THE EDITORS

Keith Brown was Editor-in-Chief of the second edition of the *Encyclopedia of Language and Linguistics* (Elsevier, 2006). He is now an Associate Lecturer in the Faculty of English at Cambridge. From 2007 he has been President of the Philological Society. From 1990 to 1994 he was President of the Linguistics Association of Great Britain, and he has been a Member of Council of the Philological Society since 1998. He is author of *Linguistics Today* (Fontana, 1984) and co-author, with Jim Miller, of *Syntax: A Linguistic Introduction to Sentence Structure* and *Syntax: Generative Grammar* (Hutchinson, 1981). Keith was joint editor of *Concise Encyclopedia of Linguistic Theories* and *Concise Encyclopedia of Grammatical Categories* (Pergamon Press, 1997 and 1998), *Common Denominators in Art and Science* (Aberdeen University Press, 1983) and *Language, Reasoning and Inference* (Academic Press, 1986).

Sarah Ogilvie, Trinity College, Oxford, is a linguist and lexicographer who specializes in words that enter English from non-European languages. She was Languages of the World section editor of the second edition of the *Encyclopedia of Language and Linguistics* (Elsevier, 2006), a former editor of the *Oxford English Dictionary*, and was Etymologies Editor of the *Shorter Oxford Dictionary* (6th ed., 2007).

INTRODUCTION

In this volume, the world's leading experts describe many of the languages of the world. It is estimated that there are more than 250 established language families in the world, and over 6800 distinct languages, many of which are threatened or endangered. This volume provides the most comprehensive survey available on a large proportion of these. It contains 377 articles on specific languages or language families drawn from the two editions of the *Encyclopedia of Language and Linguistics* (ELL). The articles describe the sounds, meaning, structure, and family relationships of the languages, and have been chosen to illustrate the range and diversity of human language.

The *Concise Encyclopedia of Languages of the World* is unrivalled in its scope and content. We include articles on all the large language families, such as *Austronesian* by Tony Crowley, *Niger-Congo* by John Bendor-Samuel, and *Indo-European* by Neville Collinge; on many smaller families, like the North American *Iroquoian* by Marianne Mithun and *Caddoan* by David Rood; and on many 'language isolates', languages with disputed genetic affiliation to any other language, such as *Burushaski* by Greg Anderson, *Basque* by José Hualde, and *Japanese* by Masayoshi Shibatani. We have included a few languages which are no longer spoken but which have been important for historical linguistics, like *Ancient Egyptian* by John Ray, *Hittite* by J G McQueen, and *Pictish* by William Nicolaisen. There are also articles on pidgins and creoles spoken all over the world, from an article by Suzanne Romaine on *Tok Pisin* in Papua New Guinea to another by Raj Mesthrie on *Fanagalo* in southern Africa; as well as various articles on *Sign languages* by Wendy Sandler, Ulrike Zeshan, and Trevor Johnston respectively.

All the world's major languages are covered with articles on *Chinese* by Yueguo Gu, *Arabic* by Stephan Procházka, *Hindi* by Shaligram Shukla, and *Spanish* by Roger Wright. *English* is thoroughly described with articles on all its periods by Cynthia Allen (*Old English*), Jeremy J Smith (*Middle English*), Helena Raumolin-Brunberg (*Early Modern English*), Joan Beal (*Later Modern English*), Michael Swan (*English in the Present Day*), and Braj Kachru (*World Englishes*). Inevitably some of the languages described in this volume have very small numbers of speakers and hence are in danger of being overwhelmed and lost altogether. Some linguists estimate that as many as 50–80% of the world's languages may be at risk of extinction in the next century. Many communities and linguists around the world are working together to develop innovative ways of passing on their languages to future generations. The article *Endangered Languages* by Lenore Grenoble describes some of the reasons for language loss and proposes practical means of assessing language vitality.

The *Concise Encyclopedia of Languages of the World* is the definitive resource on the languages of the world in one compact volume. Each language article gives a brief description of the language and its speakers, together with any known or hypothesized genetic relationships, and highlights interesting phonological, semantic, and syntactic features. Similarly, the articles on language families outline the membership and distribution of the family and highlight any particular phonological, semantic, or syntactic features common to the family. There is a list of useful references for further reading at the end of each article. The articles are ordered alphabetically by language, so the reader who wishes to see the overall coverage in a particular family or area will find it helpful to consult the subject classification in the front of the volume. Many languages are known in the literature under different names or spellings. Authors have highlighted these differences, and, in some cases, explained why they have chosen one name or spelling over another. For ease of reference, all variant language

names and spellings are listed in the index. Just because a language does not have its own article, does not mean that it is not discussed in another article, so users of this volume are encouraged to work from the index in order to find information on the language they want.

The Notion 'Language'

The identification of different languages is not a straightforward matter. Every language is characterized by variation within the speech community that uses it. If the resulting speech varieties are sufficiently similar as to be considered merely characteristic of a particular geographic region or social grouping they are generally referred to as dialects, so Cockney and Norfolk are usually considered to be dialects of English. Sometimes social, political and historical pressures are such that the varieties are considered to be distinct enough to be treated as separate languages, like *Swedish* and *Norwegian* or *Hindi* and *Urdu*. Often the question of whether two languages are varieties of a single language or distinct languages is much argued over, like *Macedonian* and *Bulgarian*, or *English* and *Scots*. The naming of a language is another point of possible contention. While most linguists estimate around 6800 languages in the world, they also recognise four or five times that number of language names. A particular language may be known by one name to scholarship and another to its speakers; thus the name 'Akan' is not generally used by speakers of the language since Akan speech forms constitute a dialect continuum running from north to south in Ghana and different communities refer to their tongue by different names – *Asante*, *Fante*, *Twi*, *Akuapem*, *Brong*, *Akyem* or *Kwahu*.

Language Classification

Languages can be classified in a number of different ways and for a number of different purposes. The most common classification is 'genetic', which classifies languages into families on the basis of descent from a presumed common ancestor. 'Areal' classification groups languages together either on the basis of structural features shared across language boundaries within a geographical area, or more straightforwardly simply within a geographical area. A 'lexicostatistic' classification uses word comparisons as evidence of language relationships. A 'typological' classification supposes a small set of language types, traditionally word types (isolating, agglutinating, fusional, polysynthetic), to which languages can be assigned.

Genetic classification The article *Classification of Languages* by Barry Blake describes the principles underlying the classification of languages adopted in ELL2 and hence in this work. It is accompanied by a map showing the location of major language groupings worldwide. This approach is one in which languages are classified into families, based on divergence from a presumed common ancestor. Good examples are the *Dravidian languages* of Southern India and *Indo-European*. The Indo-European family includes most of the languages of Europe, Iran, Afghanistan, and the northern part of South Asia. These languages can be shown to descend from a common ancestor, a common protolanguage. There are no records of the ancestral language, but it can be reconstructed from records of daughter languages such as *Sanskrit*, *Ancient Greek*, and *Latin* by using what is known as the 'comparative method'. The method is briefly explained in the article. The comparative method relies on the existence of historical records and while this is possible for Indo-European and Dravidian languages, it is not possible in the same way for other proposed language families – the indigenous languages of the Americas or of Australia for example.

More speculative classifications, far from universally accepted, relate more language families together and hence try to explore language further back in time. These efforts are discussed in Lyle Campbell's article *Long-Range Comparison: Methodological Disputes*. One of the boldest and most controversial is the *Nostratic hypothesis*, which proposes a macrofamily consisting of Indo-European, Semitic, Berber, Kartvelian, Uralic, Altaic, Korean, Japanese, and Dravidian. Similarly ambitious is the proposed *Austro-Tai hypothesis* combining Hmong-Mien (Miao-Yao), the Tai-Kadai (or Daic) family, and Austronesian. The *Austriac hypothesis* extends this proposal to include Austroasiatic.

Areal classification There is a broader and a looser sense in which an areal classification can be useful. The looser sense simply groups languages together regionally. Here genetic affiliations are not firmly established but shared lexicon and similar structural features suggest that the languages in question have been in contact with each other over a long period of time. In the stricter sense, areal linguistics is concerned with the diffusion of structural features across language boundaries within a geographical area. The term 'linguistic area' refers to a geographical area in which, due to borrowing and language contact, languages of a region come to share certain structural features – not just loanwords, but also shared phonological, morphological, syntactic, and other

traits. The central feature of a linguistic area is the existence of structural similarities shared among languages where some of the languages are genetically unrelated, like Turkish and Greek in the Balkans. It is assumed that the reason the languages of the area share these traits is through contact and borrowing. In addition to a general article on *Areal Linguistics* by Lyle Campbell, this volume also includes articles on areas which have been particularly studied from an areal point of view: *Africa as a Linguistic Area* by Bernd Heine; *Balkans as a Linguistic Area* by Victor Friedman; *Ethiopia as a Linguistic Area* by Joachim Crass; *Europe as a Linguistic Area* by Thomas Stolz; *South Asia as a Linguistic Area* by Karen Ebert; *Southeast Asia as a Linguistic Area* by Walter Bisang.

Lexicostatistic classification Word comparisons were thought for a long time to be evidence of language family relationship, but, given a small collection of likely-looking words, it is difficult to determine whether they are really the residue of common origin and not due to chance or some other factor. Lexical comparisons by themselves are seldom convincing without additional support from other criteria. Most scholars require that basic vocabulary be part of the supporting evidence for any distant genetic relationship. Basic vocabulary is generally understood to include terms for body parts, close kinship, frequently encountered aspects of the natural world (mountain, river, cloud), and low numbers. Basic vocabulary is generally resistant to borrowing, so comparisons involving basic vocabulary items are less likely to be due to diffusion and stand a better chance of being inherited from a common ancestor than other kinds of vocabulary. Still, basic vocabulary can also be borrowed – though infrequently – so that its role as a safeguard against borrowing is not foolproof. Lexicostatistics are often used as partial evidence in discussing relationships between Southern American and African languages where there are few historical records: see for example the articles by Constenla Umaña on *Misumalpan* and *Chibchan*, and the article by David Dwyer on *Mande*.

Typological classification At the beginning of the nineteenth century, morphological studies identified a small set of language types related primarily to word structure. The main types were isolating (words are monomorphemic and invariable, as explained in the article on *Chinese as an Isolating Language* by Jerome Packard) agglutinating (words are formed by a root and a clearly detachable sequence of affixes, each of them expressing a separate item of meaning, as exemplified in the article *Finnish as an Agglutinating Language* by Fred Karlsson), fusional (words are formed by a root and (one or more) inflectional affixes, which are employed as a primary means to indicate the grammatical function of the words in the language; see *Italian as a Fusional Language* by Claudio Iacobini) and polysynthetic (the base is the lexical core of the word; it can be followed by a number of postbases e.g. *Central Siberian Yupik as a Polysynthetic Language* by Willem de Reuse). Further types have been added as explained in *Arabic as an Introflexing Language* by Janet Watson. This morphological typology is still of some relevance but with advances in grammatical and semantic description typological classification is nowadays refined. It extends to a range of other linguistic features and to an interest in ‘universal’ linguistic properties. Syntactic features such as word order differences between languages, case marking systems, tense and aspect distinctions, modal markers, for instance evidentiality, and serial verb construction. Phonological features such as consonant types, like ejectives or clicks, vowel or nasal harmony and stressmarking. It also includes discourse phenomena including topic marking, reference chaining, and switch reference. Features like these can be found in the index.

The articles in this volume provide fascinating insights into the structure, history, and development of language families and individual languages. They highlight the diversity of the world’s languages, from the thriving to the endangered and extinct. No other single volume matches the coverage of languages or the authority of the contributors of the *Concise Encyclopedia of Languages of the World*.

Hebrew Union College – Jewish Institute of Religion,
Los Angeles, CA, USA

A Berge

University of Alaska, Fairbanks, AK, USA

J Beswick

University of Southampton, Southampton, UK

P Bhaskararao

Tokyo University of Foreign Studies, Tokyo, Japan

T K Bhatia

Syracuse University, Syracuse, NY, USA

T Biberauer

Newnham College, Cambridge, UK

W Bisang

Johannes Gutenberg University, Mainz, Germany

B J Blake

La Trobe University, Bundoora, VIC, Australia

K M Booker

The University of Kansas, Lawrence, KS, USA

K Börjars

The University of Manchester, Manchester, UK

S Brainard

Summer Institute of Linguistics, Philippines, Manila, Philippines

J O Breedveld

Leiden University, Leiden, The Netherlands

G Breen

Institute for Aboriginal Development, Alice Springs, NT, Australia

G A Broadwell

State University of New York, Albany, NY, USA

J L Brockington

University of Edinburgh, Edinburgh, UK

L Campbell

University of Utah, Salt Lake City, UT, USA

U Canger

University of Copenhagen, Copenhagen, Denmark

S Chaker

INALCO, Paris, France

P Ni Chatháin

University College Dublin, Dublin, Ireland

J Cole

University of Illinois at Urbana-Champaign, Urbana, IL, USA

N E Collinge

Cambridge, UK

B Connell

York University, Toronto, ON, Canada

A Constenla Umaña

University of Costa Rica, San José, Costa Rica

J Crass

Johannes Gutenberg University, Mainz, Germany

J Cremona**T Crowley[†]**

University of Waikato, Hamilton, New Zealand

G Cunningham

University of Oxford, Oxford, UK

G Darms

University of Fribourg, Fribourg, Switzerland

A T de Castilho**W J de Reuse**

University of North Texas, Denton, TX, USA

B Demiraj

University of Munich, Munich, Germany

P Denwood

University of London, London, UK

G Deutscher

Leiden University, Leiden, The Netherlands

G J Dimmendaal

University of Cologne, Cologne, Germany

A Dolgopolsky

University of Haifa, Haifa, Israel

M Donohue

National University of Singapore, Singapore

E Drechsel

University of Hawai'i at Manoa, Honolulu, HI, USA

H Dua

Central Institute of Indian Languages, Mysore, India

J Le Dù

Université de Bretagne Occidentale, Brest, France

M Durrell

University of Manchester, Manchester, UK

P N Dutta Baruah

Central Institute of Indian Languages, Mysore, India

D Dwyer

Michigan State University, East Lansing, MI, USA

K Ebert

University of Zurich, Zurich, Switzerland

J Edmondson

University of Texas at Arlington, Arlington, TX, USA

J F Elwolde

Valladolid, Spain

G Escore

University of Minnesota, Minneapolis, MN, USA

A Esposito

Oxford English Dictionary, Oxford, UK

J Essegbey

University of Florida, Gainesville, FL, USA

N Evans

University of Melbourne, Melbourne, Australia

T Eythórsson

University of Iceland, Reykjavík, Iceland

T T Field

University of Maryland, Baltimore, MD, USA

D W Fleck

La Trobe University, Bundoora, VIC, Australia

M Florey

Monash University, Clayton, VIC, Australia

[†]Deceased.

C Fowler

University of Nevada, Reno, Nevada

V A Friedman

University of Chicago, Chicago, IL, USA

N Gabas Jr

Belém, Brazil

J W Gair

Cornell University, New York, NY, USA

P Geraghty

University of the South Pacific, Suva, Fiji

D Gil

Max Planck Institute for Evolutionary Anthropology,
Leipzig, Germany

C Githiora

University of London, London, UK

C Goddard

University of New England, Armidale, Australia

B Gopinathan Nair

St Xavier's College, Thiruvananthapuram, Kerala State,
India

R G Gordon Jr

SIL International, Dallas, TX, USA

R Graczyk

St. Charles Mission, Pryor, MT, USA

G B Gragg

University of Chicago, Chicago, IL, USA

J H Grayson

University of Sheffield, Sheffield, UK

M L Greenberg

University of Kansas, Lawrence, KS, USA

L Grenoble

Dartmouth College, Hanover, NH, USA

A L Grünberg

St Petersburg Institute of Linguistics, St Petersburg,
Russia

Y Gu

Chinese Academy of Social Sciences, Beijing,
China

W H G Haacke

University of Namibia, Windhoek, Namibia

J A Hackett

Harvard University, Cambridge, MA, USA

E P Hamp

University of Chicago, Chicago, IL, USA

R T Harms**A Harris**

State University of New York, Stony Brook,
NY, USA

J B Haviland

Reed College, Portland, OR, USA

E C Hawkesworth

University College London, London, UK

R J Hayward**B Heine**

Institut für Afrikanistik, Universität zu Köln, Köln,
Germany

B G Hewitt

SOAS, London, UK

J H Hill

University of Arizona, Tucson, AZ, USA

K C Hill

University of Arizona, Tucson, AZ, USA

R Hoogenraad

Alice Springs, NT, Australia

T Hopkins

Florida International University, Miami, FL, USA

J I Hualde

University of Illinois at Urbana-Champaign, Urbana,
IL, USA

T J Hudak

Arizona State University, Tempe, AZ, USA

G Hudson

Michigan State University, East Lansing, MI, USA

M Hutt

University of London, London, UK

C Hyslop

La Trobe University, Bundoora, VIC, Australia

C Iacobini

Università di Salerno, Salerno, Italy

B Ingham

SOAS, London, UK

P J Jaggard

University of London, London, UK

E H Jahr

Agder University, Kristiansand, Norway

L A Janda

University of North Carolina, Chapel Hill, NC, USA

J A Janhunen

University of Helsinki, Helsinki, Finland

D Jauncey

Australian National University, Canberra, Australia

M Job

University of Göttingen, Göttingen, Germany

L Johanson

Johannes Gutenberg University, Mainz, Germany

T Johnston

Macquarie University, Sydney, Australia

M C Jones

University of Cambridge, Cambridge, UK

B D Joseph

Ohio State University, Columbus, OH, USA

B Kachru

University of Illinois at Urbana-Champaign, Urbana, IL, USA

LIST OF ABBREVIATIONS

| | |
|--------|---|
| A | act (in speech act theory); actor (tagmemics); addressee; agent; agentive; argument; author |
| ABESS | abessive |
| ABL | ablative |
| ABS | absolute |
| ACC | accusative |
| ACT | active; actor |
| Ad | adjunct |
| ADESS | adessive |
| ADJ | adjective, -ival |
| AdjP | adjective phrase |
| ADV | adverb(ial) |
| AdvP | adverbial phrase |
| AFF | affective; affix |
| AFFIRM | affirmative |
| AGR | agreement |
| AGT | agent |
| AI | Artificial Intelligence |
| ALL | allative |
| AM | amplitude-modulated (signal) |
| Amer | American |
| AN | adjective precedes noun (in word order typology) |
| ANIM | animate |
| ANN | artificial neural network |
| ANT | anterior |
| ANTI | antipassive |
| AOR | aorist |
| AP | atomic phonology |
| APG | arc pair grammar |
| APPL | applicative |
| ART | article |
| ASCII | American Standard Code for Information Interchange |
| ASL | American Sign Language |
| ASP | aspect(ual) |
| ASR | automatic speech recognition |
| ASSOC | associative |
| ATN | augmented transition network |
| ATR | advanced tongue root (distinctive feature) |
| ATTR | attribute |

| | |
|--------------|--|
| Ausian | Australian Sign Language |
| AUX | auxiliary |
| <i>b.</i> | born |
| BASIC | Basic All-purpose Symbolic Instruction Code |
| BEN | benefactive |
| BEV | Black English Vernacular |
| BNC | British National Corpus |
| BSE | base-form |
| BSL | British Sign Language |
| C | clause; coda (of syllable); codomain (set theory); complement(izer); consonant |
| c-command | constituent command |
| c-structure | constituent structure |
| CA | componential analysis; contrastive analysis; conversation analysis |
| CALL | computer assisted language learning |
| CAP | control agreement principle |
| CAT | category; computer-assisted translation |
| CAUS | causative |
| CCG | combinatory categorial grammar |
| CD | communicative dynamism; conceptual dependency |
| CF | characteristic frequency; constant frequency |
| CFG | context-free grammar |
| CFL | context-free language |
| CFPSG | context-free phrase structure grammar |
| CG | categorial grammar |
| CL | computational linguistics |
| CLASS | classifier |
| CN | common noun |
| COLL | collective |
| COM | comitative |
| COMP | comparative; complement(izer) |
| CONJ | conjunction/conjugation |
| CONS | consonantal |
| CONT | continuant; continuative |
| COP | copula |
| COR | coronal |
| CP | complement(izer) phrase |
| cps | cycles per second |
| CS | context-sensitive |
| CSG | context-sensitive grammar |
| CV | consonant vowel structure/sequence |
| CV phonology | skeletal phonology |
| D-structure | deep structure |
| <i>d.</i> | died |
| DA | discourse analysis |
| DAF | delayed auditory feedback |
| DAG | directed acyclic graph |
| DAT | dative |
| DCG | definite clause grammar |
| DD | discourse domain |
| DDG | daughter dependency grammar |
| DECL | declarative |
| DEF | definite |
| DEM | demonstrative |
| DESID | desiderative |
| DEST | destinative |

| | |
|----------------|--|
| DET | determiner |
| DG | dependency grammar |
| DIM | diminutive |
| DIR | direction(al) |
| DIST | distributive |
| DM | discourse marker |
| DO | direct object |
| dp | determiner phrase |
| DRS | discourse representation structure |
| DRT | discourse representation theory |
| DS | deep structure; direct speech |
| DTR | daughter (in HPSG) |
| DU | dual |
| DYN | dynamic |
| EA | error analysis |
| EAP | English for academic purposes |
| ECM | exceptional case marking |
| ECP | empty category principle |
| EEG | electroencephalography |
| EFL | English as a foreign language |
| EL | elative |
| ELT | English Language Teaching |
| EMG | electromyograph(y) |
| EMPH | emphatic |
| ENCL | enclitic |
| Eng | English |
| equi | equi NP deletion (= identity erasure transformation) |
| ERG | ergative |
| ESL | English as a second language |
| ESP | English for Specific/Special Purposes |
| ESS | essive |
| EST | Extended Standard Theory |
| etym | etymology |
| EXCL | exclusive |
| EXIST | existential |
| EXP | experiencer |
| F | false (in truth table); formant |
| f-structure | functional structure |
| F ₀ | fundamental frequency |
| F ₁ | first formant |
| F ₂ | second formant |
| F ₃ | third formant |
| FACT | factive |
| FDS | free direct speech |
| FEM | feminine |
| FFP | foot feature principle |
| FG | functional grammar |
| fig. | figure |
| FIN | finite |
| FIS | free indirect speech |
| ff. | <i>foruit, flourished</i> , lived |
| FLA | first language acquisition |
| FM | frequency modulation |
| FSP | functional sentence perspective |
| FSTN | finite state transition network |

| | |
|--------------|--|
| FUT | future |
| FUG | functional unification grammar |
| GB | government and binding (theory) |
| GB-phonology | government-based phonology |
| GEN | gender; genitive |
| GER | gerund |
| GN | genitive precedes noun (in word order typology) |
| GPSG | generalized phrase structure grammar |
| GR | grammatical relation |
| GS | generative semantics |
| H | head (of construction); hearer/reader; high/superposed (code/variety, in adiglossic situation); high (pitch/tone) |
| HABIT | habitual |
| HCI | human-computer interaction |
| HFC | head feature convention |
| HFP | head feature principle |
| HG | head grammar |
| HON | honorific |
| HPSG | head-driven phrase structure grammar |
| HUM | human |
| HYPOTH | hypothetical |
| Hz | hertz |
| IA | Item-and-Arrangement [model of grammatical description] |
| IC | immediate constituent |
| I-E | Indo-European |
| IELTS | [British Council] International English Language Testing System |
| iff | if and only if |
| IGNOR | ignorative |
| IL | interlanguage |
| ILL | illative |
| IMP | imperative |
| IMPERSONAL | impersonal |
| IMPERF | Imperfect(ive) |
| INAN | Inanimate |
| INCL | Including; inclusive |
| INCORP | Incorporating |
| INDEF | Indefinite |
| INDIC | Indicative |
| INF | infinitival; infinitive |
| INFL | Inflection |
| INSTR | Instrumental |
| INTERJ | Integration |
| INTERROG | interrogative |
| INTRANS | Intransitive |
| IO | indirect object |
| IP | inflection phrase; Item-and-process [model of grammatical description] |
| IPA | International Phonetic Alphabet |
| IR | inflectional rule; internal reconstruction |
| IRR | irrealis |
| IRREG | irregular |
| IS | indirect speech |
| ISA | subsumption/subclass 'is a' |
| IT | Information Technology |
| ITER | iterative |

| | |
|-------|--|
| K | set of situations (in speech act theory) |
| kHz | kilohertz |
| KWIC | keyword in context |
| L | language; low (pitch/tone); low/vernacular variety [in diglossia] |
| L1 | first language |
| L2 | second or foreign language |
| LAB | labial |
| LAD | language acquisition device |
| LARSP | language assessment, remediation, and screening procedure |
| LAT | lateral |
| LEX | lexicality (in HPSG) |
| LF | lexical function; logical form |
| LFG | Lexical Functional Grammar |
| lit. | literally |
| LMC | lower middle class |
| LOC | local; locative; locus |
| LP | language planning; linear precedence [statements]; linear prediction |
| LSP | language for special/specific purposes |
| LTAG | lexicalized tree adjoining grammar |
| LU | lexical unit |
| M | mid [tone]; Middle (in language names); modal |
| MASC | masculine |
| Mb | megabyte |
| MDS | multidimensional scaling |
| MG | Montague Grammar |
| MLAT | Modern Language Aptitude Test |
| MLU | mean length of utterance |
| MMC | middle-middle class |
| Mod | modern |
| MOD | modifier |
| MRI | magnetic resonance imaging |
| MT | mother tongue; machine translation |
| N | new (speaker); noun; nucleus (of syllable) |
| n.d. | no date |
| n.s. | new series |
| NA | noun precedes adjective (in word order typology) |
| NAS | nasal |
| NEG | negation; negative |
| NEUT | neuter |
| NG | noun precedes genitive (in word order typology) |
| NL | native language; natural language |
| NLG | natural language generation |
| NLP | natural language processing |
| NLU | natural language understanding |
| NMR | nuclear magnetic resonance |
| NN | neural net(work) |
| NNS | nonnative speaker |
| NOM | nominative; nominal(ization) |
| NP | noun phrase |
| NPrel | relative noun phrase |
| NRel | noun precedes relative clause (in word order typology) |
| NS | native speaker |
| nt | nonterminal |
| NT | New Testament |

| | |
|------------|--|
| NUM | number |
| NVC | non-verbal communication |
| O | onset (of syllable) |
| OBJ | object |
| OBL | oblique |
| OBS | obstruent |
| obs. | obsolete |
| OCR | optical character recognition |
| <i>OED</i> | <i>Oxford English Dictionary</i> |
| OOP | object-oriented programming |
| OPT | optative |
| OSV | object-subject-verb (in word order typology) |
| OT | Old Testament; Optimality Theory |
| OV | object precedes verb (in word order typology) |
| OVS | object-verb-subject (in word order typology) |
| P | phrase; predicate |
| PA | pushdown automation |
| PART | participle; particle; partitive |
| PASS | passive |
| PAT | patient |
| PERF | perfect(ive) |
| PERS | person(al) |
| PET | positron-emission tomography |
| PF | phonetic form (in principles and parameters framework) |
| PHON | phonology |
| PIE | Primitive Indo-European; Proto-Indo-European |
| PL | plural |
| PM | phrase marker |
| Po | postposition |
| PO | primary object |
| POL | polite |
| POSS | possessive; possessor |
| POTEN | potential |
| PP | prepositional phrase |
| PP | past participle |
| PLUPERF | pluperfect |
| PRED | predicative |
| PREF | prefix |
| PREP | preposition |
| PRES | present |
| PRO | an unspecified NP |
| PRO | pronominal element; pronoun |
| PROG | progressive |
| ProgP | progressive phrase |
| PROHIB | prohibitive |
| PRESP | present participle |
| PS-rule | phrase structure rule |
| PSG | Phrase Structure Grammar |
| PTQ | [the] proper treatment of quantification [in English] (Montague grammar) |
| PURP | purpose; purposive |
| Q | question |
| QR | quantifier raising |
| QUANT | quantifier |
| QU | <i>wh</i> -marking |

| | |
|--------------|--|
| R-expression | referential/referring expression |
| R-graph | relational graph (in arc pair grammar) |
| RC | relative clause |
| RECIP | recipient/reciprocal |
| REFL | reflexive |
| reg | regular |
| ReIN | relative clause precedes noun (in sword order typology) |
| REP | repetitive |
| RES | resumptive/result |
| REST | Revised Extended Standard Theory |
| rev. | revised |
| RG | Relational Grammar |
| RNR | right node raising |
| RP | received pronunciation |
| RR | readjustment rule; redundancy rule |
| RST | Rhetorical Structure Theory |
| RT | reaction time; RTN recursive transition network |
| S | point of speech (temporal logic); sentence; sign (sign language); source; speaker; speaker/writer; standard (speaker); strong (syllable); subject (tagmemics); subject term (or conclusion in a syllogism) |
| S-structure | surface structure |
| SAE | Standard American English; standard average European OVhorO |
| SC | small clause; structural change |
| SD | structural description |
| SEM | semantics |
| SGML | standard generalized markup language |
| SIB | sibilant |
| sing | singular |
| SL | source language |
| SLA | second language acquisition |
| SLASH | unbounded dependency (in HPSG) |
| SON | sonorant |
| SOV | subject-object-verb (in word order typology) |
| SPEC | specifier |
| SS | surface structure |
| SSC | specified subject condition |
| Sta | statement |
| STAT | static |
| STRID | strident |
| SUBCAT | subcategorization |
| SUBJ | subject; subjunctive |
| SUBJUNC | subjunctive |
| SUBORD | subordinate, subordinative |
| SUF | suffix |
| SUP | supine |
| SUPERESS | superessive |
| SV | subject precedes verb (in word order typology) |
| SVO | subject-verb-object (in word order typology) |
| SYLL | syllabic; syllable |
| SYN | synonym; syntax |
| T | tense; text; time; transformation; tree; true (in truth table); tu (= familiar pronoun of address) |
| T | trace |
| T-rule | transformational rule |
| TAG | Tree-Adjoining Grammar |

| | |
|----------|--|
| TAL | tree-adjoining language |
| TBU | tone-bearing unit |
| TC | total communication [approach] (in schools for the deaf) |
| TEFL | Teaching English as a foreign language |
| TEMP | temporal |
| TERM | terminative |
| TESOL | Teaching of English to Speakers of Other Languages |
| TG | Transformational Grammar |
| TGG | Transformational Generative Grammar |
| TL | target language |
| TNS | tense |
| TOEFL | Test of English as a Foreign Language |
| TOP | topic(alization) |
| TRANS | transitive |
| TRANSLV | translative |
| TYP | type |
| U | utterance |
| UCG | Unification Categorical Grammar |
| UG | Universal Grammar |
| UMC | upper middle class |
| V | verb(al); vowel; “our (= polite pronoun of address) |
| V | short vowel |
| V | long vowel |
| V-form | honorific form (of address) |
| VFORM | verb form |
| VIS | visual |
| VLSI | very large scale integration |
| VN | verbal noun |
| VO | verb precedes object (in word order typology) |
| VOC | vocalic |
| VOS | verb-object-subject (in word order typology) |
| VOT | voice onset time |
| VP | verb phrase |
| VS | verb precedes subject (in word order typology) |
| VSO | verb-subject-object (in word order typology) |
| W | weak (syllable) |
| WF | word formation |
| WFF | well-formed formula |
| WG | word grammar |
| WH-word | question word (<i>what, which</i> , etc.) |

Abkhaz

B G Hewitt, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

The Abkhaz language (/ [a.]'aps.(wa bəz.'i)f^wa/) belongs to the North West Caucasian family (*see Caucasian Languages*). Abkhazians traditionally occupied the triangle framed in northwestern Transcaucasia between the Black Sea, the Greater Caucasus, and the river Ingur; the river Psou is now the northern frontier. This territory comprises the Republic of Abkhazia (/a.ps.'nə/, capital Aq^w'a, aka Sukhum), *de facto* independent since the war with Georgia (1992–1993) but in international law, deemed to be part of Georgia still. For most of the Soviet period it was an autonomous republic.

A wave of migrants out of Abkhazia after the Mongol incursions (14th century) removed the most divergent dialect, T'ap'anta, to the northern Caucasus (Karachay-Cherkessia). Consolidated there by Ashkharywa dialect speakers (17th and 18th centuries), today's Abaza population descended from them. Following Russia's conquest of the northwest Caucasus in 1864, most North West Caucasian speakers (including the now extinct Ubykhs) migrated to Ottoman lands, where the diaspora-communities (predominantly in Turkey) vastly outnumber the homelander; even so, the surviving languages are endangered in all locations. The dialects of Sadz, Akhch'ypsy, and Ts'abal are no longer attested in Abkhazia; only northern Bzyp and southern Abzhywa remain. Of the 102 938 Soviet Abkhazians recorded in 1989, 93 267 resided in Abkhazia, constituting 17.8% of the population. The single largest ethnic group in Abkhazia in 1989 were the Mingrelians; Abazas totalled 33 801. Though 93.3% of Abkhazians claimed fluency in Abkhaz, younger generations tend to use Russian (or Turkish).

The 17th-century, half-Abkhazian traveller Evliya Çelebi provided the first linguistic evidence. P. Uslar produced the first grammar (1862–1863), devising a Cyrillic-based script. An adaptation of this alphabet served the Abkhazians when the Soviets assigned them literary status (1921), though two different

roman orthographies were tried during the infant USSR's *latinizatsija*-drive. A Georgian orthography was imposed in 1938 and replaced by another Cyrillic alphabet in 1954. This one is still used, albeit with a recent reform to regularize labialization-marking. Abaza acquired literary status only in 1932; the Abkhaz and Abaza Cyrillic scripts diverge markedly.

A comprehensive list of phonemes appears in **Table 1**.

Certain idiolects have /f/ only in /a.'f'a/ 'thin' (otherwise /a.'p'a/). Bzyp boasts 67 phonemes by adding /f̥ d̥z̥ f̥z̥' z̥' z̥^w z̥^w/ to the alveolo-palatals and /χ̣ χ̣^w/ to the back fricatives. A glottal stop, apart from possibly realizing intervocalic /q'/, is also heard in /ʔaj/ 'no' (cf., /a:j/ 'yes'). Open vowel /a/ contrasts with close /ə/; /a:/ might also be phonemic. Stress is distinctive.

Abkhaz(-Abaza) is unique among Caucasian languages in not employing case-markers for the verb's major arguments, relying purely on pronominal crossreferencing within the polysynthetic verb; this patterning with three sets of affixes confirms the family's ergative nature. Some preverbs distinguish directionality via an a-grade (essive/illative/allative)

been little detailed research. This is particularly true of the Adamawa languages. Knowledge of many of them is very sketchy.

Classification

The languages fall into two main groups – Adamawa and Ubangi. The Adamawa languages are found in northern Nigeria, Cameroon, and Chad, whereas the Ubangi languages are spoken in CAR, northern Zaire, and southwestern Sudan.

The Adamawa languages are divided into 16 groups: Waja (at least 6 languages), Leko (4 languages), Duru (18 languages), Mumuye (9 languages), Mbum (7 languages), Yungur (5 languages), Kam, Jen (2 languages), Longuda, Fali, Nimbari, Bua (9 languages), Kim, Day, Burak (6 languages), and Kwa.

Lexicostatistic studies show that the relationship among the groups is loose, but some of them can be grouped together so that two or perhaps three clusters emerge. The Leko, Duru, Mumuye, and Nimbari groups form a core of closely related languages. Another cluster comprises Mbum, Bua, Kim, and Day. Possibly a third cluster of Waja, Longuda, Yungur, and Jen can be formed.

The Ubangi languages show a much closer relationship to each other than do the Adamawa languages, and they fall into six main groups: Gbaya (4 languages), Banda, Ngbandi, Sere (6 languages), Ngbaka-Mba (9 languages), and Zande (5 languages).

Structural Features

Phonetics and Phonology

In Adamawa languages the set of initial consonants is much larger than the set of noninitial consonants,

whereas in Ubangi languages there is little difference in size between the two sets of consonants. Most languages have either a five- or seven-vowel system. Two, three, or four contrastive tones are found. Downstep is not common.

Grammar and Syntax

Noun class systems are not universal and are found mainly in the Adamawa languages. Some only comprise paired singular and plural suffixes without concord markers.

Verb systems usually contrast perfective and imperfective forms. Verbal extensions mark iteration, intensive, benefactive, and causative. Generally, inflectional morphemes are prefixed, and derivational morphemes are suffixed.

The predominant sentence word order is SVO. Negative markers occur clause final, and interrogative markers and words occur sentence final.

Africa as a Linguistic Area

B Heine, Institut für Afrikanistik, Universität zu Köln, Köln, Germany

On Linguistic Areas

A number of different definitions of linguistic areas have been proposed; what is common to most of them are the following characteristics:

1. There are a number of languages spoken in one and the same general area.

2. The languages share a set of linguistic features whose presence can be explained with reference to neither genetic relationship, drift, universal constraints on language structure or language development, nor to chance.
3. This set of features is not found in languages outside the area.
4. On account of (2), the presence of these features must be the result of language contact.

Among the linguistic areas (or Sprachbunds) that have been proposed, perhaps the most widely

recognized are the Balkans and Meso-America. The African continent has been said to form a linguistic area, but so far there is no conclusive evidence to substantiate this statement.

Earlier Work

While there were a number of studies on areal relationship in Africa in the earlier history of African linguistics, Greenberg (1959) constitutes the first substantial contribution to this field. In an attempt to isolate areal patterns both within Africa and separating Africa from other regions of the world, he proposed a number of what he called ‘special’ features of African languages. The properties listed by Greenberg include in particular a number of lexical polysemies, such as the use of the same term for ‘meat’ and ‘(wild) animal,’ the use of the same term for ‘eat,’ ‘conquer,’ ‘capture a piece in a game,’ and ‘have sexual intercourse,’ and the use of a noun for ‘child’ as a diminutive or of ‘child of tree’ to denote ‘fruit of tree.’ Another noteworthy contribution to areal relationship within Africa appeared in 1959: Larochette (1959) presented a catalog of linguistic properties characteristic of Congolese Bantu (Kikongo [Kituba], Luba, and Mongo [Mongonkundu]), an Ubangi language (Zande), and a Central Sudanic language (Mangbetu), but many of the properties proposed by him can also be found in other regions and genetic groupings of Africa. A catalog of properties characterizing African languages was also proposed by Welmers (1974) and Gregersen (1977). Building on the work of Greenberg (1959) and Larochette (1959), Meeussen (1975) proposed an impressive list of what he called ‘Africanisms,’ that is, phonological, morphological, syntactic, and lexical properties widely found in African languages across genetic boundaries.

Another seminal publication on areal relationship was published by Greenberg in 1983. Noting that there are no areal characteristics found everywhere in Africa but nowhere else, he proceeded to define areal properties “as those which are either exclusive to Africa, though not found everywhere within it, or those which are especially common in Africa although not confined to that continent” (1983: 3). As an example of the former, he mentioned clicks; as instances of the latter, he discussed in some detail the following four properties: (1) coarticulated labiovelar stops, (2) labiodental flaps, (3) the use of a verb meaning ‘to surpass’ to express comparison, and (4) a single term meaning both ‘meat’ and ‘(wild) animal.’ He demonstrated that these four properties occur across genetic boundaries and, hence, are

suggestive of being Pan-African traits, especially since they are rarely found outside Africa.

Greenberg (1983) went on to reconstruct the history of these properties by studying their genetic distribution. He hypothesized that (1), (3), and (4) are ultimately of Niger-Kordofanian origin, even though they are widely found in other African families, in particular in Nilo-Saharan languages. For (2), however, he did not find conclusive evidence for reconstruction, suggesting that it may not have had a single origin but rather that it arose in the area of the Central Sudanic languages of Nilo-Saharan and the Adamawa-Ubangi languages of Niger-Congo.

Search for areal properties across Africa is associated not the least with creole linguistics. In an attempt to establish whether, or to what extent, the European-based pidgins and creoles on both sides of the Atlantic Ocean have been shaped by African languages, students of creoles pointed out a number of properties that are of wider distribution in Africa, perhaps the most detailed study being Gilman (1986).

Pan-African Properties

The term ‘Pan-African properties’ refers to linguistic properties that are (1) common in Africa but clearly less common elsewhere, (2) found at least to some extent in all major geographical regions of Africa south of the Sahara, and (3) found in two or more of the four African language families. The following catalog of selected properties is based on previous work on this subject (especially Greenberg, 1959, 1983; Larochette, 1959; Meeussen, 1975; Gilman, 1986).

A general phonological property that has been pointed out by a number of students of African languages is the preponderance of open syllables and an avoidance of consonant clusters and diphthongs. Furthermore, tone as a distinctive unit is characteristic of the majority of African languages, in most cases on both the lexical and grammatical levels.

Ignoring click consonants, which are restricted to southern Africa and three languages in East Africa (Sandawe, Hadza, and Dahalo), there are a number of consonant types that are widespread in Africa but uncommon elsewhere. This applies among others to coarticulated labiovelar stops, (especially *kp* and *gb*), which occur mainly in a broad geographical belt from the western Atlantic to the Nile-Congo divide. Perhaps even more characteristic are labiodental flaps, produced by the lower lip striking the upper teeth; although restricted to relatively few languages, they are found in all families except Khoisaan. A third type of consonants that is widespread in Africa but

rarely found outside Africa can be seen in voiced implosive stops.

In their arrangement of words, African languages of all four families exhibit a number of general characteristics such as the following: While on a worldwide level languages having a verb-final syntax (SOV) appear to be the most numerous, in Africa there is a preponderance of languages having subject-verb-object (SVO) as their basic order: Roughly 71% of all African languages exhibit this order. Furthermore, the placement of nominal modifiers after the head noun appears to be more widespread in Africa than in most other parts of the world. Thus, in Heine's (1976: 23) sample of 300 African languages, demonstrative attributes are placed after the noun in 85%, adjectives in 88%, and numerals in 91% of all languages.

Logophoric marking appears to constitute a specifically African construction type. Logophoric pronouns indicate coreference of a nominal in the nondirect quote to the speaker encoded in the accompanying quotative construction, as opposed to its noncoreference indicated by an unmarked pronominal device (concerning the areal distribution of these pronouns, see Güldemann, 2003).

Perhaps the most conspicuous area where one might expect to find Pan-African properties can be seen in lexical and grammatical polysemies. A number of examples of polysemy, such as 'meat'/animal, 'eat'/conquer, and so on, were mentioned earlier. Furthermore, there are some grammaticalization processes that are common in Africa but rare elsewhere, examples being the grammaticalization of body parts for 'stomach/belly' to spatial concepts for 'in(side),' or of verbs meaning 'surpass,' 'defeat,' or 'pass' to a standard marker of comparison (Heine, 1997: 126–129).

Quantitative Evidence

Being aware that for many of the Pan-African properties that have been discussed in the relevant literature there is only sketchy cross-linguistic information, Heine and Zelealem (2003) use a quantitative approach to determine whether Africa can be defined as a linguistic area. For each of the 149 languages of their sample, of which 99 are African languages and 50 are languages from other continents, they apply 11 criteria that have figured in previous discussions on the areal status of African languages. The criteria and main results of their African survey are listed in Table 1, and those of their worldwide sample in Table 2. What Table 2 suggests is the following:

Table 1 Relative frequency of occurrence of 11 typological properties in African languages^a

| <i>Properties used as criteria</i> | <i>Number of languages having that property</i> | <i>Percentage of all languages</i> |
|--|---|------------------------------------|
| 1. Labiovelar stops | 39 | 39.4 |
| 2. Implosive stops | 36 | 36.4 |
| 3. Lexical and/or grammatical tones | 80 | 80.8 |
| 4. ATR-based vowel harmony | 39 | 39.4 |
| 5. Verbal derivational suffixes (passive, causative, benefactive, etc.) | 76 | 76.7 |
| 6. Nominal modifiers follow the noun | 89 | 89.9 |
| 7. Semantic polysemy 'drink/pull, smoke' | 74 | 74.7 |
| 8. Semantic polysemy 'hear/see, understand' | 72 | 72.7 |
| 9. Semantic polysemy 'animal, meat' | 40 | 40.4 |
| 10. Comparative constructions based on the schema [X is big defeats/surpasses/ passes Y] | 82 | 82.8 |
| 11. Noun 'child' used productively to express diminutive meaning | 50 | 50.5 |

^aSample: 99 languages. Parameters 3, 7, and 8 have two options; if one of the options applies, this is taken as positive evidence that the relevant property is present.

Table 2 Distribution of 11 typological properties according to major world regions^a

| <i>Region</i> | <i>Total of languages</i> | <i>Total of properties</i> | <i>Average number of properties per language</i> |
|------------------------|---------------------------|----------------------------|--|
| Europe | 10 | 11 | 1.1 |
| Asia | 8 | 21 | 2.6 |
| Australia/ Oceania | 12 | 37 | 3.0 |
| The Americas | 14 | 48 | 3.4 |
| Africa | 99 | 669 | 6.8 |
| Pidgins and creoles | 6 | 14 | 2.3 |
| <i>All regions</i> | <i>149</i> | | |

^aSample: 99 African and 50 non-African languages.

1. Africa clearly stands out against other regions of the world in having on average 6.8 of the 11 properties, while in other regions clearly lower figures are found.

2. Outside Africa, no language has been found to have as many as five properties, while African languages have between 5 and 10 properties.

Isopleth Mapping

To study the internal structure of linguistic areas, isopleth mapping has been employed in linguistic areas such as South Asia (Masica, 1976), the Balkans (van der Auwera, 1998), and Meso-America (van der Auwera, 1998). Isopleth maps are designed on the basis of the relative number of features that languages of a linguistic area share: languages having the same number of properties, irrespective of which these properties are, are assigned to the same isopleth and, depending on how many properties are found in a given language, the relative position of that language within the linguistic area can be determined.

Applying isopleth mapping to Africa yields the following results: The most inclusive languages, having nine or more properties, are found in West Africa, including both Niger-Congo and Afro-Asiatic languages. A secondary isopleth center is found in the Cameroon–Central Africa area, where up to nine

properties are found. Clearly less central are languages farther to the west and south, that is, Atlantic and Mande languages on the one hand, and Bantu languages on the other, where around six properties are found. Peripheral Africa consists of the Ethiopian Highlands (*see Ethiopia as a Linguistic Area*) and northern (Berber) Africa, where less than five properties are found. **Figure 1** is based on an attempt to reduce the complex quantitative data to an isopleth map.

Conclusion

While there is no linguistic property that is common to all of the 2000-plus African languages, it seems possible on the basis of the quantitative data presented to define Africa as a linguistic area: African languages exhibit significantly more of the 11 properties listed in **Table 1** than non-African languages do, and it is possible to predict with a high degree of probability that if there is some language that possesses more than five of these 11 properties, then this must be an African language. Not all of the properties, however, are characteristic of Africa only; some are equally common in other parts of the world.

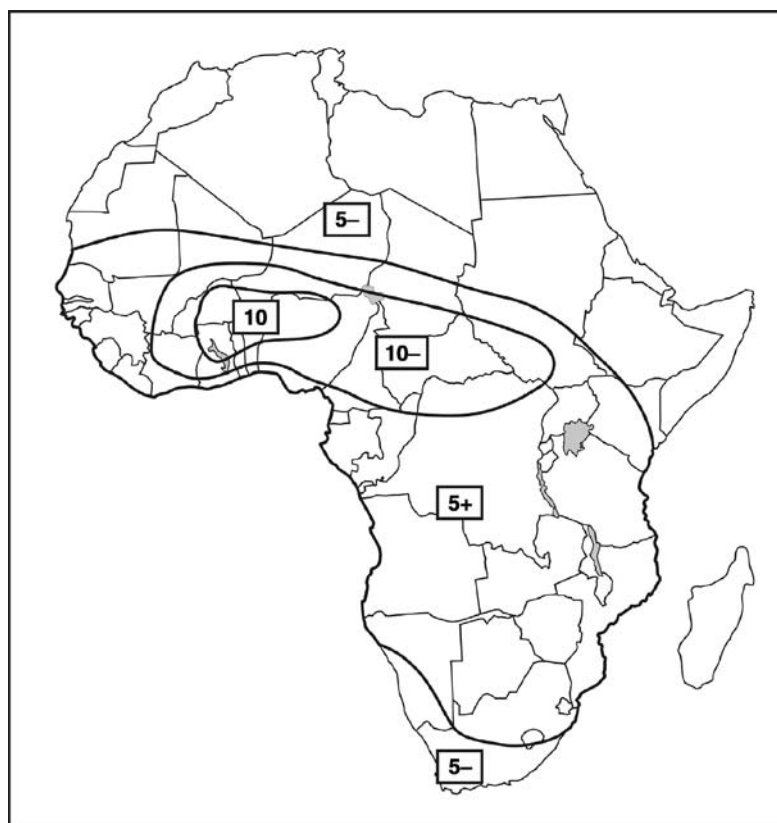

Figure 1 An isopleth sketch map of Africa based on 11 properties (sample: 99 languages).

Afrikaans

T Biberauer, Newnham College, Cambridge, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Afrikaans is the youngest fully standardized member of the West Germanic branch of the Indo-European language family. A daughter of Dutch (*Afrikaans* = the Dutch adjective meaning 'African'), it is primarily spoken in South Africa, where it is one of 11 official languages. Currently, it boasts the third largest speaker population, with only Zulu and Xhosa being more widely spoken (1996 Census). Afrikaans

also represents a minority language in Namibia and, increasingly, in expatriate communities, notably in Britain, Australia, New Zealand, and Canada.

History

The precise circumstances surrounding the development of Afrikaans as a language in its own right have been energetically disputed. What is uncontroversial is that the Dutch East India Company's establishment of a refreshment station in 1652 led to the introduction of various varieties of 17th-century Dutch at the Cape. During the next 150 years, these Dutch speakers

came into contact with indigenous Khoekhoe, with slaves imported from Asia (India, Indonesia, Sri Lanka), East Africa, and Madagascar, and also, more sporadically, with French- and German-speaking Europeans. Written records reveal that a distinctive local variety of Dutch – so-called Kaaps Hollands (Cape Dutch), which was also variously described at the time as *geradbraakte/gebroke/onbeskaafde Hollands* (‘mutilated/broken/uncivilized Hollandic’), *verkeerde Nederlands* (‘incorrect Dutch’) and *kom-buistaal* (‘kitchen language’) – already existed by the mid-18th century. There are three main positions on how this extraterritorial variety became a distinct, structurally simplified and reorganized language: the superstratist, variationist/interlectalist, and creolist positions. On the superstratist view, Afrikaans is essentially the product of the normal linguistic evolution that typically occurs in the absence of strong normative pressures, with the influence of Khoekhoe and the slave languages (i.e., Malay and Creole Portuguese) being confined to the lexical domain (see below). The variationist/interlectalist position similarly downplays the role of the non-Germanic languages interfacing with Dutch at the Cape, identifying dialect-leveling/convergence as the impetus behind the emergence of a new Dutch-based language. By contrast, the creolist view analyses Afrikaans as a semicreole, the product of interaction between the ‘creolizing’ and ‘decreolizing’ influences of the multilectal Cape Dutch(es) and the Dutch-based pidgin(s) spoken respectively by the Cape’s European and non-European populations. Exactly when Afrikaans was ‘born’ is also disputed, but official recognition of its distinctness came in 1925 when it was finally standardized following two *Taalbewegings* (‘language movements’) and recognized, alongside English, as one of South Africa’s two official languages. The Bible was translated into Afrikaans in 1933 and a rich literary and cultural heritage accrued during the 20th century, with two major annual arts festivals now being dedicated solely to Afrikaans (the Klein Karoo Kunstefees/‘Little Karoo Arts Festival’ and Aardklop/‘Earth-beat’). Because of its unfortunate association with the apartheid policy pursued between 1948 and 1994, there are, however, concerns about Afrikaans’s future in post-apartheid South Africa and there has, in recent years, been a move to promote it as the only South African language which is both European *and* African.

Varieties of Afrikaans

The three basic varieties of Afrikaans traditionally identified are Kaapse Afrikaans (Cape Afrikaans) spoken in the western Cape, Oranjerivier–Afrikaans (Orange River Afrikaans) spoken in the northwestern

Cape, and Oosgrens–Afrikaans (Eastern Cape Afrikaans), the variety that provided the basis for standard Afrikaans, spoken in the rest of the country (see **Figure 1**). Kaapse and Oranjerivier Afrikaans are both spoken by people of color, the former reflecting particularly strong Malay and English influences, and the latter, that of Khoekhoe. Various subvarieties are discernible within these regional boundaries, one example being the Arabic-influenced Afrikaans spoken by Cape Muslims. Additionally, Afrikaans also forms the basis of a number of special group languages. Of these, Bantu-influenced Flaaitaal (‘Fly-language’), a township argot spoken mostly by black migratory workers in urban areas, represents the best-studied case. During the apartheid era, normative pressures promoting *suiwer Afrikaans* (‘pure Afrikaans’) were strong and often directed against Anglicisms. Socio-political changes and attempts to promote Afrikaans as more ‘inclusive’ have, however, led to a more relaxed attitude in many contexts, with many younger speakers frequently speaking and writing Afrikaans, which is lexically heavily influenced by South Africa’s other languages, particularly English. In its turn, Afrikaans has also left its mark on the other languages spoken in South Africa, with South African English featuring lexical items such as *braai* (‘barbecue’), *veld* (‘bush’), and *stoep* (‘verandah’); Xhosa with *ispeki* (> *spek* = ‘bacon’), *isitulu* (> *stoel* = ‘chair’), and *ibhulukhwe* (> *broek* = ‘trousers’); and Sotho, with *potloto* (> *potlood* = ‘pencil’), *kerese* (> *kers* = ‘candle’), and *sekotelopulugu* (> *skottelploeg* = ‘disc-plough’).

Formal Features

Many aspects of Afrikaans’s formal structure represent simplifications of their Dutch counterparts, but the language also features a number of structural innovations. Phonologically, striking differences between Afrikaans and Dutch are that Afrikaans features:

- apocope of /t/ after voiceless consonants – cf. Afrikaans *lig* (‘light’) and *nag* (‘night’) versus Dutch *licht* and *nacht*
- syncope of intervocalic /d/ and /g/ – cf. Afrikaans *skouer* (‘shoulder’) and *spieël* (‘mirror’) versus Dutch *schouder* and *spiegel*
- fricative devoicing – cf. Afrikaans *suid* (‘south’) versus Dutch *zuid*
- diphthongization of long vowels – cf. Afrikaans [bruət] versus Dutch [bro:t] for *brood* (‘bread’).

There are also consistent orthographic differences, with Dutch *ij* and *sch* being rendered in Afrikaans as *y* and *sk*, respectively.

Morphologically, Afrikaans is characterized by extreme deflection: it lacks both Dutch’s gender system

Figure 1 Map of South Africa showing the nine provinces created in 1994 and the areas in which the three main regional varieties of Afrikaans are spoken. Key: dark grey, Cape Afrikaans; light grey, Orange River Afrikaans; mid grey, Eastern Frontier Afrikaans.

and its system of verbal inflection, pronouns being the only nominals exhibiting distinct forms, although fewer than in Dutch (cf. Afrikaans *ons*, which corresponds to both Dutch *wij* – ‘we’ and *ons* – ‘us’), and all lexical verbs taking the same form, regardless of their person, number, and finiteness specifications. Afrikaans also differs from Dutch in employing reduplication – cf. *gou-gou* (‘quick-quick’), *stuk-stuk* (‘piece-piece,’ i.e., bit by bit), and *lag-lag* (‘laugh-laugh,’ i.e., easily).

Afrikaans’s retention of West Germanic’s distinctive word-order asymmetry (main clauses being verb–second/V2 and embedded clauses, verb–final) distinguishes it from Dutch-based creoles, which are exceptionlessly SVO and undermines extreme creolist accounts of its origins. Among the syntactic peculiarities that distinguish Afrikaans from Dutch are:

- its negative concord system – cf. Afrikaans *Ons lees nie hierdie boeke nie* (‘Us read not here – the books NEGATIVE’) and Dutch *Wij lezen niet deze boeken* (‘We read not these books’)
- verbal hendiads – cf. Afrikaans *Ek sit en skryf* (‘I sit and write’) versus Dutch *Ik zit te schrijven* (‘I sit to write,’ i.e., I sit writing)
- use of *vir* with personal objects – cf. *Ek sien vir jou* (‘I see for you’) versus Dutch *Ik zien je* (‘I see you’)

- *dat*-dropping in subordinate clauses – cf. *Hy weet ek is moeg* (‘He knows I am tired’), which alternates with *Hy weet dat ek moeg is* (‘He knows that I tired am’), whereas standard Dutch permits only the latter
- retention of main-clause ordering in subordinate interrogatives – cf. *Hy wonder wat lees ek* (‘He wonders what read I’) versus *Hy wonder wat ek lees* (‘He wonders what I read’), which is the only permissible structure in Dutch.

Lexically, Afrikaans differs substantially from Dutch in featuring borrowings from Khoekhoe, Malay, and Creole Portuguese (see ‘Lexical Borrowing’ section), and also, as a consequence of the ‘*suiwer Afrikaans*’ policy, in respect of many neologisms, which were created to avoid adopting an English expression – cf. *skemerkelkie*, *rekenaar*, and *trefferboek* or *blitsverkoper* whereas Dutch uses *cocktail*, *computer*, and *bestseller*, respectively.

The Taalmonument

Afrikaans is unique in being the only language with its own monument (see Figure 2). The *Taalmonument* (‘language-monument’) in Paarl was erected to celebrate the 100-year anniversary of the 1875 *Eerste Taalbeweging* (‘First Language-movement’) at which

Figure 2 (A) The Afrikaans Language Monument (*Taalmonument*) in Paarl, South Africa. Reprinted by kind permission of the Afrikaans Language Museum, Paarl. (B) Diagrammatic representation of the structure of the Afrikaans Language Monument. A, The Enlightened West; B, Magical Africa; C, the bridge between the two; D, Afrikaans; E, The Republic of South Africa; F, Malay. Adapted from *Die Afrikaanse Taalmonument*, the official brochure of the Afrikaans Language Museum, Paarl.

the first concerted calls for the elevation of Afrikaans to the status of written language were made. The monument was inspired by the writings of two prominent Afrikaans writers, C. J. Langenhoven (1873–1832) and N. P. van Wyk Louw (1906–1970). Langenhoven visualized the growth potential of Afrikaans as a hyperbolic curve, whereas van Wyk Louw conceived of Afrikaans as “the language that links Western Europe and Africa ... form[ing] a bridge between the enlightened west and magical Africa” (1961, ‘Laat ons nie roem’/‘Let us not extoll’ in *Vernuwing in die Prosa/Renewal in prose*. Cape Town: Human and Rousseau). The monument symbolizes these ideas as follows:

- it features two curves (A and B) representing the influences of Europe and Africa respectively
- A, which starts as a colonnade, flows into the main column symbolizing Afrikaans (D), signifying the direct manner in which Afrikaans grew out of Dutch
- B, which features three semispherical mounds symbolizing the indigenous languages and cultures of South Africa, also flows into the main column via a lesser curve
- at the base of the column, A and B form a bridge (C) symbolizing the confluence of linguistic and cultural influences from Europe and Africa
- a low wall (F) located between A and B symbolizes the contribution of Malay
- column E represents the Republic of South Africa, the political entity established in 1961, within which Afrikaans was well established as one of two official languages.

Afrikaans was Written in Arabic

By the mid-19th century, Afrikaans was being used by the Cape Muslim community in the exercise of their religion and some of the *imams* were beginning to translate holy texts into Afrikaans using Arabic script. The first of these *ajami* (Arabic–Afrikaans) manuscripts, the *Hidāyat al-Islām* (‘Instruction in Islam’), is said to have been prepared in 1845 but is no longer extant. The first *ajami* text to be published, the *Bayānu ddīn* (‘Exposition of the religion’), was written by Abu Bakr in 1869 and published in Constantinople in 1877. Seventy-four texts, written between 1856 and 1957, survive today.

Lexical Borrowings

Afrikaans has drawn on the lexical resources of a wide variety of languages with which it has been in contact during the course of its history. Here are some examples of the range and nature of this borrowing:

- From Khoekhoe: animal names such as *geitjie* ('lizard'), *kwagga* (a zebra-like creature), and *gogga* ('insect'); plant names like *dagga* ('cannabis'); place names such as *Karoo* and *Knysna*; and also miscellaneous items such as *kierie* ('walking-stick'), *abba* ('carry') and *kamma* ('quasi/make-believe')
- From Malay: *baie* ('very/much'), *baadjie* ('jacket'), *baklei* ('fight'), *piesing* ('banana'), *rottang* ('cane'), *blatjang* ('chutney')
- From languages spoken on the Indian subcontinent: *koejawel* ('guava'), *katel* ('bed')
- From Creole Portuguese: *mielie* ('corn/maize'), *kraal* ('pen/corral'), *tronk* ('jail')
- From Bantu languages spoken in South Africa: *malie* ('money'), *aikôna* ('no'), *hokaai* ('stop'), *babelas* ('hangover').

Afroasiatic Languages

J Crass, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The Afroasiatic languages are spoken by more than 250 million people living in northern Africa, the Horn of Africa, and in South West Asia. The Afroasiatic language phylum (or superfamily) contains more than 200 languages, even 372 according to Grimes (2000). In addition, a number of languages are documented only literally. With the exception of the extinct Sumerian, Afroasiatic has the longest documented history of any language phyla in the world: Egyptian was recorded as early as 3200 B.C., while the documentation of Semitic languages goes back to 2500 B.C. The name Afroasiatic was established by Greenberg (1952), replacing the inappropriate term Hamito-Semitic (or rarely Semito-Hamitic) that is still used by a few scholars. Other terms with little acceptance are Afrasian, Erythraic, and Lisramic.

Classification and Geographical Origin

The Afroasiatic languages are divided into six branches, namely Berber, Chadic, Cushitic, Egyptian, Omotic, and Semitic. Whereas Egyptian (Arabic, Egyptian Spoken) is a single language with four stages (Old-, Middle-, and New-Egyptian and Coptic), the other five branches are families. Chadic encompasses the largest number of languages – namely 195 according to Grimes (2000) or approximately 140 according to Newman (1992) – followed by Semitic (74), Cushitic (47), Omotic (28), and Berber (26), the latter four numbers as stated by Grimes (2000). These six branches are considered ‘sister families,’ i.e., they are equal, flat, and parallel. However, there are attempts to connect these branches to larger units. Semitic and Berber are relatively closely related, and both are somehow connected to Cushitic (Zaborski, 1997). Bender (1997) calls this group of branches macro-Cushitic and speculates on its connection with Indo-European.

According to Diakonoff (1988) and Bender (1997), the original homeland of the speakers of Afroasiatic languages was in the southeast of today’s Saharan desert, while Militarev and Shnirelman (1984) believe it was in Asia. The former scenario seems likely because – except for Semitic – all families of the Afroasiatic phylum are spoken exclusively in Africa. The latter scenario is also possible, however, because parts of the lexis are shared by the Afroasiatic

languages, the Sumerian language, and the Caucasian languages (Hayward, 2000: 95).

History of the Investigation of Afroasiatic Languages

In the Middle Ages, the genetic relationship between the Semitic languages Arabic (Standard Arabic) and Hebrew was discovered only after the study of Afroasiatic languages had already begun. Likewise, only after Egyptian was deciphered in the 19th century did the affinity of Egyptian to Semitic become apparent. A short time later, Berber and Cushitic were recognized as belonging to this phylum. The Chadic languages as a whole were classified as Afroasiatic languages by Greenberg in the 1950s. The sixth branch, Omotic, was regarded as a branch of Cushitic until the end of the 1960s, and while some scholars still consider this to be true (Lamberti, 1991; Zaborski, 1986, 1997), most believe that Omotic is an independent branch of Afroasiatic (Fleming, 1969). A few scholars even regard it as the first family that split off from Proto-Afroasiatic, the reconstructed ancestor of all Afroasiatic languages (Fleming, 1983; Ehret, 1995).

Finally, it should be mentioned that Hetzron (1980) sees Beja (Bedawi) – generally regarded as the only representative of North Cushitic – as another family of Afroasiatic, but Zaborski (1984) does not agree with this view.

For a long time, the structure and features of Semitic determined which languages belonged to the Afroasiatic language phylum. Most likely this was because Arabic and Hebrew were the first languages European scholars knew. Also, for a significant period of time, racial, even racist prejudices dominated classification suggestions of the Afroasiatic languages. In the mid-19th century, the idea of a language family, of which Semitic is one branch, was born. The term Hamitic, derived from the name Ham, the second son of Noah, was created in opposition to Sem, the name of the first son of Noah, who was the eponym of the Semitic languages. All Afroasiatic languages related to Semitic, but considered to be non-Semitic, were classified as Hamitic, the second branch of ‘Hamito-Semitic.’ These criteria were a mixture of linguistic (genetic and typological), physical anthropological, and partly geographical features.

Lepsius (1863), the first important exponent of this theory, classified the Hamitic branch into four groups, namely (1) Egyptian; (2) Ethiopic (Ge’ez), i.e., mostly Cushitic languages spoken in the Horn of Africa; (3) Libyan, i.e., Berber and the Chadic language

Hausa; and (4) Hottentottan (Nama), i.e., languages of the Khoisan phylum of southern and southwestern Africa. In 1880 he included even Maasai – a language of the Nilosaharan phylum – in the Hamitic branch. Lepsius's main criterion for his classification was grammatical gender. African languages possessing the masculine vs. feminine gender distinction were classified Hamitic, while African languages without gender distinction were called 'Negersprachen,' i.e., 'languages of the negroes.'

The most famous exponent of the Hamitic theory was Meinhof (1912), who tried to work out the features of the Hamitic languages by considering genetic, typological, and physical anthropological features. Meinhof was of the opinion that one must distinguish more 'primitive' from more 'highly developed' languages, a criterion that he believed correlated with the mental abilities of the speakers of the respective languages. In the tradition of Schleicher, he believed that inflecting languages reflect the highest level of linguistic evolution. This typological feature of the Hamitic languages derived from a race called 'Hamites' who had white skin, curled hair, and other physical anthropological features considered prototypical of the old Egyptian and Ethiopide types.

Besides grammatical gender, ablaut and other typological features of the Indo-European and Semitic languages were the main linguistic criteria Meinhof took into consideration. He classified as Hamitic not only Afroasiatic languages (except Semitic) but also languages like Ful (Fulfulde, Adamawa) (an Atlantic language of the Niger Congo phylum), Maasai, and other Nilotic languages of the Nilosaharan phylum and languages of the Khoisan phylum, earlier excluded by others from the Afroasiatic languages.

The first opponents of the Hamitic theory were Beke (1845) and Lottner (1860–61), later followed by Erman (1911) and Cohen (1933) who considered – as did the aforementioned scholars – the branches of this phylum to be 'sister families.' According to Sasse (1981: 135), the final breakthrough of this theory and the beginning of a new era in the study of Afroasiatic languages was marked by Cohen (1947). Greenberg (1952, 1955) finally provided evidence that a number of languages had to be excluded from the Afroasiatic language phylum, and he created the Chadic family by unifying the former 'chadhamitic' language Hausa with the rest of the Chadic languages that until then had been classified as non-Afroasiatic languages.

Shared Features

The genetic relationship among the six branches of Afroasiatic is shown best by some shared morphological features (cf. Hayward, 2000: 86ff; Sasse, 1981:

138ff). These are case marking, plural formation on nouns, gender marking, pronouns, verb inflection, and verb derivation.

The basic nominal form of Proto-Afroasiatic, functioning as the direct object of a verb, is termed 'absolute,' marked by the suffix **-a*. In Cushitic and – as Sasse (1984) claims – in Semitic and Berber, its function is more widespread, so it can be treated as the functionally unmarked form. The nominative, marked by **-u*, is used for subject NPs. A similar morphology can be assumed for Egyptian and Omotic, the latter having a reconstructed accusative marking system (Hayward and Tsuge, 1998), i.e., the unmarked form is the nominative and not – as reconstructed for Semitic, Berber, and Cushitic – the absolute. Chadic, however, is not concerned here since it generally lacks case marking. Modern languages with a marked nominative case system occur mainly in central and southwestern Ethiopia and adjacent areas where this system of case marking is an areal feature found not only in several Cushitic and Omotic languages, but also in languages of the Nilosaharan phylum.

Complex plural formation of nouns is another characteristic of many Afroasiatic languages. A likely pattern of Afroasiatic plural formation is the "ablaut to *a*, usually in the last stem syllable of a noun ... [partly] accompanied by reduplication, and sometimes trigger[ing] dissimilation or assimilation of other stem vowels of the plural" (Hayward, 2000: 92; cf. Greenberg, 1955). Other reconstructed plural markers are a suffix containing a labial-velar glide and a suffix *-t*, the latter not easy to disentangle from the *-t* of the feminine gender marker. Such a gender marker is found, in all six branches of Afroasiatic. In addition gemination of consonants marking nominal and verbal plurality is widespread.

Two formally distinct sets of pronouns must be set up for Afroasiatic, the first for the absolute, the second for the nominative case. Due to the shift of a marked nominative to a marked accusative system, the absolute pronouns often were converted to nominative pronouns, e.g., in Berber and Chadic, so consequently, the subject pronouns of these languages just happen to look like object pronouns of other languages. Gender markers **n-* and **k-* for masculine and **t-* for feminine are often derived from demonstrative elements. These gender markers may be combined with the pronominal gender marker **-uu* for masculine and **-ii* for feminine and function as demonstrative pronouns, especially of the near deixis. This applies exactly to the Highland East Cushitic language K'abeena, in which the demonstrative pronouns have an additional morpheme *n* – probably a definite marker – that results in the forms *kuun* and *tiin*.

Subject agreement on the verb may be marked in two ways, either by a so-called prefix conjugation or by a suffix (or stative) conjugation. Some languages make use of both, e.g., most modern Semitic languages; others have only the suffix conjugation, e.g., Egyptian and many Cushitic languages. The reconstructed subject-agreement morphemes of the prefix conjugation are *ʾ- (1S), *t- (2S, 3Sf, 2P), *y- (3Sm), and *n- (1P). Suffixes differentiate number and partly gender.

Some morphemes used for verb derivation are found in many Afroasiatic languages, so most probably those are a feature of Proto-Afroasiatic. The transitivity/causativizing *s- ~ *-s and the intransitivity/passivizing *m- ~ *-m, *n-, and *t- ~ *-t belong to these morphemes.

Furthermore, hundreds of lexical items have been reconstructed for Proto-Afroasiatic by Ehret (1995) and Orel and Stolbova (1995) of which a small number “seem unlikely to be disputed” (Hayward, 2000: 94), e.g., *dim-/dam- ‘blood’, *tuf- ‘to spit’, *sum-/sim- ‘name’, *sin-/san- ‘nose’, *man-/min- ‘house’, and *nam-/nim- ‘man’.

The rich consonant inventory of Proto-Afroasiatic – Orel and Stolbova 1995: xvi reconstruct 32, Ehret 1995: 72, even 42 consonants – includes three obstruents, namely, a voiceless, a voiced, and a glottalized sound “not only for most places of articulation but also for certain other articulatory parameters, for example, among lateral obstruents, sibilants and labialised velars” (Hayward, 2000: 94). Furthermore, two pharyngeals, two glottals, and four uvulars are reconstructed by Orel and Stolbova (1995).

Typologically, there is a contrast between Berber, Egyptian, and Semitic on the one hand and Chadic, Cushitic, and Omotic on the other. According to Bennett (1998: 22), the first three languages “generally have (or can be reconstructed as having had) three underlying vowels, no tonal contrasts ... and typically triconsonantal roots that at least in the verbal system seem not to include vowels.” He writes that the latter three, however, are characterized by “relatively full vowel systems, tonal contrasts, and roots of varied length that normally include a vowel” (Bennett, 1998: 22). Concerning word order, Afroasiatic languages can be divided as follows: Berber, Chadic, and Semitic languages outside Ethiopia have VO word order, while Cushitic, Omotic, and Ethiopian Semitic languages generally have OV word order.

Finally, two hypotheses must be mentioned. Diakonoff (1965) is of the opinion that Proto-Afroasiatic was an ergative language, a hypothesis adopted by Bender (1997) and for Semitic by Waltisberg (2002). The second hypothesis concerns the possible substrate influence of Afroasiatic

languages on the Celtic languages (cf. Adams, 1975; Gensler, in press).

Ainu

M Shibatani, Rice University, Houston, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Ainu is a near-extinct language that was once spoken widely in the northern part of the main Japanese island of Honshu as well as the Hokkaido island, in Sakhalin, and in the Kurile Islands. The current Ainu population, concentrated mainly in Hokkaido, is estimated to be around 24 000, but as a result of intermarriage between Ainu and Japanese, pure-blood Ainu are said to number less than 1% of that figure. Ainu is no longer used as a means of daily communication, and is remembered to a varying extent only by a handful of people of advanced age.

Ainu has not developed a writing system, but it is endowed with a rich tradition of oral literature. In addition to various kinds of songs, e.g., love songs and boating songs, Ainu oral literature contains both verse and prose. The verse forms, generally called *yukar* in Ainu, are recited epics that relate to the experiences of gods or to the experiences of love and war of heroes. The language of *yukar* differs

significantly from the spoken language; it is more conservative and has less dialectal variation as compared with the colloquial language. The two types of language show differences in both syntax and vocabulary, although there is a great deal of overlap. The most salient difference between the two is that the language of *yukar* tends to be more strongly polysynthetic than its colloquial counterpart. The language of *yukar* will be referred to as Classical Ainu, but the difference between this type of language and the colloquial form is more a difference in genre than in chronology.

In terms of genetic affiliation, Ainu is best considered as a language isolate. Although there have been suggestions that Ainu is related to such language families as Paleo-Asiatic, Ural-Altaic, Indo-European, and Malayo-Polynesia or to individual languages such as Gilyak and Eskimo, none of these suggestions has progressed beyond the level of speculation. Hypotheses relating Ainu to Japanese have also been entertained by many scholars, but other than the similarities due to lexical borrowing and typological characteristics rooted in the shared basic word order (Subject-Object-Verb), no strong evidence has been

uncovered to relate the two languages. Indeed, Ainu has a number of morphological characteristics that distinguish it from Japanese, e.g., extensive use of personal affixes and a polysynthetic character as well as absence of verbal inflections.

Ainu has a rather simple phonological system, with five vowel phonemes (/i, e, a, o, u/) and 12 consonantal phonemes (/p, w, m, t, s, c, y, n, r, k, ʔ, h/). Syllable-initial vowels are preceded by a glottal stop, e.g., *aynu* [ʔajnu] ‘person,’ and this fact makes Ainu syllables conform to one of the following types: CV, CVC (for Hokkaido Ainu) or CV, CVV (long vowel), CVC (for Sakhalin Ainu).

According to the pitch accent system of the language, Ainu syllables are pronounced with either high or low pitch. In words consisting of stems and affixes, the stems have high pitch, e.g., *nú-pa* ‘to hear-pl.OBJ.’ In other two- and three-syllable words, high pitch falls on the first syllable if it is a heavy syllable, i.e., a diphthong or a closed syllable, e.g., *áynu* ‘person.’ In all other words, high pitch occurs in the second syllable, e.g., *kirá* ‘to flee.’

Among the small number of phonological processes, the most notable are assimilatory and dissimilatory processes of the following type: *akor nispa* → *akon nispa* ‘our chief,’ *pon-pe* → *pompe* ‘small thing,’ (assimilation); *kukor rusuy* → *kukon rusuy* ‘want to have’ (dissimilation).

Both nominal and verbal morphologies are characterized by extensive use of affixes. In nominal morphology perhaps the most notable are deverbal nominal suffixes that derive nominal expressions from verbs. The suffix *-p(e)* derives a noun that denotes a person or things characterized by the meaning of the original verb, e.g., *pirka* ‘good’ → *pirka-p* ‘good thing,’ *wen* ‘bad’ → *wen-pe* ‘poor man.’

Two other noun-forming derivational affixes are the suffixes *-i* and *-ike*. The former yields nouns having the meaning ‘X-place’ or ‘X-time,’ and the latter produces nouns with the meaning ‘thing’ or ‘person,’ e.g., *esan* ‘go out there’ → *esan-i* ‘place that is protruded, i.e., peninsula,’ *poro* ‘big’ → *poro-ike* ‘bigness, big thing/person.’

One notable feature of these suffixes with theoretical significance is that they, especially *-p(e)* and *-i*, also attach to phrases and clauses, functioning as both lexical and phrasal nominalizing suffixes, e.g., *a-koyki rok-pe* (1sg-strike PERF-SUF) ‘the one I have fought,’ *a-yanene-p ya-kotan-oro esina-p* (1sg-dislike-SUF REFL-village-from hide-SUF) ‘what I dislike is hiding one’s village (from which one came).’

Possession is expressed by the use of personal affixes that, when attached to verbs, index the subject

of transitive clauses, e.g., *a-maci* (1sg-wife), *e-maci* (2sg-wife) ‘young wife,’ *maci* ‘his wife.’

In both Classical and colloquial Ainu, intransitive and transitive verbs each have distinct sets of personal affixes indicating person and number of the subject and object, e.g., Classical Ainu intransitive affixes: *itak-an* (speak-1sg) ‘I speak,’ *e-itak* (2sg-speak) ‘you (sg) speak,’ *itak* ‘he/she speaks’; Classical Ainu transitive affixes: *a-kor* (1sg-have) ‘I have,’ *e-kor* (2sg-have) ‘you (sg) have,’ *kor* ‘he/she has.’ These subject-indexing affixes combine with object-indexing affixes, yielding forms such as *a-e-kore* (1sg-2sg-give) ‘I give you,’ *e-i-kore* (2sg-1sg-give) ‘you give me.’

Ainu verbs – Ainu makes no distinction between verbs and adjectives – also index the plurality of the subject and object. The plural verb forms typically co-occur with a plural subject when the verb is intransitive and with a plural object when it is transitive. However, Ainu also shows cases of plural verbs co-occurring with plural transitive subjects. Plural verbs are of either suppletive type (*arpa* ‘go,’ *paye* ‘go.pl’) or productive-suffixed type (*kor* ‘have (sg):’ *kor-pa* ‘have (pl)’); e.g., *An-an* (be-1sg) ‘I was (there):’ *Oka-an* (be.pl-1pl) ‘We were (there):’ *Icen poronno kor-pa* (money lot have-pl) ‘They had a lot of money’ (Ishikari dialect); *Sisam sokor goza sinep hok-pa wa arki* (Japanese from mat one buy-pl and come.pl) ‘They bought one mat from a Japanese and came’ (Ishikari dialect).

Plural verb forms are also used as honorifics, e.g., *Kane rakko a-res-pa kamuy ronnu* (golden otter 1pl-raise-pl god kill.pl) ‘Our honorable god, whom we have raised, killed the golden sea otter’.

The most notable feature of Ainu verbal morphology is incorporation of various elements – the feature that contributes to the polysynthetic character of Ainu, especially Classical Ainu. Nouns corresponding to intransitive subjects and those corresponding to transitive objects are incorporated, though many instances of the former type appear to be frozen expressions, e.g., *Sir-pirka* (weather-good) ‘It’s fine.’ Typical noun incorporation is of the following type, where incorporation of a noun corresponding to an object results in an intransitive expression with concomitant change in the personal affix: *Cise ci-kar* (house 1pl-make) ‘We make a house’: *Cise-kar-as* (house-make-1pl) ‘We make a house’ (Ishikari dialect).

In addition, Ainu verbs incorporate adverbs, e.g., *Toyko a-kikkik* (thoroughly 1sg-beat) ‘I beat (him) up thoroughly’: *A-toyko-kikkik* (1sg-thoroughly-beat). While no more than one noun can be incorporated into the verb at a time, a noun and an adverb can be

incorporated into one verb base at the same time, e.g., *Pinne kamuy kiraw-rik-kur-roski* (male god horn-high-EXPL-raise) ‘The male (dragon) god raised the horns high.’

Moreover, Ainu verbal morphology permits applicative extension, thereby exhibiting the following paraphrases between postpositional expressions and the corresponding applicative expressions: *Poro cise ta horari* (big house at live) ‘He lives in a big house’: *Poro cise e-horari* (big house APPL-live) ‘He lives in a big house’; *kaya ari terke* (sail with run) ‘run by a sail’: *kaya e-terke* (sail APPL-run) ‘run by a sail.’

A combination of noun incorporation and applicative extension yields an expression such as *Nea cep a-pone-ko-kuykuy* (that fish 1sg-bone-APPL-bite) ‘I bit that fish with its bone.’

Ainu syntax is consistently head-final, thereby exhibiting word order patterns similar to those observed in other head-final languages such as Japanese and Korean. Thus, the basic word order is SOV: *Kamuy aynu rayke* (bear person kill) ‘The bear killed the man.’ Postpositions are used rather than prepositions: *cise ta* (home at) ‘at home,’ and modifiers precede the heads they modify: *pirka kewtum* (good heard) ‘good heart,’ [*beko respa*] *sisam* ([cow raise] Japanese) ‘a Japanese who raises cows,’ *sapo ninkaribi* (sister earrings) ‘sister’s earrings,’ *toan seta* (that dog) ‘that dog,’ *sine aynu* (one person) ‘one

person,’ *turasno paye* (quickly go) ‘go quickly,’ *a-e rusuy* (1sg-eat want) ‘want to eat,’ *menoko kasuno okirasunu* (woman than strong) ‘stronger than a woman.’

Subordinating conjunctions occur after subordinate clauses, which come before main clauses, e.g., *E-eh kusu anekiroro-an* (2sg-came because happy-1sg) ‘Because you came, I am happy’ (Sakhalin dialect).

Auxiliary verbs are not generally marked by personal affixes, which are attached to the main verbs. And finally, question sentences are marked by the final particle *ya*, or are simply indicated by rising intonation alone. Like many other head-final languages, interrogative pronouns need not move to sentence-initial position. The following final example illustrates the use of auxiliary verbs and interrogative sentence pattern: *Eani hemanta e-e rusuy ya* (you what 2sg-eat want Q) ‘What do you want to eat?’

Akan

M E Kropp Dakubu, University of Ghana, Legon, Accra, Ghana

© 2006 Elsevier Ltd. All rights reserved.

The Akan language is spoken throughout the central portion of Ghana. It is the most widely spoken member of a family of about 20 languages known as Tano or Volta-Comoe spoken in Ghana and the eastern Ivory Coast. Formerly the entire group was referred to as Akan. These languages belong to the Niger-Congo family. Within Niger-Congo they are part of the Kwa grouping.

Dialects and Their Distribution

The name ‘Akan’ is not generally used by speakers of the language, who refer to their language as Fante, Twi, or Brong. These Akan speech forms constitute a dialect continuum running from north to south in Ghana. ‘Fante’ refers to the dialects spoken in

those regions that reach the sea, in the Central Region and parts of the Western Region of Ghana. ‘Twi’ is the most general term, referring to a wide range of dialects, of which the best known are Akuapem, the main tongue of the Eastern Region, and Asante, the dialect of the Ashanti Region. Others are Akyem and Kwahu. In genetic terms, Akuapem is more closely related to Fante than to the other dialects, but all of these dialects are mutually intelligible. The Brong dialect group of the Brong-Ahafo Region to the north of Ashanti is mutually intelligible with Asante Twi, but there is less mutual intelligibility with the dialects spoken farthest south.

History and Development

Lists of several hundred words in Fante were published in Europe during the 17th and 18th centuries, but the language became a written language

with a printed literature in the first half of the 19th century. The first written form was based on the Akuapem dialect, and was the work of members of the Basel Mission, which became established in the Eastern Region in the 1830s. The major names connected with this work are H. N. Riis, who published the first grammar in German in 1853 and in English in 1854, and Johann Gottlieb Christaller, whose grammar and dictionary appeared in 1875 and 1881, respectively. His collection of 3,600 Akan proverbs appeared in 1879. Christaller's work was important not only for Akan but for West African linguistics generally, because he analyzed the characteristic vowel harmony system and the tone system (see later), and their significance for the grammar.

The Akuapem-based orthography was used in schools of the Basel Mission, and later throughout the Twi-speaking areas until an Asante orthography was established in the 1950s. Since then, three orthographies, Fante, Asante, and Akuapem, have been used in the schools. A Unified Akan Orthography was developed in 1978 and published, but has not been put into practice by publishers or teachers. Nevertheless, more works have been published in Akan than in any other Ghanaian language, more than half of them in the Akuapem orthography.

Sociolinguistic Situation

As mother tongue of about 43% of the population of Ghana (7 550 405 out of about 18 million) and spoken as a second language by many more, Akan is indisputably the most commonly spoken Ghanaian language. Asante, with 2 578 829 speakers, is the largest dialect, Fante coming second with 1 723 573 speakers (figures are based on the report of the 2000 Census). Exactly how many speak Akan as a second language is not known, but there are very few places in Ghana where a speaker cannot be found. The Asante dialect seems to be the most widely known, and is expanding. Although Accra, the capital of Ghana, historically is not an Akan town, there are strong indications that today Akan is more widely spoken there than any other Ghanaian language.

From the 17th century until British conquest in the 20th century, Akan was the language of expanding kingdoms, of which the Ashanti became the largest and most famous. The resulting impact on the other languages of Ghana was considerable, especially in the south. Virtually all southern Ghanaian languages have borrowed Akan words related to war, government/state, the arts (especially music), and personal names and appellations. Akan is the

source of several English words and proper names, especially in the Caribbean. The most well-known English word of Akan origin is probably the name of the Jamaican folktale character, Anancy, from Akan *ananse* 'spider'. Another is okra, from Akan *η-koro-ma*.

Akan is the language most used after English in the electronic public media, and in some areas is used more than English. This is most noticeable on the FM radio stations distributed throughout Akan-speaking regions and in Accra. It is fairly often heard on television and is very commonly used in both television and radio advertising. However, there is little if any print journalism in Akan, although there has been more in the past.

Akan is a school subject in Akan-speaking regions, in many Accra schools, and in teacher training colleges. It can be studied to degree level at the University of Ghana and the University of Cape Coast, and is an area of specialization at the University College of Education at Winneba.

Aspects of the Ethnography of Speaking

Formal speech is very important in Akan culture. Every chief or king has an *ɔkyeame*, or spokesman, whose function is to speak for the chief on all formal occasions. This man is highly regarded as a master of the language. Elegant speech, especially that used at court, is profuse and indirect. Mastery of proverbs and their appropriate use are important aspects of this style.

Major Linguistic Features

The Sounds of Akan

This section is based mainly on Dolphyne's (1988) *The Akan (Twi-Fante) language*, which should be consulted for more detail.

Consonants The Akan consonants p, b, t, d, k, g, m, n, f, s, h, w, l, r, and y are usually pronounced much as they are in English, although n is pronounced [ŋ] in some contexts, e.g., in *nkwan* 'soup'. The spellings ky, gy, and hy, however, are pronounced similarly to English ch, j, and sh, respectively. Akan also has rounded consonants with no comparable English sounds, because the inner parts of the lips are rounded and the sound is also palatalized. These sounds include tw [tɕ], dw [dɕ], and hw [ɕ]. The syllabic nasals *m n* (representing both [n] and [ŋ]) always have the same position of articulation as the following consonant, thus *mpaboa* 'shoes' but *nsuo* 'water'.

The most obvious difference between Fante and the other dialects is that in Fante, *t* and *d* are pronounced [ts] and [dz] before front vowels. Thus Fante has *dzi*, meaning ‘eat’, whereas other dialects have *di*, and *itsir* ‘head’, whereas other dialects have *etire* (or *eti*). Also before front vowels, *n* in Fante is pronounced as *ny*; for example, *nye* ‘and’ is *ne* in other dialects. The sound [l] occurs mainly in loanwords from English, although it exists in both Asante and Fante dialects as an alternative pronunciation for [r] or [d] in some words.

Vowels and Vowel Harmony Akan has nine oral vowel phonemes, /i ɪ e ε u ʊ o ɔ a/, and five nasal vowels, /ĩ ɪ̃ ũ ʊ̃ ã/. The vowels [ɪ] and [ʊ] are spelled *e* and *o*, respectively. Asante and Akuapem have a tenth vowel, [ɑ]. These vowels pattern according to the rules of cross-height or advanced tongue root vowel harmony. This means that any of the vowels except [ɑ] can be the vowel of a stem syllable, but for prefixes and some suffixes the vowels fall into two sets. These are /a ɪ e ʊ ɔ ɪ̃ ʊ̃ ã/ and /ɑ i e u o ɪ̃ ũ/. A prefix to a word must have a vowel from the same set as the stem vowel. Thus, for example, the pronoun prefix meaning ‘he, she’ is pronounced [o] in *odi* ‘she eats’, but [ɔ] in *ɔhwɛ* ‘he looks at it’, because the verb stem vowels /i/ and /ε/ belong to different sets.

The Fante dialects also have rounding harmony, whereby the prefix vowels are rounded if the stem vowel is. Thus, in Fante, the expression meaning ‘I am going’ is pronounced [mʊ-rʊ-kɔ], because the stem *kɔ* has a rounded vowel, but in other dialects it is pronounced [mi-ri-kɔ].

Tone Every syllable carries contrastive tone. There are two contrastive tone levels, high and low. In a sentence or phrase the pitch of high tones is lowered after a low tone, so that in a sentence such as *Pàpá Kòfí rɛ̀fré nɛ̀ bá* ‘Papa Kofi is calling his child’, each high tone syllable is pronounced at a lower pitch than the earlier high tone syllables. Tone is not reflected in any of the Akan orthographies.

Word Formation

Nouns Most nouns consist of a stem with a singular or a plural prefix. The common singular prefixes are created using the vowels *o*, *e*, and *a* (varying according to the vowel harmony rules), and the common plural prefixes use the vowel *a* (only if there is a different vowel prefix in the singular) or a syllabic nasal. Thus we have *ɔ-hene* ‘king’, plural *a-hene*, and *ɔ-kwasea* ‘fool’, plural *n-kwasea*. Some nouns have no singular prefix, only a plural: thus *gyata* ‘lion’, plural *a-gyata*, and *kuku* ‘pot’, *n-kuku* ‘pots’. Some

adjectives also have singular and plural forms, but there is no noun class agreement of the Bantu type.

Nouns referring to persons often have a suffix *-ni* in the singular, which is replaced by *-fo* in the plural. Thus, *o-buro-ni* ‘European person’, in the plural is *a-buro-fo*. Kinship terms are usually formed with a suffix *-nom* with no change in the prefix, e.g., *ena* ‘mother’, *ena-nom* ‘mothers’.

Verbs With slight variations among the dialects, the Akan verb is inflected principally for aspect: completive with a suffix with a form that depends on the final stem vowel, perfect with the prefix *á-*, progressive with the prefix *re-*, and habitual and stative forms that have no prefix or suffix and differ only in the tone of the verb. There is also a future marker *bé-*. The consecutive form has a prefix *a-* and is used only in serial verb constructions. The negative is expressed by a prefix consisting of a syllabic nasal before the verb stem, and the imperative also by a syllabic nasal prefix but with high tone.

Syntax

Word Order Akan has subject-verb-object word order. In a noun phrase, adjectives and determiners follow the noun but possessives precede it, as shown in the following examples:

Abofra no re- n- noa bi
child the PROG-NEG-cook some
‘the child will not cook any’

Kwasi kye-ε abofra no paanoo
Kwasi give-COMPL child the bread
‘Kwasi gave the child bread’

Amma sika
‘Amma’s money’

Postpositions Locations are represented by a special class of nouns called postpositions at the end of the locative phrase. An example is *so* ‘top, on’, as in the following sentence:

Sekan bi da ɔpon no so
knife some lie table the on
‘a knife is lying on the table’

There is only one preposition, *wɔ* ‘at’.

Serial Constructions Serial verb constructions, in which two or more verbs and their objects occur in sequence with a single subject and no conjunctions to form a complex clause, are a characteristic feature of Akan syntax. For example:

Kwasi de paanoo kye-ε abofra no
Kwasi took bread give-COMPL child the
‘Kwasi gave bread to the child’

ɔ-be-tɔ nwoma no a-kan
 she-FUT-buy book the CONSEC-read
 'she will buy the book and read it'

Akkadian

G Deutscher, Leiden University, Leiden,
The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Akkadian is an extinct Semitic language spoken in ancient Mesopotamia, the 'land between the rivers' (Tigris and Euphrates), in an area that roughly corresponds to today's Iraq. In the later second millennium B.C., Akkadian was also a lingua franca throughout the Near East. Akkadian was written on clay tablets in the cuneiform script in a system that combined syllabic and logographic signs. It is one of the earliest and longest attested languages, with a history that starts around 2500 B.C. and spans more than two thousand years. The ancient name of the language, Akkadûm, derives from the city of Akkade, founded by King Sargon as his capital around 2300 B.C.

From the second millennium B.C., two distinct dialects of Akkadian emerged: Babylonian and Assyrian. Babylonian was spoken in the southern part of Mesopotamia, and Assyrian was spoken in the northern part. During the first millennium B.C., Aramaic gradually ousted Akkadian as the language of the region, and Akkadian ceased to be spoken sometime around 500 B.C. Some texts in Akkadian continued to be written even until the first century A.D., but the language then fell into oblivion, and was rediscovered only in the nineteenth century, when the cuneiform writing system was deciphered. Today, hundreds of thousands of Akkadian texts have been discovered, encompassing many different genres, including poetry (such as the epic of Gilgamesh),

religious compositions, royal and monumental inscriptions, histories, monolingual and multilingual dictionaries (word-lists), grammatical texts, astronomical and mathematical texts, legal documents (such as the Code of Hammurabi), private and diplomatic correspondence, and an endless quantity of economic and administrative documents.

The history of the Akkadian language is conventionally divided into four main chronological periods: Old Akkadian (2500–2000 B.C.), Old Babylonian/Old Assyrian (2000–1500 B.C.), Middle Babylonian/Middle Assyrian (1500–1000 B.C.), and Neo-Babylonian/Neo-Assyrian (1000–500 B.C.). The conventional name 'Old Akkadian' for the earliest attested period is based on the (probably mistaken) assumption that no dialectal variation between the Babylonian and Assyrian idioms existed before the second millennium. The Old Babylonian dialect was considered the classical stage of the language by later generations of Babylonians and Assyrians, and it was the language towards which the later literary idiom (sometimes known as 'Standard Babylonian') aspired.

Grammatical Sketch

During the third millennium B.C., speakers of Akkadian were in prolonged and intimate contact with speakers of the unrelated and typologically dissimilar Sumerian (ergative, agglutinating, verb-final). In consequence, the structure of Akkadian shows an interesting mixture between inherited Semitic features (nominative-accusative alignment, synthetic non-concatenating morphology, noun-modifier order in the NP) with features acquired through convergence.

Such ‘Sprachbund’ effects are evident especially in the phonology and the syntax, as well as in massive lexical borrowing.

The phonemic system of Akkadian underwent a considerable reduction from the putative Proto-Semitic inventory, with the loss of most of the laryngeal and pharyngeal consonants, probably because of contact with Sumerian. Morphology is the area which shows the least evidence of convergence (although even here, some features, such as the ‘ventive’ suffix *-am* may be due to Sumerian influence). Nouns have two genders (masculine, feminine), three cases (nominative, accusative, genitive), and show a distinction between singular, plural, and a partly productive dual.

As in the other Semitic languages, verbal morphology is highly synthetic, and based on a system of mostly three-consonantal roots and internal vowel patterns, combined with prefixing, suffixing, infixing, and gemination. The root *p-r-s* ‘cut’, for instance, appears in forms such as *i-prus* (3SG-cut.PAST), *purs-ā* (cut.IMPERATIVE-2PL), *a-parras* (1SG-cut-NON PAST), *pars-at* (cut.STATIVE-3FSG), *i-pparis* (3SG-cut.PAST.PASSIVE), *nu-šapras* (1.PL-cut.NON PAST.CAUSATIVE).

Where Akkadian morphology diverges significantly from the other (and later attested) Semitic languages, especially in its so called ‘stative conjugation,’ Akkadian seems to present an earlier situation. The ‘stative’ has its origin in conjugated forms of the predicative adjective, but it gradually acquired verbal features. In Akkadian, the stative had not yet become a fully verbal form, but in the other Semitic languages, it was fully integrated in the verbal paradigm (as the ‘perfect’), and this led to a restructuring in the tense-aspect system. The morphology of Akkadian remained fairly stable until the first millennium B.C., when the weakening and loss of final syllables led to the disintegration of the case system on nouns, and to the loss of some distinctions on verbs, and so to the appearance of more periphrastic constructions.

Akkadian is nominative-accusative in both morphology and syntax, and generally has dependent marking, although the verb has obligatory subject agreement as well as direct and indirect object nominal suffixes. Akkadian word order is interesting, because it can be considered highly ‘inconsistent.’ Akkadian must have inherited a VSO word-order

from Proto-Semitic, and this order is still reflected in archaizing personal-names, especially from the earliest period, such as *Iddin-Sin* (gave:3MSG-Sin – ‘(the god) Sin gave’).

However, undoubtedly because of contact with Sumerian, Akkadian acquired a strict verb-final word order, which is attested from the earliest documents. Both SOV and OSV orders are common, but the only constituents that can follow the verb are the bound object pronoun suffixes (and in later periods finite complement clauses). Nevertheless, inside the noun phrase, Akkadian has retained the characteristic Semitic ‘VO’ characteristics: prepositions, Noun-Genitive, Noun-Relative, Noun-Demonstrative, Noun-Adjective orders. These apparently inconsistent word-order patterns showed no signs of instability, and were maintained intact for two thousand years.

Albanian

B Demiraj, University of Munich, Munich, Germany
A Esposito, Oxford English Dictionary, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Linguistic Type

Albanian constitutes a single branch of the Indo-European family of languages. It is often held to be related to Illyrian, a poorly attested language spoken in the western Balkans in classical times, but this has not yet been proved conclusively. Although as a people the Albanians have been known since the 2nd century A.D., the earliest surviving records of the Albanian language date only from the 15th century. In its grammar Albanian displays several characteristic features of Indo-European languages, such as declension of nouns by means of case endings and conjugation of verbs by means of personal endings; in its lexicon it preserves a considerable number of words of inherited Indo-European stock.

Albanian may further be characterized as a member of the Balkan Sprachbund. During the many centuries of their evolution the languages of the Balkans (several languages not directly related and belonging to different branches of Indo-European) have come to share certain linguistic features with each other that they do not share with other non-Balkan languages to which they are ostensibly more closely related. Albanian displays several of these features, for example: postposition of the definite article, analytic formation of the future tense (in Albanian with the semiauxiliary verb *dua* 'to want' in the fossil form *do*), substitution of the infinitive by subjunctive clauses, pronominal doubling of objects.

In addition to features shared respectively with other Indo-European languages and with other Balkan languages, Albanian also displays several innovative features, in phonology, in morphosyntax, and in lexis, which mark it out from other European languages.

The phonemic inventory of standard Albanian comprises 7 vowels and 29 consonants, and is remarkable for the way that phonetically similar consonants (including plosives, affricates, fricatives, and liquids) have formed phonemic pairs. The phonological system also reveals the operation of umlaut in former times (with which compare the Germanic languages). As regards morphosyntactic structure, may be mentioned the development, alongside the postpositive definite article, of a proclitic article with indefinite function, which, in turn, has given rise to further innovations: the creation of a special class of adjectives and the reformation of ordinal numerals and of the genitive case. Another important

innovation is the development of the admirative mood in the verbal system, used to express surprise, disagreement, etc.

Present-day Albanian may be categorized as a partly synthetic, partly analytic language, which, alongside synthetic features (both inherited and innovatory), has also developed several analytic features, such as the formation of the perfect and future tenses with auxiliary verbs and the frequent use of prepositions with inflected forms of nouns and pronouns.

The vocabulary of Albanian is notable for the high level of borrowing it shows from different neighboring and influential languages over the course of many centuries, for example: ancient Greek and Latin, the Slavic languages of the Balkans, Turkish, medieval and modern Greek, and (in our own times) French, Italian, and English.

Geographic Spread

Today Albanian is spoken by a population of about 6 500 000 native speakers in a compact ethno-linguistic area in the western Balkans, which comprises:

1. Albania;
2. almost the whole of Kosovo;
3. a broad band of northwestern Macedonia (the former Yugoslav republic) from Kumanovo to Struga;
4. the districts of Medveda, Preševo, and Bujanovac in southern Serbia;
5. the southern and southwestern part of Montenegro;
6. the region of Chameria in northwestern Greece.

Albanian is the official language of the Republic of Albania, and one of the official languages of Kosovo (U.N. administration) and the Republic of Macedonia; it is a national minority language in the Republic of Montenegro.

Outside this compact ethno-linguistic area Albanian is also spoken today in a considerable number of linguistic pockets in the Balkans and beyond. These have arisen as a result of continuing economic and political migrations over the last 700 years. The descendants of the earliest attested diaspora of Albanian-speakers live in scattered communities in southern Greece (the Peloponnese, Attica, and the Aegean islands); the original migration dates from the 14th and 15th centuries, and its cause appears to have been chiefly economic (see Jochalas, 1971). Further scattered communities of Albanian-speakers are to be found in southern Italy and Sicily, where their ancestors settled during the 15th and 16th centuries for political and religious reasons after the

occupation of the western and southern Balkans by the Ottoman Turks. The exact number of Albanian-speakers in these linguistic pockets is difficult to determine, as many of them, especially the younger generation, have abandoned their ancestral language, and speak Greek or Italian, respectively. Those who still retain Albanian (all of whom are bilingual) speak an archaic variety heavily influenced by the superstrate language.

Other linguistic pockets, which, however, are now in danger of being completely assimilated, exist in Serbia (the Sanjak), Croatia (Zadar), central Macedonia, south-eastern Bulgaria (Mandrica), Turkey, and the Ukraine.

During the 20th century emigration of Albanian speakers has continued, especially at the beginning and end of the century from Albania to the United States, Canada, Italy, Greece, and the United Kingdom, and from Yugoslavia (and its successor states) and northern Greece to Turkey, Germany, Switzerland, and Sweden.

Dialects

Within the compact ethno-linguistic area in the western and central Balkans, Albanian is spoken in two main dialects, Gheg and Tosk, each of which may be further divided into several subvarieties. The River Shkumbin in central Albania historically forms the boundary between these two dialects, with the population to the north speaking varieties of Gheg and the population to the south varieties of Tosk (see Gjinari, 1989).

Gheg and Tosk are distinguished from one another chiefly by several important phonological developments. For example, in Tosk /a/ before a nasal has become a central vowel (schwa), and intervocalic /n/ has become /r/. These two sound changes have affected only the old pre-Slav stratum of the Albanian lexicon, that is, native words and loanwords from ancient Greek and Latin. The only important dialectal difference in grammatical structure is the loss of the infinitive in Tosk, in which constructions with the subjunctive predominate just as in all other Balkan languages (with the exception of Serbian and Croatian). However, these innovations, as those that are also evident in different varieties of Gheg, are not such as to impede communication between speakers of the two dialects. Furthermore, the major part of the Albanian lexicon is common to the two dialects.

Of the two main varieties of Albanian spoken outside the ethno-linguistic area, Arvanitika (spoken by the descendants of the ancient migration to Greece) and Arbëresh (spoken by the descendants of the ancient migration to Italy), both preserve archaic features characteristic of varieties of southern Tosk. (The majority of emigrants in these historical

migrations were from southern Albania.) The archaic dialectal features and the separate development of these varieties under the powerful influence of superstrate languages (Greek and Italian) make communication between speakers of the diaspora and those of the ethno-linguistic homeland almost impossible. This differentiation, conditioned by time and space, has caused several specialists to treat these varieties as separate languages (see Sasse, 1991).

Overlying the dialectal diversity of Albanian are different religious (Catholic, Orthodox, Muslim), cultural, and political allegiances that over time have also greatly influenced linguistic developments.

Codification

Up until the early 20th century Albanian was written in a variety of scripts (Roman, Greek, Arabic, Cyrillic), depending on local influences. In 1908 the Congress of Monastir decided on the adoption of the Roman alphabet. The use of Albanian as an official language first became possible after the proclamation of independence of Albania in 1912. However, the emergence of an agreed standard language took time; competing local standards continued to be used until well into the second half of the 20th century. Modern standard Albanian (largely Tosk-based), which is today the accepted standard throughout the whole ethno-linguistic area, did not gain its final sanctioning until 1972 at the Orthographic Congress of Tirana, organized by the Albanian Academy of Sciences, in which linguists and writers from Yugoslavia and the Albanian diaspora also participated.

Present and Future Trends

The decade of the 1990s saw great upheavals in the western Balkans (the fall of communism in Albania, the dismemberment of Yugoslavia, and the war in Kosovo) that radically affected the lives of Albanian speakers. One consequence has been a dramatic increase in the influence of foreign languages on Albanian. A flood of loanwords, especially from English and Italian, is pouring into both the colloquial and the standard language. There exists an unofficial movement opposed to the use of 'unnecessary' foreign words, but attempts to engage the interest of the state in support of its efforts have so far proved unsuccessful.

Algonquian and Ritwan Languages

D H Pentland, University of Manitoba, Winnipeg, MB, Canada

© 2006 Elsevier Ltd. All rights reserved.

More than 30 languages of the Algonquian family were formerly spoken along the east coast of North America from about 34°N (Cape Fear, North Carolina) to about 56°N (Davis Inlet, Labrador), around the upper Great Lakes, and west to the foothills of the Rocky Mountains. They were the first North American languages encountered by French and English explorers; by the end of the 17th century several languages had already been described in detail. Three centuries later, however, two-thirds of the languages are no longer spoken, with only English loanwords such as *moccasin*, *skunk*, and *squaw* to reflect their former existence. The 'Ritwan' languages (Wiyot and Yurok) of California are distantly related. Pilling (1891) provides a nearly exhaustive inventory of the earlier sources; later publications are listed by Pentland and Wolfart (1982), but the only comprehensive bibliography of the most recent literature is in Nichols (1981–).

Classification

The only widely accepted genetic subgroup within the Algonquian family is Eastern Algonquian, consisting of the languages which descended from Proto-Eastern Algonquian (Goddard, 1978b). It includes the languages of the Maritime provinces, southern Quebec, and the northern New England states – Micmac (several dialects), Malecite-Passamaquoddy, Etchemin, Eastern and Western Abnaki (two languages, each

with several dialects), and Pocumtuck or 'Loup B' – and those formerly spoken in the Hudson and Delaware River basins of New York, Pennsylvania, and New Jersey – two dialects of Mahican, and the two 'Delaware' languages, Munsee (including the divergent Wappinger dialect) and Unami (three dialects). The languages of southern New England and Long Island – Nipmuck ('Loup A'), Massachusetts (Wampanoag), Narragansett, Pequot-Mohegan-Montauk, and Quiripi-Unquachog – and those of the southeastern states – Nanticoke, Conoy (Piscataway), Powhatan (Virginia Algonquian), and Roanoke-Pamlico (Carolina Algonquian) – may also be part of the Eastern subgroup, but since all are extinct, the crucial phonological details depend on interpretations of early written records.

The so-called 'Central' languages were located between Hudson Bay and the Ohio River valley; each shares many features with its neighbors, but there are no ancient subdivisions.

Cree-Montagnais-Naskapi is a dialect chain extending across central Canada from Labrador to Alberta, conventionally subdivided according to the reflex of Proto-Algonquian **l*: Plains Cree (Nêhiyawêwin), the dialect with *y* < **l*, in Alberta and Saskatchewan; three varieties of Woods Cree (with *ð*) in northern Saskatchewan and Manitoba, one of which probably continues the extinct Missinipi dialect (with *r*; cf. Pentland, 2003); three or more varieties of Swampy Cree (with *n*) in Manitoba and northern Ontario; Moose Cree (with *l*) on the southwest coast of James Bay; and Atikamekw (or Tête de Boule, with *r*), in southwestern Quebec, cut off from the others by a dialect of Ojibwa. In the eastern dialects Proto-Algonquian **k* has

palatalized to *č* before front vowels: Eastern Montagnais (Innu-aimun) and Eastern Naskapi (with *n* < **l*), in Labrador and southeastern Quebec; Southern Montagnais (with *l*), at Lac St-Jean, Quebec; and the extinct dialect of Tadoussac, Quebec (with *r*). The several varieties of East Cree and Western Naskapi in northern Quebec (all with *č* < **k* and *y* < **l*) are considered transitional between the eastern and western dialects (MacKenzie, 1980), or as varieties of a Western Montagnais dialect (Pentland, 1978); some East Cree speakers understand Moose Cree, but speakers of the nonpalatalized dialects generally find East Cree and (other) Montagnais dialects completely unintelligible.

Ojibwa (also spelled Ojibway or Ojibwe) is another dialect chain, extending from Quebec to Saskatchewan. The Algonquin dialect of southwestern Quebec is separated by a large number of isoglosses from its immediate neighbors (Rhodes and Todd, 1981), but shares a number of features with Northern (or Severn) Ojibwa, in northwestern Ontario. A quite different dialect, also usually called Algonquin, is spoken at Maniwaki, Quebec; it apparently is the result of a large migration of Eastern Ojibwa speakers from Lake Nipissing into an originally Algonquin-speaking community at Oka. The Eastern Ojibwa dialect of southern Ontario and the Ottawa (or Odawa) dialect of Michigan and southwestern Ontario have both reduced or lost all unstressed vowels. According to Rhodes and Todd (1981), the other dialects are Central Ojibwa, in northeastern Ontario; Northwestern Ojibwa, between Lake Superior and Lake Winnipeg; Southwestern Ojibwa (Chippewa), in northern Michigan, Wisconsin, and Minnesota; and Saulteaux (Plains Ojibwa) in southern Manitoba and eastern Saskatchewan.

Potawatomi, originally spoken in southern Michigan, was once a part of the Ojibwa dialect chain; it separated before Ojibwa merged **ye* with *i*; prior to the first contact with Europeans, but shares with some southern Ojibwa dialects the complete loss of unstressed vowels. Menomini (or Menominee), in Wisconsin, has many Ojibwa loanwords and shares some sound changes (including **ye* > *i*), but is in other respects quite different from other Algonquian languages.

Four dialects of a single language were formerly spoken in southern Michigan: Fox (or Mesquakie), Sauk, Kickapoo, and the extinct Mascouten dialect. The three surviving varieties are probably still mutually intelligible, but Kickapoo has some significant differences.

The states of Illinois and Indiana were the home of the Miami-Illinois language, which contained

a number of dialects, including Kaskaskia, Peoria, Tamaroa, Wea, Piankashaw, and Miami; by the 1870s there were only two groups, known as Peoria and Miami, but they may not correspond to older dialect divisions. In the early 18th century the Michigamea spoke a dialect of Illinois (cf. Masthay, 2002: 26), but earlier may have spoken an unrelated language (Goddard, 1978a: 587).

The Shawnee originally lived in southern Ohio, but during the historic period they often split into widely scattered bands, eventually merging into three politically independent groups, the Eastern Shawnee, Cherokee Shawnee, and the Absentee Shawnee, all now resident in Oklahoma. Neither early nor recent dialect differences have yet been examined in detail.

In addition to Plains Cree and Plains Ojibwa (Saulteaux), there were at least six other Algonquian languages spoken on the Great Plains (Goddard, 2001). Blackfoot is spoken in Alberta by the Blackfoot (Siksika), Blood, and Northern Peigan, and in Montana by the Southern Peigan (or Blackfeet) with only slight differences. Arapaho (including the extinct Besawunena dialect, in Wyoming and Oklahoma) is closely related to Atsina or Gros Ventre (in Montana). Some Arapaho formerly spoke Ha'anahawunena, an unrecorded language said to have been very different from Arapaho; the Southern Arapaho originally spoke Nawathinehena, a distinct Algonquian language of which only a few words were recorded in 1899.

The two modern Cheyenne communities in Montana and Oklahoma speak almost identical dialects; the Sutaio, who joined the Cheyenne in the 19th century, spoke a different dialect or language, but little reliable information about it was ever recorded.

In 1913 Edward Sapir showed that Wiyot and Yurok, two languages of northwestern California which had just been assigned to a new linguistic family called Ritwan, are related to the Algonquian languages.

Sapir extended the name Algonkin (i.e., Algonquian) to the larger group. This unfortunate relabeling was misunderstood by Truman Michelson, who argued (correctly) that Wiyot and Yurok are not 'Algonquian' in the same sense as Fox or Cree; he was wrong, however, to deny the more distant relationship, which later work has amply confirmed.

The family consisting of the Algonquian languages plus Wiyot and Yurok is now called Algic; the name Ritwan is reserved for Wiyot and Yurok, should it turn out that they form a single branch within the Algic family: the question is still undecided. The last speaker of Wiyot died in 1962; fieldwork continues with the last few speakers of Yurok.

The extinct Beothuk language of Newfoundland may have been related to the Algonquian family, but the early 19th-century vocabularies are poorly transcribed and very inconsistent (Hewson, 1978); some words and inflections appear to be cognate, but others bear no resemblance to their Algonquian counterparts, even allowing for the usual kinds of transcription errors. It is unlikely that the relationship (if there is one) will ever be demonstrated satisfactorily.

Edward Sapir placed Algonquian in a stock with Kutenai and the Salishan, Chimakuan, and Wakashan families, but the similarities he noted are probably ancient loans or areal features. The few resemblances between single morphemes in Proto-Algonquian and the languages of the Gulf coast are probably coincidental.

Demography

No accurate census of Algonquian speakers exists. According to the 2001 Canadian census there were 72 680 Cree people, but 102 185 speakers of the Cree language; Grimes (1992) estimated 42 725 speakers, but even this number may be too high. An additional 14 000 people speak the ‘palatalized’ dialects, East Cree, Naskapi, and Montagnais.

There are at least 20 890 speakers of Ojibwa in Canada (2001 census) and perhaps 30 000 in all; earlier estimates ranged above 50 000 speakers. About 40–50 fluent speakers of Potawatomi remain, although 200–500 were estimated 30 years ago. A few dozen elderly people still speak Menomini. Perhaps 200 people still speak Fox or Sauk, but Kickapoo has well over 1000 speakers. Shawnee is said to have 200–250 speakers; the Miami-Illinois language became extinct about 50 years ago.

Of the Eastern Algonquian languages, only Micmac and Malecite-Passamaquoddy are still viable. There may be as many as 8000 speakers of Micmac in the Maritime provinces and southern Quebec, and more than 1000 speakers of Malecite-Passamaquoddy in New Brunswick and Maine. The last speaker of Penobscot (Eastern Abenaki) died in 1993; a few elderly people may still speak Western Abenaki. Perhaps a dozen people in southern Ontario speak Munsee Delaware, but Unami, in Oklahoma, is virtually extinct.

The 2001 Canadian census reported 2740 Blackfoot in Canada, but 4495 speakers of the language; there may be 5000 speakers in all, including a few children. Arapaho is estimated to have several hundred fluent speakers (Goddard, 2001), but there are only two speakers of Atsina (Gros Ventre) left. Cheyenne is spoken by about 2500 people.

Since the number of speakers of many Algonquian languages has declined rapidly in recent years, many communities have sought to revitalize their traditional language by introducing language programs in the local schools. A few programs have been very successful, but many others have failed to increase the use of the language outside the classroom.

Recent attempts to revive extinct languages such as Miami-Illinois and Pequot-Mohegan cannot yet be evaluated.

Typological Characteristics

Algonquian languages are polysynthetic, hierarchical, nonconfigurational head-marking languages with discontinuous constituents and relatively free word order.

Phonology

The parent language, Proto-Algonquian (PA), was reconstructed by Leonard Bloomfield (1925, 1946), in part to demonstrate that the comparative method can be applied successfully to ‘unwritten’ languages as well as those with ancient records. PA probably had 13 consonants (**p, t, k, kʷ, s, š, h, θ, l, m, n, w, y*) and four short and four long vowels (**a, e, i, o; *a, e, i, o*). Bloomfield also reconstructed **č*, but it occurs only before **i(·)* and **y* (where it does not contrast with **t*); however, **č* may also have replaced **t* in words with diminutive consonant symbolism. He did not reconstruct **kʷ*, but it probably contrasted with the sequence **kw*. Consonant clusters could not occur word initially, and every word ended in a vowel (usually, but not always, a short vowel).

In PA, stress was predictable, with all long vowels and every second short vowel receiving a stress; this stress system is preserved with little change in Ojibwa, and underlies the vowel length alternations in Menomini, but some languages (e.g., Plains Cree, Montagnais) have replaced it with systems which count syllables from the end of the word, and Miami-Illinois reflects both types. Arapaho-Atsina and Cheyenne have developed pitch accent systems (largely from the old length contrast), while others (Eastern Montagnais, Kickapoo, and Malecite-Passamaquoddy) have acquired pitch contrasts from the loss or contraction of certain syllables.

Almost all the daughter languages have merged PA **θ* and **l*, and some have a further merger with **n* (as in Massachusetts and in modern Ojibwa, Menomini, and Fox) or with **y* (as in Pequot-Mohegan); although the PA phonetic values of the consonants Bloomfield labeled **θ* and **l* are debated, the reflexes in Table 1 clearly show that they

Table 1 Intervocalic reflexes of five Proto-Algonquian consonants in selected languages

| | *t | θ | n | l | y |
|----------------|----|---|---|---|---|
| Plains Cree | t | t | n | y | y |
| Swampy Cree | t | t | n | n | y |
| Ojibwa, Fox | t | n | n | n | y |
| Shawnee | t | l | n | l | y |
| Pequot-Mohegan | t | y | n | y | y |
| Arapaho | t | θ | n | n | n |

were distinct phonemes in PA. In morpheme-final position, *t and *θ still contrast in Cree, and *θ and *l still contrast in Shawnee.

Inflectional Morphology

Nouns are classified as animate (NA) or inanimate (NI), the animate category including not only all living things but also some plants and their products, a few body parts, and miscellaneous other items such as snow, kettles, and snowshoes; all other nominals, including most body parts and the personal pronouns, are grammatically inanimate.

Possession is indicated by a pronominal prefix; plurality of the possessor is marked by a suffix. Most kinship terms and body parts, and a very few other noun stems, are ‘dependent’ (inalienably possessed); a special ‘unspecified possessor’ prefix is used with body part nouns when there is no actual possessor (e.g., *me-sit-i ‘someone’s foot’), but to express ‘a daughter’ Algonquian languages must resort to a verbal derivative, literally ‘(one that) someone has as a daughter.’

Nominals are obligatorily specified as singular (PA *-a NA, *-i NI) or plural (PA *-aki NA, *-ali NI), but with the loss of final vowels singulars have no overt marking in most of the daughter languages. The third person distinguishes between proximate (central, in focus) and obviative, but only animate nouns have separate obviative inflections (PA *-ali obv. sg., *-ahi obv. pl.); otherwise, obviation is evident only in verb agreement. Some languages have a second set of endings to indicate inaccessibility or absence (PA *-a NA sg., *-e NI sg., etc.).

The vocative has distinct singular and plural suffixes. A locative (in *-[e]nki) may be derived from any possessed or unpossessed noun stem (as well as a few other initial elements), but it is an uninflected ‘particle’ which does not distinguish number or obviation.

Intransitive verbs have distinct stems for animate and inanimate subjects, transitive verbs for animate and inanimate objects: e.g., Cree *kisiso-* ‘be hot

(ANIM)’, *kisite-* ‘be hot (INAN)’, *kisiw-* ‘heat (ANIM)’, *kisiam-* ‘heat INAN’. Animate intransitive (AI), inanimate intransitive (II), and transitive inanimate (TI) stems have similar inflections; transitive animate (TA) stems have more complicated paradigms, since they may distinguish almost any combination of subject and (animate) object.

Verb inflections are divided into three formally distinct sets of paradigms (‘orders’). The PA forms of the basic endings were reconstructed by Bloomfield (1946); Goddard (1979) provided much additional information.

The independent order, used primarily in main clauses, employs the same personal prefixes as possessed nouns, to indicate the highest-ranking argument of the verb (as determined by the hierarchy 2nd person > 1st > unspecified > anim. 3rd > anim. obv. 3rd > inan. 3rd > inan. obv. 3rd) if this is not otherwise marked; suffixes indicate direction (direct when the agent of a TA verb outranks the patient, inverse when the agent is not the highest-ranking argument), plurality and obviation, negation, and various modal categories (Pentland, 1999).

The conjunct and imperative orders employ only suffixes to indicate the same categories, but some forms in the conjunct order (such as participles) also have ‘initial change’ or ablaut of the vowel of the first syllable of the verb complex (Costa, 1996).

Derivational Morphology

Most Algonquian words can be described as consisting of an initial, an optional medial, and a final, each of which may itself be derived from shorter elements (Goddard, 1990). Roots (unanalyzable initials) are typically adjectival or adverbial rather than nominal or verbal, e.g. *melw- ‘good, well’ (as in *melwa:kamiy- II ‘be good water, taste good [of a liquid]’, *melwa:pam- TA ‘like to look at someone’, *melwenk^{iv}am-AI ‘sleep well’) and *wel- ‘properly arranged’ (as in *welenam- TI ‘arrange something by hand, place something in readiness’, *weleşam- TI ‘cut something to shape’). The final determines the word class; thus beside the TI stem *weleşam- (with final *-[e]šam- ‘cut-INAN’) there is a corresponding TA stem *weleşw- ‘cut someone to shape’ (with *-(e)šw- ‘cut-ANIM’), and further derivatives *welesamaw- TA ‘cut something to shape for someone’ (with benefactive final *-aw-), *weleşama:swi- AI ‘cut something to shape for oneself’ (with reflexive final *-[e]swi- added to the benefactive), and *weleşama:sowen- NI ‘(act of) cutting something to shape for oneself’ (with noun-final *-wen- added to the reflexive). The addition of an additional final almost always changes the word class.

Medials are nominal elements incorporated between the initial and final. Some are classifiers, such as **-axk^w*- ‘wooden’, **-apeθk-* ‘stone or metal’, and **-apye^k*- ‘stringlike’, in the II stems **kenwa^waxk^wat-* ‘be long [of something wooden]’, **kenwa^wapeθkat-* ‘be long [of a stone or metal object]’ and **kenwa^wpye^kat-* ‘be long [of something stringlike]’. Others correspond to the direct object of the English equivalent, such as **-neθk-* ‘hand, arm’ in **kenwineθke-* AI ‘have a long hand or arm’ or **-eθk^wew-* ‘woman’ in **no^wteθk^wewe-* AI ‘pursue women’, but noun incorporation is not very productive and does not interact with agreement.

Syntax

As many as four noun phrases may occur in a single clause, but no more than two arguments can be marked on the verb by inflectional affixes (Thomason, 2004). All verbs obligatorily take a subject, and may take an instrumental argument. TA stems obligatorily take an animate object; both AI and TI stems may also take an object, and TA stems may take a second object. Instrumentals, AI objects, and TA second objects may be of either gender.

Word order is very free: almost all permutations of constituents are grammatical. A noun phrase may be discontinuous, with part before the verb and the remainder after (Reinholtz, 1999); in Fox, compound verbs may also be discontinuous, with other parts of a clause inserted between a preverb and the remainder of the verb complex, as in (1):

- (1) ne-kehke^wnem-ekw-a ni^wna e^wh = pwa^wwi-
 1ST-know-INV-3RD.ANIM.SG I COMP = not-
 ke^wko^whi -ašeno-ni-ki
 something be.absent-OBV-3RD.INAN.SG
 ‘he knows that as for me, nothing is missing’
 (Dahlstrom, 1995: 9)

The topic of the subordinate clause, *ni^wna* ‘I’, has been raised to the left-hand edge of the clause; the subject of the II verb *ašeno-* ‘be absent’ has been moved into the verb complex following the complementizer clitic *e^wh* (which bears the ‘initial change’) and a negative preverb.

In example (1) the topic has also been copied as the direct object of the matrix verb, which is therefore the TA stem *kehke^wnem-* ‘know someone’ rather than TI *kehke^wnetam-* ‘know something’; subjects and (some) objects can also be copied, and the verb of the subordinate clause may be incorporated into the matrix verb, as in the Fox example in (2):

- (2) ke-ki-ši = meko yo^wwe
 2ND-already = EMPH in.the.past
 nepow-e^wnem-ene-pena

die-think-2ND.OBJ-1ST.PL

‘we had thought you were already dead’
 (Goddard, 1988: 71)

The preverb of the incorporated clause *ki-ši-nep-* ‘have already died’ has been moved to the preverb position of the matrix clause (where it is followed by an emphatic clitic and an adverb) but semantically still modifies only the lower verb.

Mixed Languages

Blackfoot may be descended from a precontact creole: it has (for the most part) normal Algonquian morphology and cognates of many individual morphemes, but few complete words are reconstructible.

A number of pidgins arose during the contact period, based on Powhatan (Virginia, early 17th century), Unami (New Jersey, 17th century), Cree (Hudson Bay, 18th century), and Ojibwa (Lake Superior, 19th century). An early Micmac–Basque pidgin in Nova Scotia was the source of a few Basque loanwords in modern Micmac, such as *elekewit* ‘(one who is) king’ < Basque *errege*.

Métchif or Michif, a French–Cree mixed language, is still spoken in some Metis communities in North Dakota, Manitoba, Saskatchewan, and Alberta (Bakker, 1997), and a remarkably similar French–Montagnais mixed language has developed at Betsiamites, Quebec. In these languages, the noun phrase is mainly French lexical items with French phonology and morphology, while the remainder of the clause is Plains Cree or Southern Montagnais.

Philology and Documentation

With more than four centuries of records on various languages available, philological studies have long played a role in Algonquian linguistics. The earlier English sources have been utilized by many scholars, notably in a study of the historical phonology of Powhatan (Siebert, 1975). The early French records have not been as thoroughly studied, but editions of older grammars (e.g., Daviault, 1994) and dictionaries (e.g., Masthay, 2002) have increased interest in the use of older materials to elucidate various details in the development of the modern languages.

One problem with the early sources is that they tend to provide individual words and partial paradigms rather than connected sentences; most early textual material is based on European originals, and was probably translated by the missionaries themselves. One notable exception is the collection of Massachusetts documents edited by Goddard and Bragdon (1988). Since the beginning of the 20th century many texts written or dictated by native

speakers have been published, but many more remain in manuscript.

Grammars and dictionaries of many Algonquian languages have been published, but much remains to be done: syntax is seldom treated at length, and some of the dictionaries are pitifully small. Leonard Bloomfield showed the way with a grammar (1962) and an 11 000-word dictionary (1975) of Menomini; notable later productions are the Montagnais-French dictionary compiled by Lynn Drapeau (1991), with nearly 24 000 entries, and the 1100-page reference grammar of Ojibwa by J. Randolph Valentine (2001). Mithun (1999: 328–337) provides a brief survey of the sources available for each of the languages.

Altaic Languages

L Johanson, Johannes Gutenberg University, Mainz, Germany

A common designation for the typologically related languages of the Turkic, Mongolic, and Tungusic families is ‘Altaic languages’; according to some scholars, this designation also includes Korean and Japanese. The common typological features of these languages include an agglutinative and exclusively suffixing word structure, sound harmony, verb-final word order, with dependents preceding their head, and use of numerous nonfinite verb constructions.

Altaic as ‘Ural-Altaic’

The term ‘Altaic’ was first used by M. A. Castrén in the middle of the 19th century for a supposed family comprising Finno-Ugric, Samoyedic, Turkic, Mongolic, and Tungusic. This group of languages was later called ‘Ural-Altaic.’ The Ural-Altaic hypothesis, which was largely based on general typological criteria such as agglutination and vowel harmony, was widely accepted in the 19th century. Later on, this hypothesis was seriously doubted. The works on ‘Altaic’ languages by W. Schott, M. A. Castrén, J. Grunzel, H. Winkler, and others contain abundant incorrect data. Castrén, however, rejected the purely typological approach and applied linguistic criteria of lexical and morphological comparison. There are not sufficient materials to establish a Ural-Altaic protolanguage.

Scholars of the following period, e.g., J. Németh and J. Deny, who took a more cautious attitude, published detailed works on phonology, word formation, etc. Syntactic typological arguments for the unity of Ural-Altaic were, however, discussed as late as 1962, by Fokos-Fuchs.

Altaic as ‘Micro-Altaic’

Scholars such as G. J. Ramstedt and N. Poppe argued for a ‘Micro-Altaic’ family (Comrie, 1981: 39) that at least consisted of Turkic, Mongolic, and Tungusic, three well-established genealogical groups. Ramstedt is the founder of Altaic linguistics in a scientific sense, though his works contain many problematic details. His introduction to Altaic linguistics was published posthumously (1952–1957). Poppe’s contributions to Altaic linguistics are not less important. His comparative phonology, planned as the first part of a comparative grammar, appeared in 1960. An example of phonological correspondences according to

Ramstedt and Poppe is the supposed development of the initial Altaic stop **p-* into Korean *p-* and *ph-*, into Tungusic *p-* (Nanai), *f-* (Manchu), and *h-* (Evenki), into Mongolic **p-* (Proto-Mongolic), *h-* (Middle Mongolian), *f-* (Monguor), and *Ø-* (Buriat, Oirat, Kalmyk, etc.), and into Turkic *h-* (Proto-Turkic, some modern languages) and *Ø-* (most modern languages). Ramstedt’s and Poppe’s arguments were largely accepted until they were challenged by G. Clauson (1956, 1962). Opponents such as J. Benzing and G. Doerfer expressed doubts even against this Micro-Altaic unit as a valid genealogical family.

Whereas the Altaicists regarded certain similar features as a common heritage from a protolanguage, others claimed that the similarities were the result of contact processes. Thus certain common features in Mongolic and Chuvash could go back to Proto-Altaic or had been borrowed into Mongolic from a language of the Chuvash type. Clauson had criticized the lack of evidence for a common basic vocabulary in Altaic. In his huge work on Turkic and Mongolic loanwords in Iranian, Doerfer (1963–1975) refuted the Altaic etymologies presented by Ramstedt, Poppe, and others, arguing that similarities that can be attributed to general typological principles or to areal diffusion must be excluded from genealogical comparisons.

A possible Altaic unity must have been dissolved about 3000 B.C. The crucial question in Altaic comparative studies is by which methods common elements due to early contacts can be distinguished from elements inherited from a protolanguage. One problem is the scarcity of early data. Whereas Indo-European is attested already in the second millennium B.C., there are no real Turkic sources prior to the 8th century (East Old Turkic inscriptions in the Orkhon valley, Inner Asia). The first Mongolic materials are found in *The secret history of the Mongols* (believed to be written around 1240 A.D., partly based on older materials). The first substantial materials documenting Tungusic emerge centuries later.

The Turkic–Mongolic–Tungusic Relationship

As for the relationship between Turkic and Mongolic, it has been possible to establish a number of convincing sound laws on the basis of words with similar sound shape and content, and to find certain corresponding derivational and grammatical suffixes. The question is how to judge these similarities. The earliest Turkic and Mongolic sources hardly show any common features except for intercultural words

such as *qayan* ‘supreme ruler’ and *tejri* ‘heaven.’ Middle Mongolian displays a number of words with similar Turkic equivalents. The few pairs of corresponding words do not, however, relate to the most significant parts of the vocabulary, i.e., numerals, kinship terms, and basic verbs, nouns, and adjectives. A few common elements are found in morphology. On the other hand, it is obvious that later Mongolic languages have converged with Turkic by giving up some old features, e.g., an inclusive vs. exclusive distinction in pronouns and verbs, grammatical gender in verb forms, agreement between the adjectival attribute and its head, and the option of postposed adjectival attributes.

Many similarities may thus be due to contact processes. There were close ties between Turkic and Mongolic as early as the middle of the first millennium B.C. Borrowings in both directions had taken place since early times. With the rise of the Chingisid Empire in the 13th century, many Turkic varieties came under strong Mongolic influence. The impact lasted longer in areas of intensive contact, such as South Siberia and the Kazakh steppes. The lexical influence is particularly strong in Tuvan, Khakas, Altay Turkic, Kirghiz, Kazakh, etc. Look-alikes that occur only in typical contact zones cannot easily be used as evidence for genealogical relatedness.

Mongolic displays early layers of loanwords from several Turkic languages and has developed many structural traits under Turkic influence. Words common to Turkic and Mongolic, e.g., Bulgar-Mongolic correspondences, are regarded by Altaicists as true cognates and by non-Altaicists as Turkic loans in Mongolic. Some scholars consider the possibility that correspondences between Turkic and Mongolic go back to a common adstrate, some ‘language X’ that might have delivered loans to both groups. Tungusic words considered by Altaicists as Altaic are rather regarded by non-Altaicists as loans from Mongolic in certain contact areas. Similar derivational and grammatical suffixes are very scarce. Mongolic and Tungusic had been in contact for a long time prior to the first documentation of Tungusic. Except for recent Yakut loans in North Tungusic, there are hardly any plausible lexical correspondences between Turkic and Tungusic. In a non-Altaicist perspective, the overall Turkic–Mongolic–Tungusic relationship thus appears to be due to diffusion rather than to genealogical relatedness. According to this view, words common to all groups may have wandered along the path Turkic → Mongolic → Tungusic.

After decades of discussions, the nature of the relationship between the Altaic languages is still controversial. Many common features are the result of

recent contact, often limited to certain languages within the groups. The question is what reliable correspondences remain to justify the recognition of Altaic as a family in the sense of Indo-European or Semitic. There is no consensus as to whether the relatedness is proven, still unproven, or impossible. Some scholars argue that too few features are common to all three groups, and only to these groups. There are clear lexical and morphological parallels between Turkic and Mongolic, and between Mongolic and Tungusic, but not between Turkic and Tungusic. All three groups exhibit a few similar features, e.g., in the forms of personal pronouns, but similarities of this kind are found in different unrelated languages, in the rest of northern Eurasia and elsewhere. Today, however, compared to the 1960s, the fronts between Altaicists and non-Altaicists are not always as rigid. For example, the pronounced non-Altaicist Doerfer, who had criticized the proposed Altaic sound laws as being construed less strictly or even *ad hoc*, has accepted the above-mentioned development of **p*- into Turkic *h*- and *Ø*-: e.g., **pat* ‘horse,’ *bat* (Khalaj, etc.), *at* (most Turkic languages). Doerfer expresses his appreciation of the achievements of the Altaicist Ramstedt in the following way: “We must be grateful to the ingenious founder of Altaistics as a science for discovering so many sound laws which are valid to this date” (Doerfer, 1985: 135).

Korean and Japanese

The most controversial point in recent discussions has been whether Korean and Japanese (with the closely related Ryukyuan language) should be regarded as members of an Altaic family. G. J. Ramstedt (1939, 1949) was the first scholar to attempt to prove a remote relationship between Turkic–Mongolic–Tungusic and Korean. Though his comparisons have been heavily criticized in more recent studies, N. Poppe considered Ramstedt to have identified at least 150 incontestable Korean–Tungusic–Mongolic–Turkic cognates.

Japanese has often been taken to consist of an Austronesian substratum and an Altaic superstratum. E. D. Polivanov (1924) argued that it is of hybrid origin, containing both Austronesian elements and continental elements that are also found in Korean and Micro-Altaic. In an early study, Ramstedt (1924) investigated possible links between Japanese and Altaic without reaching a clear final conclusion. Forty-two years later, S. E. Martin (1966) provided 320 etymologies relating Japanese to Korean on the basis of regular sound correspondences, which

allowed him to reconstruct Proto-Korean–Japanese forms. R. A. Miller (1971), who established a set of sound correspondences to the Proto-Altaic phonemes reconstructed by Poppe (1960), clearly claimed Japanese to be one branch of the Altaic family. K. H. Menges (1975) took up a number of Miller’s arguments and elaborated further on them. In his book on the Altaic problem and the origin of Japanese (1991), S. A. Starostin established sound correspondences between Japanese, Korean, and Altaic on the basis of numerous lexical comparisons of Turkic, Mongolic, Tungusic, Korean, and Japanese lexical items. J. Janhunen (1992, 1994), however, pointed out some problems with the Altaic affiliation of Japanese, which he considers premature. He takes Japanese and Ryukyuan to form a distinct family of its own and the Old Koguryō language, once spoken on the Korean peninsula, to be a close relative of Japanese.

Amharic

D Appleyard, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introductory Remarks

Amharic (self-name *amarippna*) is the largest member of the South Ethiopic branch of Ethiopian Semitic languages. Amharic is spoken, according to the most recent estimate (1999), by around 17.4 million people as a first language and between 5 and 7 million more as a second language, making it the second largest Semitic language after Arabic, and the fourth largest language of sub-Saharan Africa after Swahili, Hausa, and Yoruba, although some estimates suggest that Oromo may have more speakers in total. Amharic is the main lingua franca of Ethiopia and is the constitutionally recognized working language of the country. As such it forms the language of instruction of public education at primary and secondary level, including from the third grade upwards in areas where it is not the first language. It is also the majority language of most urban-dwelling Ethiopians except where Tigrinya (Tigrigna) is the first language. The current status and wide distribution of Amharic are due especially to the amharization policies of previous Ethiopian governments in the 20th century. Until the change in language policy after the Ethiopian revolution of 1974, Amharic was the only Ethiopian language used in state education and the official media. The earliest records of Amharic date to the rise of the Amhara or Solomonid dynasty in the 14th century, and the spread of the language over an ever-increasing area of the Ethiopian highlands accompanied the expansion of the Christian kingdom up to modern times.

Modern Amharic shows some dialectal variation, though perhaps less than might be supposed for a language with such a wide distribution. This may in fact be due to the way in which the language has spread over the last 700 years, as part of a deliberate process of amharization, and it is notable to this extent that the dialect areas that are generally recognized are geographically defined within the regions where Amharic either originated or has been spoken the longest. The dialect of Shoa and, in particular, Addis Ababa has become the prestige dialect, forming a *de facto* standard. This is the form of Amharic that is used in the media as well as in the areas of administration and education.

Like all the modern Ethiopian Semitic languages, Amharic has been heavily influenced by the Cushitic languages alongside which it has developed, initially

the now minority Central Cushitic languages and then, as it spread, Highland East Cushitic and later Oromo. This influence can be seen not only in the lexicon, but also in syntax and typology. As the language of the ruling elite and thus the inheritors of Ethiopian Christian culture from Aksum, Amharic was also open to borrowing from Ge'ez, the classical or liturgical language of the Ethiopian Orthodox Church, which in more recent times has provided a rich source for the expansion of the Amharic lexicon to satisfy the need for technical, political, and other vocabulary.

Amharic is written in the Ethiopic syllabary, the script used for Ge'ez and developed in Ethiopia probably sometime during the 4th century C.E. out of the South Arabian consonantal alphabet. The Ethiopic syllabary, or *fidäl*, used for Amharic has 33 primary symbols, which indicate C + vowel /*v*/, each of which is further modified in some way to indicate C + one of the remaining six vowels: **ሀ** /*be*/, **ሁ** /*bu*/, **ሂ** /*bi*/, **ሃ** /*ba*/, **ሄ** /*be*/, **ህ** /*bi*/, **ሆ** /*bo*/, in the traditional sequence, giving 231 basic letters. Whilst some of the modifications are more or less regular across the whole system, others are not. For instance C + vowel /*e*/ is always marked by a loop attached to the bottom right-hand of the basic letter, but there are 16 different ways of marking C + vowel /*i*/. The whole structure is traditionally displayed in a grid with consonants on the vertical axis and vowels on the horizontal. The sixth column of the grid indicates both C + vowel /*i*/ and C without a following vowel: **ሐ** = both /*bi*/ and /*b*/. The contrast between C + /*v*/ and C + /*a*/ is mostly neutralized where C is a guttural /**ገ**/ or /**ሀ**/: graphemes **ሀ** {*hə*} and **ሁ** {*ha*} are both /*ha*/, whilst there are 33 base letters, these correspond to 27 consonant phonemes, as there is a certain amount of redundancy: for example, the letters **ሀ**, **ሁ**, **ሂ**, and **ሃ** all mark the consonant /*h*/; **ሐ** and **ሁ** mark a lack of consonantal onset, or /**ገ**/ depending on analysis. The labialized gutturals /*k^w*/, /*g^w*/, /*k^w*/, and /*h^w*/ are indicated by additional vowel symbols attached to the corresponding nonlabialized consonant signs: **ሀ** = /*k^wv*/, **ሁ** = /*k^wu*/, **ሂ** = /*k^wi*/, **ሃ** = /*k^wa*/, **ሄ** = /*g^wv*/, **ህ** = /*g^wu*/, **ሆ** = /*g^wi*/, **ሇ** = /*g^wa*/, **ለ** = /*h^wv*/, **ሉ** = /*h^wu*/, **ሊ** = /*h^wi*/, **ላ** = /*h^wa*/. There is lastly one other place where the Ethiopic syllabary does not correspond exactly to the phonemic structure of the language; consonantal length is phonemic in Amharic but is not marked at all in the script: thus /*alv*/ 'he said' and /*allv*/ 'there is' are both written **ላ**, i.e., {*ʔa*} + {*lʷ*}. As an example of a piece of continuous text, consider the following, which is the last example cited in this article:

ይህ ነገር ብዙ ጊዜ ስለሚያስፈልግ አስከ

ምሽት ነው መሥሪያ ቤት የሚቆዩት።

{ji + hi ne + ge + ri bi + zu gi + ze
 si + le + mi + ja + si + fe + li + gi ጸt + si + ke
 mi + fe + ti ne + wi me + si + ri + ja be + ti
 je + mi + k^we + ju + ti}

/jih neɣer bizu gize silemmijasfellig iske mijfet dirəs
 new məsrija bet jəmmik’ ojjut/

‘because this thing needs a lot of time, they’ll stay
 behind at work until evening’

Phonology

Amharic has a system of 30 consonant (see Table 1) and 7 vowel phonemes. Distinctive are the glottalized consonants, which have parallels in other languages of the Ethiopian language area. Also notable are the labialized gutturals /k^w/, /k^ʷ/, /g^w/, and /h^w/; indeed, labialization of other consonants occurs, but only before the vowel /a/, and is contrastive as for instance in the nearly minimal pair /m^w atʃ/ ‘deceased’ – /mætʃe/, /mætʃ/ ‘when?’ The addition of phonemic units such as /m^w/ would increase the number of consonant phonemes. Consonant length is also phonemic; only /h/ and the glottal stop, whose phonemic status in Amharic is debatable, do not have lengthened counterparts. The vowel system is distinguished by the presence of two central vowels, high /i/ and low-mid /e/, which together with low /a/ are the most frequent vowels in the language. Vowel length is not phonemic.

The vowels of Amharic are /i/, /i/, /u/, /e/, /o/, /e/, and /a/. The phonemic status of the vowel /i/ has been the matter of some discussion, and certainly its occurrence as a default epenthetic vowel in the application of syllable structure rules is predictable: the consonantal strings/s-n-t/, /m-l-kk-t/being resolvable only as /sint/ ‘how much?’ and /milikkit/ ‘sign,’

respectively. Contrast /d-n-g-l/, which surfaces predictably as /dingil/ ‘virgin.’ Indeed, the Ethiopic syllabary uses the same set of symbols for a consonant alone and a consonant + /i/. However, forms such as /jis’ifall/ ‘he writes’ rather than the predicted /*jis’fall/ indicate that /i/ does have phonemic status.

Ethiopianist convention occasionally employs different symbols from the IPA ones used here; thus, š = ʃ, ž = ʒ, č = tʃ, q = k’, t = t’, č = tʃ’, ǧ = dʒ, ʂ = s’, p = p’, ñ = ɲ, y = j, ä = e, ə = i.

Syllable structure is [C]V[C][C], with no more than one consonant permitted in syllable onset position, and no more than two in syllable coda or, indeed, word medially and finally, with a lengthened consonant counting as two, as in the example of /milikkit/ above.

Accent in Amharic has been the subject of only a few studies, and its nature is still somewhat a matter of discussion. Generally, whilst Amharic accent is essentially a weak stress accent, it seems that word accent is subordinate to phrasal or sentence accent.

Morphology

Amharic has a complex inflectional morphology, particularly in the verbal system, employing not only prefixes and suffixes but also internal modification of the typical Semitic consonantal root-and-pattern type. In general, the morphology of Amharic has been less influenced by the Cushitic substratum than, for instance, syntax or the lexicon. The inflectional morphology of nouns, on the other hand, is relatively simple. Like other South Ethiopic languages, Amharic has mostly lost the heterogeneous system of noun plural formation by internal modification, the so-called broken plurals that are so common in North Ethiopic languages such as Ge’ez and Tigrinya, and in some other Semitic languages such as Arabic. Noun plurals in Amharic are for the most part formed by means of the suffix /-otʃtʃ/. Nouns also show two genders, though these are mostly manifest only in concord, chiefly between subject and verb predicate. Nouns further show definite marking by means of suffixes: masc. /-u/~/-w/ and fem. /-wa/, which are in origin 3rd person pronominal suffixes: /bet-u/ is thus both ‘the house’ and ‘his house.’ Amharic does not have a true case system, adverbial functions being expressed variously by prepositions, or postpositions, or interestingly by a combination of the two: /kə-səwije-w gar/ ‘with the man,’ where /kə-/ and /gar/ together gloss ‘with.’ Of the primary relational case functions, the subject is unmarked, a definite direct object is usually marked by the clitic /-n/, which occurs after the marker of definiteness within the noun phrase, and the possessive or adjunct function is indicated by the bound preposition /je-/,

Table 1 The consonant phonemes of Amharic

| | <i>bilabial</i> | <i>alveolar/ dental</i> | <i>palatal</i> | <i>velar</i> | <i>glottal</i> |
|--|-----------------|-----------------------------|---|--------------|----------------|
| Plosive/affricate | b p | d t | dʒ tʃ | g k | (ʔ) |
| Glottalized plosive/ affricate/ fricative | pʰ | tʰ | tʃʰ | kʰ | |
| Labialized | | | g ^w k ^w k ^ʷ | | h ^w |
| Fricative | f | z s | ʃ j | | h |
| Nasal | m | n | ɲ | | |
| Lateral | | l | | | |
| Approximant | w | r | j | | |

which is in form and origin identical to the adjunct or relative marker on verbs:

leba jə-gəbərə-w-n lam sərrək'-ə
 thief of-farmer-DEF- cow steal.PAST-3MASC.
 OBJ PAST

'a thief stole the farmer's cow'

abbat-e gomən-u-n b-atakilt bota zərra-[Ø]
 father-my cabbage- in-vegetable place sow.PAST-
 DEF-OBJ {3MASC.
 PAST}

'my father sowed the cabbages in the garden'

The verb is inflected for voice or valency, tense–mood–aspect (TMA), and person. Negation is also marked within the inflected verb, as is to a large extent the distinction between main and subordinate verbs. In addition to the base stem, typically with active function, there are three fundamental voices or derived stems formed by prefixes: causative /a-/, passive-reflexive /tə-/, and factitive or (double) causative /as-/. There are other less productive formatives of more restricted occurrence, such as /astə-/, which also has a causative function, and /an-/ and /tən-/, with transitive-causative and stative-passive functions on verbs with expressive meaning (movement, sound, emotion, etc.). Internal changes in the various formations of TMA stems, however, combine with these prefix formatives and sometimes obscure them: /tə-sərrək'-ə/ 'it was stolen' but /ji-ssərrək'-all/ 'it will be stolen,' where the imperfective or nonpast stem corresponding to /təsərrək'-/ is /-ssərrək'-/. The occurrence of derived stem formatives is also to some extent lexical: /tə-k'əmmət'-ə/ 'he sat down' is active and does not contrast with a base stem /*k'əmmət'-/.

Other derived stem patterns involve internal modification such as a change of vocalization, or reduplication of syllables, often in combination with the prefixes described above: /a-nnəgaggər-u/ 'they engaged one another in conversation' from the basic /nəgəgər-u/ 'they spoke.'

TMA marking is done by internal changes in the verb stem together with variations in person marking. Most notable here is the use of one set of personal suffixes for the past in contrast to a quite different set of prefixes, or prefixes and suffixes combined, for the nonpast stem: /wəddək'-ətʃtʃ/ 'she fell' but /ti-wədk'-all-ətʃtʃ/ 'she falls, is falling,' /a-t-wədk'-imm/ 'she isn't falling,' /ti-wdək'/ 'let her fall,' /bi-t-wədk'/ 'if she falls,' etc., where the stems are past /wəddək'-/, nonpast /-wədk'-/, and jussive-imperative /-wdək'-/, and the person markers for the 3rd feminine are past /-ətʃtʃ/, nonpast and jussive /tʃi-/, and the other elements are variously /-all-/ main verb affirmative nonpast, /a- . . . -[i]mm/ main verb negative nonpast, and /b[i]-/ 'if.'

In addition to subordinate verbs formed by prefixes such as the conditional formative above, Amharic also possesses an inflected all-purpose adverbial subordinate verb, called the gerundive in much of the literature, though the term 'converb' (CONVB), which is occasionally used, is a better label: /wədk'-a/ 'she having fallen,' but from /səmma-tʃtʃ/ 'she heard' /səmt-a/ 'she having heard.' The gerundive/converb is typically used in describing a sequence of events:

innantə izzih k'ərt-atʃtʃihu zimm
 you.PL here remain.CONVB-2PL 'quiet'
 bil-atʃtʃihu tə-k'əmmət'-u
 say.CONVB-2PL sit.IMP-PL
 'you, stay here and sit quietly' ('. . . being quiet')

t'əlat jəst-o təmelləs-in
 enemy flee.CONVB-3MASC return.PAST-1PL
 'they enemy fled and so we returned'

The gerundive/converb in combination with the main verb marker (MVM) /-all/, etc., also forms the basis of a second past tense main verb form which generally indicates a recent past event or situation resulting from a past event: /alk'-o-all/>/alk'w'all/ 'it is finished.'

The formal distinction between main and subordinate verb forms is not carried through the whole TMA system. The past tense form, such as /wəddək'-ə/ 'he fell' occurs in both positions and has no MVM as such, whilst the simple nonpast form /ji-wədk'/ 'he falls, will fall' occurs only in subordinate position, either with an auxiliary as in /ji-wədk' nəbbər/ 'he was falling,' or more usually with a subordinating element: /jəmm-i-wədk'/ '(he) who falls,' /s-i-wədk'/ 'when he falls/fell.' When used in main verb position, it requires the partially inflecting MVM if affirmative: /ji-wədk'-all/ 'he falls,' /ti-wədk'-all-ətʃtʃ/ 'she falls,' or the main verb form of the negative marker if negative: /a-j-wədk'-imm/ 'he doesn't fall.'

In addition to the elements discussed so far, the verbal complex may also contain pronoun object markers. These are of two kinds, essentially direct object pronouns and pronominal object pronouns, which involve an element /-ll-/ or /-bb-/ clearly associated with the simple nominal prepositions /lə-/ 'to, for' and /bə-/ 'in, with':

ajt-ən-əw-all
 see.CONVB-1PL-him-MVM
 'we have seen him'

adrig-o-ll-ijjə-all
 do.CONVB-3MASC-for-me-MVM
 'he has done [it] for me'

Syntax

Word order in Amharic is generally subject-object-verb (SOV), with subordinate clauses preceding the main clause. Noun phrases are also generally head final with modifiers, including relative clauses, preceding the noun. Whilst a large part of Amharic syntax is influenced by Cushitic language patterns and is in accord with the typology of verb-final languages, there are still structures such as prepositions alongside postpositions which betray the older ‘classical’ Semitic syntax. Like most languages of the Ethiopian language area, Amharic makes considerable use of focus marking, which is here expressed by a construction involving the copula, which ‘highlights’ the focused item, and the relative verb, the so-called cleft clause construction:

zəməd-otʃtʃ-wa n-atʃtʃəw bal
relative-PL-her COP-3PL husband
 jə-mərretʃ-u-ll-at
REL-choose.PAST-3PL-for-her
 ‘it is her relatives who have chosen a husband
 for her’

jih nəgər bizu gize
this thing much time
 silə-mm-ij-asfellig
because-REL-3MASC-need.NONPAST

iskə miʃʃət dirəs n-əw məsriya-bet
until evening until COP-3MASC work-place
 jəm-m-i-k’ojj-u-t
REL.NONPAST-3(PL)-stay.NONPAST-PL-DEF
 ‘because this thing needs a lot of time, it’s until
 evening that they’ll stay behind at work’

Anatolian Languages

J G Macqueen, University of Bristol, Bristol, UK

© 1994 Elsevier Ltd. All rights reserved.

Strictly speaking the term ‘Anatolian Languages’ should refer to all the languages which are or have been in use in the region known as Anatolia (modern Turkey). In practice however the term is reserved for the Indo-European languages which were in use in that area in the second and first millennia BC (*see Indo-European Languages*).

The Anatolian Languages

For the second millennium, the most fully documented of these languages is Hittite (*see Hittite*), the main language of the extensive archives dated ca. 1650–1180 BC and preserved in cuneiform script on clay tablets at the site of Boğazköy (now Boğazkale) in central Anatolia. Less amply documented Anatolian languages from the same archives are Luwian and

Palaic, while a fourth language, written in a locally developed hieroglyphic script and preserved mainly on seal-impressions and on rock-monuments scattered over a wide area of Anatolia (there is evidence to suggest that it may also have been employed in documents written on wax thinly spread on wooden tablets) is rather clumsily known as Hieroglyphic Luwian or (less accurately) Hieroglyphic Hittite.

This language continued in use for inscriptions on stone in southeast Anatolia and north Syria well into the first millennium, while further west the local languages of Lycia and Lydia in the classical period, though written in scripts related to that of contemporary Greece, show clear signs that they too are members of the Anatolian group. Place names also provide evidence for the survival of Anatolian languages into the Roman period.

Phonology

In the area of phonology, a distinctive feature of the group is that Indo-European *o* is totally absent from

the vowel-system. But the most important distinguishing feature is the survival of at least some of the postulated Indo-European laryngeals which have been lost in all other groups. The nature and number of these laryngeals are still very much under discussion, but their appearance in the Anatolian languages offers strong support to the basic correctness of the theory first put forward by Saussure.

Morphology

The principal distinguishing characteristic of the group in the area of morphology is its lack of many features of the common Indo-European grammatical inventory. In the noun, for instance, the feminine gender is entirely absent, as is the dual number. Several parts of the plural paradigm are also lacking, although the singular retains a larger number of case forms. In the verbal system an even greater simplification has taken place, with only two moods (indicative and imperative) and only two tenses (present and preterite). Features such as reduplication and infixes -s-, elsewhere used in tense-formation, do exist, but they do not play any part in the Anatolian tense-system. There are two conjugations, known after the first present singular of each as the ‘*mi*-conjugation’ and the ‘*hi*-conjugation.’ Of these the former shows clear links with the Indo-European present-system, while the latter, though showing no ‘perfect’ characteristics in its use, seems to preserve in its endings elements of the Indo-European perfect. A medio-passive voice, with a similarly reduced mood- and tense-system, is also clearly attested.

Lexicon

Characteristic of the Anatolian lexicon is the extensive loss of original Indo-European vocabulary. Yet sufficient survives to indicate, as does the grammatical material, that the Anatolian languages, though subject throughout their history to a great deal of influence from non-Indo-European sources, still maintained their basic character as members of that family.

Particles

A lesser distinctive feature of the Anatolian languages is their liking for ‘chains’ of particles and enclitic pronouns placed at the beginning of a sentence or clause. Among these particles is one which serves the function of indicating indirect speech.

Division into Dialects

Study of the available texts has now made it possible to construct a dialect pattern of the Anatolian

languages. In the second millennium there is a clear distinction between northern (Hittite) and southern (Luwian) Anatolian. In phonology the main criterion is the treatment of Proto-Anatolian *e*, which in northern Anatolian with increasing closure moved towards *i*, while in the south it became more open and partially fused with *a*, thus obliterating the ablaut patterns which survived in the north. Among other distinctive features is the treatment of the voiceless dental before *i*. This is retained in the south, but affricated in the north; thus the 3pl ending is *-nti* in Luwian, but *-nzi* in Hittite. In the north too voiced dentals were assibilated before *i*, while in the south loss of voice was the rule (Hittite *siuni-* ‘god,’ *siwatt-* ‘day,’ as opposed to Luwian *Tiwat* ‘sun-god’).

In noun morphology the south shows a high proportion of *-i*-stems while the north retains a greater number of *-a*-stems; the north too shows a proliferation of *r/n*-stems in contrast to their disappearance in the south. The Indo-European nominative and accusative plural endings are retained in the north (Hittite *-es*, *us < ns*) but replaced in the south by Luwian *-nzi* and *-nza*, forms possibly of pronominal origin. The number of case forms, already reduced in Proto-Anatolian, is further reduced in the south, where in Luwian the genitive singular almost entirely disappears and is replaced by an adjectival suffix *-assi-*. In pronominal declension the south shows much more leveling with nounforms than the north, while in the verbal system the principal southern distinction is the lack of the *-hi* conjugation present tense, although such forms as the Luwian first person singular preterite in *-ha* (not found in Hittite where the preterite is formed by the addition of secondary endings to the present stem) are ultimately related to the same source. Lesser distinctions are northern iterative *-sk-* as opposed to southern *-s(s)-*, and the retention in the south, but not in the north, of an archaic passive participle in *-mmi-*.

The features displayed by Palaic are mainly those of the northern subdivision, though some southern features (e.g., *e > a*, and the affrication of the voiceless dental before *i*) are clearly present. The language written in hieroglyphic script, on the other hand, is clearly southern in character, and is best described as East Luwian.

In the first millennium sources for North Anatolian are lacking, but East Luwian continues in use for several hundred years, showing a number of features which distinguish it from the Central Luwian of the previous period (e.g., nom pl in *-(a)i*, dat-loc pl in *-i*); and later still in western Anatolia, Lycian appears as a latter-day West Luwian language with its own local peculiarities (e.g., acc pl *-as*, dat-loc pl *-a* or *-e*, gen pl *-āi*; replacement of both Luwian *a (< e)* and Hittite

a by *e*). The position of Lydian is more difficult to establish. The apparent retention of *i* (< *e*), and the preponderance of *-a*-stems, for instance, point strongly towards the north, while features such as the disappearance of the genitive and its replacement by an adjectival suffix (in this case *-li-*) suggest a closer connection with the south.

Origins

Despite attempts to locate the ‘homeland’ of Indo-European within Anatolia itself, or immediately to the east of it, it is more generally accepted that the ancestor of the languages was introduced to the area from the north, more probably via the Balkans than via the Caucasus, and that the divisions described above took place in Anatolia during the third and early second millennia BC. The distinctive character of Anatolian, combining as it does extensive loss of original features (e.g., the feminine) with retention of other features which are extremely archaic (e.g., the laryngeals) makes it extremely likely that it diverged from the rest of the Indo-European continuum at an early stage, and was thus subject to a very long period of attrition from other languages with which it came into contact. There is however no need to postulate an earlier ‘Indo-Hittite’ from which the Anatolian languages on the one hand and

the Indo-European languages on the other are separately descended.

Ancient Egyptian and Coptic

J D Ray, University of Cambridge,
Cambridge, UK

© 2006 Elsevier Ltd. All rights reserved.

The Ancient Egyptian language is first attested a little before 3000 B.C., when the earliest inscriptions in hieroglyphic make their appearance. Connected texts of some length are found from about 2700 B.C., and these develop into a considerable literature, which forms one of our major sources of information about the ancient Near East. The language survived the downfall of the Roman Empire and the transition to Christianity, and in its latest form, written in a modification of the Greek alphabet, it is known as Coptic. Coptic survived until well after 1000 A.D. Egyptian therefore has the longest attested history of any language, and this makes it uniquely important to linguistics. The language is a member of the Afroasiatic family (sometimes referred to as Hamito-Semitic), although its exact place within this family is

disputed. Many of the related languages were not written down until modern times, and several ‘missing links’ may never have been recorded at all. Egyptian shares the preference of most of this family for triconsonantal roots, from which whole families of words may be formed, normally through variations on the internal vowels and the use of some affixes. It may be this feature that encouraged the Egyptians to omit the vowels from their writing system. The language recognizes two genders, conventionally termed masculine and feminine; neuter meanings are expressed in the early stages of the language by the feminine, later by the masculine. It is possible that case endings, similar to those in some Semitic languages, existed at a very early stage of Egyptian, but they are not written and soon fell away. Traces may remain in the so-called construct state, where a direct genitive relationship is expressed by two nouns apparently in apposition. Grammatical function is marked by strict word order. A dual number is recognized alongside singular and plural.

The Egyptian verb has unique features. A stative tense, known in Coptic as the qualitative, seems to be inherited from an early stage of Afroasiatic, and has cognates in Akkadian (Egyptian). This tense expresses the result of a verbal action, and is often best rendered by an adjective or an adverbial phrase: ‘open, continuous, far away, already knowing,’ or the like. The narrative tense system, on the other hand, is peculiar to Egyptian, and appears to consist of various verbal nouns with possessive suffixes for subject (‘his hearing’ developing into ‘he hears’). Other forms include a possessive construction with parallels to modern perfects (‘hearing to him’ developing into ‘he has heard’), and an infixed series which expresses past, present, and future contingency. There is also a set of so-called active participles, which are really epithets or nouns of agent (‘a hearer’), and a sequence of relative tenses formed from passive participles (‘his heard one’ developing into ‘the one which he heard’). Participles and relative forms show two aspects, perfective and imperfective, depending on whether the action is envisaged as completed or not; there are also traces of a prospective, which has future or subjunctive force. Aspect also features in the narrative tenses, where prospective and probably circumstantial forms also occur. The language is VSO in narrative contexts, but stative constructions take the form SV. A remarkable feature is that four uses of the English verb ‘to be’ – existential, predicative, identifying, and partaking of a quality – are rendered by distinct constructions. On the other hand, there is no verb ‘to have,’ which is conveyed by periphrases such as ‘there is to me.’ A welcome omission is comparative inflection of adjectives: ‘she is better than I’ is expressed simply as ‘she is good against/in respect to/ me.’

This is the form taken by Egyptian in its classic period, Middle Egyptian, during the early second millennium B.C. This canonical stage was recognized by the Egyptians themselves, and was retained in formal inscriptions until the end of Pharaonic history. However, after about 1400 B.C., pressure from the spoken language, which was constantly changing, began increasingly to affect the written texts. The result is Late Egyptian, which took over many of the functions of its predecessor. Late Egyptian, which is the direct ancestor of Coptic, stands to Middle Egyptian rather as Italian does to Latin, although phonetic changes are often concealed by the continuity of the script. Word order is noticeably freer. The most obvious innovations are in the verb, where the old patterns are replaced by analytic expressions derived from obsolescent verbal forms. This process – which is strikingly similar to the development of modern English – leads to greater emphasis on time distinction and modal subtleties. The number of compound ‘tenses’ in

such a system is almost limitless, although one distinction present in the last phase of Late Egyptian – that between preterite and present perfect – is lost in Coptic. One unusual feature of Late Egyptian is the existence of a second series of tenses, which throw emphasis on an adverbial adjunct. These may have originated in the relative forms (‘what he heard (is) yesterday’ developing into ‘it was yesterday that he heard’). This system is foreshadowed in Middle Egyptian, although the details are not yet understood. The development of the verbal system makes Coptic appear an SVO language, although this is historically accidental. Coptic also dispenses with most adjectives, the passive voice, and most plurals, preferring stative paraphrases, using active third-person plural constructions, and marking the plural of nouns merely by the forms of the article, possessive adjective, or demonstrative. Late Egyptian contains many Semitic loanwords; Coptic, on the other hand, is almost as full of Greek words as modern English is of French or Latin.

Egyptian throughout its history deserves the epithet *lingua geometrica*, given to it in the 19th century, when the regularity and elegance of its constructions were first appreciated. The following examples may illustrate this. (Egyptian is conventionally transliterated into Romanized consonants.)

Middle Egyptian:

| | | | | |
|--------------|---------|---------|----------------|-----------|
| ḥ'.n | h3b.n | wi | ḥm.f | r |
| arise+pa | send+pa | me | embodiment+his | to |
| K3š | r | sn-nw | sp, | ib.f |
| Cush | for | two+ord | occasion, | heart+his |
| 3w | im.i | r | bt | nbt |
| content+stat | in+me | against | thing | any+f/sg |

‘As a result his majesty sent me to Nubia for a second time, his heart being pleased with me more than anything.’

Late Egyptian:

| | | | | |
|--------------|--------------|-----------|-----------------|----------|
| wn.in | Pr-3 | ḥr | h3b.i | r |
| exist+pa | contingency | Pharaoh | upon sending+me | to |
| p3 | t3 | Nḥs | n | p3 |

Andean Languages

W F H Adelaar, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

‘Andean languages’ is a cover term for the native indigenous languages spoken in the western part of South America, more precisely in the Andean mountain ranges and the adjacent Pacific coastal strip. Genealogically, the Andean languages do not constitute a unity. They comprise some language families, most of which have a limited geographical importance, as well as several linguistic isolates (languages without proven relatives or languages that have been left unclassified so far). An ‘Andean’ language family proposed by Greenberg (1987) covers only part of the Andean languages and has not been generally accepted. From a typological point of view, Andean languages are also highly diverse. Many Andean languages have become extinct and cannot be classified because of a lack of data.

From north to south, the following families and isolates are encountered. In the northern and eastern parts of the Colombian Andes, several languages belong to the Chibchan family, which extends further into Central America: Barí (Motilón; also in Venezuela), Chimila, Cuna (Kuna), Damana, Ika (Aruaco), Kogui (Cogui), and Tunebo (Uwa). The Muisca (Chibcha) and Duit languages, which have been extinct since the late 18th century, also belonged to the Chibchan family. Muisca, originally spoken in the surroundings of Bogotá, was a language of administration during the colonial period. Chibchan languages share a common

lexical base, but are highly diverse structurally. Some of them (Barí, Chimila) are tonal.

Chocoan, a small family comprising two languages, Waunana and Emberá, has its largest concentration in the Pacific regions of Colombia and Panama. It is one of the rare language groups in the Americas featuring ergative case. The Emberá, who occupy an expanding territory, are locally known under different names (Catío, Sambú, Saija, etc.).

Cariban, a large family with its center of gravity in the Amazonian region and in the Guyanas, is represented in the northeast of Colombia and in adjacent Venezuela by Opón-Carare (extinct), Yukpa (Motilón), and Japreria. Several extinct languages of the Magdalena valley received Cariban influence (Muzo, Colima, Panche, Pijao), although their exact classification remains undecided.

The Arawakan family, also one of the major Amazonian groupings, is represented on the Guajira peninsula, west of Lake Maracaibo, by two verb-initial languages, Guajiro (Wayuu) and Paraujano (Añú), a rarity for the Andean region. The Guajiro, with a population of about 300 000, are one of the fastest-growing indigenous groups in South America. Two small families, both extinct – Timote-Cuica and Jirajaran – were confined to the Venezuelan part of the Andes and its Caribbean foothills.

In the southern Andes of Colombia and adjacent Ecuador, the Barbacoan language family has five living members: Cayapa (Cha’palaachi, Chachi), Colorado (Tsafiki), Cuaiquer (Awa Pit), Guambiano, and Totoró. Several extinct languages (Cara, Pasto) may have belonged to this family, which extended

from the highlands to the Pacific Coast. In addition, several linguistic isolates are found in southern Colombia: Kamsá (Sibundoy), Páez (Nasa Yuwe), and the extinct Yurumanguí. On the coast of north-western Ecuador, the extinct Esmeraldeño (Atacame) language was also an isolate.

The central Andean region, which comprises the highlands and coast of Ecuador, Peru, and Bolivia, as well as northern Chile and northwestern Argentina, is dominated by two language families: Quechua(n) (see **Quechua**) and Aymaran (see **Aymara**). Both language groups are very similar from a phonological and structural point of view, and they share more than 20% of their lexicon. The Quechumaran hypothesis, which rests on these similarities, assumes that the two groups developed from a common source. However, nearly all the similarities can be explained by intensive contact (convergence), leaving the genealogical classification of both groups undecided. Quechua has about 8 000 000 speakers and is divided into numerous dialects with a limited degree of mutual intelligibility. Its territory extends from southern Colombia to northwestern Argentina with several interruptions. Aymaran comprises two, possibly three languages: Aymara (with over 2 000 000 speakers in Bolivia, Chile, and Peru), Jaqaru, and Cauqui (both in Peru). The typically agglutinating ('Altaic') structure based on suffixation of these languages has been considered characteristic for Andean languages, but the other languages in the region do not seem to share it in all respects. The Uru-Chipaya family, with one surviving language in Bolivia (Chipaya), has a different structure with some prefixation (along with suffixes) and extensive gender agreement.

The remaining languages of the central Andean region are all presumably extinct. They include (partly) documented languages, such as Atacameño (in northern Chile), Mochica (on the coast of northern Peru), and Puquina (in the border region of Bolivia and Peru). Some Puquina vocabulary (combined with Quechua morphology) survives in a professional language used by the Callahuaya herb doctors in Bolivia. Atacameño (Kunza) and Mochica are isolates, but Puquina may be distantly related to Arawakan. There is ample evidence of other, minimally documented languages: Panzaleo and the Puruhá-Cañar group in highland Ecuador, the Tallán-Sechura group (on the coast of northern Peru), Chacha and Culli (in the highlands of northern Peru), Quingnam (on the coast of central-northern Peru), Diaguíta (in northwestern Argentina and in Chile), and Humahuaca (in northwestern Argentina). In addition, in Argentina the Lule or Tonocoté language (extinct but documented) presumably had its origin in the Chaco region.

In the southern Andes, Mapuche (Mapudungun; also known as Araucanian) is the native language with the largest distribution. Originally the dominant language of Chile, it is now confined to an area in southern Chile (Biobío, Malleco, Cautín, Arauco, etc.) and several locations in the Argentinian pampas and in Patagonia. Its number of speakers may be close to 500 000 (no reliable count is available). The closely related Huilliche (Tsesungun) language, originally spoken in Osorno Valdivia and on the isle of Chiloé, is nearly extinct. Mapuche is an agglutinating, suffixing language, as are Quechua and Aymara, but it differs from these languages in that it has practically no nominal morphology. By contrast, its verbal morphology is exceptionally rich. Some of its characteristics (interdental consonants, lack of case, noun incorporation) cause the Mapuche group to stand alone among the Andean languages. It has no known relatives. In the Argentinian region of Cuyo (Mendoza, San Juan), the unrelated Huarpean group (with the languages Allentiac and Millcayac) was spoken until the 17th century.

In the southern tip of Chile, the isolates known as Kawesqar (Qawasqar) or Alacaluf (in the archipelago west of the mainland) and Yahgan or Yamana (on the islands south of Tierra del Fuego) are both close to extinction. A third language, Chono (north of Kawesqar), has long been extinct. The Chon family, which comprises Ona or Selknam (on Tierra del Fuego), Tehuelche, Teushen, and Gününa Yajich (all in southern Argentina), is now only represented by Tehuelche, which is also nearly extinct.

An issue under debate is the affiliation of languages or language families situated on the eastern fringe of the Andes. From a genealogical viewpoint, this area is exceptionally diverse. Some of these languages share characteristics with Amazonian groups (e.g., 'Amazonian' classifiers, extensive prefixation, loose morphology, rich vowel systems, nasal harmony), whereas others are closer to Andean languages and seem to have had some relationship to the languages spoken in the highlands. Among the latter are Betoí and Cofán in Colombia (the latter also in Ecuador), the Jivaroan languages and the Candoshi group (in Ecuador and northern Peru), the Cahuapanan and Hibito-Cholón groups (in northern Peru), and a series of isolates on the Andean slopes of northern and eastern Bolivia (Leco, Mosetén, Movima, Yuracaré). Amuesha (Yanesha) found in Peru is an Arawakan language with a heavy Quechua admixture.

Because of massive language extinction, many Andean languages have disappeared during the last 500 years, leaving an incomplete picture of the original situation. It is not easy to link known languages to specific cultures established by archaeologists. Most

of the extinct languages were replaced by expanding local languages, such as Quechua, Aymara, and Mapuche, or by Spanish (now spoken by a majority of the population).

Arabic

S Procházka, University of Vienna, Vienna, Austria

© 2006 Elsevier Ltd. All rights reserved.

Arabic is the official language of 21 countries in the Middle East and North Africa, from Oman in the east to Mauritania in the west. This includes Israel, where Arabic is, after Hebrew, the second official language. Significant Arab minorities exist in Iran, Turkey, Chad, and Nigeria, as well as in western Europe and the Americas. With approximately 280 million native speakers, Arabic is by far the largest living representative of the Semitic language family. Because it is the language of the Koran and thus the liturgical language of Islam, Arabic also plays an important role for more than 1 billion Muslims worldwide.

History of the Language

Arabic is an offshoot of the Semitic branch of the Afro-Asiatic languages. According to the traditional classification of Semitic, Arabic is part of its southern subdivision and grouped with Ethiopic and South Arabian (by stressing the common *p > f* shift and the internal plurals). In the 1970s, Hetzron proposed placing Arabic with Aramaic and Canaanite in a 'Central Semitic' group (stressing the imperfect pattern and the *t* as a marker for the first- and second-person singular perfect). The problem of the affiliation

of Arabic within the Semitic languages continues to be discussed (see Faber, 1997).

Although people labeled Arabs are attested as early as the 9th century B.C.E. in Assyrian sources, the history and development of their language before the emergence of Islam, 1.5 millennia later, is largely unknown. Doubtless Arabic originated in the central and northern parts of the Arabian peninsula, later spreading northward to the edges of the Fertile Crescent. The first evidence of a language akin to Arabic are the so-called Ancient North Arabian inscriptions (5th century B.C.E. to approx. 4th century C.E.): these consist of thousands of short, and therefore linguistically scarcely informative, graffiti in a script derived from the South Arabian writing system and found mainly in western Arabia and southern Syria. There are traces of Arabic in the Aramaic inscriptions of the Nabateans and Palmyrenes – both certainly Arab people. Textual evidence of pre-Islamic Arabic is also found in a handful of inscriptions in early Arabic script from the 2nd to 6th centuries C.E.

Our richest source of pre-Islamic Arabic is a large corpus of orally transmitted poetry from the 6th and 7th centuries C.E., later compiled by Arab philologists. The language of these poems and, although not exactly identical to theirs, that of the Koran (proclaimed by Muhammad between circa 610 and 632) is usually termed 'Old Arabic.' These texts, although a kind of poetic koinè, contain phonetical,

morphological, and lexical inconsistencies that reflect the actual dialectal differences between the spoken tribal vernaculars of the era (on these, see Rabin, 1951).

The expansion of Arab territory during the Islamic conquests (7th–8th centuries) made Arabic the language of communication, administration, and liturgy for an empire that stretched from central Asia to the Atlantic. The form of Arabic described, systematized, and canonized by the Arab grammarians and lexicographers between the 8th and 10th centuries is called Classical Arabic (CA). It remains the only universally accepted standard of the language. During the Golden Age of the Abbasid caliphate (9th–10th centuries) CA became the linguistic vehicle of a highly developed civilization that brought forth a rich literature, including *belles-lettres* and religious and scientific works. The hegemony of Arabic during the Middle Ages, and its prestige as the ‘sacred’ language in which the holy book of the Koran had been revealed to humankind, have influenced the languages of all Muslim people, written and unwritten. Thus, the lexicon of languages such as Persian (Western Farsi), Urdu, Turkish, or Swahili include numerous CA words. In many Muslim countries, Arabic has continued to be the language of religious treatises, and the teaching of it forms part of school curricula.

The Present Situation

Modern Standard Arabic

During Ottoman rule over most parts of the Arab world (from the 16th century onward), Arabic stagnated linguistically and literarily. Thus, in the early 19th century, when Arab intellectuals began to ‘discover the West’ and to translate European works into Arabic, they soon recognized its lexical shortcomings. This was the starting point of Modern Standard Arabic (MSA). MSA is practically identical in phonology, morphology, and syntax to CA, but it exhibits major differences from it in lexicon, phraseology, and style. After World War I, the modernization of Arabic continued in the language academies of Damascus, Cairo, and other capitals, which coined and still are coining thousands of neologisms. But not all the problems have been solved and, particularly in technical and scientific terminology, Arabic has not yet reached the standard of European languages. Competition among the academies frequently resulted in several terms for one and the same thing, and many academic neologisms have not been accepted by the speech community, which often prefers a loanword from English or French. In the standard language, loans play a remarkably minor role, but

the phraseology and style of MSA is deeply influenced by English (and in the Maghreb by French), above all in the language of the media. Thus, it is justified to call MSA a register of Arabic clearly differentiated from the classical language. The importance of MSA is that, as the only accepted medium of written and formal oral communication, it constitutes the tie that linguistically binds the Arab world together. However, MSA has to be learned in school because the native tongue of every Arabic speaker remains his or her local dialect as used in everyday life by all social strata. Therefore, MSA is almost completely limited to written use and to highly formal speech (news, official speeches, and academic discourse). Actually, this diglossic situation has been inherent in Arabic for at least the past millennium. The two linguistic layers are, of course, in a state of permanent mutual influence, and between the extremes of ‘pure standard’ and ‘plain colloquial’ Arabic are levels such as ‘educated colloquial.’ During the past decades, active and, especially, passive knowledge of MSA has significantly increased because of better education and the media. This trend was recently reinforced by the establishment of pan-Arabic satellite channels, which enjoy great popularity. Thus, even if MSA remains restricted to the domain of written and formal speech, a continually growing portion of the speech community will be able to participate in it.

Arabic Dialects

The various dialects belong to a language type called ‘New Arabic,’ whereas both CA and (in spite of its label ‘modern’) present-day MSA are ‘Old Arabic.’ The term ‘Middle Arabic’ does not denote, as we might assume, an intermediate chronological stage but a form of written Arabic exhibiting deviations from the standard norm due to the influence of ‘New Arabic,’ (i.e., the dialects; see Veersteegh, 1997: 114–129).

Although there are numerous typological differences, it is widely accepted, especially among Arabic speakers themselves, that the distinction between Old and New Arabic is the presence or absence of the case and mood endings (in Arabic, *i‘rāb*). The question of when and how the transformation from the old to the new type of Arabic happened is one of the most intriguing and discussed issues of Arabic studies (good summaries are Holes, 1995: 7–14; Versteegh, 1997: 93–113). There are indications from inscriptions that in the speech of the Nabateans the case system may have broken down as early as the 1st century C.E. If this is true, the new type of Arabic would have been spread along the trade routes of northern and western Arabia before the rise of Islam. Nevertheless, it seems very likely that in the time of

Muhammad the structure of everyday Arabic was not identical, but quite close, to the language of the poetry and the Koran. Only the social and political turmoils during and after the conquests resulted in a rapid shift to New Arabic. It should be emphasized, however, that Arabic developed along a line of internal linguistic trends common to all modern Semitic languages and clearly traceable before that time. The argument, often urged by the Arabs themselves, that these changes were mainly caused by so many non-Arabs using Arabic must be rejected.

The new type of Arabic spread among the urban centers of the Fertile Crescent and Egypt (the countryside had not yet been Arabicized) in the aftermath of the conquests. The language of the Bedouins, however, was not, or was only slightly, affected by these changes until approximately 2 centuries later. Ferguson (1959) explained the relative homogeneity of the urban dialects by the existence of a single koinè in the 7th–8th centuries. Although this theory is not tenable in its entirety, it was the starting point of a fruitful scientific discussion. From the present point of view, it seems very likely that the resemblances among the urban dialects are the consequence of continuous convergence and the mutual leveling of several regional koinai (see the summary in Miller, 1986).

The greatest typological differences are found between the sedentary (urban and rural) dialects and the Bedouin dialects. Thus, the speech of a sedentary Bedouin living in the outskirts of Tunis, for example, typically is closer to that of a Bedouin of Mauritania living 2000 miles away than it is to the speech of his neighbors speaking the dialect of the city of Tunis. Another sharp division separates the North African or Maghrebi dialects (including Maltese) west of Egypt from those to the east. The eastern dialects themselves can be divided into four large groups: (1) Arabian Peninsula, (2) Mesopotamia, (3) Syria and Palestine, and (4) Egypt, Sudan, and Chad (see Fischer and Jastrow, 1980). Audio files of a great number of dialects are available on the Semitic Sound Archive website of the University of Heidelberg.

Structure of Arabic

Phonology

The Arabic vowel system consists of three vowels /a, i, u/, with a phonemic contrast of short and long, for example, [mudi:runa:] ‘our director’ versus [mudi:ru:na:] ‘our directors’. In contrast to this relatively small number of vowels, Arabic possesses 28 consonant phonemes (see Table 1), also with a phonemic short-long contrast, for example, [hama:m] ‘pigeons’ versus [ham:a:m] ‘bath’ (as is usual, isolated Arabic nouns are cited without their case endings). The characteristic sound of Arabic is created mainly by a couple of consonants articulated in the velar and postvelar regions of the vocal tract and by the four velarized (also called ‘emphatic’) consonants that also have a lowering effect on adjacent vowels.

The realization of the consonant phonemes in MSA reflects almost completely the situation of Old Arabic. Exceptions are *j* [dʒ] (ج), which was most probably pronounced [ʒ], and the somewhat problematic sound *ḍ* [ɗ] (ض). There is an ongoing discussion on the original pronunciation of this consonant, which was so characteristic that Arabic was even called ‘the language of the letter *dād*’ (*luḡhat aḍ-ḍād*). Most likely it was either a velarized lateral fricative [ɗ] or a lateralized variety of *d* [ɗ^l] (the latter perhaps reflected in such Spanish loans from Arabic as *alcalde* < ‘*al-qāḍī*’ ‘the judge’).

The present-day standard pronunciation of the consonants shows no regional variations other than the sound *ḍ* [ɗ] (ظ), which in many countries (e.g., Syria and Egypt) is pronounced *z* [z].

Except in religious utterances (i.e., the recitation of the Koran), other alterations are widely accepted, which make it quite easy to recognize the country of a given news broadcast. The most striking among these is the replacement of [dʒ] by [g] in Egypt or by [ʒ] in the Levant and large parts of North Africa.

The syllabic structure of CA is restricted to three types: CV, CV:, and CVC (under certain conditions also Ca:C/CayC). However, in MSA final short

Table 1 The consonants of standard Arabic

| | Bilabial | Labiodental | Dental Alveolar Postalveolar | Palatal | Velar | Uvular | Pharyngeal | Glottal |
|---------------------|----------|-------------|--|---------|-------|--------|------------|---------|
| Plosive | b | | ʔ d ɗ | | k | q | | ʔ |
| Nasal | m | | n | | | | | |
| Trill | | | r | | | | | |
| Fricative | | f | θ ð ð̣ s ʂ z (z) ^a ʃ dʒ | | x ɣ | | ħ ʕ | h |
| Approximant | | v | | j | | | | |
| Lateral approximant | | | l | | | | | |

^aThe sound /z/ is used in some countries (e.g., Egypt, Syria, and Lebanon) instead of ð̣.

vowels are often omitted, so CV:C and CVCC are also found. An Arabic word cannot begin with a vowel, and two vowels must be separated by no fewer than one consonant but by no more than two consonants.

Phonology of the Dialects Leaving aside the lexicon, the greatest difference among Arabic dialects is in phonology. The following summary provides only a general overview. In all modern dialects (with negligible exceptions in Yemen) the non-initial [ʔ] is lost and the two sounds ڤ (ظ) and ڤ (ض) are mingled into one sound [ð]. The consonants that most frequently exhibit changes compared to CA are (1) the three interdental fricatives [ð], [θ], and [ð̤] that, in the majority of the sedentary dialects, have been shifted to corresponding postdental stops (i.e., [d], [t], [d̤]); (2) the affricate [dʒ], which is pronounced [ʒ] in Central Arabia and the Sudan, [ʒ] in large parts of North Africa and the Levant, [g] in Lower Egypt, and [j] along the Arab Gulf; and (3) the reflexes of CA *q* (usually indicates whether a dialect is of the Bedouin or the sedentary type), which in Bedouin dialects has a voiced pronunciation ([g], [dz], [dʒ]) but in sedentary dialects is usually unvoiced ([q] or, as a typical urban phenomenon, [ʔ]).

Excluding the few that have been lengthened, all final short vowels of CA have been lost. There is also an almost universal tendency toward eliding unstressed short vowels (especially [i] and [u]) in open syllables (e.g., Cairo (Egyptian Spoken Arabic): [ʔjirib] ‘he drank’ versus [ʔjirbu] ‘they drank’). Many sedentary dialects exhibit a reduction of the inventory of short vowels from three to two (either *a/ə* or *u/ə*), whereas the majority of both Bedouin and sedentary dialects have developed a system of five long vowels [a:, e:, i:, o:, u:] as a result of the monophthongization of [ai] > [e:] and [au] > [o:].

Morphology

Derivational Morphology In all layers of Arabic, the bulk of the vocabulary is built on the principle of root and pattern. To express certain semantic terms (i.e., words), a purely consonantal root carrying the basic semantic information is combined with a limited set of patterns using a fixed sequence of consonants, vowels, and optional prefixes and suffixes. Most of the roots consist of three consonants called radicals. Those with four consonants are by no means rare, but are often merely extensions of triconsonantal roots. A few words of the most elementary vocabulary have only two radicals, for example, *ʾab* ‘father’, *yad* ‘hand’, and *mā* ‘water’. Such words, and the numerous instances of triconsonantal roots with two

common radicals expressing similar semantic concepts, have fueled speculations that the original system was built on a biconsonantal root system.

Many patterns are semantically and morphologically ambiguous; that is, one and the same pattern can serve for different semantic concepts and can be used for both verbs and nouns and for both singular and plural. Nevertheless, there are also patterns that are used exclusively for verbs or for certain semantic or morphological classes.

- CuCayC is the pattern of diminutives, for example, *kuwayt* ‘small fortress’.
- maCCaC/-a is used for nouns of place, for example, *maktab* ‘office’, *maktaba* ‘library’ (root *k-t-b* ‘writing’).
- miCCaC/miCCāC is used for instruments, for example, *miṣʿad* ‘elevator’ (root *ṣ-ʿ-d* ‘ascending’), *miḥtāh* ‘key’ (root *f-t-h* ‘opening’).
- CaCCāC denotes professions, for example, *jazzār* ‘butcher’ (root *j-z-r* ‘slaughtering’).
- CaCCāCa is used for professions of females and instruments, for example, *ghassāla* ‘washer-woman, washing machine’ (root *gh-s-l* ‘washing’), *barrāda* ‘refrigerator’ (root *b-r-d* ‘cold’).

As can be seen from *miṣʿad* and *barrāda*, the system of derivation is widely used for the creation of neologisms. Although noun patterns are quite numerous (approximately 90 in CA) and are mostly not clearly related to semantic classes, the derivation of verbs is practically limited to 10 stems for triconsonantal roots and two for quadriconsonantal roots. Each stem has a set of five patterns reserved for the perfect and imperfect base, for the active and passive participle, and for a verbal noun (also called infinitive, lexicalized, i.e., not predictable, in stem I). As is shown in Table 2, certain functions can generally be attributed to each verb stem, although in detail the situation is highly complex (see the overview in Cuvalay-Haak, 1997: 95–108).

The principle is exemplified by the root *q-ṭ-ʿ* ‘cutting’.

- I: *qaṭaʿ-a* ‘to cut (in two)’.
- II: *qaṭṭaʿ-a* ‘to cut into pieces’.
- III: *qāṭaʿ-a* ‘to dissociate’.
- IV: *ʾaqṭaʿ-a* ‘to make cut’.
- V: *taqaṭṭaʿ-a* ‘to be cut off’.
- VI: *taqāṭaʿ-a* ‘to break off mutual relations’.
- VII: *ʾinqaṭaʿ-a* ‘to be cut off’.
- VIII: *ʾiqṭaṭaʿ-a* ‘to take a part’.

Note that no root is combined with all 10 stems.

The root-pattern system of derivation is responsible for the remarkable uniformity of the Arabic lexicon. Only a very few types of roots, above all those

Table 2 Stems of triconsonantal verbs in Standard Arabic

| Stem | Perfect | Imperfect | Verbal noun | Active participle ^a | General functions | Frequency/MSA ^b |
|------|------------|--------------|--------------------------|--------------------------------|----------------------|----------------------------|
| I | CaCVC- | ya-CCVC- | CVCC/CVCVC ^c | CāCiC- | basic | 40.07% |
| II | CaCCaC- | yu-CaCCiC- | taCCiC- | muCaCCiC- | causative/intensive | 14.28% |
| III | CāCaC- | yu-CāCiC- | muCāCaC-at- ^d | muCāC:C | conative and others | 5.14% |
| IV | 'aCCaC- | yu-CCiC- | 'iCCāC:C | muCCiC- | causative/factitive | 10.56% |
| V | taCaCCaC- | ya-taCaCCaC- | taCaCCuC- | mutaCaCCiC- | reflexive/passive | 10.80% |
| VI | taCāCaC- | ya-taCāCaC- | taCāCuC- | mutaCāCiC- | reciprocal | 4.44% |
| VII | 'inCaCaC- | ya-nCaCiC- | 'inCiCāC- | munCaCiC- | intransitive/passive | 2.93% |
| VIII | 'iCtaCaC- | ya-CtaCiC- | 'iCtiCāC- | muCtaCiC- | reflexive | 6.94% |
| IX | 'iCCaCC- | ya-CCaCC- | 'iCCiCāC- | muCCaCC- | colors ^e | 0.19% |
| X | 'istaCCaC- | ya-staCCiC- | 'istiCCāC- | mustaCCiC- | reflexive and others | 4.67% |

^aThe passive participle has an *a* instead of *i* in the last syllable, except in stem I, where the pattern maCCūC-is used.

^bRelative frequency of the stems in a modern dictionary; from Cuvalay-Haak (1997: 88).

^cBoth occur also with the suffix-*at*; there are numerous other patterns, in CA approximately 40.

^dAnd CiCāC-.

^eFor instance 'ihmarra 'to be red, to blush'.

containing the two weak consonants *w* and *y*, cause changes in most patterns; but, because even these follow certain rules, Arabic morphology is almost completely free of irregularities.

