The 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) was implemented by the Tanzania National Bureau of Statistics (NBS) and the Office of Chief Government Statistician (OCGS) in collaboration with the Ministries of Health of Tanzania Mainland and Zanzibar. The Tanzania Food and Nutrition Centre (TFNC) collaborated on several aspects of the survey, especially biomarkers. Funding for the 2022 TDHS-MIS was provided by the Government of Tanzania; the United States Agency for International Development (USAID); the President's Malaria Initiative (PMI); the Canadian International Development Agency (CIDA); the Centers for Disease Control and Prevention (CDC); the Foreign, Commonwealth and Development Office (FCDO); the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ); the Hilton Foundation; Irish AID; the Royal Norwegian Embassy and Legal and Human Rights Centre (LHRC); Nutrition International, United Nations Children's Fund (UNICEF); the World Food Programme (WFP); and the Bill & Melinda Gates Foundation. ICF provided technical assistance through The DHS Program, a USAID-funded project providing support and technical assistance in the implementation of population and health surveys in countries worldwide.

Additional information about the 2022 TDHS-MIS may be obtained from the National Bureau of Statistics, Head Office, 64 Lusinde Road, P.O. Box 2683, 41104 Tambukareli, Dodoma, Tanzania; telephone: +255-26-296-3822; fax: +255-26-296-3828; email: sg@nbs.go.tz; website: www.nbs.go.tz and the Office of the Chief Government Statistician, P.O. Box 2321, Zanzibar, Tanzania; telephone: +255-24-224-0134; email: zanstat@ocgs.go.tz; website: https://www.ocgs.go.tz.

CONTENTS

TABLES, FIGURES, AND MAPS

FOREWORD

The 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) is the seventh in a series of DHS surveys in Tanzania conducted through The Demographic and Health Surveys (DHS) Program, a global programme coordinated by ICF.

The 2022 TDHS-MIS was implemented by the National Bureau of Statistics (NBS) and the Office of the Chief Government Statistician Zanzibar (OCGS) in collaboration with the Ministries of Health of the United Republic of Tanzania and Zanzibar. The Tanzania Food and Nutrition Centre (TFNC) collaborated on several aspects of the survey, especially biomarkers. ICF provided technical assistance in the implementation of the survey.

Funding for the 2022 TDHS-MIS was provided by the Government of the United Republic of Tanzania; ICF; the United Nations Children's Fund (UNICEF); the United States Agency for International Development (USAID); the President's Malaria Initiative (PMI); the Canadian International Development Agency (CIDA); the Centers for Disease Control and Prevention (CDC); the Foreign, Commonwealth and Development Office (FCDO); the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ); the Hilton Foundation; Irish AID; Nutrition International; the Royal Norwegian Embassy and Legal and Human Rights Centre (LHRC); the World Food Programme (WFP) and Bill & Melinda Gates Foundation.

The main purpose of the 2022 TDHS-MIS was to provide current data needed to monitor and evaluate population, health, and nutrition programmes on a regular basis. It is a useful source of information for assessing national, regional, and global commitments such as Tanzania Development Vision 2025, the Third National Five-Year Development Plan III (FYDP III 2021/22–2025/26), East Africa Community Vision 2050 (EAC 2050), Africa Development Agenda 2063 (ADA 2063), and the Global Agenda 2030 on Sustainable Development Goals (2030 SDGs). The 2022 TDHS-MIS also helps to assess the progress made in improving the living standards of the people in Tanzania.

First and foremost, deepest and heartfelt appreciation is directed to Her Excellency Dr. Samia Suluhu Hassan, the President of the United Republic of Tanzania, and His Excellency Dr. Hussein Ali Mwinyi, the President of the Revolution Government of Zanzibar, for their dedication in ensuring the social welfare of their citizens. The survey results are expected to play a key role in informing the development, implementation, monitoring, evaluation, and review of their agendas, which touch upon all of the topics covered in the survey.

The findings from the survey show significant improvements in some indicators and declines in others. This report is therefore an important tool to address health concerns and inform policymakers and other stakeholders of priority areas for intervention, future planning, and resource allocation.

We are pleased to present this report to the line Ministries and to Development Partners, Non-Governmental organizations, policymakers, program implementers, and researchers. We believe that the findings can be used to make informed decisions and help guide policy formulation, development, implementation, and review. Also, those in academia are encouraged to undertake further analytical work to provide a deeper understanding of key topical areas that touch the lives of Tanzanians. We hope that this report will provide useful information to address intervention concerns and future planning in the health sector.

Ummy A. Mwalimu
Minister for Health
United Republic of Tanzania

Nassor Ahmed Mazrui
Minister for Health
Revolutionary Government of Zanzibar

ACKNOWLEDGEMENTS

The 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) report has been prepared with the participation of organizations and individuals. We would like to express our gratitude to all of them.

First, we sincerely acknowledge all local leaders and all survey respondents who provided their valuable time participating during survey interviews. The response rate was very high (99% household, 97% women and 91% men).

We also present our sincere thanks to the President's Office, Regional Administration and Local Government (PO-RALG) Tanzania Mainland and President's Office, Regional Administration and Local Government and Special Department (PO-RALGSP) Zanzibar for its assistance and contributions to the smooth implementation of the survey.

We would like to express our appreciation to the Ministry of Health from the United Republic of Tanzania and that of Revolutionary Government of Zanzibar for playing a key role in providing policy guidance in setting the survey objectives and relevant data needs. The strategic guidance of the National Bureau of Statistics (NBS), Office of the Chief Government Statistician Zanzibar (OCGS) and Tanzania Food and Nutrition Centre (TFNC) is highly appreciated.

We express our gratitude to our development partners for their vital financial support. Contributions from the United States Agency for International Development (USAID); the Canadian International Development Agency (CIDA); the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ); ICF; the United Nations Children's Fund (UNICEF); the President's Malaria Initiative (PMI); the Centers for Disease Control and Prevention (CDC); the Foreign Commonwealth and Development Office (FCDO); the Hilton Foundation; Irish AID; Nutrition International; the Royal Norwegian Embassy, the Legal and Human Rights Centre (LHRC); the World Food Programme (WFP) and the Bill & Melinda Gates Foundation were of immense importance to the effective accomplishment of the survey.

We express our profound gratitude to the team from ICF, in particular. Livia Montana, Gulnara Semenov, Ruilin Ren, Michelle Winner, Hanna Useem, Ms. Lady Ortiz Parra, and Joy Fishel. Their technical assistance and mentorship during the implementation of the survey are highly appreciated.

We are grateful for the technical guidance of the Technical Committee (TC) members from the Ministries of Health of the United Republic of Tanzania (URT) and Revolutionary Government of Zanzibar (RGZ), the Tanzania Food and Nutrition Centre (TFNC), the National Malaria Control Program (NMCP), the Eastern Africa Statistical Training Centre (EASTC), the Sokoine University of Agriculture (SUA), and the University of Dodoma (UDOM). The TC was managed by the Secretariat from NBS and OCGS and coordinated by survey directors, managers, and desk officers on our behalf.

We congratulate the Quality Control Team, NBS regional staff, IT, team leaders, field supervisors, CAPI supervisors, cartographers, and listers and the nurses who worked tirelessly as interviewers. Likewise, we thank the biomarker technicians for their valuable efforts and the drivers who were able to overcome fatigue and fieldwork transport challenges.

We acknowledge the contributions made by chapter authors and reviewers from the Muhimbili University of Health and Allied Sciences, the Kilimanjaro Christian Medical Centre (KCMC), the University of Dar es Salaam (UDSM), UDOM, and SUA. Also, we thank the retired statisticians and demographers from NBS, OCGS, the ministries responsible for health and gender in Mainland and Zanzibar, TFNC, the

Tanzania Commission for AIDS (TACAIDS), UNICEF Tanzania, and the Tanzania Association of Persons with Disabilities.

Lastly, we wish to recognize the valuable contributions made by the staff of TFNC Laboratories in Mikocheni, Dar es Salaam, in conducting laboratory microscopic analysis of malaria, urinary iodine, and salt iodine tests and other biomarker lab tests for the survey.

DHS	Demographic and Health Survey
DPT	diphtheria, pertussis (whooping cough), and tetanus vaccine
DPT-HepB-Hib	pentavalent or diphtheria, pertussis, tetanus, hepatitis B, and *Haemophilus influenzae* type b vaccine
DVD	digital video disc
EA	enumeration area
ECDI2030	Early Childhood Development Index 2030
EmONC	emergency obstetric newborn care
FGM/C	female genital mutilation/cutting
GAR	gross attendance ratio
GFR	general fertility rate
GPI	gender parity index
GPS	Global Positioning System
HIV	human immunodeficiency virus
ICCPR	International Covenant on Civil and Political Rights
IPV	inactivated polio vaccine
ITN	insecticide-treated net
IUD	intrauterine device
JMP	Joint Monitoring Programme for Water Supply, Sanitation, and Hygiene

LAM	lactational amenorrhoea method
LLIN	long-lasting insecticidal net
LPG	liquefied petroleum gas
MCH	maternal and child health
MDG	Millennium Development Goal
MDSR	Maternal Death Surveillance and Response
MIS	Malaria Indicator Survey
MMAM	Primary Health Care Service Development Programme (for its name in Kiswahili, *Mpango wa maendeleo wa afya ya msingi*)
mmHg	millimetres of mercury
MMR	maternal mortality ratio
MoH	Ministry of Health
MoHCDGEC	Ministry of Health, Community Development, Gender, Elderly and Children
MR	measles-rubella vaccine
MTCT	mother-to-child transmission
NAR	net attendance ratio
NBS	National Bureau of Statistics
NGO	nongovernmental organisation
NHIF	National Health Insurance Fund
NMCP	National Malaria Control Programme
NPA-VAWC	National Plan of Action to End Violence against Women and Children
NSSF	National Social Security Fund
OCGS	Office of the Chief Government Statistician Zanzibar
OPV	oral polio vaccine
ORS	oral rehydration salts
ORT	oral rehydration therapy
PCV	pneumococcal conjugate vaccine
PHNB	public health nurse B
PHSDP	Primary Health Service Development Programme
PMI	U.S. President's Malaria Initiative
PNN	postneonatal mortality
PrEP	pre-exposure prophylaxis
PRMR	pregnancy-related mortality ratio
RDT	rapid diagnostic test
RHF	recommended homemade fluids
RMNCAH	reproductive, maternal, newborn, child, and adolescent health
RV	rotavirus vaccine
SBC	social behaviour change
SBP	systolic blood pressure
SDG	Sustainable Development Goal
SDM	standard days method
SHIB	Social Health Insurance Benefit
STI	sexually transmitted infection

TAR	total induced abortion rate
TASAF	Tanzania Social Action Fund

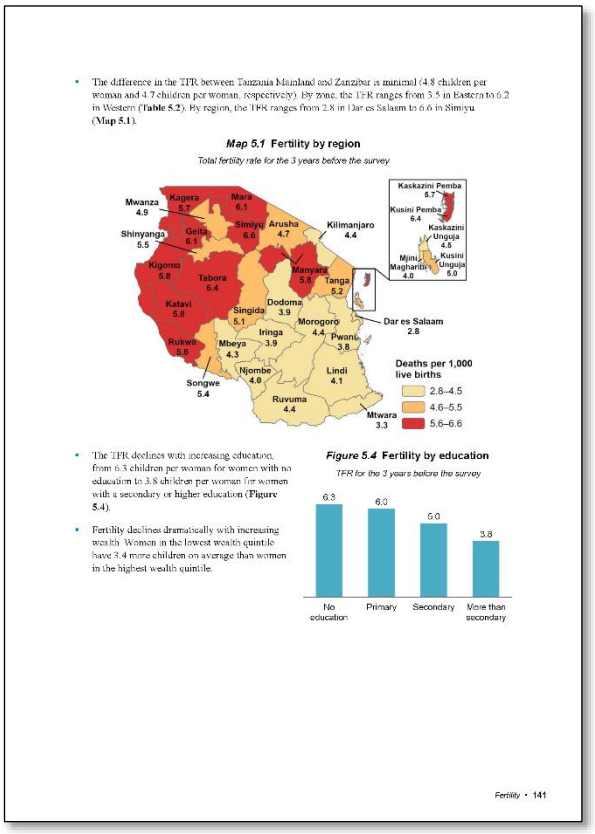
TIKA	Tiba kwa Kadi
TMIS	Tanzania Malaria Indicator Survey
TRCHS	Tanzania Reproductive and Child Health Survey
TZS	Tanzania shilling
UNICEF	United Nations Children's Fund
USAID	United States Agency for International Development
VCT	voluntary counselling and testing
VIA	visual inspection with acetic acid
VIP	ventilated improved pit
WG	Washington Group on Disability Statistics
WHO	World Health Organization

READING AND UNDERSTANDING TABLES FROM THE 2022 TANZANIA DEMOGRAPHIC AND HEALTH SURVEY AND MALARIA INDICATOR SURVEY (TDHS-MIS)

The 2022 Tanzania DHS-MIS final report is based on approximately 303 tables of data. For quick reference, they are located at the end of each chapter and can be accessed through links in the pertinent text (electronic version). Additionally, this more reader-friendly version features about 126 figures that clearly highlight trends, subnational patterns, and background characteristics. Large, colourful maps display breakdowns for region in Tanzania. The text has been simplified to highlight key points in bullets and to clearly identify indicator definitions in boxes.



While the text and figures featured in each chapter highlight some of the most important findings from the tables, not every finding can be discussed or displayed graphically. For this reason, TDHS-MIS data users should be comfortable reading and interpreting tables.

The following pages provide an introduction to the organization of TDHS-MIS tables, the presentation of background characteristics, and a brief summary of sampling and understanding denominators. In addition, this section provides some exercises for users as they practice their new skills in interpreting TDHS-MIS tables.

Example 1: Exposure to mass media: Women

A Question Asked of All Survey Respondents

Table 3.4.1 Exposure to mass media: Women 1

Percentage of women age 15-49 who are exposed to specific media on a weekly basis, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic 3	Reads a newspaper at least once a week	Watches television at least once a week	Listens to the radio at least once a week	Accesses all three media at least once a week	Accesses none of the three media at least once a week	Number of women 2
Age						
15–19	6.5	30.4	28.5	2.8	54.8	3,083

Total 4	6.3	29.8	31.9	3.1	54.4	15,254

5

Step 1: Read the title and subtitle, highlighted in orange in the table above. They tell you the topic and the specific population group being described. In this case, the table is about women age 15–49 and their exposure to different types of media. All eligible female respondents age 15–49 were asked these questions.

Step 2: Scan the column headings—highlighted in green in Example 1. They describe how the information is categorised. In this table, the first three columns of data show different types of media that women access at least once a week. The fourth column shows women who access all three types of media, while the fifth column shows women who do not access any of the three types of media on a weekly basis. The last column lists the number of women age 15–49 interviewed in the survey.

Step 3: Scan the row headings—the first vertical column highlighted in blue in Example 1. These show the different ways the data are divided into categories based on population characteristics. In this case, the table presents women's exposure to media by age, urban-rural residence, Mainland/Zanzibar residence, zone, region, level of education, and wealth quintile. Most of the tables in the TDHS-MIS report will be divided into these same categories.

Step 4: Look at the row at the bottom of the table highlighted in pink. These percentages represent the totals of all women age 15–49 and their weekly access to different types of media. In this case, 6.3% of women age 15–49 read a newspaper at least once a week, 29.8% watch television at least weekly, and 31.9% listen to the radio on a weekly basis.*

Step 5: To find out what percentage of women in rural areas listen to the radio at least once a week, draw two imaginary lines, as shown on the table. This shows that 26.2% of women in rural areas listen to the radio at least once a week.

By looking at patterns by background characteristics, we can see how exposure to mass media varies across Tanzania. Mass media are often used to communicate health messages. Knowing how mass media exposure varies among different groups can help programme planners and policymakers determine how to most effectively reach their target populations.

*For the purpose of this document data are presented exactly as they appear in the table, including decimal places. However, the text in the remainder of this report rounds data to the nearest whole percentage point.

Practice: Use the table in Example 1 to answer the following questions:

a) What percentage of women in Tanzania do not access any of the three media at least once a week?
b) Which age group of women is most likely to watch television at least once a week?
c) What percentage of women read a newspaper at least once a week by educational level?
d) Which age group is the least exposed to newspapers at least once a week?
e) What are the lowest and highest percentages (range) of women who access none of the three media once a week by educational level?
f) Is there a clear pattern in women who access all three media at least once a week by wealth quintile?

Answers:

a) 54.4%.

b) Women age 25–29 are most likely to watch television at least once a week.

c) 10.3% of women with a secondary education or higher read a newspaper a least once a week, as compared with 6.4% of women with a complete primary education, 3.1% with an incomplete primary education, and 0.3% with no education.

d) Women age 30–34 and 45–49 are least exposed to newspapers at least once a week, at 5.8%.

e) The percentage of women who access none of the three media at least once a week ranges from 35.5% among those with a secondary education or higher to 79.0% among those with no education.

f) Yes, weekly exposure to all three media increases with increasing wealth, from 0.5% among women in the lowest wealth quintile to 6.9% among women in the highest quintile.

Example 2: Children with symptoms of ARI and care seeking for symptoms of ARI

A Question Asked of a Subgroup of Survey Respondents

Table 10.6 Children with symptoms of ARI and care seeking for symptoms of ARI 1

Among children under age 5, percentage who had symptoms of acute respiratory infection (ARI) in the 2 weeks preceding the survey, and among children with symptoms of ARI in the 2 weeks preceding the survey, percentage for whom advice or treatment was sought, according to background characteristics, Tanzania DHS-MIS 2022

	Among children under age 5:		Among children under age 5 with symptoms of ARI:		
Background characteristic	2 Percentage with symptoms of ARI[1]	Number of children	Percentage for whom advice or treatment was sought[2]	Percentage for whom advice or treatment was sought the same or next day[2]	Number of children

Middle	1.3	2,001	(75.9)	(34.2)	27
Fourth	2.1	2,110	(90.7)	(60.4)	43
Highest	1.9	1,889	(75.4)	(50.5)	37
Total	3 1.5	10,497	79.3	46.8	162

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
[1] Symptoms of ARI include short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.
[2] Includes advice or treatment from the following sources: public sector, religious/voluntary sector, private medical sector, pharmacy, accredited drug dispensing outlet (ADDO), and nongovernmental organisation (NGO)/voluntary testing and counselling (VCT) centre. Excludes advice or treatment from a shop/kiosk/market/traditional practitioner.

Step 1: Read the title and subtitle. In this case, the table is about two separate groups of children: all children under age 5 (a) and children under age 5 with symptoms of acute respiratory infection (ARI) in the 2 weeks before the survey (b).

Step 2: Identify the two panels. First, identify the columns that refer to all children under age 5 (a), and then isolate the columns that refer only to children under age 5 with symptoms of ARI in the 2 weeks before the survey (b).

Step 3: Look at the first panel. What percentage of children under age 5 had symptoms of ARI in the 2 weeks before the survey? It is 1.5%. Now look at the second panel. How many children under age 5 had symptoms of ARI in the 2 weeks before the survey? It's 162 children, or 1.5% of the 10,497 children (with rounding). The second panel is a subset of the first panel.

Step 4: Only 1.5% of children under age 5 had symptoms of ARI in the 2 weeks before the survey. Once these children are further divided into the background characteristic categories, there may be too few cases for the percentages to be reliable.

- What percentage of children age 6–11 months with symptoms of ARI had advice or treatment sought the same or next day? 60.3%. This percentage is in parentheses because there are between 25 and 49 children (unweighted) in this category. Readers should use this number with caution—it may not be reliable. (For more information on weighted and unweighted numbers, see Example 3.)

- What percentage of children under age 5 with symptoms of ARI from Dodoma had advice or treatment sought the same or next day? There is no number in this cell—only an asterisk. This is because fewer than 25 children under age 5 from Dodoma had advice or treatment sought the same or next day. Results for this group are not reported. The subgroup is too small, and therefore the data are not reliable.

Note: When parentheses or asterisks are used in a table, the explanation will be noted under the table. If there are no parentheses or asterisks in a table, you can proceed with confidence that enough cases were included in all categories that the data are reliable.

Example 3: Understanding Sampling Weights in TDHS-MIS Tables

A sample is a group of people who have been selected for a survey. In the TDHS-MIS, the sample is designed to represent the national population age 15–49. In addition to national data, most countries want to collect and report data on smaller geographical or administrative areas. However, doing so requires a large enough sample size in each area. For the 2022 TDHS-MIS, the survey sample is representative at the national and regional levels and for urban and rural areas.

To generate statistics that are representative of the country as a whole and the 31 regions, the number of women surveyed in each region should contribute to the size of the total (national) sample in proportion to size of the region. However, if some regions have small populations, then a sample allocated in proportion to each region's population may not include sufficient women from each region for analysis. To solve this problem, regions with small populations are oversampled. For example, let's say that you have enough money to interview 15,254 women and want to produce results that are representative of Tanzania as a whole and its regions (as in Table 3.1). However, the total population of Tanzania is not evenly distributed among the regions: some regions, such as Dar es Salaam, are heavily populated while others, such as Lindi, are not. Thus, Lindi must be oversampled.

A sampling statistician determines how many women should be interviewed in each region in order to get reliable statistics. The **blue column (1)** in the table at right shows the actual number of women interviewed in each region. Within the regions, the number of women interviewed ranges from 362 in Lindi to 835 in Dar es Salaam. The number of interviews is sufficient to get reliable results in each region.

Table 3.1 Background characteristics of respondents

Percent distribution of women and men age 15–49 by selected background characteristics, Tanzania DHS-MIS 2022

	Women

Highest	26.0	3,971	4,044
Total	100.0	15,254	15,254

Note: Education categories refer to the highest level of education attended, whether or not that level was completed.

With this distribution of interviews, some regions are overrepresented and some regions are underrepresented. For example, the population in Dar es Salaam is about 9.1% of the population in Tanzania, while Lindi's population contributes only 2.2% of the country's population. But as the blue column shows, the number of women interviewed in Dar es Salaam accounts for only 5.5% of the total sample of women interviewed (835/15,254), and the number of women interviewed in Lindi accounts for 2.4% of the total sample of women interviewed (362/15,254). This unweighted distribution of women does not accurately represent the population.

In order to get statistics that are representative of Tanzania, the distribution of the women in the sample needs to be weighted (or mathematically adjusted) such that it resembles the true distribution in the country. Women from a small region, like Lindi, should contribute only a small amount to the national total. Women from a large region, like Dar es Salaam, should contribute much more. Therefore, DHS statisticians mathematically calculate a "weight" that is used to adjust the number of women from each

region so that each region's contribution to the total is proportional to the actual population of the region. The numbers in the **purple column (2)** represent the "weighted" values. The weighted values can be smaller or larger than the unweighted values at the regional level. The total national sample size of 15,254 women has not changed after weighting, but the distribution of the women in the regions has been changed to represent their contribution to the total population size.

How do statisticians weight each category? They take into account the probability that a woman was selected in the sample. If you were to compare the **green column (3)** to the actual population distribution of Tanzania, you would see that women in each region are contributing to the total sample with the same weight that they contribute to the population of the country. The weighted number of women in the survey now accurately represents the proportion of women who live in Dar es Salaam and the proportion of women who live in Lindi.

With sampling and weighting, it is possible to interview enough women to provide reliable statistics at national and regional levels. In general, only the weighted numbers are shown in each of the TDHS-MIS tables, so don't be surprised if these numbers seem low: they may actually represent a larger number of women interviewed.

SUSTAINABLE DEVELOPMENT GOAL INDICATORS

Sustainable Development Goal Indicators, 2022 Tanzania DHS-MIS

Indicator	Residence		Total	TDHS-MIS table number
	Urban	Rural		
1. No poverty				
1.4.1 Proportion of population living in households with access to basic services				
a) Access to basic drinking water services	93.9	51.5	63.8	16.2
b) Access to basic sanitation services	57.8	53.5	54.7	16.7

2.2.2 Prevalence of malnutrition among children under 5 years of age	7.9	5.7	6.8	na
a) Prevalence of wasting among children under 5 years of age	4.2	2.4	3.3	11.1
b) Prevalence of overweight among children under 5 years of age	3.7	3.3	3.5	11.1
2.2.3 Prevalence of anaemia in women age 15 to 49 years, by pregnancy status				
a) Prevalence of anaemia in nonpregnant women age 15 to 49 years	na	40.3	na	11.17.1
b) Prevalence of anaemia in pregnant women age 15 to 49 years	na	55.7	na	11.17.1
3. Good health and well-being				
3.1.1 Maternal mortality ratio[3]	na	na	104	14.4
3.1.2 Proportion of births attended by skilled health personnel	na	na	85.0	9.9
3.2.1 Under-5 mortality rate[4]	52	34	43	8.1 and 8.2
3.2.2 Neonatal mortality rate[4]	27	21	24	8.1 and 8.2
3.7.1 Proportion of women of reproductive age (aged 15–49 years) who have their need for family planning satisfied with modern methods	na	53.9	na	7.14.2
3.7.2 Adolescent birth rates per 1,000 women				
a) Girls aged 10–14 years[5]	na	1	na	5.1
b) Women aged 15–19 years[6]	na	112.0	na	5.1
3.a.1 Age-standardised prevalence of current tobacco use among persons aged 15 years and older[7]	11.1	0.6	5.9[a]	3.13
3.b.1 Proportion of the target population covered by all vaccines included in their national programme				
a) Coverage of DPT containing vaccine (3rd dose)[8]	90.9	89.1	90.0	10.4
b) Coverage of measles containing vaccine (2nd dose)[9]	62.7	65.0	63.8	10.4
c) Coverage of pneumococcal conjugate vaccine (last dose in schedule)[10]	88.0	87.8	87.9	10.4
4. Quality education				
4.2.1 Proportion of children aged 24–59 months who are developmentally on track in health, learning, and psychosocial well-being	44.1	50.8	47.4	10.13
4.2.2 Participation rate in organised learning (one year before the official primary entry age)	71.7	72.3	72.0	2.15
5. Gender equality				
5.2.1 Proportion of ever-partnered women and girls aged 15 years and older subjected to physical, sexual, or psychological violence by a current or former intimate partner in the previous 12 months[11,12]	na	32.5	na	18.13
a) Physical violence	na	23.9	na	18.13
b) Sexual violence	na	8.9	na	18.13
c) Psychological violence	na	22.2	na	18.13
5.2.2 Proportion of women and girls aged 15 years and older subjected to sexual violence by persons other than an intimate partner in the previous 12 months[13]	na	0.3	na	18.6
5.3.1 Proportion of women aged 20–24 years who were married or in a union before age 15 and before age 18				
a) before age 15	na	5.2	na	4.4
b) before age 18	na	29.1	na	4.4
5.3.2 Proportion of girls and women aged 15–49 years who have undergone female genital mutilation/cutting	na	8.2	na	17.2
5.6.1 Proportion of women aged 15–49 years who make their own informed decisions regarding sexual relations, contraceptive use, and reproductive health care[14]	na	49.6	na	15.12
5.b.1 Proportion of individuals who own a mobile telephone[15]	75.1	59.4	67.3[a]	15.6.1 and 15.6.3
	Residence			
	Urban	Rural	Total	
6. Clean water and sanitation				
6.1.1 Proportion of population using safely managed drinking water services				
a) Proportion with basic drinking water services	93.9	51.5	63.8	16.2
b) Proportion with water available when needed	67.7	77.7	74.8	16.4
6.2.1 Proportion of population using (a) safely managed sanitation services and (b) hand-washing facility with soap and water				
a) Proportion using basic sanitation service	57.8	53.5	54.7	16.7
b) Proportion in which excreta are safely disposed of in situ or treated off site	93.1	63.4	72.0	16.9
c) Proportion using open defecation	0.7	13.4	9.7	16.6

INTRODUCTION AND SURVEY METHODOLOGY 1

The 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) was implemented by the National Bureau of Statistics (NBS) and the Office of the Chief Government Statistician Zanzibar (OCGS) in collaboration with the Ministries of Health (MoH) in Tanzania Mainland and Zanzibar. The Tanzania Food and Nutrition Centre (TFNC) collaborated on several aspects of the survey, especially biomarkers. Data collection took place from February to July 2022. ICF provided technical assistance through The DHS Program, which is funded by the United States Agency for International Development (USAID) and offers financial support and technical assistance for population and health surveys in countries worldwide. Other agencies and organisations that facilitated the successful implementation of the survey through technical or financial support were the President's Malaria Initiative (PMI); the Canadian International Development Agency (CIDA); the Centers for Disease Control and Prevention (CDC); the Foreign, Commonwealth and Development Office (FCDO); the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ); Hilton Foundation; Irish AID; Legal and Human Rights Centre (LHRC); Nutrition International; Royal Norwegian Embassy; United Nations Children's Fund (UNICEF); and World Food Programme (WFP). The United Nations Children's Fund (UNICEF) in Tanzania acted as a disbursing entity for most of the donors' funds.

1.1 SURVEY OBJECTIVES

The primary objective of the 2022 TDHS-MIS is to provide current and reliable information on population and health issues. Specifically, the 2022 TDHS-MIS collected information on marriage and sexual activity, fertility and fertility preferences, family planning, infant and child mortality, maternal health care, disability among the household population, child health, nutrition of children and women, malaria prevalence, knowledge, and communication, women's empowerment, women's experience of domestic violence, adult maternal mortality via sisterhood method, awareness and behaviour regarding HIV/AIDS and other sexually transmitted infections (STIs), female genital cutting, and early childhood development. Other information collected on health-related issues included smoking, blood pressure, anaemia, malaria, and iodine testing, height and weight, and micronutrients.

The information collected through the 2022 TDHS-MIS is intended to assist policymakers and programme managers in evaluating and designing programmes and strategies for improving the health of Tanzania's population. The 2022 TDHS-MIS also provides indicators to monitor and evaluate international, regional, and national programmes, such as the Global Agenda 2030 on Sustainable Development Goals (2030 SDGs), Tanzania Development Vision 2025, the Third National Five-Year Development Plan (FYDP III 2021/22–2025/26), East Africa Community Vision 2050 (EAC 2050), and Africa Development Agenda 2063 (ADA 2063).

Tanzania has undertaken five population and housing censuses since its independence in 1961. The first census, conducted in 1967, reported a total population of 12.3 million. According to the 2012 census, the population had increased to 44.9 million (**Table 1.1**). The average population density of the country is still relatively low. However, density is high in some parts of the country and has been increasing over time. In 1967, the average population density was 14 persons per square kilometre; by 2012, it had increased to 51 persons per square kilometre.

Table 1.1 Selected demographic indicators from various sources, Tanzania 1967–2012

Indicator	Census year				
	1967	1978	1988	2002	2012
Population (millions)	12.3	17.5	23.1	34.4	44.9
Intercensal growth rate (%)	2.6	3.2	2.8	2.9	2.7
Sex ratio	95.2	96.2	94.2	96.0	95.0
Crude birth rate	47	49	46	43	42
Total fertility	6.6	6.9	6.5	6.3	5.5
Crude death rate	24	19	15	14	9.3
Infant mortality	155	137	115	95	46.2
Percent urban	6.4	13.8	18.3	23.1	29.6
Density (population/km2)	14	20	26	39	51
Life expectancy (years)	42	44	50	51	61.8
Male	6,005,339	8,586,713	11,327,511	16,829,861	21,869,990
Female	6,308,130	8,925,897	11,846,825	17,613,742	23,058,933

Source: National Bureau of Statistics

1.2 SAMPLE DESIGN

The sample design for the 2022 TDHS-MIS was carried out in two stages and was intended to provide estimates for the entire country, for urban and rural areas in Tanzania Mainland, and for Zanzibar. For specific indicators such as contraceptive use, the sample design allows for estimation of indicators for each of the 31 regions—26 regions in Tanzania Mainland and 5 regions in Zanzibar.

The sampling frame excluded institutional populations, such as persons in hospitals, hotels, barracks, camps, hostels, and prisons. The 2022 TDHS-MIS followed a stratified two-stage sample design. The first stage involved selection of sampling points (clusters) consisting of enumeration areas (EAs) delineated for the 2012 Tanzania Population and Housing Census (2012 PHC). The EAs were selected with a probability proportional to their size within each sampling stratum. A total of 629 clusters were selected. Among the 629 EAs, 211 were from urban areas and 418 were from rural areas.

In the second stage, 26 households were selected systematically from each cluster, for a total anticipated sample size of 16,354 households for the 2022 TDHS-MIS. A household listing operation was carried out in all the selected EAs before the main survey. During the household listing operation, field staff visited each of the selected EAs to draw location maps and detailed sketch maps and to list all residential households found in each EA with addresses and the names of the heads of the households. The resulting list of households served as a sampling frame for the selection of households in the second stage. During the listing operation, field teams collected global positioning system (GPS) data—latitude, longitude, and altitude readings—to produce one GPS point per EA. To estimate geographic differentials for certain demographic indicators, Tanzania was divided into nine geographic zones. Although these zones are not official administrative areas, this classification system is also used by the Reproductive and Child Health Section of the Ministry of Health. Grouping of regions into zones allows for larger denominators and smaller sampling errors for indicators at the zonal level. The zones are as follows:

Tanzania Mainland:

- Western zone: Tabora, Kigoma
- Northern zone: Kilimanjaro, Tanga, Arusha
- Central zone: Dodoma, Singida, Manyara
- Southern Highlands zone: Iringa, Njombe, Ruvuma
- Southern zone: Lindi, Mtwara
- Southwest Highlands zone: Mbeya, Rukwa, Katavi, Songwe
- Lake zone: Kagera, Mwanza, Geita, Mara, Simiyu, Shinyanga
- Eastern zone: Dar es Salaam, Pwani, Morogoro

Zanzibar:

- Zanzibar zone: Kaskazini Unguja, Kusini Unguja, Mjini Magharibi, Kaskazini Pemba, Kusini Pemba

All women age 15–49 who were either usual residents or visitors in the household on the night before the survey interview were included in the 2022 TDHS-MIS and were eligible to be interviewed. In a subsample of half of all households selected for the survey, all men age 15–49 were eligible to be interviewed if they were either usual residents or visitors in the household on the night before the survey interview. In this subsample, children age 0–59 months, women age 15–49, and men age 15–49 were eligible for height and weight measurement. Children age 6–59 months were also eligible for anaemia and malaria testing using rapid tests. Women were eligible for anaemia testing and were asked to provide a urine sample for laboratory testing to detect the presence of iodine. In this subsample of half of households, anaemia and malaria testing were conducted using capillary blood.

A subsample of approximately 20% of all households was selected for the micronutrient component. Within those households, all interviewed women age 15–49 and children age 6–59 months were eligible for venous blood collection. In 40% of the households selected for micronutrient testing, a dose of vitamin A was administered, and an additional blood sample was collected approximately 4 hours later for relative dose response testing. Questions on food fortification were asked, and samples of salt, wheat flour, maize flour, and cooking oil were collected from the household. Blood specimens and food samples were collected, processed, and sent to TFNC for storage and analysis. Drops of the venous blood collected from women and children in the field were tested on-the-spot for anaemia and malaria. Haematocrit was measured in venous blood collected from women, and all blood samples were processed on the same day they were collected to prepare them for frozen storage until the start of laboratory testing. A range of micronutrient laboratory analyses was carried out by TFNC. The results for all tests conducted in the 20% of households included in the micronutrient component will be published in a separate report. Results of the anaemia testing for children and women in this micronutrient subsample using venous blood are published in this report and will be included in the separate micronutrient report as well.

1.3 QUESTIONNAIRES

Five questionnaires were used for the 2022 TDHS-MIS: the Household Questionnaire, the Woman's Questionnaire, the Man's Questionnaire, the Biomarker Questionnaire, and the Micronutrient Questionnaire. The questionnaires, based on The DHS Program's Model Questionnaires, were adapted to reflect the population and health issues relevant to Tanzania. In addition, a self-administered Fieldworker's Questionnaire collected information about the survey's fieldworkers.

The Household Questionnaire was used to list all the usual members and visitors in the selected households. Basic demographic information was collected on characteristics of each person listed, including age, sex, marital status, education, and relationship to the head of the household. Parents' survival status was determined for children under age 18. The data on age and sex of household members obtained from the Household Questionnaire were used to identify women and men who were eligible for individual interviews. The Household Questionnaire also collected information on characteristics of the household's dwelling unit, such as source of drinking water, type of toilet facilities, materials used for the floor of the dwelling unit, ownership of various durable goods, and ownership and use of mosquito nets. Questions were also asked about the disability status of household members age 5 or above. The Household Questionnaire also collected information on the results of iodine tests conducted on the salt consumed by households.

The Woman's Questionnaire was used to collect information from all eligible women age 15–49. These women were asked questions on the following topics:

- Background characteristics (age, education, media exposure, etc.)
- Birth history and childhood mortality
- Knowledge and use of family planning methods
- Fertility preferences, antenatal, delivery, and postnatal care
- Breastfeeding and infant feeding practices
- Vaccinations and childhood illnesses
- Marriage and sexual activity
- Women's work and husband's background characteristics
- Other health issues
- Adult mortality, including maternal mortality
- Female genital cutting
- Early childhood development
- Malaria
- Domestic violence

The Man's Questionnaire was administered to all men age 15–49 in the subsample of households selected for the men's survey. The Man's Questionnaire collected much of the same information found in the Woman's Questionnaire, but it was shorter because it did not contain a detailed reproductive history or questions on maternal and child health.

The Biomarker Questionnaire was used to record anthropometric (height and weight) measurements for children under age 5 and women and men age 15–49; to record anaemia test results for children age 6–59 months and women age 15–49; to record malaria rapid test results for children age 6–59 months; and to document responses to requests to women age 15–49 to collect urine samples for laboratory testing of urinary iodine. The samples were to be tested later for iodine at the TFNC laboratory.

A Micronutrient Questionnaire was used to record anthropometric measurements, anaemia and malaria test results, and haematocrit results for women and to document the outcome of venous blood collection procedures and, in the relevant subset, the time for each step in the vitamin A relative dose response test.

The Fieldworker Questionnaire recorded basic background information on the people collecting data in the field, including the team supervisors, computer-assisted personal interviewing (CAPI) supervisors, interviewers, and biomarker technicians.

The questionnaires and the survey protocol, including administration of questionnaires and collection of biomarkers, were approved by the Medical Research Council of Tanzania and the Zanzibar Health Research Institute and reviewed by ICF's Internal Review Board (IRB).

1.4 Anthropometry, Anaemia, Malaria and Iodine Testing, and Blood Pressure Measurements

The 2022 TDHS-MIS included biomarker measurements such as anthropometry (height and weight), anaemia testing, and blood pressure. The Biomarker Questionnaire was used to record anthropometric measurements and the results of anaemia and malaria testing, while blood pressure measurement data were recorded in the Woman's and Man's Questionnaires. In the households selected for the micronutrient component, a Micronutrient Questionnaire was used to record anthropometric measurements, the results of anaemia, malaria, and haematocrit testing.

Blood pressure measurements were conducted in all households. In the subsample of 50% of households selected for the male interview, anthropometry measurements were taken for children, women and men, malaria testing was conducted for children, urine was collected from women for iodine testing, and

anaemia and malaria testing were conducted for women and children using capillary blood. This report also includes results from the anaemia testing conducted for women and children in the 20% subsample for the micronutrient component. In this subsample, anaemia testing was conducted using venous blood.

Anthropometry: Weight and height measurements were recorded for children age 0–59 months and for women and men age 15–49. SECA model 878U scales with a digital display number were used to measure weight, while height and length were measured using ShorrBoard® measuring boards. Children younger than 24 months were measured lying down (recumbent length), while older children and adults were measured standing (height). Children with a *z* score of less than −3 or more than 3 for height-for-age, weight-for-height, or weight-for-age were flagged and measured a second time. The remeasurement of flagged cases was performed to ensure accurate reporting of height and weight measurements. For children having severe acute malnutrition, referral was made to the nearest health facility for further investigation.

Anaemia: Blood specimens for anaemia testing were collected from eligible women age 15–49 who consented to the testing. Blood specimens were also collected from children age 6–59 months whose parents or guardians consented to the testing. In the 50% of households selected for the male interview, blood samples were drawn from a drop of blood taken from a finger prick (or a heel prick in the case of children age 6–11 months) and collected in a microcuvette. In the 20% of households selected for the micronutrient component, anticoagulated blood from venous collection was used to fill a microcuvette. Haemoglobin analysis was carried out on-site using a battery-operated portable analysis device (HemoCue® 201+ photometer), which produces a result in less than 1 minute. HemoTrol® controls were used as quality control materials for haemoglobin measurements using a HemoCue® 201+ photometer. Results were provided verbally and in writing to those being tested. Parents or guardians of children with a haemoglobin level below 8 g/dl were provided with a referral and instructed to take the child to a health facility for follow-up care. Likewise, adults were referred for follow-up care if their haemoglobin levels were below 8 g/dl.

Malaria: Malaria testing was conducted for children age 6–59 months. Using the same finger- (or heel-) prick or venous blood sample used for anaemia testing, a drop of blood was tested immediately using the SD Bioline Ag Pf rapid diagnostic test (RDT), which is a rapid qualitative test for malaria specific to *Plasmodium falciparum* (Pf), the major cause of malaria in Tanzania.

Children who tested positive for malaria using the RDT were screened to determine whether malaria was severe. Those with uncomplicated malaria in Tanzania Mainland were offered a full course of treatment according to Tanzania national malaria treatment guidelines, provided they were not currently on treatment with artemisinin-based combination therapy (ACT) and had not completed a full course of ACT during the preceding 2 weeks. To ascertain the correct dose, health technicians were provided with treatment guidance charts and were instructed to ask about signs of severe malaria and about any medications the child might already be taking. The nurses then provided the age-appropriate dose of ACT along with instructions on how to administer the medicine to the child.[1] Children who tested positive and showed symptoms of severe malaria—haemoglobin levels below 8 g/dl, extreme weakness, loss of consciousness, rapid breathing, seizures, bleeding, jaundice, and dark urine—were not offered the treatment. Because the first-line treatment for severe malaria is parenteral quinine, the parents or guardians were advised to take the child to a health facility immediately. The parents or guardians of all other children treated were told to take the child to a health facility immediately if they became sicker, developed a fever or difficulty breathing, or were not able to drink or breastfeed. Parents also received counselling on how to prevent malaria. Women who tested positive for malaria were not offered treatment; all were referred to a health facility. Children who tested positive for malaria in Zanzibar were not treated but referred to a health facility for

[1] Dosage of ACT was based on recipient's age. The proper dosage for a child age 6 months to 3 years is one tablet of artemether-lumefantrine (co-formulated tablets containing 20 mg of artemether and 120 mg of lumefantrine) to be taken twice daily for 3 days, while the dosage for a child age 4–7 is two tablets of artemether-lumefantrine to be taken twice daily for 3 days.

management based on the current procedure for malaria elimination on the island. Their parents or guardians were advised to go to the nearest health facility immediately.

In those households in which anthropometry, anaemia, or malaria testing were done, a brochure was provided returning all results and explaining the causes and prevention of malnutrition, anaemia, and malaria.

Urinary iodine: Urine samples were requested from women age 15–49, regardless of current pregnancy status. The sample was collected into a 50 ml bottle and then transferred into two screw-capped vials (2 ml each). The samples were then transported to TFNC for iodine testing by Sandell-Kolthoff reaction. To ensure quality in the determination of urinary iodine concentrations, TFNC participated in an external quality control programme organised by the Centers for Disease Control and Prevention (CDC) known as the programme for Ensuring the Quality of Urinary Iodine Procedures (EQUIP).

Blood pressure: During the woman's interview, three blood pressure measurements were taken from women age 15–49 who consented to the measurement. The measurement was done using the Life Source blood pressure monitor (UA-767F) or a similar digital oscillometric device with automatic upper-arm inflation and automatic pressure release. Measurements were taken at intervals of 10 minutes or more. Systolic and diastolic blood pressure values are expressed in millimetres of mercury (mmHg). The average of the second and third measurements was used to classify the respondent with respect to hypertension, according to internationally recommended categories (WHO 1999). The results of the respondent's average blood pressure were given to respondents, along with a corresponding referral for advice when necessary. The results were read aloud and then provided to the respondent in writing via the Blood Pressure Reporting Form.

1.5 Training of Trainers and Pretest

A pretest was conducted in Kilimanjaro region from 30 September to 21 October 2021. Eighteen interviewers (12 women and 6 men) and 6 health technicians (3 male and 3 female) participated in the training, which was conducted by trainers from NBS, OCGS, TFNC, the National Malaria Control Programme (NMCP), and MoH, with technical assistance from ICF. Classroom instructions were provided during the first 15 days, and a pretest field practice took place over 4 days in two rural clusters and one urban cluster. Following the field practice, a debriefing session was held with the pretest field staff, and modifications were made to the questionnaires and CAPI applications based on lessons learnt from the exercise.

A training of trainers (TOT) for questionnaire content and the CAPI system was held before the main training from 19 January to 25 January 2022 in Moshi, Kilimanjaro region.

1.6 Training of Field Staff

The main training for the 2022 TDHS-MIS took place in Kilimanjaro region from 26 January 2022 to 21 February 2022. A total of 120 potential interviewers from all over the country—including 60 female nurses, 20 male nurses, 20 team leaders, and 20 CAPI supervisors—were invited to participate in the training. The training sessions were conducted by NBS, OCGS, and MoH trainers with support from ICF. Trainers from TFNC and UNICEF provided training to 80 biomarker technicians, including 40 who were trained on the standard survey biomarkers (anthropometry and haemoglobin) and 40 who were trained on procedures for the micronutrient component.

Participants were evaluated through in-class exercises, quizzes, and observations made during the field practice. By the end of the main training, 18 teams were formed, with 18 individuals serving as team leaders, 18 as CAPI supervisors, 18 as male interviewers, 54 as female interviewers, and 72 as biomarker technicians (36 technicians for standard biomarkers and 36 for micronutrients). All the interviewers were nurses and clinicians. The team leaders and CAPI supervisors received additional training on how to

identify the selected households, implementation of different subsamples, data quality control procedures, and coordination of the fieldwork.

Nurses and clinicians were trained on how to provide doses of antimalarial drugs for eligible respondents who were diagnosed as malaria positive. The course of ACT was based on the recipient's age. During the training, biomarkers were trained on how to measure the height and weight of children and adults, including standardisation and restandardisation exercises. All biomarkers and interviewers who passed the exams on both theory and practicals were given opportunities to participate in the data collection exercise.

1.7 FIELDWORK

Data collection was carried out by 18 field teams, 3 teams for Zanzibar and 15 teams for Tanzania Mainland. Each team was provided with two vehicles (four-wheel drive trucks) with two drivers. Each team consisted of a team supervisor, a CAPI supervisor, three female interviewers, one male interviewer, and four biomarker technicians (two for standard biomarkers and two for micronutrients). During fieldwork, EA maps, listing forms, and local leaders assisted the field staff in identifying the sampled clusters and households. The team leaders and CAPI supervisors were responsible for data quality in the field.

Fieldwork monitoring was an integral part of the 2022 TDHS-MIS. Quality control teams consisted of staff from NBS, OCGS, TFNC, and the ministry responsible for health from both Tanzania Mainland and Zanzibar. Fieldwork monitoring involved visiting teams regularly to ensure that the survey was conducted according to the survey protocol and providing real time solutions to field challenges by observing the biomarker measurements of eligible respondents. All biomarker questionnaires and urine specimens were sent to the nearest TFNC laboratory every week. Field check tables were generated regularly from Syncloud to monitor data quality and fieldwork progress. For field teams with specific problems, quality control staff provided specific instructions to help those teams to improve their performance, otherwise feedback was regularly provided to all field teams. ICF provided technical assistance during the entire 5-month data collection period, which ran from 24 February to 21 July 2022. All teams completed their first cluster in Kilimanjaro region. Data collection in other regions started in March 2022.

1.8 DATA PROCESSING

In the 2022 TDHS-MIS survey, CAPI was used during data collection. The devices used for CAPI were Android-based computer tablets programmed using a mobile version of CSPro. Programming of questionnaires into the android application was done by ICF, while configuration of tablets was done by NBS and OCGS in collaboration with ICF. All fieldwork personnel were assigned usernames, and devices were password protected to ensure the integrity of the data collected. Selected households were assigned to CAPI supervisors, whereas households were assigned to interviewers' tablets via Bluetooth. The data for all interviewed households were sent back to CAPI supervisors, who were responsible for initial data consistency and editing, before being sent to the central servers hosted at NBS Headquarters via Syncloud.

The data processing of the 2022 TDHS-MIS ran concurrently with the data collection exercise. The electronic data files from each completed cluster were transferred via Syncloud to the NBS central office server in Dodoma. The data files were registered and checked for inconsistencies, incompleteness, and outliers. Errors and inconsistencies were communicated to the field teams for review and correction. Secondary central data editing was done by NBS and OCGS survey staff at the central office. A CSPro batch editing tool was used for cleaning data and included coding of open-ended questions and resolving inconsistencies.

The Biomarker paper questionnaires were collected by field supervisors and compared with the electronic data files to check for any inconsistencies that may have occurred during data entry. The concurrent data collection and processing offered an advantage because it maximised the likelihood of having error-free

data. Timely generation of field check tables allowed effective monitoring. The secondary data editing exercise was completed in October 2022.

1.9 Response Rates

Table 1.2 presents the response rates for the 2022 TDHS-MIS. A total of 16,312 households were selected for the 2022 TDHS-MIS sample. This number is slightly less than the targeted sample size of 16,354 because one EA could not be reached due to security reasons, while a few EAs had less than the targeted 26 households. Of the 16,312 households selected, 15,907 were found to be occupied. Of the occupied households, 15,705 were successfully interviewed, yielding a response rate of 99%. In the interviewed households, 15,699 women age 15–49 were identified as eligible for individual interviews. Interviews were completed with 15,254 women, yielding a response rate of 97%. In the subsample (50% of households) of households selected for the male questionnaire, 6,367 men age 15–49 were identified as eligible for individual interviews, and 5,763 were successfully interviewed, yielding a response rate of 91%.

Table 1.2 Results of the household and individual interviews

Number of households, number of interviews, and response rates, according to residence (unweighted), Tanzania DHS-MIS 2022

	Tanzania Mainland				
Result	Urban	Rural	Total	Zanzibar	Tanzania
Household interviews					
Households selected	4,771	9,201	13,972	2,340	16,312
Households occupied	4,595	9,019	13,614	2,293	15,907
Households interviewed	4,493	8,957	13,450	2,255	15,705
Household response rate[1]	97.8	99.3	98.8	98.3	98.7
Interviews with women age 15–49					
Number of eligible women	4,741	8,345	13,086	2,613	15,699
Number of eligible women interviewed	4,576	8,110	12,686	2,568	15,254
Eligible women response rate[2]	96.5	97.2	96.9	98.3	97.2
Household interviews in subsample					
Households selected	2,382	4,600	6,982	1,170	8,152
Households occupied	2,288	4,502	6,790	1,147	7,937
Households interviewed	2,232	4,469	6,701	1,129	7,830
Household response rate in subsample[1]	97.6	99.3	98.7	98.4	98.7
Interviews with men age 15–49

Number of eligible men interviewed	1,547	3,225	4,772	991	5,763
Eligible men response rate[2]	86.5	91.0	89.5	95.8	90.5

[1] Households interviewed/households occupied
[2] Respondents interviewed/eligible respondents

HOUSING CHARACTERISTICS AND HOUSEHOLD POPULATION 2

Key Findings

- ***Cooking:*** 7% of the population in Tanzania relies primarily on clean fuels and technologies for cooking.
- ***Household population composition:*** The population of Tanzania is young, with 46% under age 15.
- ***Birth registration:*** Registration of children under age 5 has increased substantially, from 26% in the 2015–16 TDHS-MIS to 68% in the 2022 TDHS-MIS.
- ***Orphans:*** In Tanzania, 28% of households have a child under age 18 who is either an orphan or does not live with a biological parent.
- ***School attendance:*** The net attendance ratio (NAR) has increased from 23% in 2015–16 to 37% in 2022 for secondary school. The primary school NAR also increased between the two surveys.
- ***Disability by domain:*** 8% of household members age 5 and older have some level of difficulty in at least one functional domain, and 3% have a lot of difficulty or cannot function at all in at least one domain.

Information collected in the 2022 TDHS-MIS on the socioeconomic characteristics of the household population provides context for interpreting demographic and health indicators and furnishes an approximate indication of the representativeness of the survey. The information also sheds light on the living conditions of the population.

This chapter presents information on housing characteristics, frequency of smoking in the home, household possessions, means of transportation, agriculture land and livestock/farm animals, wealth, and use of clean fuels and technologies (related to cooking, heating, and lighting). The chapter also includes information on household population and composition, children's living arrangements and orphanhood, birth registration, educational attainment, school attendance, participation in organised learning, and disability.

2.1 HOUSING CHARACTERISTICS

The 2022 TDHS-MIS collected information on access to electricity, flooring materials, and the number of rooms used for sleeping (**Table 2.1**). Nationally, more than one-third of households (36%) have electricity. The lowest rate is 17% in Tanzania Mainland rural households and the highest is 75% of Tanzania Mainland urban households. Two-thirds of households in Zanzibar have electricity. Access to electricity has increased in all these areas since the 2015–16 TDHS-MIS.

Furthermore, the survey results on flooring material reveal that earth and sand are the most common flooring materials for households in Tanzania (46%), followed by cement (43%). Earth or sand flooring is most common in rural households of Tanzania Mainland (64%), while cement is the most common flooring material in urban households of Tanzania Mainland (67%) and Zanzibar (71%). In Tanzania, smoking in the home is not common, with 83% of households in Tanzania reporting that smoking never occurs inside the home. Daily smoking in the home occurs in 10% of households in Tanzania—12% of

households in rural Tanzania Mainland, 7% in urban Tanzania Mainland, and 6% of households in Zanzibar.

2.1.1 Use of Clean Fuels and Technologies

Primary reliance on clean fuels and technologies

The percentage of the population using clean fuels and technologies for cooking, heating, and lighting, where each component is defined as follows:

Clean cooking fuels and technologies

Includes electric stove, solar cooker, liquefied petroleum gas (LPG)/cooking gas stove, piped natural gas stove, biogas stove, liquid fuel stove, manufactured solid fuel stove, traditional solid fuel stove, three-stone stove/open fire.

Clean heating fuels and technologies

Includes alcohol/ethanol, gasoline/diesel, kerosene/paraffin, coal/lignite, charcoal, wood, straw/shrubs/grass, agriculture crops, animal dung/waste, processed biomass (pellets) or woodchips, garbage/plastic and sawdust.

Clean lighting fuels and technologies

Includes electricity, solar lantern, battery powered or rechargeable flashlight/torch/lantern, biogas lamp, gasoline lamp, kerosene or paraffin lamp, charcoal, wood, straw/shrubs/grass, agriculture crops, animal dung/waste, oil lamp and candle.

Sample: Households and de jure population

2.1.2 Cooking

Only 7% of the Tanzanian population lives in households that use clean fuels and technologies for cooking, and there is a notable difference by residence. Clean fuels and technologies are used by 18% of the population in urban Tanzania Mainland, as compared with 11% in Zanzibar and just 2% in rural Tanzania Mainland. In Tanzania, the most commonly used cooking technology is a three-stone stove or open fire (67%), and the most common type of cooking fuel is wood (67%), followed by charcoal (25%) (**Table 2.2**).

2.1.3 Heating and Lighting

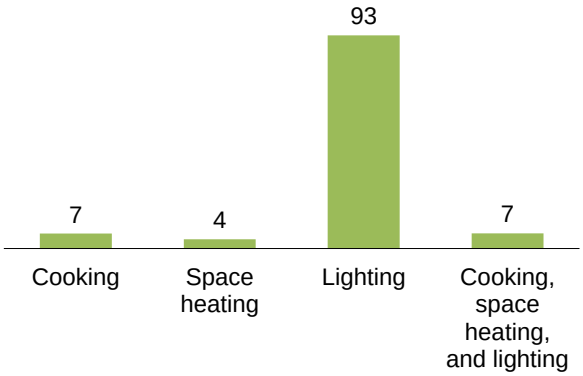
Ninety-three percent of the population in Tanzania uses clean fuels and technologies for lighting. Moreover, 38% of household residents rely on a solar lantern for lighting, followed by 32% who use electricity. In Tanzania Mainland, 74% of the population in urban areas and 16% in rural areas use electricity, while in Zanzibar it is used by 65% of the population (**Table 2.3**). The use of space heating is uncommon in Tanzania.

2.1.4 Primary Reliance on Clean Fuels and Technologies

Seven percent of the population relies primarily on clean fuels and technologies for cooking, space heating, and lighting. The vast majority of the population relies on clean fuels and technologies for lighting (93%). However, only 7% relies on clean fuels and technologies for cooking. Ninety-three percent of the population relies primarily on solid fuels for cooking, including 93% in Tanzania Mainland and 88% in Zanzibar (**Table 2.4** and **Figure 2.1**).

Figure 2.1 **Primary reliance on clean fuels and technologies**

Percentage of de jure population relying on clean fuels and technologies for:



2.2 Household Wealth

2.2.1 Household Durable Goods

The survey also collected information on household effects, means of transportation, and ownership of agricultural land and farm animals. About 8 in 10 households (83%) own a mobile phone; nearly half (44%) own a radio, and almost 3 in 10 (27%) own a television. Possession of all types of household effects tends to be highest among households in urban areas in Tanzania Mainland, followed by Zanzibar, and then rural areas in Tanzania Mainland. In contrast, Tanzania Mainland rural households are more likely to own agricultural land (69%) or farm animals (62%) than are Tanzania Mainland urban households (21% and 26%, respectively) and Zanzibar households (20% and 29%, respectively). A bicycle is the most common means of transport, especially among households in Zanzibar (35%) and in Tanzania Mainland rural areas (31%). For further information on household durable goods, see **Table 2.5**.

2.2.2 Wealth Index

Wealth index

Households are given scores based on the number and kinds of consumer goods they own, ranging from a television to a bicycle or car, and housing characteristics such as source of drinking water, toilet facilities, and flooring materials. These scores are derived using principal component analysis. National wealth quintiles are compiled by assigning the household score to each usual (de jure) household member, ranking each person in the household population by her or his score, and then dividing the distribution into five equal categories, each with 20% of the population.

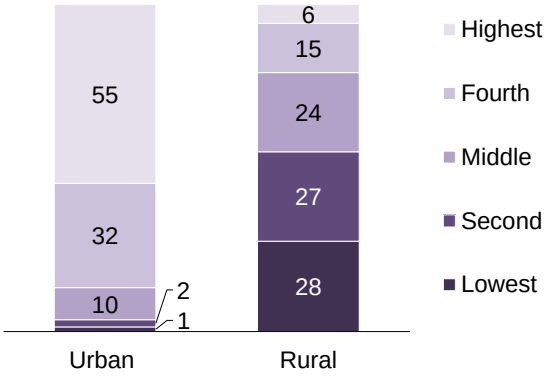
Sample: Households

Table 2.6 and **Figure 2.2** show that 55% of the de jure population in urban areas are in the highest wealth quintile, as compared with 6% in rural areas.

In Tanzania Mainland, households are equally distributed across the five wealth quintiles, in contrast to Zanzibar, where the highest wealth quintile holds the greatest percentage of the population (44%). By zone, the Western and Central zones have the greatest percentages of the population falling in the lowest quintile (32% each). **Table 2.6** shows the distribution of the population by wealth quintile within each region.

***Figure 2.2* Household wealth by residence**

Percent distribution of de jure population by wealth quintiles



2.3 Coverage of Assistance Programmes

Table 2.7 shows that 10% of households are currently benefitting from a Tanzania Social Action Fund (TASAF) programme. Cash transfers are the most common type of programme. Rural households are more likely than urban households to be receiving benefits from a TASAF programme (12% versus 5%). TASAF programme coverage is the lowest in the Eastern zone and in Dar es Salaam

2.4 Household Population and Composition

Household

A person or group of related or unrelated persons who live together in the same dwelling unit(s), who acknowledge one adult male or female as the head of the household, who share the same housekeeping arrangements, and who are considered a single unit.

De facto population

All persons who stayed in the selected households the night before the interview (whether usual residents or visitors).

De jure population

All persons who are usual residents of the selected households, whether or not they stayed in the household the night before the interview.

How data are calculated

All tables are based on the de facto population, unless specified otherwise.

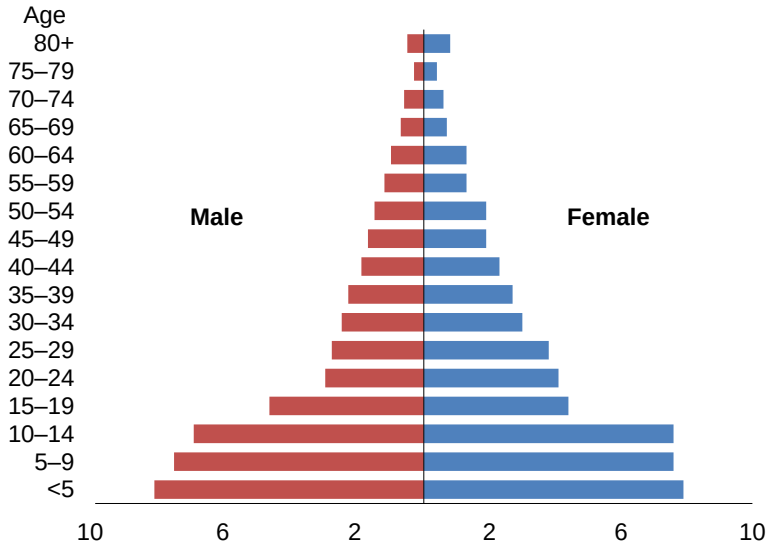
A total population of 69,664 individuals stayed overnight in the 15,705 households interviewed in the 2022 TDHS-MIS. Fifty-two percent of them (36,541) were female, and 48% (33,123) were male. Nearly half of the population is under age 15 (46%), while only 5% is age 65 and older (**Table 2.8**).

The population pyramid in **Figure 2.3** shows the population distribution by 5-year age groups, separately for males and females. The broad base of the pyramid illustrates that Tanzania's population is young, which is typical of countries with low life expectancy and high fertility.

The average household size in Tanzania is 4.5 people per household (**Table 2.9**). Tanzania Mainland urban households are slightly smaller (4.0 people per household) than Tanzania Mainland rural households (4.7 people per household). Zanzibar has the highest average household size (5.3 people). Twenty-nine percent of households in the 2022 TDHS-MIS are headed by women.

Figure 2.3 **Population pyramid**

Percent distribution of the household population



Trends: The age-sex structure of the Tanzanian population has shown little change over the past decade. The percentage of children under age 15 is the same as in the 2015–16 TDHS-MIS (46%).

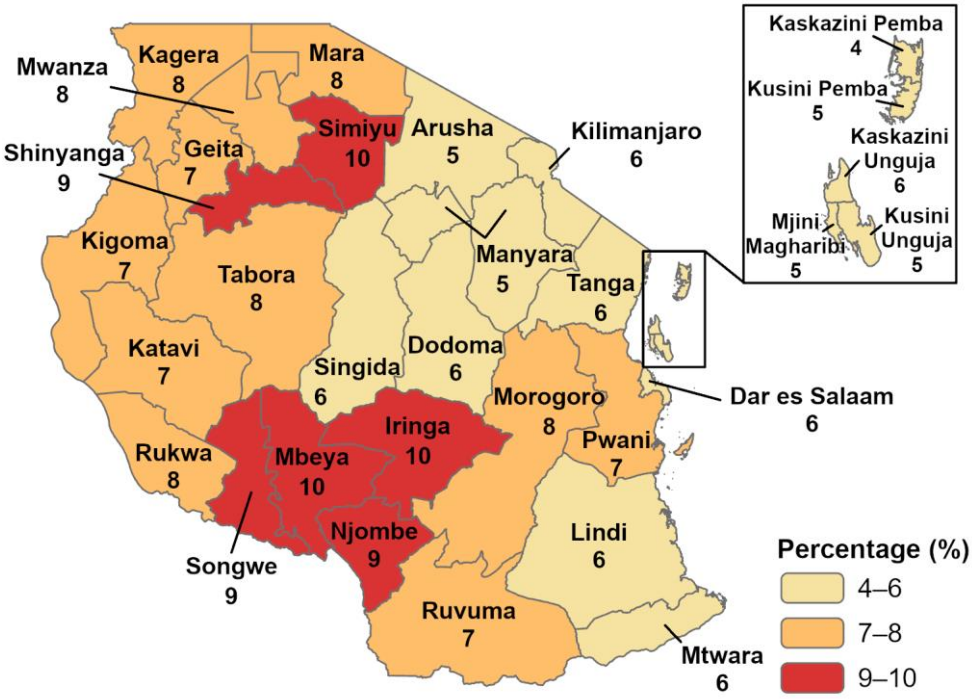
2.5 Children's Living Arrangements and Parental Survival

Orphan
A child with one or both parents who are dead.
Sample: Children under age 18

In Tanzania, 7% of children age under age 18 are orphans, meaning that one or both of their parents are dead. The percentage of children not living with a biological parent and the percentage of children with one or both parents dead increase with age. Among children age 15–17, 29% do not live with a biological parent, while 15% are orphans (**Table 2.10**). By region, orphanhood ranges from 4% in Kaskazini Pemba to 10% in Iringa, Mbeya, and Simiyu (**Map 2.1**).

Map 2.1 Orphanhood by region

Percentage of de jure children under age 18 with one or both parents dead



Trends: The percentage of children under age 18 who are orphans has slightly decreased, from 10% in the 2010 TDHS, to 8% in the 2015–2016 TDHS-MIS, and to 7% in the 2022 TDHS-MIS.

2.6 Birth Registration

Registered birth

Child has a birth certificate or child does not have a birth certificate, but the birth is registered with the civil authorities.

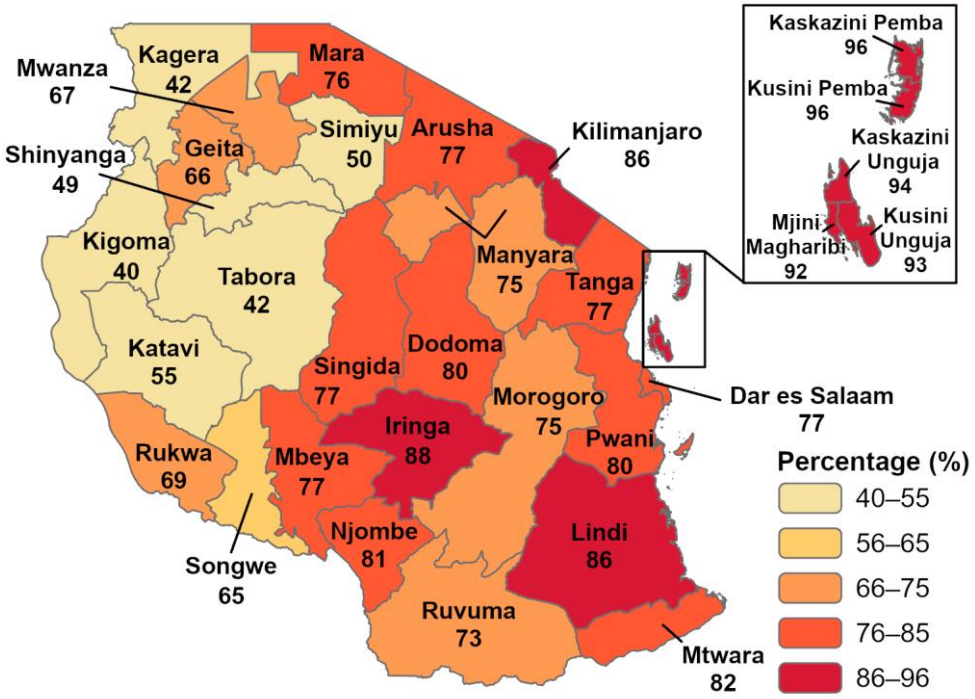
Sample: De jure children under age 5

The global concern regarding the need to have all births registered by 2030 is evident in targets 16.9.1 and 17.19.2 of the SDGs. Birth registration is important because a child who is not registered is in danger of being denied the right to an official identity, a recognised name, and a nationality.

Respondents were asked whether they had birth certificates for the children in the household who were under age 5. If a child did not have a birth certificate, they were asked whether the birth had been registered with the civil authority. The 2022 TDHS-MIS found that 58% of children had birth certificates and 10% did not have birth certificates but had birth notifications. In total, 68% of children under age 5 had been registered with the civil authority. Boys and girls under age 5 are equally likely to be registered. The registration of births is more common in Tanzania Mainland urban areas (75%) than in Tanzania Mainland rural areas (65%). The registration of births in Tanzania Mainland as a whole (67%) is lower than in Zanzibar (94%). The percentage of births that have been registered increases with increasing household wealth, from 55% in the lowest wealth quintile to 82% in the highest wealth quintile (**Table 2.11**). By region, birth registration ranges from 40% in Kigoma to 96% in Kaskazini Pemba and Kusini Pemba (**Map 2.2**).

Map 2.2 Birth registration by region

Percentage of de jure children under age 5 whose births are registered with the civil authorities



For all births that occurred in a health facility during the 2 years preceding the survey, the mother was asked if she received a birth notification form. Women who received a birth notification form were asked if they received the form from the health facility where they gave birth or from another place. For 54% of facility births, the mothers reported receiving a birth notification form from the health facility where they gave birth. Birth notification forms were received from another place for an additional 5% of facility births (**Table 2.12**).

Provision of birth notification forms is nearly universal in Zanzibar, with mothers reporting they received a notification form from the health facility where the birth occurred for 98% of facility births.

Trends: Registration of children has increased dramatically, from 26% in the 2015–16 TDHS-MIS to 68% in the 2022 TDHS.

2.7 EDUCATION

2.7.1 Educational Attainment

Median educational attainment

Half of the population has completed less than the median number of years of schooling, and half of the population has completed more than the median number of years of schooling.

Sample: De facto household population age 6 and older

Educational attainment is fairly similar among women and men in Tanzania. Overall, 21% of females age 6 and older have no formal education, compared with 16% of males. The percentage who completed primary school and no higher is 30% among females and 29% among males. Nine percent of women and 10% of men completed secondary school and no higher. Attendance after the secondary level is slightly higher for

men (2%) than women (1%) (**Tables 2.13.1** and **2.13.2**). The median number of years of schooling completed among females is 5.5 years, compared with 5.8 years among males.

Trends: The percentage of the population with no education has declined slightly over time, from 24% of females and 22% of males in the 2015–16 TDHS-MIS to 21% of females and 16% of males in the 2022 TDHS-MIS.

Patterns by background characteristics

- The median number of years of schooling is higher in urban areas than in rural areas among both females (6.5 years versus 4.0 years) and males (6.5 years versus 4.5 years).
- Among both females and males, the median number of years of schooling increases with increasing wealth. For example, among females, the median number of years of schooling completed rises from 1.0 years in the lowest wealth quintile to 6.7 years in the highest quintile.

2.7.2 Primary and Secondary School Attendance

Net attendance ratio (NAR)

Percentage of the school-age population that attends primary or secondary school.

Sample: Children age 7–13 for primary school NAR and children age 14–17 for secondary school NAR

Gross attendance ratio (GAR)

The total number of children attending primary school divided by the official primary school age population and the total number of children attending secondary school divided by the official secondary school age population.

Sample: Children age 7–13 for primary school GAR and children age 14–17 for secondary school GAR

In Tanzania, the average primary school net attendance ratio (NAR) for children age 7–13 is 79% (80% for girls and 78% for boys). The secondary school NAR for children age 14–17 is 37% (40% for girls and 33% for boys) (**Table 2.14**). The secondary school NAR has increased from 23% in the 2015–16 TDHS-MIS.

The primary school gross attendance ratio (GAR) for children age 7–13 is 98%, overall and for both girls and boys. The secondary school GAR for children age 14–17 is 53%, and the ratio is higher for girls (58%) than for boys (49%).

Gender parity indices (GPI)

The ratio of female to male students attending primary school and the ratio of female to male students attending secondary school. The index reflects the magnitude of the gender gap.

Sample: Primary school students and secondary school students

The primary school gender parity index (GPI) for the GAR is 0.99, indicating that similar percentages of girls and boys are attending primary school. The secondary school GPI for the GAR is 1.18, indicating that secondary school attendance is higher among girls than boys (**Table 2.14**).

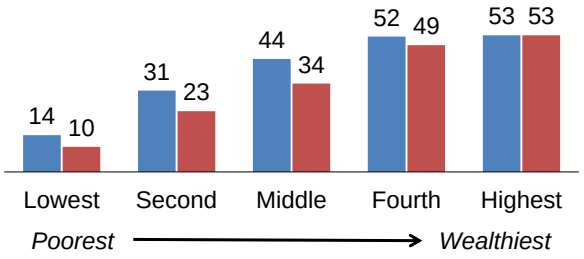
Patterns by background characteristics

- According to the NAR, more children in urban areas attend primary school than children in rural areas (85% versus 77%). Similar patterns exist for secondary school attendance—the NAR for secondary school is 51% in urban areas and 31% in rural areas.

- In 19 of the 31 regions, primary school attendance is higher among girls than boys.
- The primary and secondary school NAR and GAR both increase with increasing household wealth. For example, the NAR for secondary school increases from 14% for girls and 10% for boys in the lowest quintile to 53% for girls and boys in the highest quintile (**Figure 2.4**).

Figure 2.4 **Secondary school attendance by household wealth**

Net attendance ratio for secondary school among children age 14–17



2.7.3 Participation Rate in Organised Learning among Children Age 5

Participation rate in organised learning—adjusted net attendance ratio (NAR)

Percentage of children 1 year younger than the official primary school entry age (at the beginning of school year) who are attending an early childhood education programme or primary school. The ratio is termed adjusted since it includes children in primary school.

Sample: Children age 6 at the beginning of the school year

Seventy-two percent of children who were age 6 at the beginning of the school year participated in organised learning; 23% attended an early childhood education programme, and nearly half (49%) attended primary school (**Table 2.15**).

Patterns by background characteristics

- The adjusted NAR for children age 6 at the beginning of the school year is the same among girls and boys (72%).
- The adjusted NAR is higher in Zanzibar (93%) than in Tanzania Mainland (72%)
- By zone, the adjusted NAR is lowest in Western Zone (46%) and highest in Zanzibar (93%).
- The percentage of children age 6 at the beginning of the school year who participate in early learning increases with wealth. Those in the lowest wealth quintile have the lowest adjusted NAR (52%), and those in the highest wealth quintile have the highest adjusted NAR (97%).

2.8 DISABILITY

The 2022 TDHS-MIS included The DHS Program's Disability Module, a series of questions based on the Washington Group on Disability Statistics (WG) questions, which are based on the framework of the World Health Organization's International Classification of Functioning, Disability, and Health. The questions address six core functional domains—seeing, hearing, communication, cognition, walking, and self-care—and provide the basic necessary information on disability. This information is comparable to that collected worldwide via the WG disability tools.

2.8.1 Disability by Domain and Age

The respondent to the Household Questionnaire provided information for all household members and visitors on whether they had no difficulty, some difficulty, a lot of difficulty, or no ability at all in the specified domain. Results, based on over 58,443 people, are presented in **Table 2.16** for the de facto household population age 5 and older.

Functional domains

Seeing, hearing, communicating, remembering or concentrating, walking or climbing steps, and washing all over or dressing.

Sample: De facto household population age 5 and above

Overall, 8% of the population age 5 and older was reported to have some level of difficulty in at least one domain. Three percent of the population was reported to have either a lot of difficulty functioning in at least one domain or could not function in a domain at all. The percentage of people who have a lot of difficulty or cannot function at all in at least one domain is higher among individuals age 60 and older (14%) than among younger individuals (4% or lower).

2.8.2 Disability among Adults by Other Background Characteristics

Functional domains

Seeing, hearing, communicating, remembering or concentrating, walking or climbing steps, and washing all over or dressing.

Sample: De facto household population age 15 and above

Eighty-four percent of women and 86% of men have no difficulty in any domain. Eleven percent of women and 9% of men have difficulty seeing, the most prominent type of difficulty in the population age 15 and older. Six percent of women and 4% of men have at least some difficulty walking or climbing steps. Four percent of women and 3% of men have a lot of difficulty or cannot perform the function at all in at least one domain (**Tables 2.17.1** and **2.17.2**).

Patterns by background characteristics

- By region, the percentage who have some difficulty in at least one domain is highest in Kilimanjaro among both women and men (25% and 24%, respectively). Among women, this percentage is lowest in Singida and Tabora (6% and 4%, respectively). Among men, it is lowest in Tabora (4%) (**Tables 2.17.1** and **2.17.2**).
- The percentage of men who have some difficulty in at least one domain decreases with increasing education, from 13% among those with no education to 8% among those with more than a secondary education.
- The trend by level of education is less clear among women (**Table 2.17.2**).

