracking task

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object tracking annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object tracking worker task interface and demonstrates how the worker can navigate the point cloud frames in the sequence. The annotating tools are a part of the worker task interface. They are not available for the preview interface.

Once workers add a single cuboid, that cuboid is replicated in all frames of the sequence with the same ID. Once workers adjust the cuboid in another frame, Ground Truth will interpolate the movement of that object and adjust all cuboids between the manually adjusted frames. The following GIF demonstrates this interpolation feature. In the navigation bar on the bottom-left, red-areas indicate manually adjusted frames.

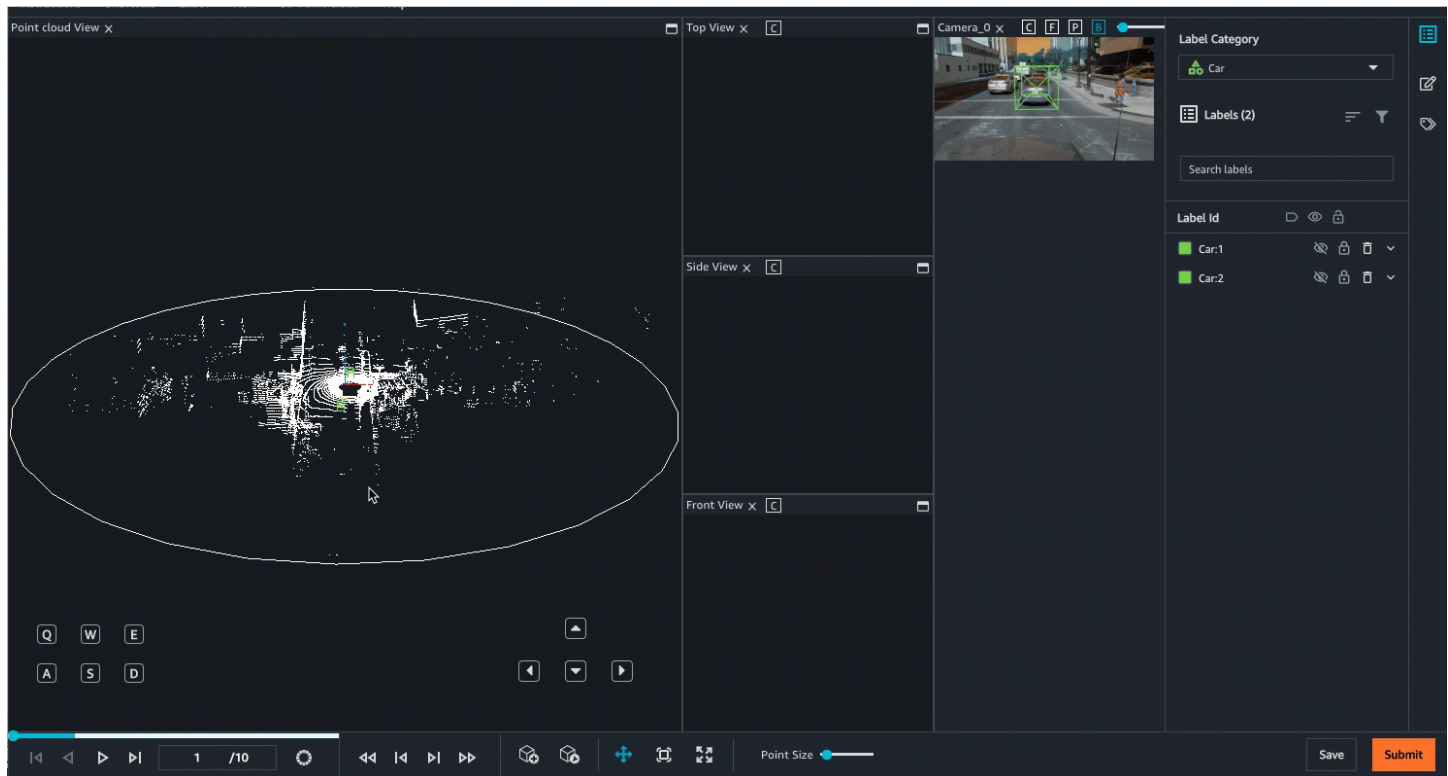

If you provide camera data for sensor fusion, images are matched up with scenes in point cloud frames. These images appear in the worker portal as shown in the following GIF.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboids in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.

Additional view options and features are available. See the [worker instruction page](#) for a comprehensive overview of the Worker UI.

## Worker tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. If workers click on a point in the point cloud, the UI will automatically zoom into that area. Workers can use various tools to draw 3D cuboid around objects. For more information, see **Assistive Labeling Tools**.

After workers have placed a 3D cuboid in the point cloud, they can adjust these cuboids to fit tightly around cars using a variety of views: directly in the 3D cuboid, in a side-view featuring three zoomed-in perspectives of the point cloud around the box, and if you include images for sensor fusion, directly in the 2D image.

View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes. Workers can also choose between perspective and orthogonal projections.

## Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using UX, machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Label autofill** – When a worker adds a cuboid to a frame, a cuboid with the same dimensions and orientation is automatically added to all frames in the sequence.
- **Label interpolation** – After a worker has labeled a single object in two frames, Ground Truth uses those annotations to interpolate the movement of that object between those two frames. Label interpolation can be turned on and off.
- **Bulk label and attribute management** – Workers can add, delete, and rename annotations, label category attributes, and frame attributes in bulk.
  - Workers can manually delete annotations for a given object before or after a frame. For example, a worker can delete all labels for an object after frame 10 if that object is no longer located in the scene after that frame.
  - If a worker accidentally bulk deletes all annotations for an object, they can add them back. For example, if a worker deletes all annotations for an object before frame 100, they can bulk add them to those frames.
  - Workers can rename a label in one frame and all 3D cuboids assigned that label are updated with the new name across all frames.
  - Workers can use bulk editing to add or edit label category attributes and frame attributes in multiple frames.
- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object's boundaries.
- **Fit to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side -panel displays front and two side perspectives to help the worker adjust the cuboid tightly around the object. Workers can annotation the 3D point cloud, the side panel and the adjustments appear in the other views in real time.
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time.
- **Auto-merge cuboids** – Workers can automatically merge two cuboids across all frames if they determine that cuboids with different labels actually represent a single object.

- **View options** – Enables workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

## Output data for a 3D point cloud object tracking labeling job

When you create a 3D point cloud object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status ([LabelingJobStatus](#)) is Completed.

If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object tracking output data format, see [3D point cloud object tracking output](#).

## Information for creating a 3D point cloud object tracking adjustment or verification labeling job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see [Label verification and adjustment](#).

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.

Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y'-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x''-axis (roll).

## Understand the 3D point cloud semantic segmentation task type

Semantic segmentation involves classifying individual points of a 3D point cloud into pre-specified categories. Use this task type when you want workers to create a point-level semantic segmentation mask for 3D point clouds. For example, if you specify the classes `car`, `pedestrian`, and `bike`, workers select one class at a time, and color all of the points that this class applies to the same color in the point cloud.

For this task type, the data object that workers label is a single point cloud frame. Ground Truth generates a 3D point cloud visualization using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers paint objects. When a worker paints an object in either the 2D image or the 3D point cloud, the paint shows up in the other view.

You can also adjust or verify annotations created in a 3D point cloud object detection labeling job using the 3D point cloud semantic segmentation adjustment or labeling task type. To learn more about adjustment and verification labeling jobs, and to learn how create one, see [Label verification and adjustment](#).

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review [3D point cloud labeling jobs overview](#). This labeling modality is different from other Ground Truth task types, and this topic provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

The following topics explain how to create a 3D point cloud semantic segmentation job, show what the worker task interface looks like (what workers see when they work on this task), and provide an overview of the output data you get when workers complete their tasks.

## Topics

- [Create a 3D point cloud semantic segmentation labeling job](#)
- [View the worker task interface for a 3D point cloud semantic segmentation job](#)
- [Output data for a 3D point cloud semantic segmentation job](#)

## Create a 3D point cloud semantic segmentation labeling job

You can create a 3D point cloud labeling job using the SageMaker AI console or API operation, [CreateLabelingJob](#). To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see [Create a Point Cloud Frame Input Manifest File](#). If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review [Accepted Raw 3D Data Formats](#).
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk workers for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see [Workforces](#).
- A label category configuration file. For more information, see [Labeling category configuration file with label category and frame attributes reference](#).

Additionally, make sure that you have reviewed and satisfied the [Assign IAM Permissions to Use Ground Truth](#).

Use one of the following sections to learn how to create a labeling job using the console or an API.

### Create a labeling job (console)

You can follow the instructions [Create a Labeling Job \(Console\)](#) in order to learn how to create a 3D point cloud semantic segmentation labeling job in the SageMaker AI console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see [Create a Point Cloud Frame Input Manifest File](#).
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

### Create a labeling job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

The page, [Create a Labeling Job \(API\)](#), provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudSemanticSegmentation`. Replace `<region>` with the AWS Region you are creating the labeling job in.

There should not be an entry for the `UiTemplateS3Uri` parameter.

- Your [LabelAttributeName](#) must end in `-ref`. For example, `ss-labels-ref`.
- Your input manifest file must be a single-frame manifest file. For more information, see [Create a Point Cloud Frame Input Manifest File](#).

- You specify your labels and worker instructions in a label category configuration file. See [Labeling category configuration file with label category and frame attributes reference](#) to learn how to create this file.
- You need to provide a pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:PRE-3DPointCloudSemanticSegmentation`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:ACS-3DPointCloudSemanticSegmentation`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604800 seconds).

## View the worker task interface for a 3D point cloud semantic segmentation job

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud semantic segmentation annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud semantic segmentation worker task interface. If you provide camera data for sensor fusion, images are matched with scenes in the point cloud frame. Workers can paint objects in either the 3D point cloud or the 2D image, and the paint appears in the corresponding location in the other medium. These images appear in the worker portal as shown in the following GIF.

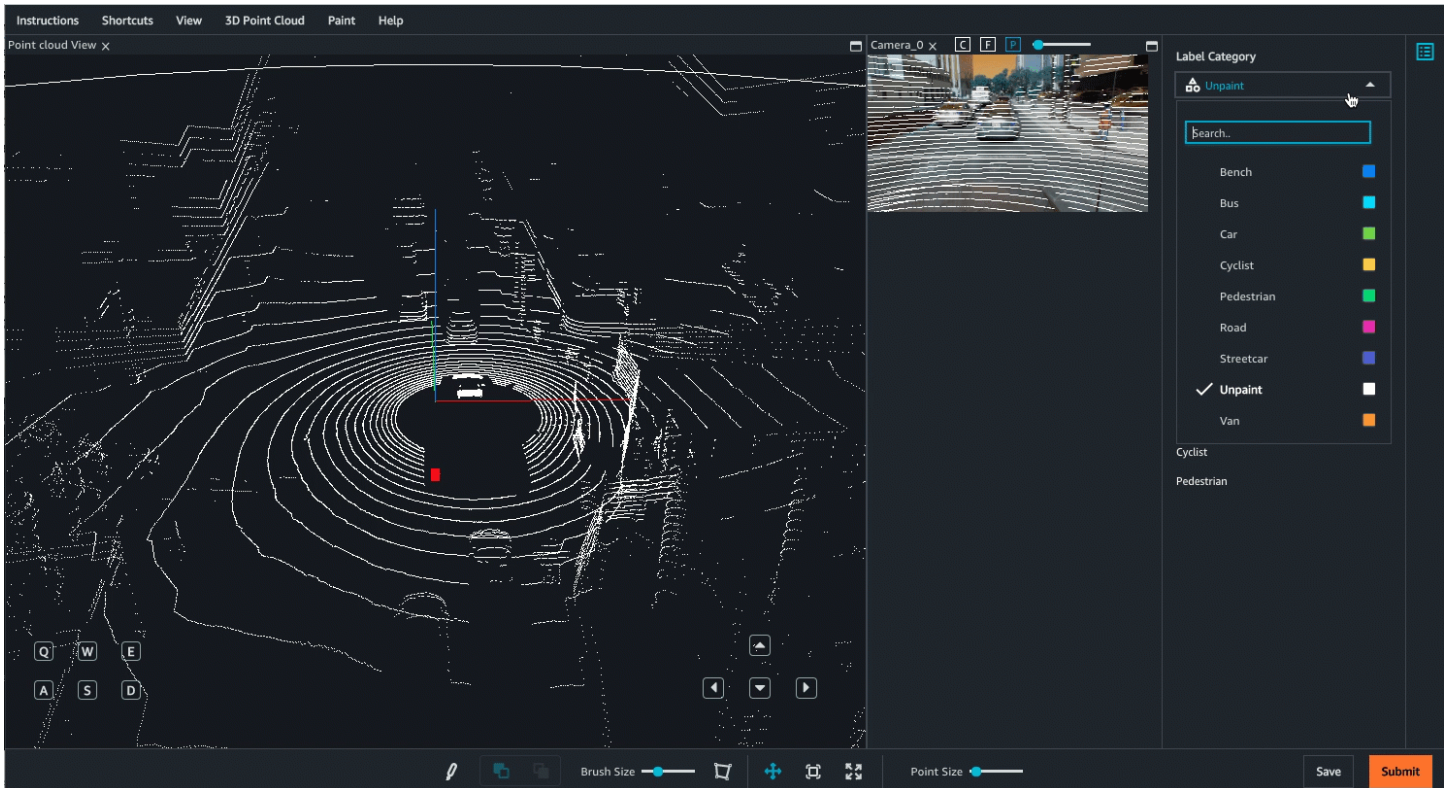

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud. Workers can hide and re-expand all side views and menus. In this GIF, the side-views and menus have been collapsed.

The following GIF demonstrates how a worker can label multiple objects quickly, refine painted objects using the Unpaint option and then view only points that have been painted.

Additional view options and features are available. See the [worker instruction page](#) for a comprehensive overview of the Worker UI.

## Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. When you create a semantic segmentation job, workers have the following tools available to them:

- A paint brush to paint and unpaint objects. Workers paint objects by selecting a label category and then painting in the 3D point cloud. Workers unpaint objects by selecting the Unpaint option from the label category menu and using the paint brush to erase paint.
- A polygon tool that workers can use to select and paint an area in the point cloud.
- A background paint tool, which enables workers to paint behind objects they have already annotated without altering the original annotations. For example, workers might use this tool to paint the road after painting all of the cars on the road.
- View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

## Output data for a 3D point cloud semantic segmentation job

When you create a 3D point cloud semantic segmentation labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status ([LabelingJobStatus](#)) is Completed.

If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see [3D point cloud semantic segmentation output](#).

## Understand the 3D-2D point cloud object tracking task type

Use this task type when you want workers to link 3D point cloud annotations with 2D images annotations and also link 2D image annotations among various cameras. Currently, Ground Truth supports cuboids for annotation in a 3D point cloud and bounding boxes for annotation in 2D videos. For example, you can use this task type to ask workers to link the movement of a vehicle in 3D point cloud with its 2D video. Using 3D-2D linking, you can easily correlate point cloud data (like the distance of a cuboid) to video data (bounding box) for up to 8 cameras.

Ground Truth provides workers with tools to annotate cuboids in a 3D point cloud and bounding boxes in up to 8 cameras using the same annotation UI. Workers can also link various bounding boxes for the same object across different cameras. For example, a bounding box in camera1 can be linked to a bounding box in camera2. This lets you to correlate an object across multiple cameras using a unique ID.

**Note**

Currently, SageMaker AI does not support creating a 3D-2D linking job using the console. To create a 3D-2D linking job using the SageMaker API, see [Create a labeling job \(API\)](#).

The following topics explain how to create a 3D-2D point cloud object tracking labeling job, show what the worker task interface looks like (what workers see when they work on this task), and provide an overview of the output data you get when workers complete their tasks.

**Topics**

- [Create a 3D-2D point cloud object tracking labeling job](#)
- [View the worker task interface for a 3D-2D object tracking labeling job](#)
- [Output data for a 3D-2D object tracking labeling job](#)

**Create a 3D-2D point cloud object tracking labeling job**

You can create a 3D-2D point cloud labeling job using the SageMaker API operation, [CreateLabelingJob](#). To create a labeling job for this task type you need the following:

- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see [Workforces](#).
- Add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in [CORS Permission Requirement](#).
- Additionally, make sure that you have reviewed and satisfied the [Assign IAM Permissions to Use Ground Truth](#).

To learn how to create a labeling job using the API, see the following sections.

## Create a labeling job (API)

This section covers details you need to know when you create a 3D-2D object tracking labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of [CreateLabelingJob](#).

[Create a Labeling Job \(API\)](#) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectTracking`. Replace `<region>` with the AWS Region you are creating the labeling job in.

There should not be an entry for the `UiTemplateS3Uri` parameter.

- Your [LabelAttributeName](#) must end in `-ref`. For example, `ot-labels-ref`.
- Your input manifest file must be a point cloud frame sequence manifest file. For more information, see [Create a Point Cloud Sequence Input Manifest](#). You also need to provide a label category configuration file as mentioned above.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to [PreHumanTaskLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN that ends with `PRE-3DPointCloudObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to [AnnotationConsolidationLambdaArn](#). Use the Region you are creating your labeling job in to find the correct ARN that ends with `ACS-3DPointCloudObjectTracking`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in [LabelingJobAlgorithmsConfig](#).
- 3D-2D object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

**Note**

After you have successfully created a 3D-2D object tracking job, it shows up on the console under labeling jobs. The task type for the job is displayed as **Point Cloud Object Tracking**.

## Input data format

You can create a 3D-2D object tracking job using the SageMaker API operation, [CreateLabelingJob](#). To create a labeling job for this task type you need the following:

- A sequence input manifest file. To learn how to create this type of manifest file, see [Create a Point Cloud Sequence Input Manifest](#). If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review [Accepted Raw 3D Data Formats](#).
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. For more information, see [Create a Labeling Category Configuration File with Label Category and Frame Attributes](#) to learn how to create this file. The following is an example showing a label category configuration file for creating a 3D-2D object tracking job.

```
{
  "document-version": "2020-03-01",
  "categoryGlobalAttributes": [
    {
      "name": "Occlusion",
      "description": "global attribute that applies to all label categories",
      "type": "string",
      "enum": [
        "Partial",
        "Full"
      ]
    }
  ],
  "labels": [
    {
      "label": "Car",
      "attributes": [
        {
          "name": "Type",
          "type": "string",
          "enum": [
            "SUV",
```

```

        "Sedan"
      ]
    }
  ],
  {
    "label": "Bus",
    "attributes": [
      {
        "name": "Size",
        "type": "string",
        "enum": [
          "Large",
          "Medium",
          "Small"
        ]
      }
    ]
  }
],
"instructions": {
  "shortIntroduction": "Draw a tight cuboid around objects after you select a
category.",
  "fullIntroduction": "<p>Use this area to add more detailed worker
instructions.</p>"
},
"annotationType": [
  {
    "type": "BoundingBox"
  },
  {
    "type": "Cuboid"
  }
]
}

```

### Note

You need to provide `BoundingBox` and `Cuboid` as `annotationType` in the label category configuration file to create a 3D-2D object tracking job.

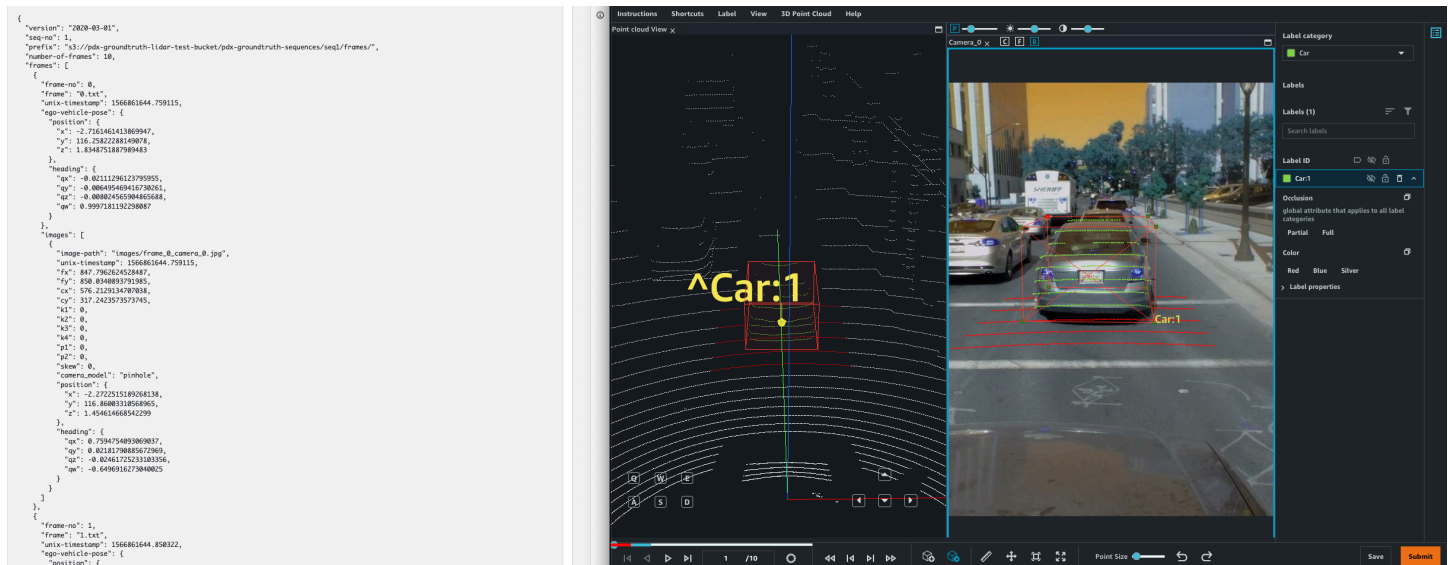

## View the worker task interface for a 3D-2D object tracking labeling job

Ground Truth provides workers with a web portal and tools to complete your 3D-2D object tracking annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. To use the UI when you create a labeling job for this task type using the API, you need to provide the `HumanTaskUiArn`. You can preview and interact with the worker UI when you create a labeling job through the API. The annotating tools are a part of the worker task interface. They are not available for the preview interface. The following image demonstrates the worker task interface used for the 3D-2D point cloud object tracking annotation task.

When interpolation is enabled by default. After a worker adds a single cuboid, that cuboid is replicated in all frames of the sequence with the same ID. If the worker adjusts the cuboid in another frame, Ground Truth interpolates the movement of that object and adjust all cuboids between the manually adjusted frames. Additionally, using the camera view section, a cuboid can be shown with a projection (using to B button for "toggle labels" in the camera view) that provides the worker with a reference from the camera images. The accuracy of the cuboid to image projection is based on accuracy of calibrations captured in the extrinsic and intrinsic data.

If you provide camera data for sensor fusion, images are matched up with scenes in point cloud frames. Note that the camera data should be time synchronized with the point cloud data to ensure an accurate depiction of point cloud to imagery over each frame in the sequence as shown in the following image.

The manifest file holds the extrinsic and intrinsic data and the pose to allow the cuboid projection on the camera image to be shown by using the **P** button.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboids in the 3D scene, a side-view appears with the three projected side views: top, side, and front. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The worker should first select the cuboid to draw a corresponding bounding box on any of the camera views. This links the cuboid and the bounding box with a common name and unique ID.

The worker can also first draw a bounding box, select it and draw the corresponding cuboid to link them.

Additional view options and features are available. See the [worker instruction page](#) for a comprehensive overview of the Worker UI.

## Worker tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. If workers click on a point in the point cloud, the UI automatically zooms into that area. Workers can use various tools to draw 3D cuboid around objects. For more information, see **Assistive Labeling Tools** in the following discussion.

After workers have placed a 3D cuboid in the point cloud, they can adjust these cuboids to fit tightly around cars using a variety of views: directly in the 3D point cloud, in a side-view featuring three zoomed-in perspectives of the point cloud around the box, and if you include images for sensor fusion, directly in the 2D image.

Additional view options enable workers to easily hide or view label text, a ground mesh, and additional point attributes. Workers can also choose between perspective and orthogonal projections.

## Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using UX, machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Label autofill** – When a worker adds a cuboid to a frame, a cuboid with the same dimensions, orientation and xyz position is automatically added to all frames in the sequence.
- **Label interpolation** – After a worker has labeled a single object in two frames, Ground Truth uses those annotations to interpolate the movement of that object between all the frames. Label interpolation can be turned on and off. It is on by default. For example, if a worker working with 5 frames adds a cuboid in frame 2, it is copied to all the 5 frames. If the worker then makes adjustments in frame 4, frame 2 and 4 now act as two points, through which a line is fit. The cuboid is then interpolated in frames 1,3 and 5.
- **Bulk label and attribute management** – Workers can add, delete, and rename annotations, label category attributes, and frame attributes in bulk.
  - Workers can manually delete annotations for a given object before and after a frame, or in all frames. For example, a worker can delete all labels for an object after frame 10 if that object is no longer located in the scene after that frame.

- If a worker accidentally bulk deletes all annotations for an object, they can add them back. For example, if a worker deletes all annotations for an object before frame 100, they can bulk add them to those frames.
- Workers can rename a label in one frame and all 3D cuboids assigned that label are updated with the new name across all frames.
- Workers can use bulk editing to add or edit label category attributes and frame attributes in multiple frames.
- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object's boundaries.
- **Fit to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side-panel displays front and two side perspectives to help the worker adjust the cuboid tightly around the object. Workers can annotation the 3D point cloud, the side panel and the adjustments appear in the other views in real time.
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations are projected into the other view in real time. To learn more about the data for sensor fusion, see [Understand Coordinate Systems and Sensor Fusion](#).
- **Auto-merge cuboids** – Workers can automatically merge two cuboids across all frames if they determine that cuboids with different labels actually represent a single object.
- **View options** – Enables workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

## Output data for a 3D-2D object tracking labeling job

When you create a 3D-2D object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status ([LabelingJobStatus](#)) is Completed.

If you are a new user of Ground Truth, see [Labeling job output data](#) to learn more about the Ground Truth output data format. To learn about the 3D-2D point cloud object tracking output data format, see [3D-2D object tracking point cloud object tracking output](#).

## 3D point cloud labeling jobs overview

This topic provides an overview of the unique features of a Ground Truth 3D point cloud labeling job. You can use the 3D point cloud labeling jobs to have workers label objects in a 3D point cloud generated from a 3D sensors like LiDAR and depth cameras or generated from 3D reconstruction by stitching images captured by an agent like a drone.

### Job pre-processing time

When you create a 3D point cloud labeling job, you need to provide an [input manifest file](#). The input manifest file can be:

- A *frame input manifest file* that has a single point cloud frame on each line.
- A *sequence input manifest file* that has a single sequence on each line. A sequence is defined as a temporal series of point cloud frames.

For both types of manifest files, *job pre-processing time* (that is, the time before Ground Truth starts sending tasks to your workers) depends on the total number and size of point cloud frames you provide in your input manifest file. For frame input manifest files, this is the number of lines in your manifest file. For sequence manifest files, this is the number of frames in each sequence multiplied by the total number of sequences, or lines, in your manifest file.

Additionally, the number of points per point cloud and the number of fused sensor data objects (like images) factor into job pre-processing times. On average, Ground Truth can pre-process 200 point cloud frames in approximately 5 minutes. If you create a 3D point cloud labeling job with a large number of point cloud frames, you might experience longer job pre-processing times. For example, if you create a sequence input manifest file with 4 point cloud sequences, and each sequence contains 200 point clouds, Ground Truth pre-processes 800 point clouds and so your job pre-processing time might be around 20 minutes. During this time, your labeling job status is `InProgress`.

While your 3D point cloud labeling job is pre-processing, you receive CloudWatch messages notifying you of the status of your job. To identify these messages, search for `3D_POINT_CLOUD_PROCESSING_STATUS` in your labeling job logs.

For **frame input manifest files**, your CloudWatch logs will have a message similar to the following:

```
{
  "labeling-job-name": "example-point-cloud-labeling-job",
  "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
  "event-log-message": "datasetObjectId from: 0 to 10, status: IN_PROGRESS"
}
```

The event log message, `datasetObjectId from: 0 to 10, status: IN_PROGRESS` identifies the number of frames from your input manifest that have been processed. You receive a new message every time a frame has been processed. For example, after a single frame has processed, you receive another message that says `datasetObjectId from: 1 to 10, status: IN_PROGRESS`.

For **sequence input manifest files**, your CloudWatch logs will have a message similar to the following:

```
{
  "labeling-job-name": "example-point-cloud-labeling-job",
  "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
  "event-log-message": "datasetObjectId: 0, status: IN_PROGRESS"
}
```

The event log message, `datasetObjectId from: 0, status: IN_PROGRESS` identifies the number of sequences from your input manifest that have been processed. You receive a new message every time a sequence has been processed. For example, after a single sequence has processed, you receive a message that says `datasetObjectId from: 1, status: IN_PROGRESS` as the next sequence begins processing.

## Job completion times

3D point cloud labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

It is strongly recommended that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth will save their work every 15 minutes.

When using the SageMaker AI `CreateLabelingJob` API operation, set the total time a task is available to workers in the `TaskTimeLimitInSeconds` parameter of `HumanTaskConfig`.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

## Workforces

When you create a 3D point cloud labeling job, you need to specify a work team that will complete your point cloud annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for 3D point cloud labeling jobs.

To learn more about vendor workforce, see [Subscribe to vendor workforces](#).

To learn how to create and manage a private workforce, see [Private workforce](#).

## Worker user interface (UI)

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your 3D point cloud labeling tasks.

You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter [HumanTaskUiArn](#) to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker AI [RenderUiTemplate](#) API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, label category attributes that are displayed in the worker UI.

## Label category attributes

When you create a 3D point cloud object tracking or object detection labeling job, you can add one or more *label category attributes*. You can add *frame attributes* to all 3D point cloud task types:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to provide metadata about a label.
- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each point cloud frame a worker is sent to annotate. It is used by workers to provide metadata about frames.

Additionally, you can use label and frame attributes to have workers verify labels in a 3D point cloud label verification job.

Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the **Create Labeling Job** section on the [task type page](#) of your choice.

### Label category attributes

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a *global label category attribute*.

For example, if you add the label category *car*, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute *occluded* to the car label category, you can assign *partial*, *completely*, *no* to the *occluded* attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

### Frame attributes

Add frame attributes to give workers the ability to provide more information about individual point cloud frames. You can specify up to 10 frame attributes, and these attributes will appear on all frames.

For example, you can add a frame attribute that allows workers to enter a number. You may want to use this attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide a free form answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a point cloud frame.

### Worker instructions

You can provide worker instructions to help your workers complete your point cloud labeling tasks. You might want to use these instructions to do the following:

- Best practices and things to avoid when annotating objects.
- Explanation of the label category attributes provided (for object detection and object tracking tasks), and how to use them.
- Advice on how to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker AI console while creating a labeling job. If you create a labeling job using the API operation `CreateLabelingJob`, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on [Worker instructions](#).

## Declining tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object ([NumberOfHumanWorkersPerDataObject](#)) decline the task, the data object is marked as expired and will not be sent to additional workers.

## 3D point cloud labeling job permission requirements

When you create a 3D point cloud labeling job, in addition to the permission requirements found in [Assign IAM Permissions to Use Ground Truth](#), you must add a CORS policy to your S3 bucket that contains your input manifest file.

### Add a CORS permission policy to S3 bucket

When you create a 3D point cloud labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

## JSON

```
[
  {
    "AllowedHeaders": [
      "*"
    ]
  }
]
```

```

    ],
    "AllowedMethods": [
      "GET",
      "HEAD",
      "PUT"
    ],
    "AllowedOrigins": [
      "*"
    ],
    "ExposeHeaders": [
      "Access-Control-Allow-Origin"
    ],
    "MaxAgeSeconds": 3000
  }
]

```

## XML

```

<?xml version="1.0" encoding="UTF-8"?>
  <CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <CORSRule>
      <AllowedOrigin>*</AllowedOrigin>
      <AllowedMethod>GET</AllowedMethod>
      <AllowedMethod>HEAD</AllowedMethod>
      <AllowedMethod>PUT</AllowedMethod>
      <MaxAgeSeconds>3000</MaxAgeSeconds>
      <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
      <AllowedHeader>*</AllowedHeader>
    </CORSRule>
  </CORSConfiguration>

```

To learn how to add a CORS policy to an S3 bucket, see [How do I add cross-domain resource sharing with CORS?](#) in the Amazon Simple Storage Service User Guide.

## Worker instructions

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your 3D Point Cloud labeling task. First, select the type of task you are working on from **Topics**.

For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.

### Important

It is recommended that you complete your task using a Google Chrome or Firefox web browser.

## Topics

- [Saving Your Work and Submitting](#)

## Your Task

When you work on a 3D point cloud semantic segmentation task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the drop down menu **Label Categories**. After you've selected a category, use the paint brush and polygon tools to paint each object in the 3D point cloud that this category applies to. For example, if you select the category **Car**, you would use these tools to paint all of the cars in the point cloud. The following video demonstrates how to use the paint brush tool to paint an object.

If you see one or more images in your worker portal, you can paint in the images or paint in the 3D point cloud and the paint will show up in the other medium.

You may see frame attributes under the **Labels** menu. Use these attribute prompts to enter additional information about the point cloud.

**Frame 1 attributes** [-] [X]

**Is the point cloud clearly visible?**  
Visible: frame attribute that applies to all frames

Yes  No

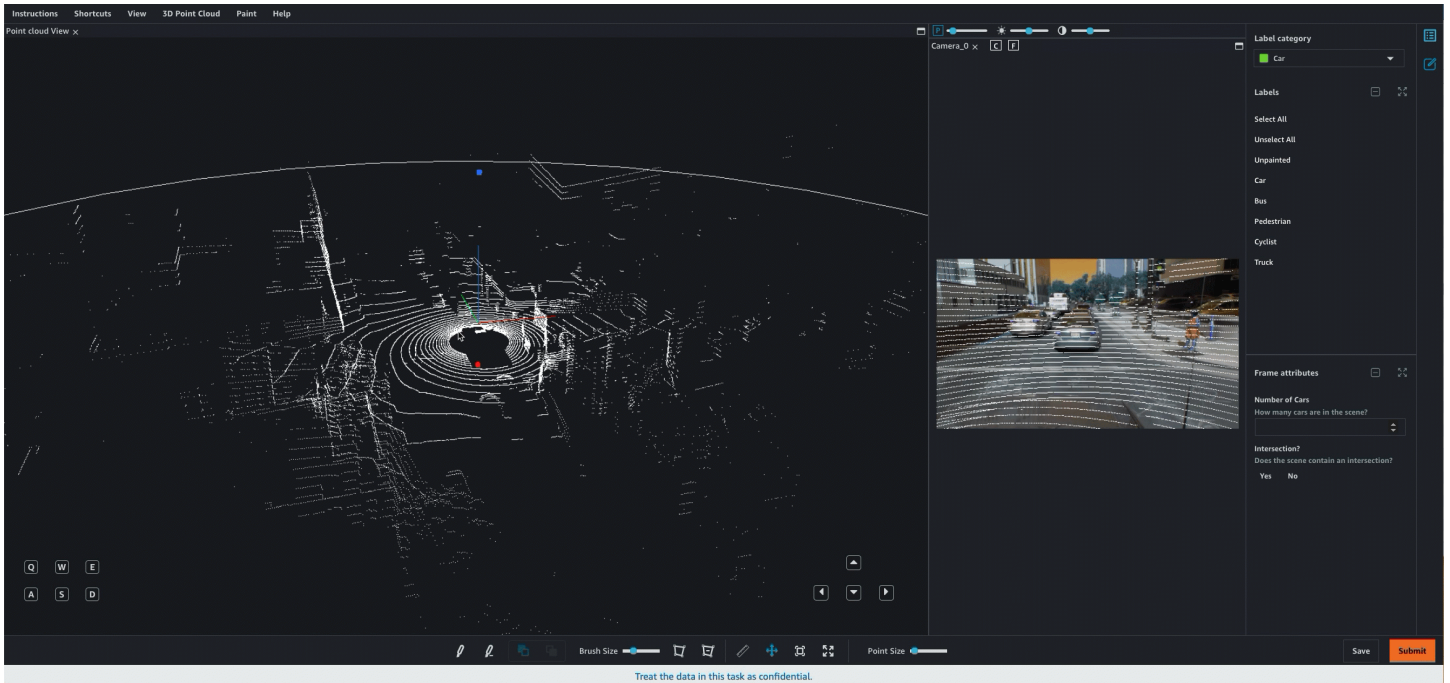

**Describe Issues**  
Issues: frame attribute that applies to all frames

**Number of Cars Labeled**  
Cars labeled: frame attribute that applies to all frames

**⚠ Important**

If you see that objects have already been painted when you open the task, adjust those annotations.

The following video includes an image that can be annotated. You may not see an image in your task.

After you've painted one or more objects using a label category, you can select that category from the Label Category menu on the right to only view points painted for that category.

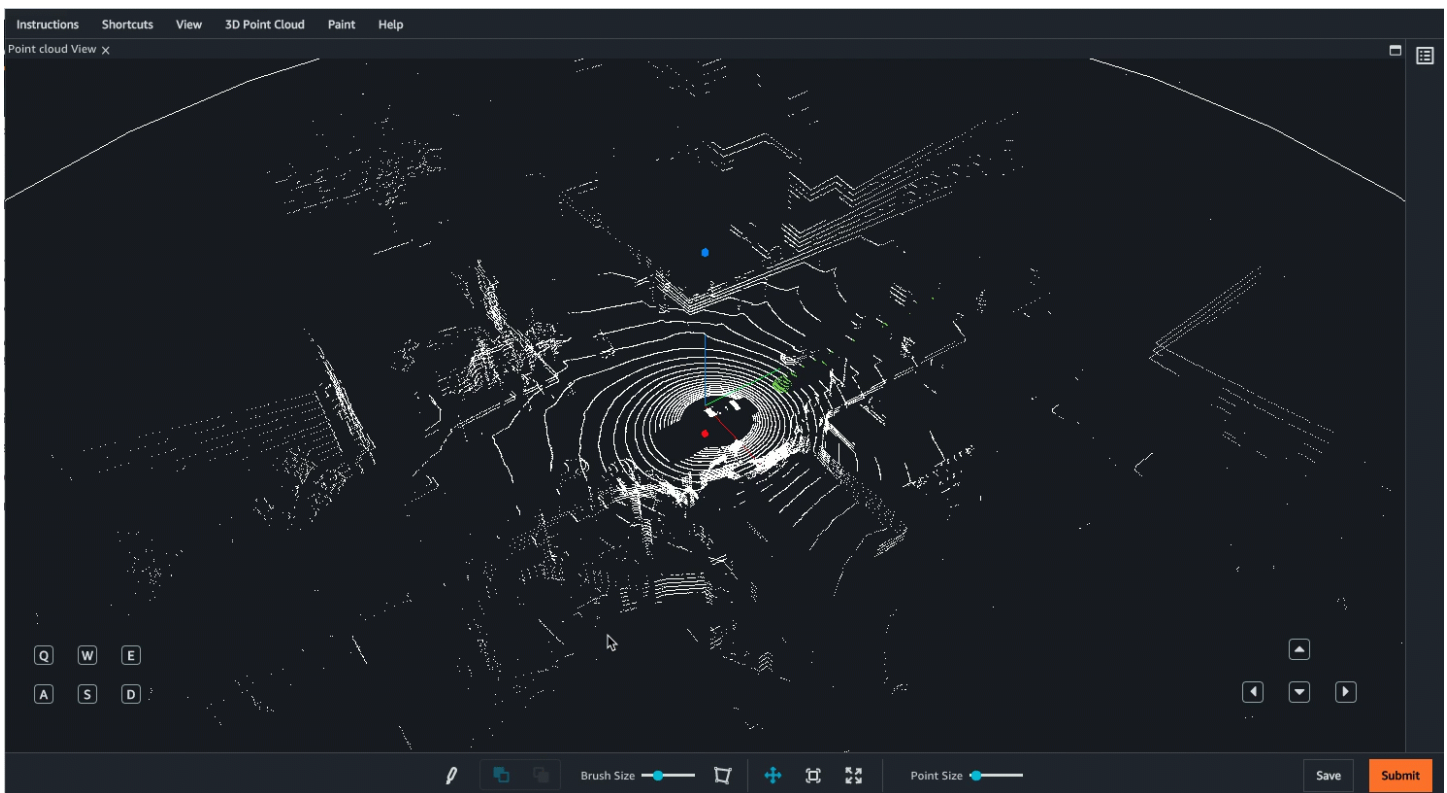

## Navigate the UI

You can navigate in the 3D scene using their keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud and in the side-view. You can hide and re-expand all side views using the full screen icon. In this GIF, the side-views and menus have been collapsed.

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.

- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that some or all of these options may not be available.
- **Paint** – Use this menu to modify the functionality of the paint brush.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

After you select the paint icon, you can add paint to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full screen, select the full screen icon.

For the camera images and side-panels, you have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.

## Icon Guide

Use this table to learn about the icons available in your worker task portal.

Icon	Name	Description
	brush	Choose this icon to turn on the brush tool. To use with this tool, choose and move over the objects that you want to paint with your mouse. After you choose it, everything you paint be associated with the category you chose.
	polygon	Choose this icon to use the polygon paint tool. Use this tool to draw polygons around objects that you want to paint. After you choose it, everything you draw a polygon around will be associated with the category you have chosen.

Icon	Name	Description
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon will be selected when you first start a task.
	full screen	Choose this icon to make the 3D point cloud visualization full screen, and to collapse all side panels.

Icon	Name	Description
	ruler	<p>Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data.</p> <p>When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement.</p> <p>After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set.</p> <p>After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.</p>

## Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use the paint tool.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

## Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task:** You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task:** If you release a task, you lose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later:** You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

## Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

## 3D point cloud object detection

Use this page to familiarize yourself with the user interface and tools available to complete your 3D point cloud object detection task.

## Topics

- [Your Task](#)

- [Navigate the UI](#)
- [Icon Guide](#)
- [Shortcuts](#)
- [Release, Stop and Resume, and Decline Tasks](#)
- [Saving Your Work and Submitting](#)

## Your Task

When you work on a 3D point cloud object detection task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the **Label Categories** menu. After you've chosen a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its dimensions, location, and orientation directly in the point cloud, and the three panels shown on the right.

If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

If you see cuboids have already been added to the 3D point cloud when you open your task, adjust those cuboids and add additional cuboids as needed.

To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the **Shortcuts** menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

Mac Command	Windows Command	Action
Cmd + Drag	Ctrl + Drag	Modify the dimensions of the cuboid.
Option + Drag	Alt + Drag	Move the cuboid.
Shift + Drag	Shift + Drag	Rotate the cuboid.
Option + O	Alt + O	Fit the cuboid tightly around the points it has been drawn around. Before using the

Mac Command	Windows Command	Action
		option, make sure the cuboid fully-surrounds the object of interest.
Option + G	Alt + G	Set the cuboid to the ground.

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the **Label Id** menu. Fill in required values for all label attributes.

You may see frame attributes under the **Labels** menu. Use these attribute prompts to enter additional information about each frame.

**Frame 1 attributes** [-] [X]

**Is the point cloud clearly visible?**  
Visible: frame attribute that applies to all frames

Yes No

**Describe Issues**  
Issues: frame attribute that applies to all frames

**Number of Cars Labeled**  
Cars labeled: frame attribute that applies to all frames

↑ ↓

## Navigate the UI

You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [ and ] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [ or ], the UI will zoom into the first label in the **Label Id** list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.

- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object's boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon. Resetting the view will not modify your annotations.

After you select the add cuboid icon, you can add cuboids to the 3D point cloud visualization. Once you've added a cuboid, you can adjust it in the three views (top, side, and front) and in the images (if included).

You must choose the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The **F** option is used to view the field of view of the camera (the gray area), the **C** options shows the direction the camera is facing and angle of the camera (blue lines), and the **B** option is used to view the cuboid.

## Icon Guide

Use this table to learn about the icons you see in your worker task portal.

Icon	Name	Description
	add cuboid	Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.
	edit cuboid	Choose this icon to edit a cuboid. After you have added a cuboid, you can edit its dimensions, location, and

Icon	Name	Description
	ruler	<p>orientation. After a cuboid is added, it automatically switches to edit cuboid mode.</p> <p>Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data.</p> <p>When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement.</p> <p>After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set.</p> <p>After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.</p>
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon is chosen when you first start a task.

Icon	Name	Description
	full screen	Choose this icon to make the 3D point cloud visualization full screen, and to collapse all side panels.
	show labels	Show labels in the 3D point cloud visualization, and if applicable, in images.
	hide labels	Hide labels in the 3D point cloud visualization, and if applicable, in images.
	delete labels	Delete a label.

## Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

## Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task:** You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task:** If you release a task, you lose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.

- **Stop and resume later:** You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

## Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

## 3D point cloud object tracking

Use this page to become familiar with the user interface and tools available to complete your 3D point cloud object detection task.

### Topics

- [Your Task](#)
- [Navigate the UI](#)
- [Bulk Edit Label Category and Frame Attributes](#)
- [Icon Guide](#)
- [Shortcuts](#)
- [Release, Stop and Resume, and Decline Tasks](#)
- [Saving Your Work and Submitting](#)

### Your Task

When you work on a 3D point cloud object tracking task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the **Label Categories** menu. After you've selected a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects

in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its location, dimensions, and orientation directly in the point cloud, and the three panels shown on the right. If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

### Important

If you see cuboids have already been added to the 3D point cloud frames when you open your task, adjust those cuboids and add additional cuboids as needed.

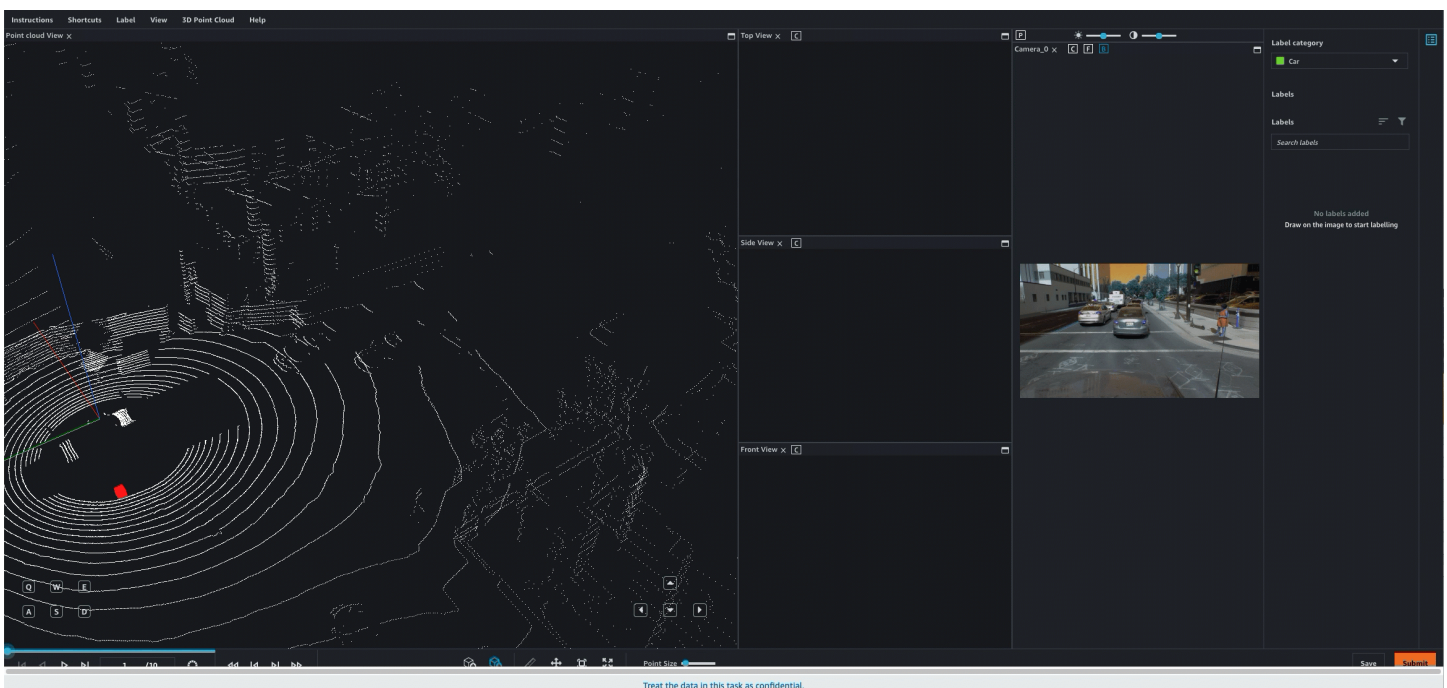

To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the **Shortcuts** menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

Mac Command	Windows Command	Action
Cmd + Drag	Ctrl + Drag	Modify the dimensions of the cuboid.
Option + Drag	Alt + Drag	Move the cuboid.
Shift + Drag	Shift + Drag	Rotate the cuboid.
Option + O	Alt + O	Fit the cuboid tightly around the points it has been drawn around. Before using the option, make sure the cuboid fully-surrounds the object of interest.
Option + G	Alt + G	Set the cuboid to the ground.

When you open your task, two frames will be loaded. If your task includes more than two frames, you need to use the navigation bar in the lower-left corner, or the load frames icon to load additional frames. You should annotate and adjust labels in all frames before submitting.

After you fit a cuboid tightly around the boundaries of an object, navigate to another frame using the navigation bar in the lower-left corner of the UI. If that same object has moved to a new location, add another cuboid and fit it tightly around the boundaries of the object. Each time you manually add a cuboid, you see the frame sequence bar in the lower-left corner of the screen turn red where that frame is located temporally in the sequence.

Your UI automatically infers the location of that object in all other frames after you've placed a cuboid. This is called *interpolation*. You can see the movement of that object, and the inferred and manually created cuboids using the arrows. Adjust inferred cuboids as needed. The following video demonstrates how to navigate between frames. The following video shows how, if you add a cuboid in one frame, and then adjust it in another, your UI will automatically infer the location of the cuboid in all of the frames in-between.

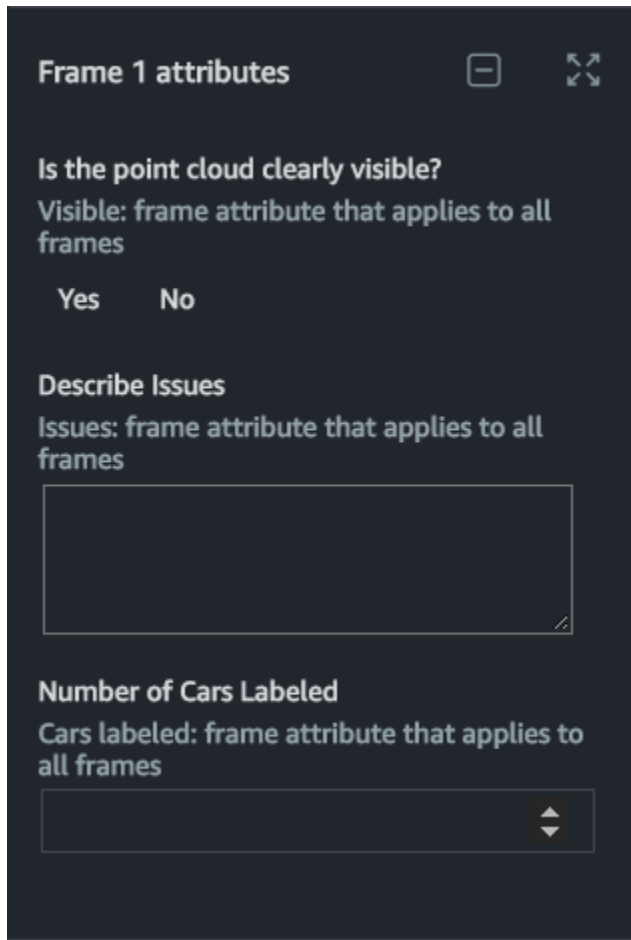

### Tip

You can turn off the automatic cuboid interpolation across frames using the 3D Point Cloud menu item. Select **3D Point Cloud** from the top-menu, and then select **Interpolate Cuboids Across Frames**. This will uncheck this option and stop cuboid interpolation. You can reselect this item to turn cuboid interpolation back on.

Turning cuboid interpolation off will not impact cuboids that have already been interpolated across frames.

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the **Label Id** menu. Fill in required values for all label attributes.

You may see frame attributes under the **Label Id** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.

**Frame 1 attributes** [-] [↔]

**Is the point cloud clearly visible?**  
Visible: frame attribute that applies to all frames

Yes No

**Describe Issues**  
Issues: frame attribute that applies to all frames

**Number of Cars Labeled**  
Cars labeled: frame attribute that applies to all frames

⬆

## Navigate the UI

You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [ and ] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [ or ], the UI will zoom into the first label in the **Label Id** list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.

- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object's boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

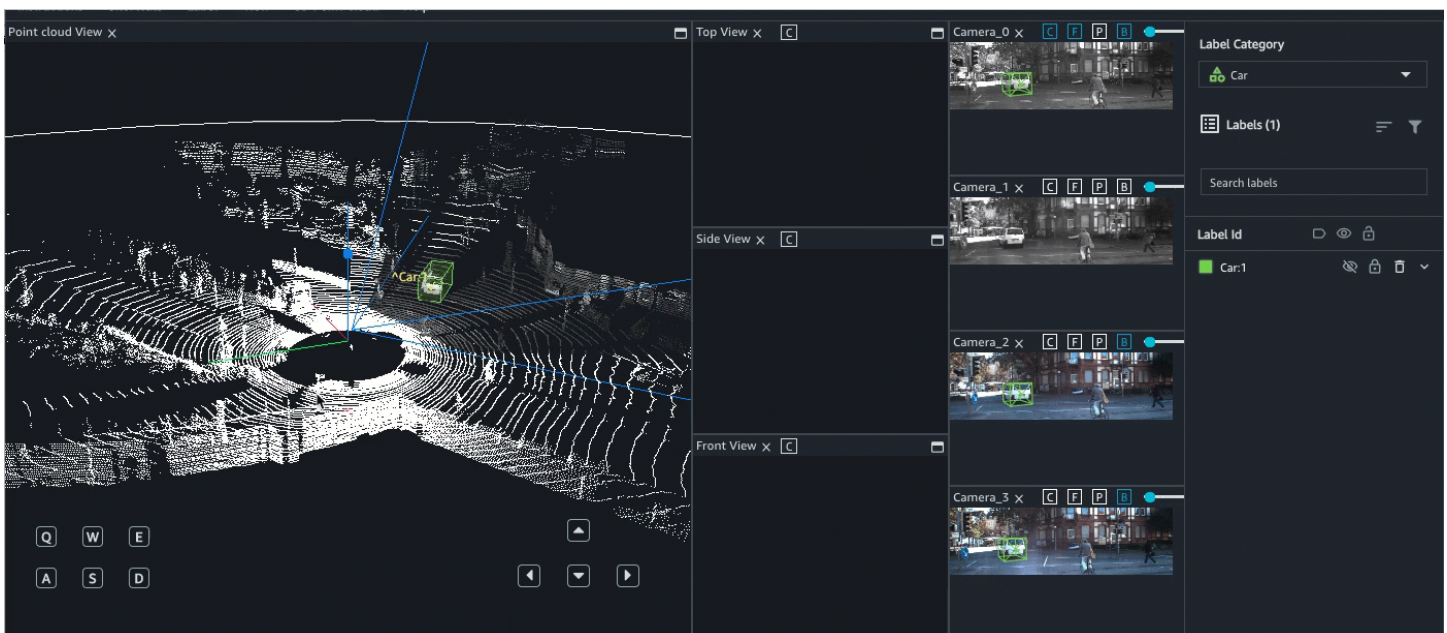

After you select the add cuboid icon, you can add cuboids to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The **F** option is used to view the field of view of the camera (the gray area), the **C** options shows the direction the camera is facing and angle of the camera (blue lines), and the **B** option is used to view the cuboid.

## Delete Cuboids

You can select a cuboid or label ID and:

- Delete an individual cuboid in the current frame you are viewing.
- Delete all cuboids with that label ID before or after the frame you are viewing.
- Delete all cuboids with that label ID in all frames.

A common use-case for cuboid deletion is if the object leaves the scene.

You can use one or more of these options to delete both manually placed and interpolated cuboids with the same label ID.

- To delete all cuboids before or after the frame you are currently on, select the cuboid, select the **Label** menu item at the top of the UI and then select one of **Delete in previous frames** or **Delete in next frames**. Use the Shortcuts menu to see the shortcut keys you can use for these options.
- To delete a label in all frames, select **Delete in all frames** from the **Labels** menu, or use the shortcut **Shift + Delete** on your keyboard.
- To delete an individual cuboid from a single frame, select the cuboid and either select the trashcan icon

( next to that label ID in the **Label ID** sidebar on the right or use the Delete key on your keyboard to delete that cuboid. )

If you have manually placed more than one cuboid with the same label in different frames, when you delete one of the manually placed cuboids, all interpolated cuboids adjust. This adjustment happens because the UI uses manually placed cuboids as anchor points when calculating the location of interpolated cuboid. When you remove one of these anchor points, the UI must recalculate the position of interpolated cuboids.

If you delete a cuboid from a frame, but later decide that you want to get it back, you can use the **Duplicate to previous frames** or **Duplicate to next frames** options in the **Label** menu to copy the cuboid into all the previous or all of the following frames, respectively.

## Bulk Edit Label Category and Frame Attributes

You can bulk edit label attributes and frame attributes.

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify *must* contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you *must* specify the desired value for the attribute first. For example, if you want to change an attribute from *Yes* to *No*, you must select *No*, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

### To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (-) in the text box. For example, if you want to apply the edit to frames one through ten, enter 1-10. If you want to apply the edit to frames two to five, eight to ten and twenty enter 2-5, 8-10, 20.
3. Select **Confirm**.

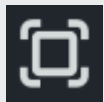

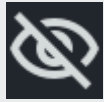

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

## Icon Guide

Use this table to learn about the icons you see in your worker task portal.

Icon	Name	Description
	add cuboid	Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.
	edit cuboid	Choose this icon to edit a cuboid. After you add a cuboid, you can edit its dimensions, location, and orientation. After a cuboid is added, it automatically switches to edit cuboid mode.
	ruler	<p>Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data.</p> <p>When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement.</p> <p>After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set.</p> <p>After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.</p>

Icon	Name	Description
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon is chosen when you first start a task.
	full screen	Choose this icon to make the 3D point cloud visualization full screen and to collapse all side panels.
	load frames	Choose this icon to load additional frames.
	hide labels	Hide labels in the 3D point cloud visualization, and if applicable, in images.
	show labels	Show labels in the 3D point cloud visualization, and if applicable, in images.
	delete labels	Delete a label. This option can only be used to delete labels you have manually created or adjusted.

## Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

## Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task:** You should only decline a task if something is wrong with the task, such as an issue with the 3D point clouds, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task:** Use this option to release a task and allow others to work on it. When you release a task, you lose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later:** You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks must be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

## Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work every 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

## Label verification and adjustment

When the labels on a dataset need to be validated, Amazon SageMaker Ground Truth provides functionality to have workers verify that labels are correct or to adjust previous labels. These types of jobs fall into two distinct categories:

- *Label verification* — Workers indicate if the existing labels are correct, or rate their quality, and can add comments to explain their reasoning. Workers will not be able to modify or adjust labels.

If you create a 3D point cloud or video frame label adjustment or verification job, you can choose to make label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes editable by workers.

- *Label adjustment* — Workers adjust prior annotations and, if applicable, label category and frame attributes to correct them.

The following Ground Truth [built-in task types](#) support adjustment and verification labeling jobs:

- Bounding box
- Semantic segmentation
- 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation
- All video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint

#### Tip

For 3D point cloud and video frame labeling verification jobs, it is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame. To learn more about label category and frame attributes, see [Worker user interface \(UI\)](#) for 3D point cloud and [Worker user interface \(UI\)](#) for video frame.

You can start a label verification and adjustment jobs using the SageMaker AI console or the API.

## Cautions and considerations

To get expected behavior when creating a label verification or adjustment job, carefully verify your input data.

- If you are using image data, verify that your manifest file contains hexadecimal RGB color information.

- To save money on processing costs, filter your data to ensure you are not including unwanted objects in your labeling job input manifest.
- Add required Amazon S3 permissions to ensure your input data is processed correctly.

When you create an adjustment or verification labeling job using the Ground Truth API, you *must* use a different `LabelAttributeName` than the original labeling job.

### Color information requirements for semantic segmentation jobs

To properly reproduce color information in verification or adjustment tasks, the tool requires hexadecimal RGB color information in the manifest (for example, #FFFFFF for white). When you set up a Semantic Segmentation verification or adjustment job, the tool examines the manifest to determine if this information is present. If it can't find it, Amazon SageMaker Ground Truth displays an error message and the ends job setup.

In prior iterations of the Semantic Segmentation tool, category color information wasn't output in hexadecimal RGB format to the output manifest. That feature was introduced to the output manifest at the same time the verification and adjustment workflows were introduced. Therefore, older output manifests aren't compatible with this new workflow.

### Filter your data before starting the job

Amazon SageMaker Ground Truth processes all objects in your input manifest. If you have a partially labeled data set, you might want to create a custom manifest using an [Amazon S3 Select query](#) on your input manifest. Unlabeled objects individually fail, but they don't cause the job to fail, and they might incur processing costs. Filtering out objects you don't want verified reduces your costs.

If you create a verification job using the console, you can use the filtering tools provided there. If you create jobs using the API, make filtering your data part of your workflow where needed.

### Topics

- [Requirements to create verification and adjustment labeling jobs](#)
- [Create a label verification job \(console\)](#)
- [Create a label adjustment job \(console\)](#)
- [Start a label verification or adjustment job \(API\)](#)
- [Label verification and adjustment data in the output manifest](#)

## Requirements to create verification and adjustment labeling jobs

To create a label verification or adjustment job, you must satisfy the following criteria.

- For non streaming labeling jobs: The input manifest file you use must contain the label attribute name (`LabelAttributeName`) of the labels that you want adjusted. When you chain a successfully completed labeling job, the output manifest file is used as the input manifest file for the new, chained job. To learn more about the format of the output manifest file Ground Truth produces for each task type, see [Labeling job output data](#).

For streaming labeling jobs: The Amazon SNS message you sent to the Amazon SNS input topic of the adjustment or verification labeling job must contain the label attribute name of the labels you want adjusted or verified. To see an example of how you can create an adjustment or verification labeling job with streaming labeling jobs, see this [Jupyter Notebook example](#) in GitHub.

- The task type of the verification or adjustment labeling job must be the same as the task type of the original job unless you are using the [Image Label Verification](#) task type to verify bounding box or semantic segmentation image labels. See the next bullet point for more details about the video frame task type requirements.
- For video frame annotation verification and adjustment jobs, you must use the same annotation task type used to create the annotations from the previous labeling job. For example, if you create a video frame object detection job to have workers draw bounding boxes around objects, and then you create a video object detection adjustment job, you must specify *bounding boxes* as the annotation task type. To learn more video frame annotation task types, see [Task types](#).
- The task type you select for the adjustment or verification labeling job must support an audit workflow. The following Ground Truth [built-in task types](#) support adjustment and verification labeling jobs: bounding box, semantic segmentation, 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation, and all video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint.

### Create a label verification job (console)

Use one of the following sections to create a label verification job for your task type. Bounding box and semantic segmentation labeling jobs are created by choosing the **Label verification** task type in the console. To create a verification job for 3D point cloud and video frame task types, you must choose the same task type as the original labeling job and choose to display existing labels.

## Create an image label verification job (console)

Use the following procedure to create a bounding box or semantic segmentation verification job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This is the labeling job that produces the labels you want verified.

### To create an image label verification job:

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/> and choose **Labeling jobs**.
2. Start a new labeling job by [chaining](#) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. In the **Task type** pane, select **Label verification**.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Workforces](#).
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. In the **Existing-labels display options** pane, the system shows the available label attribute names in your manifest. Choose the label attribute name that identifies the labels that you want workers to verify. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
8. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

You can add new labels that workers choose from to verify labels. For example, you can ask workers to verify the image quality, and provide the labels *Clear* and *Blurry*. Workers will also have the option to add a comment to explain their selection.

9. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.
10. Select **Create**. This will create and start your labeling job.

## Create a point cloud or video frame label verification job (console)

Use the following procedure to create a 3D point cloud or video frame verification job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

### To create an image label verification job:

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/> and choose **Labeling jobs**.
2. Start a new labeling job by [chaining](#) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. In the **Task type** pane, select the same task type as the labeling job that you chained. For example, if the original labeling job was a video frame object detection keypoint labeling job, select that task type.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Workforces](#).
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. Toggle on the switch next to **Display existing labels**.
8. Select **Verification**.
9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for verification. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
10. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

You cannot modify or add new labels. You can remove, modify and add new label category attributes or frame attributes. It is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame.

By default, preexisting label category attributes and frame attributes will not be editable by workers. If you want to make a label category or frame attribute editable, select the **Allow workers to edit this attribute** check box for that attribute.

To learn more about label category and frame attributes, see [Worker user interface \(UI\)](#) for 3D point cloud and [Worker user interface \(UI\)](#) for video frame.

11. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.
12. Select **Create**. This will create and start your labeling job.

## Create a label adjustment job (console)

Use one of the following sections to create a label verification job for your task type.

### Topics

- [Create an image label adjustment job \(console\)](#)
- [Create a point cloud or video frame label adjustment job \(console\)](#)

## Create an image label adjustment job (console)

Use the following procedure to create a bounding box or semantic segmentation adjustment labeling job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This is the labeling job that produces the labels you want adjusted.

### To create an image label adjustment job (console)

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/> and choose **Labeling jobs**.
2. Start a new labeling job by [chaining](#) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Workforces](#).

6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. Expand **Existing-labels display options** by selecting the arrow next to the title.
8. Check the box next to **I want to display existing labels from the dataset for this job**.
9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
10. Use the instructions areas of the tool designer to provide context about what the previous labelers were tasked with doing and what the current verifiers need to check and adjust.
11. Choose **See preview** to check that the tool shows the prior labels correctly and presents the task clearly.
12. Select **Create**. This will create and start your labeling job.

### Create a point cloud or video frame label adjustment job (console)

Use the following procedure to create a 3D point cloud or video frame adjustment job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

#### To create a 3D point cloud or video frame label adjustment job (console)

1. Open the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/> and choose **Labeling jobs**.
2. Start a new labeling job by [chaining](#) a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Toggle on the switch next to **Display existing labels**.
5. Select **Adjustment**.
6. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
7. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current adjusters need to check.

You cannot remove or modify existing labels but you can add new labels. You can remove, modify and add new label category attributes or frame attributes.

By default, preexisting label category attributes and frame attributes will be editable by workers. If you want to make a label category or frame attribute uneditable, deselect the **Allow workers to edit this attribute** check box for that attribute.

To learn more about label category and frame attributes, see [Worker user interface \(UI\)](#) for 3D point cloud and [Worker user interface \(UI\)](#) for video frame.

8. Choose **See preview** to check that the tool shows the prior labels correctly and presents the task clearly.
9. Select **Create**. This will create and start your labeling job.

## Start a label verification or adjustment job (API)

Start a label verification or adjustment job by chaining a successfully completed job or starting a new job from scratch using the [CreateLabelingJob](#) operation. The procedure is almost the same as setting up a new labeling job with `CreateLabelingJob`, with a few modifications. Use the following sections to learn what modifications are required to chain a labeling job to create an adjustment or verification labeling job.

When you create an adjustment or verification labeling job using the Ground Truth API, you *must* use a different `LabelAttributeName` than the original labeling job. The original labeling job is the job used to create the labels you want adjusted or verified.

### Important

The label category configuration file you identify for an adjustment or verification job in [LabelCategoryConfigS3Uri](#) of `CreateLabelingJob` must contain the same labels used in the original labeling job. You can add new labels. For 3D point cloud and video frame jobs, you can add new label category and frame attributes to the label category configuration file.

## Bounding Box and Semantic Segmentation

To create a bounding box or semantic segmentation label verification or adjustment job, use the following guidelines to specify API attributes for the `CreateLabelingJob` operation.

- Use the [LabelAttributeName](#) parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different `LabelAttributeName` than the one used for the original labeling job.
- If you are chaining the job, the labels from the previous labeling job to be adjusted or verified will be specified in the custom UI template. To learn how to create a custom template, see [Create Custom Worker Task Templates](#).

Identify the location of the UI template in the [UiTemplateS3Uri](#) parameter. SageMaker AI provides widgets that you can use in your custom template to display old labels. Use the `initial-value` attribute in one of the following crowd elements to extract the labels that need verification or adjustment and include them in your task template:

- [crowd-semantic-segmentation](#)—Use this crowd element in your custom UI task template to specify semantic segmentation labels that need to be verified or adjusted.
- [crowd-bounding-box](#)—Use this crowd element in your custom UI task template to specify bounding box labels that need to be verified or adjusted.
- The [LabelCategoryConfigS3Uri](#) parameter must contain the same label categories as the previous labeling job.
- Use the bounding box or semantic segmentation adjustment or verification lambda ARNs for [PreHumanTaskLambdaArn](#) and [AnnotationConsolidationLambdaArn](#):
  - For bounding box, the adjustment labeling job lambda function ARNs end with `AdjustmentBoundingBox` and the verification lambda function ARNs end with `VerificationBoundingBox`.
  - For semantic segmentation, the adjustment labeling job lambda function ARNs end with `AdjustmentSemanticSegmentation` and the verification lambda function ARNs end with `VerificationSemanticSegmentation`.

### 3D point cloud and video frame

- Use the [LabelAttributeName](#) parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different `LabelAttributeName` than the one used for the original labeling job.
- You must use the human task UI Amazon Resource Name (ARN) (`HumanTaskUiArn`) used for the original labeling job. To see supported ARNs, see [HumanTaskUiArn](#).

- In the label category configuration file, you must specify the label attribute name ([LabelAttributeName](#)) of the previous labeling job that you use to create the adjustment or verification labeling job in the `auditLabelAttributeName` parameter.
- You specify whether your labeling job is a *verification* or *adjustment* labeling job using the `editsAllowed` parameter in your label category configuration file identified by the [LabelCategoryConfigS3Uri](#) parameter.
  - For *verification* labeling jobs, you must use the `editsAllowed` parameter to specify that all labels cannot be modified. `editsAllowed` must be set to "none" in each entry in `labels`. Optionally, you can specify whether or not label categories attributes and frame attributes can be adjusted by workers.
  - Optionally, for *adjustment* labeling jobs, you can use the `editsAllowed` parameter to specify labels, label category attributes, and frame attributes that can or cannot be modified by workers. If you do not use this parameter, all labels, label category attributes, and frame attributes will be adjustable.

To learn more about the `editsAllowed` parameter and configuring your label category configuration file, see [Label category configuration file schema](#).

- Use the 3D point cloud or video frame adjustment lambda ARNs for [PreHumanTaskLambdaArn](#) and [AnnotationConsolidationLambdaArn](#) for both adjustment and verification labeling jobs:
  - For 3D point clouds, the adjustment and verification labeling job lambda function ARNs end with `Adjustment3DPointCloudSemanticSegmentation`, `Adjustment3DPointCloudObjectTracking`, and `Adjustment3DPointCloudObjectDetection` for 3D point cloud semantic segmentation, object detection, and object tracking respectively.
  - For video frames, the adjustment and verification labeling job lambda function ARNs end with `AdjustmentVideoObjectDetection` and `AdjustmentVideoObjectTracking` for video frame object detection and object tracking respectively.

Ground Truth stores the output data from a label verification or adjustment job in the S3 bucket that you specified in the [S3OutputPath](#) parameter of the [CreateLabelingJob](#) operation. For more information about the output data from a label verification or adjustment labeling job, see [Label verification and adjustment data in the output manifest](#).

## Label verification and adjustment data in the output manifest

Amazon SageMaker Ground Truth writes label verification data to the output manifest within the metadata for the label. It adds two properties to the metadata:

- A `type` property, with a value of `groundtruth/label-verification`.
- A `worker-feedback` property, with an array of comment values. This property is added when the worker enters comments. If there are no comments, the field doesn't appear.

The following example output manifest shows how label verification data appears:

```
{
  "source-ref": "S3 bucket location",
  "verify-bounding-box": "1",
  "verify-bounding-box-metadata": {
    "class-name": "bad",
    "confidence": 0.93,
    "type": "groundtruth/label-verification",
    "job-name": "verify-bounding-boxes",
    "human-annotated": "yes",
    "creation-date": "2018-10-18T22:18:13.527256",
    "worker-feedback": [
      {"comment": "The bounding box on the bird is too wide on the right side."},
      {"comment": "The bird on the upper right is not labeled."}
    ]
  }
}
```

The worker output of adjustment tasks resembles the worker output of the original task, except that it contains the adjusted values and an `adjustment-status` property with the value of `adjusted` or `unadjusted` to indicate whether an adjustment was made.

For more examples of the output of different tasks, see [Labeling job output data](#).

## Custom labeling workflows

These topics help you set up a Ground Truth labeling job that uses a custom labeling template. A custom labeling template allows you to create a custom worker portal UI that workers will use to label data. Template can be created using HTML, CSS, JavaScript, [Liquid template language](#), and [Crowd HTML Elements](#).

## Overview

If this is your first time creating a custom labeling workflow in Ground Truth, the following list is a high-level summary of the steps required.

1. *Set up your workforce* – To create a custom labeling workflow you need a workforce. This topic teaches you about configuring a workforce.
2. *Creating a custom template* – To create a custom template you must map the data from your input manifest file correctly to the variables in your template.
3. *Using optional processing Lambda functions* – To control how data from your input manifest is added to your worker template, and how worker annotations are logged in your job's output file.

This topic also has three end-to-end demos to help you better understand how to use custom labeling templates.

### Note

The examples in the links below all include pre-annotation and post-annotation Lambda functions. These Lambda functions are optional.

- [Demo template: Annotation of images with crowd-bounding-box](#)
- [Demo Template: Labeling Intents with crowd-classifier](#)
- [Build a custom data labeling workflow with Amazon SageMaker Ground Truth](#)

## Topics

- [Set up your workforce](#)
- [Creating a custom worker task template](#)
- [Adding automation with Liquid](#)
- [Processing data in a custom labeling workflow with AWS Lambda](#)
- [Demo template: Annotation of images with crowd-bounding-box](#)
- [Demo Template: Labeling Intents with crowd-classifier](#)
- [Create a custom workflow using the API](#)

## Set up your workforce

In this step you use the console to establish which worker type to use and make the necessary sub-selections for the worker type. It assumes you have already completed the steps up to this point in the [Getting started: Create a bounding box labeling job with Ground Truth](#) section and have chosen the **Custom labeling task** as the **Task type**.

### To configure your workforce.

1. First choose an option from the **Worker types**. There are three types currently available:
  - **Public** uses an on-demand workforce of independent contractors, powered by Amazon Mechanical Turk. They are paid on a per-task basis.
  - **Private** uses your employees or contractors for handling data that needs to stay within your organization.
  - **Vendor** uses third party vendors that specialize in providing data labeling services, available via the AWS Marketplace.
2. If you choose the **Public** option, you are asked to set the **number of workers per dataset object**. Having more than one worker perform the same task on the same object can help increase the accuracy of your results. The default is three. You can raise or lower that depending on the accuracy you need.

You are also asked to set a **price per task** by using a drop-down menu. The menu recommends price points based on how long it will take to complete the task.

The recommended method to determine this is to first run a short test of your task with a **private** workforce. The test provides a realistic estimate of how long the task takes to complete. You can then select the range your estimate falls within on the **Price per task** menu. If your average time is more than 5 minutes, consider breaking your task into smaller units.

### Next

#### [Creating a custom worker task template](#)

## Creating a custom worker task template

To create a custom labeling job, you need to update the worker task template, map the input data from your manifest file to the variables used in the template, and map the output data to Amazon

S3. To learn more about advanced features that use Liquid automation, see [Adding automation with Liquid](#).

The following sections describe each of the required steps.

## Worker task template

A *worker task template* is a file used by Ground Truth to customize the worker user interface (UI). You can create a worker task template using HTML, CSS, JavaScript, [Liquid template language](#), and [Crowd HTML Elements](#). Liquid is used to automate the template. Crowd HTML Elements are used to include common annotation tools and provide the logic to submit to Ground Truth.

Use the following topics to learn how you can create a worker task template. You can see a repository of example Ground Truth worker task templates on [GitHub](#).

## Using the base worker task template in the SageMaker AI console

You can use a template editor in the Ground Truth console to start creating a template. This editor includes a number of pre-designed base templates. It supports autofill for HTML and Crowd HTML Element code.

### To access the Ground Truth custom template editor:

1. Following the instructions in [Create a Labeling Job \(Console\)](#).
2. Then select **Custom** for the labeling job **Task type**.
3. Choose **Next**, and then you can access the template editor and base templates in the **Custom labeling task setup** section.
4. (Optional) Select a base template from the drop-down menu under **Templates**. If you prefer to create a template from scratch, choose **Custom** from the drop down-menu for a minimal template skeleton.

