

CERN Benchmarking Cluster

Alex Iribarren
CERN IT/FIO

HEPiX Spring 2008
8 May 2008

The Goal

- To provide a stable benchmarking environment
- Help the Benchmarking WG establish a standard benchmark
- Help the experiments compare their code to this benchmark

Fabric
Infrastructure
and
Operations

The Machines

- 11 machines (3 temporary)
 - From Intel Xeon Noconas (2005, Netburst microarchitecture, single core)
 - ... to Intel Xeon Harpertowns (2008, Core microarchitecture, quad core)
- Representative selection of our computer center
- Intel CPUs
 - (except for 2 AMDs)
- 2 GB RAM per core
 - (except for 3 machines)
- All 64bit capable

All The Machines

- Lxbench01
 - 2x Nocona 2.8 GHz/1 MB, 2x 1GB
- Lxbench02
 - 2x Irvindale 2.8 GHz/2 MB, 4x 1GB DDR333
- Lxb6106
 - 2x Irvindale 2.8 GHz/2 MB, 2x 1GB DDR333
- Lxb7006
 - 2x Irvindale 2.8GHz/2 MB, 2x 1GB DDR-II 400
- Lxbench03
 - 2x Opteron 275 2.2GHz/2 MB, 4x 1GB DDR-II 400

All The Machines, cont.

- Lxbench04
 - 2x Woodcrest 2.66 GHz/4 MB, 8x 1GB DDR-II 533
- Lxb7609
 - 2x Woodcrest 3.00 GHz/4 MB, 4x 2GB DDR-II 667
- Lxbench05
 - 2x Woodcrest 3.00 GHz/4 MB, 8x 1GB DDR-II 533
- Lxbench06
 - 2x Opteron 2218 rev. F 2.6GHz/2 MB, 8x 1GB DDR-II 667
- Lxbench07
 - 2x Clovertown 2.33 GHz/2x 4MB, 8x 2GB DDR-II 667
- Lxbench08
 - 2x Harpertown E5410 2.33 GHz/2x 4M, 8x 2GB DDR-II 667

About SPEC CPU

- Industry standard CPU performance benchmark
 - SPECint and SPECfp
- CPU2000 no longer maintained, CPU2006 new standard
 - Longer running time
 - Higher memory usage (2GB per benchmark in 64-bit)
 - Lower FP content in SPECint (0.1% vs. 1%)
- Two different modes:
 - Speed and Rate

