Introduction

Gamilaraay (Kamilaroi) is an Australian Aboriginal language that was traditionally spoken over a large area in the northwest of New South Wales, from the Great Diving Range, near Tamworth, north and west to the Darling and Barwon rivers. There was a range of dialect variation within this region, mostly marked by vocabulary differences, with all the local groups identified as *gamil* 'no' -*araay* 'having'. The sociolinguistic history of Gamilaraay is typical of many southeastern Australian languages.

The first recording of Gamilaraay is a short word list collected in 1832 by Major Thomas Mitchell (1839), and there is quite an amount of vocabulary material collected by local landowners in the late 19th century. The missionary William Ridley (Ridley, 1856, 1875) lived among the Gamilaraay in the 1850s and studied the language, collecting vocabulary and making simple primers and Bible translations. In 1903 the surveyor R. H. Mathews published grammatical notes and a short word list; however, the first professional recordings of the language date from 1930, when the anthropologist Norman Tindale took down words in phonetic notation and collected a short traditional narrative text (Austin and Tindale, 1986). By that time, local Aboriginal social and cultural transmission had been so disturbed by the impact of

European settlement (*see Australia: Language Situation*) that the two old men Tindale interviewed had difficulty recalling the story. In 1955, S. A. Wurm carried out extensive fieldwork in eastern New South Wales and at Boggabilla interviewed Peter Lang, who seems to have been the last fluent native speaker of the language. He died the following year. Wurm's materials included field notes and a 13-minute tape recording. In 1972–1974, Austin interviewed a large number of semispeakers who could recall up to 200 lexical items and fixed phrases from their youth, though none could produce sentences in the language. Using all the existing modern and 19th-century materials, together with comparative data from neighboring languages, one can obtain a fair but incomplete idea of the language and its structure.

From the 1940s onward, Gamilaraay ceased to be used as the main means of communication, although knowledge of words and expressions (such as plant, animal, and food names) continues until today. Since the 1990s, there has been intense local interest in the language, and strong support for its documentation and reintroduction. Austin (1992) is a bilingual dictionary that has been widely distributed; a hypertext version created by Austin and Nathan (1995) was the first fully hypertext bilingual dictionary on the World Wide Web.

As a result of local initiatives and with support from the New South Wales government, Gamilaraay is currently undergoing a language revival and is being taught both in adult education and primary school classes. A range of materials are now available on the language and its neighbor Yuwaalaraay, including a

reference dictionary (Giacon *et al.*, 2001), language lessons (Giacon, 1999), and a wordbook with accompanying music CD.

Language Relationships

Gamilaraay is closely related to its immediate western neighbors, Yuwaalaraay and Yuwaaliyaay. The languages share about 70% common vocabulary with Gamilaraay, and a similar grammatical system. Fortunately, Corinne Williams was able to study with the last two fluent speakers of these languages in 1975 and compiled a basic reference grammar and vocabulary list (Williams, 1980). There is also a large amount of tape-recorded material, collected in the 1970s by amateur linguist Janet Mathews (a relative of R. H. Mathews), that is being mined for other data.

These languages are quite clearly related to Wiradjuri (Wiradhuri), spoken over a large area of central New South Wales, and Ngiyampaa and Wayilwan, spoken along the Lachlan River (Donaldson, 1980; Austin *et al.*, 1980), and are members of a single linguistic subgroup (see Austin, 1997). This subgroup belongs to the widespread Pama-Nyungan family, which covers the southern two-thirds of Australia (see *Australia: Language Situation*).

Linguistic Characteristics

Phonology

The phonological system of Gamilaraay is typical of languages of eastern Australia, with contrastive stops at five points of articulation, a nasal for each stop position, a single lateral, a flap, a semiretroflex continuant, and two glides. **Table 1** gives the relevant consonants in their practical orthographic form. There are just three vowels: high front *i*, high back *u*, and low *a*, with a phonemic length contrast found in all syllables of words.

The general structure of Gamilaraay roots is CV(C)CV(C). Every word must begin with a consonant and end in a vowel, or *n*, *l*, or *y*. Word-initially, only nonapical stops and nasals and the two glides

are found. Word-medially, there are limited consonant clusters, primarily homorganic nasal plus stop, and apical nasal or lateral plus peripheral stop (*b* and *g*). Vowel clusters are not found. Words borrowed from English are generally restructured to meet these phonotactic constraints, e.g., *wajiin* ‘white woman’ (from ‘white gin’), *ganjibal* ‘policeman’ (from ‘constable’). Word stress is entirely predictable from the phonological shape of words: primary stress falls on long vowels or on the first syllable of a word that does not contain a long vowel. Secondary stress is on each even-numbered syllable to the left or right of the primary stress (except that final short syllables are not stressed). Examples are *gamilaraay* [gʌmilʌˈtʌy] ‘Gamilaraay’, *bandaar* [bʌnˈdʌ:r] ‘kangaroo’, *thinawan* [ˈtɪnʌwʌn] ‘emu’.

Morphology

Gamilaraay, like other languages of the Pama-Nyungan group, is entirely suffixing in its morphology. There are two major word classes: nominals and verbs, with nominals showing a rich system of case marking and verbs marking tense/aspect/mood and dependent clause categories. Nominals can be subdivided into substantives (which cover both noun and adjective concepts in a language like English), pronouns, and demonstratives. Minor word classes include adverbs, particles, and interjections.

Nominals in Gamilaraay inflect for case, with the syntactic functions of intransitive subject (S), transitive subject (A), and transitive object (P) showing a split-ergative pattern of syncretism in the case forms determined by animacy:

- For the first and second person pronouns, S and A fall together as a single (unmarked) form with P different, making nominative-accusative case marking.
- For third person pronouns and all other nominals, S and P fall together as a single (unmarked) form with A different, making ergative-absolutive case marking.

In addition to the three main cases (*nominative* for S, *ergative* for A, *accusative* for P), there are also the following case forms:

- *dative* marking alienable possession, and direction toward a place
- *locative* coding location in a place
- *ablative* coding direction from a place, and cause

The actual forms of the cases are affected by the phonological shape of the root, e.g., whether it ends in a vowel or not and what kind of vowel or consonant is root-final.

Table 1 Consonants

| | Bilabial | Lamino-Dental | Palatal | Apico-Alveolar | Dorsovelar |
|------------|----------|---------------|-----------|----------------|------------|
| Stop | <i>b</i> | <i>dh</i> | <i>j</i> | <i>d</i> | <i>g</i> |
| Nasal | <i>m</i> | <i>nh</i> | <i>ny</i> | <i>n</i> | <i>ng</i> |
| Lateral | | | | <i>l</i> | |
| Flap | | | | <i>rr</i> | |
| Continuant | | | | <i>r</i> | |
| Glide | <i>w</i> | | <i>y</i> | | |

Gamilaraay has a well-developed system of nominal word-building morphology that involves suffixation between the root and case inflection. Categories encoded in word-building morphology include number (plural), having (e.g., *bagaay-baraay* ‘Boggabri’ (literally ‘creek-having’)), lacking (e.g., *yuul-ngin* ‘hungry’ (literally ‘food-lacking’)).

Pronouns in Gamilaraay distinguish three persons and singular, dual, and plural number; in the first person nonsingular, there is no inclusive-exclusive contrast (unlike other Australian languages). **Table 2** sets out the basic pronoun forms. There are also bound pronouns for second person reference only; these are reduced forms of the free pronouns and are suffixed to sentence initial negative and interrogative particles only. Examples are the following:

- (1) *Yaama-nda ngalingu wuu-rri dhingгаа*
Q-2sg 1dl.dat give-fut meat
‘Will you give us meat?’
- (2) *Gariya-ndaali dhingгаа nhama dha-la*
not-2pl meat this eat-imper
‘Don’t you two eat this meat!’

Verbs morphologically distinguish between main verb and dependent verb inflections. Main verbs encode tense and mood categories, distinguishing future, nonfuture (covering past and present time reference), and imperative. Dependent verbs occur in hypotactically linked clauses and mark relative present tense (giving background information about the main clause event) and relative future tense (typically expressing purpose). The relative future is formally future plus dative case. There are four morphologically determined verb conjugations: conjugation 1 is primarily

transitive, conjugation 2 is primarily intransitive, and conjugations 3 and 4 are much smaller and have mixed transitivity. There are monosyllabic verb roots that occur in all conjugations. **Table 3** sets out the verb conjugation endings.

Verbs show productive word-building morphology, including affixes that indicate the temporal reference of an event within the tense frame of the inflected verb, e.g., *-ngayi-* indicates ‘event in the morning’, *-mayaa-* ‘event in the evening’, and aspectual, e.g., *-waaba-* ‘completive’, or directional meanings, e.g., *-uwi-* ‘back’. There are also transitivity and detransitivizing affixes, which shift conjugation and transitivity, e.g., *-ala-* ‘reciprocal’, *-ngiili-* ‘reflexive’. There are also limited category-changing processes with only nominalization marked by addition of a conjugation marker to the verb, e.g., *giili-y* ‘urine’ being productive.

The minor categories of adverb, particle, and interjection show no morphological variation.

Syntax

Like other Australian languages (see **Jiwarli**), Gamilaraay has relatively free word order and shows all possible orders of Subject, Object, and Verb, although there is a preference for A P V order; Williams (1980: 93) said this is found in 65% of examples. It also allows nouns and adjectives to be separated in the clause, with case agreement indicating which elements are constituents. Williams (1980: 96) gave the Yuwaalaraay sentence showing this:

- (3) *Buma-ay dhayin-du buyabuya dhayin*
hit-nonfut man-erg thin man
wamu-bidi-ju
fat-big-erg
‘The fat man hit the thin man’

When the adjective precedes the noun, no case marker needs to be attached to the adjective. Similarly, possessors (in dative case) may precede or follow the alienable possessed noun.

Gamilaraay interclausal syntax is relatively simple compared with some other Australian languages. Dependent clauses occur hypotactically, located on the margins of main clauses, and distinguish only

Table 2 Pronouns

| | A/S | P | Dative | Locative |
|-----|------------------|---------------------|---------------------|------------------------|
| 1sg | <i>ngaya</i> | <i>nganha</i> | <i>ngay</i> | <i>nganunda</i> |
| 1dl | <i>ngali</i> | <i>ngalinya</i> | <i>ngalingu</i> | <i>ngalingunda</i> |
| 1pl | <i>ngiyani</i> | <i>ngiyaniya</i> | <i>ngiyangu</i> | <i>ngiyangunda</i> |
| 2sg | <i>nginda</i> | <i>nginunha</i> | <i>nginu</i> | <i>nginunda</i> |
| 2dl | <i>ngindaali</i> | <i>ngindaalinya</i> | <i>ngindaalingu</i> | <i>ngindaalingunda</i> |
| 2pl | <i>ngindaay</i> | <i>ngindaaynya</i> | <i>ngindaayngu</i> | <i>ngindaayngunda</i> |

Table 3 Verb conjugations

| | Conjugation 1 | Conjugation 2 | Conjugation 3 | Conjugation 4 |
|------------------|-----------------------|------------------|------------------|---------------|
| Future | <i>-li</i> | <i>-y</i> | <i>-gi</i> | <i>-rri</i> |
| Non-future | <i>-(a)y</i> | <i>-nhi</i> | <i>-nhi</i> | <i>-nhi</i> |
| Imperative | <i>-la</i> | <i>-ya</i> | <i>-nga</i> | <i>-na</i> |
| Relative present | <i>-ldaay~ -ndaay</i> | <i>-ngindaay</i> | <i>-ngindaay</i> | <i>-ndaay</i> |
| Relative future | <i>-ligu</i> | <i>-ygu</i> | <i>-gigu</i> | <i>-rrigu</i> |

between relative future tense (purposive) or relative present tense (with adverbial or adnominal interpretations, depending on context). There are no cross-clausal coreference restrictions (such as switch reference or syntactic ergativity). Examples from Yuwaalaraay (Williams, 1980: 117–122) are shown in (4), (5), and (6).

- (4) *Girr ngaya nhama baa-nhi*
 affirm 1sgnom that jump-past
nhaadhiyaan-di, nginda garra-ldaay
 log-ablat 2sgnom cut-relpres
 'I jumped off the log that you cut'
- (5) *Nginda ngaaluurr burrulaa bayama-ndaay,*
 2sgnom fish many catch-relpres
ngay bulaarr wuu-na
 1sgdat two give-imper
 'If you catch many fish give me two'
- (6) *Ngaya yana-y walaay-gu,*
 1sgnom go-nonfut camp-dat
dhingгаа dha-ligu
 meat eat-relfut
 'I am going to camp to eat meat'

Particles in Gamilaraay have scope over the whole clause and encode such semantic concepts as polar question, as in (1); affirmation, as in (4); and negation. There are different particles for negative imperative, as in (2), and negative statement, as in (7).

- (7) *Gamil ngaya gamilaraay guwaa-li*
 not 1sgnom Gamilaraay speak-fut
 'I will not speak Gamilaraay'

Gə'əz

S Weninger, Philipps-Universität, Marburg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Gə'əz (Gə'əz, Classical Ethiopic, Old Ethiopic) is the classical language of Ethiopia. Gə'əz belongs to the Northern branch of Ethio-Semitic, which is part of South Semitic, a subgroup of the Semitic languages. The earliest extant texts are inscriptions from the 3rd century found in Northern Ethiopia, especially in the city of Aksum. From this time, Gə'əz maintained its exclusive status as a medium of

formal communication, until the 19th century, when it gave way to Amharic. Within the Ethiopian Orthodox Church it still holds a position comparable to the status of Latin in Catholicism. Gə'əz was also the liturgical language of the Jewish community of Ethiopia, the Betä 'Īsra'el.

Gə'əz is written in a quasi-syllabic script, developed on the basis of the Sabaean alphabet. Each sign represents either a combination of a consonant and a vowel or a simple consonant, e.g., አቡነ፡ ዘበሰማያት፤, representing the sequence 'a-bu-nä zä-bä-sä-ma-ya-t, pronounced 'abunä zäbäsämayat ('Our father who

art in heaven'). In its classical form, Gə'əz phonology comprises 26 consonants plus a set of four labialized velar obstruents and seven vowels. Noteworthy are sets of lateral, pharyngeal, and laryngeal obstruents as well as a set of ejectives. In the traditional pronunciation as practiced by learned Ethiopians, many consonantal distinctions are lost under the influence of modern Ethio-Semitic languages.

Gə'əz has a rich morphology based on the common Semitic system of three or four consonantal roots and vocalic patterns, with prefixes and suffixes used both in derivation and inflection, as in *šāḥafä* 'he wrote', *šāḥafku* 'I wrote', *nəšəḥəf* 'we shall write', *šāḥafi* 'scribe', and *mäšḥaf* 'book'. Grammatical categories of the noun are gender (male/female), number (singular/plural), and case (nominative-genitive/accusative). The verb has five tense-aspect-mood (TAM) categories (perfect, imperfect, jussive, imperative, and converb). Other categories of the verb are person, number (singular/plural), and gender (male/female, also for second person!). The syntax is based on a rather loose verb-subject-object word order, and agreement is not strict.

The vocabulary of Gə'əz is to a large degree common Semitic. However, loanwords from Cushitic languages, especially Central Cushitic languages,

form a sizable part of the Gə'əz lexicon. Contacts with the Church of Alexandria paved the way during late antiquity for many Greek and, during the Middle Ages, Arabic loanwords. On the one hand, Gə'əz shares many typological features with the Asian Semitic languages, such as Arabic or Hebrew. On the other hand, it shows features known from the modern Ethio-Semitic languages, which belong to the Ethiopian language area, also shared by the Cushitic languages, with their subject-object-verb syntax. The converb, already present in Gə'əz, is typical for this area.

Georgian

B G Hewitt, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Georgian is spoken in the Republic of Georgia, the Zakatala district of Azerbaijan, the historical Georgian regions of northeastern Turkey, by descendants of Georgians transplanted to Fereydan in Iran by Shah Abbas (17th century) and by émigré communities established in such countries as France following sovietization but growing in Russia and beyond since the collapse of the USSR in 1991.

The Georgian language (*kartuli ena*) belongs to the Kartvelian (South Caucasian) family (see **Caucasian Languages**). Georgian possesses a number of dialects, which can differ sharply from both one another (e.g., western Gurian versus northeastern Khevsurian) and the literary standard. The latter is in some respects still in the process of regularization but is based on the central Kartlian dialect, in which region lies the capital, Tbilisi (formerly T'pilis).

The language is customarily periodized as Old Georgian (5th–11th centuries) → Mediæval

(12th–18th centuries) → Modern (post-1800). Iranian, more recently Russian, and now English lexical influences are marked; Greek, Armenian, Arabic, and Turkish loans have also penetrated.

The oldest inscription dates from circa 430 AD at a site near Bethlehem. Within Georgia, the church at Bolnisi boasts an inscription dated to 494. Iak'ob Tsur'taveli's "Martyrdom of Shushanik," apparently composed between 476 and 483, represents the first work of native literature, while the oldest dated manuscript (the Sinai Polycephalon) hails from 864. The earliest survivals exhibit peculiarities in the marking of the third person indirect object/second person subject, from which they are styled *xanmet'i* 'with extra *x*' or *haemet'i* 'with extra *h*'; the nature of this distinction (diachronic versus dialectal) has been hotly debated. Little seems to have been written during the centuries of Mongol and Tatar depredations.

Georgian is written in a unique, wholly phonemic alphabet with 33 characters from left to right without any upper- versus lower-case distinction. The modern script *mxedruli* 'military; secular' evolved in the

11th century from its precursor *k'utxovani* 'angular.' This in turn developed in the 9th century from the oldest variant *mrg(v)lovani* 'rounded,' which was probably devised in the 4th century AD on the model of Greek to facilitate the spread of Christianity, adopted as the official religion by King Mirian of Kartli during the 330s. Even after the 11th century, religious texts continued to be written in a combination of the two earliest scripts, called *xutsuri* 'ecclesiastical,' such that the oldest served as the majuscule (*asomtavruli*) to the minuscule (*nusxuri*) of its successor.

Modern Georgian has 28 consonants plus five vowels (Tables 1 and 2).

Old Georgian additionally had the voiceless uvular plosive /q/, which in standard Georgian has merged with the voiceless back fricative, plus the palatal glide /j/, sounds retained in Svan. Circumfixes abound. Verbs divide into transitives, intransitives, 'medials,' indirects (with logical subject in the dative), and a small stative class; 'medials' often appear intransitive but largely behave morphosyntactically like transitives because the relevant forms are borrowed from corresponding transitive paradigms. Georgian (with Svan) preserves the feature, assumed to have characterized Proto-Kartvelian, whereby a transitive verb's arguments are case-marked in one of three ways determined by which of three tense-mood-aspect (or *screeve*) series the given form displays. Verbs can agree with up to three arguments by virtue of the presence of two sets (A and B) of pronominal agreement affixes. The patterns of morphosyntactic behavior (with subscripts indicating affixal agreement) are (Table 3) distributed as follows (where the transitives and 'medials' are combined as Type I verbs, while intransitives, indirects, and statives are subsumed under Type II) (Table 4).

Table 1 Consonantal system

| | | | | | | | | | |
|---|---|----|----|----|-----|-----------|---|--|---|
| b | p | p' | | | | | | | m |
| | | | | | | v [v/f/w] | | | |
| d | t | t' | | | | | | | n |
| | | | dʒ | fʒ | fʒ' | z | s | | l |
| | | | dʒ | fʒ | fʒ' | ʒ | j | | r |
| g | k | k' | | | | | | | |
| | | q' | | | | ɣ | χ | | h |

Table 2 Vowel system

| | | | | |
|---|---|---|---|---|
| i | | | | u |
| | ε | | ɔ | |
| | | a | | |

The examples below demonstrate that, while case marking in Series II follows ergative alignment, affixal agreement is accusative, creating a split-ergative configuration. Although the Series III pattern might appear to be a better candidate for illustrating ergativity, this inverted construction developed relatively late across Kartvelian out of a past (essentially intransitive) resultative. No unique Ergative morph can be reconstructed for proto-Kartvelian. The system is illustrated by the transitive 'The shepherd (a) will toss_β, (b) tossed_α, (c) (has) apparently tossed_γ, food down for his flock' versus the intransitive 'The priest (d) will drown_β, (e) drowned_β, (f) (has) apparently drowned_{β'}, where (a/d) represent Series I, (b/e) Series II, (c/f) Series III:

- (a) mʃs'q'ε ms-i sa.mʃs'q's.ɔ-s sa.fʃ'm. εl-s

German

M Durrell, University of Manchester, Manchester, UK

© 2006 Elsevier Ltd. All rights reserved.

In terms of speaker numbers, German is the most important language in western and central Europe. With English, Dutch, and Frisian (Western Frisian; Northern Frisian), it belongs to the western group of the Germanic languages. In its standardized form, however, it is linguistically more conservative, having retained more of the synthetic morphology of the common ancestor. Its dialects exhibit immense variation, with a low degree of mutual intelligibility, and the standard form emerged relatively late as a consequence of the political fragmentation of central Europe.

The Speakers of German

With approximately 100 million speakers, German ranks 10th among the languages of the world, and it is the most widely spoken language in the European Union in terms of first-language speakers. Within Europe, it is exceptional in terms of the number of countries in which it is spoken. The largest proportion is in the Federal Republic of Germany (80 million), followed by Austria (7.5 million), German-speaking Switzerland with Liechtenstein (4.5 million), and Luxembourg (350 000). German also has some official status as a regional language in Belgium, Denmark, Hungary, Italy, and Romania,

and there are significant German-speaking minorities in the Czech Republic, France, Poland, Slovakia, and a number of the successor countries to the Soviet Union, notably Kazakhstan. However, where German-speaking minorities lack official status, the number of speakers is generally in decline.

Outside Europe, there are over a million active users of German in the United States and significant numbers in Argentina, Australia, Brazil, Canada, Namibia, South Africa, and a few other South and Central American countries. These numbers are now declining quite rapidly as German speakers assimilate to the majority linguistic community.

German has a few significant offshoots. The only example of a German-based creole was in Rabaul (Unserdeutsch, spoken in New Britain), but this is now vestigial. Pennsylvania Dutch (Pennsylvanish), deriving from Palatinate dialects, is spoken in parts of Pennsylvania, Ohio, and Ontario, although it is in decline outside closed religious communities such as the Amish. Since the Second World War, the local dialects of Luxembourg have no longer come to be perceived by their speakers as forms of German, and a standard Luxembourgish (Luxembourgeois) is becoming established. The most important language to have developed from German, though, is Yiddish, whose origin was the medieval German spoken in Jewish communities in central and southern Germany but that has subsequently developed into a distinct language, with a syntax and vocabulary unlike that of any variety of German.

The History of German

Modern Standard German (customarily referred to as *Hochdeutsch*, or High German) arose from the West Germanic dialects spoken by a number of peoples (Franks, Alemannians, and Bavarians) who settled between the north German plains and the Alps in the first centuries A.D. These dialects came to differ from other forms of West Germanic, and especially from the Low German dialects of the northern plains, through the consonant changes that are known collectively as the Second (or High German) Sound Shift. Because of this change, inherited voiceless plosives became affricates or fricatives (depending on whether they were word-initial or not), as illustrated by the pairs of cognates from English (which retained the original West Germanic consonants) and modern German in **Table 1**.

There are continuous written records in varieties of High German from the second half of the 8th century, and the history of the German language is usually divided into four major periods. Relatively few texts, mainly of a religious character, have survived from the first period (750–1050), known as Old High German, because Latin was the dominant language of literacy. The Middle High German period (1050–1350) saw some development of secular writing, notably in the form of chivalric verse on French models. The linguistic territory was extended during this period as High German settlers moved east across the Elbe.

The third period, Early New High German (1350–1650), saw the beginnings of a slow process of standardization. Up to this time, numerous regional varieties had been used in writing, but, with the invention of printing, certain variants started to be used more widely than in their region of origin. This development was aided by the Reformation and the prestige of Luther's writings, especially his Bible translation, which often proved decisive in the preference for a particular variant over competing forms. In this way, the process of selection, as the first stage in the process of standardization, had been largely completed by the mid-17th century, and a relatively uniform High German was being used for writing in central Germany and, significantly, also in the north, where it supplanted the native Low German.

Table 1 Second sound shift: English and German cognates

| English | German |
|---------|-------------------|
| pepper | Pfeffer |
| tin | Zinn (<z> = [ts]) |
| water | Wasser |
| book | Buch (<ch> = [x]) |

The process continued into the fourth, New High German period (1650 on) as this written variety was codified in terms of grammar, orthography, and lexis. Crucially, in the course of the 18th century, this variety gained acceptance in Catholic south Germany, Switzerland, and Austria, which had resisted a variety associated with Lutheranism and retained regionally based norms. Nevertheless, *Hochdeutsch* long remained a primarily written variety, with local dialect being the norm in speech. By the middle of the 19th century, however, a prestige pronunciation had arisen based on the north German tradition of speaking written High German precisely as it was spelled. This was formally codified for use on the stage in 1898, and it has subsequently been adopted by a majority of speakers as a spoken supraregional norm.

The Structure of Modern Standard German

Sounds and Spelling

Among the noteworthy features of German phonology is the existence of a set of affricates, specifically a labial /pf/ and dental /ts/, which have (controversially) been analyzed as single phonological units. There is also a set of front rounded vowels, as in *fühlen* [fy:lən] 'feel,' *böse* [bø:zə] 'evil.' The opposition of voicing in obstruents is neutralized in syllable-final position, as in *ich sage* [za:gə] 'I say' but *ich sagte* [za:ktə] 'I said.'

A striking feature of German orthography is the capitalization of nouns. Otherwise, it is broadly phonemic, if not precisely so. In particular, the tense/lax distinction in vowels is not marked in a uniform way, and there is a general principle that root morphemes retain a consistent spelling wherever possible. The Latin alphabet is used, with some modifications, specifically the symbol <ß>, used for /s/ in some words, and the umlaut symbol, which assists in maintaining the consistent orthographic shape of roots. The spelling of German was reformed in 1996 (after the initial codification in 1902) with the aim of eliminating inconsistencies. This reform has generated considerable controversy that is still ongoing, but the changes are relatively slight and chiefly affect the use of the symbol <ß> and punctuation.

Morphology

German is the only West Germanic language to retain extensive inflectional marking of grammatical categories, although the nature of this marking has often changed. The four noun cases, for example, are now marked primarily through the inflection of the determiner and/or the adjective, as in *der Mann* 'the man':

NOM: der Mann

ACC: den Mann

GEN: des Mannes

DAT: dem Mann

The three genders of the noun can only be identified through agreement and do not correlate consistently with any phonological or semantic features of the noun itself, for example, *der Band* ‘the volume’ (masculine), *die Hand* ‘the hand’ (feminine), *das Land* ‘the country’ (neuter).

German makes extensive use of vowel changes in inflection. Ablaut in the strong verbs (e.g., *singen* ‘sing,’ past *sang*, past participle *gesungen*) is found in other Germanic languages, but German has also morphologized the vowel fronting alternations known as umlaut in several functions, for example, in noun plurals (*der Bruder* ‘the brother,’ *die Brüder* ‘the brothers’), the subjunctive (past indicative *ich war* ‘I was,’ past subjunctive *ich wäre*), and adjective comparison (*groß* ‘big,’ *größer* ‘bigger’).

Syntax

A striking aspect of German syntax is the position of the finite verb. In main clause statements it is the second constituent, but in questions it occurs first and in subordinate clauses it occurs finally. In verb-second and verb-initial clause types, any non-finite components of the verb phrase are placed finally, forming what German linguists term a ‘bracket construction’ enclosing the other constituents:

deinen Bruder habe ich zufällig
 your brother have I by chance
 gestern in der Stadt gesehen
 yesterday in the city seen

‘I have by chance seen your brother in the city
 yesterday’

The preverbal position constitutes a topic slot that can be filled by any appropriate constituent. The position of other clause-level constituents depends on communicative criteria. The syntax of German has thus often been considered to be characteristically flat (Kathol, 2001), although a more conventional view is that it is an underlyingly SOV language, with the finite verb being moved into second position.

Regional and Social Variation in German

The German speech area exhibits much geographical variation, with significant linguistic differences among distant regional dialects. The area can be seen as a dialect continuum from the Alps to the coast, with the most important division being between the High German dialects of the center and south, which

participated in the Second Sound Shift, and the Low German dialects of the north, which did not. The Low German dialects are closer to standard Dutch than standard German, but these areas adopted standard (High) German as their language of literacy in the 17th century. The major dialect groups within High German are West Central German (in the Rhinelands and Hesse), East Central German (in Thuringia and Saxony), Bavarian (including most of Austria), and Alemannic (in the southwest, including German-speaking Switzerland).

These dialects are very diverse, and the degree of mutual comprehensibility between even geographically quite close dialects can be remarkably low. Not all Swiss Germans, who are all competent in their local dialect, can understand the dialects of the remoter Alpine valleys. Few linguistic criteria, with the possible exception of the verb-second constraint, link all the speech varieties within this continuum exclusively, and only the long-established notion that these are all, in some way, forms of German provides a connection, as does the use of the common standard, which is important for supraregional communication and as a unifying symbol of ethnic identity. The significance of the latter has become clear again following reunification in 1990. Nevertheless, there is significant variation in the codification of the standard between the various German-speaking countries, and some regional diversity is accepted in the standard even within Germany, particularly at the level of lexis (e.g., northern *Sonnabend* and southern *Samstag* ‘Saturday’).

Remarkable, too, is the sociolinguistic diversity of the German speech area in the variety of the relationships between standard German, the dialects, and other languages. German-speaking Switzerland is a classic instance of diglossia, although the nature of this diglossia is changing rapidly. South Tyrol and eastern Belgium exhibit relatively stable – and nowadays institutionalized – bilingualism, whereas in Alsace-Lorraine the centuries-old French–German bilingualism is breaking down with the rapid decline of the local dialects and the decoupling of the link between them and standard German. Within Germany and Austria the relationship between *Hochdeutsch* and the dialects varies markedly over the whole area, with the relative prestige and use of dialect increasing the further south one travels. A common pattern in central and southern Germany is the existence of a continuum of variants between near-dialect and near-standard, with speakers employing two focused varieties along this continuum that they perceive as (and label) *Hochdeutsch* and dialect. These are then used in accordance with the perceived formality of a given speech situation.

Germanic Languages

M Durrell, University of Manchester, Manchester, UK

© 2006 Elsevier Ltd. All rights reserved.

The Germanic languages include Dutch, English, German, and the Scandinavian languages. From their original home in northwest Europe, they have become one of the most widely distributed language groups, being spoken on five continents by at least 550 million native speakers. By far the largest proportion of these (over 70%) are first-language speakers of English.

The Germanic Language Group

The Germanic languages constitute a distinct branch of the Indo-European language family. Since the 19th century it has been conventional to distinguish three major subgroupings within Germanic:

- *West Germanic*, including English (with many varieties and descendants, notably Scots and numerous creoles and pidgins), German (with several relatively distinct varieties and offshoots, including Low German, Luxembourgish (Luxembourgeois), Pennsylvanian (Pennsylvanish), and Yiddish), Dutch (with its descendent Afrikaans), and Frisian (with three mutually unintelligible varieties: Western Frisian, East Frisian, and Northern Frisian).
- *North Germanic* in Scandinavia, comprising a western group that includes Icelandic, the closely related Faroese (together with the now-extinct dialects of other early Norse settlements), and Norwegian (with its two codified standard varieties Bokmål and Nynorsk); and an eastern group including Danish and Swedish. The mainland Scandinavian languages are mutually comprehensible to a significant degree.

- *East Germanic*, which is usually taken to include Gothic, Burgundian, and Vandalic and possibly some further languages such as Gepidic and Rugian. However, all these languages are now extinct and the evidence that they actually constituted a discrete group with common linguistic features is slight. Little is known of them except for Gothic, for which part of a 4th century Bible translation has survived. This is the earliest continuous text in any Germanic language.

The Origins and Early History of the Germanic Languages

The genetic relationship among the Germanic languages is clear from many lexical cognates (cf. English *house*, *red*, *I gave*; Dutch *huis*, *rood*, *ik gaf*; Norwegian (Bokmål) *hus*, *rød*, *jeg gav*; Gothic *hus*, *rauþs*, *ik gaf*), and this relationship was already recognized by scholars in the 16th century. The ancestor language, usually called Proto-Germanic, was probably spoken around the North Sea and the Baltic in the first millennium B.C. Within the Indo-European family, Proto-Germanic appears to be most closely related to Italic (and possibly Illyrian and Venetic), although there are significant affinities, particularly in morphology and lexis, with Baltic (and possibly Slavonic). Nevertheless, almost one-third of the core vocabulary that can be reconstructed for Proto-Germanic lacks any Indo-European cognates, notably words relating to the sea and seafaring, such as English *boat*, *sea*, and *ship* and the words for the points of the compass. Early lexical loans from Celtic (e.g., the ancestor of German *Reich* 'kingdom') testify to the earliest contacts of the Germanic peoples, as do a significant number of lexical loans

from Proto-Germanic into Finnish (e.g., Finn. *kuningas* ‘king’). These are particularly interesting because they still retain features and forms that have disappeared in even the earliest attested Germanic dialects and can only be reconstructed for the common ancestor.

The first longer account of the Germanic peoples is by the Roman historian Tacitus in his *Germania* of 98 A.D., by which time some Germanic tribes had moved southward from the shores of the Baltic into central Europe and come into contact and conflict with the Roman Empire as it expanded northward. The first linguistic records, from the 3rd century A.D. onward, are carved inscriptions using the Runic alphabet or *futhork* (so-called after the first six letters of the alphabet). The origins of this writing system are obscure, although it appears to be based on an early Etruscan or north Italian alphabet, and it is not used for longer texts. Runic inscriptions have been found in many parts of northern and eastern Europe, and their language is remarkably uniform, irrespective of their provenance. It is sometimes erroneously referred to as Primitive Norse or Proto-Norse, but there is no evidence that its form is specifically North Germanic.

The relationship of the early Germanic dialects to one another is a matter of controversy. The assumption of an early three-way split into East, North, and West Germanic is no longer accepted, but no consensus has replaced it. A majority view at present is that the East Germanic group, specifically Gothic, split from the common ancestor first, leaving a North-West Germanic group that has been identified with the language of the early Runic inscriptions. This divided into the North Germanic and West Germanic groups. North Germanic or Old Norse is the common ancestor of the modern Scandinavian languages; it is very close, if not identical, to the attested Old Icelandic of the sagas and the *Edda*.

West Germanic, on the other hand, as the ancestor of modern Dutch, English, Frisian, and German, appears to have been a much more diffuse grouping with few common features. It is probably best considered as a dialect continuum, although the relationship of the dialects within it and the development from the earliest stages into the modern languages and dialect groups are not clear in every respect. Within West Germanic, three main complexes of dialects have been identified: North Sea Germanic (sometimes referred to as *Ingwaëonic*, following the terminology of Tacitus), Weser-Rhine Germanic (or *Istwaëonic*), and Elbe Germanic (or *Erminonic*). Modern English and Frisian have their origin in dialects of the North Sea Germanic group. Early forms of Dutch (called Old Low Franconian) are poorly attested, but modern Dutch, like Low German (and its earliest form

Old Saxon) seems to combine features of North Sea and Weser-Rhine Germanic. The principal characteristic of (High) German within West Germanic results from the Second Sound Shift, whereby inherited voiceless plosives developed into affricates or fricatives (cf. English *pepper*, *water*, *token* with German *Pfeffer*, *Wasser*, *Zeichen*). This change is commonly assumed to have occurred between the 5th and 7th centuries A.D. in the Elbe Germanic dialects and some of the more southerly Weser-Rhine Germanic dialects, which thereby combined to form the basis for modern German.

This view of the development of the Germanic languages has recently been challenged by Vennemann (1984), who put forward a new account of the development of the Germanic languages from the earliest times. In his view, the division reflected in the Second Sound Shift goes back to an underlying division within Proto-Germanic into Low and High Germanic, with (High) German thus separated from the other dialects at a very early stage. These views have not been widely accepted, but they succeeded in reopening a still ongoing debate on some of the more intractable problems in the early history of the Germanic languages.

The Germanic peoples played a significant part in the great migrations that followed the fall of the Roman Empire, and Germanic tribes spread over wide areas of Europe, although they were subsequently assimilated into the local populations. This has left substantial traces in the form of lexical loans in many languages of southern Europe (e.g., French *garder*, Italian *guardare*, and Spanish/Portuguese *guardar* from the Germanic root **wardōn* ‘watch’). The lexical influence of Frankish, a West Germanic language, on early French, is of particular importance, and some 700 such loans can be dated from the 3rd to the 8th centuries. Proto-Germanic had only two tenses (past and nonpast), although this has been extended by periphrastic forms in all the descendent languages. Proto-Germanic also retained only one nonindicative mood, combining the functions of the I-E subjunctive and optative, although this is vestigial in all the modern languages except German and Icelandic. Characteristic of all the Germanic languages, however, is an extensive set of auxiliary verbs expressing modality (called modal auxiliaries), represented

Table 1 First Sound Shift (Grimm's Law)

| <i>Indo-European</i> | <i>Latin</i> | <i>Gothic</i> | <i>English</i> |
|----------------------|--------------|---------------|----------------|
| *trejes | trēs | þreis | three |
| *dekṃ | decem | taihun | ten |
| *dhur- | forēs | daur | door |

Table 2 Verner's Law

| Indo-European | Latin | Gothic | English |
|---------------|-------|--------|---------|
| *pāter | pater | fadar | father |

in English by *can, may, must, shall, will*, and so on. These verbs are typically highly irregular and syntactically deviant. Traces of the I-E synthetic passive are found only in Gothic (and there only in the present tense), and the passive is expressed through auxiliary constructions in all the modern languages. However, the Scandinavian languages have also developed a new inflectional passive deriving from the grammaticalization of the reflexive pronoun.

In the noun, the three I-E genders were retained, but these have been reduced to two (common vs. neuter) in standard Dutch and much of Scandinavian. English, Afrikaans, and some dialects of Danish, however, have lost all gender distinctions. Germanic kept four of the I-E cases, nominative, accusative, genitive, and dative (although early West Germanic has traces of an instrumental). These have been subject to further attrition in almost all the modern languages, with only Icelandic (with Faroese) and standard German retaining four cases. The other languages, in particular, no longer mark any verb arguments through inflections, except in the pronouns.

The original word order of Germanic is a matter of controversy, although majority opinion favors the assumption of underlying SOV. The sentence structure in all the extant older texts, however, is very variable, and it has been viewed as flat, or nonconfigurational. The modern languages have moved to more fixed word order, with most of them

exhibiting a characteristic verb-second (V2) structure in declarative main clauses, with the verb as the second constituent and the initial position typically being occupied by the sentence topic, which may not be the subject. English is the exception here, having moved to SVO in all clause types in the early modern period. The other West Germanic languages, with the exception of Yiddish, have a characteristic SOV structure in subordinate clauses.

Gikuyu

C Githiora, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Gĩkũyũ (alternate names: Kikuyu, Gikuyu) is spoken as a first language by about one-third of Kenya's population, or about 10 million people. The speakers are known as the Agĩkũyũ (singular Mũgĩkũyũ) and they refer to their language as Gĩgĩkũyũ. The geographical dialects of Gĩkũyũ correspond to four

administrative districts, which are Mt. Kenya (Kĩrĩnyaga), Northern (Nyĩrĩ), Central (Mũrang'a), and Southern (Kiambu), but there is minimal differentiation among them. Gĩkũyũ is classified as a Thagicu language (Guthrie's zone E51) of the Central Northern Bantu family, and ultimately the Niger-Congo superfamily. Gĩkũyũ has borrowed significantly from Maasai (Purko and Ukwavi dialects), Swahili, and English. Gĩkũyũ is one of Kenya's most thriving languages with a vibrant presence in mass media and publications. It is broadcast on a number of community radio stations, and on national radio, KBC.

Pamphlets, journals, and magazines are published regularly in this language, and books written in Gĩkũyũ are published each year in Kenya and abroad. The renowned writers Ngũgĩ wa Thiong’o and Gakaara Wanjau maintain the language’s international visibility by publishing major literary works in Gĩkũyũ. A standardized orthography was first published by the United Kikuyu Language Committee (UKLC) in 1947. It was revised and updated by UKLC’s successor, UUGI (Ūūrũmwe na ūkũria wa Gĩgĩkũyũ) in 1984 and 2002. Two significant studies on the language have been done by Barlow (1960) and Armstrong (1967), and two grammar sketches by Gecaga (1953) and Mugane (1997). A Kikuyu-English dictionary by Benson (1964) is still in print.

