

# Granularity of ATLAS Tile Calorimeter studied through Geant4 simulations

Anabel Romero  
Universidad Simón Bolívar

# ATLAS and the Tile Calorimeter

# Coordinates

Cylindrical  
coordinates:  
 $Z, r, \Phi$

Spherical  
coordinates:  
 $\rho, \Phi, \theta$

Instead of  $\theta$ , we use  $\eta$ ,  
which is defined as:

$$\eta = -\ln \left( \operatorname{tg} \left( \frac{\theta}{2} \right) \right)$$

# Module

**Fig. 2.** Mechanical structure of a TileCal module, showing the slots in the iron for scintillating tiles and the method of light collection by WLS fibers to PMTs. The holes for radioactive source tubes that traverse the module parallel to the colliding beams are also shown.

# Granularity

64 modules  $\rightarrow$   
 $\Delta\Phi = 2\pi/64 = 0.1 \text{ rad}$

Cells defined so  
 that  $\Delta\eta = 0.1 \text{ rad}$

										$\phi$	$\phi.1$	$\phi.2$	$\phi.3$	$\phi.4$	$\phi.5$	$\phi.6$	$\phi.7$

# Why is granularity important or interesting?

Example:

- Boxes represent detectors.
- Particle Red and particle Blue hit the detectors and deposit their energies.
- Energy distribution is as shown below.

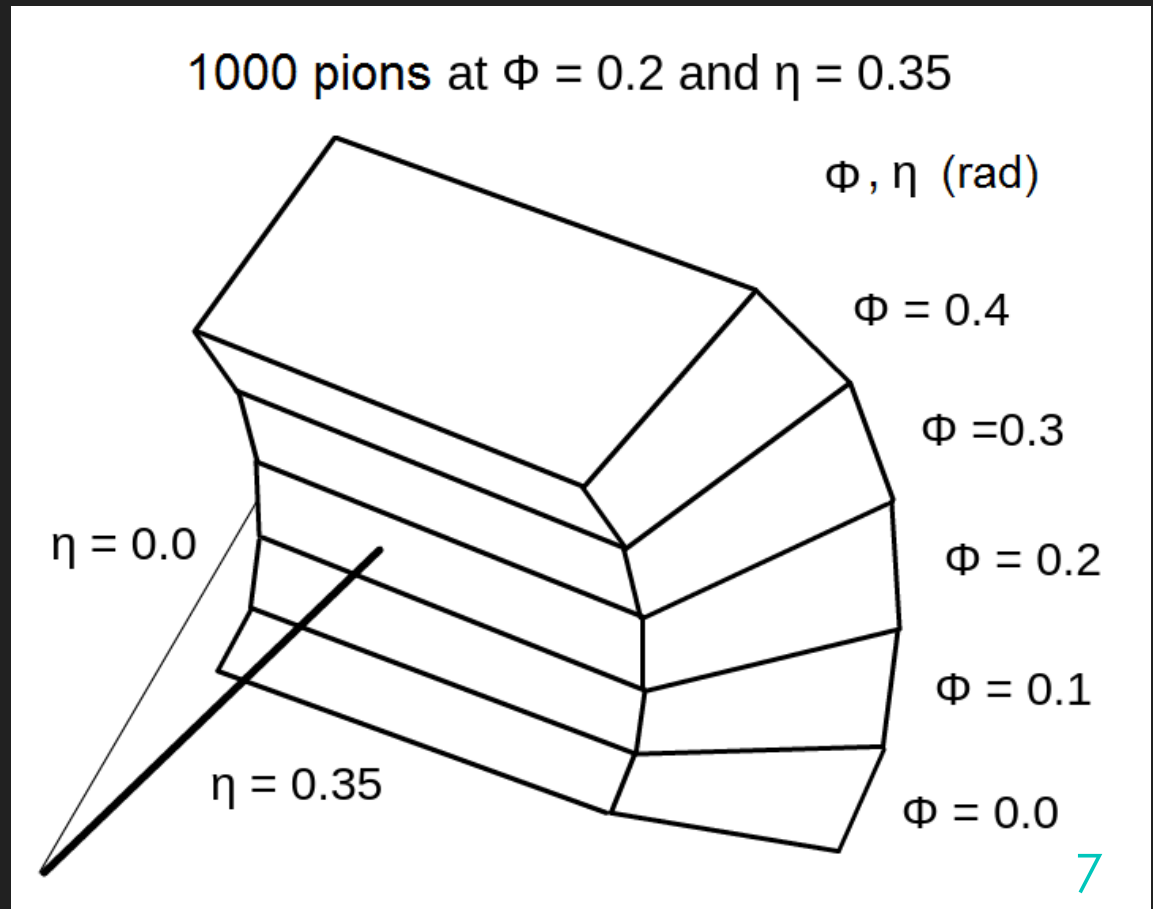

Which configuration of detectors would allow us to know the energy of each particle with least error?

