Remarks to Purchasers

READ CAREFULLY BEFORE ORDERING

Name and Address. Write your Name, Post Office, County, and State as distinctly as possible. Some orders reach us which give neither name nor location. In such cases it is impossible for us to fill such orders until we again hear from the senders.

Send Us Your Order as Early as Possible. It will facilitate its prompt execution, and you will have your seed when you are ready to plant.

Use the Order Sheet. Make out your list of requirements consecutively in the order as given in the Catalogue, placing the quantity wanted before the article, and the price of the same in the column to the right; and always keep a copy of your orders.

Correspondence should not be intermingled with the body of the order, but written either at the bottom of the Order Sheet or on a separate sheet of paper.

Remittances. The safest method of sending money is by **Post-Office Orders**. Where they are not obtainable, it can be sent by Express Money Order, Registered Letter, or Draft on New York. For small amounts, postage stamps will be acceptable.

When the Remittance is not sufficient to pay for the quantity of seeds ordered, we will reduce the quantity to correspond with the remittance.

Errors. All possible precautions are taken to avoid their occurrence. Notify us at once if your order is not properly filled, and we will promptly make the necessary corrections.

Substitutions. As the season advances, some stocks of seeds are exhausted, so it is advisable when late orders are sent to name a few substitutes. We make substitution only when requested to do so, sending varieties that will as fully cover the indicated wants as our stock will permit. If not so instructed, the remittance will be refunded.

Parcel Post. Seeds and bulbs can be sent by parcel post at special rates up to 8 ounces; in excess of 8 ounces at the same rates as general merchandise. See inclosed table of parcel-post rates for all zones.

Express Rates. Seeds, bulbs, and plants are now entitled to special rates, which are considerably lower than rates on general merchandise. Where quick delivery is desired, we advise, unless goods are too bulky, to have shipments go forward by express.

Shipments by Freight. Seeds in bulk, implements, and other heavy goods are shipped by freight, and unless there is a freight agent at point of destination, the freight must be prepaid, the purchaser advancing the same, unless otherwise arranged. Our facilities for shipping to points south of Pittsburgh on the Ohio River and connecting streams are excellent, steamers plying daily between this and southern points.

Catalogues are sent free to all our customers of the **past year**. Should any change their place of residence, we desire to be informed, that we may correct the address in our Catalogue list. Our local customers, who purchase over our counters, will please give their correct address when making their first annual purchase; this will insure their receiving Catalogues the following year by mail. Many of our patrons who desire our Catalogues fail to receive them because their post-office address is unknown to us.

Non-Warranty. We do not warrant in any way, expressed or implied, the contents or description, quality, productiveness, or any other matter of any seeds, bulbs, or plants sold by us, and we will not be in any way responsible for the crop. If the purchaser does not accept goods on the above terms, no sale is made thereof, and he must return them at once and money will be refunded. We make all sales subject to the above conditions.

BEANS (Bohnen)

BUSH BEAN CROP LARGELY A FAILURE

Beans should not be planted before the ground becomes light and warm, in favorable seasons usually about the first of May. The soil should be rich and mellow, and the seeds scattered about 3 inches apart in drills 2 to 2½ feet apart and covered about 2 inches deep. Successive sowings, made at intervals of about two weeks until the middle of July, will give a plentiful supply of Beans throughout the season. One quart of seed will sow 100 feet of drill.

POLE or RUNNING BEANS

(Stangenbohnen)

These and Bush Limas are less hardy than other Bush Beans, and should be planted several weeks later, when the ground is warmer. Plant the seeds in slightly raised hills, 5 to 6 feet apart, four or five seeds to a hill. The Limas are especially tender and the rule for late outside planting with them is rigid. Painstaking cultivators who are usually the most successful, plant them eye downward, after setting stout poles for every hill. All sorts of late-ripening Pole Beans are benefited by pinching the tips of the vines back when they are about 5 feet high. Lima Beans are considered by many the very finest of all Beans, and there is nothing in the vegetable line that can take their place. A quart of Limas will plant about 100 hills; a quart of smaller sorts about 200.

