#### Abstract

We comment on the paper 'UCN anomalous losses and the UCN capture cross section on material defects' by A. Serebrov et al., Phys. Lett. A 335 (2005) 327 - 336. Data presented do not originate from these authors alone but were taken in collaboration with several other authors and institutes not mentioned.

Recently, the article 'UCN anomalous losses and the UCN capture cross section on material defects' appeared in Physics Letters A, see Ref. [1]. The authors are A. Serebrov, N. Romanenko, O. Zherebtsov, M. Lasakov, A. Vasiliev, A. Fomin, P. Geltenbort, I. Krasnoshekova, A. Kharitonov, V. Varlamov from the Petersburg Nuclear Physis Institute (PNPI), Gatchina, Russia and Institut Max von Laue-Paul Langevin (ILL), Grenoble, France. The results presented in Figs. 2 and 4 in this article originate from data taken in joint collaboration between PNPI, Paul Scherrer Institut (PSI), ILL, TU Munich, and University of Sussex, unpublished so far, published in Ref. [1] by a rather incomplete list of authors and institutes from the mentioned collaboration.

### 1) Data in Fig. 2 of PLA 335 (2005) 327

Part of the data in Fig. 2, the data for the narrow Be-coated copper trap at 90 K, stem from joint experiments of a collaboration between PNPI Gatchina, PSI Villigen, ILL Grenoble and Phys. Dep. TU Muenchen. The ILL proposals are:

(i) ILL proposals 3-14-148 and 3-14-138,

"Test for Be coatings for a new Spallation Ultracold Neutron Source (SUNS) at PSI." Authors: A. Serebrov (PNPI), M. Daum (PSI), R. Henneck (PSI), K. Kirch (PSI), P. Geltenbort (ILL), K. Schreckenbach (TU Munich), V. Varlamov (PNPI), A. Kharitonov (PNPI).

(ii) ILL Proposal 3-14-120,

"Precision measurement of the free neutron lifetime using a gravitational trap for ultra-cold neutrons (UCN)." Authors: A. Serebrov (PNPI), P. Geltenbort (ILL), K. Schreckenbach (TU Munich), J. Pendlebury (Sussex), M. Daum (PSI), A. Pichlmaier (TU Munich), A. Kharitonov (PNPI), V. Varlamov (PNPI), R. Taldaev (PNPI), G. Shmelev (PNPI), I. Krasnochtchekova (PNPI).

Part of the results from these experiments appeared (unrefereed) as a contribution to the PSI internal annual report [2]. Here, the authors were A. Kharitonov, I. Krasnoschekova, A. Serebrov, R. Taldaev, V. Varlamov, A. Vassiljev (all PNPI), P. Geltenbort (ILL), M. Daum, R. Henneck, K. Kirch (all PSI), K. Schreckenbach (TU Munich).

Results from the above mentioned experiments at ILL from which the data of Fig. 2 in Ref. [1] were deduced, had been submitted for publication in Physics Letters B, editor Hendrik Weerts, in May 2003 with the title "Neutron lifetime measurements with UCN gravitational trap with Be coating". The authors were A. Serebrov (PNPI and PSI), V. Varlamov (PNPI), P. Geltenbort (ILL), A. Kharitonov (PNPI), R. Taldaev (PNPI), I. Krasnoschekova (PNPI), A. Vassiljev (PNPI), A. Fomin (PNPI), O. Zherebtsov (PNPI), M. Daum (PSI), R. Henneck (PSI), K. Kirch (PSI), J. Butterworth (ILL), K. Schreckenbach (TU Munich). This action was undertaken by the corresponding author, A. Serebrov, without the agreement of the whole collaboration. There were major concerns about details of the analysis as they were also pointed out later by the referee.

The referee's report was obtained from the editor on July 18, 2003, where several items should be addressed by modifying the manuscript. Instead, part of the data from this experiment appear in Ref. [1], however, with a surprisingly different and incomplete authorship.

### 2) Data in Fig. 4 of PLA 335 (2005) 327

Data shown in Fig. 4 originate from joint experiments of a collaboration between PNPI Gatchina, PSI Villigen, ILL Grenoble and Phys. Dep. TU Munich, see ILL proposals 3-14-138 and 3-14-148 above. Results were submitted for publication in Nucl. Instr. and Meth. in Phys. Res. A, Manuscript Number RK2004-0124, in December 2004: 'Magnetron-sputtered Be coatings as reflectors for ultracold neutrons' [3]. The list of authors is T. Brys (PSI), M. Daum (PSI), P. Fierlinger (PSI), A. Fomin (PNPI), P. Geltenbort (ILL), R. Henneck (PSI), K. Kirch (PSI), A. Kharitonov (PNPI), I. Krasnoshekova (PNPI), M. Kuzniak (PSI), M. Lasakov (PNPI), A. Pichlmaier (PSI), F. Raimondi (PSI), R. Schelldorfer (PSI), A. Serebrov (PSI and PNPI), E. Siber (PNPI), R. Tal'daev (PNPI), V. Varlamov (PNPI), A. Vasiliev (PNPI), J. Wambach (PSI), O. Zherebtsov (PNPI).

Please compare Fig. 11 of Ref. [3] with Fig. 4 of Ref. [1].

#### Conclusion

The text in Ref. [1] suggests that the mentioned data originate from the research of the Ref. [1] authors only (Fig. 2) or from a new experiment with the authors of Ref. [1], see page 4 of Ref. [1]: "In a new experiment the transmission for fifteen different samples was measured for UCN in the energy range ...". Various data presented in Ref. [1] do not originate from these authors alone. They originate, however, from experiments with a remarkably different list of participants and contributors. Several of these participants learned about this process after publication only. We do not accept such a procedure and state our vehement protest.

Concerning the physics content, the basic approach of Ref. [1] has been demonstrated to be wrong [4]. Furthermore, it was shown experimentally that at least part of the "anomalous losses" can be explained by (i) holes and cracks in the coating surfaces, (ii) microscopic (or nanoscopic) particles sitting on the surface (dust particles), or (iii) hydrogen contamination on and in the surface [3,5–8].