Phonology

Gĩkũyũ is a tone language, where the syllable is the tone-bearing unit. In autosegmental terms, the syllable is the licenser of tone, i.e., it assigns one tone per syllable, regardless of its length (weight). These tones, however, are not marked in standard Gĩkũyũ orthography.

Gĩkũyũ has three levels of tone: high (H), mid (M) and low (L), as illustrated in the following examples: *gĩthiitũ* (MHL) ‘charm’, *mũthũngũ* (MHL) ‘European person’, *ikuua* (LLM) ‘load’, *njĩngiri* (HMH) ‘musical rattles’.

Lexical tone in Gĩkũyũ changes the meaning of words: for example, *aka* (HH) ‘build’ vs. *aka* (MM) ‘wives’; *iria* (HHM) ‘sea’ vs. *iria* (MML) ‘milk’; *ira* (ML) ‘yesterday’ vs. *ira* (LM) ‘snow’. Grammatical tone changes sentence or phrase meaning: for example, *nĩmaakaga* (MMHL) (habitual tense) ‘they build’; *nĩmaakaga* (HMML) (past habitual) ‘they used to build’.

Syllables are always open, minimally consisting of a vowel (V) or a consonant-vowel (CV) sequence, and there are heavy and light syllables. Examples: V o ‘they’; VV *ooki* ‘newcomers, immigrants’; CVV *tũĩĩ* ‘soil’; CV *ke* ‘take’, *ma* ‘truth’, *ha?* ‘where?’; NCwV *ngwa* ‘thunder’; NCyV *ndya* ‘feast’; NCV *nda* ‘stomach’.

Vowels

Gĩkũyũ has seven vowels: a, e, i, ĩ, o, u, ū. There is contrastive vowel length so each vowel can be either long or short: for example, *tata* ‘drip’/taata ‘aunt’; *kana* ‘or’/kaana ‘child’; *kara* ‘etch’/kaara ‘little finger’. At the phonemic level, the two high vowels ĩ and ū are more centralized than the cardinals, i and u respectively. Examples: *ira* ‘yesterday’/ĩra ‘tell’; *uga* ‘say’/ũra ‘run away’. Derived vowels, both long and short, are numerous in the language.

The most common ones result from assimilation across morpheme boundaries, and reduplication of certain stems also induces V-length. Examples: *Githiora ūkĩra* → *Gĩthiorookĩra* ‘Githiora, wake up’; *hiti igĩrĩ* → *hitiigĩrĩ* ‘two hyenas’; *anake erĩ* → *anakeerĩ* ‘two warriors’; *te* ‘discard’ → *teateea* ‘waste’; *rĩa* ‘eat’ → *rĩarĩĩa* ‘pick at food’; *aria* ‘talk’ → *araaria* ‘talk a bit’.

Diphthongs and triphthongs can also occur within stem boundaries, in normal speech, e.g., *kũina* ‘sing’, *kiuga* ‘half calabash’, or across phrase/morpheme boundaries, e.g., *kĩmwĩreoke* ‘then tell him/her to come’, *mbũkũikumi* ‘ten rabbits’, *rekeambeoime* ‘let him/her come out first’.

The glides y, w result predominantly from vowel sequences across morpheme boundaries, whereby ĩ becomes y and ū becomes w, as the following examples illustrate: *kĩ-ũria* → *kyũria* ‘question’; *ũ-othe* → *wothe* ‘all’; *ũ-athani* → *wathani* ‘reign’. The high cardinal vowels i and u do not produce glides.

Consonants

Gĩkũyũ’s inventory is made up of the following consonants:

| | |
|-------------|-------------------------------------|
| nasals: | n m ny ng’ |
| glides: | w y r (voiced alveolar flap) |
| stops: | t k |
| fricatives: | th c h b g |

As in most Bantu languages, prenasalized consonants, **nd**, **mb**, **ny**, **ng’**, **ng**, **nj**, occur very frequently in Gĩkũyũ. Sometimes they occur as derived segments: for example, when an N-morpheme (prefix) comes into contact with an obstruent, it must produce a nasal consonant, as in the following examples involving the 1st person singular subject prefix N-: *rega* ‘refuse’ → *ndega* ‘refuse me’; *kora* ‘find’ → *ngora* ‘find me’; *tũma* ‘send’ → *ndũma* ‘send me’; *cuna* ‘lick’ → *njuna* ‘lick me’, etc.

Noun Classes

Gĩkũyũ is no exception to the chief characteristic feature of Bantu languages, namely the grouping of nouns into noun classes (see Table 1). These are based primarily on concordial properties, but there are discernible semantic relationships among members of each noun group.

The Concord System and Morphosyntax

The classification of nouns into these groups has important bearing on the language’s grammar. Adjectives must agree with the number (singular or plural) and class of the head noun, somewhat like the behavior of the gender system in Romance languages.

Table 1 Gĩkũyũ noun classes

| Noun prefix singular/plural | Examples | General semantic content |
|-----------------------------|---|---|
| mũ-/a- | mũ ndũ, mũ rĩmi, mwarimũ | human; kinships; professionals |
| mũ-/mĩ- | mũ tĩ, mũ barĩki, mũ tũng'ũ | trees, plants; diseases; parts of body |
| i-/ma- | ĩbuku, ĩniũrũ, ĩgongona, ĩruqa | inanimates; parts of the body; ceremony |
| kĩ-/i-/ci- | Kĩ mbaruuhia, Gĩ thweri, gĩ thiitũ | ceremonial, religious objects; liquids; languages |
| o-/o- | thonjo, thigiriri, ngi, ndutuura, huria, njogu | birds, insects, animals |
| rũ- | rũ ũĩ, rũ nyeki | long objects |
| ka-/tũ- | ka mũndũ, ga tu, ka nyũmba | diminutives |
| ũ-/ũ- | ũthaka, ũcoorua, wagi; ũcũrũ | abstracts; miscellaneous |
| ku-/o | kũ gura; gũ thambia, kũ iya | verbal nouns; miscellaneous |
| ha-/o; kũ-/o | ha aha, kw ene, kw ao | locatives |

Table 2 Examples of concord in Gĩkũyũ

| Singular | Plural | Gloss (in plural) |
|----------------------------|----------------------------------|---------------------|
| mũndũ ũyũ | andũ aya aniini nĩ | 'these short people |
| mũ kuhĩ nĩ | marathooma | are reading |
| arathoma ibuku | mabuku | books' |
| kamũndũ gaaka | tũmũndũ tũũtũ | 'these (dim.) small |
| ga kuhĩ | tũ kuhĩ | people are |
| ka rathooma | tu rathooma | reading books' |
| ibuku | mabuku | |
| riitho rĩake rĩnene | maitho maake | 'his/her big eyes |
| rĩrona wega | ma nene | are seeing very |
| mũno | ma roona wega | well' |
| | muno | |
| ibuku rĩakwa | mabuku makwa | 'my old books got |
| ri kuru rĩrorĩire | ma kũrũ | lost there' |
| kũu | ma rorĩire kũu | |

The noun also must be mapped onto the verb phrase by use of a 'marker' or prefix whose form is determined by the noun's class. In the illustrating examples in Table 2, the head noun is underlined, and its concordial prefixes highlighted in bold.

When coordinate phrases involve head nouns that belong to different classes, it becomes necessary to resolve the clash of subject concords. Two strategies are possible in such cases. One strategy opts for use of the human subject plural marker for final agreement or concord on the verb phrase, irrespective of the order of the coordinating clauses, e.g., *mwarimũ (a-/ma-) na buria (ĩ-/i-) magĩcemanĩa* 'the teacher and the rhino met'; *buria na mwarimũ magĩcemanĩa nĩra* 'the rhino and the teacher met'. The second strategy takes advantage of the plural subject prefix of inanimate, nonhuman nouns of the *kĩ-/i-/ci-* noun group, e.g., *muti (ũ-/ĩ-) na karamu (ga-/tũ-) cikiunika* 'stick and pen broke'.

Word Order in Gĩkũyũ: Subject-Verb-Object (SVO)

The chief elements of the verb phrase or sentence according to the following template:

nĩ (focus) + SM + TAM + (*kĩ*) + (OM) + (RF) + stem + FV (O)

RF = reflexive marker which may alternately occupy object marker position (OM). FV stands for final vowel and O for object. The latter is actually outside the main template, but is necessary for a fully formed sentence.

For example:

| | | |
|----------------------|----------------|-----------------|
| Kamau | nĩ-ari-ngi-re | mũbiira |
| <i>Kamau</i> | FOC-hit-TAM-FV | <i>the.ball</i> |
| 'Kamau hit the ball' | | |
| S | V | O |

Verb morphology is very rich in an agglutinating language such as Gĩkũyũ. Derivation in the verb system, for example, is a highly productive process involving the use of extensions (infixes) inserted before the final vowel to create additional senses or meaning to the base verb. These are highlighted in bold in the following examples:

- ia**/-**thia** (causative) e.g., *koma* 'sleep' → *komial* / *komithia* 'make sleep'
- ĩra**/-**era** (applicative/prepositional) e.g., *thooma* 'read' → *thoomera* 'read for/to'
- ũra** (reversive) e.g., *binga* 'close' → *bingũra* 'open'
- ĩka**/-**eka** (stative) e.g., *hingika* 'be closed', *thoomeka* 'readable'
- ana** (reciprocal) e.g., *enda* 'like, love' → *endana* 'love each other'
- anga** (diffusive) e.g., *ita* 'pour' → *itanga* 'pour all over'.

A verb may have more than one extension in a single sequence, e.g., *binga* 'close' → *bingũra* 'open' → *hingurithia* 'cause to open' → *hingũrithania* 'cause each other to open', etc.

Doubling the verb stem or reduplication diminishes the force of the action expressed by the verb. It also indicates repetition, e.g., *rũma* 'bite' → *rũmarũma* 'nibble/mince'; *rekiã* 'let go' → *rekarekiã* 'let go little

by little'. In the case of verb stems consisting of more than two syllables, only the first two are repeated, e.g., *bingūra* 'open' → *bingahingūra* 'open a little'; *tindika* 'push' → *tindatindika* 'push a little'.

For negation, the marker *-ti-* is inserted in the verb phrase, immediately after the subject marker, e.g., *tūtiagaathū naake* 'we will not go with him/her'. However, the negative form in subordinate phrases is marked with *-ta-*, e.g., *tūgaathū tūtari naake* 'we shall go without him/her'.

Tense and Aspect Marking

The tense-aspect system is very complex in Gikūyū. Tense combines with aspect to produce a wide variety of temporal notions, in the order of TS-VB-AS-FV. (TS (tense); VB (verb); AS (aspect); FV (final vowel) which may differ according to aspect of the verb phrase). There are 9 major tenses, whose markers are highlighted in bold below:

- ra-: present progressive, current, e.g., *nīarathooma*
- ∅/ra-: current past (within a day), e.g., *nīathoomire*
- a-: near past, e.g., *nīathoomire*
- raa-: remote past, e.g., *nīaraathomire*
- aa-: current past/future (within a day), e.g., *nīagathooma*
- kū-: near future (within the next few days), e.g., *nīekūrithooma*
- rū-: remote future, e.g., *nīndīrithooma*
- ka-: present consecutive, e.g., *nīagaathooma*
- kī-: parallel, e.g., *nīekūgithooma*

There are three aspect markers, which are **-ag-** (stative/imperative/subjunctive), **-īt-** (perfect), and **-ir-** (completive). Twenty-seven combinations are possible in theory, but only about 20 are clearly attested in the language because some combinations are constrained by semantic considerations.

Nominal Derivation

Two broad types of noun can be distinguished in Gikūyū. The first type consisting of a basic noun and its prefix only. This type of noun is not further divisible, e.g., *irigū* 'banana', *mūcinga* 'gun', *kīrīma* 'mountain'. Like the others, these nouns can derive postpositional phrases using the locative suffix, *-inī*, e.g., *irigūinī* 'in the banana', *mūcingainī* 'on/in the gun', *kīrīmainī* 'on/at the mountain', etc.

Derived nouns in Gikūyū are easily and creatively generated by use of prefixation and/or suffixation. The former consists of such prefixes as: the diminutive prefixes *ka-/ga-/tū-*, e.g., *kamūici* 'little thief', *tūmūdū* 'little people'; the augmentative prefix *kī-*, e.g., *kīmūici* 'big thief', *kīmūdū* 'big (gigantic) person'; and the

collective class prefix *ma-*, e.g., *mamūici* 'group of big thieves'.

Deverbal nouns are distinct in that they are formed through both prefixation and suffixation using the formula *mū + verb + i*, e.g., *mūtegi* 'trapper' ← *tega* 'trap'; *mwaniki* 'dryer' ← *anika* 'put to dry'; *mūkorori* 'cougher' ← *korora* 'cough'. Verbs can also function as simple verbal nouns, e.g. *gūūka gwake ti kwega* 'his coming is not good', *kwaria kūū nū kūūru* 'that talk is bad'.

Compound nouns are many in Gikūyū, and two very significant words in the speakers' cosmology are nouns of this category, that is, *Mwene + Nyaga* 'Owner of Majesty [God]', who habitually graces *Kīrī + Nyaga* 'Mountain of Majesty' or Mt. Kenya. Other such nouns include *mwaki + nyūmba* 'house-builder' and *mutua + uhoru* 'arbitrator'. Other complex nominals involve use of the associative marker *-a*, e.g., *mwaki wa nyūmba* 'builder of houses'; *nyūmba ya toro* 'sleeping room [bedroom]'.

There are a large number of nominal derivations, creating nouns each expressing a unique meaning which is determined by the semantic argument. Such thematic roles include agent, patient, manner, result, occasion, or locative. For example, agent nominalization is very productive. It involves a nominalizing suffix *-i*, and an appropriate noun class prefix. A number of proper names of Agikūyū are thus derived, e.g., *Mwaniki* 'one who cures skins' or *Mūrīthi* 'one who herds'. The agent type of nominalization is also the source of many synthetic compounds such as *mūenda-andū* 'a person who is kind to people'. Patient nominalization involves transitive verb stems with the suffix *-o* to describe 'the act of,' e.g., *mwūiro* 'telling oneself, self-deception', while reflexive *-ī-* can be added to the stem, e.g. *mwīendo* 'state of liking oneself, selfishness'. Product nominalization uses the *mū-* prefix or *kī-/gī-*, and the final vowel changes from *a* to *o*. Intransitive verbs mostly participate in this process, e.g., *gīcaambio* 'defamation' ← *caambia* 'defame'; *gīthoomo* 'education' ← *thooma* 'read'; *mwandīko* 'handwriting' ← *andīka* 'write'. Location-type nominalization involves the *i-* prefix for consonant-initial stems, and *rī-* for V-initial stems, e.g., *ikuūiro* 'place of loading' ← *kuua* 'carry'; *ithūiro* 'sunset' ← *thūa* 'go down'. Nominalization of manner involves prefixation with *mū-* and suffixation with *-ire*, e.g., *mūkuūire* 'manner of carrying' ← *kuua* 'carry'; *mwandīkīre* 'writing style' ← *andīka* 'write'. Occasion nominalization can occur with any verb type by prefixing with *i-* and leaving the final vowel unchanged. The resulting noun refers to occasions of an event specified by the verb stem, e.g., *iceera* 'visit' ← *ceera* 'visit'; *iruga* 'feast' ← *ruka* 'cook'.

Goidelic Languages

P Ni Chatháin, University College Dublin, Dublin, Ireland

© 1994 Elsevier Ltd. All rights reserved.

'Goidelic' is the term used to denote a linguistic subgroup of Celtic spoken in Ireland, Scotland, and the Isle of Man. It may describe both the original unattested predecessor of primitive Irish and its direct historical descendants, i.e., Old, Middle, and Modern Irish, Scottish Gaelic, and Manx.

The earliest corpus of Goidelic is the collection of names inscribed in Ogham cypher on stone and datable from around the fourth to the sixth centuries. These archaic Irish names reflect a state of the language comparable to Continental Celtic and Classical Latin and to some degree the intermediate stages between proto-Celtic and Old Irish (see *Celtic*).

Old Irish retains the *IE* system of nominal declension, with masculine, feminine, and neuter gender and a reduction to five cases – nominative, vocative, accusative, genitive, and dative. The old Irish noun reflects archaic formations such as the remains of the ancient hetero-clitic declension as in *arbor* ('corn') with gen. *arbe*, and dvandva substantival compounds as in *gaisced* ('spear and shield') and *fotlethet* ('length and breadth').

Nominal forms are the verbal adjective, the verbal of necessity, and the verbal noun. The verbal noun is used in a wide variety of constructions but it retains its nominal character in governing the genitive and not the accusative, e.g., *imgabáil uilc (gen.) do dénum* ('to avoid doing evil').

Conjugated prepositions, usually styled prepositional pronouns, e.g., *dom* 'to me' (<do 'to' + 1 sg. pronominal element), form part of a complex pronominal system ranging from emphatic enclitic particles, e.g., *mo chenn-sa* ('my head'), to obsolescent suffixed object pronouns, *gaibthi* < *gaibid-i* ('he takes it'), and the more productive infixed object pronouns, e.g., *no-t-gaib* ('he takes you').

Active and medio-passive are found in the Irish verb which has inherited -r endings in the dependent and passive forms. The Old Irish verb had primary stems in the present indicative, present subjunctive, future, and preterite. The first three formed secondary or past tenses which are original to Celtic. Thus:

| | Present | Subjunctive | Future | Preterite |
|-----------|------------------|-----------------|-----------------|---------------|
| Primary | <i>gaibid</i> | <i>gabaid</i> | <i>gébaid</i> | <i>gabais</i> |
| Secondary | <i>no-gaibed</i> | <i>no-gabad</i> | <i>no-gébad</i> | — |

There were two sets of endings in the primary stems, one used in independent, the other in dependent position. This opposition, originally belonging to the *IE* present/aorist system, was transformed in Irish into the opposition absolute/conjunct for simple verbs and deuterotonic/prototonic for compound verbs and spread through most parts of the verb, e.g., *gaibid* ('he takes'), *ní gaib* ('he does not take'), and *gébaid* ('he will take'), *ní géba* ('he will not take'). The secondary tenses in Irish had a distinctive set of endings and display no -r endings.

The preterite reflects a coalescence of the aorist and perfect of the parent language. The perfect is expressed in *oi* by the use of preverbs most notably *ro*, e.g., *as-beir* ('says'), pret. *as-bert*, and perf. *as-rubart*.

The verb 'to be' has a two-fold division in Irish. The copula consists of proclitic forms and denotes the connection between predicate and subject e.g., *it móir ind fhir* ('the men are big'). The substantive verb occurs with a prepositional or adverbial phrase, e.g., *attá oc techt* ('he is going').

It is possible that the Norse presence in Ireland, for nearly 400 years from the end of the eighth century, may have been a force for transition from the tenth century onwards associated with the middle Irish period (950–1200). Morphological simplifications characterize these changes for the most part:

- a. Deponent verb becomes obsolete, *molaithir* ('he praises') > *molaid*.
- b. Distinctions absolute/conjunct and deuterotonic/prototonic become blurred beside the actual decline of the compound verb, *do léici* ('he casts') *ní teilet* ('he does not cast'), is superseded by *teilcid* ('he casts'), a back-formation from the prototonic with the ending of the simple verb.
- c. Infixed pronouns give way to independent object pronouns, *no-m-marba* ('he kills me'), becomes *marbaid mé*.
- d. Predicative adjectives are no longer declined and the inflected copula is reduced to an impersonal third sg. form, *is mór na fir sin* ('those men are big').

By the beginning of the thirteenth century Middle Irish had disappeared and a new literary Irish based on vernacular usage became the norm. Although phonetically conservative, it was grammatically of its time, with an innovative vocabulary freely borrowing from Latin, French, and English. This standard Irish remained for over 400 years as the language of professional Gaelic men of learning in Ireland, Scotland (for almost another century), and the Isle of Man.

It is described in profuse detail in grammatical tracts datable to the sixteenth century and unique for the European languages of the time. Speech parts were classified as: *focal* concrete noun, adjective, and stressed pronoun; *pearsa* verbal noun and verb; and *iarmbérla* particle, which comprised all proclitics including the article, the copula, and prepositions. The system is not that of Latin. It had been observed that the threefold division corresponds to that of Arabic grammar but no connection has been traced. The amassing of such a wealth of material with its meticulous classification and thousands of citations had as its aim teaching of verse composition in the classical standard language.

With the collapse of the Gaelic world and its aristocratic culture the subliterate dialects emerge in their divergent forms. Western Gaelic or Modern Irish in the early 1990s comprises three principal dialect areas with native Irish speakers largely confined to the western seaboard of three eponymous provinces, Ulster, Connacht and Munster. There are few monoglot speakers.

Since the Irish state was set up in 1922 the Irish language has been taught in the schools. The orthography was simplified in 1948 and a standard grammar based on the main dialects has been in official use since 1953 with subsequent revisions.

Eastern Gaelic had become Scottish Gaelic and Manx. Shared features are:

- | | |
|---|--|
| Nouns declined only for number with the commonest plural endings in -n: | (a) |
| Sc: cáirdean Mx. caarjin Ir. cáirde 'friends' | |
| Coalescence of future and present forms: | (b) |
| Ir. caillfidh 'will lose' | Sc. caillidh, Mx. caillee, 'will lose' |
| caillidh 'loses' | |
| Periphrasis used for non-habitual present tense: | (c) |
| Ir. an gcreideann tú? | |
| Sc. am bheil thu creidsinn? 'Do you believe?' | |
| Mx. vel oo credjal? | |
| Negative particle <i>ni</i> replaced by <i>cha</i> . | (d) |

The oldest document of length in a Scottish Gaelic recognizably different from Irish dates from the early sixteenth century and that in Manx from the very beginning of the seventeenth. Manx orthography differed from that of its sisters by being based on English. Scottish Gaelic is spoken in the Hebrides and the western mainland of Scotland and in Canada (Nova Scotia). Irish and Scottish Gaelic are used extensively in the mass media.

Sample Texts

Irish

Ár n-Athair, atá ar neamh: go naofar d'ainm.
 /a:r nahirⁱ aata: erⁱ nⁱa:w gəni:fər danⁱ imⁱ
 Go dtaga do ríocht.
 gədagə də rⁱəxt/
 'Our Father who is in heaven: be-blessed thy name.
 may-come thy kingdom'

Scottish Gaelic

Ar n-Athair a tha air nèamh; gu naomhaichear d'ainm.
 Thigeadh do rìoghachd.

Manx

Ayr ain, t'ayns niau: casherick dy row dty ennym. Dy jig dty reeriaght.

All three languages were threatened by the spread of English. The last speaker of Manx died in 1974 though it is in use as a second language; some 80 000 in Scotland speak Scottish Gaelic (plus fewer than 10 000 in Nova Scotia); and, although Irish is taught to all pupils in the Republic of Ireland and censuses show returns for 1 million speakers, it is estimated that it is the native language of some 60 000.

Gondi

P S Subrahmanyam, Annamalai University, Bangalore, India

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Gondi (also written Gonḍi with ḍ representing the actual pronunciation) is a tribal language of the Central subgroup of the Dravidian family with a population of more than two million, the largest among the tribal languages of that family. Gonds of almost all regions call themselves *kōytūr* and their language *kōyāṅ*. It is spread over the five states of Madhya Pradesh, Chattisgarh, Maharashtra, Andhra Pradesh, and Orissa in India. Further, the tribe has roughly thirty social subdivisions, the well known among them being Raj Gonds, Madias, Murias, and Koyas. Because of the vast area occupied and the social subdivisions, the language has a number of dialects, which could be considered as separate languages rather than dialects because of the great variation exhibited. There is great scope for further study on the various aspects of the language. (Unless otherwise mentioned, all examples given below are from the Adilabad dialect of Andhra Pradesh.)

Phonology

Gondi contains ten vowels like the majority of its sister languages as shown in Table 1. The core consonant system that is common to most of the dialects is presented in Table 2. However, there are additional consonants in most of them. The Adilabad dialect not only retains the aspirated stops of Marathi loans, but

the stops in some of the native words also take on aspiration as an additional feature, e.g., *phōṛd* 'sun.' In the northern area, while some dialects retain the contrast between *r* and *ṛ*, these two sounds merge into *r* in some others and into *ṛ* in still others. The dialects in the remoter parts of Chanda, Bastar (Muria Gondi), and the Koya area of Malkangiri have two *r* sounds, one a normal trill (*r*) and the other a strong trill (written *r̄*/R); the latter represents Proto-Dravidian. **t*. In the Hill-Maria dialect, the original **r* changes to a postvelar voiced fricative G; this dialect, on the other hand, preserves *ʃ* and *ɳ*. Koya shows glottalized *t'* and *k'* and retroflex *ṇ* but does not have *h*.

One important phonological feature that divides the entire Gondi area into three dialects is the development of Proto-Dravidian **c*- in the word-initial position. The dialects of the north and west (e.g., Adilabad, Betul) show *s*- for it, those of the south and east show *h*- (e.g., Chanda, Bastar, Kanker), while it is elided in the Hill-Maria and the Koya dialects, e.g., *sovvōṛ/hovvōṛ/ovōṛ* 'salt.'

In some of the dialects, the contrast between short and long vowels is found only in the first syllable and vowel length is neutralized in noninitial syllables. In the Adilabad dialect, all vowels in noninitial syllables are invariably long, except in some recent loans. On the other hand, all vowels in such syllables are short in the Muria dialect.

Table 1 Vowels of Gondi

| | Front | | Central | | Back | |
|------|-------|------|---------|------|-------|------|
| | Short | Long | Short | Long | Short | Long |
| High | i | ī | | | u | ū |
| Mid | e | ē | | | o | ō |
| Low | | | a | ā | | |

Table 2 Consonants of Gondi (Core System)

| | L ^a | D ^a | R ^a | P ^a | Vel ^a | G ^a |
|-----------|----------------|----------------|----------------|----------------|------------------|----------------|
| Stop | | | | | | |
| VL | p | t | ṭ | c | k | |
| VD | b | d | ḍ | j | g | |
| Nasal | m | n | | | ɳ | |
| Fricative | | s | | | | h |
| Lateral | | l | | | | |
| Trill | | r | | | | |
| Flap | | | r̄ | | | |
| Semivowel | v | | | y | | |

^aAbbreviations: D, dental; G, glottal; L, labial; P, palatal; R, retroflex; VD, voiced; Vel, velar; VL, voiceless.

Syntax

Word Classes

The following word classes may be recognized for Gondi: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections.

An adjective in Gondi agrees with the noun that is qualified in number and gender; this agreement rule, which is alien to Dravidian, is taken over from Indo-Aryan, for example:

| | |
|----------------------|-----------------|
| persā | marā |
| ‘big | tree’ |
| persā-ŋ | marā-k |
| <i>big-NON-M.PL.</i> | <i>tree-PL.</i> |
| ‘big trees’ | |
| pers-ōr | māynāl |
| <i>big-M.SG.</i> | <i>man</i> |
| ‘big man’ | |
| pers-ūr | māynāl-īr |
| <i>big-M.PL.</i> | <i>man-PL.</i> |
| ‘big men’ | |

Adverbs may be divided into those of (a) time (e.g., *ninnē* ‘yesterday,’ *nēnd* ‘today,’ *nārī* ‘tomorrow’), (b) place (e.g., *iggā* ‘here,’ *aggā* ‘there,’ *baggā* ‘where’), and (c) manner (e.g., *bhāy* ‘much,’ *cokkōt* ‘well’).

Examples for particles include *ānī* ‘and,’ *mattī/battī* ‘but,’ *pajjā* ‘afterwards.’

Examples for interjections include *hav* ‘yes,’ *āyō* ‘no.’

Word Order

The favored word order in Gondi is S(ubject) O(bject) V(erb), for example:

| | | | |
|---------------------|--------------|--------------|-------------------------|
| vōr | nā-kūn | kottā-ŋ | sī-t-ōr |
| <i>he</i> | <i>I-DAT</i> | <i>money</i> | <i>give-PAST-3M.SG.</i> |
| ‘He gave me money.’ | | | |

Gender and Number

Gondi shows a two-way distinction in gender, differentiating between men and all others (including women) in the singular and plural; but the masculine (+feminine) plural form also denotes, apart from men, a group of persons that contains at least one man:

| |
|---|
| vōr |
| ‘he’ |
| vūr |
| ‘those men/men(/man) and women(/woman)’ |
| ad |
| ‘she/it’ |
| av |
| ‘those women/nonhumans’ |

Finite Verb Agreement

The finite verb shows agreement with the subject pronoun (or a corresponding noun in the case of the third person) by a change in the personal suffix (see Table 4), for example:

| | |
|-----------|----------------------|
| nannā | vā-t-ōn |
| <i>I</i> | <i>come-PAST-1SG</i> |
| ‘I came.’ | |

For agreement between the demonstrative adjectives and the nouns qualified with regard to number, see ‘Word Classes.’

Noun Morphology

Most of the nominal bases are underived but a few masculine ones have the suffix *-āl* and a few feminine ones *-ār* or *-ī*, for example:

| |
|------------------|
| novr-āl |
| ‘bridegroom’ |
| novr-ī |
| ‘bride’ |
| sēl-ār |
| ‘younger sister’ |

A nominal base is followed by the plural suffix when plurality has to be expressed. A case suffix/postposition, which occurs at the end, is preceded in most cases by one of the oblique suffixes *-d-*, *-t-* or *-n-* (conditioned variants).

Plural Suffixes

Most of the masculine nouns take the plural suffix *-r* (conditioned variants *-īr* and *-ūr*), for example:

| |
|---------------|
| kāndī-r |
| <i>boy-PL</i> |
| ‘boys’ |

The plural suffix in the nonmasculine nouns has three variants: after a vowel, *-ŋ*; after a consonant, *-k*; after a disyllabic noun ending in *l*, *-īk*. There are some exceptions for the conditionings indicated, for example:

| |
|-------------------|
| panḍī-ŋ |
| <i>fruit-PL</i> |
| mal-k |
| <i>peacock-PL</i> |
| ‘peacocks’ |
| ḍuvvāl-īk |
| <i>tiger-PL</i> |
| ‘tigers’ |

Case Suffixes and Postpositions

The nominative is unmarked.

The accusative-dative suffix is *-ūn*. The case is unmarked in the case of inanimate nouns:

kōndā-t-ūn
bull-OBL-ACC/DAT
 ‘bull (accus)/to the bull’

The instrumental-locative suffix is *-ē*:

kay-d-ē
hand-OBL-INSTR/LOC
 ‘with/in the hand’

The ablative suffix is *-āl*:

kuhī-t-āl
well-OBL-ABL
 ‘from the well’

The genitive suffix is *-ā* (variants *-nā*, *-vā*):

kuhī-t-ā
well-OBL-GEN
 ‘of the well’

Examples for postpositions are: *+aggā* ‘in, near,’ *+karūm* ‘near,’ and *+pajjē* ‘behind’:

rō-t + pajjē
house-OBL-POSTP
 ‘behind the house.’

Pronouns

The personal pronouns are:

nannā ‘I’ marāt ‘we’
 nimmē ‘you (sg.)’ mirāt ‘you (pl.)’

The deictic and the interrogative pronouns are given below.

| | | | |
|---------|-----------|---------------|------------------|
| Distant | Proximate | Interrogative | |
| vōr | vēr | bōr | ‘he’ |
| vūr | vīr | būr | ‘they (m.[+f.])’ |
| ad | id | bad | ‘she, it’ |
| av | iv | bav | ‘they (non-m.)’ |

The reflexive pronouns are *tannā* (sg.) and *tam-mō(t/k)* (pl.).

Numerals

Dravidian cardinal numerals are preserved only up to seven in the Adilabad dialect (up to six in the Muria dialect and up to ten in the Betul dialect); the word for ‘hundred’ is also preserved in most of the dialects). These native numerals have separate forms for masculine and nonmasculine (see Table 3). The remaining numerals as well as all ordinals are borrowed in each dialect from the major language of the area. The higher numerals borrowed from Marathi

Table 3 Native numerals of Gondi

| Numerals | Nonmasculine | Masculine |
|----------|--------------|-----------|
| 1 | undī | vorō-r |
| 2 | ranḍ | i-vvīr |
| 3 | mūnd | mu-vvīr |
| 4 | nālūṅ | nāl-vīr |
| 5 | siyyūṅ | siy-vīr |
| 6 | sārūṅ | sār-vīr |
| 7 | ērūṅ | ēr-vīr |
| 100 | nūr | |

in the Adilabad dialect add the classifier *jhank* when they qualify a masculine noun and *jhanik* when they qualify a feminine noun, for example:

āṭh jhank mās-ūr
eight CLASSIF man-PL
 ‘eight men’

āṭh jhanik veylō-k
eight CLASSIF woman-PL
 ‘eight women’

Verb Morphology

Verb Bases

A verb base in Gondi can be simple or complex. The complex base is formed from the simple one by the addition of the transitive-causative suffix *-ūs* (conditioned variants: *-h*, *-pūs*). This suffix converts an intransitive into a transitive and an underived transitive into the corresponding causative, for example:

| | |
|----------------|----------------------------|
| un- ‘to drink’ | u-h- ‘to make to drink’ |
| udd- ‘to sit’ | u-ppūs- ‘to seat’ |
| aṭṭ- ‘to cook’ | aṭṭ-ūs- ‘to cause to cook’ |

Finite Verbs

A finite verb is distinguished from a nonfinite one by the presence of the personal suffix at the end of the former; a finite verb of the indicative mood is of the following structure (the past negative and the debitive are exceptions to this):

Verb Base + Tense/Negative Suffix + Personal Suffix.

There are five types of finite verb: past (suffix: *-t-*), present-future (suffixes: *-ānt-*, *-nt-*), future (suffixes: *-ak-*, *-k-*, *-n-*, *-ān-*, *-ār*), past habitual-cum-irrealis (suffixes: *-nd-*, *-d-*) and negative (nonpast; suffixes: *-ō-*, *-v-*) (see Table 4 for all the forms of *pā-* ‘to beat’).

The imperative suffixes are: 2sg. *-ā* (variants: *-m*, *-Ø*), 2pl. *-āṭ* (variants: *-mṭ*, *-ṭ*), for example:

Table 4 Finite forms of *pā-* 'To Beat'

| | <i>Past</i> | <i>Pres.-fut.</i> | <i>Fut.</i> | <i>Past hab./irrealis</i> | <i>Neg.</i> |
|--------------|-------------|-------------------|-------------|---------------------------|-------------|
| 1 sg. | pā-t-ōn | pā-nt-ōn | pā-k-ā | pā-nd-ūn | pāy-ō-n |
| 1 pl. | pā-t-ōm | pā-nt-ōm | pā-k-ōm | pā-nd-ūm | pāy-ō-m |
| 1 pl (incl). | | | pā-k-āt | | |
| 2 sg. | pā-t-ī | pā-nt-ī | pā-k-ī | pā-nd-ī | pāy-v-ī |
| 2 pl. | pā-t-īṭ | pā-nt-īṭ | pā-k-īṭ | pā-nd-īṭ | pāy-v-īṭ |
| 3 msg. | pā-t-ōr | pā-nt-ōr | pā-n-ūr | pā-nd-ūr | pāy-ō-r |
| 3 m (+f) pl. | pā-t-ēr | pā-nt-ēr | pā-n-īr | pā-nd-īr | pāy-ēr |
| 3 fmsg. | pā-t-ā | pā-nt-ā | pāy-ār | pā-nd-ū | pāy-ō |
| 3 fnpl. | pā-t-āṅ | pā-nt-āṅ | pā-n-ūṅ | pā-nd-ūṅ | pāy-ō-ṅ |

atṭ-ā
cook-2SG
'Cook!'

atṭ-āt
cook-2PL
'Cook (pl.)!'

The corresponding negative imperative has the negative suffix *-m-/v-* between the base and the personal suffix:

at-v-ā/at-m-ā
cook-NEG-2SG
'Don't cook (sg.)!'

at-v-āt/at-m-āt
cook-NEG-2PL
'Don't cook (pl.)!'

The past negative has the suffix *-makī(n)*, which is invariable for person, number, and gender:

tar-makī(n)
bring-PASTNEG
'(One) did not bring.'

The debitive has the suffix *-ānā*, for example:

tind-ānā
eat-DEB
'(One) must eat.'

Nonfinite Verbs

The past participle has the suffix *-sī* (variants: *-cī*, *-jī*):

vā-sī
come-PASTPP
'having come'

The present participle has the suffix *-sēr* (variants *-cēr*, *-jēr*), for example:

un-jēr
drink-PRESPP
'while drinking'

The negative participle has the suffix *-vāk*, for example:

veh-vāk
tell-NEGPP
'without telling'

The conditional (with the conditional suffix *-ēkē*) has three subtypes as illustrated below.

- (1) Past conditional:
vā-t-ēkē
come-PAST-CONDI
'when one came'
- (2) Nonpast conditional:
vā-n-ēkē
come-NON-PAST-CONDI
'when one is coming'
- (3) Negative conditional:
vāy-v-ēkē
come-NEG-CONDI
'when one does not come'

Two types of verbal nouns are commonly used. One with the suffix *-mār* simply denotes action:

at-mār
cook-VN
'cooking'

The other one with *-vāl* denotes action, agent, or goal:

veh-vāl
tell-VN
'telling/one who tells/the matter that is told'

Gothic

J M Y Simpson, University of Aberdeen, Aberdeen, UK

© 2006 Elsevier Ltd. All rights reserved.

Gothic is the only documented member of the East Germanic group of Germanic languages.

Early History and Wulfila's Gothic

From around the second century B.C.E. onward, various Gothic tribes migrated from southern Scandinavia to eastern and southeastern Europe, following the Vistula and Danube rivers and reaching the north of the Black Sea area by the middle of the 3rd century C.E. Tribes of Ostrogoths settled to the east of the River Dniestr and tribes of Visigoths to the west of it. In the 4th century C.E., in present-day Bulgaria, a translation of much of the Bible, based on a Greek text used in the diocese of Constantinople, was made by Bishop Wulfila (Ulfilas), a Visigoth. Portions of this (by far the greater part from the New Testament) have survived and, since this translation is the earliest literary record in any Germanic language, these are documents of outstanding importance for Germanic and Indo-European linguistic history. Significant writings in other Germanic languages begin to appear only four centuries later.

Most of Wulfila's translation has been lost. Just over half the Gospels are preserved in the surviving pages of the splendid Codex Argenteus, an Ostrogothic manuscript probably written in present-day Italy and dating from the 5th century; it is now in Uppsala. Other portions of the Gospels and of the Pauline Epistles, together with three chapters of Nehemiah, survive

in various other manuscripts, the majority of them in Milan.

Wulfila designed an alphabet clearly based on that of Greek; a version used by later scribes appears in **Figure 1** with a widely used transliteration. (The two untransliterated symbols were used only to form numerals.) ⟨q⟩ is taken to be /kw/, ⟨þ⟩ to be /θ/, and ⟨h⟩ to be /ʁ/ or /hw/. It may be assumed that this system is phonemic, though the following digraphs have the probable values: ⟨ei⟩ = /i:/, ⟨au⟩ = /ɔ/, ⟨ai⟩ = /ɛ/, and ⟨gg⟩ = /ŋg/. It is likely that intervocalically the letters ⟨b⟩, ⟨d⟩, and ⟨g⟩ denoted the voiced fricative allophones [β], [ð], [ɣ]. All other symbols may be given their IPA values (see **Figure 1**).

Wulfila's Gothic shows the typically Germanic features of

1. the 'First Sound Shift' development from Proto-Indo-European, thus Latin *pes* 'foot,' *tu* 'thou,' *centum* 'hundred' versus Gothic *fotus*, *þu*, *hund*;
2. strong versus weak verbs (respectively with vowel-change (*Ablaut*) versus a dental suffix in the past tense) e.g., *tiuhan* 'lead,' *haban* 'have' (infinitive) but *tauþ*, *habaida* (1 sg. past);
3. weak declension of adjectives (used after a determiner) versus strong (used elsewhere), e.g., *sa goda hlaiþs* 'the good bread,' *gods hlaiþs* 'good bread.'

Figure 1 Reprinted from *Concise encyclopedia of language and religion*, Sawyer et al. (eds.), J. M. Y. Simpson, 'Gothic,' p. 189, Copyright (2001) with permission from Elsevier.

Among various archaic features are the retention of a masculine nominative (-s), e.g., *fisks* 'fish' and reduplicating verbs, e.g., *greten* 'weep' (infinitive), *gaigrot* (1 SING PAST).