Noun Inflection The class of nouns comprises substantives, adjectives, and numerals; the categories gender, number, definiteness/indefiniteness, and case are differentiated. Arabic has two genders, masculine and feminine, the latter marked usually by the suffix-*a(t)* and in some noun patterns by *-ā'/-ā*. Among the unmarked feminines are nouns denoting beings of the female sex (e.g., 'umm 'mother'), paired parts of the body (e.g., 'ayn 'eye'), and some basic concepts of nature (e.g., 'arḍ 'earth', shams 'sun', and nār 'fire').

The number system is trifold: singular (unmarked), dual (suffix *-āni*), and plural. The plural is formed either by suffixation (MASC PL *-ūna*; FEM PL *-āt*) or more frequently by a complete restructuring of the word (thus the term internal or 'broken' plural), for example, *bayt* 'house', *buyūt* 'houses'; *kitāb* 'book', *kutub* 'books'; *miftāḥ* 'key', *mafātīḥ* 'keys'. A number of patterns (especially those containing three vowels) are restricted to plurals, but many others are used for both numbers; the pattern CiCāC, for instance, is singular in *kitāb* 'book', but plural in *jibāl* 'mountains' (for broken plurals see, Murtonen, 1964). Indefiniteness is usually expressed by a final *-n*, for example, *bayt-u-n* 'a house'; definiteness is usually expressed by the proclitic article 'al- (assimilated to dentals, sibilants, *n*, and *r*), by a pronominal suffix, or by a following genitive, for example, 'al-bayt-u 'the house', *bayt-u-nā* 'our house', *bayt-u ḥasan-i-n* 'Hasan's house'.

Arabic has the three cases, nominative, genitive, and accusative, which are differentiated in the singular and in broken plurals by declensions marked by

the final vowel, for example, NOM 'al-bint-u, GEN 'al-bint-i, ACC 'al-bint-a 'the girl'. The dual and external plural have common forms for the genitive and accusative (DUAL *-ayni*, MASC PL *-ina*, FEM PL *-āt-i-n*), a feature that is shared by a second (called 'diptote') type of declension (NOM *-u*, GEN/ACC *-a*) used primarily in female or foreign personal names and in certain plural patterns (in indefinite status).

Pronouns In pronouns, and hence in verbal inflection, Arabic distinguishes between masculine and feminine in all but the first person and the dual (see Table 3). Independent personal pronouns exist only in the nominative; for the other cases, suffixed forms are used, for example, 'anti marīḍ-at-u-n 'you (FEM SING) are ill', *bayt-u-ki* 'your (FEM SING) house', *qabbala-ki* 'he kissed you (FEM SING)'.³

The relative pronouns and the two sets of demonstrative pronouns (for near and far deixis) also differentiate gender and number.

Verb Inflection Arabic has a twofold system for the inflection of finite verbs: a suffix-based conjugation, traditionally called 'perfect', and a prefix-based conjugation, called 'imperfect'. For both of these bases, a second set of vowel patterns exists to form a passive voice, for example, in stem I *ḍarab-a* 'he hit' versus *ḍurib-a* 'he was hit'; *ya-ḍrib-u* 'he hits' versus *yu-ḍrib-u* 'he is hit'. Usually the passive is used when the agent of a sentence is not mentioned or to express impersonality, for example, *ya-dkbul-u* 'he enters' versus *yu-dkbal-u* 'one enters'.

The imperfect has four moods, morphologically marked by different suffixes (the examples in parentheses are the forms of 'to write' in third-person singular masculine): indicative (*ya-ktub-u*), subjunctive (*ya-ktub-a*), jussive (*ya-ktub-Ø*), and

Table 3 Personal pronouns

| | Singular | | Dual | | Plural | |
|--------|-------------|----------------------|-------------|-------------|-------------|---------------|
| | Independent | Suffixed | Independent | Suffixed | Independent | Suffixed |
| 1 | 'anā | -nī -ī ^a | | | nahnu | -nā |
| 2 MASC | 'anta | -ka | 'antumā | -kumā | 'antum | -kum |
| 3 FEM | 'anti | -ki | 'antumā | -kumā | 'antunna | -kunna |
| 3 MASC | huwa | -hū/-hī | humā | -humā/-himā | hum | -hum/-him |
| 3 FEM | hiya | -hā | humā | -humā/-himā | hunna | -hunna/-hinna |

^a-nī is used with verbs, -ī with nouns and prepositions.

the so-called energetic (*ya-ktub-anna*), which is used in CA to express very strong assertions but is almost obsolete in MSA. The imperative is basically a subset of the jussive without prefixes. The verb conjugation expresses person, gender, and number. The system is, except for an additional dual for third-person feminine, analogous to the pronouns given in Table 3.

Morphology of the Dialects Generally speaking, no radical structural changes appear in the morphology of the dialects as compared to CA. Morphological derivation by applying the principle of root and pattern has been slightly simplified (there are fewer patterns compared to CA), but has remained productive. The most striking morphological difference between CA/MSA and all dialects is the lack of a case system. The indefinite marker *-n* has not survived except in some Bedouin dialects where it is found in a few syntactical positions such as attribution (e.g., North Syrian Bedouin: *bēt-in chibīr* 'a big house'). Some dialects (e.g., Iraqi), however, have developed an indefinite article.

All dialects lack dual forms of the pronouns and verbs, and most sedentary dialects have given up gender distinctions in the plural and those in North Africa no longer have gender distinctions in the second-person singular, as well. Together with nouns, the category dual is fully productive in the east, but in the sedentary dialects west of Egypt the dual is usually expressed by the numeral 'two' followed by a noun in the plural.

For the verbs, the perfect conjugation has not changed significantly. In the imperfect, however, the category mood is not expressed by internal inflection (a result of the loss of final short vowels) but, instead, where not completely obsolete, by modifiers prefixed to the verb. For example, in Damascus *b-yashrab* 'he drinks' roughly corresponds to the indicative and *yashrab* to the subjunctive/jussive. The formation of an internal passive voice seems to be limited to a few Bedouin dialects. In other dialects, certain verbal

stems (especially VII and VIII) are used to express passive voice, for example, Damascus: *ḥabas* 'he imprisoned' (stem I) versus *nḥabas* 'he was imprisoned' (stem VII).

Syntax

Tense and Aspect The verbal system of Arabic can be described as a combination of aspect and time reference. The suffix conjugation (called 'perfect') serves for the past and for the perfective (completed/factual) aspect, and the prefix conjugation serves for the nonpast (present/future) and for the imperfective (noncompleted/ongoing) aspect, including habituality, continuousness, and progressivity. An exception is the combination of the negation *lam* and the jussive mood, which indicates the negation of the perfect (e.g., *lam ya-ktub* 'he has not written').

The Arabic tense system is to a high degree a relative one. In main clauses, the temporal reference point is usually the moment of speaking, whereas in complement clauses the time has to be derived by reference from the main verb. Verbs in the perfect are also used in conditional clauses, in wishes and curses, and for assertions of factuality:

Allāh-u 'azz-a wa-jall-a
God-NOM was.mighty-PERF and-was.sublime-PERF
 'God, he is mighty and sublime'

Participles do not mark any particular time reference, but frequently serve for a resultant aspect; that is, they describe an action that bears relevance to the moment of speaking.

Word Order The basic neutral word order of Arabic is VSO, but thematization of the subject is achieved by SVO. The latter therefore is not possible if the subject is indefinite, in which case sometimes also VOS appears.

The foreground/background distinction also influences word order. Generally VS is used for foreground information and events, and SV for background information and descriptions.

An adjectival attribute follows its head noun and agrees with it in case, in definiteness, and – with restrictions – in gender and number:

| | |
|---|---|
| bayt-u-n <i>house.MASC.SING-NOM-</i> INDEF | kabīr-u-n <i>big.MASC.SING-NOM-</i> INDEF |
| ‘a big house’ | |
| fi l-qal‘-at-i <i>in the.DEF-fortress.SING-FEM-</i> GEN | l-kabīr-at-i <i>the.DEF-big.SING-FEM-</i> GEN |
| ‘in the big fortress’ | |

Nominal annexations are in the genitive case and follow the head noun, which is morphologically determined (i.e., in the so-called *status constructus*). Indefinite/definite is therefore indicated solely by the noun annexed to it, for example, *bāb-u bayt-in* ‘a door of a house’ versus *bāb-u l-bayt-i* ‘the door of the house’. Although the number of annexations is theoretically unrestricted, there can be only one head noun. In phrases such as ‘the director and the teachers of the school’ the second head noun follows the genitive and takes a suffix referring to it:

| | | |
|---|--|--|
| mudīr-u <i>director.MASC-</i> NOM | l-madras-at-i <i>the-school-</i> FEM-GEN | wa-mu‘allim-ū-hā <i>and-teachers-</i> NOM-PL-her.FEM |
| ‘the director and the teachers of the school’ | | |

Under the influence of European languages, this rule is frequently ignored in MSA.

Agreement Strict agreement in gender and number exists only in the singular. Nouns in the plural agree with feminine singular unless they denote human beings.

| | |
|---|---|
| kutub-u-n <i>books.MASC.PL-NOM-</i> INDEF | qayyim-at-u-n <i>precious-FEM.SING-NOM-</i> INDEF |
| ‘precious books’ | |
| riḡāl-u-n <i>men.MASC.PL-NOM-</i> INDEF | kirām-u-n <i>generous.MASC.PL-NOM-</i> INDEF |
| ‘generous men’ | |
| ‘ar-riḡāl-u <i>the-men.MASC.PL-NOM.DEF</i> | katab-ū <i>wrote-MASC.PL</i> |
| ‘the men wrote’ | |
| ‘al-banāt-u <i>the-girls.FEM.PL-NOM.DEF</i> | ḡāḡik-na <i>laughed-FEM.PL</i> |
| ‘the girls laughed’ | |

However, if the verb precedes its nominal subject, it agrees in gender but not in number:

| | |
|---------------------------------------|--|
| katab-a <i>wrote-MASC.SING</i> | r-riḡāl-u <i>the-men.MASC.PL-NOM.DEF</i> |
| ‘the men wrote’ | |
| ḡāḡik-at-i <i>laughed-FEM.SING</i> | l-banāt-u <i>the-girls.FEM.PL-NOM.DEF</i> |
| ‘the girls laughed’ | |

A special case of agreement occurs with the cardinal numbers from 3 to 10, which take the opposite gender of the counted noun’s singular, itself added in the genitive plural:

| | | |
|---------------------------------------|---|--|
| khams-u <i>five.MASC-</i> NOM | sanaw-āt-i-n <i>years-PL-GEN-</i> INDEF | [san-at-u-n] <i>[year-FEM.SING-NOM-</i> INDEF] |
| ‘five years’ | | |
| khams-at-u <i>five-FEM-</i> NOM | ‘ayyām-i-n <i>days.PL-GEN-INDEF</i> | [yawm-u-n] <i>[day.MASC.SING-</i> NOM-INDEF] |
| ‘five days’ | | |

Equational Sentences Positive equational sentences in the present have no copula:

| | |
|--|---|
| ‘al-bayt-u <i>the-house.MASC.SING-</i> NOM.DEF | kabīr-u-n <i>big.MASC.SING-NOM-</i> INDEF |
| ‘the house is big’ | |
| ‘anti <i>you.FEM.SING.NOM</i> | ṭabīb-at-u-n <i>physician-FEM.SING-NOM-INDEF</i> |
| ‘you (FEM) are a physician’ | |

For the negated present, the special verb *laysa* ‘to be not’ is used; in all other cases, appropriate forms of the verb *kān-a* ‘to be’ appear. Both verbs exhibit the peculiarity that their nominal complement is in the accusative:

| | | |
|------------------------------------|---------------------------------|-----------------------------------|
| ‘al-bayt-u <i>the-house-NOM</i> | laysa/kāna <i>is-not/was</i> | kabīr-a-n <i>big-ACC-INDEF</i> |
| ‘the house is not/was big’ | | |

Subordination Temporal, final, causative, and other clauses are usually introduced by subordinating conjunctions such as *lammā* ‘when’, *li-* ‘in order to’, and *li-‘anna* ‘because’.

Constructions with the conjunction *wa-* ‘and’ are frequently used to express simultaneousness of actions or events (in Arabic, called *ḡāl*, ‘circumstance’ sentence):

| | |
|--|--------------------------------------|
| dakhal-a <i>entered.PAST-3.SING</i> | l-ḡurfata <i>the-room</i> |
| wa-huwa <i>and-he</i> | yadḡak-u <i>laughs.PRES-INDIC</i> |
| ‘he entered the room laughing’ | |

Relative Clauses In Arabic, relative clauses are complete sentences that are normally linked to their head by a personal pronoun referring to it. A relative pronoun, which agrees in number and gender, is used only if the head is definite:

| | | | |
|-----------------------------------|---------------------------|--------------------|----------------------------|
| ‘al-bint-u <i>the-girl-NOM</i> | llatī <i>REL.PRON.</i> | hiya <i>she</i> | faqīr-at-un <i>poor</i> |
| ‘the girl who is poor’ | | | |

'al-bint-u llatī ra'ay-tu-hā 'amsi
the-girl- NOM REL.PRON. SING.FEM saw-1.SING- her.ACC yesterday
 'the girl whom I saw yesterday'

'al-bint-u llatī mā-t-at
the-girl-NOM REL.PRON.SING.FEM died-3.FEM
 'umm-u-hā

mother-NOM-her.GEN
 'the girl whose mother has died'

bint-u-n mā-t-at 'umm-u-hā
girl-NOM-INDEF died-3.FEM mother-NOM-her.GEN
 'a girl whose mother has died'

Syntax of the Dialects In principle, most dialects have preserved the combined time aspect system, although there are tendencies toward a stricter tense system (perfect for past, imperfect for nonpast). Frequently found as a discourse mechanism, however, is the narrative imperfect, in which a single past-time reference gives the frame for a following series of imperfective verb forms describing past actions or events. The perfect aspect expressed by the participle has become a well-established category in many, particularly eastern, dialects.

A great variety of auxiliary verbs (also called aspectualizers) exists for emphasizing punctual, durative, ingressive, progressive, and other aspects (see, for Cairo, Eisele, 1999).

Regarding word order, recent studies (Dahlgren, 1998; Brustad, 2000) have shown that the alleged preference of the dialects for SV order is true only for some urban dialects. On the whole, the same principles of thematization and foreground/background distinction obtain in the spoken vernaculars: "VSO represents the dominant typology in event narration, while SVO functions as topic-prominent typology that is used to describe and converse" (Brustad, 2000: 361). Particularly in dialogs, OVS is very frequent in topic-prominent structures, in which case a pronominal suffix has to mark the original place of the object, for example, in the Cairene dialect:

ukht-ak shuf-t-aha mbāriḥ
sister-your saw-1.SING-her yesterday
 'I saw your sister yesterday'

Agreement of nonhuman plural with feminine singular is possible, but in nearly all dialects 'logical' agreement is widely found. In the dialect of Damascus, both of the following phrases are equally acceptable: *byūt zghīre* ~ *byūt zghār* 'small houses'. Which of the two is used depends on semantic, idiomatic, and stylistic features insufficiently investigated in detail. In general, the word order has no influence on agreement; that is, a verb usually agrees with its nominal

subject in number whether the noun precedes or follows the verb.

Many dialects have developed so-called 'genitive exponents,' particles that are used under certain conditions for an analytic linking of two nouns or a noun and a pronoun suffix instead of a direct annexation. For example, in Arab Gulf dialect:

mēz māl ṭa'ām
table GEN PRT meal
 'dining table'

and in Cairo dialect:

il-baṣbūr bitā'i
the-passport GEN PRT-my
 'my passport'

Etymologically most of these particles can be traced back to a word meaning 'property' or 'right'. The choice whether an analytic or a synthetic construction is preferred depends on stylistic, semantic, and syntactical principles (Eksell Harning, 1980).

Arabic as an Introflecting Language

J C E Watson, University of Oslo, Oslo, Norway

© 2006 Elsevier Ltd. All rights reserved.

In some languages, words are constructed or partially constructed not through the concatenation of linearly separable morphemes (e.g., English un-accept-able), but by the interdigitation of morphological forms which individually do not constitute self-standing phonological wholes. This type of morphology is variably termed in the literature introflexional, nonconcatenative (McCarthy, 1981), or transfixing (Bauer, 2003). It is a pervasive feature of the Semitic languages, and is particularly highly developed in Arabic. A simple example of introflexion in Arabic is provided by *katab* 'wrote,' consisting of the root *k-t-b* {write}, the template CVCVC {PERF} and the vocalic melody a-a {ACT}.

Although introflexion is a central feature of Arabic, most inflectional and some derivational categories are expressed through affixation; many derivational categories, which are expressed principally by introflexion, take complementary prefixes or, less commonly, suffixes. This entry focuses on the morphology of Modern Standard Arabic, the formal written-based variety of the language, although many of the features outlined here are also found in the hundreds of Arabic dialects identifiable across the Arab world. The entry deals first with introflexing morphology in Arabic, sometimes in combination with affixation, and goes on to consider how introflexion interacts with inflecting morphology.

Root and Pattern

Basic noun and verb stems in Arabic comprise a consonantal root and a pattern. The pattern can be further divided into two elements – a prosodic template and a vocalic melody. Most consonantal roots are trilateral. The root prototypically expresses the content

meaning of the word, the pattern functional meaning. The association of the consonantal root and vocalic melody with the prosodic template is illustrated for the verb stem *katab* 'wrote.ACT' in **Figure 1**.

The consonantal root is always fully independent of the prosodic template; the vocalic melody, by contrast, shows independence for relatively few morphological categories; such examples include *katab* 'wrote.ACT' versus *kutib* 'wrote.PASS' in which the vocalic melody alone expresses voice. However, in the word *ʕilaaʕ* 'healing; treatment,' which comprises the consonantal root *ʕ-l-j* {heal; treat}, the prosodic template CVCVVC, and the vocalic melody *i-a*, the combination of the latter two expresses the category of verbal noun, rather than either the prosodic template or the vocalic melody independently.

Verbal Morphology

As illustrated in **Table 1**, Modern Standard Arabic has one basic verb form (form I) and nine derived forms (forms II–X), each of which typically imposes a more specific sense on that of the basic form: forms II, III, and IV are derived from form I by extension of

Figure 1 Association of consonantal root and vocalic melody.

Table 1 Verb forms I–X

| Typical meaning extension | Form | PERF ACT | Gloss | PERF PASS | IMPERF ACT | IMPERF PASS |
|---|------|----------|----------------------|------------|-------------|--------------|
| | I | katab | write | kutib | yaktub | yuktab |
| causative | II | kattab | make s.o. write | kuttiib | yukattiib | yukattiab |
| attempt | III | kaatab | correspond with s.o. | kuuttiib | yukaattiib | yukaattiab |
| causative | IV | ʔaktab | dictate | ʔuktiib | yuktiib | yuktab |
| reflexive of II | V | takattab | NA | tukuuttiib | yatakattiab | yutakattiab |
| reflexive of III | VI | takaatab | write to e.o. | tukuuttiib | yatakattiab | yutakaattiab |
| medio-passive | VII | inkatab | subscribe | unkuttiib | yankattiib | yunkattiab |
| reflexive | VIII | iktatab | be recorded | uktuttiib | yaktattiib | yuktattiab |
| be/come a color/defect (e.g., red/lame) | IX | iktabb | NA | uktibb | yaktibb | yuktabb |
| reflexive of IV | X | istaktab | ask s.o. to write | ustuttiib | yastattiib | yustattiab |

the stem; forms V and VI are derived by prefixation of *ta-* to forms II and III, respectively. Forms VII, IX, and X involve various types of prefixation, and form VIII is derived from form I by infixation of *t* after the left-most root consonant. No consonantal root in Modern Standard Arabic has all ten verb forms, and a few verbs have one or more derived forms but lack the basic form. The prosodic template expresses the verbal form, the vocalic melody voice and aspect. The imperfect is distinguished from the perfect by imperfect person prefixes, and, in the case of form I only, by a different prosodic template. The root *k-t-b* {write} is used to illustrate verb forms in Table 1. The prototypical meaning correlates of the derived forms are listed in column two, and the specific meanings associated with the root *k-t-b*, where attested for the form in question, in column four.

The vocalic melody *a-a* indicates perfect aspect active voice, *u-i* perfect aspect passive voice, and *u-a* imperfect aspect passive voice. Excepting forms I, V and VI, the vocalic melody is *(u)-(a)-i* for the imperfect aspect active voice, and *(u)-(a)-a* for the imperfect passive. The same vocalic melodies express voice in the verbal participles, which are distinguished from the verb forms by the complementary prefixation of *mu-* to the stem. Active and passive participles from verb forms II–X are illustrated in Table 2.

Nominal Morphology

In contrast to participles from forms II–X, participles from form I verbs are derived through prosodic change: lengthening of the left-most vowel for the active participle, and of the right-most vowel for the passive participle, which also takes the complementary prefix *ma-*. Thus, *katab* ‘wrote’ has the participles *kaatib* ‘writing; writer’ and *ma-ktuub* ‘written; letter.’

Finite verb stems are marked prosodically by a final light syllable – CVC, as seen in Table 1. As shown in Table 3, verbal nouns of most derived verbs (all tokens of forms IV, VII, VIII, IX, X, some of III), and a

Table 2 Active and passive participles

| Form | PART ACT | PART PASS |
|------|--------------|--------------|
| II | mukattiib | mukattiab |
| III | mukaattiib | mukaattiab |
| IV | muktiib | muktab |
| V | mutakattiib | mutakattiab |
| VI | mutakaattiib | mutakaattiab |
| VII | munkattiib | munkattiab |
| VIII | muktattiib | muktattiab |
| IX | muktibb | muktabb |
| X | mustattiib | mustattiab |

Table 3 Verbal noun patterns

| Form | Verbal noun |
|------|----------------------|
| I | kitaab-ah |
| II | taktiib |
| III | kitaab / mukaatab-ah |
| IV | ʔiktaab |
| V | takattub |
| VI | takaatub |
| VII | inkitaab |
| VIII | iktitaab |
| IX | iktaabb |
| X | istiktaab |

number of form I verbs, are derived from finite verbs by lengthening of the stem-final syllable to CVVC and the vocalic melody *i-a*, the inverse of the vocalic melody for the active participle. Exceptions are form II, which has a complementary prefix *ta-* and the vocalic melody *a-i*, one form III variant (*mu-kaatab-ah*), and forms V and VI, both distinguished from the finite verb by umlaut of the stem-final vowel to *-u-*.

Singular Nouns and Adjectives

In contrast to verbs, singular nouns and adjectives take a vast array of different prosodic templates and vocalic melodies. Some, such as CaCCaaC, typically used for nouns of profession (e.g., *jazzaar*

‘butcher’), and the typically adjectival CaCuuC (e.g., *ḥasuud* ‘envious’), and CaCiiC (e.g., *kabiir* ‘big; old’), have a restricted range of meanings. Other patterns, such as CaCC, have a large range of meanings, covering human (*jadd* ‘grandfather’), non-human (*kalb* ‘dog’), concrete (*baḥr* ‘sea’), abstract (*ʕaql* ‘intelligence’), and adjectives (*ḥayy* ‘alive’).

Broken Plurals and Diminutives

Plurals are formed in Arabic in one of two ways: either through ‘sound’ plural suffixes or through the rich set of ‘broken’ plurals, wherein the plural is derived by mapping a portion of the singular to a plural prosodic template. McCarthy and Prince (1990a,b, 1998) have successfully analyzed broken plural derivation in moraic terms. The majority of singulars comprising three or more moras take predictable broken plural patterns. To derive the plural from such nonminimal singulars, the first two moras of the singular are mapped to an iambic template. *makaatib* ‘offices’ is derived from *maktab* ‘office,’ for example, as follows: the first two moras of the singular (*mak*) are mapped to an iambic template ($\mu\ \mu\mu$) to give *mukmu*. The vocalic melody *-a-* associates to the moraic slots to give *makaa*. The remainder of the singular (*-tab*) is suffixed to the iamb, and where this contains a vocalic slot, as here, *-i-* of the plural vocalic melody overrides the vowel of the remainder, to give *makaatib*. In the case of words comprising two moras and a number of non-minimal words, the plural cannot be predicted as easily from the singular form. Examples include *bayt* ‘house’ pl. *buyuut*, *bint* ‘girl’ pl. *banaat*, *kitaab* ‘book’ pl. *kutub*, *walad* ‘boy’ pl. *ʔawlaad*.

Whereas broken plural derivation is predictable in a proportion of cases, the diminutive is totally predictable and can, at least as far as Standard Arabic is concerned, be derived from almost any singular noun or adjective: the first two moras of the unmarked singular are mapped to an iambic template, as for the broken plural. From *walad* ‘boy,’ *wala* maps to *wulmu*. The vocalic melody *u-ai* associates to the moraic slots to give *wulai*; the remainder of the singular (*-d*) is added, to derive *wulaid* ‘little boy’.

Elatives (Comparatives, Superlatives)

Elatives are derived predictably from most basic adjectives. The elative pattern is *ʔaCCaC* for trilateral roots. The vocalic melody (*-a-*) is dependent on the pattern. Examples include: *ʔakbar* ‘bigger; older’ (*kabiir* ‘big; old’); *ʔaʕʔab* ‘more difficult’ (*ʕaʕb* ‘difficult’); *ʔajban* ‘more cowardly’ (*jabaan* ‘cowardly’); *ʔaḥsan* ‘better’ (*ḥasan* ‘good’).

Inflectional Morphology

While stems are partially or wholly the product of introflection, grammatically complete words involve further affixation. Affixational elements include:

- Verbal pronominal prefixes and suffixes
- Object suffixes
- Possessive suffixes
- *-at-* feminine suffix
- Sound plurals
- Dual
- Case (nominative *-u*, accusative *-a*, genitive *-i*)
- *-n* suffix (indefinite/non-construct marker)
- Mood endings (indicative *-u*, subjunctive *-a*, jussive *-o*)

Pronominal prefixes and most suffixes, the feminine suffix, sound plurals and the dual comprise consonants and vowels, whereas all three case markers and indicative and subjunctive mood markers for the imperfect aspect are simple vowel endings. As seen in Table 4, pronominal subject markers are suffixal in the perfect aspect; in the imperfect aspect, pronominal markers are suffixal and/or prefixal. The jussive mood is given in Table 4 in the imperfect column. The indicative is expressed by suffixation of *-u* to forms ending in a root consonant (here *-b*) and suffixation of *-na* to forms ending in a vocalic suffix. The subjunctive is expressed by suffixation of *-a* to forms ending in a root consonant.

Sound Plural and Dual

Arabic has two nominal ‘sound’ plural suffixes: masculine and feminine. The sound feminine plural *-aat* takes the endings *-u* for nominative and *-i* for accusative or genitive case, and, further, *-n* to express indefiniteness or non-construct, as in:

mudarris-aat-u-n
teacher-FEM.PL.-NOM-INDEF
‘teachers FEM.PL.’

Table 4 Verbal inflections

| PERS/NUM/GEN | PERF | IMPERF.JUSSIVE |
|--------------|-------------|----------------|
| 1 s. | katab-tu | ʔ-aktub |
| 1 pl. | katab-naa | n-aktub |
| 2 s.m. | katab-ta | t-aktub |
| 2 s.f. | katab-ti | t-aktub-ii |
| 2 pl.m. | katab-tum | t-aktub-uu |
| 2 pl.f. | katab-tunna | t-aktub-na |
| 3 s.m. | katab-a | y-aktub |
| 3 s.f. | katab-at | t-aktub |
| 3 pl.m. | katab-uu | y-aktub-uu |
| 3 pl.f. | katab-na | y-aktub-na |

The sound masculine plural has two main forms: nominative *-uuna* and accusative/genitive *-iina*. The dual morpheme, suffixed to masculine or feminine nouns or adjectives, also has two main forms – *-aani* for the nominative and *-aini* for the accusative/genitive case.

Arabic Languages, Variation in

E Al-Wer, University of Essex, Wivenhoe Park, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Arabic is a native language to some 200 million people, distributed over 22 different countries collectively known as the 'Arab World.' The Arab World stretches from the Indian Ocean in the east to the Atlantic Ocean in the west and includes most of the countries of the Middle East, the whole of North Africa, and Sudan (as well as Somalia and Mauritania). The Asian part of the Arab World is commonly referred to as al Mashreq 'the East,' and the North African part (particularly from and including Libya westwards) as al Maghreb 'the West.' Egypt represents the geographical link between the East and the West, and the Egyptian dialects may be thought of as a bridge between the Maghreb and the Mashreq dialects. In terms of demographic distribution, approximately 66% of the total population live in the African part. The largest concentration of Arabic speakers is in Egypt (67 million).

A Historical Sketch

The ancient home of the Arabs is the Arab Peninsula, and the Arabic language is traced to the second millennium B.C. in the northern part of the peninsula. To varying extents, everywhere else, Arabic is a relative newcomer. From the peninsula, and starting in the second half of the seventh century A.D., the language was disseminated first through direct military conquest, and later it affirmed its position through intellectual influence. In the course of its spread northwards to the eastern Mediterranean, Mesopotamia, and Egypt it ousted Greek, Persian, Aramaic, and Coptic. In the Maghreb, Arabic obscured Berber, and although it never managed to obliterate Berber, which continues to be spoken by no less than 40 million people, it altered the linguistic shape of the region.

Arabic prospered in a climate of dominant Arab civilization and declined alongside the diminution in power and influence of the Arabs. The rise to power of the Ottoman Turkish Empire in the 16th century resulted in the replacement of Arabic by Turkish as the language of state administration, although Turkish never managed to replace colloquial Arabic as the

everyday language of communication in the Arabic speaking provinces. The Ottomans lost the Maghreb in the mid-19th century (to Italy in Libya, and to France in Morocco, Algeria, and Tunisia), and Egypt to Napoleon for a short period of time and then to Britain. The outcome of the First World War brought an end to Ottoman rule in the Mashreq. Most of the Arabic speaking provinces were then divided into separate political entities and were placed under the tutelage of Britain and France. The linguistic significance of these developments was mainly that French and English became important features on the linguistic scene. English, however, did not influence the linguistic identity of the regions that came under British rule; it became at best the most widely spoken foreign language. French, on the other hand, had a far-reaching influence that continues to be visible, especially in the Maghreb, to this day. Much of the colonized or mandated territories became independent by the early 1960s, and Arabic has since then been declared the official language in Arab World.

Varieties of Arabic

To provide a concise outline of variation in Arabic, I will deal with two issues: the linguistic resources available to speakers of Arabic, and the sociolinguistic determinants of variation in Arab communities.

Standard Arabic

Throughout the Arab World, Standard Arabic (a modernized version of Classical Arabic), in an almost invariant form, is designated as the official language, the medium of instruction in education, and the language of the mass media, although in actual practice a mixture of Standard and colloquial varieties is used in education and in the media. The language was standardized twelve centuries ago, and the Standard variety has not been a spoken language for longer than that (see Holes, 1995a). It is not ordinarily used for everyday spoken purposes by any sector of the population. A functional knowledge of it is attainable through formal learning only, i.e., it is not acquired naturally. It stands in a diglossic relation to the spoken dialects (e.g., Spoken Egyptian Arabic), very much along the lines explained by Ferguson (1959).

The fact that this variety is not associated with a particular social group in contemporary Arab communities, and is not spoken natively, has sociolinguistic ramifications. There is no doubt that the Standard variety is accorded the highest status by Arabs, but its esteem and the degree to which it is involved in the course of linguistic change are unrelated. Research shows that linguistic variation and change in Arabic

is determined by interplay between local dialects and emerging local or regional standards, independently of Standard Arabic (see Al-Wer, 1997). Educated speakers of Arabic do resort to the use of Standard lexemes and constructions in formal situations. This is largely due to the established appropriateness of the Standard in such domains, and to the fact that learned and specialized lexical items are only available in a Standard form. Outside these situations, educated speakers use the colloquial varieties, and research shows that where linguistic change is in progress away from Standard features, the educated generally lead other groups, in the same way that they lead when the change happens to be in the direction of a Standard feature (for instance, see the results in Jabeur, 1987 and Al-Wer, 1991, and the discussion in Holes, 1995b).

The Dialects

Arabic dialects are the linguistic systems that speakers of Arabic speak natively. They vary considerably from region to region, with varying degrees of mutual intelligibility (and some are mutually unintelligible). Many aspects of the variability attested in the modern dialects can be found in the ancient Arabic dialects in the peninsula (for a detailed description of the ancient dialects, see El-Gindi, 1983). By the same token, many of the features that characterize various modern dialects, or distinguish between them, can be traced to the original settler dialects. In terms of typological classification, Arabic dialectologists distinguish between two basic norms: Bedouin and Sedentary. This classification is based on a bundle of phonological, morphological, and syntactic features that distinguish between the two norms. In the modern, especially urban dialects, it is not really possible to maintain this classification, partly because the modern dialects are typically an amalgam of features from both norms. Geographically, modern Arabic dialects are classified into five groups: Arabian Peninsula (four subgroups); Mesopotamian; Syro-Lebanese (or Levantine, three subgroups); Egyptian (four subgroups); and Maghreb (two subgroups) (for details, see Versteegh, 1997).

Common Dimensions of Variation in Arab Communities

There is a general shortage of studies on variation in Arabic, especially on Arabic in its social setting and in large and heterogeneous urban environments; but this situation is changing. A number of important empirical research studies, utilizing modern methodological and analytical techniques, are in preparation.

On the basis of the studies available, it seems that the factors outlined below play important roles in the dynamics of variation and the course of linguistic change.

All variation studies on Arabic mention education as an important social variable, and indeed the findings show that linguistic usage correlates with the level of education of speakers. However, the exact denotation of education as a variable is poorly understood. It is noticeable, for instance, that while level of education of the speaker is used as a sampling tool, it is not integrated in the explanatory model in a consistent way. It is likely that this variable actually symbolizes different aspects of the speakers' characteristics in different communities. It is also likely to be a proxy variable, acting on behalf of such things as contact and exposure to outside communities, especially since in many communities institutions of education are not available locally, and generally the longer individuals spend in formal education the more frequent their contacts become with speakers of other dialects (see Al-Wer, 2002a). In some cases, the type of education, private or public, was found important (as in Haeri's 1997 study in Cairo).

Social class is not usually used in Arabic studies. A notable exception in this domain is Haeri's (1997) study in Cairo, which analyzes this variable and finds it significant. A forthcoming study on Damascus also uses social class as a sampling and analytical tool. There are two types of urban Arabic communities, which seem to show different correlational patterns. In the well-established urban centers, such as Cairo and Damascus, the original regional, ethnic, or sectarian linguistic distinctions among the population are blurred and do not play a role in sociolinguistic correlations. On the other hand, in the new cities, such as Amman (the capital city of Jordan) and most of the cities in the Gulf region, stratification along ethnic, regional, and sectarian backgrounds are the more relevant criteria for sociolinguistic studies. There are signs that as these cities become established and their new dialects become focused, alternative ways of stratification become necessary. For instance, in Amman, the original distinctions of Jordanian versus Palestinian dialects and urban versus rural Palestinian (which are based on the regional origins of the city's population), while continuing to be important for an understanding of patterns of linguistic variation among certain groups, are much less important in the speech of the third generation inhabitants of the city. Other, more locally defined criteria, such as socioeconomic class, are becoming significant (for more details, see Al-Wer, 2002b).

Gender has been found to be an important parameter of variation in Arabic. Consistent linguistic

differences between male and female speakers are reported in the earlier studies (e.g., Abdel-Jawad, 1981, and Bakir, 1986), as well as in later works (e.g., Jabeur, 1987; Haeri, 1997; Gibson, 1998). Gender is also reported to be significant in studies focusing on code switching and code mixing (e.g., Lahlou, 1992, and Sadiqi, 2002). The interpretation of gender-differentiated patterns in Arabic experienced a complete transformation, although the patterns themselves are consistent and are in keeping with the patterns found in other languages, such as English. In the earlier studies, Arabic was thought to contravene the then generally reported tendency for female speakers to use standard features more often than men, since in Arabic studies men were found to use Standard Arabic features more than women. However, the features that Arab men were found to use more often than Arab women were at the same time characteristic of the localized and in many cases overtly stigmatized varieties, but simply happened to be identical to Standard Arabic features. Since the approach to understanding variation in Arabic has shifted from one based on the assumption that approximation to Standard Arabic features is the governing factor to one recognizing that the target features are characteristic of the *de facto* spoken local standards (which derive their status from the social groups whose speech they represent), the interpretation of gender patterns has also shifted (see Ibrahim, 1986; Haeri, 1987; Al-Wer, 1997).

Within this revised framework, the findings with respect to male-female differences in Arabic communities studied so far suggest that where linguistic change is in progress, allowing for other factors, the female speakers are ahead of the male speakers in the use of newer forms. However, it must be emphasized that the data available from Arabic do not permit us to make generalizations on the basis of gender (to the extent such generalizations can be made for any language). Although there is now a respectable number of sociological studies, mainly in the feminist literature, providing thorough analyses of gender as a social construct in Arab societies, these models have not yet been integrated in studies on linguistic variation in Arabic.

The current generation of students of Arabic linguistics increasingly pays attention to the study of dialect contact. This comes in recognition of the linguistic repercussions of the massive population movements, rapid urbanization, and modernization all over the Arab World. In the established cities, the newcomers largely accommodate to the city dialect (see for instance the results in Jabeur, 1987; Gibson, 1998; Jassem, 1993). In the new cities, various processes of

leveling take place and new linguistic forms emerge. There are also signs that regional koineization, transcending political borders, is taking place.

Aramaic and Syriac

J Watt, Cardiff University, Cardiff, UK

Origin and Expansion

Aramaic is the native name of a language that first manifests itself in inscriptions in Syria early in the 1st millennium B.C. but that in subsequent centuries, during the period of the Assyrian and Persian empires, was widespread throughout the Near East and is found as far afield as Egypt, Cilicia, and Iran. Following the conquests of Alexander the Great, and during the subsequent eras of Macedonian and Roman influence, it co-existed with Greek as a principal medium of written communication over this wide area. The conquest of the region by the Arabs in the 7th century A.D. eventually brought its dominant position to an end, but it remained significant for many years thereafter as a spoken and, especially, a literary language. Greek writers designated it

Syriac, a term derived from *Assyrian*, and the Greek name was frequently preferred over the native one by Aramaic-speaking Jews and Christians, among whom *Aramaean* became a designation for their pagan neighbors. Over time, Aramaic developed a number of clearly distinct literary dialects, each evolving out of a local form of the language, and these were extensively employed by Jewish, Christian, and other religious communities. In contemporary usage, Syriac usually refers to the principal literary dialect employed by Christians, whereas Aramaic is retained as a generic term for the whole group. Spoken forms of the language have survived to this day among the religious communities that have preserved it in their liturgies and in a few places as an everyday language.

Aramaic belongs to the Semitic group of languages and, more particularly, to the northwest branch, which, according to prevalent opinion, contained in the 1st millennium B.C. two distinct strands, Canaanite (which includes Hebrew and Phoenician) and Aramaic. Despite its extensive use

in the Assyrian and Persian empires, it has left few literary or epigraphic remains from these periods, although those that have survived are of considerable importance in the study of the history of the region and fresh discoveries are steadily adding to the stock. In the Hellenistic and Roman periods, the material becomes more abundant, and, especially from the 4th century onward, a large body of Christian literature is preserved in Syriac and a substantial body of Jewish literature in Palestinian and Babylonian Aramaic dialects. Smaller extant corpora in dialects employed by the religious communities in question stem from the Mandaean, Samaritan, and Syro-Palestinian Christians who adhered to the Orthodox confession of the Byzantine emperors.

Phases and Dialects

Over the 3000 years of its recorded history, the language has naturally undergone many developments. Three broad phases are easily discernible. In the first, represented mainly in inscriptions and papyri, the form of the language is surprisingly uniform, and the differences between documents from diverse times and places are relatively minor. In the second, represented in the literature (beginning in the 4th century A.D. or earlier) of Jews, Christians, Samaritans, and Mandaeans, more marked dialectal differences are apparent, with two broad groupings. The eastern group, of Mesopotamian provenance, comprises Syriac, Jewish Babylonian Aramaic, and Mandaic; the western group comprises Jewish Palestinian Aramaic, Samaritan, and Syro-Palestinian Christian Aramaic. A third phase of modern eastern and western dialects can be discerned from approximately the 17th century. Further differentiation beyond these three is less clear cut, but in recent years a fivefold classification has gained considerable support, with the period prior to the emergence of the literature in the eastern and western literary dialects divided into three. The distinction between the earliest of these, Old Aramaic, and its successor is relatively unproblematic. Old Aramaic inscriptions belong to the period of the independent Aramaean states (10th–8th centuries B.C.) and exhibit a number of distinctive grammatical features, some of them similar to those known in Canaanite. Texts in Aramaic from the subsequent period come from a vastly greater area, but despite their wide geographical and chronological range they exhibit a high degree of homogeneity. Many of them are administrative in nature, and the language in which they are composed was evidently employed as a formal means of communication in much of the Assyrian, Babylonian,

and Achaemenid empires. Its adoption by the imperial chancelleries (a striking example of which is the presence of Aramaic ideograms in Pahlavi texts) is no doubt the reason for the high degree of standardization, and this phase is therefore commonly designated Official Aramaic. More problematic is the characterization of the Aramaic material originating between the end of the Achaemenid Empire and the beginnings of the extensive literature in the later Jewish dialects and classical (Christian) Syriac. In this period (roughly 200 B.C.–200 A.D.), several different dialects emerge in a number of localities. These include Palmyrene, Nabataean, Hatran, and Old Syriac (Edessan) inscriptions, and inscriptions and fragments of literary works from Palestine. Although all these dialects are quite similar to Official Aramaic and developed out of it, the influence of spoken local dialects or other languages (Arabic among the Nabataeans and Akkadian in Mesopotamia) led to a fragmentation and modification of the earlier fairly uniform Official Aramaic. In none of these areas, however, do we have evidence this early of the emergence of a vigorous or widespread new literary Aramaic. Although some scholars therefore consider this period as still belonging to the literary phase of Official Aramaic, others are sufficiently impressed by the differences to classify it as a new phase, Middle Aramaic, falling between Official Aramaic and the Later Aramaic of rabbinical Jewish and Christian Syriac literature. The expansion and consolidation of these religions was presumably responsible for the transformation of local dialects into significant and widespread means of literary expression.

Dialects and Religious Communities

The Aramaic inscriptions of Old, Official, and Middle Aramaic provide important information on deities worshipped in Syria and Mesopotamia in pre-Christian and early Christian times. Papyri from Egypt constitute the largest body of material in Official Aramaic, among which those of a Jewish military colony at Elephantine are of particular interest for the light they shed on the religious beliefs and practices of this group of Jews in the Achaemenid Empire. The language of the Aramaic sections of *Ezra* and *Daniel* also belongs to Official Aramaic and differs only slightly from that of the Elephantine papyri. Subsequent Jewish writings and inscriptions of Palestinian provenance belong to the Middle Aramaic phase and include fragments of a number of literary works preserved among the Dead Sea Scrolls. The problem of determining the form of

spoken Aramaic current in 1st century A.D. Palestine has attracted much attention on account of its relevance to New Testament studies. Although the literary and epigraphic material from the period is consistent with the use of Middle Aramaic, the extant material is still fairly sparse, and some scholars still hold (as did most of those of earlier generations, to whom Middle Aramaic was unknown) that the Palestinian dialects of later rabbinical literature are a valuable source for the reconstruction of the spoken language of the 1st century A.D.

The rabbinical literature in Jewish Palestinian Aramaic comprises various Targumim (paraphrastic Aramaic versions of sections of the Hebrew Bible), Midrashim (commentaries on the biblical books), and parts of the Palestinian Talmud. The latter two are written partly in Hebrew and partly in Aramaic. The Targum on the Pentateuch attributed to Onkelos and that on the *Prophets* attributed to Jonathan were used in Babylonia and, unlike the Palestinian Pentateuch Targum, do not therefore represent a purely Palestinian form of Aramaic. Jewish Babylonian Aramaic is represented in the Aramaic sections of the Babylonian Talmud and in the Responsa literature of the 8th–10th centuries A.D., the replies of the heads of the Babylonian academies to legal questions from scattered Jewish communities. The famous 13th century mystical work from Spain known as the *Zohar* is also written partly in Hebrew and partly in an artificial Aramaic. Samaritan Aramaic is represented principally by the Samaritan Targum to the Pentateuch and the theological treatise known as *Memar Marqah*, an important source for the knowledge of Samaritan religion. The language of the Mandaean texts is Eastern Aramaic, but linguistic as well as historical arguments have been advanced in favor of a Palestinian origin contemporary with the beginnings of Christianity. Because, however, these are not decisive, and the Madaeans are only known in Iraq and further east, a Mesopotamian origin of the religion and the texts is still widely accepted.

The largest extant corpus of Aramaic literature is that in Syriac. Originally the local dialect of Edessa (modern Urfa), Syriac was adopted as a literary language by Christians throughout the Near East. Once adopted, it remained remarkably stable in most respects, although two slightly differing dialects (eastern and western, using different scripts and differing in the pronunciation of some vowels) emerged around the 5th century. These were associated respectively with the East Syrian Church (in Sasanid domains) and the Syrian Orthodox Church (in the Roman domains). Syriac-speaking Christians were active in the translation of Greek writings into Syriac,

not only the Bible and Greek patristic writers but also (from the 6th century) medicine (Galen) and logic (Aristotle). Their expertise in these secular subjects in the period of the 'Abbasid caliphate, and their ability to read both the relevant Greek texts and the earlier Syriac translations of them, stimulated Muslim interest in these subjects and led to the Syrians being in great demand as translators from Greek to Arabic, such translations being frequently done through a Syriac intermediary. Greek loanwords, grammatical forms modeled on Greek, and Greek syntax all greatly influenced Syriac, increasingly so from the 6th century. By contrast, the influence of Arabic on the literary language was slight. In the earlier period, the most striking literature in Syriac is the religious poetry of Saint Ephrem, which was much admired and imitated even beyond the Syriac language area. From the 10th century, Arabic replaced Syriac among Christians as the chief language of theology, philosophy, and medicine, but the 13th century saw a veritable West Syriac renaissance, embodied especially in the great polymath Bar Hebraeus, who wrote with equal facility in Syriac and Arabic. In contrast to the wide use of Syriac, Syro-Palestinian Christian Aramaic (alternatively designated Syro-Palestinian Syriac because it was written in the West Syriac script) was employed only in Palestine and Syria, and the extant texts (mostly biblical, liturgical, or hagiographical) are all translations from Greek.

Spoken Aramaic dialects have been in continuous use in a number of places right into modern times. Modern Western dialects of Aramaic are spoken, by Christians and Muslims, in three villages north of Damascus, namely Ma'lula, Bah'a, and Jubb 'Addin. Eastern dialects have been more extensively used by Christians in various localities. In the mountainous area of Southeast Turkey known as Tur 'Abdin, Turoyo ('the mountain language') is spoken by members of the Syrian Orthodox Church. Other Eastern Aramaic dialects have been spoken in modern times by the Jews of Kurdistan and Azerbaijan, most of whom have now emigrated to Israel, and a modern Mandaic dialect has survived in Iran. The greatest use of Aramaic in modern times, however, has been by East Syrian Christians, among whom a number of East Aramaic dialects have been employed. Modern literary Syriac (Swadaya) may be said to have begun with the printing of books in the local dialect by the American Presbyterian Mission at Urmia in Northwest Iran. Although the number of people currently using some form of Aramaic is small, their determination to keep it alive is a testimony to their pride in a language whose demonstrable lifespan extends to 3000 years.

Arawak Languages

A Y Aikhenvald, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Arawak language family contains the largest number of languages in Latin America. Geographically, it spans four countries of Central America – Belize, Honduras, Guatemala, Nicaragua – and eight of South America – Bolivia, Guyana, French Guiana, Surinam, Venezuela, Colombia, Peru, Brazil (and also formerly Argentina and Paraguay).

There are about 40 living Arawak languages. The first Native American peoples encountered by Columbus – in the Bahamas, Hispaniola, and Puerto Rico – were the Arawak-speaking Taino. Their language became extinct within a hundred years of the invasion. Spanish and many other European languages inherited a number of loans from Arawak languages. These include widely used words such as *hammock*, *tobacco*, *potato*, *guava*, and many other names for flora and fauna.

The creation of a mixed language of Arawak/Carib origin in the Lesser Antilles is one of the most interesting pieces of evidence on language history in pre-conquest times. Speakers of Iñeri, a dialect of the Arawak language now (misleadingly) called Island Carib, were conquered by Carib speakers. They developed a mixed Carib/Arawak pidgin that survived until the 17th century (Hoff, 1994). Speech of men and speech of women were distinguished in the following way. Women used morphemes and lexemes of Arawak origin, while men used lexical items of Carib origin and grammatical morphemes mostly of Arawak origin. The pidgin coexisted with Carib used by men and Iñeri used by women and children; it belonged to both parties and served as a bridge between them. This diglossia gradually died out with the spread of competence in Island Carib among both men and women. As a result, Island Carib, an Arawak language, underwent strong lexical and, possibly, grammatical influence from Carib.

The languages in areas settled by the European invaders soon became extinct. Those on the north coast of South America perished first, before 1700. When the search for gold and rubber extended up the Amazon and its tributary the Rio Negro, further languages succumbed, from the 18th century up until the present day. Sometimes the Indians retaliated, attacking settlements and missions; but the invaders always returned. Indian rebellions often provoked forced migrations which sometimes ended up creating a new dialect or even a language. For instance, in 1797 the British authorities removed the rebellious inhabitants of St. Vincent (an island in the Lesser Antilles) to Belize on the mainland. These were racially a mixture of black slaves and Indians, who spoke Island Carib. This resulted in the creation of a new dialect of Island Carib – known as Central American Island Carib, Kariff, Black Carib, or Garifuna – which by the 20th century had developed into a separate language, now spoken in Central America (Taylor, 1977).

The overwhelming majority of Arawak languages are endangered. Even in the few communities with more than 1000 speakers, a national language (Portuguese or Spanish) or a local lingua franca (Lingua Geral Amazônica, Quechua, or Tucano) is gaining ground among younger people. The few healthy Arawak languages are Guajiro in Venezuela and Colombia (estimates vary from 60 000 to 300 000 speakers) and the Campa languages (total estimate 40 000 to 50 000 speakers), one of the largest indigenous groups in Peru.

Most of the materials on Arawak languages collected during the second half of the 20th century are by missionary linguists. Their quality and quantity varies. Only three or four languages have full descriptions available.

The genetic unity of Arawak languages was first recognized by Father Gilij as early as 1783. The recognition of the family was based on a comparison of pronominal cross-referencing prefixes in Maipure, an extinct language from the Orinoco Valley, and in Moxo from Bolivia. Gilij named the family Maipure. Later, it was renamed Arawak by Daniel Brinton after

one of the most important languages of the family, Arawak (or Lokono), spoken in the Guianas. This name gained wide acceptance during the following decades. The majority of Native South American scholars use the name Arawak (Aruák) to refer to the group of unquestionably related languages easily recognizable by pronominal prefixes such as *nu-* or *ta-* ‘first person singular’, (*p*)*i-* ‘second person singular’, prefix *ka-* meaning ‘have’, and negator *ma-*. A number of scholars, mainly North Americans, prefer to use the term Arawak(-an) to refer to a much more doubtful higher-level grouping, and reserve the term Maipuran (or Maipurean) for the group of undoubtedly related languages that are claimed to be one branch of Arawakan (see Payne, 1991). Here I follow the South American practice and use the name *Arawak* for the family of definitely related languages.

The limits of the family were established by the early 20th century. Problems still exist concerning internal genetic relationships within the family and possible genetic relationships with other groups. Reconstruction, internal classification, and subgrouping of Arawak languages remain matters of debate; further detailed work is needed on both the descriptive and comparative fronts.

The putative studies of Arawakan by Ester Matteson, G. Kingsley Noble, and others are deeply flawed. Unfortunately, these have been adopted as the standard reference for the classification of Arawak languages, especially among some anthropologists, archaeologists, and geneticists, influencing ideas on a putative proto-home and migration routes for proto-Arawakan – see the criticism in Tovar and De Tovar (1984), Dixon and Aikhenvald (1999: 12–15), and Aikhenvald (1999a).

Little is known about a proto-home for the Arawak family. The linguistic argument in favor of an Arawak proto-home located between the Rio Negro and the Orinoco rivers – or on the Upper Amazon – is based on the fact that there is a higher concentration of structurally divergent languages found in this region. This area has also been suggested as one of the places where agriculture developed. This is highly suggestive and corroborated by a few mythical traditions of northern origin by Arawak-speaking peoples south of the Amazon. The origin myths of the Tariana, in northwest Amazonia, suggest that they could have come from the north coast of South America.

Arawak languages are complicated in many ways. Words can be differentiated by stress in some languages, such as Baure and Waurá (south of Amazonas), and Tariana, Achagua, and Warekena (north of Amazonas). At least two have tones – Terêna in the South, and Resígaro spoken in the far northeast of Peru.

Each Arawak language has a few prefixes and numerous suffixes. Prefixes are typically monosyllabic, while suffixes can consist of one or more syllables. Roots usually contain two syllables. Prefixes are rather uniform across the family, while suffixes are not. What is a free morpheme in one language can be a grammatical marker in another language; for instance, postpositions become causative markers, and nouns become classifiers. An Apurina noun *maka* means ‘clothing’ – this is where the word for hammock comes from. In Baniwa of Içana, *-maka* is a classifier for stretchable thin extended objects, e.g., *tsaia* ‘skirt’ or *dzawiya* ‘jaguar’s skin’, as in *apa-maka* (one-CCLASSIFIER:CLOTHING) ‘one piece of clothing’.

Most grammatical categories in Arawak languages are verbal. Cases to mark subjects and objects are atypical. Tariana, spoken in northwest Brazil, has developed cases for core grammatical relations to match the pattern in nearby Tucanoan languages (Aikhenvald, 1999b).

Arawak languages spoken south of the Amazon (South Arawak) have a more complex predicate structure than those north of the Amazon (North Arawak). South Arawak languages such as Amuesha or Campa have up to thirty suffix positions. North Arawak languages such as Tariana or Palikur have not more than a dozen suffixes. Suffixes express meanings realized by independent words in familiar Indo-European languages, e.g., ‘be about to do something’, ‘want to do something’, ‘do late at night’, ‘do early in the morning’, ‘do all along the way’, ‘in vain’, ‘each other’.

Verbs are typically divided into transitive (e.g., ‘hit’), active intransitive (e.g., ‘jump’) and stative intransitive (e.g., ‘be cold’). All Arawak languages share pronominal affixes and personal pronouns. Pronominal suffixes refer to subjects of stative verbs and direct objects. Prefixes are used for subjects of transitive verbs and of intransitive active verbs, and for possessors. That is, most Arawak languages are of active-stative type. For instance, in Baniwa one says *nu-kapa* ‘I see’ and *nu-watsa* ‘I jump’, but *nu-kapa-ni* ‘I see him’ and *hape-ni* ‘he is cold’ (*nu-* refers to ‘I’ and *-ni* to ‘him’). And ‘my hand’ is *nu-kapi*.

Some languages have lost the pronominal suffixes (and with them the morphological basis for an active-stative system); these include Yawalapiti (Xingú area, Brazil) and Chamicuro (Peru) to the south of the Amazon, and Bare, Resígaro, Maipure, and Tariana to the north. The form of the first person pronoun is *ta-* in the Caribbean (Lokono, Guajiro, Añun, Taino) and *nu-* in other languages. This is the basis for classification of Arawak languages into *Nu-Arawak* and *Ta-Arawak*.

Table 1 Pronominal prefixes and suffixes in proto-Arawak

| Person | Prefixes | | Suffixes | |
|--------------|--------------------------|--------------|----------------------|------------|
| | Singular | Plural | Singular | Plural |
| 1 | <i>nu-</i> or <i>ta-</i> | <i>wa-</i> | <i>-na, -te</i> | <i>-wa</i> |
| 2 | <i>(p)i-</i> | <i>(h)i-</i> | <i>-pi</i> | <i>-hi</i> |
| 3nf | <i>r i-, i-</i> | <i>na-</i> | <i>-r i, -i</i> | <i>-na</i> |
| 3f | <i>thu-, ru-</i> | <i>na-</i> | <i>-thu, -ru, -u</i> | <i>-na</i> |
| 'impersonal' | <i>pa-</i> | — | — | — |

Proto-Arawak must have had an unusual system of four persons: first, second, third, and impersonal. The forms of prefixes and suffixes reconstructed for proto-Arawak are given in Table 1.

Most Arawak languages distinguish two genders – masculine and feminine – in cross-referencing affixes, in personal pronouns, in demonstratives, and in nominalizations, e.g., Palikur *amepi-yo-* ‘thief (woman)’, *amepi-ye* ‘thief (man)’, Tariana *nu-phe-ri* ‘my elder brother’, *nu-phe-ru* ‘my elder sister’. No genders are distinguished in the plural. The markers go back to proto-Arawak third person singular suffixes and prefixes: feminine (*r*)*u*, masculine (*r*)*i*. Some languages also have complicated systems of classifiers – these characterize the noun in terms of its shape, size, and function (Aikhenvald, 1999a). For instance, Tariana and Baniwa of Içana have more than 40 classifiers which appear on numerals, adjectives, verbs, and in possessive constructions. Palikur has more than a dozen classifiers which have different semantics and form depending on whether they are used on numerals, verbs, or on adpositions (Aikhenvald and Green, 1998). Pronominal genders have been lost from some languages, e.g., Terêna, Amuesha, Chamicuro, Pareci, Waurá (south of the Amazon), and Bahwana (north of the Amazon).

All Arawak languages distinguish singular and plural. Plural is only obligatory with human nouns. Plural markers are **-na/-ni* ‘animate/human plural’, **-pe* ‘inanimate/animate non-human plural’. Dual number is atypical. In Resígaro, markers of dual were borrowed from the neighboring Bora-Witoto languages.

Throughout the Arawak language family, nouns divide into those which must have a possessor (inalienably possessed) and those which do not have to have a possessor (alienably possessed). Inalienably possessed nouns are body parts, kinship terms, and a few others, e.g., ‘house’ and ‘name’. Inalienably possessed nouns have an ‘unpossessed’ form marked with a reflex of the suffix **-<i or *-hV*, e.g., Pareci *no-tiho* ‘my face’, *tihoti* ‘(someone’s) face’; Baniwa *nu-hwida* ‘my head’, *i-hwida-fi* (INDEFINITE-head-NON.POSSESSED) ‘someone’s head’. Alienably possessed nouns take

one of the suffixes **-ne/ni*, **-te*, **-re*, **-i/-e* (Payne, 1991: 378), or **-na* when possessed, e.g., Baniwa *nu-<inu-ni* (1sg-dog-possessive) ‘my dog’.

The overwhelming majority of Arawak languages have a negative prefix *ma-* and its positive counterpart, prefix *ka-*, e.g., Piro *ka-yhi* (ATTRIBUTIVE-tooth) ‘having teeth’, *ma-yhi* (NEGATIVE-tooth) ‘toothless’; Bare *ka-witi-w* (ATTRIBUTIVE-eye-FEMININE) ‘a woman with good eyes’, *ma-witi-w* ‘a woman with bad eyes; a blind woman’.

The common Arawak lexicon (cf. Payne, 1991) consists mostly of nouns. There are quite a few body parts, fauna, flora, and artifacts. Only a few verbs can be reconstructed, e.g., **kau* ‘arrive’, **p^(da)* ‘sweep’, **po* ‘give’, **(i)ya* ‘cry’, **kama* ‘be sick, die’; **itha* ‘drink’. Most languages have just the numbers ‘one’ (proto-Arawak **pa-*; also meaning ‘someone, another’) and ‘two’ (proto-Arawak **(a)pi* and **yama*). A preliminary reconstruction is in Payne (1991). An up-to-date overview of the family is in Aikhenvald (1999a, 2001), and an overview of the proto-language is in Aikhenvald (2002).

Areal Linguistics

L Campbell, University of Utah, Salt Lake City, UT, USA

Introduction: Defining the Concept

Areal linguistics is concerned with the diffusion of structural features across language boundaries within a geographical area. The term ‘linguistic area’ refers to a geographical area in which, due to borrowing and language contact, languages of a region come to share certain structural features – not just loanwords, but also shared phonological, morphological, syntactic, and other traits. The terms ‘sprachbund,’ ‘diffusion area,’ ‘adstratum relationship,’ and ‘convergence area’ are also sometimes used to refer to linguistic areas. The central feature of a linguistic area is the existence of structural similarities shared among languages of a geographical area, where usually some of the languages are genetically unrelated or at least are not all close relatives. It is assumed that the reason the languages of the area share these traits is because they are borrowed.

There are two sorts of linguistic area studies. The more common circumstantialist approach lists similarities found in the languages of a geographical area, allowing the list of traits to suggest diffusion, but typically without seeking the historical linguistic evidence which could demonstrate that the traits are indeed diffused. Circumstantialist areal linguistics has been criticized, since it does not eliminate chance, universals, and possibly undetected genetic relationships as alternative possible explanations for shared traits. The historicist approach seeks concrete evidence showing that the shared traits are diffused. The historicist approach is preferred because it is more rigorous and reliable, although the lack of clear evidence in many cases makes reliance on the circumstantialist approach necessary in some situations (Campbell, 1985).

Linguistic areas are often defined, surprisingly, by a rather small number of shared linguistic traits.

Examples of Linguistic Areas

A good way to get a solid feel for linguistic areas and how they are defined is to look at some of the better-known ones. In what follows, some of the best-known linguistic areas are inspected briefly together with the more important of the generally accepted defining traits shared by the languages of each area.

The Balkans

The Balkans is the best known of all linguistic areas. The languages of the Balkans are Greek, Albanian, Serbo-Croatian, Bulgarian, Macedonian, and Romanian (to which some scholars also add Romani and Turkish). Some salient traits of the Balkans linguistic area are the following:

1. a central vowel /i/ (or /ə/) (not present in Greek or Macedonian);
2. syncretism of dative and genitive cases (dative and genitive merged in form and function); this is illustrated by Romanian *fetei* ‘to the girl’ or ‘girl’s’, as in *am data o carte fetei* ‘I gave the letter to the girl’ and *frate fetei* ‘the girl’s brother’;
3. postposed articles (not in Greek), for example Bulgarian *máat* ‘the man’ / *má* ‘man’;
4. periphrastic future (future signaled by an auxiliary verb corresponding to ‘want’ or ‘have,’ not in Bulgarian or Macedonian), as in Romanian *voi fuma* ‘I will smoke’ (literally ‘I want smoke’) and *am a cínta* ‘I will sing’ (literally ‘I have sing’);
5. periphrastic perfect (with an auxiliary verb corresponding to ‘have’);
6. absence of infinitives (rather with constructions such as ‘I want that I go’ for ‘I want to go’);
7. double marking of animate objects by use of a pronoun copy, as in Romanian *i-am scris lui Ion* ‘I wrote to John’, literally ‘to.him-I wrote him John’, and Greek *ton vlépo ton Jáni* ‘I see John’, literally ‘him.ACC I see him.ACC John’ (Sandfeld, 1930; Schaller, 1975; Joseph, 1992).

South Asia (the Indian Subcontinent)

The South Asia linguistic area is composed of languages belonging to the Indo-Aryan, Dravidian, Munda, and Tibeto-Burman language families. Some traits shared among different languages of the area are the following:

1. retroflex consonants, particularly retroflex stops;
2. absence of prefixes (except in Munda);
3. presence of a dative-subject construction (that is, dative-experiencer, as in Hindi *mujhe maaluam thaa* ‘I knew it’ [‘to me’ + ‘know’ + PAST]);
4. subject-object-verb (SOV) basic word order, including postpositions;
5. absence of a verb ‘to have’;
6. ‘conjunctive or absolutive participles’ – a tendency for subordinate clauses to have nonfinite verbs (that is, participles) and to be preposed; for example, relative clauses precede the nouns they modify;
7. morphological causatives;

8. so-called ‘explicator compound verbs,’ where a special auxiliary from a limited set is said to complete the sense of the immediately preceding main verb, and the two verbs together refer to a single event, as for example Hindi *le jaanaa* ‘to take (away)’ (‘take’ + ‘go’);
9. sound symbolic forms based on reduplication, often with *k* suffixed (for example in Kota, a Dravidian language: *kad-kadk* ‘[heart] beats fast with guilt or worry’; *a:nk-a:nk* ‘to be very strong [of man, bullock], very beautiful [of woman]’).

Some of these proposed areal features are not limited to the Indian subcontinent, but can be found also in neighboring languages (for example, SOV basic word order is found throughout much of Eurasia and northern Africa) and in languages in many other parts of the world. Some of the traits are not necessarily independent of one another; for example, languages with SOV basic word order tend also to have nonfinite (participial) subordinate clauses, especially relative clauses, and not to have prefixes (Emeneau, 1956; Masica, 1976; Emeneau, 1980; Emeneau, 2000).

Mesoamerica

The language families and isolates which make up the Mesoamerican linguistic area are Nahua (a branch of Uto-Aztecan), Totonacan, Otomanguean, Mixe-Zoquean, Mayan, Xinkan (Xinca), Tarascan (Purépecha), Cuitlatec, Tequistlatecan, and Huave. Five areal traits are shared by nearly all Mesoamerican languages, but not by neighboring languages beyond this area, and these are considered particularly diagnostic of the linguistic area:

1. nominal possession of the type *his-dog the man* ‘the man’s dog’, as in Pipil (Uto-Aztecan) *i-pe:lu ne ta:kat*, literally ‘his-dog the man’;
2. relational nouns (locative expressions composed of noun roots and possessive pronominal affixes), of the form, for example, *my-head* for ‘on me’, as in Tzutujil (Mayan) *č-r-i:x* ‘behind it, in back of it’, composed of *č-* ‘at, in’, *r-* ‘his/her/its’ and *i:x* ‘back’, contrasted with *č-w-i:x* ‘behind me’, literally ‘at-my-back’;
3. vigesimal numeral systems, based on combinations of 20, such as that of Ch’ol (Mayan): *huk’al* ‘20’ (1 × 20), *č-aʔ-k’al* ‘40’ (2 × 20), *uf-k’al* ‘60’ (3 × 20), *hoʔ-k’al* ‘100’ (5 × 20), *hun-bahk* ‘400’ (1 × 400), *č-aʔ-bahk* ‘800’ (2 × 400), etc.;
4. nonverb-final basic word order (generally no SOV languages) – although Mesoamerica is surrounded by languages both to the north and south

which have SOV (subject-object-verb) word order, languages within the linguistic area have VOS, VSO, or SVO basic order;

5. a number of loan translation compounds (calques) shared by the Mesoamerican languages, including examples such as ‘boa’ = ‘deer-snake,’ ‘egg’ = ‘bird-stone/bone,’ ‘lime’ = ‘stone(-ash),’ ‘knee’ = ‘leg-head,’ and ‘wrist’ = ‘hand-neck’.

Since these five traits are shared almost unanimously throughout the languages of Mesoamerica but are found almost not at all in the languages just beyond the borders of Mesoamerica, they are considered strong evidence in support of the validity of Mesoamerica as a linguistic area. Four of these five traits have essentially the same distribution, clustering at the borders of Mesoamerica. Such bundling is uncommon in linguistic areas.

A large number of other features are shared among several Mesoamerican languages, but are not found in all the languages of the area, while some other traits shared among the Mesoamerican languages are found also in languages beyond the borders of the area (for details see Campbell *et al.*, 1986).

The Northwest Coast of North America

The Northwest Coast, the best known North American linguistic area, includes Tlingit, Eyak, the Athabaskan languages of the region, Haida, Tsimshian, Wakashan, Chimakuan, Salishan, Alsea, Coosan (Coos), Kalapuyan (Kalapuya), Takelma, and Lower Chinook (Chinook). These languages are characterized by elaborate systems of consonants, which include series of glottalized stops and affricates, labiovelars, multiple laterals, and uvular stops in contrast to velars. There are typically few labial consonants (labials are completely lacking in Tlingit and Tillamook and are quite limited in Eyak and most Athabaskan languages); in contrast, the uvular series is especially rich in most of these languages. There are typically few vowels, only three (*i*, *a*, *o*, or *i*, *a*, *u*) in several of the languages, four in others. Several of the languages have pharyngeals (ʕ, ħ), and most have glottalized resonants and continuants. Shared morphological traits include: extensive use of suffixes; near absence of prefixes; reduplication (of several sorts, signaling iteration, continuative, progressive, plural, collective, distribution, repetition, diminutive, etc.); numeral classifiers; alienable/inalienable oppositions in nouns; evidential markers in the verb, and verbal locative-directional markers; masculine/feminine gender (shown in demonstratives and articles); visibility/invisibility opposition in demonstratives. Aspect is more important than tense. All but Tlingit have passivelike constructions. The

negative appears as the first element in a clause regardless of the usual word order. Overt marking of nominal plurals, as in many American Indian languages, is absent or limited. Northwest Coast languages also have lexically paired singular and plural verb stems (that is, a lexical root may be required with a plural subject which is entirely different from the root used with a singular subject).

Some other traits are shared by a smaller number of Northwest Coast languages (see Campbell, 1997: 333–334; cf. Sherzer, 1976).

The Baltic

The Baltic linguistic area includes at its core (Balto-)Finnic languages (especially Estonian and Livonian), Baltic languages (Indo-European), and Baltic German; however, all of the following have been included in different treatments of the Baltic linguistic area: Old Prussian (Prussian) (extinct), Lithuanian, and Latvian (Baltic languages); the ten Saami (Lapp) languages, Finnish, Estonian, Livonian, Votic (Votian), Vepsian (Veps), Karelian, and others (of the Finnic branch of Finno-Ugric); High German, Low German (Low Saxon), Baltic German, and Yiddish (Western Yiddish) (West Germanic); Danish, Swedish, and Norwegian (North Germanic); Russian, Belorussian, Ukrainian, Polish, and Kashubian (Slavic); Romani (Indo-Aryan, branch of Indo-European); and Karaim (Turkic).

Shared features of the Baltic area include the following:

1. first-syllable stress;
2. palatalization of consonants;
3. tonal contrasts;
4. partitive case/partitive constructions (to signal partially affected objects, equivalent to, for example, “I ate [some] apple”) in Finnic, Lithuanian, Latvian, Russian, Polish, etc.;
5. direct objects in the nominative case in a number of constructions which lack overt subjects (Finnic, Baltic, North Russian);
6. evidential mood: “John works hard (it is said/reported/inferred)” (Estonian, Livonian, Latvian, Lithuanian);
7. prepositional verbs (as German *aus-gehen* [out-to-go] ‘to go out’): German, Livonian, Estonian, Baltic, and others;
8. subject-verb-object (SVO) basic word order;
9. agreement of adjectives in number with the nouns they modify (all languages of the area except Saami languages and Karaim); they also agree in case in all except the Scandinavian languages (which have lost case distinctions for adjectives);

they also agree in gender in Baltic, Slavic, and Scandinavian languages, as well as in German, Yiddish, and some others.

For a more complete list of traits attributed to the Baltic linguistic area, see Zeps, 1962; Koptjevskaja-Tamm, 2002; and especially Koptjevskaja-Tamm and Wälchli, 2001; compare also Jakobson, 1931.

Ethiopia

Languages of the Ethiopian linguistic area include: Beja (Bedawi), Awngi, Afar, Sidamo, Somali, etc. (Cushitic languages); Geez, Tigré, Tigrinya (Tigrigna), Amharic, etc. (Ethiopian Semitic languages); Wellamo (Wolaytta), Kefa (Kaficho), Janjero (Yemsa), etc. (Omotic languages); Anyuak (Anuak) and Gumuz (Nilo-Saharan languages); and others. Among the traits they share are the following:

1. SOV basic word order, including postpositions;
2. subordinate clause preceding main clause;
3. gerund (nonfinite verb in subordinate clauses, often inflected for person and gender);
4. a ‘quoting’ construction (a direct quotation followed by some form of ‘to say’);
5. compound verbs (consisting of a nounlike ‘pre-verb’ and a semantically empty auxiliary verb);
6. negative copula;
7. plurals of nouns not used after numbers;
8. gender distinction in second- and third-person pronouns;
9. reduplicated intensives;
10. a different present tense marker for main and subordinate clauses;
11. a form equivalent to the feminine singular used for plural concord (feminine singular adjective, verb, or pronoun is used to agree with a plural noun);
12. a singulative construction (the simplest noun may be a collective or plural and it requires an affix to make a singular);
13. shared phonological traits such as *f* but no *p*, palatalization, glottalized consonants, gemination, presence of pharyngeal fricatives (*ħ* and *ʕ*) (Ferguson, 1976; Thomason, 2001; cf. Tosco, 2000).

How Linguistic Areas Are Defined

The following criteria have at times been considered relevant for attempts to establish linguistic areas: (1) the number of traits shared by languages in a geographical area, (2) bundling of the traits in some significant way (for example, clustering at roughly

the same geographical boundaries), and (3) the weight or complexity of different areal traits (some are accorded more significance for determining areal affiliation on the assumption that they are more difficult to acquire than others).

To establish a linguistic area, the more shared features the better. Linguistic areas in which many diffused traits are shared among the languages are considered better established. Nevertheless, some scholars believe that even one shared trait is enough to define a weak linguistic area (Campbell, 1985). In any event, it is clear that some areas are more securely established than others because they are supported by more shared areal traits. In the linguistic areas described above, the number and kind of shared traits vary considerably.

The idea that greater weight or importance should be attributed to some traits for defining linguistic areas can be illustrated with the borrowed word order patterns in the Ethiopian linguistic area. Ethiopian Semitic languages exhibit a number of interconnected word order patterns which are borrowed from neighboring Cushitic languages. Several of these traits reflect the diffusion of the SOV basic word order typology of Cushitic languages into the formerly VSO Ethiopian Semitic languages. Typologically the orders noun-postposition, verb-auxiliary, relative clause-head noun, and adjective-noun are all correlated and tend to co-occur with SOV order cross-linguistically. Their presence in Ethiopian Semitic languages (some with all of these, others with somewhat fewer) might seem to reflect several different diffused traits (SOV counted as one, noun-postposition as another, and so on), and might be taken as several independent pieces of evidence supporting the existence of the linguistic area. However, from the perspective of expected word order co-occurrences, these word order arrangements are not independent traits, but reflect the diffusion of a single complex feature, the overall SOV word order type with its tendency for the various expected coordinated orderings in typologically interrelated constructions to co-occur. However, if borrowed SOV word order is counted as a single diffused areal trait, it must rank high in significance for defining a linguistic area, since it is much more difficult for a language to change so much of its basic structure under areal influence than it is to acquire less complex traits.

Some scholars had thought that the bundling of areal traits, clustering at the boundaries of a linguistic area, might be required for defining linguistic areas, though this has proven a poor criterion. Linguistic areas are similar to traditional dialects, where often one trait spreads across more territory than another

trait, so that their boundaries (or territories) do not coincide (do not 'bundle'). Typically the geographical extent of individual traits may vary considerably. However, in the rare situation where the traits do coincide at a clear boundary, the definition of a linguistic area matching their boundary is relatively secure. As mentioned, several of the traits in the Mesoamerican linguistic area do have the same boundary, but typically in other areas the areal traits do not share the same geographical boundaries, offering no clearly identifiable outer border of the linguistic areas in question.

Implications of Areal Linguistics for Linguistic Reconstruction and Subgrouping

Areal diffusion can have important implications for comparative reconstruction and for subgrouping within known language families. Nootkan provides a good example which illustrates this. The sound correspondences upon which Nootkan subgrouping is based are given in Table 1.

Nitinat and Makah appear to share the innovation which changed nasals to corresponding voiced stops (in [1]–[4]), while Nitinat and Nootka appear to share the change of the glottalized uvulars to pharyngeals (in [5] and [6]). (Makah and Nitinat also share the retention of uvular fricatives, which Nootka has changed to a pharyngeal [in (7) and (8)]; however, shared retentions are not valid evidence for subgrouping.) Here, one innovation (denasalization) suggests a subgrouping of Makah and Nitinat together, with Nootka more distantly related, while the other innovation (pharyngealization) suggests Nitinat and Nootka together, with Makah less closely related. This seeming impasse is solved when we take into account the fact that the absence of nasals is an areal feature shared by several other languages of the area; it diffused into both Makah and Nitinat

Table 1 Nootkan sound correspondences

| | <i>Makah</i> | <i>Nitinat</i> | <i>Nootka</i> | <i>Proto-Nootkan</i> |
|----|-----------------|----------------|---------------|----------------------|
| 1. | b | b | m | *m |
| 2. | b' | b' | m' | *m' |
| 3. | d | d | n | *n |
| 4. | d' | d' | n' | *n' |
| 5. | q' | ʕ | ʕ | *q' |
| 6. | q' ^w | ʕ | ʕ | *q' ^w |
| 7. | χ ^w | χ ^w | h | *χ ^w |
| 8. | χ | χ | h | *χ |

(Haas, 1969).

under areal influence and is thus not real evidence of a shared common development before the languages separated; rather, it reached these two languages independently from elsewhere in the linguistic area. The innovation shared by Nitinat and Nootka of glottalized uvulars changing to pharyngeals (in [5] and [6]) is real evidence of subgrouping – a true (nondiffused) shared innovation. So, Nitinat and Nootka together constitute one branch of the family, Makah the other branch. Moreover, with respect to areal implications for reconstruction, if we did not know about the areal diffusion in this case, we might be tempted to reconstruct the voiced stops in Proto-Nootkan, since they occur in more languages than the nasals do, and to postulate a change of these to nasals in Nootka (for [1]–[4]), getting it wrong in this case. Thus, areal linguistic traits can have important implications for classification (subgrouping) and for reconstruction.

Areal Linguistics and Proposals of Distant Genetic Relationship

Some similarities among languages which are due to areal diffusion are often mistakenly taken to be evidence of a possible distant family relationship among languages whose classification is in question. The Mosan hypothesis, which proposes a genetic relationship between the Salishan, Wakashan, and Chimakuan language families, illustrates this problem, which is common in many instances of long-range comparison. Several scholars noted structural similarities among these Northwest Coast languages, but the Mosan hypothesis was not found convincing because much of the evidence turned out to rely on areal traits widely borrowed in the Northwest Coast linguistic area. Swadesh (1953) presented 16 shared structural similarities in support of Mosan, but most of these are Northwest Coast areal features (some of the traits are also typologically commonplace, found independently in languages throughout the world), for example:

1. “Extensive use of suffixes.”
2. “Nearly complete absence of functioning prefixes in Chimakuan and Wakashan, minor role in comparison to the suffixes in Salish.” (Typologically it is not unusual for suffixing languages to lack prefixes.)
3. “Extensive use of stem reduplication, including initial reduplication . . . and . . . full stem reduplication.”
4. “Aspect, including at least the dichotomy of momentaneous and durative.”
5. “Tense is an optional category.”

6. “Plural is an optional category.”
7. “Dichotomy of non-feminine versus feminine gender shown in demonstratives and articles.”
8. “Numeral classifier notions, shown by suffixes.”
9. “Two alternate stems for number” (lexically paired distinct singular and plural verb stems).
10. “Lexical suffixes . . . referring to body parts and other space references.”
11. “Predicative use of nouns.”
12. “Demonstrative distinctions such as the present versus absent, or visible versus invisible.”

As is clear, the traits which Swadesh listed as evidence for the Mosan hypothesis are better explained as the results of diffusion within the Northwest Coast linguistic area (see Campbell, 1997 for details.)

From this case, it is easy to see why the identification of areal traits is so important in historical linguistics. In this instance, failure to recognize the areal borrowings led to an erroneous proposal of genetic relationship among neighboring language families.

Kinds of ‘Linguistic Area’

It is generally recognized that things that have been called linguistic areas include entities with widely divergent character and historical backgrounds, depending on the social, cultural, political, geographical, attitudinal, and other factors which correlate with diffusion of linguistic features in different regions (Dahl, 2001: 1458; Kuteva, 1998: 308–309). As Thomason (2001: 104) explained,

[linguistic areas] arise in any of several ways – through social networks established by such interactions as trade and exogamy, through the shift by indigenous peoples in a region to the language(s) of invaders, through repeated instances of movement by small groups to different places within the area.

One finds in the literature many different sorts of linguistic areas, such as: incipient ones, only beginning to form and with as yet few shared traits; moribund and decaying ones, where, due to many changes after the area was actively formed, fewer traits are currently recognizable among the languages; overlapping ones, where different areas formed on top of or partially overlapping one another at different times for different reasons; multilateral (areal traits spreading from various languages of the region) versus unilateral areas (with the traits shared throughout the languages of an area stemming predominantly from one language); areas due to rapid conquest, population spread, and migration (traits moving with movement of speakers), others through home-grown, stay-in-place contact (movement of traits but not of peoples); and disrupted areas with

“latecomers, earlier drop-outs, and temporary passers-by” (Stolz, 2002: 265). “In short, the notion ‘linguistic area’ does not refer to a uniform phenomenon, either socially or linguistically” (Thomason, 2001: 115). This array of different kinds of linguistic area raises questions about whether the notion of ‘linguistic area’ is warranted, whether all these different ‘objects’ legitimately qualify as ‘linguistic areas,’ given their very different natures and composition and given the very different circumstances of their birth (and decay). The notion of ‘linguistic area’ offers little upon which these different sorts of linguistic areas can be united other than the fact that they all involve borrowing in some way, but borrowings of different sorts, for different reasons, in different settings, and at different times.

Linguistic Areas versus Borrowing Generally

It is generally acknowledged that linguistic areas are “notoriously messy,” “notoriously fuzzy” things (Thomason and Kaufman, 1988: 95; Heine and Kuteva, 2001: 396; Tosco, 2000: 332), and that “what we understand about linguistic areas is depressingly meager” (Thomason, 2001: 99). A common perception is that the term ‘linguistic area’ is difficult to define (cf. Heine and Kuteva, 2001: 409). As Thomason (2001: 99) observed, “linguistics has struggled to define the concept ever since [Trubetzkoy, 1928], mainly because it isn’t always easy to decide whether a particular region constitutes a linguistic area or not.” Stolz (2002: 259) believed that “the search for clearcut definitions [of ‘Sprachbund, linguistics area, and areal type’] has been largely futile and will probably never come to a really satisfying conclusion.” In spite of prolonged efforts to define ‘linguistic area,’ there is no general agreement on its definition, and even for the most widely accepted linguistic areas, such as the Balkans, scholars do not agree wholly on which languages belong to the area, what linguistic traits characterize the area, and what its precise geographical extent is. This difficulty has been related to the lack of clear distinction between areal phenomena and borrowing generally (Campbell, in press). Thus Dahl (2001: 1458) asked:

In the end, we are led to the following more far-going question about the notion of area: to what extent do areas . . . have a reality of their own and to what extent are they just convenient ways of summarizing certain phenomena? At the most basic level, linguistic contact relationships are binary: one language influences another. An area is then simply the sum of many such binary relationships.

Campbell (in press) argues that the various definitions of ‘linguistic area’ offered in the literature confirm that linguistic areas amount to just the study of local linguistic borrowing and its history. Every ‘linguistic area,’ to the extent that the notion has any meaning at all, arises from an accumulation of individual cases of ‘localized diffusion’; it is the investigation of these specific instances of diffusion, and not the pursuit of defining properties for linguistic areas, that increases our understanding and explains the historical facts. With the focus rather on specific instances of borrowing, many of the unresolved issues and indeterminacies which have dogged areal linguistics from the outset cease to be relevant questions. It is the diffused linguistic changes themselves that count and not the attempt to seek meaning in the geography that secondarily is involved (Campbell, 2004). A linguistic area, to the extent that it may have a legitimate existence at all, is merely the sum of borrowings in individual languages in contact situations. If we focus rather on understanding borrowings, those contingent historical events, the difficulty of determining what qualifies as a legitimate linguistic area ceases to be a problem.

Armenian

B Vaux, University of Wisconsin-Milwaukee, Milwaukee, WI, USA

© 2006 Elsevier Ltd. All rights reserved.

'Armenian' actually refers to several languages, including Standard Eastern and Western Armenian, Middle (/Medieval/Cilician) Armenian, and Classical Armenian, as well as Zok, formerly spoken by the Armenian inhabitants of southeastern Nakhichevan; Kistinək, spoken by the Armenian inhabitants of Musaler, Turkey; Kesbənuək, spoken by the Armenian inhabitants of Kesab, Syria; Homshetsma or Homshetsnak (referred to as Hemşince in Turkish), spoken by the Hemshinli of northeast Turkey and the Hamshen Armenians of the Black Sea coastal regions of Abkhazia and Russia; and dozens of other mutually unintelligible variants of Armenian originally spoken in Turkey, Armenia, Azerbaijan, Iran, Georgia, Abkhazia, Russia, and Israel. Lomavren, the language of the Boshā (or Posha) gypsies of Turkey

and Armenia, draws its grammar from the Erzerum dialect of Armenian but its lexicon is mostly of Indic origin; it therefore is not clear whether or not the language should be classified as a form of Armenian. All employ the Armenian alphabet (created by Mesrob at the beginning of the 5th century) except for the Turkish forms of Homshetsma, which normally appear only in oral contexts, but in recent years have begun to show up in Turkish orthography in collections of word lists from minority groups in Turkey, lyrics on CDs, and the like.

Armenian belongs to the Indo-European family, and is commonly believed to be most closely related to Greek and Indo-Iranian. (For instance, all three share a prohibitive particle **me*: (Greek *me*.; Sanskrit *ma*.; Armenian *mi*) and the imperfect third-person singular augment **e*- (as in Greek *e-pher-e*, Sanskrit *a-bhar-a-t*, Armenian *e-ber* '(s)he/it carried'). Many more such parallels are discussed in Clackson, 1994.) Because of its many loans from various Middle Iranian languages, especially Parthian, Armenian

was thought to be an Iranian dialect until Heinrich Hübschmann demonstrated in 1875 that it was a distinct branch of the Indo-European family. Scholars disagree on how the Armenians came to historical Armenia, the eastern half of present-day Turkey centered around Lake Van and Mount Ararat; some believe they came southward from the Russian steppe, others believe they and the Hittites came eastward from Greece, and others suggest they moved only a short distance from an original Indo-European homeland in the Transcaucasus. It is most likely that this settlement occurred in the second millennium B.C. The earliest mentions of the Armenians occur in the inscriptions of the Achaemenid Persian king Darius (6th century B.C.) and the Greek historian Herodotus (5th century B.C.)

The earliest written records of the Armenian language date from the 5th century A.D. shortly after the conversion of the Armenians to Christianity in the 4th century led to the creation of an Armenian alphabet by Mesrob around 401 and a systematic program of translating the books of the Bible. The language of the earliest translations was Classical Armenian (also called *grabar*, ‘written [language]’), which continued as the preferred literary form of Armenian until the 19th century, when it was supplanted by the three modern literary dialects.

In linguistic terms Armenian is notable for its significant divergences from Proto-Indo-European, particularly in terms of pronunciation and vocabulary. Some of the more striking phonological changes are the development of a rich set of affricates (*ts*, *dz*, etc.), the loss of final syllable rimes (e.g., PIE **worgʷom* ‘work’ > Classical Armenian *gorts*), the change of initial **dw* to *erk-* (e.g., PIE **dwo*: ‘2’ > Classical Armenian *erku*), and the change of original **w* to *g*. Most striking in the vocabulary of Armenian is the rarity of words inherited from Indo-European and the overwhelming predominance of words of unknown origin. Unsurprisingly, native IE words survive primarily in the core vocabulary: *mayr* ‘mother’ < **ma:ter*, *hayr* ‘father’ < **pater*, *kʰoyr* ‘sister’ < **swesor*, *kov* ‘cow’ < **gwows*, *tun* ‘house’ < **domos*, *em* ‘I am’ < **esmi*. The remainder of the lexicon is drawn primarily from Parthian, and to a lesser extent Greek and Syriac (q.v. Hübschmann, 1895); several hundred and perhaps as many as several thousand words are of unknown origin, most likely having come from Urartian, Hurrian, and other now-extinct autochthonous languages. Armenian also incorporated large numbers of Arabic words following the expansion of the Arabs in the Middle East in the 7th century, and the spoken language absorbed thousands of Turkish words following the arrival of Turkic tribes in Anatolia beginning in the 11th century.

Though there are dozens of mutually unintelligible varieties of Armenian, all share certain features. Proto-Armenian had four verbal conjugations, characterized by theme vowels -e-, -i-, -a-, and -u- (*ber-e-m* ‘I carry’, *χawsim* ‘I speak’, *χndam* ‘I rejoice’, *zgen-u-m* ‘I wear’); most modern dialects (including the Western and Eastern literary languages) have completely or partially lost the -u- conjugation, and standard Eastern Armenian has merged the -i- conjugation into the -e- conjugation. There were originally three morphologically distinct sets of personal endings for verbs – present, imperfect, and aorist – which were used in combination with additional tense and aspect markers to form the various tenses and moods. The system of nominal morphology in Proto- and Classical Armenian was rich, preserving the IE nominative, accusative, genitive, dative, instrumental, ablative, and locative cases in both singular and plural (but the IE dual was lost); there were at least eight different declensions, distinguished primarily by different theme vowels. This system was significantly reduced by the medieval period; Middle Armenian and the modern varieties now use the singular endings for the plural as well, and have only one productive declension, formed from parts of the original -i- and -o- declensions. With the exception of pronouns, the inventory of cases has significantly reduced as well: the accusative has merged with the nominative, and the genitive with the dative. Proto-Armenian had several participial forms, but only two of these survive into the modern period: the original past participle -eal is now -el in the Eastern dialects, and the original present participle -oϝ is now used as a present participle and for relativizing subjects of subordinate clauses, as in the following Standard Western Armenian example:

| | | | |
|--------------------------------------|-----------|---------------|------------|
| ɑjn | kʰirkʰ-ə | kʰən-oϝ | gin-ə |
| that | book-def. | buy-pres.ppl. | woman-def. |
| ‘the woman that is buying that book’ | | | |

The Western dialects have replaced -eal with -ats (> -adz) for past participles; all modern dialects also use the -ats participle to relative non-subjects of subordinate clauses, as in the following Western example:

| | | |
|-----------------------------------|---------------|--------------------------|
| (kʰu) | kʰən-adz | kʰirkʰ-ətʰ |
| 2sg _{GEN} | buy-past.ppl. | book-2sg _{POSS} |
| ‘the book that you (have) bought’ | | |

Most of the changes between Classical and Modern Armenian first appear in the medieval period in Middle Armenian documents, associated with the Armenian kingdom of Cilicia, which flourished from the 11th to 15th centuries A.D. in what is now south-central Turkey. Middle Armenian is generally

Western in character, though it shares many features with Eastern dialects as well. It inverts the pronunciation of the Classical Armenian plain voiced and voiceless stops (e.g., *berem* ‘I carry’ > *perem*, *pat* ‘wall’ > *bad*), a feature that is preserved in the modern Cilician dialects of Zeytun and Hadjin but differs from the Western and Eastern literary varieties (Eastern preserves the Classical system [bɛrɛm]); Western devoices and aspirates the original voiced series [p^hɛrɛm]). The Cilician kingdom was in close contact with several Crusader kingdoms; as a result, it borrowed a significant number of words from Crusader French, most famously what comes out as the standard Western form for ‘mister’, *baron*.

In the 19th century Armenian nationalists became interested in developing a literary form of the modern language. This was brought about by excising most Turkish forms from the regional dialects and replacing them with new borrowings from the classical language. The intellectual center around which the new Western literary language was organized was Constantinople (modern Istanbul), though many features of the standard dialect (including the pronunciation of the consonants) do not come from the Armenian dialect originally spoken there. The same holds for Eastern Armenian with respect to Erevan. The relationship between the two modern literary dialects is somewhat complicated; there are many grammatical differences (e.g., W *gə sɪrɛm* vs. E *sɪrum ɛm* ‘I love’, W *bidi sɪrɛm* vs. E *kəsɪrɛm* ‘I will love’ (note that the same form is used for the present in W and the future in E) and lexical differences (e.g., W *dʒɛrmag* vs. E *spitak* ‘white’; W *həs* vs. E *ɛstɛɛ* ‘here’, W *bɛdk^haran* vs. E *zuk^haran* ‘bathroom’, W *havgit^h* vs. E *dzu* ‘egg’), and most Western speakers have difficulty understanding Eastern, but many Eastern speakers are relatively comfortable with the Western dialect. This asymmetry in mutual intelligibility most likely results from the fact that large numbers of speakers of Western dialects fled to Eastern Armenia following the Russo-Turkish war in 1828 and the Turkish Genocide in 1915–1920, whereas before the fall of the Soviet Union in 1991 most Western Armenians had little or no exposure to Eastern Armenian. The fact that there is some mutual intelligibility in both directions can also be linked to the fact that the literary dialects tend to borrow the same forms from Classical Armenian, and (at least in recent decades) employ the same newly coined words.

The destruction of the Armenian homeland and more than a million Armenians by the Ottoman government in 1915–1920 rendered most nonstandard varieties of modern Armenian moribund; with few exceptions the Armenians in the diaspora (primarily Lebanon, France, and notably in the Los Angeles area

of the United States) speak only Standard Western Armenian. There were approximately 6.8 million speakers of Armenian in 1996, but all varieties of the language except for Standard Eastern Armenian are in immediate danger of extinction as very few diaspora Armenians under the age of 30 speak the language fluently.

Whereas Classical Armenian was relatively Indo-European in its syntactic and morphological structure, all varieties of Modern Armenian are typologically much closer to Turkish and the Balkan languages. Compare, for instance, the formation of relative clauses, exemplified by ‘I saw the bird that was singing in the tree’: Classical – *tesɪ əz-t^hɛrtʃ^hun-ən* or *ɛtɛr i veraj tsar-ɔj-n* (I.saw specific-bird-definite that was.-singing in on tree-genitive-definite), Western – *dzar-i-n vɛrə jɛrk^hɔɛ t^hɛrtʃ^hun-ə dɛsə* (tree-gen.-def. on singing bird-def.I.saw). Western Armenian has undergone additional influence from Turkish and Greek (cf. *sɛpɛɔin* ‘carrot’, *istak^hɔz* ‘lobster’, *bant^hɔg* ‘hotel’), whereas Eastern Armenian has been heavily influenced by Russian (e.g., the standard form for ‘potatoes’ is *k^hart^hɔfli*, and the word for ‘gay’ is *galubɔj*, from the Russian word originally meaning ‘sky blue’; the native word for ‘blue’, *kapujt*, cannot be used in this sense).

The Lord’s Prayer in Different Varieties of Armenian, Rendered in the IPA Classical Armenian (Edžmiatsin ms. 229, 989 A.D.)

Հայր մեր որ յերկինս. սուրբ եղիցի անուն քո.

Arrente

G Breen, Institute for Aboriginal Development, Alice Springs, NT, Australia

© 2006 Elsevier Ltd. All rights reserved.

Arrente, using the most common current spelling, is the name of what was for many years, if it is not still, the most well-known Aboriginal language name in Australia. The first widely used spelling was 'Arunta,' and this is the spelling that leads to the best approximation to the pronunciation of the name ([ɾ̥r̥əŋd̥ə], often [ˈr̥əŋd̥ə]) by the general English-speaking reader. The early German Lutheran missionaries introduced the spelling 'Aranda.' The spelling 'Arrente' is that of the practical orthography most

used now by writers in the language, and has acquired wide currency, for example, in the print media. The (Lutheran) Finke River Mission now uses the spelling 'Arrarnta.'

At the time of European settlement, which reached the central part of Australia in the 1870s, the Arrente speakers occupied a large area in the southeastern part of the present Northern Territory, spilling over into Queensland and South Australia (see Figure 1). The name Arrente (with various qualifiers) is used for several dialects of what is generally regarded as a single language, called Upper Aranda by Hale (1962), and also for another closely related language that Hale called Lower Aranda. The Upper Aranda language group includes three main subgroupings: Western,

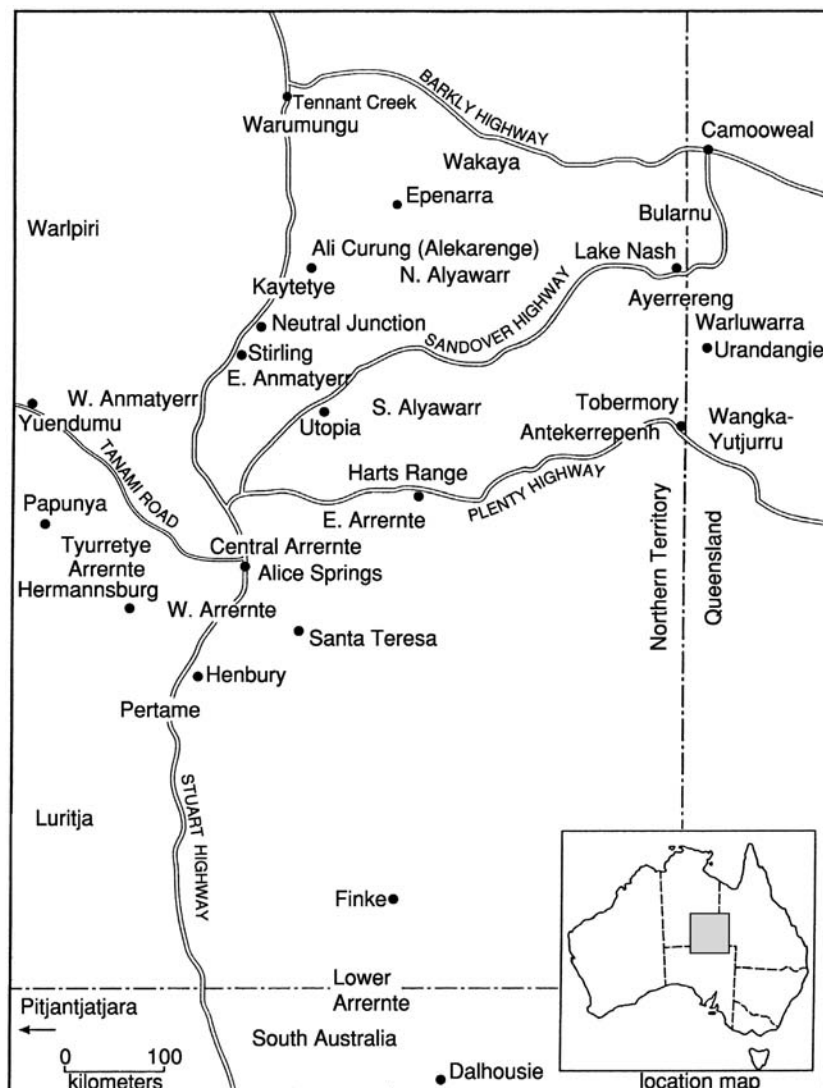

Figure 1 Locations in Australia where Arrente and some neighboring languages are spoken. Reprinted from Green (1998), Kin and country: aspects of the use of kinterms in Arandic Languages. M.A. thesis, University of Melbourne.

Central, and Eastern Arrernte and Anmatyerr and Alyawarr as dialects, which have of the order of a 1000 speakers each and are still being learned by children; Southern Arrernte (or Pertame), many of whose speakers now use Western Arrernte; and extinct or nearly extinct varieties, Antekerrepenh and Ayerrereng. The relationship of modern Western Arrernte to an almost extinct dialect that has been called Tyurretye Arrernte (Breen, 2001) is not clear; it could be that the latter is the original western dialect and the former is essentially Southern Arrernte. Anmatyerr and Alyawarr do not identify as Arrernte. The other language, Lower Arrernte (Hale's Lower Aranda, called Lower Southern Arrernte/Aranda by some, but Arrernt Imarnt in the dictionary that is being compiled by the author at the time of writing), had in 2004 only a couple of moderately competent, elderly speakers. The two languages, Upper and Lower Arrernte, are grouped (but not uncontroversially) with the more distantly related Kaytetye under the name Arandic (see Koch, 2004), and this is classed as a subgroup of the Pama–Nyungan family (which, again, is not universally accepted).

Study of the Arrernte language was begun after 1877, by German missionaries, notably Carl Strehlow. Strehlow's son, T. G. H. Strehlow, continued his father's study of the language and amassed a vast quantity of data, the culmination of his work being the wonderful *Songs of Central Australia* (1971). Somewhat earlier, around 1960, the linguist Ken Hale (1934–2001) had collected excellent material in most dialects. The Summer Institute of Linguistics (SIL) and other mission linguists have also worked on the languages for many years; the first substantial Western Arrernte Bible portion appeared in 1925 and there have been many other, mostly smaller, works. Substantial theses on Arrernte phonetics and grammar have been written by David Wilkins (1989), John Henderson (1998), and Victoria Anderson (2000). One of the most extensive dictionaries of any Australian language to appear to date is that of Eastern and Central Arrernte by Henderson and Dobson (1994).

Smaller dictionaries are those of Alyawarr (Green, 1992) and Western Arrernte (Breen, 2000); dictionaries of Anmatyerr (a work in progress, by Jenny Green) and Lower Arrernte (Breen) are to appear in the near future. No detailed grammar has been published. Indigenous writing is in its infancy.

Table 1 gives the consonant inventory of Central Arrernte, using orthographic symbols, as typical of these languages. The basic vowel system comprises a featureless vowel, written *e*, dependent for its quality on the surrounding consonants, and a low vowel, *a*. In most dialects there is also a high front vowel, with a comparatively small functional load, and in some there may also be a high back vowel, with a small functional load, which, however, may be better analyzed as due to the effect on *e* of roundness on a following consonant. Roundness, derived from an ancestral rounded vowel, may be associated with consonant positions. A seventh consonant position, prepalatalized apical (*yt*, *yn*, *ytn*, *yl*), postulated for some dialects, may be more correctly analyzed as a palatalization feature associated with the consonant position. In other dialects, prepalatalized apicals are an allophone of phonemes in the series called apical postalveolar.

Arrernte (and also Kaytetye) are a focus of attention for linguists because of the substantial sound changes that the languages have undergone in the not too distant past. These include loss of initial syllables or their replacement by a vowel; transfer of the feature 'roundness' from the vowel to an adjacent consonant (from which it might spread or migrate) – this resulted in the earlier three-vowel inventory being reduced to two, with later expansion, as noted previously; prestopping of certain nasals; and loss (or, as Koch (1997) has it, neutralization) of final vowels. Orthographically, in some dialects, all words are written with final *e*, representing schwa, whereas in others, final (predictable, often optional) vowels are not written, except, as *a*, in short words, in which they may be the stressed or even the only vowel. Thus, for example, earlier **nyina*- 'sit' has become *n-* or *an-*; **ngali* 'we (dual, inclusive)' has become *il-*, *ayl-*, or

Table 1 Central Arrernte consonants

| Type | Peripheral | | Laminal | | Apical | |
|------------------|------------|-------|---------|----------|----------|--------------|
| | Bilabial | Velar | Dental | Alveolar | Alveolar | Postalveolar |
| Stop | p | k | th | ty | t | rt |
| Nasal | m | ng | nh | ny | n | rn |
| Prestopped nasal | pm | kng | thn | tny | tn | rtn |
| Lateral | | | lh | ly | l | rl |
| Tap | | | | | rr | |
| Glide | w | h | | y | | r |

aly-; **wama* ‘snake’ has become *apme* or *apmwe*; and **munga* ‘night’ has become *ingwe*. Breen and Pensalfini (1999) have argued that, contrary to the supposed universal situation that all languages have consonant–vowel (CV) syllables and that VC syllables can occur only in a language that also has CV, CVC, and V syllables, the sole underlying syllable shape in Arrernte is VC(C). Words that are consonant-initial on the surface have an underlying initial schwa. See Breen (2001) for a brief overview of the phonologies of the different dialects, and Koch (1997) for his view of the sound changes that have occurred.

In phonotactics, Arrernte is atypical in Australia in that it allows monosyllabic words and (surface) word-initial consonant clusters (homorganic or heterorganic). In most dialects, the vast majority of words are vowel–initial, mostly *a*-initial (the remainder having the underlying initial schwa, which never appears utterance-initially). The definition of the concept ‘word’ in Arrernte is problematic; units that are clearly words, or even phrases, can be incorporated into words, dividing them into parts that are clearly less than words (see Henderson, 2003).

Grammatically, Arrernte is typical of languages of most of Australia in the following ways:

- Nouns operate in an absolutive/ergative paradigm but pronouns are nominative/accusative, except that first- and second-person singular in eastern and northern dialects distinguish intransitive subject, transitive subject, and object.
- Pronouns have three numbers – singular, dual, and plural – and in some dialects distinguish exclusive from inclusive in first-person dual and plural (whereas others have lost this distinction but retain, with no function, the old exclusive marker).
- Cases are marked by suffixation.
- There is no grammatical gender.
- The rich verbal morphology includes a variety of compound types; verb suffixation marks tense, mood, aspect, associated motion, and, optionally, number of subject.
- Reduplication, of various types, is prominent in the grammar of the major lexical categories.
- Preferred constituent order is subject-object-verb (SOV), but this is frequently varied by pragmatic factors.

There is a complex interaction between kinship and grammar, although much of this is being lost. Society was, in the recent past, organized into four sections (called ‘skins’ in Aboriginal English) based on a division into two patrilineal moieties superimposed on a division of alternating generations. Not long before European settlement, a further division to form eight subsections diffused from groups in the northwest,

but did not reach to the easternmost or southernmost parts of the Arrernte area. Nonsingular pronouns can be marked according to the relationship of the persons concerned; thus, in Alyawarr, we have *ayla* ‘we (dual, inclusive, same section),’ *aylern* ‘we (dual, exclusive, same section),’ *aylak* ‘we (dual, inclusive, same moiety but differing by an odd number of generations, as father and child),’ *aylernak* (as *aylak*, but exclusive), *aylanth* ‘we (dual, inclusive, different moiety, as mother and child or husband and wife),’ and *aylernanth* (as *aylanth*, but exclusive). Kinship terms can be suffixed with morphemes derived from dative pronouns to indicate possessor; so, from *arreg* ‘father’s father and reciprocal’ we can have *arregaty* ‘my father’s father,’ ‘my son’s child (I being male),’ ‘my brother’s son’s child,’ and so on; *arregangk* ‘your father’s father,’ etc.; *arregikw* ‘his or her father’s father,’ etc.; *arregalyew* ‘our father’s father, we being siblings,’ etc.; and *arregalyewak* ‘father’s father of one of us (we being in the same moiety but differing by an odd number of generations, as father and child),’ etc. This last term, *arregalyewak*, can be used by some speakers in the singular (‘father’s father of one or other of us’), but others could use it only if, say, there were two people who were ‘your and my father’s fathers.’ Each of the 27 possible suffixes can be used in this way. The following sentence is a relatively simple example in Antekerrenh, translated by the speaker (SS means ‘same section’; VOC, vocalic; ERG, ergative; 1DU, first-person dual; DAT, dative):

- (1) Angkwer-ey antyeny ayn-el-ayl-ek
 elder.sister-VOC old.man father-ERG-1DU.SS-DAT
 aherr atw-ern.
 kangaroo kill-PAST
 ‘Well sister, old dad’s killed a kangaroo.’

Another example, in Alyawarr, is from a children’s story (Summer Institute of Linguistics, 1996); the stories were the result of a linguist showing the (adult) language workers a series of drawings and asking them to make a story about the drawings. The first story in the book, about three boys who got lost, had the following sentence (DM means ‘different moiety’; 3PL, third-person plural):

- (2) Am-ayn-ew-anth-err-then
 mother-3PL-DAT-DM-PL-also
 ayn-ayn-ew-anth-err-then
 father-3PL-DAT-DM-PL-also
 nthw-ew-anem ampa ikwer-rnem
 look.for-PAST-then child 3SG.DAT-PL

This is translated as ‘Their mothers and fathers looked for the children’; the boys could have been two brothers and their cross-cousin. The same kinship

terms were used with ergative marking on the following page of the story. Note that, there is no number marking, but the use of the complex kinship terms seems perfectly natural and efficient (these and other complexities of kinship grammar are as yet unpublished, but see Breen (1998) and Green (1998)).

Artificial Languages

P O Bartlett, Vienna, VA, USA

© 2006 Elsevier Ltd. All rights reserved.

An artificial language is a language that has been deliberately designed for a purpose by one person or a small group of people over a relatively short period of time. (Adapted with permission from a definition by Richard K. Harrison, personal communication, 2004.) This definition, while serviceable, does lead to uncertain cases, such as whether pidgins should be considered artificial, being developed by small groups for a purpose, but usually pidgins are not considered to be artificial languages and will not be treated as such within the scope of this article. There is additionally the question of whether reduced languages such as Basic English (1930) are artificial. Also, this article pertains only to languages for interhuman communication and therefore does not address such constructs as computer programming languages.

Constructors can operate from any of several motives for designing a language. Some language designers intend that eventually their languages will replace an entire family of languages, such as Tutonish (1902) for the Germanic languages, or Ro (1906) for the entire world, considering that their languages would confer some overwhelming advantage to warrant replacing other existing languages.

Perhaps the most common design goal of artificial languages is international auxiliary languages, languages intended for use among people who do not have (or do not choose to use) any other language in common. Auxiliary languages, of which the best known but by no means the only is Esperanto (1887), may be intended to serve among localized areas (e.g., Guosa in Nigeria, 1965) or for the whole world. (Some have questioned whether replacement and auxiliary languages should be considered real languages. The experience of Esperanto, among others, tends to show that at least some such languages are

adequate for any level of discourse for which their users want to employ them. Also, there are individuals who have learned Esperanto from infancy in Esperanto-speaking homes. Therefore at least some auxiliary languages are real languages.)

There are authors who have designed languages, at highly varying levels of specification and completeness, for artistic use or to be part of a fictional or mythic world. Examples are the Elvish languages of J. R. R. Tolkien's Middle Earth and Klingon on the *Star Trek* series.

A few languages have been designed to test some or other linguistic hypothesis. The original motivation of James Cooke Brown's Loglan (1960) seems to have been to test the Sapir-Whorf Hypothesis.

From time to time, smaller or larger groups have constructed languages in order to communicate among themselves without their communications being readily intelligible to outsiders. Often such concealment languages, such as the Pig Latin of childhood, are modifications of existing languages.

Special communication needs are a sixth motivation for constructing languages. Some, such as a later adaptation of Blissymbolics (originally Semantography, 1949), are designed for communication needs of persons with physical and/or mental disabilities. Languages allegedly usable in psychoanalysis and psychotherapy, such as aUI (1962), are another venue. Additionally, intended communication, at least on a rudimentary level, with hypothesized extra-terrestrial beings can give rise to a language.

Some individuals (and occasionally small groups) construct languages merely for enjoyment, as hobbies, just as some people construct model ships.

Finally, there may be miscellaneous occasions, such as altered religious and/or mental states, although one might question whether some such languages are constructed for a conscious purpose.

Artificial languages, and auxiliary languages especially, have various provenances. The Indo-European (IE) matrix of language designers seems to be the most common provenance of languages readily documented, that is, the designers themselves tend to be speakers of IE languages, and the products are heavily influenced by an IE substrate. In many instances, the languages have an intended primary audience of speakers of European languages, including speakers of non-IE European languages. However, some languages such as Afrihili (1970) have target audiences other than Indo-European speakers (although the languages themselves are often presented and described using an IE language). On the other hand, some auxiliary languages may have an IE base but have an intended audience worldwide.

The history of artificial languages, even in the West, is extensive, and only the briefest outline is possible, inasmuch as the number of auxiliary languages alone is in the hundreds spanning several centuries.

One of the earliest constructed languages in the West of which there is a record is the *Lingua Ignota* of St. Hildegard of Bingen (12th century). It comprised a 23-letter alphabet and about 1000 words. It is not entirely clear whether she intended it as an amusement, as an auxiliary language, or to express certain religious assertions, such as mystical states.

In the 13th–14th centuries, Ramón Llull wrote his *Ars Magna*, which he conceived as a perfect and universal language, especially for the religious conversion of non-Christians.

It was during the 17th century (and later) that the so-called *a priori* philosophical languages came to the fore, especially with the *Real Character* (1668) of Bishop John Wilkins in Great Britain. Perhaps the most notable characteristic of the philosophical languages is their basis in a classificatory scheme of (supposedly) all knowledge. Knowledge is broken into categories, and the vocabulary follows in almost mathematically combinatorial form from the classification.

During the 18th and 19th centuries, a number of artificial language proposals surfaced, such as the rather eccentric *Solresol* (1827) by (Jean) François Sudre, based on a seven-note musical scale, which did, nonetheless, gather some interest.

Volapük, invented in 1879 by the Catholic priest Johann Martin Schleyer, was the first artificial language designed as an auxiliary language to gain any substantial following. It was an *a posteriori* language, i.e., one in which the grammar and (especially) vocabulary derive from one or more existing languages, although word forms of Volapük were greatly modified from readily recognizable forms. The language enjoyed considerable initial enthusiasm throughout Europe and North America, although that enthusiasm quickly waned due to what some considered to be shortcomings in the language itself, factional infighting within the movement, and the rise of Esperanto. (There were, however, some derivatives of Volapük itself, and the language, in a revised form, did have some slight revival in the 20th century.)

Esperanto (1887), the brainchild of Ludwig Lazarus Zamenhof (spellings vary), has become the most successful, in relative terms, of all the artificial auxiliary languages to date. It has a largely Indo-European grammar with a rather agglutinative word-formation system. Estimates of the number of

Esperanto speakers differ widely and are controversial, ranging from a few tens of thousands to several million. Over the decades, people have raised various objections to Esperanto's structure, vocabulary, or orthography (which includes some accented letters unique to itself). Consequently, Esperanto has given rise to numerous derivatives, of which the only one to have any significant number of users at all has been Ido (1907).

Several artificial languages have the design goal of being naturalistic in terms of recognizability to speakers of west European languages. Notable among them have been Latino sine Flexione (1903) by Giuseppe Peano, a kind of Latin with most of the inflections stripped out, Occidental (1922) of Edgar de Wahl, and Interlingua (1951) of the International Auxiliary Language Association, Inc.

A few artificial languages have been known as logical languages, being based on predicate logic rather than on more common grammatical principles. Among these are Loglan (1960) and Lojban (1988) by the Logical Language Group, Inc.

Finally, there have been numerous artificial languages, too many and too varied to try to describe here even cursorily, that might be subsumed under the catch-all heading of just about anything under the sun. They have characteristics similar to those of languages all over the world.

Artificial languages have various features in both grammar and vocabulary, although the grammars of auxiliary languages (at least those developed by Westerners) often (although not always) tend to follow an Indo-European model.

A priori languages, first mentioned above, have two overlapping types. There are those, such as Wilkins's Real Character, Foster's Ro, or Elam's Oz (1932), which follow a classificatory system for vocabulary, as noted above. Such schemata are open to several criticisms:

- The totality of knowledge does not always fit neatly into a simple and single taxonomic schema.
- The taxonomic schema is dependent on the state of knowledge at the time of the creation of the schema.
- It can be difficult to fit new discoveries, taxa, and techniques into the schema, as the schema tends to be relatively closed.
- In practice there is a prodigious demand on the memory (and on the oral-aural channel) to retain the schema and to make fine distinctions (both semantic and oral).

Another use, however, of the term '*a priori*' is simply a reference to artificial languages whose

vocabularies are made up *ad hoc* and not derived from the vocabularies of existing languages. Some languages of this type (many examples could be cited) may have some internal structure to the vocabulary, primarily for mnemonic value, but do not follow a classificatory scheme as such.

A posteriori languages have their grammar and vocabulary bases in existing languages. The degree to which the vocabulary items are deformed varies widely.

There are also logical languages, as mentioned above. Their vocabulary may be *a priori* or at least partially *a posteriori*.

Auxiliary languages in particular can have different intended audiences and purposes. Some designers target their products largely for informal, personal use, such as among travelers and correspondents. On a wider scale, commercial and professional applications may come into purview. IALA Interlingua has seen some professional use in the past, but few languages seem to have yet found much widespread use in the commercial realm. Intergovernmental use, such as diplomacy and treaties, may be encompassed within the design of a language, although none have yet made significant inroads into this area. Different members of target audiences may have different assessments of the ease with which adult learners can acquire and use an artificial language.

Artificial languages in general (and not just auxiliary languages) differ markedly in their division of semantic space. Some have a rich vocabulary, making fine semantic distinctions, and others have a much more restricted vocabulary, depending on periphrasis to convey distinctions. Languages differ widely in how they handle (or even allow) unassimilated or partly assimilated foreign terms.

The issue of idiom often tends not to be treated extensively in the construction of auxiliary (and other artificial) languages. As a result, many users often import native idioms, impeding ready communication, or make conscious efforts to avoid idiom entirely. Of course, there is nothing to prevent a body of users from developing over time idioms unique to the user base itself.

Just why an auxiliary language does or does not have much use (in terms of speaker base) may depend on several factors. Not all of these factors are linguistic characteristics in and of themselves. Among them are:

- Propitiousness of circumstances, or 'right place at the right time.' In some language milieux, there is simply little felt need for an auxiliary language.

- Perception by prospective learners and users that the language itself is adequate for the task and sufficiently easily acquired by adult learners. This factor, although highly subjective, is operative. This factor can be called 'good enough.'
- A proposed international auxiliary language must have a stable enough base so that it is not always moving under the feet, so to speak, of would-be users. (Some language designers continue indefinitely to make changes.)
- A language proposal must be sufficiently dispersed to the attention of prospective users, with didactic material available.
- Proponents must have sufficient enthusiasm to work against social inertia.
- Proponents must have at least a minimally sufficient organization at some time to assist propagation.
- External events, such as wars or government favorable (or disfavorable) attention, may work for or against the spread of an auxiliary language.

Although much material exists for individual artificial languages, there are few comprehensive studies

of artificial languages in general. Most available material relates to international auxiliary languages, and some of that is on a popular level. Some of the works cited in the Bibliography contain further references for the interested reader.

Assamese

P N Dutta Baruah, Central Institute of Indian Languages, Mysore, India

© 1994 Elsevier Ltd. All rights reserved.

Assamese is the principal vernacular and official language of Assam, a northeastern state of India, and is spoken by 10 million persons there and by 10 million more in Bangladesh. An Anglicized derivation of *ᱛᱟᱞ* 'Assam,' Assamese refers to both the language and the speakers. Natives call it *ᱛᱟᱞᱟᱫ* < *ᱛᱟᱞ* + *ᱫ* meaning 'belonging to.' A descendant of the Magadhan group of the Indo-Aryan family of languages, it shows affinity with modern Hindi, Bengali, and Oriya. Its formative period begins from the tenth century and written records in verse date from only the late thirteenth century, *prahlada charita* by Hem Saraswati being the earliest one. Developed from Brahmi through Devanagari, its script is similar to that of Bengali except the symbols for /r/ and /w/; there is no one-to-one phoneme-grapheme correspondence.

Its characteristic phonemic features include a voiceless velar fricative /x/, the alveolar fricatives /s/ and /z/, alveolar plosives, the alveolar nasal /ɳ/, only one /r/, and the intervocalic occurrence of /ɳ/. Characteristic

morphological features are: (a) gender and number are not grammatically marked; (b) there is lexical distinction of gender in the third person pronoun; (c) transitive verbs are distinguished from intransitive; (d) the agentive case is overtly marked as distinct from the accusative; (e) kinship nouns are inflected for personal pronominal possession, e.g., *deuta* 'father,' *deuta-r* 'your father,' *deuta-k* 'his father'; (f) adverbs can be derived from verb roots, e.g., *mon pokhila uradi ure* 'The mind flies as a butterfly flies'; (g) a passive construction may be employed idiomatically, e.g., *eko muxuni* 'Nothing is audible.'

Syntactically it is non-distinct from its genetic relatives. Assamese has no caste dialects but a geographical dialect *kamrupi* with further sub-dialects. Written Assamese is almost identical with standard colloquial. An Assamese-based pidgin, Naga Pidgin or Nagamese, is spoken in Nagaland. Mutual convergence with neighboring Tibeto-Burman languages and Bengali spoken in Assam is noticeable in phonology and vocabulary. Its indigenous vocabulary is gradually falling into disuse in favor of Sanskritized forms. It stands unique among its genetic relatives in having developed historical and biographical prose as far back as the sixteenth century.

Australia: Language Situation

P K Austin, School of Oriental and African Studies, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The languages spoken in Australia can be classified into the following:

- indigenous languages spoken by Aboriginal and Torres Strait Islander people;
- pidgins and creoles arising from language contact, primarily spoken by Aboriginal and Torres Strait Islander people and the descendants on Pacific Islander groups;
- community languages, including Australian Sign Language (Auslan) and the languages spoken by immigrant community groups and their descendants;
- Aboriginal English, primarily spoken by Aboriginal and Torres Strait Islander people;
- Australian English, the official language of the country and spoken as a first language by 90% of the population, with regional and social variation.

Aboriginal and Torres Strait Islander Languages

When Australia was colonized by Europeans in the late 18th century, it was home to approximately 250 indigenous Aboriginal and Torres Strait Islander languages (Dixon, 1980; Walsh, 1997; Angelo *et al.*, 1994; Austin, 1996), many of which are now either extinct, moribund, or endangered. Today, only 12 indigenous languages continue to be learned by children (McConvell and Thieberger, 2004), meaning that 95% of Australia's indigenous heritage has disappeared or is highly threatened. Recently there have been moves toward revitalization of Aboriginal languages (see below).

The languages spoken in the Torres Strait Islands fall into two groups: Meryam Mer, spoken in the

eastern islands, is related to Papuan languages to the north, and Kala Lagaw Ya, spoken in the western islands, is related to languages of the Australian mainland. For Tasmania, the existing sources are poor and it is difficult to say much definitively about the traditional indigenous language situation (Crowley and Dixon, 1981); however, much work has been done on reconstructing old sources (Crowley, 1993) and the Tasmanian Aboriginal Centre is promoting the revived language.

There has been growing awareness of Aboriginal and Torres Strait Islander languages among the general Australian population, and Aboriginal language courses are now taught in secondary schools in Victoria, South Australia (Nathan, 1996), and soon to be introduced in New South Wales. Bilingual education is also available in the Northern Territory, Queensland, and Western Australia, although programs are often threatened with funding cuts and lack of staff. Over the past 20 years, a number of Aboriginal-run Language Centres have been established throughout the country to collect language and culture information, prepare practical materials such as dictionaries and text collections, and to support local education and cultural revival initiatives. These grassroots organizations have been successful in mobilizing scarce resources in support of the languages. National bodies such as the Federation of Aboriginal and Torres Strait Islander Languages (FATSIL) have been set up, and Aboriginal languages have an increasing presence on the internet (see David Nathan's Aboriginal Languages Virtual Library website for sources). The Central Australian Aboriginal Media Association is also involved in broadcasting and recording and distribution of Aboriginal music. Since the 1980s, Aboriginal rock music bands, some of whom, such as Yothu Yindi, sing in indigenous languages, have become popular across Australia and internationally.

Although threatened by dominant Australian English, there are signs of indigenous language and cultural revival in South Australia (Amery, 2001)

and elsewhere. In 2003, the New South Wales government committed significant funds to supporting indigenous languages in that state and introducing them into the school system in the Languages Other than English (LOTE) program.

Language Relationships

The indigenous languages spoken across the southern two-thirds of the Australian continent plus eastern Arnhem land belong to a single language family called Pama-Nyungan, originally proposed by Kenneth Hale and Geoffrey O'Grady in the 1960s. Much descriptive and comparative work, especially in the last 10 years, has provided support for this family group (see Bowern and Koch, 2003 for the most recent sources, especially the extensive cognate materials given by Alpher in that volume). In the 'Top End' (the Kimberley, Daly River, and western Arnhemland), there is much more linguistic diversity, with some 20 language families having been identified (although recent research has increasingly argued that higher level groupings may also exist; see Evans, 2003). Whether all the languages are ultimately related as a single genetic family remains to be determined.

Linguistic Characteristics

Traditionally, Aboriginal groups were multilingual, as a result of exogamous marriage patterns, and individuals spoke several languages, while claiming primary allegiance to the tongue of their descent group. Languages also showed sociolinguistic variation: geographically different dialects, and special speech styles reflecting kinship and ritual relationships (see Walsh and Yallop, 1993).

Phonologically, languages generally lack fricatives and affricates, and there are contrastive stops at up to five points of articulation, with a nasal for each stop position, one or more laterals, a flap, a semiretroflex continuant, and two glides (see *Gamilaraay* and *Jiwarli* for further details). Stops and nasals contrast laminal and apical manners of articulation. There is usually no voicing contrast for stops (i.e., no contrast between *p* and *b*, for example). Most languages have just three vowels: high front *i*, high back *u*, and low *a*, with a phonemic length contrast found in about half the languages (Dixon, 1980). Some Cape York Peninsula languages have undergone historical sound changes introducing fricatives, prenasalized stops and additional vowel contrasts; Arandic languages of Central Australia are argued to have only two vowels and a contrast between rounded and unrounded consonants (see Breen in Simpson *et al.*, 2001).

The general phonotactic structure of word roots is CV(C)CV(C). Every word must begin with a single consonant and end in a vowel, or a restricted number of consonants. Some languages only allow vowel-final words (see *Jiwarli*). Word initially, in general only nonapical stops and nasals, and the two glides are found. Word medially, there are limited consonant clusters, primarily homorganic nasal plus stop, and apical nasal or lateral plus peripheral stop (*p* and *k*). Vowel clusters are not found, though Vowel-Glide-Vowel sequences are possible. Word stress is generally not phonemic and predictable from the phonological shape of words (see *Gamilaraay* for examples).

Languages of the Pama-Nyungan (PN) group are entirely suffixing in their morphology; non-Pama-Nyungan (non-PN) languages may show both suffixes and prefixes, and tend to be head-marking rather than dependent-marking. There are two major word classes: nominals and verbs, with nominals in PN languages typically showing rich systems of case-marking (in non-PN case-marking is often absent) and verbs marking tense/aspect/mood and dependent clause categories. Nominals can be subdivided into substantives (that cover both noun and adjective concepts in a language like English), pronouns, and demonstratives. Minor word classes include adverbs, particles, and interjections.

Nominals in PN languages typically inflect for case, with the syntactic functions of intransitive subject (S), transitive subject (A), and transitive object (P) showing a split-ergative pattern of syncretism in the case forms determined by animacy:

- for pronouns S and A fall together as a single (unmarked) form with P different (making nominative-accusative case marking);
- for other nominals, S and P fall together as a single (unmarked) form with A different, making ergative-absolutive case marking.

In some languages, some nominal categories (e.g., animate nouns) show a three-way contrast distinguishing S-A-P. In non-PN languages, there are typically systems of verb affixation encoding agreement with verb arguments; this agreement may also reflect gender categories of the nominals.

The following cases are also typically found in PN languages:

- dative, marking alienable possession and direction toward a place;
- locative, coding location in a place;
- ablative, coding direction from a place, and cause.

Australian languages typically have complex systems of nominal word-building morphology that involves suffixation between the root and case inflection. Categories encoded in word-building morphology include number, having, and lacking. Some non-PN languages encode gender on nouns via affixation.

Pronouns generally distinguish three persons and singular, dual, and plural number; in the first person nonsingular, there is an inclusive–exclusive contrast in about half the languages. Some languages also show bound pronouns, often these are reduced forms of the free pronouns and in PN languages are suffixed to particular elements of the clause (Dixon, 1980).

Verbs morphologically distinguish between main verb and dependent verb inflections. Main verbs encode tense and mood categories, while dependent verbs occur in hypotactically linked clauses and mark relative tense (and is some central Australian languages also switch-reference; see below). There are typically a number of verb conjugations that are morphologically determined but may show some correlations with transitivity (Dixon, 1980). Verbs show productive word-building morphology, including affixes that indicate aspectual categories or change in transitivity (detransitivizing and transitivity processes). Generally passive forms are not found, though some eastern Australian languages have anti-passive derivations. Non-PN languages show agreement via affixation on the verb. The minor categories of adverb, particle, and interjection show no morphological variation. All languages also have affixes that attach to words of any category, typically encoding discourse status, evidentiality, and other pragmatically based meanings.

A common pattern in many Australian languages (see **Jiwarli**) is for word order to be relatively free and hence to find all possible orders of Subject, Object, and Verb, as well as separation of nouns and adjectives referring to a single entity (with case agreement indicating common reference). Similarly, possessors (in dative case) may precede or follow the alienable possessed noun. Free omission of nominals whose reference is clear from the context is also common. Australian languages have become famous for their ‘nonconfigurational syntax.’

Interclausal syntax shows a degree of variation; some languages (see **Gamilaraay**) place little restriction on linking of clauses, while others such as Dyrbal have ‘ergative syntax’ where the linked clauses must share coreferential absolutive (S or P) nominals. Many central Australian languages have switch-reference where cross-clausal identity or nonidentity of subjects (S or A) is encoded on the dependent verb. Non-PN languages tend to make use of parataxis in clause linkage.

Particles in Australian languages tend to have scope over the whole clause and encode such semantic concepts as polarity (affirmation versus negation) and mood (possibility, negative imperative, etc.).

Pidgins and Creoles

Australia has a number of English-based pidgins and creoles as a result of language contact between the indigenous languages and the English of the colonizers, beginning in the late 18th century. A range of geographically diverse forms have been and are found, including Sydney-pidgin (extinct since the 19th century; Troy, 1990), Kriol of the ‘Top End,’ Cape York Creole (Crowley and Rigsby, 1979), and Broken or Blaikman Tok of the Torres Strait islands (see Schnukal in Angelo *et al.*, 1994). Kriol is now the native language of some 30 000 speakers in northern Australia.

The various creoles show clear influence from Australian indigenous languages both lexically and structurally (e.g., distinguishing singular, dual, and plural pronouns, and inclusive–exclusive reference in the nonsingular). They also share many characteristics with Pacific pidgins and creoles such as Tok Pisin and Bislama.

The descendants of Pacific islanders removed to Australia in the 19th century to work on sugar plantations in Queensland spoke Pacific pidgins and creoles – these are now being replaced by Aboriginal English.

Community Languages

As a result of on-going immigration of non-English speakers into Australia, some 200 languages have been added to the linguistic ecology of the country (see Clyne, 1991; Clyne and Kipp, 1997). The distribution of these ‘community languages’ varies regionally, especially between the major urban centers, e.g., Melbourne adolescents show dominance of Italian and Greek (reflecting immigration after the Second World War), while Sydney shows dominance of Arabic and Chinese languages (reflecting more recent immigration from the middle East and Southeast Asia). All community languages are undergoing shift to English (Clyne and Kipp, 1997), though to varying degrees in different communities (e.g., more highly among Dutch than Poles or Maltese and Turks). Community languages are widely taught in schools (as LOTE), and bilingual education (including immersion programs) is available in some languages. Local governments in Australia, particularly in the urban centers, pay attention to community languages and provide services and information in a

range of languages. There is a system of registration for interpreters and translators, and strong infrastructure of telephone and court interpreting services for non-English speakers.

An important community language is Australian Sign Language (Auslan), which is widely used in the deaf community, and differs in significant ways from American Sign Language (ASL) and British Sign Language (BSL). After being ignored for a long time, research and publications on Auslan have appeared over the past 15 years (see Johnston, 1989, for example) and an active program of documenting Auslan is underway. Because of early diagnosis of deafness and the widespread use of cochlear implants in deaf children, the number of native Auslan signers has shown a dramatic decline in recent years; the language is currently endangered.

Aboriginal English

Aboriginal English is a particular form of Australian English primarily spoken by Aboriginal and Torres Strait Islander people. It is spoken as a first or second language and is a continuum that ranges from varieties that resemble pidgin or creole English to those more like nonstandard Australian English (Eagleson, 1983; Eades, 1991; Kaldor and Malcolm, 1991). Aboriginal English in rural settings shows substrate influence in articulation (having apico-domal (retroflex articulations) and replacement of fricatives with stops, for example), lack of copula, lack of number marking and *bin* as a past tense marker. In urban settings, Aboriginal English shows many features found in nonstandard varieties across the world, such as multiple negation, and nonstandard verb agreement; however, there are lexical and pragmatic features (Eades, 1991) that are distinctive. Even in regions such as Sydney and Melbourne where the indigenous languages ceased to be spoken in the 19th century, Aboriginal English contains lexical items derived from the indigenous languages such as *koorie* 'Aboriginal person' and *goom* 'alcohol.'

Australian English

A distinctive Australian variety of English (AustEng) is spoken by 90% of the 20 million inhabitants of the continent, with regional and social variation. AustEng has its origins in the English dialects brought by mainly English and Irish settlers in the 18th and 19th centuries, to which have been added the speech of immigrants from all over the world. Long regarded as a substandard form of speech and lacking prestige (Turner, 1994), AustEng has become accepted over

the past 20 years and has been codified in dictionaries (including the Macquarie Dictionary in various versions dating from 1981, also now with a strong web presence, and the Australian National Dictionary), is used in English language teaching in Australia, and has been popularized in textbooks (e.g., Burrige and Mulder, 1998). It is now the prestige variety of English-language broadcasting. Like most other varieties of English, AustEng is currently being subjected to influence from American English, especially in the lexicon, but also in pronunciation (Burrige and Mulder, 1998).

Australian English shows a large number of loan words from indigenous languages (the Australian National Dictionary records over 400), especially for the distinctive flora and fauna of the country, and for place names, e.g., *kangaroo*, *billabong*, *waratah*, and *galah*, or *Woomooloo* and *Mordialloc* (see Dixon *et al.*, 1990 for other examples). Other sources of distinctive lexical materials include English dialects, convict slang, and rhyming slang, e.g., *Joe Blake* for *snake*, as well as locally developed terms, e.g., *outback*.

AustEng shows a degree of regional variation, particularly in vocabulary and pronunciation. Lexical variation has been well researched and increasingly documented in the dictionaries, while variation in pronunciation has been less studied. Among features that show geographical differences are [æ] vs. [a] in *graph* or *dance*, postvocalic vocalization of *l* (in words like *eagle*), lowering of low front [e] (in words like *Mel*, *helicopter*) and bisyllabification of past participles (so that *grown* sounds like *grow-en*).

Social variation in Australian English has been well studied since Mitchell and Delbridge (1965) established the categories of Broad, General, and Cultivated Australian. The differences are particularly clear phonetically in vowel nuclei, especially the diphthongs of *face*, *price*, *goat*, and *mouth* (see Harrington *et al.*, 1997). Table 1 below (from Melchers and Shaw, 2003: 105, based on Wells, 1982) shows the variants of Australian English vowels in comparison to Received Pronunciation.

Melchers and Shaw (2003: 104) list the following as especially salient features of AustEng:

- front [a:] in *palm*, and *start* (shared with New Zealand English)
- wide diphthongs in *fleece*, *face*, *price*, *goose*, *goat*, and *mouth*;
- close front vowels, in *dress*;
- extremely productive use of two noun suffixes *-ie* and *-o*,

Table 1 Australian English vowels

| Broad | General | Cultivated | Key word | RP |
|-----------|--------------------|------------|----------|----|
| | ɪ | | kit | ɪ |
| | e | | dress | e |
| | æ | | trap | æ |
| | ɐ | | lot | ɐ |
| | ʌ | | strut | ʌ |
| | ʊ | | foot | ʊ |
| | a: | | bath | a: |
| | ɒ | | cloth | ɒ |
| | ɜ: | | nurse | ɜ: |
| ɔ: | + i | ii | fleece | i: |
| ʌ:ɪ - a:ɪ | ʌɪ | ɛɪ | face | eɪ |
| | a: | | palm | a: |
| | ɔ: | | thought | ɔ: |
| ʌ:ʊ - a:ʊ | ʌʊ | öʊ | goat | əʊ |
| ə:ʊ | ʊʊ | ʊʊ | goose | u: |
| ɒ: | ɒɪ | aɪ | price | aɪ |
| | ɔɪ | | choice | ɔɪ |
| ɛ:ɔ | æɔ | aʊ | mouth | aʊ |
| | ɪə - ɪə - i : | | near | ɪə |
| | eə | | square | ɛə |
| | a: | | start | ɒ: |
| | ɔ: | | north | ɔ: |
| | ɔ: | | force | ɔ: |
| | ʊə - ɔ: - ʊ:ə - ʊ: | | cure | ʊə |

- use of *she* as a generic pronoun, e.g., *she'll be right 'it's fine'*;
- highly characteristic vocabulary, some drawn from indigenous languages, some from British dialect slang, and other elements locally developed.

Note also that AustEng differs from RP in having schwa in unstressed syllables, intervocalic voicing and flapping of *t*, and shares with it lack of post-vocalic *r* found in American and Canadian English. A distinctive high rising terminal intonation contour, noticed by Mitchell and Delbridge (1965) and investigated in depth for Sydney speech by Horvath (1985), is characteristic of female, teenage, and lower working class speech.

Morphologically, AustEng is characterized by a high degree of clipping, e.g., *uni* for *university*, *Oz* for *Australia*, which may or may not be combined with highly productive suffixation of *-ie* or *-o*, as in *Salvos* for *Salvation Army*, *maggie* for 'magpie,' *sunnies* for *sun glasses* and *lippie* for *lipstick*.

Australian Languages

B J Blake, La Trobe University, Bundoora, VIC, Australia

Introduction

Archeological evidence indicates that Australia has been inhabited by humans for over 50 000 years. At the time of the establishment of the first British colony at Port Jackson (Sydney), in 1788, there were about 250 different languages spoken on the continent. Estimates of the Aboriginal population at that time vary from the low figure of 300 000 to several times that number. Over a period of a little more than 100 years, Europeans took over the whole country, killing a large proportion of the indigenous population in the process. Today only 60 or so Aboriginal languages are still spoken, and as few as 20 or so are likely to be spoken a generation from now.

For almost all the native languages, we have some record, though in some cases only a brief English–Aboriginal word list. Grammatical information is available for approximately 100 languages, the bulk of it having been collected since the 1960s, in many cases from the last speakers.

Classification

Capell classified Australian languages typologically into two groups: suffixing and prefixing, the latter group being confined to an almost continuous area in the north of the continent (see **Figure 1**). In the suffixing group, all affixes are suffixes, while in

the prefixing group there are some prefixes, mainly pronominal forms for subject and object (Capell, 1956: 31–60). The suffixing languages are predominantly agglutinative, but in the prefixing languages there is more fusion, mainly in the pronominal and other prefixes to the verb.

The languages of the mainland are generally thought to be related, since certain roots are widespread. These include lexical roots, such *na* 'to see,' *mil* 'eye,' and *yan* 'to go,' and grammatical roots, such as *nga-* 'first person,' *nu* 'he,' and *ku* 'dative case marker'. In 1966 O'Grady, Wurm, and Hale produced a classification that recognized 29 'families' (O'Grady *et al.*, 1966a; O'Grady *et al.*, 1966b), but more recent work by various scholars has demonstrated that the figure could be reduced to as few as a dozen or so. The basis of the classification was lexicostatistical, and 'family' in this context meant a group of languages that could be linked on the basis of any member's sharing 15 percent or more of basic vocabulary with any other member.

A notable feature of the O'Grady *et al.* (1996a,b) classification is that one family, the Pama-Nyungan family, covers most of the mainland except for the Kimberleys and the Top End. It coincides roughly with the suffixing languages, taking in the Yolngu languages of northeast Arnhem Land, which represent an enclave of suffixing among the prefixing languages. The name Pama-Nyungan is derived from *pama* 'man' in the northeast of the continent and *nyunga* 'man' in the southwest.

Blake showed that between Pama-Nyungan and the other (Northern) languages, there are some

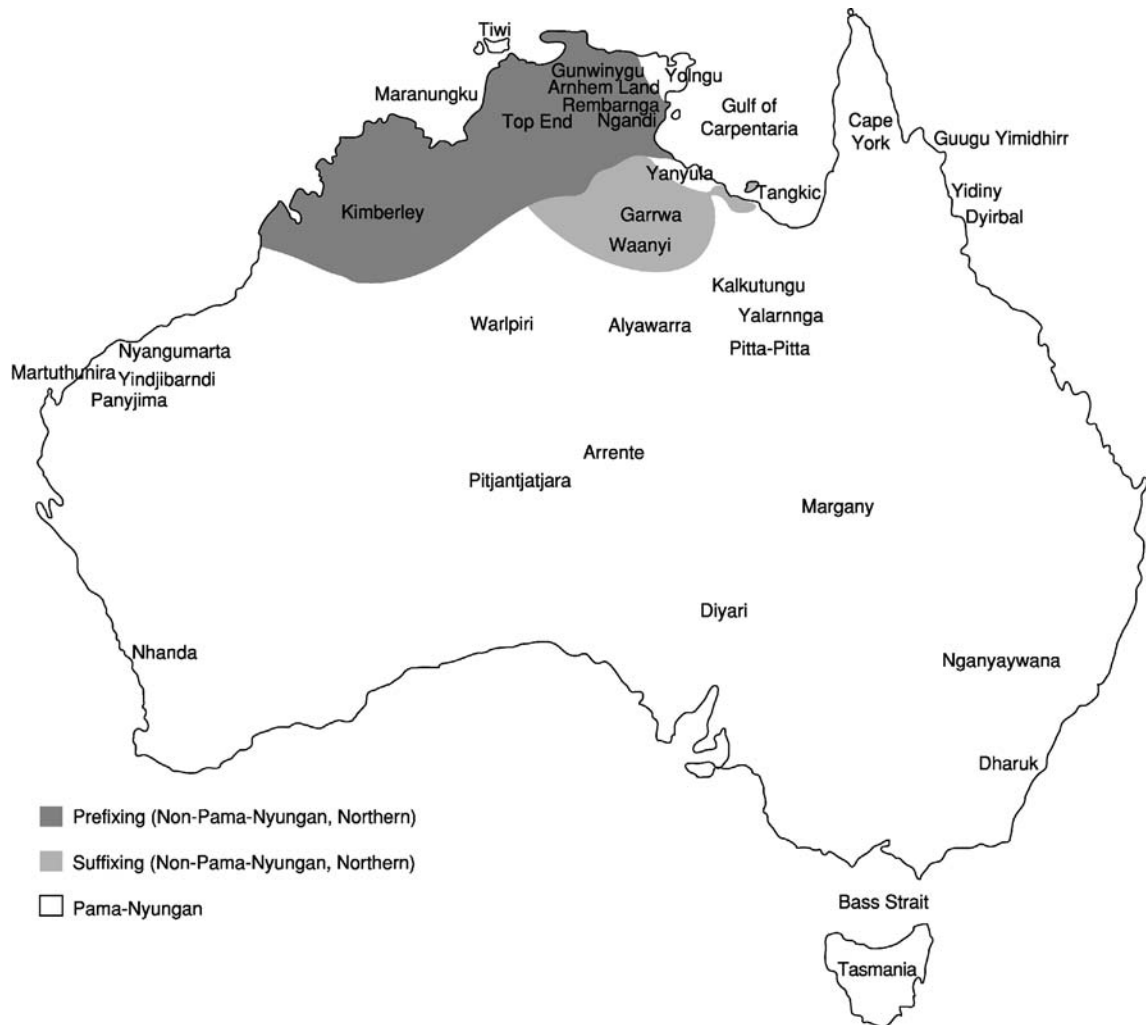

Figure 1 Pama-Nyungan and northern Australian languages.

consistent differences in the forms of some pronouns. For instance, while most Pama-Nyungan languages have a first person dual pronoun *ngali*, this is absent from the Northern languages, and while most Pama-Nyungan languages reflect a second singular **ngin*, a majority of Northern languages reflect **ngin'* with a palatal nasal as the third segment. A number of Pama-Nyungan languages have a third person pronoun root *nhu-*, whereas the Northern languages have *nu-* (Blake, 1988: 13). Blake's classification involved some reclassification, taking the Tangkic languages of the Gulf of Carpentaria to be Northern, and Yanyuwa to be Pama-Nyungan. Garrwa (Garawa) and Waanyi (Wan[j]i) are two languages with some Northern and some Pama-Nyungan pronouns.

Evans demonstrated that there is a regular correspondence between Pama-Nyungan and the Northern languages, reflecting a phonological change in Pama-Nyungan in which initial apicals (*t, n, l*) merged with

laminals (dental or palatal), the *nhu-/nu-* correspondence in the third person singular pronoun being part of the evidence for this change (Evans, 1988: 98–100).

While Blake and Evans provided evidence for a revised Pama-Nyungan that went beyond the lexicostatistical, in his recent book of Australian languages, Dixon argued strongly against the existence of Pama-Nyungan. He argued that the pronouns that characterize so-called Pama-Nyungan such as *ngali* 'we two' have diffused. He showed that the original lexicostatistical classification was flawed and that the shift in initial apicals to laminal did not coincide exactly with Pama-Nyungan. He also pointed out that no fauna or flora terms had been reconstructed that could be attributed to Proto-Pama-Nyungan (Dixon, 2002). Nevertheless, Australianists have so far not been convinced by Dixon's arguments (see, for instance, the papers in Bowern and Koch, 2004).

As noted in this article, the languages of the mainland look as if they are related, though Dixon was pessimistic about the prospects of demonstrating this by the comparative method. There are several factors militating against reconstructing anything like Proto-Australian: the enormous time depth, demonstrable diffusion, and paucity of data, particularly for the southeast, which was taken over by Europeans early and was heavily settled.

It has not been possible to relate the languages of Tasmania to those of the mainland. Tasmania was cut off from the mainland about 14 000 years ago, when the earth warmed as it slowly emerged from the last Ice Age and the sea level rose, resulting in an unnavigable strait (Bass Strait) between Tasmania and the mainland. Given a time depth of 14 000 years for the period of separation, it is likely that any evidence of a genetic connection would have been obliterated.

It has likewise not been possible to establish a genetic connection between any Australian language, whether from the mainland or Tasmania, and any language from elsewhere.

Phonology

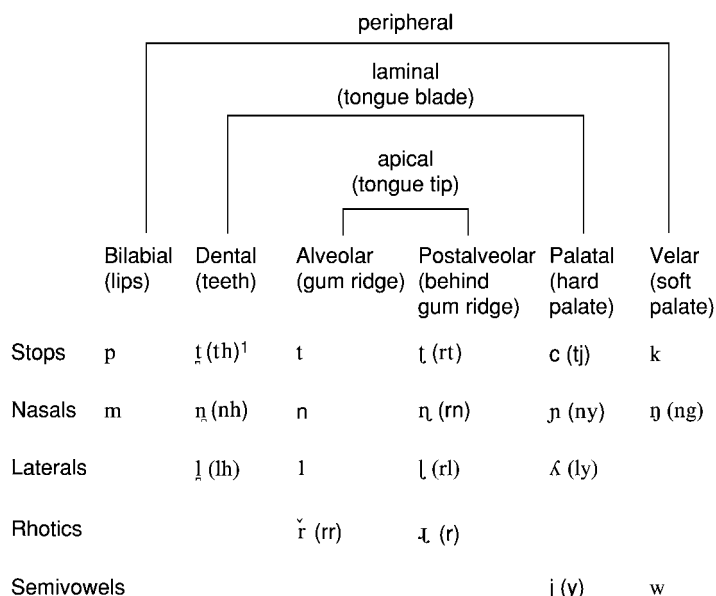

In Europe the phonologies of English, French, German, Italian, and Polish are quite different, but the mainland languages of Australia tend to be similar in their inventory of phonemes and in their phonotactics (word shapes). All Australian languages have stop sounds, but there is typically only one set, represented

either by *p, t, k*, etc., or by *b, d, g*, etc. Normally five or six stops are found: labial (*p*), apico-alveolar (*t*), apico-postalveolar or retroflex (represented here by *rt*), dorso-velar (*k*), and one or two laminal stops. Where there is one laminal stop, the pronunciation may range from dental to palatal, and by convention this stop is represented as palatal (*tj*). Where the dental and palatal stops are phonemically distinct, the dental is usually represented as *th*. Corresponding to each stop is a nasal. There is always one lateral (*l*), but there may also be dental (*lh*), palatal (*ly*), or retroflex (*rl*) laterals. Commonly there are two rhotics: a glide often described as retroflex and a flap, or trill. These are represented here by *r* and *rr*, respectively. All Australian languages have a labio-velar glide (*w*) and a palatal glide (*y*). **Figure 2** displays the consonants commonly found in Australian languages.

The majority of Australian languages have only three vowels (*i, a, and u*), though often there are long and short versions, which gives effectively six vowels. Some languages have *e* or *o* or both.

Words in Australian languages usually have more than one syllable, and more often than not they end in a vowel.

Although Australian languages right across the continent tend to have quite similar phonological systems, a few languages in a number of quite separate areas have undergone a series of phonological changes involving the loss of initial consonants or even whole syllables. In a number of Pama-Nyungan languages, there is a word *kumpu* for ‘urine.’

1. Letter in parentheses are in common use and are used in this article. Where voiced symbols appear in sources, they have been retained.

Figure 2 Consonants.

In Nhanda (western Australia), the initial consonant has been lost to yield *umpu*; in some languages of Cape York, the first syllable has been lost to give *mpu*; and in the Arandic languages of central Australia, the form *mpwa* occurs, the *k* having been lost and the *u* being reflected as labialization of the *mp* cluster. The effect of these changes has been to make some languages look quite atypical, and at one stage certain languages, such as Nganyaywana, were thought to be unrelated to other mainland languages, because cognate forms could not be readily recognized.

Morphology and Syntax

Inflection apart, words may be simple, compound, or reduplicated. In Pitta Pitta, for instance, *ngampa-manha* (stomach-bad) is ‘sad,’ and reduplicated forms of *ngapu* ‘water,’ *mayi* ‘dirt,’ and *maka* ‘fire’ yield *ngapu-ngapu* ‘wet,’ *mayi-mayi* ‘dirty’ and *maka-maka* ‘hot.’ The most common means of deriving new words is via suffixes. An almost ubiquitous feature of Australian languages is the presence of a suffix for ‘having’ and a suffix for ‘lacking,’ though the actual forms employed vary a good deal from language to language (see [1] and [3] for examples). In Pitta Pitta, for instance, we find forms like *kangamaru* (alcohol-having) ‘intoxicated’ and *nhupu-yaku* (spouse-lacking) ‘unmarried.’ Most languages have suffixes to mark the derivation of nouns from verbs and vice versa. In Diyari *wirlpa-nganka* ‘to make a hole’ is formed from the noun *wirlpa* ‘hole,’ and from this stem can be derived the noun *wirlpa-mganka-ni* ‘opener.’ Most languages have a suffix to mark the derivation of intransitive verbs from nouns, often with an inchoative sense. In Dieri we find formations such as *kilpa-rrri* ‘become cool’ and *yapa-rrri* ‘become afraid.’ Causatives of intransitive verbs are also common as in Diyari *pali-ma* ‘to extinguish a fire,’ from *pali* ‘to die.’ The majority of Australian languages express reflexive and reciprocal notions by using a derived intransitive verb. In Diyari we find *muduwa* ‘to scratch’ (transitive) and *muduwa-thadi* ‘to scratch oneself.’ Note the *d* in these words. Diyari has a voicing contrast in apical stops.

In the Pama-Nyungan languages, all derivational and inflectional affixes are suffixes. Nouns are marked for case, and verbs are marked for categories such as aspect, tense, and mood. In some languages, case concord extends from the head noun to its dependents; in others, it occurs only on the final word in the noun phrase.

With only a handful of exceptions, nouns in Pama-Nyungan languages take ergative case marking when functioning as the agent of a transitive verb (A) and zero case marking when functioning as the

sole argument of an intransitive predicate (S) and a direct object (O). The following examples are from Margany, a language of southwestern Queensland.

- (1) Nguda barndin-bayi.
dog dirt-having
‘The dog is dirty.’
- (2) Nguda-nggu yurdi gamba-nhi.
dog-ERG meat bury-PRES
‘The dog is burying the meat.’

On the other hand, in most Pama-Nyungan languages pronouns serving as S or A are treated alike (normally the bare stem is used, at least with nonsingular pronouns), while a pronoun in O function takes accusative case marking. This, too, can be illustrated from Margany.

- (3) Ngali bulu-idba.
we.two food-LACKING
‘We have no food.’
- (4) Gara ngali nhaa-nhi ina-nha.
not we.two see-PRES you-ACC
‘We can’t see you.’

Typically there is a dative case, an allative (‘to’), a locative (‘at’), an ablative (‘from’), frequently a genitive, and sometimes a causal or aversive that can cover cause, as in ‘I’m sick from (eating) bad meat,’ or what is to be avoided, as in ‘Keep away from the fire.’ The paradigms of Margany case forms displayed in Table 1 are typical with respect to both forms and categories. However, there is one idiosyncratic difference. The ergative case marker covers not only instrumental function, as it does in the majority of Pama-Nyungan languages, but also the causal or aversive sense alluded to in this article. In this function it can occur with pronouns and contrasts with the unmarked form used for the agent of a transitive verb.

A feature of case marking in Australian languages is the prevalence of double case marking. This is found, for instance, where a genitive-marked dependent of a noun displays case concord with its head, as in Margany.

Table 1 Margany case marking

| | | |
|--------------|-------------------|-----------------------|
| English | stone | we two |
| nominative | <i>barri</i> | <i>ngali</i> |
| ergative | <i>barringgu</i> | <i>ngali</i> |
| accusative | <i>barri</i> | <i>ngalinganha</i> |
| genitive | <i>barrigu</i> | <i>ngalingu</i> |
| dative | <i>barrigu</i> | <i>ngalingun.gu</i> |
| allative | <i>barridhadi</i> | <i>ngalingundhadi</i> |
| locative | <i>barringga</i> | <i>ngalingunda</i> |
| ablative | <i>barrimundu</i> | <i>ngalingunmundu</i> |
| instrumental | <i>barringgu</i> | <i>ngalingundu</i> |

- (5) Ngaya waban-gu ngali-ngu-ngga bama-ngga.
 I go-PURP we-GEN-LOC bro-LOC
 ‘I’m going with our brother.’

In about two-thirds of Australian languages, there are bound pronominal representations, either clitic pronouns or inflection, for subject (S and A) and object (O), and in a few languages there are forms for other complements or adjuncts, such as recipients or beneficiaries. In the suffixing languages, these pronominal elements are suffixed to the verb or to the first constituent in the clause.

Examples (6), (7), and (8), from Pitjantjatjara, illustrate the contrast between *-rna* the S/A(subject) form and *-rni* the O form. In this language, the bound pronouns are enclitic to the first constituent in the clause.

- (6) Munu-rna purta kapi-ku kutju a-nkuku?
and-I.SUBJ QUERY water-DAT alone go-FU
 ‘And should I go for water alone?’
- (7) Purnu-rna mantji-nu.
wood-I.SUBJ get-PT
 ‘I got the wood.’

Example (8) illustrates the double object construction, with a verb for ‘give’ in which the noun serving as patient object is unmarked, while the recipient is represented by both an accusative marked pronoun and a bound object pronoun that is enclitic to the first constituent. There is no overt form for third person subject.

- (8) Minyma-ngku-rni mayi ngayu-nya u-ngu.
woman-ERG-1SG.O bread 1SG-ACC give-PT
 ‘The woman gave me bread.’

In some languages, there is a detransitivized construction in which the agent of a two-place verb is encoded as S and the patient is expressed in the dative or some other oblique case. The following pair of sentences from Pitta Pitta (Queensland) illustrate the normal transitive construction and the derived intransitive construction, which, following Silverstein (1976), is generally known as the antipassive (AP). Pitta Pitta and some other related languages of western Queensland are unusual in that they have both ergative and accusative marking on all nouns and pronouns.

- (9) Pithi-ka nga-thu ina.
hit-PT I-ERG you.ACC
 ‘I hit you.’
- (10) Pithi-li-ya ngantja in-ku.
hit-AP-PRES I you-DAT
 ‘I feel like hitting you.’

The antipassive has a different semantic function in different languages, but it always signals some kind of

reduced semantic transitivity. In Pitta Pitta, it signals desiderative aspect.

Pitta Pitta uses a construction similar to the antipassive in the future tense. The verb is unmarked, there being neither the derivational antipassive nor the past or present inflection, and the subject (S or A) bears a special future subject inflection.

- (11) Pithi nganyu in-ku.
hit.FU I.FU.SUBJ you-DAT
 ‘I’ll hit you.’

Pama-Nyungan languages are generally referred to as ‘ergative’; this term indicates that they exhibit ergative case marking on the agent of a transitive verb. While most of these languages are like Margany, in that the ergative marking is found only on nouns and is complemented by accusative marking on pronouns, a handful of Pama-Nyungan languages – including Warlpiri, Kalkutungu (Kalkutung), and Yalarnnga – have ergative marking on both nouns and pronouns in A function, but no accusative marking on any free nominals. About two-thirds or more of Australian languages have bound pronominal representation for core functions, and these bound pronouns, with only a very few partial exceptions, operate on the basis of a subject (S and A) form and an object form (O).

Dixon (1972) argued that in Dyirbal, syntactic rules are sensitive to the grouping S + O, as opposed to A. This phenomenon has come to be referred to as ergative syntax, as opposed to accusative syntax; the latter term refers to a system of syntactic rules based on the notion of S + A (i.e., subject), as in English and numerous other languages. Ergative syntax is also found in some of Dyirbal’s neighbors, including Yidiny, and in two adjacent languages of western Queensland, Kalkutungu (Kalkutung) and Yalarnnga. It manifests itself in a number of rules. For instance, there is a requirement that in relative clauses, the relativized function, which is covert, can be only S or O. To relativize an agent, the relative clause must be detransitivized via the antipassive, which thereby converts a potential A into S. In purpose clauses (also used for indirect commands), antipassive is used to signal that A is coreferent with S or O. The examples in (12) and (13) are from Yalarnnga. In the nature of things, coreference between S and A is common (as in [12]) and between P and A (as in [13]). In both these patterns of coreference, the antipassive is used.

- (12) Ngani-mi ngiya manhi-wu miya-li-ntjata.
go-FU I food-DAT get-AP-PURP
 ‘I’ll go and get food.’
- (13) Tjuwa tjala ngathu ngapa-mu,
boy this I.ERG tell-PT

watjani-wu pinpa-li-ntjata.
wood-DAT gather-AP-PURP
 'I told this boy to gather firewood.'

The example in (14) provides a nice contrast. Here there is coreference between S in the second clause and P in the third, and there is no antipassive.

- (14) Ngathu tjala ngapa-mu ngani-ntjata
I.ERG this tell-PT go-PURP
 marnu-yantja-mpa karri-ntjata.
mother-HIS-ALL wash-PURP
 'I told him to go to his mother and get washed.'

In (15) there is coreference between A and A, and no antipassive.

- (15) Ngathu miya-ntjata yimarta
I.ERG get-PURP fish
 yunkunhi-nti-yarta yita-wampa.
return-CAUS-PURP this-ALL
 'I am going to get some fish and bring it back here.'

It appears, however, that ergative syntax is not common in Australia, despite the widespread use of ergative case marking. In a number of languages with ergative case, there are syntactic rules based on the familiar grammatical relation of subject (S + A). Many such rules have to do with showing maintenance of reference or switch reference. In Pitjantjatjara, for instance, the conjunction *munu* is used to link clauses with the same subject (SS), while *ka* is used to link clauses where there is a change of subject (DS). The point is that the rules operate on the basis of S and A, not S and O, as in languages like Dyirbal.

- (16) Tjitji panya ngarrikati-ngu munu
child that lie-PT and.SS
 ngarri-ngi kunkunpa ka kurta
lie-PT-IMPF sleep and.DS old.bro
 panya paka-rnu.
that get.up-PT
 'The child lay down and was lying asleep and the older brother got up.'

In a small group of Pama-Nyungan languages in western Australia, there is no ergative marking at all. The subject (S + A) appears in the nominative case, and the object (O) in the accusative/dative case. This group includes Ngarluma, Panyjima (Panytyima), and Yindjibarndi. It has been argued that these accusative languages derive from ergative languages via the generalizing of detransitivized constructions of the type illustrated in (10) and (11).

The non-Pama-Nyungan or Northern languages span the Northern part of the continent from western Australia to the Gulf of Carpentaria. With a few exceptions, mostly at the eastern end of their range,

the Northern languages have bound pronominal elements for subject and object prefixed to the verb. In some languages, these pronominal elements are separable, but more often than not, they fuse to one another and to other formatives in the verb. There is no accusative case marking on nouns or free pronouns, though there is ergative marking in some languages.

Among the prefixing languages, but also in the northwestern suffixing languages, it is common to find that only certain verbs can bear inflection. These verbs can appear on their own, as in (17), or they can act as auxiliaries in concert with an uninflected lexical verb, as in (18). These examples are from Maranungku (Maranunggu).

- (17) Tawun kangani yi.
town NONFU.I.go PT
 'I went to town.'
- (18) Tirr wuttar wat kangani yi.
edge sea walk NONFU.I.go PT
 'I walked to the beach.'

Systems of noun classes are common among the Northern languages, though a rarity in the Pama-Nyungan family. A majority of the Northern languages of the Kimberleys and the Top End have from two to eight noun classes, with each class marked by a prefix. The classification typically includes a masculine class, a feminine class, and a class for vegetable food. It is thought that these class markers are derived generic nouns. It is not uncommon in Australian languages to use a generic noun accompanied by a specific noun. See, for instance, (26). The vegetable class marker is *m-*, *ma-* or *mi-*, and *mayi* is a widespread word for 'vegetable food,' so it is thought likely that the former derives from the latter. These class markers may appear not only on nouns representing direct dependents of the verb but also on associated demonstratives and appositional nouns. They may also appear on the verb, where they serve as crossreferencing pronominal forms. In the following example from Ngandi, *ni* (masculine) and *gu* (marking one of the inanimate classes) appear prefixed to the subject and object nouns respectively, and they are also prefixed to the verb.

- (19) Ni-gu-may ni-yul-thu gu-dyundu.
NI-GU-got NI-man-ERG GU-stone
 'The man got the stone.'

The noun phrases in (19) can be omitted. *Ni-gu-may* can stand as a sentence on its own, meaning 'He got it' or, more precisely, 'A member of the *ni* class got a member of the *gu* class'.

A feature of the prefixed bound pronoun systems is the prevalence of hierarchical principles of ordering

or marking. In Gunwinygu (Gunwinggu) (Northern Territory), first and second person forms always precede third, irrespective of which is subject.

(20) Nga-n-di bun.
1SG-OBJ-3PL hit
'They hit me.'

(21) Nga-be-n bun.
1SG-3PL-OBJ hit
'I hit them.'

The form *n-* glossed as object is common among the prefixing languages. In some languages this behaves like an inverse marker, in that it is used only when a person lower on the hierarchy acts on a higher person. This is the situation in Rembarnga (Rembarunga), where the hierarchy is 1 > 2 > 3PL > 3SG. Note that it does not appear in (22), where first acts on third, but it does appear in (23), where third plural acts on first.

(22) Pa-nga-na.
3PL-1SG-saw
'I saw them.'

(23) Nga-n-pa-na.
1SG-O-3PL-saw
'They saw me.'

A number of Northern languages incorporate nominals into the verb. The incorporated forms are often different from the corresponding words used outside the verb, and the range of concepts that can be incorporated is usually relatively small. The following example is from Tiwi, in which the incorporated form *wuliyondyi* refers to the direct object represented by *ti*.

(24) Pi-ti-wuliyondji-rrurlimpirr-ani.
3PL-3SG.FEM-dead.wallaby-carry.on.shoulders-
PT.HABIT
'They would carry the wallaby on their
shoulders.'

Incorporated forms tend to correspond to the object of the verb, but they can correspond to other complements or adjuncts or to the subject of an intransitive verb.

Example (24) is fairly typical of Tiwi and of a number of other Northern languages that can be described as polysynthetic incorporating languages. Tiwi is obviously of quite a different type from Margany, which has no bound pronouns, or even Pitjantjatjara, which does. Tiwi has no case marking at all, and relations of complements and adjuncts to the verb are signaled via three series of bound pronouns representing subject, direct object, and indirect object, plus a few local prepositions. Not only are relations within the clause

marked on the verb, but the possessive relation is signaled within phrases by cross-referencing the possessor on the possessed (head) noun. 'Purrukuparli's son' is expressed as *Purrukuparli ngarra-mirani*, literally 'Purrukuparli, his son.'

Most Australian languages appear to have very free word order. Not only can the predicate, its complements, and its adjuncts appear in any order, but even the sets of words that translate a noun phrase of English may be separated. A common pattern is for a more general term, such as a pronoun or a generic noun, to be placed first, with the modifier late, often at the end. The example in (25) is from Nyangumarda (Nyangumarta).

(25) Nyungu ngawu tjininganinyi
this mad make.1PL.O
walypila-mila-lu kari-lu.
white.man-GEN-ERG beer-ERG
'This is making us silly, the white man's beer.'

The strategy employed in (25) is common in Australian languages. Another variation on this tendency is to use a generic noun early in the sentence and then a specific noun later, as in (26), from Yidiny.

(26) Ngayu minya bugang ganguul.
I animal eat wallaby
'I'm eating wallaby.'

The fact is that most Australian languages have pragmatic principles rather than grammatical rules for word order. One such principle that is widespread is to put the focus (the emphasized phrase) first. There is probably no Australian language with word order as rigid as in English, but some languages have very strongly preferred orders. Some languages in the interior of the continent, including Pitjantjatjara, have fairly regular subject-object-verb order, and a few, such as Garrwa (Garawa), are predicate-initial.

Semantics

The Australian Aborigines were hunter-gatherers, and naturally the vocabularies of Australian languages are rich in terms for fauna and flora as well as in terms for hunting and catching animals. There is regularly a distinction, for instance, between hitting or killing with a missile and hitting or killing with the hand or a handheld implement. There are words for decoy devices for attracting birds, words for a noose on a stick to catch a bird, words for different kinds of spears and boomerangs, and so on. Some semantic distinctions that are quite different from any made in European languages intrude into the grammar. In some Northern languages, there are forms for 'you and I' that pattern as singulars, i.e., the speaker and

Table 2 Gunwinygu (Gunwinggu) pronominal prefixes

| Number | Singular | Dual | Plural |
|--------|---------------|---------------|----------------|
| 1 | <i>nga-</i> | <i>ngane-</i> | <i>ngarri-</i> |
| 12 | <i>ngarr-</i> | <i>kane-</i> | <i>karri-</i> |
| 2 | <i>yi-</i> | <i>ngune-</i> | <i>ngurri-</i> |
| 3 | ∅ | <i>bene-</i> | <i>birri-</i> |

addressee are treated as a unit. This becomes obvious when we examine the distribution of dual and plural marking. In **Table 2** the prefixed pronominal forms in Gunwinygu (Gunwinggu) are presented. The form *ngarr-* for ‘thou and I’ does not take dual marking but contrasts with a dual-marked form *ka-ne*, meaning ‘speaker and two addressees,’ and a plural-marked form *ka-rrri*, meaning ‘speaker and three or more addressees.’

In some languages there are different nonsingular pronouns for the kinship relations between the people referred to. In Alyawarra (Alyawarr), for instance, *mpula* means ‘you two’ but is used only for two people who belong to the same section. Among the Alyawarra everyone belongs to a patrimoiety, and within each patrimoiety there are two sections of alternating generations. There is a separate pronoun, *mpulaka*, for two people who are members of the same patrimoiety but not the same section (e.g., father and child), and a third form, *mpulantha*, for two people belonging to different patrimoieties (e.g., mother and child). This system of distinctions applies to all dual and plural pronouns.

Avoidance and Secret Vocabularies

In Aboriginal society it is common to have a special vocabulary that is to be used in the presence of certain kin. Normally a man is required to avoid dealings with his mother-in-law, for instance, and the prohibition covers real, prospective, and classificatory mothers-in-law. In some areas a man is required to use the special vocabulary in the presence of a mother-in-law, and such special vocabularies have come to be called ‘mother-in-law languages,’ though they are not separate languages, nor are they always reserved for speech in the presence of a mother-in-law.

Secret languages have also been reported from a number of areas. Like forms of avoidance language, these are special vocabularies usually taught as part of male initiation.

All these special vocabularies are of great linguistic interest. They typically consist of only a few hundred words, and often one finds a generic term in the reduced vocabulary that is lacking in the everyday language. In the avoidance language of the

Dyirbal (Queensland), for instance, there is a single word, *dyidyan*, for any lizard, skink, or goanna, and a single word, *dyiburray*, for any possum, squirrel, or glider. However, in the everyday language, there are words only for particular species (Dixon, 1980: 61).

Sign Language

Over much of central and northern Australia, sign language is used as an alternative to speech. Signs are made with the hands and correspond to words in the spoken language and to particles and suffixes that have local meanings, such as ‘to’ or ‘here.’ Sign language is traditionally used in a variety of contexts, including rituals, during periods of mourning when speech is proscribed, in conversing over long distances, or in hunting, where silence is important.

The Future of Australian Languages

Only a score or so of Australia’s native languages are being passed on to the next generation. Over the past three decades, there have been bilingual programs aimed at helping Aboriginal languages survive, and there is at least one instance of a language’s being revived, namely Dyaabugay in Queensland. There are also attempts at reclamation of languages no longer spoken, but the materials available for many languages, particularly in the southeast of the continent, are inadequate, and the best that future generations can hope for is to learn about their languages rather than acquire their languages. Some languages that are still spoken are undergoing drastic changes. Modern Tiwi, for instance, is much more analytic than traditional Tiwi, which is polysynthetic. For many Aborigines in the north of the continent, a creole is the first language – Torres Strait Broken (Torres Strait Creole), for example, spoken on Cape York, or Kriol in the Kimberleys and the Northern Territory. These creoles have a lexicon largely from English, with an admixture of vernacular vocabulary. They have some claims to being Aboriginal languages, not only on the grounds that they serve to mark Aboriginal identity but also in that they embody traditional semantic concepts that are calques from the vernaculars.

For most Australians, Aboriginal languages are a closed book, though there is a testimony to their existence in a few hundred words borrowed from Aboriginal languages – including *kangaroo* (Guugu-Yimidhirr, Guguyimidjir), *boomerang* (Dharuk), and *dingo* (Dharuk) – and thousands of place names, including Geelong (*tjilang* ‘tongue’), Warrnambool (*warnam-bul* ‘having fire’), and Wagga-Wagga (*waga-waga* ‘crows’).

Austric Hypothesis

L A Reid, University of Hawai'i, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Austric is the name given by the German missionary priest Wilhelm Schmidt (1906: 81–82) to the hypothesis that the Austronesian and Austro-Asiatic language families (also first named by Schmidt) are genetically related. Other versions of the hypothesis either include or exclude the Tai-Kadai language family of Southeast Asia, and/or the Hmong-Mien language family. The term 'Macro-Austric' is sometimes applied to a phylum which includes the Hmong-Mien language family.

The possible relationship of an Austro-Asiatic language, Nicobarese, with languages in what was then known as Malayo-Polynesian was first proposed in the latter part of the 19th century, but it was Schmidt who made the first systematic comparison of the two families, citing a considerable number of lexical comparisons, and claiming "complete agreement in phonology, morphology and various features of the syntax." Most of the lexical similarities cited by Schmidt have since been rejected by linguists (Diffloth, 1994) as not being adequately supported by regular sound correspondences. Nevertheless, the search for possible lexical cognates between the two language families continues. The most ambitious work in recent times has been that of Hayes

(1999, and earlier works). However a careful review (Reid, 2004) of Hayes's proposed basic vocabulary comparisons revealed that only a very small percentage are probable cognates supported by the usual requirements of regular sound correspondences and semantic similarity.

As for their phonology, morphology, and syntax, it is clear from the extensive descriptive materials that have been published since Schmidt's time that there is certainly not the "complete agreement" that Schmidt claimed for them. However, there are a number of puzzling similarities which call for explanation, especially when Nicobarese is considered. The aspect of Nicobarese that first stimulated Schmidt and others to note its similarities to Austronesian was not only that the language was typologically similar to languages such as Malay (with which they usually compared it) in having prefixes, infixes, and suffixes attached to verbs, but that the form and function of these affixes in many respects appeared to be similar to those in many Austronesian languages. Some of these features were first discussed by Schmidt (1916), and were expanded on in Reid (1994, 1999). Much of the following discussion is based on these two papers.

Typologically, Nicobarese is unlike other Austro-Asiatic languages in being a verb-initial language. In many respects it appears to be an Austronesian language with Austro-Asiatic lexicon. It has been generally characterized as SVO (Schmidt, 1906); however, text materials show numerous examples

of VOS word order, found for example in Tagalog, Malagasy, and other Austronesian languages. Noun phrase structure in Nicobarese is also strikingly similar to that found in many Austronesian languages, with noun-attribute word order, and attributes such as relative clauses linked to their head nouns with a form *na*, which commonly occurs in Austronesian languages with identical function. The same form also links adverbial attributes to their head verbs, just as in Austronesian. Noun phrases are introduced by one of a set of distinct case-marking forms, some of which have identical shape and function with those found in Austronesian languages. In morphology, there are a number of affixes, such as the causative prefix *ha-* (from earlier **pa-*), the agentive affixes *<um>* and *ma-l <am>*, the nominalizing infixes *<an>* and *<in>*, and the objective suffix *-a*, which are taken to be cognate with Austronesian affixes with the same or similar shape, and similar if not identical functions.

The main alternative explanation that has been proposed by those who reject a genetic relationship to account for these facts is borrowing. The claim has been made that the morphosyntactic features found in Nicobarese that appear to be Austronesian are probably remnants of a language spoken by early Austronesian sailors who may have made frequent landfall in the Nicobars, perhaps in some cases staying, intermarrying, and influencing the local language. But there remain several strong barriers to acceptance of this position. One is that several of the proposed comparisons between Nicobarese languages and Austronesian are not limited to Nicobarese, but are found across wide areas of the Austro-Asiatic family. In some cases (especially *<um>* and *<in>*), comparisons are clearest between Nicobarese and Austronesian, because other eastern Austro-Asiatic languages have either lost the form (in the case of verbal suffixes) or modified them due to the strong areal influence of Chinese. Another argument against the borrowing scenario is that some of the forms that are apparently of Austronesian origin predate Proto-Malayic and had changed by the time Austronesian sailors could have reached the Nicobars. A third argument against the borrowing hypothesis that has been proposed is that it is highly unlikely that a language could borrow so much morphology without also borrowing any of the lexical forms which carried it.

The only other possible explanation, according to Reid (1994), is a genetic one. The claim is that Nicobarese is a very conservative Austro-Asiatic language, a classic example of a 'relic' language because of its geographic isolation, lying far off the coast of mainland Southeast Asia, uninfluenced by

the leveling influences of Chinese and subsequently Thai that have produced the set of areal features commonly found in Mon-Khmer and other Austro-Asiatic languages. Nicobarese therefore is considered to reflect much of what must be reconstructed for the morphology and syntax of Proto-Austro-Asiatic and ultimately Proto-Austric.

Despite the lack of verifiable lexical comparisons and sustainable sound correspondence sets, some linguists still believe the Austric hypothesis has merit, considering the fairly substantial body of morphosyntactic evidence outlined above. Blust (1996) even proposes a homeland for Proto-Austric, in the general area of the watersheds of the Salween, Mekong and Yangtze rivers in the upper Burma-Yunnan border area. He claims that pre-Austronesians separated from this homeland around 7000 B.C., gradually moving down the Yangtze River valley till they reached the coast, and eventually sailed south and across the Taiwan Strait to Formosa. These proposals, however, have not been widely accepted.

The most recent challenge to the Austric hypothesis has come from Sagart (2004), who proposes an alternative genetic relationship for Austronesian. He claims that Austronesian is most closely related to Sino-Tibetan, and that at least some of the morphological features that appear to support the Austric hypothesis were present also in the parent of Sino-Tibetan-Austronesian, and therefore possibly give evidence of a relationship with Austro-Asiatic at a much greater time depth.

Austroasiatic Languages

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

The Austroasiatic languages are spoken in small, often remote and inaccessible, hilly or mountainous regions throughout Southeast Asia, as far west as central India and as far east as Vietnam. There are over 150 languages belonging to the numerous Austroasiatic subgroups, enumerated below.

The primary split in the family is between the Munda languages in central and eastern India and the rest of the family. While lexically it is clear that Munda belongs to Austroasiatic, structurally the highly synthetic Munda languages are radically different from their predominantly isolating sister languages to the east. There are two major Munda subgroups, North Munda and South Munda (*see Munda Languages*).

Nahali (Nihali), an enigmatic group who speak a language that may or may not belong to Austroasiatic, are now mostly living as subjects to the North Munda Korku in the Indian states of Madhya Pradesh and Maharashtra. Some consider Nahali to have a special relation to Munda, others consider it to be a separate but related group of Austroasiatic, a third faction consider Nahali to be an isolated group in South Asia, like Burushaski (*see Burushaski*), while a fourth group of researchers reject Nahali as an independent language, rather considering it to be some kind of thieves' argot or secret language. Exact numbers of speakers are hard to gauge but may be around 5000.

There are at least three other major subgroups of Austroasiatic, the internal relations of which are still a subject of dispute. One such group is Nicobarese, which consists of a small number of languages spoken in the various Nicobar Islands, which lie off the southeastern coast of India, to which they belong administratively. Among this group of languages, Car Nicobarese, Nancowry Nicobarese or Central Nicobarese have received the most amount of linguistic investigation. One language, Shompeng (Shom Peng), appears to be highly divergent within the group,

but the materials on this language remain scanty. Other Nicobarese languages include Southern Nicobarese, Chaura (Chowra), and Teresa. Published sources include Radakrishnan's (1981) study of Nancowry morphology, among others. The total number of speakers of all Nicobarese languages is likely less than 25 000.

The next major subgroup of Austroasiatic is the Aslian group, which is spoken primarily in Malaysia (where the speakers are known as Orang Asli) but also in adjacent areas of Thailand. Ethnoracially, the Orang Asli of Malaysia fall into three subgroups: the Semang/Negrito, the Sakai/Senoï, and the Jakun/Aboriginal Malay (Parkin, 1991: 41). The first option in each case was traditional but has now become stigmatized, and the latter variant is now preferred. (Note that curiously the Semang/Negrito speakers prefer Sakai, although this is considered offensive to those whom it originally designated; cf. Parkin, 1991: 42.) Only two Jakun/Aboriginal Malay groups speak Aslian languages, Semelai and Temoq. Importantly, the linguistic subgroups of Aslian do not correspond neatly (although partially) to this ethnoracial categorization. In particular, there appears to be a primary split between a southern group (Semelaic (Semelai)) a northern, and a central subgroup (Jahaic (Jehai) and Senoic, respectively). Jah Hut may constitute an isolate branch within Aslian, although others consider it a divergent member of the Senoic subgroup. The exact relation between these subgroups remains to be worked out explicitly. Jahaic includes Negrito groups as well as racially Senoic Chewong. Jahaic languages are mainly spoken by very small groups of a few hundred speakers at most. None could be described as well known, but the subgroup includes such languages as Kintaq (Kintaq Bong), Minriq, Mintil, Jehai (Jahai), Batek, Tonga/Mos, which is mainly spoken in Thailand, Kensiu, and probably the Lowland Semang of Sumatra, with nearly 10 000 speakers. Senoic languages consist of several subgroups. The most important of these are the Lanoh, the poorly known Sabüm, the Temiar, and especially the Semai, who are the largest Aslian-speaking group with possibly as many as 20 000

speakers. Temiar, with perhaps 10 000 speakers, has been an important loan source for Jahaic languages, and is one of the best-studied members of this group (Carey, 1961; Benjamin, 1976). The Semelaic (South Aslian) branch consists of a small number of languages, each of which has probably fewer than 2000 speakers. In addition to Semelai and Temoq, the languages include Semaq Beri and Maq Betiseq (Besisi), also known as Mah Meri. Semelai has recently become the best studied of all Aslian languages with the publication of a large grammar by Nicole Kruspe (2004).

The fourth and final major subgroup within Austroasiatic is the far-flung Mon-Khmer group. This has a number of different subgroups, the internal relations of which remain to be adequately worked out. Major languages in this subgroup include Khmer (Cambodian, Khmeric), Mon (Monic), Vietnamese (Viet-Muong), Khasi (Khasic), Bahnar (Bahnaric) [BDQ], Kuy (Katuic), Palaung (Palaung-Wa), including Pale, Rumai, and Shwe, and so forth (*see Mon-Khmer Languages*).

Generally speaking, the westernmost languages of the family exhibit the greatest degree of morphological development. Munda languages are inflectional and agglutinating, with a diverse and highly developed system of tense/aspect marking, subject and object agreement, noun incorporation, and so on. An extreme example of this comes from Kharia, where the following word has no fewer than 8 morphemes:

- (1) *Kharia*
ḍoḍ-kay-tu-ḍom-bhaʔ-god-na-m
 carry-BEN-TLOC-PASS-quickly-COMPLT-FUT-2
 ‘get yourself there for me quickly’
 (Malhotra, 1982)

Tense/aspect morphology is not common among non-Munda Austroasiatic languages but may be found in Lyngngam of the Khasic branch of Mon-Khmer (*see Khasi*) and in certain Bahnaric and Katuic languages. In addition to Munda, certain Aslian languages show subject agreement in the verb, but otherwise this feature is not a common one in Austroasiatic.

South Munda and Nicobarese, and to a lesser extent the Aslian language Temiar, reflect evidence of noun incorporation, and this may therefore have been a feature of earlier stages of the Austroasiatic language family.

- (2) *Temiar*
pasal-naq ki-chiibjuq
 reason-that 1PL-walk < *‘go.foot’
 ‘so we had to go on foot’
 (Carey, 1961: 46)

It seems certain that Proto-Austroasiatic was richer morphologically than the majority of Mon-Khmer languages, particularly in terms of derivation, but not as developed as the Munda languages. Among the more noteworthy features of Austroasiatic is the unusually frequent use of infixation processes. A small number of derivational elements appear to be cognate across the members of the family, for example, a causative verb formant and a nominalizing element. The former appears either as a prefix or an infix, depending on the stem shape. Both elements are found in such branches as Munda, here exemplified by Juang Nicobarese, and the Mon-Khmer subgroups Monic and Khmuʔic (Khmuic), while other branches preserve only the prefix allomorph.

- | | |
|---|---|
| (3) <u>Juang</u> <i>aʔb-soŋ</i> CAUS-buy ‘sell’ (Pinnow, 1960a) < <i>kəsoŋ</i> | <u>Juang</u> <i>kəʔb-səŋ</i> dry..-CAUS...dry ‘dry sthg’ |
| (4) <u>Nancowry</u> <i>ha-kab-naŋ</i> CAUS-know-ear ‘make understand’ (Radakrishnan, 1981: 87) | <u>Nancowry</u> <i>p-um-lóʔ</i> lose-CAUS-lose ‘make lose’ (Radakrishnan, 1981: 54) < <i>plóʔ</i> |

Another infixation process found across the languages of the Austroasiatic stock is the nominalizing infix -n-. This is found in such forms as Khasi *shmong* ‘village’ < *shong* ‘live,’ Mlabri *chnrɛt* ‘comb’ < *chrɛt* ‘to comb,’ or Mundari *dunub* ‘meeting’ < *dub* ‘sit.’

It has been put forth that Austroasiatic may be a part of a larger genetic unit. Various proposals include relations with Austronesian, Tai-Kadai, Hmong-Mien (Miao-Yao), and even Sino-Tibetan, variously labeled ‘Austic,’ Austro-Tai, and so on. None of these proposals are widely accepted by specialists, and these hypotheses should therefore be treated with caution. Among modern specialists in Austroasiatic languages, Gerard Diffloth deserves special mention.

Austronesian Languages

T Crowley[†], University of Waikato, Hamilton, New Zealand

The Language Family and Its Speakers

Austronesian is possibly the largest language family in the world. Its 1200 or so languages (Grimes *et al.*, 1994: 122) amount to about a fifth of the world's total number. While the Niger-Congo family is sometimes said to be larger than Austronesian by a couple of hundred languages, it is by no means a well-established grouping, and some have suggested that

it is merely a typological rather than a genetic grouping. The lower-level Benue-Congo grouping (*see Benue-Congo Languages*) is much better established, but it has about 200 fewer languages than the Austronesian family. Austronesian is way ahead of the next grouping, the Trans New Guinea languages, which has fewer than 600 members. However, Austronesian again constitutes a much more clearly recognizable family than the Trans New Guinea grouping.

Austronesian languages represent the fourth-largest grouping of languages in the world in terms of the number of speakers. According to some, they are beaten again by Niger-Congo languages, relegating them to fifth position, though the relatively poorly supported claims about the genetic unity of these languages means that the fourth position for

[†]Deceased.

Austronesian should perhaps be maintained. The total number of speakers of Austronesian languages is about 300 million, which represents about 5% of the world's population. The Austronesian family includes the world's 13th-largest individual language (Javanese) in terms of the number of native speakers. Malay/Indonesian (*see Malayo-Polynesian Languages*) and Tagalog (spoken in the Philippines) (*see Tagalog*) come in at 9th and 18th respectively in terms of the total number of first- and second-language speakers (Crystal, 1987: 287). No putative Niger-Congo language appears in the top 20 for either list.

If we exclude the spread of Indo-European languages to the New World in association with colonialism, Austronesian languages also have by far the largest geographical spread of any language family in the world. Their territory extends from the islands of Taiwan and Hawai'i in the north, Easter Island (or Rapanui) in the east, New Zealand in the south, and Madagascar in the west. However, the territory within these bounds is not occupied exclusively by speakers of Austronesian languages, as Australia (*see Australian Languages*) and Tasmania, parts of the New Guinea area, and parts of mainland Southeast Asia include a variety of different non-Austronesian languages.

The Austronesian family is noteworthy not just for its largest languages, as it includes a huge number of very small languages as well. The Republic of Vanuatu – located in the southwest Pacific – has a population of only about 200 000, but its people speak at least 80 separate Austronesian languages (Lynch and Crowley, 2001), giving each language an average population of about 2500 speakers and making Vanuatu possibly the world's most diverse nation in terms of the number of languages per capita.

While Austronesian languages constitute a well-defined linguistic grouping, their speakers are very diverse in terms of physical appearance. People of a variety of Asian types speak Austronesian languages in what is now Indonesia, Malaysia, Singapore, Brunei, the Philippines and the interior of Taiwan. In the far west in Madagascar, speakers of the Austronesian language Malagasy clearly exhibit African genes. In the Pacific, the Melanesian speakers of Austronesian languages from the island of Timor, the Indonesian province of West Papua, Papua New Guinea, Solomon Islands, Vanuatu, New Caledonia, and Fiji differ in appearance from their Asian neighbors to their west, from their Polynesian neighbors to their east, and from their Micronesian neighbors to their north.

In fact, the boundaries between physical types are far from rigid, and there is often a gradual transition from one type to another, as genes have been mixing for centuries. In any case, linguistic boundaries and the boundaries of physical types often fail to coincide. We see this most dramatically in the New Guinea area, where physically similar Melanesian peoples may speak Austronesian languages or any of a number of completely unrelated non-Austronesian languages, including languages belonging to the Trans New Guinea grouping referred to earlier in this article. Sometimes, people in neighboring villages may speak totally unrelated languages. In fact, in the agglomerated village of Hanuabada, in Papua New Guinea, speakers of Austronesian Motu and non-Austronesian Koita (Koitabu) live side by side in the same community.

The Austronesian-speaking area exhibits cultural diversity that is even more dramatic than the diversity of physical types. As an illustration, we could point to the Hindu culture of Bali, in Indonesia; the traditional animist belief systems of Austronesian speakers in Melanesia (which continue to be practiced in some areas); the traditional polytheistic practices of the Polynesians, the Muslims of most of Indonesia, Malaysia, and southern Philippines; and the centuries-old Christian traditions of the central and northern Philippines. In some parts of the Austronesian-speaking world, traditional culture areas may be only slightly larger than the areas occupied by some of the very small individual languages. For instance, on the island of Malakula, in Vanuatu, significant differences in social organization and material culture can be found over quite short distances, with distinct culture areas including only two or three quite small language groups.

Of course, there has been a great deal of relatively recent technological and cultural change throughout the Austronesian-speaking world, with the advent of European colonialism and the modern technological revolution. The changes have perhaps been most dramatic (and most recent) in Melanesia, where in some cases fully traditional practices held sway until the first half of the 20th century. Although there are unlikely to be any more dramatic discoveries of 'lost tribes' who know nothing of the outside world, there are certainly still places where contact has until now been fairly minimal. While Christianity has now been adopted with fervor in most of Melanesia, Micronesia, and Polynesia, this change has often taken place in a way that has allowed for the retention of various aspects of the traditional belief system along with (or as part of) local Christianity.

Internal Genetic Relationships and Reconstruction

Based on the analogy of the naming of the Indo-European family after the geographical extremities – Indian and European languages – the Austronesian languages were originally referred to as Malayo-Polynesian, after Malay (and its relatives) in the west and the Polynesian languages in the east. However, it was subsequently realized not only that the indigenous Formosan languages of Taiwan belonged in this family but also that these represented several distinct high-level subgroups. The term *Malayo-Polynesian* was then reassigned to cover all of the non-Formosan languages within the enlarged family. This was, henceforth, referred to as Austronesian, based on the elements *Austro-* ‘southern’ and *-nesia* ‘island.’ The latter element is, of course, also found in the names for the geographical areas of Polynesia (= many islands, because of the large number of islands involved), Melanesia (= black islands, because they are occupied by dark-skinned peoples), and Micronesia (= small islands, because these are mostly narrow, low-lying atolls).

While the Austronesian languages exhibit a considerable amount of structural diversity, the existence of the language family as a whole is completely uncontroversial, in contrast to that of some other language groupings – including the so-called Niger-Congo languages – where debates rage between ‘lumpers’ (who seek to link together as many languages on the basis of what sometimes look to others more like typological similarity) and ‘splitters’ (who are sometimes overcautious in requiring anything but absolutely infallible proof of genetic relationship).

In fact, the idea that Austronesian languages are related is often obvious even to a casual observer, in contrast, again, to many other language groupings where even an experienced linguist might find it difficult to see convincing evidence of a relationship. For example, the root for ‘eye’ is *mata* in exactly this shape in languages as far apart as Yami (in Taiwan), Tagalog (in the Philippines), Malay/Indonesian, Manggarai (in eastern Indonesia), Manam (in Papua New Guinea), Roviana (in Solomon Islands), Raga (in Vanuatu), and Tongan, Tahitian, and Rapa Nui (on Easter Island). Such lexical similarities are reasonably common in those parts of the vocabulary which we would expect to be most resistant to borrowing – hence strong indicators of genetic relationship – and borrowing is most unlikely, in any case, as an explanation for these similarities, given the huge distances involved.

