

Summary of the NMSSM subgroup

Theory:

Ulrich Ellwanger (Orsay), Maggie Muhlleitner (KIT), Nausheen Shah (Wayne)

Experiment:

ATLAS: Nikolaos Rompotis (Liverpool),
CMS: Daniel Winterbottom (Imperial College)

Structure of the subgroup

- Where to find us

Mode of operation

- NMSSM = MSSM + singlet
 - At the beginning of the LHC, NMSSM related searches usually focused on light pseudo-scalars
 - For the last years this subgroup is interested mostly in multi-Higgs final states and cascade-like signatures
- Benchmarking
 - MSSM style of benchmarking had been considered in the past, but the opinion prevailed that the NMSSM phase space is too complicated for a useful simple benchmark
 - Instead of that the group shows maximum cross sections times BR for specific signatures

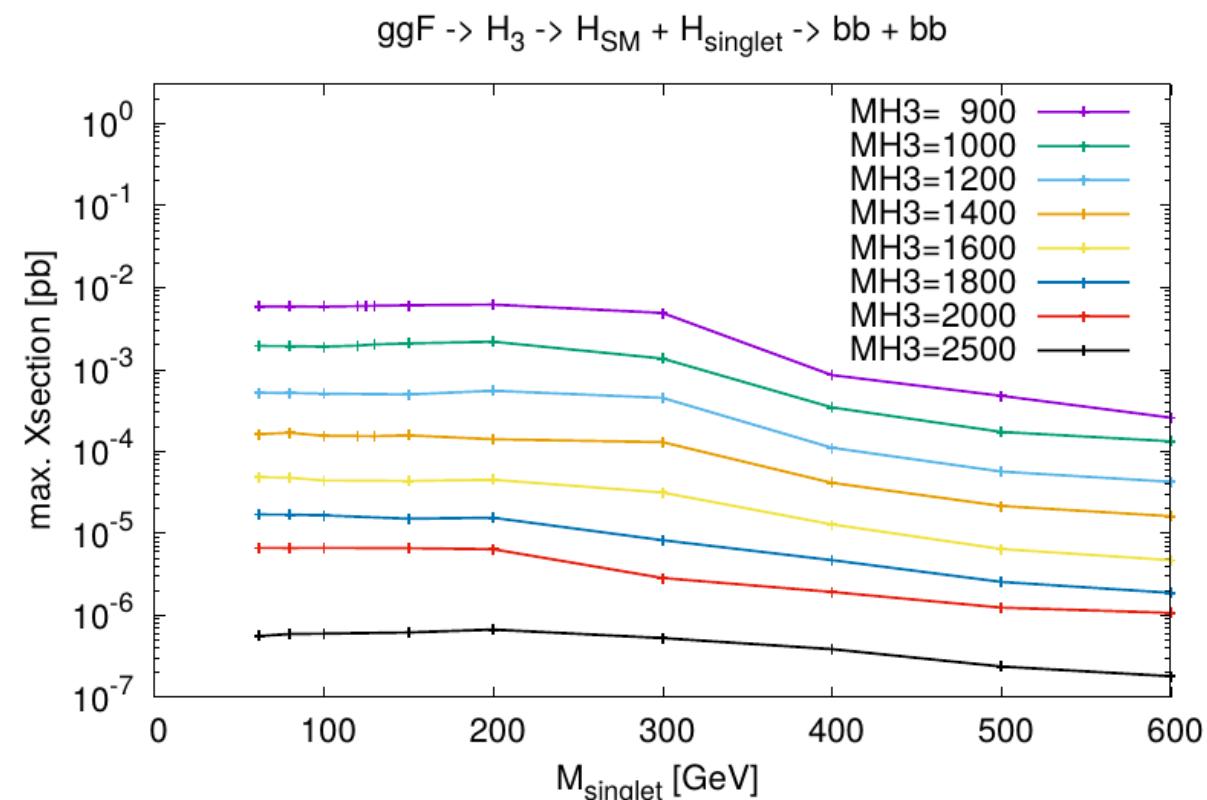

Example of benchmark

- $ggF \rightarrow H_3 \rightarrow H_{SM} + H_{\text{singlet}}$ with $H_{SM} \rightarrow bb/\tau\tau$ and $H_{\text{singlet}} \rightarrow bb$

<https://twiki.cern.ch/twiki/bin/view/LHCPhysics/NMSSMBenchmarksNov2021bbbb>

Maximum cross sections times BR from an NMSSM parameter scan respecting constraints from:

