# The DIRAC Web Portal 2.0

The DIRAC web interface allows users to have control over the whole DIRAC system. The Web framework provides a large set of "applications" (web pages), each of which can be used for interacting with various parts of the system.

The DIRAC Web interface provides two views. The default view can be easily configured.

- Each user can customize the applications and can create desktops.
- These personalized applications and desktops can be saved and stored in the User Profile database.
- The owner can share a desktop or an application with other users.
- Communities can also create their own set of personalized web applications, and can easily extend already existing web applications with a minimal effort.