LPG = liquefied petroleum gas
[1] Includes central heating, electricity, LPG/natural gas/biogas, solar air heater, and alcohol/ethanol

Table 2.4 Primary reliance on clean fuels and technologies

Percentage of de jure population relying on clean fuels and technologies for cooking, percentage relying on solid fuels for cooking, percentage relying on clean fuel and technologies for space heating, percentage relying on clean fuel and technologies for lighting, and percentage relying on clean fuels and technologies for cooking, space heating, and lighting, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Primary reliance on clean fuels and technologies for cooking[1]	Primary reliance on solid fuels for cooking[2]	Number of persons in households that reported cooking in the house	Primary reliance on clean fuels and technologies for space heating[3]	Number of persons in households that reported use of space heating	Primary reliance on clean fuels and technologies for lighting[4]	Number of persons in households that reported use of lighting	Primary reliance on clean fuels and technologies for cooking, space heating, and lighting[5]	Number of persons

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
nc = no cases
[1] Includes stoves/cookers using electricity, LPG/natural gas/biogas, solar, and alcohol/ethanol
[2] Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crops, and animal dung/waste, processed biomass (pellets) or woodchips, garbage/plastic, and sawdust
[3] Includes central heating, electricity, LPG/natural gas/biogas, solar air heater, and alcohol/ethanol
[4] Includes electricity, solar lantern, rechargeable flashlight/torch/lantern, battery powered flashlight/torch/lantern, and biogas lamp
[5] In order to calculate SDG indicator 7.1.2, persons living in households that report no cooking, no space heating, or no lighting are included in the numerator.

Mean size of households	4.0	4.7	4.5	5.3	4.5
Percentage of households with children under age 18 who are orphans or not living with a biological parent					
Double orphans	1.3	1.2	1.2	0.5	1.2
Single orphans[1]	8.4	9.7	9.2	8.4	9.2
Children not living with a biological parent[2]	22.0	25.3	24.2	23.9	24.2
Orphans and/or children not living with a biological parent	25.1	29.1	27.8	27.0	27.8
Number of households	4,965	10,313	15,278	427	15,705

Note: Table is based on de jure household members, i.e., usual residents.
[1] Includes children with one dead parent and an unknown survival status of the other parent
[2] Children not living with a biological parent are those under age 18 living in households with neither their mother nor their father present.

Table 2.10 Children's living arrangements and orphanhood

Percent distribution of de jure children under age 18 by living arrangements and survival status of parents, percentage of children not living with a biological parent, and percentage of children with one or both parents dead, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Living with both parents	Living with mother but not with father		Living with father but not with mother		Not living with either parent					Total	Percentage not living with a biological parent	Percentage with one or both parents dead[1]	Number of children
		Father alive	Father dead	Mother alive	Mother dead	Both alive	Only mother alive	Only father alive	Both dead	Missing information on father/ mother

[1] The NAR for primary school is the percentage of the primary-school age (7–13 years) population that is attending primary school. The NAR for secondary school is the percentage of the secondary-school age (14–17 years) population that is attending secondary school. By definition the NAR cannot exceed 100.0.
[2] The GAR for primary school is the total number of primary school students, expressed as a percentage of the official primary-school-age population. The GAR for secondary school is the total number of secondary school students, expressed as a percentage of the official secondary-school-age population. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100.0.
[3] The Gender Parity Index for primary school is the ratio of the primary school NAR (GAR) for females to the NAR (GAR) for males. The Gender Parity Index for secondary school is the ratio of the secondary school NAR (GAR) for females to the NAR (GAR) for males.

Table 2.15 Participation rate in organised learning

Percent distribution of children age one year younger than the official primary school entry age at the beginning of the school year by attendance at an early childhood education programme or primary school, and the adjusted net attendance ratio (NAR), according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Percent distribution of children attending				Adjusted NAR[1]	Number of children age 6 years at beginning of the school year

[1] If a person was reported to have difficulty in more than one domain, only the highest level of difficulty is shown.

CHARACTERISTICS OF RESPONDENTS 3

Key Findings

- ***Education:*** 44% of women and 40% of men age 15–49 have completed primary school as their highest level of schooling; 31% of women and 36% of men have attended at least some secondary school.
- ***Literacy:*** 80% of women and 87% of men are literate.
- ***Exposure to mass media:*** 32% of women and 52% of men listen to the radio at least once a week. Fifty-four percent of women and 34% of men do not access any of the three media on a weekly basis. Fourteen percent of women and 28% of men have ever used the internet.
- ***Employment status:*** 60% of women and 81% of men are currently employed.
- ***Health insurance coverage:*** Less than 10% of women and men have any health insurance.
- ***Migration:*** 35% of women and 36% of men have migrated within the country. That is, they were born in Tanzania, but their current place of residence is different from where they were born.
- ***Blood pressure:*** The prevalence of hypertension is 11% among women and 10% among men age 15–49.
- ***Tuberculosis:*** 4% of all households had at least one household member diagnosed with tuberculosis in the last 5 years.

This chapter presents information on the demographic and socioeconomic characteristics of the survey respondents, including age, education, literacy, marital status, employment, occupation, wealth, health insurance coverage, residence at birth, current place of residence and recent migration, blood pressure, and tuberculosis. The chapter also presents information on respondents' use of alcohol and tobacco. Together, this information is useful for understanding the factors that affect the use of reproductive health services, contraceptive use, and other health behaviours.

3.1 BASIC CHARACTERISTICS OF SURVEY RESPONDENTS

The 2022 TDHS-MIS interviewed 15,254 women and 5,763 men age 15–49. **Table 3.1** shows the percent distribution of women and men age 15–49 by background characteristics. In this age group, 55% of women are under age 30, with adolescents (those age 15–19) constituting 20%. For men, 56% are under age 30.

Nearly two-thirds of women (61%) are currently married or living together with a partner as though married, while 27% of women have never been married. Fifty-one percent of men are currently married or living together with a partner as though married, while 44% have never been married. Further, 13% of women are divorced, separated, or widowed.

Two-thirds of respondents, irrespective of sex, live in rural areas.

Among the respondents interviewed, 97% of women and 97% of men live in Tanzania Mainland and 3% of each live in Zanzibar. About 1 in 10 respondents age 15–49 live in Dar es Salaam (9% of women and 9% of men).

3.2 EDUCATION AND LITERACY

Literacy

Respondents who have attended secondary school A level or higher are assumed to be literate. All other respondents were considered literate if they could read aloud all or part of a sentence shown to them.

Sample: Women and men age 15–49

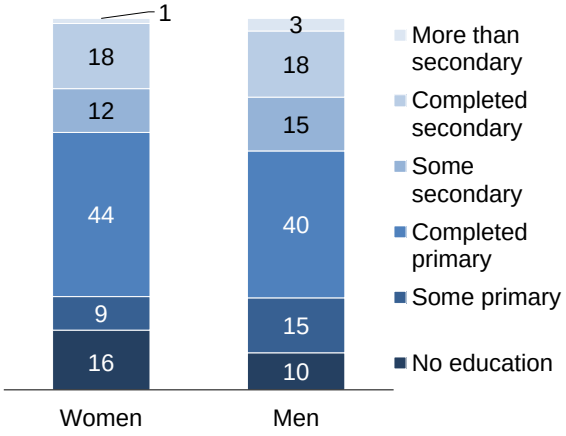
Education is one of the most important determinants of an individual's knowledge and behaviour. **Table 3.2.1**, **Table 3.2.2**, and **Figure 3.1** show levels of education among interviewed women and men.

In general, the percentage who never attended school is higher among women than men (16% and 10%, respectively). The median years of school completed is 6.6 for women and 6.7 for men.

Eighty percent of women and 87% of men are literate in Tanzania (**Tables 3.3.1** and **3.3.2**).

Figure 3.1 **Education of survey respondents**

Percent distribution of women and men age 15–49 by highest level of schooling attended or completed



Trends: The median number of school years completed has remained stable, from 6.5 years for both women and men in the 2015–16 TDHS-MIS to 6.6 years for women and 6.7 years for men in the TDHS-MIS 2022. Among women, the median years of schooling increased from 6.6 years to 11.6 years among those age 15–19, and from 8.1 years to 13.7 years in Zanzibar. Among men, the median years of education increased from 6.9 years to 13.0 years among men in urban areas, and from 8.1 years to 13.5 years in Zanzibar.

Patterns by background characteristics

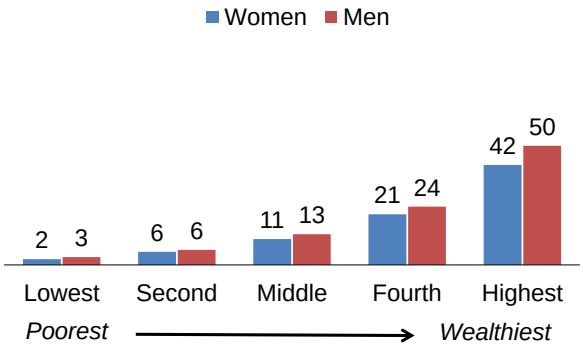
- The percentage of women who have never attended school is higher in rural areas than urban areas (22% and 6%, respectively). For men, 13% in rural areas have never attended school compared with 3% in urban areas.

- The greatest disparities in access to education are seen by wealth quintile. Four in 10 women and 3 in 10 men in the lowest wealth quintile have never been to school. The percentage of women who have completed secondary O level education or higher steadily increases with rising wealth, from 2% to 42% among those in the highest wealth quintile. The same pattern is observed among men (**Tables 3.2.1** and **3.2.2** and **Figure 3.2**).

- Women from the wealthiest households have completed a median of 4.4 more years of schooling than women from the poorest households (9.3 years versus 4.9 years).

Figure 3.2 Secondary education by household wealth

Percentage of women and men age 15–49 with secondary education complete or higher

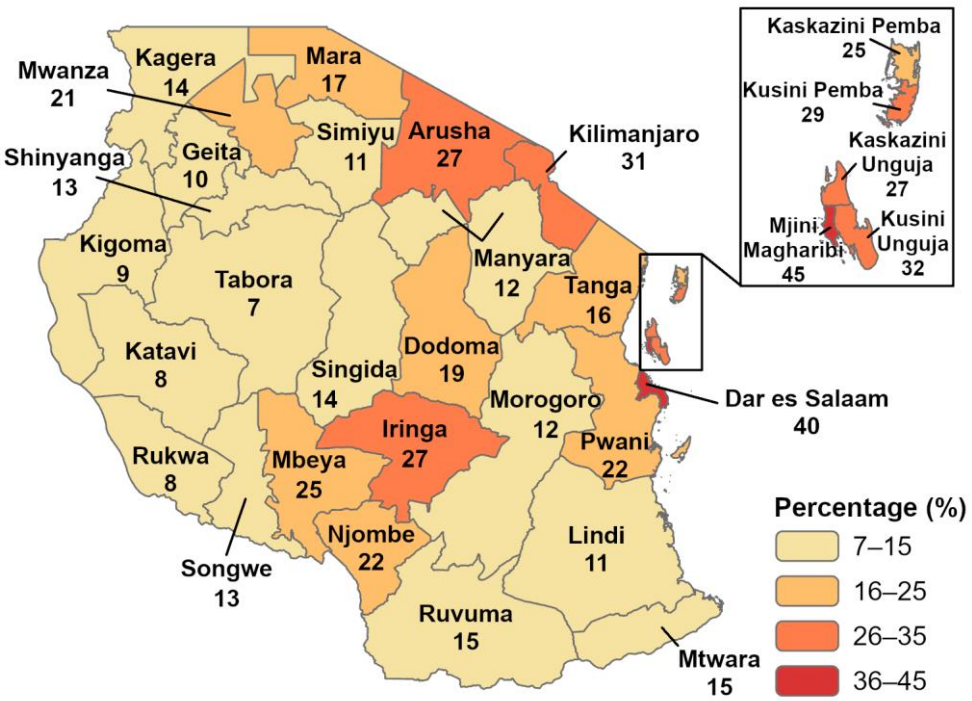


- Literacy rises steadily and dramatically with rising wealth among both women and men.

- The percentage of women who have completed secondary education (O level) or higher is highest in Mjini Magharibi (45%) and lowest in Tabora (7%) (**Map 3.1**).

Map 3.1 Education by region

Percentage of women age 15–49 who completed secondary education or higher



3.3 Mass Media Exposure and Internet Usage

Exposure to mass media

Respondents were asked how often they read a newspaper, listened to the radio, or watched television. Those who responded *at least once a week* are considered regularly exposed to that form of media.

Sample: Women and men age 15–49

Use of the internet

Respondents were asked if they have ever used the internet from any device, if they used the internet in the last 12 months, and if so, how often they have used it during the last month.

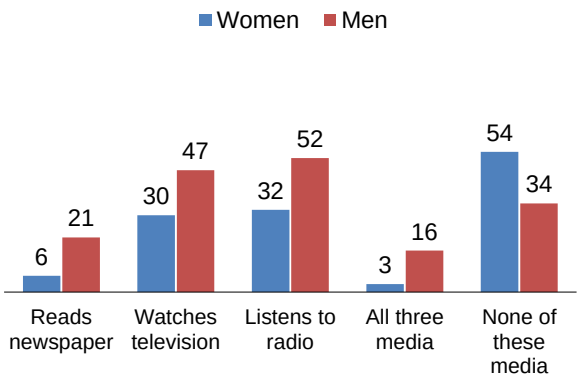
Sample Women and men age 15–49

Exposure to different mass media is key to information dissemination and expansion of knowledge. Data on women's exposure to media are useful for understanding which women are likely to be reached by media campaigns disseminating family planning, health, and other information.

Radio is the most frequently accessed form of media among both women and men; 32% of women and 52% of men listen to the radio at least once a week. Thirty percent of women watch television, and 6% read a newspaper at least once a week. The corresponding percentages for men are 47% and 21% (**Table 3.4.1** and **Table 3.4.2** and **Figure 3.3**).

Figure 3.3 **Exposure to mass media**

Percentage of women and men age 15–49 who are exposed to media on a weekly basis



The internet has gradually become an important means of transacting business, sharing information, and interacting through social media. A number of organisations have adopted it as a way to reach people. There are currently online shopping platforms through which business is transacted on a daily basis in Tanzania. Also, some e-health platforms have started operating in the country. Overall, 13% of women and 26% of men age 15–49 reported that they have used the internet in the past 12 months. Among those who had used the internet in the past 12 months, about half used it on a daily basis during the past month (47% for women and 53% for men), while about one-third of both women and men used it at least once a week (**Table 3.5.1** and **Table 3.5.2**).

Trends: The percentage of women and men who read a newspaper or magazine at least once a week has declined from 13% to 6% for women and from 25% to 21% for men between the 2015–16 TDHS-MIS and the 2022 survey. Similarly, the percentage listening to the radio at least once a week has declined from 45% to 32% for women and 60% to 52% for men. However, internet usage has increased from 10% to 14% among women and 21% to 28% among men during the same period. These changes in levels of exposure to various media may relate, at least in part, to the rapid growth in accessibility to computers among Tanzanian households over the last 5 years.

Patterns by background characteristics

- The percentage of women who read a newspaper at least once a week is very low—9% of women in urban areas and 5% of women in rural areas. The urban-rural gap is more evident in television viewing and radio listening.

- The percentage of women and men who have used the internet in the last 12 months is also higher in urban areas (27% and 48%) than in rural areas (5% and 15%).
- The proportion of women and men who have ever used the internet increases with increasing education and increasing wealth.

3.4 EMPLOYMENT

Currently employed
Respondents who were employed in the 7 days before the survey.
Sample: Women and men age 15–49

In the 2022 TDHS-MIS, respondents were asked whether they were employed at the time of the survey and, if not, whether they had worked at any time during the 12 months preceding the survey. Sixty percent of women and 81% of men were employed at the time of the survey (**Tables 3.6.1** and **3.6.2**). In addition, 5% of women and 4% of men reported that they had worked in the 12 months preceding the survey but were not employed at the time of the survey.

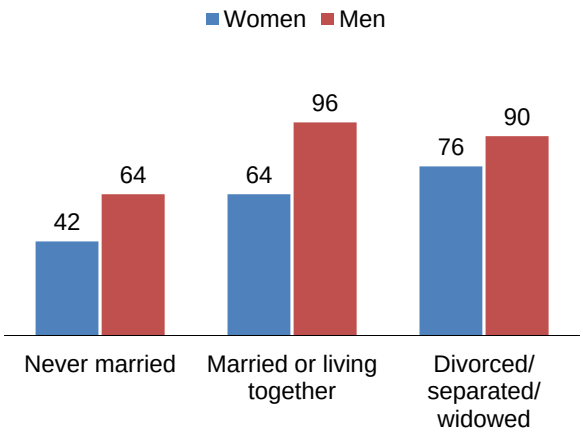
Trends: There have been marked changes in employment since the 2015–16 TDHS-MIS. The percentage of women who are currently employed decreased from 72% in 2015–16 to 60% in the 2022 TDHS-MIS, while the percentage of men employed decreased from 88% to 81% in the same period.

Patterns by background characteristics

- The percentage of women and men who are currently employed increases with age through the younger age groups. Levels of employment tend to reach a plateau at about age 40–49 for women and age 30–39 for men.
- The percentage of women and men who are employed is higher among those who are currently married than among those who have never been married (**Figure 3.4**).
- Women and men with children are more likely to be currently employed than those without children.

Figure 3.4 **Employment status by marital status**

Percentage of women and men age 15–49 who are currently employed



3.5 OCCUPATION

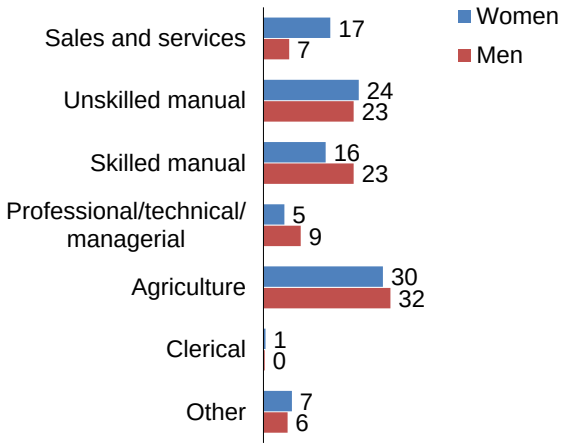
Occupation
Categorised as professional/technical/managerial, clerical, sales and services, skilled manual, unskilled manual, domestic service, agriculture, and other.
Sample: Women and men age 15–49 who were currently employed or had worked in the 12 months before the survey

Women age 15–49 are most commonly employed in agriculture (30%) and unskilled manual labour (24%). Men are most commonly employed in agriculture (32%) and both skilled and unskilled manual labour (23% each) as shown in **Table 3.7.1**, **Table 3.7.2**, and **Figure 3.5**.

Overall, 50% of women employed in the past 12 months were paid in cash only, and 14% were paid in both cash and kind. Four in 10 women (43%) were self-employed, and 44% worked seasonally. How women are paid, who they work for, and how often they work varies greatly depending on whether or not they work in the agricultural sector (**Table 3.8**).

***Figure 3.5* Occupation**

Percentage of women and men age 15–49 employed in the 12 months before the survey by occupation



Trends: The percentage of women working in agriculture has decreased steadily over time, from 78% in the 2004–05 TDHS, to 69% in 2010 TDHS, to 56% in 2015–16 TDHS-MIS, and 30% in the 2022 TDHS-MIS. Similarly, the percentage of men engaged in agriculture has decreased from 71% in 2004–5 the TDHS-MIS to 62% in 2010 TDHS, 59% in 2015–16 TDHS and 32% in 2022 TDHS-MIS. The percentage of men engaged in skilled manual labour has increased during this period.

Patterns by background characteristics

- In rural areas, about 4 in 10 people work in agriculture (41% of women and 44% of men), compared with 10% of women and 8% of men in urban areas (**Table 3.7.1** and **Table 3.7.2**).
- In urban areas, sales and services is the leading occupation among women (31%) and skilled manual labour is the leading occupation among men (30%).
- The percentage of people employed in agriculture drops steadily and dramatically with increasing education. The majority of women who have no education work in agriculture (46%), compared with 14% of those with secondary or higher schooling. The majority of men who have no education also work in agriculture (48%), compared with 17% of those with secondary or higher schooling.
- Almost half of women who work in the agricultural sector are not paid. Most women who work in agriculture either work for a family member (68%) or are self-employed (27%) (**Table 3.8**).

3.6 Health Insurance Coverage

The 2022 TDHS-MIS collected information about specific types of insurance coverage and the percentage of women and men age 15–49, children age 0–14, and women and men age 50+ with any health insurance. Nine out of 10 women (94%) and 93% of men age 15–49 in Tanzania do not have any health insurance, as shown in **Table 3.9.1** and **Table 3.9.2**. Only 5% of children age 0–14 have health insurance coverage, as shown in **Table 3.9.3**. Moreover, 16% each of women and men age 50+ have health insurance coverage, as shown in **Table 3.9.4** and **Table 3.9.5**.

Trends: Lack of health insurance among women and men age 15–49 has not dramatically changed since the 2010 TDHS, with rates fluctuating between 91% and 93%.

Patterns by background characteristics

- Possession of health insurance is more prevalent among women and men age 15–49 with secondary or higher levels of education (13% of women and 15% of men), and those from households in the highest wealth quintile (14% of women and 17% of men) (**Table 3.9.1** and **Table 3.9.2**).
- Among children age 0–14 with health insurance, most have employer-based or mutual health organisation/community-based health insurance (56% and 40%, respectively) (**Table 3.9.3**).
- Among women and men 50+ with health insurance, the most common types are employer-based health insurance coverage (63% and 65%, respectively) and mutual health organisation/community-based health insurance (32% and 29%, respectively) (**Table 3.9.4** and **Table 3.9.5**).
- The percentage of women and men age 50+ in urban areas who have health insurance coverage is two times higher than among those in rural areas (26% and 13%, respectively, for both women and men).

3.7 Tobacco Use

Table 3.10.1 shows that few women (<1%) smoke any type of tobacco. Ten percent of men age 15–49 smoke any type of tobacco, among whom 8% smoke daily (**Table 3.10.2**). Forty-eight percent of men age 15–49 who are daily smokers smoke less than five cigarettes per day, while 2% smoke at least 25 cigarettes per day (**Table 3.11**). Less than 1% of women and 1% of men use smokeless tobacco (**Table 3.12**).

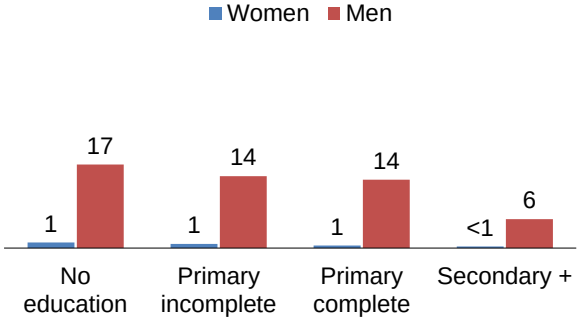
Trends: The percentage of nonsmokers among women has remained the same, at 99%, since the 2004–05 TDHS. On the other hand, the percentage of men who smoke has been declining over time, from 22% in the 2004–05 TDHS to 14% in the 2015–16 TDHS-MIS and 10% in the 2022 TDHS-MIS.

Patterns by background characteristics

- The percentage of men who use any type of tobacco (including smokeless tobacco) rises with age, from a low of 2% at age 15–19 to a high of 23% among those age 45–49 (**Table 3.13**).
- Use of any type of tobacco is most common among men in the Eastern zone (15%) followed by the Northern zone (14%).
- The percentage of men using any type of tobacco declines with increasing education (**Figure 3.6**).

***Figure 3.6* Any tobacco use by education**

Percentage of women and men age 15–49 who are currently using any type of tobacco



3.8 Alcohol Consumption

Almost 7% of women and 19% of men consumed at least one alcoholic drink in the last month. Among women and men who consumed alcoholic beverages in the month preceding the survey, 69% and 59%, respectively, reported drinking 1–5 days during the preceding month, while 18% of women and 21% of men drink every day or almost every day (**Table 3.14.1** and **Table 3.14.2**).

Among women who consumed alcohol during the last month, 25% usually consumed one drink on days when alcohol was consumed, and 31% usually consumed two drinks. Sixty percent of men usually consumed three or more drinks on days when alcohol was usually consumed (**Table 3.15.1** and **Table 3.15.2**).

Patterns by background characteristics

- The percentage of women and men who consumed at least one alcoholic drink in the last month increases with increasing age (**Table 3.14.1** and **Table 3.14.2**).
- There is no urban-rural difference in alcohol consumption among women and men.
- Alcohol consumption among women and men is less common in Zanzibar (1% and 2%, respectively) than in Tanzania Mainland (7% and 19%, respectively).

3.9 Place of Birth and Recent Migration

Recent migration

Percentage of respondents who were born outside of their current place of residence and moved to their current place of residence in the 5 years preceding the survey.

Sample: Women and men age 15–49 who were born outside their current place of residence

Thirty-five percent of women and 36% of men were not born in their current place of residence. Among these respondents, 36% of women and men moved to the current place of residence in the 5 years prior to the survey. Less than 1% of women and men were born outside Tanzania (**Table 3.16.1** and **Table 3.16.2**).

Patterns by background characteristics

- The percentage of women and men who were born outside their current place of residence is higher in urban areas than in rural areas.
- The percentage of women who moved to their current place of residence during the last 5 years increases with increased education, from 28% among women with no education to 45% among those with secondary education or more.

3.9.1 Type of Migration

Among women who recently migrated, the most common type of migration is from a rural area to another rural area (32%). Among men, the most common type of migration is from an urban area to another urban area (39%). Rural to urban migration is more common among women who recently migrated (23%) than among their male counterparts (17%) (**Table 3.17**).

3.9.2 Reason for Migration

For respondents who have moved to their current place of residence, family reunification/other family-related reason is the most common reason for migration among both women and men (38% each). Marriage formation comes next among women (25%), while employment is next among men (28%) (**Table 3.18.1** and **Table 3.18.2**).

Patterns by background characteristics

- Migration for employment is substantially higher among women and men in urban areas (21% and 32%, respectively) than their counterparts in rural areas (8% and 23%, respectively).
- Among men who moved from a rural area to an urban area, 49% migrated for employment. Among women who moved from a rural area to an urban area, 29% did so for reasons of employment.

- Among women who moved to their current place of residence, the percentage who moved for reasons of employment is higher in Tanzania Mainland (14%) than in Zanzibar (10%), and higher among those currently residing in urban areas (21%) than among those in rural areas (21% versus 8%). Within Zanzibar, employment is reported as the reason for migration more often in Unguja (11%) compared with in Pemba (2%).

3.10 Blood Pressure

In Tanzania, like many developing countries, the burden of noncommunicable diseases has been increasing steadily. WHO country estimates of 2010 showed that noncommunicable diseases account for 27% of all deaths in Tanzania (WHO 2011). High blood pressure or hypertension is among the major risk factors for cardiovascular disease. The 2022 TDHS-MIS included questions to determine if respondents' blood pressure had ever been measured by a doctor or other health care provider, if they had ever been diagnosed as hypertensive, and if they were currently taking medicine to control their blood pressure. The 2022 TDHS-MIS also offered respondents the opportunity to have their blood pressure measured as part of the survey.

3.10.1 History of Blood Pressure Measurement Prior to the Survey

Tables 3.19.1 and **13.9.2** summarise the results of the questions relating to hypertension asked during the survey interview. Six in ten (62%) women age 15–49 reported having ever had their blood pressure measured by a doctor or other health care provider, and 6% reported having ever been told by a doctor or other health care provider that their blood pressure was high. Among women who have ever been informed that they have high blood pressure or hypertension, 49% had been informed in the 12 months preceding the survey, 50% were prescribed medication to control their blood pressure, and 17% were taking medication to control their blood pressure at the time of the survey (**Table 13.9.1**).

The results are different for men. One in four (26%) men age 15–49 reported having ever had their blood pressure measured by a doctor or other health care provider, and 4% reported having ever been told by a doctor or other health care provider that their blood pressure was high. Among men who have ever been informed that they have high blood pressure or hypertension, 50% had been informed in the 12 months preceding the survey, 36% were prescribed medication to control their blood pressure, and 20% were taking medication (**Table 3.19.2**).

Patterns by background characteristics

- The percentage of women and men who ever had their blood pressure measured by a doctor or other health care provider generally increases with age, body mass index (BMI), and wealth.
- The percentage of women who have ever been told they have high blood pressure is slightly higher among those classified as overweight or obese (9%) than among those classified as normal weight (5%) or thin (3%).
- The percentage of women who were ever told they have high blood pressure by a doctor or other health care provider is higher in urban areas (9%) than in rural areas (4%). However, among women who have ever been told by a doctor or other health care provider that they have high blood pressure, there is little difference in the percentage taking medication to control their blood pressure between rural areas (18%) and urban areas (16%).
- There is high variation in the percentage of women who have ever been told they have high blood pressure or hypertension by a doctor or other health care provider by region—ranging from 1% in Singida and Mara to 19% in Mjini Magharibi.

3.10.2 Blood Pressure Status

In addition to asking questions about history of blood pressure measurement and use of medication to control blood pressure, the 2022 TDHS-MIS also offered respondents the opportunity to have their blood pressure measured as part of the survey. Please see Chapter 1 of this report for a description of the methods used to measure blood pressure.

Hypertension

Respondents were classified as having hypertension if they had a systolic blood pressure level of 140 mmHg or above or a diastolic blood pressure level of 90 mmHg or above at the time of the survey or were currently taking antihypertensive medication to control their blood pressure. Elevated blood pressure was classified as Grade 1, 2 or 3, according to the cut-off points recommended by the World Health Organization (WHO 1999).

Blood pressure category	Systolic (mmHg)		Diastolic (mmHg)
Optimal	<120	AND	<80
Normal	120–129	OR	80–84
High normal	130–139	OR	85–89
Level of hypertension			
Grade 1, Mildly elevated	140–159	OR	90–99
Grade 2, Moderately elevated	160–179	OR	100–109
Grade 3, Severely elevated	180+	OR	110+

Note: Respondents whose blood pressure fell into two different categories based on their average systolic and average diastolic levels were classified according to the highest blood pressure category in which they fell on either of the two measures.

Sample: Women and men age 15–49 with valid blood pressure measurements

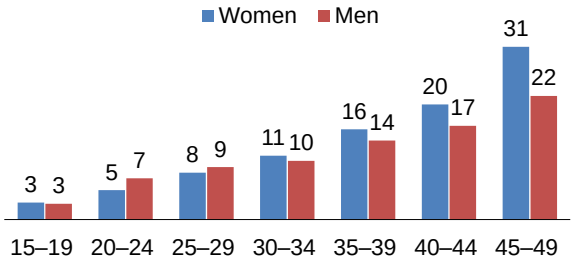
Among eligible respondents, 98% of women and 98% of men had their blood pressure measured at least once at the time of the survey, and 97% of women and 97% of men had three valid blood pressure measurements (data not shown).

Eleven percent of women age 15–49 were classified as hypertensive, including 7% with Grade 1 hypertension (mildly elevated), 2% with Grade 2 hypertension (moderately elevated), 1% with Grade 3 hypertension (severely elevated), and less than 1% who had normal blood pressure but were taking antihypertensive medication (**Table 3.20.1**). Blood pressure status was very similar among men, among whom 10% were classified as hypertensive (**Table 3.20.2**). An additional 9% of women and 14% of men had high-normal blood pressure. It should be noted that the blood pressure measurements taken in the survey are not intended to provide a medical diagnosis of the disease; therefore, the term hypertension as used here should be regarded as a statistical description of the survey population as opposed to a clinical diagnosis.

Although the overall rate of hypertension among women and men age 15–49 in Tanzania is relatively low, hypertension is a serious health problem. Further, as shown in **Table 3.20.1**, **Table 3.20.2**, and **Figure 3.7**, hypertension increases with age, and the 2022 TDHS-MIS did not measure blood pressure in the population age 50+. It is safe to assume that the prevalence of hypertension among the general adult population is higher than among those of reproductive age surveyed here.

Figure 3.7 **Hypertension by age**

Percentage of women and men age 15–49 with hypertension[1]



[1] A person is classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above, or an average DBP level of 90 mmHg or above, or was currently taking antihypertensive medication. The term hypertension as used in this figure is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.

A first step toward bringing hypertension under control is awareness by individuals of their condition, and its implications in terms of premature disability and death. Many Tanzanian women and men may suffer from hypertension but do not know it; hypertension is often termed the 'silent killer' because of the lack of warning signs or symptoms. Educating the population about the adverse effects of hypertension and promoting blood pressure screening, particularly among older individuals, should be an important focus of health programmes.

Patterns by background characteristics

- Prevalence of hypertension increases with age, from 3% of women and men age 15–19 to 31% of women and 22% of men age 45–49 (**Table 3.20.1**, **Table 3.20.2**, and **Figure 3.7**).
- Prevalence of hypertension increases with wealth quintile for both women and men.
- Among women, 18% of those classified as overweight or obese according to the anthropometric measurements conducted in the 2022 TDHS-MIS have hypertension, compared with 8% of those classified as normal and 5% of those classified as thin. Results among men are similar—17% of those classified as overweight or obese having hypertension, compared with 10% of those classified as normal and 6% of those classified as thin.
- By region, the prevalence of hypertension is highest among women in Pwani and Kagera (19%), and highest among men in Dar es Salam (24%) and Iringa (21%).

3.10.3 Awareness, Treatment, and Control of Hypertension

Controlled hypertension

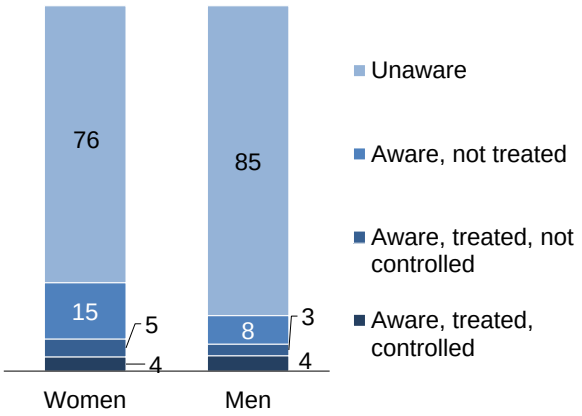
Percentage of respondents with systolic blood pressure of less than 140 mmHg and diastolic blood pressure less than 90 mmHg and currently taking antihypertensive medication.

Sample: Women and men age 15–49 with hypertension

The vast majority of women and men age 15–49 classified as having hypertension according to the 2022 TDHS-MIS are unaware of their condition. Seventy-six percent of women and 85% of men classified as having hypertension have never been told by a doctor or other health care provider that they have high blood pressure. Fifteen percent of women and 8% of men have ever been told that they have high blood pressure but are not currently taking antihypertensive medication; 5% of women and 3% of men with hypertension are taking medication but still have high blood pressure. Only about 4% of women and men have controlled hypertension (**Figure 3.8**).

***Figure 3.8* Awareness, treatment, and control of hypertension**

Percent distribution of women and men age 15–49 classified as having hypertension



Patterns by background characteristics

- Only 45% of women currently on antihypertensive medication have controlled hypertension. The percentage for men is based on few cases but appears to be similar (**Table 3.21.1** and **Table 3.21.2**).
- Results by nutritional status differ for women and men. Among women with hypertension, those who are classified as overweight or obese are slightly more likely to have controlled hypertension (5%) than those who are classified as normal (3%), whereas among men with hypertension, controlled hypertension is higher among those who are thin (9%) than those who are normal (4%) or overweight or obese (2%).

3.11 TUBERCULOSIS

Tuberculosis (TB), once known as the 'White Plague,' is contagious and spreads through droplets that can travel through the air when a person with the infection coughs, talks, or sneezes. The 2022 TDHS-MIS included questions about knowledge and attitudes towards tuberculosis as well as whether any members of the household have been diagnosed with tuberculosis.

3.11.1 Knowledge and Attitudes toward Tuberculosis

More than 80% of women and men age 15–49 (85% women and 81% men) have heard about tuberculosis from media, friends, or relatives. Eight in 10 women and men know that tuberculosis is transmitted through air when an infected person coughs, laughs, talks, or sneezes. Sixty-eight percent of women and 70% of men know at least one of the five main symptoms of tuberculosis (coughing, coughing blood, weight loss, fever, and night sweats). More than 7 in 10 women and men know that tuberculosis can be treated and cured. However, only 5% of women and 10% of men have heard messages on TV or radio that anti-inflammatory medicine does not cure tuberculosis (**Table 3.22.1** and **Table 3.22.2**).

Patterns by background characteristics

- Knowledge about TB in all the categories is higher among women and men in urban areas than among their counterparts in rural areas.
- Knowledge of at least one symptom of TB is highest among men in Dar es Salaam (93%) and among women in Iringa women (93%). This knowledge is lowest among women in Tabora (49%) and among men in Simiyu and Kaskazini Unguja (42% each).

- The proportion of women who have heard of TB from media, friends, or relatives generally increases with increasing education and wealth.
- Thirty percent of women and 37% of men know that having HIV increases an individual's risk of acquiring TB (**Table 3.23**).
- Among both women and men, 97% report that they would seek treatment from a health facility if they had symptoms of TB (**Table 3.24**).

3.11.2 Households with a Member Diagnosed with Tuberculosis

Four percent of households had a household member diagnosed with tuberculosis during the 5 years before the survey.

Patterns by background characteristics

- The percentage of households in which any member was diagnosed with tuberculosis varies among and within the zones and regions. It is highest in the North, Southern Highlands, and Lake Zone and lowest in the South West Highlands and South zones. In Zanzibar, the percentage of households with any members diagnosed with tuberculosis in the last 5 years is very low in all areas (**Table 3.25**).
- Shinyanga, Tanga, and Manyara each saw 7% of households in which any household member was diagnosed with tuberculosis in the last 5 years, while all five regions in Zanzibar have less than 2% of households in which any household member was diagnosed with tuberculosis in the last 5 years.

List of Tables

For detailed information on the characteristics of survey respondents, blood pressure, and tuberculosis, see the following tables:

Table 3.1 Background characteristics of respondents

Percent distribution of women and men age 15–49 by selected background characteristics, Tanzania DHS-MIS 2022

[1] Includes manufactured cigarettes, hand-rolled cigarettes, and kreteks

Table 3.12 Smokeless tobacco use and any tobacco use

Percentage of women and men age 15–49 who currently use smokeless tobacco, according to type of tobacco product, and percentage who use any type of tobacco, Tanzania DHS-MIS 2022

Tobacco product	Women	Men
Snuff, by mouth	0.1	0.8
Snuff, by nose	0.0	0.5
Chewing tobacco	0.0	0.3
Betel quid with tobacco	0.0	0.1
Other type of smokeless tobacco	0.0	0.0
Any type of smokeless tobacco[1]	0.2	1.1
Any type of tobacco[2]	0.6	11.1
Number	15,254	5,763

Note: Table includes women and men who use smokeless tobacco daily or occasionally (less than daily).
[1] Includes snuff by mouth, snuff by nose, chewing tobacco, and betel quid with tobacco
[2] Includes all types of smokeless tobacco shown in this table plus cigarettes, kreteks, pipes, cigars, cheroots, cigarillos, and water pipes.

Table 3.13 Any tobacco use by background characteristics

Percentage of women and men age 15–49 who are currently using any type of tobacco, according to background characteristics, Tanzania DHS-MIS 2022

Fourth	6.7	3,359	77.3	3.9	7.5	11.3	100.0	226
Highest	7.0	3,971	83.3	3.9	5.1	7.6	100.0	279
Total	6.9	15,254	69.3	6.7	5.7	18.3	100.0	1,058

Note: One drink of alcohol corresponds to one can or bottle of beer, one glass of wine, one shot of spirits, or one cup of mbege, ulanzi, gongo, chang'aa, etc. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
[1] The respondent reported that she drank alcohol every day, almost every day, or 25 or more days in the last 1 month.

Table 3.14.2 Alcohol consumption: Men

Percentage of men age 15–49 who have consumed at least one alcoholic drink in the last 1 month; and among men who have consumed at least one alcoholic drink in the last 1 month, percent distribution by frequency of drinking (number of days at least one drink was consumed), according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Consumed any alcohol in the last month	Number men	Among men who have consumed any alcohol in the last 1 month, percent distribution by frequency of drinking:					Number of men who consumed any alcohol in the last month

Note: Respondents who are visitors in the household are excluded from this table. Figures in parentheses are based on 25–49 unweighted cases.
[1] May include respondents who were born elsewhere in Tanzania but moved to their current place of residence when very young.
[2] Includes respondents who reported that they were born outside of Tanzania and that they always lived in their current place of residence. Such respondents are assumed not to have moved in the last 5 years.

Table 3.16.2 Place of birth and recent migration: Men

Percent distribution of men age 15–49 who have always lived in their current place of residence, who were born in Tanzania but outside of current place of residence, and who were born in another country, and among men who were born outside of current place of residence, percentage who moved to current place of residence in the last 5 years, according to background characteristics, Tanzania DHS-MIS 2022

	Percent distribution by residence and place of birth					Among men who were born outside of current place of residence

Note: When a respondent's SBP and DBP fell into different classifications categories, the respondent is classified into the higher classification of blood pressure. If blood pressure was measured 3 times, the average of the 2nd and 3rd blood pressure measurements is used to classify individuals with respect to hypertension. If the 3rd blood pressure measurement is missing, the 2nd measurement is considered the average. If the 3rd and the 2nd blood pressure measurements are missing, the 1st measurement is considered the average. Figures in parentheses are based on 25–49 unweighted cases.

SBP = systolic blood pressure

DBP = diastolic blood pressure

[1] A person is classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above, or an average DBP level of 90 mmHg or above, or was currently taking antihypertensive medication. The term hypertension as used in this table is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.

[2] Includes women who do not know if they are pregnant

[3] Includes manufactured cigarettes and hand-rolled cigarettes.

[4] Nutritional status is defined using body mass index (BMI) for women age 20–49 and using BMI-for-age for women age 15–19 as presented in Tables 11.14.1 and 11.14.2. Excludes pregnant women and those who gave birth in the past 2 months. Also excludes women who were not weighed and measured.

Table 3.20.2 Blood pressure status of men

Among men age 15–49, percent distribution of blood pressure values, percentage having normal blood pressure and taking antihypertensive medication, and prevalence of hypertension, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Classification of blood pressure						Total	Blood pressure less than SBP140/ DBP90 mmHg and currently taking antihyper-tensive medication	Prevalence of hyper-tension[1]	Number of men
	Optimal SBP <120 and DBP <80 mmHg	Normal SBP 120–129 and DBP 80–84 mmHg	High normal SBP 130–139 and DBP 85–89 mmHg	Mildly elevated (Grade 1) SBP 140–159 or DBP 90–99 mmHg	Moderately elevated (Grade 2) SBP 160–179 or DBP 100–109 mmHg	Severely elevated (Grade 3) SBP 180+ or DBP 110+ mmHg

Note: When a respondent's SBP and DBP fell into different classification categories, the respondent is classified into the higher classification of blood pressure. If blood pressure was measured 3 times, the average of the 2nd and 3rd blood pressure measurements is used to classify individuals with respect to hypertension. If the 3rd blood pressure measurement is missing, the 2nd measurement is considered the average. If the 3rd and the 2nd blood pressure measurements are missing, the 1st measurement is considered the average. Figures in parentheses are based on 25–49 unweighted cases.

SBP = systolic blood pressure

DBP = diastolic blood pressure

[1] A person is classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above, or an average DBP level of 90 mmHg or above, or was currently taking antihypertensive medication. The term hypertension as used in this table is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.

[2] Includes manufactured cigarettes and hand-rolled cigarettes.

[3] Nutritional status is defined using body mass index (BMI) for men age 20–49 and using BMI-for-age for men age 15–19 as presented in Tables 11.14.3 and 11.14.4. Excludes men who were not weighed and measured.

Note: When a respondent's SBP and DBP fell into different classifications categories, the respondent is classified into the higher classification of blood pressure. If blood pressure was measured 3 times, the average of the 2nd and 3rd blood pressure measurements is used to classify individuals with respect to hypertension. If the 3rd blood pressure measurement is missing, the 2nd measurement is considered the average. If the 3rd and the 2nd blood pressure measurements are missing, the 1st measurement is considered the average. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
SBP = systolic blood pressure
DBP = diastolic blood pressure
[1] Controlled hypertension is measured among persons with hypertension and is defined as having an SBP less than 140 and DBP less than 90 mmHg and currently taking antihypertensive medication.
[2] A person is classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above, or an average DBP level of 90 mmHg or above, or was currently taking antihypertensive medication. The term hypertension as used in this table is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.
[3] Includes women who do not know if they are pregnant
[4] Includes manufactured cigarettes and hand-rolled cigarettes.
[5] Nutritional status is defined using body mass index (BMI) for women age 20–49 and using BMI-for-age for women age 15–19 as presented in Tables 11.14.1 and 11.14.2. Excludes pregnant women and those who gave birth in the past 2 months. Also excludes women who were not weighed and measured.

MARRIAGE AND SEXUAL ACTIVITY 4

Key Findings

- ***Current marital status:*** 61% of women and 51% of men in Tanzania are currently married or living together with their partner as if married.
- ***Marriage registration:*** 51% of women who are married have registered with the civil authorities, while 42% have a marriage certificate.
- ***Age at first marriage:*** There is a difference of 5 years between the median age at first marriage for women (19.8 years) and men (24.9 years).
- ***Age at first sexual intercourse:*** 66% of women age 25–49 had their first sexual intercourse by age 18, as compared with 41% of men.

Marriage and sexual activity help to determine the extent to which women are exposed to the risk of pregnancy. Thus, they are important determinants of fertility levels. The timing and circumstances of marriage and sexual activity also have profound consequences for women's and men's lives. This chapter presents information on marital status, polygyny, age at first marriage, age at first sexual intercourse, and recent sexual activity.

4.1 MARITAL STATUS

Currently in union

Women and men who report being married or living together with a partner as though married at the time of the survey. In this report, the terms currently in union and currently married are used interchangeably except where noted.

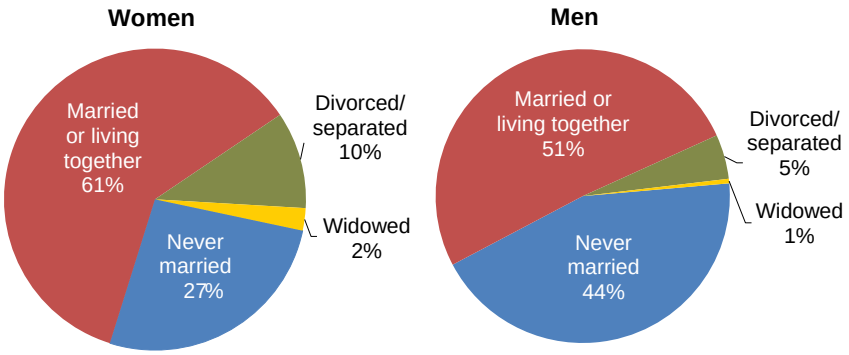
Sample: Women and men age 15–49

The civil registration system in Tanzania routinely monitors major vital events, including the status of marriage and widowhood. However, the coverage is low because many events are not reported to the responsible authorities. The survey collected information on marriage status among women and men age 15–49. Sixty-one percent of women and 51% of men in Tanzania are currently in union (married or living together) (**Table 4.1**).

Trends: Overall, there has been very little change in marital status since the 2015–16 TDHS-MIS. The percentages of men and women who are currently in union remain nearly the same (62% for women and 50% for men in 2015–16 and 61% for women and 51% for men in 2022). There has been no change in the percentage of women (13%) and men (5%) who are divorced, separated, or widowed (**Table 4.1** and **Figure 4.1**).

Figure 4.1 Marital status

Percent distribution of women and men age 15–49



Patterns by background characteristics

- There are marked differences in marital status by sex. For instance, below age 30, the percentage who are married is higher among women than men, whereas above age 30, the reverse is true.
- For women, the percentage currently in union increases up to the 30–34 age group, after which it decreases. The percentage of divorced/separated and widowed women increases with increasing age. For men, the percentage currently in union increases as age increases (**Figure 4.1**).
- Overall, the percentage of women who are separated, divorced, or widowed is more than twice that of men (13% for women compared to 5% for men).

4.2 Marriage Registration

Registered marriage

A woman whose marriage is registered with the civil authorities regardless of whether or not she has a marriage certificate.

Sample: Currently married women age 15–49; does not include women who are living together with a man as if married but do not report themselves to be married

Fifty-one percent of women who are married have registered their marriage with the civil authorities; however, only 42% have a marriage certificate (**Table 4.2**).

Patterns by background characteristics

- The percentage of married women who have registered their marriage with the civil authorities in urban areas is 69%, and 60% of them have certificates. In rural areas, the percentage of married women who have registered their marriage with the civil authorities is 43%, and 33% of them have certificates.
- More than 90% of married women have registered their marriages with the civil authorities in Dar es Salaam, Kusini Unguja, and Mjini Magharibi, compared with only 11% in Simiyu (**Table 4.2**).

4.3 POLYGYNY

Polygyny
Women who report that their husband or partner has other wives are considered to be in a polygynous marriage.
Sample: Currently married women age 15–49

In Tanzania, like many other African countries, polygyny is commonly practiced in some parts of the country. Polygyny has implications for the frequency of sexual activity and for the fertility rate.

The results from the 2022 TDHS-MIS show that 15% of married women have co-wives (**Table 4.3.1**). About 8 in 10 married women reported that their husbands have no other wives. Among married men, 6% have more than one wife (**Table 4.3.2**).

Trends: The percentages of women and men who reported being in polygynous unions have decreased over time. Among women, the percentage with co-wives decreased from 21% in the 2010 TDHS to 18% in the 2015–16 TDHS-MIS and further decreased to 15% in the 2022 TDHS-MIS. Among men, the percentage with more than one wife decreased from 10% in the 2010 TDHS to 9% in the 2015–16 TDHS-MIS and reached 6% in the 2022 TDHS-MIS.

Patterns by background characteristics

- In general, older women are more likely than younger women to have co-wives (**Table 4.3.1**).
- More currently married women in rural areas (18%) are in polygynous unions than those in urban areas (9%).
- There are marked regional differences in the percentage of women currently in polygynous unions. Thirty percent or more of married women in Kusini Pemba and Kaskazini Pemba regions are in polygynous unions, compared with 3% of women in Kilimanjaro.
- Polygyny decreases with level of education; 26% of married women with no education have co-wives compared with 9% of women with a secondary or higher education.
- The practice of polygyny is inversely related to the level of wealth; only 8% of married women in households in the highest wealth quintile have co-wives, compared with 24% of married women in households in the lowest wealth quintile.
- Similar to women, older men, men in rural areas, men with no education or a primary education, and men in households in the lowest wealth quintile are more likely to have two or more wives than other men. Men in Zanzibar are more likely to be in polygynous unions than men in Tanzania Mainland (13% and 6%, respectively) (**Table 4.3.2**).

4.4 AGE AT FIRST MARRIAGE

Median age at first marriage
Age by which half of respondents have been married.
Sample: Women age 20–49 and 25–49 and men age 25–49

Marriage is a primary indication of the regular exposure of women to the risk of pregnancy and therefore is important for the understanding of fertility. Populations in which age at first marriage is low tend to have early childbearing and high fertility. Women tend to marry considerably earlier than men in

Tanzania. The median age at first marriage is 19.8 years among women age 25–49 and 24.9 years among men age 25–49 (**Table 4.4**).

Trends: The median age at first marriage among women age 25–49 has increased slightly over the past 12 years, from 18.8 years in 2010 and 19.2 years in 2015–16 to 19.8 years in 2022. Among men, median age at first marriage increased from 24.3 years in both 2010 and 2015–16 to 24.9 years in 2022.

Patterns by background characteristics

- Both women and men in rural areas are more likely to marry earlier than their urban counterparts (19.2 years versus 21.4 years) (**Table 4.5**).
- Median age at first marriage is directly related to education and wealth. For example, the median age at first marriage among women with no education is almost 6 years younger than that among women with a secondary or higher education (18.1 years versus 23.7 years).

4.5 Age at First Sexual Intercourse

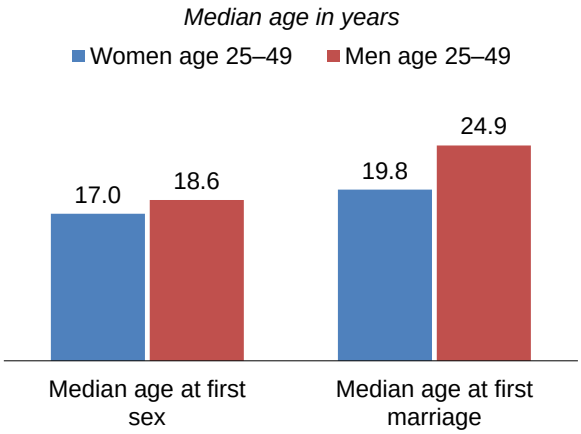
Median age at first sexual intercourse
Age by which half of respondents have had sexual intercourse.
Sample: Women age 20–49 and 25–49 and men age 20–49 and 25–49

Age at first marriage is often used as a proxy for first exposure to sexual activity, but the two events do not necessarily occur at the same time. The 2022 TDHS-MIS collected information on the timing of first sexual intercourse for both women and men. The median age at first intercourse for women age 25–49 is 17.0 years, around one and a half years younger than the median age of men (18.6 years) (**Table 4.6**). Fourteen percent of women age 25–49 have experienced sexual activity by age 15.

In general, the median age at which both women and men initiate sexual activity occurs prior to the age of first marriage, and the median age of men at both sexual debut and first marriage is older than that of women (**Figure 4.2**). On average, women start sexual activity nearly 3 years before entering into marriage (17.0 versus 19.8), while for men the difference is around 6 years (18.6 versus 24.9).

Trends: The median age at first sexual intercourse for both women and men age 25–49 in the 2022 TDHS-MIS has remained almost unchanged from that reported in the 2015–16 TDHS-MIS and the 2010 TDHS.

Figure 4.2 **Median age at first sex and first marriage**



Patterns by background characteristics

- The median age at first sexual intercourse for urban women age 25–49 is 1 year older than for women in the same age group in rural areas (17.6 and 16.7 years, respectively). Urban and rural men have first sexual intercourse at similar ages—18.4 years and 18.6 years, respectively (**Table 4.7**).
- The median age at first sexual intercourse for women age 25–49 in Zanzibar (19.6 years) is nearly 3 years (2.7 years) older than that of the women in Tanzania Mainland (16.9 years).
- The data indicate that among both women and men, a higher level of education is associated with later age at first sexual intercourse. Among women age 25–49, there is a 2.6-year difference in the

median age at first sex between women with secondary or higher education and those with no education (18.7 versus 16.1). The difference for men between the two levels of education is 0.5 years (18.3 versus 18.8).

- Women age 25–49 in the lowest wealth quintile have their first sexual intercourse nearly 2 years earlier than women of the same age in the highest wealth quintile (16.3 years and 18.0 years, respectively).

4.6 Recent Sexual Activity

In the absence of contraception, the chances of becoming pregnant are related to the frequency of sexual intercourse. Thus, information on sexual activity can be used to refine measures of exposure to pregnancy, as well as HIV and other sexually transmitted infections.

Women and men age 15–49 interviewed in the 2022 TDHS-MIS were asked about their recent sexual activity. Over half of women (57%) and men (55%) age 15–49 reported having sexual intercourse in the 4 weeks preceding the survey (**Tables 4.8.1** and **4.8.2**).

List of Tables

For more information on marriage and sexual activity, see the following tables:

FERTILITY 5

Key Findings

- ***Total fertility rate:*** The total fertility rate has declined over the past decade, from 5.4 children in 2010 to 4.8 children in 2022.
- ***Birth interval:*** The median birth interval has increased over the past decade, from 33.9 months in 2010 to 37.1 months in 2022.
- ***Postpartum insusceptibility:*** The median duration of postpartum insusceptibility (that is, the period of time after giving birth that women are not at risk of pregnancy because they are still amenorrhoeic, still abstaining, or both) is 10.2 months.
- ***Age at first birth:*** The median age at first birth among women age 20–49 is 20 years.
- ***Teenage pregnancy:*** 22% of women age 15–19 have ever been pregnant.

The number of children that a woman bears depends on many factors, including the age she begins childbearing, how long she waits between births, and her fecundity. Postponing first births and extending the interval between births have played a role in reducing fertility levels in many countries. These factors also have positive health consequences. In contrast, short birth intervals—of less than 24 months—can lead to harmful outcomes for both newborns and their mothers, such as preterm birth, low birth weight, and death. Childbearing at a very young age is associated with an increased risk of complications during pregnancy and childbirth and higher rates of neonatal mortality.

This chapter describes the current level of fertility in Tanzania and some of its proximate determinants. It presents information on the total fertility rate, birth intervals, insusceptibility to pregnancy (because of postpartum amenorrhoea, postpartum abstinence, or menopause), age at first birth, teenage pregnancy, and induced abortion rates.

5.1 CURRENT FERTILITY

Total fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the 3 years before the survey, based on detailed pregnancy histories provided by women.

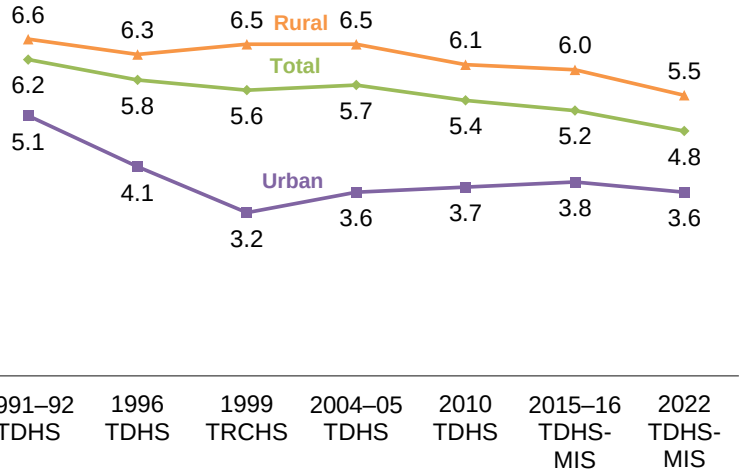
Sample: Women age 15–49

The total fertility rate (TFR) in Tanzania is 4.8 children per woman for the 3-year period preceding the survey. Age-specific fertility rates (ASFRs) peak at age 25–29 (222 births per 1,000 women) and decline steadily thereafter (**Table 5.1**). Eight percent of women reported that they were pregnant at the time of the survey (**Table 5.2**).

Trends: As shown in **Figure 5.1,** the TFR has declined from 6.2 children per woman in 1991–92 to 4.8 children per woman in 2022. The TFR among women in rural areas declined from 6.6 to 5.5 during the same period. However, after declining from 5.1 children in 1991–92 to 3.2 children in 1999, the urban TFR has remained relatively stable from the 2004–05 TDHS to the 2022 TDHS-MIS.

Figure 5.1 **Trends in fertility by residence**

TFR for the 3 years before each survey



Fertility has generally been declining in all age groups. For example, the ASFR for women age 15–19 declined from 131 births per 1,000 women in the 15–19 years preceding the survey to 116 births per 1,000 women in the 0–4 years preceding the survey (**Table 5.3.1**).

Information on trends in age-specific and total fertility across TDHS surveys and the most recent TDHS-MIS surveys is presented in **Table 5.3.2**. Declines in fertility since 2010 have been most apparent for women age 20–24 and women age 25–29 (**Figure 5.2**).

Patterns by background characteristics

- Fertility is higher in rural areas (5.5 children per woman) than urban areas (3.6 children per woman) (**Figure 5.3**).

Figure 5.2 **Trends in age-specific fertility**

Births per 1,000 women

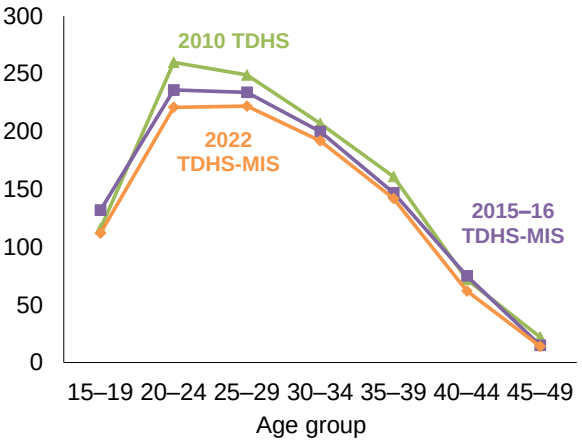


Figure 5.3 **Fertility by residence**

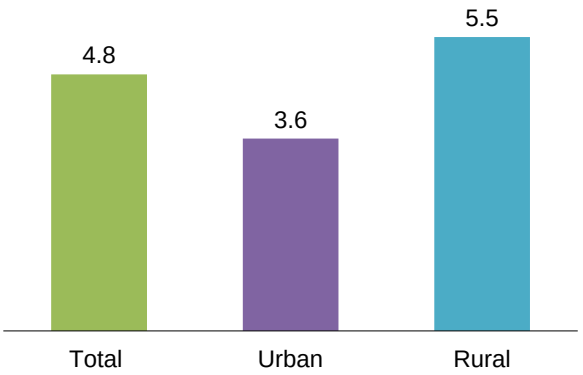
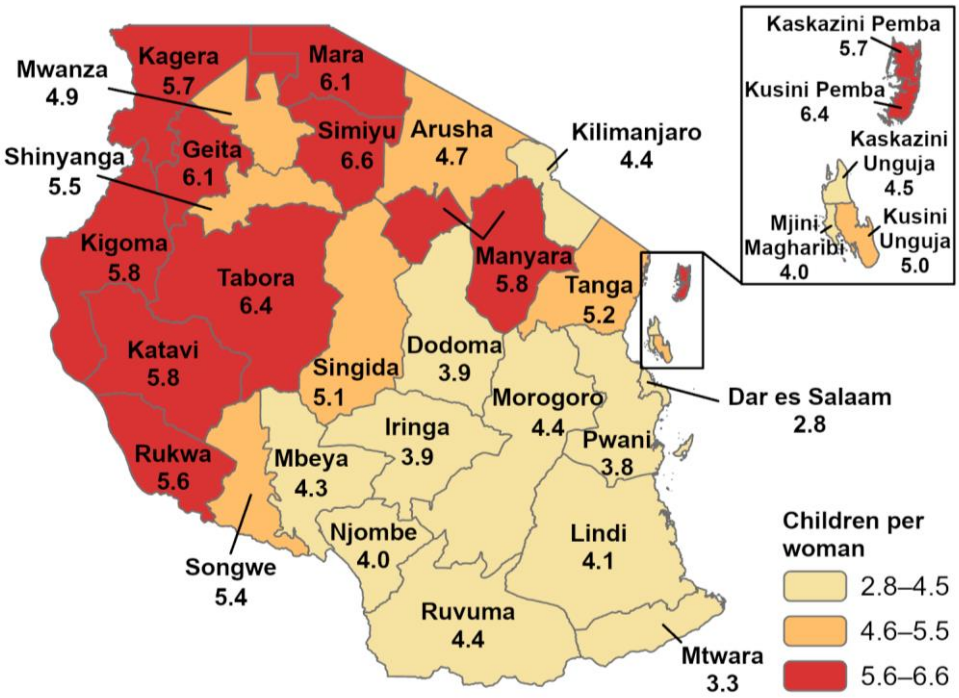
TFR for the 3 years before the survey



- The difference in the TFR between Tanzania Mainland and Zanzibar is minimal (4.8 children per woman and 4.7 children per woman, respectively). By zone, the TFR ranges from 3.5 in Eastern to 6.2 in Western (**Table 5.2**). By region, the TFR ranges from 2.8 in Dar es Salaam to 6.6 in Simiyu (**Map 5.1**).

Map 5.1 Fertility by region

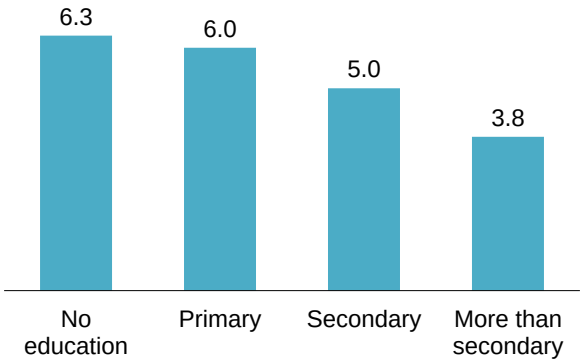
Total fertility rate for the 3 years before the survey



- The TFR declines with increasing education, from 6.3 children per woman for women with no education to 3.8 children per woman for women with a secondary or higher education (**Figure 5.4**).
- Fertility declines dramatically with increasing wealth. Women in the lowest wealth quintile have 3.4 more children on average than women in the highest wealth quintile.

Figure 5.4 Fertility by education

TFR for the 3 years before the survey



5.2 CHILDREN EVER BORN AND LIVING

By collecting complete pregnancy histories, the 2022 TDHS-MIS is able to estimate the number of children ever born to women of reproductive age and the number of children living at the time of the survey. The findings show that, overall, women age 15–49 have an average of 2.6 children, with an average of 2.5 children still living. The mean number of children ever born to currently married women is 3.5, while the mean number of living children is 3.3. Among all women, the average number of children ever born increases from 0.2 among those age 15–19 to 5.5 among those age 45–49. Among currently married women in the corresponding age groups, the average number of children rises from 0.7 to 5.8 (**Table 5.4**).

5.3 BIRTH INTERVALS

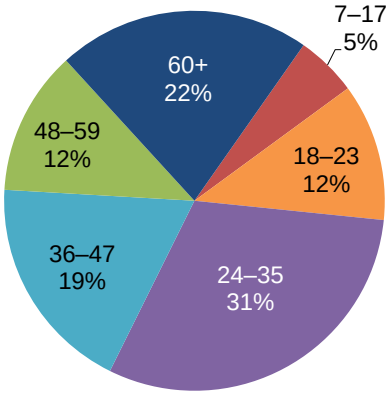
Median birth interval
Number of months since the preceding birth by which half of children are born.
Sample: Non-first births in the 5 years before the survey

Short birth intervals, particularly those less than 24 months, place newborns and their mothers at increased risk for adverse health outcomes. In Tanzania, the median interval between births is 37.1 months; thus, half of non-first births occur slightly more than 3 years after the previous birth. Nearly 17% of births occurred less than 24 months after the preceding birth (**Table 5.5** and **Figure 5.5**).

Trends: Median birth intervals have increased by 3.2 months over the last decade, from 33.9 months in 2010 to 37.1 months in 2022. The percentage of children born less than 24 months after the preceding birth has remained roughly the same since the 2010 TDHS.

Figure 5.5 **Birth intervals**

Percent distribution of non-first births by number of months since the preceding birth



Patterns by background characteristics

- The median birth interval increases with age, from 25.4 months among women age 15–19 to 47.8 months among women age 40–49.
- The median birth interval is 10 months shorter if the child from the preceding birth has died than if the child is living (28.1 months versus 37.6 months).
- The median interval between births in urban areas is 12 months longer than in rural areas (47.1 compared to 35.0 months).
- The median birth interval is longer in the Tanzania Mainland (37.3 months) than in Zanzibar (32.7 months). By region, the median birth interval ranges from 28.4 months in Kusini Pemba to 71.3 months in Mtwara.
- Median birth intervals increase with increasing wealth, from 32.3 months among women in the lowest wealth quintile to 47.9 months among those in the highest quintile.

5.4 INSUSCEPTIBILITY TO PREGNANCY

Postpartum amenorrhoea

The period of time after the end of a pregnancy and before the resumption of menstruation.

Postpartum abstinence

The period of time after the end of a pregnancy and before the resumption of sexual intercourse.

Postpartum insusceptibility

The period of time during which a woman is considered not at risk of pregnancy either because she is postpartum amenorrhoeic and/or abstaining from sexual intercourse postpartum.

Median duration of postpartum amenorrhoea

Calculated as the number of months after the end of a pregnancy by which time half of women have begun menstruating.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

Median duration of postpartum insusceptibility

Calculated as the number of months after the end of a pregnancy by which time half of women are no longer protected against pregnancy either by postpartum amenorrhoea or abstinence from sexual intercourse.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

Overall, 34% of the mothers of live births or stillbirths that occurred in the 3 years preceding the survey are insusceptible to pregnancy because they are amenorrhoeic (29%) and/or because they are abstaining from sexual intercourse (17%). Almost all (98%) are insusceptible to pregnancy during the first 2 months after birth. The median duration of postpartum amenorrhoea is 8.1 months, and that of postpartum abstinence is 3.4 months. The median duration of insusceptibility to pregnancy after childbirth is 10.2 months (**Table 5.6**).

Trends: A comparison of the last three surveys indicates that there has been a decrease in the median duration of postpartum amenorrhoea from 9.8 months in 2010 to 8.1 months in 2022. The median duration of postpartum abstinence increased from 3.8 months in 2010 to 4.4 months in 2015–16, then decreased to 3.4 months in 2022. Overall, the median duration of postpartum insusceptibility has decreased from 11.4 months in 2010 to 10.2 months in 2022.

Patterns by background characteristics

- The median duration of postpartum amenorrhoea following births in the three years preceding the survey is slightly longer for births to women age 30–49 (9.4 months) than for births to women age 15–29 (7.7 months). Overall, median duration of insusceptibility following births to women age 30–49 (12.0 months) is higher than that of births to women age 15–29 (9.0 months) (**Table 5.7**).
- Births to rural women have a longer duration of postpartum amenorrhoea (8.9 months) than do births to urban women (6.4 months). The median duration of postpartum insusceptibility following births to rural women (11.0 months) is longer than for births to urban women (8.1 months).
- The duration of postpartum amenorrhoea generally decreases as education of the mother increases, falling from 9.0 months among women with no education and 10 months among women with incomplete primary education to 5.8 months for women with secondary education or higher.

5.5 Age of First Menstruation

The age when a young woman experiences her first menstruation is an important milestone in her life. It signals the beginning of her fertile years and means that if she has sexual intercourse, she can become pregnant. The mean age at first menstruation among women age 15–49 is 14.7 years. Half of women age 15–49 have their first menstruation at age 15 or above. Overall, age at first menstruation has been decreasing, from 15.0 years among women age 45–49 to 14.2 years among women age 15–19 (**Table 5.8**).

5.6 Arrival of Menopause

Menopause
Women are considered to have reached menopause if they are neither pregnant nor postpartum amenorrhoeic and have not had a menstrual period in the 6 months before the survey, or if they report being menopausal or having had a hysterectomy, or if they have never menstruated.
Sample: Women age 30–49

Once women reach menopause, they are no longer able to become pregnant. Overall, 11% of women age 30–49 are menopausal. As expected, the percentage of women who are menopausal increases with age, ranging from 3% of women age 30–34 to 46% among women age 48–49 (**Table 5.9**).

5.7 Age at First Birth

Median age at first birth
Age by which half of women have had their first child.
Sample: Women age 20–49 and 25–49

The age at which childbearing commences is an important determinant of the overall level of fertility, as well as the health of the mother and the child. In some societies, postponement of first births has contributed to a decline in the overall fertility rate. An increase in the median age at first birth signals a transition to lower fertility levels. National guidelines in Tanzania advise women to start childbearing at age 20 or older. Currently, 84% of women age 15–19 have never had a live birth. The median age at first birth among women age 20–49 is 20 years, which aligns with national guidelines (**Table 5.10**).

Patterns by background characteristics

- Women age 25–49 with a secondary education or higher begin childbearing 4 years later than women age 25–49 with no education (23.1 versus 18.8 years).
- On average, women age 25–49 in the highest wealth quintile have their first birth 2 years later than women age 25–49 in the lowest quintile (21.5 versus 19.3 years) (**Table 5.11**).

5.8 Teenage Pregnancy

Teenage pregnancy
Percentage of women age 15–19 who have ever been pregnant.
Sample: Women age 15–19

Teenage pregnancy is a major health concern and has been associated with maternal and child morbidity and mortality. Additionally, childbearing during the teen years has adverse social and economic implications, particularly regarding educational attainment. Women who become mothers in their teens are more likely to drop out of school. In Tanzania, 22% of women age 15–19 have ever been pregnant (**Table**

5.12). Sixteen percent of women age 15–19 have already had a live birth, 2% have had a stillbirth, miscarriage or induced abortion, and 6% were pregnant at the time of the survey. No men reported marrying or fathering a child before age 15 (**Table 5.13**).

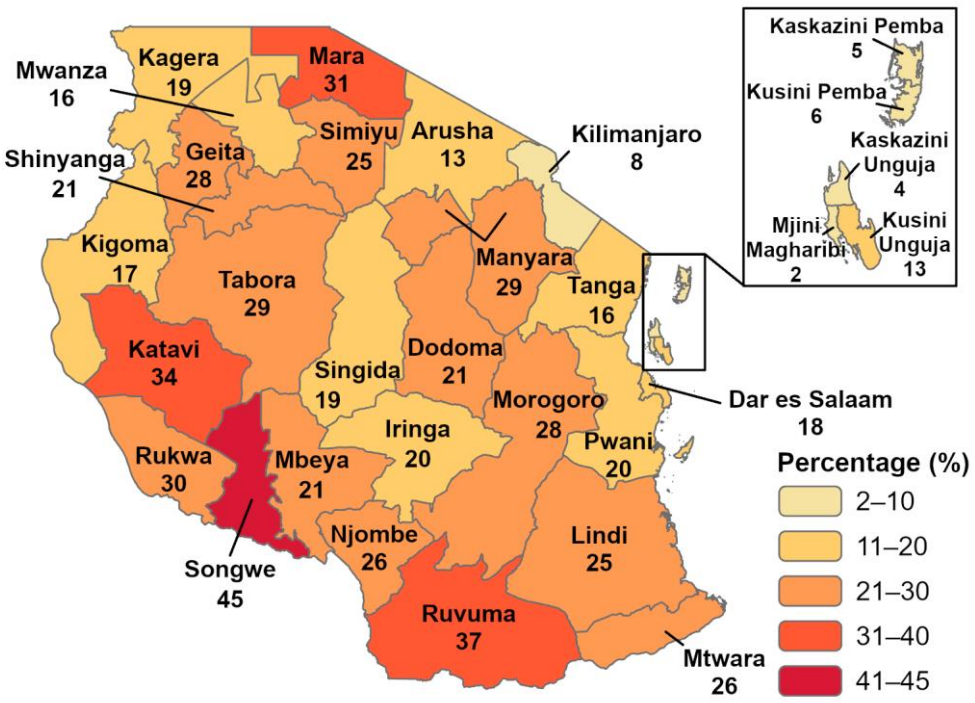
Trends: The addition of a full pregnancy history in the 2022 TDHS-MIS allows for a more comprehensive picture of teenage pregnancy. In prior surveys, data on pregnancies that ended in a miscarriage or induced abortion were not collected. This means that trends across surveys are not strictly comparable—the 2022 TDHS-MIS captured some pregnancies among young women age 15–19 that previous surveys would have missed. Overall, the percentage of women age 15–19 who were reported as ever having been pregnant decreased from 27% in 2015–16 to 22% in 2022.

Patterns by background characteristics

- The percentage of teenage women 15–19 who have ever been pregnant is higher in rural Tanzania (25%) than in urban Tanzania (16%) (**Table 5.12**).
- The percentage of young women age 15–19 who have ever been pregnant is lower in Zanzibar (4%) than Tanzania Mainland (23%).
- South West Highlands zone and Southern Highlands zone have the highest levels of teenage pregnancy in Tanzania (31% and 29%, respectively).
- By region, teenage pregnancy ranges from 45% in Songwe to 2% in Mjini Magharibi (**Map 5.2**).
- Teenage pregnancy decreases with increasing education; 53% of women age 15–19 with no education have ever had a live birth, as compared with 9% of women age 15–19 with a secondary education or higher.
- Teenage pregnancy also decreases with increasing wealth, from 35% in the lowest wealth quintile to 12% in the highest quintile.

Map 5.2 **Teenage pregnancy by region**

Percentage of women age 15–19 who have ever been pregnant



5.9 PREGNANCY OUTCOMES

Pregnancy outcomes

Live birth:	a child that was born alive, even if for a very short time
Stillbirth:	a child that was born dead (no signs of life) following a pregnancy that lasted 7 months (28 weeks) or longer
Miscarriage:	a pregnancy that ended involuntarily before completing 7 months (28 weeks)
Induced abortion:	a pregnancy that was voluntarily ended

Sample: Pregnancies among women age 15–49 ending in the 3 years preceding the survey

Among pregnancies to women age 15–49 years in the 3 years preceding the survey, 90% ended in a live birth, 8% resulted in miscarriage, 2% resulted in a stillbirth, and less than 1% were reported as induced abortions (**Table 5.14**). **Table 5.15** shows age-specific and total induced abortion rates. In Tanzania, reported induced abortion is negligible.