Use the following section to learn how to visualize a template developed in the console locally.

## Visualizing your worker task templates locally

You must use the console to test how your template processes incoming data. To test the look and feel of your template's HTML and custom elements you can use your browser.

**Note**

Variables will not be parsed. You may need to replace them with sample content while viewing your content locally.

The following example code snippet loads the necessary code to render the custom HTML elements. Use this if you want to develop your template's look and feel in your preferred editor rather than in the console.

**Example**

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

**Creating a simple HTML task sample**

Now that you have the base worker task template, you can use this topic to create a simple HTML-based task template.

The following is an example entry from an input manifest file.

```
{
  "source": "This train is really late.",
  "labels": [ "angry" , "sad", "happy" , "inconclusive" ],
  "header": "What emotion is the speaker feeling?"
}
```

In the HTML task template we need to map the variables from input manifest file to the template. The variable from the example input manifest would be mapped using the following syntax **task.input.source**, **task.input.labels**, and **task.input.header**.

The following is a simple example HTML worker task template for tweet-analysis. All tasks begin and end with the `<crowd-form>` `</crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between them. Ground Truth generates the workers' tasks directly from the context specified in the template, unless you implement a pre-annotation Lambda. The `taskInput` object returned by Ground Truth or [Pre-annotation Lambda](#) is the `task.input` object in your templates.

For a simple tweet-analysis task, use the `<crowd-classifier>` element. It requires the following attributes:

- *name* - The name of your output variable. Worker annotations are saved to this variable name in your output manifest.
- *categories* - a JSON formatted array of the possible answers.
- *header* - a title for the annotation tool

The `<crowd-classifier>` element requires at least the three following child elements.

- `<classification-target>` - The text the worker will classify based on the options specified in the `categories` attribute above.
- `<full-instructions>` - Instructions that are available from the "View full instructions" link in the tool. This can be left blank, but it is recommended that you give good instructions to get better results.
- `<short-instructions>` - A more brief description of the task that appears in the tool's sidebar. This can be left blank, but it is recommended that you give good instructions to get better results.

A simple version of this tool would look like the following. The variable

`{{ task.input.source }}` is what specifies the source data from your input manifest file. The `{{ task.input.labels | to_json }}` is an example of a variable filter to turn the array into a JSON representation. The `categories` attribute must be JSON.

### Example of using `crowd-classifier` with the sample input manifest json

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="'{{ task.input.labels | to_json }}'"
    header="{{ task.input.header }}"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Sentiment Analysis Instructions">
      Try to determine the sentiment the author
      of the tweet is trying to express.
      If none seem to match, choose "cannot determine."
    </full-instructions>
```

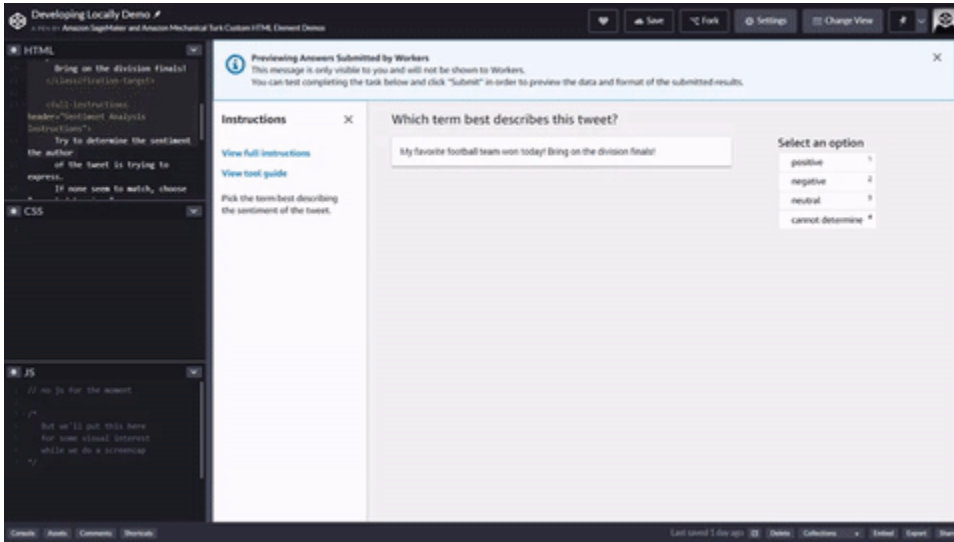

```

<short-instructions>
  Pick the term that best describes the sentiment of the tweet.
</short-instructions>

</crowd-classifier>
</crowd-form>

```

You can copy and paste the code into the editor in the Ground Truth labeling job creation workflow to preview the tool, or try out a [demo of this code on CodePen](#).

## Input data, external assets and your task template

Following sections describe the use of external assets, input data format requirements, and when to consider using pre-annotation Lambda functions.

### Input data format requirements

When you create an input manifest file to use in your custom Ground Truth labeling job, you must store the data in Amazon S3. The input manifest files must also be saved in the same AWS Region in which your custom Ground Truth labeling job is to be run. Furthermore, it can be stored in any Amazon S3 bucket that is accessible to the IAM service role that you use to run your custom labeling job in Ground Truth.

Input manifest files must use the newline-delimited JSON or JSON lines format. Each line is delimited by a standard line break, `\n` or `\r\n`. Each line must also be a valid JSON object.

Furthermore, each JSON object in the manifest file must contain one of the following keys: `source-ref` or `source`. The value of the keys are interpreted as follows:

- `source-ref` – The source of the object is the Amazon S3 object specified in the value. Use this value when the object is a binary object, such as an image.
- `source` – The source of the object is the value. Use this value when the object is a text value.

To learn more about formatting your input manifest files, see [Input manifest files](#).

### Pre-annotation Lambda function

You can optionally specify a *pre-annotation Lambda* function to manage how data from your input manifest file is handled prior to labeling. If you have specified the `isHumanAnnotationRequired` key-value pair you must use a pre-annotation Lambda function. When Ground Truth sends the pre-annotation Lambda function a JSON formatted request it uses the following schemas.

#### Example data object identified with the `source-ref` key-value pair

```
{
  "version": "2018-10-16",
  "labelingJobArn": arn:aws:lambda:us-west-2:555555555555:function:my-function
  "dataObject" : {
    "source-ref": s3://input-data-bucket/data-object-file-name
  }
}
```

#### Example data object identified with the `source` key-value pair

```
{
  "version": "2018-10-16",
  "labelingJobArn" : arn:aws:lambda:us-west-2:555555555555:function:my-function
  "dataObject" : {
    "source": Sue purchased 10 shares of the stock on April 10th, 2020
  }
}
```

The following is the expected response from the Lambda function when `isHumanAnnotationRequired` is used.

```
{
  "taskInput": {
    "source": "This train is really late.",
    "labels": [ "angry" , "sad" , "happy" , "inconclusive" ],
```

```
"header": "What emotion is the speaker feeling?"
},
"isHumanAnnotationRequired": False
}
```

## Using External Assets

Amazon SageMaker Ground Truth custom templates allow external scripts and style sheets to be embedded. For example, the following code block demonstrates how you would add a style sheet located at `https://www.example.com/my-enhancement-styles.css` to your template.

### Example

```
<script src="https://www.example.com/my-enhancement-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding types for remote scripts are: `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets are: `text/css;CHARSET=UTF-8`.

## Output data and your task template

The following sections describe the output data from a custom labeling job, and when to consider using a post-annotation Lambda function.

### Output data

When your custom labeling job is finished, the data is saved in the Amazon S3 bucket specified when the labeling job was created. The data is saved in an `output.manifest` file.

#### Note

*labelAttributeName* is a placeholder variable. In your output it is either the name of your labeling job, or the label attribute name you specify when you create the labeling job.

- `source` or `source-ref` – Either the string or an S3 URI workers were asked to label.
- `labelAttributeName` – A dictionary containing consolidated label content from the [post-annotation Lambda function](#). If a post-annotation Lambda function is not specified, this dictionary will be empty.
- `labelAttributeName-metadata` – Metadata from your custom labeling job added by Ground Truth.
- `worker-response-ref` – The S3 URI of the bucket where the data is saved. If a post-annotation Lambda function is specified this key-value pair will not present.

In this example the JSON object is formatted for readability, in the actual output file the JSON object is on a single line.

```
{
  "source" : "This train is really late.",
  "labelAttributeName" : {},
  "labelAttributeName-metadata": { # These key values pairs are added by Ground Truth
    "job_name": "test-labeling-job",
    "type": "groundTruth/custom",
    "human-annotated": "yes",
    "creation_date": "2021-03-08T23:06:49.111000",
    "worker-response-ref": "s3://amzn-s3-demo-bucket/test-labeling-job/annotations/
worker-response/iteration-1/0/2021-03-08_23:06:49.json"
  }
}
```

## Using a post annotation Lambda to consolidate the results from your workers

By default Ground Truth saves worker responses unprocessed in Amazon S3. To have more fine-grained control over how responses are handled, you can specify a *post-annotation Lambda function*. For example, a post-annotation Lambda function could be used to consolidate annotation if multiple workers have labeled the same data object. To learn more about creating post-annotation Lambda functions, see [Post-annotation Lambda](#).

If you want to use a post-annotation Lambda function, it must be specified as part of the [AnnotationConsolidationConfig](#) in a `CreateLabelingJob` request.

To learn more about how annotation consolidation works, see [Annotation consolidation](#).

## Adding automation with Liquid

Our custom template system uses [Liquid](#) for automation. It is an open source inline markup language. In Liquid, the text between single curly braces and percent symbols is an instruction or *tag* that performs an operation like control flow or iteration. Text between double curly braces is a variable or *object* that outputs its value.

The most common use of Liquid will be to parse the data coming from your input manifest file, and pull out the relevant variables to create the task. Ground Truth automatically generates the tasks unless a pre-annotation Lambda is specified. The `taskInput` object returned by Ground Truth or your [Pre-annotation Lambda](#) is the `task.input` object in your templates.

The properties in your input manifest are passed into your template as the `event.dataObject`.

### Example manifest data object

```
{
  "source": "This is a sample text for classification",
  "labels": [ "angry" , "sad" , "happy" , "inconclusive" ],
  "header": "What emotion is the speaker feeling?"
}
```

### Example sample HTML using variables

```
<crowd-classifier
  name='tweetFeeling'
  categories='{{ task.input.labels | to_json }}'
  header='{{ task.input.header }}' >
<classification-target>
  {{ task.input.source }}
</classification-target>
```

Note the addition of `| to_json` to the `labels` property above. That is a filter that turns the input manifest array into a JSON representation of the array. Variable filters are explained in the next section.

The following list includes two types of Liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you will be redirected to the Liquid documentation.

- [Control flow](#): Includes programming logic operators like `if/else`, `unless`, and `case/when`.

- [Iteration](#): Enables you to run blocks of code repeatedly using statements like for loops.

For an example of an HTML template that uses Liquid elements to create a for loop, see [translation-review-and-correction.liquid.html](#) in GitHub.

For more information and documentation, visit the [Liquid homepage](#).

## Variable filters

In addition to the standard [Liquid filters](#) and actions, Ground Truth offers a few additional filters. Filters are applied by placing a pipe (|) character after the variable name, then specifying a filter name. Filters can be chained in the form of:

### Example

```
{{ <content> | <filter> | <filter> }}
```

## Autoescape and explicit escape

By default, inputs will be HTML escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that the escaping is being done.

### escape\_once

escape\_once ensures that if you've already escaped your code, it doesn't get re-escaped on top of that. For example, so that &amp; doesn't become &amp;amp;.

### skip\_autoescape

skip\_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

#### Use skip\_autoescape sparingly

The best practice in templates is to avoid passing in functional code or markup with skip\_autoescape unless you are absolutely sure you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a Cross Site Scripting attack.

## to\_json

to\_json will encode what you feed it to JSON (JavaScript Object Notation). If you feed it an object, it will serialize it.

## grant\_read\_access

grant\_read\_access takes an S3 URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display to workers the photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible.

## s3\_presign

The s3\_presign filter works the same way as the grant\_read\_access filter. s3\_presign takes an Amazon S3 URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

## Example of the variable filters

### Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?" }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?" | escape }}
explicit escape_once: {{ "Have you read 'James & the Giant Peach'?" |
  escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://amzn-s3-demo-bucket/myphoto.png" | grant_read_access }}
s3_presign: {{ "s3://amzn-s3-demo-bucket/myphoto.png" | s3_presign }}
```

## Example

### Output

```
auto-escape: Have you read &#39;James & the Giant Peach&#39;?
explicit escape: Have you read &#39;James & the Giant Peach&#39;?
explicit escape_once: Have you read &#39;James & the Giant Peach&#39;?
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/amzn-s3-demo-bucket/myphoto.png?<access
  token and other params>
```

```
s3_presign: https://s3.amazonaws.com/amzn-s3-demo-bucket/myphoto.png?<access token and other params>
```

## Example of an automated classification template.

To automate the simple text classification sample, replace the tweet text with a variable.

The text classification template is below with automation added. The changes/additions are highlighted in bold.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author
      of the tweet is trying to express.
      If none seem to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term best describing the sentiment
      of the tweet.
    </short-instructions>

  </crowd-classifier>
</crowd-form>
```

The tweet text in the prior sample is now replaced with an object. The `entry.taskInput` object uses `source` (or another name you specify in your pre-annotation Lambda) as the property name for the text, and it is inserted directly in the HTML by virtue of being between double curly braces.

## Processing data in a custom labeling workflow with AWS Lambda

In this topic, you can learn how to deploy optional [AWS Lambda](#) functions when creating a custom labeling workflow. You can specify two types of Lambda functions to use with your custom labeling workflow.

- *Pre-annotation Lambda*: This function pre-processes each data object sent to your labeling job prior to sending it to workers.
- *Post-annotation Lambda*: This function processes the results once workers submit a task. If you specify multiple workers per data object, this function may include logic to consolidate annotations.

If you are a new user of Lambda and Ground Truth, we recommend that you use the pages in this section as follows:

1. First, review [Using pre-annotation and post-annotation Lambda functions](#).
2. Then, use the page [Add required permissions to use AWS Lambda with Ground Truth](#) to learn about security and permission requirements to use your pre-annotation and post-annotation Lambda functions in a Ground Truth custom labeling job.
3. Next, you need to visit the Lambda console or use Lambda's APIs to create your functions. Use the section [Create Lambda functions using Ground Truth templates](#) to learn how to create Lambda functions.
4. To learn how to test your Lambda functions, see [Test pre-annotation and post-annotation Lambda functions](#).
5. After you create pre-processing and post-processing Lambda functions, select them from the **Lambda functions** section that comes after the code editor for your custom HTML in the Ground Truth console. To learn how to use these functions in a CreateLabelingJob API request, see [Create a Labeling Job \(API\)](#).

For a custom labeling workflow tutorial that includes example pre-annotation and post-annotation Lambda functions, see [Demo template: Annotation of images with crowd-bounding-box](#).

### Topics

- [Using pre-annotation and post-annotation Lambda functions](#)
- [Add required permissions to use AWS Lambda with Ground Truth](#)

- [Create Lambda functions using Ground Truth templates](#)
- [Test pre-annotation and post-annotation Lambda functions](#)

## Using pre-annotation and post-annotation Lambda functions

Use these topics to learn about the syntax of the requests sent to pre-annotation and post-annotation Lambda functions, and the required response syntax that Ground Truth uses in custom labeling workflows.

### Topics

- [Pre-annotation Lambda](#)
- [Post-annotation Lambda](#)

### Pre-annotation Lambda

Before a labeling task is sent to the worker, an optional pre-annotation Lambda function can be invoked.

Ground Truth sends your Lambda function a JSON formatted request to provide details about the labeling job and the data object.

The following are 2 example JSON formatted requests.

Data object identified with "source-ref"

```
{
  "version": "2018-10-16",
  "labelingJobArn": <labelingJobArn>
  "dataObject" : {
    "source-ref": <s3Uri>
  }
}
```

Data object identified with "source"

```
{
  "version": "2018-10-16",
  "labelingJobArn": <labelingJobArn>
  "dataObject" : {
    "source": <string>
  }
}
```

```
}
}
```

The following list contains the pre-annotation request schemas. Each parameter is described below.

- `version` (string): This is a version number used internally by Ground Truth.
- `labelingJobArn` (string): This is the Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as `DescribeLabelingJob`.
- The `dataObject` (JSON object): The key contains a single JSON line, either from your input manifest file or sent from Amazon SNS. The JSON line objects in your manifest can be up to 100 kilobytes in size and contain a variety of data. For a very basic image annotation job, the `dataObject` JSON may just contain a `source-ref` key, identifying the image to be annotated. If the data object (for example, a line of text) is included directly in the input manifest file, the data object is identified with `source`. If you create a verification or adjustment job, this line may contain label data and metadata from the previous labeling job.

The following tabbed examples show examples of a pre-annotation request. Each parameter in these example requests is explained below the tabbed table.

Data object identified with "source-ref"

```
{
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:us-west-2:111122223333:labeling-job/
<labeling_job_name>"
  "dataObject" : {
    "source-ref": "s3://input-data-bucket/data-object-file-name"
  }
}
```

Data object identified with "source"

```
{
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:<aws_region>:111122223333:labeling-job/
<labeling_job_name>"
}
```

```
"dataObject" : {
  "source": "Sue purchased 10 shares of the stock on April 10th, 2020"
}
```

In return, Ground Truth requires a response formatted like the following:

### Example of expected return data

```
{
  "taskInput": <json object>,
  "isHumanAnnotationRequired": <boolean> # Optional
}
```

In the previous example, the `<json object>` needs to contain *all* the data your custom worker task template needs. If you're doing a bounding box task where the instructions stay the same all the time, it may just be the HTTP(S) or Amazon S3 resource for your image file. If it's a sentiment analysis task and different objects may have different choices, it is the object reference as a string and the choices as an array of strings.

#### Implications of `isHumanAnnotationRequired`

This value is optional because it defaults to `true`. The primary use case for explicitly setting it is when you want to exclude this data object from being labeled by human workers.

If you have a mix of objects in your manifest, with some requiring human annotation and some not needing it, you can include a `isHumanAnnotationRequired` value in each data object. You can add logic to your pre-annotation Lambda to dynamically determine if an object requires annotation, and set this boolean value accordingly.

### Examples of pre-annotation Lambda functions

The following basic pre-annotation Lambda function accesses the JSON object in `dataObject` from the initial request, and returns it in the `taskInput` parameter.

```
import json

def lambda_handler(event, context):
```

```
return {
    "taskInput": event['dataObject']
}
```

Assuming the input manifest file uses "source-ref" to identify data objects, the worker task template used in the same labeling job as this pre-annotation Lambda must include a Liquid element like the following to ingest dataObject:

```
{{ task.input.source-ref | grant_read_access }}
```

If the input manifest file used source to identify the data object, the work task template can ingest dataObject with the following:

```
{{ task.input.source }}
```

The following pre-annotation Lambda example includes logic to identify the key used in dataObject, and to point to that data object using taskObject in the Lambda's return statement.

```
import json

def lambda_handler(event, context):

    # Event received
    print("Received event: " + json.dumps(event, indent=2))

    # Get source if specified
    source = event['dataObject']['source'] if "source" in event['dataObject'] else None

    # Get source-ref if specified
    source_ref = event['dataObject']['source-ref'] if "source-ref" in event['dataObject'] else None

    # if source field present, take that otherwise take source-ref
    task_object = source if source is not None else source_ref

    # Build response object
    output = {
        "taskInput": {
            "taskObject": task_object
        },
```

```

        "humanAnnotationRequired": "true"
    }

    print(output)
    # If neither source nor source-ref specified, mark the annotation failed
    if task_object is None:
        print(" Failed to pre-process {} !".format(event["labelingJobArn"]))
        output["humanAnnotationRequired"] = "false"

    return output

```

## Post-annotation Lambda

When all workers have annotated the data object or when [TaskAvailabilityLifetimeInSeconds](#) has been reached, whichever comes first, Ground Truth sends those annotations to your post-annotation Lambda. This Lambda is generally used for [Annotation consolidation](#).

### Note

To see an example of a post-consolidation Lambda function, see [annotation\\_consolidation\\_lambda.py](#) in the [aws-sagemaker-ground-truth-recipe](#) GitHub repository.

The following code block contains the post-annotation request schema. Each parameter is described in the following bulleted list.

```

{
  "version": "2018-10-16",
  "labelingJobArn": <string>,
  "labelCategories": [<string>],
  "labelAttributeName": <string>,
  "roleArn" : <string>,
  "payload": {
    "s3Uri": <string>
  }
}

```

- **version (string):** A version number used internally by Ground Truth.

- `labelingJobArn` (string): The Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as `DescribeLabelingJob`.
- `labelCategories` (list of strings): Includes the label categories and other attributes you either specified in the console, or that you include in the label category configuration file.
- `labelAttributeName` (string): Either the name of your labeling job, or the label attribute name you specify when you create the labeling job.
- `roleArn` (string): The Amazon Resource Name (ARN) of the IAM execution role you specify when you create the labeling job.
- `payload` (JSON object): A JSON that includes an `s3Uri` key, which identifies the location of the annotation data for that data object in Amazon S3. The second code block below shows an example of this annotation file.

The following code block contains an example of a post-annotation request. Each parameter in this example request is explained below the code block.

### Example of an post-annotation Lambda request

```
{
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:us-west-2:111122223333:labeling-job/labeling-job-name",
  "labelCategories": ["Ex Category1", "Ex Category2", "Ex Category3"],
  "labelAttributeName": "labeling-job-attribute-name",
  "roleArn" : "arn:aws:iam::111122223333:role/role-name",
  "payload": {
    "s3Uri": "s3://amzn-s3-demo-bucket/annotations.json"
  }
}
```

#### Note

If no worker works on the data object and `TaskAvailabilityLifetimeInSeconds` has been reached, the data object is marked as failed and not included as part of post-annotation Lambda invocation.

The following code block contains the payload schema. This is the file that is indicated by the `s3Uri` parameter in the post-annotation Lambda request `payload` JSON object. For example, if the previous code block is the post-annotation Lambda request, the following annotation file is located at `s3://amzn-s3-demo-bucket/annotations.json`.

Each parameter is described in the following bulleted list.

### Example of an annotation file

```
[
  {
    "datasetObjectId": <string>,
    "dataObject": {
      "s3Uri": <string>,
      "content": <string>
    },
    "annotations": [{
      "workerId": <string>,
      "annotationData": {
        "content": <string>,
        "s3Uri": <string>
      }
    }]
  }
]
```

- `datasetObjectId` (string): Identifies a unique ID that Ground Truth assigns to each data object you send to the labeling job.
- `dataObject` (JSON object): The data object that was labeled. If the data object is included in the input manifest file and identified using the source key (for example, a string), `dataObject` includes a `content` key, which identifies the data object. Otherwise, the location of the data object (for example, a link or S3 URI) is identified with `s3Uri`.
- `annotations` (list of JSON objects): This list contains a single JSON object for each annotation submitted by workers for that `dataObject`. A single JSON object contains a unique `workerId` that can be used to identify the worker that submitted that annotation. The `annotationData` key contains one of the following:
  - `content` (string): Contains the annotation data.
  - `s3Uri` (string): Contains an S3 URI that identifies the location of the annotation data.

The following table contains examples of the content that you may find in payload for different types of annotation.

### Named Entity Recognition Payload

```
[
  {
    "datasetObjectId": "1",
    "dataObject": {
      "content": "Sift 3 cups of flour into the bowl."
    },
    "annotations": [
      {
        "workerId": "private.us-west-2.ef7294f850a3d9d1",
        "annotationData": {
          "content": "{\"crowd-entity-annotation\":{\"entities\":[{\"endOffset\":"
          "\":4,\"label\":" "\"verb\"\",\"startOffset\":" "\"0\"},{\"endOffset\":" "\"6,\"label\":" "\"number"
          "\",\"startOffset\":" "\"5\"},{\"endOffset\":" "\"20,\"label\":" "\"object\"\",\"startOffset\":" "\"15\"},
          {\\"endOffset\":" "\"34,\"label\":" "\"object\"\",\"startOffset\":" "\"30\"}]}}"
        }
      }
    ]
  }
]
```

### Semantic Segmentation Payload

```
[
  {
    "datasetObjectId": "2",
    "dataObject": {
      "s3Uri": "s3://amzn-s3-demo-bucket/gt-input-data/images/bird3.jpg"
    },
    "annotations": [
      {
        "workerId": "private.us-west-2.ab1234c5678a919d0",
        "annotationData": {
          "content": "{\"crowd-semantic-segmentation\":{\"inputImageProperties\":"
          "\":{\"height\":" "\"2000,\"width\":" "\"3020\"},\"labelMappings\":" \"{\"Bird\":" \"{\"color\":" "\"#2ca02c"
          "\",\"labeledImage\":" \"{\"pngImageData\":" \"iVBOR...\"}}}"
        }
      }
    ]
  }
]
```

```
}
]
```

## Bounding Box Payload

```
[
  {
    "datasetObjectId": "0",
    "dataObject": {
      "s3Uri": "s3://amzn-s3-demo-bucket/gt-input-data/images/bird1.jpg"
    },
    "annotations": [
      {
        "workerId": "private.us-west-2.ab1234c5678a919d0",
        "annotationData": {
          "content": "{\"boundingBox\":{\"boundingBoxes\":[{\"height\":2052,
          \"label\":\"Bird\", \"left\":583, \"top\":302, \"width\":1375}], \"inputImageProperties
          \":{\"height\":2497, \"width\":3745}}}"
        }
      }
    ]
  }
]
```

Your post-annotation Lambda function may contain logic similar to the following to loop through and access all annotations contained in the request. For a full example, see [annotation\\_consolidation\\_lambda.py](#) in the [aws-sagemaker-ground-truth-recipe](#) GitHub repository. In this GitHub example, you must add your own annotation consolidation logic.

```
for i in range(len(annotations)):
    worker_id = annotations[i]["workerId"]
    annotation_content = annotations[i]['annotationData'].get('content')
    annotation_s3_uri = annotations[i]['annotationData'].get('s3uri')
    annotation = annotation_content if annotation_s3_uri is None else
s3_client.get_object_from_s3(
    annotation_s3_uri)
    annotation_from_single_worker = json.loads(annotation)

    print("{} Received Annotations from worker [{}] is [{}]"
          .format(log_prefix, worker_id, annotation_from_single_worker))
```

**Tip**

When you run consolidation algorithms on the data, you can use an AWS database service to store results, or you can pass the processed results back to Ground Truth. The data you return to Ground Truth is stored in consolidated annotation manifests in the S3 bucket specified for output during the configuration of the labeling job.

In return, Ground Truth requires a response formatted like the following:

**Example of expected return data**

```
[
  {
    "datasetObjectId": <string>,
    "consolidatedAnnotation": {
      "content": {
        "<labelattributename>": {
          # ... label content
        }
      }
    }
  },
  {
    "datasetObjectId": <string>,
    "consolidatedAnnotation": {
      "content": {
        "<labelattributename>": {
          # ... label content
        }
      }
    }
  }
  .
  .
  .
]
```

At this point, all the data you're sending to your S3 bucket, other than the `datasetObjectId`, is in the content object.

When you return annotations in content, this results in an entry in your job's output manifest like the following:

### Example of label format in output manifest

```
{ "source-ref"/"source" : "<s3uri or content>",
  "<labelAttributeName>": {
    # ... label content from you
  },
  "<labelAttributeName>-metadata": { # This will be added by Ground Truth
    "job_name": <labelingJobName>,
    "type": "groundTruth/custom",
    "human-annotated": "yes",
    "creation_date": <date> # Timestamp of when received from Post-labeling Lambda
  }
}
```

Because of the potentially complex nature of a custom template and the data it collects, Ground Truth does not offer further processing of the data.

### Add required permissions to use AWS Lambda with Ground Truth

You may need to configure some or all the following to create and use AWS Lambda with Ground Truth.

- You need to grant an IAM role or user (collectively, an IAM entity) permission to create the pre-annotation and post-annotation Lambda functions using AWS Lambda, and to choose them when creating the labeling job.
- The IAM execution role specified when the labeling job is configured needs permission to invoke the pre-annotation and post-annotation Lambda functions.
- The post-annotation Lambda functions may need permission to access Amazon S3.

Use the following sections to learn how to create the IAM entities and grant permissions described above.

### Topics

- [Grant Permission to Create and Select an AWS Lambda Function](#)
- [Grant IAM Execution Role Permission to Invoke AWS Lambda Functions](#)
- [Grant Post-Annotation Lambda Permissions to Access Annotation](#)

## Grant Permission to Create and Select an AWS Lambda Function

If you do not require granular permissions to develop pre-annotation and post-annotation Lambda functions, you can attach the AWS managed policy `AWSLambda_FullAccess` to a user or role. This policy grants broad permissions to use all Lambda features, as well as permission to perform actions in other AWS services with which Lambda interacts.

To create a more granular policy for security-sensitive use cases, refer to the documentation [Identity-based IAM policies for Lambda](#) in the [AWS Lambda Developer Guide](#) to learn how to create an IAM policy that fits your use case.

## Policies to Use the Lambda Console

If you want to grant an IAM entity permission to use the Lambda console, see [Using the Lambda console](#) in the [AWS Lambda Developer Guide](#).

Additionally, if you want the user to be able to access and deploy the Ground Truth starter pre-annotation and post-annotation functions using the AWS Serverless Application Repository in the Lambda console, you must specify the `<aws-region>` where you want to deploy the functions (this should be the same AWS Region used to create the labeling job), and add the following policy to the IAM role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "serverlessrepo:ListApplicationVersions",
        "serverlessrepo:GetApplication",
        "serverlessrepo:CreateCloudFormationTemplate"
      ],
      "Resource": "arn:aws:serverlessrepo:<aws-region>:838997950401:applications/
aws-sagemaker-ground-truth-recipe"
    },
    {
      "Sid": "VisualEditor1",
      "Effect": "Allow",
      "Action": "serverlessrepo:SearchApplications",
      "Resource": "*"
    }
  ]
}
```

```

    }
  ]
}

```

## Policies to See Lambda Functions in the Ground Truth Console

To grant an IAM entity permission to view Lambda functions in the Ground Truth console when the user is creating a custom labeling job, the entity must have the permissions described in [Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console](#), including the permissions described in the section [Custom Labeling Workflow Permissions](#).

## Grant IAM Execution Role Permission to Invoke AWS Lambda Functions

If you add the IAM managed policy [AmazonSageMakerGroundTruthExecution](#) to the IAM execution role used to create the labeling job, this role has permission to list and invoke Lambda functions with one of the following strings in the function name: GtRecipe, SageMaker, Sagemaker, sagemaker, or LabelingFunction.

If the pre-annotation or post-annotation Lambda function names do not include one of the terms in the preceding paragraph, or if you require more granular permission than those in the AmazonSageMakerGroundTruthExecution managed policy, you can add a policy similar to the following to give the execution role permission to invoke pre-annotation and post-annotation functions.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action":
        "lambda:InvokeFunction",
      "Resource": [
        "arn:aws:lambda:<region>:<account-id>:function:<pre-annotation-lambda-
name>",
        "arn:aws:lambda:<region>:<account-id>:function:<post-annotation-lambda-
name>"
      ]
    }
  ]
}

```

## Grant Post-Annotation Lambda Permissions to Access Annotation

As described in [Post-annotation Lambda](#), the post-annotation Lambda request includes the location of the annotation data in Amazon S3. This location is identified by the `s3Uri` string in the payload object. To process the annotations as they come in, even for a simple pass through function, you need to assign the necessary permissions to the post-annotation [Lambda execution role](#) to read files from the Amazon S3.

There are many ways that you can configure your Lambda to access annotation data in Amazon S3. Two common ways are:

- Allow the Lambda execution role to assume the SageMaker AI execution role identified in `roleArn` in the post-annotation Lambda request. This SageMaker AI execution role is the one used to create the labeling job, and has access to the Amazon S3 output bucket where the annotation data is stored.
- Grant the Lambda execution role permission to access the Amazon S3 output bucket directly.

Use the following sections to learn how to configure these options.

### Grant Lambda Permission to Assume SageMaker AI Execution Role

To allow a Lambda function to assume a SageMaker AI execution role, you must attach a policy to the Lambda function's execution role, and modify the trust relationship of the SageMaker AI execution role to allow Lambda to assume it.

1. [Attach the following IAM policy](#) to your Lambda function's execution role to assume the SageMaker AI execution role identified in `Resource`. Replace `222222222222` with an [AWS account ID](#). Replace `sm-execution-role` with the name of the assumed role.

```
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": "sts:AssumeRole",
    "Resource": "arn:aws:iam::222222222222:role/sm-execution-role"
  }
}
```

2. [Modify the trust policy](#) of the SageMaker AI execution role to include the following Statement. Replace `222222222222` with an [AWS account ID](#). Replace `my-lambda-execution-role` with the name of the assumed role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::222222222222:role/my-lambda-execution-role"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

### Grant Lambda Execution Role Permission to Access S3

You can add a policy similar to the following to the post-annotation Lambda function execution role to give it S3 read permissions. Replace `amzn-s3-demo-bucket` with the name of the output bucket you specify when you create a labeling job.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
    }
  ]
}
```

To add S3 read permissions to a Lambda execution role in the Lambda console, use the following procedure.

## Add S3 read permissions to post-annotation Lambda:

1. Open the [Functions page](#) in the Lambda console.
2. Choose the name of the post-annotation function.
3. Choose **Configuration** and then choose **Permissions**.
4. Select the **Role name** and the summary page for that role opens in the IAM console in a new tab.
5. Select **Attach policies**.
6. Do one of the following:
  - Search for and select **AmazonS3ReadOnlyAccess** to give the function permission to read all buckets and objects in the account.
  - If you require more granular permissions, select **Create policy** and use the policy example in the preceding section to create a policy. Note that you must navigate back to the execution role summary page after you create the policy.
7. If you used the AmazonS3ReadOnlyAccess managed policy, select **Attach policy**.

If you created a new policy, navigate back to the Lambda execution role summary page and attach the policy you just created.

## Create Lambda functions using Ground Truth templates

You can create a Lambda function using the Lambda console, the AWS CLI, or an AWS SDK in a supported programming language of your choice. Use the AWS Lambda Developer Guide to learn more about each of these options:

- To learn how to create a Lambda function using the console, see [Create a Lambda function with the console](#).
- To learn how to create a Lambda function using the AWS CLI, see [Using AWS Lambda with the AWS Command Line Interface](#).
- Select the relevant section in the table of contents to learn more about working with Lambda in the language of your choice. For example, select [Working with Python](#) to learn more about using Lambda with the AWS SDK for Python (Boto3).

Ground Truth provides pre-annotation and post-annotation templates through an AWS Serverless Application Repository (SAR) *recipe*. Use the following procedure to select the Ground Truth recipe in the Lambda console.

### Use the Ground Truth SAR recipe to create pre-annotation and post-annotation Lambda functions:

1. Open the [Functions page](#) on the Lambda console.
2. Select **Create function**.
3. Select **Browse serverless app repository**.
4. In the search text box, enter **aws-sagemaker-ground-truth-recipe** and select that app.
5. Select **Deploy**. The app may take a couple of minutes to deploy.

Once the app deploys, two functions appear in the **Functions** section of the Lambda console: `serverlessrepo-aws-sagemaker-GtRecipePreHumanTaskFunc-<id>` and `serverlessrepo-aws-sagemaker-GtRecipeAnnotationConsol-<id>`.

6. Select one of these functions and add your custom logic in the **Code** section.
7. When you are finished making changes, select **Deploy** to deploy them.

### Test pre-annotation and post-annotation Lambda functions

You can test your pre-annotation and post annotation Lambda functions in the Lambda console. If you are a new user of Lambda, you can learn how to test, or *invoke*, your Lambda functions in the console using the [Create a Lambda function](#) tutorial with the console in the AWS Lambda Developer Guide. You can use the sections on this page to learn how to test the Ground Truth pre-annotation and post-annotation templates provided through an AWS Serverless Application Repository (SAR).

#### Topics

- [Prerequisites](#)
- [Test the Pre-annotation Lambda Function](#)
- [Test the Post-Annotation Lambda Function](#)

#### Prerequisites

You must do the following to use the tests described on this page.

- You need access to the Lambda console, and you need permission to create and invoke Lambda functions. To learn how to set up these permissions, see [Grant Permission to Create and Select an AWS Lambda Function](#).
- If you have not deployed the Ground Truth SAR recipe, use the procedure in [Create Lambda functions using Ground Truth templates](#) to do so.
- To test the post-annotation Lambda function, you must have a data file in Amazon S3 with sample annotation data. For a simple test, you can copy and paste the following code into a file and save it as `sample-annotations.json` and [upload this file to Amazon S3](#). Note the S3 URI of this file—you need this information to configure the post-annotation Lambda test.

```
[{"datasetObjectId":"0","dataObject":{"content":"To train a machine learning model,
you need a large, high-quality, labeled dataset. Ground Truth helps you build
high-quality training datasets for your machine learning models."},"annotations":

```

```
\ "startOffset\ ":18}, {"endOffset\ ":73, "label\ ": "adjective\ ", "startOffset\ ":69}}}]}}}]}}
```

- You must use the directions in [Grant Post-Annotation Lambda Permissions to Access Annotation](#) to give your post-annotation Lambda function's execution role permission to assume the SageMaker AI execution role you use to create the labeling job. The post-annotation Lambda function uses the SageMaker AI execution role to access the annotation data file, `sample-annotations.json`, in S3.

## Test the Pre-annotation Lambda Function

Use the following procedure to test the pre-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.

### Test the Ground Truth SAR recipe pre-annotation Lambda function

- Open the [Functions page](#) in the Lambda console.
- Select the pre-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to `serverlessrepo-aws-sagemaker-RecipePreHumanTaskFunc-<id>`.
- In the **Code source** section, select the arrow next to **Test**.
- Select **Configure test event**.
- Keep the **Create new test event** option selected.
- Under **Event template**, select **SageMaker Ground Truth PreHumanTask**.
- Give your test an **Event name**.
- Select **Create**.
- Select the arrow next to **Test** again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
- Select **Test** to run the test.

After you run the test, you can see the **Execution results**. In the **Function logs**, you should see a response similar to the following:

```
START RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f Version: $LATEST
Received event: {
```

```
"version": "2018-10-16",
"labelingJobArn": "arn:aws:sagemaker:us-east-2:123456789012:labeling-job/example-
job",
"dataObject": {
  "source-ref": "s3://sagemakerexample/object_to_annotate.jpg"
}
}
{'taskInput': {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
END RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f
REPORT RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f Duration: 0.42 ms Billed
Duration: 1 ms Memory Size: 128 MB Max Memory Used: 43 MB
```

In this response, we can see the Lambda function's output matches the required pre-annotation response syntax:

```
{'taskInput': {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
```

## Test the Post-Annotation Lambda Function

Use the following procedure to test the post-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.

### Test the Ground Truth SAR recipe post-annotation Lambda

1. Open the [Functions page](#) in the Lambda console.
2. Select the post-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to `serverlessrepo-aws-sagemaker-GtRecipeAnnotationConsol-<id>`.
3. In the **Code source** section, select the arrow next to **Test**.
4. Select **Configure test event**.
5. Keep the **Create new test event** option selected.
6. Under **Event template**, select **SageMaker Ground Truth AnnotationConsolidation**.
7. Give your test an **Event name**.
8. Modify the template code provided as follows:
  - Replace the Amazon Resource Name (ARN) in `roleArn` with the ARN of the SageMaker AI execution role you used to create the labeling job.

- Replace the S3 URI in `s3Uri` with the URI of the `sample-annotations.json` file you added to Amazon S3.

After you make these modifications, your test should look similar to the following:

```
{
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:us-east-2:123456789012:labeling-job/example-
job",
  "labelAttributeName": "example-attribute",
  "roleArn": "arn:aws:iam::222222222222:role/sm-execution-role",
  "payload": {
    "s3Uri": "s3://your-bucket/sample-annotations.json"
  }
}
```

9. Select **Create**.
10. Select the arrow next to **Test** again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
11. Select the **Test** to run the test.

After you run the test, you should see a `-- Consolidated Output --` section in the **Function Logs**, which contains a list of all annotations included in `sample-annotations.json`.

## Demo template: Annotation of images with crowd-bounding-box

When you chose to use a custom template as your task type in the Amazon SageMaker Ground Truth console, you reach the **Custom labeling task panel**. There you can choose from multiple base templates. The templates represent some of the most common tasks and provide a sample to work from as you create your customized labeling task's template. If you are not using the console, or as an additional recourse, see [Amazon SageMaker AI Ground Truth Sample Task UIs](#) for a repository of demo templates for a variety of labeling job task types.

This demonstration works with the **BoundingBox** template. The demonstration also works with the AWS Lambda functions needed for processing your data before and after the task. In the Github repository above, to find templates that work with AWS Lambda functions, look for `{{ task.input.<property name> }}` in the template.

## Topics

- [Starter Bounding Box custom template](#)
- [Your own Bounding Box custom template](#)
- [Your manifest file](#)
- [Your pre-annotation Lambda function](#)
- [Your post-annotation Lambda function](#)
- [The output of your labeling job](#)

## Starter Bounding Box custom template

This is the starter bounding box template that is provided.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{ task.input.taskObject | grant_read_access }"
    header="{ task.input.header }"
    labels="{ task.input.labels | to_json | escape }"
  >

  <!-- The <full-instructions> tag is where you will define the full instructions of
your task. -->
  <full-instructions header="Bounding Box Instructions" >
    <p>Use the bounding box tool to draw boxes around the requested target of
interest:</p>
    <ol>
      <li>Draw a rectangle using your mouse over each instance of the target.</li>
      <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel
margin</li>
      <li>
        When targets are overlapping, draw a box around each object,
        include all contiguous parts of the target in the box.
        Do not include parts that are completely overlapped by another object.
      </li>
      <li>
        Do not include parts of the target that cannot be seen,
        even though you think you can interpolate the whole shape of the target.
      </li>
      <li>Avoid shadows, they're not considered as a part of the target.</li>
      <li>If the target goes off the screen, label up to the edge of the image.</li>
    </ol>
  </full-instructions>
</crowd-bounding-box>
</crowd-form>
```

```
</ol>
</full-instructions>

<!-- The <short-instructions> tag allows you to specify instructions that are
displayed in the left hand side of the task interface.
It is a best practice to provide good and bad examples in this section for quick
reference. -->
<short-instructions>
  Use the bounding box tool to draw boxes around the requested target of interest.
</short-instructions>
</crowd-bounding-box>
</crowd-form>
```

The custom templates use the [Liquid template language](#), and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named `taskInput` and that object's properties can be accessed as `{{ task.input.<property name> }}` in your template.

### Your own Bounding Box custom template

As an example, assume you have a large collection of animal photos in which you know the kind of animal in an image from a prior image-classification job. Now you want to have a bounding box drawn around it.

In the starter sample, there are three variables: `taskObject`, `header`, and `labels`.

Each of these would be represented in different parts of the bounding box.

- `taskObject` is an HTTP(S) URL or S3 URI for the photo to be annotated. The added `| grant_read_access` is a filter that will convert an S3 URI to an HTTPS URL with short-lived access to that resource. If you're using an HTTP(S) URL, it's not needed.
- `header` is the text above the photo to be labeled, something like "Draw a box around the bird in the photo."
- `labels` is an array, represented as `['item1', 'item2', ...]`. These are labels that can be assigned by the worker to the different boxes they draw. You can have one or many.

Each of the variable names come from the JSON object in the response from your pre-annotation Lambda, The names above are merely suggested, Use whatever variable names make sense to you and will promote code readability among your team.

### **i Only use variables when necessary**

If a field will not change, you can remove that variable from the template and replace it with that text, otherwise you have to repeat that text as a value in each object in your manifest or code it into your pre-annotation Lambda function.

## **Example : Final Customized Bounding Box Template**

To keep things simple, this template will have one variable, one label, and very basic instructions. Assuming your manifest has an "animal" property in each data object, that value can be re-used in two parts of the template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    labels="[ '{{ task.input.animal }}' ]"
    src="{{ task.input.source-ref | grant_read_access }}"
    header="Draw a box around the {{ task.input.animal }}."
  >
  <full-instructions header="Bounding Box Instructions" >
    <p>Draw a bounding box around the {{ task.input.animal }} in the image. If
    there is more than one {{ task.input.animal }} per image, draw a bounding
    box around the largest one.</p>
    <p>The box should be tight around the {{ task.input.animal }} with
    no more than a couple of pixels of buffer around the
    edges.</p>
    <p>If the image does not contain a {{ task.input.animal }}, check the <strong>
    Nothing to label</strong> box.
  </full-instructions>
  <short-instructions>
    <p>Draw a bounding box around the {{ task.input.animal }} in each image. If
    there is more than one {{ task.input.animal }} per image, draw a bounding
    box around the largest one.</p>
  </short-instructions>
</crowd-bounding-box>
</crowd-form>
```

Note the re-use of `{{ task.input.animal }}` throughout the template. If your manifest had all of the animal names beginning with a capital letter, you could use `{{ task.input.animal`

| lowercase }}, incorporating one of Liquid's built-in filters in sentences where it needed to be presented lowercase.

## Your manifest file

Your manifest file should provide the variable values you're using in your template. You can do some transformation of your manifest data in your pre-annotation Lambda, but if you don't need to, you maintain a lower risk of errors and your Lambda will run faster. Here's a sample manifest file for the template.

```
{"source-ref": "<S3 image URI>", "animal": "horse"}
{"source-ref": "<S3 image URI>", "animal" : "bird"}
{"source-ref": "<S3 image URI>", "animal" : "dog"}
{"source-ref": "<S3 image URI>", "animal" : "cat"}
```

## Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process your manifest entries and pass them to the template engine.

### Naming your Lambda function

The best practice in naming your function is to use one of the following four strings as part of the function name: SageMaker, Sagemaker, sagemaker, or LabelingFunction. This applies to both your pre-annotation and post-annotation functions.

When you're using the console, if you have AWS Lambda functions that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic example, you're just passing through the information from the manifest without doing any additional processing on it. This sample pre-annotation function is written for Python 3.7.

```
import json

def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```

The JSON object from your manifest will be provided as a child of the event object. The properties inside the `taskInput` object will be available as variables to your template, so simply setting the value of `taskInput` to `event['dataObject']` will pass all the values from your manifest object to your template without having to copy them individually. If you wish to send more values to the template, you can add them to the `taskInput` object.

## Your post-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer consolidation and scoring as it comes in, you can apply the scoring and/or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

### Provide permissions to your post-annotation Lambda

The annotation data will be in a file designated by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign `S3ReadOnly` access to your Lambda so it can read the annotation files. In the Console page for creating your Lambda, scroll to the **Execution role** panel. Select **Create a new role from one or more templates**. Give the role a name. From the **Policy templates** drop-down, choose **Amazon S3 object read-only permissions**. Save the Lambda and the role will be saved and selected.

The following sample is in Python 2.7.

```
import json
import boto3
from urlparse import urlparse

def lambda_handler(event, context):
    consolidated_labels = []

    parsed_url = urlparse(event['payload']['s3Uri']);
    s3 = boto3.client('s3')
    textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
    filecont = textFile['Body'].read()
    annotations = json.loads(filecont);
```

```

for dataset in annotations:
    for annotation in dataset['annotations']:
        new_annotation = json.loads(annotation['annotationData']['content'])
        label = {
            'datasetObjectId': dataset['datasetObjectId'],
            'consolidatedAnnotation' : {
                'content': {
                    event['labelAttributeName']: {
                        'workerId': annotation['workerId'],
                        'boxesInfo': new_annotation,
                        'imageSource': dataset['dataObject']
                    }
                }
            }
        }
        consolidated_labels.append(label)

return consolidated_labels

```

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the payload object the Lambda should iterate through. What you send back will be an object meeting the [API contract](#).

### The output of your labeling job

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a sub folder named `manifests`.

For a bounding box task, the output you find in the output manifest will look a bit like the demo below. The example has been cleaned up for printing. The actual output will be a single line per record.

### Example : JSON in your output manifest

```

{
  "source-ref": "<URL>",
  "<label attribute name>":
  {
    "workerId": "<URL>",
    "imageSource": "<image URL>",
    "boxesInfo": "{ \"boundingBox\": { \"boundingBoxes\": [ { \"height\": 878, \"label\": \"bird\", \"left\": 208, \"top\": 6, \"width\": 809 } ], \"inputImageProperties\": { \"height\": 924, \"width\": 1280 } } }",

```

```
"<label attribute name>-metadata":  
  {  
    "type":"groundTruth/custom",  
    "job_name":"<Labeling job name>",  
    "human-annotated":"yes"  
  },  
  "animal" : "bird"  
}
```

Note how the additional `animal` attribute from your original manifest is passed to the output manifest on the same level as the `source-ref` and labeling data. Any properties from your input manifest, whether they were used in your template or not, will be passed to the output manifest.

## Demo Template: Labeling Intents with `crowd-classifier`

If you choose a custom template, you'll reach the **Custom labeling task panel**. There you can select from multiple starter templates that represent some of the more common tasks. The templates provide a starting point to work from in building your customized labeling task's template.

In this demonstration, you work with the **Intent Detection** template, which uses the [crowd-classifier](#) element, and the AWS Lambda functions needed for processing your data before and after the task.

### Topics

- [Starter Intent Detection custom template](#)
- [Your Intent Detection custom template](#)
- [Your pre-annotation Lambda function](#)
- [Your post-annotation Lambda function](#)
- [Your labeling job output](#)

### Starter Intent Detection custom template

This is the intent detection template that is provided as a starting point.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>  
  
<crowd-form>  
  <crowd-classifier
```

```

name="intent"
categories="{{ task.input.labels | to_json | escape }}"
header="Pick the most relevant intention expressed by the below text"
>
<classification-target>
  {{ task.input.utterance }}
</classification-target>

<full-instructions header="Intent Detection Instructions">
  <p>Select the most relevant intention expressed by the text.</p>
  <div>
    <p><strong>Example: </strong>I would like to return a pair of shoes</p>
    <p><strong>Intent: </strong>Return</p>
  </div>
</full-instructions>

<short-instructions>
  Pick the most relevant intention expressed by the text
</short-instructions>
</crowd-classifier>
</crowd-form>

```

The custom templates use the [Liquid template language](#), and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named `taskInput` and that object's properties can be accessed as `{{ task.input.<property name> }}` in your template.

## Your Intent Detection custom template

In the starter template, there are two variables: the `task.input.labels` property in the `crowd-classifier` element opening tag and the `task.input.utterance` in the `classification-target` region's content.

Unless you need to offer different sets of labels with different utterances, avoiding a variable and just using text will save processing time and creates less possibility of error. The template used in this demonstration will remove that variable, but variables and filters like `to_json` are explained in more detail in the [crowd-bounding-box demonstration](#) article.

## Styling Your Elements

Two parts of these custom elements that sometimes get overlooked are the `<full-instructions>` and `<short-instructions>` regions. Good instructions generate good results.

In the elements that include these regions, the `<short-instructions>` appear automatically in the "Instructions" pane on the left of the worker's screen. The `<full-instructions>` are linked from the "View full instructions" link near the top of that pane. Clicking the link opens a modal pane with more detailed instructions.

You can not only use HTML, CSS, and JavaScript in these sections, you are encouraged to if you believe you can provide a strong set of instructions and examples that will help workers complete your tasks with better speed and accuracy.

### Example Try out a sample with JSFiddle

Try out an [example `<crowd-classifier>` task](#). The example is rendered by JSFiddle, therefore all the template variables are replaced with hard-coded values. Click the "View full instructions" link to see a set of examples with extended CSS styling. You can fork the project to experiment with your own changes to the CSS, adding sample images, or adding extended JavaScript functionality.

### Example : Final Customized Intent Detection Template

This uses the [example `<crowd-classifier>` task](#), but with a variable for the `<classification-target>`. If you are trying to keep a consistent CSS design among a series of different labeling jobs, you can include an external stylesheet using a `<link rel...>` element the same way you'd do in any other HTML document.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
```

```

name="intent"
categories=["buy', 'eat', 'watch', 'browse', 'leave']"
header="Pick the most relevant intent expressed by the text below"
>
<classification-target>
  {{ task.input.source }}
</classification-target>

<full-instructions header="Emotion Classification Instructions">
  <p>In the statements and questions provided in this exercise, what category of
  action is the speaker interested in doing?</p>
  <table>
    <tr>
      <th>Example Utterance</th>
      <th>Good Choice</th>
    </tr>
    <tr>
      <td>When is the Seahawks game on?</td>
      <td>
        eat<br>
        <greenbg>watch</greenbg>
        <botchoice>browse</botchoice>
      </td>
    </tr>
    <tr>
      <th>Example Utterance</th>
      <th>Bad Choice</th>
    </tr>
    <tr>
      <td>When is the Seahawks game on?</td>
      <td>
        buy<br>
        <greenbg>eat</greenbg>
        <botchoice>watch</botchoice>
      </td>
    </tr>
  </table>
</full-instructions>

<short-instructions>
  What is the speaker expressing they would like to do next?
</short-instructions>
</crowd-classifier>
</crowd-form>

```

```
<style>
  greenbg {
    background: #feee23;
    display: block;
  }

  table {
    *border-collapse: collapse; /* IE7 and lower */
    border-spacing: 0;
  }

  th, tfoot, .fakehead {
    background-color: #8888ee;
    color: #f3f3f3;
    font-weight: 700;
  }

  th, td, tfoot {
    border: 1px solid blue;
  }

  th:first-child {
    border-radius: 6px 0 0 0;
  }

  th:last-child {
    border-radius: 0 6px 0 0;
  }

  th:only-child{
    border-radius: 6px 6px 0 0;
  }

  tfoot:first-child {
    border-radius: 0 0 6px 0;
  }

  tfoot:last-child {
    border-radius: 0 0 0 6px;
  }

  tfoot:only-child{
    border-radius: 6px 6px;
  }
}
```

```
td {
  padding-left: 15px ;
  padding-right: 15px ;
}

botchoice {
  display: block;
  height: 17px;
  width: 490px;
  overflow: hidden;
  position: relative;
  background: #fff;
  padding-bottom: 20px;
}

botchoice:after {
  position: absolute;
  bottom: 0;
  left: 0;
  height: 100%;
  width: 100%;
  content: "";
  background: linear-gradient(to top,
    rgba(255,255,255, 1) 55%,
    rgba(255,255,255, 0) 100%
  );
  pointer-events: none; /* so the text is still selectable */
}
</style>
```

### Example : Your manifest file

If you are preparing your manifest file manually for a text-classification task like this, have your data formatted in the following manner.

```
{"source": "Roses are red"}
{"source": "Violets are Blue"}
{"source": "Ground Truth is the best"}
{"source": "And so are you"}
```

This differs from the manifest file used for the "[Demo template: Annotation of images with crowd-bounding-box](#)" demonstration in that source-ref was used as the property name

instead of `source`. The use of `source-ref` designates S3 URIs for images or other files that must be converted to HTTP. Otherwise, `source` should be used like it is with the text strings above.

## Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda that can be called to process your manifest entries and pass them to the template engine.

This Lambda function is required to have one of the following four strings as part of the function name: `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`.

This applies to both your pre-annotation and post-annotation Lambdas.

When you're using the console, if you have Lambdas that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic sample, where you have only one variable, it's primarily a pass-through function. Here's a sample pre-labeling Lambda using Python 3.7.

```
import json

def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```

The `dataObject` property of the event contains the properties from a data object in your manifest.

In this demonstration, which is a simple pass through, you just pass that straight through as the `taskInput` value. If you add properties with those values to the `event['dataObject']` object, they will be available to your HTML template as Liquid variables with the format `{{ task.input.<property name> }}`.

## Your post-annotation Lambda function

As part of the job set up, provide the ARN of an Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer-consolidation and scoring as data comes in, you can apply the scoring or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

### Set permissions for your post-annotation Lambda function

The annotation data will be in a file designated by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign `S3ReadOnly` access to your Lambda so it can read the annotation files. In the Console page for creating your Lambda, scroll to the **Execution role** panel. Select **Create a new role from one or more templates**. Give the role a name. From the **Policy templates** drop-down, choose **Amazon S3 object read-only permissions**. Save the Lambda and the role will be saved and selected.

The following sample is for Python 3.7.

```
import json
import boto3
from urllib.parse import urlparse

def lambda_handler(event, context):
    consolidated_labels = []

    parsed_url = urlparse(event['payload']['s3Uri']);
    s3 = boto3.client('s3')
    textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
    filecont = textFile['Body'].read()
    annotations = json.loads(filecont);

    for dataset in annotations:
        for annotation in dataset['annotations']:
            new_annotation = json.loads(annotation['annotationData']['content'])
            label = {
                'datasetObjectId': dataset['datasetObjectId'],
                'consolidatedAnnotation' : {
                    'content': {
                        event['labelAttributeName']: {
                            'workerId': annotation['workerId'],
                            'result': new_annotation,
                            'labeledContent': dataset['dataObject']
                        }
                    }
                }
            }
            consolidated_labels.append(label)
```

```
return consolidated_labels
```

## Your labeling job output

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the payload object the Lambda should iterate through.

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a sub folder named manifests.

For an intent detection task, the output in the output manifest will look a bit like the demo below. The example has been cleaned up and spaced out to be easier for humans to read. The actual output will be more compressed for machine reading.

### Example : JSON in your output manifest

```
[
  {
    "datasetObjectId": "<Number representing item's place in the manifest>",
    "consolidatedAnnotation":
    {
      "content":
      {
        "<name of labeling job>":
        {
          "workerId": "private.us-east-1.XXXXXXXXXXXXXXXXXXXXXXXXXX",
          "result":
          {
            "intent":
            {
              "label": "<label chosen by worker>"
            }
          },
          "labeledContent":
          {
            "content": "<text content that was labeled>"
          }
        }
      }
    },
    "datasetObjectId": "<Number representing item's place in the manifest>",
```

```

    "consolidatedAnnotation":
    {
      "content":
      {
        "<name of labeling job>":
        {
          "workerId": "private.us-east-1.6UDLPKQZHYWJQSCA4MBJBB7FWE",
          "result":
          {
            "intent":
            {
              "label": "<label chosen by worker>"
            }
          },
          "labeledContent":
          {
            "content": "<text content that was labeled>"
          }
        }
      }
    },
    ...
    ...
    ...
  ]

```

This should help you create and use your own custom template.

## Create a custom workflow using the API

When you have created your custom UI template (Step 2) and processing Lambda functions (Step 3), you should place the template in an Amazon S3 bucket with a file name format of: `<FileName>.liquid.html`. Use the [CreateLabelingJob](#) action to configure your task. You'll use the location of a custom template ([Creating a custom worker task template](#)) stored in a `<filename>.liquid.html` file on S3 as the value for the `UiTemplateS3Uri` field in the [UiConfig](#) object within the [HumanTaskConfig](#) object.

For the AWS Lambda tasks described in [Processing data in a custom labeling workflow with AWS Lambda](#), the post-annotation task's ARN will be used as the value for the `AnnotationConsolidationLambdaArn` field, and the pre-annotation task will be used as the value for the `PreHumanTaskLambdaArn`.

## Create a Labeling Job

You can create a labeling job in the Amazon SageMaker AI console and by using an AWS SDK in your preferred language to run `CreateLabelingJob`. After a labeling job has been created, you can track worker metrics (for private workforces) and your labeling job status using [CloudWatch](#).

Before you create a labeling job it is recommended that you review the following pages, as applicable:

- You can specify your input data using an automatic data setup in the console, or an input manifest file in either the console or when using `CreateLabelingJob` API. For automated data setup, see [Automate data setup for labeling jobs](#). To learn how to create an input manifest file, see [Input manifest files](#).
- Review labeling job input data quotas: [Input Data Quotas](#).

After you have chosen your task type, use the topics on this page to learn how to create a labeling job.

If you are a new Ground Truth user, we recommend that you start by walking through the demo in [Getting started: Create a bounding box labeling job with Ground Truth](#).

### Important

Ground Truth requires all S3 buckets that contain labeling job input image data to have a CORS policy attached. To learn more, see [CORS Requirement for Input Image Data](#).

### Topics

- [Built-in Task Types](#)
- [Create instruction pages](#)
- [Create a Labeling Job \(Console\)](#)
- [Create a Labeling Job \(API\)](#)
- [Create a streaming labeling job](#)
- [Labeling category configuration file with label category and frame attributes reference](#)

## Built-in Task Types

Amazon SageMaker Ground Truth has several built-in task types. Ground Truth provides a worker task template for built-in task types. Additionally, some built in task types support [Automate data labeling](#). The following topics describe each built-in task type and demo the worker task templates that are provided by Ground Truth in the console. To learn how to create a labeling job in the console using one of these task types, select the task type page.

Label Images	Label Text	Label Videos and Video Frames	Label 3D Point Clouds
<ul style="list-style-type: none"> <li>• <a href="#">Classify image objects using a bounding box</a></li> <li>• <a href="#">Create an image classification job (Single Label)</a></li> <li>• <a href="#">Create an image classification job (Multi-label)</a></li> <li>• <a href="#">Identify image contents using semantic segmentation</a></li> <li>• <a href="#">Label verification and adjustment</a></li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Extract text information using named entity recognition</a></li> <li>• <a href="#">Categorize text with text classification (Single Label)</a></li> <li>• <a href="#">Categorize text with text classification (Multi-label)</a></li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Classify videos</a></li> <li>• <a href="#">Identify objects using video frame object detection</a></li> <li>• <a href="#">Track objects in video frames using video frame object tracking</a></li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Classify objects in a 3D point cloud with object detection</a></li> <li>• <a href="#">Understand the 3D point cloud object tracking task type</a></li> <li>• <a href="#">Understand the 3D point cloud semantic segmentation task type</a></li> </ul>

### Note

Each of the video frame and 3D point cloud task types has an *adjustment* task type that you use to verify and adjust labels from a previous labeling job. Select a video frame or 3D point cloud task type page above to learn how to adjust labels created using that task type.

## Create instruction pages

Create custom instructions for labeling jobs to improve your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console or you can create your own. The instructions are shown to the worker on the page where they complete their labeling task.

There are two kinds of instructions:

- *Short instructions*—instructions that are shown on the same webpage where the worker completes their task. These instructions should provide an easy reference to show the worker the correct way to label an object.
- *Full instructions*—instructions that are shown on a dialog box that overlays the page where the worker completes their task. We recommend that you provide detailed instructions for completing the task with multiple examples showing edge cases and other difficult situations for labeling objects.

Create instructions in the console when you are creating your labeling job. Start with the existing instructions for the task and use the editor to modify them to suit your labeling job.

### Note

Once you create your labeling job, it will automatically start and you will not be able to modify your worker instructions. If you need to change your worker instructions, stop the labeling job that you created, clone it, and modify your worker instructions before creating a new job.

You can clone a labeling job in the console by selecting the labeling job and then selecting **Clone** in the **Actions** menu.

To clone a labeling job using the Amazon SageMaker API or your preferred Amazon SageMaker SDK, make a new request to the `CreateLabelingJob` operation with the same specifications as your original job after modifying your worker instructions.

For 3D point cloud and video frame labeling jobs, you can add worker instructions to your label category configuration file. You can use a single string to create instructions or you can add HTML mark up to customize the appearance of your instructions and add images. Make sure that any images you include in your instructions are publicly available, or if your instructions are in Amazon

S3, that your workers have read access so that they can view them. For more information about the label category configuration file, see [the section called “Label category and frame attributes reference”](#).

## Short Instructions

Short instructions appear on the same web page that workers use to label your data object. For example, the following is the editing page for a bounding box task. The short instructions panel is on the left.

### Bounding box labeling tool

Provide labeling instructions with examples below for workers. Workers will be viewing these instructions when they perform your tasks. Make sure the pop-up blocker of the browser is disabled before generating the preview

[Preview](#)

**GOOD EXAMPLE**  
Enter description of a correct bounding box label

Upload image

Add a good example

**BAD EXAMPLE**  
Enter description of an incorrect bounding box label

Upload image

Add a bad example

Enter a brief description of the task

**Label**  
Add a label name

► **Additional instructions - Optional**

Keep in mind that a worker will only spend seconds looking at the short instructions. Workers must be able to scan and understand your information quickly. In all cases it should take less time to understand the instructions than it takes to complete the task. Keep these points in mind:

- Your instructions should be clear and simple.
- Pictures are better than words. Create a simple illustration of your task that your workers can immediately understand.
- If you must use words, use short, concise examples.
- Your short instructions are more important than your full instructions.

The Amazon SageMaker Ground Truth console provides an editor so that you can create your short instructions. Replace the placeholder text and images with instructions for your task. Preview the worker's task page by choosing **Preview**. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

### Full Instructions

You can provide additional instructions for your workers in a dialog box that overlays the page where workers label your data objects. Use full instructions to explain more complex tasks and to show workers the proper way to label edge cases or other difficult objects.

You can create full instructions using an editor in the Ground Truth console. As with quick instructions, keep the following in mind:

- Workers will want detailed instruction the first few times that they complete your task. Any information that they *must* have should be in the quick instructions.
- Pictures are more important than words.
- Text should be concise.
- Full instructions should supplement the short instructions. Don't repeat information that appears in the short instructions.

The Ground Truth console provides an editor so that you can create your full instructions. Replace the placeholder text and images with instructions for your task. Preview the full instruction page by choosing **Preview**. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

### Add example images to your instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions:

- Place the cursor where the image should go in the instructions editor.

- Click the image icon in the editor toolbar.
- Enter the URL of your image.

If your instruction image in Amazon S3 is not publicly accessible:

- As the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.
- This renders the image URL with a short-lived, one-time access code appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview.

## Create a Labeling Job (Console)

You can use the Amazon SageMaker AI console to create a labeling job for all of the Ground Truth built-in task types and custom labeling workflows. For built-in task types, we recommend that you use this page alongside the [page for your task type](#). Each task type page includes specific details on creating a labeling job using that task type.

You need to provide the following to create a labeling job in the SageMaker AI console:

- An input manifest file in Amazon S3. You can place your input dataset in Amazon S3 and automatically generate a manifest file using the Ground Truth console (not supported for 3D point cloud labeling jobs).

Alternatively, you can manually create an input manifest file. To learn how, see [Input data](#).

- An Amazon S3 bucket to store your output data.
- An IAM role with permission to access your resources in Amazon S3 and with a SageMaker AI execution policy attached. For a general solution, you can attach the managed policy, `AmazonSageMakerFullAccess`, to an IAM role and include `sagemaker` in your bucket name.

For more granular policies, see [the section called "IAM Permissions"](#).

3D point cloud task types have additional security considerations. [Learn more](#).

- A work team. You create a work team from a workforce made up of Amazon Mechanical Turk workers, vendors, or your own private workers. To learn more, see [Workforces](#).

You cannot use the Mechanical Turk workforce for 3D point cloud or video frame labeling jobs.

- If you are using a custom labeling workflow, you must save a worker task template in Amazon S3 and provide an Amazon S3 URI for that template. For more information, see [Creating a custom worker task template](#).
- (Optional) An AWS KMS key ARN if you want SageMaker AI to encrypt the output of your labeling job using your own AWS KMS encryption key instead of the default Amazon S3 service key.
- (Optional) Existing labels for the dataset you use for your labeling job. Use this option if you want workers to adjust, or approve and reject labels.
- If you want to create an adjustment or verification labeling job, you must have an output manifest file in Amazon S3 that contains the labels you want adjusted or verified. This option is only supported for bounding box and semantic segmentation image labeling jobs and 3D point cloud and video frame labeling jobs. It is recommended that you use the instructions on [Label verification and adjustment](#) to create a verification or adjustment labeling job.

### Important

Your work team, input manifest file, output bucket, and other resources in Amazon S3 must be in the same AWS Region you use to create your labeling job.

When you create a labeling job using the SageMaker AI console, you add worker instructions and labels to the worker UI that Ground Truth provides. You can preview and interact with the worker UI while creating your labeling job in the console. You can also see a preview of the worker UI on your [built-in task type page](#).

### To create a labeling job (console)

1. Sign in to the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the left navigation pane, choose **Labeling jobs**.
3. On the **Labeling jobs** page, choose **Create labeling job**.
4. For **Job name**, enter a name for your labeling job.
5. (Optional) If you want to identify your labels with a key, select **I want to specify a label attribute name different from the labeling job name**. If you do not select this option, the labeling job name you specified in the previous step will be used to identify your labels in your output manifest file.

6. Choose a data setup to create a connection between your input dataset and Ground Truth.
  - For **Automated data setup**:
    - Follow the instructions in [Automate data setup for labeling jobs](#) for image, text, and video clip labeling jobs.
    - Follow the instructions in [Set up Automated Video Frame Input Data](#) for video frame labeling jobs.
  - For **Manual data setup**:
    - For **Input dataset location**, provide the location in Amazon S3 in which your input manifest file is located. For example, if your input manifest file, manifest.json, is located in **example-bucket**, enter **s3://example-bucket/manifest.json**.
    - For **Output dataset location**, provide the location in Amazon S3 where you want Ground Truth to store the output data from your labeling job.
7. For **IAM Role**, choose an existing IAM role or create an IAM role with permission to access your resources in Amazon S3, to write to the output Amazon S3 bucket specified above, and with a SageMaker AI execution policy attached.
8. (Optional) For **Additional configuration**, you can specify how much of your dataset you want workers to label, and if you want SageMaker AI to encrypt the output data for your labeling job using an AWS KMS encryption key. To encrypt your output data, you must have the required AWS KMS permissions attached to the IAM role you provided in the previous step. For more details, see [the section called "IAM Permissions"](#).
9. In the **Task type** section, under **Task category**, use the dropdown list to select your task category.
10. In **Task selection**, choose your task type.
11. (Optional) Provide tags for your labeling job to make it easier to find in the console later.
12. Choose **Next**.
13. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see [Workforces](#).
14. (Optional) After you've selected your workforce, specify the **Task timeout**. This is the maximum amount of time a worker has to work on a task.

For 3D point cloud annotation tasks, the default task timeout is 3 days. The default timeout for text and image classification and label verification labeling jobs is 5 minutes. The default timeout for all other labeling jobs is 60 minutes.

15. (Optional) For bounding box, semantic segmentation, video frame, and 3D point cloud task types, you can select **Display existing labels** if you want to display labels for your input data set for workers to verify or adjust.

For bounding box and semantic segmentation labeling jobs, this will create an adjustment labeling job.

For 3D point cloud and video frame labeling jobs:

- Select **Adjustment** to create an adjustment labeling job. When you select this option, you can add new labels but you cannot remove or edit existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box **Allow workers to edit this attribute** for that attribute.

Optionally, you can add new label category and frame attributes.

- Select **Verification** to create an adjustment labeling job. When you select this option, you cannot add, modify, or remove existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box **Allow workers to edit this attribute** for that attribute.

We recommend that you can add new label category attributes to the labels that you want workers to verify, or add one or more frame attributes to have workers provide information about the entire frame.

For more information, see [Label verification and adjustment](#).

16. Configure your workers' UI:

- If you are using a [built-in task type](#), specify workers instructions and labels.
  - For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other built-in task types, you must specify at least one label category.
  - (Optional) If you are creating a 3D point cloud or video frame labeling job, you can specify label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes. Label category attributes can be assigned to one or more labels. Frame attributes will appear on each point cloud or video frame workers label. To learn more,

see [Worker user interface \(UI\)](#) for 3D point cloud and [Worker user interface \(UI\)](#) for video frame.

- (Optional) Add **Additional instructions** to help your worker complete your task.
  - If you are creating a custom labeling workflow you must :
    - Enter a [custom template](#) in the code box. Custom templates can be created using a combination of HTML, the Liquid templating language and our pre-built web components. Optionally, you can choose a base-template from the drop-down menu to get started.
    - Specify pre-annotation and post-annotation lambda functions. To learn how to create these functions, see [Processing data in a custom labeling workflow with AWS Lambda](#).
17. (Optional) You can select **See preview** to preview your worker instructions, labels, and interact with the worker UI. Make sure the pop-up blocker of the browser is disabled before generating the preview.
18. Choose **Create**.

After you've successfully created your labeling job, you are redirected to the **Labeling jobs** page. The status of the labeling job you just created is **In progress**. This status progressively updates as workers complete your tasks. When all tasks are successfully completed, the status changes to **Completed**.

If an issue occurs while creating the labeling job, its status changes to **Failed**.

To view more details about the job, choose the labeling job name.

## Next Steps

After your labeling job status changes to **Completed**, you can view your output data in the Amazon S3 bucket that you specified while creating that labeling job. For details about the format of your output data, see [Labeling job output data](#).

## Create a Labeling Job (API)

To create a labeling job using the Amazon SageMaker API, you use the [CreateLabelingJob](#) operation. For specific instructions on creating a labeling job for a built-in task type, see that [task type page](#). To learn how to create a streaming labeling job, which is a labeling job that runs perpetually, see [Create a streaming labeling job](#).

To use the `CreateLabelingJob` operation, you need the following:

- A worker task template (`UiTemplateS3Uri`) or human task UI ARN ([HumanTaskUiArn](#)) in Amazon S3.
  - For 3D point cloud jobs, video object detection and tracking jobs, and NER jobs, use the ARN listed in `HumanTaskUiArn` for your task type.
  - If you are using a built-in task type other than 3D point cloud tasks, you can add your worker instructions to one of the pre-built templates and save the template (using a `.html` or `.liquid` extension) in your S3 bucket. Find the pre-build templates on your [task type page](#).
  - If you are using a custom labeling workflow, you can create a custom template and save the template in your S3 bucket. To learn how to build a custom worker template, see [Creating a custom worker task template](#). For custom HTML elements that you can use to customize your template, see [Crowd HTML Elements Reference](#). For a repository of demo templates for a variety of labeling tasks, see [Amazon SageMaker Ground Truth Sample Task UIs](#).
- An input manifest file that specifies your input data in Amazon S3. Specify the location of your input manifest file in `ManifestS3Uri`. For information about creating an input manifest, see [Input data](#). If you create a streaming labeling job, this is optional. To learn how to create a streaming labeling job, see [Create a streaming labeling job](#).
- An Amazon S3 bucket to store your output data. You specify this bucket, and optionally, a prefix in `S3OutputPath`.
- A label category configuration file. Each label category name must be unique. Specify the location of this file in Amazon S3 using the `LabelCategoryConfigS3Uri` parameter. The format and label categories for this file depend on the task type you use:
  - For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other task types, the minimum number of label categories required is one.
  - For named entity recognition tasks, you must provide worker instructions in this file. See [Provide Worker Instructions in a Label Category Configuration File](#) for details and an example.
  - For 3D point cloud and video frame task type, use the format in [Labeling category configuration file with label category and frame attributes reference](#).
  - For all other built-in task types and custom tasks, your label category configuration file must be a JSON file in the following format. Identify the labels you want to use by replacing `label_1`, `label_2`, . . . , `label_n` with your label categories.

```
{  
  "document-version": "2018-11-28",  
  "labels": [  
    "label_1",  
    "label_2",  
    . . . ,  
    "label_n"  
  ]  
}
```

```

    {"label": "label_1"},
    {"label": "label_2"},
    ...
    {"label": "label_n"}
  ]
}

```

- An AWS Identity and Access Management (IAM) role with the [AmazonSageMakerGroundTruthExecution](#) managed IAM policy attached and with permissions to access your S3 buckets. Specify this role in `RoleArn`. To learn more about this policy, see [Use IAM Managed Policies with Ground Truth](#). If you require more granular permissions, see [the section called "IAM Permissions"](#).

If your input or output bucket name does not contain `sagemaker`, you can attach a policy similar to the following to the role that is passed to the `CreateLabelingJob` operation.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_input_bucket/*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_output_bucket/*"
      ]
    }
  ]
}

```

- A pre-annotation and post-annotation (or annotation-consolidation) AWS Lambda function Amazon Resource Name (ARN) to process your input and output data.

- Lambda functions are predefined in each AWS Region for built-in task types. To find the pre-annotation Lambda ARN for your Region, see [PreHumanTaskLambdaArn](#). To find the annotation-consolidation Lambda ARN for your Region, see [AnnotationConsolidationLambdaArn](#).
- For custom labeling workflows, you must provide a custom pre- and post-annotation Lambda ARN. To learn how to create these Lambda functions, see [Processing data in a custom labeling workflow with AWS Lambda](#).
- A work team ARN that you specify in `WorkteamArn`. You receive a work team ARN when you subscribe to a vendor workforce or create a private workteam. If you are creating a labeling job for a video frame or point cloud task type, you cannot use the Amazon Mechanical Turk workforce. For all other task types, to use the Mechanical Turk workforce, use the following ARN. Replace *region* with the AWS Region you are using to create the labeling job.

```
arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default
```

If you use the [Amazon Mechanical Turk workforce](#), use the `ContentClassifiers` parameter in `DataAttributes` of `InputConfig` to declare that your content is free of personally identifiable information and adult content.