The Benchmarks

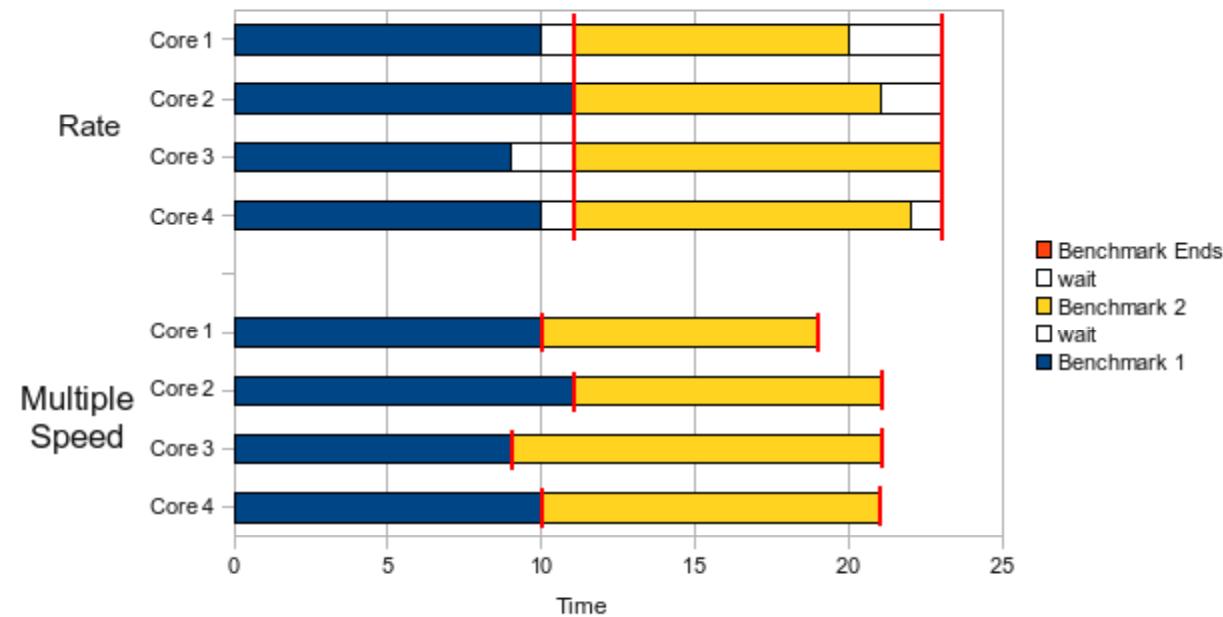

- SPECint2000
 - Conservative flags (-O2 -fPIC -pthreads)
 - 64bit
 - Parallel
- SPECint2006
 - 32bit and 64bit
 - Rate and parallel
- SPECfp2006
 - 32bit and 64bit
 - Rate and parallel

