

# *Higgs analyses at the LHC*

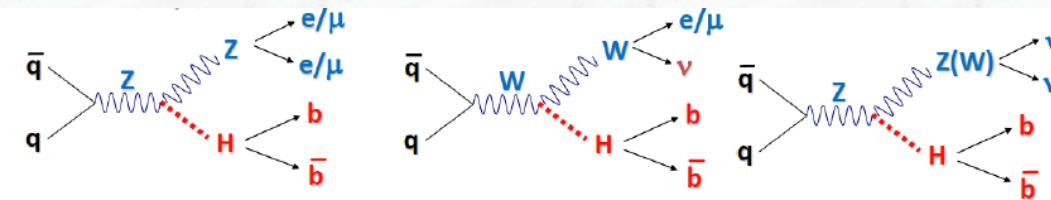

*Part IIb: VH, H → bb*

*Part III: Higgs boson parameters*

Karl Jakobs  
Physikalisches Institut  
Universität Freiburg 1

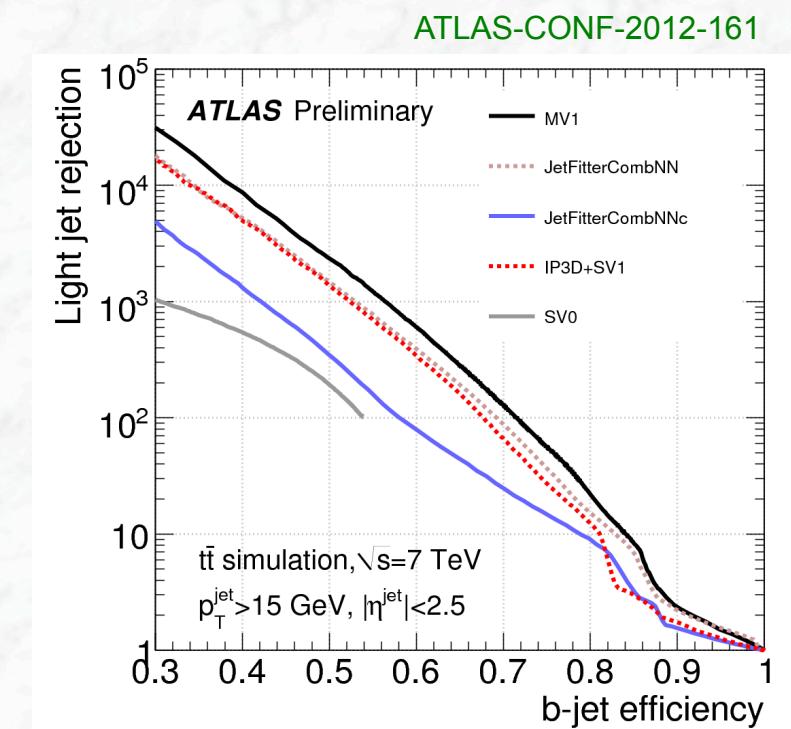

# Search for VH production with $H \rightarrow bb$ decays

- Exploit **three leptonic vector boson decay modes**  
→ split analysis in 0, 1, and 2-lepton categories
- Require 2 b-tagged jets  
(working point for 70% efficiency)
- Major background: W/Z bb, W+jets, tt
- Signal-to-background ratio improves for “boosted Higgs boson”,  
split analysis in bins of  $p_T(V)$

ATLAS: in total 15 categories  
(0,1,2 jets  $\times p_T$  bins)

CMS: multivariate analysis

# Event selection for $H \rightarrow bb$ analyses

## (i) Basic event selection for the three channels

Object	0-lepton	1-lepton	2-lepton
Leptons	0 loose leptons	1 tight lepton + 0 loose leptons	1 medium lepton + 1 loose lepton
Jets	$2 b$ -tags $p_T^{\text{jet}_1} > 45 \text{ GeV}$ $p_T^{\text{jet}_2} > 20 \text{ GeV}$ + $\leq 1$ extra jets		
Missing $E_T$	$E_T^{\text{miss}} > 120 \text{ GeV}$ $p_T^{\text{miss}} > 30 \text{ GeV}$ $\Delta\phi(E_T^{\text{miss}}, p_T^{\text{miss}}) < \pi/2$ $\min[\Delta\phi(E_T^{\text{miss}}, \text{jet})] > 1.5$ $\Delta\phi(E_T^{\text{miss}}, b\bar{b}) > 2.8$	$E_T^{\text{miss}} > 25 \text{ GeV}$	$E_T^{\text{miss}} < 60 \text{ GeV}$
Vector Boson	-	$m_T^W < 120 \text{ GeV}$	$83 < m_{\ell\ell} < 99 \text{ GeV}$

## (ii) Further topological criteria in intervals of $p_T(V)$

	$p_T^V \text{ [GeV]}$	0-90	90-120	120-160	160-200	>200
All Channels	$\Delta R(b, \bar{b})$	0.7-3.4	0.7-3.0	0.7-2.3	0.7-1.8	<1.4
1-lepton	$E_T^{\text{miss}} \text{ [GeV]}$	>25			>50	
	$m_T^W \text{ [GeV]}$	40-120		<120		

## Definition of signal and control regions

	2jets, 1tag	3jets, 1tag	2jets, 2tag	3jets, 2tag	top e- $\mu$ <b>CR</b>
3 $p_T^\nu$ bins x <b>0-lepton</b>	CR	CR	SR	SR	-
5 $p_T^\nu$ bins x <b>1-lepton</b>	CR	CR	SR	SR	-
5 $p_T^\nu$ bins x <b>2-lepton</b>	CR	CR	SR	SR	CR ↓ 1 electron+1 muon $m_{ee} > 40 \text{ GeV}$

CR=Control Region (low S/B)

SR=Signal Region

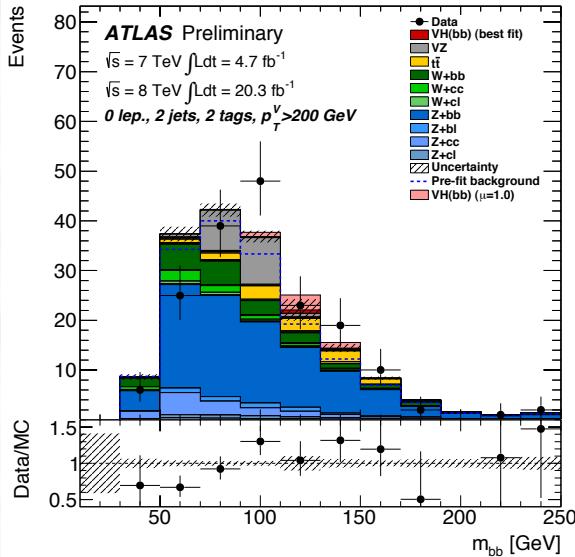

- Common nuisance parameters across regions
- Systematic uncertainties on extrapolation between control and signal regions

# Background normalization, interplay of regions

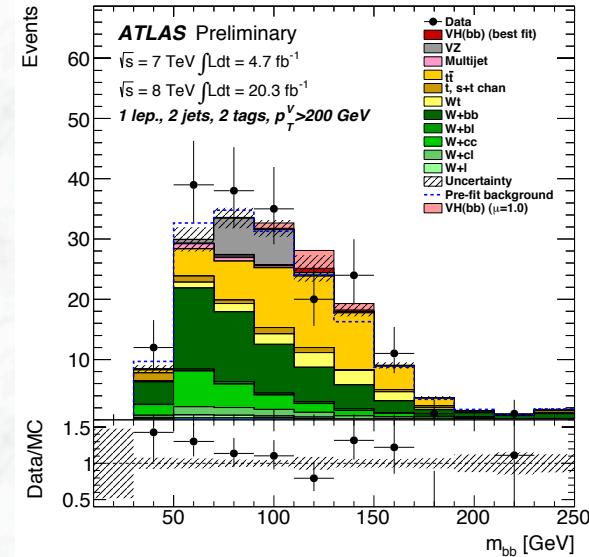

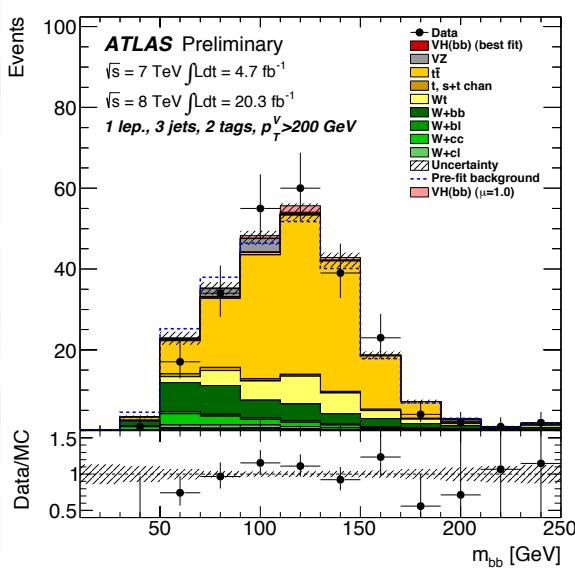

# Reconstructed mass distributions -full data set, 7 and 8 TeV (a selection, high $p_T$ bins)-

0 lepton

1 lepton

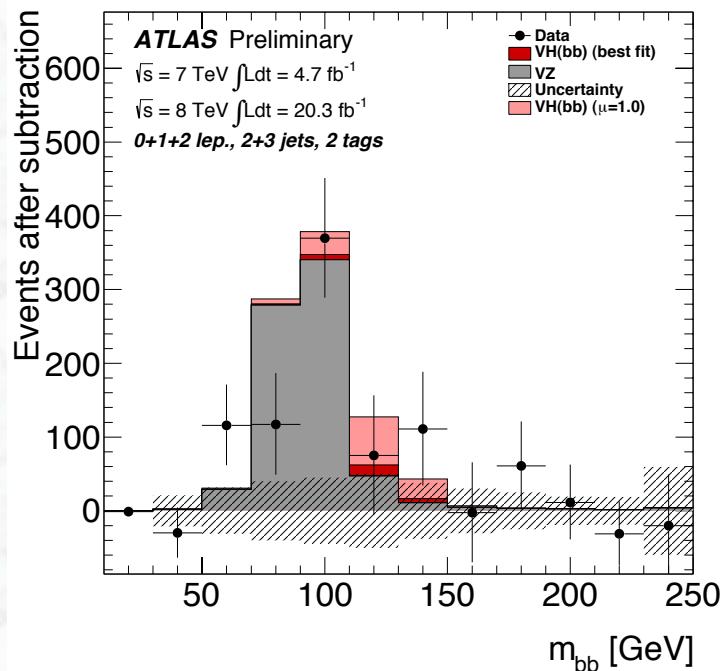

2 leptons

ATLAS-CONF-2013-079

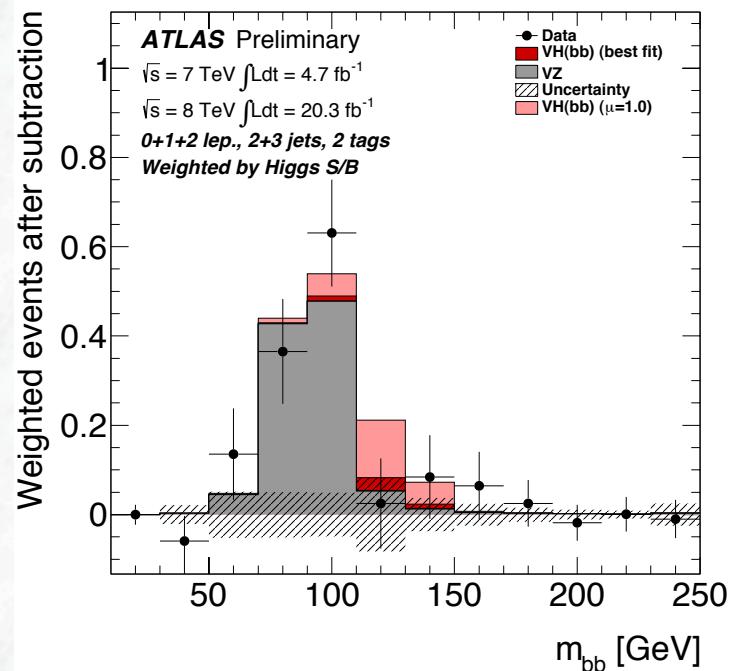

# Demonstration of di-boson production with $Z \rightarrow bb$ in ATLAS

combination (all bins, channels)  
data - background

weighted distribution, by S/B ratio

Di-boson signal established  
(important “calibration” signal; a Standard Model Higgs boson signal is included as background)

Significance  $5.1\sigma$

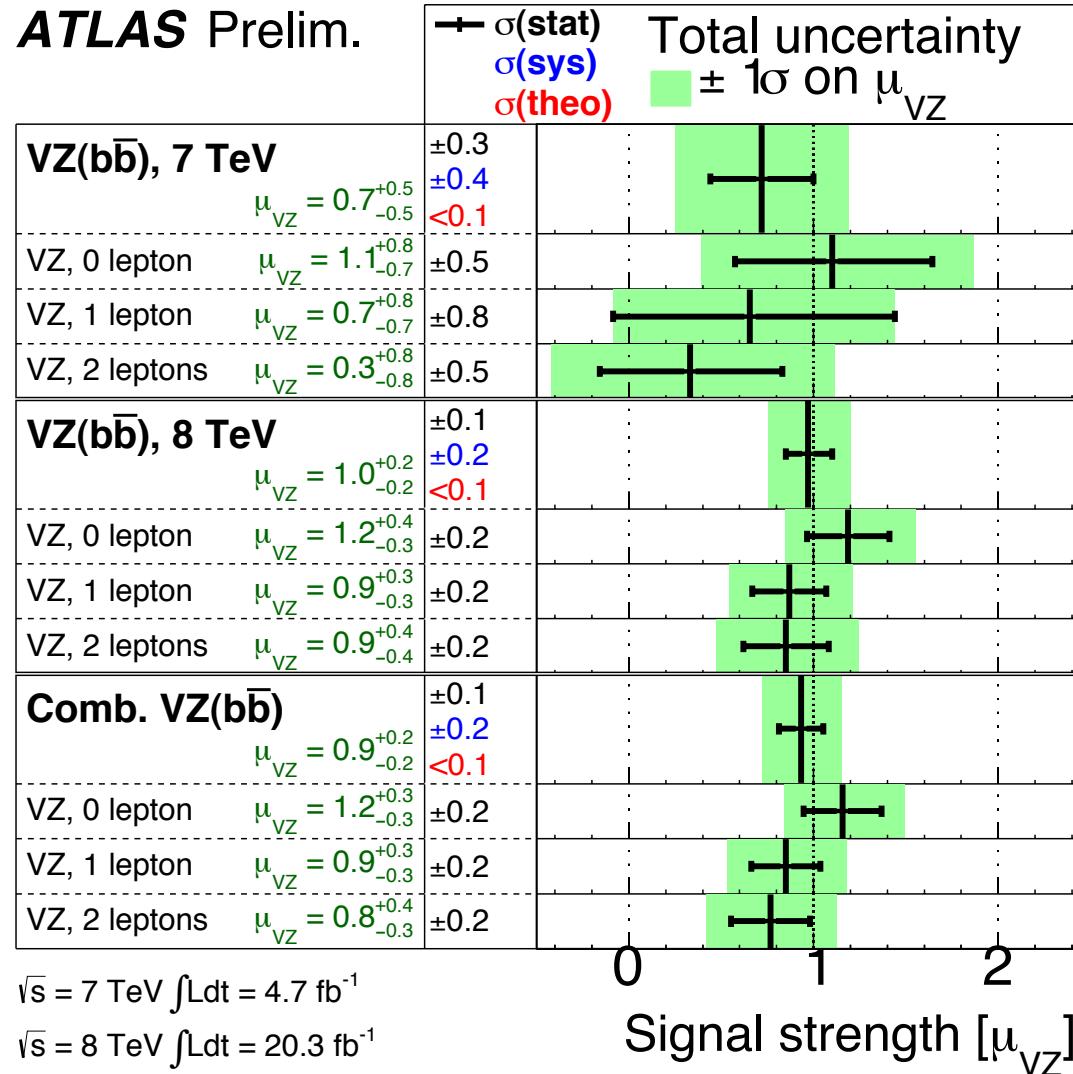

$$\mu_{WZ+WW} = 0.90 \pm 0.20$$

ATLAS-CONF-2013-079

# Di-boson signal strength

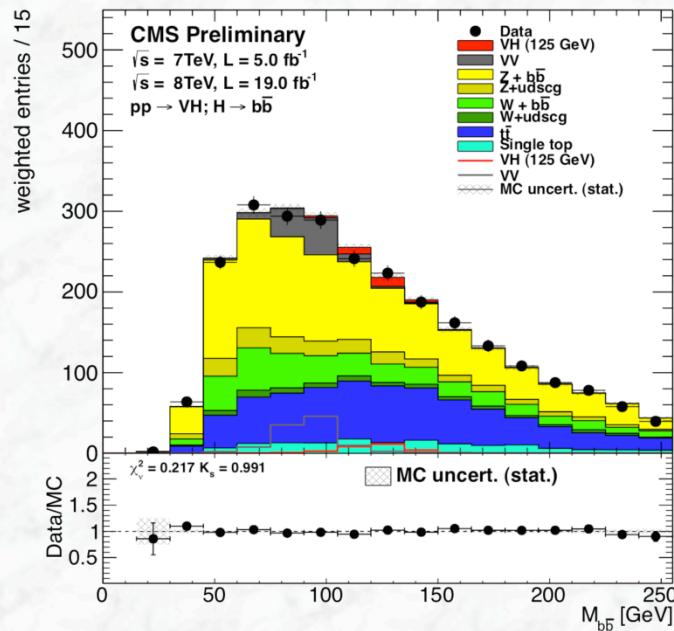

ATLAS Prelim.