Patterns by background characteristics

- The risk of miscarriage increases with age, from 7% among pregnancies to women less than 20 years of age to 46% among pregnancies to women age 45–49 (**Table 5.14**).
- A higher percentage of pregnancies end in miscarriage in urban areas (13%) than in rural areas (6%).
- By region, the percentage of pregnancies that end in miscarriage is highest in Dar es Salaam (23%) and lowest in Rukwa (less than 1%).

Total	89.8	1.8	8.2	0.2	100.0	7,348

[1] Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months.
[2] Miscarriages are foetal deaths in pregnancies lasting less than 28 weeks. When pregnancy duration is reported in months, miscarriages are foetal deaths in pregnancies lasting less than 7 months.

Table 5.15 Induced abortion rates

Age-specific and total induced abortion rates, and general abortion rates, for the 3 years preceding the survey, according to residence, Tanzania DHS-MIS 2022

Age group	Tanzania Mainland: Urban	Rural	Total	Zanzibar	Tanzania
15–19	[1]	[0]	[1]	[1]	[1]
20–24	2	0	1	0	1
25–29	1	0	0	0	0
30–34	0	0	0	0	0
35–39	0	1	1	0	1
40–44	[0]	[0]	[0]	[1]	[0]
TAR (15–49)	0.0	0.0	0.0	0.0	0.0
GAR	1	0	1	0	0

Notes: Age-specific induced abortion rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview. Rates for the 10–14 age group are based on retrospective data from women age 15–17.
TAR: total induced abortion rate, expressed per woman
GAR: general induced abortion rate, expressed per 1,000 women age 15–44

FERTILITY PREFERENCES 6

Key Findings

- ***Desire for another child:*** 24% of currently married women age 15–49 want another child soon (within the next 2 years), 35% want to have another child later (in 2 or more years), and 2% want another child but have not decided when.
- ***Desire to limit childbearing:*** 22% of currently married women and 15% of currently married men say they want no more children or are sterilised.
- ***Ideal family size:*** Overall, women want 5.1 children on average and men want 5.6 children. Currently married women want 5.5 children and currently married men want 6.3 children.
- ***Fertility planning status:*** 72% of live births and current pregnancies were wanted at the time, 25% were mistimed (wanted later), and 4% were not wanted at all.
- ***Wanted fertility rates:*** The total wanted fertility rate is 4.4 children, while the actual total fertility rate is 4.8 children; thus, on average, women are having 0.4 more children than they want.

Information on fertility preferences can help family planning programme planners assess the desire for children, the extent of mistimed and unwanted pregnancies, and the demand for contraception to space or limit births. This information suggests the direction that fertility patterns could take in the future.

This chapter presents information on whether and when married women and men want more children, their ideal family size, whether the last birth was wanted, and the theoretical fertility rate if all unwanted births were prevented.

6.1 DESIRE FOR ANOTHER CHILD

Desire for another child

Women and men were asked whether they wanted more children and, if so, how long they would prefer to wait before the birth of the next child. Women and men who are sterilised are assumed not to want any more children.

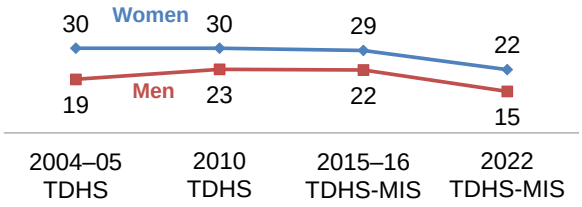
Sample: Currently married women and men age 15–49

Women are less likely than men to want another child. Twenty-four percent of currently married women age 15–49 want another child soon (within the next 2 years), 35% want to have another child later (in 2 or more years), and 2% want another child but have not decided when. Among currently married men, 25% want to have a child soon, 48% want to have a child later, and 3% want another child but have not decided when (**Table 6.1**). Twenty-two percent of currently married women and 15% of currently married men say they want no more children or are sterilised (**Tables 6.2.1** and **6.2.2**).

Trends: The percentage of currently married women age 15–49 who want no more children or are sterilised has decreased over the past two decades, from 30% in the 2004–05 TDHS to 22% in the 2022 TDHS-MIS. The percentage of currently married men who want no more children increased from 19% in the 2004–05 TDHS to 23% in 2010 and then decreased to 15% in 2022 (**Figure 6.1**).

Figure 6.1 **Trends in desire to limit childbearing**

Percentage of currently married women and men age 15–49 who want no more children

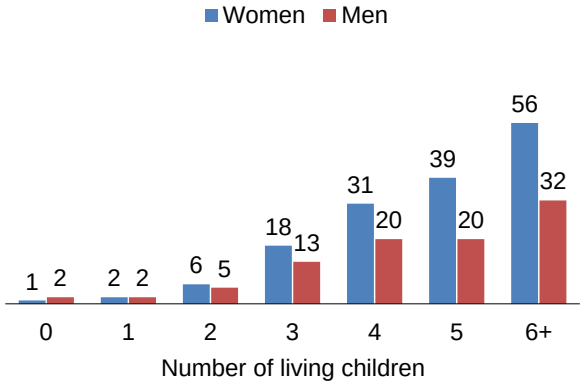


Patterns by background characteristics

- The percentage of currently married women and men who want no more children or have been sterilised increases with the number of living children. Two percent each of women and men with one living child want no more children or have been sterilised, as compared with 56% of women and 32% of men with six or more children (**Figure 6.2**).

Figure 6.2 **Desire to limit childbearing by number of living children**

Percentage of currently married women and men age 15–49 who want no more children



- In general, more women want to limit childbearing than men. The difference in desire to limit childbearing between women and men becomes more apparent as the number of living children increases.
- About 2 in 10 currently married women in both Tanzania Mainland (23%) and Zanzibar (20%) want to limit childbearing. Among currently married men, 15% in Tanzania Mainland and 9% in Zanzibar want to limit childbearing (**Tables 6.2.1** and **6.2.2**).
- By region, the percentage of currently married women who want to limit childbearing ranges from 9% in Rukwa to 45% in Kilimanjaro. Among currently married men, the percentage ranges from 2% in Kaskazini Pemba to 35% in Njombe.
- Except for women with one child, more currently married women with a secondary education or higher want to limit childbearing compared with those with no education. There is no clear relationship between education and desire to limit childbearing among men.

6.2 IDEAL FAMILY SIZE

Ideal family size

Respondents with no children were asked "If you could choose exactly the number of children to have in your whole life, how many would that be?" Respondents who had children were asked "If you could go back to the time when you did not have any children and could choose exactly the number of children to have in your whole life, how many would that be?"

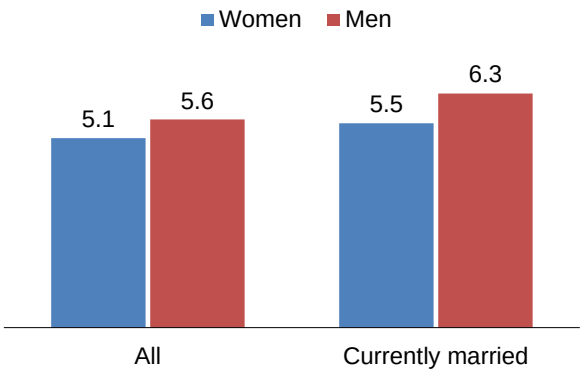
Sample: Women and men age 15–49

About half of women (51%) and men (55%) in Tanzania report that their ideal family size is five or more children (**Table 6.3**). Women want to have slightly fewer children than men (5.1 children and 5.6 children, respectively) on average. Similarly, among those who are currently married, the average ideal number of children is higher among men (6.3 children) than among women (5.5 children) (**Figure 6.3**).

Trends: The ideal mean number of children among women in Tanzania decreased from 4.9 in 2010 to 4.7 in 2015–16 before increasing to 5.1 in 2022. Among men, ideal number of children increased from 4.8 in 2010 to 5.1 in 2015–16 and 5.6 in 2022.

Figure 6.3 **Ideal family size**

Mean ideal number of children among women and men age 15–49



- The average ideal number of children among women increases with age, from 4.2 children among those age 15–19 to 6.4 children among those age 45–49 (**Table 6.4**).
- The ideal number of children on average is higher in rural areas (5.5 children) than in urban areas (4.3 children).
- The average ideal family size is smaller in Tanzania Mainland (5.1 children) than in Zanzibar (6.1 children).
- The mean ideal number of children varies across zones, from 4.3 children among women in the Southern Highlands zone to 6.5 children among women in the Western zone.
- Ideal number of children decreases as education increases, from 6.5 children among women with no education to 4.0 children among women with a secondary education or higher.
- Similarly, ideal family size decreases with increasing wealth, from 6.1 children among women in the lowest wealth quintile to 4.2 among women in the highest quintile.

6.3 Fertility Planning Status

Planning status of births/pregnancies

Women reported whether their births/pregnancies were wanted at the time (planned birth), at a later time (mistimed birth), or not at all (unwanted birth).

Sample: Current pregnancies and live births in the 3 years before the survey among women age 15–49 and all pregnancy outcomes in the 3 years before the survey among women age 15–49

Seventy-one percent of all pregnancies in the 3 years preceding the survey were wanted at the time of conception, 25% were wanted later, and 4% were not wanted all (**Table 6.5** and **Figure 6.4**).

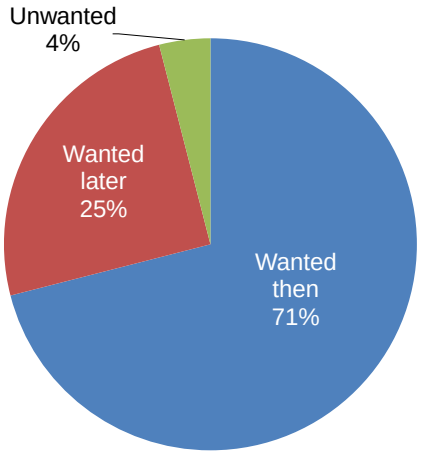
Trends: The percentage of pregnancies in the 3 years preceding the survey that were wanted at the time of conception increased slightly from 66% in the 2015–16 TDHS-MIS to 72% in 2022 TDHS-MIS. Over the same period, the percentage of pregnancies that were mistimed decreased from 30% to 25%. The percentage of unwanted pregnancies remained stable from 2015–16 to 2022 (4%).

Patterns by background characteristics

- Seven percent of fourth- and higher-order live births and current pregnancies were unwanted, as compared with 1% of first- and second-order births and pregnancies (**Table 6.5**).

Figure 6.4 **Fertility planning status**

Percent distribution of all pregnancy outcomes among women age 15–49 in the 3 years before the survey by planning status of pregnancy



- Women below age 40 have more mistimed pregnancies (22%–30%) than women age 40–44 (15%) and women age 45–49 (7%).
- Pregnancies that ended in a stillbirth or a miscarriage are more likely to have been reported as unwanted (9% and 10%, respectively) than are current pregnancies (5%) and live births (3%).

6.4 WANTED FERTILITY RATES

Unwanted birth

Any birth in excess of the number of children a woman reported as her ideal number.

Wanted birth

Any birth less than or equal to the number of children a woman reported as her ideal number.

Wanted fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates, excluding unwanted births.

Sample: Women age 15–49

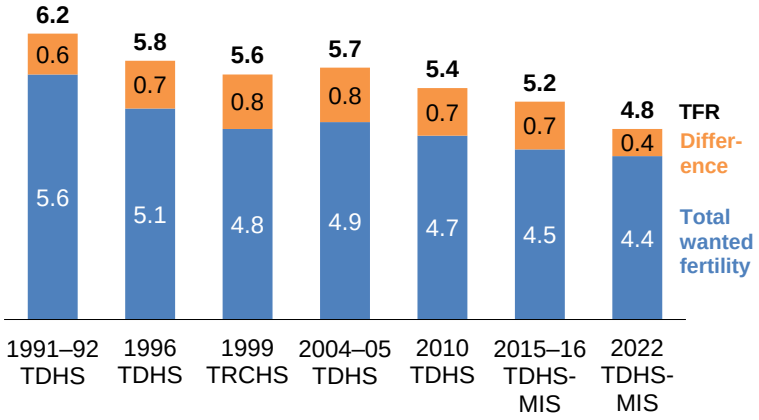
The wanted fertility rate is a measure of the potential demographic impact of fertility that would have prevailed in the 3 years preceding the survey if all unwanted births had been avoided. The total wanted fertility rate and the total fertility rate are calculated in the same manner. A birth is considered wanted if the number of living children at the time of conception is lower than the ideal number of children reported by the woman. **Table 6.6** shows total wanted fertility rates and total fertility rates for the 3 years preceding the survey according to background characteristics.

The total wanted fertility rate is 4.4 children, while the actual fertility rate is 4.8 children; thus, on average, women are having 0.4 more children than they want (**Table 6.6**).

Trends: The total wanted fertility rate in Tanzania has declined over time, from 5.6 children in the 1991–92 TDHS to 4.5 children in 2015–16 TDHS-MIS and 4.4 children in the 2022 THD-MIS. In the same period, the actual total fertility rate decreased from 6.2 children to 4.8 children. The gap between wanted and actual fertility remained consistent between the 1991–92 TDHS and the 2015–16 TDHS-MIS (0.6 to 0.8 children), but the gap has since narrowed to 0.4 children (**Figure 6.5**).

***Figure 6.5* Trends in wanted and actual fertility**

Wanted and actual number of children per woman



Patterns by background characteristics

- Across all background characteristics, the wanted fertility rate is consistently lower than the total fertility rate (**Table 6.6**).
- The total wanted fertility rate is higher in rural areas (5.0 children) than in urban areas (3.4 children). The gap between actual and wanted fertility is also higher in rural areas (0.5 children versus 0.2 children).
- The gap between actual and wanted fertility is the same in Tanzania Mainland and Zanzibar (0.4 children). The gap between actual and wanted fertility is largest in the Lake zone (0.7 children) and smallest in the Eastern and Southern zones (0.2 children each).
- Wanted fertility rates range from 2.8 children in Dar es Salaam to 6.2 children in Tabora. The regions with the largest gaps between wanted and actual fertility are Shinyanga (1.7 children) and Simiyu (1.2 children). In Dar es Salaam, there is no difference between actual and wanted fertility.
- The wanted fertility rate decreases from 5.6 children among women with no education to 3.6 children among women with a secondary education or more.
- A similar pattern is observed for wealth; the wanted fertility rate is higher among women in the lowest wealth quintile (6.0 children) than among those in the highest quintile (3.1 children).

List of Tables

For more information on fertility preferences, see the following tables:

[1] The number of living children includes a woman's current pregnancy.
[2] Wants next birth within 2 years
[3] Wants to delay next birth for 2 or more years
[4] Includes both female and male sterilisation
[5] The number of living children includes one additional child if the respondent's wife is pregnant (or if any wife is pregnant for men with more than one current wife).

Table 6.5 Fertility planning status

Percent distribution of live births and current pregnancies among women age 15–49 in the 3 years preceding the survey by planning status of the pregnancy, according to birth order and mother's age at birth, and percent distribution of all pregnancy outcomes among women age 15–49 in the 3 years preceding the survey by planning status of the pregnancy, according to type of pregnancy outcome, Tanzania DHS-MIS 2022

Characteristic	Planning status of pregnancy outcome: Wanted then	Wanted later	Wanted no more	Total	Number of pregnancy outcomes[1]
LIVE BIRTHS AND CURRENT PREGNANCIES					
Birth order					
1	76.5	22.6	0.9	100.0	1,771
2	75.2	23.8	1.0	100.0	1,643
3	71.2	27.3	1.5	100.0	1,350
4+	67.1	25.6	7.3	100.0	3,014
Mother's age at birth[2]					
<20	69.1	29.7	1.2	100.0	1,172
20–24	72.3	26.7	1.0	100.0	2,062
25–29	75.9	22.2	2.0	100.0	1,880
30–34	71.0	26.3	2.7	100.0	1,370
35–39	69.5	22.3	8.2	100.0	927
40–44	61.8	14.9	23.3	100.0	317
45–49	65.1	6.5	28.3	100.0	49
Total	71.7	24.8	3.5	100.0	7,778
ALL PREGNANCY OUTCOMES					
Pregnancy outcome type					
Current pregnancies	72.3	23.1	4.5	100.0	1,182
Live births	71.5	25.1	3.3	100.0	6,596
Stillbirths	70.0	21.2	8.8	100.0	135
Miscarriages	67.5	22.3	10.2	100.0	600
Abortions	*	*	*	100.0	18
Total	71.3	24.6	4.1	100.0	8,530

Note: A pregnancy outcome refers to a miscarriage, abortion, live birth, or stillbirth. Some pregnancies produce multiple outcomes, for example in the case of twins. In this table, each pregnancy outcome is counted individually. Therefore, a pregnancy will be counted more than once if it produces multiple births (live births or stillbirths). Current pregnancies, miscarriages, and abortions are always counted as one pregnancy outcome. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] For pregnancies that resulted in multiple outcomes (for example, twins), each outcome is counted individually.

[2] For current pregnancies, the maternal age at birth is estimated as the mother's expected age at the time of the birth.

Table 6.6 Wanted fertility rates

Total wanted fertility rates and total fertility rates for the 3 years preceding the survey, according to background characteristics, Tanzania DHS-MIS 2022

Note: Rates are calculated based on births to women age 15–49 in the period 1–36 months preceding the survey. The total fertility rates are the same as those presented in Table 5.2.

FAMILY PLANNING 7

Key Findings

- ***Contraceptive use:*** 38% of currently married women are using a method of contraception, with 31% using a modern method and 7% using a traditional method. Implants are the most commonly used method (14%).
- ***Sources of modern methods:*** Nearly 8 in 10 modern contraceptive users (78%) obtain their methods from government suppliers.
- ***Demand for family planning satisfied:*** Among currently married women, the total demand for family planning that is satisfied is 64%; about half (53%) of the total demand is satisfied by modern methods.
- ***Unmet need for family planning:*** 21% of currently married women have an unmet need for family planning.
- ***Future use of contraception:*** 34% of currently married women who are not using a contraceptive method intend to use family planning in the future.

Couples can use contraceptive methods to limit or space the number of children they have. This chapter presents information on use and sources of contraceptive methods, informed choice of methods, and rates and reasons for discontinuing contraceptives. It also examines the potential demand for family planning and how much contact nonusers have with family planning providers.

In Tanzania, family planning services are components of the reproductive, maternal, newborn, child, and adolescent health interventions provided by the Ministries of Health of both Tanzania Mainland and Zanzibar. Provision of these services is reflected in various United Republic of Tanzania government documents, including the Tanzania Development Vision (2025); the Health Sector Strategic Plan V (July 2021–June 2026); the National Plan for Reproductive, Maternal, Newborn, Child and Adolescent Health and Nutrition (2021/2022–2025/2026) One Plan III; and the National Family Planning Costed Implementation Plan (2019–2023) for Tanzania Mainland. In the case of Zanzibar, the main documents are the Zanzibar Development Vision 2050, the Zanzibar Health Sector Strategic Plan IV (2020/21–2024/25), and the Zanzibar Reproductive, Maternal, Newborn, Child and Adolescent Health Strategic Plan (2019–2023).

7.1 CONTRACEPTIVE KNOWLEDGE AND USE

Knowledge of contraceptive methods is nearly universal in Tanzania; 98% each of currently married women and men age 15–49 know at least one method of contraception (**Table 7.1** and **Table 7.2**). Injectables, implants, and the pill are the most widely known methods among currently married women (96% each), while currently married men are most knowledgeable about male condoms (97%) and injectables (93%). The least recognised methods are the standard days method (SDM) (23%) and emergency contraception (34%) among currently married women and the lactational amenorrhoea method (LAM) (40%), emergency contraception (46%), and male sterilisation (46%) among currently married men.

Contraceptive prevalence

Percentage of women who use any contraceptive method.

Sample: All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

Modern methods

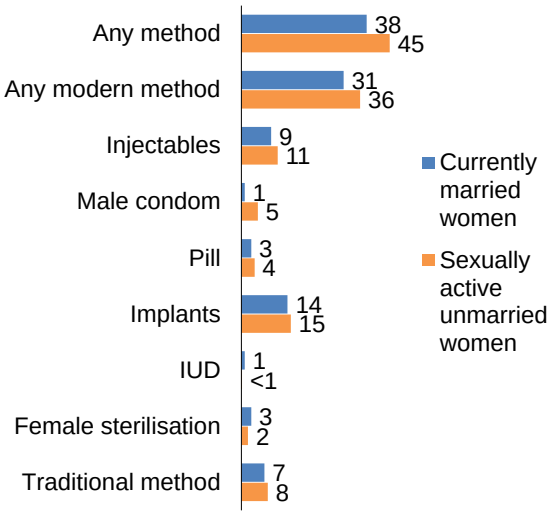
Include male and female sterilisation, intrauterine devices (IUDs), injectables, implants, contraceptive pills, male and female condoms, emergency contraception, the standard days method, and the lactational amenorrhoea method.

Contraceptive prevalence among all women age 15–49 in Tanzania is 31%, with 25% using modern methods and 6% using traditional methods (**Table 7.3**). Contraceptive prevalence is 38% among currently married women (with 31% using modern methods and 7% using traditional methods) and 45% among sexually active unmarried women (with 36% using modern methods and 8% using traditional methods).

Implants and injectables are the most commonly used contraceptive methods among all women (11% and 7%, respectively) and currently married women (14% and 9%, respectively). The most widely used methods among sexually active unmarried women are implants (15%), injectables (11%), the rhythm method (6%), and male condoms (5%) (**Figure 7.1** and **Table 7.3**).

***Figure 7.1* Contraceptive use**

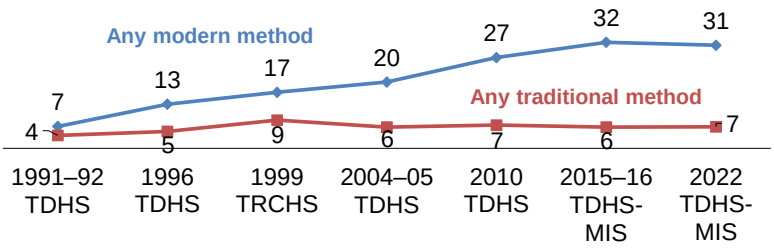
Percentage of women age 15–49 currently using a contraceptive method



Trends: Modern contraceptive use among currently married women increased from 7% in 1991–92 to 32% in 2015–16 and remained relatively unchanged in 2022 (31%). Use of traditional contraceptive methods has remained almost unchanged since 2004–05 (6%–7%) (**Table 7.4.1** and **Figure 7.2**).

***Figure 7.2* Trends in contraceptive use**

Percentage of currently married women currently using a contraceptive method



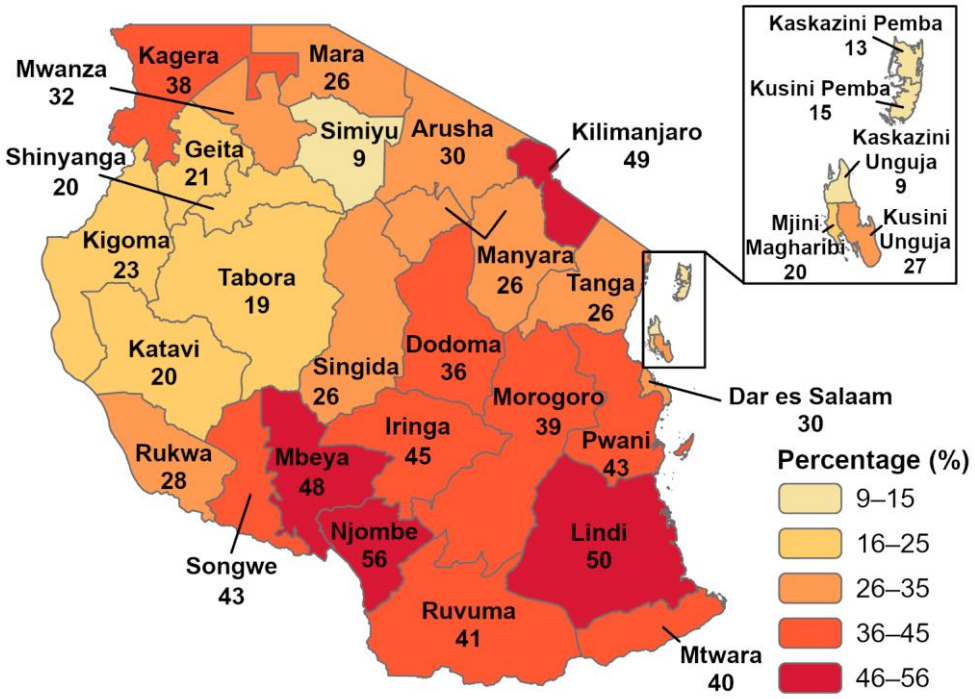
Patterns by background characteristics

- Among currently married women, use of modern contraception is highest among those age 35–39 (36%), followed by those age 25–29 (35%) and age 30–34 (34%) (**Table 7.3**).
- Among currently married women, use of modern contraceptives is slightly higher in urban areas (35%) than in rural areas (29%). Use of traditional methods (mostly rhythm and withdrawal) is also more common in urban areas than in rural areas (11% and 5%, respectively) (**Table 7.4.2**).

- Among sexually active unmarried women, use of traditional methods is more common in urban than in rural areas (14% and 4%, respectively). Conversely, 38% of sexually active unmarried women in rural areas use modern contraceptives, as compared with 35% in urban areas.
- In both urban and rural areas, implants are the most widely used method among currently married women (15% and 13%, respectively) as well as sexually active unmarried women (13% and 16%, respectively).
- Women in Tanzania Mainland are substantially more likely to use modern contraceptive methods (32%) than those in Zanzibar (17%). In Zanzibar, modern contraceptive use is more common in Unguja (19%) than in Pemba (14%).
- There is a notable difference in contraceptive use across zones and regions. Modern contraceptive use is highest among currently married women in the Southern Highlands (46%) and Southern (44%) zones and lowest among women in Zanzibar (17%). Across regions, modern contraceptive use ranges from a low of 9% in Simiyu and Kaskazini Unguja to a high of 56% in Njombe (**Map 7.1**).

Map 7.1 Modern contraceptive use by region

Percentage of currently married women age 15–49 using a modern contraceptive method



- Modern contraceptive use increases with increasing education, from 23% among women with no education to 35% among women with a secondary education or higher (**Table 7.4.2**).
- Use of sterilisation is not common in Tanzania (3% among currently married women and 2% among sexually active unmarried women). The median age at sterilisation is 34 years (**Table 7.5**).

7.1.1 Use of Emergency Contraception

One percent of women age 15–49 used emergency contraception during the 12 months prior to the survey. Women in urban areas are more likely to use emergency contraception than women in rural areas (**Table 7.6**). Only 34% of currently married women and 39% of sexually active unmarried women had heard of emergency contraception (**Table 7.1**).

7.1.2 Knowledge of the Fertile Period

Around one quarter (23%) of all women age 15–49 correctly reported that a woman is most at risk of pregnancy if she has intercourse halfway between two menstrual periods (**Table 7.7**). Thirty percent of women incorrectly believe that a woman's fertile period is immediately after her menstrual period has ended, 16% state that there is no specific time a woman is more or less likely to become pregnant, and 19% state that they do not know the fertile period. As expected, a higher percentage of women who use the rhythm method correctly identified a woman's fertile period (35%). The most common misconception among rhythm users is that the fertile period is immediately after the menstrual period has ended (33%). There is minimal variation by age in knowledge of the fertile period (**Table 7.8**).

7.2 Source of Modern Contraceptive Methods

Source of modern contraceptives

The place where the modern method currently being used was obtained the last time it was acquired.

Sample: Women age 15–49 currently using a modern contraceptive method

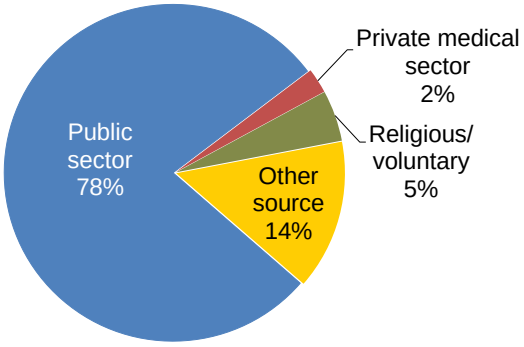
More than three quarters (78%) of all modern contraceptive users obtain their methods from the public sector, 5% from the religious or voluntary sector, 2% from the private medical sector, and 14% from other sources, mainly pharmacies (6%) and accredited drug dispensing outlets (ADDOs) (5%) (**Table 7.9** and **Figure 7.3**).

Socially marketed brand pills and condoms are available in Tanzania (**Table 7.10**).

- *Implants, IUDs, injectables, and pills:* Most users of implants (92%), IUDs (84%), injectables (76%), and pills (65%) obtain their method from the public sector, primarily dispensaries or health centres.

Figure 7.3 **Source of modern contraceptive methods**

Percent distribution of current users of modern methods age 15–49 by most recent source of method



Note: Percentages may not sum to 100% due to rounding.

- *Male condoms:* The predominant sources for male condoms are shops or kiosks (29%), pharmacies (24%), and ADDOs (18%).
- *Female sterilisation:* Eighty-four percent of women who underwent sterilisation had the procedure done in a public sector facility, and 10% had the procedure done in a religious or voluntary health facility (**Table 7.9**).

7.3 Informed Choice

Informed choice

Informed choice indicates that women were informed about the method's side effects, about what to do if they experience side effects, and about other methods they could use.

Sample: Women age 15–49 who are currently using selected modern contraceptive methods and who started the last episode of use within the 5 years before the survey

Ensuring that women have the support necessary for informed choice is a critical component of high-quality family planning service delivery. Three quarters (75%) of women currently using modern contraceptives were informed about possible side effects or problems associated with the method they used, and 73% were advised on what to do if they experienced side effects. Seventy-eight percent of women were informed about other methods that they could use. Overall, two-thirds (66%) of women currently using modern contraceptive methods were provided with all three types of information at the time they started their last episode of use (**Table 7.11**).

7.4 Discontinuation of Contraceptives

Contraceptive discontinuation rate

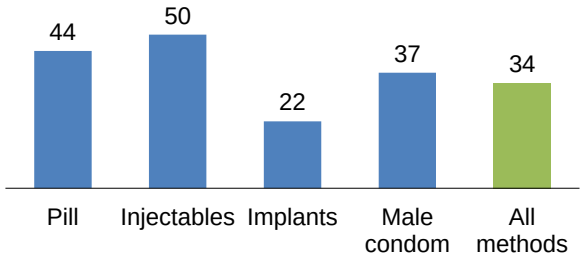
Percentage of contraceptive use episodes discontinued within 12 months.

Sample: Episodes of contraceptive use in the 5 years before the survey experienced by women who are currently age 15–49 (one woman may contribute more than one episode)

Among contraceptive episodes experienced by women age 15–49 in the 5 years before the survey, 34% were discontinued within 12 months. In an additional 4% of episodes, women switched to another method within 12 months (**Table 7.12**). Discontinuation rates are highest for injectables (50%) and pills (44%) (**Figure 7.4**).

***Figure 7.4* Contraceptive discontinuation rates**

Percentage of contraceptive episodes discontinued within 12 months



Reasons for discontinuation depend on the method. Overall, the most common reason for discontinuing a method in less than 12 months is the desire to become pregnant (36%). Thirteen percent of discontinuations were due to changes in menstrual bleeding and 19% to other side effects or health concerns. Five percent of discontinued episodes resulted from a woman becoming pregnant while using the method. The percentages of women who cited side effects other than changes in menstrual bleeding and health concerns as a reason for discontinuation are higher among users of IUDs (28%), implants (27%), injectables (24%), and pills (20%) than among users of male condoms (5%) (**Table 7.13**).

7.5 DEMAND FOR FAMILY PLANNING

Unmet need for family planning

Percentage of women who:

(1) are not pregnant and not postpartum amenorrhoeic and are considered fecund and want to postpone their next birth for 2 or more years or stop childbearing altogether but are not using a contraceptive method, or

(2) have a mistimed or unwanted current pregnancy, or

(3) are postpartum amenorrhoeic and their most recent birth in the last 2 years was mistimed or unwanted.

Met need for family planning

Current contraceptive use (any method).

Sample: All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

Demand for family planning:

Unmet need for family planning + met need (current contraceptive use [any method])

Proportion of demand satisfied:

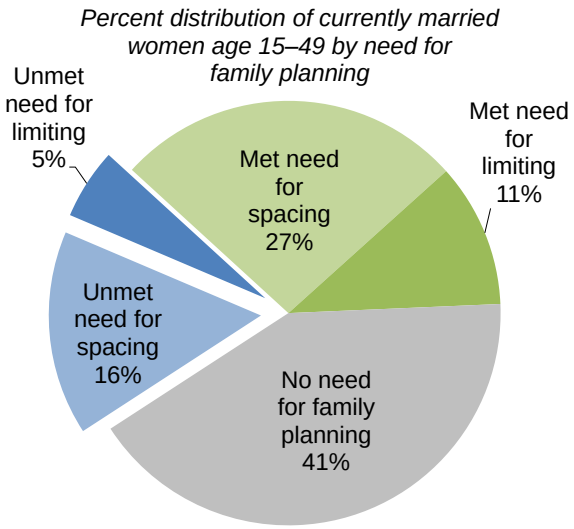
$$\frac{\text{Current contraceptive use (any method)}}{\text{Unmet need + current contraceptive use (any method)}}$$

Proportion of demand satisfied by modern methods:

$$\frac{\text{Current contraceptive use (any modern method)}}{\text{Unmet need + current contraceptive use (any method)}}$$

In Tanzania, about 6 in 10 currently married women age 15–49 (59%) have a demand for family planning (42% for spacing and 16% for limiting) (**Table 7.14.1**). Thirty-eight percent of currently married women are using a contraceptive method for either spacing (27%) or limiting (11%); that is, their family planning need is met. However, 21% of currently married women have an unmet need for family planning: 16% for spacing and 5% for limiting (**Figure 7.5**). The total demand for family planning is 59%. Around two-thirds (64%) of total demand is satisfied; about half (53%) of the total demand is satisfied by modern methods. Data on demand for family planning among all women and among sexually active unmarried women are presented in **Table 7.14.2**.

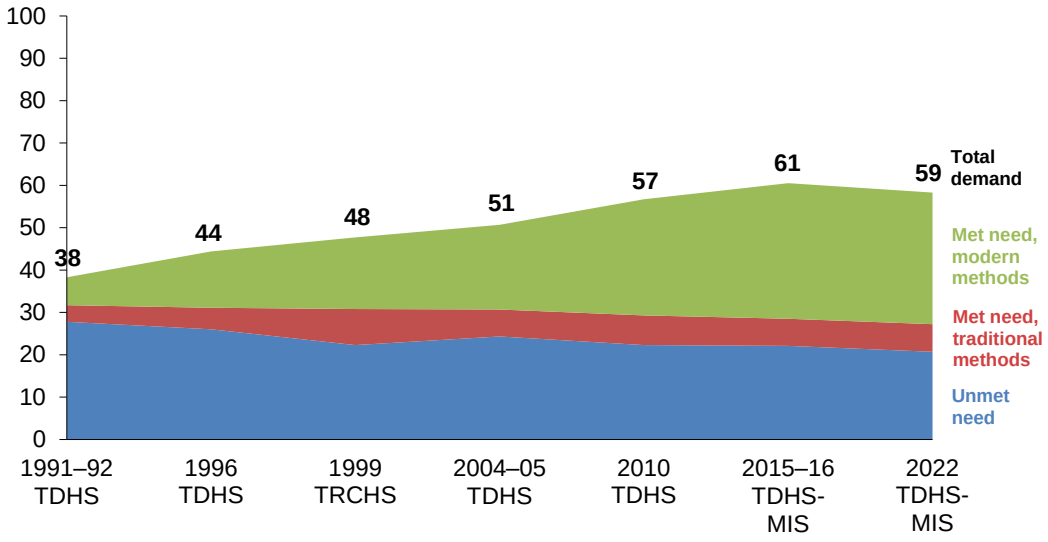
Figure 7.5 **Demand for family planning**



Trends: Demand for family planning among currently married women age 15–49 in Tanzania increased markedly from 38% in 1991–92 to 61% in 2015–16 before decreasing slightly to 59% in 2022 (**Figure 7.6**). Met need for family planning has increased significantly since 1991–92; most of the need has been met with modern methods. The increase in contraceptive use has slightly outpaced the increase in demand; thus, unmet need for family planning has declined slightly over time, from 28% in 1991–92 to 21% in 2022.

Figure 7.6 **Trends in demand for family planning**

Percentage of currently married women age 15–49

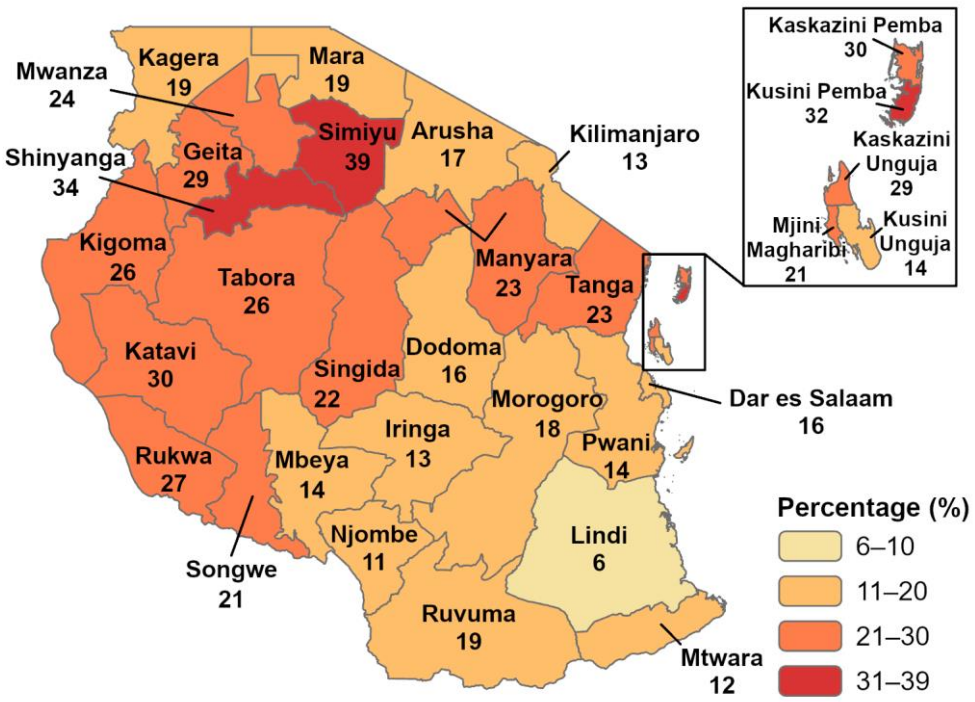


Patterns by background characteristics

- Unmet need for family planning among currently married women ranges from a low of 10% in the Southern zone to a high of 26% in the Western and Lake zones (**Table 7.14.1**).
- Across regions, unmet need for family planning ranges from 6% in Lindi to 39% in Simiyu (**Map 7.2**).
- Unmet need for family planning declines steadily with increasing education, from 25% among women with no education to 17% among those with a secondary or higher education (**Table 7.14.1**).
- Unmet need for family planning also declines with increasing wealth, from 27% among women in the lowest wealth quintile to 15% among those in the highest quintile.

Map 7.2 Unmet need by region

Percentage of currently married women age 15–49 with unmet need for family planning



7.6 Decision Making about Family Planning

The survey collected information from both users and nonusers regarding how the decision about family planning was made. Fifty-four percent of currently married women reported that they made the decision to use or not use family planning jointly with their husband, 31% decided mainly themselves, and 14% attributed the decision mainly to their husband (**Table 7.15** and **Table 7.16**).

Pressure to Become Pregnant and Future Use of Contraception

Four percent of currently married women reported that they were pressured by their husband/partner or any other family member to become pregnant when they did not want to (**Table 7.17**). Overall, 34% of currently married women who are not using any contraceptive method intend to use contraception in the future; however, 55% do not plan to use contraception in the future and 9% are unsure (**Table 7.18**).

7.7 Exposure to Family Planning Messages

The survey also collected information on exposure to family planning messages in the media and other sources among women and men age 15–49. Fifty percent of women and 64% of men reported having heard a family planning message on the radio in the last 12 months, and 50% of women and 53% of men reported seeing a message on an outdoor sign or billboard. Social media was the least commonly cited source of family planning messages (10% of women and 20% of men). Overall, 22% of women and 19% of men reported that they had no exposure to family planning messages through any of the specified sources in the past 12 months (**Table 7.19.1** and **Table 7.19.2**).

7.8 CONTACT OF NONUSERS WITH FAMILY PLANNING PROVIDERS

Contact of nonusers with family planning providers

Respondent discussed family planning in the 12 months before the survey with a fieldworker or during a visit to a health facility.

Sample: Women age 15–49 who are not currently using any contraceptive methods

Women age 15–49 who were not using contraception were asked whether they had discussed family planning in the 12 months prior to the survey with fieldworkers or providers at health facilities. Eight in 10 women (81%) not using contraception reported that they had not discussed family planning with a fieldworker or at a health facility visit in the past 12 months. Eighteen percent of women visited a health facility and discussed family planning, while 29% visited a health facility but did not discuss family planning. Only 2% of women were visited by a fieldworker who discussed family planning (**Table 7.20**).

Patterns by background characteristics

- The proportion of women who did not discuss family planning either with a fieldworker or at a health facility is the same in urban areas and rural areas (81%).
- By region, the percentage of women who did not discuss family planning with a fieldworker or at a health facility visit ranges from 69% in Pwani to 88% in Shinyanga and Mjini Magharibi.
- Women in the lowest wealth quintile were slightly more likely not to have discussed family planning with a fieldworker or at a health facility (83%) than those in the highest wealth quintile (80%).

List of Tables

For more information on family planning, see the following tables:

Table 7.1 Knowledge of contraceptive methods

Percentage of all respondents, currently married respondents, and sexually active unmarried respondents age 15–49 who have heard of any contraceptive method, according to specific method, Tanzania DHS-MIS 2022

	Women			Men

Table 7.7 Knowledge of fertile period

Percent distribution of rhythm users, SDM users, and all women age 15–49 by knowledge of the fertile period during the ovulatory cycle, Tanzania DHS-MIS 2022

Perceived fertile period	Users of rhythm method	Users of SDM	All women
Just before her menstrual period begins	11.0	*	9.8
During her menstrual period	1.5	*	1.2
Right after her menstrual period has ended	32.5	*	30.3
Halfway between two menstrual periods	34.9	*	22.5
Other	0.1	*	0.4
No specific time	11.7	*	16.3
Don't know	8.2	*	19.4
Total	100.0	100.0	100.0
Number of women	532	0	15,254

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
SDM = standard days method

Table 7.8 Knowledge of fertile period by age

Percentage of women age 15–49 with correct knowledge of the fertile period during the ovulatory cycle, according to age, Tanzania DHS-MIS 2022

Age	Percentage with correct knowledge of the fertile period	Number of women
15–19	15.6	3,083
20–24	23.6	2,727
25–29	26.4	2,533
30–34	25.3	2,076
35–39	24.1	1,884
40–44	24.3	1,588
45–49	20.3	1,363
Total	22.5	15,254

Note: Correct knowledge of the fertile period is defined as "halfway between two menstrual periods."

Table 7.9 Source of modern contraceptive methods

Percent distribution of users of modern contraceptive methods age 15–49 by most recent source of method, according to method, Tanzania DHS-MIS 2022

Total	74.8	73.1	78.1	65.6	76.5	3,107

Note: Table includes users of only the methods listed individually. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
na = not applicable
ADDO = accredited drug dispensing outlet
CHW/CHV = community health worker/community health volunteer
NGO = nongovernmental organisation
VCT = voluntary counselling and testing
[1] The method information index is the percentage of women who were informed about (1) side effects or problems of the method used, (2) what to do if they experienced side effects, and (3) other methods that could be used.
[2] Source at start of current episode of use

Table 7.12 Twelve-month contraceptive discontinuation rates

Among episodes of contraceptive use experienced within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, according to reason for discontinuation and specific method, Tanzania DHS-MIS 2022

Method	Method failure	Desire to become pregnant	Other fertility-related reasons[1]	Changes in menstrual bleeding	Other side effects/ health concerns	Wanted more effective method	Other method-related reasons[2]	Husband/ partner dis-approved	Other reasons[3]	Any reason[4]	Switched to another method[5]	Number of episodes of use[6]
Injectables	1.1	12.6	2.4	9.1	13.0	3.8	3.6	1.4	2.7	49.6	5.1	2,203
Implants	0.3	6.2	0.4	4.2	7.8	0.8	0.6	0.6	0.8	21.6	1.4	2,529
Pill	2.0	10.8	2.2	4.3	11.4	7.3	3.2	1.0	2.0	44.3	4.9	545
Male condom	1.3	12.1	5.0	0.0	2.3	5.8	2.3	2.3	6.3	37.3	7.5	359
Rhythm	3.9	10.2	2.0	0.7	0.3	2.2	1.1	0.5	4.5	25.4	1.2	705
Withdrawal	3.8	9.5	2.0	1.4	0.0	8.7	1.9	0.7	4.1	32.1	6.1	340
Other[7]	1.8	5.1	1.6	13.1	3.0	3.1	1.5	0.0	0.5	29.7	5.9	545
All methods	1.3	9.2	1.7	5.7	8.0	3.1	2.0	0.9	2.2	34.0	3.6	7,227

Note: Figures are based on life table calculations using information on episodes of use that occurred 3–62 months preceding the survey.
[1] Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
[2] Includes lack of access/too far, costs too much, and inconvenient to use
[3] Includes up to God/fatalistic and other reasons
[4] Reasons for discontinuation are mutually exclusive and add to the total given in this column.
[5] A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.
[6] All episodes of use that occurred within the 5 years preceding the survey are included. Episodes of use include both episodes that were discontinued during the period of observation and episodes that were not discontinued during the period of observation.
[7] Includes lactational amenorrhoea method (LAM), female sterilisation, male sterilisation, IUD, female condom, emergency contraception, and standard days method (SDM)

Table 7.13 Reasons for discontinuation

Percent distribution of discontinuations of contraceptive methods in the 5 years preceding the survey by main reason stated for discontinuation, according to specific method, Tanzania DHS-MIS 2022

Reason	IUD	Inject-ables	Implants	Pill	Male condom	Female condom	Emer-gency contra-ception	SDM	Rhythm	With-drawal	Other[1]	All methods
Became pregnant while using	0.0	2.5	1.6	4.6	4.5	*	*	*	16.9	21.2	8.6	4.8
Wanted to become pregnant	43.5	35.8	36.9	37.6	33.8	*	*	*	45.2	33.5	20.9	36.4
Husband/partner disapproved	2.1	1.9	1.6	2.0	5.5	*	*	*	1.2	3.2	0.0	1.9

Highest	10.3	4.6	15.0	33.1	13.8	46.9	43.5	18.4	61.9	2,090	75.8	54.4
Total	15.6	5.4	21.0	26.6	11.0	37.6	42.2	16.4	58.6	9,252	64.2	53.1

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al. 2012.
[1] Total demand is the sum of unmet need and met need.
[2] Percentage of demand satisfied is met need divided by total demand.
[3] Modern methods include female sterilisation, male sterilisation, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, standard days method (SDM), lactational amenorrhoea method (LAM), and other modern methods.

Table 7.14.2 Need and demand for family planning among all women and among sexually active unmarried women

Percentage of all women and sexually active unmarried women age 15–49 with unmet need for family planning, percentage with met need for family planning, total demand for family planning, percentage of the demand for family planning that is satisfied, and percentage of the demand for family planning that is satisfied by modern methods, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Unmet need for family planning			Met need for family planning (currently using)			Total demand for family planning[1]			Number of women	Percentage of demand satisfied[2]	Percentage of demand satisfied by modern methods[3]

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al. 2012. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
[1] Total demand is the sum of unmet need and met need.
[2] Percentage of demand satisfied is met need divided by total demand.
[3] Modern methods include female sterilisation, male sterilisation, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, standard days method (SDM), lactational amenorrhoea method (LAM), and other modern methods.
[4] Women who have had sexual intercourse within 30 days preceding the survey

Table 7.15 Decision making about family planning

Percent distribution of currently married women by person who usually makes the decision to use or not use family planning, Tanzania DHS-MIS 2022

Decision maker	Percentage
Mainly wife	30.7
Wife and husband/partner jointly	54.1
Wife's opinion more important	7.5
Wife's and husband's/partner's opinion equally important	44.7
Wife's opinion less important than husband's/partner's	1.8
Mainly husband	14.1
Someone else/other	1.1
Total	100.0
Number of currently married women	9,252

Table 7.16 Decision making about family planning by background characteristics

Percent distribution of currently married women age 15–49 by person who usually makes the decision to use or not use family planning and percentage who participate in the decision to use or not use family planning, according to background characteristics, Tanzania DHS-MIS 2022

INFANT AND CHILD MORTALITY 8

Key Findings

- ***Current levels:*** In the 5 years preceding the survey, the infant mortality rate was 33 deaths per 1,000 live births, and the under-5 mortality rate was 43 deaths per 1,000 live births. This means that 1 in 23 children in Tanzania die before their fifth birthday. During the same period, neonatal mortality was 24 deaths per 1,000 live births.
- ***Trends in infant and child mortality:*** Under-5 mortality decreased from 67 to 43 deaths per 1,000 live births between the 2015–16 TDHS-MIS and the 2022 TDHS-MIS. Over the same period, infant mortality declined from 43 to 33 deaths per 1,000 live births, while neonatal mortality remained basically unchanged.
- ***Risk factors:*** Infant and under-5 mortality rates are highest among children with birth intervals of less than 2 years (45 and 65 deaths per 1,000 live births, respectively).
- ***Perinatal mortality:*** The perinatal mortality rate in Tanzania is 38 deaths per 1,000 pregnancies of 28 or more weeks' duration.

Information on infant and child mortality is relevant to a demographic assessment of a country's population and is an important indicator of the country's socioeconomic development and people's quality of life. It can also help identify children who may be at higher risk of death and lead to strategies to reduce this risk, such as promoting birth spacing.

This chapter presents information on levels, trends, and differentials in perinatal, neonatal, postneonatal, infant, child, and under-5 mortality rates. It also examines biodemographic factors and fertility behaviours that increase mortality risks for infants and children. The information was collected as part of a retrospective pregnancy history in which female respondents listed all of the children to whom they had given birth, along with each child's date of birth, survivorship status, and current age or age at death.

The quality of mortality estimates calculated from pregnancy histories depends on the mother's ability to recall the dates of birth of all children she has given birth to and the dates and ages at death for any children who have died. The paragraphs below summarize some potential causes of data quality problems and the extent to which these appear to affect the 2022 TDHS-MIS data:

- Displacement of birth dates can distort mortality trends. This problem can occur if an interviewer knowingly records a birth as occurring in a different year than the one in which it occurred. This may happen if an interviewer is trying to cut down on his or her overall workload, because live births occurring during the 3 years before the interview are the subject of a lengthy set of additional questions. The distribution of the number of births captured in the 2022 TDHS-MIS birth history data according to year preceding the survey shows no sign of displacement of birth dates that would affect the mortality estimates (Appendix C, **Table C.5**).
- Selective omission from pregnancy histories of those births that did not survive can result in underestimation of childhood mortality. Child deaths that occur very early in life are the most likely to

be omitted. One way of looking for evidence of omission is to compare the ratio of neonatal deaths to all infant deaths before the survey and to compare the ratio of early neonatal deaths (deaths in the first week of life) to all neonatal deaths to see if these measures fall within expected ranges. It is expected that, as mortality levels decline, about two-thirds of infant deaths are neonatal and two-thirds of neonatal deaths are early neonatal. Early neonatal deaths do not appear to be underreported in the 2022 TDHS-MIS; the ratio of early neonatal deaths to all neonatal deaths is 81% in the period 0–4 years prior to the survey (Appendix C, **Table C.6.1**). Likewise, the ratio of neonatal to infant deaths is 75% in the period 0–4 years prior to the survey (Appendix C, **Table C.6.2**).

- Misreporting the child's age at death may distort the age pattern of mortality, especially if the net effect of the age misreporting is to transfer deaths from one age bracket to another. For example, heaping of age at death on 12 months can result in an underestimation of infant mortality and an overestimation of child mortality. To minimize errors in reporting of age at death, interviewers were instructed to record age at death in days if the death took place in the month following the birth, in months if the child died before age 2, and in years if the child was at least age 2. Interviewers were also asked to probe for deaths reported at 1 year to determine a more precise age at death in terms of months. Despite the emphasis during interviewer training and fieldwork monitoring on probing for accurate age at death, the distribution of age at death for children who died under age 2 shows that there is some heaping on 12 months, with corresponding deficits in adjacent months. Appendix C, **Table C.6.2** shows that, for the 20 years preceding the survey, there are 71 deaths reported at 12 months compared with 23 deaths at 11 months and 12 deaths at 13 months. Heaping on 12 months is less severe for the 5 years preceding the survey. However, this would have little effect on the infant and child mortality rate.

- Any method of measuring childhood mortality that relies on mothers' reports (for example, birth histories) assumes that female adult mortality is not high or, if it is high, that there is little or no correlation between the mortality risks of mothers and those of their children.

8.1 Infant and Child Mortality

Neonatal mortality: The probability of dying within the first month of life.

Postneonatal mortality: The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality).

Infant mortality: The probability of dying between birth and the first birthday.

Child mortality: The probability of dying between the first and the fifth birthday.

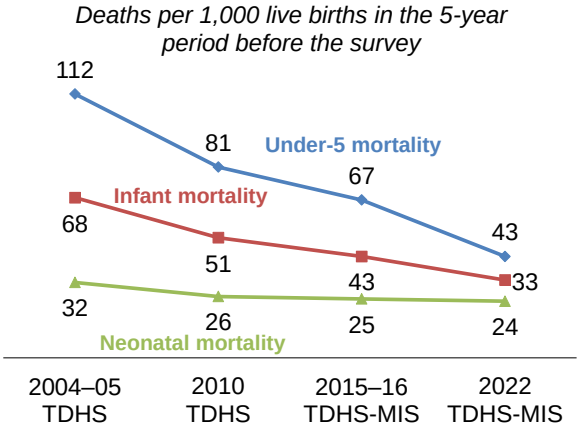
Under-5 mortality: The probability of dying between birth and the fifth birthday.

The Tanzania Health Sector Strategic Plan V (July 2021–June 2026) (MoHCDGEC 2021a) and the National Plan for Reproductive, Maternal, Newborn, Child and Adolescent Health and Nutrition (2021/2022–2025/2026) One Plan III (MoHCDGEC 2021b) have set a goal of reducing the neonatal mortality rate to less than 12 deaths per 1,000 live births and the under-5 mortality to less than 25 deaths per 1,000 live births by 2030.

During the 5 years preceding the survey, the neonatal mortality rate was 24 deaths per 1,000 live births, the infant mortality rate was 33 deaths per 1,000 live births, and the under-5 mortality rate was 43 deaths per 1,000 live births (**Table 8.1**). Neonatal deaths account for 73% of infant deaths.

Trends: Under-5 mortality rate declined from 112 deaths per 1,000 live births in the 5 years preceding the 2004–05 TDHS to 43 deaths per 1,000 live births in the 5 years preceding the 2022 TDHS-MIS (**Figure 8.1**). Over the same period, the infant mortality rate declined from 68 to 33 deaths per 1,000 live births and the neonatal mortality rate declined from 32 to 24 deaths per 1,000 live births.

Figure 8.1 **Trends in early childhood mortality rates**



Patterns by sex and residence

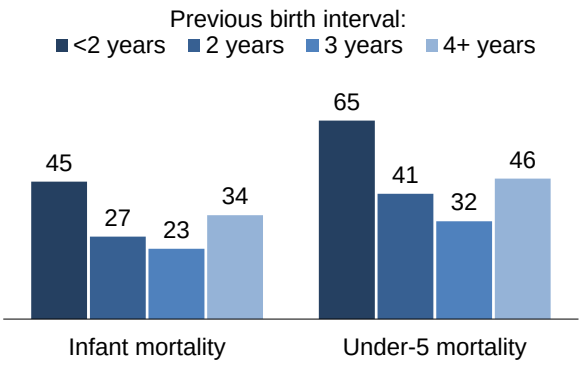
- Overall, mortality is higher among boys than girls, as in all previous surveys in Tanzania. The under-5 mortality rate is 52 deaths per 1,000 live births among boys and 34 deaths per 1,000 live births among girls (**Table 8.2**).
- Urban areas are expected to have lower early childhood mortality than rural areas due to better education, living conditions, and access to health facilities with well-trained providers. Contrary to that expectation, neonatal, infant, and under-5 mortality rates are higher among children in urban areas than among those in rural areas. For example, the under-5 mortality rate is 49 deaths per 1,000 live births in urban areas and 41 deaths per 1,000 live births in rural areas. This is similar to findings from the 2010 TDHS and the 2015–16 TDHS-MIS. Possible explanations include that mortality rates may be underreported in rural areas and that urban mortality rates may be influenced by higher mortality in peri-urban areas.

Tables 8.3.1 and **8.3.2** present mortality estimates for the 10-year period preceding the survey by additional background characteristics. A 10-year period was used to increase the reliability of the estimates calculated.

Patterns by additional background characteristics

- Neonatal and infant mortality rates are higher among children born to young mothers (under age 20) and older mothers (age 40–49) (**Table 8.3.1**).
- The under-5 mortality rate is higher among first order births (51 deaths per 1,000 live births) and seventh- and higher-order births (57 deaths per 1,000 live births). Similar patterns are observed for postneonatal and infant mortality rates. The neonatal mortality rate is highest among first-order births (32 deaths per 1,000 live births).
- Infant and under-5 mortality rates are highest among children born less than 2 years after the preceding birth (45 and 65 deaths per 1,000 live births, respectively) (**Figure 8.2**).
- The neonatal mortality rate increases with increasing household wealth, from 13 deaths per 1,000 live births in the lowest wealth quintile to 31 deaths per 1,000 live births in the highest quintile. Similarly, infant mortality rises from 24 deaths per 1,000 live births in the lowest quintile to 44 deaths per 1,000 live births in the highest quintile (**Table 8.3.1**).

Figure 8.2 **Childhood mortality by previous birth interval**



- Neonatal and infant mortality rates are higher in Zanzibar than in Tanzania Mainland. The opposite pattern is observed for postneonatal and child mortality (**Table 8.3.2**).

- Across zones, the under-5 mortality rate ranges from 26 deaths per 1,000 live births in the Central zone to 68 deaths per 1,000 live births in the Southern Highlands zone.

8.2 Perinatal Mortality

Perinatal mortality rate

Perinatal deaths comprise stillbirths (pregnancy losses occurring after 28 weeks of gestation) and early neonatal deaths (deaths of live births within the first 7 days of life). The perinatal mortality rate is calculated as the number of perinatal deaths per 1,000 pregnancies of 28 or more weeks duration.

Sample: Number of pregnancies of 28 or more weeks' duration among women age 15–49 in the 5 years before the survey

In 2014 the Every Newborn Action Plan, a global multipartner movement to end preventable maternal and newborn deaths and stillbirths, set a target for national stillbirth rates of 12 or fewer stillbirths per 1,000 births in all countries by 2030 (WHO and UNICEF 2014). Tanzania has adopted the target in its key policy documents.

It can be difficult to correctly classify stillbirths and early neonatal deaths. When misclassification occurs, studies have shown that it is more likely for early neonatal deaths to be misclassified as stillbirths than for stillbirths to be misclassified as neonatal deaths; as a result, examining just early neonatal deaths can underestimate the true level of mortality around the time of delivery (Peven et al. 2021). The perinatal mortality rate encompasses both stillbirths and early neonatal deaths, thus offering a better measure of the level of mortality around delivery. In the 2022 TDHS-MIS, 203 stillbirths were recorded, equivalent to a rate of 18 stillbirths per 1,000 pregnancies of 28 or more weeks' duration. Meanwhile, there were 215 early neonatal deaths during the 5-year period preceding the survey, with a rate of 20 early neonatal deaths per 1,000 live births. This yields a perinatal mortality rate of 38 deaths per 1,000 pregnancies of 28 or more weeks duration (**Table 8.4**).

Patterns by background characteristics

- The perinatal mortality rate is higher in Zanzibar than in Tanzania Mainland (45 deaths versus 37 deaths per 1,000 pregnancies) (**Table 8.4**).

- The perinatal mortality rate is higher in urban than in rural areas (49 deaths versus 33 deaths per 1,000 pregnancies).

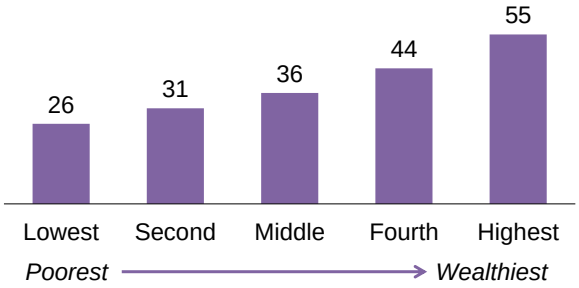
- The perinatal mortality rate is highest in the Eastern zone and lowest in the Southern zone (68 versus 20 deaths per 1,000 pregnancies).

- Perinatal mortality is highest among children whose mothers were age 40–49 at the time of the birth (56 deaths per 1,000 pregnancies) and for first pregnancies (55 deaths per 1,000 pregnancies).

- The perinatal mortality rate increases as wealth increases, from 26 deaths per 1,000 pregnancies among women in the lowest wealth quintile to 55 deaths per 1,000 pregnancies among women in the highest quintile (**Figure 8.3**).

Figure 8.3 **Perinatal mortality by wealth**

Deaths per 1,000 pregnancies of 28 or more weeks' duration in the 5-year period before the survey



8.3 High-Risk Fertility Behaviours

The survival of infants and children depends in part on the demographic and biological characteristics of their mothers. Typically, the probability of dying in infancy is much greater among children born to mothers who are too young (under age 18) or too old (over age 34), children born after a short birth interval (less than 24 months after the preceding birth), and children born to mothers of high parity (more than three children). **Table 8.5** shows the percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality (along with risk ratios) and the percent distribution of currently married women by their category of risk if they were to conceive a child at the time of the survey.

Overall, 52% of births in the 5 years prior to the survey were in any avoidable high-risk category. Twenty percent of births were in more than one high-risk category. The most common individual high-risk categories were birth order greater than three (38%) and mother's age more than 34 years (16%).

The risk ratio denotes the relationship between risk factors and mortality. For example, the risk of dying for a child who falls into any of the avoidable high-risk categories is 1.10 times higher than that for a child not in any high-risk category. Among births in a single high-risk category, the risk ratio is highest for births to mothers less than age 18; children born to mothers less than age 18 are 1.49 times more likely to die than those not in any risk category.

Among births in multiple high-risk categories, the risk of dying is highest for births to mothers above age 34, with a birth interval of less than 24 months, and with a birth order greater than three. Children born to mothers in all three of these risk categories are 3.87 times more likely to die than those born to mothers who are not in any high-risk category.

Seventy-two percent of currently married women would have been in an avoidable high-risk category if they had conceived at the time of the survey; 30% would have been in a single avoidable high-risk category, and 43% would have been in multiple avoidable high-risk categories (**Table 8.5**).

List of Tables

For more information on infant and child mortality, see the following tables:

- **Table 8.1 Early childhood mortality rates**
- **Table 8.2 Five-year early childhood mortality rates according to background characteristics**

Total	203	215	18	20	38	11,088	0.9

Note: Respondents may choose to report the duration of their pregnancy in either weeks or months.
[1] Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months.
[2] Early neonatal deaths are deaths at age 0–6 days among live-born children.
[3] The number of stillbirths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000
[4] The number of early neonatal deaths divided by the number of live births, expressed per 1,000
[5] The sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000
[6] Includes pregnancies lasting 7 or more months when duration of pregnancy is reported in months
[7] Pregnancy interval categories correspond to birth interval categories of <24 months, 24–35 months, 36–47 months, and 48+ months assuming a pregnancy duration of 9 months.

Table 8.5 High-risk fertility behaviour

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Tanzania DHS-MIS 2022

Risk category	Births in the 5 years preceding the survey		Percentage of currently married women[1]
	Percentage of births	Risk ratio	
Not in any high-risk category	30.3	1.00	22.8[a]

Birth interval <24 months	13.0	1.53	24.6
Birth order >3	38.2	1.07	56.7
Number of births/women	10,884	na	9,252

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. Ratios in parentheses are based on 25–49 unweighted births. An asterisk indicates that a ratio is based on fewer than 25 unweighted births and has been suppressed.
na = not applicable
[1] Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or older than 34 years and 2 months, latest birth less than 15 months ago, or latest birth being of order 3 or higher.
[2] Includes the category age <18 and birth order >3
[a] Includes sterilised women

MATERNAL AND NEWBORN HEALTH CARE 9

Key Findings

- ***Antenatal care coverage:*** Nine in 10 women who gave birth in the 2 years before the survey received antenatal care (ANC) from a skilled provider during their most recent live birth.
- ***Timing and number of ANC visits:*** 34% of pregnant women started antenatal care during the first 3 months, and 65% had four or more ANC visits as recommended.
- ***Components of antenatal care:*** Among women who received ANC for their most recent pregnancy, more than 90% had a blood sample taken and the baby's heartbeat checked, 76% had their blood pressure measured, and 60%–70% had a urine sample collected, were counselled about their diet, were counselled about breastfeeding, and were asked about vaginal bleeding.
- ***Delivery care services:*** 81% of live births and 93% of stillbirths in the 2 years prior to the survey were delivered in health facilities. Eighty-five percent of live births and 96% of stillbirths were assisted by health professionals.
- ***Postnatal checks:*** Roughly half of mothers (51%) and newborns (54%) received a postnatal check within 2 days after delivery.
- ***Breast and cervical cancer screening:*** Among women age 15–49, coverage of screening tests for breast and cervical cancers is low (5% and 7%, respectively).

Maternal health refers to the health of women during pregnancy, childbirth, and the postpartum period. Health care services during pregnancy and childbirth and after delivery are important for the well-being and survival of both the mother and the infant. Antenatal care (ANC) can reduce health risks for mothers and infants though monitoring of pregnancies and screening for complications to enable timely interventions. Delivery at a health facility, with skilled medical attention and hygienic conditions, reduces the risk of complications and infections during labour and delivery and improves birth outcomes. Timely postnatal care can lead to diagnosis and treatment of any complications arising from delivery and offers an opportunity to counsel the mother on how to care for herself and her newborn.

Government policies and programs place a high priority on improving maternal health care and reducing maternal deaths. Tanzania Vision 2025 cites "access to quality reproductive health services for all individuals and reduction in infant and maternal mortality" as among the most important health service goals. The national post-MDG agenda seeks to improve maternal, newborn, and child health as one of its major objectives. The Primary Health Service Development Programme (PHSDP/MMAM 2007–2017) (MoHSW 2007) addresses the crucial issue of equity by calling for increased coverage and quality of primary health care services, including maternal health services for communities in rural and remote areas. The Health Sector Strategic Plan V 2021–2026 (HSSP V) (MoHCDGEC 2021a) also addresses the importance of reducing maternal and child morbidity and mortality.

This chapter provides information on maternal and newborn health care. The first part focuses on antenatal care, including the number and timing of ANC visits, ANC providers, and various components of care. The second part presents information on delivery services such as place of delivery, assistance during delivery, and caesarean deliveries. The third section focuses on postnatal care and provides information on postnatal health checks for mothers and newborns and men's involvement in maternal health care. The final section covers issues that affect women's health regardless of their maternal status: whether or not women have been examined for breast or cervical cancer, problems they experience accessing health facilities, and the distance from their home to the nearest health facility.

9.1 Antenatal Care Coverage and Content

9.1.1 Skilled Providers

Antenatal care (ANC) from a skilled provider

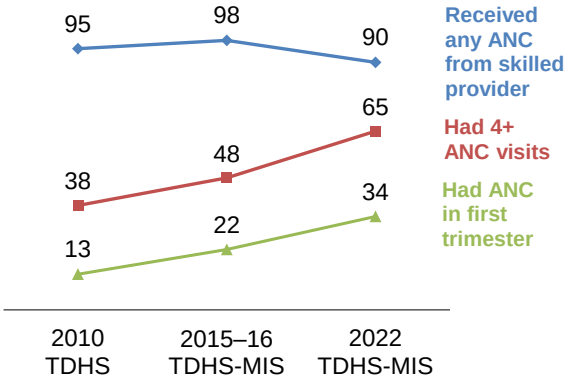
Pregnancy care received from skilled providers, such as doctors/assistant medical officers (AMOs), clinical officers, assistant clinical officers, nurses/midwives/public health nurses B (PHNBs), assistant nurses, and maternal and child health (MCH) aides. ***Sample:*** Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Ninety percent of women age 15–49 who had a live birth in the 2 years preceding the survey received ANC from a skilled provider for their most recent birth (**Table 9.1**). The majority of women (65%) received ANC from nurses/midwives/PHNBs. Coverage of ANC is similar for women with stillbirths.

Trends: The percentage of women with a live birth in the 2 years preceding the survey who received ANC from a skilled provider for the most recent live birth increased from 95% in the 2010 TDHS to 98% in the 2015–16 TDHS and then decreased to 90% in the 2022 THDS-MIS (**Figure 9.1**).

Figure 9.1 **Trends in antenatal care coverage**

Percentage of women age 15–49 who had a live birth in the 2 years before the survey (for the most recent birth)



Patterns by background characteristics

- A higher percentage of women in urban areas (18%) than rural areas (4%) received ANC from doctors or AMOs. Dar es Salaam (52%), Morogoro (28%), and Kaskazini Pemba (18%) had the highest percentages of women who received ANC from doctors or AMOs.
- The percentage of women who received ANC from skilled providers generally increases with increasing education and wealth.
- By region, the percentage of women who received ANC from a skilled provider ranges from 65% in Njombe to 100% in Kagera, Kusini Unguja, and Kaskazini Pemba (**Table 9.1**).

9.1.2 Timing and Number of Antenatal Care Visits

Antenatal care is most effective in improving maternal health and pregnancy outcomes when it is sought early in pregnancy and continues through to delivery. The World Health Organization (WHO) recommends that pregnant women without complications have at least four antenatal care visits and that the first visit occur during the first trimester of pregnancy.

Sixty-five percent of women had at least four ANC visits during their last pregnancy resulting in a live birth in the 2 years preceding the survey. However, only 34% of women started ANC within the first 3 months of pregnancy, and 6% did not seek ANC until the seventh month or later. The median gestational age at the first ANC visit is 4.5 months (**Table 9.2**).

Sixty percent of women who had a stillbirth in the 2 years preceding the survey had four or more ANC visits for their most recent stillbirth, and 40% made their first ANC visit within the first 3 months of pregnancy.

Trends: The percentage of women who had the recommended four or more ANC visits increased from 38% in the 2010 TDHS to 48% in the 2015–16 TDHS-MIS and 65% in the 2022 TDHS-MIS. The percentage of women who sought ANC during the first trimester also increased, from 13% in the 2010 TDHS to 22% in the 2015–16 TDHS-MIS and 34% in the 2022 THIS-MIS (**Figure 9.1**).

Patterns by background characteristics

- A higher percentage of urban women (76%) than rural women (61%) had four or more ANC visits. Similarly, a slightly higher percentage of urban women than rural women sought ANC within the first trimester (40% versus 32%) (**Table 9.2**).
- By region, the percentage of women with four or more ANC visits ranges from 36% in Simiyu to 90% in Dar es Salaam, while the percentage who sought ANC during the first trimester ranges from 10% in Katavi to 58% in Iringa and Mtwara.

9.2 Components of Antenatal Care

Components of antenatal care

Specific antenatal care services performed by a health care provider include measuring blood pressure, taking a urine sample, taking a blood sample, listening for the baby's heartbeat, counselling about the mother's diet, counselling about breastfeeding, and asking about vaginal bleeding.

Sample – quality of care indicator: Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey and had at least one ANC visit

Sample – population-based indicator: All women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

The ability for antenatal care to act as an effective intervention for identifying issues occurring during pregnancy that could adversely affect pregnancy outcomes is dictated in large part by the components of ANC services offered by the health care provider. As a part of ANC, certain interventions and tests are recommended. These include the following:

- Measuring blood pressure. Taking a woman's blood pressure at each antenatal care visit is essential to monitor for gestational hypertension or preeclampsia.
- Conducting urine and blood tests. These tests assess signs of infection or other diseases and conditions that could negatively affect a woman or her baby during or after pregnancy.
- Listening to the baby's heartbeat. This can confirm that the foetus is alive as well as reassure the mother.
- Counselling on maternal nutrition, specifically on healthy eating during pregnancy and breastfeeding. These counselling messages promote healthy weight gain during pregnancy and can help the pregnant woman breastfeed her newborn early.

- Asking about vaginal bleeding. Light bleeding or spotting is common, especially during the first few months of a pregnancy. Heavy bleeding may be a sign of something more serious.

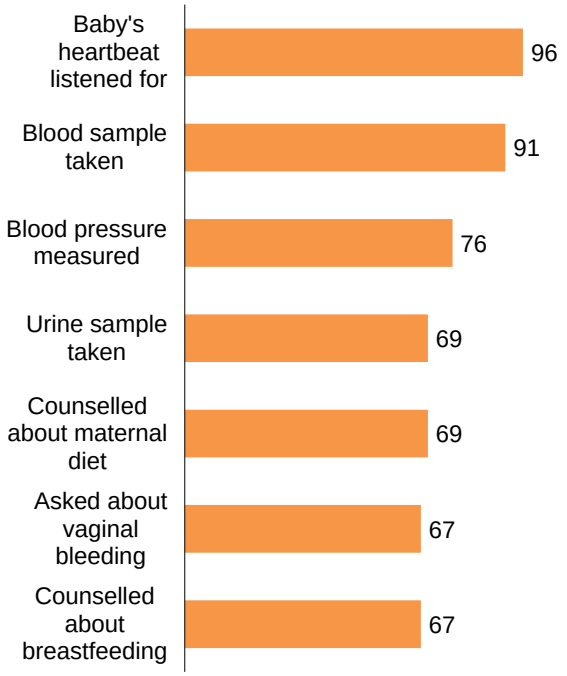
In the 2022 TDHS-MIS, data collected on components of ANC were tabulated in two ways. **Table 9.3.1** shows the percentage of women who received specified ANC services among those who reported that they had at least one ANC visit. This tabulation is a measure of the quality of the ANC services these women received. **Table 9.3.2** shows the percentage of all women who gave birth in the 2 years preceding the survey and received specified ANC services, regardless of whether they reported an ANC visit; this tabulation is a measure of coverage of these key ANC interventions among the population of women in need of them.

Among women age 15–49 who received ANC for their most recent live birth, three quarters (76%) had their blood pressure measured, 91% had a blood sample taken, 69% had a urine sample taken, and almost all had their baby's heartbeat checked (96%). Approximately two-thirds of women received counselling on their diet (69%) and breastfeeding (67%) and were asked about vaginal bleeding (67%) (**Table 9.3.1** and **Figure 9.2**). Among women who had a stillbirth and received ANC, 87% had their blood pressure measured, 92% had a blood sample taken, 85% had a urine sample taken, 94% had their baby's heartbeat checked, 71% received counselling on their diet, 50% received counselling on breastfeeding, and 73% were asked about vaginal bleeding.

Trends: Among women who received ANC for their most recent live birth in the 2 years before the survey, the percentage who had their blood pressure measured increased slightly from 69% in the 2015–16 TDHS-MIS to 76% in the 2022 TDHS-MIS. Over the same period, the proportion who had a urine sample taken increased from 59% to 69%.

***Figure 9.2* Components of antenatal care**

Among women who received ANC for their most recent live birth, the percentage with selected services



9.2.1 Deworming and Iron Supplementation during Pregnancy

During pregnancy, women have higher micronutrient needs and are at risk of micronutrient deficiencies, including iron deficiency, which is a primary cause of anaemia. Severe anaemia can place the mother and the baby in danger through an increased risk of blood loss during labour and an increased risk of preterm delivery, low birth weight, and perinatal mortality (Haider et al. 2013). To help address maternal anaemia, iron tablets or syrup are provided to pregnant women (WHO 2016c). The 2022 TDHS-MIS findings show that 62% of women age 15–49 with a live birth in the 2 years preceding the survey took deworming medication during their most recent pregnancy resulting in a live birth, while 81% took iron-containing supplements or syrup (**Table 9.4**). Coverage of deworming medication is slightly higher among pregnancies ending in stillbirths (69%), whereas coverage of iron supplementation is similar among live births and stillbirths.