The Reasons

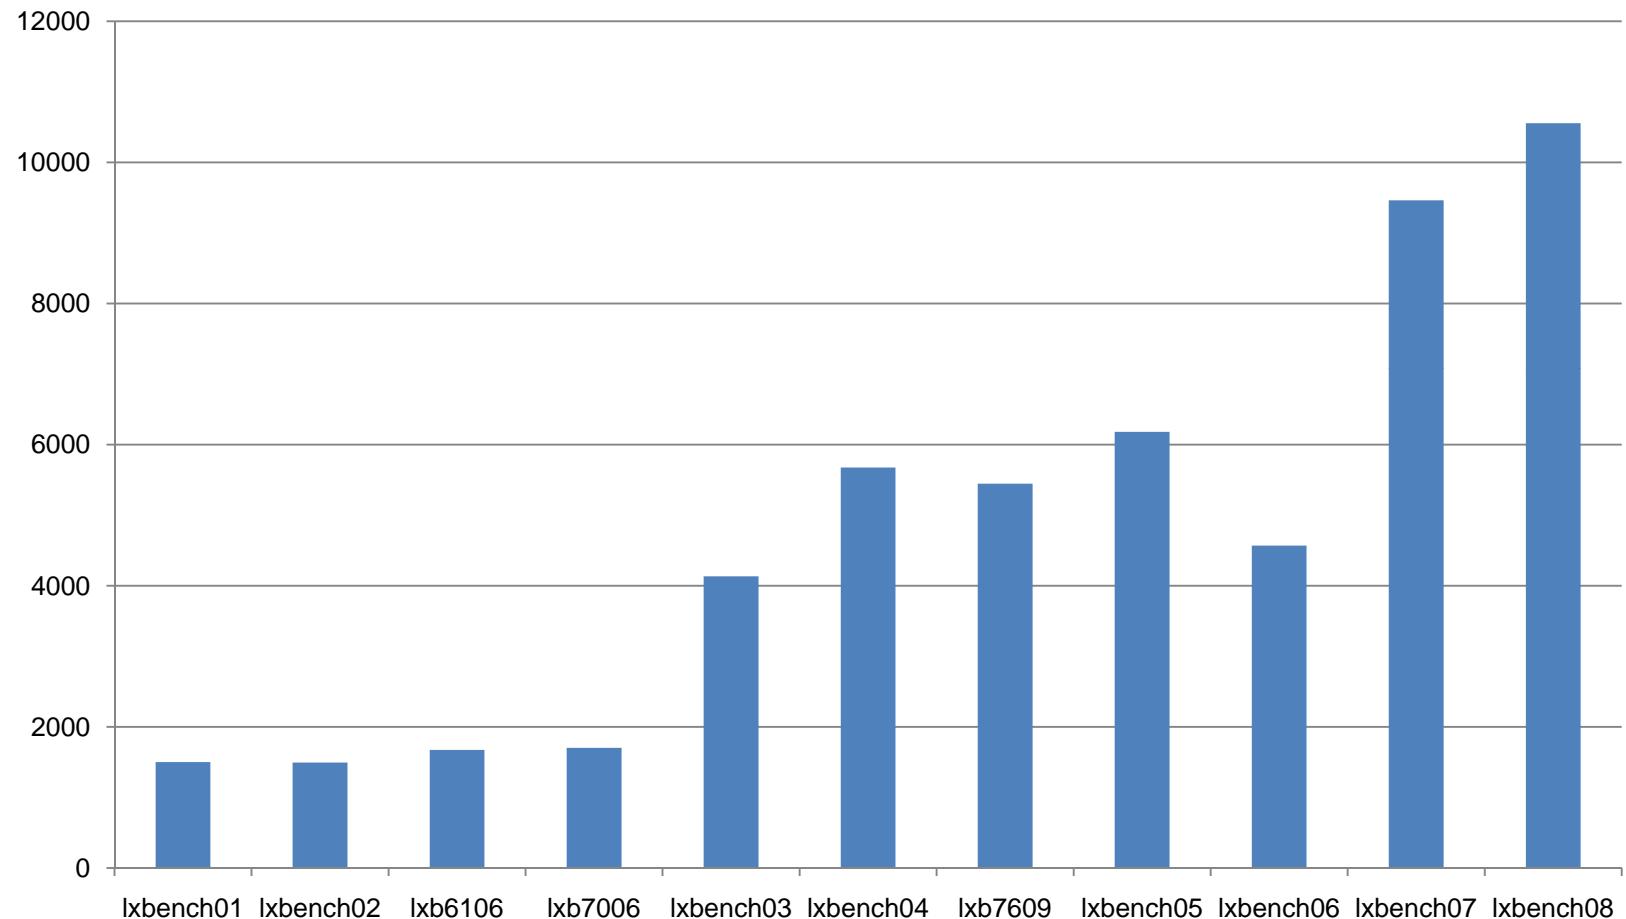

- SPEC.org results aren't representative
- Flags as recommended by LCG/SPI
- 32-bit vs. 64-bit
- Speed vs. rate vs. parallel