Ground Truth *requires* that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that your input data is free of PII using the `FreeOfPersonallyIdentifiableInformation` flag, your labeling job will fail. Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker AI may restrict the Amazon Mechanical Turk workers that can view your task if it contains adult content.

To learn more about work teams and workforces, see [Workforces](#).

- If you use the Mechanical Turk workforce, you must specify the price you'll pay workers for performing a single task in **`PublicWorkforceTaskPrice`**.
- To configure the task, you must provide a task description and title using `TaskDescription` and **`TaskTitle`** respectively. Optionally, you can provide time limits that control how long the workers have to work on an individual task (**`TaskTimeLimitInSeconds`**) and how long tasks remain in the worker portal, available to workers (`TaskAvailabilityLifetimeInSeconds`).
- (Optional) For [some task types](#), you can have multiple workers label a single data object by inputting a number greater than one for the `NumberOfHumanWorkersPerDataObject` parameter. For more information about annotation consolidation, see [Annotation consolidation](#).

- (Optional) To create an automated data labeling job, specify one of the ARNs listed in [LabelingJobAlgorithmSpecificationArn](#) in `LabelingJobAlgorithmsConfig`. This ARN identifies the algorithm used in the automated data labeling job. The task type associated with this ARN must match the task type of the `PreHumanTaskLambdaArn` and `AnnotationConsolidationLambdaArn` you specify. Automated data labeling is supported for the following task types: image classification, bounding box, semantic segmentation, and text classification. The minimum number of objects allowed for automated data labeling is 1,250, and we strongly suggest providing a minimum of 5,000 objects. To learn more about automated data labeling jobs, see [Automate data labeling](#).
- (Optional) You can provide [StoppingConditions](#) that cause the labeling job to stop if one the conditions is met. You can use stopping conditions to control the cost of the labeling job.

## Examples

The following code examples demonstrate how to create a labeling job using `CreateLabelingJob`. For additional examples, we recommend you use one of the **Ground Truth Labeling Jobs** Jupyter notebooks in the SageMaker Examples section of a SageMaker notebook instance. To learn how to use a notebook example from the SageMaker AI Examples, see [Access example notebooks](#). You can also see these example notebooks on GitHub in the [SageMaker AI Examples repository](#).

### AWS SDK for Python (Boto3)

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create a labeling job for a built-in task type in the US East (N. Virginia) Region using a private workforce. Replace all *red-italized text* with your labeling job resources and specifications.

```
response = client.create_labeling_job(
    LabelingJobName="example-labeling-job",
    LabelAttributeName="label",
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': "s3://bucket/path/manifest-with-input-data.json"
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                "FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent",
```

```

    ]
  }
},
OutputConfig={
  'S3OutputPath': "s3://bucket/path/file-to-store-output-data",
  'KmsKeyId': "string"
},
RoleArn="arn:aws:iam::*:role/*",

## AWS CLI

The following is an example of an AWS CLI request to create a labeling job for a built-in task type in the US East (N. Virginia) Region using the [Amazon Mechanical Turk workforce](#). For more information, see [start-human-loop](#) in the [AWS CLI Command Reference](#). Replace all *red-italized text* with your labeling job resources and specifications.

```
$ aws --region us-east-1 sagemaker create-labeling-job \
--labeling-job-name "example-labeling-job" \
--label-attribute-name "label" \
--role-arn "arn:aws:iam::account-id:role/role-name" \
--input-config '{
    "DataAttributes": {
        "ContentClassifiers": [
            "FreeOfPersonallyIdentifiableInformation",
            "FreeOfAdultContent"
        ]
    },
    "DataSource": {
        "S3DataSource": {
            "ManifestS3Uri": "s3://bucket/path/manifest-with-input-data.json"
        }
    }
}' \
--output-config '{
    "KmsKeyId": "",
    "S3OutputPath": "s3://bucket/path/file-to-store-output-data"
}' \
--human-task-config '{
    "AnnotationConsolidationConfig": {
        "AnnotationConsolidationLambdaArn": "arn:aws:lambda:us-
east-1:432418664414:function:ACS-"
    },
    "TaskAvailabilityLifetimeInSeconds": 21600,
    "TaskTimeLimitInSeconds": 3600,
    "NumberOfHumanWorkersPerDataObject": 1,
    "PreHumanTaskLambdaArn": "arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype",
    "WorkteamArn": "arn:aws:sagemaker:us-east-1:394669845002:workteam/public-
crowd/default",
    "PublicWorkforceTaskPrice": {
        "AmountInUsd": {
            "Dollars": 0,
```

```
        "TenthFractionsOfACent": 6,  
        "Cents": 3  
    }  
},  
"TaskDescription": "Select all labels that apply to the images shown",  
"MaxConcurrentTaskCount": 1000,  
"TaskTitle": "Multi-label image classification task",,  
"TaskKeywords": [  
    "Images",  
    "Classification",  
    "Multi-label"  
],  
"UiConfig": {  
    "UiTemplateS3Uri": "s3://bucket/path/custom-worker-task-template.html"  
}  
}'
```

For more information about this operation, see [CreateLabelingJob](#). For information about how to use other language-specific SDKs, see [See Also](#) in the `CreateLabelingJobs` topic.

## Create a streaming labeling job

Streaming labeling jobs enable you to send individual data objects in real time to a perpetually running, streaming labeling job. To create a streaming labeling job, you can specify the Amazon SNS *input topic* ARN, `SnsTopicArn`, in the `InputConfig` parameter when making a [CreateLabelingJob](#) request. Optionally, you can also create an Amazon SNS *output topic* and specify it in `OutputConfig` if you want to receive label data in real time.

### Important

If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review [Ground Truth streaming labeling jobs](#) before creating a streaming labeling job. Ground Truth streaming labeling jobs are only supported through the SageMaker API.

Use the following sections to create the resources that you need and can use to create a streaming labeling job:

- Learn how to create SNS topics with the permissions required for Ground Truth streaming labeling jobs by following the steps in [Use Amazon SNS Topics for Data Labeling](#). Your SNS topics must be created in the same AWS Region as your labeling job.
- See [Subscribe an Endpoint to Your Amazon SNS Output Topic](#) to learn how to set up an endpoint to receive labeling task output data at a specified endpoint each time a labeling task is completed.
- To learn how to configure your Amazon S3 bucket to send notifications to your Amazon SNS input topic, see [Creating Amazon S3 based bucket event notifications based of the Amazon SNS defined in your labeling job](#).
- Optionally, add data objects that you want to have labeled as soon as the labeling job starts to your input manifest. For more information, see [Create a Manifest File \(Optional\)](#).
- There are other resources required to create a labeling job, such as an IAM role, Amazon S3 bucket, a worker task template and label categories. These are described in the Ground Truth documentation on creating a labeling job. For more information, see [Create a Labeling Job](#).

### Important

When you create a labeling job you must provide an IAM execution role. Attach the AWS managed policy **AmazonSageMakerGroundTruthExecution** to this role to ensure it has required permissions to execute your labeling job.

When you submit a request to create a streaming labeling job, the state of your labeling job is `Initializing`. Once the labeling job is active, the state changes to `InProgress`. Do not send new data objects to your labeling job or attempt to stop your labeling job while it is in the `Initializing` state. Once the state changes to `InProgress`, you can start sending new data objects using Amazon SNS and the Amazon S3 configuration.

## Topics

- [Use Amazon SNS Topics for Data Labeling](#)
- [Creating Amazon S3 based bucket event notifications based of the Amazon SNS defined in your labeling job](#)
- [Create a Manifest File \(Optional\)](#)
- [Create a Streaming Labeling Job with the SageMaker API](#)
- [Stop a Streaming Labeling Job](#)

## Use Amazon SNS Topics for Data Labeling

You need to create an Amazon SNS input to create a streaming labeling job. Optionally, you may provide an Amazon SNS output topic.

When you create an Amazon SNS topic to use in your streaming labeling job, note down the topic Amazon Resource Name (ARN). The ARN will be the input values for the parameter `SnsTopicArn` in `InputConfig` and `OutputConfig` when you create a labeling job.

### Create an Input Topic

Your input topic is used to send new data objects to Ground Truth. To create an input topic, follow the instructions in [Creating an Amazon SNS topic](#) in the Amazon Simple Notification Service Developer Guide.

Note down your input topic ARN and use it as input for the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`.

### Create an Output Topic

If you provide an output topic, it is used to send notifications when a data object is labeled. When you create a topic, you have the option to add an encryption key. Use this option to add a AWS Key Management Service customer managed key to your topic to encrypt the output data of your labeling job before it is published to your output topic.

To create an output topic, follow the instructions in [Creating an Amazon SNS topic](#) in the Amazon Simple Notification Service Developer Guide.

If you add encryption, you must attach additional permission to the topic. See [Add Encryption to Your Output Topic \(Optional\)](#) for more information.

#### Important

To add a customer managed key to your output topic while creating a topic in the console, do not use the **(Default) alias/aws/sns** option. Select a customer managed key that you created.

Note down your input topic ARN and use it in your `CreateLabelingJob` request in the parameter `SnsTopicArn` in `OutputConfig`.

## Add Encryption to Your Output Topic (Optional)

To encrypt messages published to your output topic, you need to provide an AWS KMS customer managed key to your topic. Modify the following policy and add it to your customer managed key to give Ground Truth permission to encrypt output data before publishing it to your output topic.

Replace `<account_id>` with the ID of the account that you are using to create your topic. To learn how to find your AWS account ID, see [Finding Your AWS Account ID](#).

```
{
  "Id": "key-console-policy",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Enable IAM User Permissions",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam:::root"
      },
      "Action": "kms:*",
      "Resource": "*"
    },
    {
      "Sid": "Allow access for Key Administrators",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam:::role/Admin"
      },
      "Action": [
        "kms:Create*",
        "kms:Describe*",
        "kms:Enable*",
        "kms:List*",
        "kms:Put*",
        "kms:Update*",
        "kms:Revoke*",
        "kms:Disable*",
        "kms:Get*",
        "kms>Delete*",
        "kms:TagResource",
        "kms:UntagResource",
        "kms:ScheduleKeyDeletion",
        "kms:CancelKeyDeletion"
      ]
    }
  ]
}
```

```

    ],
    "Resource": "*"
  }
]
}

```

Additionally, you must modify and add the following policy to the execution role that you use to create your labeling job (the input value for RoleArn).

Replace `<account_id>` with the ID of the account that you are using to create your topic. Replace `<region>` with the AWS Region you are using to create your labeling job. Replace `<key_id>` with your customer managed key ID.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "sid1",
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:<region>:<account_id>:key/<key_id>"
    }
  ]
}

```

For more information on creating and securing keys, see [Creating Keys](#) and [Using Key Policies](#) in the AWS Key Management Service Developer Guide.

## Subscribe an Endpoint to Your Amazon SNS Output Topic

When a worker completes a labeling job task from a Ground Truth streaming labeling job, Ground Truth uses your output topic to publish output data to one or more endpoints that you specify. To receive notifications when a worker finishes a labeling task, you must subscribe an endpoint to your Amazon SNS output topic.

To learn how to add endpoints to your output topic, see [Subscribing to an Amazon SNS topic](#) in the *Amazon Simple Notification Service Developer Guide*.

To learn more about the output data format that is published to these endpoints, see [Labeling job output data](#).

**⚠ Important**

If you do not subscribe an endpoint to your Amazon SNS output topic, you will not receive notifications when new data objects are labeled.

## Creating Amazon S3 based bucket event notifications based of the Amazon SNS defined in your labeling job

Changes to your Amazon S3 bucket, event notifications, are enabled either the Amazon S3 console, API, language specific AWS SDKs, or the AWS Command Line Interface. Events must use the same Amazon SNS input topic ARN, `SnsTopicArn`, specified in the `InputConfig` parameter as part of your `CreateLabelingJob` request.

**⚠ Amazon S3 bucket notifications and your input data should not be the same Amazon S3 bucket**

When you create event notifications do not use the same Amazon S3 location that you specified as your `S3OutputPath` in the `OutputConfig` parameters. Linking the two buckets may result in unwanted data objects being processed by Ground Truth for labeling.

You control the types of events that you want to send to your Amazon SNS topic. Ground Truth creates a labeling job when you send [object creation events](#).

The event structure sent to your Amazon SNS input topic must be a JSON message formatted using the same structure found in [Event message structure](#).

To see examples of how you can set up an event notification for your Amazon S3 bucket using the Amazon S3 console, AWS SDK for .NET, and AWS SDK for Java, follow this walkthrough, [Walkthrough: Configure a bucket for notifications \(SNS topic or SQS queue\)](#) in the *Amazon Simple Storage Service User Guide*.

Amazon EventBridge notifications are not natively supported. To use EventBridge based notification you must update the output format to match the JSON format used in the [Event message structure](#).

## Create a Manifest File (Optional)

When you create a streaming labeling job, you have the one time option to add objects (such as images or text) to an input manifest file that you specify in `ManifestS3Uri` of `CreateLabelingJob`. When the streaming labeling job starts, these objects are sent to workers or added to the Amazon SQS queue if the total number of objects exceed `MaxConcurrentTaskCount`. The results are added to the Amazon S3 path that you specify when creating the labeling job periodically as workers complete labeling tasks. Output data is sent to any endpoint that you subscribe to your output topic.

If you want to provide initial objects to be labeled, create a manifest file that identifies these objects and place it in Amazon S3. Specify the S3 URI of this manifest file in `ManifestS3Uri` within `InputConfig`.

To learn how to format your manifest file, see [Input data](#). To use the SageMaker AI console to automatically generate a manifest file (not supported for 3D point cloud task types), see [Automate data setup for labeling jobs](#).

## Create a Streaming Labeling Job with the SageMaker API

The following is an example of an [AWS Python SDK \(Boto3\) request](#) that you can use to start a streaming labeling job for a built-in task type in the US East (N. Virginia) Region. For more details about each parameter below see [CreateLabelingJob](#). To learn how you can create a labeling job using this API and associated language specific SDKs, see [Create a Labeling Job \(API\)](#).

In this example, note the following parameters:

- `SnsDataSource` – This parameter appears in `InputConfig` and `OutputConfig` and is used to identify your input and output Amazon SNS topics respectively. To create a streaming labeling job, you are required to provide an Amazon SNS input topic. Optionally, you can also provide an Amazon SNS output topic.
- `S3DataSource` – This parameter is optional. Use this parameter if you want to include an input manifest file of data objects that you want labeled as soon as the labeling job starts.
- [StoppingConditions](#) – This parameter is ignored when you create a streaming labeling job. To learn more about stopping a streaming labeling job, see [Stop a Streaming Labeling Job](#).
- Streaming labeling jobs do not support automated data labeling. Do not include the `LabelingJobAlgorithmsConfig` parameter.

```

response = client.create_labeling_job(
    LabelingJobName= 'example-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            },
            'SnsDataSource': {
                'SnsTopicArn': 'arn:aws:sns:us-east-1:123456789012:your-sns-input-
topic'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string',
        'SnsTopicArn': 'arn:aws:sns:us-east-1:123456789012:your-sns-output-topic'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/custom-worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype',
        'TaskKeywords': [
            'Example key word',
        ],
        'TaskTitle': 'Multi-label image classification task',
        'TaskDescription': 'Select all labels that apply to the images shown',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {

```

```
        'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-  
east-1:432418664414:function:ACS-tasktype'  
    }  
},  
Tags=[  
    {  
        'Key': 'string',  
        'Value': 'string'  
    },  
]  
)
```

## Stop a Streaming Labeling Job

You can manually stop your streaming labeling job using the operation [StopLabelingJob](#).

If your labeling job remains idle for over 10 days, it is automatically stopped by Ground Truth. In this context, a labeling job is considered *idle* if no objects are sent to the Amazon SNS input topic and no objects remain in your Amazon SQS queue, waiting to be labeled. For example, if no data objects are fed to the Amazon SNS input topic and all the objects fed to the labeling job are already labeled, Ground Truth starts a timer. After the timer starts, if no items are received within a 10 day period, the labeling job is stopped.

When a labeling job is stopped, its status is STOPPING while Ground Truth cleans up labeling job resources and unsubscribes your Amazon SNS topic from your Amazon SQS queue. The Amazon SQS is *not* deleted by Ground Truth because this queue may contain unprocessed data objects. You should manually delete the queue if you want to avoid incurring additional charges from Amazon SQS. To learn more, see [Amazon SQS pricing](#).

## Labeling category configuration file with label category and frame attributes reference

When you create a 3D point cloud or video frame labeling job using the Amazon SageMaker API operation `CreateLabelingJob`, you use a label category configuration file to specify your labels and worker instructions. Optionally, you can also provide the following in your label category attribute file:

- You can provide *label category attributes* for video frame and 3D point cloud object tracking and object detection task types. Workers can use one or more attributes to give more information about an object. For example, you may want to use the attribute *occluded* to have workers

identify when an object is partially obstructed. You can either specify a label category attribute for a single label using the `categoryAttributes` parameter, or for all labels using the `categoryGlobalAttributes` parameter.

- You can provide *frame attributes* for video frame and 3D point cloud object tracking and object detection task types using `frameAttributes`. When you create a frame attribute, it appears on each frame or point cloud in the worker task. In video frame labeling jobs, these are attributes that workers assign to an entire video frame. For 3D point cloud labeling jobs, these attributes are applied to a single point cloud. Use frame attributes to have workers provide more information about the scene in a specific frame or point cloud.
- For video frame labeling jobs, you use the label category configuration file to specify the task type (bounding box, polyline, polygon, or keypoint) sent to workers.

For workers, specifying values for label category attributes and frame attributes will be optional.

### Important

You should only provide a label attribute name in `auditLabelAttributeName` if you are running an audit job to verify or adjust labels. Use this parameter to input the [LabelAttributeName](#) used in the labeling job that generated the annotations you want your worker to adjust. When you create a labeling job in the console, if you did not specify a label attribute name, the **Name** of your job is used as the `LabelAttributeName`.

The following topics show examples of a label category configuration file for different kinds of labeling jobs. They also explain the schema and quotas of a category configuration file.

### Topics

- [Examples: label category configuration files for 3D point cloud labeling jobs](#)
- [Examples: label category configuration files for video frame labeling jobs](#)
- [Label category configuration file schema](#)
- [Label and label category attribute quotas](#)

### Examples: label category configuration files for 3D point cloud labeling jobs

The following topics show examples of 3D point cloud label category configuration files for object detection, object tracking, semantic segmentation, adjustment, and verification labeling jobs.

## Topics

- [Example: 3D point cloud object tracking and object detection](#)
- [Example: 3D point cloud semantic segmentation](#)
- [Example: 3D point cloud adjustment](#)
- [Example: 3D point cloud verification](#)

## Example: 3D point cloud object tracking and object detection

The following is an example of a label category configuration file that includes label category attributes for a 3D point cloud object detection or object tracking labeling job. This example includes a two frame attributes, which will be added to all point clouds submitted to the labeling job. The Car label will include four label category attributes—X, Y, Z, and the global attribute, W.

```
{
  "documentVersion": "2020-03-01",
  "frameAttributes": [
    {
      "name": "count players",
      "description": "How many players to you see in the scene?",
      "type": "number"
    },
    {
      "name": "select one",
      "description": "describe the scene",
      "type": "string",
      "enum": ["clear", "blurry"],
      "isRequired": true
    }
  ],
  "categoryGlobalAttributes": [
    {
      "name": "W",
      "description": "label-attributes-for-all-labels",
      "type": "string",
      "enum": ["foo", "buzz", "biz"]
    }
  ],
  "labels": [
    {
      "label": "Car",
      "categoryAttributes": [
```

```

    {
      "name": "X",
      "description": "enter a number",
      "type": "number",
    },
    {
      "name": "Y",
      "description": "select an option",
      "type": "string",
      "enum": ["y1", "y2"]
    },
    {
      "name": "Z",
      "description": "submit a free-form response",
      "type": "string",
    }
  ]
},
{
  "label": "Pedestrian",
  "categoryAttributes": [...]
}
],
"instructions": {"shortInstruction": "Draw a tight Cuboid", "fullInstruction": "<html
markup>"}
}

```

### Example: 3D point cloud semantic segmentation

The following is an example of a label category configuration file for a 3D point cloud semantic segmentation labeling job.

Label category attributes are not supported for 3D point cloud semantic segmentation task types. Frame attributes are supported. If you provide label category attributes for a semantic segmentation labeling job, they will be ignored.

```

{
  "documentVersion": "2020-03-01",
  "frameAttributes": [
    {
      "name": "count players",
      "description": "How many players to you see in the scene?",
      "type": "number"
    }
  ]
}

```

```
    },
    {
      "name": "select one",
      "description": "describe the scene",
      "type": "string",
      "enum": ["clear", "blurry"]
    },
  ],
  "labels": [
    {
      "label": "Car",
    },
    {
      "label": "Pedestrian",
    },
    {
      "label": "Cyclist",
    }
  ],
  "instructions": {"shortInstruction": "Select the appropriate label and paint all objects in the point cloud that it applies to the same color",
  "fullInstruction": "<html markup>"}
}
```

### Example: 3D point cloud adjustment

The following is an example of a label category configuration file for a 3D point cloud object detection or object tracking adjustment labeling job. For 3D point cloud semantic segmentation adjustment labeling jobs, `categoryGlobalAttributes` and `categoryAttributes` are not supported.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the adjustment labeling job. Optionally, you can use the `editsAllowed` parameter to specify whether or not a label or frame attribute can be edited.

```
{
  "documentVersion": "2020-03-01",
  "frameAttributes": [
    {
      "name": "count players",
      "description": "How many players to you see in the scene?",
      "type": "number"
    },
  ],
}
```

```
{
  "name": "select one",
  "editsAllowed": "none",
  "description": "describe the scene",
  "type": "string",
  "enum": ["clear", "blurry"]
},
],
"categoryGlobalAttributes": [
  {
    "name": "W",
    "editsAllowed": "any",
    "description": "label-attributes-for-all-labels",
    "type": "string",
    "enum": ["foo", "buzz", "biz"]
  }
],
"labels": [
  {
    "label": "Car",
    "editsAllowed": "any",
    "categoryAttributes": [
      {
        "name": "X",
        "description": "enter a number",
        "type": "number"
      },
      {
        "name": "Y",
        "description": "select an option",
        "type": "string",
        "enum": ["y1", "y2"],
        "editsAllowed": "any"
      },
      {
        "name": "Z",
        "description": "submit a free-form response",
        "type": "string",
        "editsAllowed": "none"
      }
    ]
  },
  {
    "label": "Pedestrian",
```

```

        "categoryAttributes": [...]
    }
],
"instructions": {"shortInstruction": "Draw a tight Cuboid", "fullInstruction": "<html
markup>"},
// include auditLabelAttributeName for label adjustment jobs
"auditLabelAttributeName": "myPrevJobLabelAttributeName"
}

```

### Example: 3D point cloud verification

The following is an example of a label category configuration file you may use for a 3D point cloud object detection or object tracking verification labeling job. For a 3D point cloud semantic segmentation verification labeling job, `categoryGlobalAttributes` and `categoryAttributes` are not supported.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Additionally, you must use the `editsAllowed` parameter to specify that no labels can be edited.

```

## Examples: label category configuration files for video frame labeling jobs

The annotation tools available to your worker and task type used depends on the value you specify for `annotationType`. For example, if you want workers to use key points to track changes in the pose of specific objects across multiple frames, you would specify `Keypoint` for the `annotationType`. If you do not specify an annotation type, `BoundingBox` will be used by default.

The following topics show examples of video frame category configuration files.

### Topics

- [Example: video frame keypoint](#)
- [Example: video frame adjustment](#)
- [Example: video frame verification](#)

### Example: video frame keypoint

The following is an example of a video frame keypoint label category configuration file with label category attributes. This example includes two frame attributes, which will be added to all frames submitted to the labeling job. The Car label will include four label category attributes—X, Y, Z, and the global attribute, W.

```

      "type": "number"
    },
    {
      "name": "select one",
      "description": "describe the scene",
      "type": "string",
      "enum": ["clear", "blurry"]
    }
  ],
  "categoryGlobalAttributes": [
    {
      "name": "W",
      "editsAllowed": "any",
      "description": "label-attributes-for-all-labels",
      "type": "string",
      "enum": ["foo", "buz", "buz2"]
    }
  ],
  "labels": [
    {
      "label": "Car",
      "editsAllowed": "any",
      "categoryAttributes": [
        {
          "name": "X",
          "description": "enter a number",
          "type": "number",
          "editsAllowed": "any"
        },
        {
          "name": "Y",
          "description": "select an option",
          "type": "string",

```

```

        "enum": ["y1", "y2"],
        "editsAllowed": "any"
    },
    {
        "name": "Z",
        "description": "submit a free-form response",
        "type": "string",
        "editsAllowed": "none"
    }
]
},
{
    "label": "Pedestrian",
    "editsAllowed": "none",
    "categoryAttributes": [...]
}
],

}

```

## Label category configuration file schema

The following table lists elements you can and must include in your label category configuration file.

### Note

The parameter `annotationType` is only supported for video frame labeling jobs.

Parameter	Required	Accepted Values	Description
<code>frameAttributes</code>	No	<p>A list of JSON objects.</p> <p><b>Required Parameters in each JSON Object:</b></p> <p><code>name</code>, <code>type</code>, <code>description</code></p> <p><code>minimum</code> and <code>maximum</code> are required if <code>type</code> is "number"</p> <p><b>Optional Parameters in each JSON Object:</b></p> <p><code>enum</code>, <code>editsAllowed</code> , <code>isRequired</code></p>	<p>Use this parameter to create a frame attribute that is applied to all frames or 3D point clouds in your labeling job. See the third table in this section for more information.</p>
<code>categoryGlobalAttributes</code>	No	<p>A list of JSON objects.</p>	<p>Use this parameter to create label category attributes that</p>

Parameter	Required	Accepted Values	Description
		<p><b>Required Parameters in each JSON Object:</b></p> <p>name, type</p> <p>minimum and maximum are required if type is "number"</p> <p><b>Optional Parameters in each JSON Object:</b></p> <p>description , enum, editsAllowed , isRequired</p>	<p>are applied to all labels you specify in labels.</p> <p>See the third table in this section for more information.</p>

Parameter	Required	Accepted Values	Description
labels	Yes	<p>A list of up to 30 JSON objects</p> <p><b>Required Parameters in each JSON Object:</b></p> <p>label</p> <p><b>Optional Parameters in each JSON Object:</b></p> <p>categoryAttributes ,            editsAllowed</p>	<p>Use this parameter to specify your labels, or classes. Add one label for each class.</p> <p>To add a label category attribute to a label, add categoryAttributes to that label.</p> <p>Use editsAllowed to specify whether or not a label can be edited in an adjustment labeling job. Set editsAllowed to "none" for verification labeling jobs.</p> <p>See the following table for more information.</p>

Parameter	Required	Accepted Values	Description
annotationType (only supported for video frame labeling jobs)	No	String  <b>Accepted Parameters:</b>  BoundingBox , Polyline, Polygon, Keypoint  <b>Default:</b>  BoundingBox	Use this to specify the task type for your video frame labeling jobs. For example, for a polygon video frame object detection task, choose Polygon.  If you do not specify an annotationType when you create a video frame labeling job, Ground Truth will use BoundingBox by default.

Parameter	Required	Accepted Values	Description
instructions	No	A JSON object <b>Required Parameters in each JSON Object:</b>  "shortInstruction" , "fullInstruction"	<p>Use this parameter to add worker instructions to help your workers complete their tasks. For more information about worker instructions, see <a href="#">Worker instructions</a>.</p> <p>Short instructions must be under 255 characters and long instruction must be under 2,048 characters.</p> <p>For more information, see <a href="#">Create instruction pages</a>.</p>

Parameter	Required	Accepted Values	Description
auditLabelAttributeName	Required for adjustment and verification task types	String	<p>Enter the <a href="#">LabelAttributeName</a> used in the labeling job you want to adjust annotations of.</p> <p>Only use this parameter if you are creating an adjustment job for video frame and 3D point cloud object detection, object tracking, or 3D point cloud semantic segmentation.</p>

## Labels object schema

The following table describes the parameters that you can and must use to create a list of Labels. Each parameter should be included in a JSON object.

Parameter	Required	Accepted Values	Description
label	Yes	String	The name of the label category that is displayed to workers. Each label category name must be unique.
categoryAttributes	No	A list of JSON objects.	Use this parameter to add label category attributes to specific

Parameter	Required	Accepted Values	Description
		<p><b>Required Parameters in each JSON Object:</b></p> <p>name, type</p> <p>minimum and maximum required if type is "number"</p> <p><b>Optional Parameters in each JSON Object:</b></p> <p>description , enum, editsAllowed , isRequired</p>	<p>labels you specify in labels.</p> <p>To add one or more label category attributes to a label, include the categoryAttributes JSON object in the same labels JSON object as that label. See the following table for more information.</p>

Parameter	Required	Accepted Values	Description
<code>editsAllowed</code>	No	String  <b>Supported Values:</b>  "none": no modifications are not allowed.  or  "any" (Default): all modifications are allowed.	Specifies whether or not a label can be edited by workers.  For video frame or 3D point cloud <i>adjustment</i> labeling jobs, add this parameter to one or more JSON objects in the <code>labels</code> list to specify whether or not a worker can edit a label.  For 3D point cloud and video frame <i>verification</i> labeling jobs, add this parameter with the value "none" to each JSON object in the <code>labels</code> list. This will make all labels uneditable.

### **`frameAttributes` and `categoryGlobalAttributes` schema**

The following table describes the parameters that you can and must use to create a frame attributes using `frameAttributes` and label category attribute using the `categoryGlobalAttributes` and `categoryAttributes` parameters.

Parameter	Required	Accepted Values	Description
name	Yes	String	<p>Use this parameter to assign a name to your label category or frame attribute. This is the attribute name that workers see.</p> <p>Each label category attribute name in your label category configuration file must be unique. Global label category attributes and label specific label category attributes cannot have the same name.</p>
type	Yes	String <b>Required Values:</b> "string" or "number"	<p>Use this parameter to define the label category or frame attribute type.</p> <p>If you specify "string" for type and provide an enum value for this attribute, workers will be able to choose from one of the choices you provide.</p>

Parameter	Required	Accepted Values	Description
			<p>If you specify "string" for type and do not provide an enum value, workers can enter free form text.</p> <p>If you specify number for type, worker can enter a number between the minimum and maximum numbers you specify.</p>
enum	No	List of strings	<p>Use this parameter to define options that workers can choose from for this label category or frame attribute. Workers can choose one value specified in enum.</p> <p>For example, if you specify ["foo", "buzz", "bar"] for enum, workers can choose one of foo, buzz, or bar.</p> <p>You must specify "string" for type to use an enum list.</p>

Parameter	Required	Accepted Values	Description
description	frameAttributes : Yes  categoryA ttributes or categoryG lobaAttributes : No	String	<p>Use this parameter to add a description of the label category or frame attribute. You can use this field to give workers more information about the attribute.</p> <p>This field is only required for frame attributes.</p>
minimum and maximum	Required if attribute type is "number"	Integers	<p>Use these parameters to specify minimum and maximum (inclusive) values workers can enter for numeric label category or frame attributes.</p> <p>You must specify "number" for type to use minimum and maximum.</p>

Parameter	Required	Accepted Values	Description
<code>editsAllowed</code>	No	String  <b>Required Values:</b>  "none": no modifications are not allowed.  or  "any" (Default): all modifications are allowed.	Specifies whether or not a label category or frame attribute can be edited by workers.  For video frame or 3D point cloud <i>adjustment</i> and <i>verification</i> labeling jobs, add this parameter to label category and frame attribute JSON objects to specify whether or not a worker can edit an attribute.
<code>isRequired</code>	No	Boolean	Specifies whether workers are required to annotate an attribute. Workers cannot submit the job until all required attributes are annotated.

### Label and label category attribute quotas

You can specify up to 10 label category attributes per class. This 10-attribute quotas includes global label category attributes. For example, if you create four global label category attributes, and then assign three label category attributes to label X, that label will have  $4+3=7$  label category attributes in total. For all label category and label category attribute limits, refer to the following table.

Type	Min	Max
Labels (Labels)	1	30
Label name character quota	1	16
Label category attributes per label (sum of categoryAttributes and categoryGlobalAttributes )	0	10
Free form text entry label category attributes per label (sum of categoryAttributes and categoryGlobalAttributes ).	0	5
Frame attributes	0	10
Free form text entry attributes in frameAttributes .	0	5
Attribute name character quota (name)	1	16
Attribute description character quota (description )	0	128
Attribute type characters quota (type)	1	16
Allowed values in the enum list for a string attribute	1	10
Character quota for a value in enum list	1	16

Type	Min	Max
Maximum characters in free form text response for free form text frameAttributes	0	1000
Maximum characters in free form text response for free form text categoryAttributes and categoryGlobalAttributes	0	80

## Use input and output data

The input data that you provide to Amazon SageMaker Ground Truth is sent to your workers for labeling. You choose the data to send to your workers by creating a single manifest file that defines all of the data that requires labeling or by sending input data objects to an ongoing, streaming labeling job to be labeled in real time.

The output data is the result of your labeling job. The output data file, or *augmented manifest file*, contains label data for each object you send to the labeling job and metadata about the label assigned to data objects.

When you use image classification (single and multi-label), text classification (single and multi-label), object detection, and semantic segmentation built in task types to create a labeling job, you can use the resulting augmented manifest file to launch a SageMaker training job. For a demonstration of how to use an augmented manifest to train an object detection machine learning model with Amazon SageMaker AI, see [object\\_detection\\_augmented\\_manifest\\_training.ipynb](#). For more information, see [Augmented Manifest Files for Training Jobs](#).

### Topics

- [Input data](#)
- [3D Point Cloud Input Data](#)
- [Video Frame Input Data](#)
- [Labeling job output data](#)

## Input data

The input data are the data objects that you send to your workforce to be labeled. There are two ways to send data objects to Ground Truth for labeling:

- Send a list of data objects that require labeling using an input manifest file.
- Send individual data objects in real time to a perpetually running, streaming labeling job.

If you have a dataset that needs to be labeled one time, and you do not require an ongoing labeling job, create a standard labeling job using an input manifest file.

If you want to regularly send new data objects to your labeling job after it has started, create a streaming labeling job. When you create a streaming labeling job, you can optionally use an input manifest file to specify a group of data that you want labeled immediately when the job starts. You can continuously send new data objects to a streaming labeling job as long as it is active.

### Note

Streaming labeling jobs are only supported through the SageMaker API. You cannot create a streaming labeling job using the SageMaker AI console.

The following task types have special input data requirements and options:

- For [3D point cloud](#) labeling job input data requirements, see [3D Point Cloud Input Data](#).
- For [video frame](#) labeling job input data requirements, see [Video Frame Input Data](#).

## Topics

- [Input manifest files](#)
- [Automate data setup for labeling jobs](#)
- [Supported data formats](#)
- [Ground Truth streaming labeling jobs](#)
- [Input Data Quotas](#)
- [Select Data for Labeling](#)

## Input manifest files

Each line in an input manifest file is an entry containing an object, or a reference to an object, to label. An entry can also contain labels from previous jobs and for some task types, additional information.

Input data and the manifest file must be stored in Amazon Simple Storage Service (Amazon S3). Each has specific storage and access requirements, as follows:

- The Amazon S3 bucket that contains the input data must be in the same AWS Region in which you are running Amazon SageMaker Ground Truth. You must give Amazon SageMaker AI access to the data stored in the Amazon S3 bucket so that it can read it. For more information about Amazon S3 buckets, see [Working with Amazon S3 buckets](#).
- The manifest file must be in the same AWS Region as the data files, but it doesn't need to be in the same location as the data files. It can be stored in any Amazon S3 bucket that is accessible to the AWS Identity and Access Management (IAM) role that you assigned to Ground Truth when you created the labeling job.

### Note

3D point cloud and video frame [task types](#) have different input manifest requirements and attributes.

For [3D point cloud task types](#), refer to [Input Manifest Files for 3D Point Cloud Labeling Jobs](#).

For [video frame task types](#), refer to [Create a Video Frame Input Manifest File](#).

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, `\n` or `\r\n`. Because each line must be a valid JSON object, you can't have unescaped line break characters. For more information about data format, see [JSON Lines](#).

Each JSON object in the manifest file can be no larger than 100,000 characters. No single attribute within an object can be larger than 20,000 characters. Attribute names can't begin with \$ (dollar sign).

Each JSON object in the manifest file must contain one of the following keys: `source-ref` or `source`. The value of the keys are interpreted as follows:

- `source-ref` – The source of the object is the Amazon S3 object specified in the value. Use this value when the object is a binary object, such as an image.
- `source` – The source of the object is the value. Use this value when the object is a text value.

The following is an example of a manifest file for files stored in an Amazon S3 bucket:

```
{"source-ref": "S3 bucket location 1"}  
{"source-ref": "S3 bucket location 2"}  
...  
{"source-ref": "S3 bucket location n"}
```

Use the `source-ref` key for image files for bounding box, image classification (single and multi-label), semantic segmentation, and video clips for video classification labeling jobs. 3D point cloud and video frame labeling jobs also use the `source-ref` key but these labeling jobs require additional information in the input manifest file. For more information see [3D Point Cloud Input Data](#) and [Video Frame Input Data](#).

The following is an example of a manifest file with the input data stored in the manifest:

```
{"source": "Lorem ipsum dolor sit amet"}  
{"source": "consectetur adipiscing elit"}  
...  
{"source": "mollit anim id est laborum"}
```

Use the `source` key for single and multi-label text classification and named entity recognition labeling jobs.

You can include other key-value pairs in the manifest file. These pairs are passed to the output file unchanged. This is useful when you want to pass information between your applications. For more information, see [Labeling job output data](#).

## Automate data setup for labeling jobs

You can use the automated data setup to create manifest files for your labeling jobs in the Ground Truth console using images, videos, video frames, text (.txt) files, and comma-separated value (.csv) files stored in Amazon S3. When you use automated data setup, you specify an Amazon S3 location where your input data is stored and the input data type, and Ground Truth looks for the files that match that type in the location you specify.

**Note**

Ground Truth does not use an AWS KMS key to access your input data or write the input manifest file in the Amazon S3 location that you specify. The user or role that creates the labeling job must have permissions to access your input data objects in Amazon S3.

Before using the following procedure, ensure that your input images or files are correctly formatted:

- Image files – Image files must comply with the size and resolution limits listed in the tables found in [Input File Size Quota](#).
- Text files – Text data can be stored in one or more .txt files. Each item that you want labeled must be separated by a standard line break.
- CSV files – Text data can be stored in one or more .csv files. Each item that you want labeled must be in a separate row.
- Videos – Video files can be any of the following formats: .mp4, .ogg, and .webm. If you want to extract video frames from your video files for object detection or object tracking, see [Provide Video Files](#).
- Video frames – Video frames are images extracted from a videos. All images extracted from a single video are referred to as a *sequence of video frames*. Each sequence of video frames must have unique prefix keys in Amazon S3. See [Provide Video Frames](#). For this data type, see [Set up Automated Video Frame Input Data](#)

**Important**

For video frame object detection and video frame object tracking labeling jobs, see [Set up Automated Video Frame Input Data](#) to learn how to use the automated data setup.

Use these instructions to automatically set up your input dataset connection with Ground Truth.

**Automatically connect your data in Amazon S3 with Ground Truth**

1. Navigate to the **Create labeling job** page in the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.

This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the [navigation bar](#), choose the name of the currently displayed Region.

2. Select **Create labeling job**.
3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**.
6. Specify your **S3 location for output datasets**. This is where your output data is stored.
7. Choose your **Data type** using the dropdown list.
8. Use the drop down menu under **IAM Role** to select an execution role. If you select **Create a new role**, specify the Amazon S3 buckets that you want grant this role permission to access. This role must have permission to access the S3 buckets you specified in Steps 5 and 6.
9. Select **Complete data setup**.

The following GIF demonstrates how to use the automated data setup for image data. This example will create a file, dataset-*YYMMDDTHHMMSS*.manifest in the Amazon S3 bucket example-groundtruth-images where *YYMMDDTHHMMSS* indicates the year (YY), month (MM), day (DD) and time in hours (HH), minutes (mm) and seconds (ss), that the input manifest file was created.

## Supported data formats

When you create an input manifest file for a [built-in task types](#) manually, your input data must be in one of the following support file formats for the respective input data type. To learn about automated data setup, see [Automate data setup for labeling jobs](#).

### Tip

When you use the automated data setup, additional data formats can be used to generate an input manifest file for video frame and text based task types.

Task Types	Input Data Type	Support Formats	Example Input Manifest Line
Bounding Box, Semantic Segmentation, Image Classification (Single Label and Multi-label), Verify and Adjust Labels	Image	.jpg, .jpeg, .png	<pre>{"source-ref":   "s3://amzn-s3-   demo-bucket1/   example-im   age.png" }</pre>
Named Entity Recognition, Text Classification (Single and Multi-Label)	Text	Raw text	<pre>{"source":   "Lorem ipsum   dolor sit amet"}</pre>
Video Classification	Video clips	.mp4, .ogg, and .webm	<pre>{"source-ref":   "s3:///example-   video.mp4" }</pre>
Video Frame Object Detection, Video Frame Object Tracking (bounding boxes, polylines, polygons or keypoint)	Video frames and video frame sequence files (for Object Tracking)	<b>Video frames:</b> .jpg, .jpeg, .png <b>Sequence files:</b> .json	Refer to <a href="#">Create a Video Frame Input Manifest File</a> .
3D Point Cloud Semantic Segmentation, 3D Point Cloud Object Detection, 3D Point Cloud Object Tracking	Point clouds and point cloud sequence files (for Object Tracking)	<b>Point clouds:</b> Binary pack format and ASCII. For more information see <a href="#">Accepted Raw 3D Data Formats</a> . <b>Sequence files:</b> .json	Refer to <a href="#">Input Manifest Files for 3D Point Cloud Labeling Jobs</a> .

## Ground Truth streaming labeling jobs

If you want to perpetually send new data objects to Amazon SageMaker Ground Truth to be labeled, use a streaming labeling job. Streaming labeling jobs allow you to:

- Send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously receive new data objects to label as long as the labeling job is active and new objects are being sent to it.
- Gain visibility into the number of objects that have been queued and are waiting to be labeled. Use this information to control the flow of data objects sent to your labeling job.
- Receive label data for individual data objects in real time as workers finish labeling them.

Ground Truth streaming labeling jobs remain active until they are manually stopped or have been idle for more than 10 days. You can intermittently send new data objects to workers while the labeling job is active.

If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review [How it works](#).

Use [Create a streaming labeling job](#) to learn how to create a streaming labeling job.

### Note

Ground Truth streaming labeling jobs are only supported through the SageMaker API.

## How it works

When you create a Ground Truth streaming labeling job, the job remains active until it is manually stopped, remains idle for more than 10 days, or is unable to access input data sources. You can intermittently send new data objects to workers while it is active. A worker can continue to receive new data objects in real time as long as the total number of tasks currently available to the worker is less than the value in `MaxConcurrentTaskCount`. Otherwise, the data object is sent to a queue that Ground Truth creates on your behalf in [Amazon Simple Queue Service](#) (Amazon SQS) for later processing. These tasks are sent to workers as soon as the total number of tasks currently available to a worker falls below `MaxConcurrentTaskCount`. If a data object is not sent to a worker after 14 days, it expires. You can view the number of tasks pending in the queue and adjust the number of objects you send to the labeling job. For example, you may decrease the speed at which you send objects to the labeling job if the backlog of pending objects moves above a threshold.

## Topics

- [Send data to a streaming labeling job](#)
- [Manage labeling requests with an Amazon SQS queue](#)
- [Receive output data from a streaming labeling job](#)
- [Duplicate message handling](#)

## Send data to a streaming labeling job

You can optionally submit input data to a streaming labeling job one time when you create the labeling job using an input manifest file. Once the labeling job has started and the state is `InProgress`, you can submit new data objects to your labeling job in real time using your Amazon SNS input topic and Amazon S3 event notifications.

### **Submit Data Objects When you Start the Labeling Job (One Time):**

- **Use an Input Manifest File** – You can optionally specify an input manifest file Amazon S3 URI in `ManifestS3Uri` when you create the streaming labeling job. Ground Truth sends each data object in the manifest file to workers for labeling as soon as the labeling job starts. To learn more, see [Create a Manifest File \(Optional\)](#).

After you submit a request to create the streaming labeling job, its status will be `Initializing`. Once the labeling job is active, the state changes to `InProgress` and you can start using the real-time options to submit additional data objects for labeling.

### **Submit Data Objects in Real Time:**

- **Send data objects using Amazon SNS messages** – You can send Ground Truth new data objects to label by sending an Amazon SNS message. You will send this message to an Amazon SNS input topic that you create and specify when you create your streaming labeling job. For more information, see [Send data objects using Amazon SNS](#).
- **Send data objects by placing them in an Amazon S3 bucket** – Each time you add a new data object to an Amazon S3 bucket, you can prompt Ground Truth to process that object for labeling. To do this, you add an event notification to the bucket so that it notifies your Amazon SNS input topic each time a new object is added to (or *created in*) that bucket. For more information, see [Send data objects using Amazon S3](#). This option is not available for text-based labeling jobs such as text classification and named entity recognition.

**⚠ Important**

If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.

**Send data objects using Amazon SNS**

You can send data objects to your streaming labeling job using Amazon Simple Notification Service (Amazon SNS). Amazon SNS is a web service that coordinates and manages the delivery of messages to and from *endpoints* (for example, an email address or AWS Lambda function). An Amazon SNS *topic* acts as a communication channel between two or more endpoints. You use Amazon SNS to send, or *publish*, new data objects to the topic specified in the [CreateLabelingJob](#) parameter `SnsTopicArn` in `InputConfig`. The format of these messages is the same as a single line from an [input manifest file](#).

For example, you may send a piece of text to an active text classification labeling job by publishing it to your input topic. The message that you publish may look similar to the following:

```
{"source": "Lorem ipsum dolor sit amet"}
```

To send a new image object to an image classification labeling job, your message may look similar to the following:

```
{"source-ref": "s3://amzn-s3-demo-bucket/example-image.jpg"}
```

**📘 Note**

You can also include custom deduplication IDs and deduplication keys in your Amazon SNS messages. To learn more, see [Duplicate message handling](#).

When Ground Truth creates your streaming labeling job, it subscribes to your Amazon SNS input topic.

## Send data objects using Amazon S3

You can send one or more new data objects to a streaming labeling job by placing them in an Amazon S3 bucket that is configured with an Amazon SNS event notification. You can set up an event to notify your Amazon SNS input topic anytime a new object is created in your bucket. You must specify this same Amazon SNS input topic in the [CreateLabelingJob](#) parameter `SnsTopicArn` in `InputConfig`.

Anytime you configure an Amazon S3 bucket to send notifications to Amazon SNS, Ground Truth will publish a test event, "s3:TestEvent", to ensure that the topic exists and that the owner of the Amazon S3 bucket specified has permission to publish to the specified topic. It is recommended that you set up your Amazon S3 connection with Amazon SNS before starting a streaming labeling job. If you do not, this test event may register as a data object and be sent to Ground Truth for labeling.

### Important

If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.

For image-based labeling jobs, Ground Truth requires all S3 buckets to have a CORS policy attached. To learn more, see [CORS Requirement for Input Image Data](#).

Once you have configured your Amazon S3 bucket and created your labeling job, you can add objects to your bucket and Ground Truth either sends that object to workers or places it on your Amazon SQS queue.

To learn more, see [Creating Amazon S3 based bucket event notifications based of the Amazon SNS defined in your labeling job](#).

### Important

This option is not available for text-based labeling jobs such as text classification and named entity recognition.

## Manage labeling requests with an Amazon SQS queue

When Ground Truth creates your streaming labeling job, it creates an Amazon SQS queue in the AWS account used to create the labeling job. The queue name is `GroundTruth-labeling_job_name` where *labeling\_job\_name* is the name of your labeling job, in lowercase letters. When you send data objects to your labeling job, Ground Truth either sends the data objects directly to workers or places the task in your queue to be processed at a later time. If a data object is not sent to a worker after 14 days, it expires and is removed from the queue. You can setup an alarm in Amazon SQS to detect when objects expire and use this mechanism to control the volume of objects you send to your labeling job.

### Important

Modifying, deleting, or sending objects directly to the Amazon SQS queue associated with your streaming labeling job may lead to job failures.

## Receive output data from a streaming labeling job

Your Amazon S3 output bucket is periodically updated with new output data from your streaming labeling job. Optionally, you can specify an Amazon SNS output topic. Each time a worker submits a labeled object, a notification with the output data is sent to that topic. You can subscribe an endpoint to your SNS output topic to receive notifications or trigger events when you receive output data from a labeling task. Use an Amazon SNS output topic if you want to do real time chaining to another streaming job and receive an Amazon SNS notifications each time a data object is submitted by a worker.

To learn more, see [Subscribe an Endpoint to Your Amazon SNS Output Topic](#).

## Duplicate message handling

For data objects sent in real time, Ground Truth guarantees idempotency by ensuring each unique object is only sent for labeling once, even if the input message referring to that object is received multiple times (duplicate messages). To do this, each data object sent to a streaming labeling job is assigned a *deduplication ID*, which is identified with a *deduplication key*. If you send your requests to label data objects directly through your Amazon SNS input topic using Amazon SNS messages, you can optionally choose a custom deduplication key and deduplication IDs for your objects. For more information, see [Specify a deduplication key and ID in an Amazon SNS message](#).

If you do not provide your own deduplication key, or if you use the Amazon S3 configuration to send data objects to your labeling job, Ground Truth uses one of the following for the deduplication ID:

- For messages sent directly to your Amazon SNS input topic, Ground Truth uses the SNS message ID.
- For messages that come from an Amazon S3 configuration, Ground Truth creates a deduplication ID by combining the Amazon S3 URI of the object with the [sequencer token](#) in the message.

## Specify a deduplication key and ID in an Amazon SNS message

When you send a data object to your streaming labeling job using an Amazon SNS message, you have the option to specify your deduplication key and deduplication ID in one of the following ways. In all of these scenarios, identify your deduplication key with `dataset-objectid-attribute-name`.

### Bring Your Own Deduplication Key and ID

Create your own deduplication key and deduplication ID by configuring your Amazon SNS message as follows. Replace *byo-key* with your key and *UniqueId* with the deduplication ID for that data object.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/prefix/object1",
  "dataset-objectid-attribute-name": "byo-key",
  "byo-key": "UniqueId"
}
```

Your deduplication key can be up to 140 characters. Supported patterns include: `^[a-zA-Z0-9](-*[a-zA-Z0-9])*`.

Your deduplication ID can be up to 1,024 characters. Supported patterns include: `^(https|s3)://[^(/)]+/?(.*)$`.

### Use an Existing Key for your Deduplication Key

You can use an existing key in your message as the deduplication key. When you do this, the value associated with that key is used for the deduplication ID.

For example, you can specify use the `source-ref` key as your deduplication key by formatting your message as follows:

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/prefix/object1",
  "dataset-objectid-attribute-name": "source-ref"
}
```

In this example, Ground Truth uses `s3://amzn-s3-demo-bucket/prefix/object1` for the deduplication id.

### Find deduplication key and ID in your output data

You can see the deduplication key and ID in your output data. The deduplication key is identified by `dataset-objectid-attribute-name`. When you use your own custom deduplication key, your output contains something similar to the following:

```
"dataset-objectid-attribute-name": "byo-key",
"byo-key": "UniqueId",
```

When you do not specify a key, you can find the deduplication ID that Ground Truth assigned to your data object as follows. The `label-attribute-name-object-id` parameter identifies your deduplication ID.

```
{
  "source-ref": "s3://bucket/prefix/object1",
  "dataset-objectid-attribute-name": "$label-attribute-name-object-id"
  "label-attribute-name" :0,
  "label-attribute-name-metadata": {...},
  "$label-attribute-name-object-id": "<service-generated-key>"
}
```

For `<service-generated-key>`, if the data object came through an Amazon S3 configuration, Ground Truth adds a unique value used by the service and emits a new field keyed by `sequencer` which shows the Amazon S3 sequencer used. If object was fed to SNS directly, Ground Truth use the SNS message ID.

#### Note

Do not use the `$` character in your label attribute name.

## Input Data Quotas

Input datasets used in semantic segmentation labeling jobs have a quota of 20,000 items. For all other labeling job types, the dataset size quota is 100,000 items. To request an increase to the quota for labeling jobs other than semantic segmentation jobs, review the procedures in [AWS Service Quotas](#) to request a quota increase.

Input image data for active and non-active learning labeling jobs must not exceed size and resolution quotas. *Active learning* refers to labeling job that use [automated data labeling](#). *Non-active learning* refers to labeling jobs that don't use automated data labeling.

Additional quotas apply for label categories for all task types, and for input data and labeling category attributes for 3D point cloud and video frame task types.

## Input File Size Quota

Input files can't exceed the following size- quotas for both active and non-active learning labeling jobs. There is no input file size quota for videos used in [video classification](#) labeling jobs.

Labeling Job Task Type	Input File Size Quota
Image classification	40 MB
Bounding box (Object detection)	40 MB
Semantic segmentation	40 MB
Bounding box (Object detection) label adjustment	40 MB
Semantic segmentation label adjustment	40 MB
Bounding box (Object detection) label verification	40 MB
Semantic segmentation label verification	40 MB

## Input Image Resolution Quotas

Image file resolution refers to the number of pixels in an image, and determines the amount of detail an image holds. Image resolution quotas differ depending on the labeling job type and the

SageMaker AI built-in algorithm used. The following table lists the resolution quotas for images used in active and non-active learning labeling jobs.

Labeling Job Task Type	Resolution Quota - Non Active Learning	Resolution Quota - Active Learning
Image classification	100 million pixels	3840 x 2160 pixels (4 K)
Bounding box (Object detection)	100 million pixels	3840 x 2160 pixels (4 K)
Semantic segmentation	100 million pixels	1920 x 1080 pixels (1080 p)
Object detection label adjustment	100 million pixels	3840 x 2160 pixels (4 K)
Semantic segmentation label adjustment	100 million pixels	1920 x 1080 pixels (1080 p)
Object detection label verification	100 million pixels	Not available
Semantic segmentation label verification	100 million pixels	Not available

## Label Category Quotas

Each labeling job task type has a quota for the number of label categories you can specify. Workers select label categories to create annotations. For example, you may specify label categories *car*, *pedestrian*, and *biker* when creating a bounding box labeling job and workers will select the *car* category before drawing bounding boxes around cars.

### Important

Label category names cannot exceed 256 characters.

All label categories must be unique. You cannot specify duplicate label categories.

The following label category limits apply to labeling jobs. Quotas for label categories depend on whether you use the SageMaker API operation `CreateLabelingJob` or the console to create a labeling job.

Labeling Job Task Type	Label Category Quota - API	Label Category Quota - Console
Image classification (Multi-label)	50	50
Image classification (Single label)	Unlimited	30
Bounding box (Object detection)	50	50
Label verification	Unlimited	30
Semantic segmentation (with active learning)	20	10
Semantic segmentation (without active learning)	Unlimited	10
Named entity recognition	Unlimited	30
Text classification (Multi-label)	50	50
Text classification (Single label)	Unlimited	30
Video classification	30	30
Video frame object detection	30	30
Video frame object tracking	30	30
3D point cloud object detection	30	30

Labeling Job Task Type	Label Category Quota - API	Label Category Quota - Console
3D point cloud object tracking	30	30
3D point cloud semantic segmentation	30	30

### 3D Point Cloud and Video Frame Labeling Job Quotas

The following quotas apply for 3D point cloud and video frame labeling job input data.

Labeling Job Task Type	Input Data Quota
Video frame object detection	2,000 video frames (images) per sequence
Video frame object detection	10 video frame sequences per manifest file
Video frame object tracking	2,000 video frames (images) per sequence
Video frame object tracking	10 video frame sequences per manifest file
3D point cloud object detection	100,000 point cloud frames per labeling job
3D point cloud object tracking	100,000 point cloud frame sequences per labeling job
3D point cloud object tracking	500 point cloud frames in each sequence file

When you create a video frame or 3D point cloud labeling job, you can add one or more *label category attributes* to each label category that you specify to have workers provide more information about an annotation.

Each label category attribute has a single label category attribute name, and a list of one or more options (values) to choose from. To learn more, see [Worker user interface \(UI\)](#) for 3D point cloud labeling jobs and [Worker user interface \(UI\)](#) for video frame labeling jobs.

The following quotas apply to the number of label category attributes names and values you can specify for labeling jobs.

Labeling Job Task Type	Label Category Attribute (name) Quota	Label Category Attribute Values Quota
Video frame object detection	10	10
Video frame object tracking	10	10
3D point cloud object detection	10	10
3D point cloud object tracking	10	10
3D point cloud semantic segmentation	10	10

## Select Data for Labeling

You can use the Amazon SageMaker AI console to select a portion of your dataset for labeling. The data must be stored in an Amazon S3 bucket. You have three options:

- Use the full dataset.
- Choose a randomly selected sample of the dataset.
- Specify a subset of the dataset using a query.

The following options are available in the **Labeling jobs** section of the [SageMaker AI console](#) after selecting **Create labeling job**. To learn how to create a labeling job in the console, see [Getting started: Create a bounding box labeling job with Ground Truth](#). To configure the dataset that you use for labeling, in the **Job overview** section, choose **Additional configuration**.

### Use the Full Dataset

When you choose to use the **Full dataset**, you must provide a manifest file for your data objects. You can provide the path of the Amazon S3 bucket that contains the manifest file or use the

SageMaker AI console to create the file. To learn how to create a manifest file using the console, see [Automate data setup for labeling jobs](#).

## Choose a Random Sample

When you want to label a random subset of your data, select **Random sample**. The dataset is stored in the Amazon S3 bucket specified in the **Input dataset location** field.

After you have specified the percentage of data objects that you want to include in the sample, choose **Create subset**. SageMaker AI randomly picks the data objects for your labeling job. After the objects are selected, choose **Use this subset**.

SageMaker AI creates a manifest file for the selected data objects. It also modifies the value in the **Input dataset location** field to point to the new manifest file.

## Specify a Subset

### Amazon S3 Select

Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. To learn more see, [How to optimize querying your data in Amazon S3](#)

You can specify a subset of your data objects using an Amazon S3 SELECT query on the object file names.

The SELECT statement of the SQL query is defined for you. You provide the WHERE clause to specify which data objects should be returned.

For more information about the Amazon S3 SELECT statement, see [Selecting Content from Objects](#).

Choose **Create subset** to start the selection, and then choose **Use this subset** to use the selected data.

SageMaker AI creates a manifest file for the selected data objects. It also updates the value in the **Input dataset location** field to point to the new manifest file.

## 3D Point Cloud Input Data

To create a 3D point cloud labeling job, you must create an input manifest file. Use this topic to learn the formatting requirements of the input manifest file for each task type. To learn about the raw input data formats Ground Truth accepts for 3D point cloud labeling jobs, see the section [Accepted Raw 3D Data Formats](#).

Use your [labeling job task type](#) to choose a topics on [Input Manifest Files for 3D Point Cloud Labeling Jobs](#) to learn about the formatting requirements for each line of your input manifest file.

### Topics

- [Accepted Raw 3D Data Formats](#)
- [Input Manifest Files for 3D Point Cloud Labeling Jobs](#)
- [Understand Coordinate Systems and Sensor Fusion](#)

### Accepted Raw 3D Data Formats

Ground Truth uses your 3D point cloud data to render a 3D scenes that workers annotate. This section describes the raw data formats that are accepted for point cloud data and sensor fusion data for a point cloud frame. To learn how to create an input manifest file to connect your raw input data files with Ground Truth, see [Input Manifest Files for 3D Point Cloud Labeling Jobs](#).

For each frame, Ground Truth supports Compact Binary Pack Format (.bin) and ASCII (.txt) files. These files contain information about the location (x, y, and z coordinates) of all points that make up that frame, and, optionally, information about the pixel color of each point for colored point clouds. When you create a 3D point cloud labeling job input manifest file, you can specify the format of your raw data in the `format` parameter.

The following table lists elements that Ground Truth supports in point cloud frame files to describe individual points.

Symbol	Value
x	The x coordinate of the point.
y	The y coordinate of the point.
z	The z coordinate of the point.

Symbol	Value
i	The intensity of the point.
r	The red color channel component. An 8-bit value (0-255).
g	The green color channel component. An 8-bit value (0-255)
b	The blue color channel component. An 8-bit value (0-255)

Ground Truth assumes the following about your input data:

- All of the positional coordinates (x, y, z) are in meters.
- All the pose headings (qx, qy, qz, qw) are measured in Spatial [Quaternions](#) .

### Compact Binary Pack Format

The Compact Binary Pack Format represents a point cloud as an ordered set of a stream of points. Each point in the stream is an ordered binary pack of 4-byte float values in some variant of the form `xyzirgb`. The x, y, and z elements are required and additional information about that pixel can be included in a variety of ways using `i`, `r`, `g`, and `b`.

To use a binary file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter `binary/` in the `format` parameter for your input manifest file and replace with the order of elements in each binary pack. For example, you may enter one of the following for the `format` parameter.

- `binary/xyzzi` – When you use this format, your point element stream would be in the following order: `x1y1z1i1x2y2z2i2...`
- `binary/xyzrgb` – When you use this format, your point element stream would be in the following order: `x1y1z1r1g1b1x2y2z2r2g2b2...`
- `binary/xyzirgb` – When you use this format, your point element stream would be in the following order: `x1y1z1i1r1g1b1x2y2z2i2r2g2b2...`

When you use a binary file for your point cloud frame data, if you do not enter a value for `format`, the default pack format `binary/xyzi` is used.

## ASCII Format

The ASCII format uses a text file to represent a point cloud, where each line in the ASCII point cloud file represents a single point. Each point is a line the text file and contains white space separated values, each of which is a 4-byte float ASCII values. The `x`, `y`, and `z` elements are required for each point and additional information about that point can be included in a variety of ways using `i`, `r`, `g`, and `b`.

To use a text file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter `text/` in the `format` parameter for your input manifest file and replace  with the order of point elements on each line.

For example, if you enter `text/xyzi` for `format`, your text file for each point cloud frame should look similar to the following:

```
x1 y1 z1 i1
x2 y2 z2 i2
...
...
```

If you enter `text/xyzrgb`, your text file should look similar to the following:

```
x1 y1 z1 r1 g1 b1
x2 y2 z2 r2 g2 b1
...
...
```

When you use a text file for your point cloud frame data, if you do not enter a value for `format`, the default format `text/xyzi` will be used.

## Point Cloud Resolution Limits

Ground Truth does not have a resolution limit for 3D point cloud frames. However, we recommend that you limit each point cloud frame to 500K points for optimal performance. When Ground Truth renders the 3D point cloud visualization, it must be viewable on your workers' computers, which depends on workers' computer hardware. Point cloud frames that are larger than 1 million points may not render on standard machines, or may take too long to load.

## Input Manifest Files for 3D Point Cloud Labeling Jobs

When you create a labeling job, you provide an input manifest file where each line of the manifest describes a unit of task to be completed by annotators. The format of your input manifest file depends on your task type.

- If you are creating a 3D point cloud **object detection** or **semantic segmentation** labeling job, each line in your input manifest file contains information about a single 3D point cloud frame. This is called a *point cloud frame input manifest*. To learn more, see [Create a Point Cloud Frame Input Manifest File](#).
- If you are creating a 3D point cloud **object tracking** labeling job, each line of your input manifest file contains a sequence of 3D point cloud frames and associated data. This is called a *point cloud sequence input manifest*. To learn more, see [Create a Point Cloud Sequence Input Manifest](#).

### Create a Point Cloud Frame Input Manifest File

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, `\n` or `\r\n`. Because each line must be a valid JSON object, you can't have unescaped line break characters. In the single-frame input manifest file, each line in the manifest contains data for a single point cloud frame. The point cloud frame data can either be stored in binary or ASCII format (see [Accepted Raw 3D Data Formats](#)). This is the manifest file formatting required for 3D point cloud object detection and semantic segmentation. Optionally, you can also provide camera sensor fusion data for each point cloud frame.

Ground Truth supports point cloud and video camera sensor fusion in the [world coordinate system](#) for all modalities. If you can obtain your 3D sensor extrinsic (like a LiDAR extrinsic), we recommend that you transform 3D point cloud frames into the world coordinate system using the extrinsic. For more information, see [Sensor Fusion](#).

However, if you cannot obtain a point cloud in world coordinate system, you can provide coordinates in the original coordinate system that the data was captured in. If you are providing camera data for sensor fusion, it is recommended that you provide LiDAR sensor and camera pose in the world coordinate system.

To create a single-frame input manifest file, you will identify the location of each point cloud frame that you want workers to label using the `source-ref` key. Additionally, you must use the `source-ref-metadata` key to identify the format of your dataset, a timestamp for that frame, and, optionally, sensor fusion data and video camera images.

The following example demonstrates the syntax used for an input manifest file for a single-frame point cloud labeling job. The example includes two point cloud frames. For details about each parameter, see the table following this example.

### **⚠ Important**

Each line in your input manifest file must be in [JSON Lines](#) format. The following code block shows an input manifest file with two JSON objects. Each JSON object is used to point to and provide details about a single point cloud frame. The JSON objects have been expanded for readability, but you must minimize each JSON object to fit on a single line when creating an input manifest file. An example is provided under this code block.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/examplefolder/frame1.bin",
  "source-ref-metadata": {
    "format": "binary/xyzi",

```

The following table shows the parameters you can include in your input manifest file:

Parameter	Required	Accepted Values	Description
source-ref	Yes	String  <b>Accepted string value format:</b>  <i>s3://&lt;bucket-name&gt; /&lt;folder-name&gt; /point-cloud-frame-file</i>	The Amazon S3 location of a single point cloud frame.
source-ref-metadata	Yes	JSON object  <b>Accepted parameters:</b>  format, unix-timestamp, ego-vehicle-pose, position, prefix, images	Use this parameter to include additional information about the point cloud in source-ref, and to provide camera data for sensor fusion.
format	No	String  <b>Accepted string values:</b> "binary/xyz", "binary/x	Use this parameter to specify the format of your point cloud data. For more information, see

Parameter	Required	Accepted Values	Description
		<p> <code>zyi" , "binary/xyzrgb" , "binary/xyzirgb" , "text/xyz" , "text/xyz i" , "text/xyz rgb" , "text/xyz irgb"</code> </p> <p><b>Default Values:</b></p> <p>When the file identified in <code>source-ref</code> has a <code>.bin</code> extension, <code>binary/zyi</code></p> <p>When the file identified in <code>source-ref</code> has a <code>.txt</code> extension, <code>text/zyi</code></p>	<p><a href="#">Accepted Raw 3D Data Formats.</a></p>
<code>unix-timestamp</code>	Yes	<p>Number</p> <p>A unix timestamp.</p>	<p>The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a sensor.</p>

Parameter	Required	Accepted Values	Description
ego-vehicle-pose	No	JSON object	The pose of the device used to collect the point cloud data. For more information about this parameter, see <a href="#">Include Vehicle Pose Information in Your Input Manifest</a> .
prefix	No	String  <b>Accepted string value format:</b>  <i>s3://&lt;bucket-name&gt; /&lt;folder-name&gt;/</i>	The location in Amazon S3 where your metadata, such as camera images, is stored for this frame.  The prefix must end with a forward slash: /.
images	No	List	A list of parameter s describing color camera images used for sensor fusion. You can include up to 8 images in this list. For more information about the parameter s required for each image, see <a href="#">Include Camera Data in Your Input Manifest</a> .

## Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the location of the vehicle used to capture point cloud data. Ground Truth uses this information to compute LiDAR extrinsic matrix.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see [Sensor Fusion](#).

The following table provides more information about the position and orientation (heading) parameters that are required when you provide ego-vehicle information.

Parameter	Required	Accepted Values	Description
position	Yes	JSON object  <b>Required Parameters:</b>  x, y, and z. Enter numbers for these parameters.	The translation vector of the ego vehicle in the world coordinate system.
heading	Yes	JSON Object  <b>Required Parameters:</b>  qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the device or sensor mounted on the vehicle sensing the surrounding, measured in <a href="#">quaternions</a> , (qx, qy, qz, qw) in the a coordinate system.

## Include Camera Data in Your Input Manifest

If you want to include video camera data with a frame, use the following parameters to provide information about each image. The **Required** column below applies when the images parameter is

included in the input manifest file under `source-ref-metadata`. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the camera position and heading used to capture the images in the world coordinate system.

If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients ( $k_1, k_2, k_3, k_4, p_1, p_2$ ), the camera model and the camera intrinsic matrix. The intrinsic matrix is made up of focal length ( $f_x, f_y$ ), and the principal point ( $c_x, c_y$ ). See [Intrinsic Matrix](#) to learn how Ground Truth uses the camera intrinsic. If distortion coefficients are not included, Ground Truth will not undistort an image.

Parameter	Required	Accepted Values	Description
<code>image-path</code>	Yes	String  <b>Example of format:</b>  <i>&lt;folder-name&gt; /&lt;imagefilename.png&gt;</i>	The relative location, in Amazon S3 of your image file. This relative path will be appended to the path you specify in prefix.
<code>unix-timestamp</code>	Yes	Number	The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a camera.
<code>camera-model</code>	No	String:  <b>Accepted Values:</b>  "pinhole" , "fisheye"  <b>Default:</b>	The model of the camera used to capture the image. This information is used to undistort camera images.

Parameter	Required	Accepted Values	Description
		"pinhole"	
$f_x$ , $f_y$	Yes	Numbers	The focal length of the camera, in the x ( $f_x$ ) and y ( $f_y$ ) directions.
$c_x$ , $c_y$	Yes	Numbers	The x ( $c_x$ ) and y ( $c_y$ ) coordinates of the principal point.
$k_1$ , $k_2$ , $k_3$ , $k_4$	No	Number	Radial distortion coefficients. Supported for both <b>fisheye</b> and <b>pinhole</b> camera models.
$p_1$ , $p_2$	No	Number	Tangential distortion coefficients. Supported for <b>pinhole</b> camera models.
skew	No	Number	A parameter to measure the skew of an image.
position	Yes	JSON object  <b>Required Parameters:</b>  $x$ , $y$ , and $z$ . Enter numbers for these parameters.	The location or origin of the frame of reference of the camera mounted on the vehicle capturing images.

Parameter	Required	Accepted Values	Description
heading	Yes	JSON Object  <b>Required Parameters:</b>  qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the camera mounted on the vehicle capturing images, measured using <a href="#">quaternions</a> , (qx, qy, qz, qw), in the world coordinate system.

## Point Cloud Frame Limits

You can include up to 100,000 point cloud frames in your input manifest file. 3D point cloud labeling job have longer pre-processing times than other Ground Truth task types. For more information, see [Job pre-processing time](#).

## Create a Point Cloud Sequence Input Manifest

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, `\n` or `\r\n`. Because each line must be a valid JSON object, you can't have unescaped line break characters. In the point cloud sequence input manifest file, each line in the manifest contains a sequence of point cloud frames. The point cloud data for each frame in the sequence can either be stored in binary or ASCII format. For more information, see [Accepted Raw 3D Data Formats](#). This is the manifest file formatting required for 3D point cloud object tracking. Optionally, you can also provide point attribute and camera sensor fusion data for each point cloud frame. When you create a sequence input manifest file, you must provide LiDAR and video camera sensor fusion data in a [world coordinate system](#).

The following example demonstrates the syntax used for an input manifest file when each line in the manifest is a sequence file. Each line in your input manifest file must be in [JSON Lines](#) format.

```

{"source-ref": "s3://amzn-s3-demo-bucket/example-folder/seq1.json"}
{"source-ref": "s3://amzn-s3-demo-bucket/example-folder/seq2.json"}

```

The data for each sequence of point cloud frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the `frames` list. This is an example of a sequence file with two point cloud frame files, `frame300.bin` and `frame303.bin`. The `...` is used to indicate where you should include information for additional frames. Add a JSON object for each frame in the sequence.

The following code block includes a JSON object for a single sequence file. The JSON object has been expanded for readability.

```
{
  "seq-no": 1,
  "prefix": "s3://amzn-s3-demo-bucket/example_lidar_sequence_dataset/seq1/",
  "number-of-frames": 100,
  "frames": [
    {

  "images": [...]}
...
]
}

```

The following table provides details about the top-level parameters of a sequence file. For detailed information about the parameters required for individual frames in the sequence file, see [Parameters for Individual Point Cloud Frames](#).

Parameter	Required	Accepted Values	Description
seq-no	Yes	Integer	The ordered number of the sequence.
prefix	Yes	String	The Amazon S3 location where the

Parameter	Required	Accepted Values	Description
		<b>Accepted Values:</b> <i>s3://&lt;bucket-name&gt; /&lt;prefix&gt;/</i>	sequence files are located.  The prefix must end with a forward slash: <code>/</code> .
<code>number-of-frames</code>	Yes	Integer	The total number of frames included in the sequence file. This number must match the total number of frames listed in the <code>frames</code> parameter in the next row.
<code>frames</code>	Yes	List of JSON objects	A list of frame data. The length of the list must equal <code>number-of-frames</code> . In the worker UI, frames in a sequence will be the same as the order of frames in this array.  For details about the format of each frame, see <a href="#">Parameter s for Individual Point Cloud Frames</a> .

## Parameters for Individual Point Cloud Frames

The following table shows the parameters you can include in your input manifest file.

Parameter	Required	Accepted Values	Description
frame-no	No	Integer	<p>A frame number. This is an optional identifier specified by the customer to identify the frame within a sequence. It is not used by Ground Truth.</p>
unix-timestamp	Yes	Number	<p>The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a sensor.</p> <p>The timestamp for each frame must be different and timestamps must be sequential because they are used for cuboid interpolation. Ideally, this should be the real timestamp when the data was collected. If this is not available, you must use an incremental sequence of timestamps, where the first frame in your sequence file corresponds to the</p>

Parameter	Required	Accepted Values	Description
			first timestamp in the sequence.
frame	Yes	String <b>Example of format</b> <i>&lt;folder-name&gt; /&lt;sequence-file.json&gt;</i>	The relative location, in Amazon S3 of your sequence file. This relative path will be appended to the path you specify in prefix.

Parameter	Required	Accepted Values	Description
format	No	<p>String</p> <p><b>Accepted string values:</b> "binary/xyz" , "binary/xyzi" , "binary/xyzrgb" , "binary/xyzirgb" , "text/xyz" , "text/xyzi" , "text/xyzrgb" , "text/xyzirgb"</p> <p><b>Default Values:</b></p> <p>When the file identified in source-ref has a .bin extension, binary/xyzi</p> <p>When the file identified in source-ref has a .txt extension, text/xyzi</p>	<p>Use this parameter to specify the format of your point cloud data. For more information, see <a href="#">Accepted Raw 3D Data Formats</a>.</p>
ego-vehicle-pose	No	JSON object	<p>The pose of the device used to collect the point cloud data. For more information about this parameter , see <a href="#">Include Vehicle Pose Information in Your Input Manifest</a>.</p>

Parameter	Required	Accepted Values	Description
prefix	No	String  <b>Accepted string value format:</b>  <i>s3://&lt;bucket-name&gt; /&lt;folder-name&gt;/</i>	The location in Amazon S3 where your metadata, such as camera images, is stored for this frame.  The prefix must end with a forward slash: /.
images	No	List	A list parameter <code>s</code> describing color camera images used for sensor fusion. You can include up to 8 images in this list. For more information about the parameters required for each image, see <a href="#">Include Camera Data in Your Input Manifest</a> .

## Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the pose of the vehicle used to capture point cloud data. Ground Truth uses this information to compute LiDAR extrinsic matrices.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see [Sensor Fusion](#).

The following table provides more information about the position and orientation (heading) parameters that are required when you provide ego-vehicle information.

Parameter	Required	Accepted Values	Description
position	Yes	JSON object  <b>Required Parameters:</b>  x, y, and z. Enter numbers for these parameters.	The translation vector of the ego vehicle in the world coordinate system.
heading	Yes	JSON Object  <b>Required Parameters:</b>  qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the device or sensor mounted on the vehicle sensing the surrounding, measured in <a href="#">quaternions</a> , (qx, qy, qz, qw) in the a coordinate system.

## Include Camera Data in Your Input Manifest

If you want to include color camera data with a frame, use the following parameters to provide information about each image. The **Required** column in the following table applies when the `images` parameter is included in the input manifest file. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the `position` and orientation (`heading`) of the camera used to capture the images.

If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients ( $k_1, k_2, k_3, k_4, p_1, p_2$ ), camera model and focal length ( $f_x, f_y$ ), and the principal point ( $c_x, c_y$ ). To learn more about these coefficients and undistorting images, see [Camera calibration With OpenCV](#). If distortion coefficients are not included, Ground Truth will not undistort an image.