9.2.2 Source of Iron-containing Supplements

Information on sources of iron-containing supplements increases understanding of the availability and distribution patterns of the supplements.

Among women age 15–49 with a live birth in the 2 years preceding the survey who took some form of iron supplementation during their most recent pregnancy, 90% obtained the iron supplements from the public sector and 5% from religious/voluntary organisations. Three quarters (75%) of pregnant women obtained iron supplements from dispensaries and health centres (**Table 9.5**). In pregnancies ending in stillbirths, mothers were somewhat less likely to obtain their iron supplements from the public sector (72%) and somewhat more likely to obtain them from religious/voluntary organisations (9%), the private medical sector (12%), and other private sector sources (10%).

9.3 Protection against Neonatal Tetanus

Protection against neonatal tetanus

Protection of a baby from neonatal tetanus depends on the mother's tetanus toxoid vaccination status. A birth is protected against neonatal tetanus if the mother has received any of the following:

- Two tetanus toxoid injections during the pregnancy
- Two or more injections, the last one within 3 years of the birth
- Three or more injections, the last one within 5 years of the birth
- Four or more injections, the last one within 10 years of the birth
- Five or more injections at any time prior to the birth

Sample: Women age 15–49 with a live birth in the 2 years before the survey

Tetanus toxoid injections are given during pregnancy to prevent neonatal tetanus, one of the major causes of early infant death in many countries. Neonatal tetanus is often caused by failure to observe hygienic procedures during delivery. More than half (57%) of women age 15–49 with a live birth in the 2 years preceding the survey received two or more tetanus toxoid injections for their most recent live birth. Overall, 85% of women's most recent live births were protected against neonatal tetanus (**Table 9.6**).

Trends: The percentage of women whose last birth in the 2 years preceding the survey was protected against neonatal tetanus has decreased slightly since the 2015–16 TDHS, from 87% to 85%. However, the percentage of women receiving two or more tetanus toxoid injections during their last pregnancy has increased from 51% to 57%.

Patterns by background characteristics

- Sixth- or higher-order births are more likely to be fully protected against tetanus than first-order births (87% versus 73%) (**Table 9.6**). Births to mothers under age 20 are less likely to be protected against neonatal tetanus than births to mothers age 35–49 (74% versus 90%). The percentage of women receiving two or more tetanus toxoid injections during pregnancy is much lower in rural areas than in urban areas (54% versus 66%).

- The percentage of women whose last birth was protected against neonatal tetanus and the percentage who received two or more tetanus toxoid injections during pregnancy generally increase with increasing education and wealth. The percentage of women whose last birth was protected against neonatal tetanus ranges from 72% in Tabora and Katavi to 96% in Kusini Unguja.

9.4 Delivery Services

9.4.1 Institutional Deliveries

Institutional deliveries

Deliveries that occur in health facilities.

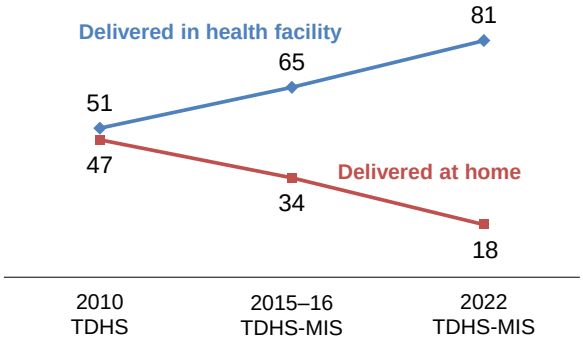
Sample: All live births and/or stillbirths in the 2 years before the survey

One way to expand timely access to key interventions needed to prevent and treat obstetric and newborn complications is to increase the percentage of births that occur in health facilities. Therefore, the percentage of births that take place in health facilities is an important indicator of maternal and newborn health. More than 8 in 10 live births and more than 9 in 10 stillbirths in the 2 years preceding the survey took place in health facilities. Three quarters of live births took place in a government health facility, 4% in a religious/voluntary sector health facility, and 2% in a private medical sector health facility. Among stillbirths, 80% took place in a government facility, 9% in a religious/voluntary sector facility, and 5% in a private medical sector facility (**Table 9.7**).

Trends: Facility deliveries in Tanzania have increased substantially over time, from 51% in the 2010 TDHS to 81% in the 2022 TDHS-MIS (**Figure 9.3**).

Figure 9.3 **Trends in place of birth**

Percentage of live births in the 2 years before the survey

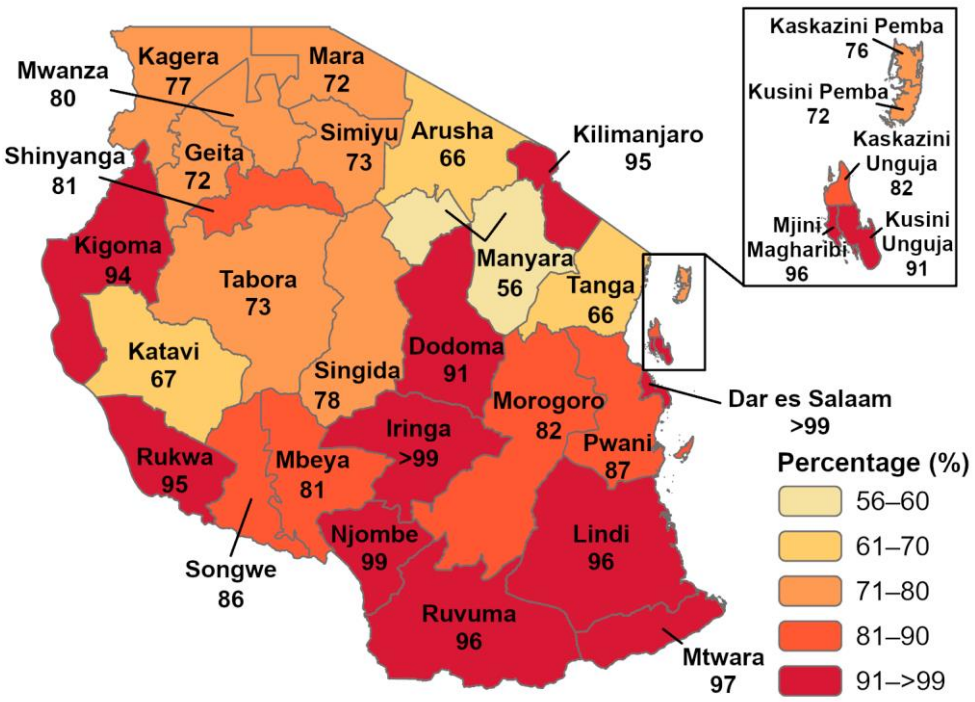


Patterns by background characteristics

- The percentage of live births delivered in a health facility decreases with birth order, from 91% among first-order births to 66% among sixth- or higher-order births (**Table 9.7**).
- A higher percentage of births in urban areas (94%) than rural areas (76%) occur in health facilities.
- As expected, the percentage of births that occur in a health facility increases with increasing mother's education (from 66% of births to mothers with no education to 94% of births to mothers with a secondary education or higher) and household wealth (from 64% of births to mothers in the lowest wealth quintile to 97% of births to mothers in the highest quintile).
- The percentage of live births occurring in a health facility increases with number of ANC visits, from 77% of births to women with no visits to 86% of births to women with four or more visits. Within Zanzibar, Unguja has a higher percentage of institutional deliveries (92%) than Pemba (74%).
- The proportion of births occurring in a health facility varies widely by zone and region, ranging from 72% in Northern to 98% in Southern Highlands and from 56% in Manyara to 100% in Dar es Salaam and Iringa. In Zanzibar, the percentage of facility deliveries is highest in Mjini Magharibi (96%) and lowest in Kusini Pemba (72%) (**Map 9.1**).

Map 9.1 Health facility births by region

Percentage of live births in the 2 years before the survey that were delivered in a health facility



9.4.2 Delivery by Caesarean

Caesarean section, also known as C-section, is a surgical intervention to prevent or treat life-threatening maternal or perinatal complications. Appropriate use of caesarean sections reduces maternal and neonatal morbidity and mortality and complications such as obstetric fistula. However, WHO advises that caesarean sections be done only when medically necessary. Use of caesarean sections without medical need can put women at risk of short- and long-term health problems. WHO does not recommend a target rate for caesarean deliveries; however, research conducted by WHO has shown that caesarean section rates above 10% are not associated with reductions in maternal and newborn mortality rates (WHO 2015). Eleven percent of live births and 39% of stillbirths in the 2 years preceding the 2022 TDHS-MIS were delivered via caesarean section (**Table 9.8**).

Trends: The percentage of live births in the 2 years preceding the survey delivered via caesarean section increased from 7% in the 2015–16 TDHS-MIS to 11% in the 2022 TDHS-MIS.

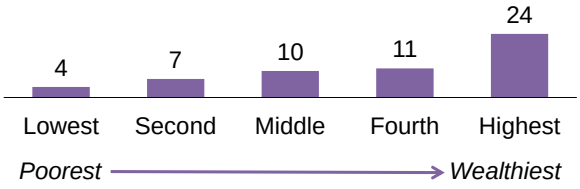
Patterns by background characteristics

- The percentage of live births delivered via C-section decreases with birth order, from 17% among first-order births to 6% among sixth- or higher-order births (**Table 9.8**). Caesarean deliveries are more common in urban than in rural areas (19% and 8%, respectively).
- The percentage of live births delivered via C-section is highest in private medical sector health facilities (30%), followed by religious/voluntary facilities (28%). Public sector facilities have the lowest percentage of live births delivered via C-section (12%).

- By region, the percentage of live births delivered via C-section is highest in Njombe (33%), Kilimanjaro (30%), and Dar es Salaam (26%) and lowest in Simiyu and Geita (2% each).
- Four percent of live births to women with no education are delivered via C-section, as compared with 20% of live births to women with a secondary education or higher.
- The percentage of live births delivered via C-section is six times higher in the highest wealth quintile than in the lowest wealth quintile (24% versus 4%) (**Figure 9.4**).

***Figure 9.4* Caesarean sections by household wealth**

Percentage of live births in the 2 years before the survey that were delivered by caesarean section



9.4.3 Skilled Assistance during Delivery

Skilled assistance during delivery

Births delivered with the assistance of doctors/assistant medical officers (AMOs), clinical officers, assistant clinical officers, nurses/midwives, assistant nurses, and maternal and child health (MCH) aides.

Sample: All live births and/or stillbirths in the 2 years before the survey

Obstetric care from a health professional during delivery is recognised as a critical element in managing complications that may arise during childbirth and hence reducing maternal and neonatal mortality. In the 2 years preceding the survey, 85% of live births were delivered by a skilled provider. Fifty-eight percent of births were delivered by nurses and midwives, while 11% were delivered by doctors or AMOs, 7% by clinical officers or assistance clinical officers, and 8% by assistant nurses (**Table 9.9**). Five percent of births were assisted by a traditional birth attendant and 7% by a relative or friend.

The pattern of delivery assistance differs between live births and stillbirths. A higher percentage of stillbirths than live births were delivered by skilled attendants (96% versus 85%), and a higher percentage were delivered by the most skilled cadres—doctors and AMOs (33% versus 11%). Fifty-five percent of infants born in the 2 years preceding the survey had skin-to-skin contact with their mother immediately after birth.

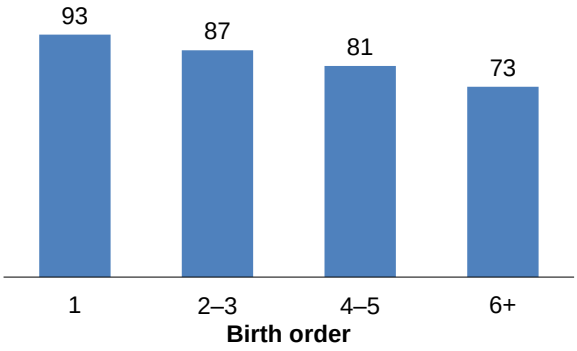
Trends: The percentage of live births with skilled assistance during delivery increased from 66% in the 2015–16 TDHS to 85% in the 2022 TDHS MIS.

Patterns by background characteristics

- The percentage of live births attended by a skilled provider decreases with increasing birth order, from 93% among first-order births to 73% among sixth- or higher-order births (**Table 9.9** and **Figure 9.5**).
- Births to mothers with four or more antenatal care visits are more likely to be assisted by a skilled provider than births to mothers with no visits (90% and 80%, respectively).
- The percentage of live births delivered by a skilled provider is higher in urban areas (96%) than in rural areas (81%).
- In Zanzibar, the percentage of deliveries assisted by skilled providers is higher in Unguja (94%) than in Pemba (78%). The percentage of live births assisted by a skilled provider varies by zone, from 79% in Northern and 80% in Lake to 99% in Southern Highlands and 98% in Southern.

Figure 9.5 **Skilled assistance at delivery by birth order**

Percentage of live births in the 2 years before the survey that were delivered by a skilled provider



- The percentage of live births assisted by skilled providers is highest in Kilimanjaro and Dar es Salaam (100% each) and lowest in Manyara (61%) and Arusha (67%).
- The percentage of births assisted by a skilled provider increases with increasing mother's education and household wealth.

9.4.4 Birth Companion

A birth companion is a support person whom a woman may choose to be with her during labour or delivery. This might be the woman's husband or partner, or it could be another family member or friend of her choosing. Women who gave birth in a health facility in the 2 years preceding the survey were asked if they had their partner or another close person with them during labour and delivery. Eighty percent of women who had a live birth in a health facility in the last 2 years said they had a birth companion with them for their most recent live birth, as compared with 82% of women who had a stillbirth. The percentage of women who had a birth companion is higher in Tanzania Mainland (81%) than in Zanzibar (57%) (**Table 9.10**). For information on male involvement in reproductive health, including whether or not a woman's husband or partner escorted her to the place where she gave birth, see section 9.6.

9.4.5 Respectful Care and Nondignified Treatment in Health Facilities

Respectful care during delivery is an essential indicator of maternal health care quality. When women are treated with respect and dignity during childbirth, they are likely to have positive birth experiences, feel empowered to make informed decisions about their care, and have better health outcomes for themselves and their newborns. In the 2022 TDHS-MIS, women who gave birth in health facilities were asked three questions about different aspects of respectful care: whether health care providers treated them with respect, whether providers explained the reasons for examinations or procedures, and whether providers took the best possible care of them (**Table 9.11**).

Women were also asked if they suffered nondignified treatment, such as having to share a bed with another patient, having to sleep on the floor without a mattress, being denied medical services due to lack of payment, and being prevented from leaving the health facility due to lack of payment (**Table 9.12**).

Among women age 15–49 with a live birth in the 2 years preceding the survey who delivered their most recent birth in a health facility:

- Ninety percent reported that they were treated with respect at all times. Only 1% reported that they were not treated with respect at all (Table 9.11).
- Seventy-six percent reported that they were always given an explanation regarding why examinations or procedures were done, 16% said that they were sometimes given an explanation, and 8% said that they were never given an explanation.
- Eighty-eight percent reported that health care providers took the best care of them all of the time, 11% said that providers took the best care of them some of the time, and 1% said that providers never took the best care of them.
- Eleven percent reported that they shared a bed. Sharing of a bed was reported more often in urban areas (19%) than in rural areas (8%) and was more common in Zanzibar (30%) than in Tanzania Mainland (11%) (**Table 9.12**).
- Three percent slept on the floor without a mattress.
- Four percent were denied medical services due to lack of money, and another 4% were prevented from leaving the health facility due to lack of payment.

The percentage of women who felt that they did not receive respectful care is higher among those who had a stillbirth than among those with a live birth:

- Seven percent reported that they were not treated with respect at all (versus 1% among women with a live birth).
- Eleven percent reported that health care providers did not take the best care of them at all (versus 1% among women with a live birth).

9.4.6 Presence of and Access to Toilets in Health Facilities

Ninety-one percent of women with a live birth in the 2 years preceding the survey who delivered their last live birth in a health facility reported that the facility had a toilet for patients, and among these women 93% reported that the toilet was functioning when they needed to use it (**Table 9.13**).

9.4.7 Experience of Physical and Verbal Abuse in Health Facilities

In the 2022 TDHS-MIS, women who gave birth in a health facility in the 2 years before the survey were asked if they experienced any form of physical or verbal abuse by health care providers at any time during their stay in the facility. In terms of physical abuse, women were asked if they were slapped, punched or hit, physically threatened, or physically mistreated in any other way by any health facility staff member. With respect to verbal abuse, women were asked if any health facility staff member shouted at them, said something to humiliate them, verbally threatened them, or verbally mistreated them in any other way.

- The level of reported physical abuse is low. Only 6% of women reported that they experienced at least one form of physical abuse from a health facility staff member at any time during their stay in the facility (**Table 9.14**).
- Women who gave birth in religious/voluntary facilities (8%) were more likely than those who gave birth in private facilities (2%) to report at least one form of physical abuse.
- The percentage of women reporting any form of physical abuse ranges from less than 1% in Mtwara, Lindi, Kusini Unguja, and Kaskazini Pemba to 13% in Dar es Salaam and 12% in Kagera.

- Thirteen percent of women who delivered their most recent live birth in a health facility experienced at least one form of verbal abuse (**Table 9.15**).

- The percentage of women who experienced any form of verbal abuse varies from less than 1% in Lindi and Mtwara to 34% in Dar es Salaam, 22% in Mwanza, and 21% in Kaskazini Pemba. Women with stillbirths reported levels of physical abuse similar to those reported by women with live births; however, the percentage of women reporting verbal abuse is higher among those with a stillbirth than among those with a live birth (25% versus 13%).

9.4.8 Duration of Stay at the Health Facility

Monitoring of the mother and the newborn after birth is necessary to ensure timely diagnosis and treatment of any complications that may arise. To enable close monitoring of both mothers and newborns, it is recommended that women with uncomplicated vaginal deliveries stay in the hospital at least 24 hours after delivery. Women with a caesarean delivery should stay in the hospital for 3 to 4 days. The 2022 TDHS-MIS findings show that 62% of women with a vaginal live birth in the 2 years preceding the survey stayed at the health facility 1–2 days after their delivery (**Table 9.16**). By contrast, 76% of women with a live birth via C-section stayed at the facility 3 days or longer. Longer hospital stays were more common among women with stillbirths. Among women with vaginal deliveries, 17% of those whose pregnancy resulted in a stillbirth stayed 3 or more days in the health facility after birth, as compared with 8% of those with a live birth.

9.5 Postnatal Care

9.5.1 Postnatal Health Check for Mothers

The postnatal period—the days and weeks immediately following childbirth—is a critical phase in the lives of mothers and newborn babies. Most maternal and infant deaths occur during this period (WHO 2004).

In Tanzania, 51% of women age 15–49 with a live birth in the 2 years preceding the survey and 61% with a stillbirth had a check-up within the first 2 days after birth (**Table 9.17**).

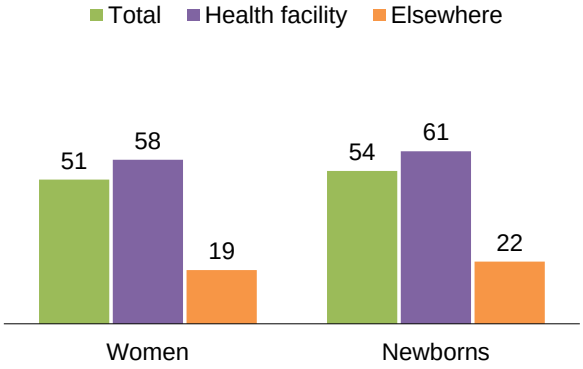
Trends: The percentage of women with a live birth in the 2 years preceding the survey who received a postnatal check within 2 days after birth increased from 34% in the 2015–2016 TDHS-MIS to 51% in the 2022 TDHS-MIS.

Patterns by background characteristics

- The percentage of women with a postnatal check during the first 2 days after a live birth increases with age and decreases with the birth order of the child (**Table 9.17**).
- The percentage of women with a postnatal check during the first 2 days after a live birth is higher among those who delivered in a health facility than among those who delivered elsewhere (**Figure 9.6**).
- The percentage of women who received timely postnatal care is higher in urban areas (60%) than in rural areas (47%).
- There are marked regional differences in the percentage of women who received a postnatal check within 2 days after a live birth. In Tanzania Mainland, the percentage is lowest in Katavi (21%) and Rukwa (24%) and highest in Iringa (86%) and Njombe (78%). In Zanzibar, the percentage is lowest in Kaskazini Pemba (18%) and highest in Mjini Magharibi (77%).
- The percentage of women who received timely postnatal care increases with increasing education and household wealth.

Figure 9.6 Postnatal care by place of delivery

Percentage of last live births in the 2 years before the survey for which women and newborns received a postnatal check during the first 2 days after birth



Type of Provider

The skill level of the health provider who performs the first postnatal check also has important implications for maternal and neonatal health. Among women with a live birth in the 2 years preceding the survey, 34% received their first postnatal check-up during the first 2 days after birth from a nurse or midwife, and 14% were seen by a doctor or AMO. Among women with a stillbirth, 30% received their first postnatal check-up from a nurse or midwife and 31% from a doctor or AMO (**Table 9.18**).

Content of Care

Thirty-two percent of women with a live birth in the 2 years preceding the survey had their blood pressure measured, 39% were asked about vaginal bleeding, 45% discussed family planning, and 42% discussed nutrition needs. Among women with a stillbirth, 58% had their blood pressure measured, 57% were asked about vaginal bleeding, 46% discussed family planning, and 53% discussed nutrition needs (**Table 9.19**).

9.5.2 Postnatal Health Check for Newborns

The probability of neonatal death is particularly high during the first 48 hours after birth, making postnatal checks in this period particularly important. Postnatal care services for newborns should start as soon as possible after birth. In Tanzania, 54% of newborns received a postnatal check within 2 days after birth, while 41% did not receive a postnatal health check at all (**Table 9.20**).

Patterns by background characteristics

- The percentage of newborns who received a postnatal check-up within 2 days after birth decreases with birth order, from 58% among first births to 46% among sixth- or higher-order births (**Table 9.20**).

- The percentage of newborns with a postnatal health check-up within 2 days after birth is higher among those delivered in a health facility (61%) than among those delivered elsewhere (22%) (**Figure 9.6**).
- Timely postnatal care for newborns is higher in urban than rural areas (63% versus 51%).
- The percentage of newborns who received a postnatal health check within 2 days varies by region, from 20% in Katavi to 85% in Iringa and Lindi.
- The percentage of newborns with a postnatal check-up in the first 2 days increases with increasing mother's education and household wealth.

Type of Provider

Nurses and midwives are the most common health care providers for newborns who received a check-up within the first 2 days after birth (35%) (**Table 9.21**). Nine percent of newborns were seen by a doctor or assistant medical officer, and 6% were seen by a clinical officer or assistant clinical officer.

Content of Care

The 2022 TDHS-MIS collected information on whether newborns received five key elements of newborn care (signal functions) within 2 days after birth. These signal functions are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counselling on breastfeeding, (4) telling the mother about danger signs and how to recognise if the baby needs immediate attention, and (5) weighing the newborn (Moran et al. 2013). In addition, mothers were asked if a health care provider spoke with them about childhood vaccinations.

Seventy-nine percent of Tanzanian newborns were weighed by a health care provider in the first 2 days after birth, 50% had their umbilical cord examined, and 34% had their temperature measured (**Table 9.22**). In addition, 35% of mothers were told how to recognise if the baby needs immediate medical attention, 49% were counselled on breastfeeding, and 51% were observed while breastfeeding. Fewer than one quarter (24%) of newborns had all five signal functions performed within 2 days after birth. Fifty-nine percent of mothers were informed about childhood vaccinations.

9.5.3 Postnatal Health Checks for Mothers and Newborns

Overall, 45% of both mothers and newborns received a postnatal check within 2 days after birth. In 41% of live births, neither the mother nor the newborn received a postnatal check (**Table 9.23**).

9.6 Men's Involvement in Maternal Health Care

Male involvement in maternal and child health is a practice wherein fathers actively participate in caring for women and supporting their family to access better health services. Men's health status and behaviour affect women's and newborns' health. Men who are involved in maternal health care typically have increased awareness, acceptance, and support of their partners' needs, choices, and rights. Questions were asked to both men (**Table 9.24**) and women (**Table 9.25**) about male involvement in women's health during ANC and delivery.

Almost all men with a youngest child age 0–2 (94%) reported that the child's mother had an antenatal check-up during the pregnancy. Among men who reported that the mother of their youngest child had an antenatal check-up, 84% said that they were present during an antenatal visit. Eighty-eight percent of men reported that their child was delivered in a health facility. About three quarters (76%) of men who reported that their youngest child was delivered in a health facility said that they went with the child's mother to the health facility at the time of delivery.

Women who received ANC for their most recent live birth in the 2 years preceding the survey were asked whether their partner encouraged them to receive ANC and accompanied them to ANC (**Table 9.25**). Eighty-seven percent of women reported that their partner encouraged them to receive ANC, and 74% reported that their partner accompanied them to ANC.

9.7 Breast and Cervical Cancer Examinations

Breast cancer examination

Women were asked if a doctor or other health care provider examined their breasts to check for cancer. The examination could include either a clinical breast exam, in which health care providers use their hands to feel for lumps or other changes, or use of medical equipment to make an image of the breast tissue, such as a mammogram.

Cervical cancer examination

To be checked for cervical cancer, a woman is asked to lie on her back with her legs apart. Then the health care worker uses a brush or swab to collect a sample from inside her. The sample is sent to a laboratory for testing. This test is called a Pap smear or human papillomavirus (HPV) test. Another method is visual inspection with acetic acid (VIA). In this test, the health care worker puts vinegar on the cervix to see if there is a reaction. Women were asked if a doctor or other health care provider ever tested them for cervical cancer. Information on the type of screening test was not collected.

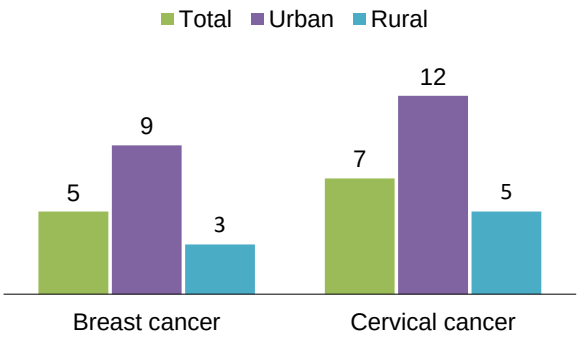
Sample: Women age 15–49

Both cervical and breast cancer can be cured if diagnosed at an early stage. Screening women for these cancers is therefore important to enable early diagnosis and timely treatment. The 2022 TDHS-MIS included questions on history of breast and cervical cancer screening.

Only 5% of women age 15–49 reported that they had ever been examined by a doctor or other health care provider to check for breast cancer. Similarly, 7% reported that they had been screened for cervical cancer (**Table 9.26**). The percentage of women who have received breast and cervical cancer examinations is higher in urban than rural areas and increases with increasing education and household wealth (**Table 9.26** and **Figure 9.7**).

Figure 9.7 **Breast and cervical cancer screening by residence**

Percentage of women age 15–49 who were ever examined by a health care worker for breast or cervical cancer



9.8 Problems in Accessing Health Facilities

Problems in accessing health facilities

Women were asked whether each of the following factors is a big problem in seeking medical advice or treatment for themselves when they are sick:

- Getting permission to go to the doctor
- Getting money for advice or treatment
- Distance to a health facility
- Not wanting to go alone

Sample: Women age 15–49

Easy physical access to health facilities enhances timely utilisation of health services. The 2022 TDHS-MIS findings show that 50% of women age 15–49 reported at least one problem in accessing health care for themselves (**Table 9.27**). The most frequently mentioned problems were getting money for treatment (36%) and distance to the facility (29%).

Patterns by background characteristics

- A higher percentage of women in rural than urban areas reported at least one problem in accessing health care (56% versus 39%) (**Table 9.27**).

- The percentage of women reporting at least one problem in accessing health care decreases with increasing education (from 62% among those with no education to 38% among those with a secondary education or higher) and increasing household wealth (from 70% among those in the lowest wealth quintile to 32% among those in the highest quintile).

9.9 Distance and Means of Transport to the Nearest Health Facility

Short distances and availability of transportation to health facilities enable easier access to facilities, which improves utilisation of health services. The 2022 TDHS-MIS collected information on the amount of time it took for women reach a health facility and whether they used motorised transport to travel there.

Almost half of women (47%) reported that it takes them less than 30 minutes to travel to the nearest health facility, 28% reported that they need between 30 minutes and 1 hour, 16% need between 1 and 2 hours, and 9% need 2 hours or more (**Table 9.28**). Only 15% of women travel to the nearest health facility using a motorised vehicle such as a car or truck, a public bus, a motorcycle/scooter, or a boat with a motor. Eighty-five percent use a nonmotorised means of transport such as walking or using a bicycle, an animal-drawn cart, or a boat without a motor.

List of Tables

For more information on maternal and newborn health care, see the following tables:

Table 9.1 Antenatal care

Percent distribution of women age 15–49 who had a live birth and/or stillbirth in the 2 years preceding the survey by antenatal care (ANC) provider during the pregnancy for the most recent live birth or stillbirth and percentage receiving antenatal care from a skilled provider for the most recent live birth or stillbirth, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Antenatal care provider								
	Doctor/ AMO	Clinical officer/ assistant clinical officer	Nurse/ midwife/ PHNB	Assistant nurse	MCH aide	No ANC	Total	Percentage receiving antenatal care from a skilled provider[1]	Number of women

Total	7.8	5.7	64.7	9.8	1.7	10.3	100.0	89.7	4,335
STILLBIRTHS									
Total	13.4	5.0	65.1	6.9	0.0	9.5	100.0	90.5	83
LIVE BIRTHS AND STILLBIRTHS[3]									
Total	7.9	5.7	64.7	9.8	1.7	10.2	100.0	89.8	4,401

Note: If more than one source of ANC was mentioned, only the provider with the highest qualifications is considered in this tabulation. Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months.

[1] Skilled provider includes doctor/assistant medical officer (AMO), clinical officer, assistant clinical officer, nurse/midwife/public health nurse B (PHNB), assistant nurse, and maternal and child health (MCH) aide.

[2] Birth order refers to the order of the birth among the respondent's live births.

[3] For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.2 Number of antenatal care visits and timing of first visit

Percent distribution of women age 15–49 who had a live birth and/or a stillbirth in the 2 years preceding the survey by number of antenatal care (ANC) visits during the pregnancy for the most recent live birth or stillbirth and by the timing of the first visit; and among women with ANC, median months pregnant at first visit, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Number of ANC visits								Number of months pregnant at time of first ANC visit							Median months pregnant at first visit (for those with ANC)	Number of women with ANC
	None	1	2–3	4–7	8+	Don't know	Total	4+ ANC visits	No antenatal care	<4	4–6	7+	Don't know	Total	Number of women

[2] For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.3.1 Components of antenatal care among women receiving ANC

Among women age 15–49 receiving antenatal care (ANC) for their most recent live birth and/or stillbirth in the 2 years preceding the survey, percentage receiving specific antenatal services from a health care provider, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Percentage who received specific services during ANC from a health care provider:							Number of women with ANC for their most recent live birth and/or stillbirth in the last 2 years
	Blood pressure measured	Urine sample taken	Blood sample taken	Baby's heartbeat checked	Counselled about maternal diet	Counselled about breastfeeding	Asked about vaginal bleeding

Note: Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Includes woman's home, another home, and premises of a traditional birth attendant

[2] Birth order refers to the order of the birth among the respondent's live births.

[3] Includes only the most recent birth in the 2 years preceding the survey

Table 9.8 Caesarean section

Percentage of live births and/or stillbirths in the 2 years preceding the survey delivered via caesarean section (C-section), according to background characteristics, Tanzania DHS-MIS 2022

LIVE BIRTHS AND STILLBIRTHS		
Total	11.2	4,591

Note: The question on C-section is asked only of women who delivered in a health facility. In this table, it is assumed that women who did not give birth in a health facility did not receive a C-section. Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Birth order refers to the order of the birth among the respondent's live births.

[2] Includes only the most recent birth in the 2 years preceding the survey

Table 9.9 Assistance during delivery

Percent distribution of live births and/or stillbirths in the 2 years preceding the survey by person providing assistance during delivery and percentage assisted by a skilled provider; and among most recent live births in the 2 years preceding the survey, percentage with skin-to-skin contact immediately after birth, according to background characteristics, Tanzania DHS-MIS 2022

Note: If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation. Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
na = not applicable
[1] Skilled provider includes doctor/assistant medical officer (AMO), clinical officer, assistant clinical officer, nurse/midwife, assistant nurse, and maternal and child health (MCH) aide.
[2] Birth order refers to the order of the birth among the respondent's live births.
[3] Includes only the most recent birth in the 2 years preceding the survey

Table 9.10 Presence of a companion during labour and delivery

Among women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey who delivered their most recent birth in a health facility, percentage who had a companion with them during labour and delivery, according to background characteristics, Tanzania DHS-MIS 2022

LIVE BIRTHS AND STILLBIRTHS[2]		
Total	80.4	3,580

Note: Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
[1] Birth order refers to the order of the birth among the respondent's live births.
[2] For women who had both a live birth and a stillbirth in the 2 years preceding the survey and both occurred in a health facility, data are tabulated for the most recent birth only.

Table 9.11 Respectful care

Among women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey who delivered their most recent birth in a health facility, percent distribution by amount of time health care providers in the health facility demonstrated three aspects of respectful care, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Treated with respect				Given explanation why examinations or procedures were done				Provider took the best care				Number of women
	All of the time	Some of the time	Not at all	Total	All of the time	Some of the time	Not at all	Total	All of the time	Some of the time	Not at all	Total

STILLBIRTHS						
Total	57.6	56.6	45.8	53.3	26.4	83
LIVE BIRTHS AND STILLBIRTHS[2]						
Total	32.8	39.7	45.4	41.6	24.4	4,401

Note: Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months.
[1] Birth order refers to the order of the birth among the respondent's live births.
[2] For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.20 Timing of first postnatal check for the newborn

Percent distribution of most recent live births in the 2 years preceding the survey by time after birth of first postnatal check, and percentage of births with a postnatal check during the first 2 days after birth, according to background characteristics, Tanzania DHS-MIS 2022

[1] Captures newborns who were weighed "at birth." May exclude some newborns who were weighed during the 2 days after birth.
[2] The functions are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counselling on breastfeeding, (4) telling the mother about danger signs/how to recognise if the baby needs immediate attention, and (5) weighing. Corresponds to the definition of the five signal functions to assess the content of postnatal care for newborns described in Moran et al. 2013.
[3] Birth order refers to the order of the birth among the respondent's live births.

Table 9.23 Postnatal checks on mother and newborn

Among most recent live births in the 2 years preceding the survey, percentage for which mothers age 15–49 received a postnatal check during the first 2 days after birth, percentage for which newborns received a postnatal check during the first 2 days after birth, percentage for which both mothers and newborns received a postnatal check, and percentage for which neither mothers nor newborns received a postnatal check, according to background characteristics, Tanzania DHS-MIS 2022

CHILD HEALTH 10

Key Findings

- ***Vaccinations:*** 53% of children age 12–23 months were fully vaccinated against all basic antigens, and 23% were fully vaccinated according to the national schedule.
- ***Symptoms of acute respiratory infection:*** 2% of children under age 5 had symptoms of acute respiratory infection (ARI) in the 2 weeks before the survey; advice or treatment was sought for 79% of them.
- ***Fever:*** 11% of children under age 5 had a fever in the 2 weeks before the survey, and advice or treatment was sought for 78% of them.
- ***Diarrhoea:*** 9% of children under age 5 had diarrhoea in the 2 weeks before the survey, and advice or treatment was sought for 64% of these children. Forty-nine percent of children with diarrhoea received oral rehydration therapy (ORT); 23% received no treatment.
- ***Early Childhood Development Index:*** According to the ECDI2030, 47% of youngest children age 24–59 months living with their biological mother are developmentally on-track in health, learning, and psychosocial well-being.

Information on child health and survival can help policymakers and programme managers assess the efficacy of current strategies, formulate appropriate interventions to prevent deaths from childhood illnesses, and improve the health of children in Tanzania.

This chapter presents information on child's size at birth and vaccination status for young children. It also looks at the prevalence of, and care-seeking behaviours for, three common childhood illnesses: symptoms of acute respiratory infection (ARI), fever, and diarrhoea. In addition, the chapter presents data on early childhood development, which will provide insight regarding whether the children of Tanzania are on track in terms of health, learning, and psychosocial well-being.

10.1 CHILD'S SIZE AT BIRTH

The 2022 TDHS-MIS collected information on the size and birthweight of all children born in the 2 years before the survey. Children who weigh less than 2.5 kg at birth or are reported to be very small or smaller than average are considered to have a higher-than-average risk of early childhood death.

Among all live births, 1% were reported as very small, 7% as smaller than average, and 87% as average or larger (**Table 10.1**).

Seventy-nine percent of births have a reported birth weight, 55% from a written record and 24% from the mother's recall. However, so as to avoid possible bias, a 90% threshold was used for reporting the percentage of children with a birth weight below 2.5 kg. Therefore, the data are not presented in this report.

10.2 VACCINATION OF CHILDREN

Universal immunisation of children against common vaccine-preventable diseases is crucial in reducing infant and child morbidity and mortality. In Tanzania, routine childhood vaccines include BCG (tuberculosis); oral polio vaccine (OPV) or inactivated polio vaccine (IPV); pentavalent or DPT-HepB-Hib (diphtheria, pertussis, tetanus, hepatitis B, and *Haemophilus influenzae* type b); pneumococcal conjugate vaccine (PCV); rotavirus vaccine (RV); and measles-rubella (MR) vaccine.

Information on vaccination coverage was obtained in two ways in the TDHS-MIS: from written vaccination records, including vaccination or health cards, or from verbal reports. For each child born in the 3 years before the survey, mothers were asked to show the interviewer the vaccination card or other document used for recording the child's immunisations. If the vaccination card or other document was available, the interviewer copied the dates of each vaccination received. If a vaccination was not recorded in the vaccination card or on the document as having been administered, the mother was asked to recall whether that particular vaccination had been given during a vaccination campaign. If the mother was not able to present the vaccination card or other document for a child, she was asked to recall whether the child had received the BCG, polio, DPT-HepB-Hib, pneumococcal, rotavirus, and measles-rubella vaccines. If she indicated that the child had received any of the multi-dose vaccines, she was asked the number of doses the child received.

10.2.1 Vaccination Card Ownership and Availability

Vaccination cards are critical tools in confirming that a child received all recommended vaccinations on schedule. Among children age 12–23 months and age 24–35 months, 97% and 96%, respectively, ever had a vaccination card or other document on which their vaccinations were recorded (**Table 10.2**). However, not all mothers were able to produce their child's vaccination card at the time of the interview; 81% of children age 12–23 months and 73% of children age 24–35 months had vaccination cards available at the time of the interview.

Patterns by background characteristics

- Ownership of vaccination cards differed little by background characteristics. However, the percentage of children with a vaccination card seen showed wide variation by region. In Rukwa it was as low as 58% and 47% among children age 12–23 months and 24–35 months, respectively.

10.2.2 Basic Antigen Coverage

Fully vaccinated—basic antigens

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report). To have received all basic antigens, a child must receive at least:

- One dose of BCG vaccine, which protects against tuberculosis
- Three doses of polio vaccine given as oral polio vaccine (OPV), inactivated polio vaccine (IPV), or a combination of OPV and IPV
- Three doses of DPT-containing vaccine, which protects against diphtheria, pertussis (whooping cough), and tetanus
- One dose of measles-containing vaccine given as measles rubella (MR)

Sample: Children age 12–23 months and age 24–35 months

Historically, an important measure of vaccination coverage has been the proportion of children receiving all "basic" antigens. Children are considered fully vaccinated against all basic antigens if they have received the BCG vaccine, three doses each of polio vaccine and DPT-containing vaccine, and a single dose of measles-containing vaccine. In Tanzania, the BCG vaccine is usually given at birth or at first clinic contact, while the polio and DPT-containing vaccines are given approximately age 6, 10, and 14 weeks. A first measles-containing vaccination should be given at or soon after age 9 months.

Among children age 12–23 months, overall, 53% are fully vaccinated with basic antigens: 91% received the BCG vaccine, 90% received three doses of DPT-containing vaccine, 59% received the three doses of oral polio vaccine, and 87% received an MR vaccination (**Table 10.3** and **Figure 10.1**). Among children age 24–35 months, 59% are fully vaccinated with the basic antigens. However, only 49% of children age 12–23 months and 52% of children age 24–35 months received all basic vaccines by the time the time they were age 12 months.

Trends: The percentage of children who were fully vaccinated against basic antigens held relatively steady between the 1991–92 TDHS (71%) and the 2015–16 TDHS-MIS (75%) but dropped off markedly in 2022 (53%). Over this same time period, the percentage of children age 12–23 months who did not receive any vaccinations has varied between 2% and 5% (**Figure 10.2**).

***Figure 10.1* Childhood vaccinations**

Percentage of children age 12–23 months vaccinated at any time before the survey

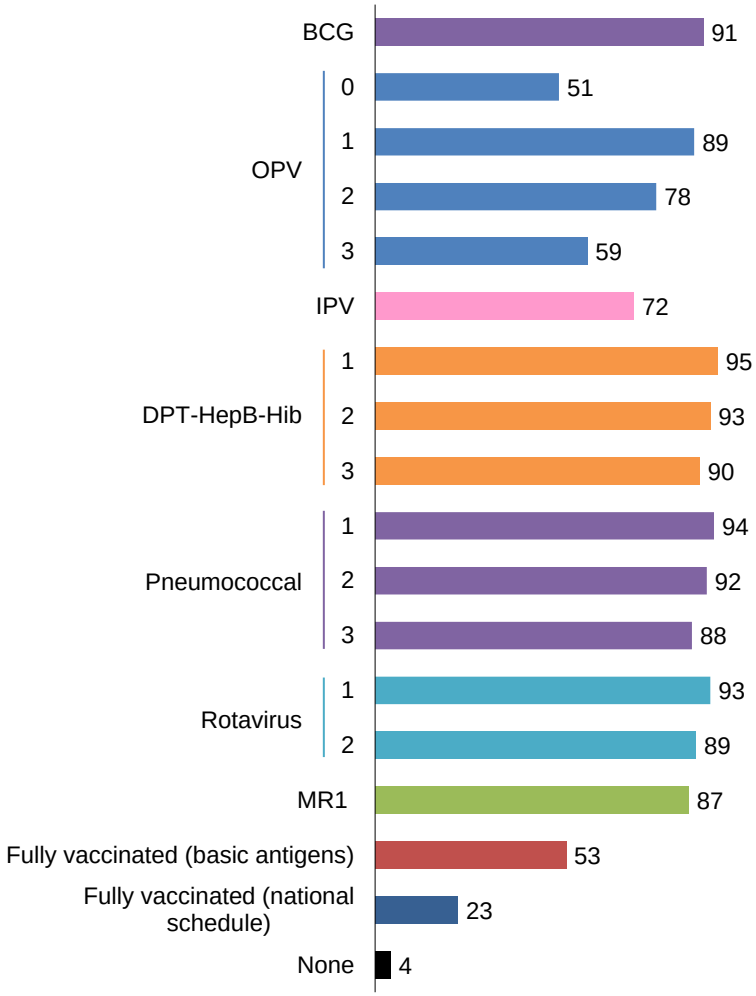

***Figure 10.2* Trends in childhood vaccinations**

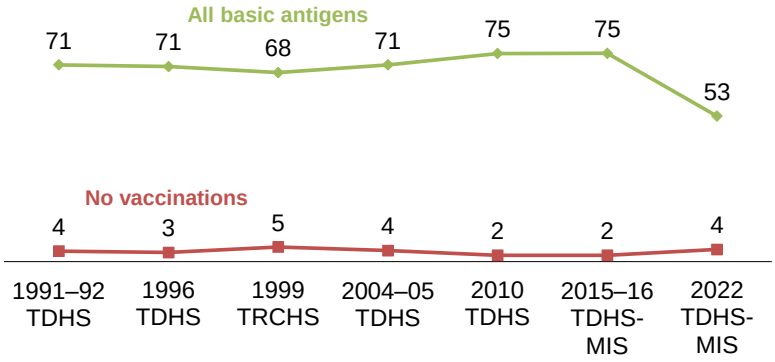
Percentage of children age 12–23 months who received all basic antigens at any time before the survey



The decline in children fully vaccinated against all basic antigens relative to the 2015–16 TDHS-MIS appears due to a large drop off in the coverage of OPV3, from 83% in 2015–16 to 59% in 2022. It should also be mentioned that data collection was conducted in the aftermath of the COVID pandemic.

10.2.3 National Schedule Coverage

Fully vaccinated according to national schedule (age 12–23 months)

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report). To be fully vaccinated according to national schedule, a child must receive the following:

- One dose of BCG vaccine
- OPV (birth dose)
- Three doses of OPV and one dose of IPV
- Three doses of DPT-HepB-Hib
- Three doses of PCV
- Two doses of RV
- One dose of measles rubella (MR)

Sample: Children age 12–23 months

Fully vaccinated according to national schedule (age 24–35 months)

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report). To be fully vaccinated according to national schedule, a child must receive all of the vaccinations listed above along with the following:

- A second dose of measles rubella (MR)

Sample: Children age 24–35 months

A second measure of vaccination coverage is the percentage of children age 12–23 months and 24–35 months who are fully vaccinated according to the national schedule. In this report, a child age 12–23 months is considered to be fully vaccinated according to the national schedule if the child has received all basic antigens as well as a birth dose of BCG and OPV, a dose of IPV, three doses of HepB and Hib (given as part of DPT-containing vaccine), three doses of the pneumococcal vaccine, and two doses of rotavirus vaccine. Children age 24–35 months have received all vaccinations according to the national schedule if they have received a second dose of the MR vaccine in addition to all of the vaccinations relevant for a child age 12–23 months.

Twenty-three percent of children age 12–23 months were fully vaccinated according to the national schedule; 21% received the vaccinations appropriate for their age by age 12 months, as recommended. Children age 24–35 months are fully vaccinated according to the national schedule if they have received a second dose of the MR vaccine in addition to all of the vaccinations relevant for a child age 12–23 months. Sixty-four percent of children age 24–25 months received a second dose of MR. Overall, 23% of children age 24–35 months were fully vaccinated according to the national schedule; 19% received the vaccinations appropriate for their age by 24 months, as recommended. Four percent of children age 24–35 months did not receive any vaccinations (**Table 10.3**). The low proportions of OPV 0 and OPV 3 coverage may explain the low level of this indicator among children age 12–23 months especially.

Patterns by background characteristics

- The percentage of children age 12–23 months who were fully vaccinated according to the national schedule is lower among sixth- and higher-order births (16%) than among lower-order births (23%–26%) (**Table 10.4**).
- Twenty-six percent of children age 12–23 months with a vaccination card seen are fully vaccinated according to the national schedule, as compared with 12% of children without a card seen and 0% of children who never had a vaccination card.
- Forty percent of children age 12–23 months in Zanzibar are fully vaccinated according to the national schedule, compared with 23% in Tanzania Mainland.

Source of Vaccinations

Nearly all children age 12–23 months and 24–35 months received vaccinations from public medical sector sources (94% each) (**Table 10.5**).

10.3 Symptoms of Acute Respiratory Infection and Care-seeking Behaviour

Acute respiratory infection (ARI) is among the leading causes of morbidity and mortality globally, including Tanzania. Among acute respiratory diseases, pneumonia is the most serious for young children. Early diagnosis and treatment with antibiotics can prevent a large proportion of deaths from pneumonia among children.

Care seeking for symptoms of acute respiratory infection (ARI)
Children with symptoms of ARI for whom advice or treatment was sought. ARI symptoms consist of short, rapid breathing that is chest-related, and/or difficult breathing that is chest-related.
Sample: Children under age 5 with symptoms of ARI in the 2 weeks before the survey

Two percent of children under age 5 were reported by their mothers as having symptoms of ARI in the 2 weeks before the survey. Among these children, 79% were taken to a health facility or provider for advice or treatment, and 47% were taken on the same or next day after symptoms developed (**Table 10.6**).

Trends: The percentage of children with ARI symptoms who were taken for advice or treatment increased from 80% in 2010 to 85% in 2015–16 before declining to 79% in 2022.

Patterns by background characteristics

- In general, the percentage of children with ARI symptoms did not vary widely by background characteristics. The largest differences were observed by region, with the percentage of children with ARI symptoms ranging from less than 0.1% in Mtwara, Singida, and Tabora to 7% in Kusini Unguja.
- The percentage of children with ARI symptoms for whom advice or treatment was sought is slightly higher in urban areas than in rural areas (82% versus 76%).

Source of Advice or Treatment for Symptoms of ARI

Among children with symptoms of ARI for whom advice or treatment was sought, the most common places from which advice or treatment was sought were dispensaries (40%) and health centres (17%) in the public sector, and pharmacies (18%), in the private sector (**Table 10.7**).

10.4 Fever and Care-seeking Behaviour

Fever is an abnormally high body temperature, which is usually accompanied by shivering, headache, and restlessness. Fever indicates the presence of various illnesses, which can include malaria, measles, pneumonia, influenza, and other infections. Delays in diagnosis and treatment of those infections may contribute to high levels of morbidity and mortality in young children.

Care seeking for fever
Children with fever for whom advice or treatment was sought.
Sample: Children under age 5 with fever in the 2 weeks before the survey

In Tanzania, 11% of children under age 5 were reported to have fever in the 2 weeks before the survey. Among those, advice or treatment was sought for 78%, and 49% were given antibiotics (**Table 10.8**).

Trends: Care seeking for children with fever has changed little over the last decade, from 79% in 2010 to 81% in 2015–16 and 78% in 2022.

10.5 DIARRHOEAL DISEASE

Diarrhoeal disease remains an important cause of morbidity and mortality among young children in Tanzania. Oral rehydration therapy (ORT) combined with continued feeding is the recommended interventions for treating diarrhoea. The ORT can be provided as increased fluids (especially increased breastfeeding), as fluid prepared from a packet of oral rehydration salts (ORS), or as government-recommended homemade fluids (RHF). Zinc has been shown to reduce the severity and duration of diarrhoea, and it is recommended that all children with diarrhoea receive a 5-day course of zinc.

10.5.1 Diarrhoea and Care-seeking Behaviour

Care seeking for diarrhoea
Children with diarrhoea for whom advice or treatment was sought.
Sample: Children under age 5 with diarrhoea in the 2 weeks before the survey

Nine percent of children under age 5 were reported by their mothers to have had diarrhoea in the 2 weeks before the survey; treatment or advice was sought for 64% percent of children with diarrhoea (**Table 10.9**).

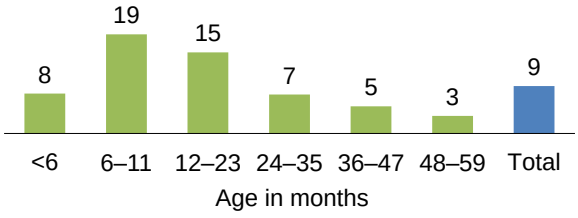
Trends: The percentage of children with diarrhoea for whom advice or treatment was sought went from 64% in 2010 to 71% in 2015–16 and 64% in 2022.

Patterns by background characteristics

- The prevalence of diarrhoea peaks among children age 6–23 months (15%–19%). This corresponds to the time when children start losing protection from maternal antibodies through breastfeeding as they are weaned, begin to crawl and walk, and are at increased risk of contamination from food, water, and the environment. Prevalence of diarrhoea steadily declines after children reach age 2, with 3% of children age 48–59 months with diarrhoea in the 2 weeks preceding the survey (**Figure 10.3**).
- The percentage of children with diarrhoea for whom advice or treatment was sought does not differ by urban-rural residence (64% each).

Figure 10.3 **Diarrhoea prevalence by age**

Percentage of children under age 5 who had diarrhoea in the 2 weeks before the survey



- Overall, care seeking for children with diarrhoea does not differ between Zanzibar and Tanzania Mainland (64% each). However, within Zanzibar, care seeking is higher in Unguja (72%) than in Pemba (53%).

10.5.2 Feeding Practices

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, caretakers are encouraged to continue normal feeding of children with diarrhoea and to increase the amount of fluids given to the child.

Appropriate feeding practices

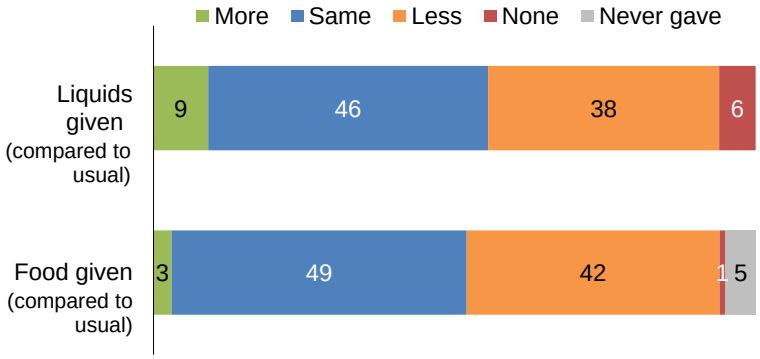
Children with diarrhoea are given more liquids than usual, and as much food or more than usual.

Sample: Children under age 5 with diarrhoea in the 2 weeks before the survey

Only 9% of children under age 5 with diarrhoea were given more liquids than usual, as recommended, while nearly half of the children (46%) received the same amount of liquids as recommended. It is of concern that 38% of children were given somewhat less or much less liquid than usual, and 6% were given no liquids at all. Just over half (51%) of children with diarrhoea were fed according to the recommended practice of giving the same or more food than usual. Forty-two percent were given much less or somewhat less food than usual, while 1% were given no food during diarrhoea (**Figure 10.4** and **Table 10.10**).

Figure 10.4 **Feeding practices during diarrhoea**

Percentage of children under age 5 with diarrhoea in the 2 weeks before the survey



Patterns by background characteristics

- The percentage of children with diarrhoea who were given more liquids than usual was higher in Zanzibar than Tanzania Mainland (21% and 9%, respectively). In contrast, the percentage of children with diarrhoea who were fed as much food or more than usual was higher in Tanzania Mainland than Zanzibar (52% versus 41%).

10.5.3 Oral Rehydration Therapy, Continued Feeding, and Other Treatments

Oral rehydration therapy

Children with diarrhoea are given increased fluids, or a fluid made from a special packet of oral rehydration salts (ORS), or government-recommended homemade fluids (RHF).

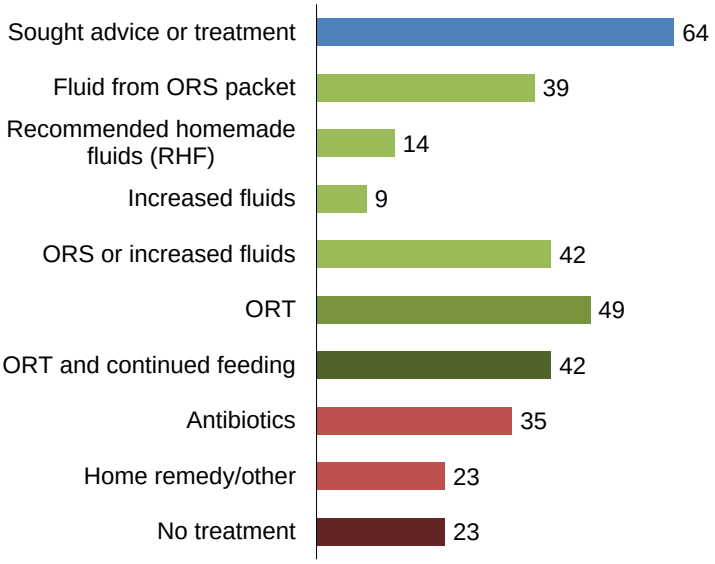
Sample: Children under age 5 with diarrhoea in the 2 weeks before the survey

About half of children under age 5 with diarrhoea (49%) received some form of ORT. Forty-two percent received ORT and continued feeding. About one-third of children with diarrhoea (35%) received antibiotics, and 23% did not receive any treatment (**Figure 10.5** and **Table 10.11**).

Trends: The percentage of children under age 5 with diarrhoea in the 2 weeks before the survey who received ORT declined from 63% in 2010 to 56% in 2015–16 and 49% in 2022. Over this same time period, the percentage of children who received no treatment increased from 17% to 23%.

***Figure 10.5* Treatment of diarrhoea**

Percentage of children under age 5 with diarrhoea in the 2 weeks before the survey



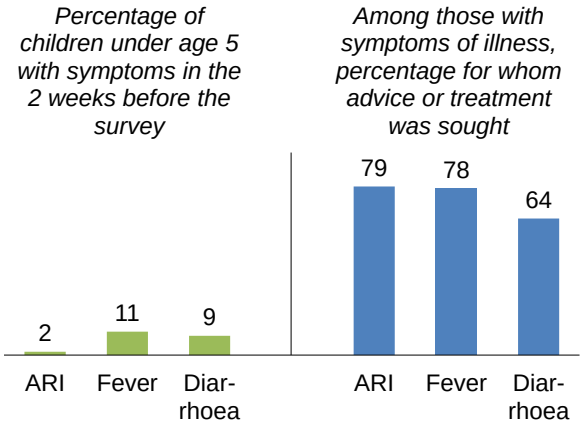
Source of Advice or Treatment for Diarrhoea

Among children with diarrhoea for whom advice or treatment was sought, the majority (67%) were taken to a public sector source, most often a dispensary (48%) or a health centre (13%) (**Table 10.12**).

10.6 Treatment of Childhood Illness

Fever (11%) was the most common illness reported among children under age 5 during the 2 weeks before the survey, followed by diarrhoea (9%) and symptoms of ARI (2%); however, more children with ARI symptoms and fever were taken for advice or treatment as compared to children with diarrhoea (**Figure 10.6**).

***Figure 10.6* Symptoms of childhood illness and care seeking**



10.7 Early Childhood Development Index 2030

Early childhood development is a multidimensional process that involves an ordered progression of motor, cognitive, language, socioemotional, and regulatory skills and capacities across the first few years of life (UNICEF et al. 2016). While these are distinct domains of early childhood development, they are interconnected. Nurturing and supporting all of these dimensions in a holistic manner is key to ensuring that children have the best chance to reach their full potential. Physical growth, literacy and numeracy skills, socioemotional development, and learning readiness set the trajectory for lifelong health, learning, and well-being (Shonkoff and Phillips 2000).

Early Childhood Development Index (ECDI2030)

The 20 items that comprise the ECDI2030 are organised according to the three general domains of health, learning, and psychosocial well-being. Each of the three general domains is composed of a set of core sub-domains:

- Health sub-domains: gross motor development, fine motor development, and self-care.
- Learning sub-domains: expressive language, literacy, numeracy, pre-writing, and executive functioning.
- Psychosocial well-being sub-domains: emotional skills, social skills, internalizing behaviour, and externalizing behaviour.

The ECDI2030 module is not designed to report on individual domains separately. Rather, it is meant to produce a single summary score that captures the interlinked developmental concepts embedded in the three domains mentioned in SDG 4.2.1.

The 2022 TDHS-MIS included the Early Childhood Development Index 2030 (ECDI2030) module developed by UNICEF. This module was administered as part of the 2022 TDHS-MIS Woman's Questionnaire. Respondents were asked 20 questions about the youngest biological child living with them who was between age 24 months and 59 months. The questions covered the way the child behaved in certain everyday situations, and the skills and knowledge the child had acquired. The questions reflect the increasing complexity of the skills children acquire as they grow. The data generated by the ECDI2030 can be used to inform government efforts to improve developmental outcomes among children.

Children developmentally on track according to the Early Childhood Development Index (ECDI2030)

Percentage of children who have achieved the minimum number of ECDI2030 milestones expected for their age group as follows:

- 24–29 months: at least 7 milestones
- 30–35 months: at least 9 milestones
- 36–41 months: at least 11 milestones
- 42–47 months: at least 13 milestones
- 48–59 months: at least 15 milestones

Sample: Respondents' youngest child age 24–59 months living with them

According to the ECDI2030, 47% of youngest children age 24–59 months living with their biological mother are on-track in health, learning, and psychosocial well-being (**Table 10.13**).

Patterns by background characteristics

- The percentage of children developmentally on track decreases with increasing age, from 58% of children age 24–35 months to 36% of children age 48–59 months.
- Half of girls (51%) are developmentally on-track in health, learning, and psychosocial well-being compared with 44% of boys.
- A higher percentage of children in urban areas are developmentally on track than children in rural areas (56% versus 44%).
- The percentage of children developmentally on track increases with increasing mothers' education, from 32% among children whose mothers have no education to 61% among those whose mothers have secondary education or higher.
- The percentage of children developmentally on track also increases with increasing household wealth, from 37% among those in the lowest wealth quintile to 65% among those in the highest quintile.

- By zone, the highest percentage of children who are developmentally on track ranges from 61% in Zanzibar to 21% in Western.

na = not applicable
BCG = bacille Calmette-Guerin
DPT = diphtheria-pertussis-tetanus
HepB = hepatitis B
Hib = *Haemophilus influenzae* type b
IPV = inactivated polio vaccine
MR = measles and rubella
OPV = oral polio vaccine
[1] Vaccination card, booklet or other home-based record
[2] Received by age 12 months
[3] For children whose vaccination information is based on the mother's report, date of vaccination is not collected. The proportions of vaccinations given during the first and second years of life are assumed to be the same as for children with a written record of vaccination.
[4] Received by age 12 months for all vaccines except MR 2, which should be received by age 24 months
[5] BCG, three doses of DPT-HepB-Hib, three doses of polio vaccine (excluding polio vaccine given at birth), and one dose of MR
[6] For children 12–23 months: BCG, three doses of DPT-HepB-Hib, four doses of OPV, one dose of IPV, three doses of pneumococcal vaccine, two doses of rotavirus vaccine, and one dose of MR. For children 24–35 months, all of these plus a second dose of MR.

Table 10.4 Vaccinations by background characteristics

Percentage of children age 12–23 months and children age 24–35 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), percentage fully vaccinated (basic antigens), percentage fully vaccinated (according to national schedule), and percentage who received no vaccinations, according to background characteristics, Tanzania DHS-MIS 2022

	Children age 12-23 months																			Children age 24–35 months:		
		DPT-HepB-Hib			Polio					Pneumococcal			Rotavirus

Note: Children are considered to have received the vaccine if it was either written on the child's vaccination card or reported by the mother. For children whose vaccination information is based on the mother's report, date of vaccination is not collected. The proportions of vaccinations given during the first and second years of life are assumed to be the same as for children with a written record of vaccination. Figures in parentheses are based on 25–49 unweighted cases.
BCG = bacille Calmette-Guérin
DPT = diphtheria-pertussis-tetanus
HepB = hepatitis B
Hib = *Haemophilus influenzae* type b
IPV = inactivated polio vaccine
MR = measles and rubella
OPV = oral polio vaccine
[1] Children are considered to have received HepB (birth dose) if it was recorded on their card or reported by their mother, regardless of timing.
[2] BCG, three doses of DPT-HepB-Hib, three doses polio vaccine (excluding polio vaccine given at birth), and one dose of MR
[3] BCG, three doses of DPT-HepB-Hib, four doses of OPV, one dose of IPV, three doses of pneumococcal vaccine, two doses of rotavirus vaccine, and one dose of MR
[4] BCG, three doses of DPT-HepB-Hib, four doses of OPV, one dose of IPV, three doses of pneumococcal vaccine, two doses of rotavirus vaccine, and two doses of MR
[5] Vaccination card, booklet or other home-based record

Table 10.5 Source of vaccinations

Among children who received at least one vaccination, percent distribution of children age 12–23 months and children age 24–35 months by source of most vaccinations, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Children age 12–23 months who received at least one vaccination						Children age 24–35 months who received at least one vaccination

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Symptoms of ARI include short, rapid breathing which was chest-related and/or difficult breathing which was chest-related.

[2] Includes advice or treatment from the following sources: public sector, religious/voluntary sector, private medical sector, pharmacy, accredited drug dispensing outlet (ADDO), and non-governmental organisation (NGO)/voluntary counselling and testing (VCT) centre. Excludes advice or treatment from a shop/kiosk/market/traditional practitioner.

Table 10.7 Source of advice or treatment for children with symptoms of ARI

Percentage of children under age 5 with symptoms of ARI in the 2 weeks preceding the survey for whom advice or treatment was sought from specific sources; and among children under age 5 with symptoms of ARI in the 2 weeks preceding the survey for whom advice or treatment was sought, percentage for whom advice or treatment was sought from specific sources, Tanzania DHS-MIS 2022

	Percentage for whom advice or treatment was sought from each source:	
Source	Among children with symptoms of ARI[1]	Among children with symptoms of ARI for whom advice or treatment was sought[1]
Public sector	51.3	63.4
Regional referral hospital	0.5	0.7
Regional hospital	0.5	0.6
District hospital	4.9	6.0
Health centre	13.7	16.9
Dispensary	31.9	39.5
Clinic	0.8	1.0
Religious/voluntary	6.0	7.4
Referral specialised hospital	0.1	0.1
District hospital	0.1	0.1
Other hospital	2.7	3.3
Health centre	1.0	1.2
Dispensary	2.1	2.6
Private medical sector	5.1	6.4
Specialised hospital	3.4	4.2
Other hospital	0.1	0.1
Health centre	0.9	1.1
Dispensary	0.8	1.0
Other private sector	20.6	25.4
Pharmacy	14.1	17.5
ADDO	5.5	6.7
Shop/kiosk/market/traditional practitioner	1.6	1.9
Number of children	162	131

Note: Advice or treatment for children with symptoms of ARI may have been sought from more than one source.
ADDO = accredited drug dispensing outlet
[1] Symptoms of ARI include short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.

Table 10.8 Children with fever and care seeking for fever

Among children under age 5, percentage who had a fever in the 2 weeks preceding the survey; and among children with fever in the 2 weeks preceding the survey, percentage for whom advice or treatment was sought, percentage for whom advice or treatment was sought the same or next day following the onset of fever, and percentage who received antibiotics as treatment, according to background characteristics, Tanzania DHS-MIS 2022

	Among children under age 5:		Among children under age 5 with fever:			
Background characteristic	Percentage with fever	Number of children	Percentage for whom advice or treatment was sought[1]	Percentage for whom advice or treatment was sought the same or next day[1]	Percentage who took antibiotics	Number of children with fever

NUTRITION OF CHILDREN AND ADULTS 11

Key Findings

- ***Nutritional status of children:*** 30% of children under age 5 are stunted, 3% are wasted, 12% are underweight, and 4% are overweight.
- ***Breastfeeding:*** 64% of children under age 6 months are exclusively breastfed. Seventy percent of children born in the 24 months before the survey were breastfed within 1 hour of birth, and 90% were exclusively breastfed for the first 2 days after birth.
- ***Complementary feeding:*** 19% of children age 6–23 months received meals with the minimum recommended diversity the day before the survey, 33% received meals at the minimum frequency, and 8% were fed a minimum acceptable diet. However, 30% were given sweet beverages and 7% were given unhealthy foods.
- ***Coverage of iron-containing supplementation, vitamin A, and deworming medication:*** 11% of children age 6–59 months were given iron-containing supplements in the last 12 months, and 53% were given vitamin A supplements in the last 6 months. Fifty percent of children age 12–59 months were given deworming medication in the last 6 months.
- ***Nutritional status of women:*** 2% of women age 20–49 are of short stature, 7% are thin, and 36% are overweight or obese. Among young women age 15–19, 12% are of short stature, 18% are thin, and 12% are overweight or obese.
- ***Nutrition status of men:*** 9% of men age 20–49 are thin and 17% are overweight or obese. Among young men age 15–19, 41% are thin and 3% are overweight or obese.
- ***Women's dietary practices:*** 25% of women age 15–49 consumed food from at least five of 10 specified food groups the previous day, 28% consumed sweet beverages, and 14% consumed unhealthy foods.
- ***Salt iodisation:*** 84% of households have iodised salt.

Nutrition is the foundation for the health and development of children and adults. This chapter reports on nutritional status and anaemia among children, adolescents, and adults; infant and young child feeding (IYCF) practices; and women's dietary practices. In addition, the chapter presents key nutrition interventions including infant and young child feeding counselling, child growth monitoring, micronutrient supplementation, deworming for children, and the presence of iodine in household cooking salt. Chapter 9 presents information on nutritional interventions provided during the antenatal period such as maternal nutrition counselling, breastfeeding counselling, deworming, iron-containing supplementation and sources of the supplements, and postnatal breastfeeding counselling and observation. Chapter 10 presents information on child feeding practices during diarrhoea.

11.1 Nutritional Status of Children

Anthropometry is commonly used to measure child nutritional status. Anthropometric measurements are used to report on child growth indicators. The distribution of height and weight among children under age 5 was compared with the WHO Child Growth Standards reference population (WHO 2006). The distribution of a well-nourished population will be similar to that of the reference population, while the distribution of a poorly nourished population will not. The indices height-for-age, weight-for-height, and weight-for-age are expressed in standard deviation units (*z* scores) from the median of the reference population. Values that are greater than two standard deviations below the median of the WHO Child Growth Standards are used to define malnutrition.

Stunting, or low height-for-age, is a measure of growth faltering. Stunting is a marker of the deficient growth environment to which children have been exposed and reflects the overall well-being of a population (Perumal et al. 2018). Suboptimal nutrition contributes to stunting, while other causes include recurrent infection, chronic diseases, and more; many of the causes of stunting are complex and unknown (WHO 2014a).

Wasting, or low weight-for-height, is a measure of acute undernutrition. It represents the failure to receive adequate nutrition in the period immediately before the survey. Wasting may result from inadequate food intake or from a recent episode of illness or infection causing weight loss.

Underweight, or low weight-for-age, is a composite index of weight-for-height and height-for-age. It reflects children who are stunted, wasted, or both.

Overweight, or high weight-for-height, results from an imbalance between energy consumed (too much) and energy expended (too little).

Stunting (assessed via height-for-age)

Height-for-age is a measure of growth faltering. Children whose height-for-age *z* score is below minus two standard deviations (−2 SD) from the median of the reference population are considered short for their age (stunted). Children whose *z* score is below minus three standard deviations (−3 SD) from the median are considered severely stunted.

Sample: Children under age 5

Wasting (assessed via weight-for-height)

The weight-for-height index measures body mass in relation to body height or length and describes acute malnutrition. Children whose weight-for-height *z* score is below minus two standard deviations (−2 SD) from the median of the reference population are considered thin (wasted). Children whose *z* score is below minus three standard deviations (−3 SD) from the median are considered severely wasted.

Sample: Children under age 5

Underweight (assessed via weight-for-age)

Weight-for-age is a composite index of height-for-age and weight-for-height that takes into account both wasting and stunting. Children whose weight-for-age *z* score is below minus two standard deviations (−2 SD) from the median of the reference population are classified as underweight. Children whose *z* score is below minus three standard deviations (−3 SD) from the median are considered severely underweight.

Sample: Children under age 5

Overweight (assessed via weight-for-height)

Children whose weight-for-height *z* score is more than two standard deviations (+2 SD) above the median of the reference population are considered overweight.

Sample: Children under age 5

The mean *z* scores for height-for-age, weight-for-height, and weight-for-age are calculated as summary statistics that represent the nutritional status of children in a population. The mean scores describe the nutritional status of the entire population of children without the use of a cutoff point. A mean *z* score of less than 0 (a negative mean value for stunting, wasting, or underweight) suggests a downward shift in the entire sample population's nutritional status relative to the reference population. The farther away mean *z* scores are from 0, the higher the severity of malnutrition.

Child Growth Measures of Malnutrition

Information on anthropometry training, standardisation, and data collection methodology can be found in Chapter 1. Appendix C, **Table C.7** provides the anthropometry standardisation results. The 2022 TDHS-MIS identified a total of 5,744 children under age 5 who were eligible for height and weight measurements. Valid height-for-age measurements were obtained for 96% of eligible children, valid weight-for-height measurements were obtained for 97% of eligible children, and valid weight-for-age measurements were obtained for 97% of eligible children (Appendix C, **Table C.8**). Appendix C, **Table C.8** provides additional information on the completeness and quality of anthropometry data for children.

Data collection included remeasurement of children as described in Chapter 1. The calculation of final *z* scores was based on the first measurement among children randomly selected for remeasurement, while the calculation of final *z* scores was based on the second measurement among children flagged for remeasurement due to out-of-range values. The remeasurement completion rate was over 99% among those selected for remeasurement. Appendix C, **Table C.9** provides additional details on remeasurement data (WHO and UNICEF 2019).

During measurements, 3% of children had hairstyles or ornamentation that interfered with height measurement, and 1% of children were not minimally dressed or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.10**).

Thirty percent of children under age 5 are stunted (too short for their age), including 9% who are severely stunted. Three percent are wasted (too thin for their height), including 1% who are severely wasted. Twelve percent of children are underweight (too thin for their age), including 3% who are severely underweight. Four percent of children are overweight (**Table 11.1** and **Figure 11.1**).

Trends: The prevalence of stunting and underweight has decreased over the years (**Figure 11.2**). Stunting decreased from 42% in 2010 to 30% in 2022, and underweight decreased from 16% to 12% over the same period. The prevalence of wasting decreased from 7% in 1991–92 to 3% in 2022. The prevalence of overweight in children has remained relatively stable over the past 30 years (4%–6%).

Figure 11.1 **Nutritional status of children**

Percentage of children under age 5 who are malnourished by severity

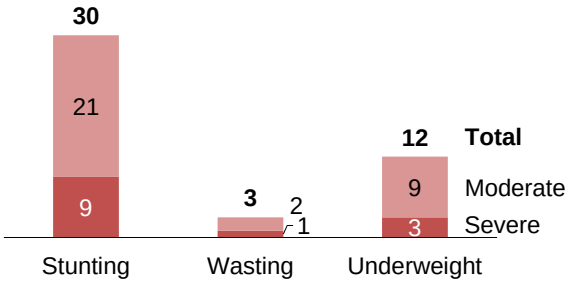

Figure 11.2 **Trends in child growth measures**

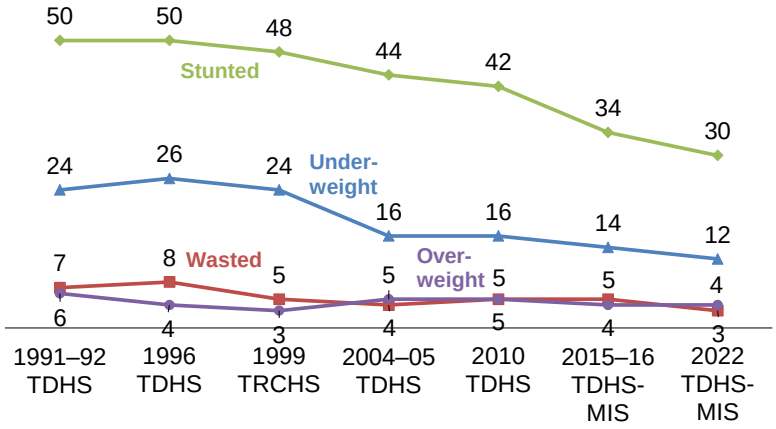
Percentage of children under age 5 who are malnourished

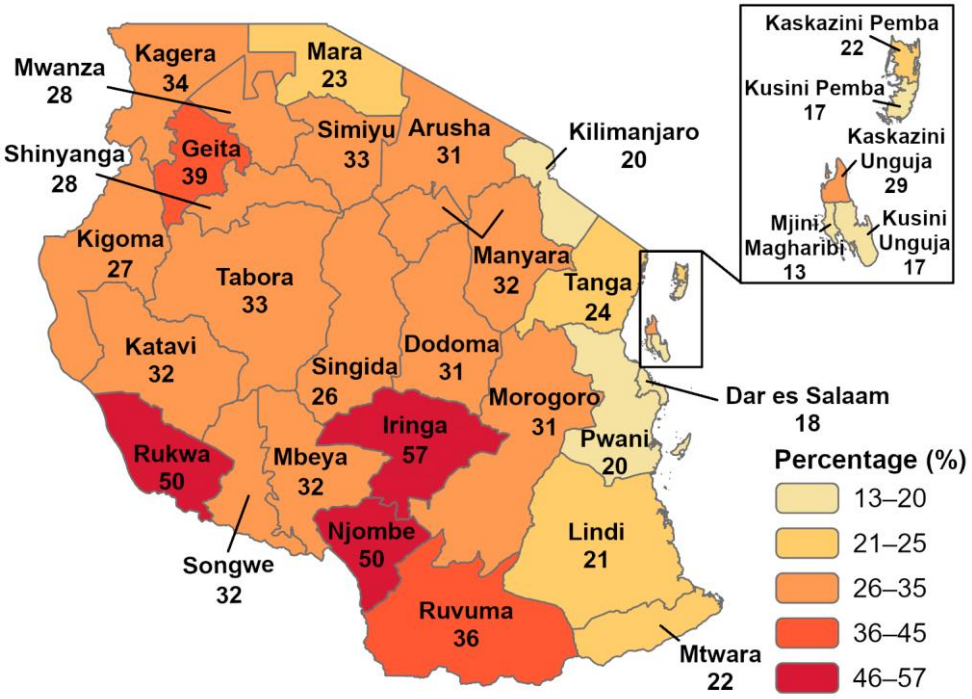


Patterns by background characteristics

- Stunting is more prevalent among children of mothers with no formal education (36%) than among children of mothers with a secondary education or higher (21%).
- The prevalence of stunting and underweight decreases with increasing household wealth, from 39% and 16%, respectively, in the lowest wealth quintile to 15% and 8% in the highest quintile.
- Children born to mothers who are thin are more likely to be wasted (11%) and underweight (21%) than children whose mothers are of normal weight (2% and 12%, respectively).
- Stunting is more prevalent in rural areas (33%) than in urban areas (21%).
- Stunting is higher in Tanzania Mainland (30%) than in Zanzibar (18%). Conversely, wasting is higher in Zanzibar (8%) than in Tanzania Mainland (3%).
- By zone, the prevalence of stunting is highest in Southern Highlands (46%) and lowest in Southern (22%). Regional variation in stunting is also observed; the prevalence is highest in Iringa, Njombe, and Rukwa (50% or above) and lowest in Kusini Unguja and Kusini Pemba (17% each) (**Map 11.1**).