Morphologically, Gothic is fairly complex. Verbs show inflections for (a) past and nonpast tenses; (b) indicative, subjunctive (sometimes called 'optative'), and imperative moods, plus an infinitive form; (c) active and passive voices; (d) first, second, and third persons; and (e) singular, dual, and plural numbers. Nouns, adjectives, and pronouns show inflections for (a) masculine, feminine and neuter genders; (b) singular and plural numbers; and (c) nominative, accusative, genitive, and dative cases. However, there are not distinct morphological forms for every possible combination of these grammatical categories. Pronouns have in addition distinct forms for the dual number.

The syntax of Wulfilas's text is very strongly influenced by that of his Greek source: the original word order is closely followed and many Greek devices, such as characteristic participial constructions, are imitated. As a result almost no information is available on what a native Gothic syntax might have been.

Other records of early Gothic are meager in the extreme. They include fragments of a commentary on St John's Gospel (the *Skeireins*), a few marginal notes on Latin manuscripts (including a title deed from Ravenna, now in Naples), and one or two runic inscriptions that have been claimed to be in Gothic.

'And when you pray, do not be like the hypocrites, for they like to pray in synagogues and on street corners standing up, so that they may be seen by people. Truly I say to you that they have their reward.' (Matthew vi:5)

Other East Germanic Languages

Related East Germanic languages, spoken by tribes who emigrated from southern Scandinavia about the same time as the Goths and even earlier, include those of the Vandals (who eventually established themselves in North Africa) and of the Burgundians (who set up a kingdom in Gaul); both languages became extinct in the 6th and 7th centuries and almost nothing is known of them except personal and place names.

Influence of Gothic on Other Languages

The Visigoths engaged in missionary work, spreading their Arian version of Christianity (which held that Christ, though divine, was not equal with the Father) among other East Germanic tribes, for whom Gothic was apparently a lingua franca. For example, the Burgundians, Vandals, and Ostrogoths were converted in the 4th and 5th centuries. It has been claimed that this missionary activity led ultimately to the appearance of a few specifically Gothic linguistic forms in the Bavarian and Alemannic dialects of Old High German (a West Germanic language), and even as far afield as Old English. The route and extent of this influence, however, and the question of whether it was direct or indirect, are subjects of scholarly debate.

Later History and Crimean Gothic

Some Goths, forced out by invading Huns in the 3rd century, migrated westward and founded kingdoms in modern Italy (Ostrogoths), France, and Spain (Visigoths), but their power was shattered everywhere by the beginning of the 8th century and Gothic became extinct in the west.

The language lived on longer in the east, surviving in present-day northern Bulgaria until the 9th century and in the Crimea until the 16th century, according to accounts by travelers. One of the last of these was by Ogier Ghiselin (or Ghislain) de Busbecq, the imperial ambassador to the Ottoman court at Constantinople in 1560–1562, who recorded 68 Crimean Gothic words as well as some phrases and numerals, with Latin translations. This collection is of rather limited value, for it was published without his permission and may contain misprints; more importantly, his two informants were dubious, one being a native Greek speaker. A great lack is that of any indication of morphological variation and syntax. Nevertheless, it appears possible that Crimean Gothic was a descendant of a somewhat different variety of Gothic from that of Wulfila.

Busbecq also notated a short 'Gothic' song (the *Cantilena*) but he gives no translation and it has been variously claimed to be not Gothic but Turkish, Swedish or Italian.

By the end of the 18th century C.E. Crimean Gothic had apparently died out.

External History

Attested from the 14th century B.C., Greek has continued in an unbroken line of development down to the present day, the 'ancient' period coming to a close around 300 A.D. with the end of Hellenistic Greek. In the 1700 years from the Mycenaean period to the *koinē* and beyond, the language underwent significant changes in phonology, morphology, syntax, and lexicon. A member of the Indo-European family of languages, Greek has particular affinities with Indo-Iranian; its connections with Latin, once thought to be so close, in fact largely reflect cultural interaction, rather than subgrouping features.

We do not know when the language entered Greek lands, but it was in use on the mainland and on Crete in the second half of the second millennium B.C. During the first millennium, it was spoken, in one form or another, on the Greek mainland; the Aegean islands, including Crete, Cyprus, and Rhodes; in parts of Asia Minor; and in southern Italy and northern Africa. From earliest times, Greek existed as a collection of dialects, with Attic, the dialect of Athens, eventually dominating and serving as the foundation for the Hellenistic *koinē* and its further development into later stages of the language.

Dialects

Mycenaean

Mycenaean Greek was written in a syllabic script on clay tablets used for record keeping in the Bronze Age

centers on the Greek mainland and on the island of Crete. Deciphered only in 1952, these documents, although they contain no literature (which presumably at this time was still maintained exclusively in an oral tradition) and (owing to the nature of their contents) offer only limited evidence particularly of syntax and verb morphology, nevertheless provide us with an invaluable source of information regarding the development of Greek from Proto-Indo-European. Although the Linear B syllabary does not mark all contrasts (e.g., one series of signs represents both [l] and [r], and there is no differentiation of [k], [k^h], and [g]; of [p] and [p^h]; or of [t] and [t^h], although both voicing and aspiration were phonemic in the language), the script does provide a series of signs for the labiovelars (PIE *k^w, *g^w, *g^{w^h}), which by the time of alphabetic Greek in the 8th century B.C. had developed into the phonologically conditioned series of stops [p, b, p^h/t, d, t^h/k, g, k^h].

'Historical' Dialects

The dialectal status of Mycenaean is disputed. We know that it was not the only variety of Greek spoken in the second millennium because it shows innovations not shared by all of the later-attested dialects, such as assibilation of *-t* before *-i*; debate continues as to whether it should be grouped unqualifiedly with any of the so-called historical dialects attested in the first millennium (and, with the exception of Cypriot, written in an alphabetic script), although its affinities with Arcado-Cypriot are clear. The dialects are grouped as follows: Attic-Ionic (in Attica and its chief city Athens, the Ionic islands of the Aegean, and parts of Asia Minor), Aeolic (including Boiotian, Thessalian, and Lesbian), Doric (or West Greek, in the Peloponnese, the Doric islands of the Aegean,

and parts of Asia Minor), Northwest Greek (on the northern mainland), and Arcado-Cypriot (in Arcadia and Cyprus). The old view, supported by the testimony of the ancient Greeks themselves, that the dialects entered Greece in three successive waves – Attic-Ionic, Aeolic with Arcado-Cypriot, and Doric with Northwest Greek – has recently been challenged by a model that locates the dialectal differentiation in Greece itself during the course of the second millennium.

'Literary' Dialects

Certain dialects or conventionalized forms of them were associated with certain genres of literature. Thus, regardless of the native dialect of a given author, dactylic hexameter poetry (epic, etc.) was predominantly in Ionic with a heavy admixture of Aeolic, choral poetry was in Doric, the dialogue of Athenian tragedy was in Attic (the choral lyrics were in Doric), and so on.

Phonology

Vowels

The phonological system included 10–12 vowels, subject to dialect variation: the short vowels [a, e, o, i, u] (with [u] fronted to [y] in Attic) and the long vowels [a:, e:, o:, i:, u:] (with [u:] fronted to [y:] in Attic). In addition, some dialects, including Attic, distinguished long open *e* and *o* (ε: and ο:), in addition to [e:] and [o:]. The situation was further complicated by the orthography (e.g., the long close *e* [e:] that arose from compensatory lengthening fell together with the original long *e* in some dialects and was written η, the pronunciation of which varied from higher to lower position in different dialects). Other dialects, which distinguished [e:] and [ε:], wrote the latter as η, the former as ει, a sign that had earlier represented the diphthong [ej] but had subsequently been reduced to a monophthong, thus allowing for the use of the digraph to represent compensatorily lengthened [e:] as well. Similarly, [o:] was written ου in those dialects that distinguished [o:] and [ο:] (ω). Four diphthongs remained in frequent use: [aj, oj, aw, ew] (written αι, οι, αυ, ευ). The status of *vi* is uncertain. The 'long' diphthongs [a:j, e:j, o:j] (written αι, ηι, ωι or, with iota subscript, a Byzantine innovation, ς, Ϻ, φ) generally lost the glide or merged with the short diphthongs.

The Indo-European vocalic resonants **r**, **l**, **m**, **n**, yielded vowel reflexes or vowel and consonant combinations (e.g., **r** > α/αv, **r** > αρ/ρα/ορ/ρο).

A major dialectal feature of Ionic and, with exceptions, Attic is the raising of inherited [a:] to [ε:] (written η).

Consonants

There were nine stops, grouped in three points of articulation – labial, dental, velar – with each point of articulation having three types: voiceless, voiceless aspirate, and voiced: [p, p^h, b/t, t^h, d/k, k^h, g]. There were four resonants – the liquids [l, r] and the nasals [m, n] – and two fricatives: the dental [s] (with a voiced allophone [z] before voiced consonants) and the glottal [h], the so-called rough breathing (marked ˊ) in word-initial position before some vowels, e.g., Ἑλλάς (*Hellas*), ἅγιος (*hagios*) 'holy', and before *r*, e.g., ῥόδον (*rhodon* 'rose') (where it may indicate not aspiration but a voiceless pronunciation). Initial [h] arose as a development from earlier [s], [j], etc. The velar nasal [ŋ] occurred as an allophone of [n] before velars and was usually written γ, e.g., ἄγγελος (*angelos*), cf. Eng. 'angel'. In the liquids λ represented a dental lateral [l], and ρ in non-initial position was apparently a voiced rolled *r*, as in, e.g., Italian. The three letters ζ, ξ, and ψ represented consonant clusters. The sound represented by ζ seems to have varied in different dialects and at different periods from [dz] to [zd], eventually simplifying to [zz] or [z]; ξ represented [ks] and ψ [ps]. The voiced semivowel [w], widely attested in Mycenaean, was dropped early in Attic-Ionic (cf. Myc. *wa-na-ka* = Hom. and Att. *anaks* ἄναξ), but was retained by some dialects well into the historical period, where it was represented by the letter *digamma* (Ϝ).

The loss of digamma and of intervocalic *s*, etc., resulted in the vowel contractions characteristic of the later language. Many morphophonemic changes resulted in complex developments, particularly of consonant clusters. Constraints on word-final consonants left only final *-r*, *-s*, *-n*. The aspirated stops [p^h, t^h, k^h] developed by the later period into the corresponding fricatives [f, θ, χ].

Accent

Ancient Greek had a pitch accent: rising (acute ˊ), falling (grave ˋ), or rising-falling (circumflex ˆ), the latter restricted to long vowels and diphthongs. The accent was 'free,' subject to certain phonological and morphological constraints; it fell only on one of the last three syllables of a word and was recessive in verbs (a residue of an early stage in which the verb of a main clause was cliticized).

Morphology and Syntax

Ancient Greek has a very rich derivational and inflectional morphology. Use is made of prefixes, very rarely of infixes, and overwhelmingly of suffixes.

Derivational processes depend primarily on composition and suffixation. The verbal morphology is especially complex.

Morphosyntax of Nominals

Ancient Greek has three declensional classifications for nouns and adjectives: *o*-stems, $\bar{\alpha}$ -stems, and consonant stems. There are five cases (nominative, genitive, dative, accusative, vocative), three numbers (singular, dual, plural), and three genders (masculine, feminine, neuter). There are remnants of an instrumental case (e.g., the suffix *-phi* in Mycenaean and Homeric Greek) and the locative (e.g., *oikoi* 'at home'); otherwise, the functions of the locative, instrumental, and ablative cases reconstructed for Proto-Indo-European are taken over by the genitive and dative in Greek. The dual category, already unstable in Homer, was eventually largely eliminated. Grammatical gender was not necessarily determined by natural gender; although terms for males and females were as a rule masculine and feminine, respectively, this was not exclusively the case, and inanimate objects could be categorized indiscriminately as masculine, feminine, or neuter.

Morphosyntax of Verbs

The verbal morphology encodes many morphosyntactic categories. Finite forms are marked for person and number; nonfinite forms include infinitives, participles, and other verbal adjectives. In addition to person and number, finite verbs are marked for tense, aspect, voice, and mood. The complexity of the Greek verbal system arises from its retention of the already complex system of Proto-Indo-European (PIE), to which is added a number of new categories of tense/aspect and voice (e.g., the future, the pluperfect, further contrasts of active, middle, and passive, etc.), and innovations in the aspectual status of the aorist and perfect. Thus, the PIE aspectual opposition of present/aorist/perfect, indicating, respectively, imperfective, perfective, and stative aspect, was maintained to a great extent, especially in the non-indicative moods and the nonfinite forms. However, in the indicative 'tenses,' the opposition of present/aorist/perfect was combined with distinctions of time that eventually overshadowed the original distinctions of aspect so that the aorist could be used simply as a past tense and the perfect came to develop a resultative use.

The tenses are present, imperfect, aorist, perfect, pluperfect, future, and future perfect. The categories of voice are active, middle, and passive (the middle indicating close involvement of the subject in the

action, e.g., reflexive usage, etc.). The moods are indicative, subjunctive, optative, and imperative.

The Indo-European process of morpheme-internal vowel gradation (*Ablaut*), e.g., *e/o/Ø*, etc., was widely used in Greek. What began as a phonological process was morphologized already in the pre-PIE period and yielded many distinctions in both nouns and verbs in Greek, for example, the distribution seen in the following forms built on the root **pet* 'fly': *pétomai* 'fly,' *poté* 'flight,' and *pterón* 'wing'; within the verbal paradigm, examples are present *peíthō* 'I persuade,' perfect *pépoitha* 'I am persuaded.'

Syntactic Typology

Ancient Greek has a relatively free word order that resists simple classification in terms of SOV, SVO, and so on. More fruitful is a recent approach (Devine and Stephens, 2000) that sees the syntactic typology of Ancient Greek as changing from an earlier non-configurational type to configurationality, from a syntax of juxtaposition to a syntax of government and embedding. Particularly in its earlier stages (and in archaizing poetic traditions), Greek made pervasive use of discontinuous constituency, adjunct lexical arguments, null anaphora, and parataxis. Thus, the language of the Homeric poems, which were recorded in writing in the 8th or early 7th century B.C., but represent a prior oral tradition of a thousand years or more, is heavily paratactic, whereas 4th-century Attic prose is, by contrast, markedly hypotactic, with complex forms of subordination.

Specific features of interest in Greek syntax include the use of particles, the distribution of clitics, and the development of the article.

General Overview

Although very much a living and vibrant language with speakers numbering in the millions around the world, Modern Greek actually began to develop thousands of years ago, when speakers of the ancient form of the language entered the Balkan peninsula some time in the early part of the second millennium B.C. These speakers moved quickly, according to most current accounts, into the southern part of the region – what is now northern and central Greece and the Peloponnese – and into most of the neighboring islands of the Aegean Sea, including Crete as the most southerly point. This settlement area essentially defines the space where to this day the Greek language remains an enduring presence, though there has been spread into other areas, in some cases dating from ancient times.

Modern Greek is the official language of the Hellenic Republic (i.e., the Republic of Greece) where there are some 11 000 000 speakers, and also of the Republic of Cyprus, with some 600 000 speakers. In large part because of ancient colonization, Greek is found today in numerous communities and enclaves around the Mediterranean and Black Sea area, including Sicily, southern Italy, Alexandria (Egypt), and the region around the Crimean peninsula. Moreover, Greeks in modern times have migrated to many locations throughout Europe (but especially England), Australia (with a large concentration around Melbourne), and North America (particularly in New York, Chicago, Ohio, Florida, and Toronto), forming the modern-day ‘Hellenic Diaspora.’ Although Greek is mainly a second language in these diaspora communities, it is still robust and alive there, and these communities add perhaps as many

as 2 500 000 speakers to the overall total of speakers of Greek worldwide.

The language is generally referred to as ‘Greek’ in English, but the linguistic autonym for Greek speakers is based on an entirely different root. Greek speakers call their language *eliniká* (i.e., ‘Hellenic’) or *neoliniká* (i.e., ‘neo-Hellenic’). Occasionally, the designation *roméika* is used also; it is literally, ‘Romaic’, a use deriving from the affinities many (Orthodox Christian) Greeks have felt for the Eastern Roman (or Byzantine) Empire, centered in Constantinople after the 4th century A.D.

The modifier ‘modern’ is generally used in referring to the language in English, in much the same way that the Greeks themselves often use *neo-*, literally ‘new’, in their self-designation (*neoliniká*, as above). Indeed, the unadorned label ‘Greek’ in English usually refers to the ancient language. This usage recognizes the fact that the language has a long and rich documented history, being attested as early as the 14th century B.C. (so-called Mycenaean Greek) and continuing through ancient times and the Byzantine era up to modern times.

The modern form of the language is significantly different from its ancient Greek predecessor with regard to pronunciation and general structural features, but at the same time, as perhaps with all languages, there is noticeable continuity as well. The changes that set Modern Greek apart from the ancient language (e.g., the falling together of some eight distinct vocalic nuclei to [i], the shift from a pitch accent to a stress accent, a greater degree of analyticity in nominal and verbal constructions for earlier synthetic ones, among others) can be seen in nascent form in the period of the Hellenistic Koine. By the 10th century A.D., the language in many respects had a quite modern look to it. Still, it is customary to date the modern period of Modern Greek to approximately the 17th century, recognizing that even in the so-called Medieval Greek period, some structural differences from contemporary Greek were to be found

(e.g., syntactically in the continued use of an infinitive, morphologically in the formation of the future tense, and phonologically in the expansion of a dental affricate and the elimination of a front rounded vowel), as well as numerous lexical differences.

Dialects of Modern Greek

Taken as a whole, Modern Greek exhibits great diversity across all its varieties, defined both geographically and socially. However, the considerable differences are largely masked by the dominance and ubiquity of the standard language, the variety that reflects the everyday usage of speakers in Athens and its environs, by far Greece's leading population center, with over 4 000 000 inhabitants, and the country's focal point for culture, economy, religion, and government.

Looking first at diversity from a geographic standpoint, the major modern regional dialects (following Newton, 1972a) that can be identified are Peloponnesian-Ionian Greek, traditionally viewed as the basis for the contemporary standard language; northern Greek, in a zone starting north of Attica (where Athens is located) and extending up to and beyond Greece's second largest city, Thessaloniki; Cretan, the dialect of the island of Crete; Old Athenian, the dialect of Athens before the 1821 War of Independence and, as a result of various resettlements, found elsewhere in Greece into the early 20th century; and southeastern Greek, including Greek of the Dodecanese islands, as well as Cypriot Greek. However, modern Cypriot shows significant differences on all levels (phonological, morphological, and syntactic) that invite its classification as a separate language.

Two other important geographic varieties include (1) Tsakonian, the rather divergent form of the language, a direct descendant of the ancient Doric dialect that is spoken still in the eastern Peloponnesos; and (2) the Pontic dialects, which were once spoken along the Black Sea coast (Crimea area and Asia Minor), but are now mostly found in various parts of Greece as a result of the 1923 population exchanges with Turkey. Both Tsakonian and Pontic diverge significantly enough from the rest of Greek to merit consideration now as separate languages (though they are still clearly Hellenic).

Sociolinguistic Setting and Other Diversity

Geography and regional dialects account for only part of the diversity present in the Greek-speaking world; an additional crucial facet is the diglossia

(in the sense of Ferguson, 1959) that Greek exhibits, as an outcome of centuries of cultural influence from the Classical Greek language and Classical Greece itself on modern speakers. Classical Greek and Classical Greece were treated as the prescriptive norms against which speakers of later stages of Greek generally judged themselves, resulting in a 'two-track system' for the language, with a consciously archaizing form that speakers and writers modeled on Classical Greek set against a vernacular innovative variety. With the founding of the new nation-state of Greece after the revolution of 1821, these two tracks developed into a significant register and stylistic difference between a high-style variety associated with official functions (those involving government, education, religion, and the like), known as *katharevousa* ('Purist', literally 'the purifying' language), and the ordinary, day-to-day language of the people, known as *dimotiki* ('demotic', literally 'the popular' language). These two varieties vied for status as the primary form of the language; each had its advocates, for whom language attitudes tended to correlate with certain social attitudes and political positions, more conservative for advocates of *katharevousa* and more progressive for followers of *dimotiki*. The competition continued throughout most of the 20th century, with *katharevousa* generally being in the ascendancy for official use, but was resolved most recently by various governmental acts and actions in 1976 declaring *dimotiki* as the official language. Still, all throughout the various official and unofficial periods of diglossia, the usage that speakers exhibited has actually been mixed, showing borrowing between the two varieties, in particular with *katharevousa* forms incorporated into *dimotiki*. The present state of Standard Modern Greek is essentially *dimotiki*, but with significant borrowings from *katharevousa* involving grammar (morphology and syntax), pronunciation, and vocabulary.

Linguistic diversity for Modern Greek, therefore, involves the mixing of varieties of both a regional and stylistic/social nature and mutual interactions among them.

Structure of Modern Greek

Modern Greek's vowel system is fairly unremarkable, showing /i e a o u/ with no distinctive length or nasality. Consonants include /p t k f v θ ð s z x γ j r l m n t̪ d̪/; /b d g/, although deriving in some analyses from underlying nasal plus voiceless stop combinations, are probably best taken as distinctive elements in their own right. Still, the consonants are somewhat overstocked with fricatives, by most typological standards.

Modern Greek has a distinctive stress accent, restricted to occurring only on one of the last three syllables in a word; to some extent, accent placement is tied to particular morphological categories, but in general there is some degree of unpredictability as to which of the final three syllables is to be stressed.

In its morphology, Modern Greek is for the most part synthetic and fusional, with grammatical endings marking two numbers (singular and plural) and four cases (vocative, nominative, accusative, and genitive, which covers some 'dative'-like functions) in the noun. In the verb, there is a complex interplay of realizations for tense (present, past, future), mood (indicative, imperative, subjunctive), aspect (perfective and imperfective, with the so-called perfect tense perhaps forming a third distinction), person (speaker, hearer, and other; that is, first, second, and third), and number (singular and plural). Endings carry most of the marking functions, but some categories are realized by prefixal (or prefix-like) elements, especially the future tense and subjunctive mood. Weak object pronouns under some analyses are considered to be transitivity markers on the verb, thus possibly constituting a further inflectional category. Negation too might be considered to be realized via prefixal elements.

With regard to syntax, Modern Greek shows a significant degree of analyticity, even with its generally synthetic morphology. Sentential complementation is always via person- and number-marked finite clauses, as there is no infinitive proper in the language, and for some case functions, especially of the genitive case, prepositional phrases occur as alternatives. Word order is fairly free, responding more to pragmatic and discourse-related criteria, such as focus and topicalization, than to purely syntactic concerns. Dislocated elements are often cross-indexed, so to speak, on the verb through the use of agreeing weak pronouns (so-called object reduplication).

Much of what Modern Greek shows in the way of surface syntactic and morphological patterns that differs from Ancient Greek may be attributable to interactions between speakers of Greek and speakers of other neighboring languages in the Balkans during the medieval (i.e., pre-modern) period, though language-internal factors clearly played a major role too.

Guaraní

W F H Adelaar, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Guaraní (or *Avañe'ẽ*) is the name of a language spoken in parts of the South American lowlands, in particular in the basin of the Paraná and Paraguay rivers. It is one of the official languages of Paraguay, where it is the mother tongue of a majority of the population. The present number of speakers of Guaraní is estimated at 5 000 000. It survives as a minority language in neighboring areas of Argentina (Corrientes, Misiones) and Brazil (Mato Grosso do Sul, Paraná). In Bolivia, Guaraní (*guaraní boliviano*) is the name used for the closely related Chiriguano language. Originally an Amerindian language, Guaraní is now used by most layers of the Paraguayan population, regardless of their Indian or mixed background. They often speak a variety of Guaraní with a heavy Spanish admixture, called *jopará*. More conservative varieties of Guaraní are spoken by tribal groups such as the Chiripá (called Nhandéva in Brazil), the Mbyá and the Paĩ-Tavyterá (or Kaiová). The purity of the Guaraní literary language is watched over by writers and academic institutions.

The Guaraní language is part of a larger family, Tupi-Guaraní, which has a wide distribution in the South American lowlands. The latter also includes Tupinambá, the language that was used as a general language (*língua geral*) along the coasts of Brazil before the 19th century. Tupi-Guaraní, in its turn, is part of a larger stock named Tupí, which may be distantly related to the Cariban and Macro-Ge families. The original area of diffusion of both Tupi-Guaraní and its Tupí sister languages appears to be the Guaporé basin in southwestern Brazil (state of Rondônia). The expansion of the Tupi-Guaraní peoples may have occurred shortly before the European conquest. The strong position of Guaraní in Paraguay is related to the consequences of Jesuit missionary policy during the 17th and 18th centuries. The first authoritative grammar of Guaraní was written by a Jesuit, Antonio Ruiz de Montoya (1640).

Modern Paraguayan Guaraní differs from the language described by Montoya in that it has lost some of its original morphophonemic complexity. Guaraní is a mildly polysynthetic language with a loosely structured morphology. It uses both prefixes and suffixes, the former being more tightly bound to the root than the latter. Guaraní prefixes indicate person (of subject, object, and possessor), mood (subjunctive, imperative), reflexive, reciprocal, accompaniment, and causative (except for transitive stems). There are two portmanteau prefixes that indicate the combination of a first person actor with a second person patient, e.g., *po-hecha* [poheʃa] 'I see you (plural)' (*po-* '1st person actor with 2nd person plural patient'). Suffixes indicate case, diminutive, collective, causative (of transitive stems), future tense, mood (wish, intention, etc.), nominalization, subordination, and several other verbal categories. Some grammatical categories (aspect, number, most tenses) are indicated by elements that are best interpreted as separate words, as in *o-mba'apo hína* [õmbaʔa'po ʰĩnã] 'he is working' (*o-* '3rd person actor; *hína* 'progressive aspect'). Negation is usually indicated by a combination of a prefix and a suffix, as in *nd-o-hó-i* [ndõ'hoj] 'he does not go' (*nd(a)-..-i(ri)* 'negation'; *o-ho* 'he goes'). Noun incorporation (both of subject and object) is frequent, especially in the colloquial language. Most incorporated nouns refer to body parts; e.g., *che-akã-rasy* [ʃẽãkãra'sĩ] 'I have a headache' (*che-* '1st person subject'; *akã* 'head'; *(-r)asy* 'hurt').

Like many other South American lowland languages, Guaraní features a so-called active/stative system. That is, transitive verbs are inherently active, but intransitive verbs can be classified either as active or as stative; compare active *a-guata* [aɣ^wa'ta] 'I walk' (*a-* '1st person singular actor') and stative *che-mandu'a* [ʃẽmãndu'a] 'I remember' (*che-* '1st person singular subject'). Adjectives (quality verbs) can be treated as a subclass of the stative verbs. Possessed nouns can also express the notion 'to have'; e.g., *che-róga* [ʃẽ'roɣa] 'my house' (*che-* '1st person singular possessor,' *(-r)óga* 'house'), but also 'I have a house.' This makes it difficult to distinguish between stative verbs, on one hand, and expressions of possession, on the other.

Many nouns and stative verbs are subject to an alternation of their initial consonant (the most frequent set is *t-/r-/h-*) depending on the construction in which the form occurs; e.g., *téra* 'name,' *che-réra* 'my name,' *héra* 'his/her name.' Most prefixed forms take *-r-*; forms with initial *r-* also indicate the core of a genitive construction, in which the modifier precedes the modified; e.g., *yvága rape* [i'vaɣa ra'pe] 'the road to heaven' (*yvaga* 'heaven,' *tape* 'road').

Grammatical relations, except subject and inanimate object, are indicated by case markers, postpositions, or combinations of both. Case markers tend to merge with pronouns or pronominal prefixes into special forms; for instance, *ha'e* [ha'ʔe] 'he, she, it' with ablative *-gui(ve)* [ɣ^wi'(ve)] is realized as (*i*)*chugui* [(i)ʃu'ɣ^wi]; with comitative *-ndi(ve)* [ndi'(ve)] as *hendive* [hēndi've], etc.

Guaraní is widely known from the linguistic literature as an example of the existence of prosodic nasality or nasal harmony (a common feature in Amazonian languages). It has six oral and six nasal vowels. Prosodic nasality takes its source from a (stressed) nasal vowel or a nasal consonant and spreads leftward covering the root that contains the source as well as all its prefixes. Suffixes show a more independent behavior: they may adapt to the root or maintain their own nasality/orality structure. When

nasality is generated by a nasal consonant (/m/, /n/, /ŋ/, /ŋ^w/) the latter marks the beginning of an oral domain, hence it is realized as half-nasal half-oral [mb, nd, ŋg, ŋg^w], e.g., in *marangatu* /maraŋa'tu/ [MĀRĀŋa'tu] 'holy' (the nasal domain is indicated in small caps). Guaraní roots generally have final stress. When stress is penultimate, rightward nasal spread can occur as well. Some suffixes are affected by rightward spread, e.g., *kuña* + *-pe* → *kuña-me* /ku'ñā-me/ [kūñāmē] 'to the woman' (*-pe* 'dative').

Gujarātī belongs to the southwestern family of Modern/New Indo-Aryan, a subgroup of the Indo-Iranian branch of Indo-European languages. The official language of Gujarat state, it is spoken across South Asia in Maharashtra (especially Bombay), Rajasthan, Sind, lower Punjab, Madhya Pradesh, and in Karnataka and among the Parsi, Hindu, Muslim, and Jain diaspora in the Persian Gulf, East and South Africa, Britain, North America, and Australia. There were approximately 45 479 000 speakers reported in 1997 (*Indian Missions Abroad*).

History and Literature

Scholars historically distinguish Old Gujarātī (12th–15th centuries); Middle Gujarātī (15th–18th centuries); and Modern Gujarātī (18th century onward).

Its antecedents are traceable to a distinct Old Western Rajasthānī literary form, despite the attestation of Jain Prākṛit treatises and studies by Middle Indian grammarians of *Nāgara Apabhraṃśa*, a literary *Apabhraṃśa* of Gujarat. The 12th-century *Bharateś-varabāhubalirāsa* (1185) is the earliest work written in Gujarātī. Prose and verse compilations written from the 13th century onward exist and include the seasonal poem *Vasantavilāsa* and the 14th-century commentary, the *Ṣaḍāvaśyakabālabodhavr̥tti*. Narasiṃha Mehtā's (c. 1414–1480) devotional ballads marked a new era in poetry, acquiring pride of place in its literary annals. The Gujarātī daily, *Mumbai Samācār* (established in 1822), is one of the oldest newspapers in Asia. Bombay Parsis were pioneers in Gujarātī and Urdū theater from the 1850s.

Dialects

Gujarātī spoken along the Baroda-Ahmedabad corridor is regarded as the standard/prestige dialect. (Whether the register of Nāgarī Brāhmaṃṣ carries

'RP' status remains debatable). Other dialects are Suratī (southern Gujarat), Carotarī (Charotari; central Gujarat), Kāthiāwārī (Saurashtra), and Pāṭānī (northern Gujarat). Pakistani Gujarātī is probably a Pāṭānī subdialect, and code switching is waning as the younger generation shifts to Urdū and provincial languages. Muslim speakers there and elsewhere obviously adopt Perso-Arabic lexicons – its largest word stock after Sanskrit – especially in religious-cultural discourse. Parsi Gujarātī, an ethnolect of the subcontinent's Zoroastrians is, however, readily intelligible. East African Gujarātī now contains Swahili loanwords. Kacchī (Kachchi) is semantically intermediate between Gujarātī and Sindhī and is also influenced by Mārwarī.

Grammar

Phonetically, Gujarātī is unique for murmured vowels developed from final /h/ and two open vowels, /ɛ/ and /ɔ/. An absence of contrast exists between short and long /i/ and /u/ vowels. Variable or invariable substantives and adjectives, as well as pronominals, have three genders (including the neuter) and two numbers; they inflect for direct and oblique forms, the latter with post-positions and clitics. Verbal forms have temporal, modal, and aspectual contrasts. Combinations of verbal nouns and adjectives with auxiliaries produce an elaborate variety of obligational and desiderative forms, and the vocabulary is rich in passive, causative, and double causative verbs (Cardona, 1965). Vector/compound verbs, a common New Indo-Aryan feature, are employed in restricted contexts with specific semantics.

Orthography

A manuscript dated 1592 (Mistry, 1996) attests that an alphasyllabic script derived from a Devanāgarī variant has been employed for writing Gujarātī and Kacchī since the 16th century. A cursive style replaced the standard Sanskrit script used in prose and verse when printing began during the 1830s. Independent and conjunct forms are expressed by 45 symbols: 8 vowels, 34 consonants, *anusvāra*, *visarga*, and a velar nasal grapheme. Written from left to right, Gujarātī is conspicuous for its absence of head strokes and varying phonemic modifications. As in other Brāhmī-derived scripts, the post-consonantal /a/ is evidently assumed in a consonant lacking diacritics.

Devanāgarī-derived numerals were adopted with modified shapes for the digits 3, 5, 6, and 9.

Gullah

T Hopkins, Florida International University, Miami, FL, USA

© 2006 Elsevier Ltd. All rights reserved.

Gullah is the name of the language spoken by the former African slaves and their descendants (also called Gullahs) living along the southeastern U.S. Atlantic coastline from the northern tip of North Carolina to Jacksonville, Florida, especially in the Sea Islands off the coast of South Carolina and Georgia and the bordering mainland areas (e.g., the low country). The Gullah language and its speakers are also respectively known as Geechee and Geechee(s), a local in-group term, and because of its negative connotation it is not used by outsiders. Other contemporary terms used to refer to the Gullah language and its speakers have included Sea Island Creole and Sea Islanders, but these terms have largely been restricted to the academic literature. Another more recent term that has sometimes been used to identify the Gullahs is Native Islanders, employed largely on Hilton Head Island to distinguish the native Gullah Sea Islanders from the influx of outsiders that began settling on the sea islands in the 1950s. However, this term has not received widespread acceptance among the Gullah population and Gullah still seems to be the preferred ethnic classification for the language and its speakers. Gullah has historical and linguistic links with Afro-Seminole, an offshoot of Gullah spoken by black Seminoles and their descendants, who were forced out of northern Florida to the west in the 1830s, and are now living in central Oklahoma, western Texas, and northern Mexico. The exact number of Gullah speakers today is uncertain because no census has attempted to distinguish the Gullahs from other African Americans living in the region.

History

The Gullahs are descendants of Africans brought from the Caribbean and directly from West Africa to provide the slave labor force for a plantation agricultural system, supported by English planters who began settling in the low country region in the late 1600s. The low country's rich fertile soil was ideal for the prosperous production of such plantation crops as rice, indigo, and the long-stapled Sea Island cotton for which the Sea Islands became known. The success of the plantation system was owed not only to the slave labor force but also to the agricultural and technical skills of the Africans, particularly in rice cultivation. Following the U.S. Civil War in 1865, the English planters abandoned their plantations, leaving the

freed Africans and their descendants to eke out a living of their own. They engaged in small-scale farming, hunting, and fishing, and the relative isolation of the Sea Islands allowed them to preserve many of the traditions and customs of their African ancestors. Today, fish netting, basket weaving, woodcarvings, and quilting are some of the customs that characterize the rich cultural lifestyle of the Gullah people.

The etymology of the term Gullah has not yet been determined. Gullah may have derived from Ngola, the name of an African tribe in the Hamba basin of Angola, a West African region from which many of the Africans were transported, or it may have originated from Gola, the name of an African tribe and language near the Liberia-Sierra Leone border in West Africa. The etymology of Geechee is also unknown. Geechee may have derived from the Ogeechee River plantation in Georgia, the word *gidzi* in Mende to mean a country called Kissy (Liberia), or it may have come from the name of a tribe and language in Liberia. Equally obscure is how or when Gullah became the local ethnic classification for the enslaved Africans and their descendants living in the low country and their language. Historical citations show its first appearance in the literature in 1822, when the Charleston City Council records made reference to Gullah Jack and his company of Gullah or Angola Negroes. This indicates that its early use was associated with a particular group of Africans. However, the Gullah people and their language are far more diverse as both their historical development and language reveal.

Language Development

Gullah is the only English-based creole in the United States, although its origins are still speculative. Three hypotheses have been proposed of its development. One hypothesis suggests that Gullah developed from the Caribbean English spoken by the Africans and their descendants on plantations in the Caribbean and was brought with the African slaves when transported to the low country and subsequently learned and linguistically influenced by the Africans who were later imported into the region. Another hypothesis is that Gullah originated in a pidgin that developed on the West African coast and was brought with Africans imported to the low country. A third hypothesis suggests that Gullah developed on the plantations in the low country out of contact between English-speaking settlers and the various West African languages of the African slaves. Whatever the source, the retention of Africanisms in all components of the Gullah grammar is a common thread, and it is largely

these features, commonly associated with an African substratum, that is often used to distinguish Gullah from its English lexifier source.

Linguistic Characteristics

Gullah differs from General American English most obviously in its phonology. Some of these features include the use of the voiced bilabial fricative [β] or the voiced labiodental frictionless continuant [v] for the voiced labiodental fricative [v] in English, e.g., [βeri] cf. 'very,' [səvænə] cf. 'Savannah'; the use of the voiced palatal nasal [ɲ] in, e.g., [ɲustə] cf. 'used to'; and the absence of interdental fricatives in, e.g., [tɪn] cf. 'thin' and [di] cf. 'the.' The prenasalized and labiovelar stops [kp/ɡb] were reported in early Gullah phonology but these sounds were largely used in the Africanisms, and although Africanisms are still present in the Gullah lexicon, they do not appear to be in widespread use among the Gullah today.

The Gullah lexicon is largely English. From his research conducted in the late 1930s, Lorenzo Turner was the first linguist to document over 4000 Africanisms in the Gullah lexicon, many of them used as basket names (e.g., Gullah nicknames). Today you can still hear in normal everyday conversations such African retentions as *buckra* 'white man,' *tita* 'elder sister,' *dada* 'mother or elder sister,' *nyam* 'eat/meat,' *sa* 'quickly,' *benne* 'sesame,' *una* 'you,' and *da* the verb 'to be.' Other Gullah Africanisms such as *cooter* 'turtle,' *tote* 'to carry,' *okra* 'plant food,' *gumbo* 'stew,' and *goober* 'peanut' are widely used in mainstream American English. In addition to direct loans, the Gullahs also employ a large number of calques, e.g., *day clean* 'dawn,' *day broad clean* 'full daylight,' *first dark* 'sunset,' *night shut-in* 'midnight,' *sweet mouth* 'flattery,' *bad mouth* 'to denigrate,' *i foot broke* 'to become pregnant,' *big eye* 'greedy,' and *hard head* 'dumb.'

Its most interesting features morphosyntactically include the pronominal form *unə* 'you' (2nd person sg/pl); *nə* 'and' (conj); *də* 'the verb be'; *bɪn* 'was'; *sɛ/fə* 'that' (complementizer); *dɛm* to refer to '& company' when postposed to proper animate nouns as in *Suzi dem* 'Susie and others' and 'those' as a demonstrative determiner to common nouns as in *dem boy* 'those boys.' Like its English lexifier creoles, Gullah also employs several preverbal auxiliaries within its tense, aspect and modal verbal paradigm. The primary auxiliaries are *də*, *ə*, *bɪn*, *don*, *dəz*, and *go*, which can occur alone or in combination with each other to express a wide range of tense, modal, and aspect

meanings in past/nonpast contexts. These same forms function as lexical verbs. As an auxiliary [*də*] in *I də go* generally indicate durative and habitual meanings cf. 'I am/was going' and 'I generally go,' respectively. Habitual meaning is also expressed with the auxiliary [*dʌz*]; the auxiliary [*də*] can also express iterative and perfective meanings. Its phonological variant [*ə*] indicates durative, habitual, iterative, and perfective meanings. The auxiliary [*don*] expresses perfective meaning in *I don go* cf. 'I have gone'; the auxiliary [*bɪn*] in, e.g., *I bɪn go* indicates anterior meaning cf. 'I went/had gone'; the auxiliary [*go*], as well as auxiliary [*ə*], expresses future meaning as in *I go go* or *I ə go* cf. 'I will/would go.' Gullah is not homogeneous, so the use of these grammatical forms and meanings may vary depending on the region (e.g., the sea island or mainland area the Gullah speaker originated) and sociocultural factors (e.g., age, education, socioeconomic status, etc.).