Parameter	Required	Accepted Values	Description
image-path	Yes	String  <b>Example of format:</b>  <i>&lt;folder-name&gt; /&lt;imagefilename.png&gt;</i>	The relative location, in Amazon S3 of your image file. This relative path will be appended to the path you specify in prefix.
unix-timestamp	Yes	Number	The timestamp of the image.
camera-model	No	String:  <b>Accepted Values:</b>  "pinhole" , "fisheye"  <b>Default:</b>  "pinhole"	The model of the camera used to capture the image. This information is used to undistort camera images.
fx, fy	Yes	Numbers	The focal length of the camera, in the x (fx) and y (fy) directions.
cx, cy	Yes	Numbers	The x (cx) and y (cy) coordinates of the principal point.
k1, k2, k3, k4	No	Number	Radial distortion coefficients. Supported for both <b>fisheye</b> and <b>pinhole</b> camera models.

Parameter	Required	Accepted Values	Description
p1, p2	No	Number	Tangential distortion coefficients. Supported for <b>pinhole</b> camera models.
skew	No	Number	A parameter to measure any known skew in the image.
position	Yes	JSON object  <b>Required Parameters:</b>  x, y, and z. Enter numbers for these parameters.	The location or origin of the frame of reference of the camera mounted on the vehicle capturing images.
heading	Yes	JSON Object  <b>Required Parameters:</b>  qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the camera mounted on the vehicle capturing images, measured using <a href="#">quaternions</a> , (qx, qy, qz, qw).

## Sequence File and Point Cloud Frame Limits

You can include up to 100,000 point cloud frame sequences in your input manifest file. You can include up to 500 point cloud frames in each sequence file.

Keep in mind that 3D point cloud labeling jobs have longer pre-processing times than other Ground Truth task types. For more information, see [Job pre-processing time](#).

## Understand Coordinate Systems and Sensor Fusion

Point cloud data is always located in a coordinate system. This coordinate system may be local to the vehicle or the device sensing the surroundings, or it may be a world coordinate system. When you use Ground Truth 3D point cloud labeling jobs, all the annotations are generated using the coordinate system of your input data. For some labeling job task types and features, you must provide data in a world coordinate system.

In this topic, you'll learn the following:

- When you *are required* to provide input data in a world coordinate system or global frame of reference.
- What a world coordinate is and how you can convert point cloud data to a world coordinate system.
- How you can use your sensor and camera extrinsic matrices to provide pose data when using sensor fusion.

### Coordinate System Requirements for Labeling Jobs

If your point cloud data was collected in a local coordinate system, you can use an extrinsic matrix of the sensor used to collect the data to convert it to a world coordinate system or a global frame of reference. If you cannot obtain an extrinsic for your point cloud data and, as a result, cannot obtain point clouds in a world coordinate system, you can provide point cloud data in a local coordinate system for 3D point cloud object detection and semantic segmentation task types.

For object tracking, you must provide point cloud data in a world coordinate system. This is because when you are tracking objects across multiple frames, the ego vehicle itself is moving in the world and so all of the frames need a point of reference.

If you include camera data for sensor fusion, it is recommended that you provide camera poses in the same world coordinate system as the 3D sensor (such as a LiDAR sensor).

### Using Point Cloud Data in a World Coordinate System

This section explains what a world coordinate system (WCS), also referred to as a *global frame of reference*, is and explains how you can provide point cloud data in a world coordinate system.

## What is a World Coordinate System?

A WCS or global frame of reference is a fixed universal coordinate system in which vehicle and sensor coordinate systems are placed. For example, if multiple point cloud frames are located in different coordinate systems because they were collected from two sensors, a WCS can be used to translate all of the coordinates in these point cloud frames into a single coordinate system, where all frames have the same origin, (0,0,0). This transformation is done by translating the origin of each frame to the origin of the WCS using a translation vector, and rotating the three axes (typically x, y, and z) to the right orientation using a rotation matrix. This rigid body transformation is called a *homogeneous transformation*.

A world coordinate system is important in global path planning, localization, mapping, and driving scenario simulations. Ground Truth uses the right-handed Cartesian world coordinate system such as the one defined in [ISO 8855](#), where the x axis is forward toward the car's movement, y axis is left, and the z axis points up from the ground.

The global frame of reference depends on the data. Some datasets use the LiDAR position in the first frame as the origin. In this scenario, all the frames use the first frame as a reference and device heading and position will be near the origin in the first frame. For example, KITTI datasets have the first frame as a reference for world coordinates. Other datasets use a device position that is different from the origin.

Note that this is not the GPS/IMU coordinate system, which is typically rotated by 90 degrees along the z-axis. If your point cloud data is in a GPS/IMU coordinate system (such as OxTS in the open source AV KITTI dataset), then you need to transform the origin to a world coordinate system (typically the vehicle's reference coordinate system). You apply this transformation by multiplying your data with transformation metrics (the rotation matrix and translation vector). This will transform the data from its original coordinate system to a global reference coordinate system. Learn more about this transformation in the next section.

## Convert 3D Point Cloud Data to a WCS

Ground Truth assumes that your point cloud data has already been transformed into a reference coordinate system of your choice. For example, you can choose the reference coordinate system of the sensor (such as LiDAR) as your global reference coordinate system. You can also take point clouds from various sensors and transform them from the sensor's view to the vehicle's reference coordinate system view. You use the a sensor's extrinsic matrix, made up of a rotation matrix and translation vector, to convert your point cloud data to a WCS or global frame of reference.

Collectively, the translation vector and rotation matrix can be used to make up an *extrinsic matrix*, which can be used to convert data from a local coordinate system to a WCS. For example, your LiDAR extrinsic matrix may be composed as follows, where R is the rotation matrix and T is the translation vector:

```
LiDAR_extrinsic = [R T;0 0 0 1]
```

For example, the autonomous driving KITTI dataset includes a rotation matrix and translation vector for the LiDAR extrinsic transformation matrix for each frame. The [pykitti](#) python module can be used for loading the KITTI data, and in the dataset `dataset.oxts[i].T_w_imu` gives the LiDAR extrinsic transform for the  $i^{\text{th}}$  frame with can be multiplied with points in that frame to convert them to a world frame - `np.matmul(lidar_transform_matrix, points)`. Multiplying a point in LiDAR frame with a LiDAR extrinsic matrix transforms it into world coordinates. Multiplying a point in the world frame with the camera extrinsic matrix gives the point coordinates in the camera's frame of reference.

The following code example demonstrates how you can convert point cloud frames from the KITTI dataset into a WCS.

```
import pykitti
import numpy as np

basedir = '/Users/nameofuser/kitti-data'
date = '2011_09_26'
drive = '0079'

# The 'frames' argument is optional - default: None, which loads the whole dataset.
# Calibration, timestamps, and IMU data are read automatically.
# Camera and velodyne data are available via properties that create generators
# when accessed, or through getter methods that provide random access.
data = pykitti.raw(basedir, date, drive, frames=range(0, 50, 5))

# i is frame number
i = 0

# lidar extrinsic for the ith frame
lidar_extrinsic_matrix = data.oxts[i].T_w_imu

# velodyne raw point cloud in lidar scanners own coordinate system
points = data.get_velo(i)
```

```
# transform points from lidar to global frame using lidar_extrinsic_matrix
def generate_transformed_pcd_from_point_cloud(points, lidar_extrinsic_matrix):
    tps = []
    for point in points:
        transformed_points = np.matmul(lidar_extrinsic_matrix, np.array([point[0],
point[1], point[2], 1], dtype=np.float32).reshape(4,1)).tolist()
        if len(point) > 3 and point[3] is not None:
            tps.append([transformed_points[0][0], transformed_points[1][0],
transformed_points[2][0], point[3]])

    return tps

# customer transforms points from lidar to global frame using lidar_extrinsic_matrix
transformed_pcl = generate_transformed_pcd_from_point_cloud(points,
lidar_extrinsic_matrix)
```

## Sensor Fusion

Ground Truth supports sensor fusion of point cloud data with up to 8 video camera inputs. This feature allows human labellers to view the 3D point cloud frame side-by-side with the synchronized video frame. In addition to providing more visual context for labeling, sensor fusion allows workers to adjust annotations in the 3D scene and in 2D images and the adjustment are projected into the other view. The following video demonstrates a 3D point cloud labeling job with LiDAR and camera sensor fusion.

For best results, when using sensor fusion, your point cloud should be in a WCS. Ground Truth uses your sensor (such as LiDAR), camera, and ego vehicle pose information to compute extrinsic and intrinsic matrices for sensor fusion.

## Extrinsic Matrix

Ground Truth uses sensor (such as LiDAR) extrinsic and camera extrinsic and intrinsic matrices to project objects to and from the point cloud data's frame of reference to the camera's frame of reference.

For example, in order to project a label from the 3D point cloud to camera image plane, Ground Truth transforms 3D points from LiDAR's own coordinate system to the camera's coordinate system. This is typically done by first transforming 3D points from LiDAR's own coordinate system to a world coordinate system (or a global reference frame) using the LiDAR extrinsic matrix. Ground Truth then uses the camera inverse extrinsic (which converts points from a global frame of reference to the camera's frame of reference) to transform the 3D points from world coordinate system obtained in previous step into the camera image plane. The LiDAR extrinsic matrix can also be used to transform 3D data into a world coordinate system. If your 3D data is already transformed into world coordinate system then the first transformation doesn't have any impact on label translation, and label translation only depends on the camera inverse extrinsic. A view matrix is used to visualize projected labels. To learn more about these transformations and the view matrix, see [Ground Truth Sensor Fusion Transformations](#).

Ground Truth computes these extrinsic matrices by using LiDAR and camera *pose data* that you provide: heading ( in quaternions:  $qx$ ,  $qy$ ,  $qz$ , and  $qw$ ) and position ( $x$ ,  $y$ ,  $z$ ). For the vehicle, typically the heading and position are described in vehicle's reference frame in a world coordinate system and are called a *ego vehicle pose*. For each camera extrinsic, you can add pose information for that camera. For more information, see [Pose](#).

## Intrinsic Matrix

Ground Truth use the camera extrinsic and intrinsic matrices to compute view metrics to transform labels to and from the 3D scene to camera images. Ground Truth computes the camera intrinsic matrix using camera focal length ( $f_x$ ,  $f_y$ ) and optical center coordinates ( $c_x, c_y$ ) that you provide. For more information, see [Intrinsic and Distortion](#).

## Image Distortion

Image distortion can occur for a variety of reasons. For example, images may be distorted due to barrel or fish-eye effects. Ground Truth uses intrinsic parameters along with distortion co-efficient

to undistort images you provide when creating 3D point cloud labeling jobs. If a camera image is already been undistorted, all distortion coefficients should be set to 0.

For more information about the transformations Ground Truth performs to undistort images, see [Camera Calibrations: Extrinsic, Intrinsic and Distortion](#).

## Ego Vehicle

To collect data for autonomous driving applications, the measurements used to generate point cloud data and are taken from sensors mounted on a vehicle, or the *ego vehicle*. To project label adjustments to and from the 3D scene and 2D images, Ground Truth needs your ego vehicle pose in a world coordinate system. The ego vehicle pose is comprised of position coordinates and orientation quaternion.

Ground Truth uses your ego vehicle pose to compute rotation and transformations matrices. Rotations in 3 dimensions can be represented by a sequence of 3 rotations around a sequence of axes. In theory, any three axes spanning the 3D Euclidean space are enough. In practice, the axes of rotation are chosen to be the basis vectors. The three rotations are expected to be in a global frame of reference (extrinsic). Ground Truth does not support a body centered frame of reference (intrinsic) which is attached to, and moves with, the object under rotation. To track objects, Ground Truth needs to measure from a global reference where all vehicles are moving. When using Ground Truth 3D point cloud labeling jobs, `z` specifies the axis of rotation (extrinsic rotation) and yaw Euler angles are in radians (rotation angle).

## Pose

Ground Truth uses pose information for 3D visualizations and sensor fusion. Pose information you input through your manifest file is used to compute extrinsic matrices. If you already have an extrinsic matrix, you can use it to extract sensor and camera pose data.

For example in the autonomous driving KITTI dataset, the [pykitti](#) python module can be used for loading the KITTI data. In the dataset `dataset.oxts[i].T_w_imu` gives the LiDAR extrinsic transform for the  $i^{\text{th}}$  frame and it can be multiplied with the points to get them in a world frame - `matmul(lidar_transform_matrix, points)`. This transform can be converted into position (translation vector) and heading (in quaternion) of LiDAR for the input manifest file JSON format. Camera extrinsic transform for `cam0` in  $i^{\text{th}}$  frame can be calculated by `inv(matmul(dataset.calib.T_cam0_velo, inv(dataset.oxts[i].T_w_imu)))` and this can be converted into heading and position for `cam0`.

```
import numpy
```

```
rotation = [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03],
            [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02],
            [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01]]

origin= [1.71104606e+00,
        5.80000039e-01,
        9.43144935e-01]

from scipy.spatial.transform import Rotation as R

# position is the origin
position = origin
r = R.from_matrix(np.asarray(rotation))

# heading in WCS using scipy
heading = r.as_quat()
print(f"pose:{position}\nheading: {heading}")
```

## Position

In the input manifest file, `position` refers to the position of the sensor with respect to a world frame. If you are unable to put the device position in a world coordinate system, you can use LiDAR data with local coordinates. Similarly, for mounted video cameras you can specify the position and heading in a world coordinate system. For camera, if you do not have position information, please use (0, 0, 0).

The following are the fields in the position object:

1. `x` (float) – x coordinate of ego vehicle, sensor, or camera position in meters.
2. `y` (float) – y coordinate of ego vehicle, sensor, or camera position in meters.
3. `z` (float) – z coordinate of ego vehicle, sensor, or camera position in meters.

The following is an example of a position JSON object:

```
{
  "position": {
    "y": -152.77584902657554,
    "x": 311.21505956090624,
    "z": -10.854137529636024
```

```
}  
}
```

## Heading

In the input manifest file, `heading` is an object that represents the orientation of a device with respect to world frame. Heading values should be in quaternion. A [quaternion](#) is a representation of the orientation consistent with geodesic spherical properties. If you are unable to put the sensor heading in world coordinates, please use the identity quaternion ( $q_x = 0$ ,  $q_y = 0$ ,  $q_z = 0$ ,  $q_w = 1$ ). Similarly, for cameras, specify the heading in quaternions. If you are unable to obtain extrinsic camera calibration parameters, please also use the identity quaternion.

Fields in `heading` object are as follows:

1. `qx` (float) - x component of ego vehicle, sensor, or camera orientation.
2. `qy` (float) - y component of ego vehicle, sensor, or camera orientation.
3. `qz` (float) - z component of ego vehicle, sensor, or camera orientation.
4. `qw` (float) - w component of ego vehicle, sensor, or camera orientation.

The following is an example of a `heading` JSON object:

```
{  
  "heading": {  
    "qy": -0.7046155108831117,  
    "qx": 0.034278837280808494,  
    "qz": 0.7070617895701465,  
    "qw": -0.04904659893885366  
  }  
}
```

To learn more, see [Compute Orientation Quaternions and Position](#).

## Compute Orientation Quaternions and Position

Ground Truth requires that all orientation, or heading, data be given in quaternions. A [quaternions](#) is a representation of the orientation consistent with geodesic spherical properties that can be used to approximate of rotation. Compared to [Euler angles](#) they are simpler to compose and avoid the problem of [gimbal lock](#). Compared to rotation matrices they are more compact, more numerically stable, and more efficient.

You can compute quaternions from a rotation matrix or a transformation matrix.

If you have a rotation matrix (made up of the axis rotations) and translation vector (or origin) in world coordinate system instead of a single 4x4 rigid transformation matrix, then you can directly use the rotation matrix and translation vector to compute quaternions. Libraries like [scipy](#) and [pyqaternion](#) can help. The following code-block shows an example using these libraries to compute quaternion from a rotation matrix.

```
import numpy

rotation = [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03],
            [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02],
            [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01]]

origin = [1.71104606e+00,
          5.80000039e-01,
          9.43144935e-01]

from scipy.spatial.transform import Rotation as R
# position is the origin
position = origin
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position:{position}\nheading: {heading}")
```

A UI tool like [3D Rotation Converter](#) can also be useful.

If you have a 4x4 extrinsic transformation matrix, note that the transformation matrix is in the form  $[R \ T; \ 0 \ 0 \ 0 \ 1]$  where R is the rotation matrix and T is the origin translation vector. That means you can extract rotation matrix and translation vector from the transformation matrix as follows.

```
import numpy as np

transformation
= [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03,  1.71104606e+00],
   [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02,  5.80000039e-01],
   [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01,  9.43144935e-01],
   [          0,          0,          0,          1]]
```

```

transformation = np.array(transformation )
rotation = transformation[0:3,0:3]
translation= transformation[0:3,3]

from scipy.spatial.transform import Rotation as R
# position is the origin translation
position = translation
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position:{position}\nheading: {heading}")

```

With your own setup, you can compute an extrinsic transformation matrix using the GPS/IMU position and orientation (latitude, longitude, altitude and roll, pitch, yaw) with respect to the LiDAR sensor on the ego vehicle. For example, you can compute pose from KITTI raw data using `pose = convertOxtsToPose(oxts)` to transform the oxts data into a local euclidean poses, specified by 4x4 rigid transformation matrices. You can then transform this pose transformation matrix to a global reference frame using the reference frames transformation matrix in the world coordinate system.

```

struct Quaternion
{
    double w, x, y, z;
};

Quaternion ToQuaternion(double yaw, double pitch, double roll) // yaw (Z), pitch (Y),
roll (X)
{
    // Abbreviations for the various angular functions
    double cy = cos(yaw * 0.5);
    double sy = sin(yaw * 0.5);
    double cp = cos(pitch * 0.5);
    double sp = sin(pitch * 0.5);
    double cr = cos(roll * 0.5);
    double sr = sin(roll * 0.5);

    Quaternion q;
    q.w = cr * cp * cy + sr * sp * sy;
    q.x = sr * cp * cy - cr * sp * sy;
    q.y = cr * sp * cy + sr * cp * sy;
    q.z = cr * cp * sy - sr * sp * cy;
}

```

```
    return q;
}
```

## Ground Truth Sensor Fusion Transformations

The following sections go into greater detail about the Ground Truth sensor fusion transformations that are performed using the pose data you provide.

### LiDAR Extrinsic

In order to project to and from a 3D LiDAR scene to a 2D camera image, Ground Truth computes the rigid transformation projection metrics using the ego vehicle pose and heading. Ground Truth computes rotation and translation of a world coordinates into the 3D plane by doing a simple sequence of rotations and translation.

Ground Truth computes rotation metrics using the heading quaternions as follows:

$$M = \begin{pmatrix} 1 - 2y^2 - 2z^2 & 2xy + 2zw & 2xz - 2yw \\ 2xy - 2zw & 1 - 2x^2 - 2z^2 & 2yz + 2xw \\ 2xz + 2yw & 2yz - 2xw & 1 - 2x^2 - 2y^2 \end{pmatrix}$$

Here,  $[x, y, z, w]$  corresponds to parameters in the heading JSON object,  $[qx, qy, qz, qw]$ . Ground Truth computes the translation column vector as  $T = [\text{poseX}, \text{poseY}, \text{poseZ}]$ . Then the extrinsic metrics is simply as follows:

```
LiDAR_extrinsic = [R T;0 0 0 1]
```

### Camera Calibrations: Extrinsic, Intrinsic and Distortion

*Geometric camera calibration*, also referred to as *camera resectioning*, estimates the parameters of a lens and image sensor of an image or video camera. You can use these parameters to correct for lens distortion, measure the size of an object in world units, or determine the location of the camera in the scene. Camera parameters include intrinsics and distortion coefficients.

### Camera Extrinsic

If the camera pose is given, then Ground Truth computes the camera extrinsic based on a rigid transformation from the 3D plane into the camera plane. The calculation is the same as the one

used for the [LiDAR Extrinsic](#), except that Ground Truth uses camera pose (position and heading) and computes the inverse extrinsic.

```
camera_inverse_extrinsic = inv([Rc Tc;0 0 0 1]) #where Rc and Tc are camera pose
components
```

## Intrinsic and Distortion

Some cameras, such as pinhole or fisheye cameras, may introduce significant distortion in photos. This distortion can be corrected using distortion coefficients and the camera focal length. To learn more, see [Camera calibration With OpenCV](#) in the OpenCV documentation.

There are two types of distortion Ground Truth can correct for: radial distortion and tangential distortion.

*Radial distortion* occurs when light rays bend more near the edges of a lens than they do at its optical center. The smaller the lens, the greater the distortion. The presence of the radial distortion manifests in form of the *barrel* or *fish-eye* effect and Ground Truth uses Formula 1 to undistort it.

### Formula 1:

$$x_{corrected} = x(1 + k_1r^2 + k_2r^4 + k_3r^6)$$

$$y_{corrected} = y(1 + k_1r^2 + k_2r^4 + k_3r^6)$$

*Tangential distortion* occurs because the lenses used to take the images are not perfectly parallel to the imaging plane. This can be corrected with Formula 2.

### Formula 2:

$$x_{corrected} = x + [2p_1xy + p_2(r^2 + 2x^2)]$$

$$y_{corrected} = y + [p_1(r^2 + 2y^2) + 2p_2xy]$$

In the input manifest file, you can provide distortion coefficients and Ground Truth will undistort your images. All distortion coefficients are floats.

- $k_1, k_2, k_3, k_4$  – Radial distortion coefficients. Supported for both fisheye and pinhole camera models.
- $p_1, p_2$  – Tangential distortion coefficients. Supported for pinhole camera models.

If images are already undistorted, all distortion coefficients should be 0 in your input manifest.

In order to correctly reconstruct the corrected image, Ground Truth does a unit conversion of the images based on focal lengths. If a common focal length is used with a given aspect ratio for both axes, such as 1, in the upper formula we will have a single focal length. The matrix containing these four parameters is referred to as the *in camera intrinsic calibration matrix*.

$$\begin{Bmatrix} x \\ y \\ w \end{Bmatrix} = \begin{Bmatrix} f_x & 0 & c_x \\ 0 & f_y & c_y \\ 0 & 0 & 1 \end{Bmatrix} \begin{Bmatrix} X \\ Y \\ Z \end{Bmatrix}$$

While the distortion coefficients are the same regardless of the camera resolutions used, these should be scaled with the current resolution from the calibrated resolution.

The following are float values.

- $f_x$  - focal length in x direction.
- $f_y$  - focal length in y direction.
- $c_x$  - x coordinate of principal point.
- $c_y$  - y coordinate of principal point.

Ground Truth use the camera extrinsic and camera intrinsic to compute view metrics as shown in the following code block to transform labels between the 3D scene and 2D images.

```
def generate_view_matrix(intrinsic_matrix, extrinsic_matrix):
    intrinsic_matrix = np.c_[intrinsic_matrix, np.zeros(3)]
```

```
view_matrix = np.matmul(intrinsic_matrix, extrinsic_matrix)
view_matrix = np.insert(view_matrix, 2, np.array((0, 0, 0, 1)), 0)
return view_matrix
```

## Video Frame Input Data

When you create a video frame object detection or object tracking labeling job, you can choose video files (MP4 files) or video frames for input data. All worker tasks are created using video frames, so if you choose video files, use the Ground Truth frame extraction tool to extract video frames (images) from your video files.

For both of these options, you can use the **Automated data setup** option in the Ground Truth section of the Amazon SageMaker AI console to set up a connection between Ground Truth and your input data in Amazon S3 so that Ground Truth knows where to look for your input data when creating your labeling tasks. This creates and stores an input manifest file in your Amazon S3 input dataset location. To learn more, see [Set up Automated Video Frame Input Data](#).

Alternatively, you can manually create sequence files for each sequence of video frames that you want labeled and provide the Amazon S3 location of an input manifest file that references each of these sequences files using the `source-ref` key. To learn more, see [Create a Video Frame Input Manifest File](#).

### Topics

- [Choose Video Files or Video Frames for Input Data](#)
- [Input Data Setup](#)

## Choose Video Files or Video Frames for Input Data

When you create a video frame object detection or object tracking labeling job, you can provide a sequence of video frames (images) or you can use the Amazon SageMaker AI console to have Ground Truth automatically extract video frames from your video files. Use the following sections to learn more about these options.

### Provide Video Frames

Video frames are sequences of images extracted from a video file. You can create a Ground Truth labeling job to have workers label multiple sequences of video frames. Each sequence is made up of images extracted from a single video.

To create a labeling job using video frame sequences, you must store each sequence using a unique [key name prefix](#) in Amazon S3. In the Amazon S3 console, key name prefixes are folders. So in the Amazon S3 console, each sequence of video frames must be located in its own folder in Amazon S3.

For example, if you have two sequences of video frames, you might use the key name prefixes `sequence1/` and `sequence2/` to identify your sequences. In this example, your sequences may be located in `s3://amzn-s3-demo-bucket/video-frames/sequence1/` and `s3://amzn-s3-demo-bucket/video-frames/sequence2/`.

If you are using the Ground Truth console to create an input manifest file, all of the sequence key name prefixes should be in the same location in Amazon S3. For example, in the Amazon S3 console, each sequence could be in a folder in `s3://amzn-s3-demo-bucket/video-frames/`. In this example, your first sequence of video frames (images) may be located in `s3://amzn-s3-demo-bucket/video-frames/sequence1/` and your second sequence may be located in `s3://amzn-s3-demo-bucket/video-frames/sequence2/`.

### Important

Even if you only have a single sequence of video frames that you want workers to label, that sequence must have a key name prefix in Amazon S3. If you are using the Amazon S3 console, this means that your sequence is located in a folder. It cannot be located in the root of your S3 bucket.

When creating worker tasks using sequences of video frames, Ground Truth uses one sequence per task. In each task, Ground Truth orders your video frames using [UTF-8](#) binary order.

For example, video frames might be in the following order in Amazon S3:

```
[0001.jpg, 0002.jpg, 0003.jpg, ..., 0011.jpg]
```

They are arranged in the same order in the worker's task: `0001.jpg`, `0002.jpg`, `0003.jpg`, ..., `0011.jpg`.

Frames might also be ordered using a naming convention like the following:

```
[frame1.jpg, frame2.jpg, ..., frame11.jpg]
```

In this case, `frame10.jpg` and `frame11.jpg` come before `frame2.jpg` in the worker task. Your worker sees your video frames in the following order: `frame1.jpg`, `frame10.jpg`, `frame11.jpg`, `frame2.jpg`, ..., `frame9.jpg`.

## Provide Video Files

You can use the Ground Truth frame splitting feature when creating a new labeling job in the console to extract video frames from video files (MP4 files). A series of video frames extracted from a single video file is referred to as a *sequence of video frames*.

You can either have Ground Truth automatically extract all frames, up to 2,000, from the video, or you can specify a frequency for frame extraction. For example, you can have Ground Truth extract every 10<sup>th</sup> frame from your videos.

You can provide up to 50 videos when you use automated data setup to extract frames, however your input manifest file cannot reference more than 10 video frame sequence files when you create a video frame object tracking and video frame object detection labeling job. If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more about these quotas, see [3D Point Cloud and Video Frame Labeling Job Quotas](#).

To use the video frame extraction tool, see [Set up Automated Video Frame Input Data](#).

When all of your video frames have been successfully extracted from your videos, you will see the following in your S3 input dataset location:

- A key name prefix (a folder in the Amazon S3 console) named after each video. Each of these prefixes leads to:
  - A sequence of video frames extracted from the video used to name that prefix.
  - A sequence file used to identify all of the images that make up that sequence.
- An input manifest file with a `.manifest` extension. This identifies all of the sequence files that will be used to create your labeling job.

All of the frames extracted from a single video file are used for a labeling task. If you extract video frames from multiple video files, multiple tasks are created for your labeling job, one for each sequence of video frames.

Ground Truth stores each sequence of video frames that it extracts in your Amazon S3 location for input datasets using a unique [key name prefix](#). In the Amazon S3 console, key name prefixes are folders.

## Input Data Setup

When you create a video frame labeling job, you need to let Ground Truth know where to look for your input data. You can do this in one of two ways:

- You can store your input data in Amazon S3 and have Ground Truth automatically detect the input dataset used for your labeling job. See [Set up Automated Video Frame Input Data](#) to learn more about this option.
- You can create an input manifest file and sequence files and upload them to Amazon S3. See [Set up Video Frame Input Data Manually](#) to learn more about this option.

## Topics

- [Set up Automated Video Frame Input Data](#)
- [Set up Video Frame Input Data Manually](#)

## Set up Automated Video Frame Input Data

You can use the Ground Truth automated data setup to automatically detect video files in your Amazon S3 bucket and extract video frames from those files. To learn how, see [Provide Video Files](#).

If you already have video frames in Amazon S3, you can use the automated data setup to use these video frames in your labeling job. For this option, all video frames from a single video must be stored using a unique prefix. To learn about the requirements to use this option, see [Provide Video Frames](#).

Select one of the following sections to learn how to set up your automatic input dataset connection with Ground Truth.

## Provide Video Files and Extract Frames

Use the following procedure to connect your video files with Ground Truth and automatically extract video frames from those files for video frame object detection and object tracking labeling jobs.

**Note**

If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more, see [Provide Video Files](#).

Make sure your video files are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in.

**Automatically connect your video files in Amazon S3 with Ground Truth and extract video frames:**

1. Navigate to the **Create labeling job** page in the Amazon SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.

Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the [navigation bar](#), choose the name of the currently displayed Region.

2. Select **Create labeling job**.
3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**. An S3 URI looks like the following: `s3://amzn-s3-demo-bucket/path-to-files/`. This URI should point to the Amazon S3 location where your video files are stored.
6. Specify your **S3 location for output datasets**. This is where your output data is stored. You can choose to store your output data in the **Same location as input dataset** or **Specify a new location** and entering the S3 URI of the location that you want to store your output data.
7. Choose **Video Files** for your **Data type** using the dropdown list.
8. Choose **Yes, extract frames for object tracking and detection tasks**.
9. Choose a method of **Frame extraction**.
  - When you choose **Use all frames extracted from the video to create a labeling task**, Ground Truth extracts all frames from each video in your **S3 location for input datasets**, up

to 2,000 frames. If a video in your input dataset contains more than 2,000 frames, the first 2,000 are extracted and used for that labeling task.

- When you choose **Use every  $x$  frame from a video to create a labeling task**, Ground Truth extracts every  $x^{\text{th}}$  frame from each video in your **S3 location for input datasets**.

For example, if your video is 2 seconds long, and has a [frame rate](#) of 30 frames per second, there are 60 frames in your video. If you specify 10 here, Ground Truth extracts every 10<sup>th</sup> frame from your video. This means the 1<sup>st</sup>, 10<sup>th</sup>, 20<sup>th</sup>, 30<sup>th</sup>, 40<sup>th</sup>, 50<sup>th</sup>, and 60<sup>th</sup> frames are extracted.

10. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.
11. Select **Complete data setup**.

## Provide Video Frames

Use the following procedure to connect your sequences of video frames with Ground Truth for video frame object detection and object tracking labeling jobs.

Make sure your video frames are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in. Each sequence of video frames should have a unique prefix. For example, if you have two sequences stored in `s3://amzn-s3-demo-bucket/video-frames/sequences/`, each should have a unique prefix like `sequence1` and `sequence2` and should both be located directly under the `/sequences/` prefix. In the example above, the locations of these two sequences is: `s3://amzn-s3-demo-bucket/video-frames/sequences/sequence1/` and `s3://amzn-s3-demo-bucket/video-frames/sequences/sequence2/`.

## Automatically connect your video frame in Amazon S3 with Ground Truth:

1. Navigate to the **Create labeling job** page in the Amazon SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.

Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the [navigation bar](#), choose the name of the currently displayed Region.

2. Select **Create labeling job**.

3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**.

This should be the Amazon S3 location where your sequences are stored. For example, if you have two sequences stored in `s3://amzn-s3-demo-bucket/video-frames/sequences/sequence1/`, `s3://amzn-s3-demo-bucket/video-frames/sequences/sequence2/`, enter `s3://amzn-s3-demo-bucket/video-frames/sequences/` here.

6. Specify your **S3 location for output datasets**. This is where your output data is stored. You can choose to store your output data in the **Same location as input dataset** or **Specify a new location** and entering the S3 URI of the location that you want to store your output data.
7. Choose **Video frames** for your **Data type** using the dropdown list.
8. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.
9. Select **Complete data setup**.

These procedures will create an input manifest in the Amazon S3 location for input datasets that you specified in step 5. If you are creating a labeling job using the SageMaker API or, AWS CLI, or an AWS SDK, use the Amazon S3 URI for this input manifest file as input to the parameter `ManifestS3Uri`.

### Set up Video Frame Input Data Manually

Choose the manual data setup option if you have created sequence files for each of your video frame sequences, and a manifest file listing references to those sequences files.

### Create a Video Frame Input Manifest File

Ground Truth uses the input manifest file to identify the location of your input dataset when creating labeling tasks. For video frame object detection and object tracking labeling jobs, each line in the input manifest file identifies the location of a video frame sequence file. Each sequence file identifies the images included in a single sequence of video frames.

Use this page to learn how to create a video frame sequence file and an input manifest file for video frame object tracking and object detection labeling jobs.

If you want Ground Truth to automatically generate your sequence files and input manifest file, see [Set up Automated Video Frame Input Data](#).

## Create a Video Frame Sequence Input Manifest

In the video frame sequence input manifest file, each line in the manifest is a JSON object, with a "source-ref" key that references a sequence file. Each sequence file identifies the location of a sequence of video frames. This is the manifest file formatting required for all video frame labeling jobs.

The following example demonstrates the syntax used for an input manifest file:

```
{"source-ref": "s3://amzn-s3-demo-bucket/example-folder/seq1.json"}
{"source-ref": "s3://amzn-s3-demo-bucket/example-folder/seq2.json"}
```

## Create a Video Frame Sequence File

The data for each sequence of video frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the frames list. The following JSON has been expanded for readability.

```
{
  "seq-no": 1,
  "prefix": "s3://amzn-s3-demo-bucket/prefix/video1/",
  "number-of-frames": 3,
  "frames": [
    {"frame-no": 1, "unix-timestamp": 1566861644, "frame": "frame0001.jpg" },
    {"frame-no": 2, "unix-timestamp": 1566861644, "frame": "frame0002.jpg" },
    {"frame-no": 3, "unix-timestamp": 1566861644, "frame": "frame0003.jpg" }
  ]
}
```

The following table provides details about the parameters shown in the this code example.

Parameter	Required	Accepted Values	Description
seq-no	Yes	Integer	The ordered number of the sequence.
prefix	Yes	String <b>Accepted Values:</b>	The Amazon S3 location where the

Parameter	Required	Accepted Values	Description
		<code>s3://&lt;bucket-name&gt; /&lt;prefix&gt;/</code>	sequence files are located.  The prefix must end with a forward slash: <code>/</code> .
<code>number-of-frames</code>	Yes	Integer	The total number of frames included in the sequence file. This number must match the total number of frames listed in the <code>frames</code> parameter in the next row.
<code>frames</code>	Yes	List of JSON objects  <b>Required:</b> <code>frame-no, frame</code>  <b>Optional:</b> <code>unix-timestamp</code>	A list of frame data. The length of the list must equal <code>number-of-frames</code> . In the worker UI, frames in a sequence are ordered in <a href="#">UTF-8</a> binary order. To learn more about this ordering, see <a href="#">Provide Video Frames</a> .
<code>frame-no</code>	Yes	Integer	The frame order number. This will determine the order of a frame in the sequence.

Parameter	Required	Accepted Values	Description
<code>unix-timestamp</code>	No	Integer	The unix timestamp of a frame. The number of seconds since January 1st, 1970 until the UTC time when the frame was captured.
<code>frame</code>	Yes	String	The name of a video frame image file.

## Labeling job output data

The output from a labeling job is placed in the Amazon S3 location that you specified in the console or in the call to the [CreateLabelingJob](#) operation. Output data appears in this location when the workers have submitted one or more tasks, or when tasks expire. Note that it may take a few minutes for output data to appear in Amazon S3 after the worker submits the task or the task expires.

Each line in the output data file is identical to the manifest file with the addition of an attribute and value for the label assigned to the input object. The attribute name for the value is defined in the console or in the call to the `CreateLabelingJob` operation. You can't use `-metadata` in the label attribute name. If you are running an image semantic segmentation, 3D point cloud semantic segmentation, or 3D point cloud object tracking job, the label attribute must end with `-ref`. For any other type of job, the attribute name can't end with `-ref`.

The output of the labeling job is the value of the key-value pair with the label. The label and the value overwrites any existing JSON data in the input file with the new value.

For example, the following is the output from an image classification labeling job where the input data files were stored in an Amazon S3 *amzn-s3-demo-bucket* and the label attribute name was defined as *sport*. In this example the JSON object is formatted for readability, in the actual output file the JSON object is on a single line. For more information about the data format, see [JSON Lines](#).

```
{
```

```
"source-ref": "s3://amzn-s3-demo-bucket/image_example.png",
"sport":0,
"sport-metadata":
{
  "class-name": "football",
  "confidence": 0.00,
  "type":"groundtruth/image-classification",
  "job-name": "identify-sport",
  "human-annotated": "yes",
  "creation-date": "2018-10-18T22:18:13.527256"
}
}
```

The value of the label can be any valid JSON. In this case the label's value is the index of the class in the classification list. Other job types, such as bounding box, have more complex values.

Any key-value pair in the input manifest file other than the label attribute is unchanged in the output file. You can use this to pass data to your application.

The output from a labeling job can be used as the input to another labeling job. You can use this when you are chaining together labeling jobs. For example, you can send one labeling job to determine the sport that is being played. Then you send another using the same data to determine if the sport is being played indoors or outdoors. By using the output data from the first job as the manifest for the second job, you can consolidate the results of the two jobs into one output file for easier processing by your applications.

The output data file is written to the output location periodically while the job is in progress. These intermediate files contain one line for each line in the manifest file. If an object is labeled, the label is included. If the object hasn't been labeled, it is written to the intermediate output file identically to the manifest file.

## Output directories

Ground Truth creates several directories in your Amazon S3 output path. These directories contain the results of your labeling job and other artifacts of the job. The top-level directory for a labeling job is given the same name as your labeling job; the output directories are placed beneath it. For example, if you named your labeling job **find-people**, your output would be in the following directories:

```
s3://amzn-s3-demo-bucket/find-people/activelearning
```

```
s3://amzn-s3-demo-bucket/find-people/annotations
s3://amzn-s3-demo-bucket/find-people/inference
s3://amzn-s3-demo-bucket/find-people/manifests
s3://amzn-s3-demo-bucket/find-people/training
```

Each directory contains the following output:

### Active learning directory

The `activelearning` directory is only present when you are using automated data labeling. It contains the input and output validation set for automated data labeling, and the input and output folder for automatically labeled data.

### Annotations directory

The `annotations` directory contains all of the annotations made by the workforce. These are the responses from individual workers that have not been consolidated into a single label for the data object.

There are three subdirectories in the `annotations` directory.

- The first, `worker-response`, contains the responses from individual workers. This contains a subdirectory for each iteration, which in turn contains a subdirectory for each data object in that iteration. The worker response data for each data object is stored in a timestamped JSON file that contains the answers submitted by each worker for that data object, and if you use a private workforce, metadata about those workers. To learn more about this metadata, see [Worker metadata](#).
- The second, `consolidated-annotation`, contains information required to consolidate the annotations in the current batch into labels for your data objects.
- The third, `intermediate`, contains the output manifest for the current batch with any completed labels. This file is updated as the label for each data object is completed.

#### Note

We recommend that you do not use files that are not mentioned in the documentation.

## Inference directory

The `inference` directory is only present when you are using automated data labeling. This directory contains the input and output files for the SageMaker AI batch transform used while labeling data objects.

## Manifest directory

The `manifest` directory contains the output manifest from your labeling job. There is one subdirectory in the `manifest` directory, `output`. The `output` directory contains the output manifest file for your labeling job. The file is named `output.manifest`.

## Training directory

The `training` directory is only present when you are using automated data labeling. This directory contains the input and output files used to train the automated data labeling model.

## Confidence score

When you have more than one worker annotate a single task, your label results from annotation consolidation. Ground Truth calculates a confidence score for each label. A *confidence score* is a number between 0 and 1 that indicates how confident Ground Truth is in the label. You can use the confidence score to compare labeled data objects to each other, and to identify the least or most confident labels.

You should not interpret the value of a confidence score as an absolute value, or compare confidence scores across labeling jobs. For example, if all of the confidence scores are between 0.98 and 0.998, you should only compare the data objects with each other and not rely on the high confidence scores.

You should not compare the confidence scores of human-labeled data objects and auto-labeled data objects. The confidence scores for humans are calculated using the annotation consolidation function for the task, while the confidence scores for automated labeling are calculated using a model that incorporates object features. The two models generally have different scales and average confidence.

For a bounding box labeling job, Ground Truth calculates a confidence score per box. You can compare confidence scores within one image or across images for the same labeling type (human or auto). You can't compare confidence scores across labeling jobs.

If a single worker annotates a task (`NumberOfHumanWorkersPerDataObject` is set to 1 or in the console, you enter 1 for **Number of workers per dataset object**), the confidence score is set to `0.00`.

## Worker metadata

Ground Truth provides information that you can use to track individual workers in task output data. The following data is located in the directories under the `worker-response` located in the [Annotations directory](#):

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS) and millisecond (mmm). The date and time are separated by a **T**.
- The `submissionTime` is the time that the worker submitted their annotations using the **Submit** button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (YYYY), month (MM), day (DD), hour (HH), minute (MM), second (SS) and millisecond (mmm). The date and time are separated by a **T**.
- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a [private workforce](#), in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Cognito user pool or OIDC Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique sub identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) using this ID using Amazon Cognito. To learn how, see [Managing and Searching for User Accounts](#) in [Amazon Cognito Developer Guide](#).

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
```

```
"identityData": {
  "identityProviderType": "Cognito",
  "issuer": "https://cognito-idp.aws-region.amazonaws.com/aws-region_123456789",
  "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
}
```

The following is an example of the `workerMetadata` you may see if you use your own OIDC IdP to create a private workforce:

```
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Oidc",
    "issuer": "https://example-oidc-ipd.com/adfs",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```

To learn more about using private workforces, see [Private workforce](#).

## Output metadata

The output from each job contains metadata about the label assigned to data objects. These elements are the same for all jobs with minor variations. The following example shows the metadata elements:

```
"confidence": 0.00,
"type": "groundtruth/image-classification",
"job-name": "identify-animal-species",
"human-annotated": "yes",
"creation-date": "2020-10-18T22:18:13.527256"
```

The elements have the following meaning:

- `confidence` – The confidence that Ground Truth has that the label is correct. For more information, see [Confidence score](#).
- `type` – The type of classification job. For job types, see [Built-in Task Types](#).
- `job-name` – The name assigned to the job when it was created.
- `human-annotated` – Whether the data object was labeled by a human or by automated data labeling. For more information, see [Automate data labeling](#).

- `creation-date` – The date and time that the label was created.

## Classification job output

The following are sample outputs (output manifest files) from an image classification job and a text classification job. They include the label that Ground Truth assigned to the data object, the value for the label, and metadata that describes the label.

In addition to the standard metadata elements, the metadata for a classification job includes the text value of the label's class. For more information, see [Image Classification - MXNet](#).

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/example_image.jpg",
  "species": "0",
  "species-metadata":
  {
    "class-name": "dog",
    "confidence": 0.00,
    "type": "groundtruth/image-classification",
    "job-name": "identify-animal-species",
    "human-annotated": "yes",
    "creation-date": "2018-10-18T22:18:13.527256"
  }
}
```

```
{
  "source": "The food was delicious",
  "mood": "1",
  "mood-metadata":
  {
    "class-name": "positive",
    "confidence": 0.8,
    "type": "groundtruth/text-classification",
    "job-name": "label-sentiment",
    "human-annotated": "yes",
    "creation-date": "2020-10-18T22:18:13.527256"
  }
}
```

## Multi-label classification job output

The following are example output manifest files from a multi-label image classification job and a multi-label text classification job. They include the labels that Ground Truth assigned to the data object (for example, the image or piece of text) and metadata that describes the labels the worker saw when completing the labeling task.

The label attribute name parameter (for example, `image-label-attribute-name`) contains an array of all of the labels selected by at least one of the workers who completed this task. This array contains integer keys (for example, `[1, 0, 8]`) that correspond to the labels found in `class-map`. In the multi-label image classification example, `bicycle`, `person`, and `clothing` were selected by at least one of the workers who completed the labeling task for the image, `exampleimage.jpg`.

The `confidence-map` shows the confidence score that Ground Truth assigned to each label selected by a worker. To learn more about Ground Truth confidence scores, see [Confidence score](#).

The red, italicized text in the examples below depends on labeling job specifications and output data.

The following is an example of a multi-label image classification output manifest file.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/example_image.jpg",
  "image-label-attribute-name": [1, 0, 8],
  "image-label-attribute-name-metadata":
    {
      "job-name": "labeling-job/image-label-attribute-name",
      "class-map":
        {
          "1": "bicycle", "0": "person", "8": "clothing"
        },
      "human-annotated": "yes",
      "creation-date": "2020-02-27T21:36:25.000201",
      "confidence-map":
        {
          "1": 0.95, "0": 0.77, "8": 0.2
        },
      "type": "groundtruth/image-classification-multilabel"
    }
}
```

The following is an example of a multi-label text classification output manifest file. In this example, `approving`, `sad` and `critical` were selected by at least one of the workers who completed the labeling task for the object `exampletext.txt` found in `amzn-s3-demo-bucket`.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/exampletext.txt",
  "text-label-attribute-name": [1, 0, 4],
  "text-label-attribute-name-metadata":
    {
      "job-name": "labeling-job/text-label-attribute-name",
      "class-map":
        {
          "1": "approving", "0": "sad", "4": "critical"
        },
      "human-annotated": "yes",
      "creation-date": "2020-02-20T21:36:25.000201",
      "confidence-map":
        {
          "1": 0.95, "0": 0.77, "4": 0.2
        },
      "type": "groundtruth/text-classification-multilabel"
    }
}
```

## Bounding box job output

The following is sample output (output manifest file) from a bounding box job. For this task, three bounding boxes are returned. The label value contains information about the size of the image, and the location of the bounding boxes.

The `class_id` element is the index of the box's class in the list of available classes for the task. The `class-map` metadata element contains the text of the class.

The metadata has a separate confidence score for each bounding box. The metadata also includes the `class-map` element that maps the `class_id` to the text value of the class. For more information, see [Object Detection - MXNet](#).

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/example_image.png",
```

    "job-name": "identify-dogs-and-toys"
  },
  "adjusted-bounding-box":
  {
    "image_size": [{"width": 500, "height": 400, "depth": 3}],
    "annotations":
    [
      {"class_id": 0, "left": 110, "top": 135,
        "width": 61, "height": 128},
      {"class_id": 5, "left": 161, "top": 250,
        "width": 30, "height": 30},
      {"class_id": 5, "left": 10, "top": 10,
        "width": 30, "height": 30}
    ]
  },
  "adjusted-bounding-box-metadata":
  {
    "objects":
    [

```

```

        {"confidence": 0.8},
        {"confidence": 0.9},
        {"confidence": 0.9}
    ],
    "class-map":
    {
        "0": "dog",
        "5": "bone"
    },
    "type": "groundtruth/object-detection",
    "human-annotated": "yes",
    "creation-date": "2018-11-20T22:18:13.527256",
    "job-name": "adjust-bounding-boxes-on-dogs-and-toys",
    "adjustment-status": "adjusted"
}
}

```

In this output, the job's type doesn't change, but an `adjustment-status` field is added. This field has the value of `adjusted` or `unadjusted`. If multiple workers have reviewed the object and at least one adjusted the label, the status is `adjusted`.

## Named entity recognition

The following is an example output manifest file from a named entity recognition (NER) labeling task. For this task, seven entities are returned.

In the output manifest, the JSON object, `annotations`, includes a list of the `labels` (label categories) that you provided.

Worker responses are in a list named `entities`. Each entity in this list is a JSON object that contains a `label` value that matches one in the `labels` list, an integer `startOffset` value for labeled span's starting Unicode offset, and an integer `endOffset` value for the ending Unicode offset.

The metadata has a separate confidence score for each entity. If a single worker labeled each data object, the confidence value for each entity will be zero.

The red, italicized text in the examples below depends on labeling job inputs and worker responses.

```

        }
    ]
}
```

```

    ]
  }
}

```

## Label verification job output

The output (output manifest file) of a bounding box verification job looks different than the output of a bounding box annotation job. That's because the workers have a different type of task. They're not labeling objects, but evaluating the accuracy of prior labeling, making a judgment, and then providing that judgment and perhaps some comments.

If human workers are verifying or adjusting prior bounding box labels, the output of a verification job would look like the following JSON. The red, italicized text in the examples below depends on labeling job specifications and output data.

```

{
  "source-ref": "s3://amzn-s3-demo-bucket/image_example.png",
  "bounding-box-attribute-name":
  {
    "image_size": [{ "width": 500, "height": 400, "depth": 3}],
    "annotations":
    [
      { "class_id": 0, "left": 111, "top": 134,
        "width": 61, "height": 128},
      { "class_id": 5, "left": 161, "top": 250,
        "width": 30, "height": 30},
      { "class_id": 5, "left": 20, "top": 20,
        "width": 30, "height": 30}
    ]
  },
  "bounding-box-attribute-name-metadata":
  {
    "objects":
    [
      { "confidence": 0.8},
      { "confidence": 0.9},
      { "confidence": 0.9}
    ],
    "class-map":
    {
      "0": "dog",
      "5": "bone"
    }
  },
}

```

```

    "type": "groundtruth/object-detection",
    "human-annotated": "yes",
    "creation-date": "2018-10-18T22:18:13.527256",
    "job-name": "identify-dogs-and-toys"
  },
  "verify-bounding-box-attribute-name": "1",
  "verify-bounding-box-attribute-name-metadata":
  {
    "class-name": "bad",
    "confidence": 0.93,
    "type": "groundtruth/label-verification",
    "job-name": "verify-bounding-boxes",
    "human-annotated": "yes",
    "creation-date": "2018-11-20T22:18:13.527256",
    "worker-feedback": [
      {"comment": "The bounding box on the bird is too wide on the right side."},
      {"comment": "The bird on the upper right is not labeled."}
    ]
  }
}

```

Although the type on the original bounding box output was `groundtruth/object-detection`, the new type is `groundtruth/label-verification`. Also note that the `worker-feedback` array provides worker comments. If the worker doesn't provide comments, the empty fields are excluded during consolidation.

## Semantic Segmentation Job Output

The following is the output manifest file from a semantic segmentation labeling job. The value of the label for this job is a reference to a PNG file in an Amazon S3 bucket.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. For more information, see [Semantic Segmentation Algorithm](#).

The red, italicized text in the examples below depends on labeling job specifications and output data.

```

{
  "source-ref": "s3://amzn-s3-demo-bucket/example_city_image.png",
  "city-streets-ref": "S3 bucket location",
  "city-streets-ref-metadata": {
    "internal-color-map": {

```

```

    "0": {
      "class-name": "BACKGROUND",
      "confidence": 0.9,
      "hex-color": "#ffffff"
    },
    "1": {
      "class-name": "buildings",
      "confidence": 0.9,
      "hex-color": "#2acf59"
    },
    "2": {
      "class-name": "road",
      "confidence": 0.9,
      "hex-color": "#f28333"
    }
  },
  "type": "groundtruth/semantic-segmentation",
  "human-annotated": "yes",
  "creation-date": "2018-10-18T22:18:13.527256",
  "job-name": "label-city-streets",
},
"verify-city-streets-ref": "1",
"verify-city-streets-ref-metadata":
{
  "class-name": "bad",
  "confidence": 0.93,
  "type": "groundtruth/label-verification",
  "job-name": "verify-city-streets",
  "human-annotated": "yes",
  "creation-date": "2018-11-20T22:18:13.527256",
  "worker-feedback": [
    {"comment": "The mask on the leftmost building is assigned the wrong side of the road."},
    {"comment": "The curb of the road is not labeled but the instructions say otherwise."}
  ]
}
}

```

Confidence is scored on a per-image basis. Confidence scores are the same across all classes within an image.

The output of a semantic segmentation adjustment job looks similar to the following JSON.

```
{
  "source-ref": "s3://amzn-s3-demo-bucket/example_city_image.png",
  "city-streets-ref": "S3 bucket location",
  "city-streets-ref-metadata": {
    "internal-color-map": {
      "0": {
        "class-name": "BACKGROUND",
        "confidence": 0.9,
        "hex-color": "#ffffff"
      },
      "1": {
        "class-name": "buildings",
        "confidence": 0.9,
        "hex-color": "#2acf59"
      },
      "2": {
        "class-name": "road",
        "confidence": 0.9,
        "hex-color": "#f28333"
      }
    }
  },
  "type": "groundtruth/semantic-segmentation",
  "human-annotated": "yes",
  "creation-date": "2018-10-18T22:18:13.527256",
  "job-name": "label-city-streets",
  "adjusted-city-streets-ref": "s3://amzn-s3-demo-bucket/example_city_image.png",
  "adjusted-city-streets-ref-metadata": {
    "internal-color-map": {
      "0": {
        "class-name": "BACKGROUND",
        "confidence": 0.9,
        "hex-color": "#ffffff"
      },
      "1": {
        "class-name": "buildings",
        "confidence": 0.9,
        "hex-color": "#2acf59"
      },
      "2": {
        "class-name": "road",
        "confidence": 0.9,
        "hex-color": "#f28333"
      }
    }
  }
}
```

```

    }
  },
  "type": "groundtruth/semantic-segmentation",
  "human-annotated": "yes",
  "creation-date": "2018-11-20T22:18:13.527256",
  "job-name": "adjust-label-city-streets",
}
}

```

## Video frame object detection output

The following is the output manifest file from a video frame object detection labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. The metadata also includes job-name which is the name you assigned to the labeling job. For adjustment tasks, if one or more bounding boxes were modified, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted.

```

{
  "source-ref": "s3://amzn-s3-demo-bucket/example-path/input-manifest.json",
  "CarObjectDetection-ref": "s3://amzn-s3-demo-bucket/output/labeling-job-name/
annotations/consolidated-annotation/output/0/SeqLabel.json",
  "CarObjectDetection-ref-metadata": {
    "class-map": {
      "0": "car",
      "1": "bus"
    },
  },
  "job-name": "labeling-job/labeling-job-name",
  "human-annotated": "yes",
  "creation-date": "2021-09-29T05:50:35.566000",
  "type": "groundtruth/video-object-detection"
}
}

```

Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:

- All annotations for all frames in a sequence in the detection-annotations list of JSON objects.
- For each frame that was annotated by a worker, the frame file name (`frame`), number (`frame-no`), a list of JSON objects containing annotations (`annotations`), and if applicable, frame-attributes. The name of this list is defined by the task type you use: `polylines`, `polygons`, `keypoints`, and for bounding boxes, `annotations`.

Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you'll see for each video frame task type.

Task Type	Parameters
Bounding Box	<p>Box dimensions: height and width</p> <p>Box top, left corner pixel location: top and left</p>
Keypoint	Keypoint vertices: { "x": int, "y": int }
Polygon	<p>A list of polygon vertices: vertices</p> <p>Polygon vertices: { "x": int, "y": int }</p> <p>A polygon is a closed shape and so the first point will also represent the last point.</p>
Polyline	<p>A list of polyline vertices: vertices</p> <p>Polyline vertices: { "x": int, "y": int }</p>

In addition to task type specific values, you will see the following in each JSON object:

- Values of any `label-category-attributes` that were specified for that label.
- The `class-id` of the box. Use the `class-map` in the output manifest file to see which label category this ID maps to.

The following is an example of a `SeqLabel.json` file from a bounding box video frame object detection labeling job. This file will be located under `s3://amzn-s3-demo-bucket/output-prefix/annotations/consolidated-annotation/output/annotation-number/`

```
{
  "detection-annotations": [
    {
      "annotations": [
        {
          "height": 41,
          "width": 53,
          "top": 152,
          "left": 339,
          "class-id": "1",
          "label-category-attributes": {
            "occluded": "no",
            "size": "medium"
          }
        },
        {
          "height": 24,
          "width": 37,
          "top": 148,
          "left": 183,
          "class-id": "0",
          "label-category-attributes": {
            "occluded": "no",
          }
        }
      ],
      "frame-no": 0,
      "frame": "frame_0000.jpeg",
      "frame-attributes": {name: value, name: value}
    },
    {
      "annotations": [
        {
          "height": 41,
          "width": 53,
          "top": 152,
          "left": 341,
          "class-id": "0",
          "label-category-attributes": {}
        }
      ]
    }
  ]
}
```

```

    },
    {
      "height": 24,
      "width": 37,
      "top": 141,
      "left": 177,
      "class-id": "0",
      "label-category-attributes": {
        "occluded": "no",
      }
    }
  ],
  "frame-no": 1,
  "frame": "frame_0001.jpeg",
  "frame-attributes": {name: value, name: value}
}
]
}

```

## Video frame object tracking output

The following is the output manifest file from a video frame object tracking labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence of frames. The metadata also includes job-name which is the name you assigned to the labeling job. For adjustment tasks, if one or more bounding boxes were modified, there is an adjustment-status parameter in the metadata for audit workflows that is set to adjusted.

```

{
  "source-ref": "s3://amzn-s3-demo-bucket/example-path/input-manifest.json",
  "CarObjectTracking-ref": "s3://amzn-s3-demo-bucket/output/labeling-job-name/
annotations/consolidated-annotation/output/0/SeqLabel.json",
  "CarObjectTracking-ref-metadata": {
    "class-map": {
      "0": "car",
      "1": "bus"
    },
  },
  "job-name": "labeling-job/labeling-job-name",
  "human-annotated": "yes",
  "creation-date": "2021-09-29T05:50:35.566000",
  "type": "groundtruth/video-object-tracking"
}

```

```
}
  }
}
```

Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:

- All annotations for all frames in a sequence in the `tracking-annotations` list of JSON objects.
- For each frame that was annotated by a worker, the frame (`frame`), number (`frame-no`), a list of JSON objects containing annotations (`annotations`), and if applicable, frame attributes (`frame-attributes`). The name of this list is defined by the task type you use: `polylines`, `polygons`, `keypoints`, and for bounding boxes, `annotations`.

Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you'll see for each video frame task type.

Task Type	Parameters
Bounding Box	Box dimensions: <code>height</code> and <code>width</code>  Box top, left corner pixel location: <code>top</code> and <code>left</code>
Keypoint	Keypoint vertices: { <code>"x": int, "y": int</code> }
Polygon	A list of polygon vertices: <code>vertices</code> Polygon vertices: { <code>"x": int, "y": int</code> }  A polygon is a closed shape and so the first point will also represent the last point.
Polyline	A list of polyline vertices: <code>vertices</code> Polyline vertices: { <code>"x": int, "y": int</code> }

In addition to task type specific values, you will see the following in each JSON object:

- Values of any `label-category-attributes` that were specified for that label.
- The `class-id` of the box. Use the `class-map` in the output manifest file to see which label category this ID maps to.
- An `object-id` which identifies an instance of a label. This ID will be the same across frames if a worker identified the same instance of an object in multiple frames. For example, if a car appeared in multiple frames, all bounding boxes uses to identify that car would have the same `object-id`.
- The `object-name` which is the instance ID of that annotation.

The following is an example of a `SeqLabel.json` file from a bounding box video frame object tracking labeling job. This file will be located under `s3://amzn-s3-demo-bucket/output-prefix/annotations/consolidated-annotation/output/annotation-number/`

```
{
  "tracking-annotations": [
    {
      "annotations": [
        {
          "height": 36,
          "width": 46,
          "top": 178,
          "left": 315,
          "class-id": "0",
          "label-category-attributes": {
            "occluded": "no"
          },
          "object-id": "480dc450-c0ca-11ea-961f-a9b1c5c97972",
          "object-name": "car:1"
        }
      ],
      "frame-no": 0,
      "frame": "frame_0001.jpeg",

### 3D point cloud semantic segmentation output

The following is the output manifest file from a 3D point cloud semantic segmentation labeling job.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. Additionally, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted` if the color mask is modified. If you added one or more `frameAttributes` to your label category configuration file, worker responses for frame attributes are in the JSON object, `dataset-object-attributes`.

The `your-label-attribute-ref` parameter contains the location of a compressed file with a `.zlib` extension. When you uncompress this file, it contains an array. Each index in the array corresponds to the index of an annotated point in the input point cloud. The value of the array at a given index gives the class of the point at the same index in the point cloud, based on the semantic color map found in the `color-map` parameter of the metadata.

You can use Python code similar to the following to decompress a `.zlib` file:

```
import zlib
from array import array

# read the label file
compressed_binary_file = open(zlib_file_path/file.zlib, 'rb').read()

# uncompress the label file
binary_content = zlib.decompress(compressed_binary_file)

# load labels to an array
my_int_array_data = array('B', binary_content);

print(my_int_array_data)
```

The code block above will produce an output similar to the following. Each element of the printed array contains the class of a point at that index in the point cloud. For example, `my_int_array_data[0] = 1` means `point[0]` in the input point cloud has a class 1. In the following output manifest file example, class 0 corresponds with "Background", 1 with Car, and 2 with Pedestrian.

```
>> array('B', [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2])
```

The following is an example of a semantic segmentation 3D point cloud labeling job output manifest file. The red, italicized text in the examples below depends on labeling job specifications and output data.

### 3D point cloud object detection output

The following is sample output from a 3D point cloud object detection job. For this task type, the data about 3D cuboids is returned in the 3d-bounding-box parameter, in a list named annotations. In this list, each 3D cuboid is described using the following information.

- Each class, or label category, that you specify in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- These classes are used to give each 3D cuboid an `object-name` in the format `<class>:<integer>` where `integer` is a unique number to identify that cuboid in the frame.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

### Note

`yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):

```
old_yaw_in_output = pi - yaw
```

- In our definition, `+x` is to the right, `+y` is to the forward, and `+z` is up from the ground plane. The rotation order is `x - y - z`. The `roll`, `pitch` and `yaw` are represented in the right-handed Cartesian system. In 3D space, `roll` is along the `x`-axis, `pitch` is along the `y`-axis and `yaw` is along the `z`-axis. All three are counterclockwise.
- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`. If you added one or more `frameAttributes` to your label category configuration file, worker responses for frame attributes are in the JSON object, `dataset-object-attributes`.

The *red, italicized text* in the examples below depends on labeling job specifications and output data. The ellipses (...) denote a continuation of that list, where additional objects with the same format as the preceding object can appear.

### 3D point cloud object tracking output

The following is an example of an output manifest file from a 3D point cloud object tracking labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data. The ellipses (...) denote a continuation of that list, where additional objects with the same format as the preceding object can appear.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`.

```

{
  "source-ref": "s3://amzn-s3-demo-bucket/myfolder/seq1.json",
  "lidar-label-attribute-ref": "s3://amzn-s3-demo-bucket/<labelingJobName>/
annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json",
  "lidar-label-attribute-ref-metadata": {
    "objects":
    [
      {
        "frame-no": 300,
        "confidence": []
      },
      {
        "frame-no": 301,
        "confidence": []
      },
      ...
    ],
    'class-map': {'0': 'Car', '1': 'Person'},
    'type': 'groundtruth/point_cloud_object_tracking',

```

```
'human-annotated': 'yes',  
'creation-date': '2019-11-12T01:18:14.271944',  
'job-name': 'identify-3d-objects',  
'adjustment-status': "adjusted"  
}  
}
```

In the above example, the cuboid data for each frame in `seq1.json` is in `SeqLabel.json` in the Amazon S3 location, `s3://amzn-s3-demo-bucket/<LabelingJobName>/annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json`. The following is an example of this label sequence file.

For each frame in the sequence, you see the `frame-number`, `frame-name`, if applicable, `frame-attributes`, and a list of annotations. This list contains 3D cuboids that were drawn for that frame. Each annotation includes the following information:

- An `object-name` in the format `<class>:<integer>` where `class` identifies the label category and `integer` is a unique ID across the dataset.
- When workers draw a cuboid, it is associated with a unique `object-id` which is associated with all cuboids that identify the same object across multiple frames.
- Each class, or label category, that you specified in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

### Note

`yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):

```
old_yaw_in_output = pi - yaw
```

- In our definition, `+x` is to the right, `+y` is to the forward, and `+z` is up from the ground plane. The rotation order is `x - y - z`. The `roll`, `pitch` and `yaw` are represented in the right-handed

Cartesian system. In 3D space, roll is along the x-axis, pitch is along the y-axis and yaw is along the z-axis. All three are counterclockwise.

- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

In the above example, the cuboid data for each frame in `seq2.json` is in `SeqLabel.json` in the Amazon S3 location, `s3://amzn-s3-demo-bucket/<labelingJobName>/annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json`. The following is an example of this label sequence file.

For each frame in the sequence, you see the `frame-number`, `frame-name`, if applicable, `frame-attributes`, and a list of annotations. This list contains 3D cuboids that were drawn for that frame. Each annotation includes the following information:

- An `object-name` in the format `<class>:<integer>` where `class` identifies the label category and `integer` is a unique ID across the dataset.
- When workers draw a cuboid, it is associated with a unique `object-id` which is associated with all cuboids that identify the same object across multiple frames.
- Each class, or label category, that you specified in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

#### Note

`yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):

```
old_yaw_in_output = pi - yaw
```

- In our definition, `+x` is to the right, `+y` is to the forward, and `+z` is up from the ground plane. The rotation order is `x - y - z`. The `roll`, `pitch` and `yaw` are represented in the right-handed Cartesian system. In 3D space, `roll` is along the `x`-axis, `pitch` is along the `y`-axis and `yaw` is along the `z`-axis. All three are counterclockwise.
- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

The cuboid and bounding box for an object are linked through a common object-id.

## Enhanced data labeling

Amazon SageMaker Ground Truth manages sending your data objects to workers to be labeled. Labeling each data object is a *task*. Workers complete each task until the entire labeling job is complete. Ground Truth divides the total number of tasks into smaller *batches* that are sent to workers. A new batch is sent to workers when the previous one is finished.

Ground Truth provides two features that help improve the accuracy of your data labels and reduce the total cost of labeling your data:

- *Annotation consolidation* helps to improve the accuracy of your data object labels. It combines the results of multiple workers' annotation tasks into one high-fidelity label.
- *Automated data labeling* uses machine learning to label portions of your data automatically without having to send them to human workers.

## Topics

- [Control the flow of data objects sent to workers](#)
- [Annotation consolidation](#)
- [Automate data labeling](#)
- [Chaining labeling jobs](#)

## Control the flow of data objects sent to workers

Depending on the type of labeling job you create, Amazon SageMaker Ground Truth sends data objects to workers in batches or in a streaming fashion. You can control the flow of data objects to workers in the following ways:

- For both types of labeling jobs, you can use `MaxConcurrentTaskCount` to control the total number of data objects available to all workers at a given point in time when the labeling job is running.
- For streaming labeling jobs, you can control the flow of data objects to workers by monitoring and controlling the number of data objects sent to the Amazon SQS associated with your labeling job.

Use the following sections to learn more about these options.

## Topics

- [Use `MaxConcurrentTaskCount` to control the flow of data objects](#)
- [Use Amazon SQS to control the flow of data objects to streaming labeling jobs](#)

## Use `MaxConcurrentTaskCount` to control the flow of data objects

`MaxConcurrentTaskCount` defines the maximum number of data objects available at one time in the worker-portal task queue. If you use the console, this parameter is set to 1,000. If you use `CreateLabelingJob`, you can set this parameter to any integer between 1 and 5,000, inclusive.

Use the following example to better understand how the number of entries in your manifest file, the `NumberOfHumanWorkersPerDataObject`, and the `MaxConcurrentTaskCount` define what tasks workers see in their task queue in the worker-portal UI.

1. You have an input manifest files with 600 entries.
2. For each entry in your input manifest file, you can use `NumberOfHumanWorkersPerDataObject` to define the number of human workers that will label an entry from your input manifest file. In this example, you set `NumberOfHumanWorkersPerDataObject` equal to 3. This will create 3 different tasks for each entry in your input manifest file. Also, to be marked as successfully labeled, at least 3 different workers must label the object. This creates a total of 1,800 tasks (600 x 3) to be completed by workers.
3. You want workers to only see 100 tasks at a time in their queue in the worker portal UI. To do this, you set `MaxConcurrentTaskCount` equal to 100. Ground Truth will then fill the worker-portal task queue with 100 tasks per worker.
4. What happens next depends on the type of labeling job you are creating, and if it is a streaming labeling job.
  - **Streaming labeling job:** As long as the total number of objects available to workers is equal to `MaxConcurrentTaskCount`, all remaining dataset objects in your input manifest file and that you send in real time using Amazon SNS are placed on an Amazon SQS queue. When the total number of objects available to workers falls below `MaxConcurrentTaskCount` minus `NumberOfHumanWorkersPerDataObject`, a new data object from the queue is used to create `NumberOfHumanWorkersPerDataObject`-tasks, which are sent to workers in real time.
  - **Non-streaming labeling job:** As workers finish labeling one set of objects, up to `MaxConcurrentTaskCount` times `NumberOfHumanWorkersPerDataObject` number of new tasks will be sent to workers. This process is repeated until all data objects in the input manifest file are labeled.

## Use Amazon SQS to control the flow of data objects to streaming labeling jobs

When you create a streaming labeling job, an Amazon SQS queue is automatically created in your account. Data objects are only added to the Amazon SQS queue when the total number of objects sent to workers is above `MaxConcurrentTaskCount`. Otherwise, objects are sent directly to workers.

You can use this queue to manage the flow of data objects to your labeling job. To learn more, see [Manage labeling requests with an Amazon SQS queue](#).

## Annotation consolidation

An *annotation* is the result of a single worker's labeling task. *Annotation consolidation* combines the annotations of two or more workers into a single label for your data objects. A label, which is assigned to each object in the dataset, is a probabilistic estimate of what the true label should be. Each object in the dataset typically has multiple annotations, but only one label or set of labels.

You decide how many workers annotate each object in your dataset. Using more workers can increase the accuracy of your labels, but also increases the cost of labeling. To learn more about Ground Truth pricing, see [Amazon SageMaker Ground Truth pricing](#).

If you use the Amazon SageMaker AI console to create a labeling job, the following are the defaults for the number of workers who can annotate objects:

- Text classification—3 workers
- Image classification—3 workers
- Bounding boxes—5 workers
- Semantic segmentation—3 workers
- Named entity recognition—3 workers

When you use the [CreateLabelingJob](#) operation, you set the number of workers to annotate each data object with the `NumberOfHumanWorkersPerDataObject` parameter. You can override the default number of workers that annotate a data object using the console or the [CreateLabelingJob](#) operation.

Ground Truth provides an annotation consolidation function for each of its predefined labeling tasks: bounding box, image classification, name entity recognition, semantic segmentation, and text classification. These are the functions:

- Multi-class annotation consolidation for image and text classification uses a variant of the [Expectation Maximization](#) approach to annotations. It estimates parameters for each worker and uses Bayesian inference to estimate the true class based on the class annotations from individual workers.
- Bounding box annotation consolidates bounding boxes from multiple workers. This function finds the most similar boxes from different workers based on the [Jaccard index](#), or intersection over union, of the boxes and averages them.
- Semantic segmentation annotation consolidation treats each pixel in a single image as a multi-class classification. This function treats the pixel annotations from workers as "votes," with more information from surrounding pixels incorporated by applying a smoothing function to the image.
- Named entity recognition clusters text selections by Jaccard similarity and calculates selection boundaries based on the mode, or the median if the mode isn't clear. The label resolves to the most assigned entity label in the cluster, breaking ties by random selection.

You can use other algorithms to consolidate annotations. For information, see [Annotation consolidation function creation](#).

### Annotation consolidation function creation

You can choose to use your own annotation consolidation function to determine the final labels for your labeled objects. There are many possible approaches for writing a function and the approach that you take depends on the nature of the annotations to consolidate. Broadly, consolidation functions look at the annotations from workers, measure the similarity between them, and then use some form of probabilistic judgment to determine what the most probable label should be.

If you want to use other algorithms to create annotation consolidations functions, you can find the worker responses in the `[project-name]/annotations/worker-response` folder of the Amazon S3 bucket where you direct the job output.

### Assess similarity

To assess the similarity between labels, you can use one of the following strategies, or you can use one that meets your data labeling needs:

- For label spaces that consist of discrete, mutually exclusive categories, such as multi-class classification, assessing similarity can be straightforward. Discrete labels either match or do not match.

- For label spaces that don't have discrete values, such as bounding box annotations, find a broad measure of similarity. For bounding boxes, one such measure is the Jaccard index. This measures the ratio of the intersection of two boxes with the union of the boxes to assess how similar they are. For example, if there are three annotations, then there can be a function that determines which annotations represent the same object and should be consolidated.

## Assess the most probable label

With one of the strategies detailed in the previous sections in mind, make some sort of probabilistic judgment on what the consolidated label should be. In the case of discrete, mutually exclusive categories, this can be straightforward. One of the most common ways to do this is to take the results of a majority vote between the annotations. This weights the annotations equally.

Some approaches attempt to estimate the accuracy of different annotators and weight their annotations in proportion to the probability of correctness. An example of this is the Expectation Maximization method, which is used in the default Ground Truth consolidation function for multi-class annotations.

For more information about creating an annotation consolidation function, see [Processing data in a custom labeling workflow with AWS Lambda](#).

## Automate data labeling

If you choose, Amazon SageMaker Ground Truth can use active learning to automate the labeling of your input data for certain built-in task types. *Active learning* is a machine learning technique that identifies data that should be labeled by your workers. In Ground Truth, this functionality is called automated data labeling. Automated data labeling helps to reduce the cost and time that it takes to label your dataset compared to using only humans. When you use automated labeling, you incur SageMaker training and inference costs.

We recommend using automated data labeling on large datasets because the neural networks used with active learning require a significant amount of data for every new dataset. Typically, as you provide more data, the potential for high accuracy predictions goes up. Data will only be auto-labeled if the neural network used in the auto-labeling model can achieve an acceptably high level of accuracy. Therefore, with larger datasets, there is more potential to automatically label the data because the neural network can achieve high enough accuracy for auto-labeling. Automated data labeling is most appropriate when you have thousands of data objects. The minimum number of objects allowed for automated data labeling is 1,250, but we strongly suggest providing a minimum of 5,000 objects.

Automated data labeling is available only for the following Ground Truth built-in task types:

- [Create an image classification job \(Single Label\)](#)
- [Identify image contents using semantic segmentation](#)
- Object detection ([Classify image objects using a bounding box](#))
- [Categorize text with text classification \(Single Label\)](#)

[Streaming labeling jobs](#) do not support automated data labeling.

To learn how to create a custom active learning workflow using your own model, see [Set up an active learning workflow with your own model](#).

Input data quotas apply for automated data labeling jobs. See [Input Data Quotas](#) for information about dataset size, input data size and resolution limits.

#### Note

Before you use an the automated-labeling model in production, you need to fine-tune or test it, or both. You might fine-tune the model (or create and tune another supervised model of your choice) on the dataset produced by your labeling job to optimize the model's architecture and hyperparameters. If you decide to use the model for inference without fine-tuning it, we strongly recommend making sure that you evaluate its accuracy on a representative (for example, randomly selected) subset of the dataset labeled with Ground Truth and that it matches your expectations.

## How it works

You enable automated data labeling when you create a labeling job. This is how it works:

1. When Ground Truth starts an automated data labeling job, it selects a random sample of input data objects and sends them to human workers. If more than 10% of these data objects fail, the labeling job will fail. If the labeling job fails, in addition to reviewing any error message Ground Truth returns, check that your input data is displaying correctly in the worker UI, instructions are clear, and that you have given workers enough time to complete tasks.
2. When the labeled data is returned, it is used to create a training set and a validation set. Ground Truth uses these datasets to train and validate the model used for auto-labeling.

3. Ground Truth runs a batch transform job, using the validated model for inference on the validation data. Batch inference produces a confidence score and quality metric for each object in the validation data.
4. The auto labeling component will use these quality metrics and confidence scores to create a *confidence score threshold* that ensures quality labels.
5. Ground Truth runs a batch transform job on the unlabeled data in the dataset, using the same validated model for inference. This produces a confidence score for each object.
6. The Ground Truth auto labeling component determines if the confidence score produced in step 5 for each object meets the required threshold determined in step 4. If the confidence score meets the threshold, the expected quality of automatically labeling exceeds the requested level of accuracy and that object is considered auto-labeled.
7. Step 6 produces a dataset of unlabeled data with confidence scores. Ground Truth selects data points with low confidence scores from this dataset and sends them to human workers.
8. Ground Truth uses the existing human-labeled data and this additional labeled data from human workers to update the model.
9. The process is repeated until the dataset is fully labeled or until another stopping condition is met. For example, auto-labeling stops if your human annotation budget is reached.