So readily apparent is the relationship between many of these languages that a connection of sorts

between the Polynesian languages and Malay was suggested by Hadrian Reland as early as 1708, when very little indeed was known about most of these languages. Lorenzo Hervas y Panduro in 1784–1787 described a more detailed set of linguistic relationships among Austronesian languages in which the language of Madagascar and a larger number of Indonesian languages were also included (Lynch *et al.*, 2002: 1).

The little-known islands of Melanesia were usually excluded from these original generalizations, perhaps partly because of a mistaken assumption that the physically distinct Melanesian peoples should also be linguistically very distinct. However, it turned out from work in the late 19th century by H. C. von der Gabelentz and R. H. Codrington (Lynch *et al.*, 2002: 2), based largely on information supplied by Christian missionaries in the field, that a substantial number of these languages *do* belong in this family as well. While many of the languages of the New Guinea area are clearly *not* Austronesian, some of the Austronesian languages of Melanesia were originally thought to be non-Austronesian only because extensive phonological changes had obscured the shapes of many widely distributed Austronesian roots, or because extensive lexical innovation had led to the replacement of some of the more widespread Austronesian cognates by which relationship could be most easily recognized. By the end of the 19th century, however, it was realized that a substantial number of indisputably Austronesian languages were in fact spoken in many of the coastal parts of the New Guinea area, as well as in Solomon Islands, Vanuatu, and New Caledonia.

This burgeoning language family was soon to become the most serious early testing ground for the comparative method of phonological and lexical reconstruction that was developed initially on the basis of Indo-European – and, less widely known, Finno-Ugric – languages in the second half of the 19th century. Although Edward Sapir’s reconstruction of Uto-Aztecan in 1913–1915 represented a stunning early application of the comparative method to unwritten languages, Otto Dempwolff’s (1934, 1937, and 1938) comparative study of the vastly larger Austronesian family represented a much more challenging test of the method.

Of course, a large number of new Austronesian data have become available since Dempwolff’s time, and there has also been significant fine-tuning of the comparative method itself. Many of his comparisons were enriched in the work of Isidore Dyen (1951, 1953a, 1953b, 1965) and others from the 1950s, and many new reconstructions have also been proposed. Robert Blust (1970, 1980) has progressively

added to the reconstructed lexicon since the early 1970s, bringing the total number of lexical reconstructions now to many thousands of entries. A substantial amount of morphosyntactic reconstruction since the late 1970s can also be ascribed to the level of Proto-Austronesian as a result of work by Stanley Starosta (1985), Lawrence Reid (1978), and others.

Comparative reconstruction has not proceeded solely at the level of Proto-Austronesian, as there has been major effort devoted to lower levels of reconstruction as well. Perhaps the most significant intermediate reconstruction involves the ongoing work since the 1990s of Malcolm Ross *et al.* (1998, 2003) in the reconstruction of Proto-Oceanic, the ancestor of the 500 or so members of the Oceanic subgroup. However, many others have also contributed in this area, beginning with the work of George Grace (1969) and Wilhelm Milke (1968) in the 1960s. Below the level of Proto-Oceanic, there is a tradition of reconstruction of Proto-Polynesian, for which serious comparative work based on a wide selection of languages dates from David Walsh and Bruce Biggs (1966).

With such a huge language family, internal subgrouping could be expected to be a somewhat contentious issue. However, there is now broad agreement on many issues of subgrouping within Austronesian. Work on subgrouping methodology by Malcolm Ross since the 1980s has added new considerations to the subgrouping of Austronesian languages, with his distinction between separation-induced ‘subgroups’ on the one hand and ‘linkages’ that have arisen as a result of gradual diversification of dialects that remained in geographical contiguity (Ross, 1988). This distinction allows us to take into account the fact that some lower-level groupings of languages, rather than uniquely sharing a set of defining innovations, may actually overlap with neighboring groupings in that they may appear to share innovations from more than one subgroup.

While new data and fresh approaches to subgrouping methodology may bring about further revisions in the future, the generally accepted current view is that the area of greatest subgrouping diversity is on the island of Taiwan (Lynch *et al.*, 2002: 4). Recent research indicates that there may be as many as nine first-order subgroups there (Blust, 1999), with the remaining first-order subgrouping consisting of the Malayo-Polynesian languages, which is made up of the huge number of remaining Austronesian languages.

The western part of the Malayo-Polynesian subgroup appears to consist of a large number of smaller subgroups. This region includes all of the languages

of the Philippines, as well as Malaysia and the islands of Indonesia from Sulawesi and Sumbawa westward, and also the Malagasy language of Madagascar. It is in this area that all of the very large Austronesian languages belong, including Tagalog (*see Tagalog*), Sebuano, Ilokano (Ilocano), Hiligaynon, and Bikol (Bicolano) in the Philippines, and Malay/Indonesian, Javanese (*see Javanese*), Sundanese (Sunda), Madura, Minangkabau, Bugis, Balinese (Bali), and Acehnese (Aceh) in Indonesia.

All of the languages to the east of the Western Malayo-Polynesian languages probably belong in a single very large Central and Eastern Malayo-Polynesian subgrouping that consists overwhelmingly of much smaller languages. This subgroup is thought to involve a binary split between a geographically restricted Central Malayo-Polynesian grouping involving the languages of Sumba, Flores, Timor, Buru, Seram, and adjacent smaller islands, and a much larger Eastern Malayo-Polynesian grouping consisting of all the rest. However, the internal subgrouping of both Central and Eastern Malayo-Polynesian and Central Malayo-Polynesian remains poorly understood. Eastern Malayo-Polynesian in turn enters into a binary split between the Southwest Halmahera–West New Guinea languages on the one hand and the very large Oceanic subgroup on the other.

The Oceanic subgroup occupies a special place within Austronesian linguistics. Although this is by no means one of the highest-level subgroups in the family, it is nevertheless a huge grouping, comprising nearly half of all of the Austronesian languages and amounting to nearly 10% of all of the languages of the world. With a total Oceanic-speaking population of about 2 million, the average-sized Oceanic language can claim only about 4000 speakers. Excluding some of the largest Oceanic languages from this total, such as Fijian (*see Fijian*), with nearly 500 000 speakers, the average size for an Oceanic language drops to closer to 3000 speakers. Most of these languages are poorly documented in comparison to languages further west, and many are almost completely undocumented.

Oceanic subgrouping diversity is greatest in the west, with possibly four of the five primary subgroups located in this area: the Admiralties languages; the Western Oceanic languages of the north coast of the Indonesian province of Papua (formerly known as West Papua) and the coast of New Guinea, New Britain, New Ireland, Bougainville, and western Solomon Islands; the St Matthias subgroup; and the Yapese language as a single-language subgroup (Lynch *et al.*, 2002: 92–120).

A putative Central and Eastern Oceanic subgroup covers Polynesia and Fiji and all remaining areas of

Micronesia and Melanesia, including New Caledonia, Vanuatu, and part of Solomon Islands. Within this very large grouping, there is a five-way split between the Micronesian languages, the languages of south-eastern Solomon Islands, the languages of Utupua and Vanikoro in Solomon Islands, the languages of Vanuatu and New Caledonia, and finally the Central Pacific languages, consisting of Fijian, Rotuman, and the Polynesian languages.

Further conclusions have been presented about subgrouping at even lower levels, with a detailed subgrouping diagram available for the Polynesian languages. Given the size of the Oceanic family within Austronesian, the final family tree diagram is obviously going to be extremely complex. All subgrouping hypotheses will have to be kept 'open' pending further linguistic documentation in poorly known areas. One point that will be obvious, however, is that the geographically expansive and relatively well-described Polynesian languages, which have for more than 200 years figured so prominently in European fantasies about the Pacific, represent just a very small grouping of just over two dozen languages at the very lowest level of Austronesian subgrouping.

Linguistic Features

The huge size of the Austronesian family makes any kind of summary statements about 'typical' features well-nigh impossible. At the same time, the approximately 5000-year time depth for Austronesian languages is relatively shallow compared with language groupings such as Australian languages and Trans New Guinea languages, and the Austronesian family is structurally rather less diverse than such groupings as a result.

Since there are major structural differences between some of the Formosan and Western Malayo-Polynesian languages on the one hand and the Oceanic languages on the other, it is perhaps best to offer several sets of generalizations about widespread linguistic features in Austronesian languages. Even so, it must be recognized that within any such structural groupings, there are many languages that exhibit rather different sorts of patterns, so the patterns that are presented here are those which, in addition to having substantial geographical distribution, also appear to reflect some antiquity in a reconstructive sense.

In terms of phonology, it is particularly difficult to generalize about Austronesian languages. One thing that it is possible to say is that tonal contrasts are almost completely absent, in contrast to the phonological systems of many neighboring Asian

languages. Tone is furthermore not reconstructible at all in Proto-Austronesian. While there has long been general agreement on the reconstructed four-vowel system /i u ə a/, there has until recently been much less agreement firstly on the number of consonantal contrasts, and secondly on the precise phonetic value of a number of reconstructed protoconsonants.

Complex sets of consonantal correspondences led scholars in the past to posit consonant inventories varying between two and three dozen segments in total. Arguments were presented, for example, that correspondences pointed to a maximal set of reconstructions involving /d ɖ D D₁ D₂ D₃ d₁ d₂ d₃/, where the symbols represented a mix of phonetic and purely formulaic information (Ross, 1994: 54). These issues of phonetic uncertainty and the proliferation of protoconsonants have now been largely laid to rest (Blust, 1999), though Wolff (2003) remains a dissenting voice. Because the few Formosan languages represent a number of primary subgroups of Austronesian, the relatively recent study of these languages has provided evidence for substantial modifications in both the inventory and the phonetic value of Dempwolff's original phonological reconstructions.

There has been a considerable amount of phonemic merger, split, and shift in many subgroups and in many individual Austronesian languages. There has also been phonological erosion of particular phonotactic positions, particularly involving word-final consonants in Oceanic languages. Original nasal-stop clusters have also been reanalyzed in Oceanic languages as prenasalized stop phonemes, resulting in substantial phonotactic simplification. Some individual languages have undergone other more dramatic phonological changes, including also the reanalysis of other material as part of the root, so reconstructible **mata* 'eye' appears regularly as /nəmɾə/ in the Lenakel language of Vanuatu.

In terms of basic clause structure, the languages of the geographical extremities of the Austronesian-speaking areas are typologically very different. The languages of Taiwan and the Philippines exhibit what are often called 'focus' systems, which appear to directly reflect a reconstructible pattern at the Proto-Austronesian level (Ross, 1994: 64–66). In this system, verbs carry inflectional marking – expressed variously as prefixes, suffixes, or infixes or as a combination of more than one of these affixed elements – for so-called Actor Focus (AF), Undergoer Focus (UF), Locative Focus (LF), and Instrumental Focus (IF). The noun phrase that is signaled as being in focus typically appears clause-finally, is definite, and performs a range of possible semantic roles according to

the nature of the focus marking on the verb. This is a completely un-English construction for which it is difficult to provide close translations, but examples (1), (2), (3), and (4) from Tagalog illustrate this pattern, based on the verb roots *bili* ‘buy,’ *tamVn* ‘plant,’ and *putol* ‘cut’:

- (1) *B-um-ili ng kotse ang lalake.*
 AF:buy PATIENT car TOPIC man
 ‘The man bought a car.’
- (2) *B-in-ili ng lalake ang kotse.*
 UF:buy AGENT man TOPIC car
 ‘The car was bought by the man.’
- (3) *T-in-amm-an ng lalake ng damo ang lupa.*
 LF:plant AGENT man PATIENT
 grass TOPIC ground
 ‘The ground was planted the grass in by the man’-i.e., ‘The man planted the grass in the ground.’
- (4) *I-p-in-utol ng lalake ng isda ang kutsilyo.*
 IF:cut AGENT man PATIENT
 fish TOPIC knife
 ‘The knife was cut the fish with by the man’ – i.e., ‘The man cut the fish with the knife.’

Oceanic languages, by way of contrast, evolved a system of formal marking for transitivity on verbs that expresses a range of different semantic roles associated with the verbal object. This marking involves verbal suffixes that express a distinction between unsuffixed transitive verbs with undergoer objects and those that carry a transitive suffix with typically oblique objects. These transitive suffixes are often described as expressing close and distant transitive respectively and are associated with different sorts of semantic roles. Thus, in Fijian the intransitive verb *qasi* ‘crawl’ corresponds to the close transitive form *qasi-va* ‘crawl to (location)’ and the distant transitive form *qasi-vaka* ‘crawl with (something held).’

Oceanic languages have evolved a wide range of other innovative features from the reconstructible Proto-Austronesian pattern. At the Proto-Oceanic stage, a formal distinction had developed between inalienable and alienable possession, with the former being expressed by means of pronominal suffixes attached directly to a noun and the latter expressed by means of an adposed possessive constituent to which pronominal suffixes were attached (Lynch *et al.*, 2002: 40–41). This distinction is still widely reflected in Oceanic languages in examples such as (5) and (6), from the Naman (Nama) language of Vanuatu:

- (5) *khavo-g*
 brother-1SG
 ‘my brother’

- (6) *neim khëso-g*
 house POSS-1SG
 ‘my house’

Naman has in fact simplified the reconstructible system for the expression of alienable possession, in that there is now only a single set of adposed possessive constituents. At the Proto-Oceanic stage, there are likely to have been separate possessive forms depending on whether the possessed item was for eating, for drinking, or for any miscellaneous purpose (Lynch *et al.*, 2002: 42). This three-way distinction is still maintained in many Oceanic languages, such as examples (7), (8), and (9), from Fijian:

- (7) *na me-mu wai*
 ART DRINK-2SG water
 ‘your water’
- (8) *na ke-mu dalo*
 ART ED-2SG taro
 ‘your taro’
- (9) *na no-mu vale*
 ART POSS-2SG house
 ‘your house’

In some Oceanic languages, however, a number of additional categories of alienable expression occur. In the Raga language of Vanuatu, for example, in addition to forms expressing edible, drinkable, and miscellaneous possession, there are the possessive constituents *bila-* ‘garden plots, crops, domestic animals, personal adornments’ and *wa-* ‘sugarcane,’ and some languages have developed even more categories of alienable possession.

The Polynesian languages have taken the expression of possession in yet another direction. A possessor is preceded by a possessive marker containing either the vowel *a* or *o*. Thus, in Samoan, we find examples such as those in (10) and (11) (Lynch *et al.*, 2002: 43):

- (10) *lo-‘u tama*
 POSS-1SG son
 ‘my son’
- (11) *la-‘u naifi*
 POSS-1SG knife
 ‘my knife’

Inalienably possessed items generally express possession by means of the *o* forms, while *a* forms tend to correspond to categories of alienable possession in other Oceanic languages. However, there is substantially more arbitrariness and metaphor involved in the interpretation of the alienable-inalienable distinction in these languages. For instance, the possession of canoes in Samoan is considered as being more ‘personal’ than the possession of a knife, so ‘my canoe’ is expressed as *lo-‘u paopao*.

Historical Interpretation

By combining subgrouping information, the content of the reconstructible lexicon of Proto-Austronesian (as well as the lexicons of various lower-level subgroups, most significantly Proto-Oceanic), and information provided by the archaeological record, it is possible to come up with a fairly sophisticated picture of Austronesian history dating back at least 5000 years (Bellwood *et al.*, 1995). The story of human settlement of the Pacific Islands has tended to attract the interest of enthusiastic amateurs and religious groups who have been prepared to argue particular points of view in a way that has sometimes attracted a certain amount of broader public acceptance, even though the scientific evidence often points in radically different directions.

Given that the area of greatest subgrouping diversity within a language family is most likely to represent the original homeland, we could argue on these grounds alone that the Austronesian homeland is likely to have been either on Taiwan or on the adjacent mainland of southern China and that there has been a general west-to-east movement, with Polynesia being the last area to be settled. Given that the Polynesian languages represent a linguistically very homogeneous and geographically expansive subgroup, this, on linguistic grounds, would be the least likely source for Austronesian languages. However, that has not prevented people inspired by the *Kon Tiki* expedition from arguing instead for a general east-to-west population movement, beginning in South America.

The view of some religious groups that Polynesian people are descendants of one of the Lost Tribes of Israel is also impossible to reconcile with the fact that there is no linguistic evidence in support of this contention, while there is a huge amount of incontrovertible evidence in support of linguistic relationships between Polynesian languages and those of the rest of the Austronesian-speaking world. And of course, there is a mass of archaeological evidence pointing to the origin of Polynesian peoples from previously settled areas of the Austronesian-speaking world, and none in support of an origin elsewhere (Howe, 2003).

The first major population movement away from the Austronesian homeland was that which took speakers of Proto-Malayo-Polynesian out of the Taiwan area into the Philippines, presumably via an entry point in the north. A series of population movements and associated linguistic splits would have seen this original group spread to the rest of that archipelago and ultimately to all of what is now Indonesia. As part of this series of population movements, the island of Madagascar was settled by a group of people who originated from Kalimantan.

Ultimately, speakers of a language immediately ancestral to Proto-Oceanic moved out of the area of Halmahera and the Indonesian province of Papua into the Oceanic homeland of New Britain and New Ireland approximately 3500 years ago. Melanesia was at the time occupied by speakers of non-Austronesian languages. As early descendants of Proto-Oceanic speakers began to spread, their progress was limited on the mainland of New Guinea to coastal areas, while the hinterland and the distant interior continued to be occupied by speakers of non-Austronesian languages.

However, there was obviously substantial linguistic contact between these two major linguistic groups, as the reconstructible VO word order often shifted to OV order in this area under the apparent influence of non-Austronesian patterns. A small number of languages – most famously Magori and Maisin of Papua New Guinea – underwent such thoroughgoing influence from non-Austronesian languages that for many years there was dispute as to whether they should be classified as Austronesian or not.

Population movements – and associated linguistic diversification – continued with the eastward drift of Oceanic-speaking groups. Up to this stage, most of the population movements involved relatively short ocean voyages to islands that were clearly visible from neighboring populated islands. However, about 3000 years ago there was a period of sudden geographical expansion out of western Melanesia involving a series of major ocean voyages into what must initially have been unknown and unpopulated territory. These voyages led to settlement as far afield as Tonga and Samoa.

It was in Tonga and Samoa that Proto-Polynesian diverged from its ancestor. From there, an even more dramatic series of oceangoing voyages led to the discovery and settlement of nearly every island group in the Pacific between the time of the birth of Christ and A.D. 1000. It should be kept in mind that this was all happening at a time when Britons were still lumbering across narrow rivers in coracles. It was Polynesian sailors who were the world's first major navigators, rather than the likes of Vasco da Gama, Christopher Columbus, and Captain Cook, whose voyages followed well over 1000 years later.

Possible External Genetic Relationships

The Austronesian languages constitute a very well defined language family in that there are few languages whose status as being Austronesian is in dispute. The status of some languages has been the subject of debate given the possibility of influence from so-called Papuan or non-Austronesian languages in the

Figure 1 The Austronesian family and major Austronesian language groups (drawn by Malcolm Ross).

New Guinea area, and different scholars in the past were uncertain as to whether Maisin and Magori should be treated as non-Austronesian languages or as Oceanic languages (Lynch *et al.*, 2002: 16). While both clearly show evidence of substantial borrowing from non-Austronesian languages, it is now accepted that they can be treated as genuinely Austronesian languages. There are also a handful of languages spoken in the extreme east of Solomon Islands about which there has been some debate in the past; this issue has not yet been definitively resolved.

Most suggestions of relationships between Austronesian languages and other language groupings call for greater willingness to come to conclusions on the basis of relatively little evidence. Some scholars have claimed that there is a relationship between Austronesian languages and Japanese, others between Austronesian and the Tai-Kadai languages of southern China, others between Austronesian and Sinitic languages, and others between Austronesian and Austro-Asiatic languages, such as Nicobarese (Ross, 1994: 95–99). The few similarities between Japanese and Austronesian seem likely, at best, to involve a few very early Austronesian loans into Japanese. The other links may point to a series of relationships within a single very large grouping, though few would regard such a hypothesis as demonstrable.

Just as interesting, of course, is the question of a possible relationship between Austronesian languages and language groupings for which no suggestions of wider relationships have ever been offered. Most significant among these are the Australian languages, which represent a completely separate language family in their own right, and the various ‘Papuan’ languages of the New Guinea area. So convincing is the lack of relationship between the latter and Austronesian languages that these ‘Papuan’ languages are often collectively referred to in regional studies simply as non-Austronesian languages.

Austro-Tai Hypotheses

L A Reid, University of Hawai'i, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Austro-Tai is the name given to the hypothesis that the Austronesian language family and the Tai-Kadai language family are genetically related. Austronesian languages are primarily spoken in Taiwan, island Southeast Asia and the Pacific, while Tai-Kadai languages are spoken in mainland Southeast Asia, specifically South China, Vietnam, Laos, Thailand, Burma, and Assam (India). Siamese, or Thai, the national language of Thailand, is the best-known Tai-Kadai language and the largest in terms of numbers of native speakers. Lexical similarities between Thai and the Austronesian languages have long been recognized (Schlegel, 1901). However, the hypothesis that the language family to which Thai belongs is genetically related to Austronesian was first proposed by Benedict (1942). Benedict proposed that the genetic relationship between the two language families was a sister relationship, implying that the Tai-Kadai languages are the descendant languages of a parent language – Proto-Austro-Tai – from which pre-Austronesian peoples split in a move to Taiwan, where Proto-Austronesian developed.

Although his later work (Benedict, 1975) was well received by archaeologists and prehistorians, it was generally less well received by linguists, who were skeptical of the extensive array of Proto-Austro-Tai reconstructions that he proposed and his unorthodox methodology for reconstructing them. A number of critical reviews of his work appeared (esp. Gedney, 1976), casting doubt on the nature of the relationship, and pointing to a number of unrecognized loans from Chinese. But the presence in the Tai-Kadai family of a considerable number of forms from the area of basic vocabulary that are very similar in sound and meaning to corresponding Austronesian forms removes the possibility of coincidence as a possible explanation for the similarities. Whether the similarities reflect a genetic relationship or are the result

of contact was examined by Thurgood (1994). He concluded that the sound correspondences and tonal developments within the Tai-Kadai languages of forms with comparable Austronesian reconstructions are irregular and thus cannot be evidence of a genetic relationship, but rather of an early contact relationship.

A recent reexamination (Ostapirat, 2000) of the whole question of the internal relationships within the Tai-Kadai family of languages (renamed by Ostapirat as Kra-Dai) has opened up once again the nature of the relationship that exists between this family and Austronesian. In an insightful paper, Ostapirat (2005) presented a list of some 50 pan-Kra-Dai basic vocabulary items, at least half of which can be related by regular sound correspondences to equivalent forms in Proto-Austronesian. The English glosses of Kra-Dai forms that appear to be related to Austronesian include the following: *bear* (n.), *bird*, *black*, *child*, *eat*, *excrement*, *eye*, *far*, *fire*, *grandmother*, *grease*, *hand*, *head*, *I*, *leaf*, *leg*, *live*, *louse* (*head*), *moon*, *nose*, *raw*, *sesame*, *shoulder*, *this*, *tooth*, *water*, and *you*.

From this evidence, Ostapirat concluded, "It does not seem likely that the very high number of roots between Kra-Dai and Austronesian that emerge from the core list could be accidental or simply result from borrowings." In commenting on Thurgood's claims that there are no regular sound correspondences between the Kra-Dai and Austronesian families, Ostapirat explained that they are the result of Thurgood's being unaware of crucial data from little-known languages, and of the inadequacy of some of his Proto-Kra-Dai reconstructions. Despite the apparent strength of the evidence he cited, Ostapirat nevertheless considered the evidence to be debatable as proof of a genetic relationship between the families.

An alternate hypothesis regarding the external relationships of the Kra-Dai family is that the languages are genetically related not to Austronesian, but to the Sino-Tibetan family. Ostapirat rejected this hypothesis, noting that etyma that appear to be related to Chinese are rarely found in all branches of the family

and almost none belong to the core vocabulary of the language.

The most recent view of the external relationships of the Kra-Dai family is that proposed by Sagart (2005). Building on the comparisons established by Ostapirat, Sagart presented data from a recently described language of the Kra group, Buyang (BYU) (Li, 1999), which apparently, alone, among the Kra-Dai family, retains a number of disyllabic forms which correspond to Proto-Austronesian or Proto-Malayo-Polynesian (PMP) reconstructions, such as BYU *ma⁰ tɛ⁵⁴* ‘die’ (PMP *matay); BYU *ma⁰ ta⁵⁴* ‘eye’ (PMP *mata); BYU *qa⁰ ɗu¹¹* ‘head’ (PMP *quluh); BYU *ma⁰ ɗu³¹²* ‘eight’ (PMP *walu), etc.

Data such as these establish beyond any doubt that a genetic relationship exists between the two families. The nature of the relationship, however, is still being discussed. Sagart rejected the possibility that Proto-Kra-Dai and Proto-Austronesian are sister languages, thereby rejecting the Austro-Tai hypothesis in its original formulation. He claimed instead that the Kra-Dai languages are a subgroup of Austronesian, being descendants of the language spoken by a group of Austronesian-speaking people who returned to the mainland from the east coast of Taiwan, long after the first Austronesian settlement there, but probably before the movement south to the Philippines some 4000 years ago of the ancestors of the Extra-Formosan, or Malayo-Polynesian, languages.

Ostapirat stated that if Kra-Dai were a subgroup within Austronesian, as Sagart believes, it would seem likely that they must have belonged to one of the primary branches, in that Proto-Kra-Dai retains a distinction between the reflexes of Proto-Austronesian *C and *t, and *N and *n, pairs of sounds which fell together and are therefore not distinguished in Proto-Extra-Formosan. Moreover Proto-Kra-Dai retains a sibilant reflex of Proto-Austronesian *S, which developed as *h in Proto-Extra-Formosan. In addition, he noted that although there are no Extra-Formosan languages which have reflexes of Proto-Austronesian *Cumay ‘bear (n.),’ the form is reflected in Kra-Dai languages.

Sagart’s position, on the other hand, is that the ancestors of the Kra-Dai languages must have

returned to the mainland about the time that the ancestors of the Extra-Formosan languages moved south, in that they apparently reflect certain forms, such as *-mu ‘you (sg.),’ *lima ‘five,’ *manuk ‘chicken,’ etc., that Sagart believes are reconstructible only to the parent of the Extra-Formosan languages, but not to Proto-Austronesian.

If the speakers of the parent of Proto-Tai-Kadai did in fact return to the mainland from Taiwan as proposed by Sagart, he suggests that they probably settled in coastal areas in Guangdong or Guangxi, and their language was eventually relexified by a language from some probably extinct phylum, but one ultimately related to Austroasiatic, retaining only the most basic elements of its Austronesian lexicon.

Avestan

E Tucker, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Avestan is the language of the most ancient collection of texts sacred to the Zoroastrian religion. It represents the Old Iranian stage of the Iranian language family, and provides, along with Old Persian, the earliest evidence for the Iranian branch of the Indo-Iranian and Indo-European language families. The language is known only via a defective medieval manuscript tradition, which was preserved in Iran and also in India, to which adherents of the Zoroastrian faith, the Parsis, emigrated according to tradition in 10th-century A.D. Hence its study presents a range of philological, textual, and interpretative problems.

Two forms of the language are documented: Old Avestan (OAv.; sometimes called Gathic Avestan) and Younger Avestan (YAv.). Opinion is at present divided as to whether they represent earlier and later forms of precisely the same language, or whether dialect differences are also involved. A difficulty is that OAv. is known only from a very small number of texts: the Gāthās, seventeen complex poems in five different meters attributed to the prophet Zarathuštra himself, which still present many problems of interpretation; two short sacred prayers; and a traditional liturgy in seven sections, the Yasna Haptaŋhāiti. The most extensive surviving Avestan texts, that is, the other parts of the 72-chapter Yasna, the lengthy Yašts, which honor divinities such as Mithra and Anāhitā, and the Vīdēvdāt, ‘the Law which rejects False Gods’ are composed in YAv. A few short sections of the Yasna are in YAv. with an artificial veneer of OAv. phonological features (pseudo-OAv.). Faulty grammar in parts of the Avesta may suggest that composition continued at a stage when Avestan was no longer a living language, but the text may also have deteriorated during transmission.

Absolute dates for Avestan are entirely lacking. The date of the prophet Zarathuštra is still debated, but many scholars agree that the Gāthās must be roughly contemporary with the RigVeda in India (i.e., toward the end of the second millennium B.C.), as OAv. morphology and syntax are on a par with those of the earliest Vedic language. YAv. shows many simplifications, particularly in its verb system, and innovations, and the text collection as a whole must span several centuries.

Avestan diverges from Old Persian in some important sound changes (IE **k*, *g*, *ǵh* > Av. *s*, *z*, *z*, but > OP *θ*, *d* [δ], *d* [δ]; IE **k*_u, *ǵu* > Av. *sp*, *zb*, but OP *s*, *z*),

but in these respects it agrees with the majority of Iranian languages. It is often described as East Iranian because geographical names found in the YAv. texts refer to the region of present day Afghanistan and East Iran and none refer to West Iran. However, Avestan does not share in the most characteristic features known from Middle Iranian languages of the extreme East, such as Khotanese. Rather it shows several phonological developments (if these do indeed belong to the original Avestan language) that are unparalleled elsewhere in Iranian (*-*aha*- > -*aŋha*-, *-*ft*- > -*pt*-, *-*rt*- > -*š*- when the syllable was accented, etc.). No Iranian language known from later times can be identified as a direct descendant of Avestan.

The Avestan texts were composed orally, and they were recited and transmitted orally by the Zoroastrian priesthood in different regions of Iran, but it is hard, if not impossible, to assign specific features of Avestan to influence from specific local languages. The written recension was only made during the Sasanian period (224–651 A.D.), when Zoroastrianism flourished as the state religion. An elaborate alphabet of 53 signs, including 16 for vowels, was invented on the basis of the cursive Zoroastrian Pahlavi script and the Christian Psalter script (both derived from Aramaic) in order to record as precisely as possible the traditional pronunciation of Avestan, which had ceased to be a living language several centuries earlier. Avestan orthography is not based on phonemic principles, but it conveys a wealth of information about allophonic variation. Consequently, Avestan words often look very different from their exact counterparts in Vedic, even though the languages are closely related; contrast YAv. *hāuuōiia*-: Vedic *śavya*- ‘left’ or OAv. *məŋghī*: Vedic *mamsi* ‘I thought.’ Moreover, morphological regularities within the Avestan language itself are often obscured (e.g., *barahi*, *baraiti*, *barenti* represent 2 sg., 3sg., 3pl. present active based on the inherited thematic stem *bara*- ‘bear,’ cf. Skt. *bharasi*, *bharati*, *bharanti*).

The Avestan manuscripts, of which the earliest dates from 13th-century A.D., reflect a written tradition that barely survived the centuries following the Islamic conquest. At one stage only a single manuscript existed for each part of the extant Avesta, and approximately three-quarters of the Avesta as described in the Sasanian Zoroastrian books has been lost. Recent scholarship has made progress in reconstructing the spellings of the ‘Sasanian Archetype’ text, but it is still often difficult to determine which features belong to the original Avestan language and which arose in the course of either oral or

written transmission. According to some scholars, the phonology of OAv. was close to that of Proto-Iranian, and Gathic meter may provide evidence for archaic features such as the vocalization of semivowels according to Sievers' Law, and a hiatus between vowels caused by the recent loss of laryngeals.

The inflectional morphology of both OAv. and YAv. is extremely rich. For nouns, adjectives and pronouns, the full set of eight IE case inflections and three numbers remain alive, with a huge range of nominal stem types, and some ancient irregular paradigms, such as YAv. *paṇtā* (nom.), *paṇō* (gen.) 'path'; OAv. *huuarē* (nom.), *x^vəng* (gen.) 'sun'; OAv. *aogō* (nom.), *aojaṇhā* (instr.) 'strength.' The OAv. enclitic acc. pl. personal pronouns *nā* 'us,' *vā* 'you' (cf. Latin *nōs*, *vōs*) are an archaism not found elsewhere in Indo-Iranian. At the same time, there are innovations, such as the OAv. (and YAv.) nom. pl. masc. ending *-ā* in thematic stems (more frequent than inherited *-ā̃*, *-āṇhō*), and the creation in YAv. of a distinct ablative singular inflectional ending for all nominal classes.

In the OAv. verb system all the IE tense-aspect stems (present, aorist, perfect) are fully employed. YAv. has a much simplified system where present and preterite are based on a single stem (the inherited present) and distinguished by different inflectional endings. The inherited augment *a-* rarely appears, and its function in Av. is problematic. Although thematic presents are productive, the rarer types of athematic present are well represented, notably acrostatic root presents

(OAv. *stāumī* 'I praise,' *aogədā* 'he said,' YAv. *āṇhāire* 'they sit'). Modal forms (subjunctives, optatives, and imperatives) are frequent at all stages.

The Avestan lexicon is remarkably free of loan-words from non-Iranian languages, and it preserves some IE lexemes that were lost in Indo-Aryan, e.g., *varəz-* 'to work,' *vad-* 'to lead.' Contrasting vocabulary items for good (ahuric) versus evil (daevic) beings reflect Zoroastrian dualism but their linguistic origins are complex (e.g., *staman-/zafar-* 'mouth,' *dōiṇra-/āši-* 'eye,' *aog-/dauu-* 'to speak,' *tak-/zbar-* 'to run,' *nmāna-/gərəḍa-* 'house,' *ṇβərəs-/karət-* 'to fashion').

Aymará

W F H Adelaar, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The name 'Aymara' is used for one of the most important native languages of South America. It is spoken by approximately 2 000 000 people in three countries: Bolivia (mainly in the department (administrative division) of La Paz, but also in parts of Cochabamba, Oruro, and Potosí), Chile (in the highlands of Tarapacá), and Peru (in the departments of Moquegua, Puno, and Tacna). Aymara is closely related to the Jaqaru language – spoken by less than a 1000 people, mainly in the village of Tupe in the province of Yauyos (department of Lima) in central Peru – as well as to Cauqui, spoken by a

few individuals in the nearby village of Cachuy. Together, the languages Aymara, Jaqaru, and Cauqui form a family that has variously been called 'Jaqi' (Hardman, 1978), 'Aru' (Torero, 1972), 'Aimara' (Cerrón-Palomino, 2000), and 'Aymaran,' which is the name used in this article.

The Aymaran language family has no proved external relatives. There are close and detailed similarities in the phonological, structural, and lexical domains with the neighboring Quechua language group; the two groups also share more than 20% of their lexicon. This situation suggests a protracted period of interaction between the underlying protolanguages of both Aymaran and Quechua. The interaction may have continued on a local basis during the further development and expansion of both language groups. The close similarities between the two language

groups have often been interpreted as a proof of common origin (the so-called Quechumaran hypothesis). Nevertheless, most similarities are attributable to linguistic convergence, making it difficult to distinguish between borrowed and inherited material (*see Andean Languages; Quechua*).

Before 1600, Aymara and related dialects were widely spoken in southern Peru and in the eastern and southern Bolivian highlands, where Quechua is now the dominant language. The historical influence of Aymara through borrowing can be appreciated from the spread of Aymara numerals into the southern cone of South America (Mapuche) and into the Amazonian basin (Tacanan languages). The name 'Aymara' is probably derived from a province or ethnic group located in the present-day Peruvian department of Apurímac (now Quechua speaking). The study of the Aymara language received an important stimulus in the 17th century when the Jesuit order established a mission in Juli, on the southwestern shore of Lake Titicaca. The first grammar and dictionary of Aymara were written in 1603 and 1612, respectively, by a Jesuit, Ludovico Bertonio.

The Aymara vowel system consists of three vowels (*a, i, u*), of which the high vowels are lowered to (*e, o*) next to a uvular consonant. There is a distinction of vowel length that is mainly used in morphology, but also in a few lexical roots. Stops and affricates are normally voiceless; they can be plain, glottalized, or aspirated. There is a contrast between velar and uvular consonants. Dialects in the border area of Bolivia, Chile, and Peru have a distinctive velar nasal consonant. Stress is predictable and is located on the penultimate syllable or mora. All roots are vowel final. However, the final vowel of a nominal expression is regularly deleted before pause. Although the structure of Aymara roots and suffixes is basically simple, surface forms can be complex due to the fact that many suffixes trigger the suppression of a preceding vowel. This suppression must be treated as a formal property of the suffix in question, because there are no synchronically valid phonological rules to account for it. In some cases, root-interior vowels are also suppressed under similar circumstances. These different types of vowel suppression produce elaborate consonant clusters, as illustrated in *han unxtkiri* 'without moving,' 'immobile,' which can be analyzed as follows (vowels between parentheses are suppressed; PROG, progressive; AGT, agent; NOM, nominalizer):

- (1) han(i) un(u)q(i)-t(a)-k(a)-iri
not rock-upward/begin-PROG-AGT.NOM

The combination *unxta-* (< unuqi-ta-) is fixed and is interpreted as 'to move slightly.'

Aymara has an agglutinating structure mainly based on suffixation; there are no prefixes at all. The morphology is complex, but regular. Words containing as many as nine consecutive suffixes are no exception (the fixed combination *aru-si-* means 'to speak'; INCL, inclusive; REFL, reflexive; PL, plural; COMPL, completive; BEN, benefactive):

- (2) hiwas-kam(a) aru-s(i)-kipa-si-p-ɣa-ña-naka-
taki-sa
we(INCL)- speak-REFL-turn-REFL-PL-
case:among COMPL-NOM-PL-case:BEN-too
'so that we are able to communicate among
ourselves'

Verb-final order is obligatory in dependent clauses and is the preferred order in full sentences. In noun phrases, all modifiers precede their heads. Nouns can be marked for case, number (plural), and person of possessor. The overall structure of the language is nominative-accusative. Case is expressed by suffixes, but the accusative is marked by eliminating a stem-final vowel. There is a four-term pronominal system consisting of speaker (*naya* 'I'), addressee (*huma* 'you'), third person (*hupa* 'he/she'), and an inclusive plural that comprises both speaker and addressee (*hiwasa*). This system is also reflected in nominal possession and in verbal inflection.

Verbs in Aymara exhibit a rich derivational morphology, including causative, reflexive-reciprocal, spatial direction, number of subject, aspect, speaker orientation ('hither'), and several other options. Tense, mood, and personal reference, both of the subject and of a human (in)direct object, are combined in complex portmanteau endings, which are a hurdle for the nonnative learner. In these endings (nine for each tense or mood paradigm), a third-person object is not explicitly indicated. Characteristic for the Aymara verb is the existence of evidential distinctions (inference, conjecture, nonpersonal witness, etc.), for which the Aymara society is highly sensitive.

Verbalizations – copula 'to be,' locative verb 'to be at' – are indicated morphologically, the former by vowel lengthening (1POSS, first-person possessor; VERBAL, verbalizer; 2SUB, second-person subject; ASSERT, assertive):

- (3) hič^ha-ɣ(a) wawa-ha-:-ɣ(a)-ta-wa.
now-topic child-1POSS-VERBAL :be-COMPL –
2SUB-ASSERT
'Now you are already my child.'

Nominalization plays an important central role in Aymara morphosyntax. Different types of dependent clauses are obtained by combining nominalized verbs with specific case markers. Nominalization is also

used to form relative clauses. In contrast to Quechua, person of object cannot be indicated morphologically in nominalized verbs. (Note: Examples (1)–(3) are from Albó and Layme (1992)).

Azerbaijani

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Azerbaijani (Azerbaijani, Azeri) (*Azərbaycan dili*, *Azərbaycanca*) belongs, like Turkish, to the western group of the southwestern, or Oghuz, branch of the Turkic language family. It is spoken in northern and southern Azerbaijan (i.e., in the Republic of Azerbaijan), particularly in the province of Azerbaijan, and in Iran. Azerbaijani is the official language of the Republic of Azerbaijan (*Azərbaycan Respublikası*), which constitutes the easternmost part of Transcaucasia. The Republic is situated between Iran and Russia, with a small European portion north of the Caucasus range. It includes the exclave of the Nakhchivan Autonomous Republic and the separatist Nagorno–Karabakh region. It borders on the Russian Federation in the north, Georgia in the northwest, Armenia in the west, Iran in the south, and the Caspian Sea in the east. Azerbaijanians make up about 90% of the Republic's total population of about 7.8 million. Other ethnic groups include Dagestanis, Russians, and Armenians (mainly in Nagorno-Karabakh). Over 80% of the citizens speak Azerbaijani as their first language. The number of speakers in the Republic amounts to about 7 million. The standard language is based on the dialect of the capital Baku (*Bakı*). The number of speakers in southern Azerbaijan, which is located in northwestern Iran and borders on Turkey in the west,

is estimated to be over 13 million. Similar varieties are spoken in eastern Anatolia, northern Iraq, Georgia, and Armenia. The total number of speakers may amount to 20 million.

The current status of the language in the Republic is very solid. More than half of Azerbaijani speakers are monolingual. The social situation of the varieties of Azerbaijani spoken in Iran is quite different. There the languages have not been promoted; on the contrary, their use has been discouraged and public use of Azerbaijani was banned for several decades. The situation is now improving.

Origin and History

The language goes back to the Oghuz Turkic varieties of the Seljuks, who immigrated to the area in the 10th and 11th centuries. These people originally belonged to the Oghuz confederation of tribes, whose Inner Asian steppe empire collapsed in 744. Due to political and religious differences, Azerbaijani Turks for centuries lived in relative separation from the Turks of Turkey. Azerbaijan's history shows substantial cultural influence from Iran. In 1828, Azerbaijan was divided into a northern and a southern part under Russian and Persian rule, respectively. Northern Azerbaijan was part of the former Soviet Union for 70 years. It regained independence in 1991.

Related Languages and Language Contacts

The language is related to Turkish, Gagauz, South Oghuz, Khorasan Turkic, and Turkmen. It has a

strong Iranian substrate and has for many centuries been in close direct contact with Persian. Turkish had a considerable influence on the northern Azerbaijani standard language as established before the Soviet era. During the past century, Russian has influenced the standard language, whereas the contacts with Turkish have been very limited. There is nevertheless a high degree of interintelligibility with Anatolian Turkish.

An Azerbaijani koiné functioned for centuries as a lingua franca, serving trade and intergroup communication all over Persia, in the Caucasus region and in southeastern Dagestan. Its transregional validity continued at least until the 18th century. Later on, it lost its importance in favor of Persian in the south, whereas Russian was dominant in the north. In the period of Russian domination of economy and politics, Russian had a strong position; 38% of the Azerbaijanians of the Republic still speak Russian fluently.

The Written Language

The early history of Azerbaijani as a literary language is closely linked to that of Anatolian Turkish. Signs of its detachment are found in sources written at the end of the 14th century. Azerbaijani has a long and rich literary tradition. The language was written in Arabic script up to the 20th century. In 1923, a Latin-based script, *yañalif* ‘the new alphabet,’ was introduced in Soviet Azerbaijan. It was a model for the Roman alphabet that was introduced in Turkey in 1928. This alphabet was replaced by a Cyrillic script in 1939–1940. In 1991, after the disintegration of the Soviet Union, the Republic of Azerbaijan adopted a new modified Roman-based alphabet incorporating a few special letters. The transition to this script has been gradual. The Republic still applies a dual script system, with the Roman- and Cyrillic-based letters appearing side by side. In southern Azerbaijan, where the written use of the language is highly restricted, the Arabic script is still used.

Distinctive Features

The language exhibits most linguistic features typical of the Turkic family (see *Turkic Languages*). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following discussions, only a few distinctive features will be dealt with – in particular, some ways in which Azerbaijani is different from Turkish. In the notation of suffixes, capital letters indicate phonetic variation, e.g., A = a/e, I = i/i. Segments in

parentheses occur after vowel-final or consonant-final stems. Hyphens are used here to indicate morpheme boundaries.

Phonology

Unlike Turkish, Azerbaijani has a mid vowel phoneme *e* and a higher phoneme *é* (e.g., *él* ‘people, country’ vs. *el* ‘hand’ and *én* ‘width’ vs. *en* ‘most’). In words of Arabic–Persian origin, non-high-position vowels are more fronted than they are in Turkish (e.g., *teref* ‘side’ vs. Turkish *taraf*). Common Turkic initial *y-* is often lost before high vowels (*üz* ‘face’ (Turkish *yüz*) and *ulduz* ‘star’ (Turkish *yıldız*)). Initial *ï-* is replaced by *i-* (*il* ‘year’ (Turkish *yıl*)). Vowels are often rounded in the neighborhood of *v* (*ov* ‘hunt’ (Turkish *av*)).

The spoken language is relatively conservative with respect to sound harmony. It still displays invariable suffixes – i.e., suffixes not subject to sound harmony (*gel-dox* [come-PAST-1.PL], *gel-dix* [come-PAST-1.PL] ‘we came’ and *işle-max* [work-INF] ‘to work’); cf. Turkish *gel-dik* [come-PAST-1.PL] and *işle-mek* [work-INF] (with front–back and rounded–unrounded harmony). In the standard language, the vowel harmony is normalized on the standard Turkish model, e.g., *it-ler-imiz-den* [dog-PL-POSS.1. PL-ABL] (front vowels) ‘from our dogs’ vs. *at-lar-imiz-dan* [horse-PL-POSS.1.PL-ABL] (back vowels) ‘from our horses.’ A few suffixes are invariable. As in Turkish, rounded vs. unrounded harmony does not affect low suffix vowels.

Common Turkic initial *q-* is, as in Turkmen, represented by the back-voiced stop *g*-, e.g., *ğara* ‘black’ (Turkish *kara*). Common Turkic final back *-q* is represented by *-g* in polysyllabic words and in certain monosyllabic words (after originally long vowels), e.g., *ayag* ‘foot’ (Turkish *ayak*), *ag* ‘white’ (Turkish *ak*). It is fricativized to *-x* in other cases (*yox* ‘non-existent’ (Turkish *yok*)). Stem-internal *q* is also fricativized (*yaxın* ‘near’ (Turkish *yakın*)). The voicing of Common Turkic *k-* generally follows the same pattern as in Turkish (*gör-* ‘to see’ < *kör-*). There are, however, some differences, as for *kêç-* ‘to pass’ vs. Turkish *geç-*. The distribution of the initial dentals *t-* and *d-* is generally the same as in Turkish (*dış* ‘tooth’ < *ti:ş*). Exceptions include *tik-* ‘to sew’ (Turkish *dik-*) and *daş* ‘stone’ (Turkish *taş*). The distribution of the initial labials *p-* and *b-* mostly follows the Turkish pattern. Exceptions include *barmag* ‘finger’ (Turkish *parmak*) and *poz-* ‘to destroy’ (Turkish *boz-*). As in most Turkic languages, the initial nasal *m-* occurs instead of *b-* as a result of assimilation to a following nasal (*min* ‘thousand’ (Turkish *bin*)). Glottal *h* and uvular *x*, which have merged into *h* in Turkish, are

distinct phonemes (e.g., *heyat* ‘life’ (Turkish *hayat*) and *xeber* ‘information’ (Turkish *haber*)). A word-medial glottal stop occurring in loans of Arabic origin may be pronounced or realized as vowel length, as in *te’sir* or *te:sir* ‘influence.’ Unvoiced obstruents may be strongly aspirated, as in *t^hop^h* ‘gun, cannon.’ The stops *k* and *g* are strongly palatalized in many dialects. Consonant metathesis is a rather common phenomenon (*ireli* ‘front’ (Turkish *ileri*) and *körpü* ‘bridge’ (Turkish *köprü*)).

Grammar

The dative forms of the pronouns *men* ‘I’ and *sen* ‘you’ are *mene* [I-DAT] and *sene* [YOU-DAT] (Turkish *bana, sana*). The marker *-(y)Ar*, corresponding to Turkish *-(V)r*, forms a general, less focused present tense with habitual, intentional, prospective, and similar meanings (e.g., *bil-er* [know-AOR] ‘knows, will know’ (Turkish *bil-ir* [know-AOR]) and *gel-er* [come-AOR] ‘comes, will come’ (Turkish *gel-ir* [come-AOR])). The present-tense marker *-(y)Ir* corresponds to Turkish *-Iyor* and Turkmen *-yA:r*, as in *yaz-ir* [write-PRES] ‘writes, is writing’ (Turkish *yaz-iyor* [write-PRES]) and *iste-yir* [want-PRES] ‘wants’ (Turkish *istiyor* [want-PRES]). Unlike in Turkish, low vowels have thus been generalized in *-(y)Ar*, whereas high vowels have been generalized in *-(y)Ir*. The first-person copula suffixes of the pronominal type are *-(y)Am* (e.g., *gör-ür-em* [see-PRES-1.SG] ‘I see,’ *al-ir-am* [take-PRES-1.SG] ‘I take,’ *gör-ür-ük* [see-PRES-1.PL] ‘we see,’ and *al-ir-ig* [take-PRES-1.PL] ‘we take’ vs. Turkish *gör-üyor-um* [see-PRES-1.SG], *al-iyor-um* [take-PRES-1.SG], *gör-üyor-uz* [see-PRES-1.PL], and *al-iyor-uz* [take-PRES-1.PL]). The second-person singular copula suffix is *-sAn*, as in *gözel-sen* [beautiful-2.SG] ‘you are beautiful’ (Turkish *güzel-sin* [beautiful-2.SG]). The perfect paradigm contains first-person forms with *-mİš*, whereas *-(y)Ib* is used in the second and third persons (e.g., *gel-miš-em* [come-PERF-1.SG] ‘I have come,’ *gel-ib-sen* [come-PERF-2.SG] ‘you have come,’ and *gel-ib-[dir]* [come-PERF-3.SG] ‘has come’). The perfect markers are not used as the corresponding Turkish *-mİš* markers, which have indirective meaning. Thus, forms such as *goy-muš-am* [put-PERF-1.SG] ‘I have put’ and *al-miš-am* [take-PERF-1.SG] ‘I have taken’ are translated into Turkish by *koy-d-um* [put-PAST-1.SG] and *al-d-im* [take-PAST-1.SG] rather than by *koy-muš-um* [put-EV-1.SG] and *al-miš-im* [take-EV-1.SG]. The Persian influence on the dialects varies considerably. Some varieties use the comparative suffix *-ter* and the superlative suffix *-teri:n*, both copied from Persian.

Though the syntax is rather similar to that of most other Turkic languages, the Persian impact has been

considerable, especially in the southern varieties. Many conjunctions and other functional words are copied from Persian and Arabic (via Persian), e.g., *ki*, which precedes complement and relative clauses.

Lexicon

Due to the different political and cultural developments for the past 600 years, the Azerbaijani vocabulary differs from the modern Turkish vocabulary in many respects. There are certain differences in the genuinely Turkic lexicon (*tap-* ‘to find’ vs. Turkish *bul-*, *öz* ‘self’ vs. *kendi, isti* ‘warm’ vs. *sıcak, düş* ‘to go down, to land’ vs. *in-*, *sümüük* ‘bone’ vs. *kemik*). Turkish *düş-* means ‘to fall’; *sümüük* means ‘mucus.’ The vocabulary has preserved numerous elements of Persian and Arabic–Persian origin that have been abandoned in Turkish as a result of the puristic language reforms, including *lüyet* ‘dictionary’ (Turkish *sözlük*), *muellim* ‘teacher’ (*öğretmen*), and *pul* ‘money’ (*para*).

Since the 19th century, Russian loanwords, particularly technical terms, have entered the northern Azerbaijani varieties (*zavod* ‘factory’ (Turkish *fabrika*), *fevral* ‘February’ (Turkish *şubat*), *stul* ‘chair’ (Turkish *sandalye*), and *galstuk* ‘necktie’ (Turkish *kra-vat*)). The southern varieties exhibit many loans from Persian (e.g., *miz* ‘table’ and *ruzname* ‘newspaper’ (the northern varieties have *stol* and *gezet*)).

Dialects

The spoken language includes several dialects. They are mostly divided into three groups: northern dialects spoken in the Republic of Azerbaijan, southern dialects in northwestern Iran, and East Anatolian dialects. Though these dialects differ a great deal from each other, they are mostly mutually intelligible. Among the northern dialects, there is a western subgroup in the central part of the Republic (including Genje, Shusha, Kazak, Karabagh, and Ayrum). Dialects of an eastern subgroup are spoken on the shore of the Caspian Sea, in Derbent, Kuba, Shemakha/Shamakhi, Baku, Sal’jany, Mughan, and Lenkoran, for example. The standard language is based on the urban dialect of the capital Baku. Dialects spoken in the northern parts of the Republic include Zakataly, Nukha, and Kutkashen. Dialects spoken in the southern parts of the republic include those of Nakhchevan and Ordubad.

The dialects of Iran include those of Tebriz, Urmia, Qūšči, Xoy, Marāya, Marand, ‘Oryān Tepe, Torkmānçay, Ardabil, Sarāb, Meyāna, and the exclave Galūgāh. The dialect of the Karapapakh ‘Black Caps’ was spoken between the upper Kura

and Arpachay Rivers, on the boundary between Armenia and Georgia, and in Persian Azerbaijan near Lake Urmiya. Some dialects are spoken in Khorasan, including Lotfābād and Daragaz.

B

Bactrian

P O Skjærø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Bactrian was the local Iranian language of the Greco-Bactrian (or Kushana) kingdom in northern Afghanistan, founded by soldiers of Alexander the Great. The language is known from coins, a few stone and wall inscriptions (private and royal, the earliest from the 2nd century), and a small number of manuscript fragments from Turfan, as well as a large number of economic and legal documents, mainly on parchment, from northwestern Afghanistan dated between 342 and 781 A.D. It shares features with both Parthian, its western neighbor, and Chorasmian and Sogdian, its northern neighbors.

Bactrian is the only Iranian language written in Greek script. One letter was added to write š (similar in form to the Old Norse letter þ, which is commonly used to transcribe it, e.g., *κωνηþκο* = *kanēško*). The letter <o> spelled *u* between consonants, *h* after vowels, and was probably not pronounced in final, but served as an end-of-word marker. This final -o often becomes -a before enclitics (e.g., *abo* ‘to,’ but *aba-fago* ‘to you’; *oto* ‘and,’ but *ota-kaldo* ‘and when’). Other final vowels are rare (except in the oldest inscriptions), and no words end in consonants. The consonants <s> and <z> may be ambivalent, as they correspond to both <s> and <z> and palatal <ś> and <ź> in the text in Manichean script.

The inscriptions are written in capital letters (without spaces between the words), while secular documents are written in a cursive ductus, in which several letters are sometimes identical. There are several Manichean or Buddhist texts in Greek cursive and one manuscript leaf in the Manichean script.

Gender (MASC-FEM) is distinguished in the definite article and in some adjectives (e.g., **torosaggo* [tursāng] ‘Turkish,’ FEM *torosanzo* [tursānz]) and in the perfect participles (e.g., *nabixt-igo* [nabixt-ig] MASC ‘written,’ FEM *nabixt-iso* [nabixt-is]). In the earliest inscriptions, there is still a two-case (direct and oblique) system of the noun, which in the documents

survives mainly in pronouns. Thus, in the inscriptions we find SING. *i bago* ‘the god.SING. DIR’ and PL. *i bage* ‘the god.PL.DIR’ as subject, but *bag-ano* ‘god-PL.OBL’ as genitive; *kanēško* ‘Kanishka. SING.DIR’ as subject, but *kanēški/kanēške* ‘Kanishka. SING.OBL’ as agent and genitive.

A definite animate direct object is indicated by the preposition *abo* ‘to.’

The verbal system is of the common Iranian type. There are three stems: present, past, and perfect (perfect participle = past stem + suffix -igo, FEM -iso; e.g., PRES *nabis-* ‘write,’ PAST *nabixt-*, PERF MASC *nabixt-igo*). Special features include modal forms formed from the indicative plus the original modal third singular ending.

optative: *ma froxoš-ond-ēio* [fraxwaš-und-ēy]
lest leave-INDIC.3RD.PL-OPT.3RD.SING
‘lest they abandon’

subjunctive: *boo-ado* [buw-ād]
become-SUBJ.3RD.SING
‘(that) he shall become’

and

boo-ind-ado [buw-ind-ād]
become-INDIC.3RD.PL-SUBJ.3RD.SING
‘(that) they shall become’

The perfect is formed with the old participle in *-aka-

ot-ēia . . . pidgirbo fromado kirdi eim-oano bag-ano
ki-di m-aska nibixt-ig-endi
and-he.OBL image ordered.PAST do.INF these-PL.OBL
god-PL.OBL REL-PART the.OBL-above written-PERF-PART-
COP.PRES.3RD.PL
‘and he ordered images to be made of these gods
which are written above’.

In the ergative construction, the relatively widespread phenomenon of letting verbs such as ‘give’ agree with the indirect object is found in Bactrian as well.

od-omo ladd-ēi iōgo zino
and-I.OBL give.PAST-be.2ND.SING one woman
‘and I have given you a (certain) woman’

A feature unusual in Iranian is the proposed negation in past tenses.

ko-ado-mēno n-isto paralado
that-PARTICLE-WE.OBL NOT-IS.3RD.SING sold.PAST
'that we have not sold'

A typically Bactrian construction is that of the subjunctive or optative with the particle *-an* used to express future eventuality.

- (1) *asid-ano oalo šatar-ano [šatar < šado + -tar]*
kald-ano abo to xoēo xoado lrogo oēn-ano
but-PART there happy.COMP-COP.SUBJ.1ST.SING when-
PART DO you lord self healthy see.PRES-
SUBJ.1ST.SING
'but I shall be happier there when I see you myself
healthy'
- (2) *ot-ēio pido asagg-e iθo oilirdo at-ano abo ma lizo*
faro karano abo ma gao-ēio
and.PART-he.OBL on stone-PL thus arrange.PAST so
that-PART in DEF citadel for people water NEG
lack-OPT.3RD.SING
'and on (it) he placed stones so that in this citadel
water might not be lacking for the people'

The particle *-do* is commonly attached to initial conjunctions, as in *kal-do* 'when,' *aki-do* 'who,' and

asi-do 'which'; the common form *oto* 'and' is from *odo* 'and' + *-do*.

Balinese

I W Arka, Australian National University, Denpasar
Bali, Indonesia

© 2006 Elsevier Ltd. All rights reserved.

Balinese (Bali) is an Austronesian language spoken by some 3 million people, mainly in the islands of Bali and Nusa Penida, Indonesia, but also in western Lombok and in transmigration sites in Lampung (Sumatra) and central Sulawesi. There is a general consensus that Balinese is a member of the Bali-Sasak-Sumbawa subgroup (Esser, 1938; Dyen, 1965; Mbete, 1990), but it is also seen as a member of a wider subgroup that includes Javanese (Blust, 1985).

History and Sociolinguistics

Balinese has had a literacy tradition for over a millennium. The earliest known Old Balinese (OB) texts are inscriptions on copper plaques dated to 882 C.E., concerning royal decrees (Goris, 1954). OB is characterized by the influence of Old Javanese (Kawi) and Sanskrit, which suggests the existence of cultural and language contact between Javanese and Balinese prior to the 9th century. Javanese influence

on Balinese intensified in the 14th–15th century, when Bali was controlled by the Javanese Majapahit Kingdom. Old Javanese elements and Sanskrit borrowings began to spread from highly formal – i.e., royal and religious – usage to everyday speech. These helped form the diglossic speech-level system of Modern Balinese, which is absent in OB (see Clynes, 1989, 1995). The speech-level system is invoked by differences in status between speech participants. As shown in **Table 1**, the English 'I' corresponds to several Balinese first person pronouns, each with a different specification of the speakers' and/or addressees' social

Table 1

| Pronominal forms | Relevant social information of the participants | |
|------------------|---|---------------|
| | Speaker | Addressee |
| <i>nira</i> | god | - |
| <i>gelah</i> | royal | - |
| <i>titiang</i> | - | highest caste |
| <i>tiang</i> | - | medium caste |
| <i>icang</i> | low caste | low caste |
| <i>kai</i> | - | nonhuman |

status, originally based on the traditional caste stratification (Arka, 1998); e.g., *icang* is used when both the speaker and the addressee are low-caste persons. While all of them are still in use now, *tiang* is widely used for polite first person irrespective of the caste of the addressee.

There are quite a large number of words like those in Table 1 in other categories, such as nouns, verbs, adjectives, prepositions and adverbs. They must be individually learned, because the related words are expressed by suppletive forms. The richness of the speech-level system is significant for Balinese verbal arts and linguistic politeness. However, the speech-level system is absent in the Bali Aga or Mountain Balinese (MB) dialect, suggesting that MB is a conservative dialect. Further evidence for this comes from the fact that MB (e.g., in the dialect of Sembiran) retains the Austronesian pronominal *aku* and *engko* and their corresponding bound forms *-ku* and *-mu*. These forms have disappeared in modern Lowland Balinese (LB). LB consists of several dialects showing phonological and lexical variations (Bawa, 1983), with Buleleng and Klungkung varieties being considered representative of standard modern Balinese.

Orthography and Phonology

The traditional Balinese script developed from the Old Javanese script, which itself originated from southern India. It is a syllabic system: a character represents a default CV (Consonant Vowel) syllable with V being phonetically [a] as in Table 2. Any specific opposition is indicated by a diacritical character on top of, below, before, and/or after it, as shown in Table 3. The line, as in the Roman script, runs from left to right.

While modern orthography in Roman script is also now commonly used, especially in paper writing, the

traditional script is the only script used in *lontar* (palm leaf) writing. *Lontar* writing and the tradition of *lontar* chanting, called *ma(be)basan*, are still practiced nowadays, primarily for religious purposes. Indonesian, not Balinese, is used as a medium of instruction in schools in Bali. However, Balinese, with its traditional script in paper writing and reading, is taught in primary and secondary schools.

Modern Balinese has six vowels, as shown in Table 4. Conventionally, the orthography *e* represents mid front [e] and the central [ə], e.g., *penek* [pənək] ‘climb’. Word-final grapheme *a* is pronounced [ə], e.g., *bapa* [bapə] ‘father’, but as [a] elsewhere, e.g., *bapanne* [bapanne] ‘his father’. VV sequences are not diphthongs but are treated as two syllables (Clynes, 1995), possibly with an intervocalic glide in certain dialects, e.g., *liu* [liu]~[liju] ‘a lot’.

Eighteen Balinese consonants are shown in Table 5. Word-final /k/ may be also alternatively realized by a glottal [ʔ] in certain dialects, but a glottal stop is not phonemic in Balinese.

Balinese allows a maximally C₁C₂VC₃ syllable structure, where only V is obligatory and C₂ is restricted to a liquid/glide, e.g., *alih* (V.CVC) ‘search’, *kranjang* (CCVC.CVC) ‘basket’, and *meme* (CV.CV). Stress is on the final syllable of a root, and a bound morpheme does not generally attract stress, particularly in the Badung dialect, e.g., *jemak* [dʒə.mak] ‘take’, *jemaka* [dʒə.mak.ə] ‘be taken’, and *jemakang* [dʒə.mak.əŋ] ‘be taken for’ (stressed syllables are underlined).

Morphosyntax

Balinese is an agglutinating language with relatively rich verbal and nominal morphology. A typical verbal expression involves a root and a voice morphology, which can be: (i) the homorganic nasal prefix N, indicating an ‘active’ or ‘agentive’ voice, (ii) a zero prefix, indicating undergoer or objective voice, (iii) the middle (intransitive) voice prefix *ma-*, which expresses a wide range of meanings, e.g., reciprocal (*madiman* ‘kiss each other’), reflexive (*mapayas* ‘dress oneself’), agentive (*magae* ‘work’), patientive (*makeplug* ‘explode’), and stative-passive (*maadep* ‘be sold’). A verb may also have a causative or applicative affix. The applicative suffix *-in* is typically

Table 4

| | Front | Central | Back |
|------|-------|---------|------|
| High | i | | u |
| Mid | e | ə | o |
| Low | | a | |

Table 5

| Glides | | w | | j | | |

associated with a locative or source role, whereas the applicative *-ang* is generally associated with a theme, goal/benefactive, or instrumental role; hence the contrast of *jemak* ‘take’ → *jemak-in* Y ‘take something from Y’ vs. *jemak-ang* Y ‘take something for Y’. The causative *-in* or *-ang* commonly appears with intransitive bases, but certain transitive verbs may have it, e.g., *diman* ‘kiss’ → *diman-ang* ‘make X kiss Y’. When *-in* and *-ang* appear with the same intransitive base, the derived verb generally contrasts in meaning, e.g., *tegak* ‘sit’ → *tegak-in* ‘sit on something’ (applicative *-in*) vs. *tegak-ang* ‘make somebody sit’ (causative *-ang*), *paek* ‘near’ → *paek-in* ‘move close(r) to something’ (applicative *-in*) vs. *paek-ang* ‘make something close(r) to something’ (causative *-ang*).

Word order is typically S(ubject)–V–O(bject), with S possibly coming after VO. In a double-object construction, the order of the two objects is fixed: S–VO_{Goal}–O_{Theme}.

Balinese appears to have symmetrical objects (Arka, 1998, 2003): either O_{Goal} or O_{Theme} could generally alternate to become S in a nonagentive voice construction, given the right context and intonation contour.

Balinese grammar has been well researched, mainly in the form of Ph.D. dissertations. Hunter (1988) and Beratha (1992) were historical-descriptive in perspective; Artawa (1994) was typological, highlighting the ergativity in Balinese syntax; and Clynes (1995) was also descriptive, focusing on Balinese phonology and morphosyntax (based on the dialect of Singaraja). Pastika (1999) was functional, focusing on the voice selection in Balinese narrative discourse. Arka (1998, 2003) was typological and theoretical, focusing on topics such as phrase structures, argument structures, and (reflexive) binding from a Lexical Functional Grammar (LFG) perspective. Wechsler and Arka (1998) and Wechsler (1999) were theoretical, from a Head-driven Phrase Structure Grammar (HPSG) perspective. Previous work on Balinese, not in the form of dissertations, also consisted essentially of descriptive sketches of grammar, e.g., Kersten (1970), Barber (1977), and Oka Granoka *et al.* (1985).

Dictionaries include Balinese-Indonesian (Warna *et al.*, 1993; Kersten, 1984; Ananda Kusuma, 1986), Indonesian-Balinese (Bahasa, 1975; Ananda Kusuma, 1986; Sutjaja, 2004), Balinese-English (Shadeg, 1977; Barber, 1979; Sutjaja, 2000), English-Balinese (Sutjaja, 2000), Kawi-Balinese-Dutch (Van Der Tuuk, 1897), and monolingual Balinese (Simpfen, 1985; Sutjaja, 2003).

Balkans as a Linguistic Area

Definitions

Sprachbund

Among the proposed glosses for *sprachbund* are 'linguistic league', 'linguistic area', 'convergence area', and 'diffusion area', but here I will treat *sprachbund* as a loanword into English, like the French *genre*, so henceforth it will be neither capitalized nor italicized. In modern terms, a sprachbund is understood as two or more geographically contiguous and genealogically different languages sharing grammatical and lexical developments that result from language contact rather than a common ancestral source. (Some linguists set the minimum number at three, but I would argue that the convergent and diffusion processes constitutive of a sprachbund are the same for two languages as for three.) In his original formulation of the concept, first in 1923 in a Russian journal article and again in 1928 at the first International Congress of Linguists, N. S. Trubetzkoy used Bulgarian as his example of a language that belongs to the Slavic linguistic family and at the same time to the Balkan sprachbund. In the case of the Balkan sprachbund, the languages are in fact all Indo-European (excluding Balkan Turkic), but they belong to groups that were separated for millennia, and thus, upon coming

back into contact, had become sufficiently distinct for contact phenomena to be distinguished from inherited phenomena.

Balkan

The use of the term 'Balkan' (from Turkish, *balkan* 'forested mountain', also the name of a mountain range in Central Bulgaria) to refer to the peninsula also known as Southeastern Europe dates from the 19th century, when European attention turned to Ottoman Turkey, which then included most of what became the Balkan states. As a geographic entity, the Balkan peninsula is unproblematically defined on three sides as the land mass defined by the Adriatic, Mediterranean, and Black Seas, but the northern geographic boundary cannot be set in any nonarbitrary way that is applicable without qualifications in terms of either politics or linguistics. In modern geopolitical terms, from the 1920s to 1991, the Balkans were most frequently understood as comprising Albania, Bulgaria, Greece, Romania, Turkey in Europe, and former Yugoslavia.

The Balkan Languages

For linguistics, the Balkan sprachbund has traditionally consisted of Albanian, Greek, Balkan Romance (BR), and Balkan Slavic (BS). Albanian is divided into two dialects, Gheg north of the river Shkumbi and Tosk south of it. The modern standard is based on

northern Tosk. Mainland Greek is also divided between northern and southern dialects at the Gulf of Corinth and the northern frontier of Attica, the southern dialects of the Peloponnese being the basis of the standard vernacular Dhimotiki. During the 19th century, Modern Greek was still called *Romaic*, i.e., ‘Roman’, a reference to Byzantium as the second Rome. BR consists of Romanian, Aromanian, Megleno-Romanian (MR), and Istro-Romanian. Dalmatian, a remnant of West Balkan Romance, whose last speaker died in 1898, is rather poorly attested and generally does not figure in Balkan linguistic accounts. Istro-Romanian is, like Arbëresh (the Albanian of Italy) and Asia Minor Greek (until the exchange of populations between Greece and Turkey in 1923), outside the Balkan geolinguistic area (see ‘Balkan Languages vs. Languages of the Balkans’). The Romanian standard is based on the Wallachian dialects of the south, as is the standard of the Republic of Moldova, which at various times has called its official language Moldovan or Romanian. (At present [31 October 2004] the official name is Moldovan.) Aromanian, spoken in Albania, Greece, the Republic of Macedonia, and southwestern Bulgaria (with a large diaspora in Romania, especially Dobrogea) is divided into north/west dialects of Albania and western Macedonia and south/east dialects of Greece and eastern Macedonia. A standard based primarily on the eastern dialect is in use in the Republic of Macedonia. MR survives in seven villages near Gevgelija in the southeast of the Republic of Macedonia and across the border in Greece. During the 19th century, BR was often called Wallachian. The term ‘Vlah’ can be used as a convenient cover term for BR south of the Danube (Aromanian plus Megleno-Romanian). BS consists of Bulgarian, Macedonian, and the southeast Serbian (Torlak) dialects. Bosnian/Croatian/Serbian (BCS) together with Slovene, form the West South Slavic group, and Macedonian and Bulgarian comprise East South Slavic. The Bulgarian standard is based on its eastern dialects, the Macedonian standard on its west-central dialects. The northern and western boundaries of Torlak as a Balkan dialect are variously defined using phonological or morphological criteria. The narrowest definition is morphological, e.g., the isogloss for the presence of the postposed definite article; the broadest definition is phonological, e.g., the absence of distinctive vocalic length and tone. During the 19th century, BS was often called ‘Bulgarian,’ and Bulgarian and Serbian linguists and armies fought over where to draw a line between Bulgarian and Serbian. Unable to adjust to modern times, many Bulgarian linguists still cling to the 19th-century practice.

Romani Despite having been summarily dismissed by traditional Balkan linguists, Romani in the Balkans displays many of the same contact-induced structural phenomena and is increasingly present in Balkanological works. Two of the four main dialectal groups of Romani are spoken in the Balkans: Balkan and Vlax (not to be confused with Vlah). The Vlax dialects of Romani take their name from the fact that they took shape in Romania, but they are now dispersed all over Europe and beyond. In the Republic of Macedonia, a Romani standard is emerging on the basis of the Arli dialect of the Balkan group. Unless otherwise specified, references to Romani refer to those dialects spoken in the Balkans.

Turkish Balkan Turkish is divided into two major dialect groups: West Rumelian Turkish (WRT) and East Rumelian. The boundary between the two corresponds roughly to the east-west line of Bulgarian dialects. The Christian Gagauz of Bulgarian and Romanian Dobrudja and Gagauz Yeri in Moldova and adjacent parts of Ukraine speak a language in the Oghuz group – to which Turkish also belongs – which was recognized as official in the USSR in 1957. Although most Balkan linguistic studies treat Turkish as an adstratum, contributing lexicon and phraseology but very little else (aside from evidentiality, see ‘Evidential’ below), WRT and Gagauz also participate to a certain extent in the Balkan sprachbund. Most of Gagauz, however, ended up in the former Russian Empire, due to migration and border changes. As a result, most of Gagauz is now more influenced by Russian, while the dialectal Gagauz remaining in the Balkans is in need of description.

Jewish Languages Judezmo, the language of the Jews expelled from Spain in 1492, became the majority language among Balkan Jews, overwhelming Judeo-Greek (Yavanic, Yevanic), which survived in the Romaniote liturgy and some enclaves in Epirus. (A written version of Judezmo based on literal translation from Hebrew is known among scholars as Ladino.) Although most speakers of both Judezmo and Judeo-Greek were murdered in the Holocaust, these languages survive as endangered languages and also participated in Balkan linguistic processes.

Balkan Languages vs. Languages of the Balkans There are many other languages spoken in the Balkans in enclaves with varying social relations, e.g., Armenian, Circassian (until 1999), German, Hungarian, Ruthenian, Tatar, Ukrainian, Yiddish, etc. Aside from the dialects spoken in Romania, most of these are outside the geolinguistic Balkans, which for

our purposes has a northwest boundary defined by contiguous Albanian dialects that join the major Torlak isoglosses continuing to the Danube. (Such a definition includes the southernmost Slavic dialects of Montenegro as well as the Slavic dialects of northern Kosovo, neither of which fall in the Torlak group. In terms of the Balkan sprachbund, these dialects do show some important transitional features, which will be noted.) For the most part, the enclave languages were late arrivals or outside the area of intensive diffusion/convergence and did not participate in the type of complex Balkan multilingualism that characterizes the sprachbund as a whole. We can thus distinguish Balkan languages, i.e., those in the sprachbund, from languages of the Balkans, i.e., languages spoken in the Balkan peninsula.

History of Balkan Linguistics

1770–1861

The earliest collections of Balkan linguistic material were intended to eliminate Balkan linguistic diversity. The 1770 Greek-Aromanian-Albanian vocabulary of T. Kavaliotis and the 1793 or 1794(?) Greek-Aromanian-Macedonian-Albanian lexicon of Daniil of Moschopolis (Albanian Voskopoja) were explicitly aimed at the Hellenization of the speakers of other Balkan languages. The first was republished in 1774 by J. Thunmann, who was the first to suggest that Albanians and Romanians were descended from Illyrians, Dacians, and Thracians, thus laying the groundwork for the substratum theory of Balkan linguistics. The second was republished in 1814 by M. Leake, who suggested that similarities among Albanian, BR, and Greek were due to BS influence. His one concrete example was the postposed definite article. It was this same phenomenon that most impressed J. Kopitar, whose 1829 characterization of BR, BS, and Albanian as *drey lexikalisch verschiedenen, aber grammatisch identischen Sprachen* ‘three lexically distinct but grammatically identical languages’ – which he attributed to the influence of a Thracio-Illyrian substratum – is taken as the earliest formulation characterizing the Balkan sprachbund. Kopitar also noted the replacement of infinitival with subjunctive constructions and the formation of the future using ‘want’ as shared with Greek and Serbian as well.

A. Schleicher is sometimes cited as the first to formulate the Balkan sprachbund in 1850, when he writes of Albanian, BR, and BS saying *eine Gruppe aneinandergränzender Sprachen zusammengefunden hat, die bei stammhafter Verschiedenheit nur darin*

übereinstimmen, dass sie die verdorbensten ihrer Familie sind (‘a group of propinquitous languages has coalesced that, being of different lines of descent, agree only in the fact that they are the most corrupt in their families’). However, since he gives no indication of the causes of this ‘corruption’, his formulation differs from Kopitar’s mainly in its ideology of language change as degeneration.

The next real advance in the development of Balkan linguistics was F. Miklosich’s 1861 article on Slavic elements in Romanian, which added genitive-dative merger (see ‘Genitive-Dative Merger’), object pronoun doubling (see ‘Resumptive Clitic Pronouns [Reduplication, Replication]’), and the formation of teens (see ‘Numeral Formation: The Teens’). Miklosich accorded more attention to Greek and was also the first to adduce a number of phonological changes, including the development of stressed schwa (see ‘Vowel Reduction and Raising’) and the raising of unstressed /a/ and /o/ to schwa and /u/, respectively (see ‘Stressed Schwa’).

1861 Onward

The next six decades were characterized by the gathering of materials relating to specific Balkan languages or specific aspects of individual or pairs of Balkan languages. The 1920s saw the basic syntheses and theoretical formulations that continue to inform the field. Trubetzkoy’s contribution has already been described. In 1925, A. Seliščev attempted a balanced account of Turkish, Slavic, Latin, Greek, and substratum languages as the sources of various Balkanisms, i.e., the similarities among the Balkan languages that can be attributed, at least in part, to shared, contact-induced change. Sandfeld (1930) tried to attribute almost all the commonalities of the Balkan sprachbund to the influence and prestige of Byzantine Greek. Other scholars have laid particular emphasis on Balkan Latin as the primary causal factor, while our knowledge of the pre-Latin non-Hellenic languages of the Balkans remains too meager for almost any serious speculations beyond the lexicon.

While the 1920s saw the establishment of Balkan linguistics as a subdiscipline within linguistics, the period from 1930 to 1960 was characterized by slow growth and was also the period when the insights gained in Europe finally came to the attention of North American linguists. From the 1960s onward, there has been a constant increase in the production of studies pertaining to the Balkan languages and Balkan linguistics. At the same time, studies of such contact-induced phenomena as creolization, code switching, and language shift have led to the

identification of contact linguistics as an overarching field of study. More recently, in the past decade or so, a renewed interest in linguistic typology has brought forward questions of the extent to which the Balkan sprachbund is or is not part of a larger European linguistic area, defined more by typological profile without necessarily identifying specific paths of diffusion or convergence. We will return to the question of Eurology vs. Balkanology in 'Causation'.

Balkanisms

This section surveys some of the principal Balkanisms (see '1770–1861') as identified during the course of the past two centuries. Although system, not mere inventory, must be the basis of detailed study, and a given surface phenomenon may function differently in different systems, it is nonetheless convenient to use lists as a kind of shorthand for the systemic relations that can yield the most insights. We do not want to fetishize the labels for these systemic manifestations, assigning numeric values to them and tallying up the number of points a language 'scores'. Rather these labels stand for complex interrelations that include differences as well as similarities that must be elucidated in their larger contexts (cf. Friedman in Reiter, 1983).

Phonology

In contradistinction to linguistic areas such as the Caucasus, the Northwest Coast, and South Asia, where phonological features such as glottalization and retroflexion are among the most salient commonalities, there are no truly pan-Balkan phonological features. Rather, there are articulatory tendencies of greater or lesser extent.

Vowel Reduction and Raising The reduction of unstressed vowels to schwa or nonsyllabic elements (and thence sometimes to zero) as well as the raising of unstressed mid-vowels (/e/ and /o/) to high vowels (/i/ and /u/, respectively) can be treated as Balkan, albeit not pan-Balkan. Both Albanian and BR show a tendency to reduce unstressed vowels as early as the Latin period, e.g., Lat. *imperātor* > Albanian *mbret* and Romanian *împărat* 'king'. While shared phonological tendencies in Albanian and BR, like shared vocabulary of pre-Latin origin, are attributed by some scholars to substrate influence, the evidence of vowel reduction in Western Romance leads other scholars to suggest that this is a typological rather than an areal feature. Nonetheless, the raising and/or elimination of unstressed vowels is characteristic of southeastern Macedonian, eastern Bulgarian,

northern Greek, BR, and Gheg, although the details differ among these languages.

Stressed Schwa All the Balkan languages and their dialects possess the classic European five vowel system /a, e, i, o, u/, at least under stress. A phenomenon common in the Balkans is the existence of a stressed schwa, but its status as a contact-induced phenomenon is not pan-Balkan. Greek lacks stressed schwa altogether. In Macedonian, almost all the dialects outside the west-central area have stressed schwa, but of different origins in different areas, and some western peripheral dialects also lack stressed schwa. Most of Bulgarian has stressed schwa, but not the Teteven-Erkech and central Rhodopian dialects. In Albanian, stressed schwa develops from nasal *â* only in Tosk, but it is incorrect to characterize all of Gheg as lacking stressed schwa, since it also occurs in central Gheg as a result of later processes. Romani has schwa when in contact with languages that have it. WRT has a tendency to lower and front the high back unrounded vowel to schwa.

Other Vowels Most Balkan languages lack front rounded vowels, but most of Albanian has /ü/, or, in West Central Gheg, /ö/. Southern Montenegrin dialects in contact with Albanian also have /ü/, but East Central Gheg, which is mostly in Macedonia, unrounds /ü/ to /i/, as does southernmost Tosk (Lab, Çam, Arvanitika), in contact with Aromanian and Greek (which also merged /ü/ with /i/, a change that had not yet been completed in the 10th century). Similarly, WRT tends to eliminate /ö/ by merging it with /o/ or /ü/ (more rarely /e/), and /ü/ (like /u/ and /i/) becomes /i/ word finally. Other vocalic phenomena that have been suggested are relatively localized.

Consonants The alternation of clear /l/ before front vowels and velar /l/ elsewhere is characteristic of BS (including Torlak but not the rest of BCS), Northern Greek, Balkan Romani, and Vlah, but not Albanian, where the two sounds are in phonemic contrast, nor Daco-Romanian and Southern Greek, where only clear /l/ occurs. Aromanian has Greek and Albanian interdental and Greek voiced velar and palatal fricatives in loanwords from Albanian and Greek, but these tend to be replaced by corresponding stops and the palatal glide by speakers who do not know Greek or Albanian, particularly the younger generation in Macedonia.

Aside from Greek, most Balkan languages have an opposition between strident palatal affricates, on the one hand, and mellow palatals, dorso-palatals, or palatalized velars, on the other. The opposition is neutralized in Albanian, BS, and WRT dialects in

Kosovo, parts of Western Macedonia, and along the Serbo-Bulgarian border. Northern Greek has palatals lacking in the south.

In western Macedonia, the velar fricative is generally lost or replaced in Albanian, Macedonian, and WRT, a phenomenon that extends into parts of Kosovo, as well as adjacent Serbia, much of Montenegro, and Bosnia-Herzegovina, where the preservation of BCS /x/ is characteristic of Muslim and some Catholic dialects now Bosnian and Croatian, respectively.

In the northern Ghëg of Malësia e Madhe, final devoicing is a phenomenon shared with adjacent Montenegrin dialects. It is worth noting that final devoicing is atypical for most of the rest of BCS and Ghëg, and it appears rather to be a Macedonian feature extending into this region. Such influence also seems to be the case in the transitional Ghëg and northern Tosk dialects. Some of the Romani dialects in this region also have final devoicing, and in the WRT of these regions final devoicing, which is usually limited to stops in Turkish, extends to fricatives. Five of the seven MR villages also have final devoicing.

Prosody Although prosodic distinctions of length, and in some cases pitch, were present in the attested ancestors of the Balkan languages, the modern Balkan languages are generally characterized by the absence of length and tone and the presence of a stress accent that usually does not move further back in the word than the antepenultimate syllable. If stress does move further back, there is usually a secondary stress on one of the last three syllables. However, Northern Ghëg and Southern Tosk preserve Common Albanian length, and Southeastern Macedonian has new long vowels as the result of loss of intervocalic consonants and elision. Similar new long vowels occur in Gora, a string of Slavic-speaking Muslim villages along the western and northern slopes of Mounts Korab and Šar in northeastern Albania and the southwestern corner of Kosovo. The most significant isoglosses (fixed antepenultimate stress, postposed article, etc.) link Goran with the northwest Macedonian dialects rather than with the Serbian of Prizren.

Morphosyntax

Grammaticalized Definiteness In BS, BR, and Albanian, native demonstrative pronouns have been encliticized or suffixed to nominals (normally the first in the noun phrase) and become definite articles. The article follows a plural marker, if any, and in BS the clitic-like nature of the article is seen in that it does not trigger certain morphophonemic alternations,

e.g., Macedonian *starec* ‘old man’, *starci* ‘old men’ but *starecot* ‘the old man’ and not **starcot*. Hamp (1982) adduces evidence suggesting that the autochthonous language that became Latinized into Romanian and with which the ancestor of Albanian was in contact might already have had a postposed definite article by the time of contact with Latin. Common Slavic already had a postposed relative pronoun **ji* affixed to adjectivals to denote definiteness, as this phenomenon is attested in Old Church Slavonic (OCS; 9th–11th centuries), and the morphology (but not the grammatical meaning) survives in Slavic outside the geopolitical Balkans. Remnants of this older definite/indefinite opposition survive in West South Slavic adjectives, and traces of the morphology occur in BS, e.g., Macedonian *star* ‘old INDEF. MASC’, *stariot* ‘old DEF.MASC’, where the /i/ indicates that the newer definite article has been suffixed to a definite adjectival form. Scandinavian and dialectal North Russian also have postposed definite articles of pronominal origin, and Czech, which has been in close contact with German, has uses of its deictics that are basically articular. These typological parallels and historical antecedents, however, do not change the fact that the BS postposed definite article developed during the period of its contact with BR and Albanian.

Greek and Romani have preposed definite articles, both based on native material. In the case of Greek, the pronoun that became an article was still mostly demonstrative and was facultative except with proper names in Homeric, but it was obligatory in Attic. Romani articles look like borrowings from Greek, e.g., MASC NOM SG *o* FEM NOM SG *i*, but the oblique forms /le/ and /la/ in Vlax dialects demonstrate that the Romani articles are derived from native demonstratives, reflecting the regular change of **t > l*, which occurred prior to contact with Greek. It was contact with Greek, however, that triggered the transformation of native material into definite articles, and Romani usage patterns very much like Greek. Romani dialects outside the Balkans in contact with languages lacking definite articles tend to lose them.

The use of an atonic form of the numeral ‘one’ as an indefinite article is characteristic of the Balkan languages and, even though such developments are common in many languages, is arguably a Balkanism. ‘One’ was not used in this function in OCS, Ancient Greek, or Latin, but it was so used in Orkhon Turkic (8th century C.E.). To this we can add the fact that such usage does not occur in East Slavic. Usage in Turkish, Albanian, and BR is at a similar level of frequency to that of English, although details in individual grammars will cause some lack of isomorphism. Usage in

BS and in Greek is approximately half that of the other Balkan languages, while usage in Romani in the Balkans patterns with BS and Greek, and Romani elsewhere patterns like its contact languages. An indication that this is an areal phenomenon despite the occurrence of such usages in Western Europe and elsewhere is the fact that, as one moves north and east through West South Slavic territory, the usage becomes increasingly restricted.

Finally, we can mention here the phenomenon of double determination, i.e., the presence of a definite article on a noun modified by a demonstrative pronoun. Such usage occurs in Greek, BR, BS, Albanian, and Romani, although the rules and relative frequency and acceptability of the construction vary. In Greek it is obligatory, e.g., *autós o ánthrōpos* or *o ánthrōpos autós* but not **autós ánthrōpos* 'this person'. In Romanian, the article is not used if the deictic is preposed, but is used if it is postposed (and the deictic takes the so-called deictic particle *-a*): *omul acesta* but *acest om* 'this person', cf. Aromanian *aistã carte*, *cartea aistã* 'this book'. Megleno-Romanian has frequent double determination *tsista lup-u* 'this wolf-DEF', but indefinite nouns also occur *tsista drãc* 'this devil-INDEF'. In Albanian, the deictic is preposed to either the indefinite or definite: *ai njeri*, *ai njeriu* 'this person'. In BS, double determination occurs but is considered dialectal, Macedonian *ovoj čovekov* (vs. *ovoj čovek*) 'this person', or Torlak *taja starata* 'that old [lady]'. Romani permits but does not require the use of a definite article with a demonstrative, in which case the article must precede the substantive but the demonstrative can precede or follow: *kova manuš*, *kova o manuš*, *o manuš kova* 'this person'. Double determination or the order noun-determiner is pragmatically more thematic in the discourse.

Resumptive Clitic Pronouns (Reduplication, Replication) Balkan languages are characterized by the use of clitic or weak resumptive object pronouns that agree in gender, number, and case with the non-clitic/strong pronoun or substantive they refer to. This phenomenon is called (object/pronoun) reduplication/doubling in Balkan linguistics and is connected to expressions of definiteness, referentiality, and animacy: the first candidates for reduplication are personal pronouns (inherently definite and, in the first two persons, usually human), then indirect objects (usually human, often topicalized), then definite direct objects, and finally specific or topicalized direct objects.

From a morphosyntactic point of view, there are four types of reduplication: pronominal object doubling, substantival object replication, pronominal possessive doubling, and substantival possessive

replication. All four phenomena can be illustrated in the following Macedonian sentence:

| | | | |
|----------------------|--------------------|-----------------|---------------------|
| Tatko mi | moj | i | majka |
| <i>father me.DAT</i> | <i>my.M</i> | <i>and</i> | <i>mother</i> |
| mu | na car-ot | im | rekoa |
| <i>him.DAT</i> | <i>to king-the</i> | <i>them.DAT</i> | <i>said.3PL.AOR</i> |
| nim | da | mu | gi |
| <i>them.DAT</i> | <i>SP</i> | <i>him.DAT</i> | <i>them.ACC</i> |
| dadat | knigi-te | na | dete-to |
| <i>give.3PL.PRES</i> | <i>books-the</i> | <i>to</i> | <i>child-the</i> |

'My father and the king's mother told them to give the books to the child.'

The first three of these expressions are facultative and could be replaced by *tatko mi*, *majkata na carot* (*majka* is definite), and *im*, respectively. The reduplication serves to emphasize or focus the referent of the reduplicated pronoun. The last set of reduplications, *mu ... na deteto* and *gi ... knigite*, are obligatory in standard Macedonian and, for the most part, in the western dialects on which it is based. The norm requires reduplication for definite direct objects and all indirect objects. In practice, however, even the most normative grammar shows that specificity or topicalization rather than definiteness is the trigger (Koneski, 1967: 232):

| | | |
|-------------------|---------------|----------------------------------|
| kako vistinski ja | doživuvame | edna situacija |
| <i>how truly</i> | <i>it.ACC</i> | <i>experience. one situation</i> |
| | | <i>1PL.PRES</i> |

'how we actually experience a [given] situation'

Pronominal object doubling occurs in all of BS (and southern Montenegro), BR, Albanian, Greek, and Romani. It is conditioned by discourse factors such as emphasis or focus and can be compared to the use of subject pronouns. Just as the fact that the subject is marked on the verb makes the subject pronoun redundant unless there is a need for emphasis or specification, so, too, the clitic pronominal object, which is the required form if the object is a pronoun, makes the full form redundant except under similar discourse-bound circumstances. The absence of such doubling from the rest of BCS is a diagnostic separating Balkan from non-Balkan Slavic.

The clitic replication of oblique nominals shows how grammatical change can enter a language via discourse phenomena and at the same time supports Topolińska's observation that analytic markers of referentiality are characteristic of convergent development. Object reduplication is another scalar Balkanism. It is rare in Torlak and used only for emphasis and thus separates East from West South Slavic. Similar conditions hold for Romani except in possessive constructions. Object reduplication is more pragmatically conditioned and less grammaticalized

in Bulgarian, Romanian, and Greek, where the phenomenon signals topicalization, focus, or emphasis, and is restricted by factors such as animacy (or humanness) and degree of referentiality (definiteness, specificity, determinacy, etc.). In Albanian, Vlah, and West Macedonian, reduplication has become grammaticalized. It is most frequent in Macedonian, where, unlike in the other Balkan languages, it can even occur (facultatively) with indefinite indeterminate pronouns such as *nikoj* ‘nobody’.

While it lacks a definite article, Turkish does have a special accusative marker used for definite or specified direct objects. The following proverb illustrates how the Turkish definite accusative is rendered by Balkan object reduplication. Note that Greek and Bulgarian have reduplication with an indefinite object, indicating its specificity:

| | | | | |
|------------|--|--------------|-----------------|-----------|
| Turkish: | Yavaş başı | kılıç | kes-mez | (Turkish) |
| | <i>gentle head-</i> | <i>sword</i> | <i>cuts-not</i> | |
| | DEF.ACC | | | |
| Bulgarian: | Pokorena glava sabja ne ja seče | | | |
| | <i>bent head sword not it.ACC cuts</i> | | | |
| Greek: | Kefáli proslynēméno spathì dhèn | | | |
| | <i>head bent sword not</i> | | | |
| | tò kóvei | | | |
| | <i>it.ACC cuts</i> | | | |
| Romanian: | Cap-ul plecat nu l taie sabia | | | |
| | <i>head- bent not it.ACC cuts sword.</i> | | | |
| | DEF DEF | | | |
| Albanian: | Kokën e falur yatagan-i | | | |
| | <i>head PART.F.DEF.ACC bent sword-DEF</i> | | | |
| | nuk e pret | | | |
| | <i>not it.ACC cuts</i> | | | |
| | ‘A/The sword does not cut off a/the bent head’ | | | |
| | (= Keep your head down.) | | | |

Possessive doubling is a more restricted phenomenon. The use of dative clitics to indicate possession in Macedonian is limited to kinship terms, Aromanian has special possessive clitics that can only be used with kinship terms, and Albanian also has special possessive constructions for kinship terms. In Bulgarian, possession is usually signaled by a dative clitic following the definite form of the noun, and possessive adjectives, which are the norm in Macedonian, are more emphatic in Bulgarian. In Greek, clitic dative pronouns after the definite form of the noun is the normal manner of indicating possession, and emphasis is rendered by adding the appropriate form of the adjective *dikós* ‘[one’s] own’ immediately before the pronoun. However, pronominal doubling is also used colloquially for emphasis:

| | | | |
|------------|-------------|---------------|---------------|
| to | vivlio | mou | mena |
| <i>the</i> | <i>book</i> | <i>me.GEN</i> | <i>me.GEN</i> |
| | ‘my book’ | | |

Romanian also has such clitic doubling colloquially:

| | | |
|-------------------------|-----------|----------------------|
| propria-mi | mea | semnătura |
| <i>own.FEM-me.DAT</i> | <i>my</i> | <i>signature.DEF</i> |
| ‘my very own signature’ | | |

Substantival possessive replication occurs in all the Balkan languages, but the details differ from language to language. The Turkish construction of genitive possessed plus pronominal suffix on the possessor is the normal pattern:

| | |
|--|-------------------|
| kral-in | anne-si |
| <i>king-GEN</i> | <i>mother-his</i> |
| ‘the king’s mother = the mother of the king’ | |

Genitive-Dative Merger Albanian, BS, BR, and Greek have no formal (i.e., surface) distinction between the shape of the genitive and the shape of the dative, the dative having replaced the genitive except in Greek, where the genitive replaced the dative. The same forms thus do double duty for marking possession and indirect objects. Romani and WRT maintain the genitive/dative distinction, and the situation is more complicated in Albanian and MR. Albanian has merged genitive and dative but has a distinct ablative. The dative is used as the object of a verb, the genitive is preceded by a particle of concord, and the ablative is the object of certain prepositions or in apposition to another substantive. In the indefinite plural, however, Albanian has a special ablative form in *-sh*. Pronominal declension also has a distinct ablative form used with certain prepositions, NOM *nga unë/djali* ‘from me/the boy’, ACC *për mua/djalin* ‘for me/the boy’, DAT *më tha muaji tha djalit* ‘he told me/the boy (with initial clitic reduplication)’, ABL *prej meje/djalit* ‘from me/the boy’. MR preserved a remnant of the genitive-dative distinction, albeit only in the speech of the oldest generation: *cari* ‘who’ *pe cari* ‘whom.ACC’, *la cari* ‘to whom.DAT’ but *al cruj* ‘of whom, whose’. Elsewhere, the dative and accusative are distinct, and the genitive is identical to the dative.

Analytic Case Relations All the Balkan languages have simplified their inherited patterns of inflection. Eastern Macedonian and colloquial Bulgarian have gone the farthest, completely eliminating all traces of case morphology other than accusative personal pronouns and accusative vs. dative clitics. The marking of nonclitic dative objects is by means of the preposition *na* and the accusative pronoun. All other case relations are likewise indicated syntactically throughout BS, usually by a preposition but sometimes just by apposition. Western Macedonian preserves a distinctive set of dative synthetic pronouns, and, in the

dialects that serve as the basis for the standard, a few remnants of animate singular masculine accusatives. As one moves further to the periphery of BS in the southwest and north, the complexity of case marking increases to include feminine accusatives, masculine datives, feminine datives, and eventually, in Gora and Torlakia, oblique plurals. In the Torlak dialects and the Macedonian dialects around Korça in Albania, case marking also occurs in the definite article. The other Balkan languages all retain at least three distinct cases (nominative, accusative, and genitive-dative).

Balkan Romani and WRT both preserve their full inflectional systems, but with tendencies toward simplification that show an intersection between the areal and typological. From a typological point of view, it is the peripheral cases that are expected to be lost first, and this is precisely what happens. Thus, WRT exhibits dative-locative confusion:

gitti-k Selanik-te
went-1PL.AOR Salonica-LOC
'We went to Salonica'

There is also a tendency to eliminate case marking in locational postpositions:

ürti üsti [vs üstü-n-de] kedi-ler
blanket top top-its-LOC cat-PL
'on top of his blanket [there were] cats'

Romani dialects in contact with BS tend to replace the locative with the dative and the dative, locative, and ablative with prepositional constructions derived from case affixes, themselves of postpositional origin:

| | | | | | | | | |
|-----------------|------------|----------|--------------|------------|---|-----------------|------|-------|
| jekh-e | aindž-a-te | vs. | jekh-e | aindž-a-ke | > | k-i | jekh | aindž |
| one- | field- | | one- | field- | | to-FEM | one | |
| OBL | OBL- | | OBL | OBL- | | field | | |
| | LOC | | | DAT | | | | |
| 'in a field', | | | 'to a field' | | | 'in/to a field' | | |
| aindž-a-tar | = | tar-i | aindž | | | | | |
| field-OBL-ABL | | from-FEM | field | | | | | |
| 'from a field'. | | | | | | | | |

Outside the pronouns, a distinct Romani accusative is limited to animate (or in some dialects referential) nouns, while in Turkish accusative marking is limited to definite or specific direct objects (see 'Resumptive Clitic Pronouns' [Reduplication, Replication]).

The vocative survives in all the Indo-European Balkan languages, and some argue that this preservation is a shared archaism, reinforced by contact, which is consistent with the direct encounters that lead to contact phenomena. It runs counter to the tendency toward analytism, however.

Analytic Gradation of Adjectives Although the comparative is analytic in all the Balkan languages,

remnants of synthetic comparatives survive at the peripheries, i.e., Greek has a number of inflected comparative forms, and northern Torlak preserves a very limited set. In the rest of BS, analytic comparatives with *po* are realized with almost complete consistency. Southern Montenegrin dialects also have analytic adjectival gradation using the same markers. BR, Albanian, and most Balkan dialects of Romani have complete consistency in the analytic marking of the comparative, the markers being *mai* (<*magis*) in Romanian and Megleno-Romanian, *cama* (*quam* + *magis*) in Aromanian, *më* in Albanian, and borrowed in Romani (generally the marker of the main contact language, but Slavic *po* and Turkish *da[h]a* are both more widespread). Remnants of a synthetic comparative in *-eder* also survive in some Romani dialects, but generally those spoken outside the Balkans. Given that Romani entered the Balkans some time between the 10th and 13th centuries, and given that during this same period Slavic preserved its inflectional system of adjectival gradation, it would appear that BS and Romani were undergoing this shift at about the same time, and those dialects that left the Balkans did so before its completion.

In general, the standard of comparison is an ablative marker, which is synthetic in Turkish and most of Romani but prepositional (lexical 'from') in BS, BR, Greek, some Romani, and Albanian, particularly Tosk. Albanian can also use relative *se* and BR can have relative *ca*. Clausal comparisons (e.g., 'to eat is better than to sleep') in Albanian, BR, and BS involve quantifiers, *se [sa]* 'that [how much]', *de.cît* 'from. how much', *ot.kolko[to]* 'from.how much [that]', respectively. Greek has *pará* 'contrary to, despite'.

There is a bifurcation in the superlative between Turkish and BS, on the one hand, and Greek and Albanian on the other, with BR and Romani occupying a middle ground. In Turkish and BS, the relative superlative is purely analytic and uses native markers: Turkish *en*, BS *naj*. In Greek and Albanian, the relative superlative is expressed by the definite of the comparative. (Greek also has a synthetic absolute comparative in a few adjectives.) Romanian and most of MR pattern like Albanian, whereas Aromanian and the MR of Tsárnareka have borrowed Slavic *naj*.

The expression of analytic adjectival gradation in Turkish is attested in the oldest monuments (8th century). The Greek dialects of Epirus, Thrace, Asia Minor, and of the Sarakatsan (transhumant Hellenophone shepherds) use the comparative marker *[a]kóm[a]* 'yet, still', calquing exactly Turkish *daba* (Table 1).

In Moldavian Gagauz, *sam* (<Russian *samyj*) is in competition with *en* as the superlative marker for the younger generation of speakers.

Table 1 Balkan adjectival gradation

| | | | | |
|-----------------|---------------|---------|----------|------------------|
| Turkish | daha | büyük | ablative | en büyük |
| Romani (Arlı) | po/da[h]a | baro | ablative | en/naj baro |
| Bulgarian | po- | goljam | ot | naj-goljam |
| Macedonian | po | golem | od | najgolem |
| Aromanian | kama | mari | di | nai mari |
| MR (Tsärnareka) | mai | mari | di | naimar[!]i |
| | | | | most big |
| MR | mai | mari | di | tsäl mai mar[!]i |
| Romanian | mai | mare | de[cît] | cel mai mare |
| Albanian (Tosk) | më | i madh | nga | më i madhi |
| Greek | pio | megálos | apó | o pio megálos |
| | more | big | from | the more big |
| | 'bigger than' | | | 'biggest' |

Numeral Formation: The Teens The formation of teens by means of a construction meaning 'numeral on ten' is pan-Slavic but absent from Baltic, occurs in BR but not the rest of Romance, and is also Albanian. Although assumed to be a calque from BS into BR and Albanian, Hamp (1992) has pointed out that the words for 'twenty' in BS and BR and 'thirty' in Albanian show the numeral 'ten' is masculine in Slavic but feminine in Albanian and BR. Based on the isomorphism in gender for BR and Albanian and a combination of old shared sound changes and ancient borrowed lexicon among the three, Hamp suggests that this innovation occurred at a time when the Indo-European dialects that became Slavic, Albanian, and the language that Latinized into Romanian were part of a Northwest European sprachbund prior to their respective migrations to the Balkans (Table 2).

Analytic Subjunctive The analytic subjunctive formed by means of a subordinating particle (SP), usually of pronominal origin, plus a finite verb agreeing with its subject (omitted if the same as in the main clause, specified if different) replaces older nonfinite complements (infinitives) in all Balkan languages to varying degrees. Gheg has a new infinitive employing the preposition *me* 'with' and a short participle in contexts where Tosk uses the analytic subjunctive, but Gheg also has uses of the analytic subjunctive, and Tosk has some nonfinite participial constructions where other Balkan languages have the analytic subjunctive. Romanian and MR still have remnants of the Latin infinitive that can be used in some traditional infinitival functions. The BR infinitive is strongest in Maramureş, the northernmost Romanian region and the one in most contact with infinitive-using languages (Ukrainian, Hungarian, formerly Yiddish). BR in general also preserves Latin infinitives in *-re* as verbal nouns. Greek has a morphological remnant of the infinitive, but its only living function is to

Table 2 Balkan teens and tens^{a-f}

| | | | |
|-----------------|---------------------|-----------|------------|
| OCS | edinŭ | na | desęte |
| Romanian | un | spre | zeci |
| Aromanian | ună | spră | [dzătse] |
| MR | un | spră | ts |
| Albanian (Tosk) | një | mbë | dhjetë |
| | <i>one</i> | <i>on</i> | <i>ten</i> |
| Greek | enteka (en[a] deka) | | |
| | <i>one ten</i> | | |
| Romani | deş u jekh | | |
| | <i>ten and one</i> | | |
| Turkish | on bir | | |
| | <i>ten one</i> | | |
| | 'eleven' | | |

^aSlavic gender in numerals: dva (MASC) dve (FEM) 'two'.^bRomanian gender in numerals: doi (MASC) două (FEM) 'two'.^cAlbanian gender in numerals: tre (MASC) tri (FEM) 'three' (dy [MASC], dË [FEM] 'two').^dOCS 10 = MASC dŭva desęte 'twenty'.^eRomanian 10 = FEM două zeci 'twenty' (zece 'ten' < Lat. decem).^fAlbanian 10 = FEM tri dhjetë 'thirty'.

represent the main verb in perfects and pluperfects. Bulgarian has a very marginal remnant of the Slavic infinitive limited to subordination to a tiny number of verbs. The infinitive has disappeared completely from Torlak except in some folk songs. Macedonian and Romani have eliminated all traces of earlier infinitives. Thus the replacement of infinitives with subjunctives is not uniform but scalar. At one end is Gheg, followed closely by Romanian, then Tosk, Bulgarian, Greek, and Vlah, with Torlak, Romani, and Macedonian at the other end.

New infinitival constructions have arisen in Romani outside of the Balkans in contact with infinitive-using languages. In Macedonian, some uses of the verbal noun can replace SP-clauses and thus function as a kind of new infinitive, although these constructions, which are highly colloquial, are merely alternatives. The option of using an SP-clause rather than an infinitive is available to all of BCS, but there is a

Table 3 Balkan SP clauses

| | | | |
|-----------------|-------------------|-----------|--------------------|
| Romani | mangav | te | hramonav |
| Albanian (Tosk) | dua | të | shkruaj |
| Albanian (Gheg) | [due | me | shkrue] |
| Greek | thélō | na | gráfo |
| Bulgarian | iskam | da | piša |
| Macedonian | sakam | da | pišuvam |
| Torlak | oču | da | pišem |
| Romanian | vreau | să | scriu |
| Vlah | voi | s(i) | scriu |
| <i>gloss</i> | <i>I.want</i> | <i>SP</i> | <i>I.write</i> |
| WRT | isterim | | yazayım |
| <i>gloss</i> | <i>I.want</i> | | <i>I.write.OPT</i> |
| | 'I want to write' | | |

tendency for such usage to become more frequent as one moves from northwest to southeast in the direction of Torlak. Since 1991, Croatian language planners have identified SP-clauses with Serbian and infinitives with Croatian, as a result of which Croatian speakers are now discouraged from using SP-clauses. In Serbian and Bosnian, however, the two constructions continue to coexist amicably (Table 3).

In WRT, optatives have expanded at the expense of infinitives owing to the influence of the other Balkan languages. The usage in Table 3 was a possibility in older Turkish, but, in a classic case of convergence via feature selection, the WRT optative now occurs where Turkish would normally have a nonfinite construction:

ben seni ist-er-im şimdi bir
I you.ACC want-PRES-1SG now one
 müneccim ol-a-sın
astrologer be-OPT-2SG
 Now I want you to be an astrologer

Similarly, Balkan Judezmo, which preserves the Spanish infinitive, nonetheless has some uses of its subjunctive, e.g., in questions, that calque Balkan SP-clauses and do not occur in Modern Spanish or North African Judezmo:

kwando ke te vengamoz a tom-ar?
 (Balkan Judezmo)
when that you.ACC we.come to take-INF
 Pôte na 'rthoume na se pároume? (Greek)
when SP we.come SP you.ACC we.take
 Koga da ti dojdeme da te zemame?
 (Macedonian)
when SP you. we.come SP you. we.take
 DAT ACC
 Cuándo quieres que vengamos a recog-er-te?
 (Modern Spanish)
when you.want that we.come to take-INF-you
 'When do you want us to come to get you?'

All Balkan languages use the independent analytic subjunctive to express wish, desire, or a milder form

of imperative. Albanian also has a synthetic optative used mostly in formulae.

Futures in 'Will' and 'Have' When Slavic entered the Balkans (6th–7th centuries C.E.), there was competition between the auxiliaries 'have' and 'want (will)' + infinitive to mark futurity in Latin and Greek, with Latin favoring 'have' and Greek favoring 'want'. OCS used the perfective of 'be' in addition to 'want', 'have' and various forms of 'begin' + infinitive. The 'will' + infinitive construction survives (with modified or new infinitives) in Romanian, northwestern Gheg (near and in Montenegro), in Bulgarian dialects (with postposed auxiliary), and MR (for speculations and threats). This form also survives in all the non-Balkan Štokavian dialects of BCS and connects them with East South Slavic. In fact, much of Štokavian ended up in its current location as a result of northward migrations during the 15th–18th centuries. The rest of Slavic developed the perfective of 'be' as a future marker. The next stage was 'will' + SP + conjugated present tense verb (Greek 14th century, Slavic 15th century). This stage also survives in BCS, including Torlak. The third stage, which overlaps the second, is the transformation of 'will' into an invariant particle + SP + conjugated main verb. This type of construction is still the main one in Tosk and parts of Gheg, especially in the northwest and southeast peripheries; it is characteristic of southern Romanian and survives in Torlak and in certain modal uses in East South Slavic, but not in Greek. The fourth stage is the elimination of the SP so that the future is marked by an invariant particle plus a conjugated verb. In addition to being the standard future in Balkan and southern Vlach Romani, Greek, and BS, it is common in colloquial Tosk. In MR, the future marker merged with SP, producing a new particle, *ās*, in Tsárnareka, but eliminating a distinct future marker in the other villages. Romani outside the Balkans has other means of forming or expressing the future, and it appears that the Romani development in the Balkans occurred in concert with the other Balkan languages (cf. 'Analytic Gradation of Adjectives') (Table 4).

Conjugated 'have' + infinitive, attested for early stages of all the traditional Balkan languages, remains the predominant future in most of Gheg. Conjugated have + SP + present is still used in Romanian, and invariant 'have' (which can also be an existential in all the Balkan languages with lexical 'have', cf. French *il y a*) is used in Arbëresh and occurs with modal functions in BS. In East South Slavic, the ordinary negated future uses this negative existential + SP + present, and this type is calqued into Aromanian, Romani, and WRT. Since Turkish and most of

Table 4 Balkan futures

| | | | |
|------------------------------|------------|--------|----------|
| Romani | ka | | dža[s] |
| Albanian (Tosk) | do | [tê] | shkojmë |
| Greek | tha | | páme |
| Bulgarian | šte | | trūgnem |
| Macedonian | ke | | odime |
| Torlak | če | | odime |
| Romanian (Colloquial, South) | o | să | mergem |
| Aromanian | va | s- | neadzim |
| MR | | si, să | neadzim |
| [MR-Tsárnareka | ās | | neadzim] |
| English | we will go | | |

Table 5 Negated futures

| | | | |
|------------|-------------|--------|-------------|
| Macedonian | nema | da | odime |
| Bulgarian | njama | da | hodime |
| Aromanian | noare | s' | neadzim |
| | not.has | SP | we.go |
| Romani | na-e | amen | te |
| | not-is | we.ACC | SP |
| | | | go.IPL.PRES |
| WRT | yok-tur | | gid-elim |
| | not-is | | go-OPT.1PL |
| English | we won't go | | |

Romani lack lexical verbs meaning 'have', their calques use their negated existentials, which also code possession (Table 5).

Future in Past as Conditional The combination of a future marker with a past tense marker to form a conditional, especially irrealis, is a classic Balkanism, although its realization differs among the various Balkan languages. (The construction itself can have a variety of related meanings, e.g., 'X almost happened/was about to happen', iterative-habitual, anterior future, and languages and dialects can be differentiated on the basis of which of these meanings are encoded.) Greek, Macedonian, and Romani all use the invariant future marker plus the imperfect. Tosk and Aromanian are almost the same, but they still have the SP, at least optionally. MR has an invariant 'will' marker (*vręa*) + SP + present or perfect (see 'Perfect in "Have"'). In Bulgarian, Torlak, and other dialectal BCS, however, it is 'will' that conjugates in the imperfect + SP + present, and Gheg has the conjugated imperfect auxiliary 'have' + infinitive. The Balkan construction extends into BCS as far as southern Croatia and southwestern Serbia, and the southern Montenegrin dialects have the widest range of uses for the construction, thereby being most Balkan. In Turkish, the future participle plus a past auxiliary [*i*]di or [*i*]miş has the same nuances of irrealis conditional (Table 6).

Table 6 The Balkan conditionals

| | | | |
|-----------------|---------------------|---------------|-----------------------|
| Romani | ka | | keravas* |
| Greek | thá | | égrafa |
| Macedonian | ke | | napravev ^u |
| Aromanian | va | [s] | fáceam ^u |
| Albanian (Tosk) | do | tê | bēja |
| | <i>FU</i> | <i>SP</i> | <i>do.IM.ISG</i> |
| MR | vręa | si | am fat(ă) |
| | want.PRES.3SG | SU | do.PERF.1SG |
| Bulgarian | štjah | da | napravja |
| | ščaše/ščeše | da | napravim/ radim |
| | <i>want.3SG.IM</i> | <i>SU</i> | <i>do.PRES.1SG</i> |
| Albanian (Gheg) | [kishna | me | bâ] |
| | <i>I.have</i> | <i>with</i> | <i>do.PART</i> |
| Romanian | aş | fi | făcut |
| | <i>COND</i> | <i>be.INF</i> | <i>do.PAST.PART</i> |
| Turkish | yap | acak | tı m |
| | <i>ROOT</i> | <i>FU</i> | <i>PAST 1SG</i> |
| | 'I would have done' | | |

*Arli has a new imperfect formed by the long present + imperfect of '3SG/PLbe', e.g. *kerava sine*.

In Greek, Albanian, and Vlah, conditional constructions normally have a form of the 'will' morpheme. In BS, the Balkan conditional is in competition with the inherited conditional using the old optative of 'be' (invariant *bi* in Macedonian, conjugating in Bulgarian and Torlak) + old resultative participle. Romani dialects in contact with Slavic also use invariant *bi* + present as a conditional. In Romanian, a special conjugation of 'have' + infinitive serves as a conditional-optative.

Perfect in 'Have' The use of 'have' as an auxiliary with a nonfinite main verb to form an analytic perfect is attested for Greek and Latin at the end of the ancient period and is characteristic of Albanian, BR, and Greek, while such constructions (and lexical 'have') are absent from WRT and most of Romani. In BS 'have' + past passive participle (or its descendant) forms resultative constructions ranging from a fully grammaticalized perfect (with an invariant neuter verbal adjective) that has completely replaced the inherited perfect ('be' + old resultative particle in *-l*) in extreme southwestern Macedonian and spreading north to Mt. Šar and east to the Vardar and beyond, to resultative syntagms with 'have' + past passive participles agreeing with their direct objects and limited to transitive verbs with human subjects in most of Bulgaria.

Given the geography and history of the 'have' perfect in BS, it is clearly a calque on one of the non-Slavic contact languages. Although Greek and Albanian have been proposed as the possible models, Goľab's arguments in favor of Aromanian are the most convincing. In Aromanian, the feminine participle is selected

as the invariant, since in BR (as in Albanian) the feminine gender is unmarked (neuter is obsolete). The Macedonian invariant neuter verbal adjective therefore corresponds exactly to the Aromanian in terms of unmarked gender. In Greek, the main verb is a remnant of the infinitive and in Albanian the participle does not mark singular gender. Thus the BR construction most closely resembles the Macedonian. An additional argument in favor of BR as the model is evidence of Macedonian and Vlah mutual calquing in other resultative constructions.

Evidential In a Balkan context, evidentiality (inferential, distance, mode of indirect narration, indirective, status, French *médiatif*) is a grammatical category encoding the speaker's evaluation of the narrated event, often, but not always, predicated upon the nature of the available evidence. Evidentials can be of two types: confirmative (vouched for, 'witnessed') and nonconfirmative (not vouched for, 'reported', 'inferential'). The nonconfirmative can be felicitous (neutral report or inference) or infelicitous, in which latter case the nonconfirmative expresses either acceptance of a previously unexpected state of affairs (i.e., surprise, admirativity *sensu stricto*) or rejection of a previous statement (i.e., sarcasm, dubitativity). The opposition confirmative/nonconfirmative was already encoded in the Turkic simple past in *-di* (confirmative) and the perfect participle in *-miş* (nonconfirmative) at the time of the earliest monuments. In East South Slavic, the old synthetic pasts are markedly confirmative (this same meaning is also sometimes identified in Torlak). By contrast, the old perfect using the resultative participle in *-l* has become an unmarked past, with a chief contextual variant meaning of nonconfirmative. In Albanian, the inverted perfect (participle + 'have') has fused into a marked nonconfirmative present paradigm called admirative, which can then function as an auxiliary to form analytic past tenses. The Frasheriote Aromanian dialect of Bela di Suprã has reinterpreted the 3SG.PRES Albanian admirative marker as an admirative suffix, which it adds to a masculine plural

imperfect participial base to form a new admirative (Table 7).

Megleno-Romanian uses an inverted perfect + auxiliary construction in a similar function. The Romanian presumptive mood formed with a future, subjunctive, or conditional marker + invariant *fi* 'be' + gerund (or past participle) is a similar marked nonconfirmative, as is the probabilitive mood (based on a BCS-type inverted future) of Novo Selo Bulgarian, a dialect spoken across the Danube from Romania and a few kilometers east of Serbia (Table 8).

The Judezmo of Istanbul uses the pluperfect as a calque on the Turkish past in *-miş*:

Kuando esta-v-an en l' Amérika, les
 when be-IM-3PL in the America them.DAT
 av-iy-a entra-do ladrón
 have-IM-3SG enter-PAST.PART thief
 'When they were in America [i.e., absent], a thief broke into
 (Turkish *girmiş*) their house.'

Other Many other features too numerous to discuss here are cited as Balkanisms, e.g., the conflation of adverbs of location and motion ('where'/'whither'), purposives in 'for' + SP + verb and other prepositional parallelisms, a distinction between realis and irrealis complementizers, and absolute relativizers and interrogatives as complementizers, this last being a feature that has spread to WRT:

čovek-ot što go vid-ov (Macedonian)
 person-the what him.ACC see-1SG.AOR
 adam ne cür-d-üm (WRT)
 man what saw-PAST-I
 gör-düğ-üm adam (Standard Turkish)
 see-PART-my man
 'the man that I saw'

Word Order

Clitic Ordering Greek, Albanian, and BR all permit absolute initial pronominal clitics when the first stressed element is a finite verb, but in BS only Macedonian (especially the western dialects) permits this. Bulgarian keeps pronominal clitics bound to the verb but either requires the verb or some other element in

Table 7 Aromanian (Färshälots, Bela di Suprã and Albanian indicatives (3sg 'work')

| | Nonadmirative | | Admirative | |
|----------------|------------------|------------------|--------------------|---------------------|
| Present | lukrã | punon | lukracka | punuaka |
| Perfect | ari lukratã | ka punuar | avuska lukratã | paska punuar |
| Pluperfect | ave lukratã | kish punuar | – | paskësh punuar |
| 2nd Pluperfect | avu lukratã | pat punuar | – | – |
| Double perfect | ari avut lukratã | ka pasë punuar | ari avuska lukratã | paska pasë punuar |
| Double plup. | ave avut lukratã | kish pasë punuar | ave avuska lukratã | paskësh pasë punuar |
| 2nd Dbl. plup. | avu avut lukratã | pat pasë punuar | – | – |

Table 8 The Novo Selo probabilitive 'see'

| | | | |
|---------|---|---------------------------------|-------------|
| Present | 1 | gla*dáčã m | gla*dáčã mo |
| | 2 | gla*dáčãš | gla*dáčã tã |
| | 3 | gla*dáčã | gla*dáčã ju |
| Future | | čã gla*dáčã m, etc. | |
| Past | | budáčã m ~ bičã m glã dâl, etc. | |

initial position. BCS, including most of Torlak, still follows Wackernagel's law and has clitics in second position.

Az često mu go davam. (Bulgarian)
I often. him.DAT it.ACC give.1SG.PRES
 Ja mu ga često dajem. (Serbian)
I him.DAT it.ACC often give.1SG.PRES.
 'I often give it to him'
 Davam mu go (Bulgarian)
give.1SG.PRES him.DAT it.ACC
 Mu go davam (Macedonian)
him.DAT it.ACC give.1SG.PRES
 'I give it to him'

Romani pronominal clitics follow the verb. WRT is basically suffixal, like the rest of Turkish, and clitics always follow the stressed element, but elements that can be fused or separated are more likely to be separated and less likely to show vowel harmony in WRT.

Constituent Order Balkan languages are characterized by relatively free constituent order with certain patterns being favored for various types of syntactic and narrative strategies (emphasis, topicalization, focus, contrastive thematization, etc.). The unmarked word order tendency is SVO in all the Indo-European Balkan languages. Unlike most of Turkish, where the tendency is verb-final, WRT and Gagauz show SVO tendencies. Similarly, BR, BS, Albanian, and Greek all have the basic order head-genitive, while Turkish and Romani are genitive-head. Romani dialects in the Balkans and WRT, however, also have head-genitive constructions:

m-e phral-es-k(er)e kher-es-k(or)o vudar (Romani)
my-OBL brother-OBL- house-OBL- door
 GEN GEN
 'the door of my brother's house'
 o vudar e kher-es-ko
the.MASC.NOM door the.OBL house-OBL-GEN
 m-e phral-es-kere (Romani)
my-OBL brother-OBL-GEN
 Baba-si Ali-nin (WRT)
father-his A.-GEN
 Tatkto mu na Ali (Macedonian)
father him.DAT to Ali
 Baba-i i Ali-ut (Albanian)
father-DEF PC.MASC.NOM.SG A.-Def.GEN
 Ali-nin babası (Standard Turkish)
Ali-GEN father-his
 'Ali's father'

Adjectives generally follow their heads in Albanian and BR, but precede in BS, Greek, WRT, and Romani. In all of these languages, the opposite order is possible in various discourse functions. Albanian enclaves in the eastern Balkans also have preposed adjective as the standard order.

Lexicon, Semantics, and Derivational Morphology

The etymological commonalities of the Balkan lexicon received considerable attention during the formative years of Balkan linguistics, whereas more recently the focus has been on shared grammatical features. Miklosich's 1861 survey of Balkan grammatical commonalities occupied only 4% of what was basically a study of the Slavic lexical influence on Romanian. Sandfeld (1930) devotes 40% of his book to the lexicon, whereas Asenova (2002) allots 10% of her text to such issues. Although the lexicon is the most salient surface manifestation of linguistic influence, words can travel between languages without the aid of communal multilingualism, whereas the diffusion or convergence of grammatical structures is a more complex process that requires at least a core community of bi- or multilingual speakers. In terms of the definition of a sprachbund, it is the shared grammatical features rather than shared vocabulary that is the key determiner, although shared vocabulary is usually part of the picture.

There are common loanwords from each of the component language families in the Balkan languages. Words shared by Albanian and Romanian of pre-Latin (substrate) origin are often connected with domestic items or husbandry, e.g., Albanian *shtrungë*, BR *strungă*, BS (Macedonian and west Bulgarian) *strunga*, Greek (Epirus and Sarakatsan) *stroúgka* 'dairy'. Greek, Slavic, and Romance (especially Balkan Latin and Venetian Italian) were all languages of power in the Balkans at various times during the Middle Ages and contributed a variety of lexemes and even derivational affixes to the common Balkan lexicon, e.g., the Latin agentive suffix *-arius*, the Slavic feminine suffix *-ica*, and the Greek aorist marker *-s-* (used in deriving verbs). As the language of administration, the market place, and urban life in general, Turkish dominated the Balkan peninsula for more than half a millennium. By the 19th century, the shared Turkish lexicon in the Balkan languages was of considerable size. The rise of Balkan standard languages, however, entailed the stylistic lowering and marginalization of many Turkish loanwords, and as many of these items were of Arabo-Persian origin, they were discouraged by Turkish purists as well. The Turkish agentive *-ci*, attributive *-li*, qualitative or concrete *-lik* (with adjustments for vowel harmony, voicing

assimilation, and adaptation) continue to be productive as derivational affixes, e.g., Macedonian *pubertelija* ‘adolescent (ironic)’ Albanian *partiakçi* ‘party hack’, Judezmo *hanukalik* ‘Chanukah present’, etc.

The Balkan languages also share numerous idioms, collocations, and calqued expressions; e.g., the use of ‘eat’ to mean ‘undergo something unpleasant’ as in ‘eat wood’ = ‘take a beating’ or ‘it doesn’t cut his mind’ = ‘he doesn’t understand’. There are a variety of shared discourse particles and conjunctions (e.g., Turkish *am[m]a* ‘but’, Greek *bre* ‘hey, vocative particle’) that also form part of the common Balkan lexicon.

Sociolinguistics

Factors such as power, prestige and religion have influenced directions and degrees of Balkan contact phenomena. Throughout the Ottoman period, Turkish had high prestige as the language of the state and the town, Greek had prestige among Christians as the language of the (Orthodox) church with its own literary tradition (and history of power, i.e., Byzantium) and was also a language of commerce. BS had less prestige in the southern Balkans, but its history of medieval literacy and political competition with Byzantium gave it some limited prestige. Although BR was descended from Latin, another language of empire and conquest, the local varieties that developed after the Slavic invasions did not have that level of prestige and, like Albanian, were associated mainly with rural contexts. In Wallachia and Moldavia, Church Slavonic was the liturgical language for centuries, and Romanian was written in Cyrillic until the mid-19th century. Aromanian speakers in southern Balkan towns used Greek outside the home. Romani was at the bottom of the social hierarchy, but Judezmo was outside it. This is reflected in 19th-century Macedonian folklore collections, where characters in ethnic jokes, including Roms (Gypsies), speak in their own languages, except Jews, who speak Turkish, not Judezmo. For both Romani and Judezmo, multilingualism was unidirectional, i.e., Roms and Jews learned other languages but heard their languages spoken by others rarely, if ever. At the opposite end of the prestige scale, speakers of Greek and Turkish were less likely to learn less prestigious languages but were more likely to hear their languages spoken by others. Those languages in the middle of the hierarchy (BS, BR, and Albanian) had the highest degree of multidirectional multilingualism and show a higher degree of congruence.

Marriages could be freely contracted across linguistic lines but not religious ones, so that multilingual households were a commonplace. Although speakers

Figure 1 Schematic linguistic social/political hierarchy (Ottoman Period).

of BS, BR, and Greek were mostly Christian and speakers of Albanian were usually Muslim, each of these religions also had significant communities speaking the other languages. Except for Gagauz, speakers of Turkish were Muslim, but there was still plenty of linguistic contact via religious conversion. Jews and Roms, however, were endogamous along a combination of linguistic and other social lines. This boundary maintenance is reflected linguistically in Romani, where there is a clear opposition between the relatively open systems of adjectival comparison and modality on the one hand to the conservative nominal, pronominal, and tense-aspect systems on the other.

Figure 1 illustrates the relative prestige of the various languages during the Ottoman period. Height symbolizes prestige, while incline indicates relative (never absolute) directionality. The directionality is reversed in the case of slang and secret languages, where it is the covert prestige of languages further down on the social scale that is reflected in patterns of lexical borrowing. In the case of Judezmo, knowledge of Turkish was most widespread, while knowledge of other Balkan languages would depend on the particular (urban) environment.

Causation

For most of the history of Balkan linguistics, causation has been sought in the influence of (interference from) one of the languages, e.g., Greek, Latin, or a pre-Latin non-Hellenic substratum (e.g., Illyrian, Thracian, and/or Dacian – all so poorly attested that we do not have so much as a single sentence in any of them). More recently, however, an ecological model of feature selection argues that those grammatical developments more suitable for effective communication that might be already present in the language, i.e., more adaptive, are more likely to be selected for further development and spread (cf. ‘Resumptive Clitic Pronouns [Reduplication, Replication]’). In such a model, languages can utilize native resources that are reinforced by their occurrence, or potential

for occurrence, in the contact languages. Mechanisms such as fusion, metatypy, and code copying are all potentially relevant. At the same time, sociolinguistic factors such as those adduced in ‘Sociolinguistics’ can influence directions of change. The diffusion of borrowings and the development of convergences are thus compatible parts of a larger picture of a sprachbund in which languages come to be similar without becoming identical. It is worth emphasizing here the insight of Joseph (2001), namely that the move from lexical via phraseological to syntactic borrowings that characterizes the contact-induced changes of a sprachbund such as the Balkans are quintessentially surface phenomena.

Although some scholars have argued against the idea of a Balkan sprachbund since the 1930s, the argument that the Balkans are basically just part of a larger European linguistic zone coincides roughly with the recent rise in interest in contact linguistics and typology. In the case of the Balkans, however, while it is clear that Kopitar’s formulation is an exaggeration, it is equally clear that Trubetzkoy’s original insight captures facts about language relationships. Of particular significance is the manner in which patterns map such that the languages that surround the Balkan sprachbund do not share the most salient features. The fact that English and Western Romance have gone even further than most of the Balkan languages in some changes does not contradict the hypothesis that the Balkan sprachbund is precisely that, i.e., a product of the process of language contact. If some of those contact-induced changes are the result of shared feature selections, having parallels elsewhere, that may contribute to identifying likely directions of language change, but it does not vitiate the sprachbund as a historical and sociolinguistic phenomenon.

In a sense, a sprachbund is more like a dialect chain than a linguistic family: as features spread over areas, they may do so with differential impact. Thus, while it is possible to define a sprachbund in terms of languages displaying a coalescence of a number of such features, it is not necessarily the case of an ‘all and only’ phenomenon. Moreover, the transition from pragmatic to syntactic (grammaticalized) to morphological sometimes maps onto the territory of the sprachbund itself, moving from periphery to core. Like dialects, there can be a transitional effect, and a given language, e.g., BCS, can participate in the changes to a greater or a lesser extent. For both the dialect and the sprachbund, politics can have a crucial effect in setting boundaries that favor internal consistency and external differentiation. Just as the very concept of language vis-à-vis dialect (e.g., to which language a given dialect ‘belongs’ or which isoglosses

will be chosen as defining one dialect in opposition to another) can be a complex of intersecting factors, so too can the definition of sprachbund.

Balochi

P O Skjærve, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Balochi (or Baluchi, in several dialects) is spoken by the Baloch in eastern Iran and western Pakistan (Baluchistan), but also in southern Afghanistan, Turkmenistan, and the Arab Gulf States (totaling 6–8 million speakers?). The Baloch are first mentioned in literature about 1000 C.E., but the language did not become a written one until the 20th century, although the earliest known manuscript dates from the early 19th century. On the other hand, the Baloch have an oral poetic tradition with historical themes reaching back to the 15th century, but especially productive in the 19th century. Modern literature and publications are centered in Quetta in Pakistani Baluchistan and in Karachi. A Balochi Academy was founded in Quetta in 1959 and still publishes Balochi literature and supports Balochi language and culture in various ways, and the University of Quetta offers a Balochi Studies program. Balochi radio programs are broadcast from Zahedan in Iranian Baluchistan and from Quetta and Karachi, formerly also from Kabul.

There are, by one count, six principal dialects of Balochi, characterized by differences in grammar and

lexicon. The western dialect of Raxšāni is the largest, the principal subdialect being Sarhaddi.

Balochi belongs with the North(west) Iranian languages, differently from Persian, which is a South-west Iranian language; compare, for instance, Balochi *asin* 'iron,' *jan-* [dʒan-] 'strike,' *zird* 'heart,' versus Persian *āhan*, *zan-*, *dil*. It is a phonetically conservative language, having preserved much of the Old Iranian consonant system intact, notably intervocalic stops and affricates, for instance, Bal. *pād* 'foot,' *āp* 'water,' *roč* [rōtʃ] 'day' (Pers. *pā*, *āb*, *rūz*). Among innovations are the development of initial *w-* to *g(w)* (OIran. *wāta-* 'wind,' Bal. *gwāt*, Pers. *bād*), *xw-* to *w-* (OIran. *xwara-* 'eat,' Bal. *war-*, Pers. *x^oor-*), and the change of fricatives into stops (Bal. *nākun* 'nail,' Pers. *nāxon*; Bal. *gipta* 'seized,' Pers. *gereft*).

Balochi has retroflex consonants in words borrowed from Indo-Aryan, including originally English words, for instance, *ḍrēwar* (*ḍ* = [dʒ]) 'driver.'

There is a four-case system, distinguishing nominative, genitive, and an oblique case. The suffix *-rā* (*-ā* with personal pronouns) can be added to the oblique to express direct and indirect objects.

Notable features of the verb system include the formation of continuous tenses by means of a present participle in *-ag* (*raw-ag-ā int* 'go-ing-in he-is' = 'he is going'), a construction perhaps influenced by

the neighboring Indic languages and replacing the older formation with prefix *a-* (*a-rot* ‘he goes, is going’). In the conservative dialects, the past tenses use the ergative construction in pure passive form (*man gūnī zurt-ant o šut-un* ‘I.OBL sack.PL take.PAST-3RD.PL and go.PAST-1ST SING’ = ‘I took the sacks and went’), while in the western dialects, the active construction of Persian prevails (*man gūnī-ān zurt-un o šut-un* ‘I.DIR/OBL sack.PL.DO take.PAST-1ST.SING and go.PAST-1ST.SING’ = ‘I sacks took-I and went-I’).

Balochi lexicon contains a large number of loanwords, mainly Arabo–Persian and Indo–Aryan from a western Sindhi dialect, as well as a small number of words from Brahui, a Dravidian language, which contains a large number of Balochi words.

Balto-Slavic Languages

S Young, University of Maryland Baltimore County, Baltimore, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

The term Balto-Slavic encompasses the languages of the closely related Baltic and Slavic branches of the Indo-European language family. The Slavic languages, traditionally divided into East, West, and South Slavic, are well-represented over much of Central and Eastern Europe and Siberia. Of the once more numerous and widespread Baltic languages, only two have survived to the present, Latvian and Lithuanian, which together form East Baltic. West Baltic is represented by Old Prussian, which died out in the early 18th century; it is known from word lists, place names, and catechism translations.

The nature of the relationship between the Baltic and Slavic languages has long been a source of debate. In the traditional *Stammbaum* approach, reflected in K. Brugmann’s landmark *Grundriß der vergleichenden Grammatik der indogermanischen Sprachen*, Baltic and Slavic are presented as equivalent branches of a Balto-Slavic protolanguage, which derives in turn from Proto-Indo-European.

The assumption of a post-Indo-European period of Balto-Slavic linguistic unity is based on a number of striking and seemingly exclusive correspondences between the Baltic and Slavic languages. In phonology, the most cogent argument for a Balto-Slavic protolanguage is found in the highly complex prosodic structures of both language families, which typically

agree in details of stress placement (including reflexes of Hirt’s law), syllable tone (including reflexes of Winter’s law), and accentual paradigm. Among other phonological agreements, syllabic resonants develop into both *-iR-* and (exceptionally) *-uR-*, with a similar distribution in both language groups. Morphological correspondences include an *-ā* formant marking the preterite/aorist stem, often accompanied by the reduced grade of the root: Lith. *pīrko* (pres. *peřka*) ‘buy.PRET’ : OCS *žbda* (pres. *židetŭ*) ‘wait, expect.AOR’; and a present passive participle in *-m-* (for East Baltic and Slavic): Lith. *nešamas*, Latv. *nesams* : OCS *nesomŭ* ‘being carried’. There are a number of exclusive correspondences in word formation, among them deverbal nouns in *-imo-*: Lith. *piešimas* ‘drawing’ : Slavic **přisŭmo* ‘writing’; agent nouns in *-ā-jo-*: Lith. *artójus*, OPr. *artoys* : OCS *ratajŭ* ‘plowman’; agent nouns in *-ik-o-*: Lith. *siuwikas*, OPr. *schuwikis* ‘shoemaker’ : ORus. *šувьсь* ‘tailor; shoemaker’; denominal adjectives in *-in-*: Lith. *krūvinas*: OSC *krŭvŭnŭ* ‘bloody’, and diminutives in *-uk-o-*: Latv. *dēluks*, OCS *synŭkŭ* ‘sonny’. Finally, there are many apparently exclusive lexical items, among them Lith. *rankà* : OCS *roka* ‘hand’; Lith. *rāgas* : OCS *rogŭ* ‘horn’; Lith. *lėpa* : OCS *lipa* ‘linden’.

The assumption of a Balto-Slavic proto-language was first challenged by A. Meillet (1908), who argued that the various agreements between the two language families are only apparent, a result of inherited archaisms and parallel developments in each of the branches. A refinement of this model was advanced by J. Endzelin (1911), who accounted for shared features

by positing a period of prolonged language contact between neighboring Baltic and Slavic communities, leading to a degree of linguistic convergence.

More recent studies have stressed the non-equivalence of the notions of Baltic and Slavic. C. Stang (1966: 10 ff.), developing one of Endzelin's ideas, pointed out that while Common Slavic presents a relatively uniform system, Baltic is divided by a number of significant isoglosses. Certain of the innovations represented by these isoglosses connect East Baltic with Slavic as opposed to Old Prussian (for example, the Indo-European **-s(i)o* genitive singular of *o*-stem nouns, apparently preserved in Old Prussian, has been replaced in East Baltic and in Slavic by a form that appears outside of Balto-Slavic in ablative function: Lith. *rāgo*, Latv. *raga* = OCS *roga*, 'horn-GEN SG'); while other isoglosses link Old Prussian with Slavic (for example, the possessive pronouns OPr. *mais*, *twais*, *swais* = OCS *mojb*, *tvojb*, *svojb* 'my, your, one's own' are refashionings of the IE root represented in Lith. (*manas*), *tavas*, *savas* and Latvian (*mans*), *tavs*, *savs*).

V. V. Ivanov and V. N. Toporov (1961), in reviewing the methodological preconditions for discussing the Balto-Slavic relationship, have argued that a relatively homogeneous proto-Slavic can be derived from a considerably more archaic and heterogeneous proto-Baltic linguistic model, in effect redefining the notion of Balto-Slavic by treating Slavic as a local development within a Baltic dialectal continuum.

Progress in further defining the relationship between Baltic and Slavic is hampered by a lack of linguistic data from the former Baltic populations assimilated by the East Slavs in the upper Dniepr river basin (the Dniepr Balts), and in present-day

Baltic territories by neighboring Latvians and Lithuanians (the Couronians, Selians, Zemgalians, and Jatvingians). The written documents of extinct Old Prussian are scant and rather unreliable, while the earliest monuments of Latvian and Lithuanian date only from the 16th century, when these languages already had a modern appearance. Nevertheless, dialectal data (including toponymic) still being drawn from various Baltic and Slavic languages, together with a more profound study of Baltic and Slavic borrowings in neighboring languages, may help provide new perspectives on the question of Balto-Slavic.

Bantu Languages

Introduction

Bantu is the largest of the dozen or so language families that make up the Niger-Congo phylum, which, with nearly 1500 languages, is the largest phylum in the world. Some 750 million people live in Africa, some 400 million speak a Niger-Congo language, and some 250 million – a third of all Africans – speak a Bantu language. Bantu-speaking communities live south of a

line from western Cameroon across the Central African Republic, the Democratic Republic of Congo (DRC; once known as Zaire), Uganda, and northern Kenya to southern Somalia. Most languages spoken from that line to the southern tip of South Africa are Bantu. Within that area, they coexist with some non-Bantu languages: a few Khoisan, mostly in the southwest, a few Cushitic, in the northeast, and a string of Nilo-Saharan and Adamawa-Ubangian languages along and within the northern border. In all, 27 African countries – roughly a half – are partly or entirely Bantu speaking.

Certain generalities are true of Bantu-speaking communities. One is that, just as most African

countries are multilingual, many individuals are bi- or multilingual. In former times, many who came in contact with neighboring communities, mainly males such as traders or soldiers, spoke two or more languages. Though this is still true, it is increasingly true that many young people are born into one language community, are formally educated in a second language, and may acquire a third language later. Men tend to speak more languages than do women, and living in cities encourages multilingualism more so than does life in rural areas (Wolff, 2000).

Another truism is that many languages are poorly described. Three broad language categories can be distinguished. At the lower end are many dozens of languages for which no data are available. In the middle, the largest set, are many languages for which some data are publicly available, ranging from just a word list to a partial description. Finally, for about 10% of the languages, a reasonably comprehensive grammar exists, as books, doctoral theses, or long articles. In some areas – for example, South and East Africa – the languages are fairly well described, whereas in others (Angola, Cameroon, the DRC, and Zambia) they are less well covered.

A third point concerns the poor health of some of these communities. Dividing the Bantu population of 250 million by the number of languages, 500, gives an average of half a million speakers per community, but that ignores the fact that many smaller communities, especially rural, are in much worse shape than the figures indicate. The best demographic collection available (Gordon, 2004) gives figures for most communities, but gives no breakdown according to age. In many small communities, the fluent speakers are aging, with few or no younger speakers, so these communities of speakers will silently fade away in this century. As the small communities get smaller, the large get larger. At the same time, new urban and regional forms of languages are thriving (see Sommer, 1992; Bernsten, 1998; Wolff, 2000).

Finally, across the area, it has proved difficult to distinguish language from dialect. The difference is one of degree of similarity, and the question concerns where to cut a cline of similarity. Thus readers should treat with skepticism the figure of 500 Bantu languages. Estimates have varied between 300 and 600. If lack of reasonable mutual intelligibility with other varieties is a major defining feature of a language, then the figure is nearer 250 than 500.

Classifications

The second half of the 20th century saw dozens of referential and genealogical classifications. The most widely used referential system is that of Guthrie

(1948, 1971), who divided the (Narrow) Bantu languages into 15 zones (designated A, B, C, D, E, F, G, H, K, L, M, N, P, R, S), and each zone in turn into groups (designated A11, A12, A13, . . . , etc.), for a total of 85 groups. Thus Nen is A44, Lingala is C36(d), Ha is D66, varieties of Swahili are G41, -42, or -43, and Zulu is S42. Guthrie's zones and groups are based partly on shared features he regarded as important, and partly on geographical contiguity. The most recent version of Guthrie (2003) is Maho. Guthrie's taxonomy did not reflect history, except indirectly.

In contrast, genealogical classifications aim to reflect the evolutionary history and, to a lesser extent, the contact history of the Bantu languages. Nearly all genealogical classifications assume that the current languages derive from Proto-Bantu and nearly all are based on the use of vocabulary in some form: lexicostatistics (counting percentages of shared vocabulary), glottochronology (assigning dates to percentages of shared vocabulary), shared lexical innovations, or juxtaposing results from lexical investigations with those from other disciplines, such as culture or archaeology (DNA comparison on a wide scale is so far lacking). The only study that examined the whole Bantu area and drew on hundreds of languages was the lexicostatistical work of Bastin *et al.* (1999); others used a smaller sample (Ehret, 1998, 1999; Nurse, 1999; Nurse and Philippson, 2003; see also Nurse, 1994–1995). Most of these classifications have in common that (1) they have some trouble defining an exact line between Narrow Bantu and closely related Bantoid languages in Cameroon, (2) they see a small set of languages (zones A, B, C, and bits of D and H, spoken in the northwest and north, in Cameroon, Gabon, Congo, and the northern fringe of the DRC, often called the Forest languages) as different from the rest, and (3) they divide the rest, the majority, into a smaller western (Angola, Namibia, parts of the DRC, Zambia, and Botswana) and a larger eastern set (all of eastern and most of southern Africa). Using nonlexical criteria, Nurse and Philippson (2003) differed somewhat in their view of classification (and history). While acknowledging the northwestern/northern grouping and the western group, they also saw a distinct northeastern group (Uganda, Kenya, and Uganda), but otherwise viewed the remaining languages as a group defined negatively by not sharing the innovations of the west, northwest, north, and northeast.

History

The entire Bantu area historically was covered in work by Vansina (1995), and Vansina (1990) and

Ehret (1998) dealt in detail with the northwest/north and east/south/southwest, respectively. An older, slightly outdated, view of the development of Bantu history is found in the work of Oliver (1966) and Phillipson (1977).

Though Ehret and Vansina disagreed on many details, the general outline is clear. Within Niger-Congo, Bantu is part of a grouping currently called Benue-Congo. The ancestors of the Benue-Congo, farmers, lived between what is now the Ivory Coast and western Cameroon, starting some seven millennia ago. By 3000 B.C., the ancestors of the Bantu had emerged and had already divided into what were later to become western and eastern Bantu. During the next millennium, they all moved slowly south and east across Cameroon, carrying the West African planting tradition with them. By 1000 B.C., they had moved much further into the rainforest and had reached various points on or near the Congo (Zaire) River in today's DRC, so that there was a wide range of Bantu communities in the forest (Vansina, 1990: 51–54). There is a popular myth that the huge equatorial rainforest is uninhabitable and uncrossable. In fact, today it has some 12 million inhabitants, spread across 450 ethnic groups (Vansina, 1990: 3), and the early Bantu crossed it easily, following the major rivers (the Congo (Zaire), Kasai, Sankuru, Lualaba, Lomami, and Sangha). By 1000 B.C., the ancestors of today's eastern Bantu were already at the eastern end of the forest, at the western edge of the Great Lakes region, to the east and south of the forest. This is necessarily a shortened and simplified version of events: in particular, it ignores the northwestern and northern Bantu communities, speaking the so-called Forest languages, whose history is somewhat separate and not further followed here.

Ehret saw the ancestors of today's eastern Bantu communities as having divided into two groups, an incipient northern and an incipient southern group, by 3000 years ago, both located in the area west of the West Rift valley in East Africa. The former group likely was to the west and south of Lake Victoria, the latter being west of Lake Tanganyika. The northern group had reached Lake Victoria by the middle of the first millennium B.C. During this period and later, these ancestors came across communities speaking Nilo-Saharan, Cushitic, and Khoisan languages, encounters that contributed to a diversified agriculture and boosted pastoralism. Iron working also had appeared in the region by this time, but its origins are disputed. During the next 500 years, some communities spread around Lake Victoria; some spread across Kenya and northern Tanzania to the coast by the early centuries A.D. and, by a couple of

centuries later, others spread south and southeast across Tanzania close to northern Mozambique.

Meanwhile, the southern offshoot of eastern Bantu had left the southern fringes of the rainforest and approached northeast Zambia by the second half of the last millennium B.C. They spread thence into much of Zambia, Malawi, Zimbabwe, southern Mozambique, and eastern South Africa, early Shona societies being established south of the Limpopo River by the third century A.D. These early groups ran across long-established Khoisan peoples in most of the region. Later movements, even into the second millennium A.D., resulted in the current configuration of Bantu communities in South Africa. Western Bantu likewise splintered. Sections moved east and northeast along the upper Congo River and its tributaries, and then southeast, so that nearly all of the rainforest was occupied by western Bantu populations by 1 A.D. Once the ancestors of a southern arm had crossed the lower Congo River and moved out of the rainforest into the adjacent savanna, during the latter half of the last millennium B.C., one section continued south across the Benguela Highlands in Angola and finally into northern Namibia, and another turned east and southeast and moved as far as western Zambia, along the Upper Zambezi River. Most western Bantu populations were in or near their current locations by the late centuries B.C. or the early centuries A.D.

With a few notable exceptions, most major movements of early Bantu-speaking peoples, east and west, were complete by the early centuries A.D., and the ancestors of most current Bantu populations had occupied central, eastern, and southern Africa by that time. Thereafter, some minor movements and local dispersals followed, with much contact, interaction, mixing, and assimilation.

Typology

This section sketches some characteristic features of Bantu phonology, morphology, and syntax, mainly those that occur widely but including a few less widespread, but intrinsically interesting. Exceptions to these generalities occur mainly in northwestern and northern languages.

Phonology

Nearly all Bantu languages have five or seven contrastive vowels, the few exceptions being mainly in Cameroon, Congo, and DRC, with languages with nine or more vowels. Five- and nine-vowel systems derive from earlier seven-vowel systems, the number usually assigned to Proto-Bantu. Despite the apparent similarity of the systems, phonetic realization varies

considerably, especially in languages with seven vowels. The full range of vowels is seen in most stem positions, whereas a reduced set occurs in other contexts, such as prefixes and extensions (the derivational suffixes following the stem). Vowel height harmony is widespread, whereby the historical degree-two vowels (the second highest vowels in the seven-vowel system) harmonize and lower to /e/ and /o/ after /e/ and /o/ in the root (and in some languages after /a/) (see Schadeberg, 1994/1995; Hyman, 1999, 2003; Kisseberth and Odden, 2003; Maddieson, 2003).

Proto-Bantu had a few pairs of words differentiated only by vowel length. Some languages have kept these, some have neutralized the length distinction, some have reintroduced it, and others have increased its function, often via loanwords. Phonetic vowel length is typically induced by vowel fusion, following prenasalized consonants, or gliding and ‘compensatory lengthening’ of the remaining vowel (in sequences of two vowels, /i, e/ and /u, o/ in the first position typically become the glides /y/ and /w/, respectively, before nonidentical vowels).

Most Bantuists credit Proto-Bantu with the following consonant system:

| | | | |
|---|---|---|---|
| p | t | c | k |
| b | d | j | g |
| m | n | ɲ | |

Here there is a voiced:voiceless contrast in plosives and a full set of nasals at nearly all the same points of articulation as the plosives. Most contemporary languages have these features, although the voiced plosives have often become continuants. Not shown here, there were also two sets of prenasalized consonants (mb, nd. . . : mp, nt. . .). Most languages still have the voiced set, but the voiceless set has been less stable over time, apparently because of the disparity in voicing between nasal and obstruent.

Some languages still have a simple consonant system that, although altered from the one shown here, derives from it fairly directly. Others have a much-expanded system, partly due to common phonetic processes such as palatalization, gliding, and voicing, but often resulting from a widespread process known as Bantu Spirantization. In this, the two high vowels in the original seven-vowel system affected the preceding plosives, typically producing affricates or fricatives: labial /pf, bv, f, v/ from /p, b/, labials from the nonlabial consonants before the high back vowel, and alveolar or palatal /ts, dz, s, z, etc./ from the nonlabial consonants before the front vowel. Typically, the two high vowels then merged with the degree-two vowels. The result was a smaller five-vowel inventory but a larger consonant inventory with voiced and voiceless plosives and fricatives.

Other consonant processes, geographically more limited, are defined by Dahl’s Law and Meinhof’s Law. Dahl’s Law voices a voiceless stop if the obstruent in the next syllable is also voiceless (so Kikuyu *geki* from English ‘cake’), which has interesting effects in long strings. Possibly linked to this is a more local phenomenon, Katupha’s Law, which disallows aspirated consonants in adjacent syllables, deaspirating the first. Meinhof’s Law affects sequences of noun, consonant, vowel, noun (consonant), or NCVN(C), deleting the first C, so *ɲgombe* ‘cow’ would become *ɲombe*. A local variant, the Kwanyama Law, produces the opposite result, *ɲgobe*. Syllables in Bantu are almost universally open, that is, CV or CVV. In restricted contexts, such as prefixes, other shapes (V, N, NCV) occur. A few languages, mostly in the northwest, may have closed syllables (CVC), due to loss of final vowels (but their tones are mostly kept).

Some 95% of Bantu languages are tonal and have a basic contrast between high (H) and low (L), or H and toneless. Contour tones (falling, rising) are usually restricted to bimoraic syllables. Downstepping of each successive H is common. Nouns and verbs show significant differences in the distribution of tone. Nominal prefixes are typically toneless and a number of stem patterns are possible, varying from language to language. Tones in verbs are more complicated than they are in nouns. Verb stems in many languages show a lexical contract between H and toneless, and affixes may also have their own tone, so that in some languages the tone of the verb is more or less the sum of individual tones, modified by certain general processes. In other languages, verb stems have no lexical tone, tone being assigned by general principles, often particular to certain tenses. Even languages with lexical stem tone often have grammatical tone, whereby an H may be assigned to a specific stem mora in certain tenses.

In many Bantu languages, the relationship between an underlying and a surface H is not direct, being modified by widespread principles and processes that favor or disfavor certain configurations. One such is tone spreading (tone of one syllable spreads to the next syllable(s), so being realized on two or more syllables), or tone shift (tone of one syllable is realized only on the next), typically from left to right. Another is avoiding situations whereby phonological structures – typically the intonational phrase or the word – end on an H. A third is the disfavoring of successive (nonsurface) H’s, the obligatory contour principle (OCP). Working against the OCP is the plateau principle, whereby a toneless stretch between two H’s is avoided. Finally, tones mark certain grammatical functions. Besides being associated with

certain tenses or groups of tenses, as already noted, tone often serves, for example, to distinguish statement from question, positive from negative, main from subordinate clause (the latter often including relative clauses), and the third person (H) from the second person singular subject prefix, which are otherwise segmentally identical.

Morphology

Bantu languages have the following word classes: noun, verb, pronoun, adjective (a small class; only a dozen or so are reconstructable for Proto-Bantu), numeral, demonstrative (often a three-way contrast), a small set of quantifiers and interrogatives, preposition (often a compound), and ideophone. One conjunction (*na*) is widespread (see Katamba, 2003; Nurse, 2003; Schadeberg, 2003).

Nouns consist of a stem and a prefix (L). Most prefixes have a CV-shape, stems are of the shapes -CV, -CVCV, -CVCVCV, etc., whereby the last vowel might be part of the stem or it might be a derivational suffix, so in Ha the final vowel of [umwáana] is part of the stem, whereas in *umuhanuuz-i* 'advisor,' *umukén-e* 'pauper,' and *igisus-o* 'example,' the final vowels are derivational suffixes (from *-hanuur-* 'tell,' *-ken-* 'miss,' and *-sus-* 'resemble,' respectively). Nouns in many but not all languages have an augment (also called preprefix, initial vowel), consisting of a vowel that reflects the vowel of the prefix. It has various pragmatic and syntactic functions.

All nouns are assigned to a class. Classes have four characteristics: (1) each class has a nominal prefix, (2) there is extensive concord between the noun and the constituents of the noun phrase and the subject and object prefixes in the verb, (3) there are typical singular-plural class pairings, often called genders, and (4) and there is some semantic content to each class and gender. Concord, incidentally, is not always automatic – animacy, for example, can sometimes override automatic class agreement. Typical languages have between 15 and 21 classes and at least six genders, leaving some single classes with no plural pairing. The classes (Cl.) have been given conventional numbers (Cl. 1, 2, 3, 4, etc.) and some genders are widespread (e.g., 1/2, 3/4, 5/6, 7/8, 9/10, 11/10, 12/13, 14/6). Classes 15, 16, and 17 are locative classes and typically have a single member, or even no regular members, their prefixes being added to other nouns. Gender 12/13 (and sometimes 7/8) is a diminutive gender, gender 5/6 (and sometimes 20/21) is an augmentative. Gender 9/10 in many languages appears to act as a dumping ground for nouns that do not fit elsewhere. Nouns may be shifted from one (primary) class to another (derived), typically the

classes just mentioned, in which case the prefix and semantic features of the new class will be added to or replace those of the primary class. Thus there are the Ha words *u-mw-ána* 'child' (Cl. 1), *a-ka-ána* 'small child' (13), *u-tw-ána* 'small children' (13), *i-zí-iko* 'fireplace' (5), and *ku-zí-iko* 'to/on the fire' (16 + 5); also, in Haya (E22), there is *o-mu-ntu* 'person' (1), but *o-lu-ntu* 'tall, slim but slightly ridiculous person' (11). A few northwestern and northern languages have greatly reduced the number of noun classes to a handful, or even to none.

For many decades, it was maintained that with the exception of the derived genders and of gender 1/2 (humans), it was not possible to state the semantic content of most classes and genders, other than by listing typical and obvious groupings, and there were many anomalies. These groupings and anomalies occur across Bantu. Thus gender 3/4 typically contains plants, bushes, trees, and some natural phenomena, but it also widely contains 'year' and 'end,' and, in Swahili, 'mosque'! Contemporary attempts have been made to look at semantic content differently. Rather than trying to reduce content to one or a very few clearly storable characteristics, the new, cognitively inspired approach tries to find coherence in the notion of semantic networks, thus plants > objects made from plants > powerful things (e.g., medicine), or plants/trees > long, extended shape > time trajectory (e.g., 'year, journey'). This still leaves unexplained exceptions, but may lead to even better results when applied to more languages.

It is interesting to note in closing that the final semantic contrasts remaining in languages that have reduced their noun classes almost to zero are those of languages recognized as pidgins. Thus the Cameroonian language Kako (Katanga, 2003: 108), certain D30 languages in the northeastern DRC, and Pidgin Swahili, as spoken in Nairobi, have in common that they have only two or three classes left, retaining only the distinction animate/inanimate or human/nonhuman.

Bantu languages are verby, that is, the verb is not only the organizational center of the sentence but encodes more information than any other word class, information that in, for example, English requires several words. The verb structure is agglutinating and may include up to 20 morphemes in some languages (Nurse and Philippson, 2003c: 9). These two structures cover the main possibilities for the one-word verb:

NEG₁ - prefix - formative - object - root - extension - final vowel - postfinal
 prefix - NEG₂ - formative - object - root - extension - final vowel - postfinal

The only two obligatory constituents are root and final vowel, which cooccur in the imperative. Several morphemes may cooccur at prefix, formative, object, extension, and postfinal, typically in a canonical order. The structures differ only in the position of the NEG. Over the past two decades, phonologists have interpreted these linear structures as a hierarchy. Root and extension form the derivational stem: extensions are tonally neutral, have a canonical VC shape, and have a reduced five-vowel system; the derivational stem is the domain of vowel harmony with the root. Derivational stem and final vowel form the inflectional stem, the domain of reduplication, vowel coalescence, and limited consonant harmony with the final root consonant. Derivational stem and object form the macrostem, the domain of certain tonal phenomena. Finally, the macrostem combines with all preceding material to form the verbal word. This synchronic division of the verb into macrostem and prefixes corresponds well with likely historical development – other Niger-Congo languages have the macrostem, to which Bantu prefixes were added later.

Always or nearly always encoded in the inflected verb are subject, tense, aspect, mood, valency, and negation. Subject concord is usually obligatory and encoded at the prefix in both of the preceding structures, whether the subject noun is present or not. Tense is most often encoded at formative, less often at the final vowel or before the prefix. Bantu languages typically have multiple past and future reference: 83% of a database of 100 languages geographically representative of all 500 had between two and five discrete past tenses (40% had two, 32% had three), and 87% had one to three futures (46% had just one, 25% had two). Aspect seems to have been originally marked at the final vowel, but today also appears at formative: perfective, imperfective, progressive, habitual, anterior (also called ‘perfect’), and persistent are the commonest aspects. Mood is most often subjunctive, marked by a suffixal [e] at the final vowel. Valency changes are marked at extension and include causative, applicative (encompassing various functions), impositive, neuter/decausative, positional, reciprocal/plurational, repetitive, extensive, tentative, reversible, and passive. Negation appears variously; 51% of the database languages have two negatives, one associated with subordinate clauses, relative clauses, subjunctives, and imperatives, the other with main clauses. The former is typically but not always marked at NEG₂, the latter at NEG₁; 28% of the database languages have a single negative, either at NEG₁ or NEG₂ or pre- or postverbally, and 15% of the languages have more than two negatives. Tense, aspect, mood (TAM)

distinctions in negative verbs may differ from those in positives.

Less often, rarely, or not encoded in the verb are relative markers, focus, pronominal objects, and other categories. Relatives are most often marked before or at prefix in the second structure, and often the main marking is tonal. Focus can highlight several categories (e.g., the lexical verb itself, what follows the verb, or the aspect) and is usually indicated as a second or third morpheme in the formative slot, or verb initially. Pronominal object marking is also variable: some languages allow no object markers in the verb, some allow one, some allow two, and in a few languages four and even five have been recorded, especially in association with an applicativized verb.

A second or third morpheme in the formative slot marks consecutive, itive, or ventive in some languages. Many languages allow compound verbs, whereby the first verb is a tense-marked auxiliary, most often ‘be,’ and the second, lexical verb carries aspect. Many TAM markers are visibly grammaticalized, reduced forms of auxiliaries.

Syntax

Bantu languages belong to Heine’s (1976) Type A, having subject (S) (Aux)-verb (V)-object (O)-X, whereby there may be two objects (double object marking, rather than direct and indirect), and X represents adverbials (the Cameroonian language, Nen, with subject-object-verb (SOV), is the only known exception): prepositions: and noun phrase constituents, including relative clauses and the genitive construction, follow the head noun. The following Ha examples illustrate these and other features mentioned earlier:

- inkokó ziníni zóóse záanje
‘all my big chickens’ (lit. chickens big all my)
- izo inkokó ziníni zibíri
‘those two big chickens’
- igúnira dzuuzúye imbutó
‘bag which.is.full.of seeds’
- ubwáato bwa-dáatá
‘canoe of-father’
- ba-ø-teera ibiharagi
‘they-sow beans’ (postverbal focus)
- ba-ø-ra-téera
‘they sow’ (verbal focus)
- wari wágiye hééhe
‘where had you gone?’ (lit. you.were you.went where)
- kéera ha-rabáaye
‘once there-was’ (Class 16)

- yasutse-mwó amáazi
‘she.poured-in water’ (Class 16)
- urondera-kó (Class 17)
‘...where you sought’ (lit. you sought-where)
- yamúhaaye umukáaté umwáana kumwóonga
‘she.gave bread to.child at.river’

The first four examples illustrate the order of constituents of the noun phrase. Harjula (2004: 131), from whom these examples come, stated that some of the constituents may change their order “without a change in the meaning” (in other languages, a change of place implies a change in emphasis) and that demonstratives precede the noun (in other languages, they may precede or follow). The fifth and sixth examples show one kind of focus contrast and one way of doing it: the form showing the close relationship between verb and postverbal constituent, also called the conjunctive, has a zero marker (ϕ) between subject marker and verb, whereas the form with focus on the verb, the disjunct, has a morpheme *ra* and retains the H of the stem. The seventh example shows a typical compound verb (‘be’ followed by main verb) and a wh-question: the wh-word typically retains the position of the element replaced, at least for nonsubjects. Yes/no questions are indicated either by a question marker at the beginning or end of the sentence, or by use of tone. Examples 8–10 show locatives in subject, object, and relative function, respectively, spatial relations being typically coded on the verb. The last example shows the ditransitive verb ‘give’ with two objects and an adverbial. Of this, Harjula said: “When there are two object prefixes the more indirect (i.e., the patient) is closer to the stem.” This runs counter to Bearth’s (2003: 127) claim that “the widespread tendency in Bantu languages is to assign the positions next to the verb on account of a hierarchy of parameters defined, in terms of (i) animacy of the referent (human > animate > inanimate), (ii) semantic role relationship (beneficiary > goal > patient > locative), (iii) participant category (first > second > third person), and (iv) number (plural > singular)”. This is true of noun phrases following the verb, and their mirror image, object prefixes preceding it. Finally, although the canonical word order is SVO, considerable word-order variation is possible for pragmatic purposes. The position to the right of the verb, in particular, acts as a focus position.

Bashkir

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Bashkir (*bašqort tǝlǝ, bašqorǝsa*) belongs to the northern group of the northwestern, or Kipchak, branch of Turkic. Its main area of distribution is the basin of the Belaya River and the southwestern slopes of the Ural Mountains. The Republic of Bashkortostan, or Bashkiria (*Bašqortostan Respublikahı*), which belongs to the Russian Federation and whose capital is Ufa (Öfö), borders on Tatarstan, the Udmurt Republic, and the Orenburg, Perm, Sverdlovsk, and Chelyabinsk regions. Of the more than 4 million inhabitants of the Republic, Bashkirs make up only 22%. Other groups include Russians, Tatars, Chuvash, Udmurts, Mari, and Ukrainians. Bashkir-speaking groups are also found south of Kuybyshev and east of Ural, in the regions Orenburg, Chelyabinsk, Samara, Kurgan, and Sverdlovsk. The total number of speakers of Bashkir is about 1.4 million.

Origin and History

The Bashkirs previously lived farther to the east, in West Siberia, first as subjects of the Volga Bulgar state and, after 1236, under Mongol rule. They reached their present-day territory under the Golden Horde. With the disintegration of the Golden Horde, the Bashkir territory was divided between the three khanates of Kazan, Noghay, and West Siberia. Bashkirs and Tatars came under Russian rule at the end of the 18th century. In 1919, a Bashkir Autonomous Soviet Socialist Republic was established. In 1992, Bashkortostan became an autonomous republic within the Russian Federation.

Related Languages and Language Contacts

Bashkir is closely related to Tatar and constitutes a connecting link to Kazakh. The different origins of

its speakers are reflected in heterogeneous linguistic features. Since Bashkir and Tatar varieties have been in close contact for many centuries, the boundaries between them are not always clear.

The Written Language

The Bashkirs used a local variety of Chagatay as their written language until the beginning of the 20th century, when they adopted written Tatar. A Bashkir standard language, mainly based on the eastern (Kuvakan) dialect, was established in the Soviet era. The Arabic script was replaced in 1929 and 1930 by a Roman-based script. The Cyrillic-based script system that was introduced in 1939 and 1940 differs considerably from the script of the Tatar system.

Distinctive Features

Bashkir exhibits most linguistic features typical of the Turkic family (*see Turkic Languages*). It is an agglutinative language with suffixing morphology and a head-final constituent order (subject-object-verb). In the following discussions, some of the distinctive features of Bashkir will be dealt with, with focus in particular on certain comparisons with Tatar.

Phonology

The Bashkir vowel system is very similar to that of the Tatar system. It comprises fully articulated and reduced vowels and exhibits the same systematic vowel shifts. Thus, low vowels of the first syllable have been raised: *e* > *i* (*bin* 'you' (<*sen*)), *o* > *u* (*yul* 'way' (<*yol*)), *ö* > *ü* (*hüd* 'word' (<*söz*)). High vowels have been centralized and reduced: *i* > *ě* (*těd* 'knee' (<*tiz*)), *u* > *ö* (*moron* 'nose' (<*burun*)), *ü* > *ö* (*kön* 'day' (<*kün*)).

In its consonant system, Bashkir differs from Tatar and approaches Kazakh. Thus, *č* has developed to *s* (*kis* 'evening' (Tatar *kič*), *sės* 'hair' (Tatar *čěč*)). Word- and suffix-initial *s* has developed to *h* (*hari* 'yellow' (Tatar *sari*), *bul-ha* 'if it is' (Tatar *bul-sa*)). In other cases, *s* has developed to *θ* (*ki θ* 'to cut'

(Tatar *kis*). The corresponding voiced sibilant *z* has developed into *δ* (*δur* ‘big, great’ (Tatar *zur*), *hüδ* ‘word’ (Tatar *süz*)). Interdental sibilants are also typical of Turkmen. Bashkir exhibits word-initial *y-* in cases in which Tatar has *ǰ* (*yǰlı* ‘warm’ (Tatar *ǰılı*)). This phenomenon also affects old loanwords, e.g., *yen* ‘soul’ (< Persian (*ǰā:n*, cf. Tatar *ǰan*). In its vowel harmony system, Bashkir is similar to Turkmen, Kirghiz, and some other languages in that low suffix vowels are rounded after a rounded vowel in the preceding syllable, e.g., *bölöt* ‘cloud’ (Tatar *bölit*), *öšön* ‘for’ (Tatar *öčän*).

The rules for consonant assimilations are much more complicated than they are in Tatar. Suffix-initial consonants may have up to four variants (plural *qala-lar* [city-PL] ‘cities,’ *at-tar* [horse-PL] ‘horses,’ *kül-der* [lake-PL] ‘lakes,’ and *taw-ǰar* [mountain-PL] ‘mountains,’ or ablative *qala-nan* [city-ABL] ‘from the city,’ *taw-ǰan* [mountain-ABL] ‘from the mountain,’ *at-tan* [horse-ABL] ‘from the horse,’ and *yalan-dan* [steppe-ABL] ‘from the steppe’). The third-person personal pronouns are singular *ul* ‘he, she, it’ and plural *ular* ‘they’ (Tatar *ul*, *alar*). The oblique stem of *ul* is *un-* (Tatar *an-*). The demonstrative pronouns include *bıl*, *bıñaw* ‘this,’ *ošo* ‘this here,’ and *şul*, *ul*, *anaw*, *tęę* ‘that.’

Dialects

Bashkir has a few main dialects and numerous sub-dialects. The eastern or mountain (Kuvakan) dialect comprises the subdialects Ay, Argayash, Salyut,

Miyas, and Kizil. The southern (Yurmat) group comprises Ik-Sakmar and the central dialect group comprises Kara-Idil and Dim. There are important differences between the eastern and southern dialects. The steppe, or southwestern, dialects have been strongly influenced by Tatar.

Basque

J I Hualde, University of Illinois at Urbana-Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Basque (Euskara) is the only remaining vestige of the linguistic situation in western and central Europe before the Indo-European expansion. Although many attempts have been made to relate Basque to other languages of the world, none of them is generally considered to have been successful. Genetic links with the Finno-Ugric family, the languages of the Caucasus, or any other living language for which some scholars have sought a genetic relationship with Basque would be so remote that no solid proof is likely to emerge.

As for the extinct language of the ancient Iberians, once spoken along the Mediterranean coast of Spain and known to us from a relatively large number of inscriptions, the fact that Basque has been of little help in deciphering these inscriptions forces us to discard the hypothesis that the two languages are closely related (although they do share a number of phonological and morphological features, attributable to areal phenomena). Basque is thus a language isolate.

Throughout its known history, Basque has been spoken in an area of variable extent on both sides of the western Pyrenees and along the coast of the Bay of Biscay. The present-day Basque-speaking area (*Euskal Herria*) corresponds to parts of three different administrative units, two in Spain and one in

France. There are currently approximately 700 000 speakers of Basque, almost all fully bilingual in either Spanish or French. The largest number of speakers is found in the Autonomous Community of the Basque Country (ACBC), which comprises the provinces of Bizkaia, Gipuzkoa, and Araba (in Basque)/Alava (in Spanish). Here Basque is co-official with Spanish and has an important presence in the educational system. In this region, the number of Basque speakers is growing in areas where the language is natively spoken by part of the population as well as in other areas, such as the city of Bilbao and most of Araba/Alava, where the Basque language had been lost centuries ago. Basque also enjoys some official recognition in Navarra (in Basque, Nafarroa), which is a separate autonomous community within the administrative structure of Spain. Although the greatest part of Navarra was Basque-speaking just a few centuries ago, the language suffered a strong geographical recession in the 19th and 20th centuries, and nowadays it is spoken natively only in the northwestern area of this region. The French Basque country comprises approximately the western half of the Département des Pyrénées Atlantiques. In most of the Basque-speaking area of France, the transmission of the language has seriously declined in the last few decades. Only a small percentage of children are currently learning Basque in this area.

From toponyms and other sources, we know that historically the Basque language was spoken over a larger area. The word *Basque* derives from Vascones, a nation that in Roman times occupied most of Navarra and northern Aragon. Across the Pyrenees, there is abundant epigraphic evidence showing that Basque or a very similar language was also spoken in the territory of the Aquitani. The Aquitanian inscriptions on tombstones, in Latin, provide only evidence for proper names, but they contain such clear elements as *ANDERE* (cf., Basque *andere* ‘woman’) and *CISSON* (cf., Basque *gizon* ‘man’) as proper names for individuals of the respective sex. For the late Middle Ages, we have documentary evidence that Basque was spoken both in northern Aragon and in areas of La Rioja and northern Castile, to the west and south of the present-day Basque country. It is, however, likely that the historical presence of the Basque language in these latter areas, and perhaps even in part of the territory of the ACBC, is due to territorial expansion during the early Middle Ages.

One reason for the hypothesis that Basque may have occupied a compact area at some point after the fall of the Roman Empire is that dialectal diversity within Basque is relatively small and clearly not ancient. Many obvious innovations are shared by all dialects. In some aspects, such as the accentual system

and the morphology of finite verb forms, variation is, nevertheless, considerable (even if it is due to relatively recent diversification) and in fact virtually every valley or town has a recognizable local variety. *Euskara batua* (unified Basque), the standard promoted by the Basque Academy, which is based on the literary tradition of central areas both to the north and the south of the Pyrenees, has been enormously successful in its social implantation through its use in the educational system and in the media.

Most Basque dialects have five vowel phonemes /i e a o u/. Zuberoan (Souletin) and a few other varieties spoken in France have a sixth oral vowel /y/ as well as contrastively nasalized vowels. A common consonantal inventory, such as is found in Gipuzkoan, is the following (the most common orthographic representation follows in parentheses when it is different from the phonetic symbol): /p t c (tt) k b d ʒ (dd) g t͡ʂ (tz) t͡ʂ (ts) t͡ʃ (tx) ʂ (z) ʂ (s) ʃ (x) x (j) m n ɲ (ñ) l ʎ (ll) r (r) r (rr)/. The most unusual aspect of this inventory is presented by the contrast between the two fricatives, lamino-alveolar *z* /ʂ/ (*izan* ‘be’) and apico-alveolar *s* /s/ (*esan* ‘say’), and the two corresponding affricated segments (*atzo* ‘yesterday,’ *atso* ‘old woman’). All Bizkaian and some Gipuzkoan varieties have lost this contrast. The phoneme /x/ is found only in the speech of speakers from Spain. Besides being found in borrowings from Spanish, in central areas (Gipuzkoa and some neighboring regions) it also appears in native words as a result of an evolution /j > ʒ > ʃ > x/ (like in Castilian Spanish). Other dialects have stopped at various stages along this evolutionary path. The result is that orthographic *j* in native words such as *jan* ‘eat’ is subject to much variation in its pronunciation. Whereas the official standard pronunciation is /jan/, the Gipuzkoan form /xan/ is also in widespread usage in standard Basque, and locally forms like /zan/ and /jan/ are also used. Conversely, a phoneme /h/ (orthographic *h*: *hemen* ‘here,’ *aho* ‘mouth’) is used only in parts of the French Basque country. That is, for most speakers orthographic *h* is silent. The (pre)palatal consonants have a special status. One way to form diminutive/affective forms is by palatalization, for example, *tanta* ‘drop,’ *ttantta* /canca/ ‘small drop,’ *zezen* ‘bull,’ *xexen* /ʃeʃen/ ‘little bull.’ A pitch-accent system strikingly similar to that of Tokyo Japanese, with a lexical contrast between accented and unaccented words, is found in the northern Bizkaian area. The most common accentual system (in Gipuzkoan and neighboring areas), however, has regular stress on the second syllable.

Marking of grammatical functions works on a strictly ergative basis, with one case (absolute, morphologically unmarked) assigned to objects and intransitive subjects and another (ergative, *-k*) assigned

to transitive subjects: *lagunak liburua dakar* ‘the friend is bringing the book,’ *laguna dator* ‘the friend is coming.’ Nevertheless, a class of syntactically intransitive verbs takes ergative subjects (and transitive auxiliaries and agreement) in a somewhat unpredictable manner: *lagunak dantzatu du* ‘the friend has danced.’ Finite verb forms are marked for agreement with up to three arguments (subject, object, and indirect object): *dakarzkiguzu* ‘you (-zu) are bringing them (-z-) to us (-gu)’ (-kar- is the verb root ‘bring’; -ki- is a dative pre-prefix). In addition, in the familiar treatment, an addressee who is not an argument of the verb is also obligatorily encoded in the morphology of verbs in main clauses. Thus, for instance, plain/formal *dakit* ‘I know it’ is replaced, in the familiar treatment, by *zekiat* ‘I know it (male addressee)’ or *zekinat* ‘I know it (female addressee).’

Although both SOV and SVO orders are common in texts, verb-final structures are more basic: *gizona da* ‘it is the man.’ Focalized elements and question words are normally immediately preverbal. Main verbs precede auxiliaries (*etorri da* ‘(she/he) has come’), except in negative clauses (*ez da etorri* ‘(she/he) has not come’).

Articles and demonstratives are phrase-final: *laguna* ‘the friend,’ *lagun bat* ‘a/one friend,’ *lagun hori* ‘that friend,’ *lagun gazte hori* ‘that young friend.’ Although, as shown in the last example, adjectives follow nouns, genitives and relative clauses precede the head noun, as in most other SOV languages (*lagunaren liburua* ‘the friend’s book,’ *etorri den laguna* ‘the friend who has come’). Noun phrases are inflected for number and case by suffixes attached to the last word in the phrase: *lagunari* ‘to the friend,’ *lagun onari* ‘to the good friend,’ *etorri den lagun gaztearentzat* ‘for the young friend who has come.’

Belorussian

S Young, University of Maryland Baltimore County, Baltimore, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Belorussian (*belaruskaja mova*; Belarusian, Belarusan), which together with Ukrainian and Russian forms the East Slavic branch of the Slavic languages, is the native language of some 8 million speakers in the Republic of Belarus. The standard language is based on the central dialect of the Minsk region. In an earlier form known as Old Belorussian, West Russian, or among contemporaries simply as *rus'skij*, Belorussian served from the 15th through the late 17th centuries (when it finally yielded to Polish) as the chancery language of the multiethnic Grand Duchy of Lithuania (which in 1569 became part of the Polish Commonwealth). Thereafter, with political bans on publication in the language, Belorussian went into a period of decline. It was not until the first decades of the 20th century that Belorussian experienced a revival, with roots not in the distant literary traditions of the Grand Duchy, but in the vernacular of the countryside. The first legal Belorussian periodical, *Naša Niva* 'Our Cornfield' (1906–1915), attracted contributions from leading intellectuals of the day and did much to promote structural and orthographic uniformity in the language. The first attempt at a normative grammar of the language was Branislaŭ Taraškevič's *Belaruskaja hramatyka dlja škol* 'Belorussian grammar for schools' (1918). The consolidation of grammatical norms continued well into the 20th century.

Belorussian, which is written in the Cyrillic alphabet, shares a number of phonological features with both Russian and Ukrainian. As in standard Russian, unstressed *o* is pronounced *a* (*ákanne*), and (as in certain Russian dialects) unstressed *e* becomes *'a* (*jákanne*). Unlike Russian, these features are reflected in the orthography (in the case of *jákanne*, only in pretonic position), which is set up on the phonemic, rather than morphophonemic, principle: *nažy* 'knives' (sg. *nož*) and *zjamljá* 'world' (pl. *zémli*). Most consonants occur in phonemically opposed palatalized–nonpalatalized pairs. East Slavic *tʲ* and *dʲ* have

assibilated to *tsʲ* and *dzʲ*: *dzéci* ['dzʲetsʲi] 'children' (Rus. *děti* ['dʲetʲi]); palatalized *rʲ* has been lost: *rad* 'row' (Rus. *rjad*). As in Ukrainian, the palatal affricates *č* and *šč* are pronounced hard, East Slavic *g* is a fricative [ɣ], and *v* becomes [w] (in transcription from Cyrillic, *ŭ*) in closed syllables: *halóŭka* 'head, dim.' (*halavá* 'head').

Morphological characteristics of the noun include the loss of a distinct neuter plural: *aknó* 'window' (pl. *vókny*; Rus. *oknó, ókna*); the alternation of stem-final velars and dental affricates in certain case forms: nom. sg. *ruká* 'hand' (dat. sg. *rucé*); and a tendency toward the spread of the first declension genitive plural marker *-oŭ* (unstressed *-aŭ*) to other declensions: *zímaŭ* (Rus. *zim*) 'of winters'.

The verb has two regular conjugation patterns, illustrated in the present tense by *nésci* 'to carry' (I) and *rabíc* 'to do, make' (II): 1SG *njasú, rabljú*; 2SG *njaséš, róbiš*; 3SG *njasé, róbic*; 1PL *nesëm, róvim*; 2PL *nesjacé, róbice*; 3PL *njasúc', róbjac'*. Like Ukrainian, but unlike Russian, the third-person ending (lacking in the singular of pattern I) is palatalized. As in Ukrainian, there is a change of the masculine past tense marker *l* to *w*: *znaŭ* masc. 'knew' (fem. *znála*).

To a greater extent than in Ukrainian, the lexicon reflects the historical influence of Polish, chiefly from the period of the Polish-Lithuanian Commonwealth. Since the late 18th century unification with Russia, the influence of Russian has prevailed.

Bengali

H-R Thompson, School of Oriental and African Studies, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Bengali is the official language of Bangladesh and of the state of West Bengal in India. There is some controversy about the correct name of the language. The term 'Bangla' is increasingly in use, particularly among Indian linguists, for whom the term 'Bengali' may be associated with British India. It is likely that in the not-too-distant future 'Bangla' will replace 'Bengali.' With a total number of about 260 million speakers, Bengali is the world's fifth largest language.

Bengali, together with Assamese and Oriya, belongs to the eastern branch of Indo-Aryan languages. A high percentage of vocabulary is derived from Sanskrit, with lesser influences from Persian, Arabic, and English. Bengali has a very large vocabulary but the language situation is diglossic. The vocabulary used in spoken language is distinct from the highly Sanskritized words used in some literature and formal contexts. Many words have both a Sanskritic and a colloquial version, e.g., হস্ত, /hɔsto/, হাত /hat/ 'hand,' চন্দ্র /cɔndro/, চাঁদ /cād/ 'moon,' দন্ত /dɔnto/, and দাঁত /dāt/ 'tooth.' The early 20th-century rivalry between the *sadhu bhasha* (literary language) and *calit bhasha* (colloquial language) is now a thing of the past. Standard Colloquial Bengali, based on the language spoken in Kolkata, is the accepted norm. Some Bengali dialects retain the *sadhu* extended verb forms, e.g., আমি যাইতেছি /ami yaitechhi/) rather than the contracted *calit* form (আমি যাচ্ছি /ami yacchi/ for 'I am going.'

Dialects vary in phonological and grammatical deviation. Sylheti, the dialect spoken by most Bangladeshis living in the United Kingdom, has a high percentage of Persian words and is considered by some to be a separate language.

Orthography and Phonology

Bengali is written in a variant of the Devanagari script, which is related to but distinct from the script used for Sanskrit and Hindi. Writing is from left to right and is syllabic. There are 12 vowels or diphthongs, two semivowels, and almost 40 consonants. Bengali has a great number of conjunct letters that combine, in one symbol, two or more consonants or consonant-vowel clusters. Vowel signs are attached to consonants except at the beginning of words and syllables, where the full vowel is written.

An inherent vowel (pronounced /ɔ/ or /o/) is often pronounced when no other vowel is given.

Bengali, like other South Asian languages, distinguishes between aspirated/unaspirated and dental/palatal sounds. Nasalization occurs in individual words and is phonemic (কাদা /kada/ 'mud,' কাঁদা /kāda/ 'weep,' বাধা /badha/ 'obstruction,' বাঁধা /bādha/ 'bind') and in the distinction between ordinary and honorific personal pronouns, as in ওর /or/ 'his/her' (familiar) and ওঁর /ōr/ 'his/her' (honorific). Bengali spelling retains some Sanskrit features, but its pronunciation has evolved and changed. The word for 'soul,' though it is spelled আত্মা /atma/, is pronounced /atta/. The Sanskrit word for heaven 'swarga' becomes স্বর্গ, pronounced /sɔrgo/. The distinction between long and short u and i, which is present in the script, is no longer felt in pronunciation. Long /o/ can be represented by the vowel sign or by the inherent vowel. There are three symbols for the sound /ng/: ঙ, ঞ, and the conjunct ঞ্. Their uses are to some extent interchangeable, but ঙ is never followed by a vowel, thus we have বাংলা /bangla/ (the name for the language), but বাঙালি /bangali/ (the adjective and name for the people). There are three sibilants in Bengali স /s/, শ /ʃ/, and ষ /ʂ/. Their pronunciation is /sh/, except in some conjuncts, in which it changes to /s/, e.g., বিশ্রাম /biʃram/ 'rest,' স্থান /sthan/ 'place,' and নাস্তা /nasta/ 'breakfast.'

Morphology and Syntax

Basic word order is subject-object-verb, but sentence parts can move freely to express emphasis. Bengali has a complex relative-correlative system – i.e., subordinating conjunctions such as যখন /yokhon/ 'when' and যদি /yodi/ 'if' almost invariably have a correlative conjunction in the main clause. Subordinate clauses generally precede main clauses.

Nouns have no grammatical gender. There are four cases, nominative, genitive, object, and locative. The **nominative** is unmarked. Number and definiteness is marked by determiners that are suffixed to nouns, but their use is partly defined by the context. Plural markers for animate and inanimate nouns are distinct from one another. All case endings are added after these suffixes, e.g., মেয়ে /meɣe/ 'girl,' মেয়েটি /meɣe-ti/ 'the girl,' and মেয়েটিকে /meɣe-ti-ke/ 'to the girl.'

In the **genitive** nouns, add র /r/ or এর /er/: বাবা /baba/ 'father,' বাবার /baba-r/ 'father's,' উকিল /ukil/ 'lawyer,' and উকিলের /ukil-er/ 'the lawyer's.' The genitive has a wide variety of uses, including possession (রিমার ভাই /rima-r bhai/ 'Rima's brother'), attribute (প্রেমের গল্প /præm-er golpo/ 'love story'), function (বসার ঘর /bosar ghor/ 'sitting room'), measurement (দুই ঘণ্টার ছবি /dui

ghoṅṭa-r chobi/ ‘a film lasting two hours’), and cause or origin (সমস্যার সমাধান /sɔmɔsʃa-r sɔmadhan/ ‘solution to the problem’). The genitive usually functions as the logical subject in impersonal structures.

The **object case** is marked by কে /ke/: from (বাবা /baba/ ‘father’ বাবা-কে /baba-ke/ ‘to father’). The case ending is used to mark direct or indirect objects. The case marking is usually omitted for inanimate nouns, but can be added for emphasis or to avoid ambiguity.

The **locative** ending is এ /e/ after consonants: সহর /sɔhor/ ‘town’ সহরে /sɔhor-e/ ‘in the town’; য় /y/ after আ /a/ (ঢাকা /dhaka/ ঢাকায় /dhaka-y/ ‘in dhaka,’ and তে /te/ after all other vowels: বালু /balu/ বালুতে /balu-te/ ‘in the sand.’ The locative is used to indicate place: বাড়িতে /bari-te/ ‘at home,’ direction: ঘরে /ghor-e/ ‘into the house,’ time: দশটায় /dɔʃta-y/ ‘at ten o’clock,’ cause: তার বলায় /tar bɔla-y/ ‘because of what he said,’ instrument: হাতুড়িতে /hatuṛi-te/ ‘with a hammer,’ or origin: চেষ্টায় /ceṣṭa-y/ ‘from/through trying.’ The locative is rarely used with animate nouns.

Bengali has personal, demonstrative, relative, interrogative, and indefinite **pronouns**. Personal pronouns distinguish three grades of familiarity in the second person and two grades of respect in the third person. They distinguish singular and plural, but not gender. There is a three-way deictic distinction (*here, there, and removed from context*) that applies to third-person pronouns, attributive adjectives, demonstratives, and place adverbials, for instance, এ মেয়ে /e meye/ ‘this girl,’ ও মেয়ে /o meye/ ‘that girl (over there),’ সে মেয়ে /se meye/ ‘that girl, (removed from context),’ এখানে /ekhane/ ‘here,’ ওখানে /okhane/ ‘there,’ and সেখানে /sekhane/ ‘in that place.’

Adjectives precede nouns and are indeclinable. For comparisons, auxiliary words are used:

- (1) আমার ভাই আমার চেয়ে লম্বা।
/amar bhai amar ceye lombha/
my brother my than long
‘My brother is taller than me.’
- (2) এই গাছ সবচেয়ে সুন্দর।
/ei gach sobceye sundor/
this tree all than beautiful
‘This is the most beautiful tree.’

Postpositions are, with a few exceptions, noun forms: about my parents: *on the subject of my parents*; or verbal participles: with the hammer *having taken the hammer*.

Verb conjugation is very regular. Verb endings are the same for singular and plural. Some active verbs can be extended to form causative verbs, e.g., জানা /jana/ ‘know’ becomes জানানো /janano/ ‘inform’; দেখা /dækha/ ‘see’ becomes দেখানো /dækhano/ ‘show’). There are, morphologically, eight tenses. Present and past tense have simple and progressive

aspect. Perfect tenses (present and past) can express not only perfective aspect but are also used to refer to past events or actions directly. The past habitual is used for remote past events and for subjunctive uses. The future tense forms the after-state of all other tenses. Tense use is much freer than in English – in fact, narrative texts gain color and liveliness through frequent tense changes.

Every verb has four **nonfinite verb forms**: infinitive, verbal noun, conditional, and perfective participle. Conditional and perfective participles, in particular, offer in very concise forms a great range of meanings. The conditional participle is formed by adding লে /le/ to the stem of the verb: থাকলে /thakle/ from থাক- /thak-/ ‘stay.’ It can be used temporally as well as conditionally and its temporal structure is determined by the main clause, thus a phrase such as সে থাকলে /se thakle/ has a range of meaning, from ‘when he is here’ to ‘if he were alive.’ The perfective participle, formed by adding এ /e/ to the verb stem, describes in its basic use a preceding action (e.g., খবরটা শুনে সে বাইরে গেল। /khɔborṭa juṇe se baire gælo/ ‘having heard the news he went out’), but it can also take on causal meaning, can describe simultaneous actions, or can be used to change an adjective into an adverb (e.g., ভাল /bhalo/ ‘good’ becomes ভাল করে /bhalo kore/ ‘well’). It is not unusual to have a number of perfective participles in one sentence to describe consecutive events. Perfective participles are also used in the formation of compound verbs, in which two verbs combine to take on a new meaning. The second verb can lose its original meaning entirely and instead add an aspectual feature to the perfective participle, as in খাওয়া /khaoṛa/ eat, খেয়ে ফেলা /kheye phæla/ (lit: having eaten, throw = ‘eat up’) and আসা /asa/ ‘arrive’). To some extent, nonfinite verb forms take over the role of subordinate clauses.

Impersonal structures are very common, as, for instance, in expressing possession, possibility, obligation, and physical sensations, feelings, and experiences (examples (3)–(6), respectively):

- (3) আমার গাড়ি আছে।
/amar gaṛi ache/
my car be.3.PERS PRES
‘I have a car.’
- (4) এখানে যাওয়া যায়।
/ekhane yaoṛa yay/
there go.VN go.3.PERS PRES
‘It is possible to go there.’
- (5) তাকে যেতে হবে।
/take yete hobe/
him.ACC go.INF be.3.PERS FUT
‘He will have to go.’

