ATLAS Tile Calorimeter: simulation and validation of the response

Jana Faltova, Charles University in Prague On behalf of the ATLAS Collaboration

Calor2014, Giessen, 6-11 April 2014

Tile Calorimeter in ATLAS

- Sampling hadronic calorimeter
 - Scintillator/Iron
- Position in ATLAS
 - From 2280 to 3865 mm in the radial direction
 - Covers $|\eta| < 1.7$
 - Full azimuth angle
- 3-dimensional cells
 - Three radial layers
 (A, BC/B, D)
 - $\Delta \eta \times \Delta \varphi = 0.1(0.2) \times 0.1$

3865 mn D2 D0 D1 D3 BC1 BC2 BC3 BC4 BC5 BC6 BC7 BC8 1.4 B12 A1 A2 A3 A4 A5 A6 A7 A8 A13 🖉 A14 Á15 . A16, E2 2280 mm 500 1000 1500 mm E3 ≈ beam axis

More details in talks given by Djamel Eddine Boumediene Maria Fiascaris

TileCal simulations

SIMULATION

- Geant4
- Detector description
- Passage of particles through matter

Collection of hits

DIGITIZATION

- Sampling fraction
- Digitization 7 read-out samples spaced 25 ns
- Electronic noise, pile-up added to individual samples

Read-out samples

RECONSTRUCTION

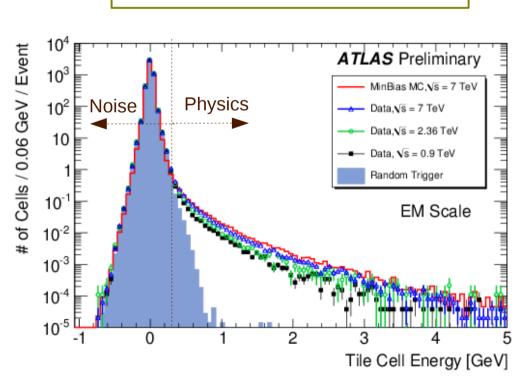

- Follows standard reconstruction of data
- Energy reconstruction (Optimal Filtering Method)
- Energy calibration

Cells at the EM scale

Calor2014, Giessen, 6-11 April 2014

Electronic noise

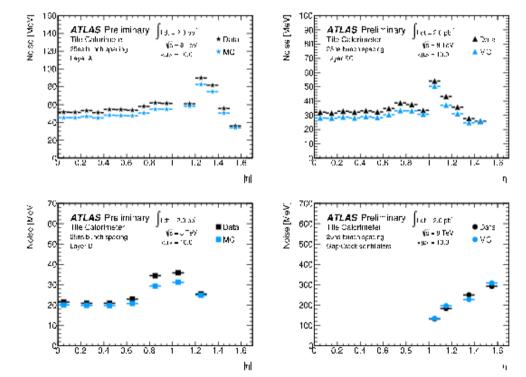

- Good description important for the creation of topoclusters (clusters of cells based on noise significance)
- Deviations from the Gaussian shape observed during Run1
 - Low Voltage Power Supplies (LVPS)
- Cell noise modeled with double Gaussian function
- Electronic noise added to the individual samples in Monte Carlo
- Good agreement between data and Monte Carlo

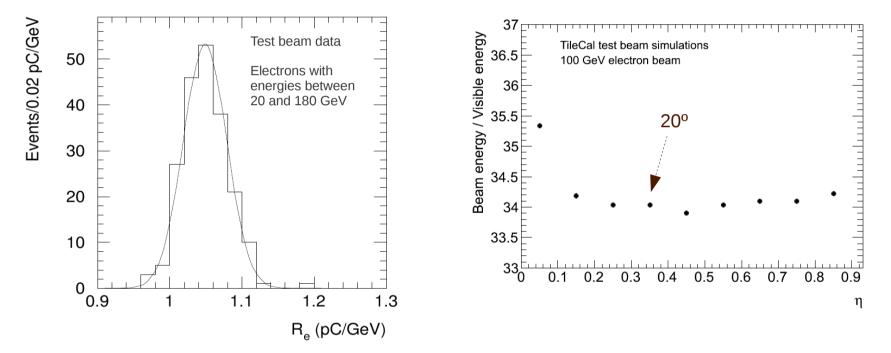

Pile-up term

- Pile-up comes from multiple minimum bias collisions overlaid with the hard scattering process
- Varies with the radial layer and pseudorapidity
- Expected to scale with average number of low energy collisions like $\sqrt{\mu}$
- Agreement between data and Monte Carlo within ±20% in the region where pile-up is dominant
- Improved description of pile-up planned for Run2

Electromagnetic scale in TileCal

 Calibration of data and Monte Carlo to the electromagnetic (EM) scale uses 20 degrees electron beams