Map 11.1 Stunting in children by region

Percentage of children under age 5 who are stunted



11.2 Growth Monitoring and Promotion

Growth monitoring and promotion programmes include monitoring children's nutritional status through physical growth measurements and using this information to provide caregivers with counselling and referrals of children who have growth failure (WHO 2013; WHO 2017a). An important component of growth monitoring is regular measurement of children's weight and length/height.

Weight measured in the last 3 months

Percentage of children under age 5 who had their weight measured in the last 3 months.

Weight and height measured in the last 3 months

Percentage of children under age 5 who had their weight and height measured in the last 3 months.

Sample: Children under age 5

Sixty-eight percent of children under age 5 had their weight measured in the 3 months before the survey, while 8% had height measurements taken. Overall, 8% of children had both weight and height measurements taken (**Table 11.2**).

Patterns by background characteristics

- The percentage of children who had their weight measured is higher among those age 0–23 months (84%) than among those age 24–59 months (57%).
- There is wide variation by zone in the percentage of children who had their weight and height measured. Weight measurements were lowest in Zanzibar (41%) and highest in Southern Highlands (93%), while height measurements were lowest in Eastern and Southern (3%) and highest in Southern Highlands (47%).

- The percentage of children who had both weight and height measurements taken increases with increasing mother's education and household wealth.

11.3 Infant and Young Child Feeding Practices

Optimal infant and young child feeding (IYCF) practices are critical to the survival, good health, and development of young children. Recommended IYCF practices include early initiation of breastfeeding (within the first hour after birth), exclusive breastfeeding for the first 2 days after birth, exclusive breastfeeding for the first 6 months of life, continued breastfeeding for 2 years or more, and introduction of safe, appropriate, and adequate complementary foods at age 6 months. This section reports on IYCF indicators for children under age 2 (WHO and UNICEF 2021).

11.3.1 Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth

Breastfeeding supports children's growth and development and benefits mothers' health. Initiation of breastfeeding within the first hour of birth is important for both the mother and the child. The first breast milk contains colostrum, which is highly nutritious and has antibodies that protect the newborn from infections. Early initiation of breastfeeding also encourages bonding between the mother and her newborn, especially through skin-to-skin contact, which facilitates the production of breast milk. Feeding newborns anything other than breast milk in the first 2 days after birth can delay early initiation of breastfeeding and interrupt exclusive breastfeeding and is not recommended unless medically indicated (WHO and UNICEF 2021).

Ever breastfed

Percentage of children born in the last 2 years who were ever breastfed.

Early initiation of breastfeeding

Percentage of children born in the last 2 years who were put to the breast within 1 hour of birth.

Exclusive breastfeeding for the first 2 days after birth

Percentage of children born in the last 2 years who were fed exclusively with breast milk for the first 2 days after birth.

Sample: Children born in the last 2 years

Among children born in the 2 years preceding the survey, 95% were breastfed at some point; 70% were breastfed within an hour after birth, and 90% were exclusively breastfed (given nothing other than breast milk to eat or drink) for the first 2 days after birth (**Table 11.3**).

Patterns by background characteristics

- Notably, the percentages of infants breastfed within an hour after birth and exclusively breastfed during the first 2 days after birth are lowest in the highest wealth quintile (63% and 85%, respectively).
- Early initiation of breastfeeding is higher among women who were assisted by health personnel at delivery (73%) than among those assisted by a traditional birth attendant (62%) and those who did not receive any assistance (54%). A similar pattern is observed for exclusive breastfeeding in the first 2 days. Also, early initiation of breastfeeding is higher (73%) among women who delivered at a health facility than among those who delivered at home (60%).
- There are no differences in early initiation of breastfeeding and exclusive breastfeeding in the first 2 days after birth between children whose mothers did and did not receive breastfeeding counselling

during postnatal care (PNC) and between those whose mothers were and were not observed breastfeeding during PNC.

- Seventy-two percent of women in rural areas initiated breastfeeding within an hour after birth, as compared with 66% in urban areas. By region, early initiation of breastfeeding is lowest in Kusini Unguja (46%), Mbeya (52%), and Mwanza (54%) and highest in Iringa (84%), Lindi (86%), and Rukwa (90%).

11.3.2 Exclusive Breastfeeding and Mixed Milk Feeding

In the first 6 months of life, children should be exclusively breastfed; that is, they should be given nothing but breast milk. Exclusive breastfeeding for the first 6 months lowers the risk of infections that can lead to diarrhoea and respiratory illnesses and provides all of the nutrients and liquid an infant requires for optimal growth and development. Mixed milk feeding, in which children are fed both breast milk and formula or animal milk within the first 6 months, has the adverse effect of reducing breast milk output because the production of breast milk is modulated by the frequency and intensity of suckling. Mixed feeding under age 6 months also can increase children's risk of diarrhoea, alter their intestinal microflora, and lead to early cessation of breastfeeding (WHO and UNICEF 2021).

Exclusive breastfeeding under 6 months

Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day.

Sample: Youngest children age 0–5 months living with their mother

Mixed milk feeding under 6 months

Percentage of children age 0–5 months who were fed both breast milk and formula and/or animal milk during the previous day.

Sample: Youngest children age 0–5 months living with their mother

Figure 11.3 **Infant feeding practices by age**

Percent distribution of youngest children age 0–5 months

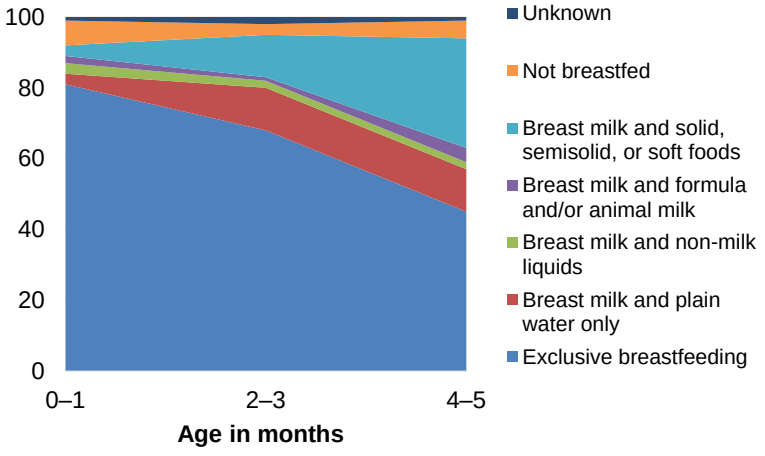


Figure 11.3, **Table 11.4**, and **Table 11.5** show the pattern of how children are fed in the first 6 months. Overall, 64% of children age 0–5 months are exclusively breastfed, 9% are receiving breast milk and plain water only, 2% are receiving breast milk and non-milk liquids, 2% are receiving breast milk and formula and/or animal milk, and 16% are receiving breast milk and solid, semisolid, or soft foods (**Table 11.5**). Five percent of children age 0–5 months are not breastfed at all. At age 0–1 month, 81% of children are exclusively breastfed as per WHO recommendations. The percentage decreases to 68% by 2–3 months and to 45% by 4–5 months. The percentage of children consuming breast milk in combination with solid, semisolid, or soft foods increases from 3% at age 0–1 month to 12% at age 2–3 months and 31% at age 4–5 months.

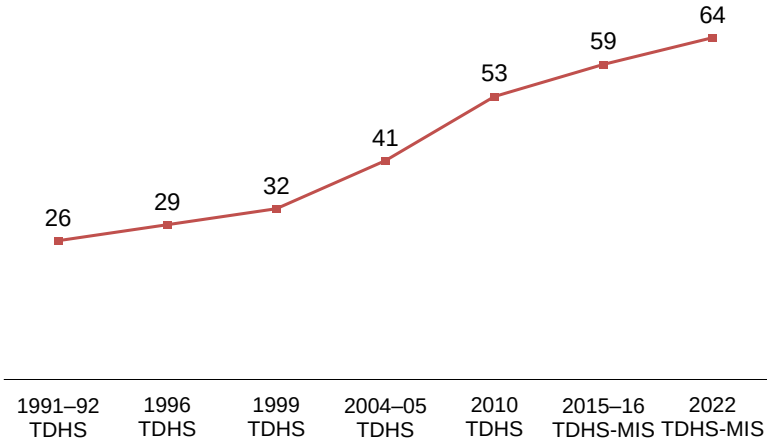
Trends: Exclusive breastfeeding among children under 6 months has increased substantially over time, from 26% in 1991–92 to 64% in 2022 (**Figure 11.4**).

Patterns by background characteristics

- Exclusive breastfeeding among children age 0–5 months is slightly higher in urban areas (67%) than in rural areas (63%) (**Table 11.4**).
- Exclusive breastfeeding is higher in Tanzania Mainland (65%) than in Zanzibar (41%), with the lowest prevalence recorded in Pemba (31%).

Figure 11.4 **Trends in exclusive breastfeeding**

Percentage of youngest children age 0–5 months exclusively breastfed



11.3.3 Continued Breastfeeding and Bottle Feeding

Breastfeeding should continue for the first 2 years or beyond because breast milk lowers children's risk of illness, promotes their recovery during illness, and remains an important source of nutrients for healthy growth and development. Longer durations of breastfeeding have many health benefits for women, including reducing risks of certain breast and ovarian cancers and diabetes. The nipple on a feeding bottle is susceptible to contamination and increases the risk of disease among children (WHO and UNICEF 2021). Thus, bottle feeding is not recommended for children under age 2.

Continued breastfeeding

Percentage of children age 12–23 months who were fed breast milk during the previous day.

Sample: Children age 12–23 months

Bottle feeding

Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day.

Sample: Children age 0–23 months

Among Tanzanian children age 12–23 months, 62% are currently breastfeeding. Five percent of children age 0–23 months are bottle fed (**Table 11.4**).

Patterns by background characteristics

- The percentage of children age 12–23 months who are currently breastfeeding declines sharply with increasing age, from 86% at 12–15 months to 35% at 20–23 months.
- By region, continued breastfeeding is highest in Dodoma (84%) and lowest in Geita (42%).
- The percentage of children age 0–23 months who are bottle fed is higher in urban areas (11%) than in rural areas (3%).

- Bottle feeding is more prevalent in Zanzibar (13%) than in Tanzania Mainland (5%).
- Use of a bottle with a nipple increases with increasing mother's education and household wealth.

11.3.4 Introduction of Complementary Foods

After the first 6 months, breast milk alone is no longer sufficient to meet all of the nutritional needs of an infant. After 6 months, appropriate complementary foods should be introduced while breastfeeding is continued until age 2 or older. Liquids and foods consumed by children under age 2 in the day or night preceding the interview (**Table 11.6** and **Table 11.7**) show some unhealthy feeding practices including sweet drinks and salty foods. The transition from exclusive breastfeeding to family foods is when children are most vulnerable to becoming undernourished. During this time, it is important that children receive solid, semisolid, or soft foods (WHO 2003; WHO and UNICEF 2021).

Introduction of solid, semisolid, or soft foods

Percentage of children age 6–8 months who were fed solid, semisolid, or soft foods during the previous day.

Sample: Youngest children age 6–8 months living with their mother

Overall, 89% of children were introduced to solid, semisolid, or soft foods at age 6–8 months (**Table 11.10**).

11.3.5 Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption

Infants and young children should be fed a minimum acceptable diet, which means that they are fed meals with appropriate frequency and a variety of foods to meet their energy and nutrient needs. The minimum acceptable diet indicator is a combination of minimum dietary diversity and minimum meal frequency for breastfeeding children and the same combination along with minimum milk feeding frequency for nonbreastfed children.

Minimum dietary diversity is a proxy for adequate micronutrient density of foods. Consumption of food from at least five groups means that the child has a higher likelihood of consuming at least one animal source of food and at least one fruit or vegetable in addition to a staple food such as grains, roots, or tubers. The five groups should come from a list of eight food groups: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency is a proxy for meeting energy requirements. Breastfed children age 6–8 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least twice a day. Breastfed children age 9–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least three times a day. Nonbreastfed children age 6–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods or milk feeds at least four times a day and if at least one of the feeds is a solid, semisolid, or soft food.

Minimum milk feeding frequency is a proxy for meeting the nutrient needs of nonbreastfed children. Milk and milk products are important sources of nutrients. Nonbreastfed children age 6–23 months are considered to be fed with a minimum milk feeding frequency if they receive at least two feeds of milk and/or milk products each day.

Egg and/or flesh food consumption by breastfed and nonbreastfed children age 6–23 months increases energy, protein, and nutrient intake. Eggs, meat, fish, poultry, and organ meats are important sources of nutrients that support healthy child growth (WHO and UNICEF 2021).

Minimum dietary diversity

Percentage of children age 6–23 months who were fed a minimum of five out of eight defined food groups during the previous day. The eight food groups are as follows: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency

Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (including milk feeds for nonbreastfed children) the minimum number of times or more during the previous day.

Minimum milk feeding frequency

Percentage of nonbreastfed children age 6–23 months who were given at least two milk feeds during the previous day.

Minimum acceptable diet

Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day. This indicator is a composite of children fed with a minimum dietary diversity and a minimum meal frequency, with the additional requirement that nonbreastfed children are fed with a minimum milk feeding frequency.

Sample: Youngest children age 6–23 months living with their mother

Egg and/or flesh food consumption

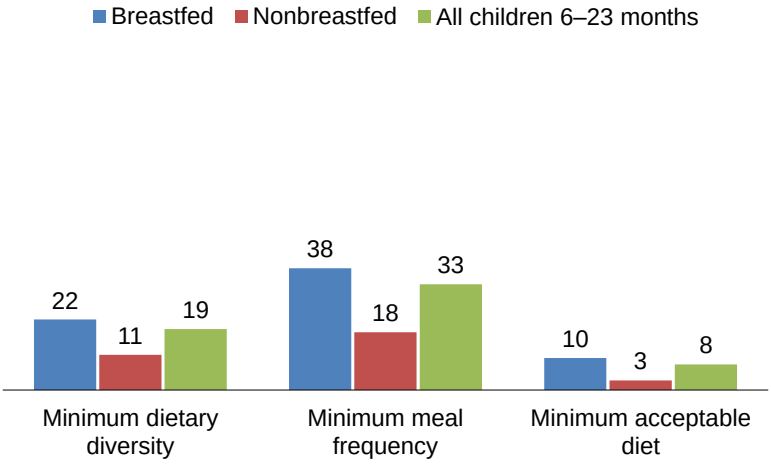
Percentage of children age 6–23 months who were fed eggs and/or flesh food during the previous day.

Sample: Youngest children age 6–23 months living with their mother

Nineteen percent of children age 6–23 months received the minimum number of food groups during the previous day or night (22% of breastfed children and 11% of nonbreastfed children), while 33% were fed the minimum number of times according to their age (38% of breastfed children and 18% of nonbreastfed children). Among nonbreastfed children, 12% received the minimum number of milk feeds the previous day. Overall, 8% of children were fed a minimum acceptable diet (10% of breastfed children and 3% of nonbreastfed children) (**Table 11.8** and **Figure 11.5**).

Figure 11.5 **IYCF indicators on minimum acceptable diet by breastfeeding status**

Percentage of children age 6–23 months meeting feeding practice recommendations



In addition, 44% of children age 6–23 months consumed eggs and/or flesh food such as meat, fish, poultry, and organ meats (**Table 11.9**).

Patterns by background characteristics

- A higher percentage of children in urban areas than rural areas are fed with a minimum dietary diversity (26% versus 16%), are fed with a minimum meal frequency (36% versus 32%), and are fed a minimum acceptable diet (11% versus 7%). Similarly, children in urban areas are more likely to consume eggs and/or flesh foods (49% versus 42%).

- By region, the percentage of children fed with a minimum dietary diversity is highest in Kusini Unguja and Kilimanjaro (41%) and lowest in Mara (5%), the percentage of children fed the minimum number of times each day is highest in Dar es Salaam (56%) and lowest in Lindi (7%), and the percentage of children fed a minimum acceptable diet is highest in Kilimanjaro (25%) and lowest in Morogoro (less than 1%).

- Minimum dietary diversity, minimum meal frequency, minimum acceptable diet, and consumption of eggs and/or flesh foods increase with increasing mother's education and household wealth.

11.3.6 Sweet Beverage Consumption, Unhealthy Food Consumption, and Zero Vegetable or Fruit Consumption among Children

Unhealthy infant and young child feeding practices should be avoided because they can replace nutritious foods that provide important nutrients for children and promote unhealthy weight gain. For infants and young children, consumption of sweet foods and beverages increases the risk of dental caries and obesity in childhood. In addition, too much salt in the diet increases the risk of noncommunicable diseases, and unhealthy fats and refined carbohydrates contribute to unhealthy weight gain. Children consuming diets low in vegetables and fruits have reduced nutrient intakes, which can negatively impact healthy growth and development; low vegetable and fruit consumption is also associated with noncommunicable diseases later in life. The indicator definition below for unhealthy food consumption describes "sentinel unhealthy foods," which are foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by infants and young children (WHO and UNICEF 2021).

Sweet beverage consumption

Percentage of children age 6–23 months who were given a sweet beverage during the previous day.

Unhealthy food consumption

Percentage of children age 6–23 months who were fed sentinel unhealthy foods during the previous day.

Zero vegetable or fruit consumption

Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day.

Sample: Youngest children age 6–23 months living with their mother

Thirty percent of children age 6–23 months were given sweet beverages, 7% were given unhealthy foods, and 40% did not consume any vegetables or fruits during the previous day (**Table 11.9**).

Patterns by background characteristics

- The percentages of children who consumed sweet beverages and unhealthy foods during the previous day are higher in urban areas (48% and 11%, respectively) than in rural areas (23% and 6%), while the percentage who did not consume any vegetables or fruits is higher in rural areas (44% versus 31%).

- Consumption of sweet beverages and unhealthy foods is higher in Zanzibar (63% and 35%, respectively) than in Tanzania Mainland (29% and 7%).

- The percentages of children who are fed sweet beverages and unhealthy foods generally increase with increasing mother's education and household wealth.
- The percentage of children who did not consume any vegetables or fruits during the previous day is highest in the lowest wealth quintile (47%) and lowest in the highest quintile (24%).

11.3.7 Infant and Young Child Feeding (IYCF) Indicators

Table 11.10 summarises all 17 WHO-UNICEF IYCF indicators.

11.4 Infant and Young Child Feeding Counselling

IYCF counselling helps support appropriate breastfeeding and complementary feeding practices (WHO 2003; WHO 2018). Counselling is an interactive process that helps empower mothers and caregivers to follow the recommended IYCF practices. Counselling can take place in health facilities and the community and is delivered by trained health providers, community health workers, and others in the community.

Mothers who received IYCF counselling in the last 6 months

Percentage of mothers with children age 6–23 months who received IYCF counselling in the last 6 months from a health care provider or community health worker.

Sample: Women whose youngest child age 6–23 months is living with them

Overall, 18% of mothers with children age 6–23 months received counselling in the last 6 months on how or what to feed their child **Table 11.11**.

Patterns by background characteristics

- Twenty-six percent of mothers living in urban areas received IYCF counselling, as compared with 15% of those living in rural areas.
- The percentage of mothers who received counselling is higher in Zanzibar (26%) than in Tanzania Mainland (18%). By zone, a higher percentage of women in South West Highlands (31%) than Western (4%) received IYCF counselling.
- By region, IYCF counselling is highest in Dar es Salaam (46%) and lowest in Tabora and Mara (1% each).
- The percentage of mothers who received counselling increases with increasing education and household wealth.

11.5 Micronutrient Supplementation and Deworming among Children

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Micronutrient deficiency can be caused by a lack of consumption of foods that supply vitamins and minerals, as well as by infections and genetic abnormalities. Strategies to prevent or address micronutrient deficiency include agricultural approaches such as biofortification, food-based approaches that can be complemented with food fortification, and, for specific life stages and population groups, direct micronutrient supplementation (USAID 2019).

Iron is a micronutrient that plays an important role in numerous biological systems. Iron deficiency is one of the primary causes of anaemia. Interventions targeting iron deficiency and anaemia include periodically giving children iron tablets or syrup and/or iron-containing micronutrient powders (WHO 2011a; WHO 2016a; WHO 2016b).

Vitamin A is a micronutrient that supports the immune system and plays an important role in maintaining the epithelial tissue in the body. Severe vitamin A deficiency can cause eye damage, increase the severity of infections such as those causing measles, and slow recovery from illness. Vitamin A supplementation programmes help reduce vitamin A deficiency and mortality in children (WHO 2011b).

Soil-transmitted helminth infections can cause internal bleeding, inflammation, impaired nutrient absorption, diarrhoea, vomiting, and loss of appetite. Deworming programmes help reduce the burden of helminth infections (WHO 2017b).

Iron-containing supplements

Percentage of children age 6–59 months who were given iron-containing supplements in the last 12 months, including micronutrient powders.

Sample: Children age 6–59 months

Vitamin A supplements

Percentage of children age 6–59 months who were given vitamin A supplements in the last 6 months.

Sample: Children age 6–59 months

Deworming medication

Percentage of children age 12–59 months who were given deworming medication in the last 6 months.

Sample: Children age 12–59 months

Overall, 11% of children age 6–59 months were given iron-containing supplements (in the form of multiple micronutrient powders) in the last 12 months, and 53% received vitamin A supplements within 6 months prior to the survey. Among children age 12–59 months, 50% received deworming medication within the 6 months prior to the survey (**Table 11.12**).

Patterns by background characteristics

- The proportion of children receiving multiple micronutrient powders and deworming medication generally increases with increasing mother's education and household wealth.
- Children in urban areas are more likely to receive multiple micronutrient powders and deworming medication (18% and 61%, respectively) than those in rural areas (8% and 45%).
- By region, the percentage of children receiving multiple micronutrient powders is highest in Dar es Salaam (36%) and lowest in Tabora and Songwe (both at 1%). Vitamin A supplementation is highest in Njombe (91%) and Iringa (90%) and lowest in Simiyu (29%) and Arusha (33%).
- The percentage of children receiving deworming medication is highest in Iringa (91%) and Njombe (90%) and lowest in Simiyu (19%) and Rukwa (20%).

11.6 Anaemia Prevalence in Children and Women

Anaemia is a condition characterised by insufficient haemoglobin, a protein responsible for transporting oxygen in the blood (Chaparro and Suchdev 2019). In children, anaemia can impair cognitive development and is associated with long-term health consequences. When anaemia is severe, it can cause death (Chaparro and Suchdev 2019).

In the 2022 TDHS-MIS, the main test for anaemia was done using capillary blood, and this test was conducted in the subsample for standard biomarkers of 50% of households. Capillary blood-based anaemia

estimates were used to look at differences by background characteristics and to assess trends over time. However, recent studies show that venous blood may provide more accurate estimates for anaemia. Women and children in the micronutrient subsample of the survey provided venous blood to assess anaemia. For more information on anaemia measurement procedures in the 2022 TDHS-MIS, see Chapter 1. Results from anaemia testing on capillary blood are presented first, followed by results from anaemia testing on venous blood samples.

11.6.1 Anaemia in Children Based on Capillary Blood Samples

Anaemia in children

Anaemia status	Haemoglobin level in grams/decilitre*
Anaemic	<11.0
Mildly anaemic	10.0–10.9
Moderately anaemic	7.0–9.9
Severely anaemic	<7.0
Not anaemic	≥11.0

* Haemoglobin levels are adjusted for altitude in enumeration areas above 1,000 metres.

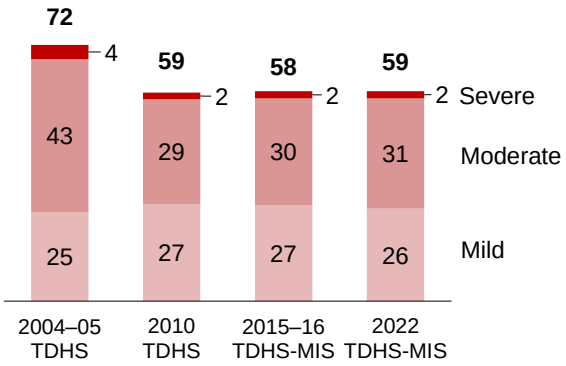
Sample: Children age 6–59 months

Table 11.13.1 presents information on the prevalence and severity of anaemia among children age 6–59 months based on capillary blood samples. Anaemia testing using capillary blood was successfully completed for 97% of eligible children (Appendix C, **Table C.13.1**). The overall prevalence of anaemia among children 6–59 months based on capillary blood is 59%, with 26% having mild anaemia, 31% having moderate anaemia, and 2% having severe anaemia.

Trends: The percentage of children age 6–59 months classified as anaemic decreased from 72% in 2004–05 to 59% in 2010 and has since remained relatively stable (**Figure 11.6**). It should be noted that the greater variability in anaemia measures taken using capillary blood as compared with venous blood may affect the reliability of trends in estimates based on capillary blood samples.

Figure 11.6 **Trends in childhood anaemia: capillary blood**

Percentage of children age 6–59 months classified as anaemic

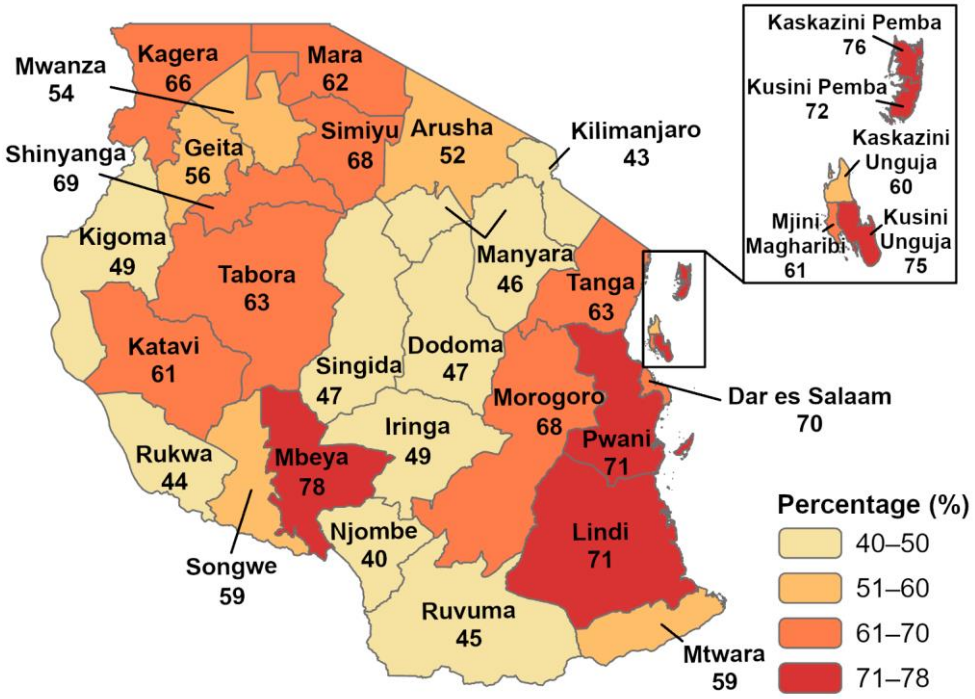


Patterns by background characteristics

- The prevalence of anaemia declines gradually with age, from 76% among children age 6–11 months to 44% among children age 48–59 months.
- By zone, the prevalence of anaemia is highest in Eastern (70%) and lowest in Southern Highlands (45%).
- Children in the Mbeya and Kaskazini Pemba regions have the highest prevalence of anaemia (78% and 76%, respectively), while those in the Njombe and Kilimanjaro regions have the lowest prevalence (40% and 43%) (**Map 11.2**).
- As expected, children who tested positive for malaria in the field have a higher prevalence of anaemia (83%) than those who tested negative (57%).

Map 11.2 Anaemia in children by region: capillary blood

Percentage of children age 6–59 months with any anaemia



11.6.2 Anaemia in Women Based on Capillary Blood Samples

Anaemia in adults can cause fatigue, lethargy, reduced physical productivity, and poor work performance (Chaparro and Suchdev 2019). Anaemia is a major concern among pregnant women because it can lead to increased maternal mortality and poor birth outcomes (Haider et al. 2013).

Haemoglobin levels below which women are considered anaemic

Respondents	Haemoglobin level in grams/decilitre*
Nonpregnant women age 15–49	Less than 12.0
Pregnant women age 15–49	Less than 11.0

* Haemoglobin levels are adjusted for cigarette smoking and for altitude in enumeration areas above 1,000 metres.

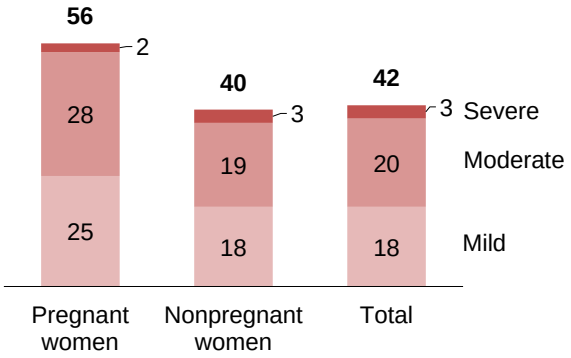
Sample: Women age 15–49

Anaemia testing using capillary blood was successfully completed for 99% of eligible women (Appendix C, **Table C.14.1**). The overall prevalence of anaemia among women age 15–49 measured by capillary blood is 42%.

Trends: The prevalence of anaemia among women has remained relatively stable over time (48% in 2004–05, 40% in 2010, 45% in 2015–16, and 42% in 2022). It should be noted that the greater variability in anaemia measures taken using capillary blood as compared with venous blood may affect the reliability of trends in estimates based on capillary blood samples.

***Figure 11.7* Anaemia in pregnant and nonpregnant women: capillary blood**

Percentage of women age 15–49 classified as anaemic



Patterns by background characteristics

- The prevalence of anaemia is higher among pregnant women (56%) than among nonpregnant women (40%) (**Table 11.14.1** and **Figure 11.7**).
- The prevalence of anaemia is higher in Zanzibar (60%) than in Tanzania Mainland (41%). In Zanzibar, the prevalence is highest in Kaskazini Pemba (65%) and Mjini Magharibi (61%). In Tanzania Mainland, the highest prevalence is observed in Pwani (58%) and Mbeya (51%). The only region with a prevalence of less than 20% is Rukwa (15%).

11.6.3 Anaemia in Children and Women Based on Venous Blood Samples

Literature shows that there is a greater variability in anaemia measures taken using capillary blood that may affect the validity and reliability of anaemia estimates based on capillary blood samples (Neufeld et al. 2019). In the 2022 TDHS-MIS micronutrient subsample, haemoglobin and additional tests were conducted using venous blood in women and children to gain more insight on current anaemia status and causes of anaemia. Summary results on the prevalence of anaemia based on venous blood samples are presented below. More detailed results of the anaemia testing using venous blood will be presented in a separate micronutrient report and in an anaemia brief. Prevalence estimates based on capillary and venous blood are not comparable and should not be used interchangeably.

Anaemia testing using venous blood was successfully completed for 93% of eligible children (Appendix C, **Table C.13.2**). The overall prevalence of anaemia among children age 6–59 months based on venous blood is 47%, with 25% having mild anaemia, 21% having moderate anaemia, and 1% having severe anaemia (**Table 11.13.2**). The percentage of children with any anaemia is higher in rural areas (49%) than in urban areas (42%).

Anaemia testing using venous blood was successfully completed for 97% of eligible women (Appendix C, **Table C.14.2**). The overall prevalence of anaemia among women age 15–49 measured by venous blood is 37% (**Table 11.14.2**). Nineteen percent of women have mild anaemia, 17% have moderate anaemia, and 2% have severe anaemia. The percentage of women with any anaemia is slightly higher in urban than in rural areas (40% versus 36%). A comparison of haemoglobin concentration and anaemia using capillary and venous blood for both children and women is provided in Appendix C, **Table C.15**.

11.7 Adults' Nutritional Status

Chronic energy deficiency is caused by eating too little or having an unbalanced diet that lacks adequate nutrients. Women of reproductive age (age 15–49) are especially vulnerable to chronic energy deficiency and malnutrition due to low dietary intakes, inequitable distribution of food within the household,

improper food storage and preparation, dietary taboos, infectious diseases, and inadequate care practices. Chronic energy deficiency leads to low productivity among adults and greater morbidity and mortality (WHO 1995). In addition, undernutrition among women is a major risk factor for adverse birth outcomes. Overweight and obesity have adverse health outcomes as well. Overweight and obesity are major risk factors for several chronic diseases, including diabetes, cardiovascular diseases, and cancer.

Body mass index (BMI) is the ratio of weight relative to height squared; it is used to measure nutritional status among adults age 20 or older. BMI values are independent of age and sex. Adult women age 20 or older whose height is less than 145 centimetres are classified as being of short stature.

BMI-for-age, the ratio of weight relative to height for different age groups, is used to measure nutritional status among children and adolescents age 5–19 (WHO 2007). BMI-for-age is sex and age specific. The reason is that children and adolescents are still growing and the timing of peak growth velocity differs in boys and girls. In the DHS surveys, BMI-for-age is reported among adolescents age 15–19. Similarly, short stature among adolescent women (age 15–19) is assessed according to low height-for-age.

Body mass index (BMI)

BMI is calculated by dividing weight in kilogrammes by height in metres squared (kg/m^2).

Adult status	BMI
Too thin for height	Less than 18.5
Normal	Between 18.5 and 24.9
Overweight	Between 25.0 and 29.9
Obese	Greater than or equal to 30.0

Sample: Women age 20–49 who are not pregnant and who have not had a birth in the 2 months before the survey and men age 20–49

BMI-for-age

BMI-for-age is measured in *z* score standard deviations (SD).

Adolescent status	BMI-for-age
Too thin for height	Less than −1 SD
Normal	Between −1 SD and +1 SD
Overweight	Between +1 SD and +2 SD
Obese	Greater than +2 SD

Sample: Women age 15–19 who are not pregnant and who have not had a birth in the 2 months before the survey and men age 15–19

Short stature

Percentage of women age 20–49 with height under 145 cm.

Sample: Women age 20–49

Percentage of women age 15–19 with height-for-age *z* score less than −2 SD.

Sample: Women age 15–19

11.7.1 Nutritional Status of Women

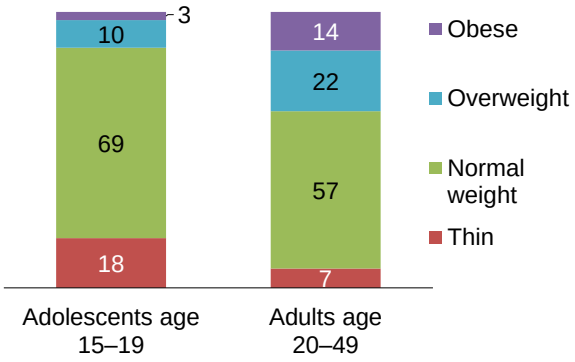
Height and weight data were collected for 96% of eligible women age 15–49 (Appendix C, **Table C.6**). During measurements, 8% of women had hairstyles or ornamentation that interfered with height measurement, and 3% of women were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.11**).

Among women age 20–49, data on height and weight were used to calculate two measures of nutritional status: height and BMI. Overall, 2% of women are shorter than 145 cm. Seven percent of women are thin, while 36% are overweight or obese (**Table 11.15.1** and **Figure 11.8**).

Among adolescent women age 15–19, data on height, weight, and age were used to calculate two measures of nutritional status: height-for-age and BMI-for-age. Overall, 12% of adolescents are of short stature, 18% are thin, and 12% are overweight or obese (**Table 11.15.2** and **Figure 11.8**).

Figure 11.8 **Nutritional status of adolescent and adult women**

Percent distribution of women age 15–19 and 20–49 by nutritional status



Patterns by background characteristics

- Among women age 20–49, those who are younger (age 20–29) are more likely to be thin (10%) than those who are older (age 30–49) (5%). Conversely, the percentage of women who are overweight or obese increases with age, from 26% among those age 20–29 to 46% among those age 40–49 (**Table 11.15.1**).
- The prevalence of overweight or obesity among women age 20–49 increases with increasing education and household wealth.
- The percentage of women who are overweight or obese is higher in Zanzibar (46%) than in Tanzania Mainland (36%) and higher in urban (50%) than rural (28%) areas. There is less variation by place of residence in the proportion of women who are thin.
- The proportion of women who are overweight or obese is highest in Dar es Salaam (54%), Kusini Unguja (54%), and Mbeya (53%) and lowest in Rukwa and Mara (18% each). The proportion of women who are thin is highest in Kaskazini Unguja (14%) and lowest in Iringa (1%).
- Among adolescent women age 15–19, the percentage who are overweight or obese is higher in urban areas (20%) than in rural areas (9%). There are no substantial differences by residence in the percentage of women who are thin (**Table 11.15.2**).
- The percentage of adolescents who are overweight or obese generally increases with increasing education and household wealth.

11.7.2 Nutritional Status of Men

Height and weight data were collected for 88% of eligible men age 15–49 (Appendix C, **Table C.6**). During measurements, 4% of men had hairstyles or ornamentation that interfered with height measurement, and 3% of men were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.11**).

Among men age 20–49, data on height and weight were used to calculate BMI. Overall, 17% of men are overweight or obese and 9% are thin (**Table 11.15.3**).

Among adolescent men age 15–19, data on height, weight, and age were used to calculate BMI-for-age. Three percent of adolescent men are overweight or obese, and 41% are thin (**Table 11.15.4**).

Patterns by background characteristics

- The prevalence of overweight and obesity among men age 20–49 increases with increasing age, education, and household wealth (**Table 11.15.3**).
- The percentage of men who are overweight or obese is twice as high in urban areas (26%) as in rural areas (12%).
- By region, the percentage of men who are overweight or obese is highest in Kusini Unguja (32%), Dar es Salaam (30%), and Mbeya (28%) and lowest in Shinyanga (6%), Simiyu (7%), Tabora (10%), and Geita (10%).
- The percentage of adolescent men age 15–19 who are overweight or obese is higher in Zanzibar (10%) than in Tanzania Mainland (3%).

11.8 Women's Dietary Practices

Dietary practices that support a healthy diet include eating a variety of different foods and food groups and limiting consumption of sugary beverages and unhealthy foods. Eating a variety of unprocessed foods helps women consume the appropriate amount of essential vitamins and minerals. A healthy diet also protects against overweight, obesity, and noncommunicable diseases.

Minimum dietary diversity for women is an indicator of diet diversity validated for nonpregnant women age 15–49. The indicator is based on 10 food groups: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits. Women who consumed at least five of the 10 possible food groups in the 24 hours before the survey were classified as having minimally adequate dietary diversity. Deficiencies in micronutrients such as iron, iodine, vitamin A, folate, and zinc can have devastating consequences for the human body. Women, particularly those of childbearing age, are especially vulnerable due to their greater needs for essential vitamins and minerals. Having minimally adequate dietary diversity is important for micronutrient adequacy (FAO 2021).

Unhealthy foods and sweet beverages should be limited because they are associated with overweight, obesity, and noncommunicable diseases (Askari et al. 2020). Overweight and obesity among women can affect reproductive health and increase complications in pregnancy (Mitchell and Shaw 2015). The indicator for unhealthy food consumption describes "sentinel unhealthy foods," which are fried foods or foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by women (FAO 2021).

Minimum dietary diversity for women

Percentage of women who consumed foods from at least five out of 10 defined food groups during the previous day. The 10 food groups are as follows: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits.

Sample: Women age 15–49

Sweet beverage consumption

Percentage of women who consumed sweet beverages during the previous day.

Sample: Women age 15–49

Unhealthy food consumption

Percentage of women who consumed selected sentinel unhealthy foods during the previous day.

Sample: Women age 15–49

The most commonly consumed foods are those made from grains (95%); meat, fish, poultry, and organ meat (56%); and dark green leafy vegetables (55%). The foods consumed least often are eggs (4%); sweet foods such as chocolate, candies, pastries, cakes, biscuits, ice cream, and popsicles (5%); and nuts and seeds (7%) (**Table 11.16**). Overall, 25% of women age 15–49 consumed foods from at least five of the 10 defined food groups during the day or night preceding the survey, while 28% consumed sweet beverages and 14% consumed unhealthy foods (**Table 11.17**).

Patterns by background characteristics

- The percentage of women with minimum dietary diversity is higher in urban areas (38%) than in rural areas (18%). Similarly, women in urban areas are more likely than those in rural areas to consume sweet beverages (48% versus 18%) and unhealthy foods (24% versus 9%) (**Table 11.17**).
- Consumption of sweet beverages and unhealthy food is higher in Zanzibar (57% and 36%, respectively) than in Tanzania Mainland (27% and 13%).
- Minimum dietary diversity increases with increasing education and household wealth. The same pattern is observed with consumption of sweet beverages and unhealthy foods.
- Minimum dietary diversity is highest in Dar es Salaam (49%), Arusha (45%), and Kilimanjaro (45%) and lowest in Singida and Shinyanga (8% each).
- The percentage of women consuming sweet beverages is highest in Dar es Salaam (71%) and Kusini Unguja (61%) and lowest in Singida (8%) and Kigoma (9%).
- Unhealthy food consumption is highest in Kaskazini Pemba (45%), Kusini Pemba (36%), Dar es Salaam (35%), and Mjini Magharibi (35%) and lowest in Singida (3%), Ruvuma (4%), and Morogoro, Tabora, Shinyanga, and Mtwara (5% each).

11.9 Presence of Iodised Salt in Households

Iodine is a micronutrient that plays an important role in thyroid function, which is critical for reproductive function, growth, and development. It is recommended that household salt be fortified with iodine. Sufficient iodine prevents goitre, brain damage, and other thyroid-related health problems (WHO 2014b).

Household salt iodisation

Percentage of households with iodised salt.

Sample: Households in which salt was tested for iodine content

In Tanzania, salt is fortified with potassium iodate. The 2022 TDHS-MIS tested for the presence of potassium iodate in salt available in the household using a rapid test kit. Among households with tested salt, 84% had iodised salt. Five percent of households did not have salt on the day of the survey (**Table 11.18**).

Patterns by background characteristics

- The proportion of households with iodised salt is higher in urban (94%) than rural (80%) areas.
- By zone, the percentage of households with iodised salt is highest in South West Highlands and Eastern (95% each) and lowest in Southern (41%). By region, the percentage is highest in Arusha, Dar es Salaam, Mbeya, Mara, and Songwe (99% and higher) and lowest in Lindi (34%), Mtwara (47%), and Singida (59%).
- The percentage of households with iodised salt increases with increasing household wealth, from 72% in the lowest wealth quintile to 97% in the highest quintile.

11.10 Urinary Iodine Concentrations in Women

Urinary iodine concentration (UIC) is an indicator of iodine status. Women age 15–49, regardless of pregnancy status, were asked to provide a urine sample for laboratory testing to detect the presence of iodine. Among eligible women, 94% provided urine samples (Appendix C, **Table C.16**). The samples were sent to the Tanzania Food and Nutrition Centre and tested as per the methods described in Chapter 1.

Iodine insufficiency in women

Population	Median urinary iodine concentration in micrograms/litre (µg/L)
Nonpregnant women age 15–49	Less than 100
Pregnant women age 15–49	Less than 150

Sample: Nonpregnant and pregnant women age 15–49 whose urine was tested for iodine

Iodine insufficiency is measured at the population level rather than the individual level through comparing the median UIC for the population with the established cutoff. Median concentrations of urinary iodine were 166.0 µg/L among pregnant women, 157.0 µg/L among nonpregnant women who were breastfeeding, and 196.3 µg/L among nonpregnant women who were not breastfeeding (**Tables 11.19.1** and **11.19.2**). These median concentrations are all above the thresholds. Therefore, these women are not considered to have iodine insufficiency.

Trends: The median concentration of urinary iodine among pregnant women increased from 136.0 µg/L in 2010 to 171.4 µg/L in 2015–16 and then decreased to 166.0 µg/L in 2022. The median concentration among nonpregnant breastfeeding women has increased over time, from 113.3 µg/L in 2010 and 122.9 µg/L in 2015–16 to 157.0 µg/L in 2022. The median concentration among nonpregnant women who are not breastfeeding has remained relatively stable, at 193.6 µg/L in 2010, 203.7 µg/L in 2015–16, and 196.3 µg/L in 2022.

Patterns by background characteristics

- Among nonpregnant women age 15–49, the median UIC generally declines with increasing age, from 193.7 µg/L among those age 15–19 to 165.5 µg/L among those age 40–49. Among pregnant women, median UIC increases from age 15–19 to age 20–24 and decreases thereafter (**Table 11.19.2**). Pregnant women age 30–39 have a median UIC of 139.7 µg/L, which is below the cutoff of 150 µg/L, and thus this population is considered iodine insufficient.
- Among nonpregnant women, the median UIC is lower in rural areas (153.6 µg/L) than in urban areas (254.2 µg/L). Nonpregnant women in the Southern zone (98.0 µg/L) and in Mtwara (87.1 µg/L) and Geita (66.5 µg/L) have median concentrations below the cutoff of 100 µg/L.

- The median UIC among pregnant women in rural areas (139.6 µg/L) is below the cutoff of 150 µg/L. By zone, the median UIC among pregnant women is below the cutoff in Western (117.7 µg/L) and Lake (146.3 µg/L).

- The median UIC among nonpregnant women with at least a secondary education (219.7 µg/L) is higher than that of women with no education (148.3 µg/L). Among pregnant women, those with no education (116.1 µg/L) and those with an incomplete primary education (128.3 µg/L) are considered iodine insufficient, whereas those with a complete primary education and those with a secondary education or higher have median concentrations above the cutoff of 150 µg/L.

- The median UIC increases with increasing household wealth. Among pregnant and nonpregnant women in the lowest quintile, the median concentrations are 116.4 µg/L and 148.1 µg/L, respectively, while the medians among pregnant and nonpregnant women in the highest quintile are 232.0 and 252.4 µg/L, respectively. The median UIC among pregnant women in the lowest three wealth quintiles is below the cutoff of 150 µg/L.

List of Tables

Note: Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards. Figures in parentheses are based on 25–49 unweighted cases.

[1] Recumbent length is measured for children under age 2; standing height is measured for all other children.

[2] Includes children who are below −3 standard deviations (SD) from the WHO Child Growth Standards population median

[3] Excludes children whose mothers were not interviewed

[4] First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.

[5] Information available only for children age 0–35 months

[6] Includes children whose mothers are deceased

[7] Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status is defined using body mass index (BMI) for mothers age 20–49 and BMI-for-age for mothers age 15–19 (as presented in Tables 11.15.1 and 11.15.2).

[8] For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

Table 11.2 Child growth monitoring

Percentage of children under age 5 who had selected measurements performed by a health care provider in the 3 months preceding the survey, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Weight	Height	Weight and height	Number of children
Age in months				
<6	74.5	7.1	7.0	1,115
6–11	92.3	6.8	6.6	1,073

Note: Table is based on children born in the 2 years preceding the survey regardless of whether the children were living or dead at the time of the interview. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
ANC = antenatal care
PNC = postnatal care
[1] Children given nothing other than breast milk to eat or drink during the first 2 days after delivery
[2] Information available for the most recent live birth only
[3] Doctor/assistant medical officer, clinical officer, assistant clinical officer, nurse/midwife, assistant nurse, or maternal and child health aide
[4] Women were asked about counselling on breastfeeding by any health care provider in the first 2 days after their most recent live birth regardless of where they gave birth.

Table 11.4 Breastfeeding status according to age

Among youngest children age 0–5 months living with their mother, percentage exclusively breastfeeding and percentage receiving mixed milk feeding; among all children age 12–23 months, percentage currently breastfeeding; and among all children age 0–23 months, percentage using a bottle with a nipple, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Among youngest children age 0–5 months living with their mother:			Among all children age 12–23 months:		Among all children age 0–23 months:

Table 11.4—*Continued*

Background characteristic	Among youngest children age 0–5 months living with their mother: Percentage exclusively breastfeeding	Percentage receiving mixed milk feeding[1]	Number of children	Among all children age 12–23 months: Percentage currently breast-feeding[2]	Number of children	Among all children age 0–23 months: Percentage using a bottle with a nipple	Number of children
Wealth quintile							
Lowest	56.2	3.4	260	67.2	514	1.5	997
Second	68.3	1.4	226	63.4	438	1.5	867
Middle	62.5	1.9	220	63.4	392	3.3	845
Fourth	72.7	3.8	207	59.1	424	6.7	856
Highest	63.4	7.2	185	57.0	413	14.7	803
Total	64.3	3.4	1,098	62.3	2,180	5.3	4,368

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.
na = not applicable
[1] Received breast milk and infant formula and/or fresh, powdered, or packaged animal milk. Excludes yogurt drinks because they are generally not fed as a substitute for breast milk. Excludes soy milks.
[2] Corresponds to the IYCF indicator "continued breastfeeding"

Table 11.5 Infant feeding practices by age

Percent distribution of youngest children age 0–5 months living with their mother by feeding category, according to age in months, Tanzania DHS-MIS 2022

Age group in months	Breast milk only (exclusively breastfed)	Breast milk and plain water only	Breast milk and non-milk liquids[1]	Breast milk and formula and/or animal milk[2]	Breast milk and solid, semisolid, or soft foods[3]	Not breastfed	Unknown[4]	Total	Number of youngest children age 0–5 months living with their mother
0–1	81.1	2.8	2.9	1.5	3.2	6.6	1.8	100.0	376
2–3	67.7	11.6	1.5	1.3	12.3	2.7	2.8	100.0	336
4–5	44.9	12.0	1.6	3.7	31.1	4.8	1.9	100.0	385
0–5	64.3	8.8	2.0	2.2	15.8	4.8	2.1	100.0	1,098

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). The categories of breast milk only; breast milk and plain water only; breast milk and non-milk liquids; breast milk and formula and/or animal milk; breast milk and solid, semisolid, or soft foods; and not breastfed are hierarchical and mutually exclusive. Thus, children who receive breast milk and non-milk liquids and who do not receive breast milk and formula and/or animal milk and who do not receive any solid, semisolid, or soft foods are classified in the non-milk liquid category even though they may also get plain water. When combined with children whose feeding category is classified as unknown due to "don't know" responses, the percentages in each row add to 100%.
[1] Non-milk liquids include fruit juice or fruit-flavoured drinks, chocolate-flavoured drinks, sodas, clear broth or soup, tea, coffee, herbal drinks, soy milk, and other liquids.
[2] Animal milk here includes liquid yogurt but does not include solid yogurt. Note that animal milk in Table 11.4 excludes liquid yogurt and solid yogurt.
[3] Solid, semisolid, or soft foods includes solid yogurt but not liquid yogurt.
[4] Not classified elsewhere due to "don't know" responses

Table 11.6 Liquids consumed by children in the day or night preceding the interview

Percentage of youngest children under age 2 living with their mother by type of liquids consumed in the day or night preceding the interview, according to age and breastfeeding status, Tanzania DHS-MIS 2022

Age in months	Plain water	Infant formula[1]	Fresh, powdered, and packaged animal milk		Yogurt drinks		Soy milk		Fruit juice and fruit-flavoured drinks	Soft drinks	Tea, coffee		Clear broth and clear soup	Other liquids		Number of youngest children under age 2 living with their mother

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Minimum dietary diversity is receiving foods from five or more of the following eight food groups: a. breast milk; b. grains, white/pale starchy roots, tubers, and plantains; c. beans, peas, lentils, nuts, and seeds; d. dairy products (fresh, powdered, and packaged animal milk; infant formula; yogurt; cheese); e. flesh foods (meat, fish, poultry, organ meats); f. eggs; g. vitamin A-rich fruits and vegetables; h. other fruits and vegetables.

[2] For breastfed children, minimum meal frequency is receiving solid, semisolid, or soft food at least twice a day for infants age 6–8 months and at least three times a day for children age 9–23 months.

[3] For breastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1) and a minimum meal frequency (footnote 2).

[4] For nonbreastfed children, minimum milk feeding frequency is two or more feedings of infant formula; fresh, powdered, or packaged animal milk; and liquid or solid yogurt.

[5] For nonbreastfed children, minimum meal frequency is receiving solid, semisolid, or soft food or milk feeds at least four times a day. At least one of the feeds must be a solid, semisolid, or soft feed.

[6] For nonbreastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum milk feeding frequency (footnote 4), and a minimum meal frequency (footnote 5).

[7] Minimum meal frequency is receiving the minimum recommended number of feeds per day according to age and breastfeeding status as defined in footnotes 2 and 5.

[8] Minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum meal frequency (footnotes 2 and 5), and a minimum milk feeding frequency (footnote 4).

Table 11.9 Egg and/or flesh food consumption and unhealthy feeding practices among children age 6–23 months

Percentage of youngest children age 6–23 months living with their mother who consumed eggs and/or flesh food, and percentage who experienced each specified unhealthy feeding practice, during the day or night preceding the survey, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Eggs and/or flesh food[1]	Unhealthy feeding practices:			Number of youngest children age 6–23 months living with their mother
		Sweet beverage[2]	Unhealthy food[3]	Zero vegetables or fruits[4]

[1] Eggs and/or flesh food include meat, fish, poultry, organ meats, and eggs.
[2] Sweet beverages include sweet/flavoured milk and yogurt drinks, sweet/flavoured soy milks, fruit juice and fruit-flavoured drinks, chocolate-flavoured drinks, sodas, malt drinks, sports drinks, energy drinks, sweetened tea, coffee, herbal drinks, and other sweetened liquids.
[3] Unhealthy foods are a group of sentinel food types that include sweet foods such as chocolates, candies, cakes, cookies, vishetti, sweet biscuits, and ice cream and fried and salty foods such as chips, bagia, mandaazi, fried potatoes, fried cassava, fried sweet potatoes, and instant noodles.
[4] Vegetables or fruits include collard greens, spinach, chainizi, mchicha, majani ya kunde, au kisamvu, nightshade leaves, spider flower, jute mallow, sweet potato leaves, pumpkin leaves, malabar spinach, carrots, sweet potatoes that are orange inside, mangoes, papayas, passionfruit, and other fruits and vegetables such as bananas, oranges, watermelon, avocado, baobab, cabbage, tomato, African eggplant, eggplant, sweet pepper, cucumber, and okra.

Table 11.10 Infant and young child feeding (IYCF) indicators

Percentage of children fed according to various IYCF practices, Tanzania DHS-MIS 2022

IYCF number	IYCF abbreviation	Table number	Indicator	Indicator definition and denominator	Value
1	EvBF	11.3	Ever breastfed[1]	Percentage of children born in the last 2 years who were ever breastfed	95.4
				Number of children born in the last 2 years	4,506
2	EIBF	11.3	Early initiation of breastfeeding[1]	Percentage of children born in the last 2 years who were put to the breast within 1 hour of birth	70.2
				Number of children born in the last 2 years	4,506
3	EBF2D	11.3	Exclusively breastfed for the first 2 days after birth[1]	Percentage of children born in the last 2 years who were fed exclusively with breast milk for the first 2 days after birth	90.2
				Number of children born in the last 2 years	4,506
4	EBF	11.4	Exclusive breastfeeding under 6 months	Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day	64.3
				Number of youngest children age 0–5 months living with their mother	1,098
5	MixMF	11.4	Mixed milk feeding under 6 months	Percentage of children age 0–5 months who were fed both breast milk and formula or animal milk during the previous day	3.4
				Number of youngest children age 0–5 months living with their mother	1,098
6	CBF	11.4	Continued breastfeeding 12–23 months	Percentage of children age 12–23 months who were fed breast milk during the previous day	62.3
				Number of children age 12–23 months	2,180
7	ISSSF	-	Introduction of solid, semisolid, or soft foods 6–8 months	Percentage of children age 6–8 months who were fed solid, semisolid, or soft foods during the previous day	88.6
				Number of youngest children age 6–8 months living with their mother	525
8	MDD	11.8	Minimum dietary diversity 6–23 months	Percentage of children age 6–23 months who were fed foods and beverages from at least five out of eight defined food groups during the previous day	18.8
				Number of youngest children age 6–23 months living with their mother	3,090
9	MMF	11.8	Minimum meal frequency 6–23 months	Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (but also including milk feeds for nonbreastfed children) the minimum number of times or more during the previous day	33.0
				Number of youngest children age 6–23 months living with their mother	3,090
10	MMFF	11.8	Minimum milk feeding frequency for nonbreastfed children 6–23 months	Percentage of nonbreastfed children age 6–23 months who were given at least two milk feeds during the previous day	12.4
				Number of youngest children age 6–23 months living with their mother who were not breastfed	786
11	MAD	11.8	Minimum acceptable diet 6–23 months	Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day	7.9
				Number of youngest children age 6–23 months living with their mother	3,090
12	EFF	11.9	Egg and/or flesh food consumption 6–23 months	Percentage of children age 6–23 months who were fed eggs and/or flesh food during the previous day	44.0
				Number of youngest children age 6–23 months living with their mother	3,090
13	SWB	11.9	Sweet beverage consumption 6–23 months	Percentage of children age 6–23 months who were given a sweet beverage during the previous day	30.0
				Number of youngest children age 6–23 months living with their mother	3,090
14	UFC	11.9	Unhealthy food consumption 6–23 months	Percentage of children age 6–23 months who were fed selected sentinel unhealthy foods during the previous day	7.4
				Number of youngest children age 6–23 months living with their mother	3,090
15	ZVF	11.9	Zero vegetable or fruit consumption 6–23 months	Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day	40.4
				Number of youngest children age 6–23 months living with their mother	3,090
16	BoF	11.4	Bottle feeding 0–23 months	Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day	5.3
				Number of children age 0–23 months	4,368
17		11.5	Infant feeding area graph	Percent distribution of youngest children age 0–5 months living with their mother, by feeding category	
				Number of youngest children 0–5 months living with their mother	

[1] Includes children born in the 2 years preceding the survey regardless of whether the children were living or dead at the time of the interview.

Table 11.11 Infant and young child feeding counselling

Among women age 15–49 whose youngest child age 6–23 months is living with them, percentage who talked with a health care provider or community health worker about how or what to feed their child in the last 6 months, according to background characteristics, Tanzania DHS-MIS 2022

Total	59.1	25.7	31.4	2.0	4,925

Note: Haemoglobin is measured using capillary blood. Table is based on children who stayed in the household on the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using formulas in CDC 1998 and cutoffs defined in WHO 2017c. Haemoglobin is measured in grams per decilitre (g/dl) using the HemoCue 201+ device. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Result of the malaria rapid diagnostic test (SD Bioline Ag Pf) administered during the survey

[2] Includes children whose mothers are deceased

[3] For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

Table 11.13.2 Prevalence of anaemia in children: Venous blood

Percentage of children age 6–59 months in the micronutrient subsample classified as having anaemia, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Anaemia status by haemoglobin level				Number of children age 6–59 months
	Any (<11.0 g/dl)	Mild (10.0–10.9 g/dl)	Moderate (7.0–9.9 g/dl)	Severe (<7.0 g/dl)

Note: Body mass index (BMI) is expressed as the ratio of weight in kilogrammes to the square of height in metres (kg/m^2).
[1] Excludes pregnant women and women with a birth in the preceding 2 months

Table 11.15.2 Nutritional status of adolescent women age 15–19

Among women age 15–19, percentage with height-for-age below −2 standard deviations (SD), mean body mass index (BMI)-for-age *z* score, and percentage with specific BMI-for-age levels, according to background characteristics, Tanzania DHS-MIS 2022

	Short stature		Body mass index-for-age[1]								
Background characteristic	Height-for-age below −2 SD	Number of women	Mean BMI-for-age *z* score	−1 SD to +1 SD (total normal)	Below −1 SD (total thin)[2]	Below −1 SD to −2 SD (mildly thin)	Below −2 SD (moderately or severely thin)	Above +1 SD (total overweight or obese)[3]	Above +1 SD to +2 SD (overweight)	Above +2 SD (obese)	Number of women

Note: Height-for-age and body mass index (BMI)-for-age are expressed in standard deviation units (SD) from the median of the WHO Growth Reference for adolescent women age 15–19. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

[1] Excludes pregnant women and women with a birth in the preceding 2 months

[2] Includes adolescent women age 15–19 who are below −2 standard deviations (SD) from the WHO Growth Reference population median

[3] Includes adolescent women age 15–19 who are above +2 standard deviations (SD) from the WHO Growth Reference population median

Table 11.15.3 Nutritional status of men age 20–49

Among men age 20–49, mean body mass index (BMI) and percentage with specific BMI levels, according to background characteristics, Tanzania DHS-MIS 2022

Note: Body mass index (BMI) is expressed as the ratio of weight in kilogrammes to the square of height in metres (kg/m^2).

Table 11.15.4 Nutritional status of adolescent men age 15–19

Among men age 15–19, mean body mass index (BMI)-for-age *z* score and percentage with specific BMI-for-age levels, according to background characteristics, Tanzania DHS-MIS 2022

	Body mass index-for-age								
Background characteristic	Mean BMI-for-age *z* score	−1 SD to +1 SD (total normal)	Below −1 SD (total thin)[1]	Below −1 SD to −2 SD (mildly thin)	Below −2 SD (moderately or severely thin)	Above +1 SD (total overweight or obese)[2]	Above +1 SD to +2 SD (over-weight)	Above +2 SD (obese)	Number of men

Note: Body mass index (BMI)-for-age is expressed in standard deviation units (SD) from the median of the WHO Growth Reference for adolescent men age 15–19. Figures in parentheses are based on 25–49 unweighted cases.

[1] Includes adolescent men age 15–19 who are below −2 standard deviations (SD) from the WHO Growth Reference population median

[2] Includes adolescent men age 15–19 who are above +2 standard deviations (SD) from the WHO Growth Reference population median

Table 11.16 Foods and liquids consumed by women in the day or night preceding the interview

Percentage of women age 15–49 by type of foods and liquids consumed in the day or night preceding the interview, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Foods made from grains[1]	White/ pale starchy roots, tubers, and plantains[2]	Beans, peas, lentils[3]	Nuts and seeds[4]	Milk, cheese, yogurt, other milk products	Meat, fish, poultry, organ meats[5]	Eggs	Dark green leafy vegetables[6]	Other vitamin A-rich fruits and vegetables[7]	Other vegetables[8]	Other fruits[9]	Sweet foods such as cakes, cookies, vishetti, sweet biscuits, candies, chocolates, or ice cream	Fried and salty foods such as chips, mandaazi, bagia, french fries, fried cassava, fried sweet potato, and instant noodles	Fruit juice and fruit drinks	Soft drinks	Sweetened tea, coffee, chocolate drinks, and other sweetened beverages	Number of women

Table 11.17—*Continued*

Background characteristic	Minimum dietary diversity for women[1]	Sweet beverage consumption[2]	Unhealthy food consumption[3]	Number of women
Total	25.0	28.2	14.0	15,254

[1] Minimum dietary diversity for women is defined as consuming foods from five or more of the following 10 food groups: a. grains, white/pale starchy roots, tubers, and plantains; b. pulses (beans, peas, lentils); c. nuts and seeds; d. dairy (milk, cheese, yogurt, other milk products); e. meat, fish, poultry, organ meats; f. eggs; g. dark green leafy vegetables; h. other vitamin A-rich fruits and vegetables; i. other vegetables; j. other fruits
[2] Sweet beverages include fruit juice and fruit drinks, sodas, chocolate-flavoured drinks, sweetened tea, coffee, herbal drinks, and other sweetened liquids.
[3] Unhealthy foods include sweet foods such as chocolates, candies, cakes, sweet biscuits, cookies, vishetti, and ice cream and fried and salty foods such as chips, mandaazi, bagia, french fries, fried cassava, fried sweet potato, and instant noodles.
[4] Includes women who do not know if they are pregnant

Table 11.18 Presence of iodised salt in household

Among all households not included in the micronutrient subsample, percentage with salt tested for iodine content, percentage with salt in the household but the salt was not tested, and percentage with no salt in the household, and among households with salt tested, percentage with iodised salt, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Among all households, percentage:				Among households with tested salt:	
	With salt tested	With salt but salt not tested[1]	With no salt in the household	Number of households	Percentage with iodised salt	Number of households

MALARIA 12

Key Findings

- ***Ownership of insecticide-treated nets (ITNs):*** 74% of households in Tanzania own at least one ITN, and 41% own at least one ITN for every two people in the household. Most ITNs were obtained from mass distribution campaigns (39%).
- ***Access to ITNs:*** 58% of the population could sleep under an ITN if every ITN in the household were used by two people.
- ***Use of ITNs:*** 59% of the household population, 64% of children under age 5, and 66% of pregnant women slept under an ITN the night before the survey.
- ***Intermittent preventive treatment during pregnancy (IPTp):*** 58% of women with a live birth in the 2 years preceding the survey received at least two doses of sulfadoxine-pyrimethamine (SP)/Fansidar for prevention of malaria; only 32% received three or more doses.
- ***Low haemoglobin levels:*** 6% of children age 6–59 months have a haemoglobin level below 8 g/dl.
- ***Malaria:*** 8% of children age 6–59 months were classified as having malaria according to a malaria rapid diagnostic test (mRDT).
- ***Malaria perceptions:*** 71% of women and 74% of men believe that the consequences of malaria are serious.
- ***Exposure to malaria messages:*** More than half of women (63%) and men (57%) reported having seen or heard a malaria message in the last 6 months, with the most commonly cited source being the radio.

This chapter presents data that are useful in assessing how well malaria control strategies are being implemented, including the availability and use of mosquito nets, prophylactic use of antimalarial drugs among pregnant women, care seeking and therapeutic use of antimalarial drugs among children with fever, and the prevalence of anaemia and malaria among children under age 5.

The Government of Tanzania, in collaboration with its partners, is implementing recommended preventive and curative interventions according to malaria strategic plans. The National Malaria Control Programme (NMCP) Strategic Plan 2021–2025 (NMCP 2020) aims to reduce malaria prevalence in children less than age 5 from 7.5% in 2017 to less than 3.5% by 2025. Moreover, Tanzania Zanzibar envisages completely malaria-free zones through the Zanzibar Malaria Elimination Programme (ZAMEP) Strategic Plan 2018/19–2022/23.

The NMCP Strategic Plan 2021–2025 focuses on sustaining the achievements of the previous phase, further reducing malaria parasite transmission, and preventing malaria-related mortality by 2025. The Zanzibar malaria elimination plan also aims at consolidating malaria control achievements attained since 2018. Both programmes recommend improvements in access to malaria testing and treatment. The 2022 TDHS-MIS provides an opportunity to evaluate achievements against some of the goals and objectives in these plans.

12.1 Ownership of Insecticide-Treated Nets

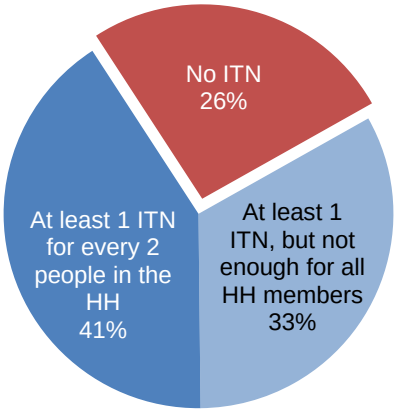
Ownership of insecticide-treated nets
Households that have at least one insecticide-treated net (ITN). An ITN is a factory-treated net that does not require any further treatment.

Full household ITN coverage
Percentage of households with at least one ITN for every two people.

Seventy-seven percent of households in Tanzania own at least one mosquito net, and 74% own at least one ITN. The average number of ITNs per household is 1.6. Forty-one percent of households have at least one ITN for every two persons who stayed in the household the night before the survey. One-third of households either do not have a mosquito net or have at least one but not enough for all household members (**Table 12.1** and **Figure 12.1**).

Figure 12.1 **Household ownership of ITNs**

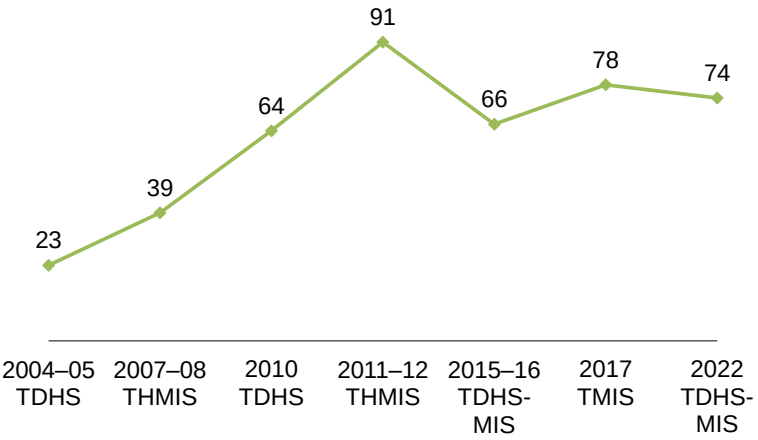
Percent distribution of households



Trends: The percentage of households owning at least one ITN increased substantially from 2004–05 to 2011–12 but has subsequently fluctuated and has declined by 4 percentage points since 2015–16 (74% versus 78%) (**Figure 12.2**).

Figure 12.2 **Trends in household ownership of ITNs**

Percentage of households owning at least one insecticide-treated net (ITN)



Note: The definition of an ITN in surveys conducted prior to the 2014–15 TDHS-MIS included nets that had been soaked with insecticides within the past 12 months.

Patterns by background characteristics

- Household ownership of ITNs is higher in rural (75%) than urban (73%) areas. A higher percentage of households in Zanzibar (78%) than in Tanzania Mainland (74%) own ITNs.
- Household ownership of ITNs is lowest (63%) in the highest wealth quintile and highest (79%) in the middle quintile (**Table 12.1**).
- By region, ownership of at least one ITN ranges from 48% in Arusha to 93% in Katavi.
- The percentage of households owning at least one ITN for every two persons who stayed in the household the night preceding the survey is higher in Zanzibar (50%) than in Tanzania Mainland (40%).

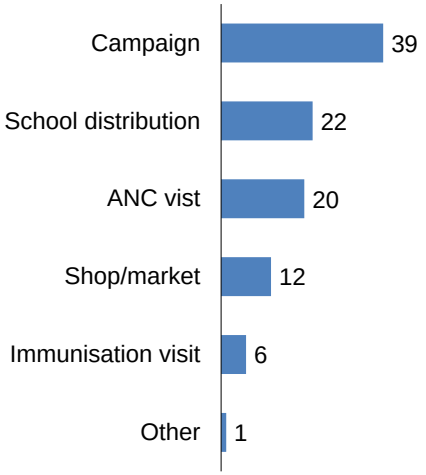
- Seventy-one percent of households in Kaskazini Unguja own at least one ITN for every two persons who stayed in the household the night preceding the survey, as compared with 15% in Simiyu.

Source and Cost of Nets

Most of the ITNs in Tanzania were obtained from mass distribution campaigns (39%), followed by school distribution programmes (22%), shops or markets (20%), and ANC visits (12%) (**Table 12.2.1** and **Figure 12.3**).

Figure 12.3 Source of ITNs

Percent distribution of ITNs in households



Forty-three percent of households in rural areas obtained ITNs from mass distribution campaigns, as compared with 31% of those in urban areas. Similarly, the percentage of households obtaining ITNs during antenatal visits is higher in rural (15%) than urban (8%) areas. Thirty-seven percent of households in urban areas purchased ITNs in shops or markets, compared with only 11% in rural areas.

Although the majority of ITNs are obtained from mass distribution campaigns, there is considerable variation in campaign distribution across regions, ranging from 5% in Mtwara to 90% in Tanga and Kaskazini Unguja. The percentage of nets obtained through school net programmes is highest in Ruvuma (54%).

Among nets obtained from pharmacies, shops/markets, or other sources, 95% were purchased. Most nets were purchased for 10,000 to 15,000 TSh (42%) (**Table 12.2.2**).

12.2 Household Access to and Use of ITNs

Access to an ITN

Percentage of the population that could sleep under an ITN if each ITN in the household were used by up to two people.

Sample: De facto household population

Use of ITNs

Percentage of the population that slept under an ITN the night before the survey.

Sample: De facto household population

ITNs act as both a physical and a chemical barrier against mosquitoes. By reducing the vector population, ITNs can help to reduce malaria risk at the community level as well as among individuals who use them.

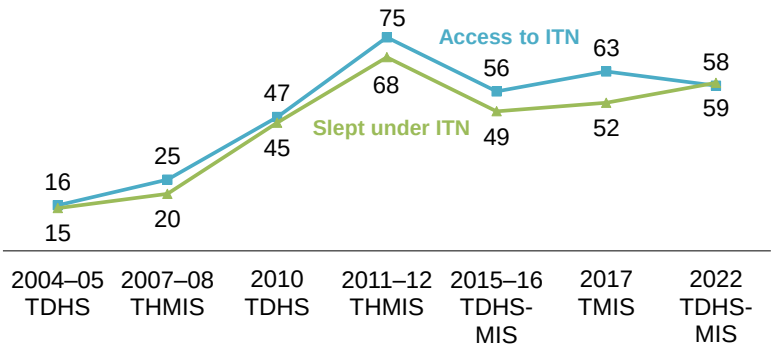
Access to an ITN is measured by the proportion of the population that could sleep under an ITN if each ITN in the household were used by up to two people. Comparing ITN access and ITN use indicators can help programmes identify if there is a behavioural gap in which available ITNs are not being used. If the difference between these indicators is substantial, the ITN programme may need to design an appropriate intervention that focuses on behaviour change and on how to identify the main drivers of or barriers to ITN use. This analysis helps ITN programmes determine whether they need to achieve higher ITN coverage, promote ITN use, or both.

Fifty-eight percent of the population could sleep under an ITN if each ITN in the household were used by up to two people (**Table 12.3**). Similarly, 59% of the population slept under an ITN the night before the survey. Thus, there is no gap between ITN access and ITN use at the population level. In households with at least one ITN, 77% of the population slept under an ITN the night before the survey (**Table 12.4**). Overall, 82% of ITNs were used the night before the survey (**Table 12.5**).

Trends: The percentage of the household population with access to an ITN increased from 16% in 2004–05 to 75% in 2011–12 before declining to 58% in 2022. Similarly, the percentage of the population who slept under an ITN the night before the survey increased from 15% in 2004–05 to 68% in 2011–12 and then declined to 59% in 2022 (**Figure 12.4**).

***Figure 12.4* Trends in ITN access and use**

Percentage of the household population with access to an ITN and percentage of the population that slept under an ITN the night before the survey



Note: The definition of an ITN in surveys conducted prior to the 2014–15 TDHS-MIS included nets that had been soaked with insecticides within the past 12 months.