- (6) আমার ভয় লাগে।
/amar bhoý lage/
my fear attach.3.PERS PRES
'I am afraid.'

The logical subject is usually in the genitive.

Passives are formed with verbal nouns and the verb হওয়া /hoýa/ 'be, become'; for example, সে আমাকে টাকা দিয়েছে। /se amake taka diýeche/ 'he has given me money' becomes as shown in example (7):

- (7) আমাকে টাকা দেওয়া হয়েছে।
/amake taka deoýa hoýeche/
me. ACC money give.VN be.3.PERS PRF
'The money has been given to me.'

Intransitive verbs can also be used in passive structures; for example, আমি যাবো। /ami yabo/ 'I will go' becomes as shown in example (8):

- (8) আমার যাওয়া হবে।
/amar yaýoa hobe/
my go.VN be.3.PERS FUT
'My going will be.'

Special Features

If languages can be said to have particular characteristics, then Bengali has a sense of play in its phonetic structure. We find it in numerous onomatopoeia, such as চকচক /çokçok/ 'glittering,' টিপটিপ /tipip/ 'dripping' (water), ঘোঁত ঘোঁত /ghõtghõt/ 'grunting,' খিলখিল /khilkhil/ 'giggling,' and ধু-ধু /dhu-dhu/ (expressing 'desolation'), but also in sequences of similar or identical syllables to express mutual or extended actions, as in হাসাহাসি /hasahasi/ 'laughing,' মারামারি /maramari/

'fighting,' ঠেলাঠেলি /thælatheli/ 'jostling,' বকাবকি /bõkabõki/ 'bickering,' লেখালেখি /lækhalækhi/ 'correspondence,' and কান্নাকাটি /kannakatì/ 'continuous weeping.' Reduplication of adjectives and adverbs has an intensifying effect, as in বড় বড় /bõro bõro/ 'big big'-'very big,' দূরে দূরে /dure dure/ 'far far' = 'a long way away,' and সকাল সকাল /sõkal sõkal/ 'morning morning'-'very early.' Many of these combinations have an element of improvisation and greatly add to the charm of the language.

Benue–Congo Languages

K Williamson

© 2006 Elsevier Ltd. All rights reserved.

The Benue–Congo languages form a very large group in Africa and include the well-known Bantu languages. The term 'Benue–Congo' was introduced by Greenberg (1963) to refer to one of the six branches of his Niger–Congo family. Previously, the Bantu languages had been treated as a separate family and the similarity of the other Benue–Congo languages to Bantu had been recognized by referring to them as 'Semi–Bantu' (Johnston, 1919–1922) or 'Bantoid' (e.g., Guthrie, 1948), equivalent to the 'Benue–Cross'

of Westermann (1927). Greenberg's innovation was to remove the separate status of Bantu, add it to Westermann's Benue–Cross as a subgroup, and re-name the group, using the term 'Congo' to indicate its extension into the Bantu area.

Greenberg's View of Benue–Congo

Greenberg contrasted Benue–Congo with the other five branches of Niger–Congo, though he noted it was particularly close to Kwa. Internally, he subdivided it into Plateau, consisting of seven numbered subgroups; Jukunoid; Cross River, consisting of three numbered subgroups; and Bantoid, containing seven

languages or groups, the last of which is Bantu. The term ‘Old Benue–Congo’ refers to this scenario.

Views of Benue–Congo in the Late Twentieth Century

Bennett and Sterk (1977) noted that lexicostatistics led to some major changes in Greenberg’s scenario. In particular, they split Kwa in half and combined the Eastern half with Benue–Congo. The approximate consensus is presented in Bendor-Samuel (1989); Benue–Congo, including the former Eastern Kwa, is now one of the branches of Volta–Congo, which is in its turn a branch of Atlantic–Congo, within Niger–Congo. The term ‘New Benue–Congo’ refers to this scenario.

Subgrouping of (New) Benue–Congo

Because of the reclassification in the late 1980s and the very large number of languages involved, the subgrouping of New Benue–Congo is in a fluid state. On the basis of lexical innovations, Blench (1989) has suggested a major division between Western Benue–Congo, corresponding to the former Eastern Kwa, and Eastern Benue–Congo, corresponding to Old Benue–Congo. The recognized subgroups are now listed. (Nigerian orthographic conventions used in language names are as follows: ɔ [ɔ], ɛ [ɛ], ɪ [i], ɔ̄ [ə], ɟ [j].) Western Benue–Congo (formerly Eastern Kwa):

- (a) Ọkọ (Ogori): a small, little-studied language.
- (b) Ukaan–Akpes: two clusters of tiny, barely studied dialects.
- (c) Defoid: two clusters of tiny Akokoid (Amgbe) dialects, plus the Yoruboid group, comprising Yoruba, Işẹkiri, and Igala.
- (d) Edoid: a large number of languages, including Edo (Bini), and Urhobo.
- (e) Nupoid (Niger–Kaduna): some seventeen languages including Ebira (Igbirra), Gade, Gbagyi and Gbari (jointly called Gwari), Kakanda, and Nupe.
- (f) Idomoid: some nine languages, including Idoma.
- (g) Igbooid: comprises Ekpẹye and a large language cluster centered around Igbo.

Eastern Benue–Congo (Old Benue–Congo):

- (h) Kainji: corresponds to Greenberg’s Plateau 1; subdivided into Western Kainji, including the Kambari and Bassa groups and the Lela (Dakarkari) language, and Eastern Kainji, including the Northern Jos group of small languages.
- (i) Platoid: corresponds to Greenberg’s Plateau 2–7 plus Jukunoid; subdivided into Plateau, with five geographical subgroups including many languages,

such as Eggon, Che (Rukuba), Berom, Jju (Kaje), and Tyap (Katab); and Benue, containing Tarok and related languages in one group and Jukunoid, including Jukun, in another.

- (j) Cross River: subdivided into Bendi, corresponding to Greenberg’s Cross River 1 and including Bekwarra and Bokyi; and Delta–Cross, corresponding to Greenberg’s Cross River 2 and 3 combined, comprising four subgroups: Upper Cross, including Mbembe and Lokāa, Lower Cross, including Anaang, Efik, Ibibio, and Obolo; Ogoni (Kegboid), including Kana, Gokana, and Eleme; and Central Delta, including Abuan and Ogbja.
- (k) Bantoid: subdivided into Northern Bantoid, comprising Mambila with related languages and Samba Daka with related languages; and Southern Bantoid, comprising the Bantu languages, taken in the broad sense, as used by Greenberg, with the addition of Tiv and languages related to it.

Geographical Location

The Benue–Congo language groups are chiefly found in Nigeria, with Yoruboid, Jukunoid, Cross River, and Northern Bantoid extending slightly into neighboring countries and Bantu having expanded dramatically into Central, East, and Southern Africa.

Typological Characteristics of the Group

Benue–Congo languages have Subject–Verb–Object or occasionally Subject–Modal–Verb–Object word order; adverbials are normally sentence-final. A wide variety of serial verb and consecutive verb constructions are found.

The most typical morphological feature is the existence of noun class systems, usually marked by paired singular/plural prefixes or, for mass nouns, by a single prefix. Words that qualify the noun show concord with the verb, and the verb also shows concord with the noun class of its subject. Some languages have developed noun class suffixes in addition to or instead of prefixes. Bantu languages are the most conservative in showing very full noun class systems, but there are few Benue–Congo languages that do not display at least remnants of a former noun class system.

Verbs often take suffixes, ‘verbal extensions’ or ‘extensional suffixes,’ which add such meanings as causative, reciprocal, or separative to the meaning of the root.

Most Benue–Congo language groups show typical phonological features of Niger–Congo, such as vowel harmony, labial-velar stops, and tone. The typical root structure is CVCV (where C = Consonant,

V = Vowel) in the more conservative languages; others have reduced their roots to CVC or CV. Complex nasal phenomena involving both vowels and consonants are widespread.

Berber

S Chaker, INALCO, Paris, France

Introduction

The Berber language is one of the branches of the large Hamito-Semitic (Afroasiatic) linguistic family, which also includes Semitic, Cushitic, ancient Egyptian, and Chadic. With all that this notion implies, Berber can be considered as the ‘aboriginal’ language of North Africa because currently there is no positive trace of an exterior origin or of the presence of a pre- or non-Berber substratum in this region. As far back as one can go (first Egyptian accounts: cf. Bates, 1914/1970), the Berber language was already installed in its present territory. Particularly, the toponymy has not allowed us to identify, up till now, any kind of pre-Berber linguistic sediment. Despite numerous theories suggested by linguists since the 19th century in favour of an external origin of the language (Middle East or East Africa), neither prehistoric archaeology nor physical anthropology could show the movement of a population coming from elsewhere; it has even been solidly established that man has been present in North Africa, in a continuous manner, for at least a million years (cf. Camps, 1974, 1980).

Tamazight (the Berber word for language) covers a vast geographical area: all of North Africa, the Sahara, and a part of the West African Sahel. But the countries principally concerned are, by order of demographical importance: Morocco (35–40% of the total population), Algeria (25% of the population), Niger, and Mali (Tuaregs) (Figure 1).

The Berber-Speaking Regions

In Morocco, spoken Berber is spread into three large dialectical areas that cover the totality of the mountainous regions: in the north is the Rif (Tarifit); in the center, the Mid-Atlas and a part of the High-Atlas (Tamazight [Tamazight, Central Atlas]); and in the south/southwest (High-Atlas, Anti-Atlas and Under), the Chleuh domain (Tachelhit/Tašelhit/Chilha).

In Algeria, the principal Berber-speaking region is Kabylia. In a relatively limited but densely populated surface area, Kabylia (Kabyle; Taqbaylit dialect) alone has two-thirds of Algeria’s Berber speakers. The other significant Berber-speaking groups are: the Chaouias (Chaouia; Tachawit) of the Aures region, having in all likelihood a million people, and the people of the Mzab (in Ghardaia and other Ibadhite cities), having a population of between 150 000 and 200 000. There are in fact other Berber-speaking groups in Algeria, but these are modest linguistic islands of only several thousands to tens of thousands of speakers.

The third large group of Berber speakers is the Tuaregs (Tamashaq [Tamasheq], Tamajaq [Tamajaq, Tawallamat], Tamahaq [Tamahaq, Tahaggart]), straddling several countries across the Sahara-Sahel zone, principally in Niger (±500 000 people) and in Mali (450 000). The other countries: Algeria (Ahaggar, Ajjer dialects), Libya (Ajjer dialect) Burkina-Faso, and even Nigeria, have more limited Tuareg populations. The total Tuareg population is well over 1 million individuals.

The other Berber speaking regions are isolated, often threatened areas, spread out across the south of Mauritania (Zenaga), in Tunisia (in Djerba, in part, and in several villages in the south-central part

Figure 1 Map of the Berber-speaking region in North Africa.

of the country), in Libya (where Berber-speaking groups are clearly larger and more resistant), and in Egypt (the Siwa Oasis).

But these are only the traditional locations: from the beginning of the 20th century and especially since decolonization, worker emigration and the massive rural exodus that took place throughout the Maghrib have been the basis for the formation of Berber-speaking communities in all the major cities: Algiers and Casablanca are the most outstanding examples. And Paris is one of the three principal Berber-speaking cities of the world, perhaps even the largest!

Linguistic Features

Phonetics and Phonology

The phonological consonantic system of Berber (Basset, 1952/1969; Prasse, 1972–1974) relies on an opposition between tensed and nontensed consonants. Variation is induced by: phonemes borrowed from

Arabic (Arabic, Standard) (pharyngeals, some emphatics), a tendency towards spirantization in Northern dialects, and palatalization and labio-velarization.

The vocalic system of Berber is ternary: /a/ vs. /i/ vs. /u/. The schwa [ə] is considered by most researchers as a neutral vowel without phonological status. Intermediary phonemes (/e/, /o/, /ä/) that exist in some dialects (Tuareg, Libya, Tunisia) are recent innovations (Prasse, 1984–1986), stemming from the probable phonologization of former contextually conditioned variants. The same is also probably true of vocalic duration, which has distinctive status in those dialects (for instance, to mark the intensive perfective in Tuareg). It probably originates in an expressive lengthening, or in a quantitative reinterpretation of accentual phenomena.

Morphology

Berber stems are composed of a consonantal root and an inflectional scheme, which is specific to the

considered part of speech. There are, for instance, adjectival schemes, verbal (aspectual) schemes, and nominal schemes (Table 1, Table 2).

The verb ‘go/go with’, is composed of a root (*dd*) and an obligatory aspectual inflection (Table 3).

The morphology of Berber is heavily derivational. For instance, there is a class of labile (ambitransitive) verbs, which varies in size depending on the dialects, and which can be semantically transitivized thanks to a causative-transitive prefix (*s-*). The ‘passive’ is rare and marked through a *ttw-* prefix, reciprocals and middles are marked thanks to a nasal prefix (*my-*). Those prefixes have variants within each dialect (Table 4).

Case in Berber is limited to an opposition between what is traditionally called ‘état libre’ and ‘état d’annexion.’ The former is unmarked, and the latter marked. ‘État libre’ is the form taken by nominals in citation form, topic position, direct object, possessee.

Table 1 Adjectival scheme

| Adjective | Verb | Root | Adj. Scheme | Adjective |
|-----------|--|--------------------------|---------------|----------------|
| ‘white’ | <i>i-mlul</i> sub.3MSG- be.white | <i>mll</i> <i>ccc</i> | <i>acc:ac</i> | <i>aməllal</i> |

Table 2 Nominal scheme

| Noun | Verb | Root | Nom. Scheme | Adjective |
|----------|--|------------------------|----------------------------------|---------------------------|
| ‘robber’ | <i>y-uk^wər</i> sub.3MSG- be.white | <i>kr</i> <i>cc</i> | (agent noun) <i>am-vcc</i> | <i>amak^war</i> |

Table 3 Aspectual inflections (Taqbaylit)

| Verb | Root | Aorist | Perfective | Negative Perfective | Imperfective |
|------|-----------|------------|------------|---------------------|--------------|
| ‘go’ | <i>dd</i> | <i>ddu</i> | <i>dda</i> | <i>ddi</i> | <i>təddu</i> |

Table 4 Verbal derivation

| Stem | Prefix | Verb | Grammar | Gloss |
|-------------|---------------|------------------|---------------------------|----------------------------|
| <i>kkəs</i> | + <i>s-</i> | <i>su-kkəs</i> | CAUS-take.off.PERFECTIVE | ‘made X take off’ |
| ‘take off’ | + <i>ttw-</i> | <i>ttwa-kkəs</i> | PASS-take.off.PERFECTIVE | ‘got taken off’ |
| | + <i>my-</i> | <i>my-kkəs</i> | RECIP-take.off.PERFECTIVE | ‘took off from each other’ |

‘État d’annexion’ is the form taken by postverbal subjects, nominals following prepositions and numerals, possessors (Table 5).

This distinction is no longer alive in all dialects. Dialects that have lost the opposition are: Nefoussa, Ghadames, Sokna, Siwa (Siwi) in Egypt and Zenaga of Mauritania.

There are two genders, masculine (unmarked), and feminine (marked). Gender is arbitrary. Feminine gender can function as a diminutive or partitive, or denote an item as opposed to a collection (Table 6).

Number distinctions are between singular and plural. Plural inflections are varied, either formed by affixation, or apophony; some plurals are irregular (Table 7).

There are no articles in Berber. Definiteness is contextually inferrable, word order playing a role in the matter. Anaphoric and deictic particles appear where necessary to disambiguate.

All verbs are completed with a personal or participial affix. Therefore, the minimal utterance is composed of a root, always inflected for aspect, and its obligatory personal affix (and accusative and dative clitics where applicable):

- (1) *yə-čča* (Taqbaylit)
SUB.3MSG-eat.PERFECTIVE
he ate/has eaten
- (2) *yə-fka* *yas*
SUB.3MPL-give.PERFECTIVE DAT.3SG
t *idd*
ACC.3MSG proximal.particle
He gave it to her/him

Constituent Order

Such minimal utterances are very frequent in authentic speech. However, longer utterances, containing noun phrases, also appear. The maximal configuration is exemplified below, and illustrates the VSO type:

- (3) *yə-fka* *umɣar* *idrimən*
SUB.3MSG-give.PERFECTIVE old.man.EA money.EL
i *umddak^wəl-is*
to *comrade.EA-POSS.3MSG*
the old man gave (some) money to his
companion

Table 5 Case

| | <i>État libre (EL)</i> | <i>État d'annexion (EA)</i> |
|--------|---|---|
| clause | <i>tafunast tə-čča</i> COW.EL SUB.3FSG- eat.PERFECTIVE (As for) the cow (she) ate/ has eaten. | <i>tə-čča tafunast</i> SUB.3FSG-eat.PERFECTIVE cow.EA The cow ate/has eaten. |
| phrase | <i>axxam uməkxa</i> house.EL shepherd.EA The shepherd's house | <i>axxam uməkxa</i> house.EL shepherd.EA The shepherd's house |

Table 6 Gender

| <i>Noun Form</i> | <i>Masculine</i> | <i>Feminine</i> |
|--------------------------|-------------------------|---------------------------------------|
| diminutive/ partitive | <i>axxam</i> 'house' | <i>taxxamt</i> 'small house/ room' |
| collective vs. item/ | <i>azəmmur</i> 'olives' | <i>tazəmmurt</i> 'olive tree' |

Table 7 Number

| <i>Number</i> | <i>'house'</i> | <i>'braid'</i> | <i>'heart'</i> | <i>'town'</i> |
|---------------|----------------|----------------|----------------|-----------------|
| singular | <i>axxam</i> | <i>asaru</i> | <i>ul</i> | <i>tamdint</i> |
| plural | <i>ixxamən</i> | <i>isura</i> | <i>ulawən</i> | <i>timdinin</i> |

Only a few quantitative studies on word order have been conducted. Among them, Mettouchi (to appear a) showed that in Taqbaylit, word order was in fact pragmatically motivated. This motivation is also probably true of other dialects. The following table (where V actually stands for a minimal utterance (root+personal affix)) shows the various configurations encountered in authentic speech (Table 8).

This table shows that, whereas the characterization of Berber (here Taqbaylit) as a VO language seems to hold, the status and position of the 'subject' is somewhat more problematic: almost one-fourth of the utterances can appear without one. This special behavior of the subject in Berber has long been recognized in Berber studies. Thus, traditionally, it is the personal affix that is considered as the real subject (and not as an agreement marker), whereas the preverbal coreferential nominal is called 'indicateur de thème' and the postverbal coreferential nominal 'complément explicatif' (Galand, 1964/2002). The positions of nominal constituents are determined to a large extent by pragmatic and semantic factors. Taqbaylit can therefore be considered as a nonconfigurational language, and more precisely, as a pronominal argument language. Quantitative studies

Table 8 Constituent order found in a conversational excerpt (143 third-person verbal predications)

| VS | SV | V | OV | VO |
|-----------------------------|-------------------------------|-------------|-------------|-------------|

must be conducted on other dialects to see whether this characterization is valid for Berber as a whole.

Berber is head marking at the level of the clause, but dependent marking at the level of the phrase. At the level of the phrase, Berber is also more rigid, and has the following properties among Greenberg's universals: it has prepositions, the possessor follows the possessee, the modifier (as well as relative clauses) follows the head noun and affixes are mostly prefixes.

Relative clauses (Galand, 1988) are distinguished according to the status of the antecedent: if it is coreferential to the subject of the relative clause, a participle is used. This form is composed of a root inflected for aspect, and an invariant circumfix (in Taqbaylit), or a limited set of affixes (in Tuareg) (Table 9).

In some syntactic contexts (relative clauses, interrogation, negation, TAM preverbs), clitics change position and attach themselves to the new head of the sentence (negative marker, interrogative pronouns or relativizer, preverb). This phenomenon of clitic-climbing is exemplified below:

- (4) ad as t idd
irrealis DAT.3SG ACC.3MSG *proximal.particle*
 yə-fk
 SUB.3MSG-give.PERFECTIVE
 He will give it to her/him

Predicate Nominals and Related Constructions

Verbs very often are the center of predication, but predicates can also be nonverbal. Nouns, adjectives, and free pronouns can function as predicates.

Attribution is marked, either, as in Tuareg, through a simple juxtaposition of nouns

- (5) Mûsa amɣar n Ahaggar
Mûsa chief.EL of Ahaggar
 Mûsa is the chief of Ahaggar

or, as in most Northern Berber dialects, thanks to a special invariant copula (particle):

- (6) d amur-iw
predicative.particle share.EL-my
 It's my share

Focus constructions are mostly based on attributive clauses (Taqbaylit):

- (7) d amur-iw i
predicative.particle share.EL-my relator
 dd y-uk^wər
prox.particle SUB.3MSG-steal.PERFECTIVE
 It's my share that he stole

But focus-fronting (traditionally called 'anticipation renforcée') is also encountered (Tuareg):

- (8) tagalla a tə-kša
bread DEMONSTRATIVE SUB.3FSG-eat.PERFECTIVE
 təmɣart
old-woman.EA
 It's bread that the old woman has eaten

Attributive predication can also be expressed thanks to a special category of verbs, quality verbs, which are only alive in some dialects, among them Taqbaylit. This category represents approximately 60 verbs, mostly referring to size and color, but also to other, more unexpected, semantic domains (Chaker, 1983: 117–118). It is characterized morphologically by a special suffixal conjugation in the perfective, in the 3rd person and the plural. Here is the paradigm of affixes for the verb *məqq^wr* 'be big' (Table 10).

Table 10 Quality verbs

| Person | Singular | Plural |
|--------|----------------------------|-----------------------------|
| 1 | <i>məqq^wr-ɣ</i> | |
| 2 | <i>məqq^wr-d</i> | <i>məqq^wr-it</i> |
| 3 M | <i>məqq^wr</i> | |
| 3 F | <i>məqq^wr-t</i> | |

Table 11 Basic aspectual opposition

| Aorist | Perfective | Imperfective |
|--|---|--|
| <i>y-ak^wər</i> SUB.3MSG-steal.aorist neutral/indefinite | <i>y-ukər</i> SUB.3MSG-steal.perfective punctual/definite/completed | <i>yə-ttak^wər</i> SUB.3MSG-steal.imperfective durative/iterative/habitual/progressive |

'Existence' is marked thanks to the verb *ili* 'be,' 'exist,' in the perfective (Taqbaylit).

- (9) lla-n waman
exist.PERFECTIVE-SUB.3MPL waters.EA
 There is water

Location can be predicated thanks to the association of an interrogative pronoun and an accusative clitic (Taqbaylit):

- (10) anda t umur-iw?
where ACC.3MSG share.EA-my?
 where is my share?

Possession is mostly predicated through the association of a preposition and a special personal affix (Taqbaylit):

- (11) ɣur-s sin yəzgarən
with-him two oxen.EA
 He has two oxen

Aspect

Berber dialects are basically aspectual, with evolutions towards tensedness in some of them (Tachelhit, cf. Leguil, 1992). A. Basset (1929, 1952/1969) was the first to reconstruct the basic ternary system of Berber, which opposes three forms: aorist ('aoriste simple'), perfective ('accompli,' 'prétérit'), and imperfective ('inaccompli,' 'aoriste intensif') (Table 11).

All dialects have a special negative form (negative perfective, called 'accompli négatif' or 'prétérit négatif') that is used instead of the perfective after the negative marker. Some dialects also have secondary, more recent, forms: negative imperfective ('inaccompli négatif'), and resultative perfective ('accompli résultatif'). Here is for instance the full system of Tuareg (Table 12).

In all dialects, those forms are preverbed by TAM markers, giving rise to various configurations. Taking into account the preverbs is absolutely necessary to describe properly the oppositions at stake in Berber (Chaker, 1997). Among those preverbs, the most frequent cross-dialectally are *ad* (irrealis), *rad* (future), and *la* (progressive). They stem from ancient deictic or locative markers, and from auxiliaries.

Moreover, verbal negation (*ur*) acts on those oppositions, giving rise to asymmetries (Mettouchi, to

Table 12 Aïr Tuareg aspectual bases

| Roots | Aorist | Perfective | Perfect | Neg. Perfective | Imperfective | Neg. Imperfective |
|-------------|--------|------------|----------|-----------------|--------------|-------------------|
| rtk, 'fall' | -rtək- | -rtak- | -rtaak- | -rtek- | -raattək- | -rattək- |
| g, 'do' | -g(u)- | -ge/a/ə- | -gee/aa- | -ge/a/ə- | -taagg(u)- | -tagg(u)- |

Table 13 Negation and aspectual asymmetry in Taqbaylit^a

| Positive | Negative |
|--|----------------------------------|
| aorist (optative, imperative) 1% | a wər + aorist (optative) <1% |
| ad + aorist 30% | ur + imperfective 37% |
| la/ad/∅ + imperfective 16% | |
| perfective 53% | ur + negative perfective 63% |
| 100% of positive utterances | 100% of negative utterances |

^aFrequency counts are based on a conversational corpus.

appear b). Here are, for instance, the actual oppositions encountered in Taqbaylit (Table 13).

Further Resources

A systematic, regular bibliographic orientation can be found in the *Annuaire de l'Afrique du Nord* (Paris, CNRS) since 1965 (volume IV), edited by Lionel Galand, then Salem Chaker and Claude Brenier-Estrine. There is also a recent, very complete bibliographic recapitulation in *Langues et littératures berbères des origines à nos jours*. Bibliographie internationale (Paris, Ibis Press, 1997), and a bibliographic database developed by Salem Chaker, that can be queried online on the Internet site of the Berber Research Center.

Bikol

J W Lobel, University of Hawai'i, Manoa, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Bikol refers to a group of three related Austronesian languages spoken in the Bikol Region of the southern Luzon peninsula of the Philippines, one of the central Philippines' most dialectally diverse areas. As a branch of the Central Philippine subgroup, Bikol is coordinate with the Tagalog and Bisayan branches. The Bikol branch contains 2 of the 12 major Philippine languages (i.e., those having more than 1 million speakers), with Northern Bikol (Central Bicolano) (including the standard Bikol of the cities of Naga and Legaspi) having 2.5 million speakers, and Southern Bikol (Bicolano, Albay), with about 1 million speakers. A third language, Northern Catanduanes Bikol (Bicolano, Northern Catanduanes), has a population of approximately 100 000. Most speakers of a Bikol language simply refer to their language as 'Bikol' without any further distinction of the specific language or dialect they speak. Furthermore, the name Bikol is also used by native speakers to refer to two dialects in central and southern Sorsogon province, even though these dialects are generally classified as Central Bisayan dialects with heavy lexical borrowing from Bikol.

All of the Bikol languages are spoken natively solely within the Bikol Region, a political unit that includes the six provinces of Camarines Norte, Camarines Sur, Albay, Sorsogon, Catanduanes, and Masbate. The Northern Bikol language consists mainly of dialects spoken in and around the major centers of Naga, Legaspi, Daet, and Virac, along with the entire northern coast of the Bikol peninsula from Vinzons in Camarines Norte to Prieto Diaz in Sorsogon, as well as in the town of San Pascual in Masbate Province, and Magallanes in central

Sorsogon. The Southern Bikol language consists of the Rinconada and Buhi-non dialects of southeastern Camarines Sur, the Miraya dialects in southwestern Albay and Donsol town in northwestern Sorsogon province, and the dialect of Libon, Albay. The Northern Catanduanes language is spoken in the northern half of the island of Catanduanes.

The standard dialect of the Bikol Region is the dialect of the cities of Naga and Legaspi, referred to as 'Bikol Naga' in the towns closer to Naga and as 'Bikol Legaspi' in the towns closer to Legaspi. The origin of this dialect's status can be traced to the end of the 16th century when Naga (formerly Nueva Caceres) was one of only three officially designated *ciudades* and the seat of one of only three bishops outside of Manila. (Doeppers, 1972) This dialect is still used by the church throughout the Bikol Region to the exclusion of all other varieties of Bikol. With the exception of Bikol Naga, most of the speech varieties of the Bikol Region are underdocumented. The only works that have been published on other dialects are a short description (Yamada, 1972) and textbook (Portugal, 2000) for Buhi-non, and a phrasebook (Lobel and Bucad, 2001b) for Rinconada.

The Bikol language (Naga dialect) was first documented by Marcos de Lisboa (d. 1622), whose *Vocabulario de la lengua Bicol* was published posthumously in 1754 and republished in 1865. Lisboa's work was preceded in print by Andres de San Agustin's (d. 1649) *Arte de la lengua Bicol*, first published in 1647, and republished in 1739, 1795, and 1879. Together, these two works represent the basis of nearly everything written about the Bikol language prior to the 20th century.

The major modern works on Bikol include a textbook (Mintz, 1971a), a grammar description (Mintz, 1971b, 1973), a dictionary (Mintz and del Rosario Britanico, 1985), and two descriptions of dialectology (McFarland, 1974 and Lobel and Tria, 2000).

Table 1 Standard Bikol pronouns

| <i>Person and number</i> | <i>Nominative case</i> | <i>Genitive case</i> | <i>Oblique case</i> |
|-----------------------------------|------------------------|------------------------------|---------------------|
| 1st singular | akó | ko ² (OBik nyákò) | sakò, sakúyà |
| 2nd singular | iká, ka ^b | mo (OBik nímò) | saímò |
| 3rd singular | siyá | niyá | saíya |
| 1st exclusive ^a plural | kami | mí, nyámò | samò, samúyà |
| 1st inclusive ^a plural | kitá | ta, nyátò | satò, satúyà |
| 2nd plural | kamó | nindó | saindó |
| 3rd plural | sindá | nindá | saindá |

^aInclusive pronouns include the addressee, while exclusive pronouns do not.

^bThe portmanteau pronoun *taká* replaces the ungrammatical sequence *ko ká.

Table 2 Standard Bikol case markers

| <i>Case</i> | <i>Reference</i> | <i>Bikol Naga marker</i> | <i>Bikol Legaspi marker</i> |
|-------------|------------------|--------------------------|-----------------------------|
| Nominative | – referential | an | an |
| | + referential | si | su |
| Genitive | – referential | nin | ki |
| | + referential | kan | kan |
| Oblique | | sa | sa |

Table 3 Standard Bikol demonstratives

| <i>Location of person/object</i> | <i>Nominative</i> | <i>Genitive</i> | <i>Oblique</i> | <i>Locational</i> |
|-------------------------------------|----------------------|------------------------|------------------------|---|
| Near speaker | iní 'this' | kainí 'this' | digdí, igdí 'here' | yaon digdí (Bikol Naga) anion digdí (Bikol Legaspi) 'is here' |
| Near addressee, far from speaker | iyán, an 'that' | kaiyán, kan 'that' | diyán 'there' | yaon diyán (Bikol Naga) uya diyán (Bikol Legaspi) 'is there' |
| Far from both speaker and addressee | idtó 'that (far)' | kaidtó 'that (far)' | dumán 'there (far)' | yaon dumán (Bikol Naga) idtoón dumán (Bikol Legaspi) 'is there (far)' |

Table 4 Standard Bikol focus-mood-aspect morphology

| <i>Mood</i> | <i>Aspect</i> | <i>Actor focus</i> | <i>Object focus (1)</i> | <i>Object focus (2)/Beneficiary focus</i> | <i>Location focus</i> |
|------------------------|---------------------|--------------------|-------------------------|---|-----------------------|
| Indicative | infinitive | mag- | -on | i- | -an |
| | past/perfective | nag- | pig- | (i)pig- | pig-...-an |
| | present/progressive | nag-R- | -in- | i-...-in- | -in-...-an |
| | | | -in-R- | (i)pig-R- | pig-R-...-an |
| | future | mā- | R-...-n | i-R- | -in-R-...-an |
| imperative | -um-/ø- | -a | -an | R-...-an | |
| Abilitative/Accidental | negative | mag- | pag-...-on | ipag- | -i |
| | negative imperative | pag- | pag-...-a | pag-...-an | pag-...-an |
| | infinitive | maka- | ma- | ika- | pag-...-i |
| | past/perfective | naka- | na- | ikina- | ma-...-an |
| | present/progressive | nakaka- | na-R- | ikinaka- | na-R-...-an |
| future | makaka- | ma-R- | ikaka- | ma-R-...-an | |

With the exception of the dialectology studies, all of these works concentrate exclusively on the standard Bikol of Naga or Legaspi.

During the first part of the 20th century, the Bikol Region was home to a relatively bustling literary

scene, but today there are only scattered efforts at reviving a written tradition, and very little can be found in print in the Bikol language other than the Bible and other religion-related materials. In the past decade, there have been efforts to introduce Bikol

language subjects in the schools, and several universities have offered electives in Bikol Language and Literature in recent years. In general, the local variety of Bikol is still the language of most daily transactions, with Tagalog and English being confined to educational institutions, most forms of media, and higher-level business and government transactions.

Bikol has the basic Central Philippine-type phonology with 16 consonants /p b m w t d n s l r y k ŋ ʔ h/, three vowels /a i u/, contrastive stress, and contrastive length. Some dialects of Southern Bikol have preserved a fourth vowel as a reflex of PAn *e, usually realized as a high, central tense vowel /i/ but also realized as /o/ in Libon. Two dialects have an extra consonant phoneme: Southern Catanduanes, which has an interdental lateral, and Buhi-non, which has a voiced velar fricative. The Bikol orthography is largely phonemic except that it does not represent stress, length, or the glottal stop.

Bikol is agglutinative, with a complex system of verbal morphology expressing a wide variety of semantic and syntactic contrasts. Although sometimes analyzed as ergative, these languages are probably of a separate type called Symmetrical Voice Languages in which multiple voice distinctions exist, yet none can be considered more basic than the other (Himmelman, to appear). Like most other Philippine languages, there are four main verbal voices or 'focuses' (Actor, Object, Location, and Beneficiary) and three case distinctions (Nominative, Genitive, and Oblique) marked on Noun Phrases, name phrases, and pronouns by an introductory morpheme. Nouns, adjectives, and verbs distinguish between singular, plural, and in some cases, dual, and verbs may also be marked for reciprocal action. A number of other meanings can be marked by verbal affixes, including accidental, abilitative, distributive, repetitive, causative, social, diminutive, and infrequentive. Tense-aspect-mood distinctions include infinitive, past/perfective, present/progressive, future, imperative, negative, and negative imperative. Both reduplication and repetition are productive mechanisms that can denote diminutive, repetitive, and intensive meanings, among others. Refer to tables 1–4 for more information about: pronouns, case markers, demonstratives, and focus-mood-aspect morphology.

The Bikol languages have much the same grammatical structure as Tagalog, except for (a) a preference for inflecting verbs for plural actors (with the infix -Vr-), (b) the existence of distinct imperative forms, (c) the indication of repetitive action by a verbal affix (-para-), and (d) a more elaborate system of case markers that distinguish between referential and nonreferential, and in some dialects, past vs. nonpast.

A noteworthy feature of the Bikol languages is the presence of a speech register reserved for use in anger (Mintz, 1991, Lobel to appear). The lexicon of this angry register is usually either loosely derived or totally unrelated to their normal, nonangry equivalents. As such, an utterance by an angry speaker may hardly resemble an utterance with the same meaning spoken by a nonangry speaker.

Bislama

C Hyslop, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

Bislama, an English-lexifier pidgin-creole, is the national language of Vanuatu, a republic in the south-west Pacific within the region of Melanesia. Along with English and French, it is also one of the official languages of the country. As the national language, it is spoken by the majority of the population as either a first or second language. There are as many as 100 distinct languages spoken in Vanuatu (81 actively spoken languages according to Lynch and Crowley, 2001) for a population of only 186 678 (1999 census), and as a result Bislama is vital as a lingua franca between speakers of different language groups. In urban areas and even in some rural areas, it is fast becoming the main language used in daily life. According to the 1999 census, in urban areas, where there is a great deal of intermarriage, Bislama is the main language used at home in 58% of households; in rural areas, this figure is considerably lower, at 13.3%. However, even in the most remote areas of the country only a minority of elderly people are not fluent in Bislama. Currently, English and French are the principal languages of education in Vanuatu and Bislama is generally banned in schools. However, Bislama is used for many other government and community services. For example, the majority

of radio broadcasts are in Bislama, although only some of the content of newspapers is published in Bislama. Parliamentary debates are conducted in the language, as are local island court cases.

Bislama is a dialect of Melanesian Pidgin, mutually intelligible with Solomons Pijin (Pijin), spoken in Solomon Islands, and Tok Pisin, spoken in Papua New Guinea. Thus, the language is not just an important lingua franca of Vanuatu, but also a common regional language that allows for communication among most peoples of Melanesia. Only in New Caledonia is Melanesian Pidgin not spoken.

The formation and development of Bislama, and of Melanesian Pidgin generally, took place within Vanuatu and other regions of Melanesia and also in Australia and other countries of the Pacific. A pidgin first started to emerge in Vanuatu (known as the New Hebrides at the time) in the mid-1800s as a result of the sandalwood and sea slug trade. Further development took place in the second half of the 19th century, with increasing numbers of Ni-Vanuatu being recruited to work on plantations both inside Vanuatu and in other areas of the Pacific, particularly in the sugarcane plantations of Queensland and Fiji (Crowley, 1990a). During the early decades of the 20th century, the language stabilized, such that its structure today is very close to what it was then. The status of and need for Bislama as a lingua franca within the country increased in the period leading up to independence in 1980, to the extent that today it has become the unifying language of the nation.

The majority of the Bislama lexicon, approximately 84–90%, is derived from English, reflecting its history of development alongside English-speaking traders, plantation owners, and colonists. Only approximately 3.75% of the vocabulary originates from the vernacular languages and 6–12% derives from French (Crowley, 2004). Of those words that derive from local languages, the majority describe cultural artifacts and concepts and endemic floral and faunal species that have no common names in English, such as *nasara* ‘ceremonial ground,’ *navele* ‘*Barringtonia edulis*,’ and *nambilak* ‘buff-banded rail.’ Note that many of these words start with *na-*, the form of an article or noun marker in many Vanuatu languages.

Although the majority of the lexicon is derived from English, the grammar of Bislama is greatly influenced by the vernacular languages. For example, in the pronominal system there is an inclusive-exclusive distinction in the first person, *yumi* ‘we (inclusive)’ is distinguished from *mifala* ‘we (exclusive).’ Dual and trial number is also distinguished from the plural, as *yutufala* ‘you (two),’ *yutrifala* ‘you (three),’ and *yufala* ‘you (pl.).’ Another feature that Bislama inherits from the substratum languages is reduplication. Reduplication is a productive process for both verbs and adjectives, but it is rarer for nouns. In verbs, reduplication can mark an action as being continuous, habitual, reciprocal, or random. It can mark intensity in both verbs and adjectives, and it also marks plurality in adjectives.

Like English and many Vanuatu languages, Bislama is characterized by AVO/SV word order, and this is the only means of recognizing the subject and object of the clause. Peripheral arguments are marked by prepositions. The preposition *long* has a wide general use; it marks the locative, allative, ablative, and dative. It can also mark the object of comparison in a comparative construction, the instrumental, and a number of other less easily defined functions. The preposition *blong* also has a

number of functions, marking the possessor in a possessive construction, a part-whole relationship, and a purposive role. Prepositions marking other semantic roles are *wetem* ‘with’ (instrumental and comitative), *from* ‘for, because of’ (reason), and *olsem* ‘like’ (similitive).

As is true of most pidgin languages, there is little marking of tense, aspect, and mood. The preverbal markers *bin* and *bae* mark the past and future tense, respectively. However, it is possible for an unmarked verb, preceded only by its subject, to indicate either past, present, or future tense, depending on the context. A number of auxiliaries also occur, with aspectual or modal functions, such as *stap*, marking a continuous or habitual action; *mas* ‘must’; *save* ‘be able’; and *wantem* ‘want.’ Verb serialization is a productive process in Bislama, encoding various meanings and functions such as a cause-effect relationship; a causative; or direction, position, or manner of action.

Brahui

P S Subrahmanyam, Annamalai University, Bangalore, India

© 2006 Elsevier Ltd. All rights reserved.

The word ‘Brahui’ designates both a language and its speakers. Brahui is the conventional spelling for the phonetically more correct Brāhōī/Brāhūī. The language is a member of the Dravidian family; more

specifically, it belongs to the North Dravidian subgroup, of which the other two members are Kūṛux and Malto. The Brahuīs live mainly in the Baluchistan and Sind provinces of Pakistan, but some are found also in Afghanistan (Šōrāwāk desert) and Iran (Sistan area). It is estimated that there are about 700 000 Brahui tribesmen, of whom only about 300 000 speak the language. Even those who speak Brahui are bilinguals in either Balochi or Siraki. There are

two views current among the scholars to explain the location of Brahui, which is far away from the main Dravidian area. Whereas one view maintains that the Brahuis lived where they are now located from the earliest times, the other holds that they migrated to the current locations from that part of the main area that is occupied by the speakers of Kuṛux and Malto.

Phonology

The Brahui phonological system contains eight vowels and 28 consonants (see **Tables 1** and **2**). Proto-Dravidian short *e and short *o have been removed from the Brahui vowel system under the influence of Balochi; *e developed into *ila* and *o developed into *ula/ō* (the exact conditionings are not known). The *ē* and *ō* have shorter (and somewhat lower) allophones before a consonant cluster.

The voiceless stops *p*, *t*, and *k* may optionally be accompanied by aspiration in all positions (*pōk/ phōk/phōkh* ‘wasted’); however, aspirated stops in Indo-Aryan loans sometimes lose their aspiration in the south (*dhōbī/dōbī* ‘washerman’). The voiceless lateral *L* is the most characteristic sound of Brahui since it does not occur either in Proto-Dravidian (PDr) or in the neighboring languages of Brahui. It comes from two sources, PDr (alveolar) *l and (retroflex) *ɭ; both of these also show the reflex *l* in some words, the conditioning being unclear because of

the paucity of the data (*pāl* ‘milk’ < PDr *pāl, *tēL* ‘scorpion’ < PDr *tēl). The contrast between *L* and *l* is illustrated in *pāl* ‘milk’ and *pāl* ‘omen.’

One major dialectal division in Brahui involves the voiceless glottal fricative *h*; it appears in all positions in the northern dialects but is replaced in the south by the glottal stop in initial and intervocalic positions, and is lost before a consonant or in final position; the following examples illustrate the variation in the northern and southern dialects, respectively: *hust*, *ʔust* ‘heart’; *sahi affaʔ*, *saʔi affaʔ* ‘I don’t know’; *šahd*, *šad* ‘honey’; and *pōh*, *pō* ‘intelligence.’

Syntax

Word Classes

The following word classes may be recognized for Brahui: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections. An adjective normally occurs before the noun it qualifies but may be shifted to the postnominal position for the sake of emphasis:

| | |
|--------------|-------------|
| jwān-ō | hullī-as |
| good-INDEF | horse-INDEF |
| ‘good horse’ | |
| hullī-as | jwān-ō |
| horse-INDEF | good-INDEF |
| ‘good horse’ | |

Nouns and adjectives characteristically distinguish between definite and indefinite forms. The basic forms are definite and the corresponding indefinite ones are derived by adding *-ō* to the adjective base and *-as* to the nominal base, as illustrated in the preceding examples. A definite adjective that is monosyllabic is often strengthened by the addition of *-ā/-angā*:

| | |
|--------------------|---------|
| sun-angā | šahr |
| deserted | village |
| ‘deserted village’ | |

Table 1 Vowels of Brahui

| | Front | | Central | | Back | |
|------|-------|------|---------|------|-------|------|
| | Short | Long | Short | Long | Short | Long |
| High | i | ī | | | u | ū |
| Mid | | ē | | | | ō |
| Low | | | a | ā | | |

Table 2 Consonants of Brahui^a

| | Labial | | Dental | | Alveolar | | Retroflex | | Palatal | | Velar | | Glottal (VL) |
|-----------|--------|----|--------|----|----------|----|-----------|----|---------|----|-------|----|--------------|
| | VL | VD | VL | VD | VL | VD | VL | VD | VL | VD | VL | VD | |
| Stop | p | b | t | d | | | ʈ | ɖ | c | j | k | g | ʔ |
| Nasal | | m | | | | n | | ɳ | | | | | |
| Fricative | f | | | | | | | | | | x | G | h |
| Sibilant | | | | | s | z | | | š | ž | | | |
| Lateral | | | | | L | l | | | | | | | |
| Trill | | | | | | | | r | | | | | |
| Flap | | | | | | | | ɾ | | | | | |
| Semivowel | | w | | | | | | | | y | | | |

^aAbbreviations: VD, voiced; VL, voiceless.

An indefinite adjective can function also as a noun:

ball-ō
big-INDEF
'big (one)'

An adverb occurs before the verb. Adverbs may be divided into those of (1) time (e.g., *dāsā* 'now,' *darō* 'yesterday,' *aynō* 'today,' *pagga* 'tomorrow'), (2) place (e.g., *monaṭi* 'forward'), and (3) manner (e.g., *dawn* 'thus'). For particles, the enclitic pronouns are very commonly used in Brahui. Whereas those for the third person are used in dialects throughout the Brahui area, those for the first and the second persons are more common in the Jahlawān dialect. They are suffixed to nouns or verbs. When added to a noun, they carry the sense of a pronoun in the genitive case; when added to a verb, they signal the direct or indirect object. The forms are: 1SG + *ka* 'my', 2SG + *nē* 'your,' 3SG + *ta* 'his/her/its', 3PL + *tā* 'their' (there are no plurals in the first and second persons):

maL-ē + ka
son-ACC/DAT + 1ENCL
'my son (accus.)/to my son'

xalkus + ka.
strike-PAST-2SG + 1ENCL
'You struck me.'

Word Order

The favored word order in Brahui is subject-object-verb:

ī dā kārēmē kar-ōī uṭ
I this work do-NOM be.1SG
'I must do this work.'

Sentences Without the Copular Verb

Like most of the other Dravidian languages (especially the southern ones), Brahui contains sentences without the copula in certain contexts:

numā šahr-aṭi aṭ urā/ō?
your village-LOC how many house
'How many houses are there in your village?'

Gender and Number

Brahui, like Toda of South Dravidian, has no gender distinction, but number (singular versus plural) is distinguished (see later, Plural Suffixes). The original neuter forms (both singular and plural) of the third person are retained to refer to all categories: *ō(d)* 'he/she/it' (cf. Ta(mil). *atu* 'it', Te(legu). *adi* 'she, it') and *ōfk* 'they' (cf. Ta. *av(ay)*, Te. *avi* 'they (NEUT)').

Agreement

A finite verb shows agreement with the subject pronoun for person and number (see Table 3).

Noun Morphology

A nominal base is followed by the plural suffix when plurality has to be expressed and then by a case suffix; a postposition is normally attached to the genitive form of a noun.

Plural Suffix

The plural suffix is -k (variant -āk) in the nominative but -tē- before a nonnominative case suffix (see Table 4); as in the South Dravidian languages, use of the plural suffix is optional when plurality is understood from the context:

irā mār/mā-k (<*mār-k)
two son/son-PL
'two sons'

Case Suffixes and Postpositions

The nominative is unmarked; locative I means 'in' and locative II means 'on, by' (Table 4 shows all of

Table 3 Finite tenses of *tix-* 'to put'

| <i>Tense</i> | <i>Singular</i> | <i>Plural</i> |
|--------------------|------------------------------------|----------------------|
| Past | | |
| 1. | <i>tix-ā + t</i> 'I put' | <i>tix-ā + n</i> |
| 2. | <i>tix-ā + s</i> | <i>tix-ā + re</i> |
| 3. | <i>tix-ā</i> | <i>tix-ā + r</i> |
| Imperfect | | |
| 1. | <i>tix-ā + t-a</i> 'I was putting' | <i>tix-ā + r-a</i> |
| 2. | <i>tix-ā + s-a</i> | <i>tix-ā + re</i> |
| 3. | <i>tix-āk-a</i> | <i>tix-ā + r-a</i> |
| Pluperfect | | |
| 1. | <i>tix-ā + sut</i> 'I had put' | <i>tix-ā + sun</i> |
| 2. | <i>tix-ā + sus</i> | <i>tix-ā + sure</i> |
| 3. | <i>tix-ā + sas</i> | <i>tix-ā + sur</i> |
| Perfect | | |
| 1. | <i>tix-ā-n + ut</i> 'I have put' | <i>tix-ā-n + un</i> |
| 2. | <i>tix-ā-n + us</i> | <i>tix-ā-n + ure</i> |
| 3. | <i>tix-ā-n + e</i> | <i>tix-ā-n + a</i> |
| Present indefinite | | |
| 1. | <i>tix-i-v</i> 'I may put' | <i>tix-i-n</i> |
| 2. | <i>tix-i-s</i> | <i>tix-i-re</i> |
| 3. | <i>tix-e</i> | <i>tix-i-r</i> |
| Future | | |
| 1. | <i>tix-o-t</i> 'I will put' | <i>tix-o-n</i> |
| 2. | <i>tix-o-s</i> | <i>tix-o-re</i> |
| 3. | <i>tix-o-e</i> | <i>tix-o-r</i> |
| Nonpast negative | | |
| 1. | <i>tix-pa-r</i> 'I will not put' | <i>tix-pa-n</i> |
| 2. | <i>tix-p-ēs</i> | <i>tix-p-ēre</i> |
| 3. | <i>tix-p</i> | <i>tix-pa-s</i> |

Table 4 Case forms of *xal* 'stone'

| Case | Singular | Plural |
|-------------------|------------------|---------------------|
| Nominative | <i>xal</i> | <i>xal-k</i> |
| Accusative-dative | <i>xal-ē</i> | <i>xal-tē</i> |
| Instrumental | <i>xal-aṭ</i> | <i>xal-t-aṭ</i> |
| Comitative | <i>xal-tō</i> | <i>xal-tē-tō</i> |
| Ablative | <i>xal-ān</i> | <i>xal-tē-ān</i> |
| Genitive | <i>xal-nā</i> | <i>xal-tā</i> |
| Locative I | <i>xal-(a)ṭī</i> | <i>xal-tē-ṭī</i> |
| Locative II | <i>xal-ā(ṭī)</i> | <i>xal-tē-ā(ṭī)</i> |

the case forms of *xal* 'stone'). The following example shows postpositions:

ka-nā nēmaGāi
my towards
'towards me'

There are also a few prepositions, such as *bē(d)* 'with-out,' of Perso-Arabic origin that have entered Brahui through Balochi.

Pronouns

All of the pronouns are of Dravidian origin; however, Brahui developed postclitic forms of personal and demonstrative pronouns under the influence of Balochi (see preceding discussion, Word Classes). The first-person personal pronouns are *ī* 'I' and *nan* 'we'; the second-person personal pronouns are *nī* 'you(singular)' and *num* 'you (plural)'. There is only the singular reflexive pronoun, *tēn* 'self'. The interrogative pronouns are *dēr* 'who?' and *ant* 'what?'. The third-person forms show a threefold deictic distinction: proximal *dā(d)* '(one) who is here' (plural *dāfk*), medial *ē(d)* '(one) who is at some distance' (plural *ēfk*), and distal *ō(d)* '(one) who is far off' (plural *ōfk*).

Numerals

Only the cardinal numbers for one, two, and three are of Dravidian origin (the forms without the final *ṭ* of these function as adjectives); all others are borrowed from Balochi. The number '1' is *asi(t)*, '2' is *ira(t)*, and '3' is *musi(t)*.

Verb Morphology

Verb Bases

A verb base in Brahui may be simple or complex. The complex base is formed from the simple one by the addition of the transitive-causative suffix *-if* (conditioned variant: *-f*). This suffix converts an intransitive into a transitive and an underived transitive into the corresponding causative; it is, therefore, possible to use the suffix twice in a sequence,

e.g., *bin-* 'to hear,' *bin-if-* 'to cause to hear,' *ka?* 'to die,' *kas-f-* 'to kill,' and *kas-f-if-* 'to cause (someone) to kill.'

Finite Verbs

There are four kinds of past tense (past, imperfect, pluperfect, and perfect), each with different shades of meaning, and all of them are periphrastic constructions involving the 'be' verb. The past stem, which is the basis for all of these, is formed by adding to the base *-b-* (conditioned variants: *-ē-*, *-k-*, *-g-*, *-is-*, *-s-*, *-ss-*). The following formulas give the structures of these tenses:

1. Past: past stem + present of *ann-* 'to be.'
2. Imperfect: past + *a*.
3. Pluperfect: past stem + past of *ann-* 'to be.'
4. Perfect: past stem + (*u*)*n* + present of *ann-* 'to be.'

The present indefinite, the future, and the nonpast negative are morphological constructions with the following structures (these and the previously mentioned tenses are illustrated in Table 3 with the verb base *tix-* 'to put'):

1. Present indefinite: verb base + *i* + personal suffix.
2. Future: verb base + *o* + personal suffix.
3. Nonpast negative: verb base + *pa* + personal suffix.

There are some other syntactic constructions involving *ann-* 'to be' that need not be mentioned here. One noteworthy feature of Brahui is the strategy of suffixing *-a* to form one type of finite verb from another. The imperfect present-future and the negative present-future are thus formed from the past present-indefinite and the nonpast negative, respectively.

The imperative suffixes are 2SG *-o*, 2PL *-bo* (conditioned variant: *-ibo*):

tix
put-2SG
'Put!'

tix-bo
put-2PL
'Put (plural)!'

The corresponding negative imperative has the negative suffix *-pa-* (conditioned variant: *-fa-*) between the base and the imperative suffix:

tix-pa
put-NEG-2SG
'Don't put (singular)!'

tix-pa-bo
put-NEG-2PL
'Don't put (plural)!'

Nonfinite Verbs

The present adverb has the suffix *-isa*:

bis-isa
bake-PRES ADV
'baking'

The present adjective has the suffix *-ok*:

bin-ok
hear-PRES ADJ
'that hear(s)'

The infinitive-cum-action noun is formed by adding *-ing* (conditioned variant: *-ēng*) to the verb base:

bin-ing
hear-INF/VN
'to hear, hearing'

Breton

J Le Dû, Université de Bretagne Occidentale,
Brest, France

© 2006 Elsevier Ltd. All rights reserved.

Breton (*brezoneg*, *brezhoneg*) belongs to the Brythonic branch of the Celtic languages. It is spoken in Lower Brittany, and its linguistic border is the westernmost limit of the withdrawal of Celtic before Roman expansion.

Breton has long been considered the continuation of Gaulish. Linguistic studies in the 19th century smothered all purported genetic connection between Breton and French and also any close relationship to Gaulish. Some historians argued that Breton had been imported whole by immigrants from Britain into

a thoroughly romanized Armorica. Modern Celtic studies confirmed the view that Breton was a late offshoot of British Celtic. We now know that emigration from Britain began before the Saxon invasions, so that most scholars acknowledge that Breton is rooted in Armorican Gaulish, absorbing different varieties of British Celtic.

A traditional view of the language purports the existence of a unified old Breton, supposed to have split into four dialects, named after the dioceses as they existed before the 1789 French Revolution: Léonais for the diocese of Léon, Trégorrois for Tréguier, Cornouaillais for Cornouaille, and Vannetais for Vannes. There are, in fact, two major dialect groups: (1) KLT – Cornouaille (Kerne), Léon, Trégor and (2) Vannetais, the western border of which is the river

Ellé. Falc'hun (1962, 1981) has reported the existence of an intermediate dialect centered on Carhaix, the meeting point of all the major roads, and constituting a bridge between remote linguistic forms, like the reflexes of the dental spirants from old Celtic **tt* and **d*. Léon *deiz* 'day' and *dervez* 'duration of a day' (Welsh *dydd* and *dyddwaith*) are far removed from vannetais *de* and *deñeb*. The central forms are *de* and *devez*, dropping *z* from **d* as in vannetais, but keeping *z* from **tt* as in Léon. The primitive twofold partition could reflect the difference between Osismii and Venetes Gaulish, the latter keeping closer to Armorican.

An intensity stress generally falls on the penultimate in the northwest, whereas in the Southeast a pitch stress affects the last syllable, not unlike French.

Voiceless consonants and /m/ are fortes, voiced spirants are lenes, and voiced stops and /l/, /n/ and /r/ can be either. Vowels are short before fortes and long before lenes when stressed. One can thus oppose *ar zal* 'the room' (long [a:], weak [l]) and *zall* 'salted' (short [a], strong [l]). There can be up to eight phonemic nasal vowels, which are not borrowings from French, but archaic features, as in *hañv* 'summer'.

Primitive consonants were weakened, especially between vowels. These changes survived the loss of final syllables, turning a simple phonetic mechanism into a grammatical device called 'lenition,' so that the initial consonants of feminine words are lenited after the article – originally ending in a vowel – and also the following adjective: *mamm* 'mother,' *mad* 'good,' *ar vamm vad* 'the good mother.' The geminate voiceless fortes became voiceless spirants, giving rise to the spirant mutation: *penn* 'head,' *he fenn* 'her head.' Another sandhi phenomenon caused the so-called protective mutation: a final *-h* in *hoh* 'your' devoiced a following voiced initial consonant, as in *bugel* 'child,' *ho(h) pugel* 'your child.'

Final consonants are devoiced before pause. *Ma zad* 'my father' keeps a long [a:], but a devoiced *-d* when final, the voice being restored when the utterance is followed by a vowel as in *ma zad eo* '(he) is my father'. All voiceless consonants are voiced before a vowel or *l*, *m*, *n*, and *r*. Native Breton speakers are readily recognizable in French when they pronounce *toud' la z'maine* for *toute la semaine* 'during the whole week.'

English and Breton grammars show striking similarities; for example, both use a compulsory periphrastic progressive in opposition to a simple present: *Ma breur ne gan ket* 'my brother does not sing' vs. *ma breur n'ema ket o kana* 'my brother is not singing.'

The lexis is basically Celtic (*dorn* 'fist, hand', Welsh *dwrn*, Gaelic *dorn*; *den* 'person', Welsh *dyn*, Gaelic *duine*). About 500 common words are Latin borrowings (*taol* < *tabula* 'table,' *spered* < *spiritus* 'mind,'

kistin < *castanea* 'chestnut'). For centuries, a flow of romance and French words has enriched the language, very much like in English. Some words have been kept in both languages while disappearing from French; for example, *skourje* 'whip' from *escourgée, écourgée*, English *scourge*. The most important borrowings are the numerous affixes, taken both from Latin (*-adur* < *-atura* as in *skub-adur* 'sweepings') and French (*lenn-abl* 'read-able').

Polls carried out in 1991 and 1997 show that from 1950 to 1990, the percentage of Breton speakers has decreased from about roughly 70 to 20% of the population. In 2004, it is estimated that about 250 000 persons are able to speak the language, and most of them are over 60 years old. French has become dominant because of the unprecedented social and agricultural revolution occurring in Brittany.

Before 1941, there existed two written forms, called at the time 'breton vannetais' and 'bas-breton,' which had been developed in the two Jesuit colleges of Quimper and Vannes in the 17th century; each form had its own grammars, dictionaries, and literature. In 1941 the *peurunvan* 'totally unified' orthography was established. 'Cat,' *kaz* in KLT and *kah* in vannetais, would be spelled *kazh*. A new spelling called 'orthographe universitaire,' which was closer to the spoken language, was created in 1954. Finally, a third orthography, *etrerannyezbel* 'interdialectal,' was created in the 1970s to take into account all regional differences.

Both the French State and the Breton Regional Assembly have encouraged publishing in the Breton language in the last 30 years, and Breton is partially used on local state-owned (France-Bleu Breiz Izel) and private radio (like *Radio Kerne*) and television stations (France 3).

Degrees in Breton, at all levels, are delivered in Rennes and Brest. Breton language teachers have been recruited since 1982 to teach in the secondary schools. Breton is taught to about 5000 children at the primary level in a few bilingual classes in public and Catholic schools, and the private *Diwan* schools teach mostly through Breton. However, less than 1% of Breton children benefit from this bilingual education.

Bulgarian

J Miller, University of Auckland, Auckland, New Zealand

© 2006 Elsevier Ltd. All rights reserved.

Bulgarian is a South Slavic language, along with Slovene (Slovenian), Macedonian, and the Serb-Croatian linguistic complex. Geographically Bulgarian is also a Balkan language and shares a number of phonetic, grammatical, and lexical features with Rumanian (Romanian), Greek, and Albanian. For instance, Rumanian and Albanian have schwa in stressed syllables and so does Bulgarian, the only Slav language with this property.

Bulgarian has two sets of dialects, Eastern and Western (further subdivisions are recognized). A major difference is in the reflexes of the Common Slavic *jat* vowel, roughly equivalent to 'ye' as in English *yet*. In the North Eastern dialects the *jat* vowel became 'ja' in a stressed syllable and followed by a syllable with a back vowel. Elsewhere it became 'e.' Standard Bulgarian, based on the North Eastern dialects, has the 'ja' – 'e' alternation, in, e.g., adjectives: *bjalo* 'white' (neuter singular) versus *beli* (plural).

The Common Slavic 'l' and 'r' plus *jer* (extra-short vowel) and syllabic 'l' and 'r' became 'ür' and 'ül' in polysyllabic words before two consonants and 'rű' and 'lű' elsewhere: *skűrben* 'sorrowful'; 'prüv' (first-person

masculine) versus 'pűrva' (first-person feminine). Consonants are palatalized or non-palatalized, as in other Slav languages.

Bulgarian has lost the Slavic case-suffixes but has developed definite articles, attached to the first word in noun phrases: Bulgarian *knigata* 'the book,' *kniga* 'a book,' *novata kniga* 'the new book,' *nova kniga* 'a new book.' In written Bulgarian masculine nouns take different subject and oblique forms of the article: (*j*)*at* and (*j*)*a*. In spoken Bulgarian (*j*)*at* is typically not used.

Bulgarian has preserved the Indo-European tense-aspect system of imperfect and aorist alongside the newer perfective-imperfective system. Typically, imperfect suffixes are added to imperfective stems and aorist suffixes to perfective stems. Bulgarian does offer examples of perfective stems with imperfect suffixes in subordinate clauses introduced by, e.g., *shtom* 'as soon as' and in main clauses; they express a completed action that is repeated. The following example (1) is from Feuillet (1995: 36).

- (1) *Večer sedneshe na chardaka*
Evening sit-down-3SG on verandah-DO
 'In the evening he would sit down on the verandah'

Sedn is perfective and *-eshe* is imperfect.

There are two future constructions, one for assertions and the other for denials. The former structure uses the particle *shte*, derived from the verb *xoshtō* 'I want/wish.' The meaning 'want' is now expressed by *iskam*, cognate with the Russian *iskat* 'search for'. Compare (2) and (3).

(2a) Dimo shte dojde utre
Dimo particle come-PERF-3SG tomorrow
 'Dimo will come tomorrow'

(2b) azshte dojda utre
I particle come-PERF-1SG tomorrow
 'I will come tomorrow'

(3) az iskam da dojda
I want-IMPERF-1SG conjunction come-PERF-1SG
 'I want to come'

The future-conditional still consists of a verb (originally the imperfect of *xoshtō*) plus a *da* complement clause: *shtjax da dojda* 'I would come,' *shteshe da dojdesh* 'you would come.'

The negative future construction consists of the invariable *njama*, originally a negative form of *imam* 'have,' plus a *da* clause, as in (4).

(4a) Donka njama da dojde
Donka not-have-IMPERF-3SG conjunction come-PERF-3SG
 'Donka won't come'

(4b) az njama da dojda
not-have-IMPERF-1SG conjunction come-PERF-1SG
 'I won't come'

Ne shte occurs, but the *njama* construction is the norm.

Bulgarian has a perfect as well as a perfective: Bulgarian *chetox* 'I read' (last week) versus *chel sūm* 'I have read.' *Chel* is the perfect participle (originally resultative) and *sūm* is the copula. Both Bulgarian and Macedonian have developed another perfect, with a passive (resultative) participle and *imam* 'I have': compare *angazhiral sūm masa* 'I have booked a table,' where *angazhiral* expresses a property of the speaker, and *imam angazhirana masa* 'I-have booked a-table,' where *angazhirana* expresses a property of table.

Bulgarian has what Bulgarian linguists call a renarrative construction. It is based on the perfect and past perfect. De Bray (1980: 123) talks of the past perfect as used in renarration; Feuillet talks of the use of the perfect and past perfect to signal distance or inference. That is, neither recognizes a separate renarrative tense. Examples are in (5); see Feuillet (1995: 41).

5(a) Kazal na Bozhura, che
He-supposedly-said to Bozhura that
 shtjal da se vurne
he-would conjunction self return
 'He is supposed to have told Bozhura that he would return'

5(b) Kaza na Bozhura, che
 He-said to Bozhura that
 shtjal da se vurne
he-would conjunction self return
 'He told Bozhura that he would return'

(3a) demonstrates a Balkan feature, a lack of infinitives. Where Russian, for example, has an infinitive, Bulgarian has a finite clause. Bulgarian has two principal subordinating conjunctions, *da* and *che*. *Da* is used for irrealis clauses; in (4a) the event of Donka coming is not a fact but a possibility. In (6) (from Feuillet, 1995) the event of his looking at the traffic is irrealis; he is not doing it. In (7), in contrast, the event of Donka coming is presented as fact, and the clause is introduced by *che*.

(6) Toj varveshe, bez da
He was-walking without conjunction
 obrashta vnimanie na dvizhenie-to
turns attention to traffic-the
 'He was walking without paying attention to the traffic'

(7) Tja kaza, che Donka shte dojde
 'She said that Donka will come'

Da was originally a marker of irrealis main clauses, a function which it still has in modern Bulgarian.

Bulgarian has a relativizer *kojto* (masculine), *kojata* (feminine), and *koeto* (neuter), with the plural *kito*. It is used as a free relative: *kojto pie tazi rakija e glupak* 'whoever drinks this rakija is an idiot,' and as a relativizer in relative clauses, as in (8).

(8) knigata, kojato kupix
book-the which I-bought
 'the book which I bought'

The structure preposition plus relativizer is used: *knigata, v kojato chetox tezi dumi* 'the book in which I read these words.' Spoken Bulgarian has a relative clause introduced by the invariable *deto* 'where': *knigata DETO ja kupikh* 'the book that I bought,' *momcheto deto dojde* 'the boy that came.' It also has a relative clause structure with *shto* ('what') and resumptive pronoun: *kniga, shto ja kupikh* 'the-book that it I-bought.'

Despite the lack of case suffixes Bulgarian has flexible word order because of clitic personal pronouns (see Feuillet, 1995: 52–55). The personal pronouns have long and short (clitic) forms: *mene me* (me-accusative), *mene mi* (me-dative), *nego go*

(him-accusative), and so on. Consider the question–answer pair in (9).

- (9) Chete li ja Dimo novata kniga?
 Read Q it Dimo new-the book?
 ‘Did Dimo read the new book?’
 Dimo ja chete novata kniga
 Dimo it read new-the book
 ‘Dimo read the new book’

(9) is neutral; it asks simply if this event took place, not whether it was Dimo doing it or someone else, or if it was the new book that was read or something else. The order *novata kniga ja chete Dimo* highlights *ja chete Dimo*; the pronoun *ja* signals that *novata kniga* is the direct object of *chete*. The order *novata kniga, Dimo ja chete*, with focal stress on *Dimo*,

puts contrastive highlighting on *Dimo*: ‘As for the book, it was Dimo who read it and not anyone else.’

Introduction

Burmese is the national language of Burma/Myanmar and is the mother tongue of the Burman (Bamar) ethnic majority, who make up approximately two-thirds of Burma’s population of slightly over 50 million. The rest of the country’s indigenous population is diverse, speaking between 60 and 100 other languages among them, depending on the criteria used to distinguish languages from one another. Most non-Burmans live in the areas near Burma’s borders with Thailand, Laos, China, India, and Bangladesh, although many live interspersed with Burmans and speak Burmese and other languages in addition to their native language. Burmese is little spoken outside Burma, but widely dispersed and fragmented communities of Burmese expatriates may be found in Asia and around the world.

Burmese belongs to the Tibeto-Burman language family, which comprises approximately 350 languages spoken across a vast territory stretching from the Himalayas to mainland Southeast Asia. Burmese has by far the largest number of speakers of any of the Tibeto-Burman languages, most of which have only a few thousand speakers and many of which may disappear during the 21st century.

Most of the other languages spoken in Burma also belong to the Tibeto-Burman language family. Some,

such as Arakanese (Rakhine), Intha, and Danu, are so similar to Burmese as to be considered by some to be dialects of Burmese rather than separate languages.

History and Script

The Burmese have been in the area of modern Burma/Myanmar from approximately 850 C.E. onward, founding their capital at Pagan (Bagan). Despite extensive contact over the following two centuries with the Pyu, the speakers of a now-dead Tibeto-Burman language that occupied the area, the first inscriptions in Burmese date from the 11th century, with no extant examples of Burmese writing before then. Burmese script is a close cousin of the Mon script, which was adapted from a southern Indian script, a descendant of the Brāhmī script that was the ancestor of many Indic scripts found in South and Southeast Asia. It is thought that the Burmese adapted the script from Mon after Mon scribes were brought to the city of Pagan after the Burmese king Anawratha, in 1057 C.E., defeated the Mon, although this theory has been disputed in recent research.

Aside from the rounding of the originally square characters into the distinctive round-shaped letters of Burmese today, the alphabet has remained largely unchanged to the present day. It is widely believed that the round shapes of Burmese letters evolved because texts were traditionally written on palm leaves, which would split easily if angled shapes were scratched on them. Whether or not this is true, Burmese writing retains its distinctive round shapes, and handwriting with consistent, even circles is praised.

The writing system evolved between the period of the early inscriptions and the 16th century C.E. when it assumed a form similar to its present-day state. The spoken language has changed considerably since that time, with the result that a faithful transliteration of written Burmese (such as the one approved by the American Library Association and the Library of Congress used here) gives little impression of the way letters or words are pronounced in the language today. Sound changes have applied to certain initial consonants. Final consonants have disappeared. A glottal stop is all that remains of final stop consonants, whereas the place contrasts of written final stops are realized as vowel changes in the syllable. Final nasal consonants have been replaced by a parallel series of nasalized vowels. In general, many combinations of symbols are pronounced differently from the sounds represented by the symbols individually.

The phonetic transcription used here is faithful to the principles of the IPA, although several others have been devised. A transliteration and transcription are compared in the following example.

Burmese script ရုပ်မြင်သံကြား
 Transliteration RUP·MRAN·SAMKRĀ
 Transcription jouʔ.mjìN.θàn.dʒá
 Gloss picture.see.sound.hear
 Translation 'television' (more commonly တီဗွီ tí.vì
 'T.V.')

Burmese script is basically alphabetic. There are separate symbols to represent consonants (Table 1) and vowels (Table 2), but the symbols are organized

in syllabic clusters, which are written from left to right. Within each cluster, however, the symbols do not necessarily appear in left-to-right order. For example, to write the syllable တီ tí 'worm,' the vowel é -i is placed on top of the consonant တ t, but to write တူ tí 'nephew,' the ယဲ ù must hang below the initial တ t. Certain sounds in Burmese, namely affricates, voiceless sonorants, and initial consonant clusters, are written using medial forms of four consonants, shown in Table 3.

Burmese script has retained the features and symbols needed for writing the South Asian languages for which its parent scripts were originally designed, such as Pāli, the language of the Buddhist scriptures and the source of many loans in Burmese, which can easily be identified because of phonological features such as doubled consonants and retroflex consonants that do not occur in Burmese words. A Pāli phrase and its rendition in Burmese are shown next.

Burmese script ဗုဒ္ဓိသာရန္တဂစ္ဆာမိ
 Transliteration BUDDHĀM SARANĀM GACCHĀMI
 Transcription bouʔdāN θaɹənāN gjiʔsʰamj
 'I go to the Buddha for refuge'

Phonetics and Phonology

Some of the sounds used in Burmese are considered unusual because they occur relatively rarely in the world's languages. These are the so-called voiceless nasals, which include the sound of air escaping through the nose. The Burmese word for ရင်းနှီးမြှုပ်နှံမှု jín.nù. mjouʔ.nṵn.mū 'investment' contains examples

Table 1 Consonants of Burmese, transliterated and transcribed

| Burmese script | | | | | Tranliteration | | | | | Transcription | | | | |
|----------------|---|----|---|---|----------------|----|---|----|-------|---------------|-----------------|---|---|---|
| က | ခ | ဂ | ဃ | င | K | KH | G | GH | Ń | k | k ^h | g | g | ŋ |
| စ | ဆ | ဇ | ဈ | ည | C | CH | J | JH | Ñ /ÑÑ | tɕ | tɕ ^h | ɕ | ɕ | ɲ |
| ဋ | ဌ | ဍ | ဎ | ဏ | Ṭ | ṬH | Ḍ | ḌH | Ṇ | t | t ^h | d | d | n |
| တ | ထ | ဒ | ဓ | န | T | TH | D | DH | N | t | t ^h | d | d | n |
| ပ | ဖ | ဗ | ဘ | မ | P | PH | B | BH | M | p | p ^h | b | b | m |
| ယ | ရ | လ | ဝ | သ | Y | R | L | V | S | j | r | l | w | θ |
| | ဟ | ဇွ | အ | | | H | Ḷ | - | | | h | l | ʔ | |

of two such sounds: /ḿ/ and /ṃ/. The consonants in Burmese are set out in **Table 4**.

For reasons of historical phonology, vowels in orthographically open syllables (**Table 5**), which are written with no final consonant letter, can be distinguished from those found in orthographically closed syllables (**Table 6**) namely those ending in a glottal stop or with a nasal vowel (transcribed here with /N/, which does not represent a final nasal consonant), both of which are written as final consonant letters in the writing system.

Like the majority of the languages spoken in mainland East and Southeast Asia, Burmese is a

tone language. The tonal contrasts involve not only the commonly observed differences in pitch and vowel length but also differences in phonation type – whether the voice is breathy or sharp in character. The presence or absence of a glottal stop at the end of the syllable may also considered to be part of the tonal system. **Table 7** gives a basic description of the tonal contrasts on a syllable consisting of a bilabial nasal and an open vowel.

Burmese morphemes in phrases and compounds display varying degrees of phonological juncture, principally voicing assimilation and reduction of the first syllable, as shown in the following examples.

- Voicing assimilation on internal morpheme boundaries in compounds.

ဝန်း + ခြံ > ဝန်းခြံ pán + tɛ^háN > ‘flower’ +
pánzàN ‘enclosure’ >
‘garden’
စား + ပွဲ > စားပွဲ sá + pwé > ‘eat’ + ‘event’ >
sábwé ‘feast’
မြင် + တယ် > မြင်တယ် mjìn + tè > ‘see’ + REALIS >
mjìndè ‘sees/saw’

- Reduction of first element in compounds.

ခါ + ပိုက် > ခါးပိုက် k^há + pai? > waist + carry >
gəbai? ‘pocket’
စား + ပွဲ > စားပွဲ sá + pwé > eat + event >
zəbwé ‘table’

Table 2 Burmese word-initial and word-internal vowel symbols

| Word-initial | | Word-internal | | Transliteration | |
|--------------|----|---------------|----|-----------------|---|
| အ | အာ | — | — | A | Ā |
| ဣ | ဤ | ◌◌ | ◌◌ | I | Ī |
| ဥ | ဦ | ◌◌ | ◌◌ | U | Ū |
| ဧ | ဧ | ◌◌ | ◌◌ | E | O |

|-------|----------|-----|-----------|-----|-------------|-----|
| /i/ | ိ | ိ̃ | ိး | ိး | ိး | ိး |
| /e/ | ေ | ဲ | ေး | ေး | ေး | ေး |
| /ɛ/ | ေ့ | ဲ့ | ေး့ | ေး့ | ေး့ | ေး့ |
| /a/ | ာ | ာ̃ | ား | ား | ား | ား |
| /ɔ/ | ော | ော̃ | ေား | ေား | ေား | ေား |
| /o/ | ဝ | ဝ̃ | ဝး | ဝး | ဝး | ဝး |
| /u/ | ု | ု̃ | ူး | ူး | ူး | ူး |

Morphology

Morphemes in Burmese are predominantly monosyllabic. With the exception of Indo-European loans, typically from Pali or English, compounding is the major source of polymorphemic words. In the television example above, four morphemes (N + V) (N + V) combine to form a noun.

Derivational morphology by prefixation is common, in particular noun-formation from verbs using the prefix အ-အို-

ပြိုင်ဆိုင် > အပြိုင်အဆိုင် pjàins^háin > compete >
 ?əpjáin competition
 ?əs^háin
 ရောင်း / ဝယ် > အရောင်းအဝယ် jáUN / wè > sell / buy >
 ?əjáUN trade
 ?əwè

The verbal complex, typically occurring at the end of a Burmese sentence, may comprise one or more head verbs in series followed by a string of auxiliary verbs, verbal particles, and markers.

Burmese, like other languages of the region, encodes power and solidarity in personal relationships using a rich system of pronouns and forms of address. Pronouns may be true pronouns, such as ငါ့ 1SING ‘I’ and နင် 2SING ‘you’ (both familiar, not polite), or grammaticalized from other sources, such as ကျွန်တော် 1SING (male, polite; literally ‘royal slave’). Other forms of address include titles, personal relationships, and names or a combination of all three, such as ဆရာမဒေါ်ခင်ခင်ချော s^həjama_. dò.k^hi nk^hiŋtə^hò ‘Teacher (FEM) Aunt (= Mrs.) Khin Khin Chaw.’

Literacy and Literary Burmese

The literacy rate in Burma has often been said to be high compared to other countries in the region, but accurate data are extremely difficult to obtain. One recent source suggests that nearly 80% of Burmese

Table 6 Vowels of Burmese in orthographically closed syllables: killed tone or nasal vowel

| Vowel | Nasal vowel | | | | | | Killed tone | |

Table 7 Burmese tones

| Tone name | IPA | Burmese script | Description |
|-----------|-------|----------------|--------------------------------------|
| Low | [ma:] | မာ | long, low |
| High | [má:] | မား | long, high; sometimes breathy |
| Creaky | [mǫ] | မ / မ့ | short, high, with creaky phonation |
| Killed | [maʔ] | မတ် | short, high, with final glottal stop |

Syllables with one of these tones may in some contexts become reduced to a short, unstressed schwa which is counted as a fifth tonal category in some analyses.

people over the age of 15 are literate, but other sources have put the figure much lower.

The Burmese language exists in a colloquial style used in spoken informal contexts and a literary style used in official formal settings. The main difference between the two is that they have separate sets of grammar words and some other vocabulary. A colloquial-style sentence is compared to its literary-style equivalent in the next example.

Spoken ဦးဘက မန္တလေးကို အမေနဲ့ လာတယ်။

 ʔú.ba_ði mánda.lé.ðò ʔəmè.ŋiN lá.ʔi
 U Ba.SUBJ Mandalay.to mother.with come.

REALIS

‘U Ba came to Mandalay with his mother’

Given the large number of speakers of Burmese and the existence of a large diaspora community

scattered around the world, Burmese has an inevitable presence on the Web, although at the time of writing standardized encoding has yet to be widely adopted and so text is usually displayed on the Internet as graphics. For ease of use, computer users often render Burmese in romanized form in Internet chat rooms or e-mail.

Burushaski

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Burushaski is a language isolate spoken in the Northern Areas, Pakistan, primarily in the Hunza, Nagar, and, Yasin valleys. A small enclave of Burushaski speakers is also found over the border in Kashmir, India. The Hunza and Nagar varieties differ only minimally from each other; both stand at a relative distance from the Yasin variety of Burushaski, sometimes also considered to be a close sister language, Werchikwar.

There are approximately 80 000 speakers of Burushaski, including somewhere in the area of 15 000–20 000 people speaking the Yasin dialect,

with an additional 20 000–30 000 speakers of both Hunza Burushaski and Nagar Burushaski. In all communities where Burushaski is spoken, the language remains vital, with many women and children still monolingual speakers.

The first comprehensive study of Burushaski was Lorimer (1935–1938). The most recent is Berger's three-volume grammar, dictionary, and text collection (1998).

Bilingualism among Burushaski speakers is common primarily in the two Dardic Indo-European languages Shina (Nagar Burushaski speakers) and Khowar (the Burusho of Yasin valley). In Hunza, especially in the village of Mominabad, the Indo-Aryan-speaking Dúumaki (Domaaki) live in close contact with Burushaski speakers; nearly all Dúumaki speakers appear to be bilingual in Burushaski. Burushaski

itself may have previously been spoken in a wider area than it is currently found: for example, in Dras, in Baltistan, there is a group of people known as the Brokpa or Brusa; also, in Ponjal, there are the so-called Burushken, who are now Shina speaking.

Burushaski has a basic five-vowel system, with two series of contrastive long vowels, alternatively bearing stress or higher pitch on the first or second mora, respectively:

| | | | | | | | |
|-----|---|----|----|----|---|----|----|
| (1) | i | íi | íí | | u | úu | úú |
| | e | éé | éé | | o | óó | óó |
| | | a | áa | áá | | | |

There is some dispute among Burushaski specialists as to the exact nature of these long vowels. Varma (1941: 133) described the suprasegmental or intonational contrasts of Burushaski long vowels as representing a rising and falling tone; modern investigators, however, e.g., Tiffou (1993), Berger (1998), and Morin and Tiffou (1989), considered this to be a difference of moraic stress: that is, Burushaski long vowels may receive stress on either the first mora or the second, corresponding to Varma's falling and rising tones, respectively. These phenomena are phonemic in Burushaski. A comprehensive instrumental analysis of Burushaski vocalism remains to be done. A lowered pitch on the first mora is sometimes heard with the former (initial-mora prominent) forms. (Note that expressive diminutives are generally associated with this intonational pattern, e.g., *šon* 'blind' vs. *šóon* 'somewhat blind' or *tak* 'attached' vs. *táak* 'somewhat attached'.) Yasin exhibits the same intonational phenomena as the standard Hunza and Nagar varieties, although the moraic stress difference seems to be less pronounced, and in some speakers, this contrast has been neutralized.

Examples of phonemic vowel contrasts in Burushaski include *bat* 'flat stone' vs. *baát* 'porridge' (as in *bras-e baát* 'cooked rice,' *aalu-e baát* 'mashed potatoes'); *dir* 'boundary, water ditch between fields, small irrigation canal; hostility' vs. *dir̄* 'overhanging rock'; *yun* 'wooden block in door lock, stocks (for prisoner)' vs. *yúun* 'quail'; *men* 'who' vs. *meén* 'old, venerable; fallow field'; *gon* 'dawn' vs. *goón* 'like, as.' Note that these length contrasts only appear in stressed syllables in Burushaski.

Three-way contrasts between short, first-mora-prominent, and second-mora-prominent vowels are found in a small number of lexical items in Burushaski. Such triplets include *bo* 'grain, seed, sperm/seed' vs. *bóo et-* 'low, bellow' vs. *boó* (cf. *nupáu* ~ *nupoón* in the converb form) 'sit down, lower self,' *don* 'large herd' vs. *dóon* (~*dóon ke*) 'still, yet, nevertheless' vs. *doón* 'woman's head scarf; open' (Berger, 1998: vol. 3, pp. 121–122). Two-way length contrasts, such as

báak 'punishment, torture' vs. *baák* 'generosity' are relatively common.

Burushaski has an extensive system of consonants. In fact, there are eight different stop/affricate series attested in the language. This includes labial, dental, alveolar, retroflex, palatal, palatal-retroflex, velar, and uvular. All of these series may be found in voiceless unaspirated, voiceless aspirated, and voiced series (see Table 1).

While retroflexion is common throughout the languages of south Asia, Burushaski has one of the largest inventories of nonsonorant retroflex sounds among the languages of the region, with no fewer than seven such sounds. In addition, the Hunza and Nagar varieties possess a curious retroflex, a spirantized palatal, symbolized /ỵ/, with a range of local or idiolectal realizations. This sound is lacking in the Yasin Burushaski dialect.

Burushaski possesses four noun classes, based on real-world semantic categorization. Thus, male humans belong to class I, female humans to class II, nonhuman animates to class III and inanimates to class IV (2). These classes are formally realized not in the noun themselves but through the selection of case allomorphs and verb agreement morphology.

| | | |
|-----|-----------------------|-----------------------|
| (2) | I: male human | II: female human |
| | <i>bir</i> 'man' | <i>dasín</i> 'girl' |
| | III: animate nonhuman | IV: inanimate |
| | <i>bayúr</i> 'horse' | <i>yaténç</i> 'sword' |

Another salient feature of the nominal system of Burushaski is the wide range of plural formations attested in the language. There are literally dozens of plural markers in the language, each often found with only a small number of nouns. Sometimes these are found only with nouns of a particular class but others crosscut this categorization (see Table 2).

Burushaski has a highly developed system of grammatical and instrumental cases as well as an elaborate system of local/directional cases and instrumental/comitative cases (see Table 3). The exact number is difficult to determine as new elements enter this

Table 1 The consonantal inventory of Burushaski

| | | | | | | | | |
|------------------|----------------|----------------|-----------------|----------------|-----------------|------------------|----------------|---|
| p | t | c | ṭ | č | č̣ | k | q | |
| p ^h | t ^h | c ^h | ṭ ^h | č ^h | č̣ ^h | k ^h | q ^h | |
| b | d | z | ḍ | j̣ | j̣̣ | g | ɣ | |
| (f) ^a | | s | | š | ṣ̌ | (x) ^a | | h |
| m | n | | | | | ŋ | | |
| w | | | | y | ỵ | | | |
| | l | r | | | | | | |

^a[f] and [x] occur only in loan words, or as a variant of the aspirated stops [p^h] and [q^h] or [k^h], respectively.

system through the grammaticalization (and phonological fusion) of relational nouns/postpositions. There are at least the following grammatical cases (i.e., ones assigned by structural position or verbal subcategorization): ergative, genitive, dative, ablative. In the latter two instances with class II nouns, the cases are built off the genitive (or oblique) stem.

Table 2 Plural formation in Burushaski

| Singular | Plural | |
|----------------|----------------------------|-----------------|
| <i>hal</i> | <i>hal-jó</i> | 'fox' |
| <i>jiip</i> | <i>jiip-uc</i> | 'jeep' |
| <i>γus</i> | <i>γuš-oŋo</i> | 'earthen clump' |
| <i>čonč</i> | <i>čonč-iŋ</i> | 'summit, peak' |
| <i>-γarum</i> | <i>γarum-iŋ ~ γarim-iŋ</i> | 'part' |
| <i>girkiš</i> | <i>girkič-o</i> | 'rat' |
| <i>γurkun</i> | <i>γurkuy-o</i> | 'frog' |
| <i>γurkuc</i> | <i>γurkuč-o</i> | 'frog' (Nagar) |
| <i>ašaáto</i> | <i>ašaátu-tiŋ</i> | 'weak(ling)' |
| <i>γat-enč</i> | <i>γat-aŋ</i> | 'sword' |

Numerals agree in class with their nominal complement in class in Burushaski (note class-I and class-III are conflated here; see **Table 4**). Numbers 20 and above are based on a clear vigesimal system, 30 literally being '20+10' and 40 being (etymologically) '2+20.' etc.

- (3) *aalter(an) 20 aalter toorumo 30*
aaltuwalter 40 aaltuwalter toorumo 50
iiski aalter 60 iiski aalter toorumo 70
waalti aalter(an) 80 waalti aalter toorumo 90 t^ba 100

The verbal system of Burushaski stands out for its morphological complexity among south Asian languages. There are two basic sets of inflections, depending in part on the stem allomorph. These two broad categories are as follows:

- | | |
|-------------------|-----------|
| (4) I | II |
| past | future |
| perfect | present |
| pluperfect | imperfect |
| aorist (conative) | |

Table 3 Case forms in Burushaski

| bow-INSTR-SUPERESS | throw | | | |
| 'shoot with bow' | | | | |

Table 4 Numerals

| | I/III | II | IV |
|----|------------------|-------------------|--------------------|
| 1 | <i>hin</i> | <i>han</i> | <i>hi(k)</i> |
| 2 | <i>aaltan</i> | <i>aala/aalto</i> | <i>aalti/aalto</i> |
| 3 | <i>iisken</i> | <i>usko</i> | <i>iiski</i> |
| 4 | <i>waalto</i> | <i>waalto</i> | <i>waal(ti)</i> |
| 5 | <i>cundo</i> | <i>cundo</i> | <i>cindi</i> |
| 6 | <i>mišindo</i> | <i>mišindo</i> | <i>mišin(di)</i> |
| 7 | <i>talo</i> | <i>talo</i> | <i>tale</i> |
| 8 | <i>aaltambo</i> | <i>aaltambo</i> | <i>aaltam(bi)</i> |
| 9 | <i>hunčo</i> | <i>hunčo</i> | <i>hunti</i> |
| 10 | <i>toorumo</i> | <i>toorumo</i> | <i>toorimi</i> |
| 11 | <i>turma hin</i> | <i>turma han</i> | <i>turma hik</i> |

The maximal template of the Burushaski simplex verb is given by Tikkanen (1995: 91) as:

| | | | | | |
|-----|-------------|------|----------------------|-----------|----|
| (5) | NEG- | D- | PERSON/CLASS/NUMBER- | CAUS- | √- |
| | -4 | -3 | -2 | -1 | ∅ |
| | PL.SUBJ- | DUR- | | 1SG.SUBJ- | |
| | +1 | +2 | | +3 | |
| | PRTCPL/OPT/ | | SUBJ.SFX- | | Q |
| | COND/AUX- | | | | |
| | +4 | | +5 | | +6 |

Some examples of verbs reflecting this template are given in (6). Note the curious and morphologically triggered (and phonologically unmotivated) devoicing of obstruents following the negative allomorph *a-* (but not *oó-*).

| | | |
|-----|---------------------------|---------------------------------|
| (6) | <i>oó-min-im-i</i> | <i>oó-man-um-an</i> |
| | NEG-drink-AP-I | NEG.PL-become-AP-PL |
| | 'he didn't drink (it)' | 'they didn't become' |
| | (Berger, 1998: 106) | (Berger, 1998: 106) |
| | <i>a-túru-m-i</i> | <i>duróo-m-i</i> |
| | NEG-work-AP-I | work-AP-I |
| | 'he didn't work' | 'he worked' |
| | (Berger, 1998: 105) | (Berger, 1998: 105) |
| | <i>a-mí-kač-ič-a-i</i> | <i>mi-k^báč-iča-i</i> |
| | NEG-1PL-enclose-DUR-AUX-I | 1PL-enclose-DUR-AUX-I |
| | 'he doesn't enclose us' | 'he encloses us' |
| | (Berger, 1998: 105) | (Berger, 1998: 105) |
| | <i>a-tu-ququ-m-i</i> | <i>du-q^bóqu-m-i</i> |
| | NEG-D-be.confused-AP-I | D-be.confused-AP-I |
| | 'he was not confused' | 'he was confused' |
| | (Berger, 1998: 105) | (Berger, 1998: 105) |

In addition to subject and direct/indirect objects, the Burushaski verb may also optionally encode an animate possessor of a logical argument as an argument morphologically in the verb-word (7).

| | | | |
|------|---|-------------------------|---------------------|
| (7a) | <i>k^bak^báy-umuc</i> | <i>p^bašú</i> | <i>mée-t-aa</i> |
| | walnut-PL | gobble.up | 1PL-AUX-2 |
| | 'you gobbled up our walnuts' | | (Berger, 1998: 162) |

| | | | | |
|------|--|-----------------|---------------|-----------------------|
| (7b) | <i>hiles-e</i> | <i>dasin-mo</i> | <i>mo-miš</i> | <i>moo-skarc-im-i</i> |
| | boy-ERG | girl-GEN | II-finger | II-cut-AP-I |
| | 'the boy cut off the girl's finger' (Willson, 1990: 5) | | | |

Another characteristic feature of the Burushaski verbal system is the grammaticalized use of double argument indexing with intransitive verbs. This single vs. double marking appears within two separate functional subsystems. In the first one, presence vs. absence of double marking implies degree of control of the subject over the action: less control is indexed through double marking (8a). In the second such subsystem, class-IV nouns receive single marking while class-III nouns receive double marking with the same predicate (8b).

| | | |
|------|--|-------------------|
| (8a) | <i>γurc-im-i</i> | |
| | sink-AP-I | |
| | 'he dove under' (Berger, 1998: 118) | |
| | <i>i-γúrc-im-i</i> | |
| | I-sink-AP-I | |
| | 'he drowned' (Berger, 1998: 118) | |
| (8b) | <i>ha</i> | <i>γulú-m-i</i> |
| | house | burn-AP-IV |
| | 'the house burned' (Berger, 1998: 118) | |
| | <i>hun</i> | <i>i-γúl-im-i</i> |
| | wood | III-burn-AP-III |
| | 'the wood burned' (Berger, 1998: 118) | |

Syntactically, Burushaski is a fairly rigid SOV language. In narrative texts, head-tail linkage, a common narrative device among south Asian languages, is frequently found (clauses are linked by rote repetition of the finite verb of a preceding sentence in a nonfinite form in an immediately following sentence). Further, some cases appear only on the leftmost of two (conjunctively or disjunctively) conjoined nouns, while others appear on both. There thus appear to be both phrasal and word-level case forms in Burushaski. A further curious aspect of Yasin Burushaski is the highly atypical semantic (plural) agreement seen with disjunctively conjoined NPs (Anderson and Eggert, 2001). Most of these features can be seen in the following examples.

| | | | | | |
|------|--|-----------|---------------|--------------|---------------------|
| (9a) | <i>gus</i> | <i>ya</i> | <i>hir-e</i> | <i>dasen</i> | <i>a-mu-yeec-en</i> |
| | woman | or | man-ERG | girl | NEG-II-see-PL |
| | 'the woman or the man didn't see the girl' | | | | |
| | (Anderson <i>et al.</i> , 1998) | | | | |
| (9b) | <i>hir</i> | <i>ya</i> | <i>guse-e</i> | <i>dasen</i> | <i>a-mu-yeec-en</i> |
| | man | or | woman-ERG | girl | NEG-II-see-PL |
| | 'the man or the woman didn't see the girl' | | | | |
| | (Anderson <i>et al.</i> , 1998) | | | | |

Another characteristic feature of Burushaski syntax is the extensive use of case forms to mark a wide range of subordinate clause functions (Anderson, 2002).

- (10) *ma ma-ír-áte ĵe taŋ*
 y'all 2PL-die-SUPERESS I sad
a-máy-a-m
 1-become.dur-1-AP
 'when you all die I will be sad'
 (Berger, 1998: 140)

Burushaski includes loans from a range of local languages including Urdu, Khowar, Shina, and even (perhaps indirectly) from Turkic languages as well. In some instances, loan affixes may be found as well, e.g., *dađaq-ci* 'big-drum drummer' (Berger, 1998: 209). More tenuous lexical connections have been proposed with Northeast Caucasian languages and Paleo-Balkan Indo-European languages (Casule, 1998).

There is a small body of indigenous literature in Burushaski written in a modified Urdu script. In addition, various texts in transcription have appeared, including Skyhawk *et al.* (1996), Skyhawk (2003), etc.

Caddoan Languages

D Rood, University of Colorado, Boulder, CO, USA

© 2006 Elsevier Ltd. All rights reserved.

Caddoan is a family of North American language consisting of two branches: Caddo, formerly spoken in Texas and Louisiana, and now spoken only in Oklahoma; and North Caddoan, found in the central Plains from Oklahoma to North Dakota. The North Caddoan languages include Arikara, Pawnee, Kitsai, and Wichita. Arikara and Pawnee are linguistically very close, while Kitsai falls between them and Wichita.

Language Structure

The Caddoan languages have extremely small phoneme inventories, but complex morphophonemics. They are morphologically and syntactically prototypical examples of polysynthetic structure. The proposed phoneme inventory for the family is */p, t, k, c (= [ts]), s, w, n, r, y, ʔ, h, i, a, u/ (Chafe, 1979: 218–219). Caddo has a somewhat larger set, which appears to result from relatively recent expansion.

Caddoan verbs consist of 30 or more positional slots into which bound morphemes may be inserted; the verb root occurs near the end. In addition to expected categories like tense, modality, aspect, pronoun, number, evidential, and verb root, there are slots for certain adverbs, incorporated objects, patient definiteness (in Wichita and possibly others), and derivational stem-forming elements. All the languages have a bipartite verb stem for many verbs; a class of ‘preverbs’ occurs separated from the root by several slots.

Nouns generally may take only one of two or three suffixes: an ‘absolutive’ (which occurs only when the noun is used alone), a locative, or, in some of the languages, an instrumental. Noun compounds are frequent and productively formed. All the languages lack adpositions and most adjectives.

Sentential argument structure (subject, object, indirect object, possessor) is marked entirely in the

verbal complex; word order in clauses has strictly pragmatic functions. Intransitive verbs fall into two classes depending on whether their subjects are marked by transitive object pronouns or transitive agent pronouns.

History and Scholarship

Europeans first encountered speakers of Caddoan languages during the 16th-century Spanish expeditions from Mexico searching for Quivira (the land supposed to have included El Dorado, a rumored but non-existent city with streets of gold). Maps from those expeditions record a few (now largely uninterpretable) place names, but beyond that most information on the languages has been collected since the 1960s. Kitsai was recorded as spoken by its last monolingual speaker in the early 20th century, but none of the data has been published. The other languages continued to have a few speakers at the beginning of the 21st century, but all will probably be extinct by 2025, despite language preservation and revival efforts.

Large text collections and good grammars are available for two of the languages, Arikara and Pawnee, thanks to the work of Douglas R. Parks. Parks has also coauthored a series of Arikara teaching grammars and a dictionary for elementary school students. Wichita is documented in a grammar, several articles about grammatical phenomena, and a few texts by David S. Rood, as well as audio and video documentation archived at the Max Planck Institute for Psycholinguistics in Nijmegen, the Netherlands. For Caddo, see the texts by Wallace L. Chafe and the detailed description of verb morphology by Lynette Melnar. Allan R. Taylor and W. L. Chafe have published on the history of the Caddoan language family (see Chafe, 1979, for further reading).

Cape Verdean Creole

M Baptista, University of Georgia, Athens, GA, USA

© 2006 Elsevier Ltd. All rights reserved.

Cape Verdean Creole (henceforth CVC) is spoken in Cape Verde Islands, an archipelago located in the Atlantic Ocean off the northwestern coast of Africa, at approximately 450 kilometers from Senegal. The archipelago is divided into two main clusters: the windward islands (locally known as Barlavento) and the leeward islands (Sotavento). Barlavento includes Boavista, Sal, São Nicolau, Santa Luzia, São Vicente, and Santo Antão. Sotavento consists of Brava, Fogo, Santiago, and Maio.

Given the strategic location of the archipelago at the crossroads of Europe, Africa, and America, the Portuguese settled the islands from 1462 onward, and the islands came to play a critical role in the slave trade from the 15th to the 19th centuries. As a result, many view CVC as the oldest creole alive today. Historical sources (Brásio, 1962) state that the tribes of Mandingues, Balantes, Bijagos, Feloupes, Beafadas, Pepels, Quissis, Brames, Banhuns, Peuls, Jalofos, Bambaras, Bololas, and Manjakus provided most of the human contingent to the slave trade in Cape Verde. The white settlers came from Algarve and Alentejo in Portugal and also included Jews, Spaniards, Italians, and French (Martinus, 1996). Having been settled at different times with different populations, it is not surprising that a number of morphophonological and syntactic features distinguish Barlavento varieties (closer to Portuguese) from their Sotavento counterparts (more Africanized), resulting in a fairly complex sociolinguistic situation.

Although earlier descriptions of the language viewed CVC as a mere dialect of Portuguese, recent studies have shed new light on the hybrid nature of CVC focusing on the African contributions to the formation of the language. Baptista (2003a) studied specifically reduplication, a morphological process found in African languages whereby a reduplicated adjective or adverb expresses emphasis, as in *moku moku* 'very drunk' or *faxi faxi* 'very quickly'. Noun reduplication may yield a distributive interpretation, as in *dia dia* 'every day' or may simply lead to a change in meaning, as in *boka* 'mouth,' *boka boka* signifying 'in secret'. Lexical categories such as adjectives once reduplicated may shift category (i.e., adjective to noun) as in *mansu* 'quiet', *mansu mansu* 'secrecy'. Other scholars such as Rougé (2004) and Quint (2000) have examined the possible African etymology of some of the Cape Verdean linguistic items that have found their way in the grammatical and lexical components of the language. Lang (2004) has investigated how some grammatical morphemes inherited from Portuguese may also take on new functions passed down from substrates like Wolof. In a similar vein of work, Baptista (2003b) has examined how the plural suffix *-s* in Cape Verdean inherited from Portuguese is sensitive to conditions such as the animacy hierarchy and definiteness, two variables playing a role in the African languages having contributed to the genesis of CVC.

Such studies demonstrate the genuine hybrid nature of CVC by examining how various elements from all source languages involved in its genesis interact and at what level. This gives us valuable insights into cognitive processes at play when languages come abruptly into contact.

Cariban Languages

S Meira, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The Cariban family is one of the largest genetic groups in South America, with more than 25 languages (see **Figure 1**) spoken mostly north of the Amazon, from Colombia to the Guianas and from northern Venezuela to Central Brazil (see **Figure 2**). Despite the long history of their studies, most Cariban languages are still insufficiently described. The best descriptive works published so far are Hoff (1968, on Karinya) and Derbyshire (1979, 1985, on Hishkaryana). There are good descriptive works on Apalai, Makushi, and Waiwai in Derbyshire and Pullum (1986–1998); Jackson (1972) gives a brief, but detailed, overview of Wayana. Muller (1994) is a very informative Panare dictionary. Meira (2005) and Carlin (2004) are full descriptions of Tiriyo; Meira (2000), mostly a historical study, contains some descriptive work on Tiriyo, Akuriyo, and Karihona. Gildea (1998) and Derbyshire (1999) contain surveys of the family.

Comparative Studies and Classification

First recognized by the Jesuit priest Filippo Salvatore Gilij in the 18th century (Gilij, 1780–1783), the Cariban family was subsequently studied by L. Adam (1893) and C. H. de Goeje (1909, 1946). After some initial tentative proposals within larger South American classifications (the last of which is Loukotka, 1968), the first detailed classification was published by V. Girard (1971), followed by M. Durbin (1977) and T. Kaufman (1994). Durbin's classification – unfortunately used in the Ethnologue (SIL) – is, as

Gildea (1998) pointed out, seriously flawed; Girard's classification is limited (14 low-level subgroups); Kafuman's classification is probably the best; it is based not on firsthand sources but on the comparison of other classifications. The proposal in **Figure 1** is the preliminary result of ongoing comparative research. There is some good evidence that Cariban and Tupian languages are distantly related (Rodrigues, 1985); other hypotheses (e.g., Ge-Pano-Carib and Macro-Carib, from Greenberg, 1987) remain mostly unsupported and are not accepted by specialists.

Shafer (1963) was the first attempt at reconstructing Proto-Cariban phonology, but its many flaws make Girard (1971) the real first proposal in this area. The most up-to-date study is Meira and Franchetto (2005). Meira (2000) reconstructs the phonology and morphology of the intermediate proto-language of the Taranoan subgroup.

Main Linguistic Features

Phonology

Cariban languages have small segmental inventories: usually only voiceless stops (*p*, *t*, *k*, *ʔ*), one or two fricatives/affricates (*b* or *β*, *s* or *ʃ* or *tʃ*), two nasals (*m*, *n*), a vibrant (*r*, often *ɹ* or *ʀ*), glides (*w*, *j*), and six vowels (*a*, *e*, *i*, *o*, *u*, *ɨ*). Some languages have distinctive voiced obstruents (Bakairi, Ikpeng, Karihona), more than one vibrant or lateral (Bakairi, Kuikuro, Ikpeng, Hishkaryana, Waiwai, Kashuyana), or more fricatives or affricates (Bakairi, Waimiri-Atroari, Kashuyana, Waiwai); others have an extra vowel *ə* (Wayana, Tiriyo, Panare, Bakairi, Pemong, Kapong). Vowel length is often distinctive, whereas nasality usually is not, with few exceptions (Apalai, Bakairi, Kuikuro).

Figure 1 A tentative classification of Cariban languages. (?) = difficult to classify; (†) = extinct (not all listed here). Different names or spellings for the same language are given in parentheses. Dialects are indented under the language name. (Demographic data refer to speakers, not ethnic members of the group; sources: Ethnologue and author's own work).

Many languages have weight-sensitive rhythmic (iambic) stress (Table 1; Meira, 1998); some, however, have simple cumulative, usually penultimate, stress (Panare, Bakairi, Kuikuro, Yukpa). Morphophonological phenomena include stem-initial ablaut in verbs and nouns and the systematic reduction of stem-final syllables within paradigms (Gildea, 1995; Meira, 1999).

Morphology

Cariban languages are mostly suffixal; prefixes exist also, marking person and valency (the latter on verbs). Some languages (Tiriyo, Wayana, Apalai) have reduplication. The complexity of the morphology is comparable to that of Romance languages. There are usually nouns, verbs, postpositions, adverbs (a class that includes most adjectival notions), and particles.

Possessed nouns take possession-marking suffixes that define subclasses (*-ri*, *-ti*, *-ni*, *-∅*) and person-marking prefixes that indicate the possessor (e.g., Ikpeng *o-megum-ri* 'your wrist', *o-muj-n* 'your boat', *o-egí-∅* 'your pet'). With overt nominal possessors, some languages have a linking morpheme *j-* (e.g., Panare *Toman j-uwə?* 'Tom's house, place'). Nouns can also be marked for past ('ex-N', 'no longer N') with special suffixes (*-tpo*, *-tpi*, *-bi*, *-tpə*, *-hpə*, *-npə*, etc.; e.g., Bakairi *ūwī-bi-ri* 'my late father'). Pronouns distinguish five persons (1, 2, 3, 1 + 2 = dual inclusive = 'you and I,' 1 + 3 = exclusive; the 1 + 3 pronoun functions syntactically as a third-person form) and two numbers (singular, or noncollective, and plural, or collective). The third-person forms also have gender (animate vs. inanimate) and several deictic distinctions (Table 2). To each pronoun usually

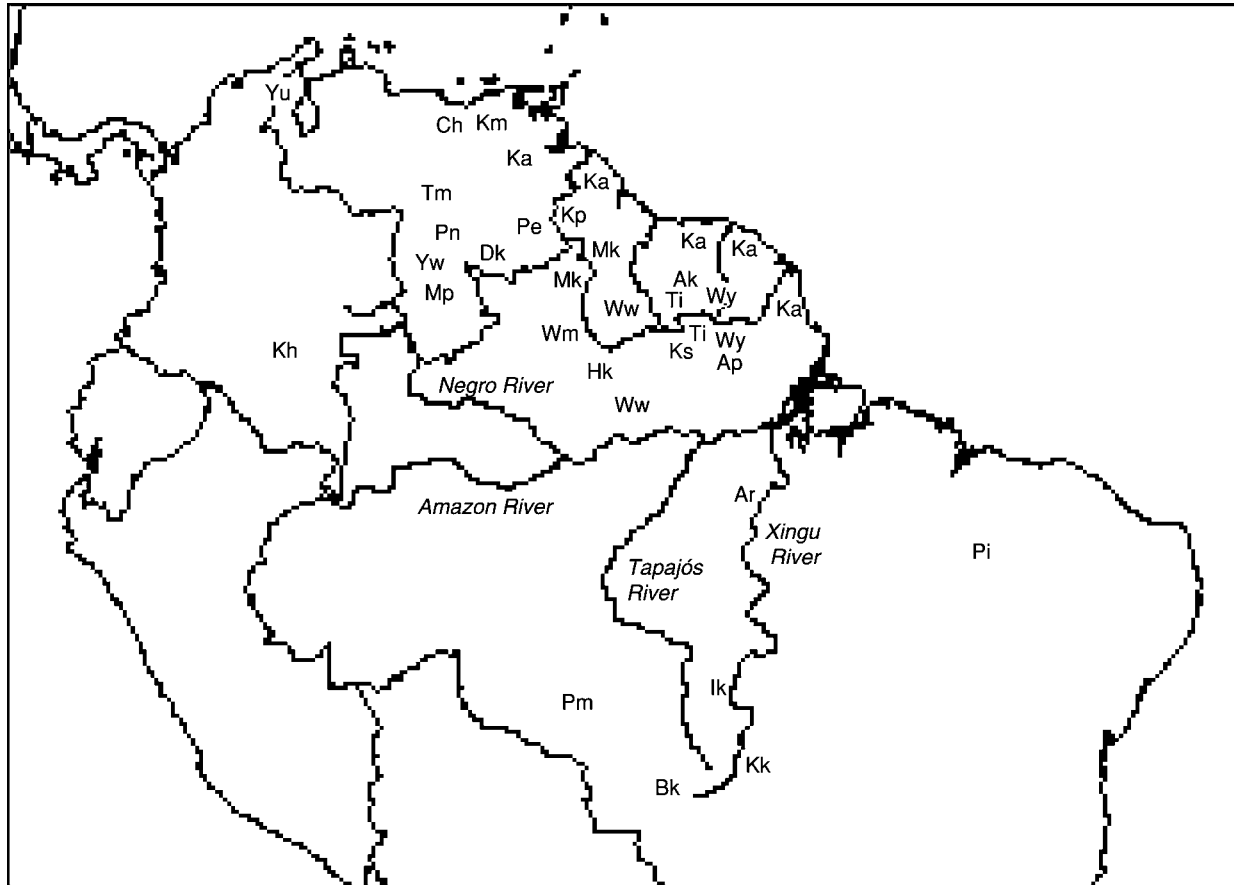

Figure 2 Map of the current distribution of Cariban languages. Living languages in bold, extinct languages in normal type. **AK**, Akuriyo; **Ar**, Arara; **Bk**, Bakairi; **Ch**, Chayma†; **Dk**, De'kwana; **Hk**, Hishkaryana; **Ik**, Ilkpeng; **Ka**, Karinya; **Kh**, Karihona; **Kk**, Kuikuro; **Km**, Kumanakoto†; **Kp**, Kapong; **Ks**, Kashuyana; **Mk**, Makushi; **Mp**, Mapoyo; **Pe**, Pemong; **Pi**, Pimenteria†; **Pm**, Palmella†; **Pn**, Panare; **Ti**, Tiriyo; **Tm**, Tamanaku; **Yu**, Yukpa; **Yw**, Yawarana; **Wm**, Waimiri-Atroari; **Ww**, Waiwai; **Wy**, Wayana.

Table 1 Rhythmic (iambic) stress: Tiriyo

1. Words with only light (CV) syllables, based on the stem *apoto* 'helper, servant'^a

| | | |
|---------------------------|---------------------------------|----------------------------|
| <i>apoto</i> | [(a.po):to] | 'helper' |
| <i>m-apoto-ma</i> | [(ma.po):to.ma] | 'you helped him' |
| <i>kit-apoto-ma</i> | [(ki.ta:).(po.to:).ma] | 'the two of us helped him' |
| <i>m-apoto-ma-ti</i> | [(ma.po:).(to.ma:).ti] | 'you all helped him' |
| <i>kit-apoto-ma-ti</i> | [(ki.ta:).(po.to:).ma.ti] | 'we all helped him' |
| <i>m-apoto-ma-po-ti</i> | [(ma.po:).(to.ma:).po.ti] | 'you all had him helped' |
| <i>kit-apoto-ma-po-ti</i> | [(ki.ta:).(po.to:).(ma.po:).ti] | 'we all had him helped' |

2. Words with at least one heavy (non-CV) syllable.

| | | |
|-------------------------|------------------------------|-----------------------------|
| <i>kin-erahtə-po-ti</i> | [(ki.ne:).(rah).(tə.po:).ti] | 'he made them all be found' |
| <i>mi-repentə-tə-ne</i> | [(mi.re:).(pen).(tə.tə:).ne] | 'you all paid/rewarded him' |
| <i>m-aitə-po-tə-nə</i> | [(mai).(tə.po:).tə.ne] | 'you all had it pushed' |

^aIambic feet are enclosed in parenthesis. Dots = syllable boundaries; hyphens = morpheme boundaries.

corresponds a person-marking prefix (except 1 + 3, to which correspond simple third-person markers). In some languages, the 1 + 2 prefixes were lost (Kapong, Pemong, Makushi); in others, the prefixes are replaced by pronouns as overt possessors (Yukpa, Waimiri-Atroari).

In more conservative languages, verbs have a complex inflectional system, with prefixes marking person and suffixes marking various tense-aspect-mood and number distinctions. The person-marking prefixes form what Gildea termed the *Set I* system (Table 3), variously analyzed as split-S or active-stative (e.g., by Gildea) or as cross-referencing both A (Agent) and P (Patient) (Hoff, 1968). In most languages, however, innovative systems have arisen from the reanalysis of older deverbal nominalizations or participials, and are now in competition with the *Set I* system. Most of the new systems follow ergative patterns, thus creating various cases of ergative splits and even a couple of fully ergative languages (Makushi, Kuikuro, in which the *Set I* system has been entirely lost). Gildea (1998)

Table 2 A typical Cariban pronominal system: Kashuyana

| Third person | Inanimate | | Animate | | Other persons | Sing. | Pl. |
|---------------|-------------|------------------|---------------|-----------------|---------------|---------------|----------------|
| | Sing. | Pl. | Sing. | Pl. | | | |
| Anaphoric | <i>iro</i> | <i>iro-tomu</i> | <i>noro</i> | <i>norojami</i> | 1 | <i>owi</i> | |
| Demonstrative | | | | | | | |
| Proximal | <i>soro</i> | <i>soro-tomu</i> | <i>mosoro</i> | <i>moʔtjari</i> | 2 | <i>omoro</i> | <i>omjari</i> |
| Medial | <i>moro</i> | <i>moro-tomu</i> | <i>moki</i> | <i>mokjari</i> | 1 + 2 | <i>kumoro</i> | <i>kimjari</i> |
| Distal | <i>moni</i> | <i>mon-tomu</i> | <i>mokiro</i> | <i>mokjari</i> | 1 + 3 | <i>amna</i> | |

Table 3 Cariban person-marking systems

| Conservative (Set I) system: <i>Karinya</i> | | | | | Innovative system: <i>Makushi</i> | | | | |
|---|---------------|--------------|-----------|----------------|-----------------------------------|-------|------------|------------------|------------------|
| | 1P | 2P | 1 + 2P | 3P | (S _A) | S | P | A | |
| 1A | | <i>k-</i> | | <i>s(i)-</i> | ∅- | 1 | <i>u-</i> | <i>u(j)-</i> | <i>-u-ja</i> |
| 2A | <i>k-</i> | | | <i>m(i)-</i> | <i>m-</i> | 2 | <i>a-</i> | <i>a(j)-</i> | <i>-∅-ja</i> |
| 1 + 2A | | | | <i>kis(i)-</i> | <i>kit-</i> | 1 + 2 | <i>i-</i> | <i>i(t)-/ ∅-</i> | <i>-i-ja</i> |
| 3A | ∅-/ <i>j-</i> | <i>a(j)-</i> | <i>k-</i> | <i>n(i)-</i> | <i>n(i)-</i> | 3Refl | <i>ti-</i> | <i>t(i)-</i> | <i>-ti(u)-ja</i> |
| (S _P) | ∅-/ <i>j-</i> | <i>a(j)-</i> | <i>k-</i> | <i>n(i)-</i> | | | | | |

provides a detailed account of this diachronic development.

Underived adverbs usually take no morphology other than one nominalizing suffix. There are many postpositions, often formed with smaller locative or directional elements; they can take the same person-marking prefixes as nouns, and (usually) the same nominalizing suffix as adverbs. There are many particles in several syntactic subclasses and with various semantic and pragmatic contents (diminutives, evidentials, modals, etc.; cf. Hoff, 1986, 1990, for the *Karinya* case).

Class-changing morphology is quite rich. Verbs have many nominalizing affixes ('actual' vs. 'habitual' or 'potential' A, P, S; circumstance; action) and also adverbial-ized forms (participial, temporal, modal, etc.). There also are affixes for intransitivizing, transitivity and causativizing verb stems (according to their valency). There are several noun verbalizers (inchoative: 'to produce/have N'; privative: 'to de-N X'; dative: 'to provide X with N').

Syntax

Cariban languages are famous as examples of the rare OVS word order (Derbyshire, 1977), with Hishkaryana as the first case study.

- (1) *toto j-oska-je okoje* (Hishkaryana)
 man LINKER -bite-PAST snake
 'The snake bit the man.'
 (Derbyshire, 1979: 87)

Tight syntactic constituents are few: most languages have only OV-phrases (only with third-person

A and P), possessive phrases (possessor-possessed), and postpositional phrases. There are no modifier slots: 'modification' is carried out by the apposition of syntactically independent but pragmatically coreferential nominals (e.g., *the woman, that one, the tall one, the one with beads* instead of *that tall woman with beads*). Equative clauses can have a copula, but verbless clauses also occur:

- (2) *tubu firə* (Bakairi)
 stone this
 'This is a stone.'
 (author's data)

Negation is based on a special adverbial form of the verb, derived with a negative suffix (usually *-pira*, *-pra*, *-bra*, *-ra*, etc.), in a copular clause:

- (3) *isapokara on-ene-pira aken* (Apalai)
 lizard.sp 3NEG-see-NEG 1:be:PAST
 'I did not see a *jacuraru* lizard.'
 (Lit. lizard not-seeing-it I-was)
 (Koehn and Koehn, 1986: 64)

Subordinate clauses are usually based on deverbal nominals or adverbials. In some languages, there are finite subordinate clauses (Panare, Tamanaku, Yukpa, Tiriyo). The sentences below exemplify relative clauses (in brackets): nominalizations (4) and finite clauses with relativizing particles (5).

- (4) *kaikui ə-wa:rə [pahko* (Tiriyo)
 dog 2-known.to father
i-n-tu:ka-hpə]?
 3-PAT.NMLZR-beat-PAST
 'Do you know the dog that my father beat?'
 (author's data)

- (5) a. *tʃonkaiʔpe it-etʃeti pare* (Tamanaku)
 which 3-name priest
[n-epu-i netʃiʔ]
 3-come-PAST RELAT
 ‘What is the name of the priest who has (just) come?’
 (Gilij, 1782: III, 176)
- b. *akeʃ peru [kat amo=n woneta]* (Yukpa)
 that dog RELAT YOU=DAT 1.talk
sa=ne siiw
 thus=3.be white
 ‘The dog that I talked to you about was white.’
 (author’s data)

With verbs of motion, a special deverbal (supine) form is used to indicate the purpose of the displacement.

- (6) *epi-be wi-tə-jai* (Wayana)
 bathe-SUPINE 1-go-PRESENT
 ‘I am going (somewhere) to bathe.’
 (Jackson, 1972: 60)

Lexicon and Semantics

Cariban languages have few number words, usually not specifically numerical (one = alone, lonely; two = a pair, together; three = a few); higher numbers are expressed with (often not fully conventionalized) expressions based on words for *hand*, *foot*, *person* or *body*, or are borrowings. Spatial postpositions often distinguish: vertical support (‘on’), containment (‘in’), attachment/adhesion, Ground properties (‘in open space,’ ‘on summit of,’ ‘in water’), and complex spatial configurations (‘astraddle,’ ‘parallel to,’ ‘piercing’). Some languages have ‘mental state’ postpositions (desiderative: *want*; cognoscitive: *know*; protective: *protective toward*; etc.). There are different verbs for eating, depending on what is eaten; to every verb corresponds a noun designating the kind of food in question (e.g., Tiriyo *ənə* ‘eat meat,’ *oti* ‘meat food’; *enapi* ‘eat fruits, vegetables,’ *napi* ‘fruit, vegetable food’; *əku* ‘eat bread,’ *uru* ‘bread food’; *aku* ‘eat nuts,’ *mme* ‘nut food’).

Geography and Demography

The territories where Catalan is natively spoken cover 68 730 km², of which 93% lies within Spain (see Figure 1). They are:

1. The Principality of Andorra
2. In France: North Catalonia – almost all of the département of Pyrénées-Orientales
3. In Spain: Catalonia, except for the Gascon-speaking Vall d’Aran; the eastern fringe of Aragon; most of Valencia (the Comunitat Valenciana), excepting some regions in the west and south that have been Aragonese/Spanish-speaking since at least the 18th century; El Carxe, a small area of the province of Murcia, settled in the 19th century; and the Balearic Islands
4. In Italy: the port of Alghero (Catalan *L’Alguer*) in Sardinia

Table 1 shows the population of these territories (those over 2 years of age in Spain) and the percentages of the inhabitants who can understand, speak, and write Catalan. Information is derived from the 2001 census in Spain together with surveys and other estimates; the latter are the only sources of language data in France and Italy. The total number of speakers of Catalan is a little under 7.5 million. Partly as a result of the incorporation of Catalan locally into the education system, there are within Spain a significant number of second-language speakers who are included in this total. Virtually all speakers of Catalan are

bilingual, using also the major language of the state they live in. (Andorrans are bilingual in Spanish or French, or are trilingual.)

Genetic Relationship and Typological Features

Catalan is a member of the Romance family and a fairly prototypical one, as befits its geographically central position in the European Romance area. Some particularly noteworthy characteristics are pointed out here (for more details see Wheeler, 1988). In historical phonology, note the palatalization of initial /l-/ and loss of stem-final /n/ that became word final, for example, LEONEM > *lleó* [lɔ’o] ‘lion.’ Original intervocalic -c-, -tj-, -d- became /w/ in word-final position and were lost elsewhere, for examples, PLACET > *plau* [’plaw] ‘please.3.SING,’ PLACEMUS > *plaem* [plə’em] ‘please. 1.PL.’ As the previous examples also illustrate, post-tonic nonlow vowels were lost, so that a dominant pattern of phonological words is of consonant-final oxytones. The full range of common Romance verbal inflection is retained, including inflected future (*sentirà* ‘hear.3.SING.FUT’), widely used subjunctives, and a contrast between present perfect (*ha sentit* ‘has heard’) and past perfective (*sentí* ‘heard.3.SING.PERF’). In addition to the inherited past perfective form, now largely literary, Catalan developed a periphrastic past perfective using an auxiliary that was originally the present of ‘go’ (*va sentir* ‘AUX.PERF.3.SING hear.INF’). In some varieties of Catalan, this construction has developed a subjunctive (*vagi sentir* ‘AUX.PERF.SUBJ.3.SING hear.INF’), introducing, uniquely in Romance, a perfective/imperfective aspect distinction in the subjunctive. Considerable use

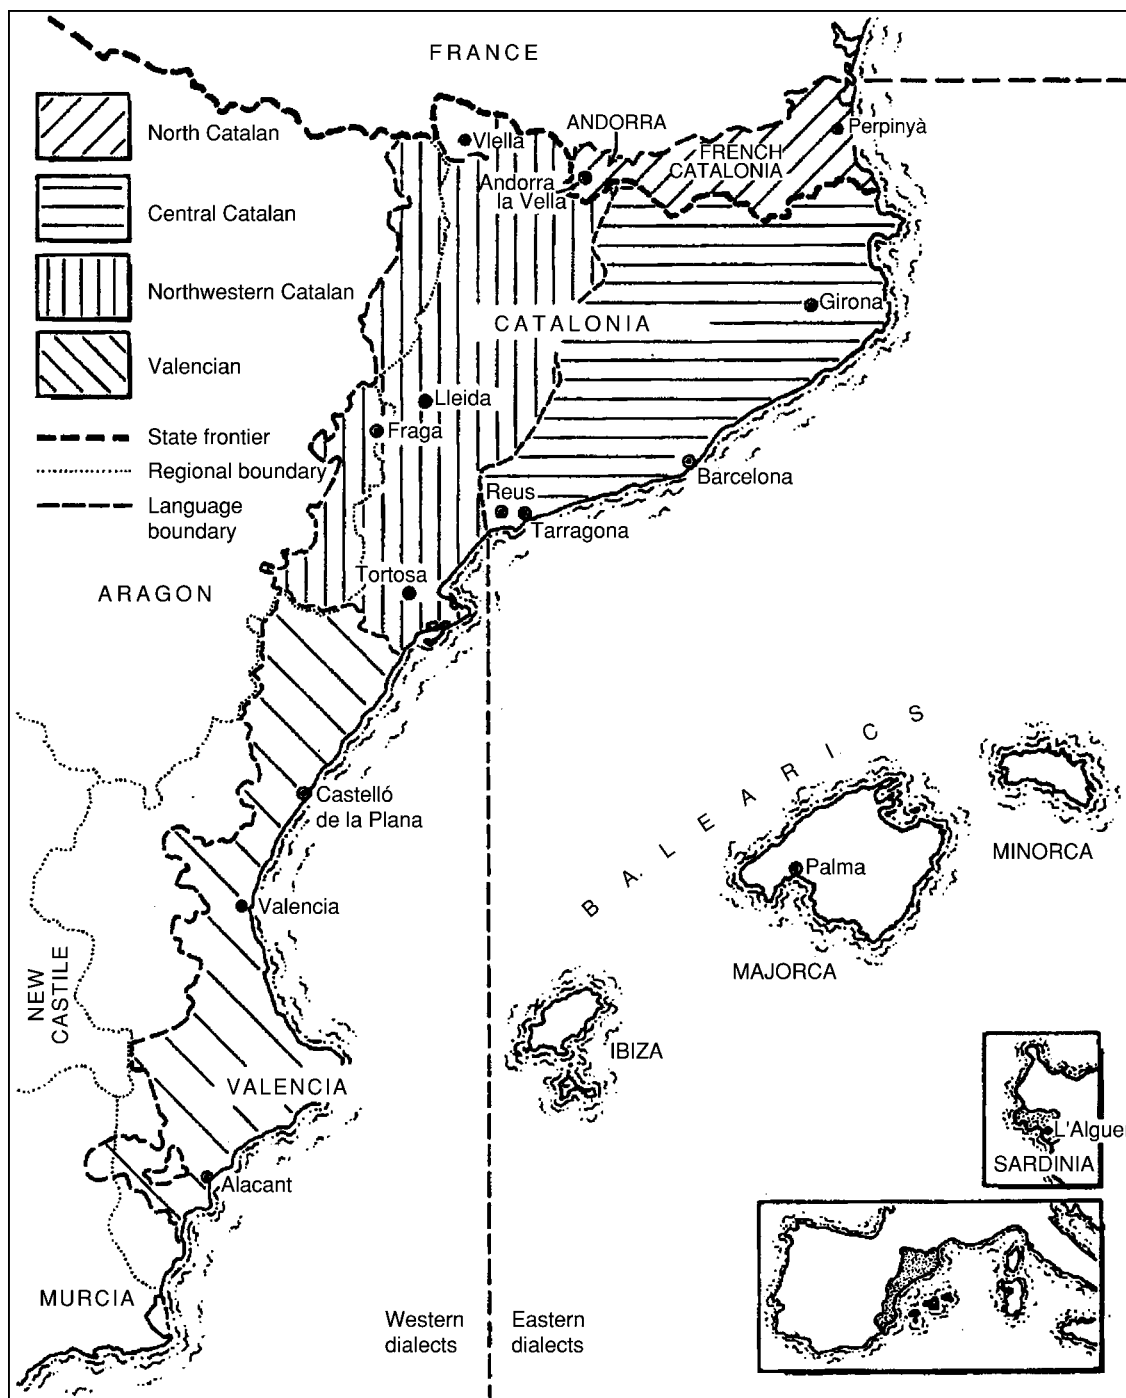

Figure 1 Catalan-speaking areas and dialects.

is made of pronominal and adverbial clitics that attach to verb forms in direct and indirect object functions or partitive or adverbial functions, quite often in clusters of two or three, as in (1).

- (1) us n'hi envi-en
 2.PL.OBJ PART.LOC send-3.PL
 "they send some to you (PL)
 there"

Most of the pronominal/adverbial clitics have several contextually conditioned forms; thus, the partitive clitic shows variants *en* ~ *n'* ~ *-ne*. Clitic climbing is commonly found with a pronominal complement of a verb that is itself the complement of a (semantic) modal, as in (2). This example also shows the (optional) gender agreement of a perfect participle with a preceding direct object clitic.

Table 1 Catalan language demography and competences

| Territory | Population | Understand Catalan (%) | Speak Catalan (%) | Write Catalan (%) |
|------------------|------------|------------------------|-------------------|-------------------|
| Andorra | 66 000 | 97 | 91 | (No data) |
| North Catalonia | 363 000 | 59 | 41 | 10 |
| Catalonia | 6 215 000 | 95 | 75 | 50 |
| Aragon fringe | 50 000 | 95 | 90 | (No data) |
| Valencia | 4 145 000 | 85 | 48 | 23 |
| Balearics | 822 000 | 90 | 68 | 26 |
| Alghero/L'Alguer | 38 000 | 53 | 46 | (No data) |
| Total | 11 699 000 | 89 | 64 | 37 |

(2) no l'he sab-ud-a agafa-r
 not DO.3.SING.F. know- catch-INF
 have.1.SING PART-F
 "I haven't been able to catch it (FEM)"

A fair number of items in the basic vocabulary are etymologically distinct from the corresponding terms in neighboring Romance languages, for example, *estimar* 'to love,' *ganivet* 'knife,' *gens* 'not at all,' *massa* 'too,' *pujar* 'to go up,' *tardor* 'autumn,' and *tou* 'soft.'

Dialects

Although there are significant dialect differences in Catalan, the dialects are to a high degree mutually intelligible. They are conventionally divided into two groups, on the basis of differences in phonology as well as some significant features of verb morphology; there are some interesting lexical differences, too. The eastern dialect group (see **Figure 1**) includes North Catalan or *rossellonès* (in France), central Catalan (in the eastern part of Catalonia), Balearic, and *alguerès* (in Alghero/L'Alguer). The western group consists of Northwestern Catalan (western and southern Catalonia and eastern Aragon) and Valencian. The main diagnostic heterogloss distinguishing the two major dialect groups involves vowel reduction in unstressed syllables: In the eastern dialects /a/ is pronounced [ə] in unstressed syllables and, with some exceptions, /e/ and /ɛ/ are also reduced to [ə], whereas /o/ and /ɔ/ are reduced to [u].

History

Catalan is a variety of Latin that developed originally on a small territory on either side of the eastern Pyrenees. Expansion of this territory, the Marca Hispanica of the Carolingian empire, is associated with a process of developing political independence, beginning with the separation (A.D. 988) of the county of

Barcelona from the trunk of the Carolingian domain. Eventual fusion with the crown of Aragon (1162) gave new momentum to this projection. In 1151, a treaty between the kings of Aragon and Castile had carved up the future conquest of territories then under Arab control, so that Valencia would fall to the crown of Aragon while lands further west would be attached to Castile. The kingdom of Valencia was captured in the 1230s and was populated by speakers from various parts of Catalonia and Aragon, although a numerous subordinate population of Arabic-speaking *moriscos*, as they were called, remained until their expulsion in 1609. The Balearic Islands were conquered between 1229 and 1287 and were resettled by speakers largely from eastern Catalonia. Sicily was also captured for the house of Barcelona (1282), as was Sardinia (1323–1327); Catalan was widely used as an official language in Sicily until the 15th century and in Sardinia until the 17th century. In Sardinia, only the port of Alghero was subject to Catalan resettlement, and it has remained Catalan-speaking to the present day. The original expansion southward of Catalan following the reconquest extended as far as Murcia and Cartagena, although the kingdom of Murcia became Spanish-speaking during the 15th century.

The chancellery of the kingdom of Aragon was trilingual, using Latin, Catalan, and Aragonese as the occasion required. A substantial body of Catalan literature in various prose and verse genres was produced before decline set in in the 16th century. In 15th-century Valencia the court was already bilingual, and after the merger of the Aragonese and Castilian crowns in 1479 Spanish (Castilian) gradually increased in prestige throughout the Catalan territories, with the urban and literate classes becoming bilingual. From the 16th century, Catalan came increasingly under Spanish influence in vocabulary, syntax, pronunciation, and orthography as a result of the social and cultural prestige of Castile. It was not until the 19th century that a substantial Catalan literary and cultural revival took place,

which continues to the present. Standardization of the modern language was achieved in the early 20th century.

Since the Second World War, most of the Catalan-speaking territories have experienced a substantial immigration of non-Catalan speakers. In France, these have been *pièdes noirs* resettled from Algeria and retired people from various parts of France. In Catalonia and Valencia, the population almost doubled between 1950 and 1975 as people from less-developed southern Spain sought employment in the manufacturing and service industries. Majorca and Ibiza (Eivissa) have attracted a workforce from many parts of Spain, feeding the tourist industry. Many immigrants have wished to acquire Catalan, or at least have wished their children to do so, as an aid to integration, but until the late 1970s there were few opportunities to realize this. These large Spanish-speaking communities have added to the institutional and cultural pressures in favor of the use of Spanish in the Catalan territories.

In 1659, Philip IV of Spain ceded the northern part of Catalonia (essentially the modern *département* of Pyrénées-Orientales) to the French crown. From that point, North Catalonia became subject to the linguistic unification policies of the French state. French became the official language in 1700 and has had a marked influence on the vocabulary of North Catalan and, in recent times, on its phonology as well. Minorca was under British rule during most of the 18th century, and there is a handful of Minorcan Anglicisms in the vocabulary dating from that period. The dialect of Alghero is, not surprisingly, heavily influenced by Sardinian and even more so by Italian in all components of the language.

Present Sociolinguistic Situation

The status, situation, and prospects of the Catalan language are significantly different in each of the territories in which it is spoken, although each of those in Spain shares, in some way, the consequences of Catalan's having been for centuries an oppressed minority language. The cultural decline and loss of prestige affecting Catalan from the 16th century onward has already been mentioned. The defeat of the Catalans in the war of the Spanish Succession (1714) initiated a series of measures, extending throughout the 18th and 19th centuries, that imposed the use of Spanish in public life, for example, in accounts, in preaching, in the theater, in the criminal courts, in education, in legal documents, in the civil registers, and on the telephone. In the 20th century, these measures were mostly repeated and supplemented by the imposition of Spanish in catechism, by the

prohibition of the teaching of Catalan, and by sanctions against people refusing to use Spanish. The Second Republic (1931–1939) to a large extent removed these restrictions, but Franco's victory in the Spanish Civil War was followed in 1940 by a total ban on the public use of Catalan. Despite a gradual relaxation allowing some publication of books and magazines, Catalan remained excluded from nearly all public institutions until Spain's adoption of a democratic constitution in 1978.

In the early 1980s, Catalonia, Valencia, and the Balearics obtained their statutes of autonomy, involving co-official status for Spanish and Catalan. All of these statutes promote language normalization, the goal of which is universal bilingualism without diglossia. In Catalonia, the expressed aim of the Generalitat (the autonomous government) goes further than this: It seeks to make the local language the normal medium of public life, with Spanish having a secondary role as an auxiliary language or a home language for its native speakers. In Catalonia, the teaching of Catalan is obligatory in all schools, and primary and secondary education through the medium of Catalan now reaches at least 60% of the population. In Valencia and the Balearics, the *de facto* policy has been to promote effective knowledge of Catalan through education and to enhance its status while largely preserving a diglossic relationship between Spanish and Catalan. In Valencia, significant political forces reject the name Catalan for the local language and insist on the term Valencian. Although the Balearic Islands Council passed a linguistic normalization law in 1986, progress has been inconsistent, although Catalan is widely available in the education system which includes some Catalan-medium education.

In Andorra, Catalan has always been the sole official language. In 1993, Andorra adopted a new constitution, and the government has been pursuing an active Andorranization policy, involving Catalan-medium education. The status of Catalan in North Catalonia is parallel to that of the other traditional minority languages in France. Language shift was all but universal after the Second World War, so that most native speakers are (as of 2004) over 60 years old. Catalan has at best an occasional, decorative role in public life. In primary schools, some 30% study Catalan (as a foreign language) and, in secondary schools, some 15%.

The current trend is for intergenerational language shift from Catalan in French Catalonia, in Alghero, in southern Valencia around Alicante (Alacant), and possibly in Palma (Majorca). Elsewhere, Catalan is holding its own, with some evidence of intergenerational shift toward Catalan in Catalonia.

Caucasian Languages

B G Hewitt, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Around 38 languages are deemed to be indigenous to the Caucasus; often difficult demarcation between language and dialect explains the uncertainty. The ancestral homelands are currently divided between:

1. Russia’s north Caucasian provinces (Circassian, Abaza, Ingush, Chechen, Avaro-Ando-Tsezic, Lako-Dargic, northern Lezgetic);
2. *de facto* independent Abkhazia (Abkhaz, Mingrelian, Svan, Georgian, Laz);
3. Georgia (Georgian, Mingrelian, Svan, Laz, Bats, Chechen, Avar, Udi);
4. Azerbaijan (Lezgi, Budukh, Kryts’, Khinalugh, Rutul, Ts’akhur, Avar, Udi) Turkey (Laz, Georgian).

Diaspora-communities of North (especially north-west) Caucasians can be found across former Ottoman territories, particularly Turkey, where the majority Circassian and Abkhazian populations reside and where the term ‘Cherkess’ often indiscriminately applies to any North Caucasian. Circassians are found in Syria, Israel, and Jordan, home also to a significant Chechen population. Speaker numbers range from 500 (Hinukh) to 3–4 million (Georgian). Many of the languages are endangered.

Three families are usually recognized:

- A. South Caucasian (Kartvelian)
- Georgian
 - Svan
 - Mingrelian (Megrelian)
 - Laz (Ch’an)

[Scholars in Georgia regard Mingrelian and Laz as codialects of Zan]

- B. North West Caucasian

Abkhaz
Abaza
 Ubykh (extinct from 1992)
West Circassian (Adyghe)
East Circassian (Kabardian)

- C. Nakh-Daghestanian

(a) *Nakh (North Central Caucasian)*

Chechen
Ingush
 Bats (Ts’ova Tush)

(b) *Daghestanian (North East Caucasian)*

1. Avaro-Ando-Tsezic(/Didoic):
 Avaric: **Avar**
 Andic: Andi, Botlikh, Godoberi, K’arat’a (Karata), Akhvakh, Bagvalal, T’indi (Tindi), Ch’amalal (Chamalal)
 Tsezic: Tsez (Dido), Khvarshi, Hinukh, Bezht’a (Bezhta) (K’ap’uch’a), Hunzib (these last two are sometimes regarded as codialects)

2. Lako-Dargic:
 Lakic: **Lak**
 Dargic: **Dargwa** (Dargi(n)) – some treat K’ubachi, Chiragh, and Megeb as full languages

3. Lezgetic:
Lezgi(an), **Tabasaran** (Tabassaran), Rutul (Mukhad), Ts’akhur (Tsakhur), Aghul, Udi, Archi, Budukh, Khinalugh, Kryts’ (Kryts)

Some challenge the Lezgetic status of Archi, Khinalugh, Budukh, and Kryts.’ Mutual intelligibility basically

exists between Laz and Mingrelian, Abkhaz, and Abaza, West and East Circassian. Only Georgian has an ancient tradition of writing, but during the Soviet period the languages in bold all enjoyed literary status. Publishing in Mingrelian, Laz, Ts'akhur, Aghul, Rutul, and Udi was tried in the 1930s but discontinued, though there have been some post-Soviet attempts to publish more widely (including Dido).

Phonetics and Phonology

All Caucasian languages have voiced vs. voiceless aspirate vs. voiceless ejective plosives, affricates, and occasionally fricatives, to which some add a *fortis* series (voiceless unaspirated or geminate). North West Caucasian is characterized by large consonantal inventories coupled with minimal vowel systems, consisting of at least the vertical opposition open /a/ vs. closed /ə/. Ubykh possessed 80 phonemes (83 if the plain velar plosives attested only in loans are admitted), with every point of articulation between lips and larynx utilized and displaying the secondary features of palatalization, labialization, and pharyngalization – Daghestanian pharyngalization is normally assigned to vowels (Table 1).

Some recent analyses of Daghestanian languages have produced inventories rivaling those of the North West Caucasian, though no parallel minimality among the vowels is posited. One analysis of Archi assigns it 70 consonants (Table 2).

Table 1 Consonantal phonemes for Ubykh

| | | | | | |
|-----------------|-----------------|------------------|-----------------|-----------------|----------------|
| p | b | p' | | m | w |
| p ^ʃ | b ^ʃ | p ^ʃ | | m ^ʃ | w ^ʃ |
| | | | f | | |
| | | | v ^ʃ | | |
| t | d | t' | | n | r |
| t ^w | d ^w | t' ^w | | | |
| ts | dʒ | ts' | s | z | |
| ts ^w | dʒ ^w | ts' ^w | ɕ | ʒ | |
| tʃ | dʒ ^w | tʃ' | e ^w | z ^w | |
| | | | ʃ | ʒ ^w | |
| | | | ʃ ^w | ʒ ^w | |
| ts̄ | ɕʒ | ts̄' | ʂ | ʒ | |
| | | | ɕ | | |
| | | | | ɕ' | l |
| | | | | | j |
| (k) | (g) | (k') | x | ɣ | |
| k ^ʃ | g ^ʃ | k ^ʃ | | | |
| k ^w | g ^w | k ^w | | | |
| q | | q' | χ | ʁ | |
| q ^ʃ | | q ^ʃ | χ ^ʃ | ʁ ^ʃ | |
| q ^j | | q ^j | χ ^j | ʁ ^j | |
| q ^w | | q ^w | χ ^w | ʁ ^w | |
| q ^{ʃw} | | q ^{ʃw} | χ ^{ʃw} | ʁ ^{ʃw} | |
| | | | h | | |

Noticeable here, is the presence of 10 laterals, though some specialists recognize no more than three or four.

Kartvelian occupies a mid-position with between 28 and 30 consonants (see Georgian). Georgian shares with Avar and Andi the simple five-vowel triangle (Table 3).

Schwa is added to this in the other Kartvelian languages, while the various Svan dialects have length and/or umlaut, Upper Bal having the richest system (Table 4).

Triangular or quadrilateral vowel systems are attested in Nakh-Daghestanian (Table 5).

All but /y, ε, œ/ possess long counterparts, and the nasalized vowels: /ĩ, ẽ, ã, õ, û, ũ, ã, ỹ:/ have also been recognized. Table 6 shows the Hunzib basic vowels.

Table 2 Consonantal system of Archi

| | | | | | | | |
|-----------------|----------------|-------------------|------------------|----------------|------------------|----------------|---|
| p | b | p' | p: | | | m | w |
| t | d | t' | t: | | | n | r |

| | | | | | |
|---|----|---|----|----|----|
| i | i: | y | y: | u | u: |
| | | | ə | ə: | |
| ε | ε: | œ | œ: | ɔ | ɔ: |
| a | a: | | | ɑ | ɑ: |

Table 5 Bezht'a basic vowel system

| | | | | |
|---|---|---|---|---|
| i | y | | | u |
| | ε | œ | | ɔ |
| | | a | a | |

All these Hunzib vowels have long counterparts, and fluctuating nasalization on short vowels has been observed.

The simplest (near-)quadrilateral system is attested in Chiragh Dargwa, with four pairs distinguished by length (Table 7). Udi has been analyzed in Table 8, whilst Chechen presents the complicated system (Table 9).

Most, if not all, of these can be nasalized as a result of the weakening of a following /n/.

Stress is sometimes distinctive (Abkhaz-Abaza) but usually not. Tonal distinctions have been proposed for some of the Daghestanian languages (Andi, Akhvakh, Ch'amalal, Khvarshi, Hinukh, Bezht'a, Tabasaran, Ts'akhur, Ingush, and Budukh).

| 4. 'in (mass)' | -ɬɬ: | -ɬɬ:..ɛ | -ɬɬ:..ɑ |
| 5. 'in (space)' | -D (= class-marker) | -D-ɛ | -s:ɑ |

Morphology

North West Caucasian sememes are typically C(C)(V), and minimal case systems combine with highly polysynthetic verbs, which may contain up to four agreement prefixes, locational preverbs, orientational preverbs and/or suffixes, interrogative and conjunctive elements, and markers of tense-modality, (non-)finiteness, causation, potentiality, involuntariness, polarity, reflexivity, and reciprocity (see Abkhaz). Kartvelian balances a moderate total of cases with reasonably complex verbs, which may contain: agreement with two or three (rarely four) arguments via two sets of agreement affixes, directional/perfectivizing preverbs (the large total in Mingrelian-Laz suggests North West Caucasian influence), and markers of tense-aspect-modality, causation, potentiality, version (vocalic prefixes indicating certain relations between arguments), and voice – Kartvelian is the only family to have a full active-passive diathetic opposition. Nakh-Daghestanian has complex nominal systems with both grammatical and sometimes large numbers of locative cases; Lezgi(an), Aghul, and Udi apart, nouns fall into one of between two and (depending on the analysis) five or eight (largely covert) classes. Verbs are correspondingly simple: agreement is totally absent from Lezgi(an) and Aghul; elsewhere, verbs with an agreement slot typically allow only class agreement (Andic), though some languages (Bats, Lak-Dargwa, Tabasaran, Akhvakh, Archi, Hunzib, and Avar dialects) have added perhaps rudimentary person agreement, whilst Udi has person agreement only. Some languages have a small selection of preverbs. Some distinguish perfective from imperfective roots. Some North Caucasian verbs can be construed transitively or intransitively (?passively), depending on the clausal structure. Antipassives are also attested.

Avar illustrates a typical system of locative-cases (Table 10).

Ergativity and some other oblique case function are often merged in a single morph.

Deictic systems range from two-term (Mingrelian, Ubykh, Kryts'), through three-term (Georgian, Abkhaz, Circassian), to five-term in a swathe of Daghestanian, and even six-term (Lezgi(an), Godoberi).

Counting systems are predominantly vigesimal, at least up to ‘99’ (though Bats is vigesimal throughout), but some systems are decimal.

Syntax

Word orders are: Kartvelian and Nakh-Daghestanian AN, GN, N-Postposition, SOV, though Old Georgian was rather NA and NG; North West Caucasian GN, predominantly NA, N-Postposition, SOV. Some degree of ergativity characterizes all the languages, but in Mingrelian, where the system was originally as illustrated for Georgian (*q.v.*), the ergative case marker was extended vertically to replace the original nominative for intransitive (including indirect) verbs in Series II (aorist indicative and subjunctive), where it functions as a Series II nominative allomorph, the original nominative effectively becoming an accusative just for Series II. Laz has extended the case marker horizontally across its three series for all transitive subjects. Active–inactive alignment plays a role in some languages (Bats).

A nominative/absolute argument is the obligatory minimum in a clause, and where verbs have class agreement, this is the determiner for the class marker (which in some languages also appears on adverbs and as part of a locative case exponent); the determiner for person agreement in languages with class agreement might be this same or a different argument (e.g., the logical subject), depending on a variety of factors.

Verbs such as *want*, *have*, *hear* are construed indirectly with the logical subject in an oblique case, but, if Kartvelian and North West Caucasian employ just the dative/general oblique case for this argument, greater distinctions can apply in Nakh-Daghestanian: Avar employs its dative case with verbs of emotion (*love*), a locative (Series I essive) with verbs of perception (*see*), and the genitive for the possessor in conjunction with the copula.

Only Kartvelian has the category of subordinating conjunctions, naturally associated with full clauses containing indicative or subjunctive finite verbs. Such structures are rare in North Caucasian, where one finds a variety of nonfinite (nominalized) verb forms fulfilling the subordinate role.

Examples:

ilu-di rikʰiʰi b-ε3-a vs. rikʰiʰi b-ε3-a
mother- meat. 3-fry-
Erg Absol₃ Past
 ‘Mother fried the meat’ vs. ‘The meat (was) fried’
 (Andi)

is-tʰi si kart:ɔl-tʰa
brother-Erg water.Absol boil-Pres
 ‘Brother is boiling the water’ (Bezhtʰa)

vs.

is si-d kart:ɔl-dar-tʰh
brother.Absol water-Instr boil-AntiPass-Pres

Kinship

Kartvelian is unrelated to any known language or language family, but the debate continues concerning the relationship between the northern families. Linkage to Hattic is postulated for northwestern Caucasian and to Hurrian for Nakh-Daghestanian. Udi has recently been conclusively demonstrated to descend from Caucasian Albanian.

Cebuano

J U Wolff, Cornell University, Ithaca, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Cebuano is spoken in the central and southern Philippines. It is a member of the Austronesian family of languages, the group of languages spoken throughout most of Indonesia, northward into the Philippines and Taiwan and eastward through much of Papua New Guinea and over the Pacific as far as Hawaii and Easter Island. The languages of the Philippines, with the exceptions of the Spanish Creoles, Chabacano and Chavacano, are closely related and typologically similar to one another. In particular, Cebuano is subgrouped with Tagalog and is similar to Tagalog in much the same way as Italian and Spanish are similar to each other (see **Tagalog**). Cebuano is called *Sinugbaʔanun* or *Sinibuwanú* natively, and is sometimes referred to as 'Sugbuanon' in the literature about the language. Cebuano is also commonly called 'Visayan' (*Binisayaʔ* natively), after the name of the region of the central Philippines. However, there are in fact more than 30 languages spoken in this area, all of which are referred to as 'Visayan,' such that many publications referring to 'Visayan' have to do with languages other than Cebuano.

Cebuano is spoken by somewhere around a fifth of the population of the Philippines. It is thus second only to Tagalog in number of speakers. Throughout the 20th century Cebuano was widely used as a lingua franca in Mindanao and was almost universally known as a second language by those in Mindanao who were not native speakers of Cebuano. At the present time Tagalog is gaining as the lingua franca at the expense of Cebuano, and in Mindanao, as throughout the Cebuano speech area, native speakers of Cebuano are more and more learning Tagalog as a second language. Cebuano is considered a language of the home and social intercourse, and as such enjoys little prestige and is excluded from settings that are considered official or involve people of high rank. For these settings English is used. Further, the educated classes use English as a code together with Cebuano in social settings. Church services that aim at a lower-class audience are in Cebuano, but those aiming at an upper-class congregation are held in English. Books are in English, and English is the official medium of instruction, although for practical reasons teachers make frequent resort to Cebuano at the primary and even secondary levels (the children do not understand English). As an upshot of the emphasis given to English in the educational system and Cebuano's lack of prestige, the elite know the latter but poorly and speak a kind of basic Cebuano mixed with

English, which does not make full use of the rich vocabulary and grammatical apparatus which would allow for eloquence. The best knowledge of Cebuano and most eloquent use is on the part of low-status groups, people with little education and little access to English. Cebuano was widely used in mass media until the middle of the 20th century, but in recent years Tagalog has become more and more widespread. There are still radio programs in Cebuano, and there is one weekly, *Bisaya*, distributed throughout the Cebuano-speaking area, which is aimed at a readership with little education.

Cebuano was first recorded in 1521 in a word list written down by Pigafetta, Magellan's chronicler, when Magellan's expedition made its ill-fated stop in Cebu. Catechisms in Cebuano were composed in the years shortly after the first Spanish colonization in 1564, and the translations made at this time are still in use. The earliest dictionaries and grammatical sketches were composed during the 17th century, although none of these were published until the 18th century. Otherwise no literature antedating the 20th century survives, but the beginning of the 20th century saw a surge of interest in Cebuano and the beginnings of a rich literary production, which gradually diminished from the 1920s and 1930s to the point that now very little is being written. The early dictionaries and catechisms of Cebuano show that the language has changed considerably since the 17th century. Many of the verb forms used in the catechisms and cited in the earliest dictionary are no longer used (although remnants are found in rural dialects) and others are confined to ceremonious or particularly fancy styles, and absent from normal speech. In vocabulary, too, the language has changed considerably. At least one-third of the listings in the major Cebuano dictionary by Fr. Juan Felix de la Encarnación, which dates from the middle of the 17th century, were unknown to more than 100 informants queried during the 1960s and 1970s.

What Cebuano Is Like in Comparison with Tagalog

Cebuano is typologically like the other languages of the Philippines, and most similar to Tagalog (see **Tagalog**). The sound systems of the two languages are similar, but have a very different rhythm, for two reasons. First, Tagalog loses the glottal stop in any position except before pause, whereas Cebuano pronounces the glottal stop with a sharp clear break, giving a staccato effect to the language. Second, Tagalog has short and long vowels, with no limit on the number of long vowels within a word or on

the syllable on which length occurs. Cebuano has few long vowels, and only on the final syllable. The Tagalog and Cebuano consonant inventories are exactly the same. The vowels are different, however. Cebuano has only three vowels, /i/, /a/, and /u/. (Some dialects retain a fourth central vowel, schwa, inherited from Proto-Austronesian, but this has merged with /u/ in the Cebuano of Cebu City.) The vowels /a/ and /u/ may occur lengthened in the final syllable. Stress is contrastive and occurs on the final or the penult. There can be no more than one long vowel in a word.

The Cebuano verb system is similar to Tagalog's but not commensurate with it: the Cebuano verb expresses tense (action started or not), and also has special tenseless forms which are used when the verb is preceded by an adverb or phrase which expresses tense. These three verb forms are durative or non-durative, as exemplified below:

- (1) Action started, punctual vs. action started, durative:

| | | | |
|--------------------------------------|------|-----|------|
| misul [?] ub | siya | ug | pula |
| put-on | she | OBJ | red |
| 'she put something red on' | | | |
| nagsul [?] ub | siya | ug | pula |
| is-wearing | she | OBJ | red |
| 'she is (was) wearing something red' | | | |

- (2) Action not started, punctual vs. durative:

| | | | |
|-------------------------------------|------|-----|------|
| musulub | siya | ug | pula |
| put-on | she | OBJ | red |
| 'she will put on something red' | | | |
| magsul [?] ub | siya | ug | pula |
| is-wearing | she | OBJ | red |
| 'she will be wearing something red' | | | |

- (3) Tenseless verb, durative vs. punctual:

| | | | | |
|-----------------------------------|------|------------------------|-----|------|
| wa [?] | siya | musul [?] ub | ug | pula |
| not | she | put-on | OBJ | red |
| 'she didn't put something red on' | | | | |
| wa [?] | siya | magsul [?] ub | ug | pula |
| not | she | is-wearing | OBJ | red |
| 'she wasn't wearing red' | | | | |

A system of affixes which show prepositionlike relationships, analogous to that shown by the Tagalog verb, cuts across this tense-aspect system of Cebuano: the Cebuano verbs contain morphemes which express the relation between the verb and a word it refers to. The verb may refer to the agent (active voice), the patient of the action (direct passive), the thing moved or said (conveyance passive), the instrument of the action, the place of the action, the beneficiary of the action, or (peculiarly for Cebuano) time of the action:

- (4) (Active)
Mipalit siya ug ságing
 bought he/she OBJ bananas
 'he **bought** some bananas [that's what he did]'
- (5) (Patient)
Gipalit níya ang ságing
 bought-it by-him the bananas
 'he **bought** the bananas [that's what happened to the bananas]'
- (6) (Place)
 bálik ta sa **gipalitan**
 let's-go-back we to was-bought-at
 nímu ug ságing
 by-you OBJ bananas
 'let's go back to **the place** you **bought** some bananas'
- (7) (Instrument)
 Ma[?] na y
 is-the-one that the-one-that
ipalit nímu ug ságing
 will-buy-with-it by-you OBJ bananas
 'that is the thing [money] you **will use to buy** bananas **with**'
- (8) (Beneficiary)
 Putling Mariya **ig[?]ampu?** mu kami
 Virgin Mary pray-for by-you us
 'Virgin Mary **pray for** us'

These verbal inflections are added to roots. In addition, new stems can be formed by adding one or more derivational affixes that have meanings similar to those found in Tagalog (*see Tagalog*).

Cebuano has a complex system of deictics and demonstrative pronouns that is a good deal more complex than that of Tagalog. The deictics in Cebuano distinguish tense when initial in the clause: e.g., *dinhi* 'was here', *níra* 'is here', *anhi* 'will be here.' They distinguish for four distances, *díra* 'is here near me (but not near you)', *níra* 'is here (near you and me)', *náira* 'is there (near you but not near me)', *túira* 'is there (far from both of us)'. When final in the clause the deictics distinguish motion from nonmotion: *didtu* 'there (far away)', *ngadtu* 'going there (far away)'. The interrogatives forms for 'when' and 'where' also distinguish tense.

The changes that Cebuano has undergone since the earliest attestations amount to the loss of distinctions. This can be accounted for partly by the fact that Cebuano has been brought to new areas and spread to populations formerly speaking other languages and also by the fact that there has never been a prescriptive tradition which derogates deviant forms. The four-vowel system, which Cebuano inherited from the protolanguage, has *díra* reduced to

three, except in the case of rural dialects. Further, the category durative vs. punctual, which characterizes the verbal system, has in historical times been lost in the passive verbs except in ceremonial styles. Many of the derivational affixes forming verb stems that were productive in pre-19th-century attestations of the language are now confined to petrified forms. In the past two generations Tagalog has influenced an important component of the verbal system, namely, the loss of the tenseless forms, although in rural speech this part of the system is still intact. Further, the system of deictics has been simplified in speakers influenced by Tagalog: namely, tense has been lost, the four-way distance distinction has been reduced to two – i.e., ‘here’ vs. ‘there,’ and the distinction between deictics expressing motion and those which do not has been lost. These changes are most strongly observed in areas which or among groups who have contact with Tagalog speech, and from this population these simplifications spread elsewhere in the Cebuano speech community.

Cebuano morphology differs in type of Tagalog in two ways: first, affixational patterns are regular and predictable in Tagalog but in Cebuano they are not: whereas in Tagalog the paradigms are normally filled out for all roots with a given meaning

type, in Cebuano many affixes are capriciously distributed, quite irrespective of the semantic qualities of the root. Second, there are numerous variations in affixation and some of the interrogatives, distributed by areas and individual speakers. Tagalog has much less variation.

Celtic

C Ó Baoill, University of Aberdeen, Aberdeen, UK

© 2006 Elsevier Ltd. All rights reserved.

The Celts get their name from *Keltoi*, a name of unknown origin applied by the Greeks from around 500 B.C. to a widespread people who lived mainly to the north and west of them. They have long been identified with the archaeological cultures known as Hallstatt and La Tène, named from type-sites in central Europe and dating from the period following 600 B.C., but linking a language to an archaeological culture can be unreliable, and this link and others concerned with the Celts have been queried, notably in James (1999).

The languages understood to belong to these people are of the Indo-European family, the most westerly branch of it, and one important feature thought to mark Celtic out from the rest is the loss (or reduction in some contexts) of the letter *p*. For example, the Indo-European word for a ‘father,’

which began with *p*- (whence, e.g., Greek and Latin *pater*), gives modern Gaelic (Gaelic, Irish) *athair*. This development predates all the evidence we have for the languages. Another early development was the change in some branches of Celtic, whereby the Indo-European /k^h/ (or ‘Q’) became /p/, whence the well-known division between P-Celtic and Q-Celtic languages. In the later (insular Q-Celtic) languages this *q* has developed to a /k/ sound, written *c*, and so we get oppositions like Gaelic *cenn* and Welsh *pen*, ‘head’ (from an original stem **qen*-).

The languages may be classified as Continental Celtic and Insular Celtic, the former group dating from the earliest period of Celtic history up till about 500 A.D., by which time all the continental languages had probably disappeared. Three main continental languages are identifiable, Gaulish, Lepontic, and Celtiberian, and we know all three principally from inscriptions (on stones or on coins), names (place-names and personal names) and quotations on record in other languages. Verbs, and therefore sentences, are extremely rare, so that our

knowledge of all three languages really is minimal. Gaulish and Lepontic are P-Celtic languages, the former belonging to the general area of Gaul (France, but including also parts of Switzerland, Belgium, and Italy) and the latter to parts of the southern Alps. Celtiberian is the name favored, over the alternative Hispano-Celtic, by de Hoz (1988) for the Q-Celtic language, which has, since the mid-20th century, come to be reasonably well attested by inscriptions in north central Spain; a relevant opposition here is between the form used for 'and' (Latin *-que*), appearing as *pe* in Lepontic and as *cue* in Celtiberian.

Archaeology indicates movement of features of the Hallstatt and La Tène cultures from the continent to Britain and Ireland from about 500 B.C., and it is assumed that Celtic languages came with them. Jackson (1953: 4) used the term Gallo-Brittonic to cover both Gaulish and the first P-Celtic languages in Britain. A Q-Celtic language appeared in Ireland, but there is much disagreement as to when, whence, and by what route. There is also much discussion of criteria for assessing relationships between the Celtic languages in this early period, and opinions change frequently (see Evans, 1995); evidence for dating expansion and change in the languages is inevitably scarce.

The Insular Celtic languages are divided into Brythonic and Goidelic groups, the former denoting the descendants of the P-Celtic, which reached Britain from the continent, namely Welsh, Cornish, Breton, Pictish, and Cumbric. Cumbric (or Cumbrian) is used to denote the early language(s) of what are now the northern part of England and the southern part of Scotland, but little is really known about the language(s) apart from what can be gathered from names (see Price 1984: 146–154). The surviving languages in the Brythonic group are Welsh and Breton, Cornish having gone out of general use in the 18th century, though it is still in use among enthusiasts. Sims-Williams (1990: 260; see also Russell, 1995: 132–134) argued that the main linguistic developments from (the theoretical) Brittonic, leading toward the modern insular languages, were in place by 500 A.D., and divergences between Cornish and Breton followed shortly afterward.

Goidelic is the term used by linguists for the Q-Celtic language that appeared in Ireland before the 1st century B.C. and for its descendants. The theory has long been that the original Goidelic language in Ireland spread to western Britain when the power of the Romans waned around 400 A.D., and that Scottish Gaelic (Gaelic, Scots) and Manx eventually developed there. But while the simple theory of a major Irish migration bringing Gaelic to Scotland is widely accepted, even in Scotland, Ewan Campbell

has recently shown (Campbell, 2001) that archaeology provides no evidence in support of any such invasion.

The earliest written form of the Gaelic language is that found in Ogam, the alphabet used for inscriptions on stone, dating from about the 4th century till the 7th (McManus, 1991 is a detailed study). Thereafter the language, as attested in the literature, is divided into Old (till 900 A.D.), Middle (900–1200), Early Modern (till c. 1650), and Modern periods. The distinctive Scottish and Manx forms only become clearly visible in the Early Modern period. The linguistic theory in Jackson (1951: 78–93) envisaged a historical period, c. 1000–1300 A.D., during which Irish (as Western Gaelic) became clearly distinct from Eastern Gaelic (Scottish Gaelic and Manx), but this has come under attack by those (such as Ó Buachalla, 2002) who see the significant historical division within Goidelic as a north/south one, with Scotland, Man, and Ulster in opposition to the rest of Ireland on many points.

On similar grounds, the three Gaelic languages may be seen rather as what Hockett (1958: 323–325) called an L-complex, a single linguistic continuum within which national and even geographical boundaries are ignored by dialectal isoglosses. This suggestion (cf. Ó Buachalla, 1977: 95–96) is supported (a) by the fact that all three 'languages' identify themselves by variants of the same name, *Gaeilge*, *Gàidhlig*, *Gaelck*, and others, whence the English term Gaelic; and (b) by the strong evidence that, while Gaelic survived (until the early 20th century) in the interface area between north-eastern Ireland and the southern Highlands, speakers on both sides of the North Channel were able to converse with little difficulty.

Central Siberian Yupik as a Polysynthetic Language

W J de Reuse, University of North Texas, Denton, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

An Overview of the Central Siberian Yupik Word

Central Siberian Yupik (CSY) is a representative language of the Yupik branch of the Eskimo-Aleut family. It is spoken by over 1000 people on St. Lawrence Island, Alaska and Chukotka, Russian Far East (de Reuse, 1994; Nagai, 2004). Like all Eskimo languages, CSY is, from a typological point of view, extreme because of its high level of polysynthesis, and the fact that it is almost exclusively suffixing (Woodbury, 2002: 98). There is no compounding, and CSY has only one prefix, occurring as a lexicalized element on demonstratives. The structure of the Eskimo noun or verb word can be schematized as follows:

- (1) Base + postbasesⁿ + ending + enclitic^m

The base is the lexical core of the word; it can be followed by a number *n* of postbases. The value of *n* is between 0 and a theoretically infinite number, but *n* > 6 is quite rare. Postbases are traditionally considered derivational suffixes and combine with the base to form a new base. The obligatory ending is inflectional, marking case, number, and possession for nouns, marking mood, person, and number of subject for intransitive verbs, and marking mood, person and number of subject and person and number of object for transitive verbs. Although there are about 1200 inflectional endings for ordinary verbs (Woodbury, 2002: 81), it is not the richness of inflection that characterizes CSY as a polysynthetic language, since its inflection is not very different from that found in Latin or Ancient Greek. Enclitics, of which there are 12, can follow the ending. They are

syntactic particles that form a phonological word with the immediately preceding word. The value of *m* is between 0 and 4. Example (2) is an analysis of a CSY word that illustrates the structure in Schematic (1) (abbreviations: v, verb; PST, past tense; FRUSTR, frustrative ('but . . . , in vain'); INFER, inferential evidential (often translatable as 'it turns out'); INDIC, indicative; 3s.3s, third-person subject acting on third-person object):

- (2) neghyaghtughyugumayaghpetalla
 negh- -yaghtugh- -yug- -uma-
 eat go.to.v want.to.v PST
 -yagh- -pete- -aa =llu
 FRUSTR INFER INDIC.3s.3s also
 'Also, it turns out she/he wanted to go eat it, but . . .'

In Example (2), only the base *negh-* and the inflectional *-aa*, are obligatory. Any or all of the other suffixes, which are postbases, can be left out. The element = *llu* is an enclitic.

Polysynthesis Illustrated by CSY Postbases

Since the postbases account for the polysynthesis of CSY, we will focus on their characteristics. A first characteristic is the full productivity of most (but not all) postbases. The five postbases of Example (2) are fully productive. So, picking between one and five postbases from the five in Example (2), it is possible to generate 30 different words. For semantic reasons, it happens to be the case that the order of elements has to be *-yaghtugh-yug-uma-yagh-pete-*. There are no clear morphological position classes to be set up in CSY. A second characteristic of some CSY postbases is recursion, as illustrated by Example (3):

- (3) iitghesqesaghiisqaa
 itegh- -sqe- -yaghtugh-
 come.in ask.to.v go.to.v

-sqe- -aa
ask.to.v INDIC.3s.3s
'He_i asked him_j to go ask him_k to come in'.

The postbase *sqe-* 'ask to.v' is used recursively. A third characteristic of some CSY postbases is that they can display variable order with respect to each other without resulting differences in meaning. This is illustrated with Examples (4) and (5):

- (4) aananiitkaa
aane- -nanigh- -utke-
go.out cease.to.v v.on.account.of
-aa
INDIC.3s.3s
'He ceased going out on account of it'.
- (5) aanutkenanighaa
aane- -utke- -nanigh-
go.out v.on.account.of cease.to.v
-aa
INDIC.3s.3s
'He ceased going out on account of it'.

Even though generally in CSY the rightmost postbase has scope over what is on the left, that principle does not seem to be working in Examples (4) and (5). These two sentences mean exactly the same thing and were uttered within three lines of each other in a story (de Reuse, 1994: 93). A fourth characteristic of postbases is that they can interact with the syntax, and attach to elements functioning as independent syntactic atoms. This is illustrated in Example (6) (abbreviations: ABS, absolutive; 2s.s, second-person singular possessor, singular possessum; INTRANS, intransitive; PARTL, participial mood (often nominalizing in Eskimo); ABL, ablative; N, noun; 3s, third-person singular subject):

- (6) Atan aangelghii-meng qikmilguuq.
ata- -n aange- -lghii-
father ABS.2s.s be.big INTRANS.PARTL
-meng qikmigh- -lgu- -uq
ABL.S dog have.N INDIC.3s
'Your father has a big dog'.

As Sadock (1980, 1991) demonstrated on the basis of parallel structures in Greenlandic Eskimo, the noun-incorporating postbase *-lgu* 'have.N' acts like a morphologically intransitive verb, and like other intransitive verbs, it can occur with a direct object in an oblique case (here the ABL). Since postbases cannot attach to inflected words, the ABL case marking cannot occur on *qikmigh-* 'dog,' but it does show up in the stranded modifier *aangelghii-meng* 'big.' This is expected, since CSY modifiers agree in case with their heads. At the syntactic level then, *aangelghii-meng qikmigh-* 'big dog' forms a phrasal constituent to which the *-lgu-* is attached.

A fifth characteristic of postbases is that they not only derive verbs from verbs (as in Examples (2)–(5)), or nouns from nouns (shown in Example (7)), but also verbs from nouns, as in Example (6), and nouns from verbs, as in Example (7). This is, of course, expected behavior for derivational morphology. Example (7) contains the verb *yughagh-* 'to pray,' changing to a noun *yughaghvig-* 'church,' changing to another noun *yughaghvigllag-* 'big church,' and changing back to a verb *yughaghvigl-lange-* 'to acquire a big church' (abbreviation: 3P, third-person plural subject).

- (7) yughaghvigllanguyutut
yughagh- -vig- -ghllag- -nge-
pray place.to.v big.N acquire.N
-yug- -tut
want. to.v INDIC.3P
'They want to acquire a big church.'

As noted earlier, not all postbases are productive. The postbase *-vig-* 'place to.v,' is an example of a nonproductive postbase, since it lexicalized with 'pray' to mean 'church,' and not the completely predictable 'place to pray,' i.e., any place to pray. The postbases that follow *-vig-* are completely productive. There are over 400 productive postbases in CSY, and several hundred nonproductive ones.

Productive Postbases: Neither Derivation nor Inflection?

The survey of the characteristics of productive postbases just provided casts some doubt on their status as elements of derivational morphology. Certainly, the nonproductive postbases behave like elements of derivational morphology. Regarding productive postbases, consider Table 1, a chart of criteria distinguishing inflection, (nonproductive) derivation, productive postbases, and syntax. The productive postbases, even though bound, have six features in common with syntax; they also have one (feature [6]) in common with derivation, and two (features [1] and [5]) in common with inflection. In the following explanations, the term 'elements' will be used instead of 'productive postbase' or 'words,' in order to have a term covering both morphology and syntax. The criteria of the six features are intended to show that elements such as productive postbases are syntax-like. Presumably the criteria in Table 1 are not independent of each other, but it is not yet clear which has to be derived from which.

Productivity (feature [1]) means that there are no idiosyncratic restrictions on the use of the element. Thus, its presence is conditioned by semantic plausibility only, and not by selectional restrictions.

Table 1 Criteria of inflection, derivation, productive postbases, and syntax

| Feature | Inflection | (Nonproductive) derivation | Productive postbases | Syntax |
|--|------------|----------------------------|----------------------|--------|
| [1] Productive? | Yes | No | Yes | Yes |
| [2] Recursion possible? | No | No | Yes | Yes |
| [3] Necessarily concatenative? | No | No | Yes | Yes |
| [4] Variable order of elements possible in some instances? | No | No | Yes | Yes |
| [5] Interaction with syntax possible? | Yes | No | Yes | Yes |
| [6] Lexical category changing possible? | No | Yes | Yes | Yes |

Certainly in CSY, and for many polysynthetic languages, the elements are so numerous that it is very unlikely that native speakers would have the ability to memorize the existing sequences and store them in the lexicon (Fortescue, 1980; de Reuse, 1994). Inflection, of course, is also completely productive, but only within a paradigm. The claim is that derivational morphology is never fully productive. Since some of what is traditionally called ‘derivational morphology’ is productive, we are, in effect, changing the definition of derivational morphology, so that fully productive elements of derivational morphology are no longer part of it.

Recursion (feature [2]) means that the same element can potentially occur more than once within the same word (which is the case with productive postbases), or within the same sentence (which is the case in syntax), its presence again conditioned by semantic plausibility.

Concatenative (feature [3]) means that the elements are going to be in some linear order. Neither nonconcatenative morphology, such as suppletion, nor Semitic style morpheme internal change is expected to exist instead of postbases. Similarly, nonconcatenative syntax does not exist.

Variable order (feature [4]) means that, in some cases, the order of elements can be free. Just as in free word order in syntax, some productive postbases can be freely ordered, most likely constrained by pragmatic factors only. This is impossible in derivation.

Interaction with syntax (feature [5]) has to do with relationships between the productive postbases and elements of syntax. As is well known (Anderson, 1982), inflection interacts with syntax, as in agreement or case marking. Derivation does not interact with syntax, but productive postbases do interact with syntax. And obviously, syntax interacts with itself.

Lexical category changing (feature [6]) means that the element can change the lexical category in the morphology. Derivational morphology can do this, but inflectional morphology does not. Here, postbases behave like derivational morphology. In a

parallel fashion, in the syntax, the addition of an element can change the phrasal category. For example, *very good* is an adjective phrase, but *very good quality* is a noun phrase.

These characteristics of Eskimo productive postbases lead us to suggest the existence of a branch of morphology, which is neither inflection, nor derivation, that we will call ‘productive noninflectional concatenation,’ or PNC (PNC was called ‘internal syntax’ in de Reuse (1992)). The term ‘concatenation,’ rather than ‘affixation,’ is used to highlight the fact that PNC can be affixal (as in Eskimo) or compounding. It is proposed that the existence of large amounts of PNC elements is a valid way of characterizing polysynthetic languages.

Consequences for a Productive Noninflectional Concatenation View of Polysynthesis for Morphological Theory

The proposal that polysynthesis can be characterized in terms of PNC has consequences for morphological theory. If it is assumed, for example, that productivity is definitional of PNC, it is necessary to account for productive affixation in nonpolysynthetic languages. Indeed, some of the affixes traditionally called derivational in Indo-European languages are completely productive, and among these productive ones, some are recursive as well. Examples of productive and recursive prefixes in English are *anti-*, as in *antiabortion*, *antiantibortion*, etc., or, more marginally, *re-*, as in *rewrite*, *rerewrite*, etc. The diminutive suffix of Dutch, *-je*, is completely productive. The diminutive of Dutch contrasts starkly with the diminutive suffixes of French (*-et*, *-ette*), and the diminutive suffixes of English (*-ette*, *-let*, *-kin*, *-ling*), which are unproductive. As a result, *anti-*, *re-*, and the Dutch diminutive must be considered to be PNC elements, rather than derivational ones. The difference with polysynthetic languages is a quantitative one. European languages have just a few elements of PNC. Mildly polysynthetic languages (such as found in the Arawakan and Siouan families) have more than a dozen of such elements, solidly polysynthetic languages (such as found in the

Caddoan and Wakashan families) have over 100 of such elements, and extreme polysynthetic languages (i.e., the Eskimo branch of Eskimo-Aleut) have several hundreds of such elements.

Within polysynthetic languages, it will also be necessary to distinguish between their nonproductive morphology (derivation or compounding) and PNC. According to Mithun and Gorbett's research (1999) on noun incorporation in Iroquoian, speakers can often tell which combinations are being used and which ones are not being used. If that is so, some of the noun-incorporating morphology of Iroquoian is not productive, and should not count for considering the language polysynthetic. Similarly, a distinction must be made, in Eskimo, between nonproductive postbases, such as *-vig-* 'place to.v,' as in Example (7), which do not count for considering the language polysynthetic, and the elements of PNC, i.e., the productive postbases, for which the question of which combinations are used or not used cannot be reasonably answered.

Central Solomon Languages

A Terrill, Max Planck Institute for Psycholinguistics, Nijmegen, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

There are four or possibly five Papuan languages in the central Solomon Islands: Bilua, spoken on the island of Vella Lavella; Touo (known more commonly in the literature as Baniata, after one of the villages where it is spoken), spoken on Rendova Island; Lavukaleve, spoken in the Russell Islands; Savosavo, spoken on Savo Island; and possibly Kazukuru, an extinct and barely documented language of New Georgia.

Relationships Among the Languages

By the time of Ray (1926, 1928), there was already an established list of non-Austronesian languages of the Solomon Islands, consisting of Bilua, Baniata (here referred to as Touo), Savo, and Laumbe (now called Lavukaleve). Waterhouse and Ray (1931) later discovered Kazukuru, a language of New Georgia,

identifying it as unlike both the Melanesian (i.e., Austronesian) and Papuan languages of the Solomon Islands. Much later, Lanyon-Orgill (1953) claimed Kazukuru and two further varieties, Guliguli and Dororo, to be Papuan languages; however, the data are so scant as to make classification uncertain.

Greenberg (1971) was the first to make an explicit claim for the genetic unity of these languages, as part of his Indo-Pacific family. This claim was shortly followed by Wurm's (1972, 1975, 1982) proposal of an East Papuan phylum, linking all the Papuan languages of the islands off the coast of New Guinea into one genetic grouping. Both claims have been firmly rejected by specialists in the region, and recent views have been much more cautious: Ross (2001) suggested, on the basis of similarities in pronouns, that Bilua, Touo (Baniata), Savosavo, and Lavukaleve formed a family, unrelated to other island and mainland Papuan languages. Terrill (2002) found limited evidence of similarities in gender morphology among these languages. In lexical comparisons using an extended Swadesh list of roughly 333 items (with obvious Austronesian loans removed), Bilua, Lavukaleve,

Touo, and Savosavo share only 3–5% resemblant forms (i.e., within the realm of chance). In short, at this stage of knowledge, a genetic relationship among any or all of these languages still remains to be proven.

Typological Characteristics

A typological overview of these and other Papuan languages of island Melanesia provided by Dunn *et al.* (2002) showed that, but for a few striking exceptions, the only grammatical features shared by the central Solomon Islands Papuan languages are also held in common with surrounding Oceanic Austronesian languages. These common features include an inclusive/exclusive distinction in pronouns, dual number (actually, there are four number categories in Touo), reduplication for various purposes, nominative/accusative alignment (although Lavukaleve has ergative/absolutive alignment in certain types of subordinate clauses), and serial verb constructions (absent in Bilua).

The two most notable departures from Oceanic grammatical patterns are SOV constituent order in three of the languages (Bilua has SVO with some variation) and the presence of gender; there are three genders in Lavukaleve, four in Touo, and two in Bilua and Savosavo. Gender in Bilua is contextually determined: the masculine–feminine distinction applies only to human nouns, but for inanimate nouns there is a distinction, marked by the same morphology as marks gender in human nouns, between ‘singulative’ (=masculine) and ‘unspecified number’ (=feminine) (Obata, 2003). Savosavo has two genders, masculine and feminine, and it is not clear whether they are contextually determined as in Bilua or permanently assigned as in Touo and Lavukaleve (Todd, 1975).

Touo has some very unusual features for the region, including a phonological distinction between breathy/creaky vs. modal vowels, as well as six vowel positions instead of the usual five for the region. Touo sources include Todd (1975), Frahm (1999), and Terrill and Dunn (2003). Lavukaleve too has many unusual features, including focus markers that show agreement in person, gender, and number of the head of the constituent on which they mark focus; and a very complex participant marking system depending on factors to do with predicate type and clause type (Terrill, 2003).

Chadic Languages

P J Jagger, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The Chadic language family comprises an estimated 140 to 150 languages spoken in areas to the west, south, and east of Lake Chad (west Africa). The best-known and most widespread Chadic language is Hausa, with upwards of 30 million first-language speakers, more than any other language in Africa south of the Sahara. The remaining languages, some of which are rapidly dying out (often due to pressure from Hausa), probably number little more than several million speakers in total, varying in size from fewer than half a million to just a handful of speakers, and new languages continue to be reported. Written descriptions of varying length and quality are available for only about one-third of the total, although for some – e.g., Bidiya (Bidiyo), Guruntum, Kanakuru (Dera), Kera, Kwami, Lamang, Margi (Marghi Central), Miya, and Mupun – good descriptive grammars have been produced, and several dictionaries have appeared, e.g., Dangaléat, Lamé, Ngizim, and Tangale. Hausa has four recent comprehensive reference grammars, in addition to two high-quality dictionaries, making it the best-documented language in sub-Saharan Africa.

Chadic is a constituent of the Afroasiatic phylum, which also includes Semitic (e.g., Amharic, Arabic, [Standard] Hebrew), Cushitic (e.g., Oromo, Somali), Omotic (e.g., Dime, Wolaytta), Berber (e.g., Tamahaq and Tamajeq [Tamajeq, Tayart] [spoken by the Tuareg], Tamazight [Central Atlas], and (extinct) Ancient Egyptian/Coptic. The phylogenetic membership of Chadic within Afroasiatic was first proposed almost 150 years ago, but did not receive wide acceptance until Greenberg's (1963) major (re)classification of African languages. The standard internal classification divides Chadic languages into three major branches: West (e.g., Hausa, Bole, Angas, Ron, Bade), Central = Biu-Mandara (e.g., Tera, Mandara, Bachama-Bata [Bacama], Kotoko [Afade]), and East (e.g., Somrai, Kera, Dangaléat), in addition to an isolated Masa cluster (with subbranches and smaller groupings).

Phonology

Laryngealized implosive stops, e.g., /b d/, and ejective stops, e.g., /p' t'/, are widespread throughout Chadic, together with prenasalized obstruents, e.g., /mb nd/. A characteristic pattern, therefore, is for a

language to present a four-way phonation contrast, e.g., coronal /t d d' nd/ and/or labial /p b ɓ mb/. The voiceless and voiced lateral fricatives /ɬ ɮ/ are also commonplace, in addition to palatal and velar (including labialized velar) consonants.

Vowel systems generally vary from two (monophthongal) vowels, high /ə/ (with various phonetic values) and low /a/, as in Bachama-Bata and Mandara, to seven vowels, e.g., [Dangaléat] /i e ε a ɔ o u/, with /i (e) a ə (o) u/ a common inventory, and the diphthongs /ai/ and /au/ are attested. Tangale has a nine-vowel ATR pattern. Contrastive vowel length, especially in medial position, is also widespread throughout the family.

Chadic languages are tonal, and two level (High/Low) tones, e.g., Hausa, or three (High/Mid/Low), e.g., Angas, are typical. Downstep is also common (e.g., Ga'anda, Miya, Tera). Although tone can be lexically contrastive, its primary function is normally grammatical, e.g., in distinguishing tense/aspect/mood categories. [Transcription: aa = long vowel, a = short; â(a) = L(ow) tone, â(a) = F(alling) tone, H(igh) tone is unmarked.]

Morphology and Syntax

Many Chadic languages have masculine/feminine grammatical gender (an inherited Afroasiatic feature), with no distinction in the plural, and typically distinguish gender in second and third person singular pronouns, e.g., [Miya] fiy/macə 'you (MASC/FEM)', tənɲə 'he/she'. Some also preserve the characteristic n/t/n (MASC/FEM/PL) marking pattern in grammatical formatives (and the masculine and plural markers often fall together phonologically), cf., [Masa] vèt-na 'rabbit', vèt-ta 'female rabbit', vèdai-na 'rabbits'.

Noun pluralization is complex, and some widespread plural suffixes are reconstructable for Proto-Chadic, e.g., *-Vn, *-aki, *-i, and *-ai. Examples: (-Vn) kùmən/kùmənən 'mouse/mice' [Bade], miyò/mishan 'co-wife/co-wives' [Kanakuru], (-aki) goonaa/gòonàkii 'farm(s)' [Hausa], (-i) duwimà/dùwimi 'guineafowl(s)' [Gera], (-ai) mùtù/mutai 'sore(s)' [Dangaléat]. Other plurals entail infixation of internal -a-, e.g., [Ron] sàkur/sakwàar 'leg(s)'. Some languages restrict overt plural marking to a narrow range of nouns (typically humans and animals).

Verbs in many Chadic languages have retained the lexically arbitrary Proto-Chadic distinction between final -a and final -ə verbs (where the final schwa vowel is often pronounced as [i], [ə], or [u]), cf., [Tera] na 'see' and dlə 'get', [Guruntum] daa

'sit' and shi 'eat'. Verbal semantics and valency are modified by the addition of one or more derivational extensions (often fused suffixes). These extensions encode such notions as action in the direction of (centripetal) or away from (centrifugal) a deictic center (often the speaker), or action partially or totally completed, e.g., (totality) sà-nyà 'drink up' < sà 'drink' [Margi]. Some extensions also have a syntactic function, denoting, *inter alia*, transitivity or perfectivity, e.g., (transitivity) yàw-tu 'take down' < yàw-wu 'go down' [Bole], kàta-naa 'return' (TRANS) < kàtee 'return' (INTRANS) [Ngizim]. Verb stems can be overtly inflected for tense-aspect-mood by segmental and/or tone changes.

Many languages also have so-called 'pluractional' verbs, which express an action repeated many times or affecting a plurality of subjects (if intransitive) or objects (if transitive), and are formed via prefixal reduplication, ablaut or gemination, e.g., [Guruntum] pàni/pàppàni 'take', [Angas] fwín/fwan 'untie', [Pero] lofò/loffò 'beat'. In some languages, pluractional stems occur with plural subjects of intransitive verbs and plural objects of transitive verbs, producing ergative-type agreement. In a number of languages, intransitive verbs are followed by an 'intransitive copy pronoun', which maps the person, number, and gender of the coreferential subject, e.g., [Kanakuru] nà pòrò-no 'I went out' (literally I went out-I).

Derivational and inflectional reduplication is widespread throughout the family (often signaling semantic intensification), ranging from (a) copying of a single segment, e.g., [Miya] pluractional verb tlyaaḍa 'to hoe repeatedly' < tlyaaḍa 'to hoe', [Bidiya] tàttuk 'very large' < tàtuk 'large'; (b) reduplication of a syllable, e.g., [Hausa] prefixal reduplication of the initial CVC syllable of a sensory noun to form an intensive sensory adjective, as in zùzzurfaa 'very deep' (< zur-zurf-aa) < zurfii 'depth' (with gemination/assimilation of the coda /r/); (c) full reduplication (exact copy), e.g., [Guruntum] kìnì-kìnì 'just like this' < kìnì 'like this', [Kwami] kayò-kayò 'a gallop' < kayò 'a ride', [Tangale] sàṅ-sàṅ 'very bright' < sàṅ 'bright', [Margi] pərda-pərda 'sinewy piece of meat' < pərda 'sinew'.

Like many African languages, Chadic languages often have a lexically autonomous class of highly expressive, phonosemantic words known as 'ideophones'. Ideophones usually pattern syntactically with adverbials and often have their own distinct phonological and phonotactic properties. They typically reinforce the manner of an action, event, or state, e.g., [Ngizim] ɓarak 'with a popping sound', [Miya] ɓakù-ɓakù 'hopping along', [Kwami] (adjectival) dükùdù 'small and broad', [Hausa] kwàngàrà̀m

'with a clang', [Margi] dzùl-dzùl 'jumping high in running (animal)', [Bidiya] ɓorok (Mid tones) 'emphasizes quickness'.

Word order is normally S[ubject] V[erb] O[bject], although VSO order is found in a few Central Chadic/Biu-Mandara languages spoken in the Nigeria-Cameroon border area. Pronominal indirect objects (recipients/goals) are typically realized as verb clitics, whereas nominal indirect objects occur as prepositional phrases to the right of the direct object/theme (Chadic languages are prepositional), cf., [Kanakuru] à jòḅ-rò landài 'he washed the robe for her' (literally he washed-for her robe), and à jòḅè landài gèn tamno 'he washed the robe for the woman' (literally he washed robe for woman). *Wh*-questions, focus, and relativization usually pattern together in terms of their formal morphosyntactic reflexes, with overt movement, often to left periphery, and special (focus) marking on the inflectional element, e.g., [Hausa] yaarònkà mukà ganiì 'it's your boy (that) we saw' (literally boy.your 1pl.FOCUS.PERF see). Some languages allow (or require) in situ *wh*- and (pragmatic) focus constituents, e.g., [Duwai] Saaku ɓènà mù? 'what did Saku cook?' (literally Saku cooked what).

Negation in Chadic is typically signaled with a single marker in sentence-final position, e.g., [Guruntum] tãa kyur shau dà 'she will not cook the food' (literally she will cook food NEG), [Kera] wə gùsnə hàrga bà 'he didn't buy her a goat' (literally he bought her goat NEG), sometimes reinforced by an additional pre-verbal negative marker. Comparatives are normally ditransitive constructions with the lexical verb 'exceed, surpass, be more than', i.e., exceed object X in relation to manner Y.

In noun phrase syntax, the normative order for constituents is head-initial, i.e., head noun followed by definite determiners, possessives, numerals, relative clauses, etc. The linear order in genitive constructions is possessee X (+ 'of' linker) + possessor Y, e.g., [Margi] tagu gə Haman 'Haman's horse' (literally horse of Haman). Many Chadic languages also make an overt distinction between alienable and inalienable possession whereby inalienable possession is expressed by direct juxtaposition (i.e., with no overt linker), cf. (inalienable) mɔnda Miyim 'Miyim's wife' (literally wife Miyim), and (alienable) gam ma tamnoi 'the woman's ram' (literally ram of woman) [Kanakuru]. Reflexive pronouns and reciprocals (phrasal anaphors) are typically formed with the body-part nouns 'head' and 'body' respectively, e.g., [Kwami] kuu-nì 'himself' (literally head-his), [Miya] tuwatùw-àamà 'each other (we)' (literally body-our).

Chibchan

A Constenla Umaña, University of Costa Rica, San José, Costa Rica

© 2006 Elsevier Ltd. All rights reserved.