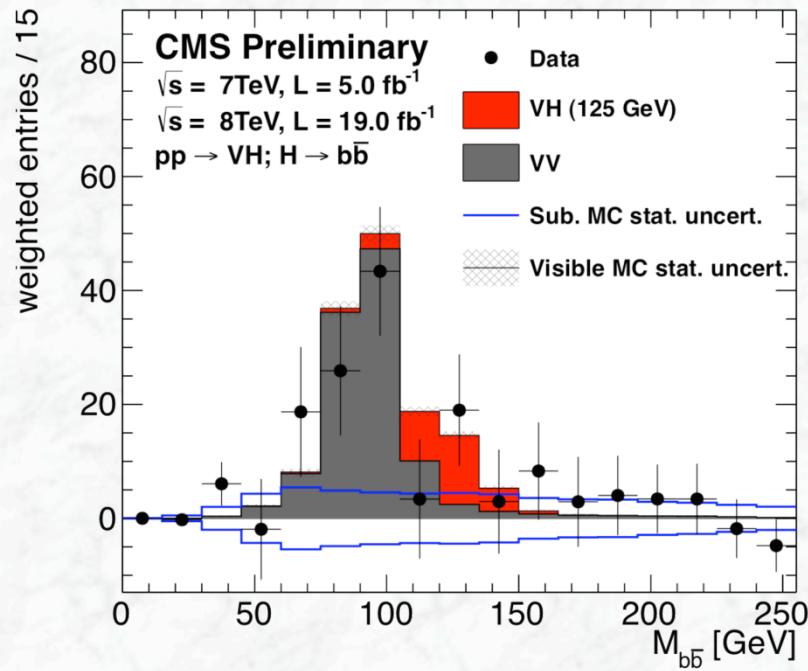

# Demonstration of di-boson production with $Z \rightarrow b\bar{b}$ in CMS

Weighted (by S/B ratio)  $m_{b\bar{b}}$  mass distribution

Weighted (by S/B ratio) background-subtracted  $m_{b\bar{b}}$  mass distribution

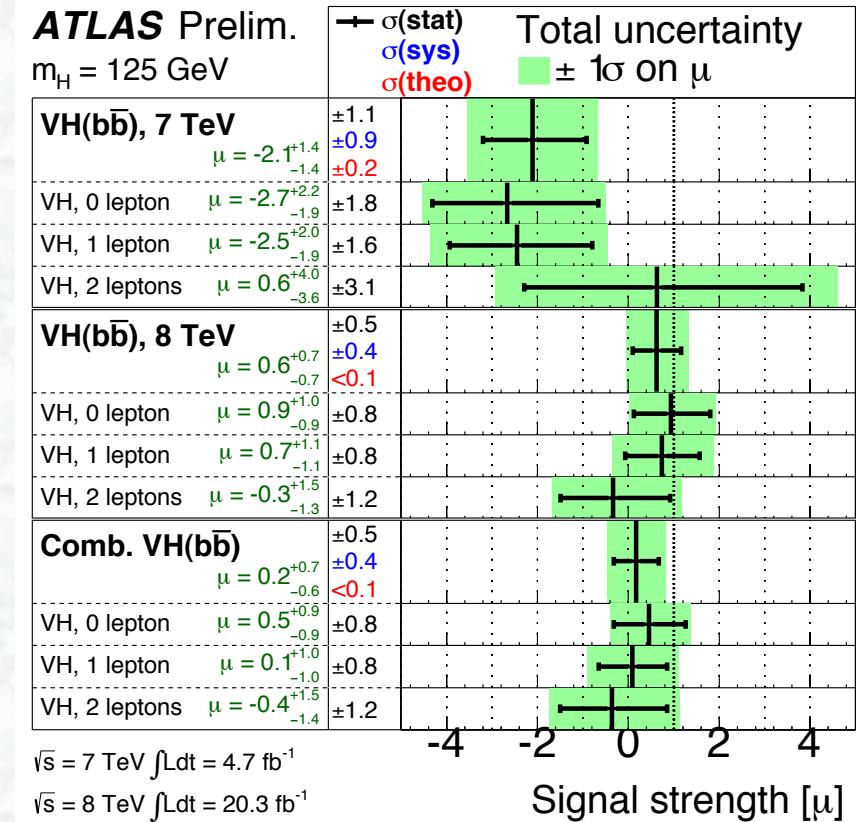

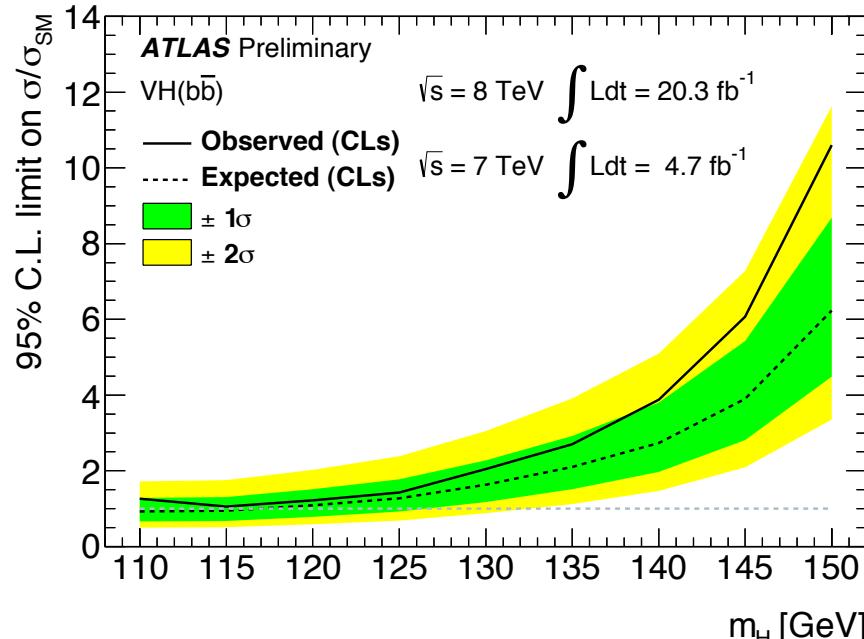

- Di-boson signal established
- Signal size consistent with expectations from Standard Model

# ATLAS results on the search for VH, H → bb decays

ATLAS-CONF-2013-079

$m_H = 125 \text{ GeV}:$

Observed 95% CL:  $1.4 \sigma_{\text{SM}}$   
Expected (no Higgs):  $1.3 \sigma_{\text{SM}}$

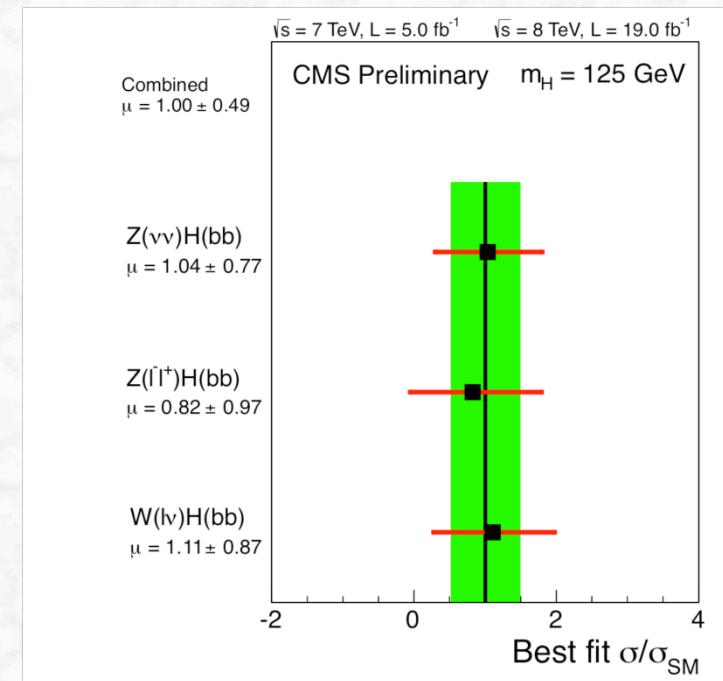

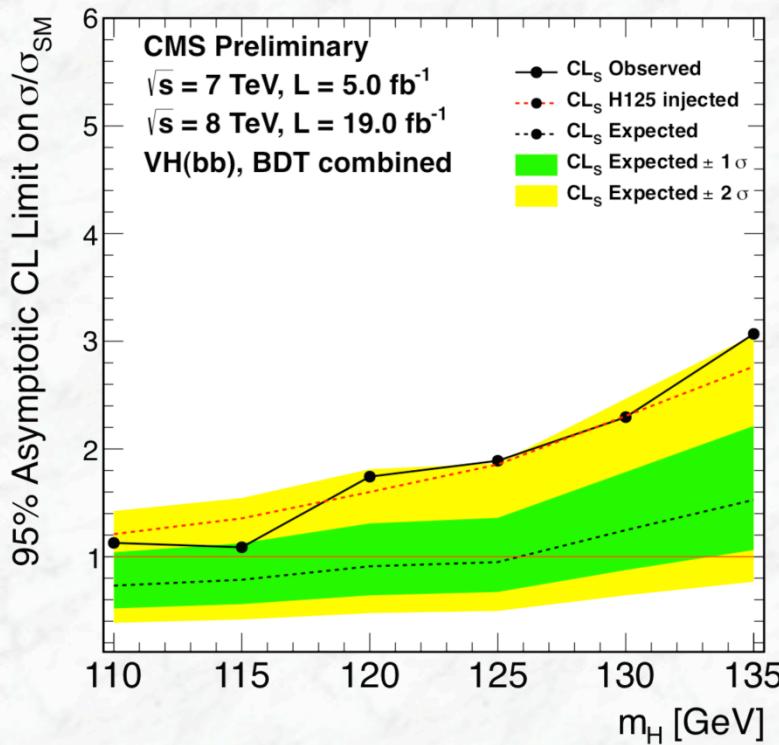

$\mu_H = 0.2 \pm 0.5 \text{ (stat)} \pm 0.4 \text{ (syst)}$

Probability of obtaining a result more background-like than the observed in the presence of a SM signal ( $\mu=1$ ) is 0.11

# CMS results on the search for VH, $H \rightarrow bb$ decays

CMS PAS HIG-13-012

$m_H = 125 \text{ GeV}:$

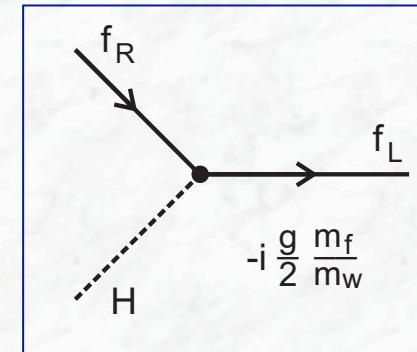

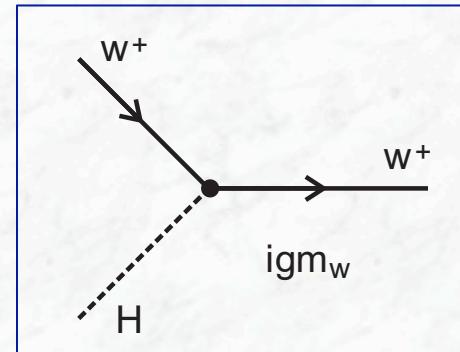

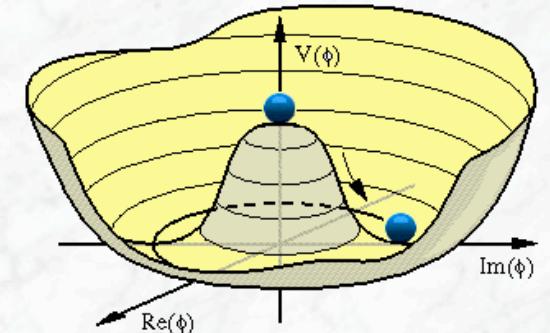

Observed 95% CL:  $1.89 \sigma_{\text{SM}}$   
Expected (no Higgs):  $0.95 \sigma_{\text{SM}}$

$\mu_H = 1.00 \pm 0.49$

# *Is the new particle the Higgs Boson ?*

- Production rates ?