The preceding steps happen in iterations. Select each tab in the following table to see an example of the processes that happen in each iteration for an object detection automated labeling job. The number of data objects used in a given step in these images (for example, 200) is specific to this example. If there are fewer than 5,000 objects to label, the validation set size is 20% of the whole dataset. If there are more than 5,000 objects in your input dataset, the validation set size is 10% of the whole dataset. You can control the number of human labels collected per active learning iteration by changing the value for [MaxConcurrentTaskCount](#) when using the API operation [CreateLabelingJob](#). This value is set to 1,000 when you create a labeling job using the console. In the active learning flow illustrated under the **Active Learning** tab, this value is set to 200.

## Model Training

## Automated Labeling

## Active Learning

## Accuracy of automated labels

The definition of *accuracy* depends on the built-in task type that you use with automated labeling. For all task types, these accuracy requirements are pre-determined by Ground Truth and cannot be manually configured.

- For image classification and text classification, Ground Truth uses logic to find a label-prediction confidence level that corresponds to at least 95% label accuracy. This means Ground Truth expects the accuracy of the automated labels to be at least 95% when compared to the labels that human labelers would provide for those examples.
- For bounding boxes, the expected mean [Intersection Over Union \(IoU\)](#) of the auto-labeled images is 0.6. To find the mean IoU, Ground Truth calculates the mean IoU of all the predicted and missed boxes on the image for every class, and then averages these values across classes.
- For semantic segmentation, the expected mean IoU of the auto-labeled images is 0.7. To find the mean IoU, Ground Truth takes the mean of the IoU values of all the classes in the image (excluding the background).

At every iteration of Active Learning (steps 3-6 in the list above), the confidence threshold is found using the human-annotated validation set so that the expected accuracy of the auto-labeled objects satisfies certain predefined accuracy requirements.

### Create an automated data labeling job (console)

To create a labeling job that uses automated labeling in the SageMaker AI console, use the following procedure.

#### To create an automated data labeling job (console)

1. Open the Ground Truth **Labeling jobs** section of the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.
2. Using [Create a Labeling Job \(Console\)](#) as a guide, complete the **Job overview** and **Task type** sections. Note that auto labeling is not supported for custom task types.
3. Under **Workers**, choose your workforce type.
4. In the same section, choose **Enable automated data labeling**.
5. Using [Configure the Bounding Box Tool](#) as a guide, create worker instructions in the section **Task Type labeling tool**. For example, if you chose **Semantic segmentation** as your labeling job type, this section is called **Semantic segmentation labeling tool**.

6. To preview your worker instructions and dashboard, choose **Preview**.
7. Choose **Create**. This creates and starts your labeling job and the auto labeling process.

You can see your labeling job appear in the **Labeling jobs** section of the SageMaker AI console. Your output data appears in the Amazon S3 bucket that you specified when creating the labeling job. For more information about the format and file structure of your labeling job output data, see [Labeling job output data](#).

### Create an automated data labeling job (API)

To create an automated data labeling job using the SageMaker API, use the [LabelingJobAlgorithmsConfig](#) parameter of the [CreateLabelingJob](#) operation. To learn how to start a labeling job using the `CreateLabelingJob` operation, see [Create a Labeling Job \(API\)](#).

Specify the Amazon Resource Name (ARN) of the algorithm that you are using for automated data labeling in the [LabelingJobAlgorithmSpecificationArn](#) parameter. Choose from one of the four Ground Truth built-in algorithms that are supported with automated labeling:

- [Create an image classification job \(Single Label\)](#)
- [Identify image contents using semantic segmentation](#)
- Object detection ([Classify image objects using a bounding box](#))
- [Categorize text with text classification \(Single Label\)](#)

When an automated data labeling job finishes, Ground Truth returns the ARN of the model it used for the automated data labeling job. Use this model as the starting model for similar auto-labeling job types by providing the ARN, in string format, in the [InitialActiveLearningModelArn](#) parameter. To retrieve the model's ARN, use an AWS Command Line Interface (AWS CLI) command similar to the following.

```
# Fetch the mARN of the model trained in the final iteration of the previous labeling
job.Ground Truth
pretrained_model_arn = sagemaker_client.describe_labeling_job(LabelingJobName=job_name)
['LabelingJobOutput']['FinalActiveLearningModelArn']
```

To encrypt data on the storage volume attached to the ML compute instance(s) that are used in automated labeling, include an AWS Key Management Service (AWS KMS) key in the

`VolumeKmsKeyId` parameter. For information about AWS KMS keys, see [What is AWS Key Management Service?](#) in the *AWS Key Management Service Developer Guide*.

For an example that uses the [CreateLabelingJob](#) operation to create an automated data labeling job, see the **object\_detection\_tutorial** example in the **SageMaker AI Examples, Ground Truth Labeling Jobs** section of a SageMaker AI notebook instance. To learn how to create and open a notebook instance, see [Create an Amazon SageMaker notebook instance](#). To learn how to access SageMaker AI example notebooks, see [Access example notebooks](#).

### Amazon EC2 instances required for automated data labeling

The following table lists the Amazon Elastic Compute Cloud (Amazon EC2) instances that you need to run automated data labeling for training and batch inference jobs.

Automated Data Labeling Job Type	Training Instance Type	Inference Instance Type
Image classification	ml.p3.2xlarge*	ml.c5.xlarge
Object detection (bounding box)	ml.p3.2xlarge*	ml.c5.4xlarge
Text classification	ml.c5.2xlarge	ml.m4.xlarge
Semantic segmentation	ml.p3.2xlarge*	ml.p3.2xlarge*

\* In the Asia Pacific (Mumbai) Region (ap-south-1) use ml.p2.8xlarge instead.

Ground Truth manages the instances that you use for automated data labeling jobs. It creates, configures, and terminates the instances as needed to perform your job. These instances don't appear in your Amazon EC2 instance dashboard.

### Set up an active learning workflow with your own model

You can create an active learning workflow with your own algorithm to run training and inferences in that workflow to auto-label your data. The notebook `bring_your_own_model_for_sagemaker_labeling_workflows_with_active_learning.ipynb` demonstrates this using the SageMaker AI built-in algorithm, [BlazingText](#). This notebook provides an AWS CloudFormation stack that you can use to execute this workflow using AWS Step Functions. You can find the notebook and supporting files in this [GitHub repository](#).

You can also find this notebook in the SageMaker AI Examples repository. See [Use Example Notebooks](#) to learn how to find an Amazon SageMaker AI example notebook.

## Chaining labeling jobs

Amazon SageMaker Ground Truth can reuse datasets from prior jobs in two ways: cloning and chaining.

*Cloning* copies the setup of a prior labeling job and allows you to make additional changes before setting it to run.

*Chaining* uses not only the setup of the prior job, but also the results. This allows you to continue an incomplete job and add labels or data objects to a completed job. Chaining is a more complex operation.

For data processing:

- Cloning uses the prior job's *input* manifest, with optional modifications, as the new job's input manifest.
- Chaining uses the prior job's *output* manifest as the new job's input manifest.

Chaining is useful when you need to:

- Continue a labeling job that was manually stopped.
- Continue a labeling job that failed mid-job, after fixing issues.
- Switch to automated data labeling after manually labeling part of a job (or the other way around).
- Add more data objects to a completed job and start the job from there.
- Add another annotation to a completed job. For example, you have a collection of phrases labeled for topic, then want to run the set again, categorizing them by the topic's implied audience.

In Amazon SageMaker Ground Truth you can configure a chained labeling job with either the console or the API.

### Key term: label attribute name

The *label attribute name* (`LabelAttributeName` in the API) is a string used as the key for the key-value pair formed with the label that a worker assigns to the data object.

The following rules apply for the label attribute name:

- It can't end with `-metadata`.
- The names `source` and `source-ref` are reserved and can't be used.
- For semantic segmentation labeling jobs, it must end with `-ref`. For all other labeling jobs, it *can't* end with `-ref`. If you use the console to create the job, Amazon SageMaker Ground Truth automatically appends `-ref` to all label attribute names except for semantic segmentation jobs.
- For a chained labeling job, if you're using the same label attribute name from the originating job and you configure the chained job to use auto-labeling, then if it had been in auto-labeling mode at any point, Ground Truth uses the model from the originating job.

In an output manifest, the label attribute name appears similar to the following.

```
"source-ref": "<S3 URI>",
"<label attribute name>": {
  "annotations": [{
    "class_id": 0,
    "width": 99,
    "top": 87,
    "height": 62,
    "left": 175
  }],
  "image_size": [{
    "width": 344,
    "depth": 3,
    "height": 234
  }]
},
"<label attribute name>-metadata": {
  "job-name": "<job name>",
  "class-map": {
    "0": "<label attribute name>"
  },
  "human-annotated": "yes",
  "objects": [{
    "confidence": 0.09
  }],
  "creation-date": "<timestamp>",
  "type": "groundtruth/object-detection"
}
```

If you're creating a job in the console and don't explicitly set the label attribute name value, Ground Truth uses the job name as the label attribute name for the job.

### Start a chained job (console)

Choose a stopped, failed, or completed labeling job from the list of your existing jobs. This enables the **Actions** menu.

From the **Actions** menu, choose **Chain**.

### Job overview panel

In the **Job overview** panel, a new **Job name** is set based on the title of the job from which you are chaining this one. You can change it.

You may also specify a label attribute name different from the labeling job name.

If you're chaining from a completed job, the label attribute name uses the name of the new job you're configuring. To change the name, select the check box.

If you're chaining from a stopped or failed job, the label attribute name uses to the name of the job from which you're chaining. It's easy to see and edit the value because the name check box is checked.

#### **Attribute label naming considerations**

- **The default** uses the label attribute name Ground Truth has selected. All data objects without data connected to that label attribute name are labeled.
- **Using a label attribute name** not present in the manifest causes the job to process *all* the objects in the dataset.

The **input dataset location** in this case is automatically selected as the output manifest of the chained job. The input field is not available, so you cannot change it.

#### **Adding data objects to a labeling job**

You cannot specify an alternate manifest file. Manually edit the output manifest from the previous job to add new items before starting a chained job. The Amazon S3 URI helps you locate where you are storing the manifest in your Amazon S3 bucket. Download the manifest file from there, edit it locally on your computer, and then upload the new version

to replace it. Make sure you are not introducing errors during editing. We recommend you use JSON linter to check your JSON. Many popular text editors and IDEs have linter plugins available.

## Start a chained job (API)

The procedure is almost the same as setting up a new labeling job with `CreateLabelingJob`, except for two primary differences:

- **Manifest location:** Rather than use your original manifest from the prior job, the value for the `ManifestS3Uri` in the `DataSource` should point to the Amazon S3 URI of the *output manifest* from the prior labeling job.
- **Label attribute name:** Setting the correct `LabelAttributeName` value is important here. This is the key portion of a key-value pair where labeling data is the value. Sample use cases include:
  - **Adding new or more specific labels to a completed job** — Set a new label attribute name.
  - **Labeling the unlabeled items from a prior job** — Use the label attribute name from the prior job.

## Use a partially labeled dataset

You can get some chaining benefits if you use an augmented manifest that has already been partially labeled. Check the **Label attribute name** check box and set the name so that it matches the name in your manifest.

If you're using the API, the instructions are the same as those for starting a chained job. However, be sure to upload your manifest to an Amazon S3 bucket and use it instead of using the output manifest from a prior job.

The **Label attribute name** value in the manifest has to conform to the naming considerations discussed earlier.

## Ground Truth Security and Permissions

Use the topics on this page to learn about Ground Truth security features and how to configure AWS Identity and Access Management (IAM) permissions to allow a user or role to create a labeling job. Additionally, learn how to create an *execution role*. An execution role is the role that you specify when you create a labeling job. This role is used to start your labeling job.

If you are a new user and want to get started quickly, or if you do not require granular permissions, see [Use IAM Managed Policies with Ground Truth](#).

For more information about IAM users and roles, see [Identities \(Users, Groups, and Roles\)](#) in the IAM User Guide.

To learn more about using IAM with SageMaker AI, see [AWS Identity and Access Management for Amazon SageMaker AI](#).

## Topics

- [CORS Requirement for Input Image Data](#)
- [Assign IAM Permissions to Use Ground Truth](#)
- [Using Amazon SageMaker Ground Truth in an Amazon Virtual Private Cloud](#)
- [Output Data and Storage Volume Encryption](#)
- [Workforce Authentication and Restrictions](#)

## CORS Requirement for Input Image Data

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as [EXIF data](#). Previously, browsers would always display images in exactly the manner in which they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called *orientation value*. This has important implications for the entire machine learning (ML) community. For example, if applications that annotate images do not consider the EXIF orientation, they may display images in unexpected orientations, resulting in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a labeling job, you must add a CORS header policy to the Amazon S3 buckets that contain your input images.

### Important

If you do not add a CORS configuration to the Amazon S3 buckets that contain your input data, labeling tasks for those input data objects will fail.

If you create a job through the Ground Truth console, CORS is enabled by default. If all of your input data is *not* located in the same Amazon S3 bucket as your input manifest file, you must add a CORS configuration to all Amazon S3 buckets that contain input data using the following instructions.

If you are using the `CreateLabelingJob` API to create a Ground Truth labeling job, you can add a CORS policy to an Amazon S3 bucket that contains input data in the S3 console. To set the required CORS headers on the Amazon S3 bucket that contain your input images in the Amazon S3 console, follow the directions detailed in [How do I add cross-domain resource sharing with CORS?](#). Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

### Important

If you create a 3D point cloud or video frame labeling job, you must add additional rules to your CORS configuration. To learn more, see [3D point cloud labeling job permission requirements](#) and [Video frame job permission requirements](#) respectively.

## JSON

```
[{
  "AllowedHeaders": [],
  "AllowedMethods": ["GET"],
  "AllowedOrigins": ["*"],
  "ExposeHeaders": ["Access-Control-Allow-Origin"]
}]
```

## XML

```
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
  </CORSRule>
</CORSConfiguration>
```

## Assign IAM Permissions to Use Ground Truth

Use the topics in this section to learn how to use AWS Identity and Access Management (IAM) managed and custom policies to manage access to Ground Truth and associated resources.

You can use the sections on this page to learn the following:

- How to create IAM policies that grant a user or role permission to create a labeling job. Administrators can use IAM policies to restrict access to Amazon SageMaker AI and other AWS services that are specific to Ground Truth.
- How to create a SageMaker AI *execution role*. An execution role is the role that you specify when you create a labeling job. The role is used to start and manage your labeling job.

The following is an overview of the topics you'll find on this page:

- If you are getting started using Ground Truth, or you do not require granular permissions for your use case, it is recommended that you use the IAM managed policies described in [Use IAM Managed Policies with Ground Truth](#).
- Learn about the permissions required to use the Ground Truth console in [Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console](#). This section includes policy examples that grant an IAM entity permission to create and modify private work teams, subscribe to vendor work teams, and create custom labeling workflows.
- When you create a labeling job, you must provide an execution role. Use [Create a SageMaker AI Execution Role for a Ground Truth Labeling Job](#) to learn about the permissions required for this role.

### Use IAM Managed Policies with Ground Truth

SageMaker AI and Ground Truth provide AWS managed policies that you can use to create a labeling job. If you are getting started using Ground Truth and you do not require granular permissions for your use case, it is recommended that you use the following policies:

- [AmazonSageMakerFullAccess](#) – Use this policy to give a user or role permission to create a labeling job. This is a broad policy that grants a entity permission to use SageMaker AI features, as well as features of necessary AWS services through the console and API. This policy gives the entity permission to create a labeling job and to create and manage workforces using Amazon Cognito. To learn more, see [AmazonSageMakerFullAccess Policy](#).

- [AmazonSageMakerGroundTruthExecution](#) – To create an *execution role*, you can attach the policy [AmazonSageMakerGroundTruthExecution](#) to a role. An execution role is the role that you specify when you create a labeling job and it is used to start your labeling job. This policy allows you to create both streaming and non-streaming labeling jobs, and to create a labeling job using any task type. Note the following limits of this managed policy.
  - **Amazon S3 permissions:** This policy grants an execution role permission to access Amazon S3 buckets with the following strings in the name: `GroundTruth`, `Groundtruth`, `groundtruth`, `SageMaker`, `Sagemaker`, and `sagemaker` or a bucket with an [object tag](#) that includes `SageMaker` in the name (case insensitive). Make sure your input and output bucket names include these strings, or add additional permissions to your execution role to [grant it permission to access your Amazon S3 buckets](#). You must give this role permission to perform the following actions on your Amazon S3 buckets: `AbortMultipartUpload`, `GetObject`, and `PutObject`.
  - **Custom Workflows:** When you create a [custom labeling workflow](#), this execution role is restricted to invoking AWS Lambda functions with one of the following strings as part of the function name: `GtRecipe`, `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`. This applies to both your pre-annotation and post-annotation Lambda functions. If you choose to use names without those strings, you must explicitly provide `lambda:InvokeFunction` permission to the execution role used to create the labeling job.

To learn how to attach an AWS managed policy to a user or role, refer to [Adding and removing IAM identity permissions](#) in the IAM User Guide.

## Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console

To use the Ground Truth area of the SageMaker AI console, you need to grant permission to an entity to access SageMaker AI and other AWS services that Ground Truth interacts with. Required permissions to access other AWS services depends on your use-case:

- Amazon S3 permissions are required for all use cases. These permissions must grant access to the Amazon S3 buckets that contain input and output data.
- AWS Marketplace permissions are required to use a vendor workforce.
- Amazon Cognito permission are required for private work team setup.
- AWS KMS permissions are required to view available AWS KMS keys that can be used for output data encryption.

- IAM permissions are required to either list pre-existing execution roles, or to create a new one. Additionally, you must use add a `PassRole` permission to allow SageMaker AI to use the execution role chosen to start the labeling job.

The following sections list policies you may want to grant to a role to use one or more functions of Ground Truth.

## Topics

- [Ground Truth Console Permissions](#)
- [Custom Labeling Workflow Permissions](#)
- [Private Workforce Permissions](#)
- [Vendor Workforce Permissions](#)

## Ground Truth Console Permissions

To grant permission to a user or role to use the Ground Truth area of the SageMaker AI console to create a labeling job, attach the following policy to the user or role. The following policy will give an IAM role permission to create a labeling job using a [built-in task type](#) task type. If you want to create a custom labeling workflow, add the policy in [Custom Labeling Workflow Permissions](#) to the following policy. Each Statement included in the following policy is described below this code block.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "SageMakerApis",
      "Effect": "Allow",
      "Action": [
        "sagemaker:*"
      ],
      "Resource": "*"
    },
    {
      "Sid": "KmsKeysForCreateForms",
      "Effect": "Allow",
      "Action": [
        "kms:DescribeKey",
        "kms:ListAliases"
      ]
    }
  ]
}
```

```
    ],
    "Resource": "*"
  },
  {
    "Sid": "AccessAwsMarketplaceSubscriptions",
    "Effect": "Allow",
    "Action": [
      "aws-marketplace:ViewSubscriptions"
    ],
    "Resource": "*"
  },
  {
    "Sid": "SecretsManager",
    "Effect": "Allow",
    "Action": [
      "secretsmanager:CreateSecret",
      "secretsmanager:DescribeSecret",
      "secretsmanager:ListSecrets"
    ],
    "Resource": "*"
  },
  {
    "Sid": "ListAndCreateExecutionRoles",
    "Effect": "Allow",
    "Action": [
      "iam:ListRoles",
      "iam:CreateRole",
      "iam:CreatePolicy",
      "iam:AttachRolePolicy"
    ],
    "Resource": "*"
  },
  {
    "Sid": "PassRoleForExecutionRoles",
    "Effect": "Allow",
    "Action": [
      "iam:PassRole"
    ],
    "Resource": "*",
    "Condition": {
      "StringEquals": {
        "iam:PassedToService": "sagemaker.amazonaws.com"
      }
    }
  }
}
```

```

    },
    {
      "Sid": "GroundTruthConsole",
      "Effect": "Allow",
      "Action": [
        "groundtruthlabeling:*",
        "lambda:InvokeFunction",
        "lambda:ListFunctions",
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket",
        "s3:GetBucketCors",
        "s3:PutBucketCors",
        "s3:ListAllMyBuckets",
        "cognito-idp:AdminAddUserToGroup",
        "cognito-idp:AdminCreateUser",
        "cognito-idp:AdminDeleteUser",
        "cognito-idp:AdminDisableUser",
        "cognito-idp:AdminEnableUser",
        "cognito-idp:AdminRemoveUserFromGroup",
        "cognito-idp:CreateGroup",
        "cognito-idp:CreateUserPool",
        "cognito-idp:CreateUserPoolClient",
        "cognito-idp:CreateUserPoolDomain",
        "cognito-idp:DescribeUserPool",
        "cognito-idp:DescribeUserPoolClient",
        "cognito-idp:ListGroups",
        "cognito-idp:ListIdentityProviders",
        "cognito-idp:ListUsers",
        "cognito-idp:ListUsersInGroup",
        "cognito-idp:ListUserPoolClients",
        "cognito-idp:ListUserPools",
        "cognito-idp:UpdateUserPool",
        "cognito-idp:UpdateUserPoolClient"
      ],
      "Resource": "*"
    }
  ]
}

```

This policy includes the following statements. You can scope down any of these statements by adding specific resources to the Resource list for that statement.

## SageMakerApis

This statement includes `sagemaker:*`, which allows the user to perform all [SageMaker AI API actions](#). You can reduce the scope of this policy by restricting users from performing actions that are not used to create and monitoring a labeling job.

## KmsKeysForCreateForms

You only need to include this statement if you want to grant a user permission to list and select AWS KMS keys in the Ground Truth console to use for output data encryption. The policy above grants a user permission to list and select any key in the account in AWS KMS. To restrict the keys that a user can list and select, specify those key ARNs in `Resource`.

## SecretsManager

This statement gives the user permission to describe, list, and create resources in AWS Secrets Manager required to create the labeling job.

## ListAndCreateExecutionRoles

This statement gives a user permission to list (`ListRoles`) and create (`CreateRole`) IAM roles in your account. It also grants the user permission to create (`CreatePolicy`) policies and attach (`AttachRolePolicy`) policies to entities. These are required to list, select, and if required, create an execution role in the console.

If you have already created an execution role, and want to narrow the scope of this statement so that users can only select that role in the console, specify the ARNs of the roles you want the user to have permission to view in `Resource` and remove the actions `CreateRole`, `CreatePolicy`, and `AttachRolePolicy`.

## AccessAwsMarketplaceSubscriptions

These permissions are required to view and choose vendor work teams that you are already subscribed to when creating a labeling job. To give the user permission to *subscribe* to vendor work teams, add the statement in [Vendor Workforce Permissions](#) to the policy above

## PassRoleForExecutionRoles

This is required to give the labeling job creator permission to preview the worker UI and verify that input data, labels, and instructions display correctly. This statement gives an entity permissions to

pass the IAM execution role used to create the labeling job to SageMaker AI to render and preview the worker UI. To narrow the scope of this policy, add the role ARN of the execution role used to create the labeling job under Resource.

## GroundTruthConsole

- `groundtruthlabeling` – This allows a user to perform actions required to use certain features of the Ground Truth console. These include permissions to describe the labeling job status (`DescribeConsoleJob`), list all dataset objects in the input manifest file (`ListDatasetObjects`), filter the dataset if dataset sampling is selected (`RunFilterOrSampleDatasetJob`), and to generate input manifest files if automated data labeling is used (`RunGenerateManifestByCrawlingJob`). These actions are only available when using the Ground Truth console and cannot be called directly using an API.
- `lambda:InvokeFunction` and `lambda:ListFunctions` – these actions give users permission to list and invoke Lambda functions that are used to run a custom labeling workflow.
- `s3:*` – All Amazon S3 permissions included in this statement are used to view Amazon S3 buckets for [automated data setup](#) (`ListAllMyBuckets`), access input data in Amazon S3 (`ListBucket`, `GetObject`), check for and create a CORS policy in Amazon S3 if needed (`GetBucketCors` and `PutBucketCors`), and write labeling job output files to S3 (`PutObject`).
- `cognito-idp` – These permissions are used to create, view and manage and private workforce using Amazon Cognito. To learn more about these actions, refer to the [Amazon Cognito API References](#).

## Custom Labeling Workflow Permissions

Add the following statement to a policy similar to the one in [Ground Truth Console Permissions](#) to give a user permission to select pre-existing pre-annotation and post-annotation Lambda functions while [creating a custom labeling workflow](#).

```
{
  "Sid": "GroundTruthConsoleCustomWorkflow",
  "Effect": "Allow",
  "Action": [
    "lambda:InvokeFunction",
    "lambda:ListFunctions"
  ],
  "Resource": "*"
}
```

To learn how to give an entity permission to create and test pre-annotation and post-annotation Lambda functions, see [Required Permissions To Use Lambda With Ground Truth](#).

### Private Workforce Permissions

When added to a permissions policy, the following permission grants access to create and manage a private workforce and work team using Amazon Cognito. These permissions are not required to use an [OIDC IdP workforce](#).

```
{
  "Effect": "Allow",
  "Action": [
    "cognito-idp:AdminAddUserToGroup",
    "cognito-idp:AdminCreateUser",
    "cognito-idp:AdminDeleteUser",
    "cognito-idp:AdminDisableUser",
    "cognito-idp:AdminEnableUser",
    "cognito-idp:AdminRemoveUserFromGroup",
    "cognito-idp:CreateGroup",
    "cognito-idp:CreateUserPool",
    "cognito-idp:CreateUserPoolClient",
    "cognito-idp:CreateUserPoolDomain",
    "cognito-idp:DescribeUserPool",
    "cognito-idp:DescribeUserPoolClient",
    "cognito-idp:ListGroups",
    "cognito-idp:ListIdentityProviders",
    "cognito-idp:ListUsers",
    "cognito-idp:ListUsersInGroup",
    "cognito-idp:ListUserPoolClients",
    "cognito-idp:ListUserPools",
    "cognito-idp:UpdateUserPool",
    "cognito-idp:UpdateUserPoolClient"
  ],
  "Resource": "*"
}
```

To learn more about creating private workforce using Amazon Cognito, see [Amazon Cognito Workforces](#).

### Vendor Workforce Permissions

You can add the following statement to the policy in [Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console](#) to grant an entity permission to subscribe to a [vendor workforce](#).

```
{
  "Sid": "AccessAwsMarketplaceSubscriptions",
  "Effect": "Allow",
  "Action": [
    "aws-marketplace:Subscribe",
    "aws-marketplace:Unsubscribe",
    "aws-marketplace:ViewSubscriptions"
  ],
  "Resource": "*"
}
```

## Create a SageMaker AI Execution Role for a Ground Truth Labeling Job

When you configure your labeling job, you need to provide an *execution role*, which is a role that SageMaker AI has permission to assume to start and run your labeling job.

This role must give Ground Truth permission to access the following:

- Amazon S3 to retrieve your input data and write output data to an Amazon S3 bucket. You can either grant permission for an IAM role to access an entire bucket by providing the bucket ARN, or you can grant access to the role to access specific resources in a bucket. For example, the ARN for a bucket may look similar to `arn:aws:s3:::amzn-s3-demo-bucket1` and the ARN of a resource in an Amazon S3 bucket may look similar to `arn:aws:s3:::amzn-s3-demo-bucket1/prefix/file-name.png`. To apply an action to all resources in an Amazon S3 bucket, you can use the wild card: `*`. For example, `arn:aws:s3:::amzn-s3-demo-bucket1/prefix/*`. For more information, see [Amazon Amazon S3 Resources](#) in the Amazon Simple Storage Service User Guide.
- CloudWatch to log worker metrics and labeling job statuses.
- AWS KMS for data encryption. (Optional)
- AWS Lambda for processing input and output data when you create a custom workflow.

Additionally, if you create a [streaming labeling job](#), this role must have permission to access:

- Amazon SQS to create an interact with an SQS queue used to [manage labeling requests](#).
- Amazon SNS to subscribe to and retrieve messages from your Amazon SNS input topic and to send messages to your Amazon SNS output topic.

All of these permissions can be granted with the [AmazonSageMakerGroundTruthExecution](#) managed policy *except*:

- Data and storage volume encryption of your Amazon S3 buckets. To learn how to configure these permissions, see [Encrypt Output Data and Storage Volume with AWS KMS](#).
- Permission to select and invoke Lambda functions that do not include `GtRecipe`, `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction` in the function name.
- Amazon S3 buckets that do not include either `GroundTruth`, `Groundtruth`, `groundtruth`, `SageMaker`, `Sagemaker`, and `sagemaker` in the prefix or bucket name or an [object tag](#) that includes `SageMaker` in the name (case insensitive).

If you require more granular permissions than the ones provided in `AmazonSageMakerGroundTruthExecution`, use the following policy examples to create an execution role that fits your specific use case.

## Topics

- [Built-In Task Types \(Non-streaming\) Execution Role Requirements](#)
- [Built-In Task Types \(Streaming\) Execution Role Requirements](#)
- [Execution Role Requirements for Custom Task Types](#)
- [Automated Data Labeling Permission Requirements](#)

## Built-In Task Types (Non-streaming) Execution Role Requirements

The following policy grants permission to create a labeling job for a [built-in task type](#). This execution policy does not include permissions for AWS KMS data encryption or decryption. Replace each red, italicized ARN with your own Amazon S3 ARNs.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "S3ViewBuckets",
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket",
        "s3:GetBucketLocation"
      ],
      "Resource": [
```

```

        "arn:aws:s3:::<input-bucket-name>",
        "arn:aws:s3:::<output-bucket-name>"
    ]
},
{
    "Sid": "S3GetPutObjects",
    "Effect": "Allow",
    "Action": [
        "s3:AbortMultipartUpload",
        "s3:GetObject",
        "s3:PutObject"
    ],
    "Resource": [
        "arn:aws:s3:::<input-bucket-name>/*",
        "arn:aws:s3:::<output-bucket-name>/*"
    ]
},
{
    "Sid": "CloudWatch",
    "Effect": "Allow",
    "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents"
    ],
    "Resource": "*"
}
]
}

```

## Built-In Task Types (Streaming) Execution Role Requirements

If you create a streaming labeling job, you must add a policy similar to the following to the execution role you use to create the labeling job. To narrow the scope of the policy, replace the \* in Resource with specific AWS resources that you want to grant the IAM role permission to access and use.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {

```

```

    "Effect": "Allow",
    "Action": [
        "s3:AbortMultipartUpload",
        "s3:GetObject",
        "s3:PutObject"
    ],
    "Resource": [
        "arn:aws:s3:::<input-bucket-name>/*",
        "arn:aws:s3:::<output-bucket-name>/*"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "s3:GetObject"
    ],
    "Resource": "*",
    "Condition": {
        "StringEqualsIgnoreCase": {
            "s3:ExistingObjectTag/SageMaker": "true"
        }
    }
},
{
    "Effect": "Allow",
    "Action": [
        "s3:GetBucketLocation",
        "s3:ListBucket"
    ],
    "Resource": [
        "arn:aws:s3:::<input-bucket-name>",
        "arn:aws:s3:::<output-bucket-name>"
    ]
},
{
    "Sid": "CloudWatch",
    "Effect": "Allow",
    "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents"
    ],

```

```

    "Resource": "*"
  },
  {
    "Sid": "StreamingQueue",
    "Effect": "Allow",
    "Action": [
      "sqs:CreateQueue",
      "sqs:DeleteMessage",
      "sqs:GetQueueAttributes",
      "sqs:GetQueueUrl",
      "sqs:ReceiveMessage",
      "sqs:SendMessage",
      "sqs:SendMessageBatch",
      "sqs:SetQueueAttributes"
    ],
    "Resource": "arn:aws:sqs:*:*:*GroundTruth*"
  },
  {
    "Sid": "StreamingTopicSubscribe",
    "Effect": "Allow",
    "Action": "sns:Subscribe",
    "Resource": [
      "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
      "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
    ],
    "Condition": {
      "StringEquals": {
        "sns:Protocol": "sqs"
      },
      "StringLike": {
        "sns:Endpoint": "arn:aws:sns:<aws-region>:<aws-account-
number>:*GroundTruth*"
      }
    }
  },
  {
    "Sid": "StreamingTopic",
    "Effect": "Allow",
    "Action": [
      "sns:Publish"
    ],
    "Resource": [
      "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
      "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
    ]
  }
}

```

```

    ]
  },
  {
    "Sid": "StreamingTopicUnsubscribe",
    "Effect": "Allow",
    "Action": [
      "sns:Unsubscribe"
    ],
    "Resource": [
      "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
      "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
    ]
  }
]
}

```

## Execution Role Requirements for Custom Task Types

If you want to create a [custom labeling workflow](#), add the following statement to an execution role policy like the ones found in [Built-In Task Types \(Non-streaming\) Execution Role Requirements](#) or [Built-In Task Types \(Streaming\) Execution Role Requirements](#).

This policy gives the execution role permission to Invoke your pre-annotation and post-annotation Lambda functions.

```

{
  "Sid": "LambdaFunctions",
  "Effect": "Allow",
  "Action": [
    "lambda:InvokeFunction"
  ],
  "Resource": [
    "arn:aws:lambda:<region>:<account-id>:function:<pre-annotation-lambda-name>",
    "arn:aws:lambda:<region>:<account-id>:function:<post-annotation-lambda-name>"
  ]
}

```

## Automated Data Labeling Permission Requirements

If you want to create a labeling job with [automated data labeling](#) enabled, you must 1) add one policy to the IAM policy attached to the execution role and 2) update the trust policy of the execution role.

The following statement allows the IAM execution role to be passed to SageMaker AI so that it can be used to run the training and inference jobs used for active learning and automated data labeling respectively. Add this statement to an execution role policy like the ones found in [Built-In Task Types \(Non-streaming\) Execution Role Requirements](#) or [Built-In Task Types \(Streaming\) Execution Role Requirements](#). Replace `arn:aws:iam::<account-number>:role/<role-name>` with the execution role ARN. You can find your IAM role ARN in the IAM console under **Roles**.

```
{
  "Effect": "Allow",
  "Action": [
    "iam:PassRole"
  ],
  "Resource": "arn:aws:iam::<account-number>:role/<execution-role-name>",
  "Condition": {
    "StringEquals": {
      "iam:PassedToService": [
        "sagemaker.amazonaws.com"
      ]
    }
  }
}
```

The following statement allows SageMaker AI to assume the execution role to create and manage the SageMaker training and inference jobs. This policy must be added to the trust relationship of the execution role. To learn how to add or modify an IAM role trust policy, see [Modifying a role](#) in the IAM User Guide.

```
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": {"Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole"
  }
}
```

## Encrypt Output Data and Storage Volume with AWS KMS

You can use AWS Key Management Service (AWS KMS) to encrypt output data from a labeling job by specifying a [customer managed key](#) when you create the labeling job. If you use the API

operation `CreateLabelingJob` to create a labeling job that uses automated data labeling, you can also use a customer managed key to encrypt the storage volume attached to the ML compute instances to run the training and inference jobs.

This section describes the IAM policies you must attach to your customer managed key to enable output data encryption and the policies you must attach to your customer managed key and execution role to use storage volume encryption. To learn more about these options, see [Output Data and Storage Volume Encryption](#).

## Encrypt Output Data using KMS

If you specify an AWS KMS customer managed key to encrypt output data, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your labeling job permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see [AWS KMS permissions](#) in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the labeling job. When you create a labeling job in the console, this is the role you specify for **IAM Role** under the **Job overview** section. When you create a labeling job using `CreateLabelingJob`, this is ARN you specify for [RoleArn](#).

```
{
  "Sid": "AllowUseOfKmsKey",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::<111122223333>:role/service-role/example-role"
  },
  "Action": [
    "kms:Encrypt",
    "kms:Decrypt",
    "kms:ReEncrypt*",
    "kms:GenerateDataKey*",
    "kms:DescribeKey"
  ],
  "Resource": "*"
}
```

## Encrypt Automated Data Labeling ML Compute Instance Storage Volume

If you specify a [VolumeKmsKeyId](#) to encrypt the storage volume attached to the ML compute instance used for automated data labeling training and inference, you must do the following:

- Attach permissions described in [Encrypt Output Data using KMS](#) to the customer managed key.
- Attach a policy similar to the following to the IAM execution role you use to create your labeling job. This is the IAM role you specify for [RoleArn](#) in `CreateLabelingJob`. To learn more about the "kms:CreateGrant" action that this policy permits, see [CreateGrant](#) in the AWS Key Management Service API Reference.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:CreateGrant"
      ],
      "Resource": "*"
    }
  ]
}
```

To learn more about Ground Truth storage volume encryption, see [Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume \(API Only\)](#).

## Using Amazon SageMaker Ground Truth in an Amazon Virtual Private Cloud

With [Amazon Virtual Private Cloud](#) (Amazon VPC) you can launch AWS resources in a logically isolated virtual network that you define. Ground Truth supports running labeling jobs inside an Amazon VPC instead of connecting over the internet. When you launch a labeling job in an Amazon VPC, communication between your VPC and Ground Truth is conducted entirely and securely within the AWS network.

This guide shows how you can use Ground Truth in an Amazon VPC in the following ways:

1. [Run an Amazon SageMaker Ground Truth Labeling Job in an Amazon Virtual Private Cloud](#)
2. [Use Amazon VPC Mode from a Private Worker Portal](#)

## Run an Amazon SageMaker Ground Truth Labeling Job in an Amazon Virtual Private Cloud

Ground Truth supports the following functionalities in Amazon VPC.

- You can use Amazon S3 bucket policies to control access to buckets from specific Amazon VPC endpoints, or specific VPCs. If you launch a labeling job and your input data is located in an Amazon S3 bucket that is restricted to users in your VPC, you can add a bucket policy to also grant a Ground Truth endpoint permission to access the bucket. To learn more, see [Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets](#).
- You can launch an [automated data labeling job](#) in your VPC. You use a VPC configuration to specify VPC subnets and security groups. SageMaker AI uses this configuration to launch the training and inference jobs used for automated data labeling in your VPC. To learn more, see [Create an Automated Data Labeling Job in a VPC](#).

You may want to use these options in any of the following ways.

- You can use both of these methods to launch a labeling job using a VPC-protected Amazon S3 bucket with automated data labeling enabled.
- You can launch a labeling job using any [built-in task type](#) using a VPC-protected bucket.
- You can launch a [custom labeling workflow](#) using a VPC-protected bucket. Ground Truth interacts with your pre-annotation and post-annotation Lambda functions using an [AWS PrivateLink](#) endpoint.

We recommend that you review [Prerequisites for running a Ground Truth labeling job in a VPC](#) before you create a labeling job in an Amazon VPC.

### Prerequisites for running a Ground Truth labeling job in a VPC

Review the following prerequisites before you create a Ground Truth labeling job in an Amazon VPC.

- If you are a new user of Ground Truth, review [Getting started](#) to learn how to create a labeling job.
- If your input data is located in a VPC-protected Amazon S3 bucket, your workers must access the worker portal from your VPC. VPC based labeling jobs require the use of a private work team. To learn more about creating a private work team, see [Use a Private Workforce](#).
- The following prerequisites are specific to launching a labeling job in your VPC.

- Use the instructions in [Create an Amazon S3 VPC Endpoint](#). Training and inference containers used in the automated data labeling workflow use this endpoint to communicate with your buckets in Amazon S3.
- Review [Automate Data Labeling](#) to learn more about this feature. Note that automated data labeling is supported for the following [built-in task types](#): [Image Classification \(Single Label\)](#), [Image Semantic Segmentation](#), [Bounding Box](#), and [Text Classification \(Single Label\)](#). Streaming labeling jobs do not support automated data labeling.
- Review the [Ground Truth Security and Permissions](#) section and ensure that you have met the following conditions.
  - The user creating the labeling job has all necessary permissions
  - You have created an IAM execution role with required permissions. If you do not require fine-tuned permissions for your use case, we recommend you use the IAM managed policies described in [Grant General Permissions To Get Started Using Ground Truth](#).
  - Allow your VPC to have access to the `sagemaker-labeling-data-region` and `sm-bxcb-region-saved-task-states` S3 buckets. These are system owned regionalized S3 buckets that are accessed from worker portal when worker is working on a task. We use these buckets to interact with system managed data.

## Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets

The following sections provide details about the permissions Ground Truth requires to launch labeling jobs using Amazon S3 buckets that have access restricted to your VPC and VPC endpoints. To learn how to restrict access to an Amazon S3 bucket to a VPC, see [Controlling access from VPC endpoints with bucket policies](#) in the Amazon Simple Storage Service User Guide guide. To learn how to add a policy to an S3 bucket, see [Adding a bucket policy using the Amazon S3 console](#).

### Note

Modifying policies on existing buckets can cause IN\_PROGRESS Ground Truth jobs to fail. We recommend you start new jobs using a new bucket. If you want to continue using the same bucket, you can do one of the following.

- Wait for an IN\_PROGRESS job to finish.
- Terminate the job using the console or the AWS CLI.

You can restrict Amazon S3 bucket access to users in your VPC using an [AWS PrivateLink](#) endpoint. For example, the following S3 bucket policy allows access to a specific bucket, *<bucket-name>*, from *<vpc>* and the endpoint *<vpc-endpoint>* only. When you modify this policy, you must replace all *red-italized text* with your resources and specifications.

### Note

The following policy *denies* all entities *other than* users within a VPC to perform the actions listed in Action. If you do not include actions in this list, they are still accessible to any entity that has access to this bucket and permission to perform those actions. For example, if a user has permission to perform `GetBucketLocation` on your Amazon S3 bucket, the policy below does not restrict the user from performing this action outside of your VPC.

```
{
  "Version": "2012-10-17",
  "Id": "Policy1415115909152",
  "Statement": [
    {
      "Sid": "Access-to-specific-VPCE-only",
      "Principal": "*",
      "Action": [
        "s3:GetObject",
        "s3:PutObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::<bucket-name>",
        "arn:aws:s3:::<bucket-name>/*"
      ],
      "Condition": {
        "StringNotEquals": {
          "aws:sourceVpce": [
            "<vpc-endpoint>",
            "<vpc>"
          ]
        }
      }
    }
  ]
}
```

Ground Truth must be able to perform the following Amazon S3 actions on the S3 buckets you use to configure the labeling job.

```
"s3:AbortMultipartUpload",  
"s3:GetObject",  
"s3:PutObject",  
"s3:ListBucket",  
"s3:GetBucketLocation"
```

You can do this by adding a Ground Truth endpoint to the bucket policy like the one previously mentioned. The following table includes Ground Truth service endpoints for each AWS Region. Add an endpoint in the same [AWS Region](#) you use to run your labeling job to your bucket policy.

AWS Region	Ground Truth endpoint
us-east-2	vpce-02569ba1c40aad0bc
us-east-1	vpce-08408e335ebf95b40
us-west-2	vpce-0ea07aa498eb78469
ca-central-1	vpce-0d46ea4c9ff55e1b7
eu-central-1	vpce-0865e7194a099183d
eu-west-2	vpce-0bccd56798f4c5df0
eu-west-1	vpce-0788e7ed8628e595d
ap-south-1	vpce-0d7fcda14e1783f11
ap-southeast-2	vpce-0b7609e6f305a77d4
ap-southeast-1	vpce-0e7e67b32e9efed27
ap-northeast-2	vpce-007893f89e05f2bbf
ap-northeast-1	vpce-0247996a1a1807dbd

For example, the following policy restricts GetObject and PutObject actions on:

- An Amazon S3 bucket to users in a VPC (<vpc>)
- A VPC endpoint (<vpc-endpoint>)
- A Ground Truth service endpoint (<ground-truth-endpoint>)

```
{
  "Version": "2012-10-17",
  "Id": "1",
  "Statement": [
    {
      "Sid": "DenyAccessFromNonGTandCustomerVPC",
      "Effect": "Deny",
      "Principal": "*",
      "Action": [
        "s3:GetObject",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::<bucket-name>",
        "arn:aws:s3:::<bucket-name>/*"
      ],
      "Condition": {
        "ForAllValues:StringNotEquals": {
          "aws:sourceVpce": [
            "<vpc-endpoint>",
            "<ground-truth-endpoint>"
          ],
          "aws:SourceVpc": "<vpc>"
        }
      }
    }
  ]
}
```

If you want a user to have permission to launch a labeling job using the Ground Truth console, you must also add the user's ARN to the bucket policy using the `aws:PrincipalArn` condition. This user must also have permission to perform the following Amazon S3 actions on the bucket you use to launch the labeling job.

```
"s3:GetObject",
"s3:PutObject",
```

```
"s3:ListBucket",
"s3:GetBucketCors",
"s3:PutBucketCors",
"s3:ListAllMyBuckets",
```

The following code is an example of a bucket policy that restricts permission to perform the actions listed in Action on the S3 bucket <bucket-name> to the following.

- *<role-name>*
- The VPC endpoints listed in `aws:sourceVpce`
- Users within the VPC named *<vpc>*

```
{
  "Version": "2012-10-17",
  "Id": "1",
  "Statement": [
    {
      "Sid": "DenyAccessFromNonGTandCustomerVPC",
      "Effect": "Deny",
      "Principal": "*",
      "Action": [
        "s3:GetObject",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::<bucket-name>/*",
        "arn:aws:s3:::<bucket-name>"
      ],
      "Condition": {
        "ForAllValues:StringNotEquals": {
          "aws:sourceVpce": [
            "<vpc-endpoint>",
            "<ground-truth-endpoint>"
          ],
          "aws:PrincipalArn": "arn:aws:iam::<aws-account-id>:role/<role-
name>",
          "aws:SourceVpc": "<vpc>"
        }
      }
    }
  ]
}
```

```
}
```

**Note**

The Amazon VPC interface endpoints and the protected Amazon S3 buckets you use for input and output data must be located in the same AWS Region that you use to create the labeling job.

After you have granted Ground Truth permission to access your Amazon S3 buckets, you can use one of the topics in [Create a Labeling Job](#) to launch a labeling job. Specify the VPC-restricted Amazon S3 buckets for your input and output data buckets.

**Create an Automated Data Labeling Job in a VPC**

To create an automated data labeling job using an Amazon VPC, you provide a VPC configuration using the Ground Truth console or `CreateLabelingJob` API operation. SageMaker AI uses the subnets and security groups you provide to launch the training and inferences jobs used for automated labeling.

**Important**

Before you launch an automated data labeling job with a VPC configuration, make sure you have created an Amazon S3 VPC endpoint using the VPC you want to use for the labeling job. To learn how, see [Create an Amazon S3 VPC Endpoint](#).

Additionally, if you create an automated data labeling job using a VPC-restricted Amazon S3 bucket, you must follow the instructions in [Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets](#) to give Ground Truth permission to access the bucket.

Use the following procedures to learn how to add a VPC configuration to your labeling job request.

**Add a VPC configuration to an automated data labeling job (console):**

1. Follow the instructions in [Create a Labeling Job \(Console\)](#) and complete each step in the procedure, up to step 15.
2. In the **Workers** section, select the checkbox next to **Enable automated data labeling**.
3. Maximize the **VPC configuration** section of the console by selecting the arrow.

4. Specify the **Virtual private cloud (VPC)** that you want to use for your automated data labeling job.
5. Choose the dropdown list under **Subnets** and select one or more subnets.
6. Choose the dropdown list under **Security groups** and select one or more groups.
7. Complete all remaining steps of the procedure in [Create a Labeling Job \(Console\)](#).

### Add a VPC configuration to an automated data labeling job (API):

To configure a labeling job using the Ground Truth API operation, `CreateLabelingJob`, follow the instructions in [Create an Automated Data Labeling Job \(API\)](#) to configure your request. In addition to the parameters described in this documentation, you must include a `VpcConfig` parameter in `LabelingJobResourceConfig` to specify one or more subnets and security groups using the following schema.

```
"LabelingJobAlgorithmsConfig": {
  "InitialActiveLearningModelArn": "string",
  "LabelingJobAlgorithmSpecificationArn": "string",
  "LabelingJobResourceConfig": {
    "VolumeKmsKeyId": "string",
    "VpcConfig": {
      "SecurityGroupIds": [ "string" ],
      "Subnets": [ "string" ]
    }
  }
}
```

The following is an example of an [AWS Python SDK \(Boto3\) request](#) to create an automated data labeling job in the US East (N. Virginia) Region using a private workforce. Replace all *red-italicized text* with your labeling job resources and specifications. To learn more about the `CreateLabelingJob` operation, see the [Create a Labeling Job \(API\)](#) tutorial and [CreateLabelingJob](#) API documentation.

```
import boto3
client = boto3.client(service_name='sagemaker')

response = client.create_labeling_job(
    LabelingJobName="example-labeling-job",
    LabelAttributeName="label",
    InputConfig={
```

```

    'DataSource': {
      'S3DataSource': {
        'ManifestS3Uri': "s3://bucket/path/manifest-with-input-data.json"
      }
    },
    'LabelingJobAlgorithmsConfig': {
      'LabelingJobAlgorithmSpecificationArn': "arn:aws:sagemaker:us-
east-1:027400017018:labeling-job-algorithm-specification/tasktype",
      'LabelingJobResourceConfig': {
        'VpcConfig': {
          'SecurityGroupIds': [ "sg-01233456789", "sg-987654321" ],
          'Subnets': [ "subnet-e0123456", "subnet-e7891011" ]
        }
      }
    },
    OutputConfig={
      'S3OutputPath': "s3://bucket/path/file-to-store-output-data",
      'KmsKeyId': "string"
    },
    RoleArn="arn:aws:iam::*:role/*",
    LabelCategoryConfigS3Uri="s3://bucket/path/label-categories.json",
    StoppingConditions={
      'MaxHumanLabeledObjectCount': 123,
      'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
      'WorkteamArn': "arn:aws:sagemaker:region:*:workteam/private-crowd/*",
      'UiConfig': {
        'UiTemplateS3Uri': "s3://bucket/path/custom-worker-task-template.html"
      },
      'PreHumanTaskLambdaArn': "arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype",
      'TaskKeywords': [
        "Images",
        "Classification",
        "Multi-label"
      ],

```

## Use Amazon VPC Mode from a Private Worker Portal

To restrict worker portal access to labelers working inside of your Amazon VPC, you can add a VPC configuration when you create a Ground Truth private workforce. You can also add a VPC configuration to an existing private workforce. Ground Truth automatically creates VPC interface endpoints in your VPC and sets up AWS PrivateLink between your VPC endpoint and the Ground Truth services. The worker portal URL associated with the workforce can be accessed from your VPC. The worker portal URL can also be accessed from public internet until you set the restriction on the public internet. When you delete the workforce or remove the VPC configuration from your workforce, Ground Truth automatically deletes the VPC endpoints associated with the workforce.

### Note

There can be only one VPC supported for a workforce.

[Point Cloud](#) and [video](#) tasks do not support loading through a VPC.

The guide demonstrates how to complete the necessary steps to add and delete an Amazon VPC configuration to your workforce, and satisfy the prerequisites.

## Prerequisites

To run a Ground Truth labeling job in Amazon VPC, review the following prerequisites.

- You have an Amazon VPC configured that you can use. If you have not configured a VPC, follow these instructions for [creating a VPC](#).
- Depending on how a [Worker Task Template](#) is written, labeling data stored in an Amazon S3 bucket may be accessed directly from Amazon S3 during labeling tasks. In these cases, the VPC

network must be configured to allow traffic from the device used by the human labeler to the S3 bucket containing labeling data.

- Follow [View and update DNS attributes for your VPC](#) to enable DNS hostnames and DNS resolution for your VPC.

### Note

There are two ways to configure your VPC for your workforce. You can do this through the [console](#) or the AWS SageMaker AI [CLI](#).

## Using the SageMaker AI console to manage a VPC config

You can use the [SageMaker AI console](#) to add or remove a VPC configuration. You can also delete an existing workforce.

### Adding a VPC configuration to your workforce

#### Create a private workforce

- [Create a private workforce using Amazon Cognito](#)
- [Create a private workforce using OpenID Connect \(OIDC\) Identity Provider\(IdP\)](#).

After you have created your private workforce, add a VPC configuration to it.

1. Navigate to [Amazon SageMaker Runtime](#) in your console.
2. Select **Labeling workforces** in the left panel.
3. Select **Private** to access your private workforce. After your **Workforce status** is **Active**, select **Add** next to **VPC**.
4. When you are prompted to configure your VPC, provide the following:
  - a. Your **VPC**
  - b. **Subnets**
    - i. Ensure that your VPC has an existing subnet
  - c. **Security groups**

i.

**Note**

You cannot select more than 5 security groups.

- d. After filling in this information, choose **Confirm**.
5. After you choose **Confirm**, you are redirected back to the **Private** page under **Labeling workforces**. You should see a green banner at the top that reads **Your private workforce update with VPC configuration was successfully initialized**. The workforce status is **Updating**. Next to the **Delete workforce** button is the **Refresh** button, which can be used to retrieve the latest **Workforce status**. After the workforce status has changed to **Active**, the VPC endpoint ID is updated as well.

### Removing a VPC configuration from your workforce

Use the following information to remove a VPC configuration from your workforce using the console.

1. Navigate to [Amazon SageMaker Runtime](#) in your console.
2. Select **Labeling workforces** in the left panel.
3. Find and select your workforce.
4. Under **Private workforce summary**, find **VPC** and choose **Remove** next to it.
5. Select **Remove**.

### Deleting a workforce through the console

If you delete a workforce, you should not have any teams associated with it. You can delete a workforce only if the workforce status is **Active** or **Failed**.

Use the following information to delete a workforce using the console.

1. Navigate to [Amazon SageMaker Runtime](#) in your console.
2. Select **Labeling workforces** in the left panel.
3. Find and select your workforce.
4. Choose **Delete workforce**.
5. Choose **Delete**.

## Using the SageMaker AI AWS API to manage a VPC config

Use the following sections to learn more about managing a VPCs configuration, while maintaining the right level of access to the work team.

### Create a workforce with a VPC configuration

If the account already has a workforce, then you must delete it first. You can also update the workforce with VPC configuration.

```
aws sagemaker create-workforce --cognito-config '{"ClientId": "app-client-id", "UserPool": "Pool_ID",}' --workforce-vpc-config \
" {"VpcId": "vpc-id", "SecurityGroupIds": ["sg-0123456789abcdef0"], "Subnets": ["subnet-0123456789abcdef0"]}" --workforce-name workforce-name
{
  "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxx:workforce/workforce-name"
}
```

Describe the workforce and make sure the status is Initializing.

```
aws sagemaker describe-workforce --workforce-name workforce-name
{
  "Workforce": {
    "WorkforceName": "workforce-name",
    "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxx:workforce/workforce-name",
    "LastUpdatedDate": 1622151252.451,
    "SourceIpConfig": {
      "Cidrs": []
    },
    "SubDomain": "subdomain.us-west-2.sagemaker.aws.com",
    "CognitoConfig": {
      "UserPool": "Pool_ID",
      "ClientId": "app-client-id"
    },
    "CreateDate": 1622151252.451,
    "WorkforceVpcConfig": {
      "VpcId": "vpc-id",
      "SecurityGroupIds": [
```

```

        "sg-0123456789abcdef0"
    ],
    "Subnets": [
        "subnet-0123456789abcdef0"
    ]
},
"Status": "Initializing"
}
}

```

Navigate to the Amazon VPC console. Select **Endpoints** from the left panel. There should be two VPC endpoints created in your account.

### Adding a VPC configuration your workforce

Update a non-VPC private workforce with a VPC configuration using the following command.

```

aws sagemaker update-workforce --workforce-name workforce-name \
--workforce-vpc-config "{\"VpcId\": \"vpc-id\", \"SecurityGroupIds\":
[\"sg-0123456789abcdef0\"], \"Subnets\": [\"subnet-0123456789abcdef0\"]}"

```

Describe the workforce and make sure the status is Updating.

```

aws sagemaker describe-workforce --workforce-name workforce-name
{
  "Workforce": {
    "WorkforceName": "workforce-name",
    "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxx:workforce/workforce-
name",
    "LastUpdatedDate": 1622151252.451,
    "SourceIpConfig": {
      "Cidrs": []
    },
    "SubDomain": "subdomain.us-west-2.sagemaker.aws.com",
    "CognitoConfig": {
      "UserPool": "Pool_ID",
      "ClientId": "app-client-id"
    }
  },
}

```

```

    "CreateDate": 1622151252.451,
    "WorkforceVpcConfig": {
      "VpcId": "vpc-id",
      "SecurityGroupIds": [
        "sg-0123456789abcdef0"
      ],
      "Subnets": [
        "subnet-0123456789abcdef0"
      ]
    },
    "Status": "Updating"
  }
}

```

Navigate to your Amazon VPC console. Select **Endpoints** from the left panel. There should be two VPC endpoints created in your account.

### Removing a VPC configuration from your workforce

Update a VPC private workforce with an empty VPC configuration to remove VPC resources.

```

aws sagemaker update-workforce --workforce-name workforce-name\
--workforce-vpc-config "{}"

```

Describe the workforce and make sure the status is Updating.

```

aws sagemaker describe-workforce --workforce-name workforce-name
{
  "Workforce": {
    "WorkforceName": "workforce-name",
    "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxx:workforce/workforce-
name",
    "LastUpdatedDate": 1622151252.451,
    "SourceIpConfig": {
      "Cidrs": []
    },
    "SubDomain": "subdomain.us-west-2.sagemaker.aws.com",
    "CognitoConfig": {

```

```
        "UserPool": "Pool_ID",
        "ClientId": "app-client-id"
    },
    "CreateDate": 1622151252.451,
    "Status": "Updating"
}
}
```

Navigate to your Amazon VPC console. Select **Endpoints** from the left panel. The two VPC endpoints should be deleted.

### Restrict public access to the worker portal while maintaining access through a VPC

The workers in a VPC or non-VPC worker portal are able to see the labeling job tasks assigned to them. The assignment comes from assigning workers in a work team through OIDC groups. It is the customer's responsibility to restrict the access to their public worker portal by setting the `sourceIpConfig` in their workforce.

#### Note

You can restrict access to the worker portal only through the SageMaker API. This cannot be done through the console.

Use the following command to restrict public access to the worker portal.

```
aws sagemaker update-workforce --region us-west-2 \
--workforce-name workforce-demo --source-ip-config '{"Cidrs":["10.0.0.0/16"]}'
```

After the `sourceIpConfig` is set on the workforce, the workers can access the worker portal in VPC but not through public internet.

#### Note

You can not set the sourceIP restriction for worker portal in VPC.

## Output Data and Storage Volume Encryption

With Amazon SageMaker Ground Truth, you can label highly sensitive data, stay in control of your data, and employ security best practices. While your labeling job is running, Ground Truth encrypts data in transit and at rest. Additionally, you can use AWS Key Management Service (AWS KMS) with Ground Truth to do the following:

- Use a [customer managed key](#) to encrypt your output data.
- Use AWS KMS customer managed key with your automated data labeling job to encrypt the storage volume attached to the compute instance used for model training and inference.

Use the topics on this page to learn more about these Ground Truth security features.

### Use Your KMS Key to Encrypt Output Data

Optionally, you can provide an AWS KMS customer managed key when you create a labeling job, which Ground Truth uses to encrypt your output data.

If you don't provide a customer managed key, Amazon SageMaker AI uses the default AWS managed key for Amazon S3 for your role's account to encrypt your output data.

If you provide a customer managed key, you must add the required permissions to the key described in [Encrypt Output Data and Storage Volume with AWS KMS](#). When you use the API operation `CreateLabelingJob`, you can specify your customer managed key ID using the parameter `KmsKeyId`. See the following procedure to learn how to add a customer managed key when you create a labeling job using the console.

#### To add an AWS KMS key to encrypt output data (console):

1. Complete the first 7 steps in [Create a Labeling Job \(Console\)](#).
2. In step 8, select the arrow next to **Additional configuration** to expand this section.
3. For **Encryption key**, select the AWS KMS key that you want to use to encrypt output data.
4. Complete the rest of steps in [Create a Labeling Job \(Console\)](#) to create a labeling job.

### Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume (API Only)

When you create a labeling job with automated data labeling using the `CreateLabelingJob` API operation, you have the option to encrypt the storage volume attached to the ML compute instances that run the training and inference jobs. To add encryption to your storage volume,

use the parameter `VolumeKmsKeyId` to input an AWS KMS customer managed key. For more information about this parameter, see [LabelingJobResourceConfig](#).

If you specify a key ID or ARN for `VolumeKmsKeyId`, your SageMaker AI execution role must include permissions to call `kms:CreateGrant`. To learn how to add this permission to an execution role, see [Create a SageMaker AI Execution Role for a Ground Truth Labeling Job](#).

#### Note

If you specify an AWS KMS customer managed key when you create a labeling job in the console, that key is *only* used to encrypt your output data. It is not used to encrypt the storage volume attached to the ML compute instances used for automated data labeling.

## Workforce Authentication and Restrictions

Ground Truth enables you to use your own private workforce to work on labeling jobs. A *private workforce* is an abstract concept which refers to a set of people who work for you. Each labeling job is created using a work team, composed of workers in your workforce. Ground Truth supports private workforce creation using Amazon Cognito.

A Ground Truth workforce maps to a Amazon Cognito user pool. A Ground Truth work team maps to a Amazon Cognito user group. Amazon Cognito manages the worker authentication. Amazon Cognito supports Open ID connection (OIDC) and customers can set up Amazon Cognito federation with their own identity provider (IdP).

Ground Truth only allows one workforce per account per AWS Region. Each workforce has a dedicated Ground Truth work portal login URL.

You can also restrict workers to a Classless Inter-Domain Routing (CIDR) block/IP address range. This means annotators must be on a specific network to access the annotation site. You can add up to ten CIDR blocks for one workforce. To learn more, see [Private workforce management using the Amazon SageMaker API](#).

To learn how you can create a private workforce, see [Create a Private Workforce \(Amazon Cognito\)](#).

### Restrict Access to Workforce Types

Amazon SageMaker Ground Truth work teams fall into one of three [workforce types](#): public (with Amazon Mechanical Turk), private, and vendor. To restrict user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the

`sagemaker:WorkteamArn` condition keys. For the `sagemaker:WorkteamType` condition key, use [string condition operators](#). For the `sagemaker:WorkteamArn` condition key, use [Amazon Resource Name \(ARN\) condition operators](#). If the user attempts to create a labeling job with a restricted work team, SageMaker AI returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: *workforcetype*-crowd, where *workforcetype* can equal public, private, or vendor.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "sagemaker:WorkteamType": "public-crowd"
        }
      }
    }
  ]
}
```

The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
```

```

        "Effect": "Deny",
        "Action": "sagemaker:CreateLabelingJob",
        "Resource": "*",
        "Condition": {
            "ArnLike": {
                "sagemaker:WorkteamArn": "arn:aws:sagemaker:*:*:workteam/public-
crowd/*"
            }
        }
    ]
}

```

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "ArnEquals": {
          "sagemaker:WorkteamArn": "arn:aws:sagemaker:us-
west-2:394669845002:workteam/public-crowd/default"
        }
      }
    }
  ]
}

```

## Monitor Labeling Job Status

To monitor the status of your labeling jobs, you can set up an [Amazon CloudWatch Events](#) (CloudWatch Events) rule for Amazon SageMaker Ground Truth (Ground Truth) to send an event to CloudWatch Events when a labeling job status changes to Completed, Failed, or Stopped or when a worker accepts, declines, submits, or returns a task.

Once you create a rule, you can add a *target* to it. CloudWatch Events uses this target to invoke another AWS service to process the event. For example, you can create a target using a Amazon Simple Notification Service (Amazon SNS) topic to send a notification to your email when a labeling job status changes.

## Prerequisites:

To create a CloudWatch Events rule, you will need an AWS Identity and Access Management (IAM) role with an `events.amazonaws.com` trust policy attached. The following is an example of an `events.amazonaws.com` trust policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "events.amazonaws.com"
        ]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

## Topics

- [Send Events to CloudWatch Events](#)
- [Set Up a Target to Process Events](#)
- [Labeling Job Expiration](#)
- [Declining Tasks](#)

## Send Events to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or *events*, for your Ground Truth labeling jobs, use the AWS Command Line Interface (AWS CLI) [put-rule](#) command. You can filter events that are sent to your rule by status change. For example, you can create a rule that notifies you only if a labeling job status changes to `Completed`. When using the `put-rule` command, specify the following to receive labeling job statuses:

- `\\"source\\":[\\"aws.sagemaker\\"]`
- `\\"detail-type\\":[\\"SageMaker Ground Truth Labeling Job State Change\\"]`

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace *"GTLabelingJobStateChanges"* with a unique CloudWatch Events rule name and *"arn:aws:iam::111122223333:role/MyRoleForThisRule"* with the Amazon Resource Number (ARN) of an IAM role with an `events.amazonaws.com` trust policy attached.

```
aws events put-rule --name "GTLabelingJobStateChanges"
  --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
  Ground Truth Labeling Job State Change\"]}"
  --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
  --region "region"
```

To filter by job status, use the `\"detail\":{\"LabelingJobStatus\":[\"Status\"]}\"` syntax. Valid values for *Status* are Completed, Failed, and Stopped.

The following example creates a CloudWatch Events rule that notifies you when a labeling job in `us-west-2` (Oregon) changes to Completed.

```
aws events put-rule --name "LabelingJobCompleted"
  --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
  Ground Truth Labeling Job State Change\"], \"detail\":{\"LabelingJobStatus\":
  [\"Completed\"]}\""
  --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
  --region us-west-2
```

The following example creates a CloudWatch Events rule that notifies you when a labeling job in `us-east-1` (Virginia) changes to Completed or Failed.

```
aws events put-rule --name "LabelingJobCompletedOrFailed"
  --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
  Ground Truth Labeling Job State Change\"], \"detail\":{\"LabelingJobStatus\":
  [\"Completed\", \"Failed\"]}\""
  --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
  --region us-east-1
```

To learn more about the `put-rule` request, see [Event Patterns in CloudWatch Events](#) in the *Amazon CloudWatch Events User Guide*.

## Set Up a Target to Process Events

After you have created a rule, events similar to the following are sent to CloudWatch Events. In this example, the labeling job `test-labeling-job`'s status changed to `Completed`.

```
{
  "version": "0",
  "id": "111e1111-11d1-111f-b111-1111b11dcb11",
  "detail-type": "SageMaker Ground Truth Labeling Job State Change",
  "source": "aws.sagemaker",
  "account": "111122223333",
  "time": "2018-10-06T12:26:13Z",
  "region": "us-east-1",
  "resources": [
    "arn:aws:sagemaker:us-east-1:111122223333:labeling-job/test-labeling-job"
  ],
  "detail": {
    "LabelingJobStatus": "Completed"
  }
}
```

To process events, you need to set up a target. For example, if you want to receive an email when your labeling job status changes, use a procedure in [Setting Up Amazon SNS Notifications](#) in the *Amazon CloudWatch User Guide* to set up an Amazon SNS topic and subscribe your email to it. Once you have create a topic, you can use it to create a target.

### To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: <https://console.aws.amazon.com/cloudwatch/home>
2. In the navigation pane, choose **Rules**.
3. Choose the rule that you want to add a target to.
4. Choose **Actions**, and then choose **Edit**.
5. Under **Targets**, choose **Add Target** and choose the AWS service you want to act when a labeling job status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the [AWS documentation for that service](#).
7. Choose **Configure details**.
8. For **Name**, enter a name and, optionally, provide details about the purpose of the rule in **Description**.

9. Make sure that the check box next to **State** is selected so that your rule is listed as **Enabled**.
10. Choose **Update rule**.

## Labeling Job Expiration

If your labeling job is not completed after 30 days, it will expire. If your labeling job expires, you can chain the job to create a new labeling job that will only send unlabeled data to workers. For more information, and to learn how to create a labeling job using chaining, see [Chaining labeling jobs](#).

## Declining Tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object ([NumberOfHumanWorkersPerDataObject](#)) decline the task, the data object is marked as expired and will not be sent to additional workers.

## Use Amazon SageMaker Ground Truth Plus to Label Data

Amazon SageMaker Ground Truth Plus is a turnkey data labeling service that uses an expert workforce to deliver high-quality annotations quickly and reduces costs by up to 40%. Using SageMaker Ground Truth Plus, data scientists and business managers, such as data operations managers and program managers, can create high-quality training datasets without having to build labeling applications and manage labeling workforces on their own. You can get started with Amazon SageMaker Ground Truth Plus by uploading data along with the labeling requirements in Amazon S3.

### Why use SageMaker Ground Truth Plus?

To train a machine learning (ML) model, data scientists need large, high-quality, labeled datasets. As ML adoption grows, labeling needs increase. This forces data scientists to spend weeks on building data labeling workflows and managing a data labeling workforce. Unfortunately, this slows down innovation and increases cost. To ensure data scientists can spend their time building, training, and deploying ML models, data scientists typically task other in-house teams consisting of data operations managers and program managers to produce high-quality training datasets.

However, these teams typically don't have access to skills required to deliver high-quality training datasets, which affects ML results. As a result, you look for a data labeling partner that can help them create high-quality training datasets at scale without consuming their in-house resources.

When you upload the data, SageMaker Ground Truth Plus sets up the data labeling workflows and operates them on your behalf. From there, an expert workforce trained on a variety of machine learning (ML) tasks performs data labeling. SageMaker Ground Truth Plus currently offers two types of expert workforce: an Amazon employed workforce and a curated list of third-party vendors. SageMaker Ground Truth Plus provides you with the flexibility to choose the labeling workforce. AWS experts select the best labeling workforce based on your project requirements. For example, if you need people proficient in labeling audio files, specify that in the guidelines provided to SageMaker Ground Truth Plus, and the service automatically selects labelers with those skills.

### Important

SageMaker Ground Truth Plus does not support PHI, PCI or FedRAMP certified data, and you should not provide this data to SageMaker Ground Truth Plus.

## How does SageMaker Ground Truth Plus work?

There are five main components to a workflow.

- Requesting a project
- Creating a project team
- Accessing the project portal to monitor progress of training datasets and review labeled data
- Creating a batch
- Receiving the labeled data

## How do I use SageMaker Ground Truth Plus?

If you are a first-time user of SageMaker Ground Truth Plus, use [Getting Started with Amazon SageMaker Ground Truth Plus](#). get started. To access SageMaker Ground Truth Plus using the SageMaker AI console, you must be in US East (N. Virginia) (us-east-1).

# Getting Started with Amazon SageMaker Ground Truth Plus.

The guide demonstrates how to complete the necessary steps to start an Amazon SageMaker Ground Truth Plus project, review labels, and satisfy SageMaker Ground Truth Plus prerequisites.

To get started using SageMaker Ground Truth Plus, review [Set up Amazon SageMaker Ground Truth Plus Prerequisites](#) and [Core Components of Amazon SageMaker Ground Truth Plus](#).

## Set up Amazon SageMaker Ground Truth Plus Prerequisites

The following page describes how to sign up for an AWS account and configure an administrative user in your account. If you already have an AWS account and user setup, you can skip this page.

### Sign up for an AWS account

If you do not have an AWS account, complete the following steps to create one.

#### To sign up for an AWS account

1. Open <https://portal.aws.amazon.com/billing/signup>.
2. Follow the online instructions.

Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

When you sign up for an AWS account, an *AWS account root user* is created. The root user has access to all AWS services and resources in the account. As a security best practice, assign administrative access to a user, and use only the root user to perform [tasks that require root user access](#).

AWS sends you a confirmation email after the sign-up process is complete. At any time, you can view your current account activity and manage your account by going to <https://aws.amazon.com/> and choosing **My Account**.

### Create a user with administrative access

After you sign up for an AWS account, secure your AWS account root user, enable AWS IAM Identity Center, and create an administrative user so that you don't use the root user for everyday tasks.

## Secure your AWS account root user

1. Sign in to the [AWS Management Console](#) as the account owner by choosing **Root user** and entering your AWS account email address. On the next page, enter your password.

For help signing in by using root user, see [Signing in as the root user](#) in the *AWS Sign-In User Guide*.

2. Turn on multi-factor authentication (MFA) for your root user.

For instructions, see [Enable a virtual MFA device for your AWS account root user \(console\)](#) in the *IAM User Guide*.

## Create a user with administrative access

1. Enable IAM Identity Center.

For instructions, see [Enabling AWS IAM Identity Center](#) in the *AWS IAM Identity Center User Guide*.

2. In IAM Identity Center, grant administrative access to a user.

For a tutorial about using the IAM Identity Center directory as your identity source, see [Configure user access with the default IAM Identity Center directory](#) in the *AWS IAM Identity Center User Guide*.

## Sign in as the user with administrative access

- To sign in with your IAM Identity Center user, use the sign-in URL that was sent to your email address when you created the IAM Identity Center user.

For help signing in using an IAM Identity Center user, see [Signing in to the AWS access portal](#) in the *AWS Sign-In User Guide*.

## Assign access to additional users

1. In IAM Identity Center, create a permission set that follows the best practice of applying least-privilege permissions.

For instructions, see [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

2. Assign users to a group, and then assign single sign-on access to the group.

For instructions, see [Add groups](#) in the *AWS IAM Identity Center User Guide*.

## Core Components of Amazon SageMaker Ground Truth Plus

The following terms are key to understanding the capabilities of SageMaker Ground Truth Plus:

- **Project:** Each qualified engagement with an AWS expert results in a SageMaker Ground Truth Plus project. A project can be in the pilot or production stage.
- **Batch:** A batch is a collection of similar recurring data objects such as images, video frames and text to be labeled. A project can have multiple batches.
- **Metrics:** Metrics are data about your SageMaker Ground Truth Plus project for a specific date or over a date range.
- **Task type:** SageMaker Ground Truth Plus supports five task types for data labeling. You can also have a custom task type. These include text, image, video, audio, and 3D point cloud.
- **Data objects:** Individual items that are to be labeled.

## Request a Project

Requesting a new Amazon SageMaker Ground Truth Plus project initiates the engagement with the SageMaker Ground Truth Plus team who works to understand your requirements and deliver a high-quality, labeled dataset that is tailored to your use case. In the project request, you can provide details about your labeling task, such as the task type, dataset size, and any sensitive data. You also need to specify an AWS IAM role with permissions for SageMaker Ground Truth Plus to access your data and perform the labeling job. The following page shows you how to create a new project request using the SageMaker AI console.

To request a project, do the following:

1. Under the Ground Truth tab of Amazon SageMaker AI, choose **Plus**.
2. On the **SageMaker Ground Truth Plus** page, choose **Request project**.
3. A page titled **Request a project** opens. The page includes fields for **General information** and **Project overview**. Enter the following information

- a. Under **General information**, enter your **First name**, **Last name** and **Business email address**. An AWS expert uses this information for contacting you to discuss the project after you submit the request.
- b. Under **Project overview**, enter your **Project name** and **Project description**. Choose the **Task type** based on your data and use case. You can also indicate if your data contains personally identifiable information (PII).
- c. Create or select an IAM role that grants SageMaker Ground Truth Plus permissions to perform a labeling job by choosing one of the options below.
  - i. You can **Create an IAM role** that provides access to any S3 bucket you specify.
  - ii. You can **Enter a custom IAM role ARN**.
  - iii. You can choose an existing role.
  - iv. If you use an existing role or a custom IAM role ARN, make sure you have the following IAM role and trust policy.

#### IAM role

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:GetBucketLocation",
        "s3:ListBucket",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::your-bucket-name",
        "arn:aws:s3:::your-bucket-name/*"
        //Ex: "arn:aws:s3:::input-data-to-label/*"
      ]
    }
  ]
}
```

#### Trust policy

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker-ground-truth-plus.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

#### 4. Choose **Request a project**.

Once you create a project, you can find it on the **SageMaker Ground Truth Plus** page, under the **Projects** section. The project status should be **Review in-progress**

#### **Note**

You cannot have more than 5 projects with the **Review in progress** status.

## Create a Project Team

A project team provides access to the members from your organization or team to track projects, view metrics, and review annotations. You can create a SageMaker Ground Truth Plus project team once you have shared your data in an Amazon S3 bucket.

To add team members using Amazon Cognito, you have two options:

1. Create a new Amazon Cognito user group
  - a. Enter an **Amazon Cognito user group name**. This name cannot be changed.
  - b. Enter the email addresses of up to 50 team members in the **Email addresses** field. The addresses must be separated by a comma.
  - c. Choose **Create project team**.

Amazon SageMaker > Ground Truth Plus > Create project team

## Create project team

### Invite new members

Add members to your project team by adding members to a new Amazon Cognito user group or importing members from existing Amazon Cognito user groups.

Create a new Amazon Cognito user group

Import existing Amazon Cognito user groups

#### Amazon Cognito user group name

Give your project team's user group a descriptive name. This name can't be changed later.

Maximum of 63 alphanumeric characters. Can include hyphens, but not spaces. Must be unique within your account in an AWS Region.

#### Email addresses

We send an invitation with instructions to each of the member email addresses that you add here.

Use a comma between addresses. You can add up to 50 members.

**i** We send an email with the login details to all the members added to your team.

#### Email Invitation

Preview the invitation that is automatically generated and sent to team members when creating a project team.

- d. Your team members receive an email inviting them to join the SageMaker Ground Truth Plus project team as shown in the following image.

**Preview invitation**

Hi,

**You are invited by {admin email} from {organization name} to join and review a Ground Truth Plus project.**

Click on the link below to log into your Ground Truth Plus project.