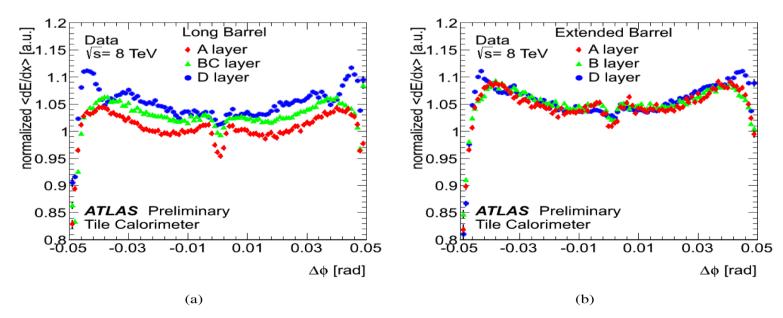

- · Test beam measurements with pions and muons
 - Validation of the EM scale
 - Comparison with Monte Carlo predictions

Light propagation in scintillating tiles

0

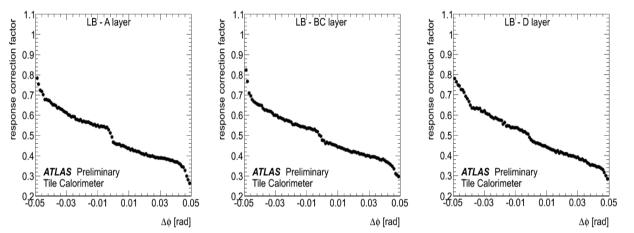

- Light propagation was recently implemented in the simulations
- Response of the photomultipliers is a function of the azimuth coordinate of the energy deposition point (so-called U-shape)
- Measurement of $\langle dE/dx \rangle$ proceeded with muons from $W \rightarrow \mu v$ decays

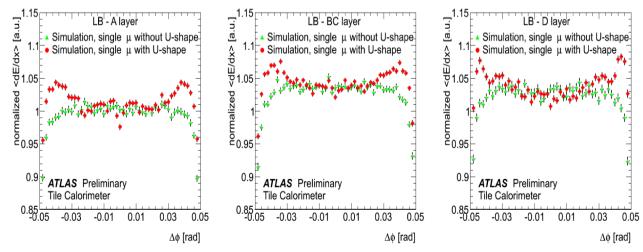

Calor2014, Giessen, 6-11 April 2014

Implementation of U-shape in MC

 Lookup table prepared from measurements in data and applied to Monte Carlo events

 Difference between energy distribution in simulations with and without U-shape

Calor2014, Giessen, 6-11 April 2014

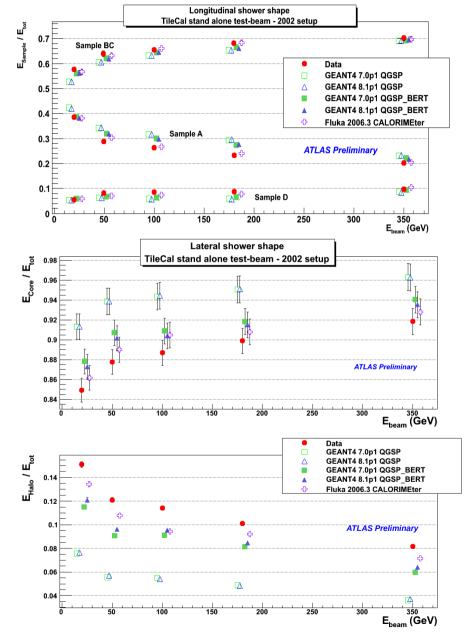

EM scale validation with muons

- Comparison between cosmic muons, testbeam and Monte Carlo per radial layer
- Truncated mean of muons' energy losses per path length in the cell (*dE/dx*)
- Agreement between data and MC to a few % level

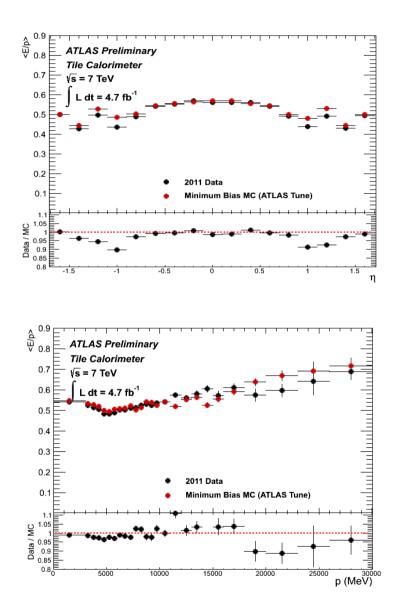

Pions' shower shape

- Longitudinal and lateral shower shapes
- The agreement of shower characteristics defined the choice of Geant model
- Important element for the uncertainty of high p₁ single hadrons in ATLAS
- Future plans
 - Comparison with new versions of Geant4
 - New measurements with the test beam

Calor2014, Giessen, 6-11 April 2014

Elp measurements

More details in talk given by Maria Fiascaris

- Single hadrons in TileCal, not interacting in Liquid Argon EM calorimeter
- Comparison between 2011 collisions data and Monte Carlo simulations
- Very good agreement except a gap region

Summary

- Noise description in the simulations
 - Good agreement for electronic noise
 - Pile-up noise higher in data compared to Monte Carlo, improved model planned for Run2
- Dependence of the energy released in TileCal on the radial angle $\Delta \varphi$ (U-shape)
 - Implemented in the simulations
 - Planned to be used in the next MC production
- Comparisons between measurements in test beam and Monte Carlo simulations show good agreement
 - Response of muons
 - Shower shapes of pions
 - Elp measurements