Couplings to bosons and fermions

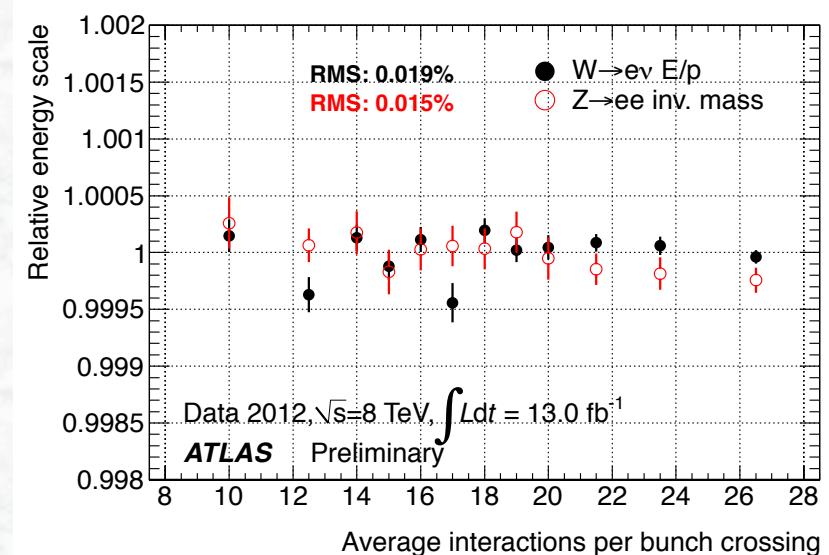

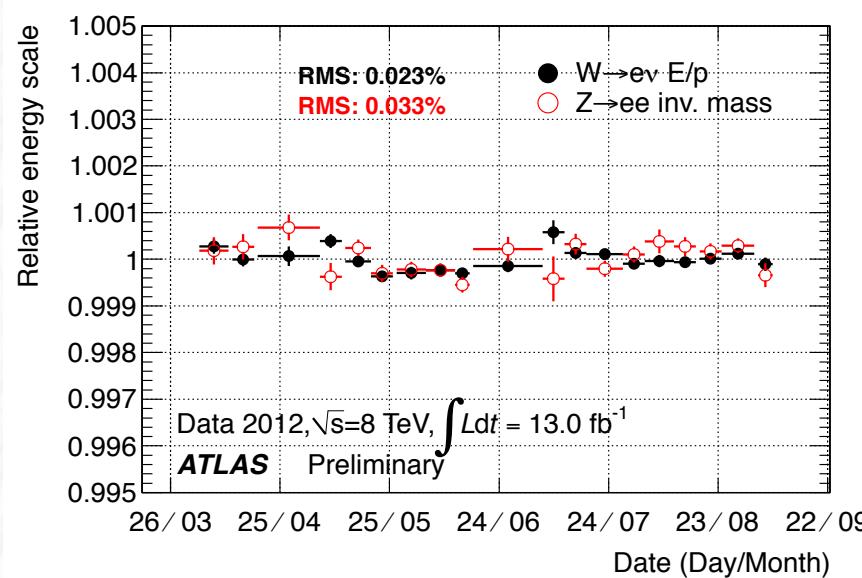

- Spin,  $J^P$  quantum number

# Higgs boson parameters

- After the discovery of the new boson, the most important question is:
  - What are its properties ?  
(mass, spin, couplings, ... )
  - Is it the Higgs boson of the Standard Model?  
Or can we finds signs of Physics Beyond the Standard Model by studying its properties?
- Much attention of the LHC (and Tevatron ) collaborations and from the theory community has been devoted to these questions during the past year.

# The Higgs boson mass

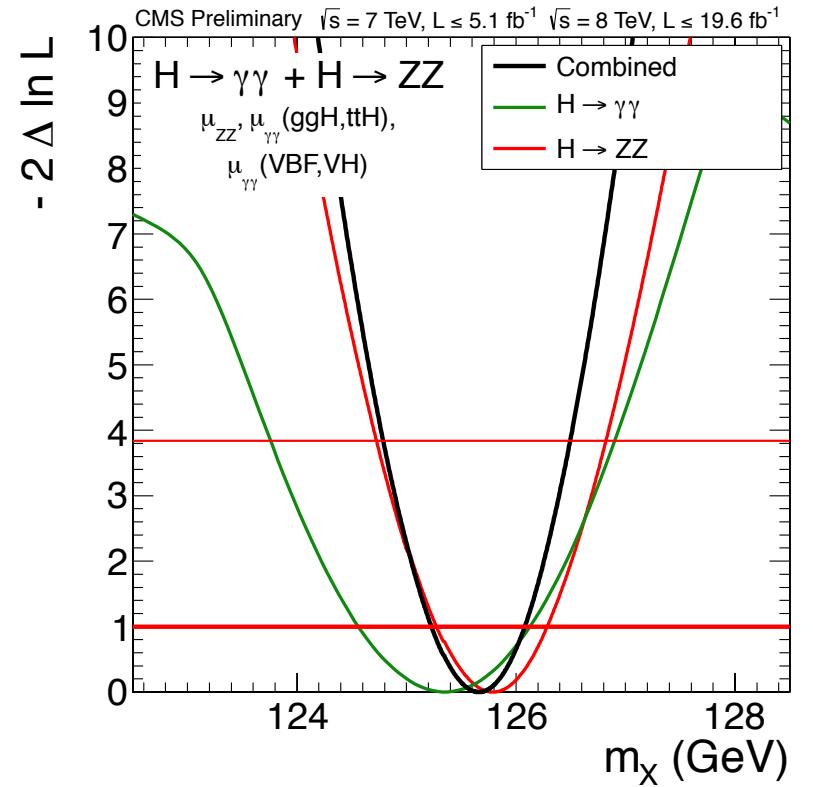

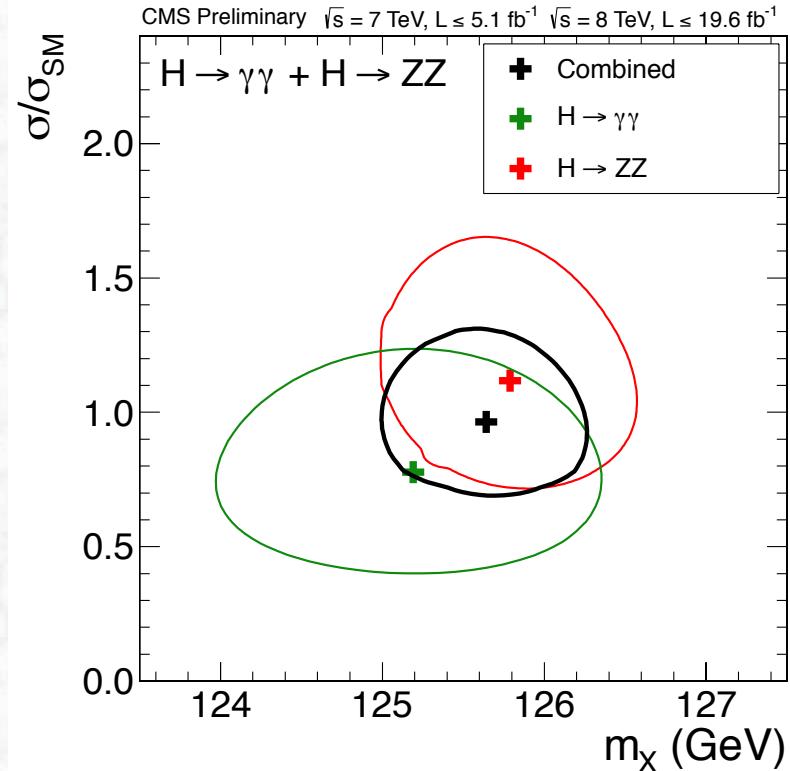

- The mass of the Higgs boson can be precisely determined by using the measurements in the high resolution  $H \rightarrow \gamma\gamma$  and  $H \rightarrow ZZ^* \rightarrow 4l$  channels
- Relevant here are the lepton/photon energy calibration, its stability and the good lepton / photon energy resolution

# Higgs boson mass: results from CMS

CMS PAS HIG-13-005

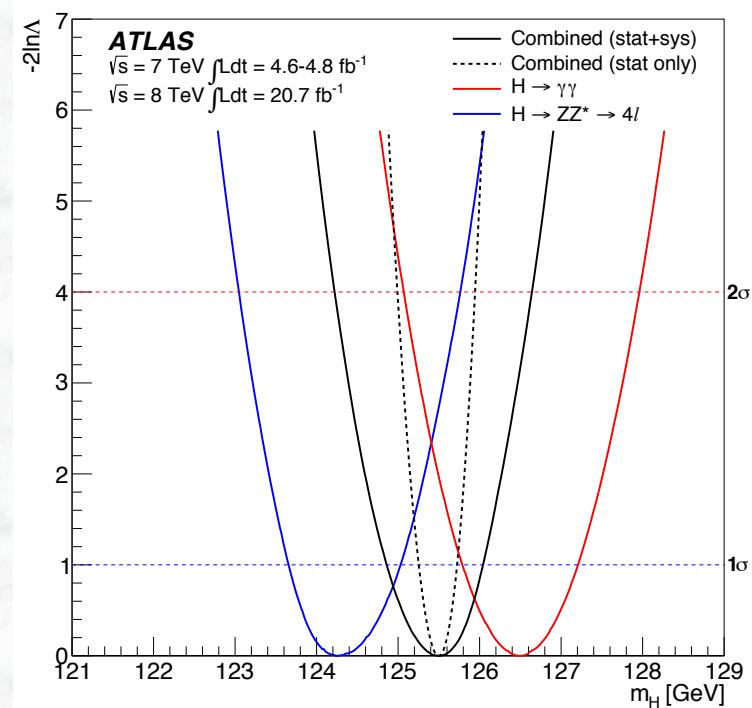

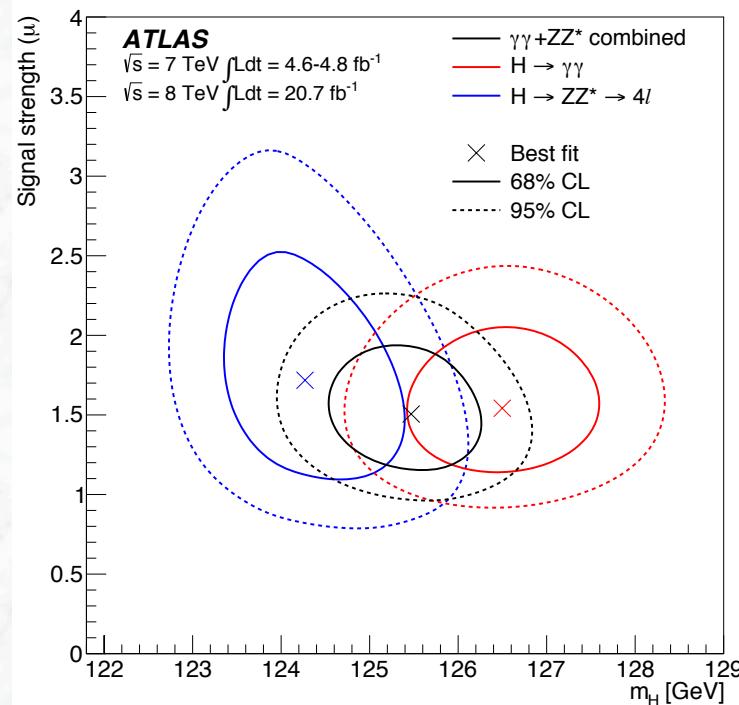

$$m_H = 125.7 \pm 0.3(\text{stat}) \pm 0.3(\text{syst}) \text{ GeV}$$

In the combination the relative signal strength for the two decay modes is constrained by the SM values

# Higgs boson mass: results from ATLAS

ATLAS arXiv:1307.1427

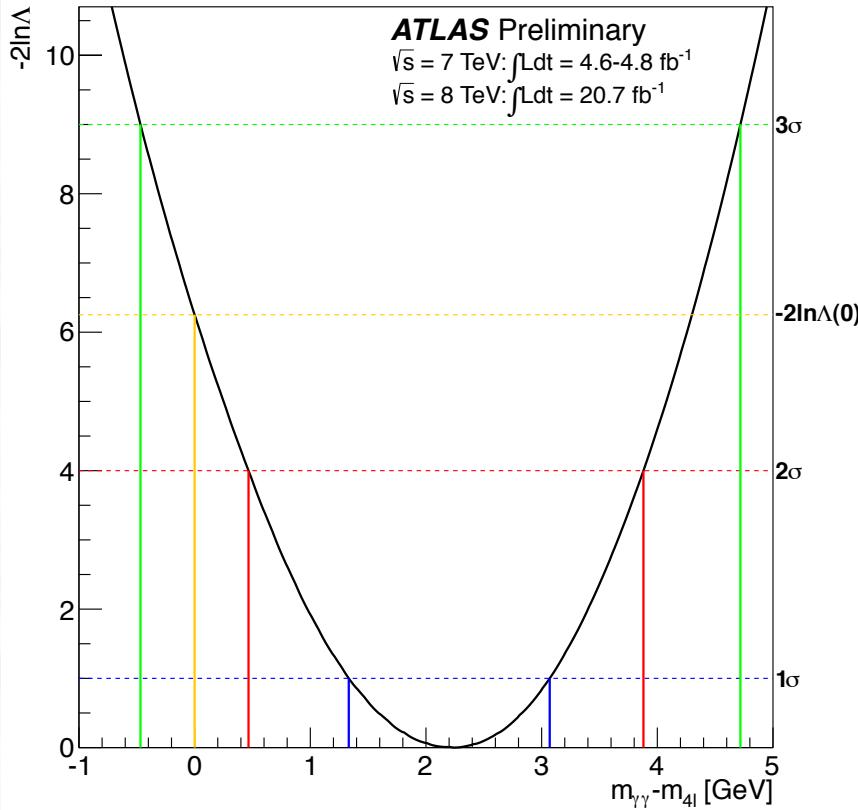

$$m_H = 125.5 \pm 0.2(\text{stat})^{+0.5}_{-0.6}(\text{syst}) \text{ GeV}$$

# Consistency between the fitted mass values

ATLAS-CONF-2013-014

Consistency between the fitted mass values from likelihood value for  $\Delta m = 0$  w.r.t. best fit value for  $\Delta m$ .

