rather than *iuvare*, as the base of Port *ajudar*, Sp *ayudar*, Cat *ajudar*, Fre *aider*, Italian *aiutare*, Romanian *ajuta*, etc.); the use of preposed *magis* or *plus* instead of comparative *-ior*; palatal affricates and semivowels; and much new vocabulary from, in particular, Germanic sources.

Texts

This reconstructed language is not very much like that of the surviving written texts of the time. Janson described reconstruction and textual analysis as two different key-holes through which one can look into the same large room, for the rules of correct writing did not change, and ‘mistakes’ are rarely attested. Most texts were written on perishable wax tablets or papyrus; the extant versions are usually later manuscript copies prepared by scribes who had specific instructions to ‘correct’ their originals according to the arcane and eventually archaic rigidities of the Imperial grammarians. Texts without such distortions are few; Adams has published some letters and drafts, and Väänänen’s study of the Pompeii *Graffiti* revolutionized the discipline by showing how ‘incorrectly’ nonscholars wrote in 79 A.D. Even these texts, however, are obviously not phonetic transcriptions of actual speech. From painstaking statistical analyses of surviving inscriptions (mostly on tombstones), whose textual details cannot be ‘corrected,’ Herman has concluded that Imperial spoken Latin was evolving but also converging, with new features starting in one place becoming eventually attested anywhere. Some further progress is made by studying borrowings from spoken Latin into, for example, Irish, Welsh, Berber, Albanian, and Greek.

Divergence

Wide variation arose, but this need not imply mutual unintelligibility. Many historians, textual critics, philologists, sociolinguists, and historical linguists currently view early Medieval Romance Europe as a single lively speech community, where almost everyone could understand old-fashioned written texts when read aloud (McKitterick, 1990, Wright, 1991). These were not ‘Dark’ Ages. Early Medieval speakers rarely made metalinguistic distinctions that we take for granted now, neither diatopic (between French, Spanish, etc.) nor diastratic (between Romance and Medieval Latin). The latter distinction was probably imported from Germanic-speaking areas, where

vernacular Germanic and official Latin *grammatica* were unrelated and self-evidently different languages; conscious distinctions between separate Romance languages became widespread only after the fashion for inventing distinctive writing systems in different areas, which began experimentally in 9th-century eastern France but generalized only in the 12th and 13th centuries. Indeed, to some extent the speech of the central Romance area is still mutually intelligible, given goodwill and clarity from those in the conversation; peripheral languages, such as Romanian, Portuguese, and French, are rarely intelligible elsewhere.

Definitions

Romani (referred to by its speakers as *řomani čhib* ‘the Romani language’ or *řomanes* ‘in a Romani way’) is the only Indo-Aryan language spoken exclusively in Europe, as well as by emigrant populations in the Americas and Australia. The language is often referred to as ‘Gypsy’; it is important, however, to distinguish between Romani, which is the fully fledged, everyday family and community language spoken by the people who call themselves *Řom*, and secret or in-group vocabularies employed in various parts of the world, including in Europe, by other populations of peripatetics or so-called service-nomads. There is nevertheless some interface between the two phenomena: in some regions of Europe, especially the western margins (Britain, the Iberian peninsula, Scandinavia), Romani-speaking communities have given up their language in favor of the majority language but have retained Romani-derived vocabulary as an in-group code. Such codes, for instance *Angloromani* (Britain), *Caló* (Spain), or *Rommani* (Scandinavia) are usually referred to as *Para-Romani* varieties.

In the absence of reliable census figures, the total population of Romani speakers can only be estimated, at anywhere upwards of 3.5 million. The largest concentrations of Romani speakers are in southeastern and central Europe, especially Macedonia, Bulgaria, Romania, and Slovakia. Romani has traditionally been an oral language, and in more traditional communities there is even opposition to codification attempts or other public use of the language, which is viewed as having protective functions. The overwhelming trend, however, since the early 1990s has been toward codification of the various dialects at local or regional levels. The language is now used in local media, on numerous Internet sites, as a medium of correspondence (especially electronic), and in some countries even as a medium of school instruction.

History

The earliest attestation of Romani is from 1542, in Western Europe. Our understanding of the language’s historical development is therefore dependent on reconstruction and comparison with other Indo-Aryan idioms as well as with the contact languages. In phonology, Romani shares a number of ancient isoglosses with the Central branch of Indo-Aryan, most notably

the realization of Old Indo-Aryan *r* as *u* or *i* (Sanskrit *śṛṇ-* Romani *šun-* ‘to hear’) and of *kṣ-* as *kh* (Sanskrit *akṣi* Romani *j-akh* ‘eye’). In contrast, however, to the other Central languages, Romani preserves a number of dental clusters (Romani *trin* ‘three’, *phral* ‘brother’; cf. Hindi *tin*, *bhāi*). This led Turner (1926) to assume a Central origin of Romani, with subsequent migration to the Northwest before the reduction of the relevant clusters took place. A north-western migration is of course well in line with an ultimate migration out of India and on towards Europe. Further support for Turner’s theory comes from the domain of verb morphology, where Romani follows the exact same pattern as Northwestern languages such as Kashmiri or Shina in its renewal of the past-tense conjugation through the adoption of oblique enclitic pronouns as person markers (*kerdo* ‘done’ + *me* ‘me’ > *kerdjom* ‘I did’). Proto- or pre-European Romani was thus a kind of Indian hybrid: a central Indic dialect that had undergone partial convergence with northern Indic languages. Although the retention of dental clusters would suggest a break with the Central languages during the transition period from Old to Middle Indo-Aryan, the overall morphology of Romani indicates that the language participated in some of the significant developments leading toward the emergence of New Indo-Aryan (such as the reduction of the nominal case system to a two-way opposition, nominative vs. oblique, and grammaticalisation of new, postposed case markers). It would appear therefore that Proto-Romani did not leave the Indian subcontinent until late in the second half of the first millennium CE. Romani is among the most conservative New Indo-Aryan languages in retaining a full consonantal present conjugation, as well as consonantal oblique nominal case endings. Typical phonological developments that characterize Romani among the Indo-Aryan languages are the devoicing of aspirates *bh*, *dh*, *gh* to *ph*, *th*, *kh*, the shift of medial *d*, *t* to *l*, of short *a* to *e*, of inflectional *-a* to *-o*, of initial *kh* to *x*, and of the retroflexes *ḍ*, *ṭ*, *ḍḍ*, *ṭṭ*, *ḍh* etc. to *r* and *ř*.

The subsequent development of the language was strongly influenced by its contact languages. Romani borrowed lexicon and some grammatical vocabulary from Iranian languages and Armenian. The heaviest impact on Early Romani (European Romani, between the 10th and 13th centuries C.E.) was of Byzantine Greek. Apart from numerous lexical loans, phonemes, and grammatical vocabulary, Romani adopted Greek inflectional morphology in nouns and verbs, which remain productive with loan vocabulary from subsequent European contact languages (see below). Greek

also had a strong impact on the syntax of Romani, triggering among other things a shift to VO word order and the emergence of a preposed definite article.

The sound system

Romani dialects generally preserve an aspirated set of voiceless stops *ph*, *th*, *kh* as well as *čh*, alongside *p*, *t*, *k*, *č* and *b*, *d*, *g*, *dž*. Nasals are *m* and *n*, fricatives are *f*, *v*, *x*, *h*, *s*, *z*, *š*, and in some dialects also *ž*, and there is an affricate *c* [ts]. All dialects have *l* and *r*, and some also retain *ř*, which is realized as either a uvular [ʀ], a long trill [rr], or in some dialects a retroflex [ɽ, ɽ̣]. Palatalization of consonants, either distinctive or nondistinctive, is common in the Romani dialects of eastern and southeastern Europe. The vowel system consists of *a*, *e*, *i*, *o*, *u*, with addition in some dialects of a central vowel *ə* or *ɨ*. Western European dialects of Romani tend to show vowel length distinctions. The phoneme inventory of individual dialects usually accommodates additional phonemes from the respective contact languages in lexical loans. Conservative stress in Romani is on the final inflectional segment of the word, though a number of affixes remain unstressed, among them the vocative ending, agglutinative (Layer II) case endings (see below), and the remoteness tense marker. Dialects in Western and Central Europe often show a shift of stress to earlier positions in the word.

Morphology

Nominal forms

Romani nominal morphology is inflectional, with some agglutination. There are two genders, masculine and feminine, and two numbers, singular and plural. Mass nouns often allow omission of overt plural marking. The principal inflectional alternation in the noun is between two ‘basic’ or Layer I cases, nominative and oblique, in the singular and plural. The different patterns of alternation constitute declension classes. Romani declension classes are sensitive to gender, to the phonological shape of the stem, and to etymology, with European loans taking Greek-derived case endings. Basic inherited declension classes are presented in Table 1.

Individual dialects show various patterns of analogies among the different classes. Loan declension classes typically have Greek-derived inflection endings *-os*, *-o*, *-is*, or *-us* (masculine) and *-a* (feminine), with a variety of plural endings such as *-i*, *-e*, *-ides*, *-uri* and more. The oblique stem serves as the base for further (Layer II) agglutinative case formation, with the endings *-tel-de* (locative and prepositional),

Table 1 Basic ikeoclitic declension classes

| | Sg. nominative | Sg. oblique | Pl. nominative | Pl. oblique |
|----------------------------|---------------------------|------------------|-------------------|------------------|
| Masculines in <i>-o</i> | <i>čhav-o</i> 'boy' | <i>čhav-es-</i> | <i>čhav-e</i> | <i>čhav-en-</i> |
| Masculines in <i>-φ</i> | <i>phral</i> 'brother' | <i>phral-es-</i> | <i>phral-a</i> | <i>phral-en</i> |
| Feminines in <i>-i</i> | <i>řomn-i</i> 'woman' | <i>řomn-ja-</i> | <i>řomn-ja</i> | <i>řomn-jen-</i> |
| Feminines in <i>-φ</i> | <i>phen</i> 'sister' | <i>phen-a-</i> | <i>phen-a</i> | <i>phen-en-</i> |

-kel-ge (dative), *-tarl-dar* (ablative), *-sa(r)* (instrumental and comitative), and *-ker-l-ger-* (genitive). As in other Indo-Aryan languages, the genitive agrees with the head noun (*čhav-es-ker-o phral* ‘the boy’s brother,’ *čhav-es-ker-i phen* ‘the boy’s sister’). The oblique without a Layer II extension serves as the case of the direct object (‘accusative’) with animate nouns.

Adjectives usually take vowel endings that agree with the vocalic case-endings of the noun (*mir-o dad* ‘my father,’ *mir-i daj* ‘my mother’). Demonstratives usually show a four-term system, encoding both proximity/remoteness (or, rather, presence in the situation vs. the discourse context), and general/specific (disambiguation), e.g., *adava*, *akava*, *odova*, *okova*. Interrogatives are cognate with other Indo-Aryan languages (*kon* ‘who,’ *kaj* ‘where’), with *so* ‘what’ serving as the base for several derived forms (*savo* ‘which,’ *soske* ‘why,’ *sode* ‘how many,’ etc.). Indefinite markers are often borrowed from the respective contact languages.

Verbs

Valency is a central feature of Romani verb morphology. It is expressed through direct affixation to the verb root. The productivity, however, of individual valency markers varies among the dialects. Typical valency-increasing markers are *-av-*, *-ar-*, *-ker-*, and valency-decreasing markers are *-jov-* and *-áv-*. They derive verbs from other verb roots, as well as from nouns and adjectives. Borrowed verbs carry loan verb extension or adaptation markers, based on Greek-derived tense/aspect affixes such as *-iz-*, *-in-*, *-is-*, sometimes in combination with valency affixes (e.g., *-is-ar-*, *-is-ker-*).

The default stem (root with derivation marker) serves as a non-perfective aspect. The plain form of the nonperfective serves as a present/subjunctive. A tense/modality extension *-a* marks the present/indicative, the future, or conditional, depending on the dialect. A perfective aspect (also ‘aorist’ or ‘simple past’) is formed by attaching a perfective extension (derived from the Middle Indo-Aryan participle extension *-t-*) to the root of the verb

(e.g. *ker-d* 'did'). The choice of perfective extension depends on the numerous perfective classes, which are sensitive to the root phonology as well as to valency and semantics.

There are two person conjugations: The present conjugation (1sg *-av*, 2sg *-es*, 3sg *-el*, 1pl *-as*, 2/3pl *-en*) continues the Middle Indo-Aryan set of present concord markers. There are two inflection classes in the present (nonperfective), distinguishing vocalic and consonantal roots (*xa-s* 'you eat,' *kam-es* 'you-want'). The perfective conjugation, which follows the perfective extension, derives from late Middle Indo-Aryan enclitic pronouns (1sg *-om*, 2sg *-allan*, 3sg *-as*, 1pl *-am*, 2pl *-an/en*, 3pl *-e*).

Both the present and the perfective may be extended by a remoteness marker *-as/-ahi/-ys/-s* that is external to the subject concord marker, indicating the imperfect/habitual/conditional (with the present) or the pluperfect/counterfactual (with the perfective).

Syntax

Romani stands out among the Indic languages through its Europeanized, specifically Balkanized syntax. Word order is VO, with variation betweenthetic (continuative) VS and categorical (contrastive) SV. Local relations are indicated by prepositions. Adjectives and determiners generally precede the noun, as does the definite article (which agrees with the noun in gender, number, and case). Relative clauses are postposed, and often introduced by a universal relativizer *kaj* < 'where.' Clauses are generally finite. Adverbial clauses are introduced by conjunctions, usually derived from interrogatives. Romani distinguishes between factual and nonfactual complex clauses. Modal, manipulation, and purpose clauses are introduced by a nonfactual conjunction *te*, as are conditional clauses. Epistemic complements

are introduced by *kaj*, which is often replaced by a borrowing from the respective contact language.

Dialect diversity

Dialect differentiation in Romani appears to have emerged largely in situ, following the dispersal of groups from the Balkans into western and northern Europe, from around the 14th century onward, and their settlement in their present locations, during the 16th–17th centuries. There are two major diffusion centers of innovations: in the southeast, especially the northern Balkans, and in western-central Europe, especially Germany. Typical of the western-northern dialects are prothesis of *j*-, simplification of *ndř* to *r*, loss of adjectival past-tense in intransitives (*gelo*, *geli* > *geljas* 'he/she went'), and retention of *-n* in the abstract nominalizer *-ipen/-iben*. In the central regions, *s* in grammatical paradigms is often replaced by *h*. Individual regions show distinct developments in morphological paradigms, especially demonstratives, 2/3pl perfective concord markers, and loan verb markers. Especially these latter isoglosses justify the current classification into the following dialect groups: Balkan (with a subgroup 'Black Sea Coast'), Vlax (Transylvania and adjoining regions), Central, Northeast (Baltic-Northrussian), and Northwest (German-Scandinavian).

Romanian

J Augerot, University of Washington, Seattle, WA, USA

© 2006 Elsevier Ltd. All rights reserved.

The Romanian (alternatively spelled Rumanian, Roumanian) language is a member of the Romance languages and is a continuation of Eastern Latin, spoken in the Roman province of Dacia and surrounding areas which were colonized by the Romans led by the emperor Trajan from 106 A.D.

The Eastern Latin spoken in this area by Roman soldiers and colonists along with presumably assimilated local tribes underwent numerous influences after the Roman legions abandoned the northernmost areas in 271 A.D. The first major influence was undoubtedly provided by the indigenous Dacian–Thracian–Illyrian inhabitants of the area, although only a few undisputed words from that source remain. A. Rosetti mentions some 88 Indo-European but pre-Latin terms whose existence in both Romanian and Albanian suggests a

substratum as the source for these words in both languages, e.g., *barză* ‘stork,’ *bucurie* ‘happiness,’ *mănz* ‘colt,’ *mos* ‘old man’; cf. Albanian *bardhë* ‘white (FEM),’ *bukuri* ‘beauty,’ *mëz* ‘colt,’ *moshë* ‘(old) age.’ It is likely that some of Romanian’s morphosyntactic structure, especially that shared with the non-Romance Balkan languages, also comes from this pre-Latin substratum, but the complete lack of textual evidence leaves these possibilities in the realm of speculation.

The longest and most consistent influence was that of the Slavs, who began to migrate across this territory to the south as early as 400 A.D. and who remain neighbors on three sides of present-day Romania. Several other migrations of peoples crossed the territory of today’s Romania between the departure of the Roman legions and the appearance of the modern Romanian people, but little or no linguistic traces of the Goths, Huns, Gepids, Avars, *et al.* remain.

This early Romanian soon (perhaps as early as the 10th century) began to split, first into four dialects which later tended to become languages in their own right: the principal one in terms of numbers is termed Daco-Romanian, spoken primarily north of the Danube. The second largest division is called Aromanian (Macedo Romanian) and is currently spoken in pockets of southwestern Bulgaria, Macedonia, Albania, and northern Greece. The other two are quite limited in extent: Megleno Romanian is confined to an area in southeastern Macedonia and adjacent northern Greece, and Istro Romanian is limited to eight localities in Istria in modern Croatia.

Daco-Romanian is now called Romanian and is the single national language among the four with approximately 25 million speakers worldwide. It shows, in addition to the Slavic mentioned above, the influences of prolonged contact with Hungarian, Turkish, and early modern Greek. More recently, from the 19th century onwards, Romanian has been subjected to a kind of re-Latinization, both from the strong influence of French and from the international European vocabulary largely based on Latin and Italian.

The first preserved texts in Romanian date from the end of the 15th and beginning of the 16th centuries. The oldest dated text (1521) is a letter to Neacsu of Câmpulung.

Although some texts from as early as the 16th century are written in the Latin alphabet, which is the norm today, until 1860 the official alphabet was Cyrillic. Most of the letters have approximately their general European values, but there is some use of diacritics that should be noted, namely *î*, *â*, *ă*, *ț*, *ș*. Phonetic equivalents are given where necessary in brackets in Tables 1 and 2.

Table 1 Vowels

| | Front | Central | Back rounded |
|------|-------|-----------|--------------|
| High | i | î (â) [i] | u |
| Mid | e | ă [ə] | o |
| Low | | a | |

Table 2 Consonants

| | Bilabial | Labio-dental | Dental | Palato-alveolar | Dorso-velar |
|------------|----------|--------------|--------|-----------------|-------------|
| Stops | p b | | t d | ch [k'] gh [g'] | c [k] g |
| Affricates | | | ț [c] | c [č] g [č] | |
| Fricatives | | f v | s z | ș [š] j [ž] | h |
| Nasals | m | | n | | |
| Lateral | | | l | | |
| Trill | | | r | | |

Romanian symbolizes diphthongs with pairs of vowels, e.g., *iu*, *ia*, *ea*, *ua*, *oa* and *ai*, *au*, *ou*, *ui*, but one can seldom be certain from the spelling alone. See the website of the Romanian Academy Center for Artificial Intelligence for a complete inventory of multiple vowel combinations.

In contrast to the practice of some of its immediate neighbors, there is no final devoicing of consonants as in Bulgarian and Russian and no contrastive vowel length as in Slovak, Hungarian, and Serbian (Serbo-Croatian). Rather, Romanian forms a bridge between Serbian and Ukrainian in terms of final voiced obstruents.

The two palatal velars are disputed as separate from the dorsovelars in phonology but are clearly different on the morphophonemic plane. They represent an interesting progression from Latin ‘cl’ and ‘gl’ in words such as *cheie* ‘key’ and *gheață* ‘ice.’ Intentionally omitted from the chart are the palatalized variants of most consonants that, according to some analyses, occur word finally before the final (voiceless?) [i], for example in the second person singular present forms of the verb, e.g., *tu plimbi* ‘you stroll,’ *vezi* ‘you see,’ *scoli* ‘you arise.’

Word stress in Romanian is basically penultimate, but only if one counts final (mostly silent and, in the case of /u/, mostly unwritten) /i/, /u/ as a syllable (the stressed vowel is given in bold type): *plecare-pleacă-plecând*, *venire-vine-venind*, *miere*. There are several exceptions to this generalization including many borrowings, e.g., through Turkish: *baklava*, *sarma*, *cafea*, and the majority of the infinitive forms, which are also stressed on the final syllable: *veni*, *citi*, *pleca*, *turna*, *putea* (historically, of course, the infinitive had

Table 3 Morphophonemics

| underlying forms | mes-ə mes-e | fet-ə fet-e | mer-u mer-e | per-u per-i |
|----------------------|-------------|-------------|-------------|-------------|
| 1. breaking | m̥easə -- | f̥eətə -- | -- -- | -- -- |
| 2. backing | m̥easə -- | f̥eətə | m̥aru -- | p̥aru -- |
| 3. coalescence | masə mese | fatə fete | -- -- | -- -- |
| 4. drop final /u, i/ | -- -- | -- -- | m̥ar mere | p̥ar per' |
| normal spelling | masă mese | fată fete | măr mere | păr peri |

a final syllable '-re'). Other exceptions include the classic Latin deviations based on heavy syllables as in *industrie* and words of specific morphological categories with stress fixed on a certain ending, such as the imperfect tense: *plecam*, *plecai*, *pleca*, etc. Note that the addition of the masculine genitive definite article /-u-lui/, the feminine definite plural article /-i-le/ or the 'multisyllabic' plural desinence /-uri/ does not cause movement of the stress: *marfă*, *mărfuri*. Thus it is not truly penultimate, only dominantly so, since one must proceed from a hypothetical base form of the word and include several classes of exceptions.

From a morphophonemic point of view, Romanian is quite complex. Space limitations will not allow a complete treatment here, but an illustration of this complexity may be seen in the singular and plural forms of words such as *masă*, *mese* 'table(s)'; *fată*, *fete* 'girl(s)'; *măr*, *mere* 'apple(s)'; *păr*, *peri* 'hair(s)', where only by beginning with a root with the front vowel /e/ may one predict all the forms of any one word. The three rules that are involved are illustrated in **Table 3**.

Rule 4 brings up some other complications such as the phonetic interpretation of consonants preceding the final 'dropped' /-i/, but it can be seen that, at least for inherited Latin vocabulary, these rules will predict the surface phonetics of many forms. Compare (given here in the normal orthography) the various forms of the verbs *a vedea* 'to see' and *a învăța* 'to learn' with the same stressed root vowel /e/, i.e. /véd-/ , /învéc-/ (see **Table 4**).

It can be seen that the same rules allow the derivation of all the verbal forms if we add the 'flip-flop' rule, namely, in the conjunctive-subjunctive the present third singular ending /-e/ goes to /-ə/ and vice versa. Thus *el pleacă* 'he leaves' becomes *el o să plece* while *el crede* 'he believes' becomes *el o să creadă*.

It should be noted that the stressed schwa is a feature that is often included among the features of the so-called Balkan Sprachbund. There are characteristics (merging of the genitive and dative, tendency to lose the infinitive, development of a postpositive definite article, repetition pronominally of the direct

Table 4 Verbal forms with root in /e/

Table 5 The definite article

| Feminine | Masculine | Neuter |
|------------------------|----------------------------|-------------------------|
| o doamnă <i>a lady</i> | un domn <i>a gentleman</i> | un os <i>a bone</i> |
| doamna doamnele | domnul domnii | osul oasele |
| o masă <i>a table</i> | un pom <i>a tree</i> | un lucru <i>a thing</i> |
| masa mesele | pomul pomii | lucruri lucrurile |
| o carte <i>a book</i> | un perete <i>a wall</i> | un scaun <i>a chair</i> |
| cartea cărțile | peretele pereții | scaunul scaunele |

object) in several areas of the grammar that Romanian shares with languages clearly not of Romance origin such as Bulgarian, Macedonian, Albanian, and dialectal areas of Serbian and modern Greek.

Most noticeable in differentiating Romanian from the rest of Romance is the postposed definite article, which takes several forms but is basically singular *-a*, plural *-le* for feminines and singular *-l*, plural *-i* for masculines (with a special category of neuter that generally takes the masculine article in the singular and the feminine in the plural; examples in **Table 5**). In the noun phrase the same definite article is attached to the first element in the phrase: *un prim pas* 'a first step,' *primul pas* 'the first step.'

Unlike the rest of Romance, although they have been whittled down to just two (plus a vocative that has almost disappeared), Romanian still maintains nominal case distinctions. Among Romanian scholars there is a tendency to name them nominative-accusative and genitive-dative after the functions of each case; see **Table 6** for some examples.

Table 7 gives two verbs illustrating the basic verbal categories: *a intra* 'to enter' and *a face* 'to do.' There are, in addition to the present tense, two ways to form the future, and a variety of past tenses, including

Table 6 Cases

| Gender | Article | Nom-Acc Singular | Gen-Dat Singular | Nom-Acc Plural | Gen-Dat Plural |
|-----------|------------|-------------------|------------------|----------------|----------------|
| Feminine | Indefinite | casă <i>house</i> | case | case | case |
| | Definite | casa | casei | casele | caselor |
| Masculine | Indefinite | bărbat <i>man</i> | bărbat | bărbați | bărbați |
| | Definite | bărbatul | bărbatului | bărbați | bărbaților |
| Neuter | Indefinite | lemn <i>wood</i> | lemn | lemne | lemne |
| | Definite | lemnul | lemnului | lemnele | lemnelor |

Table 7 Verb tenses

| | 1st sing | 2nd | 3rd | 1st plur | 2nd | 3rd |
|----------------|----------|-----------|---------|------------|-------------|-----------|
| Present | intru | intri | intră | intrăm | intrați | intră |
| | fac | faci | face | facem | faceți | fac |
| Imperfect | intram | intrai | intra | intrăm | intrați | intrau |
| | faceam | faceai | facea | faceam | faceați | faceau |
| Simple perfect | intrai | intrași | intră | intrarăm | intrarăți | intrară |
| | făcui | făcuși | făcu | făcurăm | făcurăți | făcură |
| Pluperfect | intrasem | intraseși | intrase | intraserăm | intraserăți | intraseră |
| | făcusem | făcuseși | făcuse | făcuserăm | făcuserăți | făcuseră |

the compound past, the imperfect, the perfect and the pluperfect. Again it is instructive to consider the dropped final high vowels /u/, /i/ as morphological formants of the first and second persons singular in the present tense, both for purposes of word accent and for various other phonological alternations. The forms are given in standard orthography.

There are two general types of regular verb, one with base + back vowel and the other with base + plus front vowel, and with this information plus sets of personal endings all of the conjugations of a given verb may be produced. I chose here the verb *a intra* since it gives justification for the otherwise phantom ending /-u/ of the first person singular for a-verbs and both first singular and third plural for e-verbs (also true for i-verbs, which are not illustrated here).

All other verbal formations (except for the conjunctive-subjunctive future with *o să* plus the present, discussed above with the flip-flop rule) are synthetic, relying on either the short infinitive or the past passive participle: thus the future is *voi, vei, va, vom, veți, vor* plus the infinitive (*voi intra, vei intra*, etc.), and the conditional is *aș, ai, ar, am, ați, ar* also with the infinitive (*aș intra, ai intra*, etc.); while the compound past uses *am, ai, a, am, ați, au* plus the past passive participial form (*am intrat, ai intrat*, etc.), and the past conditional also uses it after the same auxiliary as the conditional, adding the verb *fi* ‘to be’ (*aș fi intrat, ai fi intrat*, etc.). One further verb form is the past subjunctive, which does not

conjugate and has a single fixed auxiliary *să fi* with the past passive participle (*să fi intrat* for all persons). There is also a ‘future in the past’ with *fi*.

Russenorsk

E H Jahr, Agder University, Kristiansand, Norway

© 2006 Elsevier Ltd. All rights reserved.

The Arctic pidgin Russenorsk (RN), which developed from Norwegian and Russian during the second half of the 18th century, was used in barter trade in northern Norway for around 150 years. RN's main period of use was the 19th century when trading reached large proportions. The sociolinguistic situation in northern Norway during the 19th century was multifaceted and complex, involving many different languages.

RN, now extinct, exhibits several features that make it theoretically interesting. In spite of being formed as a dual-source pidgin – from two Indo-European languages – it shows most of the features common to all pidgin languages. To a stabilized grammatical and lexical core, a variety of lexical items could be added when the situation called for it. It also is noteworthy that RN, unlike most pidgins, was created by socially equal groups of speakers.

Until around 1850, RN enjoyed a high social status, as both fishermen and merchants had to use the pidgin when dealing with the Russians. After 1850, the use of RN was restricted mostly to common fishermen, because the merchants – who constituted the local upper classes – began to spend longer periods of time with colleagues in northern Russia and subsequently developed their own grammatically simplified variety of Russian. As a consequence, RN's social status was devalued.

Today, we have to rely on written material in our study of RN. However, the available texts allow for studies of both lexicon and grammar. They consist of isolated sentences, word lists, and conversations in dialogue form. Altogether, they include some 400 different words, with a core of 150–200 lexemes. Most of them are related to the barter trade. This trade constituted the socioeconomic basis for RN, and when it gradually gave way to cash trade early in the 20th century, the language lost ground and disappeared.

The characteristic features of RN can be summarized as follows:

- a. The phonology reflects Norwegian and Russian – however, sounds and consonant clusters not found in both languages are avoided or simplified.
- b. 1st and 2nd personal/possessive pronouns are *moja* and *twoja*.
- c. *po* 'on' is the only preposition.
- d. *-om* is the general verbal marker (e.g., *kopom* 'buy'), although not always used. Verbs exhibit no markers for tense or person. A special *po+V* construction represents a possible TMA (Tense, Mood, Aspect) device.
- e. *-a* tends to mark nouns (e.g., *fiska* 'fish'), which are not inflected and have no plurals.
- f. There is no copula.
- g. The vocabulary derives mostly from Norwegian and Russian, but contains a number of lexical items from other European languages (e.g., *slipom* 'sleep', from English).
- h. RN has SVO syntax. Sentences with adverbial(s) are, however, verb final (e.g., *moja kopom fiska* 'I buy fish'; *moja po twoja fiska kopom* 'I buy fish from you'). Most sentences are combined paratactically, but embedding is attested. The syntactic possibilities are quite restricted. Most syntactic variation is found in interrogative sentences, RN was used mainly to make inquiries about prices and barter for merchandise.

The Written Language

Diglossia

The adoption of Eastern Christianity in the 10th century brought to the East Slavs the religious language of the Slavs, Old Church Slavonic (OCS), written in Cyrillic.

Syntax, phraseology, and much of the word formation of OCS owed much to Byzantine Greek. In a russified form, OCS served for centuries as the language of 'culture' of the Russians. The earliest extant text is an aprakos Gospel compiled in 1056–1057 by Deacon Grigorij for Prince Ostromir ('Ostromir Gospel'). Secular works – writs, treaties, codes of law (e.g., *Russkaja Pravda* 'Russian Law', mid-11th century, earliest extant copy 1282), etc. – were written in vernacular Russian.

18th Century

Church Slavonic (CS) and Russian now merged to provide the foundation for the modern literary language. Though the everyday language that V. K. Trediakovskij (1703–1769) advocated as a literary language cannot be found in his own writings, he amply demonstrated the word-forming capabilities of CS elements and processes. M. V. Lomonosov (1711–1765) wrote the first complete grammar of Russian as Russian (1757), distinguishing 'high style' forms (i.e., of CS origin) from the rest and insisting elsewhere that CS words were an ineradicable part of Russian.

Writers of the late 18th and early 19th centuries, e.g., N. M. Karamzin (1766–1826) and others, created a 'new style' (*novyj slog*), in which clarity and straight-forwardness were fundamental criteria, eradicating the ponderous, convoluted earlier 18th century prose style. French provided a model for sentence structure and element order. Karamzin himself produced many new words – straight loans, calques (many based on French) and new creations using the resources of Russian.

Thus, modern literary Russian may be said to be at base a blend of a Graecized Church Slavonic, vernacular Russian, and French syntax and order.

Church Slavonic Features

Almost any printed page of modern Russian reveals numerous elements of CS origin. Such are the nominative singular masculine ending of the adjective *-yj/-ij*, the present active participle in *-ushchij*, etc., (and in general the use of participles), suffixes such as *-ie*, *-stvol-estvo*, *-tel'*, and compound suffixes such as *-eniel-aniel-janie*.

Some morphophonemic alternations show CS origin. For example, CS are *d ~ zhd*, *t ~ shch* against Russian *d ~ zh*, *t ~ ch*. Compare *pobedit'* (PRFV) ~ *pobezhdat'* (IMPFV) 'to conquer' with *brodit'* 'to ferment' ~ *brozhenie* 'fermentation,' and *obet* 'promise' ~ *obeshchat'* 'to promise' with *otvetit'* (PRFV) ~ *otvechat'* (IMPFV) 'to answer'. In the striking alternation of pleophonic (*polnoglasnyj*) forms, of Russian origin, and apleophonic (*nepolnoglasnyj*) forms, of CS origin, a vowel *o* or *e* flanks both sides of *l* or *r* in pleophonic forms, whereas a single vowel *a* or *e* follows *l* or *r* in apleophonic forms. Thus, *moloko* 'milk' – *mlekopitajushchij* 'mammalian', *Mlechnyj put'* 'Milky Way'; *korotkij* 'short', *ukorotit'* 'to shorten' – *kratkij* 'brief', *prekratit'* 'to curtail'; *golos* 'voice', *golosovye svjazki* 'vocal cords' – *glasnyj* 'vowel', *soglasnyj* 'consonant'; *bereg* 'bank' – *bregoukre- plenie* 'reinforcement of banks', *bezbrezhnyj* 'boundless'. Pleophonic forms are 'concrete,' mundane; apleophonic forms are 'abstract,' 'learned,' 'technical.'

Phonetics

Old Russian had 12 vowel phonemes and some two dozen consonant phonemes, with open syllables and few clusters. The lapse, from the 12th century, of two ultrashort vowels in certain positions initiated the development toward a language with five vowel phonemes, many more consonant phonemes, many clusters and closed syllables, and a system in which palatalization is largely independent of the following vowel, i.e., is largely phonemic.

The vowels /i, e, a, o, u/ have several allophones each, depending on location of stress, consonantal environment, or the two combined. For example, /a/ – *dast* [dast] ‘he will give,’ *dal* [da + l] ‘gave’ MASC, *pjat’* [pæt] ‘five,’ *dala* [dɔ’la] ‘gave’ FEM, *uydat’* [’vɪdət] ‘to give out.’

The accent is not fixed and is mobile, shifting in regular patterns in both declension and conjugation, e.g., *storoná* ‘side’, ACC *stóronu*, GEN *storoný*, NOM PL *stórony*, GEN PL *storón*, DAT PL *storonám*, etc.

Except as described below, /o/ is replaced in unstressed syllables by /a/, in a system known as *akan’e* ‘a-saying’ (operating also in southern dialects and Belorussian but not in northern dialects or Ukrainian). Thus ‘town’ appears as *gorod* /’gorat/ NOM SING, *goroda* / gara’da/ NOM PL, *mezhdugorodnyj* /mɨʒduga’rodnij/ ‘interurban’. The last example also illustrates *ikan’e* ‘i-saying’, in which /e/ is replaced in unstressed positions by /i/ (cf. *mezhdu* /’mɛʒdu/ ‘among, between’). *Ikan’e* also affects, in pretonic positions, /a/ after palatalized consonants and /j/, and /o/ after palatalized consonants, /j/ and the palatals /ʃ/ and /ʒ/. Thus, *pjat’* /p at/ ‘five’ ~ *pjati* /pi’ti/ GEN, *let* /lot/ ‘flight’ ~ *letat’* /li’tat/ ‘to fly’, *zheny* /’ʒoni/ ‘wives’ ~ *zhena* /ʒi’nal/ ‘wife’. The orthography ignores both *akan’e* and *ikan’e*.

There are 13 pairs of distinctively nonpalatalized/palatalized consonants: /p–pʲ/, /b–bʲ/, /m–mʲ/, /f–fʲ/, /v–vʲ/, /t–tʲ/, /d–dʲ/, /s–sʲ/, /z–zʲ/, /n–nʲ/, /l–lʲ/, /r–rʲ/, /k–kʲ/. Consonants /g/ and /x/ have palatalized allophones; /tʃ/ and /ʃ/ (realized as [ʃʃ]) are nondistinctively palatalized. In addition, there are /ts/, /ʃ/, /ʒ/, and /j/.

Voiced consonants except sonants are devoiced word-finally and before voiceless consonants. Conversely, voiceless consonants are voiced before voiced consonants except sonants, /v/ and /x/. Non-palatalized consonants are frequently replaced by corresponding palatalized consonants before palatalized consonants, especially homorganic ones. Apart from a very few items and the devoicing of /z/ in prefixes, (e.g., *raz-* ~ *ras-*, *iz-* ~ *is-*), the orthography entirely ignores the various consonant assimilations and final devoicing. Thus, *otdat’* /ad’dat/ ‘to give back’, *sdelat’* /’zɔɫat/ ‘to do’, *gorod* /’gorat/.

Grammar

Nouns

The Old Russian system of eight declensions, three numbers, and seven cases has been simplified into a system of three principal declensions and a vestigial consonant-stem declension, two numbers, and six cases, the dual number and the vocative case having been discarded.

The ‘feminine’ declension in *-al-ja* declines in the singular thus: NOM *komnata* ‘room’, GEN *komnaty*, DAT *komnate*, ACC *komnatu*, INSTR *komnatoj*, PREP (*v*) *komnate*. A few masculine nouns are found in this declension. A typical noun of the ‘masculine’ declension is *stol* ‘table’, *stola*, *stolu*, *stol*, *stolom*, (*na*) *stole*. Neuters decline as masculines except for nominative and accusative, e.g., *okno* ‘window’, PL *okna* (cf. *stoly*) and, usually, GEN PL – cf. *stolov* – *okon*. One masculine noun is still found in the declension that is now otherwise feminine, illustrated by *chast’* ‘part’, *chasti*, *chasti*, *chast’*, *chast’ju*, (*o*) *chasti*.

Nouns of the masculine declension denoting animate beings use the genitive as an accusative, thus *muzh* ‘husband,’ GEN and ACC *muzha*. The genitive-accusative also applies to all nouns denoting animate beings in the plural, of whatever gender: *zhena* – GEN ACC PL *zhen* (/ʒon/).

Remnants of old declensions include an additional genitive in *-u* of some masculine nouns (usually partitive in function): *kilo sakharu* ‘a kilo of sugar’, cf. *vkus sakhara* ‘taste of sugar’; and an extra PREP case in *-ú* of some masculine nouns, having purely locative function: *v lesu* ‘in the wood’ (cf. *o lese* ‘about the wood’).

A vestige of the dual probably explains the NOM PL MASC in *-á* instead of *-y*, e.g., *goroda*, cf. *stoly*. The graphic identity of the old NOM dual MASC in *-a* with the GEN SING in *-a* of the same declension has led to the use of the GEN SING of a noun of any gender with the numerals *dva* ‘two’, *tri* ‘three’, *chetyre* ‘four’, and higher numerals ending in these elements. Numeral syntax is further complicated by the use of NOM SING with all numerals ending in *odin* ‘one’ and GEN PL with all other numerals: *dva stola* ‘two tables’, *tridsat’ tri stola* ‘33 tables’, *sorok chetyre stola* ‘44 tables’, *sto odin stol* ‘101 tables’, *pjat’ stolov* ‘five tables’.

The genitive not only is obligatory in negative partitive expressions – *Net otveta* (GEN SING) ‘There is no reply’, *Deneg* (GEN PL) *ne khvataet* ‘There isn’t enough money’ – but also is more frequent than the accusative with negated transitive verbs – *Shkoly* (GEN SING) *ona ne brosit/Shkolu* (ACC SING) *ona ne brosit* ‘She will not give up school’.

Syntactically interesting too is the predicative instrumental, standard with certain copula-like verbs and the future of *byt’* ‘to be’: *Ona okazalas’ /stala budet sirotoj* ‘She turned out to be /became/ will be an orphan’. With the past tense of *byt’* both the instrumental and the nominative are found: *V to vremja ja byl student(om)* ‘At that time I was a student’, the nominative being more colloquial. *Byt’* has no present tense: *Ona sirota* ‘She (is) an orphan’.

There is no article, definite or indefinite. The 'long' form of the adjective, with a declension different from that of nouns, originally expressed 'definiteness' but is now simply the basic form of the adjective and the only attributive form. The 'short' form no longer declines and is restricted to predicative function, where it simply assigns a property to a subject – *Solntse velika, a Zemlja mala* 'The Sun is big but the Earth is small'. The long form is also used predicatively, assigning the subject to a class of like entities. Compare *Vera ochen' umna* (short form) 'Vera is very clever' to *Vera ochen' umnaja* (long form) 'Vera is (a) very clever (person)'. This distinction, while still active, is being eroded, especially in colloquial Russian, in favor of the long form.

Verbs

The aspect system of imperfective versus perfective, already active in Old Russian, has led to the reduction of the multiple tenses of Old Russian to just three: past, IMPFV or PRFV, present, IMPFV only, and future, IMPFV or PRFV. The past, originally a periphrastic participial form, is now reduced to what was the participle and so changes according to gender and number, while present and future have 'true' conjugations of three persons and two numbers, the future imperfective being periphrastic. Thus, 'to infringe' – IMPFV *narushat'*, PRFV *narushit'*: past MASC *narushal'*, *narushil*, FEM *narushala/narushila*, NEUT *narushalo/narushilo*, PL *narushali/narushili*, present *narushaju, narushaesh'*, *narushaet, narushaem, narushaete, narushajut*: FUT IMPFV *budu/budesh'/budet/ budem/ budete/budut narushat'*, FUT PRFV *narushu, narushish'*, *narushit, narushim, narushite, narushat*. The two aspects are differentiated formally by prefixation, suffixal changes, or a combination of the two and occasionally by suppletion. A complication is the existence of many verbs that are not members of minimal pairs, distinguished only by aspect. These form the groups known as *sposoby dejstvija*, Aktionsarten, 'modes of action'. While associated with a base verb, each Aktionsart, appearing in one aspect only, adds a nuance to the base verb, without forming a plain aspectual counterpart. For instance, *stuchat'* 'to knock' is IMPFV and has no plain PRFV counterpart; *postuchat'* PRFV is diminutive or attenuative – 'to knock a little / for a short time' and may have to serve in lieu of a plain PRFV; *stuknut'* PRFV is semelfactive – 'to give a single knock'; *zastuchat'* PRFV is inceptive – 'to start to knock'; *prostuchat'* PRFV is perdurative – 'to knock for a certain period of time'; *postukivat'* IMPFV is intermittent (-diminutive) – 'to knock (a little) from time to time'.

The dozen or so pairs of 'verbs of motion,' while participating in the aspect system, also distinguish between determinate (motion in a single direction) and indeterminate (motion not restricted so): *On letel v Moskvu* 'He was flying to Moscow' – *On letal v Moskvu* 'He flew to Moscow (and back, or several times)'.¹

There are five participles: PRES ACT *narushajushchij* 'infringing', PRES PASS *narushaemyj* 'being infringed', PAST ACT IMPFV *narushavshij* 'were infringing', PRFV *narushivshij* 'having infringed', and PAST PASS PRFV *narushennyj* 'infringed'. They decline as adjectives and the two passive ones have short forms, the PRFV PASS short form being an indispensable component of the passive voice: *Zakon byl narushen*. 'The law was infringed'. The two indeclinable adverbial participles, often called gerunds, are, for example, IMPFV *narushaja* 'infringing' and PRFV *narushiv (shí)* 'having infringed'. Subordination by means of participles and gerunds, instead of relative and adverbial clauses, is common.

Lexis

While the bulk of the lexis is Slavonic, Russian has not been averse to borrowing at all periods. From Western European languages Dutch has provided nautical terminology: *botsman* 'bosun', *kil'vater* 'wake'; German – military and other terminology: *lager* 'camp', *landshaft* 'landscape', *buterbrod* 'sandwich'; French – military, mundane and cultural vocabulary: *batal'on* 'batallion', *pal'to* 'overcoat', *rezhisser* 'producer'; English – nautical terms: *michman* 'midshipman', mundane: *bifshteks* 'steak', industrial: *rel'sy* 'railway lines', sociopolitical: *bojkot* 'boycott', *khuligan* 'hooligan', and in the 20th century, sport: *futbol* 'football', *vindsorfiging* 'windsurfing', and technical: *bul'dozer* 'bulldozer', *komp'juter* 'computer'.

Naturally, Russian has gone on exploiting its historically established word-forming processes, but it has also exploited less traditional ones. In this respect, notable are appositional compounds such as *raketa-nositel'* 'carrier rocket', *dom-muzej* 'home (which is also a) museum', and above all acronyms and various other accreted abbreviations – *vuz (vysshee uchebnoe zavedenie)* 'higher educational institution', *GUM (Gosudarstvennyj Universal'nyj Magazin)* 'State Department Store', *ROSTA (Rossijskoe Telegrafnoe Agentstvo)* 'Russian Telegraph Agency', *kolkhoz (kollektivnoe khozjajstvo)* 'collective farm', *univermag (universal'nyj magazin)* 'department store', *zarplata (zarabotnaja plata)* 'wages', *fizkul'tura (fizicheskaja kul'tura)* 'physical training'.

Influence of Russian

In varying degrees, Russian has provided loanwords, especially relating to 20th century life, of technological and cultural significance for many non-Slavonic languages of the former Soviet Union. An extreme case of such borrowing from Russian is provided by Chukchi. In Altaic, North Caucasian, and easterly Uralic languages, subordinating constructions on the Russian model have become common. The languages of many small speech-communities (Ingrian, Veps, Vot, Mordvinian, Siberian languages, etc.) have retreated or are retreating in the face of Russian.

Ryukyuan

M Shibatani, Rice University, Houston, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Also known as Luchuan and Okinawan, the Ryukyuan (Okinawan, Central) language comprises a group of diverse dialects of the former Ryukyu Kingdom, 1429–1879, which has lost much of its political and economic independence since 1609, when it fell to the hands of the Shimazu clan of Kagoshima, Kyushu. Following the Japanese annexation in 1879, the Ryukyu Islands became a prefecture of Japan – *Okinawa ken* 'Okinawa Pref.' – the status it regained in 1972, when the islands were returned to Japan from the American occupation. The Japanese government policy of fostering the use of standard Japanese since the time of the Meiji restoration (1868) has helped marginalize local dialects throughout Japan, and it has also had a pronounced effect in Okinawa. Based on the most recent census (2002), it can be estimated that of the current population of 1.3 million Okinawans, less than 300 000 people over the age 50 speak some variety of the Ryukyuan language with varying degrees of proficiency. Since children no longer learn to speak Ryukyuan, the language is bound to become extinct within the next 50 years unless active revitalization efforts are mounted.

Hypothesizing the sister-language relationship, Chamberlain (1895) remarked that the relationship between Ryukyuan and Japanese is something like that between Spanish and Italian or that between French and Italian. But unlike these Romance languages, the Ryukyuan dialects are often mutually completely unintelligible among their speakers, let alone to the speakers of any mainland dialect. Japanese dialectologists,

on the other hand, have generally regarded Ryukyuan as a branch of Japanese dialects comprising three large groups: the Amami-Okinawa group (Amami dialect, Okinawan dialect), the Miyako-Yaeyama group (Miyako dialect, Yaeyama dialect), and the southernmost Yonaguni dialect group. The dialect of Shuri, the former capital of the Ryukyuan Kingdom, of the main Okinawa Island is generally regarded as the standard Ryukyuan, and it has served as a lingua franca of the Ryukyus.

It is generally estimated that the Ryukyuan stock split from the mainstream Japanese language at the latest around the 6th century A.D. (Hattori, 1976). Ryukyuan dialects show systematic sound correspondences with the modern Tokyo dialect, and they preserve a number of distinct features of Old Japanese. As shown in Tokyo–Shuri correspondences such as *ame:ami* 'rain', *hone:funi* 'bone', and *kokoro:kukuru* 'heart', the mid vowels have been raised in Ryukyuan dialects with the result of the standard five vowels *i, e, u, o, a* being reduced to the three vowels *i, a, u*. Innovative phonological developments include palatalization of /k/ before the /i/ corresponding to the Tokyo /i/ (Shuri *tfiri* : Tokyo *kiri* 'fog'), centralization of the original /i/ in certain dialects (e.g., Miyako, Yaeyama), and the development of long mid vowels /o:/ and /e:/ from *au, ao, and ou*, as well as *e:* from *ai* and *ae*, respectively.

The features of Old Japanese preserved in Ryukyuan dialects cover all aspects of grammar. The Old Japanese consonant /p/ is preserved in such words as *piru* 'day time', *pi:* 'fire', and *pa:* 'leaf', corresponding to the Tokyo forms *hiru, hi,* and *ha,* respectively. The Ryukyuan lexicon contains older forms such as *tudzi* 'wife', *wan* 'I', and *warabi* 'child'. The notable

syntactic features of Old Japanese preserved include the distinction between the conclusive form and the attributive form of verbs and adjectives; e.g., *katfun* 'write-Conclusive' and *katfuru* 'write-Attributive' correspond to the Tokyo form *kaku* used in both conclusive and attributive functions. Also seen is the preservation of the nominative function of the particle *nu* (Old Japanese/Modern Japanese *no*) in the main clause. In the total picture of the Japanese dialects, the Ryukyuan dialects form the most peripheral groups that preserve historically residual forms in line with the classical theory dialectology.

S

Saami

P Sammallahti, University of Oulu, Oulu, Finland

© 2006 Elsevier Ltd. All rights reserved.

Saami is a subfamily of closely related languages within the Uralic phylum. At present, the Saami languages are spoken in an area arching from Dalecarlia in central Sweden to the tip of the Kola peninsula in northwestern Russia. The number of native speakers is ca. 30 000; ca. 85% of these speak North Saami (Saami, Northern) in Finland, Norway, and Sweden. The rest are unevenly distributed between Lule Saami (Saami, Lule) (south of North Saami in Norway and Sweden, estimated 2000 speakers), Kildin Saami (Saami, Kildin) (inland and northern coast of the Kola peninsula, 900 speakers), South Saami (Saami, Southern) (in the southernmost Saami areas in Norway and Sweden, 500 speakers), Skolt Saami (Saami, Skolt) (in Finland and some speakers in Russia, 400 speakers), Inari Saami (Saami, Inari) (in Finland, 300 speakers). The rest, Ume Saami (Saami, Ume) and Pite Saami (Saami, Pite) in Sweden between South Saami and Lule Saami areas, and Ter Saami (Saami, Ter) in eastern Kola peninsula are maintained by a score of old speakers each; Akkala Saami (Saami, Akkala) in southwestern Kola peninsula is probably extinct; the documentation of the minor languages is unsatisfactory (Ter, Pite, Ume) or highly unsatisfactory (Akkala).

There have been Saami idioms down to southern Finland and southern Karelia in Russia; of these idioms, the northernmost ones went into oblivion in the 19th century. There is evidence (language documents, etc.) of Saami presence south of the South Saami area in Sweden and Norway. Loanwords from Finnic, Proto-Indo-European, Aryan, Germanic, Baltic, and Slavic witness contacts with other linguistic groups. There is an ostensible non-Uralic substrate, especially in place names.

First Saami books date to 1619. The author belonged to a trader family and the language represents a pidgin with Saami, Finnish, and Swedish words and hardly any inflection. The first books representing Saami vernaculars (Lule Saami, Ume

Saami) were published in the same century. At present, six Saami languages (South, Lule, North, Inari, Skolt, and Kildin) have a literary norm.

The Saami languages are structurally close to the rest of the Uralic languages. The finite verb agrees with the subject and is conjugated in three numbers (singular, dual, and plural), three persons (first, second, and third), and two tenses (the present/future and the preterit) in most languages; the auxiliary *leat* 'to be' together with nonfinite forms of the main verb is used to form aspectual compound forms (progressive vs. terminative aspect in both tenses, e.g., *lean boahtime* 'I am coming' vs. *lean boahtán* 'I have come'). The number of morphological moods varies from two (indicative, imperative) to five (indicative, conditional, potential, imperative, adhortative).

Negation is expressed by a negative verb; in the idioms southwest of North Saami, it has two tenses. In North Saami and east of the language area, tense is encoded in the nonfinite main verb (e.g., North Saami *in mana* 'I do not go' vs. *in mannan* 'I did not go'). The rest of the auxiliaries (mostly for epistemic and deontic modalities) show a more complete conjugation. In addition to compound tenses the nonfinite verb forms are also used for sentence-embedding, e.g., *Máret logai Máhte* [AccSg] *boahtán* [Perfect Participle] 'Mary said that Matthew has come.' Derivation is extensive within and across word classes; in verbs, there are several morphological passives and causatives in addition to a wide selection of aspectual derivatives (frequentative, subitive, etc.).

The Saami languages are nominative-accusative languages; in North Saami, some verbs denoting natural processes may take their single participant argument either in the nominative or in the accusative (e.g., *biegga* [NomSg] *garai* 'the wind became harder' ~ *garai biekká* [AccSg] id.). The basic word order in most Saami idioms is SVO but the older SOV is still dominant in South Saami, and the object neutrally precedes its nonfinite head (S Aux O V). Word order is free for the dependents of the verb and determined by pragmatic factors; the attribute precedes its head; postpositions dominate over prepositions.

In addition to the grammatical cases nominative (= no case) and accusative, nominals have the local cases illative, inessive, and elative (illative and locative in North Saami and the languages east of its area), the predicative cases comitative, essive, and abessive; as a rare case of 'degrammaticalization,' the abessive ending has evolved into a postposition in North Saami (e.g., **guolihaga* > *guoli haga* 'without fish'). The local cases are also used in nonlocal arguments (e.g., *Máhhte ballá gumppes* [LocSg] 'Matthew is afraid of the wolf'); the comitative also expresses the instrument argument. In addition to determinative (e.g., *Máhhte* [GenSg] *govva* 'Matthew's picture') and complementing uses (e.g., *seainni* [GenSg] *čáda* 'through the wall'), the genitive expresses the owner argument when the theme is definite, e.g., *beana* [NomSg] *lea áhči* [GenSg] 'the dog is father's'; if the theme is nondefinite, the locative (< inessive) is the case of the owner argument, e.g., *áhčis* [LocSg] *lea beana* [NomSg] 'father has a dog'; in South Saami, genitive is used in both cases *aehtjien* [GenSg] *bienje* [NomSg] 'father has a dog,' *bienje aehtjien* 'the dog is father's.'

Saami phonology is an extreme sport: a bisyllabic stem may have over 20 different phonological forms depending on grade alternation, compensatory lengthening, vowel balance and metaphony, etc., caused by different suffixes. The number of consonant phonemes is 19–40 depending on idiom, and the basic vowel phonemes (5–10 depending on idiom) are combined to form vowel sequences (5–10 geminate vowels and 4–10 diphthongs with the first component higher than the second, e.g., /ie/ and /oa/). Word stress

is trochaic, e.g., /kú.laa.hàl.laa.pèeh.teh/ 'you understand each other,' but morphology may cause deviations from the rule, e.g., /múj.j.hta.liš.kòah.tiih/ 'to begin telling' (/š.kòah.tii-/ is a derivational ending). Ume, Pite, Lule, North, Inari, and Ter Saami have three degrees of quantity in consonants, e.g., North Saami /čáal.l.iih/ 'writers' (with an extra syllabic pulse) vs. /čáal.liih/ 'to write' vs. /čáa.liih/ 'make him/her write!' Also vowels in stressed syllables show three contrasting lengths (roughly [a] – [aː] – [a:]) but these derive from the phonological oppositions (a) single vowel vs. vowel sequence and (b) initial vs. final stress in a vowel sequence, e.g., /sáh.te/ 'haphazard' – /ij) maáh.te/ 'does (not) know how to' – /máah.te/ 'Matthew's (GenSg)' (phonetically [sahte] – [mahte] – [ma:hte]); initial vs. final stress is also found in diphthongs, e.g., /sóa.đan/ 'I fight' vs. /poá.đan/ 'I come.' These contrasts originate in the grammaticalization of allegro forms in which vowel sequences in stressed syllables receive final stress, and vowel sequences in the following syllables are reduced to single vowels (* /poá.đaan/ > /poá.đan/ 'I come'). Syllable border placement is distinctive in at least North Saami, e.g., eastern North Saami /pól.htuuh/ 'to rummage' vs. /pólh.tuuh/ 'you rummage.'

Salishan Languages

S Thomason, University of Michigan, Ann Arbor, MI, USA

© 2006 Elsevier Ltd. All rights reserved.

The 23 languages of the Salishan family are spoken in the U.S. Northwest and neighboring British Columbia, along the Pacific coast in Washington, Oregon, and British Columbia, and inland to interior British Columbia, the Idaho panhandle, and northwestern Montana. The languages fall into five distinct branches, according to the most commonly accepted subgrouping schema (Czaykowska-Higgins and Kinkade, 1998a; 3): **Bella Coola**, the northernmost language and a one-language branch; **Central** (or

Coast) **Salish**, comprising Comox–Sliammon (Comox), Pentlatch, Sechelt, Squamish, Halkomelem, Northern Straits, Klallam (Clallam), Nooksack, Lushootseed, and Twana; the **Tsamosan** languages, Quinault, Lower Chehalis, Upper Chehalis, and Cowlitz, located primarily south of the Central Salish languages; **Tillamook**, a one-language branch, spoken in Oregon; and **Interior Salish**, which is divided into two branches: the three Northern Interior languages – Shuswap, Lillooet, and Thompson River Salish – are spoken in interior British Columbia, and the four Southern Interior languages, Colville–Okanagan, Columbian, Coeur d'Alene, and Montana Salish (a.k.a. Flathead-) Kalispel–Spokane (Kalispel = Pend d'Oreille), are spoken primarily in the interior U.S.

Northwest (although Colville–Okanagan is also spoken across the border in Canada). In several instances, as with Montana Salish–Kalispel–Spokane, different tribes speak closely related dialects of a single (nameless) language.

Various proposals have linked the Salishan family genetically to other Northwest languages, but none of these is widely accepted. The isolate Kutenai, which has long been in close contact with some of the Southern Interior languages, is one candidate for a distant relative. Other proposed congeners are the Wakashan and Chemakuan families, also located in the Pacific Northwest; together, Salishan, Wakashan, and Chemakuan comprise the core of the famous Pacific Northwest linguistic area. A number of striking typological features are found in all three of these families (and some of them also in Kutenai); most of the features mentioned below for Salishan also occur in the other two core Pacific Northwest families.

All Salishan languages have rich consonantal inventories that include ejectives, lateral obstruents, velar vs. uvular obstruents, labialized dorsal consonants, and (in some of the languages) glottalized resonants and pharyngeal consonants. **Table 1** shows a widely (though not universally) accepted set of Proto–Salishan consonant phonemes (modified from Kroeber, 1999: 7, partly on the basis of comments in Czaykowska-Higgins and Kinkade, 1998a: 51–52). Vowel inventories, in sharp contrast, are relatively simple: Proto–Salishan is generally believed to have had just four vowel phonemes, /i ə a u/.

Salishan phonology displays other striking features as well, notably the presence (in almost all the languages) of very elaborate consonant clusters, as in Montana Salish *Ta qesm'l'm'él'čstmstx^w!* ‘Don’t play with that!’ Another widely shared phonological phenomenon is a sound change, in most of the languages and apparently independently in at least two subgroups, from the velar consonants *k k' x* to alveopalatals *č č' š* (and then sometimes to other consonants later).

Morphologically, Salishan is heavily agglutinative, or polysynthetic. All the languages have many suffixes, including both grammatical suffixes – for example, transitivity markers, subject markers, and object makers – and lexical suffixes by the dozens, primarily

indicating concrete objects (e.g., ‘hand,’ ‘face/fire,’ ‘nose/road/cost,’ ‘round object,’ ‘root/berry’). Prefixes are not so numerous, though most of the languages have locative prefixes and several others as well. An affix-loaded Montana Salish word, for instance, is *q^wo č-tax^wl-m-nt-cút-m-nt-m* ‘they came up to me’ (lit. ‘me to-START-derived.transitive-transitive-reflexive-derived.transitive-transitive-indefinite.agent’). This word contains one locative prefix and six suffixes, with one suffix set, *-m* ‘derived transitive’ plus *-nt* ‘transitive,’ repeated after the reflexive suffix etransitivizes the stem.

Reduplication is a prominent morphological process in Salishan, used for such purposes as distributive plural (e.g., Montana Salish *qe č'uč'úw* ‘all of us are gone, we left one at a time’ vs. *qe č'úw* ‘all of us are gone, we left in a group’) and diminutive. Salishan languages have pronominal clitics that mark certain subjects (e.g., in intransitive predicates), suffixes that mark other subjects (e.g., in transitive predicates), suffixes that mark patients, and pronominal possessive affixes (see Czaykowska-Higgins and Kinkade, 1998a: 31).

Word classes include at least full words and particles. Because every full word can serve as the predicate of a sentence, some scholars have argued for the absence of a lexical distinction between verbs and nouns (see Kuipers, 1968; Kinkade, 1983; Jelinek, 1998; for the other side of this controversy, see Van Eijk and Hess, 1986; Kroeber, 1999: 33–36). There is general agreement that, if the distinction exists, its morphological and syntactic ramifications are weaker than in most or possibly all language families outside the Pacific Northwest. Salishan languages have suppletive lexical pairs of roots with singular and plural reference, e.g., Montana Salish *čn řút^w* ‘I went in’ vs. *qeř npítš* ‘we went in.’

Nearly all Salishan languages are predominantly predicate-initial, mostly VSO but in some languages VOS; word order is rather free. In all the languages transitivity is a major morphosyntactic category, with transitivity markers and detransitivizing suffixes, applicatives, causatives, and other complexities; they are head-marking. Jelinek (e.g., 1984) and Jelinek and Demers (e.g., 1994) have proposed that these are pronominal argument languages, with full noun phrases having the status of adjuncts rather than arguments. This claim has been debated vigorously, on both sides of the issue, by Salishanists and other theoreticians.

Research on Salishan languages began early, with wordlists collected by travelers as early as 1810 and the first grammar and dictionary published later in the 19th century – a grammar and a thousand-page two-volume dictionary of Montana Salish (Mengarini,

Table 1 Proto-Salishan Consonant Phonemes

1961; Mengarini *et al.*, 1877–1879). Modern Salishan linguistics has been flourishing for over half a century, and three especially important surveys have appeared: Thompson, 1979; Czaykowska-Higgins and Kinkade, 1998a and Kroeber, 1999 (in particular Chap. 1). An annual conference, Salish and Neighboring Languages, is held each August, and the conference preprints are a major source for information on the languages. A sizable number of descriptive grammars and dictionaries of various Salishan languages are now available, together with a great many more articles on specific theoretical and descriptive issues, a large monograph on comparative syntax (Kroeber, 1999), and an etymological dictionary (Kuipers, 2002).

All the Salishan languages are gravely endangered. Czaykowska-Higgins and Kinkade (1998a: 64–67) report speaker figures that range from about 500 (for 4 languages) to fewer than 10 (for 9 languages) and 0 (for several now-vanished languages). Language-revitalization efforts are under way, however, for many of the Salishan languages.

Samar-Leyte

J W Lobel, University of Hawai‘i, Manoa, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Waray-Waray (Samar-Leyte) is an Austronesian language of the Central Bisayan subgroup of Central Philippine languages. With approximately 3 million speakers, Waray-Waray ranks sixth in terms of number of speakers in the Philippines, fifth in the Central Philippine subgroup, and third in the Visayan Islands. Waray-Waray is spoken in an area that roughly corresponds to the borders of the Eastern Visayas (Region VIII), except for the western coast of Leyte and Biliran and a number of small islands off the north-western coast of Samar, most of which are Cebuano-speaking, except for Capul Island, which is home to Sama Abaknon, a language of the Sama-Abaknon subgroup.

As a Central Bisayan language, Waray-Waray is most closely related to Ilonggo (Hiligaynon), Capiznon, Masbatenyo, Romblomanon, Central and Southern Sorsoganon, Porohanon, and Bantayanon. Outside of the Central Bisayan subgroup, these languages are related to Cebuano, Asi (Bantoanon), the Western Bisayan languages (including Aklanon, Kinaray-a, and Unhan [Inonhan]), and the Southern Bisayan languages (including Tausug, Surigaonon, and Butuanon). Within the Central Philippine subgroup, the Bisayan languages are coordinate with Tagalog and the Bikol (Bicolano, Central) languages.

The ‘standard’ dialect of Waray-Waray is that of Tacloban City. The Waray-Waray-speaking areas exhibit substantial dialect variation, and in many places no two towns speak the same dialect. Approximately two dozen dialects and subdialects are found in the region. The greatest major dividing line is between Northern Samareño and the rest of the

Waray-Waray area. The dialect of Allen, Samar, is predominantly Southern Sorsoganon mixed with Northern Samarenho, and neighboring towns also have a considerable amount of borrowing from Southern Sorsoganon. There is also a modest amount of evidence for a split between Samar Waray-Waray and Leyte Waray-Waray, although much of this split consists of borrowings from Cebuano into Leyte Waray. The dialect of Abuyog, Leyte, is particularly heavily influenced by Cebuano, as is the dialect of Culaba, Biliran. It is also interesting that the dialects of the oldest settlements in Baybay, Leyte, (C. Rubino, personal communication), and the Camotes Islands (Wolff, 1967) show a Warayan substratum, indicating that Waray-Waray was much more widespread in previous centuries before the expansion of the Cebuanos in the mid-1800s (Larkin, 1982). In total, there are approximately 25 dialects and subdialects of Waray-Waray, defined mostly by lexical and morphological variation, as very little phonological and grammatical differences exist.

The earliest written works on the Waray-Waray language are Domingo Ezguerra's 1663 grammar *Arte de la Lengua Bisaya de la Provincia de Leite* and a dictionary by Mateo Sanchez (1562–1618) published a century after his death as the *Vocabulario de la Lengua Bisaya* (1711).

Recent works include two dictionaries (Abuyen, 1994; Tramp, 1995), a series of pedagogical texts (Wolff and Wolff, 1967), and two compilations of literature (Luangco, 1982b; Sugbo, 1995). Zorc (1977) contains data from three Waray-Waray dialects in comparison to other Bisayan languages. Waray-Waray is the language of the church throughout the Eastern Visayas region, and by far the most readily available literature in Waray-Waray is religious in nature, including two modern Bible translations and numerous prayer pamphlets.

Waray-Waray has the basic Central Philippine-type phonology, with 16 consonants / p b m w t d n s l r y k g sng₂ uʔ_s h / and three vowels / a i u /, and both stress and length are contrastive. Most of the dialects of northeastern and eastern Samar have a fourth vowel as a reflex of PAN *e, a high, central, tense unrounded vowel i. The Waray-Waray orthography is mostly regular except that it does not represent stress, length, or the glottal stop.

Waray-Waray is most readily distinguishable from other Central Philippine languages by the *s > /h/ sound change that has affected a small number of common grammatical morphemes in all areas of Samar south of the Sta. Margarita-Matuginao-Las Navas-Gamay line and all of Leyte Waray except the towns of Javier and Abuyog. However, the *s > /h/ change and the loss or retention of PAN *e are areal features, and therefore do not define genetic subgroups within Waray-Waray.

Waray-Waray is agglutinative, with a complex system of verbal morphology expressing a wide variety of semantic and syntactic contrasts. Although sometimes analyzed as ergative, these languages are probably of a separate type called Symmetrical Voice Languages, in which multiple voice distinctions exist, yet none can be considered more 'basic' than the other (Himmelman, to appear). Like most other Philippine languages, there are four main verbal 'focuses' (actor, object, location, and beneficiary; see Table 1) and three 'case' distinctions (nominative, genitive, and oblique) in noun phrases, name phrases, and pronouns (marked by an introductory morpheme) (see Table 2). Nouns, adjectives, and verbs distinguish between singular, plural, and in some cases, dual, and verbs may also be marked for reciprocal action. A number of other meanings can be marked by verbal affixes, including accidental, abilitative, distributive, causative, social, and diminutive. Tense-aspect-mood

Table 1 Waray-Waray focus-mood-aspect morphology

| | | Actor focus | Object focus (1) | Object focus (2)/beneficiary focus | Location focus |

|-----------------|----------------------|-------------------|---------------------|----------------|
| Singular | 1st | akó, ak | ko | (ha/sa) ákon |
| | 2nd | ikáw, ka | mo, nimo, nim | (ha/sa) imo/im |
| | 3rd | hiyá/siyá | niyá | (ha/sa) iya |
| Plural | 1st exclusive | kamí | námon | (ha/sa) ámon |
| | 1st inclusive | kitá | náton | (ha/sa) áton |
| | 2nd | kamó | niyo | (ha/sa) iyo |
| | 3rd | hirá/sirá | níra | (ha/sa) ira |

Table 3 Waray-Waray case markers

| | | <i>Standard Waray</i> | <i>Abuyog</i> | <i>Calbayog; Northern Samar-A</i> | <i>Northern Samar-B</i> |
|------------|-------------|-----------------------|---------------|-----------------------------------|-------------------------|
| Nom | -ref | in | in | in | i(n) |
| | +ref, +past | an | an | an | a(n) |
| | +ref, -past | it | it | | |
| Gen | -ref | hin | sin | sin | si(n) |
| | +ref, +past | han | san | san | sa(n) |
| | +ref, -past | hit | sit | | |
| Obl | | sa | sa | sa | sa |

Table 4 Waray-Waray demonstratives

| | <i>Nominative</i> | <i>Genitive</i> | <i>Oblique</i> |
|---|-------------------|-----------------|------------------|
| Near speaker; far from addressee | adí | hadi/ sadi | didi, ngadi |
| Near speaker and addressee | iní | hini/sini | dinhi, nganhi |
| Far from speaker; near addressee | iton | hiton/ siton | dida, ngada |
| Far from speaker and addressee | adto | hadto/ sadto | didto, ngadto |

distinctions include infinitive, past/perfective, present/progressive, future, imperative/subjunctive, and future subjunctive. Both reduplication and repetition are productive mechanisms that can denote diminutive, repetitive, and intensive meanings, among others.

Waray-Waray has much the same grammatical structure as Tagalog, except for (a) the existence of distinct imperative forms, (b) a preference for inflecting verbs for plural actors, (c) a more elaborate system of case markers that distinguish between referential and non-referential and past and non-past in both the nominative and genitive cases (see Table 3), and (d) a four-way distinction in demonstratives, including a contrast

between referents that are near only the speaker vs. those that are near both the speaker and the addressee (see Table 4).

A noteworthy feature of the lexicon of dialects of Waray-Waray spoken in parts of eastern and northeastern Samar is the existence of a register of vocabulary reserved for usage by speakers when they are angry.

Sango

W J Samarin, University of Toronto, Toronto, Canada

© 2006 Elsevier Ltd. All rights reserved.

Sango was declared the 'national language' in the constitution of the Central African Republic (1964), French alone having the status of 'official language.' Sango also was given this status in 1991, allowing it to be used in governmental communications. In practice, however, it is not yet a legal language and is not used in public education, French being the official medium. Missionaries introduced written Sango in the 1920s, Catholics and Protestants using different orthographies; an official one was established by presidential decree in 1984. Literacy in Sango has been used nonreligiously, primarily in personal correspondence and by radio 'journalists' preparing notes in *ad hoc* orthographies based on religious Sango. There were about 46 hours of broadcasts in Sango in 1994, but most of them were broadcasts of dance music in the Kinshasa style, the rest news and practical information.

Sango is a pidgin in origin, emerging very quickly after representatives of King Leopold II in 1887 arrived to claim land and trade for elephant tusks in the Ubangi river basin, followed in 1889 by the French. Unlike other pidgins, Sango appears to have arisen, not from the attempts of whites to communicate in an indigenous language, but from the attempts of the linguistically diverse African soldiers and workers who were brought to the region for its colonization. The Belgians used many men from the east coast, the French from the west coast, and both many more from the Bantu population along the Congo river. Its existence as a *lingua franca* was noted by Belgians in 1895. It is based on the Ngbandi sub-family of languages (not just the variety called Sango) that make up the larger Ubangian family, to which most of the Central African languages belong. Although its phonology is the same as that of the source language and although most of its lexicon is Ngbandi, it is typically a pidgin in having a very limited vocabulary (from 500 to 1000 words in daily use) and virtually no inflection in its grammar;

tone plays a very limited grammatical role and only in the speech of those influenced by Ngbandi speakers, such as the Sangos and Yakomas.

Despite Sango's linguistic limitations, it is a symbol of Central African identity and is by far the preferred language of daily discourse in its capital of one-half million persons, Bangui. However, several Central Africans are active in legitimizing Sango with claims about its adequacy for indigenous culture and with efforts to increase its lexicon with Sango-based neologisms and words from regional languages. Nonetheless, French words occur in all varieties of Sango. The influence of French has increased since independence in vocabulary, grammar, and syntax, even among those with little education.

Although Sango was remarkably uniform as a *lingua franca*, it has become extremely variable as the vernacular of Bangui in all of its structures but exceptionally in its phonology. Contraction creates most of the word variants, as *twa* from *tongana* 'when, if,' resulting in many syllable and word forms that are strikingly different from those of indigenous languages: e.g., *tl* from *tî* 'of' with *l* carrying high tone with words beginning with *l*. Central African activists, however, are striving for a 'standard' (that is, normative or prescriptive) form of the language.

Practically all of the estimated 2 500 000 inhabitants of the Central African Republic speak Sango (according to the census of 1988, varying from 10 to 100%), and in 1994, it was the only language known by about 40–50% of Bangui's preschool non-Muslim children.

Sanskrit

The Sanskrit language – one of the oldest of the Indo-European group to possess a substantial literature – has particular interest for linguists because of the circumstances of its becoming known to Western

scholars and the stimulus thus given to historical linguistics. It has also been of enormous and continuing importance as the classical language of Indian culture and the sacred language of Hinduism.

Origin and History

Sanskrit, in its older form of Vedic Sanskrit (or simply Vedic), was brought into the northwest of India by

the Āryans some time in the second half of the second millennium BC and was at that period relatively little differentiated from its nearest relation within the Indo-European group, Avestan in the Iranian family of languages (these two being the oldest recorded within the Indo-Iranian branch of Indo-European). From there, it spread to the rest of North India as the Āryans enlarged the area that they occupied, developing into the classical form of the language, which subsequently became fixed as the learned language of culture and religion throughout the subcontinent, while the spoken language developed into the various Prākritis. There is ample evidence of rapid evolution during the Vedic period, with the language of the latest phase, attested for example in the Upanisads, showing considerable grammatical simplification from that of the earliest hymns. The later Vedic is, in broad terms, the form of the language that Pāṇini described with such exactness in his grammar around the fourth century BC, thereby creating – no doubt unintentionally – an absolute standard for the language thereafter; his work is clearly the culmination of a long grammatical tradition, based on concern to preserve the Vedas unaltered (hence the stress on phonetics), and is itself intended for memorization and oral transmission, as its brevity indicates.

This standardization was not as universal as has sometimes been represented (nor was the preceding Vedic a unified language, for it exhibits features only explicable as coming from slightly differing dialects, and classical Sanskrit is based on a more eastern dialect than the one attested in the *R̥gveda*), and it has come to be recognized that, for example, the two Sanskrit epics exhibit systematic divergences from the language described by Pāṇini and represent a distinct epic dialect. However, with the growth of classical Sanskrit literature (mainly within the period from the fourth to the tenth centuries AD, when Sanskrit was clearly no longer a natural language), Pāṇini's description was regarded as prescriptive and followed to the letter, although the spirit was less closely observed (as shown by the tendency to longer and longer compounds and to nominal constructions and the like).

The earliest record of the language is contained in the hymns of the *R̥gveda*, which belong to around 1200–1000 BC, but they were not committed to writing until a much later period because of their sacred character, for the Indian tradition has always placed greater emphasis on oral tradition than on written texts. In fact, the earliest dated record in Sanskrit is an inscription of 150 AD, significantly later than the use of Prākṛit by the Buddhist ruler Aśoka for his inscriptions in the third century BC. Early inscriptions used one of two scripts: the Kharoṣṭhī, deriving from

the Aramaic script used in Achaemenid Iran, and the Brāhmī, less certainly deriving from a North Semitic script. The latter evolved into the Nāgarī family of scripts, to which the Devanāgarī script now usually used for Sanskrit belongs, although before the twentieth-century manuscripts were normally written in the local script.

Characteristics

Any analysis of Sanskrit syntax must take account of the shift from the natural language of the Vedic and epic forms of Sanskrit to the learned language of the classical literature, which selectively exploits certain features of Pāṇini's description. Whereas the older forms of the language show frequent use of nominal compounds of two or three members and Pāṇini's grammar describes their formation in great detail (but in terms of their analysis into types: *dvandva*, *bahuvrīhi*, *tatpuruṣa*), classical literature is marked by a predilection for longer compounds, consisting in some styles of writing of 20 or more members. Another common feature, inherited from the Indo-European background but found much more extensively in the classical language, is the use of nominal sentences involving the juxtaposition of the subject and a nonverbal predicate. The frequent use of the past participle passive as a verbal equivalent leads to a preference for passive constructions, in a way typical of the Prākritis. Use of the absolutive becomes in the classical language a common means to form complex sentences by indicating actions occurring before that of the main verb; again the effect is a reduction in finite verbal forms. The usual sentence order is subject, object, verb; however, this is so commonly modified for emphasis (with initial and final positions in the sentence or verse-line carrying most emphasis) that Sanskrit word order is often regarded as being free. In vocabulary, the freeing from the affective connotations of a natural language brought a striking enlargement of the range of synonyms, skillfully exploited in much of the classical literature to produce rich sound effects.

In its morphology, Sanskrit is broadly comparable to Greek or Latin, though somewhat more complex. In both the nominal and verbal systems the dual is obligatory for all twos, not just pairs. The nominal system employs eight cases (seven according to the Indian reckoning, which regards the vocative as a form of the stem), three numbers, and three genders (masculine, feminine, neuter). Unlike other Indo-European languages, Sanskrit lacks a developed series of prepositions, and the relatively few adverbial formations used to define case relationships more exactly tend to be placed after the noun. The use of

vrddhi (IE strengthened grade) to form derivatives from nominal stems is a notable feature. The verb has two voices, active and middle, their functions well distinguished by the Sanskrit terms for them: *parasmaipada* ‘word for another’ and *ātmanepada* ‘word for oneself’; it also has five moods (injunctive, imperative, subjunctive, optative, and precative) in the Vedic, somewhat simplified in the classical language. Prepositional affixes to the verb may in Vedic be separated from the verb but in the classical language must be prefixed to it (there is a comparable development between Homeric and classical Greek). There is both an ordinary sigmatic future and a periphrastic future (formed through a specialized use of the agent noun), several aorist formations (principally a sigmatic aorist and a root aorist), and a perfect normally formed with a reduplicated stem; these are comparable to the equivalent tenses in Greek or Latin. The augment is prefixed to several past tenses: imperfect, aorist, pluperfect, and conditional. Verbal roots are divided by the Sanskrit grammarians into 10 classes: six athematic and four thematic. A distinctive feature of the verbal system is the employment of secondary conjugations with specific meanings: causative, intensive, and desiderative. Historically, the passive is also such a secondary conjugation, formed by adding the middle endings to a modified root. The Vedic language is marked by rather greater grammatical complexity with, most notably, a whole range of case forms from nouns functioning as infinitives, which are reduced to a single infinitive in the classical language. It also possessed a pitch accent that had died out by the time of the classical language.

Phonetically Sanskrit is marked by a number of innovations by comparison with other Indo-European languages of comparable age. It is also notable for the concern with phonetics of its own grammarians (exemplified by the fact that the alphabet is arranged according to the organ of articulation, with vowels preceding consonants) and the precision of their descriptions. On the one hand, Sanskrit has collapsed the three Indo-European vowels *a*, *e*, and *o* into *a*, and on the other it has introduced a complete new class of consonants, that of the retroflex consonants, mainly under the influence of one of the other language groups already present in India, either Dravidian or Munda, although in some instances the retroflex consonants probably arose through internal phonetic developments in relation to *ṣ* and *r*. The most widely known feature is that of *sam̐dhi* ‘junction,’ the process of phonetic assimilation of contiguous sounds at the junctures between both words and their component parts (external and internal *sam̐dhi*).

Sample Sentence

| | | | | |
|----------------|-----------------|-----------------|-----------------|--------------|
| <i>teṣām</i> | <i>khalv</i> | <i>eṣām</i> | <i>bhūṭānām</i> | <i>trīṇy</i> |
| /teṣa:ṅ | khəlv | eṣa:ṅ | bhu:ta:na:ṅ | tri:ṅy |
| <i>eva</i> | <i>bījāni</i> | <i>bhavanty</i> | <i>aṇḍajam</i> | |
| evə | bi:ja:ni | bhəvənty | əṇḍəjəṅ | |
| <i>jīvajam</i> | <i>udbhijam</i> | <i>iti</i> | | |
| ji:vəjəṅ | udbhijəṅ | iti/ | | |

‘Living beings here have just three origins [literally ‘Assuredly of these living beings are/come into being indeed three seeds’]: being born from an egg or live-born or produced from a sprout.’

This simple sentence (from *Chāndogya Upaniṣad* 6.3.1) exemplifies several of the features that are taken to extremes in the classical language. There is the avoidance of a transitive construction (although here the verb, *bhavanti*, is expressed, whereas later such a copula is normally suppressed), the employment of compounds, and the liking for etymological figures (the latter two combined in the three compounds ending in the adjectival form *-ja*, coming from \sqrt{jan} ‘to be born,’ while the use of cognates is exemplified by *bhavanti* third pl present indicative and *bhūta* past participle passive from $\sqrt{bhū}$ ‘to become’). The use of *iti* may also be noted – here to function as the equivalent of the colon in the translation, more usually to perform the function of quotation marks, to mark off a passage in direct speech from the sentence in which it is embedded (an idiom probably calqued on the Dravidian); Sanskrit has no method of indicating indirect speech.

Role and Influence in Indian Culture

As is implicit in some of the statements above, it is clear that throughout the main period of its use as a literary language Sanskrit was not the first language of its users, who in North India would have been native speakers of one of the Prakrits deriving from Sanskrit (used here in its widest sense of the group of OIA dialects) or even of the next stage of MIA, the Apabhraṃśas, and in South India were speakers of one of the Dravidian languages (which have been influenced to varying degrees in their vocabulary by Sanskrit). The prestige attaching to its use for the Vedas, the authoritative scriptures for Hindus, resulted in its being regarded as the only language fit for use in the major rituals of brahmanical Hinduism, a role that to a limited extent it retains to this day. This was undoubtedly the reason why the Purāṇas and the many popular texts related to them were composed (from the fourth century to as late as the nineteenth century) in a form of Sanskrit that is greatly indebted to the epics for its linguistic and metrical expression, while similarly Mahāyāna Buddhism employed the so-called Buddhist

Hybrid Sanskrit (essentially a Sanskritization of MIA). Sanskrit has therefore been a dominant influence on the development of the languages in both the MIA and NIA phases, supplying much of the religious vocabulary in the form of direct loans, over and above the large proportion of the vocabulary descended from Sanskrit.

Sanskrit and the West

First acquaintance with Sanskrit by Western scholars came even before the period of British rule. Sir William Jones's famous discourse in 1786 to the Asiatic Society in Calcutta on the affinity of Sanskrit with Greek, Latin, and the other languages now known as Indo-European was not the first notice of such connection, which had been proposed two centuries earlier by Thomas Stevens (in 1583) and Fillipo Sasseti (in 1585). However, Jones's eminence ensured it a much wider audience than before, and this was in a signifi-

cant sense the start of the discipline of comparative philology, whereas the appreciation before long of the achievements of the early Indian grammarians was an important stimulant to the development of modern linguistics, which has paid them the compliment of borrowing a number of their terms, such as *saṃdhi*.

Santali

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Santali (*ᱥᱟᱱ ᱦᱚᱱ*), a member of the North Munda (Kherwarian) subgroup of the Munda family within the Austroasiatic linguistic phylum, is spoken by between 5 million and 7 million people across several states in eastern and central India. The most compact area of Santal settlement is in the Sadar subdivision of Bunkura, the Jhargram subdivision of Midnapur, and Purulia in West Bengal; south of Bhagalpur and Monghyr, in the Santal Parganas, Hazaribagh and Dhalbhum in Bihar, and the newly formed tribal-dominant state of Jharkhand; and Baleswar, Mayurbhanj, and Keonjhar in Orissa. In Bangladesh, the Santals are found mainly in Rajsahi, Rangpur, and the Chittagong Hill tracts (Ghosh, 1994: 3).

Santali is characterized by a split into at least a northern and southern dialect sphere, with slightly different sets of phonemes (Southern Santali has six phonemic vowels, in contrast with eight or nine in Northern Santali), different lexical items, and to a certain degree, variable morphology as well (e.g., the *-ič*:-*rɛn* singular:plural opposition in animate genitive case markers).

There is a degree of laryngeal tension (phonation type) associated with certain Santali vowels. This

gives Santali and the closely related Mundari their characteristic sound and differentiates these two languages from other languages of the region. Instrumental studies are needed to determine the exact phonetic characteristics of this. In addition, a wide range of vowel combinations may be found in Santali; this tendency finds an extreme expression in words such as *kɔɛɛɛ* 'he will ask for him'.

The following statements can be made regarding the consonantism of Santali: retroflexion, while attested, is less developed in Santali (and Munda) generally than in Indo-Aryan or Dravidian languages. Further, in coda position, there is a characteristic use of so-called checked consonants, ranging in articulation from preglottalized to unreleased. Examples of checked consonants in final position in Santali include *sɛč* 'towards', *rit* 'grind', *selep* 'antelope', and *dak* 'water' (Bodding, 1923: 79); before vowels (generally speaking), these consonants alternate with voiced stops, as in *dal-aka-t-ko-a-e* 'he has beat them' vs. *dal-aka-d-e-a-e* 'he has beaten him'. Santali also makes use of prenasalized stops in a number of words as well: *k^bokṇdo* 'ill conditioned', *məñ^blə* 'fourth of six brothers', *mṅñj* 'beautiful', *o^tṅgao* 'to steady on', *gandke* 'log', *ondga* 'ogre', *b^bosṇdo* 'slovenly', *bermbak* 'incorrectly', and *teṅga* 'stick'; also *k^bəṃduŋ* ~ *k^bəṃduŋ* 'deep', *kṅñjɛ* (~*kṅñjɛ*) 'crooked', and *d^baṅga* (~*dhəŋgrali*) 'strapping' (Bodding, 1923: 36ff.).

Santali has a complicated demonstrative system (Zide, 1972). Its basic three-way system is a straight-forward proximal, distal, remote system in animate (-i/kin/ko) and inanimate forms (-a/-akin/-ako), as shown in the following examples (ANIM, animate; INAN, inanimate; SG, singular; DL, dual; PL, plural):

(1a) Proximal:

| | SG | DL | PL |
|-------|--------|-----------|-----------|
| ANIM: | nui | nukin | noko/nuku |
| INAN: | noa | noakin | noako |
| | 'this' | 'these 2' | 'these' |

(1b) Distal:

| | SG | DL | PL |
|-------|--------|-----------|-----------|
| ANIM: | uni | unkin | onko/unku |
| INAN: | ona | onakin | onako |
| | 'that' | 'those 2' | 'those' |

(1c) Remote:

| | SG | DL | PL |
|-------|---------------|--------------------|--------|
| ANIM: | hani | hankin | hanko |
| INAN: | hana | hanakin | hanako |
| | 'that yonder' | 'those (2) yonder' | |

Alongside these are intensive forms (Example (2)); marked by infixation of *-k'-*, 'just' forms (Examples (3a) and (3b)); marked by a shift of (*o/u*>)-*i-*, as well as forms adding connotations of 'things seen' and 'things heard' (Examples (4a)–(4c)):

(2) Intensives:

| | |
|--------|----------------------|
| nuk'ui | 'this very one' |
| nik'i | 'just this very one' |
| nək'oy | 'this very thing' |

(3a) 'Just' proximal:

| | SG | DL | PL |
|-------|-------------|----------------|--------------|
| ANIM: | nii | nikin | neko/niku |
| INAN: | nia | niakin | niako |
| | 'just this' | 'just these 2' | 'just these' |

(3b) 'Just' distal:

| | SG | DL | PL |
|-------|-------------|------------------|-----------|
| ANIM: | ini | inkin | enko/inku |
| INAN: | ina | inakin | inako |
| | 'just that' | 'just those (2)' | |

(4a) 'Seen' distal:

| | SG | DL | PL |
|--|-------------|------------------|-------|
| | ɔne | ɔnekin | ɔneko |
| | 'that seen' | 'those (2) seen' | |

(4b) 'Seen' remote:

| | SG | DL | PL |
|--|--------------------|-------------------------|--------|
| | hane | hanekin | haneko |
| | 'that yonder seen' | 'those (2) yonder seen' | |

(4c) 'Heard' distal:

| | SG | DL | PL |
|--|--------------|-------------------|-------|
| | ɔte | ɔtekin | ɔteko |
| | 'that heard' | 'those (2) heard' | |

Verbs as a lexical category in Santali, and indeed in Munda languages generally speaking, are not easily or rigorously defined in opposition to nouns (Bhat, 1997; Bhattacharya, 1975; Cust, 1878; Pinnow, 1966). As seen in the following examples (Ghosh, 1994: 21), one and the same root may be used as a noun, as a modifier (adjective/participle), and as a predicate/verb. Even a noun root such as 'house' may be used verbally with verbal inflection (ASP, aspect; TR, transitive; FIN, finite):

| | | |
|------|---------|-----------------|
| (5a) | kombro | kombro mərɔm |
| | thief | stolen goat |
| | 'thief' | 'a stolen goat' |

| | | |
|------|------------------------|--------------------|
| (5b) | mərɔm-ko | kombro-ke-d-e-a |
| | goat-PL | steal-ASP-TR-3-FIN |
| | 'They stole the goat'. | |

| | |
|------|--------------------|
| (5c) | oɾək-ke-d-a-e |
| | house-ASP-TR-FIN-3 |
| | 'He made a house'. |

The default position for subject agreement clitics is in immediately preverbal position in Santali. Note in the following examples (Bodding, 1929a: 58, 60, 208) that this is true even if the element appearing in this position is an overt subject (or object) pronoun (1, first person; INTR, intransitive; 2, second person; LOC, locative; ALL, allative):

| | | |
|------|---------------------------------|----------------------|
| (6a) | Kumbɾəbad-te-ko | əgu-ke-'t-le-a |
| | K-LOC/ALL-PL | bring-ASP-TR-1PL-FIN |
| | 'They brought us to Kumbrabad'. | |

| | | | |
|------|------------------|-------|-------------|
| (6b) | hē | iñ-iñ | cala'k-a |
| | yes | I-1 | go.INTR-FIN |
| | 'Yes I will go'. | | |

| | | | |
|------|-------------------|-------|-----------|
| (6c) | iñ | am-iñ | ñel-mə-a |
| | I | you-1 | see-2-FIN |
| | 'I will see you'. | | |

A wide range of arguments or referents may be encoded within the Santali verbal complex. This includes subjects, direct objects, indirect objects, benefactives, and possessors of subjects or objects. Note that Santali is doubly unusual in its system of possessor indexing: it takes a special series of possessive inflection, and this pattern of referent indexing does not reflect a process of 'raising' (to argument/term status of this logical modifier/operator), as a verb in Santali may encode both its logical argument and a possessor of that argument simultaneously, as in Example 7d). Examples (7a)–(7d) are from Bodding (1929a: 212, 1923: 22, 21–22, 209), respectively, and Example (7e) is from Ghosh (1994: 65) (NEG, negation; ANT, anterior; BEN, benefactive; POSS, possessor):

| | | |
|------|---------------------------|--------------------|
| (7a) | ba-ko | sap'-le-d-e-a |
| | NEG-PL | catch-ANT-TR-3-FIN |
| | 'They did not catch him'. | |

- (7b) im-əñ-me
give-1-2
'give me'
- (7c) dul-a-ñ-me
pour.out-BEN-1-2
'Pour out for me'.
- (7d) sukri-ko gɔ'c-ke-d-e-tiñ-a
pig-PL die-ASP-TR-3-1.POSS-FIN
'They killed my pig'.
- (7e) hɔpɔn-e hɛɕ'-en-tiñ-a
son-3 come-PAST.INTR-1.POSS-FIN
'My son came'.

The Santali language has been written in at least five alphabets, depending on the locale of production and the purpose of the written material. There have been Santali publications in Devanagari (Hindi), Oriya, Bengali, and Roman and in the *ol čemet* ~ *ol čiki* script of indigenous origin (Zide, 2000: 8). An ever-growing body of literature has appeared in Santali, and the language is used on a limited basis in other media (e.g., shortwave radio broadcasts).

Scots

C Macafee, University of Aberdeen, Aberdeen, UK

Scots comprises a group of dialects spoken in Lowland Scotland, forming a continuum with Northern English dialects, and in Orkney and Shetland. Scots was taken to Ireland in the 17th century and survived intact there in parts of Northern Ireland and County Donegal. Individual linguistic items also survive in Canada, the United States, and New Zealand. The UK government has given Scots *de facto* recognition by listing it in the European Charter for Regional or Minority Languages, albeit in a section that implies no specific commitments. Ulster Scots is recognized as a language and is given financial support by the UK and Irish governments, under the terms of an intergovernmental agreement.

Scots is in a sociolinguistic continuum with Scottish Standard English (SSE), and is often intermingled with it in practice. Speakers who maintain a rich and focused variety of Scots are found mainly in rural areas and small towns outside the central industrial belt. In the North-East and the Northern Isles, it is not uncommon for professional people to code switch sharply between Scots and English. There are concerns, however, that this ability may not be continuing among younger people. In the most densely populated areas of Scotland, Scots is spoken mainly lower down the social scale.

A question on Scots (parallel to that on Gaelic) was considered for inclusion in the 2001 Census, but it was concluded that a valid and reliable question could not be framed. The question-testing exercises suggested that almost a third of the Scottish population might call themselves speakers of (a dialect of) Scots, but, in the absence of a popularly accepted terminology, the responses were affected by the form of the question. Urban dialects, which are thinnest in traditional vocabulary, are least likely to be identified with the historical language or to be dignified with the name 'Scots,' and are most likely to be perceived as slang. There is some teaching and research on Scots at university level in Scotland and Northern Ireland, and at the Royal Scottish Academy of Music and Drama in Glasgow. In Northern Ireland, the Ulster Scots Agency supports cultural and linguistic projects, but attempts to promote a hastily modernized version have been met unsympathetically by speakers and nonspeakers alike. In Scotland, a modernized form of Scots ('Lallans') is promoted by the Scots Language Society.

Scots, like Standard English, is descended from the Anglian dialect of Old English. It is not clear to what extent this variety, established south of the Forth in the 7th century, was the ancestor of Scots, and to what extent it was swamped by a later influx of speakers, mainly from Yorkshire. These were followers of Anglo-Norman mercenaries and monastics, invited in by the Scottish crown in large numbers in the 12th century. Anglian spread throughout the Lowlands with the establishment of urban settlements (burghs) and of Norman administration in church and civil life. As a result, Lowland Scots is rich in loans from Old Norse, mostly shared with Northern English dialects. In Caithness, Orkney, and Shetland, where there was extensive Norse settlement, Scots replaced an extinct Scandinavian language, Norn (spoken in Shetland as late as the 19th century). Some loans survive, e.g., *bonxie* 'the great skua' and *moorit* 'brown (of sheep)'. Apart from place-names, Scots texts begin in the 14th century with glosses and phrases in Latin and French documents, and a few legal papers in a Scots are still very similar to Northern English. The long narrative poem, 'The Bruce,' by John Barbour, was written around 1375, but surviving manuscripts are from the early 15th century.

By the 15th century, the orthography of Scots was distinctive. The spellings <ee, oo, ea> were avoided. For /x/, <ch> was used, as in *nicht* 'night'. Words such as 'little' ended in <ill>, thus *litill*. As in Northern English, <quh> was used rather than <wh>, and <sch> rather than <sh>, and there was interchangeability among <u, v, w>, but Scots was unusual in using <w> initially, as in *wp* 'up'. Distinctively, Scots used <l3> for French- and Gaelic-derived /k/, as in *tulzie* 'a struggle', and <n3> for similarly derived /ŋ/, as in *cunze* 'a coin'. As the retention of these consonants in Early Scots illustrates, the influence of French was independent of its influence on English, and the same was true of Latin, so that loans from these languages further differentiated Scots, as did loans from Middle Dutch (through immigration to the burghs, and fishing and trade contacts), and, of course, loans from Gaelic. The long-term Gaelic influence on vocabulary is, however, unexpectedly small. It would appear that the transition from Gaelic to Scots was effected with some completeness. Gaelic has had phonological influences, e.g., North-Eastern /f/ for /hw/ (earlier /xw/), as in *fa* 'who', and grammatical influences, e.g., emphatic use of reflexives, as in 'It's yourself!'

In the mid-15th century, Early Scots gave way to Middle Scots (both being stages of Older Scots).

Middle Scots saw the spread (from Northern England) of ‘i-digraph’ spellings for stressed monophthongs—thus <ai>, as in <haim> for <hame> ‘home’; <ei>, as in <leid> for <lede> ‘lead’ (noun or verb); <oi>, as in <rois> for <rose> (the flower); and <ui>, as in <muin> for <mune> ‘moon’. As generally north of the Humber, words such as *hame* ‘home’ have retained a front development of Old English *ā*, raised by the ‘Great Vowel Shift,’ and words such as *mune* ‘moon’ have a fronted development of Old English *ō*.

Scots and its dialects are characterized by numerous conditioned sound changes. To mention just one dating from this time, there was a vocalization of /l/ following the short vowels /a, o/ and, less regularly, /u/. Examples include *ba* ‘ball’, pronounced /bɔ/ (Modern Central dialect) or /ba/ (Northern dialect); *gowd* /gʌʊd/ ‘gold’; and *fu* /fu/ or *full* /fʌl/ ‘full’. A standard based on Edinburgh was emerging when Scots was replaced in formal use by Standard English in the late 16th century, largely as a result of the printing press and of the Reformation of 1560, which introduced the Bible in English translation. Standard English became the speech of the ruling class following the Union of the Crowns in 1603, and of the professions following the Union of the Parliaments in 1707. Insistence that schoolteachers use English began with national inspection in 1845.

Literature and historical documents of all kinds exist from the Older Scots period, including the work of ‘makars’ such as William Dunbar, Robert Henryson, and Gavin Douglas. Well-known writers from the modern period include Robert Burns, John Galt, Walter Scott, and Robert Louis Stevenson. Folk tales and songs (including the ‘muckle sangs,’ or Child ballads) have been extensively collected. The 20th-century folk revival has been very important for the continuation of elevated styles of Scots.

Language revival has been a spur to literature, including the poetry of Hugh MacDiarmid (Christopher Grieve), the songs of Hamish Henderson, and drama (original and in translation). Notable work continues also in local vernaculars – for instance, in the poetry of Sheena Blackhall in North-East Scots (‘the Doric’). The urban dialects, being thinner, are more widely accessible, as witness the work of Liz Lochhead, Tom Leonard (both Glasgow), and Irvine Welsh (Edinburgh). Scots, when it is occasionally used in television and radio scripts, is generally thin, for the same reason.

Modern Scots (from 1700 on) has preserved little from Older Scots in orthography, apart from <ch> and <ui> spellings. The 18th-century introduction of <oo> for /ø/, as in /tøm, tɪm/ ‘empty’, though now replaced by <uCe, ui>, still causes some confusion

in spelling and pronunciation in historical contexts. Apostrophes for ‘missing’ letters, such as for /d/ after /n/, as in *en* ‘end’, or /d/ after /l/, as in *aul* ‘old’, and for final <th>, as in *wi* ‘with’, were also a feature of Modern Scots, but have largely been dropped as the result of spelling reform. The following example is of Modern Central Scots:

The laddies gets hame fae the schule afore the wee lass an they wint their tea the meenit they’re in the hoose. Bit it’ll no dae thaim a scart o herm tae thole their hunger a while langer.

ðɪ 'ladez ɡɪts 'hem fe ðɪ 'skɪl ʌ'for ðɪ 'wi 'las n, ðe 'wɪnt ðɪr 'tɪ ðɪ 'mɪnɪt ðɪr ɪn ðɪ 'hʊs. bɪt ɪtʃ, 'no 'de ðʌm ʌ 'skart ɪ 'hɛrm te 'θoʊl ðɪr 'hʌŋɪr ʌ 'hwəɪl 'lɑŋɪr.

Scots has minor differences in grammar from English dialects; for instance, there is a double system of concord in the present tense of verbs: if the subject is a personal pronoun adjacent to the verb, the verb is inflected only in the third-person singular (and second-person singular, where it is preserved), otherwise in all persons and numbers. The dialects of Orkney and Shetland preserve the second-person singular, as in *du* ‘thou’. A new second-person plural form, *youse*, has spread from Ulster to Glasgow. In the demonstrative system, *yon* (or *thon*) expresses a greater distance than does ‘that’ or *thae* ‘those’.

The vowel length of stressed monophthongs (other than /ɪ, ʌ/, which are always short) is determined by the Scottish Vowel-Length Rule, with long vowels before the voiced fricatives /v, ð, z, ʒ/ and /r/, and morpheme finally, thus *agreed* long but *greed* short (likewise in SSE for a narrower range of vowels). Old English *ū* remains /u/, as in *about* ‘about’ and *hoose* ‘house’. Old English *ō* fronted to /ø/ remains in conservative dialects (mainly Orkney and Shetland), as in ‘do’ (from Old French), ‘use’ and *schule* ‘school’. In North-East Scots, this unrounded already in Middle Scots to /i/, thus *dee*, *meen*, and *eese*. In Modern Central Scots, the vowel unrounds in the long environments of the Scottish Vowel-Length Rule to /e/, thus *yaise* (verb), and to /ɪ/ elsewhere, thus *yis* (noun). In some dialects, this /ɪ/ from earlier /ø/ remains separate from the reflex of Old English /i/, as in ‘bring’, which is lower and more central, as [ɛ̃]. This may be the source of the similar realization of /ɪ/ in New Zealand English.

Old English *ī* has split in Modern Scots into /aɪ/ in the long environments of the Scottish Vowel-Length Rule, as in ‘five’ and ‘why’, and into /əɪ/ otherwise, as in ‘while’. (The similar allophony in Canadian English may owe something to Scots or to SSE.) This /əɪ/ merges with the reflex of *ai* word finally, as in *cley* ‘clay’, and in Anglo-Norman *ui*, as in

bile ‘boil’. The unrounding of *ũ* to /ʌ/ is complete: there is no /ʊ/. Thus ‘push’ and ‘pull’ have /ʌ/. As a consequence of the Scottish Vowel-Length Rule, the short vowel /o/, as in ‘lot’, *tod* ‘fox’ has merged in Central Scots with the long vowel /o/, as in *thole* ‘endure’ (from Old English *ō* by Open Syllable Lengthening).

The vowel phonology of SSE is largely based on the vowel system of Central Scots, but with the lexical incidence of Standard English. In the circumstances of the 18th century, with limited access to native speakers of English, a number of interdialectal features became fixed in SSE. Since there was no /ʊ/, these words were assigned to /u/, thus ‘pool’ and ‘pull’ are homophones in SSE. (In Central Scots, they are /pɪl/ and /pu/ or /pʌl/.) Similarly, since there was no /ɔ/, words such as ‘cot’ were assigned to Central Scots /ɔ/, as in *lauch* ‘laugh’ and *saut* ‘salt’. Thus ‘cot’ and ‘caught’ are homophones in SSE. (In Central Scots, they are /kɔt/ and /kɔxt/; in Northern Scots, they are /kɔt/ and /kɔxt/.) The similar absence of distinction between the vowels of ‘cot’ and ‘caught’ in some North American varieties may owe something to SSE. The lower and more central realization of /t/ in Scots has left a residue of words in SSE with a phoneme /ɛ/, thus /nɛvər/ ‘never’, contrasting with /rɪvər/ ‘river’ and /sɛvər/ ‘sever’.

Scots has a large shared vocabulary with English (for example, ‘the,’ ‘cat,’ and ‘tell’) and also much distinctive vocabulary, as in the Old English survivals *neep* ‘turnip’ and *een* ‘eyes’, the coinages *gully* ‘knife’ and *tapsalteerie* ‘head-over-heels’, Old Norse *nout* ‘cattle’ and *skellie* ‘squint’, Middle Dutch *craig* ‘the neck’ and *redd* ‘clear up’, Anglo-Norman *leal* ‘loyal’ and *hurcheon* ‘hedghehog’, Latin

stravaig ‘roam’, Central French *Hogmanay* ‘New Year’s Eve’, and Gaelic *corrie-(fistit)* ‘left-(handed)’ and *sonse* ‘prosperity’.

Scots Gaelic

K MacKinnon, University of Herefordshire,
Black Isle, UK

Origins and Early History

The Scottish people originated with Gaelic-speaking incomers from northeastern Ulster who settled in the northwestern coastlands and islands of Caledonia in the later 5th century and subsequently relocated their kingdom of Dal Riata from Ulster to Argyll, ‘the coastland of the Gael’ (Bannerman, 1974). This community subsequently grew by absorption of the

Picts in the east and the conquest of the Britons and Angles in the south into what came to be called Scotland by the 11th century. Viking settlements in the Northern Highlands and Northern Isles from the end of the 8th century established the Norn language, which survived in Caithness, Orkney, and Shetland until the 18th century.

Under the kingship of Malcolm III, ‘Ceannmòr’ (1054–1096) Gaelic began to lose its pre-eminence at court and among the aristocracy to Norman French and in the Lowland area to the Anglian speech of the burghs, which were established first in eastern Scotland by David I (1124–1153). This speech was known first as Inglis and later as Scots, and it rapidly

became the predominant language of the Scottish Lowlands. However, Gaelic was maintained until the later Middle Ages in Galloway and Carrick in the southwestern Lowlands, reputedly finally ceasing in Ayrshire in the 18th century.

Linguistic Characteristics of Scottish Gaelic and its Dialects

Scottish Gaelic (Scots Gaelic) is a Celtic language, a member of the Goidelic or ‘Q-Celtic’ branch, closely related to Irish and Manx. It is basically a VSO language: sentences typically begin with the verb, followed by the subject and the object. Adjectives generally follow the noun. As with other Celtic languages, personal pronouns combine with prepositions and decline for person. Verbs do not generally decline for person, and there are only 10 irregular verbs.

There are two forms of the verb ‘to be’. *Bi* is the basic form for straightforward statements. It conjugates fully for tense and combines with the present participle of other verbs to form continuous tenses. The emphatic form of the verb ‘to be’ *is* exists only in the present-future and past tenses. These two verbs, together with prepositions and prepositional pronouns, enable a vast array of idioms to be formed, which enable actions in the ‘real world’ to be grammatically distinguished from abstract, mental, psychic, and emotional states.

There are many English loanwords, such as *ad* (hat), *barant(as)* (warrant), *breacaist* (breakfast), *brot* (broth, soup), *comhfhurtail* (comfortable), *geata* (gate), *mionaid* (minute of time), *paidhir* (pair), *rathad* (road), *stràid* (street), and *targaid* (target). Direct borrowings from Latin include *aingeal* (angel), *airgid* (silver, money), *crois* (cross), *eaglais* (church), *Ifrinn* (Hell), *feasgair* (evening), *gineal* (offspring), *manach* (monk). Substantial contact with Norse produced *faodhail* (ford, crossing, from Norse *vadhil*), *gocaman* (lookout, from Norse *gokman*, *gauksman*), *sgalag* (lackey, from Norse *skalkr*), *sgioba* (crew, from Norse *skip*), and *uinneag* (window, from Norse *windauga*) (MacBain, 1982: 163, 200, 310, 315, 386).

Pre-aspiration in present-day Scottish Gaelic dialects occurs before the final vowels in such words as *mac* (son, pronounced as if *mahk*), *sop* (wisp, pronounced as if *sohp*), and *sloc* (pit, pronounced as if *slohk*). This is very typical of southwest Norwegian dialects and northwestern Scottish Gaelic dialects (Marstrander, in Geipel, 1971). Historically, Scottish Gaelic dialects in the northwest with its islands were very different from dialects in the east-central and eastern Highland areas. The latter are today well

nigh extinct—and all mainland dialects are moribund. Eastern dialects did not diphthongize the long ‘e’ in words like *meud* (measure, pronounced *meeutt*) or *beul* (mouth, pronounced *beeal*) or intrude ‘s’ between final ‘r’ and ‘t’ in words like *tart* (thirst, pronounced *tarst*), *neart* (strength, pronounced *nyarst*), etc. Similarly, the northwestern dialects intrude ‘t’ between initial ‘s’ and ‘t’ as in *sruth* (stream, current, pronounced *strooh*) and *srath* (strath, wide valley, pronounced *strah*).

As with Irish, Scottish Gaelic observes the spelling convention of *caol ri caol is leathan ri leathan* (narrow to narrow and broad to broad). Where a narrow vowel ‘i’ or ‘e’ occurs before a consonant, it must be followed by a narrow vowel. Where a broad vowel ‘a,’ ‘o,’ or ‘u’ occurs before a vowel, it must again be followed by a broad vowel. Pronunciation of consonants is determined by the surrounding vowels; that is, the consonants thus flanked by narrow or broad vowels are regarded as correspondingly ‘narrow’ or ‘broad’ and pronounced accordingly. For example, *feasgar* (evening, afternoon) is pronounced as *fessgar*, where the first *a* is silent but helps render the consonants as ‘broad.’ Another example is *seillean* (bee), where the first *o* renders the initial *s* as narrow and pronounced as *sh*, and the *i* and second *e* renders the *ll* narrow and pronounced with the tongue to the front of the palate.

Gaelic uses only these letters: *a b c d e f g i l m n o p r s t u*. The letter *h* is not regarded as a regular letter. No words begin with it, except Norse-derived place names, such as *na Hearadh*, (Harris); it never stands alone in spelling, except in combination with another consonant to signify distinctive phonemes or before words beginning with vowels (e.g., *bun na h-aibhne*, the foot of the river) or to indicate aspiration or lenition in grammatical change for gender, tense, case, or word combination.

History: Medieval to Modern

By the later Middle Ages, Gaelic had retreated to the Highlands and Hebrides, which maintained some degree of independence within the Scottish state. Attempts were made by legislation in the later medieval and early modern period to establish English at first among the aristocracy and increasingly among all ranks by education acts and parish schools. The Scots Parliament passed some ten such acts between 1494–1496 and 1698. The Statutes of Iona in 1609–1610 and 1616 outlawed the Gaelic learned orders and sought to extirpate the ‘Irish’ language so that the “vulgar English tongue” might be universally planted (MacKinnon, 1991). The suppression of the Lordship of the Isles (1411), the Reformation (1560), the final

failure of the Jacobite cause (1746), and the end of the clan system were all in turn inimical to Gaelic.

Further setbacks for the language were brought about by the loss of life in the Napoleonic Wars, the ensuing Highland Clearances, the potato famine in the 1840s, and economic marginalization and underdevelopment that engendered large-scale migration to the Lowlands and overseas. Some mitigation resulted from legislation following the 'Crofters' Wars' in 1886, and at the end of the 19th century Gaelic was still the predominant language throughout the mainland Highlands and Hebrides.

In World War I, losses of life at sea and in the armed forces took a considerable toll on the Gaelic population, and the interwar period witnessed renewed emigration, especially from the Hebrides. The numbers of Gaelic speakers declined precipitately from 254 415 in 1891 to 58 969 in 2001. Because of internal migration from the Highlands and Islands to the Lowlands, 45% of all Gaelic speakers today reside in Lowland, in urban Scotland.

Gaelic in Present-Day Society: Cultural and Administrative Infrastructure

Although only 93 282 (1.84%) of Scotland's 5 062 011 population had any sort of oral, literate, or comprehension abilities in Gaelic in 2001 (GROS, 2001 Census), speakers and supporters have made increased demands for the use of Scottish Gaelic in education, broadcasting, and the arts, and have advocated for official recognition of the language. There was some presence of Gaelic from the earliest years of radio and on television since the mid-20th century. However, radio output of Scottish Gaelic greatly increased with BBC Radio nan Gàidheal from the mid-1980s, and a more realistic television budget from the early 1990s led to its increased use on television. Now there are demands for 24-hour daily radio provision and a dedicated digital television channel in Scots Gaelic.

Gaelic has been taught as a specific subject in some Highland and Island schools since the early 20th century, and bilingual education started in the early primary stages in Gaelic areas in the late 1950s. Although a more all-through model was introduced in the Western Isles from 1975, it has not yet really produced a satisfactorily bilingual secondary stage. Gaelic medium primary education began in 1985 after a successful Gaelic preschool initiative (*Comhairle na Sgoiltean Àraich*/CNSA from 1982) in two schools at Inverness and Glasgow. By 2004, the number of schools had grown to 60, with some 1972 pupils. In the secondary stage, 36 schools were teaching 974 fluent speakers, and 14 schools had

Gaelic medium streams with 284 pupils. A Gaelic higher education college, *Sabhal Mor Ostaig*, was established in 1972, offering diploma courses taught through Gaelic since 1983, and a range of Gaelic medium degree courses have been offered within the developing University of the Highlands and Islands since 1998. Although these provisions have produced some small growth in the numbers of young people with Gaelic abilities, these efforts have been clearly insufficient in stabilizing Gaelic numbers overall or in reversing language shift.

Over the past 30 years, the Gaelic cultural scene has been enriched by the growth of theater and television production companies. They have been greatly assisted by funding from the Scottish Arts Council, the Gaelic arts agency *Proiseact nan Ealan* (from 1987), the Gaelic Television (now, Broadcasting) Fund, and Gaelic Media Services and its predecessors from 1992. These have drawn upon a wealth of traditional culture, including folk songs and vernacular verse. These genres have grown in Gaeldom out of the suppression of the bardic schools in the early 17th century and are still viable today. The more formal verse of the bardic period and later is well represented in current publications, as are more recent genres, such as plays and the novel. These have been assisted since 1968 by the Gaelic Books Council. The Gaelic cultural organization, *An Comunn Gàidhealach* (The Highland Association), was founded in 1891 and has run a national cultural festival, the Royal National Mod, from 1892. More recently, a local Gaelic folk festival *Fèis Bharraigh* (1980/81) has developed into a national organization, *Fèisean nan Gàidheal*, which organizes local and national Gaelic cultural festivals.

The end of the 20th century witnessed much enhancement of cultural infrastructure for Gaelic, with organizations for Gaelic learners (CLI from 1982), pre-school education (CNSA from 1982), Gaelic parents (*Comunn nam Parant*, from 1983), and language development (*Comunn na Gàidhlig* [CNAG] from 1984). These bodies have called for further resources for the language, have commissioned studies and reports, and have advocated for its official recognition and status. The 1997 Labor Government appointed a Minister for Gaelic and set up the Milne Gaelic Broadcasting Taskforce from 1997–2000. The Scottish Executive set up two more commissions: the Macpherson Taskforce on Public Funding of Gaelic (1999–2000), and the Ministerial Advisory Group on Gaelic (MAGOG; 2000–2002). These have resulted in improved provisions for Gaelic education, calls to improve Gaelic media provision, the establishment of a Gaelic Language Board, *Bord na Gàidhlig*, and the introduction of a Gaelic Language Bill in 2003. With these developments, there has been

an emphasis on research, and the application of such ideas as language planning, secure status, and reversing language shift (MacKinnon, 2004). New ideas and policy objectives have emerged in the new millennium. The future of Gaelic as a continuing language of home and community very much depends upon their outcome.

Introduction

The Semitic languages are part of the Afroasiatic family. In the ancient world, Semitic languages were spoken from the western Mediterranean in the west to Iraq in the east, and from Ethiopia north to Anatolia. Many Semitic languages are still spoken today. Arabic is by far the most common; some dialect of Arabic is spoken by some 200 million speakers, from Morocco to Tajikistan, and it is also used, in its Classical and Modern Standard forms, for religious and other formal purposes. Modern Standard Arabic is the official or national language of countries throughout the Middle East and northern and north-eastern Africa, and Classical Arabic has been and still is used for religious purposes all over the world, following the spread of Islam. Modern Ethiopic languages like Amharic, Tigrinya, and Tigre are spoken by 25 million people in Ethiopia and Eritrea. Modern Hebrew is the language of 5 million inhabitants of Israel. In Yemen and Oman, Modern South Arabian languages like Mehri, Jibbali, and Soqotri have around 60 000 speakers. And Aramaic dialects continue as the languages of a few hundred thousand speakers who have left the Middle East in recent years and spread far and wide.

Our earliest attestations of a Semitic language occur in Sumerian texts of the first half of the 3rd millennium. Sumerian is not a Semitic language, but within these early texts we can recognize Akkadian names and Akkadian loanwords into Sumerian. By

around 2500 B.C., entire texts written in Akkadian start to appear.

Proto-Semitic is a scholarly reconstruction that suggests a common source to which all the known languages of the Semitic language family can be traced. Although the Semitic languages are thought to descend from some common ancestor, Proto-Semitic is not that ancestor; the term is not meant to represent a language that was ever spoken. It is instead the most economical reconstruction from which the known languages could have developed, through well-established phonological, morphological, and syntactical rules. We postulate a tense-mood-aspect verbal system with a perfective conjugation (**yaqtul*) and an imperfective conjugation (**yaqattal*). There was also a verbal adjective (**qatil* + enclitic pronouns). Another characteristic of the Semitic verbal system is a set of derived verbal stems, derived from the basic stem (the G, for *Grundstamm*), including one that doubles the middle root consonant (the D stem), a causative stem with some sort of causative affix (the C stem), a passive stem with infix or prefixed *-n-* (the N stem), a medio-passive stem with infix or prefixed *-t-* (the various *t*-stems), and possibly others. Nominals in Semitic have case endings (nominative, genitive, accusative in the singular; nominative and oblique in the plural), two genders, and three numbers (singular, dual, plural), plus both bound and unbound states of a noun.

These languages typically form words around triconsonantal ‘roots.’ Although there are words that cannot be related to a verbal root at all, and others that appear to have developed from fewer than three consonants, the vast majority of lexical items are formed by patterns of vowels and affixes interdigitated into and

around the three consonants that carry the meaning of a given root. Thirty consonant phonemes are reconstructed for Proto-Semitic: bilabials p, b, m, and w; interdental θ, θ', and ð; dental/alveolars t, t', d, 's, 's', 'd, s, 't, 't', l, r, and n; palatal y; velars k, k', g, x, x, and y; pharyngeal h and 'h; and glottal ' and h. We reconstruct three short and three long vowels: a, i, u, ā, ī, ū.

Verbal sentences in Semitic are typically V-S-O, and adjectives follow the nouns they modify. There is a genitive chain, called a construct chain, that consists of two or more nouns, the first of which can be in any case, but the remaining members are genitive. For the most part, this chain describes the 'of' relation: for instance, 'the king of the land' would be 'king' + case ending followed by 'the land' + genitive case ending. Adjectives and the nouns they modify must agree in gender and number, except that the numerals from three to ten have the odd feature that the feminine-looking numeral modifies the masculine noun, and the masculine-looking numeral modifies the feminine noun. Some of these features can be followed through the innovations that define the various branches of Semitic.

East and West Semitic

The Semitic languages are a fairly close-knit family. Semitic divides into two major groupings, East Semitic and West Semitic.

East Semitic

East Semitic is made up of Akkadian and Eblaite.

Akkadian Akkadian is the language of ancient Mesopotamia (ancient Iraq), and so far hundreds of thousands of Akkadian texts have come to light. It is written in left-to-right cuneiform, inscribed with a stylus on clay tablets. Akkadian cuneiform uses logograms and syllabic signs, with vC, Cv, and CvC syllables. Akkadian can be broken down into several dialects. In the 3rd millennium, we use the term Old Akkadian for a number of dialects used to write royal inscriptions, letters, ritual texts, administrative texts, and literary texts. Beginning in the early 2nd millennium, the umbrella term Akkadian is replaced by Assyrian and Babylonian. Old Assyrian is the language of some 15 000 early 2nd-millennium documents, mostly written by or for merchants residing in Anatolia. The name Old Babylonian covers the many thousands of texts from the first half of the 2nd millennium, especially from the First Dynasty of Babylon, of which Hammurabi is the most famous king. These texts are letters, omen texts, literary texts, administrative texts, and laws, including the famous law code of Hammurabi.

Both Middle Assyrian and Middle Babylonian, from the second half of the 2nd millennium, are less fully documented, but with the same array of genres. For much of the 2nd millennium, Akkadian was a lingua franca for the entire Near East, and Peripheral Akkadian texts are found from Egypt (especially the el-Amarna archive of letters from Palestinian governors) to Syria (especially the administrative texts from ancient Ugarit, modern Ras Shamra) to Anatolia (the archive from ancient Hattusa, modern Boghazköy).

Neo-Babylonian texts survive from the first half of the 1st millennium, largely letters and administrative texts, and Late Babylonian continues in use until the 1st century A.D. Neo-Assyrian, the language of the Neo-Assyrian Empire, stretches from the early 1st millennium until the fall of the empire in the late 7th century B.C. These documents are far more numerous than the Babylonian texts of the 1st millennium. Finally, Standard Babylonian refers to the archaizing written language in use in the first half of the 1st millennium, in which both Babylonians and Assyrians recorded religious and literary texts, royal inscriptions, and other formal texts.

Eblaite A cache of texts was uncovered beginning in the 1970s at Tell Mardikh in Syria, the ancient city of Ebla. These texts, which date to the 24th or 23rd century B.C., are largely in Sumerian, but bilingual lexical lists and some other texts display another language that is not Sumerian and not Akkadian, but seems to be closely related to Akkadian. It is this language that is dubbed Eblaite.

West Semitic

The West Semitic languages are separated from the East Semitic by an innovation that can be seen in all West Semitic languages: the development of an original verbal adjective *qatil + case ending into an active, perfective suffix conjugation, *qatala. This new perfective conjugation replaces the Common Semitic perfective/volitive form *yaqtul, which continued in use in West Semitic, especially as a volitive, but as a past tense form only in restricted environments. West Semitic itself can be divided into the Ethiopian languages, the Modern South Arabian languages, and the Central Semitic languages.

Ethiopian Classical Ethiopic (Ge'ez) is attested beginning in the 4th century A.D. as the language of ancient Aksum and probably went out of use as a spoken language in the 10th century, with the demise of the Aksumite Empire. It continued, however, as the language of the Ethiopian church and as a general

literary language until recently. Closely related to Ge'ez are the Northern Ethiopian languages Tigrinya and Tigre, spoken in Eritrea. Amharic, the official language of Ethiopia, is the best known of the Southern Ethiopian languages. It is generally thought that the Ethiopian languages came to east Africa from the southwest Arabian peninsula, probably no earlier than the 1st millennium B.C. The earliest Ge'ez was written in the alphabet used for Old South Arabian inscriptions; this alphabet later developed into a distinctive Ethiopic syllabary with the addition of vowel marks.

Ethiopian languages use the innovated **qatala* perfective form, but are differentiated from the Central Semitic by their retention of the old Common Semitic imperfective form **yaqattal*, with doubled middle radical, which they share with East Semitic.

Modern South Arabian The Modern South Arabian languages (particularly Mehri, but also Jibbali, Hobyót, Harsusi, Soqotri, and several smaller groups), are spoken by around 60 000 people (and dwindling) in Yemen and Oman. They have only recently been written down and so have no literary history; there is also no script associated with them, since we know them from transcriptions into the Latin or Arabic alphabet. Like the Ethiopian languages, Modern South Arabian languages have both the innovated **qatala* perfective and the retained **yaqattal* imperfective. These languages are not the descendants of the Epigraphic or Old South Arabian inscriptions (see below).

Central Semitic The Central Semitic languages break off from the rest of West Semitic with the innovation of a new imperfective form **yaqtulu*, probably a development from an old subjunctive form such as we see in Akkadian **yaqtul-u* used in subordinate clauses. The Central Semitic languages also exhibit the innovated **qatala* perfective that defines all West Semitic languages. Volitive **yaqtul* remains but can be confused with imperfective **yaqtulu* in languages without final short vowels; preterite **yaqtul* is also used in certain restricted environments such as the *waw*-consecutive preterite *wayyiqtol* forms in Classical Hebrew. The Central Semitic branch is divided into Old South Arabian, North Arabian, and Syro-Palestinian or Northwest Semitic.

Old South Arabian The Old South Arabian (or Ancient South Arabian) inscriptions (or Sayhadic) date from the 8th century B.C. to the 6th century A.D. This umbrella term includes several dialects, the best attested of which is Sabaean (or Sabaic); inscriptions

are also found in Hadramitic, Minaean, and Qatabanian dialects, but in much smaller numbers. There are at present more than 10 000 stone inscriptions in Sabaean, and a recent find of many inscriptions on short wooden sticks in a cursive script, probably from the 2nd or 3rd century A.D., has greatly increased our knowledge of the grammar of this language.

Recent work has shown that the language of the Old South Arabian inscriptions should be classified along with Central Semitic rather than the traditional South Semitic classification. *I-w* verbs in these inscriptions never have *w* in the prefix conjugation, and since the **yaqattal* form would show the *w*, the prefix conjugation must be not **yaqattal*, but rather the Central Semitic **yaqtul*.

The earliest Sabaean inscriptions are mainly written boustrophedon; otherwise, writing is from right to left. The majority of the stone inscriptions fall into the following categories: graffiti, mostly personal names; dedicatory inscriptions; building inscriptions; reports of military campaigns; legal documents; funerary inscriptions. The inscriptions on wood at least partly concern legal and economic matters, sometimes written in the form of a letter.

The South Semitic alphabet, which broke off from the early Canaanite linear alphabet around the 13th century B.C., represented only consonants. The Old South Arabian inscriptions maintain this system of writing, with rare indications of vowels.

North Arabian The North Arabian languages of the Central Semitic branch are divided into two groups: Arabic, including Old Arabic, Classical, and modern dialects; and Old North Arabian (or Ancient North Arabian).

Old North Arabian includes inscriptions in pre-Islamic dialects, dating from the 8th century B.C. to the 4th century A.D.: Oasis North Arabian (Taymanite, Dedanite, Dumaitic, and Dispersed Oasis North Arabian); Safaitic; Thamudic; and Himaic; plus what is generally called Hasaitic – a dialect seen in a few dozen mostly funerary inscriptions from northeastern Arabia, near the Persian Gulf, probably dating from the second half of the 1st millennium B.C. Old North Arabian inscriptions are largely graffiti, and so the handwriting is mostly informal, not highly trained; therefore, the dating and even ancestor of some of the individual scripts are not clear. For the most part, however, Old North Arabian inscriptions are written in a script closely related to that of the Old South Arabian inscriptions. The number of graffiti and their dispersal patterns are astounding in their implications for literacy, both in the towns and among the nomads, since thousands of the graffiti so far published were written on rocks in the desert areas

that stretch from Syria to northern Arabia. The writing of the Oasis texts was usually right to left, and sometimes boustrophedon, while the nomads' writing on rocks goes in every possible direction, including a spiral, across the surface of the rocks on which they were written.

The Oasis dialects are those used in the oases associated with the routes of the spice and aromatics trade (especially frankincense). Approximately 400 short inscriptions found in and around the oasis of Tayma have been published so far, in a dialect and script that are somewhat different from the rest of Old North Arabian. They probably date to the 6th or 5th century B.C. Two inscriptions have recently been published that mention "Nabonidus, king of Babylon"; Nabonidus in fact spent ten years of his reign in Tayma in the mid-6th century B.C. Dedanite is the dialect of hundreds of graffiti found in the vicinity of the oasis of Dedan. It is the only one of these dialects used for monumental inscriptions as well, and so far hundreds of mostly dedicatory monumental inscriptions have been found. Dedanite inscriptions probably date to the second half of the 1st millennium B.C. The Dumaitic dialect is represented by only three texts so far, found in or near Sakaka in northern Arabia. There is very little evidence for dating, but they may also be from the second half of the 1st millennium B.C. The Dispersed Oasis North Arabian are those texts that are clearly related to the Oasis North Arabian but are found outside Arabia, carried north by traders and found mostly in what was Mesopotamia.

Of the Safaitic, Thamudic, and Hismaic inscriptions, the Safaitic are the most numerous, with some 15 000 graffiti from the 1st century B.C. to the 4th century A.D.; written by nomads, they are found as far north as Damascus and east to the Euphrates, as well as south to northern Arabia. Hismaic inscriptions are written in the language of the Hisma desert nomads, and they stretch from northwestern Arabia to central and northern Jordan. Approximately 1000 Thamudic graffiti date from the 6th century B.C. to the 3rd century A.D. Thamudic includes all the non-Oasis Old North Arabian inscriptions that are not otherwise classified.

The prominent difference between Old North Arabian and Arabic is the definite article in each: *'al-* in Arabic, but *h-* in Old North Arabian.

Classical Arabic has made its way around the world as the literary language of Islam, but a dialect or dialects similar to Classical Arabic were known already in 4th-century A.D. inscriptions (hence the name Old Arabic). Classical Arabic has elements of spoken pre-Islamic Arabic, but was shaped by the Qur'an (7th century A.D.), which reflects also the spoken dialect of the Hejaz region of central and

west Arabia, in particular, the dialect of Mecca which was Muhammad's dialect. Arabic script was adapted from the script of the Nabateans. It is written from right to left and was originally consonantal, with indication of long vowels, and has developed diacritical marks to indicate short vowels and other features. The 8th- and 9th-century Arab grammarians standardized the language, and it has changed very little since that time.

Modern Standard Arabic, which is the Arabic of newspapers, radio, television, and international communication, is still Classical Arabic at its base, with vocabulary updated as necessary. A development from Classical Arabic is Middle Arabic, which is meant to be literary Arabic, but deviates from it in ways that betray the authors' dialects; examples of Middle Arabic are Judeo-Arabic, Medieval Christian Arabic, and Spanish Arabic. Finally, there are the modern vernacular dialects of Arabic that have evolved over the centuries over the large territory in which Arabic is spoken. Many, in fact, are no longer mutually comprehensible, especially at the outer ends of that territory, so that someone speaking in the vernacular dialect of Morocco and someone speaking in the vernacular dialect of Iraq would have to move closer and closer to the classical language until they came to a point where each could comfortably understand the other. Arabic is one of the most commonly spoken languages in the world, with approximately 200 million speakers.

Northwest Semitic The Northwest Semitic (or Syro-Palestinian) languages can be divided into at least four subcategories: Ugaritic, Canaanite, Aramaic, and other. These languages all share the innovations of West and Central Semitic, plus two more: the change of initial **w* to **y* in virtually all environments except for the word 'and,' which remains proclitic **wa-*; and the plural pattern that adds *-a-* insertion to the regular external plural, for nouns of the type $C_1VC_2C_3$. Thus, **sīpr-* 'book'; plural **sīparūma/sīparīma* (Hebrew *šēper, sēpārīm*).

Ugaritic is the language attested from the late 14th century to around 1200 B.C. at the ancient city of Ugarit (modern Ras Shamra) on the Syrian coast above Latakia, and at an outlying town called Ras Ibn Hani. It is known from the approximately 1500 texts written left to right in alphabetic cuneiform on clay tablets. The writing system postdates the linear alphabet known from the same general region and seems to be a clever combination of the technology of cuneiform writing on clay (like the lingua franca at the time, Akkadian) and the idea of an alphabet and the ease of writing it affords. Ugaritic is written without vowels, but there are some multilingual texts with

columns that represent the Ugaritic pronunciation written out in syllabic cuneiform, so that the vocalization of some words and some basic rules are known. Further, there are three signs for 'aleph, representing, among other things, the consonant 'aleph plus vowels a, i, and u, so words with 'aleph as a root letter often have some indication of the vocalization of that word and by extension other words of the same type (perfective verb, for instance). The corpus consists of poetic mythological texts, ritual texts, administrative texts, letters, and school texts.

Ugaritic is sometimes thought to be a Canaanite language rather than a branch on its own, but there is at least one of the defining innovations of Canaanite that Ugaritic does not participate in (see below on 'intensive' and causative stems); perhaps there were more, but they cannot be seen in the Ugaritic consonantal alphabet, even with the aids mentioned above. Canaanite describes a grouping of closely related languages: early Canaanite seen in scattered inscriptions and in the underlying dialects of the Amarna letter scribes (see below); Phoenician; Moabite; Hebrew; Ammonite; and Edomite. These languages share a change of the 'intensive' and causative conjugation perfective verb forms from *qattila and *haqtilla to *qittila and *biqtilla, and the so-called Canaanite shift of *ā* to *ō*, among others. While these languages are written consonantally, later vocalizations (of Biblical Hebrew, for instance) and the spelling out of words in contemporaneous Akkadian, Greek, and Roman documents allow us to reconstruct many of these changes where they are not obvious.

Ancient Canaan covered roughly modern southern Lebanon, Israel, and the northwestern part of Jordan. The earliest indications of Canaanite languages come from the few scattered alphabetic inscriptions beginning in the 18th century B.C., and from the 'Amarna letters,' Akkadian cuneiform clay tablets written by rulers of ancient Canaan (among others) to the pharaoh in Akhetaten, modern el-Amarna, in Egypt. Sometimes the Canaanite-speaking scribe glosses a word in his own language, using Akkadian syllabic writing just as he did for the lingua franca Akkadian in which the texts are mostly written; and this Akkadian itself is a mixed language with Akkadian vocabulary but the morphology and syntax of the local dialects of the scribes. There is enough evidence in the Amarna letters to identify the dialects of the Canaanite scribes as an early form of what later became Phoenician, Hebrew, and so on.

Phoenician is the name we give to the Canaanite language spoken in the cities of the northern coast of the Levant; modern scholars refer to the language as Phoenician after about 1200 B.C. This date marked a turning point in the region's fortunes, because it was

approximately then that the so-called Sea Peoples, refugees from Mycenaean Greece, attacked Egypt, establishing a number of cities on the southern coast of the Levant and freeing the rest of Canaan from Egyptian control. (The most famous of the Sea Peoples are the Philistines.) Phoenician spread throughout the Mediterranean through the trading empire of the Phoenicians, and later the commercial empire of North African Carthage, originally an outpost of Levantine Tyre. Phoenician is a long-lived language: the first inscriptions long enough to analyze come from 10th-century Byblos, and in its Carthaginian extension (called Punic), the language is attested until the 4th century A.D., in Latino-Punic inscriptions. Phoenician and Punic texts are dedicatory, royal, funerary, votive, and commercial, plus a number of seals and coins.

Hebrew is the best-known Canaanite language because it was used to write most of the Hebrew Bible; because of its continued use as a literary language throughout Late Antiquity, the Middle Ages, and beyond; and because of its modern incarnation as the language of the modern state of Israel. Biblical or Classical Hebrew was the language of the ancient kingdoms of Israel and Judah in at least two dialects, Northern (or Israelian) and Judahite, from around 1200 B.C. to 600 B.C., when Judah was defeated by the Neo-Babylonian Empire. It is known from texts in the Hebrew Bible and from epigraphic remains and was written in the Hebrew script (developed from the linear Canaanite alphabet) right to left on various media, including stone, potsherds, and metals; no doubt the majority of ancient Hebrew texts were written on papyrus and are now lost to us. The few epigraphs that remain from this period are commercial, dedicatory, funerary, and administrative, plus a few seals and bullae (only a few that are surely authentic; forgeries abound).

It remained the spoken language of the area of those former kingdoms on some level, but exactly how central it was to most people is not clear, since Aramaic (see below) had taken over as the lingua franca in the Near East as early as the 8th-century Neo-Assyrian Empire. Once Israel and Judah became provinces in the Assyrian, Babylonian, and Persian empires, most epigraphic evidence appeared in Aramaic, and the books of the Hebrew Bible that are written in that era, such as Daniel, Esther, and Chronicles, are written in Late Biblical (or Classical) Hebrew, a dialect or dialects that are either simply different from or developed from the Standard Biblical Hebrew of the earlier literature of the Bible. The extent of the differences is muted by the many editorial hands that have leveled the dialects in which the Hebrew Bible was written.

Middle Hebrew was the language of the several nationalistic revolts (under the Maccabees in the 2nd century B.C.; against the Romans, ending in 70 A.D.; and the Bar Kokhba insurrection ca. 135 A.D.) and it continued to be used in written texts from the 2nd century B.C. to the 5th century A.D., including the Hebrew texts from Qumran, Samaritan Hebrew, and the Mishnah. Medieval Hebrew continued the tradition of Middle and Classical Hebrew, both as a sacred and literary language, and as the language in which Jews from different countries could communicate. Modern Hebrew was revived as a spoken language in the 19th century and is still spoken today in the state of Israel.

Besides a few seals, Moabite is known from one reasonably long inscription, written on behalf of King Mesha to commemorate his military triumphs. It dates from the second half of the 9th century and is very much like Hebrew and Phoenician. The area of ancient Moab was in the southern part of modern Jordan. Ammonite and Edomite are known from only a very few inscriptions and seals, but as far as they can be analyzed, they, too, are very similar to the better-attested Hebrew and Phoenician. Ancient Ammonite was spoken in the central highlands of what is now Jordan, and Edomite was the language of the far south of Jordan.

Aramaic is distinguished from the rest of Northwest Semitic by its use of *-na* as the first-person plural suffix in all environments; by the change from vocalic *n* to *r* in the words for 'son,' 'daughter,' and 'two'; by its loss of the N-stem; and by the development of a new causative-reflexive stem **hittaqtal*, which replaces general Central Semitic **(v)staqtala*. Aramaic is divided into Old Aramaic, Official or Imperial Aramaic, Middle Aramaic, Late Aramaic, and Modern Aramaic.

Old Aramaic describes inscriptions from a number of closely-related dialects that date from the mid-9th century to the 6th century B.C. They are royal inscriptions, for the most part, but there is also a long treaty text, funerary inscriptions, religious texts, and a few seals, as well as other scattered pieces. Most are carved into stone in a 22-letter alphabet borrowed from the Phoenicians, written right to left, that is mostly consonantal, but even early on with indications of some long vowels.

Official or Imperial Aramaic was the lingua franca of the Persian Empire (from the 6th to the 4th century B.C.), and as such it spread west to Egypt and east as far as Pakistan. It survives in large numbers of papyri, especially from Egypt, where they have been protected by the dryness for millennia. The Aramaic of the biblical book of Ezra is Imperial Aramaic.