SPECint2000 Results

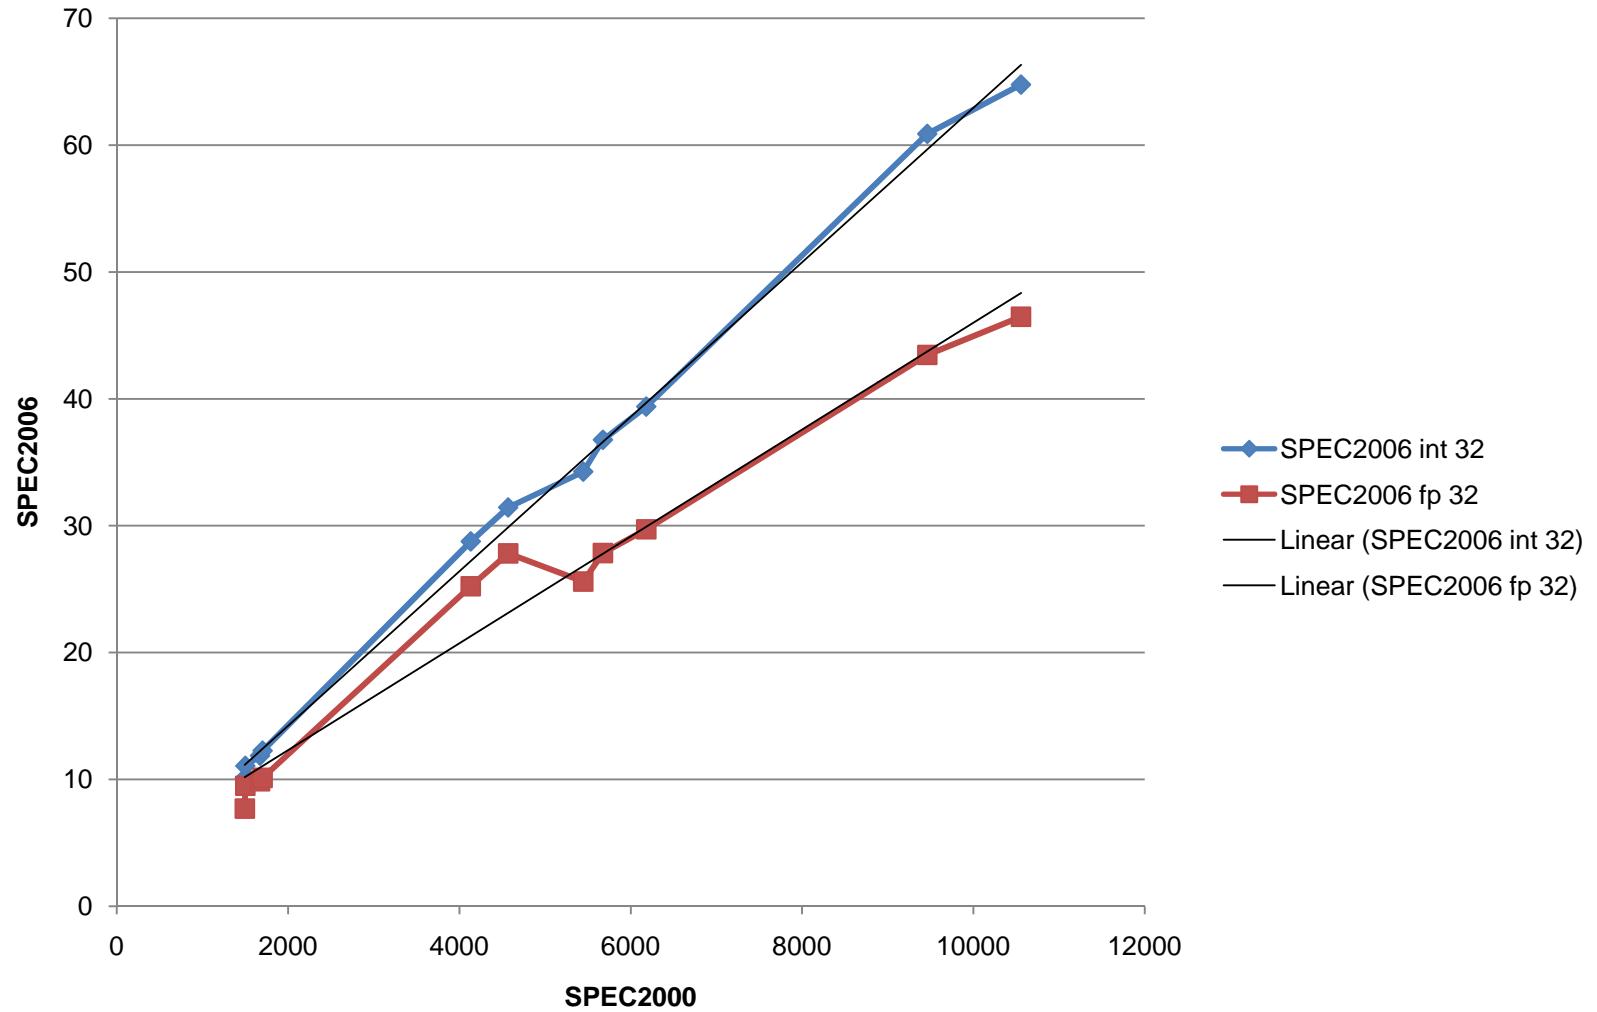

CERN IT
Department

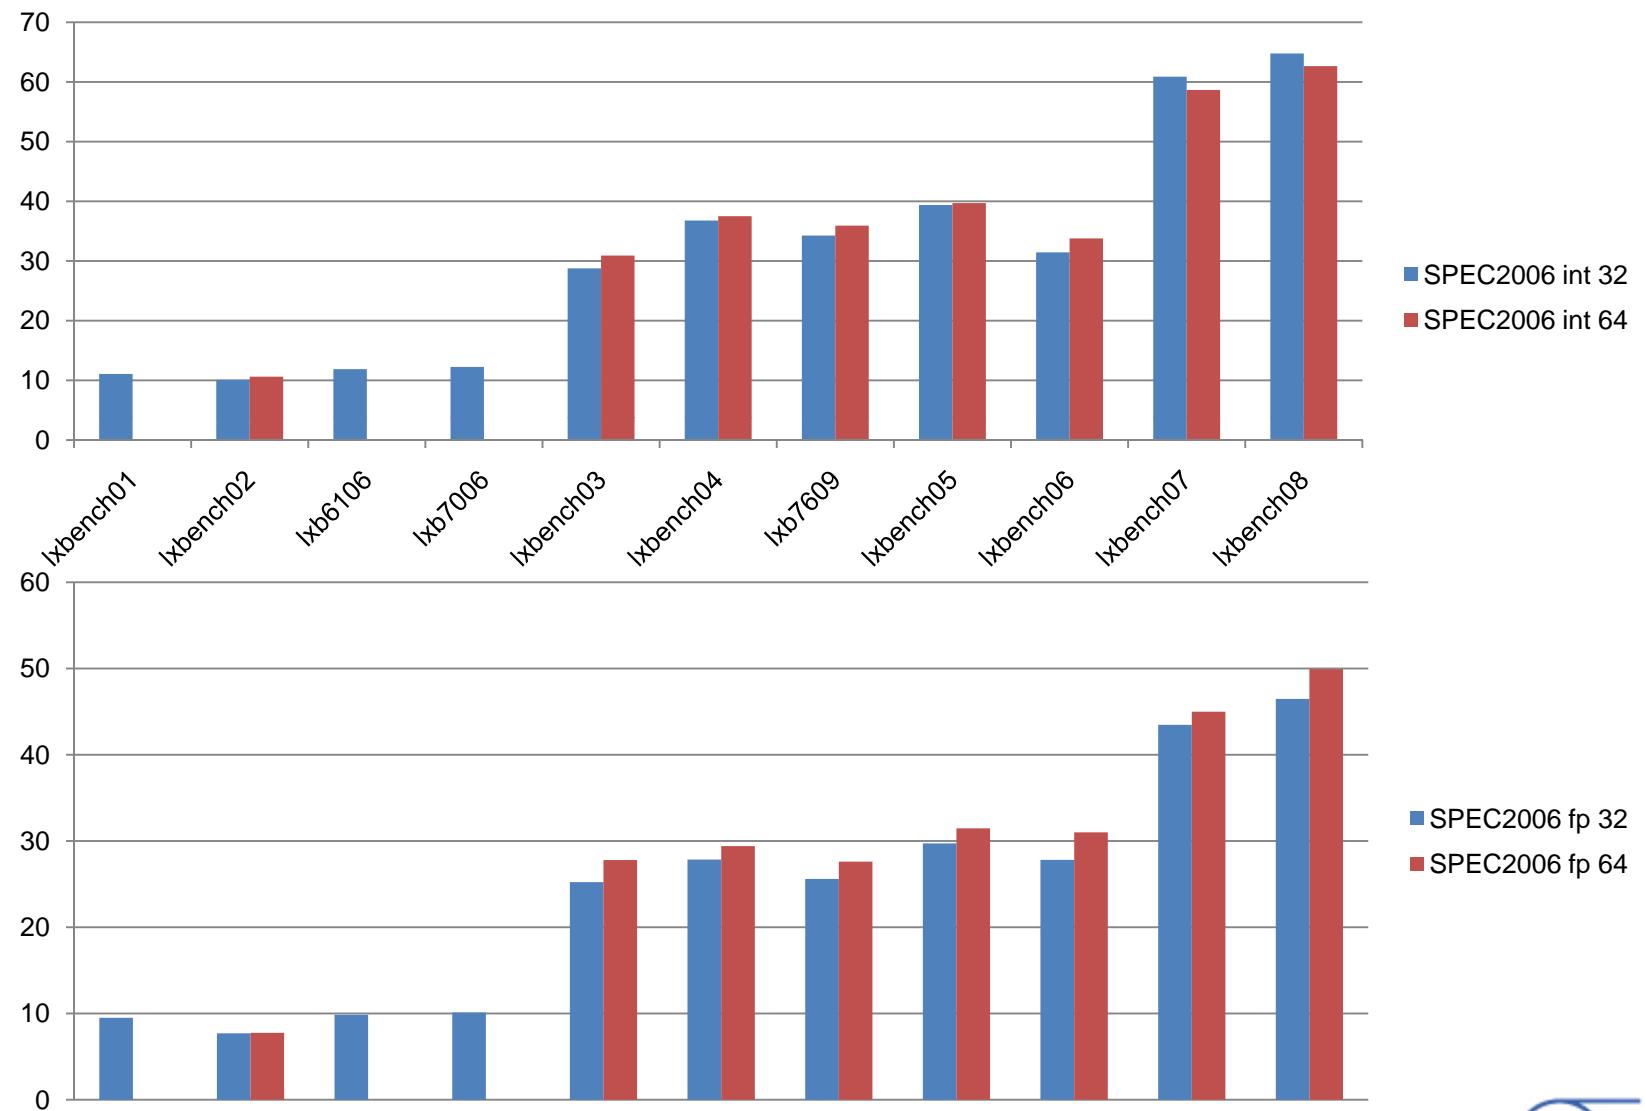