PEAS (Erbsen)

All smooth-seeded Peas may be planted as early in the spring as the soil can be prepared for them, being very hardy. Sow for the first crop as early as practicable, and for succession at intervals of about two weeks until June. Late sowings, however, do not yield so well as early ones. Sow in drills about 2 to 3 inches deep, and from 2 to 4 feet apart, according to variety, taller sorts requiring more room than dwarf ones. Dwarf Peas require a very rich soil, while taller ones thrive best in rather thin ground. The latter are frequently sown in double rows, with the brush, or support of some kind between them. Wrinkled Peas are not so hardy as the smooth sorts, and should not be sown quite so early, but are superior to them in quality, more delicate in flavor, and remain longer in season. One quart of seed will plant about 100 feet of drill.

Wrinkled varieties are marked with a star (*)

Beckert's Golden Evergreen Corn ($\frac{3}{4}$ natural size)

CORN, Sweet or Sugar (Maïs)

This delicious vegetable may be enjoyed from early summer until frost, if the proper varieties are selected and planted for succession at intervals of every two weeks until the middle of July. If the seed is planted too early, before the ground becomes warm, it is liable to decay. Plant in hills 3 to 4 feet apart each way, five or six kernels to a hill; or in rows 4 to 5 feet apart, scattering the seeds thinly in the rows. The taller growing the variety, the richer should be the soil and the wider the space allowed for development. One quart will plant 200 hills.

Time of maturity from planting the seed until the ears are fit for the table, as here given, is only approximate and for a normal season, varying in different seasons and under different conditions

Beckert's Golden Evergreen.

The originator, a market-gardener of thirty years' experience, says it is "the one best Sweet Corn." It is a cross of Golden Bantam and White Evergreen, and combines the deliciously sweet flavor of Golden Bantam and the evergreen habit of White Evergreen. It is ready for the table about five days after Golden Bantam, but the ears are much longer, being intermediate in size between those of its parents. The stalks are strong, about 6 feet high and generally produce two good ears, 8 to 10 inches long, of deep sugary grains. Usually 12-rowed, but at times 14-rowed. It is a true Evergreen; the ears remain green and edible for more than two weeks from any planting and remain in the roasting-ear stage for more than a month from late plantings. The habit has been so well fixed by eight years' careful selection that only from early plantings will seed become sufficiently matured before frost. The husk on the ears is abundant to protect the ear from corn-worm and smut, and this variety has never been affected by either. It combines all good qualities of an early, midseason, and late variety. Hardy in the seed, it may be planted early; having a strong root-system, it is drought-resistant to a large extent. If planted about July 4, the best roasting ears of the season may be gathered from the middle of September until killing frost late in October. Produces just the right-sized ears from any planting for eating off the cob. It is particularly well adapted for market-gardeners who have a discriminating trade. It has always sold at a premium and there has never been enough to supply the demand. Pkt. 10 cts., pt. 25 cts., qt. 50 cts., 4 qts. \$1.90; with corn on ear, per ear 10 cts., 3 for 25 cts.

MAYFLOWER NO. 2. 65 days. This variety is 8-, 10-, and 12-rowed. Ears quite large; kernels broad; quality excellent. Pkt. 10 cts., pt. 18 cts., qt. 35 cts., 4 qts. \$1.25.

Asparagus seed may be sown directly in the permanent bed, and the plants thinned as they grow; or it may be sown elsewhere, and the seedlings transplanted the second year. BEST GARDEN BEETS

(Salat-rüben)

The soil best suited for the Beet is a deep, light, and rich, friable loam. For very early crops, the seed is sown in hot-beds, and the seedlings are transplanted to the open ground. For main crop, the seed is sown outside as soon as the soil is in good condition, in drills from 12 to 15 inches apart, and covered about an inch deep; the plants are thinned to stand 4 or 5 inches apart in rows. For winter crops, sow in June, in drills, as for early Beets. An ounce will sow 50 feet of drill; five to six pounds to an acre.

CABBAGE (Kopfkohl)

Seed sown in hotbed or greenhouse about February

15 will give plants large enough to transplant into hotbeds about March 10. Set them 2 to 3 inches apart each way, and as soon as they become well established, remove the glass for part of the day, to harden them for final transplanting into the open ground, increasing the exposure daily until April 10 to 20, when the final transplanting may be made. For late crops, sow the seed in April or May and transplant to the open ground when large enough, setting the plants up to the first leaf, and 2 by 3 feet apart. It is important that the plants should not stand thick in the seed-beds, as this would induce weak, slender plants. The insects which molest them should be kept in check with remedies which seem most efficacious in the locality. There is a tendency to club-root if Cabbage is grown on the same ground year after year.

