Preface	xi
0.1 Optimization: insights and applications	xiii
0.2 Lunch, dinner, and dessert	xiv
0.3 For whom is this book meant?	xvi
0.4 What is in this book?	xviii
0.5 Special features	xix
Necessary Conditions: What Is the Point?	1
Chapter 1. Fermât: One Variable without Constraints	3
1-0 Summary	3
1.1 Introduction	5
1-2 The derivative for one variable	6
1.3 Main result: Fermât theorem for one variable	14
1-4 Applications to concrete problems	30
1-5 Discussion and comments	43
1-6 Exercises	59
Chapter 2. Fermât: Two or More Variables without Constraints	85
2.0 Summary	85
2.1 Introduction	87
2.2 The derivative for two or more variables	87
2.3 Main result: Fermât theorem for two or more variables	96
2.4 Applications to concrete problems	101
2.5 Discussion and comments	127
2.6 Exercises	128
Chapter 3. Lagrange: Equality Constraints	135
3.0 Summary	135
3.1 Introduction	138
3.2 Main result: Lagrange multiplier rule	140
3.3 Applications to concrete problems	152
3.4 Proof of the Lagrange multiplier rule	167
3.5 Discussion and comments	181
3.6 Exercises	190

Chapter 4. Inequality Constraints and Convexity	199
4.0 Summary	<b>199</b>
4.1 Introduction	202
4.2 Main result: Karush-Kuhn-Tucker theorem	<b>204</b>
4.3 Applications to concrete problems	<b>217</b>
4.4 Proof of the Karush-Kuhn-Tucker theorem	<b>229</b>
4.5 Discussion and comments	235
4.6 Exercises	<b>250</b>
Chapter 5. Second Order Conditions	261
5.0 Summary	<b>261</b>
5.1 Introduction	<b>262</b>
5.2 Main result: second order conditions	<b>262</b>
5.3 Applications to concrete problems	<b>267</b>
5.4 Discussion and comments	<b>271</b>
5.5 Exercises	<b>272</b>
Chapter 6. Basic Algorithms	273
6.0 Summary	<b>273</b>
6.1 Introduction	<b>275</b>
6.2 Nonlinear optimization is difficult	<b>278</b>
6.3 Main methods of linear optimization	<b>283</b>
6.4 Line search	<b>286</b>
6.5 Direction of descent	<b>299</b>
6.6 Quality of approximation	<b>301</b>
6.7 Center of gravity method	<b>304</b>
6.8 Ellipsoid method	<b>307</b>
6.9 Interior point methods	<b>316</b>
Chapter 7. Advanced Algorithms	325
7.1 Introduction	<b>325</b>
7.2 Conjugate gradient method	<b>325</b>
7.3 Self-concordant barrier methods	<b>335</b>
Chapter 8. Economic Applications	363
8.1 Why you should not sell your house to the highest bidder	<b>363</b>
8.2 Optimal speed of ships and the cube law	<b>366</b>
8.3 Optimal discounts on airline tickets with a Saturday stayover	<b>368</b>
8.4 Prediction of flows of cargo	<b>370</b>
8.5 Nash bargaining	<b>373</b>
8.6 Arbitrage-free bounds for prices	<b>378</b>
8.7 Fair price for options: formula of Black and Scholes	<b>380</b>
8.8 Absence of arbitrage and existence of a martingale	<b>381</b>
8.9 How to take a penalty kick, and the minimax theorem	<b>382</b>
8.10 The best lunch and the second welfare theorem	<b>386</b>
Chapter 9. Mathematical Applications	391
9.1 Fun and the quest for the essence	391

9-2	Optimization approach to matrices	392
9-3	How to prove results on linear inequalities	395
9-4	The problem of Apollonius	397
9-5	Minimization of a quadratic function: Sylvester's criterion and Gram's formula	409
9.6	Polynomials of least deviation	411
9.7	Bernstein inequality	414
Chapter 10.	Mixed Smooth-Convex Problems	417
10.1	Introduction	417
10.2	Constraints given by inclusion in a cone	419
10.3	Main result: necessary conditions for mixed smooth-convex problems	422
10.4	Proof of the necessary conditions	430
10.5	Discussion and comments	432
Chapter 11.	Dynamic Programming in Discrete Time	441
11.0	Summary	441
11-1	Introduction	443
11.2	Main result: Hamilton-Jacobi-Bellman equation	444
11-3	Applications to concrete problems	446
114	Exercises	471
Chapter 12.	Dynamic Optimization in Continuous Time	475
12.1	Introduction	475
12.2	Main results: necessary conditions of Euler, Lagrange, Pontryagin, and Bellman	478
12.3	Applications to concrete problems	492
12.4	Discussion and comments	498
Appendix A.	On Linear Algebra: Vector and Matrix Calculus	503
A.I	Introduction	503
A.2	Zero-sweeping or Gaussian elimination, and a formula for the dimension of the solution set	503
A-3	Cramer's rule	507
A.4	Solution using the inverse matrix	508
A.5	Symmetric matrices	510
A.6	Matrices of maximal rank	512
A.7	Vector notation	512
A.8	Coordinate free approach to vectors and matrices	513
Appendix B.	On Real Analysis	519
B-1	Completeness of the real numbers	519
B-2	Calculus of differentiation	523
B.3	Convexity	528
B.4	Differentiation and integration	535
Appendix C.	The Weierstrass Theorem on Existence of Global Solutions	537

C1	On the use of the Weierstrass theorem	537
C.2	Derivation of the Weierstrass theorem	544
Appendix D.	Crash Course on Problem Solving	547
D.I	One variable without constraints	547
D.2	Several variables without constraints	548
D.3	Several variables under equality constraints	549
D.4	Inequality constraints and convexity	550
Appendix E.	Crash Course on Optimization Theory: Geometrical Style	553
E.I	The main points	553
E.2	Unconstrained problems	554
E.3	Convex problems	554
E.4	Equality constraints	555
E.5	Inequality constraints	556
E.6	Transition to infinitely many variables	557
Appendix F.	Crash Course on Optimization Theory: Analytical Style	561
F.I	Problem types	561
F.2	Definitions of differentiability	563
F.3	Main theorems of differential and convex calculus	565
F.4	Conditions that are necessary and /or sufficient	567
F.5	Proofs	571
Appendix G.	<i>Conditions of Extremum from Fermât to Pontryagin</i>	583
G.I	Necessary first order conditions from Fermât to Pontryagin	583
G.2	Conditions of extremum of the second order	593
Appendix H.	Solutions of Exercises of Chapters 1-4	601
	Bibliography	645
	Index	651