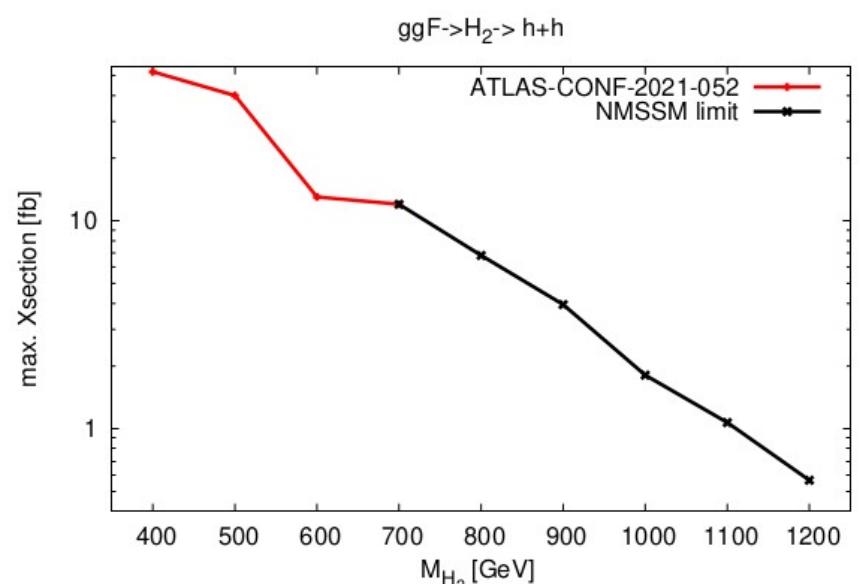

- SM Higgs measurements in the kappa framework
- mass theoretical uncertainty
- BSM searches at the LHC
- LEP constraints
- B-physics
- dark matter direct detection

Latest updates from theory

- Di-Higgs production: $ggF \rightarrow H_2 \rightarrow H_{SM} H_{SM}$

- Within the NMSSM parameter space satisfying bounds from SM Higgs properties, B-physics, dark matter, searches by ATLAS/CMS
- Xsection maximal for H_2 = strong mixture of HS and HMSSM
- For $M_{H_2} < \sim 700$ GeV: limited by the search for $bb + bb, \pi\pi, \gamma\gamma$ final states in ATLAS-CONF-2021-052

Slide by Ulrich Ellwanger

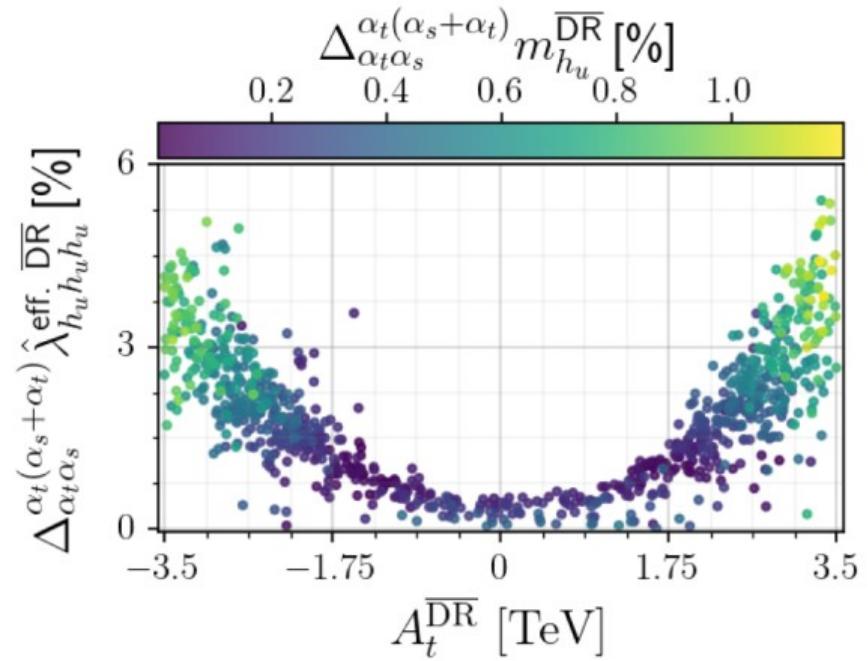

Latest updates from theory

- $\mathcal{O}(\alpha_t^2)$ Corrections to Trilinear Higgs Self-Coupling

λ_{HHH} and M_{HH} related through Higgs potential \rightarrow same precision required;
 λ_{HHH} enters Higgs-to-Higgs decays and Higgs pair production

[Borschensky, Dao, Gabelmann, MM, Rzehak, '22]