EARLY EXPRESS, or LIGHTNING. Very early; small, conical heads. Pkts. 5c. and 10c., oz. 25c., $\frac{1}{4}$ lb. 75c.

CAULIFLOWER (Krautkoh)l)

How to Grow Fine Cauliflower. Culture for Cauliflower and cabbage is essentially the same, but to the former extra care given in applying fertilizers and moisture well repays the gardener. Sow the seeds for early and late crops as directed for cabbage, but do not set the early plants in the open field too soon, for if too much stunted by severe frosts, they begin to form heads before they are strong enough to develop them well. Plants which have not headed before winter sets in may be stored in a cool cellar or cold-frame, and will form heads without further attention. An ounce of seed will produce about 1,500 plants.

BECKERT'S EARLY SNOWBALL. Produces large, handsome white heads, 8 to 10 inches across; close, compact, and of the finest quality; stalks short, of compact growth; can be planted closely; extra early, a certain header; equally good for a late crop. Unsurpassed by any strain offered. Pkt. 25 cts., $\frac{1}{4}$ oz. \$1, oz. \$3.50.

CELERY (Sellerie)

Celery can be grown in any garden soil, but the finest is produced in deep, mellow bottom land. Seed for early crops should be sown in hotbeds about March 15. The plants may be either thinned to give them room to grow, or transplanted to another bed to grow until it is time to plant them in the open ground. For main crop, seed should be sown in the open air as soon as the soil and air are warm enough. They should be covered lightly, and firmly pressed into the earth with a board, if the soil is fine and mellow. The seed-bed must be kept free from weeds, and well watered in dry weather. When the plants are large enough, transplant them to shallow trenches or furrows, from 4 to 6 feet apart, according to the variety grown, setting the plants 6 inches apart in the rows and pressing the soil firmly around them. Blanching consists of drawing earth up to the stalks at intervals of about two weeks, until all but the tops of the plants are covered. Celery may be kept for winter use in pots or cellars, or in deep, narrow trenches, in a dry situation; the latter must be covered with boards, with sufficient soil and manure on top to keep out the frost, leaving openings at short distances for ventilation in mild weather. An ounce of seed will produce about 2,000 plants.

LARGE-SEEDED. Has large, tender leaves. Pkt. 5 cts., oz. 10 cts., ¼lb. 25 cts.

Davis Perfect Cucumber

CUCUMBERS (Gurte)

The seed should not be planted in the open ground before the weather has become warm and settled, and the ground mellow and light. Plant the seeds in well-enriched hills about 4 feet apart each way, and, as soon as all danger from insects is over, thin the plants to leave four of the strongest in each hill. For succession, sow at intervals of every two weeks until midsummer. Extra-early crops are grown by planting the seed in hotbeds in April, upon pieces of sod turned upside down, and removing them to hills in open ground as soon as the weather is warm enough. For pickles, sow seed from the middle of June until the middle of July. The vines bear longer if the fruits are gathered as soon as they are large enough; their strength is soon exhausted by ripening fruits. An ounce of seed will plant 100 hills; two pounds will plant an acre.

LETTUCE (Garten Salat)

Seed for the first outdoor crop is usually sown in hotbeds in February, and the seedlings transplanted to the garden in April, 8 to 12 inches apart in rows 12 inches apart. For a succession until frost, sow in drills in the open ground at intervals of every two or three weeks, and thin the plants to stand 6 to 8 inches apart. For plants to force in hotbeds from November until spring, sow seed in hotbeds in the fall, and cover up as winter approaches, until the plants are required for use. Or the seed may be sown in hotbeds early in winter and the seedlings transplanted into fine and well-prepared garden soil. Half an ounce of seed will sow 100 feet of drill and produce about 1,500 plants.