In the mid-1950s, developers launched the Sea Islands on an explosive growth in development and population called progress, which led to an unprecedented assault on the relatively stable Gullah people and their way of life. The Sea Islands, which had until then been isolated, were now connected by causeways and bridges to the mainland (only two islands, Daufuskie Island, South Carolina, and Sapelo Island, Georgia, still remain unattached to the mainland but have not escaped development). The possible extinction of the Gullah population was threatened and local organizations, such as the Penn Center, the Gullah Coalition, and Gullah Festival, were inaugurated and are now contributing to the preservation of the Gullah language and cultural identity.

Gur Languages

J Bendor-Samuel, Summer Institute of Linguistics,
High Wycombe, UK

© 2006 Elsevier Ltd. All rights reserved.

There are some 85 Gur languages within the Volta-Congo branch of the Niger-Congo family. These languages are used in an area that stretches from southeast Mali across the northern Ivory Coast, a large part of Burkina Faso, all of northern Ghana, northern Togo, northern Benin, and into northwest Nigeria. They predominate within the parallels 6°W and 2°E and 8°N and 14°N, the savannah lands north of the forest belt where the Kwa languages are spoken. The name 'voltaïque' is used in French.

The Speakers

The number of speakers of Gur languages is probably in the region of 12 to 15 million people. There is a wide range in the size of the Gur language groups; some are large, such as the Moore in eastern Burkina Faso numbering some four million; others are much smaller with only a few thousand speakers.

Gur Studies

The earliest record of Gur languages is found in S.W. Koelle's *Polyglotta Africana*, published in 1854, which includes word lists from 10 Gur languages. There was, however, little further mention of Gur languages until the 20th century. Westermann (1927) recognized the validity of Gur as a subfamily. Greenberg (1963) and Bendor-Samuel (1971) confirmed this classification and added considerable detail to earlier work.

The first in-depth study of any Gur language was the extensive work done by Manessy (1975, 1978) and Prost in the 1970s. The Summer Institute of Linguistics began research in Gur languages in northern Ghana in the 1960s; their efforts have produced several studies in recent years (see Naden, 1989).

Languages and Their Classification

Most of the Gur languages belong to two main groups – Central Gur and Senufo – but there are several languages that do not fall into either group. Furthermore, although there is little doubt about the grouping together of the languages in Central Gur and similarly of the languages in Senufo, this bringing together of these two major groups of languages

into a single subfamily, Gur, is being increasingly questioned. However, because no other relationship to any other language group is any closer, Senufo remains within Gur for the time being.

Central Gur languages are found in northern Ghana, eastern Burkina Faso, and northern Togo and Benin and break down into two main clusters, Northern and Southern. In the Northern cluster, the Oti-Volta group predominates, with 27 out of 29 languages. These 27 languages can be subdivided into six unequal clusters with the largest, known as Western, having 13 languages, whereas the next largest, Gurma, comprises six languages. The Oti-Volta group includes a number of major languages, such as Moore, Dagaari, Dagbani, Frafra, Mampruli, Kusal (Kusaal), and Konkomba. It is noteworthy that the linguistic relationship among languages in the Oti-Volta group is considerably closer than that among languages in the Grusi group.

In the Southern cluster, the Grusi group comprises 20 of the 29 languages. The Grusi group is more scattered, with the seven eastern languages of the group being completely separated from the four northern and nine western languages by a substantial block of Oti-Volta languages.

Central Gur includes another dozen languages outside the Oti-Volta and Grusi groupings.

The Senufo group comprises 20 languages, of which 10 are related more closely to each other and form a subgroup, Senari. The Senufo languages are found on the western side of the Gur group in the northern Ivory Coast and southwestern Burkina Faso.

A further nine Gur languages do not belong to any of the groupings so far set up within Gur. Detailed studies of many more Gur languages are needed so that the relationships of the languages to each other can be established more clearly.

Structural Features

Phonetics and Phonology

Although there is a great deal of diversity among the Gur languages, a subgroup, such as Oti-Volta, includes languages with many features in common.

Consonant sets often include voiced and voiceless plosives and fricatives and nasals at five points of articulation: labial, alveolar, palatal, velar, and labiovelar, plus *l*, *y*, and *w*. Phonetic [r] often occurs as a non-initial allophone of /d/.

The geographically contiguous northern and eastern Grusi languages display a vowel harmony system. A systematic contrast in vowel length is common throughout the Gur languages, as is the syllabic nasal.

All Gur languages are marked by contrastive tones, the domain of which is usually the syllable, but may be the word or the morpheme; these tones usually carry grammatical rather than lexical implications. There is no one tonal system; both terrace systems with two tones and downstep and systems with up to four contrastive pitch levels are found.

Both CV and CVC roots occur, as well as C(V) suffixes. In many languages, transitional vowels are inserted to avoid consonant clusters.

Grammar and Syntax

Most Gur languages have singular and plural class suffixes, and in some languages, pronouns and other NP elements concord with the head noun. The contrast between imperfective and neutral forms is very common and usually occurs by means of verbal extensions, though a tone change or vowel lengthening is also found. Other verbal categories are usually shown by particles, auxiliaries, or occasionally tone.

Aspect rather than tense is marked, though 'past' may be contrasted with 'nonpast' or 'future' with 'nonfuture,' and there are often time-depth particles

(e.g., 'one day away' may be 'tomorrow' with future or 'yesterday' with nonfuture).

SVO is the predominant word order in Gur languages, though Senúfo languages show SOV word order.

Guugu Yimithirr

J B Haviland, Reed College, Portland, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

The Language and Its Speakers

Guugu Yimithirr (Gu:guyimidjir) (hereafter GY) is the language originally spoken in the area between the Annan and Jeannie Rivers on the coast of north-east Queensland and inland. Most of its modern speakers now cluster around Cooktown, at the mouth of the Endeavour River. The language name combines *guugu* 'word' or 'language' with the comitative *yimi-thirr* 'this way' – thus, 'this kind of language' or 'speaking this way.' (Contrast the name of its southern sister Kuku-Yalanji, which has *yala* for GY *yii* 'this, thus.'). GY contributed Australia's most widespread loanword to the languages of the world, via the word *gangurru* [IPA *g'aŋuru*] 'large grey wallaroo,' which was recorded as 'kangaroo' by members of Captain Cook's crew during their stay on the shores of the Endeavour in 1770. Speakers of the language were spared further contact with Europeans for about 100 years, when gold was discovered inland at the Palmer River in the mid-1870s. The consequent gold rush and invasion of the territory by settlers decimated

local Aboriginal populations, and within 10 years the few surviving speakers of GY lived in scattered hunter-gatherer bands pushed off their lands or on the fringes of Cooktown and other smaller towns. A Lutheran mission established on barren land at Cape Bedford in 1885 became a refuge for the remaining GY speakers, and GY was the lingua franca of the community as legislation relocated Aboriginal children from a wide area – including many who spoke different languages – at the mission school. The earliest written information about GY derives from the Cape Bedford missionaries, systematized by W. E. Roth, the first Northern Protector of Aborigines. The 20th century saw a severe GY diaspora, as speakers of the language who had migrated to Cooktown and Cape Bedford were forcibly relocated to southern Queensland during World War II, and returned to their homeland in only a fraction of their already reduced numbers in the 1950s. Nowadays, though most GY speakers still live around Cooktown, others are scattered through other Queensland Aboriginal communities, and as far away as Melbourne and New Zealand. Despite repeated predictions, starting in the 1920s, that GY was on the verge of extinction, the language remains a central feature of life at the Hopevale community north of

of the original second syllable. Thus, *balgal* ‘he’ll make it’ vs. *balgaalgal* ‘he is making it.’ In addition, suffixes differ according to how they affect stress and length in the stem to which they attach. Most suffixes engender length (when it is not already present) on all disyllabic stems ending in a nonnasal consonant. Thus, *gambul* ‘belly’ + *-hi* ‘LOC’ → *gambuulbi* ‘in the belly.’ Other ‘lengthening suffixes’ additionally engender length even on disyllabic vowel-final stems. Thus, *yugu* ‘fire’ + *:-ngu* ‘PURPOSIVE’ → *yuguungu* ‘for the fire.’ Still other ‘shortening’ suffixes shorten the long vowel in the second syllable of a disyllabic stem. Thus, *buurraay* ‘water’ + *-\$a* ‘PURP’ → *buurraya* ‘for water.’

The Morphology and Semantics of Cardinal Directions

Rather than base locative expressions on body-relative or egocentrically anchored perspectives, GY, like many other Australian languages, uses locational descriptors which insistently incorporate cardinal directions. Four lexical roots, *gungga-*, *jiba-*, *naga-*, and *guwa-*, correspond roughly to the English directions north, south, east, and west, respectively, except that the GY terms denote compass quadrants rather than idealized points. In virtually all circumstances, GY speakers keep track of cardinal orientation and incorporate the appropriate directional terms into descriptions of both distant places and immediate locations. In answer to a question like ‘Where are you going?’ one will answer, for example, *nagaar bayan-bi* ‘east to the house.’ To tell someone to move a bit ‘that way’ one must add the correct direction: *yarrba guwa-manaayi* ‘move a bit that way to the west’ (literally, ‘thus west-be’).

Whereas ordinary nominal expressions have just a single LOCATIVE/ALLATIVE form, and another ABLATIVE form, the directional roots have more elaborated morphological possibilities. The LOC/ALL forms, for example with the root *naga* ‘east,’ number three:

- (3) LOC/ALLforms
naga (0-form, ‘east from a point’)
naga-ar (R-form, ‘to a point east’)
naga-alu (L-form, ‘east, over some point or obstacle’)

Though all denote, in this case, motion in an easterly direction from some origo, each incorporates a different perspective or set of locational presuppositions. The least marked 0-form concentrates on the starting point of the trajectory, or emphasizes setting out toward the east. The second R-form focuses on the end point of the trajectory, also in the east, or emphasizes arrival. The third L-form is the most highly marked, presupposing some known or inferable

location to the east through or beyond which the current trajectory is conceived to pass. Similar elaboration extends to ablative and other locational case morphology, providing delicate resources for GY directional precision.

The Syntax and Semantics of the ‘Reflexive’ Suffix *:-thi*

GY transitive verbs ordinarily require animate subject NPs, whose referents are in an agent thematic role, conceived of as consciously and voluntarily controlling an action performed on some normally distinct object – the theme or patient argument.

- (4) *nyundu* *minha* *wagi* *naaybu-unh*
 2s.NOM *meat.ABS* *cut.PAST* *knife-INST*
 ‘you cut the meat with a knife.’

GY has a productive ‘reflexive’ construction, with the lengthening suffix *:-thi*, which encodes a basic variant of this situation, when agent and patient arguments are coreferential:

- (5) *ngayu(-ugu)* *wagi-ithi* *naaybu-unh*
 1s.NOM(-EMPH) *cut-REFL* *knife-INST*
 ‘I cut myself with a knife.’

Interestingly, GY uses the same verbal inflection, with varying case forms on the accompanying arguments, to encode other sorts of situation which depart from the canonical transitive situation characterized above. Thus, for example, in a situation appropriate to what in other languages might be encoded by a passive construction – for example, when there is no agent, or when the agent only accidentally acts, or when the organization of the discursive context promotes the object of the action to a position of prominence – GY uses the same *:-thi* suffix on the verb.

- (6) *nganhi* *wagi-ithi* *naaybu-unh*
 1s.ACC *cut-REFL* *knife-INST*
 ‘I got cut on the knife (by accident).’

Similarly, in a kind of generalized action in which no specific agent can be singled out, GY also has recourse to *:-thi*. A typical example might be

- (7) *nyulu* *gunda-athi*
 3s.NOM *hit-REFL*
 ‘he had a fight/was in a fight.’

There is also a small group of GY verbs which occur **only** in ‘reflexive’ form with *:-thi*, mostly denoting actions typically performed without conscious outside agency (‘come to an end,’ ‘explode,’ ‘finish,’ among others).

Language Situation and Sociolinguistic Features

Because of the particular history of its speech community, and the rapidly shifting conditions under which it is learned and spoken, GY is a language in a dramatic state of flux and variation. The mix of 'tribal' origins of its modern-day speakers, and the range of circumstances in which it serves as a medium of interaction, have produced different levels or registers in which GY and different varieties of Aboriginal and standard English combine.

Traditionally in this part of the Cape York peninsula, Aboriginal people were polyglots, often practicing linguistic exogamy and able to communicate as they traversed dialect and language areas. Even within single dialects, other socially significant linguistic varieties, such as the so-called mother-in-law or brother-in-law languages, provided linguistically marked ways of displaying deference to certain classificatory kinsmen, or of marking intimacy with others. Historically, as speakers of different Aboriginal languages (as well as creolized varieties of other contact languages) either congregated or were forcibly brought together at the Cape Bedford mission, GY became the native language of many people who still had ancestral ties to other 'tribal' languages. As knowledge faded of these other languages, so too did the specialized subvarieties of GY disappear, since they were systematically linked to social practices and processes of transmission which were radically altered by the sometimes violent upheavals in Aboriginal society.

In modern Hopevale, and around Cooktown, where the great majority of current GY speakers live, the language is still widely used, although it has a diglossic functional relationship with English. In the somewhat anarchic conditions of language acquisition in this fragmented speech community, the language is also undergoing probably accelerated simplification, as paradigms once fraught with irregularity are allowed to conform to more productive morphosyntactic patterns. Moreover, different generations in the community, with different kinds of schooling and a variety of personal backgrounds and competence in Australian English, mix English and GY freely in a typified and self-identifying variety of Hopevale

English which combines GY pronouns and individual lexical items with a largely English syntax.

H

Hausa

P J Jaggard, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Hausa is a Chadic (Afroasiatic) language spoken by an estimated 30 million or more first-language speakers (more than any other sub-Saharan language), mainly in northern Nigeria and southern Niger. It is also spoken by diaspora communities of traders, Muslim scholars, and immigrants in (mainly) urban areas of west Africa (e.g., Ghana, Cameroon), and also in the Blue Nile Province of the Sudan. Hausa is the most important and widespread west African language and continues to expand as a transnational lingua franca.

Hausa is used extensively in commercial, governmental, and educational spheres, and in the mass media. There are a number of Hausa-language newspapers, and book publishing, television, and video production are active. Many radio stations, both African and international, broadcast in (mainly Standard Kano) Hausa, including the BBC World Service, Voice of America, Radio Deutsche Welle, and China Radio International. A number of universities in Nigeria and Niger offer undergraduate and postgraduate degree courses in Hausa, and there are specialists in Hausa language and/or literature involved in comparable programs at universities in Europe, the United States, Japan, China, and South Korea. It has the best dictionaries (Bargery, 1934; Abraham, 1962; R. M. Newman, 1990) and reference grammars (Caron, 1991; Wolff, 1993; P. Newman, 2000; Jaggard, 2001) of any African language.

Substantial borrowing from neighboring African languages, such as Kanuri (central), the Mande group, Tuareg (Tamahaq, Tahaggart), Yoruba and Fula(ni) a single language (with considerable dialectal variation), has enriched the Hausa lexicon. Most loanwords come from Arabic, English, and French, however, with Arabic loans encompassing such semantic fields as religion (Islam was introduced to the area more than 500 years ago), education, government, law, commerce, war, and horsemanship.

Over the past 100 years, an ever-growing number of loanwords from English (Nigeria) and French (Niger) have been incorporated, typically denoting material objects and technology, education, and governmental and military positions.

Hausa has been written for more than 200 years in Arabic script ('ajami; see below for transcription), a system prevalent in Koranic schools and still used by many (mainly non-western-educated) Hausas for religious and literary purposes. However, 'ajami has been gradually supplanted by a modified Latin script/ alphabet called booko (probably < English 'book'), which does not, however, mark contrastive tone or vowel length. Hausa dialects vary in phonology, lexicon, and grammatical morphemes, and can be broadly grouped into Eastern Hausa (e.g., Kano = Standard Hausa, the variety described here), Western Hausa (e.g., Sokoto), and dialects in Niger (e.g., Aderanci).

Phonology

Hausa (Standard/Kano) has 32 consonant and 12 vowel phonemes (10 short/long monophthongal pairs plus two diphthongs) (See Table 1).

Table 1 Hausa: consonants

| Consonants: | | | | | | | |
|-------------|---|----|----|----|---|----|----|
| vl | f | fy | t | c | k | kw | ky |
| vd | b | | d | j | g | gw | gy |
| gl | ɓ | | ɗ | 'y | ƙ | ƙw | ƙy |
| vl | | | s | sh | | | |
| vd | | | z | | | | |
| gl | | | ts | | | | |
| | m | | n | | | | |
| | | | l | | | | |
| | | | r | | | | |
| | | | ř | | | | |
| | | | | y | w | h | |

c [tʃ] and j [dʒ] = palato-alveolar affricates, sh = palatal fricative [ʃ]; = glottal stop (orthographic ' '); ɓ, ɗ = laryngealized (implosives), 'y = glottalized palatal glide, ƙ [k'] and ts [s'] = glottalized ejectives; r [ɽ] = retroflex flap, ř = alveolar tap/roll.

Vowels (i = short; ii = long): i, ii, e, ee, a, aa, o, oo, u, uu.

Diphthongs: ai, au.

Hausa has two level tones, (H)igh (unmarked a[a]), and (L)ow (indicated with a grave accent on the first vowel à[a]), e.g., *kiifii* ‘fish’, *màcè* ‘woman’, *roogòò* ‘cassava’, *sàuka* ‘get down’. There is also a contour (H̄L) Falling tone (indicated with a circumflex), which occurs on heavy syllables, e.g., *râi* ‘life’, *kwântaa* ‘lie down’. There are three syllable types: CV, CVV (long vowel or diphthong), and CVC (long vowels are forced to conform and are reduced in extra-heavy *CVVC syllables). When followed by a front vowel, the coronal stops t, d and fricatives s, z palatalize to c, j, and sh, j respectively, e.g., *mèe sukà sàataa?* ‘what did they steal?’, *sun sàaci jàkaataa* ‘they stole my bag’ (< *sàati), *sun sàacee tà* ‘they stole it’ (< *sàatee), *taasàa* ‘metal bowl’ → pl. *taasooshii* (< *taasoosii).

Morphology

Within the pronominal system, the basic cut is between the personal and nonpersonal sets. There are eight sets of personal pronouns, each of which comprises eight forms: five singular (masculine/feminine gender is distinguished in the second and third person singular), and three plural. Personal pronoun paradigms express various syntactic functions, e.g., independent, (in)direct object, possessive, and reflexive. Nonpersonal pronouns (marked for gender and number) include demonstratives, interrogatives, and indefinites.

The categories of tense-aspect/mood (TAM) and subject agreement (person, gender, number) are marked on a lexically independent preverbal ‘person-aspect complex’ (INFL), which includes an additional (ninth) plural impersonal form (usually with arbitrary human reference and equivalent to a null subject). The TAM morphemes can be either segmentable, e.g., (Habitual) *ya-kàn zoo* ‘he regularly comes’, or fusional, involving changes in tone and/or vowel length, e.g., (Perfective) *yaa zoo* ‘he came’ and (Subjunctive) *yà zoo* ‘he should come’, and the subject-agreement elements are morphologically related to the personal pronouns. There are 16 distinct affirmative and negative inflectional paradigms, with a major Perfective:Imperfective aspectual dichotomy.

Hausa verbs are categorized into seven basic and derived ‘Grades’ (Parsons, 1960), defined in terms of their morphology (a templatic tone pattern and termination) and argument structure, and resembling the *binyanim* verbal conjugations in distantly related Semitic languages. Of the basic Grades (0–3), Grade 2 verbs (two-syllable) are canonically LH tone and are exclusively transitive, with two core (nonoblique) arguments, e.g., (Hausa is SVO) *Muusaa yaa ’àuri yaarinyār* ‘Musa married the girl’, *Muusaa yaa*

’àuree tà ‘Musa married her’. These examples also demonstrate how the final vowel of a Hausa verb can undergo changes in quantity and/or quality conditioned by the word class of the following constituent, e.g., direct object noun or pronoun. The derived Grades (4–7) add their own valency and semantics to the core meaning of the base form, e.g., basic Grade 2 verb *sàyaa* ‘buy’ → derived Grade 4 *sayèe* ‘buy up’, Grade 5 *sayař (dà)* ‘sell’, Grade 6 *sayoo* ‘buy and bring’, and Grade 7 *sàyu* ‘be completely bought up’. In the Imperfective, verbs are often replaced by participial-like verbal nouns, e.g., *sunàa daawôo-waa* ‘they are coming back’ (< Grade 6 *daawoo* ‘come back’ + ‘wà- with floating L tone), *mèe kakèe sàyee?* ‘what are you buying?’ (< Grade 2 *sàyaa* ‘buy’ [Grade 2 verbal nouns are nonpredictable]).

Nouns are masculine or feminine gender in the singular (an inherited Afroasiatic feature), and gender is overtly marked. Most native Hausa nouns are vowel-final. Feminine nouns typically end in -aa, e.g., *yaarinyàa* ‘girl’, *hùulaa* ‘cap’, or suffix-(I)YAA or -(U)WAA, e.g., *beebiyaa* ‘deaf mute (FEM)’, *gurgùwaa* ‘a cripple (MASC)’. Masculine nouns display a full range of final vowels (including -aa) and consonants, e.g., *raamii* ‘hole’, *beenee* ‘upper story’, *dilaa* ‘jackal’, *yaaròo* ‘boy’, *’àbù* ‘thing’, *mùtùm* ‘man’, *kaamùs* ‘dictionary’ (< Arabic).

Hausa noun (and adjectival) plurals are known for their complexity and involve suffixation, vowel insertion, and tonal melodies. They can be distilled into about 10 core classes, with the plural formation partially predictable from the canonical shape (e.g., tones, syllable structure) and, sometimes gender, of the singular. A disyllabic feminine singular with HL tone and final -aa, for example, will typically select a plural with the -ooCii suffix (where C = copy of final consonant of singular stem) and an all H tonal template, e.g. *jiikàa* ‘grandchild’ → pl. *jiikookii*. A disyllabic singular with a heavy CVV initial syllable and HH tones, on the other hand, is likely to pluralize by suffixing -àayee with HLH tones on the output, e.g., *giiwaa* ‘elephant’ → pl. *giiwàayee*.

Reduplication is pervasive, including (a) copying of a single consonant, e.g., past participial adjectives add a (MASC) suffix -aCCee, where CC = geminate copy of the stem-final consonant of the source verb, i.e., *cikakkee* ‘full, complete’ < *cikàa* ‘to fill’; (b) prefixal reduplication of the initial CVC- syllable of a sensory noun to form an intensive sensory adjective, e.g., *zàzzaafaa* ‘very hot’ (< *zaaf-zaaf-aa*) < *zaafii*); ‘heat’ (with gemination/assimilation of the coda C/f/); and (c) full reduplication (tones and segmentals), e.g., *coocì-coocì* ‘churches’ < *coocì* ‘church’, *yâu-yâu* ‘this very day’ < *yâu* ‘today’.

Syntax

The basic word order is S-V-IO-DO (goal/recipient arguments precede theme arguments), e.g., (ditransitive clause).

- (1) *ɗaaliɓɓin* *yaa* *kaawoo*
student.the 3MASC.SG.PERF *bring*
wà *maalaminsà* *'aikii*
to teacher.his work
 'the student brought the work to his teacher'

In *wh*-questions, relative clauses, and focus constructions, displaced constituents are moved to clause-initial position and special 'focus' marking is triggered on the INFL (Hausa is discourse-configurational), e.g., (FOC-PERF = Focus Perfective).

- (2) *wàa* *kukà* *ganii*
who 2PL.FOC-PERF *see*
'à *kàasuwa?* (*wh*-question)
at market
 'whom did you see at the market?'

- (3) *yaarònkà* *nee* *mukà*
boy.your COP 1PL.FOC-PERF
ganii (*ex situ* focus answer)
see
 'it was your boy we saw'

- (4) *yaaròn* *dà* *mukà*
boy.the REL 1PL.FOC-PERF
ganii (relativization)
see
 'the boy that we saw'

Hausa is a pro-drop language, in that sentences can occur without overt NP subjects, e.g., [\emptyset]_{subj} [*sun*]_{infl} *tàfi gidaa* 'they have gone home', and it also licenses discourse-linked null (direct) objects, e.g., *'ii, naa sàyaa* \emptyset 'yes, I bought (it)' (where \emptyset = null anaphor).

Negation in verbal sentences normally requires a double negative construction with the discontinuous morphemes *bà(a)* . . . *ba*, where the initial *bà(a)* occurs left-adjacent to INFL (following any overt subject), and the second is clause-final (though adverbs can occupy end position), as in (5) and (6).

- (5) *màataataa* *bà* *tà* *daawoo*
wife.my NEG 3FEM.SG.PERF *return*
bà (Negative Perfective)
 NEG
 'my wife has not returned'

- (6) *bàa* *zaa* *sù* *yàɗda* *ba* (Negative Future)
 NEG FUT 3PL *agree* NEG
 'they will not agree'

The Negative Imperfective uses only an initial High tone marker, as in (7).

- (7) *baa* *sàa* *zuwàa*
 NEG 3PL.IMPERF *coming*
 'they are not coming'

Within the NP, grammatical gender and number trigger agreement on: (a) prehead elements, including adjectival modifiers ([8], also posthead), indefinite determiners (8), interrogative determiners, and universal quantifiers (also posthead); as in (8) and (b) posthead elements, including definite determiners, demonstratives (also prehead), relatives, numerals, genitive phrases, e.g., possessive NP, as in (9).

- (8) *wani* *kâramin*
 INDEF.MASC.SG *small.MASC.SG.of.MASC.SG*
yaaròo
boy.MASC.SG
 'a certain small boy'

- (9) *rùiga-ĩ* *Mammàn*
gown.FEM-of.FEM *Mamman*
 'Mamman's gown'

Like many African languages, Hausa has a lexically autonomous class of highly expressive, phonosemantic words known as 'ideophones,' which normally function and distribute (sometimes collocationally) like adverbials. Hausa ideophones have their own distinct phonological and phonotactic properties (e.g., final obstruents, anomalous tones), and are semantically marked. As sound-symbolic elements, they typically denote the intensity or manner of an action, event, or state, e.g., (distinctive sounds or visually distinctive actions or features) *kwàngàrà̃m* 'with a clang', *shařaf* 'soaking wet', *řasha-řasha* 'all sprawled out', and can also function as adjectives, e.g., *dařařa* 'pronounced (facial markings),' and *fat* 'pure (white)'.

Constructions lacking a canonical verbal element include clauses containing an Imperfective INFL and nonverbal predicate, as in (10) and (11).

- (10) *Hàliimà* *tanàa* *dà*
Halima 3FEM.SG.IMPERF *with*
mootàa (possessive)
car
 'Halima has a car'

- (11) *sunàa* *masallaacii* (locative)
 3PL.IMPERF *mosque*
 'they are at the mosque'

Nonverbal clauses without any form of INFL include those in (12), (13), and (14).

- (12) *àkwai/baabù* *ruwaa* *nân* (existential)
 EXIST/NEG.EXIST *water* *here*
 'there is/is not water here'

- (13) gàa littaaŋkà (presentational)
 PRES book.your
 'here/there is your book'
- (14) shii maalàmii nèe (equational/copular)
 3MASC.SG teacher COP.MASC.SG
 'he is a teacher'

Hawaiian

P Geraghty, University of the South Pacific, Suva, Fiji

© 2006 Elsevier Ltd. All rights reserved.

Hawaiian belongs to the Eastern Polynesian branch of the Oceanic subgroup of the Austronesian language family, its nearest relatives being Tahitian and Marquesan.

Until the early 19th century it was spoken by the entire population of the Hawaiian islands, and it remained the main language for most of that century. However, the decline of the indigenous population, massive immigration, educational policies, and annexation by the United States (in 1898) have taken their toll, and Hawaiian was replaced by Hawai'i Creole English in the early 20th century as the main language of the native Hawaiian population. It is now estimated to have less than 1000 first-language speakers, mostly elderly individuals and the residents of the small island of Ni'ihau, out of a total population of over one million. Given the popularity of Hawaiian music among tourists, it could be said that Hawaiian is a language more sung than spoken.

Over the past 30 years grassroots moves to revive and revitalize the language, particularly through Hawaiian medium education from preschool (*pūmana leo*) to tertiary level, have had considerable success, and the number of speakers is increasing. Critics, however, point out that the style of Hawaiian spoken by this new generation who learned it in school is rather different from that of native speakers. It is now estimated that there

are 3000 fluent speakers of Hawaiian. There is very little Hawaiian-language radio and TV programming, and no newspaper.

Hawaiian had no traditional written form, and was first recorded by Captain Cook and his companions in 1778. A Roman-based alphabet was devised by English-speaking missionaries in 1829, and has remained in use relatively unchanged. In the 19th century, Hawaiians developed a high level of literacy through Hawaiian medium schools, and there is a large body of Hawaiian language literature from that period.

The phoneme inventory of Hawaiian consists of eight consonants (h, k, l, m, n, p, w, and glottal stop) and 10 vowels (a, e, i, o, u, ā, ē, ī, ō, ū). There are no consonant clusters and syllables are open. In writing, vowel length and glottal stop have often not been marked systematically. Most modern writers and publishers use a macron to indicate a long vowel and an inverted apostrophe (or apostrophe) to indicate the glottal stop.

There is very little morphophonemics, and most grammatical functions are performed by affixation or the use of pre- and postposed particles. Pronouns distinguish four persons (including first person inclusive and exclusive) and three numbers (singular, dual, and plural). There are two categories of possession, depending largely on whether or not the possessor has control over the fact of possession. In noun phrases, the order is head + attribute. The basic word order is VSO:

ua inu au i ka wai wela
 asp. drink I obj. the water hot
 'I drank the hot water'

Hawaiian Creole English

S Romaine, Oxford University, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Hawai'i Creole English (locally called 'Pidgin') is the first language of the majority of locally born children and the first language of somewhat less than half the state of Hawai'i's population of just over a million. Varieties of pidgin and creole English in Hawai'i arose from contact between Hawaiians, Europeans (primarily English speakers, who contributed most of the vocabulary to the emerging pidgin), and the various immigrant groups (e.g., Chinese, Japanese, Portuguese, and Filipinos) brought to Hawai'i to work as indentured laborers on plantations from the 1850s onward.

Increasing contact between creole speakers and speakers of mainland varieties of English after World War II and the political incorporation of the islands into the United States as the 50th state in 1959 have blurred the boundaries between Standard English and the creole, and created a continuum of varieties. Although adjacent varieties of the continuum are mutually intelligible, the two extreme endpoints may often not be. This example illustrates the variation.

ai go give om da book fo yu most creole-like
ai gon give om da book fo yu
ai going give om da book fo yu
aim gonna give om da book fo yu
ail give om/him/her/them the book fo yu least creole-like
I will give him/her/them the book for you most standard English-like

The most decreolized (i.e., most English-like) varieties are found on the island of O'ahu, where three-fourths of the state's population is located, along with the capital, Honolulu, and the main U.S. military base, Pearl Harbor. The outer islands of Kaua'i and Hawai'i are the least decreolized.

Although most of the vocabulary of Hawai'i Creole English is derived from English, as many as a

thousand Hawaiian words may have been in use at one time during the plantation era; several hundred were probably in fairly common use colloquially. Although this number is now fewer, partly due to the decline in knowledge of Hawaiian, many still persist in local English and many more in the Hawai'i Creole English of older speakers. Younger people tend not to know the meanings of some words, such as *pio*, 'turn off, extinguish', and *kumu*, 'girlfriend, sweetheart', but virtually every resident locally would know *ono* 'tasty'. Many of these Hawaiian words are being replaced by English ones, although in some cases the English variants are still different from mainland U.S. English, e.g., *grinds* 'food' (cf. *kaukau* 'to eat/food').

Distinctive grammatical features include the lack of the copula *be* (*you da boss*, 'you are the boss'), use of *get* in both possessive and existential constructions (*get one wahine she get one daughter*, 'There is a woman who has a daughter'), use of *stay* for locatives and progressives (*Leilani stay inside da classroom*, 'Leilani is inside the classroom', *Charlene stay working*, 'Charlene is working'), use of *wen* or *had* as a simple past tense marker (*Joe wen/had talk to da coach*, 'Joe talked to the coach'), use of *pau* (Hawaiian 'done, finished') as a completive marker (*Call me when you pau*, 'Call me when you are finished'), preverbal negation (*Stan no mo rice*, 'Stan doesn't have any more rice'), and use of *for* as a complementizer (*Darrell like know how fo play basketball*, 'Darrell wants to know how to play basketball'). Word order is generally subject-verb-object, as in Standard English, apart from topic/comment structures such as *big, da house*, 'The house is big', in which the comment appears first.

There is considerable variation in pronunciation among local residents of different ethnic and social class backgrounds. Generally speaking, however, the phonology of Hawai'i Creole English has a smaller inventory of distinctive sounds than many mainland varieties of English. The [r] after a vowel in words

such as *shark* is usually absent in the most creole-like speech varieties (i.e., ‘park’ [pak]), and many of the diphthongs (double vowels) found in mainland varieties of English in words such as *coat* [kout] and *day* [dei] are single vowels in the creole (i.e., [kot], [de]). Hawai’i Creole English often has full vowels where mainland varieties use reduced ones, e.g., [tudei], ‘today’, vs. mainland [tɔde], and ‘mountain’ [mauntɔn] vs. mainland [mauntən]. English interdental fricatives in words such as *they* and *think* tend to become stops in the creole (i.e., [de], [tink]). The stops in consonant clusters such as [tr] in words such as *try* are affricated (i.e., [črai]), and initial [s] in clusters such as [str] in words such as *stress* sounds more like [š]. There are also some stress and intonational differences, such as the use of falling pitch for yes/no questions, which also do not show the subject/auxiliary inversion typical of standard English, e.g., *you like go Honolulu?* ‘Do you want to go to Honolulu?’ The falling intonation pattern has been carried over from Hawaiian into creole. Rising pitch together with a final question particle are used as a confirmation check in utterances such as *no mo job fo you, aeh?* ‘There isn’t a job for you, right?’

Despite the lack of written norms, standardization, or any official recognition, there are nevertheless some writers who have attempted to use the creole as a medium for poetry, short stories, and drama by adapting English spelling to represent some of the distinctive characteristics of speech varieties in Hawai’i. Each writer has worked out his or her own *ad hoc* spelling system. This burst of literary creativity can be seen partly as a manifestation of opposition to colonialism and as an affirmation of distinctive local identity in which the use of creole plays a key role.

Hebrew, Biblical and Jewish

J F Elwolde, Valladolid, Spain

© 2006 Elsevier Ltd. All rights reserved.

Hebrew is the language of the people who, from the 11th century B.C., were dominant politically and culturally in and around what is the State of Israel. Members of this people stopped living in most of its ancient lands in any significant numbers following the Roman suppression of the Bar-Kochba revolt in 135 A.D. Indeed, for some 500 years previously Jews (from Judah/Judea, in the south of Israel) had settled in large numbers throughout the Hellenistic and Persian world. Even though they retained a high level of ethnic exclusivity, Jews became identified, and tended to identify themselves, as being more a ‘religious’ than a ‘national’ group, and this has been of enormous significance for the survival of Hebrew over three millennia.

A Holy Language

From the early centuries A.D., Hebrew is frequently referred to as *‘lēshōn ha-qōdesh’* ‘the sacred language’ in contrast to other languages spoken by

Jews – particularly Greek, Aramaic, and, much later, Yiddish. In addition, the Hebrew of the Bible was sometimes regarded (by certain medieval writers, for example) as ‘purer’ than later varieties. It is possible that this view is attested as early as the second century B.C., when the Qumran community derided their religious adversaries as speaking an ‘uncircumcized tongue’ (Rabbinic Hebrew, perhaps). Jewish traditions claim that Hebrew was the language spoken at the creation, that the letters of the Hebrew alphabet were active in the creation, and that it is the only language understood by the angels and efficacious in prayer.

Biblical Hebrew

The main corpus of ancient Hebrew is the Bible (minus its Aramaic portions), consisting of 304 901 graphic word-tokens. The consonantal text of this corpus had achieved roughly its current state by the 2nd century B.C., after several revisions of its different parts. A point to be stressed is that Biblical Hebrew, as it has been handed down, comprises a literary, rather than an oral or ‘colloquial,’ corpus. The Bible is not a straightforward record of spoken

utterances from biblical times, but is better viewed as a collection of written compositions, including literary versions of conversations, orally transmitted stories, etc.

The language of those parts of the Bible composed after the Jews' return from exile in Babylonia (538 B.C.) is sometimes called 'Late Biblical Hebrew,' and it differs from the 'Classical' literary language of before the exile (586 B.C.). Partly it represents a consciously 'archaizing' imitation of the earlier language and partly, like Rabbinic Hebrew, a distinct, naturally developed, stage in the history of Hebrew.

When the Bible is viewed as a single work, albeit a composite of different works, it is clear that it has been written, or at least edited, from a religious perspective and with religious motives. Even so, it contains relatively little material that was composed in order to express feelings of a specifically religious character. Far more representative are historical or epic narratives, historical fiction, social polemic ('prophecy'), and detailed regulations about law, the cult, and city planning. It has been claimed that Biblical Hebrew is particularly rich in vocabulary related to, for example, farming and water sources. But unlike the Arabic of the Qur'an created in a state of religious fervor, Biblical Hebrew is restrained in its descriptions of and vocabulary for the divine. In short, the corpus is more concerned with a people whose religion was of major importance to it rather than with that religion itself.

Hebrew is not the only language used in the great documents of Judaism. The Palestinian and Babylonian versions of the Talmud (5th to 6th centuries A.D.), excluding the Mishnah (ca. 225 A.D.), are both written mostly in Aramaic, as is the Zohar (late 13th century A.D.). Aramaic is also used for parts of the prayer book and even the Bible itself. Arabic (albeit often written in Hebrew characters) was the language of most of the great works of Jewish theology/philosophy written in territories under Muslim domination, especially Spain. Elsewhere in Europe, Yiddish was employed from the 17th century onward for devotional and ethical literature.

Moreover, even in biblical times, the use of Hebrew for secular (and nonliterary) purposes is attested on hundreds of inscriptions on seals, ostraca, stelae, etc. (These provide a further corpus of 'pre-Rabbinic' Hebrew along with various manuscripts of Ecclesiasticus and the majority of the Dead Sea Scrolls.)

The Decline of Hebrew

After the Babylonian exile, a variety of Hebrew known as 'Rabbinic Hebrew' developed. It existed until the 2nd century A.D. as a popular spoken dialect

(Tannaitic Hebrew), represented in literary form by the Mishnah. Thereafter, it survived another eight centuries as a literary and scholarly dialect (Amoraic Hebrew). However, during even its early phase, Rabbinic Hebrew had to vie with Aramaic and Greek, and it is known that large Jewish communities in Egypt apparently spoke Aramaic (Elephantine) or Greek (Alexandria) exclusively. Although the testimony of Jerome in the late 4th century A.D. indicates a good knowledge of Hebrew among his Jewish informants, the emergence, from the 3rd century B.C. onward, of Greek and Aramaic translations/interpretations of the Bible (*Septuagint*, *Targums*) is a sign of Hebrew's decline. Moreover, because written Hebrew gives relatively few indications of vocalization, there was a danger that unlearned Jews would forget even how to read their Scriptures properly let alone understand them. The situation was made yet more difficult by the existence of versions of the Bible containing different readings of the consonantal text and contentious interpretations of passages by the emerging Christian movement.

The Masoretes

The 6th to 8th centuries saw a flowering of activity among various schools of Masoretes ('bearers of tradition'), who can perhaps be regarded as religiously motivated linguistic theorists. Their aim was to safeguard against corruption of the consonantal text and to provide a system of 'pointing' the basically consonantal Hebrew script to represent how it was to be pronounced at both segmental and suprasegmental levels. One of the systems developed by the Masoretes of Tiberias became dominant and is used in the oldest surviving undamaged manuscript of the whole Hebrew Bible. This document, *Codex Leningradensis B19^A* from 1008–1009, is reproduced in the universally accepted critical edition of the corpus, *Biblia Hebraica Stuttgartensia*. Much earlier texts of parts of the Bible also exist, most notably the second century B.C. Isaiah Scroll from Qumran Cave 1 (unpointed). Texts employing other Masoretic traditions have also survived, and different pronunciations of Hebrew, as well as different trends in morphology, etc., are represented by the various communities of the diaspora (e.g., Ashkenazic, Sephardic, Yemenite).

