Let u and v represent the PET and MRI to be reconstruct $Y = D(X) + \epsilon$

where different modalities can be written in stacked form
 $Y = \begin{pmatrix} f \\ g \end{pmatrix}, \mathcal{D} = \begin{pmatrix} A \\ \mathcal{F} \end{pmatrix}, X = \begin{pmatrix} u \\ v \end{pmatrix}, \epsilon = \begin{pmatrix} \zeta \\ \xi \end{pmatrix}$

Let u and v represent the PET and MRI to be reconstructed, r $Y = D(X) + \epsilon$

where different modalities can be written in stacked form
 $Y = \begin{pmatrix} A \\ g \end{pmatrix}, Z = \begin{pmatrix} A \\ r \end{pmatrix}, \epsilon = \begin{pmatrix} \epsilon \\ \epsilon \end{pmatrix}$

Let u and v represent the PET and MRI to be reconstructed, respectively. f corresponds $Y = \mathcal{D}(X) + \epsilon$

where different modalities can be written in stacked form
 $Y = \begin{pmatrix} f \\ g \end{pmatrix}, \mathcal{D} = \begin{pmatrix} A \\ \mathcal{F} \end{pmatrix}, X = \begin{pmatrix} u \\ v \end{pmatrix}, \epsilon = \begin{pmatrix} \zeta \\ \xi \end{pmatrix}$

Let u and v represent the PET and MRI to be reconstruct $Y = \mathcal{D}(X) + \epsilon$

where different modalities can be written in stacked form
 $Y = \begin{pmatrix} f \\ g \end{pmatrix}, \mathcal{D} = \begin{pmatrix} A \\ \mathcal{F} \end{pmatrix}, X = \begin{pmatrix} u \\ v \end{pmatrix}, \epsilon = \begin{pmatrix} \epsilon \\ \xi \end{pmatrix}$

Let u and v represent the PET and MRI to be reconstructe $Y = \mathcal{D}(X) + \epsilon$

and modalities can be written in stacked form
 $Y = \begin{pmatrix} f \\ g \end{pmatrix}, \mathcal{D} = \begin{pmatrix} \mathcal{A} \\ \mathcal{F} \end{pmatrix}, X = \begin{pmatrix} u \\ v \end{pmatrix}, \epsilon = \begin{pmatrix} \zeta \\ \xi \end{pmatrix}$

by represent the PET and MR1 to be reconstructed, respectively. f where different modalities can be written in stacked form
 $Y = \begin{pmatrix} f \\ g \end{pmatrix}, \mathcal{D} = \begin{pmatrix} A \\ \mathcal{F} \end{pmatrix}, X = \begin{pmatrix} u \\ v \end{pmatrix}, \epsilon = \begin{pmatrix} \zeta \\ \xi \end{pmatrix}$

Let u and v represent the PET and MRI to be reconstructed, respectively. Let u and v represent the PFT and MRI to be reconstructed, respectively. f corresponds to the observed PET data, and g refers to the observed MRI data. A signifies the PET forward operator as the discrete Radon Let u and v represent the PET and MRI to be reconstructed, respectively. J corresponds to to
beserved PET data, and g refers to the observed MRI data. A signifies the PET forward operat
as the discrete Radon tra as the discrete Radon transform [14]. $\mathcal F$ stands for the MRI forward operator as the discrete
Fourier transform. ϵ represents the measured noise. ζ is associated with Gaussian noise,
following a normal distribut Fourier transform. ϵ represents the measured noise. ζ is associated with Gaussian
following a normal distribution, i.e., $\zeta \sim \mathcal{N}(0, I)$, and ξ denotes Poisson nois
 $\xi \sim P(\lambda)$. By reasonable assumptions, the s

$$
p(f,g|u,v) = p(f|u,v) p(g|u,v) = p(f|u) p(g|v)
$$

$$
p(u, v|f, g) \propto p(f|u) p(g|v) p(u, v) \tag{1}
$$

The posterior probability of the PET-MRI image
$$
(u, v)
$$
 for observed PET-MRI data (f, g) can
then be simplified as

$$
p(u, v|f, g) \propto p(f|u)p(g|v)p(u,v)
$$
(1)
We further assume a prior of the form $p(u, v) = \exp(-\alpha R(u, v))$. Maximizing (1) is
equivalent to minimizing

$$
arg \min_{u,v} \mathcal{J}(u, v)
$$

$$
= arg \min \{-\log p(u, v|f, g)\}
$$

$$
= -\log p(f|u) - \log p(g|v) + \alpha \mathcal{R}(u, v)
$$

$$
= \sum_{i}^{M} ((\mathcal{A}u)_i - f_i \log(\mathcal{A}u)_i) + \frac{1}{2\sigma^2} ||\mathcal{F}v - g||_2^2 + \alpha \mathcal{R}(u, v)
$$

where $\mathcal{R}(u, v) = \log P(u, v)$. u, v can be reconstructed when $\log P(u, v)$ was obtained
by diffusion model. The proposed model as JR-diffusion comprises of the forward diffusion
process and the reverse diffusion process. The forward diffusion process, noise is gradually
introduced to convert a complex data distribution into a known prior distribution. It is described as

$$
(u_{i+1}, v_{i+1}) = (u_i, v_i) + \sigma_{min} \left(\frac{\sigma_{max}}{\sigma_{min}}\right)^i z, i = 1, 2, ..., N.
$$

$$
(\textit{u}_{i+1},\textit{v}_{i+1})\!=\!(\textit{u}_{i},\textit{v}_{i})+\sigma_{min}\!\left(\!\frac{\sigma_{max}}{\sigma_{min}}\!\right)^i\!\!z,\ i\!=\!1,2,...,N.
$$

Conversely, in the reverse diffusion process, noise is removed to transform the prior distribution
back into the original data distribution. It can obtain the reconstruction result

$$
(u_i, v_i)
$$

$$
= (u_{i+1}, v_{i+1}) - s_\theta((u_{i+1}, v_{i+1}), t) - A^* \bigg[\mathcal{I} - \frac{f_{i+1}}{\mathcal{A}u_{i+1}} \bigg] - \mathcal{F}^*(\mathcal{F}v_{i+1} - g_{i+1}) + z_i.
$$
Fig. 1 shows the framework of the JR-diffusion.