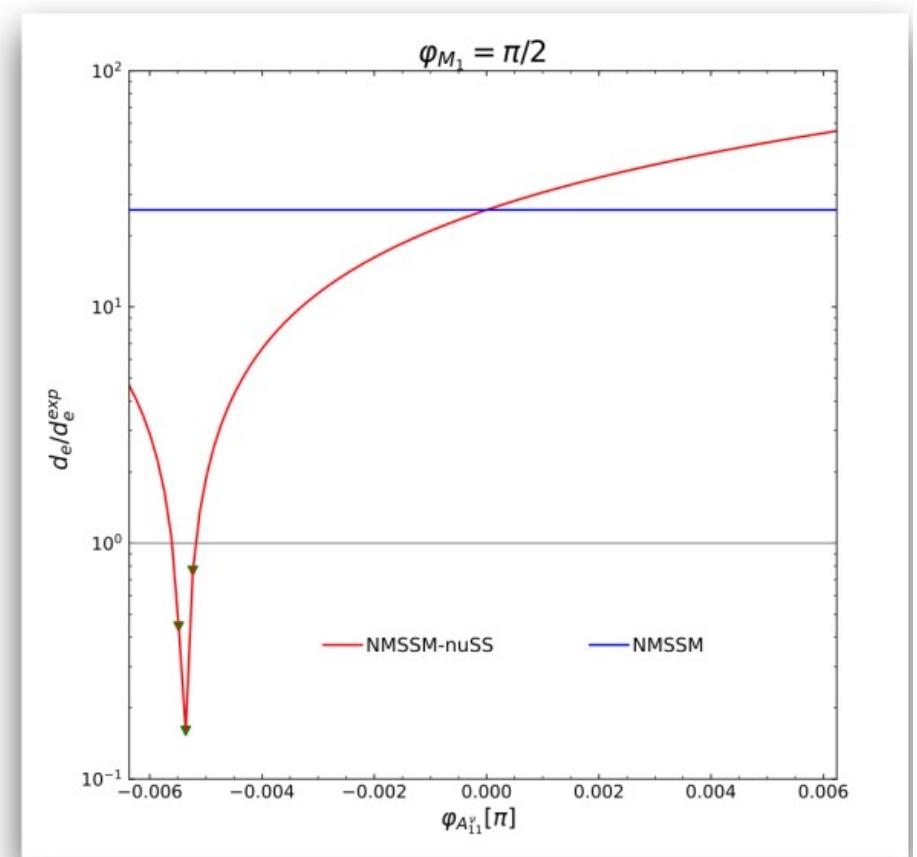

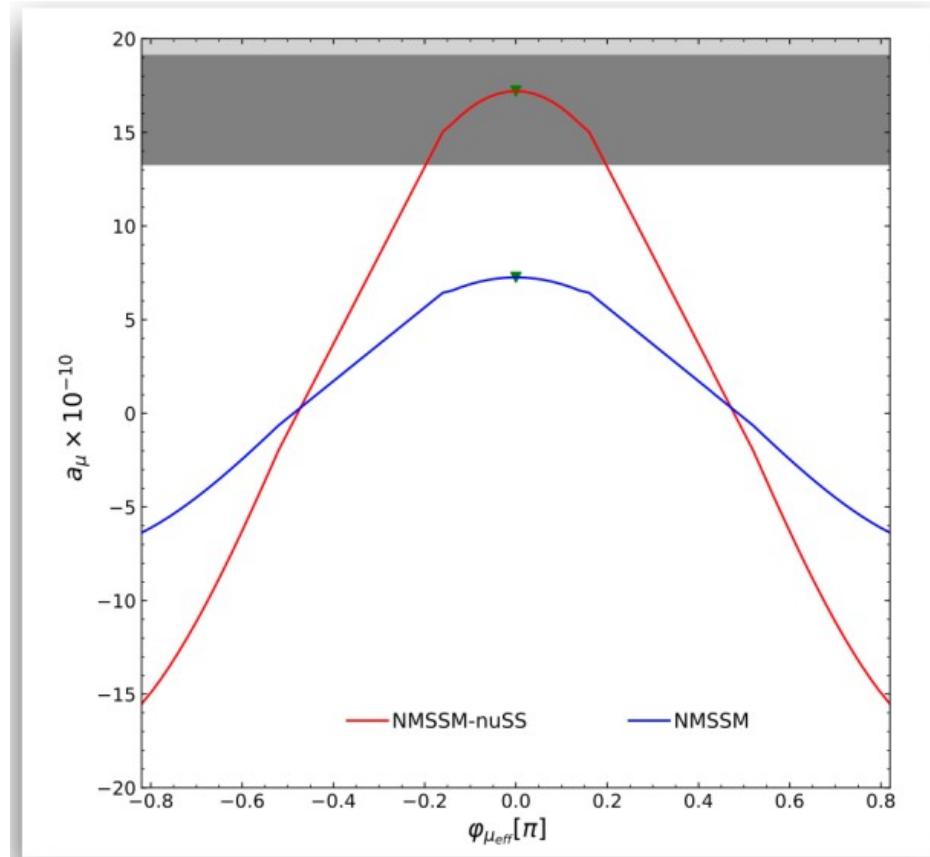

Slide by Maggie Muhlleitner

Latest updates from theory

- Anomalous magnetic moment (AMM), electric dipole moment (EDM); CP-violating NMSSM

