Re: Requests for 1967

We hope to finish an accurate $(g - 2)$ measurement for μ^- in the present run (4 - 6 weeks before Christmas, 2 weeks in February). We then need to remeasure the magnet, and readjust for μ^+ . For this we request generator time during March - June. Specifically we need the generator during the PS shut-down.

We request 6 - 8 weeks running starting about July 1st for a $(g - 2)$ measurement for μ^+ .