$$\Delta m = 2.3^{+0.6}_{-0.7} (\text{stat}) \pm 0.6 (\text{syst}) \text{ GeV}$$

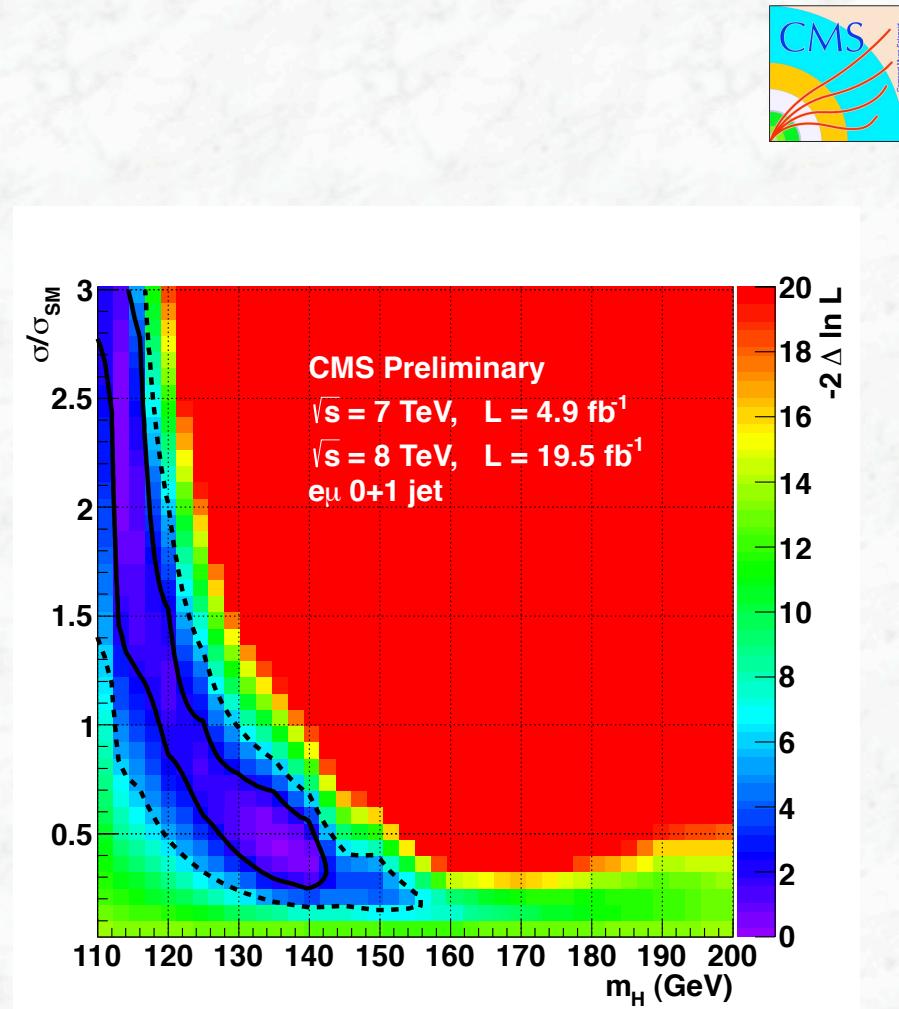

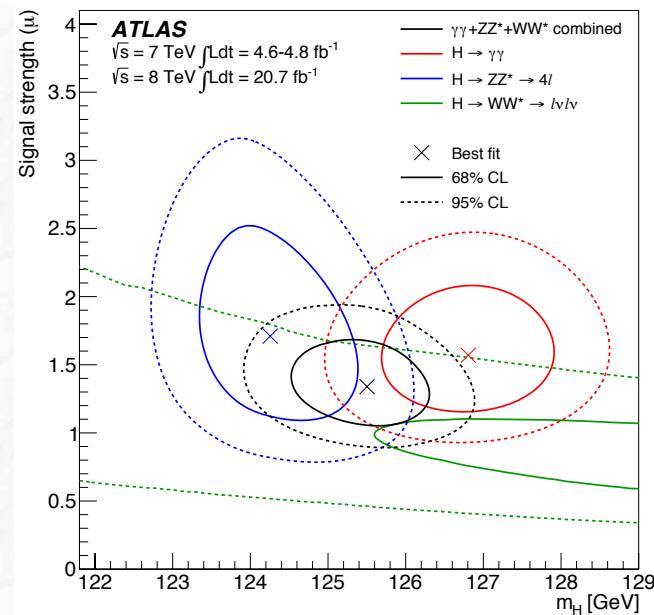

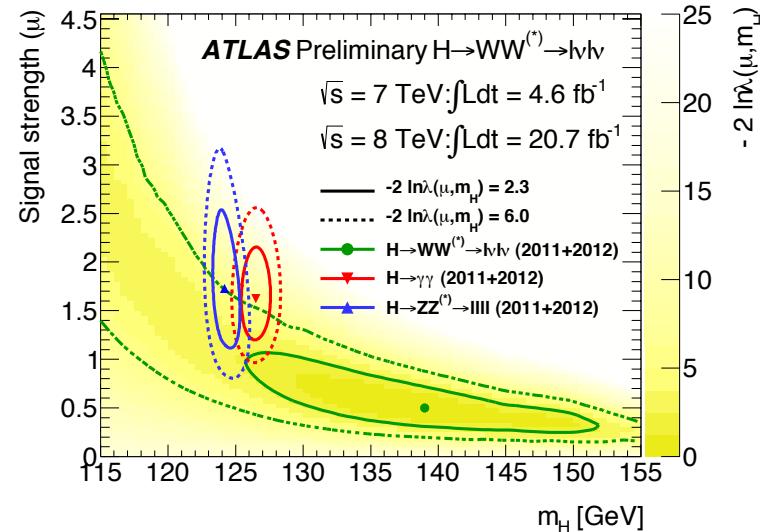

- Probability for disfavoring the  $\Delta m = 0$  hypothesis by more than observed is 1.5% ( $2.4\sigma$ )
- Increases to 8%, by fixing the three principle sources contributing to the e/ $\gamma$  energy scale uncertainty (material, pre-sampler energy scale, calibration procedure) to their  $\pm 1\sigma$  values

Likelihood as a function of the mass difference,  $\Delta m_H$ , profiling over the common mass  $m_H$ . The signal strength parameters  $\mu_{\gamma\gamma}$  and  $\mu_{4l}$  are allowed to vary independently.

# Consistency with the $H \rightarrow WW^*$ channel (mass vs. signal strength)

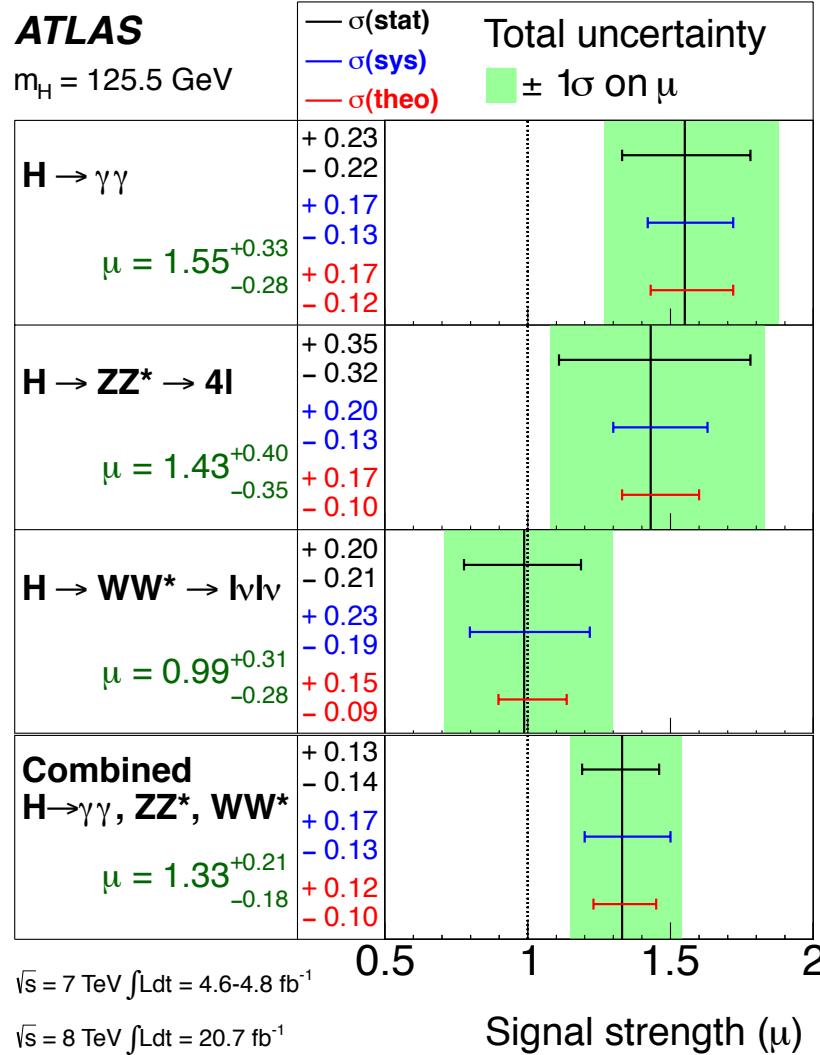

ATLAS-CONF-2013-030

# Signal strength in di-boson decay modes

-including full data set-

- Data are consistent with the hypothesis of a Standard Model Higgs boson:

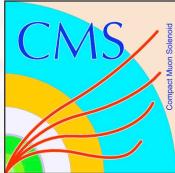

$$\mu = 1.33^{+0.21}_{-0.18}$$

- Experimental uncertainties are still too large to get excited about “high”  $\gamma\gamma$  signal strength
- Signal strengths in fermionic decay modes have large uncertainties, but are compatible with SM value of 1;

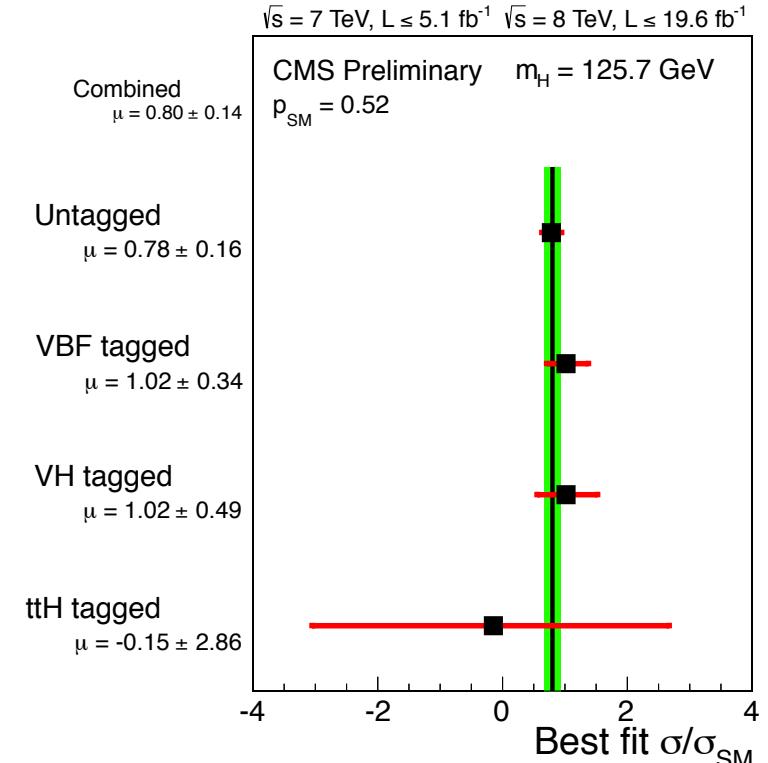

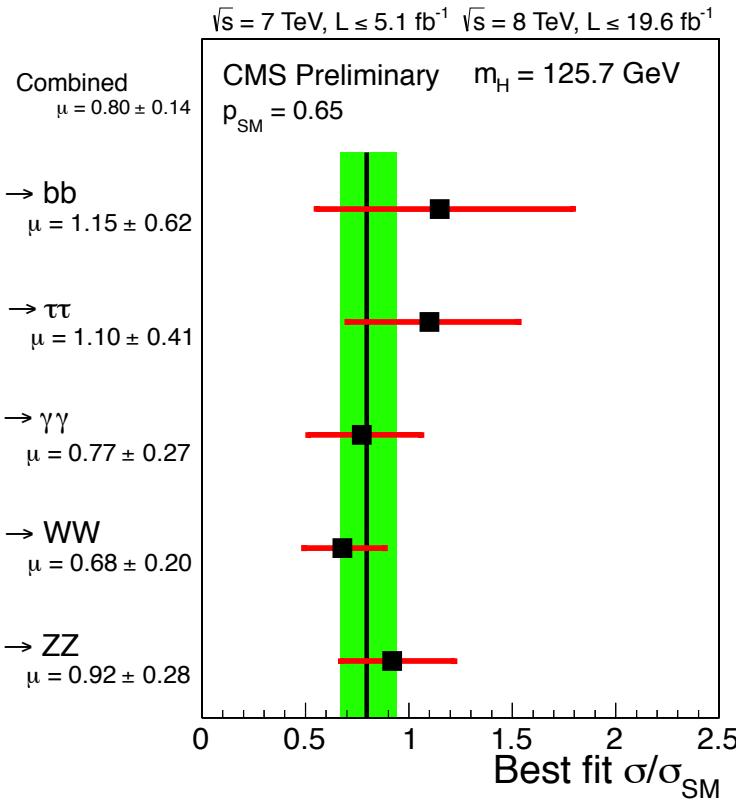

If preliminary  $H \rightarrow \tau\tau$  and  $H \rightarrow bb$  results are included:

$$\mu = 1.23 \pm 0.18$$

Ratios of production cross sections for the various processes (ggF, VBF,...) fixed to SM values

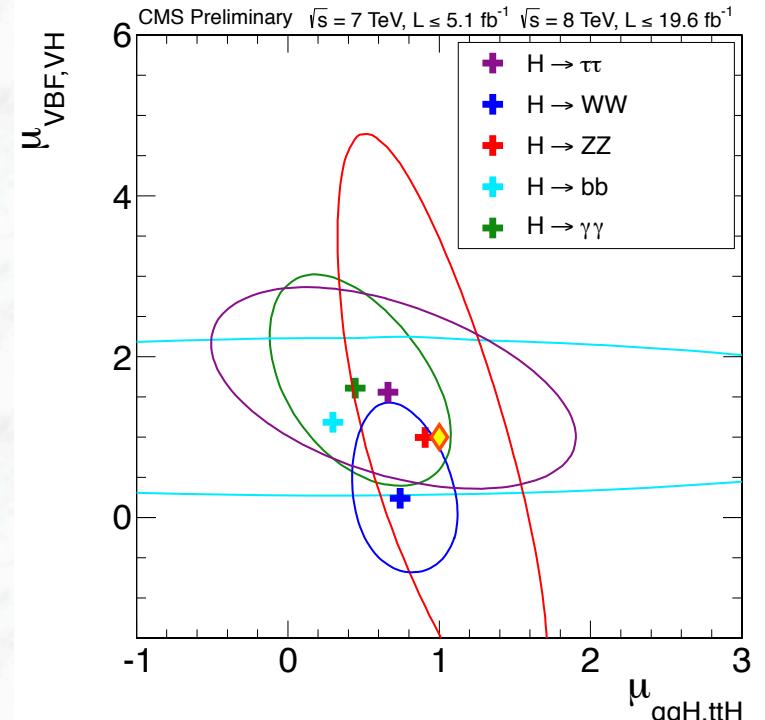

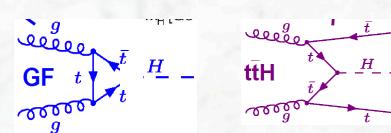

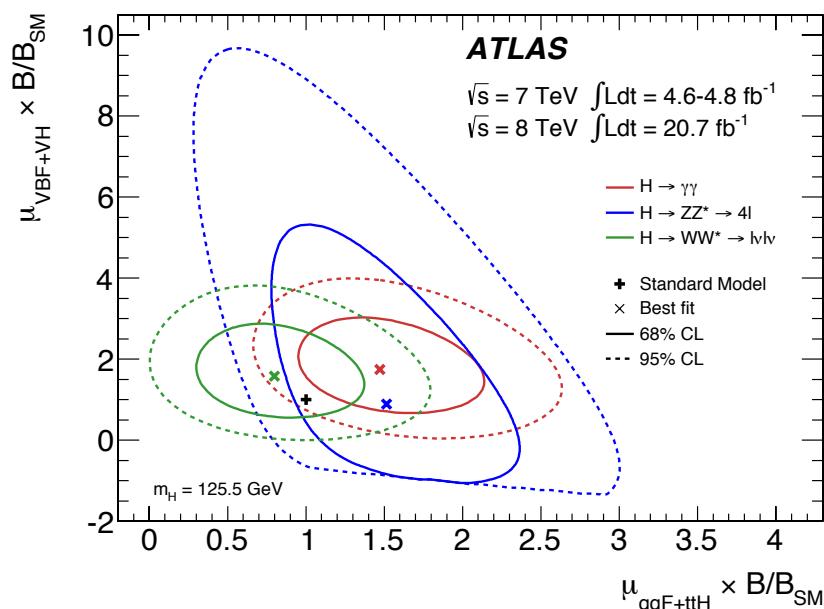

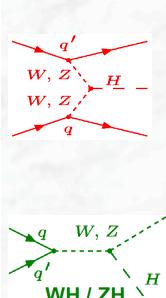

# Signal strength in all decay and production modes -including full data set-

- Data are consistent with the hypothesis of a Standard Model Higgs boson:  
 $\mu = 0.80 \pm 0.14$
- Signal strengths in fermionic decay modes have large uncertainties, but are compatible with SM value of 1