Patterns by background characteristics

- The percentage of the household population with access to an ITN is higher in Zanzibar (67%) than in Tanzania Mainland (58%).
- By region, the percentage of the population with access to an ITN is lowest in Arusha (33%) and highest in Kaskazini Unguja (83%) (**Table 12.3**).
- About one in three female (61%) and male (57%) household members slept under an ITN the night before the survey. The same pattern is observed among rural (57%) and urban (64%) residents.
- The percentage of the household population that slept under an ITN the night before the survey is highest in Katavi (83%) and Kusini Pemba (77%) and lowest in Arusha (33%).
- More than half of all existing ITNs were used by household residents in all regions. The percentage of ITNs that were used the night before the survey ranges from 57% in Kusini Unguja to 91% in Mtwara and Mara (**Table 12.5**).

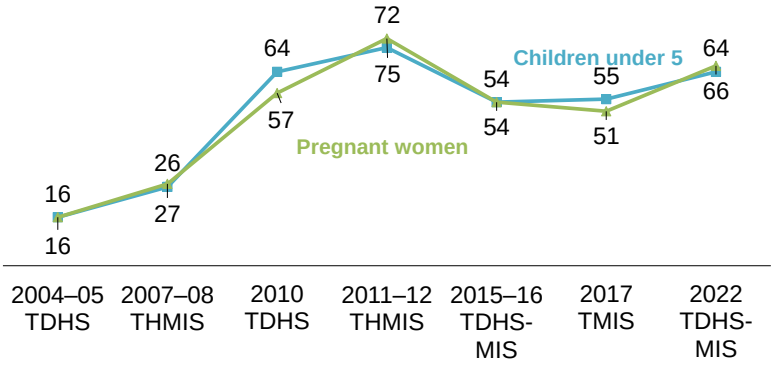
12.3 Use of ITNs by Children and Pregnant Women

Children under age 5 and pregnant women have historically been targeted for malaria interventions because they are at the highest risk of morbidity and mortality in highly malaria-endemic settings. Sixty-four percent of children less than age 5 slept under an ITN the night before the survey, and 81% of children in households with at least one ITN slept under an ITN the night before the survey (**Table 12.6**). Similarly, 66% of pregnant women slept under an ITN the night before the survey, and 85% of pregnant women in households with at least one ITN slept under an ITN the night before the survey (**Table 12.7**).

Trends: The percentage of children under age 5 who slept under an ITN the night before the survey increased from 16% in 2004–05 to 72% in 2011–12 before dropping to 64% in 2022. Similarly, the percentage of pregnant women who slept under an ITN the night before the survey increased substantially from 16% in 2004–05 to 75% in 2011–12 and then decreased to 66% in 2022 (**Figure 12.5**).

***Figure 12.5* Trends in use of ITNs by children and pregnant women**

Percentage of children and pregnant women using an ITN the night before the survey



Note: The definition of an ITN in surveys conducted prior to the 2014–15 TDHS-MIS included nets that had been soaked with insecticides within the past 12 months.

Patterns by background characteristics

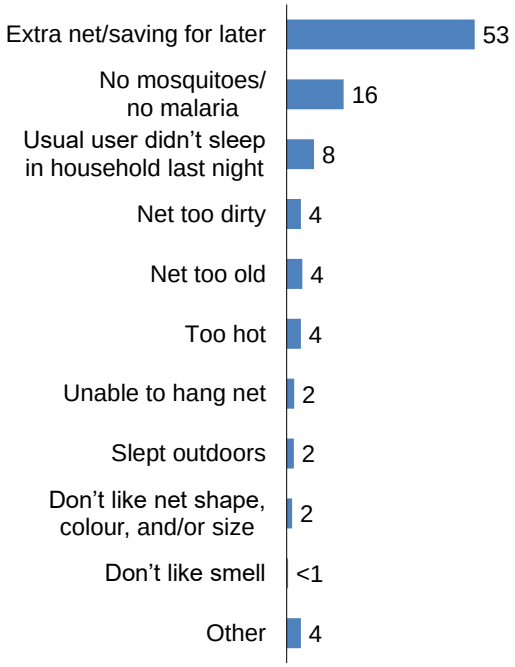
- The percentage of children who slept under an ITN decreases with increasing age, from 69% among those less than age 12 months and those age 12–23 months to 59% among those age 48–59 months (**Table 12.6**).
- By region, children in Kusini Pemba are most likely to have slept under an ITN the night before the survey (84%), followed by children in Lindi (82%) and Katavi (81%). Children in Arusha are least likely to have slept under an ITN the night before the survey (40%).
- The percentage of children who slept under an ITN the night before the survey is higher in urban areas (68%) than in rural areas (63%). The reverse is true for pregnant women where the percentage who slept under an ITN the night before the survey is higher in rural areas (67%) than in urban areas (62%).
- More than half of children in both Zanzibar and Tanzania Mainland (66% and 64%, respectively) slept under an ITN the night before the survey (**Table 12.6**). A similar pattern was observed among pregnant women (66% in both) (**Table 12.7**).
- Use of an ITN among children under age 5 increases as wealth increases from 55% in the lowest quintile to 70% in the highest. More pregnant women from households in the middle and fourth wealth quintile (71%) slept under an ITN the night before the survey than those from the lowest and highest wealth quintile (57% and 63%, respectively).

12.4 Reasons Mosquito Nets Were Not Used

Overall, 18% of ITNs were not used the night before the survey. The most common reason reported by respondents for not using an existing net is that they have an extra net or are saving the net for later use (52%). Other reasons included no mosquitoes or malaria (16%) and the usual user did not sleep in the household the night before the survey (8%) (**Table 12.8** and **Figure 12.6**).

Figure 12.6 **Reason ITN was not used**

Among ITNs that were not used the night before the survey, the main reason the net was not used



Patterns by background characteristics

- More than half of respondents in both urban and rural areas reported that their main reason for not using an existing ITN is that they have an extra ITN or are saving the net for later use (53% and 52%, respectively). Respondents in rural areas were more likely than those in urban areas to report no mosquitoes or malaria as a reason for not using an ITN (20% versus 8%) (**Table 12.8**).
- Fifty-three percent of respondents in Tanzania Mainland and 51% in Zanzibar reported that their main reason for not using an ITN is that they have an extra net or are saving the net for later use. Respondents in Zanzibar are more likely than those in Tanzania Mainland to report "too hot" as a reason for not using an ITN (22% versus 3%).
- The percentage of respondents who reported no mosquitoes/no malaria as their main reason for not using an ITN is highest in Kilimanjaro (48%) and Iringa (45%) and lowest in Katavi, Lindi, and Mtwara (less than 1% each).

12.5 Malaria in Pregnancy

Intermittent preventive treatment (IPTp) during pregnancy

Percentage of women who took at least three doses of sulfadoxine-pyrimethamine (SP)/Fansidar during their last pregnancy.

Sample: Women age 15–49 with a live birth or a stillbirth in the 2 years before the survey

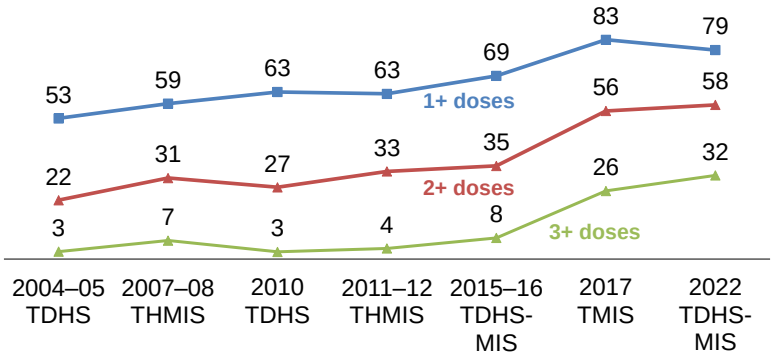
Malaria infection during pregnancy is a major public health problem in Tanzania, with substantial risks for the mother, her foetus, and the neonate. Intermittent preventive treatment of malaria in pregnancy (IPTp) is a full therapeutic course of antimalarial medicine given to pregnant women at routine antenatal care visits to prevent malaria. IPTp helps prevent maternal malaria episodes, maternal and foetal anaemia, placental parasitaemia, low birth weight, and neonatal mortality.

The 2022 TDHS-MIS results show that 79% of women age 15–49 with a live birth in the 2 years preceding the survey received one or more doses of SP/Fansidar, 58% received two or more doses of SP/Fansidar, and 32% received three or more doses of SP/Fansidar. The results also indicate that 79% of women with a stillbirth received one or more doses of SP/Fansidar, 50% received two or more doses, and 22% received three or more doses (**Table 12.9**).

Trends: The percentage of pregnant women who received one or more doses of SP/Fansidar increased from 63% in 2010 to 83% in 2017 before declining slightly to 79% in 2022 (**Figure 12.7**). There have been increases since 2010 in the percentages of women receiving two or more doses (from 27% to 58%) and three or more doses (from 3% to 32%).

Figure 12.7 Trends in IPTp use by pregnant women

Percentage of women with a live birth in the 2 years before the survey who received at least 1, 2, or 3 doses of SP/Fansidar



Patterns by background characteristics

- The percentage of women with a live birth in the 2 years preceding the survey who received three or more doses of SP/Fansidar is higher in urban areas (40%) than in rural areas (28%) (**Table 12.9**).
- The percentage of women who received three or more doses of SP/Fansidar is higher in the highest wealth quintile (44%) than in the lowest quintile (24%).
- Twenty-three percent of women with no formal education received three or more doses of SP/Fansidar, as compared with 39% of women with a secondary education and above.
- The proportion of women who received three or more doses of SP/Fansidar varies from less than 1% in the Zanzibar regions to 54% in Lindi. Use of IPTp is very low in the Zanzibar regions since this is no longer among the recommended control interventions.

12.6 Case Management of Malaria in Children

Care seeking for children under age 5 with a fever

Percentage of children under age 5 with a fever in the 2 weeks before the survey for whom advice or treatment was sought from a health provider, a health facility, or a pharmacy.

Sample: Children under age 5 with a fever in the 2 weeks before the survey

Diagnosis of malaria in children under age 5 with a fever

Percentage of children under age 5 with a fever in the 2 weeks before the survey who had blood taken from a finger or heel for testing. This is a proxy measure of diagnostic testing for malaria.

Sample: Children under age 5 with a fever in the 2 weeks before the survey

Artemisinin-based combination therapy (ACT) for children under age 5 with a fever

Percentage of children under age 5 with a fever in the 2 weeks before the survey who received artemisinin-based combination therapy (ACT).

Sample: Children under age 5 with a fever in the 2 weeks before the survey who took any antimalarial drug

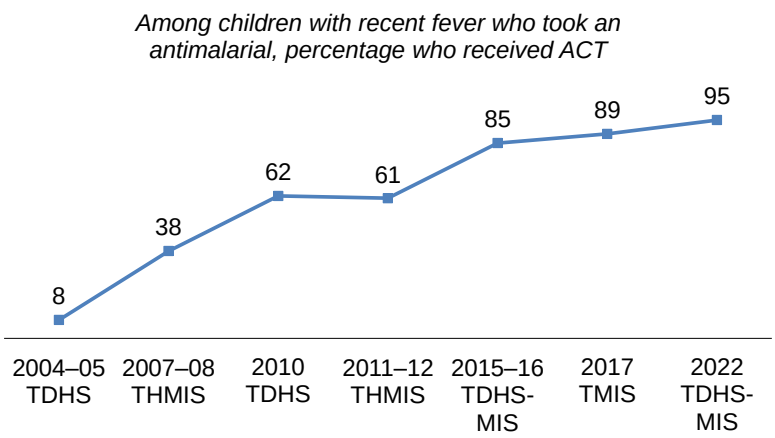
Eleven percent of children under age 5 had a fever in the 2 weeks preceding the survey. Advice or treatment was sought for 78% of these children, and 50% had blood taken from a finger or heel for testing (**Table 12.10**).

Among children with fever for whom advice or treatment was sought, 63% received advice or treatment from public sector sources, while 22% received advice or treatment from the private medical sector. Dispensaries (43%) and health centres (15%) were the most prominent public sector sources of care, while pharmacies (15%) were the primary private sector source (**Table 12.11**).

Among children with a fever in the 2 weeks preceding the survey who were given antimalarial medicines, 95% received artemisinin-based combination therapy (ACT) (**Table 12.12**).

Trends: The percentage of children under age 5 who had a fever in the 2 weeks before the survey and had blood taken from a finger or heel for testing increased from 25% in 2011–12 to 50% in 2022. Among children who took antimalarial drugs, the percentage who took ACT rose from 61% to 95% over the same period (**Figure 12.8**).

Figure 12.8 **Trend in ACT use by children with fever**



Patterns by background characteristics

- Care-seeking behaviour is highest in the Eastern zone (87%) and lowest in the South West zone (56%).
- The percentage of children with a fever in the 2 weeks preceding the survey for whom advice or treatment was sought the same or next day is higher in urban areas (50%) than in rural areas (40%). The same pattern is observed for children who had blood taken from their finger or heel for testing (59% versus 47%).
- The percentage of children with a fever in the 2 weeks preceding the survey who were diagnosed with malaria increases with age, from 22% among those less than age 12 months to 37% among those age 48–59 months.

12.7 Prevalence of Low Haemoglobin Levels in Children

Prevalence of low haemoglobin in children

Percentage of children age 6–59 months who had a haemoglobin measurement of less than 8 grams per decilitre (g/dl) of blood. The cutoff of 8 g/dl is often used to classify malaria-related anaemia. This is a different cutoff than was used to classify severe anaemia in the chapter on nutrition (7 g/dl). Haemoglobin levels reported in this chapter are based on capillary blood samples.

Sample: Children age 6–59 months

Anaemia, defined as a low level of haemoglobin in the blood, decreases the amount of oxygen reaching the tissues and organs of the body and reduces their capacity to function. Anaemia in children is associated with impaired motor and cognitive development. The main causes of anaemia in children are malaria and inadequate intake of iron, folate, vitamin B12, and other nutrients. Other causes of anaemia include intestinal worms, haemoglobinopathy, and sickle cell disease. Although anaemia is not specific to malaria, trends in anaemia prevalence can reflect malaria morbidity, and they respond to changes in the coverage of malaria interventions (Korenromp et al. 2004).

As described in Chapter 11, haemoglobin was measured in a subsample of half of households using capillary blood samples and in a separate, smaller subsample using venous blood samples. Results for low haemoglobin among children in this chapter are based on the tests conducted using capillary blood samples. Please see Chapter 11 for haemoglobin results based on the venous blood samples. Haemoglobin testing using capillary blood samples was completed for 97% of eligible children age 6–59 months (**Table 12.13**), and 6% of these children had haemoglobin levels lower than 8 g/dl (**Table 12.14**).

Trends: The percentage of children with haemoglobin levels below 8.0 g/dl has not changed significantly over time (5% in 2015–16 and 6% in 2022).

Patterns by background characteristics

- The percentage of children with low haemoglobin levels is highest among those age 12–17 months (11%) and lowest among those age 48–59 months (3%).
- The prevalence of low haemoglobin is higher among male children (7%) than among female children (4%).
- By region, low haemoglobin is most common among children from Mbeya (13%) and least common among children from Dodoma (0%) (**Table 12.14**).

12.8 Prevalence of Malaria in Children

Malaria prevalence in children
Percentage of children age 6–59 months classified as infected with malaria according to rapid diagnostic test (RDT) results.
Sample: Children age 6–59 months

Children age 6–59 months were eligible for malaria testing using a malaria rapid diagnostic test (mRDT) (SD Bioline Ag Pf); 97% of eligible children were tested (**Table 12.13**). For details on malaria testing procedures, see Chapter 1.

The SD Bioline Ag Pf rapid diagnostic test was the only method used in the 2022 TDHS-MIS to gather information about the extent of malaria infection. Microscopy was not used during the survey. Trained nurses collected blood samples (from a finger or heel prick) from eligible children. In Tanzania Mainland, all children with positive mRDT results and no symptoms of severe malaria were offered a full course of treatment of artemether lumefantrine in the field, while in Zanzibar all children with positive results were referred to health facilities for treatment.

The 2022 TDHS-MIS was conducted between 24 February and 21 July 2022. Data collection started in Kilimanjaro and spread to other regions in March. The central and southern zones of the country have a single primary rainy season (with a peak in March through June), with more than 60% of rainfall concentrated in less than 3 months, while the eastern, northern, and western zones experience peaks in November and April, with rainfall spread over a longer period during April and May.

Overall, 8% of children age 6–59 months tested positive for malaria according to mRDT results (**Table 12.15**).

Trends: The prevalence of malaria among children declined from 14% in 2015–16 to 8% in 2022.

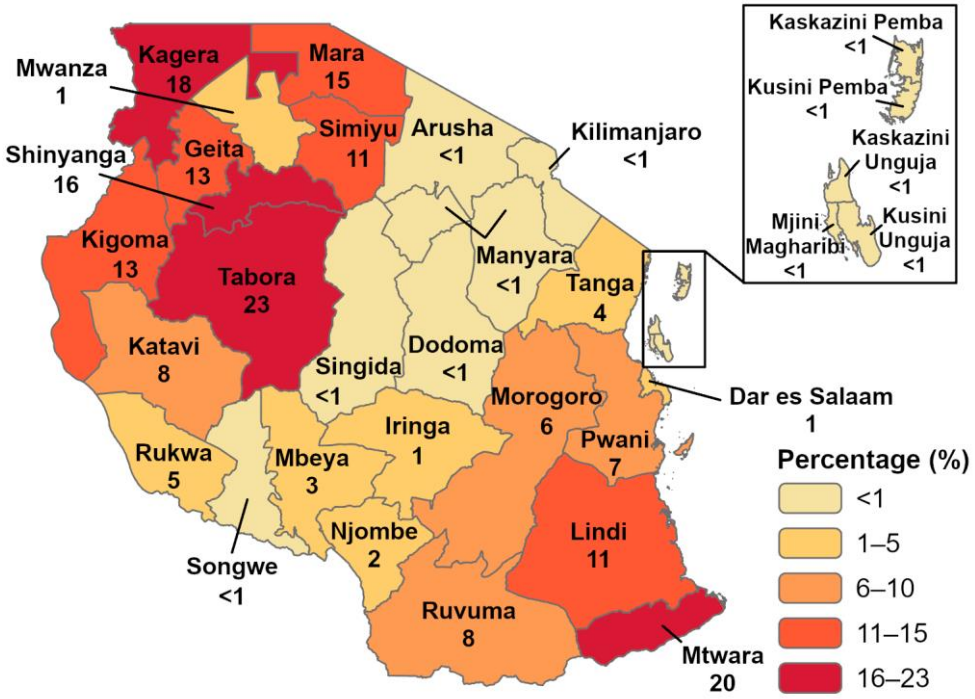
Patterns by background characteristics

- Malaria prevalence is higher among children in rural areas (10%) than among those in urban areas (1%).

- By region, the percentage of children with malaria is highest in Tabora (23%), followed by Mtwara (20%), Kagera (18%), and Shinyanga (16%). Malaria prevalence is below 1% among children in Dodoma, Arusha, Kilimanjaro, Singida, Songwe, and the Zanzibar regions (**Map 12.1**).

Map 12.1 Prevalence of malaria in children by region

Percentage of children age 6–59 months who tested positive for malaria by RDT



- Malaria prevalence varies substantially by mother's education, from 4% among children of mothers with a secondary education or higher to 10% or more among children of mothers with less than a primary education.

- Malaria prevalence decreases with increasing household wealth, from 15% in the lowest wealth quintile to only 1% in the highest quintile.

12.9 Exposure to Malaria Messages

Exposure to malaria messages

Percentage of women and men age 15–49 who recall seeing or hearing a message about malaria through various sources in the last 6 months.

Sample: Women and men age 15–49

Social behaviour change (SBC) is key to the uptake of malaria control interventions. Implementation of SBC activities through multiple approaches and channels has contributed to high levels of knowledge and awareness of malaria in Mainland Tanzania. Knowledge and exposure are necessary for positive behaviour change in individuals, households, and communities.

Programmes in Tanzania emphasise the following strategies to promote social behaviour change: (1) reinforcing and updating knowledge among all community members regarding appropriate malaria prevention, testing, and treatment practices; (2) promoting desired positive behaviours and social norms with respect to healthy behaviours; (3) maintaining high levels of knowledge and improving practices among vulnerable groups with an elevated risk of malaria infection so that they know about their specific

risks and the prevention and treatment options available to them; (4) encouraging communities to implement community-based malaria control and elimination initiatives; (5) strengthening public-private partnerships to maximise SBC efforts and ensure consistency in the fight against malaria; and (6) increasing the visibility of specific malaria campaigns among politicians, communities, and the general public so that malaria becomes a priority at all levels.

To assess coverage of malaria communication programmes, women and men age 15–49 were asked if they had seen or heard any message about malaria prevention in the 6 months preceding the survey. Women and men who had heard or seen messages were further asked about the source of the messages.

Overall, 63% of women and 57% of men reported having seen or heard a message about malaria in the 6 months prior to the survey (**Tables 12.17.1** and **12.17.2**), and 38% of women and 19% of men have seen or heard the malaria message *Ziro malaria* (**Table 12.18**). Among women and men who had seen or heard a malaria message, the most commonly cited source of information was the radio (65% and 78%, respectively), followed by television (33% and 43%, respectively). The percentages of women who mentioned other communication channels ranged from 4% for reading a leaflet to 28% for hearing a message from a health care provider. Among men, the percentages ranged from 2% for reading a leaflet to 13% for seeing a billboard.

Patterns by background characteristics

- The percentage of women and men who report having seen or heard malaria messages in the 6 months preceding the survey is higher in urban areas (69% and 65%, respectively) than in rural areas (58% and 54%, respectively). Radio is the predominant source of malaria messages among women and men in both urban and rural areas (**Tables 12.17.1** and **12.17.2**).

- The percentage of women who reported having seen or heard malaria messages in the 6 months preceding the survey increases with increasing education, from 37% among those with no formal education to 68% among those with a secondary education or above. Similarly, 38% of men with no education have seen or heard malaria messages in the past 6 months, as compared with 66% of men with a secondary education or above.

- The percentage of women and men who saw or heard a malaria message in the 6 months preceding the survey also increases with increasing household wealth. Thirty-nine percent of both women and men in the lowest wealth quintile reported having seen or heard a malaria message, compared with 71% of women and 68% of men in the highest quintile.

- In Tanzania Mainland, women (66%) are less likely than men (79%) to report having heard malaria messages on the radio. Conversely, women (57%) in Zanzibar are more likely to report having heard messages on the radio than men (49%).

12.10 Most Serious Health Problem in the Community

Percentage of women and men age 15–49 who believe that malaria is the most serious health problem in their community.

Sample: Women and men age 15–49

Thirty-two percent of women and 42% of men believe that malaria is the most serious health problem in their community. Twenty-nine percent of women and 34% of men report that HIV/AIDS is the most serious health problem (**Table 12.16.1** and **Table 12.16.2**).

Patterns by background characteristics

- Malaria is more often recognized as the most serious health problem in the community by women and men in Tanzania Mainland (33% and 44%, respectively) than women and men in Zanzibar (4% and 6%, respectively).

- Forty-five percent of women and 82% of men in the Southern zone believe that malaria is the most serious health problem in their community.

- Among regions, the percentage of women who believe that malaria is the most serious health problem is lowest in Kaskazini Unguja and Kusini Pemba (2% each) and highest in Morogoro (61%). Among men, the percentage is lowest in Kaskazini Pemba (1%) and highest in Lindi (83%) (**Table 12.16.1** and **Table 12.16.2**).

12.11 Knowledge of Ways to Avoid Malaria

Better knowledge of ways to avoid and prevent malaria, such as increasing the use of insecticide-treated nets (ITNs), is a foundational step toward changing behaviour. Women and men age 15–49 were asked if there are ways to prevent malaria, and, if so, they were further asked to report specific ways of avoiding the disease. Ninety-four percent of both women and men stated that there are ways to avoid getting malaria. Among those who said there are ways to avoid getting malaria, 97% of women and 98% of men cited sleeping under a mosquito net or ITN (**Tables 12.19.1** and **12.9.2**).

Patterns by background characteristics

- The percentage of women who believe that there are ways to avoid getting malaria is highest in Iringa and Njombe (100%) and lowest in Simiyu (78%). Among men, the percentage is highest in Dar es Salaam (100%) and lowest in Kaskazini Unguja (77%).

- The percentage of women and men who believe that one needs to sleep under a mosquito net or ITN to avoid malaria is high across all background characteristics (above 90%).

12.12 Access to Artemisinin-based Combination Therapy (ACT) and Visits from Health Workers

Access to early diagnosis and treatment ensures that all confirmed malaria cases are managed within 24 hours after the onset of fever. Treatment using first-line antimalarial medicine immediately improves the patient's condition by minimizing further complications of the disease. Eighty-three percent of women and 75% of men reported that artemisinin-based combination therapy (ACT) can be obtained at the nearest health facility or pharmacy (**Table 12.20**). Nine percent of both women and women said that they were visited by a health worker or volunteer who talked about malaria in the past 6 months.

Patterns by background characteristics

- The percentage of women reporting that ACT can be obtained at the nearest health facility or pharmacy is 84% in rural areas and 81% in urban areas. Among men, the percentages are 75% and 76%, respectively.

- The percentage of men and women who reported that ACT can be obtained at the nearest health facility or pharmacy is higher in Tanzania Mainland (77% and 84%, respectively) than in Zanzibar (15% and 42%).

- The percentage of women who said that they were visited by a health worker or volunteer who discussed malaria in the previous 6 months is highest in the Western zone and lowest in the Central

zone. Among men, the percentage is highest in the Western zone and lowest in the Southern Highlands and Southern zones.

12.13 Perceived Susceptibility, Severity, and Self-efficacy

Risk involves the following components: the likelihood of a specific event occurring (perceived susceptibility) multiplied by the magnitude of the consequences associated with that event (perceived severity) (Douglas 1986). Self-efficacy refers to people's confidence in their ability to perform a specific behaviour.

During the survey, a series of statements were read to capture respondents' perceptions of malaria susceptibility, their beliefs regarding the severity of the consequences of malaria, and their perceived self-efficacy to perform specific malaria-related behaviours.

Eighty-nine percent of women and 84% of men perceive that their families and communities are at risk for malaria. Similarly, 71% of women and 74% of men believe that the consequences of malaria are serious.

Eighty percent of women and 86% of men said that they are confident in their ability to perform specific malaria-related behaviours. This includes women and men who agree that they can sleep under a mosquito net for the entire night when there are lots of mosquitoes or agree that they can sleep under a mosquito net for the entire night when there are few mosquitoes (**Tables 12.21.1** and **12.21.2**).

Patterns by background characteristics

- The percentage of women who perceive that their families and communities are at risk for malaria is highest in the Western zone (95%), Pwani (97%), and Lindi (97%) and lowest in Zanzibar (81%) and Iringa (71%). Among men, the percentage is highest in the South West Highlands zone (93%) and Rukwa (97%).

- The percentage of women who feel that the consequences of malaria are serious increases with increasing wealth, from 59% among those in the lowest wealth quintile to 78% among those in the highest wealth quintile. Sixty-seven percent of men in the lowest wealth quintile believe that the consequences of malaria are serious, as compared with 74% of those in the highest quintile.

- Eighty percent of women in Tanzania Mainland and 93% in Zanzibar are confident in their ability to perform specific malaria-related behaviours. Among men, the percentages are 87% and 92%, respectively.

12.14 Attitudes toward Malaria-related Behaviours and Perceptions of Community Norms

People who view a behaviour favourably or positively are more likely to adopt the behaviour. Those with favourable attitudes toward a behaviour anticipate beneficial outcomes (such as seeking prompt care to ensure peace of mind) or feel that the behaviour has positive attributes (such as sleeping under a net and feeling safe).

Women and men were asked whether they do not like sleeping under a mosquito net when the weather is too warm and whether it is best to start giving a child with a fever any medicine they have at home. If they disagreed with either statement, they were considered to have a favourable attitude towards specific malaria-related behaviours. Overall, 70% of women and 78% of men had a favourable attitude towards specific malaria behaviours (**Table 12.22.1** and **Table 12.22.2**).

Beliefs about what others do and what others think we should do often guide our actions. These types of beliefs are called norms. Malaria programmes can influence behaviours if they portray certain behaviours as socially desirable or socially unacceptable. Seventy-two percent of women and 78% of men believe that

most people in their community currently practise specific malaria-related behaviours (**Table 12.22.1** and **Table 12.22.2**). This includes women who agree that people in their community usually take their children to a health care provider on the same day or the day after they develop a fever or who agree that people in the community who have a mosquito net usually sleep under a mosquito net every night.

Women and men were also asked about the importance of carrying out malaria prevention and treatment measures such as sleeping under a net every night, obtaining treatment if their child gets malaria, and taking the entire course of malaria medicine. Results are presented in **Tables 12.23.1** and **12.23.2**.

Patterns by background characteristics

- By region, the percentage of women who have a favourable attitude toward specific malaria behaviours is highest in Iringa (95%) and lowest in Katavi (31%).

- The percentage of women who believe that people in their community practise specific malaria-related behaviours is highest in Morogoro (96%) and lowest in Songwe (37%).

List of Tables

Table 12.9—*Continued*

Background characteristic	Percentage who received one or more doses of SP/Fansidar	Percentage who received two or more doses of SP/Fansidar	Percentage who received three or more doses of SP/Fansidar	Number of women with a live birth and/or a stillbirth in the 2 years preceding the survey
Wealth quintile				
Lowest	74.8	53.6	24.2	980
Second	79.1	56.6	29.0	865
Middle	78.5	58.3	31.1	838
Fourth	80.2	58.0	32.2	850
Highest	84.5	66.8	43.7	801
Total	79.2	58.4	31.7	4,335
STILLBIRTHS				
Total	79.1	49.5	22.0	65
LIVE BIRTHS AND STILLBIRTHS[2]				
Total	79.2	58.3	31.5	4,400

Note: Stillbirths are foetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are foetal deaths in pregnancies lasting 7 or more months.
SP = sulfadoxine-pyrimethamine
[1] Birth order refers to the order of the birth among the respondent's live births.
[2] For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 12.10 Children with fever and care seeking, prompt treatment, and diagnosis

Percentage of children under age 5 with a fever in the 2 weeks preceding the survey, and among children under age 5 with fever, percentage for whom advice or treatment was sought, percentage for whom advice or treatment was sought the same or next day following the onset of fever, percentage who had blood taken from a finger or heel for testing, and percentage who were diagnosed with malaria by a health care provider, according to background characteristics, Tanzania DHS-MIS 2022

	Children under age 5		Children under age 5 with fever				
Background characteristic	Percentage with a fever in the 2 weeks preceding the survey	Number of children	Percentage for whom advice or treatment was sought[1]	Percentage for whom advice or treatment was sought the same or next day	Percentage who had blood taken from a finger or heel for testing	Percentage who were diagnosed with malaria by a health care provider	Number of children

Middle	5.0	999
Fourth	5.6	991
Highest	5.4	798
Total	5.6	4,925

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Haemoglobin levels are adjusted for altitude using CDC formulas (CDC 1998). Haemoglobin is measured in grams per decilitre (g/dl) using the HemoCue 201+ device. Results presented in this table are based on capillary blood samples. For haemoglobin levels in children based on venous blood samples, see Table 11.13.2.

[1] Includes children whose mothers are deceased

[2] For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

Table 12.15 Prevalence of malaria in children

Percentage of children age 6–59 months classified in a rapid diagnostic test (RDT) as having malaria, according to background characteristics, Tanzania DHS-MIS 2022

KNOWLEDGE, ATTITUDES, AND BEHAVIOUR RELATED TO HIV AND AIDS

13

Key Findings

- ***Discriminatory attitudes:*** 28% of women and 27% of men age 15–49 expressed discriminatory attitudes towards people living with HIV.
- ***Attitudes towards pre-exposure prophylaxis (PrEP) to prevent getting HIV:*** *56%* of women and 64% of men age 15–49 have heard of PrEP and approve using it to prevent HIV infection.
- ***Sex with nonmarital or non-cohabiting partners:*** 21% of women and 38% of men reported having sex with a person who neither was their partner nor lived with them in the 12 months preceding the survey.
- ***Condom use:*** 22% of women and 43% of men reported using a condom during their last sexual intercourse with a nonmarital or non-cohabiting partner.
- ***Coverage of HIV testing:*** 80% of women and 64% of men age 15–49 reported having ever been tested for HIV and receiving the test results.

Acquired immunodeficiency syndrome (AIDS) is one of the most serious public health and development challenges facing Sub-Saharan Africa today. AIDS is caused by the human immunodeficiency virus (HIV) when left untreated. HIV weakens the immune system, making the body susceptible to secondary infections and opportunistic diseases. HIV infection leads to AIDS if it remains untreated.

The predominant transmission mode of HIV is sexual contact. Other modes of transmission include unsafe injections, use of tainted blood supplies during blood transfusions, and mother-to-child transmission (in which the mother passes HIV to her child during pregnancy, delivery, or breastfeeding).

This chapter provides data on levels of and trends in knowledge, attitudes, and behaviours related to HIV and AIDS, including knowledge of HIV prevention methods, stigma and discrimination, sexual behaviour, self-reported HIV testing, and prevention of mother-to-child transmission.

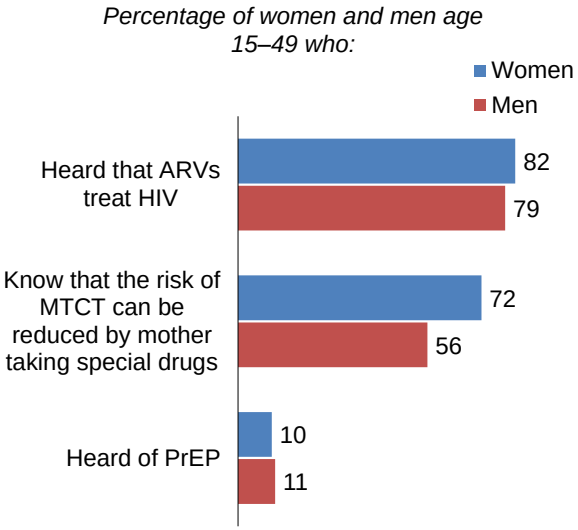
13.1 Knowledge and Attitudes about Medicines to Treat or Prevent HIV

Antiretroviral medicines, or ARVs, are a powerful tool in the fight against HIV. ARVs are taken by people living with HIV to keep them healthy by preventing the virus from progressing to AIDS. By taking ARVs, individuals living with HIV also greatly reduce the risk of passing the virus on to others. Women living with HIV who take ARVs during pregnancy and breastfeeding reduce the chances of passing the virus on to their children. In addition, people who are HIV negative can take ARVs to reduce their chances of acquiring HIV. This is called pre-exposure prophylaxis, or PrEP. Knowledge about and positive attitudes towards these treatment and prevention measures help to promote their use.

Table 13.1 shows that women tend to have greater knowledge of medicines to treat HIV or prevent HIV transmission than men. Eighty-two percent of women age 15–49 have heard of ARVs that treat HIV, 72% know that the risk of mother-to-child transmission (MTCT) of HIV can be reduced by the mother taking special drugs, and 10% have heard of PrEP. The corresponding percentages among men are 79%, 56%, and 11% (**Figure 13.1**). Among those who have heard of PrEP, 56% of women and 64% of men approved of people who take PrEP to prevent getting HIV.

Trends: The percentage of women who know that the risk of MTCT can be reduced by the mother taking special drugs increased from 31% in 2004–05 to 75% in 2010 and decreased slightly to 72% in 2022. Among men, knowledge increased from 36% in 2004–05 to 67% in 2010 and decreased to 56% in 2022.

Figure 13.1 **Knowledge of medicines to treat HIV or prevent HIV transmission**



Patterns by background characteristics

- Among respondents who have heard of PrEP, women in urban areas are less likely than those in rural areas to approve of people who take PrEP to prevent HIV infection (53% versus 59%). Among men, the difference by residence is very small (63% versus 64%).
- Among women who have heard of PrEP, the percentage who approve of taking PrEP for HIV prevention tends to increase with age, from 54% among those age 15–19 to 60% among those age 40–49. On the other hand, among men who have heard of PrEP, there is no strong pattern by age in the percentage who approve of its use (**Table 13.1**).
- Among women who have heard of PrEP, the percentage who approve of taking PrEP for HIV prevention tends to decrease with level of education; for example, for women with primary incomplete education, 69% approve, compared with 54% of women with complete primary education, and 55% of women with secondary education or above. Among men who have heard of PrEP, 65% of those with incomplete primary education and of those with secondary education or above approve of taking PrEP for HIV prevention, compared with 62% of those with complete primary education (**Table 13.1**).

13.2 Discriminatory Attitudes towards People Living with HIV

Widespread stigma and discrimination in a population can adversely affect both people's willingness to be tested and their adherence to antiretroviral therapy (ART) in ART programmes. Thus, reduction of stigma and discrimination in a population is an important indicator of the success of programmes targeting HIV prevention and control.

Discriminatory attitudes towards people living with HIV

Women and men are asked two questions to assess discriminatory attitudes towards people living with HIV. Respondents with discriminatory attitudes towards people living with HIV are those who say that they would not buy fresh vegetables from a shopkeeper or vendor if they knew that person had HIV or who say that children living with HIV should not be allowed to attend school with children who do not have HIV.

Sample: Women and men age 15–49

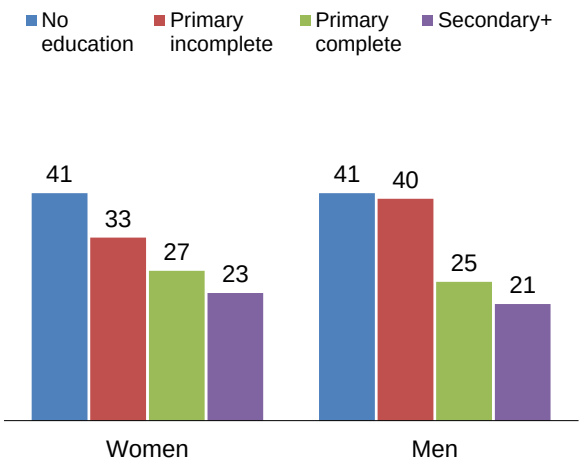
Table 13.2 shows that 28% of women and 27% of men age 15–49 have discriminatory attitudes towards people living with HIV.

Patterns by background characteristics

- Discriminatory attitudes towards people living with HIV tend to be more common in rural than in urban areas. In urban areas 26% of women and 20% of men have discriminatory attitudes, as compared with 30% of women and 31% of men in rural areas.
- Discriminatory attitudes towards people with HIV decrease with increasing education among both women and men; 41% of both women and men with no education have discriminatory attitudes, compared with 23% of women and 21% of men with secondary education or above (**Figure 13.2**).

Figure 13.2 **Discriminatory attitudes towards people living with HIV by education**

Percentage of women and men age 15–49 with discriminatory attitudes



- Similarly, the percentage of respondents with discriminatory attitudes towards people with HIV decreases with increasing wealth, from 39% among women in the lowest wealth quintile to 23% among those in the highest wealth quintile; respective figures for men are 41% in the lowest quintile to 19% among those in the highest quintile.
- There are also differences by age in discriminatory attitudes. For example, 31% of women age 15–24 have discriminatory attitudes compared to 26% for those age 40–49. The respective figures for men are 31% and 24%.
- The Western zone has the highest percentage of women with discriminatory attitudes (49%), compared to the Southern Highlands zone with only 9%. The same pattern is observed among men, with 32% and 18%, respectively.
- Differences in discriminatory attitudes are also observed for regions. Kigoma has the highest percentage (57%) of women with discriminatory attitudes, and Iringa has the lowest (5%). For men, the highest is Shinyanga (86%), followed by Simiyu (76%), while Iringa has the lowest (3%).

13.3 Multiple Sexual Partners

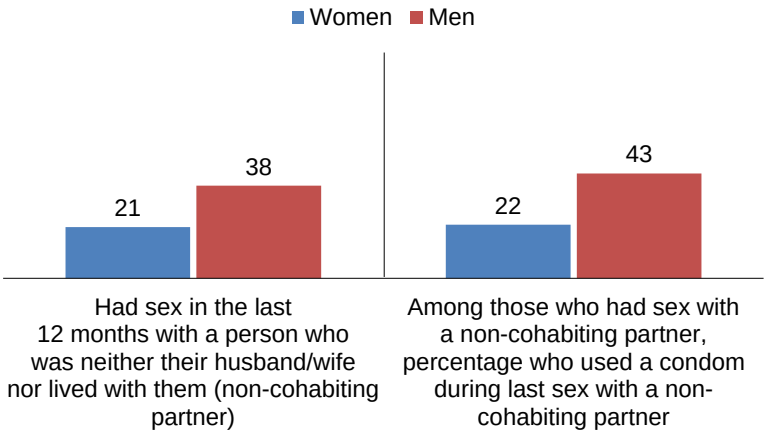
Table 13.3.1 shows that 4% of women age 15–49 had two or more sexual partners in the last 12 months and 21% had intercourse with a person who was neither their husband nor lived with them in the 12 months preceding the survey. Among women who had two or more sexual partners in the 12 months before the survey, 14% reported using a condom during their last sexual intercourse. Twenty-two percent of

women who had intercourse in the last 12 months with a person who neither was their husband nor lived with them used a condom during the last sexual intercourse with such a partner.

Table 13.3.2 shows that 23% of men age 15–49 reported having two or more sexual partners in the 12 months preceding the survey, and 38% had intercourse in the last 12 months with a person who was neither their wife nor lived with them. Among men with two or more sexual partners, 23% used a condom during their last sexual intercourse. Forty-three percent of men who had intercourse in the last 12 months with a person who neither was their wife nor lived with them used a condom during the last sexual intercourse with such a partner (**Figure 13.3**).

***Figure 13.3* Sex and condom use with non-cohabiting partners**

Percentage of women and men age 15–49



The mean number of lifetime sexual partners is 3.2 for women and 8.3 for men.

Patterns by background characteristics

- Men living in urban areas reported a higher mean number of lifetime sexual partners (9.9) than those living in rural areas (7.5) while for women it is 3.7 and 2.9, respectively.
- Men's mean number of lifetime sexual partners tends to increase with increasing wealth. It is 7.8 for those in the lowest wealth quintile and 9.4 for those in the highest wealth quintile. A similar pattern is observed for women (2.7 and 3.4 respectively).
- The men's mean number of sexual partners varies according to the type of union. The mean is 9.1 for men in polygynous unions, compared with 8.7 for men who are in non-polygynous unions.
- For Tanzania Mainland, the men's mean number of sexual partners is 8.4, compared to 4.3 in Zanzibar. The mean number of sexual partners is highest (13.0) in the Southern zone and lowest in Zanzibar (4.3).
- Mean number of lifetime sexual partners among men is highest in Katavi region (14.7), followed by Mtwara (13.1), Dar es Salaam (12.9), and Lindi (12.8). On the other hand, the mean number of lifetime sexual partners time is lowest in Kaskazini Unguja (1.8), followed by Kusini Pemba (2.3).

13.4 Coverage of HIV Testing Services

HIV testing programmes diagnose people living with HIV so that they can be linked to care and access antiretroviral therapy (ART). In addition, knowledge of HIV status helps HIV negative individuals reduce their risk and remain negative.

13.4.1 HIV Testing of Pregnant Women

Table 13.4 presents information on HIV testing during pregnancy or delivery among women age 15–49 who gave birth in the 2 years preceding the survey. Eighty-three percent of women were tested for HIV during ANC and received results while 88% of women had an HIV test during an ANC visit or labour and received the test results.

13.4.2 Experience with Prior HIV Testing

Tables 13.5.1 and **13.5.2** show 80% of women have ever been tested for HIV and received the results, as compared with 64% of men. Less than 1% of women and men have been tested but did not receive the test results. Thirty-seven percent of women and 31% of men were tested for HIV and received the results in the 12 months preceding the survey (**Figure 13.4**).

Ten percent of women and 11% of men reported having been tested only once during their lifetime, and 20% of women and 15% of men report having been tested six or more times during their lifetime (**Table 13.6**).

Trends: The percentage of women age 15–49 who have ever been tested for HIV and received the results increased substantially from 12% in 2004–05 to 80% in 2022. The same pattern is observed for men, where it increased from 12% in 2004–05 to 64% in 2022 (**Figure 13.5**).

***Figure 13.4* HIV testing**

Percentage of women and men age 15–49

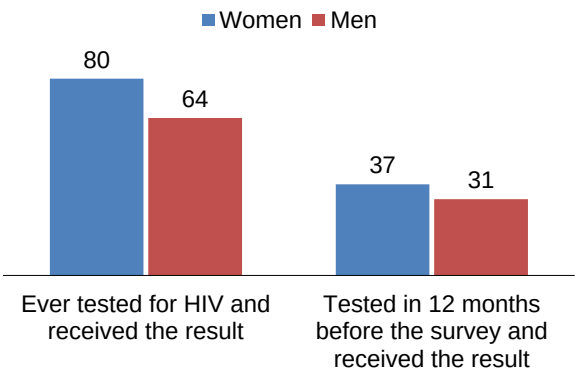


***Figure 13.5* Trends in HIV testing**

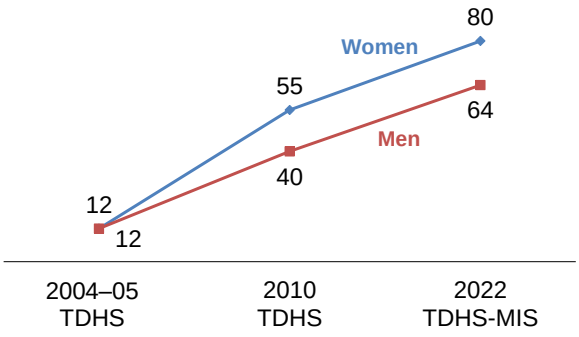
Percentage of women and men age 15–49 who have ever been tested for HIV and received the results



Patterns by background characteristics

- A slightly higher percentage of urban women (81%) and men (68%) have been tested for HIV and received the results than their rural counterparts (79% and 62%, respectively).
- For Tanzania Mainland, the percentage of women who have ever been tested for HIV and received the results is 80%, compared to 74% for Zanzibar. The corresponding figures for men are 64% and 58% for Tanzania Mainland and Zanzibar, respectively.
- By region, the percentage of women who have ever been tested for HIV and received the results is highest in Njombe (90%) and lowest in Shinyanga (65%). Among men the percentage is again highest in Njombe (79%) and lowest in Kaskazini Pemba (31%).
- The percentage of both women and men who have been tested and received the results tends to increase with increasing wealth, from 76% and 55% among women and men, respectively, in the lowest wealth quintile to 80% and 71% among women and men in the highest wealth quintile.

Knowledge and Coverage of Self-testing

Eighteen percent of women and 31% of men age 15–49 have ever heard of HIV self-test kits, and 3% of women and 5% of men have ever used a self-test kit (**Table 13.7**).

13.5 Disclosure, Shame, and Stigma among People Living with HIV

Internalised and experienced stigma adversely impact the physical and mental health and well-being of people living with HIV and are structural drivers of the HIV epidemic. In the 2022 TDHS-MIS, respondents who have ever received an HIV test were asked to report what the result of their most recent test was. Those who said that their test result was HIV positive were asked a series of questions about their experience of living with HIV, including a question on internalised stigma and questions on experience of

stigma in community and health care settings. An indicator on experience of stigma in a community setting is calculated from the three questions included on this topic.

All of these indicators are based on the population of people who are aware that they have HIV and chose to disclose their positive HIV status during the interview. However, it is important to keep in mind that this group may exclude some respondents who know they have HIV and did not choose to disclose their status; therefore, results should be interpreted with caution.

Stigma and discrimination experienced in community settings in the last 12 months among people living with HIV

Women and men living with HIV who agreed that one or more of the following three experiences happened to them because of their HIV status in the last 12 months: (1) people talked badly about them; (2) someone else disclosed their HIV status without their permission; (3) they were verbally insulted, harassed, or threatened because of their HIV status.

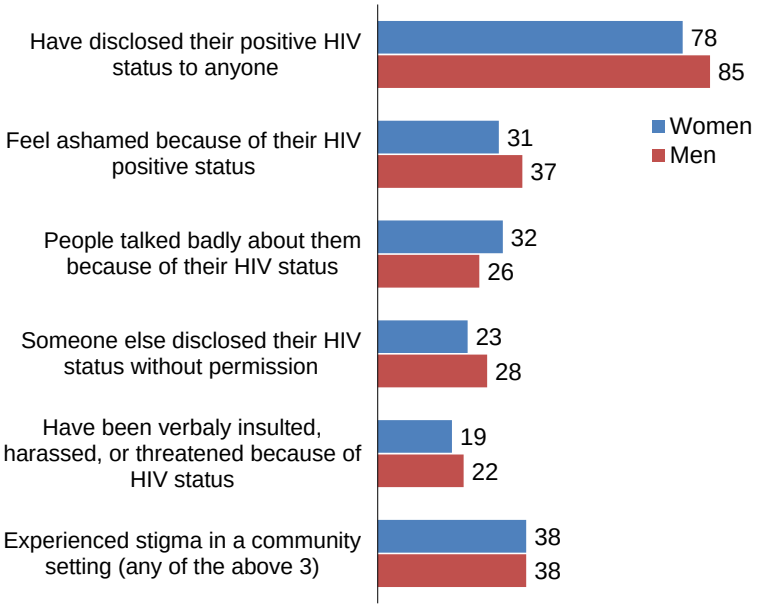
Sample: Women and men age 15–49 self-reported as HIV positive

Overall, a total of 485 women and 70 men reported being HIV positive (**Tables 13.8.1** and **13.8.2**). Among those who reported being HIV positive, 78% of women and 85% of men have disclosed their positive HIV status to someone. Seventy-six percent of women living in urban areas disclosed their HIV status. The corresponding figure for women living in rural areas is 79%. Thirty-one percent of women and 37% of men felt ashamed because of their positive status.

Three questions assessed experience of stigma in a community setting. Thirty-two percent of women and 26% of men living with HIV reported that people talk badly about them because of their HIV status. Twenty-three percent of women and 28% of men reported that someone else disclosed their HIV status without their permission, and 19% of women and 22% of men reported that they had been verbally insulted, harassed, or threatened because of their status. Overall, 38% of women and men who are living with HIV reported at least one of these three forms of stigma in a community setting (**Figure 13.6**).

Figure 13.6 **Disclosure, shame, and stigma experienced by people living with HIV**

Percentage among women and men age 15–49 who reported their last HIV test as HIV positive



13.6 MALE CIRCUMCISION

Traditional circumcision

A cut, partial removal, or complete removal of the foreskin by a traditional practitioner, family member, or friend for religious, health, or cultural reasons. Can be performed at any age.

Medical circumcision

Complete removal of the foreskin by a health care worker. Can be performed at any age.

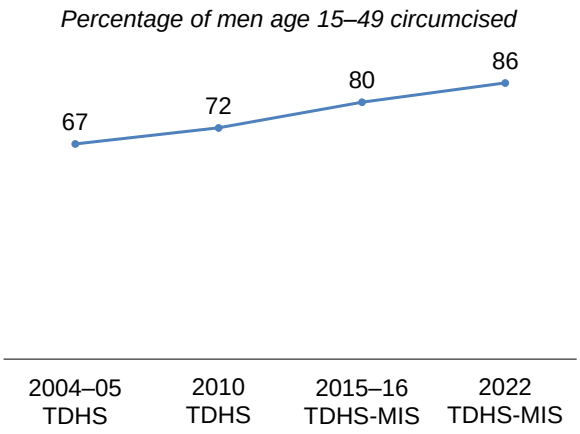
Sample: Men age 15–49

All men were asked whether they were circumcised. If they said they were circumcised, they were asked both whether they had been traditionally circumcised and whether they had been medically circumcised, as well as the age at which each procedure had occurred. In some settings, traditional circumcision may leave enough of the foreskin intact that it is possible to perform a medical circumcision afterward, making it possible for a man to have been circumcised both traditionally and medically.

Eighty-six percent of men age 15–49 have been traditionally or medically circumcised, while 14% have not been circumcised (**Table 13.9**). The percentage of medically circumcised men is twice as high as those traditionally circumcised (53% compared to 26%).

Trends: Overall male circumcision has increased gradually, from 67% in the 2004–05 TDHS to 86% in the 2022 TDHS-MIS (**Figure 13.7**).

Figure 13.7 **Trends in male circumcision**



Patterns by background characteristics

- By residence, 96% of men in urban areas are circumcised, compared to 81% of men in rural areas.
- For Tanzania Mainland, 86% of men are circumcised, while for Zanzibar, the figure is 97%.
- By region, all men included in the sample from Tanga are circumcised, followed by Dar es Salaam, Mtwara, and Pwani (99% each).
- The lowest percentage (55%) of circumcised men is found in Songwe region followed by Kagera (62%).
- The percentage of circumcised men increases with increasing education, ranging from 68% for those with no education to 95% for secondary and above.
- Similarly, the percentage of circumcised men increases with increasing wealth, ranging from 74% for the lowest wealth quintile to 97% for the highest wealth quintile.

13.7 Self-reporting of Sexually Transmitted Infections

Sexually transmitted infections (STIs) and symptoms

Respondents who have ever had sex are asked whether they had an STI or symptoms of an STI (a bad-smelling, abnormal discharge from the vagina/penis or a genital sore or ulcer) in the 12 months before the survey.

Sample: Women and men age 15–49 who have ever had sex

STIs have been found to increase susceptibility to HIV infection. Overall, 14% of women and 13% of men age 15–49 self-reported having an STI or symptoms of an STI in the 12 months preceding the survey (Table 13.10). In the 2010 TDHS, 7% of women and 6% of men reported having an STI or symptoms of an STI in the 12 months preceding the survey.

13.8 Knowledge and Behaviour Related to HIV and AIDS among Young People

This section addresses HIV-related knowledge among young people age 15–24 and also assesses the extent to which young people engage in behaviours that may place them at risk of acquiring HIV.

Knowledge about HIV prevention

Knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chances of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Sample: Women and men age 15–24

13.8.1 Knowledge about HIV Prevention

Knowledge of how HIV is transmitted is crucial to enable people to avoid HIV infection, and this is especially true for young people, who are often at greater risk because they may have shorter relationships with more partners or engage in other risky behaviours.

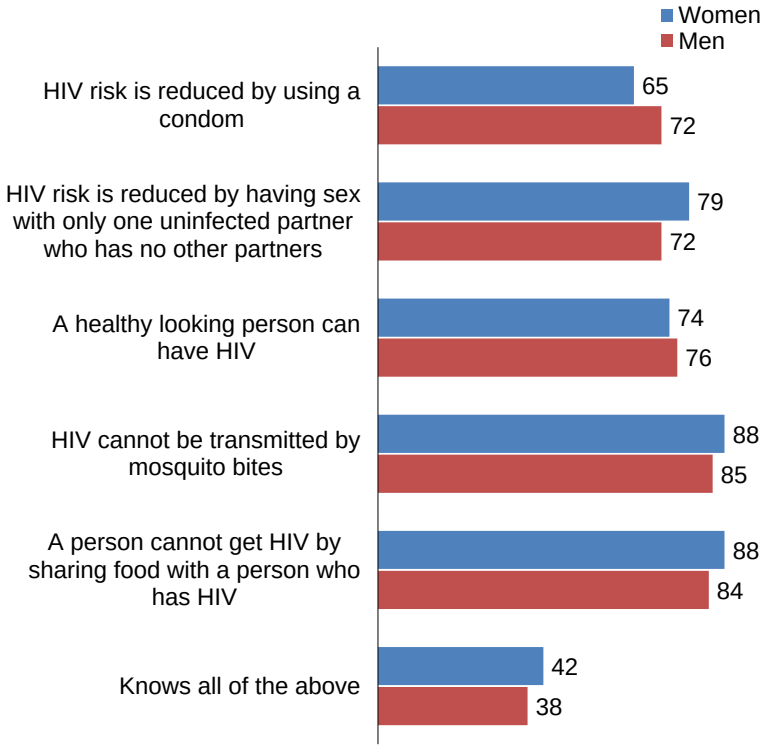
The percentage of young women and men age 15–24 with comprehensive knowledge on how to prevent HIV infection is 42% and 38% (**Table 13.11.1** and **Table 13.11.2** and **Figure 13.8**).

Patterns by background characteristics

- Young women and men in urban areas (49% and 44%, respectively) are more likely than their counterparts in rural areas (38% and 36%, respectively) to have knowledge about HIV prevention.
- The percentage of young women with knowledge about HIV prevention is higher in Tanzania Mainland (42%) than in Zanzibar (33%), while for men knowledge about HIV prevention is 39% and 19%, respectively.

Figure 13.8 **Knowledge about HIV prevention among young people**

Percentage of women and men age 15–24 with specified knowledge



- By region, the percentage of young women with knowledge about HIV prevention ranges from 22% in Simiyu to 71% in Iringa. Among young men, the highest percentage is in Tanga (57%) and the lowest is in Kaskazini Unguja (7%).
- The percentage of young women and men with knowledge about HIV prevention increases with increasing education. Nineteen percent of young women with no formal education have knowledge, as compared with 53% of those with a secondary education or higher. The corresponding percentages among young men are 20% and 48%, respectively.
- Knowledge about HIV prevention for both young women and young men generally increases with increasing household wealth, from 27% for women in the lowest wealth quintile to 50%. The corresponding figures for men are 26% and 45%.

13.8.2 First Sex

Young people who initiate sex at an early age are typically at higher risk of becoming pregnant or contracting an STI than young people who initiate sex later. Consistent condom use can reduce such risks.

Table 13.12 shows that 12% of young women and 9% of young men age 15–24 had sex before age 15. Fifty-eight percent of young women and 45% of young men age 18–24 reported that they had sex before age 18.

Trends: The percentage of young women age 15–24 who had sex before age 15 has remained roughly the same for the past three TDHS surveys (12% in 2004–05, 13% in 2010, and 12% in 2022). For men, it was 9% in 2004–05, 7% in 2010, and 9% in 2022. The percentage of women who had sex before age 18 was

58% in 2010 and remained the same in 2022. For men, there has been a very slight increase, from 44% in 2010 to 45% in 2022.

Patterns by background characteristics

- A higher percentage (13%) of rural young women age 15–24 had sexual intercourse before age 15 than their counterparts in urban areas (10%). However, a lower percentage (8%) of young men in rural areas had sexual intercourse before age 15 than their counterparts in urban areas (11%).
- A higher percentage (65%) of young women age 18–24 in rural areas reported having sex before age 18 than their urban counterparts (47%). For men, the percentage was more or less the same (45%).
- The percentage of young women age 15–24 who reported having sex before age 15 decreases with increasing education, from 26% among those with no formal education to 4% among those with secondary education or higher. A similar pattern is observed among young men (12% to 9%).
- The percentage of young women and men age 18–24 who reported having sex before age 18 also decreases with increasing education. For women, it decreases from 83% to 37%, while for men it decreases from 57% to 42%.

13.8.3 Premarital Sex

The 2022 TDHS collected information on patterns of sexual activity among never-married young women and men age 15–24. **Table 13.13** shows that among never-married young women age 15–24, 62% reported never having had sexual intercourse. The corresponding figure for men is 49%.

By residence, the findings show that a higher percentage of rural women (66%) and men (54%) age 15–24 had never had sexual intercourse, compared to their counterparts in urban areas (58% and 41%, respectively) (**Table 13.13**).

13.8.4 Multiple Sexual Partners

Individuals who have multiple sexual partners increase their risk of contracting HIV because each new relationship introduces another pathway for HIV transmission.

Four percent of young women age 15–24 reported having had two or more sexual partners in the 12 months preceding the survey, and 22% of young women age 15–24 reported having sexual intercourse with a partner who neither was their husband nor lived with them in the 12 months preceding the survey. Twenty-two percent of young women reported using a condom with such a partner (**Table 13.14.1**).

Among young men age 15–24, 16% reported having had two or more partners in the 12 months preceding the survey, 40% reported having sex with a person who was neither their wife nor lived with them, and 41% reported using a condom during their last sexual intercourse with such a partner (**Table 13.14.2**).

13.8.5 Recent HIV Testing

Seeking an HIV test may be more difficult for young people than adults because many young people lack experience in accessing health services for themselves and because there are often barriers to young people obtaining services. Overall, among young people age 15–24 who had sexual intercourse in the 12 months preceding the survey, 44% of women and 30% of men were tested for HIV in the 12 months preceding the survey and received the results of their last test (**Table 13.15**).

Trends: Among young people age 15–24 who had sexual intercourse in the 12 months preceding the survey, the percentage who were tested for HIV in the 12 months preceding the survey and received the results increased among women, from 9% in the 2004–05 TDHS to 39% in the 2011–12 THMIS and 44%

in the 2022 TDHS-MIS. For men, this percentage also increased, from 7% in the 2004–05 TDHS to 29% in the 2011–12 THMIS and 30% in the 2022 TDHS-MIS.

List of Tables

For more information on knowledge, attitudes, and behaviour related to HIV and AIDS, see the following tables:

[1] Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Table 13.11.2 Knowledge about HIV prevention among young people: Men

Percentages of young men age 15–24 who, in response to prompted questions, say that people can reduce their risk of getting HIV by using condoms every time they have sexual intercourse and by having one sex partner who is not infected and has no other partners, that a healthy-looking person can have HIV, that HIV cannot be transmitted by mosquito bites, and that a person cannot get HIV by sharing food with a person who has HIV, and the percentage with knowledge about HIV prevention, according to background characteristics, Tanzania DHS-MIS 2022

Note: Figures in parentheses are based on 25–49 unweighted cases.
[1] Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

ADULT AND MATERNAL MORTALITY 14

Key Findings

- ***Adult mortality:*** The adult mortality rate is 2.81 deaths per 1,000 population among women and 3.48 deaths per 1,000 population among men.
- ***Lifetime risk of maternal death:*** The lifetime risk of maternal death indicates that 1 in 200 women in Tanzania will die from maternal causes.
- ***Maternal mortality ratio:*** The maternal mortality ratio for the 7-year period prior to the 2022 TDHS-MIS is estimated at 104 maternal deaths per 100,000 live births.

Adult and maternal mortality indicators can be used to assess the health status of a population and the performance of health systems. Reproductive health is a major concern in most developing countries, and thus there is a need for reliable data on maternal deaths.

The problem of maternal mortality can be approached using a delay model that includes delays in deciding to seek life-saving care, delays in reaching a health care facility, and delays in receiving the needed services upon reaching the facility (Thaddeus and Maine 1994). This model takes into account human, health system, and socioeconomic factors such as poverty, poor emergency obstetric services, and fatalistic beliefs. These problems contribute to a high incidence of infectious diseases, postpartum haemorrhage, hypertensive disorders, unsafe abortions, and prolonged labour, leading to high adult and maternal mortality. The target of UN Sustainable Development Goal (SDG) 3.1 is to reduce the global maternal mortality ratio to less than 70 per 100,000 live births by 2030.

Estimation of mortality rates requires complete and accurate data on adult and maternal deaths. In the 2022 TDHS-MIS, data were collected from female respondents on the survival status of their sisters and brothers to estimate adult mortality. Questions were included to determine if any of the sisters' deaths were related to pregnancy or childbirth, allowing an estimation of maternal mortality—a key indicator of maternal health and well-being.

14.1 POLICIES AND PROGRAMMES FOR THE PREVENTION OF MATERNAL MORTALITY IN TANZANIA

The Government of Tanzania has always been concerned about the health and well-being of the country's population. The efforts of the government were translated into the National Health Policy in 1990 (United Republic of Tanzania 1990). The policy gained notice when it was translated and implemented during the Primary Health Care Service Development Programme, popularly known as MMAM for its name in Kiswahili (*Mpango wa maendeleo wa afya ya msingi*) (PHSDP/MMAM 2007–2017) (MoHSW 2007). MMAM required each region to have a regional referral hospital, each council to have a hospital, each ward to have a health centre, and each village to have a dispensary. All of the strategies implemented were aimed at strengthening health systems, including good governance and leadership; improvements in health delivery services, the health workforce, and health information systems; and increases in medical supplies and financing. MMAM continued to operate at a moderate pace until 2015. The highest political will in strengthening the country's health services was shown during the fifth phase of the Government of Tanzania (2015–2021), and strong political will to strengthen the health sector continued during the sixth phase (2021 to present). This had an impact in terms of effective leadership and governance, ensuring

further strengthening of health systems. These efforts on the part of the government have created a policy environment conducive to achieving significant reductions in maternal mortality in the country.

One of the early decisions made was to discourage traditional birth attendants (TBAs) from delivering pregnant mothers at home. Rather, TBAs were instructed to escort women in labour to nearby health facilities. It should be noted that improvements in health facilities and health facility staffing have been a priority. Health facility staff are required to implement maternal death audits—systematic, in-depth reviews of all maternal deaths to identify underlying health, social, and other contributing factors. The lessons learned from these audits have been used in making recommendations to prevent future deaths. The maternal death audit system is designed to cover all maternal deaths in the country. The death audit data are compiled at the district and regional levels, and eventually reports are submitted to the Ministry of Health. In line with this approach, the government introduced the Maternal Death Surveillance and Response (MDSR) system in 2015 to facilitate death notification and learning from death audits in order to prevent future deaths. The aim was to describe the strengths, challenges, and impact of implementing the MDSR system in Tanzania (Said 2021). All death audits were reviewed, and follow-up was conducted when reporting was not sufficiently comprehensive.

At the same time, significant efforts have been made to improve delivery of health care services. Good service delivery comprises quality, access, safety, and coverage. Infrastructure is a key pillar supporting the fundamental aim of promoting improved standards of care and well-being for all patients, together with positive experiences by users of the health care system. Quality health care service provision and equitable geographic access and service delivery are important components of universal health coverage in the country. The government has been maintaining existing facilities, constructing new facilities, and acquiring newer technologies for improved health care infrastructure, which function together to expand access to improved health care services. This effort was observed to reduce maternal mortality in a small-scale study conducted in the country's Kigoma region (Prasad et al. 2022). During the roughly 10 years preceding the 2022 TDHS-MIS, there was a dramatic increase in the number of health care facilities in the country. For example, between 2010 and 2022, the number of dispensaries increased from 5,469 to 7,447, the number of health centres increased from 633 to 1,016, and the number of hospitals increased from 240 to 418.

The increased number of health facilities contributes to increased availability of health care services, especially reproductive, maternal, newborn, child, and adolescent health (RMNCAH) services, including expanding basic and comprehensive emergency obstetric newborn care (EmONC) services. Health centres have been upgraded to provide caesarean sections to pregnant mothers, and availability of ambulance services has been expanded. From 2015 to 2020, there were increases in the percentages of health facilities offering basic EmONC (from 13% to 51% for dispensaries and from 28% to 76% for health centres) as well as comprehensive EmONC (from 12% to 24% for health centres and from 59% to 87% for hospitals). As shown in Chapter 9, these improvements have been associated with a steady increase in the percentage of births occurring in health facilities, from 51% of live births in the 2 years preceding the 2010 TDHS and 65% in the 2 years preceding the 2015–16 TDHS-MIS to 81% in the 2 years preceding the 2022 TDHS-MIS.

There have also been major changes in the areas of medical supplies and health care financing. Procurement and supply programmes need to ensure equitable access, quality, and cost-effectiveness. In Tanzania, the budget for medical supplies increased from TZS 31 billion in 2015–16 to TZS 269 billion in 2018–19. Furthermore, the budget for the health sector as a whole increased from TZS 577 billion in 2007–08 to TZS 2.8 trillion in 2020–21 in nominal terms.

Improvements in the transportation system can also contribute to reducing delays in accessing health care services. All regional and district hospitals are connected to good roads. Improvements in the transportation sector have played a role in reducing the time taken for pregnant women to reach a service delivery point of care. For instance, research has shown that motorcycles have made a substantial difference towards improving access to EmONC health facilities in Kigoma (Chen et al. 2017).

14.2 DATA

The 2022 TDHS-MIS collected sibling histories by asking each female respondent to list all children born to her biological mother. The respondent was then asked if each sibling was still alive. For living siblings, the interviewer asked their current age. For deceased siblings, age at death and number of years since death were recorded. When a respondent could not provide precise information on age at death or years since death, approximate but quantitative answers were accepted.

For sisters who died at age 12 or older, three questions were asked to determine whether the death was pregnancy related: "Was [NAME OF SISTER] pregnant when she died?" and, if not, "Did she die during childbirth?" and, if not, "Did she die within 2 months after the end of a pregnancy or childbirth?" For sisters who died within 2 months after the end of pregnancy or childbirth, time of death was further refined by asking "How many days after the end of the pregnancy or childbirth did [NAME OF SISTER] die?" For sisters who died during pregnancy, childbirth, or the 2 months following childbirth, the respondent was asked whether the sister died from an act of violence or an accident.

A total of 82,467 siblings were recorded in the adult mortality section of the 2022 TDHS-MIS (see **Table C.21** in Appendix C). There was complete reporting of current age (used to estimate exposure to death) for all surviving siblings. Likewise, age at death and years since death were obtained for all dead siblings. Survival status was unknown for 0.1% of siblings. Data capture via CAPI may have aided the completeness of data on siblings because in the CAPI system, interviewers are required to populate all relevant fields in order to progress through the interview. The sex ratio for enumerated siblings (the ratio of brothers to sisters multiplied by 100) was 101.5 (see **Table C.22** in Appendix C), slightly below the expected ratio of around 104.

14.3 DIRECT ESTIMATES OF ADULT MORTALITY

Adult mortality rate

The number of adult deaths per 1,000 population age 15–49. Adult mortality rates by 5-year age groups are calculated as follows: the number of deaths to a respondent's siblings in each age group is divided by the number of person-years of exposure to the risk of dying in that age group in the 7 years preceding the survey. The number of deaths is the number of siblings (brothers or sisters) reported as having died within the 7 years preceding the survey. The person-years of exposure in each age group are calculated for both surviving and dead siblings based on their current age (living siblings) or age at death and years since death (dead siblings).

Sample: Siblings (both living and dead) who were age 15–49 in the 7 years preceding the survey, by sex and 5-year age groups

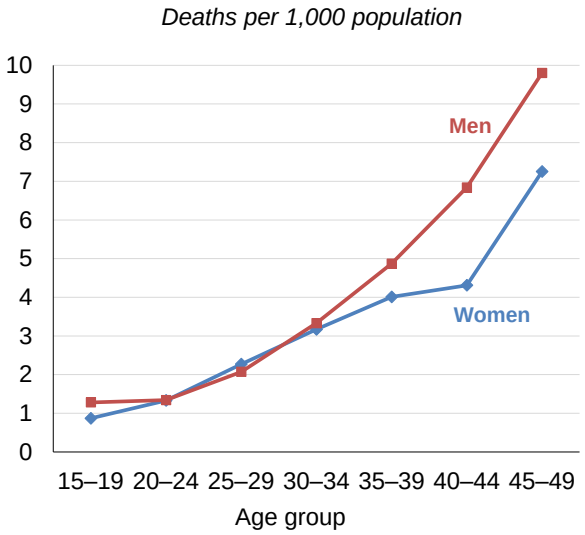
Adult mortality rates for women and men age 15–49 were calculated for the 7-year period before the 2022 TDHS-MIS (roughly 2015 to 2022). The 7-year period before the survey was selected to balance the competing goals of reporting the most recent data possible and capturing a sufficient number of deaths to obtain an acceptable level of sampling error. Nevertheless, the total number of deaths upon which the adult mortality rates are based is low—491 female deaths and 604 male deaths—so age-specific adult mortality rates are subject to considerable sampling variation.

It is important to note that previous Tanzania DHS reports used a reference period of 10 years preceding the survey for adult and maternal mortality estimates. For trend data, the mortality estimates for previous surveys have been recalculated for the 7 years preceding the survey. Therefore, estimates for prior surveys in this chapter may not match the numbers reported in those surveys' final reports.

Table 14.1 and **Figure 14.1** show age-specific mortality rates among women and men age 15–49 for the 7 years before the 2022 TDHS-MIS. The age-adjusted adult mortality rate per 1,000 population for adults age 15–49 is lower among women (2.81 deaths per 1,000) than among men (3.48 deaths per 1,000). Age-specific adult mortality rates generally increase with age among both women and men, especially after age 40.

Furthermore, **Figure 14.1** shows that mortality rates are higher for men than women in the 35–39, 40–44, and 45–49 age groups. In contrast, in the 2015–16 TDHS-MIS, adult mortality rates were fairly similar for men and women across all age groups. Please see Appendix C for further information about all-cause adult mortality estimates in the 2022 TDHS-MIS.

Figure 14.1 **Adult mortality rates by age**



14.4 TRENDS IN ADULT MORTALITY

This chapter includes a summary measure of adult mortality ($_{35}q_{15}$) that describes the probability of dying between the 15th and 50th birthdays if individuals experienced the age-specific mortality rates shown in **Table 14.1**.

Table 14.2 shows the probability of a woman or man age 15 dying by age 50 ($_{35}q_{15}$) for the 7 years preceding the 2022 TDHS-MIS as well as for the 7-year period preceding the prior four TDHS surveys.

According to the 2022 TDHS-MIS results, 110 of every 1,000 women and 137 of every 1,000 men surviving to age 15 would be expected to die before age 50 (**Table 14.2**). There appears to have been a notable decrease in adult mortality in Tanzania over time. A comparison of the 2004–05 TDHS and the 2022 TDHS-MIS shows that the probability of dying between age 15 and 50 has decreased by 53% among women (from 236 to 110 deaths per 1,000 population) and 43% among men (from 242 to 137 deaths per 1,000 population). Standard errors and confidence intervals for the adult mortality rates can be found in **Table B.20** in Appendix B.

14.5 Direct Estimates of Maternal Mortality

Maternal mortality rate

The number of maternal deaths per 1,000 women age 15–49. Maternal mortality rates by 5-year age groups are calculated by dividing the number of maternal deaths to female siblings of respondents in each age group by the total person-years of exposure of the sisters to the risk of dying in that age group in the 7 years preceding the survey. The number of deaths is the number of sisters reported as having died in the 7 years preceding the survey during either pregnancy or delivery, or in the 42 days following the delivery or termination of a pregnancy, by their age group at the time of death. Deaths due to accidents or violence are excluded. The person-years of exposure in each age group are calculated for both surviving and dead sisters based on their reported current age (living sisters) or age at death and years since death (dead sisters).

Sample: Sisters (both living and dead) age 15–49 in the 7 years preceding survey, by 5-year age groups

Maternal mortality ratio

The number of maternal deaths per 100,000 live births. The maternal mortality ratio is calculated by dividing the age-standardised maternal mortality rate for women age 15–49 in the 7 years preceding the survey by the general fertility rate (GFR) for the same time period.

Maternal deaths are a subset of female deaths; they are defined as any deaths that occur during pregnancy or childbirth or within 42 days after the birth or termination of a pregnancy, excluding deaths due to accidents or violence. Two methods are generally used to estimate maternal mortality in developing countries including Tanzania: the indirect sisterhood method (Graham et al. 1989) and a direct variant of the sisterhood method (Rutenberg and Sullivan 1991; Stanton et al. 1997). The direct estimation procedure is applied in this report.

Total and age-specific maternal mortality rates for the 7-year period before the 2022 TDHS-MIS are shown in **Table 14.3**.

- A total of 30 maternal deaths were identified in the 2022 TDHS-MIS.
- The maternal mortality rate among women age 15–49 is 0.16 deaths per 1,000 woman-years of exposure.
- The age-specific mortality rate is highest among women age 35–39 (0.36 deaths per 1,000 woman-years of exposure) and lowest among women age 25–29 (0.06 deaths per 1,000 woman-years of exposure).
- The percentage of female deaths due to maternal causes—or the proportion maternal—is 6% during the 7-year period before the survey. The percentage of female deaths that are maternal varies by age and ranges from 2% among women age 45–49 to 15% among women age 20–24. Please see Appendix C for further information on the estimate for the proportion maternal in the 2022 TDHS-MIS.

Table 14.4 shows the estimated maternal mortality ratio (MMR). The MMR is estimated at 104 deaths per 100,000 live births in the 7-year period before the survey. In other words, for every 1,000 live births, one woman died during pregnancy or childbirth or within 42 days following childbirth or the termination of a pregnancy excluding deaths due to violence or accidents. The lifetime risk of maternal death is 0.005, which indicates that at the maternal mortality rates observed for the 7-year period before the survey, 0.5% of women are likely to suffer a maternal death over their lifetime (that is, a lifetime risk of 1 in 200). For additional information on the maternal mortality ratio estimate, see Appendix C.