<https://####.labeling.us-east-1.sagemaker.aws>

You will need the following username and temporary password provided below to login for the first time.

User name: **{username}**

Temporary password: **{####}**

Once you log in with your temporary password, you will be required to create a new password for your account.

After creating a new password, you can log into your project team to access your Ground Truth Plus project.

For more information, please refer to

<https://docs.aws.amazon.com/sagemaker/latest/dg/gtp.html>.

If you have any questions, please contact us at **{admin email}**.

2. Import team members from existing Amazon Cognito user groups.
  - a. Choose a user pool that you have created. User pools require a domain and an existing user group. If you get an error that the domain is missing, set it in the **Domain name** options on the **App integration** page of the Amazon Cognito console for your group.
  - b. Choose an app client. We recommend using a client generated by Amazon SageMaker AI.
  - c. Choose a user group from your pool to import its members.
  - d. Choose **Create project team**.

You can view and manage the list of team members through the AWS console.

**To add team members after creating the project team:**

1. Choose **Invite new members** in the **Members** section.

2. Enter the email addresses of up to 50 team members in the **Email addresses** field. The addresses must be separated by a comma.
3. Choose **Invite new members**

### To delete existing team members:

1. Choose the team member to be deleted in the **Members** section.
2. Choose **Delete**.

Once you have added members to your project team, you can open the project portal to access your projects.

## Project Portal

Once you have successfully submitted the intake form and created a project team, you can access the SageMaker Ground Truth Plus project by choosing the **Open project portal** on the AWS console.

Each project consists of one or more batches. A *batch* is a collection of recurring similar data objects (text, image, video frame, and point cloud) to be labeled. The project portal provides you with transparency into the data labeling process. You can stay updated about a project, create batches within a project, review the progress of the datasets across multiple projects, and analyze project metrics. The project portal also allows you to review a subset of the labeled data and provide feedback. You can configure the columns displayed in your project and batch table.

You can use the SageMaker Ground Truth Plus project portal to track the following details about your project.

**Project name:** Each project is identified using a unique name.

**Status:** A SageMaker Ground Truth Plus project has one of the following status types:

1. **Review in progress:** You have successfully submitted the project request form. An AWS expert is currently reviewing your request.
2. **Request approved:** Your project request is approved. You can now share your data by creating a new batch from the project portal.
3. **Workflow design and setup progress:** An AWS expert is setting up your project.
4. **Pilot in-progress:** Object labeling for the project in the pilot stage is currently in progress.
5. **Pilot complete:** Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
6. **Pricing complete:** An AWS expert shares the pricing for the production project with you.
7. **Contract executed:** The contract is complete.
8. **Production in-progress:** Labeling for the project in the production stage is in progress.
9. **Production complete:** Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
- 10 **Paused:** Project is currently paused at your request.

**Task type:** SageMaker Ground Truth Plus lets you label five types of tasks that include text, image, video, audio, and point cloud.

**Batches:** Total number of batches within a project.

**Project creation date:** Starting date of a project.

**Total objects:** Total number of objects to be labeled across all batches.

**Objects completed:** Number of labeled objects.

**Remaining objects:** Number of objects left to be labeled.

**Failed objects:** Number of objects that cannot be labeled due to an issue with the input data.

## Create a Batch

You can use the project portal to create batches for a project after the project status is changed to **Request approved**.

# Create batch

A batch is a collection of similar recurring data objects such as images, video frames and text to be labeled. A project can have multiple batches. Create a batch by following the steps below

## Basic Information

### Batch name

Enter the name of your batch.

### Batch description - *optional*

Provide a brief description of the batch...

Maximum 200 characters.

## Data setup

### S3 location for input datasets [Info](#)

This is the location in S3 where your dataset objects are stored. Ground Truth Plus will use all data objects in this location for your labeling job.

### S3 location for output datasets [Info](#)

This is the location in S3 where your labeling job output data is stored.

Cancel

Submit

To create a batch, do the following.

1. Select a project by choosing the project name.
2. A page titled with the project name opens. Under the **Batches** section, choose **Create batch**.
3. Enter the **Batch name**, **Batch description**, **S3 location for input datasets**, and **S3 location for output datasets**.
4. Choose **Submit**.

**To create a batch successfully, make sure you meet the following criteria:**

- Your data is in the US East (N. Virginia) Region.
- The maximum size for each file is no more than 2 gigabytes.
- The maximum number of files in a batch is 10,000.
- The total size of a batch is less than 100 gigabytes.
- You have no more than 5 batches with the **Data transfer in-progress** status.

**Note**

You cannot create a batch before the project status changes to **Request approved**.

## Batch Metrics

Metrics are data about your SageMaker Ground Truth Plus project for a specific date or over a date range.

You can review metrics for all batches or choose a batch of your choice as shown in the following image.

You can review the following metrics about the batch:

**Total objects:** Total number of objects in a batch or across all batches.

**Objects completed by day:** Total numbers of objects labeled on a specific date or over a date range.

**Labels completed by day:** Total numbers of labels completed on a specific date or over a date range. An object can have more than one label.

## Batch Details

Every Amazon SageMaker Ground Truth Plus project consists of one or more batches. Each batch is made up of data objects to be labeled. You can view all the batches for your project using the project portal as shown in the following image.

The screenshot shows the 'How it works' section of the Amazon SageMaker Ground Truth Plus project portal. It contains five steps:

- Step 1. Track batches:** Monitor batch progress through metrics and status updates.
- Step 2. Provide feedback:** Review each batch when its status is **Ready for review**. Provide feedback on each object as needed. *This step is optional.*
- Step 3. Accept or reject batch:** Accept or reject each batch once its status is **Review submission in-progress** or **Review complete**. Accepting a batch completes the work. Rejecting a batch sends the objects back for rework. *This action can not be undone.*
- Step 4. Receive labeled data:** After approving a batch in the project portal, receive the labeled data in a secure Amazon S3 bucket.
- Step 5. Request new batch:** Request a new batch by contacting your AWS expert.

Below the steps, the 'Beta-Project-1' section shows a 'Batches' tab with a table of 4 batches:

Batch name	Status	Task type	Batch creation date	Total objects	Completed objects	Remaining objects	Failed objects	Objects to review	Objects with feedback
Batch1	Accepted	Image classification (single label)	10/20/2021	1	1	0	0	0	0
Batch2	Rejected	Image classification (single label)	10/26/2021	1	1	0	0	0	0
Batch3	Rejected	Image classification (single label)	10/26/2021	1	1	0	0	0	0
Batch4	Review complete	Image classification (single label)	10/26/2021	8	6	1	1	0	1

You can use the SageMaker Ground Truth Plus project portal to track the following details about every batch:

**Batch name:** Each batch is identified with a unique batch name.

**Status:** A SageMaker Ground Truth Plus batch has one of the following status types:

- 1. Request submitted:** You have successfully submitted a new batch.
- 2. Data transfer failed:** Data transfer failed with errors. Check the error reason and create a new batch after fixing the error.
- 3. Data received:** We have received your unlabeled input data.
- 4. In-progress:** Data labeling is in progress.
- 5. Ready for review:** Data labeling is completed. A subset of labeled objects from the batch are ready for you to review. This is an optional step.
- 6. Review submission in-progress:** Review feedback is currently being processed.
- 7. Review complete:** You have successfully reviewed the batch. Next, you have to accept or reject it. This action can not be undone.

8. **Accepted:** You have accepted the labeled data and will receive it in your Amazon S3 bucket shortly.
9. **Rejected:** Labeled data needs to be reworked.
- 10 **Sent for rework:** Labeled data is sent for rework. You can review the batch after its status changes to **Ready for review**.
- 11 **Ready for delivery:** Labeled data is ready to be transferred to your Amazon S3 bucket.
- 12 **Data delivered:** Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
- 13 **Paused:** Batch is paused at your request.

**Task type:** SageMaker Ground Truth Plus lets you label five types of tasks that include text, image, video, audio, and point cloud.

**Batch creation date:** Date when the batch was created.

**Total objects:** Total number of objects to be labeled across a batch.

**Completed objects:** Number of labeled objects.

**Remaining objects:** Number of objects left to be labeled.

**Failed objects:** Number of objects that cannot be labeled due to an issue with the input data.

**Objects to review:** Number of objects that are ready for your review.

**Objects with feedback:** Number of objects that have gotten feedback from the team members.

SageMaker Ground Truth Plus lets you review a sample set of your labeled data (determined during the initial consultation call) through the review UI shown in the following image.

The screenshot displays the Amazon SageMaker AI review interface. At the top, there's a header with a greeting, customer ID, task description, and task time. Below this are buttons for 'Decline task', 'Release task', and 'Stop and resume later'. The main area is divided into three sections: an 'Instructions' panel on the left, a central image viewer, and a 'Labels' panel on the right. The 'Instructions' panel provides guidance on providing feedback, navigation, submitting, image controls, saving, closing, and verifying. The 'Labels' panel shows a search bar, a 'No labels added' message, and 'Frame 1 attributes' including 'FrameQuality' (High, Medium, Low) and 'Provide Feedback' (Annotation Feedback). At the bottom, there's a navigation tray with play, stop, zoom, and pan icons, and a 'Save' and 'Submit' button. A footer note says 'Treat the data in this task as confidential.'

The portal allows your project team members and you to review a small sample set of the labeled objects for each batch. You can provide feedback for each labeled object within that subset through this UI. The review UI allows you to navigate across the subset of labeled objects and provide feedback for those labeled objects.

You can perform the following actions using the review UI.

- Use the arrow controls on the bottom left to navigate through the data objects.
- You can provide feedback for each object. The **Feedback section** is in the right panel. Choose **Submit** to submit feedback for all images.
- Use the image controls in the bottom tray to zoom, pan, and control contrast.
- If you plan on returning to finish up your review, choose **Stop and resume later** on the top right.
- Choose **Save** to save your progress. Your progress is also autosaved every 15 minutes.
- To exit the review UI, choose **Close** on the upper right corner of the review UI.
- You can verify the **Label attributes** and **Frame attributes** on each frame using the panel on the right. You cannot create new objects or modify existing objects in this task.

## Accept or Reject Batches

After you have reviewed a batch, you must choose to accept or reject it.

If you accept a batch, the output from that labeling job is placed in the Amazon S3 bucket that you specify. Once the data is delivered to your S3 bucket, the status of your batch changes from **Accepted** to **Data delivered**.

If you reject a batch, you can provide feedback and explain your reasons for rejecting the batch.

SageMaker Ground Truth Plus allows you to provide feedback at the data object level as well as the batch level. You can provide feedback for data objects through the review UI. You can use the project portal to provide feedback for each batch. When you reject a batch, an AWS expert contacts you to determine the rework process and the next steps for the batch.

### Note

Accepting or rejecting a batch is a one-time action and cannot be undone. It is necessary to either accept or reject every batch of the project.

## Workforces

A *workforce* is the group of workers that you have selected to label your dataset. You can choose either the Amazon Mechanical Turk workforce, a vendor-managed workforce, or you can create your own private workforce to label or review your dataset. Whichever workforce type you choose, Amazon SageMaker AI takes care of sending tasks to workers.

When you use a private workforce, you also create *work teams*, a group of workers from your workforce that are assigned to specific *jobs*— [Amazon SageMaker Ground Truth](#) labeling jobs or [Amazon Augmented AI](#) human review tasks. You can have multiple work teams and can assign one or more work teams to each job.

You can use Amazon Cognito or your own private OpenID Connect (OIDC) Identity Provider (IdP) to manage your private workforce and work teams. For more information about the permissions required to manage your workforce this way, see [Permissions required to use the Amazon SageMaker Ground Truth console](#).

### Topics

- [Using the Amazon Mechanical Turk Workforce](#)

- [Subscribe to vendor workforces](#)
- [Private workforce](#)

## Using the Amazon Mechanical Turk Workforce

The Amazon Mechanical Turk (Mechanical Turk) workforce provides the most workers for your [Amazon SageMaker Ground Truth](#) labeling job and [Amazon Augmented AI](#) human review task. The Amazon Mechanical Turk workforce is a world-wide resource. Workers are available 24 hours a day, 7 days a week. You typically get the fastest turnaround for your human review tasks and labeling jobs when you use the Amazon Mechanical Turk workforce.

Any Amazon Mechanical Turk workforce billing is handled as part of your Ground Truth or Amazon Augmented AI billing. You do not need to create a separate Mechanical Turk account to use the Amazon Mechanical Turk workforce.

### Important

You should not share confidential information, personal information, or protected health information with this workforce. You should not use the Amazon Mechanical Turk workforce when you use Amazon A2I in conjunction with AWS HIPAA-eligible services, such as Amazon Textract and Amazon Rekognition, for workloads containing protected health information.

You can choose Mechanical Turk as your workforce when you create a Ground Truth labeling job or Amazon A2I human review workflow (flow definition). You can create a labeling job and a human review workflow using the SageMaker AI console and API.

When you use an API operation to create a labeling job or human review workflow, you use the following ARN for the Amazon Mechanical Turk workforce for your `WorkteamArn`. Replace *region* with the AWS Region you are using to create the labeling job or human loops. For example, if you create a labeling job in US West (Oregon), replace *region* with `us-west-2`.

- `arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default`

Ground Truth and Amazon A2I *require* that your input data is free of personally identifiable information (PII) when you use Mechanical Turk. If you use the Mechanical Turk workforce and do

not specify that your input data is free of PII, your Ground Truth labeling jobs and Augmented AI tasks will fail. You specify that your input data is free of PII when you create a Ground Truth labeling job and when you create a Amazon A2I human loop using a built-in integration or the `StartHumanLoop` operation.

Use the following sections to learn how to use Mechanical Turk with these services.

## Topics

- [Use Mechanical Turk with Ground Truth](#)
- [Use Mechanical Turk with Amazon A2I](#)
- [When is Mechanical Turk Not Supported?](#)

## Use Mechanical Turk with Ground Truth

You can use Mechanical Turk with Ground Truth when you create a labeling job using the console, or the [CreateLabelingJob](#) operation.

When you create a labeling job, we recommend you adjust the number of workers that annotate each data object based on the complexity of the job and the quality that you need. Amazon SageMaker Ground Truth uses annotation consolidation to improve the quality of the labels. More workers can make a difference in the quality of the labels for more complex labeling jobs, but might not make a difference for simpler jobs. For more information, see [Annotation consolidation](#). Note that annotation consolidation is not supported for Amazon A2I human review workflows.

### To use Mechanical Turk when you create a labeling job (console):

1. Use the following to create a labeling job using the Ground Truth area of the SageMaker AI console: [Create a Labeling Job \(Console\)](#).
2. When you are selecting **Worker types** in the **Workers** section, select **Amazon Mechanical Turk**.
3. Specify the total amount of time workers have to complete a task using **Task timeout**.
4. Specify the total amount of time a task remains available to workers in **Task expiration**. This is how long workers have to pick up a task before it fails.
5. Select the **Price per task** using the dropdown list. This is the amount of money a worker receives for completing a single task.
6. (Optional) If applicable, select **The dataset does not contain adult content**. SageMaker AI may restrict the Mechanical Turk workers that can view your task if it contains adult content.

7. You must read and confirm the following statement by selecting the check box to use the Mechanical Turk workforce. If your input data contains confidential information, personal information, or protected health information, you must select another workforce.

**You understand and agree that the Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information, or protected health information with this workforce.**

8. (Optional) Select the check box next to **Enable automated data labeling** if you want to enable automated data labeling. To learn more about this feature, see [Automate data labeling](#).
9. You can specify the **Number of workers per dataset object** under **Additional configuration**. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.

When you create your labeling job by selecting **Create**, your labeling tasks are sent to Mechanical Turk workers.

#### To use Mechanical Turk when you create a labeling job (API):

1. Use the following to create a labeling job using the [CreateLabelingJob](#) operation: [Create a Labeling Job \(API\)](#).
2. Use the following for the [WorkteamArn](#). Replace *region* with the AWS Region you are using to create the labeling job.

```
arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default
```

3. Use [TaskTimeLimitInSeconds](#) to specify the total amount of time workers have to complete a task.
4. Use [TaskAvailabilityLifetimeInSeconds](#) to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.
5. Use [NumberOfHumanWorkersPerDataObject](#) to specify the number of workers per dataset object.
6. Use [PublicWorkforceTaskPrice](#) to set the price per task. This is the amount of money a worker receives for completing a single task.
7. Use [DataAttributes](#) to specify that your input data is free of confidential information, personal information, or protected health information.

Ground Truth *requires* that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that

your input data is free of PII using the `FreeOfPersonallyIdentifiableInformation` flag, your labeling job will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker AI may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: [Ground Truth Jupyter Notebook Examples](#). You can access these notebooks under the SageMaker AI [Access example notebooks](#) in a [notebook instance](#).

## Use Mechanical Turk with Amazon A2I

You can specify that you want to use Mechanical Turk with Amazon A2I when you create a human review workflow, also referred to as a *flow definition*, in the console, or with the `CreateFlowDefinition` API operation. When you use this human review workflow to configure human loops, you must specify that your input data is free of PII.

### To use Mechanical Turk when you create a human review workflow (console):

1. Use the following to create a human review workflow in the Augmented AI section of the SageMaker AI console: [Create a Human Review Workflow \(Console\)](#).
2. When you are selecting **Worker types** in the **Workers** section, select **Amazon Mechanical Turk**.
3. Select the **Price per task** using the dropdown list. This is the amount of money a worker receives for completing a single task.
4. (Optional) You can specify the **Number of workers per dataset object** under **Additional configuration**. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.
5. (Optional) Specify the total amount of time workers have to complete a task using **Task timeout**.
6. (Optional) Specify the total amount of time a task remains available to workers in **Task expiration**. This is how long workers have to pick up a task before it fails.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter `FlowDefinitionArn`. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, `StartHumanLoop`. To learn more, see [Create and Start a Human Loop](#).

When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the `FreeOfPersonallyIdentifiableInformation` content classifier in `DataAttributes`. If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker AI may restrict the Mechanical Turk workers that can view your task if it contains adult content.

### To use Mechanical Turk when you create a human review workflow (API):

1. Use the following to create a human review workflow using the [CreateFlowDefinition](#) operation: [Create a Human Review Workflow \(API\)](#).
2. Use the following for the [WorkteamArn](#). Replace *region* with the AWS Region you are using to create the labeling job.

```
arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default
```

3. Use [TaskTimeLimitInSeconds](#) to specify the total amount of time workers have to complete a task.
4. Use [TaskAvailabilityLifetimeInSeconds](#) to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.
5. Use [TaskCount](#) to specify the number of workers per dataset object. For example, if you specify 3 for this parameter, each data object will be labeled by 3 workers.
6. Use [PublicWorkforceTaskPrice](#) to set the price per task. This is the amount of money a worker receives for completing a single task.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter `FlowDefinitionArn`. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, `StartHumanLoop`. To learn more, see [Create and Start a Human Loop](#).

When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the `FreeOfPersonallyIdentifiableInformation` content classifier in `DataAttributes`.

If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker AI may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: [Amazon A2I Jupyter Notebook Examples](#).

## When is Mechanical Turk Not Supported?

This workforce is not supported under the following scenarios. In each scenario, you must use a [private](#) or [vendor](#) workforce.

- This workforce is not supported for Ground Truth video frame labeling jobs and 3D point cloud labeling jobs.
- You cannot use this workforce if your input data contains personally identifiable information (PII).
- Mechanical Turk is not available in some of the AWS special regions. If applicable, refer to the documentation for your special region for more information.

## Subscribe to vendor workforces

You can use a vendor-managed workforce to label your data using Amazon SageMaker Ground Truth (Ground Truth) and Amazon Augmented AI (Amazon A2I). Vendors have extensive experience in providing data labeling services for the purpose of machine learning. Vendor workforces for these two services must be created and managed separately through the Amazon SageMaker AI console.

Vendors make their services available via the AWS Marketplace. You can find details of the vendor's services on their detail page, such as the number of workers and the hours that they work. You can use these details to make estimates of how much the labeling job will cost and the amount of time that you can expect the job to take. Once you have chosen a vendor you subscribe to their services using the AWS Marketplace.

A subscription is an agreement between you and the vendor. The agreement spells out the details of the agreement, such as price, schedule, or refund policy. You work directly with the vendor if there are any issues with your labeling job.

You can subscribe to any number of vendors to meet your data annotation needs. When you create a labeling job or human review workflow you can specify that the job be routed to a specific vendor.

### **Important**

Before you send sensitive data to a vendor, check the vendor's security and compliance practices on their detail page and review the end user license agreement (EULA) that is part of your subscription agreement. You are responsible for ensuring that the vendor meets your compliance requirements for personal or confidential information. Do not share protected health information with this workforce.

You must use the console to subscribe to a vendor workforce. Once you have a subscription, you can use the [ListSubscribedWorkteams](#) operation to list your subscribed vendors.

### **To subscribe to a vendor workforce**

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose the appropriate page in the SageMaker AI console.
  - For Ground Truth labeling jobs, choose **Labeling workforces**, choose **Vendor**, and then choose **Find data labeling services**.
  - For Amazon A2I human review workflows, choose **Human review workforces**, choose **Vendor**, and then choose **Find human review services**.
3. The console opens the AWS Marketplace with:
  - data labeling services category selected for Ground Truth
  - human review services category selected for Amazon A2I

Here you see a list of the vendor services available for this service.

4. Choose a vendor. The AWS Marketplace shows detailed information about the data labeling or human review service. Use this information to determine if the vendor meets your requirements for your task.

5. If the vendor meets your requirements, choose **Continue to subscribe**.
6. Review the details of the subscription. If you agree to the terms, choose **Subscribe** to complete your subscription to the service.

## Private workforce

A **private workforce** is a group of workers that *you* choose. These can be employees of your company or a group of subject matter experts from your industry. For example, if the task is to label medical images, you could create a private workforce of people knowledgeable about the images in question.

Each AWS account has access to a single private workforce per region, and the owner has the ability to create multiple **private work teams** within that workforce. A single private work team is used to complete a labeling job or human review task, or a *job*. You can assign each work team to a separate job or use a single team for multiple jobs. A single worker can be in more than one work team.

Your private workforce can either be created and managed using [Amazon Cognito](#) or your own private OpenID Connect (OIDC) Identity Provider (IdP).

If you are a new user of [Amazon SageMaker Ground Truth](#) or [Amazon Augmented AI](#) and do not require your workers to be managed with your own IdP, it is recommended that you use Amazon Cognito to create and manage your private workforce.

After you create a workforce, in addition to creating and managing work teams, you can do the following:

- [Track worker performance](#)
- [Create and manage Amazon SNS topics](#) to notify workers when labeling tasks are available
- [Manage Private Workforce Access to Tasks Using IP Addresses](#)

### Note

Your private workforce is shared between Ground Truth and Amazon A2I. To create and manage private work teams used by Augmented AI, use the Ground Truth section of the SageMaker AI console.

## Topics

- [Amazon Cognito Workforces](#)
- [OIDC IdP Workforces](#)
- [Private workforce management using the Amazon SageMaker API](#)
- [Track Worker Performance Metrics](#)
- [Create the Amazon SNS topic](#)

## Amazon Cognito Workforces

Create and manage your private workforce using Amazon Cognito when you want to create your workforce using the Amazon SageMaker AI console or you don't want the overhead of managing worker credentials and authentication. When you create a private workforce with Amazon Cognito, it provides authentication, authorization, and user management for your private workers.

## Topics

- [Create a Private Workforce \(Amazon Cognito\)](#)
- [Manage a Private Workforce \(Amazon Cognito\)](#)

## Create a Private Workforce (Amazon Cognito)

When you use Amazon Cognito, you can create a private workforce in one of the following ways:

- Create a new workforce while you are creating your labeling job. To learn how, see [Create an Amazon Cognito Workforce When Creating a Labeling Job](#).
- Create a new workforce before you create your labeling job. To learn how, see [Create an Amazon Cognito Workforce Using the Labeling Workforces Page](#).
- Import an existing workforce after creating a user pool in the Amazon Cognito console. To learn how, see [Create a Private Workforce \(Amazon Cognito Console\)](#).

Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon Augmented AI human review workflows tasks.

If you are new to Amazon SageMaker AI and want to test Ground Truth or Amazon A2I, we suggest that you create a private work team consisting of people from your organization using the console.

Use this work team when creating labeling or human review workflows (flow definitions) to test your worker UI and job workflow.

## Topics

- [Create a Private Workforce \(Amazon SageMaker AI Console\)](#)
- [Create a Private Workforce \(Amazon Cognito Console\)](#)

## Create a Private Workforce (Amazon SageMaker AI Console)

You can create a private workforce in the Amazon SageMaker AI console in one of two ways:

- When creating a labeling job in the **Labeling jobs** page of the Amazon SageMaker Ground Truth section.
- Using the **Labeling workforces** page of the Amazon SageMaker Ground Truth section. If you are creating a private workforce for an Amazon A2I human review workflow, use this method.

Both of these methods also create a default work team containing all of the members of the workforce. This private workforce is available to use for both Ground Truth and Amazon Augmented AI jobs.

When you create a private workforce using the console, SageMaker AI uses Amazon Cognito as an identity provider for your workforce. If you want to use your own OpenID Connect (OIDC) Identity Provider (IdP) to create and manage your private workforce, you must create a workforce using the SageMaker API operation `CreateWorkforce`. To learn more, see [Create a Private Workforce \(OIDC IdP\)](#).

## Create an Amazon Cognito Workforce When Creating a Labeling Job

If you haven't created a private workforce when you create your labeling job and you choose to use private workers, you are prompted to create a work team. This will create a private workforce using Amazon Cognito.

### To create a workforce while creating a labeling job (console)

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Labeling jobs** and fill in all required fields. For instructions on how to start a labeling job, see [Getting started: Create a bounding box labeling job with Ground Truth](#). Choose **Next**.

3. Choose **Private** for the workforce type.
4. In the **Workers** section, enter:
  - a. The **Team name**.
  - b. Email addresses for up to 100 workforce members. Email addresses are case sensitive. Your workers must log in using the same case used when the address was initially entered. You can add additional workforce members after the job has been created.
  - c. The name of your organization. SageMaker AI uses this to customize the email sent to the workers.
  - d. A contact email address for workers to report issues related to the task.

When you create the labeling job, an email is sent to each worker inviting them to join the workforce. After creating the workforce, you can add, delete, and disable workers using the SageMaker AI console or the Amazon Cognito console.

### Create an Amazon Cognito Workforce Using the Labeling Workforces Page

To create and manage your private workforce using Amazon Cognito, you can use the **Labeling workforces** page. When following the instructions below, you have the option to create a private workforce by entering worker emails importing a pre-existing workforce from an Amazon Cognito user pool. To import a workforce, see [Create a Private Workforce \(Amazon Cognito Console\)](#).

#### To create a private workforce using worker emails

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Labeling workforces**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. Paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

## 8. Click the **Create private team** button.

After you import your private workforce, refresh the page. On the **Private workforce summary** page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce.

### **Note**

If you delete all of your private work teams, you have to repeat this process to use a private workforce in that region.

## Create a Private Workforce (Amazon Cognito Console)

Amazon Cognito is used to define and manage your private workforce and your work teams. It is a service that you can use to create identities for your workers and authenticate these identities with identity providers. A private workforce corresponds to a single **Amazon Cognito user pool**. Private work teams correspond to **Amazon Cognito user groups** within that user pool.

Example identity providers supported by Amazon Cognito:

- Social sign-in providers such as Facebook and Google
- OpenID Connect (OIDC) providers
- Security Assertion Markup Language (SAML) providers such as Active Directory
- The Amazon Cognito built-in identity provider

For more information, see [What Is Amazon Cognito?](#).

To create a private workforce using Amazon Cognito, you must have an existing Amazon Cognito user pool containing at least one user group. See [Tutorial: Creating a User Pool](#) to learn how to create a user pool. See [Adding Groups to a User Pool](#) to learn how to add a user group to a pool.

Once your user pool has been created, follow the steps below to create a private workforce by importing that user pool into Amazon SageMaker AI.

### To create a private workforce by importing a Amazon Cognito user pool

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Labeling workforces**.

3. Choose **Private**.
4. Choose **Create private team**. This creates a private workforce and a work team.
5. Choose **Import workers from existing Amazon Cognito user groups**.
6. Choose a user pool that you have created. User pools require a domain and an existing user group. If you get an error that the domain is missing, set it in the **Domain name** options on the **App integration** page of the Amazon Cognito console for your group.
7. Choose an app client. We recommend using a client generated by SageMaker AI.
8. Choose a user group from your pool to import its members.
9. Optionally choose an Amazon Simple Notification Service (Amazon SNS) topic to which to subscribe the team so that workers are notified by email when new labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
10. Choose **Create private team**.

#### **Important**

After you create a workforce using an Amazon Cognito user pool, it should not be deleted without first deleting all work teams associated with that pool in the SageMaker AI console.

After you import your private workforce, refresh the page to see the **Private workforce summary** page. On this page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce. This workforce is now available to use in both Amazon Augmented AI and Amazon SageMaker Ground Truth for human review tasks and data labeling jobs respectively.

### **Manage a Private Workforce (Amazon Cognito)**

After you have created a private workforce using Amazon Cognito, you can create and manage work teams using the Amazon SageMaker AI console and API operations.

You can do the following using either the [SageMaker AI console](#) or [Amazon Cognito console](#).

- Add and delete work teams.

- Add workers to your workforce and one or more work teams.
- Disable or remove workers from your workforce and one or more workteams. If you add workers to a workforce using the Amazon Cognito console, you must use the same console to remove the worker from the workforce.

You can restrict access to tasks to workers at specific IP addresses using the SageMaker API. For more information, see [Private workforce management using the Amazon SageMaker API](#).

## Topics

- [Manage a Workforce \(Amazon SageMaker AI Console\)](#)
- [Manage a Private Workforce \(Amazon Cognito Console\)](#)

### Manage a Workforce (Amazon SageMaker AI Console)

You can use the Amazon SageMaker AI console to create and manage the work teams and individual workers that make up a private workforce.

Use a work team to assign members of your private workforce to a labeling or human review *job*. When you create your workforce using the SageMaker AI console, there is a work team called **Everyone-in-private-workforce** that enables you to assign your entire workforce to a job. Because an imported Amazon Cognito user pool may contain members that you don't want to include in your work teams, a similar work team is not created for Amazon Cognito user pools.

You have two choices to create a new work team:

- You can create a work team in the SageMaker AI console and add members from your workforce to the team.
- You can create a user group by using the Amazon Cognito console and then create a work team by importing the user group. You can import more than one user group into each work team. You manage the members of the work team by updating the user group in the Amazon Cognito console. See [Manage a Private Workforce \(Amazon Cognito Console\)](#) for more information.

### Create a Work Team Using the SageMaker AI Console

You can create a new Amazon Cognito user group or import an existing user group using the SageMaker AI console, on the **Labeling workforces** page. For more information on creating a user group in the Amazon Cognito console, see [Manage a Private Workforce \(Amazon Cognito Console\)](#).

## To create a work team using the SageMaker AI console

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose **Labeling workforces** from the left menu.
3. Under **Private**, choose **Create private team**.
4. Under **Team details**, enter a **Team name**. The name must be unique in your account in an AWS Region.
5. Under **Add workers**, choose a method to add workers to the team using a user group.
  - If you chose **Create a team by adding workers to a new Amazon Cognito user group**, select the workers to add to the team.
  - If you chose **Create a team by importing existing Amazon Cognito user groups**, choose the user groups that are part of the new team.
6. If you select an **SNS topic**, all workers added to the team are subscribed to the Amazon SNS topic and notified when new work items are available to the team. Select from a list of your existing Ground Truth related Amazon SNS topics or select **Create new topic** to open a topic-creation dialog.

Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

Workers in a workteam subscribed to a topic receive notifications when a new Ground Truth labeling job for that team becomes available and when one is about to expire.

Read [Create the Amazon SNS topic](#) for more information about using Amazon SNS topic.

### Subscriptions

After you have created a work team, you can see more information about the team and change or set the Amazon SNS topic to which its members are subscribed by visiting the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. Read [Create and manage Amazon SNS topics for your work teams](#) for more information on creating and managing the Amazon SNS topic.

## Add or Remove Workers

A *work team* is a group of workers within your workforce to whom you can assign jobs. A worker can be added to more than one work team. Once a worker has been added to a work team, that worker can be disabled or removed.

### Add Workers to the Workforce

Adding a worker to the workforce enables you to add that worker to any work team within that work force.

#### To add workers using the private workforce summary page

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Choose **Labeling workforces** to navigate to your private workforce summary page.
3. Choose **Private**.
4. Choose **Invite new workers**.
5. Paste or type a list of email addresses, separated by commas, into the email addresses box. You can have up to 50 email addresses in this list.

### Add a Worker to a Work Team

A worker must be added to the workforce before being added to a work team. To add a worker to a work team, first navigate to the **Private workforce summary** page using the steps above.

#### To add a worker to a work team from the private workforce summary page

1. In the **Private teams** section, choose the team to which you want to add the workers.
2. Choose the **Workers** tab.
3. Choose **Add workers to team** and choose the boxes next to the workers that you want to add.
4. Click **Add workers to team**.

### Disable and Remove a Worker from the Workforce

Disabling a worker stops the worker from receiving a job. This action does not remove the worker from the workforce, or from any work team with which the worker is associated. To disable or remove a worker from a work team, first navigate to the private workforce summary page using the steps above.

## To deactivate a worker using the private workforce summary page

1. In the **Workers** section, choose the worker that you would like to disable.
2. Choose **Disable**.

If desired, you can subsequently **Enable** a worker after they have been disabled.

You can remove workers from your private workforce directly in the SageMaker AI console if that worker was added in this console. If you added the worker (user) in the Amazon Cognito console, see [Manage a Private Workforce \(Amazon Cognito Console\)](#) to learn how to remove the worker in the Amazon Cognito console.

## To remove a worker using the private workforce summary page

1. In the **Workers** section, choose the worker that you would like to delete.
2. If the worker has not been disabled, choose **Disable**.
3. Select the worker and choose **Delete**.

## Manage a Private Workforce (Amazon Cognito Console)

A private workforce corresponds to a single **Amazon Cognito user pool**. Private work teams correspond to **Amazon Cognito user groups** within that user pool. Workers correspond to **Amazon Cognito users** within those groups.

After your workforce has been created, you can add work teams and individual workers through the Amazon Cognito console. You can also delete workers from your private workforce or remove them from individual teams in the Amazon Cognito console.

### **Important**

You can't delete work teams from the Amazon Cognito console. Deleting an Amazon Cognito user group that is associated with an Amazon SageMaker AI work team will result in an error. To remove work teams, use the SageMaker AI console.

## Create Work Teams (Amazon Cognito Console)

You can create a new work team to complete a job by adding a Amazon Cognito user group to the user pool associated with your private workforce. To add a Amazon Cognito user group to an existing worker pool, see [Adding groups to a User Pool](#).

### To create a work team using an existing Amazon Cognito user group

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Workforces**.
3. For **Private teams**, choose **Create private team**.
4. Under **Team details**, give the team a name. The name must be unique in your account in an AWS Region.
5. For **Add workers**, choose **Import existing Amazon Cognito user groups**, and choose one or more user groups that are part of the new team.
6. If you choose an **SNS topic**, all workers added to the team are subscribed to the Amazon Simple Notification Service (Amazon SNS) topic and notified when new work items are available to the team. Choose from a list of your existing SNS topics related to SageMaker Ground Truth or Amazon Augmented AI or choose **Create new topic** to create one.

#### Note

Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

## Subscriptions

After you have created a work team, you can see more information about the team and change or set the SNS topic to which its members are subscribed using the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. For more information, see [Create the Amazon SNS topic](#).

## Add and Remove Workers (Amazon Cognito Console)

When using the Amazon Cognito console to add workers to a work team, you must add a user to the user pool associated with the workforce before adding that user to a user group. Users can be added to a user pool in various ways. For more information, see [Signing Up and Confirming User Accounts](#).

### Add a Worker to a Work Team

After a user has been added to a pool, the user can be associated with user groups inside of that pool. After a user has been added to a user group, that user becomes a worker on any work team created using that user group.

#### To add a user to a user group

1. Open the Amazon Cognito console: <https://console.aws.amazon.com/cognito/>.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker AI workforce.
4. Under **General Settings**, choose **Users and Groups** and do one of the following:
  - Choose **Groups**, choose the group that you want to add the user to, and choose **Add users**. Choose the users that you want to add by choosing the plus-icon to the right of the user's name.
  - Choose **Users**, choose the user that you want to add to the user group, and choose **Add to group**. From the dropdown menu, choose the group and choose **Add to group**.

### Disable and Remove a Worker From a Work Team

Disabling a worker stops the worker from receiving jobs. This action doesn't remove the worker from the workforce, or from any work team the worker is associated with. To remove a user from a work team in Amazon Cognito, you remove the user from the user group associated with that team.

#### To deactivate a worker (Amazon Cognito console)

1. Open the Amazon Cognito console: <https://console.aws.amazon.com/cognito/>.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker AI workforce.

4. Under **General Settings**, choose **Users and Groups**.
5. Choose the user that you want to disable.
6. Choose **Disable User**.

You can enable a disabled user by choosing **Enable User**.

### To remove a user from a user group (Amazon Cognito console)

1. Open the Amazon Cognito console: <https://console.aws.amazon.com/cognito/>.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker AI workforce.
4. Under **General Settings**, choose **Users and Groups**.
5. For **User** tab, choose the **X** icon to the right of the group from which you want to remove the user.

## OIDC IdP Workforces

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to manage and authenticate your workers using your own OIDC IdP. Individual worker credentials and other data will be kept private. Ground Truth and Amazon A2I will only have visibility into worker information you provide through the claims that you send to these services. To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I map one or more groups in your IdP to a work team. To learn more, see [Send Required and Optional Claims to Ground Truth and Amazon A2I](#).

If you are a new user of Ground Truth or Amazon A2I, you can test your worker UI and job workflow by creating a private work team and adding yourself as a worker. Use this work team when you create a labeling job or human review workflow. First, create a private OIDC IdP workforce using the instructions in [Create a Private Workforce \(OIDC IdP\)](#). Next, refer to [Manage a Private Workforce \(OIDC IdP\)](#) to learn how to create a work team.

### Topics

- [Create a Private Workforce \(OIDC IdP\)](#)
- [Manage a Private Workforce \(OIDC IdP\)](#)

## Create a Private Workforce (OIDC IdP)

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to authenticate and manage workers using your own identity provider. Use this page to learn how to configure your IdP to communicate with Amazon SageMaker Ground Truth (Ground Truth) or Amazon Augmented AI (Amazon A2I) and to learn how to create a workforce using your own IdP.

To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I use one or more groups that you specify to create work teams. You use work teams to specify workers for your labeling jobs and human review tasks. Because groups are not a [standard claim](#), your IdP may have a different naming convention for a group of users (workers). Therefore, you must identify one or more user groups to which a worker belongs using the custom claim `sagemaker:groups` that is sent to Ground Truth or Amazon A2I from your IdP. To learn more, see [Send Required and Optional Claims to Ground Truth and Amazon A2I](#).

You create an OIDC IdP workforce using the SageMaker API operation [CreateWorkforce](#). Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon A2I human review workflows tasks. To learn more, see [Create an OIDC IdP Workforce](#).

### Send Required and Optional Claims to Ground Truth and Amazon A2I

When you use your own IdP, Ground Truth and Amazon A2I use your `Issuer`, `ClientId`, and `ClientSecret` to authenticate workers by obtaining an authentication `CODE` from your `AuthorizationEndpoint`.

Ground Truth and Amazon A2I will use this `CODE` to obtain a custom claim from either your IdP's `TokenEndpoint` or `UserInfoEndpoint`. You can either configure `TokenEndpoint` to return a JSON web token (JWT) or `UserInfoEndpoint` to return a JSON object. The JWT or JSON object must contain required and optional claims that you specify. A [claim](#) is a key-value pair that contains information about a worker or metadata about the OIDC service. The following table lists the claims that must be included, and that can optionally be included in the JWT or JSON object that your IdP returns.

#### Note

Some of the parameters in the following table can be specified using a `:` or a `-`. For example, you can specify the groups a worker belongs to using `sagemaker:groups` or `sagemaker-groups` in your claim.

Name	Required	Accepted Format and Values	Description	Example
sagemaker :groups or sagemaker-groups	Yes	<p><b>Data type:</b></p> <p>If a worker belongs to a single group, identify the group using a string.</p> <p>If a worker belongs to multiple groups, use a list of up to 10 strings.</p> <p><b>Allowable characters:</b></p> <p>Regex: <code>[\p{L}\p{M}\p{S}\p{N}\p{P}]</code> +</p> <p><b>Quotas:</b></p> <p>10 groups per worker</p> <p>63 characters per group name</p>	Assigns a worker to one or more groups. Groups are used to map the worker into work teams.	<p>Example of worker that belongs to a single group: "work_team1"</p> <p>Example of a worker that belongs to more than one groups: ["work_team1", "work_team2"]</p>
sagemaker :sub or sagemaker-sub	Yes	<p><b>Data type:</b></p> <p>String</p>	This is mandatory to track a worker identity inside the Ground Truth platform for auditing and to identify tasks worked on by that worker.	"11101110 1-1234567 89-368705 6437-1111"

Name	Required	Accepted Format and Values	Description	Example
			For ADFS: Customers must use the Primary Security Identifier (SID).	
sagemaker:client_id or sagemaker-client_id	Yes	<b>Data type:</b> String  <b>Allowable characters:</b>  Regex: [\w+-]+  <b>Quotes:</b>  128 characters	A client ID. All tokens must be issued for this client ID.	"00b600bb-1f00-05d0-bd00-00be00fbd0e0"
sagemaker:name or sagemaker-name	Yes	<b>Data type:</b> String	The worker name to be displayed in the worker portal.	"Jane Doe"

Name	Required	Accepted Format and Values	Description	Example
email	No	<b>Data type:</b> String	The worker email. Ground Truth uses this email to notify workers that they have been invited to work on labeling tasks. Ground Truth will also use this email to notify your workers when labeling tasks become available if you set up an Amazon SNS topic for a work team that this worker is on.	"example-email@domain.com"
email_verified	No	<b>Data type:</b> Bool  <b>Accepted Values:</b> True, False	Indicates if the user email was verified or not.	True

The following is an example of the JSON object syntax your UserInfoEndpoint can return.

```
{
  "sub": "122",
  "exp": "10000",
  "sagemaker-groups": ["group1", "group2"],
  "sagemaker-name": "name",
  "sagemaker-sub": "122",
  "sagemaker-client_id": "123456"
}
```

Ground Truth or Amazon A2I compares the groups listed in `sagemaker:groups` or `sagemaker-groups` to verify that your worker belongs to the work team specified in the labeling job or human review task. After the work team has been verified, labeling or human review tasks are sent to that worker.

## Create an OIDC IdP Workforce

You can create a workforce using the SageMaker API operation `CreateWorkforce` and associated language-specific SDKs. Specify a `WorkforceName` and information about your OIDC IDP in the parameter `OidcConfig`. It is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI with the worker portal URL after you create the workforce. To learn more, see [Configure your OIDC IdP](#).

The following shows an example of the request. See [CreateWorkforce](#) to learn more about each parameter in this request.

```
CreateWorkforceRequest: {
  #required fields
  WorkforceName: "example-oidc-workforce",
  OidcConfig: {
    ClientId: "clientId",
    ClientSecret: "secret",
    Issuer: "https://example-oidc-idp.com/adfs",
    AuthorizationEndpoint: "https://example-oidc-idp.com/adfs/oauth2/authorize",
    TokenEndpoint: "https://example-oidc-idp.com/adfs/oauth2/token",
    UserInfoEndpoint: "https://example-oidc-idp.com/adfs/oauth2/userInfo",
    LogoutEndpoint: "https://example-oidc-idp.com/adfs/oauth2/log-out",
    JwksUri: "https://example-oidc-idp.com/adfs/discovery/keys"
  },
  SourceIpConfig: {
    Cidrs: ["string", "string"]
  }
}
```

## Configure your OIDC IdP

How you configure your OIDC IdP depends on the IdP you use, and your business requirements.

When you configure your IdP, you must to specify a callback or redirect URI. After Ground Truth or Amazon A2I authenticates a worker, this URI will redirect the worker to the worker portal where the workers can access labeling or human review tasks. To create a worker portal URL, you need

to create a workforce with your OIDC IdP details using the [CreateWorkforce](#) API operation. Specifically, you must configure your OIDC IdP with required custom sagemaker claims (see the next section for more details). Therefore, it is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI after you create the workforce. See [Create an OIDC IdP Workforce](#) to learn how to create a workforce using this API.

You can view your worker portal URL in the SageMaker Ground Truth console, or using the SageMaker API operation, [DescribeWorkforce](#). The worker portal URL is in the [SubDomain](#) parameter in the response.

### Important

Make sure you add the workforce subdomain to your OIDC IdP allow list. When you add the subdomain to your allow list, it must end with `/oauth2/idpresponse`.

### To view your worker portal URL after creating a private workforce (Console):

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Labeling workforces**.
3. Select the **Private** tab.
4. In **Private workforce summary** you will see **Labeling portal sign-in URL**. This is your worker portal URL.

### To view your worker portal URL after creating a private workforce (API):

When you create a private workforce using [CreateWorkforce](#), you specify a `WorkforceName`. Use this name to call [DescribeWorkforce](#). The following table includes examples of requests using the AWS CLI and AWS SDK for Python (Boto3).

#### SDK for Python (Boto3)

```
response = client.describe_workforce(WorkforceName='string')
print(f'The workforce subdomain is: {response['SubDomain']}')
```

#### AWS CLI

```
$ C:\> describe-workforce --workforce-name 'string'
```

## Validate Your OIDC IdP Workforce Authentication Response

After you have created your OIDC IdP workforce, you can use the following procedure to validate its authentication workflow using cURL. This procedure assumes you have access to a terminal, and that you have cURL installed.

### To validate your OIDC IdP authorization response:

1. Get an authorization code using a URI configured as follows:

```
{AUTHORIZE_ENDPOINT}?client_id={CLIENT_ID}&redirect_uri={REDIRECT_URI}&scope={SCOPE}&response_type=code
```

- a. Replace `{AUTHORIZE_ENDPOINT}` with the authorize endpoint for your OIDC IdP.
- b. Replace `{CLIENT_ID}` with the Client ID from your OAuth client.
- c. Replace `{REDIRECT_URI}` with the worker portal URL. If it is not already present, you must add `/oauth2/idpresponse` to the end of the URL.
- d. If you have a custom scope, use it to replace `{SCOPE}`. If you do not have a custom scope, replace `{SCOPE}` with `openid`.

The following is an example of a URI after the modifications above are made:

```
https://example.com/authorize?  
client_id=f490a907-9bf1-4471-97aa-6bfd159f81ac&redirect_uri=https%3A%2F%2F  
%2Fexample.labeling.sagemaker.aws  
%2Foauth2%2Fidpresponse&response_type=code&scope=openid
```

2. Copy and paste the modified URI from step 1 into your browser and press Enter on your keyboard.
3. Authenticate using your IdP.
4. Copy the authentication code query parameter in the URI. This parameter begins with `code=`. The following is an example of what the response might look like. In this example, copy `code=MCNYDB...` and everything thereafter.

```
https://example.labeling.sagemaker.aws/oauth2/idpresponse?code=MCNYDB....
```

5. Open a terminal and enter the following command after making required modifications listed below:

```
curl --request POST \  
  --url '{TOKEN_ENDPOINT}' \  
  --header 'content-type: application/x-www-form-urlencoded' \  
  --data grant_type=authorization_code \  
  --data 'client_id={CLIENT_ID}' \  
  --data client_secret={CLIENT_SECRET} \  
  --data code={CODE} \  
  --data 'redirect_uri={REDIRECT_URI}'
```

- a. Replace `{TOKEN_ENDPOINT}` with the token endpoint for your OIDC IdP.
- b. Replace `{CLIENT_ID}` with the Client ID from your OAuth client.
- c. Replace `{CLIENT_SECRET}` with the Client Secret from your OAuth client.
- d. Replace `{CODE}` with the authentication code query parameter you copied in step 4.
- e. Replace `{REDIRECT_URI}` with the worker portal URL.

The following is an example of the cURL request after making the modifications described above:

```
curl --request POST \  
  --url 'https://example.com/token' \  
  --header 'content-type: application/x-www-form-urlencoded' \  
  --data grant_type=authorization_code \  
  --data 'client_id=f490a907-9bf1-4471-97aa-6bfd159f81ac' \  
  --data client_secret=client-secret \  
  --data code=MCNYDB... \  
  --data 'redirect_uri=https://example.labeling.sagemaker.aws/oauth2/idpresponse'
```

6. This step depends on the type of `access_token` your IdP returns, a plain text access token or a JWT access token.
  - If your IdP does not support JWT access tokens, `access_token` may be plain text (for example, a UUID). The response you see may look similar to the following. In this case, move to step 7.

```
{  
  "access_token": "179c144b-fccb-4d96-a28f-eea060f39c13",  
  "token_type": "Bearer",  
  "expires_in": 3600,
```

```

"refresh_token": "ef43e52e-9b4f-410c-8d4c-d5c5ee57631a",
"scope": "openid"
}

```

- If your IdP supports JWT access tokens, step 5 should generate an access token in JWT format. For example, the response may look similar to the following:

```

{
  "access_token": "eyJh...JV_adQssw5c",
  "refresh_token": "i6mapTIAVSp2oJkgUnCACKKfZxt_H5MBLiQcybBBd04",
  "refresh_token_expires_in": 6327,
  "scope": "openid",
  "id_token": "eyJ0eXAiOiJK9...-rDaQzUH16cQQWniDpW01_lxXjQEvQ"
}

```

Copy the JWT and decode it. You can use python script or a third party website to decode it. For example, you can go to the website <https://jwt.io/> and paste the JWT into the **Encoded** box to decode it.

Make sure the decoded response contains the following:

- The **Required** SageMaker AI claims in the table found in [Send Required and Optional Claims to Ground Truth and Amazon A2I](#). If it does not, you must reconfigure your OIDC IdP to contain these claims.
  - The [Issuer](#) you specified when you set up the IdP workforce.
7. In a terminal and enter the following command after making required modifications listed below:

```

curl -X POST -H 'Authorization: Bearer {ACCESS TOKEN}' -d '' -k -v {USERINFO
ENDPOINT}

```

- Replace *{USERINFO ENDPOINT}* with the user info endpoint for your OIDC IdP.
- Replace *{ACCESS TOKEN}* with the access token in the response you received in step 7. This is the entry for the "access\_token" parameter.

The following is an example of the cURL request after making the modifications described above:

```
curl -X POST -H 'Authorization: Bearer eyJ0eX...' -d '' -k -v https://example.com/userinfo
```

8. The response to the final step in the procedure above may look similar to the following code block.

If the `access_token` returned in step 6 was plain text, you must verify that this response contains required information. In this case, the response must contain the **Required SageMaker AI claims** in the table found in [Send Required and Optional Claims to Ground Truth and Amazon A2I](#). For example, `sagemaker-groups`, `sagemaker-name`.

```
{
  "sub": "122",
  "exp": "10000",
  "sagemaker-groups": ["group1", "group2"],
  "sagemaker-name": "name",
  "sagemaker-sub": "122",
  "sagemaker-client_id": "123456"
}
```

## Next Steps

Once you've created a private workforce using your IdP and verified your IdP authentication response, you can create work teams using your IdP groups. To learn more, see [Manage a Private Workforce \(OIDC IdP\)](#).

You can restrict worker access to tasks to specific IP addresses, and update or delete your workforce using the SageMaker API. To learn more, see [Private workforce management using the Amazon SageMaker API](#).

## Manage a Private Workforce (OIDC IdP)

Once you've created a private workforce using your OpenID Connect (OIDC) Identity Provider (IdP), you can manage your workers using your IdP. For example, you can add, remove, and group workers directly through your IdP.

To add workers to an Amazon SageMaker Ground Truth (Ground Truth) labeling job or Amazon Augmented AI (Amazon A2I) human review task, you create work teams using 1-10 IdP groups and assign that work team to the job or task. You assign a work team to a job or task by specifying that

work team when you create a labeling job (Ground Truth) or a human review workflow (Amazon A2I).

You can only assign one team to each labeling job or human review workflow. You can use the same team to create multiple labeling jobs or human review tasks. You can also create multiple work teams to work on different labeling jobs or human review tasks.

## Prerequisites

To create and manage private work teams using your OIDC IdP groups, first you must create a workforce using the SageMaker API operation [CreateWorkforce](#). To learn more, see [Create a Private Workforce \(OIDC IdP\)](#).

## Add work teams

You can use the SageMaker AI console to create a private work team using your OIDC IdP workforce on the **Labeling workforces** page under **Ground Truth**. If you are creating a Ground Truth labeling job, you can also create a private work team while creating a labeling job.

### Note

You create and manage work teams for Amazon A2I in the Ground Truth area of the SageMaker AI console.

You can also use the SageMaker API and associated language-specific SDKs to create a private work team.

Use the following procedures to learn how to create a private work team using the SageMaker AI console and API.

### To create a private work team on the Labeling workforces page (console)

1. Go to the Ground Truth area of the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.
2. Select **Labeling workforces**.
3. Select **Private**.
4. In the **Private teams** section, select **Create private team**.

5. In the **Team details** section, enter a **Team name**.
6. In the **Add workers** section, enter the name of a single user group. All workers associated with this group in your IdP are added to this work team.
7. To add more than one user group, select **Add new user group** and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. (Optional) For Ground Truth labeling jobs, if you provide an email for workers in your JWT, Ground Truth notifies workers when a new labeling task is available if you select an SNS topic.
9. Select **Create private team**.

### To create a private work team while creating a Ground Truth labeling job (console)

1. Go to the Ground Truth area of the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.
2. Select **Labeling jobs**.
3. Use the instructions in [Create a Labeling Job \(Console\)](#) to create a labeling job. Stop when you get to the **Workers** section on the second page.
4. Select **Private** for your worker type.
5. Enter a **Team name**.
6. In the **Add workers** section, enter the name of a single user group under **User groups**. All workers associated with this group in your IdP are added to this work team.

#### **Important**

The group names you specify for **User groups** must match the group names specified in your OIDC IdP.

7. To add more than one user group, select **Add new user group** and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. Complete all remaining steps to create your labeling job.

The private team that you create is used for this labeling job, and is listed in the **Labeling workforces** section of the SageMaker AI console.

### To create a private work team using the SageMaker API

You can create a private work team using the SageMaker API operation [CreateWorkteam](#).

When you use this operation, list all user groups that you want included in the work team in the `OidcMemberDefinition` parameter `Groups`.

### Important

The group names you specify for `Groups` must match the group names specified in your OIDC IdP.

For example, if your user group names are `group1`, `group2`, and `group3` in your OIDC IdP, configure `OidcMemberDefinition` as follows:

```
"OidcMemberDefinition": {
  "Groups": ["group1", "group2", "group3"]
}
```

Additionally, you must give the work team a name using the `WorkteamName` parameter.

### Add or remove IdP groups from work teams

After you've created a work team, you can use the SageMaker API to manage that work team. Use the [UpdateWorkteam](#) operation to update the IdP user groups included in that work team.

- Use the `WorkteamName` parameter to identify the work team that you want to update.
- When you use this operation, list all user groups that you want included in the work team in the [OidcMemberDefinition](#) parameter `Groups`. If a user group is associated with a work team and you do *not* include it in this list, that user group is no longer associated with this work team.

### Delete a work team

You can delete a work team using the SageMaker AI console and SageMaker API.

#### To delete a private work team in the SageMaker AI console

1. Go to the Ground Truth area of the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.
2. Select **Labeling workforces**.

3. Select **Private**.
4. In the **Private teams** section, select the work team that you want to delete.
5. Select **Delete**.

### To delete a private work team (API)

You can delete a private work team using the SageMaker API operation [DeleteWorkteam](#).

### Manage Individual Workers

When you create a workforce using your own OIDC IdP, you cannot use Ground Truth or Amazon A2I to manage individual workers.

- To add a worker to a work team, add that worker to a group associated with that work team.
- To remove a worker from a work team, remove that worker from all user groups associated with that work team.

### Update, Delete, and Describe Your Workforce

You can update, delete, and describe your OIDC IdP workforce using the SageMaker API. The following is a list of API operations that you can use to manage your workforce. For additional details, including how you can locate your workforce name, see [Private workforce management using the Amazon SageMaker API](#).

- [UpdateWorkforce](#) – You may want to update a workforce created using your own OIDC IdP to specify a different authorization endpoint, token endpoint, or issuer. You can update any parameter found in [OidcConfig](#) using this operation.

You can only update your OIDC IdP configuration when there are no work teams associated with your workforce. To learn how to delete work teams, see [Delete a work team](#).

- [DeleteWorkforce](#) – Use this operation to delete your private workforce. If you have any work teams associated with your workforce, you must delete those work teams before you delete your work force. For more information, see [Delete a work team](#).
- [DescribeWorkforce](#) – Use this operation to list private workforce information, including workforce name, Amazon Resource Name (ARN), and, if applicable, allowed IP address ranges (CIDRs).

## Private workforce management using the Amazon SageMaker API

You can use Amazon SageMaker API operations to manage, update, and delete your private workforce. For each API operation listed on the following topics, you can find a list of supported language-specific SDKs and their documentation in the **See Also** section of the API documentation.

### Topics

- [Find your workforce name](#)
- [Restrict worker access to tasks to allowable IP addresses](#)
- [Update OIDC Identity Provider workforce configuration](#)
- [Delete a private workforce](#)

### Find your workforce name

Some of the SageMaker AI workforce-related API operations require your workforce name as input. You can see your Amazon Cognito or OIDC IdP private and vendor workforce names in an AWS Region using the [ListWorkforces](#) API operation in that AWS Region. If you created your workforce using your own OIDC IdP, you can find your workforce name in the Ground Truth area of the SageMaker AI console.

### To find your workforce name in the SageMaker AI console

1. Go to the Ground Truth area of the SageMaker AI console: <https://console.aws.amazon.com/sagemaker/groundtruth>.
2. Select **Labeling workforces**.
3. Select **Private**.
4. In the **Private workforce summary** section, locate your workforce ARN. Your workforce name is located at the end of this ARN. For example, if the ARN is `arn:aws:sagemaker:us-east-2:111122223333:workforce/example-workforce`, the workforce name is `example-workforce`.

### Restrict worker access to tasks to allowable IP addresses

By default, a workforce isn't restricted to specific IP addresses. You can use the [UpdateWorkforce](#) operation to require that workers use a specific range of IP addresses ([CIDRs](#)) to access tasks. If you specify one or more CIDRs, workers who attempt to access tasks using any IP address outside

the specified ranges are denied and will get a HTTP 204 No Content error message on the worker portal. You can specify up to 10 CIDR values using `UpdateWorkforce`.

After you have restricted your workforce to one or more CIDRs, the output of `UpdateWorkforce` lists all allowable CIDRs. You can also use the [DescribeWorkforce](#) operation to view all allowable CIDRs for a workforce.

## Update OIDC Identity Provider workforce configuration

You may want to update a workforce created using your own OIDC IdP to specify a different authorization endpoint, token endpoint, or issuer. You can update any parameter found in [OidcConfig](#) using the [UpdateWorkforce](#) operation.

### Important

You can only update your OIDC IdP configuration when there are no work teams associated with your workforce. You can delete a private work team using the [DeleteWorkteam](#) operation.

## Delete a private workforce

You can only have one private workforce in each AWS Region. You may want to delete your private workforce in an AWS Region when:

- You want to create a workforce using a new Amazon Cognito user pool.
- You have already created a private workforce using Amazon Cognito and you want to create a workforce using your own OpenID Connect (OIDC) Identity Provider (IdP).

To delete a private workforce, use the [DeleteWorkforce](#) API operation. If you have any work teams associated with your workforce, you must delete those work teams before you delete your workforce. You can delete a private work team using the [DeleteWorkteam](#) operation.

## Track Worker Performance Metrics

Amazon SageMaker Ground Truth logs worker events to Amazon CloudWatch, such as when a worker starts or submits a task. Use Amazon CloudWatch metrics to measure and track throughput across a team or for individual workers.

**⚠ Important**

Worker event tracking is not available for Amazon Augmented AI human review workflows.

**Enable Tracking**

During the set-up process for a new work team, the permissions for Amazon CloudWatch logging of worker events are created. Since this feature was added in August 2019, work teams created prior to that may not have the correct permissions. If all of your work teams were created before August 2019, create a new work team. It does not need any members and may be deleted after creation, but by creating it, you establish the permissions and apply them to all of your work teams, regardless of when they were created.

**Track Metrics Using Logs**

After tracking is enabled, the activity of your workers is logged. Open the Amazon CloudWatch console and choose **Logs** in the navigation pane. You should see a log group named `/aws/sagemaker/groundtruth/WorkerActivity`.

Each completed task is represented by a log entry, which contains information about the worker, their team, the job, when the task was accepted, and when it was submitted.

**Example Log entry**

```
{
  "worker_id": "cd449a289e129409",
  "cognito_user_pool_id": "us-east-2_IpicJXXXX",
  "cognito_sub_id": "d6947aeb-0650-447a-ab5d-894db61017fd",
  "task_accepted_time": "Wed Aug 14 16:00:59 UTC 2019",
  "task_submitted_time": "Wed Aug 14 16:01:04 UTC 2019",
  "task_returned_time": "",
  "task_declined_time": "",
  "workteam_arn": "arn:aws:sagemaker:us-east-2:#####:workteam/private-crowd/Sample-labeling-team",
  "labeling_job_arn": "arn:aws:sagemaker:us-east-2:#####:labeling-job/metrics-demo",
  "work_requester_account_id": "#####",
  "job_reference_code": "#####",
  "job_type": "Private",
  "event_type": "TasksSubmitted",
  "event_timestamp": "1565798464"
```

```
}
```

A useful data point in each event is the `cognito_sub_id`. You can match that to an individual worker.

1. Open the Amazon SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. Under the **Ground Truth** section, choose **Workforces**.
3. Choose **Private**.
4. Choose the name of a team in the **Private teams** section.
5. In the **Team summary** section, choose the user group identified under **Amazon Cognito user group**. That will take you to the group in the Amazon Cognito console.
6. The **Group** page lists the users in the group. Choose any user's link in the **Username** column to see more information about the user, including a unique **sub** ID.

To get information about all of the team's members, use the [ListUsers](#) action ([examples](#)) in the Amazon Cognito API.

## Track Metrics Using the CloudWatch Console

If you don't want to write your own scripts to process and visualize the raw log information, Amazon CloudWatch metrics provide insights into worker activity for you.

### To view metrics

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the `AWS/SageMaker/Workteam` name space, then explore the [available metrics](#). For example, selecting the **Workteam** and **Workforce** metrics lets you calculate the average time per submitted task for a specific labeling job.

For more information, see [Using Amazon CloudWatch Metrics](#).

## Create the Amazon SNS topic

The steps for creating Amazon SNS topics for work team notifications are similar to the steps in [Getting Started](#) in the *Amazon SNS Developer Guide*, with one significant addition—you must add an access policy so that Amazon SageMaker AI can publish messages to the topic on your behalf.

If you create a work team using the console, the console provides an option to create a new topic for the team so that you don't have to perform these steps.

### Important

The Amazon SNS feature is not supported by Amazon A2I. If you subscribe your work team to an Amazon SNS topic, workers will only receive notifications about Ground Truth labeling jobs. Workers will not receive notifications about new Amazon A2I human review tasks.

### To add the policy when you create the topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In **Create topic**, enter the name of your topic and then choose **Next steps**.
3. In **Access policy**, choose **Advanced**.
4. In the **JSON editor**, find the Resource property, which displays the topic's ARN.
5. Copy the Resource ARN value.
6. Before the final closing brace (]), add the following policy.

```
, {
  "Sid": "AwsSagemaker_SnsAccessPolicy",
  "Effect": "Allow",
  "Principal": {
    "Service": "sagemaker.amazonaws.com"
  },
  "Action": "sns:Publish",
  "Resource": "arn:partition:sns:region:111122223333:MyTopic", # ARN of the
topic you copied in the previous step
  "Condition": {
    "ArnLike": {
      "aws:SourceArn":
"arn:partition:sagemaker:region:111122223333:workteam/*" # Workteam ARN
    },
    "StringEquals": {
      "aws:SourceAccount": "111122223333" # SNS topic account
    }
  }
}
```

## 7. Create the topic.

After you create the topic, it appears in your **Topics** summary screen. For more information about creating topics, see [Creating a Topic](#) in the *Amazon SNS Developer Guide*.

### Manage worker subscriptions

If you subscribe a work team to a topic after you've already created the work team, the individual work team members who were added to the team when the work team was created are not automatically subscribed to the topic. For information about subscribing workers' email addresses to the topic, see [Subscribing an Endpoint to an Amazon SNS Topic](#) in the *Amazon SNS Developer Guide*.

The only situation in which workers are automatically subscribed to your topic is when you create or import an Amazon Cognito user group at the time that you create a work team **and** you set up the topic subscription when you create that work team. For more information about creating and managing your workteams with Amazon Cognito, see [Create Work Teams \(Amazon Cognito Console\)](#).

## Crowd HTML Elements Reference

Crowd HTML Elements are web components, a web standard that abstracts HTML markup, CSS, and JavaScript functionality into an HTML tag or set of tags. Amazon SageMaker AI provides customers with the ability to design their own custom task templates in HTML.

As a starting point, you can use a template built using Crowd HTML Elements from one of the following GitHub repositories:

- [Example task UIs for Amazon SageMaker Ground Truth](#)
- [Over 60 example task UIs for Amazon Augmented AI \(A2I\)](#)

These repositories include templates designed for audio, image, text, video, and other types of data labeling and annotation tasks.

For more information about how to implement custom templates in Amazon SageMaker Ground Truth, see [Custom labeling workflows](#). To learn more about custom templates in Amazon Augmented AI, see [Create Custom Worker Task Templates](#).

## SageMaker AI Crowd HTML Elements

The following is a list of Crowd HTML Elements that make building a custom template easier and provide a familiar UI for workers. These elements are supported in Ground Truth, Augmented AI, and Mechanical Turk.

### crowd-alert

A message that alerts the worker to a current situation.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-alert>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <div id="errorBox"></div>

  <crowd-keypoint
    src="{ task.input.taskObject | grant_read_access }"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
  </crowd-keypoint>
</crowd-form>

<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
```

```
    return p.label;
  });

  // 1. Make sure total number of keypoints is correct.
  var original_num_labels = document.getElementsByTagName("crowd-keypoint")
[0].getAttribute("labels");

  original_num_labels = original_num_labels.substring(2, original_num_labels.length -
2).split("\\", "\\");
  var goalNumKeypoints = num_obj*original_num_labels.length;
  if (keypoints.length != goalNumKeypoints) {
    e.preventDefault();
    errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all
keypoint annotations and use each label only once.</crowd-alert>';
    errorBox.scrollIntoView();
    return;
  }

  // 2. Make sure all labels are unique.
  labelCounts = {};
  for (var i = 0; i < labels.length; i++) {
    if (!labelCounts[labels[i]]) {
      labelCounts[labels[i]] = 0;
    }
    labelCounts[labels[i]]++;
  }
  const goalNumSingleLabel = num_obj;

  const numLabels = Object.keys(labelCounts).length;

  Object.entries(labelCounts).forEach(entry => {
    if (entry[1] != goalNumSingleLabel) {
      e.preventDefault();
      errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each
label only once.</crowd-alert>';
      errorBox.scrollIntoView();
    }
  })
};
</script>
```

## Attributes

The following attributes are supported by this element.

## dismissible

A Boolean switch that, if present, allows the message to be closed by the worker.

## type

A string that specifies the type of message to be displayed. The possible values are "info" (the default), "success", "error", and "warning".

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-badge

An icon that floats over the top right corner of another element to which it is attached.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a template that uses the `<crowd-badge>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Choose the correct category for this image."
    categories="['Person', 'Umbrella', 'Chair', 'Dolphin']">
```

```
>
<full-instructions header="Classification Instructions">
  <p>Read the task carefully and inspect the image.</p>
  <p>Choose the appropriate label that best suits the image.</p>
</full-instructions>

<short-instructions id="short-instructions">
  <p>Read the task carefully and inspect the image.</p>
  <p>Choose the appropriate label that best suits the image.</p>
  <crowd-badge icon="star" for="short-instructions"/>
</short-instructions>
</crowd-image-classifier>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### for

A string that specifies the ID of the element to which the badge is attached.

### icon

A string that specifies the icon to be displayed in the badge. The string must be either the name of an icon from the open-source [iron-icons](#) set, which is pre-loaded, or the URL to a custom icon.

This attribute overrides the *label* attribute.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-badge>` HTML element. Replace *icon-name* with the name of the icon you'd like to use from this [icons set](#).

```
<crowd-badge icon="icon-name" for="short-instructions"/>
```

### label

The text to display in the badge. Three characters or less is recommended because text that is too large will overflow the badge area. An icon can be displayed instead of text by setting the *icon* attribute.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-button

A styled button that represents some action.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a template that uses the `<crowd-button>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Please select the correct category for this image"
    categories="['Person', 'Umbrella', 'Chair', 'Dolphin']"
  >
  <full-instructions header="Classification Instructions">
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
  </full-instructions>
  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <crowd-button>
      <iron-icon icon="question-answer"/>
    </crowd-button>
  </short-instructions>
```

```
</crowd-image-classifier>  
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### disabled

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

### form-action

A switch that either submits its parent [crowd-form](#) element, if set to "submit", or resets its parent `<crowd-form>` element, if set to "reset".

### href

The URL to an online resource. Use this property if you need a link styled as a button.

### icon

A string that specifies the icon to be displayed next to the button's text. The string must be the name of an icon from the open-source [iron-icons](#) set, which is pre-loaded. For example, to insert the [search](#) iron-icon, use the following:

```
<crowd-button>  
  <iron-icon icon="search"/>  
</crowd-button>
```

The icon is positioned to either the left or the right of the text, as specified by the *icon-align* attribute.

To use a custom icon see **icon-url**.

### icon-align

The left or right position of the icon relative to the button's text. The default is "left".

### icon-url

A URL to a custom image for the icon. A custom image can be used in place of a standard icon that is specified by the *icon* attribute.

## loading

A Boolean switch that, if present, displays the button as being in a loading state. This attribute has precedence over the *disabled* attribute if both attributes are present.

## target

When you use the `href` attribute to make the button act as a hyperlink to a specific URL, the `target` attribute optionally targets a frame or window where the linked URL should load.

## variant

The general style of the button. Use "primary" for primary buttons, "normal" for secondary buttons, "link" for tertiary buttons, or "icon" to display only the icon without text.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-bounding-box

A widget for drawing rectangles on an image and assigning a label to the portion of the image that is enclosed in each rectangle.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-bounding-box>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this [GitHub repository](#).

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

```

<crowd-form>
  <crowd-bounding-box
    name="annotatedResult"
    src="{ task.input.taskObject | grant_read_access }"
    header="Draw bounding boxes around all the cats and dogs in this image"
    labels="['Cat', 'Dog']"
  >
    <full-instructions header="Bounding Box Instructions" >
      <p>Use the bounding box tool to draw boxes around the requested target of
interest:</p>
      <ol>
        <li>Draw a rectangle using your mouse over each instance of the target.</li>
        <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel
margin</li>
        <li>
          When targets are overlapping, draw a box around each object,
          include all contiguous parts of the target in the box.
          Do not include parts that are completely overlapped by another object.
        </li>
        <li>
          Do not include parts of the target that cannot be seen,
          even though you think you can interpolate the whole shape of the target.
        </li>
        <li>Avoid shadows, they're not considered as a part of the target.</li>
        <li>If the target goes off the screen, label up to the edge of the image.</li>
      </ol>
    </full-instructions>

    <short-instructions>
      Draw boxes around the requested target of interest.
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>

```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

## initial-value

An array of JSON objects, each of which sets a bounding box when the component is loaded. Each JSON object in the array contains the following properties. Bounding boxes set via the `initial-value` property can be adjusted and whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

- **height** – The height of the box in pixels.
- **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the `labels` attribute of the `<crowd-bounding-box>` element.
- **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.
- **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
- **width** – The width of the box in pixels.

You can extract the bounding box initial value from a manifest file of a previous job in a custom template using the Liquid templating language:

```
initial-value="[
  {% for box in task.input.manifestLine.label-attribute-name-from-prior-job.annotations %}
    {% capture class_id %}{{ box.class_id }}{% endcapture %}
    {% assign label = task.input.manifestLine.label-attribute-name-from-prior-job-
metadata.class-map[class_id] %}
    {
      label: {{label | to_json}},
      left: {{box.left}},
      top: {{box.top}},
      width: {{box.width}},
      height: {{box.height}},
    },
  {% endfor %}
]"
```

## labels

A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion enclosed by a rectangle. **Limit:** 10 labels.

## name

The name of this widget. It's used as a key for the widget's input in the form output.

## src

The URL of the image on which to draw bounding boxes.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are required by this element.

### full-instructions

General instructions about how to draw bounding boxes.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### boundingBoxes

An array of JSON objects, each of which specifies a bounding box that has been created by the worker. Each JSON object in the array contains the following properties.

- **height** – The height of the box in pixels.
- **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the `<crowd-bounding-box>` element.
- **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.

- **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
- **width** – The width of the box in pixels.

### inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### Example : Sample Element Outputs

The following are samples of outputs from common use scenarios for this element.

#### Single Label, Single Box / Multiple Label, Single Box

```
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 401,
          "label": "Dog",
          "left": 243,
          "top": 117,
          "width": 187
        }
      ],
      "inputImageProperties": {
        "height": 533,
        "width": 800
      }
    }
  }
]
```

#### Single Label, Multiple Box

```
[
```

```
{
  "annotatedResult": {
    "boundingBoxes": [
      {
        "height": 401,
        "label": "Dog",
        "left": 243,
        "top": 117,
        "width": 187
      },
      {
        "height": 283,
        "label": "Dog",
        "left": 684,
        "top": 120,
        "width": 116
      }
    ],
    "inputImageProperties": {
      "height": 533,
      "width": 800
    }
  }
}
```

## Multiple Label, Multiple Box

```
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 395,
          "label": "Dog",
          "left": 241,
          "top": 125,
          "width": 158
        },
        {
          "height": 298,
          "label": "Cat",
          "left": 699,
```

```
        "top": 116,  
        "width": 101  
    }  
  ],  
  "inputImageProperties": {  
    "height": 533,  
    "width": 800  
  }  
}  
]  
]
```

You could have many labels available, but only the ones that are used appear in the output.

### See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

### crowd-card

A box with an elevated appearance for displaying information.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a template designed for sentiment analysis tasks that uses the `<crowd-card>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>  
  
<style>  
  h3 {  
    margin-top: 0;  
  }  
  
  crowd-card {  
    width: 100%;  
  }  
  
  .card {
```

```
    margin: 10px;
  }

  .left {
    width: 70%;
    margin-right: 10px;
    display: inline-block;
    height: 200px;
  }

  .right {
    width: 20%;
    height: 200px;
    display: inline-block;
  }
</style>

<crowd-form>
  <short-instructions>
    Your short instructions here.
  </short-instructions>

  <full-instructions>
    Your full instructions here.
  </full-instructions>

  <div class="left">
    <h3>What sentiment does this text convey?</h3>
    <crowd-card>
      <div class="card">
        Nothing is great.
      </div>
    </crowd-card>
  </div>

  <div class="right">
    <h3>Select an option</h3>

    <select name="sentiment1" style="font-size: large" required>
      <option value="">(Please select)</option>
      <option>Negative</option>
      <option>Neutral</option>
      <option>Positive</option>
      <option>Text is empty</option>
```

```
</select>
</div>

<div class="left">
  <h3>What sentiment does this text convey?</h3>
  <crowd-card>
    <div class="card">
      Everything is great!
    </div>
  </crowd-card>
</div>

<div class="right">
  <h3>Select an option</h3>

  <select name="sentiment2" style="font-size: large" required>
    <option value="">(Please select)</option>
    <option>Negative</option>
    <option>Neutral</option>
    <option>Positive</option>
    <option>Text is empty</option>
  </select>
</div>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### heading

The text displayed at the top of the box.

### image

A URL to an image to be displayed within the box.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-checkbox

A UI component that can be checked or unchecked allowing a user to select multiple options from a set.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-checkbox>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>

  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>

  <crowd-checkbox name="website-found">Website Found</crowd-checkbox>

</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### checked

A Boolean switch that, if present, displays the check box as checked.

The following is an example of the syntax used to check a checkbox by default.

```
<crowd-checkbox name="checkedBox" value="checked" checked>This box is checked</crowd-  
checkbox>
```

## disabled

A Boolean switch that, if present, displays the check box as disabled and prevents it from being checked.

The following is an example of the syntax used to disable a checkbox.

```
<crowd-checkbox name="disabledCheckBox" value="Disabled" disabled>Cannot be  
selected</crowd-checkbox>
```

## name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

## required

A Boolean switch that, if present, requires the worker to provide input.

The following is an example of the syntax used to require a checkbox be selected.