[Thi Nhungh Dao, Duc Ninh Le, MMM,'22]

Latest updates from theory

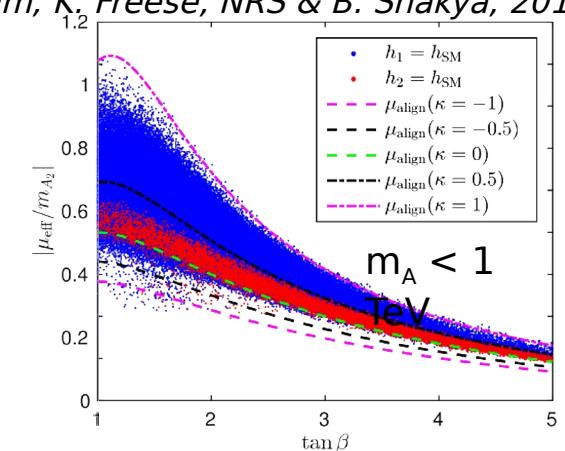

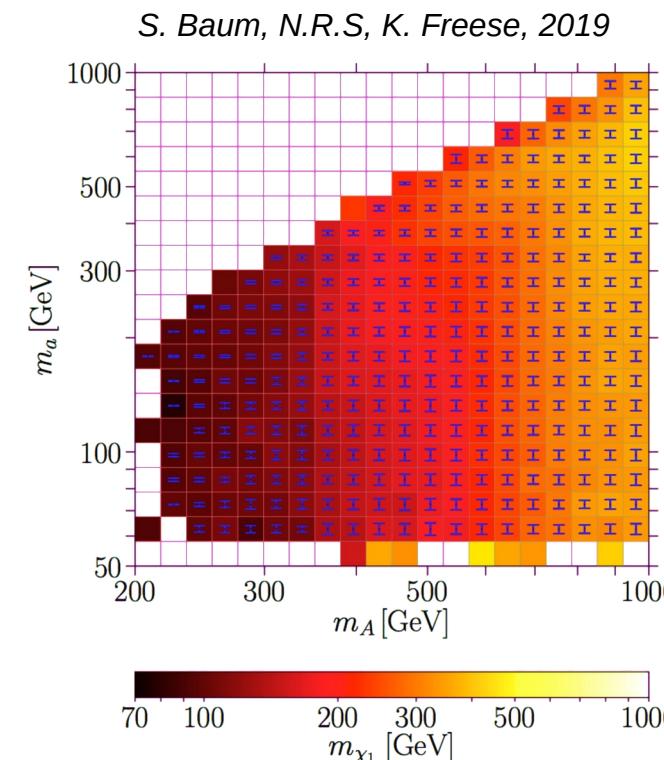

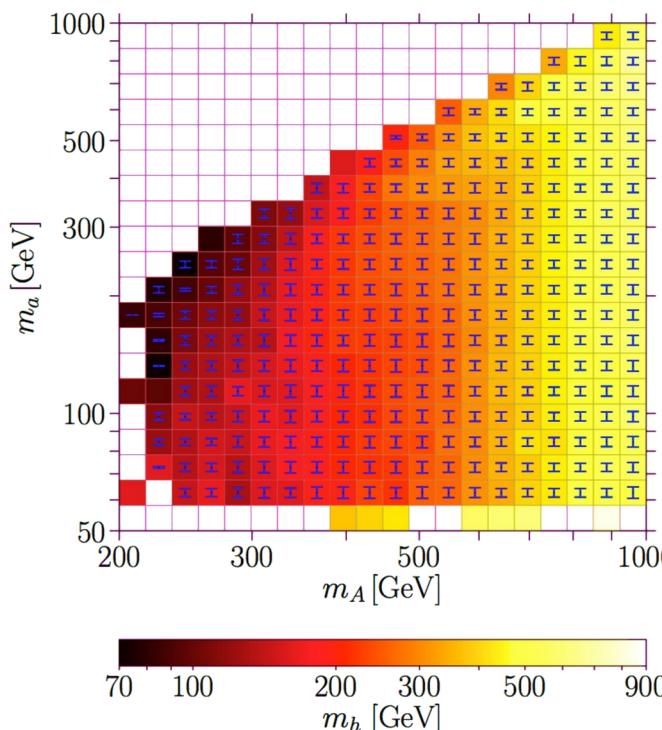

- NMSSM SM - like h_{125}

M. Carena, H. Haber, I. Low, NRS & C. Wagner, 2015

$$\lambda_{\text{alt}}^2 = \frac{m_h^2 - M_Z^2 c_{2\beta}}{v^2 s_\beta^2}$$

$$1 - \frac{m_A^2}{4\mu^2} s_{2\beta}^2 - \frac{\kappa}{2\lambda} s_{2\beta} = 0$$