MUSKMELONS (Muscat Melonen)

Muskmelon seed should not be planted outdoors until the ground has become warm and dry. The hills should be about 6 feet apart, and carefully prepared. Rich earth is far better for the young plants than manure; but, if the latter must be used, see that it is well rotted. Plant from six to twelve seeds in a hill, and when the young seedlings are strong enough to resist the attacks of insects, thin them, leaving three of the strongest in each hill. An ounce of seed will plant about 100 hills.

ONION SEED

(Zwiebel)

Good Onion Seed is of the Greatest Importance

Onions thrive best on a rich, deep, loamy soil. For sets, the seed should be sown very thickly in drills as early as possible in spring. In summer, as soon as the tops die down, harvest the bulbs and store them in a dry, cool place, spreading them in thin layers. Early in the following spring, replant them 4 inches apart, in small drills 12 inches apart, and they will form fine, large bulbs early in the season. Large Onions may also be grown from seed the first season if the land is strong and well manured, the seed sown thinly in drills a foot apart, and the seedlings thinned to stand 3 or 4 inches apart in the drills; they must be well cultivated and kept free from weeds. Five pounds to the acre will be required for large Onions; for sets, 60 pounds.

YELLOW GLOBE DANVERS. Bulbs of fine shape and good size, while the yield per acre is enormous, averaging from 600 to 800 bushels on good soil and with good culture. Thin, yellow skin and mild, fine-grained, white flesh. Pkts. 5 cts. and 10 cts., oz. 25 cts., ¼lb. 75 cts.

For early, sow as soon as the ground can be prepared, in drills 15 inches apart, and thin the plants to stand 8 inches apart. Sow for succession at intervals of a fortnight, until the last week in July, and from that time onward until the last of August sow for main crop. The sowing should always be made just before a rain, if possible, as the success of the crop depends, in a great measure, upon quick germination and rapid growth of the young plants. An ounce of seed will sow 150 feet of drill; two pounds will sow an acre.

Explanation of Abbreviations Used in the Descriptions

HARDY ANNUALS, HA. These should be sown outside in April or May, according to season, latitude, and condition of soil; or they may be sown at a somewhat earlier date in a hotbed or greenhouse, the combining of the two methods being advisable, thereby providing for a succession of plantings if both sowings prosper. Seed sown under glass will also produce earlier-blooming plants than seed sown outdoors. The soil should be rather light and rich, and for outdoor sowing it must be thoroughly dug up, well raked and leveled. The coarser seeds are to be covered to once or twice their thickness, while very fine seeds are to be merely pressed into the soil. All sowing should be firmed with a board or the hand, as this hastens the germination of the seed as well as promoting its regularity. For indoor sowing, use shallow boxes of several inches in depth, and of a size to suit. Careful attention is required as soon as the seed is sprouted that seedlings may not suffer for lack of moisture, and of air if grown indoors.

HALF-HARDY ANNUALS, HHA, HALF-HARDY BIENNIALS, HHB, and HALF-HARDY PERENNIALS, HHP. These may be sown indoors, as above directed, from March to May, and outdoors after the middle of May. Many of the Biennials and Perennials will bloom the first season if sown early.

HARDY BIENNIALS, HB, and HARDY PERENNIALS, HP, can be sown outdoors as soon as the soil is in good tillable condition. If sown early indoors many of them will bloom the first season. Sowings made from July to September will produce well-established plants for the next season. These should be somewhat protected during the winter. Many seeds of Hardy Biennials and Hardy Perennials are of very slow germination, and seeds of such should not be condemned as bad if a quick germination does not show.

TENDER ANNUALS, TA, TENDER BIENNIALS, TB, and TENDER PERENNIALS, TP, can be sown in March in the greenhouse or in hotbeds in shallow boxes. Transplant to secure sturdy plants, which can then be planted outdoors after danger of frost is over, about May 15.

HHA, HHB and HHP designate Half-Hardy Annuals, Biennials and Perennials.

HB and HP designate Hardy Biennials and Perennials.

TA and TP designate Tender Annuals and Perennials.

Any species or variety to which no letters are affixed are to be considered as Hardy Annuals.

LAWN GRASS SEED. If you desire a perfect lawn, use our Evergreen Lawn Seed. For **SHADY PLACES** sow our Shady-Nook Lawn Seed. Both kinds, if sown early in the spring, will produce a good lawn by midsummer. See inside back cover for seed and for directions how to make a lawn.