# Gluon fusion versus vector-boson fusion

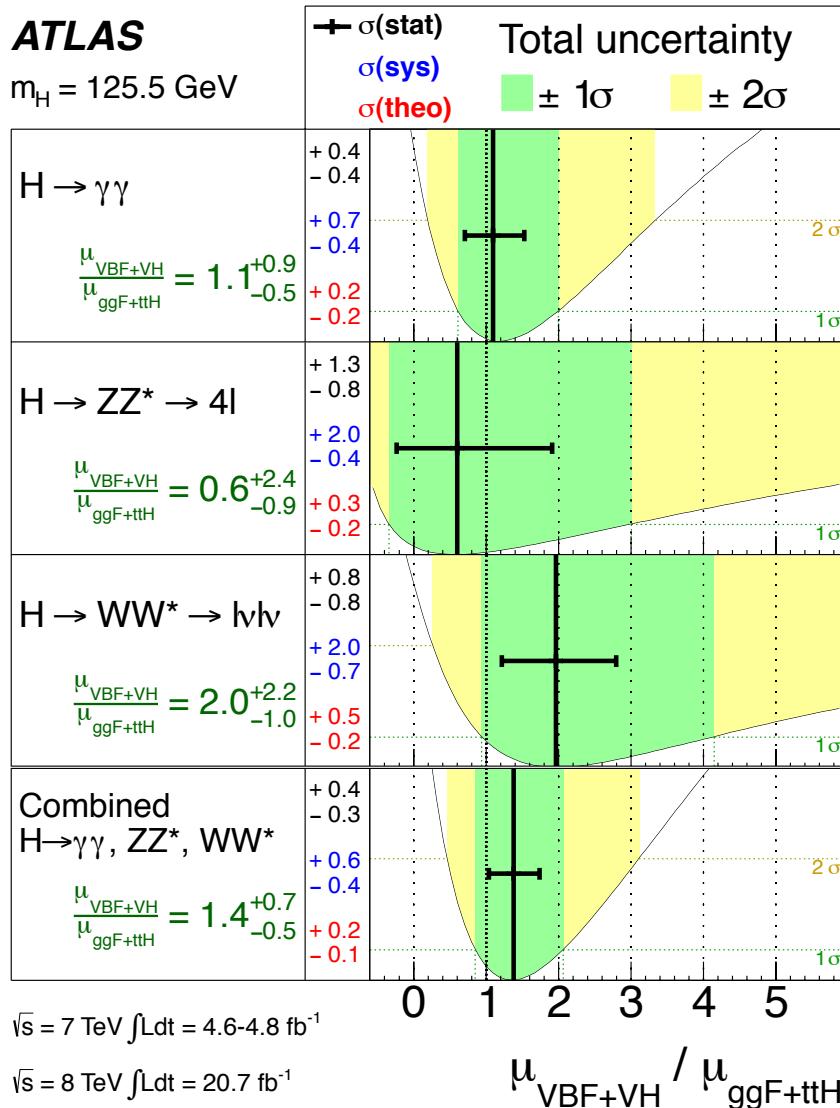

- Sensitivity to (ggF + ttH) and (VBF+VH) production fractions, modulo branching ratio factors  $B/B_{\text{SM}}$
- Good agreement with the Standard Model, within the large uncertainties
- A combination of the different decay modes is not performed, since it would require introducing hypotheses on the relative branching ratios;

# Evidence for production via vector boson fusion

**ATLAS**

$m_H = 125.5 \text{ GeV}$

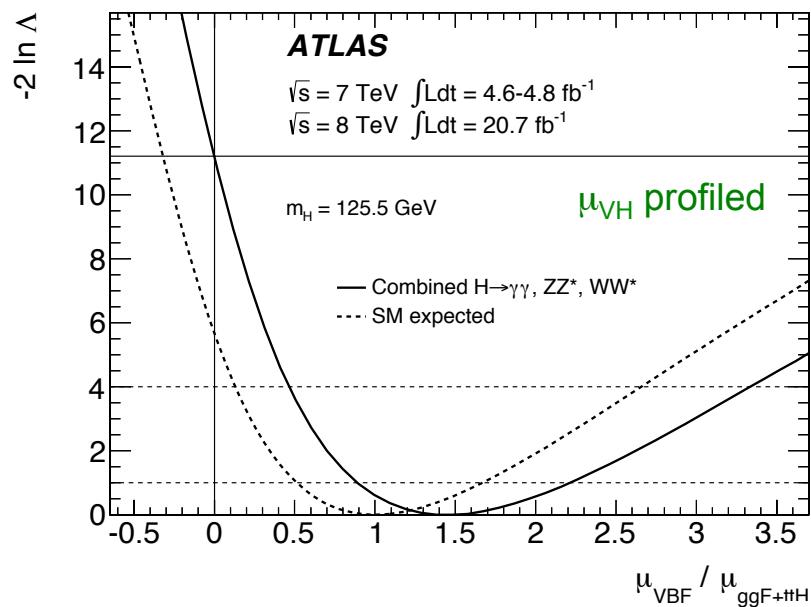

- Fit for the ratio of  $\mu_{\text{VBF+VH}} / \mu_{\text{ggF+ttH}}$  for the individual channels (model independent)
- Good agreement with SM expectation for individual channels and the combination)

Next step: combination of results

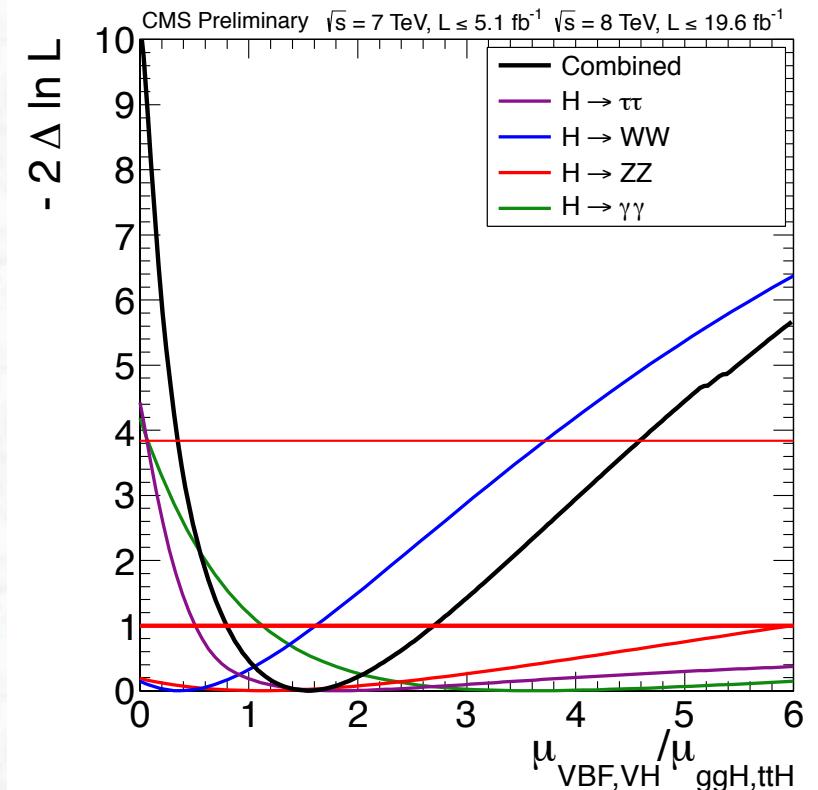

# Evidence for production via vector boson fusion

$$\mu_{VBF} / \mu_{ggF+ttH} = 1.4^{+0.4}_{-0.3} (\text{stat})^{+0.6}_{-0.4} (\text{syst})$$

$3.3\sigma$  evidence for VBF production

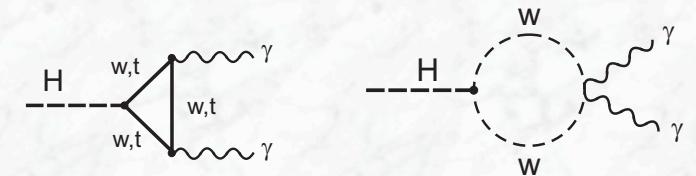

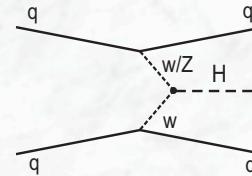

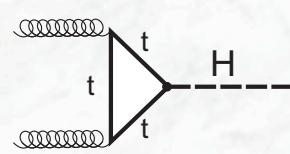

$3.2\sigma$  evidence for V-boson mediated production

# Higgs boson couplings

- Production and decay involve several couplings

Production:

Decays: e.g.  $H \rightarrow \gamma\gamma$  (best example)

(Decay widths depends on W and top coupling, destructive interference)

- Standard Model couplings are tested by introducing coupling scale factors  $\kappa$

$$g_i = \kappa g_i^{SM}$$

- Standard Model tree level amplitudes:

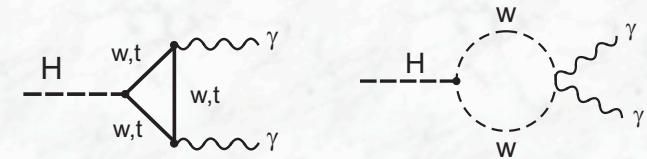

$$\Gamma_{ff} \propto \left( \kappa_f \frac{m_f}{v} \right)^2 = \kappa_f^2 \cdot \Gamma_{ff}^{SM}$$

$$\Gamma_{VW} \propto \left( \kappa_f \frac{m_V^2}{v} \right)^2 = \kappa_V^2 \cdot \Gamma_{VW}^{SM}$$

# Higgs boson couplings

- Example:  $H \rightarrow \gamma\gamma$

$$\Gamma_{\gamma\gamma} \propto |1.28\kappa_w - 0.28\kappa_t|^2 \cdot \Gamma_{\gamma\gamma}^{SM}$$

- Loop scaling factors can be expressed in terms of  $\kappa_f$  and  $\kappa_V$
- The analysis is also done in terms of **effective loop couplings**  $\kappa_g$  and  $\kappa_\gamma$

# Higgs boson couplings

- Benchmarks defined by LHC cross section working group (leading-order tree-level framework):
  - Signals observed originate from a single resonance; (mass assumed here is 125.5 GeV)
  - Narrow width approximation: → rates for given channels can be decomposed as:

$$\sigma \cdot B(i \rightarrow H \rightarrow f) = \frac{\sigma_i \cdot \Gamma_f}{\Gamma_H}$$

i, f = initial, final state  
 $\Gamma_f, \Gamma_H$  = partial, total width

- Modifications to coupling strength are considered (coupling scale factors  $\kappa$ ), tensor structure of Lagrangian assumed as in Standard Model

## Scaling of cross sections with $\kappa_F$ and $\kappa_V$ factors

$$\sigma \cdot \text{BR}(\text{gg} \rightarrow H \rightarrow \gamma\gamma) = \sigma_{\text{SM}}(\text{gg} \rightarrow H) \cdot \text{BR}_{\text{SM}}(H \rightarrow \gamma\gamma) \cdot \frac{\kappa_g^2 \cdot \kappa_\gamma^2}{\kappa_H^2}$$

$$\begin{aligned}\sigma(gg \rightarrow H) * \text{BR}(H \rightarrow \gamma\gamma) &\sim \frac{\kappa_F^2 \cdot \kappa_\gamma^2(\kappa_F, \kappa_V)}{0.75 \cdot \kappa_F^2 + 0.25 \cdot \kappa_V^2} \\ \sigma(qq' \rightarrow qq'H) * \text{BR}(H \rightarrow \gamma\gamma) &\sim \frac{\kappa_V^2 \cdot \kappa_\gamma^2(\kappa_F, \kappa_V)}{0.75 \cdot \kappa_F^2 + 0.25 \cdot \kappa_V^2} \\ \sigma(gg \rightarrow H) * \text{BR}(H \rightarrow ZZ^{(*)}, H \rightarrow WW^{(*)}) &\sim \frac{\kappa_F^2 \cdot \kappa_V^2}{0.75 \cdot \kappa_F^2 + 0.25 \cdot \kappa_V^2} \\ \sigma(qq' \rightarrow qq'H) * \text{BR}(H \rightarrow ZZ^{(*)}, H \rightarrow WW^{(*)}) &\sim \frac{\kappa_V^2 \cdot \kappa_V^2}{0.75 \cdot \kappa_F^2 + 0.25 \cdot \kappa_V^2} \\ \sigma(qq' \rightarrow qq'H, VH) * \text{BR}(H \rightarrow \tau\tau, H \rightarrow b\bar{b}) &\sim \frac{\kappa_V^2 \cdot \kappa_F^2}{0.75 \cdot \kappa_F^2 + 0.25 \cdot \kappa_V^2}\end{aligned}$$

## (i) Couplings to fermions and bosons

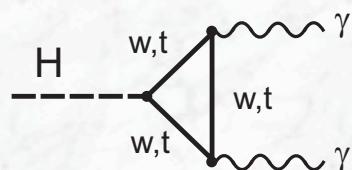

- Assume only one scale factor for fermion and vector couplings:

$$\kappa_V = \kappa_W = \kappa_Z$$

$$\kappa_F = \kappa_t = \kappa_b = \kappa_\tau$$

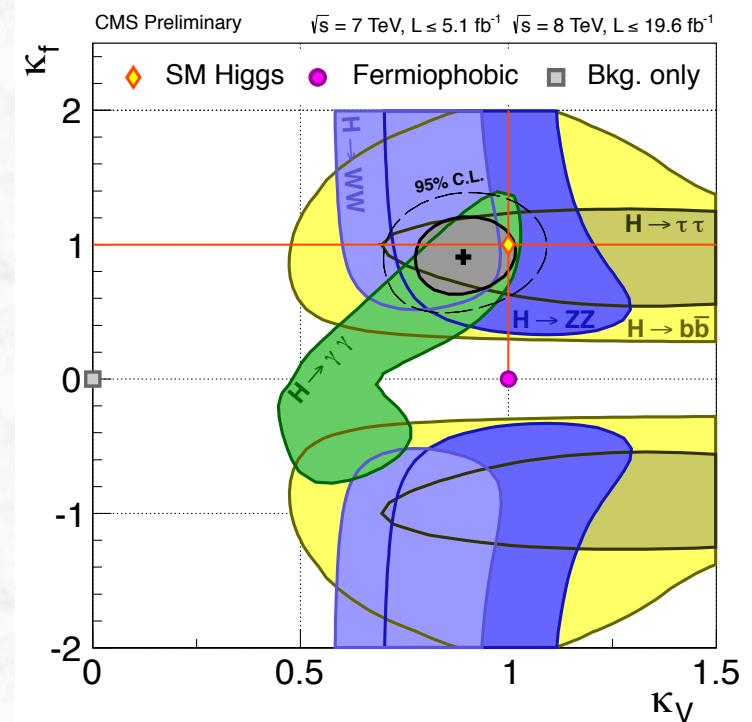

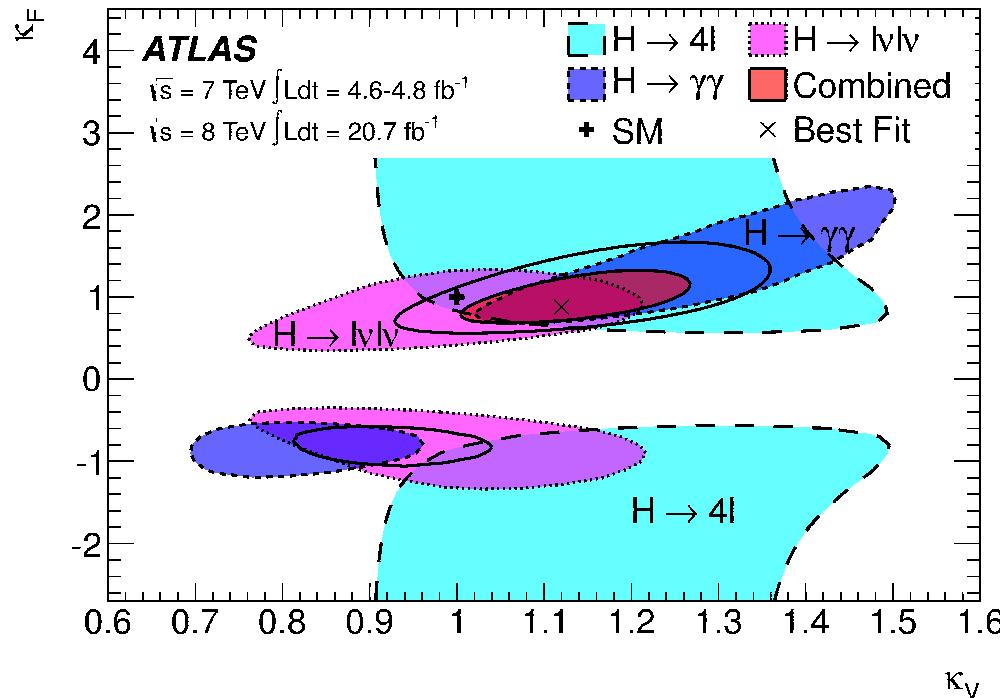

The size of the current data set is insufficient to quantify all parameters

- Assume that  $H \rightarrow \gamma\gamma$  and  $gg \rightarrow H$  loops and the total Higgs boson width depend only on  $\kappa_V$  and  $\kappa_F$  (no contributions from physics beyond the Standard Model)
- Sensitivity to relative sign between  $\kappa_F$  and  $\kappa_V$  only from interference term in  $H \rightarrow \gamma\gamma$  decays (assume  $\kappa_V > 0$ )