The Chibchan stock is currently composed of the 16 languages from Central America and northwestern South America listed below with their main current alternate names, approximate number of speakers, and location: Pech (Paya; 900; Olancho Department, eastern Honduras), Rama (20; Rama Cay and other localities south of Río Escondido, southeastern Nicaragua), Maléku Jaíka (Guatuso; 300; Guatuso County, northern plains of Costa Rica), Cabécar (8500; Atlantic watershed and southern Pacific slope of the Talamanca Range, southern Costa Rica), Bribri (6000; southern Atlantic and Pacific

slopes of the Talamanca Range), Boruca (Brunka; 2, 20 semi-speakers with a passive domain of the language; Térraba Valley, southwestern Costa Rica), Teribe (a dialect of Naso; 3000; Teribe and Changuinola rivers area, northwestern Panama; Térraba, the Costa Rican dialect, is extinct), Buglere (Bocotá, Guaymí Sabanero; 3700; Bocas del Toro, Veraguas, Chiriquí Provinces, western Panama), Ngäbere (Guaymí; 110 000 in the Bocas del Toro, Chiriquí, and Veraguas provinces, Western Panama, and 2172 in the bordering area of southwestern Costa Rica), Kuna (70 000 in the eastern Atlantic coast and the southeastern Paya and Pucuro localities of Panama, and 800 in Arquía and Caimán Nuevo in the Urabá Gulf, Colombia), Chimila (450; lowlands to the south of Fundación River, Magdalena Department, Colombia), Cogui (Cágaba; 6000; northern, eastern,

and western slopes of the Sierra Nevada de Santa Marta, Colombia), Damana (Malayo; 1500; southern and eastern slopes of the Sierra Nevada de Santa Marta), Ica (Bintucua; 8000; southern slopes of the Sierra Nevada de Santa Marta), Barí (Motilón; 1500 in Colombia, 850 in Venezuela; Serranía de Motilones), and Tunebo (Uwa; 3500, mostly in Colombia, a few in Venezuela; eastern slopes of the Sierra Nevada de Cocuy). Formerly, the stock included at least eight more languages which are listed with their original location, and approximate time of extinction: Huetar (central Costa Rica, 18th century), Chánguena, Dorasque (both in western Panama, Chiriquí Lagoon area, beginning of the 20th century), Antioquian (central and northeastern Department of Antioquia, Colombia, 18th century), Tairona (the coast to the north of the Sierra Nevada de Santa Marta, 18th century or before), Kankuama (eastern slopes of the Sierra Nevada de Santa Marta, first half of the 20th century), Duit (Boyacá Department, Colombia, 18th century), and Muisca (Cundinamarca Department, Colombia, 18th century).

Subgrouping

The following subgrouping is based on both lexicostatistical and comparative evidence (Constenla, 1995: 42):

- I. Pech.
- II. Core Chibchan:
 - IIA. Votic: Rama, Guatuso.
 - IIB. Isthmic:
 - B1. Viceitic: Cabécar, Bribri.
 - B2. Boruca.
 - B3. Teribe.
 - B4. Guaymiic: Ngäbere, Buglere.
 - B5. Doracic: Dorasque, Chánguena.
 - B6. Kuna.
 - IIC. Magdalenic:
 - C1. Core Magdalenic:
 - C1.1. Southern Magdalenic:
 - C1.1a. Chibcha: Muisca, Duit.
 - C1.1b. Tunebo.
 - C1.2. Arhuacic:
 - C1.2a. Cogui.
 - C1.2b. Eastern-southern Arhuacic:
 - C1.2b.1. Eastern Arhuacic: Damana, Kankuama.
 - C1.2b.2. Ica.
 - C2. Chimila.
 - C3. Barí.

There are some indications that (a) the Isthmic group could be divided into two branches: Viceitic-Boruca and Teribe-Guaymiic-Doracic-Kuna, (b) the Magdalenic group could be also divided into two branches: Southern Magdalenic-Barí and Arhuacic-Chimila, (c) Huetar might belong to Votic, and (d) Tairona to Eastern-southern Arhuacic (Jackson, 1995: 67–68).

The split of Proto-Chibchan into the ancestors of Pech and Core Chibchan occurred, according to glottochronology, around 6550 years BP, at the times of the beginning of the transition from the hunter-gatherer way of life to the agricultural one. The greater diversity between the languages is found to the west and north, in Central America, which suggests that the Chibchan people's homeland must have been there, probably in Costa Rica and Panama, where archeology has found the oldest sites related to them.

External Relationships

There have been proposals of relationships between Chibchan and at least a score of other Amerindian language groups and isolates from Florida in the United States to northern Chile and Argentina (such as Timucua, Tarascan, Cuitlatec, Xincan, Lencan, Misumalpan, Chocoan, Andaquí, Beto, Warao, Yanomama, Paez, Barbacoan, Mochica, Kunza, Allentiac), which together would constitute a Macro-Chibchan phylum. None of these have been proved, and the quality of the supposed evidence in their favor is extremely poor (Constenla, 1993: 81–95).

Typology

The Chibchan languages belong to the Lower Central American Linguistic Area, characterized by features such as SOV order, postpositions, prepositive genitive, postpositive numerals and adjectives, lack of gender contrasts, and contrasts between voiced and voiceless stops.

The Chibchan languages of southern Costa Rica and western Panama, together with the Chocoan languages, constitute a Central Subarea characterized by the predominance of features such as distinctive vowel nasality, tense/lax vocalic contrasts, ergative or active case systems, and absence of person inflections. Most Chibchan languages in this subarea present numeral classifiers, postpositive demonstratives, and tone contrasts.

Pech, Rama, and Maléku Jaíka are part of a Northern Subarea, and the Magdalenic languages, of an Eastern Subarea. Although each of these subareas possesses its own characteristics, they share the predominance of features, both positive and negative,

opposed to those of the Central subarea such as accusative-nominative case systems (Maléku Jaíka and Tunebo are exceptions to this), person inflection for possession in nouns and for agent and patient in verbs, prepositive demonstratives, and lack of numeral classifiers, distinctive vowel nasality, and tense/lax vocalic contrasts.

Chimakuan Languages

E P Hamp, University of Chicago, Chicago, IL, USA

© 1994 Elsevier Ltd. All rights reserved.

The Chimakuan [tʃim'ækʊən] (or ['ɑ]) family of languages on the northwest coast of North America comprises the smallest possible number of comparanda, just two known languages. This situation is not for lack of careful probing investigation, and the surrounding area is one of the best regions of aboriginal scholarship. The data will yield only with a fresh spurt of imagination.

The Family and its Recognition

This linguistic stock consists of Chemakum [tʃ'eməkəm], a neighbor's designation, and Quileute (also *Quillayute*, *Kwille'hiüt*, *Quilahutes*, *Kwe-dée-tut*) [kʷ'ili u-t] in English, /kʷ'o'li-yo't/ in their language, a tribe of less than 500 persons with 10 speakers in 1986, where we employ their self-name. The tribe occupies the western, Pacific coast of the Olympic Peninsula, state of Washington, USA, between the Wakashan Makah to the north and the Salishan Quinault to the south. Besides the Quileute at the river-mouth settlement of LaPush (a Chinook Jargon name, from French), the tribe includes the Hoh people /čalā-t/ of the Hoh River (Quinault /hóχ/); but note that in Quileute /čalá-l/ means 'Quinault language' – a tangle of important neighbors' designations, which looks like a language shift on the part of the Hoh.

Chemakum, now extinct, was located at a remove at the northeast corner of the Olympic Peninsula, adjacent to the Salishan Clallam, who absorbed them in 1890, and the Olympic mountains. In 1855

the Chemakum were about 100 strong, but by 1890, when F. Boas collected a modest number of words and sentences, there were only 3 speakers. The two language groups traditionally recognized their kinship, and Timofei Tarakanov reported this relation in his 1808–09 shipwreck account.

The remaining question of nearby kinship affects Salishan, which does not seem promising, or Wakashan, where the encouraging matches may be ancient borrowings.

The Data

The two languages share obvious characteristics; although some are of structural typology their cumulative weight coupled with phonological agreement in elements that make them up results in a strong case for homomorphism. The build of words is nearly identical. There are no prefixes, a couple of dozen inflexional suffixes, and over 200 elements called lexical suffixes, which additionally agree in selecting three empty bases with idiosyncratic semantics. Diminutives and plurals use infixes. There are identical structure requirements in word classes: for every predicate, for article and pronoun suffixes, and for (non-) feminization of deictics. More of an areal feature here is the property that all words except particles can be predicates.

There are phonological regularities and morphological divergences that lead to the recognition of correspondences with time depth. Ironically, such non identities are necessary to demonstrate kin relation. The consonants agree well, the fullest set is the glottalized one: *p̣ṭḷč̣č̣ḳḳẉq̣'q̣'ẉ, plus *ṃṇḷỵẉ matching *ṃṇḷỵẉ. A set of spirants matching *ḷ through ʔ fills out a picture that in its outer limits

points more to areal typology. An interesting idiosyncrasy is the lack of plain lateral λ , which Quileute has filled in, this writer believes by a Grassmann-like dissimilation. Just as in pre-Chimakuan before front vowel labio-velars palatalized to palatal groove obstruent, so did front velars in Chemakum. Quileute has developed vowel length and pitch accent (or, as this writer believes, more a stress placement) and has undergone stress shift to penult.

Quileute, probably the only language in the world to lack surface nasals completely, has turned them into voiced stops; but the witch Daski-ya of folklore spoke in her characterizing style with nasals.

These are powerful correspondences. Chemakum seems to have revalued its plural on the Clallam model. Quileute may have lost detail in the subject pronouns, and perhaps mirrors Tillamook in the feature-inflexion of feminines.

Chinantec: Phonology

D Silverman, Nanvet, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Chinantecan is a group of about 14 VSO languages within the Otomanguean family, spoken by approximately 90 000 people in northeastern Oaxaca, Mexico, having branched from the Otomanguean tree more than 16 centuries ago. The 14 major languages (where ‘language’ is defined as a speech community with mutual intelligibility not in excess of 80% with other communities) are Ojiltán, Usila, Tlacoatzintepec, Chiltepec, Sochiapan, Tepetotutla, Tlapetusco, Palantla, Valle Nacional, Ozumacín, Lalana, Lealao, Quiotepec, and Comaltepec. The first seven are northern languages and tend to be more innovative phonologically; the second seven southern languages are more conservative. Syllables are usually CV, with only a few post-vocalic elements, among them a nasal and/or laryngeals. Proto-Chinantec is reconstructed as possessing consonants *p, *t, *k, *k^w, *b, *z, *g, *g^w, *s, *m, *n, *ŋ, *w, *l, *r, and *j. Laryngeals *h and *ʔ could stand alone pre-vocalically, or could precede any of the voiced consonants. Additional consonant-glide clusters are reconstructed as well. The reconstructed tonal inventory includes *H, *L, *HL, *LH, and *HLH. Vowels included *i, *e, *a, *u, *ī, and *ā, as well as several diphthongs. The vowels may be augmented in a bewildering number of ways, however. In modern Comaltepec – the most conservative Chinantecan

language – eight vowel qualities (i, e, æ, a, o, ʌ, ī, u) may be combined with five tonal qualities (L, M, H, LM, LH), two voice qualities (plain and aspirated), a nasality contrast, as well as a binary length contrast. The cross-classification of these 5 independent systems results in 320 possible nucleus qualities (8 × 5 × 2 × 2). Thus, a single vowel quality may possess up to 40 contrastive values.

Chinantec roots and words are usually monosyllabic. The rich inflectional system normally involves modification of root vowels, resulting in monosyllabic stems that bear a particularly high informational load. In Comaltepec, for example, a single syllable may contain not only the root but also (in the case of verb complexes) active/stative markers, gender markers (animate/inanimate), transitivity markers (intransitive/transitive/ditransitive), aspect (progressive/intentive/completive), and possibly subject pronoun clitics (two subsyllabic classes). Methods of stem modification involve nasalization, tone, length, phonation augmentation, and sometimes consonant changes. Additionally, certain irregular patterns are marked by ablaut. Due to their inherent inflection, bare verbal roots do not exist as such in Chinantecan. All Chinantecan languages have a large number of verb classes, along with many lexical exceptions. Classes are differentiated by patterns of identity or nonidentity across aspect/person combinations. For example, in the partial paradigm for the verb ‘to hit’ shown in Table 1, some complexes are identical to others, while others are different. Verbs in this class

Table 1 Partial verb paradigm from comaltepec

| | | | | |
|----------------------------|-------|-------|-------|-------|
| hit (transitive/inanimate) | 1s | 1p | 2 | 3 |
| progressive | bah↓ | ba↓ | bah↓ | bah↓ |
| intensive | bah↓ | bah↓ | bah↓ | bah↓ |
| completive | bah↓ | bah↓ | bah↓ | bah↓ |
| hit (transitive/animate) | | | | |
| progressive | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ |
| intensive | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ |
| completive | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ | bA:ꞑ↓ |

Table 2 Examples of stem inflection in Quiotepec (Robbins, 1968)

| | |
|-------------------------|--|
| k ^w o:t | I give (something) |
| k ^w o:t | I gave (something) |
| k ^w o:tꞑo | thou givest (something) |
| k ^w o:tꞑo | thou gavest (something) |
| k ^w o:tꞑo | I give (something to someone) |
| k ^w o:tꞑo | I gave (something to someone) |
| k ^w o:tꞑo | thou givest (something to someone) |
| k ^w o:tꞑo | thou gavest (something to someone) |
| k ^w o:jꞑ nã | I give (something animate) |
| k ^w o:jꞑ nã | I gave (something animate) |
| k ^w o:jꞑ ꞑnã | thou givest (something animate) |
| k ^w o:jꞑ ꞑnã | thou gavest (something animate) |
| k ^w o:jꞑ ꞑnã | I give (something animate to someone) |
| k ^w o:jꞑ ꞑnã | I gave (something animate to someone) |
| k ^w o:jꞑ ꞑnã | thou givest, gavest (something animate to someone) |

will tend to show a similar pattern of identity and nonidentity across cells, while verbs in other classes show a different pattern.

Table 2 provides examples of stem inflection from Quiotepec (Robbins, 1968).

In at least some Chinantecan languages, the verb may be prefixed by a subject agreement marker for intransitive verbs, or by an object agreement marker for transitive verbs. Additional verbal prefixes include a negation marker, and tense and aspect markers (imperfect, past, hodiernal past, perfect, past imperfect, etc.). Unlike verbs, nouns do not typically display internal inflection, instead showing stability across inflectional augmentation. In Tepetotutla, for example, noun roots may concatenate with a quantifier, a gender-inflected numeral, a classifier, etc. In Lealao, constituents of the noun phrase may include a quantifier, the head, a modifier, a possessor, and a deictic marker, in that order, as well as a classifier prefix in some cases.

Stem complexes are obligatorily stressed. Posttonic and pretonic syllables are not stressed. Stressed syllables may possess greater phonological and morphological complexity than do unstressed syllables. In Sochiapan, unstressed syllables differ from stressed

ones in displaying a more limited distribution of phonemes. Posttonic syllables in Palantla consist of a small list of words that do not contrast for tonal features. Pretonic syllables, while maintaining tonal contrasts, do not possess postvocalic elements, except in very careful speech. In Comaltepec, posttonic syllables consist of a limited set of clitics, person-of-subject inflectors (in verbs), and possessors (in nouns). Pretonic syllables consist of only several verbal prefixes and a few proclitics, and possess a smaller inventory of tone values. These syllables are not a site for further inflection, and thus do not possess morphological complexity. In Quiotepec, too, stress falls on the major lexical classes (verbs, nouns, etc.); most pretonic syllables consist of inflectional material. Pretonic syllables only occur with single tones, never with tonal contours. In at least several Chinantecan languages, the vocalism of posttonic syllables is harmonically determined by the stem vowel. Tone may spread from stem to suffix as well.

Regarding Chinantecan stress, several languages are traditionally characterized as possessing either ‘ballistic’ stress or ‘controlled’ stress on stem syllables. In Palantla, Tepetotutla, Sochiapan, and Comaltepec, ballistic syllables have been characterized by an initial surge and rapid decay of intensity, and a loss of voicing of postvocalic elements; controlled syllables exhibit no such initial surge of intensity, displaying a more evenly controlled decrease of intensity, and a lack of postvocalic devoicing. Ballistic syllables tend to be shorter in duration than controlled syllables, and may possess a smaller inventory of tonal patterns. In at least several Chinantecan languages, ballistic syllables cross-classify with almost every other syllable type. Both oral and nasal vowels, both long and short vowels, preaspirated and preglottalized onsets and plain onsets, open and checked syllables, and nasally closed syllables, may all possess ballistic stress. Ballistic stress interacts most significantly with tone, tending to raise high tones and lower low tones. In Lalana, ballistic stress (considered postvocalic h in some analyses) may not occur with glottal checking, and may occur with only H, L, and HL tones, whereas controlled syllables reportedly also possess MH, LH, and HLH, and may be checked. In Lealao, only level tones (L, M, H, VH) may occur with ballistic stress, whereas controlled syllables may also occur with tonal contours (LM, LH). In Comaltepec, ballistic syllables may occur with almost any tonal pattern.

The ballistic stress found in some Chinantec languages corresponds to tonal lowering in Ojitlán and Usila. Quiotepec is variously characterized as possessing ballistic accent or raised tones in these same contexts, often accompanied by postvocalic aspiration. The Chinantecan ballistic syllable

Table 3 Tone sandhi in Comaltepec

| Non-sandhi context | Sandhi context | Gloss |
|--------------------|-------------------------|------------------|
| to:] | kwa] to:] | give a banana |
| ɲih] | kwa] ɲih] | give a chayote |
| ku:] | kwa] ku:] | give money |
| hi:] | mi:] hi:] [○] | I ask for a book |
| moh?] | mi:] moh?] [○] | I ask for squash |

corresponds to postvocalic aspiration in related Mixtecan and Otopamean languages, to prevocalic aspiration in related Popolocan languages, and to glottally ‘interrupted’ (CV?V) syllables in the Chatino, Zapotec, and Tlapanec languages. Chinantecan ballistic syllables may derive from Proto-Otomanguean *CVh syllables (which may or may not have been phonetically realized as interrupted vowels). Indeed, recent phonetic and phonological investigations have recharacterized the ballistic phenomenon as largely laryngeally-based, involving postvocalic aspiration.

Segmental sandhi is rather limited in Chinantecan, although tone sandhi is widespread, being both phonologically and morphologically conditioned. The best-studied tone sandhi system is that of Comaltepec. Here, LH tones spread their H component on to a following vowel. Furthermore, M tones on unchecked controlled syllables (deriving from Proto-Chinantec H) trigger the presence of an H tone on the following syllable. Examples are shown in Table 3.

Chinese

Y Gu, Chinese Academy of Social Sciences, Beijing, China

The State of the Art

If language is ultimately seated in the minds of individual speakers, as some linguists claim, then Chinese can be described as a collection of over 1.3 billion idiolects scattered around the world, in Mainland China, Taiwan, Hong Kong, and Singapore in particular. If on the other hand language is held to be the property of a speech community, as many linguists believe, Chinese is then an assemblage of numerous ‘dialects’ spreading over different continents and across time zones, some of which are so

different that their speakers cannot even communicate with one another. In spite of the vast diversity, and even some mutual oral unintelligibility, all literate speakers can overcome the barrier imposed by the oral unintelligibility via reading (not aloud!) and writing. The writing script partly enables the users to transcend the differences of idiolects and dialects, and bridges the past and the present.

In this article, Chinese will be discussed within its two natural divisions: spoken Chinese and written Chinese. The former includes (1) the classification of dialects and their geographic and demographic distributions; (2) Putonghua as a lingua franca; and (3) a brief discussion plus sound illustrations of three major dialects. The latter includes (1) the writing script, and (2) the historical evolution of written Chinese from archaic Chinese to modern Chinese.

The article concludes with a summative account of how Chinese, both spoken and written, is electronically processed.

Spoken Chinese

Although Chinese, like any other language in the world, is substantiated in idiolects, i.e., parole in the Saussurean term, they are thrown away after being used as evidence for language system construction i.e., the Chinese language. In other words, talking about Chinese, over 1.3 billion idiolects are generally ignored. What linguists are interested in is the various dialects evolved from them. The number of dialects depends on how fine-grained the researcher's scheme is intended to be. It is hardly a rare case that people in two villages only a dozen of miles apart cannot intelligibly communicate through speech.

Dialect Classification and Distribution

Chinese dialects can be classified by adopting a tree-like structure. The first branching-out from the trunk is the two major supergroups: Mandarin and non-Mandarin. Mandarin includes eight subgroups: Northeastern, Beijing, Beifang, Jiaoliao, Zhongyuan, Lanyin, Southwestern, and Jianghuai. The non-Mandarin group comprises nine subgroups: Jin, Wu, Hui, Gan, Xiang, Min, Yue, Pinghua, and Hakka. Each of the subgroups has its own clusters, each of which in turn encompasses local dialects (see Figure 1).

Geographically speaking, Mandarin is spoken in the following provinces and major cities: Heilongjiang, Jilin, Liaoning, the eastern part of the Inner Mongolia Autonomous Region, Shandong, Beijing, Tianjing, Hebei, Shanxi, Gansu, Qinghai, Ningxia Hui Autonomous Region, Sichuan, Yunnan, Guizhou,

Guangxi Zhuang Autonomous Region, western part of Hubei, Chongqing, northern parts of Jiangsu, and Anhui. The total Mandarin-speaking population, based on the 1982 census, was about 662.23 million. Table 1 shows the demographic distributions among the subgroups of Mandarin. The demographic distributions of other non-Mandarin dialects are shown in Table 2.

Table 1 Mandarin-speaking population by 1982

| | |
|-------------------|------------------|
| Northeastern | 82.00 |
| Beijing | 18.02 |
| Beifang | 83.63 |
| Jiaoliao | 28.83 |
| Zhongyuan | 169.41 |
| Lanyin | 11.73 |
| Southwestern | 200.00 |
| Jianghuai | 67.25 |
| Yet to be grouped | 1.36 |
| Total | 662.23 (million) |

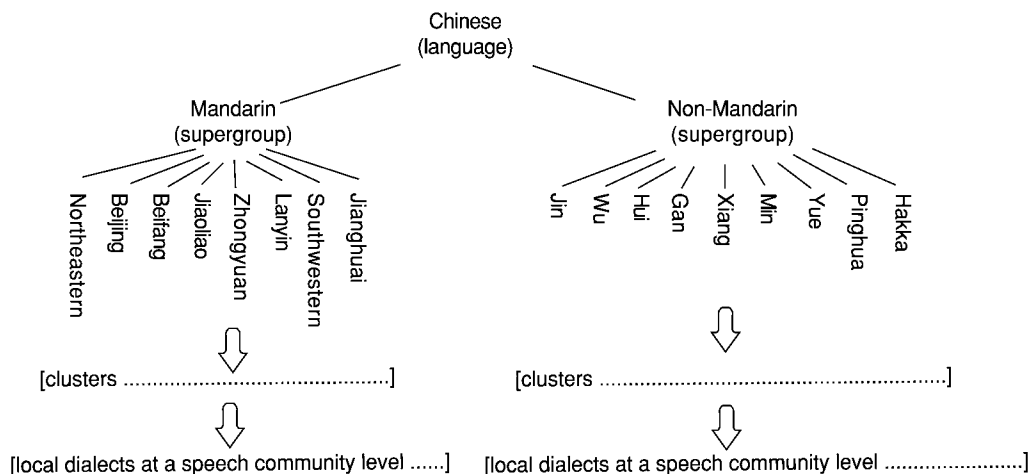

Figure 1 Classification of Chinese dialects.

Mandarin Chinese is often nontechnically regarded as an equivalent to Chinese, which was historically the language of the Han nationality. Thanks to massive immigration and frequent contact, Mandarin Chinese is spoken by non-Han ethnic peoples as well. Some members of the Hui nationality, for instance, who are of Mohammedan origin, adopt Mandarin as their mother tongue. Almost all members of the She and Manchu nationalities speak Mandarin Chinese. Conversely, some people of Han origin in Hainan Province speak the Be language instead of Mandarin.

Putonghua as Lingua Franca

Dialects create diversity and local identity, and at the same time impose constraints on communication and social interaction. A tension always exists between diversification and standardization of the language. Many campaigns have been launched in the long history of China in favor of standardizing both spoken and written Chinese. The policy of *shu tong wen zi* ('writing according to the same script') adopted in the Qin Dynasty (248–207 B.C.) was in fact a systematic reform undertaken by the imperial court to standardize the writing script. In the Sui Dynasty, Lu Fayan's (fl. 600 A.D.) *Qieyun* ('Guide to poetic rhyming') became a standard reference on pronunciation for the generations to come, as well as for the reconstruction of ancient phonological systems. The campaign for the standardization of modern Chinese started as early as the last leg of the Qing Dynasty (1616–1911 A.D.) when the National Language Movement was vigorously launched as a part of the measures to revitalize the shattered country. It was argued that the nation could not be unified without a unified language. Guoyu ('national language') was initially envisaged and artificially constructed on the basis of some major dialects. This proved to be untenable, for it was next to impossible to promote such a language without natural speakers. New Guoyu ('new national language'), with the Beijing dialect as its base, was proposed and eventually adopted. Immediately after the founding of the People's

Republic of China in 1949, language reform was put high on the government's agenda. Modern Standard Chinese, officially called Putonghua, was adopted as the national language. It uses the Beijing dialect for its standard pronunciation and northern dialects as its base input. Putonghua is officially stipulated to be the language of instruction at all levels of education, and of mass media.

The term Guoyu is still being used in Taiwan, while in Singapore it is called Huayu (i.e., Chinese). Putonghua, Guoyu, and Huayu are three different terms to refer to more or less the same Modern Standard Chinese.

Modern Standard Spoken Chinese

Phonology The phonological structure of Modern Standard Chinese is conceptualized more in traditional Chinese terms than otherwise. A syllabic structure has three essential components: initials, finals, and tones. The initials and finals are two segments of a syllable, while the tones are supersegmental, i.e., features superimposed on the segments. The initials are the sounds known as consonants in Western literature. The finals, i.e., vowels, have internal structures of their own: the medial and the root of the final, which is further decomposed into two: the main vowel and the syllabic terminal (see Figure 2).

The initial, the medial, and the syllabic terminal are not obligatory to make a Chinese syllable. A simple syllable can consist of a main vowel plus a tone only.

The possible initials, finals, and tones of Modern Standard Chinese are summarized in Tables 3, 4, and 5, respectively.

It is perhaps well-known now to the non-Chinese speaking world that Chinese tones are phonemic, that is, the same phonetic syllable pronounced in different tones will produce different words. The syllable /ma/ is the classic example: ma55 (mother), ma35 (hemp), ma214 (horse), ma51 (scold), and ma0, (a functional particle without a fixed lexical meaning).

While tones are properties of words, there are also intonations of utterances. The relation between the tone and the intonation is often metaphorized as

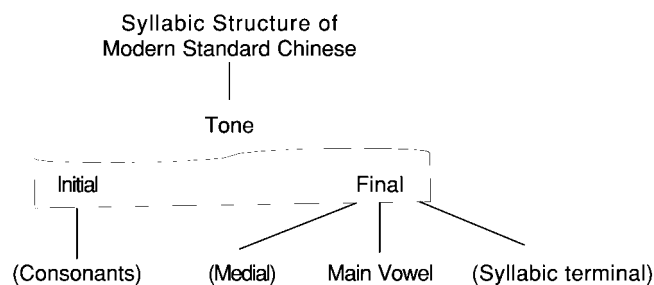

Figure 2 Syllabic structure of Modern Standard Chinese.

small ripples (cf. word tones) riding on large waves (cf. utterance intonations). The interaction between the tone and the intonation results in an algebraic sum of the two kinds of waves.

Grammar It is generally held that, although Chinese dialects are so diversified that mutual unintelligibility in speech is not uncommon, they are conversely amazingly unified in matters of grammar. There are some minor divergencies found between dialects, for example, with regard to the order of direct and indirect objects, the Wu dialects and Cantonese differing from Mandarin Chinese. Cases like this, however, are

extremely limited. It is quite valid to hold that there is one universal Chinese grammar.

At the risk of oversimplification, which is unavoidable in such a short essay as the present one, Chinese grammar, in comparison with English and other European languages, is pragmatically oriented. The subject and predicate in the grammar of Western languages are best viewed as the topic and comment in Chinese. The subject/actor and the predicate/action are treated as a special case of topic and comment. For instance, *jiu bu he, yan chou* (word-for-word rendering: wine not drink, cigarette smoke) is understood as 'Talking about wine, I don't drink; but as for cigarettes, I do smoke.'

The topic-comment structure has something to do with the complaint often made by Westerners about Chinese saying 'no' but actually meaning 'yes.' Responding to the utterance *zhe shu bu hao* (word-for-word rendering: 'this book not good'), if the speaker also thinks that the book is not good, he will say *shi* ('yes'), meaning that he agrees with what the first speaker said about the book. While the English mind checks the statement against the fact, the Chinese mind expresses agreement or disagreement with the speaker. In other words, the Chinese mind tends to treat the speaker's utterance as setting up a topic, and the responder's job is to comment on the topic. The issue of the truth or falsehood of the statement becomes secondary.

Pragmatics One of the Chinese politeness maxims dictates that the speaker should denigrate him or herself, while elevating the other. This maxim has been codified in a range of lexical items. All the self-related expressions, including those referring to one's family members, relatives, properties, writings, and so on, are marked with denigration, whereas the

| ong | uŋ | iong | iŋ | | | | |
| er | ɚ | | | | | | |

other-referring expressions, including those referring to the other's family members, relatives, properties, writings, and so on, carry the force of elevation. For instance, a man referring to his own house will politely use *han she* ('cold living place'), but *fushang* ('mansion') to refer to the other's residence.

The self-denigration and other-elevation maxim also operates in compliment-taking. Complaints are made about Chinese failing to take a compliment gracefully. Hearing a compliment like *ni de yifu hen piaoliang* ('your dress is beautiful'), a Chinese lady will vigorously insist that it is very ugly indeed: *bu bu bu, chou shile* ('no no no, deadly ugly').

Written Chinese

In most languages, spoken and written forms are generally regarded as two functional varieties of one and the same language. The relation between spoken and written Chinese, however, cannot be dealt with so readily in the same way. Inscriptions incised on oracle bones, dated 1400–1100 B.C., are the earliest existent written records of Chinese. The inscriptions were not transcripts of the speeches of emperors or tribal kings. They can be regarded, at best, as setting up some of the earliest instances of a particular genre of written Chinese. By the time of the late years of Qing Dynasty (1616–1911) 3000 years or so later, the archaic written Chinese had become so different from the contemporary spoken Chinese that it would take years of dedicated study before one could

read and write it. To make things even worse, the archaic written Chinese was prescribed as the medium of education. It was, and still is, no easier for students to learn it than it would be to learn a foreign tongue. Some language reform activists in the 1910s went on record arguing that archaic written Chinese was partially to blame for the humiliating decline of the Chinese civilization following the time of the Tang dynasty (618–907).

Attempts to reform written Chinese thus had two aspects: the reform of the writing script and the reform of archaic written Chinese as the medium of education.

Writing Script Reform: Alphabetization Versus Simplification

The nature of the Chinese writing script has been disputed for years, as can be seen in the variety of English terms used to designate the marks on paper known in Chinese as *hanzi* (i.e., Chinese characters): pictographs, pictograms, ideographs, ideograms, phonograms, logographs, ideophonographs, lexigraphs, morphographs, sinographs, and so on. The evidence for the claim that the Chinese writing originated from picture-drawing is substantial. Table 6 shows four instances of pictographs taken from oracle bone inscriptions with their corresponding present-day characters.

It is apparent that the pictographs have evolved, through orthographic reforms, to such an extent that even those characters with highly iconicized origins as shown in the table have lost their picturesqueness. Chinese characters are constructed from five basic strokes (see Table 7) in a square space.

Picture-based character creation is only one of the many ways in which Chinese characters are constructed. Some philologists in the Han dynasty (206 B.C.–220 A.D.), on the basis of the then existent writings, abstracted six principles of character formation. Later studies show that only four of them are genuine: (1) *zhi shi*, the simple indicative principle; (2) *xiang xing*, the pictographic principle; (3) *hui yi*, the compound indicative principle; and

Table 7 Strokes and character writing

| Strokes | Sample | Translation |
|---------|--------|-------------|
| 一 | 舞 | dance |
| 一 | | |
| フ | | |
| 、 | | |
| ノ | | |

(4) xing sheng, the semantic–phonetic principle. The pictographic method of character formation had ceased to be productive by the Han dynasty. The semantic–phonetic character formation has been the most productive of all, and the majority of Chinese characters are thus constructed. It is on this account that the Chinese writing system can be appropriately designated as being morphosyllabic.

A Chinese character can be as simple as one stroke (e.g., 一 ‘one’), or as complex as dozens of strokes (e.g., 鼾 ‘snuffling’). Given a set of 11 834 characters, the average number of strokes per character is 11.5516, and 63 percent of the set is made of 12-stroke characters. Since it is quite a challenging task to learn to write such characters, there has been no shortage of appeals to reform the writing script. As early as the 1910s, some language reform activists argued for abolishing the characters altogether, to be replaced with a new alphabet script. This proved to be completely infeasible. The PRC government eventually adopted three reform measures: (1) a romanization alphabet known as Pinyin that is used to mark the pronunciations of characters; (2) a simplification scheme according to which 1754 characters would be simplified; and (3) a total of 1055 duplicate characters that were to be abolished.

The Reform of Archaic Written Chinese

Archaic written Chinese models the writings prevalent from the Spring and Autumn (770–476 B.C.) to the Later Han (25–220 A.D.) periods. Partially because the characters were immune to the dynamic changes of actual speech sounds over space and time, archaic written Chinese achieved, as it were, an independent symbolic existence. By the 1900s, it had no natural speakers. It did, however, have several potential rivals under the name *baihua wen*, literally meaning ‘unadorned speech writing,’ which was far closer to the contemporary vernacular speech. The reform movement basically dethroned archaic

written Chinese and replaced it with the *baihua wen* that had been formerly much despised. The reform proved to be an uphill task, however, as it met with fierce resistance from die-hard adherents.

Three Major Dialects

As graphically shown in Figure 1, the non-Mandarin supergroup falls into nine subgroups of dialects, which of course can be further divided into smaller groups. In this section three dialects, Hong Kong Cantonese, Shanghainese and Fuzhou dialect, representing the Yue group, the Wu group and the Min group respectively, are examined as a window to show what the non-Mandarin dialects look like. They are highlighted here thanks to the demographic size (see Table 2) and relatively prestigious status they enjoy.

The Yue Group: Hong Kong Cantonese

Hong Kong Cantonese is one of the important varieties of the Yue group. It is spoken by 89 percent of Hong Kong’s 6.4 million population (by the 1996 census) in family discourse. It is also used in some radio and TV programs, and as an instructional language in schools and university classrooms. English was the main official language in the former British colony, but its use actually was, and still is, quite limited. Since the return of sovereignty to China in 1997, Putonghua has become increasingly popular. Having said this, Hong Kong Cantonese still remains a true vernacular of the local people.

The term ‘Cantonese’ is derived from Guangzhou, the most influential city in southern China, which is known as Canton in English. Hong Kong and Guangzhou Cantonese are not noticeably different except that the former’s lexicon has more English loan words than the latter’s. In speech Cantonese and Mandarin or Putonghua are mutually unintelligible. Educated Cantonese speakers, however, use the standard form of written Putonghua. There are some spoken Cantonese words that have no corresponding Putonghua characters. Some Cantonese written words coined by local newspapers and in advertisements in Hong Kong are unintelligible to Putonghua readers.

Backed up by the economic and financial strength and influence of Hong Kong and Guangzhou, Cantonese is enjoying a prestige that is unprecedented for any regional dialect in China, and is the most studied of all the dialects. Grammars, dictionaries, and textbooks have been written to render it more like a language than a regional dialect.

Cantonese has 16 initial consonants. Unlike Mandarin, it has completely nasal syllables with *m* and *ng* functioning as vowels. For instance, the Cantonese word for the Mandarin word *wu* ('five') is *ng*, which can only be a syllabic nasal terminal of a final in Mandarin. It has eight vowels, and two sets of consonants that can be syllabic terminals: (1) nasals: -*m*, -*n*, -*ng*; (2) unreleased consonants: -*p*, -*t*, -*k*. Its tone system is far more complex than that of Putonghua. The exact number of tones is not without controversy. Some hold that only six tones are clearly distinctive in Hong Kong Cantonese, although there can be up to nine tones in the Yue group.

The Wu Group: Shanghainese

The Wu group is spoken mainly in Shanghai, Southern Jiangsu Province, and a large part of Zhejiang Province. Historically the Suzhou Wu dialect enjoyed more prestige and esteem than the other regional varieties. When Shanghai established itself as an industrial and commercial center in China, it lost its glory and was replaced by Shanghainese, whose speakers seem to be eager to establish their own identity. Shanghainese speakers, who may speak fluent Putonghua, will lose no opportunity to code-switch to Shanghainese if they can be understood by an interlocutor, even at the risk of rudely shutting off any non-Shanghainese speakers from the conversation.

In comparison with Cantonese, Shanghainese is very much under-studied. Existent literature on it mainly consists of academic research papers. Like Cantonese, educated Shanghainese speakers write in written Putonghua, although there exist lexical items that are unique to the dialect.

The term Shanghainese refers to the majority speech of downtown Shanghai. It has 28 initials (i.e., consonants), and 43 finals (i.e., vowels). One of its hallmark features (and also of the Wu group) is a three-way distinction in the initial consonants *p*, *p'*, and *b*, which become a two way distinction, *p*, and *p'*, in Putonghua. Although Wu dialects have seven or eight tones, tones 4, 5, and 6 have been lost as separate categories, which results in five tones in Shanghainese: (1) high level (53), (2) level high (35), (3) low level (13), (4) high + a glottal stop (5), and (5) low + a glottal stop (1).

The Min Group: Fuzhou Dialect

The Min group is mainly spoken in Fujian, Taiwan, Hainan, as well as some areas in Guangdong, Zhejiang, Guangxi, and Jiangxi. It is by no means a

Table 8 Sample usage in Fujian dialect

| Putonghua | Fujian dialect | English translation |
|--------------|----------------|---------------------|
| 水稻 (shuidao) | 糶 | rice |
| 书信 (shuxin) | 批 | letter |
| 冷 (leng) | 清 | cold |
| 哭 (ku) | 啼 | cry |
| 逃跑 (taopao) | 走 | escape |
| 走 (zou) | 行 | walk |

homogeneous group. On the contrary, even within Fujian Province six subgroups can be identified, one of which is known as the Min eastern subgroup, with the Fuzhou dialect as its prototype. Mutual communicability within this eastern subgroup is quite low.

Historically the Fuzhou dialect was understood to cover an area of 11 counties. The present-day use of the term is much restricted to the speech of the locals in downtown Fuzhou. Phonologically it has 15 consonants, 46 vowels including diphthongs, and 7 tones. One of the striking features of the Fuzhou dialect in comparison with Mandarin is that it has preserved a great many archaic words or usages. For instance, the word for 'rice' is 糶 in Fujian dialect, which is totally obsolete in Putonghua. For another instance, the word 批 in Fujian dialect is used to mean a letter, a usage found only in archaic Chinese. Table 8 lists some more instances.

Sound Illustrations

The phonological differences between Putonghua, Hong Kong Cantonese, Shanghainese, and Fujian dialects can be illustrated by the ways four natural objects – the sun, the moon, stars, and thunder – are lexicalized and pronounced (see Table 9).

Chinese Information Processing

At the early stage of computer technology, processing Chinese characters seemed to be such a forbidding task that calls for the romanization of the Chinese writing system were made again, but initial conceptions of the problem proved to be exaggerated. The national standard GB 2312-80, established on the basis of ISO 646 and officially coming into effect in 1981, provides a standard scheme of coding 6763 characters, which are subdivided into two groups according to the frequency of usage: the most frequent set, and the less frequent set. The most frequent set of 3755 characters is assumed to be 99.9% adequate for general usage (based on a statistical study of lexical frequency made in 1974). The GB

Table 9 The phonological differences between Putonghua, Hong Kong Cantonese, Shanghainese, and Fujian dialects

| Dialects | The sun | The moon | Stars | Thunder |
|---------------------|--|---|--|--|
| Putonghua | 太阳 t'ai ⁵¹ • iɑŋ ¹ 老爷儿 lau ²¹⁴⁻²¹ ier ³⁵ 日头 ʒ ⁵¹ • t'ou ¹ | 月亮 ye ⁵¹ • liɑŋ ¹ | 星星 ciŋ ⁵⁵ • ciŋ ² | 打雷 ta ²¹⁴²¹ lei ³⁵ |

| Shanghainese | 太阳 t'a ³³⁻³⁴ fiā ¹³⁻⁴⁴ 日头 ŋji ¹⁻¹¹ dɣ ¹³⁻⁴⁴ | 月亮 fiyɪ ¹⁻¹¹ liā ¹³⁻²³ 月光 fiyɪ ¹⁻¹¹ kuŋ ⁵³⁻²³ | 星 ciŋ ⁵³ | 雷响 le ¹³⁻²² ciā ³⁴⁻⁴⁴ 打雷 tā ³⁴⁻⁴⁴ le ²³ |
| Fuzhou | 日头 ni [?] 544 t'au ⁵³ | 月 ŋuo [?] 5 | 星 siŋ ⁴⁴ | 拍亮线 p'a [?] 23-21 liɑŋ ⁴⁴ s nian ²¹² |

Note: The characters are transcribed in IPA symbols. The superscripted numbers are tone types with 1–5 values.

2312–80 standard met the demands of hardware and software development and exchange of information for general purposes, but it soon had to be amended as new demands arose. In 1994, a standard coding scheme for two supplementary sets consisting of 7237 and 7039 characters was officially announced. As GB 2312–80 was designed to accommodate simplified characters, the new GB 12345–90 was introduced for nonsimplified characters that are maintained in Taiwan and Hong Kong. Nowadays, character recognition for both print fonts and handwriting is commercially available. Text-to-speech synthesis and production in the genre of journalistic texts has achieved a high degree of naturalness. The character script and lexical tones, which were thought to be two major obstacles for Chinese information processing, are no longer condemned, but appreciated as features with a flavor of real Chinese.

Chinese as an Isolating Language

J L Packard, University of Illinois at Urbana-Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

If we use the term ‘isolating’ in what is perhaps its simplest and most often used sense – referring to whether the words of a language are mostly monomorphemic (*see Classification of Languages*) – then Chinese can be considered only a moderately isolating language, because Chinese has at least as many multimorphemic as it has monomorphemic words. The term isolating, however, has also been used to refer to whether the morphemes of a language are clearly identifiable, defined by the following properties: (1) whether morpheme boundaries in the language are sharply defined, (2) whether there is only a single distinct morphemic identity represented within a defined morpheme boundary space (i.e., the extent to which there is no overlapping exponence; *see Classification of Languages*), and (3) whether morphemes in the language have a single, invariant phonological form. If we define an isolating language based on an identifiable morphemes criteria, then Chinese scores relatively high on the ‘isolating language’ scale. It can be profitably studied using both definitions of the term.

Isolating Defined as Having Monomorphemic Words

The definition of isolating language as monomorphemic relies on whether words in a language appear without the obligatory affixation of grammatical morphemic information. This property was intended to contrast with languages such as Russian and Latin in which word roots are generally bound content forms that require affixation of grammatical morphemic information (indicating such properties as case, number, or gender) when they occur in context. For example the Russian root for ‘book’ (*knig-*) must be augmented with an inflectional ending that reflects case or number (*knig-u* book-ACC.SING; *knig-i* book-NOM.PL), and cannot appear as a bare stem in isolation.

Languages like Chinese whose words occur without such obligatory grammatical marking are considered isolating because the words in such languages may appear in bare form without the necessity of adding morphemic information. The absence of obligatory affixation means that words in such languages will tend to contain fewer morphemes on average, giving rise to the monomorphemic word definition of isolating language.

As it turns out, many (if not most) Chinese words are in fact dimorphemic, consisting of either (1) two free content morphemes (compound word), (2) one free and one bound content morpheme or two bound content morphemes (bound root word), (3) a free or bound content morpheme plus a word-forming affix (derived word), or (4) a free content morpheme plus an inflectional affix (grammatical word; *see Packard, 2000* for further details). However, most dimorphemic Chinese words are either compound words or bound root words, and so the multimorphemic status of Chinese words is generally not due to the presence of affixation. Moreover, when Chinese words do contain affixes, they are never obligatory in the sense that they are required in the default case, as seen in the Russian example above.

Chinese affixes are, nonetheless, sometimes obligatory in an alternative sense: if a property in question is selected to be expressed by the speaker, then the use of the affix concomitant with that property is a required element. Some common examples of this obligatory marking of an optionally selected property in Chinese are the use of classifiers with nouns, the marking of plural numbers on human pronouns, and the use of aspect marking on verbs.

Classifiers are word-forming morphemes that are required when nouns are modified by a number and/or a determiner. For example, the noun *shu* ‘book’ generally occurs in context in bare form with no grammatical marking whatsoever. But when *shu* is modified by a number such as *san* ‘three’ or a determiner such as *na* ‘that,’ the classifier *ben* ‘volume’ must occur between the modifying element and the noun, yielding *san-ben shu* and *na-ben shu* for ‘three books’ and ‘that book’ respectively.

In the case of human pronouns, the personal pronouns *wo* ‘I/me,’ *ni* ‘you,’ and *ta* ‘he, she’ are obligatorily marked with the plural suffix *-men* when the referent is plural in number, to yield *women* ‘we, us,’ *nimen* ‘you (pl),’ and *tamen* ‘they, them.’

Verbs in Chinese may occur with inflectional suffixes that express various forms of grammatical aspect, that is, that refer to the activity profile of the event represented by the verb. For example, the verbal aspect marker *-le* (note that this is the *-le* that affixes to and has scope over the verb, and not the *le* that occurs in sentence-final position and has scope over the sentence) indicates that the event associated with the verb has been completed, the verbal aspect marker *-guo* indicates that the event associated with the verb has occurred at least once, and the verbal aspect marker *-zhe* indicates that the action represented by the verb is ongoing or continuous.

In Chinese, the obligatory marking of a selected property as seen in classifiers, human plural pronouns, and verbal aspect contrasts with cases in which the marking of a selected property is optional, as with plural marking on regular human nouns. When a human noun is transparently plural in number, the addition of the suffix *-men*, which would explicitly represent a plural number, is optional. For example, in both of the following examples the Chinese noun that translates into English as ‘teachers’ refers unambiguously to a set that contains multiple members.

- (1) laoshi dou you shu
teacher all have book
‘the teachers all have books’
- (2) laoshimen dou you shu
teacher-PL all have book
‘the teachers all have books’

Both examples refer to ‘teachers’ as a plural concept but only the second overtly marks the plural number with the suffix *-men*. The two examples are identical in meaning, but the second explicitly marks the plural while the first does not.

If Chinese is examined as an isolating language based on its use of monomorphemic words, it is worthwhile to consider in concrete terms where Chinese should be located on the monomorphemic word scale. The contemporary Chinese novel *Shui Ru Da Di* by Wen Fan (2004; Beijing: People’s Literature Publishing House) provides a typical sampling. If we examine the first 100 words in the third paragraph on page 16, we find that 51 (51%) of the words are monomorphemic (if by token; 35 words or 47.2% if by type), 45 (45%) of the words are dimorphemic (if by token; 35 words or 47.2% if by type), and 4 words (4% if by token, 5.4% if by type) contain more than two morphemes. If counted by type, 47.3% of the words are monomorphemic, and 52.7% are multimorphemic.

In addition, the average number of morphemes per word token for that hundred-word sample is 1.54. This figure may be compared with the 1.06 morphemes-per-word cited for Vietnamese (perhaps the most purely isolating language using this criterion), 1.68 for modern English, and 3.72 for Eskimo (see *Classification of Languages*). In sum, if the concept of monomorphemic words is used as the defining criterion, Chinese must be considered only moderately isolating.

Isolating Defined as Having Clearly Identifiable Morphemes

To determine where Chinese belongs on the isolating language scale using the ‘identifiable morpheme’

criterion, the first property to consider is sharply defined morpheme boundaries. In Chinese, morpheme boundaries are nothing if not clearly defined. There is generally no question where one morpheme ends and another one begins in any Chinese utterance. Even in cases of affixation in which the phonological form of the stem is affected, it is quite clear which part of the affixed word belongs to the stem and which part belongs to the affix.

To illustrate, consider the following examples of *-er* (phonetically [ər]) diminution suffixation (data from Cheng, 1973; in IPA, tones not marked). The *-er* suffix often makes only a negligible semantic contribution to the derived word, but it is the affixation operation that has the greatest phonological effect in (Mandarin) Chinese.

The *-er* suffix attaches to words with varying degrees of phonological effect on the stem and on the affix itself. In examples (1)–(3) of **Table 1**, the *-er* suffix is appended to the stem with the [ə] vowel of the suffix dropped in favor of stem vocalic elements, and with no effect on the phonological form of the stem. In (4), the [ə] vowel of the suffix is dropped and the stem final velar nasal [ŋ] is lost, but its nasality is retained in the form of nasalization on the stem nuclear vowel, that is, [ã]. In (5), the [ə] vowel of the suffix is dropped and the stem final apical nasal [n] is lost, but its nasality is not retained as in (4). In (6), we see a stronger contribution from the suffix, since it retains its [ə] vowel. In (7), the suffix is appended in unaltered form, and the stem final [n] is displaced. In (8)–(10), the suffix is appended in unaltered form, replacing various parts of the stem final, including its complete replacement in (9) and (10).

The examples in **Table 1** demonstrate that even though suffixation of *-er* results in a good deal of phonological variability on both stem and affix, in all cases the resulting derived words contain phonological strings that can be unambiguously attributed to either the stem or the affix, and the phonological

Table 1 Some phonological effects of *-er* suffixation

| | <i>Noun</i> | <i>Noun plus -er ([ər]) suffix</i> | <i>Meaning</i> |
|------|-------------|--|----------------|
| (1) | niou | niour | ‘ox’ |
| (2) | ua | uar | ‘frog’ |
| (3) | kɿ | kɿr | ‘song’ |
| (4) | gaŋ | gār | ‘jar’ |
| (5) | p’an | p’ar | ‘pan’ |
| (6) | i | iər | ‘clothes’ |
| (7) | in | iər | ‘seal’ |
| (8) | kuei | kuər | ‘ghost’ |
| (9) | ci | cər | ‘word’ |
| (10) | pei | pər | ‘cup’ |

identities of the participating morphemes remain clear. Thus, the sharply defined morpheme boundary aspect of the identifiable morpheme criterion for isolating language makes Chinese appear quite isolating indeed.

The second criterion for identifiable morphemes is the existence of overlapping exponence. ‘Overlapping exponence’ refers to the occurrence of more than one grammatical property within a single affix. For example, in the case of the *-us* ending on the Latin word *lupus* ‘wolf’, where the *-us* encodes both accusative case and singular number, there is no way to confer an independent phonological identity upon a portion of the *-us* suffix that encodes the accusative and a part that encodes the singular. In Chinese, there are no affixes that do such double duty by systematically encoding more than one grammatical meaning in a single affix. Therefore, Chinese is clearly an isolating language in view of this property.

The third necessary property of identifiable morphemes is invariance of phonological form. Chinese morphemes do commonly change from their citation phonological forms when they appear in context. Such phonological variation, however, is virtually always completely determined by phonological environment. This is in contrast with languages such as Russian and Latin, where allomorphic variation in general is grammatically conditioned, and generally occurs independent of phonological context. In Chinese, the shift from citation form usually involves tone sandhi, a phonologically conditioned change in lexical tone. Two tone sandhi rules from Mandarin, the L tone sandhi rule and the MH tone sandhi rule, provide an illustration (from Chen, 2000: 20, 27).

Mandarin Chinese has four lexical tones: a high (H) tone, a mid-rising (MH) tone, a low (L) tone, and a high-falling (HL) tone. The L tone sandhi rule changes an L into an MH when the L precedes (i.e., occurs to the left of) another L. The MH tone sandhi rule changes a nonfinal MH into an H when it follows (i.e., occurs to the right of) by an H or an MH. In (3), the citation tones for ‘to bury a horse’ are MH and L, and their surface realizations are the same as their citation forms. In (4), the tone on the word ‘buy’ in ‘to buy a horse’ changes from citation L to sandhi MH

following the L tone sandhi rule, making utterances (3) and (4) completely homophonous.

- | | | | | |
|-----|-----|------|------|---|
| (3) | mai | | | ‘to bury’ |
| | MH | | | |
| | mai | ma | | <i>bury horse</i> ‘to bury a horse’ |
| | MH | L | | sandhi tones = citation tones |
| (4) | mai | | | ‘to buy’ |
| | L | | | |
| | mai | ma | | <i>buy horse</i> ‘to buy a horse’ |
| | L | L | | citation tones |
| | MH | L | | sandhi tones |
| (5) | fen | shui | ling | <i>divide water mountain-ridge</i> |
| | | | | ‘watershed’ |
| | H | L | L | citation tones |
| | H | MH | L | sandhi tone forms |
| | | | | (intermediate, nonrealized forms) |
| | H | H | L | sandhi tone forms (final surface forms) |

In (5), the citation L tone on *shui* changes to an intermediate, nonrealized sandhi MH tone in accord with L tone sandhi, and that intermediate sandhi MH value for *shui* acts as input into the MH tone sandhi rule, changing the nonrealized sandhi MH tone to a final surface H tone. From these examples it is clear that the phonological shape of Chinese morphemes does undergo considerable variation, but such variation is entirely a function of phonological context.

To conclude, the reputation of Chinese as an isolating language is perhaps not so well-deserved if we rely merely on the monomorphemic word criterion, since the preponderance of Chinese words are multimorphemic. But if our criterion is how easy the morphemes of a language are to identify and individuate, then Chinese scores rather high on the isolating language scale.

Present Indians of Western Colombia

Colombia, a basically Spanish-speaking nation in the northwestern corner of South America, conserves a considerable number of Indian languages. The speakers of the various languages survived the colonization of the subcontinent, isolating themselves in rather desolate places far from the urban centers, where there were no mestizos and only the black population dared to enter. Of the immense mosaic of aboriginal languages thought to have existed when the Europeans arrived in what is today Colombian territory – for its privileged situation as a crossroads for peoples from north to south and from south to north of the continent – about 90 peoples still survive. They are characterized as different from the majority of the Spanish-speaking population, because they maintain particular sociocultural characteristics, among them a language of their own, as is the case for 65 of these 90 peoples. These languages have been characterized by the most diverse range of linguistic varieties, i.e., isolating, agglutinating, and flexive languages, as correspond to such highly varied regions in which their speakers are found: desert zones, grasslands, jungles, coastal littorals, river littorals, foothills, and mountainous zones of both temperate and cold climates.

Four of these Indian languages still survive in western Colombia, which correspond to four ethnic groups that continue to preserve their own cultural characteristics, such as their language and, therefore, their particular way of thinking, or worldview. The first of these four languages is Tule, of the Chibchan linguistic family, the speakers of which are known as ‘Cunas.’ They occupy the extreme northwestern part of the country, in the Golfo de Uraba (where there are no more than 1000 individuals) and the majority are found in the neighboring country of Panama, in the San Blas Islands (around 40 000 individuals), where they have immigrated for more than half a century. The second language is Awa or Awa-Cuaiquer, classified as an independent language, whose speakers are thought to number about 4000 and are located in the extreme southwestern part of the country (in the department of Nariño) and in smaller numbers in the neighboring country of Ecuador. The third and fourth languages are Waunméu (Woun Meu) and Embera, which belong to the so-called Choco language group, which has only recently been classified as an independent linguistic family.

Waunméu is spoken by the Waunanas, who number around 4000 individuals in Colombia, along the lower San Juan River, in the south of the department of Choco, and no more than 2000 individuals who have immigrated to the Province of Darien, in Panama. Embera is spoken by the Indians who call themselves Emberas but who are known by different names in the literature because they constitute a much larger number of speakers – around 60 000 – divided in various dialects. The Emberas are dispersed throughout the western part of Colombia and even in the frontier zones of Panama and Ecuador, and some of these dialects have grown so far apart that they are now mutually unintelligible.

Of course, this is a timid sample of the much greater number of ethnic groups that inhabited the western part of Colombia when the Europeans arrived, among which we can recall the names of the Idabáez, Ingarás, Birus, Surrucos, Poromeas, and the present-day Kunas, Waunanas, Katíos, or Emberas. Some of the denominations applied to the Indians then generally known as ‘Choco’ or ‘Chocoos’ were the Andáguedas, Baudó, Chamís, Dabeibas, Dariens, Katíos, Noanamás, and Saijas. Nowadays it is known that these names are derived from the names of the regions inhabited by these groups, which generally took the name of the main river that crossed through their territory and, in the case of the name ‘Katío,’ to the fact that the Embera Indians eventually occupied the region of the Katío Indians, a brave warrior tribe that succumbed to the Spanish.

The Embera Indians occupy a much greater territory today than they did at the time of the arrival of the Europeans, but with a very atomized coverage, i.e., only in different and specific points of little extension. Mestizo settlers displaced them to these Indian reservations, called ‘Resguardos’ or ‘Cabildos,’ which were very effective in the colonial period in preventing the extinction of these peoples, by impeding their occupation by outsiders but obliging the Emberas to give up the extensive territories in which they had once freely roamed.

In this article we see the different dialects into which the Embera language is presently divided. These dialects are a product of the different regions in which the Embera Indians have settled since the arrival of the Spanish, in different latitudes of the continent but always limited to a fringe that extends from the western littoral: the Pacific coast of Colombia, from north to south, to the Cauca River, which separates the western and central cordilleras stretching from north to south along the country, together with the eastern cordillera, the final branches of which

disappear as they enter the Caribbean region of Colombia. Thus, the scenario that the Choco Indians occupy consists of the Pacific coast of Colombia, with its jungle plains; the Province of Darién, in Panama; and the spurs of the western cordillera and its terminal branches to the west of the Cauca River.

Retrospective of Linguistic Studies and Attempts to Classify the Emberas

The inclusion within a single linguistic family of the speech of the different Choco groups (the Waunana language and the different Embera dialects) that survived the Conquest and the colonial period is a recent fact. Their classification within any one of the great variety of American linguistic families is still open to discussion.

In the literature on the country's Indians, there is abundant documentation on population and migrations of the Choco, from chroniclers like Fray Pedro Simón, Bartolomé de Las Casas, Jorge Robledo, Juan de Castellanos, Pedro Cieza de León, to recent researchers like Henry Wassen, Katleen Romoli, Reina Torres de Arauz, Sven Isacson, Mauricio Pardo, and Patricia Vargas. The last two, who are Colombian authors, have advanced in research about the Emberas, having reviewed all previous studies. In his article 'Bibliografía sobre indígenas Choco' (1981), for example, Pardo did an excellent review of the ethnohistoric literature available to date, and in 'Regionalización de indígenas Choco' (1987), he updated the discussion of the ethnohistoric panorama. Vargas (1986), on the other hand, found that the incursion of the Emberas into the territories of the Katio Indians did not mean the total extinction of the latter, because the two peoples intermingled, which is why the present Emberas of the region present particular characteristics that could be assigned to the Katíos.

The term Choco was already used in the 17th century to designate the Emberas of the upper San Juan and Atrato rivers and the Waunanas of the lower San Juan River. The earliest report known about the Emberas is found in the diary of the missionary Father Joseph Palacios de la Vega, around 1787, in San Cipriano, on the San Jorge River. This linguistic material, consisting of 37 phrases and 107 morphemes, fundamentally corresponds to the speech of the present Emberas of the northeast (Reichel-Dolmatoff, 1955).

A series of vocabularies was later collected by travelers, mostly foreigners, in different Choco Indian localities (Mollien, 1824; Cullen, 1851; Seeman, 1851; Bastian, 1876; Greiffenstein, 1878; Collins, 1879; White, 1884; Peláez, 1885; Etienne, 1887; Simons, 1887; Pinart, 1887; Velásquez, 1916; Robledo, 1922). These materials fundamentally

served as the basis for analysis and classification until the middle of the 20th century.

But there have also been comparative studies since the 19th century: Bollaert (1860) proposed affinities between the Choco and Mesoamerican groups; Adam (1888) compared vocabularies obtained by Cullen, Seeman, and Uribe; Brinton (1891) observed the territorial extension of the speech of the Choco; Chamberlain (1907) determined that the geographical limits of the Choco were between 8 and 4 degrees northern latitude, between the Golfo de Urabá and the Golfo de San Miguel, and proposes Choco as an independent linguistic group; Lehmann (1910, 1920) suggested kinship with the Chibcha dialects of the Barbacoas and Talamanca groups; Loukotka (1968 [1942]) reaffirmed the separation of these languages as an independent linguistic family and recognized nine extant languages and five extinct languages; Rivet (1912, 1924, 1943) compared elements of the Choco vocabulary with 56 Caribe dialects, 34 Chibcha dialects, and 29 Arawak dialects and concluded that there was a strong Caribe influence and, to a much lesser degree, Chibcha and Arawak influence; Ortiz (1937, 1940, 1954, 1965), Mason (1950), Meillet and Cohen (1952), and Tovar (1961) followed Loukotka's regionalization and Rivet's affiliation.

The first attempts to classify the native languages of America were made in the second half of the 20th century. At the beginning of the 20th century, 19 independent language families were mentioned for the Pacific coast, including the Choco family (see, for example, the classifications of Alexander Chamberlain [1913] for the linguistic families of South America). Later researchers, such as Paul Rivet (1944), reduced this number and proposed the inclusion of the Choco family within other macro-families, like the Chibcha or the Caribe. At present, in light of recent linguistic explorations, the thesis of the independence of this family seems to be the most reliable, vindicating its defenders, among whom, in addition to Chamberlain, we can name Nordenskiöld (1928), Loukotka (1968 [1942]), Tovar and Larrucea (1984), and Pardo and Aguirre (1993).

The cultural unity and the common origin of the Choco Indians were the subject of controversy for a long time. Mason's classification (1950) (broadened with that of Greenberg, 1960), for example, divided the Choco languages into Empera, with 3 variants; Catio (Embera-Catio), with 14 variants; and Noanamá (with 1 variant). Loukotka (1968 [1942]) had already spoken of 9 extant and 5 extinct Choco languages, and later Loukotka and Rivet proposed 10 extant variants for the Choco group (which they call the Emperá division) and 2 extinct ones (see Ortiz, 1965: 197–200).

Jacob Loewen (1960) confirmed Erland Nordenskiöld's statement, testifying that linguistically only two languages (Waunana and Embera) – mutually unintelligible but nonetheless related – belonged within the Choco family, and proposed, with a phonological criterion, four large dialectal areas, one Waunana and three Embera, with lexical variations within the Embera areas.

Among the main bibliographical compilations on the Choco languages were those of Adam (1888), with 7 references; Lehmann (1920), with 30 references; Reichel-Dolmatoff (1945), with 38 references; Ortiz (1954), with 60 references; Loewen (1963), with 191 references, which were not only linguistic but historical as well; Ortega (1978), with 67 references; and Pardo (1981), with 72 references, and (1986), a survey of everything written on the subject to date, with 135 references, including everything from academic studies to simple lists of words.

There have been grammatical studies of the Embera language since 1881, when José Vicente Uribe published a brief article in which he presented the different types of Embera words in a general way. In 1936, Fray Pablo del Santísimo Sacramento published a grammatical essay on the speech of the Embera-Catíos of the Apostolic Prefecture of Urabá, as well as a classification of Embera, in which he dedicated a small portion to the syntax of the language. In 1918, an anonymous Catío-Spanish catechism appeared for missionaries of Antioquia. There is also an undated Catía grammar by María Betania (quoted in Pinto, 1974), and the Claretian priest Constancio Pinto published a Catío-Español dictionary (1950), as well as another extensive dictionary with grammar (1974).

Scientific studies based on fieldwork began with the research of Jacob Loewen, an American Mennonite missionary who did a study for a master's degree (1954) among the Waunana Indians of the lower San Juan River, and a doctoral thesis (1958) on the speech of the Emberas of the Sambú River, in the province of Darién in Panama. Loewen also wrote numerous articles on Embera phonology and dialectology, on comments on traditional stories, on loans from Spanish, on problems of bilingual literacy programs, and on basic readers in Indian languages.

Jean Caudmont (1955) elaborated notes on phonological and grammatical generalities through the use of field notes of Reichel-Dolmatoff (1945), taken 10 years earlier among the Embera group in Riofrío in the department of Valle, who had emigrated from the region of the Chamí. The Claretian missionary Constancio Pinto, who lived with the Emberas of the region of the Chamí (headwaters of the San Juan River) for more than 40 years, published a dictionary (1950) of the Embera language, as well as a book with a much more extensive vocabulary and with a

section on grammar (1974). Despite their having been based on methodical fieldwork, these studies suffered from the fact that they had been transcribed using Spanish-language phonetics and indistinctly presented, especially in the work of Pinto, words from zones like the Chamí, the Andágueda, the Sinú, and the Atrato, without taking the dialectal variations into account. With more linguistic precision, the Swedish researcher Nils Holmer (1963), in one of the publications of the Gutemberg Ethnographic Museum, occupied himself extensively with phonological and morphological aspects of Waunana.

The Summer Institute of Linguistics (SIL), which arrived in the country in 1962, carried out linguistic studies in distinct zones inhabited by Embera Indians. Francés Gralow (1976) elaborated a phonological description for the Chamí zone. In the 1970s, Eileen Rex and Mareike Schotlenndreyer traveled throughout the municipalities of Dabeiba, Frontino, and Chigorodó, in the department of Antioquia, and the upper Sinú, in the department of Córdoba, and published a phonology (1973) of the speech of the Emberas of the upper Sinú and northwestern Antioquia. Schotlenndreyer developed a literacy primer for the zone of Chigorodó (1973) and a structural analysis of her and Rex's stories (1977). Eileen Rex wrote her master's thesis on the Catía grammar (1975). Phillip Harms developed basic readers on the Embera language and tales and stories in the company of the natives from 1981 to 1985, for the Emberas of the Saija River on the coast of the department of Cauca, to the south of the department of Choco, and carried out a phonological description with Judy Powell (1984) and a grammatical study of the speech of these Emberas (Harms, 1987). Powell also mimeographed some Embera stories and biblical passages. David Stansell, who lived for more than 10 years among the Emberas of the Bojayá River in the department of Choco, wrote about them in *Aspectos de la cultura material de grupos étnicos de Colombia* (1973). Michael and Nellis (1984) produced primers in Chamí for the Emberas of the Valle de Garrapatas in the department of Valle del Cauca.

Gordon Horton worked with the Emberas of the upper Sinú in the 1960s and 1970s, mainly on the morphology of the language, and developed a series of primers and other didactic materials. Miguel Loboguerrero carried out a linguistic study (1976) on the dialect of the Chamí region; his resulting work included a phonological description, a grammatical description, and a corresponding lexicon. Nelly Mercedes Prado did an analysis of the 'Epera' variant ('Embera,' according to the phonology of this dialect) of the Saija River (1982) as her master's thesis, the presentation of which included phonology, morphology, and

an appendix titled 'Un estudio inicial,' along with a lexicon of 845 items, each with its respective phonetic transcription. She continued her work with the publication of didactic materials (1985), further explored aspects of the language, such as nasality (1991), and later worked in ethnolinguistic conflicts between blacks and Indians (1992) within the broadest project, known as 'Cada río tiene su decir.'

Many missionaries working in Embera territories have concerned themselves with the language. One primer on the language of the Emberas of the upper San Juan, with an alphabet, was developed by G. Manzini (1973); another primer, on the Katía variety, was designed by Martínez and Guisao (1980). There are a catechism in the Baudó dialect (1981) and a primer by Livia Correa (1982), as well as one, by María L. Picón (1985), on the Itsmina region.

For the Waunanas, in addition to Holmer's studies, there was a phonological and grammatical study done by the Sacred Heart missionaries Sánchez and Castro (1977), with the advice of Reinaldo Binder of the SIL, and a monograph by Luz Lotero (1972).

The Embera Waunana Regional Organization (OREWA) of Choco wrote a manual for indigenous teachers (1987), within the framework of its newly initiated ethnoeducation program.

Mauricio Pardo has done phonological and grammatical descriptions of the Embera language in north-western Antioquia and the zone of the upper Baudó River in the department of Choco. With his participation in workshops with teachers from Baudó and in 1983 in northeastern Antioquia, an era of studies began that committed both Indians and researchers to a common cause in the application of the results of linguistic studies. In 1986, Pardo proposed, together with the author of this article, a revision of the Choco dialectology established by Loewen, 1963 (see next section of this article), and has done an extensive compilation of the publication of linguistic data on this language up to 1986. This author has also concerned himself with the elaboration of language primers and sociolinguistic aspects of the ethnic group.

Present Regionalization of the Embera Indians

The first Indians denominated 'Chocos' by the Spanish were the Emberas of the upper San Juan River, who were then known as the Simas or the Tatamá. These Indians today call themselves Chamí. This denomination would later be applied to all indigenous groups of the upper Atrato River, in the department of Choco, then known as 'Citará' or 'Citarambirá,' and to the Indians of the middle and lower San Juan, respectively called 'Poya' and 'Noanama' in

Drawn by M Pardo

● Choco denominations in the time of the Conquest

- A: Noanama (Lower San Juan)
- B: Cirambirá, Poya (Mid San Juan)
- C: Tatama, Sima (Upper San Juan)
- D: Citara (Upper Atrato)
- E: Eastern tributaries of the Atrato River

---->: Post-Colombian Migrations

Mistrató and Pueblorico, on the border with Choco. They have moved northward and southward along the cordillera to places like the upper Andágueda River, in southeastern Choco, to the southwestern

part of the department of Antioquia in the municipalities of Jardín, Valparaíso, and Bolívar, and to the northern part of the department of the Valle del Cauca along the Garrapatas and Sanguiniñí rivers. Small groups are also located in other parts of Antioquia and Valle and have even moved down into the departments of Caquetá and Putumayo.

Those who were called Citarás or Citarambirás during colonial times – then located along the upper Atrato River, on the Capá River, in Lloró, and along the lower Andágueda River – have moved northward along the river to the upper Baudó River, toward the coastal tributaries to the north of Cabo Corrientes and the Panamanian portion of Darién. These river-dwelling Indians are known as 'Cholos' on the Pacific coast of Colombia.

Because these people form a distinct dialectal zone and because they are generally considered a mountain group, researchers believe the Indians who presently occupy territories in northeastern Antioquia – in Dabeiba, Frontino, Ituango, Murrí, among other places, and in the department of Córdoba, in the upper Sinú, San Jorge River, Rioverde, etc. – must descend from Emberas who, after the Conquest, settled along the eastern tributaries of the middle course of the Atrato River, a group different from the Citarás. These Indians are erroneously known as 'Katíos,' but colonial documents imply that the real Katíos succumbed toward the end of the 17th century, after a terrible struggle with the Spanish. Vargas (1990) postulated, based on archival documents, that many Katíos united both in alliance and in war with the Emberas.

The Indians encountered by the Spanish in the middle San Juan River, whom the Spanish called 'Poyá,' are believed to be the ancestors of the present dwellers of middle Baudó River, in the affluents Catrú, Dubasa, and surroundings. The Poyá presented a dialectal difference with the ones from the upper Baudó River. These people called themselves Emberas to differentiate themselves from the mountain people, who were called Katíos.

The Indians presently located to the south of Buenaventura also descended from the Poyás, whose main settlements are along the Saija River (department of Cauca), and the Satinga and Saquianga rivers (department of Nariño) (Pardo, 1987). They call themselves 'Eperas,' in accordance with the phonology of their dialect.

In the department of Caldas, there are settlements of Embera Indians, known to the rest of the population as 'Memes.' They live in municipalities such as Belalcázar, Vitervo, and Riosucio, in places like La Betulia, La Tesalia, and the Indian reservations of San Lorenzo and Nuestra Señora de la Montaña. Some are Indian reservations with reserved territory, while

others such as Cañamomo and Lomapieta are in the process of becoming reservations (these are called ‘partialities’). In addition to the problem of vindicating their own identity as a separate ethnic group, they have encountered major difficulties for having lost their native tongue, but nonetheless they are at present actively committed to carrying out programs to recover their language with the help of native speakers from other regions.

The Emberas who settled along the lower San Juan River and its tributaries, along the Juradó, Jampavadó, Docampadó, and Siguirisúa in southern Choco, and along the San Juan de Micay River in Cauca were called ‘Nonamá’ or ‘Noanamá’ ever since the invasion, but they call themselves ‘Waunana’ or ‘Waunán.’ Over the course of a century they have migrated to the province of Darién in Panama, where 2000 now reside, and to the Chintadó River along the lower Atrato, where there are several hundred who migrated some 20 years ago. There are estimated to be about 4000 native speakers of Waunana in Colombia. Like the Emberas, they are known as ‘Cholos.’ The Waunanas and the Emberas are the only two ethnic groups that can clearly be identified as presently forming part of the Choco family.

In 1988, the author of this article, together with the anthropologist/researcher Mauricio Pardo, presented a proposal for the regional classification of the Choco Indians – a revision of that proposed by J. Loewen – based on the different dialects encountered during fieldwork in the different zones with Choco Indians

in Colombia. Some samples to support this proposal are presented below. These are taken from personal fieldwork notes and first appeared in an article entitled ‘Dialectología Choco’ in the memoirs of the seminar-workshop ‘Estado actual de la clasificación de la lenguas indígenas de Colombia,’ held in February 1988 at the Instituto Caro y Cuervo in Bogota (Pardo and Aguirre, 1993) (see Figure 3).

To begin, a diagram showing the present linguistic variations and the local denominations is presented (Figure 3). The proposal of Jacob Loewen is then presented (Table 1), followed by the Pardo-Aguirre proposal (Table 2). After that, the zones and specific places identified by Pardo and Aguirre are presented in detail (Table 3), along with a global diagram of said zones (Figure 4). Finally, phonological and grammatical comparisons of the Waunana language and the different dialects proposed for the Embera language (as well as among the latter) are shown (Tables 4–6).

Present State of Studies on the Embera Language

Colombia, together with the other Latin-American countries, with all the richness that multiculturalism and plurilinguism represent, only in recent times has given attention to its aboriginal languages. There is not still an official position on the defense of these languages and their speakers, who are not extinct, thanks to their proper fight and the support of a sector of the civil population. Just during the

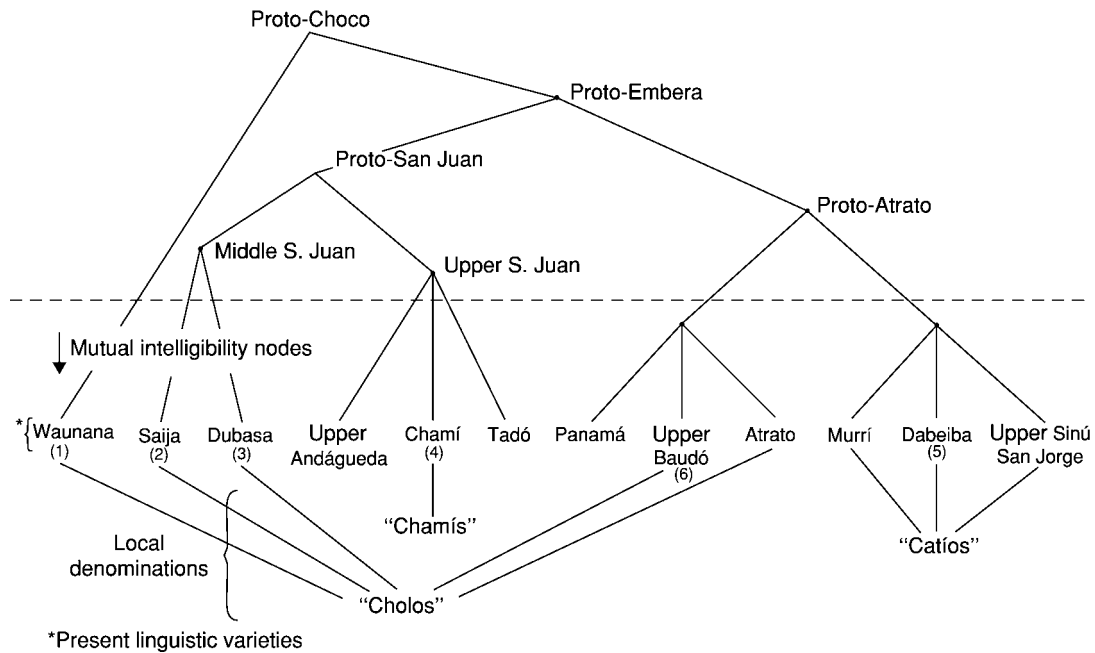

Figure 3 Phylogenetic tree of the Choco linguistic varieties (local denominations).

Note: As can be seen, Loewen proposed 4 phonological systems and dialect subdivisions at the lexical level within them. Nonetheless, the recent data show that at least 6 different systems can be identified: 1 for Waunana and 5 for the different Embera dialects.

^dData from Aguirre (1995a)

last 20 years of the 20th century were the Indian and Afro-Colombian languages, still alive in the national panorama, taken seriously by academia.

In 1984, the Anthropology Department of Andes University instituted a Masters in ethnolinguistics, with the sponsorship of the Centre Nationale de la Recherche Scientifique (CNRS) of France. In the program, researchers are prepared for the study of

the native and Afro-Colombian languages, their eventual goals being publication, conservation, and strengthening of these languages. The program's students and professors constitute the Centro Colombiano de Estudios de Lenguas Aborígenes (CCELA), through which they do the scientific work of the rescue and fortification of these languages. With these linguist students, a new era in the research and

Note: According to this scheme, at the strictly phonological level, Saija and Waunana have identical systems, even though they are very different at the lexical level.

promotion of the aboriginal and creole languages of the country has begun, with them covering the entire national territory, doing fieldwork and linguistic data analysis *in situ*. This has yielded an awakening of these communities for the rest of Colombian population and even for themselves.

Several students from the program have done research on the Embera language:

Rito Llerena Villalobos. He was a student from the first promotion, having finished the program in 1987. He is now a professor at Universidad de Antioquia, in the Department of Linguistics. From 1989 to 1992, he worked on compared phonology of the Amerindian languages of Antioquia, including the Tule language (of the Cuna Indians), subject of his degree thesis (1987). This researcher has worked lately on the Embera language, creating didactic materials for the Indian teachers of Alto Andágueda, phonological and morphological research in the Embera Reservation of Jaidukamá, department of Antioquia, and collaborating in ethnoeducation among the Emberas of Tierralta, upper Sinú River, in the department of Córdoba, where he is working at present. In the year 2000 he wrote a report on the grammar and phonology of the Tule language for the Instituto Caro y Cuervo.

Mario Hoyos Benites. He, too, was a student from the program's first promotion and finished in 1987. At present he is a professor at the Universidad de la Guajira. He worked in 1984 in the Napipí and middle Atrato rivers and other places in the region. His research has addressed everything from the design of didactic material for Indian teachers around all the country (1991) to interdialectal phonology. He presented a report on the Embera language for the Atlas Etnolingüístico de Colombia of the Instituto Caro y

Cuervo in 1997, and wrote a report (2000) on the Embera language of the Napipí River for the institute.

Ernesto Llerena García. He completed the program in 2001, with a dissertation titled 'La predicación de la oración simple en la lengua embera del Alto Sinú' (simple sentence predication of the Embera of Atto Sinú). He has been profesor of linguistics at the Antioquia and Córdoba universities, where is working at the moment. With his father, Rito Llerena, and the Emberas of upper Sinú River, he wrote *Diccionario etnolingüístico de la lengua Embera* (2003) for the Normal Superior de Montería (capital of the department of Córdoba).

Daniel Aguirre Licht. A student from the second promotion, he finished up in 1989. In 1985, he began phonological studies of Chamí, southeast of the department of Antioquia. He continued with morphological studies in 1987, and then morphophonological and grammarians in 1998. In 1988, he collaborated with the anthropologist Mauricio Pardo in research on Choco dialectology; included in the resulting article (Pardo and Aguirre, 1993) was an answer to Paul Rivet's hypothesis about the origin Karib of the Choco languages. Aguirre Licht also worked in the department of Risaralda, the location of the Indian reservation Embera-Chamí of Purembará (from *puru* = 'town' and *embera*), a possible place of the dispersion of the different Embera groups at the Spanish arrival, and he has also worked with the Emberas of Garrapatás Valley, in the department of Valle del Cauca.

About the Waunana there are also the works of Gustavo Mejía (1987), another student from the first promotion of the master's in ethnolinguistics of the Universidad de los Andes. He did a grammarian investigation in 1987 as his thesis. He also did, for the

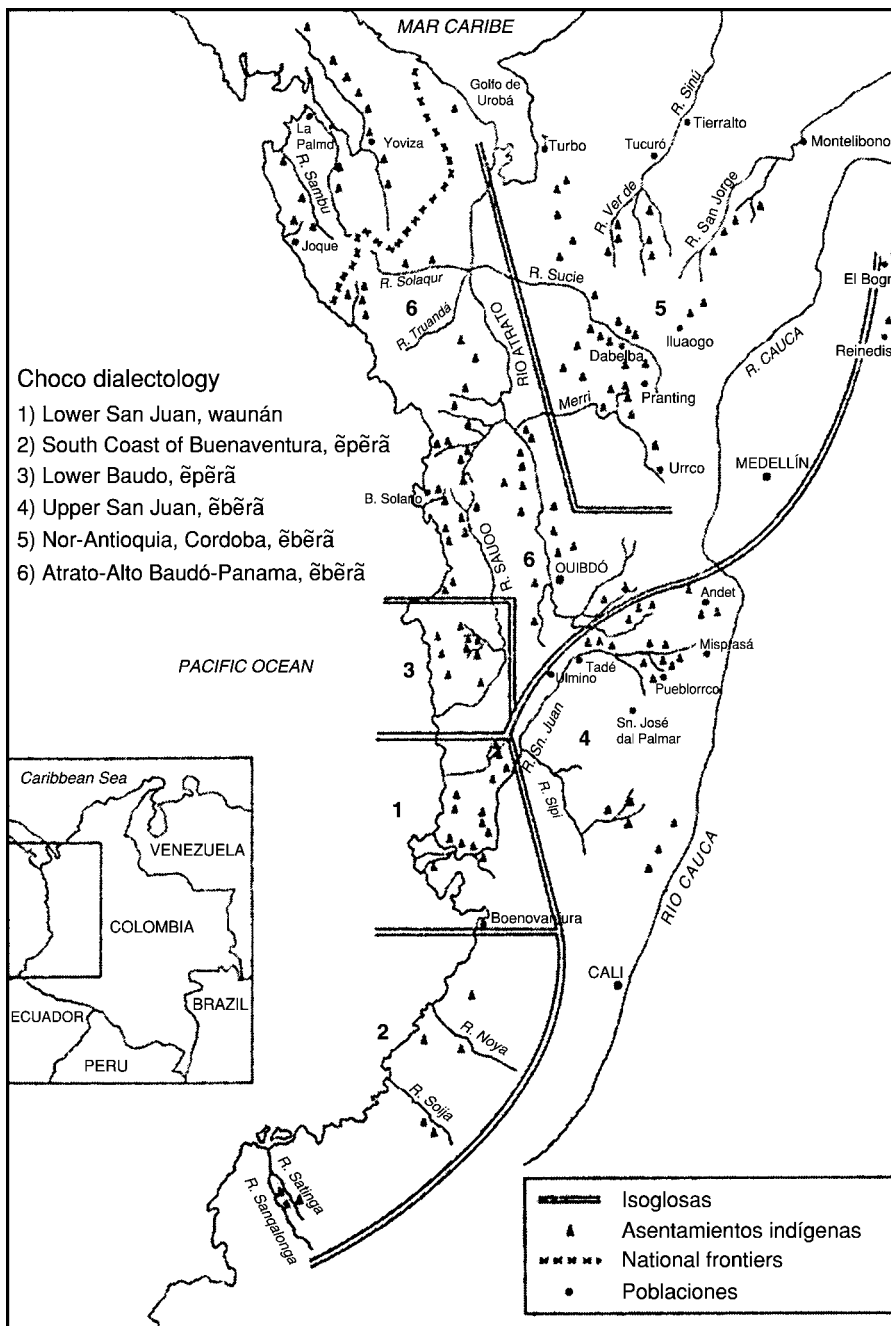

Figure 4 Choco dialectology.

Instituto Caro y Cuervo, a phonological and morpho-syntactic description of Waunana (2000b) and a presentation of the aboriginal languages of the Pacific coast of Colombia (2000a).

Edel Rasmussen, who worked at the Universidad Nacional de Panamá, studied the Embera language of the Panama area and published research on phonology (1986) and on grammar (1985).

The Technological University of Pereira (UTP), located in the capital of the department of Risaralda, has paid attention to the great number of the Embera-Chamí Indians who live in the department, both in

studies of their language and in projects on other matters. Fernando Romero L. of the Psycho-Pedagogy Department in the School of Education does research on linguistic and pedagogical problems of the teaching of Spanish as a second language with bilingual Chamí and Nasa (Páez) teachers, as well as on discourse analysis of this variety of the Embera language, including studies in which the author of this article has participated. Linguist Olga L. Bedoya works with him, and as Director of the Ethnoeducation and Community Development Program in the same school she does research on the interference of

Notes: Details regarding the zones and specific places of the Choco proposed by Pardo and Aguirre. **Waunana:** lower San Juan River, Docampadó, coastal rivers, Juradó, Panama, Chintadó. **South Coast:** Saija, Satinga, Saquianga, Naya, Cajambre, south of Buenaventura. **Lower Baudó:** Catrú, Dubasa, coastal rivers, Purricha, Pavaja. **Upper San Juan:** Chamí, Tadó, upper Andágueda River, southwest of Antioquia Department, Garrapatos River (north of Valle Department). **Antioquia/Córdoba:** Dabeiba, Murri, Riosucio, upper Sinú and San Jorge Rivers. **Atrato:** upper Atrato River, Capá, Bojayá, upper Baudó River, Panamá. Actually, the difference among the diverse phonological inventories is in the plosive systems and the voicing of the sibilant /s/ and the palatal affricate. Hence, the global scheme outlined in **Table 3** can be suggested.

Table 5 Grammatical similarities and differences

| | <i>Waunana</i> | <i>South Coast</i> | <i>Upper San Juan</i> | <i>Antioquia Córdoba</i> | <i>Atrato Panamá</i> |
|-----------------------------------|--------------------|--------------------|-----------------------|--------------------------|----------------------|
| Ergative/Instrumental/Attributive | a/au/iu | a/pa | a/ba | a/ba ± ra | a/ba |
| Intransitive/Accusative | ø/ta | ø/ta | ø/ra | ø/ra/a | ø/ra/da |
| Previous Reference | ø | ø | ra | ra | ra |
| Dative | ik | ma/ja/a | a | a | a |
| Benefactive | it ^h ee | it ^h e | ita | ita | ita |
| Sociative | dui | ome | ome | umẽ | ume |
| Situative | e | de | ɖe | ðe | ɖe |
| Alative | g | ma | m/ɖa | eɖa | ɖa |
| Ablative | mu | depa | ɖeba | ðeba | ɖeba |

Table 6 Basic sentence order

| | S | O | V |
|----------------------|--------------------------|---------------------------------|--------------------------------|
| 1. Waunana | saak-iu perro- erg | berúć tatabro | k ^h aahim mordió |
| 2. South Coast | usa-pa perro-erg | et ^h érre gallina | peehí mató |
| 4. Upper San Juan | ũērā-ba mujer-erg | mũ-buda mi pelo | kōsí cortó |
| 5. Antioquia/Córdoba | ũērā-ba mujer-erg | ũāũā-ra niño-ac | ubeasia pegó |
| 6. Atrato/Panamá | hāībana-ba chamán-erg | kauzake-da niñita-ac | uratusía frotó |

Common characteristics: 1. Predominant suffixing. 2. Occasional prefixing: integration in nominals, some verbal aspectualizing. 3. Variants of: number, gender, affection, position, permanence in the auxiliary. 4. Tactical order variation for focalization. 5. Verbalized lexical determination (adjectival verbs). 6. Actancy, opposition: agent, attributive, instrumental versus intransitive subject, accusative. 7. Great variation in prenominal suffixing. 8. Basic S O V order.

Spanish in different Embera dialects, problems of orality versus writing, and other aspects of Embera language and culture.

Chorasmian

P O Skjærvø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Chorasmian was an Iranian language spoken in medieval Chorasmia, a state on the Oxus/Amu Darja south of the Aral Sea. The name is first mentioned in the Avesta and the Achaemenid inscriptions (see *Avestan; Persian, Old*) but the language is known only from much later times. Several words pertaining to the calendar and astronomy were cited by Abu Rayhan Biruni in his *Athar al-baqiya* (comp. 1000). Since then archeological excavations have uncovered inscriptions and documents on parchment and wood from ca. 200–700 A.D.; also, a number of manuscripts of Arabic works containing interlinear glosses in Chorasmian have been found in libraries in Turkey, notably Abu'l-Qasim Zamakhshari's *Muqaddimat al-adab* (ms. from ca. 1200) and several 13th-century Arabic law books. The Chorasmian glosses are written in Arabic script, with several modified letters. Those in the *Muqaddima* are often underpointed or not pointed at all, which makes them hard to interpret.

Some Arabo-Persian letters were modified to express special Chorasmian sounds. Triple superscript dots over $c = ts$ and dz , over $f = \beta$. Triple subscript dots were used under s to indicate s , not \check{s} , and single subscript dot under d to indicate d , not δ .

Chorasmian historical phonology is characterized by extensive affrication of dentals, palatalization, and

a variety of, often unpredictable, simplifications of consonant groups. For instance, t and $d > c$ [ts] and j [dz] before and after i , y : $pc < pati-$ (preverb) and $*pitā$ 'father'; pzy 'sinew', cf. Av. *paidiia-*. Intervocalic \check{s} developed variously: $'mh$ 'ewe', cf. Av. *maēši-*; *mwf* 'mouse', cf. Av. *mūš*; γwx 'ear', cf. MPers. *gōš*; etc.

The Chorasmian vowel system is characterized by the reappearance (in the script) of final vowels before suffixes, $pc = pic^a$ 'father', but $pcm = picā-m^i$ 'my father'. Contraction of final vowels with vowels of suffixes is common, e.g., *hāβⁱr-īn^a* 'give.IMPERF-1ST.SING' = 'I gave', but *hāβⁱr-īn^a-hⁱ-dⁱ* 'give.IMPERF-1ST.SING-he/she/it. ENCL.OBL-YOU.ENCL.OBL' = 'I gave her to you' > *hāβⁱr-nā-hī-dⁱ* > *hāβⁱr-n-ī-dⁱ*. Such final vowels are sometimes indicated by the Arabic vowel marks.

Masculine and feminine gender are distinguished in the definite article (\check{i} , ya ; \check{i} , \check{a} after prepositions) and in declension (nom. sing. masc. no ending, but fem. $-a$). Five cases are distinguished in masculine nouns: nominative-accusative, vocative ($-a$), possessive ($-ān$), dative ($-i$), and ablative-locative ($-a$), but feminine nouns have only two forms: nominative and locative ($-a$) contrasting with the other cases ($-iya$). The plural endings are $-i$ or $-ina$, possessive $-in-ān$. A final $-k$ becomes $-c$ before $-i$. The direct object can be marked by $-dār$ attached to the dative (presumably < $*rād$, cf. Pers. $-rā$). Examples: \check{i} *kām-hⁱ* 'DEF mouth.MASC-he. ENCL.OBL' 'his mouth'; $f-\check{i}$ *kāmā-hⁱ* 'in DEF mouth'; $yā$ *camā-hⁱ* 'DEF eye.FEM-he.ENCL.OBL'; $yā$ *cam-yā-hⁱ* *dār* 'DEF eye.FEM-DAT-he.ENCL.OBL' = 'his eye' (DO); \check{i} *bandik* 'the servant', \check{i} *bandic-ⁱ* 'the servants', $f-\check{i}$ *bandic-ī-hⁱ* 'with-DEF servant-PL-he.ENCL.OBL' = 'with

his servants'; *ī bfin-ēnik ī βūm-in-ān* 'DEF create.AGT DEF earth-PL-POSS' = 'the creator of the earths'.

When several enclitic personal and local pronouns are added to a verb, the order is strict, e.g., *γēr-īdā-hī-nā-bir* 'turn-IMPERF.3RD.SING-he.ENCL.OBL-they.ENCL.OBL-upon' = 'he made them go around him', where *-bir* goes not with the preceding *-nā-*, but with *-hī-*. When personal and local complements follow the verb, they must be anticipated as enclitics, e.g., *m-uxwās-idā-nā-w^a f-ī razik-^a ī cūb* 'IMPERF-let-PAST.3RD.SING-they.ENCL.OBL-there in-DEF-vineyard-LOC DEF-water.PL' = 'he let the water into the vineyard'; *hīδ-idā-hī-nā-dā-bir ī salām* 'read.IMPERF.3RD.SING-it.ENCL.OBL-they.ENCL.OBL-there-on DEF-greeting.PL' = 'he recited the greetings upon him'.

The verbal system is of the Eastern Middle Iranian type. There are three stems: present, past, and perfect (perfect participle = past stem + suffix *-ik*, FEM *-ic^a*). There are numerous modal forms (indicative, imperative, subjunctive, optative, injunctive); an imperfect formed with prefixes (*m-ikk-* 'did') or lengthening of the vowel of the first syllable (*h-ā-βir-* 'gave'), both reflexes of the Old Iranian augment; a form ending in *-i(n)* added to personal endings, the function of which is not completely clear but which is referred

to as 'permansive'; a (present) perfect formed with the perfect participle and the verb *δār-* (transitive verbs) or 'be' (intransitive verbs), e.g., *akt-ik δāriy-ā-yī* 'do.PERF.PART.MASC have.PRES-1ST.SING-PERMAN SIVE' = 'I may have done'; *purāc^a-ihi* [*<purād-c-*] > *purācīhi* 'divorce.PERF.PART.FEM-be.PRES.2ND.SING' = 'you are divorced'.

Chukotko-Kamchatkan Languages

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

Chukotko-Kamchatkan

Chukotko-Kamchatkan, formerly also known as Luor[a]vetlan, is a small family of languages spoken in extreme northeastern Siberia on the Chukotka Peninsula, opposite Alaska and the large Kamchatka Peninsula in far Eastern Siberia. The family consists of four remaining languages, Alutor, Chukchi, Itelmen, and Koryak. All of the languages in the group, excluding Chukchi, are endangered; Kerek became extinct in the 1990s.

Alutor (*Ethnologue* code ALR), also known as Alyutor or Palana Koryak, is spoken by some 200 people in the villages of Vyvenka and Rekinniki in the Koryak National District, in the northeast Kamchatka Peninsula. Chukchi (*Ethnologue* code CKT) is spoken by some 10 000 people, primarily on the Chukchi Peninsula of northeastern Siberia. In English language literature, especially older works,

the language is sometimes spelled Chukchee as well. Several local variants exist, but differences are relatively minor. More celebrated were the once active phonological differences in men's and women's speech, seen in the following word pair: (men) *reqər-kən* = (women) *tzeqətzən* 'what is s/he making/doing?' (Kämpfe and Volodin, 1995: 8). Itelmen (*Ethnologue* code ITL) is also known as Kamchadal. Itelmen is currently moribund, with fewer than 100 speakers. Itelmen speakers are found primarily in the Tigil region, in Kovran, and in the Upper Khairiuzovo villages on the Kamchatka Peninsula. There were originally at least three Itelmen languages, two gradually giving way to Russian over the past two centuries, and they are now extinct. Only the Western dialect remains; it is sometimes divided into separate Kovran and Sedanka varieties. Kerek (*Ethnologue* code KRK) became extinct in the late 1990s. It was closely related to Koryak (*Ethnologue* code KPY); Koryak has some 3500 speakers scattered across the Koryak National Okrug, on the northern half of Kamchatka. An alternate name is Nymylan. There are several divergent varieties, some now

considered separate languages (Alutor). Dialects include Chavchoven, Apukin, and Kamen.

Itelmen stands in isolation from the northern languages genetically, with the speech representing a southern branch. It is sometimes debated whether Itelmen is related at all to Northern Chukotko-Kamchatkan, and it is indeed different in numerous ways, but these are attributable rather to different substrate populations and various locally defined internal developments within Northern and Southern Chukotko-Kamchatkan, and their ultimate genetic unity seems clear. The northern branch in many interpretations has further subgroups of Alutor and Koryak (and Kerek), in opposition to Chukchi.

Along the coasts, Chukchi people live as sea mammal hunters, like the local Yup'ik populations, but they live as reindeer herders in the interior. Approximately three-quarters of the Chukchi live as reindeer herders. Northern Kamchatkan groups mainly practice reindeer-oriented economies and fishing and sea mammal hunting along the coasts. The Itelmen live primarily as subsistence fishers.

Chukotko-Kamchankan languages in general, but the northern ones in particular, are characterized by a range of features that set them apart from many indigenous Siberian languages, but also reflect a number of areally common features. First, many words in Chukotko-Kamchatkan languages are very long (e.g., Chukchi *ga-npənačg-ərgəna-qora-ma* 'with the old men's reindeers' (Skorik, 1986: 107)), and initial *ŋ*-is common (as is typical of northern and eastern Siberian languages (Anderson, 2003). Clusters of stop + *ŋ* are also found. Example (1) is from Skorik (1986: 79, 85) (cf. Itelmen *ŋosx* 'tail' and *ŋeyŋe* 'mountain' (Volodin, 1976: 31)):

| | | | | | |
|-----|---------|--------|--------|---------|--------------|
| (1) | Chukchi | Koryak | Alutor | Kerek | gloss |
| | ŋoyŋəŋ | ŋoyŋəŋ | ŋoyŋəŋ | ŋuyŋəŋ | 'tail' |
| | ŋəron- | ŋəyon- | ŋərun- | nəyuyq- | '3 together' |
| | laŋ-o | laŋ | laŋ | laŋu | |

Compare Kerek *tŋivek* 'to send' (Skorik, 1986: 89) with Itelmen *pŋilpnəl* 'root' (Skorik, 1986: 78)). Itelmen shows an unusual tolerance to consonant clusters word-initially, as well as ejective consonants that the northern languages do not share. Thus, words such as *klfknan* 'it fell out' and *kstk'ɬknan* 'he jumped' may be found in Itelmen.

Northern Chukotko-Kamchatkan languages stand out for their areally atypical system of vowel harmony. Vowels belong to one of two harmonic classes, strong/dominant and weak/recessive. A strong vowel triggers strong allophones throughout the word, and therefore a vowel in an affix may trigger alternation in stem vowels, as shown in Example (2) for Koryak:

| | | | | |
|-----|--------|------------|----------|-------------|
| (2) | weyem | 'river' > | wayaməŋ | 'river-DAT' |
| | mil'ut | 'hare' > | mel'otaŋ | 'hare-DAT' |
| | eŋpič | 'father' > | aŋpeče- | 'father- |
| | | | na-naŋ | AUGM-DAT' |

Note: *geyqə-miml-e* 'with water' vs. *gawən-meml-əma* 'with water' (Zhukova, 1972: 111–112; 120).

Among the most characteristic features of Chukotko-Kamchatkan morphology is the frequent use of circumfixes (combined prefix + suffix combinations) to encode a variety of inflectional categories, both nominal and verbal, some of which appear to be very old in the family. In Koryak, this is realized as *ga-čol'-ma* 'with salt' (Zhukova, 1972: 120), and in Chukchi it is *ga-npənačg-ərgəna-qora-ma* 'with the old men's reindeers' (Skorik, 1986: 107). In Koryak, *y(A)-...-ŋ* (Zhukova, 1972: 202):

| | | |
|-----|-----------------------|-----------------------|
| (3) | y-ačəgaŋ-ŋ-ək | ye-lqəŋ-ŋ-ək |
| | DESID-laugh-DESID-INF | DESID-leave-DESID-INF |
| | 'want to laugh' | 'want to leave' |

In Chukchi, *re-...-ŋ* (Kämpfe and Volodin, 1995: 88):

| | | | |
|-----|--------------|---|---------------------|
| (4) | vinretə-rkən | > | re-vinretə-ŋə-rkən |
| | help-IMPERF. | | DESID-help- |
| | REALIS | | DESID-IMPERF-REALIS |
| | 'he helps' | | 'he wants to help' |

Among the wider relationships that have been proposed for Chukotko-Kamchatkan languages, none widely accepted by specialists, are connections with Uralic, Eskimo-Aleut, and 'Eurasian,' among others.

Church Slavonic

C M MacRobert, Oxford University, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Church Slavonic is a generic term for the closely related, highly conservative varieties of Slavic language used for liturgical purposes by the Eastern Orthodox Slavs (Belorussian, Bulgarian, Macedonian, Russian, Serbian, Ukrainian) and the Ukrainian Uniates, and also by the Romanians until the 16th century and, until the introduction of services in the vernacular, the Roman Catholic Croats of the Slavonic rite. In the medieval period, Church Slavonic

also had the wider functions of a literary language among most of these peoples.

Church Slavonic originated in the translations of Scripture and liturgy made mainly from Greek by SS Cyril and Methodius and their associates in the late 9th and early 10th centuries (see **Old Church Slavonic**). The basic vocabulary, grammatical forms, and pronunciation of these texts predominantly followed the usage of Slavs in the southeast Balkans, while syntax and word-formation were to a large extent modeled on Greek.

Two developments signal the transition, by the end of the 11th century, from Old Church Slavonic to Church Slavonic. One was the emergence of local

varieties, such as Croatian, Russian, and Serbian Church Slavonic, which compromised between traditional pronunciation and grammatical forms and the vernacular usage of the area. Initially unsystematic, these modified varieties rapidly stabilized to local norms that in the hands of competent scribes attained a high degree of regularity. The other development consisted in revisions of syntax and vocabulary, which seem to have been motivated partly by the desire to eliminate outdated or unfamiliar linguistic material, but also aimed to make texts conform to a received Greek version and to produce more closely literal translations. The earliest systematic revisions are associated with Preslav, the capital of Bulgaria in the 10th century, when a number of early Church Slavonic revisions, new translations, and original compositions came into existence. There also appears to have been a revision of Croatian Church Slavonic texts on the basis of Latin sources in the 12th century.

Revisionist tendencies culminated by the 14th century in comprehensive reform of scriptural and liturgical translations into Bulgarian and Serbian Church Slavonic. This development has been associated with the Bulgarian patriarch Euthymius (elected patriarch in 1375; exiled by the Turks in 1393), though more recent research suggests it began in the early part of the century, perhaps on Mount Athos. The resulting standardized orthography, conservatism in grammatical forms and vocabulary, and highly literalistic translational practice were introduced among the East Slavs from the end of the 14th century, albeit with some adjustments to pre-existing local usage. The late 16th and early 17th centuries saw attempts in the Ukraine at systematic description of this late and composite type of Church Slavonic, on the model of Greek and Latin grammars; the most comprehensive of these, compiled by Meletij Smotryc'kyj in the early 17th century and subsequently modified to conform to Muscovite practice, remained the fullest description of Russian Church Slavonic until the 19th century.

Further revisions of Church Slavonic texts initiated in Muscovy or the Ukraine in the 16th and 17th centuries, though controversial in their time, dealt with minor textual discrepancies or the detail of grammatical and orthographical norms. A final standardization was effected in the publications approved by the Synod of the Russian Orthodox Church in the 18th century. Thanks to the dissemination of these printed books in the Balkans, the Orthodox Bulgarians, Macedonians, and Serbs came to use 'Synodal' Russian Church Slavonic, albeit with their own pronunciations.

Modern Church Slavonic does not stand in a simple genetic relationship to other Slavic languages. Its

texts may be understood in different ways and to varying degrees by Slavs of differing linguistic background and, as a result of literalistic translational practices aiming at morpheme for morpheme equivalence, some of them are intelligible only with the help of their Greek originals. It is virtually a closed system, for though new texts can be created if need arises, they are acceptable as Church Slavonic only insofar as they reproduce traditional constructions and phraseology. While its liturgical use still prevails in the Russian Orthodox Church, among the Orthodox South Slavs, Church Slavonic tends increasingly to be supplanted by modern vernacular translations, and survives mainly as a vehicle for the traditional corpus of hymns.

Chuvash

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Chuvash (*čävaš čělxi, čävašla*) is the only modern representative of the Oghur (or Bulgar) branch of the Turkic language family. It is spoken in the Volga-Ural region, partly in the Chuvash Republic (*Čävaš Respubliki*) at the ‘Great Bend’ of the Volga River. The Chuvash Republic (the capital is Cheboksary, *Šupaškar*) was established in 1990 within the Russian Federation; its forerunner was the Chuvash Autonomous Soviet Socialist Republic, created in 1925. The Chuvash have majority status in the Republic, forming nearly 70% of the population. Over three-fourths of the population regard Chuvash as their native language.

More than half of the speakers of Chuvash live outside the Republic, especially in the south and southwest parts of Tatarstan, in the central and west parts of the Bashkortostan, and in the Kuybyshev, Ulyanovsk, and Samar provinces. Speakers of Chuvash also live in other parts of Russia, in West and East Siberia, in the Far East, and in some Central Asian republics. The total number of Chuvash-speaking people is nearly 2 million. According to a law adopted in 1991, Chuvash and Russian are the official languages of the Republic. Russian is the medium of communication between nationalities and the main language of instruction. However, the efforts to maintain Chuvash are strong, even in the younger generation.

Origin and History

Parts of the old Oghur tribal confederation, originally based in the Baikal Lake region, moved west and arrived, in the mid-5th century, in the European steppe, where they established states on the Kuban, Danube, and Volga rivers. They mostly assimilated linguistically, a well-known example being the Slavicization of Bulgar groups in the Balkans. At the end of the 9th century or earlier, Oghur groups settled in the Volga-Kama region, where they established the Volga Bulgar kingdom, with its center on

the middle and lower course of the Volga River. They accepted Islam as early as 922. After the destruction of this state by the Mongols in the 13th century, the Volga Bulgars and other groups of the region became subject to the Golden Horde.

Early Oghur is unknown except for the evidence found in some proper names and old loanwords. Chuvash, which was recorded for the first time in the 18th century in word lists, texts, and one grammar, is considered closely related to Volga Bulgar and other old varieties of the Oghur type. Volga Bulgar is partly known from tombstone inscriptions found on the left bank of the Volga River, dating to the 13th and 14th centuries. Several linguistic features recorded in these epitaphs do not, however, fit very well with the known features of Chuvash. It is thus still not quite clear that Chuvash is a direct descendant of Volga Bulgar. It is also unknown whether the ancestors of the Chuvash took part in the written culture of the Bulgars. There are no Volga Bulgar epitaphs on the territory of the Chuvash Republic. The fact that Chuvash is one of the very few Turkic languages that is not strongly influenced by Islam may indicate that the ancestors of the Chuvash were not affected by the Volga Bulgar Islamic culture.

Related Languages and Language Contacts

Chuvash is the result of the oldest known split within the Turkic family. Its origins reside in the language of Oghur Turkic group. Chuvash has played a key role in comparative Turkic linguistics, especially in discussions about a possible genealogical relationship of Turkic, Mongolic, and Tungusic within an Altaic language family. According to an older view, Chuvash constitutes an independent Altaic language. The hypothesis of an Altaic protolanguage relies on reconstructions on the basis of words shared by Turkic, Mongolic, Tungusic, and sometimes other languages, such as Korean and Japanese. Deviant Chuvash consonant representations have been used to reconstruct a Proto-Altaic phonology.

Chuvash words with *r* and *l* sometimes correspond to Common Turkic words with *z* and *š* (e.g., Chuvash

čul ‘stone’ vs. Common Turkic *ta:š*). This is an archaic Oghur feature. Two Samoyed words that can be traced back to **yür* ‘hundred’ and **kil* ‘winter’ have obviously been copied from Oghur words containing the same final consonants. The corresponding Chuvash words are *šer* and *xěl*, whereas other Turkic languages display forms ending in *-z* and *-š*, respectively (e.g., Turkish *yüz*, *kış*). Chuvash words with *r* and *l* sometimes have Mongolic equivalents with *r* and *l* (e.g., *čul* ‘stone’ vs. *čilayun*). Cases such as these have been used to reconstruct the special Proto-Altaic elements *r*² and *l*², which are thought to be represented by *r* and *l* in Mongolic and Chuvash, whereas they have developed into *z* and *š* in Common Turkic. Scholars who do not accept the Altaic hypothesis explain these and other correspondences by contact relationship. In this case, the assumption is that an Oghur language of the Chuvash type, with certain features, was the source of the oldest layer of Turkic loanwords in Mongolic. Tungusic, in turn, is thought to have borrowed words with these features from Mongolic.

Complex processes of linguistic assimilation have taken place in the Volga-Kama region since the 10th century. The Bulgar influence on East Finnic, Slavic, and early Kipchak Turkic was considerable. Ancestors of the Chuvash assimilated speakers of Udmurt (Votyak) and Meadow Mari (Cheremis). The assimilation of local populations led to strong substrate influences, especially from Mari. The term ‘Chuvash,’ first documented in Russian chronicles of the 16th century, originally referred to groups that also included speakers of Mari. On the other hand, the designation ‘Cheremis’ was also applied to Chuvash. After the Mongol conquest, from the 14th century on, Kipchak-speaking newcomers played an important role in the area. Speakers of Volga Bulgar were linguistically influenced by them. Parts of them assimilated Volga Bulgars and other Oghur-speaking groups, which led to substratum influence. What is known as Chuvash today remained relatively uninfluenced by the Kipchak wave. In its more recent linguistic history, however, Chuvash has been closely connected with Kipchak Turkic through massive Tatar impact.

The Written Language

Standard Chuvash is written with a Cyrillic-based alphabet that includes a few special letters. It goes back to a script system established by Ivan Jakovlev (1848–1930), which mirrors the pronunciation of the Anatri dialect. The alphabet was reformed in 1938 and has remained unchanged since then. It basically represents phonemes, and few allophones.

Distinctive Features

Chuvash shares basic linguistic features with other Turkic languages, preserving numerous so-called Common Turkic traits. It exhibits most linguistic features typical of the Turkic family (see **Turkic Languages**). It is, for example, an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. On the other hand, it strongly deviates from Common Turkic in some respects, particularly in its phonology. In the following suffix notations, capital letters indicate phonetic variation (e.g., A = *ä/ě*). Hyphens are used to indicate morpheme boundaries.

Phonology

Chuvash phonology displays many irregular and complicated sound changes. This is especially true of the vowels, of which correspondences with Common Turkic vowels are far from unequivocal. For instance, the Common Turkic vowel *a* is represented by *u* in words such as *ut* ‘horse’ (cf. Tatar *at*), but by *i* in words such as *pür-* ‘to go’ (cf. Tatar *bar-*). Chuvash possesses the reduced vowels *ä* and *ě* (e.g., *tär-* ‘to stand’, *për* ‘one’), which have their counterparts in neighboring languages, including Tatar, without corresponding to them in a systematic way. Originally long vowels are generally not preserved in Chuvash. In some cases, however, they are represented by diphthongs (e.g., *kěvak* ‘blue’ < *kö:k*).

Chuvash has a rather reduced consonant inventory in comparison with most other Turkic languages. Under Slavic influence, palatalized and nonpalatalized consonants are distinguished, the palatalized ones occurring before and after front vowels. Chuvash *r* sometimes corresponds to an Old Turkic interdental *δ*, as in *ura* ‘foot’ vs. *ađaq*. This is not necessarily an archaic feature. In cases such as this, early Bulgar *δ* seems to have changed into *z*, which then developed into *r* in late Bulgar.

Chuvash words are, as a rule, subject to sound harmony. The vowels of a word normally belong either to the front or to the back class. Most suffixes have a back vowel and a front vowel variant. However, some suffixes of standard Chuvash exist only in a front vowel variant: the plural suffix *-sem*, as in *ača-sem* ‘children’ (of *ača* ‘child’), and the third-person possessive suffix, as in *iväl-ě* ‘her/his son’ (of *iväl* ‘son’).

Grammar

The morphology exhibits certain deviations from Common Turkic patterns. There are thus exceptions from the agglutinative principles generally valid for Turkic languages (e.g., *tu* ‘mountain’ vs. *täv-a* [mountain-DAT] ‘to the mountain’) (cf. Turkish

dağ [mountain], *dağ-a* [mountain-DAT]). Eight cases are normally distinguished for the standard language. As a result of phonetic development, the dative and accusative case markers have fused into one marker, -A. Besides the suffixless nominative, the dative-accusative, the genitive in -An, the locative in -rA, and the ablative in -rAn, Chuvash grammarians reckon with an instrumental-comitative case in -pA[IA], a privative (or abessive) case in -sAr, and a causal or purposive case in -šAn. Some scholars distinguish still more cases, e.g., a directive in -AllA. The plural suffix -sem is of unknown origin; other Turkic languages use plural suffixes of the type -lAr. The plural marker -sem follows possessive suffixes and precedes case markers (e.g., *kil-ëm-sen-čen* [house-POSS.1.SG-PL-ABL] ‘from my houses’). In other Turkic languages, the plural suffix precedes the possessive markers, as in Turkish *ev-ler-im-den* [house-PL-POSS.1.SG-ABL].

The nominative forms of the personal pronouns of the first and second persons contain a proclitic deictic element *e-*, lacking in other Turkic languages: *epë* ‘I’, *esë* ‘you (singular)’, *epir* ‘we’, *esir* ‘you (plural)’ (cf. Turkish *ben, sen, biz, siz*). The reflexive pronouns of the type *xa-* plus possessive suffixes (e.g., *xam* ‘I myself’) are unknown in other Turkic languages. Three degrees of proximity are expressed with the demonstrative pronouns *ku* ‘this’, *šak(ă)* ‘this there’, and *šav(ă)* ‘that there’. The numerals 1–10 display, besides their normal forms (*për(e)* ‘one’, *tăxăr* ‘nine’), emphatic variants with long consonants for use in isolated syntagmatic positions (*përre* ‘one’, *tăxxăr* ‘nine’). Ordinals are formed with the suffix -mëš, otherwise unknown in Turkic (*ikkë-mëš* [two-ORD] ‘second’).

The Chuvash verb system does not exhibit such important deviations from the common Turkic system as has been assumed by some researchers. For example, the so-called ‘aorist’ (e.g., Turkish *gel-ir* [come-AOR.3.SG] ‘comes, will come’) is not lacking in Chuvash, but has survived as the so-called future, as in *kil-ë* [come-FUT.3.SG] ‘will come’. The negated imperative is formed with a preposed particle *an* (*an pîr* [NEG go.IMP] ‘do not go’), whereas other Turkic languages use the negation suffix -mA with imperatives as well (e.g., Turkish *git-me* [go-NEG.IMP] ‘do not go’).

It has been suggested that some of these idiosyncratic Chuvash features – the deictic element *e-*, the pronouns *šakă* and *šavă*, the negative particle *an*, and the plural suffix -sem – have been copied from Mari or other Volga Finnic languages.

Lexicon

Most basic words in the Chuvash lexicon belong to the common Turkic vocabulary. Many elements have, however, been copied from other languages, mostly

from Tatar, neighboring Finnic languages, and Russian. An old layer indicates contacts with Samoyeds in southwestern Siberia. Later loans reflect the contacts with Mari in the Volga region, e.g., *pürt* ‘house’ < pört. Tatar dialects have exerted strong influence on the lexicon. Words of Arabic and Persian origin have mostly entered Chuvash via Tatar, but certain words were borrowed already in the Volga Bulgar period. Words of Mongolic origin have also mostly been copied from Tatar, such as *tăxta-* ‘to wait’ < *tuqta-* ‘to stop’. There are numerous Russian loans, including *xaşat* ‘newspaper’ < *gazeta* and *këneke* ‘book’ < *kniga*. There are also many lexical elements of unknown origin.

Dialects

Modern Chuvash has two main dialects. Viryal, the ‘upper’ dialect, is spoken in the northern and northwestern parts of the Republic. Anatri, the ‘lower’ one, is spoken in the south. In the center and northeast, there is found a transitional dialect that is rather close to the lower dialect. The differences between the dialects are small. Standard Chuvash is based on Anatri dialects. Chuvash speakers living outside the Republic also speak Anatri dialects. Vowel harmony is less consistent in Standard Chuvash and Anatri than in Viryal. Tatar loans are more common in Anatri, whereas Mari and Russian loans are more common in Viryal.

Classification of Languages

This article describes the principles underlying the classification of languages in this volume. Classification may be based on genetics, diffusion, lexicostatistics, or other relationships. A map (Figure 1) showing locations of major language groupings worldwide is provided.

Genetic Classification

Both professional linguists and general readers find a genetic classification the most satisfying way to group languages. This approach is one in which languages are classified into families on the basis of descent from a common ancestor. A good example is the Indo-European family of languages, which includes most of the languages of Europe, Iran, Afghanistan, and the northern part of South Asia. These languages can be shown to descend from a common ancestor, a common protolanguage. There are no records of the ancestral language, but it can be reconstructed from records of daughter languages such as Sanskrit, Ancient Greek, and Latin by using what is known as the ‘comparative method’. Consider the following words for ‘father’: Sanskrit *pitár*, Greek *patê:r*, and Latin *pater*. It is possible to align the initial *ps*, the medial *ts*, and the final *rs* and reconstruct a root with the consonants *p-t-r* (the vowels require a little further examination). English is also a related language, so the word *father* should show the same consonants, but in fact the expected *p* shows as an *f* and the *t* shows up as a *th* (representing a voiced dental fricative). However, a consideration of further words shows that the *f/p* correspondence also appears in many other words, such as English *foot* against Sanskrit *pád-*, Greek *pod-*, and Latin *ped-*, and the *th/t* correspondence also shows up in other words, such as English *mother* against Sanskrit *ma:tá:r*, Greek *má:tê:r*, and Latin *ma:ter*. We still reconstruct *p-t-k* and conclude that English has systematically changed the original stop consonants into fricatives. In fact, all the Germanic languages have done so.

Inflections as well as roots can be reconstructed. A common genitive ending in *-s* can be seen in Greek *pod-ós*, Latin *ped-is*, and English *foot’s*. Proceeding in this way, we can reconstruct a good deal of the protolanguage and we can demonstrate that these languages and a score or so others are

related as members of one family, which we call Indo-European.

A language family can be represented by a tree diagram, with the branches representing subgroups. Subgroups are characterized by shared innovations, which sets them apart from other languages in the family. The Germanic branch of Indo-European (English, German, Dutch, etc.) is characterized by various consonant shifts such as *p* → *f* and *t* → *th*, as just mentioned, and by a past tense marked by a dental (or alveolar) stop, as in English *answered* or German *antwortete*. Other branches of Indo-European that can be reconstructed include Armenian, Anatolian, Celtic, Tocharian, and Italic. The Italic branch contained languages located in Italy, such as Oscan, Umbrian, and Latin. Latin was spread by conquest from Rome to a large area around the Mediterranean. It is no longer a spoken language, but it survives through its daughters, namely, French, Portuguese, Spanish, Italian, and Romanian, to mention only national languages. These languages, collectively called the Romance languages, form a sub-branch of the Italic branch of the Indo-European family. In this instance, we have records of Latin, which serves as a check on what we might reconstruct as proto-Romance. All of the Indo-European languages treated in this encyclopedia are included in the alphabetic list of families and other large groupings in the last section of this article (‘Status of the Groupings Used in the Classification’).

It is common in studying languages to find among them resemblances that are insufficient for the reconstruction of a protolanguage. This can be because there are insufficient data or because the languages have diverged so far that only a little evidence remains of their genetic affiliation. Where there is insufficient evidence for establishing a family or grouping families into a wider family, so that they become branches of the larger family, we can describe the languages in question as belonging to a particular stock. There can be degrees of resemblance among languages. If languages are grouped into stocks on the basis of sharing 10–20% of vocabulary, and some stocks are found to share between 5 and 10%, then these stocks can be said to belong to the one phylum.

Diffusion

In the ideal case, a number of innovations will coincide, as with the Germanic innovations mentioned previously, and a branch can be added to a tree diagram. However, all innovations, whether they are new pronunciations, new affixes, new words, or

Figure 1 Locations of the major language groupings of the world, excluding the large-scale expansion of European languages such as English and Spanish over the past 500 years. The approximate locations of major concentrations are shown. In the Americas, there are many families, often with discontinuous and interlocking distributions, so the labels, indicated by name, are very approximately located.

new constructions, must start at a particular location and then spread, and different innovations can have different starting points, and the spreads can overlap. This can happen within a particular language or between languages in contact, with the result that linguists cannot always present a neat, noncontroversial tree diagram.

The diffusion of language features can be massive and widespread. Vocabulary can be borrowed from one language to another. 'Borrow' is the conventional term for the adoption of language features from another language, but no paying back is implied. Words to do with culture are most easily borrowed. English, for instance, has borrowed almost the entire learned stratum of its lexicon from French, Latin, and Greek. Similarly, Thai, Lao, and Khmer (Cambodian) have borrowed their learned stratum from Pali, a language of the Indo-Aryan branch of Indo-European. Pali is the language of Buddhism. In areas where Islam is found, languages exhibit various degrees of borrowing from Arabic. Common vocabulary is not immune from borrowing. English, for example, has borrowed *very* from French, and it has borrowed some hundreds of fairly basic words from Old Norse, including the pronominal forms *they*, *their*, and *them*. The standard tree diagram shows English as part of the West Germanic sub-branch of Germanic and Old Norse (ancestral to the modern Scandinavian languages), as representing North Germanic, but it is more realistic to think of English as a mixture, predominantly West Germanic, but with an admixture of North Germanic. And there is also the learned stratum of vocabulary already mentioned.

Though grammatical forms, particularly bound forms such as plural markers or past tense markers, are not normally borrowed, grammatical structure or patterns are relatively diffusible. It is interesting to note that most of the languages of South Asia have subject-object-verb (SOV) word order even though they belong to different language families: the Indo-Aryan branch of Indo-European, Dravidian, and the Munda branch of Austro-Asiatic. Burushaski, a language isolate spoken in northern Pakistan, is also SOV. In China, and in Laos, Thailand, and Vietnam to the south, a number of genetically diverse languages have assimilated to Chinese in having monosyllabic roots and tones. When languages converge in this way, we have a *Sprachbund* (German for 'language union'), or linguistic area. If languages were classified typologically, then various languages of different genetic provenience would be classified together because of diffusion. Vietnamese is a good example. Historically, it belongs to the Mon-Khmer branch of Austroasiatic, but it has been so

influenced by Chinese that not only has it adopted numerous Chinese words, but it has also reduced its own roots to conform to Chinese patterns and it has developed tones as in Chinese. Word order is subject-verb-object, as in Chinese.

Lexicostatistics

Linguists are not always in a position to reconstruct the relationship between languages as has been done in the case of Indo-European. Where linguists have been confronted with a number of languages that have not been studied in detail, a common situation outside Europe over the past century, they have resorted to lexicostatistics. The method is very simple. The percentages of common roots are counted using a list of 'basic' words. The theory is that basic vocabulary is resistant to borrowing, so that the percentage will give a guide to how closely languages are related. Although it is true that everyday words are less easily borrowed compared to words to do with culture (in the broadest sense), the difference is one of degree. One of the 200-word lists of basic vocabulary that has been used contains the numerals 'one', 'two', 'three', 'four', and 'five', but these can be borrowed, as in the case of the Tai languages, which have borrowed them from Chinese. The same list also contains 'animal', 'lake', and 'mountain', all of which are borrowings in English, ultimately from Latin. The problem of distinguishing roots that have been borrowed as opposed to those that have been inherited from a protolanguage is even greater when dealing with languages for which no detailed descriptions are available. Nevertheless, lexicostatistics has been widely used in the classification of the languages of various areas, including Africa, the Americas, Australia, and New Guinea. Lexicostatistics does give a good guide to the degree of similarity between languages, and on the basis of the percentages obtained it is possible to draw a hierarchical tree diagram and classify languages in terms of phylum, stock, family, branch, sub-branch, language, and dialect. However, there is no guarantee that such a tree diagram reflects the successive breaking up of protolanguages, and the terms *family*, *branch*, and *sub-branch* do not have the same meaning as these terms do when based on the comparative method.

Greenberg classified the languages of Africa and the Americas using a form of lexicostatistics. Although his classification of African languages is widely accepted and in general use, his classification of the languages of the Americas is rejected by most scholars. In this classification, all of the languages of the Americas are united in one vast Amerind family,

except for Na-Dene (mainly in northwestern part of North America) and Eskimo-Aleut in the Arctic (Greenberg, 1987).

Beyond the Language Family

As mentioned previously, there can be various degrees of resemblance between language families and the levels of relationship can be quantified lexicostatistically and described in terms of stock and phylum. But besides hypotheses of wider relationships based purely on lexicostatistics, there are hypotheses about possible relationships between families using standard techniques of reconstruction or mixtures of standard methodology and lexicostatistics. The Nostratic hypothesis is one of the boldest and most controversial approaches; largely the work of Aharon Dolgopolsky and Vladimir Illich-Svitych, the hypothesis claims that there is a macrofamily consisting of Indo-European, Semitic, Berber, Kartvelian, Uralic, Altaic, Korean, Japanese, and Dravidian (Dolgopolsky, 1998). Other work includes that of Paul Benedict, who proposed an Austro-Tai family combining Hmong-Mien (Miao-Yao), the Tai-Kadai (or Daic) family, and Austronesian. Joseph Greenberg considered that these three recognized families plus Austroasiatic form an Austric family (Ruhlen, 1991: 152–156).

Isolates

A number of languages appear to belong to no family, though in many cases they are presumably remnants of families. The following languages are examples:

- Ainu (spoken in Japan)
- Burushaski (spoken in northern Pakistan)
- Basque (spoken in the Pyrenees)
- Elamite (an extinct language of southwestern Iran; it has been claimed to be related to the Dravidian languages of southern India)
- Japanese and the Ryukyuan dialects (the latter spoken in the Ryukyu Islands of Japan)
- Ket (spoken in the Yenisei Basin, Siberia)
- Korean
- Nivkh (spoken in eastern Siberia, including Sakhalin Island)
- Sumerian (extinct language of Mesopotamia with records from the 3rd millennium B.C.)
- Yukaghir (spoken in eastern Siberia).

For most of these languages, hypotheses are put forward from time to time linking them with other languages. A number of scholars include Japanese or

Korean, or both, in the Altaic family, and some would include Yukaghir in the Uralic family.

Pidgins and Creoles

Where people find themselves in contact but without a common language, a ‘pidgin’ develops, which is a simplified form of language. The pidgin usually combines elements from more than one language, but in most cases the bulk of the lexicon comes from one particular language. A number of pidgins developed in the context of European colonial expansion from the 15th to the 19th centuries in places where workers, often slaves, from different language backgrounds were faced with an unfamiliar European language and in many cases unfamiliar languages of fellow workers. Where later generations learned these pidgins as their native language, the pidgins expanded to be full languages. Such languages are known as ‘creoles’. In terms of classification, pidgins and creoles do not lend themselves to the hierarchical taxonomy wherein each language has a single ancestor. However, they tend to be identified in terms of which language supplies most of the vocabulary. The list of the pidgins and creoles included in this work, given in **Table 1**, shows the main source of the lexicon and where the pidgin or creole is, or was, spoken.

Table 1 Pidgins and creoles

| <i>Language</i> | <i>Main source of the lexicon</i> | <i>Location</i> |
|---------------------|-------------------------------------|--------------------------------------|
| Bislama | English | Vanuatu |
| Cape Verdean creole | Portuguese | Cape Verde |
| Fanagolo | Bantu languages (e.g., Xhosa, Zulu) | Southern Africa |
| Gullah | English | Sea Islands of South Carolina |
| Hawaiian creole | English | Hawaii, United States |
| Krio | English | Sierra Leone |
| Louisiana creole | French | Louisiana, United States |
| Mobilian jargon | Choctaw, Chickasaw | Southeastern United States (extinct) |
| Palenquero | Spanish | Colombia |
| Papamiento | Portuguese, Spanish | Aruba, Bonaire, Curaçao |
| Russenorsk | Russian, Norwegian | Arctic (extinct) |
| Sango | Ngbandi, French | Central African Republic |
| Sranan | English | Surinam |
| Tok Pisin | English | New Guinea |
| Yanito | English, Spanish | Gibraltar |

Status of the Groupings Used in the Classification

This section contains a list of language families and other groupings in alphabetic order with an indication of the status of the groupings, i.e. whether the labels represent generally accepted families, controversial families or larger entities. It should be noted that while the list covers most of the language families of the world, it is not a complete catalogue of the world's languages, which total somewhere near 5000.

Afroasiatic Languages

There are various classifications of Afroasiatic languages. The one used here recognizes six families: Ancient Egyptian and its successor, Coptic; Berber (northwest corner of Africa); Chadic (Niger and Chad); Cushitic (Somalia and eastern Sudan); Omotic (southern Ethiopia); and Semitic. Semitic has three branches. The eastern branch is represented by Akkadian, which was spoken in Mesopotamia from the 3rd to the 1st millennium B.C. The southern branch is represented by the Ethiopian languages (Amharic, Tigrinya, and the extinct Ge'ez). The central branch, which is centered around the eastern end of the Mediterranean, includes the dead languages Phoenician, Syriac, and Ugaritic, plus Aramaic, a language in which parts of the Bible are written and which is still spoken; Hebrew, which has been brought back to life as the language of Israel; and Arabic, which, as the language of Islam, has spread over northern Africa and the Middle East.

Altaic Languages

Altaic is a widely, though not universally, accepted language family covering three branches: Turkic, Mongolic, and Tungusic, represented in this work by Evenki. The Turkic languages, which include Turkish, extend across from the Balkans through Turkey across central Asia to Siberia. The Mongolic languages are centered on Mongolia and the Tungusic languages in Siberia and northern China. If Altaic is rejected as a family, then we have three separate families rather than three branches of a family. These languages are typologically similar in that they are agglutinative, and they represent the classic SOV word-order type with SOV word order, postpositions, and preposed genitives. Some linguists would include Japanese and/or Korean in the Altaic family.

Australian Languages

The languages of the Australian mainland look as if they are related, but no detailed reconstruction of a

protolanguage has been undertaken and it is unlikely that such a reconstruction will be possible. These languages have been classified lexicostatistically, i.e., by counting percentages of common vocabulary. This classification currently recognizes about a score of lexicostatistical families, with one of them, Pama-Nyungan, covering most of the mainland. Some genetic groupings are recognizable within Pama-Nyungan, and some of the other lexicostatistical families can be shown to be true families, such as the Tangkic family, which includes Kayardild, and West Barkly, which includes Wambaya. Tiwi is the sole member of the Tiwian family. Dixon (2002: 674) suggests that the similar-looking Daly group of languages (represented in this work by Ngan'gityemerri) is an areal group rather than a genetic one. Records of the extinct Tasmanian languages consist almost entirely of amateur word lists. These show very few resemblances to the languages of the mainland. Joseph Greenberg classified the Tasmanian languages, the Papuan languages, and the languages of the Andaman Islands in an Indo-Pacific phylum (Ruhlen, 1991). This grouping has been disregarded by almost all other linguists.

Austroasiatic Languages

The Austroasiatic classification comprises two branches: the Munda languages of northeast India, which includes Santali, and the more scattered Mon-Khmer branch, which includes Mon (southeastern Myanmar (Burma)), Khmer (or Cambodian, the official language of Cambodia), Khasi (northeast India), Wa (southwest Yunnan, China), and Vietnamese. Vietnamese is interesting from the point of view of classification. It has been so influenced by Chinese that as well as borrowing large numbers of Chinese words, it has reduced the form of roots and developed tones so that the language looks like a Chinese language.

Austronesian Languages

The Austronesian language family contains over 1000 languages. In the most widely used classification, there are four branches, Paiwanic, Tsouic, Aytalic, and Malayo-Polynesian. The first three are the indigenous languages of Taiwan and are collectively known as the Formosan languages. The extra-Formosan languages, which are assumed to have emanated from Taiwan, make up the Malayo-Polynesian branch, which is spread from Madagascar in the western Indian Ocean, where Malagasy is spoken, to Easter Island in the eastern Pacific. Oversimplifying somewhat, we can consider there are three sub-branches: western, which takes in the languages of the Philippines, Indonesia, and Malaysia as well as

Malagasy and Hawaiian; central, represented in this work by the Flores languages and Malukan languages; and Oceanic, which covers languages such as Fijian, Maori, Samoan, Tahitian, and Tongan.

Caucasian Languages

The languages of the Caucasus comprise a South Caucasian or Kartvelian family, represented here by Georgian, and the North Caucasian languages, with a northwestern sub-branch, represented here by Abkhaz, and a northeastern sub-branch, represented by Lak. It is not quite certain that the northwestern branch and northeastern Branch are branches of a single family, and it is even more uncertain that South Caucasian and North Caucasian families form a genetic group, but the label 'Caucasian languages' is useful since the two groups share some features and are all quite distinct from surrounding languages.

Chukotko-Kamchatkan Languages

This is a small family of languages spoken on the Chukotka and Kamchatka peninsulas of Siberia.

Dravidian Languages

This language family is concentrated in southern India. Some branches are recognizable. Dravidian proper includes Gondi, Kurukh, and Telegu; the southern branch includes Kannada, Malayalam, Tamil, and Toda, and the northwestern branch includes Brahui.

Eskimo-Aleut

The Eskimo-Aleut language family has two primary branches. The Aleut branch is spoken in the Aleutian Islands and the Eskimo languages are found in Siberia, Alaska, Canada, and Greenland. The latter branch is represented here by Inupiaq and West Greenlandic.

Indo-European

Indo-European is the most widely studied of all language families and has a well-articulated sub-grouping based on the comparative method, though details of the classification are subject to dispute from time to time. This family of languages contains a number of branches containing a single language (or group of dialects), namely, Albanian, Armenian, Hellenic (Greek), and two dead languages, records of which came to light only in the 20th century. One dead language is Hittite, which was spoken in Anatolia (modern Turkey). There are records of Hittite from the latter part of the second millennium B.C. The other dead language, Tocharian, the

easternmost Indo-European language, was spoken in what is now the Xinjiang province of western China. There are records of Tocharian from the period 500–700 A.D.

Among other branches are the following Indo-European languages:

- Baltic contains Lithuanian and Latvian, and Slavic, the earliest records of which are in Old Church Slavonic and date from the 11th and 12th centuries. Modern Slavic languages include Polish, Sorbian, Czech, and Slovak (western sub-branch); Bulgarian, Macedonian, Slovene, and the 'Serbian-Croatian-Bosnian complex' (southern sub-branch); and Russian, Belorussian, and Ukrainian (eastern sub-branch). Some linguists would classify Baltic and Slavic as sub-branches of a Balto-Slavic branch.
- Celtic is usually divided into two sub-branches: the Brythonic branch, which contains Breton, Cornish, Welsh, and possibly Pictish, about which little is known, and the Goidelic branch, which contains Scots Gaelic.
- Germanic contains three sub-branches. The eastern sub-branch is represented by the extinct Gothic; the northern sub-branch, by the Scandinavian languages (Danish, Icelandic, Norwegian, Swedish); and the western sub-branch, by German (including High German, Yiddish, and Low German), Frisian, Dutch, and its South African derivative, Afrikaans, and various forms of English, including Scots.
- Indo-Iranian is a large branch containing two large sub-branches, Indo-Aryan (or Indic) and Iranian. Indo-Aryan covers Sanskrit, the language of the Hindu sacred texts; Pali, the language of the Hinayana Buddhist canon; plus Bengali, the Dardic languages, Dhivehi, Domari, Gujarati, Hindi, Hindustani, Kashmiri, Lahnda, Marathi, Nepali, Punjabi, Sindhi, Sinhala, and Urdu, all of which are spoken in India, Pakistan, and Bangladesh, plus Romani, the language of scattered Gypsy communities. Iranian covers Avestan, the language of the Zoroastrian scriptures, plus Bactrian, Baluchi, Chorasmian, Khotanese, Kurdish, Ossetic, Pahlavi (Middle Persian), Pashto, Persian, Sogdian, and Tajik.
- Italic contains a number of extinct languages of Italy, one of which, Latin, was spread via the political dominance of Rome. The descendants of Latin, known collectively as the Romance Languages, include several national languages (French, Italian, Portuguese, Romanian, and Spanish) as well as Catalan (northeastern Spain), Galician (northwestern Spain), Jèrriais (Jersey), Occitan (southern France), Rhaeto-Romance (eastern Switzerland and northeastern Italy), and Sardinian.

Khoesaaan Languages

The Khoesaaan group of languages is spoken by the Khoekhoe and San peoples of southern Africa. The group is often described as having three branches, but the branches are probably separate families. Two languages of northern Tanzania, Hadza and Sandawe, are also included in the group in most reference works, but it is not clear that they are genetically related to any of the southern families.

Languages of the Americas

As mentioned in the preceding section on lexicostatistics, Joseph Greenberg classified all of the languages of the Americas in one vast Amerind family, except for Na-Dene (mainly in northwestern part of North America) and Eskimo-Aleut in the Arctic. This classification is generally rejected and most scholars would recognize some scores of separate families in Greenberg's Amerind, though allowing that some of these can be grouped into stocks. We have followed a widespread convention of breaking up the languages of the Americas into three geographical regions: North America, Central America, and South America. This is largely to reduce a very large area to manageable chunks. We have considered Eskimo-Aleut separately from the languages of the Americas since it is not confined to North America.

Languages of North America

- The Algonquian languages are found in the eastern part of North America and westward into Alberta and Montana, and the Ritwan languages (Wiyot and Yurok) are found in northern California. Mithun (1999: 327) recognizes Eastern Algonquian, Central and Plains Algonquian, and Ritwan as branches of an Algic family. Algonquian is represented in this work by Cree and Michif. Michif is a creole, but, unlike most creoles, it did not arise from a pidgin. It retains the complex verbal morphology of Cree, and noun phrases show distinctions of number, gender, and definiteness, as in French.
- The Caddoan language family belongs to the Great Plains of the midwestern United States.
- The Hokan group of languages is centered in California. It is not established that these languages form a family. Among the Hokan languages is the Pomoan family of northern California.
- The Iroquoian language family of southeastern Canada and the eastern United States is represented in this work by Oneida (Northern Iroquoian) and Cherokee (Southern Iroquoian).
- The Keres language consists of a number of dialects spoken in New Mexico.
- The Muskogean language family of the southeastern United States includes Choctaw (Mississippi) and Creek (Alabama and Georgia).
- The Na-Dene language family includes Tlingit, Eyak, and the large Athapaskan branch. Most of these languages belong to Alaska and western Canada, but there is an enclave of Athapaskan in the southwest of the United States. Navajo (Navaho) is spoken in Arizona, New Mexico, and Utah.
- The Penutian group of languages or stock belongs to the west of North America, from British Columbia to California.
- Languages of the Salishan family are spoken in British Columbia and the northwest of the United States.
- The Siouan family of languages covered a vast area of the Great Plains and included Crow, Lakota, and Omaha-Ponca.
- The Wakashan language family is mainly from Vancouver Island, British Columbia, and is represented by Nuuchahnulth (Nootka).

Languages of Central America

- Languages of the Chibchan family are spoken in Nicaragua, Costa Rica, Panama, western Colombia, and Ecuador, and the Paezan languages are spoken in Colombia.
- The Mayan family of languages is spoken in southeastern Mexico and Guatemala.
- The Misumalpan language family is found in western Honduras and western Nicaragua.
- The Mixe-Zoquean language family is found in southern Mexico.
- The Oto-Manguean language, represented here by Zapotecan, is found in Southern Mexico.
- The Uto-Aztecan language family is found mainly in the southwest of the United States and Mexico, but extends as far north as Idaho. This family includes Cupeño, Hopi, Tohono O'odham, and Nahuatl, the language of the Aztec civilization.

Languages of South America

- The most widely spoken native language of South America is Quechua. It is spoken in Peru, Ecuador, and Bolivia, extending north into Colombia and extending south into northern Chile and northwestern Argentina. It shares similarities with Aymará and the two are sometimes grouped in an Andean family, but this is not generally accepted, since it is not agreed whether the resemblances are genetic or arise from contact.

- The large Arawak language family is widespread, ranging from Honduras in Central America to Brazil in South America, and formerly to Paraguay and Argentina. The Arawak language in this work is Tariana, of Brazil.
- The large Carib language family is found in Brazil and the countries of South America north of Brazil.
- The Choco language family is found in Brazil.
- The languages of the Panoan family are found in Peru and neighboring parts of Bolivia and Brazil.
- Macro-Jê is a grouping of languages that have been considered to be related to the Jê family. These languages are located in Brazil.
- The Mapudungan language is spoken in Chile and Argentina. It has no clear genetic affiliation.
- The Tucanoan language family is found in western Brazil and neighboring parts of Colombia, Ecuador, and Brazil.
- The Tupian language family is located in Brazil. The Tupí-Guaraní sub-group is also found in Brazil, but various members of the sub-group are found in Bolivia, Paraguay, and Argentina. Guaraní is an official language of Paraguay, along with Spanish.

Niger-Congo Languages

This is a very large language family, with about 1000 members. It is spread over southern Africa. There are various classifications, including some that are hierarchical with several levels. We have adopted a flat classification with eight branches:

- The Kordofanian group of languages is spoken in Sudan. In some classifications, a Niger-Kordofanian family is recognized, with Kordofanian and Niger-Congo as the primary branches.
- The Atlantic Congo language sub-group is located in the far west of Africa from Liberia to Senegal. It includes Fula and Wolof.
- Languages of the Kru sub-group are spoken in Ivory Coast and Liberia.
- The Mande language sub-group is found from Senegal to Burkina Faso (Upper Volta) and Ivory Coast.
- The Gur (Voltaic) language sub-group is spoken in Mali, Burkina Faso, and Ghana, and extends east into Nigeria. In some classifications, Dogon is not assigned to any branch; in others, it is assigned to the Gur sub-branch.
- The Kwa sub-group of languages extends from Liberia to Nigeria.
- The Benue-Congo language sub-group covers a very large part of southern Africa. This branch includes Efik, Yukuben, and Mambila. The very large Bantu language group, which includes

- Kikuyu, Kinyarwanda, Nyanja, Shona, Swahili, Xhosa, and Zulu, is a sub-group of Benue-Congo and hence a sub-sub-group of Niger-Congo.
- The Adama-Ubangi language sub-group is spoken in a band running across Africa from Nigeria to Sudan.

Nilo-Saharan

The languages of the Nilo-Saharan family are found mainly in northeastern and north-central Africa. They include Dinka, Kanuri, Luo, and the Songhay languages.

Papuan Languages

The label 'Papuan' has no genetic significance. It is defined negatively as the non-Austronesian languages of New Guinea and surrounding islands. It covers about 750 languages in New Guinea and another 50 or so on neighboring islands from Timor to the Solomons. These languages can be classified into 23 families and 10 isolates. One very large family, the Trans-New Guinea family, covers most of New Guinea and is also found on some of the neighboring islands. It contains a number of branches, including the Madang languages. Other families include Sepik, represented in this work by Manambu of the Ndu subgroup, Skou, Torricelli, and West Papuan. Also included in this work is an article on several of the Papuan languages of the central Solomons.

Sino-Tibetan

The Sino-Tibetan languages include the Sinitic family and Tibeto-Burman. Sinitic can be equated with Chinese, but Chinese is popularly understood to be a single language, whereas in fact it is more like a family of languages, one of which, Mandarin Chinese, is the standard, based largely on the Beijing dialect. Tibeto-Burman takes in a number of genetically related languages, including Tibetan and Burmese, but there is no consensus about the details of the classification. Whether Tibeto-Burman and Sinitic are genetically related is not agreed, but there are some apparent cognates.

Tai Languages

The Tai, or Daic, language family is centered in Laos and Thailand and includes the national languages of these two countries, Lao (or Laotian) and Thai. The family is also represented in Burma, southern China, northern Vietnam, and on Hainan Island in the Gulf of Tonkin. Lao and Thai are mutually comprehensible. A purely linguistic classification would recognize a chain of Tai dialects across the two countries that included the national languages.

Uralic Languages

The Uralic languages are a family of languages spoken in northeastern Europe, extending across northern Russia into northwestern Siberia. There are two major branches, the Samoyed branch, represented in this work by Nenets, spoken in northern Russia, and Finno-Ugric, which includes Estonian, Finnish, and Saami (spoken in northern Norway, Sweden, and Finland), as well as Hungarian, the national language of Hungary, which is separated from the rest of the family. Some would include Yuhaghir in the Uralic family, others would combine Uralic and Altaic into a larger family.

Cornish

P J Payton, University of Exeter, Cornwall, UK

© 2006 Elsevier Ltd. All rights reserved.

Cornish is a member of the Brythonic branch of the Celtic languages; it is related closely to Welsh and, especially, Breton and less closely to the Goidelic group comprising Irish, Scots Gaelic, and Manx. It emerged as a recognizably distinct language in the early medieval period. Although Anglo-Saxon traders or settlers had brought English into the far north-eastern tip of Cornwall, place-name evidence shows that, by the year 1200, Cornish was still spoken over the greater part of Cornwall. By 1500, the language had retreated westward to the River Fowey/River Camel line in mid-Cornwall; it was then spoken in a little more than half of the territory by approximately

30 000 people. Thereafter, decline was swift, with a core of about 5000 speakers left by 1700 and only a handful by the mid-18th century. Dolly Pentreath, popularly supposed to be the last Cornish speaker, died in 1777, but she was certainly survived by others. John Davey, who died in 1891, was said to have been able to converse in Cornish on a few simple matters, and counting rituals in Cornish survived in fishing communities until the 1920s and 1930s.

Cornish is divided into three periods: Old Cornish (from the 9th to the 13th centuries), Middle Cornish (from the 13th to the mid-16th centuries) and Late or Modern Cornish for the final period. The main corpus of literature survives from the Middle Cornish period, notably the *Ordinalia*, *Beunans Meriasek* ('The Life of St. Meriasek'), *Greans an Bys* ('The Creation of the World'), and the recently

discovered (2002) *Beunans Ke* ('The Life of St Kea'). The Reformation ensured that these plays were seen as 'subversive,' and the Cornish rebellions of 1497 and 1549 – the latter explicitly against the introduction of English in Cornish church services – meant that the Cornish language too had become subversive. The post-Reformation loss of contacts with Brittany deprived Cornish of an important cultural resource, including access to a mutually intelligible language (Breton).

Although a group of Cornish scholars did what they could to encourage the survival of the language in the late 17th and early 18th centuries, when the Celtic scholar Edward Lhuyd visited Cornwall around 1700 he found that Cornish was spoken only in 25 parishes in the far west. Antiquarian interest continued throughout the 18th and 19th centuries, with edited versions of the several of the plays published, but it was not until the publication of Edward Jenner's *Handbook of the Cornish language* in 1904

that a serious revivalist movement emerged. In the inter-war period, Robert Morton Nance produced a synthesis that he dubbed 'Unified Cornish.' This remained the standard for Cornish learners until the late 1980s when competing forms based on Late/Modern Cornish and a phonemic form of Middle Cornish emerged. However, despite this dissension, Cornish was one of the indigenous British languages recognized by the British government in 2003 under the terms of the Council of Europe's Charter on Minority Languages.

Cree

H C Wolfart, University of Manitoba, Winnipeg, Manitoba, Canada

© 2006 Elsevier Ltd. All rights reserved.

The Cree language exhibits an extraordinarily rich morphology, traditionally compared in its profusion to that of Ancient Greek.

Inflexion

The epistemological import of a statement, for example, may not only be indicated by particles such as *êsa* 'reportedly' or *iska* 'by dream or revelation' or through direct quotation, but also inflexionally, e.g., in the dubitative form of the changed conjunct verb *wêhtinâkwê* 'there he must have obtained him' in such sentences as ... *tânitê mîna wêhtinâkwê askihkwa*. '... I wonder where he got a pail.' The stem *obtin-* 'thus or there obtain s.o.,' which requires an antecedent (*tânitê* 'whence'), is followed by the thematic suffix *-â-*, specifying a proximate (central) agent and an obviative (noncentral) patient of animate gender. The dubitative suffix *-kwê*, finally, combines with the ablaut (apophony) affecting the initial vowel of the word to express subordination to the interrogative and evidential modality.

Cree verbs are inflected in four major paradigms, with the stems themselves typically grouped into two

derivational pairs. Stative verbs differ by the gender of the agent, *mihkwâ-* 'be red (inanimate),' *mihkosi-* 'be red (animate),' while transitive verbs are distinguished by the gender of the patient: *pakamah-* 'strike s.t. (inanimate),' *pakamahw-* 'strike s.o. (animate).' Verbs of this last class specify both agent and patient inflexionally.

Their overall complexity aside, the inflexional paradigms of Cree are also subject to substantial dialect variation, both in particular endings and in entire paradigmatic dimensions.

Number in Inflexion and Derivation

In the expression of grammatical categories, inflexion and derivation complement each other. The basic distinction of number, for example, is that of singular and plural expressed inflexionally, e.g., *iskwêw* 'woman; a woman; one woman' vs. *iskwêwak* 'women (more than one).' The singular is unmarked and in elevated prose may be used collectively, as in *kôsisiminaw* 'our grandchildren [lit. 'our grandchild']'; in a sentence like *kîspin êkâ iskwêw ôta kîpakitinikowisit* 'if women [lit. 'Woman'] had not been put here [on earth] by divine powers,' both the noun *iskwêw* and the verb (in the simple [unchanged] conjunct mode and with the third-person suffix *-t-*) show the singular. Quantifiers such as *mihcêt* 'many'

heighten the literary effect of this device, e.g., *mihcêt namôy kiskêyih tam* ‘many do not [lit. ‘does not’] know this.’ Reciprocal stems construed as singulars, e.g., *ayisiyiniw k-âyimôhtot* ‘that people [lit. ‘a person’] should gossip about one another,’ are a mark of high rhetoric.

The number system of Cree is remarkable for its range of associative plural constructions; for example, a first person plural verb accompanied by a singular noun (here flanked by the demonstrative *awa*) indicates a conjoint noun phrase including the first person: *kâ-sipwêhtâyâhk awa nisîmis awa* ‘when we took off, my little sister [and I].’ A third person plural verb construed with a singular noun is interpreted as including the extended family hunting band of the person specified by the noun: *ita nôhtâwiy k-âyâcik* ‘where my father [and his people] live’; this construction is rare among the languages of the world.

The opposition of singular and plural is neutralized for both nouns and verbs in the obviative (noncentral) third person, e.g., *sîsîpa tahkonêw* ‘she carried a duck/ducks,’ where the number of the patient is not specified in the verb form and the noun *sîsîpa* itself is number-indifferent. In such contexts, it is not uncommon for the verb stem to be reduplicated, e.g., *ê-kî-miyikoyâhk mâna sîsîpa ka-tâh-tahkonâyâhkik*. ‘he used to give us [each several] ducks to carry.’ With the long vowel *-â-* and strong devoicing (*-h-*) before what is treated as a word-boundary (indicated by a word-internal hyphen in the standard roman orthography), this highly productive type of ‘heavy’ reduplication expresses iteration or distributive action, which here takes the place of inflexionally marked plurality.

High literary style also exploits a much less productive type of disyllabic reduplication, which does not introduce a word boundary; the reduplication syllable is ‘light’ (with the short vowel *-a-*), and the initial syllable of the stem itself shows lengthening of the vowel in accordance with rules that are largely those of the ablaut pattern illustrated in our opening example. This more archaic type of reduplication typically appears with paired referents, e.g., *ê-mamêhkwâpicik* ‘they had their eyes painted red’ (cf. *mihkwâpi-* ‘have a red eye’), suggesting a kind of dual marking not otherwise reported for the Algonquian languages.

Derivation

The derivational morphology of Cree easily matches the exuberance of the inflexional paradigms. In the formation of primary stems from roots (or initials), optional medials and obligatory finals, the stems

corresponding to the four major verb paradigms (with their pairings by gender) are thrown into sharp relief:

- pakâsim-* ‘boil s.o. (e.g., a rabbit, a beaver) in water’
- pakâhtâ-* ‘boil (it) (e.g., bones, clothes) in water’
- pakâso-* ‘be boiled in water (animate; e.g., a rabbit, a beaver)’
- pakâhtê-* ‘be boiled in water (inanimate; e.g., bones, clothes)’

(The root on which these stems are based refers to immersion; cf. the secondary stem *pakâsimo-* ‘immerse oneself in water; swim.’) Semantic sets are not necessarily fourfold or symmetrical, nor are they confined to a canonical stem, occasionally showing suppletion instead, e.g., *mow-* ‘eat s.o. (a duck, bread),’ *mîci-* ‘eat (it).’

The initial constituent of the stem defines one paradigmatic set; e.g., *âyimôt-* ‘speak unguardedly about s.t., gossip about s.t.,’ *âyimôm-* ‘speak unguardedly about s.o., gossip about s.o.’ (and secondary stems *âyimômiso-*, *âyimôhto-* ‘speak unguardedly, gossip about oneself, one another’), *âyimisi-* ‘be of difficult disposition’, *âyimî-* ‘have a difficult life,’ *âyiman-* ‘be difficult.’ An equally prominent set is defined by the final, e.g., the *-ôt-* which recurs in *mâmiskôt-* ‘expound s.t.,’ *tâhkôt-* ‘discourse upon s.t.,’ *tipôt-* ‘discuss s.t. with authority.’ In less specialized domains, initials such as *pîmi-* ‘in linear progression,’ *sîpwê-* ‘departing,’ *tako-* ‘arriving’ and finals such as *-ohtê-* ‘walk,’ *-pahtâ-* ‘run’ cooccur freely.

In secondary derivation, full stems give rise to further stems, e.g., the transitive *pakamahw-* ‘strike s.o.’ to the reciprocal *pakamahoto-* ‘strike one another’ or the inagentive verb of suffering *pakamahokowisi-* ‘be struck by divine force’; or the parallel stem *pakamah-* ‘strike s.t.’ to the noun stem *pakamahikanis-* ‘club, hammer.’ Noun stems such as *maskisin-* ‘moccasin, shoe’ or *nîmihitowin-* ‘dance, dance ceremony’ (itself derived from the reciprocal verb stem *nîmihito-*) yield such verb stems as *maskisinhkê-* ‘make moccasins, make shoes’ or *nîmihitowinikhkê-* ‘hold a dance ceremony; give a dance.’ Some highly transitive verbs permit the formation of patient nouns, e.g., *misw-* ‘shoot s.o., wound s.o.,’ *miswâkan-* ‘wounded person,’ which in turn is the base for *miswâkaniwi-* ‘be wounded.’

Recursive suffixation is complemented by a highly productive pattern of deriving noninitial nominals from stems. While some of these deverbative medials closely resemble the full noun, others are distinct; the medials *-ihkomân-*, *-astimw-*, *-askisin-*, for instance, vary more or less obviously from the stems *môhkomân-* ‘knife’, *atimw-* ‘dog; horse’ or *maskisin-* ‘moccasin, shoe,’ as in *mistihkomân* ‘big knife’

or *manihkomânê-* ‘take a knife,’ *mihcêtwastimwê-* ‘have many horses’ or *kikaskisinê-* ‘wear moccasins, wear shoes.’

Noun Incorporation

Transitive stems with animate patients may function as the base of an overtly incorporative stem consisting, for instance, of the stem *obtîn-* ‘thus or there obtain s.o.’ as the initial constituent, the derived medial *-iskwêw-* ‘woman’ and the verb-final forming intransitives, *-ê-*; the resulting stem *obtînskîwêwê-* has the specialized meaning ‘take a wife from there, take one’s wife from there.’

Noun incorporation yields syntagmatically ordered series: the transitive stem *kanawêyim-* ‘watch over s.o., guard s.o. with care,’ when construed with the medial *-iskwêw-* ‘woman’ and the intransitive final *-ê-*, results in the incorporative verb *kanawêyimiskwêwê-* ‘watch over one’s wife/wives, carefully guard one’s wife/wives.’ It is then subject to further derivation, for instance as the transitive stem *kanawêyimiskwêwât-* ‘guard s.o. as one’s wife’; or with the noun final *-win-* forming the abstract noun *kanawêyimiskwêwêwin-* ‘watching over one’s wife/wives, carefully guarding one’s wife/wives’; or with the habitual suffix *-ski-*, giving rise to *kanawêyimiskwêwêski-* ‘habitually watch over one’s wife/wives, jealously guard one’s wife/wives at all times.’

Stems incorporating the same nominal constitute a paradigmatic set. They may not only be based on fully transitive stems, overt as in the above examples or covert as in *nâtiskwêwê-* ‘seek a wife; fetch one’s wife’ (cf. *nât-* ‘fetch s.o.’); but also on stems belonging to the paradigmatic class of mostly vowel-final stems that combines intransitive and transitive stems without marking the latter inflexionally, e.g., *mêkiskwêwê-* ‘give a woman in marriage; give (her) in marriage’ (cf. *mêki-* ‘give [it/him] away’). Finally, they may also be primary, based on a mere root instead of a full stem, e.g., *nôtiskwêwê-* ‘pursue a woman, court a woman.’

Even with intransitive stems, a medial such as *-iskwêw-* may function in an oblique relation, e.g., *âcimokwêwê-* ‘tell about one’s affairs with women’ (cf. *âcimo-* ‘tell a story’).

Such medials also appear in completely distinct constructions: with initial and medial forming a single larger constituent construed with the final *-ê-*, such verbs mean either ‘have X,’ e.g., *oskiskwêwê-* ‘have a new wife,’ *nîsôskwêwê-* ‘have two wives,’ or ‘be X,’ e.g., *kakâmwâtiskwêwê-* ‘be a quiet woman.’

Parallel to the stative ‘be X,’ we find the denominal stem *kakâmwâtiskwêwêhkê-* ‘give the impression of being a quiet woman’ (with the *-êw-* of the noun

and the suffix-initial vowel contracting to *-ê-*). The incorporative stems proper, on the other hand, give rise to further transitives, e.g., *nôtiskwêwât-* ‘court s.o. as a woman’; this is true even for the oblique case: *âcimokwêwât-* ‘tell about one’s affair with s.o. as a woman.’ But note the difference in thematic structure in *nitomiskwêwât-* ‘ask for a woman’s hand of s.o.’ (cf. *nitomiskwêwê-* ‘ask for a woman’s hand’).

Finally, the incorporative verbs may even be construed with a full patient noun phrase. The full noun often appears in a separate clause, e.g., ... *câh-cîki niwâhkômâkanak kitâcimostawin, ê-âcimokwêwâtacik.* ‘... you told me about very close relatives of mine, telling of your affairs with them as women’; but it may also be part of the same clause, e.g., ... *ôhi iskwêwa ôhi kâ-nôtiskwêwâtimiht.* ‘... the woman who was being courted.’

Verbal Art

Cree literary form liberally exploits the combined riches of inflexion, word formation, and word order. Parallel constructions, for instance, may have the verb repeated in full and both nouns in contrast position, preceding the verb: *kisêyiniwa ka-nâtâmototawêw, nôtikwêwa ka-nâtâmototawêw.* ‘They will turn to the old men (*kisêyiniwa*), they will turn to the old women (*nôtikwêwa*).’ Or the first noun may follow the verb (again repeated in full), and the second precede it, chiasmatically: *ôtê, naway ahêw kêhtê-aya, nôtikwêwa ôtê ahêw.* ‘The old people (*kêhtê-aya*) they have put over there in the background, they have put the old women (*nôtikwêwa*) over there.’ Verbless sentences, here with the personal pronoun *niya* ‘I’ and the nouns *nêhiyaw* ‘Cree,’ *nêhiyaw-iskwêw* ‘Cree woman,’ show the same rhetorical structure: *êwako ohci mitoni niya nêhiyaw, nêhiyaw-iskwêw mitoni niya.* ‘And because of that truly a Cree am I, I am truly a Cree woman.’

Both nouns may follow the verb: *pêyakosâp ihtasiwak nôsisimak, mihcêtiwak nitâniskotâpânak.* ‘My grandchildren (*nôsisimak*) number eleven, and my great-grandchildren (*nitâniskotâpânak*) are many.’ Much the same sentence (with the verbs in the changed conjunct) also shows the order of noun and verb inverted from one clause to the next: *pêyakosâp ê-ih-tasicik nôsisimak, nitâniskotâpânak ê-mihcêticik.* ‘My grandchildren number eleven, and many are my great-grandchildren.’ This is the classical figure of chiasmatic reversal.

The relative position of nouns and verbs can be controlled even more dramatically when the nominal element is incorporated into the verb: *misatimwak kâ-nâtacik kâ-nitawi-minihkwahastimwêyan ... kâ-nitawi-minihkwêyâpêkinacik ôki misatimwak.* ‘when

you fetched the horses and went to do the watering of the horses . . . when you went leading the horses to be watered.’ In the second clause, instead of the noun *misatimwak* ‘horses,’ the verb (built on the transitive stem *minihkwah-* ‘make s.o. drink’) incorporates the medial *-astimw-*; the full noun precedes the verb in the first clause and follows it in the last.

Dialects, Speakers, Sources

Much more diverse than is traditionally acknowledged, the many dialects of Cree are spoken by isolated groups, derived from family hunting bands, which in many places persisted well into the 20th century. While the exact size of the speech community has not been established, Cree has far more speakers than any other indigenous language of Canada; the published numbers, however, including the 100 000 of the 2001 Census of Canada, are mere guesswork, and even the 20 000 speakers of more realistic estimates must be viewed against the backdrop of a landmass that stretches for thousands of miles across the subarctic and the northern prairies of Canada.

Cree is spoken in a chain of dialects, each remote from the next, and though many speakers control more than one dialect, distant dialects are not mutually intelligible. (The situation is roughly analogous to that which held until the end of the 18th century and the rise of the nation-state for the Romance continuum or for the complex dialectological and sociolinguistic picture presented by Alemannic [or Swiss German], the Bavarian majority language of Austria, Standard High German, Low German, and Dutch.) None of the conventional classifications of the dialects is reliable. Even the definition of the language itself is uncertain: while some limit the term ‘Cree’ to the dialects spoken between Hudson’s Bay and the Rocky Mountains, others include those spoken between Hudson’s Bay and the Atlantic coast (otherwise called Montagnais-Naskapi but also Cri de l’Est or East Cree). The examples and textual extracts in the present article represent Plains Cree as spoken on the northern prairies.

The intricate dialect situation and the high incidence of bilingualism (especially with Ojibwe, a closely related Algonquian language with a comparable degree of dialect diversity) form the backdrop for the striking case of Michif, a language distinct from both Cree and French but combining a largely French-based nominal complex with a largely Cree-based verbal system and syntax. Negation, for example, employs both the declarative *nô* (reflecting French *non*), as in *nô wihkât mîna nika-itostân*. (NEG-decl ever also I.will.go.there.INDEP) ‘Never again will I go there.’ and the deontic negator *kâya* (based on Cree),

as in *kâya misçêt aštâ lisel!* (NEG-deont much put.(it).IMVE salt) ‘Don’t put much salt in!’

The 19th-century grammars and dictionaries of Howse, Lacombe and Watkins are important documents, built upon in the more technical analyses of Bloomfield and Wolfart (Plains Cree), Voorhis (Western Swampy Cree), Ellis and Béland (Eastern Swampy Cree, Moose Cree, Atikamekw) and, for the Québec and Labrador dialects of Cree-Montagnais-Naskapi, by MacKenzie, Mailhot, Martin and others. The turn of the 21st century is marked by a renewed pedagogical tradition, ideally personified in Freda Ahenakew, herself a Cree speaker, and a surge of syntactic studies pioneered by James and Dahlstrom and continued by Blain, Branigan, Brittain, Déchaine, Junker, Reinholtz, Russell, etc.

A large collection of authentic Plains Cree literature was recorded by Bloomfield in 1925 (Early Texts). Over the last third of the 20th century, a corresponding corpus of Modern Texts has been recorded and published by Wolfart and Ahenakew.

Historical Background

When encountered by European explorers in the 16th century, the ancestors of the Native Americans belonging to what is now called the Creek and Seminole nations were living along the rivers of the present-day states of Alabama and Georgia. The English called the natives 'Creeks' because of the settlement patterns along the rivers, but these Native Americans called themselves *este maskoke listi ma(:)sko:ki* 'the Muskogee people' and referred to their language as *este maskoke empunvka listi ma(:)sko:ki imponaka* 'the language of the Muskogee people.' Conflicts with European settlers resulted in the removal of the Muskogee people (Creeks) from their ancestral lands. Some of these people joined with Hitchiti and Mikasuki speakers and fled into the swamps of Florida, becoming the 'Seminoles,' a term derived from Spanish *cimarrón* 'wild, untamed.' Others were forcibly moved to Indian Territory (the present state of Oklahoma) in the 1830s. After the Seminole Wars, a Florida contingent also settled in Indian Territory. These two Creek-speaking groups separated into the Creek (Muskogee) and Seminole nations. In Florida, the term 'Seminole' has come to refer to the political unit composed of Mikasuki and Seminole (Creek) speakers. The various population dispersals have resulted in three separate Creek dialects – Muskogee and Oklahoma Seminole, spoken by some 5000 descendants of those who settled in Oklahoma (Hardy, 2005), and Florida Seminole, spoken by fewer than 100 Creek speakers residing in Florida. The dialects differ mainly in vocabulary and are mutually intelligible (Martin and Mauldin, 2000).

On settling in Indian Territory, the Creeks were heavily missionized. With the help of educated native speakers, an alphabet was devised that is still in use today. Numerous religious publications, even a

newspaper, were published in the language. Generations of Creeks learned to read and write their language using the traditional alphabet, and it remains a vital part of Creek culture and ethnic identity. The Creek language belongs to the Muskogean family along with the extant languages Choctaw, Chickasaw, Alabama, Koasati, and Mikasuki. The interrelationships among the various branches are a topic of current research.

Phonology

The traditional Creek alphabet is a semiphonemic representation of the language that does not indicate pitch. For accuracy, the data presented here are in phonemic notation. Because instructional materials use the Creek alphabet, the traditional symbols are enclosed in parentheses to better illustrate the correspondences between the two systems.

Creek has 13 consonants. The three stops and one affricate, *p*(*p*), *t*(*t*), *c* [tʃ] (*c*), and *k*(*k*), are articulated at the labial, alveolar, alveopalatal, and velar positions, respectively. They are lenis, unaspirated, and are voiced between vowels. There are four fricatives: *f*(*f*), which is bilabial in some speakers but labiodental in others; *ɬ*(*r*), a voiceless alveolar lateral; *s*(*s*), an alveolar sibilant that may be retroflexed in some speakers; and the glottal *h*(*h*). Resonants include two nasals, bilabial *m*(*m*) and alveolar *n*(*n*); the alveolar lateral *ɬ*(*l*); and two glides, alveopalatal *y*(*y*, *e*) and velar *w*(*w*, *u*, *o*). The vowel system consists of three phonemic short vowels, *i*(*e*), *a*(*a*, *v*), and *o*(*o*, *u*), contrasting with three corresponding long vowels, *i:*(*ē*, *e*), *a:*(*a*), and *o:*(*o*), and the diphthongs *ey*(*i*), *aw*(*vo*), and *oy*(*ue*).

Creek has a pitch accent system with three contrasting tones, high /'/, falling /'/, and extra high /'/. High pitch is primarily nonphonemic, with iambic assignment based on syllable structure. It is phonemic (fixed), however, in some lexemes and a few grammatical morphemes. Falling tone is both lexical and grammatical. Extra high pitch occurs only in the intensive stem grade (EGR; discussed later). In words

with more than one accented syllable, a downdrift phenomenon occurs in which an accented syllable is one step lower in pitch than the accented syllable it follows (see Haas (1977) and Martin and Johnson (2002) for the specifics of Creek pitch).

Morphology

Creek is a largely agglutinating language with minimal noun morphology and extensive verb morphology. Prefixation, suffixation, infixation, vowel lengthening, tonal accent, and suppletion are used to mark grammatical categories.

Noun Morphology

Nominal case marking occurs only on indefinite nouns, *-t* for the nominative and *-n* for the oblique case. Definiteness is indicated by the lack of suffixation. Compare Examples (1) and (2), in which ‘snake’ is indefinite in both examples, whereas ‘dog’ is indefinite in Example (1) but definite in Example (2):

(1) *citto-t ifa-n ákkis*
snake-SUBJ dog-OBL bit
‘A snake bit a dog.’

(2) *citto-t ifa ákkis*
snake-SUBJ dog bit
‘A snake bit the dog.’

Most nouns are unmarked for number, although Creek does have three lexically determined plural suffixes restricted to human referents: the collective-*álki* in *masko:k-álki* ‘Creek people,’ *-aki* in *acol-aki* ‘old men,’ and *-ta:ki* in *hopoy-ta:ki* ‘children.’

Possession is indicated by one of two sets of nominal prefixes. Possessed nouns intimately associated with the possessor, such as most body parts and kin terms, take the inalienable (Type II) prefixes, as in *ca-cokwa* ‘my mouth’ and *ca-posi* ‘my grandmother.’ Nouns having a looser relationship with the possessor take the alienable (Type III) set of possessive prefixes, such as *an-coko* ‘my house’ and *an-hissi* ‘my friend.’

Derivational morphology includes the productive diminutive *-oci* and augmentative *-lakko* (from *tákki*: ‘big’) suffixes (compare *ifa* ‘dog’ with *if-oci* ‘puppy’ and *ico* ‘deer’ with *co-lakko* ‘horse’).

Several derivational processes create nouns from verbs. Agentives are formed by suffixing *-a* to the verb stem with concomitant vowel lengthening: *alí:kc-a* ‘a doctor’ is formed from *alíkc-ita* ‘to cure.’ The instrumental prefix *is(s)-* combined with the nominalizer *-ka* creates derived nouns, as in *is-lá:f-ka* ‘knife’ (*laff-ita* ‘to cut with a knife’). Other nouns are formed with the instrumental and the infinitive, as in *is-łolak-ita* ‘awl’ (*łolak-ita* ‘to pierce’).

Verb Morphology

Creek has a complex system of inflectional verb morphology utilizing prefixes, suffixes, infixes, pitch, and suppletion to mark person, tense, aspect, and number. Although independent pronouns exist, they are used only for emphasis. The verb is obligatorily marked for person with one of two sets of subject affixes. Transitive and intransitive verbs in which an actor exercises control over the event are marked with the Type I suffixes: *-eyl-ay* ‘I,’ *-íck* ‘you.SG,’ *-i:/-iy* ‘we,’ *-á:ckl* *-á:cc* ‘you.PL.’ Third person is unmarked. The sentences in Examples (3a)–(3c) illustrate the conjugation of *hic-ita* ‘to see’ in the lengthened grade (LGR; see later) with the Type I suffixes:

- (3a) *hi:c-ey-s* *hi:c-i:-s*
see.LGR-I-DECL see.LGR-we-DECL
‘I see.’ ‘We see.’
- (3b) *hi:c-íck-is* *hi:c-á:ck-is*
see.LGR-you.SG-DECL see.LGR-you.PL-DECL
‘You see.’ ‘You see.’
- (3c) *hi:c-is* *hi:c-is*
see.LGR-DECL see.LGR-DECL
‘He sees.’ ‘They see.’

With stative verbs, the Type II prefixes are used: *ca-* ‘I,’ *ci-* ‘you,’ *po-* ‘we.’ The third person is unmarked and there is no number distinction in the second person. These are the same prefixes that are used to mark inalienable possession on nouns. Examples (4a)–(4c) illustrate the conjugation of the stative verb *má:h-i:* ‘tall’:

- (4a) *ca-má:h-i:-s* *po-má:h-i:-s*
I-tall-STATE-DECL we-tall-STATE-DECL
‘I’m tall.’ ‘We’re tall.’
- (4b) *ci-má:h-i:-s* *ci-má:h-i:-s*
you-tall-STATE-DECL you-tall-STATE-DECL
‘You’re tall.’ ‘You’re tall.’
- (4c) *má:h-i:-s* *má:h-i:-s*
tall-STATE-DECL tall-STATE-DECL
‘He’s tall.’ ‘They’re tall.’

A small set of intransitive verbs take either set of affixes. Note the difference in meaning between Examples (5) and (6):

- (5) *nockihl-ey-s*
sleepy.HGR-I-DECL
‘I fell asleep.’
- (6) *ca-nockil-i:-s*
I-sleepy-STATE-DECL
‘I’m sleepy.’

The Type II prefixes also index direct objects, as in Example (7):

- (7) *ca-híhc-is*
me-see.HGR-DECL
‘He saw me.’

A third set of pronominal affixes is used to mark dative objects; they are the same as the prefixes used to encode alienable possession:

- (8) in-háhy-ey-s
for.him-make.HGR-I-DECL
'I made it for him.'

Other pronominal verbal prefixes include the reflexive *i:-* 'one's self' (Example (9)) and the reciprocal *ti-* 'each other' (Example (10)):

- (9) i:-nókt-eyc-is
REFL-burn-CAUS-DECL
'He burned himself.'

- (10) ti-pak-ita
RECIP-join-INF
'to get married.'

The verb stem undergoes changes in pitch, vowel lengthening, and infixation, resulting in five aspectual ablaut grades. The zero grade is the unaltered stem, as found in the infinitive *hic-ita* 'to see.' In the lengthened grade (LGR), the stem vowel is lengthened (Example (3)), usually indicating the continuative aspect. The falling tone grade (FGR) encodes the resultative aspect, a state resulting from the action of the verb (see later, Examples (24) and (25)). The extra high pitch grade (EGR) involves nasal infixation (indicated by ⁿ), extra long vowel lengthening, and extra high pitch, signaling the intensive aspect. Examples (11a)–(11c) illustrate three degrees of smallness, the first with the unmodified verb, the second with the intensive morpheme, and the third with the intensive morpheme plus the EGR:

- (11a) cótk-i:-s
small.SG-STATE-DECL
'It's small.'
- (11b) cótk-ós-i:-s
small.SG-INTENS-STATE-DECL
'It's very small.'
- (11c) cõ:ⁿtk-ós-i:-s
small.SG.EGR-INTENS-STATE-DECL
'It's really, really small.'

The final stem grade, the *b*-grade (HGR), involves infixing an *b* with high pitch on the preceding stem vowel, as in Examples (5), (7), and (8). The HGR has multiple uses, the most common of which is to indicate an instantaneous or an immediate past action.

Creek has five past tenses marked by suffixes and stem change. Past I, the immediate past, marks events in the recent past, i.e., earlier today or last night. It is realized by using the HGR of the stem. Examples (5) and (8) showed one allomorph of the HGR. Past II, the recent past, refers to events happening up to a year ago. The tense suffix is *-ánk* and it cooccurs with the LGR, as in Example (12):

- (12) hi:c-ay-ánk-s
see.LGR-I-PASTII-DECL
'I saw it (a while ago).'

Events occurring a year or several years ago take the intermediate past suffix *-(i)mát* (Past III) with the verb stem in the LGR, as shown in Example (13):

- (13) hi:c-ey-mát-s
see.LGR-I-PASTIII-DECL
'I saw it (long ago).'

The remote past tense suffix *-ánta* (Past IV) marks events happening a long, long time ago; the verb stem is in the LGR, as in Example (14):

- (14) hi:c-ay-ánta-s
see.LGR-I-PASTIV-DECL
'I saw it (long, long ago).'

Past V, the indefinite past, is reserved for events outside the speaker's sphere of reference. It is rarely used in conversation but is always found in traditional folktales. In Example (15), the tense suffix is *-ati:*; the stem vowel is not lengthened because it is in a heavy syllable:

- (15) honanwa acól-i:-t leyk-ati:-s
man old-STATIVE-INDEF sit-PASTV-DECL
'Once upon a time there was an old man.'

Future time is marked by the future suffix *-áti:* in Example (16), and the intensive *-áha:n* in Example (17):

- (16) ay-áti:-s
go.SG-FUT-DECL
'He will go.'
- (17) ay-áha:n-is
go.SG-INTENT-DECL
'He's going.'

Creek marks the declarative, interrogative, and imperative modes, all with verb-final suffixes. The declarative *-(i)s* is exemplified in the preceding examples. The interrogative *-a* occurs on yes/no questions, as in Example (18), whereas *-a:* is the final suffix in questions seeking information, as in Example (19):

- (18) níhs-íck-a
buy.HGR-YOU.SG-INTERROG
'Did you buy it?'
- (19) nâ:ki-n níhs-íck-a:
thing-OBL buy.HGR-YOU.SG-INTERROG
'What did you buy?'

The affirmative imperative is formed with *-as* in the singular and *-aks* in the plural, e.g., *pap-as* 'eat it' (to one person) and *homp-aks* 'eat' (to more than one person). For the hortative, the suffix *-ik* is added before the imperative ending, as in *lít-ík-as* 'let him run.'

For Further Study

Two published Creek grammars are available for more in-depth language study. Hardy (2005) contains a text with an extensive linguistic sketch. Innes *et al.* (2004) is the first in an anticipated series of pedagogical texts. A comprehensive dictionary by Martin and Mauldin (2000) has entries in the traditional alphabet, with transliterations in phonemic transcription. A volume of traditional folktales by Martin *et al.* (2004) has the Creek text and free English translation in parallel columns (for earlier works on Creek, see Booker (1991)).

Crow

R Graczyk, St. Charles Mission, Pryor, MT, USA

© 2006 Elsevier Ltd. All rights reserved.

Location, Speakers, and External Relationships

The Crow, or *Apsáalooke*, language is spoken primarily on and near the Crow reservation in southeastern Montana. There are over 4000 speakers, most of whom are adults, although there are a few children who still speak the language, and many more who understand it. For most adults, Crow is still the language of the home and the preferred language for interaction with other tribal members.

Crow, along with Hidatsa, is a member of the Missouri River subgroup of the Siouan language family (see **Siouan Languages**). Crow and Hidatsa have diverged considerably from the other languages of the family, suggesting that this subgroup may have been the first to separate from the protolanguage.

Orthography and Phonology

Crow is written in a practical orthography developed by the Crow Agency Bilingual Education Program and the Wycliffe Bible translators in the late 1960s. The values of the letters are roughly as in English, with the following exceptions: *ch* = /č/, *sh* = /š/, *tch* = /čč/, *ssh* = /šš/, *sch* = /šč/, ? = glottal stop, and *x* represents the velar fricative. Long vowels are written as digraphs: *aa*, *ee*, etc.

The consonant sounds of Crow are given in **Table 1**. The voiced sonorants *m* and *n* have three allophones: *w* and *l* between vowels, *b* and *d* word-initially and following an obstruent, and *m* and *n* elsewhere;

Table 1 Crow consonant inventory

| Consonant | Labial | Alveolar | Palatal | Velar | Glottal |
|------------|--------|----------|---------|-------|---------|
| Stops | p | t | ch | k | (?) |
| Fricatives | | s | sh | x | |
| Sonorants | m | n | | | h |

Table 2 Crow vowel inventory

| Vowel | –Round | | +Round | |
|------------|---------|-------|--------|-------|
| | Long | Short | Long | Short |
| High | ii | i | uu | u |
| Mid | ee | | oo | |
| Low | aa | a | | |
| Diphthongs | ia (ea) | | ua | |

m occurs in free variation with *b* word-initially, although *b* is the more common realization. The glottal stop (written with the question mark) is a defective phoneme that occurs only as the sentence-final marker of an interrogative. Crow has a single stop series. Stops are aspirated word-initially and -finally, and as the second member of a cluster. Geminate stops are treated as clusters and are aspirated. Single stops between vowels are lax, unaspirated, and often voiced. The *k* is palatalized after *i*, *ih*, *e*, *eh*, *ch*, and *sh*. Fricatives are lax (and sometimes voiced) intervocally.

The vowel inventory of Crow is given in Table 2. The diphthongs are realized as long vowels followed by an off-glide; *ea* is a marginal diphthong that occurs in only two stems. Crow and Hidatsa lack the nasalized vowels found in other Siouan languages. Length is phonemic in Crow (e.g., *báalaa* ‘winter’, *bálaa* ‘money’) with the exception of the mid vowels, which are always phonemically long, although users of the practical orthography often spell words with short *e* and *o*. Crow has a pitch-accent system that contrasts long falling, long high, and short accented vowels (*chíisa* ‘tail’, *chíi* ‘pack on back’, *axíchi* ‘wet’). Long vowels preceding the accent are high in pitch, and all vowels following the accent have low pitch. Short vowels that occur between a high vowel and the accent assimilate to high pitch. The accent may occur on any syllable of the word. Accent is distinctive in Crow: there are minimal pairs that differ only in the placement of the accent, as in *húupa* ‘handle’ and *huupá* ‘shoe’.

Morphology

Nouns are inflected for possessor with two different inflectional patterns, one for alienable possession and the other for inalienable possession (kin terms, body parts, and a few other objects closely associated with a person, such as items of clothing). The following examples demonstrate alienable and inalienable paradigms:

| | |
|----------------------------|-------------------|
| Alienable | Inalienable |
| bas-búupche ‘my ball(s)’ | b-apé ‘my nose’ |
| dís-buupche ‘your ball(s)’ | d-ápe ‘your nose’ |

| | |
|-------------------------------|----------------------------|
| is-búupche ‘his/her balls(s)’ | ø-apé ‘his/her nose’ |
| bas-búupt-uua ‘our ball(s)’ | b-ap-úua ‘our noses’ |
| dís-buupt-uua ‘your ball(s)’ | d-áp-uua ‘your (PL) noses’ |
| is-búup-tuua ‘their ball(s)’ | ø-ap-úua ‘their noses’ |

There are several other inflectional paradigms for inalienably possessed nouns. The plural marker (*uua* in these examples) on a possessed noun indicates that the possessor is plural; the forms are ambiguous as to whether the possessum is singular or plural. Crow has a series of articles that are suffixed to the final word of a noun phrase: *iichíil-eesh* ‘the horse’ (definite), *iichíili-m* ‘a horse’ (indefinite specific), and *iichíil-eem* (indefinite nonspecific). Plural number for both nouns and verbs is marked by a suffix: *uu(a)* after short vowels and *o* or *u* after long vowels.

Verbal morphology is considerably more elaborated in Crow. Crow verbs are inflected according to an active/stative pattern, with the subjects of some intransitive verbs utilizing the same pronominal prefixes as the objects of transitive verbs:

| | |
|---|--|
| Object of transitive active bii-lichík ‘he hit me’ | Subject of stative bii-waakuhpáak ‘I am sick’ |
| dii-lichík ‘he hit you’ | dii-waakuhpáak ‘you are sick’ |
| ø-ø-dichík ‘he hit him/her’ | ø-baakuhpáak ‘she/he is sick’ |
| balee-lichík ‘he hit us’ | balee-waakuhpáak ‘we are sick’ |
| dii-lit-úuk ‘he hit you all/they hit you all’ | dii-waakuhpáauk ‘you all are sick’ |
| ø-ø-dit-úuk ‘they hit/him/her/them’ | ø-baakuhpáauk ‘they are sick’ |

Both active and stative verbs lack an overt third-person pronominal prefix for either subject or object. Other pronominal prefixes mark the subjects of active verbs, both transitive and intransitive:

| | |
|----------------------------|--|
| Intransitive active | Transitive active |
| baa-xalússhik ‘I run’ | dii-wah-kuxshík ‘I helped you’ |
| da-xalússhik ‘you run’ | bii-láh-kuxshik ‘you helped me’ |
| ø-xalússhik ‘she/he runs’ | ø-ø-kuxshík ‘she/he helped them’ |
| baa-xalússuuk ‘we run’ | dii-wah-kuxsúuk ‘I helped you all’/‘we helped you’ |
| da-xalússuuk ‘you all run’ | bale-láh-kuxsuuk ‘you all helped us’ |
| ø-xalússuuk ‘they run’ | bale-ø-kuxsúuk ‘they help us’ |

Object prefixes ordinarily precede the subject prefixes. With second-person objects, there can be ambiguity as to whether subject or object is singular or plural.

Crow has a number of different inflectional patterns for active verbs that have arisen from the combination of pronominal prefixes with locative and instrumental prefixes. The following examples demonstrate these paradigms:

| | | | |
|-------------------|-----------------|--------------|--------------------|
| du(u)- 'by hand' | 1.sg-bulusshuak | 2-dilússhuak | 3-dússhuak 'bend' |
| da(a)- 'by mouth' | 1.sg-balapxík | 2-dalápxík | 3-dáapxík 'bite' |
| ala- 'by foot' | 1.sg-baatshík | 2-dáatshík | 3-alatshík 'slip' |
| pa- 'by pushing' | 1.sg-bapchílek | 2-dápchílek | 3-páachílek 'push' |

A variety of suffixes may follow the verb stem. Some encode aspectual notions, as in *áhi* 'punctual, instantaneous' and *i* 'habitual'. Others function as manner adverbials; examples are *aachílichí* 'rather, like' (approximative), *aahi* 'here and there' (distributive), *kaáshi* 'very much, really' (augmentative), and *káata* 'little' (diminutive). Reduplication of a portion of the stem adds a distributive or augmentative sense, as in *dappaxí* 'split', *dappáppaxii* 'chop into little pieces' and *ihchipúá* 'jump', *ihchipúpuahi* 'jump up and down'.

Morphosyntax

Although Crow is a head-marking subject-object-verb language, overt noun phrases need not be present to constitute a grammatical sentence; the verb and its pronominal prefixes are sufficient. Crow morphosyntax tends strongly toward polysynthesis and incorporation; as a result, a sentence often consists of a single morphologically complex phonological word:

baa-w-aash-baa-lée-wia-waa-ssaa-k
 INDEF-1-hunt-1-go-want.to-1-NEG-DECL
 'I'm not going to go hunting'.

This sentence consists of three verbs: *aashí* 'hunt', *dée* 'go', and *wiá* 'want to' (auxiliary verb). Each of the verbs is marked for person of subject. *Baa* marks the object of 'hunt' as indefinite. The final declarative marker *k* is preceded by the negative suffix *ssaa*.

Nominal object incorporation is also common when referring to habitual activities, with the incorporated object preceding the verb, as in *ílii-laxxoxxi* 'peel teepee poles', *bálaa-kaali* 'ask for money', *iichíil-aakinnee* 'ride horseback', and *bil-issbíi* 'drink water'. When transitive verbs lack a specific object, *baa* (indefinite object) is prefixed to the verb stem, as in *baa-kaali* 'ask for (things)' and *baa-issbíi* 'drink, be drinking'.

Crow sentences end with one of a series of final markers of utterance type. The principal ones are *k* (declarative), *h* (imperative), and ? (interrogative):

| | |
|-----------------------------|---|
| Baáhpuuo kuss- baa-lée-k | 'I went to Pryor' (declarative) |
| Baáhpuuo kuss-da- lée-? | 'Did you go to Pryor?' (interrogative) |
| Baáhpuuo kuss- dáa-h | 'Go to Pryor!' (imperative) |

Other sentence-final markers code evidentiality:

| | |
|---------------------------|---|
| Baáhpuuo kuss- dée-sho | 'He must have gone to Pryor' (indirect evidence) |
| Baáhpuuo kuss- dée-wis | 'She probably went to Pryor' (probability) |

Subordinate clauses are marked by a clause-final suffix, as in *huu-lák* 'if he comes', *baakuhpáa-lasshen* 'because she is sick', and *xalaa-lahtaa* 'even if it rains'.

Crow marks switch-reference in nonindependent clauses: clause-final *ak* indicates that the subject of the following clause will be the same, whereas *m* indicates that the subject of the following clause will be different. It is not unusual to find long chains of clauses linked by *ak* and *m*, with only the final clause in the series terminating in declarative *k*. In noun phrases, demonstratives precede nouns, and other modifiers follow. The determiner is phrase-final, as in *hinne bachée-sh* 'this man-DEF'. Relative clauses are internally headed, and the head noun is marked with the indefinite specific determiner *m*. The agentive subject of the relative clause is marked by the relativizer (REL) *ak*:

[hileen bachee-m ak-húua-sh] aw-ák-uu-k
 these men-INDEF REL-come-DEF 1-see-PL-DECL
 'We saw these men who were coming'.

Crow has a limited set of postpositional suffixes that combine with nouns, demonstratives, or other postpositions to form complex postpositions: *n* 'at, in, on' (location), *ss(aa)*, *ss(ee)* 'to, toward' (goal), *taa* 'along' (path), and *kaa* 'from' (source):

ótchia héelapee-n
 night middle -at
 'in the middle of the night'

bin-náaskee-taa
 water-edge-along
 'along the water's edge'

awaxaawé ku-ssee
 mountain it -toward
 'toward the mountain'

Under certain conditions, postpositions may be incorporated by the following verb:

Ammalapáshkua ku-ss-dée-k
 Billings it-to-go-DECL
 'She went to Billings'.

Cupeño

J H Hill, University of Arizona, Tucson, AZ, USA

© 2006 Elsevier Ltd. All rights reserved.

Cupeño is a Uto-Aztecan language in the Cupan group of the Takic subfamily. Until 1903, speakers lived primarily in two villages, Kupa and Wilakalpa, located at hot springs sites southeast of Mount Palomar in southern California. In 1903, the Cupeño were forced from their homes by the legal machinations of White landowners (Hyer, 2001). Many live today at Pala, California. The Cupeño continue to maintain close economic, social, and ritual ties with speakers of other Takic languages, including Luiseño and Cahuilla, and with speakers of the Iipay (Diegueño) languages, in the Yuman family. These connections are reflected in loan material in Cupeño (Hinton, 1991), including the name of their principal village, *Kupa*, from Iipay Aa *ha-kupin* 'water-warm.' No fluent first-language speakers of the language remain, but the language is studied and is used in song, including in original composition.

Cupeño is an agglutinative language in the sense summarized by Plank (1995), characterized by complex words consisting of long strings of affixes that largely retain a CV or CVC syllable structure, being loosely bound to word roots and to one another with relatively few morphologically conditioned word-internal alternations. (1) illustrates a minimal sample of the rich morphological apparatus for verb constructions (primary stress is on the first syllable of the word, unless it is marked with an underline; the symbol 'e' stands for a central vowel /ə~i/.)

- (1a) mi = pem-chi'
 them = they-gather
 'they gathered them'

- (1b) mi = ne-chi'-qal
 them = I-gather-IMPERESING
 'I was gathering, I would gather'
- (1c) mi = chem-chi'-lyu-wen
 them = we-gather-go.to-IMPEREPL
 'we were going in order to gather them, we would go in order to gather them'

The examples in (2) illustrate nominal constructions. As in most Uto-Aztecan languages, nouns (except Spanish loans and a few words for plants and animals) must appear with one of the nonpossessed noun suffixes (in (2), the suffix *-ly(a)*). Animate nouns are always marked for object case, in which case demonstratives, quantifiers, and adjectives appearing with them in complex nominal constructions also bear object case (and plural number suffixation if the noun is plural). With inanimate nouns, only qualifying elements appear with the object case marker; the noun itself is usually unmarked.