NMSSMTools scans with consistent h_{125} pheno

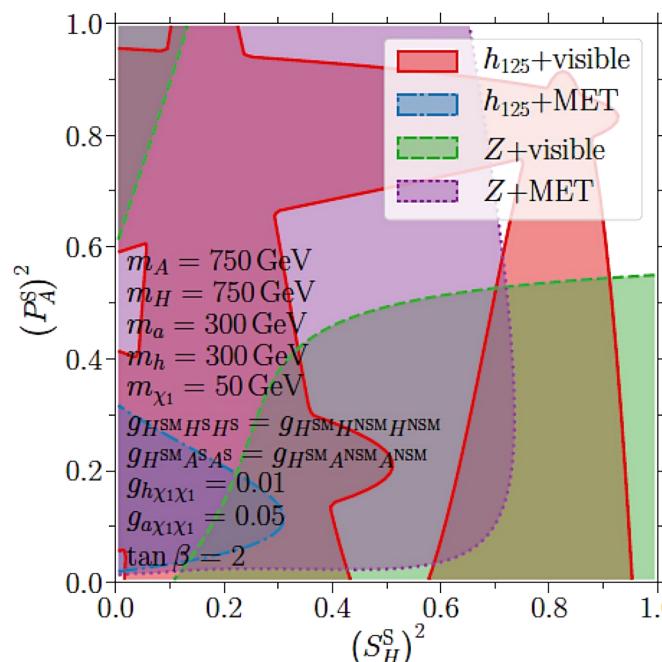

Slide from
Nausheen Shah

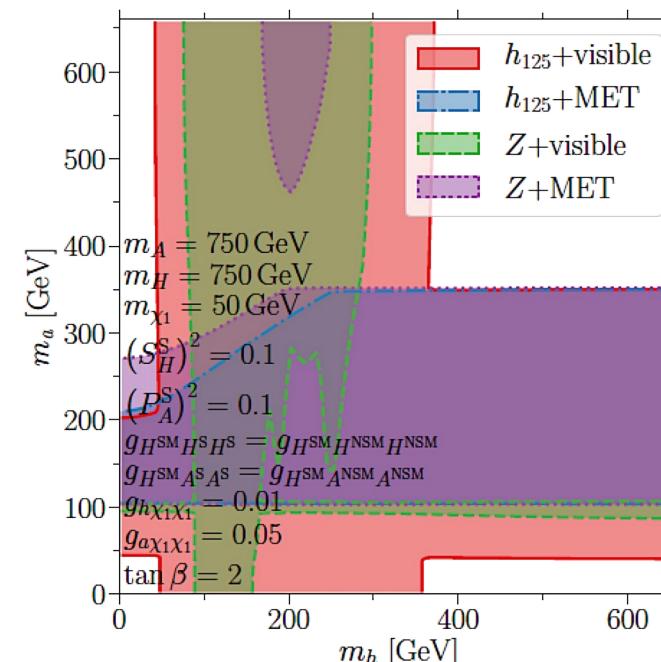

Latest updates from theory

- Cascade decays due to the presence of additional Higgs particles with visible and invisible decays