SPEC2000 vs. SPEC2006

CERN IT
Department

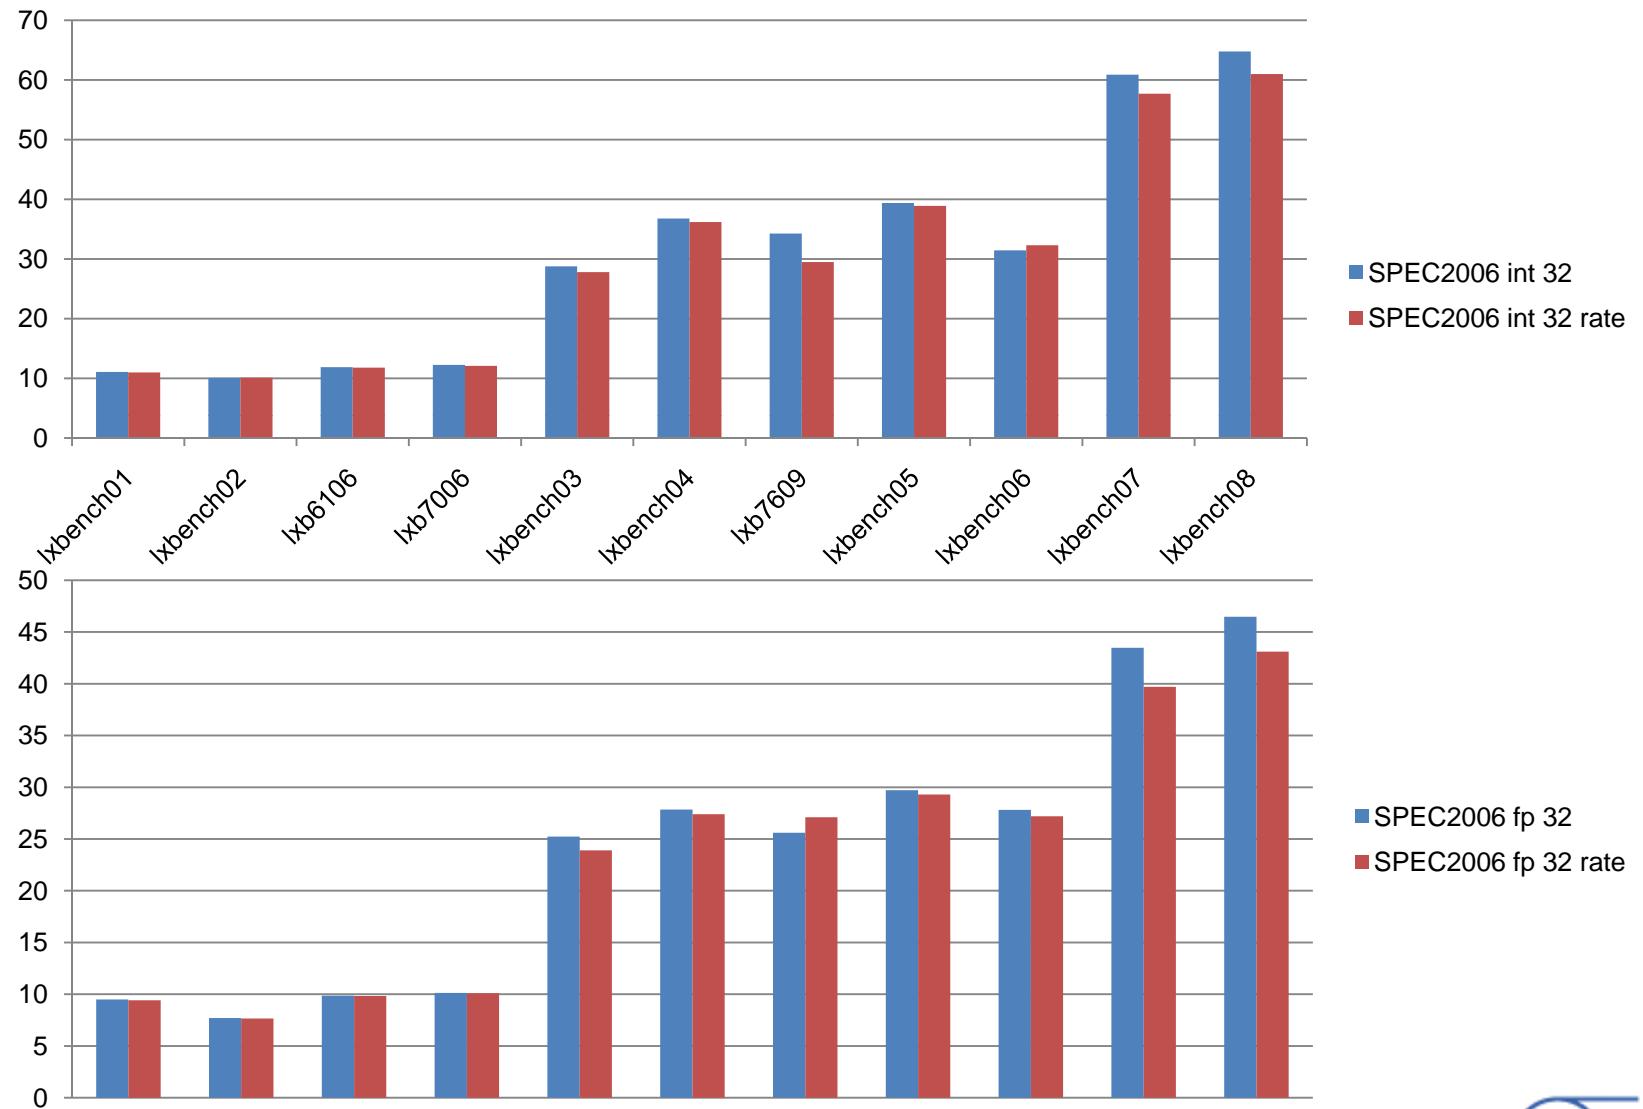