- (2a) axwesh achi-ly
 that pet-NON.POSSESSED
 'that pet'
- (2b) axw^echi-m ash-lya-m
 that-PL pet-NON.POSSESSED-PL
 'those pets'
- (2c) axwesh-m-i ash-lya-m-i
 that-PL-OBJ pet-NON.POSSESSED-PL-OBJ
 'those pets (object case)'
- (2d) i'i ne-ash
 this my-pet
 'this pet of mine'
- (2e) ivi-y ne-ach-i
 this-OBJ my-pet-OBJ
 'this pet of mine (object case)'

Word classes do not exhibit rigid lexical discrimination; instead, the same root can appear in both nominal and verbal constructions. Example (3) shows the root *chi* 'to gather,' seen in verb constructions in (1), in a nominal construction. Example (4) shows the root *ash* 'pet,' seen in nominal constructions in (2), in a verbal construction.

- (3) *ne-chi-'a*
my-gather-POSSESSED
'my harvest'
- (4) *ne-'ash-lyu = 'ep*
I-pet-VERBALIZER = REALIS
'I had a pet'

Turning to syntax, Cupeño word order is head-final, with occasional pragmatically driven departures from SOV order. Cupeño permits very rich discontinuous constituency, as seen in (5). The first discontinuous constituent is in boldface; the second, interrupted by the noun of the first constituent and the verb, is underlined. Both elements of the second constituent are marked with the locative suffix *-aw* 'at, on.'

- (5) *i'i* ***ivi-'aw ku'a-l*** *hiw-qa* *ne-qwa'i-'aw*
this this-at fly- stand- my-food-at
 POSSESSED PRES.SING
'**this fly is here on this food of mine**'

Cupeño exhibits *Suffixaufnahme*, which Plank (1995) considered to be a regular typological feature of agglutinative languages. When genitive-noun expressions appear as objects of transitive verbs, both the possessor and possessed noun bear the object suffix, as in (6):

- (6) *ne'=ne mukikma-l-i*
I=I.ERG bird-NON.POSSESSED-OBJ
pe-wek-'i-y *tew-qa'*
its-wing-POSSESSED-OBJ see-PRES.SING
'I see the bird's wing'

Cupeño has a highly developed auxiliary complex in the second position in the sentence. This complex includes clitics marking subject person, number, and case (as with *=ne* in example (6)). An example is seen in (7), with the auxiliary complexes in boldface.

- (7) ***hani=qwe=n=pe***
exhort=NONINSTANTIATIVE =I.ABS=IRR
nangini met'ish
PAY.HABILITATIVE MUCH
me=qwe=pe *ichaa*
AND=NONINSTANTIATIVE =IRR GOOD
miyax-wene
BE-CUSTOMARY.STATIVE
'if I had paid more it would be better for me'

Properties of special typological interest include dual agreement marking. Past-tense verbs (as in (1) and (4)) are head-marked, requiring prefixes (always

nominative) encoding the person and number of the subject. In tenses other than the past, null subjects are common, although subject number is encoded in the present tense and imperfective aspect suffixes. However, multiple marking of subject values can also occur, with independent nouns and pronouns, clitics in the auxiliary complex or past-tense subject markers, and subject-number-marking aspect suffixes cooccurring in a single sentence. All verbs can appear with object proclitics (seen in (1)) that encode the person and number of the object. In non-past-tense verbs, clitics in the second-position auxiliary complex encode the person, number, and case of the subject. With imperative verbs, these clitics encode the object. However, the language also has dependent marking for case, with a generalized object case suffix *-i ~ -y* on quantifiers, demonstratives, adjectives, and nouns and pronouns, as seen in the examples in (2) and (5).

Cupeño exhibits an unusual split-ergative system in which past-tense clauses have nominative-accusative case alignment while nonpast clauses, with the subject marked in the auxiliary complex, exhibit ergative-absolutive alignment. As previously noted, nominal constructions mark object case and the subject prefixes on past-tense verbs are nominative. However, the person-number clitics in the second-position auxiliary complex with nonpast verbs distinguish ergative (A) and absolutive (S, O) cases.

The many unusual typological properties of Cupeño hint that the language has undergone esoterogeny (Thurston, 1987), accumulating strategies for distinction from its neighboring languages. The split-ergative case system, the exuberant development of discontinuous constituency, and the *Suffixaufnahme* found in possessive expressions in questions are unattested elsewhere in Uto-Aztecan. Esoterogeny, using Thurston's characterization, is exactly what would be predicted in a language with very few speakers – probably never more than 1000 – incorporated into the linguistic ecology of aboriginal California, a classic example of an accretion or residual linguistic zone (Nichols, 1992). Golla (2000) has observed similar processes of accumulated distinctiveness in the California Athabaskan languages, the other major case in which a language family that is widespread outside aboriginal California has a few members within that zone.

Cushitic Languages

D Appleyard, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

The Cushitic languages are generally thought of as forming a distinct family of the Afroasiatic superfamily or phylum, comprising four branches in distribution from north to south: Beja, Central Cushitic or Agaw, East Cushitic, and South Cushitic. Of these, East Cushitic is by far the largest both in terms of number of languages and of the overall number of speakers of those languages. East Cushitic is also the most complex branch insofar as it is further divided into several discrete sub-branches: Saho-Afar, Lowland East Cushitic, Highland East Cushitic, and as has been suggested Dahalo, a single language formerly subsumed under South Cushitic. Indeed, some now prefer to see South Cushitic (minus Dahalo) as a further sub-branch of East Cushitic and not a separate branch of the family (see **Figure 1**).

In terms of numbers of speakers, most Cushitic languages are comparatively small, with a few thousands or tens of thousands of speakers, and occasionally with only a couple of hundred or fewer. Although available figures are not always reliable, the only Cushitic languages with more than 1 million speakers are Afar (1.5 million), Oromo (at least 18 million, all varieties), Sidamo (1.8 million), and Somali (between 10 and 11 million). The principal branches of the Cushitic family are as follows (see also **Figure 1**):

- Beja (or Bedawi, Bedawiye), though showing some dialect variation, is regarded as a single language and is the sole representative of North Cushitic.
- Central Cushitic or Agaw forms a fairly cohesive group of four small languages or dialect clusters, one of which, Bilen (Bilin), is spoken in Eritrea, the others in Ethiopia. The largest language is Awngi with about 300 000 speakers.
- The Highland East Cushitic group comprises five major languages with some variants that are sometimes considered separate languages, all spoken in the Rift Valley region of Ethiopia. The largest language is Sidamo (Sidaama) with about 1.8 million speakers, followed by Hadiyya with just under 1 million.
- The Lowland East Cushitic branch has the largest number of languages, about fifteen, stretching from Eritrea in the north to the south of Ethiopia, Somalia, and Djibouti, and beyond into Kenya and Tanzania. The Cushitic languages of Kenya are, in addition to Dahalo, extensions of those spoken to the north in Ethiopia and Somalia, and are all varieties of the two large Lowland East Cushitic languages, Oromo and Somali. The few Cushitic languages of Tanzania spoken by few people all belong to the South Cushitic branch, except for the probably extinct Yaaku, which has been seen as forming a discrete branch of Southern Lowland East Cushitic, perhaps linked to the Dullay (previously called Werizoid) languages of Ethiopia. Oromo and Somali are the languages with the

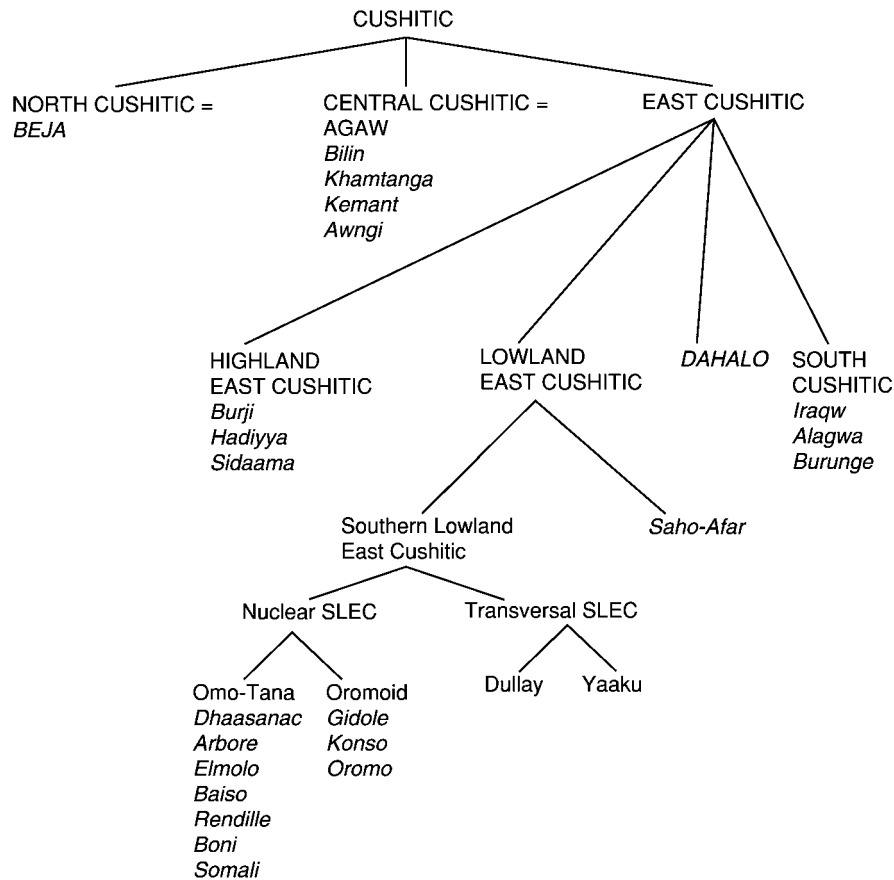

Figure 1 The Cushitic languages.

largest populations, at least 18 and 11 million speakers, respectively. Afar is the only other Lowland East Cushitic language with more than 1 million speakers, forming a separate sub-branch with the closely related Saho.

- The South Cushitic languages, all of which are spoken in Tanzania, and about whose position within the family there has been some debate, are all minority languages, and several are extinct or severely threatened.

The Question of Omotic

The ongoing re-analysis of the internal classification of Cushitic is not the only question regarding the nature of the family, nor the most recent one. For many years since the first attempts at classification of Cushitic, a further branch called West Cushitic was proposed, comprising a number of languages spoken in South West Ethiopia. There are sufficient substantial differences both in morphology and lexicon that set these languages apart from the rest of Cushitic, such that the erstwhile West Cushitic, now renamed Omotic, was proposed as a quite separate family of

the Afroasiatic phylum (definitively in Fleming, 1969), and the majority of linguists working in the area now concur with this classification. It has also been suggested that only part of Omotic, the Aroid (also called Ari-Banna, or Southern Omotic) languages, form a separate branch of Afroasiatic, while the rest are part of Cushitic. These problems of classification essentially revolve around the questions (a) of how much that is similar between Omotic and Cushitic is due to shared archaisms from Afroasiatic, and (b) how much arises from convergence due to an extended period of geographical proximity. There are certainly many similarities at all levels of linguistic analysis that are best explained by contact and convergence. Further discussion of Omotic is excluded from what follows.

Typological Characteristics of Cushitic Languages

While there is considerable variety in details of linguistic types among the Cushitic languages, it is by and large possible to draw up a list of structural features that exemplify most Cushitic languages. This

was done most clearly by Hetzron (1980: 14–53), and though some of the details are rather language-specific, what was said there is a sound statement. The features that he lists are all morphological, and it is indeed at the level of morphology (inflectional and derivational) that most of the strongest diagnostics can be found. A slightly different list is presented below, differing from Hetzron's principally only in its wider scope. Not all Cushitic languages obviously exhibit all of these features, but it is fair to say that a good part of them can be found or is traceable in probably all languages, and certainly in what Hetzron called the 'safe' branches of the Cushitic family: Agaw, Highland East Cushitic (his Rift Valley Cushitic), and Lowland East Cushitic (i.e., excluding South Cushitic). Lastly, what follows is by its very nature a generalization, and grammars of individual languages should be consulted for details.

Phonology

- a range of special coronal and velar consonants with secondary articulation, typically glottalized or implosive: e.g., t', d, ts', tʃ', k', g' . . .
- a tone-accent system with an underlying high-low contrast, functioning more in the context of morphological marking than lexically: e.g., Somali libaax = /libæːh/ 'lion' L.LL (subject case), L.HL (non-subject case), inan = /inan/ H.L (masc. 'boy'), L.L (fem. 'girl').

Morphology

- two genders, masculine and feminine, the latter being the marked form, either by suffix and/or tone, with concord marking in pronouns and verbs, and with gender marking in pronominal (demonstrative) particles being widely masc. k-, fem. t-.
- a primary case system with two terms: a marked nominative or subject case (probably originally only on masc. nouns), and an unmarked absolutive case. A special genitive or possessive case may probably be also added to the primary cases. Other case functions are variously expressed by postpositions, evolving variously into suffixes or verbal proclitics. The morphemes expressing these various case functions are also by and large common between languages: e.g., a dative/benefactive -s, also -k in some languages; a locative/allative -l or -d/-t, sometimes appearing with comitative function. The marked subject case is often -i, though the vowel -u is also used in some languages.
- heterogeneous noun plural formation by means of a wide array of suffixes and occasionally a

degree of internal modification. In some languages, Lowland East Cushitic especially, gender polarity can also be observed between singular and plural. The quantificational system of nouns often also includes categories such as collective, singulative, and paucal: e.g., Hadiyya fellaʔa 'goat(s)', fella-kkitʃtʃo '(one) goat', fella-ʔuwwa '(lots of) goats', fella-kkitʃtʃaʔa '(a few) goats'.

- person marking on verbs for subject with seven terms, gender being marked only in the 3rd person singular. (Here Beja differs, marking gender also in the 2nd singular.) The patterning of person marking morphemes employed is perhaps the most immediately visible diagnostic of the Cushitic languages, and indeed of their membership in the Afroasiatic phylum (see **Figure 2**). In some languages (e.g., Beja, Afar, Somali), there are two systems of person marking, one by means of prefixes to the verb stem (combining with suffixes for marking plural in the 2nd and 3rd persons), and the other by means of suffixes placed after the verb stem. The former is the more archaic, having direct correspondents in Berber and Semitic, while the second is a specifically Cushitic innovation, whereby an auxiliary inflecting after the archaic pattern became fused with the verb stem as a suffix element carrying both markers of person and tense-mood-aspect. The actual markers of person are the same in both types, except for the 3rd masc. and pl. where prefix y->∅. **Figure 3** shows prefix and suffix inflecting paradigms in two tenses in Afar; the suffix -[V]h is required here in final position where the verb is focused.
- the finite verb has three primary tense-mood-aspect (TMA) forms: a past or perfective, a non-past or imperfective, and a subjunctive which typically has both modal and dependent functions. These are distinguished by vocalic variation, either in the suffixes in suffix-inflecting verbs, or originally by internal vocalic modification of the verb stem in prefix-inflecting verbs. In addition to these three primary forms, most languages have developed a range of other TMA forms, often including distinct negative paradigms, sometimes employing

| | SING. | PLUR. |
|--------|-------|--------------|
| 1 | ʔ | n |
| 2 | t | t ... -n |
| 3MASC. | y > ∅ | y > ∅ ... -n |
| 3FEM. | t | |

Figure 2 The Cushitic 'block pattern' of person marking.

| | prefix perfect | prefix imperfect | suffix perfect | suffix imperfect |
|--------|----------------|------------------|----------------|------------------|
| 1sg. | u-duure-h | a-duure-h | fak-e-h | fak-a-h |
| 2sg. | tu-duure-h | ta-duure-h | fak-te-h | fak-ta-h |
| 3m.sg. | yu-duure-h | ya-duure-h | fak-e-h | fak-a-h |
| 3f.sg. | tu-duure-h | ta-duure-h | fak-te-h | fak-ta-h |
| 1p1. | nu-duure-h | na-duure-h | fak-ne-h | fak-na-h |
| 2p1. | tu-duuree-n-ih | ta-duuree-n-ih | fak-teen-ih | fak-taan-ah |
| 3pl. | yu-duuree-n-ih | ya-duuree-n-ih | fak-een-ih | fak-aan-ah |

Figure 3 Person marking in the verb in Afar.

auxiliaries and sometimes additional suffix elements. So, for example, alongside Afar fakeh and fakah, etc., in **Figure 3**, there are also such forms as jussive fakay ‘let me open’, requestive fako ‘may I open?’, negative perfective ma-fakinniyo ‘I didn’t open’, anticipatory fake-liyo ‘I will open’, negative present continuous fakah-maan ‘I am not opening’, and so on.

- the verb has a rich system of stem derivation expressing voice with such categories as passive, causative, autobenefactive or middle, reciprocal, etc. The markers of voice, which generally follow the lexical stem of the verb and come before person and TMA markers in suffix-inflecting verbs, show a marked degree of commonality between all Cushitic languages, with the causative marked by $-[V]s$, the passive by $-[V]m$, and the autobenefactive or reflexive by $-[V]t$, or elements that can be shown to have derived from such. Combinations of derivational suffixes also occur. Stem reduplication or partial reduplication is also typically employed in making iteratives, or sometimes reciprocal forms, often in combination with the primary stem derivational suffixes.

Syntax

- focus systems are common, often deriving from cleft constructions; special reduced subject-focus verb paradigms are also common: e.g., Oromo

obboleettii issa-tu foon nyaat-a
sister.ABS his-FOCUS meat eat-3MASC.SING.IMPERF
 ‘it is his sister who eats meat / **his sister** eats meat’ i.e.,
 verb 3masc.sing and not in agreement with focused
 subject.

Contrast the same sentence with predicate focus:

obboleettii-n isaa foon ni nyaat-ti
sister-SUBJ his meat FOCUS eat-3FEM.SING.IMPERF
 ‘his sister **eats meat**’

- clause chaining constructions, often including the use of special converbs, e.g., Hadiyya:

it’t’i-m sigg-aa woʔoo-ma
it-and cool-3MASC.SING.CONVERB water-DEF
 t’uut’-aa lasage k’ureʔe
suck-3MASC.SING.CONVERB after pot
 giira-nne kaas-akkamo
fire-LOC put-3POL.IMPERF

‘and after it has cooled and absorbed the water, one puts the pot on the fire’

Additionally, subordinate clauses often use special verb forms that are either of a relative clause verb type, or are ostensibly derived from relative constructions.

- sentence word order is SOV, though both head-final and head-initial types of phrase (e.g., noun phrases) occur.

Czech

L A Janda, University of North Carolina, Chapel Hill, NC, USA

© 2006 Elsevier Ltd. All rights reserved.

Czech is the official language of the Czech Republic (with over 10.2 million inhabitants), bordered by Austria, Germany, Poland, and Slovakia. There are significant emigré populations, particularly in the United States, Canada, and Australia.

Czech is a West Slavic language (with Slovak, Sorbian, and Polish). In 862 the ancestors of the Czechs became the first Slavs to achieve literacy in their own language when the Byzantine Saints Cyril and Methodius brought liturgical texts translated into Old Church Slav(on)ic. In the 12th to 14th centuries Czech underwent the 'přehláska' vowel-fronting changes that established 'hard' vs. 'soft' stem differentiations throughout the morphology. The 15th-century theologian Jan Hus is credited with the invention of diacritic marks to adapt the Latin alphabet to Czech phonology. Under the control of the Habsburg dynasty, particularly after the 1620 defeat at White Mountain, use of German was enforced at the expense of Czech. Czech endured decline and disuse before reasserting itself as a literary and official language in the early 19th century. The modern literary language is based on the 16th-century *Kralice* Bible, but vernacular Czech had continued to evolve, resulting in a pronounced gap between the literary and spoken language (involving phonology, morphology, syntax, and lexicon), often described as diglossia between Literary Czech (LCz) and Colloquial Czech (CCz).

Most peripheral zones of the Czech Republic belong to no dialect group due to resettlement by Czech speakers from other locations after German inhabitants were ousted at the end of World War II. The two largest dialect groups are classified according to their treatment of certain etymologically

long vowels as Bohemian (central and western) and Hanák Moravian (eastern). Northeastern Lachian Silesian and mixed Polish-Czech dialects serve as a transition to Polish, characterized by loss of vowel length, penultimate stress, and consonantism similar to Polish. Southeastern Moravian-Slovak dialects serve as a transition to Slovak, characterized by retention of *ů/ú* and of back vowels after palatal consonants.

Czech has the following consonant phonemes: voiced and voiceless bilabial, dental, palatal, and velar plosives; bilabial, dental, and palatal nasals; a dental trill; voiced and voiceless labiodental, dental, and postalveolar fricatives; a voiceless velar fricative; a voiced glottal fricative; voiceless dental and palatal affricates; a palatal approximant; and a dental lateral approximant. In addition, Czech has a double-articulation phoneme produced by simultaneous pronunciation of the dental trill and the voiced postalveolar fricative (*ř*). Final devoicing (*dub* [dup] 'oak') and regressive voicing assimilation of obstruents (*kdo* [gdo] 'who') is pervasive, and progressive devoicing occurs in certain word-initial clusters. Two subphonemic consonants are the velar nasal (an allophone of *n* before a velar, as in *banka* 'bank') and the glottal plosive, which appears before word-initial vowels and between vowels at the prefix boundary (eliminating vowel chains in Czech). Czech has a five-vowel system, consisting of short *a, e, i/y, o, u* and long *á, é, í/ý, ó, ů/ú*. There are seven native (*ij, ej, aj, oj, uj, ůj, ou*) and two borrowed (*eu, au*) diphthongs. The liquids *r* and *l* participate in both syllable peaks (as vowels in *smrt* 'death' and *vlk* 'wolf') and slopes (as consonants). The sole phonemic prosodic feature is vowel length. A non-phonemic stress falls on the first independent syllable of a phonological word (which may contain stressless proclitics and enclitics). CCz shows reflexes of *é>í/ý* and *ý>ej*. Since etymological *é* and *ý* figure as essential components of Czech morphology, these vowel

changes are prominent in differentiating CCz and LCz morphology. Another hallmark of CCz is prothetic *v*-before word-initial *o*-, as in CCz *vocas* 'tail' (cf. LCz *ocas*).

Inflectional morphology is expressed as synthetic terminal desinences added to the stems of nouns, adjectives, verbs, and most pronouns. Inflectional desinences conflate all relevant categories: gender, number, and case for nouns and adjectives; person and number for non-past conjugations; and gender, person, and number for past conjugations. All native stems are inflected, as are the vast majority of foreign borrowings. Morphophonemic alternations include: vowel-zero alternations (*pēs* 'dog'Nsg : *psi* 'dogs'Npl); qualitative vowel alternations (*moucha* 'fly'Nsg vs. *práce* 'work'Nsg); quantitative vowel alternations (*nést* 'carry' vs. *nesu* 'I carry'); and consonant alternations (*kniha* 'book'Nsg vs. *knize* 'book'Lsg).

All nouns have grammatical gender (masculine, feminine, neuter), and are declined for both number (singular, plural) and case (nominative, genitive, dative, accusative, vocative, locative, instrumental). Each gender has its own set of characteristic paradigms, including hard-stem types, soft-stem types, and special types. Masculine paradigms regularly signal animacy with distinctive animate endings in the Dsg, Asg, Lsg, and Npl. There are also special paradigm types that signal virile (male human) gender.

Adjectives are declined to match the gender, case, and number of the nouns they modify. Like nouns, adjectives have both hard- and soft-stem paradigms.

Pronouns have a mixed declensional type, using endings from both noun and adjective paradigms. Personal pronouns have both full (emphatic) and enclitic short forms.

Cardinal numerals are inflected for case, *jeden* 'one' and *dva* 'two' additionally distinguish gender,

and *jeden* 'one' distinguishes number as well. Ordinal numerals are declined as adjectives.

Verbal morphology expresses aspect (perfective, imperfective; obligatory for all forms), mood (indicative, imperative, conditional), voice (active, passive), tense (non-past, past), person (first, second, third), gender (masculine animate and inanimate, feminine, neuter), and number (singular, plural); motion verbs distinguish directionality. Past conjugation uses the auxiliary verb *být* 'be' in the first and second persons. As a rule, non-past conjugation of perfective verbs signals future tense, whereas non-past conjugation of imperfective verbs signals present tense. Imperfective verbs form a periphrastic future tense with forms of *být* 'be'. Most simplex verbs are imperfective (*volat* 'call'), but some are perfective (*dát* 'give'). Perfective and imperfective verbs can be derived from simplex verbs by means of prefixation and suffixation.

Czech is a pro-drop language; nominative case pronouns are emphatic. Czech case indicates the syntactic function of a given noun phrase and the relationship it bears to the verb and to other noun phrases and can also indicate pragmatic relationships. Word order is free, however there is a strict order of enclitics after the first stressed word in a clause.

Danish

T Lundskær-Nielsen, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Danish is the native language of more than 5 million people in the Kingdom of Denmark, including the Faroe Islands and Greenland, where Danish is the second language for most of the inhabitants. It is the first language of some 50 000 people in South Schleswig, North Germany, and of more than 100 000 Danes currently living in other European countries, including Norway and Sweden. There are also some Danish émigré communities in the United States and Canada.

History

Danish belongs to the North Germanic group of the Germanic languages. The earliest language of this group, Ancient Scandinavian (c. 200–600), was common to the Scandinavian area, as indicated by runic inscriptions. Around the 9th century, the descendant language, Old Scandinavian, gradually developed into two distinct branches, viz., West Scandinavian (Old Norwegian and Old Icelandic (or Old Norse)) and East Scandinavian (Old Danish and Old Swedish). Historically, the Danish language may be divided into three periods: Old Danish (c. 800–1100) spans the Viking Age, Middle Danish (c. 1100–1500) was the language of the late Middle Ages, and Modern Danish covers the time from around the Reformation (and the first translation of the Bible) to the present. Of the Scandinavian languages, Danish is now closest to Norwegian *bokmål* and Swedish. For more than 400 years (1380–1814), Norway was part of a Dual Monarchy under the Danish Crown.

Early changes from Old Scandinavian to East Scandinavian saw some diphthongs develop into monophthongs (e.g., <ai> and <ei> > <e> and <au> and <øy> > <ø>) and the loss of <h> before <l, n, r>. In Middle Danish, a number of changes in sounds and spelling began to distance Danish (Da.) from Swedish (Sw.): (1) the full vowels <a, i, u> were weakened

to <e> [ɐ] in unstressed syllables (e.g., Sw. *skriva*, Da. *skrive* ‘write’); (2) the aspirated stops <p, t, k> became unaspirated <b, d [ð], g [j]> (e.g., Sw. *gata*, Da. *gade* ‘street’); and (3) the sounds [d, g, v], when they did not disappear altogether, changed into [ð, j, w], respectively, with [j] and [w] often becoming the second element of diphthongs (e.g., Da. *dag* [daj] ‘day,’ *liv* [liw] ‘life’).

Orthography

Modern Danish has the same 26 letters as English has, plus the three additional vowels, <æ> [ɛ], <ø> [ø], and <å> [ɔ], which are placed last in the alphabet; the letters <q, w, x, z> occur only in foreign loans. Since there have been very few and only minor spelling reforms for centuries, Danish spelling does not accurately reflect the pronunciation. This is true concerning both consonants and vowels.

Pronunciation

Danish has some 15–20 consonant phonemes, comprising at least the stops /p t k b d g/, the fricatives /f v s ð/, the nasals /m n ŋ/, the lateral /l/, the uvular /r/, the glottal /h/, and the two ‘semivowels’ /j/ and /w/. All the stops are voiceless, so /p t k/ and /b d g/ are distinguished solely by /p t k/ having (strong) aspiration and by /b d g/ being unaspirated. However, in positions other than initially before /j, l, r, v/ and/or a full vowel, /p t k/ are pronounced [b], [d] or [ð], and [g]. Postvocalic /r/ becomes vocalic [ʀ], merging with the preceding vowels, e.g., in the <-(e)r> ending of the present tense and the plural of some nouns, as in *jeg læse-r* /'1ɛ:ʂ/ ‘I read’ (cf. *at læse* ‘to read’) and *mange sted-er* /'sde:ð/ ‘many places’ (cf. *et sted* ‘a place’). The /h/ is pronounced initially only before a full vowel and is dropped before /j/ or /v/, as in *hjelpe* /jelb/ ‘home’ and *hvad* /vað/ ‘what.’

Danish has 11 vowel phonemes /i e ɛ α y ø ɐ u o ɔ/, all of which have a long and a short realization, so the real number may be said to be 22. There are eight front vowels – five unrounded /i e ɛ α/ and three rounded /y ø ɐ/ rounded – and three rounded back

vowels (/u o ɔ/). There are no unrounded back vowels. There are also some allophones, e.g., [œ̃] in relation to [œ], and [ɒ] in relation to [ɔ], both lowered by an adjacent /r/. The unstressed vowels [ə] and [ʌ] may be seen as allophones of /e/ and /r/, respectively. The number of front vowels (unrounded and rounded) is very large compared with most other European languages. In addition, there are two sets of diphthongs with an underlying long or short vowel, respectively, as the first element, and /j/, /w/, or /ʌ/ as the second, numbering over 20 in all.

Danish has a unique feature called *stød* (marked /ʔ/), which resembles the glottal stop in English but is more of a 'creaky voice' without complete closure of the vocal cords. It can occur when there is a so-called *stød* base in the form of either a long vowel or a short vowel + a sonorant (/l/ or a nasal), as in *hus* /hu:ʔs/ 'house' and *lyn* /lynʔ/ 'lightning.' Certain word pairs are distinguished in speech solely by the presence or absence of *stød* (*hund* /hunʔ/ 'dog' vs. *hun* /hun/ 'she'). Some southern Danish dialects are without *stød*, though.

There are no tones and no sentence accent in Danish, so the last stressed syllable shows no more prominence than other stressed syllables do. This can make Danish speakers sound rather dull and uninteresting to foreigners. The intonation contour of the stressed syllables is characterized by a gradual fall, but the first unstressed syllable in a prosodic stress group is on a higher pitch than the immediately preceding stressed one is. Both range of and variation in pitch are much narrower than in English, Norwegian, and Swedish.

Morphology

Danish nouns are inflected for number, gender, and case. There are two numbers (singular and plural), two genders (common and neuter), and two cases (unmarked case and genitive). Plural endings are *-e*, *-(e)r*, or *zero*-ending, though some foreign loans may retain a foreign ending, as in *faktum*, *fakta* 'fact(s)' and *fan*, *fans* 'fan(s).' The indefinite article is *en* in common gender and *et* in neuter (*en bil* 'a car,' *et dyr* 'an animal'); the definite article is either a front article (*den* or *det* (SG), *de* (PL)), used when an adjective follows the article, as in *den store bil* 'the big car,' *det store dyr*, *de store biler/dyr* 'the big car(s)/animal(s),' or an end article attached to the noun (*-(e)n* or *-(e)t* (SG), *-ne* (PL)), when there is no adjective, as in *bil-en* 'the car,' *dyr-et* 'the animal,' *biler-ne/dyre-ne* 'the cars/animals.' The genitive ending is *-s* (*bilen-s lygter* 'the car's lights').

Verbs have no person or number distinction and thus no agreement with the subject, as in *jeg/hun/de er/spiser* 'I am/eat, she is/eats, they are/eat.' There are

four conjugations: three weak ones with the past tense endings *-(e)de*, *-te*, *-de* and one strong one with the *zero*-ending (*-t*), as in *leg-ed*, *hør-te*, *sag-de*; and *sang*, *fand-t* 'played, heard, said'; and 'sang, found.' The past participle ending is *-(e)t*, as in *leg-et* 'played and *hør-t* 'heard.' The infinitive ends in *-e* or a full vowel (*at leg-e* 'to play,' *at få* 'to get'), and the present participle ends in *-ende* (*løb-ende* 'running'). There are two passive forms, an *-s* passive and a form with the auxiliary verb *blive* + a past participle, as in *brevet sendte-s/blev sendt* 'the letter was sent.'

Most adjectives agree with nouns and articles and have the endings *zero* or *-t* (SG) or *-e* (PL) in indefinite forms, and *-e* in all definite forms: *god smag* 'good taste,' *god-t arbejde* 'good work,' *god-e kager* 'good cakes' (definite forms were mentioned previously). Comparison of adjectives is marked by the endings *-(e)r* (comparative) and *-(e)st* (superlative) or *-* with longer adjectives – the adverbs *mere* and *mest*. Most adverbs have the ending *-t* (*han løb hurtigt-t* 'he ran fast').

Personal pronouns show case distinction (nominative vs. oblique) as well as person and number distinction, as in *jeg/mig*, *hun/hende*, *de/dem* 'I/me, she/her, they/them.' Some possessive pronouns inflect like adjectives (*min*, *din*, *sin* 'my, your, his/her/its [third-person reflexive]') and others have just one form in all uses (*hans*, *deres* 'his, their').

Syntax

Danish word order is relatively fixed, but a distinction must be made between main clauses and subordinate clauses. A sentence schema, devised by the Danish linguist Paul Diderichsen, can account for the order of most Danish sentences. As shown in Table 1, the two types of clauses consist of seven positions (to which can be added extra positions both initially and finally), but note the different order of **v**, **n**, and **a** (finite verb, subject (when not in front), and central adverbial, respectively). In main clauses, another element may move to the front (**F**) position for emphasis (i.e., topicalization), thus causing the subject (here: *han*) to move into the **n**-position. Note that the finite verb is always in second position, because Danish is a V2 language (**V** is the nonfinite verb). Examples of **A** (other adverbials) (especially) or **N** (object/complement, both indirect and direct) moving to the front position are common:

| F | v | n | a | V | N | A |
|------------|-----|-----|-------|-------|------------------------|----------|
| Til jul | har | han | altid | sendt | sin søster et brev. | — |
| Sin søster | har | han | altid | sendt | et brev | til jul. |
| Et brev | | har | han | altid | sendt sin søster | til |

Table 1 Positions in main and subordinate clauses in Danish^a

| Clause | Position | | | | | | |
|--------------------------|-------------|------------|-----------------|-----------------|---------------|---|-----------------------------|
| Main | F | v | n | a | V | N | A |
| | Han (He | har has | — | altid always | sendt sent | sin søster (IO) et brev (DO) his sister a letter | til jul. for Christmas.) |
| Subordinate ^b | k | n | a | v | V | N | A |
| | at (that | han he | altid always | har has | sendt sent | sin søster (IO) et brev (DO) his sister a letter | til jul. for Christmas) |

^aAbbreviations: F, front position (subordinate clause: k, = conjunction); v, finite verb; n, subject (when not in F); a, central adverbial(s); V, nonfinite verb(s); N, object/complement; A, other adverbial(s). Note that an indirect object (IO) precedes a direct object (DO).

^bAssume a preceding main clause: *Han siger* 'He says' (note that there is no change of order in English!).

Examples with a or VNA (moving together) in F can also be construed, but are rarer.

Questions are formed either by inversion of subject (S) and finite verb (v) (Sv > vS), thus leaving F empty, or by having a question-word in F (e.g., *Hvorfor* 'Why'):

| | | | | | | |
|----------|----------|----------|----------|----------|------------|----------|
| F | v | n | a | V | N | A |
| — | Har | han | altid | sendt | sin søster | til jul? |
| | | | | | et brev | |
| Hvorfor | har | han | altid | sendt | sin søster | til |
| | | | | | et brev | |

When a main clause (MC) follows a subordinate clause (SC), there is inversion in the main clause:

| | | | | | | | |
|-------|-----|-------|-------|-------------|------|------|--------|
| | SC | | | | MC | | |
| Da | han | havde | sendt | brevet, | gik | han | hjem. |
| k | S | v | V | DO | v | S | A |
| (When | he | had | sent | letter-the, | went | he | home) |
| 'When | he | had | sent | the letter, | he | went | home.' |

Language Authorities

Dansk Sprognævn (the Danish Language Council), which acquired legal status in 1997, monitors the development of Danish, including the adoption of new loanwords. The Council provides guidance on language matters and is the highest authority on modern Danish spelling.

Dardic

S Munshi, University of Texas at Austin, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

‘Dardic’ languages are spoken in northwestern Pakistan and Jammu & Kashmir state in India, and extend into Afghanistan. The region, commonly known as ‘Dardistān,’ i.e., ‘the land of the Dard (people),’ is composed of the whole mountainous territory of the Hindukush, Swāt, and Indus Kohistān, the valleys of the Karakoram, and the western Himalayas. Dardistān also includes some areas occupied by non-Dardic language speaking people. Situated between South and Central Asia, with Iranian languages on one side and Indo-Aryan on the other, Dardic languages are in contact with and influenced by languages of other language families, such as Sino-Tibetan, as well as the language isolate Burushaski. One of the characteristic features of Dardic languages is that they have similarities with both Indo-Aryan as well as Iranian, the two major branches of the Indo-Iranian languages.

Dardic languages were previously divided into three sub-groups: Kāfiri/Kāfir or (present-day) Nūristānī group, Khowār group, and the Dard group proper (Grierson, 1919; Kachru, 1969). However, scholars now believe that Nūristānī is a separate sub-group of Indo-Iranian, while other languages currently classified as Dardic are of Indo-Aryan origin (Morgenstierne, 1965; Bashir, 2003: 822). Based on historical sub-grouping approximations and geographical distribution, Bashir (2003) provides six sub-groups of the Dardic languages:

1. Pashai group, also called Laghmānī, Deganó, or Dehgānī (Chugani and Chalās-KuRangal forming the eastern dialects; Sum, Damench, and Upper and Lower Darra-i-Nur constituting the south-eastern dialects; and several western dialects)
2. Kunar group (Gawarbati, Shumashti, and Grangali-Ningalami classified as the Gawarbati-type; and Dameli)
3. Chitral group (Khowar and the Kalasha sub-group)

4. Kohistānī group (Tirahi; the Dir-Swat sub-group; and the Indus-Kohistānī sub-group)
5. Shina group (the Kohistān sub-group, including Chilāsī and other languages; the Astor sub-group including Astori, Drāsi, and other languages; Gilgit sub-group, including Gilgiti and Brokskat in addition to others; and Palula)
6. Kashmiri (Standard Kashmiri, Kashtwāri/Kishtwāri, Poguli, Sirājī, Rāmbani, and Bunjwali dialects).

Of these, only Kashmiri has a well-developed tradition of written literature dating back to the 13th century. Originally written in Shārada, the current officially recognized script for Kashmiri is a modification of Perso-Arabic/Nastālīq. Shina and Khowar have also developed a writing system by modifying the Perso-Arabic script.

Available information on the numbers of speakers of most Dardic languages is based on estimated figures. The total number of speakers is about 5000 for Grangali (in 1994; spoken in the valleys south of Pech River in Kandai, Afghanistan; *Ethnologue*, 2003); 5000–6000 or less for Kalasha (spoken in southern Chitral District in Pakistan, closely related with Khowar) and Dameli (spoken in Damel valley towards the left bank of Chitral River); 8000–10 000 for Gawarbati (mainly spoken in Afghanistan; some speakers were also displaced to Pakistan during war); 60 000 for Torwali (Rensch, 1992: 33; Bashir, 2003: 864; spoken in Swat valley and Chail side valley; most speakers are bilingual in Pashto, and more and more are becoming bilingual in Urdu); 60 000–70 000 for Swat-Dir Kohistānī (in 1995; Baart, 1997: 4; spoken in Swat Kohistan and Dir Kohistan; most speakers are bilingual in Pashto); 200 000 for Indus-Kohistānī (Hallberg, 1992: 89; spoken in District Kohistan); 300 000 for Khowar (spoken in Chitral; some speakers are also found in Yasin and Ishkoman, upper Swat, Peshawar, and Karachi); and over 4 million for Kashmiri (*Ethnologue*, 2003; Koul, 2003: 897; spoken in India, primarily in Kashmir valley and its surroundings, and also in Pakistan-administered Kashmir; most speakers are bilingual in Urdu and sometimes Punjabi or other languages).

Estimates for total Shina speakers in Pakistan vary greatly, from 0.5 million (Radloff, 1992: 93) to about 3 million (Schmidt, 1988: 107–108). There are approximately 20 000 Shins (Shina speakers) in India (Radloff, 1992: 93). Shina is spoken in Gilgit, Hunza, Astor valley, Tangir-Darel valley, Chilas, Indus-Kohistān, and in the gorges of Brog-yul in central Ladakh south of the Hindukush-Karakoram ranges. The inhabitants of Brog-yul, speaking the Brokskat dialect of Shina, prefer to be called Shins/Shrins but they are popularly known as Brokpas/Dokpas by their Ladakhi and Balti neighbors (Sharma, 1998: 1). Most Shina speakers are bilingual in Balti, Kashmiri (eastern dialects), Burushaski and Khowar (Gilgit dialect), and Pashto and Indus-Kohistānī (Kohistānī dialects) (Bashir, 2003: 878).

History and Development

‘Dardic’ is a cover term used for a group of geographically contiguous languages of Indo-Iranian origin that share several linguistic features characteristic of themselves. It is derived from another term ‘Dard’ (dental *d*), which was originally used to refer to an ancient tribe living in the present-day Dardistān. Dards have been variously mentioned in literature (Ptolemy’s ‘Daradrai,’ Strabo’s ‘Derdai,’ the ‘Dardæ’ of Pliny and Nonnus, and Dinsyios Periêgêtês’ ‘Dardanoi’; Grierson, 1919: 1). ‘Dārada’/‘Darada’ have also been referred to in Sanskrit literature (e.g., ‘Dārada’/‘Darada’ by Kalhana in *Rājatarangini*). In Sanskrit the term *Dard* means ‘mountain’ and was perhaps used because most of the Dardic area is mountainous (Kachru, 1969: 285). Mohi-ud-Din (1998: 19) points to the possibility that the term *Dard* may be a corruption of *Dravad*, given the historical evidence that Dravidians inhabited a vast area, including northern India, before the advent of ‘Aryans’ into this land. He further claims that Dards were not an ‘Aryan’ race but they were the original inhabitants of this area while Aryans came later. The term *Piśachas* or *Paiśachas* (‘flesh devourers’), a derogatory term, also used in literature for Dards, was probably used by ‘Aryans’ to refer to the natives who perhaps called themselves *Dards*.

There has been a considerable debate over the classification of Dardic languages in terms of whether they are a third branch of Indo-Iranian language family (other two being Indo-Aryan and Iranian), or (at least, some of them) are of pure Indo-Aryan origin. Dardic languages have preserved many archaic Indo-Iranian features otherwise lost in the modern Indo-Aryan languages. A defining feature of Dardic languages is that they have undergone only some of

the major Middle Indo-Aryan (MIA) phonological and morphological changes. They have also developed certain areal features neither found in other Indo-Aryan (IA) nor in Iranian languages.

Phonological Characteristics

Dardic languages have descended from the north-western group of the MIA languages. Non-Dardic members of the same group include Punjabi, Sindhi, and Lahnda. One of the characteristic features of the phonological system of Dardic languages is the retention of the three-way distinction of Old Indo-Aryan (OIA) fricatives/sibilants -ś (palatal), *s* (dental), and ṣ (retroflex), which merged into one (dental *s*) or sometimes two (palatal ś and dental *s*) in many New Indo-Aryan (NIA) languages. For example, Pashai, Shumashti, Dameli, Khowar, Kalasha, Swat-Kohistani, Torwali, Indus Kohistani, and Shina have retained all three sibilants, while Grangali, Tirahi, and Kashmiri possess two sibilants (ś and *s*). Dardic languages have also retained the consonantal component *r* in the derivatives of the OIA syllabic *r̥* that had a number of reflexes in MIA, viz., *a*, *i*, or *u*. Various OIA consonant clusters lost in other IA languages are retained in Dardic languages.

One of the major Dardic innovations is the (partial) loss of aspiration, mainly in voiced stops/obstruents (e.g., most Dardic languages, except Torwali, which has both voiced and voiceless aspirated stops), but sometimes also in voiceless obstruents (e.g., Pashai and Grangali). Loss of aspiration is a recent development in Dardic and could be a result of contact with Iranian languages where aspiration was lost at a very early stage. Traces of aspiration in Dardic are sometimes observed in the development of tonal contrasts (e.g., Khowar *buím* ‘earth’ vs. IA *b^huumi*; Pashai *duú^m* ‘smoke’ vs. IA *d^hūvāā* and OIA *d^huumra*).

Another innovation of Dardic languages is the development of retroflex affricates ɟ, ɟ^h, ʒ, and ʒ from various OIA clusters. This change could also possibly be attributed to areal influence. Retroflex affricates are also found in Burushaski spoken in the northwest frontier province in Pakistan and in Dravidian languages (It is a well-established theory that Dravidians were the original inhabitants of the region before the advent of Aryans who pushed Dravidians down south. The assumption is further strengthened by the presence of Brahui, a Dravidian language, in Afghanistan). Dardic languages have also developed a contrast between voiceless and voiced fricatives (e.g., *s/z* and sometimes *x/ɣ*), a distinction absent in most NIA as well as OIA languages but present in the Iranian languages. The vowel systems of many Dardic languages have undergone several changes.

Vowel inventories as large as the 16-vowel system of Kashmiri or the 20-vowel system of Kalasha are an example. Some of the phonological changes with respect to the vowels are vowel epenthesis, consonantal palatalization, and vowel harmony.

Morphosyntax

Like most areal languages, Dardic languages are typically postpositional with S(ubject)-O(bject)-V(erb) word order. The only exception, however, is Kashmiri, which is a V2 language (i.e., the inflected verb occurs at clause-second position). Most languages exhibit Split-Ergative case marking (e.g., Dameli, Gawarbat, Grangali, Pashai, Kalam Kohistani, Kashmiri), except a few that are Nominative-Accusative (e.g., Khowar and Kalasha) or fully Ergative (e.g., Shina). Complementizers in most Dardic languages are derived from the verb 'say' (e.g., Kalasha, Khowar, Palula, and Shina), but in many others *ki/ke* (*ki/zi* in Kashmiri), also used in most contact languages, is employed as a complementizer. Relative clauses are mostly prenominal with a fully finite verb, sometimes without a relative pronoun, and a relative-correlative construction – a typical IA and areal syntactic feature. Overtly marked case-endings behave like postpositions. Nominals preceding postpositions appear in oblique case (another typical areal feature).

Agreement patterns vary across languages. Both subject and object pronominal clitics may appear on the inflected verb (e.g., Kashmiri). In many Dardic languages animacy has become grammaticized (e.g., Khowar, Kalasha, and Torwali). Feminine gender is often marked by consonantal palatalization (e.g., Pashai, Shumashti, and Kashmiri). Most Dardic languages have developed a vigesimal counting system with (10 + n) numeral structure (sometimes with modifications) as compared to the typical IA (n + 10) system. Kashmiri is an exception, with the IA (n + 10) numeral system. A significant morphological feature of Dardic languages is a three-term (or larger), instead of the typical two-term, deictic system. For instance, the three-fold demonstrative systems of Pashai (proximate *yo* 'this', distal *e-lo* 'this', remote (*e*)-*se* 'that'; Bashir, 2003: 828) and Kashmiri (proximate *yi* 'this',

visible *bu/ho* 'that; masculine/feminine', invisible/remote *su/so* 'that; masculine/feminine').

Dhivehi

J W Gair, Cornell University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

General

Dhivehi (Dhivehi Bas, Divehi, Maldivian) is the language of the Maldives, where it is the official language, with approximately 3.2 million speakers (U.N., 2003). It is also spoken by about 3000 inhabitants on the island of Minicoy (Maliku), a territory of India, where it is known as Mahl. It is an Indo-European language of the Indo-Aryan family, and its closest relative is Sinhala of Sri Lanka, with which it forms a separate southern (island) subbranch. Though the two languages are clearly related and share many structural features, they are mutually unintelligible. The manner and date of their separation is uncertain, and serious scholars have proposed widely varying times. It has been suggested, on the one hand, that they represent a common source but separate settlements in the mid-first millennium B.C.E., the generally recognized date for the arrival of Sinhala in Sri Lanka. On the other hand, a date as late as the 10th century through the importation of Sinhala into the Maldives has been proposed. One problem is that some important sound changes that would appear to be common to the two, when examined closely, turn out to have slightly different conditions. Thus, there are signs of divergence as early as the 1st century B.C.E., but these are followed at several subsequent points by changes shared by the two languages that are of a kind that are uncommon elsewhere. Certainly the earliest and latest dates proposed seem extreme on the basis of more recent research, and one scenario might be that divergence began around the first century B.C.E. but was followed by Sinhala influence over time, together with some dialect admixture within Dhivehi and contact of both languages with South Indian Dravidian (for a detailed account see Cain, 2000).

The base vocabulary of Dhivehi is Indo-Aryan, but it has incorporated many words from other languages, including Arabic, English, and Dravidian as well as Sinhala.

The Maldives are a chain of over 1000 islands in atolls (a word borrowed from Dhivehi) ranging 450 miles north and south, and there are significant dialect differences within it. The standard language is based on the language of Malé, the capital, in the North. The speech of the southernmost atolls differs from the standard in important respects. There is also differentiation within the southernmost atolls (see Fritz, 2002). The Mahl of Minicoy is mutually intelligible with the Malé variety, and there

is significant cultural interaction between Minicoy and the Maldives. Maldivian literacy is high: almost 99% in 2001.

Although Dhivehi is the official language of the Maldives, and the first language of the regular inhabitants of the islands, there is widespread knowledge of English, and English is the medium of instruction in government schools.

Phonology

Like other Indo-Aryan languages, Dhivehi has voiced and voiceless consonants and a contrast between dental and retroflex stops. There are five vowels: *i*, *e*, *a*, *o*, *u*, that occur long and short. A retroflex grooved spirant /ʃ/ is unique to Dhivehi and derives from intervocalic retroflex /t/, with the latter reintroduced through loanwords. Two notable features, shared with Sinhala, are the lack of any aspirated consonant series and a set of prenasalized stops /^mb, ⁿd, ⁿḍ, ⁿg/ that contrast with nasal-stop clusters. Unlike in Sinhala, the consonant /f/ is of quite frequent occurrence, having arisen from a sound change /p/ > /f/, as well as from loanwords.

Orthography

The current Dhivehi script, known as ‘Thaana,’ is unique to that language. It is written left to right, and the characters are made to resemble Arabic, reflecting the influence of Islam. They are not Arabic, however, although the first nine letters were fashioned after Arabic numerals. The system is of the alphasyllabic type, with all consonants and vowels being written, but grouped in syllabic clusters. Vowels following consonants are written above or below them, as in many South Asian scripts, but unlike most Indic scripts, consonants do not imply an unmarked inherent vowel. Also, initial or independent vowels do not have their own signs but are written using the character *alifu* (↵) which has no phonetic value by itself, but serves as a vehicle for the same vowel diacritics that are used with consonants. Consonants not followed by a vowel are marked with *sukun* (◌◌). Thus, the name of the language in Thaana, with a transliteration (read right to left) and phonological representation (left to right) is:

$$\text{ސުކަނު ދިވެހި ބާސު} = \langle s - \text{sukun} \rangle + \langle \text{ba} \rangle \langle \text{hi} \rangle + \langle \text{ve} \rangle$$

$$\langle \text{dhi} \rangle = / \text{divehi bas} /$$

(For a fuller account, see Gair and Cain, 2000). The basic Thaana alphabet is supplemented by a set of characters for the numerous Arabic borrowings.

There is also an official romanization, designed to avoid diacritics, that reflects some English influence. Thus, long *a* is written <aa>, long *e* is <ey>, long *o* is <oa>, and retroflex *ṣ* is <sh>. The combinations <th> and <dh> represent dental stops, as in *Dhivehi* and *Thaana*. Thus the <h> represents dental articulation (vs. retroflex), not aspiration, which is lacking in Dhivehi. (For a description, see Maniku and Disanayake, 1990 or the Thaana equivalents in Cain and Gair, 2000.)

Morphology

Although there are differences in inflectional forms across dialects, the major categories are shared (see Fritz, 2002; Cain and Gair, 2000).

Nouns are human or nonhuman in gender. They inflect for case (direct, dative genitive, instrumental, and locative), definiteness (definite, indefinite, and unspecified), and number (singular and plural, though the singular is generally unmarked in inanimate nouns).

The verbal system includes derivational relationships in stems between active, involitive/intransitive, and causative forms. There are finite and nonfinite forms based on three stems: present, past, and participial. Finite verbs inflect for three tenses (past, present, and future) and three aspects (habitual, present, and perfect). Person and number categories vary with the dialect.

Syntax

The basic constituent order in Dhivehi is subject-object verb, as illustrated in (1), though other orders are possible for pragmatic effect. It is a thoroughgoing 'right headed' language, with complements and modifiers preceding heads, as illustrated in (2). This includes relative clauses, which use a tensed relativizing (adjectival) form of the verb, as in (3). Note that, the singular of inanimate nouns is commonly used in the plural as well. An important feature of Dhivehi, shared with Sinhala, is the presence of a focus cleft construction of frequent occurrence in discourse. In Dhivehi, this is formed with a 'prefocus' form of the verb, as in (4).

- (1) alī e mīhā duṣ.
Ali that person see.PAST
'Ali saw that person.'
- (2) mi raⁿgaḷu tin fot
this good three book-Sg/Pl
'these three good books'
- (3) [hassan alīy-aṣ din] fot

Diachronic Morphological Typology

A Harris and Z Xu, State University of New York,
Stony Brook, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

The morphology of various languages has been typed in terms of prefix, suffix, infix, and circumfix, although this omits some types, such as ablaut and subtractive morphology. This article considers the diachronic origins of these affix types and the diachrony of the so-called suffixing preference. Languages have also been typed as fusional, agglutinating, or isolating; the diachrony of these and related concepts is explored in the last section.

Diachronic Origins of Affixes

Prefixes and Suffixes

Most affixes are formed either from old affixes or from grammatical words through the process of grammaticalization. For example, the Old Georgian ergative case suffix, *-man*, is derived from the ergative singular case form of the definite article, *man* ‘the,’ which followed the noun and was unstressed. In Modern Georgian the ergative suffix is *-ma* or, after a vowel, *-m*. Prefixes are formed in a similar way, usually from grammatical material proclitic to a lexical item.

Infixes

An infix is a morpheme appearing within another morpheme. Alan C. L. Yu showed that typologically there are several phonological units to which infixes can be adjacent: first consonant, first vowel, final syllable, final vowel, stressed syllable, stressed vowel, stressed foot (Yu, 2003). Yu argued that the reason why an infix tends to be close to the boundary of the base to which it attaches is because it has been either a prefix or suffix historically. For example, the Proto-Muskogean plural **obo-* prefix developed into a prefinal syllable infix, *-bo-*, in Creek-Seminole (Muskogee) (e.g., *likw-i*: ‘rotten’ → *likhow-i* ‘rotten.PL’) (Martin, 1994, cited in Yu, 2003).

Yu discussed four processes that give rise to infixes: entrapment, metathesis, reduplication mutation, and prosodic stem association. For example, in Proto-Muskogean the mediopassive proclitic **il-* appeared after the applicative **a-* and the plural **obo-*, which were later reanalyzed as part of the verb stem, entrapping the intervening affix **il-* (e.g., **obo-il-icca* ‘be shot’ → Alabama *holicca* ‘be shot’) (Martin and Munro, 2005, cited in Yu, 2003). A case of metathesis causing infixation comes from Copainalá Zoque (CZ). The third-person marker was historically a

prefix, **i-*, which later became a glide. Metathesis turned all **j + C(onsonant)* sequences into *Cj* in CZ (e.g., *mula* ‘mule’ → *mjula* ‘his mule’) (Yu, 2003: 221). Reduplication mutation can also trigger infixation. In Pre-Trukic the durative form of **kasam^wó:nu* ‘pay chiefly respect to’ was **kak-kasam^wó:nu* ‘be in the habit of paying chiefly respects to.’ After the dropping of initial **k*, the reduplicated form became **ak-kasam^wó:nu*, which was later reanalyzed as **akk-asam^wó:nu*. The V(owel)kk-affix was generalized in other vowel-initial verbs. After a process took place in which a glide *w* was inserted verb-initially and became part of the base, *Vkk*-turned into an infix. For example, in Trukese the durative form of *win* ‘drink’ is *w-ikk-in* ‘be in the habit of drinking.’ A case of prosodic stem association causing infixation is what Yu called “Homeric infixation” or “*ma*-infixation,” a colloquial expression indicating “roughly attitudes of sarcasm and distastefulness” (Yu, 2003: 249). For example, *-ma*-in *whatchimacallum* ‘what you may call him’ comes from the word ‘may.’ Because the construction with *-ma-* indicates colloquialism and *-ma-* usually appears between two metrical feet (e.g., [*whatcha*]-*ma*[*callit*], [*thingu*]*ma*[*bob*]), speakers analyze it as an infix.

Circumfixes

A circumfix is a single complex affix composed of a prefixal and a suffixal part functioning together. The circumfix as a whole expresses a single meaning or category, and the parts of a circumfix are not affixed separately to the same base to which they are affixed together.

The Proto-Austronesian circumfix **ka-an* has two meanings, only one of which is described here. In some of the Formosan languages, and in languages of the Philippines and western Indonesia, *ka-an* forms nouns, often ones meaning a location or having some other concrete meaning. Proto-Austronesian also had a prefix **ka-*, which formed nouns, and a suffix **-an*, marking ‘locative focus.’ Thus, two Proto-Austronesian affixes may have come together, combining their meanings; these became a circumfix and no longer function as a distinct prefix and suffix, even though the prefix or the suffix is also continued in some languages (Blust, 2003).

We learn more by looking at the facts of Algic languages. In Algonquian, circumfixal pronominals are used in noun possession and the independent order, the set of verbal paradigms used in most main clause statements. These are reconstructed as follows:

- | | |
|--------------------|------------|
| (1) 1 PL exclusive | *ne-enaan- |
| 1 PL inclusive | *ke-enaw- |
| 2 PL | *ke-waaw- |
| 3 PL | *we-waaw- |

Proto-Algonquian *-enaan- (first person exclusive) is cognate to Wiyot *binód* ‘we, us,’ a separate word; Proto-Algonquian *-waaw- is cognate to Wiyot *wow*, a particle or postposition used only to pluralize the second person pronoun, *khil*. Wiyot is a language of the Ritwan group, distantly related to Algonquian, the two groups together forming the Algic family. Thus, it appears that in Proto-Algonquian the independent words *-enaan and *-waaw came to be suffixed to forms already prefixed with *ne- and *ke- and that at some point these prefixal and suffixal pairs were reanalyzed as circumfixes (Ives Goddard, personal correspondence).

Summary

Prefixes and suffixes are most often derived either from old affixes, not illustrated here, or from grammatical words, usually with an intermediate stage as a clitic. Infixes are usually derived from prefixes or suffixes, and circumfixes from a combination of prefixes and suffixes. Usually affixes occur in the same position, relative to a base, as the clitic from which they derive.

The Suffixing Preference

The suffixing preference, first noted by Edward Sapir (Sapir, 1921), is the generalization that suffixing is far more frequent than prefixing crosslinguistically.

John A. Hawkins and Gary Gilligan set out to quantify the suffixing preference (Hawkins and Gilligan, 1988). Using a sample of about 200 languages, they studied the distributions of specific affixes of both nouns and verbs (e.g., case markers, tense markers) for distribution as prefixes or suffixes in relation to word order type (head final vs. head initial). Their findings show a strong suffixing preference for affixes of most types tested (but a slight prefixing preference for object markers and only a weak suffixing preference for markers of subject, negation, and voice). They state 18 implicational universals, several of them exceptionless, such as the first one below:

- If a language has case affixes on n[oun], they are always suffixed.
- If a language has SOV, causative affixes on v[erb] (if any) are suffixed with more than chance frequency.

Hawkins and Gilligan proposed an explanation of the suffixing preference in terms of competition between two forces. One is an independent

head-ordering principle (HOP), which states that “heads are identically ordered relative to their modifiers at [morphological and syntactic] levels” (Hawkins and Gilligan, 1988: 220). The second component of the competition is a processing preference for ordering the important part of a word before the less important, and hence for stems before affixes; this is elaborated in Hawkins and Cutler (1988).

Christopher Hall observed a problem with the proposed explanation in terms of the HOP and processing preferences: it is incomplete in that it does not explain how processing preferences are linked to language types (Hall, 1988). That is, the notion of competition between the HOP and processing preferences provides no means of implementing these preferences. Hall proposes instead that the processing mechanism influences the diachronic changes that lead to the formation of prefixes or suffixes. Thus, suffixing is more common because the language processor influences diachronic processes that determine whether an affix will develop as a prefix or suffix.

Affixes in Verb Forms

Most grammatical affixes in verbs are derived from old verbal morphology, from auxiliaries, or from adverbs; new subject and object agreement affixes may originate as pronouns or as auxiliaries. In all instances, independent words usually become clitics before they go on to become affixes. It is widely assumed that the position of an affix is usually due to the position of the clitic from which it derives. This assumption is often attributed to Givón, 1971, but in fact it was made traditionally in historical grammar. Many linguists believe that the historical origin of an affix is one part of the explanation of its position as a prefix or suffix and thus that history plays an important part in explaining the suffixing preference.

Joan M. Bybee, William Pagliuca, and Revere Perkins studied the suffixing preference by surveying 71 languages (Bybee *et al.*, 1990). They observed that grammatical morphemes (e.g., adpositions, clitics, particles, and auxiliaries) following the stem are more likely to become affixes than are grammatical morphemes preceding the stem. Categorizing the languages in their sample into three groups based on word order type, i.e., V(erb)-initial languages, V-medial languages, and V-final languages, they distinguished bound and unbound grammatical morphemes in both preposed and postposed positions. They focused on the relation between verb stems and grammatical morphemes, specifically particles and auxiliaries.

Their data showed that postposed grammatical morphemes far outnumber preposed ones and have

a strong tendency to be bound. In the 32 V-final languages they studied, Bybee, Pagliuca, and Perkins found 1018 postposed grammatical morphemes, 80% of which are bound (i.e., are suffixes), and only 233 preposed grammatical morphemes. Based on the hypothesis that affixes that develop from lexical or grammatical forms stay in their original positions, they explain that in V-final languages auxiliaries, which typically follow main verbs and are a primary source of grammatical morphemes, become suffixes. Additionally, their data suggest that it is more usual for person/number markers to be suffixes in V-final languages (see **Table 1**). **Table 1** shows that the number of postposed person/number markers (171) is almost twice that of preposed person/number markers (90), and all postposed person/number markers are bound (are suffixes) in languages of this type.

Putting aside the cases in which person/number markers postpose in V-initial languages, Bybee, Pagliuca, and Perkins observed no suffixing preference in V-initial languages. “The tendency for preposed grams [grammatical morphemes] to be bound [is] slightly stronger than the tendency for postposed grams to be bound, but ... it is statistically not significant” (Bybee *et al.*, 1990: 13) (see **Table 2**).

Turning now to V-medial languages, Bybee, Pagliuca, and Perkins found that they show a slight

preference for preposing grammatical material, together with a strong preference for these morphemes not to be bound (see **Table 3**). Their account of this dispreference for prefixing in V-medial languages is that clause-internal auxiliaries do not necessarily attach to verb stems; for example, they may “fuse with pronouns and with one another to form an auxiliary complex that occurs between the subject and the verb, or in second position in the clause, without ever fusing with the verb” (Bybee *et al.*, 1990: 31); prefixing is conditioned by the semantic relevance of clause-internal grammatical morphemes to verb stems.

On the basis of data from 237 languages, Anna Siewierska and Dik Bakker found that there is no suffixing preference for agreement markers (Siewierska and Bakker, 1996). They attributed this in large part to the inclusion in their sample of many languages of North America, a large number of which have subject or object agreement prefixes. However, even without the languages of North America, their data showed a slight preference for subject agreement prefixes, and only a slight preference for object agreement suffixes. Thus, they found no suffixing preference for agreement.

Studies that show us what happens to particular grammatical morphemes over time are especially valuable in understanding these issues. Comrie (1980) showed that Classical Mongolian (attested from the 13th century) had the word orders SOV and adjective-noun and lacked verb agreement. When the subject was a pronoun, the language permitted a variant of SOV, with an unstressed pronoun subject following the verb. The permitted orders in Classical Mongolian can be illustrated from contemporary Halh Mongolian.

- (2a) bi med-ne
I know-PRES
'I know'
- (2b) med-ne bi
know-PRES I
'I know' (Comrie, 1980: 90)

Table 1 Position and boundedness of person/number markers in V-final languages

| | Nonbound | Bound | All |
|-----------|----------|------------|-----------|
| Preposed | 13% (10) | 87% (80) | 35% (90) |
| Postposed | 0 | 100% (171) | 65% (171) |

Buriat and other daughters have subject agreement suffixes derived during the historical period from the variant in (2b). It is usually assumed that independent pronouns occur in the same basic position as full nouns, unless the pronouns cliticize, and this is recognized as the first stage on the way to grammaticalization as an agreement marker. What we do not know in this case is whether in a stage of Mongolian before the first attestation, free pronouns occurred only where full noun subjects occur, as usually assumed crosslinguistically, and then moved into enclitic position. If so, this trivializes the idea that we can explain the order in which affixes occur by the order of the words from which they derive.

We do know that in the history of French, object pronouns occurred after the verb in independent forms and later, when cliticized, moved into immediately preverbal position. SVO order, with object pronouns following the verb, was established in Latin as early as the 5th century. In Old French (SVO), stressed pronouns remained in the position used for full NPs, while unstressed pronouns were attracted to the verb, usually occurring immediately before it. According to many, these Old French clitics have developed into agreement prefixes in the modern language, though others consider them still to be proclitics (and they are still written as separate words). In either case, this is another example of a clitic developing in a position different from that of the stressed pronoun.

It is widely agreed that the position of an affix is very often determined by the position of its etymon before grammaticalization. New affixes most often develop from clitics, but the position of a clitic is largely determined by prosodic conditions. As discussed above, a pronoun may be cliticized in a position in which it did not occur before becoming a clitic, and a definite article may also cliticize in a new position. For prosodic reasons, clitics are attracted to certain positions relative to other words or relative to the clause as a whole. It is the position of a clitic, not that of the lexical item to which it corresponds, that largely accounts for the position in which it grammaticalizes as an affix.

Bybee (1988: 358) and Bybee *et al.* (1990) suggested that the apparently lower tendency of preposed grammatical material (in comparison with postposed) to grammaticalize as an affix may be due to the fact that other words intervene. Recent work on grammaticalization in progress seems to support this. Kraehenmann and Plank (forthcoming) shows that proclitic articles on their way to becoming prefixes in two German dialects seem to be prevented from doing so by the intervention of other lexical items, such as adjectives, between the article and

noun. For additional discussion of the relation between order of words and order of morphemes from a historical point of view, see Harris and Campbell (1995: 199 ff.).

Affixes in Nominal Forms

When we turn to the issue of the suffixing preference in nouns, the facts are a little different. There are very few case prefixes in the languages of the world, and even where they do occur, it appears that there are no whole declensions consisting just of case prefixes.

There are several known sources for affixal case markers, including old case markers, definite articles, and adpositions. Greenberg (1978) showed that definite articles, themselves derived from demonstrative pronouns, often become gender class markers or case markers. For example, certain case suffixes can be shown to be derived from postposed definite articles in Georgian (see 'Prefixes and Suffixes' above), and whole new declensions may also be constructed in this way.

Postpositions often become case suffixes: for example, Votic (Vod), a Balto-Finnic language, still retains the comitative postposition *kāsa*, *kaaza*, and from it has developed a case suffix shown in *mineka* 'with what,' *jummalaga* 'with God,' *lehmika* 'with cows' (Oinas, 1961: 36–40).

In Hungarian, inflected forms of nouns have been reanalyzed as complex cases. It appears, however, that these inflected nouns went through an intermediate stage as complex postpositions before becoming suffixes. Similarly, serial verbs may become case prefixes, but it is most likely that they are prepositions at an intermediate stage. Thus, we cannot be sure that nouns and serial verbs constitute distinct sources of cases; both are known to be sources of adpositions, and it is most likely that it is these that give rise to cases.

Greenberg (1978) documents in detail that in various languages, mostly African, the definite article can be preposed or postposed and may become a gender prefix or suffix respectively. As we have seen, definite articles may instead be grammaticalized as case markers, but virtually all of the latter are suffixes.

There is a great deal here we do not yet understand. In languages that have definite articles that precede nouns, do the articles not grammaticalize as case markers, or do they become enclitics and then grammaticalize as suffixal case markers? Whatever historical behavior results in only case suffixes, why does it apply to case marking and not to gender marking (or why does it apply to gender marking to a lesser extent)?

Summary

Research has confirmed the existence of a suffixing preference in both nouns and verbs. For V-final languages this preference is very strong, but for both V-initial and V-medial languages suffixes are preferred in the verb less strongly than in V-final languages. There are also significant differences among different types of verbal affixes, with agreement markers more likely than most other types to be prefixes, looking at languages of all types together. There is also evidence that in at least some language types postposed grammatical material is more likely to be bound than is preposed grammatical material. In the noun we find an overwhelming preference for case suffixes; other noun affixes, such as markers of gender and number, exhibit a somewhat weaker preference for suffixal position.

The position of affixes is best explained historically and with reference to language processing. Historical explanation of affix position refers to the position of the clitics from which prefixes and suffixes derive, and to the additional events that result in the creation of infixes and circumfixes. There is still much to be learned about the positions in which clitics form diachronically.

Fusional, Agglutinating, Isolating

A morphological typology to which linguists have returned repeatedly designates languages as fusional, agglutinating, or isolating. A language is said to be fusional (or flecational or inflecting) if the separation between morphemes is not readily apparent. Characteristically, in such languages inflectional morphemes each express two or more categories (for example, number + case in the noun, or tense + person + number in the verb). Many Indo-European languages, such as Latin, Greek, and Sanskrit, are examples of this type. In Russian declensions, as shown in (3), each suffix indicates number and case, and some also indicate declension class.

| | | | | |
|---------------|----------|----------|-----------|------------|
| (3) | I | | II | |
| | Singular | Plural | Singular | Plural |
| Nominative | stol | stol-y | komnat-a | komnat-y |
| Accusative | stol | stol-y | komnat-u | komnat-y |
| Genitive | stol-a | stol-ov | komnat-y | komnat |
| Dative | stol-u | stol-am | komnat-e | komnat-am |
| Instrumental | stol-om | stol-ami | komnat-oi | komnat-ami |
| Prepositional | stol-e | stol-akh | komnat-e | komnat-akh |
| | | 'table' | | 'room' |

If we consider here, for example, the genitive plural of *stol*, *stol-ov*, we cannot say that one part of *-ov* indicates the genitive, another the plural, and a third the first declension. Rather, *-ov* as a whole indicates all three of these values.

In an agglutinating language, words are made up of a sequence of morphs, each expressing a separate category, and the boundaries between morphemes are unambiguous. Turkish is often cited as an example of an agglutinating language, for here number and case are expressed by different morphemes in the noun, for example. Old Georgian (4) illustrates agglutination in the verb.

(4) Old Georgian 'write' in the optative

| | | |
|---|----------|------------|
| | Singular | Plural |
| 1 | v-c'er-o | v-c'er-o-t |
| 2 | s-c'er-o | s-c'er-o-t |
| 3 | c'er-o-s | c'er-o-n |

In the Old Georgian verb paradigm in (4), the morpheme *v-* marks first-person subjects without respect to number, while *s-* marks second-person subjects. The optative is indicated by the suffix *-o*, and plurality of the subject by *-t*. These aspects of this paradigm are agglutinative, but some fusion is found in the third person, where one suffix, *-s*, combines the marking of person and singular number, while *-n* combines the marking of person and plural number.

In an isolating language the forms of words are invariable, and such languages are sometimes said to have no morphology. An isolating language depends more upon syntax to express grammatical categories and relationships among words. Vietnamese is often cited as an example; see (5).

| | | | | | | |
|-----|--|-----|---------|-------|--------|------|
| (5) | Khi | tôi | đến | nhà | bạn | tôi, |
| | when | I | come | house | friend | I |
| | chúng | tôi | bắt đầu | làm | bài. | |
| | PL | I | begin | do | lesson | |
| | 'when I came to my friend's house, we began to do lessons' | | | | | |
| | (Comrie, 1988: 40) | | | | | |

Each morpheme in (5) is a word, with the possible exception of *bắt đầu* 'begin.' There is no morphological variation for either tense or case. Plurality is indicated by the addition of a separate word *chúng*.

This typology can usefully be broken down into two scales, each with a single criterion – the index of synthesis (based on the number of morphemes per word) and the index of fusion (based on the number of categories expressed per morpheme). These indices represent an advance, but to the extent that they require generalizing over an entire language, they are still abstract and subject to differing interpretations. That is, many languages mix types, even within a single paradigm (as illustrated in [4]), and, for this reason and others, two specialists could still reach different conclusions about the type to which a given language belongs.

When we look at historical aspects of this typology, we find that many languages or language families have changed type historically. An isolating language can become agglutinating by accumulating new affixes through one of the means described in 'Diachronic Origins of Affixes.' In an agglutinating language, affixes may merge, and the language may then become fusional. A fusional language may lose its affixes, becoming an isolating language. For example, Old English had fusional markers in both the noun and the verb and has lost most of these, becoming more isolating (for additional examples, see Crowley, 1992: 134–136). Although it is sometimes implied that change cycles only in this direction – isolating → agglutinating → fusional → isolating, etc., – it is possible for a language to change in the opposite direction as well. An example of change from agglutinating in the direction of isolating is the Artašen dialect of Laz, which has lost all of its case markers, though it has retained most of its other morphology (Harris and Campbell, 1995: 216–217). Agglutinative affixes can be lost as well as fusional ones. Notice, too, that if a language goes in the direction specified but skips a step, that is equivalent to going in the opposite direction.

Closely related to this typology are the general labels 'synthetic' and 'analytic.' A construction, is said to be synthetic if several categories are expressed within a single word, while in an analytic construction, categories are expressed through periphrasis, that is, by combining words in a phrase. English *jumps* is synthetic, while *is jumping* is analytic because *jumping* is combined with *is*. In the history of French we can see a cycle from synthetic constructions in Classical Latin to analytic constructions and back to synthetic, for at least some forms. For example, the third person singular form of the imperfective future of the verb 'do, make' in Classical Latin was *faciet* 'he will do,' which in Vulgar Latin was replaced with the analytic (or periphrastic) expression *facere habet*, where the infinitive of 'do,' *facere*, is combined with an inflected form of the auxiliary 'have,' *habet*. In Old French this emerges as the single word *fera*, the third person singular of the future (Harris, 1978). In many ways this is a classic example of the synthetic-analytic cycle, but note that although the language moves from fusional to somewhat isolating and back to fusional, no agglutinative stage is involved. In a truly agglutinative verb form, person and number would be expressed by distinct morphemes, as in the Georgian example above, whereas at all stages of this change person and number are expressed together. When an auxiliary expresses person and number in a single morpheme, a natural outcome is for these categories to

continue to be expressed in a single morpheme in the synthetic form derived from the auxiliary. A similar complete cycle can be seen in Egyptian, where Old Egyptian was synthetic, Middle and Late Egyptian analytic, and Coptic, its descendant, again synthetic (Hintze, 1947; Hodge, 1970).

The classifications fusional, agglutinating, and isolating provide very general ways of typing languages; not all languages fit well into any one of these types, since a language may combine types in various ways. Languages may change in the direction agglutinating → fusional → isolating → agglutinative etc., but changes in the opposite direction are also known. Cyclic changes are attested, but it is not clear that these necessarily include all types.

Summary

A historical approach, sometimes paired with insights from language processing, provides an explanation of typological phenomena, including the occurrence of morphemes of different types (prefixes, suffixes, infixes, and circumfixes) and the suffixing preference.

Dinka

G J Dimmendaal, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

Dinka is spoken by around 1.4 million people, mainly in the southern Sudan. Together with Nuer and Atuot, it forms a subgroup within Western Nilotic, one of the three primary branches of Nilotic (Nilo-Saharan). Dinka divides into four major dialects or regional variants: Padang (Northeastern Dinka), Bor (Southeastern Dinka), Rek (Southwestern Dinka), and a south-central variant known as Agar (South Central Dinka); in addition, there is a more deviant northwestern variant known as Ruweng.

Although Dinka has been studied for over 180 years, it was not until more recently, mainly as a result of investigations by the Danish scholar Torben Andersen, that important structural features of the language came to be better understood. As argued by Andersen (1987; 1990; 1993), the (Agar) Dinka vowel system involves seven vowel qualities: /i, e, ε, a, ɔ, o, u/, whereby each vowel can be either breathy or creaky; historically, the breathy/creaky distinction goes back to a distinction between [+advanced tongue root] and [-advanced tongue root] vowels (Andersen,

1990). According to Andersen (1987), there is a ternary vowel-length distinction (short vs. mid vs. long), at least in the Agar dialect of Dinka (see Table 1). In an alternative analysis of the same phenomena, Gilley and Remijsen (forthcoming) interpret this ternary length distinction in Rek (Southwestern) Dinka in terms of the interaction between a binary length distinction and a complementary quantity contrast. The latter feature is supposed to account for the observed covariation between centralization of vowels, nucleus and coda duration, and the realization of coda consonants in a more natural way.

Table 1 Two Dinka nouns, transcribed for segmental phonemes and quantity both in the singular and in the plural, in terms of Andersen's (1987; 1993) ternary vowel-length hypothesis, and in terms of the complementary quantity hypothesis advanced by Remijsen and Gilley (forthcoming)

| | | Ternary vowel-length hypothesis | | Complementary quantity hypothesis | |
|---------|-----|---------------------------------|-------|-----------------------------------|-------|
| 'hand' | sg. | ciin | /VV/ | cin | /VC/ |
| | pl. | cin | /V/ | cinn | /VCC/ |
| 'grass' | sg. | noon | /VVV/ | noon | /VVC/ |
| | pl. | noon | /VV/ | noonn | /VCC/ |

Dinka distinguishes between high and low tones, which may also be combined to form a falling tone. It is an essentially monosyllabic language that nevertheless uses various layers in its derivational and inflectional morphology, involving segmental changes in the nucleus and the coda as well as tonal modifications (compare, for example, Andersen, 1993). This internal morphology corresponds to suffixation processes in more conservative Western Nilotic languages.

Whereas traditionally Dinka has been claimed to be a SVO language, Andersen (1991) has shown that the basic position of subjects in at least one variety of Dinka, Agar, is postverbally. Postverbal (but not preverbal) subjects are marked with Nominative case by way of tonal inflection, a feature also found in other Western Nilotic languages like Anywa (Anuak), Jur Lwo (Luwo), Pāri, or Shilluk. Preverbal noun phrases are topics, whose underlying grammatical relation can be that of subject, object, adverbial, or possessor. Compare:

- (1) b̩ɔ̃ɔ̃ ɔ̃-t̩ɔ̃ɔ̃ d̩ɔ̃ɔ̃k
 chief:ABS D-send boy
 'the chief is sending the boy'
- (2) d̩ɔ̃ɔ̃k ɔ̃-t̩ɔ̃ɔ̃ b̩ɔ̃ɔ̃
 boy D-send:NTS chief:OBL
 'the chief is sending the boy'

As further shown by Andersen (1991), such constructions are formally distinct from passives in Agar Dinka:

- (3) d̩ɔ̃ɔ̃k ɔ̃-t̩ɔ̃ɔ̃ (n)ɛ̃ b̩ɔ̃ɔ̃
 boy D-send:PASS PRÉP chief:OBL
 'the boy is being sent by the chief'

When no topic is expressed, sentences may be verb-initial in Agar Dinka. It remains to be determined to what extent the structure of Agar Dinka is characteristic for the Dinka cluster as a whole.

Dogon

J Bendor-Samuel, Summer Institute of Linguistics, High Wycombe, UK

© 2006 Elsevier Ltd. All rights reserved.

Dogon is spoken by about 500 000 people in north-east Mali, east of Mopti and the Niger river up to and astride the Burkina Faso border. In the past, within the Niger-Congo phylum, Dogon has been regarded as belonging to the Gur subfamily, but since the lexical and grammatical evidence for this is weak, it is now treated as an isolate within Volta-Congo. Though the Dogon people recognize themselves as one ethnic group, there are six major dialects and several additional smaller ones. The major dialects are: T̩m̩bo S̩ɔ̃, D̩n̩n̩ɔ̃ S̩ɔ̃, T̩ɔ̃ S̩ɔ̃, Jamsay, Togo Kan and Tom̩ Kan (Bendor-Samuel *et al.*, 1989).

Dogon has a seven-vowel system and displays a limited vowel harmony system with only one vowel of the pairs *e/ɛ* and *o/ɔ* occurring in any stem. This contrast is neutralized in nasalized forms. Nasalized vowels always occur after a nasal consonant but may also occur after oral consonants and word-initially.

There is contrast between high and low tones, but this is probably best analyzed as tonal accent. Once the position of the accented syllable and its associated tone are known, the pitch of the other syllables is predictable.

Close kinship terms exhibit a very restricted vestigial noun class system. The verbal system distinguishes perfective and imperfective forms and utilizes six verbal extensions that focus on the time and kind of action. The pronominal system comprises one basic set (nominal) from which three other sets, possessive, accusative, and embedded/addressee, are derived.

The basic word order is S.O.V. Sentences frequently concatenate verbs in verb strings with subject-verb agreement marked on the sentence final verb form. Subordinating conjunctions occur clause final; other conjunctions are clause initial. Questions are marked sentence final.

There is a topic-comment construction in which the subject or object is fronted and replaced by a pronoun in the comment. In general, a participant is introduced into a story indefinitely (a man) then

definitely (the man) and then as a pronoun (he). After the first pronominal reference, there may be zero reference.

Domari

Y Matras, University of Manchester, Manchester, UK

© 2006 Elsevier Ltd. All rights reserved.

Definitions

Domari is the language of populations that were traditionally commercial nomads (metalworkers and entertainers) throughout the Middle East and neighboring regions. Fragmented documentation exists from Azerbaijan in the north, through to Sudan in the south. There are still Domari-speaking communities in Lebanon, Syria, and Jordan; the number of speakers is unknown. The only well-documented variety is that of Jerusalem, now spoken by only up to 100 elderly people. They refer to their language as Dōmari or Dōmi. Names in other regions include Domani and Qurbati.

History

Like Romani, Domari shares a number of ancient isoglosses with the Central branch of Indo-Aryan, most notably the realization of Old Indo-Aryan *ṛ* as *u* or *i* (Sanskrit *śṛṇ-*, Domari *sun-/sin-* 'to hear') and of *kṣ-* as *k(h)* (Sanskrit *akṣi*, Domari *aki* 'eye'). It also preserves a number of clusters that have been lost in the other Central languages (Sanskrit *drākṣa*, Domari *drak* 'grape'; Sanskrit *oṣṭha*, Domari *ošt* 'lip'; Sanskrit *hasta*, Domari *xast* 'hand'). It appears therefore that Domari, like Romani, emerged as one of the Central Indic languages, but migrated prior to the loss of these clusters to the northwest, where the clusters were generally retained. Both Romani and Domari also share the pattern of renewal of the past-tense conjugation (through affixation of oblique enclitic pronouns to the past participle) with northwestern Indian frontier languages such as Kashmiri and Shina. The morphology of the two languages is similar in

other respects: both retain the old present conjugation in the verb (Domari *kar-ami* 'I do'), and consonantal endings of the oblique nominal case (Domari *mans-as* 'man.OBL', *mans-an* 'men.OBL'), and both show agglutination of secondary (Layer II) case endings (Domari *mans-as-ka* 'for the man').

It had therefore been assumed that Romani and Domari derived from the same ancestor idiom, and split only after leaving the Indian subcontinent. However, some isoglosses separating the two languages in phonology, morphology, and lexicon appear to be rather old, and point instead to a similar phenomenon of gradual northward and westward migrations, perhaps even to convergent development, rather than to a shared origin. Typical phonological developments that characterize Domari are loss of aspiration in *bh*, *dh*, *gh* to *b*, *d*, *g*; shift of medial *d*, *t* to *r*, of initial *v* to *w*, and of the retroflexes *ḍ*, *ṭ*, *ḍḍ*, *ṭṭ*, *ḍh*, etc., to *r*, *t*, and *d*.

The sound system

There is much volatility and variation in the Domari sound system. Consonants include the stops *b*, *d*, and *g*, and *p*, *t*, *k*, *q*, and *ʔ*, the fricatives *f*, *x*, *χ*, *ɣ*, and *h*, liquids *r* and *l* (and, marginally, a velarized *l*), the glides *y* and *w* (alternating with *v*), and the sibilants *s*, *z*, and *š*. The affricates *dž* and *č* alternate with their sibilant counterparts *ž* and *š*. Pharyngealization of the dentals *d*, *t*, and *z* enters the language in Arabic loans, but is often imported into the pre-Arabic (Indic) lexicon as well (e.g. /wa:tˤ/ 'stone'). The pharyngeals *ħ* and *ʕ* appear only in Arabic loans. Consonant gemination is distinctive.

Domari vowel phonemes are *a*, *e*, *i*, *o*, *ɔ*, and *u*, each showing a number of allophonic variants. Vowel length is generally distinctive, though the duration of a vowel in a given word may vary considerably. Stress normally falls on the final inflectional segment

of the word. Unstressed affixes are agglutinative (Layer II) case endings, external tense markers, and enclitic object pronouns.

Morphology

Nominal forms

The principal inflectional alternation in the noun is between two ‘basic’ or Layer I cases, nominative and oblique. Vocalic stems in the inherited (Indic) lexical component have the nominative endings *-a* (masculine) and *-i* (feminine). The most common oblique endings in the singular are *-as-* (*-s-* with vocalic stems) for masculines and *-ya-* (*-ē-* with vocalic stems) for feminines. Some consonantal stems, especially Arabic loans, take *-ī-* or *-ē-*. The oblique plural ending is generally *-(y)an-*. The oblique stem serves as the case of the direct object, and as the base for further (Layer II) agglutinative case formation, with the endings *-ta* (dative), *-ma* (locative), *-ka* (directive and benefactive), *-ki* (ablative and prepositional), and *-san(ni)* (instrumental and comitative).

Demonstratives and adjectives in attributive position agree with the head noun in gender, number, and case. Enclitic pronouns are used with nouns as possessive endings. They encode case and number (*putr-o-m* ‘my son’, *putr-i-m-ka* ‘for my son’, *putr-e-m* ‘my sons’), as well as person (*putr-o-man* ‘our son’). These enclitic pronouns also serve as object-concord markers with verbs, and as subject-concord markers with past-tense (perfective) verbs (*laked-om-ir* ‘I saw you’, *laked-or-im* ‘you saw me’). The genitive-possessive construction marks the head with a possessive affix and the dependent in the ablative/prepositional case (*kury-os mans-as-ki* house-3SG man-OBL-ABL ‘the man’s house’).

Verbs

Domari retains the Old Indo-Aryan intransitive (passive) derivation marker *-y-* (*ban-ari* ‘shuts’, *ban-y-ari* ‘is being shut’). The transitive/causative marker *-naw-* is also productive (*q-ari* ‘eats’, *q-naw-ari* ‘feeds’). The verb root with derivational augmentation constitutes the present or nonperfective stem. The perfective stem is formed by means of a perfective extension marker (*ban-ami* ‘I close’, *ban-d-om* ‘I closed’). Arabic verb roots are integrated by means of the ‘carrier’ verbs *-k(ar)-* (transitive, from ‘to do’), and *-b(r)-* (intransitive, from ‘to become’).

There are two sets of person markers. The present stem conjugation is (mostly) a direct continuation of the Old Indo-Aryan set of person markers (1SG *-m-*, 2SG *-k-*, 3SG *-r-*, 1PL *-n-*, 2PL *-s-*, 3PL *-n(d)-*). The perfective set derives partly from possessive markers in the singular, and from a combination of sources in the plural (1SG *-m-*, 2SG *-r-*, 3SG *-s-* [or M *-a*, F *-i*], 1PL *-n-*, 2PL *-s-*, 3PL *-e-*). The 3SG distinguishes between plain subjects, which show gender agreement (*kard-a* ‘he did’, *kard-i* ‘she did’), and agentive subjects (*kard-os-is* ‘he/she did it’).

Tenses draw on the two stems, present and perfective, and the affixes *-i-* (progressive) and *-a-* (remote), which are external to the person affixes. The present stem followed by *-i-* constitutes the present/future tense (*laha-m-r-i* ‘I see you’); followed by *-a-* it indicates the imperfect/habitual (*laha-m-r-a* ‘I used to see you/was seeing you’). The perfective stem forms the basis for the simple past (*lake-d-om-ir* ‘I saw you’), the perfect (*lake-d-om-r-i* ‘I have seen you’), and the pluperfect/counterfactual (*lake-d-om-r-a* ‘I had seen you/would have seen you’).

The copula is enclitic. In the third person, predicate nouns and adjectives take a predicative suffix (M *-ēk*, F *-ik*, PL *-ēni*). Most of the modal verbs are borrowed from Arabic, and carry Arabic person and tense inflection.

Syntax

Domari shows syntactic convergence with Arabic. Word order is VO-based and flexible, and clauses are finite. All conjunctions and particles and most adverbs and numerals are borrowed from Arabic, as are most of the prepositions. While demonstratives precede the noun, there is a tendency to use adjectives mainly in predicative constructions, which agrees with the Arabic word order noun-adjective.

Languages and Subgroups

The Dravidian language family, first recognized as separate by Francis Whyte Ellis in 1816, is the fifth largest language family in the world. It consists of four widely spoken literary languages and approximately 20 minority languages (the number increases if some dialects are counted as separate languages). They are concentrated mainly in the four southern states (Tamilnadu, Kerala, Karnataka, and Andhra Pradesh) of India. Some other states, namely Maharashtra, Madhya Pradesh, Orissa, and Bihar, also have some of the tribal languages of the family, but most conspicuous is the presence of Brahui in Pakistan from ancient times. The languages are usually divided into three main groups—South Dravidian, Central Dravidian (with two subsubgroups, Telugu-Kuvi and Kolami-Parji), and North Dravidian—as shown in Table 1 (some advocate a closer relationship of Telugu-Kuvi with South Dravidian rather than with

Kolami-Parji). Of these, only four languages, Tamil, Malayalam, Kannada, and Telugu, have their own scripts and literature from ancient times. The Sangam literature of Tamil, composed between the 2nd century B.C. and the 5th century A.D., and the pre-Christian-era grammar *Tolkāppiyam* of the same language are the oldest literary monuments for the entire family. The first inscription of Kannada belongs to the 5th century A.D. and that of Telugu to the 6th century A.D.; the literature of these two languages starts in the 9th and the 11th centuries A.D., respectively. Malayalam evolved as a separate language from Old Tamil around the 9th century.

Phonology

Vowel System

Like Proto-Dravidian, most of the languages have a 10-vowel system with five short and five long ones (see Table 2) but Iruḷa, Toda, Kurumba, and Koḍagu have added centralized vowels to the inherited stock. Tuḷu developed a contrast between [e] (< [*-ēn]) and e in word-final position, for example, *kal-t-E* ‘I learned’ versus *kal-t-e* ‘he learned’. In Modern Telugu

Table 1 Dravidian language groups

| Subgroup | Language | Abbreviation | Locations | Number of speakers |
|---|-----------|--------------|--|--------------------|
| South Dravidian | Tamil | Ta. | Tamilnadu, Sri Lanka, South Africa, Malaysia, Singapore, Maritius, Fiji, Burma | 58 million |
| | Malayalam | Ma. | Kerala | 30 million |
| | Iruḷa | Ir. | Tamilnadu | 5200 |
| | Koḍagu | Kod. | Karnataka | 93 000 |
| | Kota | Ko. | Nilgiris, Tamilnadu | 1400 |
| | Toda | To. | Nilgiris, Tamilnadu | 1600 |
| | Kannada | Ka. | Karnataka, Badaga dialect in the Nilgiris, Tamilnadu | 33 million |
| | Kurumba | Ku. | Nilgiris, Tamilnadu | 5000 |
| Central Dravidian: Telugu-Kuvi subsubgroup | Tulu | Tu. | Koraga dialect, Karnataka (Koraga dialect) | 1.6 million |
| | Telugu | Te. | Andhra Pradesh | 66 million |
| | Gondi | Go. | Maharashtra, Madhya Pradesh, Orissa, Andhra Pradesh; Koya dialect in Andhra Pradesh and Orissa | 2.4 million |
| | Konda | | Andhra Pradesh and Orissa | 17 864 |
| | Pengo | Pe. | Orissa | 1300 |
| | Manda | | Orissa | Not known |
| | Kui | | Orissa | 641 662 |
| Central Dravidian: Kolami-Parji subsubgroup | Kuvi | | Orissa and Andhra Pradesh | 246 513 |
| | Kolami | Kol. | Maharashtra and Andhra Pradesh | 99 281 |
| | Naikri | | Maharashtra | 1500 |
| | Naiki | Nk. | Maharashtra | 54 000 |
| | Gadaba | Ga. | Koḍekor dialect [Andhra Pradesh], Ollari dialect [Orissa] | ?18 000 |
| North Dravidian | Parji | Pa. | Chattisghadh, Dhurwa | 44 000 |
| | Kurux | Kur. | Bihar | 1.4 million |
| | Malto | Malt. | Rajmahal hills of Bihar | 108 148 |
| | Brahui | Br. | Baluchistan of Pakistan | 1.7 million |

Table 2 Vowels of Proto-Dravidian

| | Front | | Central | | Back | |
|------|-------|------|---------|------|-------|------|
| | Short | Long | Short | Long | Short | Long |
| High | i | ī | | | u | ū |
| Mid | e | ē | | | o | ō |
| Low | | | a | ā | | |

[ɛ] (< [*iyā]), which is the past-tense suffix, appearing after most of the verb bases before personal suffixes other than 3rd nonmasculine, became a separate phoneme. Brahui lost short [e] and short [o] under the influence of neighboring Balochi. A long vowel of the root syllable undergoes shortening when the root is followed by a root extension that begins with a vowel; this alternation is regular in verb bases, less common in disyllabic nominal bases, and totally absent in trisyllabic nominal bases, for example, [*vīl-] ~ [*vīl-u-] ‘to fall’ (Burrow and Emeneau, 1984: 5430), [*nīl-al] ~ [*nīl-al] ‘shade’ (Burrow and Emeneau, 1984: 3679).

Consonant System

The consonant system as normally reconstructed is given in Table 3. The reconstruction of a laryngeal sound for Proto-Dravidian on the basis of the Old Tamil sound called *āytam*, preserved in a few words, involves speculation (Krishnamurti, 1997, 2003: 91). The most conspicuous features of the consonant system are:

1. The presence of retroflex consonants (stop, nasal, lateral, and approximant, the last one being the most peculiar feature of the entire phonological system), which are rare in the languages outside the Indian subcontinent (even the presence of these in Sanskrit and other Indo-Aryan languages is attributed to the influence of Dravidian).
2. The presence of six stops, the most peculiar of which is the alveolar (with the uncommon three-way contrast among the dental, retroflex, and alveolar ones still retained in Malayalam, Iruḷa, Kota, Toda, and Kurumba).
3. The absence of voiced stops and aspirated stops.

The initial stops in some words irregularly became voiced in all languages except Tamil-Malayalam and Toda; the voicing of single stops in medial position seems to have developed in the later stages of Proto-Dravidian itself. The apicals, that is, the alveolar and the retroflex consonants, do not occur at the beginning of a word; but this situation changed in Malayalam, Koḍagu, Tuḷu, and Telugu-Kuvi. Clusters involving two different stops do not occur within

Table 3 Consonants of Proto-Dravidian^a

| | L | D | A | R | P | Vel |
|-------------|---|---|---|---|---|-----|
| Stop | p | t | ṭ | ṭ | c | k |
| Nasal | m | n | ṇ | ṇ | ṅ | (ŋ) |
| Lateral | | | l | ḷ | | |
| Trill | | | r | | | |
| Approximant | | | | ɻ | | |
| Semivowel | v | | | | y | |

^aAbbreviations: A, alveolar; D, dental; L, labial; P, palatal; R, retroflex; Vel, velar.

a morpheme. However, homorganic clusters of a nasal (N) and plosive (P) of the types NP, PP, and NPP can be reconstructed, for example, [*marunt(u)] ‘medicine’ (Burrow and Emeneau, 1984: 4719), [*cupp(u)] ‘salt’ (Burrow and Emeneau, 1984: 2674), [*kalaṅkkam] ‘turbidity, confusion’ (Burrow and Emeneau, 1984: 1303).

Syntax

Word Classes

The following word classes can be recognized for Dravidian: nouns (pronouns and numerals are subclasses of nouns because they are inflected for case and can occur as the head of a noun phrase like nouns), verbs, adjectives, adverbs (including expressives), particles, and interjections. The first two, which are the major classes, are dealt with in detail later; a few words on each of the other categories are in order here.

Adjectives occur before nouns, for example,

- (1a) Ta.: nalla paiyan
 (1b) Te.: manci abbāyi
 ‘good boy’

Some nouns are converted into adjectives by the addition of the past adjectival participle of the verb [*āk(u)-] ‘become’, for example,

- (2a) Ta.: aḷak-āna peṅ
 beauty-ADJ girl
 (2b) Te.: andam-ayina pilla
 beauty-ADJ girl
 ‘beautiful girl’

Monomorphemic adverbs are few in number; most of them are formed from nouns or adjectives by the addition of the suffix, for example, Ta. -āka, Ma. -āyi, Ka. -āgi, Te. -gā:

- (3a) Ta.: aḷak-āka
 beauty-ADV
 (3b) Te.: andaṅ-gā
 beauty-ADV
 ‘beautifully’

The following are examples of expressives:

- (4a) Ma.: avan **karumure** ti-nnu
 he karumure eat-PAST
 'he ate with a crunching sound'
 (4b) Ka.: avanu **paṭapaṭane** hoḍe-d-a
 he paṭapaṭa beat-PAST-3.SING
 'he beat (someone) thoroughly'
 (4c) Te.: vāḍu **karakarā** namil-Ē-ḍu
 he karakara munch-PAST-3.MASC.SING
 'he munched with a crunching sound'

Particles are bound forms that can be added to a wide range of major sentence constituents. Examples are:

1. The interrogative particle, Ta. Ka. Te. *-ā*, Ma. *-ō*:

- (5a) Ta.: avan va-nt-ān-ā?
 he come-PAST-3.MASC.SING-INT
 (5b) Ma.: avan va-nn-ō?
 he come-PAST-INT
 'did he come?'

2. The particle of emphasis, Ta. *-tān*, Ma. *-tanne*, Ka. Te. *-ē*:

- (6a) Ta.: avan-tān
 he-EMPH
 (6b) Te.: vāḍ-ē
 he-EMPH
 'he himself'

3. The particle of coordination, added at the end of both (or all) the coordinated noun phrases, Ta. Ma. *-um*, Ka. *-ū*, Te. lengthening of the final vowel (but *-ū/-Ø* after nouns ending in [m]):

- (7a) Ta.: pāl-um paḷam-um
 milk-COORD fruit-COORD
 'milk and fruit'
 (7b) Te.: moguḍu peḷḷām(-ū)
 husband-COORD wife-COORD
 'husband and wife'

Examples for interjections are: Ta. *ām* (spoken, [āmā]), Ma. *ate*, Ka. *haudu*, Te. *av(u)nu* 'yes'; Ta. Ma. Ka. Te. *ayyō/ayyayyō* expression of surprise, sympathy, pain, grief, or fear, *chī* expression of disgust.

Articles, conjunctions, and dummy subjects (as *it* in *it is raining*) are absent in Dravidian.

Word Order

The unmarked sentence structure is S(ubject) O(bject) V(erb). The head of the subject noun phrase is in the nominative case, whereas that of the object noun phrase is in the accusative, the suffix for which can be unmarked in the case of inanimate nouns (see later discussion). Other noun phrases that can be in a sentence include those that indicate the indirect object and the person associated with the agent, time and

place. Although the verb phrase normally occurs at the end of the sentence, the noun phrases can exchange their positions within the sentence with some freedom, as illustrated by the Telugu sentences in (8).

- (8a) rāmuḍu sīta-ni ninna
 Rama Sita-ACCUS yesterday
 poddunna cūś-Ē-ḍu
 morning see-PAST-3.MASC.SING
 'Rama saw Sita yesterday morning.'

which can also appear as:

- (8b) rāmuḍu ninna poddunna sīta-ni cūś-Ē-ḍu
 (8c) sīta-ni rāmuḍu ninna poddunna cūś-Ē-ḍu
 (8c) ninna poddunna rāmuḍu sīta-ni cūś-Ē-ḍu
 (8d) ninna poddunna sīta-ni rāmuḍu cūś-Ē-ḍu

and so on.

Agreement

When used as the predicate, a noun shows agreement in gender and number with the subject 3rd-person pronoun and, when used as the subject, it shows agreement with the finite verb (for the latter, Malayalam is an exception). Therefore, nouns are classified on the basis of their gender and number, but there is no uniformity among the languages in this matter. Toda and Brahui have no gender distinction at all; original nonhuman forms have been generalized in these languages for all categories, for example, To. *aθ*, Br. *ōd* 'he, she, it'. The other languages can be classified into four groups on the basis of the gender-number distinctions they show. The South Dravidian languages show a five-way distinction, as in Table 4. Telugu and Kuṛux-Malto show a four-way distinction, as in Table 5. (Te. *āmelāviḍa* 'she (honorific)' has no verb form that exclusively corresponds to it and takes either the nonmasculine singular or the human plural form.) Pengo and Maṇḍa have a six-way contrast in the pronoun, as shown in Table 6, but the contrast between the feminine singular and the nonhuman singular is neutralized in the verb. The central languages other than Telugu, Pengo, and Maṇḍa have a symmetrical system with a four-way distinction, as shown in Table 7.

Table 4 Gender-number distinctions: Tamil

| | Human | | Nonhuman |
|----------|---------------------------|---------------|-------------------------|
| | Masculine | Feminine | |
| Singular | avan 'he' | avaḷ 'she' | atu 'it' |
| Plural | avar(kal) 'they (HUM)' | | avai 'they (NONHUM)' |

Table 5 Gender-number distinctions: Telugu

| | <i>Masculine</i> | <i>Nonmasculine</i> |
|----------|-----------------------|------------------------|
| Singular | vāḍu 'he' | adi 'she/it' |
| | <i>Human</i> | <i>Nonhuman</i> |
| Plural | vā u 'they (HUM)' | avi 'they (NONHUM)' |

Table 6 Gender-number distinctions: Pengo

| | <i>Human</i> | | <i>Nonhuman</i> |
|----------|--------------------------------------|-----------------------|-----------------------------|
| | <i>Masculine</i> | <i>Feminine</i> | |
| Singular | avan 'he' | adel 'she' | adi/adaṅ 'it' |
| Plural | avar 'those men/men and women' | avek 'those women' | avaṅ 'those (NONHUM)' |

Table 7 Gender-number distinctions: Gondi

| | <i>Masculine</i> | <i>Nonmasculine</i> |
|----------|-------------------------------------|----------------------------|
| Singular | vōr 'he' | ad 'she, it' |
| Plural | vūr 'those men/men and women' | av 'those women/things' |

Equational Sentences without the Copula

A characteristic feature of the major Dravidian languages is the presence of equational sentences without the copular verb; however, Malayalam and many of the central and the northern languages have innovated by creating the copula under the influence of Indo-Aryan.

(9a) Ta.: en peyar kumār
my name Kumar
'my name is Kumar'

but:

(9b) Ma.: en-re pērō kumār enn(ō) āṅō
I-GEN name Kumar say-PAST COP
'my name is Kumar'

Dative-Subject Sentences

Although not exclusive to Dravidian, sentences with a dative subject are commonly used in these languages. In sentences of this type, the logical subject (i.e., the

noun that denotes the person or animate being who has some feeling, such as anger, hunger, wanting, or liking, or has/acquires/needs something, abstract or concrete) appears in the dative case and the noun that denotes the feeling or the thing is in the nominative and serves as the surface subject.

- (10a) Ta.: en-akku kōpam va-nt-atu
I-DAT anger come-PAST-3.N.SING
'I got angry'
- (10b) Te.: vāḍ-i-ki ḍabbu kāvāli
he-OBL-DAT money is required
'he needs money'

Complex Sentences

The most notable among the complex sentences are those (1) with a past adverbial participle, (2) with noun phrases with a relative participle (also known as verbal adjective), and (3) with the quotative marker.

A special feature of the Dravidian languages is the possibility of having more than one past participle in a sentence; this feature has spread from Dravidian to Sanskrit and modern Indo-Aryan. Examples are:

- (11a) Ka.: vanaja mane-ge hōg-i snāna māḍ-i
Vanaja house-DAT go-PAST bath do-PAST
baṭṭe badalāyis-i ūṭa māḍ-id-aḷu
clothes change-PAST food do-PAST-
3FEM.SING
- (11b) Te.: vanaja iṅṅi-ki veḷḷ-i snānam cēs-i
Vanaja house-DAT go-PAST bath do-PAST
baṭṭa-lu mārcukun-i annam tin-di
cloth-PL change-PAST food eat-PAST.3.
FEM.SING
'Vanaja went home, took a bath, changed her
clothes and ate food'

The Dravidian languages do not have relative pronouns; their functions are carried out by the verbal adjectives, which are derived from verb bases and function as adjectives carrying tense distinction and even negation (see later discussion). A verbal adjective can occur before the head noun (which may be preceded by other types of adjectives).

- (12) Te.: ninna poddunna meḍrāsu-occ-ina
yesterday morning Madras- come-
ABL PAST.RP
mā tammuḍu ikkaḍa unnāḍu
our (excl) younger here be-PRES-3.
brother MASC.SING
'my younger brother who came from Madras
yesterday morning is here'

A verbal adjective can qualify not only the agent of the source verb, as in (12), but also nouns denoting other relations, such as object (13a) and instrument (13b).

(13a) Ta.: kumār ceyy-um vēlai
 Kumar do-NON-PAST.RP work
 ‘the work that Kumar does’

(13b) Te.: kumār paṇḍu kōs-ina katti
 Kumar fruit cut-PAST.RP knife
 ‘the knife with which Kumar cut the fruit’

A quoted sentence precedes the matrix clause, which contains such verbs as ‘tell’, ‘say’, ‘think’, ‘ask’, ‘hear’, ‘believe’, and ‘know’. The quotative marker (e.g., Ta. *enru*, Ma. *ennō*, Ka. *endu*, Te *ani* ‘having said’, past participles of the verb ‘to say’) occurs at the end of the quoted sentence.

(14) Te.: dēvuḍu unnāḍu an-i
 god be-PRES-3MASC.SING say-PAST
 cālā mandi nammu-tā-ru
 many people believe-FUT-3.HUM.PL
 ‘many people believe that there is god’

This Dravidian construction has influenced the quotative construction in Sanskrit as shown by the marker *iti*, which follows the quoted sentence.

Noun Morphology

Dravidian morphological structure is agglutinative. Nouns in Dravidian are mostly underived (e.g., Ta. Ma. Te. *puli* ‘tiger’), but there are also nouns derived from verbs (e.g., Te. *pāṭa* ‘song’ from *pāḍu-* ‘to sing’) and from adjectives (e.g., Ta. *nalla-tu* ‘good thing’ from *nalla* ‘good’). A nominal stem may be followed, when plurality has to be expressed, by a plural suffix, which in turn may be followed by a case suffix or a (case suffix +) postposition (i.e., a separate word with case function), as in:

(15a) Ta.: kulantai-kaḷ-ukku
 child-PL-DAT

(15b) Te.: pillā-la-ki
 child-PL-DAT
 ‘to the children’

Only a few of the nominal stems contain an overt marker for gender. For example, in Tamil, *aṇṇa-n* ‘elder brother’ has the masculine suffix but *tampī* ‘younger brother’ has no suffix.

Plural Suffixes

The plural suffix in most of the languages shows a distinction for human vs. nonhuman (or for masculine vs. nonmasculine in the Central group of languages other than Telugu) with some exceptions in which the nonhuman suffix occurs with human nouns, as in Kannaḍa:

(16a) huḍuga-ru
 boy-PL.HUM
 ‘boys’

(16b) mara-ḡaḷu
 tree-PL.NHUM
 ‘trees’

but:

(16c) mantri-ḡaḷu
 minister-PL.NHUM
 ‘ministers’

There are also some languages in which the erstwhile nonhuman plural suffix is generalized to all nouns at the expense of the human plural suffix, as in Telugu:

(17a) akka-lu
 ‘elder sisters’

(17b) nakka-lu
 ‘jackals’

The Toda plural suffix *-ām* (optional), traceable to the postnominal modifier [**anayttum*] ‘all (NONH.)’ illustrates the process of a separate word being reduced to the status of a suffix over course of time, as in To. *kaś-ām* ‘stones’ (cf. Ta. *kall anayttum* ‘all the stones’). The use of the plural suffix with nonhuman nouns is rare in the Southern and the Northern groups, whereas it is obligatory in the Central group, for example,

(18a) Ta.: iraṇṭu paḷam
 ‘two fruit’

but:

(18b) Te.: reṇḍu paḷlu (< *paṇḍu-lu)
 ‘two fruit’

([*reṇḍu paṇḍu] without the plural *-lu* is ungrammatical in Telugu.)

Case Suffixes

The nominative is unmarked in all the languages. Some of the nominal stems take an additional suffix, called the oblique suffix, when a case suffix other than the nominative or a postposition is added; the stem thus formed is called the oblique stem. For example, in Tamil, *vītu* ‘house’ and *maram* ‘tree’ have the oblique stems *vīt-t-* (as in *vīt-t-il* ‘in the house’) and *mara-tt-* (*mara-tt-il* ‘in the tree’), respectively, but others, such as *ūr* ‘village’ (*ūr-il* ‘in the village’) and *pāl* ‘milk’ (*pāl-il* ‘in the milk’) do not have a separate oblique stem.

With regard to the accusative suffix, the languages are divided into two main groups with Tamil, Malayalam, Koḍagu, Iruḷa, Kurumba, and Brahui showing the reflexes of [**-ay*], whereas all others show the reflexes of [**-n*], often preceded or followed by a vowel.

(19a) Ta.: nāy-ai
 dog-ACCUS

- (19b) Ma.: paṭṭiy-e
dog-ACCUS
- (19c) Ka.: nāy-annu
dog-ACCUS
- (19d) Te.: kukka-ni
dog-ACCUS
'dog'

The two were probably dialectal variants in Proto-Dravidian. The accusative is generally unmarked with inanimate nouns in all the languages, for example,

- (20a) Ta.: nān pāl kuṭi-tt-ēn
I milk drink-PAST-1.SING
- (20b) Te.: nēnu pālu tāg-Ē-nu
I milk drink-PAST-1.SING
'I drank milk'

In Gonḍi (except the Koya dialect), Brahui, and some other non-South Dravidian languages, the dative case also assumes the functions of the accusative under the influence of Indo-Aryan:

- (21) Go.: vōr nā-kūn sūr-t-ōr
he I-ACCUS/DAT see-PAST-3.MASC.SING
'he saw me.'

The instrumental case is also used in the sociative sense in many languages, such as Telugu:

- (22a) nēnu karra-tō kukka-ni koṭṭ-Ē-nu
I stick-dog-ACC beat-PAST-3.
INSTR/SOC 1.SING
'I hit the dog with a stick'
- (22b) nēnu ayana-tō māṭṭāḍ-Ē-nu
I he-INSTR/SOC speak-PAST-1.SING
'I spoke with him'

But the two are distinguished in Tamil and some others:

- (23a) Ta.: kaiy-āl
hand-INSTR
'with the hand'
- (23b) Ta.: avan-ōṭu/-oṭu/-uṭan
he-SOC
'with him'

Of all the case suffixes, the dative case suffix is found with minimum variation in all the subgroups and is reconstructable as [*-kk(u)] for Proto-Dravidian.

Some languages have a genuine suffix for the ablative case, whereas others form it on the locative by the addition of a postposition, which originally was the past participle of the verb 'to be' (Ta. *iru-ntu*) or 'to stand' (Ma. *nimm̄*). Both types are illustrated by Tamil. Although Old Tamil contains the suffix *-in*, Modern Tamil has locative *-il-iruntu*, as in

- (24a) Old Ta.: mala^hiy-in
hill-ABL
'from the hill'

- (24b) Mod. Ta.: mala^hiy-il-iruntu
hill-LOC-PO
'from the hill'
- (24c) Ma.: vīṭ-ṭ-il-ninn̄
house-OBL-LOC-PO
'from the house'

The sense of the genitive case can be expressed just by the juxtaposition of one noun (or its oblique base form, if there is one) and another noun (as in the Tamil and Telugu examples in (25a) and (25b)), but a suffix or postposition is also found (as in the Kannaḍa and Koḍaga examples (25c) and (25d)).

- (25a) Ta.: tāy ccol
mother word
'mother's word'
- (25b) Te.: amma māṭa
mother word
'mother's word'
- (25c) Ka.: avar-a mane
they-GEN house
'their house'
- (25d) Koḍ.: ayṅga-ḍa mane
they-GEN house
'their house'

What appear to be the suffixes of the locative case in the major languages are in reality postpositions (historically, in some cases). Thus, Ta. Ma. *-il* is from [*il] 'house' (Burrow and Emeneau, 1984: 494) and Ka. *-alli* is identical with *alli* 'there':

- (26a) Ta.: vīṭ-ṭ-il
house-OBL-LOC
- (26b) Ka.: maney-alli
house-LOC
'in the house'

Pronouns

The following peculiarities may be noted in the pronominal system of Dravidian:

1. The distinction between exclusive (i.e., excluding the hearer) and inclusive (i.e., including the hearer) in the first-person plural, as shown in Table 8. (Modern Kannaḍa lost this distinction and has *nāvu* in both the senses.)
2. The marking of two degrees of proximity to the speaker in the third-person pronouns (e.g., Ta.

Table 8 Exclusive and inclusive 'we'

| Language | Exclusive 'we' | Inclusive 'we' |
|----------|----------------|----------------|
| Ta. | nāṅka! | nām |
| Ma. | ñāṅga! | namma!/nām/nōm |
| Te. | mēm | manam |

Table 9 Politeness in the third-person singular pronouns

| Language | Nonhonorific | | Honorific | |
|----------|------------------------|------------------------|---|---|
| | Masculine | Feminine | Masculine/feminine | |
| Ta. | avan 'he | ava 'she | avar(ka) 'he/she (HON)' | |
| | (NHON) Masculine | (NHON) Feminine | Masculine | Feminine |
| Te. | vāḍu 'he (NHON)' | adi 'she (NHON)' | atanu 'he (HON 1st degree)' āyana/ (rarely) vāru 'he (HON 2nd degree)' | āme/āviḍa/ (rarely) vāru 'she (HON)' |

avan, Te. *vāḍu* 'he (remote [formed on the root *a-*])' vs. Ta. *ivan*, Te. *viḍu* 'he (proximate [formed on *i-*])'. (Old Tamil and Old Kannaḍa, Kuvi, Kuṟux, and Brahui show three degrees of proximity, the third one, intermediary, formed on [*u-], whereas Kui shows four degrees, the stems being *i-* [proximate], *e-* [intermediary], *a-* [remote], and *o-* [very remote].)

3. The two-way (in Tamil and Malayalam) or three-way distinction (in Telugu [only in the masculine] and Kannaḍa) based on politeness in the third-person singular pronouns, as shown in Table 9.
4. The use of reflexive pronouns [*tān] (SING) and [*tām] (PL) to refer to the third-person subject of the sentence, as in:

(27) Te.: kumār tana ḍabbu aḍig-Ē-ḍu
Kumar REFL- money ask-PAST-
GEN 3.MASC.SING
'Kumar asked for his (own) money'

Numerals

The cardinal numerals show a distinction between nonhuman and human at the morphological level. Only the South Dravidian languages (especially the three literary languages) and Telugu show a developed native numeral system in which the highest native numeral is Te. (Old) *vēyi*/(Mod) *veyyi* '1000' (PL *vē-lu*; also (Old) *vē-vuru* '1000 people') (Burrow and Emeneau, 1984: 5404); the words for 'hundred thousand' (Ta. *laṭcam*, Ma. *lakṣam*, Ka. Te. *lakṣa*) and for '10 million' (Ta.Ma.Ka.Te. *kōṭi*) are borrowed from Sanskrit and, in South Dravidian, even the word for '1000' is from that source through Prakrit (e.g., Ta. Ma. *āyiram*, Ka. *sāvira* < Skt. *sahasra-*). The

Table 10 Proto-Dravidian nonhuman numerals

| Numeral | Proto-Dravidian | Comment |
|---------|-----------------|--|
| 1 | *ont(u) | |
| 2 | *iraṅt(u) | |
| 3 | *mūnt(u) | |
| 4 | *nāl | |
| 5 | *cay(-nt(u)) | |
| 6 | *cāt(u) | |
| 7 | *ēl | |
| 8 | *eṅ | Identical with *eṅ 'number' (Burrow and Emeneau, 1984) |
| 9 | *to | Preserved in Ta. Ma. to -āyiram '900', etc. |
| 10 | *patt(u) | |
| 100 | *nūt(u) | |

languages of the Central (other than Telugu) and the Northern groups retain only a few of the basic Dravidian numerals and have borrowed the higher ones from the neighboring major languages. The basic nonhuman numerals that can be reconstructed for Proto-Dravidian are shown in Table 10. The human forms are derived from the nonhuman ones (or their variants, in some cases) by the addition of the suffix [*-var] ([*-van] also in the case of 'one'), for example, [*oru-van]/(honorific) [oru-var] 'one man' and [*iru-var] 'two persons'.

Modern Telugu and Modern Kannaḍa add a classifier (Te. *mandi*, Ka. *mandiljana* 'people') to the basic numeral to form the human numeral, perhaps due to influence from the neighboring Indo-Aryan languages:

- (28a) Ka.: mūru mandi/jana makkaḷu
three CLASS children
'three children'
- (28b) Te.: enimidi mandi pillalu
three CLASS children
'eight children'

The languages of the Kolami-Parji group have created separate feminine forms for the numerals 'two' to 'five' by adding the feminine suffix [*-ā] to the root:

- (29a) *īr-ā|
two-FEM
'two women'
- (29b) *muy-ā|
three-FEM
'three women'
- (29c) *nall-ā|
four-FEM
'four women'
- (29d) *ceyy-ā|
five-FEM
'five women'

Negation in the past and the present is expressed by syntactic constructions involving the negative auxiliary verb.

• Past negative: VB + Infinitive + Negative Auxiliary

- (37a) Ta.: coll-a(v) illai
tell-INF NEG.AUX
- (37b) Te.: cepp-a lēdu
tell-INF NEG.AUX
'(one) did not tell'

• Present negative: Verbal Noun + Negative Auxiliary

- (38a) Ta.: col-v-at(u) illai
tell-FUT-N.SING NEG.AUX
- (38b) Te.: cepp-aḍam lēdu
tell-NOM NEG.AUX
'(one) is not telling'

Personal Suffixes

Personal suffixes distinguish number in the first and second persons but number and gender in the third person (see Table 11). Whereas Modern Malayalam has no personal suffixes at all, Toda and Koḍagu have no personal suffixes in the third person. Because of the presence of these suffixes in the verb, the subject pronoun or noun (the latter, if it can be retrieved from the context) can be freely omitted.

Imperative

The verb base itself serves as the imperative form in the singular in most of the languages, but a special suffix is added to it in the plural, as in Table 12. The

Table 11 Past tense paradigms of Ta. cey- and Te. ce:yu- 'to do'

| Tamil | Telugu | Gloss |
|------------------------------------|-------------------------------------|--------------------------------------|
| cey-t-ēṅ do-PAST-1.SING | cēś-Ē-nu do-PAST-1.SING | 'I did' |
| cey-t-ōm do-PAST-1.PL | cēś-Ē-m do-PAST-1.PL | 'we did' |
| cey-t-āy do-PAST-2.SING | cēś-Ē-vu do-PAST-2.SING | 'you (sg.) did' |
| cey-t-īrkaḷ do-PAST-2.PL | cēś-Ē-ru do-PAST-2.PL | 'you (pl.) did' |
| cey-t-ān do-PAST-3.MASC.SING | cēś-Ē-ḍu do-PAST-3.MASC.SING | 'he did' |
| cey-t-āḷ do-PAST-3.FEM.SING | — | 'she did' |
| cey-t-ārkaḷ do-PAST-3.HUM.PL | cēś-Ē-ru do-PAST-3.HUM.PL | 'they (HUM) did' |
| cey-t-atu do-PAST-3.NONHUM.SING | cēs-in-di do-PAST-3.NONMASC.SING | (Ta.) 'it did' (Te.) 'she/it did' |
| cey-t-aṅ-a do-PAST-3.NHUM.PL | cēś-Ē-yi do-PAST-3.NHUM.PL | 'they (NEUT) did' |

corresponding negative imperative has the negative suffix in between the verb base and the imperative suffix, as in Table 13.

Nonfinite Verbs

The nonfinite forms may be divided into verbal adjectives and other forms, most of which serve as heads of subordinate clauses. A verbal adjective is formed by adding to the VB the tense or the negative marker, followed by the adjective marker:

• Past verbal adjective: VB + Past + Adjective

- (39a) Ta.: cey-t-a
do-PAST-ADJ
- (39b) Te.: cēs-in-a
do-PAST-ADJ
'that did'

• Present verbal adjective: VB + Present + Adjective

- (40a) Ta.: cey-kinr-a
do-PRES-ADJ
- (40b) Te.: cēs-tōnn-a
do-PRES-ADJ
'that is doing'

• Future/habitual verbal adjective: VB + Fut/Hab + Adjective

- (41a) Ta.: ceyy-um
do-FUT/HAB.ADJ
- (41b) Te.: cēs-ē
do-FUT/HAB.ADJ
'that (will) do(es)'

• Negative verbal adjective: VB + Negative + Adjective

- (42a) Ta.: ceyy-āt-a
do-NEG-ADJ

Table 12 Positive imperatives

| Language | Singular | Plural | Gloss |
|----------|----------|---------------------------|---------|
| Ta. | col | coll-uṅkaḷ tell-IMP.PL | 'tell!' |
| Te. | ceppu | cepp-aṅḍi tell-IMP.PL | 'tell!' |

Table 13 Negative imperatives

| Language | Singular | Plural | Gloss |
|----------|------------------------------|----------------------------------|----------------|
| Ta. | coll-āt-ē tell-NEG-IMP.SG | coll-āt-īrkaḷ tell-NEG-IMP.PL | 'do not tell!' |
| Te. | cepp-aku tell-NEG | cepp-ak-aṅḍi tell-NEG-IMP.PL | 'do not tell!' |

(42b) Te.: ceyy-ani
do-NEG.ADJ
'that will/do(es) not do'

- Past participle: VB + Past

(43a) Ta.: va-ntu
come-PAST

(43b) Te.: occ-i
come-PAST
'having come'

- Present participle: VB + Present

(44a) Ka.: bar-uttā
come-PRES

(44b) Te.: os-tū
come-PRES
'coming'

- Negative participle: VB + Negative

(45a) Ta.: ceyy-āmal
do-NEG

(45b) Te.: ceyy-akuṇḍā
do-NEG
'without doing'

- Infinitive: VB + Infinitive

(46a) Ta.: ceyy-a
do-INF

(46b) Ma.: ceyy-ān
do-INF
'to do'

- Conditional: VB + Past + Conditional

(47a) Ta.: cey-t-āl
do-PAST-COND

(47b) Ka.: māḍ-id-ar-e
do-PAST-COND-ADD
'if (one) does'

- Concessive: Conditional + Coordinative particle

(48a) Ta.: cey-t-āl-um
do-PAST-COND-COORD

(48b) Ka.: māḍ-id-ar-ū
do-PAST-COND-COORD
'even though one did/does'

- Verbal noun: (49a) VB + Future + *atu* 'it', (49b) VB + Nominalizer

(49a) Ta.: cey-v-atu
do-FUT-N.SING

(49b) Te.: ceyy-aḍam/-aṭam
do-NOM
'doing'

Auxiliary Verbs

A modal (or passive) auxiliary follows the infinitive of the main verb, whereas other types of auxiliary

verbs follow the past participle of the main verb. Tense and personal suffixes, when they can be added, are added only to the auxiliary. Examples for a modal auxiliary are:

(50a) Ta.: avan var-a vēṅṭum
he come-INF MUST
'he must come'

(50b) Te.: vāḍu tin-āli
he eat-MUST
'he must eat'

Ta. *viṭu-* and Te. *vēyū-* (with [v] > Ø), which literally mean 'leave' and 'throw', respectively, serve here as examples for a nonmodal auxiliary; when used as an auxiliary, they mean 'completion, quickness':

(51a) Ta.: avan paṇam koṭu-ttu viṭu-v-ān
he money give-PP leave-FUT-3.
MASC.SING

(51b) Te.: vāḍu ḍabbu icc-ēs-tā-ḍu
he money give-(PP)-throw-FUT-
3.MASC.SING
'he will give the money completely/
quickly'

The passive voice, found only in the written (not in the spoken) varieties of the literary languages, is a syntactic construction with the auxiliary Ta. *paṭu-*, Ma. *peṭu-*, Te. *paḍu* (with the change [p] > [b] in the last language), which literally mean 'fall, suffer', following the infinitive of the main verb:

(52a) Ta.: ceyy-a ppaṭ-t-atu
do-INF PASSAUX-PAST-3.N.SING

(52b) Te.: ceyy-a baḍ-in-di
do-INF PASSAUX-PAST-3.N.SING
'it was done'

Contact between Dravidian and Indo-Aryan

Dravidian and Sanskrit (and later Indo-Aryan) show mutual influence on a large scale, which justifies calling the Indian subcontinent a linguistic area (Emeneau, 1954, 1956, 1980). A few words and structural features of Dravidian origin that have been found in the *R̥gveda* allow us to conclude that the Dravidian languages were spoken in the northwestern part of the subcontinent at that time. Two examples of Dravidian words in the *R̥gveda* are *mayūra-* 'peacock' and *kbāla-* 'threshing floor, granary'. The most important structural features that spread from Dravidian to Indo-Aryan are retroflexes, the use of the past participle, the use of the Sanskrit quotative marker *iti*, the use of Sanskrit *api* in the meanings 'even, also, and, indefinite', and expressives. The Dravidian languages, in turn, have a large number of loanwords from Sanskrit.

Dutch

J M Y Simpson, University of Aberdeen,
Aberdeen, UK

© 2006 Elsevier Ltd. All rights reserved.

Dutch (Nederlands) is the official language of the Netherlands (with approximately 14 million speakers) and one of the official languages of Belgium (with approximately 6 million speakers). It is also the language of administration in Aruba, Netherlands Antilles, and Suriname. There are approximately 410 000 speakers of Dutch in the United States, 159 000 in Canada, 80 000 in France, and 47 000 in Australia. The name Flemish (Vlaams), formerly applied to all varieties of Dutch spoken in Belgium and France, is now properly used only of the dialects of the Belgian provinces of West and East Flanders (West- and Oost-Vlaanderen).

Genetic Relationship

Dutch (D), together with English (E) and Frisian, belongs to the Low German branch of the West Germanic languages. That it has not participated in the Second (or High German) Sound Shift is shown by such forms as *schaap*, *beter*, *boek* (= E *sheep*, *better*, *book*) compared to (High) German (G) *Schaf*, *besser*, *Buch*. Other features shared with English are the relative rarity of grammatical umlaut (D *boek*, *boeken*, E *book*, *books* vs. G *Buch*, *Bücher*) and

the retention of the consonant clusters [sp] and [st] (D *spreken*, *stelen*, E *speak*, *steal*) vs. ([ʃp] and ([ʃt]) (G *sprechen*, *stehlen*).

However, in other respects Dutch and German are similar: Prevoicalic initial alveolar fricatives have become voiced (D *zeven*, G *sieben* ([z]) vs. E *seven*), and all word-final plosives are voiceless (D *brood* ([t]), G *Brot* vs. E *bread*).

Features peculiar to Dutch are the vocalization of preconsonantal [l] after a short vowel (D *koud* vs. E *cold*, G *kalt*), the change of initial Germanic [g] to [x] (D *geven* ([x]) vs. E *give*, G *geben*), the change of initial [sk] to [sx] rather than [ʃ] (D *schieten* [sx] vs. E *shoot*, G *schießen* ([ʃ]), the change of [-ft] to [-xt] (D *zacht* vs. E *soft*, G *sanft*), and the simplification of [-ks] to [-s] (D *vos* vs. E *fox*, G *Fuchs* [ks]).

History

Old Dutch or Old Low Franconian, conventionally dated from 700 C.E. to 1150 C.E., is attested only in a few, mainly fragmentary texts, but it already shows most of the previously mentioned typically Dutch features.

Thousands of texts date from the Middle Dutch period, c. 1150 C.E. to 1500 C.E., mainly produced in the provinces of Flanders, Brabant, and Holland and consisting of literary works and official documents. There was as yet no standardized language, and these

texts are written in a variety of dialects belonging to five main groups. A case system of nominative, accusative, genitive, and dative is discernible in nouns, adjectives, articles, and pronouns, but in the course of the period this system was eroded and greater use came to be made of prepositions and of fixed word order. Nouns showed the three genders of masculine, feminine, and neuter.

Modern Dutch is reckoned to date from c. 1500 C.E. The 17th and 18th centuries were marked by continued literary production; by the increased use of Dutch in political and scientific domains; by the beginnings of the development of a standard language; by the writing of grammars and dictionaries; and by the magisterial Bible translation of 1637, the *Statenbijbel* (States Bible). The 19th century saw the production of prescriptive grammars, contributing to an acceptance of a standard language, and a series of *Nederlandsche Taal- en Letterkundig Congressen* (Dutch Language and Literary Congresses), beginning in 1849, at which writers and scholars from all parts of the language area could meet to discuss the shape of Dutch without regard to political boundaries. This particular activity finally culminated late in the 20th century with the publication of the authoritative *Algemene Nederlandse Spraakkunst* (General Dutch Grammar) of 1984 (second edition, 1997) and the vast *Woordenboek der Nederlandsche Taal* (Dictionary of the Dutch Language), completed (in pre-1947 orthography) in 1998.

Phonetics and Phonology

The consonantal phonemes of Standard Dutch in careful educated speech of the western Netherlands are /p b t d c k g ʔ f v s z ʃ ʒ x h m n ŋ r l v j/. In this accent /p, t, k/ are unaspirated and voiceless; /b, d/ are fully voiced; /t, d, s, z, n, l/ are laminal alveolar consonants; /s, z/ have low-pitched friction; /x/ is [χ]; /h/ is [ɦ]; prevocally /r/ is realized as an alveolar tap [ɾ] and postvocally as an alveolar fricative [ɹ] (or approximant [ɹ]) or as a palatal fricative [j] (or approximant /j/); and /v/ is realized prevocally as a labiodental approximant [ʋ] and postvocally as a bilabial approximant [β].

Dutch is characterized by assimilation and elision in connected speech. A voiceless plosive becomes voiced under the influence of an adjacent voiced one (*blijkbaar* /'bleigba:r/ 'evidently'); a voiced fricative becomes voiceless under the influence of an adjacent voiceless one (*laf zijn* /laf sɛɪn/ 'to be a coward'); and, in sequences of plosive preceded or followed by a fricative, the plosive determines the voicing (*afbellēn* /'ɑvbɛlə/ 'to ring off,' *opvouwen* /'ɔpfouvəl/ 'to fold up'). Both regressive and progressive assimilation

are therefore common. A sequence of two identical consonants is simplified to a single one (*doos zeep* /do:se:p/ 'box of soap').

Alveolar consonants may coalesce with a following /j/, resulting in postalveolar or (pre)palatal sounds (*katje* /'kacə/ 'kitten,' *oranje* /o'ɾɑŋə/ 'orange,' *meisje* /'mɛiʃə/ 'girl'). Within words, a glottal stop /ʔ/ is inserted after /a:, ə/ before syllable-initial vowels (*beamen* /bə'ʔa:məl/ 'to confirm').

Because /c, g, ʃ, ʒ, ɲ/ appear only as a result of assimilation and/or in words clearly felt to be foreign borrowings, such as *goal, chef, and jury*, some scholars prefer to deny them full phonemic status and treat them as marginal phonemes or as allophones of other phonemes. Similarly, the complete predictability of the appearance of /ʔ/ raises the question of whether it should be included in the list of phonemes.

The vocalic phonemes are /i ɪ y ɤ e: ε ø: ə a: ɑ o: ɔ u ɛɪ œy ʌu/. /e: ø: o:/ tend to be realized as closing diphthongs. Additional long vowels /i: y: ε: œ: ɔ: u: ɛ̃: ɑ̃: ɔ̃:/ appear only in recently borrowed foreign words, mainly from French, and are regarded as marginal phonemes in Dutch.

Morphology

The inflectional and derivational processes of Modern Dutch remain typically Germanic and are in principle little different from those of Modern English. Modern Dutch has lost most of the inflectional endings of the earlier stages of the language.

Nouns and articles show no case distinctions (apart from occasional relics of a genitive) and pronouns have only two, as in English. The majority of nouns form their plural by adding either *-s* or *-en* (*bakker/bakkers* 'baker/bakers', *boek/boeken* 'book/books'). There remain only vestigial traces of the distinction between the indefinite and definite declension of adjectives (*een groot boek* 'a big book,' *het grote boek* 'the big book').

Apart from *hebben* 'have' and *zijn* 'be,' verbs show only three forms in the present and two in the past tense. In common with most other Germanic languages, there is a distinction between weak verbs (D *vissen, ik viste, ik heb gevist*; E *fish, I fished, I have fished*) and strong ones (D *kiezen, ik koos, ik heb gekozen*; E *choose, I chose, I have chosen*).

As in English and German, there are derivational prefixes and suffixes that indicate the relationship between countless sets of root-related lexemes, for example *meester* 'master,' *overmeesteren* 'to overpower'; *hooren* 'to hear,' *gehoor* 'audience'; *blind* 'blind,' *blindheid* 'blindness'; and *ontplofen* 'to explode,' *ontplofbaar* 'explosive.' Compound nouns are common; they may look lengthy but the principle is

no different from that of English (e.g., *postzegelverzameling* ‘postage-stamp collection’).

Syntax

Genders of inanimate objects have been reduced to two, common and neuter, revealed syntactically in the choice of definite article, *de* and *het*, respectively, and of pronominal reference, *hij/hem* and *het*, respectively; thus, *de stoel* (common) ‘the chair’ = *hij/hem* ‘he/him,’ *de tafel* (common) ‘the table’ = *hij/hem* ‘he/him,’ *het boek* (neuter) ‘the book’ = *het* ‘it’ (but see the section on Regional and Social Variation). The pronouns *hij/hem* and *zij/haar* are used to refer to males and females, respectively; *de man* ‘the man’ = *hij/hem*, *de vrouw* ‘the woman’ = *zij/haar* ‘she/her,’ *het meisje* ‘the girl’ = *zij/haar*. Moreover, in the written language *zij/haar* and the possessive *haar* are used to refer to collective nouns denoting people (e.g., *de jeugd* ‘youth’ as in the sample sentence).

In declarative main clauses, the finite verb appears in second position and may be preceded by the subject or some other element, thus *ik zag hem gisteren* ‘I saw him yesterday.’ If the initial position is not occupied by the subject, the subject follows the verb, thus

| | | | |
|-----------------------|-----|----|-----|
| gisteren | zag | ik | hem |
| yesterday | saw | I | him |
| ‘yesterday I saw him’ | | | |

A past participle or infinitive appears at the end of the clause, thus

| | | | | |
|-----------------------------|------|----|-----|--------|
| gisteren | heb | ik | hem | gezien |
| yesterday | have | I | him | seen |
| ‘yesterday I have seen him’ | | | | |

In subordinate clauses, the verb is in final position:

| | | | | | | | | |
|---------------------------------|----|-----|------|------|----|-----|-----|--------|
| als | ik | hem | zie, | zal | ik | het | hem | zeggen |
| if | I | him | see, | will | I | it | him | tell |
| ‘if I see him, I will tell him’ | | | | | | | | |

Here there is obligatory inversion of subject and verb in the main clause because the subject does not begin the sentence.

In *wh*-questions, the *wh*-element occupies first position and the finite verb the second: *waar is het station?* ‘where is the station?’ In *yes/no* questions, the finite verb occupies first position and the subject the second:

| | | | | | |
|----------------------------------|-----|-------|-----|-------|----------|
| heeft | de | vrouw | het | huis | gekocht? |
| has | the | lady | the | house | bought |
| ‘has the lady bought the house?’ | | | | | |

Many verbs have a stressed prefix in the infinitive (e.g., *ondergaan* ‘to set’). In the present and past

tenses, this prefix **follows** the verb and appears at the end of main clauses:

| | | | | | | |
|----------------------------|-----|--------|----|-----|--------|-------|
| de | zon | gaat | in | het | westen | onder |
| the | sun | V.PRES | in | the | west | PRT |
| ‘the sun sets in the west’ | | | | | | |

But in subordinate clauses it appears as a prefix: *als de zon ondergaat, wordt het donker* ‘when the sun sets, it gets dark.’

Vocabulary

The vocabulary of Dutch is basically Germanic and has preserved hundreds of words that are not found in English (e.g., *gesprek* ‘conversation’). Nevertheless, it has many Latin and Romance, mainly French, borrowings (e.g., *straat* ‘street’ and *horloge* /hɔrˈloːʒə/ ‘watch’). Since World War II, a large number of English borrowings have appeared (e.g., *management*, *website*), as well as loan translations (e.g., *diepvries* ‘deep freeze’).

Orthography

The present-day spelling system was basically established in the 19th century and a reformed version was made official in 1947. It is to a great extent phonemic, although not entirely so; thus, in *kat* ‘cat,’ *brood* ‘bread,’ and *wordt* ‘becomes’ the <t>, <d>, and <dt> all represent /t/. Furthermore, long and short vowels are distinguished in closed syllables by the use of two vowel letters versus one (*brood* /broːt/ ‘bread’ but *klok* /klɔk/ ‘clock’) and in open syllables by the use of one consonant letter versus two (*broden* /ˈbroːdə/ ‘loaves’ but *klokken* /ˈklɔkə/ ‘clocks’). The digraph <oe> is used for /u/ (*boek* /buk/) and <ui> for /œy/ (*huis* /hœys/), <w> represents /v/ (*wind* /vɪnt/ ‘wind’), and both <ch> and <g> represent /x/. Final <n> in place names and plurals of nouns and verbs is not pronounced in normal speech. The assimilation and elision typical of connected speech are not reflected in modern Dutch spelling.

Sample Sentence

This example is from Huizinga (1939, repr. 1950, 313).

| | | | | | |
|-----|--------|-------------|----------|--------|------------|
| de | meeste | bloeiende | culturen | hebben | wel |
| /də | mɛːstə | ˈblɔjəndə | kœlˈtyrə | ˈhɛbə | vɛl |
| the | most | flourishing | cultures | have | admittedly |
| de | jeugd | liefgehad | en | | |
| də | ˈjœxt | ˈlifxəɦat | ən | | |
| the | youth | loved | and | | |

vereerd, maar haar niet gecajoleerd of gefêteerd,
 və're:rt mar ha:r nit xəkɑʒə'le:rt ɔf xəfə'te:rt
 honored but her not flattered or fêted,

en steeds van haar geëist
 ɔn stɛts vɑn ha:r xə'ɪst
 and always from her demanded

gehoorzaamheid en eerbied voor de ouderen
 xə'hɔ:rza:mɦe:it ɔn 'e:rbit vɔ:r də 'ludərə/
 obedience and respect for the elderly

'while most flourishing cultures have loved and
 honored the young, they have not indulged or
 spoiled them, and always required from them
 obedience and respect for their elders'

Regional and Social Variation

The Dutch linguistic area includes not only the standard language but numerous regional variants; as many as 28 dialects, falling into six main groups, have been recognized. These dialects are dying out, however, and are being replaced by regionally colored varieties of Standard Dutch.

There is much variation in the educated pronunciation of Standard Dutch; a particularly salient set of differences distinguishes pronunciations to the north of the Rivers Rhine, Meuse, and Waal from those to the south. In the south, an additional phoneme, a voiced velar fricative /ɣ/ (spelled <g>) appears, and the corresponding voiceless fricative /x/ (<ch>) is velar rather than uvular. In fact, in the north, /v/ may be replaced by /f/ and even /z/ by /s/. In the south, particularly Belgium, /e: ø: ɔ:/ are monophthongs rather than closing diphthongs, and /v/ is [β] or (with palatalization) /ɥ/. /r/ appears in various realizations, usually alveolar in Belgium, Amsterdam, and the northeast Netherlands, but appears as uvular trills, fricatives, or approximants elsewhere.

In 1973 the official name of the language in Belgium became 'Dutch' rather than 'Flemish', the standard form being held to be that of the Netherlands, and in 1982 the Nederlandse Taalunie (Dutch Language Union), a joint Belgian-Netherlands venture, was set up with the aim of advancing Dutch language and literature throughout the Dutch-speaking area. Nevertheless, there are a few minor differences at the grammatical and lexical level between Standard Dutch in Belgium and in the Netherlands.

In Belgium, there are still three genders, revealed in pronominal reference as well as in the choice of article; thus *de stoel* (masculine) 'the chair' = *bij/hem* 'he/him,' *de tafel* (feminine) 'the table' = *zij/haar* 'she/

her,' *het boek* (neuter) 'the book' = *het* 'it.' A further striking difference is that the informal pronoun of address in the Netherlands is *jij/je*, whereas in Belgium it is *gij/ge*, a form that in the Netherlands is now reserved for the Deity.

Lexical differences are found not only in administrative terms referring to the different political structures of Belgium and the Netherlands, but also in a long heterogeneous list of colloquial words; thus, Belgian *blokken* but Netherlands *studeren* 'to study,' Belgian *solden* but Netherlands *uitverkopen* 'bargains, the sales,' Belgian *gans proper* but Netherlands *helemaal schoon* 'very nice,' and so on.

Dutch is no different from other languages in possessing various sociolects (varieties of languages spoken by particular social classes or ethnic, age, employment, or religious groups) and in undergoing constant change. One innovation, noticed in the last quarter of the 20th century and termed Polder Dutch, is the change in the realization of the diphthongal phonemes /ɛi œy ɔu/ from [ɛi œy ɔu] to [ai ɔu ɔu]. This began among educated, upper-class women and rapidly spread to other groups, including men and children, and can now be found throughout the Netherlands.

Influence on Other Languages

Dutch was the official language of the colonial empire of the Netherlands and various local and creolized forms of the language sprang up in present-day Indonesia, the Caribbean, and South America. Most of these are now extinct, although Dutch had a considerable influence on the still-extant Spanish- and Portuguese-based Papiamentu and English-based Sranan. The Dutch spoken by colonists sent to the Cape by the Dutch East India Company in the 17th century evolved into Afrikaans, now one of the official languages of South Africa.

Within the Netherlands, Frisian is strongly influenced by Dutch, particularly in its vocabulary (for example *sleutel* 'key' instead of *kaai*); in Belgium, the conversational French of bilingual Dutch and French speakers may show Dutch influence (e.g., *s'il vous plaît!* instead of *voilà!* when giving someone something, on the model of *alstublieft!* 'please!').

In the late Middle Ages, trade between the British Isles and the Low Countries brought Dutch words into Scots (e.g., *pinkie* 'little finger') and English, especially nautical terms (e.g., *deck*, *smuggler*, and *yacht*). The 17th century saw the introduction of artistic terms (e.g., *easel*, *landscape*, and *sketch*). More modern borrowings include *boss*, *coleslaw*, and *cookie*.

Eblaite

A Archi, University of Rome, Rome, Italy

© 2006 Elsevier Ltd. All rights reserved.

Eblaite, the Semitic language spoken by the people responsible for the urbanization of northern Syria and northern Mesopotamia in the early part of the third millennium B.C., is named after the city of Ebla (c. 60 km south of Aleppo) because of its archives, which cover, however, only the second half of the 24th century B.C. Eblaite is a branch of Akkadian, which dates to the 26th century B.C., whereas the texts of the Dynasty of Akkad appeared a few decades after the documents of Ebla. Eblaite was not a written lingua franca used to communicate in a large area, because the material present in the various types of sources reflect a single language. Forms with the pattern *parrus*, *parrusum* are common to Eblaite and the Assyrian dialect, whereas Old Akkadian follows the *purrus*, *purrusum* pattern.

Sources

The archives of Ebla included originally about 3000 clay tablets in cuneiform writing. Most of the texts are administrative in character and relate to palace activity. They make large use of Sumerian logograms for substantives and verbs (according to the archaic use of cuneiform); therefore, the Semitic elements include a few names of objects, most of the prepositions, and personal names. Personal names are about 3000 and geographic names about 900. The chancery documents (approximately 60), which include letters, royal decrees, some political agreements, and diplomatic reports, are richer in Semitic elements. One of the several Sumerian lexical lists was provided for most of its 1200 words with an Eblaite translation; another list of 330 words was added to it. About 50 administrative documents of the same period come from Mari (Middle Euphrates); other 200 were found in Nabata (Tell Beydar) in northern Habur.

Grammar Features

Phonological and morphological interpretation is often hampered by the inaccuracy offered by syllabic orthography, notwithstanding the rules fixed in the 'syllabary.'

Personal Pronouns

1st sg. nom. *'anna* (Akkadian *anāku*; Ugaritic *'nk*); 2nd sg. m. *'anta*, gen.-acc. *kuwāti* (O. Ass. *ku(w)āti*), dat. *kuwāši*; 3rd sg. m. nom. *šū* / *šuwā*, gen.-acc. *šuwāti*, dat. *šuwāši*. *Personal pronoun suffixes*: 1st sg. com. *-ī* / *-ya*; 2nd sg. gen.-acc. m. *-ka*, f. *-ki*, 2nd sg. m. dat. *-kum*; 3rd sg. m. gen.-acc. *-šu*; 3rd sg. m. dat. *-šum*; 1st pl. gen. *-nā* / *-nū*; 3rd pl. m. gen.-acc. *-šunū*. *Relative pronouns*: sg. m. nom. *šu*, gen. *ši*, acc. *ša*, fem. nom. *šātu*, gen. *šāti*; dual gen.-acc. *šā*; pl. gen.-acc. *šūti*, fem. *šāti*. *Interrogative pronoun*: animate nom. *mannu*, acc. *manna*; inanimate nom. *mīnu*, acc. *mīna*.

Nouns

Only Eblaite and Akkadian, among the Semitic languages, present the entire nominal inflexion of case, including the use of the dative and the locative: sg. m. nom. *-um*, gen. *-im*, acc. *-am*, dat. *-iš*, loc. *-ūm*, fem. nom. *-atum*, gen. *-atim*; dual nom. *-ān*, gen.-acc. *-ayn*; pl. nom. m. *-ū*, gen.-acc. *-ī*.

Prepositions

in 'in,' *ana* 'to,' *ašta/i/u* 'from, with, by' constitute three important isoglosses with Akkadian. *sin* 'for, toward' might be found also in Sabaean. *al* 'on,' *min* 'in,' *minu* 'from,' *ade* 'instead of,' *qidimay* 'before,' *baluli* 'without' are Common Semitic. The conjunction *šumma* 'if' is an isogloss with Akkadian and Arabic. *ap* 'further, rather' occur also in Ugaritic and Hebrew.

Verbs

There are three tenses: the imperfect with prefixes and some suffixes; the perfect with suffixes but

no prefixes; the imperative. The roots can be modified in common with other Semitic languages. Eblaita has G, Gt, D, Dt, Š, Št (but no N) conjugations. The prefix vowel of the 3rd m. sg. is *i-*, as in Akkadian; some verbal forms in personal names present also *ya-*, as in West Semitic. The 3rd fm. sg. has not only *ta-* but also *ti-*.

Efik

B Connell, York University, Toronto, ON, Canada

© 2006 Elsevier Ltd. All rights reserved.

Background

Efik is one of the better-known African languages and was at one time one of the best-described African languages. It is spoken today by perhaps 750 000 people as a first language in the southeastern corner of Nigeria, in and around the city of Calabar, its cultural center. Due to its location near the Atlantic coast, Calabar and the Efik were encountered early by European explorers, traders, and missionaries. Calabar was a major slave port during the era of the trans-Atlantic slave trade. As a result of its strategic location, Efik became the dominant language of the region, and for a considerable period was used inland along the Cross River as the local trade language. As a result of missionary activity in the mid- to late-1800s, Efik became one of the first languages of sub-Saharan Africa to be reduced to writing. A sketch grammar was published in 1857 (Goldie, 1857), followed by the first Efik-English dictionary in 1862 (Goldie, 1862). Insights from Efik data were important in the development of our current understanding of tone and its place in phonology (Ward, 1933; Welmers, 1959; Winston, 1960), leading to the notion of downstep and indirectly to the advent of autosegmental

theory. In recent years Efik has been eclipsed in prestige locally, and it has given way to English and Nigerian Pidgin as lingua francas in Southeastern Nigeria. Despite its early development, only a small literature has accrued in the language; it is used to some extent on radio and television, but there is no Efik language newspaper. Goldie (1857) remains the only attempt at a grammar of the language, and except for the work of T. L. Cook (Cook, 1969, 1985, 1986, 2002), it has largely escaped the notice of contemporary linguists.

Classification

Efik is now recognized as part of Lower Cross, a subgroup of Cross River, which is in turn a branch of Benue-Congo and part of the Niger-Congo phylum (Connell, 1994). Linguists working on the classification of African languages have frequently noted similarities between Efik and Bantu, (e.g., Guthrie, 1967–1971; Greenberg, 1963; see also Winston, 1970), though without advancing the claim that Efik or its sister Lower Cross languages are themselves Bantu or Bantoid. Other members of the Lower Cross grouping include Ibibio and Anaang, which, despite interesting structural differences among the three, exhibit a fair degree of mutual intelligibility, Ekit, Oro, Obolo, Usaghade, and a

number of other smaller languages. The variety of Efik spoken at Calabar is considered the standard form of the language; there are minor dialect variations, spoken at neighboring Creek Town and to the northwest of Calabar in the Odukpani area. The brief descriptive notes that follow are confined to remarks on certain interesting aspects of the Efik tone system.

Efik Tone

Efik is a classic example of a two-tone (high, low) terrace-level register tone language exhibiting both ‘automatic’ and ‘nonautomatic’ downstep. Thus, after H there exist only three possibilities: H, L or downstepped H ([↓]H), and after L only H is possible. H after L and [↓]H are both lowered relative to a preceding H (i.e. ‘automatic’ and ‘nonautomatic’ downstep, respectively) and no subsequent H within the same phonological phrase can rise above this new level, hence the terracing effect. H and L can combine within the same syllable to give surface contours, both rising (LH) and falling (HL). Lexical roots in Efik fall into one of three tone classes, those bearing H, L, or LH tone patterns.

Tone functions both lexically and grammatically in Efik. At the lexical level, there is an abundance of minimal pairs that establish this function. Grammatically, tone is used to mark a wide range of functions. In the noun phrase, associative and genitive constructions, whether adjective + noun or noun + noun, are indicated by means of a modification of the tone of the second element of the construction. In the verb phrase the positive imperative form of the verb is considered to bear the inherent tone; certain tenses, aspects, and moods, and focus and negation are indicated through tone modifications. Person (2_{SG} vs. 3_{SG}, 2_{PL} vs. 3_{PL}) is marked through a modification of the tone of a prefix. Together with tense and aspect, focus in Efik may be considered a basic category of the verb system. A very brief and partial sketch only of its operation is possible here; the interested reader is referred to Cook (1985, 2002) for further details.

Focus is marked by means of an inflectional affix, normally consisting of one or more tones, attached to the verb stem. On positive verbs, a three-way distinction is made, where focus is on the verb itself (verb phrase focus, VPF), on a word or words preceding the verb (PrVF), or on a word or words following the verb (PoVF). Thus, a verb with the same time

and aspect reference will vary in its tone according to its focus condition. Verbs bearing inherent H become in the past, for 1_{SG}, [↓]H (VPF), H (PrVF), and L (PoVF); verbs with inherent L remain L under these conditions. For negative verbs only a two-way distinction is realized, between PrVF on one hand and VPF and PoVF on the other.

This article has given only a brief insight into the complexity of one aspect of Efik, its tone system. Other aspects of Efik structure, both in the realm of phonology and in syntax, as well as elsewhere, are equally interesting. Renewed focus on this language would well repay linguists for their efforts.

Elamite

G B Gragg, University of Chicago, Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Elamite was a language spoken on the Iranian plateau from at least the end of the fourth millennium B.C.E. until at least the end of the Persian Empire in the fourth century B.C.E. It is attested in thousands of cuneiform documents, the great majority of which come from the western and southwestern periphery of that area, in the modern provinces of Khuzestān and Fārs, especially from the sites of Susa, which was an important political and economic center during the whole period, and Persepolis, the dynastic center of the Achaemenid Empire. The Elamite texts are almost exclusively either monumental (e.g., building inscriptions) or administrative (e.g., accounts, rations) in character. Elamite was first identified by European scholarship early in the 19th century because of its inclusion in many of the Achaemenid bilingual and trilingual monumental inscriptions: Old Persian, written in a specially created alphabetic script, and Akkadian (Babylonian) and Elamite, both written in Mesopotamian cuneiform. This corpus provided the basis for the decipherment of Akkadian, and hence Elamite, cuneiform in the 1840s.

The earliest evidence of texts in the region was found on about 1500 clay tablets dating from about the end of the fourth and beginning of the third millennium B.C.E. They are written in a still undeciphered script termed, misleadingly, ‘Proto-Elamite.’ The language of these texts is presumed, but not proven, to be Elamite. The same can be said about another small corpus of about 20 texts from the end of the third millennium written in an indigenous but cuneiform-like script known as ‘Linear Elamite.’ Apart from these two very early corpora, Elamite texts are written in various local adaptations of Mesopotamian cuneiform, usually with a significant reduction in the number of syllabic and logographic values and the occasional creation of a new local value. This corpus of texts is unevenly distributed over the commonly recognized periods given in Table 1. Achaemenid Elamite is obviously the best attested and most studied of these corpora, but, in part because of the massive presence of Old Persian and other Iranian names and loanwords in this period and doubts about the extent of Iranian influence on the development of the Elamite language, Middle Elamite, where it differs from Achaemenid Elamite, tends to be taken as a kind of classical norm.

Elamite cannot with any certainty be related to any known language, although a geographically plausible

relation to the Dravidian languages has been discussed almost since the beginning of modern scholarship in the language (see the synthesis of McAlpin, 1981). Partly because of the lack of a known cognate language and partly also because of the relatively limited and stereotyped nature of the contents of the corpus, the interpretation of many aspects of Elamite grammar remains uncertain and subject to a great deal of discussion in the literature.

In terms of word-order typology, Elamite has predominantly subject-first, verb-last order, with a certain amount of variability. Adjectival, genetical, and relative modifiers normally follow the head noun; adverbial relations are rendered principally by postpositions, although there are also some prepositions. It is a subject of current debate whether Elamite displays features that might be termed ‘ergative,’ but in any case it is much less so than its contemporary neighbors Hurrian, Urartian, and Sumerian. Elamite morphology is almost exclusively suffixing. A central role in morphology and syntax is played by a classifier suffix/enclitic, NCLASS, marking person, number, and various classes of animacy and inanimacy. This formative plays the role of subject marker in two of the three verb conjugations, but it is also used in one of most characteristic features in the language: the delineating of a syntactic constituent N_{HEAD} adjunct by one or more occurrences of a NCLASS agreeing with the head. The adjunct can be an adjective or a possessor, as in:

- (1) temti riša-r
lord.ANIM.SING great-NCLASS.ANIM.SING
‘great lord’
- (2) ulhi sunki-me
house.INAN.SING king-NCLASS.INAN.SING
‘house of the king’

Table 1 Periodization of Elamite

| <i>Period B.C.E.</i> | <i>Designation</i> | <i>Texts</i> |
|----------------------|--------------------|--|
| c. 2600–1500 | Old Elamite | Less than a dozen texts of varied content |
| c. 1500–1000 | Middle Elamite | Almost 200 royal monumental inscriptions |
| c. 1000–550 | Neo-Elamite | About 30 royal inscriptions and several hundred legal and administrative texts |
| 550–330 | Achaemenid Elamite | The several hundred royal inscriptions and several thousand administrative texts from the administrative centers of the Persian Empire |

or in some more complex combination of the two:

- (3) sian Nabu-me upat-hussi-p-me kuši-h
 temple.INAN.SING Nabu-NCLASS.INAN.SING
 brick.AN.PL-baked-NCLASS.AN.PL-NCLASS.INAN.SING
 build-I
 ‘I built a Nabu temple of baked brick’

The adjunct can also be used as relative (note the additional NCLASS formative after the negation marker before the relativized verb):

- (4) sian in-me kuši-h-š-me-a
 temple.INAN.SING not-NCLASS.INAN.SING build-PL-
 3RD-NCLASS-COMP
 ‘the temple which they did not build’

Finally, this marking can occur even in sequences which, for example, in English, would not normally be treated as a syntactic constituent (on this construction see Stolper, 2004: 85):

- (5) peti-p pat-p u-p rabba-k-na
 enemy.AN.PL-NCLASS[AN,PL] under-NCLASS.AN.PL me-
 NCLASS.AN.PL bind-PERF-OPT
 ‘may enemies be bound under me’

The last example illustrates that the NCLASS can also occur on the head noun, in this case explicitly marking it as plural.

Endangered Languages

L Grenoble, Dartmouth College, Hanover, NH, USA

© 2006 Elsevier Ltd. All rights reserved.

Language Endangerment

Although it is somewhat difficult to count languages and to measure linguistic diversity with exact precision, there are an estimated 6800 languages spoken in the world today. While there is some question as to exactly how many languages will be lost over the course of this century – ranging from a low of 25% to a high of 90% – there is widespread agreement that language loss is occurring at an unprecedented rate. Most recent studies have concluded that at least 50% of the world’s languages are losing speakers and that by the end of this century, a full 90% of the world’s languages will disappear entirely, replaced by more widely used (national and/or global) languages. This situation is generally referred to as language endangerment, a term used broadly for languages which are threatened with absolute loss;

a language is considered lost when it has no speakers. Language endangerment is sometimes called language attrition or language death, but ‘death’ is avoided out of sensitivity to the population whose language has been lost. Language attrition and moribundity – when children cease learning a language – are now taking place with exceptionally rapid speed. Hundreds of languages are currently endangered and there are few parts of the world where some form of language decline is not occurring. While language attrition is not in and of itself a new phenomenon, the rate of decline in linguistic diversity appears to be unique to this era, and is perhaps rivaled only by the kind of language loss which took place in conjunction with the agricultural revolution of approximately 10 000 years ago. One consequence is that a significant number of communities are facing the loss of a language which historically and traditionally has been foundational to their sense of identity. In some instances communities are reacting with efforts to revitalize the local language, while in others they lack the resources, time, or motivation to do so.

Linguists are particularly concerned with the loss of indigenous, or local, languages, as opposed to immigrant languages. For the latter, the language may give way in the new territory to an already established (national or dominant) language, but a robust speaker community continues/thrives in the homeland of the immigrants. (This is the situation of most immigrant languages in the United States, for example; for the most part, second-generation immigrants speak and use English in their daily lives, but their ancestral language is maintained in their original homeland. English, in contrast, is an immigrant language to North America; for a range of historical, socio-economic, and political reasons, it has largely ousted Native American local languages.) It is the loss of such local languages which is of concern to linguists, as their loss means an absolute kind of disappearance of the language. Thus, by and large, the term 'language endangerment' refers to the attrition and potential loss of local languages. A language is considered endangered when it is used by fewer speakers and when it is used in fewer situations or domains.

Language endangerment typically involves language contact situations, with two (or more) languages in use, where one language (Language A) replaces another (Language B). Prototypically, Language A is being adopted by speakers of Language B and so Language A replaces Language B in the sense that decreasing numbers of speakers of Language B use it, until ultimately there are no speakers of Language B at all. This is referred to as language shift, a term which refers specifically to such changes in patterns of language use, whereby speakers abandon the language of their parents in favor of another language. In the scenario outlined here, Language A can most neutrally be referred to as a language of wider communication; it tends to be a language which holds social prestige, serves official and governmental functions, and is used in education. It is often a regional or national *lingua franca*, i.e., the language which groups speaking different languages use to communicate with one another. It is also called, less neutrally, the dominant language, the majority language, or even the killer language. 'Dominant language' is to be avoided as it implies a deliberation on the part of the speakers of that language to dominate others; in some instances this is in fact the case, as when language policies intentionally restrict use of a local language. But in other situations the influence of the language of wider communication is more indirectly and subtly attained, through prestige and social pressures. Similarly, a number of labels are used to refer to Language B, such as minority language, indigenous language, mother tongue, or

heritage language. The term 'local language' is more neutral and captures the fact that language use is tied to a particular geography, and that a speaker community generally sees the need or desire to use this language within a given region. The respective terms 'majority' and 'minority' for Languages A and B are not always accurate; speakers of Language B may be numerically greater but in a disadvantaged social or economic position which makes the use of the language of wider communication attractive. The term 'heritage language' can be confusing, as it is often used to refer to the language of one's ancestors, regardless of how many generations have passed since anyone spoke the language. It does not necessarily refer to a local or indigenous language, and can also refer to the ancestral languages of immigrants, even when they have not been spoken for generations.

Predications of language loss stem from several considerations, which center around a combination of critical factors in language vitality, including the number and generations of speakers, their geographic distribution and relative isolation, and recognition of ongoing rapid language shift. First, there is a very uneven distribution between languages and speakers, with just a handful of languages spoken by a very large percentage of the global population. According to current counts, approximately half the world's population speaks one of just 20 languages, and eight languages (Mandarin [Mandarin Chinese], Spanish, English, Bengali, Hindi, Portuguese, Russian, and Japanese) surpass all others with over 100 million speakers. Arabic could perhaps be added to this list: the sum total of all speakers of some form of Arabic makes it the fifth largest language, with over 200 million speakers. Not all varieties of Arabic are mutually intelligible, however, and so the differences between them are more language-like than dialect-like. Yet given the total number of people who speak some variety of Arabic, it should be included in the list of major world languages. The situation is markedly different for most of the world's languages. Some 96% of all languages are spoken by just 4% of the population, and one-fourth of the total number of languages have fewer than 1000 speakers. More than half of all languages have fewer than 10 000 speakers. Although the total number of speakers is not the sole indicator of language vitality, it is certainly a very important one. A very large majority of the world's population speaks just a very few languages. More to the point is the fact that we are witnessing rapid language shift, with a small set of major or global languages gaining in terms of numbers of speakers at the expense of a vast majority of the world's languages.

Table 1 Geographic distribution of languages

| | <i>Total living languages</i> | <i>Percentage</i> |
|--------------|-------------------------------|-------------------|
| The Americas | 1013 | 15% |
| Africa | 2058 | 30% |
| Europe | 230 | 3% |
| Asia | 2197 | 32% |
| The Pacific | 1311 | 19% |
| Total | 6809 | |

Source: Grimes (2000).

Finally, it is important to note that the geographic distribution of languages is also very uneven, with the largest numbers of languages spoken in Africa and Asia, and much smaller numbers elsewhere, such as in North and South America and the Pacific. Europe has a very few languages, both in terms of raw numbers and of percentage relative to the whole. This distribution is summarized in **Table 1**.

Distribution by continent or region is only part of the story. Language density, or the number of languages per unit area, varies greatly. Papua New Guinea stands out with 820 languages; with its relatively small territory, it has the highest language density of any country in the world. In all of North America, fewer than 200 indigenous languages remain, although there were certainly hundreds of distinct languages several centuries ago. Today, only a handful of these (such as Cree, Dakota, Ojibwa, Navajo) have a hope of survival, and even their longevity is doubtful. The case of Cree is illustrative. As of the 1998 Canadian census, there was a total of 87 555 speakers of all varieties of Cree. These speakers are not monolingual, however, and they show low literacy rates in Cree (only 5–10%) but high literacy rates in a second language, usually English (75–100%). Such figures are indicative of significant language shift. The figures for Dakota are even more alarming, with fewer than 27 000 speakers in North America as a whole, and only 31 monolingual speakers (as of 1990). Basic descriptions of Dakota speech patterns note that in some communities the children and young adults do not speak Dakota or at least prefer to speak English. Again, these are all signs of ongoing and advanced language shift, leading toward language extinction.

As this may suggest, in only a very few cases is language loss due to the loss of the speaker population itself. Instead, the primary cause for language loss is language shift, when speakers cease to speak their own native tongue, the local language, in favor of the language of what is usually, politically and/or economically, the dominant culture. Such shift from the local to the language of wider communication can

occur over several generations, or even as quickly as over the course of a single generation. In many cases the oldest generation – the grandparent group – speaks the local language as their first and primary language and has limited or nonfluent knowledge of the external language of communication; in some instances they may even have no knowledge at all of the language of wider communication. In contrast, the middle generation has some knowledge but primarily uses the language of wider communication, and the youngest generation has little to no knowledge of the local language, using at best a few words or phrases, such as greetings. In cases of rapid language shift, however, these changes occur across a single generation.

Levels of Language Endangerment

Implicit to the study of language endangerment is the notion that a relatively vital language can change to a state of endangerment at some point, usually when children cease learning the language. In studying language endangerment, it is important to assess degrees of vitality versus endangerment. That said, because a large number of factors enter into each situation, it can be difficult to rank levels of endangerment. Therefore, different linguists have proposed a variety of scales, with differing numbers of stages of endangerment and different labels for each level. There is, however, widespread agreement on the ends of the scale: safe languages and extinct languages. Generally, languages are categorized with respect to endangerment on a scale of six levels: safe, at risk, disappearing, moribund, nearly extinct and extinct.

Safe: A language is considered safe when all generations use the language in all or nearly all domains. It has a large speaker base relative to others spoken in the same region and, therefore, typically functions as the language of government, education, and commerce. Many safe languages enjoy official status within nation-states, and as such tend to be held in higher prestige than other languages.

At Risk: A language is at risk when it is vital (being learned and used by people of all different age groups) without any observable pattern of a shrinking speaker base, but lacks some of the properties of a safe language: for example, it is spoken in a limited number of domains or has a smaller number of speakers than other languages in the same region.

Disappearing: A language is disappearing when there is an observable shift towards another language in the communities where it is spoken. With an overall decreasing proportion of intergenerational transfer, the speaker base shrinks because it is not being

replenished. Disappearing languages are consequently used in a more restricted set of domains, and a language of wider communication begins to replace it in a greater percentage of homes.

Moribund: A moribund language is one that is not being transmitted to children.

Nearly Extinct: A language can be considered nearly extinct when only a handful of speakers of the oldest generation remain.

Extinct: An extinct language is one with no remaining speakers.

It should be noted that sometimes an intermediate stage between 'safe' and 'at risk' is recognized, 'safe but small,' determined by languages which are otherwise safe and stable but have a relatively small speaker base. The last three levels of language endangerment given here – moribund, nearly extinct, and extinct – are characterized by a lack of intergenerational transmission; disappearing languages are characterized by a downward trend.

Many linguists would argue that any language which is not at the safe level is endangered. Furthermore, there does not appear to be a direct correlation between the level of endangerment and the anticipated rate of language attrition: some communities shift language usage more slowly, and others more quickly. That said, language endangerment is currently a pressing concern for the linguistic community precisely because rapid attrition is occurring at a global level. In addition, the kinds of documentation and revitalization efforts needed are directly related to the level of endangerment. The closer a language is to extinction, the greater the urgency to act before fluent speakers are gone. Except in cases of sudden attrition (e.g., when a language is abruptly lost through natural catastrophe or warfare; see the next section), endangered language situations tend to be characterized by speakers of differing proficiency levels. Languages ranked at any level below safe tend to have communities which include individuals who are semispeakers, i.e., not fully fluent speakers, lacking native proficiency; the ratio of semispeakers to fluent speakers varies among communities and with endangerment levels. Such semispeakers show varying degrees of fluency, ranging from strong or nearly fluent speakers, through reasonably fluent semispeakers and weak semispeakers who are less fluent, to those with even more limited speaking competence. In assessing language vitality, it is thus important to take into consideration the proficiency and knowledge of the speakers of the language. Even in the case of extinct languages, there may be cause to move quickly, as there may still be 'rememberers' of the language who have some recollection of its use or

may have some experience with it. Sometimes communities opt to resurrect (or 'resuscitate') extinct languages; rememberers can play a critical role in these efforts. Here too there is a range of proficiency: in some cases such rememberers have memorized entire texts without understanding their meaning, while the knowledge of others is restricted to only a few words or phrases. They can play an important role in language revitalization and documentation efforts, but they are static and do not represent living language.

What Is Lost?

There are a number of reasons to be concerned about language attrition. Language is a key part of each person's identity and is an essential component of a group's cultural and social heritage. Local communities who have lost their language speak about it as a deeply personal loss which is accompanied by a loss of a sense of self. Speakers whose languages are not endangered are also aware of the importance of language as a marker of identity and pay great attention to differences in dialects and speech patterns. Thus perhaps one of the most compelling reasons to be concerned about language endangerment is that the speakers who lost this part of their heritage deeply regret it and grieve over it. For this reason, so many different communities around the world are currently engaged in language revitalization efforts. Some of those groups whose languages are extinct are now attempting to resurrect them from whatever records have survived, including missionary descriptions, grammars, and sometimes oral recordings.

Loss of language also means a loss of intellectual wealth. From the linguistic standpoint, as we lose languages, we lose linguistic diversity. A great many of the world's broad array of endangered languages are understudied; what little knowledge we have indicates that many are structurally very different from the languages spoken by the majority of the global population (e.g., Mandarin, English, Spanish, and so on). The languages with the most speakers, cited in **Table 1**, represent a very small portion of the world's languages typologically and genetically. Thus language loss means a decline in sources about the range of human language and its limitations. For the linguistic community, one of the challenges of language endangerment is to record and describe as many languages as possible while they are still spoken, so that we do not lose this wealth of human knowledge without record. Language loss should also be considered from the broader scientific perspective. Language encodes the range of human experience and knowledge; its disappearance entails the loss of

the skills, information, beliefs, and ideas of a people. Often this involves specific knowledge about plants and their medicinal uses. It also includes historical knowledge; preliterate societies record their histories in their oral traditions, including stories, legends, and songs which tell the history of their people, settlements, battles, and so on. Language is more than a repository for religious and spiritual beliefs; in many societies the language itself is sacred and cannot be separated from religious beliefs and practices.

Taxonomy of Endangerment Situations

Language change and loss are naturally occurring processes which have been in place as long as language itself. Every language is constantly changing over time, and eventually evolves into one or more related but different languages; for example, the modern Romance languages (Spanish, Italian, French, and so on) are related to Latin, which is no longer used as a spoken language except for religious purposes. This kind of language 'loss' is a natural and ongoing process. Linguists are more concerned, however, with the absolute loss of language, which occurs when a language disappears entirely, without descendant languages. This kind of loss comes about in several different ways. Sometimes an entire speaker community passes away due to warfare, genocide, or disease. More frequently, however, language loss is the result of language shift, when speakers cease to speak their own native (local) tongue in favor of the language of what is usually the dominant culture, dominant politically and/or economically. The time frame for such shift varies across situations; it can take place over several generations, or much more quickly. One typical pattern is that the oldest generation, the grandparents, speaks the local language as their first and primary language, the middle generation has some knowledge but uses the dominant language primarily, and the youngest generation has little or no knowledge of the heritage language, and may at most know a few words or phrases. In cases of rapid language shift, however, these changes occur across a single generation, with the parent generation speaking the local language but their children, for whatever reasons, speaking a different one.

There are a number of ways to categorize language endangerment situations. One useful taxonomy takes into account the relative rate of attrition together with its causes. This taxonomy recognizes four different categories of attrition: sudden, radical, gradual, and top to bottom.

Sudden attrition refers to language loss which occurs abruptly because of the sudden loss of its speakers due to disease, war, natural disasters, and so on. Relatively

few cases of sudden attrition have been documented, although it most probably occurred more frequently during periods of colonization, when certain indigenous groups are known to have been annihilated due to disease. In modern times, civil strife, ethnic and religious clashes, and the spread of some diseases, such as HIV, increase the chances of sudden attrition occurring in certain areas of the world.

Radical attrition is similar to sudden attrition in the sense that it comes about due to political circumstances which cause speakers to stop using their language. Such circumstances include repression and/or genocide, often occurring where groups are singled out for ethnic cleansing. (Under colonization and later, apartheid in South Africa, for example, Khoisan speakers abandoned their ethnic identity and so too their languages in order to avoid repressive measures which included genocide.) Such language shift is thus a means of self-defense or even self-preservation for speakers for whom identification with their ethnic group may lead to persecution. In these circumstances people are likely to cease speaking their heritage language abruptly.

Cases of gradual attrition are more prevalent in the world today. Gradual attrition is the relatively slow loss of a language due to language shift away from the local language to a language of wider communication. In some cases the language of wider communication is a regionally dominant language, and in others a national lingua franca. Gradual attrition often involves transitional bilingualism: as the speaker population is in the process of shift, certain groups primarily speak the local language and others the language of wider communication. Thus it is here that the clearest gradations in intergenerational transmission are to be found. Because this type of attrition is gradual, speaker communities may be unaware that it is in progress, until it is quite advanced and the local language is seriously endangered.

Bottom-to-top attrition refers to the loss of the local languages in most domains with the exception of religious and ritual practices. Languages at this level are in an advanced stage of attrition. The local language is preserved only in those contexts where its use is seen to be the most critical. This tends to be those types of context where ritualized or sacred texts are critical, and the population may view the specific language of these as sacred in and of itself. Such ritualized or ceremonial texts are often memorized. Because these tend to be very prestigious but restricted domains for a community, it can be difficult to assess the actual vitality of the language in question. In less advanced instances of bottom-to-top attrition, the language is still used spontaneously in the settings to which it has been assigned by members of the local

community. In extreme cases, the only remaining knowledge of a local language may be memorized portions of a ceremony. There are reports of communities which have retained the memorized rituals in the local language for many generations but have lost all comprehension of them.

Assessing Language Vitality

The factors involved in assessing language endangerment or vitality are complex. Language vitality is usually ranked in scalar terms on the basis of a combination of factors, in particular on numbers and generations of speakers. On one end of the scale are extinct languages which are no longer spoken at all, and on the other end are viable languages in no current threat of endangerment. In between these two extremes, a number of stages can be recognized. A healthy language with strong vitality is used with a variety of functions and in a range of settings, usually called domains. The most vital languages are used in all settings, formal and informal, official and in the home. In cases of language attrition, the local language is used in increasingly fewer domains with fewer functions as attrition progresses. Simply put, an important diagnostic in assessing vitality is the range of uses of a particular language.

Although it is often thought that the absolute number of speakers of a language is the key factor in language vitality, experts agree that in fact it is intergenerational transmission which is critical in determining it. In order for a language to be healthy, it needs to be used by future generations. When children cease learning and speaking a language, it is already endangered, even if there still exists a significant number of speakers. Intergenerational transmission does not in and of itself guarantee the safety of a language, however, as a complex set of factors are involved. These all pertain to questions of who uses the language, how, and when. In 2003 UNESCO's Ad Hoc Expert Group on Endangered Languages established a core set of nine criteria to be used in determining language endangerment:

1. Intergenerational transmission
2. Absolute number of speakers
3. Proportion of speakers within the total population
4. Trends in existing language domains
5. Response to new domains and media
6. Materials for language education and literacy
7. Governmental and institutional attitudes and policies, including official status and use
8. Community members' attitudes toward their own language
9. Amount and quality of documentation.

These nine factors are key in assessing language vitality. Variables (1)–(3) involve the distribution of speakers of the language, relative to the total number of the ethnic population as well as to generational stratification, and in absolute terms as well. Variables (4) and (5) are concerned with domains of language use; (7) and (8) with attitudes at the local and national level; and (6) and (9) are related to the kinds of material available for the language, including both pedagogical and reference materials as well as linguistic documentation. Strictly speaking, the level of linguistic documentation relates to language endangerment only insofar as ample documentation can aid language revitalization or resurrection efforts; the act of documenting a language does not directly affect its vitality.

Intergenerational Transmission

Intergenerational transmission is the single most important factor in determining a language's viability. In order for a language to remain healthy, it must be spoken by children, as they are the representatives and predecessors of future generations of speakers. For this reason, intergenerational transmission is the single most critical factor in a language's ongoing vitality. At the same time, rates of intergenerational transmission may vary between villages or speaker communities and it cannot be assumed to be uniform across a speaker population. There can be variation within a single village: it is often the case that in one family the children do not learn to speak the local language but in another they do. As this accurately suggests, overall language vitality may be uneven, higher in some communities and lower in others. A thorough analysis of language vitality requires attention to such regional variation in addition to the generational variation in transmission and use. A 10-way distinction in terms of transmission and use is proposed by Krauss (1997) to enable a more detailed means of assessing variation in speaking patterns across generations:

- a. The language is spoken by all generations, including all, or nearly all, of the children.
 - a-. The language is learned by all or most children.
 - b. The language is spoken by all adults, parental age and up, but learned by few or no children.
- b-. The language is spoken by adults in their 30 s and older but not by younger parents.
 - c. The language is spoken only by middle-aged adults and older, in their 40 s and up.
- c-. All speakers are in their 50 s and older.
 - d. All speakers are in their 60 s and older.
 - d. All speakers are in their 70 s and older.

- d-. All speakers are in their 70s and older, and there are fewer than 10 of them.
- e. The language is extinct, with no speakers.

As this scale suggests, it is important to make distinctions across age-groups within a single generation as well as across generations. Some might argue that a language is already in danger at stage (a-), when some of the children are not learning it. At stage (b), there is a greater level of danger, and so on; if the language is to survive at this stage, efforts need to be made at revitalization, or for reversing language shift. This scale may appear overly detailed; it is clear that a language is already on the way to extinction when it has reached stage (b). Yet at times it is needed. First, it can be quite useful in assessing the relative vitality not only of different languages, but at times more importantly, of various speaker communities. Inuktitut, for example, can be rated at level (a) in Greenland, where there are fluent speakers of all generations. (There are other factors which enter into its vitality in Greenland, such as official language status and use in education.) In some other Inuktitut-speaking communities, however, children are not learning the language and it is on the path to extinction. This is the case in specific communities in Canada and Alaska, although the children are acquiring it in other communities. This example further underscores the fact that evaluating the overall status of a language can be difficult, as it may vary from community to community. Second, if community members decide to revitalize their language, it is important to have an accurate understanding of the ages and numbers of fluent speakers who can assist in the revitalization effort.

Absolute Numbers of Speakers

Absolute population size alone is not a definitive indicator of language vitality. Each individual community is embedded in a set of circumstances that affect language use, so that even a small isolated rural community which has little contact with speakers of other languages and in which all members, of all generations, learn and use the local language, cannot reasonably be called endangered. That said, as a general rule, the more speakers, the more likely the community will be able to resist language shift. Put differently, small communities are at greater risk, because they can more easily disappear due to any one of a number of natural or man-made catastrophes. Furthermore, a small community can more easily be assimilated to a large community, and is likely to have fewer resources to resist external pressures. Yet small size alone does not condemn a language to extinction, because the nexus of relevant

factors may actually favor language use. A case in point is Icelandic. It is spoken as the first language by a relatively small group of people (approximately 300 000), but it is the national language of the country of Iceland, has a long-standing literary history, and is a language of education. Icelanders have a strong sense of pride in their cultural and linguistic heritage and teach Icelandic to their children as their first language. It is hard to characterize it as being in any way endangered. By the same token, a relatively large speaker community does not guarantee language vitality. Navajo, an Athapaskan language spoken in North America, provides an example. Although there are currently approximately 178 000 speakers (2000 census), there is ample evidence of advanced language shift. In 1968, a full 90% of first-grade children spoke Navajo as their first and primary language; by 1990 this figure had dropped to 30%. Despite the relatively large speaker base, it is doubtful that future generations will speak Navajo unless measures are undertaken to assure its continuance.

Proportion of Speakers within the Total Population

The ratio of speakers of the local language with respect to the total population of the local community is an important diagnostic in evaluating language vitality. For safe languages, all of the population speaks the language. In contrast, for extinct languages, none of the population does. In between these two extremes, languages can range from unsafe, with early language shift, where nearly all of the population still uses them, to severely endangered, where only a small percentage do. The larger the percentage speaking and using the language in an active way, on a daily basis, the more likely the language is to maintain its vitality.

In addition to the ratio of speakers of the local language to the number of people who would claim that local language as ancestral, it is useful to compare how the local language speakers are embedded in a larger social and cultural context. Often local communities are in a minority position with regard to a national culture, represented by speakers of a language of wider communication. The narrower the gap, the stronger the position of the local language.

Trends in Existing Language Domains

A vital language continues to be used in existing domains, while in contrast an endangered language is used in fewer domains. The differences in usage can be placed on a continuum, with safe languages used in all domains for all purposes. Next are situations

of what is called diglossia, or the use of different varieties in different contexts. Here a language of wider communication, usually a regional or national language, is the one used in official domains, such as government, education, and other public offices and institutions. The local language, in contrast, is also used in public domains, including not only traditional (local) places of worship or other religious institutions, but elsewhere as well. Typically, the local language is used in the home and informal domains, and the language of wider communication in official domains, and both can be used in public domains. Older members of the community may use only the local language. Next on the continuum is what the UNESCO Ad Hoc Group of Experts terms dwindling domains, when use of the language of wider communication spreads at the expense of the local language. The critical change here is that the local language is used less frequently in the home and is not transmitted to children. This state is further characterized by bilingualism in both the parent and grandparent generations; the children tend to be semispeakers but may be bilingual if the local language is spoken in the home. As this description suggests, at this point there is advanced language shift; the language is endangered and could be ranked as disappearing or even moribund. There are two final stages in this continuum which precede extinction: limited or formal domains is one, and highly limited domains the other. The former is characterized by use of the local language at festivals and ceremonies, in particular when the older generation is present (and therefore using the language). Often the use of the local language is itself tied to the rituals of these occasions and to an extent may be formulaic in usage. UNESCO also includes use of the language in the home in this category when such use is limited to the grandparent generation. The next stage, highly limited domains, represents even greater restriction in use of the local language. It is used only by a very small number of people on very particular occasions, and its use is often ceremonial.

As is clear from this description, the range of domains in which a language is used can be correlated to the generational distribution of speakers and their levels of proficiency. Use in all domains requires fluent speakers of all ages. Loss of intergenerational transmission, by its very definition, is indicative of a restriction in domains, as it signals that the language is not spoken in the home setting with children.

Response to New Domains and Media

Vital, safe languages are not only used in existing domains, but a measure of their strength is the extent

to which their use is extended to new domains. These are created as society and conditions change, and an important measure of a language's vitality is the extent to which it evolves with the people who speak it. The general pattern, worldwide, is for the language of wider communication to be used in emerging domains, including formal education and media of all kinds. The question of language use in the media is critical. The media helps spread language use and fosters its growth and/or maintenance. Moreover, use of a language in media is an important indication of that language's prestige and the kind of support it receives from the larger (dominant) culture, the allocation of resources, and so on. Finally, the media represents prestige and affluence, and the language used in the media is associated with both of these.

Education is a key domain for language use. By its very nature, education promotes the language of instruction and fosters its use. Many local languages are not used in schools; in places where they are, they are more likely to be taught as a secondary subject and not used as languages of instruction. For a language to be truly vital, not only must it be taught in the schools, but it also must be used to teach other subjects.

Materials for Language Education and Literacy

Most linguists and local community members agree that education and literacy in the local language are necessary to maintain vitality, or to revitalize a language threatened with endangerment. Some local communities reject this notion, wanting to preserve their oral traditions and to rely solely on them. There is, however, a cost to this decision, as it limits the domains in which the language can be used. Regardless, most regard literacy as essential for local languages. Yet more than half of all languages have no written form, and so a writing system needs to be developed for them in order to use them in education and literacy programs. Basic pedagogical and reference materials are needed, including textbooks, dictionaries and usable descriptive grammars. Such materials are readily available for languages of wider communication, but not for the majority of local languages. In addition, reading material is needed for literacy as well.

The existence and use of such materials is another diagnostic for assessing language vitality. UNESCO uses a scale of six levels in this assessment; each of these levels correlates with ever-decreasing vitality. At one end, safe and stable languages have an established orthography with a written tradition that includes a full range of written materials; the language is used in official domains such as government and education.

At the next level, the materials exist and are used by children in the school, at least in terms of developing local language literacy, but the written language is not used in the government or administration. At the third level, children are exposed to written materials in the schools; they may play a role in education but print media, such as newspapers, journals, magazines, do not use the written form of the language. At the next level, although written materials exist, they are not used in education. Only some community members use them, while for others, their existence may have symbolic value. At the fifth level, the community has knowledge of a writing system and some written materials exist. Finally, at the other end of the community, there is no orthography and the language has no written form.

The singular importance of literacy, as presented by the UNESCO Ad Hoc Group of Experts, is not one which would be embraced by all linguists and by all community activists. It represents a practical view of the role of writing and literacy in the modern world in which local languages compete to survive.

Governmental and Institutional Attitudes and Policies

National and regional governmental policies, laws, and attitudes all play a critical role in the fate of local languages. Policies can be viewed as supportive, fostering the use and development of local languages. They can be benign, not explicitly supportive but also not disadvantageous to local languages. Governmental policies can also be explicitly hostile toward local languages and can actively discourage their use.

There is a direct relation between national-level policies and the attitudes of speakers of the language of wider communication. Positive policies at the national level tend to reflect the overall attitudes of the population toward local languages. One aspect of this is attitudes toward bi- or multilingualism. While some nation-states (such as Canada, Nigeria, or Switzerland) are multilingual, with multiple national and/or official languages, others (such as the United States) are unequivocally monolingual at a national level with regard to language and education policy, as such policies are intended to promote the use of one and only one official language (English, in this case). Because the use of local languages almost always entails at least bilingualism to some degree, so that community members can function at local, regional, and national levels, these languages suffer in countries which are dogmatically monolingual.

National-level attitudes can influence local attitudes. Language is closely associated with the people who speak it; negative attitudes toward a specific

language translate into negative thoughts and beliefs about the speakers and their culture, social norms, and heritage. Such negative views can further influence the views community members have of their language. They may perceive it as backward, useless, underdeveloped, and so on, or they may see it as an impediment to advancement in a larger society which does not value their specific local language. Needless to say, such attitudes have an adverse effect on language use and foster language attrition. The role of community members' attitudes toward their own local language cannot be overstated. Where there is a strong sense of pride in the language, it is more likely to be used and less likely to move into an endangerment situation. In cases where language attrition has begun, the chances of reversing language shift are considerably greater if the people have positive attitudes toward the local language. In the absence of these, a revitalization program must begin by fostering community support.

Causes of Language Shift

The precise causes of language shift are specific to each individual endangerment situation, yet several key factors often come into play. These include urbanization, globalization, and what have been called social dislocation and cultural dislocation. Often the causes of language shift center around imbalances in prestige and power between the local language and culture on the one hand, and the language of wider communication and dominant culture(s) on the other. The imbalance, or unequal levels of power, often means that members of the local community are socially disadvantaged in a number of ways with respect to the majority population. In concrete terms, this frequently means that members of the local community are relatively powerless politically, and are less educated and less wealthy, in many cases living in poverty, and with less access to technology and modern conveniences, than the majority population. One common result is that this socially disadvantaged position becomes associated with, or even equated with, the local language and culture, and so knowledge of the local language is seen as an impediment to social and economic advancement. Socio-economic improvement is thus perceived as tied to knowledge of the language of wider communication, as is renunciation of the local language and culture; for this reason, the situation has been called social dislocation. Social dislocation stemming from lack of prestige and power is one of the most powerful motivating factors in language shift.

Related to social dislocation is what has been called cultural dislocation, which comes about as a result of

modernization and globalization. These two related forces bring people from different cultures, speaking different languages, together in a variety of settings, from informal to official, including religious and educational settings. This often results in the culture of the minority giving way to that of the majority. At an extreme, globalization is feared to lead to cultural homogenization. The loss of cultural distinctions supports a loss of linguistic distinctions, since the culture is embedded in the language.

Urbanization is another key cause of language shift and is itself related to cultural and social dislocation. Urbanization brings people from different regions and cultures into the same living and working spaces. They are necessarily required to communicate with one another and so turn to an established lingua franca or language of wider communication. It is not surprising that we find the highest levels of language retention in rural areas; in general, the more isolated a community, the more likely it is to maintain use of the local language. Urbanization has the opposite effect: by bringing people into contact, it facilitates language shift.

Globalization puts even greater pressure on local languages and can be a major factor in language shift. One of the results of globalization is the emergence of at least one global language of wider communication. A global language is a particular type of language of wider communication, and in some instances may supplant the national language in this role. The global nature of trade and commerce has in recent decades put increasing pressure on the need for an international lingua franca, a position currently held by English. Whereas historically it was important for key figures in world politics to be able to communicate, it is now critical that a large number of people in all walks of manufacturing and business communicate with one another, increasing the need for a global language. Some local communities thus see the knowledge of a global language as necessary for socio-economic advancement. In cases where knowledge of a national or regional language is also important, and in fact may be the only language of education, the need to know the global language can supplant the need or desire to know the local language.

Thus in the modern world, multilingualism generally involves knowledge of one or more national languages and, increasingly, of the global language. This represents a change in traditional patterns, when speakers knew a number of local languages. The shift stems from a combination of factors including education, social prestige, and socio-economics. One factor which has led to diminished local-level multilingualism is the current importance of the national

language in terms of access to education, higher-paying jobs, the media, and social advancement. The national language provides a language of wider communication which makes knowledge of multiple local languages less necessary. A key characteristic of language endangerment is that use of the local language is limited, not only regionally but also functionally. In some cases, it is used only in the home, while in others, it is used in the village but not for communication with people living outside of the immediate community, and so on. Thus, the uses of the local language have become increasingly limited, with the net result that it is increasingly important for speakers to learn not only a language of wider communication but also, in many instances, a global language.