14.6 Trends in Pregnancy-related and Maternal Mortality

Between the 2015–16 TDHS-MIS and the 2022 TDHS-MIS, The DHS Program made changes in the methods and terms for maternal mortality in order to align with the *International Statistical Classification of Diseases and Related Health Problems, 11th Revision* (WHO 2022). What was called the "maternal mortality ratio" (MMR) in the 2015–16 TDHS and prior surveys is now called the "pregnancy-related mortality ratio" (PRMR). Maternal mortality—according to the current definition—differs from pregnancy-related mortality in two ways. First, maternal mortality is restricted to deaths that occurred in the 42 days after childbirth or the termination of a pregnancy, whereas pregnancy-related mortality includes deaths up to 2 months after childbirth or the termination of a pregnancy.[1] Second, maternal mortality excludes deaths due to accidents or violence, whereas pregnancy-related mortality includes such deaths. Thus, the pregnancy-related mortality ratio will usually be higher than the maternal mortality ratio and can never be lower.

The questions used to measure maternal mortality—according to the current definition—were not asked in surveys in Tanzania before the 2022 TDHS-MIS. Therefore, what this report refers to as the maternal mortality ratio cannot be calculated for previous surveys. In order to discuss trends, the pregnancy-related mortality ratio must be used.

Pregnancy-related mortality rate

The number of pregnancy-related deaths per 1,000 women age 15–49. Pregnancy-related mortality rates by 5-year age groups are calculated by dividing the number of pregnancy-related deaths to female siblings of respondents in each age group by the total person-years of exposure of the sisters to the risk of dying in that age group during the 7 years preceding the survey. The number of deaths is the number of sisters reported as having died in the 7 years preceding the survey during either pregnancy or delivery, or in the 2 months following the delivery or termination of a pregnancy, by their age group at the time of death. The person-years of exposure in each age group are calculated for both surviving and dead sisters based on their reported current age (living sisters) or age at death and years since death (dead sisters).

Sample: Sisters (both living and dead) age 15–49 in the 7 years preceding the survey, by 5-year age groups

Pregnancy-related mortality ratio

The number of pregnancy-related deaths per 100,000 live births. The pregnancy-related mortality ratio is calculated by dividing the age-standardised pregnancy-related mortality rate for women age 15–49 in the 7 years preceding the survey by the general fertility rate (GFR) for the same time period.

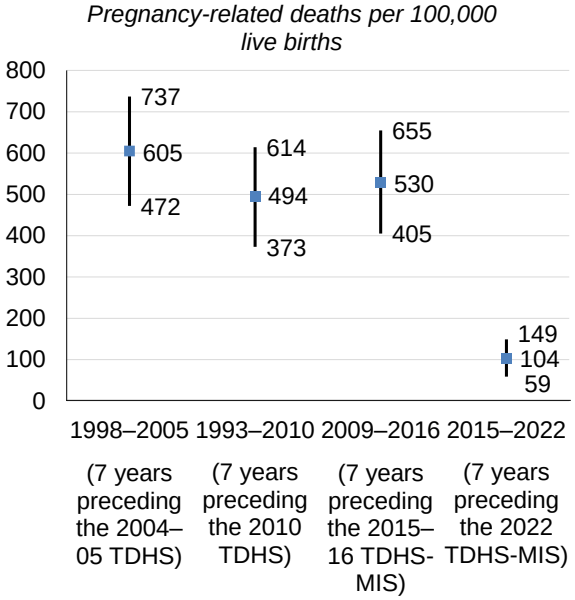
In the 7 years prior to the survey, none of the deaths identified as pregnancy related (that is, deaths that occurred during pregnancy or childbirth or within 2 months following childbirth or the termination of a pregnancy) were due to accidents or violence. Furthermore, there were no deaths occurring between 42 days and 2 months after childbirth or the termination of a pregnancy. For these reasons, the MMR and the PRMR in the 2022 TDHS-MIS are the same, which is not usually the case in DHS surveys that are able to estimate both pregnancy-related and maternal mortality. Pregnancy-related mortality rates and ratios for the 2022 TDHS-MIS and the four previous TDHS surveys are shown in **Table C.22** in Appendix C. Estimates for surveys prior to the 2022 TDHS-MIS have been recalculated for the 7-year period preceding

[1] Note that the DHS definition of a pregnancy-related death differs from the WHO definition of a pregnancy-related death, which limits the window to 42 days.

the survey. These estimates may not match those published in the final reports for the previous surveys, which used a reference period of 10 years preceding the survey.

There were no discernible trends in the PRMR from the 1996 TDHS to the 2015–16 TDHS-MIS. The PRMR estimates ranged between 494 and 612 deaths per 100,000 live births. However, the confidence intervals for these estimates largely overlapped, and the differences were not statistically significant (**Table C.22**). The PRMR for the 2022 TDHS-MIS is estimated at 104 per 100,000 live births, with a confidence interval of 59 to 149 (**Figure 14.2**). The latest estimate implies a decline in the PRMR between the 2015–16 TDHS-MIS and the 2022 TDHS-MIS that is both statistically significant and surprising in its magnitude.

Figure 14.2 **Trends in pregnancy-related mortality ratios with confidence intervals**



Estimates of maternal mortality are also available from Tanzania's population and housing censuses. Similar to the survey data, census data show evidence of a decrease in maternal mortality. Census estimates of the MMR decreased from 432 deaths per 100,000 live births in the 2012 census to 194 in the 2022 census. The estimation procedures used in surveys and censuses are different. The 2022 TDHS-MIS used the sisterhood method, and the 2022 population census used the growth balance method; thus, the estimates are not strictly comparable. The reference periods for the 2022 TDHS-MIS and the 2022 census are also different. The 2022 TDHS-MIS estimate includes deaths in the 7 years preceding the survey, while the census estimate includes deaths in the preceding 12 months. The large declines in the MMR observed in both data sources provide strong evidence that maternal mortality is decreasing. Yet another method to measure maternal mortality, based on administrative data, was implemented recently in Mainland Tanzania. This study reported an MMR of 104 for the year 2018; however, it was designed primarily to investigate the breakdown of maternal deaths by cause of death rather than the MMR (Makuwani et al. 2020). For additional information on the 2022 TDHS-MIS estimates of adult and maternal mortality, please refer to Appendix C.

List of Tables

For more information on adult and maternal mortality, see the following tables:

- **Table 14.1 Adult mortality rates**
- **Table 14.2 Adult mortality probabilities**
- **Table 14.3 Maternal mortality**
- **Table 14.4 Maternal mortality ratio**

Table 14.1 Adult mortality rates

Direct estimates of female and male mortality rates for the 7 years preceding the survey, by 5-year age groups, Tanzania DHS-MIS 2022

Age	Deaths	Exposure years	Mortality rate[1]
	FEMALE		
15–19	28	31,848	0.87
20–24	47	35,479	1.33
25–29	75	33,234	2.27

Table 14.3 Maternal mortality

Direct estimates of maternal mortality rates for the 7 years preceding the survey, by 5-year age groups, Tanzania DHS-MIS 2022

Age	Percentage of female deaths that are maternal	Maternal deaths[1]	Exposure years	Maternal mortality rate[2]
15–19	8.0	2	31,848	0.07
20–24	15.2	7	35,479	0.20
25–29	2.9	2	33,234	0.06
30–34	6.2	6	29,101	0.20
35–39	9.1	9	24,163	0.36
40–44	3.5	3	17,605	0.15
45–49	1.6	1	10,493	0.11
Total 15–49	6.1	30	181,922	0.16[a]

[1] A maternal death is defined as the death of a woman while pregnant or within 42 days of termination of pregnancy from any cause except accidents or violence.
[2] Expressed per 1,000 woman-years of exposure
[a] Age-adjusted rate

Table 14.4 Maternal mortality ratio

Total fertility rate, general fertility rate, maternal mortality ratio, and lifetime risk of maternal death for the 7 years preceding the survey, Tanzania DHS-MIS 2022

Total fertility rate (TFR)	4.9
General fertility rate (GFR)[1]	152
Maternal mortality ratio (MMR)[2]	104 (CI: 59, 149)
Lifetime risk of maternal death[3]	0.005

CI: Confidence interval
[1] Age-adjusted rate, expressed per 1,000 women age 15–49
[2] Expressed per 100,000 live births; calculated as the age-adjusted maternal mortality rate (shown in Table 14.3) times 100 divided by the age-adjusted general fertility rate
[3] Calculated as $1 - (1 - \text{MMR})^{\text{TFR}}$, where TFR represents the total fertility rate for the 7 years preceding the survey

WOMEN'S EMPOWERMENT 15

Key Findings

- ***Employment and cash earnings:*** Almost 7 in 10 (68%) currently married women and virtually all (98%) currently married men report being employed in the last 12 months. Women are less likely than men to receive cash earnings for the work they do (61% and 79%, respectively).
- ***Women's control over cash earnings:*** 37% of currently married women who receive cash earnings say they decide for themselves how their earnings are used, while 53% make these decisions jointly with their husbands.
- ***Ownership of assets:*** 37% of women and men own a house; 26% of women and 32% of men own land.
- ***Participation in decision making:*** More than half (55%) of currently married women report making decisions, either alone or jointly with their husbands, about all of the following: their own health care, major household purchases, and visits to their families and relatives.
- ***Attitude towards wife beating:*** 48% of women and 32% of men believe that a husband is justified in beating his wife in at least one of five specified circumstances.

This chapter explores women's empowerment in terms of employment, earnings, control over earnings, and magnitude of earnings relative to those of their partners. The chapter also examines women and men's ownership of assets, including houses, land, and mobile phones, as well as their use of bank accounts and mobile-money-service providers. In addition, responses to specific questions are used to define three different indicators of women's empowerment: women's participation in household decision making, women's attitudes towards wife beating, and women's participation in decision making regarding sexual and reproductive health.

15.1 MARRIED WOMEN'S AND MEN'S EMPLOYMENT

Employment

Respondents are considered to be employed if they have done any work other than their housework in the 12 months before the survey.

Sample: Currently married women and men age 15–49

Earning cash for employment

Respondents are asked if they are paid for their labour in cash or in-kind. Only those who receive payment in cash only or in cash and in-kind are considered to earn cash for their employment.

Sample: Currently married women and men age 15–49 employed in the 12 months before the survey

In Tanzania, almost 7 in 10 currently married women age 15–49 and nearly all (98%) currently married men age 15–49 reported being employed in the 12 months before the survey (**Table 15.1**).

Married men are much more likely than married women to be paid in cash (cash only and cash and in-kind) for their work (79% and 61%, respectively). However, not all married women and men receive earnings for the work they do; about 4 in 10 married women (38%) and 2 in 10 married men (20%) were not paid for their work.

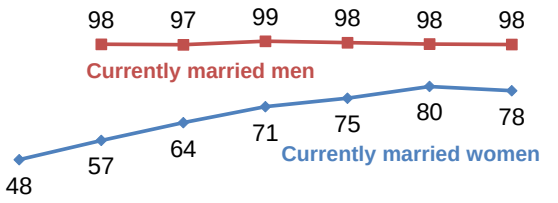
Trends: The percentage of currently married women employed in the 12 months preceding the survey declined from 84% in the 2015–16 TDHS-MIS to 68% in the 2022 TDHS-MIS. The percentage of married women receiving cash earnings has steadily increased, from 45% in the 2010 TDHS to 56% in the 2015–16 TDHS-MIS and 61% in the 2022 TDHS-MIS, while the percentage of women who were not paid for their work has steadily declined, from 53% in the 2010 TDHS to 42% in the 2015–16 TDHS-MIS and 38% in the 2022 TDHS-MIS.

Patterns by background characteristics

- Among currently married women, the percentage of women who were employed in the 12 months preceding the survey gradually increases with age, from 48% in the 15–19 age group to 80% in the 40–44 age group where it then stabilises (**Figure 15.1**).
- Sixty-three percent of married women age 15–19 and 47% of married women age 20–24 are more likely to do work that is not paid, as compared with older women (ranging from 33–38%).

Figure 15.1 **Employment by age**

Percentage of currently married women and men who were employed at any time in the12 months before the survey



Note: Results for men age 15–19 cannot be shown because the number of men in this age group who are married is fewer than 25 unweighted cases.

15.2 CONTROL OVER WOMEN'S EARNINGS

Control over one's own cash earnings

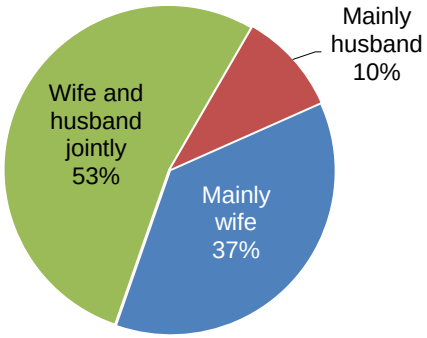
Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their spouse about how their own earnings will be used.

Sample: Currently married women and men age 15–49 who received cash earnings for employment during the 12 months before the survey

Women gain direct access to economic resources when they are paid for work in cash and have autonomy to make decisions about how to spend this earned cash. To assess women's autonomy, currently married women who earned cash for their work in the 12 months before the survey were asked about who the main decision maker is regarding the use of their earnings. More than half of currently married women age 15–49 (53%) report that decisions about how their cash earnings are used are usually made jointly with their husbands. However, 37% say they make these decisions by themselves. Less than 10% of women report that their husbands mainly decide how their earnings are used (**Figure 15.2**).

***Figure 15.2* Control over women's earnings**

Percent distribution of currently married women with cash earnings in the 12 months before the survey



The magnitude of a woman's earnings relative to her husband's earnings may affect the degree of control she has over her earnings. Among currently married women who received cash earnings for employment in the 12 months preceding the survey, 68% of women report that they earn less than their husbands, and 8% report earning more. Sixteen percent reported earning about the same amount as their husbands (**Table 15.2.1**)

Trends: The percentage of women who mainly make decisions over their own earnings decreased from 47% in the 2004–05 TDHS to 36% in the 2010 TDHS and has remained fairly stable through the 2015–16 TDHS-MIS (36%) and the 2022 TDHS-MIS (37%).

Patterns by background characteristics

- Currently married women in urban areas (45%) are more likely than those in rural areas (32%) to make independent decisions on the use of their earnings.
- Married women in Zanzibar (76%) are more likely to make decisions themselves on how their earnings are spent than women in Tanzania Mainland (36%).
- The percentage of married women who make independent decisions on how they spend their cash earnings is higher for women in the two upper wealth quintiles (above 40%) compared with those in the three lower quintiles (approximately 30%).

15.3 Control over Men's Earnings

Among married men age 15–49 who receive cash earnings, 58% report that they usually decide jointly with their wives on how to spend their earnings (**Table 15.2.2**). Only a third (34%) of married men mainly decide themselves on how to spend their earnings.

Married women are somewhat less likely than their husbands to report that decisions about the husband's earnings are made jointly; 53% report that these decisions are made together with the husband, while 40% report that it is mainly the husband who makes decisions about how his earnings are spent.

15.4 Women's and Men's Ownership of Assets

15.4.1 Ownership of a House or Land and Documentation of Ownership

Ownership of a house or land

Respondents who own a house or land, whether alone or jointly with their spouse, someone else, or both their spouse and someone else.

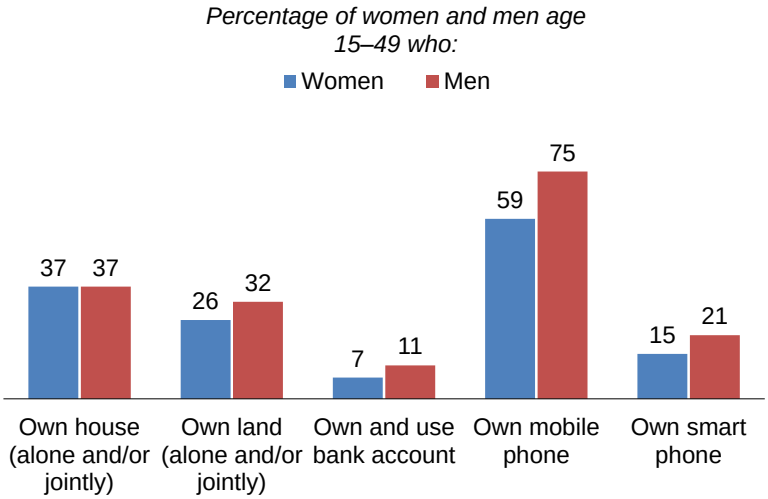
Documentation of ownership of a house or land

Respondents whose name is on the title deed or other government recognised document.

Sample: Women and men age 15–49

Thirty-seven percent of women own a house, either alone (6%) or jointly with someone else (31%). Similarly, a total of 26% of women report that they own land, either alone (4%) or jointly (22%) (**Table 15.3.1** and **Figure 15.3**). Joint ownership of these assets is more common among women than sole ownership; only 6% and 4% of women own a house or land alone respectively.

Figure 15.3 **Ownership of assets**



There is no difference between men and women age 15–49 who own a house (37%) alone or jointly. However, a higher proportion of men own land either alone or jointly (32%) compared with women (26%) (**Table 15.3.2** and **Figure 15.3**). Unlike women, men are more likely to be sole owners than joint owners of either asset; 17% of men own a house alone, compared with 6% of women, and 14% own land alone, compared with 4% of women.

Eighty-two percent of women and men who own a house say that they do not have a title deed for the house. Among those who have title deeds, women are less likely than men to have their names on the title deed (13% versus 6%) (**Tables 15.4.1** and **15.4.2**). The situation is similar regarding title deeds for land ownership (19% for men versus 4% for women) (**Tables 15.5.1** and **15.5.2**).

Trends: Since the 2015–16 TDHS-MIS, the percentage of women who own a house alone or jointly has remained stable (38% to 37%).

Patterns by background characteristics

- House and land ownership, either alone or jointly, increases with age among women. While 5% of women age 15–19 own a house and 4% own land, 72% of women age 45–49 own a house and 52% own land (**Tables 15.4.1** and **15.5.1**). Similar patterns are observed among men (**Tables 15.4.2** and **15.5.2**).
- Women's and men's ownership of a house and land, either alone or jointly, is more common in rural areas than in urban areas. For instance, 45% of rural women and only 22% of urban women own a house, and 34% of rural women and 11% of urban women own land.

- Women's ownership of both a house and land, either alone or jointly, is higher in Tanzania Mainland than in Zanzibar. Among women, 38% of those in Tanzania Mainland own a house and 27% own land, while 7% of women in Zanzibar own a house and 3% own land.

- Women with secondary or higher education and those in the highest wealth quintile are less likely to own a house or land, either alone or jointly, than those who are less educated or poorer. For example, while 24% of women in the highest wealth quintile own a house and 13% own land, 53% of women in the lowest wealth quintile own a house and 38% own land.

15.4.2 Ownership and Use of Mobile Phones and Bank Accounts

Use of bank accounts or mobile-money-service providers

Respondents who have and use a bank account or who used a mobile phone for financial transactions in the last 12 months before the survey

Sample: Women and men age 15–49

Ownership of a bank account and a mobile phone are reflections of autonomy and financial independence. Women and men interviewed in the 2022 TDHS were asked if they used an account in a bank or other financial institutions and whether they owned a mobile phone. Those who owned phones were also asked if they used the phone for financial transactions.

Seven percent of women own and use a bank account, and more than half (59%) own a mobile phone. Four in 10 women (44%) who have a phone say they have used it for financial transactions in the last 12 months (**Table 15.6.1**). Among women who own and use a bank account, 95% have sole ownership of their account (**Table 15.6.2**). Eleven percent of men own and use a bank account, and 75% own a mobile phone. Twenty-two percent of those with phones say they use them for financial transactions (**Table 15.6.3**).

Patterns by background characteristics

- Use of a bank account and ownership of a mobile phone are both higher among urban women and men than those in rural areas and increase with education as well as wealth.

- Ownership and use of a bank account is more prevalent among women in Zanzibar (11%) than in Tanzania Mainland (7%); the ownership of a mobile phone by women is also higher in Zanzibar (71%) than in Tanzania Mainland (59%). Similar patterns are observed among men.

- Mobile phone ownership varies widely by region. It is lowest for women in Simiyu and Rukwa (36%) and for men in Mara (61%). Mobile phone ownership is highest in Dar es Salaam for both men (90%) and women (87%).

15.5 Participation in Decision Making

Participation in major household decisions

Women are considered to participate in household decisions if they make decisions alone or jointly with their husband in all three of the following areas: (1) the woman's own health care, (2) major household purchases, and (3) visits to the woman's family or relatives.

Sample: Currently married women age 15–49

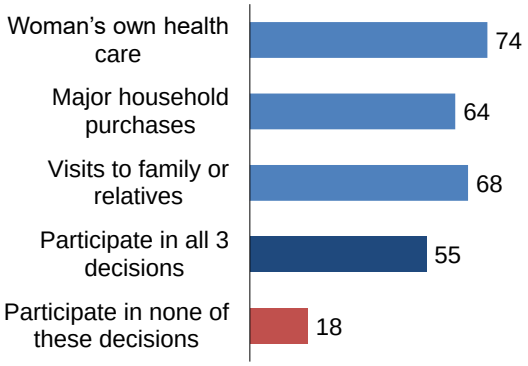
Men are considered to participate in household decisions if they make decisions alone or jointly with their wife in the following two areas: (1) the man's own health care and (2) major household purchases.

Sample: Currently married men age 15–49

The 2022 TDHS-MIS sought information from currently married women on their participation in three types of household decisions: their own health care, major household purchases, and visits to their family or relatives. More than 7 in 10 married women (74%) participate in decisions regarding their own health, either mainly themselves (21%) or jointly with their husbands (53%); over 6 in 10 women (64%) participate in decisions on major household purchases, either mainly themselves (14%) or with their husbands (50%); and about 7 in 10 (68%) participate in decisions to visit their families and relatives, either mainly themselves (14%) or with their husbands (54%) (**Table 15.7**). More than half (55%) of women participate in all three decisions, while 18% do not participate in any of the three decisions (**Table 15.8.1** and **Figure 15.4**).

Figure 15.4 **Women's participation in decision making**

Percentage of currently married women age 15–49 participating in specific decisions



Trends: The percentage of currently married women who participate in decisions regarding their own health, major household purchases, and visits to their family or relatives has increased over time, from 31% in 2004–05 to 39% in 2010 to 46% in 2015–16 and to 55% in 2022.

Patterns by background characteristics

- Participation in all three decisions increases with age, from 35% among women age 15–19 to 65% among women age 45–49.
- Urban women are more likely to participate in all three decisions than rural women (61% and 52%, respectively).
- By employment status, women employed for cash are much more likely to participate in all three decisions (67%) compared with women who are not employed (43%) or those employed but not for cash (49%).
- Women's participation in decision making increases with increasing education and wealth. Forty-four percent of women with no education participate in all three decisions, as compared with 63% of women with secondary or higher education. Similarly, 64% of women in the wealthiest households participate in all three decisions, compared with 43% in the poorest households.

The 2022 TDHS-MIS also collected information from currently married men on their participation in two types of household decisions: their own health care and making major household purchases. Information on men's participation in decision making is shown in **Table 15.7** and **Table 15.8.2**.

15.6 Attitudes toward Wife Beating

Attitudes toward wife beating

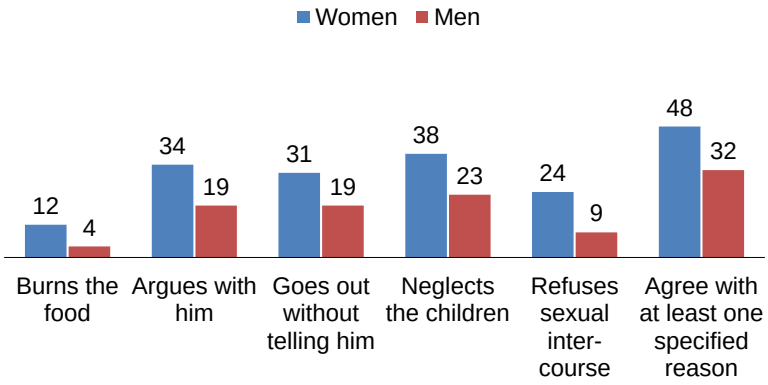
Respondents are asked if they agree that a husband is justified in hitting or beating his wife under each of the following five circumstances: she burns the food, she argues with him, she goes out without telling him, she neglects the children, and she refuses to have sex with him. If respondents answer 'yes' in at least one circumstance, they are considered to have attitudes justifying wife beating.

Sample: Women and men age 15–49

In Tanzania, 48% of women and 32% of men believe that a husband is justified in beating his wife in at least one of the five specified circumstances (**Table 15.9.1**, **Table 15.9.2**, and **Figure 15.5**). For each of the specified reasons that respondents were asked about, men were less likely to agree that wife beating was justified compared with women.

***Figure 15.5* Attitudes towards wife beating**

Percentage of women and men age 15–49 who agree that a husband is justified in beating his wife for specific reasons



Trends: The percentage of women who believe wife beating is justified for at least one of the five specified circumstances appears to have fluctuated around 50–60% since 2004–05. This percentage decreased from 60% in the 2004–05 TDHS to 54% in the 2010 TDHS but then increased to 58% in the 2015–16 TDHS-MIS and decreased to 48% in the 2022 TDHS-MIS. For men, the percentage who believe wife beating is justified for at least one of the five specified circumstances has ranged between 38–42% over the same period.

Patterns by background characteristics

- The belief that wife beating is justified is slightly lower among never-married women than among ever-married women; only 41% of women who have never been married agree that wife beating is justified in at least one of the five specified circumstances, as compared with 51% of married women and 49% of divorced, separated, or widowed women.
- More women and men living in rural areas believe that wife beating is justified compared with those in urban areas; 52% of women and 34% of men in rural areas agree that wife beating is justified in at least one of the five specified circumstances, compared with 41% of women and 26% of men in urban areas.
- The belief that wife beating is justified in at least one of the five specified circumstances is more common in Tanzania Mainland (49% of women and 32% of men) than in Zanzibar (28% of women and 13% of men).
- Acceptance of wife beating is lowest among women and men with secondary or higher education and those in the highest wealth quintile. For example, more than 5 in 10 women with primary education or no education agree that wife beating is justified in at least one of the five specified circumstances, compared with 36% of women with secondary or higher education. Similarly, 54% of women in the lowest wealth quintile and 36% of those in the highest wealth quintile agree that wife beating is justified in at least one of the specified circumstances.

15.7 Negotiating Sexual Relations

To assess attitudes toward negotiating safer sexual relations with husbands, women and men were asked whether they thought that a wife is justified in refusing to have sexual intercourse with her husband if she knows he has sex with other women or asking that he use a condom if she knows he has an STI.

Women are less likely than men to believe that a woman is justified in refusing to have sexual intercourse with her husband if she knows he has sex with other women (56% versus 65%). Similarly, a slightly lower percentage of women (65%) than men (69%) believe that women are justified in asking their husband to use a condom when they know that he has an STI (**Table 15.10**).

To assess the ability of women to actually negotiate safer sexual relations with their husbands, currently married women were asked whether they could say no to their husband if they do not want to have sexual intercourse. Women were also asked whether they could ask their husband to use a condom.

About two-thirds (68%) of women reported that they can say no to their husband if they do not want to have sexual intercourse, while a lower percentage (58%) said that they can ask their husband to use a condom (**Table 15.11**). Notably, women are less likely to report that they can ask their husband to use a condom than to say no to sexual intercourse across almost all background characteristics.

15.8 Women's Participation in Decision Making regarding Sexual and Reproductive Health

Informed decision making on sexual relations, contraceptive use, and reproductive health

Women are considered to make their own informed decisions on sexual relations, contraceptive use, and reproductive health if: (1) they can say no to their husband if they do not want to have sexual intercourse, (2) they make decisions about use of family planning alone or jointly with their husband, and (3) they make decisions about their own health care alone or jointly with their husband.

Sample: Currently married women age 15–49

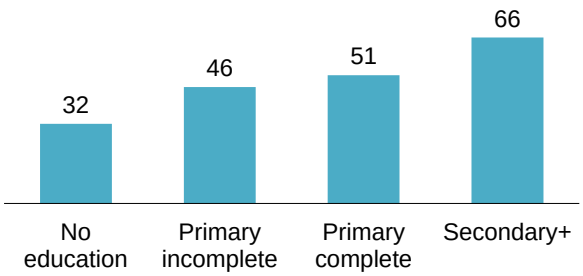
Table 15.12 presents information on the percentage of women who can say no to their husband if they do not want to have sexual intercourse, contraceptive use, and reproductive health. Overall, 50% of women reported making their own informed decisions on sexual relations, contraceptive use, and reproductive health.

Patterns by background characteristics

- Sixty-four percent of married women 15–49 in urban areas make their own informed decisions regarding sexual relations, contraceptive use, and reproductive care, compared with 43% in rural areas.
- Notably, the percentage of currently married women who make their own informed decisions regarding sexual relations, contraceptive use, and reproductive care increases with increasing education, from 32% among women with no education to 66% among women with secondary or more education (**Figure 15.6**).

Figure 15.6 **Women's participation in decision making regarding sexual and reproductive health by education**

Percentage of currently married women who make their own informed decision about sexual relations, contraceptive use, and reproductive health care



List of Tables

For more information on women's empowerment, see the following tables:

HOUSEHOLD WATER, SANITATION, AND HYGIENE 16

Key Findings

- ***Drinking water:*** Nearly two-thirds (64%) of the household population has access to at least basic drinking water service.
- ***Availability of drinking water:*** 75% of the population has sufficient quantities of drinking water when needed; availability of sufficient drinking water is higher in rural areas (78%) than in urban areas (68%).
- ***Treatment of drinking water:*** 66% of household members do not use any method or treatment to make their water safer to drink; only 22% live in households that use an appropriate water treatment method.
- ***Sanitation:*** 55% of the household population has at least basic sanitation service, while 10% practices open defecation.
- ***Management of excreta:*** 71% of household members dispose of their excreta appropriately; 1% use a facility connected to a sewer, 68% safely dispose of their excreta in situ, and 3% have their excreta removed for treatment off-site.
- ***Disposal of children's stools:*** 56% of youngest children under age 2 living with their mother had their last stools disposed of appropriately.
- ***Menstrual health and hygiene:*** 96% of women were able to wash and change in privacy and used appropriate materials to collect or absorb menstrual blood during their last period.

The extent to which households have access to and use safe drinking water and sanitation facilities and engage in hygienic practices has a significant impact on the health, safety, and overall well-being of the population. This chapter presents information on source of drinking water, type of sanitation facility, disposal of excreta (including disposal of young children's stools), and menstrual health and hygiene.

16.1 Drinking Water Sources, Availability, and Treatment

Over the past few decades, the Government of Tanzania has made steady progress towards achieving global and national targets related to universal access to safe drinking water.

Improved sources of drinking water

Include piped water, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, water delivered via a tanker truck or a cart with a small tank, and bottled water.

Sample: Households and de jure population

Improved drinking water sources protect against outside contamination so that water is more likely to be safe to drink. In Tanzania, more than 7 in 10 households (74%) obtain their drinking water from improved sources (98% of households in Zanzibar and 73% of households in Tanzania Mainland) (**Table 16.1**).

The most common sources of drinking water among Tanzanian households are water piped directly into the household's dwelling, yard, or plot (21%), followed by public taps/standpipes (17%), water piped to a neighbour (14%), and protected dug wells (11%). Nineteen percent of Tanzanian households obtain their drinking water from unimproved sources, most commonly unprotected dug wells (13%). Eight percent of households use surface water.

Overall, 45% of Tanzanian households have water on the premises, including 84% in Zanzibar and 44% in Tanzania Mainland. Forty-one percent of households travel 30 minutes or less to fetch water, and 26% use drinking water that is less than 500 metres round trip from their dwelling.

Among households with water piped to their dwelling/yard/plot or a neighbour's plot, 81% have their drinking water services provided by the government, 17% by private companies, and 3% by a community-based organisation (CBO) or a nongovernmental organisation (NGO).

Trends: The percentage of households using an improved drinking water source increased from 52% in 2010 to 64% in 2015–16 and 74% in 2022.

16.1.1 Drinking Water Service Ladder

Drinking water service ladder

Safely managed

Drinking water from an improved water source that is located on premises, available when needed, and free from faecal and priority chemical contamination.

Basic

Drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less.

Limited

Drinking water from an improved source, and round-trip collection time is more than 30 minutes.

Unimproved

Drinking water from an unprotected dug well or unprotected spring.

Surface water

Drinking water directly from a river, dam, lake, pond, stream, canal, or irrigation canal.

Sample: De jure population

Building off the classification of drinking water sources as improved or unimproved, the Joint Monitoring Programme for Water Supply, Sanitation, and Hygiene (JMP) has devised a five-rung drinking water service ladder to benchmark and compare progress towards achieving Sustainable Development Goal (SDG) targets (WHO/UNICEF 2018). The 2022 TDHS-MIS captured information on four out of the five rungs; because the survey did not include testing drinking water for faecal or chemical contamination, safely managed and basic drinking water services cannot be distinguished and are grouped together in **Table 16.2** as "at least basic service."

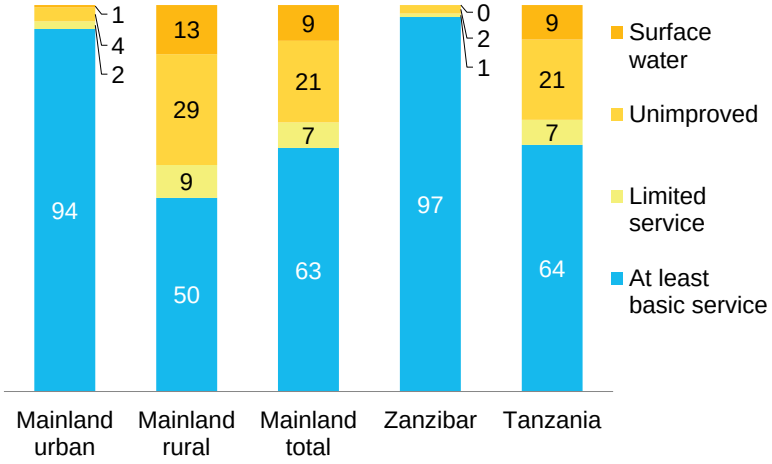
Overall, 64% of the Tanzanian population has at least basic drinking water service. Sixty-three percent of the household population in Tanzania Mainland and 97% in Zanzibar has access to at least basic drinking water service (**Figure 16.1**).

Trends: The household population with at least basic drinking water service has increased over time, from 40% in 2010 and 49% in 2015–16 to 64% in 2022.

Patterns by background characteristics

Figure 16.1 **Household population drinking water service by residence**

Percent distribution of de jure population by drinking water service ladder

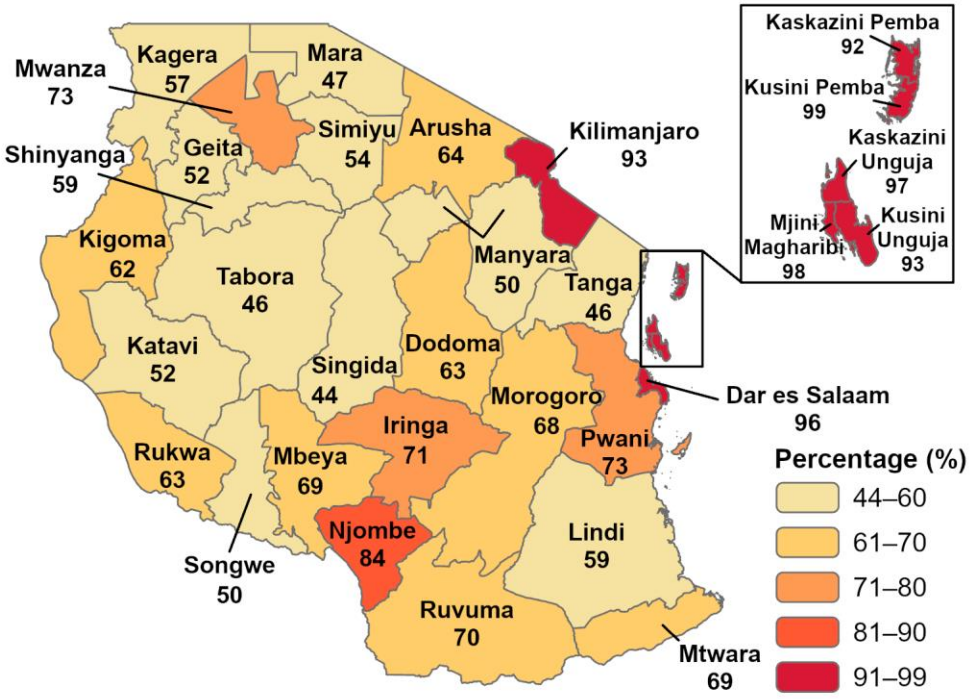


Note: Percentages may not sum to 100% due to rounding.

- In Tanzania Mainland, the percentage of the household population with at least basic drinking water service is much higher in urban areas (94%) than in rural areas (50%) (**Figure 16.1**).
- The percentage of the household population with at least basic drinking water service varies across regions, from less than 50% in Singida (44%), Tanga (46%), Tabora (46%), and Mara (47%) to more than 90% in all five regions in Zanzibar (**Map 16.1**).
- The percentage of the household population with at least basic drinking water service increases with increasing household wealth, from 30% in the lowest wealth quintile to 96% in the highest quintile (**Table 16.2**).

Map 16.1 At least basic drinking water service by region

Percentage of household population with at least basic drinking water service

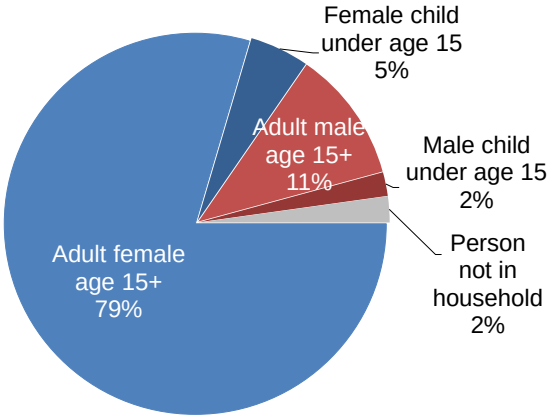


16.1.2 Person Collecting Drinking Water

Fifty-eight percent of the Tanzanian population lives in households that do not have drinking water on their premises (**Table 16.3**). Collecting drinking water is a chore that can be a great burden on household members, depending on the time spent to obtain it. In households without drinking water on the premises, water is usually collected by a female age 15 or older (79%), followed by a male age 15 or older (11%). Water is less likely to usually be collected by female and male children under age 15 (5% and 2%, respectively) (**Figure 16.2**).

Figure 16.2 Person collecting drinking water

Among the de jure household population without drinking water on premises, percent distribution by person who collects drinking water



Note: Percentages may not sum to 100% due to rounding.

Patterns by background characteristics

- Rural residents are more likely than urban residents to not have drinking water on the premises (74% versus 20%).
- By region, the percentage of the population without water on the premises ranges from 9% in Dar es Salaam to 84% in Songwe.
- The percentage of the household population without drinking water on the premises declines markedly with increasing household wealth, from 87% in the lowest wealth quintile to 14% in the highest quintile.

16.1.3 Availability of Drinking Water

Availability of sufficient drinking water

Percentage of the population with sufficient quantities of drinking water in the last month.

Sample: De jure population

Overall, 75% of the household population reported having sufficient quantities of drinking water when needed (**Table 16.4**).

Patterns by background characteristics

- The percentage of the population with sufficient drinking water is higher in rural areas than in urban areas (78% versus 68%).
- By region, the percentage of the population with sufficient quantities of drinking water is lowest in Tanga (46%) and highest in Songwe (96%).
- Having water on the premises is not a guarantee of having sufficient quantities of drinking water; 70% of the household population with drinking water on the premises has sufficient quantities of drinking water when needed, as compared with 82% of the household population that travels 30 minutes or less to obtain water and 69% that travels more than 30 minutes to do so.

16.1.4 Treatment of Drinking Water

Safe drinking water is a basic human need. **Table 16.5** shows that two-thirds (66%) of household members do not use any method or treatment to make their water safer to drink. Twenty-two percent use an appropriate water treatment method (boiling, bleaching, filtering, or solar disinfecting), most commonly boiling (20%). Appropriate treatment is less common in rural areas (16%) than in urban areas (36%).

16.2 SANITATION

Improved sanitation facilities

Include flush/pour flush toilets that flush water and waste to a piped sewer system, septic tank, pit latrine, or unknown destination; ventilated improved pit (VIP) latrines; pit latrines with slabs; and composting toilets.

Sample: Households and de jure population

Improved sanitation includes sanitation facilities that hygienically separate human excreta from human contact. Enhancing access to and use of improved and climate-resilient sanitation facilities can prevent transmission of disease and reduce sanitation-related morbidity and mortality. Better use of proper sanitation can also lead to other benefits including improving gender equality, promoting dignity, and preserving the environment.

In Tanzania, 75% of households use improved toilet facilities, including 91% in Zanzibar and 74% in Tanzania Mainland (**Table 16.6**). Overall, pit latrines with slabs (not washable) are the most common type of sanitation facility (23%), followed by flush/pour flush toilets that flush water and waste to a pit latrine (20%) and pit latrines with slabs (washable) (17%). Nine percent of households practice open defecation (13% in rural areas and 1% in urban areas).

Among households with a sanitation facility, 85% have the facility in their own yard/plot and 12% in their own dwelling.

Trends: The percentage of households using improved toilet facilities has increased markedly over time, from 21% in 2010 to 75% in 2015–16 and 2022. The percentage of households engaging in open defecation decreased from 16% in 2010 to 11% in 2015–16 and 9% in 2022.

16.2.1 Sanitation Service Ladder

Sanitation service ladder

Safely managed

Use of improved facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated off-site.

Basic

Use of improved facilities that are not shared with other households.

Limited

Use of improved facilities shared by two or more households.

Unimproved

Use of pit latrines without a slab or platform, hanging latrines, or bucket latrines.

Open defecation

Disposal of human faeces in fields, forests, bushes, open bodies of water, beaches, or other open spaces or with solid waste.

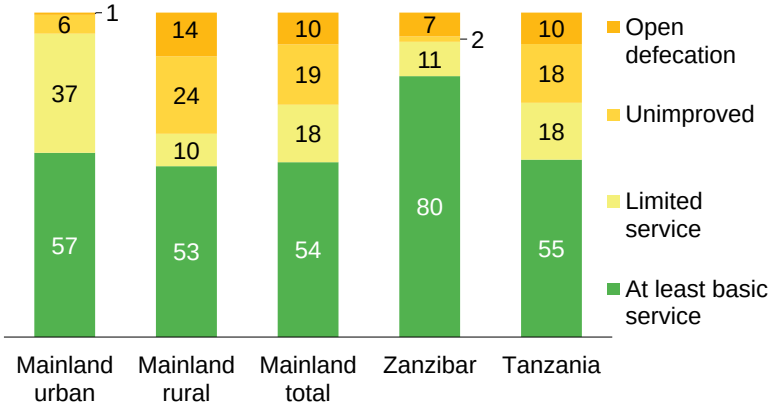
Sample: De jure population

The JMP has also devised a five-rung sanitation service ladder to benchmark and compare progress towards achieving SDG targets related to sanitation. The 2022 TDHS-MIS captured information about all five rungs. However, for those households whose excreta were taken off-site, it is not possible to know if they were treated appropriately; therefore, safely managed and basic sanitation services are grouped together in **Table 16.7** as "at least basic service." Overall, 55% of the household population has at least basic sanitation service, 18% has limited service, 18% uses unimproved sanitation, and 10% practices open defecation. Eighty percent of the household population in Zanzibar has at least basic sanitation service, as compared with 54% in Tanzania Mainland (**Figure 16.3**).

Trends: The percentage of the population with at least basic sanitation service increased from 13% in 2010 to 52% in 2015–16 and 55% in 2022.

Figure 16.3 **Household population sanitation service by residence**

Percent distribution of de jure population by sanitation service ladder



Note: Percentages may not sum to 100% due to rounding.

Patterns by background characteristics

- In Tanzania Mainland, there is a slight difference between urban and rural areas in the percentage of the household population with at least basic sanitation service (57% versus 53%). However, the percentages that have limited service, use unimproved sanitation, and engage in open defecation differ greatly between the two areas (**Figure 16.3**).

- The percentage of the household population with at least basic sanitation service varies widely across regions, from a low of 33% in Mara to a high of 87% in Kusini Unguja (**Table 16.7**).
- The percentage of the population with at least basic sanitation service increases from 29% in the lowest wealth quintile to 67% in the highest quintile.
- Open defecation is practiced by 10% of the household population in Tanzania Mainland and 7% in Zanzibar. The practice varies widely across regions, from less than 1% in Dar es Salaam and Mjini Magharibi to over 20% in Simiyu (24%), Manyara (23%), Tabora (22%), Arusha (21%), and Mara (21%).

16.2.2 Removal and Disposal of Excreta

Disposal of excreta from on-site facilities

Excreta safely disposed of in situ

Includes septic tanks and latrines in which waste is buried in a covered pit, waste is never emptied, and it is unknown if waste is ever emptied.

Excreta disposed of unsafely

Includes septic tanks and latrines in which waste is emptied to uncovered pits, open ground, a water body, or other locations.

Excreta removed for treatment

Includes septic tanks and latrines in which waste is removed by a service provider to a treatment plant or an unknown location or is removed by a non-service provider to an unknown location.

Sample: De jure population with on-site sanitation facilities (septic tanks, pit latrines, and composting toilets)

Information on the disposal of excreta from sanitation facilities that are not connected to a sewer system is essential for assessing the proportion of the population using safely managed sanitation services.

Two percent of the household population using improved, on-site sanitation facilities had their excreta removed by a service provider to a treatment plant, another 2% had their excreta removed by a service provider but did not know the removal location, 1% had their excreta buried in a covered pit, and 91% had never emptied their septic tank or latrine. Overall, 95% of the household population with on-site sanitation facilities had excreta safely disposed of in situ, less than 1% had excreta disposed of unsafely, and 4% had excreta removed for treatment (**Table 16.8**).

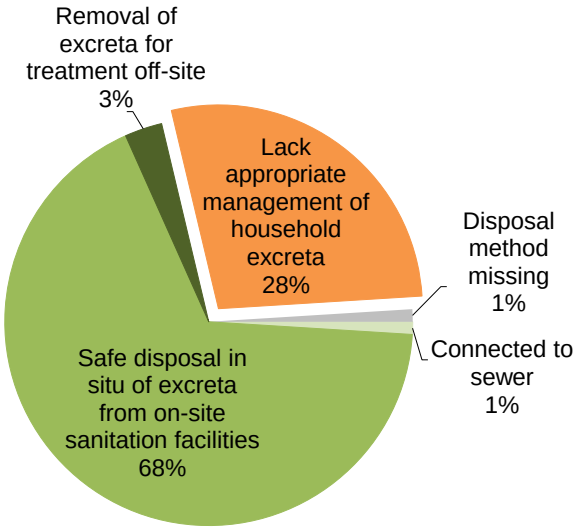
Table 16.9 shows the percent distribution of the household population by management of household excreta. One percent of Tanzanian household members manage their excreta through a connection to a sewer, 68% safely dispose of their excreta in situ, 3% have their excreta removed for treatment, and 28% lack appropriate management of their excreta (**Figure 16.4**). Overall, 71% of household members manage their excreta appropriately (**Table 16.9**).

Patterns by background characteristics

- Appropriate management of excreta (household is connected to a sewer, has excreta safely disposed of on-site, or has excreta removed for treatment off-site) is lower among the rural population (63%) than the urban population (93%).
- By region, the percentage of the population that manages household excreta appropriately ranges from 40% in Tabora to 98% in both Dar es Salaam and Mjini Magharibi.
- The percentage of the population that manages excreta appropriately increases with increasing household wealth, from 35% in the lowest wealth quintile to 98% in the highest quintile (**Figure 16.5**).

Figure 16.4 **Appropriate management of household excreta**

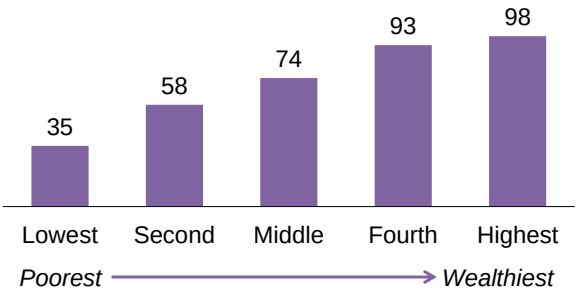
Percent distribution of household population by management of household excreta



Note: Percentages may not sum to 100% due to rounding.

Figure 16.5 **Appropriate management of household excreta by wealth**

Percentage of household population connected to sewer or using improved on-site sanitation facilities with safe disposal of excreta on-site or removal of excreta for off-site treatment



16.3 Disposal of Children's Stools

Appropriate disposal of children's stools

The child's last stools were put or rinsed into a toilet or latrine, or the child used a toilet or latrine.

Sample: Youngest children under age 2 living with their mother

Appropriate disposal of children's stools is important to prevent the spread of disease. Fifty-six percent of youngest children under age 2 living with their mother had their last stools disposed of appropriately (**Table 16.10**).

Patterns by background characteristics

- Children's stools are more likely to be disposed of appropriately in urban households (69%) than in rural households (50%).

- The percentage of children whose stools are disposed of appropriately ranges from 28% in Kusini Pemba to 95% in Mtwara.
- The percentage of children whose stools are disposed of appropriately increases with increasing mother's education; 39% of children of mothers with no education have their stools disposed of appropriately, as compared with 66% of children of mothers with a secondary or higher education.
- Seventy-one percent of children from households in the highest wealth quintile have their stools disposed of appropriately, compared with 38% of children from households in the lowest wealth quintile.

16.4 Menstrual Health and Hygiene

Appropriate menstrual health and hygiene materials

Reusable sanitary pads, disposable sanitary pads, tampons, menstrual cup, cloth, toilet paper, and/or cotton wool.

Sample: Women age 15–49 with a menstrual period in the last year

Privacy and use of appropriate menstrual health and hygiene materials

Percentage of women who were able to wash and change in privacy and who used appropriate materials during their last menstruation.

Sample: Women age 15–49 with a menstrual period in the last year who were home during their last menstrual period

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In the 2022 TDHS-MIS, women age 15–49 were asked what method or methods they used for menstrual protection during their last menstrual period, if anything. Thirty-seven percent of women used disposable sanitary pads, 53% used cloth, and 12% used reusable sanitary pads. However, 4% used underwear only (**Table 16.11**).

Women were also asked if they were able to wash and change in privacy during their last menstrual period; 99% of respondents reported that they were able to do so.

Overall, 96% of women used appropriate materials and were able to wash and change in privacy during their last menstrual period.

Patterns by background characteristics

- The percentage of women who used appropriate materials and were able to wash and change in privacy during their most recent menstrual period is nearly identical in urban (97%) and rural (96%) areas. Women in urban areas were far more likely than women in rural areas to use disposable sanitary pads (58% versus 23%), while women in rural areas were much more likely to use cloth (63% versus 37%).
- The percentage of women who used appropriate materials and were able to wash and change in privacy during their last menstrual period varies little by education or wealth. However, there are large differences in the materials used by women. For example, 8% of women in the lowest wealth quintile used disposable sanitary pads, as compared with 67% of women in the highest quintile. Conversely, 77% of women in the lowest wealth quintile used cloth, compared with 27% in the highest quintile.

List of Tables

For more information on water and sanitation characteristics, see the following tables:

Table 16.1 Household drinking water

Percent distribution of households and de jure population by source of drinking water and by time to obtain drinking water, according to residence, Tanzania DHS-MIS 2022

	Households					Population				
	Mainland					Mainland

Note: Service ladder concept/definitions are based on the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation, and Hygiene (JMP).

[1] Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

[2] Drinking water from an improved source, and round-trip collection time is more than 30 minutes or is unknown

[3] Drinking water from an unprotected dug well or unprotected spring

Table 16.3 Person collecting drinking water

Percentage of de jure population in households without drinking water on premises, and percent distribution of de jure population in households without drinking water on premises by the person who usually collects drinking water used in the household, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Percentage of de jure population without drinking water on premises[1]	Number of persons	Person who usually collects drinking water					Total	Number of persons without drinking water on premises[1]
			Adult female age 15 or older	Adult male age 15 or older	Female child under age 15	Male child under age 15	Person not in household

Note: Service ladder concept/definitions are based on the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation, and Hygiene (JMP).

[1] Defined as use of improved facilities that are not shared with other households. Includes safely managed sanitation service, which is not shown separately.

[2] Defined as use of improved facilities shared by two or more households

[3] Use of flush/pour flush toilet not to sewer, septic tank, or pit latrine; pit latrine without a slab/open pit; hanging toilet/latrine; or bucket

Table 16.8 Emptying and removal of waste from on-site sanitation facilities

Percent distribution of de jure population in households with septic tanks and improved latrines by method of emptying and removal, and percentage of on-site sanitation facilities for which excreta was safely disposed of in situ, percentage of on-site sanitation facilities for which excreta was disposed of unsafely, and percentage of on-site sanitation facilities for which excreta was removed for treatment, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Percent distribution of method of emptying and disposal of waste from septic tanks or other on-site sanitation facilities									Percentage of population with on-site sanitation facilities for which:			
	Removed by a service provider to treatment plant	Removed by a service provider, don't know where	Buried in a covered pit	Emptied to un-covered pit, open ground, water body, or else-where	Don't know where waste was taken	Never emptied	Don't know if ever emptied	Disposal method missing	Total	Excreta was safely disposed of in situ[1]	Excreta was disposed of unsafely[2]	Excreta was removed for treat-ment[3]	Number of persons with improved on-site sanitation facilities

Note: On-site sanitation facilities are those where excreta are stored in a septic tank, pit latrine, or composting toilet.
[1] Includes septic tanks and latrines in which waste was buried in a covered pit, never emptied, and don't know if ever emptied
[2] Includes septic tanks and latrines in which waste was emptied to uncovered pits, open ground, water body, or other locations
[3] Includes septic tanks and latrines in which waste was removed by a service provider to a treatment plant or an unknown location or was removed by a non-service provider to an unknown location

Table 16.9 Management of household excreta

Percent distribution of de jure population by management of excreta from household sanitation facilities, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Connected to sewer	Using improved on-site sanitation facilities: Safe disposal in situ of excreta from on-site sanitation facilities	Using improved on-site sanitation facilities: Unsafe disposal of excreta from on-site sanitation facilities	Using improved on-site sanitation facilities: Removal of excreta for treatment off-site	Using improved on-site sanitation facilities: Excreta disposal status missing	Using improved sanitation facilities, on-site status unknown	Using unimproved sanitation facilities	Practicing open defecation	Total	Percentage connected to sewer, with safe disposal on-site, or with removal for treatment off-site	Number of persons

FEMALE GENITAL MUTILATION/CUTTING 17

Key Findings

- ***Prevalence of female genital mutilation/cutting (FGM/C):*** 8% of women age 15–49 have been circumcised, a slight decrease from the figure of 10% reported in the 2015–16 TDHS-MIS.
- ***Trends in prevalence by residence:*** Since 2015–16, the prevalence of FGM/C has declined from 5% to 4% in urban areas and from 13% to 11% in rural areas.
- ***Trends in prevalence by region:*** There has been a dramatic decrease since 2015–16 in the prevalence of FGM/C among women in Dodoma, from 47% to 18%.
- ***Age at circumcision:*** 34% of circumcised women were circumcised before age 5, while 28% were circumcised at age 10–14.
- ***Persons performing circumcisions:*** 55% of circumcised women were circumcised by a traditional birth attendant and 26% by a traditional circumciser.
- ***Attitudes towards FGM/C:*** Most women (97%) and men (94%) who have heard of female circumcision believe that the practice is not required by their religion. Similarly, most (98% of women and 96% of men) believe that the practice should not continue.

Female genital mutilation/cutting (FGM/C), also known as female circumcision, is defined by the World Health Organization (WHO) as any procedure that involves partial or total removal of the external genitalia and/or injury to the female genital organs whether for cultural or any other nontherapeutic reasons (WHO, UNICEF, and UNFPA 1997). FGM/C, widely recognised as a violation of human rights, is deeply rooted in beliefs and perceptions formed over decades and generations. Tanzania's Penal Code CAP 16 (R.E. 2019) Section 169A (URT 2019) prohibits female genital mutilation from being performed on girls under age 18.

WHO classifies female genital mutilation into four main categories:

Type I: Excision of the prepuce with or without excision of part or all of the clitoris

Type II: Excision of the clitoris with partial or total excision of the labia minora

Type III: Excision of part or all of the external genitalia and stitching or narrowing of the vaginal opening (infibulation)

Type IV: Other forms, including pricking, piercing, or incising of the clitoris and/or labia; stretching of the clitoris and/or labia; cauterisation by burning of the clitoris and surrounding tissue; scraping of tissue surrounding the opening of the vagina or cutting of the vagina; and introduction of corrosive substances or herbs into the vagina to cause bleeding or to tighten or narrow the vagina

The 2022 TDHS-MIS collected information on FGM/C from all women and men age 15–49 in the subsample of households selected for the male survey. The topics covered in this chapter include knowledge and prevalence of FGM/C and attitudes towards the practice of circumcision. Women age 15–49 were asked questions about whether they themselves were circumcised, age at circumcision, provider of circumcision, and type of circumcision. Women with daughters age 0–14 were asked questions about circumcision for each of their daughters. Both women and men were asked questions on knowledge of and attitudes toward FGM/C.

17.1 Respondents' Knowledge of Female Genital Mutilation/Cutting

Although the Government of Tanzania officially discourages the tradition of FGM/C, it is still performed in some parts of the country. The government, in collaboration with various stakeholders, is committed to eradicating female genital mutilation or cutting by creating awareness of the practice and its negative consequences.

Overall, 9 of 10 women (87%) and men (90%) in Tanzania have heard of FGM/C (**Table 17.1**).

Patterns by background characteristics

- Among both women and men, knowledge of FGM/C is higher in urban areas (95% and 97%, respectively) than rural areas (83% and 87%, respectively). Knowledge of female circumcision is slightly higher for men than women in both urban and rural areas.
- Knowledge of FGM/C is higher among men from Tanzania Mainland (91%) than among their counterparts in Zanzibar (80%). Knowledge is similar among women from Tanzania Mainland (87%) and Zanzibar (90%).
- Knowledge about FGM/C among women and men is highest in the Eastern zone (95% and 98%, respectively) and lowest in the Western zone (70% and 77%, respectively).
- Women's knowledge of FGM/C increases steadily with increasing education, from 72% among women with no education to 95% among those with a secondary or higher education. A similar pattern is observed among men.
- The relationship with household wealth is also positive, with FGM/C awareness increasing from 74% among women in the lowest wealth quintile to 96% among those in the highest quintile. The same pattern is observed for men.

17.2 Female Genital Mutilation/Cutting Among Women

17.2.1 Prevalence and Type of FGM/C

To assess FGM/C prevalence, women age 15–49 were asked if they had ever been circumcised. Circumcised women were further asked about the type of circumcision, their age at the time they were circumcised, and the person who performed the circumcision.

The overall prevalence of FGM/C among women age 15–49 is 8% (**Table 17.2**). The most common type of FGM/C in Tanzania is Type II (cut, flesh removed), with almost 9 of 10 (89%) circumcised women undergoing this procedure. Six percent of women underwent a Type III procedure (narrowing), and 2% underwent a Type I procedure (cut, no flesh removed) (**Figure 17.1**).

Trends: The prevalence of FGM/C among women age 15–49 has dropped slightly since 2015–16, from 10% to 8%. The prevalence is now less than half that observed in 1996, as shown in **Figure 17.2**.

Patterns by background characteristics

- The percentage of women who have been circumcised increases with age, from 4% among those age 15–19 to 17% among those age 45–49 (**Figure 17.3**).
- The prevalence of FGM/C is three times higher in rural areas (11%) than in urban areas (4%).
- Less than 1% of women in Zanzibar have been circumcised, as compared with 9% in Tanzania Mainland.
- One quarter of women in the Central and Northern zones are circumcised, compared with 6% or less in the other zones.

Figure 17.1 **Type of FGM/C**

Percentage among circumcised women age 15–49

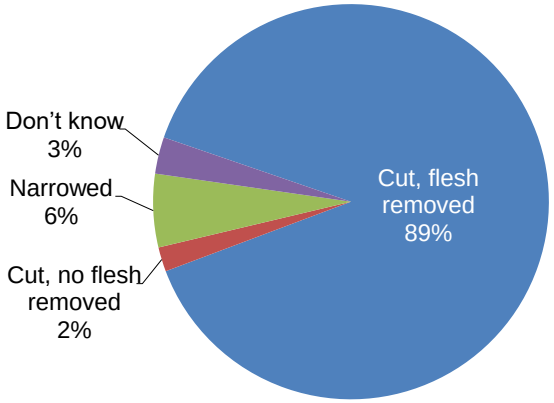

Figure 17.2 **Trends in FGM/C**

Percentage of women age 15–49 who are circumcised

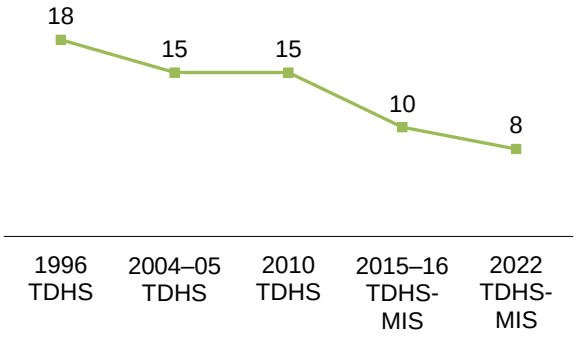

Figure 17.3 **FGM/C by age**

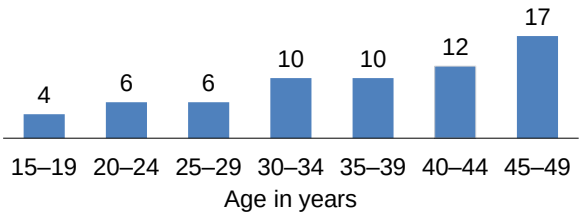
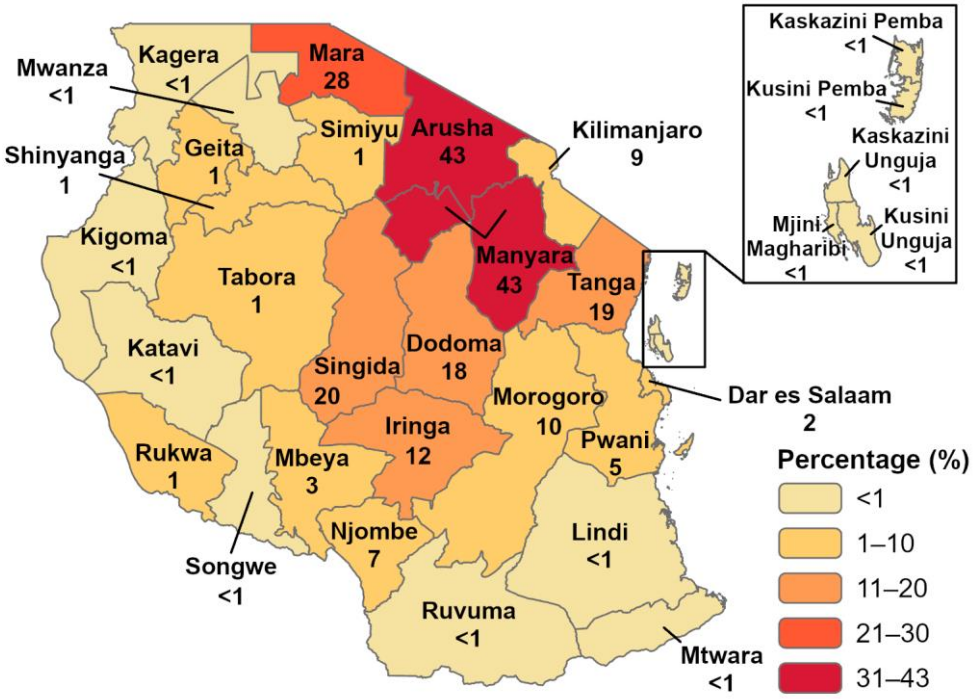
Percentage of women age 15–49 who are circumcised



- The prevalence of FGM/C varies greatly by region. In many regions, no women reported that they have been circumcised, and in most regions the prevalence is less than 5%. FGM/C is most prevalent in Manyara and Arusha, with 43% of women reporting that they have been circumcised (**Map 17.1**).

Map 17.1 **FGM/C by region**

Percentage of women age 15–49 who are circumcised



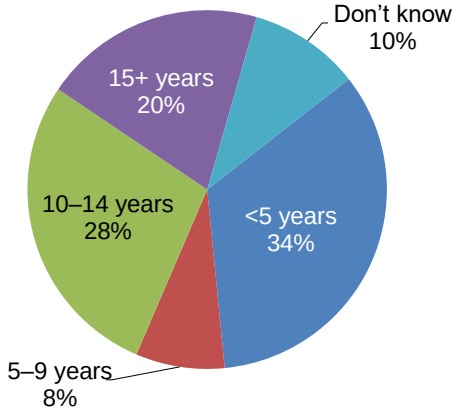
17.2.2 Age at Circumcision

In Tanzania, female circumcision is performed throughout childhood. However, women were most likely to report that they were circumcised when they were less than age 5 (34%). Twenty-eight percent of circumcised women underwent the procedure when they were age 10–14, and 20% were circumcised at age 15 or older (**Table 17.3** and **Figure 17.4**).

Women in the Northern and Central zones were most likely to be circumcised when they were less than age 5 (45% each), while women in the Lake zone were most likely to be circumcised when they were age 10–14 (64%).

Figure 17.4 **Age at circumcision**

Percent distribution of women who are circumcised



17.3 Circumcision of Daughters

In addition to reporting their own circumcision status, women were asked questions about each of their living daughters age 0–14. If a woman reported that she had never heard of FGM/C, it was assumed that her daughters have not been circumcised. Overall, less than 1% of daughters have been circumcised (**Table 17.4**).

Patterns by background characteristics

- The percentage of girls age 0–14 who have been circumcised increases slightly with age (**Table 17.5**).
- The percentage of girls who have been circumcised is highest in the Northern and Central zones (3% and 2%, respectively).

17.4 Person Who Performed the Circumcision

The survey included questions on the person who performed the circumcision. **Table 17.6** shows the percentage of circumcised girls age 0–14 and women age 15–49 according to the person performing the circumcision.

Most circumcisions among women age 15–49 were performed by traditional agents (55% by a traditional birth attendant and 26% by a traditional circumciser). However, 17% of women did not know who performed their circumcision. One percent of women reported being circumcised by a medical professional.

17.5 Attitudes towards Female Circumcision

Women and men age 15–49 who have heard of FGM/C were asked whether this practice is a requirement of their religion and whether it should continue.

Most women (97%) and men (94%) stated that their religions do not require that girls be circumcised. Similarly, most believed that the practice should not continue (98% of women and 96% of men) (**Table 17.7** and **Table 17.8**).

Patterns by background characteristics

- Women who are circumcised are more likely than those who are not to believe that FGM/C is a requirement of their religion (10% versus 1%).
- Women and men with no education (5% each) are more likely to report that FGM/C is a requirement of their religion than those with a secondary education or higher (less than 1% and 3%, respectively).
- The percentage of women who believe that female circumcision should be continued is higher among those who are circumcised (10%) than among those who are not circumcised (less than 1%).
- A higher percentage of men than women believe that FGM/C should be continued or state that they do not know whether it should be continued (4% versus 2%).

List of Tables

For more information on female genital mutilation, see the following tables:

DOMESTIC VIOLENCE 18

Key Findings

- ***Experience of violence:*** 27% of women age 15–49 have experienced physical violence since age 15, and 12% have experienced sexual violence in their lifetime.
- ***Controlling behaviours:*** 61% of women who have ever had a husband or intimate partner report that their current or most recent husband/intimate partner has demonstrated at least one specified type of controlling behaviour, and 21% report that he has demonstrated at least three controlling behaviours.
- ***Intimate partner violence:*** 39% of women who have ever had a husband or intimate partner have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner.
- ***Trends in spousal violence:*** The prevalence of spousal physical, sexual, or emotional violence among ever-married women decreased from 50% in 2015 to 39% in 2022.
- ***Violence by any intimate partner in the last 12 months:*** 33% of women who have ever had a husband or intimate partner experienced physical, sexual, or emotional violence in the 12 months prior to the survey by any current or past husband or intimate partner.
- ***Injuries due to intimate partner violence:*** 41% of women who have ever experienced physical or sexual violence committed by their current or most recent husband/intimate partner reported injuries as a result of the violence.
- ***Help seeking:*** About half of women who have ever experienced physical or sexual violence neither sought help nor told anyone about the violence.

Gender-based violence is defined by the United Nations as any act of violence that results in physical, sexual, or psychological harm or suffering to women, girls, men, and boys, as well as threats of such acts, coercion, or the arbitrary deprivation of liberty. Increasing research has highlighted the health burdens, intergenerational effects, and demographic consequences of such violence (United Nations 2006).

A common form of gender-based violence is intimate partner violence, which refers to behaviour within an intimate relationship that causes physical, sexual, or psychological harm and includes acts of physical aggression, sexual coercion, psychological abuse, and controlling behaviour. This definition of intimate partner violence covers violence by both current and former spouses and partners.[1] This chapter focuses on intimate partner violence, a form of gender-based violence, and other forms of domestic violence.

[1] https://apps.who.int/violence-info/intimate-partner-violence.

The United Republic of Tanzania has signed and ratified a number of international, regional, and subregional conventions on human rights that also apply to women's rights. Under the conventions, Tanzania is obliged to ensure equal opportunities for men and women in the enjoyment of social, economic, and political rights without any discrimination. The Charter of the United Nations (UN), under Articles 1, 8, and 55(c),[2] provides for universal respect for and observance of human rights and fundamental freedoms for all without distinction based on race, sex, language, or religion.[3] Tanzania has also ratified the 1966 International Covenant on Civil and Political Rights (ICCPR) in 1976.[4] Article 3 of the ICCPR specifically requires state parties to ensure the equal right of men and women to the enjoyment of all civil and political rights.[5] More important, in 1986 Tanzania ratified the Convention on the Elimination of All Forms of Discrimination against Women of 1979 (CEDAW).

Tanzania has incorporated some of the gender-related international, regional, and subregional commitments into its national laws and policies. According to the 1977 Constitution of the United Republic of Tanzania, all human beings are equal before the law and are entitled to protection without any discrimination.[6]

The Five-year National Plan of Action to End Violence against Women and Children (NPA-VAWC 2017/18–2021/22), which is currently being evaluated, was developed to reinforce the government's commitment to provide effective leadership for eliminating violence against women and children. The NPA-VAWC emphasises the actions needed for both preventing and responding to violence and recognises that investing in violence prevention initiatives has a positive impact on inclusive growth.

Historically, DHS surveys have collected detailed information only on intimate partner violence experienced by ever-married women, defined as women who are currently married or living with a man as if married and women who were formerly married or lived with a man as if married. More recently, the questionnaire module used to capture intimate partner violence in a DHS survey was revised to also capture intimate partner violence experienced by never-married women who reported that they currently or formerly had an intimate partner. In the 2022 Tanzania DHS-MIS, therefore, indicators on intimate partner violence are reported for women who have ever had a husband or other intimate partner. In the context of the revised questionnaire module and this report, the term "boyfriend" excludes anyone reported as an intimate partner. Given these changes, when examining trends in intimate partner violence, only the estimates provided separately for ever-married women and women living with a man as if married should be compared with corresponding estimates from previous surveys.

The 2022 TDHS-MIS implemented the module of questions on domestic violence in a 50% subsample in accordance with the World Health Organization's guidelines on the ethical collection of information on domestic violence (WHO 2001). Accordingly, the survey team randomly selected one eligible woman per household for an interview with the module, but only if her privacy could be ensured. As a result of these restrictions, 36% of the 15,699 women eligible for the survey were eligible and selected for the domestic violence module. However, only 35% were successfully interviewed. Overall, 0.2% of women eligible for the domestic violence module were not interviewed due to privacy concerns and another 1% for other reasons.

[2] The Charter of the United Nations is the UN's foundational treaty. It was signed in San Francisco, United States, on 26 June 1945 and entered into force on 24 October 1945. http://www.un.org/en/charter-united-nations/.

[3] The Universal Declaration of Human Rights was passed through United Nations General Assembly Resolution 217 (111) on 10 December 1948.

[4] In Tanzania, the ICCPR was ratified on 11 June 1976 and came into force in September 1976. https://treaties.un.org/Pages/ViewDetails.aspx?chapter=4&clang=_en&mtdsg_no=IV-4&src=IND.

[5] According to Article 3 of the ICCPR, "the States Parties to the present Covenant undertake to ensure the equal right of men and women to the enjoyment of all civil and political rights set forth in the present Covenant."

[6] Tanzania attempted to rewrite its constitution in 2011–2014, but the process has been stopped until further notice.

18.1 Measurement of Violence

Terminology for this chapter

Husband: a man with whom a woman is married or living with as if married.

Intimate partner: a man with whom a never-married woman is in a relationship that involves physical and/or emotional intimacy and for which the relationship is or has the expectation of being longer lasting. As defined for the purposes of this chapter, an intimate partner is not a husband or a man a woman is living with and is also not a boyfriend with whom her relationship is casual or a man with whom she has a one-time encounter.

Husband/intimate partner: the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

Boyfriend: a man with whom a woman has a causal relationship and who she did not mention as an intimate partner.

In the 2022 TDHS-MIS, information was obtained from women age 15–49 on their experience of violence committed by any perpetrator, including current and former husbands or other intimate partners. To capture intimate partner violence, ever-married women were asked about their experience of violence committed by their current and former husbands/live-in partners, and, if applicable, never-married women were asked about their experience of violence committed by their current and former intimate partners. More specifically, intimate partner violence was measured by asking women if their current or former husband/intimate partner ever did the following to them:

- ***Physical violence:*** push you, shake you, or throw something at you; slap you; twist your arm or pull your hair; punch you with his fist or with something that could hurt you; kick you, drag you, or beat you up; choke you or burn you on purpose; or attack you with a knife, gun, or other weapon
- ***Sexual violence:*** physically force you to have sexual intercourse with him when you did not want to, physically force you to perform any other sexual acts you did not want to, or force you with threats or in any other way to perform sexual acts you did not want to
- ***Emotional violence:*** say or do something to humiliate you in front of others, threaten to hurt or harm you or someone you care about, or insult you or make you feel bad about yourself

In addition to the questions on different forms of intimate partner violence, information was also obtained from all women about physical violence committed by anyone other than any husband/intimate partner since they were age 15 by asking if anyone had hit, slapped, kicked, or done something else to hurt them physically. Similarly, women were asked if they had experienced sexual violence committed by anyone other than any husband/intimate partner. Specifically, they were asked if at any time in their life, as a child or as an adult, they were forced in any way to have sexual intercourse or to perform any other sexual acts when they did not want to. Additionally, women who had ever been pregnant were asked about their experience of physical violence during any pregnancy.

18.2 Women's Experience of Physical Violence

Physical violence by any perpetrator

Percentage of women who have experienced any physical violence (committed by a husband, intimate partner, or anyone else) since age 15 and in the 12 months before the survey.

Sample: Women age 15–49

18.2.1 Prevalence of Physical Violence

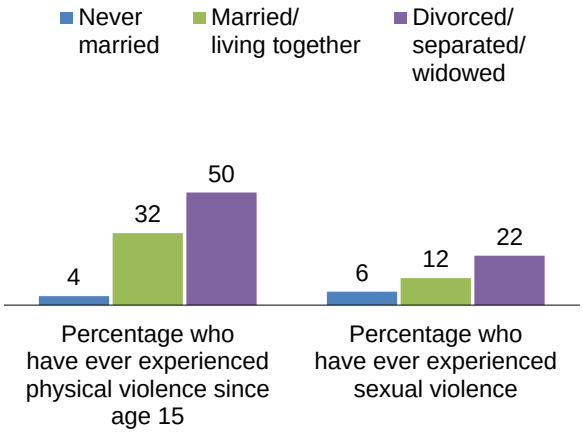
Twenty-seven percent of women age 15–49 have experienced physical violence since age 15, including 18% who experienced physical violence in the 12 months prior to the survey. A larger percentage of women reported experiencing physical violence sometimes in the past year (12%) than often in the past year (6%) (**Table 18.1**).

Trends: The percentage of women who have experienced physical violence since age 15 decreased from 39% in 2010 and 40% in 2015 to 27% in 2022.