## (i) Couplings to fermions and bosons (cont).

Results: Data are consistent with the SM expectation;

68% CL intervals:  $\kappa_F \in [0.76, 1.18]$   
(ATLAS)  
 $\kappa_V \in [1.05, 1.22]$

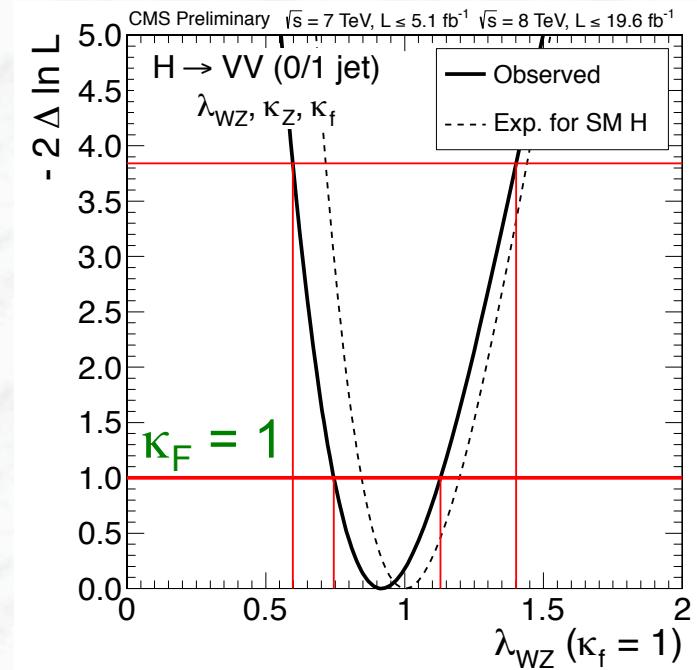

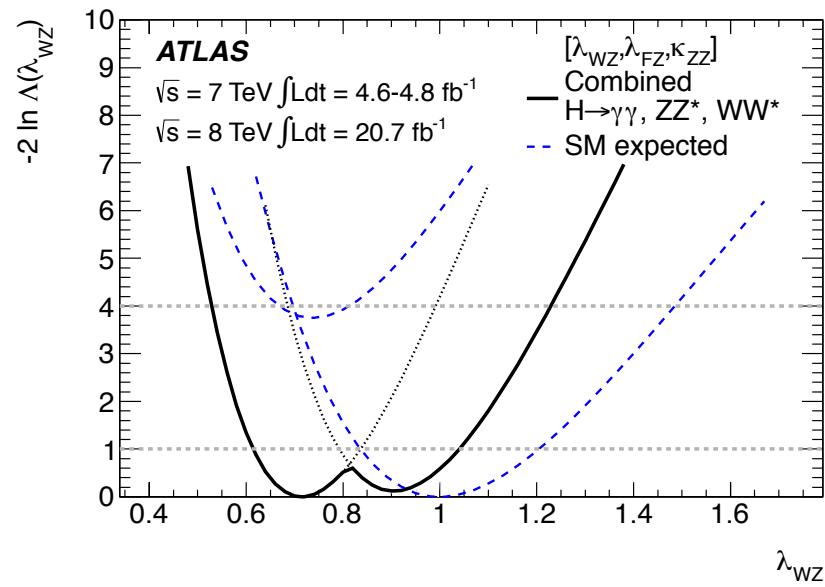

95% CL intervals:  $\kappa_F \in [0.61, 1.31]$   
(CMS)  
 $\kappa_V \in [0.74, 1.06]$

## (ii) Ratio of couplings to the W and Z bosons

- Relation between  $m_W$  and  $m_Z$  in the Standard Model requires  $\lambda_{WZ} := \kappa_W/\kappa_Z = 1$  ( $\rho$  parameter required to be 1)
- Sensitivity via VBF and VH production and  $H \rightarrow WW$  and  $H \rightarrow ZZ$  rates

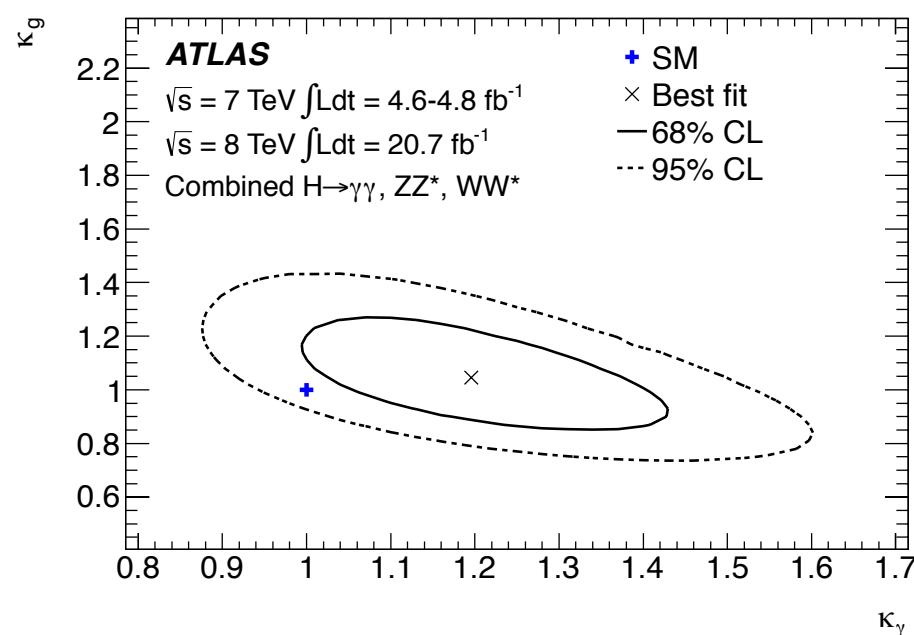

68% CL intervals:  $\lambda_{WZ} \in [0.61, 1.04]$

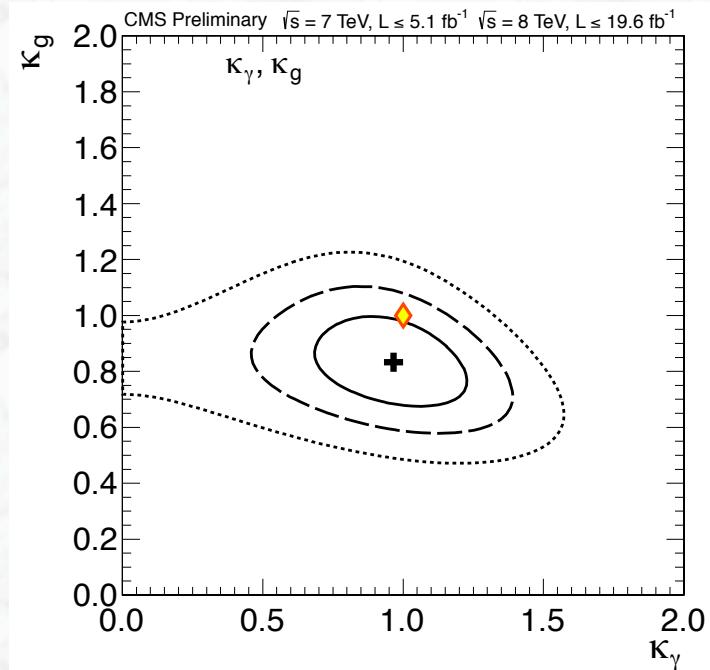

### (iii) Constraints on production and decay loops

- Test on contributions from other particles contributing to loop-induced processes
- Assume nominal couplings for all SM particles  $\kappa_i = 1$  and that the new particles do not contribute to the Higgs boson width
- Fit for effective scale factors  $\kappa_g$  and  $\kappa_\gamma$

Best fit values:  $\kappa_g = 1.04 \pm 0.14$   
(ATLAS)             $\kappa_\gamma = 1.20 \pm 0.15$

95% CL intervals:  $\kappa_\gamma \in [0.59, 1.30]$   
CMS                     $\kappa_g \in [0.63, 1.05]$

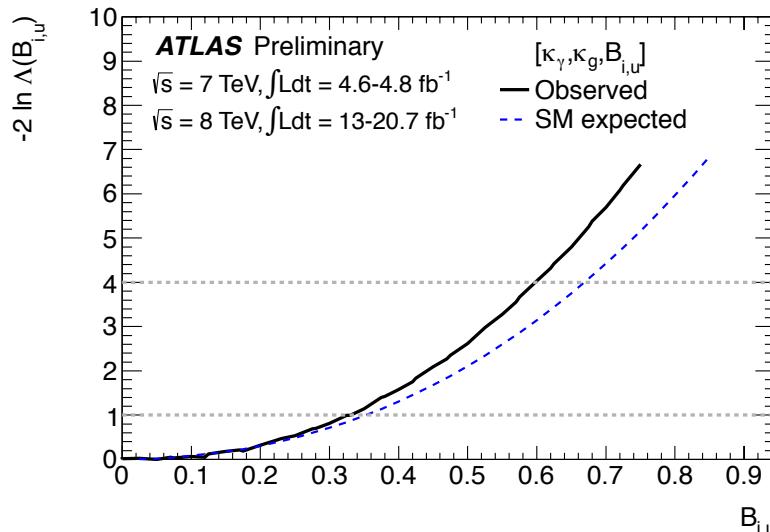

## (iv) Constraints on invisible decays ( $\text{BR}_{\text{BSM}}$ )

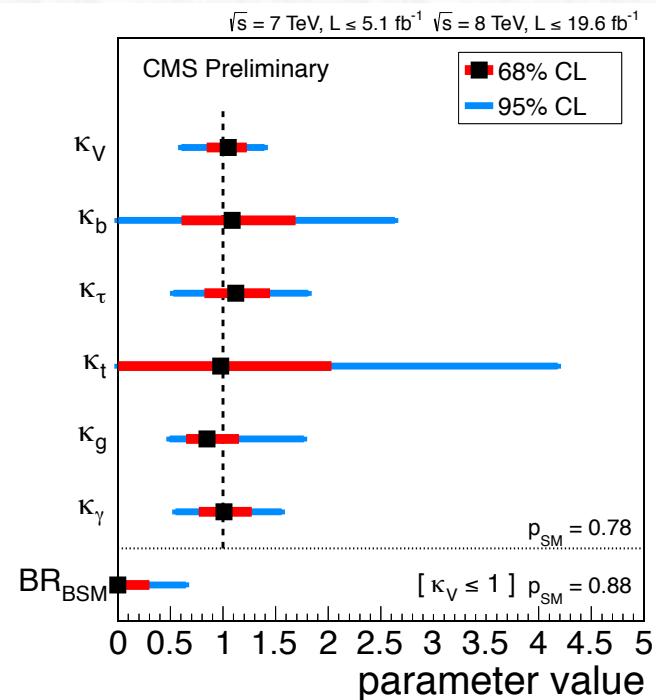

- There might be invisible decays that would increase the total decay width:
- $\Gamma_H = \Gamma_{\text{SM}} + \Gamma_{\text{BSM}}$  ( $\text{BR}_{\text{BSM}} = \Gamma_{\text{BSM}} / \Gamma_H$ )

Assume nominal couplings for all SM  
particle  $\kappa_i = 1$   
Three fitted parameters:  $k_g$ ,  $k_\gamma$  and  $\text{BR}_{\text{BSM}}$

$\text{BR}_{\text{BSM}} < 0.60$  (95% CL)  
0.67 (expected)

Assume  $k_V \leq 1$  (motivated by EWSB)  
Fit for seven parameters

$\text{BR}_{\text{BSM}} < 0.64$  (95% CL)  
0.66 (expected)

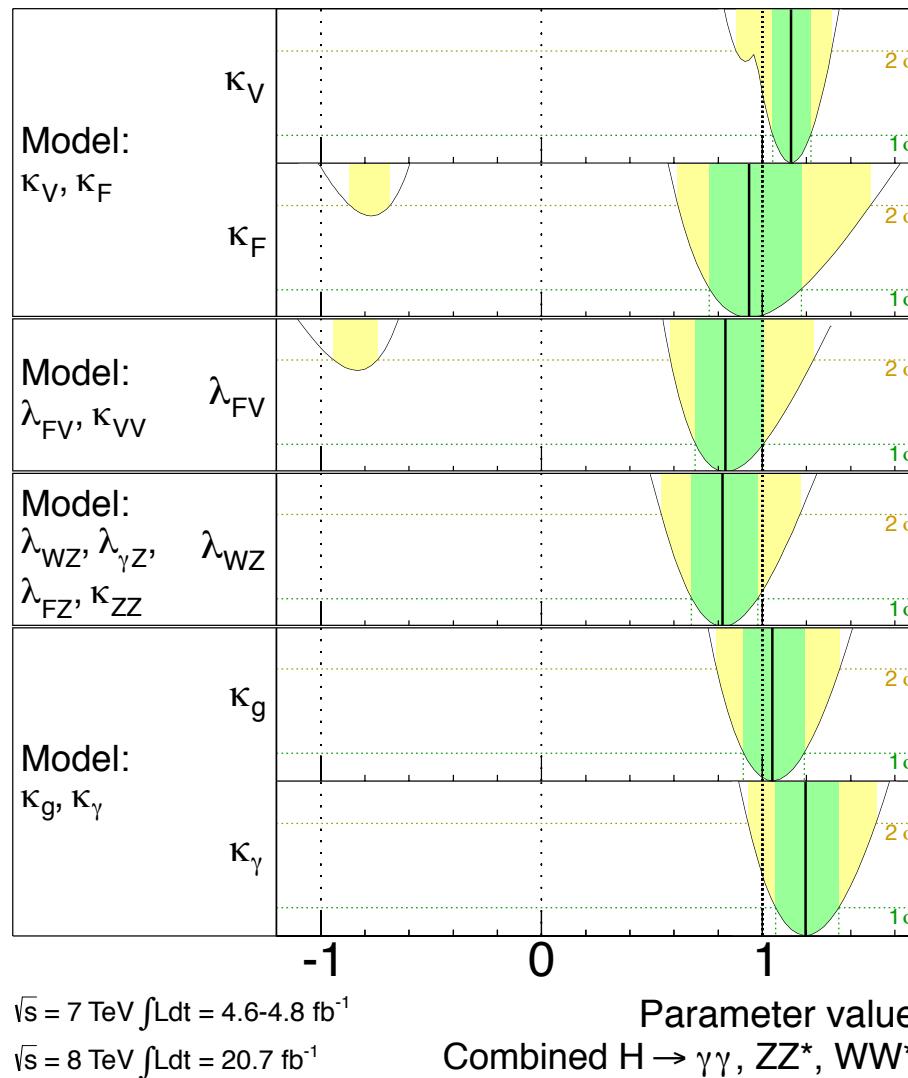

# Summary of coupling scale factor measurements

**ATLAS**

$m_H = 125.5 \text{ GeV}$

Total uncertainty

$\pm 1\sigma$        $\pm 2\sigma$

$$\lambda_{FV} = \kappa_F / \kappa_V$$

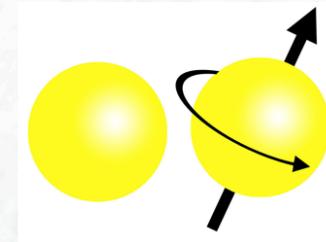

$$\kappa_{VV} = \kappa_V \kappa_V / \kappa_H$$

If assumption of no contributions from new particles to the Higgs boson width is relaxed, only the ratio of  $\kappa_F/\kappa_V$  can be measured