Known from the 3rd century B.C. to the 2nd century A.D., Middle Aramaic describes a large number of

inscriptions written in a variety of dialects, such as Nabatean, Palmyrene, Hatran, and Old Syriac. Standard Literary Aramaic developed in Palestine and is the Aramaic of the biblical book of Daniel, of Targums Onqelos and Jonathan, of the Dead Sea Scrolls, the Bar Kochba letters, and quotations in the Mishnah and New Testament.

Late Aramaic begins in the 3rd century A.D. and includes Late Western Aramaic, Late Eastern Aramaic, and Literary Syriac. Late Western Aramaic is the language of the Palestinian Talmud, the Midrashim, and the Targums. It also includes Christian Palestinian Aramaic and Samaritan Aramaic. Late Eastern Aramaic is the language of the Babylonian Talmud. It also includes Mandaic and the language of a large number of incantation bowls from the 4th to the 7th century A.D. There is, finally, a huge Christian literature written in Literary Syriac from the 4th to the 13th century A.D. After the rise of Islam in the 7th century, Syriac was used less and less as a spoken language, but continued as the literary language of the Syrian Orthodox Church.

Modern Aramaic, or Neo-Aramaic, is still spoken by a few hundred thousand people from communities formerly situated in Iran, Iraq, and Syria for the most part; in recent decades, most of the speakers have left the Middle East and emigrated with their languages to the United States, Sweden, Germany, the Netherlands, and Australia, among others. Neo-Aramaic speakers are Christian, Muslim, Jewish, and Mandaean. The four main branches of Neo-Aramaic are Western (spoken in three villages near Damascus); Central (Turoyo and Mlahso, spoken in southeastern Turkey); Eastern (or Neo-Syriac, no relation to classical Syriac; spoken originally in Kurdistan); and Neo-Mandaic (spoken originally in western Iran).

There are some Northwest Semitic inscriptions that are difficult to identify as Ugaritic, Canaanite, or Aramaic. The dialect of the 8th-century B.C. prophetic inscription found at Tell Deir Alla in Jordan has been a matter of much controversy because it seems to combine features of Aramaic dialects and of Canaanite dialects. The same is true to a lesser degree of the dialect of two 8th-century royal inscriptions from Zincirli in Turkey. It has been suggested that these inscriptions represent other forms of Northwest Semitic that did not hivel off of the main branch at quite the same time as the three major languages.

Serbian-Croatian-Bosnian Linguistic Complex

Bosnian

The official name of the language spoken in Bosnia Herzegovina is Bosnian. The status of the language in reality, however, is more complex, as may be seen in the language law adopted in 1993: "In the Republic of Bosnia and Herzegovina, the Ijekavian standard literary language of the three constitutive nations is officially used, designated by one of the terms: Bosnian, Serbian, Croatian. Both alphabets, Latin and Cyrillic, are equal." The law reflects the fact that the territory is inhabited by three national groups: Bosniaks (South Slav Muslims, the majority population of the Bosnian/Croatian Federation), Croats (Catholics, the majority population of the territory of Herzegovina,

the southwestern area of the Bosnian/Croatian Federation); and Serbs (Orthodox, the majority population of the other Bosnian entity, known as *Republika srpska*). In practice, it is normally only Bosniaks (and those committed to the survival of Bosnia Herzegovina as a unified country), who refer to their language as 'Bosnian.' And it is logical enough that Croats should speak Croatian and Serbs Serbian now that there is no longer an all-inclusive Serbo-Croatian umbrella. The debate as to whether or not a distinct Bosnian language exists continues. At the time of writing, the standard language used by the official authorities in Sarajevo and other parts of the Federation may be described as distinct from the standard languages in Serbia and Croatia, but the process of standardization, through dictionaries, grammars, and scholarly studies, has yet to be completed. For the time being, it cannot be said that Bosnian has quite the same status as Croatian in terms of its recognition as a specific standard.

Croatian

Croatian is the official name of the language spoken in the territory of Croatia. To a considerable extent, the political tensions that ultimately led to the collapse of Yugoslavia were first reflected in issues related to language. Long before it was possible for ideas of political separation to be contemplated, in 1967, Croatian linguists published a Declaration on the Name and Position of the Croatian Literary Language, calling for official recognition of Croatian as a separate language. From the outset, however, it was clear that the Declaration had more to do with cultural and sociopolitical aspirations than linguistics. From 1971, nationalist policies in Croatia became steadily more entrenched, leading eventually to the secession of Croatia (and Slovenia) from the common state of Yugoslavia in 1992. As language and statehood have been inextricably linked since the rise of nation states in Europe, it was understandable that nationalist politics should place particular emphasis on separating the Croatian element of the Serbo-Croatian language as far as possible from its Serbian counterpart. To this end, archaic words were reintroduced, neologisms forged and various 'differential' dictionaries published in an effort to raise the consciousness of individual Croats to the special nature of their language and to purify the Croatian language of Serbianisms. Apart from lexical items and favoring two characteristic syntactic differences (the infinitive in Croatian for dependent verbs, as opposed to *da* + present tense in Serbian; verb + interrogative particle *li* for questions as opposed to *da li* + verb in Serbian), particular emphasis has been placed on differences in word formation. At the height of the nationalist era, in the extreme circumstances of war and later, as Croatia consolidated its position as an independent state, linguists were particularly active. Some of the results of this frenzy were inevitably artificial and at times entertaining. This phase of heightened self-consciousness has now passed, with the recognition that Croatian has been widely accepted as a separate standard at an official level. Speakers may now be left to express themselves naturally and the language to develop in a more organic manner.

Serbian

Serbian is the official name of the language spoken in the territory of Serbia and Montenegro. Unlike the other components of the Serbian-Croatian-Bosnian linguistic complex, Serbian, as the standard language of the Serbs and Montenegrins, has not changed

essentially from its earlier incarnation as Serbo-Croat. It was the Croats who opted to remove their language from the dual name, and set about making their standard as distinct as possible from standard Serbian (see 'Croatian'), while the Serbs had only to stand still. The process of the disintegration of standard Serbo-Croatian may thus be described as 'asymmetrical and asynchronous' (Ljubomir Popovic, 'From Serbian to Serbo-Croatian to Serbian,' in Bugarski and Hawkesworth, 2004). In response, a Serbian Language Standardization Committee was set up to describe the current situation and Serbian has now been officially recognized as a separate language within Slavonic studies.

Serbian-Croatian-Bosnian Linguistic Complex

The language formerly known as Serbo-Croat belongs, with Bulgarian, Slovene, and Macedonian, to the South Slav branch of the Slavonic language family. The first written records are 11th-century inscriptions in stone in both the Glagolitic and related Cyrillic scripts. The cultural division between the two variants reflects their history: the western Latin-script culture of Croatia, in the orbit of the Catholic Church and later the Hapsburg Monarchy; and the eastern, Cyrillic, Byzantine, Orthodox culture of Serbia.

The dia-system linguistic complex is the most heterogeneous Slavonic dia-system, with an exceptionally large variety of dialects, some with six or seven cases, some with four, and a great variety of verbal tenses. At the same time, these dialects have a striking degree of connectedness, containing characteristic features, which distinguish the complex from all other Slavonic languages. One of these is its archaic prosodic system, in which stress position, vocalic quantity (length/shortness) and tone (rising/falling) are marked. The traditional accents are long falling: *noć*; short falling: *kuća*; long rising: *reka*; short rising: *ostati*. There are not many minimal pairs. Examples would be *grad* 'hail' and *grad* 'town'; *pas* 'dog' and *pas* 'belt, waist; pass'; and the sentence *Sam sam* 'I [masc.] am alone'.

In terms of morphology, the structure has remained complex, although one feature of Old Slavonic – the dual – has disappeared from the declensions and conjugations of all dialects in the complex. Case and verbal endings and accent shifts are the main morphological categories.

Word order is free, with the exception of strict rules governing the position of enclitics. These are verbal and pronominal short forms and the interrogative and reflexive particles.

Orthography has experienced the systematization of the Serbo-Croatian vernacular, which was carried out in the mid-19th century on phonetic principles, with one letter corresponding to one sound, making its orthography one of the most consistent in Europe. There is exact correspondence between the two scripts so that transliteration from one to the other is straightforward. There are three symbols unique to the language: **ć, ĥ; đ ħ; dž ʒ**. For example:

Ijekavian variant (characterized by the rendering of Old Slavonic *jat* as *je* or *ije*, and spoken in Croatia, Bosnia, and Montenegro):

Od dviju sjevernih skupina, tj. istočne i zapadne, južna se razlikuje nizom osobina.

Ekavian variant (characterized by the rendering of Old Slavonic *jat* as *e*, and spoken in most of Serbia, which can equally well be written in the Latin script):

Од двеју северних скупина, тј. источне и западне, јужна се разликује низом особина.

‘The Southern (Slavonic) group is distinguished from the two Northern groups, i.e., the Eastern and Western, by a series of features.’

Extensive bibliographies, as well as detailed studies, on the language situation of former Yugoslavia may be found in Bugarski *et al.*, 1992; the current situation is covered in the sequel: *Language in the former Yugoslav lands*, Slavica, 2004.

Serbo-Croat

The linguistic unity of the majority of the Southern Slav population of the Hapsburg and Ottoman lands that were to become Yugoslavia after the collapse of these empires in the First World War was first acknowledged in the joint Literary Agreement of 1850. The name ‘Serbo-Croat’ was officially adopted with the formation of the Kingdom of the Serbs, Croats, and Slovenes (known as Yugoslavia from 1928). It was never a straightforward phenomenon, however, as can be seen in the description adopted by many scholars: a polycentric standard language. The language could be officially termed ‘Serbo-Croat,’ ‘Croato-Serbian,’ ‘Serbian and Croatian,’ ‘Croatian and Serbian,’ ‘Serbian or Croatian,’ ‘Croatian or Serbian.’ In practice, from the end of the 1960s,

most people in Croatia and Serbia referred to their language as ‘Croatian’ or ‘Serbian,’ respectively, simply for convenience, without this label implying any separatist tendencies. This situation lasted until the collapse of Yugoslavia in the wars of 1991–1995. Since the establishment of the independent states of Bosnia Herzegovina, Croatia, and Serbia and Montenegro (still officially known as Yugoslavia until 2003), the term ‘Serbo-Croat’ no longer has any official validity in sociopolitical terms. The language spoken in these countries is now officially known as Bosnian, Croatian, and Serbian, respectively. In linguistic terms, the standard language remains essentially the same, but the sociopolitical reality is that it no longer has a single name. When native speakers wish to refer to the language in its broader sense, beyond the borders of their own homeland, they tend to say ‘*naš jezik*’ or ‘*naški* (our language)’. For the purposes of the War Crimes Tribunal in The Hague, it is known as BCS. University departments in Europe where it is taught refer to it variously as Bosnian/Croatian/Serbian (Austria, Norway); Serbo-Croatian (Denmark); Serbo-Croat (France); South Slavic (Finland); Serbian/Croatian/Bosnian (Sweden); Serbian and Croatian (UK). In the absence of an entirely satisfactory solution, in this volume the term ‘Serbian-Croatian-Bosnian linguistic complex’ has been adopted as a clumsy but accurate description.

Shona

D Odden, The Ohio State University, Columbus, OH, USA

© 2006 Elsevier Ltd. All rights reserved.

Shona is a member of the Bantu language family, S10 in the Guthrie classification, having roughly 7 000 000 speakers in Botswana, Malawi, Mozambique, and Zambia, with the majority of speakers in Zimbabwe. Shona is the dominant African language of Zimbabwe; as one of the major languages of southern Africa, the speaker population is comparable to that of Zulu and Xhosa. Shona is also a literary language, with a considerable literature having developed since the 1950s. The main dialects of Shona are Karanga, Korekore, Manyika, and Zezuru; Zezuru forms the basis of the standard language. Ndaou and Kalanga are closely related and might be considered to be highly divergent dialects or closely related but separate languages: in this article, they will not be treated as Shona dialects. The main linguistic reference works for Shona are the reference grammars of Fortune (1955, 1980) an extensive dictionary indicating tone and dialectal properties (Hannan, 1984), and *Duramazwi Guru reChiShona*, which is a major Shona monolingual dictionary.

With 5 vowels and minimally 32 uncontroversial consonants, Shona has somewhat more than the usual complement of consonants for Bantu languages. The consonantal system includes a contrast between the labiodental fricative [v], spelled *vb*, and a bilabial semi-approximant [β], spelled *v*, as well as a labiodental flap [v̥] found in some ideophones and reported in a few nouns, as well as a contrast [b, d] vs. [β, d̥]. The most well-known phonetic oddity of Shona is a set of ‘whistling fricatives,’ a set of retracted alveolar fricatives and affricates articulated between [s] and [ʃ] (with which they contrast), produced with a degree of lip protrusion but not full rounding: these sounds, for which the International Phonetic Alphabet (IPA) lacks symbols, are spelled *sv*, *zv*, *tsv*, *dzv*. In some dialects, especially Manyika, the labial constriction is so extreme that a stop closure is formed. In addition, the language has a series of prenasalized consonants of nasal plus consonant sequences [mb], etc., and morphophonemic consonant plus *w* sequences pronounced with various degrees of velarization according to dialect, so that /tw/ may be phonetically [txw] or [tkw] with unrounding after labials, and /pw/ may be [px] or [pk].

Shona is a tone language, but extensive tonal data is available only for the Karanga and Zezuru dialects (see Fivaz (1970) and Fortune (1980) for

tone-marked paradigms of Zezuru, Myers (1987) for analysis, and Odden (1981) for Karanga). Differences in the tonal morphophonemics of different Shona dialects are significant, and are comparable to tonal differences across Makonde dialects or the so-called Luhya languages. One characteristic of Shona tonology is a panoply of dissimilative H-tone lowering and rightward spreading processes, which are subject to a variety of morphosyntactic conditions. Tone-melodic inflectional patterns also play a role in marking tense aspect and clause type, providing the sole distinction between forms such as (Karanga) *akarima* ‘then he plowed’, *ákáríma* ‘he plowed (yesterday)’, and *ákárimá* ‘he having plowed’.

Shona exhibits typical structural properties of Bantu languages. It has a rich system of 19 noun classes marked on nouns by prefixes that encode singular/plural distinctions as well as semantic properties (such as diminutives and augmentatives), with all of the proto-Bantu noun classes represented, except **gu-* – class 19 **pi-* is represented in the Karanga dialect by the diminutive *svi-*. Noun stems can thus appear in a number of classes, the choice of class marking semantic differences, e.g., *mu-kómaná* ‘boy’, *gómaná* ‘huge boy’, *chi-kómaná* ‘short boy’, *ka-kómaná* ‘tiny sickly boy’, *ru-kómaná* ‘thin boy’, and *svi-kómaná* ‘little boy’. The Bantu class 5 prefix **li-* is itself phonologically null in Shona, and voicing of a stem-initial stop replaces an overt prefix in [bángá] ‘knife’ ~ [ma-pángá] ‘knives’, [déndé] ‘gourd’ ~ [ma-téndé] ‘gourds’, [guḍo] ‘baboon’ ~ [ma-kuḍo] ‘baboons’, [jékó] ‘sickle’ ~ [ma-čékó] ‘sickles’: observe that the voiced correspondents of *p*, *t* are the implosives [β, d̥], not [b, d].

Verb morphology is particularly rich. Stems are composed of a root plus a number of fully and partially productive derivational suffixes marking causative (*-is-*), applicative (*-ir-*), reciprocal (*-an-*), passive (*-w-*), intensive (*-is-*, *-isis-*), reversive (*-Vnur-*), and stative (*-ik-*), as well as reduplication for frequent actions. Pronominal markers include encoding of objects, subjects, and relative clause heads for each of the noun classes. Tense-aspect marking indicates past, present, future, persistent, potential, subjunctive, imperative, hortative, and numerous other distinctions, as well as corresponding negative and subordinate clause forms. The word-formation potential of Shona reaches astronomical levels due to a series of *Aktionsart* prefixes such as *-do-* ‘willingly’, *-ndo-* ‘go’, *-zo-* ‘hypothetical, remote’, *-garo-* ‘always’, *-nyatso-* ‘do well’, and *-raro-* ‘at night’; thus *ndichá-dó-rima* ‘I will gladly plow’, *ndichá-zó-rima* ‘I will plow in the remote future’, and *ndichá-nyatsó-rima* ‘I will

plow well'. These prefixes can be combined and permuted, so that *ndichá-zó-ndó-ráro-rima* 'I will perhaps go plow at night' can also be rendered as *ndichá-ndó-zó-ráro-rima*.

Shona syntax is typical for a Bantu language. Noun phrases are fairly strictly head initial, with noun class agreement governed by the head noun (*vána va-kúru va-viri vá-no* [children big two these] 'these two big children'), though some determiners may be put before the head noun (*iri bángá* [this knife]). Derivational verbal extensions such as the causative and applicative allow a clause to have multiple bare objects, e.g., *ákárima munda* 'he plowed the field', *ákárimisa Fáraí munda* 'he made Farai plow the field', and *ákárimira munhu munda* 'he plowed the field for the person'. Locative noun phrases can ostensibly function as subjects via inversion (*mu-mbá mu-ákárara vaná* [in-house loc-slept children] the children slept in the house') or passivization

(*mu-mbá mu-ákáfamb-w-á naFáraí* [in-house loc-walk-passive by-Farai] 'in the house was walked by Farai').

Sign Languages

W Sandler, University of Haifa, Haifa, Israel

© 2006 Elsevier Ltd. All rights reserved.

In many ways, sign languages are like spoken languages: They are natural languages that arise spontaneously wherever there is a community of communicators; they effectively fulfill all the social and mental functions of spoken languages; and they are acquired without instruction by children, given normal exposure and interaction. These characteristics have led many linguists to expect sign languages to be similar to spoken languages in significant ways. However, sign languages are different too: As manual-visual languages, sign languages exploit a completely different physical medium from the vocal-auditory system of spoken languages. These two dramatically different physical modalities are also likely to have an effect on the structure of the languages through which they are transmitted.

It is of special interest, then, to compare natural languages in the two modalities. Where the two systems converge, universal linguistic properties are revealed. Where they diverge, the physical medium of transmission is implicated, and its contribution to the form of language in both modalities is illuminated. Neither can be seen quite so clearly if linguists restrict their study to spoken language alone (or to sign language alone). For this and other related reasons, it is often remarked that sign languages provide

us with a natural laboratory for studying the basic characteristics of all human language.

Once the existence of natural language in a second modality is acknowledged, questions such as the following arise: How are such languages born? Are the central linguistic properties of sign languages parallel to those of spoken languages? Is sign language acquired by children in the same stages and time frame as spoken language? Are the same areas of the brain responsible for language in both modalities? What role does modality play in structuring language? In other words, within the architecture of human cognition, do we find the structure of one language 'faculty' or two? Although there is no conclusive answer to this deceptively simple question, an impressive body of research has greatly expanded our understanding of the issues underlying it.

How Do Sign Languages 'Happen'?

Evolution made language possible scores of millennia ago, and there is no human community without it. What sign language teaches us is that humans have a natural propensity for language in two different modalities: vocal-auditory and manual-visual. Since the human ability to use language is so old, and since speech is the predominant medium for its transmission, it seems that spoken languages are either also very old or descended from other languages with a long history. However, sign languages do not have the

same histories as spoken languages because special conditions are required for them to arise and persevere, and for this reason they can offer unique insight into essential features of human language.

The first lesson sign language teaches us is that, given a community of humans, language inevitably emerges. Although we have no direct evidence of the emergence of any spoken language, we can get much closer to the origin of a sign language and, in rare instances, even watch it come into being.

Wherever deaf people have an opportunity to gather and interact regularly, a sign language is born. Typically, deaf people make up a very small percentage of the population (approximately 0.23% in the United States, according to the National Center for Health Statistics, 1994) so that in any given local social group, there may be no deaf people at all or very few of them. The most common setting in which a deaf community can form, then, is a school for deaf children. Such schools only began to be established approximately 200 years ago in Europe and North America. On the basis of this historical information and some reported earlier observations of groups of people using sign language, it is assumed that the oldest extant sign languages do not date back farther than approximately 300 years (Woll *et al.*, 2001). Currently, linguists have the rare opportunity to observe the emergence and development of a sign language from the beginning in a school established in Nicaragua only approximately 25 years ago – an opportunity that is yielding very interesting results.

Graduates of such schools sometimes choose to concentrate in certain urban areas, and wider communities arise and grow, creating their own social networks, institutions, and art forms, such as visual poetry (Padden and Humphries, 2005; Sandler and Lillo-Martin, 2005; Sutton-Spence and Woll, 1999). Deaf society is highly developed in some places, and the term ‘Deaf’ with a capital D has come to refer to members of a minority community with its own language and culture rather than to people with an auditory deficit.

It is not only the genesis of a sign language that is special; the way in which it is passed down from generation to generation is unusual as well. Typically, fewer than 10% of deaf children acquire sign language from deaf parents, and of those deaf parents, only a small percentage are native signers. The other 90+% of deaf children have hearing parents and may only be exposed to a full sign language model when they go to school. These social conditions taken together with certain structural properties of sign languages have prompted some linguists to compare them to spoken creoles (Fischer, 1978).

Another way in which a deaf social group and concomitant sign language can form is through the propagation of a genetic trait within a small village or town through consanguineous marriage, resulting in a proportionately high incidence of deafness and the spread of the sign language among both deaf and hearing people. Potentially, this kind of situation can allow us to observe the genesis and development of a language in a natural community setting. Although the existence of such communities has been reported occasionally (see Groce, 1985), no comprehensive linguistic description of a language arising in such a community has been provided.

These, then, are the ways in which sign languages happen. The existence of many sign languages throughout the world – the number 103 found in the Ethnologue database is probably an underestimate – confirms the claim that the emergence of a highly structured communication system among humans is inevitable. If the oral–aural channel is unavailable, language springs forth in the manual–visual modality.

Not only does such a system emerge in the absence of audition, but its kernels can be also observed even in the absence of both a community and a language model. Deaf children who live in hearing households in which only oral language is used, who have not yet experienced speech training, and thus have no accessible language model, devise their own systematic means of communication called home sign, studied in exquisite detail by Goldin-Meadow and colleagues (Goldin-Meadow, 2003). The gesture talk of these children contains the unmistakable imprint of a real linguistic system, and as such it offers a unique display of the fundamental human genius for language.

At the same time, the form and content of home sign are rudimentary and do not approach the richness and complexity of a language used by a community, spoken or signed. This confronts us with another important piece of information: Language as we know it is a social phenomenon. Although each brain possesses the potential for language, it takes more than one brain to create a complex linguistic system.

The Linguistic Structure of Sign Language

Hearing people use gesture, pantomime, and facial expression to augment spoken language. Naturally, the ingredients of these forms of expression are available to sign languages too. The apparent familiarity of the raw material that contributes to the formation of sign languages has led many a naïve observer to the mistaken assumption that sign languages are actually simple gesture systems. However, instead of forming an idiosyncratic, ancillary system like the one that accompanies speech, these basic ingredients contribute

to a primary linguistic system in the creation of a sign language, a system with many of the same properties found in spoken languages. In fact, linguistic research has demonstrated that there are universal organizing principles that transcend the physical modality, subsuming spoken and signed languages alike.

The Phonology of Sign Language

William Stokoe (1960) demonstrated that the signs of American Sign Language (ASL) are not gestures: They are not holistic icons. Instead, Stokoe showed that they are composed of a finite list of contrastive meaningless units like the phonemes of spoken languages. These units combine in constrained ways to create the words of the language. Although there are some differences among different sign languages in their phonological inventories and constraints, there are many common properties, and the generalizations presented here hold across sign languages, unless otherwise indicated.

Stokoe established three major phonological categories: hand shape, location, and movement. Each specification within each of the three major categories was treated as a phoneme in Stokoe's work. Later researchers accepted these categories but proposed that the specifications within each category function not as phonemes but as phonological features. The ASL signs SICK and TOUCH, illustrated in Figure 1,

Figure 1 ASL minimal pair distinguished by a location feature. (A) SICK and (B) TOUCH.

have the same hand shape and the same straight movement. They are distinguished by location only: The location for SICK is the head, whereas the location for TOUCH is the nondominant hand. Minimal pairs such as this one, created by differences in one feature only, exist for the features of hand shape and movement as well. Although the origins of these and other (but certainly not all) signs may have been holistic gestures, they have evolved into words in which each formational element is contrastive but meaningless in itself.

Two other defining properties of phonological systems exist in sign languages as well: constraints on the combination of phonological elements and rules that systematically alter their form. One phonological constraint on the form of a (monomorphemic) sign concerns the set of two-handed signs. If both hands are involved, and if both hands also move in producing the sign (unlike TOUCH, in which only one hand moves), then the two hands must have the same hand shape and the same (or mirror) location and movement (Battison, 1978). An example is DROP, shown in Figure 2B: Both hands move, and they are identical in all other respects as well. The second defining property, changes in the underlying phonological form of a sign, is exemplified by hand shape assimilation in compounds. In one lexicalized version of the ASL compound, MIND + DROP = FAINT, the hand shape of the first member, MIND, undergoes total assimilation to the hand shape of the second member, DROP, as shown in Figure 2.

Stokoe believed that hand shapes, locations, and movements cooccur simultaneously in signs, an internal organization that differs from the sequentiality of consonants and vowels in spoken language. Liddell (1984) took exception to that view, showing that there is phonologically significant sequentiality in this structure. Sandler (1989) further refined that position, arguing that the locations (L) and movement (M) within a sign are sequentially ordered, whereas the hand configuration (HC) is autosegmentally associated to these elements – typically, one hand

Figure 2 Hand configuration assimilation in the ASL compound. (A) MIND + (B) DROP = (C) FAINT.

configuration (i.e., one hand shape with its orientation) to a sign, as shown in the representation in **Figure 3**. The first location of the sign TOUCH in **Figure 1B**, for example, is a short distance above the nondominant hand, the movement is a straight path, and the second location is in contact with the nondominant hand. The hand shape of the whole sign is ✋ .

Under assimilation, as in **Figure 2**, the HC of the second member of the compound spreads regressively to the first member in a way that is temporally autonomous with respect to the Ls and Ms, manifesting the autosegmental property of stability (Goldsmith, 1979). The sequential structure of signs is still a good deal more limited than that of words in most spoken languages, however, usually conforming to this canonical LML form even when the signs are morphologically complex (Sandler, 1993).

Morphology

All established sign languages studied to date, like the overwhelming majority of spoken languages, have complex morphology. First, as shown in **Figure 2**, compounding is very common. In addition, some sign languages have a limited number of sequential affixes. For example, Israeli Sign Language (ISL) has a derivational negative suffix, similar in meaning to English *-less*, that was grammaticalized from a free word glossed NOT-EXIST. This suffix has two allomorphs, depending on the phonological form of the base, illustrated in **Figure 4**. If the base is two-handed, so is the suffix, whereas one-handed bases trigger the one-handed allomorph of the suffix.

Figure 3 The canonical form of a sign. From Sandler (1989).

Sign languages typically have a good deal of complex morphology, but most of it is not sequential like the examples in **Figures 3** and **4**. Instead, signs gain morphological complexity by simultaneously incorporating morphological elements (Fischer and Gough, 1978). The prototypical example, first described in detail in ASL (Padden, 1988) but apparently found in all established sign languages, is verb agreement. This inflectional system is prototypical not only because of the simultaneity of structure involved but also because of its use of space as a grammatical organizing property.

The system relies on the establishment of referential loci – points on the body or in space that refer to referents in a discourse – that might be thought of as the scaffolding of the system. In **Figure 5**, loci for first person and third person are established.

In the class of verbs that undergoes agreement, the agreement markers correspond to referential loci established in the discourse. Through movement of the hand from one locus to the other, the subject is marked on the first location of the verb and the object on the second. **Figure 6A** shows agreement for the ASL agreeing verb, ASK, where the subject is first person and the object is third person. **Figure 6B** shows the opposite: third person subject and first person object. The requirement that verb agreement must refer independently to the first and last locations in a sign was one of the motivations for Liddell’s (1984) claim that signs have sequential structure.

Although each verb in **Figure 6** includes three morphemes, each still conforms to the canonical LML form shown in **Figure 3**. The agreement markers are encoded without sequential affixation. Sign language verb agreement is a linguistic system, crucially entailing such grammatical concepts as coreference, subject and object, and singular and plural. It is also characterized by sign language-specific properties, such as the restriction of agreement to a particular class of verbs (Padden, 1988), identified mainly on semantic grounds (Meir, 2002).

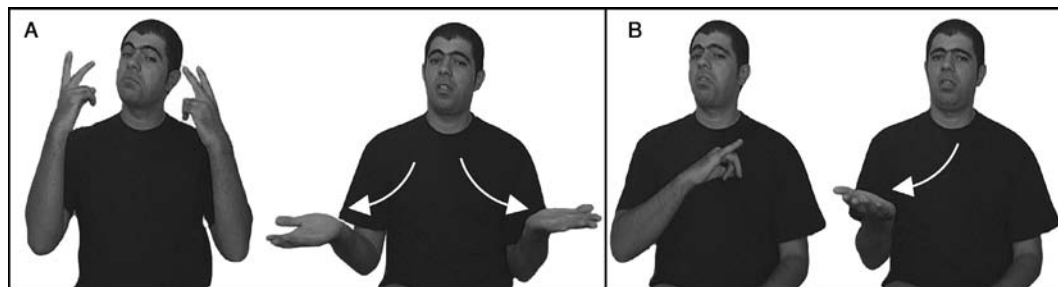

Figure 4 Allomorphs of an ISL suffix. (A) IMPORTANT-NOT-EXIST (without importance). (B) INTERESTING-NOT-EXIST (without interest).

Figure 5 Referential loci. (A) First person. (B) Third person.

Figure 6 Verb agreement. (A) 'I ask him/her.' (B) 's/he asks me.'

Another productive inflectional morphological system found across sign languages is temporal and other aspectual marking, in which the duration of Ls and Ms, the shape of the movement path, or both may be altered, and the whole form may be reduplicated, to produce a range of aspects, such as durational, continuative, and iterative (Klima and Bellugi, 1979). This system has templatic characteristics, lending itself to an analysis that assumes CV-like LM templates and nonlinear associations of the kind McCarthy (1981) proposed for Semitic languages (Sandler, 1989, 1990).

Figure 4 demonstrated that some limited sequential affixation exists in sign languages. However, the most common form of sign language words by far, whether simple or complex, is LML (setting aside gemination of Ls and Ms in the aspectual system, which adds duration but not segmental content). In fact, even lexicalized compounds such as the one shown in Figure 2 often reduce to this LML form. If movement (M) corresponds to a syllable nucleus in sign language, as Perlmutter (1992), Brentari (1998), and others have argued, then it appears that monosyllabicity is ubiquitous in ASL (Coulter, 1982) and in other sign languages as well. In the midst of a morphological system with many familiar linguistic characteristics (e.g., compounding, derivational morphology, inflectional morphology, and allomorphy), we see in the specific preferred monosyllabic form of sign language words a clear modality effect (Sandler and Lillo-Martin, 2005).

No overview of sign language morphology would be complete without a description of the classifier

Figure 7 Classifier construction in ASL.

subsystem. This subsystem is quintessentially 'sign language,' exploiting the expressive potential of two hands forming shapes and moving in space, and molding it into a linguistic system (Emmorey, 2003; Supalla, 1986). Sign languages use classifier constructions to combine physical properties of referents with the spatial relations among them and the shape and manner of movement they execute. In this subsystem, there is a set of hand shapes that classify referents in terms of their size and shape, semantic properties, or other characteristics in a classificatory system that is reminiscent of verbal classifiers found in a variety of spoken languages (Senft, 2002). These hand shapes are the classifiers that give the system its name. An example of a classifier construction is shown in Figure 7. It describes a situation in which a person is moving ahead, pulling a recalcitrant dog zigzagging behind. The  hand shape embodies an upright human classifier and the  hand shape a legged creature.

What is unusual about this subsystem is that each formational element – the hand shape, the location, and the movement – has meaning. That is, each has morphological status. This makes the morphemes of classifier constructions somewhat anomalous since sign language lexicons are otherwise built of morphemes and words in which each of these elements is meaningless and has purely phonological status. Furthermore, constraints on the cooccurrence of these elements in other lexical forms do not hold on classifier constructions. In Figure 7, for example, the constraint on interaction of the two hands described in the section on phonology is violated. Zwitserlood (2003) suggested that each hand in such classifier constructions is articulating a separate verbal constituent, and that the two occur simultaneously – a natural kind of structure in sign language and found universally in them, but one that is inconceivable in spoken language. Once again, sign language presents a conventionalized system with linguistic properties, some familiar from spoken languages and some modality driven.

Syntax

As in other domains of linguistic investigation, the syntax of sign languages displays a large number of characteristics found universally in spoken languages. A key example is recursion – the potential to repeatedly apply the same rule to create sentences of ever increasing complexity – argued to be the quintessential linguistic property setting human language apart from all other animal communication systems (Hausser *et al.*, 2002). Specifically, through embedding or conjoining, recursion can result in sentences of potentially infinite length. These two different ways of creating complex sentences have been described and distinguished from one another in ASL. For example, a process that tags a pronoun that is coreferential with the subject of a clause onto the end of a sentence may copy the first subject in a string, only if the string contains an embedded clause, but not if the second clause is coordinate (Padden, 1988). In example (1), the subscripts stand for person indices marked through verb agreement, and INDEX is a pointing pronominal form, here a pronoun copy of the matrix subject, MOTHER. (These grammatical devices were illustrated in Figures 5 and 6.)

- (1a) MOTHER SINCE _iPERSUADE_j SISTER
 _iCOME_i _iINDEX
 ‘My mother has been urging my sister to come
 and stay here, she (mother) has.’
- (1b) * _iHIT_j _iINDEX TATTLE MOTHER _iINDEX.
 ‘I hit him and he told his mother, I did.’

The existence of strict constraints on the relations among nonadjacent elements and their interpretation is a defining characteristic of syntax. A different category of constraints of this general type concerns movement of constituents from their base-generated position, such as the island constraints first put forward by Ross (1967) and later subsumed by more general constraints. One of these is the WH island constraint, prohibiting the movement of an element out of a clause with an embedded WH question. The sentence, *Lynn wonders [what Jan thinks]* is okay, but the sentence **It’s Jan that Lynn wonders [what — thinks]* is ruled out. Lillo-Martin (1991) demonstrated that ASL obeys the WH island constraint with the sentences shown in example (2). Given the relative freedom of word order often observed in sign languages such as ASL, it is significant that this variability is nevertheless restricted by universal syntactic constraints.

- (2a) PRO DON’T-KNOW [‘WHAT’ MOTHER
 LIKE].
 ‘I don’t know what Mom likes.’
 _____t

- (2b) MOTHER, PRO DON’T KNOW [‘WHAT’

 LIKE].
 * ‘As for Mom, I don’t know what likes.’

The line over the word MOTHER in (2b) indicates a marker that is not formed with the hands, in this case a backward tilt of the head together with raised eyebrows, marking the constituent as a topic (t) in ASL. There are many such markers in sign languages, which draw from the universal pool of idiosyncratic facial expressions and body postures available to all human communicators. These expressions and postures become organized into a grammatical system in sign languages.

A Grammar of the Face

When language is not restricted to manipulations of the vocal tract and to auditory perception, it is free to recruit any parts of the body capable of rapid, variegated articulations that can be readily perceived and processed visually, and so it does. All established sign languages that have been investigated use non-manual signals – facial expressions and head and body postures – grammatically. These expressions are fully conventionalized and their distribution is systematic.

Early research on ASL showed that certain facial articulations, typically of the mouth and lower face, function as adjectivals and as manner adverbials, the latter expressing such meanings as ‘with relaxation and enjoyment’ and ‘carelessly’ (Liddell, 1980). Other sign languages have been reported to use lower face articulations in similar ways. The specific facial expressions and their associated meanings vary from sign language to sign language. Figure 8 gives examples of facial expressions of this type in ASL, ISL, and British Sign Language.

A different class of facial articulations, particularly of the upper face and head, predictably cooccur with specific constructions, such as yes/no questions, WH questions, and relative clauses in ASL and in many other sign languages. Examples from ISL shown in Figure 9A illustrate a yes/no question (raised brows, wide eyes, and head forward), Figure 9B a WH question (furrowed brows and head forward), and Figure 9C the facial expression systematically

Figure 8 Lower face articulations. (A) ASL ‘with relaxation and enjoyment.’ (B) ISL ‘carefully.’ (C) BSL ‘exact.’

Figure 9 Upper face articulations. (A) yes/no question, (B) WH question, and (C) 'shared information.'

associated in that language with information designated as 'shared' for the purpose of the discourse (squinted eyes). Although some of these facial articulations may be common across sign languages (especially those accompanying yes/no and WH questions), these expressions are not iconic. Some researchers have proposed that they evolved from more general affective facial expressions associated with emotions. In sign languages, however, they are grammaticalized and formally distinguishable from the affective kind that signers, of course, also use (Reilly *et al.*, 1990).

Observing that nonmanual signals of the latter category often cooccur with specific syntactic constructions, Liddell (1980) attributed to them an expressly syntactic status in the grammar of ASL, a view that other researchers have adopted and expanded (Neidle *et al.*, 2000; Petronio and Lillo-Martin, 1997). A competing view proposes that they correspond to intonational tunes (Reilly *et al.*, 1990) and participate in a prosodic system (Nespor and Sandler, 1999). Wilbur (2000) presented evidence that nonmanuals convey many different kinds of information – prosodic, syntactic, and semantic. A detailed discussion can be found in Sandler and Lillo-Martin (2005).

Acquisition of Sign Language

Nowhere is the 'natural laboratory' metaphor more appropriate than in the field of sign language acquisition. This area of inquiry offers a novel and especially revealing vantage point from which to address weighty questions about the human capacity for language. Research has shown, for example, that children acquire sign language without instruction, just as hearing children acquire spoken language, and according to the same timetable (Newport and Meier, 1985). These findings lend more credence to the view, established by linguistic research on the adult system, that languages in the two modalities share a significant amount of cognitive territory; children come equipped for the task of acquiring language in either modality equally.

Studies have also shown that signing children attend to grammatical properties, decomposing and

overgeneralizing them as they advance through the system, sometimes even at the expense of the iconic properties inherent in that system. For example, even the pointing gesture used for pronouns (see Figure 5) is analyzed as an arbitrary grammatical element by small children, who may go through a stage in which they make mistakes, pointing at 'you' to mean 'me' (Pettito, 1987). Meier (1991) discovered counter-iconic errors in verb agreement (see Figure 6), similarly indicating that children are performing a linguistic analysis, exploring spatial loci as grammatical elements and not as gestural analogues to actual behavior and events.

Due to the social conditions surrounding its acquisition, sign language lends novel insight into two key theories about language and its acquisition: the critical period hypothesis and the notion that the child makes an important contribution to the crystallization of a grammar. Some deaf children are raised in oral environments, gaining access to sign language later in life. Studies comparing the ASL performance of early and late learners found that the age of exposure is critical for acquisition of the full grammatical system (Newport, 1990) and its processing (Mayberry and Eichen, 1991), providing convincing support for Lenneberg's (1967) critical period hypothesis. An untainted perspective on the child's contribution can be gained where the input to the child is simpler and/or less systematic than a full language system, as with pidgins (Bickerton, 1981). Researchers of the sign language that originated in the Nicaraguan school mentioned previously studied the communication system conventionalized from the home sign brought to the school by the first cohort of children. This system served as input to the second cohort of children younger than the age of 10 years who later arrived at the school. Comparing the language of the two cohorts, the researchers found that children make an important contribution: The second cohort of signers developed a significantly more structured and regular system than the one that served as their input (Kegl *et al.*, 1999; Senghas *et al.*, 2004).

Sign Language and the Brain

Broadly speaking, it is established that most spoken language functions involve extensive activity in specific areas of the left hemisphere of the brain, whereas much of visuospatial cognition involves areas of the right cerebral hemisphere. Therefore, the discovery that sign language, like spoken language, is primarily controlled by the left hemisphere despite its exploitation of the visuospatial domain is striking and significant (Emmorey, 2002; Poizner *et al.*, 1987). Various

explanations for left hemisphere dominance for language are currently on the table, such as the more general ability of the left hemisphere to process rapidly changing temporal events (Fitch *et al.*, 1997). This explanation has been rejected for sign language by some researchers on the grounds that sign language production is slower than that of spoken language (Hickock *et al.*, 1996). Whatever explanation is ultimately accepted, Emmorey (2002) and others have argued that similarities in the kind of cognitive operations inherent in the organization and use of language in the two modalities should not be ignored in the search.

Although most language functions are controlled by the left hemisphere, some do show right hemisphere involvement or advantage. With respect to sign language, there is evidence that the right hemisphere may be more involved in producing and comprehending certain topographic/spatial aspects of sign language, particularly those involving classifier constructions (Emmorey *et al.*, 2002). Although this result sits well with the known right hemisphere advantage for spatial processing, it is made even more interesting when added to discoveries of right hemisphere dominance for certain other spoken and sign language functions that may be related to the classifier system, such as processing words with imageable, concrete referents (Day, 1979; Emmorey and Corina, 1993). Findings such as these are an indication of the way in which sign language research adds important pieces to the puzzle of language organization in the brain.

Language Modality, Language Age, and the Dinner Conversation Paradox

A large body of research, briefly summarized here, attributes to sign languages, essential linguistic properties that are found in spoken languages as well (Sandler and Lillo-Martin, 2005). Also, like different spoken languages, sign languages are not mutually intelligible. A signer of ISL observing a conversation between two signers of ASL will not understand it. Although cross sign language research is in its infancy, some specific linguistic differences from sign language to sign language have already been described.

At the same time, there is a rather large group of predictable similarities across sign languages and, as Newport and Supalla (2000: 109) stated, “A long dinner among Deaf users of different sign languages will, after a while, permit surprisingly complex interchanges.” Here we find a difference between signed and spoken languages: One would hardly expect even the longest of dinners to result in complex interchanges among monolingual speakers of English

and Mandarin Chinese. Although it is clear that more differences across sign languages will be uncovered with more investigation and more sophisticated research paradigms, it is equally certain that the dinner conversation paradox will persist. Two reasons have been suggested for crosssign language similarities: the effect of modality on language structure and the youth of sign languages.

Modality Effects

Modality is responsible for two interwoven aspects of sign language form, both of which may contribute to similarities across sign languages: (i) an iconic relation between form and meaning, and (ii) simultaneity of structure. Because the hands can represent physical properties of concrete objects and events iconically, this capability is abundantly exploited in sign languages, both in lexical items and in grammatical form. Although spoken languages exhibit some iconicity in onomatopoeia, ideophones, and the like, the vocal–auditory medium does not lend itself to direct correspondence between form and meaning so that the correspondence in spoken language is necessarily more arbitrary.

Iconicity in Sign Language Leafing through a sign language dictionary, one immediately notices the apparent iconicity of many signs. An example is the ISL sign for BOOK, shown in Figure 10, which has the appearance of a book opening. Although clearly widespread, iconicity in sign language must be understood in the right perspective. Many signs are not iconic or not obviously motivated, among them the signs for abstract concepts that exist in all sign languages. Interestingly, even the iconicity of signs that are motivated is not nearly so apparent to nonsigners if the translations are not available (Klima and Bellugi, 1979). In addition, the presence of iconicity in sign language does not mean that their vocabularies are overwhelmingly similar to one another. In fact, although even unrelated sign languages have some overlap in vocabulary due to motivatedness,

Figure 10 An iconic sign: (ISL) BOOK.

their vocabularies are much more different from one another than one might expect (Currie *et al.*, 2002). Nevertheless, the kind of symbolization and metaphorical extension involved in creating motivated signs may be universal (Taub, 2001). For example, a bird is represented in ISL with a sign that looks like wings and in ASL with a sign that looks like a beak, and experience with this kind of symbolization in either sign language may make such signs easier to interpret in the other.

Simultaneity in Sign Languages Another modality feature is simultaneity of structure, alluded to previously. Some researchers have argued that constraints on production, perception, and short-term memory conspire to create simultaneity of linguistic structure (Bellugi and Fischer, 1972; Emmorey, 2002). Interestingly, iconicity also makes a contribution to simultaneity of structure, especially when one looks beyond the lexicon to grammatical forms of a more complex nature.

The hands moving in space are capable of representing events that simultaneously involve a predicate and its arguments (e.g., giving something to someone or skimming across a bumpy surface in a car) with a form that is correspondingly simultaneous. The result is verb agreement (exemplified in **Figure 6**) and classifier constructions (exemplified in **Figure 7**). Therefore, these structures, with particular grammatical properties, are found in all established sign languages that have been studied, leading to the observation that sign languages belong to a single morphological type (Aronoff *et al.*, 2005). Although the grammatical details of this morphology differ from sign language to sign language, the principles on which they are based are the same, and this similarity makes another welcome contribution at the dinner table.

The Role of Language Age

Recent work pinpoints the role of language age in the structure of sign language, indicating how age may be partly responsible for the impression that crosssign language differences are less abundant than is the case across spoken languages. It does so by comparing the type of morphology ubiquitously present in sign languages with a language-specific type (Aronoff *et al.*, 2005). This study noted that the form taken by the verb agreement and classifier systems in all established sign languages is similar (although not identical) due to the modality pressures of iconicity and simultaneity sketched previously, but that sequential affixes of the kind exemplified in **Figure 4** vary widely between the sign languages studied. Such affixes, arbitrary rather than iconic in form and limited in

number, develop through grammaticalization processes, and these processes take time. Given time, more such arbitrary, sign language-specific processes are predicted to develop.

The physical channel of transmission affects language in both modalities. Where sign languages are more simultaneously structured, spoken languages are more linear. Where spoken languages are mostly arbitrary, sign languages have a good deal of iconicity. However, none of these qualities are exclusive to one modality; it is only a matter of degree.

Sign Language: Morphology

T Johnston, Macquarie University, Sydney, Australia

© 2006 Elsevier Ltd. All rights reserved.

Morphology deals with the regular, minimal, meaning-bearing units in language – morphemes – which are words or parts of words. Morphemes can effect changes in meaning by signaling the creation of a new word or a change in word class (derivation), or by signaling grammatical information such as case, number, person, aspect, tense, etc., (inflection).

Individual signs in a signed language are the basic equivalent of words in a spoken language. Each signed language has a vocabulary of conventional lexical signs which are often monomorphemic. In the closely related Australian and British Sign Languages (Auslan and BSL, respectively), for example, none of the formational aspects of the sign *SISTER* has any separate meaning of its own (see *Sign Languages of the World*). See **Figure 1**.

The type of morphological processes commonly found in signed languages seems to be influenced by the fact that most lexical signs are monosyllabic or, at most, bisyllabic (Johnson and Liddell, 1986; Liddell, 1984; Sandler, 1995; Wilbur, 1993). Signed languages appear to favor simultaneous sign internal modification, rather than the concatenation of morphemes. This may be related to the fact that the larger size of the articulators in signed languages (the hands, arms, face, and body) means that each sign gesture takes more time to execute than each

spoken articulatory gesture (Bellugi and Fischer, 1972). If segments are added to a stem, producing a multisyllabic sign, processes of assimilation and deletion tend to restructure the resulting sign into a bisyllabic or monosyllabic one with simultaneously expressed morphemes.

This process is most clearly seen in the formation of new signs through compounding. In Auslan/BSL, for example, the sign *CHECK* derives from *SEE* and *MAYBE*. *SEE* has lost its outward movement with final hold and has incorporated the anticipated handshape of *MAYBE*, while *MAYBE* has lost its repeated twisting movement. The compound has a single syllable (Sutton-Spence and Woll, 1999). See **Figure 2**.

With the exception of prefixes in Israeli Sign Language (Aronoff *et al.*, 2000), the few affixes that have been identified in signed languages are all suffixes. Indeed, many appear to have grammaticized from one of the elements in erstwhile compounds. For example, a negative suffix *-NEG* can be attached to *AGREE* to derive the new sign *DISAGREE*, in Auslan/BSL. The affix appears to be a reduced form of an independent sign, which itself seems related to a gesture (meaning something like 'not know') shared with the hearing culture. A similar suffix (in both form and meaning) has been identified in a number of signed languages (Zeshan, 2006). See **Figure 3**.

Researchers have also identified a derivational process whereby stem signs for certain units that are enumerable (e.g., *TOMORROW*, *WEEK*) may incorporate numeral handshapes to create specific signs for

Figure 1 A monomorphemic sign. Reproduced from Johnston T & Schembri A (eds.) (2003). *The survival guide to Auslan: a beginner's pocket dictionary of Australian Sign Language*. Sydney: North Rocks Press with permission.

specific numbers of these units (e.g., IN TWO DAYS, TWO-WEEKS). See **Figure 4**.

Modification of the quality of the movement in a sign can also be used to derive new signs, such as BUSY from WORK (Auslan/BSL). A similar process derives NARROW-MINDED/PRUDISH from CHURCH in ASL, and this has been compared to templated morphology as found in Semitic languages (Fernald and Napoli, 2000). See **Figure 5**.

It is often difficult to clearly distinguish between stem modification or suprasegmental modification in signed languages. In many respects, modifying the movement parameter of a sign is akin to changing a vowel (a stem modification); however, in others, modifying for manner of movement is akin to tone (a suprasegmental modification). The derivation of nouns from verbs in some signed languages is a case in point.

Originally described in ASL (Supalla and Newport, 1978), this morphological process, in which nouns are derived from verbs by a sign-internal modification of movement, also has parallels in other signed languages. The continuous single movement found in the verb is modified to be restrained and tense, and often repeated, in the noun, as in the Auslan/BSL pair DOOR and OPEN-DOOR. See **Figure 6**.

However, typical exemplars in many signed languages overlap considerably in both form and

Figure 5 Derivation through movement modification. Reproduced from Johnston T & Schembri A (eds.) (2003). *The survival guide to Auslan: a beginner's pocket dictionary of Australian Sign Language*. Sydney: North Rocks Press with permission.

meaning, and the productivity of the derivational process appears influenced by underlying iconicity. Though it is to be expected that derivational paradigms in any language will be restricted and morpheme productivity limited, for some signed languages at least the degree of grammaticization of these modifications is as yet uncertain.

Morphemes and morphological processes can also signal the inflection of existing signs, adding grammatical information (e.g., marking for number, person, aspect, etc.) while maintaining the essential lexical meaning of the stem. Inflections in signed and spoken languages can be found on nominals or predicates (verbs and adjectives).

Inflection by concatenative affixation appears to be extremely rare in signed languages. One example is a nominal genitive suffix in Auslan which is used to signal possessive relationships between two nouns. This sign is not used as a free morpheme of any kind, but only as a suffix, as in MOTHER+GEN SISTER+GEN HUSBAND to mean 'mother's sister's husband.'

Data from a growing number of signed languages have shown that all of them exploit space and movement patterns inherent in sign formation to convey information regularly encoded in the inflectional systems of spoken languages. Indeed, the markings often appear to be in part phonologically conditioned.

For example, space will be exploited when a sign is not anchored throughout its production at a particular location on the body, or if its movement parameter is not specified for repetition.

These processes are exemplified in both nominal and verbal inflections. In nominal signs, inflection for plurality can be marked by repetition (often in different locations if the sign is not anchored). Spatial modifications can also signal topographical information about referents (e.g., a noun may be placed in the signing space to mean ‘thing-at-such-and-such-a-place’).

A basic tripartite division of ASL verb signs as plain, spatial, and agreeing (Padden, 1988) has been found to apply to signed languages to which the framework has been applied (with or without various modifications and reinterpretations).

For example, no sign language lacks the ability to modify the direction of the movement parameter of agreeing verbs so that the beginning and end points of these signs move between regions in the signing space associated with the *subject* (or the *agent*) and the *object* (or the *patient*) of the action. (Alternative interpretations of this phenomenon include those that assign *source* and *goal* as the underlying significance of these locations (Johnston, 1991; Meier, 1982).) The sign glossed as GIVE in many signed languages can have the meanings ‘I give you’ when moved from the signer to the interlocutor, or ‘you give me’ when moved from the interlocutor toward the signer, and ‘he/she gives him/her’ when moved between two (real or imaginary) third entities in the signing space. In spatial verbs the same mechanism is exploited to mark spatial and locative information. (Plain verbs are unable to exploit location and direction of movement in this way because they have a fixed place of articulation.) See Figure 7. For Padden and many linguists, the modifications on agreeing verbs are analyzed as non-concatenative affixes inflecting for person, while for other linguists the modifications indicate locations, depicting actions within a mental space representation of an event (Liddell, 2003).

A second related phenomenon in verb inflection refers to distribution and involves a ‘plural sweep’ in which the end point is moved in an arc through locations associated with referents or relocated and redirected at each in a series of repetitions, as in the modification of ASK to mean ‘ask all’ or ‘ask each.’ See Figure 8.

Similarly, modifications can be made to the movement parameter of verb signs to express a number of aspectual nuances. Researchers in many signed languages have identified similar patterns of movement modification, with similar meanings, as first described in ASL (Klima *et al.*, 1979). For example, similar patterns of cyclic and repeated movements also convey durational and continuative aspect (e.g., ‘ask repeatedly’). Aspectual and distributional modifications can also combine to create a morphologically complex multilayered pattern of modifications (e.g., ‘ask all repeatedly’).

Verbal modifications based on suprasegmental modifications involve nonmanual features such as facial expression. A large number of facial expressions have been identified across many signed languages. Two found in Auslan/BSL – ‘th’ (as if producing an interdental fricative) and ‘mm’ (a bilabial protrusion) – are examples also found in some other signed languages. The former implies lack of control or inattention, the latter implies relaxed normality and when co-articulated with DRIVE they mean ‘drive carelessly’ and ‘drive relaxed and normally’, respectively.

As with the derivation of nominals, the extent of the grammaticization of movement modifications inflecting for aspect and manner, and their obligatoriness, within many signed languages, is still yet to be determined, or, at minimum, appears to vary.

Though many signs are monomorphemic or bimorphemic, highly iconic lexical signs, of which there are significant numbers in any signed language, often have more than two identifiable morphemes – they are multimorphemic. Take the highly iconic sign DRINK/CUP (as if holding a cup to one’s mouth) which is found in many signed languages with a similar form

Figure 7 Inflection (‘person agreement’) through movement modification in the Auslan/BSL sign GIVE, and the Auslan sign HELP. Reproduced from Johnston T & Schembri A (eds.) and meaning. It consists of at least three morphemes: The handshape signifies holding a cup, the movement signifies turning a cup toward the mouth, and the location signifies the mouth.

Importantly, there are a significant number of signs produced in many utterances in any signed language which are neither lexical nor grammatical signs. They display a moderate to high degree of conventionality in the form and meaning of handshapes, while movements and locations appear to be drawn on particular representational exigencies of the moment. These signs are variously called classifier signs or polymorphemic signs.

Polymorphemic signs are used to convey a large amount of visual spatial information about participants in a situation (e.g., the size and shape and location of entities, how they may be handled, their position in space, and their path and manner of movement). In the following sign, the upright index finger represents a person, the palm the front of the body, the movement left to right the path, and the bobbing up and down movement a walking action. See Figure 9.

No signed language appears to lack these types of signs, and a considerable literature has been generated in an attempt to analyze them systematically in linguistic terms (Emmorey, 2003; Engberg-Pedersen, 1993; McDonald, 1982; Schick, 1990; Supalla, 1986). They can create monosyllabic polymorphemic signs which are unattested in spoken languages and which resist analysis into roots and listable morphemes. They remain a problem area for linguists (Schembri, 2003).

Original research into signed languages aimed to establish them as real languages with language-like characteristics. Subsequent research has aimed to establish the validity of linguistic universals that had been made on the basis of the study of spoken languages only, or to determine the impact of modality on language structure (e.g., Meier *et al.*, 2002).

PERSON-WALK-BY-FROM-RIGHT-TO-LEFT

Figure 9 A complex polymorphemic sign found in many signed languages. Reproduced from Johnston T & Schembri A (eds.) (2003). *The survival guide to Auslan: a beginner's pocket dictionary of Australian Sign Language*. Sydney: North Rocks Press with permission.

Another line of research seeks to acknowledge the degree to which signed languages are different from spoken languages. Depending on how the dynamics of spoken language are understood, these differences have been perceived as additional special characteristics peculiar to language in the visual-gestural modality, or as differences of degree only which have been occasioned by modality, e.g., some representational resources, such as space, are universally exploited in signed languages. For some linguists, the exploitation of a spatial and iconic morphology is seen as unique to signed languages but is nonetheless analyzed as part of a fully linguistic system of agreement (Aronoff *et al.*, 2000), for others it represents a fusion of elements of language and gesture (Liddell, 2003). For yet others, these face-to-face representational resources are recognized as available to *all* language users – even if they are underexploited in spoken languages and are ignored in most grammars. They saturate the lexico-grammar of signed languages because they are always available in languages that are embodied and, of necessity, always in view (Johnston, 1992).

It is as yet unclear if all of the phenomena of sign language morphology can be properly dealt with as 'linguistic,' narrowly defined. Insofar as it may contribute to the redefinition of what is 'language' or what is properly 'linguistic,' the short history of the study of signed languages belies its relative importance to linguistics.

Sign Languages of the World

The Current State of Knowledge

After more than 30 years of systematic sign language research, most sign languages throughout the world still remain scarcely documented or even entirely unknown. We can only estimate how many sign languages exist in the world, and we are even less sure about how they may be grouped into language families. A few sign languages in industrialized countries are reasonably well documented, whereas little is known about sign languages in other areas of the world, such as sub-Saharan Africa, Southeast Asia, and the Arab world. Nevertheless, increasingly more

information has been coming to light during the past decade, although we are still far away from systematic linguistic documentation in most cases.

Based on what we know to date, it is fairly clear that the sign languages of the world number in the hundreds rather than in the thousands and are thus much fewer in number than their spoken counterparts. For all we know, they are also much younger than spoken languages, although other forms of gestural communication are as old as humanity itself. The latest edition of the *Ethnologue* (Grimes, 2004) lists approximately 100 living sign languages. However, there are many omissions and errors in this list, so the actual number of sign languages in the world is likely to be at least three or four times greater.

The maximum documented age for a sign language is slightly more than 500 years for the sign language

used at the Ottoman court in Turkey (Miles, 2000). There is no reason why the large cities of antiquity more than 2000 years ago should not have had groups of sign language users, but we do not have any reliable sources for these times. On the other hand, it is quite unlikely that communities of sign language users as we know them today would have existed even earlier. Only after urbanization had created reasonably large populations could critical numbers of deaf people theoretically have come together to use a sign language.

For many known sign languages, there is more or less detailed anecdotal evidence of historical links with other sign languages. These links may have to do with colonial history, migration of populations, or, in more recent times, the establishment of deaf education with the help of another country. The principal difficulty lies in determining whether a particular relationship between sign languages is genetic in nature (i.e., in how far we can speak of a sign language family) or whether we are dealing with a language contact situation. Attempts at addressing this issue have been largely unsuccessful, and no theoretically sound method of investigating historical relationships between sign languages is available.

In recent years, increasingly more sign languages are beginning to be documented. A first step is usually the compilation of basic vocabulary in word lists (pairing a word and a picture of a sign), which are often wrongly called 'dictionaries' (see **Figure 1**). During the past decade, these and other developments have resulted in a situation in which it is now possible to systematically compare linguistic structures across a much wider range of sign languages than in the past. The newly emerging field of sign language typology is concerned with the issue of how to systematize this new knowledge in a theory of variation across sign languages.

Sociocultural and Sociolinguistic Variables

Signed communication occurs in a variety of situations. This article is concerned exclusively with natural full-fledged sign languages that are the primary languages of their users. We are not concerned with artificially created sign systems such as 'Manually Coded English,' 'Signed Japanese,' and 'Dutch in Signs,' which have been invented for educational purposes with the aim of mirroring spoken language structures 'on the hands'. We are also not concerned with secondary sign languages that are used in communities where the usual mode of communication is through a spoken language but where signed communication plays a supplementary role for certain

purposes, such as conditions of speech taboo. Rather, the sign languages we are interested in involve groups of deaf people for whom the sign language is the primary means of communication.

The first sign languages that were documented in detail from the 1970s onwards are used by communities of deaf people in urban settings. These are minority languages in which most of the users are deaf and there is constant language contact with the surrounding spoken/written language of the majority culture of hearing people. This situation is well described and occurs in urban areas in all regions of the world.

However, sign languages also exist in an entirely different sociocultural setting that is less well documented but highly significant for cross-linguistic comparison. These sign languages are used in village communities with a high incidence of hereditary deafness. Village-based sign languages arise because deaf individuals have been born into the village community over several generations, and therefore a sign language has evolved that is restricted to the particular village or group of villages. These sign languages are typically used by the whole village population no matter whether deaf or hearing, and in this sense, they are not minority languages, nor do they face any linguistic oppression. They have developed in isolation from other sign languages and are not used in any educational or official context. Deaf people are fully integrated into village life and may not be considered to be 'disabled' in any sense (Branson *et al.*, 1999). The existence of village-based sign languages has been reported from places as diverse as Bali, Ghana, Thailand, Mexico, an Arab Bedouin tribe in Israel, and a native Indian tribe in the Amazon, but their linguistic documentation is only just beginning. These languages have the potential to call into question many of the general assumptions that were made previously about the structure of sign languages.

Some village-based sign languages are already endangered and have not been documented in detail. As the larger, urban sign languages move in through formal education and the media, these small, locally restricted sign languages face similar pressures as their spoken language counterparts (*see Endangered Languages*). Similarly, sign languages in some developing countries have been under pressure from foreign sign languages, as in many African countries. In places where the deaf community is very large and the indigenous sign language has had time to develop on its own, it is relatively immune to foreign influences, as is the case in China and in the Indian subcontinent.

Despite similarities with respect to language endangerment, the life cycle of sign languages also differs from that of spoken languages in that new sign languages continuously emerge throughout the world,

as most famously documented in Nicaragua (Kegl *et al.*, 1999). Throughout the world, urbanization and the spread of special education for the deaf create new deaf communities with newly emerging sign languages. The stage of a sign language's life cycle is an important consideration for comparing the structures of sign languages.

Relationships between Sign Languages

For a number of individual sign languages as well as groups of sign languages, the notion of sign language family has been proposed, based on known facts about their relationship with each other. For example, it is well-known that sign language was brought to New Zealand and Australia from the United Kingdom, and therefore these three sign languages make up the 'British Sign Language family.' For different historical reasons, the Japanese Sign Language family includes sign languages in Taiwan and Korea, both of which had been under Japanese occupation. In cases in which one and the same sign language-using community seems to have split and subsequently developed independently from each other, the traditional family tree model can be applied, and the shared history is visible and interpretable. Sign languages in Australia, New Zealand, and the United Kingdom are still mutually intelligible to a large extent and share most of their vocabulary, to the extent that it is doubtful whether they should not be classified as dialects of one and the same language. Sign languages in Korea, Japan, and Taiwan all share a peculiar grammatical mechanism of gender marking, with the thumb indicating male and the little finger female gender as formative elements in complex signs (see Figure 2). This feature is not found in any other known sign language and, together with other factors, makes a strong case for positing a shared history of this sign language family.

However, the situation is usually not so clear-cut. In most cases, it is impossible to determine whether similarities between two sign languages are the result of a genetic relationship or the result of language contact. Instead of the 'pure' kind of family tree relationship, a more common type of relationship between two sign languages involves various kinds of language contact situations, language mixing, and creolization. For example, American Sign Language is said to have arisen in a creolization process, where Old French Sign Language came in contact with indigenous sign varieties, resulting in a new language with input from both of these sources. This kind of relationship cannot be considered genetic in the usual sense of the term.

In many cases, there is more or less clear historical evidence of relationships between sign languages. This may be related to colonial history so that, for instance, sign language communities in the Indian subcontinent use a two-handed manual alphabet as in British Sign Language. However, actual historical documentation of how this came to be the case is lacking, there are very few meaningful similarities in the vocabulary and grammar of the two sign languages, and there is thus no evidence for including Indo-Pakistani Sign Language in the British Sign Language family. Another common factor in linking two sign languages often involves the establishment of educational facilities for the deaf. For instance, the sign language in Brazil is said to have its root in French Sign Language because a deaf Frenchman established the first school for the deaf in Brazil, and Swedish Sign Language was similarly brought to Finland. We find this kind of link between many African countries and one or more Western 'source' sign languages (Schmaling, 2001). American Sign Language (ASL) has had a major impact on deaf communities in other countries, such as Thailand, the Philippines, Uganda, Zambia, Ghana, Malaysia, and Singapore,

Figure 2 Gender marking in South Korean Sign Language: SCOLD(someone), SCOLD(me), SCOLD(a male person), SCOLD(a female person).

and it is often unclear whether the sign languages used in these countries should be considered dialects of ASL, descendants of ASL in a family tree of languages, ASL-based creoles, or independent sign languages with extensive lexical borrowing from ASL. To the extent that indigenous sign languages already existed in these countries and secondarily came under the influence of a foreign sign language, the relationships between them are not genetic in the usual sense but are instances of language contact.

This kind of problem is not unknown for spoken languages but is aggravated by a number of complicating factors in the case of sign languages. First, the familiar historical-comparative method that is used to determine language families and reconstruct older forms of source languages has never been applied to sign languages. No process of regular sound change has been identified, and the comparison of morphological paradigms is often compromised because the forms in question are iconically motivated. Vocabulary comparisons are highly unreliable, and there seems to be a considerable ‘baseline level’ of iconically determined lexical similarity even between unrelated sign languages (Guerra Currie *et al.*, 2002). The first family trees that were proposed for sign languages were based on historical evidence and lexical similarities, and later attempts at using glottochronology on the basis of word list comparisons (Woodward, 1993, 2000) are similarly unreliable.

Another complicating factor in many cases is the uncertainty about whether or not there were indigenous sign varieties before the influence of a foreign sign language set in and, if so, what the linguistic status of this signed communication might have been. It is possible that in a particular region, limited home sign systems came in contact with a foreign full-fledged sign language, resulting in a new sign language in a process that has no counterpart among spoken languages. Finally, the lack of any historical records makes it difficult to directly test and evaluate any proposed historical relationship between sign languages. In the absence of any sound methodology for establishing sign language families, the issue of how one sign language is related to another one usually remains unresolved.

Grammatical Similarities and Differences across Sign Languages

Over time, sign language linguists have come to expect certain features in the structure of sign languages that have been shown to occur with great regularity in most or all sign languages known and described so far. Accordingly, there are attempts at accounting for these putative sign language universals on the basis of

their visual-gestural modality. For instance, sign languages offer the possibility of using spatial grammatical mechanisms by virtue of being three-dimensional languages, and therefore they tend to use movement modifications to express aspectual distinctions or to use movement direction to code verb agreement. Since the articulators in sign language are larger and slower than in a spoken language, sign languages tend to mark grammatical functions in a simultaneous rather than a sequential fashion; therefore, they use nonmanual behaviors such as facial expressions to mark sentence types (questions, negation, and subordination), and they use complex signs with numeral incorporation (e.g., a single complex sign meaning ‘three months’) (*see Sign Language: Morphology*). It has been claimed that sign languages are similar in the kinds of complex simultaneous morphology just mentioned but differ from each other in sequential morphology such as clitics and affixes, with sequential morphology being comparatively rare in sign languages (Aronoff *et al.*, 2000).

Most of these generalizations about the similarities between sign languages are based on investigations of a limited number of languages, mainly in Europe and North America. The picture changes somewhat when examining a larger range of the world’s sign languages. Although the previous observations are indeed true of many sign languages throughout the world, this is only part of the story. First, some sign languages do not show the ‘expected’ types of structures. Two unrelated village-based sign languages, in Bali and Israel, do not show an elaborate system of spatial verb agreement as is familiar from other sign languages. Another village-based sign language in Ghana does have spatial verb agreement but does not use the so-called ‘classifier’ hand shapes to refer to categories of moving persons, animals, and vehicles. Given that village-based sign languages have developed in isolation from any other sign language and exist under very different sociolinguistic conditions, it is not unexpected to find important differences in their structures in comparison with urban sign languages.

The range of possible structures in sign languages expands considerably when we consider non-Western, lesser-known sign languages. The gender marking system in the Japanese Sign Language family represents one such example. Sign language varieties in China also show many particularities that are not familiar from documented Western sign languages. Chinese Sign Language varieties include so-called ‘character signs,’ a particular type of borrowing in which the shapes and movements of the hands imitate the whole or part of words from the Chinese writing system (*see Figure 3*). Both northern and southern

Figure 3 Character signs in Chinese Sign Language.

Figure 4 Chinese Sign Language signs with “little finger” negative morpheme: DEAF and TASTELESS.

sign language varieties in China also make use of a productive mechanism of negation in which negative signs are marked by an extended little finger and the positive counterparts have an extended thumb (see **Figure 4**). Finally, question words for quantifiable concepts include one or two open hands with finger wiggling as part of complex signs, forming a large paradigm of interrogatives. The study of a greater range of sign languages thus reveals a large number of previously undocumented grammatical structures, just as the study of ‘exotic’ spoken languages did in earlier stages of spoken language linguistics.

Other structural differences between sign languages are more subtle and only come to light after systematic investigation. Typologically oriented studies across sign languages exist for a limited number of grammatical domains (for pronouns, see McBurney, 2002; for questions and negation, see Zeshan, 2004a, 2004b). Such studies show that the degree of structural differences between sign languages may be considerable but is unevenly distributed across different parameters of investigation. For example, sign languages differ as radically as spoken languages with respect to the set of their possible question words. A sign language may have only a single question word, as in certain dialects of Indo-Pakistani Sign

Language (see **Figure 5**), or more than a dozen, as in Hong Kong Sign Language. On the other hand, the facial expressions accompanying questions tend to be very similar across unrelated sign languages, with eye contact, forward head position, and eyebrow movement as prominent features. Understanding the reasons for these patterns is important for building a theory of typological variation across sign languages.

Another important result from comparative studies is that certain sign language forms may look very similar superficially but in fact have very different properties. For instance, in a broad range of 38 sign languages throughout the world (see **Figure 6**), it has been found that in each case, negation can be expressed by a side-to-side headshake (Zeshan, 2004a). However, the grammatical constraints governing the use of headshake negation in fact differ greatly across sign languages. Whereas in some sign languages, such as in the Scandinavian region, headshake negation is a primary negation strategy and may often be the only instance of negation in the clause (Bergman, 1995), other sign languages, such as in Japan and Turkey, obligatorily use a manual negative sign with or without headshake negation as a secondary accompaniment. Sign languages in the eastern Mediterranean region (Greece, Turkey, and neighboring Arab countries) additionally use a single backward head tilt for negation that has not been found in any other region of the world (Zeshan, 2002).

It can be assumed that the significance of many possible parameters of variation across sign languages has not been recognized. For example, mouth movements deriving from a silent representation of spoken words, so-called ‘mouthing,’ carry an important functional load in some sign languages (e.g., in Germany, The Netherlands, and Israel) but are functionally largely irrelevant in Indo-Pakistani Sign Language (Boyes Braem and Sutton-Spence, 2001). The presence or absence of contact with literacy may be another important factor, evidenced by the fact that not all sign languages use an indigenous manual alphabet for fingerspelling.

Figure 5 Combinations with the Indo-Pakistani Sign Language question word (WH): PLACE+WH “where”, TIME+WH “when”.

Figure 6 Sign languages represented in the typological survey on questions and negation.

Future Developments

The dynamics of developments throughout the world with respect to sign languages and their documentation carry considerable momentum. Some sign languages are endangered, whereas others are expanding in geographical spread and contexts of use, and some are only just being created by new communities of users. Forces such as intensive contact between sign language and spoken language, as well as between one sign language and another, and the move toward official recognition for sign languages and the deaf communities that use them rapidly change and reshape the makeup of many sign languages worldwide. It is a continuous challenge

for sign language linguistics to keep up with these developments and put together an increasingly detailed picture of linguistic diversity among the world’s sign languages.

Sindhi

J Cole, University of Illinois at Urbana-Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Sindhi is an Indo-Aryan language with its roots in the lower Indus River valley. It takes its name from the Indus River, known in earlier times as the Sindhu. Today Sindhi is spoken in the province of Sindh, Pakistan, where it is recognized by the government as the official language of the province, home to an estimated 30–40 million people (projected from 1981 census data). Nearly half of the population of Sindh lives in rural areas, where Sindhi is the primary language. In the urban centers of Sindh, Sindhi competes for status and speakers with Urdu (the national language of Pakistan) and, increasingly, English. Sindhi

is also spoken by about 2.5 million people in India, including major communities in Gujarat, Mumbai, and Pune, where immigrants from Sindh relocated after the 1947 partition of India and Pakistan. Beyond the Indian subcontinent, Sindhi is spoken by large diaspora communities in the United Kingdom and the United States, and around the world.

Language History

Sindh is the site of the ancient Harappan civilization of the lower Indus River valley. A case can be made that remnants of Harappan culture are evident in classical Sindhi folklore and religious rituals, which raises the question of a possible linguistic link between Sindhi and the Harappan language. Unfortunately, there is little evidence on which to determine the

linguistic stock of the Harappan language, the ancient script is as yet undeciphered, but a prevailing theory suggests a Dravidian origin. This theory points to the presence of the Dravidian language Brahui, spoken in the northwestern Pakistani province of Baluchistan, as a remnant of a broader Dravidian region in the subcontinent in earlier times. This possible link to an ancient Dravidian language of the Harappans has led some scholars to claim a Dravidian origin for Sindhi. This minority view, however, clashes with a substantial body of linguistic evidence for an Indo-Aryan origin of Sindhi.

The earliest historical reference to Sindhi is in the *Nātyaśāstra*, a dramaturgical text that was written between 200 B.C. and 200 A.D. Evidence for Sindhi as a written language dates to a translation of the Islamic *Qur'an* in 883 A.D., followed a century later by a Persian translation of the ancient Indian religious epic *Mahābhārata* taken from a language thought to be Old Sindhi. Dating the emergence of Sindhi in the evolution of Indo-Aryan is a matter of some controversy. Various theories, ably summarized by Khubchandani (2000), trace Sindhi to the Vṛācaḍa Apabhramśa or to an earlier pre-Vedic Prakrit language. Although Trumpp (1872), in his authoritative Sindhi grammar, describes Sindhi as a more 'pure Sanskritical' language compared to the other modern Indo-Aryan languages, Sindhi undeniably reveals the impact of its long history of contact with speakers of other languages.

Sindh has succumbed to foreign rule many times over a history of 2500 years and, much like English, has accumulated linguistic features and vocabulary from the languages of its foreign rulers. In pre-Muslim history, from the 6th century B.C. through the 1st century A.D., Sindh was invaded by a succession of Achaemenian, Greek, Mouryan, Scythian, and Persian rulers, including Alexander the Great (329–324 B.C.). After a brief period of rule by local dynasties, the Arab invasion in 711 A.D. initiated the Muslim period and the heavy influence of Persian on Sindhi with numerous lexical borrowings. Following a period of rule by local dynasties from the 11th through the mid-19th century, Sindh joined the British Empire in 1843. The influence of English on Sindhi, especially through lexical borrowings, began at that time and continues in the present, and is second only to Persian (Western Farsi) in its impact on the language. The result of language contact in all these periods of foreign rule is a Sindhi lexicon with diverse etymological bases and multiple cognate forms, which is further complicated by an exceptional number of irregular verbal inflections, and by the expansion of the sound inventory to include several Perso-Arabic sounds not native to Indo-Aryan.

Related Languages and Dialects

Among the languages spoken in the region today, Sindhi is closely related to Sirāikī (Saraiki), spoken north of Sindh province, and to Kachchhī (Kachchi), spoken in the Kachchh region of Gujarat, along the border between Pakistan and India. Grierson's (1919) survey listed five regionally defined Sindhi dialects, with Vicholī ('Central') as the standard variety. Contemporary dialectal work has been carried out by Khubchandani (1962–1963) and Rohra (1971) on Kachchhī (also spelled Kachhi, Kachchhi). Bughio's (2001) sociolinguistic study of the urban and rural Vicholī varieties is the only work since Grierson to deal with Sindhi dialect variation within Pakistan, and opened the door for promising future investigation.

Linguistic Features

Sound System

Sindhi and the neighboring languages Sirāikī and Marwari are distinct among Indo-Aryan languages for their use of the glottal implosive stops /b, d, ɟ, g/, which derive from Middle Indo-Aryan geminate voiced stops in medial position and single voiced stops in initial position. In other respects, the sound inventory of Sindhi is typical of Indo-Aryan, with a full series of voiceless, voiced, aspirated, and voiced aspirated stops and nasal stops at five places of articulation (see Table 1). Alongside the alveolar rhotic tap [ɾ] there is a retroflex tap [ɽ]; but unlike [ɾ], the retroflex tap is restricted to intervocalic position, where it can be considered the positional variant of the retroflex stop [ɽ]. Retroflex [ɽ] occurs intervocalically only in a few English loan words, where it corresponds to the English alveolar [d], as in *loḍiṅga* 'truck' and *reḍiyo* 'radio' (from English *loading*, *radio*). Sindhi has incorporated a number of consonants from Persian, including the well-established sounds /f, v, ʃ, z, ʒ/, along with /q, ɣ/, which are not typically used except by urban, educated speakers for whom they are arguably reinforced by their stable presence in Urdu.

Sindhi has the standard Indo-Aryan vowel inventory with ten vowels that can be grouped in five long–short pairs: /i, iː, e, eː, u, uː, o, oː, a, aː/. The short mid vowels are subject to dialectal variation or merger (discussed below). Long vowels can occur with contrastive nasalization; compare the final long nasal vowels in *samhoː̃* 'in front of' and *vitʰuː̃* 'scorpion', with the final long oral vowels in *sanhoː* 'thin' and *kaduː* 'gourd'. Phonetically nasal short vowels occur in the context of a following tautosyllabic nasal consonant, e.g., *āmbu* 'mango', but can also occur in an open syllable preceding or following /h/, where they

Table 1 The consonants of Sindhi

| | Labial | Dental | Alveolar | Post-alveolar | Palato-alveolar | Velar | Glottal |
|-----------|--------------------------------------|--------------------------------------|----------|--|--|--------------------------------------|---------|
| Stop | p b p ^h b ^h | t d t ^h d ^h | | ṭ ḍ ṭ ^h ḍ ^h | | k g k ^h g ^h | |
| Implosive | ɓ | | ɗ | | ʃ | ʒ | |
| Affricate | | | | | tʃ dʒ tʃ ^h dʒ ^h | | |
| Nasal | m | | n | ɳ | ɲ | ŋ | |
| Fricative | f | | s (z) | | (ʃ) | (x ʁ) | h |
| Rhotic | | | r | (t) t ^h | | | |
| Lateral | | l | | | | | |
| Glide | ʋ | | | | y | | |

contrast with oral short vowels. Compare the short nasal vowels in *mūbhū* ‘mouth’, *jīhī* ‘who/relative pronoun’ with the short oral vowels flanking /h/ in *māhalu* ‘palace’, *subahu* ‘morning’.

Sindhi syllable structure allows for at most one consonant to appear in the onset and coda position (CVC). Consonant clusters (CC) occur word medially, as in CVC.CV *kursi:* ‘chair’. With a few loanword exceptions, Sindhi words must end in a vowel. Short vowels in word-final position are extremely reduced, though grammatically important as markers of noun number, gender and case. Vowel-initial syllables may occur initially and medially, and in the latter case may give rise to word-internal vowel sequences (hiatus), as in *b^ha:fai:* ‘brother’s wife’. Hiatus sequences never occur with identical vowels.

There are several features of Sindhi pronunciation that are subject to dialectal variation, distinguishing the speech of rural, uneducated, or older speakers who represent an older variety of Sindhi, from urban, educated (i.e., literate) or younger speakers, whose speech is more noticeably influenced by Urdu, Hindi, and English pronunciation patterns. Three dialectal features described by Bughio (2001) are as follows. The short vowels /e, o/ are typically merged with their long counterparts in the old variety, resulting in [e, o] while new variety speakers more frequently keep them distinct, producing long monophthongs [e, o] and short diphthongs [ai, au] or lax vowels [ɛ, ɔ]. The diphthong realization is typical of Muslim new variety speakers, and the lax vowels are typical of Hindu new variety speakers. This distinction based on religious affiliation reflects in part the separation of Hindu and Muslim communities since the 1947 partition of India and Pakistan, and the maintenance of diphthongs in Arabic loan words (borrowed through Persian) in the speech of both Sindhi and Urdu-speaking Muslims. Old and new varieties of Sindhi are also distinguished by the frequent deletion or total loss of the word-final short vowels in the new varieties. The third dialectal feature in

Sindhi is the pronunciation of the retroflex stops /ṭ, ḍ, ḍ^h/ as stop-rhotic clusters [ṭr, ḍr, ḍ^hr] in the old varieties.

Morphology

Sindhi has a rich system of nominal and verbal morphology, with regular paradigms of declension and conjugation that exist alongside a remarkably high number of exceptional forms. Nouns, adjectives, and pronouns are marked for number, gender, and case. The gender class of the noun is in most cases marked by the final vowel, and number and case marking are expressed through a combination of stem alteration and final vowel suffix. Examples of nominal declension are shown with paradigms for the masculine noun ‘boy’ and feminine noun ‘table’ in **Table 2**.

Cases other than the ones shown in **Table 2** are marked through the use of a postposition following the noun in the oblique singular form, for example *g^bara k^be* ‘to the house’ (dative), *g^bara k^bā:* ‘from the house’ (ablative), *g^bara sā:* ‘with the house’ (comitative), *g^bara mē:* ‘in the house’ (locative), *g^bara jo:* ‘of the house’ (genitive). The genitive postposition is unique in that it is declined like an adjective, agreeing with the possessed noun in number, gender and case, as in (1):

- (1) tʃ^hokire ja:
 boy.MASC.sing.OBL GEN.MASC.pl.NOM
 kita:ba
 book.MASC.pl.NOM
 ‘the boy’s books’
 tʃ^hokire ji:
 boy.MASC.sing.OBL GEN.FEM.sing.NOM
 ʃili:
 cat.FEM.sing.NOM
 ‘the boy’s cat’

Sindhi verbs are marked for aspect, tense, mood, and concordance (gender and number) through a complex system of modification of the verb stem, which may in addition be followed by a modal and

Table 2 Nominal declensions for masculine and feminine nouns

| | | Nominative | Oblique | Ablative | Vocative |
|---------|----------|------------------------|-------------------------|---------------------------|------------------------|
| 'boy' | Singular | tʃ ^h okiro: | tʃ ^h okire: | tʃ ^h okirā: | tʃ ^h okira: |
| | Plural | tʃ ^h okira: | tʃ ^h okirani | tʃ ^h okiraniā: | tʃ ^h okira: |
| 'table' | Singular | meza | meza | mezā: | meza |
| | Plural | mezū: | mezuni | mezuniā: | mezū: |

Table 3 Example verb forms based on the root *lik^h*-‘write’

| | | |
|------------------------|-------------------------------------|-----------------------------|
| Present unspecified | lik ^h e t ^h o | ‘he writes’ |
| Definite future | lik ^h ando | ‘he will write’ |
| Present habitual | lik ^h ando a:he | ‘he writes (habitually)’ |
| Present continuous | lik ^h i: rahiyo a:he | ‘he is writing’ |
| Unspecified perfective | lik ^h iyō | ‘he wrote’ |
| Subjunctive perfective | lik ^h iyō huje | ‘he may have written’ |
| Imperative | lik ^h u | ‘Write!’ (familiar) |
| | lik ^h o | ‘Write!’ (polite) |

an auxiliary verb. These elements combine in various ways to produce 17 distinct finite verb forms, and six nonfinite verb forms that function as nominal, adjectival, and adverbial participles. Each finite and nonfinite verb form can undergo further modification of the verb stem to express voice (active/passive) and valence (transitive/causative) distinctions. Several finite forms of the verb *lik^hanu* ‘to write’, all expressing masculine, singular concordance, are illustrated in Table 3.

Syntax

The pragmatically neutral word order in Sindhi is Subject-Object-Verb, but the order of these major constituents can be changed to put a phrase with Topic focus at the front of the sentence. Within phrases, the head element always occurs at the end, as in the noun phrase and verb phrase examples in (2):

- (2) hi:za nand^hri: tɔpi:
 this small hat
 ‘this small hat’
- ama: k^he tʃi:t^hi: lik^hi:
 mother DAT letter wrote
 ‘wrote a letter to mother’

The verb typically agrees with a nominative case-marked subject, as in

- hu:za atʃe t^hi:
 she-NOM come-3sing aux.FEM
 ‘she comes’.

An ‘experiencer’ subject of a verb expressing physical state, psychological state, or kinship is marked with the dative postposition, as in

huna k^he ʃuk^hi laɟi:
 he-OBL. DAT hunger-FEM strikes-FEM.sing.
 ‘he is hungry’.

Sindhi has the split-ergative agreement pattern found in other Indo-Aryan languages, whereby in the perfective aspect the subject of a transitive verb is marked for oblique case, and the verb agrees with a nominative (inanimate) object if present, and otherwise displays a default agreement (3sing.MASC).

Linguistic Works on Sindhi

Among published grammatical works on Sindhi, there are several grammars in the Sanskritic tradition, including Stack (1849), Trumpp (1872), and a section in Grierson’s *Linguistic survey of India* (1919). Contemporary linguistic studies include instrumental phonetic studies (Nihalani, 1986, 1995), sociolinguistic and dialect studies (Rohra, 1971; Bhugio, 2001), and contemporary grammatical analysis (Khubchandani, 1961). Khubchandani (2000) presents a comprehensive bibliography of works on Sindhi from 1947–1967.

Sinhala

J W Gair, Cornell University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

General

Sinhala (Sinhalese, Singhalese) is the first language of the majority in Sri Lanka, spoken by approximately 75% of the island's population (approximately 20 million in 2004) and thus has about 15 million first language speakers. It was declared the only official language of the country in 1956, but the status of official language was extended to the main minority language, Tamil, in 1987, with English as a link language. Sinhala belongs to the Indo-Aryan family and is thus related to languages of Northern India such as Hindi-Urdu, Panjabi, Bengali, and Marathi, and ultimately through Indo-European to English and the major Western European languages. Within Indo-Aryan, its closest relative is Dhivehi (Maldivian) of the Maldivian islands (also on Minicoy, where it is known as Mahl) with which it forms a southern sub-group. These two languages have been isolated from their sister North Indian languages for over two millennia and have developed special characteristics of their own, many of them shared, though the languages are mutually unintelligible. They have also been significantly influenced by the neighboring Dravidian languages, particularly Tamil-Malayalam. One common Sinhalese Buddhist tradition states that the language was brought to the island from northeast India, on the date of the final passing of the Buddha (544–543 B.C.E. in that tradition) though there are competing accounts. In any event, there are Sinhala inscriptions from the third and second centuries B.C.E. already showing changes distinguishing it from its sisters in India, most notably the complete loss of the aspirated consonant series, so that a date around the middle of the first millennium or shortly thereafter is not unreasonable. The place of origin has been disputed by serious scholars, one problem

being that the time of separation predates the major changes that differentiate the Indian Indo-Aryan dialects. Recent work on historical phonology, however, does give some evidence for a generally eastern origin, along with dialect admixture.

The extant literature in Sinhala dates from the 9th–10th centuries, but it is clear from Pali texts and later references that there was an earlier body of works that was lost due to internal turbulence. Fortunately, there is an epigraphical record from the 3rd–2nd centuries B.C.E. on, so that we have a continuous record of the language from that time, an asset unmatched in any other modern Indo-Aryan language. The literary legacy is rich. Not surprisingly, given the cultural history of the island, much of it is Buddhist in content, encompassing both prose and poetry, but there is a flourishing current literary scene in virtually all genres, including poetry, novels, short stories, criticism, and a lively theatre. Literacy is high, approximately 89%, and near 100% in some areas, which contributes to this productivity.

Sinhala vocabulary includes words from many languages, including English, Dutch, Portuguese, and others as well as Dravidian. Sanskrit loans abound, especially in the technical and religious/philosophical spheres, but perhaps unexpectedly, given the prevalence of Theravada Buddhism, Pali loans are scarce.

Varieties

While there is some regional dialect variation, all spoken dialects are mutually intelligible, requiring only some small adjustment. The main varietal difference is diglossia, involving two main functional varieties, generally referred to as Spoken Sinhala and Literary Sinhala. The former is used for all face-to-face communication, and the latter for virtually all written and published materials, except in some informal communication and in dialogue in modern fiction and drama, with the embedding narrative material generally in Literary. One major difference that

has been taken as the defining characteristic of the varieties is that Literary Sinhala has subject-verb agreement, as in (1), while all of the Spoken varieties lack it, as in (2). There are also accompanying differences in morphology, case forms, and use, and in fact the varieties differ on all levels of structure except phonology, since oral presentations of Literary use the spoken repertory. Literary productions are virtually always written beforehand. There are subvarieties within each of the major ones, and a Formal Spoken variety lacking agreement but showing some Literary features such as lexicon and some case features is seeing increasing use, partly because of the need for live production in the media, as in interviews and speeches. Some news broadcasts now use that variety, though earlier they were written in Literary and read out.

(1) Literary (in transliteration):

mama goyam kapami.
I rice-plants cut-PRESENT-1SG
'I reap paddy.'

api goyam kapamu.
We rice-plants cut-PRESENT-1PL
'We reap paddy.'

ma:ma: goyam kapayi.
uncle rice-plants cut-PRESENT-3SG
'(Maternal) uncle reaps paddy.'

(2) Spoken (in phonological representation):

mamə/api/ma:ma goyaŋ kapənəwa.
I/we/uncle rice-plants cut-PRESENT
'I/we/maternal uncle reap paddy.'

Phonology

Two notable characteristics of the Sinhala phonological inventory that are shared with Dhivehi but that are different from other Indo-Aryan languages are the lack of aspirated consonant series and a series of prenasalized stops that contrast with nasal-stop clusters. The vowel and consonant inventories are shown in Table 1.

Orthography

Sinhala has an orthographic system of its own, also used for writing Sanskrit and Pali in Sri Lanka. Like

most other South Asian systems it is alphasyllabic; that is, consonants imply an inherent vowel <a>, with other following vowels or the lack of one indicated by satellite diacritics. The independent vowel symbols are used for word initial or independent vowels. Thus ප is <pa> and පා, පී, පු, පෙ, and පො, indicate <pa>, <pi>, <pu>, <pe>, and <po>, with (plain) <p> written as ප්. The full inventory, given in Table 2, does include symbols for aspirate consonants and others for writing Sanskrit and Pali as well as loans from those languages.

Morphology

Sinhala nouns inflect for definiteness, number, and case. The basic gender categories are animate and inanimate. Table 3 gives a partial set for Spoken and Literary. Literary Sinhala also distinguishes masculine and feminine within animate.

Spoken Sinhala has six cases, including the vocative: nominative, dative, genitive, instrumental-ablative, and vocative. Literary Sinhala and some dialects of Spoken also have a distinct accusative, though they differ in form.

Demonstratives and pronouns exhibit a four-way distinction: 1st proximal, 2nd proximal, distal, and (discourse) anaphoric. Thus, roughly, *me*: 'this by me', *oyə* 'that by you', *arə* 'that over there', and *e*: 'that has been spoken of'.

As stated earlier, Spoken Sinhala verbs lack person-number-gender agreement, while Literary Sinhala has it for all three categories. Both varieties have a number of forms for tense, mode, voice, and aspect, though the inventories differ somewhat. There is also a three-way derivational system with sets including active, causative, and involitive verbs, though some sets are incomplete. Thus, *kaḍəṇəwa* 'break' (active, transitive), *kaḍəwəṇəwa* 'cause (someone) to break', and *kəḍəṇəwa* 'get broken' (intransitive/involitive). The syntactic/semantic reflexes associated with these forms are complex and involve transitivity, causativity, and involitivity and the case of subjects and other grammatical relations, as well as special characteristics of specific verbs. Thus the causative of *kiyəṇəwa* 'say, tell' is the common verb for 'read', but it is uncommon, though possible, in its causative sense, and its conjunctive participle *kiyələ* is also the quotation marker/complementizer in Spoken Sinhala (see (6) below).

Syntax

The basic word order in Sinhala is subject-object-verb, though other orders are not only possible but common for pragmatic effects such as foregrounding and emphasis. It is a thorough-going left-branching

Table 1 The Sinhala consonant and vowel inventory

| Consonants | | Vowels | |
|---------------------|---|--------|--------|

| Lit | minisa:ṭa | minisakuṭa | minisunṭa |
| Inanimate | | | |
| Direct ^b | | | |
| Coll and Lit | potə 'the book' | potak | pot |
| Dative | | | |
| Coll and Lit | potəṭə | potakəṭə | potwəṭəṭə/ potvəṭəṭə |

^aSpoken forms are given in phonological representation; literary forms in transliteration.

^bNouns of this type have no separate accusative in either variety, but only a direct case serving both functions.

(i.e., right-headed) language, and verb and noun modifiers, including relative clauses, precede their heads. (The correlative relative construction generally characteristic of Indo-Aryan languages was lost early

in its history.) It has postpositions, and complementizers are clause final. These characteristics are illustrated in (3) through (6).

(3) siri gunəpa:ləṭə potak dunna.
Siri Gunapala-DAT book-INDEF give-PAST
'Siri gave Gunapala a book.'

(4) mama ada koləmbə iⁿdəla
I today Colombo-GEN from
ko:ciyeŋ a:wa.
train-INSTR come-PAST
'I came from Colombo by train today.'

(5) siri gunəpa:ləṭə dunna potə.
Siri Gunapala-DAT give-PAST-REL book
'The book that Siri gave Gunapala.'

(6) siri i:ye a:wa kiyəla gunəpa:lə kiwwa.
Siri yesterday came COMP Gunapala say-PAST
'Gunapala said that Siri came yesterday.'

Sinhala has the conjunctive participle that is a feature of both Indo-Aryan and Dravidian languages, and it is the major way in which sentence conjunction is effected.

(7) siri kə:mə ka:la gedərə giya.
Siri food eat-CONJPART home went
'Siri ate and went home.'

Nonverbal sentences, which are common, may be of numerous types, of which three are illustrated in (8) through (10). Such sentences do not have a

copula, but vowel-ending adjective predicators take an assertion marker, as in (10).

- (8) Nominal-equational:
 me: potə puskolə potak.
this book ola-leaf book-INDEF
 ‘This book is an ola-leaf manuscript.’
- (9) Adjectival-attributive:
 me: potə hoⁿdayi.
this book good-ASSMKR
 ‘This book is good.’
- me: potə alut.
this book new
 ‘This book is new.’
- (10) Nonverbal modal:
 maṭə e: alut navakəta:potə o:nə.
I-DAT that new novel-book want/need
 ‘I want that new novel.’

Sinhala has the dative subject sentences common in South Asia. A nonverbal example was provided in (10). Dative subject verbal sentences commonly involve involitive verbs, as in (11):

- (11) maṭə aliyek penuna.
I-DAT elephant-INDEF see-PAST
 ‘I saw the elephant (it was visible to me).’

An uncommon feature of Sinhala is that it also has subjects in case forms other than nominative/direct and dative, in fact, in all except the genitive, as in (12)–(14). (12) illustrates the involitive optative verb inflection, indicating possibility of occurrence.

- (12) minihawə gaⁿgəṭə wəte:wi.
man-ACC river-DAT fall-INVOLPT
 ‘The man might fall into the river.’
 (There are no accusative subject transitive sentences.)
- (13) ehe: po:lisiyeṅ innəwa.
there police-INSTR be (Animate)
 ‘There are police there.’
- (14) a:nduweṅ e:kəṭə a:da:rə
government-INSTR that-DAT support-PL
 denəwa.
give-PRES
 ‘The government gives support for that.’

Sinhala has an interesting cleft or focused sentence construction that requires a special form of the verb, as in (15). The focused element may be virtually any type of sentence constituent, and it may be postposed as in (15) but need not be. This structure is very common in discourse and is used in most types of question word questions, as in (16). The question marker *də* that appears in (16) is also the way in which ordinary yes/no questions are formed, as in (17):

- (15) i:ye gunəpa:ləṭə salli
yesterday Gunapala-DAT money
 dunne e: miniha.
give-PAST-FOC that man
 ‘It was that man who gave Gunapala money yesterday.’
- (16) i:ye gunəpa:lə e: minih aṭə
yesterday Gunapala that man-DAT
 dunne mokak də?
give-PAST-EMPH what Q
 ‘What did Gunapala give that man yesterday?’
- (17) e: miniha i:ye gunəpa:ləṭə
that man yesterday Gunapala-DAT
 salli dunna də?
money give-PAST Q
 ‘Did that man give Gunapala money yesterday?’

The related Dhivehi has a similar focus construction. It is also found in several Dravidian languages, and it is very likely that it, like other characteristics such as the completely left-branching nature of Sinhala-Dhivehi, is a result of language contact.

Sino-Tibetan Languages

R J LaPolla, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Sino-Tibetan (ST) language family includes the Sinitic languages (what for political reasons are known as Chinese ‘dialects’) and the 200 to 300 Tibeto-Burman (TB) languages. Geographically it stretches from Northeast India, Burma, Bangladesh, and northern Thailand in the southeast, throughout the Tibetan plateau to the north, across most of China and up to the Korean border in the northeast, and down to Taiwan and Hainan Island in the southeast. The family has come to be the way it is because of multiple migrations, often into areas where other languages were spoken (LaPolla, 2001). Proto-Sino-Tibetan (PST) would have been spoken in the Yellow River valley at least 6000 years ago. Waves of migration followed: to the southeast, forming the Sinitic languages, and to the west and southwest, forming the TB languages (the speakers of what became the Bodish languages migrated west into Tibet and then south, all the way to the Bay of Bengal, while the speakers of what became the rest of the TB languages followed the river valleys down along the eastern edge of the Tibetan plateau and across into Burma, India, and Nepal). The large spread of Mandarin Chinese to the northwest, southwest and northeast, giving it its large population and geographic spread, happened only in the last few hundred years.

In the past, and to some extent in China still today (e.g., Ma, 2003), this family was also said to include the Tai-Kadai (Zhuang-Dong) and Hmong-Mien (Miao-Yao) languages of southern China and Southeast Asia, but the resemblances found among Sinitic,

Tai-Kadai, and Hmong-Mien are now understood to be a result of contact influence (these peoples originally inhabited southern China). Sino-Tibetan has the second largest number of speakers of any language family in the world, due largely to the over one billion Sinitic speakers; except for Burmese (see Bradley, 1996), most Tibeto-Burman languages have relatively few speakers.

Subgroupings within ST are still controversial, due to differences in criteria for subgrouping, a paucity of reliable data, particularly on morphosyntactic patterns, and the fact that the development and distribution of these languages has been greatly influenced by migration and language contact. Some of the influential proposals for subgrouping within TB are Grierson 1909, Shafer 1955, Benedict 1972, DeLancey 1987, Sun 1988, Dai, Liu & Fu 1989, Bradley 1997, Matisoff 2003, and Thurgood 2003 (see Hale 1982 for comparison of the older proposals). There is now general agreement on the existence of the following groupings (individual languages listed are only representative; see Matisoff 1996 for the many different names used for TB languages and groupings).

- Qiangic (Qiang, Pumi, Muya, Namuyi, Shixing);
- Lolo-Burmese, comprising the Burmish languages (Burmese, Lawngwaw [Maru], Ngo Chang [Achang], Zaiwa, Lachik [Lashi]) and the Loloish languages (further divided into Northern: Nosu [Yi, Yunnan or Sichuan], Nasu, Nisu; Central: Lahu, Lisu, Nusu, Jinuo; and Southern: Hani, Bisu, Phunoi, Mpi);
- Bodish (Tibetan, Dzongkha, Tamang (several varieties), Tshangla, Takpa);
- Kuki-Chin (Lushai, Asho Chin, Tiddim [Chin, Tedim], Anal, Hmar);

- Bodo-Koch (Bodo, Garo, Dimasa, Kachari, Koch, Rabha);
- Konyak (Tangsa [Naga, Tangsa], Chang [Naga, Chang], Konyak [Naga, Konyak], Nocte [Naga, Nocte], Wancho [Naga, Wancho]);
- Tani (Apatani, Mising [Miri], Adi); and
- Karenic (Pwo [Karen, Pwo], Karenni, Sgaw [Karen, S'gaw]).

There is much controversy over the affiliations of many of the languages of Northeast India and whether they all form a group together (see Burling, 1999; Matisoff, 1999), as well as the positions of the Bai language of Yunnan, China, Newari and the Kiranti languages of Nepal, Dulong-Rawang-Anong (Rawang) of Burma and China, the extinct Tangut language of northwest China, and the rGyalrong language of Sichuan, China, among many others. The latter two are most often said to be part of the Qiangic group, and the Kiranti languages are often seen as forming a higher grouping with the Bodish languages, but LaPolla (2003a), with reference to the morphological paradigms, argued that rGyalrong, the Kiranti languages (Bantawa, Athpare [Athapariya], Dumi, Khaling, Camling), Dulong-Rawang-Anong, the Kham languages, and the Western Himalayan languages (Kinnauri, Rongpo, Chaudangsi, Darmiya; also often grouped with Bodish) should be seen as forming a single higher-level grouping. This grouping was given the name 'Rung' because of the similarity (but not identity) of this proposal to an earlier one by Thurgood (1985). The Rung languages most likely split off from an even higher-level grouping with the Qiangic languages, then rGyalrong split off from the group as migrations moved south, then Western Himalayan split off from Kiranti and Rawang, and then these two groups split (Figure 1; see LaPolla, 2003a, for the evidence).

Within Sinitic, it is generally agreed there are at least six major dialect groups, initially distinguished on the basis of the reflexes of the historically voiced initial consonants (Li, 1936–1937): Mandarin (northern and southwestern China), Wu (Jiangsu and Zhejiang), Xiang (Hunan), Gan (Jiangxi), Yue (Guangdong and Guangxi), and Min (Guangdong,

Figure 1 The subgrouping of Qiangic-Rung.

Fujian, Hainan Island, and Taiwan). The Hakka group of dialects (Guangdong, Fujian, Jiangxi, Sichuan, and Taiwan) is seen by some as part of the Gan group and by others as a separate group. Another three groups were proposed by Li (1987): the Jin group (Shanxi and Inner Mongolia), the Hui group (Anhui and Zhejiang), and the Pinghua group (Guangxi), but these groupings are not universally accepted. Norman (1988, 2003), based on a paradigmatic set of lexical and grammatical items, further grouped the dialect groups into the Northern (Mandarin) group, the Central group (some Xiang dialects, Wu, Gan), and the Southern group (Yue, Hakka, and some Xiang dialects). He left out the Min group because he felt that the Min dialects lay “outside the mainstream of Chinese linguistic development” (2003: 81). That is, they cannot be reconciled with the reconstructed Middle Chinese system (seventh century A.D.) to which the other dialect groups can be traced.

Mandarin has the largest geographic spread and population, and can be subdivided into as many as eight subgroups (see Li, 1987; cf. Ho, 2003), based largely on the reflexes of the stopped tone category. Of these, the Southwestern (Sichuan, Yunnan, Guizhou), Central Plains, and Jianghuai (Southeastern) groups are generally recognized.

One variety of Mandarin, *P<<ut - onghu*λa, the ‘Common Language’ of China today, was developed in the early 20th century (and dubbed *Gulóy<<ǎ*, ‘National Language,’ at that time), taking the phonology of the Beijing dialect but the lexicon and grammar from a more generalized Mandarin and from the vernacular literature of the time. Standardization and spread of the standard through aggressive educational programs continues today.

Min does not have a large spread and population, but because of the complex nature of its historical development (multiple migrations into the area, causing multiple strata, even within a single variety), it can be subdivided into as many as seven subgroups: Southern, Northern, Central, Eastern, Puxian, Shaojiang, and Qiongwen (Li, 1987). For an excellent book-length synchronic and historical overview of Sinitic, see Norman, 1988; for the best detailed analysis of a single dialect, see Chao (1968).

Proto-Sino-Tibetan was monosyllabic, but with a much more complicated syllable structure than most of the modern languages: *(PREF) (PREF) C_i (G) V (:) (C_f) (s) (Matisoff, 1991: 490; C_i = initial consonant, G = glide, := vowel length, C_f = final consonant, s = suffixal *-s; parentheses mark items that do not appear in all syllables). The modern languages have moved much more toward bisyllabic or polysyllabic words, although they are often reduced again to

sesquisyllabic (syllable and a half) or monosyllabic forms, and tone systems have developed in Sinitic and many of the TB languages (either through contact, through independent innovation, or a combination of the two). For example, in Sinitic the tones developed out of consonant suffixes (*-s, *-ʔ) and loss of initial voicing (Baxter, 1992: 8.2), and in Lhasa Tibetan the tones developed independently, out of loss of initial voicing and the influence of final consonants. Within this general commonality there is also diversity in phonemic inventories and syllable structures, with, for example, the Qiang language (LaPolla, 2003b) having 36 initial consonants, a complex system of consonant clusters in initial and final position, and no tones, while Lahu (Matisoff, 1973) has only 24 consonant initials, a simple (C)V syllable structure (no consonant clusters), and seven phonemic tones.

Proto-Sino-Tibetan morphology included derivational prefixes and suffixes and a voicing alternation of the initial consonant of some verbs that could affect the valency or form class of a word, but no relational morphology. Many of the modern languages have grammaticalized person-marking affixes on the verb and/or semantic role marking on nouns, but these cannot be reconstructed to the PST level (see LaPolla, 2003a, and references therein). The clause was verb focused, in that the verb was the key element, and noun phrases were optional. This is still the case in most languages. Most have not grammaticalized the kind of constraints on referent identification we associate with the concept of 'subject' and other grammatical relations. If noun phrases appeared in the clause, the verb would have been clause final. In Sinitic the clause is largely verb medial, as the verb has come to function as the divider between topical (preverbal) and nontopical (postverbal) elements (there has clearly been a progressive change away from verb-final order over time). This change has happened to a large extent in Bai and Karen as well. With morphology as with phonology we find diversity of types. Using our examples of Qiang and Lahu again, we find Qiang is agglutinative, whereas Lahu is isolating. Qiang has complex affixal systems of direction marking, person marking, and evidential marking on the verb and definite marking in noun phrases, whereas Lahu has none of these features. Both languages have developed complex sortal classifier systems – a common, but not universal, trait among ST languages. All ST languages have modifier-modified order in noun–noun structures (with genitive-head order being a subtype of this – there was no genitive marking in PST, but some languages have developed genitive marking), as well as relative-head order (Karen has a secondary head-relative order as

well). Proto-Sino-Tibetan had negative-verb order, and this is still true of most ST languages.

Matisoff (2003) grouped the languages in the family into the 'Sinosphere' and the 'Indosphere' due to the linguistic and political influence of China and India, respectively, on the languages. In Indospheric languages, such as the TB languages of Northeast India and Nepal, for example, we often find the development of relative pronouns and correlative structures, and also of retroflex initial consonants. In the Sinosphere we often find the development of tone systems and more analytic structure. We also find contact influence from the Altaic languages in the north (Altaic speakers controlled large parts of northern China for long periods over the last thousand years) and the Austroasiatic, Tai-Kadai, and Hmong-Mien languages in the south. For example, there is a cline from north to south in terms of complexity of tone and also classifier systems (greater in the south, less in the north), and influence on prosody and word structure where the sesquisyllabic light-heavy structure of Austroasiatic languages is also found in many of the southern TB languages, such as Burmese and Jinghpaw (Jingpho), often leading to the reduction of the first syllable in a compound, in contrast to a trochaic stress pattern in northern TB and northern Sinitic, which often leads to the reduction of the second syllable in compounds.

Siouan Languages

R L Rankin, University of Kansas, Lawrence, KS, USA

© 2006 Elsevier Ltd. All rights reserved.

At the time of earliest contact with Europeans, the Siouan-speaking peoples were found in an arc extending from the northern high plains of North America, east and southward along the prairie-plains border to the mouth of the Arkansas River, with small enclaves farther to the east and southeast. The Siouan

languages generally bear the names of the Native American tribes that speak them.

Subgroups, Locations, and Speaker Statistics

The Siouan languages fall into four major subgroups named after the river valleys where they were spoken in protohistoric times; however, the classification is based on shared linguistic innovations, not geography.

Missouri River Siouan includes Crow, still spoken in southeastern Montana by perhaps 3000 persons of all ages, and Hidatsa in North Dakota, with approximately 60 speakers, all adults. Mississippi Valley Siouan is split into three major groups, Dakotan, Chiwere-Winnebago, and Dhegiha. Dakotan is spoken by over 10 000 persons of all ages in several dialects, including Assiniboine, Stoney, Teton, Yankton-Yanktonai, and Santee-Sisseton, scattered across northern Nebraska, Minnesota, the Dakotas, Montana, Manitoba, Saskatchewan, and Alberta. The Chiwere dialects are Ioway, Otoe, and Missouriia, spoken originally in Iowa, southeastern Nebraska, and northern Missouri. The Missouriias took refuge among the Otoes in 1829, and all three tribes were moved to Oklahoma by the 1880s, where today there are perhaps a very few elderly speakers. Winnebago, called Hochunk by its speakers and originally spoken in Wisconsin, is still spoken by adults both there and in Nebraska. The Dhegiha dialects are Omaha-Ponca, Kansa, Osage, and Quapaw. Omaha-Ponca is still spoken by perhaps 50 adults of both tribes in their ancestral home, Nebraska (Omaha), and near Ponca City, Oklahoma (Ponca). Kansa, also called Kaw, originally of northeastern Kansas; Osage, originally of southwestern Missouri; and Quapaw, originally of eastern Arkansas, now in northeastern Oklahoma, no longer have fluent native speakers.

Ohio Valley Siouan is extinct but once comprised several languages, Biloxi in southwestern Alabama, Ofo in Mississippi, and Tutelo-Saponi, Moniton, and Occaneechee in Virginia. There were a few Tutelo speakers living with the Cayuga in Ontario as recently as the early 1980s. The Mandan language, with only one or two speakers in North Dakota, is considered a separate subgroup by the author and a close relation of Mississippi Valley Siouan by some others. The Dakotan, Chiwere, and Dhegiha languages share a certain amount of mutual intelligibility subgroup internally, but there is little or no intelligibility among these subgroups or among other Siouan languages.

External Relationships

The Siouan family is related to the extinct Catawban languages of the Carolina Piedmont. These included Catawba and Woccon and a number of unattested languages said by explorers to have been similar. There is fairly strong recent evidence that Siouan-Catawban is related to Yuchi, originally spoken in Tennessee. Sapir (1929) proposed even more distant links to the Iroquoian and Caddoan language families,

but there is little agreement among specialists on any of these.

Grammatical and Phonological Features

Siouan languages are primarily head-marking, active-stative, subject-object-verb (SOV), i.e., dependent-head languages of moderate morphological complexity. Sapir characterized Dakota Sioux as complex pure relational, with derivational concepts signaled by agglutinating elements and pure-relational (here, pronominal) concepts somewhat fused. Sapir characterized Dakota's overall morphological technique as agglutinative fusional and the degree of synthesis as synthetic to mildly polysynthetic. Siouan languages are among those considered by many linguists to be pronominal argument languages, i.e., the pronominal prefixes on the verb are considered to be the arguments of that verb, not just agreement markers for external arguments. If they are considered agreement markers, then Siouan languages are double-agreement languages, with prefixes for subject and object, or, alternatively, actor, patient/experiencer, along with additional roles such as recipient, locative, and instrumental. Siouan lexical classes include nouns, verbs, pronouns, postpositions, particles, and probably adverbs, but not adjectives. The equivalents of English adjectives are all conjugatable verbs.

Siouan argument structure is of the active-stative type in which the subjects of stative verbs (and some active verbs with experiencer subjects) and objects of active transitive verbs are marked alike, whereas agentive subjects of active verbs (both transitive and intransitive) are marked differently. Siouan languages possess many of the other syntactic orderings that dependent-head languages tend to have (postpositions, main verb-auxiliary verb, possessor-noun (inalienable), and subordinate clause-main clause). All mark person, number, aspect (not tense), mode, and pronominal case in their verb morphologies, and permit noun incorporation. Nominal incorporation is most active in the northern languages: Crow may incorporate entire relative clauses within the verb. Many of the languages have fairly complex phonological inventories, including aspiration, glottalization, and nasalization contrasts for three or four places of articulation among consonants, and length contrasts for five oral and three nasal vowels. Many, if not most, Siouan languages have pitch accent and tend to assign accent to the second mora of words. Phonologists are warned that the practical orthographies, such as those developed by Riggs for Dakota or La Flesche for Omaha, lack detail necessary for phonological analysis.

Future Scholarship

Siouan scholarship is presently flourishing, but much remains to be done. New dictionaries are being or have recently been elaborated for Crow, Hidatsa, Mandan, Dakota, Chiwere, Winnebago, Kansa, Osage, and Quapaw, along with grammars of Crow, Hidatsa, Chiwere, Omaha, Osage, Biloxi, and Ofo. A comparative Siouan dictionary is nearing completion.

Skou Languages

M Donohue, National University of Singapore, Singapore

© 2006 Elsevier Ltd. All rights reserved.

The languages of the Skou family are spoken along the north coast of New Guinea, from the Skou villages east of Humboldt Bay in Indonesia to Barupu west of Aitape in Papua New Guinea. There are 16 known languages in the family, split fairly evenly between three family-level units and one isolate, I'saka (Krisa). Most of the languages are found along the coast, but the orientation of most groups lies inland. Tone and in most cases either unusual consonants or a high number of vowels feature prominently. Tonal contrasts range from three to six on a monosyllabic word, but in all well-investigated cases the domain of tone is the morpheme, not the syllable. Unusual segments found in the family include the palatal lateral dental affricate of Puare (Puari) and the nonback rounded vowels [u] and [ø] of Skou. Contrastive nasalization on either the syllable or the rime is common. Other phonologically marked features include the lack of contrastive nasal consonants in I'saka and the lack of an /s/ phoneme in Skou or many of the Piore River languages.

Morphosyntactically the languages show a lot of variation from one to another, and only some salient features are mentioned here. The basic order is SOV, with postverbal obliques. Case marking is not used, but verbs typically show prefixal agreement for subject, and object agreement, if present, is suffixal. In the western group there is no suffixal agreement, but we do find alternations in the vowel of the verb root that indicate earlier affixation:

ke-fu
3.SING.NF-see.FEM.OBJ
'he saw her'

(where NF stands for nonfeminine) from earlier ke = fu-u. Compare this with Sumo, which has regular suffixation for object:

b-a-chara-u
MOOD-3.SING.MASC-see-3SING.FEM
'he saw her'

Often a language will employ one or more applicatives; typically a goal (beneficiary or direction) or, secondarily, an accompanier has dedicated applicative morphology, whereas instruments are not marked with applicatives but simply appear in the clause.

Many Skou languages show the frequent use of multiple exponence to mark the subject. In Puare we can see double marking for subject on the verb, once by an infix (marked here with angled brackets) and once by a proclitic, as in the sentence:

aro n-s<h>i
firewood 1.DU-chop<1.SING/DU>
'we chopped firewood'

Similarly in Skou we can find verbs with proclitic, prefix, and vowel agreement. The verb /ø/ 'shave' is [təri] when inflected for third-person plural

te-t-lø
3.PL-3.PL-shave<(3).PL>
'they shaved'

Gender is a pervasive feature of the languages. All the languages distinguish at least two genders in the third-person singular pronominal paradigms, and in most cases gender is found elsewhere as well. In Skou, all the dual pronouns, but none of the plural, are differentiated for gender. Barupu (Warupu) and Ramo both distinguish gender in all but the dual pronouns, both free and bound forms. The Serra Hills languages typically mark gender only in the second- and third-person dual pronouns. In Skou itself, a number of nouns obligatorily mark gender. Thus, *ume* 'woman' cannot appear on its own and must take the feminine clitic *pe*, *pe-ume* 'woman', and *aku* 'child' is heard as *pe-aku* 'girl' or *ke-aku* 'boy'.

Slavic Languages

L A Janda, University of North Carolina, Chapel Hill, NC, USA

© 2006 Elsevier Ltd. All rights reserved.

The Slavic language group contains three subfamilies: (1) East Slavic, consisting of Russian, Belarusian (Belarusan), and Ukrainian; (2) West Slavic, consisting of Polish, Czech, Slovak, and Sorbian (the latter spoken in Germany and also known as Lusatian); and (3) South Slavic, consisting of Bulgarian, Macedonian, Slovene (Slovenian), and Bosnian/Croatian/Serbian (BCS; formerly known as Serbo-Croatian). The Slavs are believed to have expanded from an

area corresponding to southwestern Belarus/northwestern Ukraine beginning in the 6th century C.E., an event that contributed to the linguistic differentiation of Late Common Slavic (LCS) into the modern Slavic languages. In the late 9th century a Byzantine mission to the present-day eastern Czech Republic yielded translations of liturgical texts into Old Church Slav(on)ic, a written language presumed to be very close to LCS. These documents have made it possible for us to reconstruct the history of the Slavic languages quite reliably. Orthography follows religion in dividing the Slavic languages into an Eastern/Orthodox Christian group that uses the Cyrillic alphabet (Russian, Belarusian, Ukrainian, Bulgarian,

Macedonian, and part of BCS), and a Western/Catholic and Protestant group that uses the Latin alphabet with the addition of diacritics (Polish, Czech, Slovak, Sorbian, Slovene, and part of BCS).

Phonological History

Within the Indo-European language family, the closest relatives to the Slavic languages are the Baltic languages (Latvian and Lithuanian). Both Slavic and Baltic are ‘satem’ languages, a name based on the Avestan word for ‘hundred,’ which identifies the reflex of Proto-Indo-European (PIE) $k' \rightarrow s$ (and $g' \rightarrow z$), as in the Late Common Slavic (LCS) *sъto* ‘hundred’. Peculiar to Slavic (though with some analogues in Baltic and Indo-Iranian languages) is the ‘ruki’ rule sound change, which caused $s (\check{s}) \rightarrow x$ in positions following $r, u, k/g$, and i , as in Proto-Indo-European (PIE) *ousos* → LCS *uxo* ‘ear’. ‘Ruki’ and ‘satem’ are ancient changes in the development of PIE into Early Proto-Slavic (EPSI). The subsequent era linking EPSI and LCS is marked by sound changes that affected all of Slavic, though their ultimate outcomes are not entirely uniform. Many EPSI-to-LCS sound changes reflect a phonotactic strategy aimed at creating ‘ideal’ syllables of rising sonority and level tonality, i.e., syllables with CV structure where both the C and V elements had the same (high or low) tonality (also known as ‘syllabic synharmony’). The conflict between the most normal structure for a root morpheme, which was CVC, and the ideal syllable structure of CV resulted in the great number of morphophonemic alternations so characteristic of Slavic. The last element in a CVC sequence was in a precarious position: either it was assigned to the syllable containing the preceding CV, in which case sonority constraints made it subject to absorption or loss, or it was assigned to the following syllable, where tonality constraints could subject it to mutation. We will look at each group of sound changes separately.

Rising Sonority

Rising sonority motivated syllable shape changes CVC → CV and V → CV, which resulted in both loss of final consonants, as in EPSI *su:nus* (cf. Gothic *sunus*) → *synъ* ‘son’, and prothesis, as in EPSI *esti* (cf. Latin *est*) → *jestъ* ‘is’. If a syllable peak contained a diphthong (a vowel followed by a sonorant: a glide, nasal, or liquid), its sonority rose but then dipped, and this lack of conformity to rising sonority also motivated changes in syllable structure, mainly monophthongization or metathesis.

Diphthongs ending in a glide monophthongized to yield new vowels:

- $ei \rightarrow i$, as in *zeim-* → *zima* ‘winter’
- $\hat{a}i \rightarrow \check{e}$ (known as ‘jat’), as in *măix-* → *měxъ* ‘fur’
- $eu \rightarrow (j)u$, as in *teu-* → *tjudъ* ‘alien’
- $\hat{a}u \rightarrow u$, as in *lău-* → *luna* ‘moon’.

The subsequent development of ‘jat’ is quite diverse in Slavic.

Diphthongs ending in a nasal monophthongized to yield nasal vowels:

- $e/i + m/n \rightarrow \epsilon$, as in *swent-* → *svetъ* ‘holy’
- $\hat{a}u + m/n \rightarrow q$, as in *zămb-* → *zqbъ* ‘tooth’

Polish is the only Slavic language that retains nasality for these vowels (though they have been reorganized: those that developed length became the back nasal q , whereas those that remained short became the front nasal ϵ). The remaining Slavic languages denasalized these vowels, with various results. Thus *svetъ* ‘holy’ and *zqbъ* ‘tooth’ yield, respectively: Russian *sviatoï* and *zub*, Polish *święty* and *zqb*, Czech *svatý* and *zub*, Slovene *svet* and *zob*, BCS *svet* and *zub*, Bulgarian *svet* and *zъb*.

Diphthongs ending in a liquid differed in the presence or absence of an initial consonant and in whether the vowel was a ‘full’ vowel or a reduced vowel (‘jer’), and are referred to as ORT (for orC- and olC-), TORT (for CorC, CerC, ColC, and CelC), and TъRT (for CъrC, CъlC, CъrC, CъlC). Overall, these are referred to as the ‘TORT’ phenomena, and the results (particularly in terms of vowel quality) are quite varied across Slavic. The examples represent only a fraction of the relevant data:

- ORT reflexes show metathesis: *orstъ* ‘growth’ → Russian *rost*, Polish *-rost*, Czech *růst*, BCS *rast*, Bulgarian *rast*.
- TORT reflexes show an epenthetic vowel in Russian (pleophony, creating two syllables from one), and metathesis elsewhere: *gordъ* ‘enclosure’ → Russian *gorod*, Polish *gród*, Czech *hrad*, BCS *grad*, Bulgarian *grad*.
- TъRT reflexes are the most varied and hard to characterize by rule: *vbьlkъ* ‘wolf’ → Russian *volk*, Polish *wilk*, Czech *vlk*, BCS *vuk*, Bulgarian *vъlk*.

Syllabic synharmony

Syllabic synharmony was violated when a low tonality consonant was followed by a high tonality vowel (or sonorant), or when a high tonality consonant was followed by a low tonality consonant. The solution in both cases was to raise the tonality of the low tonality segment. Raising the tonality of consonants yielded the postalveolar fricatives and affricates conspicuous in the Slavic languages, resulting from the palatalizations of velars. In the first palatalization, $k \rightarrow \check{c}$, $g \rightarrow \check{z}$,

$x \rightarrow \check{s}$ before a front vowel or j uniformly throughout Slavic: *plākjām* → *plačq* ‘I weep’, *gen-* → *žena* ‘woman’, *du:xe:tei* → *dyšati* ‘breathe’. The second (and third) palatalization of velars took place in two environments: after a high front vowel (or diphthong containing one) or before *ai*. This palatalization yielded $k \rightarrow c$, $g \rightarrow z$ (*dz* in Polish), $x \rightarrow s$ (*š* in West Slavic): *ātikās* → *otcb* ‘father’, *kāinā:* → *cěna* ‘price’, *kuningās* → *koneẓb* ‘prince’ (cf. Polish *ksiądz* ‘priest’), *nāgāi* → *noẓě* ‘leg.DAT/LOC.SG’ (cf. Polish *nodze*), *vixās* → *ṿsb* ‘all’ (cf. Czech *všechn*), *xāir-* → *sēr-* ‘gray’ (cf. Czech *šerý*). The velar palatalizations show a loss (except for Polish) of the stop quality of g , and this was part of a larger phenomenon which included the lenition of g in all positions to a velar or uvular fricative in East Slavic (except Russian), Czech, Slovak, and Upper Sorbian.

Dentals followed by j (and similar clusters) were subject to similar sound changes. Throughout Slavic *sj* → *š* and *zj* → *ž*: *peisjā:m* → *pišq* ‘I write’, *mā:zjā:m* → *mažq* ‘I smear’. Original *dj* (also *deu* and *gti*) and *tj* (also *teu* and *kti*), as in LCS *medja* ‘boundary’, *světja* ‘candle’, yielded a variety of reflexes: Russian *mezhal svecha*, Polish *miedzalświeca*, Czech *mezelsvíce*, Slovene *mejalsveča*, BCS *međalsvijeca*, Bulgarian *mezhdalsveshch*. The various palatalizations occur both in roots and at morpheme boundaries, where they occasion various morphophonemic alternations of consonants in Slavic languages. The principle of raising the tonality of a consonant followed by a high tonality vowel has been further continued in some languages: Russian has developed phonemic palatalization, such that all nonpalatal consonants are opposed hard to soft, except the dental affricate *ts*; in Polish this goes one step further and dentals are palatalized to palatals (*t/d/s/z/n* → *ć/dź/ś/ź/ń*) before front vowels.

A low tonality vowel following a high tonality consonant (usually j) was also subject to the adjustment of syllabic synharmony, and this resulted in the fronting of back vowels: *mārjās* → *morje* ‘sea’, *sju:tei* → *šiti* ‘sew’.

Vowel Distinctions

EPSI had four vowels, all of which could be long or short: *i*, *u*, *e*, *ā*. These vowels were reinterpreted as eight LCS vowels, differentiating the long and short vowels qualitatively. Thus long *i:* → *i*, *u:* → *y*, *e:* → *ě*, *ā:* → *a*; and short *i* → *ɨ*, *u* → *ʉ*, *e* → *e*, *ā* → *o*.

The LCS era (and the law of rising sonority) comes to an end with the loss of the two short high vowels, *ɨ* (‘front jer’) and *ʉ* (‘back jer’) in weak positions, commonly known as ‘the fall of the jers’. A jer was strong in a syllable preceding a syllable with a weak jer; all

other jers were weak. Weak jers were lost, but strong jers attained the status of full vowels. The fall of the jers created new closed (CVC) syllables, new consonant clusters, and many vowel/zero morphophonemic alternations. In this example, the strong jer is underlined: LCS *s̄n̄b/s̄bna* ‘dream.NOM/GEN.SG’ yields Russian *son/sna*, Czech *sen/sna*, BCS *san/sna*.

Prosody

LCS had a system of phonemic pitch and sub-phonemic stress. Although length had been lost in the re-interpretation of vowels, it was subsequently re-established in parts of the Slavic territory. Russian, Belarusian, Ukrainian, and Bulgarian have phonemic stress. BCS and Slovene have phonemic pitch and length. Polish and Macedonian have fixed stress on the penultimate and antepenultimate syllables, respectively. Czech and Slovak have phonemic length and fixed stress on the initial syllable.

Morphological history

Declension

LCS was, and Slavic languages for the most part remain, highly synthetic, with distinct inflectional desinences as well as derivational suffixes and prefixes affixed to roots. EPSI declensions were based mostly on stems with theme vowels, with a few consonantal stems. By the LCS period, the declensions had moved toward association with genders, and the theme vowels were absorbed by sound changes into synthetic desinences that mark case, number, and gender. LCS had three numbers, singular, dual (with restricted case distinctions), and plural, but all the modern languages except Slovene and Sorbian have lost the dual. Slavic maintained much of the PIE case structure, though it merged the ablative with the genitive (restrictive), to yield nominative, genitive, dative, accusative, vocative, locative, and instrumental. The case distinctions (all but the vocative) were subsequently lost in Macedonian and Bulgarian, and the vocative was lost in Russian, Slovene, Slovak, Lower Sorbian, and Belarusian. In addition to the three genders (masculine, feminine, neuter), an animacy distinction developed within masculine during LCS, marked by the substitution of the genitive singular inflection for the accusative singular. Animacy is realized in the plural only by a few languages, in particular Russian and Polish (where it marks only male humans), plus Czech (where it is available only in the nominative plural and dative/locative singular). In LCS, Slavic adjectives were enlarged by the affixation of the corresponding pronominal forms, to create compound adjectives, which

initially signaled definite, as opposed to the shorter 'indefinite' adjectives. BSC and Slovene continue this distribution of long vs. short adjectives. Polish, Czech, and Russian expanded the long compound adjectives, and have restricted the short adjectives to predicate position. Bulgarian and Macedonian maintained only the short adjectives, and developed a postposed article to mark definiteness. The LCS personal pronouns had both long (emphatic) and short (enclitic) forms, and the West Slavic and South Slavic languages continue this distinction.

Conjugation

The most important development for verbs is the evolution of Slavic aspect, which is peculiar because it obligatorily distinguishes perfective from imperfective in all verbal forms, and because the imperfective is more complex and unmarked (whereas it is the marked category in most other languages with this distinction). Aspect is expressed in simplex stems, and via an elaborate system of derivational prefixes and suffixes. The PIE supine, middle, subjunctive, and perfect disappeared in Slavic (but Bulgarian and Macedonian have a new perfect), and the LCS aorist and imperfect tenses have been lost in both East Slavic and West Slavic (except Sorbian). The only two tenses that the modern languages all share are a past (derived from a resultative participle) and a nonpast (usually interpreted as a future if perfective, but as a present if imperfective). Bulgarian and Macedonian lack an infinitive. The Slavic imperative has been innovated from the PIE optative, and the conditional is expressed paraphrastically using an auxiliary from *byti* 'be'. LCS had no distinct future tense, but used instead the perfective nonpast or an auxiliary verb with a participle or infinitive. LCS had a system of four participles expressing present vs. past and active

vs. passive; these survive in their entirety only in Russian. Like its nouns, EPSL verbs were inflected by combining a stem with a theme vowel and a desinence (with the exception of five 'athematic' verbs), and again sound changes obliterated the distinct role of the theme vowel by LCS. In the modern languages, verbs express aspect, tense, person, number, and, in certain forms, gender.

Slovak

R A Rothstein, University of Massachusetts, Amherst, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Slovak is a West Slavic language, most closely related to Czech. It is the native language of some 4.6 million residents of Slovakia, of somewhere between 300 000 and 500 000 residents of the Czech Republic, and of additional speakers in Hungary, Poland, Romania, Serbia, and North and South America.

Orthography

Like other Slavic languages that were historically in the cultural sphere of the Western Church, Slovak uses the Latin alphabet with diacritic marks. Long vowels are marked by an acute accent, *ô* represents the diphthong [uo], and *ä* traditionally represents the vowel [æ], which almost all speakers replace with [ɛ]. The letters *i* and *y* both represent [i], and *í* and *ý* both represent [i:]; the distinction is etymological. Digraphs are used to spell the voiceless velar fricative (*ch*)

and the voiced dental and alveolar affricates (*dz* and *dž*, respectively). The voiceless alveolar affricate and the voiced and voiceless alveolar fricatives are represented, respectively, by *č*, *ž*, and *š*. Palatal stops and sonorants are not specially marked before the vowels *e*, *i*, and *í* or the diphthongs *ia*, *ie*, *iu*; elsewhere they are indicated by diacritics: *t'*, *d'*, *l'*, *ň*. Certain words and categories of words constitute exceptions to this rule for spelling palatals; thus, there is a contrast between the adverb *stále* 'constantly,' pronounced [stál'e], which follows the rule, and the adjective form *stále* 'constant,' pronounced [stále], which does not.

Phonology

The Slovak phonemic inventory consists of fifteen vocalic segments (six short vowels, five long vowels, and four diphthongs) and 27 consonantal ones. Most speakers have only five distinct short vowels, the basic phonetic realizations of which are [i], [ɛ], [ɐ], [ɔ] and [u] (orthographic *i*, *e/ä*, *a*, *o*, *u*), but the different alternation patterns of orthographic *ä* and *e* (the former alternates with *ia*; the latter with *á* or *ia*) are grounds for treating them as representing distinct phonemes. The five long vowels correspond to the short vowels, but /ó/ occurs only in nonnative words, and the distribution of /é/ outside of nonnative words is limited. The four diphthongs are /uo/, /ie/, /ia/, and /iu/, but the last of these seems always to result from a process of contraction and may therefore not be a phoneme. The diphthongs behave like long vowels with respect to phonologically or morphologically conditioned processes of shortening and lengthening, but the relationships between the long vowels and diphthongs on the one hand and the short vowels on the other is mediated by various contextual constraints. The liquids /r/ and /l/ can be syllabic and in that role distinguish length.

A so-called 'rhythmic law' that operates in Central Slovak dialects and in the standard language mandates the shortening of a syllable that follows a long syllable (one containing a long vowel or a diphthong). Thus, in the masculine nominative singular of adjectives, we find *hladký* 'smooth,' but *krátky* 'short' and *riedky* 'rare.' The rhythmic law does not apply in certain grammatical and derivational contexts, e.g., the declension of adjectives derived from animal names (e.g., *vtáčí* 'bird's').

The consonants that arose from the historical palatalization of velars or from the deiotation of clusters consisting of dental stop or fricative plus glide have lost their palatal character. The historical palatalization of dental consonants, on the other hand, has

given rise to a series of palatal consonants: *t'*, *d'*, *ň*, *l'*. As in most other Slavic languages, final voiced obstruents lose voicing before pause. In obstruent clusters both within phonological words and between words, there is regressive assimilation with respect to voicing. Before a word-initial vowel or sonorant, a word-final obstruent is voiced; such voicing may also occur at morpheme boundaries within words. The laryngeal fricative represented by *h* devoices to the velar fricative *ch*, but when the latter becomes voiced, there is free variation between a voiced velar fricative [ɣ] and *h*. The voiced labiodental fricative *v* behaves like an obstruent at the beginning of a phonological word, but does not cause voicing of a preceding voiceless obstruent within a word. It is realized as [w] in word-final position and is generally realized as [w] word-internally in the environment V_C.

The primary word stress is on the initial syllable and can thus fall on a monosyllabic preposition, especially if the following noun or pronoun is monosyllabic, e.g., *pOd ňou* 'under it,' but also potentially *dO prácy* 'to work.' Unstressed vowels are not reduced, and words longer than three syllables alternate unstressed and secondarily stressed syllables.

Morphology

Nouns distinguish six cases (nominative, accusative, genitive, dative, instrumental, locative); a few masculine nouns have vestigial vocative forms (e.g., *synku* 'son'). Three genders (masculine, feminine, neuter) are distinguished in the singular by agreement phenomena, and a masculine animate subgender can also be distinguished by its syncretism of accusative and genitive and by the ending *-ovi* for dative and locative singular. Certain classes of semantically inanimate masculine nouns also show the accusative-genitive syncretism (e.g., names of trees, mushrooms, diseases: *st'at' duba* 'cut down an oak tree'; *nájsť hříba* 'find a boletus mushroom'; *mat' vředa* 'have an ulcer').

In the plural there is a binary distinction of masculine-personal (nouns referring to male human beings) and nonmasculine-personal (all other nouns); they are distinguished by the nominative endings, by agreement phenomena, and by the accusative-genitive syncretism of the former vs. the accusative-nominative syncretism of the latter. Adjectives and third-person pronouns also distinguish three genders in the singular and two in the plural; the past-tense forms of verbs show a three-way distinction in the singular but have only a single form for the plural. Some nouns have only plural forms (e.g., *vidly* 'pitchfork[s]'); others are used primarily in the singular

(e.g., mass and abstract nouns) but have potential plural forms that usually acquire specialized meanings (e.g., *pivo* ‘beer’ vs. *pivá* ‘kinds or portions of beer’; *láska* ‘love’ vs. *lásky* ‘objects of affection’).

Noun declensions are largely gender-based: the masculine and neuter declensions have most endings in common in the singular, while the three feminine declensions in the singular (one for nouns ending in *-a* in the nominative singular and two for those ending in a consonant, i.e., with zero-ending) also share most endings. There is a class of masculine nouns ending in *-a* that refer to male human beings; they follow the masculine declension except for the genitive and accusative singular, which use the *u*-ending of the feminine *a*-declension. In the plural, feminine and neuter nouns have common oblique-case endings, which are different from those of masculine nouns. The traditional presentation of multiple declensional types is based on the fact that certain case endings are dependent on the nature of the final stem consonant – whether it is ‘soft’ (palatal or ‘historically soft,’ i.e., the result of historical palatalization or deiotation) or not. Cf. dative singular *žene* vs. *ulici*, which traditional grammars describe as belonging to different declensional types (*žena* ‘wife’ vs. *ulica* ‘street’).

Most inherited consonant mutations have been lost from noun declensions. The remaining mutations affect velars and dentals in the masculine personal nominative plural (e.g., *vojak/vojaci* ‘soldier[s]’; *Američan/Američania* ‘American[s]’ with the alternation /n/ to /ň/; *pilot/piloti* ‘pilot[s]’, with /t/ to /t’/) and dentals in the locative singular of all three genders (e.g., *sused/susede* ‘neighbor,’ *žena/žene, mesto/meste* ‘city’). Noun declensions do show quantitative alternations of vowels, for example, between forms with an ending and forms with a zero ending (e.g., NOM/ACC sg *chlieb* vs. GEN sg. *chleba* ‘bread,’ NOM sg. *ruka* vs. GEN pl. *rúk* ‘hand; arm’).

Slovak verbs belong to one of two aspectual categories, perfective or imperfective; there are also some bispectual verbs (e.g., *absorbovať* ‘absorb,’ *pomstiť* ‘avenge’). Perfective verbs express accomplishments or transitions; imperfective verbs express states or activities/processes. Imperfective verbs are typically unprefixated; adding a prefix perfectivizes the verb, sometimes also adding an additional semantic component (e.g., *písať* ‘write = engage in the activity of writing’/ *napísať* ‘write = get something written’ vs. *prepísať* ‘rewrite,’ *opísať* ‘describe,’ *popísať* ‘write a lot’). There are also productive ways of imperfectivizing a perfective verb through a change in suffix and/or the stem (e.g., *prepísovať* ‘engage in the activity of rewriting,’ *opisovať* ‘engage in the activity of

describing’). Occasionally, corresponding verbs are based on different stems (e.g., imperfective *brať* vs. perfective *vziať* ‘take’), and some verbs have no corresponding verb of the opposite aspect (e.g., imperfective *mať* ‘have’ or perfective *vydržať* ‘bear, stand’).

Imperfective verbs have synthetic forms for past and present tense and analytic forms for the future tense; perfective verbs form their past tense in the same way as imperfective verbs, but the forms that look like the present-tense forms of imperfective verbs normally express future tense (or, under certain circumstances, potentiality). An analytic pluperfect tense is formed mostly from perfective verbs. The perfective/imperfective distinction is also present in infinitives, imperatives, and conditional/subjunctive forms. The last of these is formed analytically and distinguishes present vs. past (‘would X’ vs. ‘would have X’). Imperfective verbs form verbal adjectives and adverbs expressing simultaneity, while perfective verbs form verbal adjectives and adverbs that express temporal precedence or subordination to the action of the main verb. Both perfective and imperfective transitive verbs form passive participles, which can be used with *byť* ‘be’ to form passive constructions.