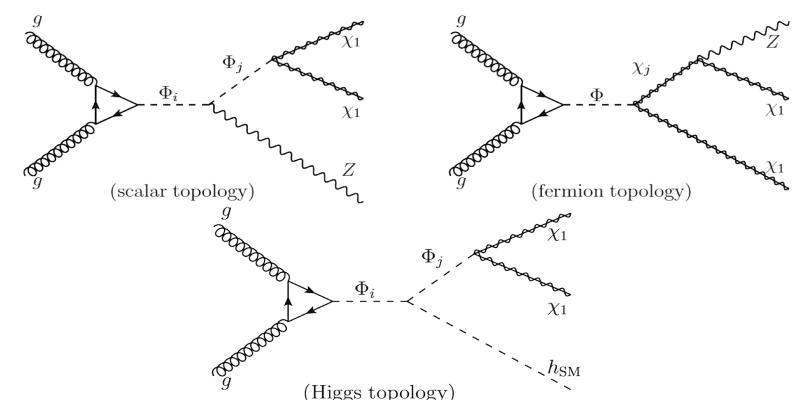

S. Baum & NRS, 2018
 S. Baum & NRS, 2019

Nikolaos Rompotis

28 November 2022

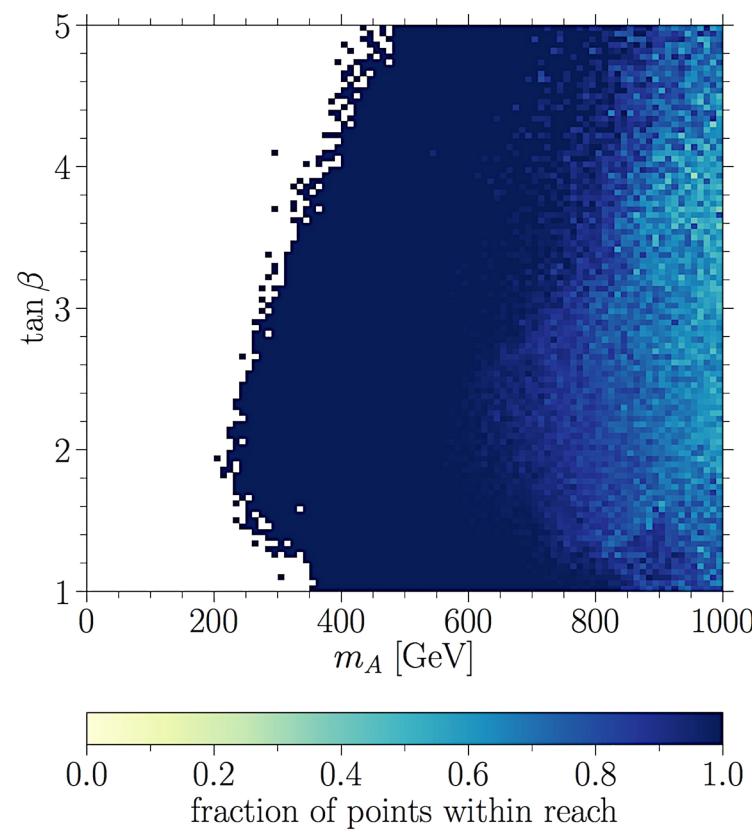

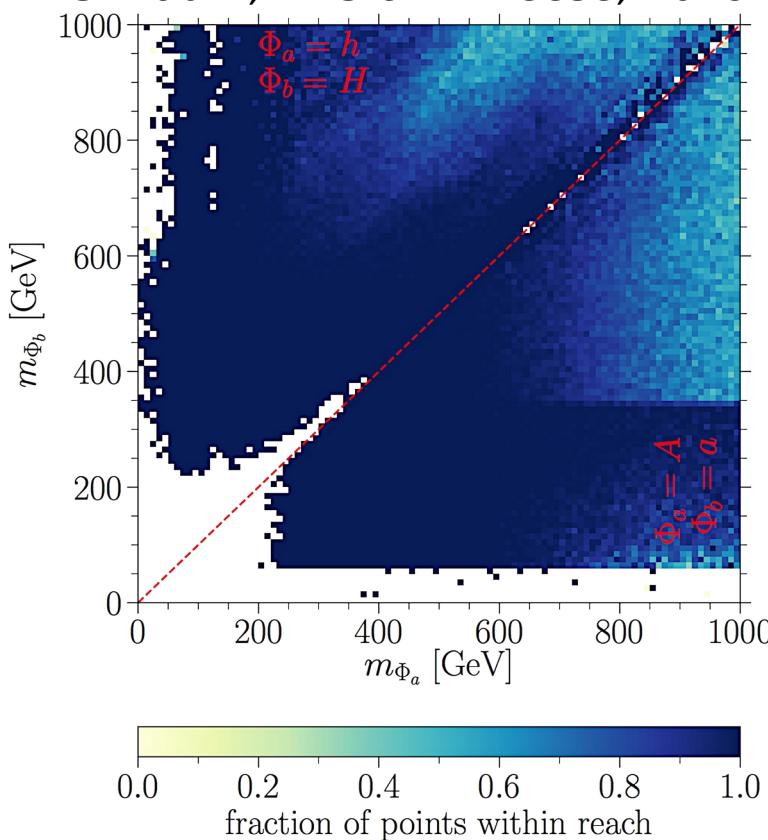

Future reach of the different Higgs Cascade search modes at the LHC with $L = 3000 \text{ fb}^{-1}$ of data.

Slide from
 Nausheen Shah

Latest updates from theory

- NMSSM: 2HDM+S + SUSY: Heavy Higgs Direct Searches & Cascades!