PANSIES (Heartsease) HP

Pansies, while preferring a light, rich soil and a partially shady, cool and moist situation, producing, under such ideal conditions, large, magnificently colored flowers, will nevertheless thrive under less favorable surroundings. In fact, almost any soil and situation will give good returns. If planted in full sun exposure, mulch beds during the hot term and water freely; the delicate tints may be partially neutralized, and flowers will not attain full size, yet a very rich and continuous display may be had which in fall will almost equal the early spring show. Faded flowers must be removed every few days to prevent seeding. Seed may be sown from July to September, and these plants, protected over winter, will flower early in spring and continue throughout the season. Spring-sown seed will flower from summer to fall. We offer a very complete collection of varieties and strains embracing "All That's Good in Pansies."

PETUNIA HHA

Hybridizing has accomplished wonders in this as in other genera of plants. But a few years back it was deemed imperative to secure

Large-flowering Fringed Petunias

in fall stock plants of all desirable varieties. At the present day this would be a waste of time and space, as the excellent strains of seed now offered fulfil all wants. Single- and double-flowering, plain or fringed petals, tall or dwarf growth, may all be had remarkably true from seed, and with these go a degree of vigor that is lacking in plants propagated by cuttings. Petunias are valuable as pot-plants, particularly adapted for vases, baskets, window-boxes, etc., and the dwarf varieties are leaders for bedding. Many of the Spencers are very grand Sweet Peas, but not fully fixed in character and not so productive as the older varieties. Their size and form, however, render them very attractive and effective. Our stock is grown for us under most favorable conditions, and will be found true to name and of excellent quality. The seeds should be sown early in spring; or, when the ground is not readily prepared in spring, fall sowing may be made, excepting the white-seeded varieties, which should not be sown until soil becomes quite warm and dry; or they may be started early in pots in greenhouse or frame and planted out as early as the weather permits. White-seeded varieties, which are more tender than the dark-seeded, should be sown in sand to germinate and then transplanted in soil.

Something You Ought to Have
KIRKE SYSTEM

Fertilize While Watering

OR
DESTROY INSECTS

THE KIRKE SYSTEM is an ingenious, scientific method of combining in one operation the several others formerly attendant upon fertilizers and insecticides for lawns, gardens, shrubbery, and foliage. The only **clean, odorless**, positively active, easily handled, practicable, **economical**, and efficient method of destroying insects or fertilizing, requiring no additional labor or experience. It abolishes the use of unsanitary stable manure, so objectionable because of its disagreeable odors and the great abundance of weed-seeds it contains. It abolishes the use of cumbersome hand-pumps, hand-sprayers, carts and wagons, etc., for distributing insecticides and fertilizers. It is without an experimental feature—it will work as well for you as for the thousands all over the country who already enjoy its benefits.

THE KIRKE SYSTEM, in competition with any other natural or artificial fertilizer or insecticide method, brings maximum efficiency with a saving to you of **time, labor, and money.**

THE KIRKE FEEDER Consists of a cylindrical nickel-plated metal cartridge-holder, which is easily connected to any standard-sized water faucet, and in which is placed a KIRKE Fertilizer, Insecticide, or Fungicide cartridge. It is a neat device and will last a lifetime. It is simplicity itself, and even a child can handle it.

"KIRKE SYSTEM" once used, always used

"KIRKE SYSTEM" received a special award at both the Philadelphia and New York Flower Shows

KIRKE CARTRIDGES, which are placed in the **KIRKE FEEDER**, are of four types: **Fertilizer, Insecticide, Fungicide, Disinfectant-Germicide.** They are composed of the highest grade of concentrated and extremely active chemicals, and dissolve gradually with even and positive distribution.

THE "KIRKE SYSTEM" SPRINKLING-CAN PLANT FOOD is a product especially prepared for those who do not necessarily require the use of a garden hose. It will be found very serviceable and highly beneficial for piazza plants, greenhouse plants, plants grown in pots and in cemeteries, etc.

There are twelve tablets in a box, each tablet is sufficient for eight gallons of water, and dissolves gradually and with an even distribution. It most efficiently promotes and sustains vigorous health, luxuriant growth, and abundant and richly colored flowers and grass.