Within the imperfective aspect, a further distinction is made between determinate and indeterminate verbs of motion. The former designate motion in a single direction on a single occasion, while the latter do not have those restrictions and can therefore designate repeated motion, the ability to move, etc. (e.g., determinate *ísť* vs. indeterminate *chodiť*). Many imperfective verbs also have derived iteratives that express repeated, often regular, actions (e.g., *hrávať* ‘play frequently’ from *hrať* ‘play’).

Most of the inherited consonant alternations have been eliminated from present-tense paradigms, except for the alternation between palatals and dentals (*idiem* ‘I’m going,’ *idieš* ‘you’re going’ vs. *idú* ‘they’re going’; cf. *pečiem, pečieš, pečú* ‘I’m baking, etc.’, and the corresponding Polish forms *piekę, pieczesz, pieką*). Other inherited consonant alternations are reflected in the relation between infinitive and present tense (*písať* ‘to write’ vs. *píšem* ‘I write’), past tense and present tense (*mohol* ‘he could’ vs. *môže* ‘he can’), or perfective and derived imperfective (*potvrdiť* ‘confirm – pf.’ vs. *potvrďovať* ‘confirm – impf.’). Quantitative alternations of vowels appear in conjugation (e.g., *piecť* ‘to bake’ vs. *pečiem*) and in the derivation of imperfective from perfective verbs (e.g., *kúpiť* vs. *kupovať* ‘buy’ or *skrýť* vs. *skrývať* ‘hide’), as well as in nonverbal derivation (e.g., *Nitran* ‘man from Nitra’ vs. *Nitrianka* ‘woman from Nitra’).

Syntax

Slovak word order is relatively free and is used, together with sentence intonation, to express the informational structure of the utterance. Thus, the rheme normally follows the theme in emotionally neutral speech. Pronominal and some verbal clitics follow the first stressed word in a sentence. Among them is the particle *sa*, which is historically the enclitic accusative form of the reflexive and reciprocal pronoun. The reciprocal function is still present (e.g., *poznáme sa* ‘we know one another’), but true reflexive uses are rare (e.g., *brániť sa* ‘defend oneself’). Verbs with *sa* can express a variety of meanings, among other things, a kind of middle voice (e.g., *umývať sa* ‘wash/wash up/get washed’) and also an intransitive verb with an unaccusative subject (e.g., *lekcija sa začína* ‘class is beginning’). They can also be used in passive constructions with unexpressed agent (e.g., *reči sa hovoria a chlieb sa je* ‘speeches are spoken, but bread is eaten’). As in some other Slavic languages, *sa* has acquired the function of a generic human subject, parallel to German *man* or French *on*, with third-person singular agreement (e.g., *hovoria sa* ‘they/people say’).

The enclitic dative form of the reflexive and reciprocal pronoun, *si*, occurs both in its literal meaning (e.g., *pomáhať si* ‘help one another’ or ‘help oneself’) and like *sa*, as a component of *reflexiva tantum* (e.g., *všimáť si* ‘notice’; cf. *báť sa* ‘be afraid’). Both *sa* and *si* also combine with prefixes to produce a variety of Aktionsart meanings (e.g., *nasedieť sa* ‘have one’s fill of sitting,’ *pospať si* ‘have oneself a nap’).

First- and second-person subject pronouns are normally used only for contrast or emphasis; third-person subject pronouns are typically dropped after their first use, unless a previous theme has been reintroduced. Nonfamiliar address uses second-person plural forms of pronouns and verbs.

Lexicon

In addition to preserving its Common Slavic patrimony, the Slovak lexicon has been open to borrowings and adaptations from neighboring languages. Among the earliest borrowings were elements of Christian terminology from Latin, often via German. Throughout the centuries, those two languages, as well as Czech, Hungarian, and Romanian have been important linguistic donors (Slovak has also contributed to Hungarian); in more recent times, Polish, Russian, French, and English have also served as source languages. In the last decades, the role of internationalisms and Anglicisms has been especially important.

Dialectology

The three major dialect areas are Western Slovak, which is transitional to Moravian Czech; Central Slovak, which served as the basis for the literary language; and Eastern Slovak, which is transitional to Polish. The most striking feature of Eastern Slovak is the lack of quantitative distinctions and a tendency to penultimate stress. Central and Western Slovak both distinguish long and short vowels, but the ‘rhythmic law’ that (with a variety of systematic exceptions) prevents two successive long syllables applies only in Central Slovak. Central and Western Slovak both have initial stress.

History

The incorporation of the Slovak lands into the Hungarian kingdom that was established at the end of the 10th century separated the Slovaks from the Czechs, who maintained their independence until being subdued by the Habsburgs in 1648. The written language of the Hungarian kingdom, and therefore also of Slovakia, was Latin, but thanks to continuing contacts with their Czech brethren, Slovaks began to use Czech as a written language as well. This was especially true after the establishment of Charles University in Prague in 1348, where Slovaks were among the students, and with the influence of the Hussite movement in the 15th century. From the beginning, the Czech written by Slovaks showed the influence of spoken Slovak.

As early as the 15th century there were efforts to write in Slovak, but the first comprehensive effort to create a Slovak literary standard was by a Catholic priest, Anton Bernolák, at the end of the 18th century, who based his norms on the Western Slovak dialects. Perhaps because Western Slovak is closest to Czech, Bernolák’s project did not win general acceptance. Slovak Protestants continued to base their writing on the language of the Czech Kralická Bible.

In the middle of the 19th century, Ľudovít Štúr and his colleagues proposed a new literary standard based on the Central Slovak dialects, and this became the basis of the modern Slovak literary language. During the first Czechoslovak Republic (1918–1938), Slovak linguists had to cope with the official doctrine of a single Czechoslovak language, and after World War II the question of the relationship between the Slovak and Czech languages was still on the agenda. Since the creation of two independent states in 1989, there is evidence of decreasing mutual intelligibility, especially among the younger generation of Slovaks and Czechs, who are less exposed to mass media in the other language.

Introduction

Overview

Slovene (or Slovenian), the titular language of the Republic of Slovenia, is spoken by some 2.4 million people, including speakers in bordering areas in Italy, Austria, and Hungary as well as in diaspora communities in Argentina, Australia, Canada, and the USA.

Together with Bosnian, Croatian, and Serbian (Serbo-Croatian), Slovene makes up the Western subgroup of the South Slavic branch of the Slavic languages (Indo-European). Slovene transitions to the Čakavian and Kajkavian dialects of Croatian. It is less close to the Štokavian dialect, the basis for the Bosnian, Croatian, and Serbian standard languages. Ancient connections to the central dialect of Slovak (West Slavic) are evident.

Slovene is traditionally divided into seven dialects, each of which has further dialect differentiation: (I) littoral dialects, spoken partly in Italy; (II) Carinthian, spoken mostly in Austria; (III) Upper Carniolan; (IV) Lower Carniolan; (V) Styrian; (VI) Pannonian, spoken partly in Hungary; (VII) Rovte (Figure 1). There are 48 distinct local varieties.

Standard Slovene is constructed of features from various dialects and historical stages of Slovene and does not correspond exactly to any one dialect. Even in the capital, Ljubljana, everyday speech differs in fundamental ways from the standard; compare standard: *kaj mislite?* 'what do you think?' and colloquial: *kva misl̩te?*

Historical Development and Emergence of Literary Language

By the 6th or 7th century A.D., Proto-Slovene was spoken in an area bounded by the Tagliamento River, the Gulf of Trieste, Linz and the outskirts of Vienna, and the southern end of Lake Balaton. The

Proto-Slovene speech territory gradually diminished in the medieval period as speakers shifted to Friulian, Italian, German (Standard German), and Hungarian, leaving a core area today consisting of the Republic of Slovenia plus border areas in Italy, Austria, and Hungary.

The earliest surviving documents are the Freising Folia, liturgical texts composed around 1000 A.D., which are among the oldest attestations of any Slavic language. There are a few surviving Slovene documents dating from then until the middle of the 16th century, mostly religious and legal texts. The first printed books in Slovene are Primus Truber's (1508–1586) *Catechismus* (1550) and Jurij Dalmatin's (1547–1598) translation of the Bible (1584), which mark the first attempt at a standard language. Truber modeled the language on the speech of Ljubljana and his native Lower Carniolan. The Counter-Reformation submerged Truber's legacy, while the Protestants developed a regional literary language in the northeast.

Until the 19th century, Slovene remained secondary to the state language, German (Standard German), and, regionally, Italian and Hungarian. Modern standard Slovene dates to Jernej Kopitar's 1809 grammar, the prestige of which was elevated by the poet France Prešeren (1800–1849) and the intellectual circle around Sigismund Zois (1747–1819). The orthographic system essentially as it is found today was codified in Maks Pleteršnik's Slovene–German Dictionary (1894–95).

Political Issues and Language Maintenance

After the incorporation of the Slovene speech territory (minus border regions in Austria, Italy, and Hungary) into the Kingdom of Serbs, Croats and Slovenes in 1918 (renamed Yugoslavia in 1929), Slovene now became subordinate to Serbo-Croatian, the *de facto* lingua franca of the Yugoslav state. The legal status of Slovene was raised after World War II. Its rights as an official language were reaffirmed in the 1974 Yugoslav Constitution. In reality, the status of Slovene remained unfavorable with

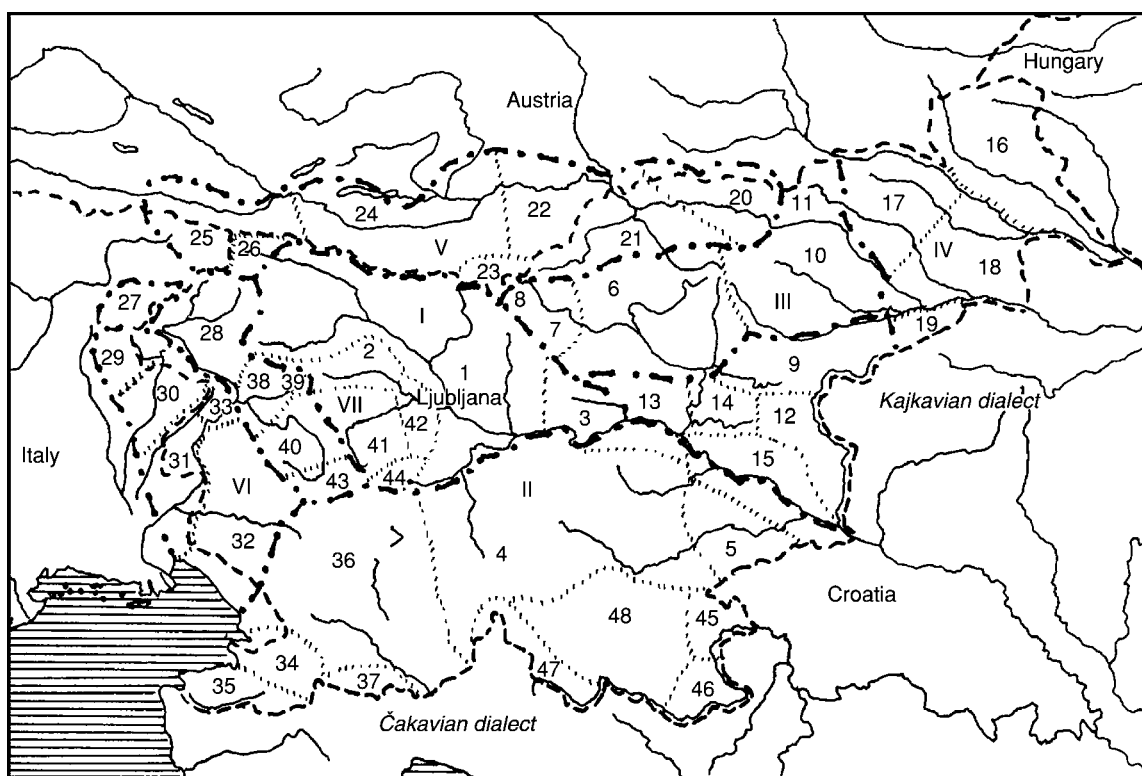

Figure 1 Map of Slovene dialects. Roman numerals indicating local speech varieties are referenced in Greenberg (2000).

respect to Serbo-Croatian, an issue that contributed to Slovene dissatisfaction with Yugoslavia and was resolved with the 1991 Slovene secession from that state.

Slovenes continue to be concerned with language rights among their minorities in Italy, Austria, and Hungary, where they have attempted to encourage the respective governments to accord language rights and allow Slovene-language media and education.

Slovene became one of the official languages of the European Union with the 2004 accession.

Phonology

Writing System

Slovene is written in modified Roman letters, with diacritic marks for sounds not represented by the inherited alphabet (see **Table 1**). Several other letters are sanctioned in standard orthography to render direct citation of foreign words, viz., *Ç, ç; Ć, ć; Đ, đ; Q, q; Š, š; X, x; Y, y; Ž, ž; Ž, ž*.

Vowel System

See **Table 2**. *i, e, ε, a, ɔ, o, u* occur in long stressed syllables, while stressed *ə* is always short (*pes* [pəs] ‘dog’). In unstressed syllables the distinctions

Table 1 The Slovene alphabet

| Upper case | Lower case | Pronunciation (IPA values where significantly different than English) |
|------------|------------|---|
| A | a | [a] |
| B | b | |
| C | c | [ts] |
| Č | č | [tʃ] |
| D | d | |
| E | e | corresponds to tense and lax e-vowels or schwa (see vowel chart) |

| S | s | |
| Š | š | [ʃ] |
| T | t | |
| U | u | [u] |
| V | v | [w] before a consonant or in word-final position |
| Z | z | |
| Ž | ž | [ʒ] as the s in pleasure |

Table 2 Standard Slovene vowel phonemes

| | Front | Central | Back |
|------------------|-------|---------|------|
| High | i | | u |
| Tense (high-mid) | e | ə | o |
| Lax (low-mid) | ɛ | | ɔ |
| Low | | a | |

between *e*–*ɛ* and *o*–*ɔ* are neutralized to *ɛ* and *ɔ* respectively: *človek* [tʃlɔːvɛk] ‘person-NOM-sing’, *človeka* [tʃlɔːvɛka] ‘person-GEN-sing’; *potok* [pɔːtɔk] ‘stream-NOM-sing’, *potoka* [pɔːtɔka] ‘stream-GEN-sing.’ The grapheme *r* between consonants represents a sequence of *ə* + *r*, e.g., *vrt* [vɔrt] ‘garden,’ *srce* [sɔrce] ‘heart.’

Word Prosody

Standard Slovene pronunciation allows two accentual norms, one with pitch accent (characteristic of the Carniolan dialects), the other by stress and vowel length. In the pitch accent system, any long-stressed syllable – almost always only one per accented word – is characterized by either a low rising tone or a high falling tone. Accented words (i.e., not unstressed particles, prepositions, conjunctions, and some pronouns) that lack a long-stressed vowel are short stressed (phonetically high falling) on the final syllable, for example, *brati* [brá:ti] ‘to read’ (low rising), *brat* [brà:t] ‘to go read’ (high falling), *brat* [brát] ‘brother’ (short), *poskòk* ‘hop’ (short).

Stress patterns are morphophonemic in that each morpheme carries an underlying prosodic marker and the concatenation of morphemes to form words determines realization of the placement and identity of the pitch and quantity. The realization of these concatenation rules is that paradigms are characterized either by fixed or by mobile stress patterns, e.g., fixed: *mesto* [mé:sto] ‘town-NOM/ACC-sing’–*mesta* [mé:sta] ‘town-GEN-sing’–*mestu* [mé:stu] ‘town-DAT-sing’; mobile: *meso* [mesò:] ‘meat-NOM/ACC-sing’–*mesa* [mesà:] ‘meat-GEN-sing’–*mesu* [mé:su] ‘meat-DAT-sing.’

Consonant System

See Table 3. *V* is pronounced as English *v* only when it precedes a vowel; otherwise, it is pronounced similarly to *w*: *cerkve* ‘church-GEN-sing,’ *cerkev* [-kəw] ‘church-NOM-sing’; *vrag* [vrak] ‘devil’; *naukreber* [-wk-] ‘uphill.’ *L* is usually pronounced as *w* in word-final position and before a consonant (except in some morphologically conditioned environments, where it is pronounced as [l]): *vedela* ‘she knew,’ *vedel* [-dew] ‘he knew’; *poznavalec* [-ləc] ‘connoisseur-NOM-sing,’ *poznavalca* [-wca] ‘connoisseur-GEN-sing.’

| Glides | | v [w] | | j | |

Morphology

Slovene is an inflecting language. Nouns, pronouns, adjectives agree in case, number, and gender. The cases are nominative, accusative, genitive, dative, locative, and instrumental, the last two occurring obligatorily with prepositions. In addition to plural and singular, Slovene has distinct forms for dual. The genders are feminine, masculine, and neuter.

In the standard language masculine adjectives in the nominative and accusative mark the definite article, e.g., *grd obraz* ‘(an) ugly face,’ *grdi obraz* ‘the ugly face.’ In the colloquial language a definite article has developed from a demonstrative pronoun (in all genders and numbers): *grd* ‘ugly’ (generic or indefinite), *ta grd* ‘the ugly (one).’ An indefinite article, also characteristic of colloquial speech, has developed from the numeral ‘one’ (*eden*), e.g., *ena grda faca* ‘an ugly face/guy.’

The present tense of the verb distinguishes person and number. Pronouns are normally dropped unless the subject is emphasized or reference is switched. Second person plural is used also as an honorific for a single addressee.

Verbs distinguish imperfective and perfective aspect, in general, incomplete vs. completed action. Unprefixed verbs are usually imperfective (*pisati* ‘to write’) or bi-aspectual (*nesti* ‘to carry’). Prefixation creates additional, primarily perfective meanings, such as *podpisati* ‘to sign (e.g., a document),’ *odnesti* ‘to carry something away.’ Imperfectives are derived from these prefixed forms by suffixation and sometimes also vowel gradation, e.g., *podpisovati* ‘to sign repeatedly, to be in the process of signing,’ *odnašati* ‘to carry away repeatedly, to be in the process of carrying away.’

Noun and Adjective Inflection

See Tables 4–6.

Table 4 Singular ADJ + noun

| Case | Feminine | Masculine | Neuter |
|--------------|-----------------------------------|--|-----------------------------------|
| Nominative | lepa hiša 'beautiful house' | lep(i) hrib 'beautiful hill, mountain' | lepo mesto 'beautiful town' |
| Accusative | lepo hišo | lep(i) hrib | lepo mesto |
| Genitive | lepe hiše | lepega hriba | lepega mesta |
| Dative | lepi hiši | lepemu hribu | lepemu mestu |
| Locative | (pri) lepi hiši | (pri) lepem hribu | (pri) lepem mestu |
| Instrumental | (z) lepo hišo | (z) lepim hribom | (z) lepim mestom |

Table 5 Plural ADJ + noun

| Case | Feminine | Masculine | Neuter |
|--------------|----------------------|-----------------------|-----------------------|
| Nominative | lepe hiše | lepi hribi | lepa mesta |
| Accusative | lepe hiše | lepe hribe | lepa mesta |
| Genitive | lepih hiš | lepih hribov | lepih mest |
| Dative | lepim hišam | lepim hribom | lepim mestom |
| Locative | (pri) lepih hišah | (pri) lepih hribih | (pri) lepih mestih |
| Instrumental | (z) lepimi hišami | (z) lepimi hribi | (z) lepimi mesti |

Table 6 Dua ADJ + noun

| Case | Feminine | Masculine | Neuter |
|---------------------------|----------------------|-----------------------|-----------------------|
| Nominative, Accusative | lepi hiši | lepa hriba | lepi mesti |
| Genitive | lepih hiš | lepih hribov | lepih mest |
| Locative | (pri) lepih hišah | (pri) lepih hribih | (pri) lepih mestih |
| Dative, Instrumental | lepima hišama | lepima hriboma | lepima mest- oma |

Verb Inflection

The present tense declension marks person and number. Past and future tenses are constructed of an auxiliary (*sem* = past, *bom* = FUT), conjugated as in the present tense, plus a past participle marked for gender and number, e.g., *sem delal* 'I worked-MASC-sing,' *bom delala* 'I shall work-FEM-sing.' The conditional is formed with an invariant particle *bi*, e.g., *bi delali* 'we/you all/they would work' (see Table 7).

Syntax

Word Order

Neutral word order (1) is SVO, but the order may be rearranged depending on emphasis, with either the

Table 7 Present-tense inflection

| | Singular | Plural | Dual |
|---|--------------------|---------|---------|
| 1 | vozi-m '(I) drive' | vozi-mo | vozi-va |
| 2 | vozi-š | vozi-te | vozi-ta |
| 3 | vozi | vozi-jo | vozi-ta |

object moving to the beginning (2) or the subject to the end of the sentence (3).

- (1) *Miran je kupil kruh*
Miran-NOM-sing 3-sing-AUX
bought-MASC-sing bread.ACC
'Miran bought bread'
- (2) *Kruh je kupil*
bread.ACC 3-sing-AUX bought-MASC-sing
'He bought bread'/'It was bread that he
bought'
- (3) *Kruh je kupil*
bread.ACC 3-sing-AUX bought-MASC-sing
Miran
Miran-NOM-sing
'Miran bought bread'/'It was Miran who bought
bread'

In noun phrases the order is DEM + NUM + ADV + ADJ + noun, where all but the ADV agree in case, number and gender:

- (4) *Tisti dve prav brihtni punčki*
those-DEM-NOM-DU-FEM two-NOM-DU-FEM quite-ADV
bright-NOM-DU-FEM girls-NOM-DU-FEM
'these two quite bright girls ...'

Clitics

Clitic elements, in accord with Wackernagel's Law, follow directly after the first accented word or noun phrase in the main clause:

- (5) *Trudili smo se jo razumeti*
try-IMPERF-PP-MASC-PL AUX-1-PL
REFL-PART PRO-3-sing-ACC-FEM understand-INF
'we were trying to understand her'

Subordinate clauses are typically introduced by *da* 'that,' *ki / kateri* 'which,' *ker* 'because,' *ko(t)* 'as,' *če* 'if':

- (6) *Prepričana sem, da je tvoj računalnik zastarel*
convinced-FEM-sing be-1-sing that be-3-sing
your-MASC- comp-MASC- superannuated-
sing-nom sing-NOM MASC-sing-NOM
'I'm convinced that your computer is obsolete'

- (7) *Pazi,* *ker* *te*
 watch out-IMP-2-sing because PRO-2-sing-ACC
bo *avto* *povozil*
 FUT-AUX-3-SG car-ACC-SG run over-PP-MASC-SG
 'watch out or the car will run you over'

Lexicon

Historical influences on Slovene have come from Friulian, German (Standard German) (especially the Bavarian and Tyrolean dialects), Hungarian and Croatian (Serbo-Croatian), as well as Venetian Italian (Venetian), Dalmatian and Istrian Romance. A number of languages, including Illyrian and continental Celtic, may have made up substrata to Proto-Slovene (or, more likely, to the Romance dialects that preceded it) and are recognizable as trace elements in the vocabulary, e.g., from Celtic *Karavanke* 'Karawanken Alps,' *Kranj(ska)* 'Carniola.' German (Standard German) and English are the source of most contemporary loans, though these are officially deprecated in favor of native formations, which are increasingly accepted in everyday speech, e.g., *zgoščenska* 'compact disk' from *zgotiti* 'to make compact,' replacing *cedejka*. The youngest generation uses English freely, e.g., *ful dober* 'really good' (from Eng. *full*).

Sogdian

P O Skjærvø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Sogdian, an Eastern Middle Iranian language, was spoken at least up to the 8th century in Sogdiana, the area of modern Uzbekistan that includes the cities of Samarkand and Bukhara. Many Sogdians were merchants, however, and traveled east as far as China, bringing with them the Sogdian language. The Manicheans and Christians, as they fled from persecutions from the 3rd century on, took the Sogdian language with them to the farthest reaches of Chinese Turkestan and beyond, into Mongolia, where the Sogdian alphabet was adopted by the local Turks and the Mongolians, who still use it. The Sogdian written remains consist of religious and nonreligious texts. Most of the religious texts are translations, the Buddhist texts from Chinese, the Manichean ones from Persian and Parthian, and the Christian ones from Syriac.

We have Sogdian texts in five different alphabets: Old Sogdian Aramaic, Sogdian-Uighur (Uyghur), Manichean, Nestorian Christian, and Northern Brahmi. The Sogdian Aramaic script is used in the *Ancient letters* (see below) and in graffiti on rocks along the Karakorum Highway in northern Pakistan. The Sogdian-Uighur script is the most common, being used for secular documents, as well as for Buddhist and Manichean texts. The Manichean and Nestorian scripts were used for Manichean and Christian texts, respectively. There are a small number of late Sogdian manuscripts from Turfan written in Northern Brahmi script.

In early times, the Sogdians must have been the neighbors of the Tocharians (see **Tocharian**), who borrowed numerous (proto-)Sogdian words. The modern Iranian language Yaghnobi is the descendant of a Sogdian dialect different from the known Sogdian.

The oldest Sogdian texts are the *Ancient letters*, written on paper and discovered by the British-Hungarian discoverer and archeologist Marc Aurel Stein in eastern Chinese Turkestan (now in The

British Library). The letters can be dated to the early 4th century by references to current events.

From the 8th century, we have a collection of letters and administrative, economic, and legal documents written in the Sogdian script from the archives of King Dhewastich found at Mount Mug east of Samarkand.

The largest corpus of Sogdian texts are the Buddhist texts removed from a cave at Dunhuang in eastern Xinjiang by Aurel Stein and the French scholar and archeologist Paul Pelliot (now in The British Library and the Bibliothèque Nationale). Numerous Sogdian Manichean and Christian texts were discovered at Turfan in northeastern Xinjiang by German archeologists (now in the Brandenburgische Akademie der Wissenschaften in Berlin).

Sogdian phonology and morphology are both conservative and innovative. The most important innovation is the 'rhythmic law,' by which words with long vowels before the endings ('heavy' stems), lose final short vowels. Thus, OIran. SING NOM **wrk-ah* and ACC **wrk-am* 'wolf' are Sogd. *wər-k-í* and *wər-k-ú* ('light' stem), while OIran. **daiw-ah* and **daiw-am* and **daiw-am* 'demon' are both *ḏēw*. Sogdian shares with Ossetic the plural suffix *-t-* (originally a collective noun, hence declined like a feminine singular), for instance, *ḏēw-t* 'demons'; forms of *ḏbar-* 'door': SING NOM *ḏbar-í*, LOC *ḏbar-yá*, PLUR NOM-ACC *ḏbar-t-á*, GEN-DAT, LOC *ḏbar-t-yá* 'at the doors'. Sogdian uses demonstrative pronouns as definite articles (*xō mártī* 'the man', *xā strīš-t* 'the women' [*< strīč-*], *uya kánθ-ī* 'in the city' [LOC]).

The verb system is complex. There are three stems: present, past, and perfect (perfect participle = past stem + suffix *-ē*, FEM *-č-a*; e.g., PRES *pətsáč-* 'fit', PAST *pətsayt-*, PERF MASC *pətsayt-ē*, FEM *pətsayč-á* [*-yt-č->-yč-*]). It has all the Old Iranian moods (indicative, imperative, subjunctive, optative, injunctive), as well as active and middle. It has, in modified form, the old imperfect, for instance, PRES *βar-ám*, IMPERF *βar-ú* 'I carry, carried', PRES *wén-am*, IMPERF *wén* 'I see, saw', PRES *θaβr-ám*, IMPERF *θáβr-u* 'I give, gave'. Progressive tenses are formed with the suffix *-skun* (*-sk*) and the future with the suffix *-kām* (*-kan*, *-k*) from a noun meaning 'wish' (IMPERF PROG *βar-á-skun* 'he was carrying', FUT *βar-ám-kām* 'I shall carry'; Christian Sogd. PRES PROG *γərb-ám-sk* 'I am seizing', FUT *wáb-t-kan* 'he shall say').

There is a large range of past tense forms built on the remade Old Iranian perfect system: transitive active tenses with past stem plus the verb *ḏār-* 'hold, have' (e.g., *uyt-u-ḏār-t* 'he has said'), but intransitive and passive tenses with past stem plus copula (e.g., *tγat-éš* 'you entered', *ážit-əθa* 'you were born').

The perfect is made with the perfect participle in the same way (e.g., *βast-é ḏārand* 'bind-PERF.MASC hold.PRES-3RD.PLUR' = 'they hold/keep bound', *βast-č-á astí* 'bind-PERF.FEM COP.3RD SING' = 'she is (now) bound'). The passive is made with the perfect participle plus 'be, become' (e.g., *βast-é-t uβ-and* 'bind-PERF.MASC.PL become.PRES-3RD.PLUR' = 'they are being bound', *ánxast-ē əkt-ēm* 'goad-PERF.MASC become.PAST-COP.1ST SING' = 'I was goaded').

Among special formations, note the 'potentialis,' formed with a past participle with the ending (light) *-a* and the verbs *kun-* 'to do' (active) and *β-* 'become' (passive), by which possibility and completion of action are expressed (e.g., *nē žayd-á kun-am* 'NEG uphold.PART do.PRES-1ST.SING' = 'I cannot uphold', *nē āpāt βō-t* 'NEG reach.PART become.PRES-3RD.SING' = 'it cannot be reached', *čānō xwart xurt kun-and* 'when food eat.PART do.IMPERF-3RD.PL' = 'when they had eaten').

There are minor dialect differences between texts written in the Sogdian, Manichean, and Nestorian scripts (e.g., Sogd. *wan-*, *kun-* 'to do', Man., Chr. *kun-*). Christian Sogdian also has phonetically more developed forms (see also on the progressive and future above), e.g., **kərtu-ḏār-am* 'I did, I have done' > Buddhist Sogdian *əktu-ḏār-am* > Christian Sogdian *k-θār-am*.

Somali

F Serzisko, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

Somali is a Cushitic language of the Afro-Asiatic language family spoken by approximately 10 million speakers in and around Somalia. There are five major Somali dialects (Lamberti, 1986).

Phonology

The following consonant phonemes are distinguished as shown in Table 1.

There are five vowels: a, e, i, o, u and vowel length, in standard orthography indicated by doubling the vowels, is distinctive.

The following shows the letters used in Standard Somali orthography

| | | | | | | |
|--------------------|---|---|---|----|----|----|
| IPA | ʔ | ʕ | ħ | ʃ | ɖ | x |
| Somali Orthography | ' | c | x | sh | dh | kh |

Tone appears to be distinctive in Somali both on the lexical level and on the grammatical level. It is, however, still a matter of debate whether this tonal distinction is really a tonal distinction or pitch accent (Hyman, 1981 for discussion).

In terms of syllable structure, no word-initial or -final consonant clusters are allowed.

Morphology

Verbs

Somali has a rather rich system of lexical affixes by which new stems can be derived. The main derivational affixes are listed below.

| | | | |
|-----------------|-------------|--------------------|------------------------|
| Causative | | | |
| in jabay | 'is broken' | <i>jab-i-yey</i> | 'to break' |
| Stative/passive | | | |
| am jeex | 'to tear' | <i>jeex-an'</i> | 'to be torn' |
| Autobenefactive | | | |
| an wádayaa | 'to drive' | <i>wadá-na-yaa</i> | 'to drive for oneself' |

Table 1 Consonant phonemes

| | | | | | |
|---|-----|---|---|-----|------|
| b | t d | ɖ | | k g | q |
| m | | n | | | |
| | | | J | | |
| | | l | | | |
| | | r | | | |
| | f | s | ʃ | x | ħʕ h |
| w | | | y | (W) | |

The following examples demonstrate the use of these derivational affixes with the verb *fur* 'to open':

| | |
|----------------------|--------------------------------------|
| <i>Wuu fúrayaa</i> | 'He is opening it. |
| <i>Wuu fúrmayaa</i> | 'It's getting opened, it is opening' |
| <i>Wuu furánayaa</i> | 'He is opening it for himself' |

Morphosyntactic categories of the verb are tense, aspect, and person. There is also an inflectional distinction between main and subordinate predications.

The basic tense distinction is past/non-past, whereby non-past usually has a habitual meaning. Future is expressed by periphrastic construction with the auxiliary *doon* 'want'. There is furthermore an aspectual distinction between progressive and non-progressive.

| | | |
|-------------------|----------------|---------------------------------|
| | Past | Non-Past |
| Non-Progressive | | |
| <i>Keen-ay</i> | 'brought' | <i>Keen-aa</i> 'brings' |
| Progressive | | |
| <i>Keen-ay-ay</i> | 'was bringing' | <i>Keen-ay-aa</i> 'is bringing' |

The progressive form is historically derived from an auxiliary construction with the verb *hay* 'to have'.

The verb agrees with the subject in gender and number. Inflection is mainly done by suffixes (weak verbs) but there is a small group of five verbs that still have at least partly prefix conjugation (strong verbs). The following sample shows the main verbal forms for the weak and the strong verbs. It should be noted that at least in the main paradigms the forms for 1st and 3rd person masculine and the forms for 2nd and 3rd person feminine are identical.

A sample paradigm for the simple past is given for *keen* 'bring' and *yimi* 'come'

| | | |
|---------|-----------------|-------------------|
| | Weak verbs | Strong verbs |
| | 'bring' | 'come' |
| 1st/3sm | <i>keenay</i> | <i>imid</i> |
| 2nd/3sf | <i>keentay</i> | <i>ti-mid</i> |
| 1pl | <i>keemay</i> | <i>nimid</i> |
| 2pl | <i>keenteen</i> | <i>timaaddeen</i> |
| 3pl | <i>keeneen</i> | <i>yimaaddeen</i> |

Predicate negation is expressed by preverbal particles and verbal inflection. An invariable form is used for all persons in the past. The present form inflects regularly.

| | | |
|----------|--------------------|------------------------------|
| Past: | <i>Má keenín</i> | 'I/you/he etc. didn't bring' |
| | <i>má iman</i> | 'I/you/he/etc. didn't come' |
| Present: | <i>má keenó</i> | 'I don't bring' |
| | <i>má imaaddó</i> | 'I don't come' |
| | <i>Má keentó</i> | 'she doesn't bring' |
| | <i>má timaaddó</i> | 'she doesn't come' |

Nouns

Nominal morphosyntactic categories are case, number, and gender. There is a twofold gender distinction based on masculine and feminine. Gender is marked by tonal distinction and by agreement on determiners like possessives, demonstratives, articles, and the verb. The masculine marker is basically *k* the feminine marker *t*. For a discussion of the status of these, see Lecarme, 2002.

Nin-ka 'the man' *naag-ta* 'the woman'
inan-kayga 'my son' *gacan-tayga* 'my arm'

The basic distinction with number is singular/plural. Plural is marked by several means depending on the length and the gender of the noun. The following examples demonstrate the diverse plural forms.

| | Singular | Plural |
|---------------|---------------|-------------------|
| Woman | <i>náag</i> | <i>naago</i> |
| Road | <i>dariiq</i> | <i>dariiqyo</i> |
| Shoulderblade | <i>gárab</i> | <i>garbo</i> |
| Man | <i>nín</i> | <i>niman</i> |
| Bull | <i>díbi</i> | <i>dibí</i> |
| Story | <i>shéeko</i> | <i>sheekóoyin</i> |
| Father | <i>áabbe</i> | <i>aabbayaal</i> |

There are mainly two cases: subject case and absolutive. The absolutive is the base form and the subject case is marked by a tonal distinction and optionally by the segmental elements *-i* with indefinite and *kultu* with definite nouns. This subject marking occurs at the end of the entire noun phrase:

Buug-ga cusub ee wiil-kan-i
 Book-DET new COORD boy-DEM-SUBJ
wux-uu yaala miis-ka guud-kiisa
 wax-3sm located table-DET top-poss3sm
 'The new book of this boy is lying on the table'

Possession is marked on the noun by pronominal suffixes: *aabe-hiis-a* 'his father'. If the possessor is expressed by a noun then the two nouns are juxtaposed and the order is possessee possessor: *faras-ka nin-ka* (horse man) 'the horse of the man'. Alienability is not expressed in Somali, with the exception that kin relationships cannot be simply juxtaposed but use an inverted construction where the possessor is additionally expressed: *ínanka aabi-hiis* 'the father of the boy' (lit. the boy his father). This construction is optional with other possessive relations.

Numerals are nouns and within the noun phrase they precede the noun and actually function as the head of the complex construction.

Laba nín 'two men' *sáddex nín* 'three men' *áfar nín* 'four men'

Adjectives

Qualitative concepts are expressed by elements whose status is not entirely clear (For a discussion, see the contributions in Bechhaus-Gerst and Serzisko (eds.), 1988). In predicative usage these elements occur with the copula:

Buug-gan waa wanaagsán yahay.
 Book-DEM DM good COP:3sm
 'This book is good.'

In attributive usage, adjectives may agree with their head noun in number; agreement is indicated by reduplication of the first syllable:

Guri cusub 'a new house'
guriyo cuscusub 'new houses'

The comparative is expressed by means of verbal case particles:

Nín-kanu nín-káas wuu ká wèyn yahay
 Man-this man-that DM than(ABL) big COP
 That man is bigger than that man.

The superlative is formed with the preverbal particle cluster *ugú*:

Nínkanu wuu ugú dhèer yahay
 Man-this DM most tall COP
 'This man is the tallest'

Syntax

The structure of a simple sentence can roughly be described as consisting of a verb complex, which contains all the necessary information, and noun phrases, which stand in a kind of appositive relation to this verbal complex. The structure of the verbal complex is as follows:

waa Impersonal object pronoun case marker
 directional verb stem

waa is a declarative marker that stands in complementary distribution with the negative marker. The declarative marker in main clauses, which has also been described as a verbal focus marker (see below), is the left-most element in the verbal complex. The next position may be filled by an impersonal marker. Object pronouns for 1st and 2nd person follow. The 3rd person object is always zero. These pronouns combine with the following case markers. Four cases are distinguished: benefactive /u/, locative/instrumental /ku/, ablative /ka/ and comitative /la/. The following shows the combinations of object pronouns and case marker for the singular pronouns:

| | | | | |
|-----------|-------------|-------------|------------|-------------|
| | Benefactive | Loc/Instr | Ablative | Comitative |
| 1st sing. | <i>ii</i> | <i>igu</i> | <i>iga</i> | <i>ila</i> |
| 2nd sing. | <i>kuu</i> | <i>kugu</i> | <i>kaa</i> | <i>kula</i> |

Directional particles indicate whether the action is directed toward the speaker /soo/ or away from speaker /sii/, as in the following examples.

| | | | |
|--------------|---------------|----------------|-----------------------|
| <i>w-aan</i> | <i>ku</i> | <i>ark-ay</i> | 'I saw you' |
| DM-1sg | 2sgOBJ | see-1sg | |
| <i>w-aan</i> | <i>ku-gu</i> | <i>ark-ay</i> | 'I saw you in it' |
| DM-1sg | 2sgOBJ-LOC | see-1sg | |
| <i>w-uu</i> | <i>ku soo</i> | <i>noqd-ay</i> | 'He came back to it.' |
| DM-3sm | LOC back | came-3sg | |

The negation particle also occurs within the verbal complex:

| | | |
|------------------------------|------------|----------------|
| <i>I-i-ma</i> | <i>soo</i> | <i>iibinin</i> |
| 1sgOBJ-DAT-NEG | DIR | bought-NEG |
| 'He didn't buy them for me.' | | |

Sentence Structure

The most striking feature of Somali is the use of focus particle. Noun focus is expressed by the particles *ayaa/baa*, which are alternants whose use is determined by regional and stylistic factors, following the noun in focus. The particle *waa*, which has been described as a declarative marker above, is by some authors called verbal focus marker. Nominal and verbal focus markers stand in complementary distribution, i.e., there can only be one focus marker in a main clause. The form of the focus marker is as a rule dependent on whether the noun in focus is the subject of the sentence or not. If the subject is in focus the marker occurs in its simple form and the predicate occurs in the restricted form. This indicates that the source of the focus construction may be a relative clause. If a non-subject is focused the subject pronoun combines with the focus marker, which yields the following paradigm of forms:

| | | |
|-----------|---------------|------------------------|
| | Singular | Plural |
| 1st sing | <i>ay-aan</i> | <i>ay-aymulay-aanu</i> |
| 2nd | <i>ay-aad</i> | <i>ay-aad</i> |
| 3rd masc. | <i>ay-uu</i> | <i>ay-ay</i> |
| 3rd fem | <i>ay-ay</i> | |

There is, furthermore, a presentative marker *waxa*, which also attracts the subject pronoun. This construction is used to highlight a nominal participant in a kind of clefting construction. The highlighted noun phrase occurs after the verbal complex.

| | |
|-------------------------------|----------------------|
| <i>Shaah b-aan doonayaa.</i> | 'I want some tea' |
| <i>waxaan doonayaa shaah.</i> | 'What I want is tea' |

Word Order

The unmarked word order in a main clause is SOV, the order of the nominal participants is relatively free and interacts with the focus marking system.

| | |
|-------------------------------------|--------------------------------------|
| <i>Nin-kii libaax-ii ayuu dilay</i> | 'The man killed the lion.' |
| Man-DET lion-DET FOC-3sg kill-3sg | |
| <i>Libaax-ii ninkii ayaa dilay</i> | 'The lion was killed by the man' |
| <i>Nin-kii ayaa libaax-ii dilay</i> | 'It was the man who killed the lion' |

Since there is an obligatory syntactic and morphological marking of aspects of discourse structure, Somali can be considered to be an example of a discourse configurational language (Svolacchia *et al.*, 1995).

Questions

Yes-No questions are formed by replacing the declarative marker *waa* by the question particle *ma*:

| | |
|------------------------|-----------------------|
| <i>Cali wuu yimid.</i> | <i>Cali ma yimid?</i> |
| 'Ali came' | 'Did Ali come?' |

If the sentence contains a nominal focus the question particle is placed before the focused noun phrase:

| | |
|-------------------------|----------------------------|
| <i>Cali baa keenay.</i> | <i>Ma Cali baa keenay.</i> |
| 'ALI brought it.' | 'Did ALI bring it?' |

WH-questions always involve nominal focus and the questioned noun phrase stands with the interrogative article *keel/tee*:

| | |
|-------------------------------|--|
| <i>Ninkee ayaa yimi?</i> | 'Which man came?' |
| <i>Xaggee buu tegay?</i> | 'Which place did he go? = Where' |
| <i>Sidee baad u sameysey?</i> | 'In which manner did you do it? = How' |
| <i>Intee baad joogaysaa?</i> | 'What amount did you stay? = How long' |

Complex Sentences

Complex sentences can be coordinated or subordinated. Clauses may be coordinated by the particle *oo* as in:

| |
|---|
| <i>Cali hilibkii ayuu keenay oo wàanu cunay</i> |
| 'Ali brought the meat and we ate it.' |

Or they may be conjoined by attaching an element *-na* to the first element of the second clause:

| | | | | |
|---------------------------------|--------|-----------|---------|---------------|
| Cali | w-uu | I | arkay | w-uu-na |
| C. | FOC-3s | 1sgOBJ | see-3sg | FOC-3sm-COORD |
| i-lá | | had | lay | |
| 1sgOBJ-COM | | speak-3sm | | |
| 'Ali saw me and he spoke to me' | | | | |

In subordinated clauses, there is no classifier or focus particle and the verb occurs in its subordinated form.

There is a formal distinction between restrictive and nonrestrictive relative clauses. The former are simply juxtaposed to the noun they qualify while the latter are coordinated by *oo*:

Nínkúú Soomáaliya ká yimí
‘The man who came from Somalia ...’
Nínkúú oo Soomáaliya ká yimí
‘The man, who came from Somalia, ...’

Complement clauses are introduced by the particle *in*:

In-uu imanayo ay-aan ogahay
Comp-3sm come-SUB FOC-1sg know-1sg
‘I know that he is coming’

Adverbial clauses expressing temporal, local, and causal circumstances are formed with relative clauses to a noun like *marka* ‘time’.

Markii aan casheyayay
Time-DET 1sg dining-PROG-PAST-1s
saaxiibkay baa soo galay
friend-POSS1sg FOC DIR come:in
‘When I was dining my friend came in.’

Songhay Languages

G J Dimmendaal, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

The name Songai (also Songhay, Songhai, Sonrai) refers to a range of lects spoken mainly along the Niger River in Mali and Niger, as well as in Burkina Faso, and centering around major towns in the area. There are three major varieties: Western Songai (which includes Koyra Chiini, the town language of

Timbuktu, and Djenne Chiini, spoken in Djenné), Central Songai (which includes Humburi Senni, with Hombori as the major city, and Kaado), and Eastern Songai (with Koyraboro Senni as a major lect) with Gao as a major urban centre. The Gao variety has been designated as the standard for Songai in Mali. The total number of speakers in these countries is estimated to be at least 1.1 million. Zarma (Dyerma), which is spoken by some 2 million people mainly in Niger and Nigeria, and Dendi, with around 72 000 speakers mainly in Niger and Benin,

are closely related, but constitute separate languages. In addition, there are varieties in Mali and Algeria whose grammatical structure is similar to Songai, but whose lexical structure is rather deviant. Their speakers, who are culturally Tuareg, are known under a variety of names, e.g., as Tasawaq or Tadaksahak in Mali, and Korandjé in Algeria.

According to Greenberg (1963), Songai constitutes one of the six primary branches of the Nilo-Saharan phylum. Nicolai (1990) has argued that Songai is nongenetic in origin, with a Tuareg (Berber) variety playing a major lexifying role. The documentation of the Songai cluster has improved dramatically as a result of a series of monographs by Nicolai (1981) and Heath (1998, 1999a, 1999b).

The spreading of the Songai lects probably is related to the expansion of the Song(h)ai Empire from the 9th century until the late Middle Ages. Areal contact with neighboring languages belonging to different language families, such as Mande, Kwa, Gur (all Niger-Congo), and Berber (Afroasiatic) appears to have resulted in considerable typological variation within this cluster. Thus, whereas Central Songai varieties such as Humburi Senni or Kaado are tonal, western varieties such as Koyra Chiini appear to be nontonal. Also, in Western Songai varieties, SVO order appears to be common, with markers for mood, aspect, and negation occurring between the subject and the verb, and with complements other than the object following the verb. However, the object precedes the verb in Central and Eastern Songai varieties, which also use a transitive marker before the object noun phrase. All Songai lects

appear to use postpositions. Nominal modifiers tend to follow the head noun, but possessors precede the latter. The use of a one-term deictic marker appears to be a more common areal phenomenon, also attested in neighboring Mande languages. Affixational morphology is somewhat restricted (derivational morphology in the verb, for example, appears to involve mainly causative and centripetal marking), but cliticization of morphemes is highly common in Songai, frequently resulting in a mismatch between phonological and grammatical words. Logophoric marking, as a reference tracking mechanism and evidential hedging strategy, is also used across sentence boundaries; compare Heath (1999a: 322–328).

Sorbian

G H Toops, Wichita State University, Wichita, KS, USA

© 2006 Elsevier Ltd. All rights reserved.

Sorbian is one of three branches of the West Slavic languages comprising Lower Sorbian and Upper Sorbian (the other two branches being the Czech-Slovak and the Lechitic). 'Sorbian' thus serves as a convenient cover term for one or both of the Sorbian literary languages and their respective dialects. The Lower Sorbian (hereafter, LSo) and the Upper Sorbian (USo) literary languages constitute supradialectal norms generally used in writing and public or mass communication (print media, radio, and television); in informal settings Sorbs (both Lower and Upper) tend to speak the dialect characteristic of their native

village, with occasional admixtures of literary elements and German vocabulary. Sorbian as defined here is spoken today as a native language entirely within the borders of the Federal Republic of Germany (from 1949 to 1990, within the borders of the former German Democratic Republic); more precisely, it is spoken completely within the eastern German region of Lusatia (LSo *Łužyca*, USo *Łužica*, German *die Lausitz*), situated partly in the German state of Saxony (*Freistaat Sachsen*) and partly in the state of Brandenburg (see **Figure 1**). The Brandenburg portion includes what is traditionally known as *Lower Lusatia* (German *Niederlausitz*), while the Saxon portion includes most of *Upper Lusatia* (German *Oberlausitz*). These geographic designations are sometimes applied to the languages spoken there, whence

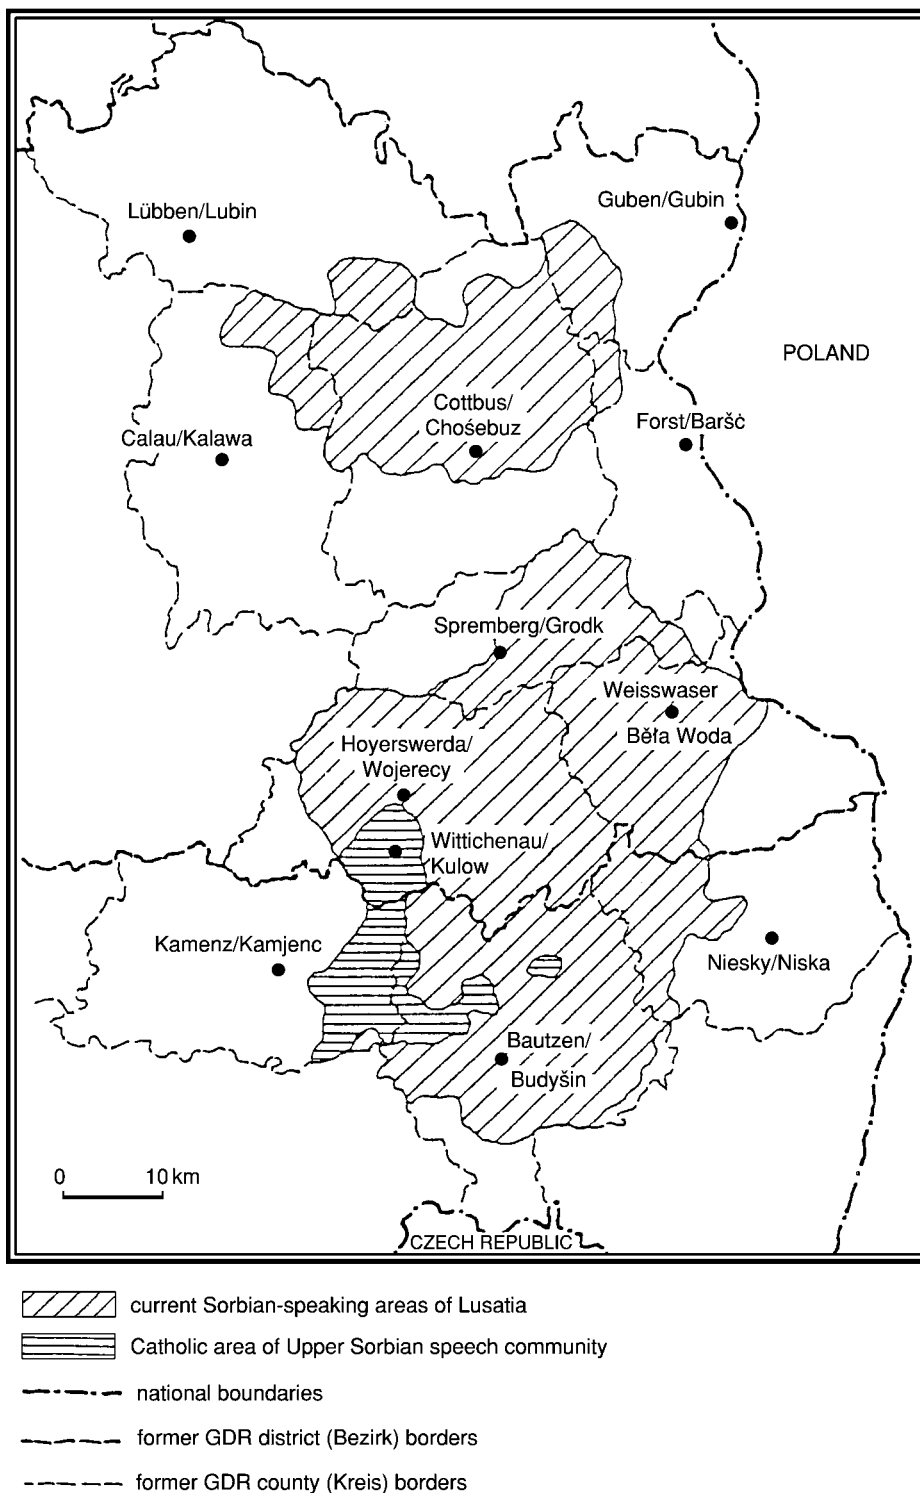

Figure 1 Sorbian speech communities. Schiller K J and Thiemann M (1979), *Stawizny Serbow* (vol. 4), Bautzen: Domowina, with permission.

the terms ‘Lower Lusatian’ and ‘Upper Lusatian’ in lieu of ‘Lower Sorbian’ and ‘Upper Sorbian,’ respectively. The Sorbian-language area, like the Sorbian speech community itself, has shrunk considerably in the past

100–150 years, so that it now extends at most only about 90 kilometers north-south and some 55 kilometers from west to east inside Lusatia proper. The Lower Sorbs call themselves *Serby* in their own

language but reveal a preference for the appellation *Wenden* ‘Wends’ in German; the Upper Sorbs call themselves *Serbjja* (*Sorben* [or, more specifically, *Obersorben*] in German). Descendants of Sorbs (now all English-speaking) who settled in the American state of Texas (some 60 kilometers east of the state’s capital city, Austin) in 1854 describe their heritage as ‘Wendish.’ As far as anyone has determined, all Lusatian Sorbs – to the extent that they still speak some form of Sorbian – are bilingual in Sorbian and German and have been so since the early decades of the 20th century. Partly as a result of this universal bilingualism, ethnic Sorbs have tended increasingly to become unilingual German-speakers.

Estimates of the current number of native Sorbian speakers vary. An ethnological poll conducted by the Institute of Sorbian Ethnography (*Institut za serbski ludospyt*) in 1987 suggested 67 000 as the maximum number of Sorbian speakers in both Lower and Upper Lusatia (Faska, 1998: 20). A more recent compendium of USo grammar puts the number of USo speakers at no more than 53 600 (Schaarschmidt, 2002). Assuming that such estimates are accurate, one is led to surmise a maximum of 13 400 speakers of LSo (67 000 minus 53 600), a figure that is not substantially at odds with the estimate of 16 000 LSo speakers cited by Šatava on the basis of data also collected in 1987 (Šatava, 1994: 198). The overwhelming majority of today’s native LSo speakers are more than 60 years old; consequently, the LSo dialects are expected to be extinct within the next 15–25 years (Jodlbauer *et al.*, 2001: 204). Schaarschmidt reckons that USo should be extinct by the year 2070; however, given current efforts at language maintenance, the USo literary language and at least some of its dialects (notably the so-called ‘Kamjenc’ [German: Kamenz] dialect of the approximately 15 000 Catholic Sorbs northwest of Budyšin [Bautzen]) stand a good chance of surviving well beyond the year 2100 (Schaarschmidt, 2002: 5–6).

The center of LSo literary and cultural activity (including radio and television broadcasting) is the city of Chošebuz (Cottbus); the center of USo literary and cultural activity is the city of Budyšin (Bautzen). This reflects the emergence of these two cities as ‘dialect centers’ in the 17th–18th centuries, owing to the fact that: (a) the majority of those educated Sorbs who translated (mostly religious) texts from German into Sorbian hailed from, or from the vicinity of, these cities; and (b) these cities already occupied major economic and political positions in Lusatia at that time. The first cohesive text written in Sorbian that we know of is the so-called ‘Budyšin Oath’ (*Budyska přisaha*) or ‘Wendish Citizen’s Oath’ (*Bürgerleid Wendisch*) dating from the year 1532. The early production of longer Sorbian texts is connected with the

spread of the Protestant Reformation in Lusatia and the ensuing Thirty Years’ War (1618–48). The first Sorbian religious text, as far as we know, is an eastern LSo translation of the New Testament of Martin Luther’s Bible, which was written by hand in 1548. The first Sorbian printed book is a LSo collection of church hymns and a small Lutheran catechism published by the preacher Albin Moller in 1574. The first printed book in USo is a translation of the Lutheran catechism published by the preacher Wenzeslaus Warichius in 1587. Such 16th-century texts already exhibited varying degrees of German lexical and grammatical influences (e.g., Sorbian use of the demonstrative pronoun/adjective as a reflection of the German definite article).

Because Protestantism did not completely take hold among the Upper Sorbs, Budyšin emerged as a dialect center only for the USo Protestants; among the USo Catholics, the dialect spoken in and around Kulow (Wittichenau) emerged in the 17th century as the basis for a Catholic variant of a nascent USo literary language. The dialectal basis for this variant eventually broadened in the direction of a West Sorbian Catholic dialect situated in the vicinity of Chrósčicy (Crostwitz). Thus, by the 18th century, two literary languages – one of them with two variants – existed among the Sorbs: LSo, Protestant USo, and Catholic USo.

Like German books printed at the time, the earliest Sorbian publications were printed in German black-letter, or Fraktur. Sorbian spelling was based on sound correspondences with German graphemes or phonetic approximations of them. Thus, the German trigraph *sch* might correspond to the graphemes *š*, *š*, or even *ž* (representing palatal continuants) in today’s USo orthography. The palatal affricates, in contrast, were graphically influenced to some extent by Polish – *cz* was used where today one finds USo *č* or *ć*. For example, in Warichius’s catechism of 1597, we find **The džesačy kašni Bobsche** (in contemporary USo orthography: *Te džesač kašni Bože*) ‘God’s ten commandments’ (cf. Schuster-Šewc, 1967: 52). Around the middle of the 19th century, efforts were made to reconcile the Catholic and the Protestant variants of literary USo by standardizing their orthographies. The resulting orthography, set forth in the 1848 publication of *Hornjolužiski serbski prawopis z krótkim rěčničnym přehladom* (‘Upper Lusatian Sorbian orthography with a brief grammatical overview’) by Christian Traugott Pfuhl (Křesčan Bohuwěr Pful), incorporated Czech and Polish conventions – use of diacritics like the Czech háček (*č*, *ě*, *ř*, *š*, *ž*) and the Polish acute accent (*ć*, *dź*, *ń*, *ó*) as well as the Polish velar *ł* (*ł*) – and was therefore labeled ‘analogical.’ The new orthography, however, was

also etymologically based, introducing graphemes – particularly in word-initial consonant clusters – that had no phonetic value: *łowa* → *hłowa* ‘head,’ *cyć* → *chcyć* ‘to want,’ *dže* → *hdže* ‘where,’ *zac* → *wzac* ‘to take.’ On the one hand, the etymologically based orthography has since led to a number of artificial spelling pronunciations; on the other hand, it has made written USo more readily interpretable for those familiar with other Slavic languages. Moreover, it disambiguates a large number of homophones – e.g., *wóz* ‘wagon, car,’ *łós* ‘elk,’ *hlós* ‘voice,’ and *włós* ‘hair’ – all of which are pronounced [ɰúʲs]. LSo remains less reflective of etymology, cf. LSo *cu* ‘I want,’ *žo* ‘there,’ *ned* ‘right away,’ and *cora* ‘yesterday’ vs. USo *chcu*, *hdže*, *hnydom*, and *wčera*, respectively. An USo spelling reform was introduced again in 1948. Several USo orthographic conventions have been adopted for LSo (*inter alia*, representing palatalization by means of the letter *j* rather than an acute accent—*młod* → *mjod* ‘honey,’ *ńasć* → *njasć* ‘to carry’; cf. Schuster-Šewc, 1996: 253 and 260). LSo influence on USo spelling can be seen in the substitution of word-initial *ch* for earlier *kh* (USo *khodźić* → *chodźić* ‘to go’; LSo *chójźis* ‘idem’).

Today’s USo alphabet consists of the following graphemes: *a, b, c, č, d, dž, e, ě, f, g, h, ch, i, j, k, l, l, m, n, ň, o, ó, p, r, ř, s, š, t, ć, u, w, y, z, ž*. The letters *v* and *x* occur in foreign names. The letters *č* and *č’* represent the same phoneme /tʃ/ while reflecting different etymologies; the same holds true for the letters *l* and *w* (phonetically [ɰ]). The letter *ř* occurs only after *k, p,* and *t* and is pronounced like *š* except where *tř* constitutes a digraph representing the phoneme /c’/ (e.g., *tři* /c’i/ ‘three’). Today’s LSo alphabet includes: *a, b, c, č, ć, d, e, ě, f, g, h, ch, i, j, k, l, l, m, n, ň, o, p, r, ř, s, š, ś, t, u, w, y, z, ž, ź*. Unlike USo, LSo alphabetizes *ch* with *c*, rather than after *h*. In 1995, the LSo Language Commission relegated *ó* (phonetically [ɛ]) or [y] after labials and velars) to language-teaching materials, replacing it with *o* (Starosta, 1999: 19).

Both LSo and USo exhibit grammatical features that set them apart from other contemporary Slavic languages. The LSo verb paradigm still includes the supine found in early Slavic. USo retains a rich system of tenses – present, preterite (also called ‘aorist’ if the verb is aspectually perfective, ‘imperfect’ if it is imperfective), future, perfect, and pluperfect; in addition, the literary language and a number of USo dialects retain the iterative preterite tense (formally identical to the conditional mood). The LSo dialects exhibit only one past tense, formed with the auxiliary *byś* ‘to be’ and the *l*-participle; literary LSo, in contrast, exhibits all the tenses of USo, artificially

(re)created and phonologically adapted. The Sorbian grammatical category of number is expressed as singular, dual, and plural, which is marked both on the noun or pronoun and on the verb. The dual is gradually giving way to the plural in the dialects, often surviving only exceptionally after the quantifier ‘two’ (USo *dwaj, dvě*) with plural agreement in the verb (*Dvě knize su na blidže leželi* in lieu of literary USo *Dvě knize stej na blidže ležaloj* ‘Two books lay on the table’). Nouns (substantive and adjective) and pronouns exhibit six cases – nominative, genitive, dative, accusative, instrumental, and locative. A vocative form exists in USo, but only for masculine nouns (*Šćěpan* → *Šćěpano! Šćěpanje!*) and one feminine noun – *mać* (*maći!*) ‘mother.’

Sorbian word order is basically SOV (Subject-Object-Verb); however, compound verb tenses and the clitic status of the auxiliary verbs usually produce a ‘bracket construction’ like that found in German (so-called *Rahmenkonstruktion*). Sorbian subordinate clauses, in contrast, generally do not imitate the German clause-final placement of finite verbs.

The LSo and the USo dialects are connected by a zone of ‘transitional’ dialects. Here, LSo lexical and morphophonological features increase and USo ones decrease as one moves from south to north, while USo features increase and LSo ones decrease as one moves from north to south. Although this might suggest a single dialectal continuum (hence, a single Sorbian language), in fact, the degree of mutual intelligibility between LSo and USo proper is perceptibly less than that which exists today between Czech and Slovak.

South Asia as a Linguistic Area

K Ebert, University of Zurich, Zurich, Switzerland

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The roughly 450 languages of South Asia belong to four different language families: Indo-European, Dravidian, Austroasiatic, and Sino-Tibetan. There are three small isolates, Burushaski, Nahali, and Kusunda (probably extinct). Speakers of Indo-Aryan (IA) languages constitute 78% of the inhabitants of South Asia, followed by Dravidian (DRAV) speakers with 20%; speakers of Austroasiatic, i.e., Khasi and Munda (MU), and Tibeto-Burman (TB) languages together do not constitute more than 2%. The number of speakers is reflected in the space devoted to languages in the sprachbund literature. Emeneau, the first authority on the subject, wrote about 'India as a linguistic area' (1956). Although Nepal and Bhutan also belong to South Asia, languages of the Himalayas are seldom included in the sprachbund literature, nor are languages of Nagaland or Meghalaya.

I shall first look at the features most often mentioned as characterizing the area. After a brief summary of the history of the field, I shall discuss the possibility of interpreting the linguistic data as evidence for earlier settlement patterns and migrations. The last section stresses the need for more detailed investigation of subareas.

Areal Features

The following features are mentioned in most of the literature on the South Asian sprachbund:

- retroflex consonants
- OV word order
- converbs ('conjunctive participles')
- compound verbs
- the quotative
- morphological causatives
- dative subjects.

Retroflex Consonants

All the major languages of South Asia have a phonemic opposition between retroflex and dental consonants (Ramanujan and Masica, 1969). Many IA and most DRAV languages also have retroflex *ɽ*, *ɳ*, and *ʎ*. There are no retroflexes in Assamese and in South MU nor in Indo-European. Kuiper's (1967) demonstration of the increasing frequency of retroflex

consonants in the successive books of the *Rigveda* is generally accepted as proof of DRAV substratum influence.

OV Word Order

The second feature, OV word order, holds for languages from Pakistan to Assam and from Nepal to Sri Lanka. The only two exceptions are Kashmiri (IA) and Khasi (AA), which are both VO. However, OV word order also characterizes the languages of Central and Northeast Asia, including Korean and Japanese.

Converbs

This feature has been extensively discussed in the sprachbund literature. But although most languages of the subcontinent have at least one converb (conjunctive participle, gerund), there are considerable differences in detail. The most general or sequential converb can fulfill a number of functions, depending on the existence of more specific converbs. Hindi has only one form (*-kar/-ke*), which has a broad range of applications. The following examples illustrate sequential, modifying, and causal interpretations of the Hindi and Tamil general converbs.

(1) HINDI (IA)

- a. us-ne nahaa-kar khaanaa khaa-yaa
he-ERG bathe-CONV meal eat-PFV:3SG:MASC
'Having bathed he ate his meal'
- b. vah dhaur-kar aa-yaa
he run-CONV come-PFV:3SG:MASC
'He came running'
- c. vah raat din kaam kar-ke biimar
he night day work do-CONV ill
par ga-yaa
fall GO-PFV:3SG:MASC
'He fell ill because he worked day and night'

(2) TAMIL (DRAV)

- a. avan inkee va-ntu enn-ai.k kuuppitt-aan
he here come-CONV I-ACC call-PT:3SG:MASC
'He came here and called me'
- b. avan oot-i va-nt-aan
he run-CONV come-PT:3SG:MASC
'He came running'
- c. mazai peytu kulam nirai-yum
rain fall:CONV pond fill-FUT:3SG:NEUT
'It rained and (therefore) the pond will fill'

Most languages have a simultaneous or modifying converb different from the conjunctive participle, which is often reduplicated. See the following examples with Hindi (1b), and Tamil (2b).

- (3) ORIYA (IA) baṭore ja-u ja-u
 'walking along the road'
MALTO (DR) eek-no eek-no paawno
 'walking along the road'
ATHPARE (TB) huk-sa huk-sa abe
 'he came down barking'

(The sequential converbs are Nepali *-ii*, *-era*, Oriya *-i*, *-iki*, Malto */-ka/* + person markers, Athpare *-ung* after finite markers.) The eastern IA languages (Assamese, Bengali, Oriya) moreover have a conditional converb, as do most Dravidian languages.

- (4) ASSAMESE (IA) moi aahi-le 'if I come'
ORIYA (IA) se asi-le 'if he comes'
TAMIL (DR) mazai peyt-aal 'if it rains'
KANNADA (DR) avaru oodid-are 'if he studies'

Santali has nonfinite forms in *-kate* and *-te* (5a); the quasi-converbs carry finite tense-aspect and person markers, though they lack the finite marker *-a* (5b).

- (5) SANTALI (MU)
a. calak'-calak'-te mir'-taṅ
 go:MID-REDPL-CONV.SIM one-CLASS
 toyo-ko jæl-tiok'-ked-e-a
 jackal-S:3PL see-reach-PT-O:3SG-FIN
 'While they were walking, they got sight of a
 jackal'
b. kəṭe'-ked-e-khon ḍaṅgra-də-e
 castrate-PT-O:3SG-ABL bullock-TOP-S:3SG
 luṭkum-en-a
 fat-PT:MID-FIN
 'Since they castrated it, the bullock became fat'

The South Asian picture is far from uniform, and the number of converbs can vary from one to ten or more (e.g., Hayu), although three or four is the norm. Converbs are even more characteristic of Central and Northeast Asian languages, where converbal forms mark all types of adverbial subordination. Moreover, converbs seem to go together with OV word order (Ethiopian Semitic and Quechua). So do adnominal 'relative participles,' which are sometimes mentioned together with converbs as an areal trait of South Asia.

Compound Verbs

South Asian languages form compound verbs consisting of the general/sequential converb form of the main verb (V1) followed by a finite form of a second verb (V2). The second verb, which also occurs as a full verb, is semantically bleached, but not fully grammaticized. The inventory of second verbs listed in grammars differs somewhat from language to language, and – as the list is not closed – also from author to author. The most frequent V2s include:

1. directionals with the full verb meanings 'go', 'come';
2. disposals that express that something is done away with, such as 'throw', 'send', 'put aside';
3. verbs that express the suddenness or unexpectedness of an event, such as 'fall', 'rise';
4. 'give' and 'take' have auto- and other-benefactive meanings as V2.

- (6) MARATHI (IA)
sagle kaagad mi phaar-un ṭaak-le
all paper I tear-CONV V2:THROW-PT
'I tore up all the papers'

BENGALI (IA)
se mar-e gela
he die-CONV V2:GO:PT
'He died'

KANNADA (DR)
avaru sattu-hoo-daru
s/he die:CONV-V2:GO-PT:3PL(HON)
'He died'

The terminology used for this construction is rather inconsistent. Apart from a plethora of names for the V2 (explicator, vector, aspectivizer, light verb), some authors use the term *serial verb* instead of compound verb. Sometimes constructions with phasal verbs (which are not semantically bleached and often combine with the infinitive) and grammaticized forms are included.

As with converbs, a closer look at compound verbs yields a rather diverse picture. First, the shape often differs from the canonical 'V1-CONV + V2 finite' pattern. Some languages have developed new converb suffixes or an optional long form. The new or long forms are used in clause combining, but not in compound verbs. Thus Hindi and Panjabi never have the converbal suffixes *-kar* or *-ke* in compound verbs, but use an old form now reduced to the bare stem of V1 (see *par ga-yaa* in (1c)); Oriya never has *-iki* or *-ikari*; Koḍava never has the converb in *-iti*, but the old converb, which is identical with the past stem (see the Tamil and Kannada examples above).

- (7) ORIYA (IA)
pila-mane pərḥ-iki ghər-u
child-PL study-CONV house-ABL
bahar-i-gol-e
go.out-CONV-V2:GO:PT-3:PL
'After studying the children went out of the house'
KODAVA (DR)
ava seebi tind-iti
she apple eat:PT-CONV
catti-pooc-i
die:PT:CONV-V2:GO:PT-3
'She ate the apple and died'

Santali root compounds look much like the Hindi and Panjabi forms. Languages that make little use of converbs often have finite markers on both verbs, such as Kurukh and some MU and TB languages.

- (8) SANTALI (MU) tɔl-uric'-ked-e-a-e
tie-V2:FIRM-
PT-O:3SG-FIN-S:3SG
'he tied him up firmly'
- KURUKH (DR) iirk-an-cicck-an
see:PT-1SG-V2:GIVE:PT-1SG
'I looked after it'
- PARENGI (MU) silay-ing-ta'y-ing
sew-1SG-V2:GIVE-1SG
'sew for me!'
- CAMLING (TB) c-ung-pak-ung-a
eat-1SG-V2:PUT-1SG-PT
'I ate it up'

Second, the inventory and semantics of second verbs sometimes differ in substantial ways from more canonical patterns, especially in MU and N-DRAV. The unusual V2s include Santali *jaora* 'gather', *uric'* 'make firm', *eset'* 'close', *nyam* 'find', *anga* 'dawn', and Kurukh *xacc-* 'break', *biʔ-* 'cook'. Tamil also has unusual second verbs, and even the common ones show irregular semantics, often conveying purely emotional meanings.

Compound verbs of the form "V1-CONV + V2 finite" are typical of Altaic (with V2 called postverb, descriptive verb, or auxiliary). Turkic and Mongolic languages share the second verbs mentioned under (a) to (d) above. But unlike South Asian languages they make regular use of postural verbs as atelicizers or durative markers. Otherwise the use of second verbs in languages in the northern part of India appears to be more similar to Turkic-Mongolian than to South Dravidian, though further detailed studies are needed.

Quotatives

Quotatives of the form 'say'-CONV, such as Bengali (IA) *bole*, Nepali (IA) *bhanera*, Telugu (DR) *ani*, Santali (MU) *mente*, and Sora (MU) *gamle* correspond to Uzbek (TURKIC) *deb*, Mongolian *gej* (and to Ethiopic Inor *barə* Quechua *nishpa*). There is nothing remarkable about the development into complementizers, which are then used together with verbs characterizing speech or mental acts, or with onomatopoeic words. The development from 'say' to complementizer is also attested in African languages and Creoles. It is an ongoing process that can be observed in South Asia, and not all languages are at the same stage. The last stage, comparatives marked by the quotative, is attested only in some languages of Nepal (e.g., Newar, Nepali) and South Dravidian. Further detailed

studies are necessary to describe the use of quotatives in the single languages and to distinguish borrowings from internal developments.

Morphological Causatives

All languages of South Asia show morphological causatives, and most have secondary or indirect forms.

- (9) HINDI (IA) *siikh-* / *sikhaa-* / *sikhwaa-*
'learn / teach / have taught'
- KASHMIRI (IA) *con-* / *caavun-* / *caavinaavun-*
'drink / give to drink / let give to drink'
- MALAYAL (DR) *oti-* / *otikk-* / *otippik-*
'break (intr/tr) / let break'

The patterns differ toward the east, where prefixes prevail. AA languages thus conform to their relatives in Southeast Asia: Khasi *tip* / *pn-tip* 'know / inform', *iap* / *pn-iap* 'die / kill', and Sora *jum* / *a-jumjum* 'eat / feed'. TB languages of the east also have prefixes, e.g., Mao Naga *apo* / *so-pho* 'break (intr/tr)'; Mikir *thi* 'die', *pe-thi* 'kill', *pa-pe-thi* 'let kill'. In some languages, double causatives can receive a simple causative interpretation; Kharia (MU) *doko* 'sit down', *ob-do-b-ko-yoʔ* (CAUS-sit-CAUS-sit-PTII) 'he made him make her sit' or 'he made him sit' (Zide and Anderson, 2001: 521, 523).

Morphological causatives, including double causatives, are also found in the languages of Central and Northeast Asia.

Dative Subjects

This construction is familiar from some European languages such as Latin and German. An experiencer is coded by the dative (in Eastern IA languages by the genitive), and the dative constituent behaves like a subject in some respects (Verma and Mohanan, 1990).

- (10) HINDI (IA) *bacce-ko* *thand* *lag* *rahii* *hai*.
child-DAT cold feel PROG:FEM:SG is
'The child is/feels cold'

- TAMIL (DR) *ena-kku* *kujiraa* *iru-kk-utu*.
he-DAT cold be-PRES-3SG:NEUT
'He is/feels cold'

The construction is less prominent in MU and TB; some languages even lack a dative or an oblique case marker. Nevertheless, it counts as a strong areal feature; as in contrast to the constructions mentioned above, it does not exist in Altaic languages. As it is not typical of Sanskrit, DRAV is usually considered a likely source.

Other Features

Several other features were claimed to be characteristic of South Asia, but most were dropped later, e.g., aspirated consonants, nasalized vowels, classifiers,

ergative constructions, no prefixes, no verb for 'have'. The proposed features were evaluated by Masica (1976: 187–190); most of them turned out to be irrelevant or of little relevance for the South Asian linguistic area. Classifiers and echo formations were suggested in Emeneau's pioneering article 'India as a linguistic area' (1956). Emeneau erroneously considered classifiers, which occur especially in eastern and central India, as borrowings from IA into the individual MU and DRAV languages. But classifiers clearly have swept over from Southeast Asia. Emeneau's conclusion probably has to be ascribed to the fact that the classifiers of MU and N-DRAV languages often have an IA shape; i.e., the morphemes are borrowed, but the function is not.

Most South Asian languages have a construction in which a word is reduplicated, replacing the first consonant (sometimes also the following vowel), so that the second word constitutes an echo of the first one. The echo expresses 'and such things', e.g., Tamil *kudirai-gidirai* 'horses and such things'. The consonants used in echo formation are distributed in areal patterns (see map in Trivedi, 1990: 80–81). Dravidian languages of the south show exclusively *k*, *g*; Orissa and Bengal have *p*, *ph* or *t*. The patterns are independent of genetic affiliation; compare Oriya (IA) *iskul-phiskul* 'school and such', *cini-phini* 'sugar and such' with Ho (MU), *ɔpis-pɔpis* 'office and such'; Bengali (IA) *ghusur-tusur* 'pigs and such' with Nocte (TB) *san-tan* 'sun and such', and Santali (MU) *bɔkɔp-tɔkɔp* 'brothers and such'. Emeneau considered this feature to be borrowed from DRAV, as he took it to be otherwise unknown in Indo-European. (It is rare in IE, though not in Altaic; Turkish *kitap kitap* 'books and such things', Uzbek *nān pān* 'bread and other baked goods').

A more promising candidate seemed to be the Sanskrit particle *api*, corresponding to Tamil *-um*, which has five functions reconstructable for Proto-Dravidian: 1. additive focus, 'also', 2. 'and', 3. 'even', 4. totality with numerals ('every'), 5. together with question words it yields indefinite pronouns. Emeneau found the five functions in all subgroups of DRAV, but only in a few modern IA languages (e.g., Marathi, Oriya). As not all functions exist in early Vedic, he concluded that the functions of Sanskrit *api* developed by analogy with the DRAV model (Emeneau, 1980: 218). No parallels in MU or TB are mentioned. Nevertheless, it is one of the few features that Masica considers to be area-defining, though the criteria are not further discussed and remain unclear. The bundle of functions 1.5. is far from rare for a particle meaning 'also, even', and parallels could be cited from Altaic and many other languages.

History of the Field

South Asia counts as a classic example of a linguistic area. As early as the 19th century, Indologists noticed some common traits between IA and DRAV. The discussion centered around the question of whether IA could have adopted certain features from DRAV, e.g., retroflex consonants or converbs. Sanskritists have at all times tried to minimize such possible influence and proposed internal developments (Hock, 2001). Emeneau, doing intensive research on DRAV, was the first to put the comparison on a more solid base. In his early article 'India as a linguistic area,' he came to the conclusion that "the languages of the two families, Indo-Aryan and Dravidian, seem in many respects more akin to one another than Indo-Aryan does to other Indo-European languages" (1980: 119–120; 1956). His definition of the term *linguistic area* as "an area which includes languages belonging to more than one family but showing traits in common which are found not to belong to the other members of (at least) one of the families" is still useful, in contrast to his later proposals. In the introductory article to the reprint volume (Emeneau, 1980), he critically reviews his own earlier work and adds the conditions: For a feature to be area-defining it has to be "pan-Indic and not extra-Indic" (1980: 2). Only if several such features are found and the area is delimited by a bundle of near isoglosses can the linguistic area, in his view, be considered established. A second step has to show the origin of the areal features and their distribution. If a feature can be reconstructed for language X, it must have been borrowed into language Y.

The newly formulated conditions turn out to be problematic. If a South Asian areal trait must not be extra-Indic, most of the proposed features have to be abandoned. But this criterion does not seem to have been taken too seriously anyway; few researchers have bothered to look outside the borders of South Asia. This is true even of Emeneau himself, as evidenced by his proposals for classifiers and echo words as areal traits. And the criterion of pan-Indianness was not tested. Areal relevance was mostly claimed on the basis of a few examples from IA and DRAV, sometimes adding one or two examples from a MU language. Isogloss bundles were not shown, as Emeneau remarks: "Unfortunately I know of no demonstration of such a bundling of isoglosses" (1980: 128).

In an important article, Kuiper (1967) examined Vedic and Sanskrit texts that could shed light on the origin of the South Asian linguistic area. He investigated the appearance of retroflex consonants, converbs ('gerunds'), and the development of

the quotative *iti* in IA. Regarding retroflexes, he comes to the conclusion that prehistoric bilingual speakers of IA – presumably native speakers of a Dravidian language – reinterpreted IA allophones in terms of their native system, thus establishing a novel phonemic distinction in IA. Kuiper further traces the gradual increase of converbs in the successive *Rigveda* texts and ascribes the development again to bilinguals, who would have used converbal constructions first in colloquial speech, from where it crept into more formal registers. The Sanskrit particle *iti* ‘thus’ originally introduced quotations and is attested in initial position in Vedic texts. Gradually it became post-quotative by analogy with the Dravidian ‘say’-CONV, and in later Sanskrit this was the standard.

A further influential article was Southworth’s contribution to the volume edited by himself and Apte (1974). Southworth found that the frequencies of retroflex consonants in modern IA languages decreases from west to east. Western IA languages such as Marathi, Gujarati, and Panjabi show a ratio of 3:1 for dentals and retroflexes, which corresponds to the ratio in DRAV, but Bengali has 12:1 (1974: 212). Southworth interprets this, together with gender marking, as evidence for a DRAV substratum in the west; the lower number of retroflexes and the presence of classifiers is interpreted as a reflex of a TB substratum in the Ganges delta and the east. The assumption that the distribution of features today mirrors the situation that obtained 2000 years ago is of course problematic.

The first comprehensive and systematic study on some features in South Asia and beyond, Masica’s *Defining a linguistic area: South Asia* (1976), has become a standard text. Whereas earlier publications on the sprachbund were confined to demonstrating shared features of South Asian languages (if not just IA and DRAV), Masica’s concern was to find out to what extent these features are purely South Asian. The results are rather devastating for the sprachbund hypothesis if based on the conditions formulated by Emeneau: of the five traits investigated, only one, namely dative subjects, turned out to be specific for South Asia. The other four – morphological causatives, OV word order, converbs, and compound verbs – are equally characteristic of most languages of Central and Northeast Asia, as already mentioned. Researchers have since also spoken of an Indo-Turanian area.

The idea of a South Asian sprachbund is thereby not invalidated. The clustering of the two essential features, dative subject and retroflexes, together with shared idioms and semantics (Emeneau, 1980: 236, 250; Masica, 2001: 258) and the OV characteristics,

some of which demonstrably spread from South Asian centers, together add up to the often perceived ‘Indianness’ of South Asian languages.

Historical Evidence

One of the aims of identifying linguistic areas is to find evidence for earlier settlements and migrations. Documentation of South Asian languages reaches back to the second millennium B.C. for Sanskrit and back two millennia for Tamil, but little is known about earlier stages of MU and TB. And in spite of the early attestations of IA and DRAV, the substratal influence of the latter on the former remains controversial. According to Hock (2001), IA and DRAV were typologically more similar at the time of the earliest contacts than is commonly assumed. Similarities such as the combination of finite marked forms, as still preferred in North and Central Dravidian, have been demonstrated by Steever (1993) for older stages of South Dravidian. Many of the South Asian traits could be retentions, being strengthened of course by area-specific preferences. Hock criticizes the still prevailing practice of drawing conclusions from comparisons of Sanskrit with (mainly) modern South Dravidian, ignoring older traits of Dravidian and setting aside 2000 years of history.

Even the DRAV origin of retroflexes, a seemingly solid cornerstone of the substratum hypothesis, has been questioned. This also casts doubt on the general assumption that Dravidians were the inhabitants of the Indus Valley at the time the Indo-Aryan infiltration into South Asia started. Witzel (1999) posits a ‘Para-Munda’ substratum of the oldest IA documents, i.e., the Vedic texts, which originate from the valley.

More recent influences can be traced by means of quantitative areal investigations. Hook (1987), trying to get “at the grain of history,” reports an interesting finding from a questionnaire investigation. In the returns from south of Goa, all subordinate clauses were preposed; the percentage gradually decreased toward the northwest, i.e., with the distance from the Dravidian model. West of the Indus, all clauses were postposed. This pattern is independent of the fact that OV word order typologically often goes together with preposed clauses and demonstrates the fading out of a typical feature toward the edge.

A quantitative analysis of this type can sometimes show the areal spread of a trait, though not its origin. The inference from present-day frequencies to situations 2000–3000 years back (Southworth, 1974) is hardly reliable. Hook’s endeavors to trace the possible origin of compound verbs on the basis

of frequency counts lead to no satisfying results. Today compound verbs are most abundant in the Ganges plains (Hindi 15–20% of total verbs, modern Bangla 10–13%, modern Marwari 13–18%). But comparison with the situation in 16th century Bangla (2%) and Marwari (1.5%) shows this to be a recent phenomenon (Hook, 2001: 109). If borrowed at all, the further development of the construction must be ascribed to internal forces. Hook's answer to the question of what we can conclude from the present-day distribution of the compound verb in the languages of South Asia is: "Not much." (2001: 110). Various processes of borrowing, internal developments, and even of loss are possible scenarios.

Much of the linguistic history of South Asia remains in the dark. Shifts in language have not been uncommon, and in some cases have occurred more than once, e.g., from MU to DRAV to IA. Widespread bilingualism and multilingualism have repeatedly lead to pidginization and the development of lingua francas, such as Calcutta-Hindustani or Hindi-Urdu in Bombay. Nagamese, based on IA Assamese, has become the mother tongue of the Tibeto-Burman Kachari. It is at present the only common medium of speakers of the 30 or so Tibeto-Burman Naga languages. Sadari, a Hindi based pidgin, has become the language of identification for groups who have abandoned their former DRAV or MU tongues. Some of the modern literary languages may have started out as pidgins too, as Southworth (1971) suggests for Marathi.

Historical investigations are restricted to what has been accepted into the written language. But written texts are far from an ideal basis for areal investigations, and written norms are especially conservative in South Asia. At all times, the spoken language has differed a great deal from the written one, and borrowings must have been much more abundant than texts reveal. Present investigations into languages used for everyday communication show remarkable structural convergences in some areas. The most well-known case is Kupwar, as described by Gumperz and Wilson (1971). The contact situation between Kannada, Marathi, and Urdu at the border between Maharashtra and Karnataka has lead to one single grammatical system with language-specific lexemes. This study also reveals another characteristic of linguistic areas: structural traits, especially in syntax, are largely unconscious and easily borrowed, whereas there may be considerable resistance toward lexical borrowing, especially if the language functions as a means of identification.

Subareas

Setting up isoglosses simply on the basis of the occurrence of a feature, as in Masica (1976), is apparently not an adequate technique for showing the intricate patterns of a linguistic area. In Masica's map of the dative subject, for example, the isogloss for this construction includes the northeastern corner of India. The map does not show that this feature is mainly restricted to IA and that numerous small languages of the area have not adopted it. As Masica himself notes (1976: 172), the isogloss maps do not show the gradual fading out of features. They also do not indicate different codings. If causatives are marked by suffixes in the west, but by prefixes in the east of the subcontinent, this is highly relevant for areal studies.

One of Masica's four Indo-Altaic isoglosses deviates from the others: The line for secondary causatives runs approximately along the 84th meridian, i.e., cutting off Bihar, parts of Orissa, and the northeastern provinces from the rest of South Asia. This line is indeed relevant, though not primarily for the feature intended by Masica. Double causatives do exist to the east of it. East of the 84th meridian, two areas can be set off: (A) a former contact zone between TB, AA, and DRAV, stretching from eastern Nepal to Orissa, and (B) the predominantly TB northeast. Only a few of the more than 100 languages of those tribal areas have been described, and hardly any of them has been considered in areal studies. The Non-IA languages from Nepal to Orissa (zone A) are characterized by a complex verbal morphology, which is not characteristic of the TB relatives farther north and east and may be due either to MU, which seems to have had a complex morphology at all times (Zide and Anderson, 2001), or to an unidentified third substratum (referred to, e.g., in Hook, 2001: 124; Witzel, 1999: 40). Different from the converbal structures typical of OV languages, much of the complex pattern of person and tense-aspect marking is retained in subordination in MU languages, in Kurukh, and in Kiranti languages of eastern Nepal. Sometimes only the finite or final marker is missing, as in Santali and Athpare. It seems that long contact between DRAV, MU, TB, and possibly other language groups have lead to an area little affected by the rest of South Asian language developments (Ebert, 1999: 392).

Subareas have been claimed for the Khondmals, for Jharkhand, for the Northwest Frontier, and others. This does not invalidate the hypothesis of a South Asian linguistic area, just as sharing the OV characteristics with Central Asia does not. We should not be surprised to find subareas within subareas without

clear boundaries. “Sprachbund situations are notoriously messy,” as Thomason and Kaufman (1988: 95) put it. But we should not look for “pan-Indic and not extra-Indic” features, as Emeneau suggested. Instead, research must concentrate on more detailed investigations of certain phenomena, such as compound verbs or converbs, which show uneven frequencies and idiosyncratic forms in subareas. The clustering of features in certain subareas is characteristic of linguistic areas, just as is their diffusion into a number of unrelated languages.

Introduction

South Philippine languages form one of three major language groups found in the Philippines, all of which

belong to the Western Malayo–Polynesian branch of the Austronesian family. The South Philippine language family includes the Subanon, the Danao, and the Manobo subgroups. The Subanon subgroup is spoken on the Zamboanga peninsula of Mindanao, the Danao subgroup is spoken in central Mindanao, and the Manobo subgroup is spoken in central and eastern Mindanao. Two other groups of languages spoken in the Philippines are not South Philippine languages but

Table 1 South Philippine, South Mindanao, and Sama languages^a

| <i>South Philippine</i> | <i>South Mindanao</i> | <i>Sama</i> |
|---|---|---|
| Subanon subgroup | Bilic | Sama |
| Eastern Subanun – Central Subanen, Northern Subanen, Lapuyan Subanun | Blaan – Koronadal Blaan, Sarangani Blaan | Sibuguey Sama, Northern Sama, Western Sama, Central Sama, Southern Sama |
| Kalibugan – Kolibugan Subanon, Western Subanon | Tboli | |
| Danao subgroup | Tiruray | Yakan |
| Maguindanao – Maguindanaon | Tiruray | Yakan |
| Maranao-Iranon – Ilanun, Maranao | Bagobo | Jama Mapun |
| Manobo subgroup | Giangan | Jama Mapun |
| North Manobo – Binukid, Higaonon, Kagayanen, Cinamiguin Manobo | | Abaknon |
| Central Manobo | | Abaknon |
| East Central Manobo – Agusan Manobo, Dibabawon Manobo, Rajah Kabunsuwan Manobo | | |
| South Central Manobo – Obo Manobo | | |
| Ata-Tigwa – Ata Manobo, Matigsalug Manobo | | |
| West Central Manobo – Ilianen Manobo, Western Bukidnon Manobo | | |
| South Manobo – Cotabato Manobo, Sarangani Manobo, Tagabawa Manobo | | |

^aBased on data from McFarland (1980).

are more likely related to languages of Indonesia and Malaysia. These languages, found in the southern Philippines, are the South Mindanao languages, spoken in southern Mindanao, and the Sama languages, spoken on the Zamboanga peninsula and the Sulu Archipelago (see **Table 1**).

Although considerable research has been devoted to identifying and grouping languages of the southern Philippines, less effort has been spent on describing the grammar of these languages. Most of the available descriptions, completed in the 1960s and 1970s, emphasized phonology, verb morphology, sentence structure, and discourse features. A number of important findings from cross-linguistic studies in the 1980s resulted in significant reanalyses of the basic verbal sentences of Philippine languages. The outcome is that the sentence type traditionally called the ‘goal-focus’ construction was confirmed to be the basic transitive sentence. Later studies have also suggested that the ‘actor-focus’ construction is not one but two distinct sentence types: an active intransitive sentence (in which the verb is semantically intransitive) and an antipassive construction (in which the verb is semantically transitive). The few descriptions of languages in the southern Philippines completed after the 1970s generally reflect these reanalyses and also provide more information about syntactic processes, giving attention to the function and behavior of constructions as well as their structure.

In the following discussion, grammatical relations are labeled as follows: the only grammatical relation of a single-argument sentence is S, the more

agent-like grammatical relation of a transitive sentence is A, and the less agent-like grammatical relation of a transitive sentence is O. Case markers are morphemes that formally distinguish between A and O in a transitive sentence. These markers form three patterns: nominative–accusative (henceforth ‘nominative’), ergative–absolutive (henceforth ‘ergative’), and tripartite. In the nominative pattern, S and A are marked the same, but O is marked differently; in the ergative (ERG) pattern, S and O are marked the same, but A is marked differently; in the tripartite pattern, S, A, and O are each marked differently. In a split ergative pattern, S, A, and O display ergative case marking in some sentences and nonergative case marking in others. If S, A, and O are all marked the same, the forms are said to be neutralized for case.

Phonology

South Philippine, South Mindanao, and Sama languages have relatively straightforward phonemic inventories. Vowel systems have four, five, six, or, more rarely, seven vowels. Consonants consist of voiced and voiceless stops (including glottal stop), a few fricatives (often /s/ and /h/), nasals, /l/ and a rhotic (which, depending on the language, is a flap, /ɾ/ or /ɽ/, or a trill, /r/), and the semivowels /w/ and /j/. Some of the Sama languages also have /ʁ/. Long vowels and geminate consonants are common. Word stress occurs on the penultimate or, less commonly, the ultimate syllable and may or may not be predictable, depending on the language.

In the Subanon and Manobo subgroups and in the Sama languages, intervocalic consonants (C), particularly /l/, tend to be deleted over time. This appears to be the source for two common phonological features noted in these languages: long vowels (V) and the syllable V(C). In a significant number of Philippine languages, an epenthetic glottal stop is inserted in syllable onsets (but not codas) when no other phonetic material is available; however, this strategy is apparently not available when an intervocalic consonant is lost in these languages. Thus, the loss of an intervocalic consonant opens a pathway for the resulting sequence of vowels to become long vowels or to coalesce into a new vowel: e.g., /o/ + /i/ → /e/ in Obo Manobo (Khor and Vander Molen, 1996: 31) and /a:/ + /i/ → /æ/ and /a/ + /u/ → /ɔ:/ in Northern Subanen (Daguman and Sanicas-Daguman, 1997: 103). The loss of /l/ or some other intervocalic consonant also seems to be the source for word-medial V(C) syllables, also noted for Subanon and Manobo subgroups and Sama languages. Only Maguindanaon allows a word-initial V(C) syllable (the facts are not available for Maranao). Thus, syllable types for Maguindanaon, Obo Manobo, Northern Subanen, and Southern Sama are CV(C) and V(C).

On the other hand, the loss of a mid-central vowel in the South Mindanao subgroup has led to the development of word-initial CCV(C) syllables. For Tboli, the loss appears to have occurred in words beginnings with CV syllables. For Blaen, it occurred in words beginning with CVC syllables. This claim is based on the fact that in Tboli, a mid-central vowel can be inserted optionally after the first consonant of the root (e.g., *btang* ~ *betang* ‘to fall’) (Forsberg, 1992: 6), but in Blaen, the mid-central vowel is inserted optionally before the first consonant of the root (e.g., *bgang* ~ *ebgang* (adj.) ‘broken’) (Sally Winter, personal communication). Thus, syllable types for South Mindanao languages are CV(C) and CCV(C). Word-initial CCV(C) syllables also occur in Maranao but are limited to homorganic nasals followed by stops: e.g., /mb/, /nd/, /ŋk/, /ŋg/ (no occurrences of /mp/ or /nt/ are listed in McKaughan and Al-Macaraya (1996)).

Three other phonological features are also notable. One is a unique set of phonological alternations triggered by the syntactic category marker G- in Subanon languages. These alternations involve change in voicing, nasalization, point of articulation, spirantization, and deletion of G-, depending on the identity of the following consonant (Sanicas-Daguman, 1996: 63–64) (see later, Morphology). The second notable feature is neutralization of contrast between /a/ and certain other vowels in Manobo languages. Specifically, in several Manobo languages, /a/ contrasts with

all vowels only in the last two syllables of a word. It never occurs in any syllable to the left of the penultimate. When /a/ moves into one of these positions, it is replaced by one particular vowel: e.g., /a/ → /o/ in Obo Manobo (Khor and Vander Molen, 1996: 30), /a/ → /e/[ə] in Western Bukidnon Manobo (Elkins, 1963), and /a/ → /ɔ/ in Matigsalug Manobo (Elkins, 1984). The third feature is the tendency for high vowels in Maguindanaon to lose their moras under certain conditions, such that high vowels surface as palatalization and labialization on preceding consonants (if they are the first vowel in the sequence) or as glides of diphthongs (if they are the second vowel in the sequence) (Lee, 1964; Skoropinski, 2004).

Morphology

Morphology tends to be more complex in South Philippine languages than in South Mindanao and Sama languages. Taking verbal morphology as an example, South Philippine languages display a fairly extensive range of verbal affixes, some of which undergo complex phonological alternations. These affixes function as portmanteau morphemes, signaling a variety of syntactic and semantic information. The most common information is transitivity (intransitive vs. transitive), dynamism (dynamic vs. stative), and the semantic role of S or O. Aspect, mood, and, less commonly, tense are marked on the verb, but for at least one South Philippine language (Obo Manobo), a mood contrast (realis vs. irrealis) is signaled by clause-level clitics, as well as by verb affixes. Other types of information that may be marked on the verb are abilitative, habitual, reciprocal, distributive, and multiple participants. South Mindanao and Sama languages typically take fewer verbal affixes, and at least some tense, aspect, and mood contrasts are indicated by words or clitics, rather than by verbal affixes. On the other hand, Sama languages gain in complexity through the ubiquitous presence of the affix *pa-*, which attaches to many verb stems and performs several functions. Most commonly, *pa-* creates new words and adds arguments to the sentence (e.g., an agent to a basic verbal sentence or a causer to a causative construction).

Three other morphemes are also of interest. The first is the Subanon syntactic category marker G-, undoubtedly the single most interesting morphophonological feature of this subgroup. The marker G- attaches to nouns and to all lexical constituents of noun phrases (NPs), marking the constructions as nominals. Evidence suggests that G- is the final consonant of an old case marker that over time became phonologically attached to the first consonant of the following nominal; it has subsequently

been reanalyzed as a syntactic category marker, i.e., a nominal marker in the literal sense.

The second morpheme of note is the verbal affix *-an*. This affix occurs in most Philippine languages and functions as a valence increaser, i.e., it occurs on a verb when an oblique NP, usually a location, a recipient, or a beneficiary, is promoted to the O argument (direct object) (see later, Syntactic Processes). Although *-an* performs this function in certain Sama languages (Southern Sama and Balangingi Sama), in these languages it also has a second function – that of verb classifier. As a verb classifier, *-an* occurs on some but not all verbs when O is a patient (PAT). (For most semantically transitive verbs, a patient is the unmarked choice for O; consequently, *-an* cannot be functioning as a valence increaser when it cross-references an O patient.) Since *-an* occurs on some, but not all, verbs when O is a patient, it divides verbs into two classes, those that require *-an* when O is a patient and those that do not. This function of *-an* seems to be unique to the Sama subgroup.

The third morpheme is the Yakan clitic *-in*. This clitic occurs on NPs and nominalized sentences and has two functions. First, it signals that a nominal is definite (DEF). In Yakan transitive (TRANS) sentences, O must be definite but not A. Consider Example (1) (Brainard and Behrens, 2002: 42):

- (1) tinnennun we' dende bunga-samahin
 -in-tennun we' dende bunga-sama-in
 TRANS-weave ERG woman bunga-sama.type-DEF
 'a woman wove the *bunga-sama* type of weaving.'

Second, *-in* marks S of a single-argument sentence (i.e., term (TRM)), whether or not S is definite (Example (2)) (Brainard and Behrens, 2002: 52):

- (2) lakkes kura'-in
 fast horse-TRM
 'a/the horse is fast.'

A phonologically identical morpheme that appears to have a similar function also occurs in Balangingi Sama (Gault, 1999: 18).

Morphosyntax of Basic Sentence Types

South Philippine, South Mindanao, and Sama languages display typical Philippine-type sentence structure: sentences are verb-initial and main verbs usually take an affix that cross-references one, and only one, NP in the sentence (i.e., S in a single-argument sentence and O in a transitive sentence). Sentences that express identity, attribute, possession, location, and existence are usually verbless. Sentences that express states may pattern like verbless sentences (in which case the state is coded as an adjective), or like verbal

sentences (in which case the state is coded as a stative verb). Sentences that express actions are verbal sentences and are grouped into four types: active intransitive, transitive, antipassive, and passive. The active intransitive sentence has a semantically intransitive verb; all the other sentence types have semantically transitive verbs (or verbs that pattern like semantically transitive verbs).

In some Philippine languages, transitive sentences have two word orders: VAO and VOA. Traditionally, this pattern has been explained in terms of phonology (i.e., the phonologically shorter argument precedes the phonologically longer one) or in terms of morphology or topicality (i.e., a pronoun precedes a full NP); however, neither explanation has accounted for all the facts. Brainard and Vander Molen (2003) suggested that the VOA sentence is a word-order inverse (a voice construction first proposed by Givón (1994)). Selection of the VOA inverse construction over the VAO active construction is determined either by a person hierarchy (if only first and second persons are involved) or a topicality hierarchy (if only third persons are involved), or a combination of both hierarchies (if first, second, and third persons are all involved). If full NPs as well as pronouns are involved in the selection, then the hierarchy looks like that in **Figure 1**. In general, if A outranks O on the hierarchy, the VAO active construction is selected, but if O outranks A, the VOA inverse construction is selected.

Antipassives and passives are detransitivized constructions, i.e., constructions in which one grammatical relation of a transitive sentence has been demoted to oblique or deleted. In Philippine antipassives, O of the transitive counterpart is demoted or deleted. Although the demoted NP is often indefinite, it may be definite. Following demotion or deletion of O, A becomes S. In a Philippine passive, A of the transitive counterpart is obligatorily deleted, and following deletion, O becomes S.

Two types of passives occur in Philippine languages: a morphological passive and a nonmorphological passive. In the morphological passive, the verb takes stative affixes, but in the nonmorphological passive, the verb takes the same affixes that occur on it in a transitive sentence. Thus, the only difference between a nonmorphological passive and a transitive sentence is the obligatory absence of A in the passive. As it happens, some Philippine languages have both types of passives. The factors determining the selection of

First person > Second person > Third person > Pronouns > Full noun phrases

Figure 1 Person-topicality hierarchy governing VAO and VOA selection.

one passive over the other appear to be language specific and have not yet been fully investigated.

With the identification of the goal-focus construction as the basic transitive sentence, case-marking patterns have undergone reexamination. In South Philippine and Sama languages, case marking displays either a consistently ergative pattern or a split ergative pattern (the precise details of the split ergative patterns vary from language to language). In South Mindanao languages, nominal markers do not function as case markers, although pronouns are marked for case.

At this point, it may be useful to compare actual data from representative languages. When discussing nominal markers, only the marking of S, A, and O will be considered.

Maguindanaon

Common nouns and personal names are marked for case and display an ergative pattern (see Table 2) (it is unclear if the VOA inverse is possible when A and O are both full NPs). Pronouns are also marked for case (see Table 3). In a VAO active construction, second-person pronouns have a tripartite pattern, but third-person pronouns have an ergative pattern. In a VOA inverse construction, second-person pronouns have an ergative pattern (for all other persons, either

A or O does not occur in the construction). Maguindanaon has five types of verbal sentences: active intransitive, VAO active construction, VOA inverse construction, antipassive, and passive. Example (3) is an active intransitive sentence (Bruce Skoropinski, personal communication):

- (3) lemu aku saguna
leave 1SG now
'I will leave now.'

Selection of a VAO active construction (Example (4); Bruce Skoropinski, personal communication) and a VOA inverse construction (Example (5); Fleischman, 1986: 30) is governed by a person-topicality hierarchy identical to that in Figure 1 (in the following examples, COMP means 'completed aspect'):

- (4) in-umbal-an ku seka sa liplanu
COMP-make-BEN 1SG 2SG OBL airplane
'I made you an airplane.'
- (5) in-enggat aku nengka kanu walay nengka
COMP-invite 1SG 2SG OBL house GEN.2SG
'you invited me to your house.'

Example (6) (Fleischman, 1986: 30) is the antipassive. (Example (7) is its transitive counterpart.)

- (6) min-umbal aku sa liplanu sa leka
COMP-make 1SG OBL airplane OBL OBL.2SG
'I made an airplane for you.'
- (7) in-umbal ku su liplanu sa leka
COMP-make 1SG ABS airplane OBL OBL.2SG
'I made the airplane for you.'

The Maguindanaon passive is a nonmorphological passive. Compare the passive in Example (8) (Bruce Skoropinski, personal communication) with its transitive counterpart in Example (6):

- (8) in-umbal su liplanu sa leka
COMP-make ABS airplane OBL OBL.2SG
'the airplane was made for you'

Obo Manobo

Obo Manobo has two types of transitive sentences, a VAO active construction and a VOA inverse construction. Case marking of common nouns and personal names in both constructions is identical and displays a consistently ergative pattern (see Table 4). Pronouns are also case marked (see Table 5). In a VAO active construction, first- and second-person pronouns have a tripartite pattern and third-person pronouns have an ergative pattern. On the other hand, in a VOA inverse construction, first-person plural exclusive pronouns and second- and third-person pronouns have an ergative pattern. (The pronouns *nikoddi* '1SG' and *niketa* '1PL.INCL' have recently come to notice and also appear

Table 2 Maguindanaon case markers

| Noun type | Marker | | |
|----------------|--------|----|----|
| | S | A | O |
| Common nouns | | | |
| Definite | su | nu | su |
| Indefinite | i | na | i |
| Personal names | si | ni | si |

Table 3 Maguindanaon pronouns

| Person/ number | VS sentence, S | VAO sentence | | VOA sentence | |
|-------------------|-------------------|--------------|---------|--------------|--------|
| | | A | O | O | A |
| Singular | | | | | |
| 1 | aku | ku | – | aku | – |
| 2 | ka | nengka | seka | ka | nengka |
| 3 | sekanin | nin | sekanin | – | nin |
| Plural | | | | | |
| 1INCL | tanu | tanu | – | tanu | – |
| 1DU | ta | ta | – | ta | – |
| 1EXCL | kami | nami | – | kami | – |
| 2 | kanu | nu | sekanu | kanu | nu |
| 3 | silan | nilan | silan | – | nilan |

to be possible for A in VOA constructions, although this needs to be confirmed.) Obo Manobo has six types of verbal sentences: intransitive, VAO active construction, VOA inverse construction, antipassive, morphological passive, and nonmorphological passive. Example (9) (Edna Vander Molen, personal communication) is an active intransitive sentence:

- (9) od usok ka diyon to baoy
IRR enter 2SG there OBL house
'you will enter into the house'

Examples (10) and (11) (Vera Khor, personal communication) show, respectively, a VAO active construction and a VOA inverse construction:

- (10) od suntuk-on din sikkow
IRR hit-PAT 3SG 2SG
'he will hit you'
- (11) od suntuk-on ka nikandin
IRR hit-PAT 2SG 3SG
'he will hit you'

Selection of the active construction and the inverse construction is controlled by a person-topicality hierarchy identical to that in Figure 1. Obo Manobo is notable in that both constructions are possible for most person combinations. Word-order inverses have also been noted for Agusan Manobo, Matigsalug Manobo, Sarangani Manobo, Tagabawa Manobo,

and Western Bukidnon Manobo. Example (12) is the antipassive. (Example (13) is its transitive counterpart (Ena Vander Molen, personal communication):

- (12) od tampod iddos anak to tali
IRR cut ABS child OBL rope
'the child will cut a rope'
- (13) od tompoddon to anak iddos tali
od tampod-on to anak iddos tali
IRR cut-PAT ERG child ABS rope
'the child will cut the rope'

Examples (14) and (15) (Ena Vander Molen, personal communication) are, respectively, a morphological passive and a nonmorphological passive (Example (13) is the transitive counterpart):

- (14) od ko-tampod iddos tali
IRR PASS-CUT ABS rope
'the rope will be cut'
- (15) od tompoddon iddos tali
od tampod-on iddos tali
IRR cut-PAT ABS rope
'the rope will be cut'

Tboli

Tboli common nouns and personal names are not marked for case, but pronouns are and display a split case-marking system (see Table 6) (some pronouns have allomorphs, not all of which are listed in Table 6). The first split occurs between singular and plural forms. Singular forms have a tripartite pattern. The second split occurs between plural forms: all plural forms except first-person inclusive have a nominative pattern, and first-person inclusive forms are neutralized for case. Table 6 shows the distribution of pronouns in affirmative sentences. A notable feature of Tboli is that the negation of a sentence triggers a change in pronoun sets for S and O. This change also alters the case-marking pattern slightly (see Table 7). In negated sentences, singular first and second persons still display a tripartite pattern, but singular

Table 4 Obo Manobo case markers

| Noun type | Marker | | |

Table 7 Distribution of pronoun sets in negated Tboli sentences

| Pronoun | Person/number | | |
|----------|---------------|-------|--------|
| | S | A | O |
| Singular | | | |
| 1 | -e | -u | dou/do |
| 2 | -i | -em | kóm |
| 3 | -en | -en | du |
| Plural | | | |
| 1INCL | tekuy | tekuy | tekuy |
| 1DU | te | te | kut |
| 1EXCL | me | me | kum |
| 2 | ye | ye | kuy |
| 3 | le | le | kul |

third persons now display a nominative pattern. All other persons except first-person plural inclusive continue to display a nominative pattern; first-person plural inclusive continues to be neutralized for case (the alternation of pronouns in affirmative and negated sentences does not occur in Blaán). Examples (16)–(19) illustrate the changes in pronouns. When a single-argument sentence is negated, S changes only when it is a singular third person (Examples (16) and (19) from Lillian Underwood (personal communication); Examples (17) and (18) from Forsberg (1992: 101, 102)):

(16) mung-e
go-1SG
'I'm going along'

(17) là mung-e
not go-1SG
'I'm not going along'

(18) mung
go
'he is going along'

(19) là mung-en
not go-3SG
'he is not going along'

When a transitive sentence is negated, O changes when it is any person except third-person singular and first-person plural inclusive (Examples (20) and (21); Porter, 1977: 114, 115):

(20) nwit Kasi ou elem bulul
TRANS.take Kasi 1SG to mountains
'Kasi took me to the mountains'

(21) là nwit Kasi dou elem bulul
not TRANS.take Kasi 1SG to mountains
'Kasi didn't take me to the mountains'

As might be expected, word order is relatively rigid and a primary means of distinguishing between A and O in transitive sentences; however, when S, A, or O is an expanded full NP, the NP moves to the end of the sentence, and a coreferential pronoun is left in the normal sentence position (Example (22); Forsberg, 1992: 57) (in the following example, PREP means 'preposition'):

(22) kól le_i bélé me
arrive 3PL PREP 1PL.EXCL
[kem tau dmadu]_i
PL person INTRANS.plow
'the men who are to plow have arrived to us'

If both A and O are expanded NPs, both NPs move to the end of the sentence, with A coming last. Coreferential pronouns are left for A and O in their normal positions (Example (23); Porter, 1977: 99) (in the following example, SPEC means 'specific'):

(23) eted le_i lu_j [yó kem
deliver 3PL 3PL SPEC PL
ngà lemnek]_j [yó kem
child small SPEC PL
tau lemwót gu leged]_j
person INTRANS.come from upstream
'the people from upstream delivered the small children'

If only one expanded NP is present at the end of a transitive sentence, it always refers to O (Example (24); Porter, 1977: 98):

(24) eted le lu_i [yó kem ngà lemnek]_i
deliver 3PL 3PL SPEC PL child small
'they delivered the little children'

Expanded NPs in Blaán do not change sentence position.

Southern Sama

Southern Sama common nouns and personal names display a consistently ergative case-marking pattern.

Table 8 Southern Sama pronouns

| Pronoun | Person/number | | |
|----------|---------------|------|--------|
| | S | A | O |
| Singular | | | |
| 1 | akú | ku | akú |
| 2 | kow | nu | kow |
| 3 | iyá | na | iyá |
| Plural | | | |
| 1INCL | kitabí | tabí | kitabí |
| 1DU | kitá | ta | kitá |
| 1EXCL | kamí | kâmi | kamí |
| 2 | kam | bi | kam |
| 3 | sigá | sigá | sigá |

For common nouns and personal names, S and O have no case marker, but A is obligatorily marked by *heb*. For pronouns, all persons except plural third persons display an ergative pattern (see Table 8). Plural third-person pronouns are neutralized for case. Note that phonological contrast is minimal for first-person plural exclusive: S, A, and O are identical except for word stress (represented in Table 8 by an acute accent). When A is a pronoun in a transitive sentence of type 1 (see Examples (26) and (27)), it is also obligatorily marked by *heb*. Southern Sama has five types of verbal sentences: active intransitive, transitive type 1, transitive type 2, antipassive, and passive. Example (25) is an active intransitive sentence (Trick, 1997: 126):

- (25) pasód anak-anak ni lumah
 enter child OBL house
 ‘the child will enter into the house’

Transitive sentences are of two types. Transitive sentence type 1 is more morphologically complex, compared to type 2, because the verb must occur with the affix *ni-* (or its allomorph *-in-*), A is either a full NP or a pronoun and must be preceded by the ergative marker *heb*, and word order may be VAO or VOA, with VOA being the more common order (transitive type 1, Examples (26) and (27), VOA and VAO order, respectively; Trick, 1997: 128):

- (26) sinampak eroh heb anak-anak
 sampak-in- eroh heb anak-anak
 slap-TRANS dog ERG child
 ‘the child will slap the dog’
- (27) sinampak heb anak-anak eroh
 sampak-in- heb anak-anak eroh
 slap-TRANS ERG child dog
 ‘the child will slap the dog’

Transitive sentence type 2 is morphologically simpler: the verb never occurs with *ni-*, A must be a pronoun and is never preceded by *heb*, and word order is

obligatorily VAO (Example (28); Doug Trick, personal communication) (similar pairs of transitive sentences have also been noted for Balangingi Sama, Pangutaran Sama, and Yakan):

- (28) sampak-ku eroh
 slap-ERG.1SG eroh
 ‘I will slap the dog’

Example (29) (Trick, 1997: 132) is the antipassive. (Example (30) (Trick, 1997: 132): is its transitive counterpart.)

- (29) ngan-dugsuh aku sowa
 AGT-stab ABS.1SG snake
 ‘I will stab a/the snake’
- (30) ni-dugsu-an sowa heb-ku
 TRANS-stab-PAT snake ERG-ERG.1SG
 ‘I will stab the snake’

Passive sentences in Southern Sama are nonmorphological passives (Example (31); Trick, 1997: 133); compare Example (31) with its transitive counterpart, Example (29):

- (31) ni-dugsu-an sowa
 TRANS-stab-PAT snake
 ‘the snake will be stabbed’

Syntactic Processes

Although syntactic processes have been investigated in a few languages, e.g., Sama, Yakan, and Northern Subanen, this is an area of Philippine linguistics that still needs more research. What has been noted to date is that South Philippine, South Mindanao, and Sama languages, like all Philippine languages, allow an oblique NP to be promoted to O (i.e., direct object), although languages vary as to which semantic roles may undergo promotion. The promoted NP is always cross-referenced by an affix on the verb. A variation of this process occurs in some Sama languages. In cleft constructions in Philippine languages, S and O are the only arguments eligible to be the head of the construction, in which case they are usually cross-referenced by a verbal affix. For certain verbs, however, the verbal affix may cross-reference an oblique NP. For these NPs, morphological and syntactic evidence shows that the cross-referenced NP has changed its relation to the verb, but has not become a grammatical relation (i.e., O). (This process has been noted for Southern Sama and Yakan. In Southern Sama, a similar process also occurs in antipassive constructions.) For those languages in which other syntactic processes have been described (e.g., relativization, clefting, raising, coreferential deletion, and control of second-position clitics), the following

preliminary generalization can be made: in South Philippine languages, control of syntactic processes seems to be more or less evenly distributed between A and O in transitive sentences, but in Sama languages, control for nearly all of these processes (including second-position clitics) is governed exclusively by O in transitive sentences, making the Sama languages highly syntactically ergative languages. As for all Philippine languages, S is always the syntactic control in single-argument sentences.

Southeast Asia as a Linguistic Area

W Bisang, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Mainland Southeast Asia – the Area, Its Languages and Language Families, Its History

Mainland Southeast Asia geographically covers the area of Vietnam, Laos, Cambodia, Thailand, Myanmar, peninsular Malaysia, and southern and southwestern China. This area is characterized by at least two millennia of lively exchange and interaction among speakers of languages that belong to no fewer than five families: Sino-Tibetan, Mon-Khmer (a subfamily of Austroasiatic), Tai (the core group of the Tai-Kadai languages), Hmong-Mien (also called Miao-Yao) and Chamic (Malayo-Polynesian subfamily of Austronesian). The families forming the core of mainland Southeast Asia as a zone of contact-induced convergence are Mon-Khmer, Tai, Hmong-Mien and Sinitic. The Hmong-Mien languages are divided into the Hmong (Miao) and the Mien (Yao) subfamilies. They are spoken in small areas of southern China and in northern Vietnam, Laos, and Thailand. The architecture of the other

families is presented in Tables 1–3: Table 1 is on Mon-Khmer, Table 2 on Tai, and Table 3 on Sinitic.

The present linguistic situation in mainland Southeast Asia is the result of extensive migrations, the rise and fall of many kingdoms, and innumerable contact situations (on the historical facts, see Wyatt, 1982). In the first millennium A.D., the inhabitants of this area had contacts with China and India. Vietnam, in the east, was governed by China between 179 B.C. and 938 A.D., while the west and the south were influenced by Theravada Buddhism through the mediation of the Mon (cf. the large corpus of Sanskrit and Pali words in modern Thai and Khmer). The geography of mainland Southeast Asia and its large rivers in particular directed migration from southern China toward Thailand, Laos, and Vietnam. Apart from Chinese and Indian influence, the first millennium A.D. is characterized by the steady emergence of greater political structures. At its end, we find the state of Vietnam, the kingdom of Champa (on the coast of central Vietnam; Austronesian: Chamic), the Khmer empire of Angkor, the kingdoms of central and northern Thailand, and the Burmese kingdoms of Mon and Pyu. At about the same time, numerous speakers of Tai languages migrated from inland southern China (Guizhou, Guangxi) to the south

|--------------|--|
| Southwestern | Ahom (Assam/India; extinct) Central Thai (= Siamese) East Central: Black Tai (Tai Dam) (N Vietnam), Red Tai (Tai Daeng) (North Central Vietnam), Phu Tai (Phuan) (Laos/Thailand) Khamti (NW Myanmar; Assam) Lanna (N Thailand): Mueang, Northern Thai, Yuan Lao (Laotian, including Isan in Thailand) Lue (Lü) (called Dai in China; situated in Yunnan) Shan (SE Myanmar, Thailand) Southern Thai White Tai (Tai Dón) (N Vietnam) etc. |
| Central Tai | Nung (on both sides of the Chinese-Vietnamese border), Southern Zhuang (China, Zhuang Autonomous Region), Tho (= Tay and Caolan; NE Vietnam, S China) |
| Northern Tai | Bouyei (Buyi), Saek (Central Laos near Vietnamese border, NE Thailand), Northern Zhuang (across S China) |

and changed the balance in the north towards the Tai population, which simultaneously became an important reservoir of manpower and a potentially dangerous rival for the adjacent kingdoms. Cambodia moved its center of gravity from Angkor further south to Phnom Penh, and the newly developed Thai kingdoms of Sukhothai (?1240–1438) and Ayudhya (1351–1767) were characterized by intensive contact and presumably by a considerable proportion of bilinguals. As a consequence, there is a high degree of structural similarity and some lexical similarity between the two languages. Finally, the

migration of a considerable number of Hmong-Mien from southern and southwestern China to Laos, Vietnam, and Thailand started in the middle of the 19th century.

Given the long-lasting and very complex patterns of interaction among speakers of a large number of languages from different families, structural convergence comes as no surprise. Studies dealing with mainland Southeast Asia from an areal perspective are Huffman (1973), Clark (1978), Capell (1979), Clark (1989), Matisoff (1991), Bisang (1992), Bisang (1996), and Enfield (2003). Huffman (1986) is an excellent bibliography on the languages and linguistics of this area.

General Properties of the Languages of Mainland Southeast Asia – the Relevance of Pragmatics

Mainland Southeast Asian languages are characterized by a high degree of indeterminateness, which as a consequence endorses the relevance of pragmatic inferencing and produces a special type of pragmatics-oriented grammaticalization (see ‘Indeterminateness and the Role of Pragmatics’ below). The pragmatics-oriented character of grammaticalization may be one reason for a syllable-based morphology (see ‘Syllabic Morphology’ below). Another consequence of this type of grammaticalization may be the comparatively weak correlation between the lexicon and individual lexical items (see ‘Versatility’ below).

The above pragmatics-based properties will be discussed in this section. Two additional general properties will be treated in the subsection ‘Directional Verbs, Coverbs and TAM Markers, and Syntactic Patterns’ with the necessary language-specific details. The properties are the existence of rigid syntactic patterns with fixed functionally determined positions and the functional motivations of these patterns.

Indeterminateness and the Role of Pragmatics

East and mainland Southeast Asian languages are well known for their indeterminateness, i.e., their lack of obligatory categories (Bisang, 1992, 2001, see also context dependency in Enfield, 2003: 55). One famous instance is the lack of obligatory arguments. In the following example from Modern Standard Chinese (Mandarin Chinese), the agent argument *wǒ* ‘I’ and the patient argument *tā* ‘he’ are no longer mentioned in the second clause with the predicate *jiàn* ‘see’ because they are already known from the previous context.

- (1) wǒ₁ bú jiàn tā₂ yǐ shì sān
I *NEG* *see* *he* *already* *be* 30
shíduō nián; jīntiān Ø₁ jiàn Ø₂ le
more *year* *today* *see* *PF*
‘I haven’t seen him for more than 30 years. Today [I] saw [him]’
(from Lu Xun, *Kuangren riji* [*Diary of a Madman*], second sentence).

Dropping arguments (prodrop) is not the only instance of indeterminateness. There are also a large number of grammatical categories which are optional (cf. Table 4), i.e., the speaker is not committed to select a particular subcategory (e.g., past, present, or future) from a particular obligatory category (e.g., tense).

Indeterminateness implies that grammatical categories which are expressed obligatorily in other languages must often be inferred from the context in mainland Southeast Asian languages. If these

Table 4 Some nonobligatory categories in mainland SE Asian languages

| Verb | Noun |
|--|--|
| Person/Number | Number |
| Tense/Aspect/Modality (TAM) | Noun class |
| Transitivity (transitive vs. intransitive) | Reference (definite, specific, indefinite) |
| Diathesis | Relationality (possession) |
| Causativity | Case |

categories are expressed, however, they are very often expressed by lexical items which occur in a special syntactic position of a construction where they get reanalyzed as grammatical markers. This type of grammaticalization differs from grammaticalization as described in the literature by dint of the vast functional range of many markers (see ‘Classifiers’ and “The Verb ‘Come to Have’” below) and the lack of a form–meaning correspondence (see ‘Directional Verbs, Coverbs and TAM Markers, and Syntactic Patterns’). The mainland Southeast Asian languages show that a high degree of abstraction (semantic generality, cf. Bybee, 1985) does not automatically lead to morphological reduction (see ‘Syllabic Morphology’ below); in other words, the semantic integrity of a linguistic sign is not fully reflected in its phonological integrity (Lehmann, 1995). The high functional range of individual markers is sometimes observed within an individual language, sometimes across languages. In the latter case, individual languages select certain domains out of the whole inferential potential of a marker common to a wider contact zone (see ‘Directional Verbs, Coverbs and TAM Markers, and Syntactic Patterns’ on verbs with the meaning ‘finish’ and the end of “The Verb ‘Come to Have’”).

The high relevance of pragmatics led to a more general discussion of the relevance of syntax in mainland Southeast Asian languages. Diller (1988) talked about “pragmatically organised syntax” in the context of Thai and other languages. Huang (1994) argued, against Huang (1984), that the interaction of syntax and pragmatics is subject to typological variance:

There seems to exist a class of language (such as Chinese, Japanese, and Korean) where pragmatics appears to play a central role which in familiar European languages (such as English, French, and German) is alleged to be played by grammar. In these ‘pragmatic’ languages ... (Huang, 1994: xiv)

Syllabic Morphology

Mainland Southeast Asian languages are characterized by or drift towards a morphology whose smallest meaningful element is the syllable. This definition

encompasses the well-known monosyllabism of languages such as Chinese (Mandarin Chinese) or Vietnamese (each syllable has its own meaning) but it also covers such cases as Thai or Khmer, which easily accept strings of semantically unanalyzable syllables, as in the elegant word for ‘restaurant’ in Thai (*pháttaakhaan*) or in Khmer (*phò:çəni:əttə:n*).

This does not mean that subsyllabic morphology does not exist in mainland Southeast Asia, but the integration into that area seems to engender a drift towards syllabic morphology. This can be illustrated by Mon-Khmer. Vietnamese, which was under the strong influence of monosyllabic Chinese for more than a millennium (see above), has completely lost its subsyllabic morphology, while Khmer, which had weaker contacts with China and was even able to transfer a lot of its vocabulary to Thai, probably has the richest morphology within the Mon-Khmer family (on Khmer morphology see Jenner and Pou, 1980–1981; Haiman, 1998). In spite of this, Khmer morphology is basically a lexical phenomenon, i.e., the affixes are not used productively. The productive strategies are all based on products of grammaticalization (as described in the subsections ‘Classifiers,’ ‘Directional Verbs, Coverbs and TAM Markers, and Syntactic Patterns,’ and “The Verb ‘Come to Have’”). In addition, Khmer subsyllabic morphology is characterized by the following two properties: (1) a large number of Khmer affixes lack functional consistency, i.e., the same marker can express different functions depending on its base (the prefix *prə-* marks causativity/factivity, change of word class and reciprocity); and (2) the same function can be expressed by different affixes (e.g., derivation of nouns from verbs belongs to the functional range of the following affixes: *k-*, *s-*, *m-*, *N-*, *buN-*, *kuN-*, *suN-*, *-b-*, *-m-*, *-n-*, *-vmm-/vN-*) (Bisang, 2001: 195–200).

Versatility

The term ‘versatility’ refers to the fact that the occurrence of a given linguistic item is not limited to a single syntactic position (Matisoff, 1969). A word’s freedom to occur in the N-position as well as in the V-position is one instance of versatility. In the extreme case of Late Archaic Chinese (5th–3rd century BC), any lexical item can take the verbal position, even a proper name:

- (2) Late Archaic Chinese (Zuo, Ding 10)
 Gōng Ruò yuē: ěr Wú wáng wǒ hū?
Gong Ruo say you Wu king I Q
 ‘Gong Ruo said: “Do you want to deal with me as King Wu was dealt with?”’
 (King Wu was murdered. → “Do you want to kill me?”)

Versatility may also enhance grammaticalization in the sense that full lexemes can take positions associated with grammatical functions. As is typical of versatility, one lexical item can take different functions depending on the construction in which it is used. Thus, the verb *ʔaoy* ‘give’ in Khmer can occur as a coverb (3), as a causative verb (4), or as an adverbial subordinator (5). The same applies to Vietnamese *cho* ‘give’ and to Thai *hây* ‘give’ (cf. Bisang, 1996: 577–578).

- (3) kəət baək tvi:ə(r) ʔaoy khjom
he open door give.COVERB I
 ‘he opens the door for me’
- (4) mda:y-mi:ŋ sovaŋ(ŋ) ʔaoy sva:mvy cù:n
aunt Sovan give.CAUS husband give a lift
 phniəv t̄vu pht̄əh
guest Vd:go house/home
 ‘Aunt Sovan had her husband bring the guests back home’ (Bisang, 1992: 440)
- (5) khjom khəm thvə:ka:(r) ʔaoy
I try hard work so that.COMP
 ʔo:pük khjom səpba:y-cvt(t)
father I be-pleased
 ‘I am working hard so that my father will be pleased.’

The versatility of lexical items may turn out to be another consequence of the high relevance of pragmatics in the sense that the positioning of lexical items into syntax is governed to a lesser or to a greater degree by pragmatics.

Some Individual Structural Properties of the Languages of Mainland Southeast Asia

This section will mostly refer to one or more of the following languages: Chinese (Mandarin Chinese) (Sinitic), White Hmong (Hmong Daw) (Hmong-Mien), Vietnamese (Mon-Khmer), Thai (Tai) and Khmer (Mon-Khmer). Apart from word order; classifiers; directional verbs (Vd), coverbs (COV), and TAM markers derived from verbs; and different functions of the verb ‘come to have,’ there are other characteristics of mainland Southeast Asia as a zone of convergence which will not be discussed here. I would like to refer to relational nouns (nouns such as Thai *nâa* ‘front’ in adpositional function with the meaning ‘in front of’), causatives marked by the verbs ‘make, do’ and ‘give, allow’ in Vietnamese, Thai, and Khmer (Bisang, 1992: 42–44; see also example (4) above), passivelike constructions with a tendency to adversative meaning, complementizers and adverbial subordinators derived from verbs such as ‘say,’ ‘give’ (cf. example (5) above), ‘finish’ and others, and,

Table 5 Word order in mainland southeast Asia

| | <i>Verb/Object</i> | <i>Adposition</i> | <i>Demonstrative</i> | <i>Classifier</i> | <i>Possessor/Genitive</i> | <i>Relative Clause</i> |
|------------|--------------------|-------------------|----------------------|-------------------|---------------------------|------------------------|
| Chinese | VO | Prep/Postp | DemN | CIN | GenN | ReIN |
| Hmong | VO | Prep | NDem | CIN | NGen | NRel |
| Vietnamese | VO | Prep | NDem | CIN | NGen | NRel |
| Thai | VO | Prep | NDem | NCI | NGen | NRel |
| Khmer | VO | Prep | NDem | NCI | NGen | NRel |

finally, comparative constructions based on verbs with the meaning ‘surpass’ (e.g., in Cantonese, Thai, Vietnamese).

Word Order

The large majority of the languages belonging to the mainland Southeast Asian convergence zone are VO (verb middle, including Chinese [Mandarin Chinese]). The noun phrase is subject to variance. While Chinese (Mandarin Chinese) is consistently head final, Thai and Khmer are consistently head initial. Hmong and Vietnamese are head initial with the exception of the classifier phrase, which follows the Chinese (Mandarin Chinese) example. There are prepositions (coverbs) in all the languages; Chinese also has postpositions (relational nouns, i.e., nouns in adpositional function). Since numerals covary with classifiers, there is no extra column for them in Table 5.

Classifiers

Classifiers are minimally used with numerals, where their presence is overwhelmingly compulsory in mainland Southeast Asian languages. Thus, a Chinese (Mandarin Chinese) noun like *xìn* ‘letter’ must take a classifier (*fēng*) if it is counted:

- (6) sān fēng xìn
three *CLASS* *letter*
‘three letters’

There is an implicational correlation between the existence of a classifier and the lack of obligatory number distinction (transnumerality): “Numeral classifier languages generally do not have compulsory expression of nominal plurality, but at most facultative expression” (Greenberg, 1974: 25). Since nouns in mainland Southeast Asian languages only denote a concept without any commitment to number, one of the functions of the classifier is to make that concept accessible by individuating it, i.e., by highlighting one of its conceptual boundaries which qualify it as a unit (Bisang, 1999). The semantic criteria for highlighting a concept also classify that concept. Typical criteria for classification are material (animate,

abstract, inanimate), shape (one-/two-/three-dimensional), consistency (flexible, hard or rigid, discrete), size (big, small), location (classifiers for plots of land, countries, gardens, fields, etc.) and spatial arrangement (Allan, 1977). Other criteria are based on physical, functional, and social interaction with the concept to be classified (Denny, 1976).

Classification can not only be used to individuate a concept by highlighting some of its properties; it can also be used for identifying one or more relevant objects denoted by a concept. While identification can take place without referring to individuation – one can identify an ‘apple’ without referring to its conceptual boundaries – it seems difficult to individuate it without simultaneously identifying it. Departing from classification, one can thus establish the following hierarchy:

- (7) classification > identification > individuation

Identification can be used either to mark the definiteness or specificity of a concept (referentialization) or to make it accessible for construction with for example a possessor or a relative clause (relationalization).

Taking together the functional range of classifiers in mainland Southeast Asia, there are no fewer than four functions: classification, individuation, referentialization, and relationalization. These functions are not equally distributed across Southeast Asia. The minimal functions operating in all the languages are classification and identification. Table 6 provides a survey (Bisang, 1999).

The following examples from Hmong illustrate the functions of classification/individuation (8a) and of relationalization (possession) (8b).

- (8a) peb rab riam
three *CLASS* *knife*
‘three knives’
- (8b) nws rab riam
he *CLASS* *knife*
‘his knife’

The referential function of classifiers is more difficult to show because this needs a lot of text. Once a concept is introduced, it can be marked as definite, sometimes by the classifier alone, sometimes by classifier plus demonstrative, sometimes only by the

demonstrative (for more, see Bisang, 1999: 152–153). It is, however, necessary to point out that reference marking is not compulsory. Thus, an unmarked noun can get any possible referential interpretation depending on context.

Directional Verbs, Coverbs and TAM Markers, and Syntactic Patterns

Markers derived from lexical items used for expressing directionality, adpositional functions, and tense-aspect-modality (TAM) are widespread in mainland Southeast Asia.

The direction taken by a state of affairs can be overtly expressed with directional verbs (Vd). Verbs belonging to this category have the meanings of ‘come,’ ‘go,’ ‘move upwards,’ ‘move downwards,’ ‘move into,’ and ‘move out of.’ In Khmer, there is a maximum of three slots (9), while Thai has only two slots and Vietnamese only one.

- (9) kət yək ʔyvan coh
he *take* *luggage move. down.DIR*
 cəŋ mək.
move. out.DIR come.DIR
 ‘He takes [his] luggage down and out [of his room upstairs towards the speaker]’

Verbal lexemes in adpositional function are called coverbs (COV) (see Clark, 1978). An instance of the verb ‘give’ in that function is discussed in the subsection ‘Versatility.’ Other frequently used verbs

are ‘be at’ (locatives or directionals), ‘arrive’ (directionals), ‘move along something’ (path), ‘use’ (instrumental), ‘be equal to’ (work as, do something in the function of), and ‘replace’ (instead of). The following example is from Vietnamese:

- (10) tôi làm việc ở Sài Gòn.
I *do* *work* *be.at.COV* *Saigon*
 ‘I work in Saigon’

Verbs in the function of TAM markers can occur in the preverbal position or clause finally (in Chinese [Mandarin Chinese], there are also the three TAM markers *-le*, *-zhe* and *-guo*, which are suffixed to the verb). The verb ‘finish’ in clause-final position, which is very widespread, is briefly looked at in this subsection (see also the next subsection on ‘come to have’). In Chinese (Mandarin Chinese), the clause-final marker *le* (derived from *liǎo* ‘finish’) marks a wide range of functions from perfect to the pragmatic function of reference to a preconstructed domain (Li *et al.*, 1982; Bisang and Sonaiya, 1997). Thai *léew*, which is borrowed from Chinese *liǎo* ‘finish,’ is an aspectual marker highlighting event-initial or event-final temporal boundaries. The functions of Hmong *lawm* (again related to Chinese *liǎo*) or *tas* (*lawm*) ‘finish,’ Vietnamese *rôi* ‘finish,’ and Khmer *haəy* (nowadays only used as a TAM marker, but cf. its transitive form *bəŋhaəy* ‘finish’) cover the same functional range as *le* and *léew*. Unfortunately, there is no detailed comparative analysis available.

If directional verbs, coverbs, and TAM markers are part of the same state of affairs, they follow a fixed pattern of word order (cf. serial unit in Bisang, 2001) described in Table 7 and illustrated by example (11) from Khmer.

- (11) kət ba:n yək ʔyvan coh
the be.able.TAM take luggage move.down.DIR
 cəŋ mək. ʔaoy khnom.
move.out.DIR come.DIR give.COV I
 ‘he was able to bring [his] luggage down and out [of his room upstairs towards the speaker] to/for me.’

As can be seen from Table 7, the structure of the serial unit follows a certain areal clustering. Vietnamese, Thai, and Khmer, in the south, follow exactly the same pattern. Chinese (Mandarin Chinese), in the

Table 6 Functions of classifiers in individual languages

| | |
|--|--|
| I. <i>Classification & individualization</i> | |
| Modern Standard Chinese (Mandarin Chinese) (classifiers with numerals and demonstratives) | |
| Vietnamese (individualization, but not necessarily in the context of counting) | |
| II. <i>Classification & individualization & referentialization</i> | |
| Thai (secondary function in combination with stative verbs in N-CLASS-ADJ) | |
| III. <i>Classification & individualization & relationalization</i> | |
| Cantonese (yue Chinese) (classifiers can be used in possessive and relative constructions) | |
| IV. <i>Classification & individualization & referentialization & relationalization</i> | |
| Hmong (with referentialization being a secondary function) | |

Table 7 Positions within the serial unit

| | | | | | | |
|------------|-----|-----|-------|-----|-----|-----|
| Chinese | TAM | COV | V-TAM | COV | Vd | TAM |
| Hmong | TAM | COV | V TAM | Vd | COV | TAM |
| Vietnamese | TAM | | V | Vd | COV | TAM |
| Thai | TAM | | V | Vd | COV | TAM |
| Khmer | TAM | | V | Vd | COV | TAM |

north, differs with regard to the following three properties: preverbal coverbs, TAM markers immediately after the verb and COV-Vd word order. Hmong lies in between. It shares the former two word order properties with Chinese (Mandarin Chinese) and the last property with the southern languages.

The above word order is not arbitrary even if one looks at languages spoken outside mainland Southeast Asia with comparable structures (Bisang, 2001: 202–214). It can be accounted for in terms of semantic generality as introduced by Bybee (1985). Increasing semantic generality of a marker is related to compatibility with more lexical stems and to greater morpho-syntactic fusion with the stem. Thus, maximally general grammatical categories are prototypically expressed inflectionally. Although there is no iconic correlation between the degree of semantic abstraction and morphological attrition in mainland Southeast Asia (see ‘Syllabic Morphology’ above), there is a form–meaning iconicity if one looks at the relative distance of the markers to the main verb. The further away a marker is from the main verb the more general it is. Directional verbs and coverbs still have enough semantic weight to be incompatible with many verbs. This is not the case with the semantically more general TAM markers. Therefore, TAM markers are situated at a greater distance from the verb than coverbs and directional verbs. Coverbs and directional verbs seem to share about the same degree of generality. Consequently, we find COV-Vd as well as Vd-COV.