S. Baum, NRS & K. Freese, 2019

Optimistic assumptions:
~90% probed with
3000 fb^{-1}

Slide from
Nausheen Shah

$$(\max[\mu_{\text{Curr. Lim.}}^{<37 \text{ fb}^{-1}} \text{(conventional)}] > 0.01 \text{ or } \max[\mu_{\text{Proj.}}^{3000 \text{ fb}^{-1}} \text{(Higgs cascades)}] > 0.1)$$

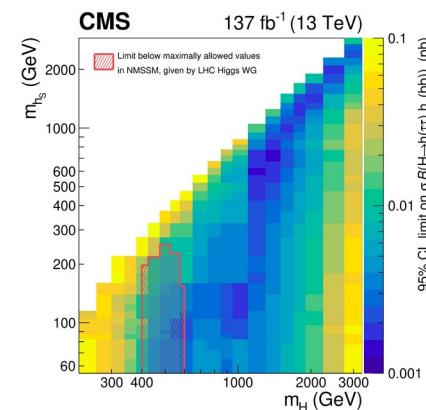

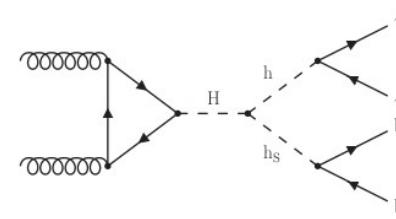

Relevant experimental results

- In general, di-Higgs results, especially (but not restricted to) those including two bosons of different masses in the final state, can use these benchmarks to show whether or not they constrain NMSSM
- So far the benchmarks have been used by 3 CMS results

We would like to advertise to the experimental colleagues interested in such signatures that they can check whether their results are relevant for NMSSM. The group provides numbers in our twikis to get some idea; if more scans are needed contact us and we will produce them for you.

First result ever to use our benchmarks in 2021
(presented in the last workshop)

arxiv:2106.10361

Selection of latest CMS results

- Di-H125 results

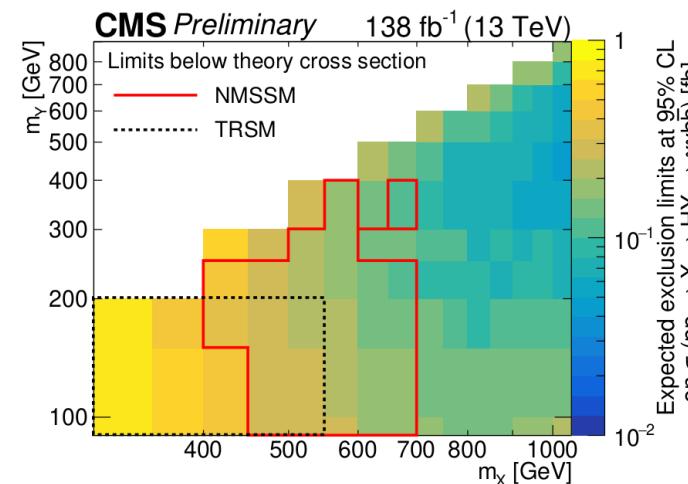

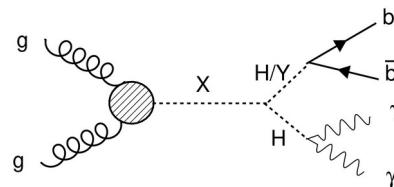

$\text{HH} \rightarrow 4W/2W2\tau/4\tau$ arxiv:2206.10268

- multi-Higgs results / cascades

$\text{H} \rightarrow \text{AA} \rightarrow 4\gamma$ (2 merged $\gamma\gamma$ pairs)
arxiv:2209.06197