IMPROVED SOIL-TESTING OUTFIT

Leads to bigger crops and better soil. Each test requires but a few minutes. Costs about one cent or less. Requires only a trifling quantity of chemicals—caustic soda, muriatic acid, and ammonia.

It will tell you how to use manure, lime, and fertilizers, and how to plant crops so as to insure the biggest results at the lowest cost. In detail it will tell you:

- Whether or not your soil is in proper condition for crop production.
- Whether or not lime is needed, and how much per acre.
- Whether or not organic matter (humus) is needed, and how much per acre.
- The different degrees of acidity in your soil.
- Where and when green-manuring will pay, and where it will not.
- Whether or not your soil needs inoculation for alfalfa and other legumes.
- Which fields on your farm are best adapted for alfalfa, clover, grains, corn, potatoes, etc.

Anyweight Lawn Roller

ANYWEIGHT LAWN MOWER

Built with a hollow steel drum with the feature of a rounded edge, a construction which overcomes any marking or turf-cutting. Entrance for the water or sand for weighting is provided by a ¼-inch opening of threaded bronze. This bronze opening eliminates the bad feature of rusting of the threads which is so common in some other makes. We have added to our list this season No. 1420, a Roller which is bound to be popular with the owners of small city lawns, etc. To weight Rollers, turn on end, remove the plug in opening, and insert nozzle of hose or use a pail and fill the drum to any desired weight, and Roller is ready for use.

No. 1420. 14¼-in. diam., 20-in. width, 46 lbs. weight empty, 148 lbs. weight filled with water. Each, \$6.75.
No. 2424. 23¼-in. diam., 23¼-in. width, 94½ lbs. weight empty, 418 lbs. weight filled with water. Each, \$10.

Simplicity Combined Hatcher and Brooder

The best thing on the market in the way of a Hatcher. Easiest and simplest of all to operate. No extra expense for a brooder after the chicks are hatched. These Hatchers are made of galvanized iron and copper. Copper is really the only material to use in an incubator, costs only \$1 more than the iron, lasts indefinitely. The heat-conducting property of copper is several times greater than that of iron or steel, and the saving in fuel alone will in a short time more than cover the difference in cost. Send for complete descriptive circular.

Simplicity Combined Hatcher and Brooder

50-egg Simplicity, with 14-oz. copper heater and tank. \$10 00
 100-egg Simplicity, with 1¼-oz. copper heater and tank 15 00

None-Such Brooder

THE IDEAL HOME FOR BABY CHICKS

Made of cypress wood and galvanized rust-resisting iron. It makes a warm, bright, sunny, sanitary home for chicks. Its splendid hot-air heating system is fine for out-door use. Capacity 150 chicks. Price, \$14.

For a Fine Lawn Use Our Evergreen Lawn Seed

GOOD soil and proper drainage are absolutely necessary to produce a good lawn. There should be no less than a foot of good surface or sandy soil,—heavy loam where possible. In light or sandy soil the grass has a tendency to burn out in hot, dry weather. Where it is necessary to grade the surface, the subsoil should be removed and replaced with good earth.

Unless the soil is sufficiently rich, apply a liberal quantity of well-rotted manure; dig or plow this in and incorporate with the soil. Rake or harrow the surface even, and after sowing the seed rake again lightly and firm the soil with a lawn-roller. Never attempt to dig, rake or roll a lawn when the ground is wet.

The best time to make a lawn is early in spring as soon as the ground is in good tillable condition, although very satisfactory results are obtained from lawns made during the summer and autumn.

When the young grass is from 3 to 4 inches high, it should be mown, but not too short, as close cropping is injurious to a new lawn. Repeat the mowing at intervals of about ten days. After the lawn is once well established, frequent rollings are beneficial, especially early in spring, after the soil and with it the roots of the grass have been drawn up by the winter's frost.

On banks and terraces, where the seed is liable to be washed off by rains before it has sprouted, a quick catch can be secured by mixing the seed with moist earth about one week before sowing; at the expiration of that time much of the seed is ready to sprout.