The Verb ‘Come to Have’

There is an excellent study on the grammaticalization of the verb ‘get, come to have’ from an areal perspective in mainland Southeast Asia in Enfield (2003). Verbs such as Chinese (Mandarin Chinese) *dé*, Hmong *tau*, Vietnamese *đuợc*, Thai *dây*, or Khmer *ba:n* with that meaning induce a large number of different inferences depending on the context. Enfield (2003) translates these verbs with ‘come to have.’ This translation is more adequate than the one with ‘get’ because it does not imply an agentive subject.

Although ‘come to have’ verbs occur preverbally as well as postverbally, a look in this subsection at their preverbal functions will be enough to illustrate the rich inferential potential. Their basic meaning in this position is that the state of affairs expressed by the main verb is true or applies “because of something else that happened before this” (Enfield, 2003: 292). A set of inferences depends on whether the state of affairs denoted by the verb is understood as [+wanted] or [–wanted]. If it is wanted, we get either an abilitative (be able) or a permissive (be allowed)

inference (12); if it is not wanted, we get a strong deontic (must, have to) interpretation (13).

- (12) Hmong (Mottin, 1980; Bisang, 1992: 241):

koj mus deev hluar nkauj,
you go court girl
koj puas tau nrog tham?
you Q PFV with.COV talk

‘you courted the girl, did you [manage to] talk to her?’

- (13) Chinese (Mandarin Chinese) (in its deontic function, *dé* ‘get’ becomes *děi*):

tā děi xuéxi zhōngwén.
s/he must learn Chinese

‘S/he must learn Chinese’

Many grammarians of individual languages describe ‘come to have’ verbs as past markers. In spite of this, past is only another possible inference, but not a clear-cut grammatical category. The following Khmer example from Enfield (2003: 314) can also trigger other temporal inferences in other contexts:

- (14) khnom ba:n riəp-ka:(r)

I get.TAM marry

ta:m prəpəyŋi: khmae(r)

according.to.COV custom Khmer

‘I married according to Khmer custom’

(could mean in other contexts ‘I would/will get to/have to marry . . .’)

A fourth inference, treated only marginally by Enfield (2003), is emphasis of the truth. This inference is related to the fact that for the agent to be able to ‘come to have’ a given state of affairs, that state of affairs needs to be true.

- (15) Hmong (Mottin, 1980: 94):

saib yog leej twg tau

look be man/CL which PFV

ua txhaum zoo li cas lawm?

make mistake like.this PERF

‘[we want to] see who [really] made such a mistake’

In spite of their rich inferential potential, most languages show preferred inferences or even completely exclude certain inferences. Thus, the meaning of preverbal ‘come to have’ in Chinese (Mandarin Chinese) is conventionalized into deontic modality. Vietnamese prefers the abilitative or permissive interpretation but is compatible with a must-interpretation. Thai and Khmer are more open, with a functional core of abilitative/permissive and past. Hmong shows a certain preference for past (Enfield, 2003: 319) but certainly does not exclude abilitative/permissive inferences.

Conclusion – Factors Leading to a Zone of Convergence

Mainland Southeast Asia is characterized by a special type of pragmatics-oriented grammaticalization and by a number of shared products of grammaticalization and syntactic patterns. The structural convergence observed in this zone is the result of a very complex interaction of cognitive (semantic and pragmatic) factors with social mechanisms of diffusion extended over a large number of different individual situations of contact. Language-internal cognition-based processes of change are combined with and sometimes enhanced or interrupted by contact-induced changes. When it comes to social factors, any of the social models accounting for the cross-linguistic diffusion of structural properties presented in the literature can contribute their part. Thus, the diffusional pattern of the properties relevant for mainland Southeast Asia as a zone of convergence is most likely a joint product of social networks, leaders of linguistic change, and invisible-hand processes.

Southern Bantu Languages

L Marten, School of Oriental and African Studies,
London, UK

Introduction

Southern Bantu languages include Bantu languages spoken in South Africa, Swaziland, Lesotho, Botswana, Zimbabwe, and southern Mozambique. The term 'southern Bantu languages' is usually taken to refer to the geographical-referential classification, and hence as not implying genetic relations, of the following languages and language groups: the Nguni group (including Zulu, Xhosa, Swati, Ndebele), the Sotho-Tswana group (including Northern Sotho, Sesotho [Sotho, Southern], Tswana), the Tswa-Ronga group, the Imhambane group, and also Shona and Venda. The Bantu languages of Angola and Namibia, such as Herero or Wambo, are usually not included under southern Bantu, but are referred to as south-western Bantu. In terms of Guthrie's (1967–1971) classification, southern Bantu languages are grouped as zone S. The designation 'southern Bantu languages' was re-enforced by Doke's monograph with the same title published in 1954.

Historically, the southern Bantu languages provide the endpoint of the so-called Bantu expansion, a period of migration and contact of more than 2000 years, during which Bantu languages slowly came to be spoken throughout the larger part of sub-Saharan Africa. The origin of the Bantu expansion lies in the Nigeria-Cameroon borderland, and the direction of the expansion was hence southwards and ended with Bantu languages reaching the southern African coastline about 1,500 years ago, coming from eastern and central Africa. Speakers of southern Bantu languages have probably shared an extended, and extensive, period of contact with speakers of Khoisan languages present in southern Africa when Bantu languages arrived. The differentiation of distinct Bantu languages, and the establishment of standardized forms occurred more recently. From the 19th century onwards, written literature was produced in the larger southern Bantu languages, and several are among the dominant languages in the countries where they are spoken. For example, all nine Bantu languages of the national languages of the Republic of South Africa (in other words, all national languages except for English and Afrikaans) are southern Bantu languages.

Southern Bantu languages have played an important part in the history of Bantu studies. While the earliest descriptions of Bantu languages are from

west-central and eastern Africa, scholarship in southern African Bantu languages provided the impetus for a number of early comparative Bantu studies (Lichtenstein, 1808; Bleek, 1862, 1869; Torrend, 1891). Bleek (1862) is credited with coining the term 'Bantu' based on the plural form for 'people' in Xhosa and in many other Bantu languages. In the 20th century, a major figure in the study of southern Bantu languages was Clement Doke, who produced numerous grammatical descriptions of southern Bantu languages and also proposed an analytical system for the description of Bantu languages, which became particularly influential in South Africa (Doke, 1935). Due to the official status of nine southern Bantu languages in South Africa and an increase in institutions of tertiary education, there is currently a wealth of new linguistic scholarship in southern Bantu languages, often with particular emphasis on lexicography, computational linguistics, and applied linguistic topics such as language policy and language teaching. Most of the southern Bantu languages with large numbers of speakers (Zulu, Xhosa, Northern Sotho, Sesotho, Tswana) have, often recent, comprehensive reference grammars and dictionaries, as well as a range of teaching materials for schools and independent learners.

Classification

The southern Bantu languages are, following Guthrie (1967–1971), classified into six groups within zone S (cf. Gowlett, 2003).

The Shona group (S10) comprises six clusters: Korekore, Zezuru, Manyika, Karanga, Ndau, and Kalanga. A standardized form of Shona based on the Korekore, Zezuru, and Karanga varieties is used as an official language in Zimbabwe. In addition to Zimbabwe, languages of the Shona group are also spoken in parts of Mozambique and Botswana (Kalanga). There are close to 9 million speakers of Shona.

The Venda group (S20) only includes Venda, spoken by around 800 000 speakers in South Africa's Northern Province and adjacent southern Zimbabwe. Venda is an official language of South Africa.

The Sotho-Tswana group (S30) includes Tswana, Northern Sotho, and Southern Sotho, all of which are cover terms for a number of related varieties. Sometimes also Lozi, spoken in western Zambia and Namibia's Caprivi strip, is classified as a Sotho-Tswana language. Standard forms of these languages are based on a majority variety, and smaller varieties are often threatened with marginalization. Tswana is an official language in Botswana and South Africa,

with about 4 million speakers. Northern Sotho, also Sesotho sa Leboa, is spoken in the northeast of South Africa by about 3.6 million speakers and is an official language of South Africa. Southern Sotho, or Sesotho, with more than 4 million speakers, is spoken in Lesotho and South Africa and it is an official language in both countries.

The Nguni group (S40) is divided into Zunda varieties and Tekela varieties. Among the Zunda varieties are Xhosa, Zulu, and Zimbabwean Ndebele. Xhosa includes a number of different varieties. Zulu, with around 10.7 million speakers, and Xhosa, with around 7.2 million speakers, are official languages of South Africa. Zimbabwean Ndebele has official status in Zimbabwe. The Tekela varieties include Swati, South African Ndebele, and the smaller languages Phuthi and Lala (Lala-Bisa). Swati has around 1.6 million speakers and is an official language both in Swaziland and South Africa. The southern variety of South African Ndebele is an official language in South Africa, spoken by around 0.6 million speakers.

The Tshwa-Ronga group (S50) includes Tshwa, Tsonga, and Ronga, all of which are spoken in Mozambique. Tshwa, with 0.7 million speakers, is also spoken in Zimbabwe, and Tsonga, with more than 3 million speakers, is also spoken in South Africa, where it is an official language.

The Inhambane, or Copi, group (S60) includes two languages spoken in the Inhamabane area of Mozambique: Copi (Chopi), with around 0.5 million speakers, and GiTonga, with around 0.3 million speakers.

Structural Features

Phonologically, southern Bantu languages are characterized by symmetric five (e.g., Nguni) or nine (e.g., Sotho) vowel systems, two tonal distinctions (high vs. low), and complex consonant systems, often including a three-way distinction between voiceless-aspirated, voiceless-unaspirated, and voiced stops and affricates, as well as several series of prenasalized consonants. A number of southern Bantu languages have borrowed click consonants from Khoisan languages during an extended period of contact, e.g., Xhosa, which has dental [ǀ], alveolar [ǃ] and lateral [ǁ] clicks (written as *c*, *q*, and *x*). A comparatively untypical Bantu feature of southern Bantu languages are depressor consonants, an often phonologically heterogeneous group of consonants that cause a following high tone to lower, as in the Zulu example below, where the depressor consonant /z/ in the plural prefix causes the following high tone to shift to the following syllable, resulting in a different tone pattern:

(1) *isihlâlò* ‘chair’ *izihlâlò* ‘chairs’

Morphologically, southern Bantu languages, like the majority of Bantu languages, are characterized by their noun classes, and the agreement, or concord, system built on it, as well as by complex verbal morphology. Nouns are grouped into 15 to 20 noun classes that are morphologically marked by a noun class prefix, usually of CV shape and sometimes accompanied by a pre-prefix vowel (see **Table 1**).

The noun class of the head noun triggers class agreement of dependent nominals, as well as subject and object concord (agreement) morphology in the inflected verb. The term agreement, although well established, can be misleading, as subject and object markers can function as subject and object, and no overt lexical NP is needed for a well-formed sentence, as the following Zulu example (from Poulos and Bosch, 1997) shows:

(2) *ngi-zo-ba-sebenz-el-a*
SM1sg-FUT-OM2-work-APPL-FIN
‘I will work for them’

In addition to subject and object markers, inflected verbs can show morphological marking of negation, tense, aspect and mood, typically prefixed to the verbal base. The verbal base consists of a root that may be suffixed by several derivational suffixes (so-called extensions), such as applicative, causative, stative, reciprocal, or passive. The following examples from Tswana show how causative and applicative extensions can be used to increase the number of nominal

Table 1 Noun class prefixes in southern Bantu languages

| Class | Shona | Venda | Sesotho | Zulu | Tsonga | Copi |
|-------|-------|-------|---------|--------|--------|--------|
| 1 | mu- | mu- | mo- | um(u)- | mu- | in- |

complements of the verb (adapted from Creissels, 2004):

- (3a) ng-wàná ó nó-lé má-ši
 NP1-child SM1 drink-PERF NP6-milk
 'the child drank milk'
- (3b) kè nó-s-ítsé ng-wàná má-ši
 SM1sg. drink-CAUS- NP1- NP6-
 PERF child milk
 'I made the child drink milk'
- (3c) kè nó-s-éd-ítsé Dimpho
 SM1sg. drink-CAUS-APPL-PERF Dimpho
 ng-wàná má-ši
 NP1-child NP6-milk
 'I made the child drink milk in Dimpho's
 place'

A number of morphological features found in southern Bantu languages are not, or only rarely, found in other Bantu languages. In the domain of nominal morphology, these include the use of derivational suffixes for diminutives and feminines (e.g., in Zulu *-ana* and *-kazi*: *indoda*, 'man' and *indodana*, 'son'; *imbuzi* 'goat' and *imbuzikazi*, 'she-goat'), and the replacement of the locative classes by a locative prefix *e-*, a locative suffix *-(i)ni*, or a combination of both. Within verbal inflection, several southern Bantu languages show a distinction between so-called conjoint and disjoint verb forms (sometimes also called definite/indefinite or long/short forms) (Creissels, 1996); for example, in Zulu, verbs in the perfect tense may end in *-e* (short) or *-ile* (long) (Doke, 1963: 335):

- (4a) si-bon-e abantu
 SM1pl-see-PERF people
 'we saw people'
- (4b) si-ba-bon-ile abantu
 SM1pl-OM2-see-PERF people
 'we saw (them) the people'

The difference in use of the two forms depends on different factors, among them whether the verb is final in the verb phrase, as in (4b), where the object marker functions as the object of the verb, and the overt NP *abantu* following the verb is hence not part of the VP.

In terms of syntax, southern Bantu languages, like most Bantu languages, have unmarked SVO order (see the examples in (3), above), but, especially in interaction with subject and object markers, the word order is syntactically comparatively free, and rather more constrained by information structure considerations. As an illustration of this, the following Xhosa examples show unmarked subject-verb order (5) and inverted verb-subject order (6) used to focus the subject *ábántwánà*, 'children', either existentially like in this example, or contrastively, as in

(7). Note that the subject marker in (6) and (7) is of the locative class 17 and thus does not show agreement with the subject (Du Plessis and Visser, 1992: 130–131):

- (5) ábá-ntwánà bá-yà-ngénà
 NP2-children SM2-ya-enter
 'the children enter'
- (6) kù-ngénà ábá-ntwánà
 NP2-children SM2-ya-enter
 'there enter children'
- (7) kù-sèbénzà ámá-dódà, háyi ábá-fázi
 SM17-work NP6-men not NP2-women
 'there are men working, not women'

Although the major southern Bantu languages, those with large numbers of speakers and official status, are comparatively well-described, for a number of smaller southern Bantu languages, some of which are endangered, very little information exists, and descriptive studies are urgently needed. In a wider perspective, the contribution southern Bantu languages can make to general and theoretical linguistic studies has only begun to be fully addressed, and remains to be developed in all areas of linguistic research in the future.

Spanish

R Wright, University of Liverpool, Liverpool, UK

© 2006 Elsevier Ltd. All rights reserved.

Spanish is the standard language of over 300 million people in Spain, Equatorial Guinea, and 18 states in Latin America; it is also widely used in the United States, Israel, and in Western (former Spanish) Sahara. The standard is based on, and almost identical with, the Romance speech of Old Castile, which is why non-Castilians tend to call it *castellano* rather than *español* and sometimes resent its privileged status; for according to the Spanish constitution, all Spaniards have the obligation to learn it and the right to use it, which has made both its use and its name serious and even dangerous political issues in areas where many people are native speakers of another language (see **Catalan**; **Basque**), or of the *babes* of Asturias.

History

The Romans came to Spain during the Punic Wars of the late third century B.C. Their language has been spoken in the Peninsula ever since (see **Latin**; **Romance Languages**). Iberian Romance languages only began to acquire separate names and identities in the 13th century; until then it is simplest to envisage one single though heterogeneous Romance speech community throughout the Peninsula. The Romance (*mozárabe*) of bilingual Arabic–Romance areas was probably barely influenced by Arabic and similar to that of Christian areas. The traditional writing techniques survived as the official written standard till the early 13th century, but the techniques used then in the first texts exclusively prepared in the new written form ('Old Spanish') are based on unofficial experimentations that can be traced from the 11th century.

Later in that century it was decided in the Kingdom of Castile (which included Leon and Galicia) to base their written standard on the speech of Castile. This written standard was extended to Aragon and Catalonia after the union of Spain in 1479, even though Aragonese and Catalan already had written standards of their own, and was the only written form exported to the New World. In the 18th century the newly founded Spanish Academy standardized written Castilian almost definitively. The spread of spoken Castilian is less easy to chart; many people fluently speak Catalan, Aragonese, Leonese, or Galician, but read or write only Castilian.

Phonetics and Phonology

Standard Castilian has 18 consonantal phonemes: /b, p, d, t, g, k, f, θ, s, x, tʃ, m, n, ɲ, l, ʎ, r/. /k/ has almost entirely delateralized to merge with /j/, often realized as [ʒ] or [dʒ]; word-initially it derives from /p/- or /k/- (e.g., Latin *clavem*, Spanish *llave* 'key'; cf., Portuguese *chave* ([ʃ-]), Italian *chiave* ([kj-]), French *clef*). Voiced plosives occur only breathgroup-initially or after nasal consonants, being so outnumbered by the fricative allophones used elsewhere that some linguists prefer to annotate the phonemes as /β, ð, γ/. Preconsonantal nasals are homorganic. /s/ is realized [z] before a voiced consonant. In most of Andalusia and all of America there is no distinction made between /θ/ and /s/; usually they merge as syllable-initial [s] and syllable-final [-h] (or ø), but in parts of rural Andalusia as [θ]. The phonemic status of the two semi-vowels /w/ and /j/ is controversial; they might be allophones of /u/ and /i/, respectively. There are only five vowels: /a, e, i, o, u/. Rising diphthongs are much more common than falling. Schwa is not found, but synalepha at word boundaries is normal (*diez y once* /djeθionθe/ [dʒéθjónθe] 'ten and eleven').

The preferred syllable structure is CV (ca., 56% of syllables), which overrides word boundaries (e.g., *cual es*, ‘which is’ [kwa + les]). Stress is largely predictable, given morphological information; many monosyllables are clitic. Intonation rarely varies more than an octave.

Morphology

The only nominal inflection is plural marking [-s] (postconsonantly [-es]). All nouns in use have to be either masculine or feminine gender, and adjectives display number and gender concord. There is an extensive system of verbal inflections; verbs are marked for number and person concord with their subjects. Several paradigms are in opposition according to mood, aspect, relative time, and subjective attitude, in ways still not entirely understood. The citation form is the infinitive, which always ends in a stressed theme vowel + [-r]. The majority end in [-ár], including all neologisms other than those with the inchoative affix *-ecer*; the rest end in [-ér] or [-ír], conjugations most of whose other inflections are shared. Second person singulars tend to end in [-s], first person plurals always in [-mos], and third person plurals always in [-n]. Several verbs have systematically patterned variation in their stems, e.g., stressed [je] versus unstressed [e] (*tener* [tenér] ‘to have’; *tiene* [tjéne] ‘he has’), or stem-final [θ] before front vowels versus [θk] before others (*conocer* [konoθér] ‘to know’; *conozco* [konóθko] ‘I know’). Irregular verbs usually belong to the [-er] or [-ir] category, combining irregular stems with regular inflections. Many verb forms employ auxiliaries, whose repertoire is numerous for progressives, while only *haber* is available for the perfect (thus *he venido pensando* ‘I’ve been thinking’; *venir* ‘come’); perfects are rarely used at all in northern Spain. Adverbs are formed off feminine adjectives with *-mente*. Derivational morphology is widely used; ostensible diminutives (*-illo*, *-ito*, and others) can be added to any nominal form with almost any meaning (depending on context and intonation); class-changing suffixes are used uninhibitedly (e.g., *-al* turns nouns into adjectives); meaningful prefixes are common, and the fashion for Verb + Plural direct object compounds with agentive meaning is spreading (e.g., *el tocadiscos*, literally ‘the play-records,’ ‘the recordplayer’).

Syntax

Sentences need no overt subject, e.g., *comíamos* ‘we were eating,’ *llueve* ‘it’s raining.’ Some linguists unhelpfully postulate an underlying subject here. Adjectives follow nouns if clarifying the reference of the

NP, and precede it if the reference is already clear; if in doubt, listeners take the order to be NA. There is no general fixed order of verb and noun phrases; in general, the known precedes the unknown. Thus, *Juan llegó* ‘John arrived,’ if John has already been discussed, and *llegó Juan* if arrivals but not John have been discussed. SV order is never obligatory; VS is obligatory in *wh*-questions, outside the Caribbean, and normal in subordinate clauses (*la casa en que vivía mi madre* ‘the house my mother lived in’). OV order is obligatory when clitic pronouns accompany finite verbs (*la vi*, ‘I saw her’). A preposed nominal direct object requires a clitic copy, and in speech an indirect object in any position often has the same effect. Direct objects with particular reference, if misidentifiable otherwise as subjects, take a preposed *a* (*a la reina la vio, vio a la reina*, both ‘he saw the Queen’); since *a* marks both direct/and indirect objects, and several Spanish speakers make no formal differentiation between direct and indirect object pronouns either, this direct/indirect distinction may be lapsing. The only preposition that can normally link nouns within a noun phrase is a correspondingly meaningless *de*. Articles are preposed: the so-called ‘definite’ article (*el, la, los, las*) is also used in generalizations; partitive use is often marked by the lack of any article.

The use of subjunctive or indicative mood is usually grammatically determined (e.g., *pido que* ‘I ask for’ is always followed by subjunctive), but the so-called ‘past subjunctive’ can also be used in subordinate clauses for already-known material; the ‘past subjunctive’ (which has two usually interchangeable paradigms) is in fact atemporal. Grammatically reflexive *se* is often used with passive or ‘impersonal middle’ meaning (*se abrió la puerta* ‘the door (was) opened’); occasionally, in VS sentences of this type but not SV, a plural subject is preceded by a verb with singular concord (sometimes *se vende manzanas*; usually *se venden manzanas*; never **manzanas se vende*, ‘apples for sale’), but this is nowhere the normal usage; linguists have tried and signally failed to analyze this *se* as a subject.

Vocabulary

The most startling fact about Spanish for an English speaker is the presence of two words for ‘to be’: *estar* (<Latin *stare* ‘stand’) and *ser* (suppletively < *sedere* ‘sit,’ and *esse* ‘be’), only approximately distinguishable as being used for individual circumstances and general statements, respectively (and roughly vice versa when used as passive auxiliaries). Linguistic atlases, currently fashionable, show that lexical usage is noticeably not geographically standardized;

fish have different names, and the same word may be applied to different fish, in different parts, for example. Latin America has naturally adopted many local words of Indian provenance. Although the inherited vocabulary has been enriched by borrowings from Basque, Arabic, Catalan, French, Italian, Renaissance Latin, Nahuatl, Quechua, English, etc., most neologisms are more commonly formed via derivational morphology or semantic shift.

The Future

Spanish has wide geographical variation but remains a single speech community with a general standard for all to style-shift toward in formal situations, for the Latin-American standard is very similar to the European and will remain so, given mass communications. Local variations grow beneath the standards, however. For example, bilingual Aymara speakers in Bolivia have adopted the Aymara evidential system into their Spanish morphology, and Guarani speakers in Paraguay have adopted Guarani nominal tense-markers (e.g., *mi noviakue*, literally 'my girl-friend-past,' 'my former girlfriend'). Areas that aspirate or lose final /s/ have thereby lost a second person singular inflection and acquired homonymy with the third person forms and use subject *tú* more in compensation; the formal second person (third person morphology, with subject *usted(es)*) is anyway decaying in some places but strong in others, and the system varies greatly in America. The study of linguistics in Spanish universities is now flourishing, lively, and fashionable, putting Spain (temporarily, perhaps) in the vanguard of modern Romance linguistics. There

is still a great deal to discover and explain. For that reason a bibliography largely confined to English-language works is necessarily partial and parochial.

Sumerian

G Cunningham, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Sumerian – a long-dead language isolate documented throughout the Middle East, in particular in the south of what is now Iraq – rivals ancient Egyptian as the earliest written language. The first sources date to the late 4th millennium B.C.E. and the last to the 1st century C.E. When the language ceased to be spoken is uncertain: some estimates date this to the early 2nd millennium B.C.E. It was subsequently an elite language, used only in royal, ritual, and scholarly contexts. The language's users referred to it as *eme gir*,

possibly meaning 'native tongue', the term *Sumerian* being an anglicization of Akkadian *Šumeru*. The grammar outlined here is based on documents from the far south in the late 3rd millennium B.C.E., benefiting from unpublished work by Bram Jagersma, but it applies broadly to other places and periods.

Phonology

Fifteen consonants are used in transliterating Sumerian: <b, d, g, ḡ (/ŋ/ as in *sing*), ḥ (/x/ as in *loch*), k, l, m, n, p, r, s, š (/ʃ/ as in *ship*), t, z>. The language also had at least two weak consonants <y, ʔ (/ʔ/ glottal stop)>, which were subject to phonological change or loss in

certain environments, and eight vowel phonemes, short and long <a, e, i, u>. Neither vowel length nor weak consonants are indicated in transliteration. These alphabetic representations should be regarded as approximations. Vowel assimilation, both anticipatory and perseverative, is extensive, resulting in considerable allomorphic variation.

Word Classes

Nouns and verbs are the primary open word classes. In addition to numerals, the language has small closed classes of adjectives, adverbs, conjunctions, circumpositions, and interjections, as well as related sets of pronouns (personal, demonstrative, indefinite, interrogative, and reflexive) and determiners (possessive, demonstrative, and an indefinite). Most determiners cliticize to whatever class of word precedes them, as do plural marking and case marking. In the cuneiform script used to record Sumerian, lexical words are typically written logographically and all function morphemes (bases, clitics, and affixes) phonographically. Signs that constitute a word are linked by hyphens in transliteration, as are enclitics to their host. Given our uncertainty about the phonological form of many words, transliteration is simply a sign-by-sign representation of what was written.

Morphology

In terms of morpheme segmentation, Sumerian is more agglutinating than fusional. Inflectional affixation is restricted to verbs. Like verbs, nouns and adjectives can have reduplicated bases. Possibly, in nouns this expresses universality, in dynamic verbs iterativity, and in stative verbs intensity; its function in adjectives is unclear.

New nouns are mainly formed by compounding; new verbs are formed as by multiword expressions in which a noun and verb combine as a semantic unit, resulting in many three-place transitive predicates, such as:

g̃iš tag
wood touch
'touch wood to something (i.e., sacrifice something)'

Nouns and Phrases

Nouns are marked for gender, although this distinction appears morphologically in only the pronominal morphemes and syntactically only in restrictions

that relate to plural and case marking. The gender distinction is between human (people and deities) and nonhuman (animals and inanimates), with some socially conditioned exceptions; in addition, non-human pronominal morphemes can refer to groups of people or deities. Only human nouns are marked for number.

At the level of the noun phrase, the language is left-headed, the sequence in outline being:

noun, modifier(s), determiner, plural marker, case marker

although the indefinite and most demonstrative determiners do not occur with modifiers.

Case markers typically indicate the syntactic role of the phrase in the clause. The core functions of the subject and direct object are marked by the ergative (*e* = transitive subject) and absolutive (\emptyset = intransitive subject and transitive direct object). Zero-marking is also used for personal pronouns as subject of both intransitive and transitive verbs. Noun phrases with a noun as head consequently follow ergative-absolutive alignment, whereas those with a personal pronoun as head follow nominative-accusative alignment. Personal pronouns occur infrequently (expressing emphasis or contrast); the language has person-number-gender (PNG) affixes in the finite verbal forms that index these core functions.

Table 1 shows the noncore adverbial case markers, arranged to reflect their relationship with a more nuanced set of morphemes incorporated in finite verbal forms. Like case markers, the verbal prefixes are postpositional in that they can be preceded by a noncore PNG prefix (see Table 2).

A further case marker, the genitive, is typically adnominal, marking noun phrase to noun phrase relations. It encompasses a much wider semantic field than possession. Genitive noun phrases may occur in the modifier(s) slot:

bad₃ iri kug-ga-ka-ni
bad iri kug = ak = ani = \emptyset
wall city holy = GEN = POSS.3.SING = ABS
'her wall in the Holy City'

(In this example, the first line is a transliteration of the script, in which the subscript numeral in *bad₃* is a modern convention that distinguishes between homophonous signs; the second line is a morphemic representation, in which = marks a clitic boundary.) This example indicates two characteristics of the script: (1) There is not always a one-to-one correspondence between morpheme and sign and (2) the reduplicated writings of consonants often appear to have no phonological implications.

Table 1 Sumerian noncore case morphemes

| Phrase-final enclitic | | Translation guide | Equivalent verbal prefix | |
|--|-----------------------|-----------------------|--------------------------|----------------------------------|
| Local | | | | |
| Dative (human only) | <i>r(a)</i> | 'to/for' | Dative | <i>a</i> |
| Directive (nonhuman only) ^a | <i>e</i> | | | |
| Dative (human only) | <i>r(a)</i> | 'in(to) contact with' | Directive ^a | <i>i</i> |
| Directive (nonhuman only) ^a | <i>e</i> | | | |
| Dative (human only) | <i>r(a)</i> | 'on(to)' | Directive ^a | <i>i</i> and <i>y (>e)</i> |
| Locative (nonhuman only) | ² <i>a</i> | 'in(to)' | Locative (nonhuman only) | <i>n(i)</i> |
| Locative (nonhuman only) | ² <i>a</i> | | | |
| Terminative | <i>š(e)</i> | 'to(ward)' | Terminative | <i>ši</i> |
| Ablative | <i>ta</i> | 'from' | Ablative | <i>ta</i> |
| Comitative | <i>d(a)</i> | '(together) with' | Comitative | <i>da</i> |
| Manner | | | | |
| Equative | <i>gin</i> | 'like' | None | |
| Adverbial | <i>eš</i> | 'in the manner of' | None | |

^aThe directive is sometimes referred to as the locative-terminative.

Table 2 Sumerian finite verb^a

| Extra-inflectional prefixes | Noncore prefixes | Core affixes and verbal base |
|-----------------------------|-------------------------|------------------------------------|
| <i>a(l)</i> or <i>i</i> | Noncore PNG | Core PNG |
| Clause | | |
| connective: <i>nga</i> | Dative | Verbal base |
| Cislocative: <i>m(u)</i> | Comitative | Aspect: <i>e(d)</i> or \emptyset |
| Middle passive: <i>ba</i> | Ablative or terminative | Core PNG |
| | Directive or locative | |

^aPNG = person-number-gender marker.

When genitive noun phrases express only possession, they have two characteristics: They are in complementary distribution with possessive determiners, and they can be shifted to the beginning of the clause, in which case a possessive determiner then is added to the original phrase (NHUM stands for nonhuman):

e_2 -a ni_2
e = ak ni
temple = GEN awesomeness
gal-bi gal = bi = \emptyset great = POSS.3.NHUM = ABS
'the temple's great awesomeness'

Here the genitive is written *a*, the form used when it is not followed by a vowel.

Verbs and Clauses

Given that the dependents of a verb can be expressed in pronominal form by verbal affixes, a clause can consist only of a finite verb. However, in a clause that

includes noun phrases, the language is right-headed, the typical order being subject(–object)–verb.

A few verbs are irregular, having a different base depending on aspect and/or number; they can be divided into two major classes: reduplicating and suppletive. Plural bases are restricted to suppletive verbs; they are mostly used with a plural intransitive subject or direct object and thus follow ergative-absolutive alignment.

The Sumerian aspect and/or tense categories are difficult to reconstruct. Many Sumerologists have adopted instead two terms used by Akkadian grammarians, *hamtu* ('quick') and *maru* ('fat'). However, the principal distinction in finite verbal forms may be between completive and incompletive aspects (*hamtu* and *maru*, respectively). Nonfinite forms are more nuanced and have stronger temporal connotations, distinguishing between completive (typically with past reference), habitual (typically with present reference), and incompletive (typically with nonpast reference).

Stative verbs are excluded from incompletive aspect and only context indicates whether they have past or nonpast reference. In nonfinite verbal forms, intransitive stative verbs are in completive aspect and transitive ones are in habitual aspect. The copular verb is also excluded from incompletive aspect. It conjugates like an intransitive verb and is attested in both enclitic (prefixless) and independent forms.

Nonfinite verbal forms function as verbal adjectives and nouns, and in nonfinite relative and adverbial clauses (for example, of purpose and time). Their inflection comprises a prefix expressing negation, base reduplication, and an aspect suffix (²*a* = completive;

Table 3 Sumerian core (subject and direct object) affixes in finite verb

| | Intransitive | | Transitive | | | |
|------------|----------------|--|----------------------------------|----------------------|----------------------|----------------|
| | Both aspects | | Completive aspect | | Incompletive aspect | |
| | Subject suffix | | Subject prefix or circumfix | Direct object suffix | Direct object prefix | Subject suffix |
| 1 HUM SING | <i>en</i> | | 𐎶 | <i>en</i> | 𐎶 | <i>en</i> |
| 2 HUM SING | <i>en</i> | | <i>y(>e)</i> | <i>en</i> | <i>y(>e)</i> | <i>en</i> |
| 3 HUM SING | ∅ | | <i>n</i> | ∅ | <i>n</i> | <i>e</i> |
| 3 NHUM | ∅ | | <i>b</i> | ∅ | <i>b</i> or ∅ | <i>e</i> |
| 1 HUM PL | <i>enden</i> | | 𐎶... <i>enden</i> | <i>enden</i> | <i>me</i> | <i>enden</i> |
| 2 HUM PL | <i>enzen</i> | | <i>y(>e)</i> ... <i>enzen</i> | <i>enzen</i> | — | <i>enzen</i> |
| 3 HUM PL | <i>eš</i> | | <i>n</i> ... <i>eš</i> | <i>eš</i> | <i>nne</i> | <i>ene</i> |

∅ = habitual; *ed(a)* = incompletive). In addition, irregular verbs have a different base in incompletive aspect.

As Table 2 indicates, the morphology of finite verbal forms can be much more complex, although a form may be as simple as a prefix, a base, and a subject affix. In addition to the base changing of irregular verbs, finite intransitive forms are marked for aspect with a suffix and transitive forms are marked with the morphology of the core PNG affixes. Setting aside plural PNG affixes, some of which are poorly attested whereas others are circumfixes, Table 3 shows that alignment in completive aspect follows ergative-absolutive principles; in incompletive aspect, it is nominative-accusative in the first and second persons but tripartite in the third person.

Partly on morphological grounds and partly because they have clausal scope, further bound morphemes can be regarded as clitics. These include an enclitic relativizer-complementizer 𐎶 and a set of proclitics that either connect clauses, such as *u* ‘after’, or change mood or polarity (CISL stands for cislocative):

h_u-mu-na-ab-šum₂-mu
 h_u=mu-nn-a-b-šum-u
 M=CISL-3.SING-DAT-DO.3.NHUM-give-SUBJ.3.SING
 ‘he must give it to him’

This example illustrates a further characteristic of the script: There is not always a one-to-one correspondence between sound syllable and sign, [nab] being written <na-ab> and [mun] being written simply as <mu>. The transitive subject prefix is an instance of perseverative assimilation from *e* to *u*.

Neither the cohortative (first person) nor the imperative (second person) distinguishes aspect, having instead hybrid forms that combine completive bases with incompletive direct object affixes. Both delete the singular intransitive and transitive subject and can therefore be regarded as following nominative-accusative alignment. The imperative is further irregular in that it is formed not with prefixes but with suffixes.

Resources

The most comprehensive grammar of Sumerian is Attinger (1993: 141–314), although in places it requires familiarity with an earlier, subsequently expanded, publication, Thomsen (2001). No full print dictionary has been published; a web-based dictionary is under development.

Introduction

Swahili is a Bantu language spoken by over 50 million (first- and second-language) speakers in East Africa, including Tanzania and Kenya, where it is a national language, and parts of Somalia, Uganda, Rwanda, Burundi, the Democratic Republic of Congo, and Mozambique. In terms of classification, Swahili belongs to the Sabaki group of the Northeast Coast Bantu languages, and it is part of group G of Guthrie's (1967–1971) referential classification. Like many Bantu languages, Swahili has elaborate noun class and agreement systems, and complex verbal morphology.

Language History

Swahili has been spoken on the East African coast since approximately 800 A.D., after Bantu-speaking people from the Great Lakes region reached the coast. The earliest Swahili speakers, after the language separated from those Sabaki languages most closely related to it, probably settled in northern Kenya on the mouth of the river Tana. Due to the maritime trading of the Swahili, the language became established in Swahili settlements along the coast from Mogadishu in the north to Cap Delgado in the south. Still today, the majority of first-language speakers of Swahili live on the East African coast of Tanzania and Kenya and the adjacent islands. Through continuous contact with Arab traders, many Swahili became Muslims, and a large number of loanwords from Arabic have entered the language over the centuries, leading sometimes to the mistaken belief that Swahili is a mixed language. The Swahili coastal city-states became important centers of the Indian Ocean trade, and in the wake of increasing political and economic power, Swahili poetry flourished, in particular in the Lamu (Kiamu), Pate (Kipate), and Mombasa (Kimvita) dialects, with the earliest surviving Swahili manuscripts, written in Arabic script, dating to the first half of the 18th century. In the 19th century, Zanzibar became part of, and indeed the capital of, the Sultanate of Oman, and the Zanzibar Swahili dialect Kiunguja became more prestigious. During this period, Swahili traders established trade routes into the area beyond the coast, and the language spread with it. During the colonial period, Swahili was

used as a language of administration, especially by the German colonialists in Tanganyika, but it was also a language of interethnic communication in the anticolonial struggle. After independence, Swahili became the national language of Tanzania and Kenya, in both countries sharing the status as official language with English. In Tanzania, and to a lesser extent in Kenya, Swahili is widely used in public administration, education (especially primary education), and the media. Especially in the urban centers, Swahili is increasingly the first language of younger Tanzanians and Kenyans. Swahili is also used to varying degrees in Somalia, Uganda, Rwanda, Burundi, Democratic Republic of Congo, and Mozambique. Outside of East Africa, there are Swahili-speaking communities in the Gulf states and in many Western countries, including the UK (often East-African Indians), and Swahili is taught as a foreign language in language schools and universities throughout the world.

Standard Swahili

There are a number of Swahili dialects spoken today, including the dialects of the Lamu archipelago (Kiamu, Kisiu, Kipate) and Kimvita, associated with classical Swahili literature, and Kiunguja, the dialect of Zanzibar town. Chimwiini and Bajuni, the traditional Swahili dialects of the Somali coast, are currently highly endangered due to the displacement of the Swahili-speaking communities in Somalia, and there are today probably more speakers in Kenya. Comparatively little is known about the more southern Swahili dialects such as Kingome spoken on Mafia island. A distinct variety of Swahili is also spoken in Lubumbashi and the Shaba province in the Democratic Republic of Congo. More recently, distinct urban varieties of Swahili are emerging, for example, the mixed code Sheng of Nairobi. The most important variety of Swahili today is the so-called Standard Swahili (*Kiswahili sanifu*). Since the beginning of the 19th century, various bodies, political and missionary, have made proposals for the development of a standard variety of Swahili. Missionaries began to write Swahili in Roman script, and in 1930 the British-run Inter-territorial Language Committee established the standard form of Swahili based on Kiunguja, which is used today. After independence, strong efforts were made by East African governments to develop Swahili further through research as well as through vocabulary development and standardization, e.g., through the *Baraza la Kiswahili la Taifa* (National Swahili Council) and the *Taasisi*

ya *Uchunguzi wa Kiswahili* (Institute for Swahili Research) in Tanzania. While the development and status of Swahili is often, and rightly, cited as a successful example for the use of an African language as a modern national and official language in post-colonial Africa, it is also leading to an increasing endangerment of Swahili dialects and many of the about 200 languages spoken in Kenya and Tanzania, a problem which has been addressed only recently.

Structure

Swahili exhibits typical Bantu structural characteristics such as an articulated noun class system and morphologically marked agreement between different constituents of clauses and sentences. The morphology is complex and Swahili is often classified as an agglutinating language. Word order, especially within the sentence, is syntactically comparatively free and often motivated by information structure. A remarkable difference from most other Bantu languages is the absence of tone in Swahili.

Noun Classes

A noun class system can be thought of as being halfway between a grammatical gender system as in German or French, and classifier systems as found, for example, in Thai or Chinese. In Swahili, every noun is assigned to a specific noun class, and noun classes are in general marked by a class prefix. Thus, for example, the word *mtoto* 'child' consists morphologically of the noun class prefix *m-* and

the stem *-toto*. Noun classes often express number distinction, so that *watoto*, with a different noun class prefix *wa-*, means 'children.' It is customary in Bantu linguistics to group noun classes according to a numerical system first proposed by Bleek (1869) (see **Table 1**).

Swahili has 16 different noun classes, which have a more or less transparent semantic base. Nouns in classes 1 and 2 denote only humans (but not all humans are in class 1/2), class 14 is used to refer to abstract qualities, class 15 has verbal infinitives, and classes 16–18 are locative classes. For the remaining classes, the semantic base is less obvious. For example, class 3/4 contains a number of words denoting plants and trees, class 9/10 contains names of animals, and class 6 contains liquids. However, in all of these, there are many words that do not fit a semantic characterization. Another use of the noun classes is for nominal derivation, by shifting nouns from one class to the other. For example, shifting nouns into class 7/8 denotes diminutive: *kitoto* 'a small child,' while class 6 can be used to express a group of individuals, rather than just plurality: *fisi* (class 10), 'hyenas,' *mafisi* (class 6) 'a pack of hyenas.'

Agreement

The noun classes are important for the agreement system of Swahili, as adjectives, demonstratives, and relative clauses show their syntactic relationship with their nominal head through agreement affixes, or concords. Similarly, verbal agreement morphology

Table 1 Swahili noun classes and agreement

| Class | Noun class prefix ^a | Example word | Concord ^b | Relative concord | Possessive concord | Dem prox | Dem ref | Dem non-prox |
|-----------------|--------------------------------|------------------|----------------------|------------------|--------------------|----------|---------|--------------|
| 1 | m | mtu 'person' | a/yu | ye | wa | huyu | huyo | yule |
| 2 | wa | watu 'people' | wa | o | wa | hawa | hao | wale |
| 3 | m | mti 'tree' | u | o | wa | huu | huo | ule |
| 4 | mi | miti 'trees' | i | yo | ya | hii | hiyo | ile |
| 5 | ji | jicho 'eye' | li | lo | la | hili | hilo | lile |
| 6 | ma | macho 'eyes' | ya | yo | ya | haya | hayo | yale |
| 7 | ki | kiti 'chair' | ki | cho | cha | hiki | hicho | kile |
| 8 | vi | viti 'chairs' | vi | vyo | vya | hivi | hivyo | vile |
| 9 | n | ndege 'bird' | i | yo | ya | hii | hiyo | ile |
| 10 | n | ndege 'birds' | zi | zo | za | hizi | hizo | zile |
| 11 | u | ubao 'board' | u | o | wa | huu | huo | ule |
| 14 | u | uhuru 'freedom' | u | o | wa | huu | huo | ule |
| 15 | ku | kuimba 'to sing' | ku | ko | kwa | huku | huko | kule |
| 16 ^c | pa | | pa | po | pa | hapa | hapo | pale |
| 17 ^c | ku | | ku | ko | kwa | huku | huko | kule |
| 18 ^c | mu | | mu | mo | mwa | humu | humo | mule |

^aNoun class prefix is also used for adjective agreement.

^bConcord is used as SM, OM (except in class 1, where SM = *a-*, OM = *m(w)-*).

^cThere are no words in classes 16–18; these are only used in agreement.

marks subjects and objects of the verb. For example, in (1), the demonstrative pronoun and the adjective show their syntactic relation to the head noun *vitabu* (of class 8) by the concord morpheme *vi-*.

- (1) *vi-tabu vi-le vi-zuri*
books those beautiful
 ‘those beautiful books’

The shape of agreement affixes is not always identical with the noun class prefix. While the agreement morpheme is identical to the noun class prefix in the case of adjective agreement, with demonstratives, it may have a different shape, as for example with a class 6 head noun, where the noun class prefix is *ma-*, but the agreement morpheme of the demonstrative is *ya-* (see Table 1 for an overview of these forms in all classes):

- (2) *ma-chungwa ya-le ma-zuri*
oranges those beautiful
 ‘those beautiful oranges’

Verbs show agreement with subjects and objects, by means of subject (SM) and object markers (OM), as in (3):

- (3) *m-toto a-li-wa-angali-a wa-zazi w-ake*
child SM1-PAST-OM2- NP2- CD2-
look_at-FIN parents his/
her
 ‘the child looked at his/her parents’

The term ‘agreement’ in relation to verbs can be misleading, as no overt noun phrases are needed for a grammatical sentence; in (4) the subject and object marker function more like pronouns in languages like English:

- (4) *a-li-wa-angali-a*
SM1-PAST-OM2-look_at-FIN
 ‘s/he looked at them’

The subject marker is an obligatory part of the inflected verbs in most tenses, while the object marker is (near) obligatory with human objects, but is used according to semantic and pragmatic considerations (for example, to indicate a specific object or discourse topic) with all other classes.

A number of aspects of the Swahili agreement system pose interesting problems from a theoretical perspective, for example the resolution of agreement with conjoined NPs, or the exact characterization of the status of object agreement. Furthermore, the relation of the Swahili agreement system to the systems of other Bantu (and indeed non-Bantu) languages provides a good testing ground for comparative and historical studies.

Verbal Morphology

Inflected Swahili verbs are, as already seen above, morphologically comparatively complex. In a morphological template for Swahili verbs, ten positions can be identified. Not all of these positions can be filled at the same time, but normally, at least positions 2, 4, 8, and 9 are filled (as in example [5]). Six and seven positions are filled in (6) and (7):

| | | | | | |
|---------|----|---------|--------|----------|--------|
| 1 | 2 | 3 | 4 | 5 | 6 |
| Pre | SM | Post | Tense | Relative | Stem |
| Initial | | Initial | Marker | Marker | marker |
| Neg | | Neg | | | |
| | 7 | 8 | 9 | 10 | |
| | OM | Verbal | Final | Post | |
| | | Base | | Final | |
| | | | | Plural | |

- (5) *wa-ta-som-a*
SM2-FUT-read-FIN
 ‘they will read’
- (6) *wa-na-o-ku-j-a*
SM2-PRES-REL2-STEM-come-FIN
 ‘they who come’
- (7) *ha-wa-ta-ku-ambi-e-ni*
NEG-SM2-FUT-OM2-tell-FIN-PL
 ‘they will not tell you (pl.)’

In addition to inflectional morphology, verbs can be modified by a number of derivational suffixes, or extensions, suffixed to the verbal root before the final. For example, the causative of *soma* ‘read’ is *somesha* ‘cause to read, teach.’ Verbal extensions change the meaning of the base verb and in many cases interact in complex ways with the valency of the base. Among the most productive extensions in Swahili are passive (*-w-*), causative (*-ish-*, *-esh-*), applicative (*-i-*, *-e-*), neutro-passive (*-ik-*, *-ek-*), separative (*-u-*, *-o-*), reciprocal (*-an-*), and stative-positional (*-am-*). The surface forms of these morphemes is determined by phonological processes such as vowel harmony. For example, *funga* ‘tie, open,’ *fungua* ‘untie, close,’ *fungia* ‘tie for/with someone/something,’ *fungika* ‘be closable,’ *fungana* ‘fasten together,’ *fungwa* ‘be closed,’ *funguliwa* ‘be opened’ (separative and passive), and *fungiana* ‘tie for each other’ (applicative and reciprocal). The last two examples show that more than one extension can be used. The exact meaning and function of extended verbs depends very much on the meaning of the base verb and on the (syntactic and nonsyntactic) context in which they are used.

Syntax

The basic word order of Swahili in the phrase is head-modifier, and SVOA in the sentence (8). However,

Swedish

K Börjars, The University of Manchester, Manchester, UK

© 2006 Elsevier Ltd. All rights reserved.

Swedish is spoken natively by ~8.5–9 million people in Sweden and by ~250 000–300 000 people in Finland. It is a Germanic language, part of the North Germanic branch, along with Norwegian, Danish, Icelandic, and Faroese. There is a fair degree of mutual intelligibility between Swedish and the other so-called mainland Scandinavian languages. The early historical stages of the North Germanic languages are normally divided into an eastern group (the dialects of the present Norway, Iceland, and Faroe Islands) and a western group (the dialects of Sweden and Denmark). As the language situation developed and Danish and Swedish crystallized as two separate languages, a north–south division became increasingly appropriate. The year 1526 is normally taken as the beginning of Modern Swedish, at which time Sweden won independence from Denmark and the first Swedish translation of the New Testament began to be circulated.

The language was originally written in runes carved in stone, but early Christian missionaries brought the idea of writing on parchment and with it the Latin alphabet. There are books preserved from as early as the beginning of the 13th century. The modern Swedish alphabet contains 28 letters; the same as those of the English alphabet, except that there is no 'w' and there are three additional letters at the end of the alphabet (å, ä, and ö). Swedish underwent a spelling reform in 1906 and its spelling is now quite regular, though there are a few sounds that can be represented in a number of different ways, most notoriously /ʃ/, which can be spelled *sk*, *sj*, *stj*, *skj*, *ch*, and *sch*, and /j/, which can be spelled *j*, *gj*, *hj*, *dj*, and *lj*.

Phonologically, Swedish is characterized by a relatively large number of vowels. The 18 vowels are frequently grouped into nine pairs; the main difference within each pair is length, but there are also

associated differences in quality. Standard Swedish does not have phonemic diphthongs, though the pronunciation of long vowels may involve some diphthongization. The consonants are also realized as long or short, with little or no difference in quality. Long sounds may only occur in stressed syllables and every stressed syllable must contain either a long vowel or a long (or double) consonant. When any of the consonants /t d s n l/ immediately precede /r/, the two consonants are then realized as a retroflex, /t̪ d̪ s̪ n̪ l̪/, respectively.

Swedish, apart from the Swedish spoken in Finland, makes a distinction that is often referred to as tonal, i.e., there is a difference between Accent I (or *akut accent*) and Accent II (or *grav accent*). The distinction is one of word accent. The difference between the two accents is mainly one of pitch, but Accent II, which is limited to bi- and polysyllabic words, has an effect of some secondary stress on the syllable immediately following the syllable with main stress. There are a number of minimal pairs in the language, distinguished only by Accent I versus Accent II, as in Examples (1a) and (1b), where I or II indicates the type of accent (abbreviation: DEF, definite):

- (1a) 'tomten "tomten
yard.DEF gnome/father Christmas.DEF
- (1b) 'anden "anden
duck.DEF spirit.DEF

Swedish verb morphology is relatively simple, with no agreement marking in any tense. The present–past distinction is made morphologically, whereas perfect aspect is marked by the auxiliary *ha* 'have,' followed by a form of the verb referred to as the 'supine.' For passive, there is both a morphological and a syntactic version, and a number of subtle factors influence the choice between the two. A paradigm for the verb *kittla* 'tickle.INFINITIVE' is provided in Example (2) (SG, singular; PL, plural; PRES, present; PERF, perfect; S PASS, BLI PASS, morphological and syntactic passive; FEM, feminine):

| (2) | SINGULAR | PLURAL | PRESENT | PAST | PERFECT (PRES) | -S PASSIVE | <i>BLI</i> PASSIVE |
|-----|----------|--------|---------|----------|----------------|------------|--------------------|
| 1 | jag | vi | kittlar | kittlade | har kittlat | kittlas | blev kittlad |
| 2 | du | ni | | | | | |
| 3 | hon(FEM) | de | | | | | |

Noun phrases, on the other hand, have richer morphology, including agreement marking on modifiers. The masculine and feminine genders have merged into one, usually referred to as common gender (or *utrum*) and marked by *-n* in singular, which contrasts with neuter, marked by *-t*. In the plural and definite noun phrases, the gender distinction is neutralized. Definiteness is marked morphologically on nouns, and a singular count noun in its definite form can function as a referential noun phrase without any need for a syntactic determiner (see Examples (3a)–(3c)); without the definiteness marking, a syntactic determiner is required for the noun to function as a full noun phrase, as illustrated by Examples (4a) and (4b). When a modifier precedes the noun, a syntactic determiner is also required. In most cases, the noun retains its morphological marking, giving rise to so-called double definiteness, as Examples (5a)–(5c) show. Most modifiers show agreement with respect to gender (in singular indefinite), number, and definiteness. This is illustrated for definite noun phrases (Example (5)) and for indefinite ones (Example (6)). The definite–indefinite distinction on modifiers is commonly referred to as a weak–strong distinction in the literature. Case marking is found only on pronouns in Swedish (DEF, definite; COM, common; NEUT, neuter; INDEF, indefinite).

(3a) gris-en
pig-DEF.COM.
'the pig'

(3b) djur-et
animal-DEF.NEUT
'the animal'

(3c) gris-ar-na
pig-PL-DEEPL
'the pigs'

(4a) en gris
a.COM pig
'a pig'

(4b) ett djur
a.NEUT animal
'an animal'

(5a) den ren-a gris-en
the.COM clean-DEF pig-DEF.COM
'the clean pig'

(5b) det hungrig-a djur-et
the.NEUT hungry-DEF animal-DEF
'the hungry animal'

(5c) de ren-a gris-ar-na
the.PL clean.DEF pig-PL-DEEPL
'the clean pigs'

(6a) en ren gris
a.COM clean.COM.SG.INDEF pig
'a clean pig'

(6b) ett hungrig-t djur
a.NT hungry-NEUT.SG.INDEF animal
'a hungry animal'

(6c) två hungriga grisar/ djur
two hungry.PL pigs/ animals
'two hungry pigs/animals'

There is also a participle form, distinct from the supine, that is used attributively and predicatively and that agrees in gender and number, in a way similar to adjectives; this is illustrated in Examples (7a) and (7b) (PART, participle):

(7a) Brevet är skrivet
letter.DEF.NEUT be.PRES write.PART.NEUT
för hand.
by hand.
'The letter is written by hand.'

(7b) ett slarvigt skrivet
a.NEUT carelessly write.PART.NEUT.SG
brev
letter
'a carelessly written letter'

A striking property of Swedish is also that the possessive determiner exists in a reflexive and a non-reflexive form. The reflexive is used roughly in those environments in which a pronoun replacing the whole noun phrase would have to occur in its reflexive form. In Example (8a), then, *Björn* is eating someone else's sandwiches, whereas in Example (8b), he is eating his own sandwiches (POSS, possessive; MASC, masculine; REFL, reflexive):

(8a) Björn_i äter hans_j smörgåsar. [i ≠ j]
Björn eat.FIN POSS.MASC sandwich.PL
'Björn is eating his sandwiches.'

(8b) Björn_i äter sina_i smörgåsar.
Björn eat.FIN POSS.REFL.PL sandwich.PL
'Björn is eating his (own) sandwiches.'

The possessive reflexive agrees with its noun for number and gender much like an adjective; it does not, however, mark the gender of the possessor, unlike the nonreflexive form.

Like the other North Germanic languages, Swedish is a verb-second language. This means that main clause word order is built around the finite verb in the second position. The initial phrase will either be the subject or will have some special information structural status, such as topic or focus, or will be an adverbial phrase, often a so-called scene-setting adverbial phrase. Some examples are provided in the following sentences:

- (9a) Philip gillar matematik.
Philip like.PRES mathematics
'Philip likes mathematics.'
- (9b) Dinosaurier gillar Nils.
Dinosaur.PL like.PRES Nils
'Nils likes dinosaurs.'
- (9c) Under sängen hittade Ellen
under bed.DEF find.PAST Ellen
inte några sockor.
not some sock.PL
'Ellen didn't find any socks under the bed.'

Any phrasal constituent can then precede the finite verb, including clauses, as illustrated in Example (10):

- (10) Att han måste ha hjälm när
that he must have.INF helemet when
han cyklar gillar Robin inte.
he cycle.FIN like.FIN Robin not
'Robin does not like the fact that he has
to wear a helmet when he cycles.'

The word order in the part of a main clause that follows the finite verb is usually described as relatively firm, with the order shown in Example (11):

- (11) Main clause word order:
INITIAL CONSTITUENT → FINITE VERB → SUBJECT →
ADVERBIAL → NEGATION → NONFINITE VERBS →
OBJECTS/COMPLEMENTS

There is, however, some variation in word order also in this part of the sentence, motivated by factors such as information structure and scope. For instance, the subject *Robin* and the negation in Example (10) could change places.

The word order in subordinate clauses differs from that in main clauses in that the verb does not normally occur in second position, and it can only do so under certain very specific circumstances. Instead, the finite verb follows the subject and adverbials – in particular,

the negation. The subordinate version of Example (9c) would then be as in Example (12):

- (12) ...att Ellen inte hittade några
that Ellen not find.PAST some
sockor under sängen.
sock.PL under bed.DEF
'... that Ellen didn't find any socks under the bed.'

Naturally, there are many Swedish dialects, two of which deserve mention here. The first is the Swedish spoken natively in Finland: this dialect is quite distinct from the Swedish spoken in Sweden in phonology, lexicon, and syntax, one of the most striking differences being the lack of the two tones previously described (*akut accent* and *grav accent*). The other variety of Swedish of note is spoken in a small area roughly in the middle of Sweden; this dialect, *Älvdalen*, is closer to older forms of Swedish in that it preserves more morphological marking (for instance, case marking and agreement on the finite verb).

Sweden has long had a generous immigration policy and hence speakers of a large number of languages now live in Sweden. Though it is a controversial issue, there have been claims that a new variety of Swedish is emerging, namely, that spoken natively by children born in Sweden to parents who are not native speakers of Swedish. In the literature, a number of terms have been used to refer to this variety of the Swedish language, the most neutral being *Svenska på mångspråkig grund* 'Swedish on a multilingual basis.'

In 1786, *Svenska Akademien* 'The Swedish Academy' was set up to promote the purity of the language. The Academy continues to be responsible for publishing the major monolingual Swedish dictionary, *Svenska akademiens ordbok*, available online at www.saob.se. The Academy has also published a four-volume grammar of Swedish (see Teleman *et al.*, 1999). An excellent collection of corpora of Swedish, written and spoken, modern and historical, is publicly available at *Språkbanken* 'the language bank' at Gothenburg University (spraakbanken.gu.se).

Syriac

G Kiraz, Beth Mardutho: The Syriac Institute,
Piscataway, NJ, USA

© 2006 Elsevier Ltd. All rights reserved.

Syriac is a form of Aramaic, a Semitic language whose many dialects have been in continuous use since the 11th century B.C. Syriac is by far the most attested dialect of Aramaic. It is used today in two forms: Classical Syriac, which is a literary form of the language, and Vernacular Neo-Syriac, which consists of many regional dialects. Syriac is used by Christian communities in the Middle East, known as Syriacs, Assyrians, Chaldeans, and Maronites; and in the Indian state of Kerala, primarily as a liturgical language, by communities known as the St Thomas Christians. There are today only a few hundred speakers of Classical Syriac, fewer than one million speakers of Vernacular Neo-Syriac, but over 10 million who consider Classical Syriac their liturgical language. Classical Syriac exists in two main dialects, West Syriac and East Syriac, the difference between them being minor phonological variations.

Historically, the earliest dated Syriac inscription is from 6 A.D., and the earliest parchment, a deed of sale, is from 243. The earliest dated manuscript was produced in November 411, probably the earliest dated manuscript in any language. Within a few centuries from its origin, Syriac produced a wealth of literature that surpassed all other Aramaic dialects. Early literature was produced in Mesopotamia, especially in and around Edessa, by pagans, agnostics, Jews, and Christians. The literature of the first three centuries consists mostly of anonymous texts whose date and origin cannot be established. The 4th century witnessed the first major writings that survive to this day. The 5th to 9th centuries mark the Golden Age of Syriac, with more than 70 important known authors, not counting numerous anonymous works and lesser authors. These writings cover philosophy, logic, medicine, mathematics, astronomy, alchemy, history, theology, linguistics, and literature. Under the Arabs, Syriac was the vehicle by which the Greek sciences passed to the Muslim world, and later to Europe through Spain, marking Syriac as an important stage in the history of world civilization. As Arabic began to replace Syriac as the primary language of the Middle East, Syriac became less prominent but has continued to be used until today.

The Syriac writing system makes use of three scripts. The oldest, known as Estrangelo ‘rounded,’ was fully developed by the 5th century. Later, two

geographic scripts derived from it: West Syriac, whose proper name is Serto, and East Syriac. Early Syriac writing consists of consonants and long vowels only. In the 7th century, a vocalization system was developed and lent itself to Hebrew and Arabic. At the time of Genghis Khan (12th century), the Mongolian script was derived from Syriac.

The phonology of Syriac makes use of 22 consonants, three of which are *matres lectionis* (glottal stop, *u*, and *y*), and seven vowels (five in the case of West Syriac). Six consonants, known by the mnemonic *bgdkpt*, undergo spirantization, where the plosives become fricatives. Traditionally, stress has been assigned to the penultimate syllable in West Syriac, and the final syllable in East Syriac. Syllabification employs long open (CVV) and closed (CVC) syllables. The short vowel of a CV syllable is almost always deleted.

The morphology of Syriac is based on root-and-pattern morphology, in addition to suffixation, prefixation, and circumfixation. Most roots consist of three consonants, although two- and four-consonantal roots exist. Roots that do not contain any of the *matres lectionis* are called ‘strong,’ and those containing *matres lectionis* are called ‘weak’ and for the most part undergo various phonological processes. Most words are derived according to a CV template and a vocalism.

Verbs exist in two tenses: perfect, denoting past tense, marked by zero or one suffix; and imperfect, denoting future tense, marked by a circumfix. The imperative is marked by the suffix part of the imperfect circumfix. Closely related to verbs are the participles and the infinitive. Verbal affixes mark number (singular, plural), person (1st, 2nd, 3rd), and gender (masculine, feminine).

Nouns exist in three states: ‘absolute’ is the basic form and in early Syriac used to indicate nondetermination; ‘emphatic,’ by far the most frequent, is marked by a gender-sensitive suffix and is used to mark determination; and ‘construct’ (joining two nouns) is used primarily to mark a genitive like relation. Adjectival forms are formed mostly by one or more suffixes, those with fewer suffixes belonging to earlier periods of the language. More complex nouns are formed by formative prefixes, and may also contain suffixes.

Personal pronouns either stand on their own, or are in the form of suffixes; they are also either in subject form or object form. Demonstrative and interrogative pronouns stand alone. The relative pronoun is in the form of a prefix.

The sentence structure does not put hard constraints on word or clause order, though idiomatic construction is not very free. Nominal sentences have a noun, an adjective, or an adverbial expression as a predicate. Copulative sentences are joined together with a conjunction in the form of a prefix (in the case of 'and') or a stand-alone word (in the case of 'or'). Syriac also uses relative clauses, marked by the prefix *d*, indirect interrogative clauses, marked by a particle, and conditional clauses, also marked by a particle.

The Syriac lexicon is either arranged by root, or in a quasiaphabetical order (in the latter case, derivations of the verb with prefixes appear in the unprefixated 3rd singular masculine form). The primary Syriac lexica in use were all composed in the 19th and early 20th centuries.

T

Tagalog

J U Wolff, Cornell University, Ithaca, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Tagalog, spoken in the Philippines, is a member of the Austronesian group of languages. The Austronesian languages are descended from Proto-Austronesian, which is believed to have developed on the Asian mainland and to have been brought to Taiwan by around 6000 B.C., whence its descendents spread through the Philippines and Indonesia eastward to the islands of the Pacific. The earliest documents in Tagalog date from a few decades after the first Spanish colonization in 1564. The pre-Hispanic Tagalogs had a syllabary called *Alibata*, which has been recorded, but if there was any written literature, none of it survives. The end of the 16th century and the beginning of the 17th saw the publication of a catechism *Doctrina Cristiana*; a magnificent and thoroughgoing dictionary, a grammatical description, and a textbook that purports to teach Spanish to Tagalog speakers. These provide good documentation of what Tagalog was like at the time, and indeed the language of these texts is readily understandable today. Other literature, mostly poetry, dates from the middle of the 19th century. It was only in the beginning of the 20th century that prose literature and other types of writing were published in Tagalog. Education in the medium of Tagalog was not introduced until the 1960s, and to this day, English predominates as the medium of instruction at all levels.

Tagalog has a unique status among the more than 100 indigenous languages of the Philippines in that it is the national language alongside of English. Although English still predominates in the Philippines as the language of education, public affairs, and formal occasions, Tagalog is increasingly coming into use in these settings, particularly in those areas in which Tagalog is spoken natively. At the time of the Philippine Commonwealth, Tagalog was spoken by less than a quarter of the population of the Philippines. To avoid political controversy among the speakers of other languages, the fiction was adopted that this language, with some modification of vocabulary taken

from other major Philippine languages, was an amalgam of these languages. As such it was called 'Pilipino.' In the 1970s, a new fiction was adopted, that the amalgamation of Philippine languages that was to serve as the national language was composed of a larger number of the indigenous languages than Pilipino had been, and this new language was termed 'Filipino.' However, the terms 'Pilipino,' 'Filipino,' or 'Tagalog' all refer to one and the same language, and all three terms are commonly used to refer to it.

Tagalog is spoken indigenously in the Manila region and in the provinces surrounding it. As such, it is the language associated with the seat of Philippine power and culture, and has acquired a special cachet or prestige. In the last few decades, Tagalog has spread far beyond its original home to urban areas to the south and the north, especially those that have seen a large influx of immigrants from other regions, although in Mindanao there is strong competition from Cebuano, and in the north competition from Ilocano. However, at this point, Tagalog has become the native language of approximately one-third of the population of the Philippines and is ever increasing in number of speakers. In addition, Tagalog press, TV, and cinema, and most importantly, population mobility, have spread the knowledge of Tagalog throughout the nation, so that only few people, and those mostly in the oldest generation, do not have at least a passive knowledge of Tagalog. Further, although loyalty to the native language is strong in the Philippines (few of the indigenous languages are in danger of dying, even though some have small numbers of speakers), it is becoming increasingly acceptable to use Tagalog in social settings (even in non-Tagalog regions), where family members and guests use Tagalog instead of the native language. This usage usually occurs on the part of native sons, who have moved to Tagalog-speaking regions for employment, or their children. Many have become dominant in Tagalog. Speaking in Tagalog in a group where everyone else is speaking the native language is not remarked upon, and in fact, there is a certain prestige attached to speakers who do this, as it is a sign of having made good in the outside world. Abroad, Tagalog has become the mark of Philippine

national identity and is used by Filipinos with other Filipinos, no matter what region they come from, and internally, Tagalog is well on its way to becoming the lingua franca of a multilingual nation.

What Tagalog Is Like

Tagalog has a simple phonology. The consonants, vowels, and diphthongs are as follows (Table 1). Note that there are long and short vowels: the long vowels are marked with an accent.

Glottal stops in standard Tagalog occur only before a pause. If a word with a glottal stop at the end of it occurs in a phrase with another word following it, the glottal stop is lost, and there is compensatory lengthening of the preceding vowel:

Wala? ‘not’ + *na* ‘any longer’ produces *walá na* ‘no longer’

The spelling system ignores important parts of the phonology and does not recognize long versus short, although pedagogical texts use a cumbersome system to indicate these partially. The system also does not indicate /ʔ/. The palatals /c/, /j/, and /ʃ/ are written *ts*, *dy*, and *sy* respectively. The phoneme /ŋ/ is written *ng*:

/cinílas/ *tsinilas* ‘slippers’; /jip/ *dyip* ‘jeep’; /ʃa ŋ á pala/ *ʃya nga pala* ‘by the way’

At the time the Spaniards first came to the Philippines, Tagalog clearly did not have this phonological system. The phonemes in parentheses in Table 1 show sounds that have been added to Tagalog since that time. This addition is proven not only by comparing Tagalog with other Philippine languages (i.e., doing historical reconstruction) but also by the treatment of loanwords from Spanish at the early time and the modern time. An example is the Spanish word for ‘hat’ *sombrero*, which was borrowed twice in Tagalog: once early on and then again later. These two words are now perceived to be two different lexical items and refer to different things, but their phonemic make-up show how Tagalog has expanded its phonology: it has added /o/ and /e/, it has come to allow a consonant clusters with /r/, and has come to allow a vowel other than /a/ to occur three or more syllables from the end:

Table 1 Tagalog phonology

| Consonants | | | Vowels and Diphthongs | | | |
|------------|--------|-----|-----------------------|----|--------|--------|
| p | t | (c) | k | ʔ | i, í | u, ú |
| b | d | (j) | g | h | (e, é) | (o, ó) |
| m | n | | ŋ | | a, á | |
| | s, ʃ | | | iw | | uy |
| w | l, (r) | y | | | | ay, aw |

sambalílu?, ‘conical sun hat of the native variety’ *sombrero* ‘western hat’

Not all of this is due directly to Spanish influence. Much has to do with internal developments in Tagalog itself, but the contact with Spanish was a catalyst or facilitated some of these developments, in that Spanish words pronounced closer to the Spanish pronunciation made certain rare combinations or types more common.

In grammar, Tagalog is characterized as a synthetic rather than an analytic language (English is an example of an analytic language). In Tagalog, single words containing a root plus affixes of all sorts express what in analytic languages would be expressed by a phrase. For example, the single word *pápa-pagparikitin* ‘will cause him or her to make a fire’ expresses what in English takes seven words to express. The root here is *dikit* (the initial /d/ is changed to /t/ by rule that says /d/ between vowels is often changed to /t/).

The verbal system in Tagalog expresses the relation between the verb and a word it refers to: the word referred to may signify the agent, the place, the beneficiary, the instrument, the patient, the thing moved, or the indirect object (depending on the affix). The verb contains what in English would be a verb and a preposition. An example is the root *pútol* ‘cut’:

- (1) (agent) Ako ang púpútol
I the-one-who will-cut
nang táli?
object-maker string
‘Let me be the one to cut the string.’
- (2) (patient) Putúlin mo ang táli?
Cut-it by-you the string
‘Cut the string.’
- (3) (local) Putúlan mo nang
Cut-from-it by-you object-marker
kóntí ang kék.
little the cake
‘Cut a little from the cake.’
- (4) (benefactive) Ipútol mo
Cut-for by-you I
ako nang kék.
object-marker cake
‘Cut the cake for me.’
- (5) (instrumental) Itong kutsilyo ang
This knife the-one-that cut-with-it
ipangpútol mo
by-you on string
‘Cut the string with this knife.’

Cutting across this system of voice or prepositional-like affixes is a system of four-way inflections that expresses time (past or present as opposed to future),

ongoing or iterative action, as opposed to a single action, and an imperative inflection, which is also used to express dependence, optativity or uncertainty. For example, sentence (1) above exemplifies future tense, (6a) below exemplifies noncompleted action, (6b), past action, and (6c), uncertain action:

- (6a) Ako ang laging
I the-one-who always cut
pumupútol nang táli?
object-maker string
'I am the one who is in charge of cutting
(literally, always cuts) the string.'
- (6b) Sino ang
Who the-one-who did-cut
pumútol nang táli??
object-maker string
'Who (purposely) cut the string?'
- (6c) Baká pumútol siya nang táli?
lest cut he object- string
marker
'He might just cut the string.'

Perfective action is not expressed by verbal inflections but rather analytically (by a phrase).

- (6d) Matagal na akong
long-ago has-been I
pumútol nang táli?
cut object-maker string
'It has been some time since I (purposely) cut
the string.'
- (6e) Alas sayis na ako
o'clock six have-done I
pupútol nang táli?
will-cut object-maker string
'At six o'clock I will have cut the string.'

There is a large number of derivational affixes that interact with the above-mentioned inflectional affixes to produce verbal forms with a wide number of meanings. Some of these affixes are applicable to almost all roots, some are more limited in their distribution. The most productive are the causative affix *pa-* and the potential affix *ka-*, both of which are addable to almost all roots that take verbal affixes. More than one derivational affix may occur within a verb. There are affixes that transitive intransitive verbs, others that form verbs of reflexive action, those that form plurals, those that indicate an action done by two together, by more than two together, actions done as a favor, actions involving another, actions done by accident, and so forth. There is also a large number of adjective and nominal derivations.

Here are a few examples from the root *sáma*, a small percentage of the total number of derivational forms that occur with this root:

No derivational affix, 'go along':

- (7) Ayó kong sumáma
not-want I go-along
'I don't want to go along.'

With *pag-*, transitivizer: 'take something. along somewhere':

- (8) Magsáma [=um+pag+sáma] ka nang
Bring-along you object-marker
tá'ò pagpunta mo do' on.
person when-go you there
'Bring someone with you when you go there.'

With *pa-*, causative:

- (9) Hindí mo siyang dápat
Not by-you him should
pasamábin.
cause-him-to-accompany
'You should not allow him to come along.'

With *ka-*, potential action:

- (10) Hindí ka makákasáma [=future
active + potential + sáma]
Not you will-be-able-to-go-along
kung íiyak ka.
if cry you
'You won't be able to come along if you are
going to cry.'

With *kápa-*, accidental and causative action:

- (11) Nápasáma [= past-passive + ká- yung
accidental action + pa-
causative + sáma]
Was-accidentally-caused-to-go-along that
papel sa dala-dala ko
paper with thing-brought my
'I accidentally took that piece of paper together
with the thing I was bringing (That piece of
paper got caught up with the things I was
bringing).'

With *pag-*, 'do together':

- (12) San Miguel, ang bir na may
San Miguel the beer that there-is
pinagsamáhan [= past + local-passive + pag-
+ sáma].
be-companions-over-it
'San Miguel, the beer people have
companionship over (while drinking).'

Influences on Tagalog and Tagalog's Influence on Other Languages

Tagalog, as a language of wider communication and as a spreading language, is being simplified. Simplification is most marked in urban areas, and the process

is gradually spreading to the provinces. It undoubtedly begins from errors made by people (immigrants from non-Tagalog regions or Filipino Chinese) who learn Tagalog as a second language and are imitated by native speakers. One simplification is the loss of contrast between long and short vowels in certain syllables, leading to the loss of contrast between the accidental and the potential conjugations, e.g., *nápa-sáma* of example (11) above is pronounced /napasáma/ (which in conservative Tagalog has no meaning). Similarly, *mábibili* 'someone might buy it' (the accidental passive future) is pronounced /mabibili/. Thus, the contrast is lost between *mábibili* 'someone might buy it' and *mabibili* 'is able to buy it'. Another aspect of this simplification is that there is a tendency to drop many of the productive derivations, which are very much alive in conservative Tagalog and exclude any vocabulary but that of the highest frequency. This tendency is exacerbated by the secondary role of Tagalog *vis-à-vis* English in public life and in education.

Mutatis mutandis, Tagalog influences the other indigenous languages of the Philippines. These other languages are replete with Tagalog loanwords that stem from the language's widespread use in the media. In some areas, Tagalog has a more intimate effect. In Samar, for example, where a large portion of the population has work experience in the Manila area and Manila has an especial cachet, the regional language is spoken by many younger people with a clearly observable Tagalog intonation. In the urban parts of the Cebuano speech area, where the managerial class is largely composed of immigrants from Tagalog regions who have learned Cebuano as a second language, complexities of Cebuano syntax that have no analogue in Tagalog are lost or regularized, and this syntax has spread to the younger generation of Cebuano natives who have no Tagalog connection (see **Cebuano**).

Tahitian

P Geraghty, University of the South Pacific, Suva, Fiji

© 2006 Elsevier Ltd. All rights reserved.

Tahitian belongs to the Eastern Polynesian branch of the Oceanic subgroup of the Austronesian language family. Its nearest relatives are other Central Eastern Polynesian languages, such as Tuamotuan, Marquesan, and Cook Islands Maori.

Until the early 19th century, Tahitian was spoken by the entire population of the Society Islands, and it remained the main language for most of that century. Annexation by France (in 1880) and educational and social policies have contributed to the decline of Tahitian, particularly in the capital, Pape'ete. At the same time, Tahitian has become the lingua franca of the Marquesas, Tuamotus, Austral Islands, and other parts of French Polynesia, at the expense of their respective indigenous languages, and it is now

estimated to have 150 000 speakers, including some 5000 residents of New Caledonia.

Tahitian has been an official language of French Polynesia, along with French, since 1978, but more *de jure* than *de facto*. It is taught in a small way up to university level. There is a substantial amount of Tahitian language radio and television programming, but no newspaper. The recent (2004) election of a government committed to more independence from France may bring about changes in the use and status of Tahitian.

Tahitian had no traditional written form and was first recorded by 18th-century explorers such as Bougainville and Cook. The latter was responsible for introducing into English the loanwords *taboo* and *tattoo*, from Tahitian *tapu* and *tatau*. A Roman-based alphabet was devised by English-speaking missionaries in 1815 and has remained in use relatively unchanged. Reliable reference works are currently available only in French.

An unusual feature of Tahitian was the custom of 'pi'i,' by which everyday words that constituted parts of chiefs' names were considered taboo, and in many cases the change became permanent. Tahitian is also unique among Pacific languages in having an academy (Fare Vana'a), founded in 1974, that aims to standardize, develop, and promote the language.

The phoneme inventory of Tahitian consists of nine consonants (f, h, m, n, p, r, t, v, and glottal stop) and

10 vowels (a, e, i, o, u, ā, ē, ī, ō, ū). There are no consonant clusters, and syllables are open. In writing, vowel length and glottal stop have often not been marked systematically. Some modern writers and publishers use a macron to indicate a long vowel and an apostrophe to indicate the glottal stop, as recommended by the Fare Vana'a.

There is very little morphophonemics, and most grammatical functions are performed by affixation or the use of pre- and postposed particles. Pronouns distinguish four persons (including first-person inclusive and exclusive) and three numbers (singular, dual, and plural). There are two categories of possession, depending largely on whether or not the possessor has control over the fact of possession. In noun phrases, the order is head + attribute. The basic word order is VSO:

| | | | | | | |
|------------------------|-------|------|-----|-----|------|------|
| 'ua | tai'o | 'oia | i | te | puta | rahi |
| ASP | read | he | OBJ | the | book | big |
| 'he read the big book' | | | | | | |

Tai Languages

D A Smyth, SOAS, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Geographical Location and Number of Speakers

Tai languages are spoken by over 70 000 000 people across a wide area of Asia that extends from Vietnam in the east to India in the west. The most important member of the family is Thai, the national language of Thailand, which accounts for approximately two-thirds of all Tai speakers. The second highest national concentration is in China, where there are an estimated 15 000 000 speakers, mainly in the southwest. Smaller Tai-speaking populations live in northern Vietnam, Laos, Burma, and northern India.

The Tai language family comprises three branches: southwestern, central, and northern. The southwestern group extends over the widest geographical area

and includes the national languages of Thailand and Laos, plus Shan and Khün (spoken in northern Burma); Lü (China-Burma border); Khamti (Burma-India border); and Black Tai (Tai Dam), White Tai (Tai Dón), and Red Tai (Tai Daeng) (Laos-Vietnam border). The central and northern branches are geographically more homogeneous, languages from both groups being spoken in both northern Vietnam and southern China. Central Tai includes Tho (Tày), Longzhou, and Nung, while Northern Tai includes Wu-ming (Northern Zhuang), Yoi (Dioi), and the Bouyei (Pu-yi) languages of China.

Wider Affiliations

Certain lexical and grammatical similarities between the Tai and Chinese languages led linguists in the 19th century to assume that the two groups were related, and until the 1940s this was the widely accepted view.

Since then, however, most authorities have come to believe that there is no such genetic link and that any similarities are due to borrowings. The wider affiliation of Tai languages has been the subject of considerable scholarly debate. In 1942, Paul Benedict first linked Tai languages to a small group of languages spoken on the island of Hainan and in southwestern China, for which he coined the term 'Kadai'. Whereas the Tai-Kadai link is, today, accepted by many – but not all – linguists, Benedict's attempt to relate Tai-Kadai languages to the polysyllabic, nontonal, Austronesian (or Malayo-Polynesian) languages of the South Pacific, under the term 'Austro-Tai,' has proved more controversial.

History

Researchers on comparative Tai dialects estimate that the parent language, Proto-Tai, dates back approximately 2000 years. Speakers of this language were once thought to have originated in China and migrated southward, but today the border area between Vietnam and China's Guangxi province is regarded as a more likely origin. From the 8th century A.D., Tai speakers began to migrate westward and southwestward, gradually driving a wedge between the Mon-Khmer speaking peoples then dwelling in what is now Thailand. Around the 11th century, all Tai languages were affected by the Great Tone Split. Essentially, this had the effect of creating additional tones while reducing the number of initial consonant sounds. The effects of this can be seen in a number of Tai writing systems; in Thai, for example, it accounts for the fact that a single tone mark can represent two distinct tones.

Typological Characteristics

The Tai languages are noninflected tonal languages with a basic monosyllabic lexicon. Among the different branches, a single lexical item will often show differences in the initial consonant, vowel, or tone; thus, the word for 'six' is *hok* in several southwestern Tai languages, but is *sok*, *rok*, *lok*, or *huk* in the central and northern branches, depending on the language. Even closely related languages within the same branch are frequently mutually unintelligible because of differences in phonology and certain basic vocabulary items.

The word order in most Tai languages is subject-verb-object, with adjectives following nouns. In Khanti, however, the order is subject-object-verb, probably due to the influence of neighboring languages from other families. Geographical location has also influenced the source of loan words; Tai languages spoken in Vietnam and China have borrowed from Chinese, and members from the southwestern branch have drawn lexical items from Sanskrit and Pali.

The writing systems have been similarly influenced; some central and northern Tai languages are written in Chinese characters, whereas southwestern Tai languages are written in alphabetic scripts that can ultimately be traced back to a south Indian origin. Many Tai languages, however, have no writing system and, with small numbers of speakers and little cultural prestige attached to them, they are in serious danger of becoming extinct.

Tajik Persian

J R Perry, University of Chicago, Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Tajik Persian (self-designation (*zabon-i forsi-i tojikī*; also called Tajik, Tajiki, Tojikī, and Tadjhik) is the variety of Persian used in Central Asia (see **Persian, Modern; Persian, Old**). Since the 1920s, Tajik has been fostered as the national literary language of the Tajik Soviet Socialist Republic (since 1991, the Republic of Tajikistan). It is also spoken in parts of Uzbekistan (notably the cities of Bukhara and Samarkand) and is the vernacular of the Bukharan Jews. It is the common written language and contact vernacular in the mountain region of Badakhshan, where people speak a variety of very different Iranian languages (see **Iranian Languages**). The so-called Tajiks of southwestern Xinjiang in China speak Sarikoli and Wakhi, not Persian. Tajik has been written in a modified Cyrillic script since 1940. Speakers number at least 5 million.

History

Persian spread to Central Asia from its home on the Iranian plateau during the 8th century C.E., as the language of Iranian converts attached to the invading Arab Muslim armies. At the autonomous Samanid court of Bukhara (9th–10th centuries), Persian was patronized as the literary language and displaced the indigenous Iranian language, Sogdian (a descendent of which, Yaghnobi, survives in the mountains of western Tajikistan). As a written language, Persian of Central Asia was hardly distinguishable from Classical Persian of Iran, Afghanistan, and India up until the early 20th century. However, invasions and settlement by Turkic peoples (most recently, the Uzbeks) in the Oxus basin and its foothills interrupted the dialect continuum; spoken Persian of Central Asia evolved independently of Persian of Iran, and northern dialects in particular were strongly influenced by Turkish speech. Persian speakers of the region came to be called Tajiks (from a Middle Persian word meaning ‘Arab’), in contradistinction to Turks.

After the Russian revolution, in accordance with Soviet nationalities policy, an ethnic Tajik republic was established and a literary language called ‘Tajik’ was engineered on a vernacular base close to the Uzbekized spoken Persian of Bukhara and Samarkand (these Tajik cultural centers, ironically, were incorporated in the Uzbek Soviet Socialist Republic). During the period ~1948–1988, Tajik lost much of its prestige, vocabulary, and domain of use, to Russian.

With *perestroika* and *glasnost* came a revival and re-Persianization of the national language, which continues (at a slower rate) in post-Soviet Tajikistan; policies include the replacement of Russian vocabulary by Persian (both native coinages and loans from Persian of Iran), and teaching of the Perso–Arabic writing system in schools.

Tajik is fundamentally Persian in grammar and core vocabulary, though generally closer to the spoken Persian of Afghanistan (e.g., Kaboli dialect) than to Standard Persian of Iran. The following descriptions highlight features that differ substantially from Standard Persian, in particular the elements of convergence with Turkic types characteristic of the bulk of Tajik literature in the Soviet period.

Phonology and Orthography

The Tajik sound system is shared almost entirely with that of Uzbek. Its Cyrillic orthography is basically Russian specific, and is illustrated here only when it involves modified or ambiguous characters.

The consonant inventory differs from that of Persian only in two features: [q] <Қ> and [ɣ] <Ғ> are distinct phonemes (they have collapsed in the Persian of Iran), and labiodental [v] tends toward bilabial [β] or [w] in the environment of rounded vowels. The affricates [tʃ] <Ҷ> and [dʒ] <Ҷ> will be transliterated as *č* and *j*, [j] <Ӣ> will be transliterated as *y*, and <Х> [h] will be transliterated as *h*.

The six-vowel system has diverged considerably from Standard Persian (see **Figure 1**). Length has been neutralized in most dialects (including literary Tajik) and replaced by a contrast between ‘stable’ [e, ʌ, ɒ] and ‘unstable’ vowels [i, u, a]. In Cyrillic, [ū] is written *ӯ* (transliterated *ū*); *i*, written as *и*, has a variant *ӣ* (transliterated *ī*). These accents do not represent length: *ū* shows a different quality from *u*, and *ī* is used for *i* in word-final position to distinguish a (stressed) morphological syllable from the (unstressed) enclitic of *izofat* (see later, Morphology and Noun Phrase Syntax). The vowel [e] represents early New Persian [eː]; [ʌ], sounding between [u] and [y], represents early New Persian [oː] and is shared with Uzbek, in which it corresponds to Turkic [y] or [ø]. The vowel [ɒ] <o> is a rounded form of Standard

Figure 1 Tajik vowels.

Persian [a]. The three ‘unstable’ vowels correspond to the ‘short’ vowels of Persian, but [i] and [u] additionally represent the corresponding ‘long’ vowels.

Examples of modern correspondences in Tajik and Persian, respectively, are *kitob*, *ketâb* ‘book’; *imrûz*, *emruz* ‘today’; *Bedil*, *Bidel* ‘name of a poet’; *na-budem*, *nabudim* ‘we were not’; and *šuda*, *šode* ‘having become’ (the final [a] is not raised in Tajik). The yotated letters ë, ю, and я represent the syllables *yo*, *yu*, and *ya*; Cyrillic e stands for *e* after a consonant, *ye* initially or after a vowel.

Morphology and Noun Phrase Syntax

There is no grammatical gender in Tajik and only a limited distinction between humans and nonhumans in the plural suffixes *-ho* (any noun) and *-on* (humans and higher animals), and in third-person singular personal pronouns, as follows: *vay* (general), *û* (literary), *in* (dialect) ‘he, she’; *on* (literary), *in*, [*h*]*amin* (colloquial), *vay* (dialect) ‘it’; *onho* (general), *in[h]o* (colloquial), *vay[h]o* (dialect) ‘they’ (all classes). The deferential pronoun *ešon* (cf. Persian *išân*) ‘he, she’ (lit. ‘they’) has been replaced in Tajik by *in kas* ‘this person.’ Plural pronouns, which may refer deprecatingly or deferentially to a singular (SG) person, can add plural (PL) suffixes as ‘explicit plurals’: *mo/mo-yon*, *mo-ho*, *mo-hon* ‘we, I/we’; *šumo/šumo-yon*, *šumo-ho* ‘you’ (SG)/‘you’ (PL; see later, discussion of verb endings).

The basic noun phrases (NPs) are the nominal *izofat* (IZ; Persian *ezâfe*), e.g., *qišloq-i Alijon* ‘Alijon’s village’ (village-of Alijon), and adjectival *izofat*, e.g., *qišloq-i kalon* ‘the big village’ (village-big); in both types, the head is linked to a following modifier by the enclitic *-i*. There are no articles; an indefinite NP may be marked by the numeral *yak* ‘one’ and/or the ‘specific’ (SPEC) enclitic *-e*; a definite NP (supplying old information) is distinguished only in the object (OBJ) position, by the enclitic *-ro*. A direct object that is familiar to the speaker, but not to the listener, is marked by both enclitics, as shown in the following examples:

pisar-ro did-am
boy-OBJ see.PAST-1SG
‘I saw the boy.’

yak pisar(-e) did-em
one boy(-SPEC) see.past-1PL
‘We saw a boy/some boy or other.’

pisar-e-ro did-em
boy-SPEC-OBJ see.PAST-1PL
‘We saw a (certain) boy.’

Other case relations are expressed through prepositions (including *bar* ‘upon’ and *be* ‘without,’ no longer

active in Persian), postpositions, and circumpositions (inflectional suffix *izofat*):

qayčī kati noxun girift-am
scissors with nail take.PAST-1SG
‘I cut my nails with scissors.’

az ibtido-i paxta-čini in-taraf
from start-IZ cotton-picking this-side
‘Since the start of cotton-picking.’

A superlative as modifier may precede the head noun (as in Persian), or may follow it:

šahr-i kalon-tarin-i tojikiston
city-IZ larg-est-IZ Tajikistan
‘The largest city off/in T.’

Nouns take the singular after a number. A classifier may intervene, most commonly the enclitic *-ta* or *-to* ‘fold, item,’ as in *yak-ta zan* ‘one woman’ and *sad-to kurta* ‘a hundred shirts’ (or *yak-sad kurta* ‘one hundred shirts’).

The simplex tenses of Tajik verbs are the same as in Persian, except for the vowel of the present/imperfect prefix, and of the first-person plural and second-person plural personal endings, as in *me-kun-em* ‘we do’ and *kard-ed* ‘you did.’ The second-person plural form may also add an ‘explicit plural’ supplement (cf. preceding discussion of pronouns) derived from the pronominal enclitic *-ton*, as in *šin-eton*, *rafiq-on* ‘sit down, friends’ (*šimed + ton*). In compound tenses and moods, Tajik verbal morphology has expanded beyond that of Persian. Three progressive tenses are formed on the past participle of a desemanticized *istodan* ‘to stand’ (in the following examples, verb glosses in bold type indicate an apparent ‘past participle’ (PP) not forming part of a tense, which is used extensively as a nonfinite verb form (gerund) in verbal conjuncts):

bača-ho ovoz xonda istoda-and
child-PL song **sing** stand.PP-be.3PL
‘The children are singing’ (present progressive).

An epistemic mode of the indicative (called ‘nonwitnessed,’ or ‘evidential’) also has three tenses. Thus, the regular perfect may function as an evidential present:

vay sayohat-ba rafta-ast
he journey-on go.PP-be.3SG
‘He went/has gone on a trip (– so I surmise/am told).’

Note here the Persian preposition as a Turkish-style postposition. This mode also includes progressive tenses:

šumo yak asar-i nav navišta istoda-buda-ed
you one work-IZ new **write** stand.PP-be.PP-2PL
‘You’ve been writing a new work (– so I gather/see).’

Here the form expresses a mirative, i.e., the appreciation of a fact not previously known.

The conjectural mood uses an augmented (AUG) form of the past participle in *-agī* to form tenses expressing a probable situation or event (IMPERF, imperfect):

yagon kor-i ganda karda-gi-st
some deed-IZ bad do.PP-AUG-be.3SG
'He must have done something bad' (past).

dast-u rū me-šusta-gi-st-ed
hand-and face IMPERF-wash-AUG-be-2PL
'(I imagine) you'll want to freshen up' (present/future).

The future participle (infinitive + adjectival formative *-ī*) is used in a quasifuture tense, and adjectivally, much more than in Persian:

xohar-am ba maktab omad-an-ī bud
sister-my to school come-INF-ADJ be.PAST
'My sister was eager to go to school.'

From an intransitive verb, the sense is active, and with a human subject, usually connotes intention. From a transitive verb, the sense may be passive (NEG, negation):

jo-ho-i no-guft-an-ī
place-PL-IZ NEG-say-INF-ADJ
'Unmentionable places; locations not to be divulged.'

The augmented past participle (also of progressive tenses) is extensively used in ways (and positions, i.e., preceding the head) similar to use in Uzbek participles, to express what, in Persian, would often be a relative clause:

gurexta-istoda-gi-ho
flee-stand.PP-AUG-PL
'Those who are/were fleeing; the fugitives.'

ana kitob-i ovarda-gi-am
here book-IZ bring.PP-AUG-my
'Here is the book that I brought.'

duxtar kurta-i me-dūxta-gi-aš-ro
girl shirt-IZ IMPERF-sew.PP-AUG-her-OBJ
ba modar-aš nišon dod
tomother-her sign give.PAST
'The girl showed the shirt that she was/had been sewing to her mother.'

The Lexicon

Nominal and adjectival compounds are formed with suffixes and prefixes, some of them different from (or more productive than) their Persian counterparts. Thus *-nok* denotes something having the quality of the base noun, as in *foida-nok* 'beneficial, profitable' (*foida* 'use, profit') and *sado-nok* 'vowel' (*sado* 'sound, voice'); *ser-* 'sated, full' indicates an abundance of the base noun, as in *ser-gap* 'garrulous'

(*gap* 'talk'), and *to-* 'up to, until' produces, e.g., *to-inqilob-ī* 'prerevolutionary' (*inqilob* 'revolution,' *-ī* is the relative adjective formative); this use of the preposition *to* (unknown with Persian *tâ*) is probably calqued on similar use of Russian *do* 'up to, until.' Other Russian calques use Tajik *sar* 'head' by analogy with the Russian prefix *glav-*, as in *sar-muhandis* 'chief engineer' (Russian *glav-inžener*). Most derivatives from Russian loans freely use Tajik Persian formatives, as in *bolševik-ī* 'Bolshevik' (adjective).

Transitivizing denominal verbs and causatives (CAUS) (obtained by infixing *-on-*) are more productive than in Persian, as in, *kollektiv-on-idan* 'to collectivize.' They may also be formed from complex and composite verbs:

papiros dar me-gir-on-ad
cigarette in IMPERF-take-CAUS-3SG
'She lights a cigarette.'

(Compare *dar me-gir-ad* 'it catches fire.') In some complex verbs, the preverbs *dar* and *bar* are attached to the verb stem: *me-dar-o-y-ad* 'he comes in' (cf. Persian *dar mi-â-y-ad*).

Characteristic of Tajik are conjunct verbs (serial verbs), of which the progressive tenses are grammaticalized instances. There are some 18 lexically established conjunct auxiliaries (corresponding to models in Uzbek) that, in regularly conjugated tenses, furnish adverbial 'modes of action' for the nonfinite participle (semantically, the main verb):

dars-i nav-ro navišta girift-em
lesson-IZ new-OBJ write take.PAST-1PL
'We copied down the new lesson' ('take': self-benefactive).

nom-i xud-ro navišta me-dih-am
name-IZ own-OBJ write IMPERF-give.PRES-1SG
'I'll jot down my name (for you)' ('give': other-benefactive).

berun-ho-ya toza karda rūfta parto!
outside-PL-OBJ clean make sweep throw.IMP
'Sweep all the outside nice and clean!'

The preceding example demonstrates a double conjunct construction: the auxiliary *partoftan* 'to throw (away), toss' adds the sense of thoroughness or completion (*-ya* is a dialect variant of *-ro*, and *toza kardan* 'to clean' is a typical Persian-type composite verb).

Syntax

Verbal conjuncts, mostly of Uzbek inspiration, compete in other ways with the Persian syntax of subordinate clauses introduced by conjunctions; e.g., the favored construction for the modal verb *tavonistan* 'to be able' is as follows:

man rafta (na-)me-tavon-am
 I go (NEG-)IMPERF-can.PRES-1SG
 'I can(not) go.'

Also embedded in the literary language is the nominalization of sentential complements through infinitives, as in the following example:

mo {kujo raft-an-i xud-ro}
 we {where go-INF-IZ own-OBJ}
 me-don-em
 IMPERF-know.PRES-1PL
 'We know where we are going' (... our going-where).

Uzbekisms in colloquial and northern dialect usage include the question (Q) enclitic *-mi* and possessive NPs, with (dative) *-ro* replacing the *izofat* construction (OBL, oblique):

muallim-a [-ro] pisa-aš raft-mi?
 teacher-OBL boy-his go.PAST-Q
 'Has the teacher's son left?'

These features were not admitted into literary Tajik, and even some of the accepted Uzbekisms are fading from post-Soviet Tajik writing.

Tamambo

D Jauncey, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Tamambo [*tama^mbo*] (Malo) is the predominant dialect of the language of the island of Malo (previously known as St. Bartholomew) in northern Vanuatu, in the southwest Pacific (Figure 1). It is spoken by at least 3000 people including those living on Malo, and those who have settled on the nearby 'big' island of Espiritu Santo and in Port Vila. It is learned as a first language by most children on the island, although Bislama (Vanuatu pidgin) is strengthening in almost all social contexts. Tamambo was originally the dialect of the western side of Malo; the dialect of the east

[*tamapo*] is now used by no more than a handful of older speakers, although some words from that dialect are heard in several old dance songs. There is no written literature in the language, except for some copies of Presbyterian mission publications dating from the 1890s. Nevertheless, a strong oral tradition of storytelling has been maintained, and activities reflecting *Kastom* (traditional custom) such as dances, and 'fighting sticks' contests [*maⁿja*] are enjoying renewed interest and participation.

Grammatical Overview

The language is Oceanic (Austronesian); it belongs to the Northern Vanuatu linkage, and appears similar to languages of nearby Tangoa, Araki, and south Santo. Tamambo can be regarded as conservative in that it shares many of the same structural characteristics

Figure 1 Malo Island within Vanuatu.

widely distributed among Oceanic languages, and many of which are posited for Proto-Oceanic (POc).

Tamabo is a nominative-accusative language, and the unmarked word order of the clause is Agent-Verb-Object or Subject-Verb. Sentence types other than the declarative are based on the unmarked declarative form. Basic clauses are most commonly verbal clauses that indicate a non-future/future contrast. There are also verbless clauses where the predicate is a noun phrase, a numeral, or a prepositional phrase. Basic noun phrase structure is similar to that outlined for POc (Lynch *et al.*, 2002: 75) with the noun as head, preceded by an article (retained only in some syntactic environments in Tamabo), and an optional premodifier such as a quantifier, and followed by an optional modifier or demonstrative. It is an agglutinating language with considerable derivational morphology and valency-changing affixes.

Lexically, many words in the language are reflexes of words posited for POc. Other characteristics common to many Oceanic languages are reflected in Tamabo: they include a subject proclitic on the verb root, marking of inclusive and exclusive distinctions in pronouns, spatial concepts ‘seaward’ vs. ‘inland,’ ‘up direction’ vs. ‘down direction’ (depending on location on island) indicated by particular verbs and/or location nouns, possessive constructions with noun phrases reflecting the semantics of alienable and inalienable possession, and ‘tail-head’ linkage of clauses in procedural narrative.

Phonology

Tamabo reflects many of the consonants of the reconstructed POc paradigm (Lynch *et al.*, 2002: 63) with little or no phonetic change. Voiced stops are prenasalized.

| Bilabial | Dental-alveolar | Pre-palatal | Velar |
|----------------|-----------------|-------------|-------|
| b | t | j | k |
| b ^w | d | | |
| m | n | | ŋ |
| m ^w | s | | x |
| β | r | | |
| | l | | |

Like POc, there is a five-vowel system, sequences of unlike vowels are permitted, and syllable structure is primarily (C)V.

Orthography

The four prenasalized stops are written as b, bw, d, j. Fricative /β/ is written as v, the additionally labialized fricative as w; /x/ is represented by h, /m^w/ by mw and /ŋ/ as ng.

Examples of Particular Grammatical Characteristics

Productive Derivations from Affixation, Reduplication, and Compounding

| <i>Affixes to nouns</i> | | |
|--------------------------------|--------------------|-------------------------------------|
| -ha <i>noun-like quality</i> | dodo → dodo-ha | ‘night’ → ‘be cloudy/dark’ |
| -a <i>nominalization</i> | luhu → luhu-a | ‘hide’ → ‘refuge’ |
| vo- <i>female</i> | natuku → vo-natuku | ‘my child/son’ → ‘my daughter’ |
| ta- <i>person belonging to</i> | ta-Alotu | ‘Santo person’ |
| vu- <i>tree</i> | vu-talaua | ‘sago palm tree’ |
| lo- <i>plural (trees only)</i> | lo-vu-talaua | ‘sago palm trees’ |
| ra- <i>female plural/leaf</i> | ra-vavine | ‘women’; ra-talaua ‘sago palm leaf’ |

Reduplication of nouns and verbs

| | |
|---------------------|--|
| hinau → hina-hinai | ‘thing’ → things |
| mata → mata-mata | ‘eye’ → ‘signs’ |
| bange → bange-bange | ‘stomach’ → ‘pregnant’ |
| mana → mana-mana | ‘laugh’ → ‘friendly’ |
| sahe → sahe-sahe | ‘go up’ → ‘keep going up’ |
| tau → tau-tau | ‘put s.t. in place’ → ‘put many things in place’ |

Compounding (noun + noun; noun + verb; verb + verb)

| | | |
|------------|-------------------|-----------------------|
| mara-rohai | ‘man-leaf/leaves’ | → ‘medicine man’ |
| mata-suri | ‘eye-follow’ | → ‘be jealous’ |
| bosi-mate | ‘turn-die’ | → ‘extinguish (lamp)’ |

Valency Changing Affixes

| | |
|--------------------|--|
| -hi, -si | ‘applicatives’; ma- ‘agentless passive’; va-/vaha- ‘causative’, and vari- ‘anti-passive’ |
| sora → sora-hi | ‘talk’ → ‘talk about s.t.’ |
| lua → lua-si | ‘vomit’ → ‘vomit on s.t.’ |
| duru → ma-daru | ‘split s.t.’ → ‘be split’ |
| mauru → vaha-mauru | ‘be alive’ → ‘save life’ |
| hati → vari-hati | ‘bite s.t.’ → ‘inclined to bite’ |

Serial Verb Constructions for a Variety of Functions

Action in specified direction

| | | |
|-----------------|-------------|----------------|
| vavine | le-hilo | le-sahe |
| woman | ASP-look | ASP-go.up |
| ta-vonavu | mo-dono | mo-jivo |
| belong-Malakula | 3.sing-sink | 3.sing-go.down |
| ana | tarusa | |
| PREP | sea | |

‘while the woman was looking up, the Malakula man drowned in the sea’

Comparative

| | | |
|-----------------------|-------|---------------|
| heletu | niani | mo-suiha |
| pig | this | 3.sing-strong |
| mo-liu-ra | | |
| 3.sing-win.over-O.3PL | | |

‘this pig is the strongest of them’

Continuative aspect

ku-vano ku-le ovi, ku-ovi
 1.sing-go 1.sing-ASP stay 1.sing-stay
 mo-vano mo-vano . . .
 3.sing-go 3.sing-go
 'I went and I was waiting, I kept on and on
 waiting . . .'

Completive aspect

voi mo-mule mo-iso
 mum 3.sing-head.home 3.sing-finish
 'mum has already gone home'

Non-result

ka-te soari-a, ka-sai-a
 1PL-NEG see-OBJ.3.sing 1PL-search-OBJ.3 sing
 mo-tete
 3.sing-negative
 'we didn't see it, we searched for it to no avail'

Possessive Constructions*Classifiers for inalienable possession*

no- personal property
 no-da vanua 'our (INCL) house'
 ma- drinkable
 ma-m reu 'your (sing.)water (to drink)'
 ha- edible
 ha-mam vetai 'our (EXCL) bananas'
 bula- living things (animals, crops + things regarded as 'living')
 bula-ra toa 'their chickens'; bula-ku redio 'my radio'

Overlap between constructions or classifiers

no-ku nunu 'my photo' (that I own)
 nunu-ku 'my photo' (of me)
 bula-na dam 'his yam/s' (growing)
 ha-na dam 'his yam/s' (to eat)

Hierarchy of Individuation: Kin Terms/Proper Names → Animate → Inanimate*Differentiation of kin/proper names vs. common nouns*— *comitatives* mai/mana

Voi mai Alis vavine atea mana mwera atea
 'Mum and Alice' 'a girl and a boy'

— *possessive linkers* ni/i indicating 'status' of possessor
 naho-ni vuti-ni Abae tamanatu-i
 mama vavine ridi
 face-POSS hill/s-POSS Ambae. husband-POSS
 dad woman DEF
 'dad's face' 'the hills of Ambae' 'the woman's
 husband'

— *prepositions* hini/ hina

hini Air Vanuatu hina siba
 'with Air Vanuatu' 'with a knife'

Differentiation of animate vs. inanimate— *quantitative verbs*

tamalo hi na-were heletu na-were sala mo-were
 person 3PL- pig 3PL- road 3sing-
 be.many be.many be.many
 'many people' 'many pigs' 'many roads'

— *prepositions* telei/ana

telei-au telei bula-ku vuria ana tano
 'to me' 'to my dog' 'to the garden'

Tamil

H F Schiffman, University of Pennsylvania,
 Philadelphia, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

Tamil is the Dravidian language with the most ancient literary tradition in India, dating from the early centuries A.D. or before. The earliest (3rd–1st century B.C.) inscriptions of Tamil are found in caves used

by Buddhist and Jain monks, in a form known as Tamil *Brahmi* script. The earliest text in Tamil is a grammar, the *Tolkaappiyam*, which describes *centamiṟ* (Old Tamil) with both literary and colloquial (*koDuntamiṟ*) dialects, spoken in what is now Tamilnadu and Kerala, in South India. An early and original poetic literature, known as *Sangam* Tamil, has survived in the form of various anthologies; these early texts show few borrowings from Sanskrit, and

minimal Brahmanic or 'Hindu' influences. After Old Tamil, a Middle Tamil literature can be distinguished, marked by diverse influences, including increasing Aryanization, Buddhism, and Jainism. Two epics, the *Cilappatikaram* (The lay of the ankle bracelet) and *Maṇimekalai* (The girdle of jewels), a Buddhist work, date from the 4th–6th centuries A.D., and the *Tirukkural*, known to every Tamil and considered by many to be the apex of their literary genius. In the 6th–9th centuries, *bhakti* devotional poetry (the hymns of the Alvars and Nayanars), devotional literature honoring Vaishnava and Shaiva saints, developed, then spread as a phenomenon across India.

From this period until the arrival of Western colonizers and missionaries, Tamil literature reflects pan-Indian norms devoted to philosophical and religious writings, with little originality (and heavy Sanskritization) except for the poetry of Kampan. After the consolidation of colonialism, Tamil literature shows more influences of Western, especially English, ideas. But the development of English education in India also stimulated resistance to these norms and a renaissance and revival of Tamil, focusing on purifying the language of Indo-Aryan and other loan words.

The Tamil language has had its current standard written form since the thirteenth century, when codified again in the grammar *nanmuul*, composed (according to some accounts) by the Jaina monk Pavanandi. But due to increasing diglossia (Britto, 1986), spoken Tamil dialects have now diverged so radically from earlier norms, including the written standard (LT, or Literary Tamil; Arden, 1942) that no spoken dialect (regional or social) can function as the koiné or lingua franca. Since LT is never used for authentic informal oral communication between live speakers, there has always been a need for some sort of spoken 'standard' for inter-dialect communication, and what has evolved has been hastened by the development of modern communication, especially the 'social' film, which is the chief disseminator of this 'standard spoken Tamil' (SST). This form (Schiffman, 1999), based on the everyday speech of educated non-Brahman Tamils, is understood wherever Tamil is spoken, including Sri Lanka, Malaysia, and Singapore.

The sound system of Tamil consists of a ten-vowel system with long and short *i* and *iː*, *e* and *eː*, *a* and *aː*, *o* and *oː*, and *u* and *uː*. The diphthongs *ai* and *au* are found in LT but are not usual in ST; a few loan words contain *au*, but often these can be represented by *avu* as in *pavuṇḍu* 'pound.' The vowel *u* has an unrounded variant [u] that occurs after the first syllable, and there are also nasalized variants [ã], [õ], as well as nasalized versions of [ẽ] and [ũ], all found in

final position only (as the result of deletion of final nasals in SST, but not in LT).

In LT, as in Proto-Dravidian, there was a series of six stop consonants: velar *k*, palatal *c*, retroflex *ʈ*, alveolar *ʈ̪*, dental *t*, and labial *p*. The apical stops *t* and *ʈ̪* could not occur in initial position. In non-initial position, all stops were voiced after nasals (i.e., they were phonetically *g*, *j*, *ɖ*, *ɖ̪*, *d*, and *b*), and intervocalically, unless geminated, they were lax (i.e., phonetically *h*, *s*, flapped *ɾ*, flapped *r*, *ð*, and *v*). Since these variants are in complementary distribution, no contrast between voiced and voiceless consonants (and the fricative variants) existed. In modern SST, because of borrowings, voiced consonants occur in other environments than these, so the phonological system now has voiced stops, though the orthography lacks provisions for this.

Today because of the loss of the alveolar contrast, modern SST only has contrasts between five points of articulation in consonantal stops, with voiced variants in many loan words (but also in onomatopoeic expressions, of which there are many). Nasal consonants (despite orthographic symbols for all six positions) are only *m*, *n*, and retroflex *ɳ*. In the area of laterals and rhotics, there is confusion. Proto-Dravidian surely had contrasts between *l* and retroflex *ɭ*, and *r* and *ɻ* a 'retroflex frictionless continuant' symbolized variously in transcriptions, but for which we prefer *ɻ*, but because of the loss of the intervocalic alveolar stop contrast (*ʈ̪*), which is flapped [r] in modern speech, orthographic symbols for three r's exist. Furthermore, the retroflex continuant *ɻ*, which happens to be the final segment in the name 'Tamil' (*tami.ɻ*) is often not maintained in speech in many dialects, merging instead with *l*, *g*, and even *y*. But sociolinguistic pressure to maintain this sound, seen as quintessentially *Tamil*, results in much variation in its maintenance. As for glides, both *y* and *v* (which varies sometimes to [w]) are found.

Grammatically, Tamil can be characterized as 'agglutinative,' with long chains of easily-identifiable morphemes concatenated as suffixes. Noun morphology is fairly simple (there is no grammatical gender), and noun phrases require no agreement with adjectives and nouns. A seven-case system with a nonfinite set of postpositions recruited from lexical items both nominal and verbal, completes the picture. Example:

anta periya viiṭṭ-ukk-pakkattu-le- rundu
That large house-DAT-near LOC + ABL
'From the vicinity of that large house'

The verbal system is morphologically more complex, with various inflectional and derivational morphemes concatenated as suffixes. Example:

avarai eppaiyoo anuppu- vittu-viṭa- veentum
 he-ACC somehow send CAUS-COMPL-MODAL
 'Somehow or other, (we) have to get rid of him'

Syntactically, word order is SOV and left-branching. Grammaticalization processes have resulted in the incorporation of certain lexical verbs into the morphology of the verb as 'aspectual' markers, a phenomenon typical in many South Asian languages.

Tanoan

L J Watkins, Colorado College, Colorado Springs, CO, USA

© 1994 Elsevier Ltd. All rights reserved.

The majority of Tanoan-speaking peoples have inhabited pueblos in the American Southwest for at least two thousand years. Only the Kiowas are plains dwellers, having occupied the southern plains for about two hundred years.

Subgroups, Locations, and Speakers

The Tanoan languages fall into four subgroups which show varying degrees of internal diversity.

Tiwa consists of two languages, separated geographically by the Tewa-speaking pueblos. Northern Tiwa comprises two very divergent dialects spoken at the northern New Mexico pueblos of Taos, with perhaps 1000 adult speakers, and Picuris. Southern Tiwa, whose varieties differ only slightly, is spoken at the pueblos of Isleta and Sandia, located in the vicinity of Albuquerque. Numbers of fluent adult speakers range from about 2000 at Isleta to fewer than a dozen elderly individuals at Sandia.

The major dialect division in Tewa reflects the emigration of Tewas usually identified as Tanos from the Rio Grande area at the time of the seventeenth-century Pueblo Revolt. Rio Grande Tewa is spoken by roughly 1000 adults at five pueblos clustered just north of Santa Fe, New Mexico: San Juan, Santa Clara, San Ildefonso, Tesuque, and Nambe. These mutually intelligible dialects exhibit only minor phonological and lexical differences. Arizona Tewa (also called Hopi-Tewa) is spoken fluently by approximately 300 speakers (including some children) who live in a multilingual community located at Hopi First Mesa in north-eastern Arizona.

Towa is the language of Jemez Pueblo, located in the Jemez mountains of New Mexico to the west of

the Rio Grande. It continues to be the first language of Jemez children in a population of approximately 2000.

Kiowa, the only non-pueblo language of the family, is spoken today by perhaps 300 older adults in south-western Oklahoma. Prior to 1700, when ethnohistorical research puts the Kiowas in western Montana, nothing is known of their earlier location or migration.

History and External Relationships

Internal relationships within Tanoan are complex and poorly understood. Although Tiwa and Tewa have been considered to be more closely related than either is to Towa or Kiowa, and Kiowa to be the most divergent, the closer resemblances among the pueblo languages may well be attributable to centuries of contact. Hale and Harris's (1979) proposal that Tanoan consists of four roughly coordinate branches appears to be supported by current comparative work: e.g., phonological innovations show less definitive subgrouping than previously described.

A more distant relationship with Uto-Aztecan, long thought plausible and incorporated in Sapir's Aztec-Tanoan group, remains an open question that has received little recent attention.

Phonological and Grammatical Features

The Tanoan languages have fairly complex phonological inventories. They share a four-way stop contrast of voiceless unaspirated, voiceless aspirated (fricatives in Towa and for some positions in Tiwa and Tewa), glottalized, and voiced. The languages have six vowel qualities, with contrastive nasalization, and for some languages contrastive vowel length. In all four subgroups there is contrastive tone (high, falling, and low). Grammatically, the languages show triple agreement, that is, fused (or portmanteau) verbal prefixes which encode three arguments for person,

number, and case. Verbal morphology includes extensive stem alternation as well as suffixation, ablaut in stem-initial consonants, and incorporation of nominal, verbal, and adverbial roots. Nouns are classified according to animacy and number; plurals of animate nouns and singulars of some inanimate nouns are morphologically alike. Basic word order is verb-final, but nouns may follow the verb depending on discourse context. Tiwa and Towa are noted for unusual passives constrained by a topicality hierarchy.

Future Scholarship

Much of the research on Tanoan languages remains unpublished in dissertation or manuscript form. Hale (1967) provides a phonological survey with discussion of morphophonemic alternations. Grammatical sketches for Northern and Southern Tiwa

are in preparation. San Juan (Tewa) Pueblo has made available a dictionary and collection of stories. Towa, about which the least material is available, is now the topic of two dissertations. For Kiowa, a grammar (Watkins 1984) will soon be supplemented by a dictionary and collection of texts.

Tariana

A Y Aikhenvald, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Tariana language belongs to the Arawak language family (*see Arawak Languages*). It is spoken by about 100 people in the multilingual linguistic area of the Vaupés River Basin (northwest Amazonia, Brazil). This area is known (Aikhenvald, 2002b; Sorensen, 1967) for its multilingual exogamy: one can only marry someone who speaks a different language and belongs to a different tribe. People usually say: ‘My brothers are those who share a language with me’ and ‘We don’t marry our sisters.’ The other languages in this area belong to the Tucanoan family, and they are still spoken by a fair number of people. The basic rule of language choice throughout the Vaupés area is that one should speak the interlocutor’s own language. Descent is strictly patrilineal, and consequently, one identifies with one’s father’s language group. There is a strong cultural inhibition against ‘language-mixing,’ viewed in terms of lexical loans. In its grammatical and semantic structure, Tariana combines a number of features inherited from proto-Arawak, with the areal influences from Tucanoan in the form of grammatical calques and diffused patterns.

Tariana was once a dialect continuum spoken in various settlements along the Vaupés river and its tributaries. The Tariana clans used to form a strict

hierarchy (according to their order of appearance as stated in the creation myth: *see Aikhenvald, 1999*). Lower-ranking groups in this hierarchy (referred to as ‘younger siblings’ by their higher-ranking tribes people) would perform various ritual duties for their ‘elder siblings.’ Each group spoke a different variety of the language. The difference between these varieties is comparable to that between Romance languages.

As the Catholic missions – and with them white influence – expanded, the groups near the top of the hierarchy abandoned the Tariana language in favor of the numerically dominant Tucano language. This process started in the early 1900s. The Tariana language is spoken nowadays just by people from two subtribes of the lowest-ranking group Wamiarikune, in two villages, Santa Rosa and Periquitos. The varieties are mutually intelligible. Most children are not learning Tariana any more. Innovative speakers of Tariana have more Tucanoan-like features in their language than traditional speakers. A literacy program in Tariana is presently under negotiation.

Tariana is a polysynthetic language, agglutinating with some fusion. It has mostly suffixes, with just a few prefixes. Constituent order depends on pragmatics. Younger speakers tend to put the verb last in the sentence, just like speakers of Tucano. There are mainly postpositions, with just one preposition (borrowed from Portuguese).

Tariana has 27 consonants (including a series of aspirated stops and pre-aspirated nasals and glide)

and 15 vowels (*a, i, e, u*, each with a long and a nasal counterpart), *o* (with a nasal counterpart), and high central *i*. Accent is distinctive and of pitch type, as a result of Tucanoan influence.

Underived adjectives form a closed class of about 30 members, while classes of nouns and verbs are open. Verbs divide into transitive and intransitive active, which take prefixes cross-referencing their subject (A/Sa). As is typical for an Arawak language, the same set of prefixes marks possessor on inalienably possessed nouns and the argument of postpositions. Intransitive stative verbs do not take any cross-referencing markers. Unlike any other Arawak language, grammatical relations in Tariana are also marked with cases: topical non-subject case *-nuku*, focused subject case *-nel-nhe*, instrumental case *-ine*, and locative case *-se*. This case system for marking core syntactic functions was developed under the Tucanoan influence. The case markers result from the reanalysis of locative suffixes of Arawak origin. A member of any word class can occupy the intransitive predicate slot.

The locative and the instrumental cases can combine with the non-subject topical case if the constituent is topical (thus yielding a peculiar instance of ‘double case’).

Tariana has a complex system of more than 40 classifiers that are used as agreement markers on adjectives, as derivational affixes on nouns, and also as numeral and as verbal classifiers; a slightly different system of classifiers is used with demonstratives. A two-way gender opposition (feminine vs. the rest) is used in personal pronouns (third singular and all plural forms, thus contravening established universals) and in verbal cross-referencing. Classifiers are an open class, since any noun with an inanimate referent can be used as a ‘repeater’ (or ‘self-classifier’). Repeaters can be used to mark the agreement with a topical noun while grammaticized classifiers are used for unmarked agreement.

There is an obligatory distinction between singular and plural for nouns with animate referent. Nouns with inanimate referent often refer to substances, and classifier suffixes are attached to them to specify singular reference. For instance, *episi* means ‘iron as a substance’, while *episi-da* (iron-CLASSIFIER: ROUND) means ‘axe’ and *episi-kha* (iron-CLASSIFIER: CURVED) means ‘wire’. Number agreement is optional for inanimate nouns.

The Tariana verb has a plethora of moods and aspects. It has an elaborate system of marking information source, known as evidentiality. Tariana distinguishes visual evidentials (something seen), non-visual evidentials (something heard, or smelled, or felt by touch), inferred evidential (something inferred based on visible results: as one infers that it

has rained on the basis of puddles); assumed evidentials (based on general knowledge), and reported evidential. Three tenses (present, recent past, and remote past) are combined with evidentials. Traditional stories are typically cast in remote past reported evidential, and autobiographical narratives in visual evidential. Non-visual evidential is used to relate the actions of evil spirits that are not ‘seen’, and dreams of ordinary people, while prophetic dreams by omniscient shamans are cast in visual evidentials. A reduced set of evidentials is used in questions, while imperatives have just one, reported, evidential (meaning ‘do something on someone else’s order’). This unusually complex evidentiality system has been largely calqued from Tucanoan languages.

A complicated system of serial verb constructions expresses aspectual, directional, and sequential meanings, and also reciprocal and associative meanings. There are three types of causatives. Morphological causatives are formed on intransitive verbs. The same morpheme on a transitive verb indicates an advancement of a peripheral argument of the transitive verb to the core, and/or complete involvement and topicality of the O argument. Periphrastic causatives (indirect causation) and serial causative constructions (direct causation) are used to form causatives of transitive verbs.

When several clauses are combined to form one sentence, all but the main clause are marked differently depending on whether their subject is the same as, or different from, that of the main clause. This feature (known as switch-reference) is shared with the Tucanoan languages.

A detailed reference grammar is in Aikhenvald (2003). Aikhenvald (2002a) is a comprehensive dictionary, while Aikhenvald (1999) contains a text collection and an outline of the Tariana ethnography with an account of the kinship system (which is of Dravidian type).

Location and Speakers

Tatar (*tatar tēlē*, *tatarča*) is the designation for Kazan Tatar and related dialects belonging to the northern subbranch of the Northwestern or Kipchak branch of the Turkic language family. It is distributed over a huge area, from Ryazan in the west to West Siberia in the east, from the Kirov region in the north to Astrakhan in the south. Most Tatar speakers live between the Volga–Kama triangle and the western slopes of southern Ural. The Republic of Tatarstan (*Tatarstan Respublikası*) with its capital Kazan is situated in the central part of the Russian Federation, at the confluence of the Volga and the Kama. It borders Bashkortostan in the east, Mari El and Udmurtia in the north, and Chuvashia in the west. This multinational republic has a total population of over 3.8 million, mainly consisting of Volga Tatars (over 50%) and Russians (over 40%). There are also speakers of Chuvash, Mordva, Udmurt, Mari, Bashkir, etc.

Speakers of Mishar Tatar live mainly west, south-west, and south of the republic. Kasimov Tatar was formerly spoken farther west, in the Ryazan region, on the territory of the old Kasimov Khanate. Tatar-speaking groups, often descendants of Noghays, still live along the Volga river south of the republic, down to the Astrakhan region. There are also scattered Tatar-speaking groups in other central parts of the Russian Federation. About 1 million Tatars live in Bashkortostan. The Tepter Tatars live along the Ural River.

East of the Ural Mountains, in an area that was once the home of sizeable Turkic-speaking groups, West Siberian Tatar varieties of different origins are still spoken by small groups, about 150 000 persons altogether: the dialects of Irtysh, Tümen, Tura, Tobol, Tara, Ishim, etc. The Baraba Tatars, about 8000 persons, live in the Baraba steppe, between Novosibirsk and Omsk. Tatar is also spoken in parts of Kazakhstan, Uzbekistan, China, etc. The total number of Tatar speakers is about 8 million.

The designation ‘Tatar’ is ambiguous. Until the end of the 19th century, it was used for all languages of Turkic Muslim groups in Russia. It is still used for Crimean Tatar (Judco Crimean Tatar), which is not identical with Volga Tatar, but a language in its own right. The so-called Tatar minority in China, mostly in Xinjiang (about 5000), consists of descendants of Volga and Crimean Tatars. Groups in Poland, Belarus,

and Lithuania, referred to as ‘Lithuanian Tatars,’ are linguistically assimilated descendants of Noghays and Crimean Tatars. The Tatars of West Siberia partly consist of emigrants from the Volga region. The Baraba Tatars go back to deported Kipchak tribes. The Tatars of Astrakhan and Siberia have strong Noghay elements.

Tatar has long been one of the most firmly established Turkic languages. It has consolidated its position further in the post-Soviet era. The official languages of Tatarstan are Tatar and Russian. Of the Tatars of the Russian Federation, 86% regard Tatar as their mother-tongue.

Origin and History

The designation Tatar is first mentioned in Chinese sources and in Turkic inscriptions of the 8th century. Later on it appears as a Mongol tribal name. Kipchak Turkic groups who arrived in the Volga region with the Mongols adopted it for themselves. It was used for the Turkic and Mongol population in the Golden Horde, also for Turkic groups that arrived later, and finally also for older Turkic groups of the Volga–Kama area.

Tatar is a result of complex linguistic contact processes, the main elements being Kipchak Turkic, Volga Bulgar, Volga Finnic, and Mongolic. Turkic groups were probably present on the middle course of Volga River from the 5th century on, absorbing local Finno–Ugric tribes of the region. The Volga Bulgar element was of decisive importance. The powerful Volga Bulgar state was created at the end the 9th century and adopted Islam in 922. The Volga Bulgars assimilated native groups of the region. Both Tatars and Chuvash regard themselves as descendants of the Volga Bulgars. The state was destroyed by the Mongols in 1237 and the Khanate of the Golden Horde was established. Its most important element was Kipchak Turkic, which became the dominant assimilating factor. Volga Bulgars, Finno–Ugric groups, and Mongols shifted to Kipchak. The speakers of the predecessor of Chuvash, however, were not assimilated but preserved their language. After the disintegration of the Golden Horde, the Khanates of Kazan, Crimea, Kasimov, Astrakhan, and Sibir were established. The Khanate of Kazan was annexed by Russia in 1552, whereby Tatars, Bashkirs, and Chuvash came under Russian rule. The West Siberian Tatars are partly descendants of Volga Tatars, who left their homeland in this period. A Tatar Autonomous Soviet Republic was established in 1920. After

the Soviet era, the Autonomous Republic of Tatarstan became a member of the Russian Federation.

Related Languages and Language Contacts

The Tatar language is related to Bashkir, Crimean Tatar, Kazakh, Karachay–Balkar, Kumyk, Karaim, etc. Tatar has influenced neighboring languages such as Bashkir, Chuvash, and the Finno-Ugric languages Mari (Cheremis), Mordva, and Udmurt (Votyak). The literary language has also had considerable influence on Turkic languages in Central Asia, e.g., Uzbek. Literary Tatar has to a certain extent served as a model for literary Kazakh. Tatar has been influenced by Russian, particularly in the lexicon. The written language was also used by the small Turkic groups of western Siberia, and thus had a strong impact on their dialects.

Certain features typical of Tatar are already found in the Kuman language as attested in the *Codex cumanicus* (14th century), where the language is even referred to as ‘Tatar.’ The written language used in the cultural centers of the Golden Horde was Khorezmian Turkic, which had its center in Khorezm on the shore of the Aral Sea and was influenced by local Kipchak and Oghuz Turkic dialects.

This tradition was continued in the Khanates that emerged after the fall of the Golden Horde. It was used, with strong Kipchak elements, as the official language in the Crimea up to the 17th century, when it was replaced by Ottoman (Turkish).

Its use in the Khanate of Kazan was strongly influenced by Chaghatay (Chagatai) and Ottoman. A so-called Volga Turki developed, which is often referred to as ‘Old Tatar,’ though it must be distinguished from older spoken Tatar. It was used for an emerging Tatar literature based on Chaghatay traditions. Religious works were written in this language up to the mid-19th century.

A more genuinely Tatar written language developed in the second part of the 19th century. It was based on the Kazan dialect, though strongly influenced by Chaghatay. It was also used by Mishers and Astrakhan Noghays and, for some decades, Bashkirs. It was of great cultural importance for all Turkic minorities in Russia. At the beginning of the 20th century, Tatar still had a considerable transregional validity. In the Soviet era, it was limited to a regional national language.

Tatar was written with Arabic script until a Roman-based alphabet was introduced in 1927. In 1939, a variant of the Cyrillic alphabet was adopted. The Christian Tatars in the Volga region had used the

Cyrillic script already at the end of the 19th century. In the post-Soviet era, a new Roman-based alphabet has been created, although it has not yet replaced the Cyrillic-based script.

Distinctive Features

Tatar exhibits most linguistic features typical of the Turkic family (see **Turkic Languages**). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., *A = ale*. A segment in round brackets only occurs after consonant-final stems. Hyphens are used here to indicate morpheme boundaries.

Phonology

The phonetic basis of modern standard Tatar is Kazan Tatar. The vowel system includes the high-mid vowels *ě, ǔ, ĭ, ǖ*, which are shorter and more centralized than the low and high vowels. The vowel *a* of the first syllable is rounded to *ǎ* in the central dialect.

Tatar exhibits the results of systematic vowel shifts. Low vowels of the first syllable have been raised: *e > i*, e.g., *min* ‘I’ (<*men*), *o > u*, e.g., *qul* ‘arm’ (<*qol*), *ö > ü*, e.g., *küz* ‘eye’ (<*köz*). High vowels have been centralized and reduced: *i > ĭ*, e.g., *bēr* ‘one,’ *u > ǖ*, e.g., *qǔš* ‘bird’ (<*quš*), *ü > ǖ*, e.g., *kǔn* ‘day’ (<*kün*).

Tatar suffixes display front vs. back harmony. The vowel of the suffix depends on the frontness vs. backness of the last stem syllable. The high suffix vowels are *ě* and *ĭ*, and the low suffix vowels are *e* and *a*, e.g., *ēt-ler-ěbēz-den* [dog-PL-POSS.1.PL-ABL] (front) ‘from our dogs’ vs. *at-lar-ǖbǖz-dan* [horse-PL-POSS.1.PL-ABL] (back) ‘from our horses.’ Rounded vs. unrounded harmony is absent in Standard Tatar, which means that *ǔ, ǖ, u* and *ü* do not occur in suffixes.

Initial *ǰ*- is sometimes found instead of *y*-, mostly in front of *ĭ* and *i*, e.g., *ǰir* ‘place’ (cf. Turkish *yer*). In loans originating from Arabic (Arabic, Standard), *ʿayn* is represented by the voiced fricative *ɣ*, e.g., *ɣadet* ‘habit’ (<*ʿa:dat*). The consonants that correspond to the affricates *č* and *ǰ* in most other Turkic languages (and are traditionally transcribed so) are pronounced as palatalized fricatives *čʹ* and *ǰʹ* in Standard Tatar. In front of suffix-initial vowels, stem-final *p*, *q*, and *k* mostly become *b*, *ɣ*, and *g*, respectively, e.g., *tab-a* [find-PRES] ‘finds’ vs. *tap* ‘find!’, *čig-ě* [boundary-POSS.3.SG] ‘its boundary’ vs. *čik* ‘boundary.’ Various assimilations affect suffix-initial consonants. Thus, the *l* of the plural suffix and the *d* of the ablative suffix are assimilated to *n* after stems

ending in nasal consonants, e.g., *uram-nar* [street-PL] ‘streets,’ *urman-nan* [forest-ABL] ‘from the forest.’ Nonpermissible consonant clusters are dissolved by means of epenthetic vowels, consonant deletion etc., e.g., *dus* ‘friend’ vs. *dust-ım* [friend-POSS.1.SG] ‘my friend.’

Grammar

After first- and second-person possessive pronouns the possessive suffix on the head is optional, e.g., *min-ëm eş-ëm* [I-GEN work-POSS.1.SG] or *min-ëm eş* [I-GEN work] ‘my work.’ The comparative degree of adjectives takes the suffix *-rAK*, e.g., *özön-raq* [long-COMP] ‘longer’ (cf. Turkish *daba uzun*). The third-person personal pronouns are *ul* ‘he, she, it’ (with the oblique stem *an-*) and *alar* ‘they.’ The demonstrative pronouns *bu*, *şuşı*, *şul*, *təgə*, *ul* express various degrees of proximity. Approximative numerals are formed with the suffix *-lap*, e.g., *un-lap* ‘approximately ten.’

Tatar has numerous simple and compound aspect-mood-tense forms as well as verbal nouns, converbs, and participles. It has a present tense in *-A* (*-y* after stem-final vowels) plus personal markers, e.g., *kil-e-m[ən]* [come-PRES-1.SG] ‘I come, I am coming.’ The most frequent verbal noun ends in *-(I)w*, e.g., *al-ıw* ‘to take, taking.’ An infinitive is formed with *-(I)rGA*, negated *-mAs-kA*. Frequently used converb markers include *-A* (*-y* after stem-final vowels), *-(I)p-* and *-GAč*, e.g., *al-yač* [take-CONV] ‘after having taken.’ Like most other Turkic languages, Tatar has evidential markers of the type *iken*, e.g., *qayt-qan iken* [return-POSTTERMINAL.PAST EV] ‘has obviously returned.’ A number of auxiliary verb (postverb) constructions express modifications of the manner of action, e.g., *yan-ıp bət-* [burn down-AUX] ‘burn down (completely).’ Possibility and impossibility are expressed by means of a converb + the auxiliary verb *al-*, e.g., *yaz-a al-* [write-CONV-POSS] ‘to be able to write,’ *yaz-a al-ma-* [write-CONV-POSS-NEG] ‘to be unable to write’ (Turkish *yaz-a-bil-* [write-CONV-POSS], *yaz-a-ma-* [write-CONV-POSS-NEG]).

Lexicon

Most basic lexical elements are of Turkic origin. Many loans are of Middle Mongolian, Arabic,

Persian, and Russian origin, e.g., *zur* ‘big,’ *aždaha* ‘dragon,’ *baqča* ‘garden,’ *atna* ‘week’ (Persian), *fikër* ‘thought,’ *taraf* ‘side’ (Arabic), *stakan* ‘glass,’ *par* ‘steam,’ *kuxnya* ‘kitchen,’ *vrač* ‘doctor’ (Russian), *uram* ‘street,’ *dala* ‘steppe’ (Mongolian). Words of Finno-Ugric origin occur mainly in dialects. Tatar conjunctions are mostly of foreign origin, e.g., *hem* ‘and,’ *emme* ‘but,’ *čönki* ‘for (causal),’ *güye* ‘as if,’ *ki* ‘that,’ *eger* ‘if, when.’

Dialects

Tatar comprises a central dialect group, Kazan Tatar proper. A western dialect group, consisting mainly of Misher Tatar, is spoken in the Volga region outside the republic. An eastern dialect group is spoken in West Siberia. The Irtysh–Tobol dialects hold an intermediate position between Kazan Tatar and other Siberian Tatar dialects. West Siberian dialects often exhibit the changes *č > ds* and *ǰ > dz* and voicing of intervocalic consonants (like in South Siberia). The vowel shifts are not so strongly developed in these dialects as in Volga Tatar.

All the third-person pronouns are listed below, along with their oblique forms (that are explained later).

The 2pl and 3pl-nh pronouns are also used as honorific ('respect') pronouns. When honorificity is taken into account, in third person we get extra sets of pronouns that denote different degrees of 'respect.' The sets of pronouns with increasing degree of honorificity are 3s-mh REMOTE *wāḍu atanulāyana, wāru*; PROXIMATE *wīḍu, itanulīyana, wīru*; INTERROGATIVE: *ewaḍu, ewaru*; Third-person singular human feminine (as nonhumans are not differentiated for honorificity): REMOTE *adi, āmelāwīḍa, wāru*; PROXIMATE *idi, ime/wīḍa, wīru*; INTERROGATIVE *ēdi, ewarte, ewaru*. Note that the pronouns with highest degree of honorificity (*wāru, wīru, ewaru*) are originally one of the alternants of the Plural human forms (but the other alternants viz., *wāḷlu, wīḷlu, ewaḷu* are not used as third-person honorific singular forms).

Oblique Forms

Nouns (simple, derived as well as plural forms) and pronouns have both direct and oblique stems. The direct stems are the nominative forms (direct stems of singular nouns and ever-plurals (e.g., *pālu* 'milk') are listed in the lexicon), whereas the oblique stems are used in several of the case inflections. In the case of some nouns, both of these stems are same in form (e.g., *kukka* 'dog': *kukka-ki* 'to a dog'). In the case of all pronouns and some nouns, the oblique stems differ in shape (e.g., *rāyi* 'stone': *rāti-tō* 'with a stone'; *kukka-lu* 'dogs': *kukka-la-ki* 'to the dogs'). The oblique stems of third-person pronouns are given in Table 3. The oblique stems of the personal pronouns are *nā* (1s), *mā-* (1e-pl), *mana-* (1i-pl), *nī-* (2s), *mī-* (2pl).

Noun

A noun is simple (monomorphemic) (e.g., *kukka* 'dog') or derived (e.g., *donga* 'thief' > *donga-tanam* 'theft'; *moga-* 'male' > *moga-tanam* 'manliness'; *cuṭtam* 'a relative' > *cuṭta-rikam* 'relationship'; *andam* 'beauty' > *anda-gatte* 'beautiful woman'; *tiṇḍi* 'eating' > *tiṇḍi-pōtu* 'glutton'; *jūdam* 'gambling' > *jūdari* 'gambler'). Verbs can give rise to two types of derived nouns: action nominals (e.g., *mūyu* 'to close, cover' > *mūy-aḍam* 'closing, covering'; *pilucu* 'to call' > *pilawa-dam* 'calling') or substantive nominals (*mūyu* 'to close, cover' > *mū-ta* 'a cover, lid'; *pilucu* 'to call' > *pilu-pu* 'invitation').

Number

A simple or derived noun can be inflected for plural number by the addition of a plural suffix. The plural suffix has two morphophonemic alternants: *-lu* and *-ḷu*. [e.g., 'dog': *kukka* (sg.), *kukka-lu* (pl.); 'backyard': *peraḍu* (sg.), *peraiḷu* (pl.); 'cat': *pilli* (sg.), *pillulu* (pl.); 'house': *illu* (sg.), *iḷlu* (pl.); 'eye': *kannu* (sg.), *kaḷlu* (pl.)]. Some nouns require their oblique stems to receive the plural suffix [e.g., 'pit': *goyyi/gōyi* (sg.), *gōtu-lu* (pl.); 'horse': *gurrām* (sg.), *gurrā-lu* (pl.)].

Case

The direct stem of a singular or a plural noun functions as a noun in nominative case. Other case forms of nouns are obtained by means of several case suffixes and postpositions. Some of them are accusative *-niḷ-nu*; dative *-kiḷ-ku*; instrumental/sociative: *-tō*; ablative *-nunci*; comparative *-kaṇṭe*; and locative *-lō*. The oblique stem of a noun functions as its genitive form (e.g., *nā* 'my', *rāti* 'of stone' [*rāyi* 'stone']). A few postpositions are: *kinda* 'below,' *mīda* 'above,' *lōpala* 'inside,' *mundu* 'in front of, before,' *tarawāta* 'after.'

