1. Introduction

The third revision of Japanese Evaluated Nuclear Data Library (JENDL) version 3, JENDL-3.3[1], was completed in March 2002, and released in May 2002. This library contains the evaluated nuclear data for 337 materials (335 nuclides and 2 natural elements) in the incident neutron energy range from 10^{-5} eV to 20 MeV. The nuclides of JENDL-3.3 are listed in Table 1 with their MAT numbers which are identification numbers of the data. The data are compiled in the ENDF-6 format[2].

This report was prepared to show the characteristics of cross-section data of JENDL-3.3. The cross sections in the resonance region are represented with resolved and unresolved resonance parameters. The point-wise cross section data at 0 K were reconstructed from the resonance parameters with the RECENT and LINEAR codes of PREPRO2000[3] or RESENDD code[4] with an interpolation accuracy of 0.1 %. Those 0 K point-wise cross sections were used for the production of tables and figures given in Chapter 2. Not all the data of JENDL-3.2 were revised to JENDL-3.3. Some of them are the same as those of JENDL-3.2. This report contains also the tables and figures for such nuclides. For the nuclides with the same data as JENDL-3.2, their figures are reproduced from the previous report of JAERI-Data/Code 97-003[5]. In Chapter 3, the numbers of neutrons per fission (ν_{tot} and ν_d) are shown in figures. In the last chapter, average cross sections calculated with typical reactor spectra are presented. Those average values were calculated from cross-section data at 300 K.

1.1 Table of Cross Sections

In Chapter 2, the following values are summarized in a table given to each nuclide. These values were obtained from the point-wise cross sections at 0 K calculated with the RECENT[3] or RESENDD[4] code. The unit of cross-section values is "barns".

(1) E-thresh

The threshold energies of the reactions.

(2) 0.0253-eV

The cross sections at 0.0253 eV.

(3) Maxw. Av

The Maxwellian spectrum average cross sections calculated in the energy range from 10^{-5} to 3.0 eV with neutron spectrum at a temperature of 0.0253 eV.

(4) Res. integ

The resonance integrals calculated in the energy range from 0.5 eV to 20 MeV.

$$\text{Resonance integral} = \int_{0.5\text{eV}}^{20\text{MeV}} \frac{\sigma(E)}{E} dE .$$

(5) 14-MeV

The cross sections at 14 MeV.

(6) FissSp Av

Averages cross sections calculated with the ^{235}U thermal neutron induced fission spectrum that was the same as that used for the previous report:

$$\chi(E) = \sqrt{\frac{4}{\pi a^3 b}} \times \exp\left(-\frac{ab}{4} - \frac{E}{a}\right) \times \sinh\sqrt{bE} ,$$

where a and b are 0.988 MeV and 2.249 MeV^{-1}, respectively[6]. The integral was performed in the energy range from 10^{-5} eV to 20 MeV.

1.2 Figures of Cross sections

Three kinds of figures are given in Chapter 2 to each nuclide.

(1) The total, elastic and inelastic scattering, capture and fission cross sections

The figures of this kind give those cross sections at 0 K from 0.01 eV to 20 MeV. The cross sections of some reactions that are not small even in the thermal region are also shown in this figure.

(2) Average values of the total, elastic and inelastic scattering, capture and fission cross sections

These figures were provided to show the average trend of cross sections. In these figures, the cross sections were averaged in the 70 energy-group structure from 0.32242 eV to 20 MeV. Averaging was performed with the CRECTJ6 code[7]. The 70 energy-group structure was originally defined from 0.32242 eV to 10 MeV. In the CRECTJ6 code, the structure was extended up to 20 MeV. It should be noted that the figures of cross sections which are the same as JENDL-3.2 are reproduced from the previous report of JAERI-Data/Code 97-003. In such figures, the data from 10 to 20 MeV are not averaged.

(3) Threshold reaction cross sections

The threshold reaction cross sections are given in the third figure.

1.3 Figures of Neutrons per Fission

The number of delayed neutrons (ν_d) and the total number of neutrons (ν_{tot}) per fission are shown in Chapter 3.

Note: The data of ^{232}Th below 1.56 MeV and ^{234}Th below 1.5 MeV are incorrect. They will be modified in the next version of JENDL.

1.4 Average Cross Sections in Typical Reactor Spectra

The one-group average cross sections are given in Chapter 4. The calculation was made as follows using the point-wise cross sections $\sigma(E)$ at 300K obtained with the SIGMA1 code[3] and five sets of neutron flux data of typical reactors $\varphi(E)$:

$$<\sigma>=\frac{\int \varphi(E)\sigma(E)dE}{\int \varphi(E)dE}.$$

The five kinds of neutron fluxes are as follows:

a) BWR

40 % void ratio, temperature = 286 K, no burn-up. The cell average flux was used in the present work.

b) PWR

UO_2 fuel, the volume ratio of moderator to fuel = 1.9

c) MOX fueled PWR (MOX PWR) :

MOX fuel, the same square cell geometry as that of the conventional PWR

d) Reduced moderation water reactor (RMWR80%)

An example of axially heterogeneous core reduced moderation BWR, upper core region cell

MOX fuel, a hexagonal cell of pin diameter 13 mm and pin pitch 14.3 mm

80% moderator void fraction core region

e) Large Liquid Metal Fast Beeder Reactor (LMFBR)

MOX fuel, reactor power = 2600 MWt

The neutron flux of a typical BWR was calculated by Ando[8]. Those of PWR and LMFBR were

provided by Akie[9] by means of 90-group lattice calculation with the SRAC system[10] based on JENDL-2[11]. Akie[12] newly provided us those of MOX PWR and RMWR80% with 107-group pin cell calculation by using the SRAC95 system[13] and group constants based on JENDL-3.2[14]. These two fluxes were used in the present work in stead of HCLWR fluxes used in the previous work.

These neutron flux data were originally given in a multi-group structure. For the present calculation, they were changed into a point-wise form by simply selecting energy points of the root-mean square of energy boundaries, and connecting them by linear interpolation in the log-log scale:

$$E_{C,i} = \sqrt{E_i \times E_{i+1}} ,$$

where E_i and E_{i+1} are lower and upper boundaries of i-th interval. In the lowest energy interval, the neutron flux was replaced with the neutron flux in the Maxwellian shape. Above 10 MeV, the values are not defined in the original flux data. In this energy region, the fission spectra of ^{235}U and ^{239}Pu given in JENDL-3.3 were tentatively used after multiplying $\sqrt{E}$ to change their dimension to flux. The neutron fluxes of BWR and PWR were connected to the ^{235}U thermal fission spectrum, those of MOX PWR and RMWR to the ^{239}Pu thermal fission spectrum, and the flux of the LMFBR to the ^{239}Pu fast fission spectrum. The five sets of flux data used in the present work are shown in Figs. 1 to 5 (dashed lines) together with the originally given multi-group ones (solid lines).