```
<crowd-checkbox name="work_verified" required>Instructions were clear</crowd-  
checkbox>
```

## value

A string used as the name for the check box state in the output. Defaults to "on" if not specified.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## Output

Provides a JSON object. The name string is the object name and the value string is the property name for a Boolean value based on the check box state; true if checked, false if not checked.

## Example : Sample Element Outputs

### Using the same name value for multiple boxes.

```
<!-- INPUT -->
<div><crowd-checkbox name="image_attributes" value="blurry"> Blurry </crowd-checkbox></div>
<div><crowd-checkbox name="image_attributes" value="dim"> Too Dim </crowd-checkbox></div>
<div><crowd-checkbox name="image_attributes" value="exposed"> Too Bright </crowd-checkbox></div>
```

```
//Output with "blurry" and "dim" checked
[
  {
    "image_attributes": {
      "blurry": true,
      "dim": true,
      "exposed": false
    }
  }
]
```

Note that all three color values are properties of a single object.

### Using different name values for each box.

```
<!-- INPUT -->
<div><crowd-checkbox name="Stop" value="Red"> Red </crowd-checkbox></div>
<div><crowd-checkbox name="Slow" value="Yellow"> Yellow </crowd-checkbox></div>
<div><crowd-checkbox name="Go" value="Green"> Green </crowd-checkbox></div>
```

```
//Output with "Red" checked
[
  {
    "Go": {
      "Green": false
    },
    "Slow": {
      "Yellow": false
    },
  },
]
```

```
    "Stop": {
      "Red": true
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-classifier

A widget for classifying non-image content, such as audio, video, or text.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an HTML worker task template built using `crowd-classifier`. This example uses the [Liquid template language](#) to automate:

- Label categories in the `categories` parameter
- The objects that are being classified in the `classification-target` parameter.

Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="category"
    categories="{ { task.input.labels | to_json | escape } }"
    header="What type of a document is this?"
  >
    <classification-target>
      <iframe style="width: 100%; height: 600px;" src="{ { task.input.taskObject |
grant_read_access } }" type="application/pdf"></iframe>
    </classification-target>
  </crowd-classifier>
</crowd-form>
```

```
<full-instructions header="Document Classification Instructions">
  <p>Read the task carefully and inspect the document.</p>
  <p>Choose the appropriate label that best suits the document.</p>
</full-instructions>

<short-instructions>
  Please choose the correct category for the document
</short-instructions>
</crowd-classifier>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### categories

A JSON formatted array of strings, each of which is a category that a worker can assign to the text. You should include "other" as a category, otherwise the worker may not be able to provide an answer.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### name

The name of this widget. It is used as a key for the widget's input in the form output.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [classification-target](#), [full-instructions](#), [short-instructions](#)

## Regions

The following regions are supported by this element.

## classification-target

The content to be classified by the worker. This can be plain text or HTML. Examples of how the HTML can be used include *but are not limited to* embedding a video or audio player, embedding a PDF, or performing a comparison of two or more images.

## full-instructions

General instructions about how to do text classification.

## short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The output of this element is an object using the specified name value as a property name, and a string from the `categories` as the property's value.

## Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      "label": "<value>"
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-classifier-multi-select

A widget for classifying various forms of content—such as audio, video, or text—into one or more categories. The content to classify is referred to as an *object*.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an HTML worker task template built using this element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier-multi-select
    name="category"
    categories="['Positive', 'Negative', 'Neutral']"
    header="Select the relevant categories"
    exclusion-category="{ text: 'None of the above' }"
  >
    <classification-target>
      {{ task.input.taskObject }}
    </classification-target>

    <full-instructions header="Text Categorization Instructions">
      <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
      <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
      <p><strong>Neutral</strong>: neither positive or negative, such as stating a
fact</p>
      <p><strong>N/A</strong>: when the text cannot be understood</p>
      <p>When the sentiment is mixed, such as both joy and sadness, choose both
labels.</p>
    </full-instructions>

    <short-instructions>
      Choose all categories that are expressed by the text.
    </short-instructions>
  </crowd-classifier-multi-select>
</crowd-form>
```

## Attributes

The following attributes are supported by the `crowd-classifier-multi-select` element. Each attribute accepts a string value or string values.

## categories

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the object.

## header

Required. The text to display above the image. This is typically a question or simple instruction for workers.

## name

Required. The name of this widget. In the form output, the name is used as a key for the widget's input.

## exclusion-category

Optional. A JSON-formatted string with the following format: "{ text: '*default-value*' }". This attribute sets a default value that workers can choose if none of the labels applies to the object shown in the worker UI.

## Element Hierarchy

This element has the following parent and child elements:

- **Parent elements:** [crowd-form](#)
- **Child elements:** [classification-target](#), [full-instructions](#), [short-instructions](#)

## Regions

This element uses the following regions.

## classification-target

The content to be classified by the worker. Content can be plain text or an object that you specify in the template using HTML. For example, you can use HTML elements to include a video or audio player, embedding a PDF file, or include a comparison of two or more images.

## full-instructions

General instructions about how to classify text.

## short-instructions

Important task-specific instructions. These instructions are displayed prominently.

## Output

The output of this element is an object that uses the specified name value as a property name, and a string from categories as the property's value.

## Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      labels: ["label_a", "label_b"]
    }
  }
]
```

## See Also

For more information, see the following:

- [Categorize text with text classification \(Multi-label\)](#)
- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-entity-annotation

A widget for labeling words, phrases, or character strings within a longer text. Workers select a label, and highlight the text that the label applies to.

### Important: Self-contained Widget

Do not use `<crowd-entity-annotation>` element with the `<crowd-form>` element. It contains its own form submission logic and **Submit** button.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a template that uses the `<crowd-entity-annotation>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-entity-annotation
  name="crowd-entity-annotation"
  header="Highlight parts of the text below"
  labels="[{'label': 'person', 'shortDisplayName': 'per', 'fullDisplayName': 'Person'},
{'label': 'date', 'shortDisplayName': 'dat', 'fullDisplayName': 'Date'}, {'label':
'company', 'shortDisplayName': 'com', 'fullDisplayName': 'Company'}]"
  text="Amazon SageMaker Ground Truth helps you build highly accurate training datasets
for machine learning quickly."
>
  <full-instructions header="Named entity recognition instructions">
    <ol>
      <li><strong>Read</strong> the text carefully.</li>
      <li><strong>Highlight</strong> words, phrases, or sections of the text.</li>
      <li><strong>Choose</strong> the label that best matches what you have
highlighted.</li>
      <li>To <strong>change</strong> a label, choose highlighted text and select a new
label.</li>
      <li>To <strong>remove</strong> a label from highlighted text, choose the X next
to the abbreviated label name on the highlighted text.</li>
      <li>You can select all of a previously highlighted text, but not a portion of
it.</li>
    </ol>
  </full-instructions>

  <short-instructions>
    Apply labels to words or phrases.
  </short-instructions>

  <div id="additionalQuestions" style="margin-top: 20px">
    <h3>
      What is the overall subject of this text?
    </h3>
    <crowd-radio-group>
      <crowd-radio-button name="tech" value="tech">Technology</crowd-radio-button>
      <crowd-radio-button name="politics" value="politics">Politics</crowd-radio-
button>
    </crowd-radio-group>
```

```
</div>
</crowd-entity-annotation>

<script>
  document.addEventListener('all-crowd-elements-ready', () => {
    document
      .querySelector('crowd-entity-annotation')
      .shadowRoot
      .querySelector('crowd-form')
      .form
      .appendChild(additionalQuestions);
  });
</script>
```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### initial-value

A JSON formatted array of objects, each of which defines an annotation to apply to the text at initialization. Objects contain a `label` value that matches one in the `labels` attribute, an integer `startOffset` value for labeled span's starting unicode offset, and an integer `endOffset` value for the ending unicode offset.

## Example

```
[
  {
    label: 'person',
    startOffset: 0,
    endOffset: 16
  },
  ...
]
```

## labels

A JSON formatted array of objects, each of which contains:

- **label** (required): The name used to identify entities.
- **fullDisplayName** (optional): Used for the label list in the task widget. Defaults to the label value if not specified.
- **shortDisplayName** (optional): An abbreviation of 3-4 letters to display above selected entities. Defaults to the label value if not specified.

### **shortDisplayName is highly recommended**

Values displayed above the selections can overlap and create difficulty managing labeled entities in the workspace. Providing a 3-4 character `shortDisplayName` for each label is highly recommended to prevent overlap and keep the workspace manageable for your workers.

## Example

```
[
  {
    label: 'person',
    shortDisplayName: 'per',
    fullDisplayName: 'person'
  }
]
```

## name

Serves as the widget's name in the DOM. It is also used as the label attribute name in form output and the output manifest.

## text

The text to be annotated. The templating system escapes quotes and HTML strings by default. If your code is already escaped or partially escaped, see [Variable filters](#) for more ways to control escaping.

## Element Hierarchy

This element has the following parent and child elements.

- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are supported by this element.

### full-instructions

General instructions about how to work with the widget.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### entities

A JSON object that specifies the start, end, and label of an annotation. This object contains the following properties.

- **label** – The assigned label.
- **startOffset** – The Unicode offset of the beginning of the selected text.
- **endOffset** – The Unicode offset of the first character after the selection.

## Example : Sample Element Outputs

The following is a sample of the output from this element.

```
{
  "myAnnotatedResult": {
    "entities": [
      {
        "endOffset": 54,
        "label": "person",
```

```
    "startOffset": 47
  },
  {
    "endOffset": 97,
    "label": "event",
    "startOffset": 93
  },
  {
    "endOffset": 219,
    "label": "date",
    "startOffset": 212
  },
  {
    "endOffset": 271,
    "label": "location",
    "startOffset": 260
  }
]
}
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-fab

A floating button with an image in its center.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template designed for image classification that uses the `<crowd-fab>` element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
```

```

src="${image_url}"
categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
header="Choose the correct category for the image"
name="category">

<short-instructions>
  <p>Read the task carefully and inspect the image.</p>
  <p>Choose the appropriate label that best suits the image.</p>
  <p>If there is an issue with the image or tools, please select
    the
      <b>None of the Above</b>, describe the issue in the text box and click
        the
          button below.</p>
  <crowd-input label="Report an Issue" name="template-issues"></crowd-input>
  <crowd-fab id="button1" icon="report-problem" title="Issue"/>
</short-instructions>

<full-instructions header="Classification Instructions">
  <p>Read the task carefully and inspect the image.</p>
  <p>Choose the appropriate label that best suits the image.
    Use the <b>None of the Above</b> option if none of the other labels suit
    the image.</p>
</full-instructions>

</crowd-image-classifier>
</crowd-form>

<script>
  [
    button1,
  ].forEach(function(button) {
    button.addEventListener('click', function() {
      document.querySelector('crowd-form').submit();
    });
  });
</script>

```

## Attributes

The following attributes are supported by this element.

### disabled

A Boolean switch that, if present, displays the floating button as disabled and prevents clicks.

## icon

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source [iron-icons](#) set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a <crowd-fab> HTML element. Replace *icon-name* with the name of the icon you'd like to use from this [icons set](#).

```
<crowd-fab "id="button1" icon="icon-name" title="Issue"/>
```

## label

A string consisting of a single character that can be used instead of an icon. Emojis or multiple characters may result in the button displaying an ellipsis instead.

## title

A string that will display as a tool tip when the mouse hovers over the button.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-form

The form wrapper for all custom tasks. Sets and implements important actions for the proper submission of your form data.

If a [crowd-button](#) of type "submit" is not included inside the <crowd-form> element, it will automatically be appended within the <crowd-form> element.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an image classification template that uses the <crowd-form> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    src="{image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>

    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.
        Use the <b>None of the Above</b> option if none of the other labels suit
        the image.</p>
    </full-instructions>

  </crowd-image-classifier>
</crowd-form>
```

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** none
- **Child elements:** Any of the [UI Template](#) elements

## Element Events

The `crowd-form` element extends the [standard HTML form element](#) and inherits its events, such as `onclick` and `onsubmit`.

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-icon-button

A button with an image placed in the center. When the user touches the button, a ripple effect emanates from the center of the button.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template designed for image classification that uses the `<crowd-icon-button>` element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    src="{image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">

  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>If there is an issue with the image or tools, please select
      <b>None of the Above</b>, describe the issue in the text box and click
the
      button below.</p>
    <crowd-input label="Report an Issue" name="template-issues"/></crowd-input>
```

```
<crowd-icon-button id="button1" icon="report-problem" title="Issue"/>
</short-instructions>

<full-instructions header="Classification Instructions">
  <p>Read the task carefully and inspect the image.</p>
  <p>Choose the appropriate label that best suits the image.
  Use the <b>None of the Above</b> option if none of the other labels suit
the image.</p>
</full-instructions>

</crowd-image-classifier>
</crowd-form>

<script>
  [
    button1,
  ].forEach(function(button) {
    button.addEventListener('click', function() {
      document.querySelector('crowd-form').submit();
    });
  });
</script>
```

## Attributes

The following attributes are supported by this element.

### disabled

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

### icon

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source [iron-icons](#) set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-icon-button>` HTML element. Replace *icon-name* with the name of the icon you'd like to use from this [icons set](#).

```
<crowd-icon-button id="button1" icon="icon-name" title="Issue"/>
```

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-image-classifier

A widget for classifying an image. Use one of the following supported image formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an image classification template that uses the `<crowd-image-classifier>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    src="${image_url}"
    categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
    header="Choose the correct category for the image"
    name="category">

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>

    <full-instructions header="Classification Instructions">
```

```
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.
    Use the <b>None of the Above</b> option if none of the other labels suit
the image.</p>
    </full-instructions>

</crowd-image-classifier>
</crowd-form>
```

## Attributes

The following attributes are required by this element.

### categories

A JSON formatted array of strings, each of which is a category that a worker can assign to the image. You should include "other" as a category, so that the worker can provide an answer. You can specify up to 10 categories.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### name

The name of this widget. It is used as a key for the widget's input in the form output.

### overlay

Information to be overlaid on the source image. This is for verification workflows of bounding-box, semantic-segmentation, and instance-segmentation tasks.

It is a JSON object containing an object with the name of the task-type in camelCase as the key. That key's value is an object that contains the labels and other necessary information from the previous task.

An example of a `crowd-image-classifier` element with attributes for verifying a bounding-box task follows:

```
<crowd-image-classifier
  name="boundingBoxClassification"
```

```

header="Rate the quality of the annotations based on the background section
  in the instructions on the left hand side."
src="https://i.imgur.com/CIPKVJo.jpg"
categories="['good', 'bad', 'okay']"
overlay='{
  "boundingBox": {
    labels: ["bird", "cat"],
    value: [
      {
        height: 284,
        label: "bird",
        left: 230,
        top: 974,
        width: 223
      },
      {
        height: 69,
        label: "bird",
        left: 79,
        top: 889,
        width: 247
      }
    ]
  },
}'
> ... </crowd-image-classifier>

```

A semantic segmentation verification task would use the `overlay` value as follows:

```

<crowd-image-classifier
  name='crowd-image-classifier'
  categories='["good", "bad"]'
  src='URL of image to be classified'
  header='Please classify'
  overlay='{
    "semanticSegmentation": {
      "labels": ["Cat", "Dog", "Bird", "Cow"],
      "labelMappings": {
        "Bird": {
          "color": "#ff7f0e"
        },
        "Cat": {
          "color": "#2ca02c"

```

```

    },
    "Cow": {
      "color": "#d62728"
    },
    "Dog": {
      "color": "#2ac599"
    }
  },
  "src": "URL of overlay image",
}
}'
> ... </crowd-image-classifier>

```

An instance-segmentation task would use the `overlay` value as follows:

```

<crowd-image-classifier
  name='crowd-image-classifier'
  categories=['good', 'bad']
  src='URL of image to be classified'
  header='Please classify instances of each category'
  overlay='{
    "instanceSegmentation": {
      "labels": ["Cat", "Dog", "Bird", "Cow"],
      "instances": [
        {
          "color": "#2ca02c",
          "label": "Cat"
        },
        {
          "color": "#1f77b4",
          "label": "Cat"
        },
        {
          "color": "#d62728",
          "label": "Dog"
        }
      ],
      "src": "URL of overlay image",
    }
  }'
> ... </crowd-image-classifier>

```

## **src**

The URL of the image to be classified.

## **Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#), [worker-comment](#)

## **Regions**

The following regions are used by this element.

### **full-instructions**

General instructions for the worker on how to classify an image.

### **short-instructions**

Important task-specific instructions that are displayed in a prominent place.

### **worker-comment**

Use this in verification workflows when you need workers to explain why they made the choice they did. Use the text between the opening and closing tags to provide instructions for workers on what information should be included in the comment.

It uses the following attributes:

### **header**

A phrase with a call to action for leaving a comment. Used as the title text for a modal window where the comment is added.

Optional. Defaults to "Add a comment."

### **link-text**

This text appears below the categories in the widget. When clicked, it opens a modal window where the worker may add a comment.

Optional. Defaults to "Add a comment."

## placeholder

An example text in the comment text area that is overwritten when worker begins to type. This does not appear in output if the worker leaves the field blank.

Optional. Defaults to blank.

## Output

The output of this element is a string that specifies one of the values defined in the *categories* attribute of the <crowd-image-classifier> element.

## Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      "label": "<value>"
      "workerComment": "Comment - if no comment is provided, this field will not be
present"
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-image-classifier-multi-select

A widget for classifying an image into one or more categories. Use one of the following supported image formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an HTML worker task template built using this crowd element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier-multi-select
    name="animals"
    categories="['Cat', 'Dog', 'Horse', 'Pig', 'Bird']"
    src="https://images.unsplash.com/photo-1509205477838-a534e43a849f?
ixlib=rb-1.2.1&ixid=eyJhcHBfaWQiOjEyMDd9&auto=format&fit=crop&w=1998&q=80"
    header="Please identify the animals in this image"
    exclusion-category="{ text: 'None of the above' }"
  >
  <full-instructions header="Classification Instructions">
    <p>If more than one label applies to the image, select multiple labels.</p>
    <p>If no labels apply, select <b>None of the above</b></p>
  </full-instructions>

  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label(s) that best suit the image.</p>
  </short-instructions>
</crowd-image-classifier-multi-select>
</crowd-form>
```

## Attributes

The following attributes are supported by the `crowd-image-classifier-multi-select` element. Each attribute accepts a string value or string values.

### categories

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the image. A worker must choose at least one category and can choose all categories.

### header

Required. The text to display above the image. This is typically a question or simple instruction for workers.

### name

Required. The name of this widget. In the form output, the name is used as a key for the widget's input.

## src

Required. The URL of the image to be classified.

## exclusion-category

Optional. A JSON-formatted string with the following format: "{ text: '*default-value*' }". This attribute sets a default value that workers can choose if none of the labels applies to the image shown in the worker UI.

## Element Hierarchy

This element has the following parent and child elements:

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#), [worker-comment](#)

## Regions

This element uses the following regions

### full-instructions

General instructions for the worker on how to classify an image.

### short-instructions

Important task-specific instructions. These instructions are displayed prominently.

## Output

The output of this element is a string that specifies one or more of the values defined in the `categories` attribute of the `<crowd-image-classifier-multi-select>` element.

## Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
```

```
    labels: ["label_a", "label_b"]
  }
}
```

## See Also

For more information, see the following:

- [Create an image classification job \(Multi-label\)](#)
- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-input

A box that accepts input data.

### Cannot be self-closing

Unlike the `input` element in the HTML standard, this element cannot be self-closed by putting a slash before the ending bracket, e.g. `<crowd-input ... />`. It must be followed with a `</crowd-input>` to close the element.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-input>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  
  <crowd-input name="tag1" label="Word/phrase 1" required></crowd-input>
  <crowd-input name="tag2" label="Word/phrase 2" required></crowd-input>
  <crowd-input name="tag3" label="Word/phrase 3" required></crowd-input>
```

```
<short-instructions>
  Your custom quick instructions and examples
</short-instructions>

<full-instructions>
  Your custom detailed instructions and more examples
</full-instructions>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### **allowed-pattern**

A regular expression that is used with the *auto-validate* attribute to ignore non-matching characters as the worker types.

### **auto-focus**

When the value is set to true, the browser places focus inside the input area after loading. This way, the worker can start typing without having to select it first.

### **auto-validate**

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the *error-message* and *allowed-pattern* attributes.

### **disabled**

A Boolean switch that, if present, displays the input area as disabled.

### **error-message**

The text to be displayed below the input field, on the left side, if validation fails.

### **label**

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the *value* attribute is set.

**max-length**

A maximum number of characters the input will accept. Input beyond this limit is ignored.

**min-length**

A minimum length for the input in the field

**name**

Sets the name of the input to be used in the DOM and the output of the form.

**placeholder**

A string value that is used as placeholder text, displayed until the worker starts entering data into the input, It is not used as a default value.

**required**

A Boolean switch that, if present, requires the worker to provide input.

**type**

Takes a string to set the HTML5 `input-type` behavior for the input. Examples include `file` and `date`.

**value**

A preset that becomes the default if the worker does not provide input. The preset appears in a text field.

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

**Output**

Provides a name string as the property name, and the text that was entered in the field as its value.

## Example : Sample JSON Output

The values for multiple elements are output in the same object, with their name attribute value as their property name. Elements with no input do not appear in the output. For example, let's use three inputs:

```
<crowd-input name="tag1" label="Word/phrase 1"></crowd-input>
<crowd-input name="tag2" label="Word/phrase 2"></crowd-input>
<crowd-input name="tag3" label="Word/phrase 3"></crowd-input>
```

This is the output if only two have input:

```
[
  {
    "tag1": "blue",
    "tag2": "red"
  }
]
```

This means any code built to parse these results should be able to handle the presence or absence of each input in the answers.

- [Crowd HTML Elements Reference](#)

### crowd-instance-segmentation

A widget for identifying individual instances of specific objects within an image and creating a colored overlay for each labeled instance.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-instance-segmentation>`. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-instance-segmentation
    name="annotatedResult"
    src="{ task.input.taskObject | grant_read_access }"
    header="Please label each of the requested objects in this image"
    labels="['Cat', 'Dog', 'Bird']"
  >
    <full-instructions header="Segmentation Instructions">
      <ol>
        <li><strong>Read</strong> the task carefully and inspect the image.</li>
        <li><strong>Read</strong> the options and review the examples provided to
understand more about the labels.</li>
        <li><strong>Choose</strong> the appropriate label that best suits the
image.</li>
      </ol>
    </full-instructions>

    <short-instructions>
      <p>Use the tools to label all instances of the requested items in the image</p>
    </short-instructions>
  </crowd-instance-segmentation>
</crowd-form>

```

Use a template similar to the following to allow workers to add their own categories (labels).

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation
    id="annotator"
    name="myTexts"
    src="{ task.input.taskObject | grant_read_access }"
    header="Click Instructions to add new labels."
    labels="['placeholder']"
  >
    <short-instructions>
      <h3>Add a label to describe each type of object in this image.</h3>
      <h3>Cover each instance of each object with a segmentation mask.</h3>
      <br>
      <h3>
        Add new label
      </h3>
    </short-instructions>
  </crowd-instance-segmentation>
</crowd-form>

```

```
<crowd-input name="_customLabel" id="customLabel"></crowd-input>
<crowd-button id="addLabel">Add</crowd-button>

<br><br><br>
<h3>
Manage labels
</h3>
<div id="labelsSection"></div>
</short-instructions>

<full-instructions>
  Describe your task in more detail here.
</full-instructions>
</crowd-instance-segmentation>
</crowd-form>

<script>
  document.addEventListener('all-crowd-elements-ready', function(event) {
    document.querySelector('crowd-instance-segmentation').labels = [];
  });

  function populateLabelsSection() {
    labelsSection.innerHTML = '';
    annotator.labels.forEach(function(label) {
      const labelContainer = document.createElement('div');
      labelContainer.innerHTML = label + ' <a href="javascript:void(0)">(Delete)</a>';
      labelContainer.querySelector('a').onclick = function() {
        annotator.labels = annotator.labels.filter(function(l) {
          return l !== label;
        });
        populateLabelsSection();
      };
      labelsSection.appendChild(labelContainer);
    });
  }

  addLabel.onclick = function() {
    annotator.labels = annotator.labels.concat([customLabel.value]);
    customLabel.value = null;

    populateLabelsSection();
  };
</script>
```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### labels

A JSON formatted array of strings, each of which is a label that a worker can assign to an instance of an object in the image. Workers can generate different overlay colors for each relevant instance by selecting "add instance" under the label in the tool.

### name

The name of this widget. It is used as a key for the labeling data in the form output.

### src

The URL of the image that is to be labeled.

### initial-value

A JSON object containing the color mappings of a prior instance segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute will appear as follows:

```
initial-value="{
  "instances": [
    {
      "color": "#2ca02c",
      "label": "Cat"
    },
    {
      "color": "#1f77b4",
      "label": "Cat"
    },
    {
```

```
    "color": "#d62728",
    "label": "Dog"
  }
],
"src": {{ "S3 file URL for image" | grant_read_access }}
```

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are supported by this element.

### full-instructions

General instructions about how to do image segmentation.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### labeledImage

A JSON Object containing a Base64 encoded PNG of the labels.

### instances

A JSON Array containing objects with the instance labels and colors.

- **color** – The hexadecimal value of the label's RGB color in the `labeledImage` PNG.
- **label** – The label given to overlay(s) using that color. This value may repeat, because the different instances of the label are identified by their unique color.

## inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### Example : Sample Element Outputs

The following is an example of output from this element.

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 533,
        "width": 800
      },
      "instances": [
        {
          "color": "#1f77b4",
          "label": "<Label 1>":
        },
        {
          "color": "#2ca02c",
          "label": "<Label 1>":
        },
        {
          "color": "#ff7f0e",
          "label": "<Label 3>":
        },
      ],
      "labeledImage": {
        "pngImageData": "<Base-64 Encoded Data>"
      }
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

### crowd-instructions

An element that displays instructions on three tabbed pages, **Summary**, **Detailed Instructions**, and **Examples**, when the worker clicks on a link or button.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that used the `<crowd-instructions>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-instructions link-text="View instructions" link-type="button">
    <short-summary>
      <p>Given an image, write three words or short phrases that summarize its
contents.</p>
    </short-summary>
    <detailed-instructions>
      <p>Imagine that you are describing an image to a friend or tagging it for a news
website. Provide three specific words or short phrases that describe it.</p>
    </detailed-instructions>
    <positive-example>
      <p></p>
      <p>
        <ul>
          <li>Highway</li>
          <li>Cars</li>
          <li>Gas station</li>
        </ul>
      </p>
    </positive-example>
    <negative-example>
      <p></p>
```

```
<p>
  These are not specific enough:
  <ol>
    <li>Trees</li>
    <li>Outside</li>
    <li>Daytime</li>
  </ol>
</p>
</negative-example>
</crowd-instructions>
  <p><strong>Instructions: </strong>Given an image, write three words or short
  phrases that summarize its contents.</p>
  <p>If someone were to see these three words or phrases, they should understand the
  subject and context of the image, as well as any important actions.</p>
  <p>View the instructions for detailed instructions and examples.</p>
  <p></p>
  <crowd-input name="tag1" label="Word/phrase 1" required></crowd-input>
  <crowd-input name="tag2" label="Word/phrase 2" required></crowd-input>
  <crowd-input name="tag3" label="Word/phrase 3" required></crowd-input>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### link-text

The text to display for opening the instructions. The default is **Click for instructions**.

### link-type

A string that specifies the type of trigger for the instructions. The possible values are "link" (default) and "button".

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## Regions

The following regions are supported by this element.

### **detailed-instructions**

Content that provides specific instructions for a task. This appears on the page of the "Detailed Instructions" tab.

### **negative-example**

Content that provides examples of inadequate task completion. This appears on the page of the "Examples" tab. More than one example may be provided within this element.

### **positive-example**

Content that provides examples of proper task completion. This appears on the page of the "Examples" tab.

### **short-summary**

A brief statement that summarizes the task to be completed. This appears on the page of the "Summary" tab. More than one example may be provided within this element.

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

### **crowd-keypoint**

Generates a tool to select and annotate key points on an image.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of an Liquid template that uses the `<crowd-keypoint>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

```
<crowd-form>
  <div id="errorBox"></div>

  <crowd-keypoint
    src="{ task.input.taskObject | grant_read_access }"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
  </crowd-keypoint>
</crowd-form>

<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
      return p.label;
    });

    // 1. Make sure total number of keypoints is correct.
    var original_num_labels = document.getElementsByTagName("crowd-keypoint")
[0].getAttribute("labels");

    original_num_labels = original_num_labels.substring(2, original_num_labels.length -
2).split("\\", "\\");
    var goalNumKeypoints = num_obj*original_num_labels.length;
    if (keypoints.length != goalNumKeypoints) {
      e.preventDefault();
      errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all
keypoint annotations and use each label only once.</crowd-alert>';
      errorBox.scrollIntoView();
      return;
    }

    // 2. Make sure all labels are unique.
    labelCounts = {};
```

```
for (var i = 0; i < labels.length; i++) {
  if (!labelCounts[labels[i]]) {
    labelCounts[labels[i]] = 0;
  }
  labelCounts[labels[i]]++;
}
const goalNumSingleLabel = num_obj;

const numLabels = Object.keys(labelCounts).length;

Object.entries(labelCounts).forEach(entry => {
  if (entry[1] !== goalNumSingleLabel) {
    e.preventDefault();
    errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each
label only once.</crowd-alert>';
    errorBox.scrollIntoView();
  }
})
};
</script>
```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### initial-value

An array, in JSON format, of keypoints to be applied to the image on start. For example:

```
initial-value="[
  {
    'label': 'Left Eye',
    'x': 1022,
    'y': 429
  },
  {
    'label': 'Beak',
    'x': 941,
```

```
'y': 403
}
]
```

### Note

Please note that label values used in this attribute must have a matching value in the `labels` attribute or the point will not be rendered.

## labels

An array, in JSON format, of strings to be used as keypoint annotation labels.

## name

A string used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

## src

The source URI of the image to be annotated.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are required by this element.

### full-instructions

General instructions about how to annotate the image.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### keypoints

An array of JSON objects containing the coordinates and label of a keypoint. Each object contains the following properties.

- **label** – The assigned label for the keypoint.
- **x** – The X coordinate, in pixels, of the keypoint on the image.
- **y** – The Y coordinate, in pixels, of the keypoint on the image.

#### Note

X and Y coordinates are based on 0,0 being the top left corner of the image.

### Example : Sample Element Outputs

The following is a sample output from using this element.

```
[
  {
    "crowdKeypoint": {
      "inputImageProperties": {
        "height": 1314,
        "width": 962
      },
      "keypoints": [
        {
```

```
    "label": "dog",
    "x": 155,
    "y": 275
  },
  {
    "label": "cat",
    "x": 341,
    "y": 447
  },
  {
    "label": "cat",
    "x": 491,
    "y": 513
  },
  {
    "label": "dog",
    "x": 714,
    "y": 578
  },
  {
    "label": "cat",
    "x": 712,
    "y": 763
  },
  {
    "label": "cat",
    "x": 397,
    "y": 814
  }
]
}
```

You may have many labels available, but only the ones that are used appear in the output.

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-line

A widget for drawing lines on an image. Each line is associated with a label, and output data will report the starting and ending points of each line.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-line>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this [GitHub repository](#).

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-line
    name="crowdLine"
    src="{ task.input.taskObject | grant_read_access }"
    header="Add header here to describe the task"
    labels="['car', 'pedestrian', 'street car']"
  >
    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
      <p>Draw a line on each objects that the label applies to.</p>
    </short-instructions>

    <full-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.
      <p>Draw a line along each object that the image applies to.
        Make sure that the line does not extend beyond the boundaries
        of the object.
      </p>
      <p>Each line is defined by a starting and ending point. Carefully
        place the starting and ending points on the boundaries of the object.</p>
    </full-instructions>

  </crowd-line>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

## header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

## initial-value

Optional. An array of JSON objects, each of which sets a line when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the line as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the `<crowd-line>` element.
- **vertices** – the x and y pixel coordinates of the start point and end point of the line, relative to the top-left corner of the image.

```
initial-value="{
  lines: [
    {
      label: 'sideline', // label of this line annotation
      vertices:[         // an array of vertices which decide the position of the
line
      {
        x: 84,
        y: 110
      },
      {
        x: 60,
        y: 100
      }
    ]
  },
  {
    label: 'yardline',
    vertices:[
      {
        x: 651,
        y: 498
      },
      {
        x: 862,
        y: 869
      }
    ]
  }
]
```

```
    ]  
  }  
]  
}"
```

Lines set via the `initial-value` property can be adjusted. Whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

### labels

Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

**Limit:** 10 labels

### label-colors

Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

### name

Required. The name of this widget. It's used as a key for the widget's input in the form output.

### src

Required. The URL of the image on which to draw lines.

### Regions

The following regions are required by this element.

#### full-instructions

General instructions about how to draw lines.

#### short-instructions

Important task-specific instructions that are displayed in a prominent place.

### Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [short-instructions](#), [full-instructions](#)

## Output

### inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### lines

A JSON Array containing objects with the line labels and vertices.

- **label** – The label given to a line.
- **vertices** – the x and y pixel coordinates of the start point and end point of the line, relative to the top-left corner of the image.

### Example : Sample Element Outputs

The following is an example of output from this element.

```
{
  "crowdLine": { //This is the name you set for the crowd-line
    "inputImageProperties": {
      "height": 1254,
      "width": 2048
    },
    "lines": [
      {
        "label": "yardline",
        "vertices": [
          {
            "x": 58,
            "y": 295
          },
          {
            "x": 1342,
            "y": 398
          }
        ]
      }
    ]
  }
}
```

```
    },
    {
      "label": "sideline",
      "vertices": [
        {
          "x": 472,
          "y": 910
        },
        {
          "x": 1480,
          "y": 600
        }
      ]
    }
  ]
}
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-modal

A small window that pops up on the display when it is opened.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of the syntax that you can use with the `<crowd-modal>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-modal
  link-text = "See Examples"
  link-type = "button">
  Example Modal Text</crowd-modal>
```

## Attributes

The following attributes are supported by this element.

### link-text

The text to display for opening the modal. The default is "Click to open modal".

### link-type

A string that specifies the type of trigger for the modal. The possible values are "link" (default) and "button".

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-polygon

A widget for drawing polygons on an image and assigning a label to the portion of the image that is enclosed in each polygon.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-polygon>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
```

```
<crowd-polygon
  name="annotatedResult"
  src="{ task.input.taskObject | grant_read_access }"
  header="Draw a polygon around each of the requested target(s) of interest"
  labels=["Cat', 'Dog', 'Bird']"
>
<full-instructions header="Polygon instructions">
  <ul>
    <li>Make the polygon tight around the object</li>
    <li>You need to select a label before starting a polygon</li>
    <li>You will need to select a label again after completing a polygon</li>
    <li>To select a polygon, you can click on its borders</li>
    <li>You can start drawing a polygon from inside another polygon</li>
    <li>You can undo and redo while you're drawing a polygon to go back and forth
between points you've placed</li>
    <li>You are prevented from drawing lines that overlap other lines from the same
polygon</li>
  </ul>
</full-instructions>

<short-instructions>
  <p>Draw a polygon around each of the requested target(s) of interest</p>
  <p>Make the polygon tight around the object</p>
</short-instructions>
</crowd-polygon>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### labels

A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion enclosed by a polygon.

### name

The name of this widget. It's used as a key for the widget's input in the form output.

## src

The URL of the image on which to draw polygons.

## initial-value

An array of JSON objects, each of which defines a polygon to be drawn when the component is loaded. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the <crowd-polygon> element.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon.

## Example

An `initial-value` attribute might look something like this.

```
initial-value =  
' [  
  {  
    "label": "dog",  
    "vertices":  
      [  
        {  
          "x": 570,  
          "y": 239  
        },  
        ...  
        {  
          "x": 759,  
          "y": 281  
        }  
      ]  
    }  
  ]'  
'
```

Because this will be within an HTML element, the JSON array must be enclosed in single or double quotes. The example above uses single quotes to encapsulate the JSON and double quotes within the JSON itself. If you must mix single and double quotes inside your JSON, replace them with their HTML entity codes (&quot; ; for double quote, &#39; ; for single) to safely escape them.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are required.

### full-instructions

General instructions about how to draw polygons.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### polygons

An array of JSON objects, each of which describes a polygon that has been created by the worker. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon. The top left corner of the image is 0,0.

### inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

## Example : Sample Element Outputs

The following are samples of outputs from common use scenarios for this element.

### Single Label, Single Polygon

```
{
  "annotatedResult":
  {
    "inputImageProperties": {
      "height": 853,
      "width": 1280
    },
    "polygons":
    [
      {
        "label": "dog",
        "vertices":
        [
          {
            "x": 570,
            "y": 239
          },
          {
            "x": 603,
            "y": 513
          },
          {
            "x": 823,
            "y": 645
          },
          {
            "x": 901,
            "y": 417
          },
          {
            "x": 759,
            "y": 281
          }
        ]
      }
    ]
  }
}
```

]

## Single Label, Multiple Polygons

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 853,
        "width": 1280
      },
      "polygons": [
        {
          "label": "dog",
          "vertices": [
            {
              "x": 570,
              "y": 239
            },
            {
              "x": 603,
              "y": 513
            },
            {
              "x": 823,
              "y": 645
            },
            {
              "x": 901,
              "y": 417
            },
            {
              "x": 759,
              "y": 281
            }
          ]
        }
      ],
      {
        "label": "dog",
        "vertices": [
          {
            "x": 870,
            "y": 278
          }
        ]
      }
    }
  }
]
```

```
    },
    {
      "x": 908,
      "y": 446
    },
    {
      "x": 1009,
      "y": 602
    },
    {
      "x": 1116,
      "y": 519
    },
    {
      "x": 1174,
      "y": 498
    },
    {
      "x": 1227,
      "y": 479
    },
    {
      "x": 1179,
      "y": 405
    },
    {
      "x": 1179,
      "y": 337
    }
  ]
}
]
```

## Multiple Labels, Multiple Polygons

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 853,
```

```
    "width": 1280
  },
  "polygons": [
    {
      "label": "dog",
      "vertices": [
        {
          "x": 570,
          "y": 239
        },
        {
          "x": 603,
          "y": 513
        },
        {
          "x": 823,
          "y": 645
        },
        {
          "x": 901,
          "y": 417
        },
        {
          "x": 759,
          "y": 281
        }
      ]
    },
    {
      "label": "cat",
      "vertices": [
        {
          "x": 870,
          "y": 278
        },
        {
          "x": 908,
          "y": 446
        },
        {
          "x": 1009,
          "y": 602
        },
        {

```

```
        "x": 1116,  
        "y": 519  
    },  
    {  
        "x": 1174,  
        "y": 498  
    },  
    {  
        "x": 1227,  
        "y": 479  
    },  
    {  
        "x": 1179,  
        "y": 405  
    },  
    {  
        "x": 1179,  
        "y": 337  
    }  
]  
}  
]  
}  
]  
]
```

You could have many labels available, but only the ones that are used appear in the output.

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-polyline

A widget for drawing polylines or lines on an image. Each polyline is associated with a label and can include two or more vertices. A polyline can intersect itself and its starting and ending points can be placed anywhere on the image.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-polyline>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this [GitHub repository](#).

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-polyline
    name="crowdPolyline"
    src="{ task.input.taskObject | grant_read_access }"
    header="Add header here to describe the task"
    labels="['car', 'pedestrian', 'street car']"
  >
  <full-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>Draw a polyline around the boundaries of all objects
    that the label applies to.</p>
    <p>Use the <b>Enter</b> key to complete a polyline.</p>
    <p>Make sure that the polyline fits tightly around the boundary
    of the object.</p>
  </full-instructions>

  <short-instructions>
    <p>Read the task carefully and inspect the image.</p>
    <p>Review the tool guide to learn how to use the polyline tool.</p>
    <p>Choose the appropriate label that best suits the image.</p>
    <p>To draw a polyline, select a label that applies to an object of interest
    and add a single point to the photo by clicking on that point. Continue to
    draw the polyline around the object by adding additional points
    around the object boundary.</p>
    <p>After you place the final point on the polyline, press <b>Enter</b> on your
    keyboard to complete the polyline.</p>
  </short-instructions>
</crowd-polyline>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

## header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

## initial-value

Optional. An array of JSON objects, each of which sets a polyline when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the polyline as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the `<crowd-polyline>` element.
- **vertices** – the x and y pixel coordinates of the vertices of a polyline, relative to the top-left corner of the image.

```
initial-value= "{
  polylines: [
    {
      label: 'sideline', // label of this line annotation
      vertices:[         // an array of vertices which decide the position of the
line
        {
          x: 84,
          y: 110
        },
        {
          x: 60,
          y: 100
        }
      ]
    },
    {
      label: 'yardline',
      vertices:[
        {
          x: 651,
          y: 498
        },
        {
          x: 862,
          y: 869
        }
      ],
    }
  ]
}
```

```
    {
      x: 1000,
      y: 869
    }
  ]
}
```

Polylines set via the `initial-value` property can be adjusted. Whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

### labels

Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

**Limit:** 10 labels

### label-colors

Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

### name

Required. The name of this widget. It's used as a key for the widget's input in the form output.

### src

Required. The URL of the image on which to draw polylines.

### Regions

The following regions are required by this element.

#### full-instructions

General instructions about how to draw polylines.

#### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [short-instructions](#), [full-instructions](#)

## Output

### inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### polylines

A JSON Array containing objects with polylines' labels and vertices.

- **label** – The label given to a line.
- **vertices** – the x and y pixel coordinates of the vertices of a polyline, relative to the top-left corner of the image.

## Example : Sample Element Outputs

The following is an example of output from this element.

```
{
  "crowdPolyline": { //This is the name you set for the crowd-polyline
    "inputImageProperties": {
      "height": 1254,
      "width": 2048
    },
    "polylines": [
      {
        "label": "sideline",
```

```
    "vertices": [  
      {  
        "x": 651,  
        "y": 498  
      },  
      {  
        "x": 862,  
        "y": 869  
      },  
      {  
        "x": 1449,  
        "y": 611  
      }  
    ],  
  },  
  {  
    "label": "yardline",  
    "vertices": [  
      {  
        "x": 1148,  
        "y": 322  
      },  
      {  
        "x": 1705,  
        "y": 474  
      },  
      ,  
      {  
        "x": 1755,  
        "y": 474  
      }  
    ]  
  }  
]  
}
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-radio-button

A button that can be either checked or unchecked. When radio buttons are inside a radio group, exactly one radio button in the group can be checked at any time. The following is an example of how to configure a crowd-radio-button element inside of a crowd-radio-group element.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of the syntax that you can use with the <crowd-radio-button> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
<crowd-radio-group>
  <crowd-radio-button name="tech" value="tech">Technology</crowd-radio-button>
  <crowd-radio-button name="politics" value="politics">Politics</crowd-radio-button>
</crowd-radio-group>
</crowd-form>
```

The previous example can be seen in a custom worker task template in this GitHub example: [entity recognition labeling job custom template](#).

Crowd HTML Element radio buttons do not support the HTML tag, required. To make a radio button selection required, use <input type="radio"> elements to create radio buttons and add the required tag. The name attribute for all <input> elements that belong to the same group of radio buttons must be the same. For example, the following template requires the user to select a radio button in the animal-type group before submitting.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <p>Select an animal type:</p>
  
  <br><br>
  <div>
    <input type="radio" id="cat" name="animal-type" value="cat" required>
    <label for="cat">Cat</label>
  </div>
</div>
```

```
<input type="radio" id="dog" name="animal-type" value="dog">
<label for="dog">Dog</label>
</div>
<div>
<input type="radio" id="unknown" name="animal-type" value="unknown">
<label for="unknown">Unknown</label>
</div>
<full-instructions header="Classification Instructions">
<p>Read the task carefully and inspect the image.</p>
<p>Choose the appropriate label that best suits the image.</p>
</full-instructions>
<short-instructions>
<p>Read the task carefully and inspect the image.</p>
<p>Choose the appropriate label that best suits the image.</p>
</short-instructions>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### checked

A Boolean switch that, if present, displays the radio button as checked.

### disabled

A Boolean switch that, if present, displays the button as disabled and prevents it from being checked.

### name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

#### Note

If you use the buttons outside of a [crowd-radio-group](#) element, but with the same name string and different value strings, the name object in the output will contain a Boolean value for each value string. To ensure that only one button in a group is selected, make them children of a [crowd-radio-group](#) element and use different name values.

## value

A property name for the element's boolean value. If not specified, it uses "on" as the default, e.g. { "<name>": { "<value>": <true or false> } }.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-radio-group](#)
- **Child elements:** none

## Output

Outputs an object with the following pattern: { "<name>": { "<value>": <true or false> } }. If you use the buttons outside of a [crowd-radio-group](#) element, but with the same name string and different value strings, the name object will contain a Boolean value for each value string. To ensure that only one in a group of buttons is selected, make them children of a [crowd-radio-group](#) element and use different name values.

## Example Sample output of this element

```
[
  {
    "btn1": {
      "yes": true
    },
    "btn2": {
      "no": false
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-radio-group

A group of radio buttons. Only one radio button within the group can be selected. Choosing one radio button clears any previously chosen radio button within the same group. For an example of a custom UI template that uses the `crowd-radio-group` element, see this [entity recognition labeling job custom template](#).

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of the syntax that you can use with the `<crowd-radio-group>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<style>
  body {
    padding-left: 20px;
    margin-bottom: 20px;
  }
  #outer-container {
    display: flex;
    justify-content: space-around;
    max-width: 900px;
    margin-left: 100px;
  }
  .left-container {
    margin-right: auto;
    padding-right: 50px;
  }
  .right-container {
    margin-left: auto;
    padding-left: 50px;
  }
  #vertical-separator {
    border: solid 1px #d5dbdb;
  }
</style>

<crowd-form>
  <div>
    <h1>Instructions</h1>
```

```
    Lorem ipsum...
  </div>
  <div>
    <h2>Background</h2>
    <p>Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor
    incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud
    exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat.</p>
  </div>
  <div id="outer-container">
<span class="left-container">
  <h2>Option 1</h2>
  <p>Nulla facilisi morbi tempus iaculis urna. Orci dapibus ultrices in iaculis nunc
  sed augue lacus.</p>
</span>
<span id="vertical-separator"></span>
<span class="right-container">
  <h2>Option 2</h2>
  <p>Ultrices vitae auctor eu augue ut. Pellentesque massa placerat duis ultricies
  lacus sed turpis tincidunt id.</p>
</span>
</div>
  <div>
    <h2>Question</h2>
    <p>Which do you agree with?</p>
<crowd-radio-group>
  <crowd-radio-button name="option1" value="Option 1">Option 1</crowd-radio-button>
  <crowd-radio-button name="option2" value="Option 2">Option 2</crowd-radio-button>
</crowd-radio-group>

  <p>Why did you choose this answer?</p>
<crowd-text-area name="explanation" placeholder="Explain how you reached your
  conclusion..."></crowd-text-area>
</div>
</crowd-form>
```

## Attributes

No special attributes are supported by this element.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)

- **Child elements:** [crowd-radio-button](#)

## Output

Outputs an array of objects representing the [crowd-radio-button](#) elements within it.

## Example Sample of Element Output

```
[
  {
    "btn1": {
      "yes": true
    },
    "btn2": {
      "no": false
    }
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-semantic-segmentation

A widget for segmenting an image and assigning a label to each image segment.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-semantic-segmentation>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-semantic-segmentation
    name="annotatedResult"
```

```
src="{ task.input.taskObject | grant_read_access }"
header="Please label each of the requested objects in this image"
labels="['Cat', 'Dog', 'Bird']"
>
<full-instructions header="Segmentation Instructions">
  <ol>
    <li><strong>Read</strong> the task carefully and inspect the image.</li>
    <li><strong>Read</strong> the options and review the examples provided to
understand more about the labels.</li>
    <li><strong>Choose</strong> the appropriate label that best suits the
image.</li>
  </ol>
</full-instructions>

<short-instructions>
  <p>Use the tools to label the requested items in the image</p>
</short-instructions>
</crowd-semantic-segmentation>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### header

The text to display above the image. This is typically a question or simple instruction for the worker.

### initial-value

A JSON object containing the color mappings of a prior semantic segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute would appear as follows:

```
initial-value='{
  "labelMappings": {
    "Bird": {
      "color": "#ff7f0e"
    },
    "Cat": {
```

```

    "color": "#2ca02c"
  },
  "Cow": {
    "color": "#d62728"
  },
  "Dog": {
    "color": "#1f77b4"
  }
},
"src": {{ "S3 file URL for image" | grant_read_access }}
}'

```

When using Ground Truth [built in task types](#) with [annotation consolidation](#) (where more than one worker labels a single image), label mappings are included in individual worker output records, however the overall result is represented as the `internal-color-map` in the consolidated results.

You can convert the `internal-color-map` to label-mappings in a custom template using the Liquid templating language:

```

initial-value="{
  'src' : '{{ task.input.manifestLine.label-attribute-name-from-prior-job |
grant_read_access }}',
  'labelMappings': {
    {% for box in task.input.manifestLine.label-attribute-name-from-prior-job-
metadata.internal-color-map %}
      {% if box[1]['class-name'] != 'BACKGROUND' %}
        {{ box[1]['class-name'] | to_json }}: {
          'color': {{ box[1]['hex-color'] | to_json }}
        },
      {% endif %}
    {% endfor %}
  }
}"

```

## labels

A JSON formatted array of strings, each of which is a label that a worker can assign to a segment of the image.

## name

The name of this widget. It is used as a key for the widget's input in the form output.

## src

The URL of the image that is to be segmented.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [full-instructions](#), [short-instructions](#)

## Regions

The following regions are supported by this element.

### full-instructions

General instructions about how to do image segmentation.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Output

The following output is supported by this element.

### labeledImage

A JSON Object containing a Base64 encoded PNG of the labels.

### labelMappings

A JSON Object containing objects with named with the segmentation labels.

- **color** – The hexadecimal value of the label's RGB color in the `labeledImage` PNG.

### initialValueModified

A boolean representing whether the initial values have been modified. This is only included when the output is from an adjustment task.

## inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

### Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 533,
        "width": 800
      },
      "labelMappings": {
        "<Label 2>": {
          "color": "#ff7f0e"
        },
        "<label 3>": {
          "color": "#2ca02c"
        },
        "<label 1>": {
          "color": "#1f77b4"
        }
      },
      "labeledImage": {
        "pngImageData": "<Base-64 Encoded Data>"
      }
    }
  }
]
```

### See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)

- [Crowd HTML Elements Reference](#)

## crowd-slider

A bar with a sliding knob that allows a worker to select a value from a range of values by moving the knob. The slider makes it a great choice for settings that reflect intensity levels, such as volume, brightness, or color saturation.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a survey template that uses the `<crowd-slider>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
<crowd-instructions link-text="View instructions" link-type="button">
  <short-summary>
    <p>Provide a brief instruction here</p>
  </short-summary>

  <detailed-instructions>
    <h3>Provide more detailed instructions here</h3>
    <p>Include additional information</p>
  </detailed-instructions>

  <positive-example>
    <p>Provide an example of a good answer here</p>
    <p>Explain why it's a good answer</p>
  </positive-example>

  <negative-example>
    <p>Provide an example of a bad answer here</p>
    <p>Explain why it's a bad answer</p>
  </negative-example>
</crowd-instructions>

<div>
  <p>What is your favorite color for a bird?</p>
  <crowd-input name="favoriteColor" placeholder="example: pink" required></crowd-input>
```

```
</div>

<div>
  <p>Check this box if you like birds</p>
  <crowd-checkbox name="likeBirds" checked="true" required></crowd-checkbox>
</div>

<div>
  <p>On a scale of 1-10, how much do you like birds?</p>
  <crowd-slider name="howMuch" min="1" max="10" step="1" pin="true" required></crowd-
slider>
</div>

<div>
  <p>Write a short essay describing your favorite bird</p>
  <crowd-text-area name="essay" rows="4" placeholder="Lorem ipsum..." required></crowd-
text-area>
</div>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### **disabled**

A Boolean switch that, if present, displays the slider as disabled.

### **editable**

A Boolean switch that, if present, displays an up/down button that can be chosen to select the value.

Selecting the value via the up/down button is an alternative to selecting the value by moving the knob on the slider. The knob on the slider will move synchronously with the up/down button choices.

### **max**

A number that specifies the maximum value on the slider.

### **min**

A number that specifies the minimum value on the slider.

**name**

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

**pin**

A Boolean switch that, if present, displays the current value above the knob as the knob is moved.

**required**

A Boolean switch that, if present, requires the worker to provide input.

**secondary-progress**

When used with a `crowd-slider-secondary-color` CSS attribute, the progress bar is colored to the point represented by the `secondary-progress`. For example, if this was representing the progress on a streaming video, the `value` would represent where the viewer was in the video timeline. The `secondary-progress` value would represent the point on the timeline to which the video had buffered.

**step**

A number that specifies the difference between selectable values on the slider.

**value**

A preset that becomes the default if the worker does not provide input.

**Element Hierarchy**

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

**See Also**

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-tab

A component styled to look like a tab with information below.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example template that uses the `<crowd-tab>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-tabs>
    <crowd-tab header="Tab 1">
      <h2>Image</h2>

      <h2>Text</h2>
      <p>
        Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor
        incididunt ut labore et dolore magna aliqua.
      </p>
      <p>
        Sed risus ultricies tristique nulla aliquet enim tortor at auctor. Tempus egestas
        sed sed risus.
      </p>
    </crowd-tab>

    <crowd-tab header="Tab 2">
      <h2>Description</h2>
      <p>
        Sed risus ultricies tristique nulla aliquet enim tortor at auctor. Tempus egestas
        sed sed risus.
      </p>
    </crowd-tab>

    <crowd-tab header="Tab 3">
      <div style="width: 40%; display: inline-block">
```

```

    
    <crowd-input label="Input inside tab" name="inputInsideTab"></crowd-input>
    <input type="checkbox" name="checkbox" value="foo">Foo
    <input type="checkbox" name="checkbox" value="bar">Bar
    <crowd-button>Some button</crowd-button>
  </div>

  <div style="width: 40%; display: inline-block; vertical-align: top">
    Lorem ipsum dolor sit amet, lorem a wisi nibh, in pulvinar, consequat praesent

  <p> Tempus egestas sed sed risus.</p>
</full-instructions>

```

```
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### header

The text appearing on the tab. This is usually some short descriptive name indicative of the information contained below the tab.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-tabs](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-tabs

A container for tabbed information.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example template that uses the `<crowd-tabs>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-tabs>
    <crowd-tab header="Tab 1">
      <h2>Image</h2>
```

```

<h2>Text</h2>

## Attributes

This element has no attributes.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** [crowd-tab](#)

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

### crowd-text-area

A field for text input.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template designed to transcribe audio clips that uses the `<crowd-text-area>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <audio controls>
    <source src="{{ task.input.taskObject | grant_read_access }}" type="audio/mpeg">
    Your browser does not support the audio element.
  </audio>
  <h3>Instructions</h3>
  <p>Transcribe the audio</p>
  <p>Ignore "umms", "hmmms", "uhs" and other non-textual phrases</p>
  <crowd-text-area name="transcription" rows="4"></crowd-text-area>
</crowd-form>
```

### Attributes

The following attributes are supported by this element.

#### allowed-pattern

A regular expression that is used with the *auto-validate* attribute to ignore non-matching characters as the worker types.

#### auto-focus

A Boolean switch that, if present, puts the cursor in this element on-load so that users can immediately begin typing without having to click inside the element.

**auto-validate**

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the *error-message* and *allowed-pattern* attributes.

**char-counter**

A Boolean switch that, if present, puts a small text field beneath the lower-right corner of the element, displaying the number of characters inside the element.

**disabled**

A Boolean switch that, if present, displays the input area as disabled.

**error-message**

The text to be displayed below the input field, on the left side, if validation fails.

**label**

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the *value* attribute is set.

**max-length**

An integer that specifies the maximum number of characters allowed by the element. Characters typed or pasted beyond the maximum are ignored.

**max-rows**

An integer that specifies the maximum number of rows of text that are allowed within a crowd-text-area. Normally the element expands to accommodate new rows. If this is set, after the number of rows exceeds it, content scrolls upward out of view and a scrollbar control appears.

**name**

A string used to represent the element's data in the output.

**placeholder**

A string presented to the user as placeholder text. It disappears after the user puts something in the input area.

## rows

An integer that specifies the height of the element in rows of text.

## value

A preset that becomes the default if the worker does not provide input. The preset appears in a text field.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## Output

This element outputs the name as a property name and the element's text contents as the value. Carriage returns in the text are represented as `\n`.

## Example Sample output for this element

```
[
  {
    "textInput1": "This is the text; the text that\nmakes the crowd go wild."
  }
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-toast

A subtle notification that temporarily appears on the display. Only one crowd-toast is visible.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following is an example of a Liquid template that uses the `<crowd-toast>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>

  <crowd-toast duration="10000" opened>
    This is a message that you want users to see when opening the template. This
    message will disappear in 10 seconds.
  </crowd-toast>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### duration

A number that specifies the duration, in milliseconds, that the notification appears on the screen.

### text

The text to display in the notification.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## crowd-toggle-button

A button that acts as an ON/OFF switch, toggling a state.

See an interactive example of an HTML template that uses this Crowd HTML Element in [CodePen](#).

The following example shows different ways you can use to use the `<crowd-toggle-button>` HTML element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <!--Toggle button without value-->
  <crowd-toggle-button name="toggleButtonWithoutValue"></crowd-toggle-button>

  <!--Toggle button with value-->
  <crowd-toggle-button name="toggleButtonWithValue" value="someValue"></crowd-toggle-
button>

  <!--Toggle button disabled-->
  <crowd-toggle-button name="toggleButtonDisabled" disabled></crowd-toggle-button>

  <!--Toggle button marked invalid-->
  <crowd-toggle-button name="toggleButtonInvalid" invalid></crowd-toggle-button>

  <!--Toggle button marked required-->
  <crowd-toggle-button name="toggleButtonRequired" required></crowd-toggle-button>
</crowd-form>
```

## Attributes

The following attributes are supported by this element.

### checked

A Boolean switch that, if present, displays the button switched to the ON position.

## disabled

A Boolean switch that, if present, displays the button as disabled and prevents toggling.

## invalid

When in an off position, a button using this attribute, will display in an alert color. The standard is red, but may be changed in CSS. When toggled on, the button will display in the same color as other buttons in the on position.

## name

A string that is used to identify the answer submitted by the worker. This value matches a key in the JSON object that specifies the answer.

## required

A Boolean switch that, if present, requires the worker to provide input.

## value

A value used in the output as the property name for the element's Boolean state. Defaults to "on" if not provided.

## Element Hierarchy

This element has the following parent and child elements.

- **Parent elements:** [crowd-form](#)
- **Child elements:** none

## Output

This element outputs the name as the name of an object, containing the value as a property name and the element's state as Boolean value for the property. If no value for the element is specified, the property name defaults to "on."

## Example Sample output for this element

```
[
  {
    "theToggler": {
```

```
    "on": true
  }
}
]
```

## See Also

For more information, see the following.

- [Training data labeling using humans with Amazon SageMaker Ground Truth](#)
- [Crowd HTML Elements Reference](#)

## Augmented AI Crowd HTML Elements

The following Crowd HTML Elements are only available for Amazon Augmented AI human workflow tasks.

### crowd-textract-analyze-document

A widget to enable human review of a Amazon Textract document analysis result.

### Attributes

The following attributes are supported by this element.

#### header

This is the text that is displayed as the header.

#### src

This is a link to the image to be analyzed by the worker.

#### initialValue

This sets initial values for attributes found in the worker UI.

The following is an example of an `initialValue` input:

```
[
  {
    "blockType": "KEY_VALUE_SET",
    "confidence": 38.43309020996094,
```

```

    "geometry": {
      "boundingBox": {
        "width": 0.32613086700439453,
        "weight": 0.0942094624042511,
        "left": 0.4833833575248718,
        "top": 0.5227988958358765
      },
      "polygon": [
        {"x": 0.123, "y": 0.345}, ...
      ]
    }
    "id": "8c97b240-0969-4678-834a-646c95da9cf4",
    "relationships": [
      {
        "type": "CHILD",
        "ids": [
          "7ee7b7da-ee1b-428d-a567-55a3e3afffa56",
          "4d6da730-ba43-467c-a9a5-c6137ba0c472"
        ]
      },
      {
        "type": "VALUE",
        "ids": [
          "6ee7b7da-ee1b-428d-a567-55a3e3afffa54"
        ]
      }
    ],
    "entityTypes": [
      "KEY"
    ],
    "text": "Foo bar"
  },
]

```

## blockTypes

This determines the kind of analysis the workers can do. Only KEY\_VALUE\_SET is currently supported.

## keys

This specifies new keys and the associated text value the worker can add. The input values for keys can include the following elements:

- `importantFormKey` accepts strings, and is used to specify a single key.
- `importantFormKeyAliases` can be used to specify aliases that are acceptable alternatives to the keys supplied. Use this element to identify alternative spellings or presentations of your keys. This parameter accepts a list of one or more strings.

The following is an example of an input for keys.

```
[
  {
    importantFormKey: 'Address',
    importantFormKeyAliases: [
      'address',
      'Addr.',
      'Add.'
    ]
  },
  {
    importantFormKey: 'Last name',
    importantFormKeyAliases: ['Surname']
  }
]
```

### no-key-edit

This prevents the workers from editing the keys of annotations passed through `initialValue`. This prevents workers from editing the keys that have been detected on your documents. This is required.

### no-geometry-edit

This prevents workers from editing the polygons of annotations passed through `initialValue`. For example, this would prevent the worker from editing the bounding box around a given key. This is required.

### Element Hierarchy

This element has the following parent and child elements.

- Parent elements – crowd-form
- Child elements – [full-instructions](#), [short-instructions](#)

## Regions

The following regions are supported by this element. You can use custom HTML and CSS code within these regions to format your instructions to workers. For example, use the short-instructions section to provide good and bad examples of how to complete a task.

### full-instructions

General instructions about how to work with the widget.

### short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Example of a Worker Template Using the crowd Element

An example of a worker template using this crowd element would look like the following.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textextract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they
don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="['KEY_VALUE_SET']"
  >
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
      .instructionsImage {
        display: inline-block;
        max-width: 100%;
      }
    </style>
```

```
<p class='instructions'>Click on a key-value block to highlight the corresponding key-value pair in the document.
```

If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.

The text of the value is incorrect, correct it.

```

```

A wrong value is identified, correct it.

```

```

If it is not a valid key-value relationship, choose No.

```

```

If you can't find the key in the document, choose Key not found.

```

```

If the content of a field is empty, choose Value is blank.

```

```

**Examples**

Key and value are often displayed next or below to each other.

Key and value displayed in one line.

```

```

Key and value displayed in two lines.

```

```

If the content of the value has multiple lines, enter all the text without line break.

Include all value text even if it extends beyond the highlight box.

```
</p>
```

```
</short-instructions>
```

```
<full-instructions header="Instructions"></full-instructions>
```

```
</crowd-texttract-analyze-document>  
</crowd-form>
```

## Output

The following is a sample of the output from this element. You can find a detailed explanation of this output in the Amazon Textract [AnalyzeDocument](#) API documentation.

```
{  
  "AWS/Texttract/AnalyzeDocument/Forms/V1": {  
    blocks: [  
      {  
        "blockType": "KEY_VALUE_SET",  
        "id": "8c97b240-0969-4678-834a-646c95da9cf4",  
        "relationships": [  
          {  
            "type": "CHILD",  
            "ids": ["7ee7b7da-ee1b-428d-a567-55a3e3affa56", "4d6da730-ba43-467c-a9a5-c6137ba0c472"]  
          },  
          {  
            "type": "VALUE",  
            "ids": ["6ee7b7da-ee1b-428d-a567-55a3e3affa54"]  
          }  
        ],  
        "entityTypes": ["KEY"],  
        "text": "Foo bar baz"  
      }  
    ]  
  }  
}
```

## crowd-rekognition-detect-moderation-labels

A widget to enable human review of an Amazon Rekognition image moderation result.

### Attributes

The following attributes are supported by this element.

#### header

This is the text that is displayed as the header.

## **src**

This is a link to the image to be analyzed by the worker.

## **categories**

This supports `categories` as an array of strings **or** an array of objects where each object has a `name` field.

If the categories come in as objects, the following applies:

- The displayed categories are the value of the `name` field.
- The returned answer contains the **full** objects of any selected categories.

If the categories come in as strings, the following applies:

- The returned answer is an array of all the strings that were selected.

## **exclusion-category**

By setting this attribute you create a button underneath the categories in the UI.

- When a user chooses the button, all categories are deselected and disabled.
- Choosing the button again re-enables the categories so that users can choose them.
- If you submit after choosing the button, it returns an empty array.

## **Element Hierarchy**

This element has the following parent and child elements.

- Parent elements – `crowd-form`
- Child elements – [full-instructions](#), [short-instructions](#)

## **AWS Regions**

The following AWS Regions are supported by this element. You can use custom HTML and CSS code within these Regions to format your instructions to workers. For example, use the `short-instructions` section to provide good and bad examples of how to complete a task.

## full-instructions

General instructions about how to work with the widget.

## short-instructions

Important task-specific instructions that are displayed in a prominent place.

## Example Worker Template with the crowd Element

An example of a worker template using the crowd element would look like the following.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3object.bucket }}/
{{ task.input.aiServiceRequest.image.s3object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
    <p class='instructions'>Review the image and choose all applicable categories.
    If no categories apply, choose None.

    <b>Nudity</b>
    Visuals depicting nude male or female person or persons

    <b>Graphic Male Nudity</b>
    Visuals depicting full frontal male nudity, often close ups
```

**<b>Graphic Female Nudity</b>**

Visuals depicting full frontal female nudity, often close ups

**<b>Sexual Activity</b>**

Visuals depicting various types of explicit sexual activities and pornography

**<b>Illustrated Nudity or Sexual Activity</b>**

Visuals depicting animated or drawn sexual activity, nudity or pornography

**<b>Adult Toys</b>**

Visuals depicting adult toys, often in a marketing context

**<b>Female Swimwear or Underwear</b>**

Visuals depicting female person wearing only swimwear or underwear

**<b>Male Swimwear Or Underwear</b>**

Visuals depicting male person wearing only swimwear or underwear

**<b>Partial Nudity</b>**

Visuals depicting covered up nudity, for example using hands or pose

**<b>Revealing Clothes</b>**

Visuals depicting revealing clothes and poses, such as deep cut dresses

**<b>Graphic Violence or Gore</b>**

Visuals depicting prominent blood or bloody injuries

**<b>Physical Violence</b>**

Visuals depicting violent physical assault, such as kicking or punching

**<b>Weapon Violence</b>**

Visuals depicting violence using weapons like firearms or blades, such as shooting

**<b>Weapons</b>**

Visuals depicting weapons like firearms and blades

**<b>Self Injury</b>**

Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

**<b>Emaciated Bodies</b>**

Visuals depicting extremely malnourished human bodies

```
<b>Corpses</b>
Visuals depicting human dead bodies

<b>Hanging</b>
Visuals depicting death by hanging</p>
</short-instructions>

<full-instructions header="Instructions"></full-instructions>
</crowd-rekognition-detect-moderation-labels>
</crowd-form>
```

## Output

The following is a sample of the output from this element. For details about this output, see Amazon Rekognition [DetectModerationLabels](#) API documentation.

```
{
  "AWS/Rekognition/DetectModerationLabels/Image/V3": {
    "ModerationLabels": [
      { name: 'Gore', parentName: 'Violence' },
      { name: 'Corpses', parentName: 'Violence' },
    ]
  }
}
```

## Using Amazon Augmented AI for Human Review

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

### What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review

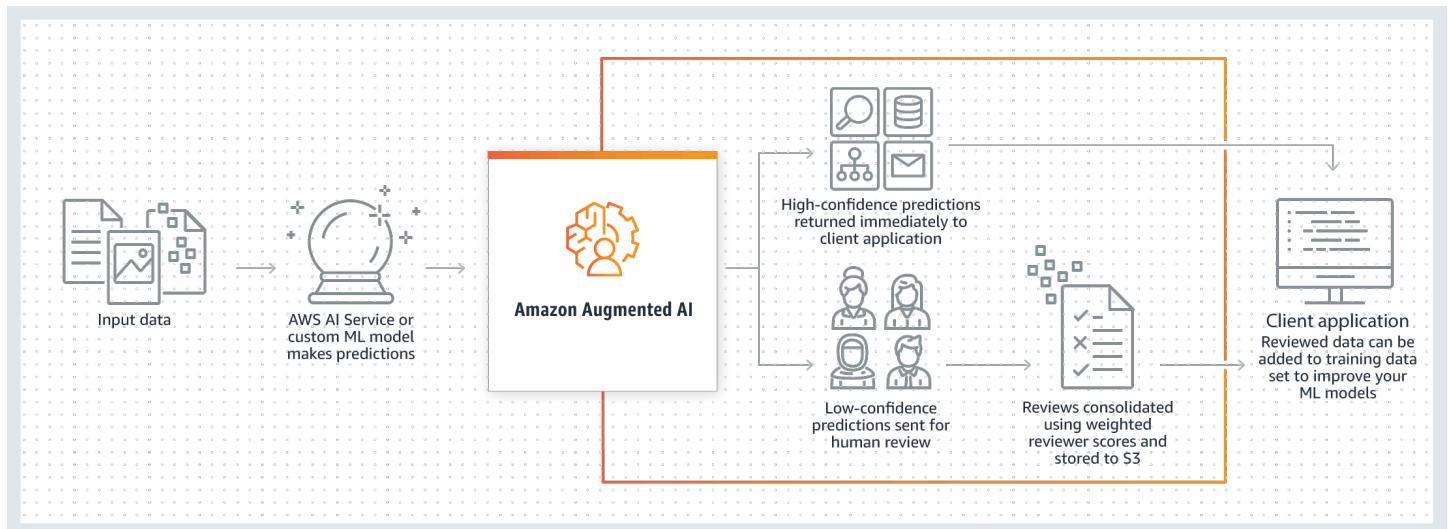

systems can be time-consuming and expensive because it involves implementing complex processes or *workflows*, writing custom software to manage review tasks and results, and managing large groups of reviewers.

Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker AI or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

### Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in [Use Cases and Examples Using Amazon A2I](#).

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.
- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.
- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker AI hosted endpoint and incrementally train your model using Amazon A2I output data.
- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.
- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.
- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
- **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.

## Get Started with Amazon Augmented AI

To get started using Amazon Augmented AI, review the [Core Components of Amazon A2I](#) and [Prerequisites to Using Augmented AI](#). Then, use the following documentation to learn how to use the Amazon A2I console and API.

- [Tutorial: Get Started in the Amazon A2I Console](#)
- [Tutorial: Get Started Using the Amazon A2I API](#)

You can also get started using the Amazon A2I API by following a Jupyter Notebook tutorial. See [Use Cases and Examples Using Amazon A2I](#) for a list of notebooks and use cases.

## Core Components of Amazon A2I

Review the following terms to familiarize yourself with the core components of Amazon A2I.

### Task Types

The AI/ML workflow into which you integrate Amazon A2I defines an Amazon A2I *task type*.

Amazon A2I supports:

- Two *built-in task types*: [Amazon Textract key-value pair extraction](#) and [Amazon Rekognition image moderation](#).
- A [custom task type](#): Use a custom task type to integrate a human review loop into *any* machine learning workflow. You can use a custom task type to integrate Amazon A2I with other AWS services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see [Use Cases and Examples Using Amazon A2I](#).

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

#### Amazon Textract – Key-value pair extraction

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

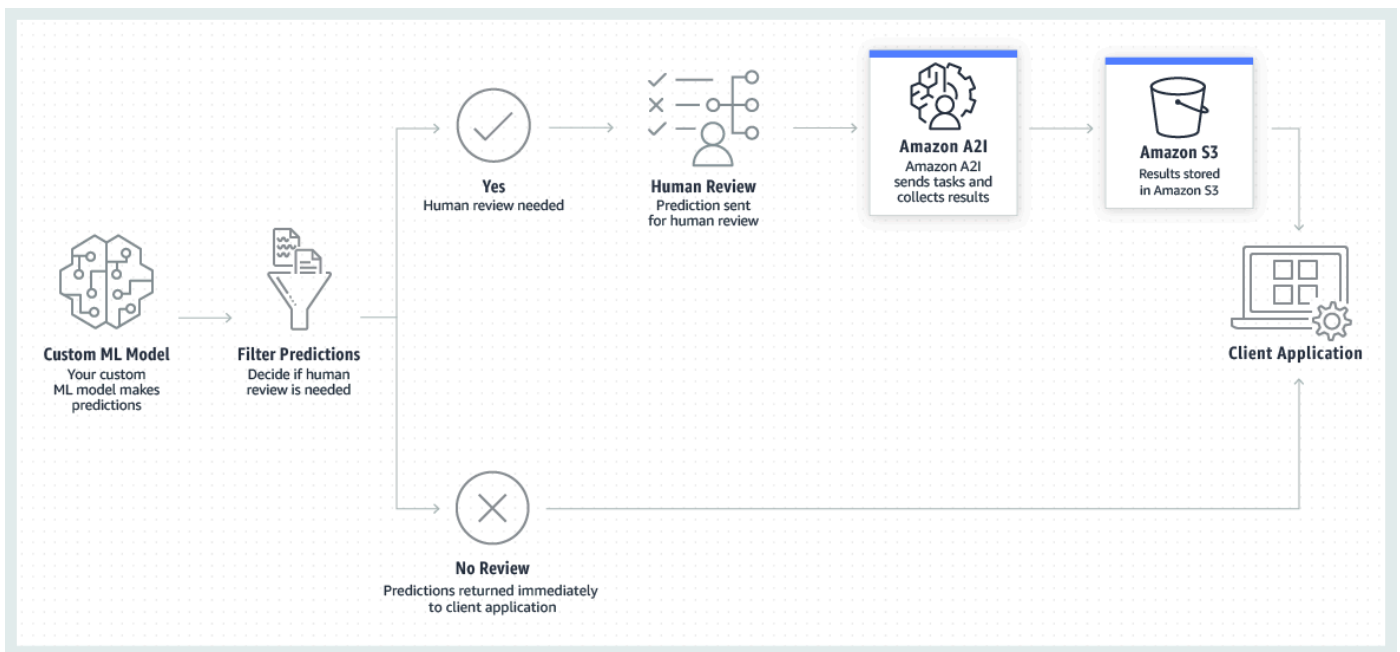

## Amazon Rekognition – Image moderation

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation loop with conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

### Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

## Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human *work team*, to set up your worker UI using a *worker task template*, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition's confidence is too low.

You can use a human review workflow to create multiple human loops.

You can create a flow definition in the SageMaker AI console or with the SageMaker API. To learn more about both of these options, see [Create a Human Review Workflow](#).

## Work Team

A *work team* is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the [Amazon Mechanical Turk workforce](#), a [vendor-managed workforce](#), or your own [private workforce](#). When you use the private workforce, you can create multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see [Workforces](#).

## Worker Task Template and Human Task UI

You use a *worker task template* to create a worker UI (a *human task UI*) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

## Human Loops

A *human loop* is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a *task* to review a single data object. For example,

if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

### When do human loops get created?

When you use one of the *built-in task types*, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation `AnalyzeDocument`. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.
- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation `DetectModerationLabels`. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a *custom task type*, you start a human loop using the [Amazon Augmented AI Runtime API](#). When you call `StartHumanLoop` in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see [Create and Start a Human Loop](#).

To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see [Use APIs in Amazon Augmented AI](#).

**Note**

AWS Region availability may differ when you use Augmented AI with other AWS services, such as Amazon Textract. Create Augmented AI resources in the same AWS Region that you use to interact with those AWS services. For AWS Region availability for all services, see the [Region Table](#).

## Prerequisites to Using Augmented AI

Amazon A2I uses resources in IAM, SageMaker AI, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see [Tutorial: Get Started in the Amazon A2I Console](#).

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same AWS Region as the workflow for your input and output data. To create a bucket, follow the instructions in [Create a Bucket](#) in the *Amazon Simple Storage Service Console User Guide*.
- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see [Permissions and Security in Amazon Augmented AI](#).
- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same AWS Region as your Amazon A2I workflow. To learn more about these workforce types, see [Workforces](#).

**Important**

To learn about the compliance programs that cover Amazon Augmented AI at this time, see [AWS Services in Scope by Compliance Program](#). If you use Amazon Augmented AI in conjunction with other AWS services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload

objectives and goals with your AWS account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

## Tutorial: Get Started in the Amazon A2I Console

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

### Prerequisites

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same AWS Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in [Create a Bucket](#) in the *Amazon Simple Storage Service Console User Guide*.
- Do one of the following:
  - If you want to complete the tutorial using Amazon Textract, download the following image and place it in your Amazon S3 bucket.

# Employment Application

## Application Information

**Full Name:** *Jane Doe*

---

**Phone number:** 550-0100

---

**Home address:** 123 Any Street, Any Town, USA

---

**Mail address:**

---

~~123 Any Street, Any Town, USA~~

---

234 Main Street, Any Town, USA

Sample

- If you want to complete the tutorial using Amazon Rekognition, download the following image and place it in your Amazon S3 bucket.

**Note**

The Amazon A2I console is embedded in the SageMaker AI console.

**Step 1: Create a Work Team**

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

**Important**

This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker AI console and is shared between Amazon A2I and Ground Truth.

## To create a private workforce using worker emails

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, choose **Labeling workforces** under **Ground Truth**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose **Create private team**.

If you add yourself to a private work team, you receive an email from `no-reply@verificationemail.com` with login information. Use the link in this email to reset your password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

## Step 2: Create a Human Review Workflow

In this step, you create a human review workflow. Each human review workflow is created for a specific [task type](#). This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

### To create a human review workflow:

1. Open the Augmented AI console at <https://console.aws.amazon.com/a2i> to access the **Human review workflows** page.
2. Select **Create human review workflow**.
3. In **Workflow settings**, enter a workflow **Name**, **S3 bucket**, and the **IAM role** that you created for this tutorial, with the AWS managed policy `AmazonAugmentedAIIntegratedAPIAccess` attached.

4. For **Task type**, select **Textract – Key-value pair extraction** or **Rekognition – Image moderation**.
5. Select the task type that you chose from the following table for instructions for that task type.

#### Amazon Textract – Key-value pair extraction

1. Select **Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing**.
2. For **Key name**, enter Mail Address.
3. Set the identification confidence threshold between 0 and 99.
4. Set the qualification confidence threshold between 0 and 99.
5. Select **Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range**.
6. Set the identification confidence threshold between 0 and 90.
7. Set the qualification confidence threshold between 0 and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for Mail Address and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the preceding paragraph are checked, and Mail Address is used as a **Key name** for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.

## Amazon Textract form extraction - Conditions for invoking human review

- i** When Amazon Textract extracts information from a document, it returns a confidence score. You can use these confidence scores to define business conditions that trigger human review.

### Identification confidence

The confidence score for key-value pairs detected within a form.

### Qualification confidence

The confidence score for text contained within key and value in a form.

You can define a range for Identification confidence and Qualification confidence thresholds. A human review will be triggered when the confidence score falls within the defined range.

[Learn more about using Amazon Augmented AI with Amazon Textract](#)

- Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing.  
The form key and value will be sent for human review.

Key name

Mail Address

Trigger human review when this form key is missing,

or when its identification confidence threshold is between  and

or when its qualification confidence threshold is between  and

Add key

- Trigger human review for all form keys identified by Amazon Textract with confidence scores in a specified range.  
The form key and value will be sent for human review.

### Identification confidence threshold

Trigger human review for key-value pairs detected within a form, whose confidence scores are in the following range:

between  and

Minimum value is 0. Maximum value is 100.

### Qualification confidence threshold

Trigger human review when the text contained within key-value pairs in a form has confidence scores in the following range:

between  and

Minimum value is 0. Maximum value is 100.

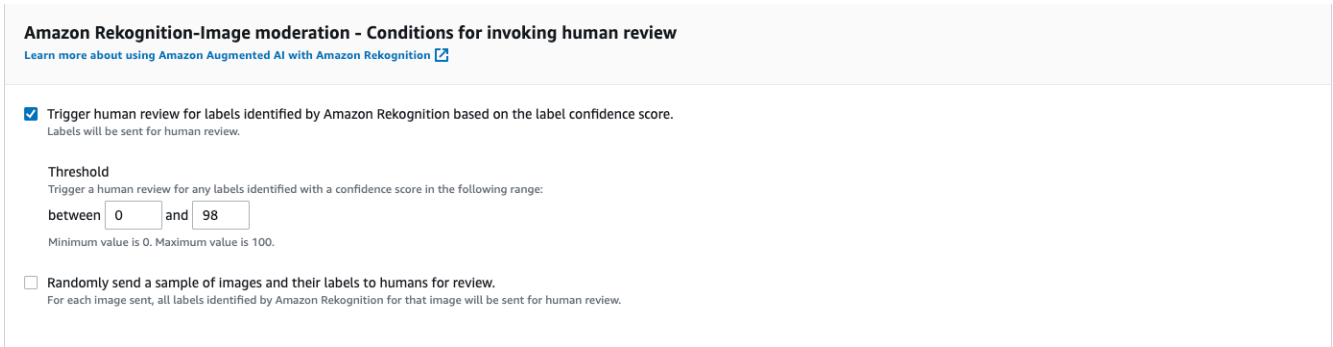

- Randomly send a sample of forms to humans for review.  
For each form sent, all key-value pairs identified by Amazon Textract for that form will be sent for human review.

## Amazon Rekognition – Image moderation

1. Select **Trigger human review for labels identified by Amazon Rekognition based on label confidence score**.
2. Set the **Threshold** between 0 and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the **Trigger human review for labels identified by Amazon Rekognition based on label confidence score** option and enter a **Threshold** between 0 and 98 in the Amazon A2I console.

**Amazon Rekognition-Image moderation - Conditions for invoking human review**  
[Learn more about using Amazon Augmented AI with Amazon Rekognition](#)

**Trigger human review for labels identified by Amazon Rekognition based on the label confidence score.**  
Labels will be sent for human review.

**Threshold**  
Trigger a human review for any labels identified with a confidence score in the following range:  
between  and   
Minimum value is 0. Maximum value is 100.

**Randomly send a sample of images and their labels to humans for review.**  
For each image sent, all labels identified by Amazon Rekognition for that image will be sent for human review.

6. Under **Worker task template creation**, select **Create from a default template**.
7. Enter a **Template name**.
8. In **Task description** field, enter the following text:

Read the instructions carefully and complete the task.

9. Under **Workers**, select **Private**.
10. Select the private team that you created.
11. Choose **Create**.

Once your human review workflow is created, it appears in the table on the **Human review workflows** page. When the **Status** is **Active**, copy and save the Workflow ARN. You need it for the next step.

### Step 3: Start a Human Loop

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the **See Also** section in the API documentation, as shown in the following image.

The screenshot shows the AWS Amazon Text Extract Developer Guide page. The main content area displays an error message: "Amazon Text Extract is temporarily unable to process the request. Try your call again." with HTTP Status Code: 500. Below this, it shows an "UnsupportedDocumentException" with a message: "The format of the input document isn't supported. Documents for synchronous operations can be in PNG or JPEG format. Documents for asynchronous operations can also be in PDF format." and HTTP Status Code: 400. A red box highlights the "See Also" section, which lists various AWS SDKs for different languages. A red arrow points to the "See Also" link in the "On this page" sidebar.

- Response Syntax
- Response Elements
- Errors
- See Also**

For this tutorial, you use one of the following APIs:

- If you chose the Amazon Text Extract task type, you use the [AnalyzeDocument](#) operation.
- If you chose the Amazon Rekognition task type, you use the [DetectModerationLabels](#) operation.

You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the AWS Command Line Interface (AWS CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see [Amazon SageMaker Notebook Instances](#).
- To learn more about and get started using the AWS CLI, see [What Is the AWS Command Line Interface?](#) in the *AWS Command Line Interface User Guide*.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

### Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the [DataAttributes](#) parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [analyze\\_document](#) documentation in the *AWS SDK for Python (Boto) API Reference*.