Strengthening Language Vitality

A number of steps can be taken to strengthen language vitality and reverse language shift. These require action and commitment on the part of community members and at the level of national government alike. Such steps include instituting educational programs which teach and promote use of the local language, and establishing national language policies which make these possible and which support linguistic diversity. An often critical part of such programs is the development of literacy in the local language. In most cases, pedagogical materials need to be developed and teachers need to be trained; in cases of advanced attrition, they will need to be taught the language itself, in addition to language pedagogy.

As this implies, levels of extinction and degrees of fluency (especially among semispeakers) are of great relevance to language revitalization efforts. Disappearing languages often have fluent speakers of many ages who can be enlisted in the work of revitalization. For moribund or nearly extinct languages, this is considerably less likely, and the importance of semispeakers to the ultimate success of the process grows considerably. An extinct language may still have rememberers who, although they have no active speaking ability, may know individual words or phrases, such as greetings. So even in cases of extinction there may be a variety of levels of lingering knowledge.

English in the Present Day

M Swan, Didcot, Oxfordshire, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Despite the enormous range of 'Englishes,' there are few important differences between the principal national standards. The following description deals mainly with the common core. Some notes are also included on salient differences between two loosely defined representative varieties, 'general American' and 'standard southern British English.'

Orthography

Modern English spelling has inherited a mixture of Anglo-Saxon, Norman-French, and classical orthographic conventions, many of which were fixed with

the invention of printing in the 15th century. Subsequent phonetic change has been considerable, so that sound–spelling correspondences are now poor. Written English, like French or Irish, is haunted by ghost letters standing for sounds that are no longer pronounced. The 40 or so phonemes of modern English are represented very unsystematically by the 26 letters of the Roman alphabet, singly or in combination. Many phonemes have various possible graphic representations; conversely, many graphemes can represent more than one sound. The situation is particularly chaotic with vowels, where six letters and their groupings serve to encode 17 or more phonemes. As in French, there is a directionality that favors readers over writers: one's chance of guessing how to pronounce a written word is considerably better than one's chance of guessing how to spell a spoken form. It is true that the extent of the orthographic irregularity can be exaggerated – a good deal

of English spelling can be shown to be rule-bound. However, the rules are complex, and many of the most common words are highly irregular and have to be learnt by rote.

There are some superficial American–British differences resulting from Noah Webster’s reforms in the early 19th century. They include:

- AmE *-or*, BrE *-our* (e.g., *color/colour*).
- AmE *-er*, BrE *-re* (e.g., *center/centre*).
- AmE *-og*, BrE *-ogue* (e.g., *catalog/catalogue*).
- AmE *-ize*, BrE *-ize* or *-ise* (e.g., *realize/realise*).
- Different spellings of some individual words. Examples are (AmE first): *aluminum/aluminium*, *analyze/analyse*, *check/cheque* (on a bank), *defense/defence*, *fulfill/fulfil*, *jewelry/jewellery*, *pajamas/pyjamas*, *skillful/skilful*, *tire/tyre* (on a wheel).

More recent moves for spelling reform have failed for predictable reasons: while the ultimate benefits would be substantial, reform would be extremely expensive and disruptive in the short term; and those who would benefit most – children and others who have yet to achieve literacy – are in no position to influence policy. Opponents of reform argue that a reformed orthography could in any case only encode the pronunciation of one variety of English, and would therefore be less than ideal for others; and that reform would obscure lexical relationships such as *photograph*, *photographer* or *sign*, *signature*. Chomsky and Halle (1968) went so far as to claim, indeed, that “Conventional orthography . . . is a near-optimal system for the lexical representation of English words,” an assertion that might raise eyebrows in the average schoolroom.

Phonology

General

English has a moderately complex phonology: more elaborate than say, Spanish or Japanese, but less so than, for instance, Georgian. There are 24 consonant phonemes (Table 1).

Sixteen of these form voiced/voiceless pairs; though voicing may disappear in word-final position, a fortis/lenis distinction is preserved. Syllable structure permits clusters of up to three consonants (e.g., *strengths* /streŋθs/); clusters of four can occur postvocally in inflected forms (e.g., *glimpsed* /glimpst/). /l/, /m/, and /n/, and (in AmE) /t/ can be syllabic.

The vowel inventory lists anything between 14 and 20 phonemes, depending both on the variety being analyzed and the descriptive approach adopted. Typical listings (for notes see ‘American-British Differences’ below) are shown in Table 2.

Table 1 English consonant phonemes

| | |
|------------------|-----------|
| p f θ t s ʃ tʃ k | m n ŋ |
| b v ð d z ʒ dʒ g | r l j w h |

Table 2 American and British vowel phonemes

| Keyword | AmE transcription | BrE transcription |
|---------------|-------------------|-------------------|
| seat | sit | sɪt |
| sit | sɪt | sɪt |
| set | set | set |
| sat | sæt | sæt |
| calm, hard | kɑm, hard | kɑ:m, hɑ:d |
| cot, cough | (kɑt, kɔf) | kɒt, kɔf |
| bought, storm | bɔt, stɔrm | bɒt, stɔ:m |
| book | bʊk | bʊk |
| too | tu | tu: |
| up | ʌp | ʌp |
| turn | (tɜrn) | tɜ:n |
| ago | ə'go | ə'gəʊ |
| day | de | deɪ |
| my | maɪ | maɪ |
| now | naw | nəʊ |
| no | no | nəʊ |
| boy | bɔɪ | bɔɪ |
| here | (hɪr) | hɪə |
| there | (ðer) | ðeə |
| tour | (tur) | tʊə |

Vowels are generally oral; nasalization can occur, but is not phonemic. Vowel phonemes differ in intrinsic length, but length is not in itself distinctive.

Prominence, or stress, is realized as a combination of pitch, loudness, and lengthening. Word stress is lexically determined and is not generally predictable from the form of a word (compare 'promise, pro'mote; 'photograph, pho'tographer, photo'graphic); initial stress is most frequent. Two levels of stress (in addition to unstress) can be usefully identified (e.g., 'enter'tainment). Some words and multiword items have contextually variable stress (compare *this after'noon*, 'afternoon nap; *they broke 'up*, *she 'broke up the chair*). Stress is phonemic in a few pairs like 'extract/ex'tract. Unstressed syllables most frequently have a reduced vowel, usually /ə/ (e.g., *malevolent* /mə'velələnt/), sometimes /ɪ/ (e.g., *decide* /dɪ'saɪd/). Many shorter function words such as articles, auxiliary verbs, prepositions, and pronouns undergo reduction to ‘weak’ forms with reduced vowels in most contexts: compare *I can* /kən/ *hear you* and *Yes, I can* /kæn/.

The rhythmic features of spoken English that distinguish it from, say, French or Spanish, arise from a combination of syllable structure, word stress, and vowel reduction; the traditional distinction between

‘stress-timed’ and ‘syllable-timed’ languages is no longer regarded as valid.

Intonation is multifunctional. Raised pitch contributes to the marking of stress. Tone groups mark off syntactic units such as phrases and clauses, with significant falls/rises at boundaries. Like many languages, English signals incompleteness or uncertainty by rising tone movements, and closure or certainty by falling tones. Thus intonation serves not only to distinguish interrogation from assertion, but also to label information as ‘given’ or ‘new’ in discourse. Pitch also contributes to the expression of emotional attitudes.

American–British Differences

While some American and British dialects (e.g., Arkansas and Glasgow) are not mutually comprehensible, speakers of general American and standard southern British English have little difficulty in understanding each other. There are, however, many differences in pronunciation. They include the following:

- BrE has a distinct open back vowel phoneme that is absent in AmE. This is the rounded short /ɔ/ occurring in words like *cot*, *stop*, *on*, *cough*, *often*, *orange*. In AmE these words are pronounced either with /ɑ/ (the same vowel as in *father*, *calm*, *car*) or with /ɔ:/ (the same vowel as in *caught*, *storm*, *all*).
- Standard southern British English is nonrhotic: /r/ is only pronounced before a vowel sound. In general American (as in many other British varieties), /r/ is pronounced in final and preconsonantal positions.
- The disappearance of postvocalic /r/ in BrE has generated new diphthongs in some environments (e.g., *dear* /diə/, *hair* /heə/).
- The AmE intervocalic tapped allophone of /t/, in words like *writer*, does not occur in BrE.
- The glide vowels exemplified in *day*, *no* differ in quality; they are generally analyzed as monophthongs in American transcriptions (/e/, /o/) and as diphthongs in British transcriptions (/eɪ/, /əʊ/).
- The vowel sounds exemplified in *die*, *boy*, and *how* are generally analyzed as phoneme sequences in American transcriptions and as diphthongs in British transcriptions.
- Some words written with *a* + consonant (e.g., *fast*, *after*) have /æ/ in AmE and northern British varieties, and /ɑ:/ in standard southern British English.
- Some words where /u:/ follows a dental or alveolar in AmE have /ju:/ in British English (e.g., *duty*, *tune*, *new*).
- Some words ending in *-ary*, *-ery*, or *-ory* have one more syllable in AmE than in BrE (e.g., *station-(a)ry*).

- French borrowings (e.g. *paté*, *ballet*) tend to have end-stress in AmE and front stress in BrE.

Changes

The last half century has seen much faster changes in pronunciation norms in Britain than in the United States. Up to the 1960s, ‘received pronunciation’ (RP), a nonregional class-based accent used by a small minority of the British population, had the status of a standard. Its prestige, reinforced by its almost universal use in broadcasting, extended to other English speaking countries such as Australia and New Zealand. RP is now spoken by no more than 3% of the population, and to the extent that an influential pronunciation standard continues to exist in Britain, it is a variety closer to vernacular London speech (‘Estuary English’). Vowel quality, in particular, is distinctly different from that of older RP. One consequence of this is that the accent of broadcasters from the 1940s and 1950s sounds decidedly amusing to modern British listeners.

Ongoing changes in pronunciation include the following:

- The use of an unvoiced /ɸ/ or /hw/ in words like *where*, *when* is becoming less common in AmE, and has virtually died out in standard BrE.
- Intrusive /r/ (as in ‘Asiar and Africa’) is on the increase in BrE.
- The change from /ju:/ to /u:/ after dentals and alveolars is continuing, with words like *suit*, *illuminate*, and *enthusiastic* increasingly being pronounced in BrE without /j/, as in AmE.
- Glottalization of medial and final /t/, /p/, and /k/ is growing in BrE.

Lexis

English has an enormous vocabulary – exactly how large is a question to which no clear answer can be given. Well over 600 000 items are included in the *Oxford English Dictionary*, which, however, does not list specialist scientific and technical terminology. In any case, attempts to assess vocabulary size founder on problems of definition. As is becoming increasingly clear from research in phraseology, it is impossible to draw a principled line between orthographic words and other fixed lexical items: compare *cosmetic*, *make-up* (n), and *make up* (v), or *unemployed* and *out of work*.

The different sources of the English word stock are reflected both grammatically and stylistically in the modern language. According to studies cited by Algeo (1998), only 5.4% of the words listed in a dictionary originate from Old English, but these account for

74.5% of the words in newspaper running text. They include most of the highest-frequency vocabulary, and almost all function words such as determiners, auxiliaries, and prepositions. Most other older English words came into the language either from Norman French, or from Latin and Greek during the Renaissance. Besides providing English with much of its learned vocabulary, these later lexical injections have allowed the language to develop a wealth of variant forms for everyday concepts. Speakers and writers can frequently choose between down-to-earth forms (usually, though not always, the older words) and more formal or elevated alternatives (usually the later imports): for example *buy* or *purchase*; *try*, *attempt*, or *endeavor*; *start*, *begin*, or *commence*; *answer*, *reply*, or *respond*; *tell* or *inform*; *get off* or *alight*. For more literary purposes, the possibilities can be almost daunting. Words describing the reflection and transmission of light, for instance, include *shine*, *glitter*, *glisten*, *gleam*, *glow*, *sparkle*, *twinkle*, *glimmer*, *blaze*, and *coruscate*.

The paucity of inflections makes the language morphologically hospitable, and English continues to borrow freely from elsewhere. Algeo (1998) lists 20th-century borrowings from 56 languages, with by far the highest proportion coming from French. Most new English words, however, are home-grown, created either by shifting word class with no formal change (most high-frequency nouns have verbal homonyms, and vice versa), by compounding (e.g., *computer-literate*), or by affixation (e.g., *pro-life*). Over the last century, the latter process has been the major source of new vocabulary. Although English has few inflections, it has a good deal of derivational morphology, with well over 100 affixes in common use, many of them productive. These serve to modify the meanings of words (e.g., *un-*, *counter-*, *re-*, *-ess*, *-hood*, *-ism*, *-ship*), and/or (especially in the case of suffixes) to change their word class (e.g., *en-*, *pro-*, *-age*, *-ance*, *-ful*, *-ly*, *-en*, *-ify*, *-ize*). Among the range of affixes there is a stock of naturalized morphological formative elements, originally borrowed mainly from Greek and Latin, which are particularly productive in present-day word-formation: for example, *auto-*, *eco-*, *cyber-*, *mono-*, *macro-*, *inter-*, *-ology*, *-cratic*, *-phile*, *-phobe*.

While the vast bulk of English vocabulary is common to AmE and BrE, there are a fair number of well-known differences. Many words in common use differ in their reference (e.g., *truck*, *mad*, *pavement*, *chip*); very frequently, different words are used for the same concept (e.g., *elevator/lift*, *faucet/tap*, *check/bill*). The independent development of industry in the two countries is strikingly reflected in, for instance, vocabulary relating to cars

(*hood/bonnet*, *trunk/boot*, *fender/wing*, *gas pedal/accelerator*, *windshield/windscreen*, *gear shift/gear lever*).

Morphology and Syntax

General Characteristics

In traditional typological terms, modern English is situated toward the 'isolating' end of the spectrum. Little of the older inflectional morphology remains; what there is is largely redundant. Nine or so major word classes are commonly distinguished. Grammatical relationships are expressed primarily through word order (SVO) and the use of function words, particularly prepositions and auxiliary verbs. Case structure is nominative-accusative. Topic is not generally distinguished grammatically from subject. Word, phrase, and clause are relatively distinct categories, but there is considerable scope for phrasal and clausal embedding, exploited especially in the formal written language. Constituent order within phrases is mixed, with modifiers generally preceding heads and complements following.

Word Classes

- **Count and mass nouns** are distinguished syntactically; count nouns have an inflected plural form. Formally singular nouns referring to human groups may have partial plural agreement, especially in British English. An inflectional/clitic genitive exists, used preferentially with nouns that have human reference. English differs from most IE languages in having no grammatical gender.
- **Determiners** include a range of quantifiers, demonstratives expressing a two-term distal contrast, and a distributionally and semantically complex article system, similar in most respects to its counterparts in other Western European languages, but using zero article for generic reference (compare German *die Musik*, Italian *la musica*, French *la musique*, English *music*). There is some overlap between determiners and pronouns.
- **Adjectives**, as in most IE languages, form a large and semantically heterogeneous class. Most can function both attributively and predicatively; a few are limited to one or other position. There are semantically based ordering constraints. Comparison is inflectional (with shorter adjectives) or analytic. There is some overlap between the adjective and adverb classes.
- **Pronouns** are personal, reflexive/emphatic, reciprocal, relative, indefinite, possessive, demonstrative, and interrogative. Personal pronouns (first and third person) have distinct case forms; third-person

singular forms encode natural gender. Relative and interrogative pronouns distinguish human from other referents (*who/which; who?/what?*), and retain a moribund case distinction (*who/whom*).

- **Lexical verbs** have a multifunctional base form that serves as a present tense (except in the third person singular), as an imperative, and as an infinitive (usually marked by a particle *to*). There is an inflected third-person singular present, and an inflected past tense. Morphologically marked non-finites are a present participle or gerund, and a ‘past participle’ identical in regular verbs with the past tense. Irregular verbs form their past tenses and past participles in various ways, mostly involving a vowel change. Participles can combine verbal with adjectival or nominal functions.
- **Primary auxiliaries** are grammaticalized versions of *be* (used to construct passive and progressive verb forms), *have* (used in perfective verb forms), and *do* (used in some interrogative and negative structures).
- **Modal auxiliaries** (*will, shall, would, should, may, might, can, could, must, and ought*) and quasi-modals (e.g., *had better*) express varying degrees and nuances of epistemic, deontic, and dynamic modality, with a good deal of semantic overlap. Modals are invariable, lacking nonfinite and past forms.
- **Adverbs** are a heterogeneous class, including both clausal modifiers and items that modify particular clause elements. Adverb particles such as *back, away, on, off, in, out, over*, up form an important group, overlapping considerably with the preposition class; they combine extensively with verbs to form phrasal verbs.
- **Prepositions and conjunctions** constitute limited but not completely closed overlapping classes, with a growing number of multiword members.
- **Inserts** such as *Hi, Yeah, OK, Sorry, Look, Please, Damn!* form a distinct word class in conversational speech.

Noun Phrase Structure

Nouns can be premodified by determiners, adjectives, and noun modifiers, in that order. Complex hierarchical structuring is possible, facilitated by the freedom with which nouns can act as modifiers; this contributes to the dense and economical approach to information packaging found in some written registers. Some determiners show number agreement; premodifying nouns are generally unmarked for number.

Relative clauses postmodify, as do nonfinite clausal modifiers. Relativized NPs can function as subjects,

direct or oblique objects, or possessives in relative clauses. Restrictive relative clauses have a hybrid character: they can be integrated into a preceding noun phrase by simple juxtaposition, by a relativizer (*that*), or by a relative pronoun (*who, whom, which*), which functions as an argument in the relative clause. The choice is subject to complex syntactic and stylistic constraints.

The Verb Group: Tense, Aspect, Modality, Mood, and Voice

English has a relatively rich and complex verbal system, especially in main clause use. The small inventory of morphological distinctions is supplemented by a range of periphrastic forms constructed with primary and modal auxiliaries. Tense, progressive and perfective aspect, mood, and voice can all be expressed separately or in combination though the verb group. Some key features:

- English perfective aspect encodes anteriority, often with continuing relevance.
We couldn't get in because I had lost my key.
I'm afraid Jane has had an accident.
- Future events arising out of present situations are generally referred to by present forms (especially the present progressive or *be going + infinitive*). Reference to future events viewed as detached from the present uses a bleached modal auxiliary *will*.
We're meeting again tomorrow.
Look out – we're going to crash!
You will be paid at the end of the month.
- ‘Irrealis’ modality is expressed principally by the use of modal auxiliaries or, especially in subclauses, by past tenses; also (mainly in AmE) by subjunctives.
It would be better if you came tomorrow.
She must have forgotten.
It's important that she be told. (AmE)
It's important that she should be told. (BrE)
- English is unusual in that oblique arguments can act as subjects of passive verbs.
I've been given one of those forms.
She hates being shouted at.
- Reflexive and middle relations can be indicated by pronouns (e.g., *hurt oneself*), but are often unmarked (e.g., *shave, marry*).

Clause and Sentence Structure

Canonical SVO order is generally observed in written English; in informal speech, departures from the norm such as fronting and left-dislocation are more common. Nonprepositional indirect objects precede direct objects. Verb and object constitute a tight unit, not usually separated; otherwise, adverbial elements

occupy a variety of positions. Relative and interrogative pronouns and adverbs are initial in clauses. Preposition-stranding is common. Interrogatives are formed by inversion of the subject and operator (the first of any primary or modal auxiliaries), negation by adding *not* to the operator. (Multiple negation is common in nonstandard dialects.) In the absence of an auxiliary, *do* is used as a dummy operator.

Nominative and accusative case are marked positionally, with redundant morphological marking in some pronouns. There is vestigial subject-verb number agreement in the present tense of lexical verbs and primary auxiliaries. Pronoun dropping is ungrammatical except in imperatives and certain elliptical structures.

Verbs have a wide range of possible complementation patterns; subcategorization rules of individual verbs are only partly predictable on semantic grounds.

Coordination and subordination operate as in most IE languages. Various types of subordinate clause with differing structural features can have nominal, adjectival, or adverbial functions in matrix clauses. Verbal structures in most subordinate clause types exhibit a more reduced range of tense/aspect expression than in main clauses. Embedding can in general be recursive up to the limits of processability. There are complex constraints on extraction from embedded clauses in interrogative and relative structures.

The sentence, as a unit, is essentially a feature of the written language. Conversational speech is not easily analyzed into sentences, and is perhaps better seen as constructed of ‘clausal’ and ‘nonclausal’ units (Biber *et al.*, 1999), which may be loosely linked into utterances in an add-on fashion rather than being organized into structural hierarchies.

Information Structure

English follows the quasi-universal tendency to put ‘given’ or background information before new. Formal written English has few topicalization devices; in order for given information to come first in an utterance without disrupting canonical word order, it therefore tends to be encoded as subject. The merging of topic and subject is facilitated in several ways. English allows an unusually wide variety of participant roles to be encoded as active subjects, including (depending on the verb) agent, patient, experiencer, benefactive, instrument, temporal, and locative. Indirect and prepositional objects can become passive subjects. The ‘*have*-passive’ enables experiencer to be encoded as subject (e.g., *She had her roof blown off in a storm*). English is also rich in lexical alternatives with different argument selections (e.g., *admire/impress, frighten/*

fear, notice/strike). In conversational speech, given-new relations are also indicated by fronting, left-dislocation, or phonological prominence.

Changes

Older changes that are still working their way through the language, and some newer developments, include:

- continuing spread of the *going-to* future
- increased use of the progressive with stative verbs (e.g., *I’m understanding German better now*)
- replacement of *shall* by *will*, and of *should* by *would* in some contexts
- spread of the *get*-passive
- decline in the use of the subjunctive, especially in BrE
- general reduction in the use of modals (see Leech, 2003)
- increased use of phrasal verbs
- spread of conditional structures with parallel verb forms in speech (e.g., *If you’d have asked me I’d have told you.*)
- increased use of noun + noun compounds
- disappearance of *whom*
- increased use and acceptability of noncanonical pronoun case in conjoined subjects and objects (e.g., *John and me went . . . ; between you and I*)
- grammaticalization of *you guys/folks* as new second-person plural pronoun
- increased use of singular indefinite *they*, partly as alternative to nonsexist *he or she*
- replacement of possessive determiner by object pronoun before *-ing* form (e.g., *This led to them being arrested.*)
- spread of analytic comparatives and superlatives (e.g., *commoner > more common*)
- dropping of complementizer/relative *that*
- increased use of preposition stranding.

For an excellent detailed discussion of ongoing syntactic changes, and further references, see Denison (1998).

American–British Differences

The grammatical systems of standard AmE and BrE are virtually identical. Minor differences, some of which are disappearing with the growing influence of AmE on BrE, include those exemplified below:

| AmE | BrE |
|--|---|
| <i>He just went home.</i> | <i>He’s just gone home.</i> |
| <i>Do you have a problem?</i> | <i>Have you (got) a problem?</i> |
| <i>I’ve never really gotten to know her.</i> | <i>I’ve never really got to know her.</i> |

| | |
|---|---|
| <i>It's important that he be told.</i> | <i>It's important that he should be told.</i> |
| <i>Yes, I may.</i> | <i>Yes, I may (do).</i> |
| <i>The committee meets tomorrow.</i> | <i>The committee meet/ meets tomorrow.</i> |
| <i>He probably has arrived by now.</i> | <i>He has probably arrived by now.</i> |
| <i>It looks like it's going to rain. (informal)</i> | <i>It looks as if it's going to rain.</i> |
| <i>He looked at me real strange. (informal)</i> | <i>He looked at me really strangely.</i> |

Standardization and Prescriptivism

Standardization continues in the English-speaking world, with regional dialects converging on standard varieties, and American English exercising increasing influence on usage in other countries. At the same time, however, increased democratization is reducing the social prestige of the standards, and there is somewhat more tolerance of variation, at least in speech, than, say, 50 years ago. The written–spoken divide is narrowing: with the continued growth of the spoken media, speech is no longer regarded as a poor relation of writing, and characteristically spoken lexical and grammatical elements are making their way into the standard written language. The recent explosion in electronic written correspondence has further reduced the gap, widening the use of relatively informal written registers at the expense of more traditional styles.

However, prescriptive attitudes to usage remain entrenched and powerful in both the United States and Britain. A command of the orthographic, grammatical, and rhetorical conventions of the standard written language is commonly equated with superior intelligence and educational achievement; failure to master these conventions can constitute a serious obstacle to educational or professional advancement. ‘Standard’ is typically seen as being synonymous with ‘correct,’ and ‘nonstandard’ with ‘incorrect’; regional or ethnic dialects such as cockney or Afro-American Vernacular English are widely believed to be grammatically deviant and ill-structured.

English is often perceived as being in a state of decay: threatened by variable and changing usage, the encroachment of nonstandard forms, a growing lack of respect for time-honored rules, and the failure of schools to provide adequate grammar teaching. Linguistic and moral decline may be seen as going hand in hand. The British politician Norman Tebbit, echoing voices from the 18th and 19th centuries, famously declared in 1985 that “If you allow standards to slip to the stage where good English is no better than bad English, where people turn up

filthy ... at school ... all those things tend to cause people to have no standards at all, and once you lose standards then there's no imperative to stay out of crime.”

The feeling that the language is in danger generates a belief that grammarians, lexicographers, publishing houses, the media, and the educated community have a duty to defend it. In both the United States and Britain, radio and TV stations, magazines, and newspapers receive voluminous correspondence complaining about the ‘mistakes’ of journalists, broadcasters, and public figures (and, in Britain, condemnation of their ‘Americanisms’). Many newspapers and magazines publish regular columns by language gurus on questions of usage. Prescriptive usage guides find a ready market among those who wish to see their prejudices reinforced or who have been made to feel insecure about their command of their own language. (A recurrent advertisement in the British press begins ‘Shamed by your mistakes in English?’) Such guides often continue to reproduce the 18th- and 19th-century proscriptions against preposition-stranding and split infinitives. Other current targets include novel part-of-speech shifts (e.g., *to task*, *to showcase*); the use of plural concord with group nouns (e.g., *the team are*, standard in BrE, but often condemned for being ‘illogical’); ‘misplaced’ *only*; dangling participles; changes in the meanings of words (e.g., *anticipate*, *disinterested*, *enormity*) and in their grammatical scope (e.g., the use of *hopefully* and *thankfully* as disjuncts); singular indefinite *they* (centuries old); *less* before a plural noun (used by King Alfred); ‘misuse’ of *me* and *I* in conjoined subjects and objects (there are examples in Jane Austen and Shakespeare); and – perhaps most inflammatory of all – the illegitimate use or omission of the possessive apostrophe. (As Steven Pinker points out [1994], prescriptive rules are often so psychologically unnatural that only those with access to the right schooling can manage to abide by them; so they serve as shibboleths, differentiating the elite from the rabble.)

Despite the growing tolerance of regional pronunciation, elitist attitudes persist: a letter to the *Sunday Times* in March 1993 described speakers of ‘Estuary English’ as resembling “the dregs of humanity.” Particular regionalisms are still widely proscribed or made fun of. British *h*-dropping in words like *horse*, *hurry*, *home*, common in Eastern England, is typically condemned as lazy, slovenly, or slipshod, generally by nonrhotic speakers who do not see their own *r*-dropping at all in the same light.

There have been quite strong counter-currents to prescriptive attitudes in educational and other circles at various times over the last century, but more liberal

and relativistic views of linguistic authority and correctness have tended to meet considerable opposition. Finegan (2001) gives an interesting account of the outrage with which the publication of Webster's 'permissive' *Third New International Dictionary* was greeted in 1961. Jean Aitchison, a British linguist who gave the BBC Reith lecture series in 1996, received copious hate mail for questioning popular views of correctness.

The Future

As English increasingly takes on the role of a world lingua franca, it is certain to develop in interesting ways. One can imagine that a future international variety of English (or group of international varieties) might detach itself somewhat from the American–British standards; alternatively, it might pull them along with it. In either event, narrowly prescriptive attitudes of the kind described above are likely to appear increasingly parochial. While we have no way of knowing how an international English might evolve, we can speculate that it might simplify, regularize or dispense with some of the features that make the present-day language hard for non-native speakers to learn and use. Such changes might include the reduction of consonant clusters; the regularization of word stress and speech rhythm; the simplification of verb phrase grammar, perhaps accompanied by an increase in the range of grammatical particles; the reduction of the modal verb inventory; the regularization of verb complementation structures; and the disappearance of indefinite and

perhaps definite articles. International English might also provide a more favorable environment for spelling reform.

English, African-American Vernacular

P L Patrick, University of Essex, Colchester, UK

© 2006 Elsevier Ltd. All rights reserved.

The term 'African-American English' (AAE) – formerly 'Negro' or 'Black English' or sometimes 'Ebonics' – denotes a range of ethnically distinctive varieties of North American English characteristically spoken by descendants of Africans brought to the Americas under slavery. This broad range includes regional and social dialects (rural Mississippi folk speech, African Nova Scotian English, Standard AAE); isolated contact and creole varieties (Gullah [Sea Island Creole English], Afro-Seminole Creole in Florida, Texas, and Mexico); distinctive oral discourse styles (preachers' rhetoric, political oratory,

and slang associated with jazz, gospel, or hip-hop); and their literary expressions.

The best known variety of AAE today is African-American vernacular English (AAVE), which is particularly associated with urban culture, working-class and younger speakers, and informal contexts. Contemporary AAVE originated via the Great Migration – the northern urbanization of rural Southern African-Americans that took place between World War I and World War II – and replaced older, post-Emancipation stereotypes of isolated rural dialect speakers, such as the Ex-Slave Elders (Bailey *et al.*, 1991). However, African-Americans collectively speak many varieties of English and other languages: not all use AAVE or participate in vernacular African-American culture (Baugh, 1991, which also surveys

labels for the variety and speakers). Many African-American adults are skilled code-switchers; most have competence in standard AAE, which, although lacking nonstandard grammatical features, is yet distinctively and fluently African-American. Of the 36 million African-Americans in the United States (13% of the population), a large but unknown proportion speaks AAVE.

The distribution and functions of AAE are generally obscured by stigmatization and misrepresentations, principally: mistaking AAVE for all of AAE; the belief that AAVE is not a complete, systematic grammatical system (e.g., mistaking adolescent slang for all of AAVE); and the belief that vernacular use of AAVE is incompatible with literacy and mastery of standard American English (SAE). Linguistic ideologies comprising such beliefs and attitudes have long obscured AAVE's structure and history and have been complicit in racist social structures. Descriptions of AAVE thus generally address not only synchronic structures but diachronic development, attitudes, and applied (especially educational) issues.

Lexicon

African-American speech diversity may be illustrated with the lexicon. Works on AAE list many thousands of items used almost exclusively or with distinctive meaning by African-Americans (Major, 1994; Smitherman, 1994; Cassidy and Hall, 1985). African-American English is a prolific source of slang and specific registers, from which items pass into general American use, if often late and with distortions. Stereotyping and stigmatization of urban slang by non-African-Americans has contributed to the general devaluation of AAVE as a linguistic system. While speaker competence varies along regional, generational, and social lines, knowledge of even widely shared lexical items (unknown in, or contrasting with, mainstream English) does not guarantee familiarity with grammatical properties of AAVE (Green, 2002). The AAE lexicon is a greater unifying force than AAVE grammar. The number of AAE lexical items with clearly identified African etymologies is significantly smaller than in Caribbean English creoles (CECs) – for example, Jamaican Creole English (Cassidy and Le Page, 1967) or Gullah (Turner, 1949), in which hundreds are attested.

Discourse

Uncensored speech (often judged profane or obscene) is subject to different norms in AAVE than in mainstream American English; items for which normalization, neutralization, and generalization have

occurred may differ (Spears, 1998). The stereotypical prominence of uncensored speech, as perceived by non-African-Americans, reflects not only their contemporary social power to censor, but the obsolescence of earlier rules of respectful address and demeanor, enforced on black people by white people. This has resulted in more frequent direct speech (Spears, 2001), including 'dissing', 'reading', and others (Morgan, 1998).

Everywhere in the African diaspora, under slavery, such enforcement spurred development of characteristic modes of indirect speech, ambiguity and speaker agency ('counter-language', Morgan, 1993), e.g., 'signifying', 'marking', and 'loud-talking' (Mitchell-Kernan, 1971). Loud-talking involves direct address and manipulates volume to invoke an audience; marking characterizes targets through direct quotation, which may manipulate features of grammar, phonology, or pragmatics; while conversational signifying attributes "personal characteristics of the target to culturally marked signs" (Morgan, 1998, p. 275). Children and adolescents practice signifying in formalized routines of verbal play known as 'sounding', 'joning', 'snapping', and 'playing the dozens', wittily placing culturally significant emblems (e.g., *yo'mama*) in implausible contexts (Abrahams, 1962; Labov, 1972). African-American English speech events resemble Caribbean ones, like 'busing' (Guyana) or 'dropping remarks' (Barbados), or have pan-African diaspora distribution ('suckteeth', Patrick and Figueroa, 2002).

Syntax

Much early analysis of AAVE grammar contrasted it with both SAE and CECs; recent historical work compares it to Southern White vernacular English (SWVE). Much attention focuses on the AAVE verb phrase, and less on negation, nominal inflection, and pronoun selection (Green, 2002; Rickford, 1999). Major questions include (a) the degree of structural independence of AAVE from general English grammar, (b) evidence for AAVE's historical ancestry and development, and (c) the nature and significance of variation. Grammatical features are more often distinctive, while many phonological features occur in other vernacular English varieties, especially SWVE. Typically, nonstandard features occur more frequently in AAVE, in a wider range of linguistic contexts, while linguistic processes (e.g., rapid-speech reduction rules) are carried further. The nonstandard nature of AAVE is thus gradient, and often exacerbated by comparison to written standard norms.

The AAVE auxiliary system largely mirrors general American English (and so contrasts with CECs).

However, main verbs and auxiliaries (*be, have, do*) have regular paradigms, without person/number agreement: third singular irregular forms are absent. For auxiliary *be*, the *is* form is generalized to all present persons and numbers (except first singular *am*), and *was* to all in the past. African-American vernacular English carries further a general American English tendency to regularize simple past and present perfect verb forms: they frequently merge in the simple past, although some participial forms are preferred. A few frequent strong verbs use stem forms with past meaning, but past-marking is overwhelming (again, unlike CECs). Future with modal *will* resembles general American English, although the normal phonological reduction to *'ll* is variably extended to complete vocalization and deletion. Question formation optionally involves inverting auxiliaries and modals. Auxiliaries (only) may also fail to surface in questions, and may invert in embedded questions. The AAVE sentential negator *ain't* appears for standard *hasn't/haven't* or *isn't/aren't*, as elsewhere, but also for *doesn't/don't*. As in CECs, the sentential negator is tense-neutral, appearing for past meanings too.

Fundamental contrasts with other dialects occur for AAVE aspectual markers, which take forms deceptively similar to Vernacular American English auxiliaries (*be, been, done, had*). The complex aspectual system makes distinctions unfamiliar to other English dialects. The case of the habitual invariant *be*, widely taken as emblematic of AAVE, is typically misused or misunderstood by nonnative speakers. Other 'camouflaged' forms, often mistaken for their SAE equivalents, include *had* marking the simple past; the nondirectional *come* to express speaker indignation (Spears, 1982); and a stressed *been* for remote past. With stative verbs, *been* denotes continuity to the present moment; stativity constraints are typical of CECs, where *been* also marks remote past. Less familiar AAVE preverbal aspect markers include the immediate future *finna* (<SWVE *fixing to*), the completive *done*, the resultative *be done*, and *steady* marking an intensified continuative. Although several resemble CEC elements in functions, constraints, and even surface forms, few are patterned identically to any CEC, and some came into being or prominence during the last century: habitual *be* was rare "before World War II and . . . virtually non-existent . . . before 1900" (Bailey, 2001, p. 57).

Although negative concord and negative inversion resemble similar strategies elsewhere, AAVE seems unique among the varieties of American English in requiring concord with indefinite object noun phrases, a feature it shares with CECs. As with verbal *-s*, possessive and plural *-s* may both be absent in AAVE, though less often (respectively, 71% absence

compared to 27% and 6% in vernacular Detroit speakers, Wolfram, 1969; absence is significantly greater in CECs). Associative plurals (*Doretha an' (th)em*) resemble CEC plurals with postposed *-dem*, but the AAVE structure (with its mandatory conjunction) occurs in SWVE. Descriptions of generational developments for these complex features are rare (Cukor-Avila, 2001). Pronominal features include pleonastic *it* and *they* in existential constructions. Invariant forms for plural possessives (*yall, they*), and occasional object forms for subjects (*us*), represent paradigm levelings that, taken together, are rare to nonexistent in other American English dialects but occur in CECs. The larger issue of modeling AAVE as a (sub-)system *vis-à-vis* general American English remains under-theorized (Labov, 1998).

Phonology

Bailey (2001) surveyed 45 phonological aspects discussed in the literature for either AAVE or SWVE: 19 were shared, 8 were common to AAVE but rare in SWVE (11 were vice-versa), and 6 were pan-English. Several of the oldest established shared features are receding for one or both groups: e.g., loss of inter-syllabic /r/ (*hurry*), and long offglides after /a/ (*half* [hæɪf]). Features that are still vigorous in both varieties, such as glide reduction in /ai/ (*tie*) and /ɔi/ (*boil*), front-stressing (*po'lice, De'troit*), or the *pin/pen* merger in [ɛ] before nasals, developed in the late 19th century, when whites and African-Americans worked in contact as tenant farmers. Final consonant cluster reduction, a general English feature, is more frequent in AAVE, significantly before vowels (*firs' apple*).

Features particular to AAVE include shibboleths such as deletion of initial voiced stops /d, g/ in auxiliaries (*I'm (g)onna* /amənə/) and realization of syllable-initial /str/ as /[skr] before high front vowels (*street* [skrit]). Others involve final singleton consonants: reduction and loss of nasality in final nasals (*man* [mæ]) and deletion of word-final single consonants after a vowel (*cat* [kæ], *bad* [bæ:]). Final voiced stops are devoiced and sometimes glottalized (*bad* [bæʔ]).

In recent research on vowel subsystems, recordings of mid-19th century speakers show monophthongal /e/ and /o/ and fully back /u/ and /ʊ/, which contrasts with SWVE and American English generally but resembles CECs. Today AAVE possesses the same vowel phonemes as American English; its mergers and glide reductions all occur elsewhere in American English (Bailey and Thomas, 1998). But African-Americans as a group do not participate in systematic shifts of vowel position – the changes from below – that are characteristic of other dialects (Labov, 2001).

Thus /æ/-raising, present in AAVE since the late 19th century, is not integrated into a pattern like the Northern Cities Shift. Several conditioned vowel mergers occur in AAVE and SWVE, but only SWVE reorganizes them into the Southern Shift.

History

The history of AAVE is controversial. Many dialectologists once held an ‘Anglicist’ position, arguing that AAE showed the same range of variation as comparable white speech (McDavid and McDavid, 1951). This was contested by the early creolist position, which held that a creole developed in colonial America (beyond the Gullah area) and subsequently decreolized, producing current forms of AAVE (Bailey, 1965; Stewart, 1968). Research on variable realization of the *be* copula and auxiliary (Labov, 1969; Baugh, 1980) noted substantial similarities with CECs that were confirmed by later research using methodological refinements (Rickford *et al.*, 1991; Winford, 1992; Blake, 1997).

This line is opposed by a neo-Anglicist position (Poplack, 2000) drawing on data from Ex-Slave recordings and African American congeners (enclaves in Nova Scotia and Samaná), varieties united under the questionable label, ‘Early AAE.’ Poplack and Tagliamonte (2001) maintain that AAVE is directly descended from British dialects. Analyses of tense/aspect marking compare Early AAE with historical English dialects and CECs and conclude that non-standard features of AAVE “were not created . . . but retained from an older variety of English” (Poplack and Tagliamonte, 2001, p. 251).

Such claims remain controversial among variationists and creolists, whose post-1990 research documents a more complex picture of CEC grammars, which neo-Anglicists largely ignore. The historical significance of enclave varieties rests on their conservative nature and representativeness of their ancestors. Singler’s studies (e.g., 1998) of transplanted African-American settlers in Liberia constitute crucial evidence for AAVE; they represent many more speakers (16,000 emigrants) and are more typical of contemporary African-Americans. Singler’s results, like Rickford’s critiques, frequently conflict with neo-Anglicist positions and emphasize compatibility with recent research on CECs. Wolfram and Thomas (2002), in conducting an intergenerational analysis of an isolated Southern community, also reached different conclusions, arguing that the ethnolinguistic distinctiveness of AAE, although temporarily submerged by accommodation to regional dialect norms, still reflects a broader range of contact influences than British dialects, including African and CEC languages.

While early creolist positions have largely been abandoned in strong form, new research locates creole-like features in ‘micro-switches’ among indigenous early AAVE speakers far outside the Gullah area (Sutcliffe, 2001). Current creolist positions emphasize multiple causation and structural convergence between CEC and other inputs in a complex contact situation. Speakers from CEC-speaking territories predominated among early black arrivals in many American colonies, often predating direct African imports (Rickford, 1997). Through sustained contact with Gullah, African varieties, and British dialects, CEC speakers contributed substrate influences to AAVE grammar, without leading to acquisition of entire creole grammars (Winford, 1997; Wolfram and Thomas, 2002). Such generalized contact scenarios invoke interlanguage restructuring, for example, in the acquisition of syllable-coda consonant clusters (absent in West African inputs), leading to substantial prevocalic consonant cluster reduction. This produced similar results in both AAVE and CECs (but not SWVE) and thus convergent structures, which might have been reinforced by contact between them (Winford, 1997; Wolfram and Thomas, 2002).

Genesis issues are logically divorced from questions of current change, which focus on convergence or divergence with other American English dialects (Fasold, 1987; Bailey and Maynor, 1989). An expansion of data sources and the range of features studied led to findings of post-Emancipation innovations in AAVE phonology and syntax (examples cited previously). Taken alongside evidence of contemporaneous innovations in SWVE and the discovery of recent rapid diversification among mainstream American English dialects in major cities – in which younger African-Americans, who show surprising agreement on nationwide norms, are not participating (Labov, 2001; Thomas, 2001) – these developments demonstrate considerable divergence. However, convergence on other levels certainly continues (plural *-s* and past-marking, Rickford, 1987), while some features display both (present *-s*, Wolfram, 1987). Moreover, many linguists agree that the evidence is incomplete, the database can be improved, and the complexities of change and variation in AAVE, including its relationships to AAE and American English and the social consequences thereof, are far from satisfactorily understood.

English, Early Modern

H Raumolin-Brunberg, University of Helsinki, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

Background

The early modern period (1500–1700) brought several significant changes in the lives of the English people. The most dramatic were perhaps the Reformation, the subsequent dissolution of the monasteries in the 16th century, and the devastating Civil War during the next. Less abrupt phenomena included population growth; changes in the social hierarchy, including greater social mobility; increasing economic activity; a widening world view; and growing national identity.

There were two developments that radically increased the number of written texts. The printing press was introduced into England in 1476, paving the way for subsequent genre diversification and popular writing. The expansion of educational opportunities promoted literacy, although still less than half the men and a third of the women could both read and write, even by 1700.

Good evidence that English had acquired its modern form is that the great literature of this period, such as Shakespeare's plays and the 1611 Bible translation known as the Authorized Version or King James Bible, can be understood by modern readers and listeners despite their archaic feel.

Linguistic Features

Phonology

Understanding Renaissance drama would be more difficult if it were performed using contemporaneous pronunciation, because many Early Modern English (EModE) words were not pronounced the same way as they are today. This divergence largely arises from shifts among the vowels, because changes in the consonant system have been limited.

The well-known series of changes known as the Great Vowel Shift affected long vowels. The origin and course of this development are still in debate, but it is clear that all Middle English (ME) long vowels changed at various times after 1400 (Table 1). The diphthongization of two ME long vowels, /i:/ and /u:/ into /ai/ and /au/, as in *write* and *house*, and the later merger of /e:/ and /ɛ:/, as in *meet* and *meat*, left English with four long vowels, /i:/, e:/, o:/, u:/. This inventory was supplemented by /ɔ:/, which developed from the diphthong /au/, as in *cause*.

During the early modern period, the ME diphthongs, /iu, eu, au, ai, ou/, were monothongized, becoming /u:, u:, ɔ:, e:, o:/, whereas /oi/ and /ui/ remained unchanged, as in *joy* and *boil*. A combination of these and new diphthongs that developed from long vowels resulted in three diphthong phonemes, /ai, au, ɔi/, at the end of the period. The impact of postvocalic /r/ which, among other things, often lowered preceding vowels, also created new diphthongs, when an epenthetic [ə] was inserted between a vowel and [r], as in *fire*. Although there may have been sporadic cases of the loss of postvocalic /r/ in the early modern period, its systematic deletion took place later.

Table 1 Change in long vowels: schematic development

| Middle English | Early Modern English (1500–1700) | | Present-day English | |
|----------------|----------------------------------|------|---------------------|-------|
| | Early | Late | | |
| i: | ɔi | ai | ai | write |
| e: | i: | i: | i: | meet |
| ɛ: | e: | e: | i: | meat |
| | | i: | | |
| a: | æ: | e: | ei | make |
| u: | əu | au | au | house |
| o: | u: | u: | u: | food |
| ɔ: | ɔ: | o: | əu | boat |

Sources: Görlach (1991: 70), Barber (1976: 294).

The ME short vowels /i, e, a, o, u, ə/ remained mostly unchanged. A significant change was the southern split of /u/ into two phonemes, /u/ and /ʌ/, e.g., *put* and *cut*.

The consonant system lost the phoneme /x/, which was often spelled <gh>, with its two allophones [x, ç]. Its realizations were replaced by vowel lengthening, e.g., *right* or by /f/, as in *enough*. Two new consonant phonemes, /ʒ, ɲ/, developed, and since that occurred, the inventory of English consonants has remained unchanged. The consonant /h/, was very weak and occasionally dropped, as contemporary spellings like <elmet> for *helmet* and the excrescent <h> in <hevere> for *every* show, but there is no evidence of its stigmatization.

Grammar

Many of the grammatical developments originating in the previous centuries continued in EModE, including morphological simplification and the stabilization of word order. On the whole, English acquired its present analytical structure during the early modern period. These developments are perceptible, for example, in the decline of inflectional endings, the increasing use of auxiliaries, and the diminishment of inversion. Natural gender, in particular, the distinction between human and nonhuman reference, became an important factor among pronouns. The grammaticalization process created new closed-class elements in several areas of grammar.

Nominal inflection was mostly limited to the plural and genitive *-s* endings, except for some *-en* plurals, such as *brethren*. The case distinction between the nominative and accusative was only retained in the personal pronouns and the pronoun *who*. The personal pronoun paradigm is indeed a good example of an area that underwent significant changes in EModE (Table 2). First, the second-person plural forms *ye/you/your* came to be used in the singular. This process, which had begun in Middle English, gradually ousted the old *thou* paradigm from Standard English, but allowed subtle expression of power relations, politeness, and intimacy before it did. Second, the originally plural nominative *ye* was replaced by the accusative *you*. Moreover, the first- and second-person possessive determiners *mine* and *thine* lost their *-n* ending. The last environment where *-n* was used was the pre-vowel position; e.g., *thine eyes*.

Furthermore, the third-person neuter possessive determiner *its* was introduced into the language around 1600, replacing *his*, which had become affiliated with male human reference as a consequence of natural gender replacing grammatical gender. Human reference also began to constrain the choice of the relative

Table 2 Early Modern English personal pronouns

| | <i>Nominative</i> | <i>Accusative</i> | <i>Genitive (Possessive Determiner)</i> |
|-----------------|------------------------------|-------------------|---|
| Singular | | | |
| 1st | I | me | my, mine |
| 2nd | you, ye , <i>thou</i> | you, <i>thee</i> | your, <i>thy</i> , thine |
| 3rd | he | him | his |
| | she | her | her |
| | it, hit | it, hit | its, it , his |
| Plural | | | |
| 1st | we | us | our |
| 2nd | you, ye | you | your |
| 3rd | they | them, hem | their |

Items in bold disappeared during the early modern period. Items in italics became rare during the early modern period. Item in small caps emerged during the early modern period.

pronoun, when *who/whom* was limited to personal reference and *which* to non-personal reference.

Verbal inflection was also simplified by reducing the present indicative suffixes to one, which in most varieties only encoded the third-person singular. The main suffix in the 16th century was *-th*, as in *he maketh*, which gave way to *-s* in the next century, as in *he makes*. These suffixes were also occasionally used in the plural. The second-person singular suffix *-st* appeared with *thou* but, as mentioned above, this pronoun became rare. The paradigms of strong and irregular verbs were stabilized to a large extent, and the number of verbs with weak conjugation grew.

An important phenomenon in the EModE verb phrase was the increasing use of periphrastic forms and auxiliaries at the expense of one-verb groups. Both *have* and *be* occurred in the (plu)perfect tense, but the use of *be* was limited to mutative intransitives, such as *a childe is come*. The aspectual marker, progressive *be + ing*, developed during the early modern era, which also witnessed the development of the auxiliary category, consisting of *can*, *could*, *may*, *might*, *must*, *shall*, *should*, *will*, and *would*, as these verbs lost their full-verb properties, such as non-finite forms and the ability to take non-verbal objects. These auxiliaries were employed to express many of the functions the subjunctive had had in earlier English, although the subjunctive did not entirely disappear.

Furthermore, during the 16th century the non-emphatic use of the auxiliary *do* grew rapidly in affirmative statements, but its popularity fell quickly in the 17th century. In contrast, the employment of *do* in interrogative, imperative, and negative declarative sentences found a firm footing in the language.

Alongside the use of *do* in negative declaratives *dos not hinder*, the old verb + *not* structure was common,

in particular with the verbs *know*, and *doubt*, as in *I know not* and *I doubt not but*. Multiple negation was frequent until around 1600, as in *he helpes me nat with natheng*.

Although the regular word-order in affirmative statements was SVO, in the first decades of the 16th century it was not uncommon to invert the word order after adverbs such as *then*, *therefore*, *thus*, and *yet*. The present-day pattern of inversion after negative adverbs, such as *neither*, *nor*, and *never*, developed from the late 16th century onwards.

New function words were created through grammaticalization. For instance, new indefinite compound pronouns with personal reference developed, such as the forms in *-body*, e.g., *nobody*, from *no + body* 'person'. Similarly, complex prepositions such as *because of* from *by + cause + of* developed in EModE. Several connectives, for instance, *since*, *while*, and *because*, grammaticalized in earlier English, acquired new senses in the early modern period.

Lexis and Semantics

The early modern period witnessed large-scale lexical growth through extensive borrowing and expansion of word-formation patterns. The major source language was Latin, but loans from other languages, in particular French, were also frequent. The extension of English into all areas of life, including science, and the broadening spectrum of genres, styles, and registers created a need for new and more varied vocabulary, which was satisfied with borrowings and native coinages.

This intake of Latinate vocabulary reduced the transparency of the English lexicon by adding a new layer to the already existing Germanic and Romance strata. On the other hand, it provided ample material for the creation of specialist technical terminologies. Not everybody was comfortable with the tremendous increase in Latinate words, as is testified to by the so-called Inkhorn Controversy in the late 16th century, when voices were raised against excessive use of learned borrowings. Dictionary evidence shows that many of these loanwords were short-lived, and it has been estimated that approximately a third of Shakespeare's numerous Latinate neologisms only occurred once.

Loanwords became integrated into the language to varying degrees. Writers occasionally used nearly synonymous word-pairs to make sure that the readers understood the borrowing, e.g., *wepung and lamentyng*. Inflectional endings such as L *-atus* > E *-ate*, were modified as in *alternate*. Multiple borrowing occurred, and the spelling of older French loanwords could be Latinized, as illustrated by *dout* > *doubt*.

The existing word-formation patterns, affixation, compounding, and conversion, were expanded by borrowing. For instance, among the negative prefixes, the native *un-*, e.g., *unmeet*, encountered four competitors, *a-*, *in-*, *dis-*, and *non-*, e.g., *discontented*.

The biggest problems for understanding EModE texts arise from semantic changes, which range from radical changes in meaning to shifts in nuances. For example, *mete* means 'food' in general and not what we understand by *meat* today, and *an auncient and sad matron* in Sir Thomas Elyot's educational treatise is simply 'an old and trustworthy married woman'.

Linguistic Diversity

Although the presentation of early modern general features may give the impression of linguistic uniformity, we must not forget that there was substantial regional, social, individual, generic, and stylistic variation. Despite the lack of a codified model, the language underwent standardization in terms of focusing and option-cutting, with orthography leading the process. The spellings of early and later texts diverge in general, but barely literate people's private writings contain atypical spellings at all times.

There is no doubt that people spoke their local dialects, but dialectal texts are rare because of the low level of literacy. Drama can offer some information on dialectal usage, and private texts occasionally contain regional features.

As in any society, there were social differences in the language use in early modern England, which was markedly hierarchical. Research on the diffusion of morphosyntactic changes shows that several were introduced by the middling ranks and diffused from the London region to the rest of the country. Changes

Table 3 The Early Modern English genres in the *Helsinki Corpus of English texts*

| | | |
|-----------------|-----------------------|-------------------|
| Literate genres | Law | |
| | Handbooks | |
| | Science | |
| | Educational treatises | |
| | Philosophy | |
| | Sermons | |
| | History | |
| | Travelogue | |
| | Biography | |

| Diary | | |
| | Autobiography | |

originating in the spoken language were usually led by women, but men were ahead of women in learned changes such as the loss of the multiple negation. The diversification of genres led to new genre conventions and stylistic variation. The 17 early modern genres included in the *Helsinki Corpus of English Texts* illustrate the broad spectrum of early modern writing (see Table 3). The most formal literate genres such as law, philosophy, and science stand out with Latinate diction and structural complexity both on the sentence and phrase level, whereas oral genres such as fiction and private correspondence often rely on Germanic words and simpler structures.

English, Later Modern (ca. 1700–1900)

J Beal, University of Sheffield, Sheffield, UK

Introduction

The recognition of Late Modern English as a separate period in the history of the English language is a fairly recent phenomenon. The first linguist to use the phrase appears to be Poutsma, but his (1914) *A grammar of Late Modern English* was effectively a synchronic study of what, to him, was present-day English. Poutsma describes his work as “a methodical description of the English Language as it presents itself in the printed documents of the last few generations” (Poutsma, 1928: viii). Sweet seems to have invented the now familiar tripartite division of the history of English when he proposed in a lecture to the Philological Society to “start with the three main divisions of *Old*, *Middle* and *Modern*, based mainly on the inflectional characteristics of each stage” (Sweet, 1873–1874: 620). His definition of Modern English was the period of lost inflections, i.e., from the 16th century to Sweet’s own lifetime. It was not until the early 20th century that a subdivision of Modern English was called for by Wyld:

We should further distinguish Early Modern, from 1400 or so to the middle of the 16th century; and after that it is convenient to distinguish late 16th-century, 17th-century, and 18th-century English and we may consider present-day English to begin toward the end of the 18th century (Wyld, 1936: 27).

Wyld thus recognized a distinction between Early Modern English and the later history of the language, but does not see this later period as a coherent entity worthy of a single label. As I have pointed out elsewhere (Beal, 1999, 2004), the study of Late, or Later Modern English, as it is sometimes termed, has been the ‘Cinderella’ of English historical linguistics: serious study of this period did not begin until the end of the 20th century, perhaps because it was not until the millennium was in sight that the Late Modern period could be seen in historical perspective. This is the explanation provided by Charles Jones:

There has always been a suggestion . . . especially among those scholars writing in the first half of the twentieth century, that phonological and syntactic change is only properly observable at a great distance and that somehow the eighteenth, and especially the nineteenth centuries, are ‘too close’ chronologically for any meaningful observations concerning language change to be made (Jones, 1989: 279).

Jones has been a pioneer in the study of Late Modern English, organizing the first conference dedicated to this period in 2001, the proceedings of which have appeared as Dossena and Jones (eds.) (2003). Görlach has produced separate volumes dedicated to 18th and 19th century English, respectively (Görlach, 1999, 2001), and Bailey (1996) likewise deals with the 19th century separately, leaving Beal (2004) as the first book to cover the whole of this period in a single volume. Although the latter defines ‘later’ Modern English as covering the period 1700–1945, I will deal here with the period (roughly) from 1700 to 1900, leaving the 20th century to the article **English in the Present Day**.

External History

Although the division between the Early and Late Modern periods is not defined by a single cataclysmic external event such as the Norman Conquest, there are several factors contributing to the view that a date around 1700 marks the beginning of a new era. Historians generally describe the ‘long’ 18th century as beginning with the Restoration of the monarchy in England (1660) and ending with the fall of Napoleon (1815), while the ‘long’ 19th century stretches from the start of the French Revolution (1789) to the end of World War I (1918). These overlapping ‘long’ centuries together provide a good working definition of the Late Modern period in English. ‘Restoration’ is perhaps a misnomer for the accession of Charles II, since, far from occupying the throne by Divine Right, he had been invited to do so by Parliament. The so-called Glorious Revolution of 1688 and the Bill of Rights (1689) further reduced the powers of the monarch, bringing in the constitutional system that still exists in Britain.

1660 is also the year when the Royal Society was founded, ushering in the Age of Reason. Both Porter (2000) and Lass (1999) cite the publication of Newton’s *Principia* (1687) as the beginning of the English Enlightenment. Scientific progress from throughout the Late Modern period stimulated lexical innovation as new inventions, processes, and whole disciplines required names. The emphasis on ‘reason’ in the 18th century also contributed to the climate of opinion, described by Leonard (1929) as the Doctrine of Correctness, in which grammatical ‘rules’ such as the proscription on negative concord (‘two negatives make a positive’) were rationalized on mathematical models. The scientific discoveries of the late 17th and early 18th centuries led to the technological innovations that drove the Industrial

Revolution of the late 18th and 19th centuries. As Britain became an industrial nation, workers moved from the countryside to the newly expanding towns and cities, especially in the English North and Midlands. In cities such as Manchester, Leeds, and Birmingham, new urban dialects evolved as the demand for labor brought in workers from various parts of Britain and beyond.

Dialect contact, and an awareness of the differences between dialects of English, was made possible by advances in transport and communications during the Late Modern period. In the course of the 18th century, the Turnpike Trusts funded a substantial number of new roads, cutting the journey from York to London from three days to one, thus making leisure travel a more pleasant and practical proposition. Travelogues such as Defoe's *A tour thro' the whole island of Great Britain* (1724–1727), Johnson's *Journey to the Western Isles of Scotland* (1755) and Cobbett's *Rural rides* (1830) describe journeys by carriage undertaken for curiosity. The 'outlandish' dialects of Northumberland and Cornwall (the areas of England most remote from London) are as much objects of curiosity for Defoe as the landscape and customs of other areas. In the course of the 19th century, the development of the railway made affordable leisure travel possible for the lower and middle classes, at least in urban areas. Communication was further facilitated by the introduction of the Penny Post in 1840 and the electric telegraph in 1837, while the invention of the phonograph in 1877 made it possible to hear the disembodied voices of speakers from distant places. All these developments had the effect of increasing dialect contact between speakers of different British dialects and, eventually, between speakers (and writers) of British and American English.

The Late Modern period also marks the beginning of the 'great divide' between British and American English. Although the first English-speaking colonies in what is now the United States were founded in the early 17th century, the development of American English as a national variety with its own prescribed norms was precipitated by the American Revolution (1775–1783). In 1789, Webster asserted that 'customs, habit and *language*, as well as government, should be national. America should have her *own*, distinct from all the world.' (Webster, 1789: 179). His *American dictionary of the English Language* (1828) provided norms for spelling which were deliberately differentiated from those of British English, as well as legitimizing Americanisms. With the loss of America, British colonial expansion diverted to Australia (1788) and, in the 19th century, to South Africa and New Zealand. The development of distinct national

varieties of English in these countries was perhaps more a phenomenon of the 20th century, but the expansion of British interests both in these colonies and the nations of Africa and Asia absorbed by the British Empire, brought into English loan words from a wide variety of languages, as flora, fauna, topographic features, and customs hitherto unknown to speakers of English required names. This, along with the scientific discoveries and inventions referred to above, accounts for the increase in lexical innovation during the 19th century.

Within Britain, increased social mobility brought about by the commercial opportunities of the Industrial Revolution and the expansion of educational provision in the course of the Late Modern period led to the emergence of an ambitious and influential middle class. Such 'social climbers' created a market for the normative texts for which this era is famous: alongside the 'triumvirate' of Johnson (1755), Lowth (1762), and Walker (1791), many other dictionaries, grammars, and pronouncing dictionaries were published to help those aspiring to linguistic correctness. Whether such normative works had any effect on the language, or whether they simply described linguistic practices already in use among the educated, is still a matter of debate (see, for instance, Beal, 2003), but it is certainly the case that the codification of Standard (British) English is one of the defining features of the Late Modern period. The following sections provide a brief account of the major changes that took place in the Late Modern English Period, but it is to be understood that this refers only to Standard English in England. For discussion of the history of other varieties of English, see Beal (2004: 190–220) and Watts and Trudgill (2002).

Morphology and Syntax

Morphology

We have seen above that Sweet defined the Modern English period as a whole as the period of lost inflections. However, this definition refers largely to the Early Modern period, as the only inflection to be lost after 1700 is the second person singular-*st* ending. This in turn depends on the loss, from Standard English, of the distinction between second person singular *thou*, *thee*, *thy*, *thine* and the formerly plural *ye*, *you*, *your*, *yours*. The singular forms had become marked in the Early Modern period, and by 1700 "survived only in dialects, among Quakers, in literary styles, as a device of heightening . . . and in its present religious function" (Strang, 1970: 140). Although some 18th-century authors, notably Sheridan and Richardson, put *thou* forms into the mouths of

upper-class males, this usage was not universally accepted. McKnight (1928, reprinted 1968: 335) cites Greenwood (1711) as stating “it is counted ungentile and rude to say, *Thou dost so and so.*” Of course, the loss of *thee/ thou* pronouns and the *-st* verb inflection (along with *art, wert* forms of *be*) meant that Standard English no longer marked the distinction between second person singular and plural. In the early 18th century, the distinction was maintained, at least with *be*, by using *you was* for the singular and *you were* for the plural. However, Lowth condemned this as an “enormous solecism” (Lowth, 1762: 48), and *you was* disappeared from Standard English, though it is still common in dialects. By the end of the 19th century, a new plural form *yous* was being used in Irish, American, and Australian English (Wright, 1898–1905), and this form has spread throughout Britain in the late 20th century (Cheshire *et al.*, 1993).

Syntax: Regulation of Early Modern Variants

Syntactic changes in the Late Modern period can be divided into two types: those that represent the final stages of processes begun in the Early Modern period, and those that are innovations of the 18th and 19th centuries. The former type involve the regulation of variants, a process to some extent helped along by the prescriptive grammarians of the Late Modern Period. Changes in the auxiliary system led, in the Early Modern period, to variation between positive declarative clauses with and without *do*. While the 16th-century grammarian Palsgrave was able to state: “*I do* is a verb moche comenly used in our tonge to be put before other verbs, as it is all one to say ‘*I do speake*’, and such lyke, and ‘*I speake*’” (Palsgrave, 1530: 523), Johnson condemned this usage as “a vitious mode of speech” (Johnson, 1755: Sig. B2v). Ellegård (1953: 162) provides a graph demonstrating the decline of this construction through the Early Modern period, reaching close to zero by 1700. However, Tieken (1987) found that, in a corpus of 18th-century prose (948,700 words), the construction was still used, but it was rare, and 13 out of the 14 examples she found occurred before 1760. In poetry, the use of *do* before another verb persisted into the 19th century, presumably because the semantically empty auxiliary here provided an extra syllable when needed, and allows the citation form of the verb to be placed at the end of a line, thus facilitating rhymes. An example from Wordsworth (1827) is:

The hapless creature which did dwell
Erewhile within the dancing shell.
(*The blind highland boy* 193–194)

However, it is certainly the case that this usage was extremely marked after the mid-18th century, at least in Standard English. Another, related, area in which Early Modern variants persist into the 18th century is negation: Ellegård (1953: 162) shows the use of *do* in negative declaratives in his corpus rising to 80% by 1700, with the steepest rise in this usage coming in the second half of the 17th century. Tieken (1987) found that an average of 76% of the negative declaratives in her 18th-century corpus involved the use of *do*, and that the decline of the *do*-less negative was gradual throughout the 18th century. She also found that the *do + not + infinitive* construction was more frequent in the usage of more educated authors, but that the *do*-less form was most frequent with the verbs *know* and *doubt*.

Another area in which regulation took place during the Late Modern period is relativization. The so-called *wh*-relatives *who*, *whom*, *whose*, and *which* had been introduced in the Early Modern period, but the options of using *that* with both human and nonhuman antecedents, and of using a zero, or contact relative in both subject and object positions, were still available. The 18th century saw grammarians expressing a preference for *who/whom/whose* with human antecedents and *which* with nonhuman antecedents, and condemning the zero relative. However, although Visser (1963–1973: 540) states that “a remarkable decline in the currency of the zero-construction becomes perceptible” in the 18th and 19th centuries and notes that Johnson called this “a colloquial barbarism,” Raybould (1998) notes that Johnson uses this construction even in the nominative. It would appear that 18th-century authors saw this construction as informal or colloquial rather than strictly ungrammatical. The only substantive changes in relativization in Late Modern English are the restriction of *which* to use with inanimate antecedents, and the restriction of zero-relatives in the nominative to colloquial usage, and to existential constructions such as *there’s a man out here wants to see you*.

Syntax: Innovations of the Late Modern Period

Perhaps the most fully researched feature of Late Modern syntax is what has been called the ‘*be + -ing*’ construction, the ‘progressive’ and the ‘expanded form,’ as in *She is reading a book*. Although this construction had been used before 1700, its use in Early Modern English was optional in contexts where today it would be required. Thus in *Hamlet* II. 2. 190, Polonius asks Hamlet “What do you read my Lord?” Today this would be interpreted as an inquiry into Hamlet’s reading habits, but Polonius was referring

to the book that Hamlet had in his hands at the time. Today, the required construction in this pragmatic context would be *What are you reading, my Lord?*

Several studies (Dennis, 1940; Strang, 1982; Arnaud, 1983) have noted the increase in usage of the *be + -ing* construction throughout the Late Modern period, both in terms of the sheer numbers of such constructions, and the types of clause in which it can occur. Strang notes that before 1750 the construction is used mainly in subordinate clauses, but that, from the second half of the 18th century, the rise in the use of *be + -ing* constructions is proportionately greater in nonsubordinate clauses. Thus, the construction becomes fully grammaticalized in the course of the Late Modern period. Likewise, from the second half of the 18th century, there is a rise in the use of *be + -ing* with stative verbs such as *love, wish*, etc., with verbs denoting instant actions such as *explode, fall*, etc., and with nominal and adjectival complements (e.g., *You're being a fool/foolish*). The extension of *be + -ing* to the passive is likewise an innovation of the Late Modern period. As late as 1870, this construction was still being condemned by grammarians such as Marsh, who described it as “at war with the genius of the English Language” (Marsh, 1860: 465). The preferred form, for Marsh, was *the house is building*. However, this had in turn been condemned by Johnson (1755) as an unacceptable innovation:

The grammar is now printing, brass is forging ... in my opinion a vitious expression probably corrupted from a phrase more pure but now somewhat obsolete: a printing, a forging.

While examples of the *a-printing* type are found in early 18th-century literature, by the 19th century they are being used (*sic.*) to represent nonstandard speech. In Richardson's *Pamela* (1740), the sentence “this girl is always a-scribbling” is given to an educated, upper-class man, but in George Eliot's *The mill on the floss* (1860), the same construction conveys uneducated, lower-class usage: “I hope, sir, you're not a-thinking as I bear you any ill-will ... I'm not a-defending him.” The first examples of the passive with *be + -ing* are found in late 18th-century letters, such as the following, cited in Denison (1998: 152):

I have received the speech and address of the House of Lords; probably, that of the House of Commons was being debated when the post went out. (1772, Harris, *Letters*)

Letters are, of course, the most informal genre of writing: we have already seen that Marsh was reluctant to accept this construction a century later, and,

even in the early 20th century Curme and Kurath seem to begrudge it:

From 1825 on ... the form with *being + perfect participle* began to lead all others in this competition, so that in spite of considerable opposition the clumsy *is being built* became more common than *is building* in the usual passive meaning, i.e. where it was desired to represent a person or thing as affected by an agent working under resistance vigorously and consciously to a definite end: ‘The house *is being built*’, ‘My auto *is being repaired*’ (Curme and Kurath, 1931: 444)

The extension of the use of the *be + -ing* construction to longer verb phrases involving perfective and modal verbs took longer. Marsh constructs such sentences as artificial examples of what he sees as the ludicrous consequences of allowing the passive with *be + -ing*:

They must say therefore ... the great Victoria bridge *has been being built* more than two years; when I reach London, the ship Leviathan *will be being built*; if my orders had been followed, the coat *would have been being made* yesterday; if the house had then *been being built*, the mortar would *have been being mixed* (Marsh, 1860: 654).

However, Marsh's ridicule was in vain, for, by the early 20th century, such constructions were in use: they were rare then as now, simply because the pragmatic circumstances in which they might be used are likewise rare. An early example is from Galsworthy: “She doesn't trust us: I shall always be being pushed away from him by her” (Galsworthy, 1915, *Freelands*, cited in Denison, 1998: 158).

The extension of the *be + -ing* form to the passive and to other paradigms is perhaps the most significant syntactic innovation of the Late Modern period. Other changes tend to involve, as Denison notes, “a given construction occurring throughout the period and either becoming more or less common generally or in particular registers” (Denison, 1998: 93). The role of prescriptive grammarians in relegating constructions such as the double negative to nonstandard usage in this period is a matter of debate. Greenwood's statement that “two *Negatives* or two *Adverbs of Denying*, do in *English* affirm” (Greenwood, 1711: 160) is often cited as an example of mathematical logic inappropriately applied to language. Yet Tieken (1982) and Austin (1984) note that, in the 18th century, multiple negation occurs in informal and lower-class writing, and in the portrayal of such usage by playwrights. Whether the grammarians created the stigma or merely reflected the sociolinguistic situation of their day is as difficult a question as that of prioritizing the chicken and the egg. What is certain is that multiple negation disappears from formal Standard

English in the course of the Late Modern Period. Other constructions condemned by grammarians, such as preposition stranding and the split infinitive remain shibboleths to this day, and are perhaps more common in informal Standard English, but have by no means disappeared. In fact, Lowth, who is often cited as proscribing preposition stranding, merely states that this “is an idiom, **which our language is strongly inclined to**” and that this “prevails in common custom, and suits very well with the more familiar style in writing; but the placing of the Preposition before the Relative is more graceful . . . and agrees much better with the solemn and elevated style” (Lowth, 1762: 167–168, my emphasis). As Tieken (2000) points out, Lowth’s use of the very construction he is supposedly condemning, is intended as a joke, and, far from proscribing preposition stranding, Lowth states that it is perfectly suitable for informal writing and, indeed, uses it in his own letters. His statement appears to be a description of 18th-century usage. The split infinitive was never mentioned by Lowth or any other 18th-century grammarian: it is first mentioned in 1834 in the *New England Magazine*, where it is represented as “not unfrequent among uneducated persons” (Lowth, 1834: 469, cited in Bailey, 1996: 248). If educated persons avoid the split infinitive in formal writing today, this is largely because it has become such a shibboleth.

Phonology

The phonology of Late Modern English has, until very recently, had much less scholarly attention paid to it than that of earlier periods. This is probably because, as MacMahon suggests “superficially, the period under consideration might appear to contain little of phonetic and phonological interest, compared with, for example, earlier changes such as the transition from Old to Middle English, and the Great Vowel Shift” (MacMahon, 1998: 373). It is in the Late Modern period that, as Holmberg so neatly puts it, “the snob value of a good pronunciation began to be recognised” (Holmberg, 1964: 20), and elocutionists such as Thomas Sheridan and John Walker made good livings from providing lectures and pronouncing dictionaries (Sheridan, 1780; Walker, 1791) to the upwardly mobile. This is also the period in which Received Pronunciation emerged as the sociolect of the public-school-educated aristocracy and upper-middle class, eventually to become the reference variety of British English. When we discuss changes in English phonology and phonetics in this period, it has to be understood that we are comparing the reference varieties of the 18th and 19th centuries, as set out, for instance, in successive editions of

Walker’s *Critical pronouncing dictionary* from 1791 to 1904, with 20th-century RP as defined in those of Daniel Jones (first edition 1917). Other varieties of present-day English tend to retain variants ‘left behind’ by Late Modern English sound changes such that a passage transcribed according to Walker (1791) would sound regional and/or slightly archaic rather than obsolete or outlandish to a 21st-century British ear (see Beal, 2004: 134 for such a transcription). Although elocutionists such as Walker and Sheridan were undoubtedly normative, their detailed descriptions of sounds and transcriptions of every word in their dictionaries provide a great deal of evidence for the prestigious pronunciation of the period. A more detailed account can be found in Beal (1999 and 2004: 125–167): here, I will briefly describe the main changes in the pronunciation of received English between 1700 and 1900.

Consonants

Perhaps the most striking difference between the pronunciation set out in Walker (1791) and present-day RP is that the former is rhotic, with orthographic <r> pronounced in all positions. The loss of rhoticity is attested by Walker, who is one of the first sources of evidence for this change, but he considers this to be a marker of lower-class London usage:

In England, and particularly in London, the r in *lard*, *bard*, *card*, *regard*, is pronounced so much in the throat, as to be little more than the middle or Italian a lengthened into *baa*, *baad*, *caad*, *regaad* (Walker, 1791: 50).

He goes on to describe the Irish pronunciation of /r/ as too harsh, but to say that the pronunciation at the beginning of a word should be more ‘forcible’ than at the end, so that ‘*Rome*, *river*, *rage*, may have the r as forcible as in Ireland, but *bar*, *bard*, *card*, *hard*, etc. must have it nearly as soft as in London (Walker, 1791: 50). This suggests that, even in the pronunciation recommended by Walker, /r/ was considerably weakened in final and preconsonantal positions. However, as Mugglestone (1995: 98–103) demonstrates, ‘dropping’ of <r> continued to be overtly stigmatized until the late 19th century. Loss of rhoticity in British, or, rather, English English, appears to have been a ‘change from below,’ first noticed in lower-class London English of the late 18th century and eventually to find its way into RP. In the 20th century, rhoticity became recessive even in regional dialects of England, remaining as a marker mainly of southwestern and some Lancashire dialects.

The other main consonantal changes in Late Modern English are not so much changes in the system, or even the distribution of phonemes, as the regulation of variants. Two of the greatest shibboleths

of nonstandard pronunciation in the 20th and 21st centuries are popularly known as ‘dropping’ of <h> and <g>. In the latter case, the term ‘dropping’ is not at all accurate, since the stigmatized variant is /n/ as opposed to /ŋ/ in, for example, *hunting*, *shooting*, and *fishing*. In both cases, the stigmatized variants had been attested at least from the Early Modern period, but are not labeled as ‘vulgar’ or ‘incorrect’ before the 18th century. Sheridan was the first to comment on ‘h-dropping’:

There is one defect which more generally prevails in the counties than any other, and indeed is gaining ground among the politer part of the world, I mean the omission of the aspirate in many words by some, and in most by others (Sheridan, 1762: 34).

Walker lists among the ‘faults of the Cockneys’ that of “not sounding *b* where it ought to be sounded, and inversely” (Walker, 1791: xii–xiii). For both Walker and Sheridan, the dropping of /h/ from the /hw/ of *which*, *what*, etc. is as much a ‘fault’ as the omission of initial /h/ in *house*, etc. While h-dropping remains highly stigmatized in all but a handful of words of French origin (*hour*, *honour*, *herb* and derivatives), the initial /hw/ is now marked in RP as very conservative. For a full account of the extent to which h-dropping became a shibboleth in the course of the Late Modern period, see Mugglestone (1995: 107–150). The stigmatization of the alveolar pronunciation of <ing> was equally strong by the late 20th century, but here the story is more complex, involving social stratification. Walker was aware of the distinction between /n/ and /ŋ/ and provides evidence that the use of /n/ for the *-ing* morpheme was condemned by some teachers, but he states that “our best speakers do not invariably pronounce the participle *ing*, so as to rhyme with *sing*, *king* and *wing*” (Walker, 1791: lxxxviii). The alveolar pronunciation was a marker both of lower-class and upper-class usage throughout the Late Modern period. By the early 20th century, the upper-class use of the alveolar was becoming a target of humor, but it can still be heard in the speech of very elderly, very conservative RP speakers.

Vowels

Such vowel changes as occurred in the Late Modern period largely involve the continuation of processes begun in the 16th and 17th centuries. In all cases, the earlier variants are still found in English regional accents, with many of the innovations still confined to RP and southern varieties. One of the clearest and most persistent markers of the ‘north–south divide’ in English accents, the presence or absence of /ʌ/ in *blood*, *cup*, *put*, etc. had already been established by the mid-18th century, as Walker points out:

If the short sound of the letter *u* in *trunk*, *sunk* etc., differ from the sound of this letter in the northern parts of England, where they sound it like the *u* in *bull* . . . it necessarily follows that every word where this letter occurs must by these provincials be mispronounced’ (Walker, 1791: xiii).

What is new here is not the southern /ʌ/ so much as the attitude that the northerners’ lack of this phoneme marks them out as provincial. That other marker of the north–south divide, the pronunciation of the vowel in *bath*, *laugh*, *grass*, etc., has a more complex history. Evidence of lengthening of /æ/ in certain environments, mainly before voiceless fricatives, pre-consonantal (but not final) /r/, and /n/ followed by another consonant, as in *dance*, etc. occurs in the late 17th century, but, throughout the 18th and 19th centuries, the pronunciation with /ɑ:/ was not universally accepted. Walker tells us that although ‘Italian *a*’ had previously been heard in words such as *glass*, *fast* “this pronunciation seems to have been for some years advancing to the short sound of this letter, as heard in *hand*, *land*, *grand* etc. and pronouncing the *a* in *after*, *answer*, *basket*, *plant*, *mast*, etc. as long as in *half*, *calf* etc. borders very closely on vulgarity” (Walker, 1791: 10). This change seems to have begun as a lengthened [æ:] in the 17th century, and not to have become stigmatized until the lengthened vowel was retracted to [ɑ:]. The latter pronunciation is described as ‘drawling’ throughout the 19th century, and there is evidence of a pronunciation with [æ] or even [ɛ] by young ladies wanting to avoid the ‘vulgar’ [ɑ:]. Those who wished their pronunciation to be beyond reproach had to avoid both the ‘drawling’ [ɑ:] and the ‘mincing’ [æ] at least until the beginning of the 20th century, when Daniel Jones’s use of cardinal *ɑ* seems to have established this as the RP pronunciation. The lengthening of short *o* to /ɔ:/ in *off*, *cloth*, *cross*, etc., likewise began in the late 17th century and was considered ‘vulgar’ through most of the Late Modern period. Walker explicitly draws a parallel between the two vowels:

What was observed of the *a*, when followed by a liquid and a mute, may be observed of the *o* with equal justice. This letter, like *a*, has a tendency to lengthen when followed by a liquid and another consonant, or by *s*, *ss* or *s* and a mute. But this length of *o*, in this situation, seems every day growing more and more vulgar; and, as it would be gross, to a degree, to sound the *a* in *castle*, *mask* and *plant*, like the *a* in *palm*, *psalm*, &c. so it would be equally exceptionable to pronounce the *o* in *moss*, *dross* and *frost*, as if written *mawse*, *drawse*, and *frawst*. (Walker, 1791: xx)

As Mugglestone (1995: 231) points out, both [ɑ:] in *bath*, etc., and [ɔ:] in *off*, etc., were condemned as

‘vulgar’ throughout the 19th century, most probably because of their association with Cockney, and both became acceptable in 20th-century RP. However, while the former remains in present-day RP and southern accents of England, [ɔ:] in *off* is now a stereotype of very conservative, very upper-class RP, such as that of older members of the Royal Family.

The other vowel changes to be considered here could be regarded as the tail-end of the Great Vowel Shift. In words such as *face* and *goat*, the ME vowels had been raised to /e:/, /o:/, respectively, and these are the pronunciations described by Walker, who writes of the ‘long, slender’ sound of <a> and the ‘long, open’ sound of <o>, respectively. While the exact quality of the vowels described by Walker is open to debate (MacMahon, 1998: 450; Beal, 2004: 136–138), the pronunciations described are monophthongal. However, the first evidence for diphthongal pronunciations of both these vowels comes very soon after Walker’s first edition: MacMahon (1998: 459) points out that the first evidence for diphthongization of /o:/ comes from the Scottish orthoepist William Smith in 1795 and it is generally accepted that the first attestation of a diphthongal pronunciation of /e:/ comes from Batchelor (1809). In both cases, the diphthongal pronunciations are widely accepted in the 19th century, and are still found in RP and many other accents of present-day English.

Lexical Innovation

Given the external factors referred to above, we would expect the Late Modern period to be a time of lexical expansion, as all the new inventions and discoveries of the scientific age would require names, and English speakers encountered a wide variety of languages as a result of trade, exploration, and colonization. **Figure 1** is based on information provided by the *Chronological English dictionary* (Finkenstaedt *et al.*, 1970), which, in turn, took its data from the *Shorter Oxford English dictionary*. Most recent accounts of lexical innovation in English, such as Bailey (1996) and Görlach (1999, 2000), take their information from this source, even though it

has limitations. **Figure 1** shows a distinct downturn in lexical innovation in the mid-18th century, an increase in the 19th century, reaching a peak in the mid-19th century, and a tailing-off toward the 20th century. The apparent decline at the end of the 19th century can be dismissed as the information ultimately comes from the first edition of the *Oxford English dictionary*, which was being produced at the end of the 19th century and therefore did not tend to include innovations from this period. The *OED online* provides a more accurate picture: for instance, a search for the year 1890 under ‘first citations’ provides 1235 entries. The apparent trough in the 18th century can partly be explained by the relative neglect of 18th-century sources on the part of the original *OED* compilers, but it is also true that there was a tendency to resist innovation in this period. Authors such as Swift and Addison satirized the ‘affectation’ of slang words such as *mob* and *bamboozle* and the importation of French military terms such as *corps* and *c(h)arte blanche*. Objections to loanwords from French were voiced at various points in the 18th and early 19th centuries, when war between the two nations brought speakers of French and English into contact, and news of France’s superior military engineering into the English papers. Several reviews in 18th-century periodicals comment adversely on the influx of French military terminology, but even in times of peace, the excessive use of French words is condemned as an affectation. In 1771, the *Monthly Review* criticizes those who use *rôle* for *part* or *penchant* instead of *the passion of love*, stating that “the offended ear of the unfranchised reader sickens at the sound” of these words. Of course, both these words are now accepted in English, but, like many French loans of the Later Modern period, they have not been fully anglicized. Apart from French, the other major sources of loanwords in the 18th century were Latin and, to a lesser extent, Greek. Publications such as Chambers *Cyclopaedia* brought information on new scientific classifications, discoveries, and inventions to a wide readership, introducing words coined from classical roots. Examples from 1753 are *aeronautics*, *azalea*, and *caldarium* from Latin, and

Figure 1 Numbers of first citations in the *Shorter Oxford English Dictionary* by decade 1661–1900.

aetiological, *eczema*, and *splenitis* from Greek: all of these were first cited in the 1753 supplement to Chambers *Cyclopaedia*. The number and the proportion of new words formed from classical roots was to increase substantially in the 19th century: figures from *CED* for 1835 show more than two-thirds of the words first cited in that year having Latin or Greek etymologies (Beal, 2004: 25). Some 19th-century authors objected to what they saw as an excessive dependency on these sources. Richard Grant White complained:

In no way is our language more wronged than by a weak readiness with which many of those who, having neither a hearty love nor a ready mastery of it, or lacking both, fly readily to the Latin tongue or to the Greek for help in naming a new thought or thing or the partial concealment of an old one (1872, 22, cited in Bailey 1996: 141–142).

Despite such complaints, many of the scientific discoveries and inventions of the 19th century were given names coined from classical roots: examples from 1835 are *bifurcate*, *capilliform*, and *locomotory* from Latin and *creosote*, *phonograph*, and *silo* from Greek. The scientific discoveries of this century also led to a growth in the number of eponyms, as inventors or discoverers claimed a stake in posterity by having a new process or mineral named after them. The new science of geology provided many new words for minerals named after the geologist who first found them or the place they were found: examples first cited in 1835 include *bromlite*, *lanarkite*, *leadhillite*, *proustite*, *smithsonite*, *stromeyerite*, *troostite*, *uralite*, and *voltzite*. These are the major sources of lexical innovation in the 19th century, but what is also evident is that, as the Late Modern period progresses, words are imported into English from a wider variety of languages as exploration and colonization brought terms for the flora, fauna, and customs of the Americas, Asia, Africa and, last of all, Australasia. In 1835, for instance, the words *kiwi*, *rata*, and *tui* are first cited, all from Maori.

English, Middle English

J J Smith, University of Glasgow, Glasgow, UK

© 2006 Elsevier Ltd. All rights reserved.

The English of the period between the Norman Conquest of 1066 A.D. and the arrival of printing in England in 1476 is generally referred to as Middle English, as opposed to Old English (before 1066) and New or Modern English (after c. 1500). This terminology was established by the late-19th-century scholars Henry Sweet and Julius Zupitza. The dates are, of course, only useful signposts because the transitions between the three periods were gradual.

External History

William of Normandy's victory over the Anglo-Saxons was followed relatively swiftly by the imposition of Norman political and cultural hegemony throughout the kingdom. By William's death in 1087, the first two classes (estates) of medieval society, the clergy and nobility, were dominated by Normans.

This major change in England's social structure had a profound effect on the status of the English language, which had hitherto occupied a position unparalleled among the western European vernaculars. When the Normans arrived, they found a sophisticated society that had developed a distinctive vernacular culture. Spoken Old English consisted of a range of different varieties, strongly affected – especially in the north and east of England – by the Norse dialects of Viking settlers. In the written mode, however, one Old English dialect, the Late West Saxon in southwest England, had achieved the prestige associated with standard languages and was copied in various scriptoria, largely monastic, outside its area of origin. The Norman Conquest ended the prestige of Late West Saxon and, although texts continued to be copied in this standardized language for some time after 1066, dialectal variation and linguistic changes, hitherto not evidenced in written English, began to spread from the spoken to the written mode. The resulting language was Middle English, the earliest surviving example of which is probably the Final Continuation of the *Peterborough Chronicle* (see Clark, 1970).

Two languages replaced Late West Saxon in prestige: Latin and Norman French. The Conquest coincided with a revival of Latin learning in western Europe, and the Channel State of England and Normandy resulting from William's victory aided the transmission of this culture to Britain. Latin became the language of official record in England during the 12th and early 13th centuries, used for the *Domesday Book* (1086) and the Magna Carta (1215); it was also the literary language used by important 12th-century writers working in England, such as Geoffrey de Vinsauf, Alexander Neckham, and John of Salisbury.

Norman French, although the mother tongue of the invading elite, could not at first compete with Latin in all its functions. However, as Clanchy (1979: 168) pointed out, "contact with England, with its long tradition of non-Latin writing, may have helped to develop French as a written language"; and, from the 13th century onward, as Norman French developed in England into what modern scholars call Anglo-Norman, it began to be used for both official and literary purposes.

Throughout this period, English remained the primary language of the majority of the population of England, which peaked at just over 6 million in the middle of the 14th century. There is good evidence that the Norman aristocracy themselves had begun to speak English by the beginning of the 12th century, although French remained a necessary accomplishment for cultivated people; the change was encouraged by the loss of Normandy in 1204. English became increasingly widely used in the written mode as the Middle Ages progressed. However, its functions were parochial; it was used for local audiences and in the equivalent of primary education. The national functions of written language, until the very end of the period, were carried out by Latin and French; there was therefore no need of a national standard English. As a result, written English for much of the Middle English period manifested a high degree of variation of the kind now more generally associated with speech. There are, for instance, 143 distinct spellings for the item *such* recorded in the authoritative *Linguistic atlas of late mediaeval English* (McIntosh *et al.*, 1986), ranging from *schch* recorded in Norfolk to such forms as *swich*, *seche*, and *soche* to Kentish *zuyche* and Northern *swilk* and *slik*. It was only in the 15th century, with the rise of London English as a prestigious written language associated with the power and functions of the capital city, that a new standard written English emerged. Even then, extensive written variation remained into the 16th century, at which point the early printers began to provide authoritative norms for private use.

Internal History

Increased vernacular literacy from the 13th century onward means that, compared with Old English, a great deal of Middle English writing in contemporary manuscripts has survived. This material forms the primary evidence for Middle English.

Graphology

Given the variety of written Middle English, it is unsurprising that handwriting styles differed diachronically and diatopically and even in the work of single scribes. In general, the Old English insular script was replaced by continental styles; usages hitherto restricted to Latin texts began to be adopted when writing English. Cursive handwriting developed as a practical response to increasing literacy in both Latin and the vernaculars.

The Middle English alphabet was almost identical with that of present-day English. The Old English letters <æ> (ash), <ð> (edh), and <ƿ> (wynn) disappeared early in the Middle English period, being replaced by <a, e>, <th, þ>, and <w>, respectively. Old English runic <þ> (thorn) was retained alongside its ultimate replacement, <th>, for some time, although commonly realized as <y>, especially in northern varieties; when printing arrived, <þ> largely disappeared, but was retained (written <y>) in a few contexts where ambiguity did not arise, for example, <ye> 'the.' A modified form of the Old English insular g, <ȝ> (yogh), was retained by many scribes, commonly to represent [x, j]; the French habit of using <ʒ> to realize [z] was also adopted by many Middle English scribes, in addition to <z>, which was adopted from Latin usage. <g>, used in Anglo-Saxon times for copying Latin, was adopted to represent [g]. <c, k, q> developed their present-day usage during this period as a result of the adoption into English of practices used for writing French. <h> was used as a diacritic to indicate a modification of the letter it followed: hence, the development of <sh> (earlier <sch>) for Old English <sc>, <gh> for <ȝ> and <wh> for Old English <hw>. The letters <u, v> were used interchangeably to represent both vowel and consonant, with <v> generally being used initially and <u> elsewhere.

In Old English, <y> had represented [y], but that vowel was unrounded in many late Old English dialects, merging with Old English <i> [i] (In western dialects, the rounding was retained, but the vowel seems to have retracted to merge with <u> [u].) <y> then came to be used interchangeably with <i>, especially in environments where contemporary handwriting could be confusing (e.g., before or

after <m, n, u>). <o> was used for <u> in similar circumstances.

The combinations <ou, ow> were adopted from French usage in place of <u> in words such as *how* and *brown* (cf. Old English *hu, brun*). Toward the end of the period, southern varieties frequently indicated vowel length by doubling the letters representing them (e.g., *good, feed*); however, in northern and Scottish varieties, long vowels were often indicated by the addition of <i> (e.g., *guid* 'good'). As inflexional-*e* fell out of use at the end of the period (see the section on Noun Phrases), it too became available as a diacritic mark to indicate a long vowel, as in *life* (cf. Old English *lif*).

Phonology

Knowledge of Middle English phonology derives from the analysis of rhyming verse, reconstruction from later and earlier states of the language, and the interpretation of orthography. There is no thorough contemporary account of Middle English pronunciation comparable to the Old Icelandic *First grammatical treatise*, although there were scribes whose orthographic practices demonstrate considerable sophistication in handling the complexities of sound-symbol mapping (e.g., Orm, the author and scribe of *The ormulum*, c. 1200). The inventory of phonemes in Middle English varied diatopically and diachronically, so the following account is very general.

Consonants The phonemic consonants in Middle English were /p, b, t, d, k, g, tʃ, dʒ, f, v, θ, ð, s, z, ʃ, h, m, n, l, r, w, j/. The major structural difference between Old and Middle English was in the fricatives; voiced and voiceless fricatives were allophones in Old English, but were phonemicized in the Middle English period.

Vowels The Old English distinction between long and short stressed vowels remained important, but ceased to be phonemic as the Middle English period progressed; there is indirect evidence that the short vowels tended to have more open pronunciations than their long equivalents from the beginning of the 13th century onward. By the beginning of the 15th century, London English seems to have had the following inventory: /i, ɪ, e, ɛ, ε:, a:, a, ɔ, ɔ:, o, u, ʊ/; /i, e, o, u/ were long vowels where length had ceased to be phonemic. Quantitative changes, some already under way in the late Old English period, meant that short vowels tended to appear in closed syllables, whereas long vowels tended to appear in stressed open syllables; thus, contrastive distribution was lost.

The major difference between Old and Middle English vocalism was in diphthongs; the Old English diphthongs monophthongized, and new diphthongs arose from vocalizations of Old English [w, j, h]. French loanwords supplied the inventory with two new diphthongs, /ʊɪ, ɔɪ/.

In unstressed vowels, the Old English qualitative distinctions were already becoming obscured by the late Anglo-Saxon period. This process continued in Middle English; /ə/ was the most common vowel, although /ɪ/ spread from the north, and /ʊ/ (indicated by spellings such as <-us, -ud>) seems to have been characteristic of the west.

Grammar

Inflexion In Middle English, inflexions are not as functionally important as they were in Old English. Many roles played by inflexions in Old English were taken over by prepositions and a more fixed word order (see section on Word Order). There were, of course, dialectal differences. In general, innovations in morphology spread from the north of England to the south, so features found in late Northumbrian Old English (e.g., the 10th-century *Lindisfarne gospels gloss*) first appear in the south in Middle English texts.

Noun Phrase The masculine/feminine/neuter grammatical gender system of Old English disappeared in the Middle English period. Although inflexional distinctions remained in the personal pronouns of Middle English, these were assigned according to natural gender. This pattern was already becoming established in late Old English, when *wif* 'woman,' a neuter noun, was occasionally referred to by the pronoun *heo* 'she.' The case system had already been subject to syncretism in pre-Old English (as in all Germanic languages); it was during the Middle English period that it largely disappeared. Only inflexional markers of plurality and possession remained. Modifiers such as determiners and adjectives ceased to be marked for agreement with their head words.

In place of the four major and four minor noun declensions of Old English, Middle English had in general the modern pattern, that is, the simple addition of *-(e)s* to mark plurality or possession, although there were rather more relicts of the *micel/children*-type than there are in present-day English. The forms in *-s* derive from the Old English strong masculine paradigm.

Traces of the old adjectival strong/weak (indefinite/definite) distinction lasted until the late 14th century in southern England, indicated by the use of *-e* in some

paradigms; thus the poet Geoffrey Chaucer (d. 1400) distinguished *the olde man* and *the man is old*. However, the system had died out everywhere by the beginning of the 15th century, and *-e* was subsequently used as a diacritic of length (see section on Graphology).

The Old English system of inflexionally differentiated determiners collapsed, and the present-day system (*the/this/that/these/those*) gradually emerged. An indefinite article *a(n)* appeared, derived from Old English *an* 'one.' Perhaps the most radical changes took place in the pronominals; the Old English dual pronouns disappeared, and a number of other forms (e.g., Old English *hie* 'they,' *heo* 'she'), which had ceased to be distinctive because of sound changes, were replaced by variants that were available in the lexicon through contact with Old Norse.

Verb Phrase The strong/weak/irregular paradigms of Old English remained, with numerous analogical reassignments. Verb inflexions, although reduced and reorganized, were retained to mark agreement between subject and predicator.

Complex verb phrases arose in place of some Old English simple verb phrases. Old English distinguished between *bundon* 'bound' (preterite plural indicative) and *bunden* 'may have bound' (preterite plural subjunctive); the obscuration of the inflexional distinction led to the replacement of the formal subjunctive by complex verb phrases with *may* and *might* (Old English *mæg*, *mihte*, etc., 'can, could'). *Shall* and *will* were increasingly used as auxiliary verbs indicating future time rather than as lexical verbs signaling obligation and volition, respectively. Toward the end of the Middle English period, a complex verb phrase with *do* emerged in affirmative declarative constructions (e.g., *she did eat*, *it doth illuminate*); this construction has not survived into present-day use.

Other characteristic Middle English innovations are the development of phrasal verbs, such as *put up* and *stand by*, and an extension of the use of impersonal verbs, such as *me thinketh* 'it seems to me.' The latter usage has disappeared from present-day use, but the former construction is still common, especially in informal styles.

Word Order In word order, there is a noticeable extension in Middle English of the subject-verb-object sequence from affirmative main clauses not beginning with an adverbial to main clauses beginning with an adverbial and to subordinate clauses, where the Old English orderings were prototypically adverbial-verb-subject-object and subject-object-verb, respectively (as in present-day German).

Lexicon

There are three main sources of loan words into English during this period: Norse, Latin, and French. (For useful lists, see Serjeantson, 1935.)

Norse Loans Many Norse words were actually taken into English in the late Anglo-Saxon period, but in general they are hidden by the standardized written mode. Most Norse loans express very common concepts (e.g., *bag*, *bull*, *egg*, *root*, *ugly*, *wing*), and it is notable that Norse has supplied such basic features as the third-person plural pronouns *they*, *their*, and *them* (cf. Old English *hie*, *hiera*, *him*).

Latin Loans A number of Latin words came directly into English during the Middle English period, largely as learned words carried over in the translation of Latin texts (e.g., *omnipotent* and *testament*). However, the great wave of Latin borrowings into English took place from the 15th century onward, with the rise of humanism, and this is therefore a feature of Early Modern English.

French Loans Up to the 13th century, recorded borrowings from French into English are few and were generally restricted to the registers of government (e.g., *justice*, *obedience*, *mastery*, *prison*, *service*). From the beginning of the 13th century to the end of the Middle English period, however, French words entered the English lexicon in large numbers. As contact with Normandy was lost, Central French, not Anglo-Norman, became the main source of these words. The range of domains covered by these words is vast (see Serjeantson, 1935: 12–156). This surge was socially driven; although the higher social classes did not speak French as their mother tongue by this time, French retained its social cachet, and the use of French expressions was an obvious way of signaling a higher social position. Even in present-day English, French-derived vocabulary is often stylistically marked as of a higher register; compare the difference in meaning between high-style *commence* and neutral *begin*.

French also affected word formation. On the one hand, compound forms, characteristic of Old English, were frequently replaced by simple borrowings (cf., *brecan* 'break,' *forbrecan* 'destroy'). On the other hand, French suffixes and prefixes were applied to native stems (e.g., *knowable*, *unspeakable*).

Typical Middle English

The heterogeneity of written Middle English means that a typical specimen of Middle English is not to be

had. The following text from Scragg (1974: 31–32) is a version of the Lord's Prayer in a Central Midlands dialect of the 1380s (MS London, British Library, Royal 1.B.vi); it exemplifies some of the features previously discussed.

Oure fadir, þat art in heuenys, halewid be þi name. þi kyngdom come. Be þi wille don as in heuene and in erþe. ȝiue to vs yis day oure breed ouer oþer substauſe. And forȝiue to vs oure dettes, as and we forȝiuen to oure dettouris. And leede vs not into temptacioun, but delyuere vs from yuel.

Modern Work on Middle English

The two most important recent single publications in Middle English studies are the *Middle English dictionary* (Kurath *et al.*, 1951–2001; also online), and *A linguistic atlas of late Mediaeval English* (LALME; McIntosh *et al.*, 1986). The former allows for a much more detailed investigation of the Middle English lexicon than has been possible hitherto. The parallel completion of the *Dictionary of the older Scottish tongue* (Craigie *et al.*, 1931–2002) means that the resources for the study of medieval lexicons of Britain are now massively enhanced. In combination with the continued evolution of the *Oxford English dictionary*, and the imminent completion of the *Historical thesaurus of English*, these publications will allow a great leap forward in the diachronic study of vocabulary and its structure.

LALME has opened up a mass of unpublished evidence for investigation, and also, by localizing so many texts to particular places, means that a much greater range of dialectal grammars can be constructed than has yet been achieved. Follow-up projects on Early Middle English and Older Scots are currently under way.

The indispensable foundation, however, for the study of Middle English remains: the editing of texts. Some fashions in literary (as opposed to linguistic) study, however, militate against the usefulness of this enterprise; the modern practice: even in scholarly editions: is to make numerous silent decisions in editing Middle English texts. Such decisions disguise important linguistic features such as punctuation, marks of abbreviation, and even spelling.

Alongside these developments, theoretical work continues. Probably the most important descriptive milestones are the major histories, such as the second volume of the *Cambridge history of the English language* (Blake, 1992) and the single-volume *Oxford history of the English language* (Mugglestone, 2005). Explanatory work is necessarily more controversial; probably the single most influential work on the

historical study of English, with a special focus on Middle English, remains Samuels (1972).

English, Old English

C L Allen, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

Old English is the development of the language which was introduced into Britain by Germanic invaders in the 5th century A.D. and became the dominant language of what is now England excluding Cornwall, and also southern Scotland. Old English evolved gradually into Modern English, and any date given to delineate the different stages of the language must be somewhat arbitrary. The period covered by Old English spans c. 425 to c. 1100, and the language underwent extensive changes in this period. The comments made below about the phonology and grammar of Old English must be understood to apply to some of this period, but not necessarily all. By 1100, the accumulation of changes had become so great that it is appropriate to speak of Middle English.

While we do not know what the earliest Germanic people coming to Britain called their language, we find it referred to as *englisc* c. 1000, and *Engla land* (land of the Angles) used for the area where it was spoken. It is impossible to estimate the number of speakers throughout the Old English period, but William the Conqueror's Domesday Survey (1086) suggests an Anglo-Saxon population of between one and two million.

It is customary to recognize four basic dialects of Old English, distinguished from each other most prominently by phonological features but also by morphological and lexical peculiarities: Northumbrian (northern), Mercian (midlands), Kentish, and West Saxon (southwestern). It is tempting to attribute the main dialect differences to the premigration period on the continent, following the tradition beginning with the famous description of the Germanic invaders in Bede's *Ecclesiastical history of the English people*. Bede, writing in Latin in 731, says that the invasion force consisted of three tribes – Angles, Saxons, and Jutes – who founded separate kingdoms. But the majority opinion of modern scholars stresses

the complexity of political and social factors that presumably contributed to the creation of regional dialects in addition to the variation that would have come with the earliest Germanic settlers.

Our knowledge of Old English dialects and how they developed is limited by the sparseness of records in English until the 9th century. Because this was a period of political hegemony by Wessex accompanied by a burst of literary activity associated with Alfred the Great (who reigned from 871 to 899), the majority of surviving Old English manuscripts were written in the West Saxon dialect, and West Saxon became a sort of standard for writing in most areas of the country. For this reason, West Saxon is what is normally taught as Old English. Standard Modern English is not in a straight line of descent from West Saxon, but derives mainly from southeastern Mercian varieties for which our information in the Old English period is scanty.

Genetic Relationships

Comparison of Old English with other languages shows that it belonged to the Germanic subgroup of the large Indo-European family, which includes Old Saxon, Old High German, Old Frisian, Gothic, and Old Norse. An example of a major phonological feature that sets the Germanic languages off from the other Indo-European languages is the Germanic shift of stress to the initial syllable of every word (excluding certain prefixes). Using the comparative method, we can reconstruct a good deal of the vocabulary and morphology of Germanic; for example, Old English, Old Saxon, and Old Frisian share the form *ūs* 'us', which can be shown to have descended from the same form **uns* in Germanic. The word shows up as *uns* in Gothic and Old High German and *oss* in Old Norse.

Such comparison indicates that Old English, Old Frisian, and Old Saxon shared some sound changes which differentiated them from the other Germanic languages. In the example just cited, the nasal *n* has been lost before the fricative *s*, with compensatory lengthening of the vowel, in these languages, and similarities of this sort have caused Germanic

scholars to refer to these three languages as ‘Ingvaeonnic’ or ‘North Sea’ Germanic. A smaller grouping of Anglo-Frisian can be made within the Ingvaeonnic group. Old English and Old Frisian were the only Germanic languages that fronted the Indo-European back vowel *a* to front *æ*. The Ingvaeonnic languages share with Old High German some consistent similarities that differentiate them from the Scandinavian languages such as Old Norse on the one hand (where assimilation of the nasal to the fricative gives *oss* from **uns*) and Gothic on the other, and so a tripartite division of the Germanic languages into West, North, and East is traditional. This picture is complicated by the fact that the speakers of the West and North Germanic languages maintained a reasonable degree of contact with each other. Even while their languages were undergoing separate development, they retained a certain amount of unity and shared innovations. The result is that Old English was more like Old Norse than it was like the East Germanic Gothic.

Written Records

We can never know for certain how Old English sounded or everything about the grammar of the language, but there is a lot we do know. We cannot know the exact quality of the vowel in what was written as *mus* (‘mouse’), for example, but we can tell that it must have been a long, high, back vowel. For one thing, comparison of the sister Germanic languages and the further history of the word in English (which saw the vowel become a diphthong) makes this the only candidate. For another, the Old English scribes adapted the Latin alphabet to represent their language, and it would have been perverse to use a letter to represent a sound that was entirely divorced from the sound it was used to represent in Latin.

Old English written records do not start appearing until *c.* 700 in quantities useful for studying the language of the time and its previous development from common Germanic. Prior to this, there are some inscriptions in the runes that the Germanic tribes used before their conversion to Christianity, when the Latin alphabet was adopted. The earliest of these dates to the 4th or early 5th century. However, runes were mostly used for inscriptions, not literary activity. The runic inscriptions found in Britain are also few in number, although they provide us with very important information (sometimes open to more than one interpretation). We also have a copy of the law code of Æthelberht of Kent (d. 616), but it is contained in a manuscript from a much later period. The fact that anyone thought it worthwhile to write these laws down in English sets Old English apart from most

vernacular languages of such an early period, when Latin was the only language used for such subject matter in much of Europe.

The earliest writings in the Latin-based alphabet, adapted slightly to deal with the sounds of Old English, are mainly glosses of Latin. These are invaluable sources of information about the phonology and morphology of the earliest period of Old English, but they cannot teach us much about Old English syntax. It is only in the time of Alfred the Great that materials become abundant. We have more remains of Old English than any other Germanic language of such an early period, covering poetry, religious material, medicine books, a grammar of Latin for English speakers, the *Anglo-Saxon chronicle*, and more, amounting to approximately three million words. Scholars are well served with electronic corpora, of which the Helsinki Corpus (see Kahlas-Tarkka *et al.*, 1993) was the first. Such corpora have become an invaluable tool in the study of Old English morphology and syntax in particular.

From Germanic to Old English: Phonology

One of the most striking features of Old English phonology is that assimilation is found in more than one guise. Assimilation is found in most Germanic languages to some extent, but Old English underwent its own special assimilatory processes. A process usually known as *i*-umlaut is one of the most important developments of the prehistoric Old English period when Old English had separated from its sister languages but was not yet written down. The essence of this process was that a high front vowel or palatal glide in one syllable caused a back vowel in the preceding syllable to become a front vowel, to oversimplify greatly. This is a type of anticipatory assimilation, in which the speaker anticipates the vowel of an upcoming syllable by moving the tongue into a front position too early. An assimilation of an even earlier period involved the palatalization of velar consonants that were adjacent to front vowels or a palatal glide in the same syllable. Palatal stops have a tendency to turn into affricates, and this is what happened in Old English, with the result that Germanic **dik* has come down to us as *ditch*.

The importance of syllable structure in Old English is seen in a process that deleted a final vowel after ‘heavy’ syllables, which either contained a long vowel or ended in a consonant cluster. Thus, the nominative plural form was *scipu* for ‘ship’ because the base *scip* had a short vowel and ended in a single consonant, while *word* was either nominative singular ‘word’ or plural ‘words’ because the consonant cluster *rd* caused deletion of the plural suffix *-u*.

One interesting difference between Old English and the language that descended from it is that voicing was not a distinctive feature for most fricatives. In Modern English, [f] and [v], written as *f* and *v*, are perceived as two distinct sounds, as the difference between *fat* and *vat* illustrates. But in Old English, they were perceived as variants of essentially the same sound or phoneme. The labiodental fricative was pronounced as voiced [v] when surrounded by voiced sounds (such as vowels), but pronounced as voiceless [f] otherwise; e.g., although *deofol* was written with an *f*, it was pronounced more like modern *devil* than the spelling suggests.

Effects of Language Contact

Some everyday words borrowed from Latin such as *cēse* ‘cheese’ (from Latin *cāseus*) bear evidence of early sound changes and are likely to have entered the language prior to the invasion of Britain. The conversion to Christianity brought writing in the Roman alphabet to the Anglo-Saxons (with the help of Irish missionaries). However, Anglo-Saxon churchmen preferred to use native resources for translating ecclesiastical concepts, e.g., *halig gāst* ‘holy ghost’ as the translation of *spiritus sanctus*; *spirit* was not used until the Middle English period.

Since Britain was inhabited by Celts before the Germanic invasion, one might suppose that Old English would show a great deal of Celtic influence, but the number of Celtic words borrowed into Old English, other than place names such as *Temes* ‘Thames,’ is exceedingly small. This is a pattern typical of an invasion, c.f. the retention of aboriginal place names by English settlers in the United States and Australia. Expert opinion varies greatly as to the number of Germanic migrants and the displacement of the Celts, but whether it was a case of language shift by the Celtic population or the spread of the language by the spread of the Germanic population, there is no convincing evidence of substratum Celtic influence on Old English grammar or phonology.

In contrast, there can be no question of very intimate contact with Scandinavian speakers, particularly in the northeast of the country, due to the Scandinavian raids that began in the 8th century, which later became determined attempts at settlement and culminated in Danish rule of the entire country by Cnut (1017–1035). Such contact cannot fail to have linguistic consequences, although the nature of those consequences is a matter of debate. Our uncertainty is exacerbated by the paucity of written records from the areas where contact with Scandinavian speakers was the greatest in Old English. Many of the consequences in English do not appear in texts until the very late Old English or

Middle English period. However, the inflectional system of the *Lindisfarne Gospels*, an interlinear gloss that was added to a Latin text of the gospels in the 10th century in an area that had been under Scandinavian domination for more than a century, exhibits considerable modification of the inflectional system presented below. Many of these changes, such as the generalization of *-es* as the genitive singular inflection to declensional classes where it historically does not belong, are harbingers of more general changes of the Middle English period. This suggests that contact with Scandinavian speakers played an important role in shaping the dialects where contact was the greatest, with ramifications for the later development of Standard English. However, it is likely that in many instances, the effect of contact was essentially to take the brakes off linguistic changes that were already in progress.

With such closely related languages, it can be difficult to tell whether a word that is only recorded in the late Old English period or later is of native origin or a Scandinavian borrowing, but it is certain that large numbers of everyday words such as *take* which replaced native *niman* are of Scandinavian origin.

French influence in English mostly dates from after the Norman Conquest of 1066 and so mostly lies outside the Old English period, but contact with French did not begin with the Conquest; especially notable is that there was a strong Norman presence at the court of Edward the Confessor (reigned 1042–1066). Several French loan words entered the language in the Old English period, including *prūd* ‘proud’, first attested c. 1000.

Grammatical Characteristics

Modern English still exhibits much of the lexicon and many of the Germanic structural characteristics of Old English, but Old English is so different from Modern English that it must be learned as a foreign language. One of the primary distinctions between Old English and later English lies in the more elaborated inflectional morphology of Old English. For example, nouns and their modifiers were inflected according to two numbers (singular and plural), three genders (feminine, masculine, and neuter) and four cases (nominative, accusative, genitive, and dative). The distinctions were mainly made by suffixation, but also by mutation of the stem vowel, as in feminine nominative/accusative singular *bōc* ‘book’ but dative singular *bēc*. An instrumental case was distinguished to a limited extent, but it had mostly merged with the dative case, and a prepositional phrase was more commonly employed than the instrumental case. Here, as in many other places,

prepositional phrases were already being used to supplement case marking. Few forms were unambiguously markers of a single combination of grammatical features; most masculine nouns did not distinguish the nominative from the accusative in either the singular or the plural, while most feminine nouns made this distinction in the singular but made no distinction between the non-nominative cases. Modifiers of the nouns, especially determiners, distinguished grammatical features more consistently, e.g., the masculine 'the stone' is *se stān* (nominative), *þone stān* (accusative), *þæs stānes* (genitive) and *þām stāne* (dative). Fewer distinctions were made in the plural even with the demonstratives, e.g., *þā stānas* 'the stones' could be nominative or accusative.

The more elaborate case marking system of Old English made a freer order of constituents possible than is found in Modern or even Middle English. 'The man killed the king' could be expressed as either *se man acwealde þone cyning* or *þone cyning acwealde se man*, because *se man* was nominative, and identified the subject wherever it was positioned, and the accusative form *þone cyning* signaled the object. Already in Old English, however, the order Subject-Object (as in the first of our examples) was much more frequent than Object-Subject. This order was the usual one even when case marking would have made the grammatical relations clear without the help of word order.

The position of the verb was also variable. Old English exhibits the preference for verb-second order in main clauses and verb-final order in subordinate clauses found in the other early Germanic dialects, but in Old English, verb-second position in main clauses was not as regular as it is in, for example, Modern Dutch, and only about 50% of subordinate clauses have verb-final order. Order within the noun phrase was also variable but far from free, with the prenominal order Determiner Adjective Noun familiar from

Modern English already the unmarked pattern. The postnominal order found in *men þa leofestan* 'most beloved people' (lit. 'people the belovedest') was mostly limited to vocatives and poetry, and is presumably a relic of more widespread postnominal positioning of modifiers in Germanic. The scene was set for further dependence on word order in the Middle English period.

English, Variation in Nonnative Varieties

Z Bao, National University of Singapore, Singapore

© 2006 Elsevier Ltd. All rights reserved.

Native vs. Nonnative Varieties

Native and nonnative varieties of English are distinguished on the basis of the sociolinguistic environment in which they take root. Native varieties are found in North America, Australia, and New Zealand, places

that saw large-scale settlement by English-speaking people. Nonnative varieties emerge in former British or American colonies in South and Southeast Asia and parts of Africa, where there has never been a sizable English-speaking settlement, and English is spoken along with the languages of the local populations. From the perspective of genetic linguistics, native varieties are the product of normal parent-to-child transmission in that both the grammar and the vocabulary are transmitted from the same parent language

(Thomason and Kaufman, 1988). There is little structural difference among them. Nonnative varieties are more complicated. Though the vocabulary is largely English, the grammar exhibits significant restructuring under the influence of indigenous languages. Given their unique sociolinguistic histories, nonnative varieties are not typologically homogenous. Because of the presence of linguistic features appropriated from indigenous languages, they are often referred to as ‘indigenized,’ ‘nativized,’ or ‘contact’ varieties, or as ‘New Englishes.’

Nonnative varieties are distinguished from English-lexified pidgins and creoles, also on sociolinguistic grounds. However, the internal variation within a nonnative variety is analogous to the post-creole continuum, ranging from basilect to acrolect. Unlike the basilectal subvarieties, the acrolect does not exhibit the effect of grammatical restructuring and serves as the local standard. It is in effect a native variety, and ‘nonnative’ applies to the basilectal subvarieties.

Native vs. Nonnative Speakers

‘Native’ is also used to describe the order of language acquisition: a ‘native’ language is the first language acquired by a ‘native’ speaker. The acquisitional status of nonnative varieties of English deserves comment. Conditioned by different postcolonial experiences, they followed separate developmental paths (Schneider, 2003). Malaysia and Singapore offer an interesting case study. In Malaysia, Malay is the national language, and English remains the language of the elite. In Singapore, the government adopts an English-centered language policy. English is the working language of government and, more importantly, the medium of instruction in schools. An English diglossia has emerged, with the nonnative variety – Singapore English – as L, and the superposed, acrolectal variety as H. Increasingly Singapore English is acquired as a first, if not the first, language (Kwan-Terry, 1991; Gupta, 1994). Given the right sociolinguistic conditions, a nonnative variety can acquire native speakers and become the mother tongue.

Variation

Variation in nonnative varieties of English is usually measured against the grammatical norm of the native variety. The focus is placed on linguistic neologisms and their possible origins. Variation can also be approached in terms of the usage patterns of linguistic variables as conditioned by context of use. But this line of enquiry is woefully lacking in the literature and is usually subsumed in the more common studies of lectal variation, conditioned by speaker proficiency.

Linguistic neologisms can be found in all levels of language.

Phonetics and Phonology

Two noticeable innovations among the English consonants have to do with the dental fricatives (*thin*, *this*) and the aspirated voiceless stops (*pot*, *top*, *cop*). The dental fricatives are replaced by *t* and *d*, respectively, and aspiration of the voiceless stops is lost. These innovations illustrate two basic mechanisms of sound interference: direct substitution and change in phonological contrast. In Singapore English, there has been a further development in the treatment of the dental fricatives: they are pronounced as *t/d* in syllable-initial position, but as *f* in syllable-final position (*healthy* [-t-] vs. *health* [-f]).

The change in the vowel system is more drastic. The typical vowel inventory of a nonnative variety consists of five or seven vowels. The additional two vowels in the larger inventory are traceable to the diphthongs in *bait* and *boat*. A plausible explanation is that the five-vowel inventory is due to simplification in phonological contrast. Table 1 displays the result.

The five-vowel inventory emerges when length is no longer phonemic and the high–mid–low contrast is reduced to high–low. The loss of phonological contrast may be caused by contact with indigenous languages or by internal drift.

Lexicon and Morphology

The lexicon is a depository of words and is the part of language that is the most susceptible to external influence. Lexical borrowing is commonplace. Not surprisingly, nonnative varieties borrow words from the languages in their contact environment: *dhobi* ‘washer man’ (from Hindi) in India, *kampung* ‘village’ (from Malay), and *kaypoh* ‘nosy’ (from Chinese [Southern Min Chinese]) in Malaysia and Singapore. It is not easy to differentiate this sort of direct borrowing from code-mixing or code-switching, which are common phenomena in multilingual communities.

New meanings may develop. In Southeast Asia, to *gostan* (< *go stern*) is to change direction; an *alphabet* is a letter (*English has 26 alphabets*), and a *parking lot* is a space in a *car park*. A more subtle change

Table 1 Simplification and vowel inventory

| RP | | Nonnative | | Examples | |
|------|------|-----------|---|-----------------|-------------------|
| i:/ɪ | u:/ʊ | i | u | <i>beat/bit</i> | <i>boot/put</i> |
| ɛ | ɔ:/ɒ | ⇒ e | o | <i>bet</i> | <i>caught/cot</i> |
| æ | ɑ:/ʌ | | a | <i>bat</i> | <i>cart/cut</i> |

involves the lexical semantics of words. Take *win* and *admit*. In Euro 2004, Greece played Portugal and won. To report this in Singapore English, you can say *Greece won*, *Greece won the game*, or *Greece won Portugal*. The last sentence reveals the change in the lexical semantics of *win*. The same is true of *admit*, as in *Teachers admit this exhibition for free*, on a museum notice board advertising a special exhibit.

Inflection is poorly developed. This is not to say that plural marking and verb agreement are completely lacking. More commonly, they are used apparently at random and may occur in unexpected places (recorded telephone message in Singapore: *This transfer will take about five seconds*). The complex verbal morphology associated with aspectual meanings suffers the same fate. However, differences in the aspect system are often due to underlying systematic differences in the way aspectual meanings are expressed.

Grammar

In the literature, grammatical description of the nonnative varieties, with the possible exception of Singapore English, is not as extensive and detailed as that for English-lexified pidgins and creoles. Nevertheless, from the available descriptions it is possible to appreciate the structural diversity within them. Topic prominence is a significant typological change that has variable structural instantiation among the extant nonnative varieties. The topic structures of Singapore English are as extensive as those in Chinese, its main substrate language. A typical example is *everything also want*, the title of a local comic strip. Here, we see Chinese influence in the fronted topic *everything*, in the adverb *also*, which reinforces the meaning of the quantifier *everything*, and in the missing subject. Related to the topic structure is the novel conditional construction in which the protasis is not introduced by *if*. In *Don't want egg, please inform first*, the protasis is interpreted as the topic that specifies the condition for the apodosis. Typologically or parametrically related syntactic properties tend to cluster in substrate transfer. Other nonnative varieties also allow missing arguments, but they do not have the same range of topic structures (Cheshire, 1991; Baumgardner 1996).

Another significant, and often substrate-driven, change concerns the aspectual system, which varies across the nonnative varieties (Platt *et al.*, 1984). In Singapore English, the perfective aspect is expressed by *already* (*I wash my hands already*), which occurs predominantly in clause-final position. Careful analysis reveals a subtle yet systematic difference between *already* and the past tense or perfect of native English. While *I wash my hands already* may be rendered as *I washed* (or *have washed*) *my hands*, *the wall white*

already means that the wall is white, not that the wall was or has been white. This use of *already* is consistent with the perfective aspect of Chinese.

Register

Nonnative varieties of English do not have an accepted written form, unlike some English-lexified pidgins and creoles, such as Tok Pisin. They are used as a vernacular for informal occasions and have yet to develop a full repertoire of registers – linguistic styles associated with context of use. Newspapers such as *The New Straits Times* (Malaysia), *The Straits Times* (Singapore), and *The Hindu* (India) use native English in their stories, which may contain linguistically trivial neologisms characteristic of the local cultural milieu. Literary works are also written in native English; nonnative varieties are used in the speech of characters as an indexical marker of their low social and educational standing (Talib, 2002). The thin repertoire of registers of a typical nonnative variety is correlated with its limited grammatical resources, its historical roles, and its present sociolinguistic status.

The lack of registral variation is supported by available corpus evidence. Table 2 displays the frequencies of *already* in the spoken and written registers of Singapore English (SIN) and British English (GB). The data are culled from the International Corpus of English (Greenbaum, 1996). (See Table 3.)

There is no difference in the written register. Differences emerge only in the spoken register of Singapore English, especially in the sentence-final position. The corpus profile suggests a clear registral division of labor: substrate-driven grammatical innovations are used in informal contexts and avoided in formal contexts.

Stigma and Grammatical Growth

One reason for the underdeveloped state of the nonnative variety is the lack of prestige in the adoptive speech community. Even in places such as Singapore, where English is the *de facto* national language and the local accent is increasingly seen as a marker of the Singaporean identity (Ooi, 2001), grammatical features that deviate from native English are stigmatized

Table 2 Counts of *already* in private conversation and writing, normalized to 1000 words of text

| | Medial position | | Final position | |
|------------------|-----------------|------|----------------|------|
| | SIN | GB | SIN | GB |
| Spoken register | 0.42 | 0.18 | 0.98 | 0.04 |
| Written register | 0.39 | 0.37 | 0.02 | 0.02 |

Note. SIN, Singapore English; GB, British English.

Table 3 Examples of *already* from the Singaporean component of the International Corpus of English

| | |
|-------------------------|---|
| With dynamic predicates | |
| 1. | Maybe she increase the price <i>already</i> |
| 2. | I told you about it <i>already</i> remember |
| With stative predicates | |
| 3. | It's like kind of oldish <i>already</i> |
| 4. | Her hand better <i>already</i> |
| Habitual states | |
| 5. | Nowadays I switch to Mandarin <i>already</i> |
| 6. | I think I am quite used to it <i>already</i> |
| With negatives | |
| 7. | By the time you eat nuh not nice <i>already</i> |
| 8. | Aiyah I cannot remember <i>already</i> |
| In coordinate sentences | |
| 9. | When I was in sec one I noticed him <i>already</i> |
| 10. | If reject then she wouldn't get her PP <i>already</i> |

and frequently targeted for eradication in government-sponsored *Speak Good English* movements. Stigmatization has serious consequences for the nonnative variety. Not only do stigmatized features face individual and institutional resistance, they are also slow to stabilize for eventual codification (Bao, 2003). Nonnative varieties need to overcome stigma, reduce internal variation, and expand linguistic resources before they are able to function in wider communicative domains. Against the international prestige and dominance of native English, this is no easy task.

Theoretical Approaches

The bulk of the literature on nonnative varieties of English is devoted to sociolinguistic issues arising from the global spread of English, among them identity, ownership, standardization, and English pedagogy (Quirk and Widdowson, 1985; Cheshire, 1991; Kachru, 1992; Fishman *et al.*, 1996; Görlach, 2002). The cause of grammatical restructuring is also the subject of intense study and lively debate, especially among scholars of pidgins and creoles. Some scholars treat all varieties of English as adaptations to their environment, so the tripartite division – native, nonnative, and pidgin and creole – has little theoretical significance (Mufwene, 1994).

Among the many factors that are involved in grammatical restructuring, we can list linguistic universals, markedness conventions, internal drift, and language acquisition. Also crucial is the role of the languages in the contact ecology, especially the linguistic substratum. The continued presence of indigenous languages in the speech community of a nonnative variety gives added importance to substrate transfer as a prime mover of grammatical restructuring (Lefebvre, 1998). At the same time, native English exerts strong normative pressure. The antagonistic

forces on the grammar of the nonnative variety cannot be resolved purely on linguistic grounds. Grammatical restructuring is a composite and complex process, and no single mechanism is solely responsible. For recent summaries of the field, see Thomason (2001) and Winford (2003).

English: World Englishes

B Kachru, University of Illinois at Urbana-Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

The conceptualization of the term ‘world Englishes’ is within a ‘socially realistic’ approach to language study (see, e.g., B. Kachru, 1981). The first linguist who, in a rather indirect way, provided such insight about what is now termed world Englishes was John Rupert Firth (1890–1960), the first holder of the chair of general linguistics at London University. In 1956, after his extensive experience in South Asia, Firth (1956: 97) observed:

English is an international language in the Commonwealth, the Colonies and in America. International in the sense that English serves the American way of life and might be called American, it serves the Indian way of life and has recently been declared an Indian language within the framework of the federal constitution. In another sense, it is international not only in Europe but in Asia and Africa, and serves various African ways of life and is increasingly the all-Asian language of politics. Secondly, and I say ‘secondly’ advisedly, English is the key to what is described in a common cliché ‘the British way of life.’

This observation, made over a half-century ago, exemplifies the linguistic pragmatism and social and functional realities of the English language in world context. Firth’s earlier observations have been addressed in much more detail in the following years by a variety of theoretical and methodological frameworks (for a perceptive historical review, see Bolton, 2004).

Spread and Stratification

The cross-cultural and cross-linguistic diffusion of English may be viewed in terms of three phases. The first phase was initiated in the British Isles in 1535 when the Act of Union annexed Wales to England. The linguistic implications of this Act were far reaching, as outlined by Edwards (1993: 108):

The most damaging section of the Act of Union, as far as the Welsh language was concerned and thus a significant element in its collective consciousness, was its emphasis on English as the language of preferment. English became essential for success. It specified “no personne or personnes that use the Welsshe speche or langage shall have or enjoy any manner of office or fees within the Realme of Onglonde Wales or other the Kinges dominions and exercise the speche or langage of Engliche.

In 1603, Scotland also came under British rule, and with this territorial expansion, King James VI became

King James I of England. The expansion continued, and in 1707 yet another non-English speaking region, Ireland and its indigenous languages of Celtic and Gaelic, were subsumed. This phase of expansion was notable for the consolidation of the dominance of English in the British Isles.

It was in the second phase of the diffusion that the diasporic varieties of English were transplanted across continents, notably to North America, Australia, Canada, and New Zealand. This phase involved a significant movement of native-English-speaking populations to new social, linguistic and cultural contexts. Although in total numbers this relocated population was limited, these groups, for example in Australia and New Zealand, developed influential and powerful English-using communities. As time passed, various strategies of educational planning, proselytization, and trading in the language were used to initiate – and increase – bilingualism in English.

The third phase of diasporic expansion introduced English into Asia and Africa. In contrast to the second phase, it brought English into contact with genetically and culturally unrelated languages in far-flung parts of the world. This diaspora provided a new ecology and, for the teaching of English, unprecedented challenges in terms of language contact, cultural contexts, norms, identities, and methodologies. Those challenges continue to confront the professionals in the new millennium.

This diasporic expansion laid the foundations for the use of the English language as cultural ammunition in all these territories and resulted in several indigenous varieties. The reactions to these transplanted varieties and their historical, social, educational, ideational, and cultural implications have ultimately resulted in the most articulate critical debates – both of agony and ecstasy (for further references, see B. Kachru, 1996).

The characterization of the stratification and functions of world Englishes within theoretical and pragmatic frameworks received a further stimulus in the 1970s. It was John Lyons (1978: xvi) who pointed out the parallels “between Labov’s approach to linguistics and that of the ‘British’ school, which draws its inspiration from J. R. Firth.” The ‘socially realistic’ paradigms – mixed with the activism of their proponents – resulted in consideration of linguistic diversity within Englishes as an integral part of social interaction and contextual realities (see B. Kachru, 1981).

Several schemas have been presented to characterize the diffusion of English and its global presence (see McArthur, 1993). One such model that has been

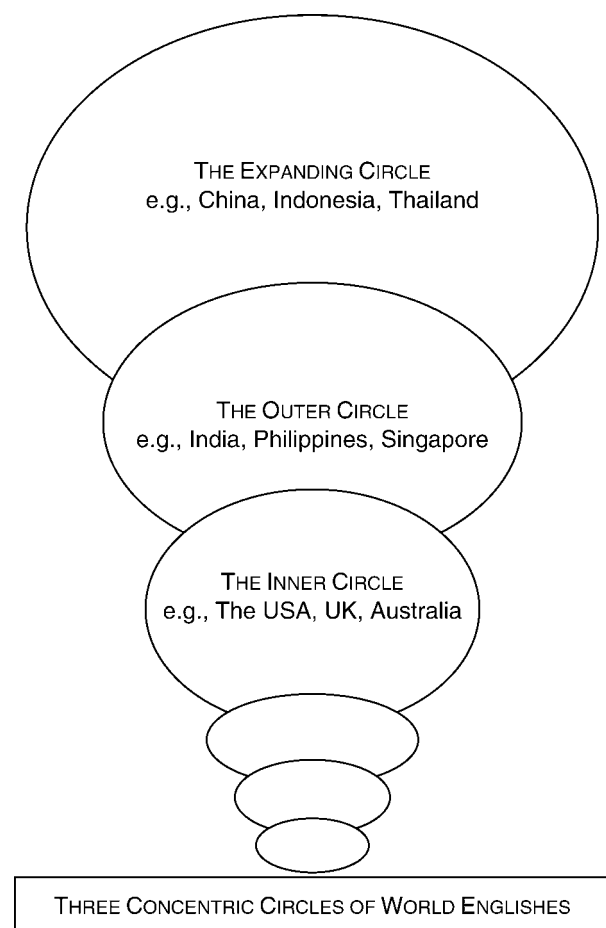

Figure 1 Three concentric circles of World Englishes.

adopted in several studies since the 1980s, the Concentric Circles model (Figure 1), is discussed below in detail.

Concentric Circle Model

The concentric circles representation of the spread of English, proposed in 1985, is more than mere heuristic metaphor for schematizing the spread of English. This representation provides a schema for the contextualization of world varieties of English and their historical, political, sociolinguistic, and literary contexts. The characterization of world Englishes is primarily based on the following factors:

- the history of the types of spread and motivation for the location of the language
- patterns of acquisition
- societal depth of the language in terms of its users, and the range of functions that are assigned to the English medium at various levels in the language policies of a nation (e.g., in administration, education, and literacy)

- functional acculturation of the English language within the local culture and societies and its nativization in the society and its literary culture

The term ‘nativization’ refers to the formal and functional changes the language undergoes at various linguistic levels (e.g., phonetic, lexical, syntactic, discursual, speech acts, literary creativity). In other words, the diffusion of English over centuries involves geographical expansion into regions of the world that had distinct physical realities and social, cultural and linguistic identities. It is in such contexts that the English language acquired ‘functional nativeness.’ It is the extent of functional nativeness in terms of the range and depth of English in a society that determines its impact. The more such functions of English increase in a speech community, the more local identities the variety acquires.

The three circles are not static, but dynamic and changing. The dynamics of the English language in terms of its status, functions, and attitudes toward it are well documented in the case studies of, for example, Bangladesh, Sri Lanka, Malaysia, Indonesia, and even in several Francophone countries.

In historical terms then, the Inner Circle primarily, but not exclusively, comprises the L1 speakers of varieties of English: It is this circle, (e.g., Britain, United States, Canada, Australia, and New Zealand), that provided the springboard for transplanting the language in other parts of the globe. The Outer Circle includes the major Anglophone countries of Africa and Asia, including India, Nigeria, the Philippines, Singapore, and South Africa. The Expanding Circle includes China, Taiwan, Korea, and Saudi Arabia (for the dynamic nature of this circle, see Berns, 2005).

The three circles model, as McArthur (1993: 334) suggested, represents “the democratization of attitudes to English everywhere in the globe.” In his view,

[T]his is a more dynamic model than the standard version, and allows for all manners of shadings and overlaps among the circles. Although ‘inner’ and ‘outer’ still suggest – inevitably – a historical priority and the attitudes that go with it, the metaphor of ripples in a pond suggests mobility and flux and implies that a history is in the making.

World Englishes Speech Communities

The earlier canonical definitions of the concept of ‘speech communities’ do not capture the pragmatic and functional global realities of the English language. Consider, for example, the restricted definition of the term provided by Bloomfield (1933: 42): “a group of people who interact by means of speech.” On the other hand, in Hymes’s view (1974: 47–51),

a speech community is “a social, rather than linguistic entity” that shares “knowledge of rules for the conduct and interpretation of speech.” The views of Firth (1957: 191) contrasted with that of sociologists and anthropologists, when he wrote:

The study of linguistic institutions is thus more specific and positive and on the whole less speculative than the sociological study of societies. Sociologists and social anthropologists are much bolder than linguists in what they find it possible to state in general human terms. To what lengths sociological abstractions can be extended is well-exemplified in Pareto’s theory of residues and derivations.

However, Firth also emphasized that a monolithic description of language does not convey the socially and contextually insightful characteristics of language. In his provocative way, Firth (1957: 29) wrote that the “unity of language is the most fugitive of all unities whether it be historical, geographical, national, or personal. There is no such thing as *une langue une* and there has never been.”

The English-using speech communities involve multiple – and often complex – historical, ideational, functional, and attitudinal contexts. In the global context, these fast-growing communities demonstrate varying degrees of competence in the language and its uses in terms of the range of functions and hybridization. These speech communities are primarily of the following types.

- Monolingual users of the language whose one and only language of communication is a variety of English; for example, a large portion of the inhabitants of the United Kingdom, United States, Australia, and Canada. In these countries, too, the number of bilingual users or non-English-using immigrant populations representing multiple languages from Asia, Africa, the Caribbean, Latin America, and Europe is fast increasing.
- Bilingual users of English who acquire English as an *additional* language for communication in those domains of function in which their L1 is not used or is not considered functionally appropriate to use.
- Multilingual users in whose verbal repertoire English is yet another code of communication, and language-shift and alternation are a normal communicative strategy. This phenomenon has been well documented with reference to multiple Anglophone English-using speech communities in Africa, Asia, Europe, and in the United States and United Kingdom.
- Bidialectal speakers and those whose L1 dialect has not attained functional and attitudinal recognition, as is the case of Ebonics (African-American English) or Spanglish in the United States.

Table 1 The statistics of World Englishes

| Society | Approximate population (million) | Percentage of L1/ L2 English users | Approximate totals (million) |
|-------------------------|----------------------------------|------------------------------------|------------------------------|
| INNER CIRCLE | | | |
| United States | 293 | | |
| United Kingdom | 59 | | |
| Canada | 32 | | |
| Australia | 20 | | |
| New Zealand | 4 | | |
| OUTER CIRCLE | | | |
| India | 1000 | 33 | 330 |
| Philippines | 86 | 56 | 48 |
| Pakistan | 159 | 11 | 17 |
| Malaysia | 24 | 32 | 8 |
| Bangladesh | 141 | 5 | 7 |
| Hong Kong | 7 | 35 | 2 |
| Singapore | 4 | 50 | 2 |
| Sri Lanka | 20 | 10 | 2 |
| EXPANDING CIRCLE | | | |
| China | 1300 | 18 | 234 |
| Japan | 127 | 33 | 42 |
| Indonesia | 238 | 5 | 12 |
| Thailand | 60 | 10 | 6 |
| South Korea | 49 | 9 | 4 |
| Vietnam | 83 | 5 | 4 |
| Myanmar | 43 | 5 | 2 |
| Taiwan | 22 | 10 | 2 |
| Cambodia | 13 | 5 | 0.6 |
| Laos | 6 | 5 | 0.3 |

The above figures are ‘guesstimates’ based on various published resources.

One major factor that distinguishes the international profile of English from that of other languages of wider communication is that it has more users now who have acquired it as an L2, L3, or L4 in their language repertoire (see Table 1).

Process of Nativization and Englishization

The speech communities of English in the Outer Circle use institutionalized varieties of English, which have the following characteristics:

- recognition of English in the overall language policy of the English-using nation (e.g., India, Nigeria, Singapore)
- an extended tradition of contact literatures in English that are recognized as part of the national literatures.
- social penetration of the language that has resulted in several social, ethnic or functional subvarieties (e.g., Singlish, Basilect, Bazaar English, Tanglish)
- distinct linguistic exponents of the process of nativization at various levels

- an extended range of localized genres and registers
- Englishized varieties of local languages, some of which may have even acquired distinct names (e.g., *Hinglish* or *Hindlish* of India)
- acculturation of the English language for articulating local social, cultural, and religious identities.

The process of nativization is one major linguistic dimension of acculturation of world Englishes: this acculturation is evident in Anglophone Asian and African functionally localized contexts.

The two processes of nativization and Englishization are Janus-like, two faced. One face reflects the impact of contact and convergence with other languages – Asian and African – at various linguistic levels. The second face shows the impact that the English language and literature have on other languages and literatures of the world. Englishization is not restricted to phonology, grammar, and lexis, but can have a deep impact on discourse, registers, styles, and literary genres in contact literatures in Englishes (see, e.g., Thumboo, 1992; Dissanayake, 1997; Y. Kachru, 1997; B. Kachru, 2003; Y. Kachru, 2003; B. Kachru, 2005).

The process of Englishization is evident in three major geographical regions associated with the spread of English:

1. Traditional regions of cultural and literary contact in which a number of cognate languages of English are used (e.g., in Western Europe and parts of Eastern Europe)
2. Anglophone, geographically noncontiguous with English, regions of the Raj, which include the Outer Circle of English, and have, in a genetic sense, unrelated or not-closely related languages (e.g., parts of Africa and Asia)
3. Expanding Circle, which includes the rest of the world (e.g., Japan, China, the Middle East, and Latin America).

In defining the nativeness of varieties of Englishes, a distinction may be made between genetic and functional nativeness. Genetic nativeness refers to the historical relationship of the languages in contact, and functional nativeness to the domains of use of English, the range and depth in social penetration, and the resultant acculturation. A profile of the functional nativeness of a variety of English includes these factors:

- sociolinguistic status of a variety in its transplanted context
- range of functional domains in which a variety is used
- creative processes used to construct localized identities

- linguistic exponents of acculturation
- types of cross-over contributing to canons of creativity
- attitude-specifying labels used for the variety of English.

The second diaspora of English has raised a variety of questions that are unique to transplanted Englishes and continue to be debated in the literature (see, e.g., B. Kachru, 1988, 1996; Mufwene, 2001; B. Kachru, 2005).

Models of Description

The canonical models of English continue to be viewed in terms of privileged British and American varieties of the language. The theoretical, methodological, and ideational issues raised by such an attitude have been extensively – and passionately – articulated in the literature in recent years. This debate has acquired a prominent position in the conceptualization of world Englishes. There are essentially three types of speech fellowships of world Englishes: (1) those that are canonically considered privileged and norm-providing – the Inner Circle, (2) those that have functionally acquired the status of norms and are pragmatically relevant in their sociolinguistic context – the Outer Circle, and (3) those that in many respects continue to be attitudinally dependent on external norms, primarily from the Inner Circle – the Expanding Circle (see Berns, 2005).

Conceptual Myths

The articulation of the following six myths in the conceptualization, methodology, and pedagogy of world Englishes has resulted in the ‘paradigms of marginalization.’ These paradigms are essentially based on age-old following fallacies:

1. World Englishes in Anglophone Asia and Africa are acquired and used to interact with canonical ‘native’ speakers of English.
2. World Englishes are acquired to learn the Judeo-Christian traditions as articulated in American and British cultural and literary values and traditions.
3. The Inner Circle Englishes are primary and standard ‘model providers’ for teaching and acquiring communicative competence in the language.
4. Conceptually, all varieties of world Englishes in Outer Circle are essentially *deficit* or *interlanguage* varieties.

5. Historically it is the Inner Circle that has provided – or should provide – models and standards for ELT pedagogy, creativity, and canonicity of Englishes across Anglophone regions and cultures.
6. The arms of codification of the English language, established – and imposed – by agencies of the Inner Circle, should ideally control the variation and diversity in world Englishes (see the Quirk-Kachru controversy, discussed in detail in Tickoo, 1991).

Constructing Identities of Englishes

The controversial modifiers of the term ‘English’ that are frequently used to characterize the post-colonial diffusion and stabilization of the English language across cultures and languages include ‘new Englishes’ and ‘international,’ ‘global,’ or ‘world English.’

The term ‘New Englishes’ was primarily – though not exclusively – used for the institutionalized varieties in the Outer Circle. All the ‘new’ varieties are transplanted (diaspora) varieties that have a presence on almost every continent. However, the use of the modifier ‘new’ for such Englishes is a misnomer – historically, contextually, and in terms of their acquisition, as some of them pre-date some Inner Circle varieties.

The conceptualization of ‘world Englishes’ (and not ‘world English’), in the sense in which it is used here, goes back to the 1960s. Its formal and functional implications were discussed in 1978 in two independently organized conferences in the United States: one at the East-West Center at Honolulu, (April 1–15) and the other at the University of Illinois at Urbana-Champaign (June 30–July 2). The Honolulu conference concluded with a statement and agenda for the future recognizing that “English used as an international and auxiliary language has led to the emergence of sharp and important distinction between the uses of English for international (i.e., external) and intranational (i.e., internal) purposes.”

In addition to this distinction between the uses of English-using speech communities, the statement further distinguished between “those countries (e.g. Japan) whose requirements focus upon international comprehensibility and those countries (e.g. India) which in addition must take account of English as it is used for their own national purposes.” The Honolulu conference also expressed concern that “[s]o far as we know, no organization exists that takes into account of any language in the light of this fundamental distinction.”

The University of Illinois conference, in contrast, “broke the traditional pattern of such deliberations:

no inconvenient question was swept under the rug. The professionals, both linguists and literary scholars, and native and non-native users of English, had frank and stimulating discussions” (Kachru, 1997: 210).

The scholars present, almost all from Anglophone countries – including, Africa and Asia, as equal partners – discussed with refreshingly fresh perspectives the sociolinguistic and linguistic profile of each English-using country in terms of the functional range of their varieties of Englishes and the social depth of the penetration of the language. What emerged were fascinating worldwide profiles of nativization and acculturation of world Englishes and construction of their identities, attitudes, and functions. It was through such discussions that a socially realistic and pragmatically appropriate preliminary framework developed.

This socially realistic framework represents the formal and functional variations, divergent sociolinguistic contexts, and histories of world Englishes. It is through such contextual insights that the bilinguals’ creativity, at various levels, acquires a social and functional meaning. The concept underscores the ‘WE-ness’ of the medium, its distinct nativeness determined in cultural, linguistic, and ideological contexts of Anglophone communities. Such cross-cultural functions of the medium acquire their own semantic signals in which the traditional dichotomies and frameworks demand alternative approaches. There is recognition of the fact that different methodologies may be needed (e.g., literary, linguistic, and pedagogical) to capture and construct the altered identities represented in the medium in Englishes of the world. The pluralization of the canonical term ‘English’ does not suggest ‘divisiveness’ in the English-using speech communities, but rather the recognition of a unique functional reality of the language: the diversity of the medium and its assimilative qualities in multiple pluralistic, linguistic, and cultural contexts.

These functional, contextual, and ideational connotations – and realism – are absent, as mentioned above, in such terms as ‘international English,’ ‘global English,’ or ‘world English.’ The term ‘international’ is misleading in more than one sense: it signifies an international English in terms of acceptance, proficiency, function, norms, and intelligibility. These presuppositions are far from the real world of Englishes in the world contexts.

The other concept currently presented to represent the global – or some times a regional – medium is ‘lingua franca English.’ This term was originally restricted to the intermediary contact language

(*Vermittlungssprach*) used by the Arabs and the Turks as a maritime jargon in the Levant. It primarily signifies a language of commerce (e.g., Italian around the Adriatic Sea). Each variety in the Outer Circle, as in the Expanding Circle, has its subvarieties in terms of functional connotations, domains, and attitudes toward localized varieties of Englishes and their cross cultural and cross-linguistic communications. Yet, the Inner Circle has made no serious efforts – socially, methodologically, or pedagogically – to recognize their status and currency.

One often-quoted interpretation of the concept of world Englishes was provided by McArthur (1993: 334) when he referred to the logo-acronym of the journal *World Englishes* (which started in 1984), which “serves to indicate that there is a club of equals here.” In this interpretation, the emphasis is on “the democratization of attitudes to English everywhere on the globe,” and it, as McArthur perceptively pointed out, dissolves the trinity of ENL, ESL, and EFL nations.

The linguistic, cultural, canonical, and literary implications of the diffusion of English beyond the Inner Circle are discussed in, for example, Dissanayake (1997), Thumboo (1992), and B. Kachru (1988, 2005).

World Englishes and Conceptual Frameworks

The theoretical, methodological, and ideological questions related to world Englishes go beyond language pedagogy, which was the primary concern before the 1950s. In the post-1960s period, several sacred linguistic cows of theoretical and applied linguistics as applied to world Englishes have been under attack as a consequence of several developments: insights gained by critical sociolinguistic paradigms, the articulation of identities with the language, and altered dynamics of the functions of English in post-colonial linguistic and cultural contexts. One thinks of, for example, the earlier theoretical and methodological emphasis given to such concepts as interference, interlanguage, and fossilization in paradigms of language acquisition. There was very little – if any – awareness of the pluricentricity of Englishes in the Outer Circle or of developing literary and cultural canons and nativized registers and genres in world Englishes in Africa, Asia, and the diasporic writers in the Inner Circle. After the 1960s, a vibrant debate started about several pedagogical issues, such as idealized models for the codification of English, the cross-linguistic claims made for teaching methods and methodologies, and English-language teaching

materials developed, published, and often exported by the English-language teaching ‘experts.’

Two often-articulated descriptive and prescriptive questions – specifically about the Outer Circle varieties – are the following: what criteria may be used to determine a difference between an error (or mistake) and an innovation? And, what variables determine intelligibility for varieties of world Englishes across cultures and languages?

In his extensive empirical research on the latter topic, Smith (1992) viewed intelligibility in a pragmatic communicative context by making a distinction among intelligibility (word utterance recognition), comprehensibility (word utterance meaning [locutionary force]), and interpretability (meaning behind the word/utterance [illocutionary force]). Smith and Nelson (1985) have also discussed some issues that should be on the agenda of any researcher studying intelligibility.

Literary Creativity, Canonicity, and World Englishes

The creative linguistic processes that result in competence in two or more languages are termed ‘contact’ or ‘interference’ varieties. The underlying process in the construction of contact literary texts is that of hybridization, as reflected in bilinguals’ (or multilinguals’) creativity. Such texts are designed with a blend of linguistic features from two or more – related or unrelated – languages. The concept of ‘contact literatures’ thus brings to the English language the multilingual and multicultural contexts of, for example, Africa and Asia. These varieties of English have acquired stable characteristics in terms of pronunciation, grammar, lexis, discursal, and stylistic strategies. These traditions are often blended with local subvarieties of English, (e.g., Nigerian Pidgin in Nigerian English, Singlish in Singapore English, Bazaar or Babu English in Indian English). In such contact situations, the English language is a medium that has been, pragmatically and contextually, localized to adapt to – and to represent, as elegantly claimed by such writers as Raja Rao and Salman Rushdie (India), Chinua Achebe and Wole Soyinka (Nigeria), Edwin Thumboo and Catherine Lim (Singapore), and F. Sionil Jose (the Philippines).

It is ‘contact’ at various levels (linguistic, social, and cultural) and the resultant nativization that contact literatures represent in literary and cultural canons that are distinct from the Judeo-Christian canons. These processes thus ultimately result in, say, the Africanization or Asianization of world Englishes.

The term ‘interference varieties’ – though attitudinally loaded – is yet another label to conceptualize the contact varieties of English and the bilinguals’ creativity. The interference varieties, as Quirk *et al.* (1985: 27–28) recognized are

so widespread in a community and of such long standing that they may be thought stable and adequate enough to be institutionalized and hence to be regarded as varieties of English in their own right rather than stages on the way to more native-like English.

All such varieties, as shown in numerous studies, have formal and functional identificational features that represent the linguistic processes at various levels: grammar, phonetics, lexis, discourse, speech acts, genres, and indeed literary creativity (see Smith and Forman, 1997; B. Kachru *et al.*, 2005). These studies are of three types: variety-specific (e.g., Indian English, Singapore English, Nigerian English), area-specific (e.g., South Asian English, West African English, Southeast Asian English), or of larger geographical regions in terms of linguistic, literary, and sociolinguistic areas (Africanization or Asianization).

The study of bilinguals’ creativity demands recognition that the institutionalized Englishes have an educated variety and a cline of subvarieties, that writers in contact literatures engage in ‘lectal mixing,’ and that in such texts there are style shifts related to the underlying context of situation. In contextual terms, style shifts result in the construction of altered discourse strategies, speech acts, and registers. In discussing such creativity in world Englishes, Thumboo (1992: 270) argued the following:

This challenge confronts almost every bi-or multilingual writer. His bilingualism is one of three broad types – proficient, powerful, or limited; his position in this cline is not static, because quite often one language gains dominance. A bilingual person has at least two language universes, and each language works with its own linguistic circuits. How the two associate depends on whether the languages as neighbors inhabit the same space and time and can bend to serve creative purposes.

There is thus multicanonicity in world Englishes that blends two or more ‘language universes’ in their creativity; the interlocutors in Englishes have a variety of linguistic, cultural, social, and literary traditions – a speaker of a Bantu language interacting with a speaker of Japanese, a Taiwanese with an Indian, and so on. The traditional and much discussed and canonical ‘native speaker’ may rarely be part of such interactions in Englishes. The linguistic

historical analogues that come to mind – though not necessarily parallel to world Englishes – are that of Latin in medieval Europe (Kahane and Kahane, 1979) and of Sanskrit in traditional South Asia and beyond.

The Pandora’s Box and World Englishes

The shared strands of current debates on world Englishes include the following seven major contextually, attitudinally, pedagogically, and linguistically relevant issues:

1. The demythologization of conventional sacred cows model initiated and nurtured by the Inner Circle constructs of English (see B. Kachru, 1988; Quirk, 1988)
2. The ecologies of multilingual Englishes, specifically in the contexts of Africanization and Asianization of Englishes (see Mufwene, 2001; B. Kachru, 2005)
3. The increasing expression of bilinguals’ creativity in the Outer Circle and its implications on traditional canons and canonicity
4. The theoretical, methodological, and pedagogical implications of the increasing depth and range of Englishes (B. Kachru, 2001)
5. The issues of intelligibility in cross-cultural and cross-linguistic communication
6. The evaluation of ethical practices related to forms, functions, and pedagogy (see, e.g., Baumgardner and Brown, 2003; Dhillon, 2003)
7. The motivation of power and politics and the role of initiators of arms of control (Phillipson, 1992).

Eskimo–Aleut

A Berge, University of Alaska, Fairbanks, AK, USA

The Terms ‘Eskimo’ and ‘Aleut’

The terms ‘Eskimo’ and ‘Aleut’ have unclear origins. ‘Eskimo’ is commonly believed to be derived from a derogatory Algonquian term meaning ‘eaters of raw meat’; it has been replaced with Inuit, meaning ‘people,’ in most of Canada, and the language is referred to variously as Inuinaqtun, Inuttun, Inuktitut, and by other names. The term ‘Aleut,’ confusingly, was bestowed on Aleut and Yupik people native to the Aleutian Islands and part of the southwestern Alaskan mainland, as well as on their languages, by Russians in the 18th century. The term in use in Alaska today for self-designation of the non-Yupik Aleut is Unangan or Unangas for the people and Unangam Tunuu for the language; however, the term ‘Aleut’ is preferred in Russia. Because there is still no other general term to describe all of the languages and dialects encompassed by the terms ‘Eskimo’ and ‘Aleut,’ and for reasons of linguistic tradition, they are still commonly used within the field of Eskimo–Aleut linguistics.

History and Genetic Relationships

The Eskimo–Aleut language family is spoken from the Siberian coast in the west to Greenland in the east. There are two major branches, Aleut and Eskimo, and Eskimo consists of at least two further subgroups, Yupik and Inuit. One recently extinct language, Sireniki (Sireniki Yupik), may either have been a third branch of Eskimo or one of the Yupik languages.

The Eskimo and Aleut people are thought to have been part of the last large-scale migration from Asia across the Bering land bridge, between 4000 and 6000 years ago. Various attempts have been made to link Eskimo–Aleut with other language families on the Asian continent (e.g., Uhlenbeck, 1935, Swadesh, 1962). While there is little solid linguistic evidence of a genetic relationship between Eskimo–Aleut and other language families, there are strong suggestions of very early contact, particularly with Uralic (for a discussion of possible linguistic affinities and contact, see Fortescue, 1998). The development and differentiation of the Aleut and Eskimo languages and dialects probably took place in Alaska because of the linguistic diversity found on the Alaskan side.

From Alaska, there were several waves of migration down to the Aleutians, west again to Siberia, and

eastward to Greenland. The earliest led to the linguistic split between Aleut and Eskimo, possibly around 4000 years ago, although there is archeological and skeletal evidence to suggest an earlier physical divergence (Laughlin, 1980). The earliest Aleut settlements appear to have been around the Island of Four Mountains, whence there were eastward and westward migrations. The Yupik and Inuit branches of Eskimo must have diverged about 2000 years ago. From their homeland around the Seward Peninsula, Yupik speakers occupied southwestern Alaska and, moving westward across the Bering Strait, reoccupied the Chukchi Peninsula in Siberia. If Sireniki is a separate branch of Eskimo, then it may have split off about 2500 years ago and its origins may be on the Chukchi Peninsula as a result of an earlier back migration. It was gradually displaced by Central Siberian Yupik and neighboring Chukchi (Chukot). The ancestors of the Inuit spread northward and eastward in several waves. The latest migration began about 1000 years ago, and resulted in the rapid spread of the Inuit language, leaving few linguistic traces of previous Eskimo populations. The present dialect differentiation (see Figure 1) is possibly as recent as the past 500 years (see Dorais, 1996).

Historiography of Research

The first systematic linguistic studies of an Eskimo–Aleut language were made in Greenland, beginning in the 18th century. Outside of Greenland, most available materials on the Eskimo–Aleut languages consisted of word lists until well into the 19th century, and even into the 20th century for some of the western Inuit dialects (see **West Greenlandic** and **Inupiaq**). Nevertheless, the Danish scholar Rasmus Rask proposed a genetic relationship between Aleut and Eskimo languages as far back as 1819. His notes were published in 1916 (Thalbitzer, 1916), and his thesis was confirmed through Marsh and Swadesh (1951) and Bergsland (1951). More recently, comparative work has been done by Bergsland (1986, 1989) and Fortescue *et al.* (1994).

Linguistic Characteristics of Eskimo–Aleut

The following features are characteristic of the Eskimo–Aleut language family:

- There are three basic vowels (i, u, a), derived from an original four-vowel system (i, u, a, and schwa, represented by [e] in Yupik, which maintains the four-vowel distinction).

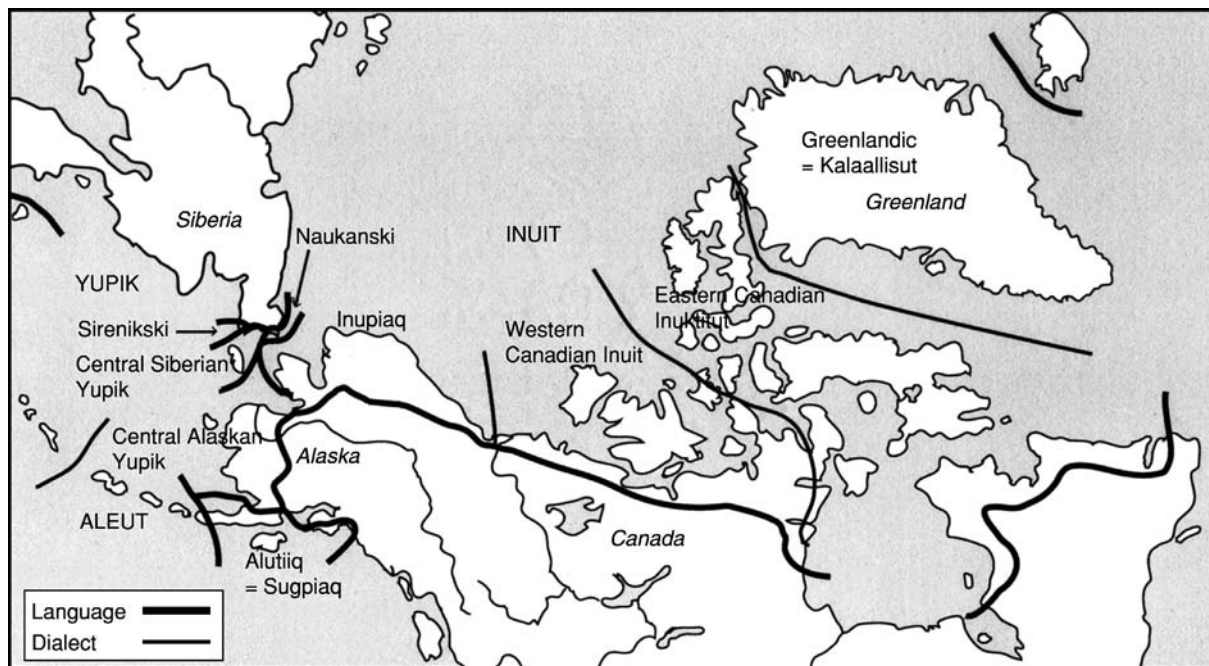

Figure 1 Eskimo-Aleut languages and major dialects. (Adapted from Map 1 in Fortescue *et al.* (1994)).

- Word building is almost exclusively through suffixation, the only exception being an anaphoric prefix *ta-* on demonstrative stems (e.g., pan-Eskimo *una* (DEIC-PRX), *tauna* ‘this one’).
- To a greater or lesser degree within the language family, polysynthesis is the norm: very complex verb structures encode meanings for which other languages need whole sentences. This example is from Uummarmiut Eskimo (from Inuvik):

kivgaluk-niaq-qati-gi-tqik-kuminait-kiga
muskrat-hunt-partner-have.as-again-will.never-
 1SG.3SG.INDIC

‘I will never again have him as a partner to hunt muskrat’ (Lowe, 1985: 18)

- Sentences typically consist of clause chains, in which a series of dependent clauses is headed by an independent clause. In the following simple example from West Greenlandic, there is one indicative clause and two subordinated participial clauses; clause chains can be quite extensive:

irn-i qajartur-tuq
son-his own be out in kayak-3SG.PART
 qinnguar-paa
see through binoculars-3SG.3SG.INDIC
 natsirsu-up sursuk-kaa
hooded seal attack-3sg.3sg.PART

‘he_i saw his son_j; through his binoculars being attacked by a hooded seal while in his_j kayak’ (Fortescue, 1984: 39)

- Word order is typically SOV to a more or less fixed degree (Aleut has essentially fixed word order).

In the previous example, the object clause *irni qajarturtuq* precedes the verb, and the subject of each of the subordinated clauses precedes its respective verb.

- Case marking follows the ergative-absolutive case-marking pattern (with extreme modifications in Aleut), where the subject of intransitive verbs receives the same marking as the object of transitive verbs, namely absolutive case, while the subject of transitive verbs receives a different marking, ergative case.

The Eskimo languages are much more closely related to each other than to Aleut. In addition to the common features listed for Eskimo-Aleut, they share

- certain restrictions on syllable and other phonological structures;
- up to six nongrammatical cases in addition to ergative and absolutive cases (locative, instrumental, ablative, allative, vialis, and equalis);
- transitive and antipassive structures, the choice of which appears to be partially determined by definiteness, as in the Central Alaskan Yup’ik (Central Yupik) examples below:

angute-m neqa ner-aa
man-ERG.SG fish-ABS.SG eat-3SG.3SG.INDIC
 ‘the man eats **the** fish’

Angun neq-mek ner’-uq
man-ABS.SG fish-INSTR.SG eat-3SG.INDIC
 ‘the man eats a fish’

Aleut

Aleut is a language with two major extant dialects, and at least two other dialects historically attested. Eastern Aleut is spoken east of Amukta Island to the Alaskan Peninsula, as well as on the Pribilof Islands. Atkan, also variously called Western or Central Aleut, is today spoken on Atka Island, and a version of it is spoken on Bering Island. A third dialect, Attuan, is essentially dead; a mixed language known as Copper Island Aleut (Mednyi Aleut), consisting of Attuan stems and Russian inflection, is still spoken on Bering Island. There is scant evidence in very early descriptions of a dialect spoken on the Rat Islands between Attu and Atka, suggesting a dialect continuum in the West.

Characteristic of Aleut are

- its lack of labial stops (although it appears that Copper Island Aleut has developed voiced labial stops), and its aspirated nasals;
- consonant clusters which differ from those in Eskimo in their distribution (e.g., they are permitted word initially, as in *qdinalix* ‘to be slippery’), in the combinations of consonants possible (e.g., velar-uvular fricatives), and in their complexity (allowing up to three consonants, as in *chāxsix̄* ‘reef’);
- use of independent pronouns, as opposed to pronominal marking on verbs in Eskimo languages:

| | | |
|-------|------------|-----------------------|
| Aleut | txin | achix-ku-qing |
| | <i>you</i> | <i>teach-PRES-1SG</i> |
| | | ‘I am teaching you’ |

| | |
|-------------|----------------------------------|
| Greenlandic | ilinniar-tip-pakkit |

Through contact with Russian traders and colonizers in the 18th and 19th centuries, modern Aleut has a large proportion of Russian loanwords. As a result of early decimation of the people and later suppression of the language in the schools, the language is severely endangered today, with at most 150 speakers in the

Aleutian Islands, the Pribilof Islands, and Anchorage, and perhaps 10 on Bering Island. With the exception of Atkan, speakers are elderly.

Yupik

The Yupik languages include Naukanski (Naukan Yupik), spoken around East Cape on the Chukchi Peninsula; Central Siberian Yupik, spoken on the Chukchi Peninsula and on St Lawrence island; Central Alaskan Yup’ik, spoken from Norton Sound to Bristol Bay in Alaska; and Sugpiaq (Pacific Gulf Yupik), also known as Sugcestun or Alutiiq, spoken around Prince William Sound, the Alaskan Peninsula, Kodiak and Afognak Islands, and the tip of the Kenai Peninsula. Yupik languages are characterized by

- their retention of a fourth vowel that presumably stems from Proto-Eskimo (cf. Proto-Eskimo **neqe* became Central Alaskan Yup’ik *neqa* ‘food,’ Iñupiaq [North Alaskan Inupiatun] *niqi* ‘food’);
- more or less complex effects of intonational stress; in stressed syllables, for example, the vowel is often lengthened (for more on Yupik prosody, see Krauss, 1985).

There are some nonnegligible syntactic differences between the languages, although these have not yet been well described. Siberian Yupik languages have a number of English loan words, from contact with 19th-century whalers, and Alaskan Yupik languages have a large number of Russian loans from 18th- and 19th-century Russian colonization, as well as 20th-century English loans. Most Yupik languages are severely endangered today, with numbers of speakers ranging from 70 (Naukanski) to 1300 (Central Siberian Yupik). The notable exception is Central Alaskan Yup’ik, with about 10 000 speakers (and on the Kenai Peninsula these include children), and with immersion programs in the schools and active production of learning materials.

Sirenikski

Sirenikski is seen as an important link to Proto-Eskimo because of particularly conservative features, such as a retention of consonants between vowels, which were lost in all other Eskimo-Aleut languages (e.g., Proto-Eskimo **ataRuciR*, Sirenikski *ategesegh*, Central Alaskan Yup’ik *atauciq*, Iñupiaq *atausiq* ‘one’). It has, however, undergone sound changes quite different from other Eskimo languages. For example, in all nonstressed (essentially, noninitial) syllables (as in the example given above) the vowel changed to schwa. Unfortunately, it was first

discovered and described at the end of the 19th century, when it was already highly moribund; the last speaker died in the year 2000.

Inuit

Inuit is generally described as a language with four distinct dialect groups, each of which have their own recognizable subdialects; these groups include Alaskan Iñupiaq, spoken from the Seward Peninsula and north; Western Canadian Inuit (Western Canadian Inuktitut), spoken over a vast area of Central Arctic Canada from MacKenzie Coast to Repulse Bay; Eastern Canadian Inuktitut, spoken in Baffin Island, Arctic Quebec, and Labrador; and Greenlandic Kalaallisut (Greenlandic Inuktitut), spoken in Greenland (there is also a sizable population of speakers in Denmark). Characteristic of Inuit are

- lack of intonational stress as compared with Yupik;
- loss of the fourth vowel, with various important phonological traces;
- various degrees of consonant and vowel cluster simplifications (cf. Iñupiaq *aglaur* ‘pen,’ Greenlandic *allaat* ‘pen,’ in which /gl/ became /ʃ/ and /au/ became /aa/);
- a tendency to merge parts of the mood system most important in narration, with most extensive merging in Alaska and least in Greenland.

All Inuit dialects have borrowed extensively from the respective languages of colonization. Most loans are from English in Alaska and Canada (although there are also French and German loans in eastern Canada, through the influence of missionaries) and from Danish in Greenland. The status and viability of the Inuit language is quite different in the different regions. In Alaska and western Canada, the language is severely endangered, with only about 3000 speakers, almost none of whom are children. In eastern Canada, there are about 20 000 speakers, but there is widespread bilingualism in almost all age groups and a growing tendency for English to replace Inuktitut. Active efforts are under way to reverse this process, including the encouragement of Inuktitut programs in schools. In Greenland, however, over 95% of the native population of some 50 000 are speakers of Kalaallisut, and the language is thriving.

Esperanto

J C Wells, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Esperanto is a constructed language intended for international use. Originating as an artificial language, it is unique in that it has enjoyed sufficient success to have acquired a speech community and even to have undergone a degree of creolization. Consequently, the epithet ‘artificial’ is arguably no longer applicable. Unlike computer languages and codes, Esperanto generally satisfies the criteria for recognition as a form of natural language. However, its proponents’ hopes of its being generally adopted for international use have not been realized, and its future must be seen as uncertain.

Background

The creator of Esperanto was Ludovic Lazar Zamenhof, a Jewish oculist of Warsaw, who used the pseudonym Doktoro Esperanto, ‘the one who hopes’. His *Lingvo internacia* was first published in 1887, in Russian. By the beginning of the 20th century, Esperanto, as the language itself quickly came to be known, had been taken up in France, Germany, and elsewhere; the London Esperanto Club (still in existence) was founded in 1903. The participants at the first International Esperanto Congress, held in 1905 in Boulogne-sur-Mer, proclaimed the essential linguistic basis (*Fundamento*) of the language as inviolable. Support has subsequently spread to most parts of the world, including Japan, China, and Brazil (although the movement remains very weak in most of the Third World). Both Stalin and Hitler saw the internationalist and idealist values of Esperanto as a threat and launched persecutions of its supporters (Lins, 1988). As of 2004, the number of speakers of Esperanto is unknown, but variously estimated as between one or two hundred thousand and several million. Universala Esperanto-Asocio, with headquarters in Rotterdam, has members in over 100 countries. Esperanto speakers in the news recently include 1994 Nobel laureate in economics Reinhard Selten, 1996 World Chess Champion Zsuzsa Polgar, and Tivadar Soros, father of financier George Soros.

The annual World Esperanto Congress – held entirely in Esperanto – regularly attracts participants in the thousands.

It must be emphasized that Esperanto is a real language, both spoken and written, successfully used as a means of communication between people who have no other common language. For the great majority of its users, of course, it is a second

language, learned well after the acquisition of the L1, so that levels of competence vary widely. However, for some speakers, children of parents who use Esperanto as a family language, it is a native language or mother tongue, normally in a bilingual or trilingual relationship with the language of the local community or other parental language(s). There is no other case in linguistic history of something that started as an intellectual scheme, a project on paper, being transformed into a language with native speakers of the second and, indeed, the third generation.

The traditional aim of the Esperanto movement is the adoption of Esperanto as L2 for all mankind. The chief arguments for this can be summarized by saying that Esperanto is easy to learn and politically neutral.

- *Ease of learning* is a consequence of the complete regularity of the language: grammatical rules have no exceptions, and the agglutinative morphological structure (discussed in the morphology section) makes vocabulary acquisition much faster than for other languages. As a result, it is claimed, Esperanto can be learned three to ten times as fast as national or ethnic languages (although obviously the rate of progress depends, as always, on many factors, including the learner’s L1).
- *Political neutrality*: Esperanto belongs to no particular nation or ethnic group. This, it is claimed, makes it politically a better choice for an international common language than English (seen by many as irredeemably attached to parochial U.K. or U.S. values) or other national languages.

Opposition to Esperanto is often more emotional than rational. Serious critics, however, argue that Esperanto is a language without culture (although supporters of Esperanto would dispute this, pointing to over a hundred years’ literary activity, including a substantial body of original poetry), and second, that it is too European (though all alternative solutions to the question of an international language are even more so). In any case, it is claimed, the economic, social, and political pressures in favor of the choice of English for international use are by now overwhelming.

In light of the perceived success of English in filling the role for which Esperanto was intended, one group (not the majority) within the Esperanto movement has redefined its aims as securing linguistic rights as a ‘stateless diaspora linguistic collective.’ It sees the speakers of Esperanto as being comparable to the speakers of other endangered or minority languages.

Pronunciation and Orthography

The phoneme system comprises 23 consonants and 5 vowels. The consonants are plosives /p b t d k g/, fricatives /f v s z ĵ ʒ x h/, affricates /ts tʃ dʒ/, nasals /m n/, liquids /l r/ and glides /j w/ (the latter only after a vowel). The vowels are /i, e, a, o, u/. Word stress is always penultimate. Orthography is strictly phonemic, using the Latin alphabet and including the following letters bearing diacritics: *ĉ*/tʃ/, *ĝ*/dʒ/, *ĥ*/x/, *ĵ*/ʒ/, *ŝ*/ʃ/, and *ŭ*/w/.

An international standard of 'good' pronunciation has by now evolved and includes the avoidance of marked interference from speakers' L1s. Intonation follows general, mainly European, models without parochialisms.

Morphology and Syntax

Esperanto syntax and morphology show strong Slavic influences. Its morphemes are invariant and can be almost indefinitely recombined into different words. The internal word structure has affinity with agglutinative languages in that all words (other than function words) consist of a stem plus a grammatical ending (-o for nouns, -a for adjectives, -i for infinitive verbs, etc.: *telefon-o* 'a telephone', *telefon-a* 'telephonic', *telefon-i* 'to telephone'). The plural ending is -j (*telefonoj* 'telephones'). There is an accusative case -n, used for the direct object. Adjectives agree with nouns in number and case: *mi vidis grandan hundon* 'I saw a big dog,' *du grandaj hundoj atakis min* 'two big dogs attacked me.' There are three verb tenses, -as present, -is past, and -os future, plus -us conditional and -u interative/volitive. The definite article, invariant, is *la*; there is no indefinite article. The grammar is entirely regular and without exceptions.

The normal word order is SVO. Determiners and adjectives usually precede nouns, and the language is prepositional. However, the morphological marking of the accusative means that the order of constituents is flexible and can be rather freely scrambled. The last sentence quoted has emphatic or stylistic variants such as *atakis min du hundoj grandaj*.

The stem of a word may be a single root (base morpheme) or a combination of roots and/or affixes: for example,

- (1) *parol-ant-o*
speak-pres.ppl-NOUN
'speaker'
- (2) *parol-em-a*
speak-tending-ADJ
'talkative'

- (3) *mar-bord-o*
sea-edge-NOUN
'seaside'

Each morpheme (root, affix, ending) is in principle unvarying in form and meaning; the meaning of a compound of affixed form is the sum of the meanings of its constituent elements. A 20th-century development is the increasing use of affixes as independent stems, for example, *em-o* 'inclination.'

Vocabulary

The lexical material was chosen by Zamenhof to be as international as possible. Some three-fourths of the basic roots are of Romance origin, with the remainder mostly Germanic or Slavic; often they are common to several source families (e.g., *dom-* 'house'). Classical and international roots are readily incorporated, though adapted to Esperanto phonology and morphology; thus since *teatr-o* is 'theater,' 'theatrical' must be *teatr-a*. Given *telefon-o* 'telephone,' *telefone* is automatically the adverb 'by telephone' and *telefon-i* the verb 'to telephone.' The extensive use of affixes means that the vocabulary is highly structured and comparatively easy to learn. From *vidi* 'to see,' dozens of derivatives such as *videbla* 'visible,' *videbligi* 'to render visible,' and *nevidebleco* 'invisibility' can be regularly and predictably formed.

General

The language is monitored by an Academy (Akademio de Esperanto). This does not, however, inhibit individual speakers from constant linguistic creativity. Many Esperanto speakers enjoy debating linguistic issues and arguing about vocabulary innovations. It is only recently that computing terminology has settled down, with *komputilo* (regularly formed by the suffix -il- 'instrument,' cf. *hakilo* 'ax') as the term for 'computer' and technical expressions such as *elsuti* 'to download.' Popular spoken Esperanto occasionally deviates from the written norm. For example, although the official form of the word for 'tax' is *imposto*, and this is the only form given in dictionaries, in spoken Esperanto the form *impoŝto* can be heard from time to time (because of contamination from *poŝto* 'post, mail'). The standard and written word for 'plastic' is *plasta*, but in conversation *plastika* is also heard. The existence of such 'incorrect' spoken forms can be interpreted as an indication that the language is truly socially embedded ('living').

With a speech community scattered around the world, but nevertheless commanding great feelings

of loyalty from its speakers, Esperanto is indeed comparable in some ways to diaspora languages such as Romani, Yiddish, or Armenian. In its lack of official government status, it is like creoles and many ethnic minority languages. It remains to be seen whether in the last analysis it is a linguistic curiosity doomed to disappear or a brilliant idea whose moment has not yet come.

Estonian

R T Harms

© 2006 Elsevier Ltd. All rights reserved.

Estonian, a Baltic–Finnic language within the Uralic family, is represented by over a million speakers, as the official language of Estonia as well as actively maintained by émigrés in Sweden, Canada, and elsewhere. The diverse Estonian dialects may be divided into a northern group and a southern group, with Tallinn and Tartu as their respective cultural centers. Standard Estonian, in large part based on the northern dialects, underwent significant adjustment at the hands of language planners during the twentieth century to provide a compromise literary medium suitable for all areas. In contrast with nationalist movements in other countries, foreign loanwords have been tolerated, in part motivated by a desire to facilitate access to Western European culture. The resulting standardization, however, has commonly forced Estonians to consult an extensive orthographic manual for spelling and morphological norms.

The history of Estonian must be projected from reconstruction, as apart from fragments dating from ca. 1220, the first written texts appeared in the

sixteenth century, beginning with the Kullamaa prayers in the 1520s. In its development the interaction of inherited features with those of contact languages (including governing superstrata, especially German) has played a major role in shaping its unique structure.

Estonian phonology is characterized by an abundance of vowels (/i ü u e ö o ä a/ plus a midcentral unrounded /õ/), few consonants (/p t k s h m n l r y v/ plus palatalized /tʲ sʲ nʲ lʲ/—and /f š/ in loans), and a richness of stressed syllable structures resulting from contrastive vowel length (*a* versus long *aa*) tautosyllabic vowel clusters (e.g., *ea*, *eo*, *õa*), and geminate consonants (*ala* versus *alla*). The writing system is based on the Latin alphabet, augmented by diacritics (*ü*, *õ*), but palatalization is not represented. Initial stress is the rule, but loans often preserve noninitial stress (*hotell*), and multiple word stresses may result from morphology (*tulemata*) < /tule + ma + tta/—with a second stress, often stronger, on the third syllable).

Typologically, the most salient feature of Estonian is its extrasegmental quantitative prosody, by which stressed heavy syllables contrast in two types of quantity and tonal contour; for example, segmental /saata/

saada together with prosodic quantity may yield [sa:ta] ‘send!’ (long *a*) or [sa::ta] ‘to become’ (overlong *a*); *linna*, [linna] ‘city (gen.)’ or [lin:na] ‘into city’; *osta*, [osta] ‘buy!’ or [os:ta] ‘to buy’ (contrast here /sata/ *sada* ‘hundred,’ *lina* ‘linen,’ with light first syllables). The first syllable of a form such as /saatta/ *saata* ‘to send’ may occur with the overlong prosodic quantity without requiring individual component segments (/aa/ or /tt/) to be overlong. Prosodic quantity is noted in spelling only for intervocalic *p*, *t*, *k*; e.g., [ata] as *ada*, [atta] as *ata*, and [at:ta] as *atta*.

The palatalized coronal consonants /tʸ sʸ nʸ lʸ/ are of special interest, since these reflect an earlier Umlaut-like process (contrasting typologically with

their Slavic counterparts in the absence of a prominent offset transition). This palatalization produces a *y*-like onset transition from a preceding stressed vowel (triggered by an [earlier] *i* in the following syllable); e.g., /kasʸk/ *kask* = [kaʸsk] < *kaski ‘birch’ (contrast the absence of palatalization in *kaks* < *kaksi ‘two’).

Ethiopia as a Linguistic Area

J Crass, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The Ethiopian linguistic area is probably the most famous linguistic area in Africa. It is often the only African linguistic area discussed to any extent in general works dealing with language contact and areal linguistics (Masica, 1976; Thomason and Kaufman, 1988; Thomason, 2001). Most scholars refer to this area as the Ethiopian language area (Ferguson, 1976; Sasse, 1986; Hayward, 1991; Zaborski, 1991, 2003; Tosco, 1994; Crass, 2002). This term, however, is problematic in several respects. First, the English translation of the German term *Sprachbund* is linguistic area, convergence area, or diffusion area (Campbell, 1994: 1471). Second, the area includes Eritrea, which was a province of Ethiopia until it became an independent state in 1993. Third, a certain number of features are found beyond Ethiopia and Eritrea in languages spoken in neighboring countries, such as Djibouti, Somalia, and Sudan, and even beyond. Some scholars have taken these facts into account, at least to some extent. Hayward (2000: 623) uses the term Ethio-Eritrean Sprachbund; Zaborski (2003: 62) proposes North East African Language Macro-Area. Bender (2003a: 4) argues that the terms Northeast Africa area, Horn of Africa Language Area, and Erythraean Area “all have their pluses and minuses” and stresses that “now we must modify it to Ethiopia-Eritrean Area.” In the present article, the term Ethiopian linguistic area (ELA) is

used in order because (1) language area is not the correct term in areal linguistics and (2) the core of the area is Ethiopia.

Most of the approximately 80 languages spoken in Ethiopia and Eritrea belong to three language families of the Afroasiatic phylum: Semitic, Cushitic, and Omotic. A number of languages in the west and in the southwest belong to various families of the Nilo-Saharan phylum.

According to a widely accepted view, Semitic-speaking peoples arrived in the Horn of Africa at the end of the first millennium B.C. by crossing the Red Sea after having left their home on the Arabian Peninsula. They migrated into the area of today’s Ethiopia and Eritrea and underwent extensive linguistic and extra-linguistic influence due to contact with Cushitic-speaking peoples (Ullendorff, 1955). A contradictory view considers Ethiopia and Eritrea to be the original homeland of Semitic-speaking people (Murtonen, 1967; Hudson, 1977). This view is based on the observation that the linguistic diversity among Semitic languages in Ethiopia and Eritrea is much greater than elsewhere.

The proposed features defining the ELA differ considerably from author to author, and the validity of these features has been discussed by the authors previously mentioned. Recently, even the existence of an ELA was rejected by Tosco (2000).

Research History

Leslau (1945) and Moreno (1948) are two early attempts to describe the influence of Cushitic languages on Ethiopian Semitic languages. The first to

claim the existence of a linguistic area in “Ethiopia and the various Somalilands” was Greenberg (1959: 24). He argues that this area is marked by “relatively complex consonantal systems, including glottalized sounds, absence of tone, word order of determined followed by determiner [*sic*], closed syllables, and some characteristic idioms.” According to Heine (1975: 41ff.), who deals with word order, Ethiopia is part of “probably the largest convergence area in Africa, stretching in a broad belt from the Lake Chad region in the west to the Red Sea and the Indian Ocean in the east.”

Ferguson (1970, 1976) was the first to describe the ELA in more detail. The second of these articles, with an extended database and improvements and corrections, is still the reference work for all scholars. Therefore, Ferguson (1976) is the starting point when in the following discussion of phonological and grammatical features. Ferguson discusses eight phonological and eighteen grammatical areal features for 18 languages, including Arabic and English. He is of the opinion that the “languages of Ethiopia constitute a linguistic area in the sense that they tend to share a number of features which, taken together, distinguish them from any other geographically defined group of languages in the world” (Ferguson, 1976: 63f.). He stresses that “some of these shared features are due to genetic relationship [...], while others result from the process of reciprocal diffusion among languages which have been in contact for many centuries” (Ferguson, 1976: 64).

Zaborski (1991: 124) criticizes Ferguson’s selection of languages and features. He is of the opinion that the languages were “rather random[ly] selected” and that “most of the alleged areal features are not really areal but of common genetic origin.” Hayward (2000: 623) argues that a number of Ferguson’s features are “characteristic of most languages of this region”; five of these features he considers to be “very widespread.” Some articles deal with only one areal feature: Appleyard (1989) discusses relative verbs in focus constructions, Tosco (1994) deals with case marking, and Tosco (1996) deals with extended verb paradigms in the Gurage-Sidamo subarea.

Tosco (2000) is a controversial paper. In it, he denies the existence of an ELA because of the genetic relatedness of Ethiopian Semitic and Cushitic languages, the unilateral diffusion from Cushitic to Ethiopian Semitic, and the occurrence of features in related languages that do not belong to the ELA. Four recent papers, Bender (2003b), Crass (2002), Crass and Bisang (2004), and Zaborski (2003: 62f), favor the existence of a linguistic area. Bender (2003b) argues against the conclusions in Tosco (2000) and tries to extend the ELA by testing a

number of Nilo-Saharan languages using a selection of Ferguson’s features. Crass (2002) discusses two phonological features in detail; in Crass and Bisang (2004), the discussion is extended to features such as word order, converbs, and ideophones verbalized by the verb ‘to say’. Zaborski (2003) presents the most extensive list, including 28 features that he considers to be valid for a macroarea that includes Ethiopia, Eritrea, Djibouti, Somalia, and parts of Sudan, Kenya, and even Tanzania and Uganda. Finally, Hayward (1991) deals with patterns of lexicalization shared by the three Ethiopian languages, Amharic (Semitic), West-Central Oromo (Cushitic), and Gamo (Gamo-Gofa-Dawro; Omotic). According to Hayward (1991: 140), these lexicalizations reinforce “the very real cultural unity of Ethiopia.” This topic is reopened in Hayward (2000).

The ELA is considered to be composed of several subareas. Leslau (1952, 1959) describes change in Ethiopian Semitic languages induced by contact with neighboring Highland East Cushitic languages. Sasse (1986) deals with the Sagan area in southwest Ethiopia, and Zaborski (1991: 125) gives a list of seven subareas that are composed of “smaller contact and interference units,” which he extends to nine by adding a Kenyan and an Tanzanian subarea (Zaborski 2003: 64).

Phonological Features

The eight phonological features listed by Ferguson (1976: 65ff.) are

- P1: /f/ replacing /p/ as the counterpart of /b/
- P2: palatalization of dental consonants as a common grammatical process in at least one major word class
- P3: the occurrence of ejectives (in Ferguson’s terminology, glottalic consonants)
- P4: the occurrence of an implosive /d/
- P5: the occurrence of pharyngeal fricatives
- P6: the occurrence of consonant germination
- P7: the occurrence of central vowels
- P8: the occurrence of an epenthetic vowel

Ferguson’s list has since been criticized by several scholars. Zaborski (1991: 114 fn. 3) considers only P3 and “with reservations” P2 to be “really areal.” In his more recent paper, Zaborski (2003: 62) lists only four phonological features for ELA. In addition to P3 and P6, he argues that “labialized consonants are frequent [and that] some palatalized consonants are innovations.” Tosco (2000: 341), in contrast, is of the opinion that P1, P2, P3, and P5 are genetically inherited within the Afroasiatic phylum; that P4, P7, and P8 are restricted

to one or two language families; and that P6 is widespread in both the Afroasiatic and the Nilo-Saharan phyla. But according to Bender (2003a: 3, 2003b: 32), P2 and P6 are typological features, P5 is too limited, and P8 “is vacuous because consonant clusters are rare” (Bender, 2003a: 3). P1, P3, P4, and P7, however, are “fairly idiosyncratic and easy to check” (Bender, 2003b: 32). Hayward (2000: 623) explicitly mentions only P6, which he considers to be areal. Crass (2002) discusses the ejectives and pharyngeal fricatives (P3 and P5) in detail. Because both features are genetically inherited within the Afroasiatic phylum, Crass argues that their occurrence (in the case of ejectives) and nonoccurrence (in the case of pharyngeal fricatives) can be considered areal features. Reconstructions of different stages of proto-languages of Afroasiatic show that ejectives were lost over the course of time (for details, see Crass, 2002: 1683); in recent times, however, ejectives were reimported into most of the languages via contact. In Proto-Highland East Cushitic, for example, only one ejective is attested, the velar ejective. In most of the modern Highland East Cushitic languages, however, four ejectives occur as phonemes: the dental, the postalveolar affricate, the velar, and to a lesser extent the labial ejective (Hudson, 1989: 11). In the Agaw languages (Central Cushitic), ejectives occur predominantly in loan words from Amharic and Tigrinya (Tigrigna) and their phonemic status is problematic (cf. Appleyard, 1984: 34).

The reasons for the nonoccurrence of pharyngeal fricatives in most of the languages of central Ethiopia are unclear. The nonoccurrence may be due to language contact or due to language-internal change. Tosco (2000: 343) supports Crass’s idea in arguing that the nonoccurrence of pharyngeal fricatives “could identify a smaller ‘central Ethiopian area’ . . . in which pharyngeal consonants are either dropped or reduced.”

Grammatical Features

Ferguson’s (1976: 69ff.) grammatical features are

- G1: SOV word order
- G2: subordinate clauses precede main clauses
- G3: converb
- G4: postpositions
- G5: quotation marked by the verb ‘to say’ (in Ferguson’s terminology, quoting clauses)
- G6: “compound verbs . . . consisting of a noun-like or interjection-like ‘preverb’ plus a semantically colourless auxiliary, commonly the verb ‘to say’” (Ferguson, 1976: 71f.)

- G7: negative copula
- G8: singular used with numbers
- G9: possessive suffixes identical or nearly identical with object suffixes added to the verb
- G10: masculine/feminine gender distinction in the second- and third-person singular of pronouns and verbs
- G11: identical subject prefixes for the second-person masculine singular and the third-person feminine singular marking a certain tense that contrast with subject suffixes forming other tenses
- G12: for many words, a consonantal skeleton carrying the lexical meaning and a pattern of vowels carrying the grammatical meaning
- G13: reduplication for forming intensive verbs and plurals of adjectives
- G14: plural formation by change of the pattern (e.g., ablaut, called broken plurals)
- G15: an independent and a subordinate form of the imperfective
- G16: plural nouns agree with a feminine singular adjective, verb, or pronoun
- G17: the imperative of the verb ‘to come’ is formed either from “a totally different stem [. . .] or with an exceptional formation” (Ferguson, 1976: 74)
- G18: the unmarked form of a noun is not singular in number but plural or collective (Ferguson, 1976: 74)

Zaborski (1991: 124) considers G1 to G6 to be areal features and G7 to G18 to be due to genetic origin. Furthermore, he adds two features that he considers areal: (1) adjectives precede substantives and (2) main verbs precede auxiliaries. Hayward (2000: 623) is of the opinion that G1, G3, G6, and G15 are “very widespread.” According to Bender (2003a: 3, 2003b: 32), G2, G3, G4, and G9 “are implicational consequences of SOV order,” G13 and G18 are “too typological,” and G10 to G12, G14, and G16 are Afroasiatic, “especially Semitic idiosyncrasies.” In addition, G7 “looks like a good choice but turns out [. . .] to be inadequately defined.” Bender seems to consider the features G1, G5, G6, G8, G15, and G17 to be good candidates for areal features.

Hayward (1991) and Tosco (2000) correctly stress that G2 and G4 have a relation to G1 and therefore cannot count as individual features. Within this context, Campbell (1994: 1471) raises the question of the weight of “a trait so central to the grammar” when it is counted only as a single feature. Also, G3, contrary to Bender’s opinion, is not related to G1 (cf. Bisang, 2001) and is found in an area exceeding the ELA. Tosco (2000) considers G3 to have spread into Semitic languages due to Cushitic influence. According to Tosco, this holds true also for G5, G6, G8, G13, and G15. The features G11, G12, and G14 are strongly

“Semitic-biased,” and G17 and G18 are Afroasiatic features.

The huge list of areal features presented by Zaborski (2003: 62f.) contains features of differing quality. Unfortunately, in most cases Zaborski simply names the features without any discussion. A number of features relate to the basic SOV word order; examples are (1) dependent clauses precede main clauses, (2) main verbs precede auxiliary ones, (3) adjectives precede nouns that they define and (4) possessor (genitive) precedes the possessed. Other features are trivial or represent frequent grammaticalizations, such as (1) relative clauses are frequent, (2) cleft sentences are frequent, (3) subject is in the oblique case, and (4) postpositions start functioning as new case endings. However, there are a few interesting features that need further study, such as (1) quoting clauses and a lack (or at least limited use) of indirect speech and (2) a considerable number of different ‘to be’ auxiliary verbs.