Numerals

Structure of the numerals follows the general Dravidian pattern. Cardinal numerals 1000, 100, and 1 to 10 are mono-morphemic. They are: *okaṭi* '1,' *reṇḍu* '2,' *mūḍu* '3,' *nālugu* '4,' *aidu* '5,' *āru* '6,' *ēḍu* '7,'

enimidi ‘8,’ *tommidi* ‘9,’ *padī* ‘10,’ *nūru/wanda* ‘100,’ and *vēyi/veyyi* ‘1000.’ The formula for forming decades is: 2, 3 and so on, followed by 10 (e.g., *nalabhai* [4–10] ‘40’). The formula for series between decades (e.g., 41–49) is: numeral for decade followed by 1–9 (e.g., *nala-bhai-reṇḍu* [4-10-2] ‘forty-two’). Ordinals are derived from cardinals by suffixation of *-awa* (> *ō*) (e.g., *āru-awa* > *ārawa/ārō* ‘sixth’).

Adjectives and Adverbs

Adjectival forms that function solely as modifiers of nouns or other adjectives (and nothing else) are very few in the language; for example, *ara* ‘half,’ *pāwu* ‘a quarter,’ *ceri* ‘each.’ These adjectives can be followed only by a noun. The demonstrative and interrogative roots: *ā* ‘that,’ *ī* ‘this,’ *ē* ‘which,’ are also adjectives. They are used before nouns (e.g., *ā pilla* ‘that girl,’ *ē pilla* ‘which girl’). Their variants can take various suffixes to give rise to different forms (e.g., *akkāḍa* ‘there,’ *appuḍu* ‘then,’ *aṭu* ‘that side,’ *alāga* ‘in that manner,’ *awatala* ‘on that side,’ *anni* ‘that many,’ *anta* ‘that much’). Even the third-person pronouns can be viewed as derivatives of these forms.

Some adjectives are bound and require a suffix or a noun to follow it (e.g., *tella* ‘white’: *tella-wāḍu* ‘white man,’ *tella-nil-ṭi maniṣi* ‘white person,’ *tella-gā* ‘whitish,’ *tella-na* ‘whiteness’). A large number of adjectives are derived from other forms such as nouns, adverbs, and verbs. A noun in genitive case always functions as an adjective (e.g., *nā pustakam* ‘my book,’ *rāti gōḍa* ‘stone wall’). Some examples of adjectives derived from adverbs are: *alāṭi maniṣi* ‘a person of that type’ [*alā(ga)* ‘in that manner’]; *rēpaṭi pani* ‘work of tomorrow’ (*rēpu* ‘tomorrow’). A majority of nouns function as modifiers when placed before another noun (e.g., *goppa maniṣi* ‘great man’).

It is difficult to find monomorphemic adverbs. Even the adverbs of time and place such as *ninna* ‘yesterday,’ *appuḍu* ‘then,’ are either basically nominal or are derived from adjectival roots. The main adverb deriving suffix is *-gā*, as in *gattī-gā* ‘hard.’ Many onomatopoeic words are basically adverbial in function (e.g., *gaba-gabā* ‘quickly’).

Verb

Like in many other Dravidian languages, verb in this language has the most complex structure. A fully inflected verb contains a verb stem followed by optional suffixes. The stem is simple, derived, or compound. A simple stem is composed of one verb root (e.g., *caccu* ‘to die’). A derived stem contains a verbal or nominal root followed by a derivative suffix (e.g.,

cam-pu ‘to kill,’ *cam-pincu* ‘to cause to kill’); *ūb-incu* ‘to imagine’ (from *ūba* ‘imagination’). A compound verb stem contains a main verb followed by one or more auxiliary verbs (e.g., *wanḍu-konu* ‘to cook for oneself’ [*wanḍu* ‘to cook’], *wanḍu-kona-bōwu* ‘to be about to cook for oneself’).

A verb stem is inflected for tense/mode, which takes a further pronominal suffix (in the case of finite verbs). Most of the inflectional suffixes have two or more allomorphs. Some of the finite tense/mode forms are – Imperative: *tinu* [<*tinu-u*] ‘(You sg.) eat!’ *tinanḍi* [<*tinu-anḍi*] ‘(You pl.) eat!’ Negative imperative: *tinaku* [<*tinu-aku*] > ‘(You sg.) don’t eat!’ *tinakanḍi* [<*tinu-aku-anḍi*] > ‘(You pl.) don’t eat!’ Past: *pilicēnu* [<*pilucu-ē-nu*] ‘I called’; *pilicindi* [<*pilucu-in-di*] ‘It called.’ Nonpast/Habitual: *tiṅṭāḍu* [<*tinu-tā-ḍu*] ‘He will eat/He eats’; *tiṅṭāmu* [<*tinu-tā-mu*] ‘We will eat/We eat.’ Durative: *tiṅṭunnāḍu* [<*tinu-tunnā-ḍu*] ‘He is/was eating’. Nonpast Negative: *tinanu* [*tinu-a-nu*] ‘I will not eat’; *pilawaḍu* [<*pilucu-a-ḍu*] ‘He will not call’. Hortative: *tindām* [*tinu-dā-mu*] ‘Let us eat!’ Sample paradigms of three regular tenses inflected for all the persons (for the verb *tinu* ‘to eat’) follow:

| | Past | Nonpast | Nonpast Negative |
|--------|------------------------------|----------|---------------------|
| 1s | tinnānu | tiṅṭānu | tinanu |
| 1e-pl | tinnāmu | tiṅṭāmu | tinamu |
| 1i-pl | | | |
| 2s | tinnāwu | tiṅṭāwu | tinawu |
| 2pl | tinnāru | tiṅṭāru | tinaru |
| 3s-mb | tinnāḍu | tiṅṭāḍu | tinaḍu |
| 3s-nmb | tinnādi > tinnadi > tindi | tiṅṭandi | tinadu |
| 3pl-b | tinnāru | tiṅṭāru | tinaru |
| 3pl-nb | tinnāyi | tiṅṭāyi | tinawu |

Nonfinite verbs do not terminate in a Pronominal suffix. They form nonfinite or subordinate clauses in a sentence. The resulting forms have adverbial, adjectival, or nominal functions. Some of the nonfinite forms are obtained by a single suffix such as: Perfective (e.g., *cadiw-i* ‘having read’), Negative Perfective: *cadaw-aka* ‘not having read’; Durative: *caduwu-tū* ‘while reading’; Conditional: *cadiw-itē* ‘if one reads’; Concessive: *cadiw-inā* ‘even if one reads.’ Some Nonfinite forms are obtained by adding more than one suffix or auxiliary (e.g., *cadaw-aka-pō-tē* ‘if one does not read’). Relative participle forms are adjectival in function – they are: Past: *cadiw-ina* ‘one who read, one which was read’; Nonpast: *cadiw-ē* ‘one who reads, one which is/will be read’; Negative: *cadaw-ani* ‘one who does/did not read, one which is/was not read.’ The other important nonfinite forms are Verbal noun (e.g., *cadawaḍam* ‘reading’), and Infinitive which

forms the basis for many further expansions (e.g., *cadawa*, as in *cadawa-kūdadu* ‘one should not read’).

Verbs are classified into different conjugation classes that account for the various morphophonemic changes that they undergo during the process of inflection.

An extensive process of verbal compounding gives rise to forms expressing different kinds of modes. These compound verbs can be classified on the basis of the inflected form of the nuclear verb. Some examples follow. *With infinitive as the nucleus*: Permissive: *cadawa-waccu* ‘one may read’; Inceptive: *cadawa-bō-yēnu* ‘I was about to read’; Potential: *cadawa-gala-nu* ‘I can read’; Negative Potential: *cadawa-lē-nu* ‘I cannot read’; Negative Past: *cadawa-lēdu* ‘One did not read’; Obligative: *cadaw-āli* ‘One should read’; Negative Injunctive: *cadawa-kūdadu* ‘One should not read’; Prohibitive: *cadawa-waddu* ‘Don’t read.’ *With past participle as the nucleus*: Benefactive: *cadiwi-peṭṭ-ēnu* ‘I read it (for somebody)’; Decisive: *cadiwi-tīru-tānu* ‘I will definitely read’; Completive: *cadiwi-wēs-ēnu* ‘I finished reading.’

Syntax

Telugu is an SOV language. “It is a nominative-accusative language and hence, the verb agrees with the argument in the nominative case. It has postpositions and the genitive precedes the governing noun. The comparative marker follows the standard of comparison. The complementizer occurs in the right peripheral position. Adjectives and participial adjectives precede the head noun. There are no pleonastic or expletive constructions such as *it* or *there*. It is a pro-drop language. The subject, direct object, indirect object, and adverbial phrase of the finite embedded and matrix sentence may be pro-dropped. There occur clefts in Telugu and the clefted constituent occurs as the rightmost element just as in other Dravidian, Tibeto-Burman languages and Sinhalese” (Subbarao and Bhaskararao, 2004: 161). It has four

kinds of nonnominative constructions and different types of verb-less sentences.

Vocabulary

Like many other Dravidian languages, the vocabulary of Telugu contains native Dravidian as well as borrowed vocabulary. The earliest borrowings were mostly from Sanskrit and Prakrit. Some of the borrowings were assimilated to fit the native phonology. Later borrowings came from Perso-Arabic sources through Urdu, Portuguese, and English in that order. Except for the sound [ʃ] all the other sounds of the borrowed sources that are not native to Telugu were replaced by nearer native sounds. Because verbal vocabulary is more resistant to accepting borrowals, although borrowing verbal concepts, the corresponding nouns from the source language were borrowed, which were verbalized by means of suffixation (e.g., *ūhincu* ‘to imagine’ [Sanskrit *ūha* ‘imagination’], *ānandincu* ‘to enjoy’ [Sanskrit *ānanda* ‘happiness’ or by means of verbal conjuncts (e.g., *ḍraywū-cēyu* ‘to drive’ [English *drive*]; *pūja-cēyu* ‘to worship’ [Sanskrit *pūjā* ‘workship’]).

Thai

T J Hudak, Arizona State University, Tempe, AZ, USA

Thai (Siamese, Central Thai) serves as the national language of Thailand where it is used by the schools, the media, and the government. Of the 1990 estimated population of 54 890 000, 75 percent are considered

ethnic Thai, 14 percent Chinese, and 11 percent other. Outside of Bangkok and the central plains, other regional dialects exist: Northern Thai (Kam Muang) in the north, Southern Thai in the south, and Lao or Northeastern Thai (Isan) in the northeast.

Thai belongs to the Tai language family, a subgroup of the Kadai or Kam-Tai family, and descended from the single protoparent Proto-Tai. A number of

linguists have claimed that Kam–Tai and Austronesian belong to a branch of Austro–Tai; however, this claim still remains controversial. Linguistic evidence indicates that the area near the border between northern Vietnam and southeastern China is the probable place of origin of the speakers of the Tai languages. The Tai languages extend from Assam in the west through northern Burma, Laos, Thailand including the peninsula down to the Malay border, northern Vietnam, and the Chinese provinces of Yunnan, Guizhou (Kweichow), and Guangxi (Kwangsi). In discussing the Tai family, linguists often divide it into northern, central, and southwestern branches. In this division, Thai belongs to the southwestern branch.

Historical Background

Late twentieth-century linguistic theory suggests that the Thai spoken in Sukhothai, the first major Thai kingdom, founded in the mid-thirteenth century, resembled Proto-Tai, particularly in tonal structure. This early system consisted of three contrasting tones on syllables ending in a vowel or sonorant, designated as ABC. A fourth category D existed on syllables ending in *ptk*, although no tonal differentiation appeared on these types of syllables. The phonetic nature of these contrasts still remains a matter of speculation. This sound system prevailed at the time that King Ramkhamhaeng (?1279–98) created the writing system sometime prior to 1292 AD, the date of the earliest known inscription, Inscription I or the Inscription of Ramkhamhaeng. The writing system used as a base an Indic alphabet that was originally designed to represent Sanskrit. It was borrowed first by the Khmer and then the Thai, with the eventual system bearing little resemblance to the original due to a variety of additions and modifications.

In 1351, the Thai capital shifted to Ayutthaya. The most generally accepted theory holds that present-day Thai descended from the Sukhothai dialect. During the Ayutthaya period (1351–1767), Thai underwent two major changes. First, sometime between the mid-fourteenth and mid-seventeenth centuries, the system of three tones split into a system of five, the changes dependent upon the phonetic nature of the initial consonant of each syllable. Another significant change was the large influx of Sanskrit, Pali, and Khmer loanwords, which expanded the vocabulary and reflected the growing complexity of Ayutthayan society. Later, during the Bangkok era (1782–twentieth century), much of this terminology and its correct use became standardized by King Mongkut (1851–68). Further emphasis upon the correct use of the language came from King Chulalongkorn (1868–1910) and King Vajiravudh (1910–26). Since then,

there has been the growth of a prescriptivism associated with the creation of a national language (Diller 1988: 304).

Phonology

A Thai syllable consists of an initial, a vocalic nucleus, a final (which may or may not be obligatory), and a tone. Initials consist of a single consonant or a cluster, and the nucleus of a long or short vowel. Only /p, t, k, m, n, ŋ, w, and y/ occur as final consonants. There are no consonant clusters at the end of the syllable. The tone may be mid, low, falling, high, or rising. The twenty consonant phonemes are the voiceless unaspirated stops /p/, /t/, /c/, and /k/; the voiceless aspirated stops /ph/, /th/, /ch/, and /kh/; the voiced stops /b/ and /d/; the fricatives /f/, /s/, and /h/; the nasals /m/, /n/, and /ŋ/; the lateral /l/; the trill /r/; and the semivowels /w/ and /y/. There are nine vowel phonemes, which may occur short or long: high /i/, /u/, /u:/; mid /e/, /ɛ/, /o/, /o:/; low /æ/, /a/, /ɔ/. Each of the three high vowels may be followed by a centering offglide /a:/ /ia/, /ua/, /ua/. The question of stress in Thai remains a debated issue; however, most studies agree that the final syllable position has the greatest prominence. In disyllabic and polysyllabic words, the remaining vowels are reduced. Along with these reductions, some tone neutralization may also occur.

Syntax

The most favored sentential word order is subject–verb–object (SVO): *kháw kin khanǝm* ‘He eats cakes.’ The subject and object may be filled with a noun phrase that can consist of a noun, a pronoun, a demonstrative pronoun, or an interrogative–indefinite pronoun. The noun phrase may also consist of a noun + attribute in which case the noun precedes the attribute: *lban phǝm* ‘my house.’ While SVO is traditionally described as the most favored order, other common orders frequently appear, especially in colloquial or informal conversation. In these cases the subject and object form topical noun phrases in arrangements that include SOV and OSV. In still other cases, the subject may follow the verb as in existential sentences: *lmii ráan thii talàat* ‘There’s a shop in the market.’ Nouns or noun referents felt to be understood from the context or to be unnecessary are often deleted by the speaker. Thai verbs have no inflection for tense or number. Tense is generally determined by context or by added time words and expressions. The preverbal *mây* ‘not’ negates the verb.

Characteristic complex verbal predicates consist of a collocation of verbs referred to as serial verbs:

/paj aw maa dat plœœŋ kêœ khăy tham sja mày/ ‘(She) went and got it changed it around, fixed it up, and made it just like new (Diller 1988: 280). These series often consist of a main verb modified by two sets of verbs, one preceding and the other following. Those verbs preceding often translate as English modals or adverbials, while those following often convey the sense of completion. In many cases the verbs are so arranged that they reflect the temporal sequence of the action.

Thai has three broad groups of particles that end utterances. One group marks a statement and forms questions that require yes–no answers; the second shows respect or deference toward the addressee; and the third indicates the mood of the speaker toward the situation at the time of speaking.

One of the most characteristic features of Thai is the use of classifiers, an obligatory class when quantifiers with nouns are present. The most usual order is noun + quantifier + classifier: */măa săam tual/* ‘three dogs.’ For each noun + classifier construction, the head noun determines the choice of classifier. Typical examples include */khon/* for human beings, */tual/* for animals, and */khan/* for vehicles and umbrellas.

Sociolinguistics

Beginning in the nineteenth century prior to the impact of Western languages, a type of traditional diglossia developed with the ‘correct’ speech based upon the speech of the royalty and upper classes (Diller 1988). Diller notes that much of this diglossia was characterized by vocabulary of Indic borrowings, although some syntactic patterns found in proper speech and formal written prose also appeared (Diller 1988: 304). With the impact of Western languages and the emphasis upon standardized grammars and languages in the nineteenth century, this diglossia became more and more solidified. A proliferation of

titles and ranks during the Ayutthaya period also helped to foster the idea of classes of speakers.

Another characteristic sociolinguistic feature of Thai is the complex pronoun system, with the choice of any one pronoun dependent upon factors such as age, sex, social position, and the attitude of the speaker toward the addressee. Pronouns are frequently omitted from surface syntax when the referent is understood. Kinship terms, and other nouns referring to relations, such as */phûan/* ‘friend,’ are often used as pronouns. Thus, */phôl/* ‘father’ may mean ‘you, he’ when speaking to or about one’s father or ‘I, father’ when the father speaks to his child.

Future Work

Continued work on Thai will undoubtedly center upon the genetic relationship between Thai and other languages of southeastern and eastern Asia. A late twentieth-century controversy has revolved around the authenticity of the earliest known inscription, the Ramkhamhaeng Inscription.

Tibetan

P Denwood, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Tibetan comprises a multiplicity of regional spoken dialects, and a standardized written language (Classical Tibetan) which is the vehicle of a major civilization whose main religion is Buddhism. There are also several modern regional written languages.

Geography, Affiliation, and History

Tibetan is spoken in the Tibetan Autonomous Region of China, and in adjoining high-altitude parts of Bhutan, India (Ladakh in Kashmir and parts of Himachal Pradesh), Pakistan (Baltistan), Nepal (Mugu, Dolpo, Mustang, Solu Khumbu), Burma, and the Chinese provinces of Yunnan, Sichuan, Gansu, and Qinghai. Estimates of the number of speakers range from about three to seven million.

It is also used as a religious language by Mongols in the Republic of Mongolia, Inner Mongolia (China), and Russia (Buriats and Kalmucks), and by members of some ethnic groups in Nepal, including Newars and Tamangs, and other parts of the Himalayas. It is usually reckoned to be a member of the Tibeto-Burman language group, which, with the Karen and Chinese groups, forms the Sino-Tibetan family, though some scholars have cast doubt on this affiliation, citing parallels with Indo-European.

The Tibetans emerge into history in the 7th century AD. It is from that time also that their alphabetic writing system, based on a model of Indian origin, is alleged to date. The earliest datable example of the language is probably an inscription on a stone pillar in Lhasa dating from about 760 AD. Although originally often used for administrative purposes, since the 10th century Classical Tibetan has been closely associated with Buddhism, having been used to translate a vast range of literature, mostly from Sanskrit. There is also an indigenous literature, which was also almost entirely religious until the mid-20th century. Since that time the nonreligious genres of journalism and other 'nonfiction' have also flourished, and since the late 20th century also novels, short stories and poetry.

The spoken dialects have usually remained unwritten. Poorly recorded from premodern times, they have often developed separately from the written language and from one another. To ease the consequent difficulties of communication, several of the spoken dialects have come to be used as *lingua francas*: Lhasa Tibetan over the Tibetan Autonomous Region and among the exile community; Dzongkha in Bhutan, Leh Ladakhi in Ladakh and Amdo Khake (Amdo) in Qinghai and Kansu. While parallel modern regional written languages have also been developed (see below), the gap between spoken and written forms of the language remains wide.

Grammar

Words

A Tibetan word (phonologically defined) comprises a noun, verb, or adjective constituent, with or without one or more particles. A noun constituent may be polysyllabic, while verb and adjective constituents are all monosyllabic. Many verbs have variant forms ('stems' or 'roots') corresponding to tense/aspect differences. Other parts of speech are invariable, apart from sandhi variation with suffixed or prefixed particles. Particles express noun case categories and adjectival degree, mark the ends of subordinate clauses, and establish verb tense/mood/aspect categories. Most particles are suffixed, though a few

negative, dubitative, or interrogative ones are prefixed. There are also many phrasal nouns, verbs, and adjectives comprising two or more words. Particles are subdivided into noun, verb, and adjective, according to which type of word they occur in. A few particles can stand as separate words.

Noun Phrases

The order of elements in the noun phrase is: (1) head (noun), (2) epithet (adjective), (3) deictic (noun), (4) numerator (particle), (5) case marker (genitive, subject-marking, instrumental, dative-locative, ablative, comparative or adverbial particle).

Verb Phrases

In Classical Tibetan, a verb paradigm may have from one to four stems, and sometimes alternative forms for the same stem, e.g., the verb *seize* (shown here in transliterated Tibetan spelling):

| present | past | future | imperative |
|---------------------|---------------------|---------------|--------------|
| ' <i>dzin.lzin.</i> | <i>bzung.lzung.</i> | <i>gzung.</i> | <i>zung.</i> |

A few verbs have suppletive paradigms with stems drawn from etymologically different verbs.

Modern spoken dialects show a reduction in the number and variety of verb stems; for example in the Lhasa dialect, for most speakers no verb has a separate future stem and many verbs have been reduced to a single stem: the equivalent of either the present or past of the classical language. More than compensating for this reduction has been a great increase in the use of verb particles and auxiliaries to express a complex mix of person, tense, aspect, mood, and evidential and judgmental modality systems. In many dialects there is also an unusual system of what may be termed 'viewpoint' – self-centered vs. other-centered – in which there is concord between the verb phrase and the speaker, who may or may not correspond to one of the arguments of the clause.

Verbs may be divided into two types: verbs of being (also used as auxiliaries) and lexical verbs. Verbs of being participate obligatorily in the grammatical systems of viewpoint and evidential modality. Lexical verbs are of two types, which determine their participation in the systems mentioned: 'intentional,' where the action is under voluntary control, and 'unintentional.' The majority pattern of the lexical verb phrase is: (1) lexical verb stem, (2) linking particle, (3) polar particle, (4) auxiliary, (5) modal particle.

Past, present and future tenses are established by a combination of verb stem and auxiliary. Similar means are used to distinguish perfect, progressive,

and prospective aspect, of which there are several subtypes in each case.

Clauses

Tibetan clauses are of SOV (subject-object-verb) type, with OSV order also possible. As well as the clause-final verb phrase, the clause may contain a subject, an object, and one or more adjuncts, all noun phrases. Subject and object phrases are regularly omitted without being represented by pronouns if they are not 'new.'

The main clause is the last in the sentence. Nonfinal (subordinate) clauses are usually marked by special particles.

Past-tense and often present-tense clauses are syntactically ergative, the subject of a transitive clause being marked with a particle identical in written form to the 'instrumental' noun particle.

Phonology

Modern central, southern, and eastern dialects have well-developed lexical tone, which has been analyzed in various ways, the simplest being as a two-tone system. In the Lhasa dialect the word is the domain of tone, which is manifested mainly as the pitch (high or low) of its first (or only) syllable. These tonal dialects mostly have few word-initial consonants, with few or no consonant clusters at word-initial position. Plosive and affricate initials always maintain a clear differentiation between an aspirated and an unaspirated series, while voicing has tended to disappear from these series as well as from fricative initials. The dialect of Dingri in southern Tibet has 27 word-initial consonants, all of them simple.

In the western dialects of Balti (spoken in northern Pakistan) and Ladakhi, as well as in some northeastern dialects of Gansu and Qinghai, tone is usually less well developed or absent, with a richer variety of word-initial consonant clusters. The northeastern Amdo Khake (Amdo) dialect has 36 simple word-initial consonants and 78 cluster initials. The writing system, whose spellings are full of consonant clusters, would suggest that the dialect it was based on, perhaps a central dialect of the 7th century, may have been pronounced somewhat like these so-called 'archaic' dialects. However, none of the present dialects approaches the complexity of the spelling system in this respect.

The tonal dialects of central and southern Tibet generally also have a system of vowel harmony. In the Lhasa dialect its domain is a pair of adjacent syllables within a word. Many noun, verb, adjective, and particle constituents vary between an open and a

close alternant. Most of the nonparticle constituents in question are spelt with one of the vowels *o*, *e*, or *a*: they will be pronounced with a closer vowel alternant when next to a syllable spelt with *i*, *u*, or the combination *ab*. There is little or no evidence of vowel harmony in the script, suggesting that its development, like that of tone, may have accompanied the progressive loss of consonant distinctions. Whereas the 'archaic' or 'cluster' dialects may typically have nine vowels, corresponding to the five of the script, the 'modern' or 'noncluster' harmonic dialects may have about 25 (in both cases, analyzed nonphonemically).

Honorifics

The written language and most of the dialects have a well-developed honorific system, in which lexical choice of verb is determined by the social status of the person acting as its grammatical subject. There is also a 'respectful' system, in which there is concord between choice of verb and direct or indirect object, and the two systems may be combined. Nouns, adjectives, and verb particles are also affected.

Recent History

Developments since World War II have led to the political fragmentation of the Tibetan-speaking

world and the increasing influence of other languages, particularly Chinese (Mandarin Chinese), English, Urdu, Hindi, and Nepali. However, the same period has also seen the development of Modern Literary Tibetan (in Tibet and among refugees), Written Dzongkha (in Bhutan), and Written Ladakhi (in Kashmir) as written languages, based respectively on Lhasa Tibetan, spoken Dzongkha, and spoken Ladakhi, but influenced by Classical Tibetan. Some other dialects, including Amdo Khake (Amdo), Kham, and Sikkimese have also had written equivalents devised for them. The late 20th century has also witnessed a Tibetan diaspora, which has led to vastly increased interest in the language and culture, centered on a

numerically small but culturally active exile community in India and Nepal. Since the late 20th century, there has also been a marked revival of Tibetan in the Republic of Mongolia. Despite the problems experienced by its speakers, Tibetan remains a living, vigorous, and developing language.

Tigrinya

D Appleyard, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Tigrinya (self-name *tigrinjma* or *tigraj*), which is spoken in Eritrea and Ethiopia, is the second largest member of the Ethiopian branch of the Semitic family of languages, constituting together with Tigre and the extinct Ge'ez (or Classical Ethiopic) the northern subdivision. Estimates of the number of speakers in both countries vary from 4 to 5 million. Tigrinya is one of the two working languages of Eritrea, where it is the first language of about 50% of the population, and a major national language of Ethiopia. Tigrinya is written in a slightly expanded version of the Ethiopic syllabary, and as a written language has a history only from the latter half of the 19th century, due in great part both to the prestige of Ge'ez as the written language of Christian Ethiopia in the past, as well as to the dominance of its sister language, Amharic, as the language of the Ethiopian court.

Modern Tigrinya shows a considerable degree of dialect variation in the handful of preliminary studies that have been done. The standardization of written Tigrinya took its impetus from the full independence of Eritrea in 1993 and the adoption of Tigrinya as the principal language of the state.

Phonology

Tigrinya has 32 consonant and 7 vowel phonemes. Distinctive are the glottalized consonants and the labialized velars. The velars /k/, /kʷ/, /kʰ/ and /kʷʰ/ have fricative allophones in postvocalic position

including across close juncture between word boundaries: *kəfətə* 'he opened' but *jixəffit* 'he opens', *k'orbot* 'leather' but *ʔita x'orbot* 'the leather'. As the script has special symbols for these allophones, they will be indicated in the data here. Consonant length is phonemic, except for the glottals and pharyngeals which do not have lengthened counterparts. (See **Table 1** for the consonant chart.)

Ethiopianist convention occasionally employs different symbols from the IPA ones used here; thus, *š* = *ʃ*, *ž* = *ʒ*, *č* = *tʃ*, *q* = *kʰ*, *t* = *tʰ*, *č* = *tʃʰ*, *ǰ* = *dʒ*, *š* = *sʰ*, *p* = *pʰ*, *ṅ* = *ŋ*, *y* = *j*, *k* = *x*, *č* = *xʰ*, *h* = *h*, *ʼ* = *ʕ*, *ʼ* = *ʔ*, *ä* = *e*, *ə* = *i*. The vowel phonemes of Tigrinya are *i*, *ɪ*, *u*, *e*, *o*, *ɐ*, and *a*, of which the central vowels *ɐ*, *ɪ*, and *a* are of particularly frequent occurrence. The mid-central vowel *ɐ* has a markedly more open allophone in word final position: *nəgərə* = [nəgərəɐ] 'he spoke', and indeed following a glottal or pharyngeal consonant this is written in the script with the same vowel sign as *e*.

Morphology

Tigrinya, like other Ethiopian Semitic languages, has a complex inflectional morphology, particularly in the verbal system, employing not only prefixes and suffixes but also internal modification of the typical Semitic consonantal root-and-pattern type. Internal modification is also employed in forming many noun plurals from the singular, sometimes in combination with the addition of an affix, in 'broken plural' patterns so typical of other Semitic languages such as Arabic: *wərhi* 'month', *ʔawarhi* 'months', *kənfer* 'lip', *kənafir* 'lips'. Other noun plurals are formed

Table 1 The consonant phonemes of Tigrinya

| | <i>Bilabial</i> | <i>Alveolar/dental</i> | <i>Palatal</i> | <i>Velar</i> | <i>Pharyngeal</i> | <i>Glottal</i> |
|----------------------------------|-----------------|------------------------|-------------------------------------|--|-------------------|----------------|
| Plosive/affricate Glottalized | b p | d t | dʒ tʃ | g k | | ʔ |
| Plosive/affricate/fricative | p' | t' | tʃ' | k' | | |
| Labialized | | | s' | [x'] g ^w k ^w k' ^w | | |
| Fricative | f | z s | [x ^w][x' ^w] | [x] | ʕ h | h |
| Nasal | m | n | ɲ | | | |
| Lateral | | l | | | | |
| Approximant | w | r | j | | | |

by suffixes alone: səb 'man', səbat 'men', g^wasa 'shepherd', g^wasot 'shepherds'. Plural formations are determined lexically and cannot be predicted from the shape of the singular form.

In addition to number, nouns also have the category of gender, with two terms linked with male and female in animate nouns, while inanimates generally fluctuate in gender. Gender is mostly observable only in agreement. Definiteness is also indicated in the noun phrase by means of an article, in origin a remote demonstrative: ʔitom kahnat 'the priests', ʔita waɣro 'the lioness', ʔitu s'ibbux' wəddi 'the good boy'. Case relations are expressed by prepositions. Particularly interesting is the use of ni-(nə- + DEF) as optional marker of a definite direct object, the same clitic also having the function of indicating an indirect object:

nə-tu sirnaj ji-xirkiriʔ-o
 OBJ-DEF wheat 3(PL)-grind.IMPERF.PL-it
 'they grind the wheat'

ʔitu k'əffji nə-ta səbɛjti ji-ngər
 DEF priest to-DEF woman 3MASC.SING-
 tell.JUSSIVE
 'let the priest tell [it] to the woman'

Verbs inflect for voice or valency, tense-mood-aspect (TMA), and person. In addition to the base-stem shapes, which are essentially three in number, there are three prefixed stem derivatives for each of these: tə-, which essentially has the function of marking passive-reflexive, ʔa- which generally has the function of marking causative-transitive, and a complex formative comprising ʔa-combined with lengthening of the first radical consonant or -t (i.e., formative ʔat-) before a glottal or pharyngeal. The meanings of derived stems are in addition often lexically defined. There are also specific TMA stem patterns associated with each of these derivational elements: nəgərə 'he spoke', tənəgərə 'it was spoken', bəxəjə 'he wept', ʔa-bkəjə 'he made someone weep', las'əjə 'he shaved himself', ʔa-las'əjə 'he made someone

shave himself', fənnəwə 'he sent away', ʔaf-fanəwə 'he accompanied someone on his way', etc.

There are four fundamental TMA forms, conventionally referred to as the Perfect, the Imperfect, the Jussive-Imperative, and the Gerundive. The latter is sometimes also described as a Converb. These are marked both by different stem shapes and by different person markers, with the Imperfect and the Jussive having the same set of person markers (the Imperative marks only gender-number). The tense system is considerably augmented beyond these basic forms by means of auxiliaries and periphrastic constructions.

ʔab ʔasməra tən-wələd-ku
 in Asmara PASS-bear.PERF-1SING.PERF
 'I was born in Asmara'

maj ʔa-filliḥ
 water 1SING.IMPERF-CAUS-boil.IMPERF
 'I boil the water'

nə-tu gənzeb ki-[i]-hib-ekka ʔij-jə
 OBJ-DEF money FUT-[1SING.IMPF]- COP-1SING
 give.IMPERF-you
 'I will give you the money'

tī-ḥiz-o ʔallo-xa
 2MS.IMPERF-catch. be.PRES-2SING.MASC[PERF]
 IMPERF-him
 'you catch him (now)'

ʔab-zu ʔabij gəza ji-x'immət' nəbər-ə
 in-this big house 3MASC.SING. be.PAST-3MS.
 IMPERF-live. PERF
 IMPERF
 'he was living in this big house'

s'ibah tənəlis-ə ʔi-xəwwin
 tomorrow return.GER- 1SING.IMPERF-be.IMPERF
 1SING.GER
 'I may come back tomorrow'

The gerundive is used both as a subordinate verb, marking an anterior event in a sequence, and as a main verb form, expressing the result of an action:

mis men mes'iʔ-ka
with who come.GER-2MASC.SING.GER
 'with whom have you come?'

nab-tu gəza tɛmɛlis-a
into-DEF house return.GER-3FEM.SING.GER
 tɛx'ɛmmit'-a ʔingera
sit.GER-3FEM.SING.GER bread
 hab-ɛtt-o
give.PERF-3FEM.SING.PERF-him
 'she returned to the house, sat down, and gave him
 some bread'

Syntax

Word order in Tigrinya is generally subject-object-verb (SOV), with subordinate clauses preceding the main clause. Noun phrases are also generally head final with modifiers, including relative clauses, preceding the noun.

Tiwi

J R Lee, Summer Institute of Linguistics, Darwin, NT, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Tiwi is an Australian Aboriginal language spoken by the Tiwi people, who number about 2000 and live on Bathurst Island and Melville Island (north of Darwin). Over the decades, since the first extensive contact with Europeans early in the 20th century, the Tiwi culture has undergone considerable change; the Tiwi people have changed from a seminomadic, hunter and gatherer way of life to a more settled lifestyle, and now mainly live in four townships on both islands. The Tiwi people are caught between two cultures, traditional and modern; they desire the benefits of European culture but also want to retain their own identity through some of their traditional ways. Although Tiwi people still do some hunting and gathering and maintain some of their traditional ceremonial life, they are now dependent on a money economy and are mostly Roman Catholic in religion. This change is also reflected in what has happened and is still happening in the language.

The language change is so extensive that young people (even people in their forties) no longer speak or even understand much of the traditional language. Not only does the language of the young people contain a number of English words, but the actual structure of the language has changed. These changes are due to a combination of factors over a period of decades. One of the most significant factors was the setting up of a school for both boys and girls in 1914, with English as the language of instruction and literacy. In addition to this, between 1921 and 1973, most girls were brought up from about the age of six in a dormitory, which effectively cut them off from extensive contact with their families and from hearing the Tiwi language spoken in a regular family context.

The verbal repertoire of the Tiwi people can be characterized by at least five codes: Traditional Tiwi, Modern Tiwi (a modified form of Traditional Tiwi), New Tiwi (an anglicized Tiwi), Tiwi–English, and Standard Australian English. These codes, though having characteristics that distinguish them from each other, are not discrete, but rather merge into one another along a spectrum. Each code has within it characteristic styles. For instance, within New Tiwi, there is a difference between the more formal style,

used in storytelling on tape and in elicited speech, and the less formal style, used in spontaneous speech. Also, the New Tiwi used by children is different from that used by adults. The Tiwi code used by a person is largely dependent on the age of the speaker, but not exclusively so. Though most young people do not command much Traditional Tiwi (with their understanding being greater than their production), older people do appear to command New Tiwi to some extent and usually use it in speaking with younger people. In addition to the diversity of codes, the situation is made more complex by switching between codes, including English.

Traditional Tiwi

In Traditional Tiwi (TT), there are four vowels: a, i, o, u. The consonants are given Table 1, in which the symbols used are the orthographic ones developed when Tiwi became a written language 30 years ago. The prenasalized and labialized stops are interpreted as single consonants on the basis that there are no unambiguous double consonants in Tiwi. The Tiwi syllable pattern is consonant-vowel (CV) or V with no closed syllables.

Tiwi nouns are divided into two classes, masculine and feminine. For humans (and some animals), the distinction is on the basis of natural sex. For nonhumans, the distinction is made on other criteria, normally semantic grounds. Plurality is marked only on human nouns, and the distinction between masculine (MASC) and feminine (FEM) is lost in plural (PL) nouns. Adjectives agree with the nouns that they qualify in gender and plurality (when applicable), as shown in the following examples:

- (1) arikula-ni tini
 big-MASC man
 ‘big men’
 arikula-nga tinga
 big-FEM woman
 ‘big women’

- arikula-pi tiwi
 big-PL people
 ‘big people’

Traditional Tiwi is a polysynthetic language, with the inflected verb having an extremely complex structure. It is one of the prefixing languages of northwestern Australia but it has not been found to be directly related to any of them. The verb is able to take a number of affixes (mainly prefixes), indicating subject person, direct or indirect object person, tense, aspect, mood, time of day, and distance in time or space, for example. The nucleus of the verb contains a verb root but may also contain one or more incorporated forms that add some other nominal, stative, or verbal meaning (abbreviations: CONT, continuous; INCL, inclusive; SUBJUNC, subjunctive; EMPH, emphatic; CON, connective; CAUS, causative):

- (2) Pi-rri-mini-wujingi-pirni.
 they-PAST-me-CONT-hit
 ‘They were hitting me.’
- (3) Yinkiti nga-ma-wun-ta-y-akirayi.
 food we(INCL)-SUBJUNC-them-EMPH-CON-give
 ‘We should give them food.’
- (4) Nganti-ri-ma-rri-pi-y-ajirringi-kitikim-ani warta.
 we.PAST.FEM-CON-with-CON-bush
 long.thing-CON-crocodile-drag-PAST.HABIT
 ‘We used to drag the crocodile to the bush with the spear still in her.’
- (5) Taringini yi-mini-maji-wutu-wirri.
 snake he.PAST-me-on-horse-bite.
 ‘A snake bit me while I was on a horse.’

In Traditional Tiwi, there is also a verb phrase, consisting of a free-form verb, which carries the basic meaning, and an auxiliary verb, which can carry the same inflections as an independent verb. The class of free-form verbs occurring in this type of construction is small and, even in TT, may be expanded by the use of English loan verbs.

Table 1 Traditional Tiwi consonants

| Feature | Apical | | Laminal | | Peripheral | |
|--------------------|----------|--------------|----------------|----------------|------------|--|
| | Alveolar | Postalveolar | Dental/Palatal | Dorsal | Labial | |
| Stops | t | rt | j | k | p | |
| Prenasalized stops | nt | rnt | nj | nk | mp | |
| Nasals | n | rn | ny | ng | m | |
| Labialized stops | | | | kw | pw | |
| Labialized nasals | | | | ngw | mw | |
| Laterals | l | rl | | | | |
| Rhotics | rr | r | | | | |
| Semivowels | | | y | g ^a | w | |

^aThe symbol ‘g’ represents a velar fricative, which seems to behave like a semivowel.

- (6) Papi awungarra pi-ri-maji-wutuwu-mi.
arrive here they.PAST-CON-on-horse-do
'They arrived here on horses.'
- (7) mwarliki nga-ma-wun-ta-m-amigi
bathe we(INCL)-SUBJUNC-them-EMPH-do-CAUS
'we should cause them to bathe'

New Tiwi

The speech of young people incorporates a number of changes to the traditional language, including phonological changes and changes in vocabulary, in noun classification, and in syntax, such as word order. However, the greatest change is in the verbs. New Tiwi (NT) is no longer a polysynthetic language but has become more isolating. Most of the verbal inflection has been lost, with simple verb forms mostly replacing the complex inflected verbs. The NT verb form is based on the TT verb phrase. However, the small class of free-form verbs has been expanded by a greater use of loan verbs from English and, in a few cases, by the use of the singular imperative as a free-form verb. The auxiliary verb may or may not be used, depending on the formality of the occasion. When it is used, there are very few inflections retained, usually only those prefixes marking subject and tense, though even these are often changed in form. The following three examples are comparisons of New Tiwi and Traditional Tiwi:

- (8a) NT: Wokapat yi-mi.
walk he.PAST-do
'He walked.'
- (8b) TT: Yi-p-angurlimayi.
he.PAST-CON-walk
'He walked.'
- (9a) NT: Lukim ngi-ri-mi nginja.
see I-CON-do you.SING
'I saw you.'
- (9b) TT: Ngi-rri-min-j-akurluwunyi (nginja).
I-PAST-you(SING)-CON-see (you.SING)
'I saw you.'
- (10a) NT: Tamu ji-mi.
sit she.PAST-do
'She sat.'
- (10b) TT: Ji-yi-muwu.
she.PAST-CON-sit
'She sat.'

Note: *tamuwu* is the singular imperative form in Traditional Tiwi.

Young people sometimes use the continuous action prefix *wuji-*, but other aspects and moods are given by loanwords from English, such as *stat* 'start,' *tra* 'try,' *jut* or *shut* 'should,' and *ken* 'can.'

- (11a) NT: Yoyi a-wuji-ki-mi.
dance he-CONT-CON-do
'He is dancing.'
- (11b) TT: Yoyi a-wuji-ngi-mi.
dance he.NONPAST-CONT-CON-do
'He is dancing.'
- (12) NT: Jirra tra kirrim ji-mi warra.
she try get she.PAST-do water
'She tried to get some water.'

Since the verbs in NT no longer have the inflections of TT, there is a greater use of nouns and pronouns, to indicate the participants, and dependence on time words or the context, to indicate the tense. In NT, there is also considerable use of other English loanwords. In the speech of young people, particularly children, these may include words such as *pijipiji* for 'fish,' for which there is a traditional Tiwi equivalent. In general, NT can be said to be an 'amalgam' of Tiwi and English – in other words, a 'mixed code,' like a pidgin (or creole) Tiwi. This type of amalgam distinguishes 'mixing' from 'switching' between codes, though it is often hard to tell where mixing ends and switching begins. The following example from a 4-year-old boy shows the mixing in his Tiwi and the switching between his New Tiwi and his Tiwi-English (TE) in the same utterance:

- (13) Ya kilim ja. [NT] I kill you, mate. (TE)
I hit you (SING) I hit you mate
'I'll hit you, mate.'

Modern Tiwi

What is normally thought of as Modern Tiwi (MT) is a style, or a range of styles, between Traditional Tiwi and New Tiwi; in general, Modern Tiwi is a modified or simplified style of TT. In Modern Tiwi, people use more verbs with TT verb roots than are used in NT, but the verbs do not have the same richness of inflection as in TT. In general, the only affixes retained in the verb are the subject and tense prefixes and others that are not able to be expressed externally in TT, such as some aspect and mood affixes. Other affixes and incorporated forms are normally omitted, particularly those affixes indicating whether an action was done in the morning or evening and the object prefixes. These are either expressed by free-form words or are understood from the context.

- (14a) MT: Japinari yi-pirni ngiya.
morning he.PAST-hit me
'He hit me in the morning.'
- (14b) TT: (Japinari) yu-watu-mini-pirni.
morning he.PAST-morning-me-hit
'He hit me in the morning.'

Another feature of MT is the loss of distinction between first-person plural inclusive and exclusive subjects, as is also the case in NT.

- (15a) TT: Ngimpi-ri-majirripi.
 we(EXCL)NONPAST-CON-lie.down
 ‘We (but not you) lie down.’
 Nga-ri-majirripi.
 we(INCL)-CON-lie.down
 ‘We (including you) lie down.’
- (15b) MT: Nga-ri-majirripi.
 we.NONPAST-CON-lie.down
 ‘We lie down.’

Conclusion

The present-day language situation among the Tiwi people is very complex; a broad overview cannot begin to describe the differences that there may be among the four townships on Bathurst and Melville islands. Briefly, there are certain domains wherein a particular code is appropriate and may be used exclusively (or almost exclusively). In other situations, more than one code may be used, depending on the speakers and hearers and the formality of the occasion. Traditional Tiwi is used in the traditional ceremonies and songs, in some liturgy in the church, and in some written material. In situations in which non-Tiwi people are involved, such as administrative and work situations, English is mostly used, though the English used by the Tiwis may vary between Standard English and Tiwi-English. English is also used in the homily and in some of the liturgy and songs in church, and in all of the schools, at least in formal education. Modern Tiwi is used in bilingual education in the primary school on Bathurst Island and in some formal situations, when young Tiwi people are involved,

such as when giving a formal speech in Tiwi. There is some written material in Modern Tiwi, produced by the schools and by the author (Jennifer Lee) and her Summer Institute of Linguistics colleague, Marie Godfrey (New Tiwi is not generally acceptable in written form). New Tiwi is the common code of young people, though with considerable code switching with English in most situations, depending on the speakers and hearers.

Tocharian

R Kim, University of Pennsylvania, Philadelphia, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

Tocharian (Tokharian) is the conventional name for two related, extinct Indo-European (IE) languages known from documents found in the oases north of the Taklamakan desert in Xinjiang (Chinese Turkestan). The languages are now generally referred to as Tocharian A (TA) and Tocharian B (TB); the alternatives *Osttocharisch* and *Westtocharisch* (East

and West Tocharian) are still used by German scholars; ‘Turfanian’ and ‘Kuchean’ are obsolete terms.

Tocharian is known from manuscripts discovered by archaeological missions to Xinjiang in the years preceding World War I, in particular those led by Sir Aurel Stein of the United Kingdom, Albert von le Coq of Germany, and Paul Pelliot of France. In addition to a wealth of Middle Iranian documents, the expeditions brought back others in unknown languages, written in the ‘slanting’ Brāhmī script of Central Asia. In 1908 the German philologists Emil Sieg and Wilhelm Siegling conclusively identified them

as non-Indo-Iranian IE languages, which they labeled ‘Indo-Scythian’; they also succeeded in distinguishing TA and TB.

The manuscripts are dated to approximately the sixth to eighth centuries AD, but further chronological precision is difficult. The TA records were discovered in and around Turfan and Qarašahr and are entirely of Buddhist religious content; most are translations or adaptations of Sanskrit originals. TB documents were found across the northern Silk Road from Kuča in the west to Turfan in the east; most are Buddhist in content, but a solitary love poem and a large number of monastery records, as well as caravan passes and cave graffiti, indicate that TB was the vernacular of at least part of the population in these areas in the later first millennium.

TA is remarkably uniform linguistically, and a number of facts indicate that it was no longer spoken at the time of the surviving manuscripts, but served as a sort of liturgical language among speakers of TB and Old Turkic. The TB documents exhibit considerable variation on all levels. On the basis of certain phonological and morphological features, they have been divided into western, central, and eastern dialects, but as vernacular TB sources (e.g., caravan passes or cave graffiti) mostly show ‘eastern’ characteristics, this division may also reflect chronological and/or sociolinguistic differences. Another source of variation is poetic: many forms in TB verse passages have been adjusted by one syllable to fit the meter; also characteristic is *pudñäkte* ‘Buddha’ for prose *pañäkte*.

The speakers of Tocharian played an important role in the Buddhist civilization of pre-Islamic eastern Central Asia, but their exact identity remains unknown. The name ‘Tocharian’ rests mainly on the form *twyry* in an Old Uyghur colophon, but both the reading and the identification have been challenged. It seems certain that the speakers of TA and TB were not the ‘Tocharians’ of antiquity (Strabon’s Τόχαιοι; Skt. *Tukhāra*-). Among the figures in the spectacular Buddhist cave paintings of the region are some with red hair and green or blue eyes, and many have speculated that these were the Tocharians; more recently, the discovery of red-haired, ‘Western’-looking mummies in the Taklamakan made headlines in the mid-1990s, but once again we cannot be sure which language they spoke. In any case, the speakers of Tocharian (more precisely, TB; see above) began to shift to Turkic in the later first millennium AD; the language was probably extinct by 1000.

Although they differ in numerous respects and certainly were not mutually intelligible, TA and TB were structurally similar, characterized by right-headed constituent phrases, a system of agglutinating

nominal case suffixes, and the central role of aspect and tense in verbal morphology. The two had doubtless been diverging for several centuries before the time of our documents, so that their latest reconstructible common ancestor, Proto-Tocharian (PT), must be dated to the last centuries BC.

The variety of Brāhmī script used to write Tocharian lacked symbols for distinctively Tocharian sounds such as labiovelar [k^w] and (in TB) the diphthongs [ew], [ow], [aw], [ay], and contained signs (*akṣaras*) for Sanskrit and Prakrit phonemes absent in the language (e.g., *v*, *h*, and the voiced, aspirated, and retroflex obstruents; the latter are used almost exclusively in Indo-Aryan borrowings). The most remarkable innovation of the Tocharian writing system is the creation of a series of *Fremdzeichen* (‘foreign signs’) to represent sequences of consonant + the vowel *ä*, probably a high central [i]; these exist for most, but not all consonants, and are used apparently interchangeably with the normal *akṣara* plus two subscript dots (hence the transcriptions *tä*, *ñä*, etc.). A second vowel (usually *u*) can be combined with a ligature (e.g., *kse + u*, transcribed *k_use*); such ‘subscript’ *u*’s may denote either a labiovelar or a reduced/syncopated vowel.

Recent research has elucidated most of the principal phonological developments from Proto-Indo-European (PIE) to PT and the two Tocharian languages. The PIE series of voiceless, voiced, and voiced aspirate stops have famously merged, except that **t*, **d*^h > PT **t* remained distinct from **d* > PT **t*^s. PIE palatals and velars merged in PT, but labiovelars and sequences of palatal/velar + **w* remained distinct. Palatalization before front vowels created new allophones that then became phonemic and gave rise to a number of morphologically conditioned alternations. The vowels underwent many changes, including loss of contrastive length. TB is in general the more phonologically conservative of the two languages, especially the western dialect; in contrast, TA has undergone sweeping changes, principally involving the vowel system.

The noun distinguishes two genders, masculine and feminine, plus a class of nouns of ‘alternating’ gender that take masculine agreement in the singular and feminine in the plural. Nouns and adjectives contrast for singular, plural, and dual. Nouns inflect for nine cases in each language, but only the three ‘primary’ cases, nominative, oblique, and genitive, are of PIE date; the remaining ‘secondary’ case suffixes are agglutinative, added to the oblique of singular and plural alike, and attached only to the last element of a noun phrase (e.g., TA *kuklas yukas onkälmas-yo* ‘with chariots, horses, and elephants’). Although their functions mostly coincide, few of the suffixes are

clearly cognate: cf. comitative TB *-mpa*, TA *-aśśäl*, ablative TB *-mem*, TA *-äs*. Most nonfeminine nouns have identical forms for nom. and obl. singular, derived from the PIE accusative, but masculine nouns denoting rational beings have secondarily created a distinct oblique in TB *-m*, TA *-(a)m*.

The numerals are of clear IE provenance: TB *wi*, TA m. *wu*, f. *we* '2,' TB m. *trey* ~ *trai*, f. *tarya*, TA m. *tre*, f. *tri* '3,' TB m. *štwer*, f. *štwärā*, TA *štwar* '4,' TB *piś*, TA *pāñ* '5,' TB *škas*, TA *šäk* '6,' TB *šukt*, TA *špät* '7,' TB *okt*, TA *okät* '8,' TB, TA *ñu* '9,' TB *šak*, TA *šäk* '10,' TB *ikäm*, TA *wiki* '20.' The prehistory of the personal and demonstrative pronouns contains a number of unsolved problems; noteworthy is the existence of separate masculine and feminine forms for 'I' in TA, m. *näs*, f. *ñuk* (vs. TB m./f. *ñäs*, *ñiś*).

The verb exhibits numerous idiosyncratic developments alongside a wealth of interesting and archaic features and has played an increasingly prominent role in the ongoing debate over the reconstruction of the PIE verbal system. The inherited voice distinction of active and mediopassive is robustly preserved. An interesting, if often overemphasized, feature is the widespread suffixation of PT **-skē-* ~ **-ššə-* (> TB */-ske-/* ~ */-ššə-/* ~ */-s-/*; TA *-sa-* ~ *-š-*) to derive transitives to intransitive roots and causatives to many, but not all, transitive roots. Both languages have the same morphological categories of present and imperfect (= nonpast and past of the imperfective stem), subjunctive/future and optative (= nonpast and past of the perfective stem), imperative, and preterite; nonfinite forms include the infinitive, gerundives I and II (denoting respectively obligation and possibility), a verbal noun or 'abstract,' almost always built to gerundive II; and a present and preterite participle. Most inflectional categories and patterns of verbal stem derivation are of PIE date, including reflexes of nasal and stative presents and root and (pre-)sigmatic aorists. Approximately a dozen verbs are suppletive, second only to Old Irish among IE languages. Among numerous unsolved problems are the remarkable paucity of simple thematic presents, and the origin of the Tocharian subjunctive and its relation to the classical PIE subjunctive and perfect.

Nominal compounds are fairly common, as are complex derivatives like TB *raddhi-lak-ä-š(š-äly)-ñe-šše* 'of causing to see wonders.' As the Tocharian languages are left-branching, the verb is usually clause-final in prose documents but may be raised for various pragmatic effects; verse texts not surprisingly offer much variation.

Early on, many Indo-Europeanists were struck by the apparent connections between Tocharian and the western IE languages, particularly Celtic and

Germanic. Today, however, the emerging consensus holds that Tocharian is not closely related to any other branch of IE but, rather, was the second after Anatolian to diverge from the ancestral speech community.

Little is known of the earliest contacts between Tocharian and other languages. Several strata of Iranian loanwords may be distinguished: the oldest appear to date from the Old Iranian period, followed by a small set whose preforms strongly resemble Ossetic; most recent are loans from neighboring Eastern Middle Iranian languages, particularly Khotanese. A few old Indo-Aryan borrowings go back to the pre-PT period – note TB (prose) *pañäkte*, TA *ptāñkät* 'Buddha' and TA *pñi* 'puṇya', reflecting the change of **u > PT *ə* – but the huge number of loanwords from Sanskrit and Prakrit entered the language comparatively recently; some have been (partly) assimilated to Tocharian phonology, but many retain their original orthography and may have belonged only to high religious registers. Certain old loanwords in Chinese appear to come from Tocharian, for example, MidChin. **mjit* (or sim.) 'honey' ← PT **m^yətə* (cf. TB *mit*). In light of the Tocharians' ultimate linguistic shift to Turkic, it is interesting to note that a few important Turkic words may be of Tocharian origin: cf. TB *okso* 'ox', *kaum* (*kom*) 'day, sun' → Proto-Turkic **öküz*, **kün*.

Toda

P Bhaskararao, Tokyo University of Foreign Languages, Tokyo, Japan

© 2006 Elsevier Ltd. All rights reserved.

Toda is the name of an ethnic group that resides on the Nilagiri mountains (= Nilgiris) in South India (with its major town of Udagamandalam = Ooty = Ootacamund located at 11.24°N and 76.44°E). The lofty Nilagiri mountains (with peaks rising above 2400 m) are the home of five culturally interrelated ethnic communities – Toda, Kota, Kurumba, Irula, and Badaga – all speaking different Dravidian languages. The Todas recognize the mutual relationship and the historical interdependency among these five communities. Though they are known as Todas to outsiders, they call themselves oḷ (meaning 'Toda person'), and their language, oḷ-po-š (po-š 'language'). The Toda language contains different words for each of the five Nilagiri communities. They are oḷ (Toda = tōḍa), *kuḷi-f* (Kōṭa), *kurb* (Kurumba), *erl* (Irula), and *ma-f* (Baḍaga). Though the Toda language does not have a word or a phrase to denote all these five communities together as one group, it has the word, *pō-ṛ*, which means 'a nonwhite low lander (who does not belong to any of the five Nilagiri communities.)' This term demarcates all the five communities together as a group from the rest of the people of India. A white person (who is expected not to be an Indian) is called *ars*.

Toda language is endangered, with just around 900 speakers, most of whom are bilingual in their mother tongue and in Tamil language, the most dominant language in the area. There is twofold division among the Todas, conventionally called 'moieties' in anthropology. The moieties are *to-ṛθaś* and *tōwfiḷy*. Except for a few words and phrases, no significant dialectal differences are found between these two moieties.

Phonology

Among the languages of India, Toda possesses a unique and complex inventory of phonemes. It is the sound system of this language that makes it sound 'very foreign' to many non-Todas, making them to imagine wildly that it is because the Todas were originally some exotic people such as Greeks, Persians, and so forth their language contains so many 'foreign' sounds. All of these 'exotic' sounds are derivable historically from a proto-stage through an intricate set of rules.

In addition to the typical five vowels (and their long counterparts) available in most of the Dravidian languages, the Toda vowel inventory contains front rounded vowels, /ü, ö/, and a back unrounded vowel, /i/. In addition, each of the eight vowel positions has a short and long counterpart. This results in a total of 16 contrasting vowel phonemes viz., *i, ī, e, ē, ü, ǖ, ö, ȫ, ī, ī̄, u, ū, o, ō, a, ā*. The inventory of consonants presents the most complex system known for any Indian language, and some of the

consonantal contrasts found in this language are not encountered in any other language in the world. There are four voiceless sibilants contrasting at dental, alveolar, palatal, and retroflex places: /s, š, ʃ, ʂ/. There are three nonsibilant fricatives: /f, θ, x/. By some morphophonemic changes, the voiced counterparts of these fricatives also attain contrastive status. Voiceless and voiced plosives contrast at seven places of articulation. They are labial (p, b), dental (t, d), denti-alveolar (c, z), alveolar (t̪, d̪), palato-alveolar (č, j), retroflex (ṭ, ḍ), and velar (k, g). There are three nasals: /m, n, ŋ/. This is the only known language that has a set of three contrastive trills and four contrastive laterals. The trills are dental /r/, alveolar /r̪/, and retroflex /r̪̄/, and the laterals are voiceless alveolar /l̪/, voiced alveolar /l̪̄/, voiceless retroflex /l̪̄̄/ and voiced retroflex /l̪̄̄̄/ (Tables 1 and 2).

Sentences

Toda is an SOV language with syntax very similar to that of other Dravidian languages. The so-called ‘extra-subject predication’ (Emeneau, 1984: 51) is peculiar to this language; for example,

o n kify kōt-s-pini
 I_{NOM} ear_{NOM} got.destroyed-PAST.SUFFIX-1ST
 PERSON.SINGULAR
 ‘My ears were ruined’

In a parallel sentence in other Dravidian languages, a dative-subject and the verb in concord with the object are expected.

The reportative/quotative sentences are also different in this language. The subject of the embedded sentence is marked for accusative case; for example,

en-n “pod-či”id, ka-k öštši/uncsi
 I-ACC “will.come.3p” QUOT, crow said.3PERSON/
 thought.3PERSON
 ‘The crow said/thought that I would come’

Pronouns and Nouns First- and second-person pronouns are differentiated for number and inclusiveness (inclusion or exclusion of the addressee). There is no differentiation on the basis of sex among the pronouns. The pronouns are: first person singular: *om*, exclusive plural *em*, inclusive plural, *om*; second-person singular *ni*, plural *nim*; third person *aθ* (and its plural *aθ-am* containing the plural suffix *-am*). Nouns are either simple or derived. Simple nouns are mono-morphemic, and derived nouns contain a suffix; for example, *kurb* ‘Kurumba community,’ *kurbč* ‘a Kurumba female.’

Nouns are inflected for plurality and case by means of suffixes. *-am* is the most common plural suffix (*ir* ‘buffalo,’ *ir-am* ‘buffalos’). Some of the case suffixes are accusative *-n*, dative *-k~g*, locative *-š*, ablative *-šn*, instrumental *-it̪*, causal *-id̪*, sociative *-wiṛ*. Some of the postpositions are *pok* ‘at the time of,’ *taš* ‘above.’ Some case forms are also formed by adding post-positions.

Numerals and Modifiers

Formation of numerals follows the general Dravidian pattern. Numerals 1000, 100, and 1–10 are mono-morphemic. They are *wid̪* ‘1,’ *eḍ* ‘2,’ *muḍ* ‘3,’ *noṅ* ‘4,’ *üz* ‘5,’ *oṛ* ‘6,’ *öw* ‘7,’ *öt̪* ‘8,’ *winboθ* ‘9,’ *pot* ‘10,’ *noṛ* ‘100,’ and *sofer* ‘1000’. The formula for forming decades is 2, 3, and so on, followed by 10 (e.g., *mu-poθ* [3–10] ‘30’). The formula for series between decades (e.g., 31–39) is the numeral for decade followed by 1–9 (e.g., *mu-poθ-eḍ* [3-10-2] ‘thirty-two’). Ordinals are derived from the above cardinals by the addition of the suffix *-oθ* (e.g., *eḍ-öθ* ‘second’).

As in the case of several other Dravidian languages, it is difficult to demarcate adjectives from nouns. A few descriptive adjectives are *kir/kin* ‘small,’ *per* ‘big,’ *poč* ‘green.’ Similarly, adverbs as a class consists of a very few members. Most of the forms that

Table 1 Vowels

| | <i>FU</i> | <i>FR</i> | <i>CR</i> | <i>CU</i> | <i>BU</i> | <i>BR</i> |
|------|-----------|-----------|-----------|-----------|-----------|-----------|
| High | i ī | ü ǖ | | | ĩ ĩ̄ | u ū |
| Mid | e ē | ö ȫ | | | | o ō |
| Low | | | | a ā | | |

Table 2 Consonants

| | <i>Labial</i> | <i>Dental</i> | <i>Denti-Alveolar</i> | <i>Alveolar</i> | <i>Palato-Alveolar</i> | <i>Retroflex</i> | <i>Velar</i> |
|---------------------|---------------|---------------|-----------------------|-----------------|------------------------|------------------|--------------|
| <i>Stops</i> | p b | t d | c z | t̪ d̪ | č j | ṭ ḍ | k g |
| <i>Nasals</i> | m | | | n | | ṇ | |
| <i>Fricatives</i> | f (v) | θ (ḍ) | s (z) | š (ž) | š (ž) | ʃ (ʒ) | x (y) |
| <i>Trills</i> | | r | | r̪ | | r̪̄ | |
| <i>Approximants</i> | | | | | y | | w |
| <i>Laterals</i> | | | | l̪ l̪̄ | | l̪̄̄ l̪̄̄̄ | |

function as adverbs are inflected nouns or forms derived from verbs. A few clear cases of adverbs are *maxar* ‘earliest,’ *p̄in* ‘later, afterwards.’

Oblique Forms

Some nouns, numerals, and so on are converted into oblique forms when some case suffixes are added to them. The most common oblique suffix is *-t*; for example, *meṇ* ‘tree’: *meṇ-t-k* ‘to the tree’ [*-k* is the dative suffix]; *eḍ* ‘two’: *n̄im eḍ-k* ‘to you both.’

Verbs

The structure of Toda verb is quite complex compared to the rest of Dravidian languages. A verb is either simple (containing only a verbal root) or derived (root+derivative suffix). The most common derivative suffix is a transitive/causative suffix (e.g., *n̄il-* ‘to stand,’ *n̄il-c-* ‘make to stand’). In a majority of cases, the transitive/causative suffix fuses with the ending of the root, as in *oṛ-* ‘to become dry,’ *oṛ-t-* ‘to dry something.’ Mediative forms can be derived from a simple or derived base by addition of the suffix *-et~ety-*. The mediative form denotes a type of indirect or noncontacting causation; for example, *miy~mis-* ‘to graze (intr),’ *miḥc- ~ miḥč-* ‘to graze (tr)’ occurring in: *ir-a-n a tiḥ-ār miḥc* ‘(Go and) graze (tr.) the buffalos over that hill!’; *mors-fy ir-k willy mad kwirt miy-et* ‘Give some good medicine to the buffalos with foot-and-mouth disease and make them graze!’

Almost all of the Toda verbal bases have two morphophonemic alternants, conventionally called Stem 1 (S1) and Stem 2 (S2). S2 enters into a majority of inflections. Historically it corresponds to the past-tense stem in some of the South Dravidian languages (such as Tamil). S1 is the etymologically underlying form, and the corresponding S2 is derivable by a set of rules from it. For instance, ‘to stand’ -S1: *n̄il-* > S2: *n̄id-*. In addition, there is a third variety of stem called the ‘Desiderative’ stem that is peculiar to Toda among the Dravidian languages. The desiderative stem takes some inflectional suffixes.

A verb base alone functions as the singular imperative form; for example, *part* ‘You(sg.) pray!’ All other full verbal forms contain a verb base followed by an optional inflection layer for tense/mode. A further optional inflectional layer of Pronominal suffixes (PN) that reflects the pronominal class of the subject terminates the verb. The third-person PN suffix is selected if the subject is any noun (singular or plural) or if it is a third-person pronoun (singular or plural). When the subject is a personal pronoun, the corresponding PN suffix is chosen. The PN layer is very complex in Toda compared with other Dravidian languages. It contains several sets of PN suffixes

that are added to different inflections. In the case of some inflections such as Non-Past, just the verb base followed by the appropriate PN suffix without an intervening tense suffix functions as the full verb. Another complexity of the PN suffix layer is the occurrence of two morphophonemic alternants of the same suffix across two sets that are conventionally called Paradigm I and Paradigm II. Paradigm I occurs before a terminating declarative suffix *-i*, and Paradigm II elsewhere.

Examples of a few tenses/modes are listed here (the verb base *t̄in- ~ t̄id-* ‘to eat’ is followed by one or more of the following suffixes: T = tense/mode suffix, Pn = Person suffix, D = declarative suffix: Past: *t̄id-s-s-i* [T-Pn-D] ‘He/she/it/they ate’; Non-past: *t̄id-č-i* [Pn-D] ‘He/she/it/they will eat’; Negative: *t̄in-in-i* [Pn-D] ‘I did/do/will not eat’; Voluntative: *t̄in-g-y* [T-Pn] ‘You(sg) may eat’; Tenseless: *t̄id-en* [T-Pn] ‘I eat’; Plural Imperative: *t̄in-š* [Pn] ‘You (pl.) eat!’; Conditional : *t̄id-u-fiṛ* [Pn-M] ‘If he/she/it eats’; Contemporaneity : *t̄id-u-k* [Pn-M] ‘while we (incl) were eating’; *t̄id-pok* [T-Pn] ‘when (somebody) ate’; Purposive: *t̄id-p̄ik* [T-P] ‘for the sake of eating.’

A number of verb bases also function as auxiliary verbs (Ax) in producing various modal forms. Some examples are: *kuty-īs-s-pini* [*kuty-* ‘to embroider’-Ax-T-Pn] ‘I knew how to embroider’; *pod-k̄iṣ-iyi* [*pod-* ‘to come’-Ax-Pn] ‘He could not come’; *noby-p̄it-s-pini* [*noby-* ‘to believe’-Ax-T-Pn] ‘I believed (him) wrongly,’ *t̄id-kur̄y-s-py* [*t̄id-* ‘to eat’-Ax-T-Pn] ‘You(sg) have completed eating’; *afoṭ-kwid-iṭi* [*afoṭ-* ‘to talk’-Ax -Pn] ‘Don’t talk to yourself,’ *kis-s-pod-s-si* [*kis-* ‘to do’ -Ax-T-Pn] ‘He went on doing,’ *kōṭ-s-pi-č-či* [*kōṭ* ‘to be spoiled’ -T-Ax-Pn] ‘It will get spoiled.’

A set of suffixes derives verbal forms that are used as modifiers; for example, *t̄id-fy oḶ* ‘man who ate’; *t̄id-θ oḶ* ‘man who ate (more definite)’; *t̄id-t oḶ* ‘man who eats’; *t̄id-p oḶ* ‘man who can eat’; *t̄in-o-fy oḶ* ‘man did/does not eat.’ The suffix *-t* also derives a verbal noun as in: *nōw kis-t* ‘making a song’ [*k̄iy- ~ k̄is-* ‘to make, do’].

Vocabulary

Before the Todas came into contact with words from the languages from the plains such as Tamil, Hindi, and English, their borrowed vocabulary must have consisted of a few words from the language of their neighbors such as Badagas. In contemporary Toda language, there are a few words from Badaga (and some Indo-Aryan words borrowed through Badaga), Tamil, Hindi, and English. Because of the elaborate ritual structure, Toda language has developed an intricate system of naming of persons, water buffalos, and places. Like other languages, it has

some culture-specific vocabulary—for instance, because of the importance of the water buffalo in the spiritual as well as mundane planes of their lives, we find words with very specific meanings such as: *malf* ‘buffalo gives a side glance before attacking.’ The traditional songs (some of them are presently in their twilight stage) contain special words as well as word-formation processes. The most important component of a Toda song is a paired unit called *koŋ* (called song-units by earlier authors). An example of a *koŋ* is: *poŋy-terθ-pom # twi-terθ-ir* [box-having.opened-money # buffalo.pen-having.opened-buffalos] (just open the box and give money or open the buffalo-pen and give buffalos to anybody who asks>) ‘to behave very generously.’

Tohono O'odham

M Miyashita, University of Montana, Missoula, MT, USA

© 2006 Elsevier Ltd. All rights reserved.

Tohono O'odham ‘Desert People,’ formerly known as Papago, belongs to the Tepiman (or Pimic) branch of the Uto-Aztecan language family, and is closely related to the Akimel O'odham (or Pima ‘River People’). O'odham is spoken in Sonora, Mexico and Southwestern Arizona (Tohono O'odham, San Xavier, Ak Chin, Gila River, and Salt River). The estimated number of speakers is between 14 000 and 15 000 (Zepeda p.c. in Mithun, 1999).

In the early 1900s, Juan Dolores, a native O'odham speaker, documented the language with linguist J. Alden Mason (Mathiot, 1991). Dolores published collections of O'odham verbs (Dolores, 1913), noun stems (Dolores, 1923), and nicknames (Dolores, 1936). Mason and Dolores compiled their work into an O'odham grammar. Ken Hale (1959) wrote his dissertation, ‘A Papago Grammar,’ based on fieldwork with O'odham speakers, and Dean Saxton (1963) published an article on the O'odham phonemic system. Madeline Mathiot (1973) compiled an extensive dictionary with the grammatical usage. Saxton *et al.* (1983) published an English-O'odham/Pima and

Pima/O'odham-English dictionary. Zepeda (1984), a native speaker, wrote a pedagogical grammar of Tohono O'odham. Some books portray O'odham songs (Bahr *et al.*, 1997; Underhill, 1993). A number of recent articles in O'odham discuss the language from theoretical points of view (Hale, 1983; Hill and Zepeda, 1992; Fitzgerald, 1997, 1998, 2000, 2002; Miyashita, 2002; Truckenbrodt, 1999).

Many loanwords are from Spanish, and some are from other indigenous languages (Miller, 1990; Hill, 1998). Five major dialects are recognized: Totoguañ, Koló:di, Gigimai, Hú:hu'ula, Ko:adk, and Huhuwos (S'óobemakame) (Saxton, 1963; Saxton *et al.*, 1983). There are generational and gender variations. Sentential conjunction such as *kuñ* ‘... and I ...’ and *kup* ‘... and you ...’ may be shortened to *n* and *p* (Zepeda, 1983). The former is more formal than the latter. Women use inhalation, or pulmonic ingressive airstream, in discourse for intimate interactional purposes (Hill and Zepeda, 1999).

The Alvarez-Hale writing system (Alvarez and Hale, 1970) is the official orthography of the Tohono O'odham Nation (Zepeda, 1983). Dictionaries by Mathiot (1973) and Saxton *et al.* (1983) use their own systems and are different from the Alvarez-Hale system (Zepeda, 1983; Miyashita and Moll, 1999).

Zepeda (1983) describes that O'odham exhibits 19 consonants: *b*, *c* (= *tʃ*), *d*, *ɖ* (= *d*), *g*, *h*, *j* (= *dʒ*), *k*, *l* (= *ʎ*), *m*, *n*, *ɲ*, *ŋ*, *p*, *s*, *ʂ* (= *ʃ*), *t*, *w*, *y* (= *j*), and asymmetric five vowels *i*, *e* (= *ɨ*), *u*, *o*, *a*. Although minimal pairs are rarely found, long and short vowels are phonemic (Hale, 1959). For example, *bik* 'navel' vs. *hi:k* 'cut,' *ta:tk* 'feel' vs. *tatk* 'the root of a plant.' There are extra-short (or aspirated, voiceless) vowels marked with a breve [i] in the orthography. An additional example, *toki* 'cotton' vs. *go:kɨ* 'footprint.' Allophonic variations appear in native words. Phonemes *t d n ɖ*, and *ʂ* appear as *c j ŋ l*, and *s* before *li*.

The stress falls on an initial syllable, e.g., *músigo* 'musician.' Prefixes do not bear a stress, e.g., *ha-wápkon* 'them-wash.' Secondary stress appears in polymorphemic words (Fitzgerald, 1997). Some loanwords are noninitially stressed, e.g., *paló:ma* 'dove < Spanish *paloma*.'

Nouns and verbs undergo partial reduplication for plural and/or distributive indications, e.g., *gogs* → *gogogs* 'dog(s),' *him* 'walking sing.' → *hibim* 'walking pl.', etc. Some words do not reduplicate, e.g., *cicwi* 'playing.' (Zepeda, 1984; Hill and Zepeda, 1998). Truncation forms a perfective verb by dropping the last consonant of an imperfective verb, e.g., *o'ohan* 'writing' → *o'oha* 'wrote.' This does not apply to a vowel-final word, e.g., *cicwi* 'playing' → *cicwi* 'played,' *si'i* 'sucking' → *si:* 'sucked.'

Person/number of possessives is indicated by a prefix, except for third person singular, which is a suffix (Zepeda, 1984). Possessed nouns are classified into alienable and inalienable categories. Alienable nouns are analyzed as either they having been previously unowned or as being related to sequential human ownership (Bahr, 1986). As shown in (1) and (2), an alienable noun must have the suffix *-ga*, and an inalienable does not.

- (1) *ɲ-je'e*
1.sing.POSS-mother
'my mother'
- (2) *gogs-ga-j*
dog-alienable-3.sing.POSS
'his or her dog'

O'odham is a nonconfigurational language. All six orders (SOV, SVO, OSV, OVS, VSO, and VOS) are possible for a transitive sentence without meaning alteration (Zepeda, 1984; Miyashita *et al.*, 2003). Pragmatic status may correlate the word order (Payne, 1987). Any nonpronominal noun must follow a particle called a *g*-determiner, except when it is sentence-initial. A sentence must have an auxiliary (AUX), which must be in the second position of the sentence as only one restriction regarding the configuration (Zepeda, 1984).

(3) Wakial 'o ceposid g haiwan. (SVO)
cowboy. AUX. branding DET cow.
sing 3.sing sing
'The cowboy is/was branding the cow.'

(4) Ceposid 'o g wakial g haiwan. (VSO)
branding AUX. DET cowboy. DET cow.
3.sing sing sing
'The cowboy is/was branding the cow.'

AUX indicates the subject's person and number, and a verb prefix indicates that of the object. However, as shown in sentences (3) and (4), any third person singular argument has no overt indication regarding the grammatical relation. Although there is no overt case marking, O'odham may be an ergative language because a reduplicated intransitive verb agrees with the plural subject, while a reduplicated transitive verb agrees with the plural object in a sentence (Zepeda, 1983; Miyashita, 2002).

Verbal aspects are distinguished between completed and continued actions (Dolores, 1913; Zepeda, 1983). Tense is divided into future and nonfuture. Imperfective present and past are not grammatically distinguished. Future is marked by a particle *o* with perfective AUX. Future imperfective sentences are formed with the perfective AUX, the imperfective verb, and usually the suffix *-d/-ad* on the verb.

O'odham kin terms show the equilateral system (Saxton *et al.*, 1983). Siblings and cousins are the same, *ʂe:pij*. Parents' siblings have eight distinct terms depending on the gender, age, and lineage. Grandparents have four distinct terms. Great-grandparents have one term, *wi:kol*. Great-great-grandparents have the same term as siblings, *ʂe:pij*. The term for 'child' is distinct depending on the gender of the parent rather than of the child.

Tok Pisin

S Romaine, Oxford University, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Tok Pisin (from English *talk pidgin*) is an English-lexicon pidgin spoken by approximately three-quarters of Papua Guinea's approximately 5 million inhabitants. It is not only the lingua franca of the entire country, with its 800 some indigenous languages, but it is also the language spoken by the most people in the South Pacific today. It is closely related to and mutually intelligible with Pijin in the Solomon Islands and Bislama in Vanuatu. All three varieties of Melanesian Pidgin owe their origins to the Queensland sugarcane plantations to which as many as 100 000 workers from these three countries were recruited during the 19th century. Men with mutually unintelligible village languages found themselves living and working together, as well as needing to

communicate with their English-speaking plantation managers. A form of pidgin English served this purpose. When the labor trade ended in 1905, most of the workers went back to their countries of origin, taking with them knowledge of this Queensland Plantation Pidgin. In these highly multilingual countries, pidgin served the useful internal function of communicating across ethnolinguistic boundaries. Social conditions were thus conducive not just for the retention and spread of the pidgin but also for its stabilization and subsequent creolization.

Today, Tok Pisin is used across Papua New Guinea's social spectrum, known by villagers and government ministers alike. It is the most frequently used language in the House of Assembly, the country's main legislative body, and the constitution recognizes Tok Pisin as one of the national languages of Papua New Guinea. Tok Pisin has become the main language of the migrant proletariat and the first language of the

younger generation of town-born children, where it has creolized (i.e., become a creole). Tok Pisin is also one of the few pidgin and creole languages to have undergone considerable standardization because missionaries realized its potential early on as a valuable lingua franca for proselytizing among a linguistically diverse population and began using it for teaching. Most printed material is still religious; the Bible has been translated into Tok Pisin. However, the language is used to some extent in radio and television broadcasting, especially in interviews and news reports. The weekly Tok Pisin newspaper, *Wantok*, has a readership of over 30 000. Until recently, English was the only official language of education in Papua New Guinea despite the fact that few children enter school knowing it. However, education reforms have allowed communities to choose the language to be used in the first 3 years of elementary education, and many have chosen Tok Pisin.

The lexicon of Tok Pisin is mainly English (79%); Tolai (Kuanua), an indigenous language, has contributed 11%, other indigenous languages 6%, German 3%, and Malay 1%; there is also a handful of words from other European languages such as Portuguese/Spanish (e.g., *save* from Portuguese/Spanish *sabir/saber* 'to know/knowledge'). English borrowings provide the most important source of new vocabulary. Even frequently used words such as *kiau* 'egg' from Tolai are increasingly being replaced by or used alongside the English *egg*. Likewise, some of the German vocabulary in the language (e.g., *beten* 'pray'), dating from the period of German colonial rule (1884–1914) of part of the country, is giving way to English. The phonology of individual speakers of Tok Pisin varies from a core system that is shared by all speakers of the language and is similar to that of the indigenous substrate languages to a highly Anglicized phonology that makes the most of English consonant and vowel distinctions. Tok Pisin has little morphology, although it has acquired some derivational and inflectional morphology in the course of its expansion. The suffix *-pela* is used to form the plural of the first- and second-person pronouns (e.g., *yu-pela* 'you plural'); it also marks a subset of monosyllabic attributive adjectives, demonstratives, and cardinal numerals (e.g., *dis-pela tu-pela pis* 'these two fish(es)'). Transitive verbs are marked with the suffix *-im*.

| | | | | |
|-------------------------------------|------|-------------|----------|---------------|
| em | i | lus-im | dis-pela | ples |
| 3.SING | PRED | leave-TRANS | this-DEM | place/village |
| 'he/she/it left this place/village' | | | | |

(Here, PRED stands for predicate marker.) Some grammatical distinctions reflect the influence of the substrate indigenous languages; in the personal pronoun

system, different pronouns are used for inclusive (i.e., speaker + hearer) and exclusive (i.e., speaker + other(s), not including hearer). Compare *yumi* 'we (inclusive)' with *mipela* 'we (exclusive).'

Full lexemes are often used to express grammatical categories such as case, number, gender, tense, mood, and aspect, which in other languages are expressed by inflectional morphology; these distinctions are, however, not always obligatory. This is especially true for tense, mood, and aspect. The normal way of indicating past time is through use of the unmarked verb form, but *bin* (from English *been*) may be used.

| | | | | | |
|----------------------------------|------|------|-------------|--------|------|
| ol | i | bin | adopt-im | liklik | meri |
| 3.PL | PRED | PAST | adopt-TRANS | little | girl |
| 'they adopted a/the little girl' | | | | | |

Sometimes *bin* is used in conjunction with *pinis* (from English *finish*) to mark completed actions in the past as a kind of perfective marker.

| | | | | | | |
|--|--------|---------|------|------|-----------|-------|
| tim | bilong | Mormads | i | bin | win-im | pinis |
| team | of | Mormads | PRED | PAST | win-TRANS | PERF |
| 'the Mormads team has won (the grand netball final)' | | | | | | |

The meanings of immediate and remote future, prediction, intention, and irrealis may be expressed by clause-initial or preverbal *bai*, which has almost entirely replaced the earlier form *baimbai* (from English *by and by*). Pronominal subjects tend to take clause-initial *bai*, and noun phrases tend to take preverbal *bai*. Preverbal position is fast becoming the preferred order, although there are regional and stylistic differences.

| | | |
|-------------|-----|----|
| mi | bai | go |
| 1.SING | FUT | go |
| 'I will go' | | |

Tok Pisin has SVO word order; there is no copula and negation is preverbal (*mi no save* 'I don't know'). There is no inversion for questions.

| | | | |
|---------------------------------|------|---------|----|
| yu-pela | gat | brus | a? |
| 2-PL | have | tobacco | Q |
| 'do you (plural) have tobacco?' | | | |

Torricelli Languages

M Donohue, National University of Singapore, Singapore

© 2006 Elsevier Ltd. All rights reserved.

The approximately 50 languages of the Torricelli are spoken in north Papua New Guinea. The family extends from the eastern Bewani mountains in Sandaun Province; through the Torricelli ranges to Maprik, where Ndu speaking villages reach through to the north coast; and continuing east of Wewak in Sepik Province in the Marienberg ranges and ground south of the Murik lakes, with a final outpost at Bogia in Madang province. The languages are remarkable for non-Austronesian languages in New Guinea for having a basic SVO word order, whereas the norm is SOV. They have been grouped into seven subgroups, whose internal constituency appears to be valid, although the seven-way division still awaits proof. The membership of the family as a whole appears to be accurate.

There are typically no phonetically unusual segments in Torricelli languages, and, although stress is frequently contrastive, reports of tonal differences are rare. The languages near Nuku share with the adjacent Ndu languages the presence of creaky or glottalized vowels, ranging from just one (/a/) to contrasts present on the whole vowel inventory. The vowel inventories tend to be large, with seven or eight vowels being not uncommon in the western languages (a typical inventory is /i e ε a ɔ o u ʉ/) and five or six vowels being more common in the east. The loss of velar segments in some western languages has led to the unusual case of languages without velar contrasts at all. Voicing contrasts are usually associated with prenasalization.

There is significant diversity within the family, and the Torricelli languages are also significantly different from most other languages of New Guinea. Although they all show SVO order, typically with prefixal agreement for the subject and suffixal agreement for the object and lacking case marking on (core) nominals – all features that are unusual in New Guinea – other details of their morphological and syntactic structure show considerable diversity. In the eastern languages, such as Monumbo and Arapesh (Bukiyip, also known as Muhiang), multiple class systems with extensive concord are found, whereas in the west only remnant traces of noun classification can be found in the synchronically irregular plural endings of One and Olo.

For example, in Bukiyip ‘stone’ is *utom* (SING) *utabal* (PL), showing the *-m* and *-bal* suffixes typical of class 5 nouns (compare this with a class 2 noun, such as ‘village’ *wa-bél* SING, *wa-lúb* PL). Adjectives show

similar suffixes, agreeing in class and number with their noun, and verbs have cognate prefixes:

yopi-**mi** uto-**m** m-a-pwe agnú
‘(the) good stone is there’

yopi-**bili** wa-**bél** bl-a-pwe agnú
‘(the) good village is there’

In the western Torricelli language One, ‘stone’ is *toma* (SING) *tomu* (PL), showing an *-a* versus *-u* pattern, just as in ‘flower’ *sula* (SING), *sulu* (PL), indicating that, although it is a minority pattern, the alternations in ‘stone’ are regular. The word for ‘village’ *wapli* can be singular or plural, with the common *-li* plural suffix, but *wap* is only singular (this form is commonly found in compounds, such as *wap oi* ‘village grounds, area’). Concord on other words is not as strong, however:

upo toma w-ae nu
‘the good stone is there’

This sentence shows no agreement on *upo* ‘good,’ and only the general second/third-person singular *w-* on the verb ‘sit, be at.’ The same forms as are found in:

upo wapli w-ae nu
‘the good village is there’

A few adjectives do show alternations:

plola toma w-ae nu
‘the short stone is there’

plolu tomu n-ai n-e nu
‘the short stones are there’

with variation for number (the verb ‘sit’ has irregular singular and plural forms). Different noun classes, however, do not show different agreement patterns. Using the same inflecting adjective, *plola*, with a different noun shows the same inflectional pattern:

plola wap w-ae nu
‘the short village is there’

plolu wapli n-ai n-e nu
‘the short villages are there’

There are also no differences in verbal morphology. Another striking aspect of the NP in One involves the lack of a fixed word order: Gen N as well as N Gen, Dem N as well as N Dem, and Adj N as well as N Adj are found, with only relative clauses being restricted to postnominal position.

Like most languages of New Guinea, there is no evidence of a voice system operating in any of the Torricelli languages, but applicatives are almost universal in the Torricelli languages, being found in at least fossilized form even on the more isolating

members of the family. In some languages the applicative and the verb 'give' show close similarities (One: *-ne* APPL and *an(e)* 'give'), whereas in other languages the two morphemes bear no obvious resemblance to each other (Olo: *-f(i)* APPL, *wa* 'give'; Arapesh *-ma* APPL, *se* 'give'). There does not seem to be a single historical source for the various applicatives attested in different branches of the family. An applicative is often required lexically by low-transitive verbs. One has *y-upa-ne* 'follow,' with a lexicalized applicative, for instance.

Serial verbs are a regular feature of Torricelli languages, although clause chaining is not. One, the westernmost Torricelli language has an unusual syntactic parameter setting whereby word order within the NP is free but the position of NPs and PPs within the clause is rigidly fixed, implying that there is configurationality at the clause level but not at the phrase level.

Over the years, there have been various suggestions concerning the history of the Torricelli languages. Authors have suggested a relationship with the Asli languages of Malaysia and with the East Bird's Head languages of western New Guinea. None of these claims has yet stood up to any serious investigation. The SVO order of the Torricelli languages, unusual in New Guinea, has been attributed to Austronesian contact (as has also been proposed for the similarly SVO languages of the Bird's Head), but it could just as easily be innate. The Torricelli languages are, indeed, not highlands languages, and there is no reason to suppose that SVO is not the original Torricelli order.

Totonacan Languages

C J MacKay and F R Trechsel, Ball State University, Muncie, IN, USA

© 2006 Elsevier Ltd. All rights reserved.

The Totonacan languages are spoken in central Mexico in a region that includes parts of three states: southern Hidalgo, northern Puebla, and northwestern Veracruz (see **Figures 1** and **2**). Although proposals have sometimes been made to relate the Totonacan languages to Mayan, Mixe-Zoquean, and other languages in Mesoamerica (McQuown, 1942), these relationships have never been demonstrated. Today, the Totonacan language family is generally regarded as an ‘isolate’ in the classification of Mesoamerican languages (Suárez, 1983; Campbell, 1997). It is thought that speakers of these languages settled near the Gulf Coast around 800 A.D. Their original homeland is unknown; however, based on ethnohistorical sources and loanwords found in other Mesoamerican languages, it has been proposed that Totonacs may have founded Teotihuacan and moved to their current location following its collapse (Justeson *et al.*, 1985).

Totonacan Language Family

The Totonacan language family is made up of two branches: Totonac, consisting of four languages, with

roughly 220 736 speakers, and Tepehua, consisting of three languages, with approximately 8252 speakers (INEGI–XII Censo General, 2000). Although the Totonac and Tepehua languages are mutually unintelligible today, they share a great deal of vocabulary and exhibit many structural similarities. These similarities indicate that the languages developed, historically, from a common ancestor, Proto-Totonacan. **Figure 3** provides a simplified representation of the relationships of the various languages. As linguistic investigation proceeds, further groupings and subgroupings within the family will undoubtedly emerge.

As illustrated in **Figure 3**, the Totonac branch consists of four languages, referred to here as Misantla, Papantla, Sierra, and Northern:

Misantla Totonac, the southernmost variety, is spoken between the cities of Xalapa and Misantla in Veracruz. Towns where speakers may still be found include Yecuatla (192 speakers), San Marcos Atexquilapan (13), Landero y Coss (61), Chiconquiaco (56), and Jilotepec (11) (INEGI–XII Censo General, 2000). Misantla Totonac is moribund, with few native speakers remaining, all over the age of 45. The largest concentration of speakers is found in Yecuatla, but their number is dwindling rapidly. According to the Mexican Census, 486 individuals spoke Totonac in Yecuatla in 1980; in 2000, only

Figure 1 Mexico (adapted from a map drawn by Ashley Withers).

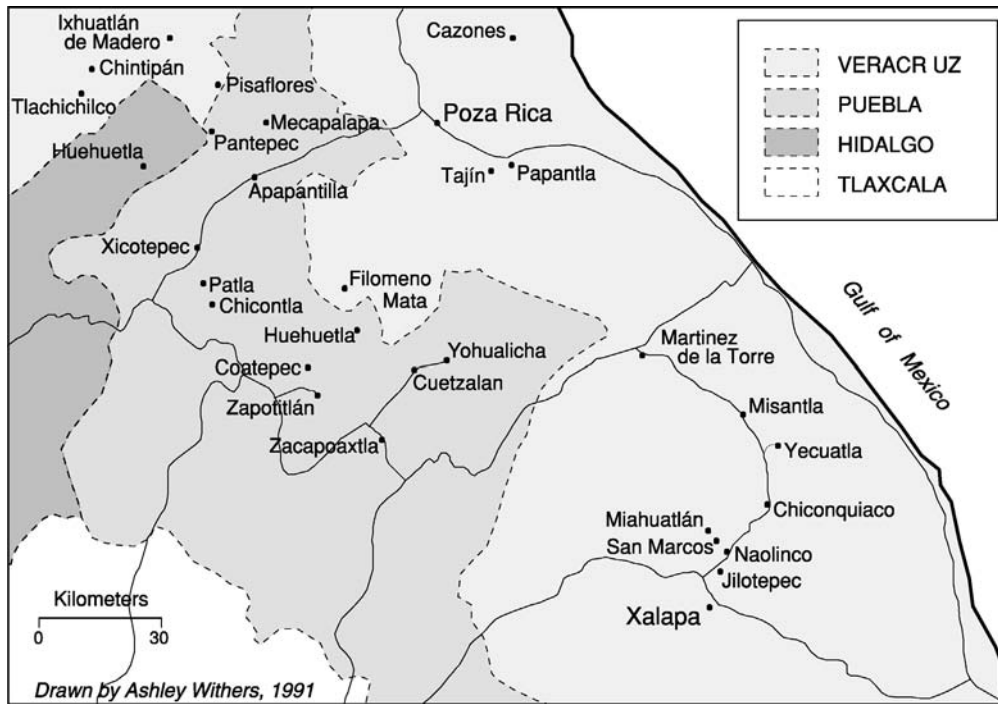

Figure 2 Totonacan language area (adapted from a map drawn by Ashley Withers).

Figure 3 Totonacan language family.

192 speakers remained (INEGI–Censo General, 1980, 2000). Data on Misantla Totonac come from Yecuatlá and San Marcos Atexquilapan (MacKay, 1994, 1999; MacKay and Trechsel, 2003, in press).

Papantla Totonac is spoken by roughly 36 000 individuals in and around the city of Papantla, Veracruz. Children are still learning Papantla Totonac, but the language is being used less frequently within the communities. Data on Papantla Totonac come from El Escolín (Aschmann, 1973), Cerro del Carbón (Levy, 1987, 1990), and El Tajín (García Ramos, 2000).

Sierra Totonac is spoken by more than 100 000 people in the Sierra Norte de Puebla and nearby towns in Veracruz. The exact limits of Sierra Totonac and Northern Totonac are still being determined. Children continue to learn Sierra Totonac as their native language, and it is the main language used in many communities. Data on Sierra Totonac come

from Zapotitlán de Méndez, Puebla (Aschmann and Wonderly, 1952; Aschmann, 1962), and Coatepec, Puebla (McQuown, 1990).

Northern Totonac is spoken by roughly 10 000 people in the region surrounding Xicotepéc de Juárez, Puebla. It is unclear how many children are learning Northern Totonac; most speakers appear to be middle aged or older. Data on Northern Totonac come from Apapantilla, Puebla (Reid *et al.*, 1968; Reid and Bishop, 1974; Reid, 1991) and Patla and Chicontla, Puebla (Beck, 2004). Beck refers to the variety of Northern Totonac spoken in the latter two communities as Upper Necaxa Totonac.

The Tepehua branch of Totonacan consists of three languages, identified here as Tlachichilco, Pisaflores, and Huehuetla.

Tlachichilco Tepehua is spoken in Tlachichilco, Veracruz, and in the surrounding communities of Chintipán, Tierra Colorada, and Tecomajapa.

According to the 2000 census, there are approximately 2463 speakers in these communities, many of whom are middle aged or older (Watters, 1988: 5). James K. Watters is the only linguist to have conducted research on Tlachichilco Tepehua. His publications include discussions of morphosyntax (1988), phonology (1987), verbal semantics (1996), and second-person laryngealization (1994). Although there is as yet no published lexicon or descriptive grammar of Tlachichilco Tepehua, it is the best documented of all the Tepehua languages.

Pisaflores Tepehua is spoken by roughly 2786 individuals in and around Pisaflores, Veracruz. Tepehua is the main language of this community and children are still learning it as their native language. Carolyn J. MacKay and Frank R. Trechsel have been conducting linguistic research in Pisaflores since 1997 and are working on a description of Pisaflores Tepehua.

Huehuetla Tepehua is spoken in and around the towns of Huehuetla, Hidalgo, and Mecapalapa, Puebla. There are approximately 1649 speakers of Huehuetla Tepehua, all of whom are at least middle aged. Publications on the language include a short sketch of sentence structure, a description of Tepehua numerals, and a preliminary description of verb inflection (Herzog, 1974). The Liga Bíblica Mundial del Hogar published the New Testament in Huehuetla Tepehua in 1976.

Totonacan Phonology

Totonacan languages exhibit three vowels, /a/, /i/, /u/, and a length distinction, contrasting short and long vowels. Some languages, like Northern Totonac, have also developed phonemic /e/ and /o/ (Beck, 2004). Plain and laryngealized variants of both short and

long vowels exist in all Totonacan languages. Whether this distinction is contrastive or predictable has not yet been determined for all varieties. However, all Totonacan languages employ laryngealization to mark second-person subjects.

- (1) Misantla Totonac (MacKay, 1999: 156, 157)
- | | |
|------------------------|----------------|
| [wɨ́f kɑ́tsɨ́] | ‘you know X’ |
| /wɨ́f kɑ́tsii/ | |
| [ʔɨ́f kɑ́tsii] | ‘s/he knows X’ |
| /ut kɑ́tsii/ | |
| [kinán kɑ́ayáa] | ‘we cut X’ |
| /kinán kɑ́a-yaa-wa/ | |
| [wɨ́jɨ́n kɑ́ayáat] | ‘y’all cut X’ |
| /wɨ́jɨ́n kɑ́a-yaa-tat/ | |

Figure 4 presents the consonants that are found in almost all Totonacan languages. In most Totonacan languages, glottal stop is contrastive only in word-final position. However, in Upper Necaxa Totonac, Pisaflores Tepehua, and Huehuetla Tepehua, /ʔ/ has replaced /q/ and therefore occurs in other positions as well.

Consonant alternations to mark degrees of size, force, and intensity have been described in Totonacan. This sound symbolism typically involves the sets of sounds *s*/*ʃ*/*ʂ*, *k*/*q*, and *ts*/*tʃ* with *ʂ*, *q*, and *tʃ* being the most intense (Bishop, 1984; Levy, 1987; MacKay, 1999; Beck, 2004).

- (2) Misantla Totonac (MacKay, 1999: 114)
- | | | |
|------------|-----------|---------------|
| [tsʊ́tsɨ́] | /tsʊ́tsū/ | ‘s/he smokes’ |
| [tʃʊ́tʃɨ́] | /tʃʊ́tʃū/ | ‘s/he sucks’ |
- (3) Papantla Totonac (Levy, 1987: 115)
- | | |
|------|---------------------|
| sukū | ‘small hole’ |
| ʂukū | ‘medium-sized hole’ |
| ʂuqū | ‘large hole’ |

| | Labial | Alveolar | Alveo-palatal | Palatal | Velar | Uvular | Glottal |
|---------------------|--------|---------------------|---------------|---------|-------|--------|---------|
| Plosive | p | t | | | k | q | ʔ |
| Affricate | | ts, tʃ ^a | tʃ | | | | |

| Fricative | | s, ʂ | ʃ | | | | h |
| Approximant | w | | | y | | | |
| Lateral approximant | | l | | | | | |

^atʃ is found only in Sierra Totonac, Northern Totonac and Papantla Totonac.

Figure 4 Totonacan consonants.

Totonacan Morphology

Totonacan languages exploit a very complex and productive morphology, characterized by a large number of affixes, both prefixes and suffixes, that do most of the work of the grammar. Verbs and nominals are the major word classes.

Nominals

In some languages (e.g., Misantra Totonac and Sierra Totonac), adjectives and nouns do not differ in their inflectional morphology. In others, however (e.g., Papantla Totonac and Upper Necaxa Totonac), nouns and adjectives are distinct. Nominal inflectional morphology is relatively simple. Nominals are optionally marked for plurality, and in possessive constructions are also marked for person (and sometimes number) of possessors.

|--|------------------------|--------------|
| (4) Misantra Totonac (MacKay, 1999: 349) | | |
| [kíntʃík] | 1POSS-house | 'my house' |
| /kin-tʃík/ | | |
| [kíntʃíkʃín] | 1POSS-house-PL | 'my houses' |
| /kin-tʃík-VVn/ | | |
| [kíntʃíkán] | 1POSS-house-POSS.PL | 'our house' |
| /kin-tʃík-kan/ | | |
| [kíntʃíkʃínkán] | 1POSS-house-PL-POSS.PL | 'our houses' |
| /kin-tʃík-VVn-kan/ | | |

Numerals

The Totonacan numerical system, like many others in Mesoamerica, is vigesimal. In many of the Totonacan languages, the numerical system is being replaced by the Spanish one.

- | | |
|---|------------------------|
| (5) Misantra Totonac (MacKay, 1999: 393, 394) | |
| [puʃúmpuʃúmpuʃún] | 'sixty (20 + 20 + 20)' |
| /puʃum-puʃum-puʃum/ | |
| [tutún puʃún] | 'sixty (3 × 20)' |
| /tutun puʃum/ | |

Body Part Prefixes

Body Part Prefixes occur on both nominal and verb stems, but are most productive on verbs. They usually denote either the body part affected by the action of the verb or a spatial relationship ('in front of,' 'behind,' 'beside,' 'above,' etc.).

| /min-ta-qaqa-nu-u-Vt/ | |
| 2POSS-INCHOATIVE-ear rel.-inside-NOM | |
| 'your earring' | |

Verbal Inflection

Totonacan verbal morphology is characterized by a layering of derivational and inflectional affixes. Verbs

may be inherently stative, intransitive, transitive, and, in some languages, ditransitive. In all languages, the verbal inflectional system distinguishes two aspectual categories (perfective and imperfective); two tense categories (past and nonpast); and two mood categories (realis and irrealis). In many, but not all, Totonacan languages, the inflectional system also marks categories of future tense and/or perfect aspect. The exact distribution of these latter categories in the family has yet to be determined.

In addition, in all Totonacan languages, verbal inflectional affixes mark categories of person and number of both subjects and objects. For the most part, inflectional affixes are transparent in the sense that they can be easily isolated and their semantic contribution is clear. In transitive sentences involving two nonthird-person arguments, however, certain contrasts are neutralized. In all languages except Sierra Totonac, combinations of a second-person subject and a first-person object, where either or both are plural, are expressed by means of reciprocal verbs with first person inclusive plural subjects. Sentences like the following, from Pisaflores Tepehua, are systematically ambiguous:

- | |
|--|
| (7) Pisaflores Tepehua (MacKay and Trechsel, 2003: 295) |
| [kiláaláʔtsínáaw] |
| /kin-laa-laʔtsin-yaa-wi/ |
| 1OBJ=RECIP-see.X-IMPERF-1SUBJ.PL |
| 'You (sg.) see us,' 'You (pl.) see me,' 'You (pl.) see us' |

A similar ambiguity emerges in sentences in which a first person subject acts on a second person object and, again, one or both are plural. In the Tepehua languages, these combinations are expressed by means of reciprocal verbs with first person exclusive plural subjects. The example in (8) is four-ways ambiguous:

- | |
|--|
| (8) Pisaflores Tepehua (MacKay and Trechsel, 2003: 297) |
| [ʔikláaláʔtsínáaw] |
| /ik-laa-laʔtsin-yaa-wi/ |
| 1SUBJ-RECIP-see.X-IMPERF-1SUBJ.PL |
| 'I see you (pl.),' 'We see you (sg.),' 'We see you (pl.),' |
| 'We (excl.) see each other' |

In contrast, the Totonac languages, with the exception of Sierra Totonac, use reciprocal verbs in 2SUBJ > 1OBJ contexts, but not in 1SUBJ > 2OBJ contexts. Nevertheless, all Totonac languages employ a single verb form to express combinations of first person subject and second person object where one or both are plural. Ambiguities of the sort illustrated in (7) and (8) are pervasive throughout the family.

Verbal Derivation

Totonacan languages exhibit a rich inventory of derivational affixes that affect the valence of both

transitive and intransitive verbs. The most productive are a causative affix, /maa-/ ‘CAUS,’ and several applicative affixes that license arguments interpreted as beneficiary, recipient/goal, instrumental, comitative, and others. In many languages, applicative affixes are the only means available for expressing arguments with these semantic roles.

- (9) Misantla Totonac (MacKay, 1999: 274)
 [ʔikliláqɛnán
 /ik-lil-laqan-yaa-na
 1SUBJ-INST-see X-IMPERF-2OBJ
 kililáqtʃaqáatáayat]
 kin-lil-laq = tʃaqaa-taaya-Vt/
 1POSS-INST-eye rel.-upright-NOM
 ‘I see you with my glasses’

On transitive verbs, causative and applicative affixes yield ditransitive verbs with two nonoblique objects. There is variation within the family concerning the treatment of these objects. At one extreme are languages like Misantla Totonac in which either or both of the objects may control overt object agreement. Sentences like (10) are systematically ambiguous in this language:

- (10) Misantla Totonac (MacKay, 1999: 190)
 [ʔikláamakaʔiʃki
 /ik-laa-maka-iʃki-wa
 1SUBJ-3OBJ.PL-hand rel.-give X to Y-1SUBJ.PL
 hɔnlíbru]
 hun-libru/
 DET-book
 ‘we handed them the book,’ ‘we handed him/
 her the books’

At the other extreme are languages like Papantla Totonac (Levy, 2000) in which only one of the two objects may control agreement.

- (11) Papantla Totonac (Levy, 2000: 5)
 ka:ma:xi’-lh lakcumaján kin-qa’wasa
 OBJ.PL-give-PFV girls 1POSS-son
 ‘I gave my son to the girls’ / *‘I gave the girls to
 my son’

Between these extremes are several intermediate types in which possibilities of double object marking are constrained by person and number features of the objects.

Totonacan Syntax

Word order in Totonacan languages is extremely flexible and almost any order is acceptable. In unmarked cases, word order is verb initial, and frequently VSO. Subjects may precede the verb for pragmatic effects associated with focus or topicalization.

Coordination and subordination are not explicitly marked and verbs in both clauses exhibit finite verbal morphology.

- (12) Misantla Totonac (MacKay and Trechsel,
 in press)
 [lakaa ʔiknispáa hɔn tʃiʃkúʔ
 /lakaa ik-nispaa hun tʃiʃkuʔ

Trans New Guinea Languages

A Pawley, Australian National University,
Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Trans New Guinea Family

Comprising upward of 400 languages, Trans New Guinea (TNG) is the third largest family in the world in number of languages, behind Austronesian and Niger-Congo and ahead of Indo-European. TNG is the predominant family on the large island of New Guinea, a region of spectacular linguistic diversity that contains some 18 families that are not demonstrably related (see **Papuan Languages** and **Austronesian Languages**). TNG languages are spoken continuously along the 2000-km mountain chain that runs along the center of New Guinea as far west as the Bird's Head, and they also are used in several parts of the lowlands. At least a dozen TNG languages are also present on Timor, Alor, and Pantar Islands in East Nusantara.

About 3 million people speak TNG languages. Yet, most of the languages have fewer than 5000 speakers. Their small size reflects the difficult terrain of New Guinea in combination with extreme political fragmentation; peoples were traditionally subsistence farmers or foragers, and until colonial times political groups seldom exceeded a few hundred people. The largest TNG language communities are Enga (about 200 000) and Medlpa (Melpa; 150 000) in the highlands of Papua New Guinea, and Western Dani (150 000) and Lower Grand Valley Dani (130 000) in the highlands of West Papua (Irian Jaya).

Until the late 19th century, the TNG languages of New Guinea were completely unknown to linguists, and most remained unrecorded until after World War II. Since then, linguists from various parts of the world have done descriptive and comparative work on TNG languages. Although most are still only documented (at best) by grammatical sketches and word lists, there are quite detailed published grammatical descriptions of perhaps 50 to 70 TNG languages. Reasonably

good dictionaries exist for about 20 TNG languages. Excellent introductory overviews are given in Foley (1986, 2000). The atlas of Wurm and Hattori (1981–83) contains detailed maps, and Carrington's work (1996) is a near-exhaustive bibliography. Languages for which there are good grammars include Korafe of the Binandere group (Farr, 1999), Grand Valley Dani (Bromley, 1981), Hua (a dialect of Yagaria) of the Gorokan group (Haiman, 1980), and Eipo (Eipomek) of the Mek group (Heeschen, 1998).

History of the Trans New Guinea Hypothesis

The hypothesis that there is a large TNG family was proposed about 1970 by linguists at the Australian National University, mainly on the basis of typological resemblances and a handful of widespread putative cognates (McElhanon and Voorhoeve, 1970; Wurm, 1975). However, critics argued that the hypothesis was based on unreliable methods and that the evidence was unconvincing. Percentages of resemblant basic vocabulary forms shared by languages belonging to distant branches of TNG are very low, in the range of 3–7%, and in a region where there has been extensive lexical diffusion for millennia, this level of agreement could be due to borrowing and chance. Recently, linguists have applied more classical comparative methods and have found evidence that strongly supports a modified version of the TNG hypothesis (Pawley, 1995; Ross, 1995; Pawley, 1998, 2001, in press; Ross, in press).

The main grounds for considering TNG to be a language family are (1) systematic form-meaning correspondences in the independent personal pronouns, permitting reconstruction of virtually a complete paradigm (Table 1); (2) some 200 putative cognate sets (nearly from 'basic vocabulary') being represented in two or more major subgroups (Table 2); (3) a body of regular sound correspondences for a small sample of languages belonging to eight different subgroups, which has allowed a good part of the Proto TNG sound system to be reconstructed (Table 3); and (4) resemblances in certain other grammatical paradigms, chiefly the form of verbal suffixes marking

Table 1 Proto TNG free pronouns

| | 1st person | 2nd person | 3rd person |
|------------------|------------|------------|------------|
| sing. | na | ŋga | [y]a, ua |
| pl. (i-graduate) | ni | ŋgi, ki | i |
| (u-graduate) | nu | | |
| pl. | nja | | |

person-number of subject. In addition, the distribution of certain striking structural features, such as switch-reference morphology on verbs, has been shown to correlate rather closely with the distribution of TNG languages.

TNG seems to have had a simple syllable structure, with syllables of the shape (C)V and (word-finally) CVC.

Subgroups of Trans New Guinea

More than 30 subgroups are recognized that have not been assigned to any larger grouping within Trans New Guinea. Much of the evidence for these groups is based on innovations in the personal pronouns (Ross, in press). The following is a selection of the more important subgroups.

Madang (Madang-Adelbert Range) is by far the largest well-defined subgroup of TNG, with about 100 members (*see Madang Languages*). It occupies the central two-thirds of Madang Province from the coast to the Bismark and Schrader Ranges. Huon-Finisterre contains about 70 languages spoken on the Huon Peninsula and in the Finisterre and Saruwagi Ranges in Morobe and Madang Provinces.

| mid | e | | | o |
| low | | a | | |

Chimbu-Wahgi (Chimbu) is centered east and south of Mt. Hagen, in the Wahgi, Nebilyer, and Kaugel Valleys and extends north of the Sepik-Wahgi Divide into the Jimi Valley. It contains perhaps 12 languages, although the situation is complicated by extensive dialect chaining. The best-known members are probably Kuman (Chimbu), Middle Wahgi, Sinasina, and Medlpa (Melpa). Engan is a well-defined group consisting of several languages spoken over a wide area to the west of Mt. Hagen. There is a northern subgroup that includes Enga, Ipili, Iniai (Bisorio), and Lembena and a southern subgroup that includes Sau (Samberigi), Huli, Mendi (Angal), and Kewa.

The Kainantu and Goroka groups occupy contiguous parts of Eastern Highlands Province. Each consists of a half a dozen or so languages, some with diverse dialects. Together they probably form a single higher-order larger subgroup, Kainantu-Goroka. The Angan group of about 12 languages occupies considerable areas of Morobe and Gulf Provinces and extends into the Eastern Highlands province. Southeast New Guinea contains the Dagan, Mailuan, Yareba, Manubaran, Kwalean, and Koiari groups, which all replace Proto TNG **ngi* '2 PL' by **ya*, as well as the Binandere and Goilalan groups.

The Ok group comprises about about 10 languages spoken in the central ranges around the West Papua-Papua New Guinea border, including the Star Mountains, and the Thurnwald and Victor Emmanuel Ranges. The Awyu-Dumut and Asmat-Kamoro groups occupy the lowlands to the southwest of this area, in West Papua. The Dani languages spoken in and around the Baliem Valley and the Wissel Lakes languages seem to belong together in a Western New Guinea group. The West Bomberai and Timor-Alor-Pantar groups share two probable innovations in pronouns, which suggests that together they may form a West Trans New Guinea group (Figure 1).

Where and When was Proto TNG Spoken?

The largest concentration of established high-order subgroups of TNG lies in the central highlands of Papua New Guinea between the Strickland River and Eastern Highlands. It is safe to say that this was a very early area of TNG expansion and that initial dispersal was mainly along the central cordillera. If we take conventional estimates for the breakup of Indo-European (at least 6000 years ago) and Austronesian (about 5000 years ago) as yardsticks, a date of between 8000 and 12000 years ago for the breakup of TNG is reasonable, given that lexicostatistical diversity within TNG is far greater than in either Indo-European or Austronesian. It is noteworthy that dates of about 10000 years ago have been established

for early agriculture, probably based on taro and bananas, in the Upper Wahgi Valley (Denham *et al.*, 2003). It may have been their use of agriculture that enabled speakers of TNG languages to establish permanent settlements along the central highlands of New Guinea as the climate warmed after the last Ice Age.

Structural Characteristics of TNG Languages

Phonology

Many TNG languages have sound systems similar to that posited for Proto TNG, with syllables of the shape (C)V and (word-finally) CVC, five vowels, and series of nasals, oral, and pre-nasalized (or voiceless and voiced) obstruents with contrasts at bilabial, apical, and velar (and sometimes palatal) positions. A number of languages in the central highlands have a contrast between dental, alveo-palatal, and velar laterals, or between resonant and fricative palatals. [t] and [r] are often allophones of the same phoneme. Many TNG languages have word tone or pitch accent (Donohue, 1997).

Grammar and Semantics

The preferred order of constituents in verbal clauses is SOV, but OVS often occurs as a marked structure. Adpositions follow the verb, whereas determiners and possessors follow the noun. Case marking is generally absent or little developed. Most languages organize pronominal affixes to show a nominative-accusative (or dative) contrast. No language is known to have a full ergative-absolutive alignment for verb pronominals.

Generally, a verb root cannot be used as a noun without derivational morphology or vice versa. In some languages verb roots are a small closed class, with between 50 and 150 members. The densest concentration of such languages seems to be in the Chimbu-Wahgi and Kalam-Kobon subgroups. Common nouns are an open class with many subclasses. Minor classes include adjectives, adverbs, and (see below) verbal adjuncts.

TNG languages typically have fairly simple systems of independent pronouns, in some cases distinguishing three persons but with no number contrasts. More complex pronoun systems are constructed by adding number markers for dual and plural. However, there is often a discrepancy between the kinds of distinctions made in independent pronouns and in verbal affixes. For example, Kuman of the Chimbu-Wahgi family has only four independent pronouns – first person singular, first person plural, second person,

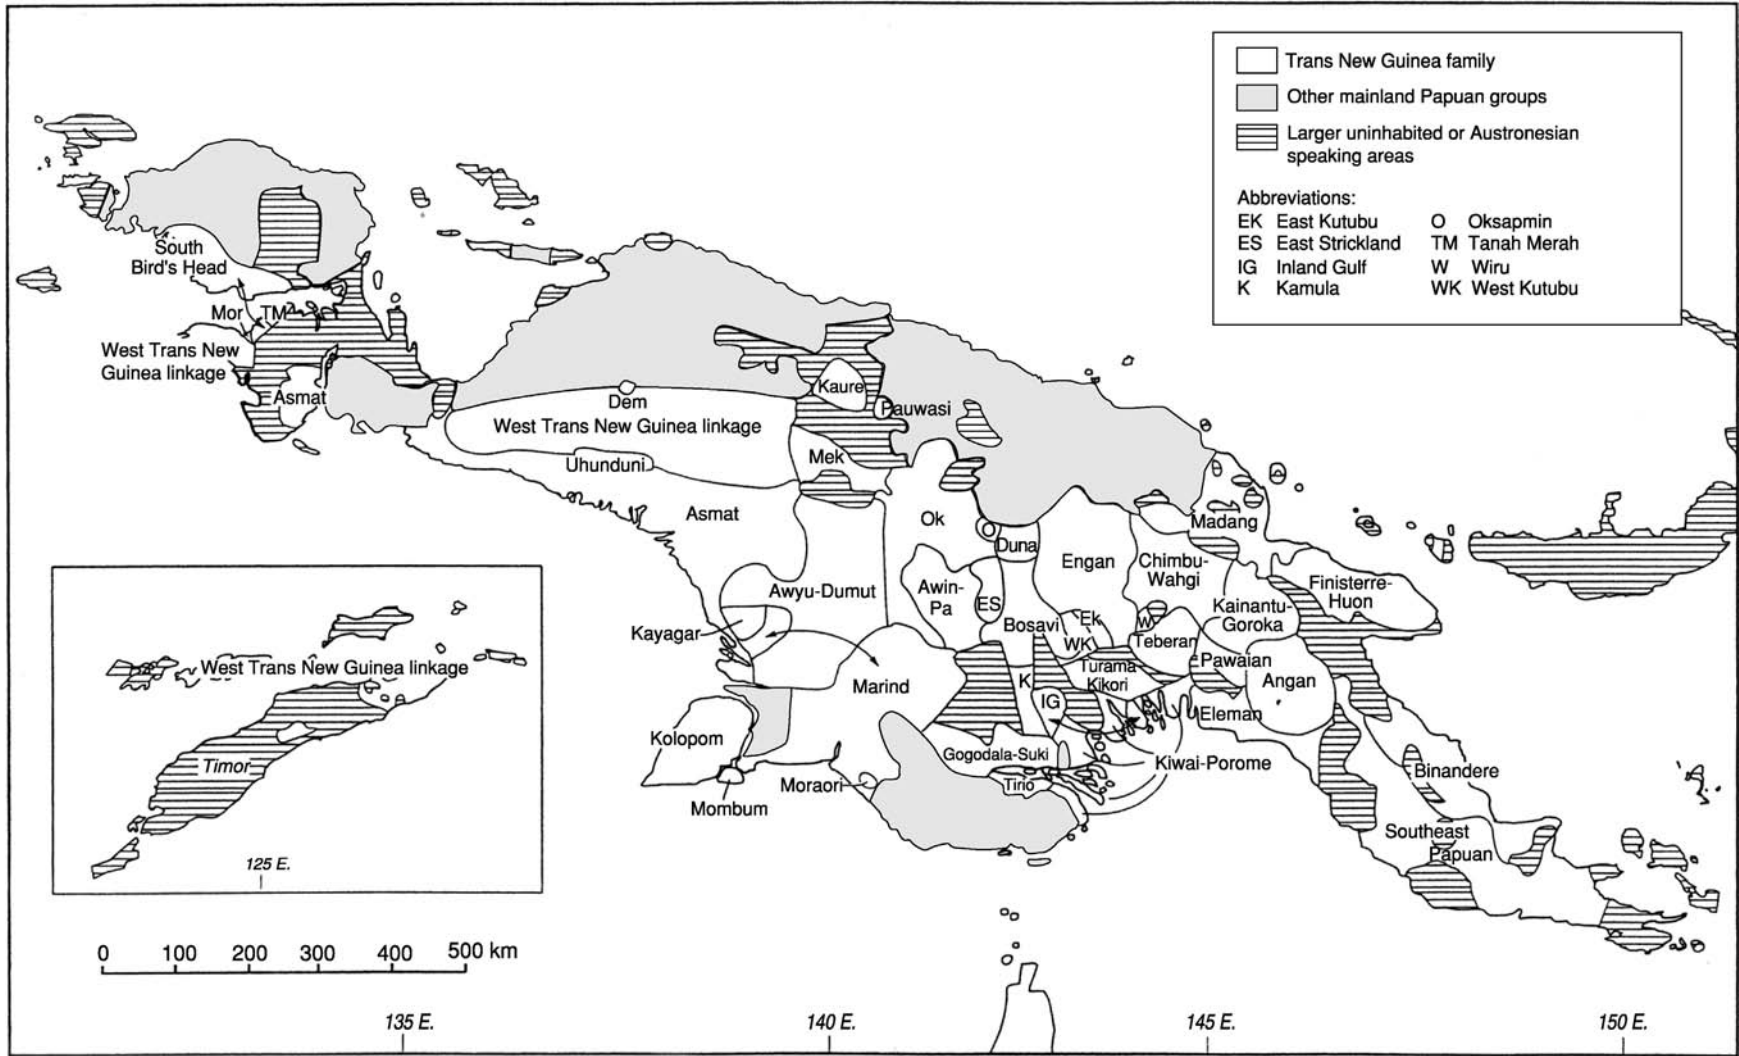

Figure 1 Location of the main subgroups of the Trans New Guinea family.

and third person – but in verbal morphology Kuman makes nine contrasts for the subject: three persons each with singular, dual, and plural.

Morphology is chiefly suffixal. In most languages, nouns carry little morphology. Kinship terms and sometimes part terms often require affixed possessive pronouns. A few languages mark gender contrasts. A good many TNG languages use existential verbs, such as ‘stand’, ‘sit’, ‘lie’ and sometimes, other verbs like ‘hang’, ‘carry’ and ‘come’, as quasi-classifiers of nouns (Lang, 1975), with nouns selecting a verb according to their shape, posture, size, and composition. However, the choice of verb has some flexibility relative to the situation of the referent. Nouns are usually not inflected for number. Certain generic categories are typically expressed by N+N (and occasionally N+N+N) compounds denoting the most salient members of a class (e.g., often ‘people’ is ‘woman-man’, ‘children’ is ‘girl-boy’, and ‘ancestors’ is ‘grandmother-grandfather’).

Most TNG languages distinguish two types of inflected verb, often called ‘final’ and ‘medial.’ Final verbs head the final clause in a sentence and carry suffixes marking absolute tense-aspect-mood and person-number of subject. Medial verbs head nonfinal coordinate-dependent clauses and carry suffixes marking (1) whether the event denoted by the medial verb occurs prior to or simultaneous with that of the final verb and (2) ‘switch reference’ (i.e., whether that verb has the same subject or topic as the next clause; Roberts (1997) surveys the several kinds of switch-reference systems.) In many languages, transitive verbs also carry a pronominal prefix or proclitic marking object agreement. Some languages have causative and applicative affixes that add arguments to the verb. Several Highlands subgroups carry evidential suffixes, indicating whether the clause denotes an event witnessed by the speaker or based on hearsay. In constructions denoting uncontrolled bodily and mental processes (e.g., sweating, sneezing, bleeding, feeling sick), the experiencer is often marked by an object/dative pronoun and is the direct object. A noun denoting the bodily condition is, arguably, the subject or else there is no referential subject. There are usually clauses with nominal predicates denoting class membership and identifying relationships.

All TNG languages make extensive use of at least one of two types of complex (multi-headed) predicates to augment their stock of verbs. First, in verbal adjunct constructions, an inflected verb, usually carrying a rather general meaning, such as ‘make’, ‘hit’ or ‘go’, occurs in partnership with a noninflecting base (the verbal adjunct), which carries a more specific meaning. Verbal adjuncts partner just a small set of verbs. For example, Kalam has a single verb of

sound making and speaking, *ag-*, but has some 30 verbal adjuncts that denote particular kinds of sounds and occur only with *ag-*. Second, in serial verb constructions, two or more bare verb roots occur in sequence to express a tightly integrated sequence of subevents; for example, Kalam: *d ap* (get come) ‘bring’, *d am* (get go) ‘take’, *am d ap* (go get come) ‘fetch’, *d nŋ* (touch perceive) ‘feel’, *ñb nŋ* (eat perceive) ‘taste’. Many languages have a looser type of serial verb construction – narrative serialization – which allows a streamlined, formulaic representation of episodes in which the same actor performs a familiar sequence of actions; for example, Kalam: *am alŋaw-kab tk d ap ad ñb-* (go pandanus-nut gather get come cook eat) ‘gather and eat pandanus nuts’.

Generally, little use is made of conjunctions to show sequential, conditional, and causal relations. Speakers commonly use long chains of clauses headed by medial verbs to report a sequence of past events that make up a single complex episode. In narratives, paragraph-like boundaries are frequently marked by head-tail linkage, in which the last clause of the previous sentence is repeated, to begin a new sentence.

Tsotsi Taal

B B Mfenyana, Kagiso, South Africa

© 1994 Elsevier Ltd. All rights reserved.

Boy Faraday, Bitch Never Die, Bra Slim, Ous Kuki (or Sta Kuja), Bro' Don, Oom Sirra, Bra Terror, Zorro – these names are all part of Tsotsi culture and language, popularly known as Isi-Tsotsi (thug-speak). Like British, American, and other types of slang, black South African taal/lingo has a checkered, colorful history stretching back to 1930 and beyond. Other names used for this street variety are Mensetaal ('the language of the people'), *Flytaal*, *Iscamtho* or *Isijita* (lit. the language of the jits or jitas: young townees; Mfenyana 1977).

This witty, controversial, and evanescent argot, whose words are adopted and discarded almost at will, sprouted in the dusty streets of Sophiatown, Alexandra, and Soweto (all urban townships or slums located around Jozi/Johannesburg), and quickly spread to Langa (Cape Town), New Brighton (Port Elizabeth), Duncan Village (East London, SA), Marabastad and Mamelodi (Pretoria), Umlazi (Durban), etc. Over time, and because each province or area is dominated by one or another African language (Sotho, Xhosa, Zulu, Afrikaans, or Tsonga), stylistic, tonal, and vocabulary differences began to emerge among the many types of Tsotsi Taal.

Predictably enough, the South African public is not yet agreed on who or what exactly 'a tsotsi' is:

M. J. H. Mfusi asserts that '...tsotsis were part of the ethnically mixed society of the locations, and among themselves spoke the Afrikaans dialect (flytaal or mensetaal)' (1992: 46). Their lifestyle revolved, as it still does today, around flashy/American clothes, shoes, hats, and motorcars (Glaser: 1992). It must be stressed that, at first, tsotsis did not use much violence to achieve their ends: they relied on their wits, speed, brute strength/size, number of followers, or pure luck. As conditions in the locations and villages worsened (1940–60), tsotsis turned increasingly to rape, armed robbery, and even murder to maintain themselves and their women (called noasias or ootsotsikazi: Town Xhosa). The tsotsi label broadened to include all urban criminals (confidence tricksters and even scholars, known after 1976 as 'comrade-tsotsis' or *com-tsotsi's*; Mfusi 1992: 46).

Thus, by 1990 the label tsotsi could justifiably be applied to any wayward, unreliable, or 'clever' person, young or old. The key issue then becomes identification of Tsotsi Taal speakers. Ordinary people, active and 'retired' crooks, journalists (like the late Casey 'Kid' Motsisi, Can Temba, and currently Bra El Makhaya of the *Sowetan* newspaper), and Bra Obed Musi (City Press); musicians like Ray 'Zwakala Nganeno' (Come nearer) Phiri and Brenda 'Weekend Special' Fassie; poets of the calibre of Bro' Don 'Zirga Special' Mattera and Siphos Sepamla. All these people have one thing in common: they are regular and enthusiastic, creative, and unapologetic users of some form of Tsotsi Taal.

Consider a few, brief examples:

- a. Greetings: *hella*, *heit*, *heita*, *heitadaa* (i.e., ‘hello there’; Afrikaans *daar* = ‘there’), and most recently *Hola-hola*.
- b. Parting shots: *skhuvet under die corset*, *sweet*, *sharp*, *grand*, and *mojo/moja*.
- c. Nicknames and ways of expressing respect: *Ta Ben* (from Afr *Boeta Ben*), *’Sta May* (‘Sister May’), *Ma-Ben-za*, etc.
- d. Expletives (cannot be excluded: this is the language of the ‘swearing class!’): *donder* = lit. ‘thunder,’ means ‘beat up’ (thus Town Xhosa *ukudonora*, ‘to assault’); *foetsek!* = ‘go away’ (thus Town Xhosa *uku-futsheka*); *fokof* = ‘get out of here,’ ‘go away,’ etc.

In brief, the lexicon of Tsotsi/*flaaitaal* covers a whole range of activities and phenomena: food, drinks, women, police, whites, jail, cigarettes, drugs, love, stealing, and dying.

The importance of this argot lies in its potential as a racial, socioeconomic, age, and gender leveller: because it brings black and white, rich and poor,

educated and unlettered, young and old, male and female together in a way no foreign language ever could. With proper recognition, care, documentation, and development, Tsotsi Taal could become South Africa’s national language.

Laat ek nou die mova’s skep, bricates. Ons sight mekaar burro ’Sta Pallie se cook-dla, late bells. Heitada, hola-hola, is dolly my ma se kind!

(Let me now take my leave, brothers. We’ll meet each other at Sister Palesa’s shebeen/tavern, after hours. OK, goodbye, all’s well my mother’s child!).

Tucanoan Languages

J Barnes, SIL International, Bogota, Colombia

© 2006 Elsevier Ltd. All rights reserved.

Overview

Classification

The Tucanoan languages of Colombia, Peru, Ecuador, and Brazil fall into two major groupings: Western Tucanoan (WT) and Eastern Tucanoan (ET). In the Eastern area, there are two languages that are very different from the other languages: Cubeo (Cub.) and Retuarā/Tanimuca (Tanimuca-Retuarā; Ret.). Waltz and Wheeler (1972: 128–129), recognizing this difference, chose to put Cub. in a category by itself, calling it ‘Middle Tucanoan.’ (In other publications, the term ‘Central Tucanoan’ is used, but is obviously not intended as a geographic term as Cub. is on the northern edge of the other ET languages.) Waltz and Wheeler, in their Proto-Tucanoan studies, referring to the differences between Cub. and the other ET languages, said, “The data indicates a possible break between Cub. and Western Tucanoan some time later than that between the Eastern Tucanoan groups and Western Tucanoan.” (1972: 128). Ret., which is spoken south of the main ET area, was not included in

the study by Waltz and Wheeler. Strom commented (1992: 1) that there appears to have been considerable influence from the Yucuna language on Ret. Ramirez (1997: 17) classified Ret. as ET, but puts it in a subcategory of its own. Malone (1986: Sect. 9.1) said: “Cubeo and Retuarā group closest to each other, which is shown by innovations for the protoconsonants *b (in the environment $_V_1CV_2$, where C is bilabial [bil]), *s, *w, *y. Cub. tends to have more innovations in common with WT languages (*b/ $_V_1C_{+bil}V_2$, *d/ $_i$, $_Vs$, *y/ $_Vd$), but also has some in common with ET languages (*d, *w); Ret. tends to have more innovations in common with ET languages (*d, *w), but also has some in common with WT languages (*b/ $_V_1C_{+bil}V_2$, *d/ $_Vs$). I consider these two languages to be Middle Tucanoan.”

In Table 1, linguistically similar languages are grouped together, based on their development from Proto-Tucanoan (Malone, 1986: Sect. 9.1 & 9.2, and I have added Pisamira [Pis.] to her data). Barasano (Barasana) and Taiwano are listed as one (Bar.), as the only major difference between the two is in pitch-stress (Jones and Jones, 1991: 2). Retuarā and Tanimuca are listed as one, (Ret.), as they differ mainly in a few lexical items (Strom, 1992: 1). Population

Table 1 The Tucanoan language family and population figures

| <i>Languages and groupings</i> | <i>Population figure</i> | <i>Abbreviations</i> |
|--------------------------------|--------------------------|----------------------|
| EASTERN TUCANOAN Group #1 | | |
| Wanano | 1560 | Wan. |
| Piratapuyo | 1070 | Pir. |
| Tucano | 5000 | Tuc. |
| Pisamira | 46 | Pis. |
| Tuyuca | 815 | Tuy. |
| Yurutí | 850 | Yur. |
| Waimajá/Bará | 700 | Wai./Bar. |
| Carapana | 650 | Car. |
| Tatuyo | 350 | Tat. |
| EASTERN TUCANOAN Group #2 | | |
| Siriano | 310 | Sir. |
| Desano | 1760 | Des. |
| Macuna | 550 | Mac. |
| Barasano/Taiwano | 350 | Bas. |
| MIDDLE TUCANOAN | | |
| Cubeo | 6150 | Cub. |
| Retuará/Tanimuca | 300 | Ret. |
| WESTERN TUCANOAN | | |
| Koreguaje | 2000 | Kor. |
| Secoya | 435 | Sec. |
| Siona | 300 | Sio. |
| Orejón | 300 | Ore. |

figures for Pis. are taken from González (2000: 374), for Wanano (Guanano; Wan.) are from Stenzel (2004: 23), and for Yurutí (Yuruti; Yur.) are from Kinch (personal communication). The rest of the population figures are taken from the Ethnologue.

The last three in the list of ET languages in Group #1 (from Table 1), demonstrate a borrowing from Arawakan languages in the inclusion of a ubiquitous prefix *ka-*, which does not occur in the other Tucanoan languages. See Metzger (1998). Many other well-established borrowings are apparent in the languages, especially from Geral (Nhengatu) and Portuguese. More recent borrowings from Spanish and/or Portuguese, are freely incorporated into the languages and suffixed with the appropriate Tucanoan suffixes.

Location

The Tucanoan languages are spoken in the border regions of Colombia with Brazil, Peru, and Ecuador. The ET languages and Cub. are spoken in the state of Vaupés in Colombia and the state of Amazonas of Brazil. Ret. is spoken in the state of Amazonas in Colombia. See Figure 1. The WT languages are spoken to the west and southwest of the ET languages. Koreguaje (Kor.) is found in the states of Caquetá and Putumayo in Colombia, Secoya (Sec.) near the Putumayo River in Ecuador and Peru, Siona (Sio.) on both sides of the Putumayo River in Colombia and Ecuador, and Orejón (Ore.) south of the Putumayo River in Peru. See Figure 2.

Interrelationship

The ET people mainly define themselves by their language, which is the language of their father. Thus, a Tuyuca (Tuy.) woman, for example, might marry a Siriano (Sir.) man. Each would continue to speak his or her own language. The children learn their mother's language first, and later on switch to speak their father's language. The men in a Sir. village might marry women from different language groups, with the result that the children in the village grow up hearing from two to six languages. For a succinct analysis of the relationships between the different ET groups, see Aikhenvald (2002: 17–28). The Western and Middle Tucanoan groups are permitted, within specific kinship guidelines, to marry those who speak their own language. The Eastern and Middle Tucanoan language groups all share basically the same culture and belief systems, which differ in significant ways from the Western groups.

Language Features

Some of the more interesting features of the Tucanoan languages are the small number of consonants, nasalization and nasal spreading, the system of numerical classifiers, and the use of evidential suffixes on the verb. These, as well as other features, will be discussed below.

Phonological Characteristics

Vowels

The Tucanoan languages, with the exception of Ret., have the vowel inventory as seen in Table 2. Ret. has a five vowel system, lacking the /ɨ/ of the other Tucanoan languages. In all of the Tucanoan languages there are oral vowels in oral syllables and nasal vowels in nasal syllables. The following examples illustrate the six vowel contrasts:

Tuy. (my field data):

- (1) /ba'a/ 'disposable basket'
- /be'e/ 'to split'
- /bi'i/ 'to be similar'
- /bo'o/ 'to desire'
- /bu'u/ 'tucunaré fish'
- /bi'i/ 'pirana'

The following examples illustrate the oral–nasal contrasts:

Bas. (Jones and Jones, 1991: 9; personal communication):

- (2) a/ā wa/wā 'to go'/'to illuminate'
- e/ē eho/ēhō 'type of jungle nut'/'cold (illness)'

Figure 1 Eastern and Middle Tucanoan languages with approximate locations.

| | | |
|-----|---------|---|
| i/ĩ | i/ĩ | ‘that (in sight)’/3SING.MASC (PRONOUN) |
| o/õ | oha/õhã | ‘to enter woods’/‘to untie’ |
| u/ũ | udi/ũdĩ | ‘to inhale’/‘be similar to’ |
| i/ĩ | ihĩ/ĩhĩ | ‘hereditary chief of a sib’/‘to burn (fire)’ |

The vowel /i/ is a high central unrounded vowel, which is realized phonetically as a back unrounded

vowel in certain environments in Carapana (Car.) and Tatuyo (Tat.) (Gómez-Imbert, 2000: 326 and Barnes field data).

Vowel Sequences Sequences of two contiguous vowels within a morpheme reveal interesting patterns of symmetry. See the description of Sir. (Nagler and Brandrup 1979: 120–122), and also of Pis. (González

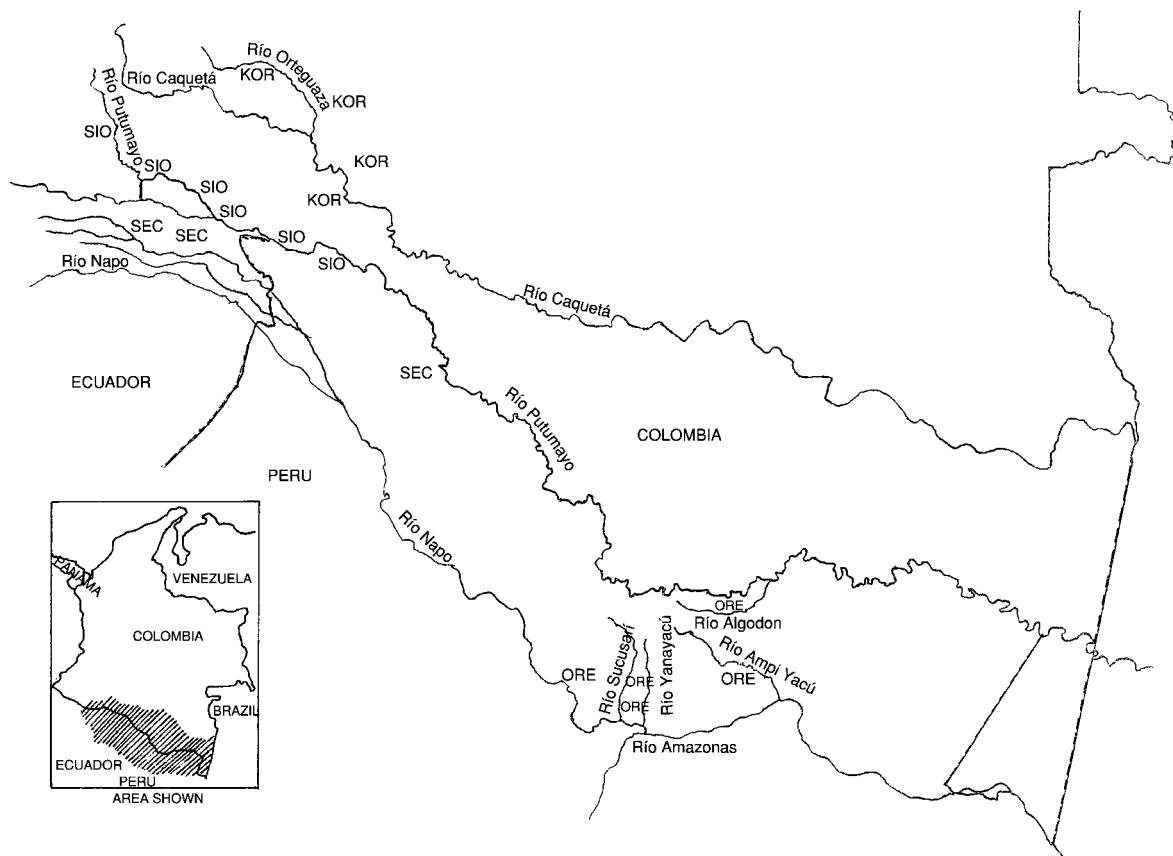

Figure 2 Western Tucanoan languages with approximate locations.

Table 2 Vowel inventory

| Type | Front | Central | Back |
|------|----------|----------|----------|
| High | <i>i</i> | <i>i</i> | <i>u</i> |
| Low | <i>e</i> | <i>a</i> | <i>o</i> |

2000: 380–381), in which she explained that /i/ and /ɨ/ may precede low vowels in the sequences iV and ɨV; /u/ may precede the three vowels farthest from itself; /e/ and /o/ may precede other low vowels; and /a/ may precede all three high vowels.