Hebrew in the Diaspora

After its complete demise as the day-to-day spoken language of the Jewish people and until its 20th-century revitalization as the principal language of the modern State of Israel, Hebrew survived as a language spoken and written by Jews in most diaspora

communities in synagogue worship and religious texts. Hebrew was used, for example, in ceremonial documents, such as Torah scrolls, Passover *haggādōt*, and texts inside phylacteries and *mēzūzōt*, as well as in synagogue and grave inscriptions. With the exception of the sermon and the prayer for the Royal Family (in the UK), Orthodox synagogue services are conducted throughout the world in Hebrew. Elementary Hebrew is traditionally taught to children in a *heder* or ‘synagogue-school.’ All orthodox Jewish males have to be sufficiently competent in Hebrew to read out loud a portion of Scripture at the age of *bar-mitzvā* (13 years), and, thereafter, when called upon, at ordinary synagogue services. Note as well that Hebrew is imparted within the family in the context of festivals like Passover and *Hanukkah*. At a much more advanced level, Hebrew is also used for instruction within rabbinic academies (*yeshībhōt*).

Literature

The use of Hebrew by Jewish writers never died out, even though its geographical center shifted through time in accordance with the fate of Jewish communities in different countries. Scholars like Rashi, the great 11th-century French Bible commentator, wrote in Hebrew. Indeed, the ‘dynamic’ of Hebrew – the cause of its internal developments and its ability to adapt to new circumstances, most notably the need to provide a language for what would become the State of Israel – has been one of literature, not speech. In the 12th to 13th centuries A.D., for example, the Ibn Tibbon family, through their translations of Arabic works, accommodated Hebrew to the expression of a wide range of philosophical and scientific topics. Although medieval and earlier literature is frequently religious (including material written at relatively short notice, such as *responsa* to problems arising within particular communities), there is also a wealth of Hebrew poetry, especially from Andalusia, on profane themes.

Secular Contexts

Hebrew was also used as a lingua franca for Jews from different parts of the world, as well as in correspondence and in credit notes, contracts, and other commercial and legal documents within Jewish communities. Records of the Spanish Inquisition attest to the use of Hebrew in oaths, etc., by forced converts to Christianity. From the late 18th century, the widespread use of Hebrew for secular composition developed with the *Haskālā* or Jewish ‘Enlightenment.’ This had less to do with Hebrew’s status as a lingua franca than with the Enlightenment’s negative view

of the Yiddish dialects of European Jewry, associated by the reformers with the socially disadvantaged status of Jews and their allegedly low level of cultural achievement. It has also been claimed that Hebrew was in daily use in Palestine during the 19th century.

Hebrew in Other Languages

Jews have usually spoken the dominant language of their host community, on occasions developing specifically Jewish languages/dialects (Yiddish, Ladino, etc.), in which Hebrew has sometimes been of great influence, at least in vocabulary. Where such a development has not taken place, or where a Jewish language/dialect has been superseded by the dominant language, it is in most cases misleading to speak of a Jewish dialect (or sociolect) of a non-Jewish language. But in this situation, Jews continue to use a number of Hebrew expressions for items of Jewish culture (e.g., *siddūr* ‘prayer book’, *tēphillīn* ‘phylacteries’, *tallīt* ‘prayer-shawl’) and in particular contexts (e.g., *mazzāl tōbh* ‘congratulations’). The Israeli pronunciation given here represents that used by younger members of Jewish communities, who also tend to use more Hebrew expressions. But the Hebrew pronunciation of older Jews and their vocabulary often reflects that of the Jewish language/dialect once used by themselves or their parents (e.g., Ashkenazic /kōshēr/ for Israeli /kāsh’ēr/ ‘kosher’, Yiddish *shul* for Hebrew *bēt-kēneset* ‘synagogue’).

Classical Hebrew has left a few direct traces in the religious vocabulary of other languages, although this has been through the medium of Bible translations rather than that of Jewish communities (e.g., *hallelujah*, *amen*, *behemoth*, *shibboleth*). In the occult, various terms, for example, names for God and other supernatural beings, have been taken over, often in garbled form, from Hebrew. More significantly, the vocabulary and phraseology of the languages of Christian countries have been influenced in a variety of ways by loan-translations from Hebrew via prestigious early, fairly literal, vernacular translations of the Bible. Hebrew also underlies many ‘Christian’ names (e.g., *Isabel*, *David*, *John*, *Jeremy*, *Sarah*), and is encountered in some Jewish surnames (e.g., *Cohen*, *Levi*, *Rabinowitz*).

The Study of Hebrew within Christianity

Historically, Hebrew has gained the scholarly attention of Christians wanting to gain a better understanding of the Old Testament or to facilitate attempts at conversion of the Jews. Until the beginning of modern

‘scientific’ analysis of the Bible, few non-Jewish scholars could have claimed a familiarity with Hebrew or the ability to contribute to its linguistic analysis on anything approaching the scale of the medieval Jewish grammarians. But it is possible that their efforts aided the long survival of Hebrew, and it is in large measure due to them that Hebrew, elementary Biblical Hebrew at least, still finds a place in the curricula of many universities.

Basic Information

The Israeli language (a.k.a. Modern Hebrew) is one of the official languages – with Arabic and English – of the state of Israel, established in 1948. It is spoken to varying degrees of fluency by its 6.8 million citizens (as of September 2004) – as a mother tongue by most Israeli Jews (whose total number slightly exceeds 5 million), and as a second language by Muslims (Arabic speakers), Christians (e.g., Russian and Arabic speakers), Druze (Arabic speakers), and others.

Hebrew was spoken by the Jewish people after the so-called conquest of Israel (c. 13th century B.C.). Following a gradual decline (even Jesus, ‘King of the Jews,’ was a native speaker of Aramaic rather than Hebrew), it ceased to be spoken by the 2nd century A.D. The Bar-Kokhba Revolt against the Romans, which took place in Judaea in A.D. 132–135, marks the symbolic end of the period of spoken Hebrew. For more than 1700 years thereafter, Hebrew was comatose – either a ‘sleeping beauty’ or ‘walking dead.’ It served as a liturgical and literary language and occasionally also as a lingua franca for Jews of the Diaspora, but not as a mother tongue.

Israeli emerged in Eretz Yisrael (or Palestine) at the beginning of the 20th century. Its formation was

facilitated by Eliezer Ben-Yehuda, schoolteachers, and others to further the Zionist cause. Earlier, during the Haskalah (enlightenment) period from the 1770s to the 1880s, writers such as Méndele Mokhër Sfarím (Shalom Abramowitsch) produced works and neologisms which eventually contributed to Israeli. However, it was not until the early 20th century that the language was first spoken.

The genetic classification of Israeli has preoccupied linguists since the language emerged. The traditional school argues that Israeli is Semitic: (Biblical/Mishnaic) Hebrew revived. Educators, scholars, and politicians have contributed to this assumption, linking the history of language to the politics of national revival. The revisionist position, by contrast, defines Israeli as Indo-European: Yiddish relexified, i.e., Yiddish (the revivalists’ mother tongue) is the ‘substratum,’ whilst Hebrew is only a ‘superstratum’ providing the lexis and lexicalized morphology (cf. Horvath and Wexler, 1997). A more recent hypothesis is that Israeli is a hybrid language, both Semitic and Indo-European. It argues that both Hebrew and Yiddish act equally as its primary contributors (rather than ‘substrata’), accompanied by many secondary contributors: Russian, Polish, German, Judeo-Spanish (Ladino), Arabic, English, etc. (see Figure 1). Although Israeli phonetics and phonology are primarily Yiddish and its morphology is mainly Hebrew, the European contribution to Israeli is not restricted to particular linguistic domains and is evident even in its morphology.

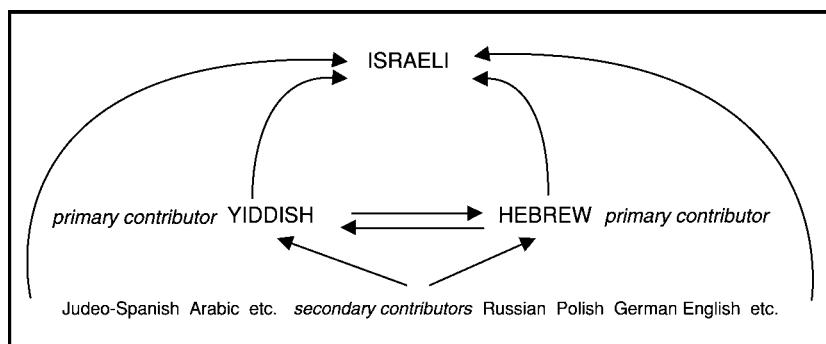

Figure 1 The Israeli hybrid hypothesis.

Thus, the term ‘Israeli’ is far more appropriate than ‘Israeli Hebrew,’ let alone the common signifiers ‘Modern Hebrew’ or ‘Hebrew’ *tout court* (cf. Zuckermann, 1999, 2003, 2005).

Grammatical Profile

Israeli is a fusional synthetic language, with discontinuous, nonconcatenative morphemes with vowel infixation, for example:

yoháv
love.3M.SG.FUT
 ‘(he) will love’

mitahévet
fall-in-love.3ESG.PRES
 ‘(she) is falling in love’

yenadvú
volunteer.3PL.FUT
 ‘(they) will volunteer (others)’

hitnudávti
volunteer.1SG.PAST.COERCIVE/INDUCIVE (hit-a-é- + -u-á-)
 ‘I (was) volunteered (by force)’

However, Israeli is much more analytic than (Biblical/Mishnaic) Hebrew. Whereas the Hebrew phrase for ‘my grandfather’ was *sav-í* ‘grandfather-1.SG.POSS,’ in Israeli it is *sába shel-ì* ‘grandfather GEN-1SG.’ Still, Israeli sometimes uses the Semitic feature known as ‘construct-state’ (Israeli *smikhút*), in which two nouns are combined, the first being modified or possessed by the second. For example, *repúblikat banánot*, literally ‘republic bananas,’ refers to ‘banana republic.’ However, unlike in Hebrew, the construct-state is not highly productive in Israeli. Compare the Hebrew construct-state *?em ha-yéled* ‘mother DEF-child’ with the more analytic Israeli phrase *ha-íma shel ha-yéled* ‘DEF-mother GEN DEF-child,’ both meaning ‘the mother of the child,’ i.e., ‘the child’s mother.’

Israeli is a head-marking language. It is nominative-accusative at the syntactic level and

partially also at the morphological level. As opposed to Biblical Hebrew – whose constituent order is VAO(E)/VS(E) – but like Standard European and English, the usual constituent order of Israeli is AVO(E)/SV(E). Thus, if there is no case marking, one can resort to the constituent order. Israeli is characterized by an asymmetry between definite Os and indefinite Os. There is an accusative marker, *et*, only before a definite O (mostly a definite noun or personal name). *Et-ha* is currently undergoing fusion and reduction to become *ta*. Consider:

| | | | |
|---------------------|------------|-----------|-----------------|
| <i>taví</i> | <i>l-i</i> | <i>et</i> | <i>ha-séfer</i> |
| give.2M.SG.IMP | DAT-1SG | ACC | DEF-book |
| (puristically FUT) | | | |
| ‘give me the book,’ | | | |

where *et*, albeit syntactically a case marker, is a preposition, and *ha* is a definite article. This sentence is realized phonetically as *taví li ta-séfer*.

Israel’s first Prime Minister, David Ben-Gurion, did not like the *et* particle and would have liked to have replaced *taví li et ha-séfer* with *taví li ha-séfer*. (It has been suggested that he was not keen on diplomatic relations with *etyópya* ‘Ethiopia’ for the same reason.) However, such a puristic attitude is hardly ever seen these days and *taví li ha-séfer* is nonnative.

Sound System

Israeli has five vowels: /i, e, a, o, u/. Its consonantal inventory reflects Yiddish (except that the latter has syllabic consonants). Unlike Hebrew, the pharyngealized (emphatic) consonants פ [q], פ [f], and ש [s] have been neutralized and are pronounced [k], [t], and [s] respectively. Hebrew ע [ʕ], נ [ʔ], and ה [h] are all ‘pronounced’ by most Israelis in the same way: most of the time, they are not pronounced. They are only pronounced (both ע and נ as [ʔ], and ה as [h]) when in a postconsonantal position **within uncommon words**. Israeli ה [h] is also pronounced by some speakers at the beginning of phrases. The Hebrew alveolar trill ר [r] is pronounced in Israeli as a unique uvular

approximant [ɣ], similar to the [ʁ] in many Yiddish dialects. For dyslexics, Israeli is much more problematic than Hebrew, the reason being that while Israeli's phonetic system is primarily European, it still uses a phonetically anachronistic Hebrew orthography. Thus, one should not be too surprised to see an Israeli child spelling עקבותיו (pronounced *ikvotáv*) 'his traces' as אכווטב.

Whereas the syllable structure of Hebrew was CV(X)(C), that of Israeli is (C)(C)(C)V(C)(C)(C). Israeli does not follow Hebrew spirantization rules. For example, most Israelis say *bekítá bet* rather than the puristic *bekhitá bet* 'in the second grade.' The stress is phonemic, e.g. *bóker* 'morning' and *bokér* 'cowboy.'

Nouns

Israeli nouns show number, normally only singular and plural. Each noun is either masculine or feminine, the latter often being created by adding a suffix to the unmarked masculine. For instance, whereas *mazkír* is 'male secretary,' *mazkirá* is 'female secretary' (note the addition of *-a*). Similarly, whilst *profésor* is 'male professor,' *profésorit* is 'female professor.' Pronouns have 'case forms' consisting of a preposition plus a suffix: nominative (e.g., *aní* 'I'), accusative (*otí* 'me'), dative (*li* 'to me') and genitive (*shelí* 'my'). However, NPs which are not pronouns do not bear case marking. The only exceptions are the above-mentioned accusative marker *et* (or *ta*), and the lexicalized allative ('to/towards') case (which, serendipitously, is based on the historical accusative case), e.g., *báit* 'house' → *ha-báyt-a* 'to the house'; *yerushaláim* 'Jerusalem' → *yerushaláym-a* 'to Jerusalem'; *tsafón* 'north' → *tsafón -a* 'to the north.' New allative phrases, e.g., *tel avív-a* 'to Tel Aviv', are not used unless one is trying to sound flowery or jocular.

Adjectives agree in number, gender, and definiteness with the nouns they modify, e.g.:

| | |
|----------------|----------|
| ha-yéled | ha-gadól |
| DEF-boy | DEF-big |
| 'the big boy'; | |
| yelad-ím | gdol-ím |
| boy-M.PL | big-M.PL |
| 'big boys.' | |

Verbs

As opposed to Biblical Hebrew, which had only a perfect-imperfect distinction, Israeli has three tenses: past, present, and future. In the past and future, verbal forms differ according to gender, number, and person. However, in the present tense, verbs are conjugated only according to gender and number and there is no person distinction. The historical reason

is that the forms of the Israeli present can be traced back to the Hebrew participle, which is less complex than the historical perfect and imperfect forms.

Verbs are transitive, intransitive or ambitransitive (labile). Ambitransitivity is usually of the S=A type, e.g. *dan shatá etmòl* 'Dan_s drank yesterday' (cf. *dan shatá etmòl bíra* 'Dan_s drank yesterday beer_o'). However, owing to Americanization, there are more and more ambitransitive verbs of the S=O type, e.g., *ha-séfer mokhér tov* 'the-book_s sells well' (cf. *grísham mókher et ha-séfer tov* 'Grisham_s sells ACC the-book_o well'); *yésh pò máshehu she-meriákh ra* 'There.is here something_s that-smells bad' (cf. *aní meriákh pò máshehu ra* 'I_s smell here something_o bad').

Clauses

The main clause in Israeli consists of (a) clause-initial peripheral markers, e.g., discourse markers; (b) NP(s) or complement clause(s); (c) a predicate – either verbal, copular, or verbless; (d) clause-final peripheral elements, e.g. discourse markers. The only obligatory element is the predicate, e.g., *higáti* 'arrive:1SG.PAST.' Sentences (1), (2), and (3) are examples of a verbal, copular, and verbless clause, respectively.

- (1) אסתר אכלה תפוח.
[ester]_A [[akhlá]_V [tapúakh]_O
[Esther]_A [[eat:3ESG.PAST]_V [apple]_O
'Esther ate an apple'
- (2) אסתר היא אחות שלי.
[ester]_{CS} [[hi]_{COP} [akhót shel-i]_{CC}
[Esther]_{CS} [[COP.ESG]_{COP} [sister GEN-1.SG]_{CC}
'Esther is my sister'
- (3) אסתר חכמה.
[ester]_{VCS} [[khakham-á]_{VCC}
[Esther]_{VCS} [[clever-F]_{VCC}
'Esther is clever'

There are many types of subordinate clause, e.g., adverbial (denoting comparison, time, place, condition, concession, reason, result, goal, state), adjectival/relative, nominal/complement. On complementation clauses in Israeli, see Zuckermann (2006).

Concluding Remarks

The grammatical profile of Israeli demonstrates its binary nature, which has important theoretical implications for many branches of language science: contact linguistics, sociolinguistics, language revival/survival, linguistic genetics and typology, creolistics, and mixed languages. Genetic affiliation – at least in the case of (semi-)engineered, 'nongenetic' languages – is not discrete but rather a continuous line. The comparative method and lexicostatistics, though

elsewhere useful, are not here sufficient. Linguists who seek to apply the lessons of Israeli to the revival of no-longer spoken languages should take warning.

Israeli affords insights into the politics not only of language, but also of linguistics. One of the practical implications is that universities, as well as Israeli secondary schools, should employ a clear-cut distinction between Israeli linguistics and Hebrew linguistics. Israeli children should not be indoctrinated to believe that they speak the language of Isaiah – unless the teacher is referring to the 20th-century Israeli polymath and visionary Isaiah Leibowitz. Although revivalists have engaged in a campaign for linguistic purity, the language they created often mirrors the very cultural differences they sought to erase. The study of Israeli offers a unique insight into the dynamics between language and culture in general and in particular into the role of language as a source of collective self-perception.

Highland East Cushitic Languages

G Hudson, Michigan State University, East Lansing, MI, USA

Demography

Highland East Cushitic (HEC) languages are spoken by some five and a half million people in south-central Ethiopia, in an area bounded generally by the 5th and 9th degrees of north latitude and the 37th and 39th degrees of longitude.

There are five HEC languages, from north to south Hadiyya, Kambaata, Sidaama, Gedeo (formerly Darasa), and Burji (formerly sometimes Bambala). A dialect of Hadiyya (i.e., mutually intelligible with it) separately reported in the 1994 census is Marak'ō (or Libido). Dialects of Kambaata also separately reported in the census are T'imbaaro and a closely related pair Alaba and K'abeena. (Letters followed by apostrophes represent glottalic ejective consonants.) Sidaama has distinct regional dialects, as do Gedeo and Burji, but these are not usually distinguished by name or otherwise in the literature. A group of Burji left Ethiopia around the turn of the century, and live in and about the northern Kenya town of Marsabit.

Table 1 shows the numbers of ethnic-group members and first-language speakers of the five languages and nine named dialects as reported by the 1994

Ethiopian Census (Office of Population and Housing Census Commission of Ethiopia, 1998, vol. 1; also see Hudson, 2003). The 1994 Census reported 4 241 804 HEC first-language speakers, which is 7.9% of the 1994 Ethiopian total population of 53 477 265. Sidaama, the most populous HEC language, was the fifth most populous Ethiopian language, after Amharic (17 372 913), Oromo (16 777 975), Tigrinya (3 224 875), and Somali (3 187 053). The Census (Summary Report, 1998) suggested a multiplier of 1.37 to estimate 2005 total

Table 1 HEC ethnic-group members and first-language speakers

| HEC dialect | Ethnic-group members, 1994 census | First-language speakers, 1994 census |
|-------------|-----------------------------------|--------------------------------------|
| 1 Burji | 46 552 | 35 731 |
| 2 Gedeo | 639 879 | 637 082 |
| 3 Hadiyya | 927 747 | 923 957 |
| 4 Marak'ō | 38 093 | 36 612 |
| Total 3–4 | 965 840 | 960 569 |
| 5 Kambaata | 499 631 | 487 654 |
| 6 Alaba | 125 894 | 126 257 |
| 7 K'abeena | 35 065 | 35 783 |
| 8 T'imbaaro | 86 499 | 82 803 |
| Total 5–8 | 747 089 | 732 497 |
| 9 Sidaama | 1 842 444 | 1 876 329 |
| Total 1–9 | 4 241 804 | 4 242 208 |

Ethiopian population, which yields a 2005 HEC first-language-speaker total of over 5.8 million. In fact, although Hadiyya and Sidaama may have increased speakers in such proportion, less populous varieties may have decreased.

Notice in **Table 1** that Alaba, K'abeena, and especially Sidaama are reported to have more first-language speakers than ethnic-group members. For Sidaama, this is consistent with its large number of speakers and presumptive function as a lingua franca in its region. The reason for this result for Alaba and K'abeena is less apparent.

The HEC territory is part of a linguistically diverse region of the West Rift Valley highlands where converge three of the six subgroups of Afroasiatic (Hamito-Semitic) languages: Cushitic, Semitic, and Omotic (the other three are Egyptian, Berber, and Chadic). Most of the HEC peoples share with Semitic 'Gurage' and Omotic peoples of this region a unique agro-ecology based on cultivation of the 'false banana' tree *ensete adulis*.

Classification

The HEC languages are Afroasiatic languages of the Eastern branch of Cushitic. The majority of Cushitic languages, some 19, are spoken in Ethiopia. The most populous Eastern Cushitic languages are Oromo and Somali. For an overview of Afroasiatic linguistics, see Hayward (2000). For a study of Cushitic grammatical characteristics, see Hetzron (1980), and for an overview of Cushitic classification, see Tosco (2000).

Figure 1 presents the tree-diagram of subgroupings within HEC, assuming mutual intelligibility within the Kambaata group. Burji is considerably divergent from the others, presumably reflecting its earlier separation from them. The general picture based on linguistic diversity, which is focused in southwest Ethiopia, is of south to north spread, with Burji the least moved and Hadiyya having diverged most recently from Kambaata. Oral traditions of these people often claim northern origins, but this

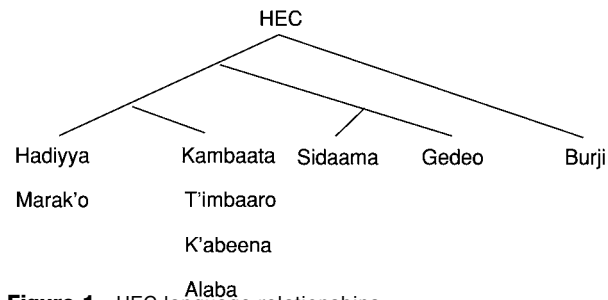

Figure 1 HEC language relationships.

is probably an influence of their Christian and/or Muslim faith.

Writing

The HEC languages were little written until the linguistic liberalization resulting after the Ethiopian revolution of 1974, which ended the unique official status of Amharic, and made Gedeo, Hadiyya, Kambaata, and Sidaama among the 15 languages promoted for literacy by the new government. Then the languages were written in the Amharic (Ethiopic) writing system. More recently, Ethiopian Cushitic languages have begun commonly to be written with the European-language alphabet. With further linguistic liberalization in the 1990s, Sidaama and Hadiyya, as the most populous languages of their areas, are now used, if limitedly, in primary education and local government, and in publications including newspapers, political writings, and fiction.

Typology

The HEC languages are typologically quite consistent as inflectional, suffixing, and head-final ('SOV'), and have closed syllables of limited types. A measure suggestive of diversity within HEC is percentages of cognates in a basic hundred-word list. **Table 2** presents these figures for the five major HEC varieties, which range from 39% for Burji-Kambaata to 70% for Gedeo-Sidaama (Wedekind, 1990: 46). Mutual intelligibility between varieties is roughly expected by such figures from about 75–80% (see also Bender and Cooper, 1971).

A broad descriptive-comparative survey of the HEC languages can be found in Hudson (1976); additional comparative information focused on morphophonemics in Abebe *et al.* (1985); a study of subclassification and history in Hudson (1981); a Burji etymological dictionary in Sasse (1982); an HEC comparative dictionary in Hudson (1989); a comparison of Kambaata varieties in Crass (2001); and a survey of HEC morphology in Hudson (2007). Analysis of Burji, Gedeo, and Sidaama texts is presented by Wedekind (1990) and of a Burji text by

Table 2 Percentage of cognates shared by five HEC varieties in a basic 100-word list

| | Burji | Gedeo | Sidaama | Kambaata |
|----------|-------|-------|---------|----------|
| Hadiyya | 44 | 56 | 62 | 66 |
| Kambaata | 39 | 49 | 66 | |
| Sidamo | 47 | 70 | | |
| Gedeo | 43 | | | |

Kellner (2001). Some characteristic features of HEC grammar concerning phonology, verb and noun morphology, and syntax are discussed next.

Phonology

Typical HEC word structure, as well as information about other phonological characteristics, is suggested in Table 3, a selection of 10 basic words in the 5 languages. Words of Table 3 are written phonemically, but phonetic interpretation is straightforward. Characteristics that may be noted are typically open syllables, five-vowel system, contrastive vowel and consonant length, glottalic ejective consonants *t'*, *k'*, *č'* (rarely also *p'*), glottalic implosive *d'* (in Burji 'bird', 'ear'), phonemic glottal stop, glottal onset *ʔm* ('bite'; there are also *ʔn* and *ʔl*), and word-internal syllables closed by sonorant consonants or the onset of long-consonants. In Sidaama and Kambaata, there are cases of final-syllable stress contrast, apparently resulting from shortened long vowels (cf. Sidaama and Gedeo 'blood').

Regarding HEC subclassification (Figure 1), apparent in Table 3 is the divergence of Burji, with its lesser number of apparent shared cognates, and the validity of subgroups Hadiyya-Kambaata and Gedeo-Sidaama, within which are more apparent cognates.

Characteristic of HEC languages other than Burji are pervasive processes of *i*-epenthesis, consonant

assimilation, and nasal metathesis that 'conspire' to assure allowed syllable contacts when stems and suffixes combine in verb formation. These processes are illustrated in Table 4, which shows Gedeo past-tense suffixes in combination with verb stems *af*- 'get', *dar*- 'tear', and *aff*- 'perspire', the first with progressive assimilation by its stem-final obstruent of *t* of *t*-initial suffixes, the second with progressive assimilation by its stem-final sonorant consonant of *n* of *n*-initial suffixes, and the third with *i*-epenthesis between its stem-final long consonant and the consonant-initial suffixes.

Verb Morphology

The Gedeo examples of Table 4 also exemplify the typical paradigm of HEC verb formation, in which a monosyllabic verb stem combines with suffixes whose initial part is cognate with those of a general Afroasiatic pattern (seen as subject-prefixes in Semitic and Berber): first singular with an initial vowel (Gedeo *-enne*), second singular, second plural and third singular feminine in *-t* (*-titto*, *-ti-ne*, and *-te*), and plurals in *-n* (*-n-enne*, *-ti-ne*, *-ne*). Sidaama adds to the paradigm gender agreement in first-person and second-person singular, with final *o* for masculine and *a* for feminine, e.g., *afummo* 'I-masc. got', *afumma* 'I-fem. got'.

Also typical of HEC, with cognates elsewhere in Cushitic, are regular verb derivatives for causative in *-is*, passive in *-am*, and reflexive in *-id'* and its reflexes. Some examples from Sidaama are *āja* 'decrease' (vi.), causative *ājisa* (vt.); *k'ana* 'suck', causative *k'ansa* 'suckle', *fana* 'open', passive *fanama*; *duna* 'pour', passive *dunama* 'leak', *afa* 'get', reflexive *afir'a*, *hasa* 'seek', reflexive *hasir'a*. Sidaama *r'* (of *-ir' < -id'*) is distinct from plain *r* only as it glottalizes preceding consonants, e.g., *k'ʔna* 'suckle,' reflexive of *k'ana* 'suck'.

A peculiar lexical phenomenon of Ethiopian languages whether Cushitic, Semitic, or Omotic, but perhaps particularly common in HEC, is verb compounds formed by words peculiar to the idioms plus the verbs 'say' for intransitives and 'do' for

Table 3 Ten basic words in five HEC varieties

| Gloss | Burji | Gedeo | Hadiyya | Kambaata | Sidaama |
|----------|----------|--------|---------------|------------|----------------|

| gota (sg.), gotanno 'sheep' | dureessa (sg.), dureeyye 'rich ones' | gaamelakiččo, (sg.), gaamela 'camels' | aburču (sg.), aburrata 'roosters' | hoončo (sg.), hoonna 'juniper trees' |
| hiliččo (sg.), hilaano 'calves' | geerčo (sg.), geeŕre 'old men' | hamašiččo (sg.), hamašša 'snakes' | bezzeečču (sg.), bezzeebeezaa 'stars' | ille (sg.), illubba 'eyes' |
| č'uuwe (sg.), č'uuweenna 'chickens' | reččo (sg.), reŕe 'goats' | kina (sg.), kinnewwa 'stones' | lokkata (sg.), lokaakkata 'feet, legs' | ibiččo (sg.), ibiibe 'lice' |

Table 6 Two sentences in HEC languages

| Gloss | HEC language | Sentence |
|-------------------------------------|--------------|--|
| 'This cow is fat' | Hadiyya | tu saay dilba-tte <i>this.fem cow fat-be.fem</i> |
| | Kambaata | ku saŕo gaana <i>this.masc cow fat</i> |
| | Sidaama | tini saa lowo-te <i>this cow fat/big-be.fem</i> |
| | Gedeo | tinni saa-yy-iččo furda-tt'e <i>this.fem cow-nom-sing fat-be.fem</i> |
| | Burji | ku saay-i gabboo-na <i>this.masc cow-nom fat-be</i> |
| 'I cut (past) meat with this knife' | Hadiyya | maar ka billawi-n mur-ummo <i>meat this.masc knife-with cut-I.past</i> |
| | Kambaata | maala ka-n billawi-n murr-oommi <i>meat this.masc-with knife-with cut-I.past</i> |
| | Sidaama | maala tenné seet'e-nni mur-umm-o <i>meat this.fem knife-with cut-I.past-masc</i> |
| | Gedeo | maala konne šiifi-nni kut-enne <i>meat this.masc knife-with cut-I.past</i> |
| | Burji | maala ta sore-čč-ina mur-anni <i>meat this.fem knife-with-focus cut-I.past</i> |

transitives. Examples with 'say' are Burji *naač'i i* 'smile', Gedeo *dapp'i hiyy-* 'be tight', 'be quiet', Hadiyya *heešš y-* 'stoop', Kambaata *abb y-* 'rise', and Sidaama *beebi y-* 'be quiet'.

Noun Morphology

HEC has a singular ('singulative') as well as plural suffix, the former basically *-č*, or *-iččo* after obstruents. Plural formations are various, sometimes involving internal change, which is perhaps a Cushitic

or Afroasiatic characteristic. Table 5 presents representative examples for all five languages.

The languages generally mark nominatives (and/or definites) with *-i*, but case marking is complex, perhaps under change, and more research is needed on this and others aspects of HEC grammar. Nominative vs. accusative marking has sometimes been considered a postergative phenomenon, as a generalization of the 'ergative' or subject-of-transitive case.

Sidaama (and perhaps other HEC languages to a lesser extent) has a phenomenon of gender-exclusive vocabulary (Anbessa, 1987). By a taboo on words beginning with the first syllable of her father-in-law's name, a woman must circumlocute or substitute words fixed in women's language for this purpose. For example, a woman whose father-in-law's name begins with *ma* would use the word *basara* 'meat' instead of the usual *maala*.

Syntax

HEC syntax may be best presented in brief as in Table 6, which compares in the five HEC languages two sentences, one copular and one with a transitive verb.

Hiligaynon

R D Zorc, Language Research Center, McNeil Technologies Inc., Hyattsville, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Hiligaynon is the fourth largest language of the Philippines, representing approximately 10% of the national population. Its seven million speakers are located throughout Negros Occidental, southeastern Panay, Guimaras Island, and in urban centers of Mindanao (Davao and Zamboanga) and of Palawan (Puerto Princesa). It is a major trade language of the

Western Visayan region (e.g., Antique and Aklan). Ilonggo, its alternate name, originally specified the dialect of Iloilo. It has many dialects with minor variations from town to town. The most distinct are Capiznon (Capiz Province) and Kawayan (south of Bacolod City). It is a member of the Central Bisayan subgroup along with Waray, Masbateño, and Romblomanon. These are, in turn, members of the Bisayan group of Central Philippine languages, including Tagalog and Bikol (Zorc, 1977), all of which are ultimately descended from Proto-Austronesian.

Although legends and fabrications abound (see Scott, 1984), nothing is known historically prior to the Spanish. Alzina recorded that the Hiligaynons of Oton (Panay) traced their origin to Leyte (Kobak, 1969–70: 22), which correlates with the subgrouping.

Table 1 Hiligaynon sound system

| Consonants | | | | |
|-------------|------------|------------------|------------|----------|
| Stops | Labial | Apical | Velar | Glottal |
| voiced | b | d | g | |
| voiceless | p | t | k | ' |

| Affricates | | | | |
| voiced | | (j) [dy] | | |
| voiceless | | (ch) [ts] | | |
| Continuants | | | | |
| liquid | | l | | |
| rhotic | | r | | |
| semivowel | w | y | | |
| Nasals | m | n | ng | |
| Vowels | | | | |
| | Front | Central | Back | |
| High | i | | u | |
| Mid | (e) | | (o) | |
| Low | | a | | |

Table 2 Hiligaynon Pronouns

| Pronoun | Topic | Oblique forms | | Locative |
|------------------|------------------|---------------|--------------------|----------------|
| | | preposed | postposed | |
| I | akó | ákon | -ko / nákon | sa'ákon |
| you [singular] | ikáw / ka | ímo | -mo / nímo | sa'ímo |
| he/she | siyá | íya | niya | sa'íya |
| we [+you / incl] | kitá | áton | -ta / náton | sa'áton |
| we [-you / excl] | kamí | ámon | námon | sa'ámon |
| you [plural] | kamó | ínyo | nínyo | sa'ínyo |
| they | silá | íla | nila | sa'íla |

The basic phonology of Hiligaynon consists of 16 consonants and 3 vowels; accent (stress) is contrastive. Native speakers educated in Spanish and English have an additional three consonants /f, j, ch/ and two vowels /e, o/. Accent (/á, í, ú/ with vowel length) occurs in an open penult. The vowel [o] is an allophone of /u/ in final syllables but is phonemic in loans. Accent predictably falls on a closed penult: *táytay* ‘bridge.’

The glottal stop is written as a hyphen when it appears before another consonant: *bág-o* ‘new,’ *búg-at* ‘heavy,’ *gáb-i* ‘evening.’ It is ignored word-finally in most local publications; linguists have spelled it with *q* or an apostrophe. Accent, which is also not represented in the orthography, is critical in distinguishing words or derivations:

| | |
|------------------------------|-----------------------------------|
| <i>ámo</i> ‘boss’ {Spanish} | <i>amó</i> ‘thus, like that’ |
| <i>sá’og</i> ‘crawl’ | <i>sa’óg</i> ‘wear out by use’ |
| <i>bílin</i> ‘remain, stay’ | <i>bilín</i> ‘leftovers’ |
| <i>pikot</i> ‘mend’ | <i>pikót</i> ‘half-closed (eyes)’ |
| <i>lútu</i> ‘to cook’ | <i>lutú</i> ‘cooked’ |
| <i>túbo</i> ‘pipe’ {Spanish} | <i>tubó</i> ‘sugarcane’ |

Various morphophonemic changes apply in inflection and derivation:

Table 3 Hiligaynon deictics

| | <i>Near me</i> | <i>Near you</i> | <i>Far away</i> |
|-------------|----------------|-----------------|-----------------|
| Topic | iní | iná’ | ató |
| Oblique | siní | siná’ | sádto |
| Locative | dirí | dirá’ | didto |
| Existential | yári | yára’ | yádto |
| Verbal | karí | kará’ | kádto |

Table 4 Hiligaynon verb inflection

| <i>Verbs</i> | <i>Past</i> | <i>Progressive</i> | <i>Contingent</i> | <i>Future</i> | <i>Command</i> |
|---------------|--------------------|---------------------|-------------------|------------------|----------------|
| Active | | | | | |
| Punctual | -um- | | -um- | ma- | mag- |
| Durative | nag- | naga- | mag- | maga- | pag- |
| Distributive | naN- | nagapaN- | maN- | magapaN- | magpaN- |
| Potential | naka- | naka- | maka- | maka- | |
| Passive | | | | | |
| Punctual | -in- | | -(h)on | -(h)on | -a |
| Durative | gin- | gina- | pag – on | paga – on | pag – a |
| Distributive | ginpaN- | ginapaN- | paN – on | paN – on | |
| Potential | na- | na- | ma- | ma- | |
| Instrumental | | | | | |
| Punctual | -in- | | i- | i- | i- |
| Durative | gin- | gina- | i(g)- | iga- | ipag- |
| Distributive | ginpaN – an | ginapaN – an | ipaN – | ipaN- | |
| Potential | (ki)na- | na- | ika- | ika- | |
| Local Passive | | | | | |
| Punctual | -in – an | | -an | -an | -i |
| Durative | gin – an | gina – an | pag – an | paga – an | pag – i |
| Distributive | ginpaN – an | ginapaN – an | paN – an | paN – an | |
| Potential | na – an | na – an | ma – an | ma – an | |

Intervocalic /d/ > [-r-]: *báyad* ‘pay’ > *bayáran* ‘be paid’

With Spanish verbs, final /r/ changes to [-h-]: *probár* ‘try’ > *probabán* ‘be tried.’ Nasal final prefixes such as the distributive pang- yield nasal assimilation and consonant loss:

batí ‘hear’ > *památi* ‘listen to,’ *tíndog* ‘stand’ > *panindúgan* ‘position,’ *káhoy* ‘wood’ > *pangahóy* ‘gather firewood’

Vowel loss is common with suffixation:

inóm ‘drink’ > *ímnon* ‘be drunk,’ *sunúd* ‘follow’ > *súndun* ‘be followed’

Grammatical relations are shown by particles (*kag* ‘and,’ *na* ‘now, already,’ *mga* plural, *man* ‘also, too,’ *lang* ‘only’) or affixes: prefixes (*pag-* temporal verb, *ka-* companion noun), infixes (*-in-* passive past), suffixes (*-un* direct passive, *-an* local passive), or circumfixes (*ka* – an abstract noun, *gina* – an local passive progressive).

Nominals are inflected for case: common nouns (marked by *ang* topic, *sing* indefinite oblique, *sang* definite oblique, *sa* locative) or personal names (*si* topic, *ni* oblique, *kay* locative; plural: *sanday* topic, *nanday* oblique, *kanday* locative). Demonstratives orient to person, locus, time, or anaphora. They have existential and verbal inflections.

Verbs are inflected for four voices (active, passive, instrumental, local), four tenses (past, progressive, contingent, future), three aspects (punctual,

durative, distributive), and three moods (factual, command, potential).

Unmarked word order is V-S-O (verb-subject-object); because nominal constituents are case marked, word order can be free. Initial position by any nonverb usually serves to highlight or contrast.

- (1) kahápon si Hwaníng nag'abút
yesterday TOP Johnny past active-arrive
'It was yesterday that Johnny arrived'

Two other markers are: *nga* (-*ng* after vowels), a ligature uniting nouns with other constituents and *ka* after numerals.

- (2) matahúm nga babáyi
pretty LINK woman
'a pretty lady'
- (3) ma'áyo-*ng* ága
ADJ-good-LINK morning
'good morning'
- (4) duhá ka simána
two NUM week
'two weeks'

There are three negatives: *ayáw* 'don't!' IMPERATIVE, *walá'* + TOPIC OR *waláy* + OBJ 'none' EXISTENTIAL, 'did not' PAST OR 'doesn't' PRESENT, and *díli'* 'will not' FUTURE OR PREDICATIVE 'is not so'; a fourth, *bukún*, negates nouns and adjectives in some dialect areas.

- (5) Walá' kitá sing baláy
NEG-EXIS we (incl) OBL house
'We have no house'
- (6) Waláy baláy kitá
NEG-EXIS house we (incl)
'We have no house'
- (7) díli' siyá manggaránun
bukún siyá manggaránun
neg-pred he/she rich
'He is not rich'

The Indo-Europeans came to India from the north-west about 4000 years ago. In India they called themselves *Arya*, 'noble honorable,' and called their country *Aryavarta*, 'abode of the noble.' Because of

this ancient reference, today their language is known as *Indo-Aryan*. In regard to its structure and its continuity, Indo-Aryan can be divided into three periods: Old Indo-Aryan, Middle Indo-Aryan, and Modern Indo-Aryan.