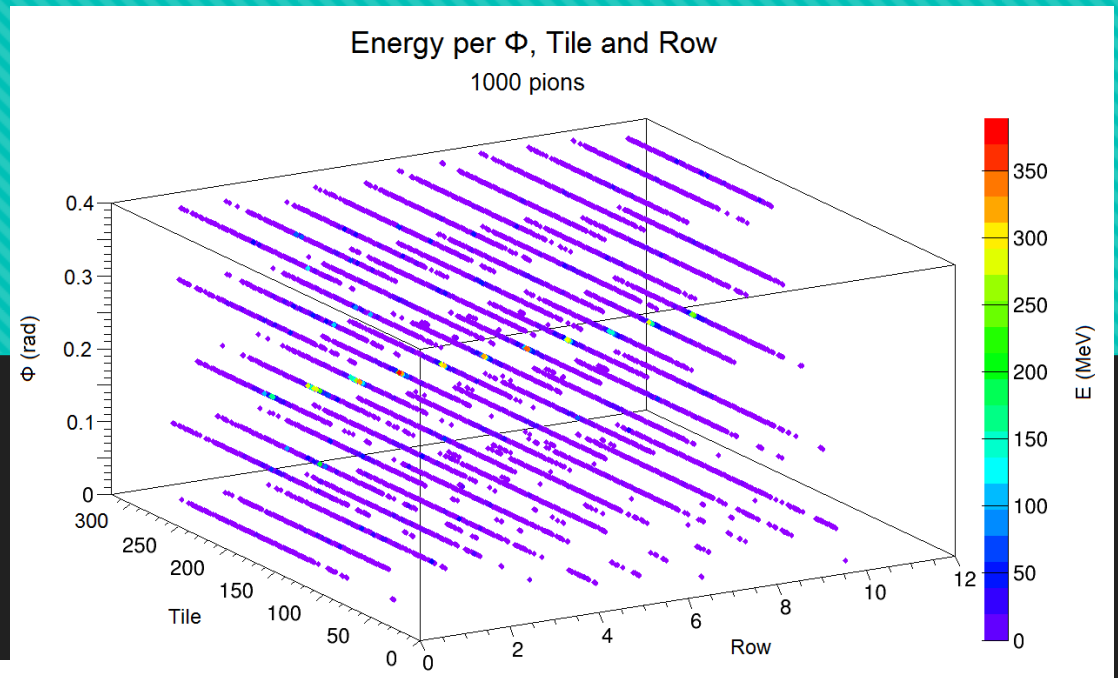

# Simulations

Objectives:

- Simulate different granularities  $\Delta\Phi \times \Delta\eta$ .
- Obtain partial energy deposited within a radius:  
$$\Delta R = \sqrt{\Delta\phi^2 + \Delta\eta^2}$$
for different granularities.

# Results

Energy per  $\Phi$  and  $\eta$  for  $\Delta\eta = 0.2$

Energy per  $\Phi$  and  $\eta$  for  $\Delta\eta = 0.1$

Energy per  $\Phi$  and  $\eta$  for  $\Delta\eta = 0.05$

Energy per  $\Phi$  and  $\eta$  for  $\Delta\eta = 0.025$

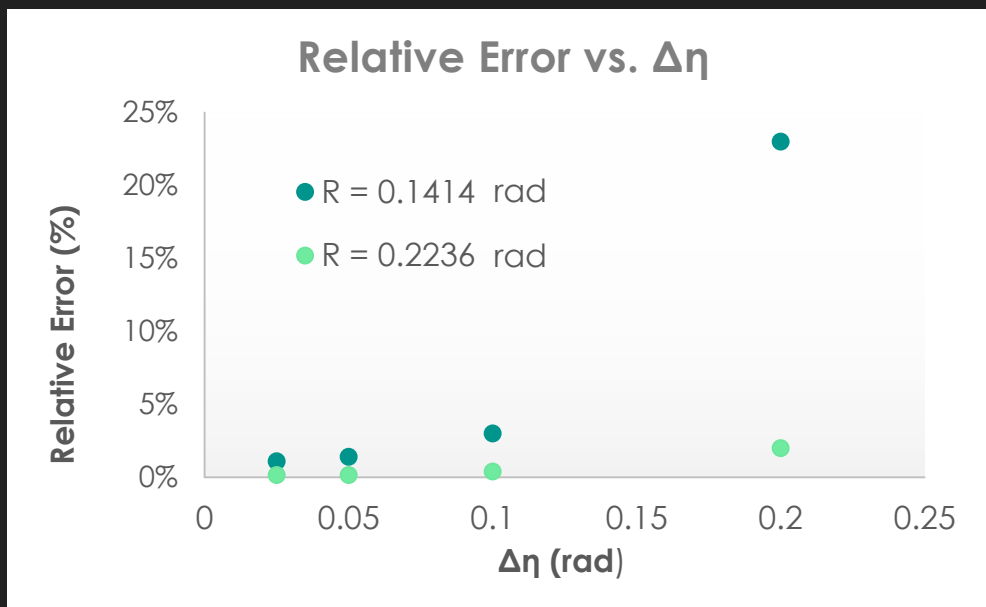

**Table 1. Partial energy deposited within a radius  $\Delta R = \sqrt{\Delta\phi^2 + \Delta\eta^2}$  for 1000 pions**

	$\Delta\eta = 0.2$ rad	$\Delta\eta = 0.1$ rad	$\Delta\eta = 0.05$ rad	$\Delta\eta = 0.025$ rad
R = 0.1414 rad	$1300 \pm 300$ GeV	$1540 \pm 40$ GeV	$1557 \pm 22$ GeV	$1561 \pm 17$ GeV
R = 0.2236 rad	$1550 \pm 30$ GeV	$1574 \pm 6$ GeV	$1578.2 \pm 2.7$ GeV	$1578.6 \pm 2.3$ GeV

**Table 2. Relative error in energy deposited within a radius  $\Delta R = \sqrt{\Delta\phi^2 + \Delta\eta^2}$  for 1000 pions**

	$\Delta\eta = 0.2$ rad	$\Delta\eta = 0.1$ rad	$\Delta\eta = 0.05$ rad	$\Delta\eta = 0.025$ rad
R = 0.1414 rad	23 %	3%	1.4 %	1.1 %
R = 0.2236 rad	2 %	0.4 %	0.17 %	0.15 %

# Conclusions

- Reducing the granularity would reduce the error in partial energy measurements.
- With half the current granularity, the percentage error would decrease by a factor of 2.2.