$X \rightarrow Y/H + H$ HIG-21-011

NMSSM interpretation included

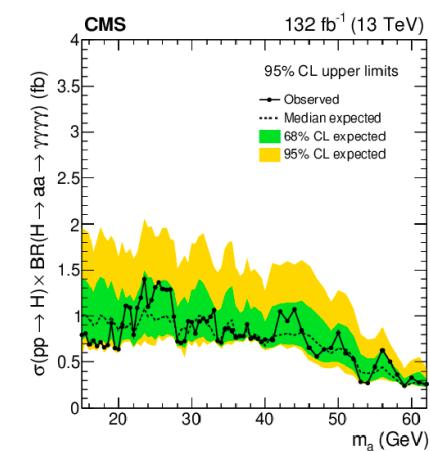

28 November 2022

- Light particles

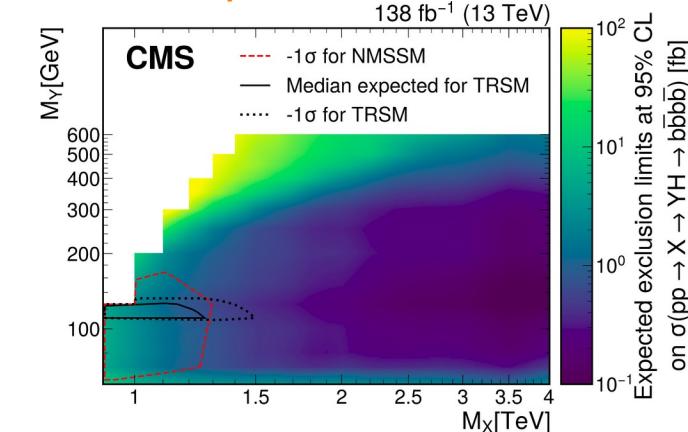

$\text{H} \rightarrow \text{aa} \rightarrow 4\gamma$ arXiv:2208.01469

$\text{H} \rightarrow \text{aa} \rightarrow b\bar{b}\mu\bar{\mu}$ HIG-21-021

$X \rightarrow YH \rightarrow 4b$ arxiv:2204.12413

NMSSM interpretation included

Selection of latest ATLAS results

- di-H125 results

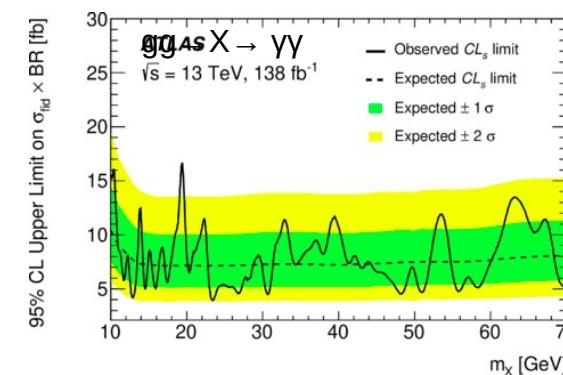

$H \rightarrow hh \rightarrow bb\pi\pi$ arxiv:2209.10910

$H \rightarrow hh \rightarrow bbbb$ arxiv:2202.07288

$H \rightarrow hh \rightarrow bb\gamma\gamma$ arxiv:2112.11876

- Light particles

Boosted di-photon
resonances (10–70 GeV)
arxiv:2211.04172

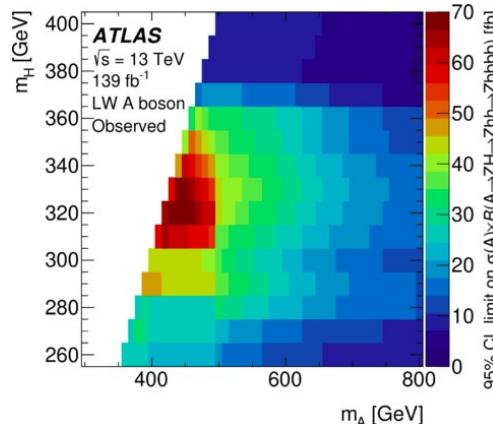

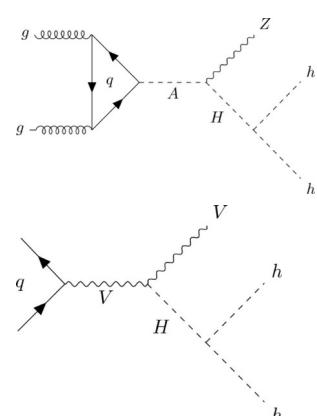

- multi-Higgs results / cascades

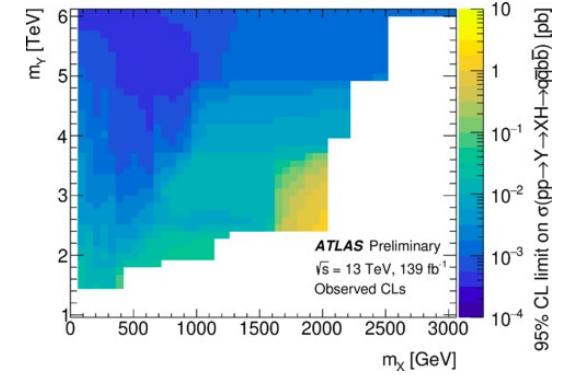

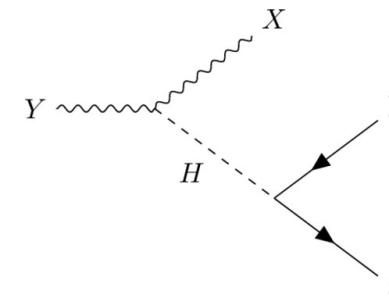

$X \rightarrow Zh/Wh$ vvbb, llbb, lvbb arxiv:2207.00230

$Z/W hh (\rightarrow 4b)$ production arXiv:2210.05415

Includes Higgs cascades, 2HDM interpretations

Y \rightarrow XH search (fully hadronic)
 ATLAS-CONF-2022-045

Conclusions

- Our subgroup provides theory predictions for NMSSM
 - Experimenters are encouraged to contact us if they think they can use the numbers we provide
 - The twiki benchmarks are just examples of possibilities and more points can be produced or more signatures can be explored upon request