Old Indo-Aryan is mostly represented by Sanskrit, which includes both Vedic and Classical Sanskrit. Middle Indo-Aryan is represented by three successive stages of development: Pali, Prakrit, and Apabhraṃsha.

Pali is the language of the canonical writings of the Theravada school of Buddhism. The various dialects recorded in the inscriptions of Ashoka (c. 250 B.C.) and other early inscriptions also belong to this first period. Prakrit, found mainly in drama and in the religious writings of the Jains, represents the second stage of development. Apabhraṃśa, though known from texts of the 10th century A.D., was undoubtedly formed prior to this date. It represents the final stage of Middle Indo-Aryan. Hindi and modern Indo-Aryan languages, such as Assamese, Bengali, Gujarati, Kashmiri, Marathi, Nepali, Oriya, Panjabi, Sindhi, Sinhalese, and others, can be dated to about the end of the 10th century A.D. From then on, their development shows a gradual transformation into their present form.

As an Indo-Aryan language, Hindi is a branch of the Indo-European family of languages, and thus is a distant cousin of English, French, Greek, Russian, Spanish, and other Indo-European languages. The name 'Hindi' is a Persian word referring to the people who lived in the Sindhu river area. Later the word was used as a name for the language spoken around Delhi. This language has been called by other names, such as Hindavi, Hindui, and Hindustani. Hindi and Urdu are variants of the same language, which, in its common spoken form, used to be called Hindustani. Hindi is written in the Devanagari script, derived from one of the scripts used to write Sanskrit, while Urdu is written in a modified version of the Persian script, itself derived from the Arabic script. Along with Urdu, Hindi has been the dominant language of modern India and has had an impact on other Aryan and non-Aryan languages spoken in the country. Today it is spoken in most of India. In terms of total number of speakers, it ranks third in the world after Chinese and English. The percentage of the population of India that speaks Hindi is growing, and ranges upwards from 45%. Large language communities outside of India, including Nepal, Pakistan, Singapore, Malaysia, Burma, Mauritius, Trinidad, Guyana, and several countries in eastern and southern Africa also speak Hindi. Furthermore, Hindi is taught at many universities in the United States, Russia, Britain, and the Near East, as well as in other parts of Asia. Today Hindi is a symbol of Indian unity and nationality. It is the national language of India and the official state language of Bihar, Delhi, Haryana, Himachal Pradesh, Madhya Pradesh, Rajasthan, and Uttar Pradesh. Since Hindi has the largest number of speakers of any language in India, it is the medium of a great number of political, social, and cultural activities. Consequently, the economic and political influence of Hindi in India cannot be overlooked.

There are regional differences in Hindi, affected by the other languages that people speak. Within each regional variety of Hindi, there is considerable variation in speech according to the education and social standing of the speakers. This creates social dialects. Naturally, educated speech has more prestige and is thus embraced by government agencies, learned professions, political parties, the media, and institutions that attempt to communicate beyond their regional boundaries. It is this educated Hindi that has acquired the status of standard Hindi.

Underlying all these varieties, however, is a nucleus or common core shared by all speakers of Hindi. Unlike the other major modern Indo-Aryan and Dravidian languages of India, Hindi is not exclusively associated with any one region or province. Although it is the home language of a relatively small number of speakers (in Haryana, western Uttar Pradesh, north-eastern Madhya Pradesh, and portions of eastern Rajasthan), Hindi in its various forms is a spoken and written language of practically all of northern India. It is also the most commonly understood Aryan language in the Dravidian south. Associated with all the different varieties of Hindi are the forms of formal and informal Hindi. The language used when giving instructions to a construction worker varies from the language used when discussing politics or poetry. Typically, the switch involves utilizing a particular set of lexical items habitually used for handling the topic in question. This tendency has produced informal Hindi, the language of everyday speech, which includes instructions to servants, waiters, workmen, clerks, etc., and formal Hindi, the language of films, newspapers, news magazines, education, and literature. Formal Hindi is often marked by an abundance of words borrowed from Sanskrit. When the majority of borrowing is from Persian and Arabic sources instead of from Sanskrit, the language becomes formal Urdu.

Informal Hindi is usually used in speaking to children, and thus is acquired by children as their mother tongue. Children are often exposed to formal Hindi through their parents, but the actual learning of this variety is accomplished through formal education. In areas where the native language is different from Hindi, most speakers acquire Hindi through formal education. As stated earlier, Hindi spoken in these areas bears the influence of the native language, including elements from the native lexicon and phonology.

The sound systems of formal and informal Hindi constitute a single phonological system shared by both varieties; there are only a few phonemes and phonological rules found exclusively in formal or in informal Hindi. Like any language, the lexicon of

Hindi consists of native words that have organically evolved from an earlier Indo-Aryan form and non-native words that have been borrowed from other languages. Sanskrit has been the primary source for borrowing in Hindi. After Sanskrit come Persian, Arabic, English, Turkish, and Portuguese borrowings, in that order. There are also a number of Dravidian words in Hindi, but most of them have come through Sanskrit. Hindi has also borrowed words from other modern Indo-Aryan languages, such as Bengali, Gujarati, Marathi, and Punjabi. As a result of these borrowings, the Hindi sound system has a large number of consonants and vowels, as shown in Table 1.

Like many Indo-European languages, Hindi has parts of speeches such as noun and pronoun, verb, adjective, adverb, postposition, and conjunction. Hindi nouns have two genders, masculine and feminine. Though these categories are largely conventional and do not necessarily correspond to natural gender, there is some element of semantic consistency for many nouns and their gender, which depend on sex, size, shape, and degree of abstraction. However, many gender affiliations remain arbitrary.

The masculine gender nouns are associated with two different sets of stems and inflections and thus fall into two classes, *ā-stem*, such as g^hoṛā} ‘horse,’ and *non-ā-stem* nouns, such as nāg ‘snake.’ The feminine gender nouns, likewise, are associated with two different sets of stems and inflections and thus form two classes: feminine *i-stem* nouns such as nānī ‘maternal grandmother,’ and *non-i-stem* nouns, such as bahū ‘bride.’ Hindi nouns also occur in various cases represented by two inflected forms of nouns: a *direct form*, which represents the function of a subject or a direct object and an *oblique form* with its postposition, which represents all other syntactic functions or cases. It is actually the postposition that indicates the particular case. An oblique form of a noun with the postposition kō also functions as a direct or indirect object (accusative or dative). When a transitive verb occurs in the *perfective*, the special postposition nē occurs directly after the subject, causing it to appear in its oblique form. This subject with nē is said to be in *ergative* case. In *ergative* constructions the verb agrees in number and gender with its direct object if this occurs in its direct form, that is, without any postposition; otherwise the verb, occurring in the

Table 1

| | Front | | | Back unrounded | | | Back rounded | | |
| Hindi vowels | Oral | | Nasal | Oral | | Nasal | Oral | | Nasal |
| high short | i | | ĩ | | | | u | | u |
| high long | ī | | ī̃ | | | | ū | | ū |
| mid short | e | | ẽ | | | | o | | o |
| mid long | ē | | ẽ | | a | â | ō | | ō̃ |
| low short | | | | | ā | ā̃ | | | |
| low long | ē | | ẽ | | | | õ | | õ̃ |

masculine singular form, agrees with neither the subject nor the object. The non-ergative types of sentences in Hindi are the usual nominative-accusative type, in which the verb agrees with the subject in number and gender.

Hindi verbs are associated with the categories of *tense* (present, past, and future), *aspect*, (imperfective, perfective, and continuous), and *mood* (indicative, subjunctive, and imperative). These categories encode grammatical aspects of meaning, some quite specific and some relatively vague or generic.

In Hindi, in addition to *derivation*, by which new words are formed from existing words through affixation, for example, *namak* 'salt,' *namkīn* 'salty,' new words are also formed from existing words by processes known as *compounding*, for example, *lāl pagaṛī* 'red turban: a policeman,' and *reduplication*. To express the ideas of *continuance distribution*, *variety*, *exclusion*, or *emphasis*, words are often completely or partially reduplicated in Hindi, for example, *bah-bah kar* 'floating floating down: repeatedly floating,' *g^har-g^har* 'house-house: each house,' *dēṣ-dēṣ* 'country-country: various countries,' *garam-garam* 'hot-hot: real hot,' and *badām-badām* 'almonds-almonds: only almonds.'

As it can be seen from the following examples, Hindi is an SOV (Subject-Object-Verb) language and sentences in Hindi show a threefold agreement involving the inflectional categories of number, gender, person, and case. These agreements are (a) between a modifier (adjective, adjective participle, and genitive attributive) and the noun it modifies, for example, *baṛā g^hōṛā* 'the big horse,' *baṛē g^hōṛē*

'the big horses,' *baṛī g^hōṛī* 'the big mare'; (b) between a predicative adjective and its subject, for example, *(g^hōṛā baṛā hæ* 'the horse is big,' *g^hōṛē baṛe hæ*) 'the horses are big,' *g^hōṛī baṛī hæ* 'the mare is big'; and (c) between a finite or main verb with its subject or object noun or pronoun, for example, *mē nē g^hōṛā xarīdā* 'I-ergative hors-masculine bought-masculine: I bought a horse,' *mē nē g^hōṛī xarīdī* 'I-ergative mare-feminine bought-feminine: I bought a mare,' *mē dōṛā* 'I-masculine ran masculine,' *tum dōṛē* 'you-masculine ran masculine,' *tum dōṛī* 'you-feminine anemone.'

Hindustani

H Dua, Central Institute of Indian Languages, Mysore, India

© 2006 Elsevier Ltd. All rights reserved.

Hindustani is a Central Indo-Aryan language based on Khari Boli (Khari Boli). Its origin, development, and function reflect the dynamics of the sociolinguistic contact situation from which it emerged as a colloquial speech. It is inextricably linked with the emergence and standardization of Urdu and Hindi. The linguistic relationship among Hindustani, Urdu, and Hindi highlights the theoretical and empirical problems of linguistic analysis and description. It also

reveals the politics of language conflict and identity in the complex sociopolitical and multilingual situation of India.

Origin and Development

Hindustani as a colloquial speech developed over almost seven centuries from 1100 to 1800. The Muslims conquered northern India from the 10th to the 13th centuries and settled down in the country, bringing with them their Persian language and culture. This mixing of cultures provided the contact situation for the emergence of Hindustani as a lingua franca. During this period, the literary language Apabhramṣa seemed to be in a state of transition

from Middle Indo-Aryan to the New Indo-Aryan stage. Some elements of early Hindustani appear in compositions of the saints of Nath Panth. However, the distinct form of the lingua franca Hindustani appears in the writings of Amir Khusro (1253–1325), who called it Hindwi. Chatterji (1960) argued that the term ‘Hindustani’ came to be used at the close of the 17th century. J.J. Ketelaer is said to have written the first European grammar of Hindustani in Dutch in 1715.

During the early stage of language contact, Hindustani showed a great deal of mixing of dialects. In particular, the western dialect group of northern India – Braj Bhasha, Bangaru (Haryanvi), and to some extent eastern Punjabi – formed the basis of the vernacular Hindustani. The Perso-Arabic words were also used by traders, religious men, Indian Muslim nobles, and common people. It needs to be emphasized that the Khari Boli base of Hindustani was firmly established only in the 18th century. It is also important to note that no long and connected specimen of the language is available during the period 1200–1650 for reconstructing its continuous history, except *Bikat Kahani* by Afzal, which appeared 300 years after Khusro.

The next important phase in the development of Hindustani is seen in the Muslim Sultanates of the Deccan by the end of the 14th century. In the 17th century, Hindustani flourished as a literary language of the North Indian Muslims who settled in the Deccan. It is referred to as Dakhini Hindi or Urdu. Although it shows some elements of local languages, such as Kannada and Telugu, it clearly attests to the source dialects of Panjabi and Haryanvi. Furthermore, the literary works produced in Dakhini or Hindustani were written in the Perso-Arabic script, which “fixed the orientation of the language,” though Hindustani retained its indigenous character (Chatterji, 1960). The use of the Perso-Arabic script had serious implications for the development of Hindustani in the late 18th and 19th centuries.

The development of Hindustani in North India lagged behind its use as a literary language in the Deccan. One of the reasons for this was the recognition of Persian as an official and court language and its acceptance by the North Indian elites and court nobles. Second, Braj Bhasha flourished as a literary language there. It was recognized by the Mughul emperor Akbar, and his courtier Khan Khanan Rahim used it for his poetic compositions. Though after Khusro an early form of Hindustani can be found in the poetry of Kabir and other religious preachers and saints, it was not cultivated as a literary language. Furthermore, Hindustani was spoken among the nobles at Delhi and Agra and by Moghul emperors

from Akbar onward at home. However, it was not taken up seriously or written in the Perso-Arabic script in North India as in the Deccan.

It was only after Wali, a poet of Dakhini, arrived in Delhi that Hindustani began to develop as a literary language in the North. Wali used what is known as Rekhta/Hindi and showed that it was capable of great poetry. Rekhta means ‘scattered’ and implies that it had not yet so much been Persianized as happened later. It is known as the earliest form of Urdu-Hindustani poetical speech. Urdu as a language name occurs for the first time in 1776 in a couplet by the poet Mashafi (1750–1824). However, the use of Urdu referring to camp, court, or city (Zaban-e-Urdu or Zaban-e-Urdu-e-Shahi or Zaban-e-Urdu-e-Mualla) had been current since 1560.

After Wali, such stalwarts as Khan Arzu (1689–1756), Shah Hatim (1699–1781), and Mazhar Janejani (1700–1781) made conscious efforts to Persianize Hindustani and weed out the Braj Bhasha or indigenous elements from it. Thus, Urdu-Hindustani was in a developed state by the end of the 18th century. John Gilchrist produced the first grammar of Hindustani. He justified the usage of the term ‘Hindustani’ for the language, as well as for its speakers. Insha Allah Khan Insha’s *Darya-e-Latafat (The river of elegance, 1807)* presented an early linguistic study of the dialects of Delhi and Lucknow. There was also a tendency to identify Urdu-Hindustani largely as a Muslim language and Hindi/Hindwi as a language of the Hindus.

However, it is important to note two points about the development of Hindustani at the beginning of the 19th century. First, after the establishment of Fort William College by the British, prose began to be written in the emergent Khari Boli that formed the basis of Hindustani. Urdu-Hindustani and Hindi developed as two distinct styles of prose produced by the writers associated with Fort William College. Chatterji (1960: 211–212) rightly remarked that Hindustani “came out into the modern world as a vehicle of prose in its twin form, High Hindi and Urdu, about 1800.” Second, the process of identification of Urdu with Muslim and of Hindi with Hindus continued during the entire 19th century and the first half of the 20th century. The development and standardization of both Urdu and Hindi had sociopolitical implications with regard to Hindustani (see Urdu and Hindi).

Forms of Hindustani

It is quite clear that the evolution of Hindustani was spread over seven centuries from 1100–1800. Before it was firmly established on the Khari Boli spoken in

the surrounding region of Delhi, it was known by several names, such as Hindwi/Hindi, Dehalvi, and Rekhta, and was made up of several western dialects mixed together. The two forms of High Hindi and Urdu that emerged by 1800 may be described as a standardization of the grammar of the “Vernacular Hindustani” dialect (Chatterji, 1960: 169). The Perso-Arabic script and Perso-Arabic vocabulary of Urdu distinguish it from High Hindi, which uses Devanagari script and Sanskrit vocabulary.

The third form of Hindustani represents the basic Khari Boli and may be considered as Hindustani proper. It holds a balance in its vocabulary as it contains only those Persian and Sanskrit words that have been fully assimilated with the structure of its *tadbhav* or native words. According to Chatterji (1960), this form of Hindustani represents colloquial speech and can be terse as well as elaborate. It is simple in grammatical structure and precise in its sounds. In its spoken colloquial form, it is used for communication by a large number of speakers in India, Pakistan, and other parts of the world. It may therefore be considered, according to Chatterji (1960), as one of the great languages of the world.

Three other forms of Hindustani may be recognized, though they show a great deal of mixture from the local dialects and simplification of grammar. First, speakers of the Western Uttar Pradesh, Eastern Panjab, Haryana, and Rajasthan may speak what may be referred to as Vernacular Hindustani with their dialect accent or other features. They may be considered, as Kelkar (1968) maintained, to be ‘adherent’ speakers of Hindi and Urdu who easily ascend the scale of culture and education and accept them as super-posed languages. Second, it is possible to recognize what may be referred to as Bazaar Hindustani spoken by the masses in market situations across the country. This form may show a simplification of grammatical gender and mixing of local dialects, depending upon the region and the language contact situation. Finally, the Dakhini spoken in Karnataka, Andhra Pradesh, and other regions in the South may be considered to be a form of Hindustani. Though it has a distinctive grammatical structure, in vocabulary it shows affinity with Hindustani. It is spoken mainly at home and shows some local literary activity. However, the Dakhini speakers regard standard Urdu as the super-posed variety and have accepted it for all formal purposes.

Hindustani as a Symbol of Unity

The process of the identification of Urdu and Hindi with Muslims and Hindus, respectively, that started in the early 19th century reached its culmination in

the first quarter of the 20th century. The formation of voluntary language associations for these languages and the development of both Muslim and Hindu revivalism strengthened this identification. This congruence of linguistic and religious identities not only increased language conflict between Urdu and Hindi but also led to the expanded use of Hindustani. In the wake of the Indian independence movement, Gandhi saw the potential for the use of Urdu and Hindi to produce political conflict and so promoted Hindustani as a symbol of unity. In 1925, he persuaded the Indian National Congress to accept Hindustani as the official language for its proceedings. Under the influence of Gandhi, many national leaders emphasized the role of Hindustani not only for communal harmony between Muslims and Hindus but also for bringing about national unity. In 1937, Nehru recognized the potential of Hindustani to spread all over the country and declared that it should be officially recognized as an all-India language.

However, the acceptance and rapid spread of Hindustani at both regional and national levels failed to bring about any fundamental change in the position of the protagonists of Urdu and Hindi. The divergence between Urdu and Hindi languages, on the one hand, and the congruence of linguistic and religious identities, on the other, became so salient politically in the process of nationalism and nation formation that Hindustani failed as a symbol of unity. Das Gupta (1970:57) pointed out that the identification of national, linguistic, and religious solidarity was “more integral and pervasive” in the case of Muslims than with the Hindus.

After it became clear that India would be partitioned along religious lines, the question of Hindustani took a different turn in the fourth Constituent Assembly session in July, 1947. The persuasiveness of Hindustani as a national language had lost much of its appeal. The supporters of Hindi saw it as “a symbol of appeasement of the Muslim concern for Urdu” (Das Gupta, 1970: 130–131). They gave up their support for Hindustani and demanded that Hindi alone, written in the Devanagari script, be accepted as the official language of India. The acceptance of Hindi as the official language of India in 1948 gave the final blow to Hindustani as a symbol of unity. However, Hindi lost the overall support that Hindustani had gained at the national level in the wake of the independence movement. Recent debate on the failure of Hindustani as symbol of unity and a common language of both Urdu and Hindi speakers throws light on politics of nationalism, language engineering and acrimony between the two communities blaming one another for this (Rai, 2000; Hasnain and Rajyashree, 2004; Trivedi, 2004).

Problems of Linguistic Description

The problems of linguistic description of Hindustani are inextricably involved with those of Hindi and Urdu. Linguists, historiographers of Hindi and Urdu, and scholars of literature and textual criticism have mainly tried to grapple with the linguistic description of Hindi and Urdu, as is evident from the phonological and grammatical studies of those languages done during the last half-century. Kelkar (1968:1) has argued that contemporary standard Hindi-Urdu “consists of a gamut of integrated variation that need to be studied together – within a single frame work.” However, he concentrated mainly on standard Hindi-Urdu and considered Hindustani as “relegated to history” (Kelkar, 1968: 9), though he included it under the Hindi-Urdu continuum of styles and took care of regional color to a certain extent.

Though the linguistic description of Hindustani has not drawn the attention of linguists for historical reasons, it raises several theoretical and empirical issues, which are relevant for linguistic analysis of both Hindi-Urdu and Hindustani. First, in addition to the dictionary of Hindustani written by John Gilchrist at the end of the 18th century, several other dictionaries were published in the late 19th century. It would be relevant to explore the range of borrowed Perso-Arabic words included in the dictionaries and to find out how far they have been assimilated or have become current in present-day colloquial speech. Second, the works of several writers have been published in both Urdu and Hindi and have been claimed equally as Hindi-Urdu writers. Prem Chand occupies an important position in this respect. It would be worthwhile to explore the distinctive alternative use of Sanskrit or Persian words in Hindi and Urdu versions of his works and to study whether the common vocabulary comprises native or *tadbhava* or fully assimilated Sanskrit and Persian words. Third, a number of textbooks have been published for teaching standard Hindi and Urdu to foreigners. Although they reflect common core grammar and distinctive characteristics of the respective languages, it would be relevant to study the range of Sanskrit and Perso-Arabic words that form an integral component of these languages. Doing so would help determine how far these textbooks support the common base of colloquial Hindustani. Fourth, it would be necessary to explore to what extent the linguistic analysis of Hindi and Urdu is based on the spoken data. Only this type of analysis can show the extent to which they differ in the choice of Sanskrit and Persian words and to what

extent these words are common in both the spoken varieties and represent the colloquial Hindustani.

Finally, some studies show lexical differences between Hindi and Urdu and question the notion that they are two distinct languages. They raise significant issues related to the processes of convergence and divergence, the difficulty of drawing boundaries between Sanskrit and Perso-Arabic words assimilated in both Hindi and Urdu, and the implications of choice for comprehension. These issues can be explored only on the basis of a large corpus. A corpus of 3 million words is now available for both Hindi and Urdu at the Central Institute of Indian Languages in Mysore. On the basis of a comprehensive sample, it would be possible to explore in what kinds of genres/texts both Hindi and Urdu show a common base of colloquial Hindustani and how they differ from one another, on the one hand, and from Hindustani, on the other, in terms of what kinds of Sanskrit and Perso-Arabic words they use. In short, the research on the issues raised above can bring an understanding of the basic linguistic structure of Hindustani and the superimposed structure of Hindi and Urdu that is characteristic of both the spoken and written styles.

Hiri Motu

L Todd, University of Ulster, Coleraine, Northern Ireland

© 1994 Elsevier Ltd. All rights reserved.

Hiri Motu is a pidginized form of the Papuan language, Motu. It developed as a trade language between speakers of Austronesian and non-Austronesian languages. (*Hiri* is the Motu word for a trading expedition.) Hiri Motu almost certainly arose prior to European contact, but it has spread rapidly in the twentieth century, partly because of an increase in trading between Papuans and non-Papuans, and also partly because, under the name of *Police Motu*, it became the lingua franca of the multilingual police force, when Papua became an Australian Protectorate after World War I. It is an official language of Papua New Guinea, is used in politics and administration in the Papuan section of the country, and is spoken by about 200 000 people. It is regularly employed in the media, and has a standardized orthography, taken over from Motu, which was adopted in the nineteenth century as a church language.

Hiri Motu speakers use 5 vowel sounds, all of which can be combined, and 12 consonants /p, b, t, d, k, g, m, n, v, l/r, s, h/. All indigenous words end in a vowel, *dubu* 'church,' *turana* 'friend,' and the consonants /l/ and /r/ are interchangeable for the majority of speakers.

The similarity between Hiri Motu and other Pacific languages may be illustrated by comparing a few items of Hiri Motu's vocabulary with their cognates in Hawaiian (1):

| Hawaiian | Hiri Motu | English | (1) |
|---------------|---------------|----------|-----|
| <i>kalo</i> | <i>taro</i> | 'taro' | |
| <i>lau</i> | <i>raurau</i> | 'leaf' | |
| <i>wahine</i> | <i>hahine</i> | 'woman.' | |

Words which are borrowed from English are restructured to suit Hiri Motu's phonology, *besini* < *basin*, *botolo* < *bottle*, *sopu* < *soap*, *tosi* < *torch*.

For Papuans, sentence structure usually follows the pattern for Motu. It is OSV when the subject is a pronoun (2):

Turana ia itaia. 'friend he see' (2)
= 'He sees a friend.'

or a SOP when the subject is a noun phrase (3):

Kuku ese aniani ia nadu. 'cook + (3)
particular food he boil'
= 'The cook boils the food.'

Adjectives follow nouns (4):

hanua ta *hanua toi* (4)
'one village' 'three villages.'

Time is either implied from the context or indicated by means of auxiliaries (5):

Au do lau utua. 'tree future I cut' (5)
= 'I'll cut the tree.'
Au lau utua vadaeni. 'tree I cut past'
= 'I've cut the tree.'

The omnipurpose postposition *dekenai* follows the noun (6):

dala dekenai 'on the road' (6)
dubu dekenai 'to church'
ruma dekenai 'in the house'

Europeans and New Guinea speakers tend to impose the grammatical patterns of their mother tongues or those of Tok Pisin on Hiri Motu. This is particularly true with regard to word order, which is SPO for many.

The government of Papua New Guinea tends to promote Tok Pisin and Hiri Motu equally, partly to avoid ethnic tensions. Before unification and independence, which occurred on September 16, 1975, Tok Pisin was most frequently used by New Guineans and Hiri Motu by Papuans.

Hittite

J G Macqueen

© 2006 Elsevier Ltd. All rights reserved.

Hittite is the name now given – its users probably called it Nesite – to the Indo-European language employed in the north-central area of Anatolia (modern Turkey) during much of the second millennium B.C. Large numbers of texts have been excavated, principally at the site of Boğazköy (Boğazkale), the ancient Hattusas, capital of the Hittite kingdom. As evidence for the language comes entirely from documentary sources, the number of speakers cannot be estimated; but it is probable that it was also the spoken vernacular of the area, at least from ca. 1700 to ca. 1300 B.C. During that period, it shows normal signs of linguistic change, but there is evidence, in the absence of continued change and in the increasing presence in the texts of forms which are Luwian in origin, to suggest that after ca. 1300 B.C. it had become a ‘dead’ language, its use confined to the Hittite chancellery, and that its more southerly relative replaced it as a vernacular.

Phonology

Hittite is written in a local variety of the Mesopotamian cuneiform script. This script, being basically unsuited to the language, makes full understanding of many phonetic features (e.g., vowel length; voiced versus voiceless stops) difficult. The vowel system shows *a* (which reflects both I-E *a* and I-E *o*), *e* and *i* (which are distinguished in earlier texts, but may well in later ones represent a single phoneme), and *u*. There are four orders of stops (labial, dental, velar, labio-velar), and lack of voice is often indicated by gemination in spelling, although the converse is by no means always the case. Hittite is unique among Indo-European languages in preserving the continuants known as laryngeals. The number and precise nature of these is still the subject of debate; but both voiced and voiceless varieties can be detected, and in some cases they can be seen to give *a*- or *o*-coloration to an original *e* vowel.

Morphology

Nominal morphology is characterized by the loss of both the feminine gender and the dual number. Earlier texts show a full range of case forms in the singular, although in later texts dative and locative have merged. In the plural, the range of case forms is much reduced. In noun formation, a striking

characteristic is the preservation in productive use of heteroclitic *r/n* stem neuters and of action nouns in *-sar*, *-tar*, and *-warl-mar*.

The verbal system shows two tenses (present and preterite), two moods (indicative and imperative), and two voices (active and medio-passive), together with two infinitives, a supine, a verbal noun, and a participle. The present indicative of the medio-passive is often marked by a suffixed *-ri* which links it to the medio-passive in Celtic, Italic, and Tocharian. There are also two conjugations (the *mi*- conjugation and the *hi*- conjugation), the first of which corresponds to the I-E present while the second is perfect in origin with the addition of a present marker.

Syntax

Syntax is on the whole simple and straightforward, and corresponds in general to that of the archaic forms of other I-E languages. Characteristic of Hittite is a liking for ‘chains’ of particles and enclitic pronouns placed at the beginning of a sentence or clause. Another interesting feature is the ‘quasiergative’ construction, in which a neuter subject with a transitive verb is not permitted, and so an original ablative case is reinterpreted as a nominative.

Example

A Hittite sentence showing some of the above features is (in syllabic transcription)

- (1) *an-da-ma-za pa-aḫ-ḫu-u-e-na-aš-ša u-da-ni-i
me-ik-ki na-aḫ-ḫa-an-te-eš e-eš-tin,*

to be read

- (2) *anda-ma-tsa pahhwenas-a uddani mekki
nabhantes esten*

and translated

- (3) ‘moreover, on the subject of fire also be greatly
fearful,’

In this sentence, *anda* acts as an adverb of transition, but is ultimately linked to the form seen in Greek *éndon*, Old Latin *endo*; *ma* is a connective particle; *tsa* is a reflexive particle; *pahhwenas* is the genitive of *pahhur*, an *r/n* stem noun cognate with Greek *pûr* and showing the presence of an original laryngeal; *-a* is an emphasizing particle; *uddani* is the dative-locative of another *r/n* stem noun with a basic meaning of ‘word’ and a possible ultimate connection with an I-E verb of saying (cf. Old Welsh *dy-wedut*); *mekki* is an adverbial neuter singular of an adverb

meaning ‘much, many’ (cf. Skt *mab-*, Gk *mégas*); *nabhantes* is the participle (cf. Latin *amans*, *amantis*) of a verb perhaps cognate with Old Irish *nar*, ‘timid’; and *esten* is the 2nd pl imperative of the I-E verb for ‘to be.’

Records in the Hittite language cease with the collapse of Hittite power ca. 1180 B.C. There are signs that the language of classical Lydia is a later relative; but the precise relationship is obscure.

Hmong-Mien Languages

M Ratliff, Wayne State University, Detroit, MI, USA

© 1994 Elsevier Ltd. All rights reserved.

The Hmong–Mien (= Miao–Yao) language family comprises some 30–40 languages spoken primarily in southwestern China, but also in northern Vietnam, Laos, and Thailand. Three main branches have been identified: Hmongic (= Miao), an internally diverse subfamily, including among others the languages Hmong, Bunu, Hmu, and Qo Xiong; Mienic (= Yao), a smaller and less diverse subfamily, including Mien and Mun; and Ho Nte (= She), consisting of the Ho Nte language alone. Further research on lesser-known members of the family may lead to the identification of more branches. The family designation *Miao–Yao* is of Chinese origin, and represents an ethnic classification rather than a purely linguistic one. Primarily for this reason, many Western scholars have adopted the name *Hmong–Mien* to refer to this language family. Genetic relationships to Sino–Tibetan, Austro–Tai, and Austric have been proposed. Due to typological similarities shared by member languages of the four main families represented in Southeast Asia (Sino–Tibetan, Hmong–Mien, Tai–Kadai, and Mon–Khmer) and contact-induced borrowings, however, it is difficult to establish the distant relations of the family with confidence.

The 1982 census in China reported 4.5 million speakers of Hmongic languages and 750 000 speakers of Mienic languages (only approximately 1000 speakers of Ho Nte live in Guangdong province near Hong Kong). They inhabit Guizhou, Guangxi, Hunan, and Yunnan provinces, and have a lesser presence in Sichuan, Guangdong, Hubei, and Jiangxi provinces and the island of Hainan. From the early nineteenth century through the early twentieth century, speakers of the Hmong, Mien, and Mun languages

moved in waves into northern Southeast Asia under pressure from the expanding Han population. The ratio of Hmong–Mien speakers in China to those in northern Southeast Asia is now approximately 5:1. Finally, there was further displacement of tens of thousands of Southeast Asian Hmong and Mien following the end of the Indochinese war in the mid-1970s, primarily to the USA, France/French Guiana, and Australia.

Speakers of Hmongic and Mienic languages have long been dominated by speakers of Chinese. There are consequently typological similarities between members of the two families. Hmong–Mien languages have monosyllabic morphemes, which occur freely or in transparent compounds, and very little affixal morphology. They are characterized by the presence of numeral classifiers, serial verb constructions, zero anaphora, expressives (ideophones), and sentence particles expressing a variety of pragmatic functions. All the languages are tone languages, some with world-record complexity: Shidongkou Hmu (= Black Miao) has been reported to have five level tones, for example, and Longmo and Zongdi Hmong each have 12 tonal contrasts. Hmongic languages are characterized by extremely rich initial consonantism (including retroflex and uvular places of articulation; prenasalized, aspirated, and glottalized stops; voiceless sonorants) and impoverished final consonantism, whereas Mienic languages are characterized by up to six consonant contrasts syllable-finally (-m, -n, -ŋ, -p, -t, -k), a rich system for the area, and correspondingly fewer initial contrasts.

Hokan Languages

T Kaufman, University of Pittsburgh,
Forest Hills, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

History of Scholarship

The Hokan Hypothesis

The Hokan hypothesis (the hypothesis that the Hokan languages are a genetic group descending from a common protolanguage) was the result of a taxonomically-motivated attempt in 1912–1913 by Roland P. Dixon and Alfred Louis Kroeber to deal with the very large number of apparently distinct genetic groupings of languages (according to John Wesley Powell's 1890 classification) known for aboriginal California – large in comparison with other parts of North America. Dixon and Kroeber, who had moderate amounts of (phonologically not very accurate) data from, and moderate amounts of familiarity with, a large number of California languages, felt that by looking at all the languages panoramically and grouping them by overall shared lexical similarities, a set of groupings could be achieved that might as well be viewed as genetic. This exercise yielded two primary sets of languages that Dixon and Kroeber labeled Penutian and Hokan, as well as some ungrouped languages. Penutian included Yokutsan (Yokuts), Miwokan, Costanoan, Wintuan (Wintu), and Maiduan; Hokan included Karuk (Karak), Shastan, Achumawi-Atsugewi (Achumawi), Pomoan (Pomo, Southeastern), Yanan (Yana), Esalen (Esselen), Salina (Salinan), Washu (Washo), and Yuman (Dixon and Kroeber, 1913a, 1913b).

Additions to the Hokan 'Core'

Later Kroeber added Seri and Chontal to Hokan (Kroeber, 1915). He (?Sapir) misguidedly tried to add Chumashan (Chumash) to Hokan. Edward Sapir, the most able American linguist between 1905 and 1925, who had done doctoral research on Takelma, added Takelma, Klamath (Klamath-Madoc), Sahaptian (Sahaptin), Alsea, Kusan (Coos), Chinookan (Chinook), Tsimshian, and Sayusla (Siuslaw) to Penutian. He added Pajalat, Yeme*, and Yue* to Hokan, but his efforts at adding Karankawe were misguided. He misguidedly tried to add Sutiaba to Hokan. In 1953, Greenberg and Swadesh added Tol to Hokan.

Hokan as a Superstock or Phylum

When originally proposed, the Hokan and Penutian hypotheses were not directly comparable to hypotheses of the order of Algonkian or Yuta-Nawan, because the numbers of resemblant forms that could

be deployed and the sound correspondences that could be discerned were so few that any true genetic relationship that lay behind the phenomena was necessarily very remote. No certainty could be felt that such a hypothesis would ever be demonstrated to be correct through reconstruction. The terms 'family' and 'stock' had been used by comparative linguists since before 1800, but by 1900, most linguists felt these terms should be reserved for genetic groupings that were not in doubt. Consequently, the terms 'phylum' and 'superstock' began to be used between 1930 and 1960 to refer to such hypotheses as Hokan and Penutian. Proposed genetic groupings were often preceded by the preposition 'macro-', thus Macro-Hokan, Macro-Penutian, and Macro-Chibchan. Doubters of the validity of the Hokan hypothesis may label it Macro-Hokan; those who believe in the hypothesis will speak of the Hokan stock.

Further Comparative Studies

Except for a small number of proposed reconstructions by Sapir, none of the above studies did more than assemble sets of resemblant forms with comparable (often identical) glosses or functions.

Since 1950, renewed efforts at establishing Hokan or parts of it have been devoted by linguists working on documenting these languages, especially as dissertations by graduate students at University of California at Berkeley (UC Berkeley). The Hokan comparative studies have been spin-offs of their documentation work. Even now, however, except for the reconstruction of Pomoan and Yuman, Hokan comparative studies at most surpass those of the period 1900–1940 by attempting to find sound correspondences among the resemblant forms compared. The other main achievement is that the data that are compared are for the most part phonologically accurate.

The Hokan stock is made up of the following (reasonably) well-documented languages and families: (1) Pomoan family; (2) Chimariko language; (3) Yanan small family; (4) Karuk language; (5) Shastan (Shasta) language; (6) Achuan family; (7) Washu language; (8) Salina language; (9) Yuman family; (10) Seri language; (11) Chontal language area; (12) Tol (= Jicaque) small family.

Some other poorly-documented languages are probably Hokan, but because of lack of data they cannot serve as the basis of reconstruction: Esalen, Kochimi* (Cochimí), Pajalat, Yeme* = Komekrudo, maybe Yue* = Kotoname.

Others often thought of as Hokan are probably not Hokan: Chumashan, Tonkawa, Karankawe. In any case, the first two, which are reasonably well

documented, have not successfully been shown to be Hokan, in spite of Sapir's efforts.

Contra Sapir (1925) (aped in Greenberg, 1983) Tlapaneko-Sutiaba is Oto-Mangean, not Hokan. Whether Hokan and Oto-Mangean are related remains an open question. In Kaufman (1990), I suggest that they are indeed related.

To date, the most notable contributions to Hokan typology and comparative Hokan grammar have been made by Sapir, Jacobsen, Langdon, Gursky, Grey, and Oswalt.

Kaufman has a fair amount of evidence to suggest a North : South division, North being 1–9, and South being 10–17.

The Hokan hypothesis is widely known; it may be accepted by nonspecialists in American Indian languages, and is accepted (with a specific list of languages shorter than the list given in this article) by many specialists in languages of Oregon, California, and Meso-America. Specialists in American Indian languages with no deep familiarity with Hokan languages are generally skeptical of the Hokan hypothesis. This skepticism is largely because, although detailed comparative work leading to reconstruction has been carried out for some of the parts of the Hokan grouping (Yuman, Pomoan), comparative work at the level of the whole stock has not yet led to fully elaborated reconstruction of either phonology or grammar.

The Hokan languages are known from three separate areas: Alta California and Baja California; Southern Texas and Coahuila; Southeastern Oaxaca and Northern Honduras. Many languages of northwestern and northeastern Mexico have disappeared with essentially no documentation: some of these may have been Hokan. From the current distribution, we could imagine a Hokan homeland or primary geographical concentration in southern California with extensions to northern California and the southern plains (skipping over what?). The Hokan languages of Meso-America would have to represent migration, as might also those of the southern plains.

The time depth of Hokan is probably quite great, perhaps 8000 years, and the population movements that need to be postulated would possibly not have been associated with distinctive archeological traditions.

Evidence assembled by Kaufman suggests that Hokan and Oto-Mangean are genetically related. If so, proto-Oto-Mangean (ca. 6500 mc) would have developed from a Hokan-like language with some of the following changes:

1. syllable-final obstruents would have dropped or become laryngeals
2. surviving features of the changed consonants would have yielded a three-way tonal contrast

3. a thorough-going shift on the phrase and clause level from right-headedness (OV) to left-headedness (VO) would have affected all morpheme arrangements above the level of derivational morphology (which involved only full words and clitics).

The Hokan Languages Classified

In the following sections, % means that the language is extinct.