Consonants

The inventory of consonants in the majority of the Tucanoan languages, charted according to their phonemic characteristics, is shown in Table 3.

For a functional analysis of the consonants in four of the ET languages, see Gómez-Imbert (2000: 327–328).

In the ET and Middle Tucanoan languages, the voiced consonants and /h/ have nasal variants in nasal morphemes.

All 12 of the consonants in Table 3 are found in Desano (Des.) and Pir. The following languages have

Table 3 Consonant inventory

| | Bilabial | Alveolar | Palatal | Velar | Glottal |
|----------------------|----------|----------|----------|----------|---------|
| Voiceless stops | <i>p</i> | <i>t</i> | | <i>k</i> | ʔ |
| Voiced stops | <i>b</i> | <i>d</i> | | <i>g</i> | |
| Voiced flap | | <i>r</i> | | | |
| Voiceless sibilant | | <i>s</i> | | | |
| Voiceless semivowels | | | <i>h</i> | | |
| Voiced semivowels | <i>w</i> | | <i>j</i> | | |

all but /ʔ/: Car., Pis., Sir., Tuy., and Yur. The voiceless affricate /tʃ/ is used in Pis. rather than the voiceless sibilant /s/. Waimajã/Bará (Waimaha; Wai.) and Tat. lack both /ʔ/ and /s/. Bas. and Macuna (Mac.) lack /ʔ/ and /p/.

Cub. lacks /ʔ/ as well as /g/, and has the voiceless affricate /tʃ/ rather than /s/. Ret. lacks /j/ and /g/, but has the palatal stop /dj/.

The speakers of languages that lack /p/ or /s/ employ those consonants both in loanwords and when speaking other Tucanoan languages.

Two Western Tucanoan languages, Kor. and Sio., have 24 and 18 consonants respectively. Kor. has no voiced stops, but rather has bilabial and alveolar nasals at those points of articulation, and has /ɲ/ rather than /j/. It includes /w/ in addition to /w/, three voiceless aspirated stops, two voiceless nasals, the voiced affricate /dʒ/, and six labialized consonants. Of the typical 12 Tucanoan phonemes, Sio. lacks /r/, but includes a ‘soft’ voiceless fricative written as /z/, plus the two nasals /m, n/, the voiceless affricate /tʃ/, and three labialized consonants /k^w, g^w, h^w/.

Sec., as with Sio., lacks /r/, but has the same ‘soft’ voiceless fricative written as /z/, plus /k^w/ rather than /g/, and /m/ rather than /b/, totaling 12.

Ore. lacks /w/ and /r/ ([r] is an allophone of /d/), and includes the voiceless affricate /tʃ/. (Adequate information on Ore. is lacking.)

Two ET languages, Tucano (Tuc) and Wan., have 15 and 16 consonants respectively. Wan., in addition to the typical 12 Tucanoan phonemes, includes the voiceless affricate /tʃ/ and three voiceless aspirated stops. For a description of the development of these additional consonants in present-day Wan. from Proto-Tucanoan, see Waltz 2002. In 1967, West and Welch analyzed Tuc. as having the 12 consonants in Table 3. In 2000, having observed a definite change in pronunciation from, and language attitude toward, what was /CV₁hV₁/ to /ChV₁/ (where C is a voiceless stop), they included voiceless aspirated stops in their analysis, bringing the total of Tuc. consonants to 15. Welch and West (personal communication) analyze the phonetic realization [ChV] as /ChV/, for example: /-k^h/ ‘large, FEM,’ whereas Ramirez recognized only /CV₁hV₁/: /-k^h/ ‘large’ (1997: 216). Ramirez also analyzed /r/ as an allophone of /d/, which results in his defining a total of 11 consonant phonemes for Tuc. (1997: 25). It is to be noted that West and Welch have studied Tuc. in Colombia, and Ramirez in Brazil. The distance between the two locations of study is so great, and contact between the two groups is so rare, that it is not surprising that there are some differences.

Syllable Patterns

The Middle and ET languages have one basic syllable pattern: (C)V. In Des., Piratapuyo (Pir.), Tuc., and Ret. there is an additional syllable pattern, one in which the syllable is closed with a glottal stop: (C)Vʔ. In all of the languages, (C)VV has been analyzed as two syllables: (C)V.V, except that Ramirez analyzed (C)VV as a bimoraic syllable (1997: 53–56). The WT languages have monosyllabic two-vowel clusters, and a syllable can be closed with a glottal stop in Kor., Sec., and Sio.

There is evidence in Pir., Tuc., and Tuy. that an unstressed vowel between consonants /s/ and /t/ is dropping out, creating the consonant cluster /st/.

Pir. (Klumpp and Klumpp, 1973: 116; Waltz, personal communication):

(3) /biásitu/ [biástu] ‘pot for hot pepper’

Tuc. (Welch and West, personal communication):

(4) /baʔa-sité/ [baʔasté] ‘eat and scatter (food)’

Tuy. (my field data):

(5) /paasiti/ [páasti] ‘to be tired/bored’

Suprasegmentals

The suprasegmentals in the Tucanoan languages are nasalization and tone or stress that is accompanied by high pitch.

Nasalization and Nasal Assimilation In all of the ET languages, nasalization is a feature of the morpheme. Root morphemes are either oral or nasal. Suffixes are either specified as oral or nasal, or they are unspecified for nasalization. Those that are unspecified are oral following an oral morpheme, and nasal following a nasal morpheme. In all of the Tucanoan languages, nasal spreading is progressive, spreading from left to right. In the following example from Des., /-re/ ‘specifier’ is unspecified for nasalization:

Des. (Miller, 1999: 14):

(6) /igo-re/ [igore] ‘to her’
/bāri-re/ [māriṛē] ‘to us’

In the Middle Tucanoan language Cub., as in the ET languages, nasalization is a feature of the morpheme, but the nasal spreading rule is different. In Cub., nasality spreads through any suffix that begins with /b, d, j/. In Ret., nasal spreading is blocked by obstruents, and present analysis has indicated that it occurs within the metrical foot (Strom, personal communication).

In the WT languages, nasalization is a feature of the syllable and spreads through all suffixes that begin with /w, j, h, ʔ/. In addition, nasalization spreads through /dʒ/ in Kor. and through /h^w/ in Sio. (Information is lacking on Ore.)

Regressive nasal spreading, where it occurs, is very limited. In the WT languages, it spreads from a morpheme consisting of a single nasal vowel to the preceding suffix. In the ET languages, regressive nasal spreading takes place in Des. (Miller, 1999: 14–15), Sir. (Criswell and Brandrup, 2000: 399), and Bas. (Jones and Jones, 1991: 15–16), affecting a limited set of specific, single-syllable suffixes. The regressive

spreading never goes beyond one syllable. In the Middle Tucanoan language Ret., regressive nasal spreading affects only the first-person singular morpheme, which is prefixed to the verb root (Strom, 1992: 20). To illustrate regressive nasal spreading, note what happens to the suffix /-bi/ ‘negative’ in the following examples:

Des. (Miller, 1999: 14):

(7) wēhē-bī-rã
kill-NEG-PL.ANIM
‘the ones who don’t kill’

(8) wēhē-bi-gi
kill-NEG-sing.MASC
‘the one who doesn’t kill’

Accent and Tone Of the 19 Tucanoan languages, 11 have tonal systems with high and low tone contrasting in identical or analogous environments. In Car., Tat., Mac., and Wai. (though perhaps not in Bar.), all four combinations of high and low on two syllable roots occur.

In Des., Tuy., and Yur., there is one accented syllable per phonological word, and it is associated with high pitch. Sec. and Sio. have a pattern of accent on alternate suffixes. Ret. has a system of multiple stress with rules that require epenthesis and stress shifts (Strom, 1992: 13–19).

Accent is a property of the morpheme in the following ET languages:

- Bas. (Gómez-Imbert and Kenstowicz, 2000: 421)
- Des. (Miller, 1999: 15)
- Ret. (Strom, personal communication)
- Sir. (Criswell and Brandrup, 2000: 398)
- Tuc. (Ramirez, 1997: 68)
- Tuy. (Barnes, 1996: 31)
- Yur. (Kinch, personal communication)

The literature indicates that accent is probably a property of the morpheme also in:

- Cub. (Morse and Maxwell, 1999: 11–12)
- Mac. (Gómez-Imbert, 2000: 331)
- Pis. (González, 2000: 382).

Grammatical Characteristics

Sentence

The sentence in Tucanoan languages obligatorily demands a verb. Sentence fragments are used, but they occur, for example, as abbreviated answers to questions, responses using question words, etc.

Word Order In the majority of the Tucanoan languages, the usual word order in declarative clauses is

(S)(O)V, with variations according to discourse constraints. In Car., the preferred word order is (O)(S)V. Bas. exhibits the basic order OVS. Cub. also has (O)VS, but SV(O) occurs as frequently. Kor. is the only language that has a preferred word order in which the verb is initial: V(S)(O), although other word orders also occur. The pattern OV occurs in all the Tucanoan languages, and the languages exhibit other typical features of OV languages.

Case Markers Nouns in the role of grammatical subject are unmarked, and there are rules for when the complements are marked. In Ret., both an animate subject and an animate object may have the same marker /-re ~-te/. Where there could be confusion, it is avoided by word order: The subject precedes the object.

Ret. (Strom, 1992: 114):

(9) ernesto-te alvaro-te hedjobaa-rape
Ernest-HUM Alvaro-HUM help-PAST
‘Ernest helped Alvaro’

Although the Tucanoan languages are almost exclusively suffixing languages, Car. and Tat. allow the complement, if it is a pronoun, to be prefixed to the verb, and Ret. has a neuter complement pronoun that only occurs as a prefix. In the rest of the Tucanoan languages, if the complement-pronoun needs to be expressed, it occurs in a separate word along with the complement/specificity suffix (REC = recent past; EV = evidential; NON3 = nonthird person – evidentiality and nonthird person are concepts discussed later in this article).

Car. (Gómez-Imbert, 2000: 332):

(10) ki-ĩjã-à-bõ
3sing.MASC-see-REC-EV:PAST.VISUAL.3sing.FEM
‘she saw him’

Sir. (‘Brandrup, personal communication):

(11) sî-bî
give-EV:PAST.VISUAL.3sing.MASC
‘he gave (it) (to me)’

(12) igó-re weré-bi
3sing.FEM-SPEC tell-EV:PAST.VISUAL.NON3
‘I told (that) to her’

The specificity suffix, which marks significant participants and props in the discourse, does not always occur with nonpronominal direct objects. Noun incorporation is evident where the object precedes the verb root and is phonologically part of the verb word.

Des. (Miller, 1999: 109):

(13) diu-pi
egg-place.on.ground
‘lay an egg’

Other nounverb combinations function as noun incorporation. Alternatively the noun may function as an independent complement (BEN = benefactive).

Tat. (Gómez-Imbert, 2000: 334):

- (14) *ji-pātu-kēdōō-* /kēdōō-ja pātu-re
boha-ja
1sing-coca-prepare- /*prepare-IMP coca-SPEC*
BEN-IMP
 ‘prepare coca for me’ / ‘prepare the coca’

When it is clear from the context that the noun is the complement, it is not marked as such, as in the case of ‘pigs’ in the following example (ANIM = animate, a concept discussed in this article).

Tuy. (Barnes, unpublished text #157):

- (15) *ape-‘bireko* ‘tuakūbū-adacu,
other.day arrive.near.goal-FUT.1,2PL pig-PL
je'se-a ja'a-adara hī'ī-ra
eat-AFFIRM.1,2PL say-PL.ANIM
 ‘the next day we will arrive near (the town) in order to eat pigs’

With few exceptions, indirect objects, experiencers, and benefactors are always marked with the complement/specificity marker (SEP = separation, i.e., uncertain; D = dimension).

Mac. (Smothermon and Smothermon, 1995: 72):

- (16) *pauru-re* *īo-gi*
Pablo-SPEC show-sing.MASC
j-a *ji*
AUXILIARY.VERB-PRES 1sing
 ‘I am showing (it) to Pablo’

Sio. (Wheeler, 2000: 187):

- (17) *ji'ŋi* *dŋhō-de* *gō'ŋā* *ha'ŋsi-gi-jā*
1sing wife-SPEC bones hurt-certainty-SEP
 ‘my wife’s bones hurt’ (lit. ‘bones hurt my wife’)

Des. (Miller, 1999: 144):

- (18) *ji-re* *su'ŋri*
1sing-SPEC clothes
āsū-basa-ra-jē *sājā-bi*
buy-BEN-NOM-CLASS: put.on-EV:PAST.VISUAL.NON3
2D.flexible
 ‘I put on the dress (cloth) that was bought for me’

A separate set of suffixes identify location, time, instrument, and accompaniment (ACC).

Pis. (González, 2000: 387):

- (19) *wetŋe-pi*
field-LOCATIVE
 ‘in the field’
 (20) *jābī-pi*
night-LOCATIVE
 ‘at night’

- (21) *wābō-bēdā*
hand-ISTR
 ‘by hand’
 (22) *kī-bai-bēdā*
3sing.MASC-younger.brother-ACCOM
 ‘with his younger brother’

Nouns

Nouns in Tucanoan languages may be divided into two basic categories: animate and inanimate. These two categories take different plural suffixes. Within the animate category, human and nonhuman categories also take different plurals. Most ET nonhuman animate nouns are inherently singular and take a plural suffix. Nouns that refer to animals, insects, or fish that generally are found in groups are inherently plural and take a singularizing suffix.

Sir. (Criswell and Brandrup, 2000: 408):

- (23) *diá* *diá-rí*
river river-PL.INAN
 ‘river’ ‘rivers’

Sir. (Criswell and Brandrup, 2000: 405):

- (24) *bāhí-gī* *bāhí-rā*
child-sing.MASC child-PL.ANIM
 ‘boy’ ‘children’
 (25) *pābú* *pābú-ā*
armadillo armadillo-PL.ANIM
 ‘armadillo’ ‘armadillos’
 (26) *burúa* *burúa-bī*
termites termites-SINGULARIZER
 ‘termites’ ‘a termite’

WT animate nouns have three categories: general, singular (with a singular suffix that is either masculine or feminine) and plural (with a plural suffix).

Sio. (Wheeler, 2000: 185):

- (27) 'zī 'zīgī 'zīgo 'zīk^wa
 ‘child’ ‘boy’ ‘girl’ ‘children’

Classifiers The Tucanoan languages all have a small set of animate classifiers and, in most of the languages, a larger set of inanimate classifiers.

Animate classifiers, which also function as animate nominalizers, include masculine singular, feminine singular, and plural. Most of the languages have past, present, and future forms for the animate nominalizers as is shown in Table 4 for Sir.

Sir. (Criswell and Brandrup, 2000: 408):

- (28) *buué-gi*
study-sing.MASC
 ‘he who studies’

Table 4 Animate classifiers in Siriano (Criswell and Brandrup, 2000: 408)

| Tense | Singular, Masculine | Singular, Feminine | Plural |
|---------|---------------------|--------------------|---------|
| Present | -gi | -go | -rã |
| Past | -dii-gi | -dee-go | -dēē-rã |
| Future | -bu-gi | -bu-go | -bū-rã |

(29) buué-dii-gi
study-PERFECTIVE-sing.MASC
 ‘he who studied’

(30) buué-bu-gi
study-POTENTIAL-sing.MASC
 ‘he who will study’

Typically each ET language has over 100 inanimate classifiers, plus many nouns that may also function as classifiers. Ramirez (1997: 109) says that Tuc. has only six classifier suffixes, which he calls “shape suffixes” (plus some 400 ‘dependent nouns’). The ‘shape suffixes’ that both West and Welch (2000: 428 and personal communication) and Ramirez have identified are a small set of classifiers that do not require a nominalizer between the verb root and the ‘shape suffix,’ as do the many Tuc. suffixes that correspond to classifiers found in other ET languages.

Inanimate classifiers in Tucanoan languages typically are suffixes that categorize the object(s) referred to in terms of some salient characteristic, such as shape or arrangement. For a complete description of Tuy. classifiers see Barnes (1990). Tucanoan classifiers have been variously described as noun classifiers or numeral classifiers. In the ET languages, they are suffixed to numerals, demonstratives, quantifiers, genitives, nouns, and to either nominalized verbs and/or descriptive adjectives, or, in the case of the WT languages, directly to these roots as nominalizers.

Des. (Miller, 1999: 37, 5, 45, 125, 38, 40):

(31) juhu-koaru
one-CLASS:gourd
 ‘one gourd’

(32) iri-ru
this-CLASS:oblong
 ‘this airplane’

(33) baha-bihī-ri
a.lot-CLASS:thin.plane-PL.INAN
 ‘many knives’

(34) bī-ja-ru
2sing-GEN-CLASS:oblong
 ‘your boat’

(35) juki-kawe
tree-CLASS:bent
 ‘crooked tree’

(36) oʔa-ri-boga
sweep-NOM-CLASS:bundle
 ‘broom’

When classifiers are suffixed to nouns, they are in a relationship of General-specific, as in the following examples, where /dēi/ is the ‘mirití’ palm.

Cub. (Ferguson *et al.*, 2000: 361):

(37) dēi-jī ‘palm tree’
 dēi-ri ‘palm fruit’
 dēi-kū ‘cluster of palm fruit’
 dēi-jabe ‘seed of the palm fruit’
 dēi-joka ‘palm leaf’

The WT languages have from 17 (Sec.) to 30 (Kor.) classifiers. These classifiers are suffixed to nouns, as in the Cub. examples above, and to verbs and adjectives as nominalizers. They are sometimes found suffixed to numerals and demonstrative adjectives.

The more than 29 Ret. classifiers are suffixed to nouns, numerals, nominalized verbs and descriptive adjectives, and optionally to demonstrative adjectives.

Noun Modifiers Noun modifiers in Tucanoan languages may be divided into two major groups: limiting adjectives and nominalized adjectival verbs.

Limiting adjectives, which are numerals, genitives, demonstratives (anaphoric or exophoric), and quantifiers, are either separate words or roots that require suffixes.

Mac. (Smothermon and Smothermon, 1995: 39–40):

(38) hīa-hibi
two-CLASS:basket
 ‘two baskets’

(39) hīgi ī ja-gi
hammock 3sing.MASC GEN-CLASS:hammock
 ‘his hammock’

Yur. (Kinch and Kinch, 2000: 477):

(40) ai-wi
that(EXOPHORIC)-CLASS:building
 ‘that house’

Des. (Miller, 1999: 45):

(41) baha-bē-rã
a.lot-NEG-PL.ANIM
 ‘a few (people)’

Nominalized adjectival verbs take the place of descriptive adjectives in the traditional sense of the term. Stative verbs, such as ‘to be red’ and ‘to be big,’ do not always take the full range of verb suffixes, and yet they are used as verbs, as can be seen in the following example.

Tuy. (Barnes, unpublished text #82):

- (42) ʃjaa dia'poa baji'ro
 1_{GEN} face very
 jĩĩ-a
 be.black-EV:PRES.VISUAL.NON3
 'my face is really dark (from the sun)'

Nominalized adjectival verbs may serve as full constituents of the sentence, i.e., the noun that is being modified will not appear in the sentence if the referent is already clear. When the referent is an animate noun, an animate classifier is suffixed directly to the verb and functions as a nominalizer. In the case of an inanimate referent, some of the languages require that a nominalizer be suffixed to the verb before the classifier.

Wan. (Waltz and Waltz, 2000: 460):

- (43) já-ĩdā
 be.bad-CLASS:PL.ANIM
 'bad people'

Bas. (Jones and Jones, 1991: 63):

- (44) sũā-ri-hāĩ joa-ri-hāĩ
 be.red-NOM-CLASS:2D be.long-NOM-CLASS:2D
 ābō-a-ha jĩ
 want-PRES-NON3 1sing
 'I want a long red piece of cloth'

Cub. has a small class of descriptive adjectives, which function neither as nouns nor as verbs. Among these are: *big*, *small*, *old*, *dry*, and *curly* (Morse and Maxwell, 1999: 124). Des., Sir., and Tuc. each list a small number of adjectives, among which are: *big* and *small* (Miller, 1999: 51; Criswell and Brandrup, 2000: 410; Welch, personal communication). Sec. and Sio. also each have a small class of descriptive adjective roots, including *big* and *small*, and derive the rest of their descriptive words from other grammatical forms (Johnson and Levinsohn, 1990: 37–38; Wheeler, 1987: 116–117). In Ret., words that are traditionally thought of as descriptive adjectives function almost exactly like nouns, and thus are listed as nouns (Strom, 1992: 23–26). The rest of the Tucanoan languages derive descriptive words by nominalizing verb roots and/or suffixing gender/number or classifier suffixes. In many, but not all, cases, these function much as do relative clauses in other languages.

Cub. (Morse and Maxwell, 1999: 86):

- (45) xidoxa-RI-xārāwi
 be.scary-NOM-CLASS:day
 'a scary day'

Personal Pronouns All of the Tucanoan languages have the same system for personal pronouns. In the singular, there are four forms: first person, second

person, third-person masculine and third-person feminine. In the plural, there are also four forms: first-person exclusive, first-person inclusive, second person, and third person.

Tat. exhibits a typical set as shown in Table 5.

Demonstrative Adjectives The Tucanoan languages are split as to whether they make a distinction between singular and plural in the demonstrative adjectives for inanimate referents. Cub., for example, does not make the distinction: /i-/ means both 'this' and 'these'; /ādĩ-/ means both 'that' and 'those.' The anaphoric pronoun /di-/ means both 'that' and 'those' (Morse and Maxwell, 1999: 96). Pluralization is indicated only on the classifier or noun that follows the demonstrative adjective. Tuy. does make the distinction as shown in Table 6, and thus number is indicated on both the demonstrative adjective and the classifier or noun which follows it.

Tuy. (my field data):

- (46) ati-do'to
 'this-CLASS:large.bundle
 'this large bundle (of firewood, cane, etc.)'
- (47) ate-do'to-ri
 this.PL-CLASS:large.bundle-PL.INAN
 'these large bundles (of firewood, cane, etc.)'

Verbs

Independent verbs in Tucanoan languages are minimally comprised of a verb root and an evidential

Table 5 Personal pronouns in Tatuyo (Gómez-Imbert, 2000: 341)

| | Person | Singular | Plural |
|---|-----------|------------|--------------|
| 1 | exclusive | | <i>hāā</i> |
| | inclusive | <i>jii</i> | <i>bādĩ</i> |
| 2 | masculine | <i>bĩĩ</i> | <i>bĩhāā</i> |
| | | <i>kĩĩ</i> | |
| 3 | feminine | <i>kōō</i> | <i>dāā</i> |

Table 6 Demonstrative pronouns in Tuyuca (Barnes and Malone, 2000: 446)

| Pronoun | Singular | Plural/Noncountable |
|-----------|-------------|---------------------|
| Exophoric | | |
| 'this' | <i>ati-</i> | <i>ate</i> |
| 'that' | <i>ii-</i> | <i>ie</i> |
| Anaphoric | | |
| 'that' | <i>tii-</i> | <i>tee</i> |

suffix, or an imperative, interrogative, or future suffix. In Tat. and Car., the verb root may be prefixed by a pronoun, and, to a lesser extent, the same is true for Bas. and Wai. Mood is indicated by suffixes that occur between the verb root and the evidential suffix, and may include negative, contraexpectation, desiderative, and irrealis suffixes. Some aspects are also indicated by verb suffixes that occur between the verb root and the evidential suffix, and indicate, for example, the habitual, durative, completive, and iterative aspects. Other aspects are indicated by auxiliary verb phrases.

Auxiliary Verbs The most common use of an auxiliary verb is in expressions of the progressive aspect. The main verb is nominalized, and the auxiliary verb is suffixed by dependent or independent verb suffixes, including whatever aspect or mood suffixes may be appropriate to the situation.

Tuy. (my field data):

- (48) 'waa-gi tii-'bī-wi
 go-NOM: do-CONTRAEXPECTATION-
 sing.MASC EV:PAST.VISUAL.sing.MASC
 'He was going, but ...'

Compound Verb Roots Compounding of verb roots is rare in the WT languages and Cub., but common in Ret. and the ET languages, where up to four verb roots can be combined in one phonological word. See Gómez-Imbert (1988) for an explanation of three different types of compounding that typically take place.

Tat. (Gómez-Imbert, 1988: 107):

- (49) yáá-róka-kúbú-ehá
 fall-strike-lie.immobile-arrive
 'to fall, arriving at and striking (the ground),
 and being immobile'

Evidentiality Evidentiality is an obligatory feature of the independent verb word in the ET languages, as well as in Cub., Sio., and Sec. It is indicated by optional verb suffixes in Ret., and is indicated by means of auxiliary verbs in Kor.

Evidential suffixes in the ET languages carry information about present and past tenses, and subject, including person, number, and gender. The function of the evidential suffixes appears to vary somewhat between the languages, indicating one of the following:

1. How the speaker obtained the information: Bar. and Wai. (my field data); Bas., Car., Mac., and Tat.

(Gómez-Imbert, 2000: 340); Des. (Miller, 1999: 64); Sir. (Criswell and Brandrup, 2000: 400); Tuy. (Barnes and Malone, 2000: 441); Yur. (Kinch and Kinch, 2000: 479),

2. The speaker's degree of knowledge of the situation: Tuc., according to Ramirez (1997: 121), or
3. the point of view of the speaker: Wan. (Waltz and Waltz, 2000: 456); Tuc., according to Welch and West (2000: 424).

Evidential suffixes in the Middle Tucanoan language Cub. and in the WT languages Sio. and Sec. convey tense and person information as in the ET languages, but they indicate the degree of certainty about the information rather than how the speaker obtained the information (Ferguson *et al.*, 2000: 363; Wheeler, 2000: 189; Johnson and Levinsohn, 1990: 66–70). There is no information available on Ore.

Ret.'s evidential system consists of three optional verb suffixes. The first is /-ko-/, by which the speaker tells something that he knows is a fact because he has heard something take place, although he has not seen it. The second is /-rihi-/, by which the speaker indicates that he is stating an assumption. The third is /-re/, by which the speaker conveys that the information is secondhand (Strom, 1992: 90–91).

Kor. employs auxiliary verbs to indicate evidentiality. One indicates secondhand information and the other indicates a supposition on the part of the speaker (Cook and Criswell, 1993: 86–87).

Wan. (Waltz and Waltz, 2000: 457) and Des. (Miller, 1999: 67–68) use an auxiliary verb phrase for the 'apparent' evidential, which is equivalent in function to the apparent evidential suffix in Tuy. The cognate verb phrase in Tuy. is distinct from the apparent evidential; the auxiliary verb bears the witnessed evidential suffix, and indicates that the speaker visually observed the end result of an action or state. (See Barnes, 1984: 264). Thus, by looking into the empty house he says, 'They left,' literally saying, 'I see that they are ones who have left.' Tuy. also has a single-syllable evidential suffix that indicates 'apparent' actions or states that the speaker deduces from evidence. That single-syllable suffix would be used, for example, when concluding that a piece of fruit was **apparently** in the state of being ripe, or it would not have fallen off the tree on its own. In the text where the following example occurs, the speaker heard the fruit fall, but never saw it.

Tuy. (Barnes, unpublished text #137):

- (50) yīi-'ri-ga dīi-'bī-a-ju
 ripen-NOM- be-CONTRAEXPECTATION-REC-
 CLASS:3D EV:PASTAPPARENT.NON3
 'apparently the fruit was ripe'

Table 7 Evidentials in Siriano (Criswell and Brandrup, 2000: 400)

| Tense | | Visual | Apparent | Secondhand | Assumed |
|---------|------------|--------|----------|------------|---------|
| Past | NON3 | -bi | -jo | -juro | -kujo |
| | 3sing.MASC | -bī | -jūbī | -jupi | -kūjūbī |
| | 3sing.FEM | -bō | -jūbō | -jupo | -kūjūbō |
| | 3PL | -bā | -jūbā | -jūrā | -kūjūbā |
| Present | NON3 | -a | - | - | -koa |
| | 3sing.MASC | -bī | - | - | -kūbī |
| | 3sing.FEM | -bō | - | - | -kūbō |
| | 3PL | -bā | - | - | -kūbā |

Malone has concluded that the apparent evidential in Tuy. developed as the Tuy. speakers moved from expressing speaker distance in time and space to emphasizing how the speaker obtained his information (Malone, 1988: 138).

Table 7 illustrates a typical Tucanoan evidential system.

As is typical of most of the ET languages, person markers distinguish between third person and non-third persons. In Table 7, NON3 includes first and second persons singular and plural, plus inanimate.

Note that two of the eight paradigms in Table 7 are totally incomplete. The present tense in Sir. only distinguishes between the visual and assumed evidentials. The largest and most complete set of paradigms described in the literature on ET languages is found in Tuy., where 8 of 10 paradigms are complete (Barnes, 1984: 258). One of the incomplete paradigms is missing only the NON3 suffix. The totally empty paradigm is the present secondhand slot where one would not expect a paradigm, since secondhand information is always reported as past. Note the use of present and past in the following examples:

Tuy. (my field data):

- (51) Bar'ia a'ti-jo
Maria come-EV.PRES.VISUAL.3sing.FEM
 'Maria is coming' (reported by a person outside the house who sees Maria coming)
- (52) a'ti-a-jigo
come-REC-EV. PAST.SECONDHAND.3sing.FEM
 'she is coming' (lit. 'I was told that she was coming'), (reported by a person inside the house who has not seen Maria, but who heard the other say that she is coming)

Two features of evidentiality that occur in all of the Tucanoan languages are (1) firsthand knowledge of the state or event and (2) secondhand knowledge, indicating that the only information the speaker has

Table 8 Probable and indefinite future suffixes in Yurutí (Kinch and Kinch, 2000: 480, and personal communication)

| Person | Probable future | Indefinite future |
|---------------|-----------------|--------------------|
| 1,2 sing.MASC | -giaku | -giga |
| 1,2 sing.FEM | -goaku | -goga |
| 1,2PL | -roaku | -raga |
| 3sing.MASC | -giaki | -giagawi |
| 3sing.FEM | -goakugo | -goagago |
| 3PL | -rakua | -ragawa ~ -roagawa |
| Inanimate | -roaku | -roga |

about what he relates is that which came from someone else. All other features such as direct or indirect evidence, and tangible or intangible evidence, or, in the WT languages: degree of certainty, can be subdivisions of point (1).

Future The WT languages express the future by means of the potential aspect. The Middle and ET languages express the future in modal terms. For example, Bas. uses one of three moods to indicate the future: avoidance, conjecture, and intention (Jones and Jones, 1991: 88–92). The rest of the Tucanoan languages have from one to three sets of future endings, composed of two to three morphemes each, which together convey probability, supposition, or definite intention. A study of Table 8 reveals how more than one morpheme is typically used in the formation of the future tenses.

Yur. (Kinch and Kinch, 2000: 480):

- (53) bē'dābē-pi 'waa-giaki
tomorrow-LOCATIVE go-FUT.PROBABLE
 'he will go tomorrow'
- (54) ati-jā'bika jo'sa-giagawi 'kꞑ
this- hang.in.hammock- 3sing.MASC
afternoon FUT.INDEFINITE
 'probably he will rest in his hammock this afternoon'

Location and Composition of the Tungusic Language Family: Sociolinguistic Data

Tungusic languages (former name: Manchu–Tungusic) are spoken in a wide territory that includes Central and East Siberia and northeast China (Manchuria). One language, Sibe (Xibe), is located in the Xinjiang province of China. There are 12 modern Tungusic languages (see Table 1).

There are also two languages attested diachronically: Jurchen, represented by some inscriptions and dictionaries (12th–15th centuries C.E.), and Manchu, the state language of the Qing empire in China (1644–1911 C.E.) that has an abundant corpus of various written texts (16th to the early 20th century C.E.), most of them translations from Chinese. For all practical purposes, Manchu can be considered an archaic dialect of Jurchen, although the two languages employ different writing systems. Jurchen used a cumbersome indigenous (inspired by Chinese and Khitan writing systems) script that included both semantographic and syllabic signs. Manchu, on the other hand, uses the modified version of the Mongolian alphabet. Classical Manchu is still used in private correspondence by Heilongjiang Manchu, Solon, and Dagur Mongolians.

All surviving Tungusic languages are endangered to a greater or lesser extent; some of them are on the brink of extinction. The only languages spoken in China that have a written form are (1) Heilongjiang Manchu, whose speakers use essentially Classical Manchu, and (2) Sibe, whose speakers use a modified

version of Classical Manchu that includes certain Sibe colloquialisms, because Sibe is historically a dialect of Manchu. During the Soviet period, literary forms were created for almost all Tungusic languages spoken in Russia, but most of them turned out to be short-lived. Even those languages that still have literary forms (Ewenki, Ewen, and Nanai) have a rather narrow application.

Internal Classification

There have been several conflicting attempts to classify Tungusic languages, but the most convincing is the recent attempt by Stefan Georg (2004), in which he proposed two basic groups: Northern (Ewenki, Ewen, Solon, Neghidal, Udehe, and Oroch) and Southern (Nanai, Ulcha, Uilta, both Classical and Modern Manchu, Sibe, and Jurchen). Within the Northern group, the following three subgroups should be distinguished: Ewen, Ewenki–Solon–Neghidal, and the intermediate subgroup including Udehe and Oroch. The languages of the intermediate subgroup are basically the Northern Tungusic languages that were strongly influenced by the Southern Tungusic languages. The Kili language that was traditionally considered a dialect of Nanai also likely belongs to the Northern group (Doerfer, 1978a). There are two subgroups within the Southern group: the Nani subgroup, including Nanai, Ulcha, and Uilta; and the Manchu subgroup, which included Manchu (both Classical and Modern), Sibe, and Jurchen.

Wider Genetic Affiliation

There is a widespread belief that Tungusic languages are distantly related to Mongolic, Turkic,

Table 1 Modern Tungusic languages

| | <i>Names appearing in Ethnologue</i> | <i>Frequently used alternative names</i> | <i>Number of native speakers^a</i> |
|---------------------|--------------------------------------|--|--|
| Ewenki | Evenki | Elunchun | 11 360 |
| Ewen | Even | Lamut | 7463 |

^aEstimates of native speakers based on Soviet census of 1989 and Chinese census of 1990.

Korean, and Japonic languages, forming with them the Altaic family. However, this controversial relationship has never been demonstrated satisfactorily. It is most likely that numerous parallels between the Tungusic and other Altaic languages represent traces of centuries- or even millennia-long contacts.

Structure

All Tungusic languages are agglutinative (with some elements of fusion) languages with SOV word order, although Ewen in some cases has shifts to SVO order, apparently under a strong Russian influence. Thus, there is only suffixation and no prefixation. Almost all languages have a rich morphology, with a somewhat reduced version of it in the Manchu subgroup.

Phonology

Tables 2 and 3 show the vowels and consonants for the Podkamennaia Tunguska subdialect of the Southern Ewenki dialect, which is used as the basis of the modern literary language. Both vocalic and consonantal systems are representative of the whole family, although, of course, certain expansions and/or reductions can be observed in individual languages. Syllabic structure is V, VC, CV, and CVC. Stress is probably dynamic, although further research is necessary. All languages have vowel harmony.

All vowels can be either short or long except *e* (< diphthong **ia*), which is always long. Vowel length is phonemic (cf. Ewenki *bu-* ‘to die,’ *bū-* ‘to give’; *tūkala* ‘name of a plant,’ *tukala* ‘earth, ground’).

Table 2 Vowels in Tungusic languages

| | Front | Central | Back |
|------|-------|---------|-------|
| High | i, ī | | u, ūa |
| Mid | ē | ə, ə̄ | o, ō |
| Low | a, ā | | |

Table 3 Consonants in Tungusic languages

| | Bilabial | | Dental | | Palatal | | Velar | | Glottal |
|---------------------|----------|---|--------|---|---------|---|-------|---|---------|
| Plosive | p | b | t | d | c | ʃ | k | g | |
| Nasal | | m | | n | | ɲ | | ŋ | |
| Trill | | | | r | | | | | |
| Fricative | | β | | s | | | | | h |
| Approximant | | | | | | j | | | |
| Lateral approximant | | | | l | | | | | |

Morphology

Overall, the Northern Tungusic languages have a richer morphology than the Southern Tungusic languages. Nouns in most Tungusic languages have categories of number, case, and possession, although possession is not present in the Manchu subgroup. The number of cases varies from 6 in Manchu to 13 in Ewen. There is a certain allomorphy in case suffixes, depending on the last consonant of a nominal stem and vowel harmony. Table 4 shows an Ewenki paradigm that includes 11 cases for the words *bira* ‘river,’ *dət* ‘tundra,’ and *oron* ‘reindeer.’

Some Tungusic languages differentiate between alienable and inalienable possession (cf. Ewenki *dili-B* head-1PERS.sing.POSS ‘my head’ and *dili-ŋi-β* head-ALIEN-1PERS.sing.POSS ‘head of an animal that I killed and have in my possession,’ where alienable possession is indicated by the special affix *-ŋi-*). There is also a distinction between exclusive and inclusive first person plural pronouns (cf. Manchu *be* ‘we without you’ and *muse* ‘we including you,’ ‘I and you’).

In some languages, adjectives agree with the modified noun in number and case, as for example in Ewenki: *ərū-l-dū bira-l-dū bad-PL-DAT.LOC river-PL-DAT.LOC* ‘in bad rivers’; adjectives stay uninflected in other languages, as in Nanai: *dāi xoton-sal-ʃiaʃi* big city-PL-EL ‘from big cities.’

The verbal morphology is very complex. All languages differentiate between nonfinite and finite verbal forms. Verbs have the following categories: voice, aspect, mood, tense, person, and number. There are six moods, six voices, and ten different aspects in Ewenki. The typical order of affixes in a verbal form is root-VOICE-ASPECT-MOOD-TENSE-PERSON/NUMBER (e.g., Ewenki *ana-wkān-ʃə-cə-n* push-CAUS-IMPERF-PAST-3PERS.sing ‘she was making [him] to push’). In most Tungusic languages, there is a special negative verb (e.g., Ewenki *baka-ra-n* find-AOR.PART-3PERS.sing ‘he found,’ *ə-cə-n baka-ra* NEG.V-PAST-3PERS.sing find-AOR.PART ‘he did not find,’ *baka-ʃaŋā-n* find-FUT-3PERS.sing ‘he will find,’ *ə-ʃəŋā-n baka-ra* NEG.V-FUT-3PERS.sing find-AOR.PART ‘he will not find’).

Table 4 Morphology in Tungusic languages

| | Vowel stem | Plosive stem | Nasal stem |
|-----------------------|------------|--------------|------------|
| Nominative | bira | dət | oron |
| Accusative | bira-βa | dət-pe | oron-mo |
| Indefinite accusative | bira-ja | dət-je | oron-o |
| Dative–locative | bira-dūa | dət-tūa | oron-dūa |
| Allative | bira-tki | dət-tiki | oron-tiki |
| Illative | bira-lā | dət-[tu]lā | oron-dulā |
| Prolative | bira-lī | dət-[tu]lī | oron-dulī |
| Allative–locative | bira-kla | dət-iklā | oron-ikla |
| Elative | bira-duk | dət-tuk | oron-duk |
| Ablative | bira-git | dət-kit | oron-ŋit |
| Instrumental | bira-t | dət-it | oron-di |

Tupian Languages

N Gabas Jr, Belém, Brazil

© 2006 Elsevier Ltd. All rights reserved.

The Tupí family is one of the largest families of languages of South America. It contains 10 branches, with a variety of languages in each branch. The first comprehensive classification of the Tupian languages was by Rodrigues (1964), and further improvements of his classification were made by Cabral (1996, 1997), Gabas (2000), Rodrigues and Cabral (2002), Rodrigues and Dietrich (1997), and Rodrigues (1966, 1980, 1985a, 1997). It is generally accepted that the point of origin of Tupian groups is the state of Rondônia, in the northwest part of Brazil. Rondônia is still the homeland of five Tupian branches – Arikém, Mondé, Puruborá, Ramaráma,

and Tuparí – and of a few dialects (Amondawa, Karipuna, and Uru-eu-wau-wau) of the Kawahib cluster of the Tupí-Guaraní branch.

Nine branches of the Tupí family are shown in Table 1, together with the languages that belong to each branch. Classification of the tenth branch of the Tupí family, Tupí-Guaraní, is shown separately, in Table 2, because of its complexity; the Tupí-Guaraní branch has the largest number of languages of the Tupí family (almost 50 languages, arranged in several subgroupings), and several of its members are spoken in countries other than Brazil. In Table 1, languages on the same line separated by a slash correspond to dialects of the same language; languages within parentheses correspond to alternate names for that language. In Table 2, language clusters are indicated by italics. These correspond roughly to dialects of the same language. The population numbers given in both

Table 1 Classification of nine branches of the Tupi family

| Branch | Language | Population |
|-----------|----------------------------------|------------------------|
| Awetí | Awetí | 100 |
| Arikém | Arikém | Extinct |
| | Karitiána | 170 |

| | Akuntsu | 7 |
| | Makuráp | 130 |
| | Mekéns (Sakirabiat) | 70 |
| | Tuparí | 200 |

tables, except where indicated, correspond to the actual number of speakers of the language.

Of the 10 branches of the Tupí family, the Tupí-Guaraní branch is the one mostly studied. Languages of this branch have a higher degree of lexical and morphological similarities to each other when compared to languages of other branches. Internal classification of the Tupí family is currently in the early stages, but what is known about languages outside the Tupí-Guaraní branch allows a few generalizations to be made about Tupian languages as a whole. Larger genetic relations between Proto-Tupí and other families of languages, especially Macro-Jê and Karíb, have been proposed by Greenberg (1987) and Rodrigues (1985b, 1999, 2000) (see *Macro-Jê; Cariban Languages*).

General Properties of Tupian Languages

From the point of view of phonetics and phonology, Tupian languages do not have intricate consonantal and/or vocalic systems. Rodrigues (1999: 112) has reported that consonant systems across the family vary from 10 to 19, and Rodrigues and Dietrich (1997) proposed that Proto-Tupí has a six-vowel system. It is common that languages of various branches have a phonological distinction between short and long vowels (cf., Jurúna and Xipáya, of the Jurúna branch; Mundurukú, of the Mundurukú branch; possibly all languages of the Tuparí branch; all languages of the Mondé branch; and Karitiána, of the Arikém branch). Furthermore, nearly half of the Tupian branches have languages with either a true

tone system (the Mundurukú and Mondé branches and possibly the Tuparí and Jurúna branches) or a pitch-accent system (Arikém and Ramaráma branches). Stress in Tupian languages is predictable, occurring generally in the last syllable of words. Tupian languages also have a syllable structure that typically does not allow consonant codas word-internally, with the exception of the glottal stop and the glottal fricative. Thus, patterns of consonant-vowel-consonant (CVC) and vowel-consonant (VC) occur exclusively word-finally.

From the point of view of morphology, Tupian languages are agglutinative and isolating. Only a few linguistic categories are marked by affixes – for instance, pronominal prefixes, two or three valence-changing prefixes (causative, comitative causative, and detransitivizer or passivizer), modal markers (usually indicative and gerund), and diminutive/augmentative markers. Categories such as number, gender, tense, and aspect are syntactically marked by particles.

Word classes are well established and easily distinguishable from each other on morphological and/or syntactic/semantic bases. Typical word classes are nouns (including pronouns), verbs (transitive, intransitive and, sometimes, uninflected verbs), postpositions, and particles. Adjectives occur in only a few branches (Arikém, Ramaráma, and Mondé). In all other branches, a descriptive verb fulfills the function of ‘attributes’ and ‘properties.’ Core cases, with the possible exception of Tupí-Guaranian languages, are not morphologically marked. Oblique case marking is conveyed by postpositions, in postpositional phrases. Usually, four or five cases are marked (ablative, allative, dative, instrumental, locative), although languages such as Karo have a larger system; Karo has 12 different postpositions that are used to mark the ablative, abessive, adessive, allative, comitative, dative, dispersive, inessive, instrumental, locative, similative, and circumjjective cases.

Nouns, with the exception of those for elements of nature, are categorized as either alienable or inalienable. Alienable nouns generally designate manufactured items, kinship terms, animals, and plants, and occur freely in noun phrases. Inalienable nouns include mostly body parts (and, in some languages, kinship terms), and must occur preceded either by a free noun or a personal prefix (or, in some languages, such as Karo, a personal clitic). The occurrence of positional demonstratives, which mark the lying, standing, sitting, and hanging position of the head noun, is common in Tupian languages. Positional demonstratives are found in Mekéns, Karitiána, Mawé, and Mundurukú.

There is a remarkable class of words called ‘ideophones’ in many Tupian languages. Although

Table 2 Classification of the Tupí-Guaraní branch^a

^aData from Rodrigues and Cabral (2002).

^bNames in italics indicate language clusters.

their properties are not yet totally understood and/or described, roughly, ideophones have similarities to intransitive verbs, but their phonological, morphological, syntactic, and discourse behaviors are rather different. Ideophones are found in Karo (Ramaráma), Karitiána (Arikém), Mundurukú (Mundurukú), Xipáya (Jurúna), and Kamayurá (Tupí-Guaraní). Languages of the Awetí, Mawé, Mondé, and Tuparí

branches do not have ideophones, but rather have a class of uninflected verbs.

Syntactic characteristics of Tupian languages include a basic subject-object-verb (SOV) order of clause constituents, with fronting of S or O being used as a syntactic device for emphasis or contrast. The occurrence of clause-chaining constructions, whereby a clause is structured of one main verb in

the finite form plus one or more chained verbs in non-finite or unmarked form, is common and is sometimes erroneously interpreted as serial verb constructions (Jensen, 1990). Typically, coreferential intransitive subjects receive special markings in chained clauses (although this does not characterize a switch-reference system), and transitive subjects are absent (zero-anaphora).

Evidentiality is also a widespread phenomenon in all branches of the Tupí family. Unfortunately, this is not yet fully understood and described, with the exception of Karo (Gabas, 1999) and Kamayurá (Seki, 2000). In Karo, the 11 evidentials are grouped in two categories. One grouping refers to the attitude of the speaker toward the proposition conveyed, and the other refers to the source of information. For Kamayurá, Seki (2000: 104) has described the existence of 'interjective particles' that are used to report to the attitude of the speaker toward the information conveyed. Although Seki does not explicitly analyze these particles as being evidentials, they can easily be interpreted as such.

Tupian languages also have systems of noun classification. In two branches, Mundurukú and Karo, a robust classifier system occurs. In Mundurukú, approximately 50 classifiers occur associated with the preceding noun according to their shape. Classifiers in Mundurukú also occur in concordance with other elements in the noun phrase. In Karo, a set of 11 classifiers occurs, relating to the shape (7), arrangement (2), and gender (1) of the preceding noun (the meaning of the 11th classifier remains unknown). Classifiers in Karo also occur, obligatorily, after an adjective, in concordance. Although languages of other branches do not have classifier systems per se, cognates of classifiers in Karo and Mundurukú occur lexicalized in many words throughout the family, usually the classifier for round objects, *ʔaʔ*; the classifier for concave/convex objects, *ka* or *kap*; and the classifier for flat objects, *peʔ*. This suggests that a system of noun classification already existed in the protolanguage, Proto-Tupí.

Development and Classification

The Turkic language family was first attested in 8th century inscriptions. Turkic-speaking groups first appeared in the Inner Eurasian steppes, from where they moved to Central Asia, Eastern Europe, the Middle East, Siberia, etc. Because of their high mobility, Turkic expanded over a huge area.

The Proto-Turkic network of varieties was dissolved by an early split of Oghur or Bulgar Turkic. Its modern representative, Chuvash, a descendant of Volga Bulgar, differs from Common Turkic by specific phonetic representations, e.g., *r* and *l* instead of *z* and *š* in words such as *šér* 'hundred' and *šul* 'year' (Turkish *yüz* 'hundred,' *yaş* 'age'). A second split is represented by Khalaj, which retains a reflex of Proto-Turkic **p*- as *h*-, e.g., *badaq* 'foot.' Dialect splitting has led to further differentiation of Common Turkic. There is no mutual intelligibility throughout the family today. The following division combines the current areal distribution with genealogical and typological features.

1. The Southwestern or Oghuz branch contains a western subgroup comprising Turkish, Gagauz, and Azerbaijani (Azerbaijani, Northern and Azerbaijani, Southern), a southern subgroup comprising dialects of southern Iran and Afghanistan, and an eastern subgroup comprising Turkmen and Khorasan Turkic.
2. The Northwestern or Kipchak branch has a western subgroup comprising Kumyk, Karachay-Balkar, Crimean Tatar, and Karaim, a northern subgroup comprising Tatar and Bashkir, and a southern subgroup comprising Kazakh, Karakalpak, Kipchak Uzbek, Nogai, and Kirghiz (of different origin, but strongly influenced by Kazakh).

3. The Southeastern or Uyghur-Karluk branch has a western Uzbek subgroup and an eastern Uyghur subgroup.
4. The Northeastern or Siberian branch has a southern heterogeneous subgroup comprising Sayan Turkic (Tuvan, Tofan), Abakan (Yenisei) Turkic (Khakas, Shor), Chulym Turkic, Altai Turkic (Altai, Northern and Southern), and a northern subgroup comprising Yakut (Sakha) and Dolgan.
5. Chuvash is geographically situated in the north-western area (Volga region).
6. Khalaj is geographically situated in the southwestern area (central Iran).

Deviant languages in China are Salar, of Oghuz origin, Yellow Uyghur (Yugur, West) and Fu-yü (Manchuria), both of south Siberian origin.

One traditional classificatory criterion is the final consonant of the word for 'nine.' Its representation as *r* in Chuvash *täxxär* separates Oghur from Common Turkic (Turkish *dokuz*). The intervocalic consonant in the word for 'foot' divides most Northeastern languages, Chuvash, Khalaj, etc. from the rest, which exhibits *-y-* (Turkish *ayak*), e.g., Tuvan *adaq*, Khakas *azax*, Chuvash *ura*. Oghuz Turkic differs from the rest by loss of suffix-initial velars, e.g., *qal-an* [remain-PART] instead of *qal-yan* [remain-PART] 'remaining.' Final *-G* is devoiced in the Southeast (Uyghur *tay-liq* [mountain-DER] 'mountainous'), preserved in southern Siberia (Tuvan *day-lïy* [mountain-DER]), and lost elsewhere (Turkish *dağ-lı* [mountain-DER]).

Most older linguistic stages are insufficiently known. Written sources, where available, provide no direct information on spoken varieties. Early Oghuz and Bulgar (East Europe, 6th–7th centuries) are unknown. There are no texts in the language of the Khazars (7th–10th centuries). Pecheneg and Kuman, predecessors of West Kipchak, are only known from loanwords, titles, and names.

Written Varieties

Turkic literary varieties have emerged in various cultural centers. Many older Turkic empires, however, used foreign languages for administration (Sogdian, Persian). Muslim Turks often used Persian for poetry, and Arabic for religious and scientific writing. Russian has played an important role for many groups. The following main stages of written Turkic may be distinguished.

1. An older pre-Islamic East Old Turkic period (8th century–), is represented in inscriptions, manuscripts, and block prints. East Old Turkic proper is documented in stone inscriptions (Orkhon Valley), which celebrate the rulers of the Second Eastern Türk Empire, in other inscriptions found in Mongolia and the Yenisei and Talas valleys, and also in a few manuscripts. The Old Kirghiz inscriptions are of this type. Old Uyghur is first recorded in the period of Uyghur rule over the Eastern Empire. Early Old Uyghur is attested in runiform inscriptions and manuscripts. From the 10th century on, Old Uyghur became the medium of a flourishing literary culture in the Tianshan-Tarim area, attested in texts of Buddhist, Manichaean, and Nestorian content.
2. A middle Turkic period comprises various early Islamic varieties.

The first East Turkic written language, Karakhanid (11th century–), developed in Kashgar, is close to Old Uyghur but lexically influenced by Arabic and Persian. Maḥmūd of Kashgar provides information (1073) on Karakhanid and other contemporary Turkic varieties.

Khorezmian Turkic, used in the 13th–14th centuries in the Golden Horde and Mamluk Egypt, is based on the older languages but contains Oghuz and Kipchak elements.

This tradition is continued in Chaghatay (15th century–). Early Chaghatay contains regional elements of the Timurid area. Later, Chaghatay became the dominant written language of Central Asia, eventually conquering an immense area of validity and developing regional varieties.

The first West Turkic written language is Volga Bulgar, insufficiently known from epitaphs of the 13th and 14th centuries. Information on early Kipchak Turkic is given in the *Codex Cumanicus*, compiled by Christians, and in dictionaries and grammars written in Mamluk Egypt and Syria.

Oghuz Turkic is first represented by Old Anatolian Turkish (13th century–), which was a subordinate written medium until the end of Seljuk rule. Old Ottoman is the initial stage of Ottoman, which

begins with the foundation of the Ottoman Empire in 1307. In Azerbaijan a literary language developed from the 15th century on.

3. A premodern period (16th century–) begins with the development of regionally influenced written languages. Middle and Late Ottoman became the leading written language with an abundantly rich literature. Chaghatay continued to play a major role and remained the literary language of all non-Oghuz Muslim Turks until a century ago.
4. A modern period begins in the second half of the 19th century with the formation of regional written languages. The political division of the Turkic-speaking world in the 20th century and the language policies pursued in the Soviet Union, Turkey, China, and Iran had dramatic effects that increasingly obstructed transregional linguistic contacts. A dozen ‘national’ languages with a narrow radius of validity emerged. In Turkey, Ottoman was replaced by modern Turkish. The social importance of many Turkic languages was very limited. After the recent political developments, their significance is rapidly increasing, but the varieties spoken in Iran, Afghanistan, Iraq, etc., still have poor possibilities to develop.

Various scripts and script systems have been applied to Turkic. A specific runiform script was created for Old East Turkic. Most Old Uyghur texts are written in Uyghur script, originating in the Near East and later taken over by Mongols and Manchus. It is similar to the Sogdian script, which is also used in Buddhist texts. A few Buddhist manuscripts are written in Brahmi script, Manichaean texts in Manichaean script, and Nestorian texts in Syriac script. Arabic script was used for the languages of the Islamic era (still used in China for Uyghur and Kazakh). A unified Roman-based script was introduced for several languages in the early Soviet period, but later replaced by different Cyrillic-based scripts. A Roman-based alphabet was introduced in Turkey in 1923. Most of the newly established Turkic republics have introduced or are introducing Roman-based scripts.

Contacts

The massive displacements of Turkic-speaking groups throughout their history have led to various phenomena induced by contacts with Iranian, Slavic, Mongolic, Uralic, etc. Speakers of Turkic have copied lexical, phonetic, morphological, and syntactic elements, whereas non-Turkic (e.g., Iranian, Greek, Finno-Ugric, Samoyedic, Yeniseian, Tungusic) groups shifting to Turkic have exerted substrate influence by

copying native elements into their new varieties. Languages such as Chuvash, Yakut, Salar, Yellow Uyghur, Khalaj, Karaim, and Fu-yü have long developed in isolation from their relatives, preserving old features and acquiring new ones in their environments. Long and intense interaction with Iranian in Central Asia, Iran, Afghanistan, etc., has led to profound convergence phenomena. Massive foreign influence has sometimes caused considerable typological deviations, e.g., drastic structural changes in Karaim and Gagauz under Slavic impact.

Most written languages have been strongly influenced by Persian and Arabic. In Chaghatay (Chagatai) and Ottoman, lexical borrowing contributed to a remarkable richness of the vocabularies, whereas grammar was much less affected. The overload of Persian and Arabic in Ottoman led to strong puristic efforts in the 20th century to create a so-called Pure Turkish.

Internal convergence processes have resulted in leveling of languages of the central area. Several Turkic koinés have been used as transregional codes for trade and intergroup communication, e.g., Azerbaijani in Iran and the Caucasus region.

Linguistic Features

Despite their huge area of distribution, Turkic languages share essential phonological, morphological, and syntactic features.

They have a synthetic word structure with numerous highly applicable derivational and grammatical suffixes, and a juxtaposing technique with clear-cut morpheme boundaries and predictable allomorphs. These agglutinative principles yield considerable morphological regularity and transparency. Exceptions include traces of vowel gradation in the pronominal declination, e.g., Turkish *ben* 'I,' *ban-a* [I-DAT] 'to me.' The agglutinative structure is partly deranged in languages of the northeast and southeast. Some languages, e.g., Uzbek, even display borrowed prefixes.

The syllable contains minimally a vowel with maximally one preceding and one subsequent consonant. Vowel hiatus and consonant clusters are avoided.

Most languages exhibit eight short vowel phonemes, *a, i, o, u, e, i, ö, ü*, classified according to the features front vs. back, unrounded vs. rounded, and high vs. low. Proto-Turkic long vowel phonemes are preserved in Turkmen, Yakut, and Khalaj. Iranian and Slavic phonetic influence has sometimes affected the front vs. back distinctions. Tatar, Bashkir, Chuvash, and Uyghur exhibit systematic vowel shifts. Chuvash, Gagauz, Karaim, etc., have developed palatalized

consonants, e.g., Karaim *méní* 'I'. Tuvan and Tofan exhibit a glottal element signaling strong obstruents, e.g., *aʔt* 'horse' vs. *at* 'name.'

The most general sound harmony phenomenon is an intrasyllabic front vs. back assimilation. An inter-syllabic front vs. back harmony causes neutralization of the front vs. back distinction under the influence of the preceding syllable. If applied consistently, it excludes back and front syllables in a word, e.g., Turkish *ev-ler-im-e* [house-PL-POSS.1.SG-DAT] 'to my houses,' *at-lar-ım-a* [horse-PL-POSS.1.SG-DAT] 'to my horses.' Some languages only display this kind of harmony, whereas others also apply a rounded vs. unrounded harmony, neutralization of the distinction rounded vs. unrounded in high suffix vowels, e.g., Turkish *el-im* [hand-POSS.1.SG] 'my hand,' *gül-üm* [rose-POSS.1.SG] 'my rose.' Languages such as Yakut and Kirghiz apply this harmony to low-vowel suffixes as well, e.g., *börö-lör* [wolf-PL] 'wolves.' There are numerous exceptions to harmony rules in loanwords. Further allomorphs are created by various consonant assimilations.

The rules of word accent vary. A high pitch accent, interacting with a dynamic stress accent, mostly falls on the last accentable syllable of native words.

The morphological structure has remained relatively stable through the centuries. The main word classes are nominals (nouns, adjectives, pronouns, numerals) and verbals. The primary stems can be used as free forms, e.g., *at* 'horse,' *at!* 'throw!'. From verbal and nominal stems, which are sharply distinguished, expanded stems are formed. Nominals take plural, possessive, case, and specific derivational suffixes. Grammatical gender is not marked. The verbal morphology comprises markers of actionality, voice, possibility, negation, aspect, mood, evidentiality, tense, person, interrogation, etc. Voice is expressed by passive, reflexive-middle, causative, and cooperative-reciprocal suffixes. The order and combinability of suffixes is basically common to all Turkic languages.

Constructions with postposed auxiliary verbs (post-verbs) express actional modifications. A few constructions have developed into aspect-tense categories, e.g., Turkish *gel-iyor* [come-PRES] 'comes' < **gel-e yori-r* [come-CONV run-AOR] ('runs coming'). Possibility markers are formed with auxiliary verbs such as *bil-* 'to know' and *al-* 'to take,' e.g., Kirghiz *ber-e al-* [give-CONVAUX.POTEN] 'to be able to give.'

Turkic languages share many syntactic characteristics. With respect to relational typology, they adhere to the nominative-accusative pattern. They have a head-final constituent order, with dependents preceding their heads. The unmarked order of clause constituents is subject + object + predicate (SOV).

Adjectival, genitival, and participial attributes precede the head of the nominal phrase. Postpositions are used instead of prepositions. There is no agreement in number or case between dependents and heads. The focus position is in front of the predicate core. The unmarked constituent order is often deviated from for discourse-pragmatic reasons. Contact-induced word order changes are common, e.g., in Gagauz, which has become an SVO language.

Preposed subordinate clauses are based on verbal nouns, participles, and converbs. The use of postposed subordinative patterns with conjunctions are typical effects of Iranian and Slavic influence. Most languages possess conjunctions, even coordinative ones meaning 'and,' 'or,' and 'but' of Persian, Arabic, or Russian origin.

Turkic lacks definite articles. The indefinite article is formally identical with the numeral 'one' Genitival attributes, expressing a possessor, stand in the genitive, whereas their head, indicating a possessed entity, carries a possessive suffix, e.g., Turkish *at-in baş-ı* [horse-GEN head-POSS.3.SG] 'the head of the horse.' The dominant type of nominal compounds follows the

pattern noun + noun + possessive suffix, e.g., Turkish *el çanta-sı* [hand bag-POSS.3.SG] 'handbag.'

All Turkic varieties exhibit numerous loanwords. Arabic and Persian loans are frequent in all Islamic-Turkic languages. The Iranian influence is strong in Uyghur, Uzbek, and varieties of Iran and Afghanistan. Many languages have been subject to considerable Mongolic and Slavic influence. Loans and calques from European languages have become increasingly important. The Turkic languages spoken in China exhibit old and recent loans from Chinese.

Turkish (natively *Türkçe*), the official language of the Republic of Turkey, is spoken by a large proportion of the Turkish population. There are also Turkish speakers in the Balkans, particularly in Greece, Bulgaria, and the former Yugoslavia, although there has been extensive population inflow from those countries into Turkey, and there is a substantial minority of Turkish speakers in Cyprus. There are Turkish-influenced Turkic dialects in Iraq in the region of Kirkuk, where the speakers are called Turkmen or Turkomans. The *Ethnologue* entry for Turkish gives a population of roughly 46 million speakers in Turkey, and 61 million in all countries.

Turkish belongs to the southwestern, or Oghuz (*Oğuz*), group of Turkic languages. This group also includes Azerbaijani, spoken in Azerbaijan and in adjacent areas of Iran; Qashqay and related dialects, spoken in the Zagros mountain area of Iran; Türkmen, spoken in Turkmenistan; and Gagauz,

spoken in Bulgaria, in Romania, and principally in Moldova, although there has been substantial migration from Moldova to Turkey. Central Asian Turkic languages include the national languages of Kazakhstan, Uzbekistan, and Kyrgyzstan, and a number of others. Turkic, in turn, belongs to the Altaic family of languages, which also includes the Mongol and Manchu-Tunguz language families. Though this relationship has recently been called into question, it was proved convincingly by Poppe more than a generation ago (Poppe, 1960). Wider affinities of the Altaic family have been suggested for Korean, and even for Japanese.

Turkish scholars divide the history of the Turkish language into three periods: (1) Old Anatolian Turkish (*Eski Anadolu Türkçesi*), comprising texts dating from the earliest arrival of Turkic speakers in Anatolia, through the Seljuk period to the formation of the Ottoman Empire; (2) Ottoman (*Osmanlıca*), the language of the Ottoman Empire, heavily influenced by Arabic and Persian; and (3) Modern Turkish (*Yeni Türkçe*), dating from the overthrow of the Ottoman Empire and from the Turkish language reform movement of the 1920s and 1930s. The Turkish language reform movement was

launched by Atatürk as part of his overall plan to distance Turkey from Middle Eastern, specifically Arabic and Persian, influences, in favor of European influence. This movement in the language area included most noticeably the replacement of the Arabic writing system with a Latin alphabet in 1928, and a drive to replace Arabic and Persian vocabulary, once pervasive in Ottoman texts, with vocabulary drawn or constructed from Turkish sources, or Turkish-looking inventions. The drive to cleanse the lexicon has waxed and waned over the interim and has acquired political correlates: writers on the left tend to use neologisms; those on the right use a more traditional vocabulary. There has been no corresponding attempt to rid the lexicon of European or English terminology (for more on the language reform movement, see Lewis (1999)). In 1997, a committee of the American Association of Teachers of Turkic Languages attempted to create a standardized English terminology for Turkish, which is used here.

Phonology

Phonemes

Consonants The International Phonetic Association (IPA) representations of the Turkish consonant system are shown in Table 1. Turkish uses 21 letters for consonants: b c ç d f g ğ h j k l m n p r s ş t v y z. These represent the expected sounds, except as follows:

| Letter | Sound |
|--------|-------|
| c | [dʒ] |
| ç | [tʃ] |
| j | [ʒ] |
| ş | [ʃ] |

In the following discussions, [tʃ] and [dʒ] will henceforth be written /ç/ and /j/, since they function in all phonological respects as members of the natural class of stops, not as clusters. The letters *k g l* each stand for two sounds: a plain velar or lateral [k g l] and a front velar or palatal [c ʝ λ]. In words of Turkish origin, the front velar variant occurs with front vowels and the plain velar occurs with back vowels.

Table 1 International Phonetic Association symbols for Turkish consonants

| Labial | Dental | Palatal | Front velar | Velar | Glottal |
|--------|--------|---------|-------------|-------|---------|
| p | t | tʃ | c | k | |
| b | d | dʒ | ʝ | g | |
| f | s | ʃ | | | h |
| v | z | ʒ | | | |
| m | n | ɲ | | | |
| | r | ɾ | | | |

In words of Arabic origin, however, /c ʝ λ/ can occur with back vowels, giving rise to pairs and thus distinctive contrasts, as in *kar* ‘snow’ [kar] and *kâr* ‘profit’ [car].

The letter *ğ*, or *yumuşak ge* ‘soft g’, has no consonantal sound. It normally represents an historical or underlying /g/ that has been deleted; in some Anatolian dialects, it survives as a voiced fricative [ɣ]. Most commonly, *ğ* lengthens the preceding vowel in syllable-final (coda) position, and represents nothing between vowels, as in *dağ* ‘mountain’ [daː] and *dağa* ‘mountain (dat)’ [daa].

Vowels Turkish vowels are traditionally represented in a ‘cube’ shape, consisting of all possible values of the features, front/back, high/low, and rounded/unrounded, as in Figure 1. Each vowel can occur long, from the deletion of *ğ*, and the vowels /e i a u/ can occur long in Arabic loanwords, giving a total of 16 vowel phonemes. The vowel letters are for the most part self-explanatory, except for *ı*, an undotted ‘i,’ which is a high back unrounded vowel, IPA [u]. All Turkish vowels are phonetically lax, except sometimes before *y* or *ğ*, thus *a e i i o ö u ü* sound like [a ε ɪ u u ɔ œ ʊ ʏ]. Because the difference between *ı* and *i* is distinctive, it must be maintained for capitals also, i.e., *I* and *İ*.

Stress Stress in Turkish consists of higher pitch, rather than greater loudness on the accented syllable. Stress is normally on the last syllable of the word; as affixes are added, stress moves rightward:

- (1) *él* ‘hand’
- ellér* ‘hands’
- ellerím* ‘my hands’

There are a number of exceptions to final stress. Some words have inherent nonfinal stress, and in these cases stress does not move with the addition of affixes. Inherently stressed words include most loans, which have their own rule for accent; in such cases, the accent may fall on a syllable other

Figure 1 Turkish vowels. Front vowels are represented at the front of the cube, high vowels are at the top, and rounded vowels are to the right. Reproduced from Underhill R (1976) Turkish grammar. Cambridge: MIT Press. With kind permission by MIT Press.

than that which is stressed in the source language, as in *sinéma* ‘cinema’ and *Kenédi* ‘Kennedy’. Some affixes are prestressing; stress then falls on the preceding syllable and remains there as additional affixes are added. The rules for stress and much else in Turkish phonology are extensively worked out in Demircan (2001).

Phonological Rules

Turkish being an agglutinating language, suffixes are added to stems in such a manner that segmentation is relatively easy. However, a number of changes take place in both stems and suffixes when this happens.

Vowel Harmony Vowel harmony involves the two features front/back and rounded/unrounded. It is a syllable-to-syllable process by which each vowel conditions the following vowel, according to the following rules:

1. Any of the vowels can occur in the first syllable of a word.
2. A noninitial vowel assimilates to the previous vowel in frontness.
3. A noninitial high vowel assimilates to the previous vowel in rounding. A noninitial low vowel is unrounded. Thus /o ö/ do not appear in harmonic suffixes.

The process is illustrated in Table 2, which shows how the stem, dative (suffix *-yA*), and objective (suffix *-yI*) case forms of a set of nouns are used (in morphophonemic transcription, the symbol *A* represents the alternation between /a/ and /e/, and the symbol *I* represents the alternation /i ı u ü/). A few native words and very many foreign words are nonharmonic, such as *kardeş* ‘brother’, *otel* ‘hotel’, and *sigorta* ‘insurance’. This has led some scholars to claim that vowel harmony no longer holds for stems (Clements and Sezer, 1982). In the case of a nonharmonic word, suffixes are controlled by the last syllable, as in *asansör* ‘elevator’ (plural *asansörler*) and *kredikart* ‘credit card’ (plural *kredikartlar*).

Table 2 Turkish vowel harmony

| Stem | Gloss | Dative | Objective |
|------------|------------|-------------|-------------|
| <i>bal</i> | ‘honey’ | <i>bala</i> | <i>balı</i> |
| <i>kıl</i> | ‘hair’ | <i>kıla</i> | <i>kılı</i> |
| <i>ok</i> | ‘arrow’ | <i>oka</i> | <i>oku</i> |
| <i>buz</i> | ‘ice’ | <i>buza</i> | <i>buzu</i> |
| <i>ev</i> | ‘house’ | <i>eve</i> | <i>evı</i> |
| <i>il</i> | ‘province’ | <i>ile</i> | <i>ılı</i> |
| <i>göl</i> | ‘lake’ | <i>göle</i> | <i>gölü</i> |
| <i>gül</i> | ‘rose’ | <i>güle</i> | <i>gülü</i> |

Other Phonological Rules Beyond vowel harmony, stems and suffixes have a highly changeable nature. Suffix-initial voiced stops devoice after a stem ending in an unvoiced consonant. Many suffixes have different postconsonantal and postvocalic forms. Stems also undergo a number of rules designed to maintain canonical syllable structure, particularly in closed syllables. Among the rules applying to syllables are final devoicing, epenthesis, degemination, and vowel shortening. There are many details concerning these rules, but as an extreme example, the verbal noun suffix best written as *-DIg* has 16 forms:

-dik/dık/duk/dük/tik/tık/tuk/tük/diğ/dığ/duğ/düğ/tiğ/tığ/tuğ/tüğ

Morphology

Turkish is an agglutinating language in which suffixes, in some cases a large number of them (the lists of suffixes in the following sections are not exhaustive), are added fairly transparently to stems:

- (2) *ev* ‘house’
evler ‘houses’
evlerim ‘my houses’
evlerimiz ‘our houses’
evlerimizde ‘in our houses’
evlerimizdeki ‘which is in our houses’

The Noun Paradigm

Noun stems may have the following inflectional suffixes, in order:

1. Plural *-IAr* (as in *baba* ‘father’, *babalar* ‘fathers’ and *deve* ‘camel’, *develer* ‘camels’).
2. Possessive (possessed agreement).
3. Case (as in *oda* ‘room’).

- (3) Nominative: *oda*
 Genitive (-*n*)*In*): *odanın*
 Dative (-*yA*): *odaya*
 Objective (-*yI*): *odayı*
 Locative (-*DA*): *odada*
 Ablative (-*DAn*): *odadan*
 Instrumental/comitative (-*y-IA*): *odayla*

The Verb Paradigm

Starting with the verb root, a number of derivational suffixes can be added to build up the verb stem. These include reflexive, reciprocal, causative, passive, impossibility, negative, and abilitative forms. At this point, from the verb stem, it is possible to go in a number of directions. For a finite (‘tensed’) verb, the next step is a tense suffix, followed normally by a personal ending:

| | | |
|----------------------|------------|-----------------------|
| (4) General present: | gelirim | 'I come', 'I'll come' |
| Progressive: | geliyorum | 'I am coming' |
| (Definite) past: | geldim | 'I came' |
| Unwitnessed past: | gelmişim | 'I (supposedly) came' |
| Future: | geleceğim | 'I will come' |
| Necessitative: | gelmeliyim | 'I ought to come' |
| Optative: | geleyim | 'let me come' |
| Conditional: | gelsem | 'if I come' |

There is also a wide range of nonfinite suffixes possible at this point for the formation of subordinate clauses. These include verbal nouns or nominalizations, participles, and adverbial clause suffixes (traditional 'converbs').

Auxiliary Suffixes

Finally, there is a group of suffixes that can be categorized under the heading of 'auxiliary'. They can be added both to verbal and nonverbal predicates, hence a separate auxiliary category. They include most prominently the personal endings, but also some morphemes that can be called 'aspects', although they are not all aspects any more than the tenses are all tenses (abbreviations: SG, singular; PROG, progressive):

- (5) Yorgun -du -m.
tired -PAST -1SG
'I was tired'.
- (6) Gel -iyor -du -m.
come -PROG -PAST -1SG
'I was coming'.

The aspects are past *-y-DI*, dubitative *-y-mİş*, and conditional *-y-sA*. Furthermore, there is an adverbial aspect *-y-ken*. These look very similar to some tenses, i.e., definite past *-DI*, unwitnessed past *-mİş*, and conditional *-sA*, but they differ in morphology, meaning, and prosody (all auxiliary suffixes are prestressing).

The inferential/quotative, sometimes called dubitative (DUB), *-y-mİş*, deserves special discussion. This aspect, and to some extent the corresponding tense, *-mİş*, are used when the speaker wishes to be disassociated from the truth of the utterance – for example, when the speaker has information that has only been heard or recently found out (VB, verb):

- (7) Sen tembel -miş -sin.
you lazy -DUB -2SG
'They say you are lazy'.
- (8) Geçen sene hasta -lan-mış-sın.
past year sick -VB-DUB-2SG
'(I heard) you got sick last year'.

The dubitative can also be used for statements for which the speaker does have personal knowledge of

the fact, but is expressing something unexpected or surprising – for example, after trying a food that the speaker had expected to dislike:

- (9) Bu yemek iyi -miş!
this food good -DUB
'This food is good!'

Syntax

Unmarked (normal) word order is subject-object-verb, as shown in the following example (OBJ, objective; DAT, dative):

- (10) Hasan mektub -u
Hasan letter -OBJ
Ayşe-ye gönder -di.
Ayşe-DAT send -PAST
'Hasan sent the letter to Ayşe'.

However, this is complicated by the fact that Turkish has pragmatically conditioned word order, by which the information status of noun phrases, rather than their grammatical function, determines their placement in the sentence. Many of the basic principles were worked out by Erguvanlı (1984). The topic is sentence initial; thus, any of the terms of Example (10) could be initial, depending on whether Hasan, the letter, or Ayşe is the topic. New information comes in the preverbal position, thus any of the terms of Example (10), if indefinite, would move preverbally:

- (11) Mektub-u Ayşe-ye bir
letter-OBJ Ayşe-DAT a
arkadaş gönder-di.
friend send-PAST
'A friend sent the letter to Ayşe'.

In fact, preverbal position is focus position; thus, *wh*-words are found here, as well as words questioned contrastively, the focused words in the answers to *wh*-questions, or any focused argument. Though the canonical sentence pattern for English might be written as subject-verb-object-X, where X is everything else, the pattern for Turkish would be topic-X-focus verb, and is thus determined by pragmatic rather than by grammatical conditions. Furthermore, sentences are not necessarily verb final. Backgrounded or unstressed information can move to the right of the verb, producing what is traditionally called a *devrik cümle (tüümce)*, or 'inverted sentence' (NEG, negative; PL, plural):

- (12) Ver-me çocuğ-a kibrit-ler-i.
give-NEG child-DAT match-PL-OBJ
'Don't give the child the matches'.

The focus in Example (12) is 'don't give,' and the child and the matches will have been previously

mentioned or are clear in the context, i.e., are ‘given’ in the sense of functional syntax.

Turkish is a left-branching and head-final language in which nouns follow adjectives (Example (13)), possessives (Example (14)), and relative clauses (Example (15)); postpositions follow noun phrases (Example (16)), and verbs follow direct objects, even subordinate clauses (Example (17)) (GEN, genitive; POSS, possessive; LOC, locative; PART, participle; ABL, ablative; VN, verbal noun; FUT, future):

- (13) çok küçük bir çocuk.
very small a child
‘A very small child’.
- (14) Enver-in şapka-sı.
Enver-GEN hat-POSS
‘Enver’s hat’.
- (15) Köşe-de otur-an kız.
corner-LOC sit-PART girl
‘The girl who is sitting in the corner’.
- (16) Bu haber-den dolayı.
this news-ABL because
‘Because of this news’.
- (17) Hasan-in yarın
Hasan-GEN tomorrow
gel-eceğ-in-i duy-du-m.
come-VN.FUT-3SG-OBJ hear-PAST-1SG
‘I heard that Hasan will come tomorrow’.

Notice from Example (17) that Turkish is a pro-drop language (‘pronoun dropping’; i.e., subject pronouns

normally are not used, as in Latin or Spanish). Overt pronouns appear in cases of focus or contrast, including topic change. Because relative clauses precede head nouns, and direct objects (including noun complement clauses) precede the main verb, Turkish sentences sometimes give the impression of having the reverse word order from English. English speakers reading Turkish sometimes find it easier to start at the end of a sentence and read toward the front, and Turkish speakers report that they do the same in reading English.

Turkmen

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Turkmen (*türkmen dili*, *türkmençe*) belongs to the southwestern or Oghuz branch of the Turkic language family, which also includes Turkish. It is mainly spoken in Turkmenistan (*Türkmenistan döwleti*), which is located in the Transcaspien region and whose capital is Ashgabat. Turkmenistan borders on Iran and Afghanistan in the south, Uzbekistan in the east, and Kazakhstan in the north. The area of distribution of Turkmen extends from the southeastern shore of the Caspian Sea to the Kazakh-speaking area in the north, the Karakalpak-speaking area in the north-east, the Uzbek-speaking area in the east, beyond

the Amudarya River, and the Persian (Farsi, Western) and Khorasan Oghuz (Khorasani Turkish) areas in the south, beyond the borders to Afghanistan and Iran. Though Turkmen make up 85% of the 4.8 million inhabitants, only 72% speak Turkmen. The other main languages are Russian (12%) and Uzbek (9%). Turkmen-speaking groups also live in the Russian Federation, Kazakhstan, Tajikistan, China, etc. The total number of speakers amounts to nearly 5 million.

The designation ‘Turkmen’ is not unequivocal. Older Oghuz varieties spoken in Khorezm, Khorasan, Azerbaijan, Anatolia, and other regions in the Near East were referred to as ‘Turkmen.’ Several nomadic groups in Anatolia, Iraq, etc. are still called ‘Turkmen’ without being Turkmen in a linguistic sense.

Since the mid-1990s, language policy aims at consolidating Turkmen as the state language and to remove the Russian dominance. Turkmen is gaining

more social functions. The 1992 constitution defines it as the “official language of inter-ethnic communication.” Geographic names and administrative terms have been changed from Russian to Turkmen. In practice, however, Russian has maintained its importance in most spheres of public communication.

Origin and History

The Turkmen go back to the Turkic-speaking Oghuz confederation of tribes, whose Inner Asian steppe empire collapsed in 744. Certain Oghuz groups migrated into the region between the Syrdarya and Ural rivers. By the late 10th century, the Seljuk dynasty was founded, and an autonomous state was established on the lower Syrdarya. The Seljuks left this region in the middle of the 11th century and migrated westwards. Their modern descendants are the Turks of Khorasan, Azerbaijan, and Turkey. The speakers of Turkmen are mainly descendants of non-Seljuk groups that did not take part in these migrations.

During the Mongol conquests in the 13th century, the remaining Oghuz tribes were pushed into the Karakum desert and the region east of the Caspian Sea. From the 16th century on, Turkmen groups migrated to Khorezm, to the southern part of today’s Turkmenistan, and to Khorasan, absorbing local Turkic and Iranian elements. The major migrations of the Salīr, Ersari, Sariq and Teke tribes took place in the 17th century. In the 18th century, the Turkmen conquered the whole core area that they inhabit today.

Most tribes were subsequently divided and controlled by the Uzbek khanates of Khiwa and Bukhara, while the Persian shahs tried to subdue the southern tribes. The dependence of Khiwa and Persia came to an end after the mid-19th century. Some decades later, Russia annexed the Turkmen territory, which caused many Turkmen groups to emigrate to Afghanistan and Iran. The Turkmen area was first administered as the Trans-Caspian district in the Governorate of Turkistan. In 1924, Turkmenistan was proclaimed a Socialist Soviet Republic.

In connection with the dissolution of the Soviet Union, Turkmenistan declared its sovereignty in 1990, achieved its independence in 1991 (after a popular referendum), and adopted its new constitution in 1992.

Related Languages and Language Contacts

The closest relative of Turkmen is Khorasan Turkic (Khorasani), spoken in northeastern Iran and Khorezm, a distinct language with which it constitutes the eastern subbranch of Oghuz. Azerbaijanian

(Azerbaijani) and Turkish represent the western subbranch. The specific features of Turkmen are partly archaic and partly innovative, due to language contact. Within the Turkic family, Khorasan Turkic, Uzbek, and Karakalpak are the most important contact languages. Turkmen has had intensive contacts with Persian and, during the last century, with Russian.

The Written Language

Old Turkmen is not clearly documented in written sources. The oldest records of ‘Turkmen’ relate to Oghuz varieties in general. Oghuz texts of the following centuries do not exhibit any specific Turkmen features. A written Turkmen literature began in the 18th century, but the language used is a variety of the classical Chaghatay (Chagatai) language. A Turkmen standard language was created in the Soviet era and formed mainly from 1928 on. It was based on the Teke dialect as spoken in the Ashgabat region.

Arabic script was used in the first period. Two script reforms, in 1922 and 1925, aimed at reflecting spoken features more adequately. A Roman-based alphabet that reflected most of these features rather accurately was in use from 1928 to 1940. A variant of the Cyrillic alphabet was adopted in 1939–1940. Since the early 1990s, there has been a transition to a Roman-based script again. In 1993, the final version of a Roman-based alphabet was adopted to replace the Cyrillic one. It has several unique letters that distinguish it from Turkey’s alphabet and the newly adopted alphabets of other Turkic republics.

Distinctive Features

Turkmen exhibits most linguistic features typical of the Turkic family (*see Turkic Languages*). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., *A = a/e*, *I = i/i*. Segments in round brackets only occur after consonant final stems. Hyphens are used here to indicate morpheme boundaries.

Phonology

Turkmen has, like Yakut and Khalaj, preserved Proto-Turkic long vowels in a consistent way, e.g., *a:t* ‘name’ < *a:t* (but at ‘horse’ < *at*), *dö:rt* ‘four’ vs. Turkish *dört* < *tö:rt*. The orthography does not normally mark vowel length, but *ü*: in words of Turkic origin is expressed by *üy*, e.g., *süyt* for [θü:t] ‘milk’.

Proto-Turkic *e*: is mostly represented by Turkmen *i*, which mostly corresponds to Azerbaijani *e*, e.g., *gi:č* ‘late’ (Azerbaijani *geç*, Turkish *geç*).

A striking feature of Turkmen pronunciation is the presence of the interdental fricatives *θ* and *ð*, which correspond to *s* and *z* in other Turkic languages, e.g., *θid* ‘you’ (Turkish *siz*).

As in Azerbaijani, the word-initial back velar *g*-corresponds to *q*- in other Turkic languages, e.g., *g̈i:ð* ‘girl’ (Azerbaijani *giz*, Turkish *kız*). Initial *b*- is preserved in *ber-* ‘to give’, *ba:r* ‘existing’, *ba-* ‘to go’ and *bol-* ‘to become’ (Turkish *ver-*, *var*, *var-*, *ol-*). The bilabial fricative *β* is used instead of labiodental *v*, e.g., *a:β* ‘hunt’ (Turkish *av*). It appears as the glide *w* between two vowels or between a liquid and a vowel. The bilabial fricative *f* is frequently replaced by the stop *p* in loans, e.g., *pikir* ‘thought’ (Turkish *fikir*).

Suffix vowels mostly assimilate to the quality of the preceding vowel. Turkmen displays both front vs. back harmony and rounded vs. unrounded harmony. The latter also includes suffixes with low vowels, e.g., *toy-do* [feast-LOC] ‘at the feast’ vs. *öy-dö* [house-LOC] ‘in the house’. Long *a*: and *e*: are not rounded; there are also other exceptions. Though the orthography represents the vowels of rather closely, rounding harmony is not consistently represented. Rounding is only expressed in high vowels and not beyond the second syllable. The tendency towards rounded low suffix vowels is also observed in languages such as Kirghiz, Altay Turkic (Altai), and Yakut.

Numerous consonant assimilations are observed, e.g., *men-ne* [I-LOC] ‘in me’, *g̈id-ðan* [girl-ABL] ‘from the girl’, *yol-loş* [way-DER] ‘comrade’ (Turkish *ben-de* [I-LOC], *kiz-dan* [girl-ABL], *yol-daş* [way-DER]). They are mostly not reflected in the orthography.

In copies of loanwords, nonpermissible consonant clusters are dissolved by means of prothetic or epenthetic vowels, e.g., *uθθul* ‘chair’ < Russian *stul*, *pikir* ‘thought’ < Arabic *fikr*. In recent loanwords from Russian, these vowels are not reflected orthographically.

Grammar

The comparative degree of adjectives is formed with *-rA:K*, e.g., *kičire:k* [small-COMP] ‘smaller, rather small’ (*kiči* ‘small’). The demonstrative pronouns *bu:*, *šu:*, *ol* and *şo[l]* form a fourfold deictic system, expressing various degrees of distance (Turkish *bu*, *o* and *şu*).

The old present tense, mostly called ‘indefinite future,’ is formed with *-Ar*, e.g., *bil-er* [know-AOR] ‘will know’ (Turkish *bil-ir* [know-AOR]), *oqa:r*

[read-AOR] ‘will read’ (Turkish *oku-r* [read-AOR]). The negative marker is *-mAð* in the third person, and *-mAr* in the other persons, e.g., *gel-mer-in* [come-NEG.AOR-1.SG] ‘I will not come’ (Turkish *gel-me-m* [come-NEG.AOR-1.SG], Azerbaijani *gel-mer-em* [come-NEG.AOR-1.SG]). A more focused present tense is formed with *-yA:r*, often contracted to *-yA*, e.g., *bil-ye:r* [know-PRES.3.SG] ‘knows’, *oqa-ya:r* [read-PRES.3.SG] ‘reads, is reading’. A few verbs exhibit contracted forms without this marker: *du:r* [stand-PRES.3.SG] ‘is standing’, *oẗi:r* [sit-PRES.3.SG] ‘is sitting’, *yaẗi:r* [lie-PRES.3.SG] ‘is lying’. These forms can be used with a converb marker to express a continuous present, e.g., *oqa:-p oẗi:r* [read-CONV AUX-PRES.3.SG] ‘is reading’.

The second-person imperatives include an unmarked singular, e.g., *gel* [come.IMP.2.SG] ‘come!’, a form expressing insistence, e.g., *gel-gin* [come-IMP.2.SG], a plural form, e.g., *gel-ij* [come.IMP.2.PL], and intensifying forms, e.g., *gel-θen-e* [come-IMP.2.SG] (singular) and *gel-θe-ηid-lä:η* [come-IMP.2.PL] (plural). The first-person plural has a special form that only refers to the speaker and the addressee, e.g., *gel-eli-η* [come-IMP.1.PL] ‘let us come’, *gel-eli* [come-IMP.1.INCL] ‘let us come (you and me)’.

The future marker *-jAK* and the intentional marker *-mAK-çI* lack personal markers, e.g., *men gel-jek* [I come-FUT] ‘I will come’ (Turkish *gel-eceğ-im* [come-FUT.1.SG]), *men yað-maq-çï* [I write-INTENT] ‘I intend to write’.

Turkmen has a postterminal (‘past’) participle marker *-An* and an intraterminal (‘present’) participle marker *-yA:n*, e.g., *bil-en* [know-POSTTERMINAL.PART] ‘having known’, *bil-ye:n* [know-INTRATERMINAL.PART] ‘knowing’. A categorical negation is formed with the participle in *-An* + possessive suffix + *yo:q* ‘non-existing’, e.g., *al-am-o:q* (<*al-an-ım yo:q*) [take-POSTTERMINAL.PART-POSS.1.SG not-existing] ‘I did/do not take at all’. There is a postterminal converb marker *-(I)p*, e.g., *oyno-p* [play-POSTTERMINAL.CONV] ‘having played’. The corresponding marker of Turkish and Azerbaijani displays the uncontracted form *-(y)Ip/-(y)Ib*, e.g., Turkish *oyna-yip* [play-POSTTERMINAL.CONV].

Among the evidential markers, the inflectional suffix *-(I)p-dIr*, negated *-mAn-dIr*, forms an evidential (indirective) past, e.g., *gel-ip-dir* [come-POSTTERMINAL.CONV-EV.3.SG] ‘has evidently come’. The copula particle *eken* combines with various participles, e.g., *gel-en eken* [come-POSTTERMINAL.PART EV.PARTICLE] ‘has obviously arrived’. The copula particle *-mİş* suggests second-hand information, e.g., *gel-ip-miş-in* [come-POSTTERMINAL.

CONV-EV.3SG] ‘has reportedly come’. A presumptive intraterminal (present, imperfect) is formed with *-yA:n-dlr*, a presumptive postterminal (perfect) with *-A:n-dlr*, e.g., *bar-ya:n-nür* [go-INTRATERMINAL.PART-PRESUMP.3.SG] ‘is probably going’, *bar-an-nür* [go-POSTTERMINAL.PART-PRESUMP.3.SG] ‘has probably gone’.

A number of postverb constructions with converbs plus auxiliary verbs, *goy-* ‘to put’, *git-* ‘to go away’, *çiq-* ‘to go out’, *dur-* ‘stand’, *otur-* ‘sit’, *yör-* ‘move’, etc., express modifications of the manner in which the action denoted by the lexical verb is carried out.

Lexicon

The Turkmen vocabulary is basically of southwestern Turkic origin, though it also contains words typical of the Northwestern and Southeastern branches of Turkic. There are synonyms representing Oghuz and non-Oghuz types, e.g., *gäpî* and *işik* ‘door’, *dodaq* and *erin* ‘lip’. The vocabulary contains numerous words of Arabic and Persian origin, borrowed from Persian and representing the traditional sphere of Islamic civilization, e.g., *xat* ‘letter’, *inθa:n* ‘human being’, *ša:t* ‘glad’, *gül* ‘flower’, *irenk* ‘color’. The Turkmen conjunctions are mainly of Arabo-Persian origin, e.g., *we* ‘and’, *emma:* ‘but’. Words of Russian origin, borrowed from the 19th century on, represent phenomena of modern life, e.g., *poθyolok* ‘settlement’, *gäðyet* ‘newspaper’, *fe:рма* ‘farm’. The vocabulary contains many recent internationalisms borrowed via Russian.

Dialects

Turkmen dialects and subdialects are referred to by the names of tribes and clans. One main dialect group comprises the Teke, Yomud, Sariq, Salir, Gökleng and Ersari dialects, which are rather close to Standard Turkmen. The Teke dialect, occupying the central

area, has two subdialects, Mari and Akhal, the latter spoken in the Ashgabat region. The Yomud dialect is spoken on the southeast shore of the Caspian Sea and in the northern part of Turkmenistan. Ersari dialects are spoken in the eastern part of the country. The second main dialect group is found in the regions on and beyond the borders to Iran and Uzbekistan. These dialects are more distant from Standard Turkmen, lacking, for example, the interdental pronunciation of the sibilants *s* and *z*.

An isolated variety of Turkmen is Türkpen (Russian Trukhmen), spoken by small groups (ca. 12 000) on the lower Kuma River in the Stavropol region of Northern Caucasus. Türkpen is strongly influenced by Noghay (Nogai). Its speakers are descended from Turkmen tribes that migrated here in the 18th century from the Mangyshlak region east of the Caspian Sea. Salar, spoken in western China, seems to go back to an early Turkmen variety.

U

Ugaritic

J A Hackett, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

The Ugaritic language was rediscovered after a 3000-year gap, when, in spring of 1928, a farmer discovered a tomb at Minet el-Beida, on the Mediterranean, in what is now Syria, about 12 km from modern Latakia and a few hundred yards away from a large tell called Ras Shamra, 'Cape Fennel.' In 1929, the French began excavating what turned out to be a large necropolis. They soon moved on to the nearby tell of Ras Shamra, and in May of that year the first Ugaritic cuneiform clay tablets were found. After the first tablets were published in 1930, it was clear that the repertoire of signs was small (only 30), and so the writing system was assumed to be alphabetic and without vowels. Within months, the language was essentially deciphered. The identification of the site with ancient Ugarit was confirmed in the early 1930s with the discovery of a tablet that mentioned Niqmaddu, king of Ugarit.

Ugaritic is one branch of the Northwest Semitic languages, along with the Canaanite languages, the several forms of Aramaic, and other less well-documented languages. It is written in a cuneiform alphabet on clay tablets. Because the acrophonic linear alphabet predates the Ugaritic alphabet by several centuries, Ugaritic cuneiform was probably devised to adapt the idea of the alphabet to the medium of clay and stylus. Our earliest abecedaries, which are texts that list the letters of an alphabet written in a standard order, come from Ugarit, and they exhibit both the usual West Semitic order and, strikingly, the South Semitic order in a very few texts. Why abecedaries in this South Semitic order were present at Ugarit is so far unknown.

Ugaritic exhibits individual signs for 27 consonants of the West Semitic languages, plus three extra signs. There are two extra 'aleph signs, plus one for a sibilant that is used for loanwords. The three 'aleph signs are transcribed 'a, 'i, and 'u: 'a is used when an 'aleph in a word is followed by the vowel /a/, 'i is used when 'aleph is followed by /i/ or /e/ (<*ay), and

'u is used when 'aleph is followed by /u/ or /o/ (<*aw). A syllable-closing 'aleph is marked by 'i. These three signs have been very helpful in determining the vocalization of Ugaritic words, as have syllabaries that include Ugaritic words spelled out in Akkadian cuneiform, which is syllabic and so includes vowels. The Ugaritic consonants, given in the indigenous alphabet order, are , ' b, g, ḥ, d, h, w, z, ḥ, t, y, k, š, l, m, ḏ, n, z, s, ʾ, p, ṣ, q, r, ṭ, ḡ, ṭ (plus, as was noted above, two extra ' signs and a sibilant sign used for loanwords). The vowels reconstructed for Ugaritic are a, i, u, ā, ī, ū, o (<*aw), and e (<*ay). This cuneiform alphabet also exists in a shorter form of 22 signs, indicating that where this shorter alphabet is used, several mergers of consonants have taken place. A few tablets written in this shorter alphabet come from the site of Ugarit, but many were found farther south, at Sarepta and Kamid el-Loz in Lebanon, and at Taanach, Mt. Tabor, and Beth Shemesh in Israel.

The city-state of Ugarit was an important port, with its position on the Mediterranean and its proximity to Cyprus on the west, and its access to inland routes to the north and east. There are writings found at Ugarit in several different languages: besides Ugaritic, there are texts in Akkadian (the lingua franca of the time), Sumerian, Hittite (both syllabic cuneiform and hieroglyphic), Egyptian, Hurrian, and Cyprominoan. Texts found at the sites of Mari, Alalakh, and Amarna, among others, mention the city-state. The Ugaritic texts cover a short period of time, probably late 14th to early 12th century B.C. Excavation continues, but as of this writing, approximately 50 poetic texts and 1500 prose texts have been found at Ras Shamra and at neighboring Ras Ibn Hani. The poetic texts are mythological; the prose texts are ritual and other cultic texts, administrative documents, letters, omens, medical texts, and school exercises. The poetic mythological texts are characterized by parallelism, as in these couplets from the Baal myth:

Sea sends messengers/Judge River, a delegation;
Message of Sea, your master/your lord, Judge River.

Like other West Semitic languages, Ugaritic has prefix- and suffix-conjugation verbs, *yaqtulu/qatala*,

but there are in addition two more prefix-conjugations: *yaqtul* and *yaqtula*. The prefix-conjugation *yaqtul* serves as both a jussive, or indirect imperative, and as a preterit. The prefix-conjugation *yaqtula* is less well understood, but appears to serve as a volitive form; it also, however, seems to occur in subordinate (especially purpose) clauses. The verb stems that are extant in Ugaritic are G, Gt, D, tD, N, Š (a causative), Št (reflexive of the causative).

Nominals in Ugaritic have masculine and feminine gender and singular, dual, and plural number. There are three cases in the singular – nominative, genitive, and accusative; the plural is diptotic – nominative and oblique. Nouns occur in both absolute (unbound) and bound states. The bound state is used for initial members of genitive chains called construct chains (see **Semitic Languages**) and for nouns before pronominal possessive suffixes. There is no marked definite article in Ugaritic. There is evidence for -a-insertion in the plurals of nouns of the shape C₁vC₂C₃–: the (nominative) plural is C₁vC₂aC₃ūma. For example, ‘king’ (nominative) is *malku*, and ‘kings’ is *malakūma* (we can compare Biblical Hebrew *mélek*, plural *mələkīm*).

Ukrainian

S Young, University of Maryland Baltimore County, Baltimore, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Ukrainian, with some 36 million speakers in the Ukrainian Republic, forms with Russian and Belorussian the East Slavic branch of the Slavic language family. The standard language, which is written in the Cyrillic alphabet, has its roots in the 19th century – no enduring literary tradition had been able to form before this time – and is based on the relatively recent and uniform southeastern dialect. Since the late 19th century, the West Ukrainian (Galician) speech of L'viv has also played a role in the formation of the national standard.

Among the vocalic features that distinguish Ukrainian from the rest of East Slavic are the preservation of *o* in unstressed syllables: *vodá* /vodá/ ‘water’ (Rus., BR /vadá/), and the merger of East Slavic (ESL.) *i* with *y*

to give a central-front mid vowel (represented in transliteration by *y*): *synij* ‘blue,’ like *syn* ‘son’ (Rus. *sinij* : *syn*). A new *i* developed in turn from ESL. **ē*: *lis* /līs/ ‘woods’ (Rus., BR /līs/) and from *e* and *o* in a secondarily closed syllable: *šist* ‘six’ (gen. *šestý*), *nis* ‘nose’ (gen. *nósa*). *e* > *o* after hushers and *j*: *čotyry* ‘four,’ *johó* ‘his’ (Rus. *četýre*, *jegó*), but *těplyj* ‘warm’ (Rus. *těplyj* /t'ò-).

In contrast to Russian and Belorussian, Ukrainian consonants are not palatalized before *e* or *y* (the merger of ESL. *i* and *y*): *nestý* ‘to carry’ (Rus. *nestí* [-tj]), but there is palatalization before the new *i* representing ESL. **ē*, *e*, *o*: *dity* [dī-] ‘children’ (Rus. *děti*), *nis* -nī-] ‘nose’ (Rus. *nos*). Stem-final *c* is typically palatalized: *kinec* [-tsj] ‘end,’ gen. *kincjá* (Rus. *konéc*, *koncá*); final labials lose palatalization: *hólub* ‘dove’ (Rus. *gólub*). Common Slavic /g/ has become /h/. Like Belorussian, Ukrainian has *w* (written *v*) corresponding to Russian *v* in a closed syllable: *právdá* [práwda] ‘truth,’ and in some cases (including

the masculine past tense marker) to *l*: *vovk* [vovk] 'wolf' (Rus. *volk*), *buw* [buw] 'was, masc.' (fem. *bulá*). Unlike other East Slavic languages, there is no regressive devoicing of voiced consonants: *kázka* 'tale' (with *z* preserved), or final devoicing: *did* 'grandfather' (with final *d*).

In addition to the six nominal case forms of Russian and Belorussian, Ukrainian has a regular vocative (*sýnu* 'son!', nom. *syn*). As in Belorussian, there is an alternation of velar and dental stems in certain case forms: nom. *rik* 'year', loc. *róci*; nom. *rih* 'corner', loc. *rózi*. The verb has two regular conjugation patterns, illustrated by *nestý* 'to carry' (I) and *xodýty* 'to walk, go' (II): 1SG *nesú*, *xodžú*, 2SG *neséš*, *xódyš*, 3SG *nesé*, *xódyt'*, 1PL *nesemó*, *xódym*, 2PL *neseté*, *xódyte*, 3PL *nesút'*, *xódjat'* (like Belorussian, but unlike Russian, the 3rd person ending is palatalized). Unlike Russian or Belorussian, there is no alternation of velar and palatal stems in 1st conjugation verbs, the palatal stem having been generalized: *mohtý* 'to be able': *móžu*, *móžěš* (BR *mahú*, *móžaš*).

Lexically, Ukrainian lacks the Church Slavisms characteristic of Russian (Ukr. *skoročú* 'shorten.1SG

PF,' with ESL. *s-*, *oro*, *č*; cf. Rus. *sokraščú*, with ChSl. *so-*, *ra*, and *šč*), but shows a large number of borrowings from Polish: *cikávyyj* 'interesting' (Pol. *ciekawyy*, but Rus. *interesnyj*), *raxúnok* 'bill, account' (Pol. *rachunek*, but Rus. *sčët*), *otrymáty* 'to receive' (Pol. *otrzymać*, but Rus. *polučít'*).

United States of America: Language Situation

D Sharma, King's College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

The linguistic landscape of the United States, though dominated by English, encompasses an unusual diversity of indigenous and immigrant languages. No federal law currently grants English the status of official language, but it is used for virtually all official and institutional functions. Americans tend to be relatively monolingual in English (82% in 2000, Figure 1), and Spanish (11%, Figure 1) and other languages (7%, Figure 2) have a minority status in terms of size of speech community and institutional support (Figure 2).

American English

Regional and Social Varieties

English was first established in America by permanent settlers in Jamestown, Virginia, in 1607. By 1780, the number of people of European and African origin had increased to 2.8 million but more than 20% of European Americans were still from non-English-speaking communities, predominantly German, Dutch,

Swedish, Irish, and French. This heterogeneity influenced the lexical stock of American English (e.g., *bayou*, *caribou*, *prairie* (French); *cookie*, *waffle* (Dutch); *noodle*, *snorkel* (German); *corral*, *ranch* (Spanish)) as well as its regional dialect features; Minnesota English, for instance, bears traces of Swedish phonology and syntax. German (German, Standard) once had a substantial presence, but native use is now primarily limited to the dialect of German known as Pennsylvania Dutch.

Standard American English is distinctive in its phonology (rhoticity, except in parts of the South and the Northeast; greater use of /æ/, e.g., *fast*, *can't*; intervocalic flapping of /t/, e.g., *butter*, *writer*; widespread leveling of the vowel distinction in *caught* and *cot*, except in the Northeast), syntax (simple past in perfect contexts, e.g., *Did you see that film yet?*; use of *gotten*), lexicon (*sidewalk*, *carpark*, *elevator*, *schmuck*), and spelling (*center*, *neighbor*, *analyze*; Noah Webster's *American Dictionary of the English Language* [1828] introduced many revisions). Early linguistic atlases (Kurath, 1949) used isoglosses of lexical variants such as *pail/bucket* to identify three primary English dialect divisions in the United States – South, North and, to a lesser extent, Midland – within which further minor dialect divisions occur. More

recent studies of contemporary dialectal phonological systems continue to reflect these divisions; new dialects are now also beginning to coalesce in more recently settled parts of the West.

Early English-speaking settlers arrived from distinct dialect regions of England and as the frontier later shifted westward, their distinct speech patterns spread along conduits of travel (see **Figure 3**). While

Figure 3 European settlement of North America since the mid-eighteenth century. Source: Reproduced from Graddol, Leith, and Swann (1996: 199).

certain features of American English have been argued to originate in the dialects of Early Modern English that first came to America (e.g., rhoticity; use of /æ/; *gotten*; *mad* ‘angry’; *fall* ‘autumn’), most dialect distinctions were rapidly leveled through early admixture in settlements. The distinctive features of present-day American English dialects therefore tend to derive more from ongoing language change than from early British English.

Pioneering work by William Labov and other sociolinguists, beginning in the 1960s, has demonstrated that social groupings are also a key factor in American dialects. For instance, the Northern Cities Vowel shift – a series of shifts in pronunciation in the area encompassing Detroit, Chicago, Buffalo, and Cleveland – results in certain linguistic features that function as social markers of class, ethnicity, age, and gender, and the associated prestige or stigma of such markers effects dialect change. This research has also indicated that despite the influence of media certain dialect boundaries, e.g., the North–South division, are strengthening in some respects.

African-American English

The variety spoken by many African Americans bears several defining linguistic features in its phonology (word-final consonant cluster simplification, e.g., *told*, *best*; use of /t, d, f, v/ for /θ, ð/, e.g., in *these*, *with*, *thumb*, *bath*), syntax (invariant *be* for habitual

meaning; nonstandard auxiliary use of *been* and *done*; null copula, e.g., *He workin’*; negative inversion and multiple negation, e.g., *Ain’t nobody told me nothing.*), lexicon, and styles of discourse (e.g., toasting, signifying, playing the dozens). Research has shown these features to be systematic and rule-governed, as in all dialects. British English and Creoles have both been proposed as possible origins.

In 1996, the linguistic status of African-American English came under public scrutiny as the Oakland School Board in California passed a resolution declaring a social and educational need to recognize that what they termed Ebonics was the primary language of many students in the county. Although the Linguistic Society of America passed a resolution affirming the importance of recognizing African-American Vernacular English as a systematic dialect, the intensity of the public debate surrounding the school board’s resolution led to its ultimate dissolution. The controversy unmasked deeply opposed popular views on the cultural status of vernacular dialects.

The Debate over Bilingualism

Early supporters of installing English as the official language of the United States included Benjamin Franklin and Noah Webster, and the English-Only movement continues this effort. As of 2004, 23 states have adopted Official English laws. However, many

Figure 4 Language use and nativeness across generations among selected immigrant groups. Source: Data from López (1982) as discussed by R. Bayley in Finegan and Rickford (2004: 274).

English-Only claims, e.g., immigrant resistance to learning English and detrimental effects of bilingualism, have been discredited: research finds consistently high rates of language shift to English among immigrants (see Figure 4), and the popular belief during the first half of the 20th century that bilingualism was detrimental to intellectual development has received no empirical support. In 1968, the Title VII Bilingual Education Act allocated federal funds to children with special linguistic needs. The Official English movement resists measures of this sort, while the English Plus movement, advocating a more bilingual model for the United States, supports them.

Spanish in the United States

The arrival of Spanish in the United States predates that of English, and its development in the Southwest and the Northeast has followed distinct historical and demographic patterns.

Spanish colonization began in Florida with Juan Ponce de León's visit in 1513, and spread soon after to Louisiana and the Southwest, where it was administered by the Spanish Viceroyalty, with colonial Spanish remaining the local prestige language for almost two centuries. After the Mexican-American war, almost half of Mexico was ceded to the United States in 1848, including all of present-day California, Nevada, and Utah and parts of Texas, New Mexico,

Colorado, Arizona, and Wyoming. Sustained Mexican migration has continually reinforced the Spanish-speaking population of many of these states. The Southwestern states are now home to just under half of the Spanish-speaking population in the United States. Sometimes termed Chicano Spanish, the Southwestern variety bears characteristics of Mexican Spanish and American English. English influence can be seen in lexical innovations (e.g., *libreria* (not *biblioteca*) 'library'; *parientes* (not *padres*) 'parents'; *puchar* 'to push'; *fensa* 'fence'; *cama king* 'king-size bed'); English-based phonology (e.g., *moven* for *mueven*, 'they move') and syntax (phrasal constructions in place of complex morphology) are also common.

Spanish in the Northeast primarily originates from Puerto Rico, the Dominican Republic, Cuba, and Colombia. In 1898, after the Spanish-American war, Puerto Rico became a territory of the United States and was the first major source of Spanish-speaking immigration to the East Coast. The majority of other immigrants arrived later; Cuban refugee migration, for instance, rose dramatically after the 1959 coup. While some phonological traits of these varieties are shared, such as deletion or aspiration of syllable-final /s/, other regional distinctions may persist: e.g., dropping of syllable-final /ll/ and /r/ (Cuban) and raspy velar /r/ (Puerto Rican). As colonial Spanish developed first in the Caribbean, the Northeastern United States varieties have brought many Native

American, African, and Creole loans into American English, e.g., *canoe* (Native American), *banana* (African), *bodega* (Caribbean Spanish).

Due to extensive language shift to English, a continuum of societal bilingualism has emerged in Hispanic communities, ranging from fluency in Spanish to symbolic use of Spanish by English-dominant bilinguals. Alongside the influence of English on Spanish structure, this bilingualism has given rise, particularly among English-dominant bilinguals in the younger generation, to ‘Spanglish,’ a hybrid style consisting of proficient and sustained code-switching between Spanish and English. Chicano English, by contrast, is a variety of English with Spanish influence.

Indigenous Languages

Native American Languages

The languages indigenous to America have undergone extensive decimation through contact with sociopolitically empowered colonial languages. Legislation punishing instruction or use of native languages and mandating English as the exclusive language of instruction was enforced in Indian reservations from the 19th century. Estimates place the number of native languages at the time of European contact at 300–600; the current figure stands at approximately 175, of which fewer than 20 are being acquired by children and are thus potentially sustainable. Over 70% of contemporary Native American languages face imminent extinction. A revitalization movement ultimately led to the Native American Languages Act of 1992, calling for federal policy to support the cultural vitality of Native American languages and authorizing funds for their maintenance.

American Creoles

New creole languages have developed indigenously in South Carolina, Hawaii, and Louisiana. In South Carolina, a creole called Gullah or Geechee (Sea Island Creole English) began to develop in 1715 when importation of African slaves, speaking different African languages natively, increased sharply in that area. Grammatical features of the variety include: pronouns such as *ee*, *um*, *shum*, *una*; *duh* or *does be* for habitual marking; *done* to mark completed actions; null copula, null possessive, and null simple past tense. Gullah has declined in recent decades, surviving in a few coastal enclaves. As it is relegated to the home, children may speak it natively but rapidly become bilingual.

Hawaiian Creole (Hawai’i Creole English), sometimes referred to as Pidgin, began to emerge between 1790 and 1820 through contact between native

Hawaiians and Europeans; this development preceded a rise in Chinese, Portuguese, and Japanese arrivals between 1860–1900, followed by further influence from Filipino (Tagalog) and American English. These waves of contact resulted in a heterogeneous developmental process, particularly via informal and covert interaction among young speakers having English forcibly imposed on them in schools. Hawaiian Creole is characterized, among other things, by innovations in syntax (e.g., aspect marking: *stei* for progressive, *wen* for past) and in the lexicon, e.g., *pau* ‘finished’ (Hawaiian), *obake* ‘ghost’ (Japanese). Despite controversy over its societal and institutional role – only English and Hawaiian are official state languages – Hawaiian Creole is spoken and positively valued by a substantial community.

Louisiana Creole (Louisiana Creole French) is sometimes described as originally one of three French-based languages in Louisiana, alongside Cajun French (French, Cajun), brought by Acadians expelled from Nova Scotia in the 18th century, and Colonial French, an extinct variety once used by French colonizers. An alternative view treats the language situation as comprising a continuum ranging from more French to more Creole usage. The Creole arose out of contact between African slaves and French colonizers during the period of 1699 and 1750; today, due to the greater social status of English and Standard French, all Louisiana Creole speakers speak another language outside their private domains.

American Sign Language

American Sign Language (ASL) is a natural, visual-spatial language not based on American English. In 1817, the first American school for the Deaf was established, and the resulting convergence of several varieties gave rise to an expanded contact variety. By the late 19th century, an oralist movement led to the banning of signing, a situation that persisted until the 1970s. ASL use nevertheless continued throughout, sometimes covertly, and ASL is now used by 0.5–2 million people, with considerable regional and social variation.

Minority Immigrant Languages

Commonly spoken immigrant languages in the United States other than English and Spanish are listed in **Figure 2**, which shows immigration-driven reversals in language use during the 1990s: a dramatic increase in the use of Russian (192%), Vietnamese (99%), Arabic (74%), Chinese (62%) and Spanish (57%) contrasts with the decline in the use of several European languages.

European languages have been replenished by immigration since the earliest arrivals in the 15th century. The first large-scale migration of unskilled Asian laborers occurred in the mid-19th century. Chinese, Japanese, and Korean enclaves formed, while South Asian and Filipino immigrants, fewer in number and largely male, did not form self-sufficient communities as early. The second wave of Asian immigration, when quotas were extended after 1965, included refugees from Cambodia, Vietnam, and Laos as well as descendants of earlier immigrants, often more educated and economically secure than their predecessors. The majority of early Arab American immigrants were Christian; subsequent to the 1950s, there has been a rise in Muslim Arab immigration, although this group remains a minority. The major varieties of Arabic represented are Lebanese and Syrian (Arabic, North Levantine Spoken), Palestinian (Arabic, South Levantine Spoken), Egyptian (Arabic, Egyptian Spoken), and Iraqi (Arabic, Mesopotamian Spoken).

Among speakers of minority immigrant languages, or 'heritage languages,' fluency declines sharply across generations, transitioning to monolingualism within two to three generations. In particular, attrition of fluency in selected registers, shift from balanced to asymmetrical bilingualism, and decline in biliteracy across generations is widespread, largely due to institutionalized monolingualism in schools. López's (1982) findings, shown in **Figure 4**, reflect a close correspondence between the nativeness of a generation in the United States and its tendency to be English-dominant. Nevertheless, language loyalty tends to be strong across generations; in particular, **Figure 4** shows a lower rate of loss of Spanish among Mexican Americans as compared to some Asian languages. Language schools, ethnically-defined neighborhoods, and religious and cultural associations serve to maintain languages among first and second generation immigrants; third generation immigrants are generally English speakers but often show renewed, albeit often nonnative, interest in their heritage languages.

Uralic Languages

A Marcantonio, University of Rome 'La Sapienza,'
Rome, Italy

© 2006 Elsevier Ltd. All rights reserved.

The 'Uralic' languages derive their name from the Ural Mountains, the assumed homeland of the hypothetical proto-Uralic population that, according to the conventional theory, spanned out into Hungary and across a wide portion of the northern Eurasian area, from Norway to Western Siberia (see **Figure 1**).

Distribution

Of the 22 million speakers of Uralic languages, about 2 million are minority speakers in Russia. The total number of speakers is decreasing; some languages are endangered and others are now extinct. The Uralic language family can be divided into eight language subgroups:

1. Saami (formerly Lapp; 34 000 speakers); about 10 dialectal varieties are spoken in the region between Sweden and the Kola Peninsula in Russia.
2. Finnic (formerly Balto-Finnic), comprising Votic (about 50 speakers, Russia), Ingrian (400 speakers, Russia), Karelian (40 000 speakers, Finland and Russia), Lude (5000 speakers, Russia), Olonetsian (30 000 speakers, Finland and Russia), Veps (6000 speakers, Russia), Livonian (about 10 speakers, Latvia), Finnish (also called Suomi; about 5 500 000 speakers), and Estonian (about 1 000 000 speakers), including the Estonian ethnic/dialectal variety Võru-Seto (50 000 speakers) in Estonia and Russia.
3. Mordvin (Mordva; 615 000 speakers, Russia), comprising two ethnic/dialectal varieties, Erzya (about 67%) and Moksha (about 33%).
4. Mari (formerly Cheremis; 488 000 speakers, Russia), comprising two dialectal varieties, Hill (Western) Mari (about 10%) and Meadow (Eastern) Mari (about 90%).
5. Permic, or Permian (Russia), comprising Udmurt (formerly Votyak; 464 000 speakers) and Komi, consisting of three ethnic/dialectal varieties, Komi-Zyrian (217 000 speakers), Komi-Permyak

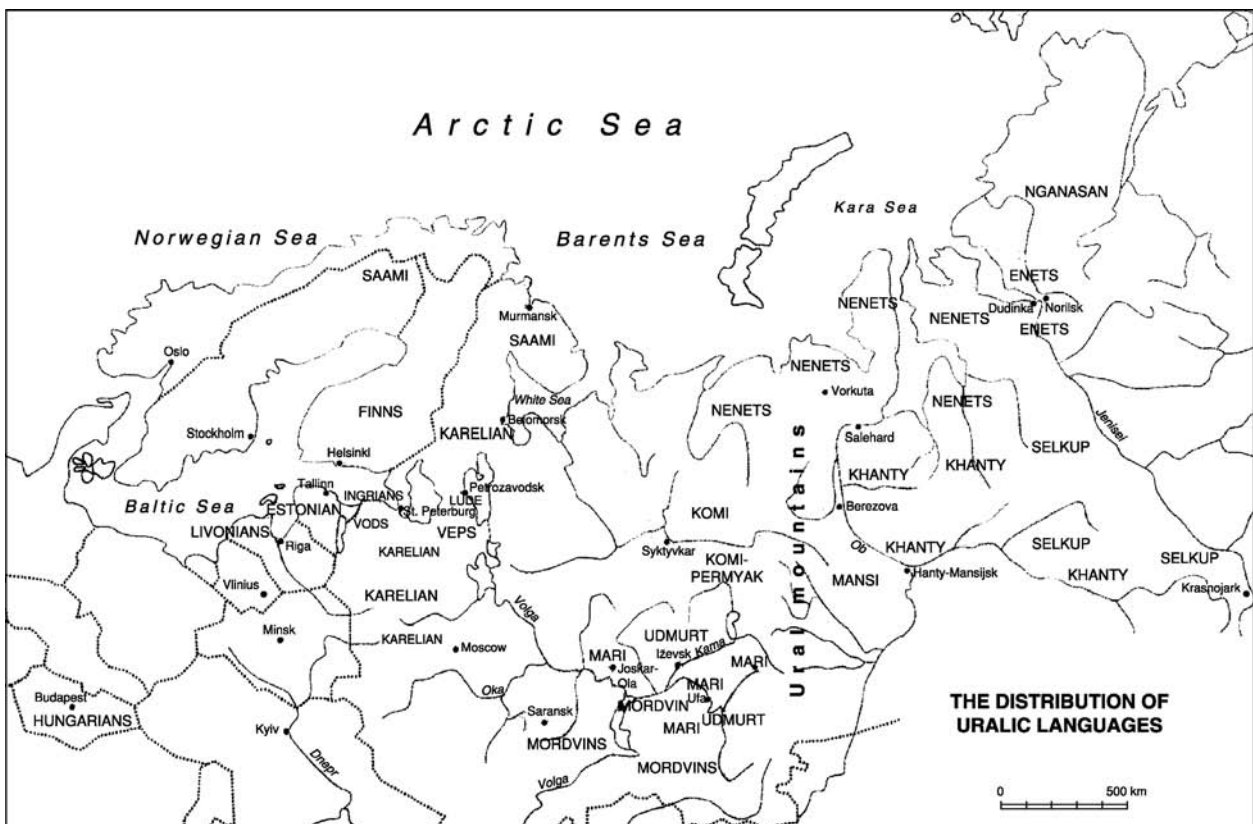

Figure 1 The Uralic languages are spoken by 22 million people. The majority consist of the Finns, Hungarians, and Estonians, living in their nation-states; some 2 million speakers are among the ethnic minorities of Russia. Reproduced from Suihkonen P (2000), *Urgiculture 2000: contemporary art of the Fenno-Ugric peoples*. Helsinki: Gallen-Kellela Museum.

- (94 000 speakers), and Yaz'va-Komi (about 200 speakers).
6. Ob-Ugric (Ob-Ugrian), comprising Mansi (formerly Vogul; 3000 speakers) and Khanty (formerly Ostyak; 14 000 speakers), scattered along the Ob' and lower-Irtysh rivers and tributaries.
 7. Hungarian (Magyar; 14 million speakers), including the ethnic/dialectal variety Csángó (100 000 speakers, Romania).
 8. Samoyed (Samoyedic), comprising seven closely related languages spoken in West Siberia, i.e., Nenets (formerly Yurak; 32 000 speakers), Enets (formerly Yenisey-Samoyed; about 200 speakers), Nganasan (formerly Tavgy; 1000 speakers), Selkup (formerly Ostyak-Samoyed; 2000 speakers), and three extinct languages, Yurats, Kamas (Kamassian), and Mator (Motor).

Hungarian and Ob-Ugric are conventionally grouped together to form the 'Ugric' subgroup, but the languages are acknowledged to be radically different in phonology, syntax, and vocabulary, and accordingly this group has not been reconstructed from the primary evidence. Several minority languages, including Veps, Mordvin, Mari, Udmurt, Komi, and Ob-Ugric, enjoy official status in their national administrative regions. Despite attempts to revitalize some endangered languages through cultural/educational/political activities and associations (e.g., 'Saami Language Nests' and 'To Save Yugra'), there remains strong pressure to assimilate into the majority languages (Suihkonen, 2002).

Phonology

Most Uralic languages display vowel harmony and consonant gradation, although there are substantial differences in implementation. These features are shared by nearby language groups, including Altaic and Yukaghir. Several Uralic languages also display quantitative vowel and consonant opposition.

Vowel Harmony

Palatovelar vowel harmony, in which the vowels of a word unit, including suffixes, enclitics, etc., are either all back or all front, is found in Finnic (not Estonian and Livonian), Mordvin, Western Mari, some Khanty and Mansi dialects, Hungarian, and Nganasan. Compare Hungarian *kert-be* 'garden-into', *kert-em-be* 'garden-my-into' and *konyhá-ba* 'kitchen-into', *konyhá-m-ba* 'kitchen-my-into'. Labial harmony occurs in Hungarian and Eastern Mari.

Consonant Gradation

Abondolo (1994: 4855) found that most Finnic and Saami languages/dialects display "alternation of

strong vs. weak consonant(ism) word-medially in open vs. closed syllables." For example, in comparing Finnish *kirkko* 'church' vs. *kirko-ssa* 'church-INESS' (INESS = inessive) and *papu* 'bean' vs. *pavu-t* 'bean-PL', the first sound of each pair, the strong grade, appears word medially in an open syllable, whereas the second sound, the weak grade, appears word medially in a syllable closed by a suffix. The Samoyed languages display a different, less homogeneous type of gradation. For example, Nganasan presents a complex co-occurrence of various mechanisms, including glottal stop alternation, truncation, syllabic and rhythmic gradation, vowel harmony, and accommodation. In some languages, within specific contexts and/or stems, the original phonetic conditioning factor for gradation has been eroded by subsequent changes; therefore, several inflectional forms can now be distinguished through grade alternation only ('fusion'). Compare the nominative (NOM), genitive (GEN), and partitive (PARTIT) in Finnish *jalka-Ø* 'foot-NOM', *jala-n* 'foot-GEN', and *jalka-a* 'foot-PARTIT' with correspondent Estonian *jala-Ø* (genitive, weak grade) and *jalga-Ø* (partitive, strong grade), in which the alternation is no longer productive.

Vocalism

The smallest vowel inventory (five vowels) is found in Erzya Mordvin; the richest inventory is found in Vakh Khanty, which has 11 full and 2 reduced, front and back (round and unround) vowels. There are diphthongs in Finnic, Saami, some dialects of Mansi, and Nganasan. In several languages, some vowels occur less frequently when not in the first syllable. Most languages (not Erzya Mordvin and most of Permian) present (some sort of) quantitative vowel opposition between two (e.g., Finnish) or three (e.g., Estonian) vowel lengths, to denote different meanings.

Consonantism

Consonantism varies considerably. Finnish has one of the smallest inventories, with 11 consonants, the obstruents being limited to the unvoiced *p*, *t*, *k*. Eastern Enontekiö (North Saami dialect) has 31 consonants; the total inventory includes voiced stops, unvoiced nasals, fricatives, affricates, palatal (or palatalized alveolar/dental) series, glides, and laryngeal and glottal stops. Several languages present quantitative consonant opposition between two-way (e.g., Finnish) or three-way (e.g., Estonian and partly Saami) opposition, to denote different meanings. Unlike the other Uralic languages, Hungarian, Permian, and (to a lesser extent) Saami display opposition of voice – for example, voiced *b* and unvoiced *p* denote different meanings.

Word Stress

The stress position varies from language to language, the governing rules often being complex or conditioned by morphophonology or phonotactics. For example, stress is fixed on the first syllable in Finnish, Hungarian, and some Khanty dialects; it is free in Erzya Mordvin, and it falls generally on the last syllable in Udmurt and on the penultimate vowel/vowel sequence in Nganasan. In Nenets, stress position varies depending on morphophonological/syllabic structure. Stress is nondistinctive, except in Udmurt in certain forms.

Morphology

The Uralic languages share $-\emptyset$ subject marking and a tendency for agglutination, suffixation, absence of copula, and richness of derivational morphology (Abondolo, 1998). These properties are also shared with Altaic. Grammatical, functional, and temporal/aspectual categories are generally language specific, with evidence from historical documents and language examination indicating relatively recent formation. Fusion (see the preceding discussion of consonant gradation) also occurs in varying degrees in several languages, including Estonian, Saami, and Hungarian.

Case Suffixes

The number of case suffixes varies from two (lative and locative) in Northern Khanty to 24 in Komi-Zyrian. In languages with rich suffixation, the majority of suffixes are local suffixes expressing three-way spatial opposition, as in stasis vs. movement ('to' and 'from'). This may be enriched by other suffixes indicating internal vs. external notions in Finnic and Permic. In Hungarian, the additional notion of vicinity is also encoded, as in *ház-ban* 'house-in (side)', *ház-ba* 'house(inside)-into', and *ház-ból* 'house(inside)-from'; *asztal-on* 'table-on', *asztal-ra* 'table(surface-of)-onto', and *asztal-ról* 'table(surface-of)-from'; and *szobor-nál* 'statue-in(the vicinity of)', *szobor-hoz* 'statue(the-vicinity-of)-toward', and *szobor-tól* 'statue(the-vicinity-of)-from'. In Komi-Zyrian and Selkup, the case suffixes also encode animacy.

Plural Markers

Plural markers also vary across the languages, some having a different marker for oblique and/or possessive forms. In Finnish, compare *talo-t* 'house-PL' and *talo-i-ssa* 'house-PL-INESS, in (the) houses'; in Hungarian, compare *birká-k* 'sheep-PL' and *birká-i-m* 'sheep-PL-POSS, my sheep'. The most common

plural suffixes are *-t*, *-n*, and *-l*. Saami, Ob-Ugric, and Samoyed have dual suffixes.

Gender and Definiteness

As in Altaic languages, Uralic languages make no gender distinction (except in some nominal derivations), and there are no articles (except in Modern Hungarian); pragmatic and referential notions are typically expressed through the morphological and morphosyntactic apparatus. Mordvin distinguishes indefinite and definite forms of the noun.

Verbs

Verbs are inflected for person, number, tense/aspect, and mood. Typically, there is at least a distinction between present (unmarked) and past tense (marked) and between indicative, imperative, and conditional (except in Mansi). Some languages (e.g., Estonian, Udmurt, and Selkup) also encode the category of evidentiality as mood and/or tense. Reflexivity and causativity are mostly expressed through verbal derivation.

Negation is mostly (although not in Estonian, Hungarian, Ob-Ugric, and Selkup) expressed by an auxiliary (AUX) negation verb, regularly inflected, followed by the main verb, as in the following examples in Finnish:

- (1) e-n mene
 AUX-1SING.PRES go
 'I do not go'.
- (2) e-t mene
 AUX-2SING.PRES go
 'You do not go'.

Aspect is expressed by various means, including co-verbal adverbs, auxiliary verbs, or appropriate marking for the direct object. Compare the different object marking in Finnish:

- (3) lue-n artikkeli-a
 read-I article-PARTIT
 'I am reading a/the article'.
- (4) lue-n artikkeli-n
 read-I article-ACC
 'I will read the article (completely)'.

Syntax

In the Uralic languages, word order, diathesis, number agreement in noun phrases, and subordinate sentence implementations are generally language specific. In common with Altaic languages, Uralic languages share the following tendencies: postpositions, modifier(s) preceding the modified element within noun phrases, marking as singular all nouns preceded

by any numeral, and expression of subordination through nominalized/nonfinite verbal phrases (Finnish and Hungarian have recently developed subordination through conjunctions).

Basic Word Order

Saami, Finnish, Estonian, Komi, and Hungarian present as subject-verb-object (SVO); Udmurt, Ob-Ugric, and Samoyed present as subject-object-verb (SOV); Mari has a flexible order. Pragmatic/logic/stylistic functions usually play a role in determining word order.

Main Verb Phrases

Verbal phrases may be elaborated in various ways. Ob-Ugric has a passive (personal) voice – e.g., the agent is marked in Khanty by locative. Finnish uses an impersonal passive, and the agent is unspecified. In some languages, extra conjugations encode information about the object, such as number, definiteness, topicality, and referentiality. Hungarian adds one objective/definite (DEF) conjugation to the normal subjective/indefinite (INDEF) conjugation (ACC, accusative):

- (5) olvaso-k
read-1SING.INDEF
'I read (something)'.
- (6) olvaso-m
read-1SING.DEF
'I read it'.
- (7) olvaso-m a könyv-et
read-1SING.DEF the book-ACC
'I read the book'.

Ob-Ugric adds three objective conjugations, for singular, dual, and plural objects. Nenets, Enets, and Nganasan have five conjugations: one subjective, three objective (as Ob-Ugric), and one objectless/reflexive. The markers differ.

Subordinate Sentences

There are several types of nonfinite (participial, infinitival, and gerundive) verbal phrases. Typically, the verb takes the relevant nonfinite morpheme, and then may be inflected with enclitics, and case, number, possessive, and passive suffixes. Compare Finnish, in which *-ä* (~ *-a*) and *-ma* (~ *-mä*) are infinitive morphemes (TRANSLV, translative; EL, elative):

- (8) syö-mme elä-ä-kse-mme
eat-1PL live-INF-TRANSLV-1PL
'We eat to live'.
- (9) Pekka on koto-na leikki-mä-ssä
Pekka is home-at play-INF-INESS
'Pekka is at home playing'.

- (10) Pekka tuli puutarha-sta ä-stä
Pekka came garden-from play-INF-EL
'Pekka came from the garden from playing/
where he was playing'.

Objects

Marking of the direct object is varied and complex, often depending on pragmatic/aspectual factors (as in Examples (3) and (4)), or on the type of sentence the object is in – for example, Hungarian has *-t*, Khanty and Sosva Mansi have *-Ø*, Eastern Mari and some Samoyed languages have *-m*, Finnish has *-n* or partitive for singular and *-Ø* or partitive for plural objects, and Udmurt has *-Ø* for indefinite and accusative for definite objects. Number agreement occurs between subject and predicate. Within the noun phrase, agreement in number and case suffixes occurs in some languages and to various degrees of completeness, being fully developed in Finnish.

Uralic Languages as a Family

The results of recent archaeological, genetic, and anthropological research are inconsistent with the predictions of the Uralic theory, and the significance of the linguistic evidence on which the conventional theory is based has been called into question: for example, there is no reconstruction of the key Ugric node based on the primary evidence, and the common linguistic tendencies appear to be shared with other language groups, such as Altaic. Alternative models have been proposed (see Künnap, 2000; Marác, 2004; Marcantonio, 2002; Wiik, 2002).

Urdu is the literary, cultural, and religious language of Muslims in India, Pakistan, Bangladesh, and other parts of the world including the United States, the United Kingdom, Germany, and Sweden. The number of Urdu speakers in census data may be under- or overestimated for social and political reasons. However, it is estimated that Urdu is spoken by 54 million worldwide, out of which 43 million speakers are found in India. In addition to being the national language of Pakistan, Urdu is one of the Schedule VIII languages of the Indian democracy, the state official language of Jammu and Kashmir, and the second official language of UP, Bihar, and Andhra Pradesh in India. It is recognized that Urdu, Hindi, and Hindustani share a common grammatical system. Urdu in its colloquial form may therefore be considered the lingua franca of one of the largest speech communities in the world. Urdu is regarded as a pluricentric language that shows different linguistic features.

Origin and Development

Historically, Urdu has developed in a language contact situation over a long period from 1100 A.D. or earlier. After the Muslim invasion of India, it emerged as a speech variety in communication among Muslim rulers, traders, mystics, and the local population. The early form of Urdu developed out of the literary language Sauraseni Apabrahṃsa, which was in a state of transition and developing as a New Indo-Aryan language. It had a wide dialect base that included Braj Bhasha, Haryanvi or Bangaru, eastern Panjabi, and other dialects spoken in the region surrounding Delhi. Khari Boli was present as one of the elements in the

formative period of Urdu and it gradually became stronger with its development. By 1800, Khari Boli could be considered as the basic source of Urdu. During the period of development, from 1100 to 1800 A.D., Urdu was known by several different names, including Hindwi, Dehalvi, Hindustani, Zaban-e-Urdu, Dakhini or Old Urdu, and Rekhta. The first use of the language name Urdu was made in a couplet in 1776 by the poet Mashafi (1750–1824). However, the use of Urdu, referring to camp, court, or city (Zaban-e-Urdu or Zaban-e-Urdu-e-Shahi or Zaban-e-Urdu-e-Mualla), had been in use from 1560.

Specimens of Hindwi in the early formative period are found scattered in the Nath Panthi literature, early Sufis of North India, Amir Khusro, Nanak, Kabir, Baba Farid, and other poets. Amir Khusro (1236–1324) shows a distinct earlier form of Urdu, or Hindwi as he calls it. However, there is no evidence that the language was in continuous use from 1200 to 1650 except *Bikat Kahani* by Afzal, which appeared 300 years after Amir Khusro's writings. It is therefore not possible to reconstruct a continuous history of the development of Urdu (Chatterji, 1960; Khan, 1958). Insha Allah Khan Insha's *Darya-e-Latafat* ('The river of elegance,' 1807) presents an early linguistic study of the dialects of Delhi and Lucknow.

The emergent variety Hindwi traveled in the south with the Muslim rulers of the Delhi Sultanate (1211–1504) along with the Muslim armies, traders, Sufis, preachers, and other people. It flourished as a literary language in the Deccan kingdoms of Golkunda and Bijapur. It was popularly known as Dakhini or Hindwi or Dehalvi. Dakhini has been claimed as Dakhini Hindi, Dakhini Urdu, or Old Urdu. It shows some linguistic features that are characteristic of its contact with local languages of the South. However, the origin and development of Dakhini has been traced to Haryanvi, Panjabi, Braj Bhasha, and Khari Boli.

During the Mughal period, Persian was the official language of the court. The elite and noblemen spoke and wrote Persian. The Mughal emperors from Akbar onward spoke an early form of Hindustani at home (Chatterji, 1960). Both the Hindus and the Mughal rulers accepted Braj Bhasha as a literary language. Akbar's courtier, Khan Khanan Rahim, wrote in Braj Bhasha, and even Akbar attempted to write some verses in it. Hindustani or Khari Boli did not develop as a literary language in the north until Wali from Aurangabad arrived in Delhi at the end of the 17th century. Wali demonstrated that Hindustani with a scattering of Persian words could be used to write great poetry. The language used by Wali is known as Rekhta, which means 'scattered,' and implies that Hindustani or Urdu had not been 'Persianized.' The Delhi school of poetry came into existence around Wali during 1700–1720.

By the end of the 18th century and the beginning of the 19th, Urdu, in its modern form, had taken deep roots. Several factors contributed to the emergence of Urdu in its distinct modern form. First, the Dakhini literature was written in the Perso–Arabic script, which had “fixed the orientation of the language” (Chatterji, 1960). Wali and subsequent poets and writers readily adopted the Perso–Arabic script. It became a symbol of linguistic and cultural identity. Second, conscious efforts were made by stalwarts such as Khan Arzu (1689–1756), Shah Hatim (1699–1781), and Mazhar Janejanaan (1700–1781) to weed out the Braj Bhasha or indigenous words from Rekhta and incorporate Arabic and Persian words in it during the middle of the 18th century. The extreme Persianization of Urdu became characteristic of the Lucknow school of poetry, whereas the Delhi school developed its own standard form of Urdu. Third, the use of subjunctive constructions, the continuous tenses with 'raha,' the ergative construction with the postposition 'ne,' and the formation of the present tense with imperfect participles became stable and characteristic. Finally, prose began to be written in the emergent Khari Boli by the end of the 18th century. The establishment of Fort William College at the beginning of the 19th century encouraged the development of two styles of prose that paved the way for the emergence of Hindi and Urdu as distinct standard varieties. The two important earliest works in Urdu prose are the *Bagh-o-Babar* of Mir Amman (1804) and the *Khairat Afroz* of Hafizuddin Ahmed (1803–1815).

Urdu Language: Identity and Conflict

The 19th century may be considered to be the century of consolidation, expansion, and growth of Urdu language identity and literature, on the one hand, and

the spread of Urdu and sociopolitical mobilization, on the other. Several mutually interactive forces played a catalytic role in this regard. A synoptic view of some of these factors reflects this. First, after the early prose produced at Fort William College, Urdu literature developed rapidly. All genres of literature, including novel, short story, drama, different forms of prose, and journalistic forms developed and made distinctive achievements. Urdu poets throughout the 19th century flourished, and Urdu entered the modern period with Hali (1837–1914) and Akbar Allahabadi (1846–1921) as well as many others. Muhammad Hussain Azad (1830–1910), in *Ab-e hayat* (1880), provided the first systematic account of the achievements of Urdu poetry, constructing a literary history, a canon, and the theory of poetry. Second, the establishment of several educational institutions, including Delhi College, Anjuman-e-Punjab, and Mohammedan Anglo–Oriental College, played multiple roles in enriching Urdu literature with translations from English as well as original writings in different disciplines. This trend spread the use of Urdu language and literature and contributed to the development of linguistic, literary, and cultural identity. Third, Urdu language and literature gained in momentum when it replaced Persian in 1837. It was used as an official court language along with English in the British-ruled provinces in North India. It gave rise to what is popularly known as the Hindi movement. Between 1868 and 1900, the Hindus of the northwestern provinces fought against Urdu through pamphlets and memoranda. They argued that the Perso–Arabic script was alien to India, that it was unintelligible to common people, and that Hindi written in the Devanagari should be made an official language. As a result of the agitation, in 1881 Hindi replaced Urdu in Devanagari script as the official language of the neighboring province of Bihar. This paved the way for the hardening of cultural-communal attitudes among the speakers of Urdu and Hindi, the divergence of Hindi and Urdu, and the formation of different linguistic identities. This can be seen in the exclusion of Hindu poets and the Hindu community in constructing the history of Urdu literature, on the one hand, and the switching of Hindu writers from Urdu to Hindi on the other (Faruqi, 2001). Prem Chand's switch from Urdu to Hindi was not merely an individual, personal choice but also was intricately involved with interrelated linguistic, political, and economic developments. This process reached its culmination with the complete identification of Urdu with Muslims in the second quarter of the 20th century.