32-bit vs. 64-bit

Rate vs. Parallel

Power Consumption

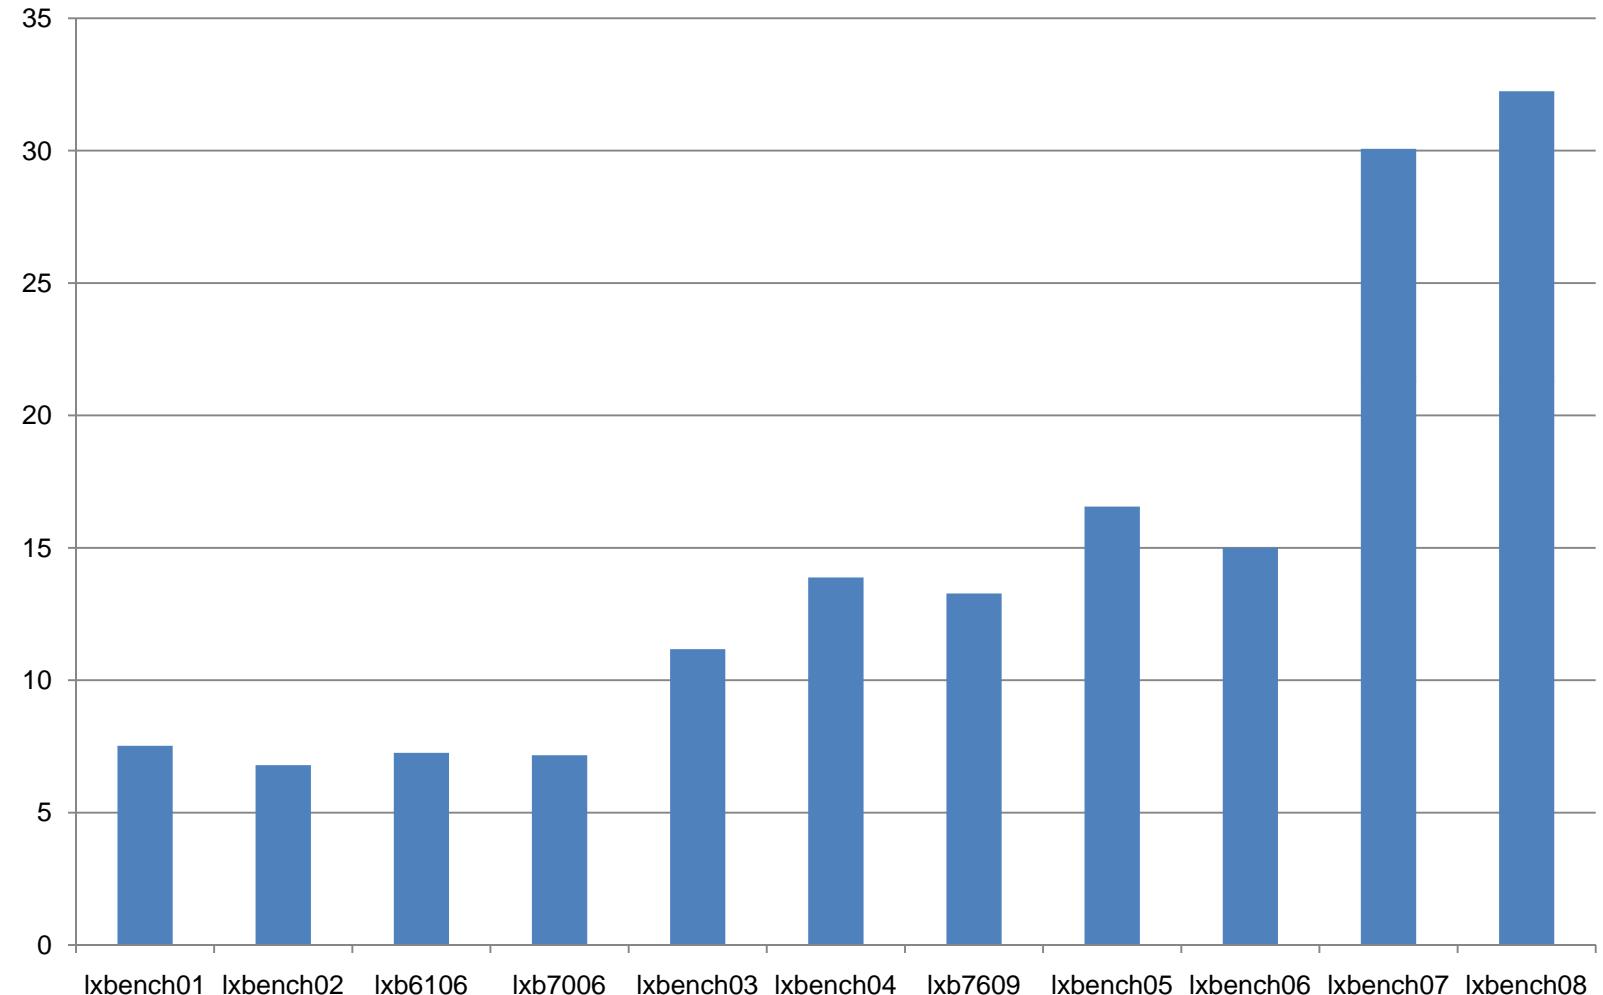

- Increasingly important issue
- Idle and loaded measurements
 - Load: 50% cpuburn, 50% lapack
 - 80-20 average
- Measured at the primary AC circuit
- High-precision power meters

SPECint2000 per VA

CERN IT
Department