Northern Hokan

Sonoma

1. Pomo family [pPom] (total number of speakers < 200)
 - Western Pomo language area [WPom]
 - SouthWestern (Kashaya) Pomo emergent lg [SWPom] EL: ca. 50
 - Southern Pomo emergent lg [SPom] EL: < 40
 - Central Pomo (Yokaya & Boya) emergent lg [CPom] EL: < 40
 - %Northern Pomo lg [NPom]
 - NorthEastern (Salt) Pomo lg [NEPom] EL: 1
 - %Eastern Pomo lg [EPom]
 - SouthEastern (Sulphur Banks) Pomo lg [SEPom] EL: < 10

Northern California

2. %Chimariko [ch'imari*ko] language [Chi]
3. %Yana language area [pYan]
 - Yana emergent lg [Yan]
 - Northern Yana dial [NYan]
 - Central Yana dial [CYan]
 - Southern Yana dial [SYan]
 - Yahi emergent lg [Yah]
4. Karuk [karu*k] language [Kar] EL: 126
5. %Shastan family [pSha]
 - Shasta lg [Sha]
 - New River Shasta lg [NRSha]
 - Okwanchu lg [Okw]
 - Konomihu lg [Kon]
6. Achu family [pAch] (total number of speakers < 100)
 - Achumawi (Pit River) lg [Ach] EL: 81
 - Atsugewi (Hat Creek) lg [Ats] EL: 4
 - Atsuge (Hat Creek) dial [Ats-HC]
 - Apwaruge (Dixie Valley) dial [Ats-DV]

Great Basin

7. Washu language [Wsh] EL: < 10

California Coast

8. %Esalen language [Esa]
 %Salina (Enalen) language [Sal]
 Miguelenyo dial [Sal-M]
 Antonienyo dial [Sal-A]

Southern Hokan**Southwest**

9. Yuman-Kochimi* family [pYK] (total number of speakers ca. 2500)
 Yuman division [pYum]
 Pai language area [Pai]
 Paipai emergent lg [Pp] EL: 300 BAJA
 Havasupai-Hwalapai emergent lg
 Havasupai dial [Hav] EL: 404
 Hwalapai dial [Hua] EL: 440
 Yavapai emergent lg [Yav] EL: 163
 River language area [Riv]
 Mohave emergent lg [Moh] EL: 234
 Maricopa-Yuma emergent lg
 Maricopa dialect [Mar] EL: 181
 Yuma dialect [Yum] EL: 343
 Dieguenyo language area [Die] EL: 97
 Mesa Grande (Tiipay) emergent lg [MG]
 Campo (Kumeyaay) emergent lg [Cam]
 La Huerta (Tiipay) emergent lg [Hue]
 Cocopa lg [Coc] EL: 321
 Kiliwa lg [Kil] EL: 24-32 BAJA
 %Kochimi* language [Cch]

10. Seri language [Ser] EL: <215 BAJA

Coahuila

- %Pajalat (Coahuilteco) language [Paj]
 %Yeme*an (Comecrudoan) family [pYem]
 Yeme* (Comecrudo) lg [Yem]
 Garza lg [Gar]
 Mamulique lg [Mam]
 %Yue* (Cotoname) language [Yue]

Oaxaca

11. Chontal (Tequistlatecan) family [pCho]
 Huamelulteco = Lowland Chontal lg [LCho]
 EL: 1 k
 Tequistlateco = Highland Chontal lg [HCho]
 EL: 3.6 k

Honduras

12. Tol (Jicaque) family [pTol]
 Eastern Tol lg [ETol] EL: 350
 %Western Tol lg [WTol]

Descriptive Work on Hokan Languages

From 1900 to 1950, the documentation of Hokan languages that stands the test of time includes Edward Sapir's documentation of Yanan and John Peabody Harrington's documentation of Karuk, Chimariko, and Salina. Just before 1950, Abraham Halpern documented Yuman.

Since 1950, Hokan languages of Meso-America have been documented first by members of the Summer Institute of Linguistics and later by academic linguists from the United States.

Also since 1950, Hokan languages of Alta California (and Washu in Nevada) and Baja California have been the object of descriptive study leading to Ph.D. dissertations by students of the University of California at Berkeley. Since 1970, several linguists trained by Berkeley Ph.D.s have documented Hokan languages of Alta and Baja California.

Characteristics of Hokan Languages**Phonology**

Phonemic Contrasts in Hokan Languages To get an idea of what the broadly general traits of Hokan phonological systems are, I present below those phonological contrasts that are common or predominant in these languages.

1. /C'/ vs. /C/: pPom, Chi, Yan, Sha, Ach, Wsh, Sal, Paj, pCho, pTol no /C'/: Kar, pYum, Ser, [Yem unclear]
2. /C^h/ vs. /C/: pPom, Chi, Yan, pAch, Wsh, pTol no /C^h/: Kar, Sha, Sal, pYum, Ser, Paj, pCho, [Com unclear]
3. /t/ vs. /t/: pPom, Chi, Sal, [pYum] no /t/: the rest
4. /ç/ vs. /ç/: Chi, Sha, Sal, Paj no contrast: the rest
5. /kʷ/ vs. /k/ or /q/: pPom, pYum no contrast: the rest
6. /q/ vs. /k/: [pPom], Chi, Ach, pYum no contrast: the rest
7. /k^w/ vs. /k/: pYum, Paj, Com, pCho no /k^w/: the rest
8. /f/ vs. /p/: Kar, Ser, pCho no /f/: the rest
9. /š/ or /š/ vs. /s/: pPom, Chi, [Kar], Ach, Wsh, Sal, pYum, Ser, Paj no contrast: Yan, Sha, Ats, Yem, pCho, pTol
10. /x^w/ vs. /x/: pYum, Paj, Yem, pCho no /x^w/: the rest
11. /h/ vs. /x/: [pPom], Chi, [Yan], Sha, Kar, Ach, [Sal] no contrast: the rest
12. /r/ vs. /l/: Yan, pAch, pYum no contrast: the rest
13. /e/ vs. /i/: pPom, Chi, Yan, Sha, Ach, Wsh, Ser, Paj, Yem, pCho, pTol no contrast: Kar, Ats, Sal, pYum

- 14. /o/ vs. /u/: pPom, Chi, Yan, Ach, Wsh, Paj, Yem, pCho, pTol no contrast: Kar, Sha, Ats, Sal, pYum, Ser
- 15. /ɨ/ vs. /i/ or /u/: Wsh, pTol no /ɨ/: the rest
- 16. vowel length: pPom, [Chi], Yan, Sha, pAch, Wsh, Sal, pYum, Ser, Paj no contrast: ?pCho, pTol
- 17. stress or pitch: pPom, Kar, Sha, pAch, Wsh, Sal, pYum, Ser, pCho no contrast: Chi, Yan, Yem, pTol.

A sort of common core that is predominant (though not universal) in the Hokan languages is shown in (Table 1).

Just in terms of the phonemic contrasts commonly found in Hokan languages, the set of phonemic contrasts shown in Table 2 is the maximum that is supported typologically (i.e., found in at least three branches).

Syllable Structure

A syllable may begin with a consonant or not; it may end with a consonant or not. Some languages tolerate syllable onsets of the shape /Cx/ or /CY/ (where Y is a semivowel); many languages tolerate syllable codas of the shape /YC/.

I postulate the following basic phonological structure for a proto-Hokan lexical item of one to three syllables that is not a compound (\$ is syllable boundary):

$$(1) \text{ } \$([C(x)]V[H])\$C(x/w)V(H) (Y) (C)\$(+CV)$$

Grammar

Hokan morphology is typically OV, while several Hokan groups currently show VO syntax.

Grammatical traits that will be discussed are as follows: alignment and person markers, nouns, verbs, adjectives, interrogatives, and quantifiers; examination of these traits is followed by a discussion of word order.

Alignment and Person Markers Most Hokan languages (e.g., Yan, Yum, Ser) have accusative case-marking; some (e.g., Chi, C&E Pom, Cho) have active case-marking. While Ergative languages often have completely different sets of person markers for ergative versus absolutive case (Mayan, Philippine languages), Accusative (Yuta-Nawan [Uto-Aztecian] family, Sapotekan [Zapotecan] family) and Active (Siuan [Siouan] family, Masatekan [Popolocan] family) languages often show related or even identical markers for the case categories that encode Agent and Patient.

In Yanan, an Obj-Subj suffixed person-marking combination follows TAM markers on the verb. In Chontal, an Active person marker precedes the verb stem and a Neutral (= Stative) person marker follows all other verbal inflexional suffixes. In Yuman and Seri, a prefixed Obj-Subj combination precedes the verb. In Chimariko, Agent or Patient is prefixed to the verb (the category that is marked is chosen according to a person hierarchy). Since in Pom and Sal, verbs are not person-marked for subject and object agreement, it seems likely that proto-Hokan had no such marking. The Chontal order reflects its SIVO pattern (VO is favored by Meso-American languages: I means indirect object), and the Seri, Yuman, and Chimariko patterns reflect their current SV and OV word orders, which are probably the proto-Hokan orders as well, although the pattern with full NP arguments is specifically SOV, not OVS. The Yanan, Yuman, and Seri data suggest that in early Hokan there may have existed an O-V (O-S?) clitic combination for person markers. The Yanan order would then reflect the verb-first syntax of Yanan. If pHokan was an Active rather than an Accusative language, the alignment categories of the pronominal clitic combination would be Neutral-Active. See below for possessor marking on nouns.

Nouns The noun stem is made up of a root optionally followed by a nominalizer ('infinitive/gerund,')

Table 1 Basic consonants and vowels in Hokan languages

| Consonants | Vowels |
|-------------|------------|
| p t c k | i u |
| p' t' c' k' | e o |
| s š x h | a |
| m n | |
| l | length /:/ |
| y w | stress /*/ |

Note: only Kar, Yum, and Ser lack glottalized obstruents; only Cho and Tol lack vowel length; only Chi, Yan, Yem, and Tol lack contrastive stress.

Table 2 Phonemic contrasts in Hokan languages

| Consonants | Vowels |
|---|------------|
| p t t̥ /c/ c̥ k k ^w q | i u |
| p ^h t ^h t̥ ^h /c ^h / c̥ ^h k ^h k ^{wh} q ^h | e o |
| p' t' t̥' /c'/ c̥' k' k ^w q' | a |
| f s š x x ^w h | |
| m n | length /:/ |
| l | stress /*/ |
| r | |
| y w | |

‘agentive’), or a ‘first-order nominal suffix’ (Pom, Chi, Wsh, Esa, Yum: not productive) and a ‘second-order nominal suffix’ (‘diminutive,’ ‘female’). In Pomo and Chimariko, a noun root may be preceded by another noun root to form a noun-noun compound with the first noun modifying the second; Salina and Yuma have no such compounding, and the status of such compounds in proto-Hokan is still in doubt.

- (2) | (NOMLZ) |
 (ROOT) { ROOT } (NOM₂)
 | (NOM₁) |

The noun word consists of a noun stem plus up to two preposed optional grammatical markers, a ‘possession state prefix’ (‘absolutive of intimately possessed noun’/‘substance or mass noun prefix’ [Yum, Ser, Cho, Tol], ‘body-part prefix’/‘possessed state of intimately possessed noun’ [Pom, Chi, Yum, Ser, Cho], ‘indefinite third person (+/- possessive)’/‘absolutive noun prefix’ [Pom, Kar, Sha, Yan, Wsh, Sal, Yum, Ser]), and a ‘proclitic classifier’ (‘proclitic count noun article,’ ‘proclitic mass/plural noun article,’ ‘absolutive noun prefix’), one optional ‘possession state suffix’ (‘absolutive’) and one obligatory ‘case suffix.’ The classifier has become a prefix in many languages.

The cases are both locative and relational, but the only relational cases that have etymologies are limited to Southern Hokan and encode switch-reference (same subject vs. different subject).

- (3) (CLASS) (POSS) NOUNSTEM (POSS) CASE

Locative cases suffixes encode such functions as ‘by means of,’ ‘from,’ ‘at,’ ‘in,’ and so on.

Verbs The verb stem is made up of a root optionally preceded by a stativizer (‘adjective-like intransitive’), a causativizer, or an incorporated instrumental pre-pound (Pom, Chi, Yan [‘primary verbs’], ?Sha, *Kar, Ach, Ats, Wsh, Yum, Ser, *Cho) and optionally followed by a ‘first-order verbalizer’ (‘to do X [X = noun, numeral]) and an incorporated ‘directional postpound’ (Pom, Chi, Yan, Kar, Sha, Ats, Wsh, Yum, Cho).

Both Northern and Southern languages have instrumental pre-pounds. Only Salina seems definitely to lack them. Instrumental pre-pounds encode such meanings as ‘with the mouth,’ ‘by speaking,’ ‘by biting/chewing,’ ‘by blowing,’ ‘with the foot,’ ‘with the hand.’ They are seemingly recruited mostly from noun and verb roots.

Both Northern and Southern languages have directional/locative postpounds. Again, only Salina seems

definitely to lack them. Directional/locative post-pounds encode such meanings as ‘down,’ ‘up,’ ‘in,’ ‘out,’ ‘away,’ ‘thither,’ ‘hither,’ ‘here and there.’

It is not clear whether there is widespread simple noun incorporation or verb root compounding. No incorporation is found in ?Pom, Sal, or Yum. V-N incorporation is found in Yan, but is probably an innovation reflecting its VO syntax. Langdon (1988) shows that compound verb stems whose first member is not necessarily instrumental occur in Yana, Shasta, Atsugewi, and Washu.

- (4) | (STAT) |
 { (CAUS) } ROOT (VRBLZ₁) (DIR)
 | (INSTR) |

The verb word (or verb complex) consists of a verb stem plus up to three preposed optional grammatical markers and up to five postposed grammatical markers, of which one is obligatory. The preposed markers are [-1] pluralizer prefix (Yum, Paj, Pom, Yan, Ats), [-2] future proclitic (Yan, Kar, Wsh, Sal, Ser, Cho, Paj, Tol), [-3] temporal subordinator proclitic (‘when, while, after’: Pom, Yum, Sal). The postposed markers are [+1] passivizer suffix (Sal, Yum, Ser) or SHIFTER (infinitive, agentive), [+2] andative suffix (‘to go and verb’: Northern Hokan only), [+3] obligatory TAM₁ suffix (e.g., imperative, present, future/optative, past/completive, remote past, desiderative), [+4] TAM₂ suffix (e.g., conditional), [+5] TAM₃ enclitic (e.g., customary/habitual). Verb-TAM order is found generally in Hokan: Pom, Chi, Yan, Kar, Wsh, Sal, Yum, Cho.

- (5) (TEMP SUBORD) (FUT) (PL) VERBSTEM
 (PASS) (ANDAT) TAM₁ (TAM₂) (TAM₃)

Adjectives Some adjective-like words act like nouns and some act like verbs. While it is possible that adjectives as a class originally had no independent existence, it is equally possible that there were two kinds of adjectives that were neither nouns nor verbs, as there are in Nahua (Yora), Mayan, and Bantu languages, to name just three cases.

Interrogatives In Amerindian languages and elsewhere, interrogative words are often encoded by lexical items that also have generic reference, such that *who?* = ‘person,’ *what?* = ‘thing,’ *where?* = ‘place,’ *how?* = ‘manner,’ and so on. This is also true of the interrogative words in Hokan languages.

Quantifiers Structurally, the numerical systems of Hokan languages do not reflect a widespread practice among their speakers of calculating or counting large

numbers of things. There are three widespread etyma that mean ‘one’ and/or ‘only, alone.’ There are three that mean ‘three’, and two that mean ‘two’ (The Oto-Mangean stock also shows multiple etyma for most of the low numerical values, and little evidence for numbers above five). Etyma with values above three are found only in Northern Hokan. The various words for ‘two’ in the Hokan languages do not all reflect a single unitary proto-Hokan etymon, and the invented word *Hok[an]* does not directly represent any of them, although such was Dixon and Kroeber’s intention.

Word Order The following remarks are based on a structural survey of certain languages only: Pomo (p.c. Oswalt, McLendon), Chimariko (TK), Yana (p.c. Hinton), Salina (p.c. Turner), and Yuma (p.c. Hinton, Langdon). Before much more can be done in this area, syntactic descriptions of Karuk (Bright), Shasta (Silver), Washu (Jacobsen), and Seri (Marlett) will have to be consulted, and descriptions of Achumawi, Atsugewi, Chontal, and Tol will have to become available.

Sentence-level Constituents On the level of the sentence, SOV word order is attested from Pomoan, Chimariko, Yuman, and Seri, and proto-Hokan probably had this order as well. Yanan has VSO, and Salina has VOS.

Noun Phrase Within the NP, the modifying adjective probably originally followed the noun it modified. Pomo, Chimariko, Yuman, and Seri all attest this, though Salina has AN order. As is well-known by now, NA order is neutral with respect to OV or VO constituent order, and not unharmonious with OV order.

There are two kinds of possessive constructions: one where the possessor [G] is an NP and one where it is a first or second person pronoun [Pn]. Several languages distinguish between intimate and casual possession or between kin terms vs. all other possessed nouns. The first type of possession in each case is marked by in several groups by prefixing or preposing a pronoun marker directly to the noun (Pom, Chi, Cho). The second type of possession is often marked by Pn-objective case # N (Pom, Yum). ‘Objective case’ is variously accusative, genitive, and benefactive in the various languages. When G is an N or NP it is preposed to the possessed N (in Pom, Chi, Sal, Yum, Ser). The possessor N(P) is case-marked objective (in Pom, Yum) and the possessed N is marked to agree for person of possessor (in Chi, Sal, Ser).

- (6) G-obj/ben # N [Pom]
- G # N-his [Chi]
- G #his-N [Sal, Ser]
- Pn-acc # N [Yum]
- Pn-N [Pom (kin terms only; otherwise like
G ...N), Sal, Ser]
- Pn:Erg-class-poss-N [Cho]
- Pn:Neu-N [Chi (intimate possession)]
- N-Pn:Act [Chi (casual possession)]

Proto-Hokan probably had postpositions, judging from the evidence of Pomo, Yuman, and Seri. These morphemes are not obviously related to nouns in most present-day languages (although they are in Seri), but their nominal origin is often apparent in etymologies that span the stock.

With the exception of the NA order, all of the word-order traits discussed above, as well as the positioning of the TAM and case markers, are shared by proto-Yuta-Nawan, and – for all I know – proto-Penutian. These facts should not be taken as supporting either diffusion or genetic relationship between the three stocks; although either or both might be the case, they are not necessarily involved; these are morphosyntactic phenomena that are quite typical of languages with OV syntax, and are found as well in Eurasia (e.g., Turkic family) and South America (e.g. Quechwa [Quechua] family). On the other hand, incorporated instrumental pre-pounds and directional postpounds are entrenched in Hokan, but sporadic in Yuta-Nawan (instrumental prefixes in Numic family only) and Penutian (instrumental prefixes and directional suffixes in Maidu, Klamath, and Sahaptian – hardly the ‘Penutian kernel’).

Viability

In pre-Columbian times most Hokan-speaking populations were nonagricultural, communities were small, and the total population for each language was under 10 000. At present most Hokan languages are dwindling (obsolescent – not being learned by children) or dying (moribund – spoken only by elderly people); several are dead already (marked with % in the classification). Since 1500, Tols and Chontals have become agriculturalists, but Tol is obsolescent, and few children are learning Chontal.

Hopi

K C Hill, University of Arizona, Tucson, AZ, USA

© 2006 Elsevier Ltd. All rights reserved.

Hopi is a Uto-Aztecan language of northeastern Arizona spoken by about 5000 people. Hopi culture focuses a rich ceremonial life on arid land corn (maize) cultivation.

Hopi orthography, which has become semi-official since the publication of the *Hopi dictionary* (Hopi Dictionary Project 1998), uses letter values close to those of the International Phonetic Alphabet but with some exceptions. The palatal glide is orthographic *y*. The high back unrounded vowel is orthographic *u*. Various letter combinations, such as *kw*, *ky*, *ng*, *ngw*, *ngy*, *qw*, *ts*, represent unitary sounds. Long vowels are written double. The apostrophe represents the glottal stop and is not written in word-initial position. Word stress is largely predictable, and only exceptional stress is represented orthographically. Unmarked stress is on the first syllable of disyllabic words and on the syllable containing the second mora of longer words, in other words, it is on the first syllable if it is long, i.e., has a long (double) vowel or ends in a consonant, and on the second syllable if the first syllable is short.

Hopi belongs to the Northern group of Uto-Aztecan languages. A diagnostic sound change for Northern Uto-Aztecan (NUA) is the development of Proto-Uto-Aztecan medial affricate *c to NUA -y-, cf. the words for 'moon', Hopi *muuya*, Nahuatl *mētztli*.

Because of the influence of the writings of B. L. Whorf, Hopi achieved a notoriety as a "timeless language" (Carroll, 1956: 216). As a response to this notion, Malotki devoted a large monograph (1983) to the demonstration that Hopi has an extensive way of talking about time and things temporal. Even Whorf's central claim that Hopi lacks spatial metaphors for time (Whorf, 1941: 83) does not hold up. The very word *qeni* 'space, room (for)' can be used with the sense 'time':

- (1) Ya pumu-y kiihu-t
 Q those-ACC house-ACC
 amùu-tsa-ve hiišaq qeni?
 them-between-at how.much space
 How much space is there between those two
 houses?
- (2) U-ngem qa qeni.
 you-for not space
 There's no room for you.

- (3) Ya ùu-pe qa qeni, um nuy
 Q you-at not space, you me
 mihikqw tutuqayna-ni-qö?
 at.night be.teaching-FUT-SUBORD(*switch-reference*)
 Is there adequate time for you to teach me tonight?
- (4) Pas qa qeni; pay kya as
 very not space; already POTEN perhaps
 ayo'wat santi-t aw qeni-ni.
 to.another week-ACC to.it space-FUT
 There is no time; maybe next week there will be time.

Nor is counting units of time foreign to Hopi, as seen in the following examples:

- (5) Sunat yaasangwu-y sen hóyokpu-t
 twenty year-ACC whether increased.amount-ACC
 ang pep yes-kyäakyangw
 along.it there live-SUBORD
 qa hii-ta aw yuku-ya.
 not anything-ACC to:it fix-PL
 They stayed there twenty years and maybe more, but they
 never fixed anything.
- (6) Pam siiva-y angsakis koyolaw-qw
 he [his.own] each.time be.stashing.
 money- away-SUBOR
 ACC
 oovi naalö-q yaasangwu-y ang
 that's.why four-ACC year-ACC along-it
 pam aw a'ni àmti.
 he to.it very accumulate
 Because he kept stashing away his money each time
 [that he got paid], after four years it really
 accumulated.

Typologically, Hopi is a head-final, left-branching language; it has a rigid Subject-Object-Verb structure:

- (7) Taaqa taavo-t niina.
 man rabbit-ACC kill
 The man killed a/the rabbit.

and subordinate clauses precede the main clause:

- (8) Pam peehu-t sami-t
 he some-ACC fresh:corn-ACC
 a'ki-qe pu' nima.
 pick:corn-SUBORD then go:home
 He went home when he had picked some
 fresh corn.

Exceptions are possible, especially for the sake of emphasis. If a subject or object appears after the verb, or if a subordinate clause occurs after a main clause, it is separated by an intonational break (represented by a comma):

- (9) Qa an'ewakw tsovawta, sinom.
 in great number were assembled people
 A great many people were assembled.
- (10) Pas sòosovik navotiwa,
 very everywhere be.known,
 puma so'qö.
 they die.SUBORD(*switch-reference*)
 It is known everywhere that they died.

Nouns inflect for number, case, and possessor. Demonstratives and pronouns inflect for number and case. For number, there are four categories to distinguish: singular (one), dual (two), plural (three or more), and distributive (for various types or in various locations). The singular form is unmarked. The dual form, with suffixed *-t(u-)* or *-m(u-)*, is used almost exclusively for animate nouns; inanimates are construed as singular or dual from context. (Things such as clouds, stars, vehicles, and the wind that seem to move of their own accord, as well as sacred things such as places with shrines and developing ears of corn, are treated as animate.) Noun plurals are formed via suffixation, reduplication, suppletion, or combinations of these. Inanimate noun plurals always involve reduplication. Accusative forms are given in parentheses:

| | | | |
|---------------------|----------------------|-------------------------------|----------------------------------|
| (11) | sing. | du. | pl. |
| person | sino(t) | sino- t(u-y) | sino-m(u-y) |
| civilized person | hopi(t) | hopi- t(u-y) | hopiit(u-y) |
| cloud | oomaw (u-y) | oomaw- t(u-y) | oo'omawt (u-y) |
| man | taaqa(t) | taaqa- t(u-y) | tâataqt(u-y) |
| woman | wùuti(t) | wùuti- t(u-y) | momoyam (u-y) |
| boy | tiyo(t) | tiyo- t(u-y) | tootim(u-y) |
| old one | wu-y (wuu- kw) | wuu-yo-m (wuu-kw- mu-y) | wuuwuyom (wuu-wu- kw-mu-y) |
| little spoon | akùwya(t) | (= sg.) | a-'akùwya(t) |
| Hopi village | Hopi- ki(t) | (= sg.) | Hopi-ki- ki(t) |

Demonstratives and pronouns are identical in the dual and plural:

| | | | | |
|---------------|-----------|-----------------|-----------|-----------------|
| (12) | nom.sing. | nom.du./ pl. | acc.sing. | acc.dl./ pl. |
| this | i' | ima | it | imuy |
| that | pam | puma | put | pumuy |
| that | mi' | mima | mit | mimuy |
| over there | | | | |
| I/we | nu' | itam | nuy | itamuy |
| you | um | uma | ung | umuy |

Verbs also show a range of pluralization types, but with verbs it is often the derivational suffix that undergoes the process:

| | | |
|-----------------|-----------|-----------|
| (13) | sing./du. | pl. |
| raise, perfect | aniwna | aniwna-ya |
| think, consider | wuuwa | wuuwa-ya |
| bury | aama | am-ya |

| | | |
|--------------------------|----------------|--------------------|
| look for | heeva | hep-ya |
| be called | maatsiwa | maa-matsiw- ya |
| pop out of the husk | tsayo | tsayòmti |
| wear out' | tsàakwa | tsakwàmti |
| descend | haawi | haani |
| die | mooki | so'a |
| sit, dwell | qatu | yeese |
| arrive | pitu | òki |
| be dancing | wunima | tiiva |
| be singing | taw-lawu | taw-lalwa |
| be grinding | hàakokin- | hàakokin- |
| coarsely | ta | tota |
| have a field | paasa'y- ta | paasa'y- yungwa |
| go along picking corn | a'kiti-ma | a'kiti-wisa |
| go to pick corn | a'ki-to | a'ki-wisa |

Dual subjects take the singular form of the verb. Compare the following (*tuwa* is the singular/dual subject form of the verb and *tutwa* the plural subject form; *itam(u-)* 'we' is identical in the dual and plural):

- (14) Nu' kawayot tuwa. I saw a horse.
Itam kawayot tuwa. We (two) saw a horse.
Itam kawayot tutwa. We (several) saw a horse.

Transitive verbs may also require a different form of the verb, depending on whether the object is plural. Such verbs are also marked for plurality of subject.

- (15) Nu' itàakawayoy I brought our horse in.
pitsina.
Itam We (several) brought our
itàakawayoy horse in.
pitsinaya.
Nu' I brought our (two) horses
itàakawayotuy in.
pitsina.
Nu' I brought our (several)
itàakawaymuy horses in.
òkina.
Itam We (several) brought our
itàakawaymuy (several) horses in.
òkinaya.

Verbs are inflected for tense (unmarked, future, habitual) as well as subject number. Further, verbs divide into perfective and imperfective stems. In most contexts, unmarked perfectives are construed as past, while unmarked imperfectives can refer to past or present.

Hopi shows an exuberance of derivational suffixing as well as of compounding and noun incorporation into verbs (Hill, 2003). The incorporated noun may be the object of a transitive verb stem:

- (16) tap- kill a cottontail (or two) (tap- < taavo
 nina 'cottontail', niina 'kill singular/
 dual object')
 tap- kill cottontails (qöya 'kill plural
 qöya object')

or the subject of an intransitive:

- (17) kwits- for smoke to rise up (kwits- <
 wunuptu kwiitsingw 'smoke')
 mori- for beans to get planted all
 'üykürümti over (mori 'beans')
 nup-'iwta for there to be snow on the
 ground (nup- < nuva
 'snow')

Verbs may also incorporate non-objects:

- (18) Nu' i-tümkwivi-y öngaspal-mortoyna.
 I my- brine-
 wild:greens- be:dipping:to:moisten
 ACC

I'm dipping my wild greens in salt water.

Hopi is unusual in that incorporated nouns may be specific in reference rather than generic, as common in most languages that show such incorporation:

- (19) Nu' pakiw-maqto-ni; noqw itam
 I fish-go:hunting:for-FUT; so we
 put enang nöönösa-ni.
 that:ACC in:addition eat:PL-FUT
 I'm going fishing; so we can eat it along with
 other food. (cf. *paakiw* 'fish')

Modifiers of the incorporated noun may appear as objects of the verb:

- (20) Pangqaqw pam naat puuhu-t
 from:there he still new-ACC
 kwilatots-ma.
 commercially.bought.shoes-PROG
 He's coming from there wearing brand-new
 shoes. (*kwilatotsi* 'commercially bought
 shoes')
- (21) Kikmongwi pas wuuhaniqamu-y mong-'oya.
 village.leader very many-ACC leader-
 put(PL.OBJ)
 The village leader sure chose a lot of leaders.
 (cf. *mongwi* 'leader')

Modifiers may also be incorporated:

- (22) puhu-hom-'oyiwta
 new-ceremonial.cornmeal-be.offered
 for fresh sacred cornmeal to be offered
- (23) hihin-hopii-tuqayta
 slight-Hopi-know
 know or speak a little Hopi
- (24) su'aw-wuko-nup-'iwta
 fairly-large-snow-be
 for there to be a fairly large amount of snow on
 the ground

Hopi distinguishes among types of sources of information. Statements based on the direct knowledge of the speaker are unmarked. Statements based on evidence (but not direct experience) are marked by the inferential particle *kur*; statements based on conjecture use the potential modal *kya*; and statements based on secondhand knowledge or hearsay use the quotative particle *yaw*. *Yaw* is especially prevalent in story narration. These evidential particles are relatively free-floating in a sentence; they may occur anywhere before the verb:

- (25) Isikwi hovàati. My meat spoiled.
 Isikwi kur My meat seems to have
 hovàati. spoiled.
 Isikwi kya (I'm afraid) my meat may
 hovàati. have spoiled.
 Isikwi yaw I hear my meat spoiled.
 hovàati.

Dialectally, Hopi divides into three main varieties, differing slightly in pronunciation and vocabulary but with a high level of mutual intelligibility. A prominent phonetic difference resides in the differential development of a feature orthographically represented by the grave accent, as in *wiuti* 'woman'. In Third Mesa speech, such syllables have falling tone. In First Mesa speech and in the speech of the Second Mesa town of Mishongnovi (cf. Whorf, 1946), they end in aspiration. In the speech of the Second Mesa towns of Shipaulovi and Shungopavi, the grave accent feature disappears, such that these syllables are pronounced in the same way as syllables without the grave accent.

Some forms differ between a male speaking and a female speaking:

- | | | |
|------|-------------|----------------------|
| (26) | feminine | masculine |
| | speaker | speaker |
| | very | hin'ur a'ni |
| | thank you | askwalí kwakwhá(y) |
| | good/pretty | nukwangw- loma- |
| | big ones | yangsayoqa hohoskaya |
| | be a large | naavinta kyaasta |
| | number | |
| | it's good | is alí is alí |
| | too much | is ehe'tihi is tathi |

There exists a rich baby talk vocabulary, used speaking with (or as with) small children. Many baby talk words are phonologically quite distinct from normal speech. An example is *uu'na* 'bite' (non-baby *kuuki*), whose first syllable is pronounced with vocal tension and with the teeth together, a pronunciation not easily handled with the orthography. Sometimes there is no normal speech equivalent: *hòona*, 'dance like a kachina', is perfective; the nearest non-baby equivalent is the imperfective *kakatsina*.

A baby talk term may cover a different range of meaning from anything in normal speech: *Tooto* can refer to any insect (as well as baby animals or birds); there is no adult word that covers insects in general.

There is a seemingly archaic register of song and ritual speech. An example is *oo'oomawutu*, a song form of *oo'omawt* 'clouds', in which a number of phonological processes characteristic of normal speech are suspended: vowel shortening, syncope, and final short vowel deletion. This is reminiscent of the archaicaizing song/poetry register of French, in which the colloquial sound change of dropping the mute *e* is suppressed.

Hungarian

K É Kiss, Hungarian Academy of Sciences, Budapest, Hungary

© 2006 Elsevier Ltd. All rights reserved.

History

Hungarian is a member of the Finno-Ugric branch of the Uralic language family. The Finno-Ugric peoples represented a kind of linguistic and areal unity, populating the southwestern slopes of the Ural Mountains, until 2000 B.C. Hungarian emerged from among the Ugric dialects around 1000 B.C. The Hungarian tribes left the Finno-Ugric homeland in 500 A.D. and occupied the territory surrounded by the Carpathian Mountains in 895, where they established a Hungarian Kingdom in 1000.

The first written records are Hungarian fragments in a Greek and a Latin text, dating from 950 and 1055, respectively. The first surviving coherent written Hungarian text originated in 1192–1195.

Hungarian has about 13.5 million native speakers, the largest number of speakers in the Uralic language family, 10 million of which live in Hungary. The Versailles Treaties in 1920 annexed one-third of Hungarian native speakers – together with two-thirds of the territory of Hungary – to neighboring countries. As a consequence, Romania now has

1.6 million indigenous Hungarian speakers; Slovakia has 520 000; Serbia-Montenegro, 290 000; Ukraine, 156 000; Croatia, 16 000; Slovenia, 7000; and Austria, 4000. The number of Hungarian speakers in the United States, Australia, and Western Europe is around one million.

Hungarian is fairly homogeneous areally; the only dialect displaying substantial lexical, phonological, and syntactic differences from standard Hungarian is the easternmost, archaic Csángó dialect in Romania.

Names for the Language

Hungarians call themselves and their language *magyar*. Others refer to them by variants of the ancient tribal name *Onogur* (e.g., *Hungarian*, *ungarisch*, *vengerski*).

Language Description

Phonology

Hungarian has the following 14 vowels: a[ɔ], á[a:], e[ɛ], é[e:], i[i], í[i:], u[u], ú[u:], ü[y], ű[y:], o[o], ó[o:], ö[ø], ő[ø:]. (In each pair of symbols, the first one is the letter denoting the phoneme; the second is its phonetic transcription.) The vowels form pairs differing in length; single or double accents mark

long vowels. Hungarian displays vowel harmony; stems (except some recent borrowings) contain either only front vowels (ö, ő, ü, ú) and neutral vowels (e, é, i, í), or back vowels (a, á, o, ó, u, ú) and neutral vowels. Suffixes having both front-vowel and back-vowel allomorphs also participate in vowel harmony – (e.g., *kert-ész-ünk-ekel* garden-er-our-with/*fodr-ász-ünk-kal* style-ist-our-with).

The number of consonant phonemes is 24: p, b, t, d, ty[tʰ], gy[dʰ], k, g, f, v, sz[s], z, s[š], zs[ž], h, c[tʰ], cs[č], dzs[j], m, n, ny[nʲ], l, r, j. The letter combination *ly*, occurring in a small set of words, has the same phonetic value as *j*. Consonants also have long versions, indicated by doubling. Adjacent consonants at morpheme boundaries are subject to assimilation processes, among them voicing assimilation:

dob-t-am [doptam]
throw-PAST-1SG
tép-d [tébd]
tear-IMP.2SG

Word stress falls on the first syllable of words, and phrasal stress falls on the first major category of phrases.

Morphology

Hungarian is an agglutinating language. Nouns are inflected for number and case. There are 18 cases, among them a rich system of adverbial cases denoting various location, goal, and source relations:

ház-ban
house-INESS
'in house'
ház-ba
house-ILLAT
'into house'
ház-ból
house-ELAT
'from house'

Possessed nominals bear a possessedness marker and a morpheme agreeing in person and number with the possessor:

lány-a-i-m-at
daughter-POSS-PL-1SG-ACC
'my daughters'

Verbs are marked for tense (present or past), marked for mood (indicative, imperative/subjunctive, or conditional), and bear an agreement suffix indicating the person and number of the subject.

vár-ok
wait-(PRES)-1SG
vár-t-ál
wait-PAST-2SG

vár-j-on
wait-IMP-3SG
vár-ná-uk
wait-COND-1PL
vár-t-ak vol-na
wait-PAST-3PL AUX-COND
'they would have waited'

Definite objects elicit the object-agreement suffix *jaleli* (*lát-já-tok őt* see-OBJ-2PL him 'you see him'), which in many cases fuses with the subject agreement morpheme, yielding an objective conjugation. Verb stems usually denote processes or states; telic accomplishments and achievements are mostly derived by means of verbal particles prefixed to the verb: *eszik* 'eats' – *meg-eszik* up eats; *megy* 'goes' – *be-megy* in goes. Hungarian lacks passive voice. Infinitives selected by an impersonal matrix predicate have their own dative-marked subject, with which they agree in person and number.

Postpositions also agree in number and person with their pronominal complement:

mi mellett-ünk
we near-1PL
'near us'
ti után-atok
you-after-2PL
'after you'

Syntax

The Hungarian sentence displays a 'Topic Focus V XP' order. The topic, or topics, names the referent(s) that the sentence is about. Any argument can serve as topic:

Jánosnak oda-adta Péter a könyvet
John-DAT PRT gave Peter the book

Péter oda-adta Jánosnak a könyvet
Peter PRT gave John-DAT the book

A könyvet oda-adta Péter Jánosnak
the book-ACC PRT gave Peter John-DAT

The immediately preverbal focus is the prosodically and pragmatically most emphatic constituent. If represented by a definite or a specific indefinite noun phrase, it expresses exhaustive identification. Thus *Péter JÁNOSNAK adta oda a könyvet* means 'It was to John that Peter gave the book'; *A könyvet PÉTER adta oda Jánosnak* means 'It was Peter who gave the book to John'. The postverbal order of arguments is free. Universally quantified phrases such as *mindenki* 'everybody', *minden fiúnak* all boy-DAT 'to all the boys' stand between the topic and the focus. The verb, the focus, or both can be preceded by a negative particle: *Nem JÁNOS nem vett autót* not John not bought car 'It wasn't John

who did not buy a car'. The negative particle triggers negative concord: *Senki nem vett semmit* nobody not bought nothing 'Nobody bought anything'. Interrogative phrases appear in the preverbal focus position (e.g., *János kit szeret?* John whom loves 'Who does John love?').

The noun phrase is head-final. Articles and attributive adjectives do not agree with the head noun. Numerals block the plural marking of the noun: *két piros alma* two read apple.

Hungarian is a pro-drop language. When combined with phonetically null morphemes, the copula is also dropped, cf.: *Éva beteg* Eve sick 'Eve is sick' – *Éva beteg volt* Eve sick be-PAST 'Eve was sick', *Beteg vagy-ok* sick be-1SG 'I am sick').

Hurrian

J G Macqueen, University of Bristol, Bristol, UK

© 1994 Elsevier Ltd. All rights reserved.

Hurrian is an ancient near-Eastern language which was in use during the later third and second millennia BC. Proper names of recognizably Hurrian form appear in northern Mesopotamia and the hills to the east from ca. 2300 BC, and by the beginning of the second millennium Hurrian-speaking peoples had established themselves in small kingdoms across much of that area. By ca. 1500 BC Hurrian was in widespread use across an area which reached as far as the Mediterranean coast in northern Syria, and cultic and ritual texts composed in Hurrian are known from as far afield as central Anatolia.

Hurrian is an agglutinative language. The root normally stands in initial position, and is not in itself either nominal or verbal. Noun forms are indicated by the addition of a stem vowel to the root, and this is followed by derivational and then relational (case) suffixes. These include agentive (subject of a transitive verb when the object is expressed) contrasted with zero-suffix (subject of an intransitive verb; direct object of a transitive verb) – i.e., Hurrian is ergative – ; genitive; dative; directive; comitative; locative; stative. Verbal suffixes indicate tense/aspect, negation, mood, etc., and are not preceded by any stem-vowel. As with the noun, derivational suffixes (e.g., iterative, factitive) come first; these are followed by aspectual/temporal forms – perfective (past tense), imperfective (future tense), and neutral/aspectless (present tense). Then come classmarkers indicating either transitive or

intransitive, negative markers, and agentive (person-) and modal markers. Two series of markers exist for the expression of negation and person in the indicative and nonindicative moods.

A brief sentence illustrating some of these points is: *un-a-lla-an žen-iff-ya*. Here *un* has the root idea of 'coming,' the lack of an aspectual/temporal marker indicates a present action, *-a-*, is an intransitive classmarker, *-lla-* is a 3rd PL marker and *-an* is a connective, while *žen* is the 'brother' root, *-iff-* is a 1st SG pronominal, and *-ya* is a dative indicator. The resultant translation is: 'And they [in the context 'gifts'] are coming for my brother.'

Hurrian seems to have died out not long after 1000 BC. A related language, Urartian, was in use in eastern Anatolia from about 850–600 BC. Urartian is not a direct descendent of Hurrian, but rather a parallel development from a common parent language to be dated at least to the earlier third millennium BC. Increasing study of the modern languages of the eastern Caucasus plausibly suggests that Hurrian and Urartian may be members of that linguistic group (see *Caucasian Languages*).