Extended fit, decouple  $H \rightarrow \gamma\gamma$  event rate from the measurement of  $\lambda_{WZ}$

- $\kappa_V$  constrained at  $\pm 10\%$  level
- Couplings to fermions indirectly observed ( $5\sigma$ )
- $\kappa_W/\kappa_Z$  found to be consistent with one
- No evidence for significant anomalous contributions to the  $gg \rightarrow H$  and  $H \rightarrow \gamma\gamma$  loops  
(for fixed nominal couplings of SM particles and no BSM contributions to Higgs width)

# Spin and Parity

*Wolfgang Pauli and Niels Bohr studying  
the motion of a gyro  
(1952, at the opening of the institute for  
theoretical physics in Lund /Sweden)*

Standard Model Higgs boson:  $J^P = 0^+$

→ strategy is to falsify other hypotheses  
 $(0^-, 1^-, 1^+, 2^-, 2^+)$

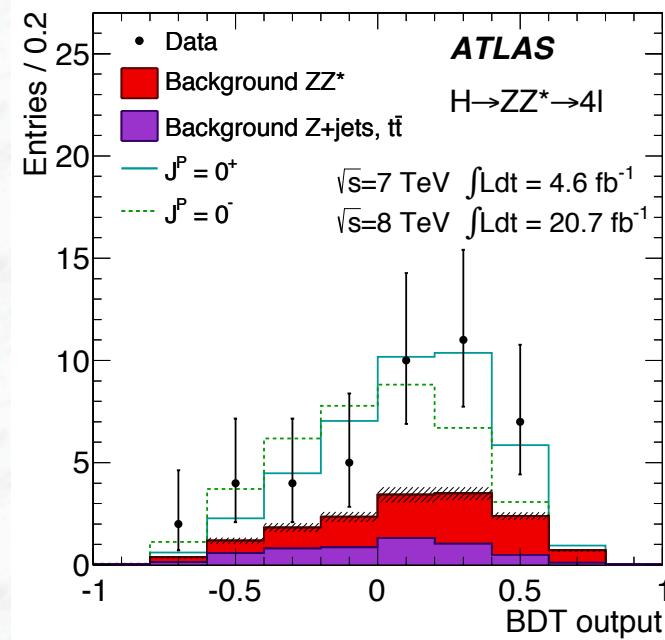

and demonstrate consistency with the  $0^+$   
hypothesis

Spin 1: strongly disfavoured by observed  
 $H \rightarrow \gamma\gamma$  decays, Landau-Yang theorem

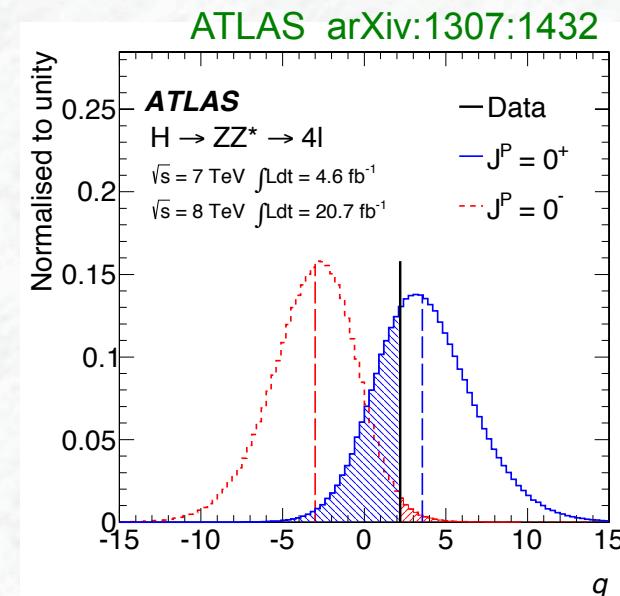

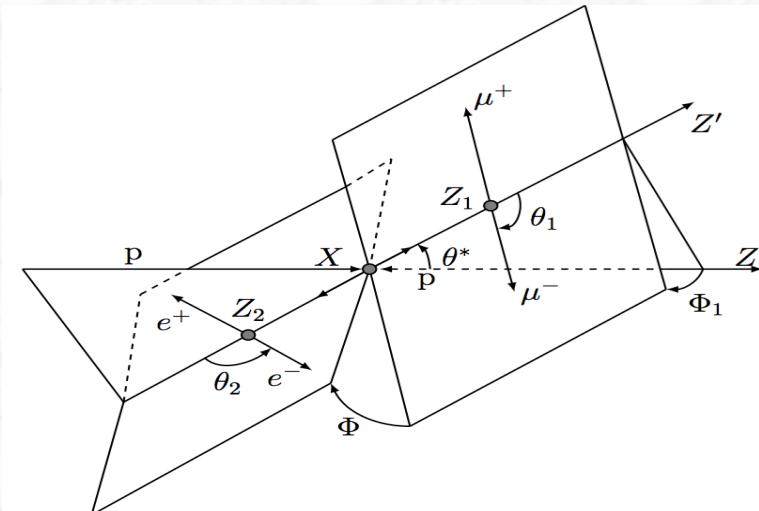

## $J^P = 0^-$ versus $J^P=0^+$

- Sensitive variables:
  - Masses of the two Z bosons
  - Production angle  $\theta^*$
  - Four decay angles  $\Phi_1$ ,  $\Phi$ ,  $\theta_1$  and  $\theta_2$
- Perform multivariate analysis  
(Boosted decision tree, similar sensitivity using matrix-element method)

$(H \rightarrow ZZ^{(*)} \rightarrow 4\ell \text{ events})$

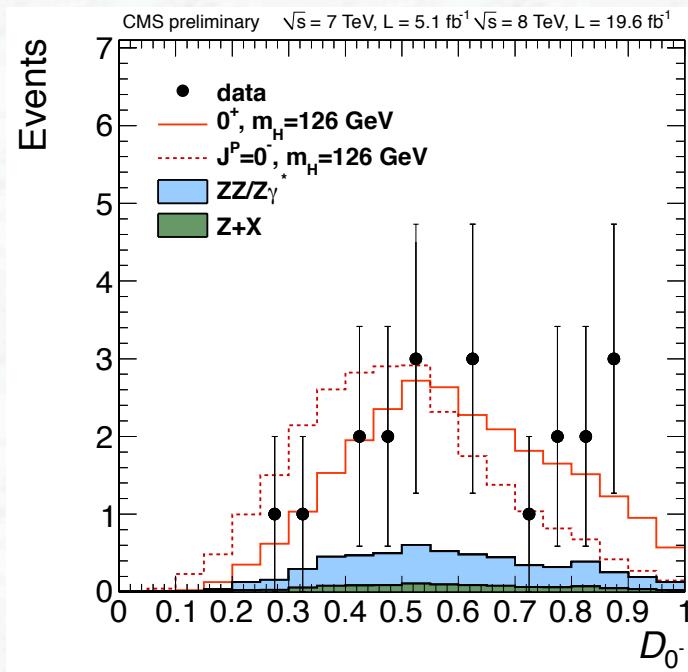

Exclude  $J^P=0^-$  (vs.  $0^+$ ) with 97.8% CL

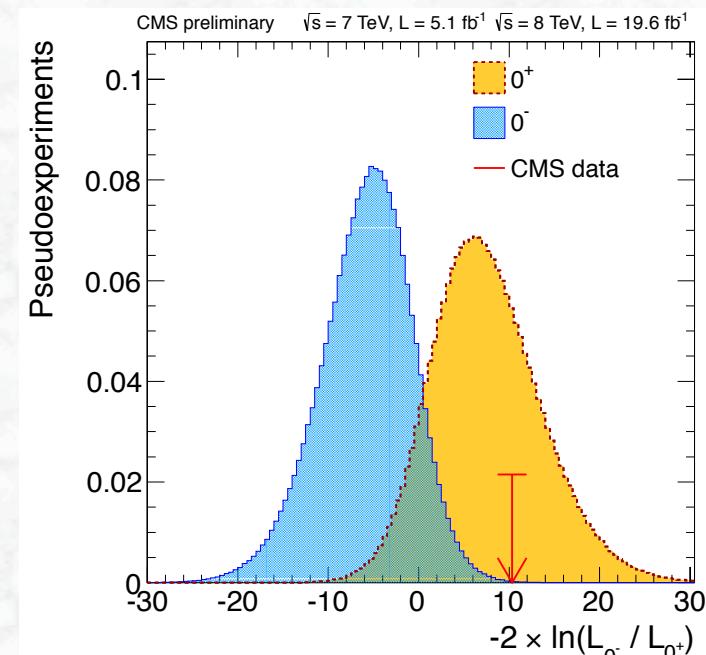

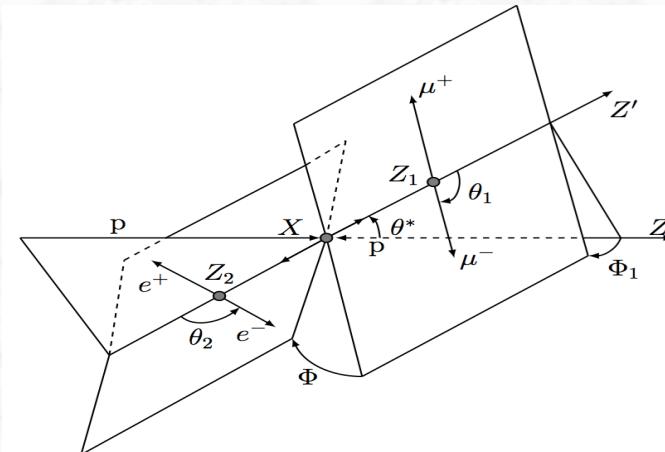

## $J^P = 0^-$ versus $J^P=0^+$

- Sensitive variables:
  - Masses of the two Z bosons
  - Production angle  $\theta^*$
  - Four decay angles  $\Phi_1, \Phi, \theta_1$  and  $\theta_2$
- Matrix-Element based discriminant  $D_{JP}$

CMS PAS HIG-13-005

## (H $\rightarrow ZZ^{(*)} \rightarrow 4\ell$ events)

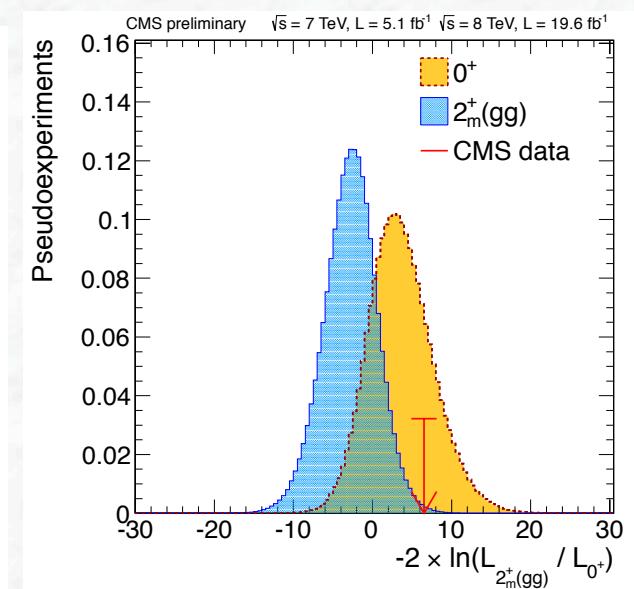

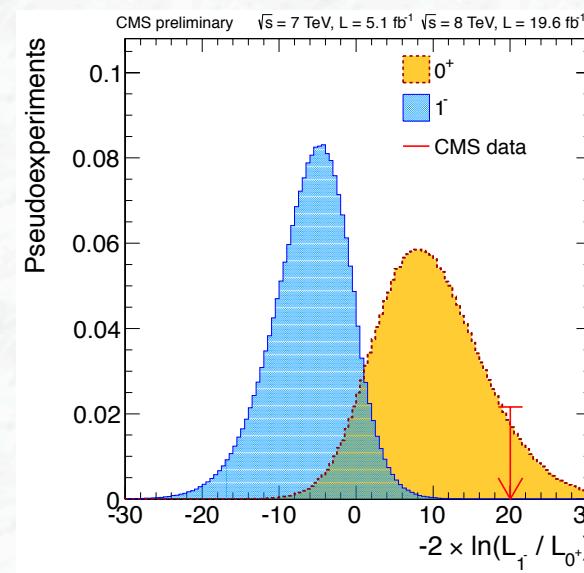

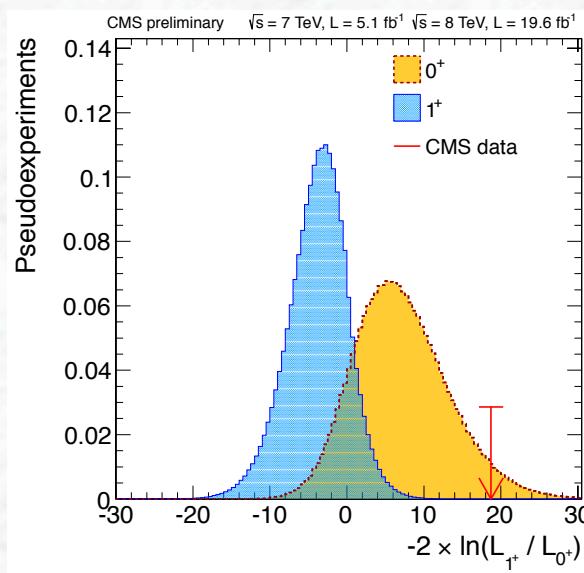

Exclude  $J^P=0^-$  (vs.  $0^+$ ) with 99.8% CL

# Further CMS results based on $H \rightarrow ZZ^{(*)} \rightarrow 4\ell$ decays

CMS PAS HIG-13-005

$J^P$	production	comment	expect ( $\mu=1$ )	obs. $0^+$	obs. $J^P$	$CL_s$
$0^-$	$gg \rightarrow X$	pseudoscalar	$2.6\sigma$ ( $2.8\sigma$ )	$0.5\sigma$	$3.3\sigma$	0.16%
$0_h^+$	$gg \rightarrow X$	higher dim operators	$1.7\sigma$ ( $1.8\sigma$ )	$0.0\sigma$	$1.7\sigma$	8.1%
$2_{mgg}^+$	$gg \rightarrow X$	minimal couplings	$1.8\sigma$ ( $1.9\sigma$ )	$0.8\sigma$	$2.7\sigma$	1.5%
$2_{mq\bar{q}}^+$	$q\bar{q} \rightarrow X$	minimal couplings	$1.7\sigma$ ( $1.9\sigma$ )	$1.8\sigma$	$4.0\sigma$	<0.1%
$1^-$	$q\bar{q} \rightarrow X$	exotic vector	$2.8\sigma$ ( $3.1\sigma$ )	$1.4\sigma$	> $4.0\sigma$	<0.1%
$1^+$	$q\bar{q} \rightarrow X$	exotic pseudovector	$2.3\sigma$ ( $2.6\sigma$ )	$1.7\sigma$	> $4.0\sigma$	<0.1%