The conflict between Urdu and Hindi was aggravated by the end of the 19th century and in the second

quarter of the 20th century. Two factors played a significant role in this process. First, this period saw the development of voluntary language associations such as Nagari Pracharini Sabha, formed in 1893, Hindi Sahitya Sammelan, founded in 1910, and Anjuman-Taraqqi-e-Urdu, formed in 1903. These associations promoted the cause of Hindi and Urdu, divided the loyalties of Hindi-Urdu speakers and writers, strengthened the linguistic divisions, and consolidated separate identities. Second, the Hindi-Urdu conflict and identities were reinforced by the development of both Hindu and Muslim revivalism and communal antagonism in the context of the Western culture, on the one hand, and the growth of the independence movement, on the other. As a consequence, the political mobilization of the masses contributed to the congruence of symbols of linguistic, cultural, and linguistic identities with the process of nationalism and nation formation. Das Gupta (1971: 57) points out that the identification of nationalism, linguistic, and religious solidarity was “more integral and pervasive” in the case of Muslims as compared to that of the Hindus. Ultimately, the partition of India led to the development of Urdu language and literature in India and Pakistan along different lines. This resulted in two linguistic and literary consequences. First, both the Hindi and Urdu speakers gave up Hindustani on ideological grounds. Although Hindi speakers identified Hindustani with Urdu, the Urdu speakers considered it another form of Hindi. Second, both the Hindi and Urdu speakers lost sensitivity and ability to appreciate the literature in a language other than their own.

Linguistic Description

It is generally recognized that Hindi and Urdu share a common grammatical system. They differ mainly in their writing systems, in their lexicon borrowed from Sanskrit or Persian and Arabic resources, and the minor aspects of syntax. Thus, at the phonological level, Urdu has a subset of phonemes (f x š z ž γ q) because of Perso-Arabic words, whereas Hindi has acquired ŋ š ʃ from Sanskrit words. Kelkar (1968: 80) points out that “it is highly unlikely that H ŋ i on the one hand, U q ? z x on the other will coexist in the same idiolect.” Similarly, Urdu has acquired some other distinctive phonological features. Khan (1978: 10–11) points out that Urdu speakers invariably break up consonant clusters in VCC structure in words of Sanskrit origin, but they pronounce the structure correctly in the Persian and Arabic words. This is partly because of cultural influence of Perso-Arabic vocabulary, and partly because of the educational background of speakers. This refers to the phenomenon of *Schwa* deletion having a wider

scope in phonological analysis. Narang and Becker (1971) show that a group of derived nouns and adjectives of Perso-Arabic origin represent an exception to the *Schwa* deletion rule. In short, the distinctive phonological features of Urdu are mainly due to Perso-Arabic words. However, it is generally not specified whether these features are characteristic of written or spoken style or both, or educated or uneducated speakers of Urdu.

The issue of lexical borrowing raises different problems at the lexical or semantic level. Borrowed words may be considered in terms of word classes such as nouns, adjectives, adverbs, compound verb formatives, and so on. For instance, Hindi and Urdu show a clear difference in compound verbs consisting of noun + verb or adjective + verb sequences such as U šurū karnā, istēmāl karnā and H ārambh karnā and prayōg karnā. It is essential to highlight some important issues that are not discussed in the analysis of lexical differences between Hindi and Urdu. First, the studies of distinctive lexicon are based on restricted data as evident from Mobbs (1981) and van Olphen (1989). The implications of the nature and scope of lexical differences between Urdu and Hindi can be understood only on the basis of a large representative sample of both spoken and written varieties belonging to different forms of literature. The corpus of three million words, each in Urdu and Hindi, available with the Central Institute of Indian Languages, Mysore, offers challenging opportunities for a wide range of linguistic studies. Second, it is necessary to recognize that the choice of a word of Persian or Arabic origin does not necessarily imply a choice in favor of Urdu. Similarly, the use of words of Sanskrit origin does not imply Hindi. In other words, both Perso-Arabic and Sanskrit words may have been assimilated and become part of the primary system of Hindustani and thus constitute an integral feature of both Hindi and Urdu. Finally, it is essential to move beyond individual lexical items and bring out the implications of borrowed words in collocations and in reflecting different cultural meanings, values, and history. In other words, it is essential to explore to what extent different sets of Perso-Arabic or Sanskrit vocabulary individually as well as in different collocations contribute to the construction of different conceptualization of entities, events, and situations, and different worldview, at the semantic level. Prem Chand’s switch from Urdu to Hindi clearly shows how he found Sanskrit vocabulary congenial to the themes of his works and the sociocultural worldview related with them (Trivedi, 1989).

The borrowing of Perso-Arabic words in Urdu creates characteristic linguistic features at the grammatical level. This can be seen in a number of

word-forming suffixes and prefixes. The process of compound formation in Persian has contributed to productivity of compounds in Urdu. Similarly, the process of word formation in Urdu depends a great deal on Arabic resources. This is particularly evident in the various derived verbs with their associated participles and verbal nouns along with their word forming affixes and vowel patterns added to the root. In other words, the productive process of word formation characteristic of Urdu at the grammatical level shows a deep impact of Perso–Arabic resources. Similarly, the distinctive grammatical features of Urdu can be seen in the use of some prepositions, negative particles, formation of noun duals, or plurals in the case of some nouns that are a result of Perso–Arabic influence. The grammatical analysis of Urdu cannot ignore these linguistic devices, as they are extremely productive and provide a distinctive character. However, a number of issues remain to be explored. First, it is essential to explore how deeply these linguistic devices have influenced the structure of Urdu. It will be useful to study whether these features are particularly typical of literary or administrative language, or newspaper texts, or they are also found in everyday Urdu use. Second, it would be relevant to explore the extent to which these linguistic devices support the process of divergence of Urdu from the colloquial Hindustani grammatical system. In this respect, van Olphen (1989) points out that “it is convergence that threatens Urdu in India.” By contrast, Hasnain (1995) shows in a small-scale empirical study of Urdu used in mass media and education that innovations in language based on Perso–Arabic resources of word formation have implications for comprehension or intelligibility of language use. In short, whereas language innovations based on Perso–Arabic resources may contribute to divergence of Urdu from the Hindustani grammatical system, the pressure of comprehensibility may check the trend of divergence. The consequences of the dynamics of convergence and divergence will become clear only in the long run.

Codification and Standardization

Language planning agencies and organizations played a significant role in the development and standardization of Urdu. Anjuman Taraqq-e-Hind, established in 1903, has been in the forefront in the development and promotion of Urdu. After the partition of India, the reorganized organization was less militant and more concerned with the promotion and popularization of Urdu among the people. It has 10 branches in different states and eminent leaders, such as Kazi Abdul Gaffar and Zakir Hussain, have played an

important role in its growth. It has made a significant contribution for the recognition of Urdu as a second official language in UP and Bihar and for the extension of its use in schools, colleges, and in radio communication. It has been engaged in the organization of celebration of Ghalib (1797–1869), Iqbal (1878–1938), and Prem Chand (1880–1936) days to popularize Urdu and Urdu conventions involving educational, literary, social, cultural, and political societies (Brass, 1975). Another organization, the Deeni Talimi Council, has focused its attention on the contents of textbooks. It works for the preservation of Muslim cultural values and basic tenets of Islam. Jamia Milia Islamia, established in 1920, has become one of the important educational and academic institutions concerned with Urdu education and academic research. The University Grants Commission recognizes it as a ‘central university.’ It not only gained prestige and respectability in Urdu education and studies but also played a constructive role in support of Urdu by influencing the language policy of the Union Government (Das Gupta, 1970).

In addition to the nongovernmental organizations, the central and state governments have made a significant contribution to the development and standardization of Urdu. The Bureau for the Promotion of Urdu, established by the Government of India in 1969, has done extensive work on the codification and standardization of Urdu. It has produced 100 000 Urdu technical terms for various disciplines of natural sciences, social sciences, and art, published more than 600 books on academic subjects, and compiled Urdu–Urdu and English–Urdu dictionaries, and Urdu encyclopedias. In UP, Bihar, Madhya Pradesh, Maharashtra, and other states, Urdu academies have been working on translation of books from English, publication of standard literary and scholarly works, university level textbooks, and the promotion of Urdu through seminars and conferences. Similar work on the codification and standardization of Urdu has been going on in Pakistan. The evaluation of the extensive work on development, codification, and standardization of Urdu needs to be studied, focusing on the impact of this on language change and development of pluricentric norms in the two countries. This is also relevant from the point of view of divergence of standard Urdu from the colloquial norm and its implications for comprehension by educated speakers of Urdu.

Although the codification and standardization work by both the government and nongovernmental organizations is essential and significant, it is also important to recognize the contribution of the individuals as creative writers, researchers, scholars, educationalists, linguists, and teachers who play a critical

role in the stabilization and cultivation of the standard language. It is not possible to mention all the names of Urdu specialists who have made a substantive contribution to research and development of Urdu. It may, however, be mentioned that several eminent scholars and researchers on Urdu have been recognized for their seminal contribution in various fields of studies on Urdu including Urdu script and spelling reform, lexicography, standardization of pronunciation and vocabulary, historiography of Urdu language and literature, and linguistic analysis and description.

Urdu Literature

Literature has been one of the most significant sources of language development and standardization in the case of many developed languages of the world. The history of Urdu shows parallel development of both literature as well as language. Just as Urdu language was formed in communication and social interaction between two cultures in the situation of language contact, Urdu literature shows fusion of two literary and cultural traditions. The Perso–Arabic elements in Urdu language do not merely constitute a superimposed structure but also form an integral aspect of language identity and its literary tradition. They have a rich semantic potential expressive of Islamic tradition and cultural worldview. Similarly, Urdu literature shows a synthesis between Islamic and Indian cultural traditions at literary, aesthetic, and philosophical levels. Narang (1991) maintains that although Urdu literature has been deeply influenced by Persian literature and rich Iranian and Islamic tradition, it has imbibed Indian cultural influences and has emerged as an expression of the composite culture of India. This is evident from the development of various forms and genres of literature during the last 300 years.

Medieval Urdu poetry shows profound influence of Persian literary tradition in its various forms, imagery, and figures of speech, as well as themes and background. The *ghazal* in the medieval poetry has “no local color,” lacks personal touches, and appears to have largely a “museum” quality (Sadiq, 1984). However, in the process of development of Urdu literature over the next two centuries, *ghazal* grew beyond erotic themes. Sadiq (1984: 19) points out that “nothing seems to be alien to its genius and it has readily accommodated ethics, metaphysics, philosophy, mysticism, satire, politics, side by side love, which still continues to be its favourite theme.” The semiotic analysis of *ghazals* of Ghalib, Iqbal, Faiz, and Firaq Gorakhpuri (1896–1982) brings out the rich potential of the genre of *ghazal*. The same is

true of other genres such as *Masnavi*, *Marsiya*, *Qasida*, and so on. *Masnavis* of Mir Hasan (1727–1786) are soaked with Indian imagery (Sadiq, 1984: 16). Srivastava (1992) shows that *Masnawi* as a poetic form has assimilated in its content Puranic legends, Indian folktales, semihistorical events of Indian soil, and so on in the process of its endogenous growth. The popular love lyric *Qawwali* was not only exclusively developed in India but also became an integral part of the secular North Indian music gaining in popularity, as did its indigenous counterparts such as Hindu Kirtan or Bhajan (Narang, 1991). Mushaira (poetic symposia) has become a popular literary convention in India, Pakistan, and other parts of the world.

The modern Urdu literature has many great achievements to its credit. The individual achievements of great poets, writers, and men of letters are difficult to enumerate. However, it would be adequate to mention a few points that are characteristic of the vitality of Urdu literature. First, the development of Urdu literature has kept pace with the trends and tendencies of the time and produced poets and writers belonging to different traditions, movements, and ideologies. Similar to literary traditions in other major Indian languages, it represents a great deal of involvement, sensitivity, and an awareness of contemporary social reality. For instance, the progressive story writers in Urdu, Rajendra Singh Bedi, Manto (1913–1955), Krishan Chander (1914–1977), and Ismat Chughtai (1915–1991), give expression to economic inequality, social exploitation, and male chauvinism as do their counterparts in Hindi. Quarratul-ain-Haider (b. 1928) and Ismat Chughtai in Urdu focus on Indian women and their consciousness as do Manu Bhandari and Krishna Sobti in Hindi. The Sahitya Akademi award to Ismat Chughtai and the Jnanpeeth award to Quarratul-ain-Haider have gained recognition for Urdu literature at the national level.

Second, Urdu literature is not merely restricted to poetry or fiction. It encompasses a wide range of literary criticism, folk literature, children’s literature, and scientific literature. In terms of total literary output, Urdu does not lag behind several major Indian languages.

Finally, it is worth emphasizing that several Urdu poets and writers have carried forward the tradition of the synthesis of the Islamic and the Indian cultures. In this context, Salahuddin Pervez has achieved a great distinction in his novel *Identity Card* for giving expression to the spirit of Islamic thought and its interaction with the Indian spiritual–cultural system and transforming it into a powerful universal humanistic Indo-Islamic ethos. There is a distinct progress

in sincere appreciation and creative assimilation of Buddhist thought and its cultural tradition. Both poets and fiction writers discover a rich potential of myths, jataka tales, and Buddhist philosophy. Quarratul-ain-Haider in her masterpiece *Aag Ka Darya* ('The river of fire') makes an imaginative representation of Vedic and Buddhist elements in the spiritual saga of man. Khalilur Rahman Aazmi (d. 1978), one of the pioneers of the new movement in Urdu poetry, presents Gautam as a symbol of perfection. Similarly, Yusuf Zafar, a leading figure of New Poetry in Pakistan, portrays Buddha as an embodiment of love and compassion and a landmark in the spiritual history of mankind.

In short, Urdu literature shows a genuine creative assimilation of the ancient Indian cultural tradition and philosophy in the context of the contemporary problems of mankind in modern age. The standardization and elaboration of the Urdu language shows not only its communicative dynamics and expressive potential but also the loyalty and identity of its speakers. Thus, the Urdu language and literature have gained recognition because of their vitality and achievements and spread at the international level.

Uto-Aztecan Languages

C Fowler, University of Nevada, Reno, Nevada

© 2006 Elsevier Ltd. All rights reserved.

Uto-Aztecan is a large family of indigenous languages whose descendants are distributed from Oregon in the north to El Salvador in the south, with the heaviest concentrations of contemporary speakers in northern and central Mexico. Today over 45 extant and extinct languages are recognized as part of the family, with some of the extant languages represented by 50 or fewer speakers and others by well over 100 000 (Campbell, 1997; Ethnologue, 2004). In times past, speakers of these languages included peoples displaying the full range of socioeconomic adaptations, from small extended families who lived by hunting and gathering to clans of small village farmers to intensive agriculturalists organized into vast empires. Today, in many communities in the United States, public education and culture change have reduced the number of speakers to dangerously low levels, and language extinction appears inevitable. For others, concerted efforts at language salvage and revitalization that are currently underway may prolong or actually reverse the decline. For several of

the more remote and robust languages of Mexico the picture is brighter and there appears to be less danger of significant language loss in the immediate future.

The languages within the Uto-Aztecan family are divided into three more or less contiguous geographic clusters across their broad range. The names for each cluster and views as to their internal relationships have changed through time and are still subject to some debate. The units are generally referred to as (1) Shoshonean or Northern Uto-Aztecan, which includes several branches and languages concentrated in the Great Basin and southern California in the United States; (2) Sonoran, which includes the languages of southern Arizona in the United States and of Sonora, Chihuahua, and Durango in northwest Mexico; and (3) Aztecan or Nahuatl, with languages widespread in central Mexico and outliers in El Salvador. The Sonoran and Aztecan languages are often subsumed under the term Southern Uto-Aztecan, either as a geographic reference to contrast them with the languages of the north or in recognition of a genetic relationship. The languages within each of the clusters and the branches with which they are affiliated are given in **Table 1**.

Table 1 Uto-Aztecan languages

Northern Uto-Aztecan

Numic:

Western [2 languages = Mono (Monache, Owens Valley Paiute) and Northern Paiute (including Bannock)]

Central [3 languages = Panamint (Timbisha), Shoshone (Western, Northern, Eastern, Gosiute) and Comanche]

Southern [2 languages = Kawaiisu and Ute (Northern and Southern Ute, Southern Paiute, Chemehuevi)]

Takic:

Serrano-Gabrielino [3 languages = Serrano (Vanyume), Kitanemuk, *Gabrielino (Fernandeño)]

Cupan [3 languages = Cahuilla, Cupeño, Luiseño (Juaneño)]

*Tataviam (?)

Tubatulabal

Hopi

Southern Uto-Aztecan

Tepiman:

Upper Piman [1 language = (Pima, Tohono O'odham, Nevome)]

Lower Piman [1 language = (Mountain, Yepachi, Yecora-Maycoba)]

Northern Tepehuan

Southern Tepehuan [1–3 languages = (Southern Tepehuan, Tepecano)]

Tarahitan:

Tarahumarán [2–7 languages = Tarahumara (Western, Northern, Central, Southern, Ariseachi, Summit) and Guarijio (Upland, Lowland)]

Opatan [2 languages = Opatá and Eudeve]

Cahitan [1–2 languages = Yaqui and Mayo]

Corachol:

Cora [1–2 languages (Cora, Santa Teresa Cora)]

Huichol

Aztecan:

*Pochutla

General Aztec (4–28 languages/dialects = Pipil, Nahuatl (Mexicano, Aztec, Tetelcingo, Zacapoaxtla, etc.)

After Campbell, 1997; Goddard, 1996; Ethnologue, 2004; does not include all extinct* languages.

Records and studies of Uto-Aztecan languages extend back to the time of the Spanish conquest of Mexico with the compilations of Fray Bernardo de Sahagun from 1540 to 1560 on Classical Aztec or Nahuatl, as well as by other early pioneers. Documentation of most of the northern languages did not begin until exploration and colonization of the western United States in the first decades of the 19th century. As explorers, military expeditions, traders, and missionaries began to compile vocabularies of western U.S. and northern Mexican languages, the work on genetic classifications of them began in earnest. Initial compilations by Albert Gallatin in the 1830s and 1840s, Johann Carl Buschmann in the 1850s, and Albert Gatschet in the 1870s, among others, led to the inclusion in the family of most of the languages and branches recognized at present. Most controversial was the linking of Nahuatl to the Sonoran and ultimately Shoshonean languages, proposed by Bushmann and accepted by Gatschet in 1878, but rejected by John Wesley Powell in his classification of 1891. Daniel Brinton in his classification the same year accepted the linkage and is credited with naming the family, choosing a northern language (Ute) and a southern one (Aztec) to represent the unity (Goddard, 1996; Lamb, 1964). However, not until Edward Sapir (1913–1914) provided the first systematic study of sound correspondences and lexical reconstructions within the family by comparing Southern Paiute with Nahuatl was the overall relationship considered to be demonstrated. Since that time, work has concentrated on better understanding internal and external relationships for the family, and on the basic description and documentation of the individual languages (Goddard, 1996; Lamb, 1964).

A link between the Uto-Aztecan language family and the Tanoan languages of the U.S. Southwest and thus ultimately to Kiowa of the U.S. Plains was first suggested by Sapir in his 1929 macro-classification of North American Indian languages. This grouping was referred to by him as Aztec-Tanoan, and later given the position of a phylum or superstock. Benjamin Lee Whorf and George Traeger provided sound correspondences and reconstructions to show the Tanoan linkage, although they initially rejected the inclusion of Kiowa. The Kiowa-Tanoan linkage was confirmed in the late 1950s and early 1960s (Goddard, 1996: 313, 317), but the Aztec-Tanoan combination has not fared as well. Suggestions of this and yet more remote relationships for Uto-Aztecan languages, all of which appear doubtful, are reviewed by Campbell (1997).

The internal relationships of some of the Uto-Aztecan branches and sub-branches are still debated. The combinations of languages that make up the

northernmost branch, Numic, found in the Great Basin of the United States, are solid. Two languages, Hopi of northern Arizona and Tubatulabal (Tübatulabal) of southern Sierran California, are understood to be independent branches. Early extinctions and thus lack of data for some of the languages of the Takic branch of southern California make internal relationships difficult to determine with certainty, particularly the position of Garbrialiño and Tataviam (Campbell, 1997: 135). Powell and A. L. Kroeber suggested that these four branches were related to each other by more than geography, and referred to them all as Shoshonean (Lamb, 1964). Miller (1983, 1984), based on a review of cognate sets and comparisons of sound systems, rejected this relationship as genetic, preferring to view the four as independent branches of the family. Others accept the unity of these four branches, citing shared innovations in the sound systems and aspects of morphology as evidence (Goddard, 1996; Campbell, 1997; Heath, 1977, 1985; Manaster Ramer, 1992).

Internal diversity within the remaining branches of the family is also debated, with some arguing for and others against various subgroupings. Again, the problem of language extinctions and thus lack of data enters into the discussion (see Campbell, 1997: 133–135 for details), with Miller (1983) remarking that relationships make the family resemble less a tree than a vine that has been severely pruned! Names for the remaining branches also differ, but there is general agreement on Tepiman (Pimic), Taracahitan (Taracahitic), Corachol (Cora-Huichol), and Aztecan (Goddard, 1996; Campbell, 1997). The position of a fifth branch, Tubar, is likewise debated, with some placing it within Taracahitan (Kaufman, 1974). Some keep Tarahumara and Cahitan as independent branches (Ethnologue, 2004), and others include these with the first three named as a genetic subunit called Sonoran. Sonoran has a long history going back to Buschmann, with the most recent evidence being presented by Hale (1964). The unity of Southern Uto-Aztecan, including Sonoran and Aztecan, is less controversial than the proposal for Northern Uto-Aztecan (Campbell, 1997; Goddard, 1996; Heath, 1977, 1985; Manaster Ramer, 1992; Miller, 1983, 1984), although there is still some argument over the position of Aztecan as either having independent status within that unit or being more closely related to Corachol (Campbell and Langacker, 1978).

Most of the languages of Uto-Aztecan, with the exception of those that went extinct early, have been reasonably well studied, beginning with the work on Southern Paiute grammar, texts, and a dictionary by Sapir in 1910 (Sapir, 1930–1931). Most recent in a

long line of descriptive works is the publication of the massive *Hopi dictionary* (Hill *et al.*, 1998), representing the largest compilation to date for a Native American language. In between, sufficient descriptive works have been published by numerous authors to provide the data for reconstruction of the basic sound system of the proto-language, as well as an outline of some of its grammatical features, and a partial lexicon.

The Proto-Uto-Aztecan sound system is considered by most to contain a single series of voiceless stops (p, t, c, k, k^w, ?), -s, h, two nasals [m, n (or ŋ)], a lateral (l), plus w, y, and possibly r, along with a five vowel system (i, a, i, o, u) plus vowel length (following Campbell, 1997). There is some disagreement as to the identity and directionality of the n, ŋ, and l: **n > *ŋ and **l > *n, particularly in selected environments in Northern Uto-Aztecan, or **ŋ > *n and **n > *l in selected environments in Southern Uto-Aztecan (see Campbell, 1997: 136–137) for discussion). The status of **r is likewise not clear, with some suggesting that it is one reflex of **t (Campbell, 1997: 137). Additional work with the cognate sets initially compiled by Miller (1967, 1988) may clarify the matter. The basic sound system has come down to the daughter languages with various alternations, with not all paths particularly clear.

Work on comparative grammar dates to the 1960s and 1970s (Heath, 1978; Langacker, 1977; Steele, 1979; Voegelin, Voegelin and Hale, 1962). Based on these studies, the proto-language is considered to have had several features, including an ‘absolute’ noun suffix, used to mark a noun that is neither possessed nor carries another postposition; an auxiliary that contained a complex of modal, pronominal, and tense elements; and various pronomial elements on the verb that marked a reflexive object (Steele, 1979: 444–448). The proto-language is also considered to be a verb final language, with a much richer verb morphology than noun morphology.

The broad distribution of Uto-Aztecan languages has spurred several investigations into the linguistic prehistory of the family, with archaeologists, anthropologists, and linguists making contributions through the years. Comparative lexical work has suggested homelands for Proto-Uto-Aztecan in various locations within its present range, and various features, including agriculture, for its earliest speakers (Fowler, 1983; Hill, 2001, 2003). The language family has thus been fertile ground for testing many hypotheses from historical and theoretical linguistics to anthropological concerns. Today, the expertise of many Uto-Aztecan specialists, especially in the United States, is also being given to Native communities in

partnerships addressing language salvage and revitalization in order to preserve these significant languages for speakers in the future.

Uyghur

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Uyghur (uyƣur tili, uyƣurča), formerly called Eastern Turki, is spoken in the Chinese Xinjiang Autonomous Region (Eastern Turkistan). It belongs to the South-eastern (Uyghur, Uyghur-Karluk, or Chaghatay) branch of the Turkic language family.

At least 10 million native speakers of Uyghur live in Xinjiang. This region borders Kirghizstan and Tajikistan in the west; Kazakhstan in the northwest; Mongolia in the north and northeast; the Russian Federation in the north; Afghanistan, Jammu, and Kashmir in the southwest; Tibet in the southeast; and the Chinese provinces Gansu and Qinghai in the east. Other languages spoken in Xinjiang include Chinese, Kazakh, and Kirghiz. The speakers of Uyghur predominantly live in the oases north of the Tarim river, on the southern slopes of Tienshan, and on the northern slopes of Kunlun in the southern Taklamakan desert up to the region west of the Lop desert. About half a million speakers of Uyghur live in eastern Kazakhstan, Kyrgyzstan, Uzbekistan, Tajikistan, Turkmenistan, Afghanistan, and Mongolia.

The status of Uyghur in Xinjiang is stable. Official documents are issued in both Uyghur and Chinese. Though education in Uyghur is possible up to the

university level, Chinese, the dominant language, is necessary for higher education. The Uyghurs make strong efforts to maintain and cultivate their language. In Kazakhstan, a few Uyghur schools exist, and there is a certain publishing activity in Uyghur.

Origin and History

The Old Uyghurs, living near the Selenga River on the territory of today's Mongolia, were vassals of the eastern Türk confederation. They defeated the Türk in 744 and created an empire that extended from Lake Baikal to the Altay Mountains. From here, they expanded their realm to Gansu in the east, and incorporated the Tarim basin and the Ferghana valley. The Uyghurs entertained close contacts with China, adopted Manicheism, and acted as the religion's protective power.

In 840, the Uyghurs were defeated by the Kirghiz, another Turkic-speaking tribal confederation. Most Uyghurs and many of their subjects fled southward. One group settled in the Ordos region of northern China and assimilated with Chinese and Mongols. The Uyghurs who settled in the Gansu corridor of western China, establishing contact with Tibetans and Mongols, are the ancestors of today's Yellow Uyghurs. The largest group fled to the Tarim basin. In Turfan, the southwesternmost possession of their steppe empire, the Uyghurs established the kingdom of Kocho, which expanded rapidly over large parts of the Tarim basin. It existed until the Mongol invasion in the 13th century, and as a semiautonomous state

for some time afterwards. A rich sedentary culture emerged, in which the Uyghur language was used for a comprehensive literary production.

Various Turkic groups had settled in this region from the 6th century on, particularly in the colonies of the Türk empire. The western Tarim basin was predominantly populated by Karluks. Large parts of the area had thus been Turkicized long before the Uyghurs settled here. The Turkic-speaking groups eventually absorbed the indigenous non-Turkic population of Indo-European origin, i.e., speakers of Soghdian (Sogdian) and Tokharian. The southern oases north of Kunlun were mostly populated by Saka speakers. Their region, which had its center in Khotan, essentially remained untouched by Turkicization up to the Mongol period.

The Old Uyghur culture was finally extinguished through the advancement of Islam. The first Islamic Turkic state in the east, the Karakhanid empire, was established in the 10th century, with Kashgar developing into the leading Islamic center in the east. Later on, the oasis states of the Tarim basin were controlled by Karakitay, Mongols, Junggars, and various local rulers. In the 20th century, Eastern Turkistan became a bone of contention in conflicts between Russia, China, and Britain.

Related Languages and Language Contacts

Uyghur is closely related to Uzbek. Modern Uyghur partly goes back to Old Uyghur, which is close to the language of the Orkhon inscriptions of the Türk dynasty. It is not a direct continuation of Old Uyghur, but differs considerably from it as a result of interaction with Indo-European varieties such as Soghdian and Tokharian, and other Turkic varieties. The Turkic varieties of Eastern Turkistan, a major crossroad of Central Asia, have been in contact with numerous other languages. A strong substratum influence has been exerted by speakers of Indo-European shifting to Turkic. Uyghurs had early contacts with Mongols, and later contacts with Kirghiz and Kazakhs. Elements of Persian and Arabic origin were spread by merchants and religious teachers along the Silk Road. Contacts with Russian began in the early 20th century. The long contacts with Chinese have been particularly important. The presence of Chinese speakers in Xinjiang has increased considerably since the 1950s.

The Written Language

Old Uyghur was a highly developed literary language, attested by rich historical materials, mostly of

a religious – predominantly Buddhist, but also Manichaeic and Nestorian Christian – nature. A rich treasure of Old Uyghur documents, written in various scripts, has been preserved, the last ones dating back to the 15th century. In the Islamic era, Eastern Turkistan was the birthplace of the literary language known as Karakhanid ('Khakani' Turkic), created in the 11th century in Kashgar, the cultural center of the Karakhanid state. Kashgar also became the basis of the eastern variety of the transregional literary language Chaghatay, which developed from the 15th century on in the Timurid realm. Modern written Uyghur is the last stage in this literary tradition.

In 1922, an assembly in Tashkent decided to adopt the historical term 'Uyghur' for speakers of Eastern Turki in Russian Turkistan. The designation was officially accepted in Xinjiang in 1934. Standard Uyghur, the official local language of Xinjiang, was originally based on varieties spoken in the Ili region, mainly on Soviet territory. The basis of the current standard language are the dialects of Ghulja and Ürümqi. Since 1954, the Language and Script Work Committee (Til-yëziq xizmiti komiteti) is responsible for its norms. The current standard pronunciation was determined in 1987 and slightly revised in 1997.

Modern Uyghur was first written with Arabic script. A Cyrillic script was introduced in 1957 but soon replaced by the Roman-based 'new script' (*yëngi yëziq*), based on the Chinese pinyin system. Since this experiment was unsuccessful, the Arabic-based 'old script' (*kona yëziq*) was revived in 1983. The return to it has made written communication with other Turkic-speaking groups more difficult. For Uyghur varieties of the Soviet Union, Arabic script was used up to 1930, then a Roman-based alphabet was used, and, from 1947 on, a Cyrillic script, which is still used in Kazakhstan, Kyrgyzstan, and Uzbekistan.

Distinctive Features

Uyghur exhibits most linguistic features typical of the Turkic family (see **Turkic Languages**). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., *A = a/e*, *G = ɣ/g*, *K = q/k*. Segment within round brackets occur after consonant-final stems only. Hyphens are used here to indicate morpheme boundaries.

Phonology

Uyghur displays many features that are lacking or uncommon in other Turkic languages. The back

vowel *i* is missing in many environments where it is normally found in Turkic, e.g., *yil* ‘year.’ It is present in the neighborhood of back velars, e.g., *qiz* ‘girl’ (written *qiz*). The Arabic-based script does not distinguish the vowels *i* and *ï*, though it otherwise provides diacritic signs to designate vowels in an unambiguous way. The typical Turkic frontness-backness and rounded-unrounded harmony is preserved. The latter is relatively weak, many suffixes lacking variants with rounded vowels.

Certain vowel changes and phonological irregularities, in particular regressive assimilations, can be interpreted as Indo-European substratum phenomena. Unaccented nonhigh vowels are raised in open syllables, i.e., *a, e, é > i, o > u, ö > ü*, e.g., *bali-lar* ‘children’ (*bala* ‘child’), *yürüg-üm* [heart-POSS.1.SG] ‘my heart’ (*yürek* ‘heart’). Words of Arabic and Persian origin are not subject to this rule. Two rules of regressive assimilation may be due to contact with Iranian. First, *a* and *e* in open first syllables are raised to *é* under the influence of *i* or *ï* of the following syllable, e.g., *ét-im* [horse-POSS.1.SG] ‘my horse’ (*at* ‘horse’) or ‘my meat’ (*et* ‘meat’). Second, *a* and *e* in open first syllables are rounded under the influence of *u* or *ü* in the following syllable, e.g., *tömür* ‘iron’ < *temür*.

Finally -G is preserved in monosyllabic words, e.g., *tay* ‘mountain,’ but it is mostly changed to -K in nonfirst syllables, e.g., *tay-liq* [mountain-DER] ‘mountainous.’ Initial *ž-* occurring before high vowels corresponds to *y-* in many other Turkic languages, e.g., *yil* ‘year’ (Turkish *yıl*). The consonants *r* and *l* are often deleted, particularly before obstruents, e.g., *qa[r]* ‘snow,’ *qa[r]ga* ‘crow,’ *bo[l]sa* [be(come)-COND.3.SG] ‘if it is.’ Loanwords are restructured according to native phonotactical rules. Thus, *f* is mostly replaced by *p*, e.g., *pikir* ‘idea’ (< *fikr*). Non-permissible consonant clusters are broken up by means of epenthetic/prothetic vowels or consonant deletion, e.g., *xaliq* ‘people’ (< *xalq*), *iradiyo* ‘radio,’ *dos* ‘friend’ (< *dost*).

Grammar

The ablative suffix is -*Din*, as in Old Uyghur, whereas most Turkic languages exhibit -*Dan*, e.g., *öy-din* [house-ABL] ‘from the house.’ Uyghur has lost, as Chaghatay already had, the ‘pronominal *n*,’ which occurs, in most Turkic languages, in third person possessive suffixes before case suffixes, e.g., *öy-i-ge* [house-POSS.3.SG-DAT] ‘to her/his house’ (cf. Turkish *ev-in-e* [house-POSS.3.SG-DAT]). The polite form of the second person plural pronoun is *si-ler* [you-PL]. There is a general present tense marker going back to *-*a tur-ur* (converb suffix + ‘stands’), e.g., *oqu-y-du* [read-CONV.3.SG] ‘reads,

will read,’ and a more focal present marker going back to *-*p yat-a tur-ur* (converb + ‘lie’ + converb + ‘stands’), e.g., *oqu-wati-du* [read-FOCAL.PRES-3.SG] ‘is reading.’ Evidentiality is expressed with the copulas *éken/ëmiş* and the past suffix *-(i)p-tu*. The marker *-gan-di* expresses presumption. More than 20 auxiliary verbs are used in postverb constructions to express manner of action.

Lexicon

Uyghur displays numerous words of Arabic and Persian origin. Many words for abstract concepts are inherited from the Karakhanid-Chaghatay literary tradition. Though this influence has now decreased, one-fifth of the vocabulary is still of Arabic-Persian origin. A large part of the modern technical and administrative vocabulary has been copied from Russian. The lexical influence of Chinese has become increasingly stronger, and many Chinese neologisms have been copied. In the 1960s, the use of Chinese scientific terminology was obligatory. There is now a tendency to replace Chinese words with products of Turkic word formation, loan translations, and internationalisms copied from Russian.

Dialects

The classification of Uyghur dialects is still controversial. A northern group includes dialects spoken north and east of the Tianshan mountains and immediately south of them. It comprises the westernmost dialects of Kashgar and Yarkent, the more central dialects of Aqsu and Kucha, and the eastern dialects of Turfan and Qumul. The Kashgar-Yarkent dialect is strongly influenced by varieties of Western Turkistan. The Turfan dialect is of special interest, since it seems to stand in a direct historic relationship with Old Uyghur. A particular variety is Taranchi, spoken in the Ili valley by groups that emigrated from Eastern Turkistan at the end of the 18th century. This dialect, which is close to Uzbek, served as the basis of written Uyghur in Russian Turkistan. It is still spoken by Uyghurs in Kazakhstan, Kyrgyzstan, Uzbekistan, etc. A southern group comprises the Khotan dialects. A third group consists of the now nearly extinct Lopnur dialect, which was spoken the eastern Tarim basin and displayed Kirghiz and Mongolian influences. The Khotan (or Busurman ‘Muslim’) dialect is spoken in the region between the lakes Ubsu-nur and Chirgis-Nur in western Mongolia. The Eynu variety, spoken at various places in southwestern Xinjiang, combines an Uyghur morphosyntax with a special vocabulary of non-Turkic – partly Iranian and partly unknown – origin. Its speakers, all adult men,

use it as a secret language to make their conversations unintelligible to outsiders. Salar and Yellow Uyghur were formerly considered dialects of Uyghur. Salar is of Oghuz Turkic origin, whereas Yellow Uyghur is the continuation of an Old Uyghur dialect.

Location and Speakers

Uzbek (*ozbek tili*, *ozbekcha*) belongs, like modern Uyghur, to the southeastern (Uyghur, Uyghur-Karluk, or Chaghatay) branch of the Turkic language family. It is spoken in various dialects in Western Turkistan, primarily in the Republic of Uzbekistan (*Ozbekiston Respublikasi*), which occupies the major part of Transoxiana and has common borders with Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan, and Turkmenistan. The Uzbek-speaking areas are concentrated in the the lower Zerafshan and upper Syrdarya valleys and in the Ferghana valley, west and north-west of western Tianshan. Though the Uzbeks make up 80% of the population of the republic, Uzbek is spoken by less than 75%, i.e., about 19.8 million people. Other languages of Uzbekistan include Russian and Tajik. The latter is mainly spoken in the oases of Bukhara and Samarkand and in the Ferghana valley. Russian is mainly spoken in the capital, Tashkent. Karakalpakistan, which comprises the northwestern part of Uzbekistan, is an autonomous republic with a special status and a language of the Kazakh type. Karakalpaks make up 2% of the population. Many Karakalpaks use Uzbek as a second language. Uzbek is also spoken in parts of Tajikistan (1.2 million speakers), northern Afghanistan (1.5 million), Kyrgyzstan (600 000),

Kazakhstan (350 000), Turkmenistan (360 000), and China (Xinjiang) (15 000). The total number of speakers amounts to about 24 million people.

Uzbek–Russian bilingualism is widespread in Uzbekistan, and Russian has a strong position. Uzbek is, however, one of the most firmly established Turkic languages, the second after Turkish in terms of cultural importance. It has been subject to systematic language planning and cultivation. Post-Soviet Uzbek is in a transitional period of dynamic developments. In general, the status of the Russian language has declined. In the first post-Soviet years, Russian was still defined as the medium of 'crossnational communication' in Uzbekistan. Later, it lost this role and its status as a compulsory subject in Uzbek education. However, the goal of enforcing obligatory use of the indigenous languages in public functions within a few years' time has proved unrealistic.

Origin and History

The historical background of the current linguistic situation is highly complex. In what is now Uzbekistan, varieties of southeastern Turkic have been spoken for a millennium, both by nomadic groups and by a sedentary population in close contact with Iranian-speaking groups. An intensive Iranian–Turkic bilingualism developed in Transoxiana and Ferghana. Sizeable Iranian-speaking groups eventually shifted to Turkic. The Uzbek conquest brought in a different element (the original Uzbeks spoke a Kipchak language of the Kazakh type). After the fall

of the Golden Horde, the Uzbeks left the Kipchak territory in the Ponto-Caspian area, seized the power in Transoxiana in about 1500, overthrew the Chaghatay empire, and established the khanates of Khiva and Bukhara. The language of these politically dominant groups was gradually absorbed by varieties of southeastern Turkic ('de-Kipchakization'). Different degrees of maintenance of Kipchak elements and of Iranicization mirror the transition from nomadic to sedentary life. Modern Uzbek is based on the language of the old sedentary Turkic population but displays a few Kipchak features. The original Kipchak varieties have gradually vanished with the abandonment of the nomadic lifestyle. Some remnants of them are found in northern and northwestern Uzbekistan. Russia conquered Uzbekistan in the late 19th century. In the 1920s, Soviet Turkistan was split into a number of socialist republics, and an Uzbek republic was set up in 1924.

Related Languages and Language Contacts

Uzbek is most closely related to modern Uyghur, with which it shares important features. The oldest Turkic population of the area had close relations to speakers of Iranian. The predecessor of Uzbek was strongly influenced by Sogdian and, after the Muslim conquest, New Persian. Long-standing intensive contacts with East Persian have led to copying of numerous features in phonology, morphology, vocabulary, and syntax. There are many striking structural similarities between Uzbek and Tajik. These influences, along with later Kipchak Turkic and Russian influences, have given Uzbek a highly composite character. Uzbek–Tajik bilingualism is still alive in some areas, e.g., in and around Samarkand and Bukhara. An increasing Uzbek influence on Tajik may be observed. Kirghiz–Uzbek bilingualism is found in Kirghiz towns bordering on the Uzbek Ferghana valley.

The Written Language

Persian was for a long time the prestigious language of administration and higher culture in Transoxiana. Its importance later decreased in favor of Chaghatay, the Persian-influenced literary language of the Chaghatay empire cultivated in Samarkand, Bukhara, Tashkent, Ferghana, and other centers. From the 18th century on, Chaghatay developed further through successive modernization and adaptation to regional spoken varieties. The 'Sart' literary language, used until 1920, consisted of Chaghatay with certain modern regional elements. After the

Russian conquest of the region, Uzbek was established as the standard language. It was first based on northern dialects, and later, after 1937, on the southern dialects of Tashkent and Ferghana. Modern standard Uzbek is the common 'roof' of highly different varieties.

Uzbek was first, as Chaghatay, written in Arabic script. A Roman-based script was introduced in 1929 and revised in 1934. In 1937, the orthography was simplified. Due to this reform, Uzbek texts became less easily intelligible to readers in neighboring Turkic areas. The old role of Uzbek as a transregional language was thus drastically restricted. A Cyrillic-based script was introduced in 1940 and 1941 and was later modified. The transition to a Roman-based alphabet was enacted by law in 1993. The new script system was revised in 1995. It is based on the American Standard Code for Information Interchange (ASCII) and dispenses with diacritic signs. The new system preserves the principles of the Cyrillic-based system. It essentially represents a transliteration of the Cyrillic spelling and is thus very different from the Roman-based system of the 1930s.

Distinctive Features

Uzbek exhibits most linguistic features typical of the Turkic family (*see Turkic Languages*). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following discussions, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., A = a/e, G = γ/g, K = q/k. Hyphens are used to indicate morpheme boundaries.

Phonology

The phonetic realizations of the vowels vary greatly. The standard orthography is very vague about the actual pronunciation. With the revision of the Roman-based script in 1934, the vowel signs were reduced to six. When, in 1937, the strongly Iranicized Tashkent dialect was chosen as the norm for the standard language, the signs for *ö*, *ü*, and *ı* disappeared, and the front vowel *æ* was written with the letter 'a.' These principles have been maintained in the new Roman-based system. Modern spelling thus applies a system of six vowel signs, identical with the system used for Tajik. It does not reflect the fact that the distinctions between back and front vowels have been largely preserved.

Standard Uzbek is claimed to have, as a result of Iranian influence, the six vowel phonemes *a*, *e*, *â*, *i*, *o*, and *u*. This analysis is mirrored in the orthography. The sign 'a' stands for a front *æ*, but also for a backed

‘a’ when adjacent to back-velar or uvular consonants. The higher vowel *e* occurs in first syllables, e.g., *er* ‘husband’ and *keræk* ‘necessary.’ A labialized *â* occurs in first syllables, e.g., *âlti* ‘six’ and *âra* ‘interval,’ confusingly enough written with the letter ‘o.’ Similarly, the letter ‘i’ stands for a front *i*, but also for a backed *ï* when adjacent to back-velar or uvular consonants, e.g., *yaxši* ‘good.’ High, unrounded vowels are often reduced or lost in closed syllables before certain consonants, e.g., [b^hr] ‘one.’ The vowels *ó* and *ú* (with a somewhat retracted pronunciation) occur instead of Common Turkic *ö* and *ü*, e.g., *ólik* ‘dead’ and *tún* ‘night.’ The distinctions *o* vs. *ó* and *u* vs. *ú* are not reflected in the script. Thus, pairs such as *bol-* ‘become’ vs. *ból-* ‘divide’ and *uç* ‘end’ vs. *üč* ‘three’ are homographic in modern spelling.

Due to Iranian influence, the manifestations of sound harmony are less straightforward than in most other Turkic languages. There are disturbances of the vowel harmony in most urban dialects, whereas the northern dialects have preserved vowel harmony. Suffixes are very often invariable and their vowels are not assimilating to the frontness–backness or the roundedness–unroundedness of the preceding vowel.

The notation of consonants in the new orthography follows the principles of the Cyrillic-based script. For example, ‘ch’ represents *č*, ‘sh’ represents *š*, and ‘j’ represents *ǰ*. The back velars *q* and *ɣ* are represented by *q* and *g*; the front velars *k* and *g* are represented by ‘k’ and ‘g’. As in Uyghur, final -G has mostly changed to -K in nonfirst-syllable positions, e.g., *sariq* ‘yellow’ and *tirik* ‘alive’ (cf. Turkish *sarı* and *diri*).

The realizations of suffixes are highly regular. Uzbek displays less consonant assimilations of suffix-initial *n*, *d*, and *l* than most neighboring languages do. The standard spelling is basically morphological and normally does not indicate vowel harmony or consonant assimilations. In loanwords, high epenthetic vowels are inserted to dissolve nonpermissible consonant clusters, e.g., *fikⁱr* ‘thought’ (written *fikr*). However, elements of Russian, Arabic, and Persian origin usually reflect the original forms as written in Cyrillic and Arabic script. Assimilations and other adaptations are thus obscured, e.g., *nisbat* ‘relation’ for [*nispæt*].

Grammar

Uzbek lacks the ‘pronominal n’ in the declension of nouns with third-person possessive suffixes, e.g., *qol-i-da* [hand-POSS.3.SG-LOC] ‘in his/her hand’ (Turkish *kol-un-da* [hand-POSS.3.SG-LOC]). The genitive suffix *-niŋ* is mostly pronounced as *-ni*, thus coinciding with the accusative suffix. Like Uyghur, Uzbek has abandoned the old pronominal flexion in favor of nominal

flexion, e.g., *sen-gæ* [you-DAT] ‘to you’ (Turkish *sana* [you-DAT]). The demonstrative pronouns constitute a four-place system with *bu* ‘this,’ *šu* ‘this (in view),’ *oša* ‘this (in view, more distant),’ and *u* ‘that.’ Lower numerals can assume the suffix *-tæ*, e.g., *ikki-tæ* ‘two (pieces).’ The suffixes *-âw* and *-ælæ* form collective numerals, e.g., *ikk-âw* ‘the two’ and *ikk-ælæ-si* [two-COLL-POSS.3.SG] ‘both of them.’

The general present-tense marker goes back to converb suffix + ‘stands,’ e.g., *kel-æ-di* [come-PRES-3.SG] ‘comes, will come.’ More focal present markers include *-(æ)yæp* and *-(æ)yâtir*, going back to constructions with *yât-* ‘to lie,’ e.g., *yâz-yæp-ti* [write-FOCAL.PRES-3.SG] ‘is writing (just now)’ and *kel-æ-yâtir* [come-FOCAL.PRES-3.SG] ‘is coming.’ Other focal forms with various nuances can be formed with auxiliary verbs meaning ‘to stand,’ ‘to sit,’ or ‘to move,’ e.g., *yâz-ib turib-mæn* [write-FOCAL.PRES-1.SG] ‘I am writing.’ Evidentiality is expressed by the indirective past marker *-(i)bdi* and the indirective copula particles *ekæn/lemiš*, e.g., *ayt-ib-di* [say-EV-3.SG] ‘obviously said,’ *unut-ib-mæn* [forget-EV-1.SG] ‘I have obviously forgotten,’ and *kæsæl ekæn* [ill COPEV] ‘is obviously ill.’ The interrogative forms *-mi-kæn* and *mi-kin* express doubt, e.g., *kel-gæn-mikan?* [come-POSTTERMINAL.PAST INTERROG] ‘has (s)he really come?’ The postterminal (‘past’) marker *-gæn* is used as participle and as a finite form, as in most other Turkic languages, corresponding functionally to Turkish *-miş*, *-(y)An*, and *-DİK*. There is also an intraterminal (‘present’) participle in *-digæn*. Postverb constructions with converb forms of the lexical verbs plus auxiliary verbs are used to express semantic modifications, including manner of action, e.g. *-æ ber-* ‘to do continuously, to keep doing.’ The Persian impact on Uzbek syntax is considerable.

Lexicon

The Uzbek vocabulary contains many loans of Arabic–Persian origin, mostly copied from Persian and inherited from the old literary language, Chaghatay. The strong Iranian influence on Uzbek has led to borrowing of word-formation affixes, even prefixes, e.g., *nâ-toŋri* ‘untrue’ (*nâ-* ‘non-’ copied from Persian plus Turkic *toŋri* ‘right, true’). Female gender is expressed in some nouns borrowed from Arabic and Russian, e.g., *šâir-a* [poet-FEM] ‘poetess’ (*šâir* ‘poet’) and *student-ka* [student-FEM] ‘female student’ (*student* ‘student’). Most conjunctions are of Arabic–Persian origin.

Dialects

The dialects exhibit different degrees of Iranicization. The northern dialects, spoken in southern Kazakhstan, north of Tashkent, show little Iranian

influence. Southern Uzbek includes the dominant urban dialects of Tashkent, Bukhara, Samarkand, etc., which go back to varieties of the settled populations. They have been heavily influenced by East Persian in their vowel system, for example. Moderately Iranicized dialects are spoken east of Tashkent, in the Fergana valley, representing a successive transition to Uyghur. The rural dialects of the Kipchak type are Kazakh dialects. Oghuz Turkic dialects, improperly called Oghuz Uzbek, are spoken in Khorezm and adjacent areas. Related dialects are also spoken in southern Uzbekistan and in southern Kazakhstan.

Historical Origins

The Vietnamese are thought to be descended from a precursor people who once dwelled near the Viet-Lao border of Central and Northcentral Vietnam where today are still found Vietic groups such as the Mu'ong, Nguồn, Arem, Rục, Pọng, Arem, Mày, Sách, Mã Liêng, and Thà Vù'ng (Nguyễn Tài Cẩn, 1995), (Ferlus, 1979, 1982, 1991, 1996, 1997). Long ago some of these groups moved north into the Red River Valley, lived under their own Hùng Vu'ong kings, and then allied with the indigenous Tày ethnicities in the joint Tày-Viet Kingdom of Âu-Lạc at Cổ Loa Citadel near Hanoi (257 to 208 B.C.). This lineage ended when the First Emperor of China and builder of the Great Wall dispatched the Chinese general 趙佗 Zhao Tuó (in *Hanyu Pingyin* transcription) or Triệu Đà (in Vietnamese), who conquered Âu-Lạc and introduced 100 000 soldiers, Chinese rule, Chinese character writing or 𡗗𡗗 *Chũ' Hán* 'Han (Chinese) script', and the Mandarin administrative system.

Vietnam remained a Chinese province until A.D. 939. After the Chinese departed, the Vietnamese continued the practice of borrowing from the Chinese cultural lexicon as well as structural and grammatical forms, and continued developing the character script, which was then renamed 𡗗𡗗 *Chũ' Nho* or 'learned script', and which contrasted with newly created characters used for writing purely Vietnamese lexical items. This new demotic script was called 𡗗𡗗 *Chũ' Nôm* 'southern, local, vernacular script' or simply *Nôm*, which was clearly in evidence by the 13th century, but was perhaps in use as early as the 10th century. Consider the following examples of strategies used for crafting *Nôm* characters: (1) 𡗗 *giò'i* 'heaven, sky' from Chinese 天 meaning 'heaven' and 上 meaning 'above'; (2) 𡗗 *đât* 'earth' composed of 土 *thổ* 'earth' for the meaning and 旦, taken from one half of 𡗗 for the sound *đât*; (3) 𡗗 *cá* 'fish' is a

combination of 魚 'fish' for the meaning and 𡗗 *cá* for the sound; and (4) 𡗗 *ba* 'three' is composed of the radical 三 meaning 'three' and 巴 *ba* for the sound. These examples show that 10th century Vietnamese were very much aware of the principles used in the construction of Chinese characters, namely to combine a radical part for meaning and a phonetic part for the sound, but the example for *sky*, *heavens* shows that sometimes other methods of creation were used.

Chinese influence in Vietnamese is generally very important and is the result of (1) 1000 years of occupation by Chinese speakers, (2) the role of Chinese as the spoken and written language of administration and, (3) the fact that Chinese continues to be the source of borrowing even today. Chinese loans in contemporary Vietnamese, called Sino-Vietnamese, can make up as much as 80% of the vocabulary in some semantic domains, (Hoàng, 1991: 5). But the depth of Chinese influence extends beyond the lexical. Indeed, some of the typological incongruities of morphology and syntax are now considered to be the result of contact with Chinese and other languages.

Politically independent at last, the Vietnamese then turned their attention to southern rivals, the Champa Kingdom. Three hundred years of greater and lesser hostilities ensued, with ebbs and flows evident in marriage alliances and other accommodations; Vietnamese absorbed some early loans from this source as well. In the 14th century, the Vietnamese gained ultimate control and the boundaries of the language were advanced southward until Vietnam reached its current geographic extension. Chinese *Chũ' Hán* with an admixture of *Chũ' Nôm* writing flourished until the late 1600s when an outside force, Jesuit missionaries including Alexander de Rhodes and Francisco de Pina, developed an orthography based loosely on Portuguese and on Italian models that were intended not for the court but for believers among the common people. It was a romanized script with diacritics for tones and vowels, called *Chũ' Quốc Ngữ*, whose timeline can be sketched as follows: 1620–1631 embryonic beginnings, 1631–1648 revisions, 1651–1659 dissemination, and 1772–1838 finalizing stage, (Lý, 1999: 234–5).

Over the 18th and 19th centuries, official character script and popular roman script co-existed, but gradually *Chữ Quốc Ngữ*, aided first by French colonial proclivities in favor of a Latin-based script and the Church and later by populist movements, led to a shift in orthography; the character-based writing of Vietnamese was finished entirely by 1917 when the French eliminated the Chinese examination system, cf., Alexandre de Rhodes (1651) and Nguyễn Đình Hoà (1973, 1992).

Regional Varieties

The regional varieties of Vietnamese are divided into three main types: Northern (e.g., Hanoi), Central (e.g., Huế), and Southern (e.g., Hồ Chí Minh City). Recently, it has been suggested by Ferlus and Nguyễn Tài Căn that a fourth regional area should be added, North-central Vietnam or Area IV (Nghệ An Province), as this area preserves several special features lost elsewhere, cf., below and Alves (2000).

Phonological Forms

Vietnamese of the northern type has six tones, the southern type five, and central/northcentral types five or six, all of which can be traced back to a parent tone system of three columns of *level*, *rising*, and *falling* tones and two rows, *high* and *low*. Haudricourt (1954) proposed that Vietnamese was originally not a tonal language but that tonality arose as a part of the historical development of Vietnamese. In this theory syllable-final consonants caused changes of pitch; rising tones were produced in syllables that formerly ended in -p, -t, -k, -ʔ, whereas falling tones were created in syllables that once ended in -s or -h, and mid-level tones were created when syllables possessed no final consonants to draw the pitch up or down. Haudricourt's famous theory of Vietnamese *tonogenesis* explains how a non-tonal Mon-Khmer language could change its typological features and become tonal. Vietnamese tone categories are also associated with specific voice quality contrasts that accompany each tone, perhaps a residue of its tonogenetic history. Thus the tone called *ngang* demonstrates mid-level with modal voice (tones are notated with the scale-of-five system in which 5 is the highest and 1 is the lowest level, cf. Y. -R. Chao, 1930); *huyền* falls from mid with lax/breathy voice; *sắc* rises sharply from mid with tense voice ending in a glottalized coda; *nặng* falls with increasingly tense voice from early in the syllable to glottal stasis; *hỏi* is a fall-rise tone; *ngã* has a glottal interruption in the center of the syllable, sounding almost as if it were composed of two syllables VʔV, with overall a very high rising pitch, cf., Nguyễn and Edmondson (1997). The

names *ngang*, *huyền*, etc., illustrate the tone they name. See Table 1.

Vietnamese consonants in Hanoi speech distinguish five places of articulation – *labio-dental*, *denti-alveolar* (the *t* series is denti-alveolar initially and apico-postalveolar finally), *palatal*, *velar*, and *glottal*, and several manners of articulation – *voiceless aspirated stops*, *voiceless unaspirated stops*, *preglottalized voiced stops*, *fricatives* (*x* is a lamino-prepalatal narrow grooved fricative), *liquids*, and *nasals*. Compare *Chữ Quốc Ngữ* and IPA values of these consonants in Table 2.

In southern Vietnamese there are some important differences in initials compared to Hanoi. Notably *tr-* and *s-* are retroflexed [tr ʂ] and contrast with *ch-* [tʃ] (with very little friction compared to Hanoi speech) and *x* [s] respectively, *g-* [g], *r-* [r] (with a lot of variation in realization of the *r-*), *v-* [j] (Thompson, 1987: 89) *d-*, *gi-*[j]. As mentioned above, Northcentral Vietnamese has preserved three distinct pronunciations for *d-*, *r-*, and *gi-*. See Table 3.

Vietnamese word structure allows only sequences C₁V(V)C₂, whereby C₁ can be any allowed initial (notice that *p-* cannot be an initial except in words borrowed from French, e.g., *pín* ‘battery’ and *píp* ‘smoking pipe’). The syllable coda C₂ can be *-p̄* *-t̄* *-k̄* *-ʔ* *-m* *-n* *-nh* [ŋ] *-ng* [ŋ]. One noteworthy phonological change in northern speech is engendered by these final consonants. Whenever the velars *-c* or *-ng* follow back rounded vowels *u*, *ô*, or *o*, there is *double closure*, and a velar and labial are simultaneously formed (because these are also accompanied by glottal stop, in reality they are triply closed). The preceding round vowel causes simultaneous assimilatory rounding of [-k -ŋ] to [-k̄p̄ -ŋ̄m̄] in addition to diphthongization of the vowel, e.g., *dùng* ‘to use’

Table 1 Vietnamese tone categories

| | <i>Level</i> | <i>Rising</i> | <i>Falling</i> |
|-------------|------------------|----------------------------|--------------------------|
| <i>High</i> | ngang [ŋaŋ33] | sắc [săk35 ⁵] | hỏi [hôi323] |
| <i>Low</i> | huyền [hwiən 31] | nặng [năŋ21 ⁵] | ngã [ŋa4 ² 5] |

Table 2 Vietnamese consonant system

| | | | |
|---------|-----------------|--------------|------------------|
| ph- [f] | th- [tʰ] | kh- [x] | |
| -p [p̄] | t [t̄] | c, k, q- [k] | |
| | | tr-, ch [tʃ] | |
| b- [ʔb] | đ [ʔd] | | g(h)- [g] or [ɣ] |
| | x-, s- [s] | | h- |
| v- [v] | r-, d-, gi- [z] | | |
| m [m] | n [n] | nh [ŋ] | ng(h) [ŋ] |
| | l- [l] | | |

[z^uŋm³¹] *duc* a suffix [z^uŋkp²¹], *học* ‘study, -ology’ [ha^ukp²¹] and *đông* ‘Vietnamese piastre’ [ʔd^uŋm³¹]. Similarly, whenever the palatals *-ch* or *-nh* follow the unrounded vowels *-i*, *-ê*, or *-a*, then diphthongization occurs as before, but there is no rounding, as all segments are unrounded to begin with, e.g., *minh* ‘clear, bright’ [mi¹ŋ33], *thích* ‘to like’ [thi¹c35¹], *lệnh* ‘order, command’ [l^əŋ²¹], *ếch* ‘frog’ [ɛ¹c35²], *anh* ‘Sir, you, older brother’ [ɔ¹ŋ33] and *thạch* ‘stone’ [th³c21¹].

The rhymes of Vietnamese syllables can have the nuclear vowels: / i iə e ε ɛ: u uΛ ʏ ʏ: a a: u uΛ o: o ɔ: ɔ/. If one assumes that /iə uΛ uΛΛ uΛN/ function as the long versions of /i u u/ u/, then all vowels except /e/ have long and short forms. In Table 4 one sees the possible

combinations of these nuclear vowels with the set of possible codas. Nuclear vowels may occur in open syllables, i.e., with *-ø* coda or in one of the following combinations: *-j* (graphically *-i/-y*), *w* (graphically *-o/-u*), *-m*, *-p*, *-n*, *-t*, *-nh*, *-ch*, *-ng*, *-c*. There are some notable areas where combinations are disallowed. For example, there are no rhymes *ij, *uw, or *ow, palatal coda may combine only with *-a*- and *-i*-, and velars may not combine with high front vowels except /ɛ:/.

Word Category and Constructions

Contrary to some reports, Vietnamese is not an absolutely monosyllabic language, but one with many compounds and reduplicated structures. Compounds demonstrate disyllabic construction and have either been borrowed intact from Chinese (so nouns are right-headed, e.g., *cổ đại* [old-[era_N]_N] ‘antiquity’, *thanh âm* [voice-[sound_N]_N] ‘sound’, and verbs are left-headed *ầu thổ* [v_V vomit]-spit] ‘to vomit’) or are pure Vietnamese creations of Vietnamese or mixed lexical roots, all left-headed *ngũ’o’i Việt* [N_N people]- Viet] ‘Vietnamese people’, *nhà thu’o’ng* [N_N house]-of the injured] ‘hospital’, *làm việc* [v_V do]-work] ‘to work’, except for the group of *father-mother compounds*, which consist mostly of semantically paired things, e.g., *bố mẹ* father-mother ‘parents’, *bàn ghế* table-chair ‘furniture’, *bát đĩa* bowl-plate ‘dishes’, which function as a unit without head. Vietnamese reduplicatives are also very productive, such as *complete reduplicatives* having the same onset and rhymes, *cu’o’i-cu’o’i* ‘laugh a little’, *nói nói* ‘keep talking’, *register change reduplicatives* with the repeated part, be it on the right or left, having opposing

high-low register of the same tone class, e.g., *xẹp* ‘be flattened’ vs. *xẹp-xẹp* ‘be completely flattened’ (with a *sắc* tone syllable being here followed by a *nặng* reduplicant); some have vowel changes in the reduplicant, e.g., *hốc* ‘hole, hollow’ vs. *hốc-hác* ‘be emaciated, gaunt’; some can have changes of onset in the first element and some in the second element as *rộn* ‘be noisy’ vs. *chộn-rộn* ‘be agitated’ and *xẹp* ‘be flattened’ vs. *xẹp-lẹp* ‘be completely flattened’, (Thompson, 1987).

Regarding word categories, Vietnamese has the following: nouns *Lê Quý Đôn* 18th century author, *học sinh* ‘student’, *gà* ‘chicken’; classifiers *hai con chó* two-CLS-dog ‘two dogs’, *các cái bàn* plural-CLStable ‘tables’; locatives *ngoài* ‘outside’, *bắc* ‘north’; numerals *hai* ‘two’, *ba* ‘three’; verbs *đi* ‘to go, walk’, *nói* ‘to talk’; stative verbs (adjectives) *tốt* ‘good’, *mới* ‘new’; and pronouns. It is noteworthy for its rich and complex set of pronouns. There are personal pronouns *tôi* ‘I, me (with modesty, servant)’, *ta* ‘I (emphatic), one’, *tao* ‘I (arrogant)’, *mày, mi, bay* ‘you (arrogant)’, and *nó* ‘it (animal)’ or ‘he (for children or contemptible persons, criminals)’. The term *mình*, meaning ‘body’ is used for ‘you (intimate)’. The term *chúng* ‘group of animate objects’ can be combined with the above to make plurals such as *chúng tôi* ‘we-exclusive’ and *chúng ta* ‘we-inclusive’. In public discourse, kinship names are often used, e.g., *chị* ‘older sister, you-*Ms.*’, *bà* ‘grandmother, old woman, you-Madame’, *anh* ‘older brother you-Sir’, *cháu* ‘niece/nephew, grandchild, you-Young Person’, *cô* ‘father’s sister, you-*Ms.*’ (One speaker from Hanoi said that *cô* was obligatory to address one’s female teachers.) These can become like 3rd person pronouns by adding *ấy*, e.g., *anh ấy* ‘he, that Sir (a contemporary)’, *chị ấy* ‘she, that Ms. (a contemporary)’, but there is also *nó* ‘he (deprecating)’ and *họ* ‘they’. Kinship names also have features of anaphoric nouns, they contain additional information about gender and degree of familiarity, and they function differently in tracking participants in discourse.

Phrases and Sentences

Phrases are mostly left-headed, e.g., attributive adjectives follow heads, *đồng Việt Nam* piaster-Vietnam ‘the Vietnamese piaster’, complements follow heads, *ăn cơm* eat-rice ‘to eat (food)’, whereas adverb-like elements can appear to the left or right of the head, *rất đắt* very-expensive ‘very expensive’ but *đắt lắm* expensive-very ‘very expensive’.

Sentences tend to have known, presupposed information at the beginning and new, asserted information at the end. One manifestation of this principle is that

after introducing a referent, a close-knit group of clauses or a topic chain follows whose subjects are PRO, the zero pronoun. For example in the famous story about Bần with no overt pronouns, one finds:

Bần chỉ là một anh nghèo xác, e_i ngày ngày lang thang khắp xóm này khác e_i xin ăn. Bần_i just be a person poor, e_i day-day wandered all over hamlet this different e_i beg eat ‘Bần was a poor fellow [who] day after day wandered about from one place to another begging for food.’

Sources and Conclusion

There are several worthy examples of grammars and dictionaries of Vietnamese. For the English speaker, there is Nguyễn Đình Hoà (1997) grammar, which is richly exemplified, but reflects the spelling and sometimes the usage before 1975. Thompson (1965, 1987), written in the 1960s, also has a lot of examples, but employs a structuralist model of grammar that might be difficult for some to understand. Some of the examples are also no longer acceptable to contemporary speakers. Cao Xuân Hạo (2003) in an 800-page collection of his essays has discussed Vietnamese from the phonological, grammatical, and semantic perspectives. His bibliography includes many important scholars from the U.S. western Europe, and Russia, such as Bloomfield, Bybee, Chao Yuen Ren, Chomsky, Ducrot, McCawley *et al.*, and a glossary of linguistic terms with English definitions. Notable dictionaries are those by Nguyễn Đình Hoà in many editions, Bùi Phụng (1995) in many editions, and Viện Ngôn Ngữ Học (2000), the model for the contemporary language and the standard-setting dictionary from the Linguistics Institute of Vietnam.

Despite the obvious influences of contact, Vietnamese shows a surprising number of unique features (e.g., tense markers for past and future, some right- and some left-headed typological features), arguably the richest set of pronouns in East and Southeast Asia as well as properties typical of the linguistic area (e.g., a fully developed tone-voice quality sound system, a sharply reduced coda inventory, four-syllable elaborate expressions, and a numeral classifier system). Vietnamese is thus ultimately not very similar to Mon-Khmer, cf., Haudricourt (1953), and is certainly not similar to Sinitic, but a language perhaps analogous in its position to Modern English in the sense that it too has lost many features found in related languages. Yet, despite borrowing and shift influences, Vietnamese, like English, remains an independent and distinctive language in its own right.

Vurës

C Hyslop, La Trobe University, Bundoora,
VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

Vurës, the name currently preferred by the speakers of the language, is referred to in Ethnologue as the Vetumboso or Vures dialect of Mosina. Mosina is a distinct language, now nearing extinction, with approximately eight speakers residing in the village of the same name, in the southeast of Vanua Lava Island, the Banks group of islands, northern Vanuatu. Vurës is now the dominant language spoken on the island, with upward of 1000 speakers. It is spoken predominantly in the villages of Vētuboso, Wasaga, and Kērēbētia and in smaller surrounding hamlets in the southwest of Vanua Lava. Like all languages of Vanuatu, Vurës is a member of the Oceanic subgroup of the Austronesian family. Within Vanuatu, it belongs to the Northeast Vanuatu-Banks Islands branch of the Northern Vanuatu linkage.

The languages of Northern Vanuatu tend to be fairly conservative Oceanic languages. Vurës has a number of features that are representative of the subgroup and others that are more distinctive. There are 15 consonants and nine vowels in the phonemic inventory, the number of vowels being quite high relative to other Oceanic languages. Notable features of the consonant inventory that are frequently observed in Oceanic languages are prenasalized voiced stops and a labialized labio-velar stop and nasal.

The language is nominative-accusative, with the grammatical relations subject and object being distinguished purely by AVO/SV word order. There is no marking of the subject and object within the verb phrase, which is unusual for an Oceanic language. Oblique arguments are mainly marked by prepositions and occur at the periphery of the clause. The language is both agglutinative and synthetic; however, compared to other Oceanic languages, there is not a great deal of morphology. There is very little

inflectional morphology; aspect and negative polarity are marked by prefixes on the verb and by some particles. There are no tense distinctions. Derivational morphology is also limited, which is linked to the fact that many words are precategorial. This means that they can occur in their underived form as members of more than one word class; in particular, many roots occur as nouns and verbs. Further, many verbs are ambitransitive.

The marking of possession is a complex area of the grammar, a characteristic common to Oceanic languages. For nouns that are inalienably possessed, such as kin terms, body parts, and intimate possessions, the possessor is marked directly on the noun as a suffix. For other items, the possessor is marked on a relational classifier that indicates the function that the item has for the possessor. In Vurës there are six classifiers that mark the possessed item as food, drink, transport, domesticated plants and animals, clothing, or a general default category.

Complex predicates are commonly expressed in Vurës by verb serialization. A serial verb construction can combine verbs to express varied meanings and functions, such as causatives, abilitatives, directionals, and aspectual functions, and some less transparent functions. For example the verb *gial* 'to lie, pretend' can serialize with another verb to express the meaning of pretending to perform the action of the other verb.

W

Wa

J Watkins, School of Oriental and African Studies,
London, UK

© 2006 Elsevier Ltd. All rights reserved.

The variety of Wa described here is known as Paraok/ pəraək/ by the people who speak it, and is widely recognized as a standard form of the language. The scope of the name ‘Wa’ is complex, but it is the most inclusive and current among the many names used to refer to the speakers of Wa languages and also corresponds to the terms 佤 *Wǎ* in Chinese and in “ဝ” /wǎ/ in Burmese. Wa encompasses a cluster of some 40 dialects belonging to the Waic subgroup of the Palaungic branch of Northern Mon–Khmer languages and is spoken by up to about one million people living between the Salween and Mekhong rivers, an area straddling the border between northeastern Myanmar (Burma) and China’s southwestern Yunnan province. About two-thirds of the Wa-speaking population live on the Burmese side of the border and one-third on the Chinese side; most Wa are bilingual in Burmese or Chinese, respectively.

The first Wa orthography intended for popular use was developed in the 1930s by the Baptist missionary

Vincent M. Young, whose translation of the New Testament was published in the 1930s. Orthographies devised for Wa have used the Roman alphabet, sometimes with certain modifications. Young’s orthography was ambiguous and inconsistent in a number of ways, for instance, by failing to represent the register contrast, final glottal consonants, and voiced/sonorants. It has been improved in recent years, however, by incorporating certain features of the phonologically faithful orthography developed by Chinese anthropologist-linguists in the 1950s, which is rather different in design. The most widely encountered orthographies may be compared in **Table 1**.

The syllable-initial consonants of Wa are set out in **Table 2**. Wa makes a 4-way voicing contrast in initial stops at 4 places of articulation, and has a range of breathy-aspirated sonorants. Complex initials are restricted to labial or velar stop + /l/ or /r/; final consonants are restricted to /p t c k/, nasals, /ʔ/, and /h/.

In Wa, as in other Mon–Khmer languages, the vowel inventory (**Table 3**) is effectively doubled because each vowel can occur in either of two registers, ‘clear’ and ‘breathy,’ analogous to the ‘head’ and

'chest' registers of Cambodian (Central Khmer). The register contrast in Wa, as in Mon–Khmer generally, has a complex of phonetic correlates, including fundamental frequency, vowel quality, phonation type, and vowel duration. The blend of these in any individual speaker's production of the register complex may vary. The register contrast cooccurs with final laryngeal consonants, as illustrated by the set of six words in **Table 4**.

The Wa system of personal pronouns (**Table 5**) retains dual number and contrasts inclusive and exclusive second-person pronouns.

In Wa, the Mon–Khmer morphological prefixation system has all but disappeared, leaving only a few nonproductive semisyllabic prefixes – of which by far the most common is /sə/ – and sound alternations that cover a broad, ill-defined range of functions, illustrated in **Table 6**.

Two characteristics of Wa syntax are that modifiers follow what they modify, as do relative clauses: thus 'the letter that I wrote,' from **Table 1**, is expressed as *lai pət ʔɿʔ* 'letter [write I]'. Secondly, VERB SUBJECT OBJECT word order is commonly observed: 'you read it' may be translated *ʔhək maiʔ nɔh* 'read you it,' though

SUBJECT OBJECT VERB word order is also possible. Two sentences in Wa are shown in (1) and (2):

- (1) hoc kɛʔ tin yɯh tiʔ
come 2PL here do what?
What did the two of them come here for?
- (2) hoc tiʔ sək puʔ ʔɿʔ
come SUBORD search younger. 1SG
brother
They came to see my younger brother.

Wa is an isolating language, adept in the formation of periphrastic compounds. There has been extensive borrowing from Shan, and locally from Chinese and Burmese in areas where those languages are spoken. Loaned vocabulary is frequently supported by a generic Wa word, as in **Table 7**.

Functional literacy in Wa is very low. Wa speakers are much more likely to be literate in the national language of the country in which they live, although some villages may organize grassroots schooling, typically undertaken in a Christian context, and some schools in Wa-speaking China provide, in theory, five years of Wa-language education. Government schools in Burma must use only Burmese.

Table 3 Wa vowels

| | Monophthongs | | | Polyphthongs | | | |

Wakashan

J Stonham, University of Newcastle, Newcastle upon Tyne, UK

© 2006 Elsevier Ltd. All rights reserved.

Pilling (1894) attributed the term 'Wakashan' to Captain James Cook's observations in Nootka Sound in 1778 wherein he stated: "I would call them Wakashians, from the word *wakash*, which was very frequently in their mouths," (Cook, 1821: 308). Gallatin (in Pilling, 1894) first used the term to designate the Wakashan family and Boas (1890) solidified the boundaries of the family.

The Wakashan family is spread over Vancouver Island and the adjoining areas of the mainland, including northwestern Washington state and the central British Columbia coast.

Languages

The languages of the Wakashan family may be divided into two major subgroups, a northern and a southern group. The Northern group consists of four main languages: Haisla, Oowekyala and Heiltsuk (mutually intelligible), and Kwakwala (Kwakiutl), located on northeastern Vancouver Island and adjacent parts of the mainland north as far as Kitimat, British Columbia. Within the Northern branch,

Kwakwala is the best documented, with an early grammar by Hall (1888) and another by Boas (1900). The most northerly language in the family is Haisla, with at least two dialects: Henaksiala and Haisla proper. Oowekyala is spoken by only a handful of people in the area of Rivers Inlet and is to a large extent mutually intelligible with Heiltsuk. Heiltsuk also has two dialects, spoken in Bella Bella and Klemtu, and there is some early work on it by Boas.

The Southern branch of Wakashan consists of three main languages: Nuuchahnulth (Nootka), Ditidaht (Nitinat), and Makah, located on the west coast of Vancouver Island and the tip of northwestern Washington state. Within each language there are various, mutually intelligible dialects. Nuuchahnulth is the most widely spoken of this group, constituting a chain of dialects ranging the length of the west coast of Vancouver Island from Brookes Peninsula to Barkley Sound. Ditidaht constitutes the southernmost Wakashan language on Vancouver Island. It has a close relationship with both the more northerly Nuuchahnulth and the more southerly Makah, which is the only Wakashan language spoken outside of Canada, in Washington state.

Recent estimates of the number of speakers of Wakashan languages vary from approximately 600 to 1200 speakers for all languages (Statistics Canada,

2003; Cook and Howe, 2004). (By comparison, there are estimated to be 1185 speakers of Gaelic languages in Canada.) Geographically, the Wakashan languages are adjacent to several other language families, including Athabaskan in the north, Chemakuan in the south, and Salish throughout the area.

Proto-Wakashan

Jacobsen (1979b) located the original home of the family on Vancouver Island or adjacent parts of the mainland, from which it has spread north and south. Swadesh (1953) proposed the Proto-Wakashan phoneme inventory shown in **Table 1**. Sapir (1921) suggested that Wakashan constituted one member, along with Salish and Chemakuan, of a Mosan subgroup, which, together with Kutenai and Algonquian-Ritwan, made up a larger superfamily. Swadesh (1962) noted similarities between Wakashan and Eskimo-Aleut, but little has been done to further any of this research recently (see **Areal Linguistics**). For a summary of work on the comparative-historical study of Wakashan, see Jacobsen (1979b).

Phonology

The phonological inventory of all Wakashan languages consists of a large number of consonant phonemes and a relatively small number of vowel phonemes, usually with a vowel length distinction. In the Northern group there is a three-way distinction among obstruents, involving lax, glottalized, and voiced stops, whereas in the Southern branch there is only a lax versus glottalized distinction, with voiced stop reflexes of the original nasal phonemes appearing in Ditidaht and Makah.

Northern Wakashan has a long/short opposition in the vowel system, whereas the Southern group displays a three-way phonemic length distinction that is realized as a two-way contrast on the surface. The phonemic distinction is due to a third category of

'variable-length' vowels that are long in the first two syllables of the word but short elsewhere, as in *-naʔk* 'have' in *tučnaak* 'have a wife' versus *t'ańanak* 'have a child.' Within Northern Wakashan, Oowekyala is purported to have glottalized vowels, which may appear only in the first syllable of a word. Howe (2000) provided minimal pairs such as *ma'təla* 'two people working together' versus *matəla* 'swimming' and *ʔa's* 'animal fat, oil, grease, blubber' vs. *ʔas* 'far out at sea or seaward.'

In Northern Wakashan, the domain of primary stress assignment is the entire word, with stress assigned to the first heavy syllable or to the final vowel if no heavy syllable is encountered. In Southern Wakashan, the domain of primary stress is the first two syllables, with weight contributing to the placement. It should be noted that, although most Wakashan languages employ stress assignment, Kortland (1975) observed that Heiltsuk makes tonal distinctions instead.

Syllable structure is similar for all the languages, allowing complex codas but simple onsets. Boas (1947) stated for Kwakwala that "consonantic clusters do not occur in initial position. Monosyllabic stems are of the types CVC, CVCC, CVVC, CVVCC." Southern Wakashan likewise involves an obligatorily filled onset (one and only one consonant) and potentially complex codas with up to three, or even four, consonants. Oowekyala appears to exhibit the most extreme cases of consonant clusters, according to Howe (2000).

The processes of glottalization ('hardening') and lenition ('softening') are quite unique in Wakashan and are invariably triggered by the attachment of a suffix to a base ending in a potential candidate for the change. In Southern Wakashan, glottalization affects both obstruents and sonorants, changing stops and affricates to their glottalized counterparts, fricatives to laryngealized glides, and sonorants to their laryngealized counterparts. Lenition, which affects only fricatives in Southern Wakashan, converts them to either /y/ or /w/, depending on whether they are labialized or not. These processes are more complex in Northern Wakashan. Boas (1947) provided the examples (somewhat modified for this presentation) from Kwakwala (**Table 2**).

One final phonological process worth noting is vowel epenthesis in Makah. In this language (and to some extent in the neighboring Ditidaht), there is a co-occurrence restriction against a voiced or glottalized consonant appearing in the onset of the second syllable when the coda of the first syllable is filled. The resulting cluster is broken up by inserting a lengthened copy of the vowel of the first syllable between the two consonants. Compare the Nuuchahnulth forms, *čaqmis* 'tree bark' and *čusyak* 'shovel'

Table 2 Kwakwala lenition and glottalization^a

| Base | | Lenition | | Glottalization | |
|------|---------------|---------------------|-----------------------|----------------|-------------------|
| eep | 'to pinch' | eeb.ayu | 'dice' | eep.id | 'begin to pinch' |
| wat | 'to lead' | wad.ək ^o | 'led' | wat'.eeneʔ | 'act of leading' |
| pəs | 'to flatten' | pəy.aayu | 'means of flattening' | pəapəc.a | 'try to flatten' |
| məx | 'to strike' | mən.əce | 'drum' | maaməñ.a | 'ready to strike' |
| čuut | 'to be black' | čuul.atu | 'black-eared' | čuul'.əmyu | 'black-cheeked' |

^a/./ indicates morpheme boundary.

Source: Boas (1947).

with the following Makah examples (from Davidson, 2002).

- (1a) čaqaabis
 čaq-bis
 bark-collectivity.of
 'tree bark'
- (1b) čusuuyak
 čus-yak
 dig-thing.for
 'shovel'

Other common phonological processes include labialization of back consonants, delabialization, and various forms of coalescence, syncope, and epenthesis.

Morphology

These languages are all highly polysynthetic, with complex morphophonemics, and rely heavily on suffixation. Reduplication is the only productive morphological operation that results in a preposed element. There are large numbers of both derivational and inflectional suffixes, but only one root may appear in each word, resulting in an absence of lexical compounding of the usual sort.

Lexical suffixes in Wakashan, unlike Salish, run the gamut of possibilities, including verbal, nominal, adjectival, locative, and adverbial functions. Perhaps the most interesting are the verbal morphemes, which interact with arguments within the sentence, resulting in their combination into a complex predicate, as illustrated in Table 3.

The last example in Table 3 illustrates another property of Wakashan suffixes: the ability of the suffix to trigger various effects on the stem to which they attach, including reduplication and vowel lengthening. The following examples from Makah illustrate these triggers (adapted from Davidson, 2002, where [L] indicates lengthening of the first vowel).

- (2a) hihitaʔsʔiq
 hita-xsa[R]-'iq
 empty.root-in.bushes-DET
 'in the bushes'

Table 3 Verbal suffixes in Kwakwala

| Verb suffix | Words |
|------------------------------|--|
| -(g)ila 'to make' | χeenagila 'to make oil' χaawayuq ^w ila 'to make a salmon weir' |
| -amāla 'to quarrel about' | suupaamāla 'to quarrel over an axe' kəlk ^w amāla 'to quarrel over a digging stick' |
| -(g)əʔala[R] 'to wear' | haahaxagəʔala 'to wear a shirt' |

Source: Boas (1947). [R] indicates reduplication.

Table 4 Uses of reduplication in Kwakwala

| | | |
|-----------------------------|---|---|
| Distributive/ plural | g ^y uk 'house' | g ^y ig ^y uk ^w 'houses' |
| Diminutive | ñala 'day' t'eesəm 'stone' bəg ^w 'man' | ñəñala 'days' t'at'edzəm 'small stone' baabagəm 'boy' |
| Repetitive | meexa 'to sleep' hanʔa 'to shoot' | meemexa 'to sleep repeatedly' hanʔanʔa 'to shoot repeatedly' |
| With derivational suffix | -(g)əʔala[R] 'to wear' | haahaxagəʔala 'to wear a shirt' |

Source: Boas (1947).

- (2b) yuuxʔapaal k^wisii
 yuxʔ-əpi[L]-' aχ-'i k^wisii
 float-in air-TEMP=3.SING.IND snow
 'snow is blowing in the air'

Reduplication is a highly productive process used to indicate a number of distinct grammatical categories. As shown in Table 4, it is employed in derivation, aspect, and inflection as a marker of the distributive or plural, diminutive, and repetition or iteration and as a concomitant of certain derivational suffixes.

Wakashan also employs a set of classifiers that categorize nouns for the purpose of enumerating

Table 5 Kwakwala classifiers

| Number | | /-uk ^o / 'person' | /-sgem/ 'round object' | /-x̩.a/ 'dish, spoon' |
|--------|---------|------------------------------|------------------------|---------------------------|
| n̩am | 'one' | n̩amuk ^o | n̩amsgem | n̩aməx̩.a |
| m̩al | 'two' | m̩al'uk ^o | m̩al'tsəm | m̩aləx̩.a |
| yud | 'three' | yuduk ^o | yuduxsəm | yudəx̩ ^o əx̩.a |

Source: Boas (1947).

and qualifying, as well as in a pronominal function, as shown by the examples from Kwakwala in Table 5.

The various combinations of suffixes may result in rather long and complex words, as demonstrated by the examples from Nuuchahnulth in (3) (from Sapir and Swadesh, 1939. NOW 'contemporaneous,' SW 'switch reference,' CLS 'classifier').

- (3a) ʔuuq̩n̩uk^w aχ'atquuč
 ʔu -'aq̩χ -n̩uk^w -'aχ -'at -quuč

 -'it̩ -m̩inh̩ -ʔaaq̩χ -(m)ɛʔicuu
 -onfloor -PL -INTENT-2PL.IND
 'You will carry two dollars on your feet' (Source: Sapir and Swadesh, 1955)

Syntax

Basic word order for Wakashan languages is, in general, head-initial, with VSO being the most common order. The degree to which individual languages allow the transposition of subjects and objects is one area of variation within the family. There is no case marking on nominals, but in some contexts complex prepositions may be used to indicate the grammatical role of arguments, as in the following example from Ditidaht (adapted from Klokeid, 1978).

- (4) čuq^wšičʔa ʔuχ^w John ʔuuquq^w Bill
 hit NOM John ACC Bill
 'John hit Bill'

Within the nominal phrase, quantifiers precede adjectives which, in turn, precede the head noun, as exemplified by the following examples from Nuuchahnulth (Rose, 1981). Relative clauses follow the head noun, as in (5b).

- (5a) ʔiih̩ saya nis̩m̩a
 very distant land
 'a really distant land'
- (5b) ha χutaay [yaaq̩h̩w̩at̩ naq̩ Bill]
 DET knife that.used Bill
 'the knife that Bill used'

There are well-developed person-number inflectional paradigms that typically appear after the first position in the sentence in clitic-like fashion. Boas (1900: 715) remarked on "... the tendency of adverbs and auxiliary verbs to take the subjective ending of the verb, while the object remains connected with the verb itself. *k̩ééʔsən d̩úuquaq* not-I see-him, shows the characteristic arrangement of sentences of this kind."

Possession associated with the arguments of the clause is sometimes marked on the predicate, as shown in the examples in (6) from Kwakwala (Boas, 1900).

- (6a) n̩eekən̩ ɡənəm
 say.my wife
 'my wife said'
- (6b) n̩eekexən̩ ɡənəm
 say.he.my wife
 'he said to my wife'
- (6c) n̩eekexees ɡənəm
 say.he.his wife
 'he said to his (own)
 wife' (Boas, 1900)

Tense markers exhibit the special Wakashan characteristic of appearing on both nouns and verbs, leading to the common conclusion that there are no category distinctions in these languages (however, cf. Jacobsen, 1979a).

A form of syntactic compounding exists, at least in some members of the family, as illustrated by the following examples from Nuuchahnulth.

- (7a) ʔiih̩ʔii [yačmuut̩ χaq̩mis]
 the big bladder oil
 'the large oil bladder' (Sapir and Swadesh, 1939)
- (7b) [muunaa̩ n̩iiq̩n̩iiq̩ay̩ak̩]
 machine sew -tool
 'a sewing machine' (Sapir and Swadesh, 1955)

Further Reading

For further information on Wakashan, the reader is referred to the references appended to this article, in particular the discussion in Boas (1947), Davidson (2002), Howe (2000), Jacobsen (1979a, 1979b), Lincoln and Rath (1980, 1986), and Stonham (1999, 2004).

Wambaya

R Nordlinger, University of Melbourne, Melbourne, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Wambaya is a non-Pama–Nyungan language of northern Australia (of the Mirndi group), originally spoken in the Barkly Tablelands region of the Northern Territory. The Wambaya people suffered greatly from the invasion of their land, their subsequent removal from their traditional country, and the dispersal of their

community. As a result of these and other factors, the Wambaya language has now almost disappeared. There are only a handful of (semi-)speakers remaining, most of whom live in the towns of Tennant Creek, Elliott, and Borroloola. Wambaya is closely related to two further dialects – Gudanji and Binbinka. Gudanji is in much the same state as Wambaya with only a handful of (semifluent) speakers left; and there are no longer any remaining speakers of Binbinka.

Like all Australian languages, Wambaya was not traditionally written, and so the earliest records we have of the language are those collected by white researchers since the early 20th century. Some lexical

items were recorded by Mathews (1900, 1908) and by Spencer and Gillen (1904), largely concerning the kinship system. The first detailed grammatical information for Wambaya is found in the field notes recorded by Ken Hale in 1959 (Hale, 1959, 1960) and is continued in Neil Chadwick's work on the whole Barkly language group (including also Jingulu [Djingili] and Ngarnka [Ngarndji]) dating from the 1970s (Chadwick, 1978, 1979, 1984, 1997). My own fieldwork on the language began in 1991 and has so far resulted in the publication of a grammar of Wambaya (Nordlinger, 1998a), the development of a dictionary and learner's guide (Nordlinger, 1998b, 1998c), and a number of articles (Nordlinger, 1995, 2001; Nordlinger and Bresnan, 1996; Green and Nordlinger, 2004). The grammatical features discussed in this brief article are all discussed and exemplified in greater detail in Nordlinger (1998a).

Phonology

Phonologically, Wambaya is a typical Australian language, with five places of articulation for stops, including two apical series (apico-alveolar and retroflex) and one laminal series. There is no voicing contrast. There is a nasal corresponding to each stop articulation, and three laterals (in the nonperipheral places of articulation). There are three vowel phonemes, and no productive length distinction. The phoneme inventory and the orthographic symbols corresponding to each phoneme are provided in Table 1.

All Wambaya words are minimally disyllabic and virtually always vowel-final. (The one exception is the auxiliary, see below, which can end in a consonant if it contains one of three nasal-final affixes: *-any* 'direction away, past tense,' *-amany* 'direction towards, past tense,' or *-n* 'progressive aspect'.) Primary stress is generally on the first syllable of the word. Words can begin with a vowel (as in *alaji* 'boy'), or a consonant (*daguma* 'hit,' *juwa* 'man,' *ngajbi* 'see'). There are no words beginning with the consonants *r* [ɹ], *rr* [ɹr], *ly* [ɬ] and further, as is common among Australian languages, the distinction between the two

apical series is neutralized in initial position. Initial apicals are all represented orthographically as apico-alveolars (*d*, *n*, *l*). Biconsonantal clusters are common, but only word-medially. Such clusters usually contain an apical or laminal consonant followed by a labial or dorsal consonant (e.g., *anmurru* 'cuddle,' *bardgu* 'fall,' *marrgulu* 'egg,' *ngajbi* 'see,' *manganyma* 'tucker, nonmeat food'), but other combinations are possible also (*bungmaji* 'old man,' *wugbardi* 'cook'). There is one triconsonantal cluster *rrgb* (*lurrgbanyi* 'grab,' *gurrgharra* 'stare').

A brief discourse in the language written in the conventional orthography is provided in (1). This example illustrates many of the grammatical properties to be discussed below.

- (1) Yarru ngurr-any gurdi-nmanji ngaj-barda.
go.NF 1PL.INC-PST.AWAY bush.IV.OBL-ALL see-INF
 Gangga ngurr-amany bangarnigadi.
return.NF 1PL.INC-PST.TWDS this way
 Gurijba gi-n mirra
good.IV.NOM 3SG.S.PRES-PROG sit.NF
 ngarrga maga.
my.IV.NOM house.IV.NOM
 'We went to the bush to have a look (at my house).
 Then we came back this way. My house is fine.'

Morphology

Wambaya, being one of the southernmost non-Pama-Nyungan languages, is typologically atypical in having lost virtually all prefixing morphology (see Nordlinger, 1998a; Green and Nordlinger, 2004; Harvey *et al.*, to appear for discussion). All productive morphology is suffixing. Like many other Australian languages, Wambaya has extensive case and agreement morphology – all elements of an NP must show concord in gender, number, and case – and 'free' (i.e., pragmatically determined) word order.

The two open word classes are verbs and nominals. Concepts translated into European languages as adjectives are split across these two classes. For example, *bulyingi* 'small,' *bugayi* 'big,' *gurijibi* 'good,' and *bagjibi* 'bad' are nominals, while *baliji* 'be

Table 1 Wambaya phonemes

| Consonants | Bilab. | Apico-alv. | Apico-postalv. (retroflex) | Lamino-palatal | Velar |
|------------|-----------------|-----------------|----------------------------|----------------|--------|
| Stop | b (b) | d (d) | ɖ (rd) | ʃ (j) | g (g) |
| Nasal | m (m) | n (n) | ɳ (rn) | ɲ (ny) | ŋ (ng) |
| Lateral | | l (l) | ɭ (rl) | ʎ (ly) | |
| Tap/Trill | | ɽ/r (rr) | | | |
| Semivowel | w (w) | | ɹ (r) | j (y) | |
| Vowels | i (i) (i: (ii)) | | u (u) | | |
| | | a (a) (a: (aa)) | | | |

hungry,’ *gurda* ‘be sick,’ and *laji* ‘be quiet’ are intransitive verbs. Verbs are characterized by the fact that they must always cooccur with the auxiliary (see below), which carries subject/object agreement information and tense/aspect/mood for the clause. Verbs have only a small amount of inflectional morphology, contrasting future/imperative, and nonfuture (unmarked) forms. This lack of morphology appears to result from the fact that these are historically derived from uninflected coverbs, with the synchronic auxiliary being the original inflected main verb (see Green and Nordlinger, 2004 and below for discussion). There are two inflectional classes for verbs, membership of which is phonologically conditioned. Vowel-final verb stems belong to the J-class of verbs, consonant-final verb stems belong to the Ø-class of verbs (and there are, of course, a dozen or so irregular verbs that don’t follow the pattern of either class). These classes are distinguished by the fact that in the J-class, there is a thematic *-j-* added before any verbal affixes, while there is no thematic consonant in the Ø-class. The two classes also have different nonfuture tense inflections. Examples of the two paradigms are:

- (2) *daguma-* ‘hit’ (J-class): *daguma* (nonfuture),
daguma-j-ba (future/imperative), *daguma-j-*
barda (infinitive)
- (3) *gulug-* ‘sleep’ (Ø-class): *gulug-bi* (nonfuture),
gulug-ba (future/imperative), *gulug-barda*
(infinitive)

In contrast to verbs, nominals have a large amount of morphology. As is relatively common among northern Australian languages, there are four genders – masculine (class I), feminine (class II), vegetable (class III) (including nonmeat food and some body parts), and neuter (class IV) (residue). These genders are marked on nominals and their modifiers by suffixes, and are marked on demonstratives by cognate prefixes (vestiges of the earlier prefixing system, see Green and Nordlinger, 2004 and Harvey *et al.*, to appear for discussion). Example (1) above shows concord with adjectives (*gurijba* ‘good.IV’) and possessive pronouns (*ngarrga* ‘my.IV’). That these forms are truly agreeing with the head nominal *barrawu* ‘house’ can be shown by contrast with the following example in which they are agreeing instead with a class I nominal *janji* ‘dog.’

- (4) *yini ngarri janji gurijbi*
this.I my.I dog.I good.I
‘this is my good dog’

Nominals are also inflected for number – dual and plural – although since the unmarked nominal can have singular, dual, or plural interpretations, this inflection is optional. Pronouns (a subclass of nominals)

Table 2 Wambaya core case system

| | A | S | O |
|----------|----------|------------|------------|
| Nominals | Ergative | Nominative | Accusative |
| Pronouns | Ergative | Nominative | Accusative |

distinguish singular, dual, and plural numbers and make an inclusive/exclusive distinction in the 1st person nonsingular.

Nominals are obligatorily inflected for case. Wambaya is what has been called a ‘split-ergative’ language. Nominals inflect according to an ergative/absolutive distinction, while pronouns inflect largely on a nominative/accusative pattern. We can, therefore, distinguish three distinct case contrasts, as in **Table 2**, where A stands for ‘transitive subject,’ S for ‘intransitive subject,’ and O for ‘transitive object.’ In the following table, the shading indicates homophony between forms; thus, nominals have homophonous nominative and accusative forms, while pronouns have homophonous ergative and nominative forms.

As well as the three core cases shown in **Table 2**, there are nine further cases in Wambaya, including: dative, ablative, allative, comitative, genitive, proprietive, privative, perlativ, causal, and originative. The ergative case additionally covers locative and instrumental functions. Gender markers also distinguish case, having one form before cases with zero realizations (i.e., the nominative and the accusative), and another form (called the ‘oblique’ form) before all other cases. For example, *jan-ji* ‘dog-I.NOM’ vs. *jan-yi-ni* ‘dog-I.OBL-ERG’; *guji-nya* ‘mother-II.NOM’ vs. *guji-ga-nka* ‘mother-II.OBL-DAT’; *mangany-ma* ‘food-III.NOM’ vs. *mangany-mi-nka* ‘food-III.OBL-DAT.’

All verb-headed clauses in Wambaya must contain a grammatical auxiliary containing subject and object cross-referencing bound pronouns and clausal tense/aspect/mood information. While word order is grammatically free in Wambaya for the most part, the auxiliary is unusual in having a fixed position: it must always occur in second position in the clause (after the first constituent, which may be a single word or a complex NP). The auxiliary appears to have derived from a fully inflecting verb with pronominal agreement prefixes and tense/aspect/mood suffixes. An original main verb–coverb structure (as is common in other northern Australian languages, see McGregor, 2002), has become an auxiliary-verb structure in Wambaya, with the auxiliary retaining only the grammatical information of the original main verb, and the original coverb now contributing all lexical meaning. Remnants of an original main verb are found in the directional/tense

Warlpiri

R Hoogenraad, Alice Springs, NT, Australia

© 2006 Elsevier Ltd. All rights reserved.

Warlpiri is a Pama-Nyungan language of the Ngumbin-Yapa subgroup (see McConvell and Laughren, 2004) spoken by some 3000 *Yapa* 'people' (typically Warlpiri people). The Warlpiri heartland is the Tanami Desert to the northwest of Alice Springs in Australia's Northern Territory, but the Warlpiri-speaking population now lives mainly in four communities around the margins of this area: Lajamanu, Nyirripi, Yurntumu, and Wirliyajarrayi. There are also sizable populations in Katherine, Tennant Creek and Alice Springs, and in Aboriginal communities around the Warlpiri area. Warlpiri is also used over a larger area as a lingua franca – possibly up to 1000 Aboriginal people speak Warlpiri as a second language.

Warlpiri had seven dialects, which are now being reduced to four communalects: Yurntumu/Nyirripi, Lajamanu, Wirliyajarrayi, and Wakirti Warlpiri (Alekenge and Tennant Creek).

All the neighboring languages belong to the Pama-Nyungan family: Ngumbin-Yapa subgroup (Warlpiri, Ngardi, Jaru, Nyininy, Gurindji, Mudburra, Warlmanpa), Warumungu, Western Desert group (Pintupi Luritja, Pintupi, Kukatja), Arandic Group (Alyawarr, Kaytetye, Central Anmatyerr). Though there are significant differences between them, they share many of their core structural and sociolinguistic features.

Warlpiri Grammar

Ken Hale was Warlpiri's 'recording angel,' starting in 1959 (see the bibliography in Simpson *et al.*, 2001). There is a learner's guide (Laughren *et al.*, 1996), and good overviews are provided by Nash (1986), Hale *et al.* (1995), Simpson (1991), and the collection of papers in Swartz (1982a).

A Warlpiri encyclopedic dictionary is in preparation: the database currently has over 9500 entries. Hale (1995) is a simple dictionary with nearly 2000 entries, and has an appendix with a concise grammatical inventory (as has Hale *et al.*, 1995).

Phonology

Table 1 shows the consonant phonemes in the standard orthography in use since 1974. The contrast between postalveolar stop *rt* and flap *rd* is only allophonic in eastern dialects: Wirliyajarrayi and Wakirti Warlpiri.

There are three vowels, *i*, *u*, and *a*. High vowels *u* and *i* harmonize with adjacent high vowels across morpheme boundaries: progressive in nominals, *wati-ngki* man-ERG, *kurdu-ngku* child-ERG, but regressive in verbs, *kipi-rni* winnow-PRES, *kupu-rnu* winnow-PAST. The low vowel *a* blocks vowel harmony: *kirlilkirlilpa-rlu* galah-ERG; *yirra-rni* put-PRES, *yirra-rnu* put-PAST. A syllable may have one 'short' vowel or a sequence of two identical vowels, e.g., *ngurrpa* 'ignorant of,' *nguurrrpa* 'windpipe.'

The Word

Warlpiri words must have at least two vowels, in the same or sequential syllables, with an initial consonant

Table 1 Warlpiri consonants

| | Peripheral | | Coronal | | |
|--------------|------------|-----------|----------------|--------------------------------|----------------|
| | Bilabial | Velar | Lamino-palatal | Apico-postalveolar (retroflex) | Apico-alveolar |
| Stop | <i>p</i> | <i>k</i> | <i>j</i> | <i>rt</i> | <i>t</i> |
| Nasal | <i>m</i> | <i>ng</i> | <i>ny</i> | <i>rn</i> | <i>n</i> |
| Lateral | | | <i>ly</i> | <i>rl</i> | <i>l</i> |
| Flap/ tap | | | | <i>rd</i> | <i>rr</i> |
| Glide | <i>w</i> | | <i>y</i> | | <i>r</i> |

and a final vowel and stress on the first syllable. The alveolar/postalveolar distinction (see Table 1) is neutralized word initially. The laminopalatal *ly* only occurs following a vowel.

There is a mora (or vowel) counting rule that determines the choice between the two forms of the locative (*-ngka* vs. *-rla*) and ergative (*-ngku~i* vs. *-rlu~i*), with minimal words hosting the velar allomorph, e.g., *ngurrpa-ngku* vs. *ngurrpa-rlu* (Hale, 1995: Appendix).

Clauses

Warlpiri has a classical nonconfigurational clause structure, with ‘free’ word order, discontinuous constituents, and a high reliance on zero anaphora (Hale, 1983; Hale *et al.*, 1995; Swartz, 1991). It has verbal and nominal (i.e., verbless) clauses. The nominal clause can be rendered as a verbal clause using one of the stance verbs as copula (see Table 2).

Ngapa ngurrju. Ngapa-ka karri-mi ngurrju.
water good water-AUX vertical.(stand)-PRES good
 ‘The water is good.’

The verbal clause consists of an obligatory verb and associated auxiliary complex, and a number of optional case-marked nominal constituents, as well as adverbial enclitics and particles with clausal or subclausal scope (Laughren, 1982a). Dependent and nonfinite subordinate clause types are discussed in Hale (1976) and Hale *et al.* (1995).

Verbs

There are 170 simple verb stems, which inflect for tense and mood in five conjugations. Past, nonpast

Table 2 Warlpiri stance verbs/copula (verb ‘to be’)

| <i>Neutral</i> | <i>Vertical</i> | <i>Horizontal</i> | <i>Humped</i> |
|-------------------------------|---------------------------|-------------------------|--------------------------------|
| <i>nyinami</i> ‘sit, stay’ | <i>karrimi</i> ‘stand’ | <i>ngunami</i> ‘lie’ | <i>parntarrimi</i> ‘crouch’ |

Table 3 The Warlpiri auxiliary complex

| <i>Aspect and tense</i> | | | | | |
|--|--|---|---|---|---|
| <i>-Ø- (i.e., nothing)</i> | | | <i>-ka-</i> | <i>-lpa-</i> | |
| <i>Perfective</i> | | | <i>Imperfective</i> | | |
| <i>Nonpast</i> | <i>Past</i> | <i>Irrealis</i> | <i>Nonpast</i> | <i>Past</i> | <i>Irrealis</i> |
| Immediate probability <i>ngarrirni</i> ‘about to tell, may tell’ | Completed action <i>ngarrurnu</i> ‘has told, told’ | Past possibility, probability <i>ngarrikarla</i> ‘would/should have told’ | Happening; habitually happens -ka <i>ngarrirni</i> ‘is telling, tells’ | Action in progress in past -lpa <i>ngarrurnu</i> ‘was telling’ | Possibility, probability -lpa <i>ngarrikarla</i> ‘would/should tell’ |

and irrealis verbs co-occur with aspect auxiliaries (see Table 3), while the imperative, infinitive, future, and presentational forms do not. Derivational morphology creates a nomic or agentive/instrumental noun from verbs (Hale, 1995), and inceptive and iterative verb forms which inflect for tense and mood, e.g., *payirni-njina-* ‘go and ask’ vs. *payirni-njina-na-* ‘go about asking.’

Verbs are fixed in one of five transitivity patterns specifying syntactic case arrays: intransitive, bi-intransitive, middle, transitive, and bi-transitive (Swartz, 1982b).

The inchoative *-jarri-* and the transitivizer *-ma-* are two very productive verb formatives with nominal stems. They form interrogative verbs: *Nyarrpa-jarrija?* ‘What did (he) do?’ and *Nyarrpa-manu?* ‘What did (he) do to (it)?’

Verbal meanings are further expanded by a large open noninflecting category termed preverb, particularly with the eight monosyllabic verb roots (Nash, 1982): *nyanyi* ‘seeing,’ *purda-nyanyi* ‘hearing,’ *parnti-nyanyi* ‘smell.’ Nominals, e.g., *jarda* ‘sleep, asleep,’ can act as preverbs; *jarda-ngunami* ‘asleep-lying, sleeping.’

Nominals

Nominals make up the largest grammatical class, and include substantives (nouns) and descriptive terms (adjectives), free pronouns, the deictics and determiners, question words, etc. In verbal clauses they are optional. Nominals host number-marking suffixes (see Table 4), followed by a range of syntactic and semantic case suffixes (Hale *et al.*, 1995).

The three syntactic cases are in an ergative system. The ergative, *-ngku~i* or *-rlu~i*, marks the subject (agent) of a transitive verb. The absolutive, *-Ø* (zero), marks the subject of an intransitive verb and the object of a transitive verb. The dative, *-ku~i*, marks indirect object and some oblique functions. There are a number of spatial cases, listed in Table 5, as well as an alienable possessive case. A grammatical

Table 4 Warlpiri grammatical number

| | Singular (one) | Dual (a pair) | Paucal (several) | Plural (more) |
|---------------------------------------|-------------------|------------------|---------------------|------------------|
| Nouns, interrogatives, adjectives | -Ø | -jarra | -patu | -Ø |
| Definite deictic and determiners | -Ø | -jarra | -patu | -rra |
| Indefinite determiners | <i>jinta</i> | <i>jirrama</i> | <i>marnkurrpa</i> | <i>panu</i> |
| 3rd Person subject pronominal clitics | -Ø | -pala | | -li~lu |
| 3rd Person object pronominal clitics | -Ø | -palangu | | -jana |

Table 5 Warlpiri spatial cases

| | locative | -kurra allative | -ngurlu | elative |
|-----------|-----------------|-----------------|---------|----------------------|
| -ngka~rla | 'at, on, in' | 'to, up to' | | 'from' |
| -wana | 'along, around' | | -jangka | 'from' origin, cause |

case may suffix to a stem containing a semantic case (see Simpson, 1991).

Auxiliary Complex

The auxiliary complex is in the Wackernagel position, i.e., after the first constituent of the clause. The auxiliary complex comprises:

- an optional finite complementizer (Hale *et al.*, 1995)
- an aspect marker, which in concert with the verb tense specifies the temporal and aspectual meaning of the clause (Table 3)
- up to three pronominal clitics marking subject and nonsubject functions (Hale, 1973, 1982).

There is a systematic mapping of the syntactic case array specified by the verb – in an ergative system – onto the auxiliary pronominal clitics – in a subject-object system – described from different perspectives by Swartz (1982b) and Hale (1982).

The free pronouns and the pronominal clitics mark person and number (Table 4). Third person singular subject and direct object is unmarked. A clause can be very minimal, without any overt nominals or auxiliary morphemes, or it can be expanded with case-marked nominals, etc.

Jarnturnu.
'He trimmed it.'

can be expanded to:

Wati-ngki-Ø-Ø-Ø karli-Ø jarntu-rnu.
man-ERG-PERF-3rd.sing.SUBJ-3rd.sing.OBJ boomerang-ABS trim-PAST
'The man trimmed the boomerang.'

Expanding this, and changing the participants and aspect to show additional possibilities:

Table 6 Warlpiri spatial location and orientation: deictics

| | Definite | | Indefinite |
|---------|---------------------------------|---|--|
| | Location certain | Not visible | Location uncertain |
| Close | <i>nyampu</i> 'this, here' | <i>yalamimpi</i> 'this one not visible' | <i>mirnimpi</i> 'somewhere here' |
| Nearby | <i>yalumpu</i> 'that, there' | <i>yalami</i> 'that one not visible' | <i>mirni</i> 'somewhere there' |
| Further | <i>yali</i> 'yon, yonder' | (<i>yalarnimpayi?</i>) 'yonder not visible' | <i>mirnimpayi</i> 'somewhere yonder' |
| Distant | <i>yinya</i> 'far yonder' | <i>yalamirra</i> 'that one far off out of sight' | <i>mirnirra</i> 'far away, a long way away' |

Table 7 Warlpiri direction of action relative to speaker, suffixed to the inflected verb

1st.exl.dual.-DAT boomerang-ABS trim-PAST man-
ERG

'Us two (excluding you) was not for whom the man was trimming the boomerang.'

Meaning, Context, and Registers

I now discuss briefly some Warlpiri cultural preoccupations – with land, social relationships, and proper behavior – that are reflected in the language.

Tables 5–7 shows some of the ways in which spatial orientation and direction is encoded in the language. For instance, there is a rich set of deictics encoding distance, visibility, and definiteness, and the choice of copula is determined by the perceived orientation of the subject (see Table 2). In addition, there is a system

of absolute three-dimensional spatial reference based on the four compass directions and up and down. The directional suffixes in **Table 7** and additional suffixes create a rich system of spatial reference (Laughren, 1978).

Although Warlpiri had no counting system, **Table 4** shows that it marks grammatical number on all nominals and references it in the pronominal clitics. There is a particular emphasis on pairing, reflected in the obligatory marking of dual, and the dual indefinite determiner.

There is also a preoccupation with relationships: the kin terminology allows any Yapa to be referenced as a relation, with higher order groupings into patrilineal, matrilineal, and generation moieties. There is also a sociocentric system of eight subsections or 'skin names.'

Pairing shows up again in an extensive set of tri-relational kin terms, which allow any pair of people to be referenced as a triangulation of the relationship between the speaker and each of the pair, and the relationship between the pair (Laughren, 1982b), e.g., *makurnta-rlangu*, the relationship between one's brother-in-law and mother, who stand in the avoidance relationship of mother-in-law/son-in-law to each other (*kurnta* 'shame, proper behavior'). Relationship to land is also registered in the kinship system.

Warlpiri has respect registers, characterized by obliqueness, used when speaking about or to relations and ritual associates in avoidance or respect relationships (Laughren, 2001). *Rdaka-rdaka* 'Hand Talk' is a sign language used when speaking is inappropriate, especially by bereaved widows and mothers in the *jilimi* 'single women's camp' (Kendon, 1988). Baby Talk is used to talk to babies, incrementally building up the phonological, grammatical, and semantic features of Warlpiri for them as they develop (Laughren, 1984).

All these registers are characterized by hyperpolysemy and a systematic reduction in distinctions, giving us an insight into the organization of Warlpiri semantics, grammar, and phonology.

Welsh

P W Thomas, School of Welsh, Cardiff University, Wales, UK

© 2006 Elsevier Ltd. All rights reserved.

Demographic Features

According to the 2001 census, 582 000 people, or 20.8% of the total population of Wales, claimed to be able to speak Welsh; almost 798 000, or 28.4% of the population, claimed to have at least one language skill in Welsh. Before 2001 successive censuses had recorded a decline in the number of Welsh speakers: 10 years previously, in 1991, there were 508 000 speakers who comprised 18.7% of the population. Apart from some very young children, all Welsh speakers in Wales are bilingual and can also speak English.

There are no official counts of Welsh speakers outside Wales but surveys commissioned by S4C, the Welsh television channel, suggest that there are more than 200 000 in England. One particular area where emigrants from Wales continue to speak Welsh is Patagonia, in the Chubut province of Argentina. The first settlers arrived in 1865, hoping to found a 'New Wales'; many of their descendants are bilingual in Welsh and Spanish.

The density and numbers of Welsh speakers show considerable geographic variation. For example, 69% of the population of Gwynedd, in the north-west, can speak the language, compared to 11% of the population of Cardiff, the capital, in the south-east. But while the 69% of Gwynedd represents almost 78 000 speakers, the 50% of Carmarthenshire in the south-west represents more than 84 000 individuals. There are also more Welsh speakers in urban than rural areas. For example, there are almost 26 000 speakers in rural Powys in mid Wales, but almost 28 000 in the post-industrial Rhondda-Cynon-Taf valleys, 29 000 in the southern city of Swansea, and 32 500 in Cardiff, the capital.

The increase in Welsh speaking is the result of growth on two main fronts. The first, and most obvious, is among school children. In addition to the growing number of Welsh-medium schools, it became compulsory in 1990 for children in English-medium state schools to learn Welsh up to the age of 14; in 1999 the upper age limit was raised to 16. These changes are reflected in the 2001 census, which recorded that 40.8% of all children between the ages of 5 and 15 could speak Welsh. The second growth area in the number of Welsh speakers is the many thousands of adults who are learning the language.

The change in the ability to use Welsh is accompanied by increasing institutional support. A Welsh television channel, S4C, was established in 1982, followed in 1998 by S4C Digital, which broadcasts over 80 hours of Welsh television a week. There are several local radio stations and a national Welsh language radio station, Radio Cymru, which broadcasts about 126 hours a week. Several hundred Welsh language books and periodicals are published a year and a network of some 50 local Welsh papers which are produced several times a year by volunteers.

The use of the Welsh language is promoted by the Welsh Language Board, a government-funded body that was established by the 1993 Welsh Language Act, which states that Welsh and English should be treated equally in the administration of justice and in public business. Public bodies in Wales must submit schemes to the Board that describe the provision they make for the language. The aims of the Board seem to have general support: according to a recent opinion poll 67% of the people in Wales thought that more should be done to promote the language.

Periods of Welsh

The periods of the development of Welsh are conventionally divided into Early Welsh (up to the end of the 8th century and represented by a few names), Old Welsh (from the 9th to the 11th centuries, represented by glosses and fragments of prose and verse), Middle Welsh (from the 12th to the 14th centuries and represented by a substantial body of prose and verse), and Modern Welsh.

Linguistic Features

Alphabet

Written Welsh uses the Roman alphabet. Particular orthographic conventions include several digraphs, e.g. ⟨th⟩ for /θ/, ⟨dd⟩ for /ð/, ⟨ch⟩ for /χ/ and ⟨ll⟩ for /ʎ/; ⟨w⟩ and ⟨i⟩ represent the consonants /w/ and /j/ or the vowels /u/ and /i/ respectively, and ⟨y⟩ represents /ə/ and /i(:)/.

Phonemic Inventory

The vowels, diphthongs, and consonants of Welsh are listed in **Table 1**. The main dialect variations with respect to this inventory are the absence of /i(:)/ (and diphthongs closing to /i/) in southern Welsh, of /ə/ in the extreme south-west, and of /h/ and voiceless /ʎ/ in the south-east. Conservative northern speakers will substitute /s/ for /z/, which features in some loans

Table 1 Phoneme inventory of modern Welsh

| Vowels | | | | | | | | | |
|----------------------|----------|-------------|--------|----------|----------------|---------|-------|--------|---------|
| i | ɨ | u | i: | ɨ: | u: | | | | |
| e | ə | o | e: | o: | | | | | |
| | a | | | a | | | | | |
| Diphthongs | | | | | | | | | |
| iu | | eu | | | | | | | |
| ɛu | əi, əu | ɔi | | | | | | | |
| | aɨ, au | | | | | | | | |
| Consonants | | | | | | | | | |
| | Bilabial | Labiodental | Dental | Alveolar | Palatoalveolar | Palatal | Velar | Uvular | Glottal |
| Voiceless stops | p | | t | | | | k | | |
| Voiced stops | b | | d | | | | g | | |
| Voiceless fricatives | | f | θ | s, ʃ, ʀ | ʃ | | | χ | h |
| Voiced fricatives | | v | ð | z | (ʒ) | | | | |
| Nasals | m | | n | | | | ŋ | | |
| Liquids | | | l | r | | | | | |
| Semivowels | w | | | | | j | | | |

Table 2 Three dialect differences

| Feature | Example | Northern | Southern |
|---|-----------------|----------|----------|
| Realisation of /ɣ/ preceding /w/ | (ch)with 'left' | χwi:θ | (h)wi:θ |
| Vowel length preceding /t/ | call 'sane' | kaɫ | ka:t |
| Vowel length preceding /sp, st, sk, ʃt/ | gw(a)llt | gwa:ɫt | gwaɫt |

from English. Two affricates – /tʃ/ and /dʒ/ – feature in loanwords and in dialects. Other salient dialect differences are listed in **Table 2**.

Consonant Mutation

In common with the other Celtic languages, some of the initial consonants of Welsh words vary according to their grammatical context, for example:

- /ka:θ/ <cath>
'cat'
- /və ŋha:θ/ <fy nghath>
'my cat'
- /i ga:θ/ <ei gath>
'his cat'
- /i χa:θ/ <ei chath>
'her cat'

Such consonantal changes are traditionally called mutations. They may be triggered by a preceding word, such as the personal pronouns in the above examples, or by grammatical context. For example, the object of a verb will mutate but not the subject:

- Gwelodd ddy.
saw-PAST man
'he/she saw a man'

Table 3 The consonant mutations

| Radical | Soft | Nasal | Spirant |
|---------|------|-------|---------|
| /p/ | /b/ | /mh/ | /f/ |
| /t/ | /d/ | /nh/ | /θ/ |
| /k/ | /g/ | /ŋh/ | /χ/ |
| /b/ | /v/ | /m/ | |
| /d/ | /ð/ | /n/ | |
| /g/ | – | /ŋ/ | |
| /m/ | /v/ | | |
| /t/ | /l/ | | |
| /tʃ/ | /r/ | | |

- Gwelodd dyn.
saw-PAST man
'a man saw'

There are three mutations, which may affect up to nine consonants (**Table 3**).

Vocabulary

The core vocabulary of Welsh is Celtic, for example, *drws* 'door', *dyn* 'man', and *haul* 'sun'. There are some 800 loanwords from Latin, mostly borrowed during the Roman occupation (43–410 A.D.); many of these refer to architectural and religious innovations, for example, *eglwys* 'church' from Latin *ecclesiā*, *ffenestr* 'window' from *fenestra*, and *pont* 'bridge' from *pontem*. There are also many thousands of loans from English. A very few of these may be dated to the Old English period, but the numbers increase from the medieval period onward; examples are *cupan* 'cup', *sêd* 'seat', *trowsus* 'trousers'.

There are some dialect differences in the vocabulary, particularly between northern and southern

varieties; for example, ‘grandmother’ is *nain* in northern Welsh but *mam-gu* in southern Welsh; ‘out’ is *allan* in the north but *mâs* in the south; and ‘with’ is *efo* in the north but *gyda* in the south. Standard Welsh may use both *nain* and *mam-gu*, but only *allan* and *gyda*. Speakers are generally tolerant of such variation.

Keeping pace with developments in English vocabulary has occupied lexicographers since the 18th century. More recently, educationalists who are concerned with delivering the school curriculum through the medium of Welsh have planned the elaboration of Welsh vocabulary through coinage, borrowing, and adaptation. The standardization of subject-specific vocabularies is undertaken professionally.

Syntax

Welsh is a VSO language. For example:

Prynodd y ferch gar.
bought the girl car.
‘the girl bought a car.’

Welsh has a definite article but no indefinite article. Adjectives tend to follow the noun they qualify, for example:

car coch
car red
‘red car’

Welsh has grammatical gender. Some adjectives have feminine and plural forms, a feature that is more prominent in formal styles and northern dialects, for example:

ceffyl gwyn
horse white
‘white horse’

caseg wen
mare white-FEMININE
‘white mare’

ceffylau gwynion
horses white-PLURAL
‘white horses’

Numerals have masculine/neutral and feminine forms for 1 (*un*), 2 (*dau*, *dwy*), 3 (*tri*, *tair*) and 4 (*pedwar*, *pedair*). The gender of the numeral *un* is apparent only when nouns beginning with certain consonants follow it; cf.

ci, un ci
dog-MASCULINE, one dog
cath, un gath
cat-FEMININE, one cat

Stylistic Variation

Informal spoken varieties of Welsh show considerable variation, and may be heavily influenced by English vocabulary, morphology, syntax, and intonation, with frequent code-switching. Formal varieties tend to be more conservative and to favor native features.

West Greenlandic

A Berge, University of Alaska, Fairbanks, AL, USA

© 2006 Elsevier Ltd. All rights reserved.

The Language and Its Dialects

Greenlandic, or Kalaallisut, is an Eskimo language (*see Eskimo-Aleut*). Greenland, or Kalaallit Nunaat, is geographically and culturally part of the North American continent; however, since 1721, it has been a territory of Denmark. In 1979 Greenland obtained autonomy over local governance, and Greenlandic was named the national language along with Danish. Today there are more than 50 000 speakers of Greenlandic, the vast majority of whom live in Greenland, although a sizable population is to be found in Denmark. There are three major dialects of Greenlandic: Polar Eskimo, spoken in the Thule region, East Greenlandic, spoken on the east coast, and West Greenlandic, spoken along most of the western coast. West Greenlandic is the dialect most widely spoken in Greenland, as well as being the standard dialect for purposes of political administration, education, church, and media. The dialect region stretches from Upernavik in the north to Kap Farvel in the south. Four subdialects are generally recognized: the subdialect spoken in Upernavik; North West Greenlandic (Uummannaq, and the Disko Bay region), Central West Greenlandic (Sisimiut to south of Nuuk); and South West Greenlandic (from north of Paamiut to south of Nanortalik), according to Dorais, 1996. The subdialects differ slightly in various aspects of their phonology and lexicon; thus, the Upernavik dialect, sharing a feature of East Greenlandic, tends to replace /u/ with /i/ under certain conditions, and Northwest Greenlandic retains a historical retroflex /ʃ/, whereas the Central and Southwestern dialects have merged /ʃ/ with /s/. The Greenlandic spoken in the capital city, Nuuk, tends to contain more Danish loans and syntactic features than the language spoken in other settlements, due to a relatively significant Danish population, as well as to its concentration of administrative and political activities. The Central West Greenlandic subdialect has long been the accepted spoken and written standard, and it will serve as the basis of the description given below.

Historiography of Descriptive Work

Greenland has seen several waves of immigration from both Eskimo and European populations. The most recent Eskimo groups are estimated to have

arrived in Northern Greenland by the end of the 12th century and in Southern Greenland by the end of the 15th century. There is some evidence they made contact with the first European immigrants, the Norse, who had arrived in the late 10th century. There is, however, scant linguistic evidence of Norse influence on Greenlandic, and the Norse had disappeared by the 16th century. From the late Middle Ages, European whalers, traders, and explorers made their way up the coast of Greenland; the first written records of West Greenlandic are wordlists they compiled during the 16th and 17th centuries, although some of the words collected appear to represent a trade pidgin (van der Voort, 1996).

The first systematic grammatical descriptions of the language date from the beginning of the Danish colonial era in the 18th century and were made by Lutheran and Moravian missionaries. The first of these was a collaborative work from 1725 between the missionary Hans Egede and his assistant Topp, with the help of Egede's son, Poul. This served as the basis of a dictionary, published in 1750, and the first complete grammar, in 1760, by P. Egede. Later descriptions were modeled on P. Egede's work, the most notable being O. Fabricius' grammar (1791, rev. 1801) and dictionary (1804). In 1851 Samuel Kleinschmidt published his grammar of Greenlandic; this is the earliest thorough linguistic description of an American native language and it is widely seen as the first modern, synchronic linguistic description of a language. Kleinschmidt also created a standard, linguistically accurate orthography for Greenlandic, which was maintained until 1972, when a more modern orthography was introduced to reflect important morphophonological changes in Greenlandic. Descriptive work on West Greenlandic has continued to the present, and important scholars include Thalbitzer, one of the first to document through sound recordings, Schultz-Lorentzen, Bergsland, and Fortescue. In addition to general descriptions, more recent work has included specialized studies of phonology (e.g., Rischel, 1972), syntax (e.g., Sadock, 1991), and discourse (e.g., Berge, 1997).

Phonetics and Phonology

West Greenlandic phonology is characterized by having few consonants and vowels and restrictions on vowel and consonant clusters, as well as on final consonants. Thus, only vowels and stops are found word finally; the only allowable diphthongs are /iV/, /Vi/, or /uV/; and consonant clusters are only found medially

Table 1 Phoneme inventory for West Greenlandic

| Manner/Place | Labial | Dental | Palatal | Velar | Uvular |
|--------------------------------|--------|--------|-----------|-------|--------|
| Stops | p | t | | k | q |
| Fricatives –v | f | s | (ʃ = [s]) | x | |
| +v | v | | | g | R |
| Nasals | m | n | | ŋ | |
| Liquids | | | ʃ = [ll] | | |
| | | | l | | |
| Glides | j | | | (w) | |
| Vowels: a, aa, i, ii, u, uu | | | | | |

Standard orthography is in brackets; parentheses indicate subdialect forms or questionable phonemic status.

and consist mostly of geminates, with the exception of /rC/ combinations (see Table 1).

Some features of Greenlandic are common to other Eskimo languages, including traces of a fourth vowel (see *Eskimo-Aleut*), and a rich morphophonology. Particular to West Greenlandic is the extreme degree of consonant cluster assimilation, which has taken place in the historic period.

| | |
|-----------------|--------------------------------------|
| Old Greenlandic | paurqi-ngnig-tar-fik |
| New | paaqqi-nnit-tar-fik |
| | <i>take.care.of-ANTI-HABIT-place</i> |
| | <i>'nursing home'</i> |

Restrictions on vowel or consonant clusters and a productive morphology, with complex rules for adding morphemes, have led to more opaque word formations than in other Eskimo languages. (For more on the morphophonology, see Rischel, 1974 and Fortescue, 1984.)

Morphology/Syntax

Greenlandic is an extremely polysynthetic language, with a large number of derivational affixes and complex inflection. Words consist of a root (or base), typically from zero to five suffixes known as postbases (although more than five are possible and quite normal), and an inflectional ending; with one non-productive exception, there are no prefixes. Roots generally are subcategorized for part of speech; nominal roots will require nominal inflection, and verbal roots will require verbal inflection. The most important parts of speech are the open classes of nouns and verbs; adjectives and adverbs tend to be verbally derived. There are also a rich system of demonstratives, a limited set of particles, a limited set of fossilized adverbs and adjectives, and few but common clitics. There are several hundred derivational postbases, many of which are highly productive. These are commonly classified into four categories: those

which derive nouns from nominal bases (NN); those that derive verbs from nominal bases (NV); those that derive verbs from verbal bases (VV); and those that derive nouns from verbal bases (VN). Some also attach to other parts of speech, e.g., particles; *nnit-and-tar-in* in the example above are both VV, and *and-fik* is VN. NN and NV are shown in the following example:

inuk-rsuaq-u-voq
man-big-COP-3sing.INDIC
 N-NN-NV-INFL
 'he is a giant'

As this example shows, verbalizing postbases can create verbal structures that 'incorporate' a verbal argument; that is, a subject or object can be brought into the verbal structure. There is some theoretical debate as to whether or not Eskimo languages can be called incorporating (e.g., Baker, 1988), but within the field of Eskimo linguistics, there is a long tradition of using the term 'incorporation' for structures of the type exemplified above. Even inflected forms can incorporate:

aappalut-toq illu-mi-iC-voq
red-PART house-LOC-COP-3sing.INDIC
 'he is in the red house'

Nominal inflection includes eight cases as well as possessive and person markers, which are also inflected for case. There are two grammatical cases, absolutive and ergative (or relative), and six oblique cases, including instrumental (a default case with many functions, both grammatical and nongrammatical), locative, ablative, allative, vialis, and equalis.

Verbal inflection is semifused and includes marking for dependence, mood, transitivity, person, and number. Verb moods are typically categorized as either independent or dependent. Sentences often consist of strings of subordinate clauses with dependent mood marking and a superordinate clause headed by a verb with independent mood marking. Independent moods include the indicative, interrogative, optative, and imperative moods. Dependent moods include the conditional, causative (indicating causation or action prior to that expressed by the independent clause), contemporative (indicating action contemporaneous with that expressed by the independent clause), and participial (used in object clauses, as an alternative to the indicative in narration, and in other discourse contexts). For an example of clause chaining from West Greenlandic (see *Eskimo-Aleut*).

Ergativity and transitivity have long been topics of interest in the study of Greenlandic. Transitive

Figure 1 Major Greenlandic dialects and West Greenlandic subdialects.

clauses are headed by verbs with subject and object person marking, and the arguments are marked with ergative and absolutive case. Intransitive and antipassive clauses are headed by verbs with pronominal marking of the subject and nouns take absolutive case. Objects of antipassive clauses take instrumental case. Traditionally, these are seen as related to definiteness of the object, although they may reflect topicality (Berge, 1997).

| | | |
|---|-----------------------|----------------------------|
| anguti-p | nanuq | taku-aa |
| <i>man-ERG.sing</i> | <i>bear.ABS.sing</i> | <i>see-3SG.3sing.INDIC</i> |
| 'the man sees/saw the bear' (definite, or old topic) | | |
| angut | nanur-mik | taku-voq |
| <i>man.ABS.sing</i> | <i>bear-INST.sing</i> | <i>see-3sing.INDIC</i> |
| 'the man sees/saw a bear' (indefinite, or topic introduction) | | |

At least one relatively major syntactic theory has been developed to account for Greenlandic morphosyntax.

This is Autolexical Theory, developed by Sadock (1991, 2003) and based in part on GPSG. It allows morphology and syntax to require structures that may not always result in exact matching, as in the stranded modification of a locative phrase in the sentence ‘he is in the red house’ given above.

Lexicon

Modern Greenlandic has seen an influx of new lexical items as a result of colonial experience and modernization. The earliest evidence of this is seen in early Bible translations, with the heavy use of Danish loans relating to Christianity. Some of these loans have been well integrated into the language, for example, *palasi*, from Danish *præst* ‘priest’, while others have been replaced by Greenlandic coinages. Greenlandic has actively incorporated new words in its lexicon, through relexicalization of obsolete terms (e.g., *issat* ‘snow goggles’ are now ‘eyeglasses’), borrowing (*kaffi* ‘coffee’), and coinage (Petersen, 1976, Berge and Kaplan, 2005). There is some evidence for the increased use of passive formations and nominalizations in the lexicon, perhaps as a result of the influence of journalistic style and literacy.

Semantics/Discourse/Sociolinguistics

Little work has been done to date on other aspects of linguistic description, especially including semantics, discourse, and sociolinguistics, although the body of work in these areas is steadily increasing. There have been reports on child language acquisition (Fortescue, 1985), bilingualism (Jacobsen, 1997), and discourse (Berge, 1997), among others. More sociolinguistic and semantic studies have been done of neighboring dialects, such as Inuktitut.

State of the Language Today

Unlike many other native languages of North America, West Greenlandic is not endangered and is, in fact, undergoing normal language development and change, although there was a period of endangerment. During the mid-20th century, increasing encroachment of the Danish language led to almost two generations of speakers who appeared to be losing their fluency in Greenlandic. In response, Greenlandic became one of the national symbols of the political campaigns for autonomy from Danish rule in the 1970s. With the establishment of Home Rule in 1979, Greenlandic was given the status of national language along with Danish. Language loss was successfully reversed, although there may have

been some lasting effects of bilingualism on the dialect spoken in Nuuk. Factors that have contributed to this reversal include a history of education and literacy in Greenlandic, a wealth of materials in the language, and political support. From earliest colonial times, education was established in West Greenlandic, and literacy was common. Today Greenlandic can be chosen as a medium of instruction throughout the years of formal schooling, and there have been efforts to include it as the language of instruction at Ilisimatusarfik, the University of Greenland. The first books in Greenlandic were published in the 1850s and the first newspaper, *Atuagagdliutit*, shortly thereafter. Since then, there have been several thousand books and articles published in Greenlandic, *Atuagagdliutit* has been in continuous print since its inception, and there are today two bilingual newspapers (in Danish and Greenlandic), local television and radio stations with Greenlandic programming, and more.

West Papuan Languages

G Reesink, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Introduction

In the area between Timor and the adjacent islands Alor and Pantar (126°E) and the Cenderawasih Bay of the Indonesian province Papua (136°E), roughly 50 of the more than 800 Papuan languages are spoken (see Figure 1).

These West Papuan languages do not form one family, in spite of earlier attempts to establish a "large West Papuan Phylum" (Cowan, 1957, 1960). More recently, the West Papuan Phylum has been restricted to the languages of North Halmahera (NH) and the Bird's Head Peninsula (Voorhoeve, 1975; Wurm, 1981, 1982), whereas the South Bird's Head (SBH) languages and some languages on the western tip of the Bomberai peninsula are claimed to form one family with those of Timor-Alor-Pantar (TAP), forming a subgroup within the largest Papuan family proposed thus far, the Trans New Guinea (TNG) family (McElhanon and Voorhoeve, 1970; Voorhoeve, 1975; Stokhof, 1975; Wurm, 1982; Pawley, 1998; Foley, 2000; Ross, 2004).

The West Papuan languages of North Halmahera and the Bird's Head could form a distantly related family, on the basis of (i) pronominal forms for 1sg as **t/d-* and **n-* for 2sg; (ii) the number-ablaut (sg is *a*, pl is *i*), found in TNG, is also attested in a number of West Papuan languages, and (iii) a small number of possible cognates. Some of these show some overlap with the TNG evidence, for example, reflexes of **niman* 'louse' (Pawley, 1998; Reesink, 2004). Although a few families have been established with reasonable certainty, the evidence for linguistic relatedness between them is so meagre that no firm conclusions should be drawn at present. Rather, the West Papuan languages form an areal network of basically

unrelated families (North Halmahera, West BH, and two East BH families (Meyah-Sougb; and Hatam-Mansim) and a number of isolates in the center of the Bird's Head (Maybrat, Abun, Mpur) and Yawa in the Cenderawasih Bay. They share a number of typological features, not only between them but also with the Austronesian languages spoken in this same region, betraying approximately four millenia of contact since the Austronesians first arrived in the Moluccas and around the Bird's Head (Bellwood, 1985).

Typological features

Verbal Complex

As typical of Papuan languages, the constituent order of the clause is SOV in TAP, NH, SBH, and Yawa, all of which also have a verbal prefix for (animate) object, which is the normal crossreference for the recipient with a verb like 'give.' Less typical is the configuration that has an additional verbal prefix for subject, as found in NH and SBH languages.

The region of the west Papuan languages is one of three in which Papuan languages are found that do not have a V-final order, the other two being the Torricelli languages and some of the East Papuan languages. Some of the NH and most BH languages have a rather strict SVO order, often with a subject prefix as the only verbal affixation.

Tense-Aspect-Mood morphology is generally poor or completely absent, as in Abun. Some aspect or mood prefixation is found in languages of the EBH. Inanwatan has tense marked by suffixation, whereas the TAP languages mark aspect that way. In the 'non-tensed' languages, predicative adjectives behave as verbs (see Stassen, 2003), whereas 'tensed' Inanwatan verbalizes adjectives by means of a copula (De Vries, to appear).

All West Papuan languages, whether OV or VO, have a clause-final negative adverb, in some cases with no morphosyntactic means to delineate its

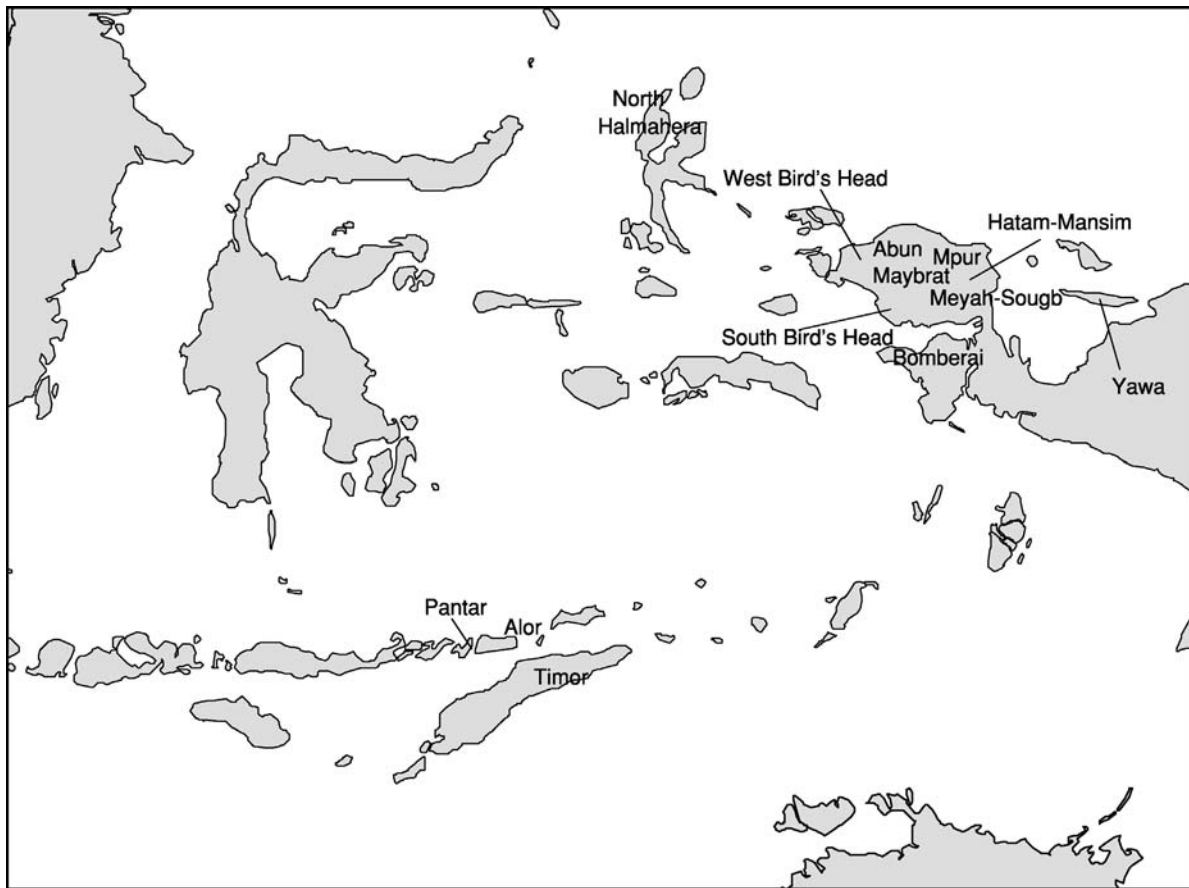

Figure 1 Map of West Papua.

scope (Reesink, 2002). They also agree in having clause-final aspectual adverbs, such as ‘already.’