Patterns by background characteristics

- The percentage of women who have experienced physical violence by any perpetrator since age 15 increases with age, from 8% among those age 15–19 to 39% among those age 40–49 (**Table 18.1**).
- By region, the percentage of women who have experienced physical violence since age 15 ranges from 5% in Kusini Pemba and 6% in Kaskazini Unguja to 45% in Arusha and 49% in Mara. By zone, the percentage is highest in the Lake zone (33%) and lowest in Zanzibar (8%).
- Fifty percent of divorced, separated, or widowed women and 32% of currently married women have experienced physical violence, as compared with only 4% of never-married women (**Figure 18.1**).
- The percentage of women who have experienced physical violence since age 15 declines from 34% among those with no education to 13% among those with at least a secondary education.
- Similarly, 34% of women in the lowest wealth quintile have experienced physical violence since age 15, compared with 20% of women in the highest quintile (**Table 18.1**).

Figure 18.1 **Women's experience of violence by marital status**



18.2.2 Perpetrators of Physical Violence

Table 18.2 provides information on perpetrators of physical violence reported by women age 15–49. The table shows that among women who have ever been married or had an intimate partner, the current husband/intimate partner is the most common perpetrator (64%) of the violence, followed by a former husband/intimate partner (36%).

18.2.3 Experience of Physical Violence during Pregnancy

Physical violence during pregnancy
Percentage of women who have experienced physical violence (committed by a husband, intimate partner, or anyone else) during any pregnancy.
Sample: Women age 15–49 who have ever been pregnant

Three percent of women age 15–49 who have ever been pregnant experienced physical violence during pregnancy (**Table 18.3**).

Patterns by background characteristics

- The percentage of women who have experienced physical violence during pregnancy is higher among those residing in rural areas (4%) than among those residing in urban areas (2%).
- Experience of violence during pregnancy is most common among women in the Central zone (5%) and least common among women in the South West Highlands zone (1%).

18.3 Experience of Sexual Violence

Sexual violence by any perpetrator
Percentage of women who have experienced any sexual violence (committed by a husband, intimate partner, or anyone else) ever and in the 12 months before the survey.
Sample: Women age 15–49

18.3.1 Prevalence of Sexual Violence

Twelve percent of women age 15–49 have ever experienced sexual violence by any perpetrator, including 7% who experienced sexual violence in the 12 months prior to the survey (**Table 18.4**).

Trends: The percentage of women who have experienced sexual violence declined from 20% in 2010 to 17% in 2015 and 12% in 2022.

Patterns by background characteristics

- The percentage of women who have ever experienced sexual violence by any perpetrator is lowest among those age 15–19 and 25–29 (9% each) and highest among those age 40–49 (15%) (**Table 18.4**).
- Divorced/separated/widowed women are more likely to have experienced sexual violence (22%) than women who are currently married/living with a man (12%) and those who have never been married (6%) (**Figure 18.1**).
- The percentage of women who have experienced sexual violence ranges from a low of 1% in Mtwara to a high of 20% each in Kagera, Mwanza, and Mara.

18.3.2 Perpetrators of Sexual Violence

Table 18.5 shows that sexual violence is frequently committed by persons with whom women have a close personal relationship. Four of five (81%) women who have ever been married or had an intimate partner reported their current husband/intimate partner as the perpetrator of the violence, and 18% reported a former husband/intimate partner. Among never-married women who have never had an intimate partner, 26% reported other relatives, 23% reported family friends, and 22% reported strangers as perpetrators.

18.3.3 Experience of Sexual Violence by a Non-intimate Partner

Overall, 3% of women have ever experienced sexual violence by a non-intimate partner, and less than 1% experienced such violence in the last 12 months (**Table 18.6**).

Patterns by background characteristics

- Experience of sexual violence by a non-intimate partner decreases with age, from 6% among women age 15–19 to 2% among women age 40–49 (**Table 18.6**).
- The percentage of women who have ever experienced sexual violence by a non-intimate partner ranges from less than 1% in Rukwa to 9% in Kusini Unguja.

18.3.4 Age at First Experience of Sexual Violence

Table 18.7 shows that by age 18, 4% of women age 15–49 have experienced sexual violence by any perpetrator, and 2% have experienced such violence by a non-intimate partner. Similarly, 7% of women have experienced sexual violence by any perpetrator by age 22, and 3% have experienced such violence by a non-intimate partner.

18.4 Experience of Multiple Forms of Violence

Physical violence and sexual violence may not occur in isolation; rather, women may experience a combination of different forms of violence. Overall, 30% of women age 15–49 have experienced physical or sexual violence, including 19% who have experienced only physical violence, 4% who have experienced only sexual violence, and 8% who have experienced both physical and sexual violence (**Table 18.8**). Notably, experience of physical violence increases with age, whereas experience of sexual violence is higher at younger ages than older ages.

18.5 Forms of Controlling Behaviours and Intimate Partner Violence

Controlling behaviour

Percentage of women whose current or most recent husband/intimate partner demonstrates one or more controlling behaviours.

***Sample*:** Women age 15–49 who ever had a husband or an intimate partner

Intimate partner violence

Percentage of women who have experienced any of the specified acts of physical, sexual, or emotional violence committed by their current or most recent husband/intimate partner, ever and in the 12 months preceding the survey.

Sample: Women age 15–49 who ever had a husband or an intimate partner

18.5.1 Prevalence of Controlling Behaviours and Violence Perpetrated by the Current or Most Recent Husband or Intimate Partner

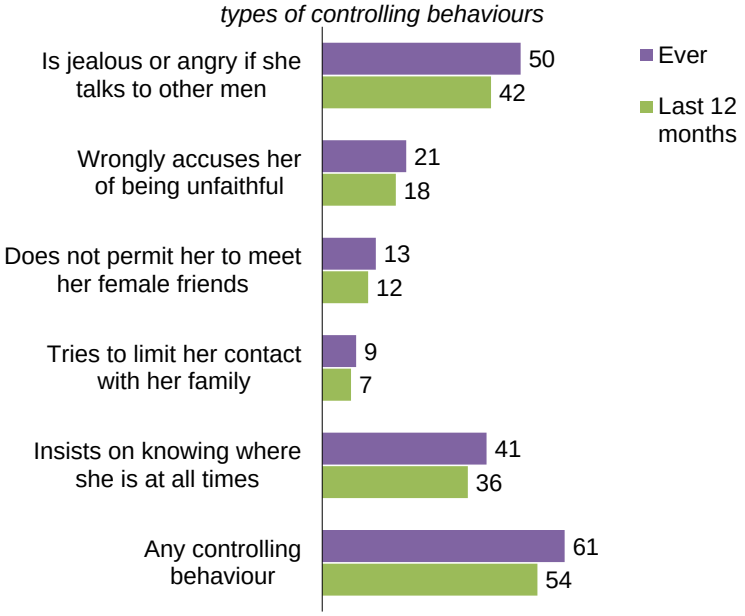
Controlling Behaviours

Attempts by husbands or intimate partners to closely control and monitor their wives'/intimate partners' behaviour are important warning signs and correlates of violence in a relationship. Because the concentration of behaviours is more significant than the display of any single behaviour, the proportion of women whose husbands/intimate partners display at least three such behaviours is also an important indicator.

Sixty-one percent of women age 15–49 who have ever had a husband or intimate partner reported that they have experienced at least one specific type of controlling behaviour by their current or most recent husband/intimate partner, and 21% reported experiencing three or more specific types of controlling behaviours. Fifty percent of women report that their husband/partner is jealous or angry if they talk to other men (50%), and 41% report that he insists on knowing where they are at all times (**Table 18.9** and **Figure 18.2**).

Figure 18.2 **Forms of controlling behaviours**

Percentage of women age 15–49 who have ever had a husband/intimate partner and have experienced specific types of controlling behaviours



Patterns of controlling behaviours by background characteristics

- Twenty-one percent of women in Tanzania Mainland have experienced at least three forms of controlling behaviours by their husband/partner, as compared with 15% in Zanzibar (**Table 18.10**).
- The percentage of women who have experienced three or more types of controlling behaviours varies greatly by region, from a low of 4% in Rukwa to a high of 48% in Mara.
- Forty-six percent of women who are afraid of their husband/intimate partner most of the time report experiencing three or more types of controlling behaviours, compared with 14% of women who are never afraid of their husband/intimate partner.

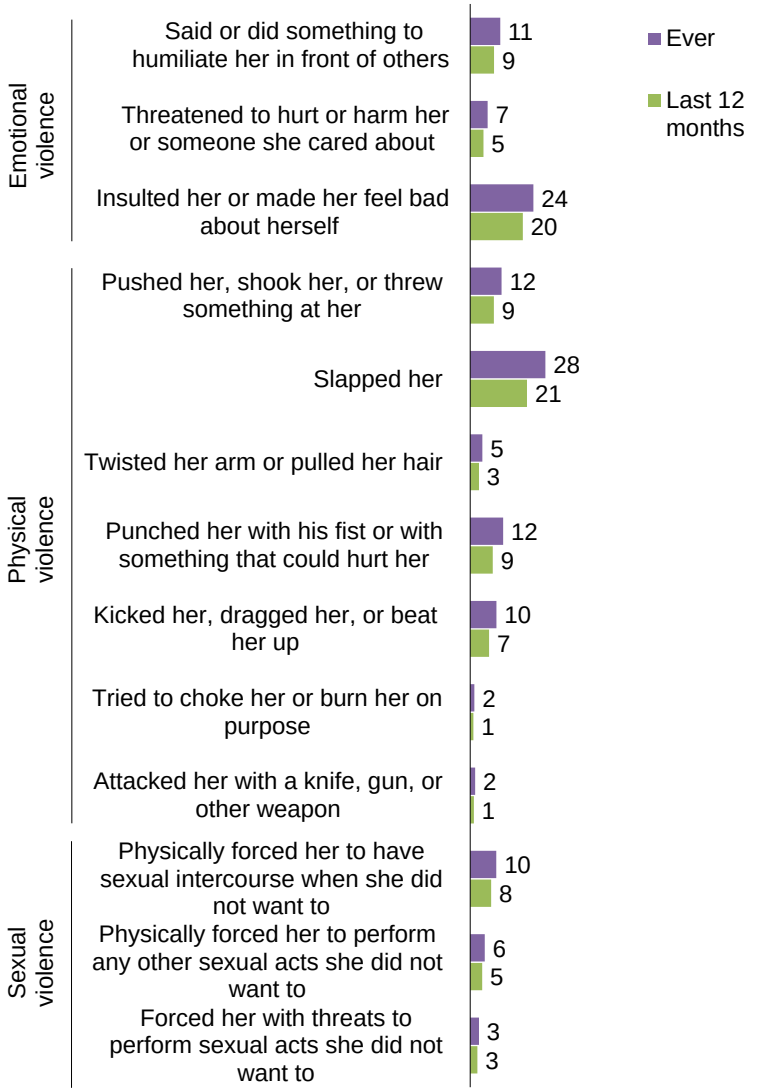
Violence by Current or Most Recent Husband/intimate Partner

Thirty-one percent of women age 15–49 who have ever had a husband or intimate partner report having experienced physical violence by their current or most recent husband/intimate partner. Twenty-eight percent reported that their husband/intimate partner slapped them, 12% reported that he punched them with his fist or something that could hurt them, and 12% reported that he pushed, shook, or threw something at them. Two percent each of women said that their husband/intimate partner had attacked them with a knife, gun, or other weapon and had tried to choke or burn them on purpose (**Table 18.9** and **Figure 18.3**).

Eleven percent of women who have ever had a husband or intimate partner reported experiencing sexual violence by their current or most recent husband/intimate partner, with 10% reporting being physically forced to have sexual intercourse when they did not want to. Six percent of women reported that their husband/intimate partner physically forced them to perform other sexual acts they did not want to, and 3% were forced with threats or in other ways to perform sexual acts they did not want to.

***Figure 18.3* Forms of intimate partner violence**

Percentage of women age 15–49 who have ever had a husband/intimate partner and who have ever experienced specific acts of violence by their husband/intimate partner



Twenty-seven percent of women who have ever had a husband or intimate partner reported experiencing emotional violence by their current or most recent husband/intimate partner. Twenty-four percent of women reported that their husband/intimate partner insulted them or made them feel bad about themselves, 11% reported that he said or did something to humiliate them in front of others, and 7% said that he threatened to hurt or harm them or someone close to them (**Table 18.9** and **Figure 18.3**).

Overall, 39% of women who have ever had a husband or intimate partner have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner.

Women who had been married or had cohabited with a man more than once and never-married women who had had more than one intimate partner were also asked about their experience of physical, sexual, or emotional violence by any previous husband or intimate partner. When violence by any previous husband/intimate partner is included in the estimate of the prevalence of physical, sexual, or emotional

intimate partner violence among women who have ever had one or more husbands or intimate partners, the prevalence increases from 39% to 42% (**Table 18.9**).

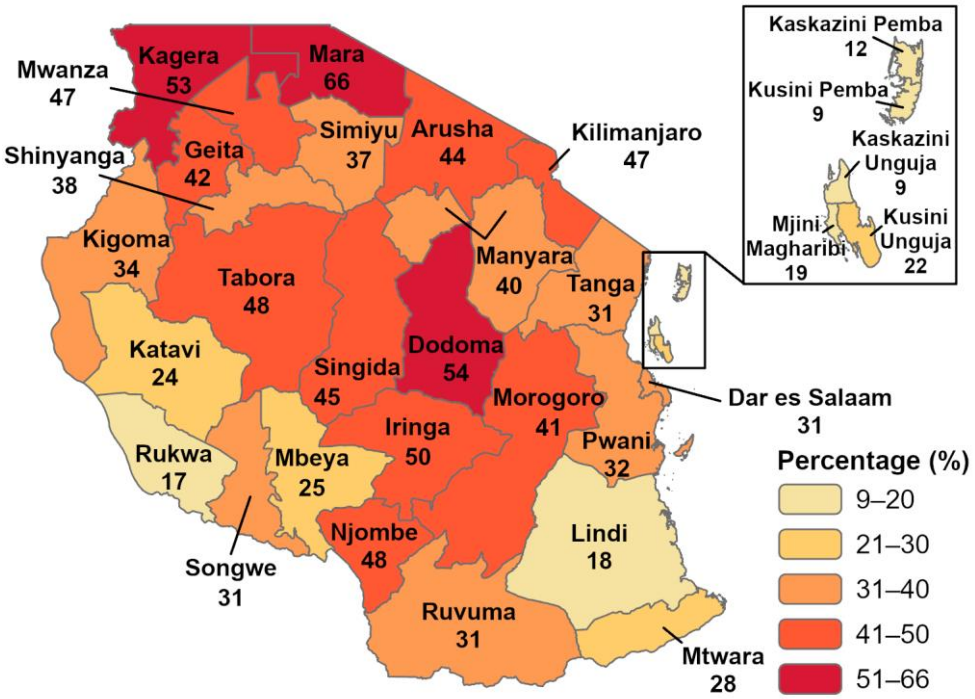
Trends: Among ever-married women, the prevalence of all forms of violence by their current or most recent husband/partner is lower in 2022 than in 2015. Overall, the prevalence of spousal physical, sexual, or emotional violence perpetrated by women's current or most recent husband/partner declined from 50% in 2015 to 39% in 2022.

Patterns of intimate partner violence perpetrated by the current or most recent husband/intimate partner by background characteristics

- Women in rural areas (41%) are more likely than their urban counterparts (35%) to have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner (**Table 18.11**).
- By region, the percentage of women who have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner is lowest in Kaskazini Unguja and Kusini Pemba (9% each) and highest in Mara (66%) (**Map 18.1**).
- The percentage of women who have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner generally decreases with increasing education and household wealth.

Map 18.1 Intimate partner violence by region

Among women age 15–49 who have ever had a husband/intimate partner, percentage who have ever experienced physical, sexual, or emotional violence committed by their husband/intimate partner

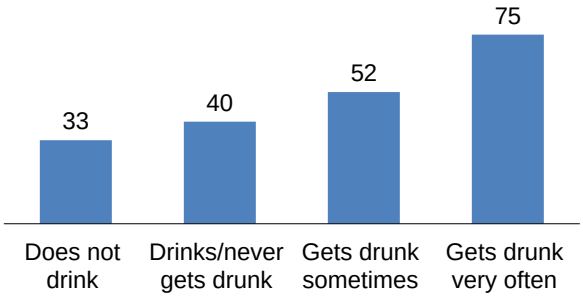


Patterns of intimate-partner violence perpetrated by the current or most recent husband/intimate partner by husband's/intimate partner's characteristics and women's empowerment indicators

- Women are much more likely to experience intimate partner violence if their husband/intimate partner drinks alcohol. Three quarters of women whose current or most recent husband/intimate partner drinks alcohol and is often drunk and 52% of women whose husband/intimate partner drinks alcohol and is sometimes drunk have experienced physical, sexual, or emotional violence, by their current or most recent husband/intimate partner as compared with 33% of women whose husband/intimate partner does not drink alcohol (**Table 18.12** and **Figure 18.4**).

Figure 18.4 **Intimate partner violence by husband's/intimate partner's alcohol consumption**

Percentage of women who have ever had a husband/intimate partner and have ever experienced emotional, physical, or sexual violence by their husband/intimate partner



- Women's experience of intimate partner violence increases sharply with the number of marital control behaviours exhibited by their husband/intimate partner. Fifteen percent of women whose husband/intimate partner exhibits no controlling behaviours have experienced physical, sexual, or emotional violence, compared with 89% of women whose husband/intimate partner exhibits all five controlling behaviours.

- Intergenerational effects of intimate partner violence are evident in Tanzania. Women who reported that their fathers beat their mothers are more likely to have themselves experienced physical, sexual, or emotional intimate partner violence (57%) than women who reported that their fathers did not beat their mothers (31%).

- Women who report that they are afraid of their husband/intimate partner most of the time are much more likely to have experienced intimate partner violence (79%) than women who are never afraid of their husband/intimate partner (27%).

18.5.2 Violence in the Last 12 Months Perpetrated by Any Husband or Intimate Partner

Intimate partner violence by any partner in the last 12 months

Percentage of women who experienced any of the specified acts of physical, sexual, or emotional violence committed by any husband or intimate partner in the 12 months preceding the survey.

Sample: Women age 15–49 who ever had a husband or an intimate partner

Thirty-three percent of women who have ever had a husband or intimate partner experienced physical, sexual, or emotional violence in the 12 months before the survey by any husband/intimate partner. Twenty-four percent experienced physical violence, 9% experienced sexual violence, and 22% experienced emotional violence (**Table 18.13**).

Patterns of intimate partner violence perpetrated by any husband or intimate partner by background characteristics

- The percentage of women who experienced any form of intimate partner violence by any husband or intimate partner in the last 12 months is higher among those age 15–19 (37%) than among those who are older.

- Women in Tanzania Mainland (33%) are much more likely than women in Zanzibar (15%) to have experienced any form of intimate partner violence by any husband or intimate partner in the last 12 months.
- The percentage of women who experienced physical, sexual, or emotional violence by any husband/intimate partner in the last 12 months tends to decrease with increasing education and wealth.

18.6 Injuries to Women due to Intimate Partner Violence

Injuries due to intimate partner violence

Percentage of women who have the following types of injuries from intimate partner violence: cuts, bruises, or aches; eye injuries, sprains, dislocations, or burns; or deep wounds, broken bones, broken teeth, or any other serious injury.

Sample: Women age 15–49 who have experienced physical or sexual violence committed by their current or most recent husband or intimate partner

Forty-one percent of women age 15–49 who have ever experienced physical or sexual violence committed by their current or most recent husband/intimate partner reported injuries as a result of the violence (**Table 18.14**). The most commonly reported injuries were cuts, bruises, or aches (40%), followed by eye injuries, sprains, dislocations, or burns (7%) and deep wounds, broken bones, broken teeth, or any other serious injury (6%). The same pattern is observed among women who experienced physical or sexual intimate partner violence in the 12 months preceding the survey.

18.7 Violence Initiated by Women against Their Husband/Intimate Partner

Initiation of physical violence by women

Percentage of women who have ever hit, slapped, kicked, or done anything else to physically hurt their current or most recent husband/intimate partner at times when he was not already beating or physically hurting them.

Sample: Women age 15–49 who ever had a husband or an intimate partner

Two percent of women who have ever had a husband or intimate partner reported initiating physical violence against their husband or intimate partner when he was not already beating or physically hurting them, and 1% reported having initiated such violence in the last 12 months (**Table 18.15**).

Patterns by background characteristics

- Women who have experienced physical intimate partner violence themselves are much more likely to have initiated physical violence against their current or most recent husband/intimate partner (5%) than those who have never experienced physical intimate partner violence (less than 1%).
- Women in the Njombe and Mjini Magharibi regions (7% percent each) are most likely to have initiated physical violence against their husband/intimate partner. In many of the other regions, less than 1% of women report having initiated such violence.
- The percentage of women who have committed physical violence against their husbands/intimate partners by background characteristics follows a pattern similar to their own experiences of such violence by background characteristics (**Table 18.16**).

18.8 Help Seeking among Women Who Have Experienced Violence

Forty-nine percent of women who have ever experienced physical or sexual violence neither sought help nor told anyone about the violence. Only 38% sought help to stop the violence, and 13% did not seek help but did tell someone about the violence (**Table 18.17**).

Patterns by background characteristics

- Women who have experienced both physical and sexual violence are more likely to have sought help (48%) than women who have experienced only physical violence (35%) or only sexual violence (31%) (**Table 18.17**).
- The percentage of women who neither sought help nor told anyone about the violence declines with age, from 60% among those age 15–19 to 44% among those age 40–49.
- The percentage of women who sought help to stop the violence is higher in Zanzibar (45%) than in Tanzania Mainland (38%).
- Help seeking to stop the violence increases from 34% among women with no education to 41% among women with at least a secondary education.

Sources for Help

Among women who have experienced physical or sexual violence and sought help, the most common source for help is their own family (62%). The next most common sources are their husband's/intimate partner's family (39%), police (9%), neighbours (8%), and religious leaders and friends (7% each) (**Table 18.18**).

List of Tables

For more information on domestic violence, see the following tables:

Table 18.1 Experience of physical violence by any perpetrator

Table 18.9 Forms of controlling behaviours and intimate partner violence

Percentage of women age 15–49 who have ever had a husband or intimate partner and have experienced controlling behaviours and various forms of intimate partner violence ever or in the 12 months preceding the survey perpetrated by a husband or intimate partner, Tanzania DHS-MIS 2022

Type of violence experienced	Ever experienced	Experienced in the last 12 months	Frequency in the last 12 months	
			Often	Sometimes
Controlling behaviour				
Any controlling behaviour	60.6	53.8	31.8	22.0
Is jealous or angry if she talks to other men	49.6	42.2	18.4	23.8
Wrongly accuses her of being unfaithful	21.0	18.4	9.6	8.9
Does not permit her to meet her female friends	13.4	11.5	6.1	5.5
Tries to limit her contact with her family	8.5	7.2	3.1	4.1
Insists on knowing where she is at all times	41.1	36.4	20.2	16.2
Physical violence				
Any physical violence	31.2	23.8	8.2	15.6
Pushed her, shook her, or threw something at her	11.8	8.9	3.5	5.4
Slapped her	28.3	21.4	6.6	14.8
Twisted her arm or pulled her hair	4.6	3.3	1.4	1.9
Punched her with his fist or with something that could hurt her	12.4	8.5	3.0	5.4
Kicked her, dragged her, or beat her up	9.9	7.1	2.4	4.7
Tried to choke her or burn her on purpose	1.6	1.2	0.4	0.8
Attacked her with a knife, gun, or other weapon	1.9	1.4	0.5	0.9
Sexual violence				
Any sexual violence	11.0	8.9	3.3	5.6
Physically forced her to have sexual intercourse with him when she did not want to	9.8	7.9	2.8	5.1
Physically forced her to perform any other sexual acts she did not want to	5.5	4.5	1.1	3.4
Forced her with threats or in any other way to perform sexual acts she did not want to	3.3	2.7	1.0	1.7
Emotional violence				
Any emotional violence	26.6	22.1	9.5	12.6
Said or did something to humiliate her in front of others	11.3	8.5	4.1	4.4
Threatened to hurt or harm her or someone she cared about	6.6	5.0	2.0	3.0
Insulted her or made her feel bad about herself	23.8	19.8	7.8	12.0
At least three forms of controlling behaviours	21.1	18.8	15.3	3.5
Any form of physical or sexual violence	33.6	26.3	9.2	17.0
Any form of emotional or physical or sexual violence	39.4	32.4	13.1	19.3
Intimate partner violence perpetrated by any current or previous husband or intimate partner				
Physical violence	33.9	23.9	na	na
Sexual violence	12.1	8.9	na	na
Emotional violence	28.2	22.2	na	na
Any form of physical or sexual violence	36.4	26.4	na	na
Any form of emotional or physical or sexual violence	42.0	32.5	na	na
Number of ever-married or never-married women who ever had an intimate partner	3,736	3,736	3,736	3,736

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.
na = not available

Table 18.10 Controlling behaviours of husband/intimate partner by background characteristics

Percentage of women age 15–49 who have ever had a husband or intimate partner whose husbands/intimate partners have ever demonstrated specific types of controlling behaviours, according to background characteristics, Tanzania DHS-MIS 2022

Background characteristic	Percentage of women whose husband/intimate partner:								Number of women who ever had a husband/ intimate partner
	Is jealous or angry if she talks to other men	Wrongly accuses her of being unfaithful	Does not permit her to meet her female friends	Tries to limit her contact with her family	Insists on knowing where she is at all times	Does not trust her with any money	Displays 3 or more of the specific behaviours	Displays none of the specific behaviours

Notes: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women, the most recent husband for divorced, separated or widowed women, the current intimate partner for never married women who currently have an intimate partner, and the most recent intimate partner for never married women who do not currently have an intimate partner but had one in the past. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

Table 18.11 Intimate partner violence by background characteristics

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced emotional, physical, or sexual violence committed by their current or most recent husband/intimate partner, according to background characteristics, Tanzania DHS-MIS 2022

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

Table 18.12 Intimate partner violence by husband's/intimate partner's characteristics and women's empowerment indicators

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced emotional, physical, or sexual violence committed by their current or most recent husband/intimate partner, according to the husband's/intimate partner's characteristics and women's empowerment indicators, Tanzania DHS-MIS 2022

Background characteristic	Emotional violence	Physical violence	Sexual violence	Physical and sexual	Physical and sexual and emotional	Physical or sexual	Physical or sexual or emotional	Number of women who ever had a husband/ intimate partner
Husband's/intimate partner's alcohol consumption								
Does not drink alcohol	21.0	24.7	8.2	5.4	4.3	27.4	33.0	2,841
Drinks alcohol but is never drunk	20.6	33.0	11.0	9.5	2.6	34.5	40.3	66
Is sometimes drunk	35.8	43.6	15.4	13.9	11.1	45.2	52.0	498

Woman afraid of husband/ intimate partner			
Afraid most of the time	1.8	0.6	373
Sometimes afraid	2.4	2.1	1,079
Never afraid	1.4	1.0	2,285
Total	1.7	1.3	3,736

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

[1] Includes in the last 12 months

[2] Includes only currently married women

[3] According to the wife's report. Includes only currently married women. See Table 15.8.1 for list of decisions.

[4] According to the woman's report. See Table 18.10 for list of behaviours.

[5] According to the woman's report. See Table 15.9.1 for list of reasons.

Table 18.17 Help seeking to stop violence

Percent distribution of women age 15–49 who have ever experienced physical or sexual violence by their help-seeking behaviour, according to type of violence and background characteristics, Tanzania DHS-MIS 2022

Type of violence/ background characteristic	Sought help to stop violence	Never sought help but told someone	Never sought help, never told anyone	Total	Number of women who have ever experienced any physical or sexual violence
Type of violence experienced					
Physical only	34.7	13.1	52.1	100.0	940

Total	37.8	12.9	49.3	100.0	1,521

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

Table 18.18 Sources for help to stop the violence

Percentage of women age 15–49 who have experienced physical or sexual violence and sought help by sources from which they sought help, according to type of violence experienced, Tanzania DHS-MIS 2022

	Type of violence experienced			
Source	Physical only	Sexual only	Physical and sexual	Physical or sexual violence
Own family	61.5	(49.6)	64.9	61.5
Husband's/intimate partner's family	44.7	(3.3)	39.1	38.9
Current/former husband/intimate partner	1.0	(0.0)	1.3	1.0
Current/former boyfriend	1.0	(0.0)	0.5	0.7
Friend	1.4	(37.4)	6.3	6.5
Neighbour	7.3	(5.8)	11.0	8.4
Religious leader	4.4	(0.0)	12.6	6.8
Doctor/medical personnel	0.9	(0.0)	5.4	2.3
Police	7.9	(0.8)	13.5	9.1
Lawyer	0.0	(0.2)	2.8	1.0
Social work organisation (NGO/CSO)	2.0	(1.9)	3.3	2.4
Other	10.5	(7.9)	14.2	11.5
Number of women who have sought help	326	55	194	575

Note: Women can report more than one source from which they sought help. Figures in parentheses are based on 25–49 unweighted cases.
CSO = community service organisation
NGO = nongovernmental organisation

SAMPLE DESIGN

Appendix A

A.1 INTRODUCTION

The 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) is the sixth survey of its kind following those implemented in 1991–92 (TDHS), 1996 (TDHS), 2004–05 (TDHS), 2010 (TDHS), and 2015–16 (TDHS-MIS). The survey used a nationally representative sample of about 16,350 households selected randomly from a random sample of 629 clusters. All women age 15–49 who were usual residents of the selected households or who slept in the households the night before the survey were eligible to be interviewed. The survey was expected to result in about 16,280 interviews of women age 15–49. As with the prior surveys, the main objectives of the 2022 TDHS-MIS were to provide up-to-date information on fertility and childhood mortality levels; fertility preferences; awareness, approval, and use of family planning methods; maternal and child health; and knowledge of and attitudes toward HIV and AIDS and other sexually transmitted infections (STIs). It was also designed to collect information on key malaria control indictors such as possession and use of bed nets, intermittent preventive treatment (IPT) of malaria for pregnant women during their most recent pregnancy, and malaria morbidity among children under age 5.

Apart from the female survey, a male survey was conducted at the same time in a subsample consisting of one household from every two selected for the female survey. All men age 15–49 who were usual residents of the selected households or who slept in the households the night before the survey were eligible for the male survey. The survey collected information on their basic demographic and social status, on their knowledge and use of family planning methods, and on their knowledge of and attitudes toward HIV/AIDS and other sexually transmitted infections. The survey was expected to result in about 6,700 interviews of men age 15–49. In the subsample including the male interview, a module on domestic violence was administered to one woman per household randomly selected from all eligible women in the household. Also in this subsample, all children under age 5 were eligible to be measured and weighed, and all children age 6–59 months were eligible to be tested for anaemia and malaria using capillary blood samples. In a subsample of households consisting of five households per cluster, a micronutrient module was administered. In the micronutrient subsample, all women age 15–49 and children under age 5 were eligible for height and weight measurements and various micronutrient tests. This report includes results from the anaemia testing conducted for women and children in the micronutrient subsample, which was conducted using venous blood. The results of other biomarker results collected in the micronutrient module are discussed in a separate report.

The survey was designed to produce representative estimates for the main demographic and health indicators for the country as a whole, for urban and rural areas separately, for Tanzania Mainland and Zanzibar and their urban and rural areas, and for each of the nine geographical zones. Where possible, representative results are provided for each of the 31 regions. However, adult mortality and maternal mortality rates were calculated only at the national level because these indicators require a very large sample size.

A.2 SAMPLING FRAME

The sampling frame used for the 2022 TDHS-MIS was the 2012 Tanzania Population and Housing Census (TPHC). The sampling frame was a complete list of enumeration areas (EAs) covering the entire country provided by the National Bureau of Statistics (NBS) of Tanzania, the implementing agency for the 2022 TDHS-MIS. The EAs were created for the 2012 TPHC and served as counting units for the census. In rural areas, an EA is a hamlet (part of a village) or a group of small hamlets; in urban areas, an EA is a street or a

city block. Each EA includes identification information, administrative information, and, as a measure of size, the number of residential households residing in the EA. Each EA is also classified into one of two types of residence, urban or rural. For each EA, there are cartographical materials that delineate its geographical location, boundaries, main access, and landmarks inside or outside the EA, which help to identify the different areas.

Tanzania Mainland's administrative units were reformed in 2012, increasing the number of regions from 21 to 25 (relative to the population census conducted in 2002). In the 2012 TPHC, Tanzania Mainland was divided into regions and each region was subdivided into districts. There are in total 25 regions and 160 districts. The 25 Mainland regions have been regrouped to form eight geographical zones. Zanzibar is treated as a geographical zone and is subdivided into five regions and 11 districts. In 2016, Mbeya region was divided into two regions, Mbeya and Songwe, thus increasing the number of Tanzania Mainland regions from 25 to 26. Currently, there are in total nine geographical zones and 31 regions in Tanzania. Below is the composition of the nine geographical zones.

- **Western zone:** Tabora, Kigoma
- **Northern zone:** Kilimanjaro, Tanga, Arusha
- **Central zone:** Dodoma, Singida, Manyara
- **Southern Highlands zone:** Iringa, Njombe, Ruvuma
- **Southern zone:** Lindi, Mtwara
- **South West Highlands zone:** Mbeya, Rukwa, Katavi, Songwe
- **Lake zone:** Kagera, Mwanza, Geita, Mara, Simiyu, Shinyanga
- **Eastern zone:** Dar es Salaam, Pwani, Morogoro
- **Zanzibar:** Kaskazini Unguja, Kusini Unguja, Mjini Magharibi, Kaskazini Pemba, Kusini Pemba

Table A.1 shows the distribution of residential households by region and according to type of residence (urban and rural), summarised from the sampling frame after exclusion of some institutional EAs. Regional shares vary from 0.3% for Kusini Unguja to 11.7% for Dar es Salaam. In Tanzania, 32.6% of residential households are in urban areas. The percentage of households that are urban varies by region from 6.7% for Kusini Unguja to 100% for Dar es Salaam. **Table A.2** shows the distribution of EAs and their average size in number of households by region. Among the 106,642 EAs, 34,960 are in urban areas and 71,682 are in rural areas. Mean EA size is practically the same in urban and rural areas, with an overall average of 86 households per EA.

Table A.1 Distribution of residential households by region and according to type of residence

	Households			Percentage

A.3 SAMPLE ALLOCATION AND SAMPLING PROCEDURE

The sample used for the 2022 TDHS-MIS was a stratified sample selected in two stages from the 2012 census frame. Stratification was achieved by separating each region into urban and rural areas, with these areas each forming a sampling stratum. In total, 61 sampling strata were created, since Dar es Salaam has only urban areas. Samples were selected independently in each sampling stratum via a two-stage selection procedure. Implicit stratification and proportional allocation were achieved at each of the lower administrative unit levels by sorting the sampling frame within the explicit stratum according to administrative units at different levels before sample selection and by using probability proportional to size selection in the first stage of sampling.

In the first stage, 629 EAs were selected with probability proportional to EA size and with independent selection in each sampling stratum according to the sample allocation shown in **Table A.3**. Among the 629 EAs, 211 were from urban areas and 418 from rural areas. With a fixed number of 26 households selected per EA, the total number of selected households was 16,354, 5,486 from urban areas and 10,868 from rural areas. Given the aim of obtaining representative results for some indicators for each of the 31 regions and the fact that the total sample size was tight, a power allocation was used to allocate the sample to the different regions and to their urban and rural areas. Small regions, such as the regions in Zanzibar, were oversampled, and large regions, such as Dar es Salaam, were undersampled.

Table A.3 Sample allocation of EAs and households by region and according to type of residence

Region	Allocation of EAs			Allocation of households

Kaskazini Pemba	5	12	17	130	312	442
Kusini Pemba	5	13	18	130	338	468
Total	211	418	629	5,486	10,868	16,354

A household listing operation was carried out in all of the selected EAs before the main survey. The listing operation consisted of visiting each of the 629 selected EAs, drawing a location map and a detailed sketch map, and recording on the household listing forms all residential households found in the EA along with the address and the name of the head of the household. The resulting list of households served as the sampling frame for the selection of households in the second stage. During the household listing operation, some of the selected EAs were found to be large in size. In order to reduce the task of household listing, selected EAs with an estimated number of households greater than 300 could be segmented. Only one segment was selected for the survey with probability proportional to segment size. The methodology and the detailed household listing procedure were addressed in the household listing manual.

In the second stage, a fixed number of 26 households from each EA were selected before the main data collection using the newly updated listing. The interviewers were asked to interview only the preselected households; to prevent bias, no replacements were allowed for nonrespondent households. Interviewers were asked to make at least two to three callbacks in order to reduce nonresponse bias.

Table A.4 shows the sample allocation of the expected numbers of interviewed women and men by region and type of residence. The survey was expected to result in 16,281 interviews of women age 15–49 (5,466 in urban areas and 10,815 in rural areas); the male survey was expected to result in 6,712 interviews of men age 15–49 (2,252 in urban areas and 4,460 in rural areas). **Table A.4** also shows the sample allocation of the expected numbers of children under age 5 with anthropometry measurements and children age 6–59 months with biomarker testing, by region and according to type of residence. The calculations were based on the 2015–16 TDHS survey results: the household response rate was 94%; there were 1.08 women age 15–49 per household, and the response rate among women was 97%; there were 0.95 men age 15–49 per household, and the response rate among men was 92%; and there were 0.82 children under age 5 per household who participated in anthropometry measurements and 0.74 children age 6–59 months per household who participated in biomarker testing.

Note: The male survey was conducted in 50% of the households selected for the female survey.

A.4 SELECTION PROBABILITY AND SAMPLING WEIGHTS

Due to the nonproportional allocation of the sample to the different regions and their urban rural areas and the differences in response rates, sampling weights are required for any analysis using 2022 TDHS-MIS data to ensure the actual representativeness of the survey results at the national level as well as the domain level. Since the 2022 TDHS-MIS sample was a two-stage stratified cluster sample, sampling weights were calculated based on sampling probabilities separately for each sampling stage and for each cluster. We use the following notations:

P_{1hi}: first-stage sampling probability of the i^{th} EA in stratum h
P_{2hi}: second-stage sampling probability within the i^{th} EA (household selection)

Let n_h be the number of EAs selected in stratum h, M_{hi} the number of households residing in the i^{th} EA according to the sampling frame, and $\sum M_{hi}$ the total number of households in stratum h. The probability of selecting the i^{th} EA in the 2022 TDHS-MIS sample is calculated as follows:

$$\frac{n_h M_{hi}}{\sum M_{hi}}$$

Let s_{hi} be the proportion of households in the selected segment relative to the total number of households in EA I in stratum h if the EA is segmented; otherwise, $s_{hi} = 1$. Then the probability of selecting cluster i in the sample is:

$$P_{1hi} = \frac{n_h M_{hi}}{\sum M_{hi}} \times s_{hi}$$

A 2022 TDHS-MIS cluster is either an EA or a segment of a large EA. Let L_{hi} be the number of households listed in the household listing operation in cluster *i* in stratum *h*, and let m_h be the sample take (number of households selected in each cluster), which is fixed at 26 for all clusters. The second stage's selection probability for each household in the cluster is calculated as follows:

$$P_{2hi} = \frac{m_h}{L_{hi}}$$

The overall selection probability of each household in cluster *i* of stratum *h* is therefore the product of the selection probabilities for each of the two stages:

$$P_{hi} = P_{1hi} \times P_{2hi}$$

The design weight for each household in cluster *i* of stratum *h* is the inverse of its overall selection probability:

$$W_{hi} = 1 / P_{hi}$$

A spreadsheet containing all sampling parameters and selection probabilities was prepared to facilitate the calculation of design weights. Design weights were adjusted for household nonresponse and for individual nonresponse to calculate the sampling weights for households and women, respectively. The differences between the household sampling weights and the women's individual sampling weights were introduced by individual nonresponse among eligible women. Sampling weights for the domestic violence module were calculated based on the household survey weights and took into account the selection of only one woman per household and corrected for nonresponse. The final sampling weights were normalised so that the total number of unweighted cases was equal to the total number of weighted cases at the national level for both household weights and women's individual weights. Several sets of weights were calculated:

- one set for all households selected for the survey
- one set for the women's individual survey
- one set for households selected for the male survey
- one set for the men's individual survey
- one set for the domestic violence survey

It is important to note that normalised weights are relative weights that are valid for estimating means, proportions, and ratios but not valid for estimating population totals and for pooled data. Also, the number of weighted cases using the normalised weight has no direct relation with survey precision because it is relative, especially for oversampled areas, where the number of weighted cases is much smaller than the number of unweighted cases and only the latter are directly related to survey precision.

A.5 SURVEY RESULTS

Table A.5 and **Table A.6** present survey results and response rates for women's and men's interviews, respectively, for Tanzania as a whole, Tanzania Mainland and its urban and rural areas, and Zanzibar. The male subsample constituted half of the households selected for the survey. A total of 16,312 households were selected for the TDHS-MIS sample. This number is slightly less than the target sample size of 16,354 because one EA could not be completed due to security issues, and a few other EAs were so small that they contained fewer than the 26 households indicated in the sample design. In these EAs, all households were selected.

Table A.5 Sample implementation: Women

Percent distribution of households and eligible women age 15–49 by results of the household and individual interviews, and household, eligible women, and overall women response rates, according to residence and region (unweighted), Tanzania DHS-MIS 2022

	Tanzania Mainland				
Result	Urban	Rural	Total	Zanzibar	Tanzania

[3] The overall men response rate (OMRR) is calculated as:

$$OMRR = HRR * EMRR/100$$

ESTIMATES OF SAMPLING ERRORS

Appendix B

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors and (2) sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and in data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2022 Tanzania Demographic and Health Survey and Malaria Indicator Survey (2022 TDHS-MIS) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in the 2022 TDHS-MIS is only one of many samples that could have been selected from the same population, using the same design and identical size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95% of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the 2022 TDHS-MIS sample was the result of a multistage stratified design, and, consequently, it was necessary to use more complex formulas. The computer software used to calculate sampling errors for the 2022 TDHS-MIS is an SAS program. This program uses the Taylor linearization method to estimate variances for survey estimates that are means, proportions, or ratios. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as fertility and mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1}{x^2}\sum_{h=1}^{H}\left[(1-f_h)\frac{m_h}{m_h-1}\left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h}\right)\right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi} \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H;
m_h is the total number of clusters selected in the h^{th} stratum;
y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum;
x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum; and
f_h is the sampling fraction of PSU in the h^{th} stratum.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample and calculates standard errors for these estimates using simple formulas. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the 2022 TDHS-MIS, there were 628 non-empty clusters. Hence, 628 replications were created. The variance of a ratio *r* is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^{k} (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 628 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 627 clusters (i^{th} cluster excluded), and
k is the total number of clusters.

In addition to the standard error, the program computes the design effect (DEFT) for each estimate, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design such as multistage or cluster sampling. The program also computes the relative standard error and the confidence limits for the estimates.

Sampling errors for the 2022 TDHS-MIS are calculated for selected variables considered to be of primary interest for the survey. The results are presented in this appendix for the country as a whole; for urban and rural areas separately; for Tanzania Mainland, Zanzibar, and their urban and rural areas; and for each of the nine geographical zones. For each variable, the type of statistic (mean, proportion, ratio, or rate) and the base population are given in **Table B.1**. **Tables B.2** to **B.20** present the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95% confidence limits (R±2SE) for each variable. The DEFT is considered undefined when the standard error considering a simple random sample is zero (when the estimate is close to 0 or 1).

The confidence interval (e.g., as calculated for *mean number of children ever born to women age 15–49*) can be interpreted as follows: the sample estimate from the national sample is 2.645 (R), and its standard error is 0.031 (SE). Therefore, to obtain the 95% confidence limits, one adds and subtracts twice the standard error to the sample estimate, that is, R ± 2 × SE. There is a high probability (95%) that the *true* mean number of children ever born to women age 15–49 is between 2.584 and 2.707.

For the total sample, the value of the design effect (DEFT), averaged over all variables for the women's survey, is 1.544. This means that, due to multistage clustering of the sample, the average standard error is increased by a factor of 1.544 over that in an equivalent simple random sample.

Table B.1 List of selected variables for sampling errors, Tanzania DHS-MIS 2022

Variable	Estimate	Base population
HOUSEHOLDS AND POPULATION		
Electricity primary source of lighting	Proportion	De jure household population
Primary reliance on clean fuels and technology for cooking, space heating, and lighting	Proportion	De jure household population
Births registered with civil authority	Proportion	De jure household population under 5
Ownership of at least one ITN	Proportion	Households
Ownership of at least one ITN for every two persons	Proportion	Households (with at least one person who stayed in the household the night before the survey)
Improved drinking water source	Proportion	De jure household population
At least basic drinking water service	Proportion	De jure household population
Water available when needed	Proportion	De jure household population
Improved sanitation facility	Proportion	De jure household population
At least basic sanitation service	Proportion	De jure household population
Using open defecation	Proportion	De jure household population
Using a handwashing facility with soap and water	Proportion	De jure household population for whom handwashing place was observed or with no on-site place for handwashing
WOMEN		
Urban residence	Proportion	Women 15–49
No education	Proportion	Women 15–49
Secondary education or higher	Proportion	Women 15–49
Literacy	Proportion	Women 15–49
Use of the internet in last 12 months	Proportion	Women 15–49
Current tobacco use	Proportion	Women 15–49
Currently married/in union	Proportion	Women 15–49
Married before age 15	Proportion	Women 20–49
Married before age 18	Proportion	Women 20–49
Had sexual intercourse before age 18	Proportion	Women 20–49
Age-specific fertility rate 15–19 (3 years)	Rate	Woman-years of exposure to childbearing at age 15–19 in the 3 years preceding the survey
Total fertility rate (3 years)	Rate	Woman-years of exposure to childbearing
Currently pregnant	Proportion	Women 15–49
Mean number of children ever born to women age 40–49	Mean	Women 40–49
Mean number of children ever born to women age 15–49	Mean	Women 15–49
Mean number of living children among women age 15–49	Mean	Women 15–49
Median birth interval	Median	Non-first births in the 5 years preceding the survey
First birth before age 18	Proportion	Women 20–49
Want to delay next birth at least 2 years	Proportion	Currently married women 15–49
Want no more children	Proportion	Currently married women 15–49
Ideal number of children	Mean	Women 15–49 with numeric responses
Total wanted fertility rate (3 years)	Rate	Women-years of exposure to childbearing
Currently using any contraceptive method	Proportion	Currently married women 15–49
Currently using any modern method	Proportion	Currently married women 15–49
Currently using pill	Proportion	Currently married women 15–49
Currently using injectables	Proportion	Currently married women 15–49
Currently using implants	Proportion	Currently married women 15–49
Currently using male condoms	Proportion	Currently married women 15–49
Currently using any traditional method	Proportion	Currently married women 15–49
12-month discontinuation rate due to method failure	Rate	Women 15–49
12-month discontinuation rate due to any reason	Rate	Women 15–49
12-month discontinuation rate due to switching to another method	Rate	Women 15–49
Unmet need for spacing	Proportion	Currently married women 15–49
Unmet need for limiting	Proportion	Currently married women 15–49
Unmet need total	Proportion	Currently married women 15–49
Demand satisfied by modern methods	Proportion	Currently married women 15–49
Demand satisfied by modern methods (all women)	Proportion	Women 15–49
Participation in decision making about family planning	Proportion	Currently married women 15–49
Not exposed to any of the eight media sources	Proportion	Women 15–49
Neonatal mortality rate[1]	Rate	Children exposed to the risk of mortality
Postneonatal mortality rate[1]	Rate	Children exposed to the risk of mortality
Infant mortality rate[1]	Rate	Children exposed to the risk of mortality
Child mortality rate[1]	Rate	Children exposed to the risk of mortality
Under-5 mortality rate[1]	Rate	Children exposed to the risk of mortality
Perinatal mortality rate	Rate	Pregnancies of 28 or more weeks' duration to women 15–49 in the 5 years preceding the survey
Stillbirth rate	Rate	Pregnancies of 28 or more weeks' duration to women 15–49 in the 5 years preceding the survey
Early neonatal mortality rate	Rate	Pregnancies of 28 or more weeks' duration to women 15–49 in the 5 years preceding the survey
In any avoidable high-risk category	Proportion	Children born in the 5 years preceding the survey to women 15–49
Received ANC from a skilled provider	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
4+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
8+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
Took any iron-containing supplements	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey

Continued…

Table B.1—*Continued*

Variable	Estimate	Base population
Mothers protected against tetanus for last birth	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Delivered in a health facility (live births)	Proportion	Live births in the 2 years preceding the survey
Delivered by a skilled provider (live births)	Proportion	Live births in the 2 years preceding the survey
Delivered by C-section (live births)	Proportion	Live births in the 2 years preceding the survey
Women with postnatal check during first 2 days	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Newborns with postnatal check during first 2 days	Proportion	Most recent live births in the 2 years preceding the survey
Any problem accessing health care	Proportion	Women 15–49
Ever had vaccination card	Proportion	Children 12–23 months
Received BCG vaccination	Proportion	Children 12–23 months
Received DPT-HepB-Hib vaccination (3 doses)	Proportion	Children 12–23 months
Received pneumococcal vaccination (3 doses)	Proportion	Children 12–23 months
Received measles and rubella 1 vaccination	Proportion	Children 12–23 months
Fully vaccinated according to national schedule (12–23 months)	Proportion	Children 12–23 months
Received measles and rubella 2 vaccination	Proportion	Children 24–35 months
Fully vaccinated according to national schedule (24–35 months)	Proportion	Children 24–35 months
Sought treatment for diarrhoea	Proportion	Children under 5 with diarrhoea in last 2 weeks
Treated with ORS	Proportion	Children under 5 with diarrhoea in last 2 weeks
Height-for-age (−3 SD)	Proportion	Children under 5 who were measured
Height-for-age (−2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (−2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (+2 SD)	Proportion	Children under 5 who were measured
Weight-for-age (−2 SD)	Proportion	Children under 5 who were measured
Exclusive breastfeeding	Proportion	Youngest children 0–5 months living with their mother
Minimum dietary diversity (children 6–23 months)	Proportion	Youngest children 6–23 months living with their mother
Prevalence of anaemia (children 6–59 months) (haemoglobin <11.0 g/dl): capillary blood	Proportion	Children 6–59 months who were tested
Prevalence of anaemia (children 6–59 months) (haemoglobin <11.0 g/dl): venous blood	Proportion	Children 6–59 months who were tested
Body mass index (BMI) <18.5	Proportion	Women 20–49 who were measured
Body mass index (BMI) ≥25	Proportion	Women 20–49 who were measured
Body mass index-for-age (−2 SD)	Proportion	Adolescent women 15–19 who were measured
Body mass index-for-age (+1 SD)	Proportion	Adolescent women 15–19 who were measured
Minimum dietary diversity (women 15–49)	Proportion	Women 15–49
Prevalence of any anaemia (women 15–49): capillary blood	Proportion	Women 15–49 who were tested
Prevalence of any anaemia (nonpregnant women 15–49) (haemoglobin <12.0 g/dl): capillary blood	Proportion	Nonpregnant women 15–49 who were tested
Prevalence of any anaemia (pregnant women 15–49) (haemoglobin <11.0 g/dl): capillary blood	Proportion	Pregnant women 15–49 who were tested
Prevalence of any anaemia (women 15–49): venous blood	Proportion	Women 15–49 who were tested
Child slept under an ITN last night	Proportion	Children under 5 in households
Pregnant women slept under an ITN last night	Proportion	Pregnant women 15–49
Received 3+ doses of SP/Fansidar	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Child had fever in last 2 weeks	Proportion	Child under 5
Child had blood taken from finger/heel	Proportion	Child under 5 who had a fever in the last 2 weeks
Child took ACT	Proportion	Child under 5 with a fever in the last 2 weeks who received any antimalarial medications
Child has malaria (based on rapid test)	Proportion	Children 6–59 tested (rapid test) for malaria
Discriminatory attitudes towards people with HIV	Proportion	Women 15–49
Condom use at last sex	Proportion	Women 15–49 with nonmarital, noncohabiting partner in last 12 months
Tested for HIV in the past 12 months and received the results of the last test	Proportion	Women 15–49
Stigma and discrimination experienced by people living with HIV in community settings	Proportion	Women 15–49 who self-reported a positive HIV test result
Employed in last 12 months	Proportion	Currently married women 15–49
Employed in last 12 months but not paid	Proportion	Currently married women 15–49 employed in last 12 months
Mobile phone ownership	Proportion	Women 15–49
Have and use a bank account or mobile phone for financial transactions	Proportion	Women 15–49
Participate in decision making (all three decisions)	Proportion	Currently married women 15–49
Agree with at least one specified reason a husband is justified in wife beating	Proportion	Women 15–49
Make own decisions about sexual relations, contraceptive use, and reproductive care	Proportion	Currently married women 15–49
Experienced physical violence since age 15 by any perpetrator	Proportion	All women 15–49
Experienced sexual violence by any perpetrator ever	Proportion	All women 15–49
Experienced sexual violence by any non-intimate partner	Proportion	All women 15–50
Experienced emotional/physical/sexual violence by any husband or intimate partner ever	Proportion	Ever-married women 15–49
Experienced physical/sexual violence by the current or most recent husband or intimate partner ever	Proportion	Ever-married women 15–49
Experienced emotional/physical/sexual violence by any husband or intimate partner in the past 12 months	Proportion	Ever-married women 15–49

41	260	0.7	182	0.6	Total	36,541	100.0	33,123	100.0

Note: The de facto population includes all residents and nonresidents who stayed in the household the night before the interview.

Figure C.1 Population pyramid

Percent distribution of the household population

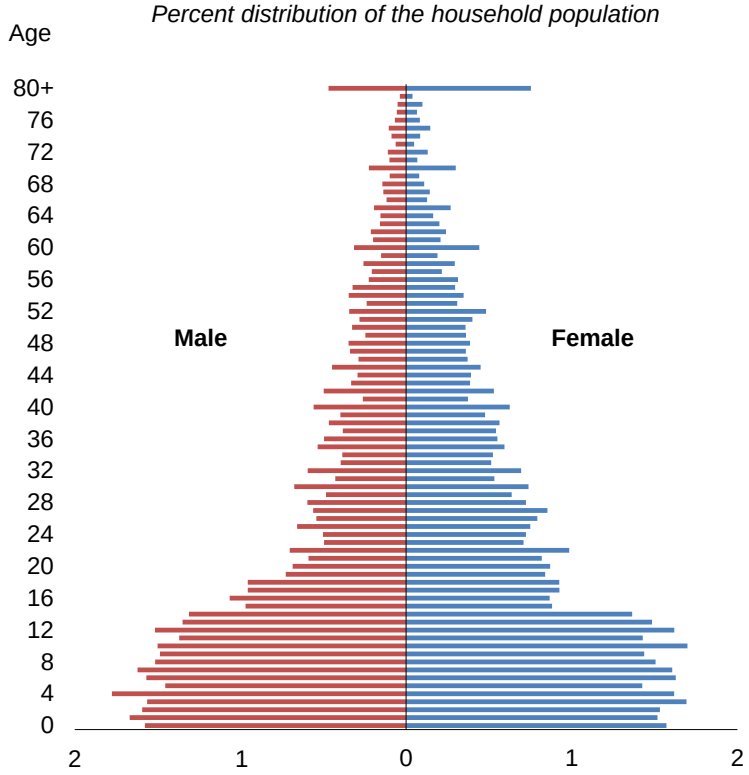

Table C.2.1 Age distribution of eligible and interviewed women

De facto household population of women age 10–54, number and percent distribution of interviewed women age 15–49, and percentage of eligible women who were interviewed (weighted), by 5-year age groups, Tanzania DHS-MIS 2022

	Household population of women age 10–54	Interviewed women age 15–49		Percentage of eligible women interviewed
Age group	Number	Number	Percentage	
10–14	5,291	na	na	na
15–19	3,093	2,968	19.8	96.0
20–24	2,861	2,770	18.5	96.8
25–29	2,616	2,521	16.8	96.4
30–34	2,094	2,039	13.6	97.4
35–39	1,902	1,849	12.3	97.2
40–44	1,606	1,560	10.4	97.1
45–49	1,343	1,302	8.7	97.0
50–54	1,322	na	na	na
15–49	15,514	15,008	100.0	96.7
Ratios				
10–14 to 15–19	171	na	na	na
50–54 to 45–49	98	na	na	na

Note: The de facto population includes all residents and nonresidents who stayed in the household the night before the interview. Weights for both the household population of women and interviewed women are household weights. Age is based on the Household Questionnaire.
na = Not applicable

Table C.2.2 Age distribution of eligible and interviewed men

De facto household population of men age 10–54, number and percent distribution of interviewed men age 15–49, and percentage of eligible men who were interviewed (weighted), by 5-year age groups, Tanzania DHS-MIS 2022

	Household population of men age 10–54	Interviewed men age 15–49		Percentage of eligible men interviewed
Age group	Number	Number	Percentage	
10–14	2,554	na	na	na
15–19	1,507	1,376	24.8	91.3
20–24	990	887	16.0	89.6
25–29	996	853	15.4	85.7
30–34	855	732	13.2	85.6
35–39	771	665	12.0	86.3
40–44	652	578	10.4	88.7
45–49	514	464	8.4	90.3
50–54	523	na	na	na
15–49	6,285	5,555	100.0	88.4
Ratios				
10–14 to 15–19	169	na	na	na
50–54 to 45–49	102	na	na	na

Note: The de facto population includes all residents and nonresidents who stayed in the household the night before the interview. Weights for both the household population of men and interviewed men are household weights. Age is based on the Household Questionnaire.
na = Not applicable

[1] $(B_m/B_f)x100$, where B_m and B_f are the numbers of male and female births, respectively

[2] $[2P_x/(P_{x-1}+P_{x+1})]x100$, where P_x is the number of pregnancy outcomes in year x preceding the survey

Table C.6 Completeness of reporting

Percentage of observations missing information for selected demographic and health questions (weighted), Tanzania DHS-MIS 2022

Subject	Reference group	Percentage with information missing	Number of cases
Date of live birth or stillbirth (last 15 years)	Live births or stillbirths in the 15 years preceding the survey		
Missing day only		1.13	28,765
Missing month but year reported		1.10	28,765
Date of live birth or stillbirth (last 5 years)	Live births or stillbirths in the 5 years preceding the survey		
Missing day only		0.48	11,088
Missing month but year reported		0.35	11,088
Date of birth of women	Women age 15–49		
Missing month but year reported		2.62	15,254
Missing year		0.16	15,254
Date of birth of men	Men age 15–49		
Missing month but year reported		6.06	5,763
Missing year		0.54	5,763
Diarrhoea in last 2 weeks	Living children age 0–59 months	1.42	10,409
Anthropometry of children	Living children age 0–59 months (from the Biomarker Questionnaire)		
Height		2.88	5,672
Weight		2.88	5,672
Height or weight		2.88	5,672
Anthropometry of women	Women age 15–49 (from the Biomarker Questionnaire)		
Height		4.29	7,816
Weight		4.32	7,816
Height or weight		4.32	7,816
Anthropometry of men	Men age 15–49 (from the Biomarker Questionnaire)		
Height		11.94	6,281
Weight		11.95	6,281
Height or weight		11.95	6,281
Anaemia			
Children	Living children age 6–59 months (from the Biomarker Questionnaire)	4.20	5,141
Women	All women (from the Biomarker Questionnaire)	6.95	7,816

Table C.6.1 Reporting of age at death in days

Distribution of reported deaths under age 1 month by age at death in days and percentage of neonatal deaths reported to occur at age 0–6 days for 5-year periods preceding the survey (weighted), Tanzania DHS-MIS 2022

Trainee 20	0.06	0.55
Trainee 21	0.33	0.39
Average	0.27	0.48

[1] Ten children were measured twice for each standardisation and restandardisation exercise.
[2] Trainees' precision and accuracy are defined in terms of a technical error of measurement (TEM), which is calculated as $\sqrt{\sum(D^2)/(2N)}$, where D is the difference in height and N is the number of repeat measurements. An acceptable TEM according to WHO-UNICEF is a TEM of <0.6 cm for precision and <0.8 cm for accuracy.

Table C.8 Height and weight data completeness and quality for children

Among children under age 5 who were eligible for anthropometry, percentage with incomplete or missing data for height, weight, or month or year of birth; among children with complete data on height and age, percentage with implausible data for height-for-age; among children with complete data on weight and height, percentage with implausible data for weight-for-height; among children with complete data on weight and age, percentage with implausible data for weight-for-age; and among all children under age 5 who were eligible for anthropometry, percentage with valid data for height-for-age, weight-for-height, or weight-for-age, according to background characteristics (unweighted), Tanzania DHS-MIS 2022

	Percentage with data incomplete or missing for:				Percentage with implausible data for:						Percentage with valid data for[8]:

[1] Child's height in centimetres is missing, child was not present, child refused, and "other" result codes
[2] Child's weight in kilograms is missing, child was not present, child refused, and "other" result codes
[3] Incomplete date of birth; a complete date of birth is month/day/year or month/year.
[4] Implausible cases for height-for-age are defined as more than 6 standard deviations (SD) above or below the standard population median (*z* scores) based on the WHO Child Growth Standards among children with complete height and month/year of birth data.
[5] Complete age is calculated from month and year of birth.
[6] Implausible cases for weight-for-height are defined as more than 5 SD above or below the standard population median (*z* scores) based on the WHO Child Growth Standards among children with complete weight and height data.
[7] Implausible cases for weight-for-age are defined as more than 5 SD above or 6 SD below the standard population median (*z* scores) based on the WHO Child Growth Standards among children with complete weight and month/year of birth data.
[8] No missing data, incomplete data, or implausible data
[9] For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.
[10] Includes results from measurers with fewer than 25 children measured

Table C.9 Height measurements from random subsample of measured children

Differences in first height measurement and second height measurement among children under age 5 randomly selected and remeasured, according to region and measurer (unweighted), Tanzania DHS-MIS 2022

Table C.12 Heaping in anthropometric measurements for children (digit preference)

Distribution of weight and height/length measurements by decimal digit recorded (unweighted), Tanzania DHS-MIS 2022

Digit	Weight		Height or length	
	Number	Percent	Number	Percent
0	603	10.7	773	13.7
1	570	10.1	583	10.3
2	544	9.6	645	11.4
3	595	10.5	571	10.1
4	543	9.6	522	9.3
5	609	10.8	746	13.2
6	558	9.9	550	9.7
7	509	9.0	468	8.3
8	556	9.9	439	7.8
9	556	9.9	346	6.1
Total	5,643	100.0	5,643	100.0
Index of dissimilarity[1]	na	2.1	na	8.8

Note: The table includes all children with weight and height/length measurements, regardless of the completeness of date of birth information and cases with implausible data. Both weight and length/height measurements were recorded with one decimal digit.
na = Not applicable
[1] The index of dissimilarity is a measure of digit preference calculated as one-half of the sum of absolute differences between the observed and expected percentage. It can be interpreted as the percentage of values that would need to be redistributed in order to achieve a uniform distribution.

Table C.13.1 Coverage of testing for anaemia in children: Capillary blood sample

Percentage of eligible children age 6–59 months in the standard biomarker subsample who were tested for anaemia, according to background characteristics (unweighted), Tanzania DHS-MIS 2022

Notes: Table is based on children or women who stayed in the household on the night before the interview and who were tested for anaemia. Capillary blood was measured in the standard biomarker subsample (half of households), and venous blood was measured in the micronutrient subsample. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using formulas in CDC 1998 and cutoffs defined in WHO 2017. Haemoglobin is measured in grams per decilitre (g/dl) using the HemoCue 201+ device.
CI = Confidence interval
Q = Quartile
[1] Any anaemia is defined as <11.0 g/dl for children, <12 g/dl for nonpregnant women, and <11 g/dl for pregnant women.

Table C.16 Coverage of urine testing for iodine among women

Percent distribution of women age 15–49 eligible for urine testing by interview and testing status, according to background characteristics (unweighted), Tanzania DHS-MIS 2022

Background characteristic	Interviewed: Urine collected	Interviewed: Refused to provide urine	Interviewed: Other/ missing	Not interviewed	Total	Number of women

Note: Age at the beginning of the school year is calculated from dates of birth of household members or by rejuvenating household members based on the date of the survey, the date after start of the school year, and completed age at the time of survey. Levels and grades refer to the current school year, or the most recent school year if data collection was completed between school years.

[a] Those age 25 at the time of interview who were age 24 at the beginning of school year are excluded from the table since current attendance was only collected for those age 4-24 years at the time of interview

Table C.20 Vaccination cards photographed

Percentage of children under age 3 reported to have a vaccination card, percentage whose vaccination card was seen by the interviewer, percentage whose vaccination card was photographed or was not photographed by reason, and among children with a vaccination card seen, percentage of cards photographed, according to background characteristics (weighted), Tanzania DHS-MIS 2022

Background characteristic	Percentage of children reported to have a vaccination card	Percentage of children whose vaccination card was seen by interviewer	Percentage of children whose vaccination card was photo-graphed	Percentage of children whose vaccination card was not photo-graphed as permission was not received	Percentage of children whose vaccination card was not photo-graphed for other reasons	Number of children	Among children with a vaccination card seen	
							Percentage of vaccination cards photo-graphed	Number of children

Table C.21 Completeness of information on siblings

Completeness of data on survival status of sisters and brothers reported by interviewed women, age of living siblings, and age at death (AD) and years since death (YSD) of dead siblings (unweighted), Tanzania DHS-MIS 2022

	Sisters		Brothers		All siblings	
	Number	Percent	Number	Percent	Number	Percent
All siblings	41,014	100.0	41,453	100.0	82,467	100.0
Living	36,806	89.7	36,605	88.3	73,411	89.0
Dead	4,178	10.2	4,805	11.6	8,983	10.9
Survival status unknown	30	0.1	43	0.1	73	0.1
Living siblings	36,806	100.0	36,605	100.0	73,411	100.0
Age reported	36,806	100.0	36,605	100.0	73,411	100.0
Dead siblings	4,178	100.0	4,805	100.0	8,983	100.0
AD and YSD reported	4,178	100.0	4,805	100.0	8,983	100.0

Table C.22 Sibship size and sex ratio of siblings

Mean sibship size and sex ratio of siblings at birth, Tanzania DHS-MIS 2022

Age of respondent	Mean sibship size[1]	Sex ratio of siblings at birth[2]
15–19	5.9	100.2
20–24	6.0	98.1
25–29	6.1	98.4
30–34	6.3	103.1
35–39	6.5	105.4
40–44	6.4	104.7
45–49	6.7	104.3
Total	6.2	101.5

[1] Includes the respondent
[2] Excludes the respondent

Table C.23 Pregnancy-related mortality trends

Direct estimates of pregnancy-related mortality rates for the 7 years preceding each survey, by 5-year age groups, Tanzania DHS-MIS 2022

	Pregnancy-related mortality rate[1,2]				
Age	2015–2022	2009–2016	2003–2010	1998–2005	1989–1996
15–19	0.07	0.28	0.25	0.44	0.67
20–24	0.20	0.67	0.94	1.22	1.48
25–29	0.06	0.98	0.90	1.43	1.25
30–34	0.20	0.60	1.57	1.48	1.31
35–39	0.36	1.26	1.09	1.33	1.30
40–44	0.15	2.06	1.26	1.19	0.87
45–49	0.11	1.13	0.34	0.96	1.58
Total 15–49	0.16[a]	0.87[a]	0.88[a]	1.12[a]	1.18[a]
General fertility rate (GFR)[3]	152	165	178	185	192
Pregnancy-related mortality ratio (PRMR)[4]	104	530	494	605	612
Confidence interval	(59, 149)	(405, 655)	(373, 614)	(427, 737)	(456, 768)
Lifetime risk of pregnancy-related death[5]	0.005	0.028	0.027	0.034	0.036

[1] Pregnancy-related mortality is defined as the death of a woman while pregnant or within 2 months of termination of pregnancy from any cause including accidents or violence
[2] Expressed per 1,000 woman-years of exposure
[3] Age-adjusted rate, expressed per 1,000 women age 15–49
[4] Expressed per 100,000 live births; calculated as the age-adjusted pregnancy-related mortality rate times 100 divided by the age-adjusted general fertility rate
[5] Calculated as $1-(1-PRMR)^{TFR}$, where TFR represents the total fertility rate for the 7 years preceding the survey
[a] Age-adjusted rate

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with National Bureau of Statistics / Office of the Chief Government Statistician. We are conducting a survey about health and other topics all over Tanzania. The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 15 to 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time. In case you need more information about the survey, you may contact the person listed on this card.

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with National Bureau of Statistics / Office of the Chief Government Statistician. We are conducting a survey about health and other topics all over Tanzania. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 30 to 60 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

Do you have any questions?
May I begin the interview now?

SIGNATURE OF INTERVIEWER _____ DATE _____

RESPONDENT AGREES TO BE INTERVIEWED . . 1 ↓

RESPONDENT DOES NOT AGREE TO BE INTERVIEWED . . 2 → END

SECTION 1. RESPONDENT'S BACKGROUND

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
101	RECORD THE TIME.	HOURS . . . . . ☐☐ MINUTES . . . . . ☐☐	
101AA	CHECK THE COVER PAGE: HOUSEHOLD SELECTED FOR THE MEN'S SURVEY? Yes ☐ ↓	No ☐ →	102
101A	During the interview I would like to measure your blood pressure to see if you have high blood pressure. If you agree, we will take a measurement three times during the interview. We will use an automated digital device operated by 6 AA-size batteries. The procedure is harmless, but you may feel discomfort while the measuring cuff squeezes your arm. If high blood pressure is not treated, it may eventually cause serious damage to the heart and blood vessels in the brain. You will receive the results of the blood pressure measurement at the end of our interview, with an explanation of the numbers. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. Do you have any questions about the blood pressure measurement so far? If you have any questions about the procedure at any time, please ask me. You can say yes or no to having your blood pressure measured. You can also decide at anytime during the interview not to have your blood pressure measured.		
	CIRCLE THE CODE AND SIGN YOUR NAME	GRANTED . . . . . 1 (SIGNATURE OF INTERVIEWER) REFUSED . . . . . 2 (GO TO 102)	
101B	Before measuring I would like to ask a few questions about things that may affect blood pressure. Have you done any of the following within the past 30 minutes: a) Eaten anything? b) Had coffee, tea, cola or other drink that has c) Smoked any tobacco product? d) Conducted any physical activity or excercises that made you breathe harder than usual?	YES NO DK a) EATEN . . . . . 1 2 8 b) CAFFEINE . . . . . 1 2 8 c) SMOKED . . . . . 1 2 8 d) EXCERCISED 1 2 8

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with National Bureau of Statistics / Office of the Chief Government Statistician. We are conducting a survey about health and other topics all over Tanzania. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

Do you have any questions?
May I begin the interview now?

SIGNATURE OF INTERVIEWER _____ DATE _____

RESPONDENT AGREES TO BE INTERVIEWED . . 1 ↓

RESPONDENT DOES NOT AGREE TO BE INTERVIEWED . . 2 → END

SECTION 1. RESPONDENT'S BACKGROUND

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
101	RECORD THE TIME.	HOURS . . . . . ☐☐ MINUTES . . . . . ☐☐	
101A	During the interview I would like to measure your blood pressure to see if you have high blood pressure. If you agree, we will take a measurement three times during the interview. We will use an automated digital device operated by 6 AA-size batteries. The procedure is harmless, but you may feel discomfort while the measuring cuff squeezes your arm. If high blood pressure is not treated, it may eventually cause serious damage to the heart and blood vessels in the brain. You will receive the results of the blood pressure measurement at the end of our interview, with an explanation of the numbers. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. Do you have any questions about the blood pressure measurement so far? If you have any questions about the procedure at any time, please ask me. You can say yes or no to having your blood pressure measured. You can also decide at anytime during the interview not to have your blood pressure measured.		
	CIRCLE THE CODE AND SIGN YOUR NAME	GRANTED . . . . . 1 _____ ← (SIGNATURE OF INTERVIEWER) REFUSED . . . . . 2 ← (GO TO 102)	
101B	Before measuring I would like to ask a few questions about things that may affect blood pressure. Have you done any of the following within the past 30 minutes: a) Eaten anything? b) Had coffee, tea, cola or other drink that has c) Smoked any tobacco product? d) Conducted any physical activity or excercises that made you breathe harder than usual?	YES NO DK a) EATEN . . . . . 1 2 8 b) CAFFEINE . . . . . 1 2 8 c) SMOKED . . . . . 1 2 8 d) EXCERCISED 1 2 8	

SECTION 1. RESPONDENT'S BACKGROUND

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
101C	Now we will measure your blood pressure. BEFORE TAKING THE FIRST BLOOD PRESSURE READING, MEASURE THE CIRCUMFERENCE OF THE RESPONDENT'S ARM MIDWAY BETWEEN THE ELBOW AND THE SHOULDER. RECORD THE MEASUREMENT IN CENTIMETERS.	ARM CIRCUMFERENCE (IN CENTIMETERS) ☐☐	
101D	USE THE ARM CIRCUMFERENCE MEASUREMENT TO SELECT THE APPROPRIATE BLOOD PRESSURE MONITOR MODEL AND CUFF SIZE.	**MODEL 767** SMALL: 16 CM – 23 CM . . . . . 1 MEDIUM: 24 CM – 35 CM . . . . . 2 LARGE: 36 CM – 41 CM . . . . . 3 **MODEL 789** EXTRA LARGE: 42 CM – 60 CM 4	
101E	TAKE THE FIRST BLOOD PRESSURE READING. RECORD THE SYSTOLIC AND THE DIASTOLIC BLOOD PRESSURE. IF YOU ARE UNABLE TO MEASURE THE RESPONDENT'S BLOOD PRESSURE, RECORD THE REASON.	**BLOOD PRESSURE READINGS** SYSTOLIC . . . . . ☐☐☐ DIASTOLIC . . . . . ☐☐☐ TECHNICAL PROBLEMS . . . . . 995 OTHER 996

119	ASK CONSENT FOR MALARIA AND ANEMIA TESTS FROM PARENT/RESPONSIBLE ADULT: As part of this survey, we are asking children all over the country to take a test to see if they have malaria and a test to see if they have anemia. Malaria is a serious illness caused by a parasite transmitted by a mosquito bite. Anemia is a serious health problem that usually results from poor nutrition, malaria and other infections, or chronic disease. This survey will assist the government to develop programs to prevent and treat malaria and anemia. We ask that all children age 6 months through 4 years take part in malaria and anemia testing. The tests require a few drops of blood from a finger or heel. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for malaria and anemia immediately, and the results will be told to you right away. All results will be kept strictly confidential and will not be shared with anyone other than members of our survey team. Do you have any questions? You can say yes or no. It is up to you to decide. Will you allow (NAME OF CHILD) to participate in the malaria and anemia tests?

119	ASK CONSENT FOR MALARIA AND ANEMIA TESTS FROM PARENT/RESPONSIBLE ADULT: As part of this survey, we are asking children all over the country to take a test to see if they have malaria and a test to see if they have anemia. Malaria is a serious illness caused by a parasite transmitted by a mosquito bite. Anemia is a serious health problem that usually results from poor nutrition, malaria and other infections, or chronic disease. This survey will assist the government to develop programs to prevent and treat malaria and anemia. We ask that all children age 6 months through 4 years take part in malaria and anemia testing. The tests require a few drops of blood from a finger or heel. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for malaria and anemia immediately, and the results will be told to you right away. All results will be kept strictly confidential and will not be shared with anyone other than members of our survey team. Do you have any questions? You can say yes or no. It is up to you to decide. Will you allow (NAME OF CHILD) to participate in the malaria and anemia tests?

ADULT RESPONDENT CONSENT FOR ANEMIA TEST

214 ASK CONSENT FOR ANEMIA TEST:

As part of this survey, we are asking people all over the country to take an anemia test. Anemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This survey will assist the government to develop programs to prevent and treat anemia.

For the anemia testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after we take your blood. The blood will be tested for anemia immediately, and the result will be told to you right away. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.

Do you have any questions?
You can say yes or no. It is up to you to decide.
Will you take the anemia test?

215	CIRCLE THE CODE.	GRANTED . . . . . 1 REFUSED . . . . . 2 NOT PRESENT/OTHER 3	→ 217

ADULT RESPONDENT CONSENT FOR URINARY IODINE TEST

217 ASK CONSENT FOR URINE IODINE TESTING:

As part of this survey, we are also asking women all over the country to give urine for iodine deficiency testing. Iodine deficiency is a health problem that usually results from poor nutrition. Urine iodine testing is being done to see how many women are iodine deficient. This survey will assist the government to develop programs to prevent and treat iodine deficiency.

For the iodine test, we need you to collect a small amount of urine. The equipment used to collect and store the urine is clean and completely safe. It has never been used before. No names will be attached to your sample so we will not be able to tell you the test results. No one else will be able to know your test results either. The urine will be tested at the Tanzania Food and Nutrition Center Labaratory.

Do you have any questions?
You can say yes or no. It is up to you to decide.
Will you provide us with a small amount of urine?