BECKERT'S EVERGREEN LAWN

Good seed is as necessary to make a lawn as the proper preparation of the ground. We have made many experiments to determine the grasses best adapted for lawn purposes, and the above mixture is composed of a combination, in proper proportions, of the best natural lawn grasses, so as to produce a continuous good lawn from early spring throughout the summer until late in fall.

The ingredients of this mixture are the highest grade of re-cleaned seeds only. This Lawn Seed is sold by the standard bushel of 32 quarts (dry measure) and weighs 24 pounds to the bushel.

Lawn Seeds are generally sold on a basis of 14 pounds to the bushel, which will invariably fall one-third or more short of actual measure if composed of choice clean seeds, and where a bushel of 14 pounds holds out in measure, it must of necessity be largely composed of light, chaffy matter of no value.

Use 1 qt. to 300 sq. ft., 4 to 5 bus. to the acre. Qt. 20 cts., postpaid 27 cts.; 2 qts. 35 cts.; 3 qts. 50 cts., 4 qts. 60 cts., pk. \$1.15, ½bus. \$2.25, measured bushel of 24 pounds, \$4.50, or \$2.65 for a bushel of 14 pounds.

PUTTING-GREEN MIXTURE

The very finest, hardy, low-growing grasses are contained in this mixture, producing a close and lasting green turf. Qt. 30 cts., postpaid 37 cts.; pk. \$1.75, ½bus. \$3, bus. of 20 lbs. \$6.

SHADY-NOOK LAWN MIXTURE

A mixture of grasses best adapted for sowing in shady places where other grasses will not thrive. In nearly all lawns where there are trees, there will be found bare, unsightly spots which can be made green and bright by using this mixture. Qt. 25 cts., postpaid 32 cts.; pk. \$1.75, ½bus. \$3, measured bus. of 20 lbs. \$6.

LAWN SEED BY PARCEL POST. In quantities in excess of 1 qt. add for postage according to your zone rate, for the quantity you order as follows: **Beckert's Evergreen Lawn Seed:** 4 qts. equal 3 lbs.; pk. equals 6 lbs.; ½bus. equals 12 lbs. **Putting-Green, Golf-Link and Shady-Nook Mixtures:** 4 qts. equal 2½ lbs. (requires postage for 3 lbs.); pk. equals 5 lbs.; ½bus. equals 10 lbs.; bus. equals 20 lbs.

GOLF-LINKS MIXTURE

Composed of such grasses as will produce a turf suitable for golf-links, cricket-tables or polo-grounds. Qt. 20 cts., postpaid 27 cts.; pk. 90 cts., bus. of 20 lbs. \$3.50.

LAWN FERTILIZERS

Stable manure should never be used as a top-dressing on a lawn, as it always contains large quantities of noxious weed seeds.

LAWN FERTILIZER. A high-grade Lawn Fertilizer. Also adapted for the vegetable- and flower-garden, trees, shrubbery, and pot-plants. Ammonia, 3½ to 5 per cent; available phosphoric acid, 4 to 6 per cent; insoluble phosphoric acid, 12 to 14 per cent; total phosphoric acid, 16 to 18 per cent, equal to bone phosphate of lime, 35 to 40 per cent. 100 lbs. \$2, 500 lbs. \$9.25, 1,000 lbs. \$18, ton \$35.

BONE MEAL, PURE RAW NO. 1. Highest grade. Contains nothing but pure, raw animal bone. Vastly superior to steamed bone. Ammonia, 4½ to 6 per cent; phosphoric acid 22 to 24 per cent, equal to bone phosphate 48 to 52 per cent. 5 lbs. 25 cts., 10 lbs. 40 cts., 25 lbs. 75 cts., 50 lbs. \$1.25, 100 lbs. \$2.25, 200 lbs. \$4, 500 lbs. \$9.75, 1,000 lbs. \$19, ton \$37.

UNLEACHED HARDWOOD ASHES. Acts as a stimulant and supplies natural plant-food, permanently enriching the soil. Apply in fall or early in spring, so that the rain may carry the elements down to the roots of the grasses, producing a rapid and rich green growth. Apply 1,500 to 2,000 lbs. to the acre. Not sold in less quantities than a barrel. Bbl., 200 lbs., \$2.75, 1,000 lbs. \$11.50, ton \$21.