Nominal Complex

The order of constituents in the Noun Phrase is in all West Papuan languages: Noun–Adjective–Numeral–Demonstrative, whereas a few NH languages have a pronominal article in addition. All of them make a distinction between alienable and inalienable possession. The latter construction consists of a possessor prefix on the possessed noun (body-part and kinship terms), which is generally identical to either the subject or object prefix, if the latter is available in the language.

Numeral classifiers are widely available in the West Papuan languages, Meyah having the most complex system, whereas its relative Sougb and their (very distantly?) related neighbour Hatam only have a vestige (see Reesink, 2002).

Pronominal systems A gender distinction (masculine; feminine; and, in some languages, neuter) for 3sg forms seems to be an old Papuan feature that links the West Papuan languages with most of the non-TNG languages along the north coast of New

Guinea, as far as the Solomon Islands. The TAP languages, and on the Bird’s Head, the isolate Abun and the two EBH families lack this feature.

The inclusive-exclusive opposition for nonsingular first person seems to be an Austronesian feature that has found its way into all the WP languages, except three central BH isolates, Maybrat, Abun, and Mpur.

Tone

Tonal contrasts are found in Mpur, with four phonemic tones (Odé, 2002) and Abun with three (Berry and Berry, 1999), whereas Meyah (Gravelle, 2002) and Sougb (Reesink, 2002) are pitch-accent languages with two contrastive tones. Ma’ya and Matbat are AN languages of the Raja Ampat Islands that have a Papuan substrate of four contrastive tones (Remijsen, 2001).

Papuan and Austronesian Contact

The SVO order with concomitant prepositions can be seen as a diffusion into many WP languages, in addition to the inclusive–exclusive opposition. There

seems to have been more diffusion in the other direction: almost all Austronesian languages in the WP sphere have a clause-final negator, a preposed possessor, and the alienable–inalienable distinction for possessive construction, albeit that the latter is expressed by possessor suffixes on the possessed noun, rather than by prefixes as in the Papuan languages. The typological contrast between western AN languages and those of this area, given by Himmelmann (to appear), focuses precisely on these ‘Papuanisms’ (see Klamer, Reesink, and Van Staden, to appear). It thus suggests a scenario of original Papuan-speaking communities that shifted to ‘imperfectly’ learned Austronesian languages. Prolonged contact between these communities allowed for further convergence to a linguistic area of AN and Papuan languages in the Moluccas and the western peninsula of New Guinea.

Wolaitta

A Amha, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The term ‘Wolaitta’ (Wolaytta) designates both the speakers and the language discussed in this article. Their administrative unit, known as the Wolaitta Zone, is part of the Southern Peoples, Nations and Nationalities Regional State of Ethiopia. The northern neighbors of the Wolaitta are the Kambatta (Kambaata) and Hadiyya (Cushitic); the southern neighbors are the Gamo and Gofa peoples (Omoti). The western and eastern parts of Wolaitta are bounded by the Omo and Bilate rivers, respectively. Most of the Wolaitta are farmers. According to the 1994 national census of Ethiopia, there are 1 210 000 Wolaitta speakers. For the names of closely related languages, see the language family tree in **Figure 1**.

The Sound System

Consonants

Table 1 lists a consonant inventory of Wolaitta. [p] and [ɸ] are free variants in word-initial and intervocalic positions; [ɸ] does not occur as a geminate or as a member of a consonant cluster. The labial implosive is attested both in word-initial and medial positions, as in *bánk’a* ‘very sour’ and *šobbá* ‘armpit,’ and the alveolar implosive occurs only in word medial position, as in *šódde* ‘frog.’ [ʒ] is used marginally and only in ideophonic words. Gemination is contrastive.

Vowels

Wolaitta has a five-vowel system with each vowel having a longer counterpart (**Table 2**). Examples are *mára* ‘calf,’ *maára* ‘row’ and *boóra* ‘ox,’ *bóra* ‘critic.’

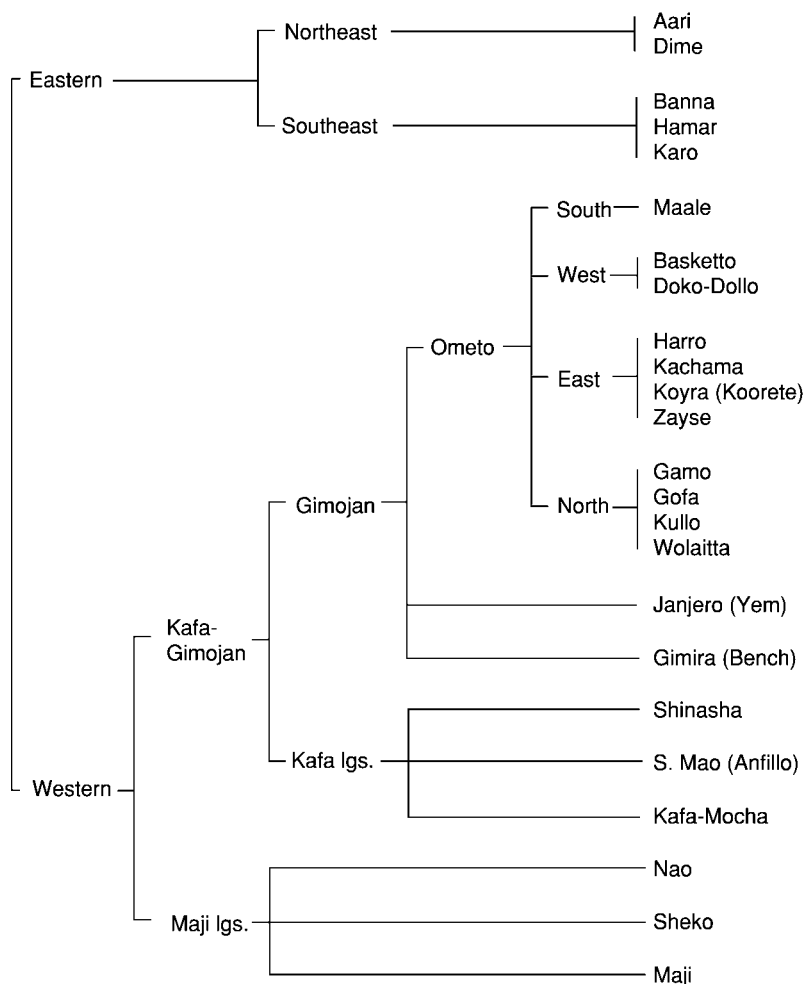

Figure 1 Omoti family tree, based on Fleming (1976).

Table 2 Vowel inventory

| | | |
|-------|-------|-------|
| i, ii | | u, uu |
| e, ee | | o, oo |
| | a, aa | |

Syllable Structure

CV, CVV, CVC, and CVVC syllable types are attested, as in *tá* 'I', *ʔéé* 'yes,' *mal.dó* 'sorghum,' and *keet.tá* 'house' (where the period indicates the syllable break). As the syllabification of the words *maldó* and *keettá* demonstrates, geminates and consonant clusters are split between two different syllables; also, clusters and geminates consist of only two members and they occur only word-medially. Syllable nucleus may be simple or branching.

Tone-Accent

Wolaitta is a tone-accent language. The language has two tones (high and low) used for making lexical distinction, as in *góda* 'lord, chief' versus *godá* 'wall' (where high tone is marked with $\acute{}$ and low tone is not marked). With a few exceptions (e.g., *ha* 'this,' *ta* 'my'), there are no words with just low tones; instead, lexical items have at least one high tone, mainly occurring on the ultimate or penultimate vowel. There are, however, a few numerals and nouns with ante-penultimate high tone, for example, *másunta* 'wound' and *k'éretta* 'split wood,' which seem to be historically derived from complex forms.

Nouns

Basic nouns in Wolaitta end in one of the following vowels: [e], [o], or [a] (Table 3). Which of these vowels a particular word may take cannot be predicted. There are no nouns ending in [i] or [u] in Wolaitta, although such nouns are attested in related languages.

Table 3 Basic nouns

| [e]-ending | [o]-ending | [a]-ending |
|-------------|------------------|----------------|
| búhe 'dust' | káwo 'dinner' | šaáfa 'river' |
| molé 'fish' | šooró 'neighbor' | keettá 'house' |

Table 4 Plural marking

| Singular | Nominative plural | Accusative plural | Gloss |
|----------|-------------------|-------------------|------------|
| šaáfa | šaáfa-t-i | šaáfa-t-a | 'river' |
| šooró | šooro-t-í | 'šooro-t-á' | 'neighbor' |

Plural Marking

On definite nouns, plural is marked by the morpheme *-t-*; indefinite nouns are not marked for plurality. Singular is unmarked. Examples are in Table 4.

Case, Gender, and Definiteness

Case, gender, and definiteness are designated cumulatively by portmanteau morphemes. In animate nouns, gender is determined by sex. Inanimate nouns are generally inflected like masculine nouns; but, when a diminutive meaning is intended, they may be inflected as feminine nouns. Plural nouns take the same nominative and accusative case markers as masculine singular nouns. Examples are in Table 5.

The genitive case is marked by *-ee* in definite feminine nouns and by *-u* in plural nouns. In masculine nouns, the genitive and accusative cases are formally identical. The possessor noun always precedes the possessed noun. Consider the forms of *šooró* 'neighbor' and *goššá* 'farm' in (1).

- (1a) šooró gošša 'a neighbor's farm'
 (1b) šoor-úwa gošša 'the neighbor's (MASC) farm'
 (1c) šoor-eé gošša 'the neighbor's (FEM) farm'
 (1d) šooro-t-ú gošša 'the neighbors' farm'

Peripheral/semantic cases such as instrumental (*-ra*), ablative (*-ppe*), dative (*yo/-ssi*), and so on are attached to a noun already marked with the genitive (for feminine and plural nouns) or accusative (for masculine singular nouns). Compare the examples in (1) with those in Table 6.

Nominal Derivation

There are several productive derivational suffixes, for example, *-ta* in *laggé-ta* 'friendship' (*lágge* 'friend') and *-tétta* in *zoʔó-tétta* 'redness' (*zoʔó* 'red'). Suffixing *-ançə* to a noun may derive agent

Table 5 Definiteness, case, and gender inflection

| | Basic noun | Definite masculine singular | | Definite feminine singular | | Definite plural | |
|----------------|-----------------------------------|-----------------------------|----------|----------------------------|----------|-----------------|------------|
| | | NOM | ACC | NOM | ACC | NOM | ACC |
| /a/- ending | keettá 'house' naʔá 'child' | keettáy | keettáa | keettiya | keettiyo | keetta-t-i | keetta-t-a |
| /o/- ending | migído 'ring' šooró 'neighbor' | migídoy | migíduwa | migídiya | migídiyo | migído-t-i | migído-t-á |
| /e/- ending | šóddé 'frog' zeére 'orphan' | šóddée | šóddíya | šooriya | šooriyo | šooro-t-i | šooro-t-á |
| | | zeéree | zeériya | zeériya | zeériyo | | |

Table 6 Peripheral semantic cases

| | 'from a' | | 'with a' | |
|----------|--|--|---------------------------------------|--|
| | Indefinite | Definite | Indefinite | Definite |
| Singular | šooró-ppe 'from a neighbor (MASC/FEM)' | šoor-úwa-ppe 'from the neighbor (MASC)' šoor-eé-ppe 'from the neighbor (FEM)' | šooró-ra 'with a neighbor (MASC/FEM)' | šoor-úwa-ra 'with the neighbor (MASC)' šoor-eé-ra 'with the neighbor (FEM)' |
| Plural | | šooro-t-ú-ppe 'from the neighbors' | | šooro-t-uú-ra 'with the neighbors' |

Table 7 Derivational suffixes

| Noun | Agent nominal | Adjective |
|--------------------|--------------------------|-----------------------------|
| kiíta 'message' | kiit-ánca 'messenger' | |
| ʔóla'a 'fight/war' | ʔol-ánca 'fighter' | |
| dooná 'mouth' | | doon-aáma 'talkative' |
| wolk'á 'power' | | wolk'-aáma 'one with power' |

nouns; whereas suffixing *-aáma* to a noun derives an adjective (Table 7).

Adjectives and Adverbs

Adjectives end in one of the word-final vowels, *e*, *o*, or *a*. When used as modifiers, adjectives are not marked for gender, case, or number; they generally do not show agreement with the head noun. However, when the head noun is dropped, the adjective must be marked for these categories.

- (2a) keéha 'kind'
 (2b) keéha šooro-y 'the kind neighbor (NOM)'
 (2c) keéha-y 'the kind one'

In the inchoative, the adjectival base is affixed with tense-aspect and mood markers, as in:

- (3a) keeh-iísi 'he became kind'
 (3b) keeh-aásu 'she became kind'
 (3c) keeh-íbénna 'he did not become kind'

Manner adverbs are mainly derived by suffixing the locative marker *-n*, the instrumental *-ra*, or the ablative *-ppe* to nominals. For example:

- (4a) ʔakeéka-ni ʔoott-á
 attention-LOC do-2.SING.IMP
 'work carefully!'

- (4b) keeh-í-ppe harg-eési
 be_kind-í-ABL be_sick-3.MASC.SING.IMPERF
 'he is extremely/badly sick'

- (4c) ʔiss-í-ppe y-iite
 one-í-ABL come-2.PL.IMP
 'come together!'

Lexical time-adverbs include *baʔʔi* 'now,' *kasé* 'earlier,' *háčči* 'today,' and *wontó* 'tomorrow.'

Pronouns

The basic pronoun paradigms of Wolaitta are possessive, nominative, and accusative. Dative, ablative, and locative pronouns are formed by adding the respective case suffixes (i.e., *-ssi*, *-ppe* and *-n(i)*, as in the nouns) to the accusative/possessive ones (see Table 8). Note the gender syncretism between third-person singular pronouns in the forms in Table 8. The pronoun sets with *ba(-)* are used when the subject of the sentence is coreferential with an object or possessive noun in the same sentence, as shown in (5a), which contrasts with the noncoreferential form in (5b).

Table 8 Pronouns

| Person ^a | Possessive | Nominative | Accusative | Dative | Ablative |
|---------------------|------------|------------|------------|----------|----------|
| 1 SING | ta | tááni/tá | tána | taássí | taáppé |
| 2 SING | ne | nééni/né | néná | neéssí | neéppé |
| 3 FEM SING | ʔi | ʔá | ʔó | ʔíssi | ʔíppé |
| 3 MASC SING | ʔa | ʔi | ʔá | ʔássi | ʔáppé |
| 1 PL | nu | núúni/nú | núná | nuússi | nuúppé |
| 2 PL | ʔinte | ʔinté | ʔintena | ʔintéssi | ʔintéppé |
| 3 PL | ʔeta | ʔeti | ʔetá | ʔetássi | ʔetáppé |
| 3 SING LOG | ba | — | báná | baássi | baáppé |
| 3 PL LOG | banta | — | bántana | bántassi | bántappe |

^aLog, logophoric form.

(5a) ʔi ba šoor-úwa
 3.MASC.SING.SUBJ 3.LOG neighbor-MASC.ACC
 maadd-eési
 help.3.MASC.SING.IMPERF
 ‘he_x helps his_x neighbor’

(5b) ʔi ʔa
 3.MASC.SING.SUBJ 3.MASC.SING.POSS
 šoor-úwa maadd-eési
 neighbor-MASC.ACC help-3.MASC.SINGIMPERF
 ‘he_x helps his_y neighbor’

In the logophoric form (LOG), the gender distinction in the third-person singular form is neutralized.

Verbs

Subject Agreement, Aspect, Negation, and Modality

In affirmative declarative sentences, a three-way temporal distinction is made, for example, *beʔ-íisi* ‘he saw,’ *beʔ-eési* ‘he sees,’ *beʔ-aná* ‘he/she/ɪ (etc.) will see.’ The verb shows subject agreement; object agreement is not marked on the verb (see Tables 9 and 10).

Future tense/aspect is formed by suffixing an invariable *-ána* to a verb root:

(6) kúnd-aná ‘I/you/he/she/we/you (PL)/
 they will see’

In negative declarative sentences, there is only two-way distinction, between perfective negative (Table 11) and imperfective negative (Table 12); the present and future forms are reduced to one paradigm: *beʔ-énna* ‘he does/will not see’ and *beʔ-íbénna* ‘he did not see.’

Interrogatives

There are the following content question words in Wolaitta: *ʔái* ‘what,’ *ʔái-gé* ‘which (MASC),’ *ʔái-nná* ‘which (FEM),’ *ʔái-ssi* ‘why,’ *ʔa-udé* ‘when,’ *ʔá-wan* ‘where,’ and *ʔoóni* ‘who.’

Table 9 Perfective paradigm

| Singular | Plural |
|-----------------------|----------------------------|
| kúnd-aási ‘I fell’ | kúnd-ida ‘we fell’ |
| kúnd-ádasa ‘you fell’ | kúnd-ideta ‘you (PL) fell’ |
| kúnd-iisi ‘he fell’ | kúnd-idosona ‘they fell’ |
| kúnd-aásu ‘she fell’ | |

Table 10 Present tense paradigm

| Singular | Plural |
|-----------------------|---------------------------|
| kúnd-aísi ‘I fall’ | kúnd-oósi ‘we fall’ |
| kúnd-aása ‘you fall’ | kúnd-eéta ‘you (PL) fall’ |
| kúnd-eési ‘he falls’ | kúnd-oósóna ‘they fall’ |
| kúnd-aúsu ‘she falls’ | |

Table 11 Perfective negative

| Singular | Plural |
|--------------------------------|---------------------------------------|
| beʔ-á-beikke ‘I did not see’ | beʔ-i-boókko ‘we did not see’ |
| beʔ-á-baákká ‘you did not see’ | beʔ-i-beékkétá ‘you (PL) did not see’ |
| beʔ-i-beénná ‘he did not see’ | beʔ-i-boókkóná ‘they did not see’ |
| beʔ-á-beíkkú ‘she did not see’ | |

Table 12 Imperfective negative

| Singular | Plural |
|----------------------------------|---------------------------------------|
| beʔ-íkke ‘I do/will not see’ | beʔ-ókkó ‘we do/will not see’ |
| beʔ-ákka ‘you do/will not see’ | beʔ-ékketa ‘you (PL) do/will not see’ |
| beʔ-énna ‘he does/will not see’ | beʔ-ókkóna ‘they do/will not see’ |
| beʔ-úkkú ‘she does/will not see’ | |

Table 13 Verbal inflection in interrogative sentences

| Interrogatives | | | |
|----------------|----------------------------------|---------------------------|----------------|
| Person | Perfective | Imperfective Pres/Hab. | Future |
| 1 SING | beʔ-ádina 'did I see?' | beʔ-aína | beʔ-ané |
| 2 SING | beʔ-ádi 'did you see?' | beʔ-áy | beʔ-uúte |
| 3 MASC SING | beʔ-ide 'did he see?' | beʔ-i | beʔ-ané |
| 3 FEM SING | beʔ-áde 'did she see?' | beʔ-áy | beʔ-ané |
| 1 PL | beʔ-ido 'did we see?' | beʔ-iyó | beʔ-ané |
| 2 PL | beʔ-ideti 'did you (PL) see?' | beʔ-eéti | beʔ- uútetí |
| 3 PL | beʔ-idona 'did they see?' | 'beʔ-iyona' | beʔ-ané |

Both in content-question-word and polar-interrogative clauses, the verb inflects for subject, tense/aspect, and modality (i.e., [+question]). The actual subject-agreement- and tense/aspect-marking morphemes are distinct from that observed for declarative sentences. Examples are shown in Table 13.

Imperative and Optative Moods

Second-person singular and plural imperatives are marked by *-á* and *-(i)ité*, respectively (Table 14). The optative/hortative involves only the third-person singular and plural forms. It is marked by *-ó* for third-person singular masculine and by *-ú* for feminine. For third-person plural, it is marked by *-óna*.

- (7a) demm-ó 'let him find'
 (7b) demm-ú 'let her find'
 (7c) demm-óna 'let them find'

The imperative and optative/hortative forms take the same negative marker, *-ópp-lúpp-*, which is formally distinct from the negation-marking morpheme in affirmative declarative sentences.

- (8a) demm-ópp-a 'don't find (2.SING)!'
 (8b) demm-ópp-ite 'don't find (2.PL)!'
 (9a) demm-ópp-ó 'let him not find!'
 (9b) demm-úpp-ú 'let her not find!'
 (9c) demm-ópp-óná 'let them not find'

Verb root extension in Wolaitta includes causative, passive, reciprocal, reflexive, and intensive verbs (Table 15).

Clauses

Simple Declarative Clauses

The most frequently used word order is SOV. However, S may occur immediately before V when it is in contrastive focus. Also, subject and object may be omitted.

Table 14 Imperative

| Singular | Plural | Gloss |
|----------|----------|---------|
| demm-á | demm-ité | 'find!' |
| y-á | y-iité | 'come!' |

Table 15 Verb root extensions

| Verb root | Causative stem | Passive/ reciprocal | Intensive/ repetitive | Gloss |
|--------------|-------------------|------------------------|--------------------------|-----------|
| k'ant'- | k'ant'- is(s)- | k'ant'-étt- | k'ant'-erett- | 'cut' |
| bóg- | bóg-is(s) | bóg-étt- | bog-erett- | 'plunder' |

- (10) ʔasa-t-í méhe-t-a
 person-PL-MASC.NOM cattle-PL-MASC.ABS
 baiz-idosona
 sell-3.PL.PERF
 'the people sold the cattle'

In phrases, modifiers precede the head. Demonstratives generally precede numerals and adjectives when both modify the same noun. Example (11a) is an NP with adjectives and a demonstrative; (11b) is a sentence containing an NP with a relative clause.

- (11a) ha heezú guútta naa-t-í
 this three small child-PL-MASC.NOM
 'these three small children'
- (11b) maay-úwa meec'c'-íya
 cloth-MASC.ACC wash-IMPERFREL
 naʔ-íya daapur-aásu
 child.FEM.NOM be_tired-3.FEM.SING.PERF
 'the girl who is washing clothes is tired'

Complex Clauses

In complex sentences, adverbial and complement clauses precede main clauses. Clausal linking is indicated by various verbal affixes attached to the dependent clause. Examples (12a) and (12b) are simultaneous, examples (12c) and (12d) are anterior and examples (12e) is conditional. Simultaneous and anterior morphemes further indicate whether the subject of the dependent clause is the same as that of the main clause.

- (12a) ʔattúma ʔasa-t-í keettaa
 male person-PL-NOM house.MASC.ACC
 keet't'-íšin mác'c'a ʔasa-t-í
 build-DS.SIMUL female person-PL-NOM
 puutt-úwa súk'k'-osona
 cotton-MASC.ACC spin-3.PL.IMPERF
 'when the men are building the house, the women
 spin cotton'

- (12b) ?attúma ?asa-t-í keettaa
 male person-PL-NOM house.MASC.ACC
 keet't'-íiddi /iisso-y /iiss-úwa
 build-DS.SIMUL one-NOM one-ACC
 k'ir-oósona
 tease-3.PL.IMPERF
 'the men tease each other while building the house'
- (12c) ?attúma ?asa-t-í keettaa
 male person-PL-NOM house.MASC.ACC

Wolof

F Mc Laughlin, University of Florida, Gainesville, FL, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Wolof is a member of the northern branch of the Atlantic family of Niger-Congo languages, formerly known as West Atlantic, and is spoken primarily in Senegal as well as in parts of Gambia and Mauritania on the West African coast. In Senegal, Wolof serves as a lingua franca, and is spoken by upwards of 80% of the population as either a first or second language, making for a total of no fewer than 6–7 million speakers and quite possibly more. Wolof society has traditionally been hierarchically stratified (Diop, 1981) and is composed of two main social groups, *ñeeño* and *géer*. The former group consists of endogamous artisans or castes, including griots (verbal artists), blacksmiths, leatherworkers, and musicians; the latter group is composed of noncasted people and

nobles. Today, a majority of Wolof speakers are Sufi Muslims, most having converted to Islam en masse in the late 19th and early 20th centuries.

Genetic Affiliation

Sapir (1971) hypothesized that Wolof, along with Serer-Sine and Pulaar or Fula, belongs to the Senegal subgroup of northern Atlantic languages. Although the three languages are clearly related, Serer-Sine and Pulaar resemble each other much more closely than either of them do Wolof. Until much more historical work is done on the northern Senegal languages, the exact relationship of Wolof to these languages, as well as to other Atlantic languages, and especially to the Cangin languages spoken around the Senegalese city of Thiès, will remain unresolved.

Phonetics and Phonology

Like most Niger-Congo languages (Clements, 2000), the consonantal inventory of Wolof, given in Table 1

Table 1 Wolof consonant articulation

| Consonant type | Labial | Alveolar | Palatal | Velar | Uvular |
|----------------|--------|----------|---------|-------|--------|
| Stops | p b | t d | c j | k g | q |
| Fricatives | f | s | x | | |
| Nasals | m | n | ɲ | | |
| Prenasalized | mb | nd | nj | ng | |
| Liquids | | l,r | | | |
| Glides | w | | y | | |

in standard Wolof orthography, distinguishes four main places of articulation: labial, alveolar, palatal, and velar. Voiced and voiceless stops, voiced prenasalized stops, voiceless fricatives, and simple nasal stops occur in the four places of articulation. Voiceless prenasalized stops no longer occur word-initially, but historical records and some place-names, such as Mpal, provide evidence that they once did. The have now been replaced by simple voiceless stops. There is also a voiceless uvular stop in the language, as in the words *sàq* ‘granary’ and *bëqët* ‘to be cowardly.’ There is a tap [ɾ] and a lateral [l] in addition to two glides, the labiovelar [w], and the palatal [j]. Consonant length is distinctive in Wolof: compare *dag* ‘valet’ to *dagg* ‘to cut,’ and *jaw* ‘to cook for a long time’ to *jaww* ‘sky’; however, not all consonants have a geminate counterpart, notably the prenasalized stops, the fricatives, and the alveolar tap. Geminate forms of the latter, however, occur in ideophones, as in *jérr* ‘of being hot’ and *curr* ‘of being red.’ Notable in the northern Atlantic context is the absence of implosive stops in Wolof. Wolof has an eight-vowel system in which vowels have either a plus or minus value for the advanced tongue root (ATR) feature. The [+ATR] vowels comprise the set i, u, é, ó, and ë; the [-ATR] vowels are e, o, and a (Figure 1). All vowels are written in standard Wolof orthography, and the character ë represents schwa. The [+ATR] and [-ATR] vowels are phonemically distinct in Wolof stems, as evidenced by the pairs *reer* ‘to dine’ and *réer* ‘to be lost,’ and *woor* ‘to fast’ and *wóor* ‘to be sure or trustworthy.’ Nominal and verbal stems and a substantial number of derivational suffixes harmonize for the ATR feature. Regressive height harmony also exists in the language. Vowel length is distinctive in Wolof, as in the pairs *bax* ‘to boil’ and *baax* ‘to be good’ and *fit* ‘to tie on’ and *fiit* ‘soul,’ but the mid-central vowel ë does not have a long counterpart. Although most Niger-Congo languages are tonal, Wolof, like Serer-Sine and Pulaar, is not a tonal language. Intonational patterns are fairly flat according to Rialland and Robert (2001), and stress falls on the initial syllable of a word in Wolof.

| [+ATR] | | [-ATR] | |
|--------|---|--------|---|
| i | u | | |
| é | ó | e | o |
| ë | | a | |

Figure 1 The Wolof eight-vowel system; vowels have either a plus or minus value for the advanced tongue root (ATR).

Morphology and Syntax

Wolof has a noun class system comprising 10 classes, of which 8 are singular and 2 are plural, marked by a single consonant. Unusually, there is no morphological marking for class on the noun, but the classifier consonant appears on nominal determiners as in the following examples, in which the determiner follows the noun:

1. m-class: *picc mi* ‘the bird,’ *picc male* ‘that bird.’
2. y-class: *picc yi* ‘the birds,’ *picc yale* ‘those birds.’
3. k-class: *nit ki* ‘the person,’ *nit kale* ‘that person.’
4. ñ-class: *nit ñi* ‘the people,’ *nit ñale* ‘those people.’

Wolof has approximately 30 verbal extensions, inflectional and derivational affixes that encode a variety of concepts such as reciprocal, applicative, causative, locative, etc. The verb *gis* ‘to see’ has, among others, the following derivatives: *gis* ‘to see,’ *gisaat* ‘to see again,’ *gise*, *gisante* ‘to see each other,’ *gisandoo* ‘to see together,’ and *gisaale* ‘to see (‘while you’re at it).’ Verb-to-noun derivation may exhibit reduplication (*gis* ‘to see,’ *gis-gis* ‘opinion’; *xam* ‘to know,’ *xam-xam* ‘knowledge’), suffixation (*gudd* ‘to be long,’ *guddaay* ‘length’), and consonant mutation (*baax* ‘to be good,’ *mbaax* ‘goodness’; *sonn* ‘to be tired,’ *cono* ‘fatigue’). It is arguable as to whether a distinct category of adjectives can be said to exist in Wolof, since adjectival forms can be subsumed under the category of verb (Creissels, 2000; Mc Laughlin, 2004). Although basic word order in Wolof is subject-verb-object, the information structure of Wolof is encoded in an elaborate focus system (Creissels and Robert, 1998). The minimal verb phrase consists of a bare verb plus an auxiliary that encodes person, number, and focus. Examples (1)–(4) show four different ways to say ‘Ami saw the thief,’ using neutral, subject, object, and verbal focus, respectively:

- (1) Ami gis na sàcc ba.
Ami see 3S:PERF thief DET
- (2) Ami moo gis sàcc ba.
Ami 3S:SFOC see thief DET
- (3) Sàcc ba la Ami gis.
Thief DET 3S:OFOC Ami see
- (4) Ami dafa gis sàcc ba.
Ami 3S:VFOC see thief DET

Urban Wolof

Urban Wolof, and especially that of the capital, Dakar, exhibits heavy lexical borrowing from French, as in Examples (5) and (6) (Mc Laughlin, 2001) (French loans are in boldface):

(5) Feu bi rouge na.
light DET be red 3S:PERF
'The traffic light turned red.'

(6) Dafa d-oon **errer** ci
3S:VFOC IMPERF-PAST wander PREP
monde bi rekk.
world DET just
'He was just wandering around the world.'

Introduction

Xhosa (or isiXhosa, with the noun class prefix) belongs, with isiZulu (Zulu) and isiNdebele (Ndebele), to the Zunda subgroup of the Nguni group of the Southeastern Zone of Bantu languages. This zone also includes the Sotho, Venda, and Tsonga language groups. In terms of Guthrie's (1967–1971) classification, isiXhosa is identified as S41 (Doke, 1943, 1954; Piron, 1998; Gowlett, 2003; Nurse and Philippson, 2003). The Bantu family forms part of the larger Niger-Congo family of African languages of which the three other major families are Afroasiatic, Nilo-Saharan, and Khoisan (Greenberg, 1963; Heine and Nurse, 2000b; Williamson and Blench, 2000). Specific areas in the Eastern Cape province of South Africa have historically been associated with the various dialects or local forms of isiXhosa, namely isiGcaleka, isiNdlambe, isiGaika, isiThembu, isiBomvana, isiMpondomise, isiMpondo, and isiXesibe.

With the establishment of a democratic South Africa in 1994, isiXhosa has obtained the status of an official language, together with eight other Bantu languages spoken in South Africa, namely isiZulu, isiNdebele, Siswati (Swati), Sesotho (Southern Sotho), Sepedi/Sesotho sa Leboa (Northern Sotho), Setswana (Tswana), Tshivenda (Venda), and Xitsonga (Tonga). The government has introduced significant legislation through the Department of Arts and Culture for promoting the status and use of these official languages in government, education, and business, in addition to the predominant use of English. Huge challenges exist for accomplishing this goal, which includes urgent work in the fields of terminology development, language in education policy, and the teaching and learning of the indigenous African languages (Webb, 2001; Visser, 2004, 2005).

Nouns and Noun Phrases

Noun Classes

The morphology and semantics of the noun class system of isiXhosa is typical of the Bantu languages (Greenberg, 1963; Welmers, 1973; Du Plessis, 1978; Poulos and Msimang 1998; Piron 1998; Williamson and Blench, 2000; Gowlet, 2003). IsiXhosa has nouns in all noun classes from class 1 to 15, excluding class 12 and 13. The locative classes 16, 17, and 18 are morphologically fossilized; thus, they all exhibit the associated locative agreement subject- and object-verb agreement morpheme *ku-* rather than the distinct agreement morphemes of class 16, 17, and 18. As is general to the Bantu languages for the first 10 classes, the consecutive odd and even class numbers are regular singular-plural pairs. The noun class prefixes have a VCV syllable structure, except for classes 1, 3, and 9; the postnasal vowel in classes 1 and 3 has been deleted, and class 9 has the prefix *in-*. Classes 1a and 2a, subclasses of classes 1 and 2, respectively, have only vowel prefixes. **Table 1** shows the noun class prefixes of isiXhosa.

Table 1 Noun class prefixes of IsiXhosa

| Noun class | Prefix | Example noun |
|------------|-----------|-------------------------------------|
| 1 | um- | umfazi 'woman' |
| 2 | aba- | abafazi 'women' |
| 1a | u- | utata 'father' |
| 2a | oo- | ootala 'fathers/father and company' |
| 3 | um- | umlilo 'fire' |
| 4 | imi- | imililo 'fires' |
| 5 | i(li)- | ilitye 'stone' |
| 6 | ama- | amatye 'stones' |
| 7 | isi- | isiqhama 'fruit' |
| 8 | izi- | iziqhama 'fruits' |
| 9 | i(n)- | indlu 'house' |
| 10 | i(z)i(n)- | izindlu 'houses' |
| 11 | ulu- | uluthi 'stick' |
| 14 | ubu- | ubusika 'winter' |
| 15 | uku- | ukutya 'food' |

Table 2 Nominal suffixes: feminine, augmentative, and diminutive

| | | |
|-----------|---|---|
| -kazi FEM | inkosi 'chief'; ixhego 'old man'; utiitshala 'teacher'; | inkosikazi 'chieftainness' ixhegokazi 'old woman' utiitshalakazi 'female teacher' |
| -kazi AUG | umthi 'tree'; intaba 'mountain'; indlu 'house' | umthikazi 'big tree' intabakazi 'big mountain' indlukazi 'big house' |
| -ana DIM | indoda 'man'; incwadi 'book'; ilitye 'stone'; | indodana 'small man' incwadana 'small book' ilityana 'small stone' |

Source: Du Plessis (1978, 1997); Louw (1963).

Nominal Suffixes

Nouns in isiXhosa can regularly take suffixes that denote the property of feminine *-azi-*, augmentative *-azi*, and reciprocal *-ana*, as shown in Table 2.

Agreement Morphology with Nominal Modifiers

As is characteristic of the Bantu languages, isiXhosa exhibits agreement morphology of the nominal modifiers with the head noun, where the latter may be a lexical noun or a phonetically empty pronominal (Doke, 1954; Greenberg, 1963; Guthrie, 1967–1971; Welmers, 1973; Du Plessis and Visser, 1992; Gowlet 2003; Nurse and Philippson, 2003b). The nominal modifiers identified for isiXhosa include demonstratives, adjectives, nominal relatives, clausal relatives, numerals, quantifiers, possessives, and enumeratives (Louw, 1963; Du Plessis, 1978, 1983; Visser, 1984, 2002; Du Plessis and Visser, 1992). The examples that follow illustrate the agreement morphology of the adjective and possessive with pairs of lexical head nouns in classes 1, 2, 5, 6, 7, and 8.

- The head noun is in class 1.

| | | | |
|------|----------|--------------|----------------------|
| (1a) | umntwana | wam | omhle |
| | umntwana | u-a-m | om-hle |
| | child | AGR-GEN-mine | AGR-beautiful |
| | | | 'my beautiful child' |

- The head noun is in class 2.

| | | | |
|------|-----------|--------------|-------------------------|
| (1b) | abantwana | bam | abahle |
| | abantwana | ba-a-m | aba-hle |
| | children | AGR-GEN-mine | AGR-hle |
| | | | 'my beautiful children' |

- The head noun is in class 5.

| | | | |
|------|--------|--------------|----------------------|
| (1c) | ihashe | lam | elihle |
| | ihashe | li-a-m | eli-hle |
| | horse | AGR-GEN-mine | AGR-beautiful |
| | | | 'my beautiful horse' |

Table 3 Deverbal nouns

| Verb | Deverbal noun | |
|-------------------------|---|----------------------------------|
| | Human | Nonhuman |
| -thenga 'buy' | umthengi 'buyer' (class 1) | intengo 'buy' (class 9) |
| -funda 'read, learn' | umfundi 'learner, student' (class 1) | imfundo 'education' (class 9) |
| -dlala 'play' | umdlali 'player' (class 1) | umdlalo 'game' (class 3) |
| -hamba 'travel', | umhambi 'traveller' (class 1) | uhambo 'travel' (class 11) |
| 'gula 'be ill' | isigulana 'patient' (class 7) | ingulo 'illness' (class 9) |
| -thanda 'like, love' | isithandwa 'beloved' (class 7) | uthando 'love' (class 11) |

- The head noun is in class 6.

| | | | |
|------|----------|--------------|-----------------------|
| (1d) | amahashe | am | amahle |
| | amahashe | a-a-m | ama-hle |
| | horses | AGR-GEN-mine | AGR-beautiful |
| | | | 'my beautiful horses' |

- The head noun is in class 7.

| | | | |
|------|--------|-----------|---------------------|
| (1e) | isitya | sam | esihle |
| | isitya | si-a-m | esi-hle |
| | dish | AGR-GEN-m | AGR-hle |
| | | | 'my beautiful dish' |

- The head noun is in class 8.

| | | | |
|------|--------|--------------|-----------------------|
| (1f) | izitya | zam | ezihle |
| | izitya | zi-a-m | ezi-hle |
| | dishes | AGR-GEN-mine | AGR-beautiful |
| | | | 'my beautiful dishes' |

Derived Nouns IsiXhosa exhibits regular nominal derivation from verbs and, to a less regular degree, from other word categories such as adjectives and nominal relatives (Louw, 1963; Du Plessis, 1978). The examples in Table 3 illustrate deverbal nouns in a range of noun classes.

Compound Nouns

Compound nouns are common in isiXhosa, and this is especially salient in proper nouns.

| | | | |
|------|-----------------------|---|-------------------|
| (2a) | umninikhaya | < | umnini-ikhaya |
| | 'home owner' | | owner-home |
| (2b) | impilontle | < | impilo-entle |
| | 'good health' | | life-AGR-good |
| (2c) | indlalifa | < | indla-ilifa |
| | 'person who inherits' | | eater-inheritance |
| (2d) | imalimboleko | < | imali-imboleko |
| | 'loan' | | money-loan |

| | | |
|---|--|---|
| (2e) uNtombizobawo 'girls of father' | < u-ntombi-za-ubawo AGR(cl.1)-girls-of- father' | (7d) -sula 'wipe' (7e) -khupha 'take out' (7f) -galela 'pour' |
| (2f) uNoxolo 'the one with peace' | < u-No-uxolo AGR(cl.1)-Fem-peace | • Verbs of creation. |
| (2g) uMzimkhulu 'big house' | < u-Mzi-M-khulu AGR(cl.1)-house- AGR-big | (8a) -qingqa 'carve' (8b) -xovula 'knead' (8c) -zoba 'draw' (8d) -akha 'build' (8e) -bhaka 'bake' |
| (2h) uNtombi zandile 'the girls have increased' | < u-Ntombi-zi-and-ile AGR(cl.1)-girls- AGR(cl.10)-increase- Perf. | • Verbs of perception. |

Verbs, Verb Phrases, and Clauses

Transitivity and Verbal Derivation

IsiXhosa has a wide range of nonderived verbs, which are intransitive and monotransitive. A smaller number of nonderived verbs are ditransitive, as shown in the following examples. Intransitive verbs (3) include experienter verbs, motion verbs, and weather verbs.

- (3a) -gula 'be ill'
- (3b) -vuya 'be happy'
- (3c) -sebenza 'work'
- (3d) -hamba 'travel'
- (3e) -phuma 'go out, exit'
- (3f) -tshona 'sink'
- (3g) -jika 'turn'
- (3h) -buya 'return'

Verbs from a wide range of semantic classes appear as nonderived monotransitive verbs, as illustrated by the following examples.

- Verbs of change.
 - (4a) -aphula 'break'
 - (4b) -goba 'bend'
 - (4c) -pheka 'cook'
 - (4d) -oja 'roast'
 - (4e) -vala 'close'
- Verbs of change of possession.
 - (5a) -qokelela 'collect'
 - (5a) -fumana 'get, obtain'
 - (5a) -(i)ba 'steal'
 - (5a) -kha 'pick (fruit)'
- Verbs of communication.
 - (6a) -bika 'report'
 - (6b) -thetha 'speak'
 - (6c) -ncokola 'converse'
 - (6d) -hleba 'gossip'
 - (6e) -geza 'joke'
- Verbs of contact.
 - (7a) -beka 'put'
 - (7b) -tyala 'plant'
 - (7c) -xhoma 'hang'

- Verbs of social interaction.
 - (9a) -bona 'see'
 - (9b) -(i)va 'hear/feel/taste'
 - (9c) -ngcamla 'taste'
 - (9d) -ngqina 'witness'
 - (9e) -jonga 'look at'
- Verbs of social interaction.
 - (10a) -vuma 'agree'
 - (10a) -qhula 'joke'
 - (10a) -tyelela 'visit'

Examples of nonderived ditransitive verbs appear in (11).

- (11a) -nika 'give'
- (11b) -pha 'give (as gift)'
- (11c) -boleka 'lend'
- (11d) -vimba 'refuse'
- (11e) -buza 'ask'
- (11f) -cela 'request'

As is typical of the Bantu languages, the transitivity properties of verbs in isiXhosa can be altered by suffixation of various verbal derivational suffixes, which can appear in combination with one another (Satyo, 1986) and which can be reduplicated to achieve various semantic effects. The applicative (APPLIC) and causative suffixes are transitivizing suffixes in that they introduce a new NP argument to the verb (Du Plessis, 1978, 1980b, 1997; Du Plessis and Visser 1992, 1998). When these suffixes appear, intransitive verbs becomes monotransitive and monotransitive verb become ditransitive. The applicative suffix can introduce an NP argument bearing the semantic role of benefactive, malefactive, recipient, purpose, and cause/reason, as shown in the examples in (12) (AGRS stands for subject agreement).

- (12a) umfazi ufundela
 umfazi u-fund-el-a
 woman AGRS-read-APPLIC-PRES
 abantwana amabali
 abantwana amabali
 children stories
 'the woman reads stories for the children'

Table 4 Reduplicated applicative forms

| Verb | Reduplicated applicative | | |
|--|-------------------------------|------|----------|
| -bopha 'tie' | -bophelela 'tie thoroughly' | | |
| -funa 'search' | -funelela 'search thoroughly' | | |
| -sula 'wipe' | -sulelela 'wipe thoroughly' | | |
| (12b) inkwenkwe | ibalekela | | indebe |
| inkwenkwe | i-balek-el-a | | indebe |
| boy | AGRS-run-APPLIC-PRES | cup | |
| 'the boy is running for the cup' | | | |
| (12c) umfazi | ulilela | | ilahleko |
| umfazi | u-lil-el-a | | ilahleko |
| woman | AGRS-cry-APPLIC-PRES | loss | |
| 'the woman cries for (her) loss' | | | |
| (12d) abafazi | baphekela | | |
| abafazi | ba-pheke-el-a | | |
| women | AGRS-cook-APPLIC-PRES | | |
| umtshato | inyama | | |
| umtshato | inyama | | |
| wedding | meat | | |
| 'The women cooks meat for the wedding' | | | |

The applicative can appear in a reduplicated form to denote an intensified action, as shown in Table 4.

Causative Suffix

The causative (CAUS) suffix *-is-* regularly denotes three kinds of meanings, depending on the verbal semantics and the pragmatic context: coercive ('make/force to do something'), assistive ('help do something'), and permissive ('let do something').

- (13a) umfana ulimisa utata intsimi
 umfana u-lim-is-a utata intsimi
 young.man AGRS-plough-
 CAUS-PRES father field
 'the young man helps his father plough the field'
- (13b) utitshala ubhalisa abantwana ileta
 utitshala u-bhal-is-a abantwana ileta
 teacher AGRS-write-
 CAUS-PRES children letter
 'the teacher makes/helps/lets write the children a letter'

Detransitivising Verbal Affixes

The reciprocal (RECIP) suffix *-ana* (14) and the reflexive (REFL) verbal prefix *-zi-* (15) in isiXhosa are detransitivizing morphemes, as is typical of the Bantu languages.

- (14a) abantu bayathandana
 abantu ba-ya-thand-an-a
 people AGRS-PRES-like-RECIP-PRES
 'the people like each other'

- (14b) uZola noNomsa bayathandana
 uZola na-uNomsa AGRS-PRES-thand-an-a
 Zola and-Nomsa like-RECIP-PRES
 'Zola and Nomsa like/love each other'
- (14c) uZola uthandana noNomsa
 uZola u-thand-an-a na-uNomsa
 Zola AGRS-like-RECIP-PRES with-Nomsa
 'Zola and Nomsa like/love each other'
- (15a) umntwana uyazibona
 umntwana u-ya-zi-bon-a
 child AGRS-PRES-REFL-see-PRES
 'the child sees himself/herself'
- (15b) abantwana bayazihlamba
 abantwana ba-ya-zi-hlamb-a
 children AGRS-PRES-REFL-wash-PRES
 'the children were themselves'

Unaccusative Verbal Suffixes: Passive and Neuter-Passive

Passive (PASS) *-w-* (16) and neuter-passive (NEUT. PASS) stative *-ele-l-akal-* (17) verbal suffixes are unaccusative, in that the object of a transitive verb must either raise to become the subject of the verb or remain in the object position and receive nominative case from a phonetically empty existential subject pronominal associated with the subject agreement prefix *ku-* on the verb (Visser, 1986; Du Plessis and Visser, 1992b, 1998).

- (16a) incwadi iyafunwa ngumfundi
 incwadi i-ya-fun-w-a ng-umfundi
 book AGRS-PRES-
 want-PASS-pres cop-student
 'the book is wanted/searched for by the student'
- (16b) kufunwa incwadi ngumfundi
 ku-fun-wa incwadi ng-umfundi
 EXIST.AGRS-want/
 search-PASS.PRES book cop-student
 'there is being wanted a book by the student'
- (17a) incwadi iyafuneka kumfundi
 incwadi i-ya-fun-ek-a ku-umfundi
 book AGRS-PRES-want to-student
 -NEUT.PASS-PRES
 'a book is needed to (for) the student'
- (17b) kufuneka incwadi kumfundi
 ku-fun-ek-a incwadi ku-umfundi
 EXIST.AGRS-want book to-student
 -NEUT.PASS-PRES
 'there is a book is needed to (for) the student'
- (17c) intaba iyabonakala
 intaba i-ya-bon-akal-a
 mountain AGRS-PRES-see-NEUT.PASS-PRES
 'the mountain is visible'
- (17d) kubonakala intaba
 ku-bon-akal-a intaba
 EXIST.AGRS-see-NEUT.PASS-PRES mountain
 'the mountain is visible'

Table 5 Intransitive-transitive verbal pairs with the consonant *-k-* and *-l-*

| Intransitive stative | Transitive |
|-------------------------------|------------------------|
| -guquka 'be turned' | -guqula 'turn' |
| -aphuka 'be broken' | -aphula 'break' |
| -ahluka 'be separated/parted' | -ahlula 'separate' |
| -phekula 'be turned upside' | -phekula 'turn upside' |
| -khawuka 'be broken off' | -khawula 'break off' |
| -sombuluka 'be unfolded' | -sombulula 'unfold' |

Source: Du Plessis and Visser (1998).

The neuter-passive suffix *-ek-/akal-* changes the verb into a stative verb, as shown in Table 5.

Verbal Inflection

IsiXhosa exhibits the inflectional morphemes typical of the Bantu languages, namely agreement, tense, aspect, mood, and negative (Du Plessis, 1986, 1997; Du Plessis and Visser, 1992b, 1998; Gowlett, 2003).

Subject and Object Agreement Prefixes The isiXhosa verb, like verbs in the Bantu languages in general, exhibits a subject agreement prefix (AGRS), which appears obligatorily, except with imperative mood verbs and certain instances of deficient verbs. The isiXhosa verb also contains an object agreement prefix (AGRO), which in general appears optionally (Du Plessis, 1978, 1997) and is often used to emphasize the verb phrase or to establish the object feature when the object argument is separated from the verb by intervening lexical or phrasal categories. In the examples in (18), the noun classes of the NP subject and object appear in brackets.

- (18a) umntwana uyayifunda incwadi
 umntwana u-ya-yi-fund-a incwadi
 [class 1] [class 9]
 child AGRS-PRES- book
 AGRO-read-PRES
 'the child reads a book'
- (18b) abantwana bayazifunda iincwadi
 abantwana ba-ya-zi-funda iincwadi
 [class 2] [class 10]
 children AGRS-PRES-AGRO- books
 read.PRES
 'the children read the books'
- (18c) amadoda ayabusela utywala
 amadoda a-ya-bu-sela utywala
 [class 6] [class 14]
 men AGRS-PRES- beer
 AGRO-drink
 'the men drink beer'

Sentences like these, in which the object co-occurs with an object agreement prefix, denote additional emphasis on the verb phrase.

Aspect Morphemes The verbal inflectional morphology in isiXhosa contain a number of prefixes that denote aspectual features. These prefixes include *-sa-* 'still' (the progressive, PROG), *-ka-* 'not, get', and *-yawa-* 'as usual'. The potential morpheme *-nga-* denotes 'ability', 'possibility', or 'permission' (Louw, 1963; Du Plessis, 1978, 1997).

- (19a) abafundi basafunda
 abafundi ba-sa-fund-a
 students AGRS-PROG-learn/read-PRES
 'the students are still reading/learning'
- (19b) abafundi abakafundi
 abafundi a-ba-ka-fund-i
 students NEG-AGRS-not-read-NEG
 'the students have not read yet'
- (19c) abafundi bayawafunda
 abafundi ba-yawa-fund-a
 students AGRS-as.usual-read-PRES
 'the students are studying as usual'
- (19d) abafundi bangaphumelela
 abafundi ba-nga-phumelela
 student AGRS-can/may-succeed
 'the students can/may succeed'

Tense Inflection IsiXhosa has the typical tense distinctions found in the Bantu languages: present tense, perfect past tense, remote (A-) past tense, future tense, and compound (recent and remote) past tenses. The compound tenses appear as complex sentence constructions with a deficient verb taking a participial clause complement. The various past tenses are associated with specific features of (im)perfectivity (Louw, 1963; Du Plessis, 1978, 1986, 1997; Poulos and Msimang, 1998).

Present Tense The present tense verb form in isiXhosa can exhibit features of habituality and emphasis, in addition to denoting a literal present tense activity (Du Plessis, 1986, 1997).

- (20a) iintombi ziphendula imibuzo
 iintombi zi-phendul-a imibuzo
 girls AGRS-answer-PRES questions
 'the girls answer the questions'
- (20b) iintombi aziphenduli mibuzo
 iintombi a-zi-phendul-i mibuzo
 girls NEG-AGRS-answer- questions
 NEG
 'the girls do not answer (any) questions'
- (20c) iintombi aziyiphenduli imibuzo
 iintombi a-zi-yi-phendul-i imibuzo
 girls NEG-AGRS-AGRO questions
 -answer-NEG
 'the girls do not answer the (specific) questions'

The negative sentences in (20b) and (20c) illustrate the indefinite and definite negative, respectively. The

former is characterized by the absence of the initial vowel (the preprefix) of the object NP and the related absence of the object agreement prefix in the verb morphology, whereas the latter is characterized by the presence of the preprefix of the NP object argument and the associated presence of the object agreement prefix in the verb morphology (Visser, 2002). Similar definite and indefinite negatives may appear in all the other tenses.

Future Tense The future tense is characterized by the verb *-za* ‘come’ or *-ya* ‘go’ followed by the infinitive prefix on the main verb.

- (21a) iintombi ziza/ziya
 iintombi zi-za/zi-ya
 girls AGRS-come/AGRS-go
 kuphendula imibuzo
 ku-phendula imibuzo
 INF-answer questions
 ‘the girls will answer the questions’

The use of the deficient verb *-za* in the future tense denotes an immediate future, whereas the use of the deficient verb *-ya* denotes either a remote future or an immediate future action with a high degree of certainty.

- (21b) iintombi azizi/aziyi
 iintombi a-zi-z-i/a-zi-y-i
 girls NEG-AGRS-come-NEG/NEG-AGRS-go-NEG
 kuphendula mibuzo
 ku-phendula mibuzo
 INF-answer questions
 ‘the girls will answer the questions’

Perfect Past Tense The perfect past tense denotes an action in the recent past that has been completed (Louw, 1963; Du Plessis, 1978, 1997).

- (22a) abafana basebenzile
 abafana ba-sebenz-ile
 young.men AGRS-work-PERF
 ‘the young men worked’
 (22b) abafana abasebenzanga
 abafana a-ba-sebenz-anga
 young.men NEG-AGRS-work-PERF.NEG
 ‘the young men did not work’

Remote Past Tense The remote past tense verb takes a subject agreement prefix with a long rising-falling vowel *-a-*.

- (23a) iintombi zacula iingoma
 iintombi zi-a-cula iingoma
 girls AGRS-PAST-sing songs
 ‘the girls sang songs’

- (23b) umfundi wabhala ileta
 umfundi u-a-bhala ileta
 student AGRS-PAST-write letter
 ‘the student wrote a letter’

Compound Past Tenses The compound past tenses denote an activity or state that took place in the past but that has not been completed; hence, they exhibit the imperfective aspect. The lexical verb in these tenses are in the participial mood.

Recent Compound Past Tense The recent compound past tense is characterized by a perfect tense deficient verb *-be* taking a participial complement clause, as shown in the following examples.

- (24a) iintombi zibe zicula iingoma
 iintombi zi-b-e zi-cula iingoma
 girls AGRS-be-PERF AGRS-sing songs
 ‘the girls were singing songs’

- (24b) iintombi zibe zingaculi ngoma
 iintombi zi-b-e zi-nga-cul-i ngoma
 girls AGRS-be AGRS-NEG songs
 -PERF -sing-NEG
 ‘the girls were not singing (any) songs’

Remote Compound Past Tense The deficient verb *-ba/-ye* appears in the remote compound past tense taking the morpheme *-a-* in its subject agreement affix and subcategorizing for a participial complement clause, as shown in the following examples.

- (25a) iintombi zaba zicula iingoma
 iintombi zi-a-ba zi-cula iingoma
 girls AGRS-PAST-be AGRS-sing songs
 ‘the girls were singing songs’
 (25b) iintombi zaba zingaculi ngoma
 iintombi zi-a-ba zi-nga-cul-i ngoma
 girls AGRS- AGRS-NEG- songs
 PAST-be sing-NEG
 ‘the girls did not sing (any) songs’

Negative Inflection The negative inflection of isiXhosa is realized through verbal prefixation, infixation, and suffixation, depending on the mood properties of the verb (Du Plessis, 1978, 1997). The examples of negative sentences given in the previous section demonstrate that negation in indicative mood verbs is realized by a verbal prefix that occurs before the subject agreement prefix and by a verbal suffix, whereas in participial clauses (in the compound tenses) the negative morpheme (*-nga-*) appears after the subject agreement prefix together with a negative verbal suffix. Further examples of negative sentences in isiXhosa appear in the subsection on mood inflection next.

Mood Inflection Linguists differ on the number of moods that can be distinguished for isiXhosa and closely related languages such as isiZulu (Louw, 1963; Du Plessis, 1978, 1997; Poulos and Msimang, 1998). The following nine moods have been distinguished for isiXhosa.

Indicative Mood The indicative mood is used in main clauses for statements and questions. Indicative mood clauses may also appear as a complement clauses of factive verbs.

(26a) abafundi bahala uviwo
 abafundi ba-bhal-a uviwo
 student AGRS-write-PRES examination
 'the student is writing examination'

(26b) abafundi ababhali viwo
 abafundi a-ba-bhal-i viwo
 students NEG-AGRS examination
 -write-NEG
 'the students are not writing (any)
 examination'

(26c) abafundi abalubhali uviwo
 abafundi a-ba-lu-bhal-i uviwo
 students NEG-AGRS-AGRO- examination
 write-NEG
 'the students are not writing the (specific)
 examination'

The sentences in (26) can be changed into questions by using rising intonation toward the sentence-final position.

The sentences in (26b) and (26c) illustrate the indefinite and definite negatives, respectively. The indefinite negative is characterized by the loss of the initial vowel of the noun class prefix of the object noun and the absence of the object agreement affix in the verbal morphology. The definite negative is characterized by the presence of the initial vowel of the object noun and the associated object agreement prefix in the verbal morphology. The indefinite-definite negative distinction also has an influence on the morphological form of several categories that function as nominal modifiers.

The indicative mood exhibits the tense distinctions discussed in the previous subsection on tense inflection.

Participial (Situative) Mood The participial mood is used in subordinate clauses that denote an activity or state that takes place simultaneously with the activity or state expressed by the main clause. It is clearly identifiable by its subject agreement morphology for noun classes 1, 2, and 6 and by morphemes that occur with monosyllabic and vowel verb stems in positive

sentences. In addition, the participial mood regularly occurs after certain temporal conjunctives (as in 27c) and deficient verbs (as in 27d) (Louw, 1963; Du Plessis, 1978, 1997; Du Plessis and Visser, 1992b).

(27a) abafundi bathula
 abafundi ba-thula
 students AGRS-be.quiet
 bebhala uviwo
 be-bhala uviwo
 AGR(PART)-write examination
 'the students are quiet while they are writing
 examination'

(27b) abafundi babhala uviwo
 abafundi ba-bhala uviwo
 students AGRS-write examination
 besiva imiyalelo
 be-si-v-a imiyalelo
 AGRS(PART)-AFF(PART)-hear-PRES instructions
 'the students write examinations while hearing
 the instructions'

(27c) abafundi bathula xa
 abafundi ba-thula xa
 students AGRS-be.quiet when
 bebhala uviwo
 be-bhal-a uviwo
 AGRS(PART)-write-PRES examination
 'the students are quiet when they write
 examinations'

(27d) abafundi basoloko
 abafundi ba-soloko
 students AGRS-always.do
 bebhala uviwo
 be-bhal-a uviwo
 AGRS(PART)-write-PRES examination
 'the students always write examination'

(27e) abafundi babhala uviwo
 abafundi ba-bhal-a uviwo
 students AGRS-write-PRES examination
 bengafundanga kakuhle
 be-nga-fund-anga kakuhle
 AGRS(PART)-NEG-learn-NEG well
 'the students write examinations (while) they
 have not studied well'

The participial mood in isiXhosa can exhibit all the various tense forms discussed in the subsection on tense inflection.

Relative Mood The relative mood clause occurs widely as a nominal modifier in isiXhosa. It is characterized by the coalescence of a definitizing morpheme *-a-*, which also occurs with various other nominal modifiers, with the subject agreement prefix of the relative clause verb. This definitizing morpheme is, however, omitted when the relative clause head is the object argument of an indefinite negative verb or when the relative clause head occurs with

a demonstrative pronoun. The relative clause in isiXhosa typically contains a resumptive pronoun, coreferential with the relative clause head, which can be realized as an object agreement prefix in the verbal morphology, a prepositional complement, or complement of a copulative, as illustrated by the following examples:

- (28a) abafundi ababhala uviwo
 abafundi a-ba-bhal-a uviwo
 students AFF(DEF)-AGRS- examination
 write-PRES
 bafunde kakuhle
 ba-fund-e kakuhle
 AGRS-learn-PERF well
 ‘the students who write examinations have studied well’
- (28b) aba bafundi babhala
 aba bafundi ba-bhal-a
 DEM students AGRS-write-PRES
 uviwo bafunde kakuhle
 uviwo ba-fund-e kakuhle
 examinations AGRS-learn-PERF well
 ‘these students who write examinations have studied well’
- (28c) asibizi bafundi
 a-si-biz-i bafundi
 NEG-AGRS-call-NEG students
 babhala uviwo
 ba-bhal-a uviwo
 AGRS-write-PRES examinations
 ‘we do not call (any) students who write examinations’
- (28d) abafundi enibafunayo
 abafundi a-ni-ba-fun-a-yo
 students AFF(DEF)-AGRS-AGRO-want-PRES-AFF(RC)
 babhala uviwo
 ba-bhal-a uviwo
 AGRS-write-PRES examination
 ‘the students who you want, are writing examination’
- (28e) abafundi endiya kubo
 abafundi a-ndi-y-a ku-bo
 students AFF(RC)-I-go-PRES to-them
 babhala uviwo
 ba-bhal-a uviwo
 AGRS-write-PRES examination
 ‘the students to whom I am going write examinations’
- (28f) utitshala ubiza abafundi
 utitshala u-biz-a abafundi
 teacher AGRS-call-PRES students
 abangabhali viwo
 a-ba-nga-bhal-i viwo
 AFF(RC)-AGRS-NEG-write-NEG examination
 ‘the teacher is calling the students who are not writing (any) examination’

The relative mood can appear in all the various tenses discussed in the subsection on tense inflection.

A relative mood clause can also occur after certain conjunctives (as in (29a)), often as an alternative to the participial mood clause due to the phenomenon that the distinction between the relative mood and participial mood is vacuous in some Southern Bantu languages such as Xitsonga.

- (29a) abafundi bathula
 abafundi ba-thul-a
 students AGRS-be.quiet-PRES
 xa bafundayo
 xa ba-fund-a-yo
 when AGRS-learn-PRES-AFF(RC)
 ‘the students are quiet when they study’
- (29b) kuseloko abafundi bafundayo
 kuseloko abafundi ba-fund-a-yo
 since students AGRS-learn-PRES-AFF(RC)
 kakuhle baphumelela uviwo
 kakuhle ba-phumelel-a uviwo
 well AGRS-pass-PRES examination
 ‘since the students study well they pass the examination’

Subjunctive Mood The subjunctive mood is associated with a range of semantic contexts. It can appear in clauses denoting successive actions, necessity and obligation, purpose, wish, and prohibition, as shown in the following examples, in which these meanings are often determined by the semantic features of the verb by which it is subcategorized.

The subjunctive mood is clearly identifiable by overt morphology, specifically the verbal suffix *-e* and the subject agreement prefix *a-* for class 1 nouns. Its morphology is invariable, and it does not exhibit tense distinctions.

- Successive actions.

- (30) abantwana bavuka kusasa bahlambe
 abantwana ba-vuk-e ba-hlamb-e
 children AGRS-wake-up early
 ubuso batye
 ubuso ba-ty-e
 AGRS-wash-AFF(SUBJ) AGRS-eat-AFF(SUBJ)
 babulise abazali
 ba bulis-e abazali
 AGRS-greet-AFF(SUBJ) parents
 baye esikolweni
 ba-y-e isikolo-ini
 AGRS-go-AFF(SUBJ) LOC school-LOC
 ‘the children wake up early, wash (their) faces, eat, greet (their) parents, and go to school’

- Necessity, obligation.

- (31a) utitshala uyalela ukuba
 utitshala u-yalel-a ukuba

teacher AGRS-instruct-PRES COMP
 abantwana bafunde iincwadi
 abantwana ba-fund-e incwadi
 children AGRS-read-AFF(SUBJ) book
 'the teacher instructs the children to read
 a book'

(31b) kufuneka ukuba abafundi
 ku-funeka ukuba abafundi
 EXIST-be.needed COMP students
 babhale uviwo
 ba-bhal-e uviwo
 AGRS-write-AFF(SUBJ) examination
 'it is necessary that the students write the
 examination'

• Request, wish, desire.

(32a) utitshala ucela ukuba
 utitshala u-cel-a ukuba
 teacher AGRS-request-PRES COMP
 abantwana bafunde incwadi
 abantwana ba-fund-e incwadi
 children AGRS-read-AFF(SUBJ) book
 'the teacher requests the children to read
 a/the book'

(32b) abazali banqwenela ukuba
 abazali ba-nqwenel-a ukuba
 parents AGRS-wish-PRES COMP
 abafundi baphumelele uviwo
 abafundi ba-phumelel-e uviwo
 students AGRS-pass-AFF(SUBJ) examination
 'the parents wish that the students pass the
 examination'

• Purpose.

(33a) abafundi bafunda kakhulu ukuze
 abafundi ba-fund-a kakhulu ukuze
 students AGRS-learn-PRES much COMP
 baphumelele uviwo
 ba-phumelel-e uviwo
 AGRS-pass-AFF(SUBJ) examination
 'the students study hard so that they pass the
 examination'

(33b) abafundi bafundela ukuba
 abafundi ba-fund-el-a ukuba
 students AGRS-learn-APPLIC-PRES COMP
 baphumelele uviwo
 ba-phumelel-e uviwo
 AGRS-pass-AFF(SUBJ) examination
 'the students study so that they pass the
 examination'

(33c) abafana basebenza evenkileni
 abafana ba-sebenz-a e-ivenkile-ini
 young.men AGRS-work-PRES LOC-shop-LOC

ukuze bafumane imali
 ukuze ba-fuman-e imali
 COMP AGRS-get-AFF(SUBJ) money
 'the young men work in the shop so that they
 get money'

- Questions expressing potential necessity or obligation. Subjunctive mood interrogatives are allowed only with first-person subject pronominals.

(34a) ndincede aba bantu?
 ndi-nced-e aba bantu
 AGRS(1.SING)-help-AFF(SUBJ) DEM people
 'must I help these people?'

(34b) singene endlwini?
 si-ngen-e e-indlu-ini
 AGRS(1.PL)-enter-AFF(SUBJ) LOC-house-LOC
 'must we enter into the house?'

- Prohibition. A subjunctive mood clause that denotes a prohibition must have a subject pronominal in the second person and must be in the negative.

(35a) ungayibeki incwadi apha!
 u-nga-yi-bek-i incwadi apha
 AGRS(2.SING)-NEG- book here
 AGRO-put-NEG
 'don't put the book here!'

(35b) ningalibali ukuthenga isonka!
 ni-nga-libal-i uku-thenga isonka
 AGRS(2.PL)-neg- INF-buy bread
 forget-NEG
 'don't forget to buy bread!'

- Exhortation.

(36a) usale kamnandi
 u-sal-e kamnandi
 AGRS(1.SING)-stay(behind)-
 AFF(SUBJ) nicely
 'you stay (behind) nicely'

(36b) uhambe kakuhle
 u-hamb-e kakuhle
 AGRS(1.SING)-travel-AFF(SUBJ) well
 'you stay (behind) well'

(36c) nilale kamnand
 ini-lal-e kamnandi
 AGRS(1.PL) nicely
 'you must sleep nicely'

- The subjunctive mood in the complement clause of deficient verbs.

(37a) umfundi uphinda abhale uviwo
 umfundi u-phinda a-bhal-e uviwo
 student AGRS-do. AGRS-write- examination
 again AFF(SUBJ)
 'the student again writes the examination'

- (37b) umfundi ukhawuleza
 umfundi u-khawuleza
 student AGRS-do.quickly
 abhale uviwo
 a-bhal-e uviwo
 AGRS-write-AFF(SUBJ) examination
 'the student quickly writes the examination'

Consecutive Mood The consecutive (CONS) mood occurs in clauses that denote successive actions or states, in which the first verb is in the past tense. It is an invariable form that cannot have tense distinctions.

- (38) umntwana uvuke wahlamba
 umntwana u-vuk-e u-a-hlamba
 child AGRS-wake-PERF AGRS-AFF(CONS)-wash
 ubuso watya wabulisa
 ubuso u-a-tya u-a-bulisa
 face AGRS-AFF(CONS)-eat AGRS-AFF(CONS)-greet
 abazali waya esikolweni
 abazali u-a-ya e-isikolo-ini
 parents AGRS-AFF(CONS)-go LOC-school-LOC
 'the child woke up, washed (his/her) face, ate, greeted (his/her) parents, and went to school'

A consecutive mood clause may occur as complement of certain deficient verbs, in which the deficient verb itself is normally in the past tense.

- (39a) umfundi uphinde wabhala uviwo
 umfundi u-phind-e wa-bhala uviwo
 student AGRS-do. AGRS (CONS)-write
 again- (CONS)-write
 PERF
 'the student again wrote the examination'

- (39b) umfundi ukhawuleze wabhala uviwo
 umfundi u-khawulez-e wa-bhala uviwo
 student AGRS-do. AGRS examination
 quickly- (CONS)-
 PERF write
 'the student quickly wrote the examination'

Imperative Mood The imperative is used for commands and instructions. If the command or instruction is directed to more than one person, the verb takes the suffix *-ni*.

- (40a) funda incwadi!
 read book
 'you (SING) read the book!'
 (40b) fundani incwadi!
 funda-ni incwadi
 read-PL book
 'you (PL) read the book!'

Hortative Mood The hortative (HORT) mood is used in clauses that express polite direct requests, in which

instance the deficient verb *-kha* is used. The hortative can also be used to express indirect requests or instructions.

- (41a) khawuphendule imibuzo
 kha-wu-phendul-e imibuzo
 let-AGRS(1.SING)- answer-AFF(HORT)
 'please answer the questions'
- (41b) khanifunde iincwadi
 kha-ni-fund-e iincwadi
 let-AGRS(1.PL)-read-AFF(HORT) books
 'please read the books'
- (41c) abafundi mabaphendule imibuzo
 abafundi ma-ba-phendul-e imibuzo
 students AFF(HORT)-AGRS- questions
 answer-AFF(HORT)
 'the students must answer the questions'
- (41d) umntwana makafunde iincwadi
 umntwana ma-ka-fund-e iincwadi
 child AFF(HORT)-AGRS- books
 read-AFF(HORT)
 'the child must read the book'
- (41e) abafundi mabangayiphenduli imibuzo
 abafundi ma-ba-nga-yi- imibuzo
 phendul-i
 students AFF(HORT)-AGRS- questions
 NEG-AGRO-answer-
 AFF(HORT)
 'the students must not answer the questions'

The hortative does not exemplify any tense distinctions.

Temporal Mood The temporal (TEMP) mood occurs as a subordinate clause that denotes an activity that takes place (partly) simultaneously with the activity or state denoted by the main clause. It contains the invariable verbal prefix *-aku*. The logical subject argument usually appears in the postverbal position.

- (42a) bakufunda abafundi
 ba-aku-funda abafundi
 AGRS-AFF(TEMP)-study students
 baxoxa incwadi
 ba-xox-a incwadi
 AGRS-discuss-PRES books
 'when the students study, they discuss the books'
- (42b) sakufika ekhaya
 si-aku-fika e-ikhaya
 LOC-home AGRS-PRES-rest-PRES
 siyaphumla
 si-ya-phuml-a
 AGRS-AFF(TEMP)-arrive
 'when we arrive at home, we rest'

- (42c) bakungasebenzi abafundi badiniwe
 ba-aku-nga abafundi ba-diniwe
 -sebenz-i
 AGRS-AFF(TEMP) students AGRS-tired
 -NEG-work-NEG
 ‘when the students do not work, they are tired’

Infinitive Mood The infinitive mood clause is regularly subcategorized by specific (cognition) verbs, as in (43a) and (43b). It may occur in NP argument positions in a nominalized grammatical function, as in (43c) and (43d). Some verbs can allow a purposive infinitival complement only if they have an applicative suffix, as in (43e) and (43f) below (Visser, 1989).

- (43a) abafana bayakwazi ukunceda abazali
 abafana ba-ya-ku-azi uku-nceda abazali
 young.men AGRS-PRES- INF-help parents
 AGRO-know
 ‘the young men know (how) to help (their) parents’
- (43b) umfundi uyaqonda ukuphendula imibuzo
 umfundi u-ya-qonda uku-phendula imibuzo
 student AGRS-PRES- INF-answer questions
 understand
 ‘the student understands to answer questions’
- (43c) ukubhala kwabafundi kulungile
 uku-bhala kwa-abafundi ku-lungile
 INF-write GEN-students AGRS(EXIST)-good
 ‘the writing of the students is good’
- (43d) ukungafundi kwabafundi
 uku-nga-fund-i kwa-abafundi
 INF-NEG-learn-NEG GEN-students
 kuyamangalisa
 ku-ya-mangalisa
 AGRS(EXIST)-PRES-amaze
 ‘the nonlearning of the students amazes (people)’
- (43e) abafana basebenzela ukufumana imali
 abafana ba-sebenz-el-a uku-fumana imali
 young.men AGRS-work- INF-get money
 APPLIC-PRES
 ‘the young men work to get money’
- (43f) abafundi bafundela ukuphumelela uvio
 abafundi ba-fund-el-a uku-phumelela uvio
 students AGRS-learn- INF-pass examination
 APPLIC-
 PRES
 ‘the students study to pass the examination’

Ideophones IsiXhosa is characteristic of the Bantu languages in that it is rich in ideophones. Ideophones can function as predicates, adverbs, or interjections and are often onomatopoeic. They denote the manner or sound of an activity or the color of an object. The ideophone (IDEO) that forms part of a predicate has

inherent lexical properties of transitivity. In isiXhosa, the verb *-thi*, which co-occurs with the ideophone to form a predicate, serves as the host element for inflection, but it can be omitted in certain instances (Du Plessis, 1978, Du Plessis and Visser, 1998).

Intransitive Ideophones

- (44a) lo mntwana uhleli uthe
 lo mntwana u-hleli u-th-e
 DEM child AGRS-sit AGRS-do-PERF
 qwa
 qwa
 ideo (upright)
 ‘this child sat upright’
- (44b) abantu bathi nqa
 abantu ba-th-i nqa
 people AGRS-do-PRES ideo (surprise)
 ngale nto
 nga-le nto
 about-this thing
 ‘the people are surprised by this thing’
- (44c) ixhego lithe chu
 ixhego li-th-e chu
 old.man AGRS-do-PERF ideo (go.slowly)
 waya endlini
 wa-ya e-ndlu-ini
 AGRS(CONS)-go LOC-house-LOC
 ‘the old man walked slowly and went to the house’
- (44d) abafazi bathe xha
 abafazi ba-th-e xha
 women AGRS-do-PERF ideo (wait)
 ‘the woman waited’
- (44e) le ndoda ithe xhwenene
 le ndoda i-th-e xhwenene
 this man AGRS-do-PERF ideo (suddenly.stop)
 ‘this man stopped suddenly’

The ideophones in (44a)–(44e) also illustrate the various click sounds, the ingressive sounds borrowed by isiXhosa from the Khoisan languages. The consonant *q* represents the palatal ingressive click sound [•], the consonant *c* represents the dental ingressive click sound [•], and the consonant *x* or (*xh*) represents the alveolateral ingressive click sound [•].

Transitive Ideophones

- (45a) lo mfana wathi
 lo mfana wa-th-i
 DEM young.man AGRS-do-PRES
 rhuthu intonga yakhe
 rhuth intonga ya-khe
 ideo (take.out) stick GEN-his
 ‘this young man took out his stick’
- (45b) lo mfana uthe
 lo mfana u-th-e
 DEM young.man AGRS-do-PERF

| | | | |
|-------|---------------------------------|-------------|---------------|
| | qhiwu | indebe | |
| | qhiwu | indebe | |
| | ideo (hold.high) | cup | |
| | 'this man held the cup high up' | | |
| (45c) | bamthe | hlasi | ngengalo |
| | ba-m-the-e | hlasi | nga-ingalo |
| | AGRS-AGRO-do-PERF | ideo (grab) | by-arm |
| | 'they grabbed him on the arm' | | |
| (45d) | bamthe | nqaku | lo mfana |
| | ba-m-th-e | nqaku | lo mfana |
| | AGRS-AGRO | ideo (grab) | DEM young.man |
| | -do-PERF | | |
| | 'they grabbed this young man' | | |

Location and Speakers

Yakut (*saxa tila*) belongs to the Northeastern or Siberian branch of Turkic languages. It has about 380 000 native speakers living in northeastern Siberia, mainly in the Yakut Autonomous Republic (*Saxa Avtonomnaya Respublikata*) within the Russian Federation. The republic, whose capital is Yakutsk, has around one million inhabitants, of whom one-third are Yakuts.

The Yakut language occupies the easternmost and, together with Dolgan, the northernmost Turkic-speaking area. The huge Yakut territory has its center in the lowlands on the middle and lower reaches of Lena and its tributaries Aldan and Vilyuy; most Yakuts live in this region. In the northwest, the Yakut territory extends up to the Arctic Ocean, comprising the Khatanga river system. In the extreme northwest, speakers of Yakut live on the Taimyr peninsula, particularly on the southern slopes of the Byrranga mountain range. In the northeast, the territory extends to the lowlands of the Yana and Indigirka river systems, up to the New Siberian Islands, and even beyond the Kolyma river. Small groups of Yakut speakers live outside the republic, e.g., in the Magadan, Irkutsk, Chita, Amur, and Khabarovsk areas.

In spite of the strong dominance of Russian, which is the language of higher education, Yakut has a relatively strong status in the republic, also being used as a second language by many speakers of Evenki, Even, and Yukagir.

Origin and History

After their emigration to northeastern Siberia, the ancestors of the Yakuts lost their contact with other Turkic-speaking groups. Since their language has been geographically isolated from other Turkic varieties for many centuries, it exhibits features that sharply distinguish it from them and makes it unintelligible

to speakers of other Turkic languages. Numerous archaic features show that the contact with the rest of the Turkic world was lost very early. On the other hand, a great number of deviations are the results of innovative developments.

The ancestors of the Yakuts seem to have belonged to the 'tree Kurikan tribes' (*üč qurıqan*) mentioned in the East Old Turkic stone inscriptions found in the Orkhon river valley. It is obvious that they lived for a relatively long time in the area surrounding Lake Baikal before they migrated northward. This is also indicated by the Yakut word *bayaǵal* 'sea.' Various Turkic-speaking groups have settled in the Baikal region, also the ancestors of the Tuvans and old Uyghur groups. The Yakut language itself contains indications of an early habitat in the south, e.g., names of months that do not fit the climate of Yakutia and words for animals such as *tebien* 'camel.' Yakut oral traditions also tell us about a migration from the south to the north. Early Yakut tribes left their southern habitat, probably pushed by Buryat groups, and migrated northward along the Lena river. This exodus did not occur before the 13th century, since the memory of Chinggis and the Mongol campaigns is still alive in Yakut traditions.

The ancestors of the Yakuts had been subject to a certain Mongolian admixture prior to the migration. When proceeding northward along the Lena river, the Turkic-speaking immigrants mixed with and absorbed indigenous Evenkis, Evens, and Yukagirs. At the same time, they also pushed local Tungusic-speaking groups northwestward and northeastward. Yukagirs and Paleoasiatic groups were forced out to still more peripheral regions. For centuries, however, the Yakuts lived south of their present-day territory. It was only under the pressure of the Russian expansion in Siberia that they migrated to more arctic regions. Yakutia was incorporated in the Russian Empire in the 1620s.

While the Yakuts have preserved many features of the southern culture of cattle and horse breeders, they have also taken over elements of northern nomadism from their new neighbors, traditionally reindeer herders and hunter-gatherers. In spite of Christianization and Russification, their ethnic structure has remained relatively intact.

Related Languages and Language Contacts

Yakut is most closely related to its geographically nearest Turkic neighbors, Tuvan and Khakas of southern Siberia. The old Yakut self-designation *Ura:nxay* points to early connections with the territory of Tuva, which has also been referred to as Uryankhay. Some scholars have assumed that Yakut was originally a Kipchak Turkic language (see *Turkic Languages*).

Yakut has been in long and close contact with other languages. It shows strong traces of Mongolic influence. The period in which the ancestors of the Yakut settled on the shore of Lake Baikal led to close interaction with Buryat. An early impact on Yakut may also have been exerted by Yeniseian, a formerly widespread Paleoasiatic language. After the emigration to northern Siberia, the Turkic language of the Yakuts underwent strong substrate influence from Tungusic dialects. The next neighbors of Yakut are the North Tungusic languages Evenki and Even (Lamut), both of which appear to have Paleoasiatic substrates. The speakers of Evenki live in the northern and northwestern parts of Yakutia, whereas the Evens live in the northeastern parts, in particular in the basins of the rivers Indigirka, Yana, and Kolyma. The contacts with the isolated language Yukagir have also been important. The complex problems of language contact and language shift in the area are still unsolved.

The Written Language

No old Yakut literary documents are known. According to a tradition in Yakut folklore, however, the Yakuts once possessed written documents, which they lost on their way to the north. There is a rich Yakut oral literature comprising legends, epics, songs, etc. A modern literature began to develop at the beginning of the 20th century. A Cyrillic alphabet was created for Yakut by the German scholar Otto Böhtlingk in the mid-19th century. A new script, based on the International Phonetic Alphabet and designed by the Yakut linguist S. A. Novgorodov, was introduced in 1922. It was later replaced by a new Roman-based script, which was in use until a Cyrillic alphabet was introduced in 1939. The orthographic rules of the modern Yakut language have often been changed. They have, however, basically followed phonetic principles, mirroring the actual pronunciation with its numerous assimilations.

Distinctive Features

Yakut exhibits many linguistic features typical of the Turkic family (see *Turkic Languages*). It has, for

example, a suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation. Hyphens are used here to indicate morpheme boundaries.

Phonology

Yakut holds an exceptional position among the Turkic languages because of certain phonetic developments. Similar phenomena are sometimes found in contact languages such as Buryat and Evenki.

Like Turkmen and Khalaj in the southwestern part of the Turkic-speaking world, Yakut has preserved Proto-Turkic long vowels, e.g., *a:t* ‘name’ and *ü:t* ‘milk.’ Yakut has eight short vowels and eight long vowels including four diphthongs. The nonhigh long vowels are realized as diphthongs, e.g., *küöl* ‘lake’ < *kö:l*. Yakut *t* corresponds to the East Old Turkic intervocalic and word-final dental δ , e.g., *atax* ‘leg,’ *tot-* ‘to become satiated.’ Initial *s-* corresponds to *y-* in most other Turkic languages, e.g., *suol* ‘way,’ *sit-* ‘to lie’ (Turkish *yol, yat-*). The consonants *z, š,* and *č* have developed into *s* in Yakut, e.g., *seri:* ‘army’ < *čerig*. Initial *s-* has been deleted, e.g., *u:* ‘water,’ *ös* ‘word’; cf. Turkish *su, söz*. Intervocalic *-s-*, however, has developed into *-h-*, e.g., *kub-a* [duck-POSS.3.SG] ‘his/her duck’ (of *kus* ‘duck’), *uhun* ‘long’; cf. Turkish *kuş* ‘bird,’ *uzun* ‘long.’

Yakut applies, like other Turkic languages, a front-back sound harmony, according to which native words contain either front or back sounds. The rounded-unrounded harmony is also well developed. The vowels *o* and *ö* may occur as suffix vowels, e.g., *kötör-ö* [bird-POSS.3.SG] ‘his/her bird’ (*kötör* ‘bird’).

Due to sound changes, progressive and regressive consonant assimilations, unstable vowels, etc., Yakut word forms often deviate from the typical Turkic agglutinative structure, e.g., *at* ‘horse’ vs. *ap-pit* [horse-POSS.1.PL] ‘our horse,’ *tayis-* ‘to go out’ vs. *taxs-ar* [go out-PRES.3.SG] ‘goes out,’ *kis:* ‘daughter’ vs. *kih-im* [daughter-POSS.1.SG] ‘my daughter.’ Some pronouns have special oblique stems, e.g., *mi:gi-* vs. *min* ‘I,’ *man-* vs. *bu* ‘this.’ The third-person imperative form consists of the verbal stem, e.g., *as* ‘open,’ whereas the corresponding negative form exhibits a vowel element in front of the negation marker, e.g., *ah-i-ma* [open-i-NEG.IMP] ‘don’t open’; cf. Turkish *aç* [open.IMP], *açma* [open-NEG.IMP].

Grammar

Yakut displays some unique grammatical features, innovations partly due to Mongolic and/or Tungusic

influence. Striking features in the case system are the lack of a genitive and the fusion of dative and locative. The nominative is used instead of a genitive in constructions such as *kibi bihaγ-a* [man knife-POSS] ‘the man’s knife.’ The old locative-ablative has lost its spatial functions, assuming a partitive function with imperatives and necessitives, e.g., *u:-ta ayal* [water-PART bring-IMP.2.SG] ‘bring [some] water.’ Its locative function has been taken over by the dative-locative in *-GA*, which expresses both location and goal, e.g., *guorak-ka* [town-DAT.LOC] ‘in/to the town.’ Special case suffixes occur with possessive markers. For instance, while *ak-ka* [horse-DAT.LOC] ‘to the horse’ is the dative-locative form of *at* ‘horse,’ *ap-p-ar* [horse-POSS.1.SG-DAT.LOC] ‘to my horse’ is the corresponding form of *at-īm* ‘my horse.’ New cases have emerged in Yakut, an instrumental, a comparative, a comitative, and an adverbial case. An example of the latter is *kibi-li* [human being-ADV] ‘in a human way’ (*kibi* ‘human being’).

The Yakut yes-no question marker is *duo* or *du:*, whereas almost all other Turkic languages use markers of the type *ml*. An enclitic question particle *-iy* is added to interrogative pronouns and adverbs, e.g., *bu kimiy?* [this who-INTERROG] ‘who is this?’ Possession may be expressed by means of the adjective suffix *-la:x*, e.g., *Min ĵie-le:x-pin* [I house-PROVIDED.WITH-1P.SG.] ‘I have a house.’ The adjective *suox* ‘nonexisting’ (cf. Turkish *yok*) is used instead of the common Turkic privative suffix *-siz* ‘without,’ e.g., *u:-ta suox* [water-POSS nonexisting] ‘without water’; cf. Turkish *su-suz* [water-PRIV]. Adjectives may be negated with a third-person possessive suffix plus *suox*, e.g., *kuharyana suox* [bad-POSS.3.SG nonexisting] ‘not bad’. The cardinal numbers from 11 to 19 are formed with *uon* ‘ten’ plus a digit, e.g., *uon tüört* [ten four] ‘fourteen.’ The tens from 40 to 90 are formed with a digit plus *uon* ‘ten,’ e.g., *tüört uon* [four ten] ‘forty’; cf. Turkish *kirk*.

An archaic feature is the retention of the verbal suffix *-BIt*, which is otherwise only found in the southwestern branch of Turkic, e.g., *kel-bit* [come-PART] ‘having come’; cf. Turkish *gel-miş* [come-PART]. As a finite form it has evidential (indirective) meaning, e.g., *kel-bit* [come-EV.PAST.3.SG] ‘has evidently come’; cf. Turkish *gel-miş* [come-EV.PAST.3.SG] ‘has evidently come.’

Lexicon

The basic lexicon of Yakut is of Turkic origin. Most words of foreign origin are Mongolic loans. There is an old Buryat layer from the early period of settlement on the shore of Lake Baikal. Even the

pronoun *beye* ‘self’ has been copied from Mongolic. Loanwords from Tungusic often belong to the domain of husbandry and everyday life. A large portion of the Yakut lexicon is of unknown origin, probably due to contact with Paleoasiatic languages. The Russian impact on the lexicon has been considerable. Loanwords are in general assimilated to the Yakut word structure, e.g., *silaba:r* ‘samovar,’ *biragra:mma* ‘programme.’

Dialects

The differences between the Yakut dialects are comparatively small. There is a central group consisting of the Aldan, eastern and western Lena dialects, a northeastern group, influenced by Even, and a northwestern group, influenced by Evenki.

Another dialect is Dolgan, spoken by about 6500 persons, mainly on the Taimyr peninsula. It differs from the northwestern dialects and has its origin in Tungusic groups who shifted to Yakut at an early stage. They left their settlements on the Vilyuy at the end of the 16th century or later, migrated northward and absorbed parts of the population of the Taimyr peninsula, primarily Nganasans, i.e., speakers of Tavgi Samoyedic, and also further groups. Dolgan thus has both an Evenki and a Nganasan substrate. It still functions as the lingua franca of Taimyr. The present-day Dolgans (self-designation *haka*, corresponding to *saxa*) distinguish themselves from Yakuts and consider their variety a language in its own right. Dolgan differs somewhat from other Yakut varieties in lexical respect, and it also displays a few differences in terms of phonology and grammar. An archaic feature is the absence of the change of initial and final *q* to *x*, e.g., *katun* ‘woman’ (Yakut *xotun*), *kol* ‘shoulder’ (Yakut *xol* ‘arm’), *atak* ‘foot’ (Yakut *atax*), *huok* ‘nonexisting’ (Yakut *suox*). An innovative feature is the development of secondary *s-* into *b-*, e.g., *haka* ‘Yakut’ (Yakut *saxa*), *bil* ‘year’ (Yakut *sil*), *heri:* ‘war’ (Yakut *seri:*).

Yanito

D Levey, Universidad de Cádiz, Cádiz, Spain

© 2006 Elsevier Ltd. All rights reserved.

Yanito (or Llanito) is the name commonly used to refer to the people of Gibraltar as well as their local vernacular. Although various theories exist, it seems likely that it has its etymological origins either in the English name 'Johnny' or alternatively, reflecting the traditional Genoese presence in the British colony, it may be derived from 'Gianni,' the diminutive of the Italian boys' name 'Giovanni.'

Yanito is not an autonomous language as such, and it is seldom found in written form. It is fundamentally a spoken Spanish-dominant variant, which incorporates English lexical and syntactic constituents as well as some unique local lexical items. Although the Spanish/English content ratio may vary from speaker to speaker, most Gibraltarians will, consciously or unconsciously, alternate between English and Andalusian Spanish in everyday situations.

Code-switching may take place inter-sententially or intra-sententially.

Yanito

What? Pero . . . I told you, no? No puedo ir shopping porque I have to work late. Sorry, no puedo hablar ahora. Anyway, te llamo esta noche OK?

English

What? But . . . I told you, didn't I? I can't go shopping because I have to work late. Sorry, I can't speak now. Anyway I'll phone you tonight, OK?

Although L1 interference and unnatural direct translations may sometimes be present resulting in what is popularly known as 'Spanglish,' the syntactic rules of both languages tend to be respected.

Individual English lexical items, particularly nouns, are commonly introduced in otherwise Spanish utterances. This is often because no direct equivalent exists or its cultural or social nuance cannot be easily or succinctly conveyed. Although British English pronunciation norms tend to be followed, some older borrowings and derivations have been Hispanicized, usually reflecting the local Andalusian pronunciation. Interestingly, several of these words have also found

their way across the border and are used in the neighboring Spanish towns of La Linea and San Roque.

- *chinga* = chewing gum
- *liquelibá* = liquorice bar
- *mebli* = marbles
- *el tishella tisha* = teacher

Other English borrowings have taken on a different meaning within the local context. *Pish-pine* (from the English 'pitch pine'), for example, is used locally as an adjective or an adverb to mean 'perfect.'

Al final todo salió pish-pine.

In the end everything turned out just fine.

While Spanish and English form the basis of the local lexicon, several borrowings from other languages are also present, reflecting the multicultural makeup of the British colony. These come mainly from Italian (e.g., *pompa* = pump), Arabic (e.g., *flush* = money), and Hebrew (e.g., *ha ham* = boss).

Although Yanito does not hold prestige status, it is not overtly stigmatized either. It is regarded with a certain degree of affection and used by many Gibraltarians as an expression of local identity. However, although the use of Yanito is widespread and considered by many to be a defining characteristic of the local speech community, Gibraltar can not be described as a diglossic speech community. Both English and Andalusian Spanish are very much alive, and speakers may adopt either of the three language forms depending on context, domain, and the interlocutor.

Yiddish

R A Rothstein, University of Massachusetts, Amherst, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Yiddish, a Germanic language spoken by the Jews of Central and Eastern Europe (Ashkenazim) and in the Ashkenazic diaspora around the world, includes significant Semitic and Slavic components as well as its Germanic base. It is one of a number of Jewish languages created on the basis of the coterritorial non-Jewish language (cf. Judaeo-Arabic, Judaeo-Persian, Judezmo [Ladino], etc.). Of all such languages, it achieved the widest range of functions, the most highly developed network of institutions and the largest number of speakers.

Orthography

Like all Jewish languages, Yiddish is written in the Hebrew alphabet. Unlike Hebrew, which except for special purposes is normally written without vowel symbols, Yiddish has adapted certain Hebrew letters (sometimes in combination with Hebrew subscript or superscript vowel symbols) to represent vowels. Words and morphemes of Semitic (Hebrew and Aramaic) origin are for the most part spelled as they are in the source languages, while words of Germanic, Slavic, and other origins are spelled in a broadly phonetic manner. The orthography is super-dialectal, which permits its use by speakers of the standard language (the phonetics of which is based

largely on Northeastern Yiddish) as well as by speakers of dialects, which most strongly differ from the standard and one another in their realization of the vowels. In the Soviet Union, the official orthography for Yiddish 'naturalized' the Semitic component, eliminating the traditional Hebrew and Aramaic spellings in favor of the kind of phonetic representations used elsewhere for the non-Semitic component. Soviet orthography also mandated standardized representations for elements that show dialectal variation, e.g., orthographic *oyf* was spelled *af* as a preposition and *uf* as a prefix. (The standard scholarly transcription for Yiddish is the system developed by the YIVO Institute for Jewish Research [originally in pre-1939 Wilno, Poland, now in New York].)

Phonology

The phonemic inventory of standard Yiddish consists of eight vocalic segments (five oral vowels and three diphthongs) and twenty-nine consonantal segments (some of which play only a marginal role). The oral vowels are *i*, *e*, *a*, *o*, and *u*, realized phonetically as [i], [ɛ], [ɐ], [ɔ], and [u]; the diphthongs are *ey*, *ay*, and *oy*. The basic consonantal inventory contains voiced and voiceless bilabial, dental, and velar stops; bilabial, dental, and palatal nasals; voiced and voiceless labiodental, dental, and alveolar fricatives; a voiceless velar fricative and a voiced laryngeal fricative; voiceless dental and alveolar affricates; a dental and a palatal lateral; a palatal glide; and an /r/ that can

be pronounced as a uvular (most speakers) or dental trill. Voiced dental and alveolar affricates, and – regionally – palatal (or palatalized) versions of /t/, /d/, /s/, and /z/ play a somewhat marginal role in the phonological system. The resonants /l/ and /n/ can be syllabic, as can the positional variants of /n/, [m] (in word-final position after /b/ or /p/) and [ŋ] (in word-final position after /k/ or /g/).

As in Slavic, Yiddish obstruents assimilate (generally regressively) with respect to voice, but /v/ does not cause voicing in a preceding voiceless obstruent. Word-final obstruents do not (as in Slavic or German) lose voicing before pause. There is, however, evidence of such devoicing being operative in an earlier stage of the language, e.g., *hunt* ‘dog’ vs. *briv* ‘letter’ (cf. German *Hund* with final [t] and *Brief* with final [f]).

Word stress tends toward the penultimate, but words of Germanic origin are often stressed on the initial root syllable, and words of Slavic origin often retain the stress of the source language. Posttonic vowels are generally reduced.

Morphology

Three noun genders (masculine, feminine, neuter) are distinguished in the singular by agreeing forms of the definite article and attributive adjectives, as well as by pronominal reference. Northeastern Yiddish, however, like the neighboring Lithuanian language, has lost the neuter gender. There are no gender distinctions in the plural.

Nouns are pluralized by means of several endings, mostly independent of gender: *-n* or its variant *-en*, *-er*, zero (Germanic in origin); *-s* (Romance in origin); *-im*, *-es* (Hebrew in origin). The Germanic and Hebrew suffixes may be accompanied by vowel changes in the stem; the same changes take place in suffixal derivation, e.g., in diminutive formation (cf. *barg* ‘mountain,’ *berg* ‘mountains,’ *bergl* ‘hill’; *hoyz* ‘house,’ *hayzer* ‘houses,’ *hayzl* ‘little house’).

The definite article, attributive adjectives, and personal pronouns distinguish nominative, accusative, and dative case forms (with extensive syncretism) in the singular (pronouns also in the plural); personal names and a few common nouns can add *-(e)n* to indicate the accusative or dative singular and *-(e)s* to mark a possessive form. Agreeing elements have the same form for dative and possessive. Predicate adjectives occur either as a bare stem or with the indefinite article and a gender ending: *zi iz yung* ‘she is young’ vs. *zi iz a yunge* ‘she is a young one,’ parallel to Russian constructions with short- and long-form adjectives (*ona moloda* vs. *ona molodaia*). Adverbs have the same form as the stem of the corresponding adjective.

Yiddish verbs have synthetic forms for the present tense and analytic forms for the past and future tenses. The future is formed by combining the conjugated auxiliary *veln* with the infinitive; the past is formed by combining the auxiliaries *hobn* ‘have’ or *zayn* ‘be’ with the past participle. Conditional and subjunctive moods are also formed with auxiliaries: *voltn* (with the past participle) for the former and *zoln* ‘should’ (with the infinitive) for the latter. The auxiliary *flegn* ‘used to’ combines with infinitives to express iterativity in the past. A large number of periphrastic verbs combine one of several auxiliaries with an invariable element, often a Hebrew verbal form (e.g., *mekane zayn* ‘be envious’; *moyre hobn* ‘be afraid, fear’; *vey ton* ‘hurt’; *geboyrn vern* ‘be born’).

Yiddish verbs may be combined with a variety of stressed adverbial complements that are prefixed to the infinitive and participles, but follow the inflected verb as a separate word in the present tense and the imperative (e.g., *avekgeyn* ‘to go away,’ *ikh bin avekgegangen* ‘I went away’ vs. *ikh gey avek* ‘I’m going away,’ *gey avek!* ‘go away!’). Under the influence of Slavic verbal systems, some of these inherited Germanic verbal complements are used to express aspectual or Aktionsart meanings, in ways that differ both from the Germanic and Slavic systems. Yiddish also makes broad use of the so-called stem construction, which combines an auxiliary (usually *gebn* ‘give’ or *ton* ‘do’) with the indefinite article and an invariant verbal stem to create a semelfactive meaning: *gebn a kuk* ‘take a look,’ *a trakht ton* ‘give a bit of thought.’

Syntax

Yiddish is a verb-second language, with the inflected verb serving as the second clause constituent. In a complex sentence, however, an initial clause can occupy the first constituent position and the verb will therefore occupy the first position in the second clause: cf. *er vet farshteyn* ‘he will understand’ vs. *az er vet zayn elter, vet er farshteyn* ‘when he is [will be] older, he will understand.’ The verb can also occupy the first position in a clause or sentence that follows as an implied consequence of a preceding clause or sentence, e.g., *der tate iz geshtorbn, bin ikh geblibn aley n* ‘my [the] father died, [so] I was left all alone.’ Interrogative elements (the particle *tsi* that introduces yes-no questions, pronouns, adverbs) count as the first constituent in a direct question but not in an indirect question: cf. *vos hot zi geshribn?* ‘what has she written?’ vs. *ikh veys nit, vos zi hot geshribn* ‘I don’t know what she has written.’

Aside from the verb-second requirement, word order is relatively free and is available to express such discourse functions as emphasis, contrast, topic vs. comment. In order to move a subject to a more emphatic position without violating the verb-second principle, the neuter pronoun *es* (or its variants in this function *se*, *s*) serves as a dummy occupying the first constituent position, e.g., *es iz tsu mir gekumen a kuzine* ‘a cousin came to me.’

Like its Slavic counterparts (but unlike the situation in Germanic), the reflexive pronoun *zikh* serves for all persons and numbers. It also serves both as the full accusative/genitive and dative of the reflexive/reciprocal pronoun (cf. Polish *siebie/sobie*) and as the enclitic form that occurs with verbs in a variety of functions (cf. Polish *sie*). Verbs with *zikh* can express, among other things, a kind of middle voice (e.g., *vashn zikh* ‘wash/wash up/get washed’) and also an intransitive verb with an unaccusative subject (e.g., *der vinter heybt zikh on* ‘winter is beginning’). Following Slavic models, prefixed (or complemented) verbs with *zikh* express various Aktionsart meanings (e.g., *tselakhn zikh* ‘burst out laughing’; cf. Russian *rassmeiat’sia*).

Yiddish does not drop subject pronouns, although some contracted forms are used in speech (*kh* for *ikh* ‘I,’ *r* for *er* ‘he’). Second-person plural pronouns and verb forms are used in nonfamiliar address.

Lexicon

Although the basic stock of Yiddish vocabulary is Germanic in origin, there is also a large Semitic component (from Hebrew and Aramaic, known collectively in Yiddish as *loshn-koydesh* ‘the language of holiness’), which may reach as much as 15% or more depending on style and register. The significant Slavic component comes primarily from Polish, Ukrainian, and Belarusian, and there are traces of old Romance influences. Many Greek- and Latin-based internationalisms entered the language in the 19th and 20th centuries, often via one Slavic language or another. The Germanic, Semitic, Slavic, and other elements were phonologically and morphologically integrated into the Yiddish linguistic system, often being creatively reworked. The verb *balebatevn* ‘keep house; manage; bully,’ for example, contains two Hebrew roots (meaning ‘master of the house’), a Slavic suffix used to derive verbs from foreign roots (cf. Polish-*owa-*), and a Germanic infinitival ending. Calques were created both on the word level (see the above examples of verbal prefixation) and on the phrase level. A colloquial phrase meaning ‘put in jail,’ *araynzetsn in koze*, borrows the Polish slang term

for ‘jail,’ *koza*, literally, ‘goat’ and uses Germanic elements (verbal complement *arayn*, root *zets-*, infinitive ending *-n*, preposition *in*) to calque the entire Polish phrase *wsadzić do kozy*. A more elaborate version replaces the Germanic verbal root with a Semitic one, and the Polish slang term with the Aramaic-origin phrase *khad-gadye* ‘a single kid,’ giving *araynyashvenen in khad-gadye*.

Although many words from the Semitic component are related to Jewish religious life, many are not (e.g., *khaver* ‘friend; [political] comrade’; *balebos* ‘master of the house; boss’), and there is no neat correspondence between the origins of words and their sphere of application. So, for example, the verb meaning ‘say a blessing’ is *bentshn*, which is of Romance origin (ultimately related to Latin *benedicere*), while the word *got* ‘God’ is from the Germanic component (and has an affective form with a Slavic suffix, *gote-nyu*). Most kinship terms are of Germanic origin, but *zeyde* ‘grandfather’ and *bobe* ‘grandmother’ come from the Slavic component.

History

Yiddish is generally assumed to have begun to develop as a distinct linguistic variety around the year 1000 C.E. The long-dominant theory of origins (connected with the work of Max Weinreich) attributes this development to the migration of Jewish speakers of Old French and/or Old Italian, who were literate in Hebrew/Aramaic, into the Rhine Valley, where they encountered Germanic speakers. In recent years, scholars have questioned parts of this theory, suggesting Northern Italy or Bavaria as the point of initial contact, arguing that Yiddish developed as a relexification with Germanic materials of a kind of Judaeo-Slavic (Paul Wexler) or proposing that Yiddish began with contacts between Aramaic-speaking Jews from the Middle East and Germanic speakers (Dovid Katz).

As Jews moved eastward, they settled among speakers of Slavic languages (first Czech, then Polish, later Ukrainian and Belarusian). From around 1500 and until World War II, the majority of Yiddish speakers inhabited the largely Slavic-speaking lands of Central and Eastern Europe. In addition to the Yiddish-speaking religious institutions (educational, social, etc.) that functioned throughout that territory, there existed during the 1920s and 1930s in Poland and (until the mid-1930s) in the Soviet Union a wide array of educational, cultural, social, and political institutions with Yiddish as their language of instruction, publication, daily business, etc. The Nazi annihilation of European Jewry, together with

assimilation (voluntary or forced) to the dominant cultures in the Soviet Union and the overseas lands of the Eastern European Jewish diaspora, has led to a great diminution in the number of speakers of Yiddish. Yiddish is alive today among a decreasing number of elderly Jews of East European origin and in certain traditionalist (mostly Hasidic) communities in North America, England, and Israel, where it serves as the principal vernacular. It is also cultivated by an unknown number of relatively young, largely secular, Jews (and some non-Jews), who are devoted to keeping the language and culture alive.

The oldest dated Yiddish text (1272) is a sentence written in a prayer book in Worms, Germany. The first printed text is a Yiddish translation of a Hebrew prayer included in a 1526 Prague haggadah, and the first Yiddish book is a Hebrew–Yiddish Bible concordance published in Cracow in 1534 or 1535.

Dialectology

The dialect map of Yiddish is divided into Western and Eastern Yiddish, with the latter subdivided into Central (Polish), Northeastern (Lithuanian), and Southeastern (Ukrainian) Yiddish. Western Yiddish is defined roughly as Yiddish spoken west of the 1939 Polish-German border; it is the descendent of the earliest Yiddish, and even by 1939 had largely been replaced by German, although some speakers continued to use it in such areas as Alsace, Switzerland, and Slovakia. Linguistically, the Yiddish dialect continuum is divided on the basis of the development of certain proto-Yiddish vowels. In particular, the phrase ‘to buy meat’ (*koyfn fleysh* in Standard Yiddish) would be *ka:fn fla:sh* (with long vowels) in WY, *koyfn flaysh* in CY, *keyfn fleysh* in NEY and *koyfn fleysh* in SEY. Standard Yiddish (which is, strictly speaking, Standard Eastern Yiddish) is largely based on NEY as far as its vocalism is concerned, although in the case of the diphthong of ‘to buy,’ the standardizers chose the variant common to CY and SEY (*oy*) rather than the NEY variant (*ey*). The more usual choice of vowel for the standard is reflected in a phrase like ‘one day’: Standard and NEY *eyn tog*, CY *ayn tug*, SEY *eyn tug*.

Standard Yiddish, like NEY, but unlike CY and SEY, does not distinguish vowel length. It does, however, distinguish dental and alveolar fricatives and affricates, like CY and SEY, but unlike NEY. NEY also has no neuter gender, unlike the other Yiddish dialects (and the standard language). A detailed account of Yiddish dialect phenomena is presented in the multivolume *Language and culture atlas of Ashkenazic Jewry*, three volumes of which have been published as of 2004.

Yoruba

K Owolabi, University of Ibadan, Ibadan, Nigeria

© 2006 Elsevier Ltd. All rights reserved.

Location and Number of Speakers

Yoruba is spoken as a first language in Nigeria in virtually all areas in the states of Èkìtì, Lagos, Ògùn, Òndó, Òşun, and Òyó, and in most of the areas in Kwara and Kogi states; Yoruba is a second language in some areas of the Delta and Edo states as well as in the non-Yoruba-speaking areas of the Kwara and Kogi states (see **Figure 1**). Outside Nigeria, there are Yoruba-speaking communities in the republics of Togo and Benin, where, in the southern part, Yoruba, Aja, and Fon are the three dominant indigenous languages (see Adeniran, 2004: 437). Based on the 1991 census, the number of speakers of Yoruba as a first or second language in Nigeria alone is about 19 000 000.

Genetic Relationship and History

Yoruba is a member of the Defoid language group within the Benue-Congo subgroup of the Niger-Congo family (see Williamson, 1989: 20, 26; Capo, 1989: 275–290). Although the origin of the term ‘Yoruba’ is still shrouded in mystery, some late 20th-century (historical/comparative) linguists have suggested that the dispersal center for the Yoruba people

is around the southwest area of the confluence of the Niger and Benue rivers in Nigeria (see Akinkugbe, 1978; Williamson, 1989: 270).

Earliest Written Record

The Yoruba writing system uses the Roman alphabet, augmented by letters with diacritics. The earliest written records include the vocabularies compiled by Thomas Bowdich in 1819 (including words for the numerals 1–10), by Hannah Kilham (1828), and by Wilhelm Koelle (1854). The teaching booklets of John Raban (1830–1832) and the vocabularies and grammars of Samuel Crowther (1843, 1852) contributed further to the written record. Publication of Crowther’s school primer (1849; written wholly in Yoruba) was followed by the various translation works in the Old and the New Testaments by Crowther (1950–1956) and by Thomas King (1957–1961). The first vernacular periodical, the newspaper *Ìwé Ìròhin*, was printed at Abeokuta from 1859 to 1867 (see, in particular, Hair (1967)).

Individual Characteristics

Yoruba has a number of characteristics that appear unique to Yoruba or are not widespread among its genetic relatives.

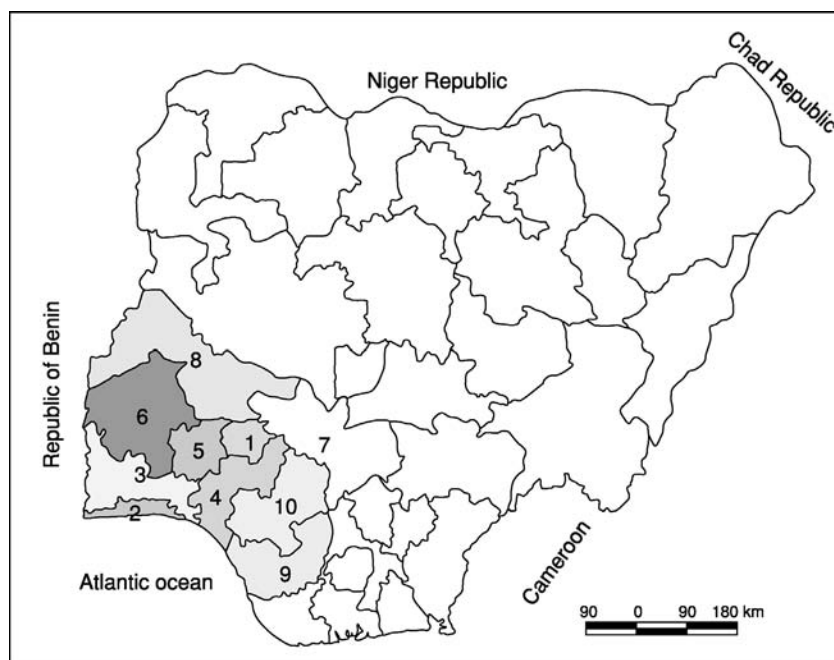

Figure 1 Nigerian states in which Yoruba is spoken as a first or second language. Key to states: 1, Èkìtì; 2, Lagos; 3, Ògùn; 4, Òndó; 5, Òşun; 6, Òyó; 7, Kogi; 8, Kwara; 9, Delta; 10, Edo.

Syntactic Characteristics

Noun Classes, Gender System, and Number Yoruba has no noun class or grammatical gender. There are no separate noun forms to distinguish singular from plural. However, when necessary, plurality can be marked by using some (pro)nominal forms before nouns, or by using certain demonstratives, as well as by reduplicating adjectives after nouns.

Possessive Noun–Noun Constructions In a sentence, the second noun in a possessive noun–noun construction can be focused by front shifting it, with its original position being occupied by the appropriate pronoun qualifier. After certain verbs, it is also possible to permute the constituent nouns with the particle *ní* obligatorily intervening (see Owolabi, 1976: 40–43).

Past and Present Actions Action verbs generally convey past action, whereas stative verbs convey past or present action.

Verbal Constructions There are verbal constructions in which subject and object nouns can switch positions with little or no difference in meaning, and verbal constructions in which the verbs are repeated after their objects; in addition, some verbal constructions contain verbs that are used for asking questions, verbs that are negative in meaning, or verbs that obligatorily select the particle *ní* (see Awobuluyi, 1978: 53–62).

Morphological Characteristics

In order to form morphologically complex nouns, certain prefixes (for example, *à-*, *è-*, *o-*, *i-*, and *àì-*) that are usually attached to roots that are verbs or verb phrases, and sometimes to ideophonic adjectives, cannot be combined. However, the prefixes *oní-* and *oni-*, which are attached to nouns or noun phrases, can be combined and can also combine with the former class of prefixes, resulting in nouns that denote emphasis (see Owolabi, 1995: 93–102).

Phonetic/Phonological Characteristics

Vowel Co-occurrence Restrictions and Vowel Elision Yoruba operates a partial system of vowel harmony in which the set /e, o/ mutually excludes the set /ɛ, ɔ/ in polysyllabic underived words. Also, in words with a vowel₁-consonant-vowel₂ (V₁-C-V₂) pattern, neither the nasalized vowels nor /u/ can occur as V₁. Vowel elision, resulting in contractions, is quite erratic apart from the relatively predictable elision of the vowel /i/,

| Consonants | | | | | | | |
|------------|---|---|---|-----------|---|-----|-----|
| b | t | d | ɖ | k | g | kp̄ | gb̄ |
| | f | s | ʃ | | | | h |
| m | n | r | | | | | |
| | | l | j | | w | | |
| Vowels | | | | | | | |
| Oral | | | | Nasalized | | | |
| | i | | u | | ĩ | | ũ |
| | e | | o | | ẽ | | õ |
| | ɛ | | ɔ | | | ã | |

Figure 2 Phonetic groupings of Yoruba consonants and vowels. Tones are indicated by diacritical marks: high (ˉ), mid (ˊ), and low (ˋ).

the initial vowel of the second noun of noun–noun combinations, or the vowels of the standard forms of words in combination with the dialectal forms (see Bamgboṣe, 1989). **Figure 2** shows the phonetic groupings of Yoruba consonants and vowels; tones are indicated by diacritical marks: high (ˉ), mid (ˊ), and low (ˋ).

The Assimilated Low Tone In addition to the high, mid, and low tones in Yoruba, a tonal feature referred to as ‘the assimilated low tone’ occurs when a low tone disappears in certain contracted expressions or in some single polysyllabic words, but its influence is still felt on the following syllable (see Bamgboṣe, 1966).

Restriction on the Occurrence of the High Tone The high tone never occurs on V₁ in words of V₁-C-V₂ pattern.

Tones of Pronouns With the exception of the second-person plural pronoun object, the lexical tones of the verbs determine the tones of all pronoun objects. Similarly, the tones of some subject pronouns vary before the verbal particle *ní*.

Other Characteristics

Various semantic effects (e.g., emphasis, anger, and anxiety) can be achieved by employing the devices of reduplication, prefixation, and vowel lengthening, or by using ‘intensifiers.’ Focusing whole sentences

apart from sentence constituents is also common. The following sentence provides an example of the Yoruba language:

Alákàá ni ilé è wó, tí olè sì kó mi ní èrù, sùgbón ó dún mí pé Olú jó, jó, jó ni léyìn iṣèlè wònyí, èyí tó mú kí àwòn ọlómòwé ọrè Olú rò pé kò fé èmi àti Alákàá fé ọrò, àmò láipé, Alákàá yòò ralé tuntun, yòò sì rọkọ pèlú.

It was Alákàá's house that fell while thieves stole my property, but it pained me that what Olú did was to really dance after these incidents, which made Olú's educated friends think that he isn't happy to see Alákàá and me prosper, however, Alákàá will soon purchase a new house and a vehicle as well.

Note that è occupies the original position of the front-shifted noun *Alákàá*, and that *mi ní èrù* is a possessive construction resulting from permutation. In *Alákàá* (from 'oní àkà'), the influence of the assimilated low tone is felt; *mi* has a high tone after the low-tone verb *dún*, but a mid tone after the high-tone verb *kó*. For emphasis, *jó* is reduplicated and *Alákàá* and the phrase beginning with *sùgbón* are focused by placing the focus marker *ni* after them. Plurality is indicated by *wònyí* and *àwòn*, *ọlómòwé* comprises the verb phrase *mòwé* and the prefixes ọ- and *oní-*, and *fé* is repeated after *èmi àti Alákàá*. The 'a' of *rà* is retained in the verb-noun contraction *ralé* (from *ra ilé* 'purchase a house') but is elided in *rọkọ* (from *ra ọkọ* 'purchase a vehicle'). A phonemic transcription of the sentence is as follows:

álá'ká lí ilé è wó, tí olè sì kó mí lí èrù, sùgbón ó dún mí kpé olú jó jó jó lí léjì iṣèlè wònyí, èyí tó mú kí àwò ọlómòwé ọrè olú rò kpé kò fé èmi àti álá'ká fé ọrò, àmò láikpé, álá'ká jòò ralé tũtũ, jòò sì rọkọ pèlú.

Other Points of Relevance

The Yoruba language comprises about 20 dialects. There is also a form of Yoruba popularly referred to as Standard Yoruba. In all of the Nigerian states in which Yoruba is spoken natively, the Standard Yoruba and the Yoruba dialects are spoken. However, a diglossic situation exists where the Standard Yoruba is the high variety and the dialects are the low variety, although the use of some of the dialects in publications, broadcasts, and native courts (in particular) is increasing. The variety of Yoruba described in this article is Standard Yoruba. Yoruba vocabularies occur in poetic recitations associated with rituals and cults in Brazil as well as in Sierra Leone, where the influence of Yoruba is also felt in Krio loanwords and personal names.

Yoruba is one of the three major languages in Nigeria (the other two are Hausa and Igbo). It is

taught as a subject at the primary, secondary, and tertiary levels. At least eight universities in Nigeria offer first degree and/or higher degree courses in Yoruba. Literature in the language is also very extensive. According to government policy, in the states in which Hausa, Igbo, or Yoruba is not a mother tongue, one of these three languages is a compulsory subject at secondary school level. The three languages are also to be used in the National Assembly in addition to English, and one of the state assemblies in the Yoruba-speaking states is currently using Yoruba in the same way. Similarly, the Nigerian federal government has embarked on the translation of the 1999 constitution of the Federal Republic of Nigeria into Yoruba and the other two major Nigerian languages (Hausa and Igbo), in order to facilitate the usage of these languages in the domain of legislation.

A Yoruba metalanguage (available in two volumes) has facilitated the use of Yoruba for writing textbooks and as a medium for teaching the language at all levels of education, whereas the Six-year Primary Project at the Obafemi Awolowo University (formerly the University of Ife), in Ile-Ife, Oṣun State, aims at demonstrating that all subjects can be taught in Yoruba at the primary level.

In the neighboring Republic of Benin, the Yoruba, Aja, and Fon languages are studied at the university level; Yoruba was adopted (along with Aja, Fon, Bariba, Bendi, and Waama) as an official language of the National Assembly in 1983 (see Adeniran, 2004: 437, 442).

Yukaghir

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Yukaghir is not a single language, but is actually a small language family consisting of two nearly extinct languages of northeastern Siberia, i.e., Tundra (Northern Yukaghir) and Kolyma (Southern Yukaghir). The speakers of these languages and the languages themselves are known by the self-designations of *Wadul* (Tundra) and *Odul* (Kolyma). Fewer than 200 total speakers, possibly as few as 40, live in northeastern Siberia. Conventionally labeled as language isolates, some consider Tundra and Kolyma to be distant relatives of the Uralic languages. The Yukaghiric family probably originally included two now extinct languages, Chuvan and Omok.

Yukaghiric-speaking peoples were once dominant over a vast area in northeastern Siberia, practicing reindeer husbandry and subsistence hunting and fishing. Yukaghiric-speaking peoples at first assimilated Tungusic-speaking peoples culturally, but eventually the Even (Tungusic) people assimilated the Yukaghiric people linguistically, and now include a discernible Yukaghiric substrate. The Tundra Yukaghir language is spoken in two villages, Andryushkino and Kolymaskoe. Kolyma Yukaghir is found predominantly in the village of Nelemnoe. Both Yukaghir languages are moribund, spoken now only by a few elders. The Yukaghir people have shifted mainly to speaking Russian, but in Andryushkino village they are mostly shifting to Yakut (Sakha), a locally dominant Turkic language.

Yukaghir possesses a range of contrastively palatalized segments in the consonant system, a pattern commonly found throughout the Siberian area. Unlike most northern and Siberian languages, Yukaghir is like Yakut in not permitting *ŋ*-in word-initial

position. However, the common four-way place contrast for nasals (*m/n/ŋ/ŋ̃*) seen across the languages of Siberia is an old and stable feature in Yukaghir, going back at least to the Proto-Yukaghir(ic) stage (Anderson 2003). Example (1) shows word forms in Tundra, Kolyma, and Proto-Yukaghir (from Krejnovich, 1958, 1982: 13–14):

| (1) | Tundra | Kolyma | Proto-Yukaghir | Gloss |
|-----|--------|--------|----------------|---------------|
| | nonol | nonol | *nonol | 'loop, noose' |
| | amun | amun | *amun | 'bone' |
| | ñava | ñava | *ñava | 'together' |
| | aŋa-ŋ | aŋa | *aŋa | 'mouth' |

Like most other Siberian languages, Yukaghir makes use of a range of case forms of nouns. This includes both areally common and typologically unusual formations. To the areally common group of features belong the opposition of instrumental (INSTR) case forms (Example (2a); Krejnovich, 1982: 49–50)) and comitative (COM) case forms (Examples (2b) and (2c); Krejnovich 1982: 45, 46)):

| (2a) | Tundra Yukaghir | Kolyma Yukaghir |
|------|--------------------|-----------------|
| | -lek, -leŋ | -le, -lek |
| | sā-lek pajduk | čoyoye-le |
| | 'hit with a stick' | 'with a knife' |

In Examples (2b) and (2c), comitative denotes possession as well, and conjoins two nouns (PV, preverb):

| (2b) | Kolyma Yukaghir | |
|------|---|---------------------|
| | núme-ñej | |
| | dwelling-COMIT | |
| | 'with a dwelling,' 'he has a dwelling' | |
| (2c) | Tundra Yukaghir | |
| | ile-ñej | ila:me me-qaldej-ŋi |
| | reindeer-COMIT | dog PV-run.off-3PL |
| | 'the dog ran off with the reindeer,' 'the dog and the reindeer ran off' | |

To the unusual group of case features belongs the characteristically Yukaghir but typologically unusual system of 'focus' marking. Simplifying matters

somewhat, this system is as follows: there is (1) an unmarked form that encodes speech act participants and lexical nouns in agent-focus and agent/subject-topic functions; (2) a marked ‘neutral’ case used with nonlocutor agent/subject topics, object-topics with locutor agents, and forms that lack the focus case (nonlocutor personal pronouns, proper names, etc.); and (3) the ‘focus’ case that encodes subject or object focus. Noun phrases (NPs) marked with focus frequently reference indefinite NPs, and focus-case marking often serves to introduce participants into the discourse (see Maslova (2003a: 51ff) for further details).

In terms of the clausal syntax of simple and complex sentences, Yukaghir is similar to many other indigenous Siberian languages. The language shows dominant subject-object-verb constituent order and uses a wide range of adverbial ‘converb’ forms in subordinate clause formation, as well as the characteristic system of case-marked nominalized verbs to mark a wide range of functional subtypes of subordinate clauses, as shown in Example (3a) (the first two words are from Krejnovich (1958: 198) and Fortescue (1988: 41), respectively; the original source for the third word is unknown) and Example (3b) (from Maslova (2003b: 372)) (abbreviations: NOM, nominal; LOC, locative; POSS, possessive; PL, plural; NF, nonfinite; NEG, negation; PROHIB, prohibitive; ACC, accusative; DESID, desiderative; INTRANS, intransitive):

(3a) Yukaghir

| | | |
|-----------------|---------------|---------------|
| u:r-eŋ | u:l-rane | u:l-lek |
| go:ACTION. | go:ACTION. | go:ACTION. |
| NOM-LOC | NOM-LOC.II | NOM-INS |
| ‘when (I) went’ | when he went’ | ‘after going’ |

(3b) Kolyma Yukaghir

| | |
|---|-----------------|
| qa:qa:-pe-gi | ajli-de-ge |
| grandfather-PL-POSS | forbid-3.NF-LOC |
| “el+qon-ti-lek” | mon-de-ge |
| NEG-go-PL-PROHIB | say-3.NF-LOC |
| tamun-gele | uørpe-p-ki |
| that-ACC | child-PL-POSS |
| el+med-o:l-tji | |
| NEG-listen-DESID- | |
| 3pl.intrans | |
| ‘Their grandfather forbids (it), saying “don’t go” but the children do not obey’. | |

Zapotecan

Introduction

Zapotecan languages belong to the Otomanguean family and are spoken across a large portion of Oaxaca, Mexico. Zapotecan is divided into two branches – Chatino and Zapotec proper. The number of languages in each group is controversial, but the Summer Institute of Linguistics recognizes 6 Chatino languages and 58 Zapotec languages.

Zapotec languages are spoken by over 200 000 people located over much of the eastern half of Oaxaca. Varieties of Zapotec divide broadly into three groups. The Valley-Isthmus group includes most varieties spoken in the valley of Oaxaca, extending to the Isthmus of Tehuantepec. The Northern group is spoken in the mountains to the north of the Valley of Oaxaca, and the Southern group is spoken in the mountains to the south. All three groups are quite diverse and contain many distinct languages.

Chatino languages are spoken in a smaller mountainous area in southwestern Oaxaca by perhaps 30 000 people.

The earliest documentation of Zapotecan languages comes from grammars, dictionaries, and religious material from the Spanish colonial period. Archaeological sites associated with the Zapotec state of ca. 100 B.C. to ca. 900 A.D. also contain Zapotec hieroglyphic writing. Efforts to decipher Zapotec hieroglyphics are still ongoing.

Phonological Characteristics

In Zapotec languages, most consonants are divisible into two morphophonologically defined groups called ‘fortis’ and ‘lenis.’ For stops and fricatives, fortis is largely equivalent to voiceless and lenis to voiced. However, the fortis/lenis distinction is also found in the nasals and sonorants, where the phonetic realization of fortis is not voicelessness, but some other characteristic that generally includes longer duration.

The morphological examples in (2) below from Mitla Zapotec show that long sonorants and voiceless obstruents seem to form a natural class. Many analyses of Zapotec historical phonology also analyze fortis consonants as having originated from geminates and consonant clusters.

Many Zapotec languages, especially those in Valley group, show contrastive phonation type differences. San Dionicio Ocotepc Zapotec, for example, shows a distinction between modal, breathy, creaky, and checked vowels. Consider the following minimal and near-minimal pairs:

- (1) San Dionicio Ocotepc Zapotec
- | | | |
|----------|------------|-----------|
| [bɛ̃] | ‘flame’ | (breathy) |
| [bɛ̃] | ‘meat’ | (creaky) |
| [bá:ld] | ‘how many’ | (modal) |
| [bâ] | ‘bullet’ | (breathy) |
| [bɛ̃ld] | ‘fish’ | (breathy) |
| [bɛ̃ʔld] | ‘snake’ | (checked) |

All Zapotecan languages are tonal. The number of reported tones varies from two tonal levels to four, with a variety of contour tones. The largest number of tonal contrasts in the family appears to be Zoogocho Zapotec, which is reported to have four tone levels and seven contours, for a total of 11 tonal contrasts.

Morphological Characteristics

Zapotec languages do not have a passive, but generally show morphological relationships between pairs of verbs that differ in valence. In one typical pattern, an intransitive stative verb begins with a lenis consonant, while the corresponding transitive active verb begins with the corresponding fortis consonant. Consider the following examples from Mitla Zapotec:

- (2) Mitla Zapotec
- | | | | |
|-------|-------------------|--------|-----------------|
| [zæb] | ‘to sink (intr.)’ | [sæb] | ‘to sink (tr.)’ |
| [dɛb] | ‘to be wrapped’ | [tɛb] | ‘to wrap’ |
| [nɪt] | ‘to be lost’ | [nnɪt] | ‘to lose’ |
| [lib] | ‘to be tied’ | [llib] | ‘to tie’ |

There are generally also other such pairs that show less regular correspondences.

Zapotec verbs are inflected with aspectual prefixes. The number of aspects varies from language to language. In Zoogocho Zapotec, for example, there are continuative, stative, completive, potential, and dubitative aspects. San Lucas Quiaviní Zapotec has progressive, habitual, perfective, irrealis, subjunctive, neutral, and definite (future) aspects.

Zapotec verbs do not show agreement, though pronominal subjects (and some pronominal objects) cliticize to the verb. Consider the following examples from San Dionicio Ocotepc Zapotec:

(3) San Dionicio Ocotepc Zapotec

(3a) Û-dàw rée = bíny bzyáá.
COM-eat PLUR = person bean
'The people ate beans.'

(3b) Û-dàw = réby bzyáá.
COM-eat = 3.HUMAN.PLUR bean
'They ate beans.'

(3c) Û-dàw = réby = rênny
COM-eat = 3.HUMAN.PLUR = 3.INAM.PLUR
'They ate them.'

Zapotec languages often show a large number of third-person pronominal categories. For example, San Lucas Quiaviní Zapotec distinguishes between proximal (near) and distal (far) third persons, as well as between animal, respectful, formal, and reverential third-person categories. These categories are not morphologically marked on nouns themselves, but on independent or clitic pronouns that are coreferential with the nouns. Pronominal category is also not completely fixed, but may vary somewhat according to a speaker's point of view and according to the structure of the narrative.

Syntactic Characteristics

Zapotecan languages show head-initial order in phrases. Clauses are VSO, noun phrases are N-initial, and the language is prepositional. The following examples from San Dionicio Ocotepc Zapotec and Yaitepc Chatino show these properties:

(4) San Dionicio Ocotepc Zapotec
Û-dèèdy Gùstááb ʃ-kèès Màrîi lòò Móòny
COM-give Gustavo POSS-pot Maria to Ramón
'Gustavo gave Maria's pot to Ramón.'

(5) Yaitepc Chatino (Pride, 1965: 82)
Nʃi?yu³² ne?³ yka³ lo?o¹ ta?a²³ lo?o¹
cutting he wood with brother with
siyera⁴ ka³ sî² bra³kô?².
saw yesterday evening then
'He was cutting wood with his brother with a saw
yesterday evening then.'

Though the languages are verb-initial, there is generally an elaborated hierarchy of positions to the left

of the verb. These frequently include special positions for topical, focal, negative, and interrogative phrases. The following examples from Quiegolani Zapotec illustrate several of these positions:

(6) Quiegolani Zapotec
[Tʃu]_{interrog} [men]_{Neg} wii-t?
who nothing saw-NEG
'Who saw nothing?'

(7) Quiegolani Zapotec
[Laad ʃ-unaa dolf]_{Focus} ɕe
FOC POSS-wife Rodolfo already
z-u nga.
PROG-stand there
'Rodolfo's wife was already standing there.'

All the Zapotecan languages also appear to show the phenomenon known as 'pied-piping with inversion.' When a subpart of NP or PP (and sometimes other constituents) is questioned, the entire phrase moves to the clause-initial interrogative position, but shows an inverted order, in which the interrogative precedes the head of the phrase:

(8) San Dionicio Ocotepc Zapotec
[Túú lòò]_{interrog} ù-dèèdy Gùstááb gèès?
who to COM-give Gustavo pot
'Who did Gustavo give the pot to?'

In broad syntactic terms, Zapotecan languages generally conform to the areal features of other Mesoamerican language families such as Mayan, Mixe-Zoquean, and Totonacan. Zapotecan languages differ from these other groups in lacking agreement and voice morphology and having a more rigid word order.

Conclusion

All Zapotecan languages are endangered, and in some communities, only a few elders speak the language. In other communities, the language is spoken by a much larger proportion of the population, but there are still economic pressures that favor language shift to Spanish or emigration to the United States and other parts of Mexico. These factors make language preservation and documentation work an urgent priority.

Introduction

Zulu, also known as isiZulu, is a Southern Bantu language, and is one of the 11 official languages of South Africa. With over nine million speakers, it is one of the country's major languages, and is used in broadcasting, journalism, and the national and provincial parliaments. Famous as the language of the Zulu empire of the 19th century, it has a growing literature, and there are efforts to develop a technical vocabulary for use in the teaching of mathematics and other sciences.

The language has been the subject of a considerable number of grammatical and linguistic studies, dating back to works of 19th-century pioneers such as Grout (1859). Zulu is closely allied to Xhosa, Swati, and Ndebele, and there is a high degree of mutual intelligibility between these languages, to the extent that it could be argued that they are all varieties of one language, Nguni. The findings of linguistic studies of the other Nguni languages are very frequently applicable to Zulu as well.

Morphology

Zulu displays the typical Bantu morphological features: it is highly agglutinative, and its nouns are divided into various classes, which command distinctive agreement morphology (see 'Syntax' below). Most of the noun classes occur in singular/plural pairs, for example, a noun such as *inja* 'dog' (class 9) will have a plural in class 10, *izinja* 'dogs.' Older studies classified the noun classes according to this pairing (e.g., Doke, 1927), but Canonici (1990) has proposed a classification according to agreement characteristics. From this point of view there are 12 noun classes. There is an elaborate tense and aspect system, and verbs may take valency-changing suffixes (known as 'extensions,' e.g., causative *-is-* in *fund-is-a* 'cause to learn, teach'; passive *-w-* in

fund-w-a 'be learnt'; reciprocal *-an-* in *fund-is-an-a*, 'teach each other').

The morphology of the language and the semantics of the various grammatical forms have been the focus of linguistic research into Zulu for the past 80 years. Dominating most studies has been Doke's model (1927), which sought to describe Bantu languages in terms appropriate to that family, rather than according to established Latin, Greek, or English terminology. Subsequent accounts have largely been refinements of the Dokean model, e.g., Cope (1984) and Poulos and Msimang (1998).

Phonology

Zulu phonology has been described in a number of works, most notably and comprehensively in Khumalo (1987). Like many Bantu languages, it has an (N)CV syllable structure. There are 40 phonologically distinct consonants, and five vowels. Vowel length is usually predictable, but occasionally distinctive (for example, between the remote past tense and the past consecutive tense: *wa:hamba* 'he/she walked,' *wahamba* 'and then he/she walked'). There is a stricture on the occurrence of two vowels in juxtaposition at surface level, which leads to rules of vowel merging; for example, possessive *a-* prefixed to *inja* 'dog' yields *enja* 'of the dog.' Other processes that have been frequently studied include palatalization and so-called nasal strengthening, where nasals in N+C clusters change the nature of the following C. For example, an aspirated consonant in this position will lose its aspiration, so that the root *phil-* 'live' becomes *-pil-* in the class 9 noun *impilo* 'life.' The language has a high/low tone contrast, and a (derived) high-low tonal cluster may occur on bimoric vowels.

Syntax

Zulu has a basic SVO word order. Relative clauses and possessive phrases follow the head noun, and auxiliaries precede the verb. There is considerable agreement marking, as in the following example,

where the affixes glossed as AGR all agree with the class 9 noun *moto* 'car.' ('REL' stands for 'relative marker'.)

| | | |
|---------------------------------------|------|-----------------|
| Le-y-o | moto | e-n-tsha |
| DEM-AGR-that | car | REL-AGR-new |
| o-yi-theng-ile | | i-fik-ile. |
| REL.PERS2-AGR-buy-PERF | | AGR-arrive-PERF |
| 'that new car you bought has arrived' | | |

Formal linguistic studies of syntactic phenomena in the Southern Bantu languages have frequently been cast in terms of the Chomskyan Principles and Parameters framework. Much of this work has concentrated on Xhosa rather than Zulu, e.g., Du Plessis and Visser (1992). Little or no work has been done in other frameworks such as Head-Driven Phrase Structure Grammar or Lexical Functional Grammar, although the latter has proved useful in descriptions of other Bantu languages such as Chewa (Nyanja).

Historical and Comparative Linguistics

Like other languages in the east of the Bantu area, Zulu shows fricativization of stops before the 'extra high' vowels of proto-Bantu, which subsequently merged with the high vowels. There is no synchronic operation of Meinhof's law or Dahl's law, and the verbal suffixes (extensions) show no vowel harmony. The noun classes found in the language are (to use the numbering system by which they are known in Bantu studies) 1–7, 9–11, 14, and 15 (the last being used for the infinitive). Only fossilized versions of locative classes remain as adverbs, such as *phansi* 'below.' Unusually for a Bantu language, Zulu has noun suffixes, e.g., the feminine marker *-kazi*. Several of the original Bantu verbal suffixes survive only in unproductive forms (e.g., *-ul-* in words such as *khumbula* 'remember'). The language is well known for its extensive borrowing of Khoi and San words and sounds, noticeably the click consonants in words such as *iqhwa* 'snow.' It has also incorporated many words from Afrikaans and English.

Sociolinguistics

Zulu has certain marked speech forms which are of interest to sociolinguists. An example is *hlonipha*, the speech form traditionally used by married women,

who have to avoid words that sound like the names of any of their close male in-laws, and therefore acquire a radically altered vocabulary (see Herbert, 1990). Another example is *isicamtho*, a group-marking variety used by young urban men, which has borrowed many words from English, often with radical change of meaning. There are several distinctive dialects of Zulu, and in some urban varieties the boundaries between Nguni languages have become less marked. In urban areas there is also much code switching between Zulu and the Sotho languages, and between Zulu and Afrikaans or English.

Current Research Directions

Zulu has long been one of the most studied Bantu languages, and it remains a focus of much research in the areas discussed above, and also in new directions including child language acquisition (Suzman, 1996) and computational linguistics (Bosch and Pretorius, 2002).

INDEX

NOTES

Cross-reference terms in italics are general cross-references, or refer to subentry terms within the main entry (the main entry is not repeated to save space). Readers are also advised to refer to the end of each article for additional cross-references - not all of these cross-references have been included in the index cross-references.

The index is arranged in set-out style with a maximum of three levels of heading. Major discussion of a subject is indicated by bold page numbers. Page numbers suffixed by T and F refer to Tables and Figures respectively. *vs.* indicates a comparison.

Subentries (or subsubentries) to a specific index entry having the same page number, have been included to indicate the breadth of the discussion (as opposed to just the location), as additional assistance to the reader.

This index is in letter-by-letter order, whereby hyphens and spaces within index headings are ignored in the alphabetization. Prefixes and terms in parentheses are excluded from the initial alphabetization.