Lexical Features

Hayward (1991) distinguishes three categories of lexicalizations, which he exemplifies with data from Amharic, Oromo, and Gamo. These categories are (1) single-sense lexicalizations, (2) lexicalizations with two or more distinct senses, and (3) lexicalizations involving similar derivations. The first category comprises “single-sense lexicalizations of typically indigenous concepts” (Hayward 1991: 145), the second category lexicalizations “showing inter-linguistic matching across the three languages” (Hayward 1991: 148), and the third category lexicalizations with a “similar (parallel) ‘derivational pathway’” (Hayward 1991: 150). To the first category belong mainly nouns, such as lexical items for seasons of the year, categories of terrain, categories of dung/excrement, supercategories for birds, types of borrowing, and the skin-color classification of people of the region. Furthermore, this category includes the suppletive imperative of the verb ‘to come’ (Ferguson’s feature G17) and particles with the meaning ‘take this!’, which have no obvious etymological relationship to a verb. The second category, lexicalizations with two or more distinct senses, predominantly comprises verbs and some nouns; examples are the verb that has the basic meaning ‘hold, catch’ and the secondary meaning ‘start, begin’ and the verb that has the basic meaning ‘play’ and the secondary meaning ‘chat’. The third category includes verbal derivations, compound verbs (Ferguson’s feature G6), possessive constructions including two NPs, and idiomatic expressions. Examples of verbal derivations are the causative of the verb ‘want’, which has

the meaning ‘need’; the causative of the verb ‘enter’, which has the meaning ‘marry’; and the causative of the verb ‘pass the night’, which has the meaning ‘administer’. Examples of compound verbs are ‘become silent’, ‘hurry up’, and ‘jump up suddenly’. Possessive constructions that include two NPs have a word-by-word meaning and a metaphorical meaning. Examples are ‘son of man/people’, with the metaphorical meaning ‘mankind, human being’, and ‘land of man/people’, with the metaphorical meaning ‘foreign country’. Examples of idiomatic expressions are ‘regain/recover control, take courage’, which is composed of the noun ‘heart’ and the verb ‘return (INTRANS)’, and ‘catch cold’, in which the noun ‘cold’ is the subject and the experiencer is the object of the verb ‘catch’.

Summary

The ELA is characterized by phonological, grammatical, and lexical features. Their areal status is not accepted by all scholars; furthermore, the existence of the ELA itself is not generally accepted. Most of the features are found in languages spoken in the highlands of Ethiopia. The more distant a given language is from this core area, the fewer features it has. However, because only a relatively small number of languages have been adequately described, these findings must be considered preliminary.

Ethiopian Semitic Languages

A Wetter, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

The Ethiopian Semitic (ES) languages form a subdivision of the Semitic language family that is a branch of the Afroasiatic superfamily. This subfamily comprises about 23 languages. Two languages (Tigre and Dahlik) are spoken only in Eritrea. Tigrinya (Tigrigna) is spoken in Eritrea and Ethiopia and all the others are in Ethiopia. (Unless otherwise

specified, figures of speakers cited in this article are taken from the Ethnologue website.)

Classification and Demography

The still widely accepted classification of ES is based on shared "innovations due to internal reasons" (Hetzron, 1972: 13) and has two main divisions, a northern (NES) and a southern branch (SES). The northern group is formed by only four languages: the ancient Ge'ez (now extinct), Tigrinya (1 900 000 in Eritrea and 3 225 000 in Ethiopia), Tigre (800 000),

and the recently identified Dahlik (1000) by Simeon-Senelle (2000). The southern branch, in contrast, comprises most of the languages and has a more complex composition, with several subgroups. This branch, according to Hetzron (1972), is classified into Transversal and Outer South ES. The languages forming the Transversal South ES are spoken in the central and center-eastern parts of Ethiopia and is subdivided into Central Transversal, consisting of Amharic (spoken as a first and second language by 80% of the 70 million total population of Ethiopia; cf. Meyer and Richter, 2003) and Argobba (10 000), and Eastern Transversal, consisting of the Eastern Gurage languages, i.e., Silt'e, Zay, and Wolane (together 900 000) and Harari (22 000), spoken in the city of Harar. The second subgroup, Outer South ES, contains all other languages that are divided into a 'n-group,' which consists of Gafat, a non-Gurage language that is extinct, and the North Gurage languages that comprise Goggot, Soddo (Gurage, Soddo), and, according to Leslau (1969) and Demeke (2001), Mäsqan, (together around 300 000) and a 'tt-group,' which comprises about nine different languages (Muher, Ezha, Chaha, Gumär, Gura, Gyeto, Ennemor, Endegen, and Endär, together 800 000). These languages are spoken in a comparatively small area south of Addis Ababa. The term Gurage therefore refers to a group of peoples with a common cultural and historical background who speak different South Ethiosemitic languages that do not necessarily constitute a single genetic group.

The geographical origin of the ES languages is controversial. The traditional hypothesis proposes an origin in the Near East: Semitic-speaking settlers from Southern Arabia crossed the Red Sea and introduced the ancestor of modern ES languages in Northeast Africa around 1000 B.C. (cf. Ullendorff, 1955). In contrast, there is a more convincing hypothesis that sets the emergence of Semitic languages in the context of the Afroasiatic language family and proposes an origin in Ethiopia proper (cf. Murtonen, 1967; Drewes, 1958; Hudson, 1977, among others).

Phonology

Ejective consonants (p', t', s', c', and k') are widespread in all ES languages and seem to represent an earlier stage of Semitic emphatic consonants. Pharyngeal consonants are retained in NES, Argobba, and Harari but are lost in the remaining languages. Labialization, especially of velars, is common. Quite complex palatalization and labialization processes appear in several Gurage languages. Vowel length is attested only in Ge'ez and Eastgurage. The central

vowel *i* acts as an epenthetic vowel in many SES languages. Gemination of consonants is distinctive.

Morphology

The verbs are categorized in different types depending on the gemination of the penultimate consonant and the vowel quality in different conjugational paradigms. The different behavior of gemination in type A verbs is one of the distinguishing features between NES and SES languages. The former geminates in the perfective whereas the latter does so in the imperfective.

Verbal negation is marked by prefixed morphemes, which may differ for different aspects. In addition to the two main aspect forms, perfective and imperfective, there are a number of compound tense constructions formed with auxiliaries (built with the verb of existence \sqrt{blw}). A special form of verbs are the so-called compound verbs. Their composition has the form ideophone + conjugated form of the verb 'to say'; the first carrying the semantic content and the latter the grammatical functions such as person or aspect.

The use of converbs for verbal subordination (expression of sequence or adverbial concept) is common. They appear generally in two different forms: In NES languages and Amharic/Argobba gerundive forms are used, whereas in the remaining SES languages there are a number of different suffixes attached to different verb forms such as perfective and imperfective.

The relative is marked with a morpheme that is prefixed to a verb that by itself precedes the head noun of the relative clause. Verbal derivation is achieved by prefixes and internal extension of the stem. Derivational prefixes are a- and as- for causative and t- for passive or middle voice.

Nominal morphology is characterized by the broken plural in NES languages and the use of suffixed plural markers in SES languages. In some languages this plural suffix marks the transnumeralis. An article derived historically from possessive marker can be observed in some languages. Marked cases are accusative, which is marked either by a pre- or by a suffix, and genitive, which is marked by position or with a prefix at the possessor that precedes the possessed.

Syntax

The most striking feature of ES language syntax is the word order, SOV, which stands in an obvious contrast to VSO in the Asian Semitic languages. This change of word order leads to a somehow

mixed typological situation, i.e., the verb is in the sentence-final position and the subordinated clause precedes the main predication.

- (1) *legan azzennewga met'illew* (Argobba)
tomorrow NEG.it-rained.if I-come
'If it doesn't rain I will come'

In addition to postpositions, which are typical for SOV, prepositions are widely used. Most of them are also used as conjunctions that are usually cliticized to the following constituent (t- and b- are more frequent; k-, s-, and l- are seldom used). The suffixed pronominal features for the direct object often have the form of affix, unlike those in Asian Semitic languages, which are clitics. The present tense copula is formed in many languages by the root *nə-* plus a person-marking suffix. Tigre and Ge'ez express present tense equative clauses without a copula or with a pronoun copula, as in most Asian Semitic languages (Crass *et al.*, 2004). The past tense copula in most ES languages is *neb(b)er*. *Wh*-items are *in situ* types and question words may be used in yes-no interrogatives and usually have postverbal position. Relative forms of verbs are frequently used in nominal function.

On the discursive level, cleft sentences play a major role, especially for focusing of certain parts of a sentence.

- (2a) *telantena new sewiyyew yemett'aw* (Amharic)
yesterday COP man-the REL.he-
came
'It was yesterday that the man came'

- (2b) *sewiyyew new telantena yemett'aw*
man-the COP yesterday REL.he-came
'It was the man that came yesterday'

Most of the morpho-syntactic differences between Ethiosemitic and Asian Semitic languages are assumed to be the result of language contact on the Ethiopian side, but there are not enough data to support this claim. Documentary works still need to be conducted on many of these languages.

Ethnologue

G F Simons and R G Gordon Jr, SIL International, Dallas, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Ethnologue: Languages of the World is a reference work cataloging all known languages of the present-day world. Now in its 15th edition (2005), the

Ethnologue identifies 6912 living languages, both spoken and signed. These are distinct languages that have living mother tongue speakers. A few hundred recently extinct languages are documented as well.

For over 50 years, the *Ethnologue* has been compiled and published by SIL International, a non-profit, nongovernmental organization that studies, documents, and assists in developing the world's

lesser-known languages. Information comes from a variety of sources including reliable published sources, a network of field correspondents, and numerous personal communications that are confirmed by consulting published sources or the network of correspondents. The editorial staff processes approximately 10 000 updates to the database every year.

History of the *Ethnologue*

The *Ethnologue* was founded by Richard S. Pittman, who was motivated by the desire to share information on language development needs around the world with his colleagues in SIL International as well as with other language researchers. The first edition in 1951 was 10 mimeographed pages and included information on 46 languages or groups of languages. Maps were first included in the 4th edition (1953). The publication transitioned from mimeographed pages to a printed book in the 5th edition (1958). Dr. Pittman continued to expand his research through the 7th edition (1969), which listed 4493 languages.

In 1971, Barbara F. Grimes became editor. She had assisted with the *Ethnologue* since 1953 (4th edition) and took on the role of research editor in 1967 for the 7th edition (1969). She continued as editor through the 14th edition (2000). In 1971, information was expanded from primarily minority languages to encompass all known living languages of the world. Between 1967 and 1973, Ms Grimes completed an in-depth revision of the information on Africa, the Americas, the Pacific, and a few countries of Asia. During her years as editor, the number of identified languages grew from 4493 to 6809, and the information recorded on each expanded so that the published work more than tripled in size.

The 15th edition (2005) was edited by Raymond G. Gordon, Jr. It reflects an increase of 103 languages over the previous edition. Most of these are not newly discovered languages, but are ones that had been previously considered dialects of another language.

The Problem of Language Identification

Given the nature of language and the various perspectives brought to its study, it is not surprising that a number of issues prove controversial. Of preeminence in this regard is the definition of 'language' itself. Since languages do not have self-identifying features, what actually constitutes a language must be operationally defined. That is, the definition of language one chooses depends on the purpose one has in identifying a language. Some base their definition on purely linguistic grounds. Others recognize that

social, cultural, or political factors must also be taken into account.

Every language is characterized by variation within the speech community that uses it. The resulting speech varieties are more or less divergent from one another. These divergent varieties are often referred to as dialects. They may be distinct enough to be considered separate languages or sufficiently similar as to be considered merely characteristic of a particular geographic region or social grouping within the speech community. Scholars do not all share the same criteria for what constitutes a 'language' and what features define a 'dialect.' The *Ethnologue* applies the following basic criteria:

- Two related varieties are normally considered varieties of the same language if speakers of each variety have inherent understanding of the other variety at a functional level (that is, can understand based on knowledge of their own variety without needing to learn the other variety).
- Where spoken intelligibility between two varieties is marginal, the existence of a common literature or of a common ethnolinguistic identity with a central variety that both understand can be a strong indicator that they should nevertheless be considered varieties of the same language.
- Even where there is enough intelligibility between varieties to enable communication, the existence of well-established distinct ethnolinguistic identities can be a strong indicator that they should nevertheless be considered to be different languages.

Increasingly, scholars are recognizing that languages are not always easily treated as discrete isolatable units with clearly defined boundaries between them. Rather, languages are more often continua of features that extend across both geographic and social space. The *Ethnologue* approach to listing and counting languages as though they were discrete, countable units does not mean to preclude a more dynamic understanding of the linguistic makeup of the countries of the world. In fact, particular language entries in the *Ethnologue* list known dialects and often comment on the similarity and intelligibility relationships among them. In the final analysis, however, the *Ethnologue* lists and counts languages as distinguished by the criteria named above because it serves as a baseline for those who are developing language policy and making plans for language development. It is also foundational for those, such as librarians and archivists, who would classify written and spoken materials with respect to the languages they are in, or would organize pieces of language-related information with respect to the languages they are about.

Three-Letter Language Identifiers

A distinctive feature of the *Ethnologue* over the years has been its use of three-letter codes to uniquely identify the languages of the world. Any enterprise that would categorize language-related resources so that others might effectively retrieve those resources depends on the uniform identification of the languages to which they pertain. Simply using language names for this purpose is not adequate since the same language is typically known by many names and those names change over time. Furthermore, different languages may be known by the same name. Thus, the most effective approach is to use standardized language identifiers.

Standardized language identifiers were introduced into the *Ethnologue* in 1971 by then consulting editor, Joseph E. Grimes, when he transformed the typesetting tapes for the 7th edition (1969) into a computerized database on languages of the world. The work was done at the University of Oklahoma under a grant from the National Science Foundation. In 1974, the database was moved to a computer at Cornell University where Dr Grimes was professor of linguistics; it was moved to a personal computer in 1979. Since 2000, it has been housed at the headquarters of SIL International in Dallas, Texas.

One feature of the database since its inception has been a system of three-letter language identifiers. Grimes explained this feature as follows in the 1974 final report for the grant: "Each language is given a three-letter code on the order of international airport codes. This aids in equating languages across national boundaries, where the same language may be called by different names, and in distinguishing different languages called by the same name." While the codes were used behind the scenes in the database that generated the 8th and 9th editions, it was not until the 10th edition (1984) that they appeared in the publication itself.

The 15th edition (2005) marked an important milestone in the development of the language identifiers, namely, their emergence as a draft international standard. In 1998, the International Organization for Standardization adopted ISO 639-2, its standard for three-letter language identifiers. That was based on a convergence of ISO 639-1 (its earlier standard for two-letter language identifiers adopted in 1988) and of ANSI Z39.53 (also known as the MARC language codes, a set of three-letter identifiers developed within the library community and adopted as an American National Standard in 1987). The current standard, ISO 639-2, has proven insufficient for many purposes since it has identifiers for fewer than 400 individual languages. Thus, in 2002, ISO TC37/SC2 invited SIL

International to participate in the development of a new standard based on the language identifiers in the *Ethnologue*. The new standard was to be a superset of ISO 639-2 that would provide identifiers for all known languages. Consequently, hundreds of the *Ethnologue* language identifiers were changed in order to achieve alignment with ISO 639-2. In 2004, the proposed new standard, ISO 639-3, passed the first round of balloting by national standards bodies to attain the status of Draft International Standard. The three-letter language identifiers in the 15th edition of the *Ethnologue* are thus the codes of ISO/DIS 639-3.

Endangered Languages

Language endangerment is a serious concern to which linguists and language planners have turned their attention in the last decade. For a variety of reasons, speakers of some languages are motivated to stop using their language and to use another. Parents may begin to use only that second language with their children. Eventually there may be no speakers who use the language as their first or primary language and frequently the language ceases to be used altogether and the language becomes extinct – existing, perhaps, only in recordings or written records and transcriptions. The concern about language endangerment is centered, first and foremost, around the factors that motivate speakers to abandon their language and the consequences of language death for the community of (former) speakers of that language. Since language is closely linked to culture, loss of language almost always is accompanied by social and cultural disruptions as well. Secondly, those concerned about language endangerment recognize the implications of the loss of linguistic diversity, both for the linguistic and social environment generally and for the academic community, which is devoted to the study of language more specifically.

There are two dimensions to the evaluation and characterization of endangerment: the number of speakers of the language and the number and nature of the domains in which the language is used. A language may be endangered because there are fewer and fewer people who speak that language. It may also, or alternatively, be endangered because it is being used for fewer and fewer functions. The *Ethnologue* attempts to provide data on both of these dimensions whenever it is available.

Language endangerment is a matter of degree. At one end of the scale are languages that are vigorous and perhaps are even expanding in numbers of speakers or functional areas of use. At the other end are

languages that are on the verge of extinction. In between are many degrees of greater or lesser endangerment. The *Ethnologue* does not attempt to identify the level of endangerment of each language listed but does specifically identify those languages at the far end of the scale by indicating 'nearly extinct' at the end of the language entry. A language is listed as nearly extinct when the speaker population is fewer than 50 or when the number of speakers is a very small fraction of the ethnic group. In the 15th edition, 497 languages are so designated.

How to identify the level of endangerment of the remaining languages that are not designated as nearly extinct is not necessarily clear. Linguists seek to identify trends in language use, such as a decrease in the number of speakers or a decrease in the use of the language in certain domains or functions. An increase in bilingualism, both in the number of bilinguals and in their proficiency levels, is often associated with these trends. When data are available, the following factors that may contribute to endangerment are reported in the language entries: small population size, bilingualism, urbanization, modernization, migration, industrialization, the function of each language within a society, and whether or not children are learning it. Such factors interact within a society in dynamic ways that are not necessarily predictable. As a scholarly consensus forms that can be applied worldwide, a scale of endangerment is becoming increasingly possible. In the meantime, only brief statements about the above factors are given for each language as data becomes available.

Overview of Contents

The *Ethnologue* begins with an 'Introduction' and 'Statistical Summaries.' The latter give a summary view of the world language situation in terms of numerical tabulations of living languages and number of speakers by world area, by language size, by language family, and by country. Then follows the main body of the work in 'Part 1: Languages of the World.' This section provides detailed information on all known living languages of the world organized by area and by country. An extensive bibliography is located at the end of this section. 'Part 2: Language Maps' provides 208 color maps locating the languages in most countries of the world. Finally, 'Part 3: Indexes' consists of three indexes: a language name index listing all of the 39 491 distinct names that are associated with the languages described in

Part 1, a language code index listing all of the three-letter language identification codes that are used in Part 1, and a country index listing the pages on which the section for that country begins in Part 1 and Part 2.

In Part 1, languages are listed by country under the five major geographic areas of Africa, the Americas, Asia, Europe, and the Pacific. The entry for a country begins with a header giving summary information about the country including official name, total population, a listing of national or official languages, a listing of recent immigrant languages, country literacy rates, and a count of languages indigenous to the country. This header is followed by an entry for each language of the country that is not a recent immigrant.

Entries are alphabetized by the primary name of the language. This is followed by all known alternate names and the three-letter identification code. An estimate of the speaker population is then given; there may also be an estimate of monolingual speakers, or of the size of the ethnic group (including those who no longer speak the language). Next, the location of the language group within the country is described, followed by the genetic classification of the language. Where dialects are known to exist, these are listed along with alternate names. Comments on intelligibility and similarity relationships among dialects or with neighboring languages may follow. Next are notes on language use, including functions of the language (such as official language or language of wider communication), viability, domains of use, age range of speakers, attitudes toward the language, and bilingual proficiency in other languages. These are followed by notes on the status of language development, including literacy rates, use in elementary or secondary schools, scripts used for writing, existence of published literature, and use in media. The entry closes with information in miscellaneous categories including general remarks, linguistic typology, geological and ecological environment, subsistence type of the speakers, and religions.

Etruscan

D Ridgeway, University of Edinburgh, Edinburgh, UK

© 1994 Elsevier Ltd. All rights reserved.

The Etruscans were an indigenous people of pre-Roman Italy. Although their language has early lexical and other debts to the Indo-European Italic languages, it does not itself belong to the Indo-European group. Written Etruscan is attested from the beginning of the seventh century BC by ca. 13 000 inscriptions, mostly of the fifth–second centuries BC and concentrated in Etruria proper, between the Tiber and the Arno; others confirm Etruscan expansion into Latium, Campania, and Northern Italy. The various types of Etruscan alphabet are derived from that brought to Italy in the eighth century BC by Greek traders, with modifications occasioned by the pre-existing phonetic systems characteristic of different Etruscan-speaking areas. In spite of the popular misconception that etymology and decipherment are still relevant approaches, Etruscan can be read and substantially understood.

Short formulaic inscriptions on tombs or sarcophagi make up the largest category of Etruscan texts; many others define the artefacts on which they appear, often identifying them further as the property or votive offerings of named individuals. Etruscan or Etruscanized Greek names frequently accompany figures in the mythological and other scenes painted in chamber tombs or engraved on bronze mirrors; a few longer texts contain ritual or contractual prescriptions. No Etruscan literature has survived, and only the quasibilingual set of three gold tablets discovered in 1964 at Pyrgi register a historical event (in Etruscan and Phoenician): the dedication ca. 500 BC of a shrine to a Phoenician goddess by the local Etruscan ruler. Exclusive of divine and other proper names, surviving Etruscan vocabulary

amounts to roughly 250 words. The investigation of Greek lexical and onomastic additions to Etruscan has shed light on the development not only of Etruscan phonology but also of the cultural connections of the Etruscans themselves. The statistical treatment of personal names has likewise shown that the addition of gentilicia (incorporating the morpheme *-na* to denote belonging) coincides with the rise of large urban centers. Although inevitably incomplete, systematic descriptions of Etruscan grammar have been prepared on traditional lines (Bonfante 1983). The application of more advanced methods (Cristofani 1979) is inhibited by the brevity and repetitive content of most of the texts, which permit little more than the recognition of adjectives, adverbs, conjunctions, and numerals, and of the inflected nouns, pronouns, and verbs commonly encountered even in short texts on tomb offerings: *mini alice Velthur* ('Velthur gave me'); *mi Spurieisi Teithurnasi aliqu* ('I was given to Spurie Teithurna').

The study of Etruscan must always depend on the comprehension of the Etruscan archaeological and historical context. Ironically, this is wholly lacking for the longest text, a liturgical calendar of the late second century BC now in Zagreb: nothing is known of the circumstances in which the linen book-roll containing its ca. 1200 words became available for recycling into bindings for a mummy, bought in Egypt by a Croatian traveller ca. 1850.

Europe as a Linguistic Area

T Stolz, Universität Bremen, Bremen, Germany

Historical Overview

Areal linguistics of Europe is currently experiencing a period of intensive empirical research and methodological discussion, as the impressive series of

eight volumes resulting from the EURO-TYP project (Bossong and Comrie, 1998–2003) and other publications either directly (Bernini and Ramat, 1992) or indirectly (Mayerthaler *et al.*, 1993) related to it amply document. Among their early predecessors in the 19th century, we find the German Indo-Europeanists Schleicher (1850) and Pott (1868; 1887), whose interest in the linguistics of Europe, however, was not primarily guided by purely geolinguistic hypotheses

but rather by the prominence given to questions of language genealogy induced by the *Zeitgeist* of their epoch. Therefore, their studies highlighted diversity rather than convergence – an attitude that continued to dominate well into the 1960s among scholars studying the European linguistic landscape. In the mid-20th century, Lewy ([1942] 1964), most probably inspired by the ‘discovery’ of the Balkan *Sprachbund* by Sandfeld (1930) and the large phonological areas proposed by prominent members of the Prague Linguistic Circle in the 1930s (Jakobson, [1931] 1971), looked at the areal makeup of Europe, mostly in the realm of morphology and morphosyntax. Lewy’s fundamental ideas are also at the heart of the contributions by Becker (1948), Wagner (1959; 1964) and Décsy ([1973] 2000), who, in a manner of speaking, are the representatives of a still somewhat speculative and impressionistic approach with strong affinities to *Völkerpsychologie*, the formerly widespread branch of cultural anthropology that, anticipating Whorf ([1941] 1956) in a way, postulated a high degree of cognitive relativism supposedly determined by and identifiable on the basis of linguistic structure. Becker (1948) turned his attention to the overall convergence of European languages, while Décsy ([1973] 2000) tried to combine the identification of distinct subareas (= diversity) with the deduction of pan-Europeanisms (= convergence), cf. below.

The three booklets by Haarmann (1976a; 1976b; 1977) mark the transition from heavy speculation to a more rigorous methodology mostly rooted in quantitative typology, whereas Bechert ([1981] 1998), evidently impressed by the progress areal linguistics had been making in the description of the linguistic geography of regions outside of Europe, instigated an entire research program for the investigation of Europe as a linguistic area, thus preparing the ground for EURO-TYP (König and Haspelmath 1999). More recently, a new approach, meant as a kind of transnational philology, has been developing. It goes by the name of *Euro-linguistik*, and, apart from the clearly cultural–political mission the major representatives have formulated, adopts a pan-European vantage point and attempts to identify those linguistic phenomena that attest to a kind of common European-ness of the languages and speech communities involved. A recent example is Hinrichs’s (2004) collection of articles that address the issue of whether the languages of Europe are currently shifting from the synthetic morphological type to the analytic type. For other linguistic endeavors with a continent-wide orientation, the reader is referred to the survey in Ureland (2004).

There is thus, an abundance of studies dedicated to the description and evaluation of the geolinguistic

situation in Europe. Indeed, these studies all contribute to our knowledge of the areal linguistics of the continent. However, they stem from a variety of schools of thought with at times widely diverging theoretical axioms. This diversity on the theoretical side, of course, has methodological consequences that, in turn, also determine which picture of areality results from the interpretation of the empirical facts.

Approaches

In addition to the commented inventories of European languages without explicit or dominant areal-linguistic goals (Nocentini, 2002; Banfi and Grandi, 2003), there are several approaches to the languages of Europe that all have been adopted at least once in the history of areal linguistics of Europe. The egalitarian approach, the segregating approach, and the center vs. periphery approach are each discussed separately, with these terms being coined here as handy labels for the present occasion. Before we proceed to this survey, some remarks of a methodological nature are in order that affect not just European areal linguistics specifically but areal linguistics in general (including subareas, etc.). For a more detailed discussion of these and similar problems, see the contributions in Matras *et al.* (2005).

With a view to establishing whether or not the distribution of linguistic phenomena over languages has or needs an areal explanation, it is absolutely necessary to clarify in advance a number of difficult issues. First of all, one has to start from somewhere, that is, one has to decide whether the area-to-be has a geographic, political, historical, cultural, or other foundation. Talking about Europe as a linguistic area presupposes an idea of some kind of what is meant by ‘Europe.’ If the starting point is geography, problems arise, as Europe is notoriously difficult when it comes to determining, for instance, where it ends and Asia begins and vice versa. A frequent victim of these uncertainties about the borders separating the two continents is the Caucasian region, which is often totally or partially (= Trans-Caucasus) ignored (Décsy, [1973] 2000), whereas languages such as Georgian, (Eastern) Armenian, Azeri (South Azerbaijani), and so on are classified as ‘European’ in other publications (Siewierska, 1998). A perhaps rhetorical question: If the Caucasus and/or Ural mountain ranges are considered topographic obstacles that supposedly render communication across the line difficult, why should this be different in the case of the Alps? As a matter of fact, individual researchers arbitrarily stipulate certain relatively time-stable landmarks as outer boundaries of the continent, even if one and the same language is spoken on both sides of

the landmark. One example is the Bosphorus, which cuts the Turkish territory into two parts of very different size, the smaller one belonging to Europe, while the larger one forms part of Asia. Does it make sense at all for areal linguistics to follow the lead of geography, especially if the solutions of the latter are inconclusive or variable? These varying solutions do not only have implications for the sample size but also for the general inventory of possible structural properties of European languages and the quantity and quality of potential subareas.

Similarly, taking political boundaries as a yardstick creates more problems than it solves, although it must be acknowledged that they may become relatively strong secondary factors in the reshaping of linguistic boundaries, especially dialect boundaries (Auer, 2004). Since state boundaries do not automatically map onto topographic landmarks of the above-mentioned kind, a political definition of 'Europe' yields a result markedly different from a geographic definition. Under the premise that the notion of 'Europe' is not reduced to the present member states of the European Union, Turkey may again serve as an example of the potential problems a policy-based definition is bound to create: If the entire territory of the Turkish state has to be taken into account, this also means that those languages that are coterritorial with Turkish, such as Kurdish, become European languages. Varieties of Kurdish, however, are also spoken in the adjacent countries of the Middle East – a fact that makes them Asian languages – and thus the political boundary induces the linguist to investigate only part of the territory occupied by a given speech community.

What is more, political boundaries are of course subject to minor and major adjustments according to the momentary balance of power among competing political entities. In other words, the supposed European linguistic area based on political boundaries is prone to metamorphosis in time, as its political basis is in no way immutable. Thus, if we go back a couple of centuries and look at the political boundaries of the *de jure* predecessor of contemporary Turkey, the Ottoman Empire, the option of including or excluding it from the study of Europe as a linguistic area in say, the 17th century, is tantamount to deciding whether to have a sizable part of the Middle East and North Africa in or out of the sample. If the answer is to exclude, then the entire Balkans and other regions and their languages have to be excluded as well because they were under Ottoman rule at that time – a solution that leaves room only for a rather small-sized Europe.

Equally unhandy is the requirement of a common cultural background of those speech communities whose languages belong to one and the same

linguistic area (Décsy, [1973] 2000). One would have to define a culture area beforehand and thus work on the hypothesis that culture areas and linguistic areas are largely coextensive with each other (Lewy, [1942] 1964; Becker, 1948). Haarmann (1976b: 71–76) demonstrates that the culture-first approach rests on the erroneous assumption that cultural convergence and linguistic convergence are two sides of the same coin, which is evidently much too strong a hypothesis. Apart from the fact that it would surely cause problems to depict Europe sweepingly as culturally homogeneous, it must be stated that cultural traits and linguistic traits may diffuse over geographic boundaries, but not necessarily in a parallel fashion. On the other hand, neither of the two kinds of traits automatically covers a geographically defined region in its entirety. Thus, instead of starting from mostly elusive or controversial nonlinguistic criteria, the more promising approach to linguistic areality is the one suggested by Bechert ([1981] 1998), according to which the diffusion patterns of the individual linguistic phenomena, independent of geographic, cultural, and political assumptions, should guide the linguist. This is what generations of dialectologists have successfully been doing when they identify isoglosses and define dialects as those varieties that share a certain set of isoglosses (or isopleths, i.e., clusters of isoglosses) (van der Auwera, 1998).

Equally important for the outcome of one's research is the status of the sample languages. The exclusive comparison of written varieties of normative standard languages will inevitably yield results different than an approach that takes nonstandard varieties (regional languages, dialects, etc.) into account (Haarmann, 1986). Recent research emphasizes the fact that we need to pay more attention to substandard varieties in order to better understand – among other things – the areality of linguistic phenomena (Kortmann, 2004). With these provisos in mind, we are now in a position to tackle the issue of the coexistence of various approaches.

The Egalitarian Approach

The egalitarian approach presupposes that all languages that qualify as European share certain features and thus display a sufficient degree of similarity, such that the entire geographic space occupied by these languages can be considered a linguistic area. Therefore, this approach adopts *per se* a continent-wide perspective. The most radical version of the egalitarian approach can be found in Becker (1948), who treats the languages of Europe as a solid homogeneous block. The evidence for this is, however, rather poor and consists mainly of idiomatic or

phraseological parallels with a more or less obvious origin in Christian religious discourse practices. Décsy ([1973] 2000) is slightly more cautious, as he also recognizes that Europe is fragmented into several subareas and thus that there is a potentially rather high degree of heterogeneity of the continent. This acknowledged internal diversity notwithstanding, Décsy ([1973] 2000) searches for pan-European commonalities that he terms ‘Europemes.’ Among these Europemes, we encounter, for instance, a kind of common core phonological system with five vowels (= /a/, /e/, /o/, /i/, /u/) and 10 consonants (/p/, /t/, /k/, /s/, /v/, /m/, /n/, /l/, /r/, /j/) that are said to be present in each and every phonological system in Europe – a somewhat dubious assumption. For reasons of space, the tenability of Décsy’s hypotheses is not reviewed here (but see Stolz, 2002). Since the identification of full-blown Europemes (in the sense of exceptionless substantial areal traits) on all linguistic levels is, for various reasons, next to impossible, Décsy ([1973] 2000: 341) resorts to a solution reminiscent of Lewy ([1942] 1964: 103–108) and Becker (1948) when he says:

[t]he genuine resemblance [of the languages of Europe] lies however in the way of thinking [...]. [T]he great majority of Europeans hold the same mind-set, which arose from a Graeco–Latin cultural tradition in a two-thousand year development, connecting the regions between Iceland and the Urals, between the North Cape and Palermo, between Dublin and Istanbul to a unity in historical proportion.

This is equivalent to a declaration of defeat in linguistic terms because it admits that one cannot find sufficient tangible proof of a pan-European linguistic structure.

Haarmann (1976a: 105–106) adopts the notion of Europeme but defines it more rigorously in analogy to the well-established Greenbergian probabilistic universals. Haarmann (1976a: 107–108) goes on to sketch the methodological and empirical requirements necessary for a wholesale comparison of the languages of Europe. On a still provisional basis of selected aspects of 65 sample languages excluding the Caucasian region (the ultimate goal being the large-scale comparison of entire grammatical systems), Haarmann (1976a: 108–116) puts forward 16 Europemes for which he feels to have sufficient evidence (the following Europemes implicitly contain the common introductory phrase ‘In all European languages,’ or a suitable variation thereof; where the Europemes come in the shape of an implication, it is always meant to be unilateral):

- Europeme 1: The number of simple phonemes ranges between 10 and 110.

- Europeme 2: Consonants outnumber vowels.
- Europeme 3: Only one-third of the potential phonotactic combinations is actually made use of.
- Europeme 4: The basic syllable structure is (C)V(C) (C).
- Europeme 5: The basic morphotactic structure is [radical](-[derivation]) (-[inflection])
- Europeme 6: Singular and plural are distinguished formally.
- Europeme 7: Nouns and verbs are distinguished formally.
- Europeme 8: Present and past tense are distinguished formally.
- Europeme 9: Morphological case distinctions range from zero to 30.
- Europeme 10: Indicative, imperative, and conditional are distinguished formally.
- Europeme 11: Multifunctional derivational affixes are ubiquitous and outnumber monofunctional ones.
- Europeme 12: Synthetic and analytic encoding strategies are compatible with each other.
- Europeme 13: Changes from synthetic to analytic structures do not necessarily embrace the whole grammatical system.
- Europeme 14: The order S > O is basic (V may occupy various positions).
- Europeme 15: VSO languages employ the category of verbal nouns.
- Europeme 16: Intonation contours in questions are different from the ones used in declarative sentences.

Some of the above generalizations are almost trivial because they meet universal expectations. Others are not particularly distinctive, and still others remain somewhat vague as they circumscribe the range of variation between a minimum and a maximum number of entities. Already Europeme 1 is problematic, as the upper limit is imposed by Kildin Saami, with whose large phoneme inventory of over 100 none of the other European languages can compete (there is a gap of over 40 units between Kildin–Saami and the second best, Lithuanian). At the same time, it remains opaque which of the languages of Haarmann’s sample comes close to the minimal size of phoneme inventories, as Haarmann (1976a: 113) himself states that European languages generally do not display significantly small inventories. Similarly, the rich morphological case-systems suggested by Europeme 9 boil down to Hungarian, which, according to the maximalist count, displays 28 cases and thus exceeds the paradigms of its competitors (Finnish, Basque) by about a dozen units. Instead of working with the

statistical extremes, it would probably have made more sense to go by the statistical mean or any other mathematical procedure on which predictions about the expected average system can be formulated. The Europemes allowing for quantitative variation therefore can be considered to be merely observations of structural facts that cannot claim to identify a certain quality that characterizes the languages of Europe. In addition, Europeme 13 is odd in the sense that it is the only diachronic generalization in a list of otherwise strictly synchronic observations, and Europeme 15 has a genetic bias as it only applies to members of the Celtic phylum.

No matter how accurately the Europemes capture the linguistic facts, Haarmann's (1976a) approach works in such a way that the languages of his sample are automatically treated as similar in one way or another (which is a pitfall of the geography-first approach criticized by Haarmann (1976b) himself). This is for methodological reasons: The researcher focuses on the common denominators alone without specifying whether or not the findings have to be explained by diffusion. Any two languages of the world, past and present, can be compared in order to determine what they have in common. Whether the shared properties call for a genetic, typological, areal, or other explanation, if at all, is a completely different matter. Thus, the above Europemes gain significance for areal linguistics if and only if it can be demonstrated that they result from diffusion (either way, i.e., receding or expanding) and/or that their combination is characteristic of the area under scrutiny such that it can be kept apart from other areas.

The Segregating Approach

The segregating approach starts from a different premise, according to which not all European languages resemble each other to the same extent; the degree of similarity may be significantly stronger in certain smaller subareas of the continent that, in turn, deserve the designation of distinct linguistic areas of their own. Thus, this approach favors research on individual regions, not necessarily with an orientation toward comparing the findings with those of other potential subareas. Haarmann (1976b), and to a lesser extent Décsy ([1973] 2000), are exceptions as they, in principle, combine the segregating and the egalitarian approaches.

On the basis of a sample of 18 languages, Lewy ([1942] 1964) distinguishes five subareas in Europe. The languages discussed are to be understood as representatives of larger groups forming geographic neighborhoods:

- Atlantic area (Celtic, Romance [without Rumanian (**Romanian**)], East and West Scandinavian, English)
- Central area (German, Hungarian)
- Balkan area (Albanian, Rumanian, Greek)
- Eastern area (Baltic, East Slavic, Finnish, Mari, Mordvin (Erzya))
- Arctic area (Yurak)

With the notable exception of the Balkan area, Lewy's proposals have experienced major alterations in the subsequent years. The changes are partly occasioned by the fact that the number of sample languages increased considerably from 65 in Décsy's and Haarmann's publications in the 1970s to 140 or more for EURO TYP and related projects. The more important factor, however, is the introduction on the list of items to be compared of further categories and phenomena on all linguistic levels. Presently, 12 potential subareas (often called *Sprachbünde* or the like) are discussed with varying intensity in the pertinent literature, even though most of them are still largely controversial and some – like the Littoral *Sprachbund* – are unlikely to pass the test at all. In the following list, the languages that count as members of a given subarea are the ones explicitly mentioned by the first source quoted; in the literature, different sets of languages may occur under the same heading, whereas different labels may be used for the same set of languages. This variation reflects the fact that the shape of a linguistic area is directly dependent on the quality and quantity of the features one scrutinizes (Haspelmath, 2001: 1505).

- Standard Average European (SAE) languages (= Albanian, Dutch, French, German, Italian, Portuguese, Sardinian, Spanish) (Haspelmath, 2001) including the *Charlemagne-Sprachbund* (van der Auwera, 1998: 824); cf. below.
- Viking *Bund* (Décsy, [1973] 2000)/northwest linguistic area (Wagner, 1964) (= insular and mainland North Germanic, Celtic, Saami, Finnish, Veps, and the Anglo-Saxon component in modern English)
- British (Isles) areal type (= Celtic, English) (Wagner, 1959), the relic of an erstwhile more extended area to which also Basque and Berber belonged
- Littoral *Bund* (= Basque, Dutch, Frisian, Maltese, Portuguese, Spanish) (Décsy, [1973] 2000), based on the idea that the speech communities involved represent renowned seafaring nations
- Mediterranean linguistic area (= Romance, Maltese, North African Arabic, Hebrew, Turkish, Balkan *Sprachbund*, Serbian, Croatian, Slovenian) (Ramat and Stolz, 2002)

- Rokytno *Bund* (= Bielarussian (**Belarusan**), Kashubian, Lithuanian, Polish, Ukrainian) (Décsy, [1973] 2000)
- (Circum-)Baltic super-position zone (Koptjevskaja-Tamm and Wälchli, 2001)/ Peipus *Bund* (Décsy, [1973] 2000) (= Balto-Finnic, Danish, Estonian, Latvian, Lithuanian, Low German (**Low Saxon**), Saami, Swedish)
- Karelian *Sprachbund* (Sarhimaa, 1991) (= Russian, Balto-Finnic)
- Eurasian *Sprachbund* (East Slavic, conservative Polish and Sorbian, Rumanian, Lithuanian, Altaic languages of the former Soviet Union) (Stadnik, 2002)
- Danube *Sprachbund* (= Czech, German, Hungarian, Slovak) (Skalička, 1968)
- Volga-Kama *Sprachbund* (= Bashkir, Chuvash, Kalmyk (Kalmyk-Oirat), Mari, Mordvin, Tatar, Votyak (Udmurt), Yurak (Nenets), **Komi-Zyrian**) (Wintschalek, 1993)
- Caucasian *Sprachbund* (= all Caucasian phyla) (Haarmann, 1977)

Décsy ([1973] 2000) does not tolerate a single European language to remain outside a *Bund*, and thus he postulates a number of so-called groups of languages (viz., Isolates [in the sense of ‘not belonging to any other *Bund*’] and Diaspora languages) that have no areal *raison d’être* but are said to be based on social and/or historical criteria. Haarmann (1976b) rightly observes that this *horror vacui* of Décsy’s renders the whole areal undertaking dubious since the classificatory criteria are not kept constant, which is characteristic of Décsy’s handling of the problems posed by European areal linguistics (Russian, for instance, counts as an SAE language just because it happens to have more than 50 million speakers; thus, demographic criteria may oust structural ones for Décsy). Moreover, languages do not have to converge even though they happen to be neighbors. The fact that the territories of two speech communities adjoin surely facilitates convergence but does not necessarily trigger it. Irrespective of these additional methodological problems, the many and sometimes competing suggestions of subareas within and beyond Europe are indicative of a certain linguistic heterogeneity of the continent. This heterogeneity on the meso level and micro level raises the question of whether it makes sense at all to talk about Europe as a linguistic area on the macro level.

Center vs. Periphery Approach

The center vs. periphery approach is not so much a compromise between the two previous ones (which

operate on the basis of predetermined areas with more or less fixed sets of member languages) as it takes a dialectology-minded stance. It assumes that individual linguistic phenomena diffuse geographically in such a way that it becomes difficult to determine clear-cut boundaries between those languages that form part of a given linguistic area and those that remain outsiders. Membership in a linguistic area is thus a matter of degree, a gradient property of the languages compared (Haspelmath, 2001). The approach is feature based with a continent-wide perspective (or more precisely, with a potentially unlimited perspective, as no boundaries are defined beforehand). This approach plays an important role in the recent discussion about the notion of SAE languages.

Haspelmath (2001: 1493–1501) presents a list of 12 properties that he classifies as major SAE features, all of which belong to the realm of morphosyntax in the widest sense of the term. In the subsequent list of features, the abbreviation ‘SAE’ stands for varying sets of languages that nevertheless overlap in such a way that some languages partake in (almost) every SAE-isogloss (namely French and German, the two pillars of the *Charlemagne Sprachbund*):

- presence vs. absence of definite and indefinite articles: SAE languages have both types of articles, whereas languages on the fringes of and beyond the SAE area either lack one or both.
- relative pronoun strategy in relativization: SAE languages employ relative pronouns, i.e., relativizers that contain grammatical information about the syntactic function of the relativized head in the relative clause, whereas outside the SAE area, languages opt for invariable relative particles or other strategies.
- ‘have’-perfect: In SAE languages, an auxiliary with the (erstwhile) lexical meaning of ‘have’ serves the purpose of encoding perfect (sometimes in complementary distribution with ‘be’-perfects); non-SAE languages prefer ‘be’-perfects or other strategies.
- agent-like experiencers: SAE languages tend to encode experiencers as subjects and thus treat them on a par with agents, whereas languages in the European east and also in the extreme northwestern regions have a predilection for keeping agents and experiencers formally apart; this difference in semanto-syntactic behavior is, however, a matter of degree, as both agent-experiencer ‘syncretism’ and agent-experiencer ‘differentiation’ can be encountered on both sides of the dividing line.
- participial passive: SAE languages have a passive construction made up of an auxiliary and a passive participle of the lexical verb, a construction type that is absent from the languages spoken

in the eastern part of the continent and in the westernmost languages.

- anticausative–prominence: Inchoative–causative alternations are expressed predominantly by anticausatives in SAE languages, whereas causatives are preferred by languages outside this area; as with agent-experiencer encoding, we are dealing with a preference for anticausatives and not with a 100% solution.
- dative external possessors: SAE languages typically have external possessors and encode them as datives, which contrasts with external possessors of the locative type found in North Germanic and with languages that lack external possessors altogether.
- negative pronouns/lack of verbal negation: SAE languages normally combine a verb unmarked for polarity with a negative indefinite pronoun, while outside this area, i.e., on the western and eastern rims of the continent, negative pronouns go along with negated verb forms.
- particle comparatives: SAE languages overwhelmingly employ particle comparatives, i.e., the standard of a comparative construction is introduced by a conjunction-like element; in other European languages, the locative strategy of marking the standard is more frequent.
- equative constructions based on the relative clause: Equally in the realm of comparison, equative constructions reveal that SAE languages resort to a kind of adverbial relative clause that contains the standard of comparison; this strategy is unknown in the languages spoken in the west, north, and east of Europe, where special equative markers or other means are employed.
- strict agreement markers: SAE languages inflect their verbs for subject person even though an overt subject NP is always copresent (= ‘non-prodrop’), whereas the vast majority of European languages are of the referential-agreement type (= ‘prodrop’).
- intensifier-reflexive differentiation: SAE languages distinguish intensifiers (= words that mark the referent of an NP as central) from reflexives, whereas nondifferentiation of the two categories is widespread among non-SAE languages.

These findings stem from a variety of studies, the empirical basis of which differs widely because of different sample size and so forth. Some of the features have a wider distribution that embraces the bulk of the languages of Europe, whereas others are attested only in a relatively small number of languages. Some are characteristic of European languages

in general and let them stand out as ‘exotic’ (Dahl, 1990), whereas others are preponderantly Indo-European or characterize only a subset of the languages of Europe. Independent of these differences in their distribution in space, the phenomena have one crucial element in common, viz., they all involve larger or smaller geographically contiguous areas. In other words, they do not occur sporadically on the map but cover entire regions (with the occasional isolate or secondary accumulation outside the more extended area). More often than not, the isoglosses cut across major (= macrophyla such as Indo-European and Uralic, etc.) or minor (= phyla and subphyla such as Germanic and Romance, North Germanic and West Germanic, etc.) genetic groups. This is of course indicative of a possible origin in diffusion via language contact.

The various isoglosses overlap, which allows us to identify a core area with a particularly high number of shared features, as opposed to a periphery in which languages only participate in a smaller number of isoglosses. Ideally, the following generalization holds: The further away one gets from the core, the smaller the number of shared features. In a manner of speaking, a given language may be more or less SAE according to the number of isoglosses in which it partakes. Being an SAE language is thus again a matter of degree. However, this observation cannot solve all the problems acknowledged by Haspelmath (2001: 1504–1506). Apart from the fact that the complete absence of shared features may be taken as evidence of a language’s areal outsider status, it is the linguists’ choice of features that has a bearing on the identification of areas. A different catalogue of properties might yield a completely different geolinguistic map of the same group of languages. Moreover, there remains a certain element of arbitrariness when it comes to deciding what the numbers of attested isoglosses tell the observer. As a matter of fact, it is up to the individual linguist to decide how many features are required for a language to be a member of the core or the periphery – and, on top of that, whether the number of shared features is in any way significant. For the solution of the latter problem, comparative studies of linguistic areas worldwide are called for.

Nevertheless, the validity of the SAE area is well documented and based on empirically solid foundations. In addition to the above major features, Haspelmath (2001: 1501–1504) mentions many further candidates for the status of SAE isogloss; however, their exact geolinguistic distribution has not been established yet. Some of these additional features provide evidence *ex negativo*, as they state the absence of a given feature in SAE languages (lack

of grammatically relevant alienability correlations in adnominal possession; lack of formal inclusive–exclusive distinction on pronouns; lack of (partially) reduplicating constructions). Three of these supposedly minor features are discussed below, based on research carried out by the present author. While one may agree with Haspelmath that negative evidence has to be taken into account when it comes to identifying linguistic areas, it is necessary to also accept the methodological consequences. If the absence of certain features is characteristic of SAE languages and is thus counted as an isogloss defining a linguistic area, then the absence of typical SAE features in languages outside the SAE area may likewise be considered evidence *ex negativo* in favor of a linguistic area (especially if the features in question are in a binary nongradient relation). Thus, a strong competitor of the SAE *Sprachbund* is created as an epiphenomenon of our search for isoglosses supporting the SAE hypothesis. It would certainly be unfortunate to baptize this additional area the ‘non-SAE area’ (not simply because it might ultimately turn out to comprise the majority of the languages of Europe). If one wants to deny those languages that lie outside the SAE *Sprachbund* the status of an area of their own, it is a necessity to find strong counterarguments, among which only internal heterogeneity seems to be convincing.

The center vs. periphery approach reveals certain important facts. In addition to the idea that membership in a linguistic area is a gradient property, Haspelmath’s findings also suggest that one and the same language may belong to several different linguistic areas at the same time (for example, a marginal member of the SAE *Sprachbund* might be a marginal or central member of the still nameless non-SAE competitor). Given that the linguist’s choice of features has a considerable influence on what a linguistic area might look like, there is at least theoretically the possibility that the prominence given to SAE languages in the extant literature does not adequately reflect the areal composition of the continent. Chances are that the members of the SAE *Sprachbund* identified so far behave differently as soon as we take other linguistic phenomena into consideration, thus relativizing the current emphasis on the SAE *Sprachbund* by showing that there are potentially other areas in Europe that could pass as serious competitors. Haspelmath (2001: 1505–1506) acknowledges these possibilities, though with certain reservations. In the next section, with a view to elaborating on these issues, a few phenomena are scrutinized that either have been ignored completely or mentioned only in passing in the recent discussion within European areal linguistics.

More Isoglosses

The evidence adduced by Haspelmath is exclusively morphosyntactic; below, there is a variety of phonological issues that also display a clear geographical distribution. For the sake of brevity, another good candidate for areality in the realm of phonology, i.e., Sandhi, cannot be discussed here (Andersen, 1985). In addition, areal phenomena in Europe are approached from the perspective of grammaticalization theory by Heine and Kuteva (2005). The phonological sketches are complemented by others that focus on morphology. The list of features is again random, apart from the fact that they are not discussed in detail in Haspelmath (2001). When reference is made to more or less central languages or ‘layers’ of SAE, these judgements are based on Haspelmath’s (2001: 1505) cluster map meant to represent the degrees of membership in the supposed linguistic area. The following (convenience) sample comprises 51 languages of all macrophyla represented in Europe (= Indo-European, Uralic, Altaic, Caucasian, Afroasiatic [= Maltese] and the isolate Basque). For the sake of simplicity, exclusively data from standard varieties are compared (occasionally allowing for a comparison of competing standards). In the east, the dividing line between Europe and Asia is assumed to run from the Arctic Sea southward along the Ural mountains to the Caspian Sea, then westward along the southern borders of Azerbaijan, Armenia, and Georgia to the Black Sea, where it follows the Turkish state boundary to the Mediterranean; in other words, the entire Trans-Caucasus and Anatolia are treated as integral parts of Europe. For the northern, western, and southern limits of Europe, a conventional solution has been taken.

Phonology

Rounded front vowels The first feature to be scrutinized is the presence or absence of vowel phonemes with the feature triple [–low] + [front] + [round] = /y/, /Y/, /ø/, /œ/ as in French *culture* [kylytyʁ] ‘culture’ and *sœur* [sœʁ] ‘sister.’ The areal distribution of rounded front vowels is also partly discussed in Chambers and Trudgill (1980). Eighteen languages of the sample used here have two rounded front vowels, and one rounded front vowel is attested in two further languages, leaving a solid majority of 31 languages that lack vowel phonemes of this kind. **Figure 1** reveals that there are two hotbeds in Europe where rounded front vowels occur.

These hotbeds are at a considerable distance from each other and are separated by a solid block of languages that do not have these vowels on their

Figure 1 Rounded front vowels [solid line = both /œ/ ~ /ø/ and /y/ ~ /ɥ/; dotted line = only /y/ ~ /ɥ/]. ALB = Albanian, ARM = Armenian, ART = article, AZE = Azeri, BAS = Basque, BASH = Bashkir, BR = Bielarussian, BRET = Breton, BULG = Bulgarian, CAT = Catalan, CHUV = Chuvash, CZ = Czech, DAN = Danish, DU = Dutch, ENG = English, EST = Estonian, FAR = Faroese, FINN = Finnish, FR = French, FRIS = Frisian, GEN = genitive, GEORG = Georgian, GER = German, GR = Greek, HUNG = Hungarian, ICE = Icelandic, IR = Irish, IT = Italian, KURD = Kurdish, LAT = Latvian, LITH = Lithuanian, MAC = Macedonian, MALT = Maltese, MORD = Mordvin, NORW = Norwegian, OCC = Occitan, PERF = perfective, PL = plural, POL = Polish, PORT = Portuguese, RHAET = Rhaeto–Romance, RUM = Rumanian, RUSS = Russian, SAA = Saami, SAE = Standard Average European, SARD = Sardinian, SCG = Scots–Gaelic, SCR = Serbo–Croatian, SLOK = Slovak, SLOV = Slovene–Slovenian, SP = Spanish, SW = Swedish, TAT = Tatar, TURK = Turkish, UKR = Ukrainian, W = Welsh.

phoneme charts. Those languages that have rounded front vowels in the east belong to the Altaic macrophylum (more precisely, to the Turkic phylum), and thus this feature most probably has a genetic explanation. In the other hotbed, however, Indo–European languages of three different phyla (Germanic, Romance, and Celtic) and Uralic languages share the feature. However, not all members of the various phyla partake in this isogloss. French and the Puter (Lower Engadine) variety of Rhaeto–Romance are the only Romance languages to display rounded front vowels; the same holds for Breton among the Celtic languages. English, however, does not follow its Germanic relatives, all of which have rounded front vowels. Likewise, Saami and Mordvin, both lacking these phonemes, do not go along with their Uralic relatives. The group of languages that make do without rounded front vowels is genetically heterogeneous, too. Note, however, that the entire Slavic and Baltic branches are immune against rounded front vowels in a manner of speaking. Nevertheless, the isogloss cuts across genetic boundaries. The languages that share the feature are geographical neighbors: Those that have rounded front vowels are

spoken next to each other, and those that do not employ rounded front vowels are also in a neighborhood relation among each other. We do not encounter islands of either type interspersed among languages of the opposite type. However, there are two special cases, Albanian and Chuvash, which have /y/ as a phoneme but lack mid-high rounded front vowels and thus fail to partake in the larger isoglosses. Chuvash is renowned for its at times idiosyncratic behavior, as opposed to other members of the Turkic phylum. In the present case, Chuvash seems to mark the transition from the Turkic solution with two rounded front vowel phonemes to the situation found in the surrounding non-Turkic languages (Mordvin, Russian, etc.) where this class of phonemes is lacking, i.e., the absence of /ø/ is likely to be a product of language contact between Chuvash and its genetically unrelated neighbors. The complete absence of rounded front vowels in Mordvin has perhaps a similar explanation. Still, Chuvash is located next to the hotbed of rounded front vowels in the east containing the sister languages of Chuvash. Albanian, on the other hand, is cut off from the hotbed in the west by members of the Slavic phylum that do not

allow for rounded front vowels at all. In all likelihood, Albanian is the remnant of an erstwhile more extended subarea to which, on earlier stages, Greek also belonged. Similarly, English and Welsh have lost rounded front vowels in the course of their history. For Breton, French, and Rhaeto–Romance, the feature is certainly a relatively late contact-induced acquisition: The two Romance languages have copied the feature from Germanic, and Breton developed it under French pressure. It is noteworthy that the *Charlemagne Sprachbund* is again involved, while other more central SAE languages are somewhat underrepresented.

Quantity This section is concerned with the distribution of phonemic length in vowels (= /V:/), as in German *Hasen* [hazən] ‘hares’ vs. *hassen* [ha(s)sən] ‘to hate,’ and consonants (= geminates /K_iK_i/), as in Italian *sanno* [sanno] ‘they know’ vs. *sano* [sa(ˈ)no] ‘healthy.’ Ternes (1998) has studied both phenomena in a survey of the phonology of European languages that tacitly corrects a number of hypotheses put forward by Haarmann (1976a). Owing to the fact that, in a variety of languages, quantitative differences epiphenomenally go along with more or less significant qualitative differences and are sometimes determined by the moraic prerequisites of the canonic syllable structure of a given language, it becomes

difficult to decide whether length itself is the phonemically relevant factor. This and other aspects pose serious problems *inter alia* for the analysis of English and French. In the latter language, vowel length is marginally phonemic only in careful educated speech. In order to keep the discussion within reasonable limits, things are simplified by leaving problems of vowel quality and moraic templates aside. Moreover, cases like the French one are treated as instances of absence of a vowel quantity correlation.

Figure 2 surveys the presence and absence of phonemic long quantity for both vowels and consonants in Europe. Twenty-five sample languages (= slightly less than 50%) have distinctive vowel length, whereas only six display a quantity correlation for consonants. Four of these latter five distinguish quantities for both vowels and consonants. Were it not for Italian and Sardinian, one could be tempted to formulate an implication according to which phonemic quantity of consonants implies phonemic quantity of vowels. Long consonant phonemes are clearly a minority solution.

Independent of the fact that vowel length is distinctive in almost half of the present sample languages, the languages where this feature is attested display a clear areal bias. Discounting the isolated instance of distinctive vowel length in Maltese, one immediately notices that phonemic long vowels are a matter of

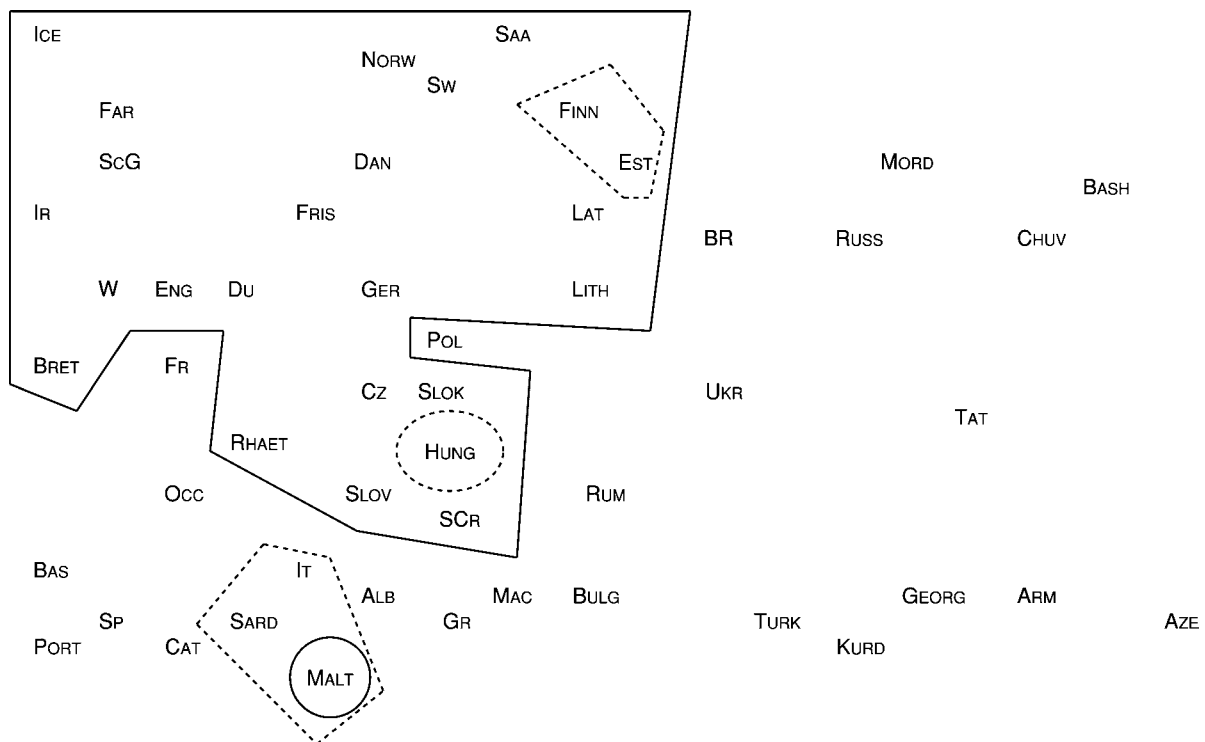

Figure 2 Quantity correlation [solid line = phonemic V:; dotted line = phonemic K:].

a large area comprising the European northwest, Scandinavia, the Baltic region, and central and part of southwest Europe. Three Indo-European phyla in their entirety partake in the isogloss: all Celtic, Germanic, and Baltic languages distinguish short vowels from long vowels. This distinction is also found in varieties of Rhaeto-Romance and some members of the South Slavic and West Slavic subphyla, all of which border the territory occupied by Germanic languages. Of the Uralic languages, those that are spoken in the vicinity of Germanic, Baltic, or Slavic languages with length distinctions for vowels have the same feature, whereas Mordvin seems to lack it. Again, the feature cuts across major and minor genetic boundaries. The same is true of the group of languages that do not allow for phonemic quantity.

The areality of the phenomena under scrutiny cannot be denied. In contradistinction to the foregoing one, where it is possible to identify waves of spread and recession, much seems to speak in favor of a slow but continuous shrinking of the area characterized by phonemic length. Given the fact that, historically, all Indo-European languages employed distinctive vowel quantity, the present situation is suggestive of a large-scale loss of the feature in the successor languages of Latin, Ancient Greek, Old Church Slavonic, and so on. Thus, the area from which phonemic length is absent has been expanding to the detriment of the hotbed of distinctive quantities. Interestingly, the two members of the *Charlemagne Sprachbund* are

this time located on different sides of the dividing line: German is an uncontroversial case of a language with phonemic vowel length, and French does not form part of the isogloss (but see above). With the exception of Dutch, vowel length distinctions are not typical of other more central SAE languages.

Morphology

Morphological case distinctions European languages come in two varieties. One group has case inflections on nouns independent of the exact size of the paradigm (Finnish *talo* {house} 'house' vs. *talo-n* {house}-{GEN} 'of a/the house'), whereas the other group does not mark case on nouns by morphological means (cf. the Welsh 'construct state' *tŷ y dyn* {house} {ART} {man} 'the man's house'). For the present purpose, neither the genitive clitic of English and the mainland Scandinavian languages nor the facultative *s*-genitive on proper nouns in Dutch and Frisian are counted as instances of bound case morphology. The present sample languages distribute over the two possible types as follows: a minority of 20 languages lack nominal case inflections, as opposed to a majority of 31 languages that employ more or less sizable inventories of morphological cases on nouns. **Figure 3** captures the areal pattern.

Nominal case morphology is largely a trait of languages located in the east and in the far west of the continent. A small strip extending from

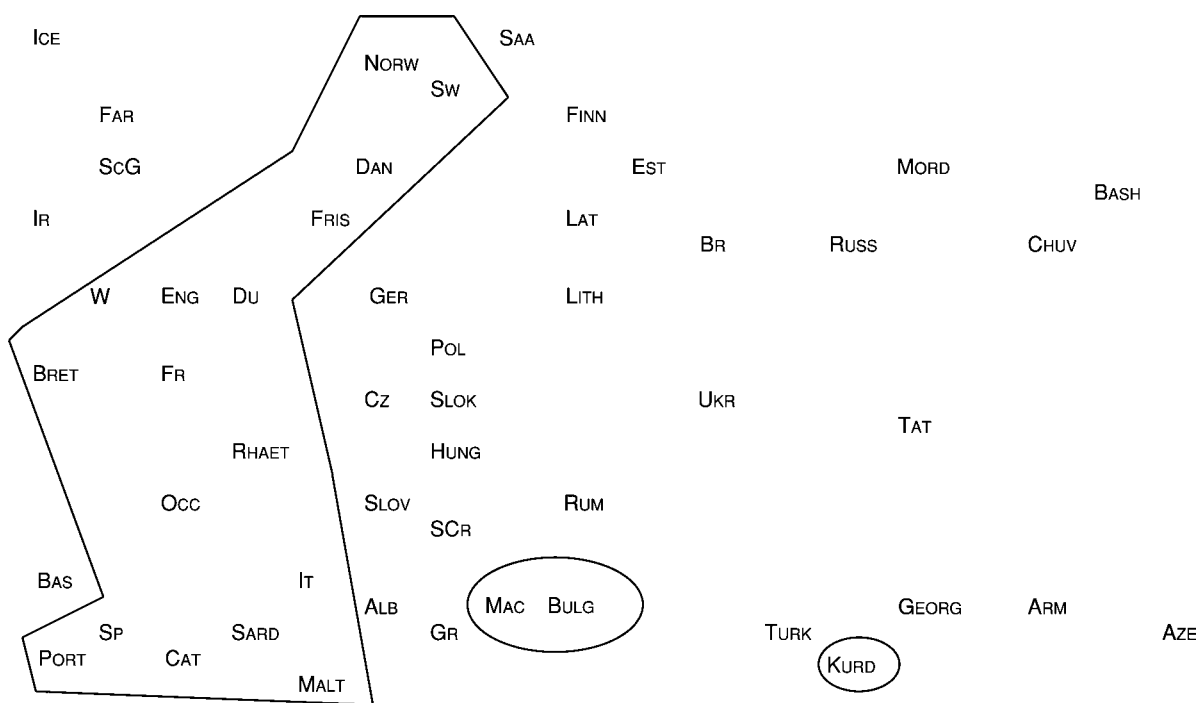

Figure 3 Morphological case on nouns [solid line = languages without case inflection].

Norwegian in the north via French in the middle down to Maltese in the south is characterized by absence of morphological case distinctions on nouns. Outside this area, this feature is also shared by Kurdish in the southeasternmost corner of the map and the two Balkan Slavic languages Macedonian and Bulgarian, which are surrounded by full-blown case languages. Basque is the only case-inflecting island in largely caseless surroundings. As is the situation with the previous isoglosses, phyla are cut across. There are case-inflecting Celtic languages and caseless ones; the same applies to the Germanic phylum, where German and the insular North Germanic languages stand out as representatives of the case-inflecting type, whereas the remaining Germanic languages have lost the ability to inflect nouns for case. Rumanian is the only Romance language with nominal case-inflection, while Bulgarian and Macedonian are dropouts from the Slavic phylum, as they have given up their erstwhile fully functional case system. All Uralic and Altaic languages are case-inflecting, as are the Baltic languages, Armenian, Greek, Albanian, and the bulk of the Slavic phylum. Maltese is the only non-Indo-European language without nominal case inflection. The primary stronghold of case inflection is clearly the eastern part of the continent. In the northwest the feature seems to be on the decline in the Celtic languages, less so in Faroese and probably not yet in Icelandic.

In their older stages, the Indo-European languages (Old Irish, Old English, Latin, Old Church Slavonic, Old Persian, etc.) were all endowed with a nominal case paradigm that in its most conservative shape resembled closely the one of present-day Lithuanian. Therefore, the absence of nominal cases in many Romance, Celtic, Germanic, and some Slavic languages (and Kurdish, for that matter) is an innovation. Much the same can be said of Maltese in comparison to Classical Arabic. In the languages that currently inflect their nouns for case, this feature can be classified as a retention, a conservatism. Old French is reported to have employed a minimal bipartite case system during the earliest stages of documentation, while the nominal case system had already disintegrated in most of its sister languages outside the Balkans. The chronology of the disintegration of nominal case systems is suggestive of a spread of caselessness from the south northward, eventually cutting the formerly continuous area of case languages into two subareas. Presently, the isogloss separates the two members of the *Charlemagne Sprachbund* that again happen to be situated on different sides of the line. The absence of case inflection, however, unites many of the more central SAE languages (Dutch, Spanish, Portuguese, Sardinian, Italian).

Comitative-instrumental syncretism The next feature also belongs to the realm of case distinctions, although it is not restricted to bound morphology. The focus is on the grammaticalized expressions of comitative and instrumental relations independent of the morpheme status of their markers. The presentation is based on the findings of a long-term crosslinguistic research on the two categories, some of which are discussed in Stolz *et al.* (2003), Haspelmath (2001), and Heine and Kuteva (2005). Languages may belong to one of three classes: They use two distinct markers to encode comitative and instrumental separately (= asyncretic); they do not distinguish formally between the two categories (= syncretic); or they employ two markers, of which one exclusively encodes either comitative or instrumental and the other one covers both functions (= mixed). Europe stands out from the rest of the world, as it is the only continent where the syncretic type is statistically the strongest (everywhere else the asyncretic type dominates by far). Thirty-five of the European sample languages (= 69%) are syncretic, 11 are asyncretic, and five are mixed. **Figure 4** suggests that the types are not randomly distributed over the continent but that there is a clear areal pattern.

The territory occupied by syncretic languages is divided into two subareas. The larger one covers most of the European north, west, and south. The smaller one is located in the extreme east; thus, the major homestead of the asyncretic type finds itself sandwiched between syncretic languages. What strikes the eye most is the fact that representatives of the mixed type never cluster anywhere. Where they occur they are situated on the margins of the syncretic territory, often trapped between syncretic and asyncretic languages. This is indicative of a transition from one major type to the other. Not surprisingly, the isoglosses do not respect genetic principles. The Uralic macrophylum contains syncretic, asyncretic, and mixed languages. Slavic, Celtic, Baltic, and Germanic languages are distributed over two different types. These differences in class membership are not random but rather are areally motivated. Those languages that fail to behave like their next of kin converge with their next-door neighbors, either fully or partially.

Diachronically, the properties of the syncretic type seem to be innovations, at least in a number of the languages involved. It can be shown that the feature spread from Germanic to the Baltic languages and Estonian in the early days of their documented history and triggered their typological change from asyncretic to syncretic via mixed – which is the stage reached by contemporary Lithuanian. Germanic and Italo-Romance can also be held responsible for the present

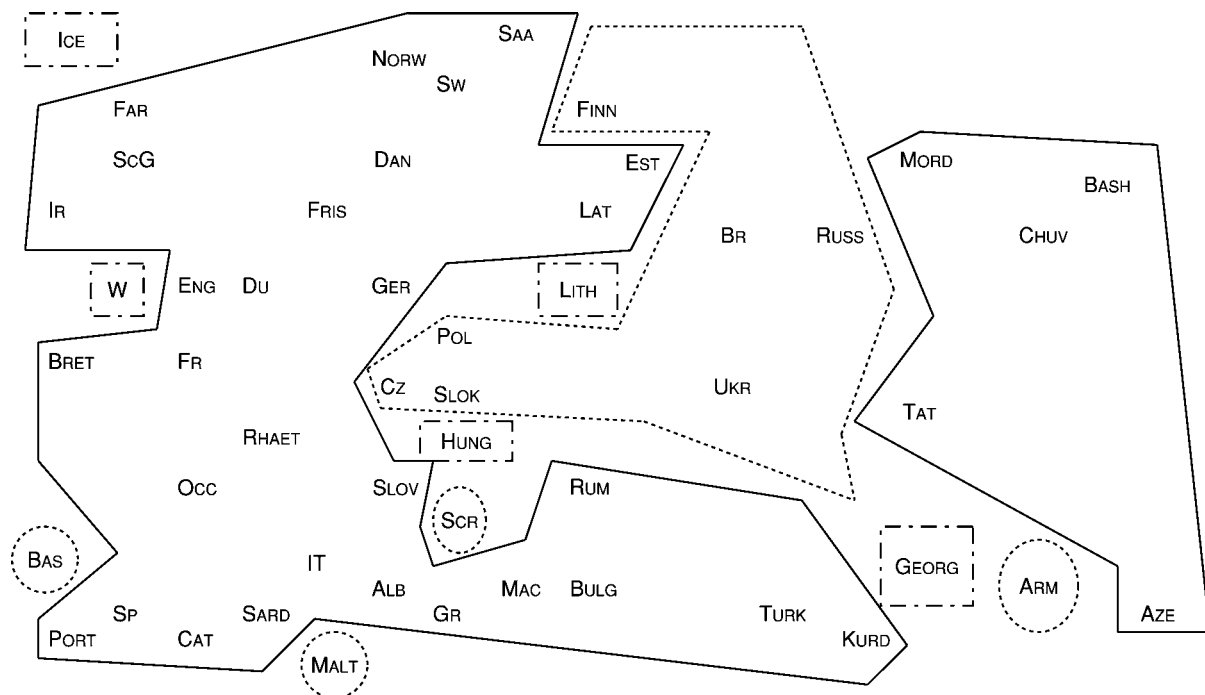

Figure 4 Comitative–instrumental syncretism [solid line = syncretic; dotted line = asyncretic; dashed/dotted line = mixed].

syncretic status of Slovenian, whereas Macedonian and Bulgarian conform to the general Balkanic picture that favors the syncretic type. A similar contact-based explanation is perhaps also possible for the mixed status of Hungarian (supported by German and Rumanian influence). In the east, syncretic properties have a genetic foundation, as all members of the Altaic phylum display the feature. Mordvin is again likely to have been influenced by the neighboring Turkic languages. Asyncretic languages are thus on the retreat.

Syncretism of comitative and instrumental is indeed a trait shared not only by the two members of the Charlemagne Sprachbund but also by those languages that belong to the more central ‘layers’ of SAE, including a variety of languages that do not partake regularly in isoglosses of the SAE languages.

Cardinal-based derivation of ordinals In Stolz and Veselinova (2005), the relationship between ordinal numerals and cardinal numerals in terms of derivation is studied in a crosslinguistic perspective. There are various types, the major ones being:

1. no formal distinction (= unattested in Europe)
2. ordinals are regularly derived from cardinals, as in Tatar *bēr* ‘one’ → *bēr-ěncě* ‘first,’ *ikě* ‘two’ → *ikě-ncě* ‘second,’ etc.
3. FIRST is not based on ONE, all other ordinals follow pattern (b), as in Georgian *erti* ‘one’ vs. *p’irveli* ‘first’ as opposed to *ori* ‘two’ → *me-or-e* ‘second,’ *sami* ‘three’ → *me-sam-e* ‘third,’ etc.

4. FIRST and SECOND are not derived from ONE and TWO, respectively, all other ordinals follow pattern (b), cf. Swedish *en* ‘one’ vs. *första* ‘first,’ *två* ‘two’ vs. *andra* ‘second’ as opposed to *tre* ‘three’ → *tre-dja* ‘third,’ *fyra* ‘four’ → *fjär-de* ‘fourth,’ etc.

On the basis of the data in Stolz (2001), Haspelmath (2001) considers the suppletive second ordinal, i.e., type (d) a potential SAE feature. Figure 5 reveals that this type is indeed the majority solution for the sample languages: 36 languages belong to type (d), 10 to type (c), and the remaining five are type (b) languages.

Type (d) occupies the large middle section on the map stretching from Saami in the north via Czech down to Sardinian in the south. The easternmost representative of this type is Mordvin, which, for once, does not show affinities to its Turkic neighbors. Irish marks the westernmost outpost of type (d) languages. The only region of Europe from which type (d) is completely missing is the southeast, where type (b) and type (c) dominate. Type (b) has a strong genetic foundation, as it is attested in all Altaic languages of the sample. The distribution of type (c) is less coherent because there are isolates and small subareas on the margins of the territories of the other two types. The largest of these comprises three West Germanic languages and Scots–Gaelic. Owing to the fact that other Celtic and Germanic languages are bona fide (d) type languages, it is clear that the isoglosses follow the familiar pattern or running

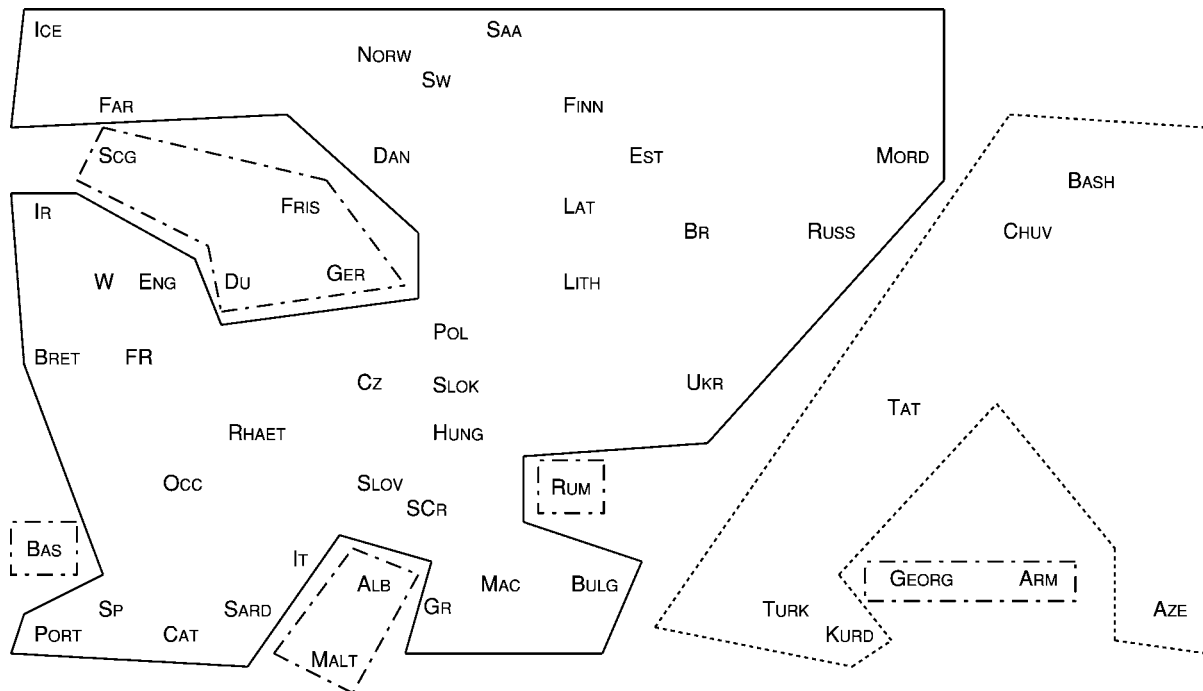

Figure 5 Suppletive ordinals [dotted line = type (b); dashed/dotted line = type (c); solid line = type (d)].

crisscross over genetic boundaries. Rumanian is the only representative of (c) type in the otherwise predominantly (d) type-oriented Romance phylum. Indo-European and non-Indo-European languages may form subareas together, as is the case for the (c) type languages Albanian and Maltese in the south and Armenian and Georgian in the southeast. The entire Uralic macrophylum partakes in the (d) type isogloss, together with the bulk of the Indo-European languages.

A word of caution is in order: There are areas of transition between the major and the minor types. Depending upon which variety of Frisian and Kurdish one chooses, the isoglosses may change direction: West Frisian follows Dutch and German (= [c] type), whereas North Frisian goes along with neighboring Danish (= [d] type). Zazaki Kurdish (Dimli) behaves like Georgian and Armenian (= [c] type), whereas other varieties of Kurdish join Turkish in the (d) type. In addition, French, with its contrast of *second* vs. *deuxième* 'second,' combines properties of both (c) type and (d) type and thus shares features not only with the bulk of typical SAE-languages that tend to belong to the (d) type but also with its partner in the *Charlemagne Sprachbund*, the (c) type language German. Turkish, Azeri, and Kurdish also allow for two allmorphs of FIRST, one of that is suppletive (Turkish *bir* 'one' → *biri-nci* 'first' vs. *ilk* 'first'). These cases add to the reality of the phenomena under scrutiny, as they clearly

demonstrate that neighborhood relations are crucial. The diachrony of the geolinguistic distribution patterns of the suppletive second ordinal still needs to be investigated more thoroughly. The most one can say for now is that German, Dutch, and Rumanian seem to have lost their erstwhile (d) type properties in the course of their history (for Rumanian, (d) type features may be found in certain stylistically marked registers).

Total reduplication Haspelmath (2001: 1503) observes that reduplication is practically unknown in contemporary European languages. This observation is correct as far as partial reduplication goes. The picture changes dramatically when we look at total reduplication, as studied in Stolz (2003). Total reduplication is firmly established as a morphological means in 25 of the sample languages, such as Maltese *ġew tnejn tnejn* {come.PERF.3Pl} {two} {two} 'they came in pairs of two,' whereas the other 26 languages do not employ total reduplication in any systematic way. For a number of languages, the situation is difficult to assess. **Figure 6** identifies the areal hotbeds of these types.

In Ibero-Romance languages, total reduplication is largely discouraged by normative grammar, although some patterns recur in the written register. This suggests that we are dealing again with an areal phenomenon. Those languages that disfavor total reduplication are located in the center of the map,

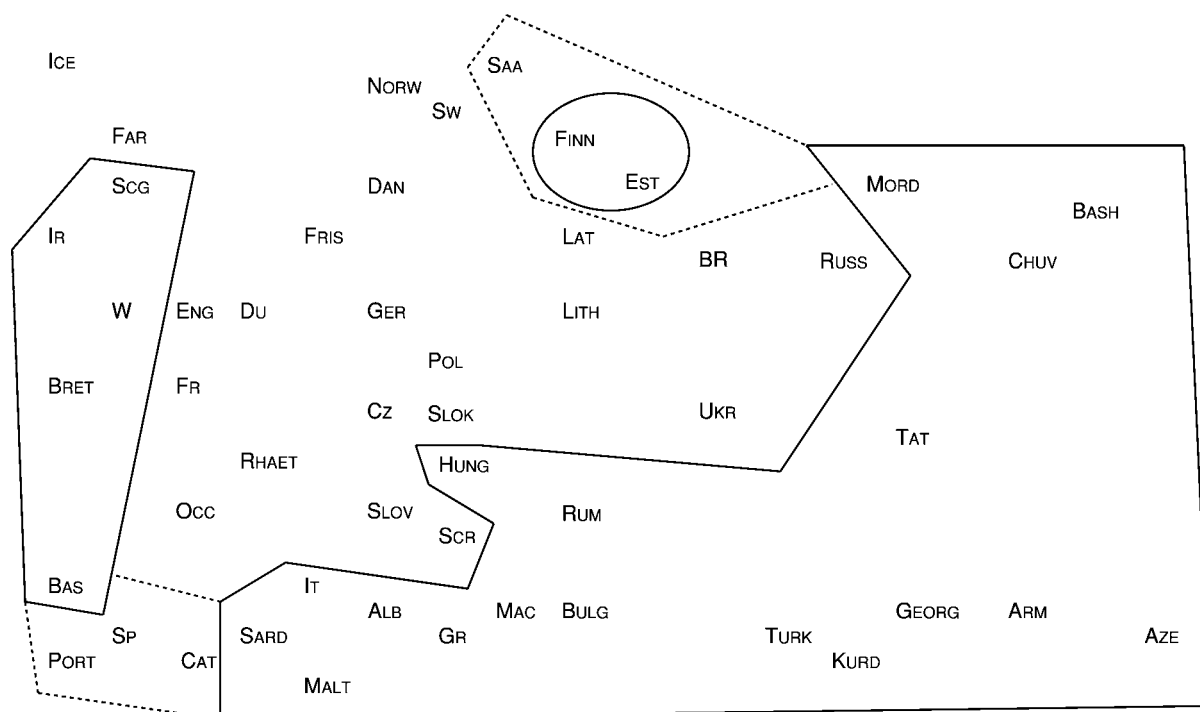

Figure 6 Total reduplication [solid line = reduplicating languages; dotted line = controversial cases].

almost completely surrounded by languages that have a predilection for total reduplication. Total reduplication is especially strong in the south and east as well as in the western rim of the continent.

As to genetic affiliation, a high percentage of languages where total reduplication is systematically employed belong to non-Indo-European macrophyla (12 out of 25 = 48% of the type). No non-Indo-European language is a bona fide case of a non-reduplicating language. Romance and Slavic phyla are divided into two, each with a substantial minority of the languages allowing for total reduplication. The entire Celtic phylum is reduplicating, whereas total reduplication is foreign to the Baltic and the Germanic phyla. Irrespective of these genetic preferences, **Figure 6** shows that neighborhood relations are again decisive: Those Romance and Slavic languages that have total reduplication share this feature with their unrelated or only distantly related neighbors. In terms of the SAE *Sprachbund*, the southern half of it is cut off from the rest by this isogloss because Italian, Sardinian, and Albanian are reduplicating but French, German, and Dutch are not.

The isogloss of total reduplication continues far beyond the limits of Europe into Siberia, the Middle East, India and South Asia, and Africa. Those languages that do not participate in this isogloss, therefore, represent the marked case. As yet, nothing definitive can be said about the history of the

isoglosses. There is evidence for diffusion of total reduplication from the Levant westward in the Mediterranean. At the same time, avoidance of total reduplication seems to spread from central Europe to the southwest. The latter processes may be supported by normative grammarians, which leaves open the question of whether total reduplication is employed by native speakers in actual discourse.

Quintessence

Summing up what **Figures 1 to 6** tell us, we observe that the distribution of the phenomena is not identical for any two isoglosses – in other words, isoglosses behave like individuals. This is of course the expected outcome. The individuality of the isoglosses notwithstanding, it is nevertheless possible to map the isoglosses onto each other to produce isopleths. **Figure 7** depicts the clustering of isoglosses from the perspective of Russian as a kind of check for the SAE-centered approach of earlier contributions of the areal linguistics of Europe. Note that every sample language shares at least one feature with Russian.

Superficially, this cluster map suggests that, with the necessary changes, it is also possible to paint a picture of the geolinguistics of Europe with a language in the center of attention that is not a prime candidate for the status of SAE language. However, there is a relatively strong genetic component that

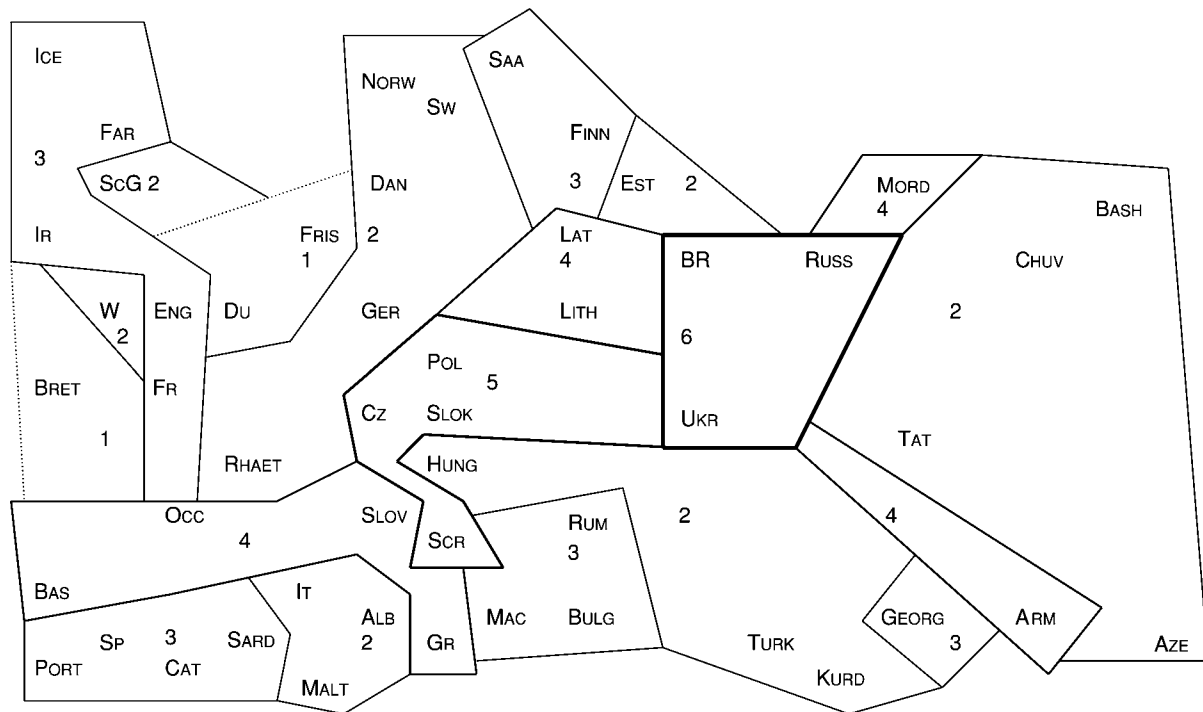

Figure 7 Cluster map.

determines similarity relations. Russian and its east Slavic sisters and neighbors, Bielarussian and Ukrainian, share all six features. The next layer, with five shared features, is also exclusively Slavic, namely the west Slavic phylum plus Serbo-Croatian. Only on the third layer does genetic diversification set in: Here we find, in addition to Slovenian, the Baltic subphylum, Armenian, Greek, all varieties of Occitan, Basque, and Mordvin. The smaller the number of shared features, the higher the genetic heterogeneity of the layer. Interestingly, the languages with the minimal number of one single shared feature, Dutch, Frisian, and Breton, are all spoken in the west at a distance from Russian. Mainland Scandinavian languages and central Europe are likewise less prone to associate with Russian in isoglosses. Nevertheless, there seems to be a somewhat stronger westward orientation of the assumed area based on Russian, as the members of the Turkic phylum in the east display unexpectedly low degrees of similarity to Russian. Discounting the fact that the very first layers (with five or six shared features) on the cluster map are clearly grounded in the Slavic phylum, it is nevertheless possible to postulate an areal structure with decreasing numbers of shared features from center to periphery. Thus, this still very superficial look at Europe from the eastern vantage point supports the idea that there is a counterpoint to SAE. This view is in line with Lewy's ([1942] 1964) observation that there

is an east-west asymmetry in Europe. As Haspelmath (2001: 1505) observes, the coexisting areas collide and overlap (most probably on the Balkans) and thus contribute to the geolinguistic diversity of Europe.

Europe as a Contact-Superposition Zone

From the above we learn that one and the same language may be part of residual and expansive areas, depending on the feature under review. What the data seem to suggest is the frequent diffusion of features originating on the (south)western mainland of the continent to the north and east. With a view to determining the balance or imbalance of SAE-based innovations and non-SAE-based ones, a much more detailed in-depth study of the geolinguistics of Europe is called for.

In the absence of such a study, one can tentatively conclude that:

- Europe is not a homogeneous linguistic area on a par with, say, the Balkan *Sprachbund*.
- The areal linguistics of Europe cannot be reduced to the identification of SAE features because:
- many languages of the continent are never or hardly ever included in the relevant isoglosses;
- many important features have not yet been checked for their areal distribution within the confines of Europe;

- the languages that fail to qualify as more central SAE languages (including those that do not share a single of the features characteristic of SAE) are likely candidates for at least one non-SAE linguistic area.
- The feature/isogloss-based approach to areal linguistics is methodologically superior to others, as it is based on proper linguistic criteria without the necessity of recourse to nonlinguistic ones.
- The feature/isogloss-orientation also gives us the opportunity to look beyond the geographic boundaries of Europe in order to establish whether the languages involved form part of a much larger macro area (Kuteva, 1998).

Given that isoglosses overlap and relatively seldom come in bundles, and given too that features may originate in different places, it is probably more accurate to speak of Europe as a contact-superposition zone (Koptjevskaja-Tamm and Wälchli, 2001) in lieu of using the suggestive label *Sprachbund* or even the somewhat less restrictive term ‘linguistic area.’ The present distribution of features on the European map is the product of a variety of processes that happened at different epochs. Not all of the phenomena can be attributed to the time of the Great Migrations or to any one major historical event of the distant past (Haspelmath, 1998; Haspelmath, 2001: 1506–1507). Some innovations spread at a higher speed than others, some are attractive and are copied in language contact, others fail to meet this criterion and thus never extend beyond a certain region. One can therefore agree with Haspelmath (2001: 1507) when he concludes that the distribution of different features is ‘due to different historical circumstances, and the correct picture is likely to be much more complicated than we can imagine at the moment.’

With a view to coming closer to the correct picture, future investigations on the basis of a much larger sample of languages will have to integrate both evidence from substandard varieties and diachronic data.

Evenki

I Nedjalkov, Institute of Linguistic Research,
St Petersburg, Russia

© 2006 Elsevier Ltd. All rights reserved.

Evenki belongs to the Tungusic family, widely considered to form a branch of the Altaic languages. Tungusic family comprises three subgroups, the Northern (or Siberian), the Southern (or Amur), and the Manchu. (There is another classification in which two subgroups are distinguished, the Northern group and the Southern group including Manchu.) The number of native speakers of Evenki in Russia does not exceed 30 000. Evenks live on vast territories in

Siberia, far east of Russia, and in the north of China and Mongolia (where they are called Oroqs or Orochons; about 12 000). The Evenki Autonomous Region comprises about 768 000 square kilometres; its population is about 30 000 and only about 5000 of them are Evenks. If we sum up all the territories of Siberia and the far east of Russia inhabited by the Evenks, the total will equal the territory of at least one-third of Russia. There is hardly another people in the world as small as the Evenks that is aboriginal to such a vast area, as they were a nomadic people.

Evenki is also remarkable for its number of dialects and subdialects, about 50 in all. They are subdivided into three groups, Northern, Southern, and Eastern.

The Northern dialects of Evenki are spoken in the northern part of the Krasnojarsk and Irkutsk regions, and the Southern dialects around Lake Baikal and in Buryatia. The Eastern dialects are spoken in the Republic of Sakha-Yakutia, in the Amur and Khabarovsk regions and on the Island of Sakhalin. The Evenki language acquired its writing system in the early 1920s. It was based on the Latin alphabet but later (in the early 1930s) it was replaced by the Cyrillic alphabet. Nowadays, books and newspapers are published in Evenki.

General Characteristics: Sentence Structure and Morphology

Evenki is an agglutinating (suffixal) language with no prefixes. It has nonrigid SOV word order, rich verbal morphology, and predominantly participial and converbal syntax. Adjectives, demonstrative, and possessive pronouns, and numerals always precede the head noun.

Case, Number, and Possessivity

The Evenki noun has 13 cases (plus the comitative, which can also be viewed as a special noncase form). Nominative: zero marker (marks the subject); Accusative 1: *-va* (marks the definite direct object); Accusative 2: *-a/-ya* (marks the indefinite direct object; can also express the partitive meaning and, with markers of personal or reflexive possession, the benefactive meaning of the direct object); Dative: *-du/-tu* (marks locative and temporal adverbials and also addressee and beneficiary); Allative 1: *-dula/-tula/-la*; Allative 2: *-tki*; Allative-Prolative: *-kli*; Locative-Allative: *-kla*; Instrumental: *-t/-di*; Ablative 1: *-duk/-tuk*; Ablative 2: *-git*; Prolative: *-duli/-li*; Comitative: *-nun*.

Accusative 2 (traditionally termed indefinite accusative) is used either for indefinite nonreferential objects or for a partitive meaning, and it generally occurs either with the future tense or with the imperative; e.g.,:

- (1) *Ukumni-ye min-du bu:-kel*
milk-ACC2 I-DAT give-IMPERATIVE:2SG
'Give me some milk'

Accusative 2 with the markers of personal possession codes object-oriented benefactive forms, while the same case with reflexive-possessive markers codes subject-oriented benefactive forms, e.g.,: *dyav-ya-v* 'a boat for me', *dyav-ya-s* 'a boat for you'(SG); *dyav-ya-vi* 'a boat for oneself (myself/yourself/himself/herself)'; *dyav-ya-var* 'a boat for ourselves/ourselves/themselves.' The plural marker is the suffix *-l* on the absolute majority of nominal stems; on nouns with the stem-final *-n*, the plural marker is *-r*, which ousts *-n*, e.g., *oron* 'reindeer.SG' → *oro -r* 'reindeer-PL'. The personal-possessive affixes are: *dyu-v* 'my house', *dyu-vun* 'our (EXCL) house'; *dyu-t* 'our (INCL) house', *dyu-s* 'your (SG) house', *dyu-sun* 'your (PL) house', *dyu-n* 'his/her house', *dyu-tyn* 'their house.' Reflexive-possessive affixes are *-vi/-mi* for a singular possessor: depending on the person of the subject it may mean 'my', 'your (SG)', 'his/her'; and *-var/-mar* for a plural possessor: depending on the person of the subject it may mean 'our', 'your (PL)', or 'their'. Morphemic ordering in nouns is the following: noun stem - plural - case - possession, e.g.,: *dyu-l-dula-tyn* 'to their houses/tents'.

Tense/Aspect System and Agreement

There are eight tenses; the markers are: *-ra*: non-future tense; *-dyara*: present tense; *-cha*: past tense; *-dyacha*: imperfect; *-ngki*: iterative past; *-dya*: future 1; *-dyanga*: future 2; *-dyalla*: future 3. There are about 10 aspectual markers: imperfective *-dya*; inchoative *-l*; semelfactive *-sin/-sn/-s*; distributive *-kta*; durative *-t/ -chi*; habitual *-ngna*; iterative *-van/-vat*; resultative *-cha*; quick action *-malcha*.

There are two types of agreement. The first one coincides with the personal possession nominal markers and is used with tense forms that go back to (and coincide with) participles. The second type is the system of verbal agreement markers proper. Agreement markers of the finite verb forms are the following (see Table 1).

Non-finite Verb Forms

There are about 15 converbs and 10 participles. The most common participles are the habitual

Table 1 Agreement markers

| | Nominal type | | Verbal type | |
|--------|--------------|----------------|-------------|--------------|
| | SG | PL | SG | PL |
| 1st p. | <i>-v</i> | <i>-vun/-t</i> | <i>-m</i> | <i>-v/-p</i> |
| 2nd p. | <i>-s</i> | <i>-sun</i> | <i>-nni</i> | <i>-s</i> |
| 3rd p. | <i>-n</i> | <i>-tyn</i> | <i>-n</i> | <i>-φ</i> |

(marker-*wki*), the simultaneous (-*dyari*), the anterior (-*cha*), the posterior (-*dyanga*). The most common converbs are those of anteriority (marked by -*ksa/kanim*) and temporal-conditional converbs in -*mi* (*same-subject*) and -*raki* (*different-subject*).

Voice System, Means of Valency Change, and Their Combinability

There are four productive means of changing the valency and/or the number of participants, traditionally regarded as voices: causative (marker -*vkan*), passive/decausative (-*v/-p/-mu*), reciprocal (-*mat/-mach*), and sociative. The sociative marker -*ldy* does not change syntactic valency of the base verb, but it changes the number of participants. Reflexivity is expressed pronominally. In this respect, Evenki, like other Tungusic languages, differs from the neighboring Turkic languages and reveals similarity to the neighboring Mongolian languages.

Causative derivation increases the valency of the base verb by one. Causatives are freely derived from all pure transitive and intransitive stems (i.e., stems with no other voice/valency suffixes) and also from sociatives and a few reciprocals, e.g.: *iche*- 'to see sth' → *iche-vken-* 'to show sth to sb' → *iche-vken-met-* 'to show sth to each other'; *archa*- 'to meet sb' → *archa-mat-* 'to meet each other' → *archa-machi-vkan-* 'to cause/let/make sb (to) meet each other'.

Sociative derivation is possible from all pure verb stems and also from causatives, but not from reciprocals and passives:

- (2) *Asa-l dyu-va*
 woman-PL house-ACC
iche-vke-ldy-re-0
 see-CAUS-SOC-NFUT-3PL
 'The women showed the house [to someone else] together'

Passive derivation (suffix -*v*) is possible from all transitive stems including causatives (thus resulting in either personal or impersonal passive constructions), almost all intransitives (resulting in impersonal passive constructions only) and seven intransitive 'weather' verbs (resulting in personal adversative passives). The marker -*v* homonymous with the passive suffix can function as a nonproductive causative suffix. Passives are not derived from reciprocals and sociative stems.

- (3a) *Asi dyu-va o:-ra-n*
 woman house-ACC make-NFUT-3SG
 'The woman put up a tent'

- (3b) *Dyu o:-v-ra-n*
 tent make-PASS-NFUT-3SG
 'The tent was put up'/'The house was built'

Reciprocal derivation is impossible from passive and sociative stems (the suffix -*ldy-met* is not a reciprocal derivation from sociative but a complex reciprocal suffix). It is possible from causative stems:

- (4a) *Asa-l dyu-l-var*
 woman-PL house-PL-their
iche-vken-met-te-0
 see-CAUS-REC-NFUT-3PL
 'The women showed their houses to each other'
- (4b) *Nungartyn eme-vken-met-chere-0*
 they come-CAUS-REC-PRES-3PL
 'They cause each other to come'

Anticausatives from verbs denoting destruction or change of state are formed by means of the suffix -*rgal-rge*. From a small group of verbs, anticausatives are formed by means of the suffix -*v/-p/-mu*, and it also functions as a passive marker (note that this very suffix is also used to derive causatives from about 50 intransitive and 20 transitive verbs):

- (5a) *kapu-* 'to break' (vt) → *kapu-rga* 'to break' (vi)
ety 'to tear' (vt) → *ety-rge* 'to tear' (vi)
- (5b) *das-* 'to close' (vt) → *dasi-v-* 'to close' (vi)
sukcha 'to break' (vt) → *sukcha-v-* 'to break' (vi)

Negation, Modality Markers, and Morphemic Ordering

There are two major ways of expressing negation in Evenki: (a) by means of the conjugated negative auxiliary verb *e* 'not to . . .', and (b) with the negative noun *achin* 'no'.

The modality markers include: -*mu* ('want'), -*ssa* ('try'), and -*na* ('go'), e.g., Nungan homoty-va (ACC1) va: -na-ssa-mu-dyere-n lit. 'He wants to try to go and kill the bear'.

Morphemic ordering in verbs is the following: verb stem - causative - sociative - reciprocal - aspect - passive - modality - evaluation - aktionsarten - tense or non-indicative moods or nonfinite markers - subject agreement (in person/number).

Ewe

J Essegbey, University of Florida,
Gainesville, FL, USA

© 2006 Elsevier Ltd. All rights reserved.

Also written *Eve*, and pronounced /əβə/, Ewe designates a dialect cluster that is spoken mainly in South-eastern Ghana, but also in the southern part of Togo and across the Togo-Benin border. Its dialects include Kpele and Notsie, spoken in Togo, Waci, spoken in Benin, and Aɲɔ, Tɔɲu, Ho, Kpedze, Anfoe, and Kpandu, all spoken in Ghana. The dialects in Ghana are grouped into Coastal (e.g., Aɲɔ, Tɔɲu), Central (e.g., Ho, Kpedze), and Northern (e.g., Anfoe, Kpando). The Central and Northern dialects are also grouped together as Inland dialects. Ewe is part of the Gbe language cluster (cf. Capo, 1991), which belongs to the Kwa family.

History and Sociolinguistics

The origin of the Gbe-speaking people has been traced to Ketu, a Yoruba town in the present-day Benin. From there they moved southward, with some founding a settlement at Tado, while others settled at Adele and others went to Notsie. The Ewes are among those who settled in Notsie. They say that their forefathers fled the tyranny of a ruler of Notsie called Agorkoli, and dispersed to their present-day locations.

Ewe is spoken by approximately 3–5 million speakers. It is taught as a subject from elementary school to the university level and is one of the seven national languages in the media in Ghana, and one of two in Togo. A clear dialectal difference can be established between the Coastal and Inland dialects, e.g., ‘ash’ is *afi* in the Coastal dialects, and *dzowɔ* in the Inland. The former also have a habitual suffix *-na*, which is represented in the other dialects as *-V*, the resultant realization being determined by the preceding vowel. Hence *zɔna* ‘walks’ is *zɔɔ* in the Inland while *fena* ‘plays’ is *fee*.

In addition, the initiator of greetings at the Coast exhausts all his or her questions before the interlocutor begins. By contrast, in the inland, both speakers take turns in asking how-are-you questions.

Left-hand use is prohibited in social interaction, giving rise to interesting modes of pointing.

Phonology

Ewe has 29 consonants and seven oral vowels with nasalized counterparts. Notable among the consonants are labiovelar stops, bilabial fricatives, and a velar approximant. Both /l/ and /r/ occur in complementary distribution: /r/ occurs before laminodentals, alveolars, and palatals, while /l/ occurs elsewhere, including in word-initial position. Also, /w/ occurs before rounded vowels while /y/ occurs before unrounded vowels (*wɔ* ‘do’ vs. *yi* ‘white’). Although most of the dialects have all the nasalized vowels, a few, including Peki, do not have /õ/. Thus instead of *lõ* ‘take off fire,’ they say *lɔ*.

Ewe is a tone language. Phonetically, all the dialects have high, mid, and low tones, which also combine to yield six contour tones. Phonologically, it has a high and nonhigh tone, both of which are dependent on the environment. Thus nonhigh tone is realized as mid in a root noun that has a voiceless obstruent or sonorant, and low before a voiced obstruent. High tone is realized as high before a voiceless obstruent and mid before a voiced obstruent. Aɲɔ also has a phonologically conditioned extrahigh tone, while Adangbe has an extralow tone that occurs on the utterance-final interrogative particle.

The syllable structure is mainly open, although a few words end with nasals, e.g., *kpam* ‘sound of slap.’ While it is possible to have a maximum of two syllable-initial consonants, the second has to be a liquid or approximant. The nucleus can be a vowel or a nasal.

Morphology

Ewe has been characterized as an isolating language with agglutinating features (Ameka, 1991). Thus, many words look like a concatenation of individual morphemes:

nyɔnu-vi-wo
woman-little-PL
‘girls’

It has only one inflectional affix, i.e., the habitual suffix *-na*. However, it has derivational processes, which include reduplication, triplication, and compounding. It also has derivational affixes such as the agentive *la*:

nu-fia-la
[thing-teach-AG]
teacher

Syntax

Syntactically, Ewe is an SVO language, with alternative OSV order being determined by semantic and pragmatic factors such as topicalization and focusing. Within the noun phrase, modifiers follow the head noun (*q̄evi nyui la* ‘child good the’). The plural morpheme *wo* is related to the third person plural pronoun *wo* and is not required when the NP has a numeral (*q̄eviwo* ‘children’ vs. *q̄evi eve* ‘two children’). It is, however, obligatory after a determiner (*q̄evi eve ma-*(wo)* ‘child two that-PL’). There is a logophoric pronoun (*ye*) that occurs in a subordinate clause introduced by *be(na)* ‘that’ (cf. Clements, 1979; Essegbey, 1994).

Ewe is a tenseless language. An active verb in the aorist receives past tense interpretation, (*e-qu nu* ‘he ate’), while a stative or inchoative verb receives present tense interpretation (*e-ku* ‘it is dead’). A potential morpheme gives rise to future interpretation. It has a serial verb construction (SVC) in which the two or more verbs in a clause share the same TMA value. Negation in the clause is a discontinuous morpheme *me . . . o*: *me* precedes the first verb and *o* occurs at the

end of the clause. Ewe has obligatory complement verbs (OCVs): verbs with fully specified meaning have to take a generic-meaning complement (*qu nu* ‘eat thing’), while others with less determined meanings have their meaning further specified by the complement. These are known as inherent complement verbs (ICVs), (*fu tsi* ‘move_limb water = swim’).

There are two types of double object constructions: Theme-Goal (*bia nya Kofi*, literally ‘ask word Kofi’) and Goal-Theme (*na Kofi ga* ‘give Kofi’). *Na* ‘give’ and *fia* ‘teach’ occur in both constructions. Finally, Ewe has ideophones, some of which code manner of motion concepts, e.g., *dziadzia* ‘energetic walking.’

F

Fanagalo

R Mesthrie, University of Cape Town, Cape Town, South Africa

© 2006 Elsevier Ltd. All rights reserved.

Fanakalo (also spelled Fanagalo) is a southern African pidgin language that continues to be used two centuries after its inception. It is used in parts of South Africa, Zimbabwe (where it is usually known as Chilalalapa), Mozambique, Malawi, Zambia, and Namibia where it has been carried by migrant workers in the South African mines. Within South Africa it is spoken mainly in the provinces of KwaZulu-Natal and Gauteng (the mining area).

Fanakalo can be described as a 'crystallized' pidgin in terms of its fairly stable structure and circumscribed contexts of use. It is a contact language used prototypically in work situations: on farms, in the mines of the Witwatersrand that draw a multilingual workforce from all over southern Africa, in other urban labor situations, and in domestic employment (between employers and maids, cooks, gardeners). One can hear it in situations of sustained labor contacts, as well as in 'transactional' communications as in gas stations, shops, markets, and the like. In South Africa in provinces other than KwaZulu Natal and Gauteng, Fanakalo is less well known, as the rival urban lingua franca in the domain of labor is Afrikaans. In rural areas, population demographics often dictate that white farmers and their families acquire the local Bantu language, especially Tswana in the Free State, Xhosa in the eastern Cape, and Zulu in KwaZulu-Natal. In former times, Fanakalo was also used in nonlabor contexts when Europeans and/or Indians had no other means of communication with each other. Thus, it was used sporadically "by white men amongst themselves when no other means of communication are available" (Mayne, 1947: ii) and when North Indians had no other means of communication with South Indians (Mesthrie, 1989).

Fanakalo use is receding slightly as English spreads as a lingua franca among younger people, even on farms. In addition, its use is no longer officially sanctioned in the mines of post-apartheid South Africa

because of its long-standing association with cheap labor and racism. However, there are still ample situations in which it is used, including some non-labor contexts (Adendorff, 1995). Two such uses are a kind of expatriate solidarity or nostalgia for things South African expressed by some expatriates in light-hearted communications with family in South Africa or as a secret language for Zimbabwean or KwaZulu-Natal tourists abroad, especially for those who do not speak a Bantu language or Afrikaans. Fanakalo is sometimes used by Zulu speakers as a playful form of code divergence that signifies harsher relations with interlocutors than is possible using Zulu (Adendorff, 1995).

Origins

The first sustained contacts between Europeans and indigenous peoples in South Africa took place in the western Cape in the 17th century, where Afrikaans arose as a lingua franca out of the experience of colonization and slavery. When Afrikaners moved into the eastern Cape from about 1770 onward, Afrikaans was no longer a viable means of communication with the Xhosa people, and several strategies of communication arose: by signs, by simplified Xhosa, by simplified Afrikaans, or by a mixture of these methods (Mesthrie, 1998). With the arrival of the first batch of settlers from England, English was added to the frontier in 1820.

Fanakalo probably came into existence amid these diffuse communicational circumstances in the eastern Cape in the early 1800s. Mesthrie (1998: 13) gave the earliest recorded sentence in the pidgin as *Wena tandaza O Taay* 'You (must) worship God' (uttered by the missionary John Reid, Kat River 1816, who thought he was speaking Xhosa). Fanakalo does not seem to have been widespread in this period: It is but one of several communication strategies that appear in the archival and travel literature of the times, and judging from the sources it was used not very frequently.

Among the many diffuse strategies of communication on the eastern Cape frontier, the one that won

out later in the new colony of Natal (established in 1843 further north along the coast) was the Fanakalo option. The pidgin, which was initially known as 'Kitchen Kaffir' in this colony, was likely brought over by people with experience of the frontier: Afrikaners away from the British in the Cape Colony, their 'colored' servants, English adventurers, and possibly some officials. No concrete evidence of this link exists, however, and the brief accounts of Fanakalo give a picture of a pidgin being invented anew from contacts between British settlers and the Zulus who outnumbered them. Two major crystallizing events for Fanakalo took place in this period: (1) the arrival of indentured Indians in large numbers in the coastal province of Natal (starting in 1860); and (2) the discovery of diamonds and gold in the interior (starting in 1867).

Structure

Although Fanakalo has none of the inflexional/agglutinative richness of Zulu (see Cole, 1953), it is not as impoverished as one might expect of a pidgin. It has four tense markers used with verbs, which are all derived from Zulu (or Nguni languages generally): *-a* (for infinitive, imperative, and present tense verbs); *-ile* (past tense); *zo* (future); and *gate* (anterior). The first two tense markers are suffixes, whereas the future marker *zo* occurs either as a free form that precedes the verb or as [z] cliticized to the subject pronoun. The fourth tense marker, *gate* (phonetically [gate] < Zulu *kade* 'long ago') is in the process of being grammaticalized for pluperfect and habitual past.

Other verb inflections, which are all taken from Zulu/Nguni, are the following:

- isa* (causative), e.g., *theng-a* 'buy' versus *theng-isa* 'cause to buy, sell'
- wa* (present passive), e.g., *phek-a* 'cook'; *phek-wa* 'is cooked'
- we* (past passive), e.g., *phek-a* 'cook'; *phek-iwe* 'was cooked.'

-ela (benefactive), e.g., *theng-a* 'buy'; *theng-ela* 'buy for'-'Buy (a shirt) for (me)'

Linguistically, Fanakalo is typical of pidgins in that it cannot be classified in terms of existing language groupings; it is not quite Germanic or Nguni in structure. Its lexis and inflectional morphology stem largely from Nguni. Its syntax, however, seems to lean in the direction of the Germanic (more specifically English, rather than Afrikaans). Fanakalo is SVO in structure in main and subordinate clauses. It has none of the word-order rules of Afrikaans that place verbs at the end of subordinate clauses and at the end of main clauses that have an auxiliary in V2 position. Nor does it have the subject inversion rule of Afrikaans and of slightly archaic English that places a verb after an adverbial of time but before a subject (again in V2 position). Furthermore, there is no trace of a Zulu word-order rule that permits object pronouns to precede verbs as a clitic in unmarked (unemphatic) sentences. However, Fanakalo is not rigidly SVO insofar as it permits topic-comment order as well.

Phonetically, Fanakalo is subject to wide variation depending on the L1 of the speaker. The common core tends to use a five-vowel system (like Zulu) with two diphthongs, [ai] and [au], and to replace the clicks by velar /k/.

Fijian

P Geraghty, University of the South Pacific, Suva, Fiji

© 2006 Elsevier Ltd. All rights reserved.

Fiji is situated in the Southwest Pacific, between the Solomon Islands and Vanuatu in the west and Tonga and Samoa in the east, but closer to the latter. There

are approximately 100 inhabited islands, with a population of 800 000.

Two hundred years ago, the vast majority of the inhabitants spoke Fijian. Today, Fijian is spoken as a first language by the indigenous population of 400 000 and by maybe 10 000 people of mixed ancestry and descendants of Solomon Islanders and other

immigrants. Fijian is also spoken in migrant communities in New Zealand, Australia, United States, and Canada.

Fijian is a continuum of some 300 distinct but related 'communalects' divided into two major subgroups, the Western in western Vitilevu (the main island) and adjoining islands, and the Eastern elsewhere. Communalects from different subgroups are not mutually intelligible, and even within each subgroup, geographical distance presents difficulties. However, the term 'Fijian' usually refers to Standard Fijian (popularly called 'Bauan'). Fijian belongs to the Central Pacific subgroup, which also includes Rotuman and all Polynesian languages. Central Pacific is a subgroup under Eastern Oceanic and then Oceanic in the Austronesian language family.

Fijian was not traditionally written and was first recorded by European visitors in the early nineteenth century. A Roman-based alphabet was devised by Methodist missionaries around 1840 and has remained in use relatively unchanged.

Although English is the main language of education, government, and commerce, Standard Fijian has a literary tradition going back over 150 years and is used to some extent in education and in the media (three radio stations and two weekly newspapers, but minimal television programming). Although Fijian speakers are mostly literate, they use their literacy very little, with literacy in English being emphasized in schools. The 1997 constitution declared Fijian one of the official languages, along with English and Hindi.

The phoneme inventory consists of 20 consonants (b [ʰb], c [ð], d [ʰd], dr [ʰr], f, g [ŋ], j [tʃ], k, l, m, n, p, q [ʰg], r, s, t, v [β], w, y, z [ʰdʒ]) and 10 vowels (a, e, i, o, u, ā, ē, ī, ō, ū). There are no consonant clusters, and

syllables are open (except in some recent loans). In writing, vowel length is not usually marked, but most modern reference works use a macron.

Grammatical functions are typically performed by affixes or pre- and postposed particles. Pronouns distinguish four persons (including first-person inclusive and exclusive) and four numbers (singular, dual, paucal, plural). Some nouns (mostly denoting body parts and kin) are suffix possessed; others suffix a possessive pronoun to a preposed marker indicating whether the possessor eats, drinks, owns, does, or is affected by the head noun. The attribute follows the noun.

There is obligatory pronominal SVO marking of subject and object within the verb phrase. It is unusual for both subject and object noun phrases to occur outside the verb phrase, but when this happens, SVO, VSO, and VOS are equally common:

era boro-ya na cauravou na no-dra vale
they paint-it the young-men the poss-their house
 'The young men are painting their house'

The popular myth among linguists that 'Fijian is a VOS language' seems to have its origin in an editorial decision made by the translator of the Bible (who was not a native speaker).

Finnish

F Karlsson, University of Helsinki, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

Background

Finnish belongs to the (Baltic-)Finnic subbranch of the Finno-Ugric languages. The closest relatives are Karelian and Estonian. The Finno-Ugric and Samoyed languages form the Uralic language family.

In 2003, the number of Finnish speakers in Finland was 4.8 million, 92% of the population. Abroad, more than 1 million people speak Finnish (or are

descendants of Finnish immigrants), especially in Sweden (300 000), the United States (600 000), Canada, and Australia. Finnish is one of the two national languages of Finland (the other is Swedish). Finnish obtained its position as national language in 1863 and ultimately 1902. Finnish has been used in writing since the appearance of the first parts of the Bible translation in the 1540s.

Phonology

Finnish has 8 vowel and 13 consonant phonemes, /i e æ y ø u o a/ and /p t k d s h v j l r m n ŋ/. /b g/ occur

only in recent borrowings. /d/ is marginal because it occurs only as a product of morphophonological processes (consonant gradation).

Finnish stress is fixed on the first syllable. The quantity distinction is effectively phonemic. Both vowels and consonants can be phonemically short and long, and they combine with one another with few restrictions in both stressed and unstressed syllables, for example, *tuli* 'fire', *tuuli* 'wind', *tulli* 'customs', *tule* 'come!', *tulee* 'comes', *tuulee* '(the wind) blows'.

There are 16 diphthongs such as /ai æi ei oi ui ou æy ey ie uo yø/. The canonical structure of words is bisyllabic; the monosyllables can be counted in the tens.

Vowel harmony is a constraint on stems and suffixes. The vowels form three groups, the harmony vowels /y ö ä/ (front) and /u o a/ (back) plus the neutral vowels /i e/. The three vowel pairs from the harmony sets are often denoted by morphophonemic symbols /U, O, A/. Vowels from the front and back harmony sets cannot co-occur in native words whose vowels are drawn either from /i e ä y ö/ or /i e u o a/. Suffixes with harmony vowels have one front and one back variant occurring after front and back stems, respectively. Stems with neutral vowels count only as front. Thus (INE = inessive case):

talo-ssa
house-SING.INE
'in (a/the) house'

kylä-ssä
village-SING.INE
'in village'

venee-ssä
boat-SING.INE
'in boat'

Finnish orthography is often commended for being among the most efficient in the world, in the sense that it is almost perfectly phonemic. Each phoneme has its own unique letter, with the sole exception of /ŋ/ for which /ŋŋ/ is written <ng>. The phonemic perfection of Finnish orthography is true with respect to the careful normative pronunciation of the standard language. However, present-day colloquial Finnish has strayed from this ideal due to many contractions and elisions.

Morphology

Finnish is a suffixing language with an elaborate morphology. Nominals (nouns, adjectives, pronouns, and numerals) are inflected for number, case, and possessive. There are two numbers, fourteen cases, and five possessive morphemes, occurring as classes

in this morphotactic order. Here are some examples of inflected Finnish nouns.

talo
house-SING.NOM
'house'

talo-t
house-PL.NOM
'houses'

talo-ssa
house-SING.INE
'in (a/the) house'

talo-i-sta-ni
house-PL-EL-POSS.1.SING
'out of my houses'

talo-o-nne
house-SING.ILL-POSS.2.PL
'into your house'

Finite verb forms are inflected for indefinite (called passive in traditional Finnish grammar), tense and mood (belonging to the same morphotactic position because tenses and moods are mutually exclusive), and person. There are two simple tenses, present and past, and two composite ones, perfect and pluperfect. There are four moods: indicative, conditional, potential, and imperative. There are three grammatical persons in the singular and the plural, plus a fourth-person linking up with the indefinite.

sano-n
say-PRES.INDIC.1.SING
'I say'

sano-i-n
say-PAST-1.SING
'I said'

sano-isi-mme
say-COND.1.SING
'we would say'

sano
say-IMP.2.SING
'say!'

sano-kaa-mme
say-IMP-1.PL
'let us say!'

sano-ta-an
say-INDEF.PRES-4
'one says, people say'

Nonfinite verb forms (i.e., infinitives and participles) are inflected for indefinite, nonfiniteness, number, case, and possessive (INE = inessive case):

sano-a
say-INE.NOM
'to say' (infinitive I in traditional Finnish grammar)

sano-e-ssa-nne
say-INF-INE-POSS.2.PL
'when you are saying' (infinitive II)

sano-v-i-ssa
say-PRES.PART-PL-INE
'in the saying (ones)' (present participle)

sano-tta-e-ssa
say-INDEF-INF-INE
'when one says'

Almost every word form in Finnish, inflected or not, can be cliticized with an element from a set of five clitics with pragmatic functions. The most important one is the question morpheme /-kO/. For example:

talo-ssa-si-ko
house-SING.INE-POSS.2.SING-Q
'in your house?'

Finnish lexicography as manifested in *Nykysuomen sanakirja* (Dictionary of modern Finnish, 1951–1961) postulates 82 inflectional classes for nominals and 45 for verbs; at the other extreme, a generative description might operate with none but with a wealth of ordered (morpho)phonological rules. A surface-oriented morphological approach would recognize at least 10 nominal inflectional classes and six verbal ones.

Finnish word structure is characterized by considerable allomorphy both in stems and suffixes and therefore Finnish is not a typical agglutinative language. There are tens of more or less morphologically conditioned alternations. The most profound one is consonant gradation, which concerns both nominals and verbs. The long voiceless stops /pp, tt, kk/ are shortened to [p, t, k], and the short

voiceless stops /p, t, k/ are weakened in various ways: /p/ → [m] (after /m/), /p/ → [v] (between vowels), /t/ → [d] (between vowels), /t/ → [l, r, n] (after an identical consonant), /k/ → [ŋ] (after /ŋ/), and /k/ → Ø (between vowels). These alternations are triggered by suffixation processes.

Syntax

Case marking has an important role in Finnish syntax in marking the arguments of the verb (nominative, genitive, partitive, accusative for grammatical subjects, objects, and predicate complements; and an assortment of local cases for adverbials). Due to extensive case marking, Finnish word order is free and used especially to indicate information structure, for example, subject-last for introducing new referents and leftward topicalization for linking to previous context. There are many highly productive nonfinite constructions. Premodifiers in NPs agree with the head in number and gender; the finite verb agrees with the person and number of the grammatical subject.

Finnish as an Agglutinating Language

F Karlsson, University of Helsinki, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

A theoretically ideal agglutinative language would satisfy five criteria: there are no inflectional classes and all words of the same part of speech are inflected in the same way; there are several morphotactic positions for affixes of composite word forms, especially those of nouns and verbs; every morphological element (stem or affix) is clearly segmentable; the affixes convey one rather than several grammatical meanings;

there are no morphophonological alternations in any element due to morphological processes such as affixation. As a corollary, every element has exactly one phonological shape (disregarding low-level phonetic processes) and no fusion of several meaning elements into one unsegmentable whole.

Morphotactic Structure

Finnish is a suffixing language with a 14-member case system. As for basic inflectional and cliticized morphotactic positions, the surface structures of Finnish

nominal (nouns, adjectives, pronouns, and numerals), finite, and nonfinite verb forms are as follows (INE = inessive case, INS = instructive case, COND = conditional mood) (see Table 1, Table 2, and Table 3).

Table 1 Nominals

| Stem | Number | Case | Possessive | Clitic |
|--------------------------------------|---------|------------|-----------------|-------------|
| talo house 'in (a/the) house' | | ssa INE | | |
| talo house 'also in my house' | | ssa INE | ni POSS.1.SG | kin also |

Inflectional Classes of Nominals

There is no consensus on how many inflectional classes there are for nominals and verbs. Traditional Finnish lexicography as manifested in *Nykysuomen sanakirja* (Dictionary of modern Finnish, 1951–1961) postulates 82 inflectional classes for nominals, whereas, at the other extreme, a generative description such as Wiik (1967) operates with none but a wealth of ordered (morpho)phonological rules. A surface-oriented morphological approach would recognize at least 10 nominal inflectional classes. The most important ones are those ending in *Bi*, *Be*, and *Bs* in the nominative singular. Four case forms (nominative, genitive, and partitive singular, partitive plural) unfold the allomorphic variation in the stems of each class, closely linked to the selection of particular ending allomorphs (NZ = nominalizer) (Table 4).

Class 1 is the largest and most productive one with the least amount of stem allomorphy, minimally only the stem vowel *Bi* alternates with *Be* before the plural *Bi*. At least 10 000 nominals are inflected according to class 1 and this is the pattern of most borrowings and other neologisms.

Classes 2 and 3 are closed: class 2 has some 220 words and class 3 around 40. Class 2 is more complex than class 1 as the stem vowel alternates also in the singular, and on top of that class 3 is more complex than class 2 by further eliding the stem vowel in SG.PART and also having alternations in the medial stem consonant. Many of the words in classes 2 and 3

are high-frequency words, for class 3, for example, *kuusi* '6,' *uusi* 'new,' *vesi* 'water,' *viisi* '5.'

For nominals in *Be*, class 5 is in principle closed (disregarding certain derivatives) even if it has more than 1000 members. Class 4 is small in contemporary Finnish, with less than 100 items, but this class is productive. Comparison of classes 1–3 and 4–5 discloses, not surprisingly, that the productive inflectional classes are those that have a minimal amount of stem allomorphy.

For nominals in *Bs*, class 6 (>4000 items) is simpler and more productive than class 7 (some 800 items). Class 8 covers a common type of derivatives.

Inflectional Classes of Verbs

Nyky-suomen sanakirja postulates 45 inflectional classes for verbs. A more generalizing approach

Table 4 Inflectional classes of nouns

| Class | SG | SG.GEN | SG.PART | PL-PART |
|-------|----------------------------|-------------|-------------|---------------|
| (1) | lasi <i>glass</i> | lasi-n | lasi-a | lase-j-a |
| (2) | ovi <i>door</i> | ove-n | ove-a | ov-i-a |
| (3) | käsi <i>hand</i> | käde-n | kät-tä | käs-i-ä |
| (4) | nalle <i>bear</i> | nalle-n | nalle-a | nalle-j-a |
| (5) | vaje <i>lack</i> | vajee-n | vaje-tta | vaje-i-ta |
| (6) | varis <i>crow</i> | varikse-n | varis-ta | variks-i-a |
| (7) | vieras <i>guest</i> | vieraa-n | vieras-ta | viera-i-ta |
| (8) | rakka-us <i>love-NZ</i> | rakka-ude-n | rakka-ut-ta | rakka-uks-i-a |

Table 5 Inflectional classes of verbs

| Class | INF.NOM | PRES.INDIC.1.SG | PAST.3.SG | PAST.PART.SG.NOM |
|-------|------------------------------|-----------------|-----------|------------------|
| (1) | sano-a <i>say</i> | sano-n | sano-i | sano-nut |
| | anta-a <i>give</i> | anna-n | anto-i | anta-nut |
| (2) | hala-ta <i>embrace</i> | halaa-n | hala-si | halan-nut |
| | kara-ta <i>escape</i> | karkaa-n | karka-si | karan-nut |
| (3) | saa-da <i>get</i> | saa-n | sa-i | saa-nut |
| | haravoi-da <i>harvest</i> | haravoi-n | haravo-i | haravoi-nut |
| (4) | nous-ta <i>rise</i> | nouse-n | nous-i | nous-sut |
| (5) | lämme-tä <i>warm up</i> | lämpene-n | lämpen-i | lämmen-nyt |

would do with six classes, here presented by way of four central inflectional forms, the endless (NOM) infinitive, the first person singular present tense indicative form, the third person singular past tense form, and the past tense participle in the nominative singular form (Table 5).

Class 1 is by far the largest class with some 10 000 members. Around 2000 verbs belong to class 2, but this is presently the most productive verb class, obviously because overall there is less stem allomorphy in class 2 than in class 1; cf. especially the indefinite forms (called passives in traditional Finnish grammar) where the last morpheme is a personal ending for the indefinite 'fourth' person.

Class 4 is also a strong class with 4000 verbs. Class 3 has fewer than 20 monosyllabic verbs but around 1000 polysyllabic ones.

Morphophonological Alternations in Stems

As demonstrated by the example words of the nominal and verbal inflectional classes, Finnish word structure is characterized by considerable allomorphy, both in stems and suffixes, which detracts from the theoretical agglutinative ideal. Part of the allomorphy is most conveniently described in terms of item-and-arrangement morphophonological alternations, partly in terms of item-and-process directional rules.

Vowel harmony is an overriding constraint on stems and suffixes. The Finnish vowels form three groups, the harmony vowels /y ö ä/ (front) and /u o a/ (back) plus the neutral vowels /i e/. The three vowel pairs from the harmony sets are often denoted by morphophonemic symbols: U, O, A. Vowels from the front and back harmony sets cannot co-occur in

native words whose vowels are drawn either from /i e ä y ö/ or /i e u o a/. Suffixes with harmony vowels have one front and one back variant occurring after front and back stems, respectively. Stems with neutral vowels only count as front. Thus:

talo-ssa
house-SG.INE
'in (a/the) house'
kylä-ssä
village-SG.INE
'in village'
venee-ssä
boat-SG.INE
'in boat'
auto-lla
car-SG.ADESS
'by car'
pyörä-llä
bike-SG.ADESS
'by bike'
veitse-llä
knife-SG.ADESS
'with knife'
tule-vat
come-PRES.INDIC.3.PL
'(they) come'
määrää-vät
decide-PRES.INDIC.3.PL
'(they) decide'
mene-vät
go-PRES.INDIC.3.PL
'(they) go'
anne-ta-an
give-INDEF-4
hala-ta-an
embrace-INDEF-4

Vowel harmony is basically a phonological phenomenon. There are tens of other, more strongly morphologically conditioned alternations. The most profound one is consonant gradation, which concerns both nominals and verbs. Under complicated phonological and (partly opaque) morphological conditions, the long voiceless stops *pp*, *tt*, *kk* (which constitute two-phoneme combinations) are shortened to *p*, *t*, *k*, and the short voiceless stops *p*, *t*, *k* are weakened in various ways, e.g., *p* → *m* (after *m*),

p → *v* (between vowels), *t* → *d* (between vowels), *t* → *l*, *r*, *n* (after an identical consonant), *k* → *ŋ* (after *ŋ*), *k* → zero (between vowels). The weak grade is triggered by suffixation processes, in particular the occurrence of a suffix closing the syllable in the beginning of which the strong grade occurs (Table 6).

However, the weak grade also occurs in many purely morphological contexts without suffixes closing the stem syllable, e.g., in certain imperative and indefinite verb forms and in the base forms (nominative singulars) of nouns belonging to inflectional class 5: *ker.ro* tell.IMP.2.SG, *ker.ro.ta-an* tell-INDEF-4, *sa.de* rain.SG.NOM, *sa.tee-n* rain-SG.GEN.

About 20% of the Finnish vocabulary is subject to consonant gradation: 8000 nouns, 1000 adjectives, and 6000 verbs. Of the 1000 most frequent words, 30% participate in consonant gradation. This is a profound characteristic of Finnish.

Another set of typical morphophonological alternations are the vowel mutations in front of certain suffixes starting with *Bi*. Long stem vowels are shortened, stem diphthongs are simplified, stem-final short *Bi* changes to *Be*, stem-final short *Ba* might change to *Bo*, etc.:

maa
country.SG.NOM
ma-i-ssa
country-PL-INE
'in (the) countries'
tie
road.SG.NOM,
te-i-llä
road-PL-ADESS
'on (the) roads'
lasi
glass.SG.NOM
lase-i-ssa
glass-PL-INE
'in (the) glasses'
pila
joke.SG.NOM
pilo-i-ssa
joke-PL-INE
'in (the) jokes'

Many word forms simultaneously display several alternations, e.g., *virka* job.SG.NOM, *viro-i-ssa*

Table 6 Consonant gradation

| | | | |
|----------------------------------|----------------------------------|---------------------------------|-------------------------------------|
| kaup.pa shop-SG.NOM | kau.pa-n shop-SG.GEN | kau.pa-s.sa shop-SG.INE | kauppa-a shop-SG.PART |
| sil.ta bridge-SG.NOM | sil.la-n ridge-SG.GEN | sil.la-l.la ge-SG.ADESS | sil.ta-an ge-SG.ILL |
| ker.to-o tell-PRES.INDIC.3.SG | ker.ro-n tell-PRES.INDIC.1.SG | ker.ro-i-m.me tell-PAST-1.PL | ker.to-.vat tell-PRES.INDIC.3.PL |

Syllable boundaries are indicated by periods.

job-PL-INE ‘in (the) jobs’ (gradation and mutation). The nominal inflectional class 3 is particularly complex. On top of gradation and mutation (deletion of *Be*) there is assibilation of stem-internal *BtB* in SG.NOM and deletion of *Be* also in SG.PART: *käsi* hand-SG.NOM, *käte-en* hand-SG.ILL ‘into (a/the) hand’, *käde-llä* hand-SG.ADESS ‘with (a/the) hand’, *kät-tä* hand-SG.PART ‘hand’ (e.g., as direct object in negated clauses), *käs-i-ä* hand-PL-PART ‘(some indefinite) hands’.

Morphophonological Alternations in Suffixes

Suffixes might lose their final consonant in front of a consonant starting the next ending, or assimilate their first consonant to the last consonant of the preceding stem. Consonants are deleted in front of possessive suffixes: *maa-han* country-SG.ILL ‘into (a/the) country’, *maa-ha-mme* country-SG.ILL-POSS.1.PL ‘into our country’, *talo-n* house-SG.GEN, *talo-t* house-PL.NOM, *talo-mme* house-SG.NOM.POSS.1.PL ~ *house-SG.GEN.POSS.1.PL* ~ house-PL.NOM.POSS.1.PL. Note the three-way ambiguity arising due to consonant deletion in a form like *talo-mme* expressing nominative singular, genitive singular, and nominative plural.

The illative case has an extreme number of allomorphs. It has four basic suppletively related allomorphs, ‘quasimorphemes,’ occurring in different phonologically determined contexts: *BVn*, *BbVn*, *Bseen*, *Bsiin*. The morphophoneme *V* is realized by reduplication as a copy of the preceding vowel. In addition, the final consonant may be deleted before possessives. Therefore the illative has no fewer than 36 allomorphs:

talo-on
house-SG.ILL
 ‘into (a/the) house’
talo-o-mme
house-SG.ILL-POSS.1.PL
lasi-in
glass-SG.ILL
lasi-i-mme
glass-SG.ILL-POSS.1.PL
maa-han
country-SG.ILL
maa-ha-mme
country-SG.ILL-POSS.1.PL
puu-hun
tree-SG.ILL
puu-hu-mme
tree-SG.ILL-POSS.1.PL, etc.

Many suffixes have several allomorphs, each linked to specific stem selection criteria and/or inflectional

classes. For example, the partitive allomorph *BttA* only goes with nominal inflection class 5, *BtA* with classes 3, 6, 7, 8, and *BA* with classes 1, 2, and 4.

Fusion and Polyfunctional Suffixes

There are several polyfunctional suffixes where the grammatical functions cannot be segmented, e.g., *Bt* (nominative plural), *Bten* (genitive plural, the segmentable genitive plural has the plural marker *Bi*), *Bine* (comitative singular or plural), *-ttU* (indefinite fourth person perfect participle), *BkAA* (imperative 2.PL).

In colloquial Finnish, there is a tendency to drop *Bi* in unstressed diphthongs. When this *Bi* is the past tense marker, the mutated stem vowel becomes the only marker of the past tense function: *anta-a* give-PRES.INDIC.3.SG, *anto-i* give-PAST.3.SG, (colloquial) *anto* give-PAST.3.SG.

Conclusion

Karlsson (1983) distinguished 45 different morphophonological alternations. They create massive allomorphy in both stems and endings. A two-way dependency exists between many stems and endings: certain stems take certain endings only, and certain endings go only with certain stems. This mutual boundedness implies that Finnish word forms are highly cohesive, a property that is amplified by vowel harmony stretching over the whole (uncompounded) word, and further amplified also by the fixed initial stress.

Thus, Finnish departs from the theoretically ideal agglutinative type in some respects, as regards the occurrence of nominal and verbal inflectional classes, allomorphy among the affixes, morphophonological alternations, endings expressing composite grammatical functions, and fusion of certain grammatical elements.

Flores Languages

M Donohue, National University of Singapore, Singapore

© 2006 Elsevier Ltd. All rights reserved.

The Austronesian languages of Flores, in southern Indonesia, all belong to the Central Malayo-Polynesian grouping, and can be divided internally into three groups, roughly western, central, and eastern. There are 11 western languages, prominent among them Manggarai and Ngad'a, which are more closely related to Bima than to the languages of the rest of Flores. The three eastern languages, Sika, Lamaholot, and Lewotobi, are related to the languages of the Solor archipelago as far as Alor. The five central Flores languages, most prominently Ende and Li'o, are the most isolating and show a chaining relationship, with the southwestern languages changing incrementally into the northeastern varieties. The languages of Flores typically employ prenasalized and imploded/preglottalized consonants, sometimes in contrast to voiced stops. Most commonly, the languages have a five vowel system with epenthetic schwas separating illicit consonant clusters. Because these epenthetic vowels do not receive stress, the epenthesis results in apparent exceptions to the penultimate stress rule. In Palu'e [l'ama] 'rice' appears to contrast in terms of stress placement with [lɛ'ma] 'tongue,' but the difference is better analysed as an underlying difference between /lama/ and /lma/.

The languages of Flores lack extensive verbal morphology to mark voice. This is part of the general isolating tendency, although the eastern languages have verbal agreement, and most languages show varying degrees of cliticization, which show degrees of development toward agreement and case marking. The eastern language Sika, for instance, shows a full set of agreement prefixes on verbs, whereas Palu'e in the center has only one proclitic, *ak* = '1sg.subj'. The recent grammaticalization of this clitic is attested in the inability of an independent pronoun to occur in the same clause as the clitic, and the optionality of the clitic: *Aku ka lama* 'I eat rice,' or *Ak=ka lama*, but not **Aku ak=ka lama*. There are no other subject clitics in Palu'e, but there are four genitive enclitics that are used in nominalized clause: *ka=gu lama* 'my eating of the rice.' The central and western languages show voice alternations. Manggarai shows an alternation in voice that is morphologically marked in word order and the choice of VP-final subject clitic. Palu'e has an active/passive alternation with only AVP and PAV word orders marking the difference, but a variety of morphosyntactic tests showing the

changed status of the A and the P. Thus, the AVP sentence *Kita ka lama wa'a* 'We ate that rice,' contrasts with PAV in *Lama wa'a kita ka* 'That rice was eaten by us.' Tests for subject, such as modification by floating quantifiers, makes this unambiguous: the clause-final quantifier *teti'on* 'all' in *Kita ka lama wa'a teti'on* can only modify the subject: 'We all ate that rice,' whereas in *Lama wa'a kita ka teti'on* can only be interpreted as 'We ate all of that rice.' Other tests support this analysis of the A in a PAV construction as oblique, and the P as subject.

Symbolism and metaphor are present in both ritual and everyday speech. This is licensed by an unusually large number of homophones, partly because of constrained phonotactic possibilities. For instance, in Palu'e the fortuitous coming-together of PAN **bənuə* > *nua* 'house' and **nuSa* > *nua* 'island' is used to enforce the sense of belonging to their island home. Another factor is the extensive precategoriality of lexical roots, such as *kɪ*, which has the referential sense 'knife,' the predicative sense 'cut off,' and the modificational sense 'severed, loose.'

Formosan Languages

M Ross, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Before the arrival of the Spanish, the Dutch, and the Chinese in Taiwan in the 17th century, the island was occupied by groups of people whose present-day descendants are known as the Taiwan 'aborigines' and speak Austronesian languages (*see Austronesian Languages*). Linguists use the term 'Formosan' (after an older Portuguese term for Taiwan) for these languages, to distinguish them from 'Taiwanese', the Southern Min dialect of Chinese spoken by the majority of Taiwan's inhabitants today.

A mountain chain, rising in places to almost 4000 meters, runs down the eastern half of Taiwan, and Formosan speakers live in the valleys on both sides of the cordillera and on the narrow eastern coastal strip. Before the arrival of outsiders, the plains stretching from the mountains across to the west coast were also occupied by Formosan speakers. Although almost everyone on the plains today speaks Taiwanese, Hakka, or Mandarin (the national language), several plains groups regard themselves as aboriginals despite the loss of their language. Almost all Formosan speakers also speak Mandarin. Many of those counted as aboriginals in official listings do not speak a Formosan language or are semi-speakers, and it is difficult to know who to count as speakers and how many speakers there are. For example, there are officially 3000 members of the Thao tribe, but only fifteen of these spoke the Thao language in 2003 (Blust, 2003: 1).

The Languages Today

Blust (1999) places the 14 living languages of Taiwan in nine phylogenetic groups. He also includes in his listing certain extinct languages for which reliable materials are extant (five total; marked [E]):

- Atayalic: Atayal, Seediq
- Northwest Formosan: Saisiyat, Kulon [E], Pazeh
- East Formosan: Basay-Trobiawan [E], Kavalan, Amis, Siraya [E]
- Western Plains: Taokas-Babuza [E], Papora-Hoanya [E], Thao
- Bunun
- Tsouic: Tsou, Kanakanavu, Saaroa
- Rukai
- Puyuma
- Paiwan.

Puyuma, Paiwan, Rukai, and Bunun are single-member groups. Some languages – Atayal, Seediq, Amis, Puyuma, Paiwan, Rukai and Bunun – have significant dialect variation. Amis almost certainly has the largest number of speakers, perhaps over 100 000, and is probably the only Formosan language that need not be considered endangered. At the opposite extreme, Pazeh had one speaker in 2003. Language locations are shown on the accompanying map (Figure 1), but in most cases these reflect a time when there were more speakers. The recognition granted to Formosan languages under Japanese rule (1895–1945) disappeared under the Kuomintang (Nationalist) government from 1949 until 1991. Since Taiwan's first democratic elections in 1991, official attitudes have come to favor other languages beside Mandarin, but this change of heart has come too late for most of the 14 Formosan languages, and their continued use by today's younger generation is very doubtful.

Figure 1 The Formosan languages.

History and Subgrouping

Blust's subgrouping above is based on shared phonological innovations. Each group is said to be a primary subgroup of Austronesian. There is a 10th group, Malayo-Polynesian, which includes all the other 1100 or so Austronesian languages spoken outside Taiwan (Yami of Orchid Island, politically part of Taiwan, is a Malayo-Polynesian language). If one accepts Blust's hypothesis, then the Formosan languages of Taiwan comprise 9 out of the 10 subgroups of Austronesian.

Blust's grouping is questionable in the view of some scholars because phonological innovations may diffuse across linguistic boundaries. A more conventional grouping is shown in Tsuchida's (1983) map. It has just three groups: Atayalic, Northwest Formosan (comprising Taokas-Babuza, Saisiyat, and Pazeh) and Southern Formosan, which includes three smaller groups, Tsouic, Rukai, and Paiwanic (comprising Amis, Bunun, Puyuma, and Paiwan). Other Formosan languages are ungrouped. This grouping and variations on it are open to the criticism that they

are based on shared similarities, not on shared innovations, and are therefore not subgroups in the standard sense of the linguistic comparative method.

It is possible that there will never be a full agreed subgrouping of Formosan languages. Speakers of Proto-Austronesian probably arrived in Taiwan from mainland Asia some 5000 years ago, and it is a reasonable inference that as their descendants populated Taiwan the language diversified first into a dialect network, then into individual languages. Contact between speakers of different languages would have continued, with concomitant mutual influence (and different patterns of contact at different times), leaving complex patterns of shared phonological features, lexicon, and grammatical constructions, the historical significance of which it is difficult to disentangle. Perhaps half the Formosan languages have disappeared since the early 17th century, hampering the task of historical reconstruction yet further.

There is, however, agreement among a number of scholars that Taiwan is the Austronesian 'homeland.' The reason why all Austronesian languages outside Taiwan belong to a single subgroup is that they are descended from a single language whose speakers appear, on current archaeological evidence, to have migrated southward from Taiwan to the Philippines about 4000 years ago.

The History of Formosan Language Studies

The first outsiders to study Formosan languages were probably Dutch missionaries in the early 17th century. Our knowledge of the extinct Siraya language, for example, comes from a New Testament translation and other documents printed by the Dutch (Adelaar, 2004). There is evidence that some Dutch observers recognized similarities between Formosan and Malay vocabulary, but the first explicit statement that Formosan languages belong to what we now call the Austronesian family is found in Klaproth (1824). The first modern examination of the historical position of the Formosan languages was Dyen (1963), and Dahl (1973) was the first major work on the reconstruction of Proto-Austronesian to incorporate Formosan material.

Japanese linguists and anthropologists made quite extensive studies of Formosan speakers and their languages, resulting in the publication of Ogawa and Asai (1935). The first 20th-century description of a Formosan language to appear in a Western language was Asai's (1934) account of Seediq. The first description to be published after World War II was Tung

(1964) on Tsou and two articles by Egerod (1965, 1966) that provided a sketch of Atayal grammar. This trickle has grown to a flow since the early 1970s, with grammars, dictionaries, text collections, as well as journal articles and Taiwanese M.A. theses, which mostly deal with one aspect of one language. Several single-language dialect comparisons were published by Paul Li and his colleagues at the Academia Sinica in the 1970s and 1980s. However, considerations of space allow only a restricted literature survey, and (with a few exceptions) only published book-length works in Western languages dealing with living Formosan languages are mentioned.

Languages are discussed in a roughly north-to-south order. The Atayalic languages are among the best described Formosan languages. As well as Egerod's work, there are short grammars of two Atayal dialects (Huang, 1992, 1995) as well as an important article on verbal morphemes (Huang, 2000). Egerod (1999) provided a substantial dictionary. Asai (1934), Holmer (1996), and Tsukida (2004) each sketch the grammars of Seediq dialects.

There are as yet no readily accessible descriptions of Saisiyat or Kavalan (but see Chang, 2000). However, Li and Tsuchida (2001) and Blust (2003) have provided thorough documentation of two languages on the verge of extinction, Pazeh and Thao. Ironically, for Amis, the Formosan language with the most speakers, there is only a partial description in a rather opaque framework (Chen, 1987). There is also a dictionary by Fey (1986). Bunun, another language with quite a large population of speakers, has received little attention since Jeng (1977).

Tsuchida (1976) provided sketches of the three Tsouic languages in the course of reconstructing Proto-Tsouic. Tsou had already been described by Tung (1964) and it has received continuing attention (see Zeitoun, 2004), but Kananavu and Saaroa are in danger of becoming extinct before being further described. Rukai was documented and described by Li (1973) and its dialects have been described in articles by Zeitoun (1997).

The grammar of one Puyuma dialect is described in Japanese with English glosses by Tsuchida (1980). Cauquelin (1991a, 1991b) provides a grammar sketch and a dictionary of another dialect. Paiwan competes with Atayal for the privilege of being the best described Formosan language, with two dictionaries (Ferrell, 1982; Egli, 2002), a grammar (Egli, 1990), and a collection of texts, some of them from Japanese work in the 1930s (Early and Whitehorn, 2003).

The documentation of Formosan languages is thus patchy, with significant gaps when it comes to

comprehensive language descriptions and dictionaries. Recently a series of short reference grammars in Chinese, of which Chang's work (2000) is an example, has been published.

The Structure of Formosan Languages

The Paiwan examples below are typical of those used to illustrate the basic structural features of Formosan clauses. Each NP is marked, either by a pronominal form or by a morpheme preceding the NP, as absolutive, genitive, or oblique (a locative marker *i* precedes or replaces the oblique in certain contexts). The verb has an affix that assigns one of four broad semantic roles to the absolutive (the 'nominative' in Formosanist parlance). This affixation is the most salient feature of Formosan languages, also shared by many Philippine languages.

q<m>alup = aken tua vavuy i (tua) gadu
<ACTOR>hunt = ABS:1SG OBL pig LOC (OBL)
mountain
'We hunt boar on the mountain.'

qalup-en nua tsautsau a vavuy i (tua) gadu tua vuluq
hunt-PATIENT GEN man ABS pig LOC (OBL)
mountain OBL spear
'The man hunts the pigs in the mountains with a spear.'

ku = qalup-an a gadu tua vavuy
GEN:1SG = hunt-LOCATION ABS mountain
OBL pig
'We hunt boar on the mountain.'

ku = si-qalup a vuluq tua vavuy
GEN:1SG = INSTRUMENT-hunt ABS spear OBL pig
'We hunt boar with a spear.'

Morphologically this is an absolutive-ergative system. The verb with ACTOR marking is intransitive, i.e., anti-passive-like, while the verb in each other example is transitive, with two core arguments: a genitive-marked actor ('genitive' because it may also serve as possessor within a NP) and an absolutive-marked NP whose role is indicated by the verbal affix.

By Formosanist convention, the verbal affix is a 'focus affix.' It would be more appropriate, however, to call it an applicative. Applicatives usually occur in nominative-accusative languages, where they change the role of the object. Here, with absolutive-ergative alignment, they change the role of the absolutive. The conventional idea that the 'focus affix' marks the semantic role of the absolutive is also suspect. On other verbs, the affixes marked as LOCATION and INSTRUMENT mark other semantic roles. The

common feature is that they progressively reduce the affectedness of the absolutive NP.

Analyzing the non-actor markers as applicatives allows us to regard the construction in which they occur as a single, 'Undergoer' voice, in opposition to the anti-passive or Actor voice. All Formosan languages except Rukai have a voice system similar to Paiwan (with some morphological differences), but its use in discourse varies from language to language (Huang, 2002). In Tsou and Puyuma, the Undergoer voice is the default in narrative discourse, and the oblique-marked Undergoer in an Actor-voice independent clause is always indefinite and often non-specific. In Paiwan and Seediq, the indefiniteness rule does not apply, and the Actor Voice behaves as an alternative default. How the speaker selects voice is not well understood.

Franglais

P Rowlett, University of Salford, Salford, UK

© 2006 Elsevier Ltd. All rights reserved.

The term *franglais* encompasses combinations of French (*français*) and English (*anglais*) of various kinds. First, it refers to any variety that has developed naturally as a mixture of the two languages as a result of long-standing contact. Such varieties are spoken, for example, in New Brunswick (Canada) and northern Maine (United States). Second, the term refers to code switching between the two languages in what in some cases are again long-standing bilingual or diglossic settings. This occurs, for example, in Quebec (Canada), where, especially in Montreal since the 1960s, Anglophones frequently switch to French midsentence, just as Francophones would switch to English. Finally, *franglais* refers to the phenomenon whereby native English or French speakers pepper their speech with lexis from the other language for humorous effect, to show off, or because of gaps in their native lexis. The use of French words in English was caricatured by Miles Kington's 'Parlez-vous Franglais?' column in the British satirical periodical *Punch* from the late 1970s and subsequently in a series of books. The reverse phenomenon, which will be our concern here, is taken much more seriously and is most closely associated with Sorbonne philosopher René Étiemble's vitriolic *Parlez-vous franglais?*, first published in 1964.

Franglais is primarily a lexical innovation: new lexis has been absorbed and existing lexis is being used differently. Francophones have enriched their lexis by (a) adopting English word forms, especially from commerce (*le shopping*, *le business*, *le discount*, *le leasing*, *le sponsor*); (b) adapting English lexis (*le self* 'self-service cafeteria', *le parking* 'parking lot', *le dressing* 'dressing room', *le loft* 'loft apartment'); and (c) innovating pseudo-English lexis (*le starter* 'choke', *le footing* 'jogging', *le baby-foot* 'table football', *le pressing* 'dry cleaner's', *le lifting* 'face-lift', *le brushing* 'blow-dry', *le planning* 'schedule', *le recordman* 'record holder', *le rugbyman* 'rugby player', *le scratch* 'Velcro').

In addition to embracing English word forms, Francophones have changed the way they use French forms, apparently under the influence of English, either as a faux ami (*un ordre* for *une commande* 'an order', *une opportunité* for *une occasion* 'an opportunity', *du matériel* for *du tissu* 'fabric') or by calquing the syntax of English expressions (*nourrir le chat* 'to feed the cat' for *donner à manger au chat*, *rejoindre l'armée* 'to join the army' for *s'inscrire à*

l'armée, parler sur le téléphone 'to speak on the telephone' for *parler au téléphone*). According to Duneton (1999: 121), this usage would have shocked just a few decades ago but is now banal.

However, Franglais is alleged to have had influence beyond lexis, too, for example, in the use of unnecessary determiners in appositive contexts (*Berlin, la capitale de l'Allemagne*); pronominal adjectives (*la composition scientifique > la scientifique composition*); adjectives as adverbs (*écrire économiquement > écrire économique* 'to write economically'). Increased use of passives has also been blamed on English influence. Finally, although Franglais lexis often submits to French stress patterns (breath-group final rather than lexical or foot-based) and orthography (*bouledozère* 'bulldozer', *boum* 'boom', *cédérom* 'CD-ROM'), Franglais has had a minor impact on the phonology and orthography of the language, with increased occurrence of the phones [ʔ] and [ɕ] (otherwise found in borrowings, only) and the graphemes *k*, *y*, and *w*. (Arguably, though, a much more apparent, economy-driven impact on French orthography is being caused by SMS messaging, with unpronounced graphemes dropped (*tabac > taba*, *comme > kom*), the representation of vowels and consonants simplified (*beau > bo*, *qui > ki*), and single graphemes used to represent whole words (*c'est/ces/ses > c*).

Étiemble's thesis is that, because of its scale, rather than being part of a natural process of dynamic development, the one-way influence of English on French taking place from the mid-20th century onward is, instead, doing unwelcome and irreparable damage to the core of the French language, culturally if not purely linguistically. Duneton (1999) has reached the same conclusion. Whether or not Étiemble is right depends on one's perspective. If one sees language as a mere vehicle for communication, then openness on the part of one linguistic community to the lexical resources of the language of another can only increase expressive power. Contact and mutual influence between Francophones and Anglophones have a history going back a millennium, and the languages are widely believed to be all the richer as a result. More recent longitudinal work by Shana Poplack on the effect of English–French contact on the French language spoken around Ottawa and Hull (Canada) suggests that French has been enriched by the contact, rather than impoverished. If, in contrast, like Étiemble, one sees language as having a role to play in articulating a speech community's social and cultural identity, then excessive influence of English on French arguably undermines French (or at least Francophone) identity. Distinguishing French lexical

influence on English from English lexical influence on French, for example, Duneton (1999: 115ff) reported the view that the former reflects middle-class snobbery, the latter, working-class ignorance. The desire to combat this perceived ignorance underlies much of the corpus planning pursued in France in recent decades, with official dictionaries cataloguing approved French alternatives to anglicisms and legislation guaranteeing the use of the French language in a number of contexts.

There are various reasons to believe that the stance adopted by Étiemble is more emotional than rational and similarly Duneton, one of whose grounds for concluding that the heart of the French language is under threat is the observation that Francophones now say *Oops!* – apparently unheard of in 1979 – rather than *Hou là là!* when they drop something! It is likely, for example, that Étiemble overestimated the scale of lexical Franglais. Leeman-Bouix (1994: 29–30) cites a 1965 study that counted 694 English-origin words in the 100 000 lexemes of French (0.7%). Similarly, Étiemble was wrong to claim that Franglais lexis was unwarranted due to the availability of French synonyms. For example, although *faire du shopping* may be as perfect a synonym of *faire des courses* as it is possible to get, Leeman-Bouix (1994: 137–138) justified the use of *challenger* over *adversaire* ‘opponent’ in TV game shows precisely because it includes the notion of challenge, absent from *adversaire*, and the use of *casting* instead of *distribution* because of the ambiguity of the latter term in the cinema context. Finally, Étiemble was in fact mistaken in some of the claims of English influence he made, for example, *examen-fenêtre* ‘the act of examining an object by the window’, blamed by Étiemble (1973: 195) on unwelcome English influence, despite the absence of any evidence to support such an accusation (Goosse, 2000: 131). It is thus difficult to disagree with Hagège (1987: 52) that “English has not impacted upon the hard core of the French language” and Goosse (2000: 141) that the unmarked variety, or varieties, of French is following its course.

A more plausible take on the underlying concerns of Étiemble and other purists hangs on yet another role of language, namely, its at times near-isomorphic relationship with, and reflection of, the status of a nation. There is no need to rehearse here the geopolitics of the 20th century and the way the role of

France on the international stage diminished after World War I and particularly World War II. In such a context, Étiemble’s talk of an attack by Anglo-American cultural imperialism and Duneton’s discourse of an infestation of teeming ants is hardly surprising. Franglais is a rude reminder of the loss of French prestige on the world stage. Thus, the concerns expressed by Étiemble, as well as the status-planning policies embraced by successive French governments since the mid 1960s, not to mention virulent anti-Americanism, can be seen as “a massive overreaction at a time when France’s political identity was being redefined” (Battye *et al.*, 2000: 44). Significant in this respect is a contrast between the level of negative reaction to Franglais in France and its broad acceptance in Quebec, for example, where, if anything, the influence of English is even greater.

French is a member of the Romance group of Indo-European languages. It forms part of the Gallo-Romance sub-group, along with Occitan and the transitional varieties labeled Franco-Provençal. Modern French can ultimately be traced back to the Latin of northern Gaul, a Latin that was significantly modified by contact with the language of the pre-Roman Celtic inhabitants of the area and the language of the Germanic invaders who occupied the region after the fall of the Roman Empire. Its more immediate ancestor is the medieval dialect of Paris (labeled *fran-cien* by 19th-century scholars), which, as the speech of the major economic and cultural center first of the Île de France and then of a progressively larger administrative unit created by conquest and royal marriages, enjoyed particular prestige; however, in the course of becoming a national standard, this variety was additionally subjected to complex processes of leveling and koineization resulting from large-scale migration to the capital.

Number of Speakers and Geographical Distribution

French is currently spoken (as a first or near-native second language) by approximately 100 000 000 people. In Europe it is the official language of France (population approximately 60 000 000), and is also spoken in the contiguous areas of southern Belgium (roughly 5 000 000 speakers), Luxembourg (500 000), western Switzerland (1 500 000), and the Val d'Aosta region of Italy (35 000). It is one of the two national languages of Canada, where it is the native tongue of almost 7 000 000 people, or between one-fifth and one-quarter of the population – at the provincial level, it is the official language of Québec and has co-official status with English in New Brunswick; smaller numbers of speakers are found elsewhere in the maritime provinces, and in Ontario, Manitoba, and Saskatchewan. French is the official language of the French Overseas Territories (most of which are situated in the Caribbean or in the Indian or Pacific Oceans). It is also the official language of several former French colonies, especially in West, North, and Central Africa, although many inhabitants of these countries do not in fact speak French, and, for the majority of those

who do, it has the status of a second language. French dialects that differ significantly from the standard language survive in northern France (Picard) and southern Belgium (Walloon), as well as in Normandy. A Norman French dialect is also found in the Channel Islands of Guernsey and Jersey, although the numbers of speakers are fast declining. For two hundred years, from the early 18th century to the early 20th, French was the unrivaled language of international (and especially diplomatic) communication. It also played a crucial role in the establishment and subsequent functioning of the institutions from which the European Union was to emerge. In addition, it has been the vehicle of one of the world's major literatures for over a thousand years. For all of these reasons, French has assumed an importance that transcends the number of its native speakers.

Phonetics and Phonology

A maximal phonemic inventory of contemporary standard European French would include the following: 16 vowels (a front unrounded series /a ε e i/; a front rounded series /œ ø y/; a back series consisting of unrounded /ɑ/ and rounded /ɔ o u/; four nasal vowels /ā ɔ̄ ē œ̄/; and the unspecified vowel schwa /ə/); three glides /j ɥ w/; two liquids /l r/, the former a voiced lateral, the latter usually realized as a voiced uvular fricative [ʁ] or trill [R]; and 16 consonants (bilabial, dental, and velar plosives, voiced and voiceless /p b t d k g/; labio-dental, alveolar, and palatal fricatives, voiced and voiceless /f v s z ʃ ʒ/; and four nasals /m n ɲ ŋ/ – the last found only in some speakers' pronunciation of English loan-words such as *parking*). However, this inventory represents an idealization, and few, if any, speakers exemplify the full system. In particular, a number of vocalic distinctions (especially amongst mid-vowels) have, for many speakers in many contexts, been either obliterated or reduced to phonetically predictable oppositions. While present phonetically, vowel length has ceased to be phonologically significant for virtually all speakers.

The phonetics and phonology of Canadian French differ in significant ways from those of the European language, especially as regards vowels. Vowel length is more salient, and has phonemic value in some contexts (compare *mettre* [mɛtʁ] 'put' vs. *maître* [mɛ:tr 'master']; long vowels may become diphthongs. Nasal vowels are less nasal, and have chain-shifted. Short high vowels in closed syllables

become lax. Unstressed high vowels in medial syllables may be devoiced or disappear completely.

A strong (although not absolute) phonotactic principle precludes sequences of more than two consecutive consonants (or, utterance-initially, more than a single consonant), excluding syllable-initial [s] and liquids following an obstruent at the end of a cluster. This principle correlates with the presence or absence of schwa in many contexts; in informal speech, schwas will be deleted unless or until such deletion would give rise to an unacceptable sequence of consonants.

The most important and characteristic French sandhi phenomenon is liaison, in which a consonant that is not usually present on the surface in other contexts intervenes between two vowels at a word boundary and blocks hiatus. Historically, liaison arises from the differential disappearance of word-final consonants, which were retained longer before a following vowel than in other contexts. However, a synchronic treatment of the phenomenon must take account of frequent hypercorrections, which suggest that the liaison consonant is no longer underlying, but rather inserted epenthetically. In addition, liaison takes place with only a subset of consonants, and many (though not all) liaisons are highly variable and socially marked. In another sandhi phenomenon, misleadingly termed ‘aspirate h’ (it does not involve aspiration and may not even involve <h>), expected hiatus-blocking processes, such as elision and liaison, are themselves blocked (compare *l’héritier* [ləʁitje] ‘the heir’ vs. *le hérisson* [ləʁisɔ̃] ‘the hedgehog’, but also *le onze* [ləɔ̃z] ‘the number eleven’).

A strong preference for open syllables means that word boundaries do not always coincide with syllable boundaries. Prosodically, French is characterized by syllable-timing and by an absence of word stress, with tonic stress falling rather on the final syllable of the phonological phrase. Non-final syllables may occasionally bear stress for affective emphasis; otherwise secondary stress is assigned to them according to eurythmic principles. There is a tendency in Canadian French for some phrase-penultimate long syllables to receive stress.

Orthography

The French spelling system is far from phonographic. The 26 letters of the Roman alphabet are insufficient in themselves to represent all the phonemes of the language, and so the inventory of symbols has been augmented by digraphs and diacritics (the acute <’> and grave <`> accents, which originally distinguished

closed and open e, respectively, from schwa, and are occasionally used to distinguish between what would otherwise be homographs, e.g., *la* ‘the (fem.)’, *là* ‘there’, *ou* ‘or’, *où* ‘where’; the circumflex <^>, originally placed over a vowel to indicate the omission of a letter that was no longer pronounced, with concomitant lengthening of the vowel; the cedilla <ç>, indicating that <c> is pronounced as [s] before <a>, <o>, or <u>; the tréma <¨>, which, when placed over the second vowel in a sequence, prevents the sequence from being interpreted as a digraph). However, their usage, even in institutionalized normative orthography, is inconsistent. The influence of a late-medieval Latinizing tendency (which, moreover, was often ignorant of the true Latin etyma of French words) is still felt in forms such as *temps* [tā] (< Latin TEMPVS, compare Old French <tens>) ‘time’ and *poids* [pwa] (< Late Latin PENSVM, mistakenly traced to Classical Latin PONDVS) ‘weight’.

Morphology and Syntax

French is a fusional language. It has three grammatical persons, singular and plural number, and two genders, masculine and feminine. (Nominal case survived into Old French, but was then lost.) The second-person plural forms are also used to encode respect toward a single addressee. Synthetic tenses of the verb (here exemplified by *faire* ‘do’) are the present (*fais*), future (*ferai*), and past. A morphological distinction of aspect exists only in the past, where a perfective simple past (*fit*) contrasts with an imperfect (*faisais*). The subjunctive, perhaps best described as a ‘non-assertive’ mood, has a synthetic present (*fasse*) and imperfect (*fisse*). Other indicative tenses, such as the present perfect (*ai fait*), pluperfect (*avais fait*) and future perfect (*aurai fait*), as well as the perfect subjunctive (*aie fait*) and pluperfect subjunctive (*eusse fait*), are realized by combining an auxiliary (usually *avoir* ‘have’, although *être* ‘be’ is found with a subset of intransitive verbs) with the past participle. The imperfect and pluperfect subjunctives have disappeared from all but the most formal written registers of the language. A ‘future in the past’ (*ferais*, *aurais fait*), used in reported speech, doubles as a conditional mood, found in the apodosis of irrealis conditional sentences. This form also conveys attenuative values, such as politeness and evidentiality, and is coming to rival the subjunctive as an exponent of non-assertive modality.

French generally exhibits more analytic exponents than other Romance languages. Unlike Italian,

Spanish, and Portuguese, it has lost productive diminutive, augmentative, and superlative morphology. In everyday spoken language, the simple past tense (*fit*) has been ousted by the present perfect (*ai fait*), and there is evidence that a similar process is affecting the future, with the synthetic form (*ferai*) yielding to an analytic 'go to do' construction (*vais faire*). Save in exceptional cases, the singular/plural distinction in nouns and adjectives has become inaudible, with the loss of final [s], (although it continues to appear in writing) and the number of a noun is effectively indicated by some other item, usually a determiner.

Both determiners and adjectives agree with the noun. Determiners precede the noun, and attributive adjectives usually follow it, although they may also precede, especially when they have an affective nuance or a metaphorical interpretation. At sentence level, the basic word order of formal written French is SVO, but the frequent dislocations and topicalizations found in speech and in the informal written language suggest that French may be moving away from a word-order determined by grammatical functions, such as subject and object, toward one that reflects discourse-prominence.

Unlike most Romance varieties, French is not a pro-drop language, and an explicit subject is required in almost all non-imperative sentences. Subject-marking often involves a pre-verbal clitic pronoun; other clitics may mark the direct object, the indirect object, and some types of adjunct. The exact status of these clitics is the topic of much debate, with some scholars seeing them as developing into verbal affixes.

In more formal styles, interrogation is conveyed by inversion of the verb with a subject-clitic. Everyday language uses the interrogative particle *est-ce que* or declarative word-order with rising intonation. Very colloquial varieties, especially in Canada, may use a postverbal interrogative particle *-ti* or *-tu*.

In earlier stages of the language, negation was indicated by the preverbal negative marker *ne*. This marker could be reinforced by a positive-polarity item (thus *personne* 'person' > 'no one', *rien* 'thing' > 'nothing'), including *pas* 'step', which came to be a default filler of this slot and was semantically bleached. Nowadays, *ne* is generally absent from everyday spoken language, leaving the original reinforcing element as the sole marker of negation.

Vocabulary

Significant external influences on the vocabulary of French have included Frankish (during the early Middle Ages), medieval Latin, Italian (especially during the 16th century), and, latterly, English (giving rise to the hotly debated phenomenon of *franglais*). Colonial contact led to the absorption of several words from North African Arabic. Internal derivational processes include affixation, conversion, and back-formation. Two phonological processes that have proved lexically significant are clipping (e.g., *prof* < *professeur* 'teacher') and *verlan* (inversion of the order of syllables – the name, from *l'envers* 'the reverse', exemplifies the process). The latter phenomenon, which originated in low-socioeconomic-status immigrant areas in the northern suburbs of Paris, but which spread beyond these confines to become widespread in the speech of young people, and which has even penetrated the standard language, is a significant sociolinguistic development, while the outcome of some inversions has contributed to our understanding of French syllable structure.

Fulfulde

J O Breedveld, Leiden University, Leiden,
The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The Language Name

Most Fulbe call their language Fulfulde. Other names currently used for the language are *Ful*, *Fula*, *Fulani*, *Peul*, and *Pulaar*. Fulfulde is in fact one large dialect continuum in Africa stretching over thousands of kilometers from Mauritania, Senegal, and Guinea in the west to as far as Sudan and Ethiopia in the east, and to Cameroon, the Central African Republic, and Congo in the south. The Fulbe call their own language *Pulaar* or *Pular* in the dialect areas of Futa Tooro (Senegal, Mauritania) and Futa Jaloo (Guinea, Sierra Leone) and *Fulfulde* in all the other dialect areas, such as Maasina (Mali), Liptaako (Burkina Faso), Gombe (Nigeria), and Aadamaawa (Cameroon). In English literature, *Fulani* is a name frequently used for both the people and their language; it is an English loanword from Hausa (spoken in Nigeria). In French literature, the people and the language are called *Peul*, which is a French loanword from Wolof (spoken in Senegal). In American literature, the name *Fula* is often used and is the name chosen for the language of the Fulbe by D.W. Arnott, who wrote an important reference book on this language. He argued that the term Fula “seems more appropriate as well as more euphonious than the plain stem *Ful*” (Arnott, 1970:1–2). The name *Ful* is often used in German; this name is based on the root, which is common to the name of the people (sing. *Pullo*, pl. *Fulbe*) and the different autochthonous language names (*pular*, *pulaar*, *fulaare*, *fulfulde*).

The Language and Its Speakers

Fulfulde is an Atlantic language, its closest relatives are Wolof and Sereer (Serer). Atlantic is a subbranch of the Niger-Congo language family.

The number of Fulfulde speakers is unknown, because for good reasons population counts usually do not determine the different ethnic backgrounds of people in various countries. In addition, numerous people in several areas of West Africa speak Fula as a second language. In the *Ethnologue* (Grimes, 2003), the number of speakers is estimated to be between 13 and 17 million.

The Fulbe are known especially for two features: in West Africa, they are almost the only group that has specialized in cattle herding (cf. Blench, 1999), and they have played an important role in the spread

of Islam in this part of the world (cf. Last, 1987). The importance of cattle for the Fulbe is reflected in the existence of a noun class NGE, which classifies all cow names and, depending on dialect, some other terms related to cows: These nouns are all pronominalized by the same pronoun *nge* (Breedveld, 1995a, 1995b). The involvement of the Fulbe with Islam is reflected in the language by numerous religious and other loanwords from Arabic (Labatut, 1984). In most areas, the class of learned Qur’anic teachers have their own sociolect that has incorporated a number of Arabic sounds (e.g., the velar fricative [x]).

Several Fulfulde key cultural words, such as *pulaaku* and *semteende*, have received a lot of attention in studies on Fulbe culture (cf. Stenning, 1959; Dupire, 1970; Riesman, 1977; Breedveld and De Bruijn, 1996). Often, these words are associated with a code of behavior. However, prescribed conduct in the Fulbe societies differs according to social class, and most descriptions take the highest social class – the *rimbe* or so-called noblemen – as the standard for the whole society, thus over-generalizing rules of behavior in certain contexts to the whole Fulbe society. In Mali, certain terms describing behavior seen as typical for the Fulbe are loanwords from neighboring languages (e.g., *yaage* ‘respect, restraint, avoidance behavior’ is a loanword from Soninke). This borrowing indicates that some component of these ideas is defined regionally and not ethnically.

Orthography

The Fulfulde language is written in both Arabic and Latin script. In both scripts, special conventions exist for writing lengths of vowels and consonants and for writing the prenasalized and laryngealized consonants (Ladefoged, 1964; Breedveld, 1995a). There is disagreement on the phonetic nature of the latter; some claim that these consonants are implosive (Sylla, 1982; Lex, 1987) or pre-glottalized (Klingenheben, 1963; Swift *et al.*, 1965). In 1966, experts attending a UNESCO meeting for the ‘Unification of Alphabets of the National Languages’ recommended a unified orthography for the Fulfulde language as shown in **Tables 1** and **2** (Arnott, 1970).

Table 1 Orthography of Fulfulde vowels (short/long)

| | Front | Back |
|------|-------|------|
| High | i/ii | u/uu |
| Mid | e/ee | o/oo |
| Low | | a/aa |

Recommended by UNESCO, 1966.

Table 2 Orthography of Fulfulde consonants (short/long)

| | <i>Labial</i> | <i>Alveolar</i> | <i>Palatal</i> | <i>Velar</i> | <i>Glottal</i> |
|---------------|---------------|-----------------|----------------|--------------|----------------|
| Plosive | | | | | |
| Voiceless | p/pp | t/tt | c/cc | k/kk | '/' |
| Voiced | b/bb | d/dd | j | g | |
| Laryngealized | ɓ/ɓɓ | d/ɗɗ | y/yy | | |
| Prenasalized | mb/mmb | nd/nnd | nj/nnj | ng/nng | |
| Nasal | m/mm | n/nn | ny/nny | ŋ/ŋŋ | |
| Continuant | | | | | |
| Fricative | f | s | | | h |
| Glide | w/ww | | y/yy | | |
| Rolled | | r/rr | | | |
| Lateral | | l/ll | | | |

Recommended by UNESCO, 1966.

Different authors and ministries of education in different West African countries use the Fulfulde alphabet in different ways. For example in Senegal the symbol [ñ] is used instead of the digraph [ny] (e.g., Fagerberg-Diallo, 1983). Arnott (1970) has used the digraph [sh] for the phonetic symbol [ʃ] because that sound has replaced [c] in the Gombe dialect. Many authors describing the eastern Fulfulde dialect also use the letter [v] for a labiodental fricative that occurs in these dialects (Labatut, 1982; Mohamadou, 1991).

Noun Class System

All the nouns in Fulfulde are divided into groups with different grammatical markings. These groups are called 'noun classes,' and the number of noun classes varies according to dialect. For example, the Aadamaawa dialect spoken in eastern Nigeria and Cameroon has 25 classes, whereas the Maasina dialect spoken in Mali has 22. The noun classes group nouns according to semantic and formal grounds. Most nouns end in the suffix form of the noun class to which they belong. The reference marker or concord that is basically the same for all nouns of the same noun class occurs in all pronominalized forms of the noun (pronouns) and in all words that modify the noun (e.g., adjectives, demonstratives). In the following example from the Maasina dialect, Tioulenta (1986:6), writing a prize-winning novel about a young man leaving the village for the big city, used in one sentence repeatedly the concord KOY, which marks the plural diminutive. The concords reoccur with the forms *-oy*, *-woy*, and *-koy* in several pronominal and modifying words that refer to the nouns in the KOY-class.

Yogaaɓe mbittan njoppa ndew-oy
 some will leave leave behind little women-KOY
naye-woy ngarbintoo-koy
 old-KOY begging-KOY
 Some will leave behind little old women begging

e ngor-oy maw-koy koy mbaaworaa.
 and little men-KOY old-KOY who are powerless
 and little old men who are powerless.

The allomorphy of the suffix forms (e.g., that which determines whether the form of the class suffix is *-oy*, *-woy*, or *-koy*) is still the subject of debate in Fulfulde studies (Klingenheben, 1941; Mohamadou, 1991; Paradis, 1992; Breedveld, 1995a; Gottschligg, 1997). The question of the semantic basis of the noun class system in Fulfulde has also recently received new attention (Mohamadou, 1991; Breedveld, 1995b). However, consensus has not been reached on these subjects.

Consonant Alternation

A large number of consonants in Fulfulde are subject to alternation in certain contexts. In most dialects, the verbal system shows a change in the initial consonant of the verb stem, depending on plural or singular number of the subject, and also when the pronominal pronoun follows rather than precedes the verb stem.

mi war-ii
 I come-COMPLETIVE
 I have come

ɓe ngar-ii
 I come-COMPLETIVE
 I have come

mande ngar-daa
 when come-you sg. COMPLETIVE
 When have you come?

In nominal stems, the initial consonant can alternate among three categories: a basic (continuant or fricative) consonant (F), a plosive consonant (P), and a pre-nasalized consonant (N). Table 3 shows the consonants that alternate in nominal stems.

Table 3 Consonant alternation in Fulfulde

| Basic (F) | w | r | y | y | w | b | d | j | g | f | s | h |
|------------------|----|----|----|----|----|----|----|----|----|---|---|---|
| Plosive (P) | b | d | j | g | g | b | d | j | g | p | t | k |
| Prenasalized (N) | mb | nd | nj | ng | ng | mb | nd | nj | ng | p | t | k |

Basically, the articulatory nature of the first consonant of a nominal depends on the noun class suffix. This distribution is shown in the following nominal paradigms derived from the verb stem *yim-* ‘to sing, recite’:

- *yim-re* poem (NDE class suffix: F initial consonant)
- *jim-e* poems (’DE class suffix: P initial consonant)
- *jim-ol* (long) song (NGOL class suffix: P initial consonant)
- *jim-i* (long) songs (’DI class suffix: P initial consonant)
- *jim-el* small song, poem (NGEL class suffix: P initial consonant)
- *njim-oy* small songs, poems (KOY class suffix: N initial consonant)
- *jim-al* big song, poem (NGAL class suffix: P initial consonant)
- *jim-eele* big songs, poems (DE class suffix: P initial consonant).

That the form of the initial consonant of nouns is determined by the class is a possible remnant of the fact that the classes that are now marked by suffixes were once prefixes (De Wolf, 1985).

There are dialect variations in the system of consonant alternations. For example, there is no initial consonant alternation in the verbal system in the dialects of Fuuta Jalloo. Additional consonants alternate in the nominal systems; for example, the dialect of Fuuta Tooro (Senegal) has an additional set ’-g-ng, and in Aadamaawa (Nigeria, Cameroon), the additional consonant alternation set v-b-mb occurs.

Focus as a Salient Feature of Fulfulde Syntax and Verbal Morphology

Most literature devoted to Fulfulde syntax also deals with its complicated verbal morphology, because both the form of the verbal conjugation and word order are determined by focus (Labatut, 1982; McIntosh, 1984). For example, in a sentence without any of the constituents in focus, the marker of the incomplete verbal conjugation is *-an*. As soon as one of the constituents is in focus, the focused constituent is placed in the first position of the sentence and the so-called relative form of the incomplete *-ata* is then used to conjugate the verb.

Baaba sood-an kaddule.
father buy-INCOMPLETE clothes
Father will buy clothes.

Kaddule baaba sood-ata.
clothes father buy-RELATIVE.INCOMPLETE
CLOTHES father will buy.

There are three voices – active, middle, and passive – marked in the Fulfulde verb, which have ramifications for the verbal morphology and constituent order. The following three sentences show combinations of the verb stem *yeggit-* ‘forget’ and the negative incomplete conjugation in the three voices.

Mo yeggit-ataa ndee innde.
he forget-NEGATIVE INCOMPLETE that name
He will not forget that name.

Ndee innde yeggit-ataako.
that name forget-NEGATIVE INCOMPLETE
MIDDLE VOICE
That name cannot be forgotten.

Ndee innde yeggit-ataake.
that name forget-NEGATIVE INCOMPLETE
PASSIVE VOICE
That name will not be forgotten.

Sentences in the passive and middle voice usually have one constituent less than sentences in the active voice. There are three paradigms of conjugational verb suffixes: each voice had its own set.

Linguistic Taboos

Part of what Fulbe consider to be proper behavior is not to say what should not be said. Certain words are taboo for all speakers, and certain names and terms of address are taboo in particular (kinship) relations.

The taboo on body part nouns has led to much dialect variation in Fulfulde. In Malim, the euphemism for the back is *caggal*, and *baawo* is considered rude. Conversely, *baawo* is the proper word in Cameroon. Because prepositions are grammaticalized from some body part terms, the same dialectal variation is replicated. In Mali, the preposition *nder* ‘in’ is not used, possibly because it is derived from the noun *reedu* ‘belly’, which is considered rude. In certain dialects, the noun class concord *ngu* is taboo because it is associated with the female genitals.

There are many taboos on names (Ameka and Breedveld, 2004). There is a general tendency to use clan names, rather than more personal first names. In certain specific kinship relations, names are replaced by other words (e.g., a child named after his or her grandmother is called *innere* 'little mother-thing').

Although many studies have been written on the Fulfulde language (cf. Seydou, 1977), descriptions of many dialects are lacking. The study of dialect comparison remains an important goal for further research.

Language Classification

Galician is a Romance language derived from Vulgar Latin, belonging to the family of Ibero-Romance language varieties, and specifically, to the Galaico/Galician-Portuguese linguistic area. Termed *Galiza* by pro-Portuguese groups; in Galician, the language is *galego*.

Historical Overview

Galicia is the northwest region of Spain. One of three self-governing regions, the indigenous language of over 3 million people shares coofficial status with Castilian but linguistic origins with Portuguese, whose independence initiated diversification of Galician-Portuguese linguistic systems. By the 17th century, Galician varieties had lost prestige functions to Castilian, solely retained for oral intra-group purposes. However, by the 1980s a regional constitution and a written standard, the *Normas Ortográficas da Lingua Galega* (RAG & ILGA, 1995), were endorsed.

The long-standing diglossic situation with Castilian has led to lexical interference, although the phonological system also exhibits some structural borrowing: unlike Portuguese, *b* and *v* are homogeneous phonetically, there are no phonological nasal vowels or distinctive voiced sibilants, and the *ceta* [θ] is present.

Two major differences between Galician/Portuguese and Castilian:

- | | | |
|--------------|------------|------------------|
| (1) Lat. Ĕ > | Port./Gal. | terra |
| | Cast. | tierra 'land' |
| Lat. Ō > | Port./Gal. | porta |
| | Cast. | puerta 'door' |

- (2) Castilian monophthongization:

| | |
|------------|------------------|
| Port./Gal. | madeira |
| Cast. | madera 'wood' |
| Port./Gal. | pouco |
| Cast. | poco 'little' |

Phonological System

The three dialectal zones based on derivations of Latin -ANUM by García de Diego (1909)

- (3) eastern -ao
western -an
central -ano

may be maintained, but like the *seseo* pronunciation of *c*, the *gheada*, the (variable) voiceless continuant pronunciation of *g* in certain western dialects, confirms Zamora Vicente's (1953) two linguistic zone thesis; *galego iriense* (west) and *galego lucense* (east) (Fernández Rei, 1990):

- (4) Gal. amigo > ami[h]o
'friend' > ami[x]o
> ami[x^h]o

However, the *Atlas Lingüístico de Galego* (ILGA, 1990, 1995, 1999) highlight the continued presence of more diverse dialectal variation. For example, whereas Portuguese acquired \hat{V} or retained V[m] of word-final VN sequences, and Castilian retains V[n], Galician generally adopts a V[ŋ] resolution, but the following can also occur:

- (5) Lat. GERMANU > Port. irmão [ãw̃]
'brother' > Gal. irmao [aw]
(center, east)
> irmán [aŋ] (west)
> irmá [a] (northwest)
> Cast. hermano [an]

The *Normas* also require [ŋ] for intervocalic *nh*:

- (6) Gal. unha
'one' (fem. sing.)

Controversy surrounding the phonemic status of [ŋ] is based upon its syllable position (Veiga Arias, 1976; González González and González González, 1994; Beswick, 1999).

See **Table 1** for a more complete display of the Galician Phonological System.

Morphology

The tense range is similar to Portuguese: no compound tense forms, but a personal infinitive:

- (7) *comeran cando eu os chamei*
‘they had eaten when I called them’

Table 1 Galician phonological system

| Oral Vowels | | | | | |
|-------------|-------|------------------------|------------------|-------------------------------|-------------------------|
| | Tonic | | Non-final atonic | | Final atonic |
| a | [a] | <i>cama</i> ‘bed’ | [a] | <i>palabra</i> ‘word’ | [a] <i>casa</i> ‘house’ |
| e | [e] | <i>cera</i> ‘wax’ | [e] | <i>escrito</i> ‘written’ | [e] <i>lume</i> ‘light’ |
| | [ɛ] | <i>letra</i> ‘letter’ | | | |
| i | [i] | <i>clima</i> ‘climate’ | [i] | <i>último</i> ‘last’ | |
| o | [o] | <i>son</i> ‘sound’ | [o] | <i>época</i> ‘era, period’ | [o] <i>novo</i> ‘new’ |
| | [ɔ] | <i>forma</i> ‘shape’ | | | |
| u | [u] | <i>grupo</i> ‘group’ | [u] | <i>portugués</i> ‘Portuguese’ | |

| Diphthongs | | | | | |
|------------|------|--------------------------------|--------|------|-------------------------------|
| Falling | | | Rising | | |
| ai | [aj] | <i>pai</i> ‘father’ | ia | [ja] | <i>copia</i> ‘copy’ |
| au | [aw] | <i>auga</i> ‘water’ | ie | [ie] | <i>ciencia</i> ‘science’ |
| ei | [ej] | <i>maneira</i> ‘manner’ | io | [jo] | <i>milenio</i> ‘millenium’ |
| eu | [ew] | <i>meu</i> ‘my’ | iu | [ju] | <i>diurno</i> ‘daily’ |
| iu | [iw] | <i>partiu</i> ‘he, she breaks’ | ua | [wa] | <i>igual</i> ‘same’ |
| oi | [oj] | <i>biscoito</i> ‘biscuit’ | ue | [wɛ] | <i>frecuencia</i> ‘frequency’ |
| ou | [ow] | <i>doutor</i> ‘doctor’ | ui | [wi] | <i>lingüista</i> ‘linguist’ |
| ui | [uj] | <i>puiden</i> ‘I was able to’ | uo | [wo] | <i>residuo</i> ‘residue’ |

| Consonants | | |
|--|------------|--|
| Orthographic symbol | | |
| b intervocalically | [β] | <i>beber</i> ‘to drink’ |
| b elsewhere | [b] | |
| c + e, l | [θ] or [s] | <i>cedo</i> ‘early’ |
| c + a, o, u | [k] | <i>carta</i> ‘letter’ |
| ch | [tʃ] | <i>chiste</i> ‘joke’ |
| d intervocalically | [ð] | <i>dedo</i> ‘finger’ |
| d elsewhere | [d] | |
| f | [f] | <i>feo</i> ‘ugly’ |
| g | [g] or [h] | <i>garfo</i> ‘fork’ |
| gu + e, i | [g] | <i>guerra</i> ‘war’ |
| l | [l] | <i>lei</i> ‘law’ |
| ll | [ʎ] or [j] | <i>allo</i> ‘garlic’ |
| m | [m] | <i>mesa</i> ‘table’ |
| n | [n] | <i>nó</i> ‘knot’ |
| ñ | [ɲ] | <i>viño</i> ‘wine’ |
| nh | [ŋ] | <i>unha</i> ‘one’ |
| p | [p] | <i>persoa</i> ‘person’ |
| q | [k] | <i>quente</i> ‘hot’ |
| r intervocalically, word finally r elsewhere | [r] | <i>ira</i> ‘anger’; <i>ser</i> ‘to be’ |
| r elsewhere | [r] | <i>rede</i> ‘net’; <i>tenro</i> ‘tender’ |
| rr | [r] | <i>carro</i> ‘cart’ |
| s | [s] | <i>sabor</i> ‘taste’ |
| t | [t] | <i>tema</i> ‘theme’ |
| v intervocalically | [β] | <i>vivir</i> ‘to live’ |
| v elsewhere | [b] | |
| x | [ʃ] | <i>xente</i> ‘people’ |
| z | [θ] or [s] | <i>zapato</i> ‘shoe’ |

- (8) para faceres iso, precisas axuda
‘in order to do that, you’ll
need help’

Verbal periphrases express aspectual, modal, or temporal meanings:

- (9) o neno está a chorar/ o neno está chorando
‘the boy is crying’
- (10) teño traballado moito cando era xoven
‘I used to work very hard when I was young’
- (11) o can foi atropelado polo coche
‘the dog was run over by the car’

Words in *-n* and polysyllabic words in *-l* are variable in the plural according to the linguistic zone:

- (12) o can > os cans (west/standard)
‘dog’ > os cas (center)
> os cais (east)
- (13) o animal > os animais (sporadic)
‘animal’ > os animales (west/center:
castilianism)
> os animais (east/standard)

The second person dative pronoun *che* is syntactically optional as a solidarity dative:

- (14) dóecheme a perna
‘my leg aches’

Object pronouns have a fixed order, as in Portuguese; contraction is common:

- (15) déullelo
deu + lles + o
‘he gave it to them’

Third person accusative pronoun allomorphs are phonologically conditioned by final phonemes of preceding words:

- (16) o/a/os/as - default
comen o pan
‘they eat the bread’
cómeno
‘they eat it’

Here, *n* may be a positional allophone: velar word-finally before the article but morphologically connected to the pronoun, syllable-initial, and hence, alveolar.

- (17) lo/la/los/las - following *-r/-s*, leading to their loss:
vou beber + a
vou bebela
‘I am going to drink it’

- (18) no/na/nos/nas - following a diphthong.
A widespread innovative trait:

farei o xantar
‘I will make dinner’
fareino
‘I will make it’

The definite article comprises two allomorphs:

- (19) o/a/os/as - default
- (20) lo/la/los/las - following *-r/-s*:
todolos días
todos + os
‘everyday’

Article/preposition contractions are common:

- (21) ós luns
a + os
‘on Mondays’
- (22) dunha amiga
de + unha
‘of a friend’

Syntax

Pronoun order is similar to Portuguese. Simple declaratives and interrogatives:

- (23) A miña irmá tróuxome unha flor
‘My sister brought me a flower’
- (24) Falaronlle da festa?
‘Did they talk to him about the party?’

Negative, subordinate, complex interrogatives:

- (25) A muller non che deu as noticias
‘The woman didn’t give you the news’
- (26) Sabes canto me custou a casa
‘You know how much the house
cost me’
- (27) ¿Quen lle deu o libro?
‘Who gave him the book?’