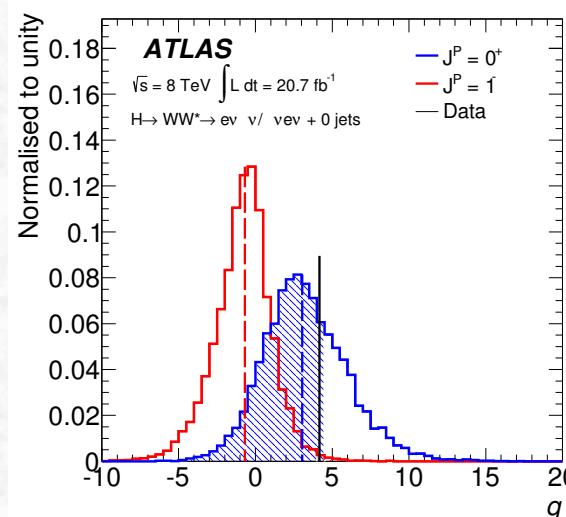

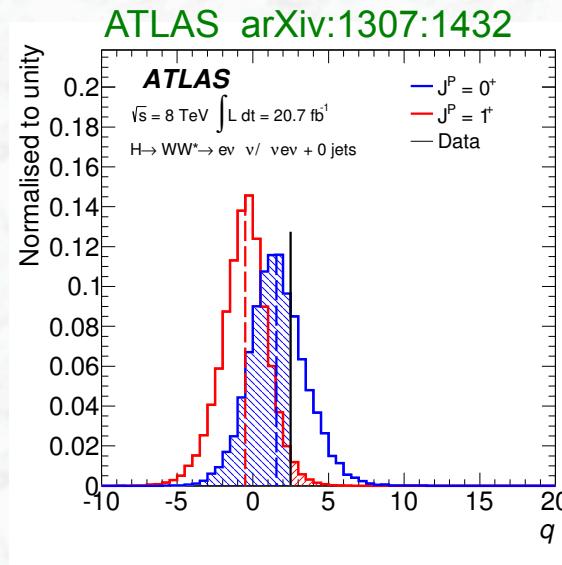

$J^P = 1^{+/-}$  versus  $J^P=0^+$

( $H \rightarrow ZZ^*$  and  $H \rightarrow WW^*$  events)

- $H \rightarrow ZZ^*$ , as before: BDT separation based on masses and angles
- $H \rightarrow WW^*$ :  $m_{\ell\ell}$ ,  $\Delta\phi_{\ell\ell}$ ,  $p_T(\ell\ell)$ ,  $m_T$  carry information on spin, combine these variables using a BDT analysis

$H \rightarrow WW^*$

$$q = \log \frac{\mathcal{L}(J^P = 0^+, \hat{\mu}_{0^+}, \hat{\theta}_{0^+})}{\mathcal{L}(J^P_{\text{alt}}, \hat{\mu}_{J^P_{\text{alt}}}, \hat{\theta}_{J^P_{\text{alt}}})}$$

$q$  = test statistics to discriminate between two spin hypotheses

	$p_0(0^+)$	CL ( $1^+$ ) Exclusion	$p_0(0^+)$	CL ( $1^-$ ) Exclusion
$H \rightarrow ZZ^*$	0.55	99.8%	0.1	94%
$H \rightarrow WW^*$	0.70	92%	0.66	98%
Combination	0.62	99.97%	0.33	99.7%

## $J^P = 2^+$ versus $J^P=0^+$ ( $H \rightarrow \gamma\gamma$ , $H \rightarrow ZZ^*$ , and $H \rightarrow WW^*$ events)

ATLAS arXiv:1307:1432

- Spin 2: consider graviton-like tensor, equivalent to a Kaluza-Klein graviton  
(Y. Gao et al, Phys. Rev. D81 (2010) 075022)
- Production via gluon fusion and qq annihilation possible;  
Studies are performed as a function of the qq annihilation fraction ( $f_{qq}$ )
- Specific model  $2^+_m$ :  
minimal couplings to SM particles  
( $f_{qq} = 4\%$  at LO, however, large uncertainties)

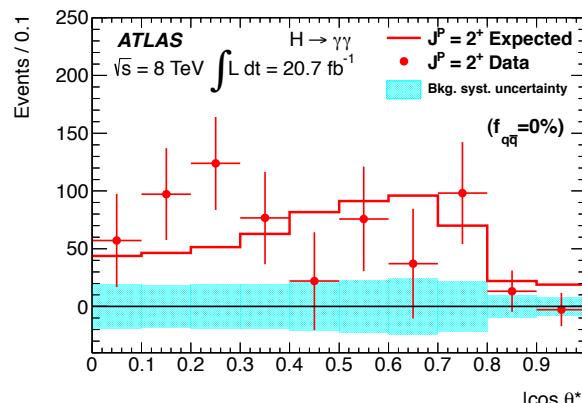

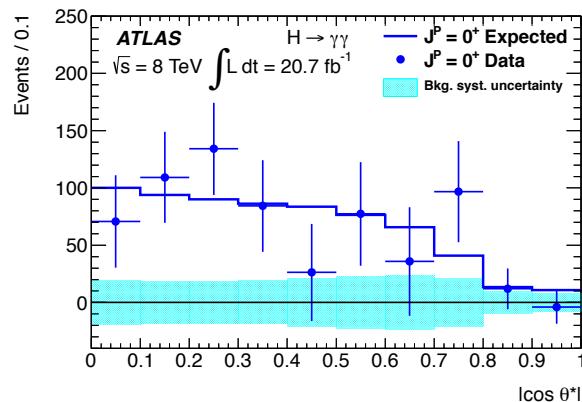

- Observed exclusion (combination of  $\gamma\gamma$ ,  $ZZ^*$  and  $WW^*$ ) of  $J^P = 2^+$  (versus the SM  $J^P = 0^+$ ) exceeds 99.9%, independent of  $f_{qq}$ ;  
Complementary behaviour of the different channels

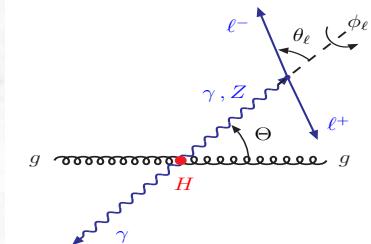

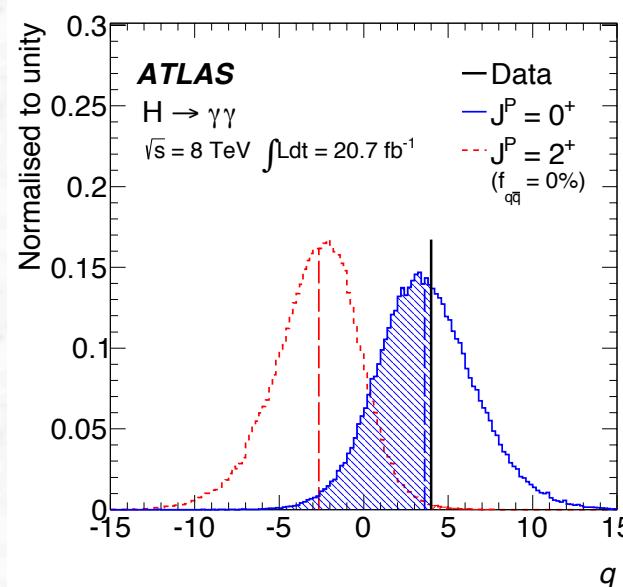

## Example: $H \rightarrow \gamma\gamma$ contribution

Use decay angle w.r.t. collision axis

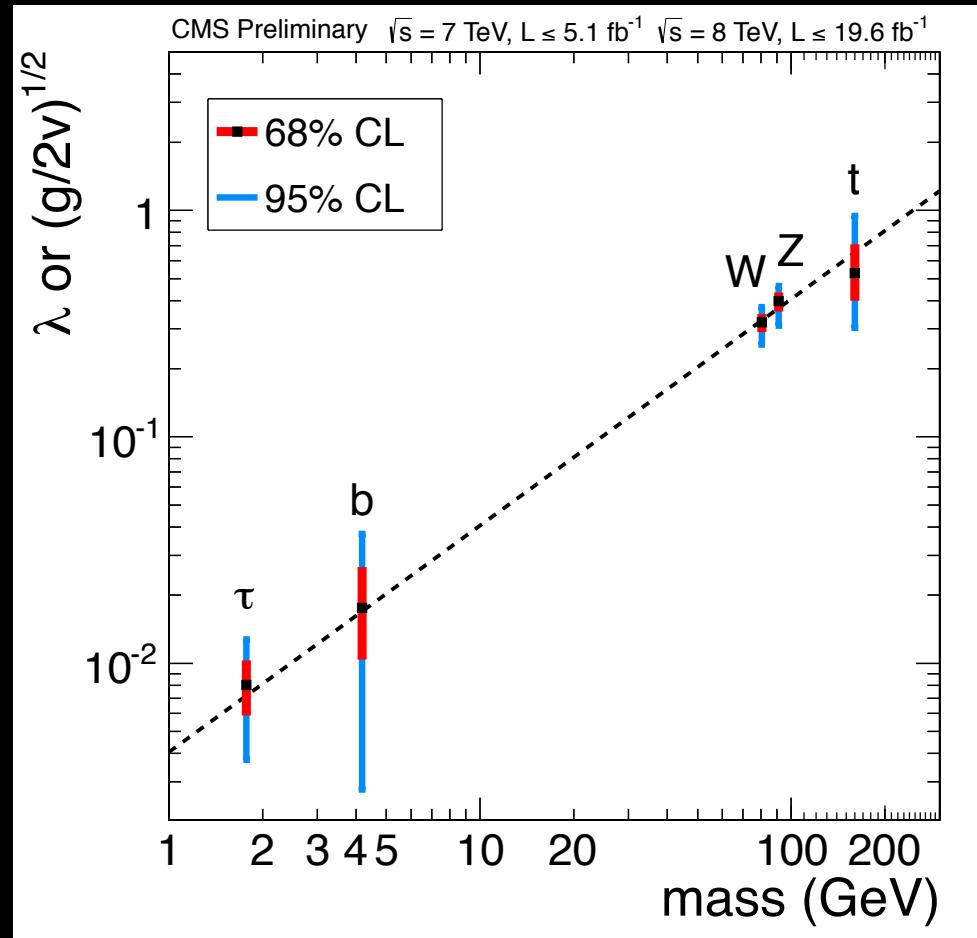

ATLAS arXiv:1307:1432

Exclude  $J^P=2^+$  (produced via gluon fusion,  $f_{qq}=0$ )  
(vs.  $0^+$ ) via  $H \rightarrow \gamma\gamma$  decays with 99.3% CL

$\cos \theta^*$  distribution in signal region,  
after background subtraction

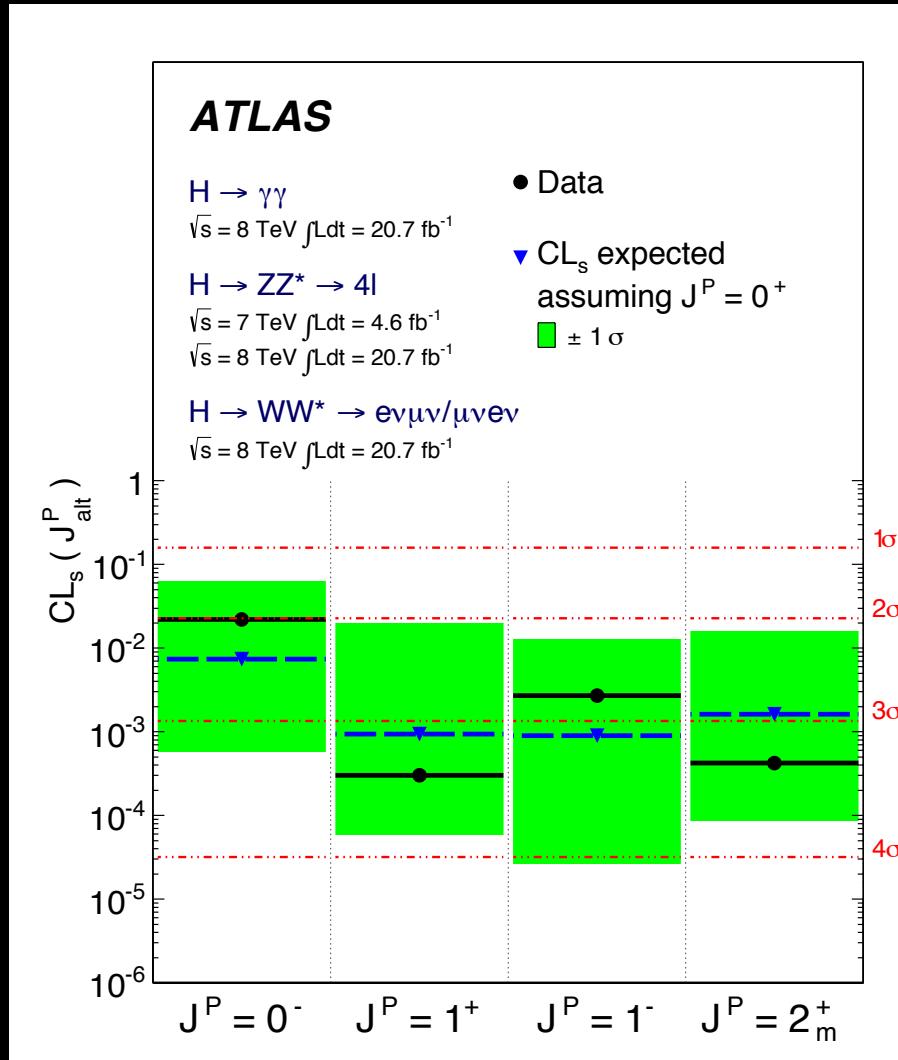

# CMS summary on coupling results

CMS PAS HIG-13-005

*"The consistency of the couplings of the observed boson with those predicted for the Standard Model Higgs boson is tested in various ways, and no significant deviations are found."*

# ATLAS summary on spin results

ATLAS arXiv:1307:1432

*"These studies provide evidence for the spin-0 nature of the Higgs boson, with positive parity being strongly preferred."*

# Summary

- A milestone discovery announced in July 2012
- Signals have been impressively confirmed with additional data;  
The discovery phase has turned into the measurement phase
- ATLAS and CMS data are consistent with the expectations for the Standard Model Higgs boson (within present uncertainties)
  - Production rates and coupling strengths
  - Evidence for VBF production
  - Evidence for spin-0 ( $0^-$  disfavoured)
- Exciting times ahead of us to study the Higgs boson with higher precision (> 2015) and to look for surprises (deviations? more Higgs bosons? ...)

# End of lectures