```
response = client.analyze_document(  
    Document={  
        "S3Object": {  
            "Bucket": "amzn-s3-demo-bucket",  
            "Name": "document-name.pdf"  
        }  
    },  
    HumanLoopConfig={  
        "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-  
definition/flow-definition-name",  
        "HumanLoopName": "human-loop-name",  
        "DataAttributes": {  
            "ContentClassifiers":  
["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]  
        }  
    },  
    FeatureTypes=["TABLES", "FORMS"])
```

### Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the [DataAttributes](#) parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [detect\\_moderation\\_labels](#) documentation in the *AWS SDK for Python (Boto) API Reference*.

```
response = client.detect_moderation_labels(  
    Image={  
        "S3Object": {
```

```
        "Bucket": "amzn-s3-demo-bucket",
        "Name": "image-name.png"
    }
},
HumanLoopConfig={
    "FlowDefinitionArn":"arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    "HumanLoopName":"human-loop-name",
    "DataAttributes":{
        ContentClassifiers:
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]
    }
})
```

#### Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

##### To view your human loop status

1. Open the Augmented AI console at <https://console.aws.amazon.com/a2i> to access the **Human review workflows** page.
2. Select the human review workflow that you used to start your human loop.
3. In the **Human loops** section, you can see your human loop. View its status in the **Status** column.

#### Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

##### To view your Amazon A2I output data

1. Open the [Amazon S3 console](#).
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

```
s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

4. Select `output.json` and choose **Download**.

## Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from [Use Cases and Examples Using Amazon A2I](#) and use [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#) to learn how to use it in a SageMaker AI notebook instance.

To learn more about the API operations you can use with Amazon A2I, see [Use APIs in Amazon Augmented AI](#).

### Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker AI console to create a private workforce and add yourself as a private worker. For instructions, see [Step 1: Create a Work Team](#).

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (`WorkteamArn`).

To learn more about the private workforce and other available configurations, see [Private workforce](#).

### Create a private workforce

If you have not created a private workforce, you can do so using an [Amazon Cognito user pool](#). Make sure that you have added yourself to this user pool. You can create a private work team using the AWS SDK for Python (Boto3) [create\\_workforce](#) function. For other language-specific SDKs, refer to the list in [CreateWorkforce](#).

```
response = client.create_workforce(  
    CognitoConfig={  
        "UserPool": "Pool_ID",  
        "ClientId": "app-client-id"  
    },  
    WorkforceName="workforce-name"  
)
```

## Create a private work team

After you have created a private workforce in the AWS Region to configure and start your human loop, you can create a private work team using the AWS SDK for Python (Boto3) [create\\_workteam](#) function. For other language-specific SDKs, refer to the list in [CreateWorkteam](#).

```
response = client.create_workteam(  
    WorkteamName="work-team-name",  
    WorkforceName= "workforce-name",  
    MemberDefinitions=[  
        {  
            "CognitoMemberDefinition": {  
                "UserPool": "<aws-region>_ID",  
                "UserGroup": "user-group",  
                "ClientId": "app-client-id"  
            },  
        }  
    ]  
)
```

Access your work team ARN as follows:

```
workteamArn = response["WorkteamArn"]
```

## List private work teams in your account

If you have already created a private work team, you can list all work teams in a given AWS Region in your account using the AWS SDK for Python (Boto3) [list\\_workteams](#) function. For other language-specific SDKs, refer to the list in [ListWorkteams](#).

```
response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use `MaxResults`, `SortBy`, and `NameContains` to filter your results.

## Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I [CreateFlowDefinition](#) operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the [CreateHumanTaskUi](#) operation.

If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

## Create a Human Task UI

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

### Amazon Textract – Key-value pair extraction

To learn more about this template, see [Custom Template Example for Amazon Textract](#).

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3object.bucket }}/
{{ task.input.aiServiceRequest.document.s3object.name }}{% endcapture %}
<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if
they don't match the following document."
    no-key-edit=""
    no-geometry-edit=""
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types='["KEY_VALUE_SET"]'>
  <short-instructions header="Instructions">
```

```

    <p>Click on a key-value block to highlight the corresponding key-value pair
in the document.
</p><p><br></p>
    <p>If it is a valid key-value pair, review the content for the value. If the
content is incorrect, correct it.
</p><p><br></p>
    <p>The text of the value is incorrect, correct it.</p>
    <p>
</p><p><br></p>
    <p>A wrong value is identified, correct it.</p>
    <p>
</p><p><br></p>
    <p>If it is not a valid key-value relationship, choose No.</p>
    <p>
</p><p><br></p>
    <p>If you can't find the key in the document, choose Key not found.</p>
    <p>
</p><p><br></p>
    <p>If the content of a field is empty, choose Value is blank.</p>
    <p>
</p><p><br></p>
    <p><strong>Examples</strong></p>
    <p>Key and value are often displayed next or below to each other.
</p><p><br></p>
    <p>Key and value displayed in one line.</p>
    <p>
</p><p><br></p>
    <p>Key and value displayed in two lines.</p>
    <p>
</p><p><br></p>
    <p>If the content of the value has multiple lines, enter all the text
without line break.
    Include all value text even if it extends beyond the highlight box.</p>
    <p></p>
</short-instructions>
<full-instructions header="Instructions"></full-instructions>
</crowd-textextract-analyze-document>

```

```
</crowd-form>
"""
```

## Amazon Rekognition – Image moderation

To learn more about this template, see [Custom Template Example for Amazon Rekognition](#).

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
    <p class="instructions">Review the image and choose all applicable categories.
    If no categories apply, choose None.

    <b>Nudity</b>
    Visuals depicting nude male or female person or persons

    <b>Partial Nudity</b>
    Visuals depicting covered up nudity, for example using hands or pose

    <b>Revealing Clothes</b>
    Visuals depicting revealing clothes and poses
```

```

<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching

<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades
  </short-instructions>

  <full-instructions header="Instructions"></full-instructions>
</crowd-rekognition-detect-moderation-labels>
</crowd-form>""""

```

## Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this [notebook](#), demonstrating a custom integration with Amazon Comprehend.

```

template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="sentiment"
    categories='["Positive", "Negative", "Neutral", "Mixed"]'
    initial-value="{{ task.input.initialValue }}"
    header="What sentiment does this text convey?"
  >
    <classification-target>
      {{ task.input.taskObject }}
    </classification-target>

    <full-instructions header="Sentiment Analysis Instructions">
      <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
      <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
      <p><strong>Neutral</strong>: neither positive or negative, such as stating a
fact</p>
      <p><strong>Mixed</strong>: when the sentiment is mixed</p>
    </full-instructions>

    <short-instructions>
      Choose the primary sentiment that is expressed by the text.

```

```

    </short-instructions>
  </crowd-classifier>
</crowd-form>
"""

```

Using the template specified above, you can create a template using the AWS SDK for Python (Boto3) [create\\_human\\_task\\_ui](#) function. For other language-specific SDKs, refer to the list in [CreateHumanTaskUi](#).

```

response = client.create_human_task_ui(
    HumanTaskUiName="human-task-ui-name",
    UiTemplate={
        "Content": template
    }
)

```

This response element contains the human task UI ARN. Save this as follows:

```
humanTaskUiArn = response["HumanTaskUiArn"]
```

## Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your `CreateFlowDefinition` request.

Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI](#).

### Amazon Textract – Key-value pair extraction

This example specifies conditions for specific keys (such as Mail address) in the document. If Amazon Textract's confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```

import json

humanLoopActivationConditions = json.dumps(

```

```

{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Mail address",
            "ImportantFormKeyAliases": ["Mail Address:", "Mail
address:", "Mailing Add:", "Mailing Addresses"],
            "KeyValueBlockConfidenceLessThan": 100,
            "WordBlockConfidenceLessThan": 100
          }
        },
        {
          "ConditionType": "MissingImportantFormKey",
          "ConditionParameters": {
            "ImportantFormKey": "Mail address",
            "ImportantFormKeyAliases": ["Mail Address:", "Mail
address:", "Mailing Add:", "Mailing Addresses"]
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Phone Number",
            "ImportantFormKeyAliases": ["Phone number:", "Phone
No.:", "Number:"],
            "KeyValueBlockConfidenceLessThan": 100,
            "WordBlockConfidenceLessThan": 100
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "*",
            "KeyValueBlockConfidenceLessThan": 100,
            "WordBlockConfidenceLessThan": 100
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {

```

```

        "ImportantFormKey": "*",
        "KeyValueBlockConfidenceGreaterThan": 0,
        "WordBlockConfidenceGreaterThan": 0
    }
}
]
}
]
}
)

```

## Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the Suggestive and Female Swimwear Or Underwear moderation labels.

```

import json

humanLoopActivationConditions = json.dumps(
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Suggestive",
                        "ConfidenceLessThan": 98
                    }
                },
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Female Swimwear Or Underwear",
                        "ConfidenceGreaterThan": 98
                    }
                }
            ]
        }
    ]
}
)

```

)

## Create a human review workflow

This section gives an example of the `CreateFlowDefinition` AWS SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in [CreateFlowDefinition](#). Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

### Amazon Textract – Key-value pair extraction

If you use the built-in integration with Amazon Textract, you must specify `"AWS/Textract/AnalyzeDocument/Forms/V1"` for `"AwsManagedHumanLoopRequestSource"` in `HumanLoopRequestSource`.

```
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/
V1"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Document entry review",
        "TaskDescription": "Review the document and instructions. Complete the
task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "document review",
        ],
    },
)
```

```

OutputConfig={
  "S3OutputPath": "s3://amzn-s3-demo-bucket/prefix/",
},
RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
Tags=[
  {
    "Key": "string",
    "Value": "string"
  },
]
)

```

## Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify "AWS/Rekognition/DetectModerationLabels/Image/V3" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```

response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/
DetectModerationLabels/Image/V3"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the
task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
)

```

```

OutputConfig={
  "S3OutputPath": "s3://amzn-s3-demo-bucket/prefix/",
},
RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
Tags=[
  {
    "Key": "string",
    "Value": "string"
  },
]
)

```

## Custom Integration

If you use a custom integration, exclude the following parameters:  
HumanLoopRequestSource, HumanLoopActivationConfig.

```

response = client.create_flow_definition(
  FlowDefinitionName="human-review-workflow-name",
  HumanLoopConfig={
    "WorkteamArn": workteamArn,
    "HumanTaskUiArn": humanTaskUiArn,
    "TaskTitle": "Image content moderation",
    "TaskDescription": "Review the image and instructions. Complete the
task",
    "TaskCount": 1,
    "TaskAvailabilityLifetimeInSeconds": 43200,
    "TaskTimeLimitInSeconds": 3600,
    "TaskKeywords": [
      "content moderation",
    ],
  },
  OutputConfig={
    "S3OutputPath": "s3://amzn-s3-demo-bucket/prefix/",
  },
  RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
  Tags=[
    {
      "Key": "string",
      "Value": "string"
    },
  ]
)

```

```
)
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

## Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the [AnalyzeDocument](#) operation.
- If you use the Amazon Rekognition built-in integration, you use the [DetectModerationLabels](#) operation.
- If you use a custom integration, you use the [StartHumanLoop](#) operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

### Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the [DataAttributes](#) parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [analyze\\_document](#) documentation in the *AWS SDK for Python (Boto) API Reference*.

```
response = client.analyze_document(  
    Document={"S3Object": {"Bucket": "amzn-s3-demo-bucket", "Name": "document-  
name.pdf"},  
    HumanLoopConfig={  
        "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-  
definition/flow-definition-name",  
        "HumanLoopName": "human-loop-name",  
        "DataAttributes" : {ContentClassifiers:  
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]}  
    }  
    FeatureTypes=["FORMS"]
```

```
)
```

Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see [HumanLoopActivationOutput](#).

```
if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]:
    # A human loop has been started!
    print(f"A human loop has been started with ARN:
{analyzeDocumentResponse["HumanLoopActivationOutput"]["HumanLoopArn"]}")
```

## Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the [DataAttributes](#) parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [detect\\_moderation\\_labels](#) documentation in the *AWS SDK for Python (Boto) API Reference*.

```
response = client.detect_moderation_labels(
    Image={"S3Object":{"Bucket": "amzn-s3-demo-bucket", "Name": "image-
name.png"}},
    HumanLoopConfig={
        "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation" | "FreeOfAdultContent"]}
    }
)
```

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see [HumanLoopActivationOutput](#).

```

if "HumanLoopArn" in response["HumanLoopActivationOutput"]:
    # A human loop has been started!
    print(f"A human loop has been started with ARN:
{response["HumanLoopActivationOutput"]["HumanLoopArn]}")

```

## Custom Integration

The following example uses the AWS SDK for Python (Boto3) to call `start_human_loop` in `us-west-2`. Replace the italicized red text with your resources. Include the [DataAttributes](#) parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [start\\_human\\_loop](#) documentation in the *AWS SDK for Python (Boto) API Reference*.

```

response = client.start_human_loop(
    HumanLoopName= "human-loop-name",
    FlowDefinitionArn= "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    HumanLoopInput={"InputContent": inputContentJson},
    DataAttributes={"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation"/"FreeOfAdultContent"]}
)

```

This example stores input content in the variable *inputContentJson*. Assume that the input content contains two elements: a text blurb and sentiment (such as Positive, Negative, or Neutral), and it is formatted as follows:

```

inputContent = {
    "initialValue": sentiment,
    "taskObject": blurb
}

```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in [Create a Human Task UI](#) to see an example.

To create *inputContentJson*, do the following:

```

import json

```

```
inputContentJson = json.dumps(inputContent)
```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use [describe\\_human\\_loop](#):

```
human_loop_info = a2i.describe_human_loop(HumanLoopName="human_loop_name")
print(f"HumanLoop Status: {resp['HumanLoopStatus']}")
print(f"HumanLoop Output Destination: {resp['HumanLoopOutput']}")
```

## Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for *built-in task types*, Amazon Textract and Amazon Rekognition, or your own custom tasks using a *custom task type*.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:

- [Use Amazon Augmented AI with Amazon Textract](#)
- [Use Amazon Augmented AI with Amazon Rekognition](#)

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other AWS services or your own custom ML application.

- For more details, see [Use Amazon Augmented AI with Custom Task Types](#)

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker AI Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#). For more examples, see this [GitHub repository](#).

Use Case	Description	Task Type
<a href="#">Use Amazon A2I with Amazon Textract</a>	Have humans review single-page documents to review important form key-value pairs, or have Amazon Textract randomly sample and send documents from your dataset to humans for review.	Built-in
<a href="#">Use Amazon A2I with Amazon Rekognition</a>	Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.	Built-in
<a href="#">Use Amazon A2I with Amazon Comprehend</a>	Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.	Custom
<a href="#">Use Amazon A2I with Amazon Transcribe</a>	Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.	Custom

Use Case	Description	Task Type
<a href="#">Use Amazon A2I with Amazon Translate</a>	Have humans review low-confidence translations returned from Amazon Translate.	Custom
<a href="#">Use Amazon A2I to review real time ML inferences</a>	Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker AI hosted endpoint and incrementally train your model using Amazon A2I output data.	Custom
<a href="#">Use Amazon A2I to review tabular data</a>	Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.	Custom

## Topics

- [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#)
- [Use Amazon Augmented AI with Amazon Textract](#)
- [Use Amazon Augmented AI with Amazon Rekognition](#)
- [Use Amazon Augmented AI with Custom Task Types](#)

## Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this [GitHub Repository](#) in a SageMaker notebook instance.

## To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in [Create an Amazon SageMaker Notebook Instance for the tutorial](#).
2. When your notebook instance is active, choose **Open JupyterLab** to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the add Github repository icon

to clone a GitHub repository into your workspace.

4. Enter the [amazon-a2i-sample-jupyter-notebooks](#) repository HTTPS URL.
5. Choose **CLONE**.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.

## Use Amazon Augmented AI with Amazon Textract

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's `AnalyzeDocument` API operation. You can use `AnalyzeDocument` to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to an `AnalyzeDocument` request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like `Full name:` and their associated input values, you can create an activation condition that starts a human review any time the `Full name:` key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team.

These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying *activation conditions*.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.

- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, **Full Name: Jane Doe** is the key-value pair, **Full Name** is the key, and **Jane Doe** is the value.

You can set these activation conditions using the Amazon SageMaker AI console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI](#) and [Use Human Loop Activation Conditions JSON Schema with Amazon Textract](#).

#### Note

When using Augmented AI with Amazon Textract, create Augmented AI resources in the same AWS Region you use to call `AnalyzeDocument`.

## Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker AI console or Augmented AI API, see the following topics:

- [Create a Human Review Workflow \(Console\)](#)
- [Create a Human Review Workflow \(API\)](#)

After you've created your flow definition, see [Using Augmented AI with Amazon Textract](#) to learn how to integrate your flow definition into your Amazon Textract task.

## End-to-End Example Using Amazon Textract and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see [Tutorial: Get Started in the Amazon A2I Console](#).

To learn how to use the Amazon A2I API to create and start a human review, you can use [Amazon Augmented AI \(Amazon A2I\) integration with Amazon Textract's Analyze Document \[Example\]](#) in a

SageMaker Notebook instance. To get started, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#).

## A2I Textract Worker Console Preview

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:

The screenshot shows a review interface for an "Employment Application" document. The interface is divided into three main sections:

- Instructions:** A sidebar on the left containing:
  - Buttons for "View full instructions" and "View tool guide".
  - Text: "Click on a key-value block or input box to highlight the corresponding key-value pair in the document."
  - Text: "If it is a key-value pair, review the content for the key or value. If the content is incorrect, correct it."
  - Text: "If it's not a key-value relationship, choose No."
  - Example 1: A key-value pair "Jane Doe" with value "123 Any Street, Any Town, USA". The "No" radio button is selected.
  - Text: "If you can't find the key in the document, choose Key not found."
  - Example 2: A key-value pair "Mail address" with value "same as home address". The "Key not found" checkbox is checked.
  - Text: "If the content of a field is empty, choose Value is blank."
  - Example 3: A key-value pair "Cell number" with an empty value. The "Value is blank" checkbox is checked.
- Document Preview:** A central area showing the document content with a "Sample" watermark. The document is titled "Employment Application" and contains:
  - Section: "Application Information"
  - Field: "Full Name: Jane Doe" (highlighted)
  - Field: "Phone number: 550-0100"
  - Field: "Home address: 123 Any Street, Any Town, USA"
  - Field: "Mail address: same as home address"
- Key-value pairs to review:** A panel on the right with two entries:
  - Entry 1: Key-value pair "Full name: Jane Done". Radio buttons for "Yes" (selected) and "No". A checkbox for "Key not found" is present.
  - Entry 2: Key-value pair "Phone number: 550-0100". Radio buttons for "Yes" (selected) and "No". A checkbox for "Key not found" is present.
  - Each entry has a checkbox for "Value is blank".

At the bottom, there are navigation controls: "Zoom in", "Zoom out", "Move", and "Fit image". A "Submit" button is located at the bottom right, along with a "No adjustment needed" checkbox.

You can customize this interface in the SageMaker AI console when you create your human review definition, or by creating and using a custom template. To learn more, see [Create and Manage Worker Task Templates](#).

## Use Amazon Augmented AI with Amazon Rekognition

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition DetectModerationLabels API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use DetectModerationLabels to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow

are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker AI console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of the `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI](#) and [Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition](#).

**Note**

When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same AWS Region you use to call `DetectModerationLabels`.

**Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job**

To integrate a human review into an Amazon Rekognition, see the following topics:

- [Create a Human Review Workflow \(Console\)](#)
- [Create a Human Review Workflow \(API\)](#)

After you've created your flow definition, see [Using Augmented AI with Amazon Rekognition](#) to learn how to integrate your flow definition into your Amazon Rekognition task.

**End-to-end Demo Using Amazon Rekognition and Amazon A2I**

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see [Tutorial: Get Started in the Amazon A2I Console](#).

To learn how to use the Amazon A2I API to create and start a human review, you can use [Amazon Augmented AI \(Amazon A2I\) integration with Amazon Rekognition \[Example\]](#) in a SageMaker notebook instance. To get started, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#).

**A2I Rekognition Worker Console Preview**

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:

You can customize this interface in the SageMaker AI console when you create your human review definition, or by creating and using a custom template. To learn more, see [Create and Manage Worker Task Templates](#).

## Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into *any* machine learning workflow using the *custom task type*. This options gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.

When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

## Create a human loop using a flow definition, integrate it into your application, and monitor the results

- Complete the Amazon A2I [Prerequisites to Using Augmented AI](#). Note the following:
  - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
  - The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role with required permissions attached.
  - (Optional) The ARN of your private workforce, if you plan to use one.
- Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see [Create Custom Worker Task Templates](#).
- Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker AI console. To learn how, see [Create a Worker Task Template](#).

In the next step, you create a flow definition:

- If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
  - If you are creating a flow definition using the console, your template automatically appears in **Worker task template** section when you choose **Create human review workflow**.
4. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.
    - To learn how to create a flow definition using the SageMaker AI CreateFlowDefinition API, see [Create a Human Review Workflow \(API\)](#).
    - To learn how to create a flow definition using the SageMaker AI console, see [Create a Human Review Workflow \(Console\)](#).
  5. Configure your human loop using the [Amazon A2I Runtime API](#). To learn how, see [Create and Start a Human Loop](#).
  6. To control when human reviews are initiated in your application, specify conditions under which StartHumanLoop is called in your application. Human loop activation conditions, such as confidence thresholds that initiate the human loop, are not available when using Amazon A2I with custom task types. Every StartHumanLoop invocation results in a human review.

Once you have started a human loop, you can manage and monitor your loops using the Amazon Augmented AI Runtime API and Amazon EventBridge (also known as Amazon CloudWatch Events). To learn more, see [Monitor and Manage Your Human Loop](#).

## End-to-end Tutorial Using Amazon A2I Custom Task Types

For an end-to-end examples that demonstrates how to integrate Amazon A2I into a variety of ML workflows, see the table in [Use Cases and Examples Using Amazon A2I](#). To get started using one of these notebooks, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook](#).

## Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) *human review workflow*, or *flow definition*, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent

- The set of instructions that your workforce receives, which is called a *worker task template*
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker AI console or using the SageMaker AI [CreateFlowDefinition](#) operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

### Important

Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—aren't available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can't specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can't set the `HumanLoopActivationConditions` attribute of the `HumanLoopActivationConditionsConfig` parameter. To control when human reviews are initiated, specify conditions under which `StartHumanLoop` is called in your custom application. In this case, every `StartHumanLoop` invocation results in a human review. For more information, see [Use Amazon Augmented AI with Custom Task Types](#).

## Prerequisites

To create a human review workflow definition, you must have completed the prerequisites described in [Prerequisites to Using Augmented AI](#).

If you use the API to create a flow definition for any task type, or if you use a custom task type when creating a flow definition in the console, first create a worker task template. For more information, see [Create and Manage Worker Task Templates](#).

If you want to preview your worker task template while creating a flow definition for a built-in task type in the console, ensure that you grant the role that you use to create the flow definition permission to access the Amazon S3 bucket that contains your template artifacts using a policy like the one described in [Enable Worker Task Template Previews](#).

## Topics

- [Create a Human Review Workflow \(Console\)](#)
- [Create a Human Review Workflow \(API\)](#)
- [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI](#)

## Create a Human Review Workflow (Console)

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker AI console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see [Create a Private Workforce \(Amazon SageMaker AI Console\)](#). If you have already set up a private workforce, see [Create a Work Team Using the SageMaker AI Console](#) to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in [Use Cases and Examples Using Amazon A2I](#).

### To create flow definition (console)

1. Open the SageMaker AI console at <https://console.aws.amazon.com/sagemaker/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows** and then choose **Create human review workflow**.
3. In **Overview**, do the following:
  - a. For **Name**, enter a unique workflow name. The name must be lowercase, unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
  - b. For **S3 location for output**, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same AWS Region as the workflow.
  - c. For **IAM role**, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in [Enable Worker Task Template Previews](#) attached.
4. For **Task type**, choose the task type that you want the human worker to perform.

5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.
  - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
  - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for any form key. Two variables specify your confidence thresholds: **Identification confidence** and **Qualification confidence**. To learn more about these variables, see [Use Amazon Augmented AI with Amazon Textract](#).
  - For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.
6. Configure and specify your worker task template:
  - a. If you are using the Amazon Rekognition or Amazon Textract task type:
    - In the **Create template** section:
      - To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose **Build from a default template**.
      - If you choose **Build from a default template**, create your instructions under **Worker task design**:
        - Provide a **Template name** that is unique in the AWS Region you are in.
        - In the **Instructions** section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
        - (Optional) In **Additional instructions**, provide your workers with additional information and instructions.

For information on creating effective instructions, see [Creating Good Worker Instructions](#).
      - To select a custom template that you've created, choose it from the **Template** menu and provide a **Task description** to briefly describe the task for your workers. To learn how to create a custom template, see [Create a Worker Task Template](#).

- b. If you are using the custom task type:
  - In the **Worker task template** section, select your template from the list. All of the templates that you have created in the SageMaker AI console appear in this list. To learn how to create a template for custom task types, see [Create and Manage Worker Task Templates](#).
7. (Optional) Preview your worker template:

For Amazon Rekognition and Amazon Textract task types, you have the option to choose **See a sample worker task** to preview your worker task UI.

If you are creating a flow definition for a custom task type, you can preview your worker task UI using the `RenderUiTemplate` operation. For more information, see [Preview a Worker Task Template](#).
8. For **Workers**, choose a workforce type.
9. Choose **Create**.

## Next Steps

After you've created a human review workflow, it appears in the console under **Human review workflows**. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see [Create and Start a Human Loop](#).

## Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the `CreateFlowDefinition` operation. After you complete the [Prerequisites to Using Augmented AI](#), use the following procedure to learn how to use this API operation.

For an overview of the `CreateFlowDefinition` operation, and details about each parameter, see [CreateFlowDefinition](#).

## To create a flow definition (API)

1. For `FlowDefinitionName`, enter a unique name. The name must be unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For `RoleArn`, enter the ARN of the role that you configured to grant access to your data sources.
3. For `HumanLoopConfig`, enter information about the workers and what they should see. For information about each parameter in `HumanLoopConfig`, see [HumanLoopConfig](#).
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in `HumanLoopActivationConfig`. To learn how to create the input required for the `HumanLoopActivationConfig` parameter, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI](#). If you do not specify conditions here, when you provide a flow definition to the AWS service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

If you are using a custom task type, `HumanLoopActivationConfig` is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see [Use Amazon Augmented AI with Custom Task Types](#).

5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the [HumanLoopRequestSource](#) parameter.
6. For `OutputConfig`, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use `Tags` to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

### Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use `'AWS/Textract/AnalyzeDocument/Forms/V1'` to create a Amazon Textract human loop. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
```

```
HumanLoopRequestSource={
  'AwsManagedHumanLoopRequestSource': 'AWS/Textextract/AnalyzeDocument/Forms/V1'
},
HumanLoopActivationConfig={
  'HumanLoopActivationConditionsConfig': {
    'HumanLoopActivationConditions': '{...}'
  }
},
HumanLoopConfig={
  'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
  'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-
task-ui/template_name',
  'TaskTitle': 'Example task title',
  'TaskDescription': 'Example task description.',
  'TaskCount': 123,
  'TaskAvailabilityLifetimeInSeconds': 123,
  'TaskTimeLimitInSeconds': 123,
  'TaskKeywords': [
    'Keyword1', 'Keyword2'
  ],
  'PublicWorkforceTaskPrice': {
    'AmountInUsd': {
      'Dollars': 123,
      'Cents': 123,
      'TenthFractionsOfACent': 123
    }
  }
},
OutputConfig={
  'S3OutputPath': 's3://bucket/path/',
  'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
},
RoleArn='arn:aws:iam::aws_account_number:role/role_name',
Tags=[
  {
    'Key': 'KeyName',
    'Value': 'ValueName'
  },
]
)
```

## Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use 'AWS/Rekognition/DetectModerationLabels/Image/V3' to create an Amazon Rekognition flow definition. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/
DetectModerationLabels/Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-
task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
```

```

        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        }
    ]
)

```

## Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit `HumanLoopRequestSource` from the flow definition request. You only need to include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```

sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-
task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {

```

```
        'Dollars': 123,  
        'Cents': 123,  
        'TenthFractionsOfACent': 123  
    }  
}  
,  
OutputConfig={  
    'S3OutputPath': 's3://bucket/path/',  
    'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'  
},  
RoleArn='arn:aws:iam::account_number:role/role_name',  
Tags=[  
    {  
        'Key': 'KeyName',  
        'Value': 'ValueName'  
    },  
]  
)
```

## Next Steps

The return value of a successful call of the `CreateFlowDefinition` API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see [Create and Start a Human Loop](#).

## JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The `HumanLoopActivationConditions` is an input parameter of the [CreateFlowDefinition](#) API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as `Rekognition.DetectModerationLabels` or `Textract.AnalyzeDocument`). This response is referred to as an *inference*. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model's best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (*key-value pairs*),

such as the association between Name : and Sue in a form as well as content within a block of text, or *word block*, such as 'Name'.

The following is the schema for the JSON. At the top level, the HumanLoopActivationConditions has a JSON array, Conditions. Each member of this array is an independent condition that, if evaluated to true, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- **ConditionType**: This attribute identifies the type of condition. Each AWS AI service API that integrates with Amazon A2I defines its own set of allowed ConditionTypes.
  - Rekognition DetectModerationLabels – This API supports the ModerationLabelConfidenceCheck and Sampling ConditionType values.
  - Textract AnalyzeDocument – This API supports the ImportantFormKeyConfidenceCheck, MissingImportantFormKey, and Sampling ConditionType values.
- **ConditionParameters** – This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the ConditionType. Each ConditionType defines its own set of ConditionParameters.

A member of the Conditions array can model a complex condition. This is accomplished by logically connecting simple conditions using the And and Or logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```
{
  "$schema": "http://json-schema.org/draft-07/schema#",
  "definitions": {
    "Condition": {
      "type": "object",
      "properties": {
        "ConditionType": {

```
        "$ref": "#/definitions/ComplexCondition"  
      }  
    }  
  }  
}
```

### Note

Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The `HumanLoopActivationConditions` parameter is disabled for custom task types.

## Topics

- [Use Human Loop Activation Conditions JSON Schema with Amazon Textract](#)
- [Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition](#)

## Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the `AnalyzeDocument` operation supports the following inputs in the `ConditionType` parameter:

- `ImportantFormKeyConfidenceCheck` – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A *form key* is any word in a document that is associated with an input. The input is called a *value*. Together, form keys and values are referred to as *key-value pairs*. A *word block* refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see [Documents and Block Objects](#) in the *Amazon Textract Developer Guide*.
- `MissingImportantFormKey` – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.
- `Sampling` – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.

- Using the `ImportantFormKeyConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ImportantFormKeyConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

### Note

If you send the same request to `AnalyzeDocument` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make an `AnalyzeDocument` request once, and `Sampling` doesn't initiate a human loop, subsequent requests to `AnalyzeDocument` with the same configuration do not initiate a human loop.

## ImportantFormKeyConfidenceCheck Inputs and Results

The `ImportantFormKeyConfidenceCheck` `ConditionType` supports the following `ConditionParameters`:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (\*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.
- `KeyValueBlockConfidenceEquals`
- `KeyValueBlockConfidenceLessThan`
- `KeyValueBlockConfidenceLessThanEquals`
- `KeyValueBlockConfidenceGreaterThan`
- `KeyValueBlockConfidenceGreaterThanEquals`
- `WordBlockConfidenceEquals`
- `WordBlockConfidenceLessThan`
- `WordBlockConfidenceLessThanEquals`
- `WordBlockConfidenceGreaterThan`

- `WordBlockConfidenceGreaterThanEquals`

When you use the `ImportantFormKeyConfidenceCheck` `ConditionType`, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in `ImportantFormKey` and `ImportantFormKeyAliases` for human review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker AI console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see [Custom Template Example for Amazon Textract](#).

### MissingImportantFormKey Inputs and Results

The `MissingImportantFormKey` `ConditionType` supports the following `ConditionParameters`:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the `MissingImportantFormKey` `ConditionType`, if the key in `ImportantFormKey` or aliases in `ImportantFormKeyAliases` are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified `Address` and `Phone` in a form, but was missing the `ImportantFormKey` `Name` (in the `MissingImportantFormKey` condition type) that form would be sent to humans for review without any of the form keys detected (`Address` and `Phone`).

If you use the default worker task template that is provided in the SageMaker AI console, a task is created asking workers to identify the key in `ImportantFormKey` and associated value. If you use a custom worker task template, you need to include the `<task.input.humanLoopContext>` custom HTML element to configure this task.

## Sampling Inputs and Results

The `SamplingConditionType` supports the `RandomSamplingPercentageConditionParameters`. The input for `RandomSamplingPercentage` must be a real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the `Sampling` condition without any other conditions, this number represents the percentage of all resulting inferences made by the `AnalyzeDocument` operation from a single request that is sent to humans for review.

If you specify the `Sampling` condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the SageMaker AI console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see [Custom Template Example for Amazon Textract](#).

### Examples

While only one condition needs to evaluate to `true` to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to `true`.

#### **Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop**

The following example shows a `HumanLoopActivationConditions` JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Employee Name`, `Name`, or `EmployeeName`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.

- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of `Gross Pay`, `GrossPay`, or `GrossAmount`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```
{
  "Conditions": [
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Employee Name",
        "ImportantFormKeyAliases": [
          "Name",
          "EmployeeName"
        ],
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 85
      }
    },
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Pay Date",
        "ImportantFormKeyAliases": [
          "PayDate",
          "DateOfPay",
          "pay-date"
        ],
        "KeyValueBlockConfidenceLessThan": 65,
        "WordBlockConfidenceLessThan": 85
      }
    },
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Gross Pay",
        "ImportantFormKeyAliases": [
          "GrossPay",
          "GrossAmount"
        ],
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 85
      }
    }
  ]
}
```

```

    }
  ]
}

```

### Example 2: Use ImportantFormKeyConfidenceCheck

In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```

{
  "Conditions": [
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "*",
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 90
      }
    }
  ]
}

```

### Example 3: Use Sampling

In the following example, 5% of inferences resulting from an Amazon Textract AnalyzeDocument request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```

{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}

```

### Example 4: Use MissingImportantFormKey

In the following example, if Mailing Address or its alias, Mailing Address:, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key Mailing Address or Mailing Address: and its associated value.

```
{
  "ConditionType": "MissingImportantFormKey",
  "ConditionParameters": {
    "ImportantFormKey": "Mailing Address",
    "ImportantFormKeyAliases": ["Mailing Address:"]
  }
}
```

### Example 5: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.

```
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
              "PayDate",
              "DateOfPay",
              "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 65,
            "WordBlockConfidenceLessThan": 85
          }
        }
      ]
    }
  ]
}
```

```

    }
  ]
}
]
}

```

### Example 6: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences less than 60, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences greater than 90, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.

```

{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
              "PayDate",
              "DateOfPay",
              "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 60
          }
        },
        {
          "And": [

```

```

        {
            "ConditionType": "Sampling",
            "ConditionParameters": {
                "RandomSamplingPercentage": 5
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 90
                "WordBlockConfidenceGreaterThan": 90
            }
        }
    ]
}

```

### Example 7: Use Sampling and ImportantFormKeyConfidenceCheck with the Or operator

In the following example, the Amazon Textract AnalyzeDocument operation returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

```

{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        }
      ]
    }
  ]
}

```

```
    },
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Pay Date",
        "ImportantFormKeyAliases": [
          "PayDate",
          "DateOfPay",
          "pay-date"
        ],
        "KeyValueBlockConfidenceLessThan": 65,
        "WordBlockConfidenceLessThan": 85
      }
    }
  ]
}
]
```

## Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition `DetectModerationLabels` operation supports the following inputs in the `ConditionType` parameters:

- `ModerationLabelConfidenceCheck` – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- `Sampling` – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model's inferences and sending a specified percentage to humans for review.
  - Using the `ModerationLabelConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ModerationLabelConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

### Note

If you send the same request to `DetectModerationLabels` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make a

DetectModerationLabels request once, and Sampling does not initiate a human loop, subsequent requests to DetectModerationLabels with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker AI console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the `<task.input.selectedAiServiceResponse.blocks>` custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see [Custom Template Example for Amazon Rekognition](#).

### ModerationLabelConfidenceCheck Inputs

For the ModerationLabelConfidenceCheck ConditionType, the following ConditionParameters are supported:

- ModerationLabelName – The exact (case-sensitive) name of a [ModerationLabel](#) detected by the Amazon Rekognition DetectModerationLabels operation. You can specify the special catch-all value (\*) to denote any moderation label.
- ConfidenceEquals
- ConfidenceLessThan
- ConfidenceLessThanEquals
- ConfidenceGreaterThan
- ConfidenceGreaterThanEquals

When you use the ModerationLabelConfidenceCheck ConditionType, Amazon A2I sends label inferences for the labels that you specified in ModerationLabelName for human review.

### Sampling Inputs

The Sampling ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for the RandomSamplingPercentage parameter should be real number between 0.01 and 100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the Sampling condition

without any other conditions, this number represents the percentage of all inferences that result from a single `DetectModerationLabel` request that are sent to humans for review.

## Examples

### Example 1: Use `ModerationLabelConfidenceCheck` with the `And` operator

The following example of a `HumanLoopActivationConditions` condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the `Graphic Male Nudity` moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the `Graphic Female Nudity` moderation label with a confidence between 80 and 99.

Note the use of the `Or` and `And` logical operators to model this logic.

Although only one of the two conditions under the `Or` operator needs to evaluate to `true` for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to `true`.

```
{
  "Conditions": [{
    "Or": [{
      "And": [{
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Male Nudity",
          "ConfidenceLessThanEquals": 99
        }
      },
      {
        "ConditionType": "ModerationLabelConfidenceCheck",
        "ConditionParameters": {
          "ModerationLabelName": "Graphic Male Nudity",
          "ConfidenceGreaterThanEquals": 90
        }
      }
    ]
  },
  {
```

```

        "And": [{
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "Graphic Female Nudity",
                "ConfidenceLessThanEquals": 99
            }
        },
        {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "Graphic Female Nudity",
                "ConfidenceGreaterThanEquals": 80
            }
        }
    ]
}

```

### Example 2: Use `ModerationLabelConfidenceCheck` with the catch-all value (\*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```

{
  "Conditions": [
    {
      "ConditionType": "ModerationLabelConfidenceCheck",
      "ConditionParameters": {
        "ModerationLabelName": "*",
        "ConfidenceGreaterThanEquals": 75
      }
    }
  ]
}

```

### Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a `DetectModerationLabels` request are sent to human workers. When using the default worker

task template provided in the SageMaker AI console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

#### Example 4: Use Sampling and ModerationLabelConfidenceCheck with the And operator

In this example, 5% of Amazon Rekognition inferences of the Graphic Male Nudity moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker AI console, only the inferences of the Graphic Male Nudity label are sent to workers for review.

```
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        }
      ]
    }
  ]
}
```

## Example 5: Use Sampling and ModerationLabelConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the Graphic Male Nudity moderation label the with confidence scores less than 60 are always sent for human review. Only the Graphic Male Nudity label is sent to workers to review.
- 5% of all inferences for the Graphic Male Nudity moderation label the with confidence scores greater than 90 are sent for human review. Only the Graphic Male Nudity label is sent to workers to review.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceLessThan": 60
          }
        }
      ],
      {
        "And": [
          {
            "ConditionType": "Sampling",
            "ConditionParameters": {
              "RandomSamplingPercentage": 5
            }
          },
          {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
              "ModerationLabelName": "Graphic Male Nudity",
              "ConfidenceGreaterThan": 90
            }
          }
        ]
      }
    ]
  }
}
```

```

    ]
  }
]
}

```

### Example 6: Use Sampling and ModerationLabelConfidenceCheck with the Or operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```

{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        }
      ]
    }
  ]
}

```

## Delete a Human Review Workflow

When you delete a human review workflow or you delete your AWS account while a human loop is in process, your human review workflow status changes to `Deleting`. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available

until it is completed or expires. As long as workers are still working on a task, your human review workflow's status is `Deleting`. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your AWS account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

- You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
- The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

- The human review workflow no longer appears on the **Human review workflows** page in the Augmented AI area of the Amazon SageMaker AI console.
- When you use the human review workflow name as input to the API operations [DescribeFlowDefinition](#) or [DeleteFlowDefinition](#), Augmented AI returns a `ResourceNotFound` error.
- When you use [ListFlowDefinitions](#), deleted human review workflows aren't included in the results.
- When you use the human review workflow ARN as input to the Augmented AI Runtime API operation [ListHumanLoops](#), Augmented AI returns a `ResourceNotFoundException`.

## Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the **Human review workflows** page in the Augmented AI area of the SageMaker AI console or by using the SageMaker AI API.

Flow definitions can only be deleted if their status is `Active`.

## Delete a human review workflow (console)

1. Navigate to the Augmented AI console at <https://console.aws.amazon.com/a2i/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the **Summary** page of your human review workflow, choose **Delete**.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose **Delete**.

You're automatically redirected to the **Human review workflows** page. While your human review workflow is being deleted, the status **Deleting** appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

## Delete a human review workflow (API)

You can delete a human review workflow (flow definition) using the SageMaker AI [DeleteFlowDefinition](#) API operation. This API operation is supported through the [AWS CLI](#) and a [variety of language specific SDKs](#). The following table shows example requests using SDK for Python (Boto3) and the AWS CLI to delete the human review workflow, *example-flow-definition*.

### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see [delete\\_flow\\_definition](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-definition')
```

### AWS CLI

The following request example uses the AWS CLI to delete the human review workflow. For more information, see [delete-flow-definition](#) in the [AWS CLI Command Reference](#).

```
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

## Create and Start a Human Loop

A *human loop* starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls `StartHumanLoop`.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

### Prerequisites

To create and start a human loop, you must attach the `AmazonAugmentedAIFullAccess` policy to the AWS Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using `HumanLoopConfig` for built-in task types. For custom task types, this is the identity that you use to call `StartHumanLoop`.

Additionally, when using a built-in task type, your user or role must have permission to invoke API operations of the AWS service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call `DetectModerationLabels`. For examples of identity-based policies you can use to grant these permissions, see [Amazon Rekognition Identity-Based Policy Examples](#) and [Amazon Textract Identity-Based Policy Examples](#). You can also use the more general policy `AmazonAugmentedAIIntegratedAPIAccess` to grant these permissions. For more information, see [Create a User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations](#).

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see [Create a Human Review Workflow](#).

**⚠ Important**

Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see [CORS Permission Requirement](#).

## Create and Start a Human Loop for a Built-in Task Type

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the `AnalyzeDocument` API operation. For Amazon Rekognition, you use the `DetectModerationLabels` API operation. You can use the AWS CLI or a language-specific SDK to create requests using these API operations.

**⚠ Important**

When you create a human loop using a built-in task type, you can use `DataAttributes` to specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker AI does not send your task to Mechanical Turk. If your data is free of adult content, also include the `'FreeOfAdultContent'` classifier. If you do not use these content classifiers, SageMaker AI may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's AWS service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.

## Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract [AnalyzeDocument API operation](#). To add a human loop to this document analysis job, you must configure the parameter `HumanLoopConfig`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the bucket identified in `Bucket` of the `Document` parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [analyze\\_document](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

textract = boto3.client('textract', aws_region)

response = textract.analyze_document(
    Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
    FeatureTypes=["TABLES", "FORMS"],
    HumanLoopConfig={
        'FlowDefinitionArn':
'arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name',
        'HumanLoopName': 'human_loop_name',
        'DataAttributes': {'ContentClassifiers':
['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
    }
)
```

### AWS CLI

The following request example uses the AWS CLI. For more information, see [analyze-document](#) in the *AWS CLI Command Reference*.

```
$ aws textract analyze-document \
```

```
--document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
--human-loop-config
HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws-
region:aws_account_number:flow-
definition/
flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation",
"FreeOfAdultContent"]}' \
--feature-types '["TABLES", "FORMS"]'
```

```
$ aws textract analyze-document \
--document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
--human-loop-config \

 '{"HumanLoopName":"human_loop_name","FlowDefinitionArn":"arn:aws:sagemaker:aws_region:aws_a
definition/flow_def_name","DataAttributes": {"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}]' \
--feature-types '["TABLES", "FORMS"]'
```

After you run `AnalyzeDocument` with a human loop configured, Amazon A2I monitors the results from `AnalyzeDocument` and checks it against the flow definition's activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the [HumanLoopActivationOutput](#) object in the `AnalyzeDocument` response.

## Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition [DetectModerationLabels API operation](#). To configure a human loop, set the `HumanLoopConfig` parameter when you configure `DetectModerationLabels`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the S3 bucket identified in `Bucket` of the `Image` parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

## AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [detect\\_moderation\\_labels](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

rekognition = boto3.client("rekognition", aws_region)

response = rekognition.detect_moderation_labels( \
    Image={'S3Object': {'Bucket': bucket_name, 'Name': image_name}}, \
    HumanLoopConfig={ \
        'HumanLoopName': 'human_loop_name', \
        'FlowDefinitionArn': , \
        "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name" \
        'DataAttributes': {'ContentClassifiers': \
        ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}] \
    })
```

## AWS CLI

The following request example uses the AWS CLI. For more information, see [detect-moderation-labels](#) in the *AWS CLI Command Reference*.

```
$ aws rekognition detect-moderation-labels \
  --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
  --human-loop-config \
  HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}'
```

```
$ aws rekognition detect-moderation-labels \
  --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
  --human-loop-config \
  '{"HumanLoopName": "human_loop_name", "FlowDefinitionArn": \
  "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name", "DataAttributes": {"ContentClassifiers": \
  ["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}]}'
```

After you run `DetectModerationLabels` with a human loop configured, Amazon A2I monitors the results from `DetectModerationLabels` and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element `HumanLoopActivationOutput` in the `DetectModerationLabels` response.

## Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the `StartHumanLoop` operation within your application. This section provides an example of a human loop request using the AWS SDK for Python (Boto3) and the AWS Command Line Interface (AWS CLI). For documentation on other language-specific SDKs that support `StartHumanLoop`, use the **See Also** section of [StartHumanLoop](#) in the Amazon Augmented AI Runtime API documentation. Refer to [Use Cases and Examples Using Amazon A2I](#) to see examples that demonstrate how to use Amazon A2I with a custom task type.

### Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition

### To configure the human loop

1. For `DataAttributes`, specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker AI does not send your task to Mechanical Turk. If your data is free of adult content, also include the `'FreeOfAdultContent'` classifier. If you do not use these content classifiers, SageMaker AI may restrict the Mechanical Turk workers that can view your task.

2. For `FlowDefinitionArn`, enter the Amazon Resource Name (ARN) of your flow definition.

3. For `HumanLoopInput`, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See [Preview a Worker Task Template](#) to learn how to preview your custom worker task template.
4. For `HumanLoopName`, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and - (hyphen).

## To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [Boto 3 Augmented AI Runtime](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    FlowDefinitionArn='arn:aws:sagemaker:aws-region:xyz:flow-
definition/flow_def_name',
    HumanLoopInput={
        'InputContent': '{"InputContent": {"prompt": "What is the answer?"}}'
    },
    DataAttributes={
        'ContentClassifiers': [
            'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
        ]
    }
)
```

### AWS CLI

The following request example uses the AWS CLI. For more information, see [start-human-loop](#) in the [AWS CLI Command Reference](#).

```
$ aws sagemaker-a2i-runtime start-human-loop
  --flow-definition-arn 'arn:aws:sagemaker:aws_region:xyz:flow-
definition/flow_def_name' \
  --human-loop-name 'human_loop_name' \
  --human-loop-input '{"InputContent": "{\\"prompt\\":\\"What is the answer?
\\"}"}' \
  --data-attributes
ContentClassifiers="FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent" \
```

When you successfully start a human loop by invoking `StartHumanLoop` directly, the response includes a `HumanLoopARN` and a `HumanLoopActivationResults` object which is set to `NULL`. You can use this the human loop name to monitor and manage your human loop.

## Next Steps:

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see [Monitor and Manage Your Human Loop](#).

## Delete a Human Loop

When you delete a human loop, the status changes to `Deleting`. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is `InProgress`, you must stop the human loop before deleting it. When you stop a human loop, the status changes to `Stopping` while it is being stopped. When the status changes to `Stopped`, you can delete the human loop.

If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is `Stopping`. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves

the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the AWS account used to create the human loop, it is stopped and deleted automatically.

## Human Loop Data Retention and Deletion

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop's status changes to one of the following: Deleted, Stopped, or Completed. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the AWS account used to create associated human loops.

## Stop and Delete a Flow Definition Using the Console or the Amazon A2I API

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to Deleted.

### Delete a human loop (console)

1. Navigate to the Augmented AI console at <https://console.aws.amazon.com/a2i/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.

3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the **Human loops** section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is Completed, Stopped, or Failed, select **Delete**.

If the human loop **Status** is InProgress, select **Stop**. When the status changes to **Stopped**, select **Delete**.

## Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation [DescribeHumanLoop](#). See examples using this operation in the following table.

### AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named *example-human-loop*. For more information, see [describe\\_human\\_loop](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
human_loop_status = response['HumanLoopStatus']
print(f'example-human-loop status is: {human_loop_status}')
```

### AWS CLI

The following example uses the AWS CLI to describe the human loop named *example-human-loop*. For more information, see [describe-human-loop](#) in the [AWS CLI Command Reference](#).

```
$ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
```

2. If the flow definition status is Completed, Stopped, or Failed, delete the flow definition using the Augmented AI Runtime API operation [DeleteHumanLoop](#).

## AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to delete the human loop named *example-human-loop*. For more information, see [delete\\_human\\_loop](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
```

## AWS CLI

The following example uses the AWS CLI to delete the human loop named *example-human-loop*. For more information, see [delete-human-loop](#) in the *AWS CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
```

If the human loop status is `InProgress`, stop the human loop using [StopHumanLoop](#) and then use `DeleteHumanLoop` to delete it.

## AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named *example-human-loop*. For more information, see [stop\\_human\\_loop](#) in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.stop_human_loop(HumanLoopName='example-human-loop')
```

## AWS CLI

The following example uses the AWS CLI to describe the human loop named *example-human-loop*. For more information, see [stop-human-loop](#) in the [AWS CLI Command Reference](#).

```
$ aws sagemaker-a2i-runtime stop-human-loop --human-loop-name 'example-human-loop'
```

## Create and Manage Worker Task Templates

You can create a task user interface for your workers by creating a *worker task template*. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in [Create a Human Review Workflow \(Console\)](#) to create a human review workflow and customize your worker task template in the Amazon SageMaker AI console. Once you create a template using these instructions, it appears on the worker task templates page of the [Augmented AI console](#).

If you are creating a human review workflow for a custom task type, you must create a *custom worker task template* using HTML code. For more information, see [Create Custom Worker Task Templates](#).

If you create your template using HTML, you must use this template to generate an Amazon A2I *human task UI Amazon Resource Name (ARN)* in the Amazon A2I console. This ARN has the following format: `arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>`. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in [Create a Worker Task Template](#) or by using the [CreateHumanTaskUi](#) API operation.

### Topics

- [Create and Delete Worker Task Templates](#)
- [Create Custom Worker Task Templates](#)

- [Creating Good Worker Instructions](#)

## Create and Delete Worker Task Templates

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the Augmented AI area of the Amazon SageMaker AI console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see [Create Custom Worker Task Templates](#).

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker AI console, a worker task template ARN is generated. Use this ARN as the input to `HumanTaskUiArn` when you create a flow definition using the API operation [CreateFlowDefinition](#). You can choose this template when creating a human review workflow on the human review workflows page of the console.

If you are creating a worker task template resource for an Amazon Textract or Amazon Rekognition task type, you can preview the worker UI that is generated from your template on the worker task templates console page. You must attach the policy described in [Enable Worker Task Template Previews](#) to the IAM role that you use to preview the template.

### Create a Worker Task Template

You can create a worker task template using the SageMaker AI console and using the SageMaker API operation [CreateHumanTaskUi](#).

#### Create a worker task template (console)

1. Open the Amazon A2I console at <https://console.aws.amazon.com/a2i/>.
2. Under **Amazon Augmented AI** in the left navigation pane, choose **Worker task templates**.
3. Choose **Create template**.
4. In **Template name**, enter a unique name.
5. (Optional) Enter an **IAM role** that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In **Template type**, choose a template type from the dropdown list. If you are creating a template for a **Textract-form extraction** or **Rekognition-image moderation** task, choose the appropriate option.

7. Enter your custom template elements as follows:
  - If you selected the Amazon Textract or Amazon Rekognition task template, the **Template editor** autopopulates with a default template that you can customize.
  - If you are using a custom template, enter your predefined template in the editor.
8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in **Step 5**.

You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

Choose **See preview** to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose **Submit**, you see the resulting output from the task that you just performed.

If you are creating a worker task template for a custom task type, you can preview your worker task UI using `RenderUiTemplate`. For more information, see [Preview a Worker Task Template](#).

9. When you're satisfied with your template, choose **Create**.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the **Amazon Augmented AI** section of the SageMaker AI console under **Worker task templates**. Choose your template to view its ARN. Use this ARN when using the [CreateFlowDefinition](#) API operation .

### Create a worker task template using a worker task template (API)

To generate a worker task template using the SageMaker API operation [CreateHumanTaskUi](#), specify a name for your UI in `HumanTaskUiName` and input your HTML template in `Content` under `UiTemplate`. Find documentation on language-specific SDKs that support this API operation in the **See Also** section of the [CreateHumanTaskUi](#).

### Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker AI console or the SageMaker API operation [DeleteHumanTaskUi](#).

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already

been created using the worker task template that you delete continue to be processed until completion and are not impacted.

### Delete a worker task template (console)

1. Open the Amazon A2I console at <https://console.aws.amazon.com/a2i/>.
2. Under Amazon Augmented AI in the left navigation pane, choose **Worker task templates**.
3. Select the template that you want to delete.
4. Select **Delete**.
5. A modal appears to confirm your choice. Select **Delete**.

### Delete a worker task template (API)

To delete a worker task template using the SageMaker API operation [DeleteHumanTaskUi](#), specify a name of your UI in `HumanTaskUiName`.

## Create Custom Worker Task Templates

*Crowd HTML Elements* are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see [Crowd HTML Elements Reference](#). For examples of templates, see the [AWS GitHub repository](#), which contains over 60 sample custom task templates.

### Develop Templates Locally

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

## Use External Assets

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a text/css style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.

### Example

```
<script src="https://www.example.com/my-enhancement-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-
styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding type for remote scripts is `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets is `text/css;CHARSET=UTF-8`.

## Track Your Variables

When building a custom template, you must add variables to it to represent the pieces of data that might change from task to task, or worker to worker. If you're starting with one of the sample templates, you need to make sure you're aware of the variables it already uses.

For example, for a custom template that integrates an Augmented AI human review loop with a Amazon Textract text review task,

`{{ task.input.selectedAiServiceResponse.blocks }}` is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition , `{{ task.input.selectedAiServiceResponse.moderationLabels }}` is used.

For a custom task type, you need to determine the input parameter for your task type.

Use `{{ task.input.customInputValuesForStartHumanLoop}}` where you specify *customInputValuesForStartHumanLoop*.

## Custom Template Example for Amazon Textract

All custom templates begin and end with the `<crowd-form>` `</crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements.

For an Amazon Textract document analysis task, use the `<crowd-textract-analyze-document>` element. It uses the following attributes:

- `src` – Specifies the URL of the image file to be annotated.
- `initialValue` – Sets initial values for attributes found in the worker UI.
- `blockTypes` (required) – Determines the kind of analysis that the workers can do. Only `KEY_VALUE_SET` is currently supported.
- `keys` (required) – Specifies new keys and the associated text value that the worker can add.
- `no-key-edit` (required) – Prevents the workers from editing the keys of annotations passed through `initialValue`.
- `no-geometry-edit` – Prevents workers from editing the polygons of annotations passed through `initialValue`.

For children of the `<crowd-textract-analyze-document>` element, you must have two Regions. You can use arbitrary HTML and CSS elements in these Regions.

- `<full-instructions>` – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – A brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

An Amazon Textract template would look similar to the following.

### Example

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3object.bucket }}/
{{ task.input.aiServiceRequest.document.s3object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
```

```

header="Review the key-value pairs listed on the right and correct them if they
don't match the following document."
no-key-edit
no-geometry-edit
keys="{{ task.input.humanLoopContext.importantFormKeys }}"
block-types="['KEY_VALUE_SET']"
>
<short-instructions header="Instructions">
  <style>
    .instructions {
      white-space: pre-wrap;
    }
    .instructionsImage {
      display: inline-block;
      max-width: 100%;
    }
  </style>
  <p class='instructions'>Choose a key-value block to highlight the corresponding
key-value pair in the document.

```

If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.

The text of the value is incorrect, correct it.

```

```

A wrong value is identified, correct it.

```

```

If it is not a valid key-value relationship, choose No.

```

```

If you can't find the key in the document, choose Key not found.

```

```

If the content of a field is empty, choose Value is blank.

```

```

```
<b>Examples</b>
```

Key and value are often displayed next to or below to each other.

Key and value displayed in one line.

```

>
```

Key and value displayed in two lines.

```

```

If the content of the value has multiple lines, enter all the text without a line break. Include all value text even if it extends beyond the highlight box.

```
</p>
```

```
</short-instructions>
```

```
<full-instructions header="Instructions"></full-instructions>
```

```
</crowd-textract-analyze-document>
```

```
</crowd-form>
```

## Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form>` `</crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- `categories` – An array of strings *or* an array of objects where each object has a name field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the name field.
    - The returned answer contains the *full* objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- `exclusion-category` – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting **Submit** after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- `<full-instructions>` – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3object.bucket }}/
{{ task.input.aiServiceRequest.image.s3object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
  <short-instructions header="Instructions">
    <style>
      .instructions {
        white-space: pre-wrap;
      }
    </style>
    <p class='instructions'>Review the image and choose all applicable categories.
    If no categories apply, choose None.

    <b>Nudity</b>
    Visuals depicting nude male or female person or persons

    <b>Graphic Male Nudity</b>
    Visuals depicting full frontal male nudity, often close ups
  </short-instructions>

```

**<b>Graphic Female Nudity</b>**

Visuals depicting full frontal female nudity, often close ups

**<b>Sexual Activity</b>**

Visuals depicting various types of explicit sexual activities and pornography

**<b>Illustrated Nudity or Sexual Activity</b>**

Visuals depicting animated or drawn sexual activity, nudity, or pornography

**<b>Adult Toys</b>**

Visuals depicting adult toys, often in a marketing context

**<b>Female Swimwear or Underwear</b>**

Visuals depicting female person wearing only swimwear or underwear

**<b>Male Swimwear Or Underwear</b>**

Visuals depicting male person wearing only swimwear or underwear

**<b>Partial Nudity</b>**

Visuals depicting covered up nudity, for example using hands or pose

**<b>Revealing Clothes</b>**

Visuals depicting revealing clothes and poses, such as deep cut dresses

**<b>Graphic Violence or Gore</b>**

Visuals depicting prominent blood or bloody injuries

**<b>Physical Violence</b>**

Visuals depicting violent physical assault, such as kicking or punching

**<b>Weapon Violence</b>**

Visuals depicting violence using weapons like firearms or blades, such as shooting

**<b>Weapons</b>**

Visuals depicting weapons like firearms and blades

**<b>Self Injury</b>**

Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

**<b>Emaciated Bodies</b>**

Visuals depicting extremely malnourished human bodies

**<b>Corpses</b>**

```
Visuals depicting human dead bodies
```

```
<b>Hanging</b>
```

```
Visuals depicting death by hanging</p>
```

```
</short-instructions>
```

```
<full-instructions header="Instructions"></full-instructions>
```

```
</crowd-rekognition-detect-moderation-labels>
```

```
</crowd-form>
```

## Add automation with Liquid

The custom template system uses [Liquid](#) for automation. *Liquid* is an open-source inline markup language. For more information and documentation, see the [Liquid homepage](#).

In Liquid, the text between single curly braces and percent symbols is an instruction or *tag* that performs an operation like control flow or iteration. Text between double curly braces is a variable or *object* that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- [Control flow](#): Includes programming logic operators like `if/else`, `unless`, and `case/when`.
- [Iteration](#): Enables you to run blocks of code repeatedly using statements like `for` loops.

For example, the following code example demonstrates how you can use the Liquid `for` tag to create a `for` loop. This example loops through the [moderationLabels](#) returned from Amazon Rekognition and displays the `moderationLabels` attributes `name` and `parentName` for workers to review:

```
{% for label in task.input.selectedAiServiceResponse.moderationLabels %}
{
  name: &quot;{{ label.name }}&quot;;
  parentName: &quot;{{ label.parentName }}&quot;;
},
{% endfor %}
```

## Use variable filters

In addition to the standard [Liquid filters](#) and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

### Example

```
{{ <content> | <filter> | <filter> }}
```

## Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that escaping is being done.

### escape\_once

escape\_once ensures that if you've already escaped your code, it doesn't get re-escaped again. For example, it ensures that `&amp;` doesn't become `&amp; amp;`.

### skip\_autoescape

skip\_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

#### Note

Use skip\_autoescape sparingly. As a best practice for templates, avoid passing in functional code or markup with skip\_autoescape unless you are absolutely sure that you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a cross-site scripting attack.

### to\_json

to\_json encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

## grant\_read\_access

`grant_read_access` takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

## s3\_presign

The `s3_presign` filter works the same way as the `grant_read_access` filter. `s3_presign` takes an Amazon S3 URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

## Example Example of the variable filters

### Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?" }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?" | escape }}
explicit escape_once: {{ "Have you read 'James & the Giant Peach'?" |
  escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://amzn-s3-demo-bucket/myphoto.png" | grant_read_access }}
s3_presign: {{ "s3://amzn-s3-demo-bucket/myphoto.png" | s3_presign }}
```

## Example

### Output

```
auto-escape: Have you read &#39;James & the Giant Peach&#39;?
explicit escape: Have you read &#39;James & the Giant Peach&#39;?
explicit escape_once: Have you read &#39;James & the Giant Peach&#39;?
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/amzn-s3-demo-bucket/myphoto.png?<access
  token and other params>
s3_presign: https://s3.amazonaws.com/amzn-s3-demo-bucket/myphoto.png?<access token and
  other params>
```

## Example Example of an automated classification template.

To automate this simple text classification sample, include the Liquid tag `{{ task.input.source }}`. This example uses the [crowd-classifier](#) element.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author
      of the tweet is trying to express.
      If none seems to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term that best describes the sentiment
      of the tweet.
    </short-instructions>

  </crowd-classifier>
</crowd-form>
```

## Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker AI `RenderUiTemplate` operation. You can use the `RenderUiTemplate` operation with the AWS CLI or your preferred AWS SDK. For documentation on the supported language specific SDKs for this API operation, see the [See Also](#) section of the [RenderUiTemplate](#).

## Prerequisites

To preview your worker task template, the AWS Identity and Access Management (IAM) role Amazon Resource Name (ARN), or `RoleArn`, that you use must have permission to access to the

S3 objects that are used by the template. To learn how to configure your role or user see [Enable Worker Task Template Previews](#).

### To preview your worker task template using the `RenderUiTemplate` operation:

1. Provide a **RoleArn** of the role with required policies attached to preview your custom template.
2. In the **Input** parameter of **Task**, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the `task.input.source` variable. For example, if you define a `task.input.text` variable in your template, you can supply the variable in the JSON object as `text: sample text`.
3. In the **Content** parameter of **UiTemplate**, insert your template.

Once you've configured `RenderUiTemplate`, use your preferred SDK or the AWS CLI to submit a request to render your template. If your request was successful, the response includes [RenderedContent](#), a Liquid template that renders the HTML for the worker UI.

#### Important

To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see [Enable Worker Task Template Previews](#).

## Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

### Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.

- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses **View full instructions**. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.

## Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.
2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.

This renders the image URL with a short-lived, one-time access code that's appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See [s3\\_presign](#) for more information about the `grant_read_access` element.

## Monitor and Manage Your Human Loop

Once you've started a human review loop, you can check the results of tasks sent to the loop and manage it using the [Amazon Augmented AI Runtime API](#). Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to `Completed`, `Failed`, or `Stopped`. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See [Use Amazon CloudWatch Events in Amazon Augmented AI](#) to learn how Amazon A2I integrates with Amazon EventBridge.

### To check your output data:

1. Check the results of your human loop by calling the [DescribeHumanLoop](#) operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, *YYYY/MM/DD/hh/mm/ss* represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

You can integrate this structure with AWS Glue or Amazon Athena to partition and analyze your output data. For more information, see [Managing Partitions for ETL Output in AWS Glue](#).

To learn more about Amazon A2I output data format, see [Amazon A2I Output Data](#).

### To stop and delete your human loop:

1. Once a human loop has been started, you can stop your human loop by calling the [StopHumanLoop](#) operation using the HumanLoopName. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
2. To delete a human loop for which the status equals Failed, Completed, or Stopped, use the [DeleteHumanLoop](#) operation.

### To list human loops:

1. You can list all active human loops by calling the [ListHumanLoops](#) operation. You can filter human loops by the creation date of the loop using the CreationTimeAfter and CreateTimeBefore parameters.

2. If successful, `ListHumanLoops` returns [HumanLoopSummaries](#) and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

## Amazon A2I Output Data

When your machine learning workflow sends Amazon A2I a data object, a *human loop* is created and human reviewers receive a *task* to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

The content of your output data depends on the type of [task type](#) (built-in or custom) and the type of [workforce](#) you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

### Output Data From Built-In Task Types

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The *value* for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

Parameter	Value Type	Example Values	Description
awsManagedHumanLoopRequestSource	String	AWS/Rekognition/DetectModerationLabels/Image/V3 or AWS/Textextract/AnalyzeDocument/Forms/V1	The API operation and associated AWS services that requested that Amazon A2I create the a human loop. This is the API operation you use to configure your Amazon A2I human loop.
flowDefinitionArn	String	arn:aws:sagemaker:us-west-2:111122223333:flow-definition/ <i>flow-definition-name</i>	The Amazon Resource Number (ARN) of the human review workflow (flow definition) used to create the human loop.
humanAnswers	List of JSON objects	<pre>{   "answerContent":   {     "AWS/Rekognition/DetectModerationLabels/Image/V3": {       "moderationLabels":       [...]     }   },   or</pre>	<p>A list of JSON objects that contain worker responses in answerContent .</p> <p>This object also contains submission details and, if a private workforce was used, worker metadata. To learn more, see <a href="#">Track Worker Activity</a>.</p>

Parameter	Value Type	Example Values	Description
		<pre>{   "answerContent": {     "AWS/Textextract/AnalyzeDocument/Forms/V1": {       "blocks": [...]     }   }, }</pre>	<p>For human loop output data produced from Amazon Rekognition DetectModerationLabel review tasks, this parameter only contains positive responses. For example, if workers select <i>No content</i>, this response is not included.</p>
humanLoopName	String	'human-loop-name'	The name of the human loop.
inputContent	JSON object	<pre>{   "aiServiceRequest":     {...},   "aiServiceResponse":     {...},   "humanTaskActivationConditionResults":     {...},   "selectedAiServiceResponse":     {...} }</pre>	<p>The input content the AWS service sent to Amazon A2I when it requested a human loop be created.</p>

Parameter	Value Type	Example Values	Description
aiServiceRequest	JSON object	<pre>{   "document":   {...},   "featureTypes": [ ...],   "humanLoopConfig": { ...} }</pre> <p>or</p> <pre>{   "image":   {...},   "humanLoopConfig": { ...} }</pre>	<p>The original request sent to the AWS service integrated with Amazon A2I. For example, if you use Amazon Rekognition with Amazon A2I, this includes the request made through the API operation <code>DetectModerationLabels</code>. For Amazon Textract integrations, this includes the request made through <code>AnalyzeDocument</code>.</p>
aiServiceResponse	JSON object	<pre>{   "moderationLabels":   [...],   "moderationModelVersion": "3.0" }</pre> <p>or</p> <pre>{   "blocks":   [...],   "documentMetadata": {} }</pre>	<p>The full response from the AWS service. This is the data that is used to determine if a human review is required. This object may contain metadata about the data object that is not shared with human reviewers.</p>

Parameter	Value Type	Example Values	Description
selectedAiServiceResponse	JSON object	<pre>{   "moderationLabels":   [...],   "moderationModelVersion": "3.0" }</pre> <p>or</p> <pre>{   "blocks":   [...],   "documentMetadata": {} }</pre>	<p>The subset of the aiServiceResponse that matches the activation conditions in ActivationConditions .</p> <p>All data objects listed in aiServiceResponse are listed in selectedAiServiceResponse when inferences are randomly sampled, or all inferences initiated activation conditions.</p>

Parameter	Value Type	Example Values	Description
humanTaskActivationConditionsResults	JSON object	<pre>{   "Conditions": [ ... ] }</pre>	<p>A JSON object in <code>inputContent</code> that contains the reason a human loop was created. This includes a list of the activation conditions (<code>Conditions</code>) included in your human review workflow (flow definition), and the evaluation result for each condition—this result is either <code>true</code> or <code>false</code>. To learn more about activation conditions, see <a href="#">JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI</a>.</p>

Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

### Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see `'AWS/Textract/AnalyzeDocument/Forms/V1'` as the value for `awsManagedHumanLoopRequestSource` in your output data.

The `answerContent` parameter contains a `Block` object that includes human responses for all blocks sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a Block object with Amazon Textract's response to the original request sent using `AnalyzeDocument`.

To learn more about the parameters you see in the block object, refer to [Block](#) in the *Amazon Textract Developer Guide*.

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.