Ijò

K Williamson, University of Port Harcourt, Port Harcourt, Nigeria

© 1994 Elsevier Ltd. All rights reserved.

The name Ijò, often anglicized as Ijaw, refers to a language cluster spoken in the Niger Delta area of Nigeria, by people who recognize a common linguistic and ethnic heritage. In older works, Ijò was considered to constitute a single language. But there is neither mutual intelligibility over the whole area, nor a single accepted standard written form, to justify its treatment as a single language. It is of particular interest because both typologically and genetically it is quite distinct from all its neighbors but one.

The Name 'Ijò'

The name 'Ijò' was first recorded by Europeans with a 'j.' In some parts of the area, however, people refer to themselves and their language as Iẓon (Iẓo, Uẓo). The term 'Ijò' is commonly used for the entire linguistic and ethnic group, and 'Iẓon' for the area where people refer to themselves and their language as Iẓon.

Nigerian orthographic conventions used in language names are as follows:

| | | | |
|---|-----|---|-----|
| o | [ɔ] | u | [ɔ] |
| e | [ɛ] | b | [β] |
| i | [i] | | |

The Classification and Nomenclature of Ijò

Ijò was first classified in the Kwa language group (e.g., Greenberg 1963). Bennett and Sterk (1977), however, showed that by lexicostatistic counts it was quite remote from both Kwa and Benue–Congo languages. It is now generally believed to branch off the Niger–Congo family tree at a much higher level (Bendor-Samuel 1989).

The only language closely related to Ijò is the tiny Defaka language, spoken in one section of Nkoro, the easternmost town in which Ijò is spoken (Jenewari 1983, 1989). Together, Ijò and Defaka are referred to as 'Ijoid.'

Using a revised nomenclature for the classification by Jenewari (1989), Ijò can be divided into west and east. West Ijò consists first of the inland Ijò group, comprising three isolated languages: Biseni, Akita (Okordia), and Tugbeni (Oruma); and second of Iẓon, a large language with a complex dialect situation. The late twentieth-century view of the Iẓon dialects distinguishes between the west Iẓon dialects (about seven, Arogbo being typical) and the central Iẓon dialects. The central Iẓon dialects subdivide into north and south; there are some eleven northwest central dialects, Mein being typical, and three northeast central dialects, Kolokuma being typical. There are some four southwest central dialects, east Olo-diana being typical, and some four southeast central dialects, Ẓumò (Boma) being typical.

East Ijò consists of three languages or dialect clusters: first Nembe–Akaha (Akassa), second KAKIBA (Kalabari–Kiriķe (Okrika)–Iḅani), and third Nkoro. There is no complete break in intelligibility; speakers of Nembe–Akaha, the westernmost east Ijò dialects, communicate with speakers of Ẓumò, the easternmost west Ijò dialect.

Geographical Location and Number of Speakers

Ijò is spoken in Nigeria, in the mangrove swamp and fresh-water areas of the Niger Delta and connected waterways bordering on the Atlantic Ocean, from the east of Rivers State to the east of Ondo State. Speakers are estimated at over a million.

Typological Characteristics of the Group

Ijò is a classical S(ubject)–O(bject)–V(erb) language. Adverbials typically occur between Subject and Object, but for emphasis they can be placed sentence-initially; as after-thoughts, or more generally in some east Ijò dialects, they also occur sentence-finally. Tense and aspect markers normally occur after the verb. Serial verb constructions are very common, only the last verb of the series being marked for tense and aspect. There are a few suffixes, 'verbal

extensions' or 'extensional suffixes,' which add meanings such as causative or reciprocal to the meaning of the verb root.

Qualifiers typically precede the noun. Nominalizations and relative clauses are usually formed by adding a general noun such as *person* or *thing* to the end of the part of the sentence which is being nominalized or relativized; alternatively, a relative marker may introduce a relative clause which would be unduly complex.

Ijò has lost the typical Niger–Congo noun class system. It has, however, developed a natural gender system; in Nembe, plural nouns are marked as human or nonhuman, while singular ones are feminine (female beings), masculine (male beings, animals (including females)), and a few classes of objects, such as knives or containers), or neuter (humans of undetermined sex and all objects not classified as masculine). This system is marked in demonstratives, definite articles, and pronouns.

Typically, Ijò dialects have vowel harmony with nine oral and nine nasal vowels, though some have reduced the number. Labio velar stops occur in all dialects; in many dialects they are in contrast with voiced implosives. KAKIBA and inland Ijò have two tones plus downstep, some Iẏon dialects have two

tones without downstep, while many other Iẏon dialects and Nembe–Akaha have pitch–accent systems. The typical root structure is CVCV(CV) (where C = Consonant and V = Vowel). Some words begin with vowels and in KAKIBA also with syllabic nasals, as the result of the loss of initial consonants or the retention of the remnants of old noun class prefixes.

Ilocano

C Rubino, Rockville, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Ilocano (Iloko, Ilokano, Samtoy) is an Austronesian language with 8 million speakers whose ancestral homeland is northwest Luzon Island, Philippines. It is the third largest language in the Philippines after Tagalog (the basis of the Philippine national language) and Cebuano (Sugbuanon). Ilocano is the largest member of the Cordilleran language family of Northern Philippine languages. Within the family, Ilocano forms its own branch with no close relatives. Other Cordilleran languages include: the Alta branch, the South Cordilleran languages of Kallahan, Ibaloi, Pangasinan, and Ilongot; the Central Cordilleran languages of Isinai, Ifugao, Balangao, Bontok (Bontoc), Kankanay (Kankanaey), Kalinga, and Itneg; Arta; and the Northern Cordilleran languages that can be subdivided into the Cagayan Valley languages of Gaddang, Itawis (Itawit), Agta, Ibanag, Atta, Yogad, and Isneg (Isnag), and the North East Luzon branch that comprises Paranan and the Dumagat (Agta, Casiguran Dumagat) languages.

The original Ilocano provinces include Ilocos Norte, Ilocos Sur, and La Union, but Ilocanos have migrated extensively and even predominate in many localities in the neighboring provinces of Abra, Pangasinan, Tarlac, Benguet, and Cagayan. In the provinces of Abra and Pangasinan, many of the Ilocano speakers are ethnically Tinguian or Pangasinan, respectively, who have traded in their native tongues for the more prestigious *lingua franca*. There are also large communities of Ilocano speakers in the major urban centers of the United States, most notably in California and Hawaii.

Unlike most of the major languages of the Philippines, dialectal variation in Ilocano is minimal. There are two main dialects, Northern and Southern, easily distinguishable by slight lexical differences, intonation patterns, and the pronunciation of the native phoneme /e/, which is pronounced as the *e* in English *let* in the Northern dialects of Ilocos Norte and parts of Ilocos Sur, and as a high, central-back unrounded vowel [u] in Abra, the southern parts of Ilocos Sur, La Union, Tarlac, and Pangasinan.

Ilocano has 15 native consonantal phonemes, and a glottal fricative used in one native word in the

Table 1 Ilocano consonants

| | ±Voice | Labial | Dental | Alveolar | Palatal | Velar | Glottal |
|------------|--------|--------|--------|----------|---------|-------|---------|
| Stops | – | p | t | | | k | – |
| | + | b | d | | | g | |
| Fricative | – | | | s | | | (h) |
| Affricates | – | | | ts, /ty/ | | | |
| | + | | | /dy/ | | | |
| Lateral | + | | | l | | | |
| Tap/trill | + | | | r | | | |
| Glide | + | w | | | y | | |
| Nasal | + | m | | n | | ŋ | |

Table 2 Ilocano vowels

| | Front | Central | Centralized back | Back |
|------|-------|---------|------------------|------|
| High | i | | e | u |
| Mid | (ɛ) | | | (o) |
| Low | | a | | |

southern dialect, *baán* ‘no’, the colloquial variant of *saán*, as well foreign loans (see **Table 1**). Of the consonants, 14 (all but the glottal stop) may appear geminate in roots; the glottal stop only occurs geminate across morpheme boundaries: *agaC-áarak* [agaʔʔá:rak] ‘smelling of alcohol’.

Stops are unaspirated and, in final position, unreleased. The voiceless velar stop is pronounced quite far back and fricatives before vowels. Unlike in Tagalog, glottal stop does not phonemically appear word-finally. Glottal stop is not represented orthographically word-initially, and word-medially, it is represented with a hyphen. Syllables have mandatory onsets, so the basic syllable structure of the language is CV(C): *ába* ‘taro’ [ʔá:.ba].

The phonemes /t/, /d/, and /s/ palatalize to [tʃ], [dʒ], and [ʃ] before the palatal glide /y/ or its equivalent (i + vowel), e.g., *siák* ‘P’ [ʃak], *tián* ‘belly’ [tʃan], *idiáy* ‘there’ [idʒay]. Because of many borrowings from English, Spanish, and colloquial Tagalog where these palatal sounds are not complex phoneme sequences, the phonemic status of [tʃ], [dʒ], and [ʃ] is open to debate.

Ilocano has four native vowel phonemes /i, e, a, and u/. The new phonemes /o/ and /ɛ/ are post-Hispanic (only in loanwords) (cf. **Table 2**). In the northern dialects, the phoneme /ɛ/ is pronounced as /e/, not differentiated from its pronunciation in Spanish loanwords.

The high vowel [u] is lowered considerably in word-final syllables, and is thus usually represented in the orthography, e.g., *ások* ‘my dog’ /á:su = k/.

Sequences of two vowels other than the diphthongs /ia/, /io/, and /ua/ are pronounced as two syllables, with an intervening glottal stop in careful speech, *saán* [sa.ʔan] ‘no’ but: *al-aliá* ‘ghost’ [ʔal.ʔal.ya].

Stress is phonemic, e.g., *siká* ‘you, familiar’ vs. *síka* ‘dysentery’. There, are, however, certain environments that attract stress. Stress falls on the last syllable if the penultimate syllable is closed: *paltóg* ‘gun’, *takkí* ‘excrement’, *tig-áb* ‘belch’, *pugtó* ‘guess’. Exceptions to this rule include words of foreign origin or words with a velar nasal coda preceding a final syllable: *bibíngka* ‘rice cake’, *karám̄ba* ‘jar’ (Spanish loan). In native words, stress also falls on the last syllable if the last vowel is preceded by a consonant and glide: *sarunuén* ‘follow’, *aniá* ‘what’.

Orthographic double vowels following two consonants usually take stress on the first vowel, with an intervening glottal stop or syllable boundary, e.g., *kanabraang* [ka.nab.rá:.ʔang] ‘gong’, *kulláaw* [kul. lá:.ʔaw] ‘owl’. Words that include two identical CVC sequences separated by a vowel usually will carry the stress on the vowel separating them: *salísal* ‘compete’, *batíbat* ‘nightmare’. There are, however, a few exceptions: *yakayák* ‘sieve’, and *pidipíd* ‘closely set together’.

Vowels before geminate consonants and in stressed open (CV) syllables are automatically lengthened: *sála* ‘dance’ [sá:.la], *babbai* ‘girls’ [bà:b.bá:.ʔi]. Open reduplicated syllables in roots that contain a vowel sequence also bear secondary stress/lengthening: *na.ka-bà:-ba.in* ‘shameful’.

Like its sister Philippine languages, Ilocano is a head-marking, predicate-initial language. When two nominals appear postpredicately, the agent normally precedes the patient: *P{in}artí ti baró ti kaldíng* (slaughter{PERF.TRANS} ART bachelor ART goat) ‘The bachelor slaughtered the goat’. The initial position in Ilocano syntax is reserved for the predicate so constituents in this position are predicative: *Tabbéd ni Bong*, ‘Bong is stupid’, *alutiút* ‘(it is a) house lizard’. When a noun phrase does precede a predicate for

Table 3 Ilocano voice

| Transitivity | Orientation | Affix | Perfective | Example | Gloss |
|--------------|--------------|---------------------------|-----------------------------|------------------------------------|-------------------------------------|
| Intransitive | Actor | <i>ag-</i> <i>-um-</i> | <i>nag-</i> <i>-imm-</i> | <i>agkatáwa</i> <i>dumakkél</i> | 'to laugh' 'to grow, become big' |
| Detransitive | | <i>mang-</i> | <i>nang-</i> | <i>mangán</i> | 'to eat' |
| Transitive | Patient | <i>-en</i> | <i>-in-</i> | <i>suráten</i> | 'to write something' |
| | Directional | <i>-an</i> | <i>-in-an</i> | <i>surátan</i> | 'to write to someone' |
| | Conveyance | <i>i-</i> | <i>in-; iny-</i> | <i>isúrat</i> | 'to write down' |
| | Benefactive | <i>i-an</i> | <i>in(y)-an</i> | <i>idaítan</i> | 'to sew for someone' |
| | Comitative | <i>ka-</i> | <i>kina-</i> | <i>katugáw</i> | 'to sit with someone; seat mate' |
| | Instrumental | <i>pag-</i> | <i>pinag-</i> | <i>pagíwa</i> | 'to slice with; knife' |

pragmatic reasons, it is preceded by a pause or the predicate marking particle *ket*. The phrase *Napintas ni Alessandra* 'Alessandra is pretty' can appear inverted as: *Ni Alessandra ... napintas* or *Ni Alessandra ket napintas*.

Most syntactic structures follow a head + modifier pattern. Genitives follow their nouns > *ti uken-ko* 'my puppy', *ti uken ni Rafael* 'Rafael's puppy'.

Typical of the native languages of the Philippine archipelago, there is a rigid voice distinction in the verbs whereby the semantic relationship between the verb and the pivot (the syntactically most privileged absolutive argument) is signaled by the verb's derivational morphology (Rubino, 2000).

The various voices in Ilocano are shown in Table 3. Each affix has an infinitival/imperative form and a perfective form. Initial CVC reduplication of the verb is employed for progressive (continual) verbs. So the actor voice verb *agdigos* 'take a bath' inflects as *agdigos* 'take a bath', *nagdigos* 'took a bath', *agdigdigos* 'is taking a bath', *nagdigdigos* 'was taking a bath.' The enclitic *=(n)to* which is realized as *=nto* after vowels and *=to* after consonants denotes future time, e.g., *agdigosto* 'will take a bath', *agdigoskanto* 'you will take a bath'. Other derivational possibilities with the root *digos* include *agindidigos* 'pretend to bathe', *pagdígos* 'used for bathing', *kadígos* 'bathing mate', *panagdigos* 'bathing', *idigos* 'to bathe with (+instrument)', *agpadigos* 'have a bath', *padigosen* 'bathe someone else', *pagdigusan* 'bathing place', etc.

Ilocano also has a potentive mode used for actions that are abilitative, coincidental, involuntary, or accidental. Potentive verbs are formed with the prefixes *ma-ka-* or *na-ka-*, e.g., *na-dungparko ti lugan* 'I accidentally hit the car' vs. *D{in}jungparko ti lugan* 'I hit the car (on purpose)'.

Compared to many other Philippine languages, the Ilocano noun marking system is rather simple, with only two case distinctions, a core case (for the two arguments that appear with a transitive verb or the one argument that appears with an intransitive predicate) and an oblique case for other referents.

Table 4 Ilocano articles

| | Non-personal, singular | Non- personal, plural | Personal, singular | Personal, plural |
|---------|---|-----------------------------|-----------------------|---------------------|
| Core | <i>ti</i> (neutral), <i>diay</i> (definite) | <i>dagití</i> | <i>ni</i> | <i>da</i> |
| Oblique | <i>ití</i> | <i>kadagití</i> | <i>kenní</i> | <i>kadá</i> |

As is shown in Table 4, plurality in nouns may be expressed by the article. Most countable nouns may also be pluralized by reduplication, e.g., *lalaki* 'boy' > *lallaki* 'boys', *sabong* 'flower' > *sabsabong* 'flowers', *kailian* 'townmate' > *kakailian* 'townmates'.

Ilocano has six sets of pronouns, which encode eight personal distinctions. There are three first person plural distinctions in the language, dual (you and I), exclusive (we but not you), and inclusive (we and you). The second person plural pronouns may be used to a single address to express politeness.

Independent pronouns are used predicatively (see Table 5). Ergative (genitive) and absolutive pronouns are enclitic; they behave like suffixes that do not attract stress shift, e.g., *Napán-ak idiáy* 'I went there', *sá-ak napán* 'then I went'. Monosyllabic enclitics are usually not immediately segmentable by native speakers and some show allomorphic variation dependent upon phonological environment. After the suffixes *-an* (NOMINALIZER; DIRECTIONAL) and *-en* (PAT), the first and second person ergative enclitics fuse with the final *n* to *-k*, and *-m*, respectively, e.g., *basaek/ basa-en = k(o)/ 'I'll read it'*. The first and second ergative enclitics also lose their final vowel after vowels, e.g., *adi-m* 'your younger brother', unless they follow the monosyllabic adverbs *sa* 'then' or *di* 'negation' or precede the adverbial enclitic *=(e)n* 'now, already' in which they maintain their full forms, e.g., *kuarta-k* 'my money' vs. *kuarta-ko-n* 'It's my money now'.

When two enclitic pronouns meet in Ilocano, they fuse in such a way that some agentive distinctions are

Table 5 Ilocano pronouns

| Gloss | Indep | Ergative | Absolutive | Oblique | Independent | Reflexive |
|---------------------|----------------|---------------|---------------|------------------|----------------------------|-----------------|
| 1s | <i>siák</i> | = <i>k(o)</i> | = <i>ak</i> | <i>kaniák</i> | <i>kukuák, bágik</i> | <i>bagík</i> |
| 2s familiar | <i>siká</i> | = <i>m(o)</i> | = <i>ka</i> | <i>kenká</i> | <i>kukuám, bágim</i> | <i>bagím</i> |
| 3s | <i>isú(na)</i> | = <i>na</i> | – | <i>kenkuána</i> | <i>kukuána, bágina</i> | <i>bagína</i> |
| 1 dual incl | <i>data</i> | = <i>ta</i> | = <i>ta</i> | <i>kadatá</i> | <i>kukuáta, bágita</i> | <i>bagíta</i> |
| 1 pl excl | <i>dakamí</i> | = <i>mi</i> | = <i>kamí</i> | <i>kadakamí</i> | <i>kukuámi, bágimi</i> | <i>bagími</i> |
| 1 pl incl | <i>datayó</i> | = <i>tayó</i> | = <i>tayó</i> | <i>kadatayó</i> | <i>kukuátayo, bágitayo</i> | <i>bagítayo</i> |
| 2 pl, (2 sg formal) | <i>dakayó</i> | = <i>yo</i> | = <i>kayo</i> | <i>kadakayó</i> | <i>kukuáyo, bágiyo</i> | <i>bagíyo</i> |
| 3 pl | <i>isúda</i> | = <i>da</i> | = <i>da</i> | <i>kadakuáda</i> | <i>kukuáda, bágida</i> | <i>bagída</i> |

Table 6 Ilocano articles and demonstratives

| Visibility | Range | Article | Demonstrative, core, singular | Demonstrative, core, plural | Demonstrative, oblique, singular | Demonstrative, oblique, plural |
|-------------------|----------|-------------|----------------------------------|--------------------------------|-------------------------------------|-----------------------------------|
| Visible ↓ Neutral | Proximal | <i>toy</i> | <i>daytáy</i> | <i>dagitáy</i> | <i>kadaytáy</i> | <i>kadagitáy</i> |
| | Medical | <i>ta</i> | <i>daytá</i> | <i>dagitá</i> | <i>kadaytá</i> | <i>kadagitá</i> |
| | Distal | <i>diay</i> | <i>daydiáy</i> | <i>dagidiáy</i> | <i>kadaydiáy</i> | <i>kadagidiáy</i> |
| Out of sight | Recent | <i>tay</i> | <i>daytáy</i> | <i>dagitáy</i> | <i>kadaytáy</i> | <i>kadagitáy</i> |
| | Remote | <i>di</i> | <i>daydí</i> | <i>dagidí</i> | <i>kadaydí</i> | <i>kadagidí</i> |

neutralized. Thus *gayyem-nak* may mean both ‘I am your friend’ or ‘I am his/her friend’; *Ay-ayaten-da-ka* can mean ‘They love you’ or ‘We love you’.

Ilocano deictics include spatial/temporal demonstratives (which have abbreviated article forms) and temporal adverbs that mark relative time. The temporal adverbs are *itá* ‘now, today’, *itattá* ‘right now’, *itattáy* ‘just a while ago, immediate past’, *itáy* ‘a while ago, recent past’, and *idí* ‘a while ago, remote past’. Temporals can mark both verb phrases and temporal nouns: *N-ag-paráng idí*. (PF-ACT-appear REM.PST) ‘It appeared a while back’, *idí rabií* (REM.PST night) ‘last night’. There is also a future marker (*in*)*ton(o)* that precedes temporal nouns; it cannot be used as a temporal adverb: *intón bigát* (FUTURE morning) ‘tomorrow’.

The nontemporal Ilocano demonstratives mark three degrees of spatial orientation and two degrees of temporality (see Table 6).

The recent and remote articles and demonstratives are used for referents that are not visible in the speech event. They mark referents that may be dead,

non-actual, or somehow distanced from the speech event. Referents that are recently activated into the consciousness of the speaker may also appear with a nonvisible demonstrative. Compare *N-ag-paráng ni Erning*. ‘Erning appeared/showed up’ vs. *Nagparáng daydi Erning*. ‘The late Erning appeared (as a ghost)’; *Ania ti nágan = mo?* ‘What is your name (*nagan*)’ vs. *Ania tay náganmo [manén]?* ‘What was your name [again], (I used to know it)?’

Indo-Aryan Languages

S Munshi, University of Texas, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Indo-Aryan languages (sometimes also called 'Indic' languages) are spoken in India, Pakistan, Bangladesh, Nepal, Sri Lanka, Bhutan and Maldives – the group of seven countries also known as the South Asian Association of Regional Cooperation (SAARC) countries. More than two-thirds of the total population of South Asia speaks Indo-Aryan languages. Owing to 20th-century migrations, considerable numbers of Indo-Aryan speakers have settled in non-SAARC countries, especially in Europe and North America. Indo-Aryan constitutes the largest language group in the Indo-European language family in terms of numerical weight of speakers (said to be approximately one-fifth of the total world population, the total number of speakers exceeding 700 000 000) as well as in terms of the total number of languages in the family (more than 70, of which 24 or more enjoy official status and have literary history). Some of the major languages in the family, both in terms of number of native speakers and literary history, are Hindi, Urdu, Bengali (known to its native speakers as Bangla), Assamese, Punjabi, Gujarati, Marathi, and Oriya. Sanskrit, in terms of historical significance and role in the development of modern Indo-Aryan languages, notwithstanding the very small number of native speakers (only a few hundred), enjoys a very important position within the Indo-Aryan language family. Romani/Romany (popularly known as the 'Gypsy' language), also a language of Indo-Aryan origin, is spoken by several million people in various countries around the world.

Being a region of enormous linguistic diversity, the sociolinguistic situation of South Asia projects a very complex picture. Indo-Aryan languages are in constant and intimate contact with languages belonging to different language families, viz., Tibeto-Burman, Iranian, Dravidian, and Austroasiatic (Munda) languages. In South Asia, from region to region, the accents, dialects, and languages change. The dividing lines between languages are often distorted by large numbers of overlapping and interwoven dialects. It is extremely rare that speakers use only one language; multilingualism is the norm. Speakers often switch between two or more languages. In the context of multilingualism, English, a foreign language, plays a major role. It has a special status in South Asia as a medium of higher education, often associated with social prestige and power. In India, after 54 years of independence, English continues to be the second

official language along with Hindi and other official languages. As a result of multilingualism, code switching, and borrowing, most Indo-Aryan languages, especially those of wider communication, have been considerably influenced. This has resulted in the emergence of various mixed languages, pidgins, and creoles. The contact situation has also led to gradual loss of native languages among many regional groups of people.

Distribution of Major Indo-Aryan Languages

Broadly speaking, Modern/New Indo-Aryan (NIA) languages fall into four geographical groups: northwestern, southwestern, midlands, and eastern. The northwestern group includes Sindhi, Punjabi, Lahnda/Lahndi, Pahari, Dogri, Kashmiri, and other Dardic languages. The southwestern language group comprises Gujarati, Marathi, Konkani, Maldivian, and Sinhala (the official language of Sri Lanka). Major languages in the eastern group are Bengali, Assamese, and Oriya. The midlands Indo-Aryan group consists of Hindi and its different dialects, Urdu (the official language of Pakistan) and its various dialects, a variety of dialects known as Eastern and Western Hindi, and many other languages. At the level of the colloquial language spontaneously spoken/heard on radio, television, or other media, and in the schools/colleges of northern India and Pakistan, Hindi and Urdu are virtually one language. They share a single, identical grammatical system and most of the vocabulary. What makes them two distinct languages are their separate writing systems, different borrowing strategies, and a very robust language ideology. For political purposes, they are essentially two languages.

In terms of total number of speakers, Hindi ranks first, with over 337 million speakers (Cardona and Jain, 2003: 4). It is considered to be the third to fifth most widely spoken language in the world. The term 'Hindi belt' refers to the regions of India with major concentrations of Hindi speakers, viz., the states of Bihar, Uttar Pradesh, Rajasthan, Haryana, Himachal Pradesh, Delhi, and Madhya Pradesh. Hindi is also widely spoken in Mumbai, with distinct regional peculiarities. In addition to Hindi, several other native regional languages, very close to Hindi in mutual intelligibility, are spoken in the Hindi belt. Urdu is spoken by approximately 43.4 million people in India, 6.4 million people in Pakistan, and 275 000 people in Bangladesh. It serves as the lingua franca among the Muslims of South Asia living in and outside the subcontinent. In several studies of Hindi

dialectology, Urdu has been listed as one of the dialects of 'Hindi,' or Hindustani. Historically, Urdu developed from Khari Boli, or 'Hindavi,' which originated in the Delhi area and was considerably influenced by Kauravi, Hariyanavi, Mevati, eastern Punjabi, and Braj Bhaṣa, which, in turn, have developed from the literary language *Śauraseni Apab^hramśa* of Middle Indo-Aryan.

Other major NIA languages with considerably large number of speakers are Bengali (approximately 69.6 million speakers in India, primarily in West Bengal, and 108.6 million speakers in Bangladesh), Marathi (approximately 62.5 million speakers, mainly spoken in Maharashtra), Gujarati (the language of Gujarat, with approximately 40.67 million speakers), Oriya (the language of Orissa, with approximately 28.06 million speakers), Punjabi (approximately 23.37 million speakers in India, mainly in Punjab but also in several other states, and 50.9 million speakers in Pakistan), Assamese (the language of Assam, with approximately 13.08 million speakers), Sindhi (approximately 9.9 million speakers in Pakistan and 2.12 million speakers in India), Nepali (approximately 2.076 million speakers in India and 9.3 million speakers in Nepal), Konkani (approximately 1.76 million speakers in India) (Cardona and Jain, 2003: 4–5), and Kashmiri (over 4 million speakers in the Jammu & Kashmir state (*Ethnologue*, n.d.)).

The NIA languages are primarily spoken in South Asia, except for Romani, the only Indo-Aryan language spoken outside the subcontinent. The Romani language evolved as a result of the migration of a population of mixed ethnic and linguistic backgrounds from different parts of India. The migration, which started in the 1100s and continued into the 14th century, took this mixed population to several countries, viz., the Byzantine Empire (Greece), Serbia, Croatia, Bulgaria, Romania, Hungary, Germany, France, Rome, Spain, Catalonia, Cyprus, Switzerland, Russia, and the United States (a total population of approximately 12 million people around the world). Despite obvious Iranian and European influence, Romani is built on a central Indo-Aryan core. It has several regional dialects, Vlax being considered as the 'standard' dialect by various scholars.

Historical Development

The Indo-Aryan language group is a major branch of the Indo-Iranian language subfamily, constituting the easternmost group within the Indo-European language family. Research on Indo-Aryan languages leading to the discovery of their relationship to the rest of the languages in the Indo-European family represents a major breakthrough in historical and

comparative linguistics. The development of Indo-Aryan languages can be traced back to a continuous span of at least 3500 years (Masica, 1991), although many scholars argue for a much earlier date of origin. The period is broadly divided into three stages: Old Indo-Aryan (c. 1500 to 600 B.C.), Middle Indo-Aryan (c. 600 B.C. to A.D. 1000), and Modern/New Indo-Aryan (A.D. 1000 onward) (Masica, 1991).

Based on their geographical distribution, Middle Indo-Aryan (MIA) dialects are classified into four main groups that developed into the present-day NIA languages: northwestern, southwestern, midlands, and eastern. In terms of phonological changes, the most conservative group consists of the northwestern dialects of the MIA, which have retained many of the Old Indo-Aryan (OIA) features and even some Indo-Iranian ones not attested in OIA. To this group belong languages such as Punjabi, Sindhi, Lahnda, Pahari, and many languages of the Dardic group, including Kashmiri. Some of the most characteristic features with respect to the phonological system of the northwestern group include retention of three sibilants (palatal ś, dental s, and retroflex ṣ) of the OIA. In many languages, these have merged into *s* or *ś* and ś; the distinction between the OIA liquids *l* and *r* has also been maintained only in certain northwestern (Shahbazgarhi and Mansehra) and in western (Girnar) groups, whereas elsewhere, they merged with *l*. The most advanced group is the eastern dialect of MIA, which has undergone the greatest number of changes.

The oldest and the best contemporary records of MIA are the Aśokan inscriptions (3rd century B.C.) in various dialects written in Kharoṣṭhī on rock edicts (e.g., Mansehra and Shahbazgarhi versions, which represent the northwestern dialects). Owing to certain changes peculiar to the dialects, the terms *Pāli* and *Apab^hramśa* have been employed to refer to the Aśokan dialects. *Prakrit* is a general term often used in the context of MIA dialects to refer to the vernacular varieties other than *Pāli* and *Apab^hramśa*. *Pāli*, the language of the Hinayana Buddhist canon and based on a midland dialect (Masica, 1991: 52), and a representative of the early MIA, developed in northern India before 200 B.C. but was produced much later in Sri Lanka, Burma, and Thailand (Masica, 1991: 56). Most advanced literary dialects of the MIA are the *Apab^hramśa* dialects, which form a rich source of literary texts dating back to A.D. 600 and earlier. In opposition to *Pāli*, *Prakrits*, and *Apab^hramśa*, is the more prestigious *Sanskrit* (the term *Sanskrita* means 'adorned/polished/cultured (language)'). No single attested Vedic dialect has been proved to be the predecessor of the Classical Sanskrit.

Indo-Aryan languages represent a source of a rich literary tradition over thousands of years. The first recorded texts, the Vedic hymns, date back to 1500 B.C. Study of grammar occupied a very important position in the ancient Indian educational system. Students had to study Vedas as well as ancillaries to Vedas, the *Vedāṅgas*. The latter included *śikṣa* ‘phonetics’, *vyākraṇam* ‘grammar’, *cʰandas* ‘meter’, *niruktam* ‘etymology’ (i.e., explanation of difficult Vedic words), *jyotiṣam* ‘astronomy’ (the Vedic calendar), and *kalpah* ‘ceremonial’ (i.e., prescribing the rituals and laying down the procedures for carrying out sacrifices and other ceremonies) (Subrahmaniam, 1999: 1). Extensive information on the details of OIA of different time periods and areas is available in Vedic recitation in *Prātiśākhya* works and in the classic works of ancient Indian grammarians such as Pānini (between the 6th and 4th centuries B.C.) and Patanjali (2nd century B.C.) (Cardona and Jain, 2003: 7). Pānini’s *Aṣṭadhyāyī* is an elaborate treatise on Sanskrit grammar consisting of eight (*aṣṭa*) chapters (*adhyāya*). There is a total of 4000 *sūtras*, which are algebraic-formula-like grammatical statements and rules traditionally assigned to six types: *saṃjñā* (definitions of technical terms), *paribhāṣā* (interpretation of grammatical statements), *adhikāra* (defining the scope of a grammatical rule), *vidhi* (signifying operational rules of grammar), *nīyama* (restricting the scope of *vidhi sūtras*), and *atideśa* (extending the scope of *vidhi sūtras*) (Singh, 1991: 1).

Writing Systems

Two very popular ancient Indo-Aryan writing systems are Kharoṣṭhī and Brāhmi. Whereas Kharoṣṭhī is written from right to left and was widely used in northwest India and Central Asia, Brāhmi is written from left to right and was popular elsewhere. Kharoṣṭhī was in use from the Aśokan period until around the 4th century A.D., and is generally agreed to be a derivation of Aramaic. Several theories have been put forth for the origin of Brāhmi. Although Indian scholars have argued for the indigenous origin of Brāhmi, many Western scholars have assumed Brāhmi to be derived from a Semitic prototype (Masica, 1991: 133). Some archaeologists argue for the emergence of Brāhmi in the 5th century B.C., but with the discovery of the Indus Valley (Harappan) civilization of c. 2500–1800 B.C. in the early 20th century, with its still undeciphered script, a new dimension was added to the question of the actual time of origin for the Brāhmi script. Many scholars now believe Brāhmi to be a derivation of the Harappan script, although some disagree, considering this to be a radical viewpoint.

Most modern Indo-Aryan writing systems have emerged from Brāhmi. The best known contemporary and widely used script that originated from Brāhmi is the Devanāgri/Nāgri script. Devanāgri, in various modified forms, is used to write several languages, including Sanskrit, Hindi, Bengali, Marathi, and Nepali. It is an outcome of several developmental stages following Brāhmi. Shāradā, a close relative of Brāhmi, which was used for writing Kashmiri several centuries ago, has been recently argued by some scholars to be the immediate predecessor of Devanāgri, which is built on the same system and corresponds with Shāradā letter for letter, although the letters have considerably changed in form. Shāradā is closely associated with the Takri alphabet used for writing Punjabi.

Modified forms of Perso-Arabic (Nastālīq) are currently used to write Urdu, Sindhi, Punjabi (Gurmukhi and Nastālīq are the officially recognized scripts for writing Punjabi), Kashmiri, Shina, and Khowar. Perso-Arabic writing systems for Urdu and Kashmiri are officially recognized whereas those for Shina and Khowar are still struggling for recognition. Representation of additional sounds not present in Persian/Arabic is achieved by use of additional diacritics to suit the specific phonemic inventories of different languages. Redundant Arabic graphemes are retained only in the spelling of Arabic or Persian borrowings, as are certain redundant letters of neo-Brāhmi (Masica, 1991: 151). Representation of Indo-Aryan vowels in Perso-Arabic script, however, is slightly problematic, especially in languages with large vowel inventories. Short vowels are not represented in this system. Reading, therefore, is often a stressful exercise for nonnative speakers and sometimes even for the native speakers beginning to read a language. It is difficult to distinguish between /e:/, /ai/, and /i:/ in word-medial position because only one symbol is used to represent all three of these vowels. Similarly, there is only one symbol representing the vowels /u:/, /o:/, and /au/ in postconsonantal position. Official script for Kashmiri is more advanced in this respect. Each vowel of the 16-vowel system is represented differently with the help of particular diacritics that are commonly used in literature and are officially recognized.

In the Maldive Islands, a script called Tana/Thaana is used. This script is argued to be phonologically quite efficient, and, written from right to left, is a complete innovation. Tana employs symbols, some of which are based on Arabic diacritics and numerals (Masica, 1991: 152). Konkani is probably the only language that seriously uses Roman script for writing. Representation of peculiar sounds is achieved by use of diacritics and special writing conventions.

Phonological Characteristics

Various phonetic and phonological changes characteristic of the Indo-Aryan group distinguish it from the Iranian group of the Indo-Iranian language family. These include (1) reduction of final consonant clusters; (2) absence of voiced sibilants (except in certain NIA languages/dialects, for which voiced sibilants resulted at a later stage of development); (3) retention of voiced aspirated stop consonants, thus having a fourfold distinction of stop consonants in terms of manner of articulation (except in the northwestern languages, which were influenced by contact with Iranian languages); (4) retention of /l/ vs. /r/ distinction in Classical Sanskrit and many central and (north-) western languages and dialects of MIA and NIA (In Iranian languages, /l/ and /r/ indiscriminately merged into /r/); and (5) development of retroflex consonants, a possible result of Dravidian influence on Indo-Aryan languages and an innovation in the Indo-European languages (Note that Burushaski, a language isolate spoken in the region between South and Central Asia, also possesses retroflex consonants). OIA typically consists of a large number of two-consonant and three-consonant clusters that occur at initial, medial, and final positions. However, a large number of these clusters are drastically limited in MIA by several phonological operations, including epenthesis or assimilation in place and manner of articulation. OIA final consonants were generally lost in MIA dialects, with the exception of *m*, which developed into its vocalic counterpart *m̄*, as in Pāli *puttā* from Sanskrit *putrāt* 'son' (ablative singular) and *putrās* 'son' (nominal singular), but Pāli *puttām* from Sanskrit *putram* (Cardona, 1987: 441). Dissimilar consonants were assimilated in interior clusters by progressive or regressive assimilation, depending on the nature of consonants involved. Examples are Pāli *puttā*, *sat^bi-*, and *vagga-* from Sanskrit *putrā*-son', *sakt^bi-* 'thigh', and *varga-* 'group' (Cardona, 1987: 441). Another MIA development was fricative weakening or lenition (except in some dialects), primarily in the postconsonantal position (i.e., *s* > *h/C_*; e.g., Pāli *b^bikk^bu* from OIA *b^bikṣu* 'monk'; the process is accompanied by consonantal assimilation), and also in pre-consonantal position, when weakening is accompanied by metathesis and gemination (e.g., Pāli *sukk^ba* from OIA *śuṣka*, with intermediate stages of *sukṣa* and *sukha*, respectively, in which the series of changes involve metathesis followed by fricative weakening and gemination, respectively; and Pāli *pupp^ba* from OIA *puṣpa* via intermediate stages of *puhpa* and *pupha*, in which the series of changes involve fricative weakening followed by metathesis and gemination, respectively) (Bubenik, 1996: 46). In the later stages of MIA, the

OIA geminates that were created as a result of consonantal assimilation (preserved in some dialects, e.g., Pāli) were degeminated. This was accompanied by compensatory lengthening of the preceding short vowel (e.g., OIA *paśyati* 'sees', *śiṣya* 'disciple' > Pāli *passati*, *siṣsa*, and Ardha Magadhi *pāsai*, *sīsa*), (Bubenik, 1996: 28). Compensatory vowel lengthening is also observed in several NIA languages in which vowel lengthening follows the degemination of MIA geminates, as in Hindi *sāt*, Bengali *śāt*, and Marathi *sāt* from MIA *satta*, resulting from OIA *sapta* 'seven'. Exceptions are Punjabi, Kashmiri, and some northwestern Indo-Aryan languages (e.g., Kashmiri *sat^b* vs. Hindi *sāt* 'seven'). OIA allowed light, heavy, and overweight syllables of the type VC, VCC, and V:CC, respectively. In MIA, long vowels were generally shortened in overweight syllables (V:>V/_CC). For instance, OIA *gātra* 'limb' and *grīṣma* 'summer' were replaced by MIA *gatta* and *gimha*, respectively (Bubenik, 1996: 29). Another way of eliminating heavy syllables in MIA was through epenthesis (e.g., MIA *sūriya* from Sanskrit *sūrya*). In many MIA dialects, the three sibilants, *ś* (palatal), *s* (dental), and *ṣ* (retroflex), merged into dental *s*. The distinction of three sibilants (and sometimes two) was, however, retained in the northwest dialects.

Although a remarkable stability is observed in the phonological system of NIA *vis-à-vis* that of MIA, and hence, OIA, different phonological operations affect both consonantal and vocalic sounds, thus differentiating the phonological systems of different NIA languages. The basic Indo-Aryan system of stops (which is also that of Sanskrit and the OIA) theoretically involves five distinctive articulatory positions of the tongue, namely, **labial**, **dental**, **retroflex** (or 'cerebral'), **palatal**, and **velar** (for example, /*p t t c k*/). Typical Indo-Aryan stop consonants are distinguished as voiceless vs. voiced (e.g., *p* vs. *b*) consonants, and unaspirated vs. aspirated (e.g., *p* and *b* vs. *p^b* and *b^b*, respectively) consonants. Some of the phonological changes taking place during the MIA stages continued through NIA, but several new developments also occurred. Voiced aspirates were lost in some languages, especially those of the northwest, being replaced by the corresponding voiced unaspirated obstruents (e.g., Kashmiri and Punjabi). In Punjabi, emergence of a tonal system worked as a compensation, whereby the OIA voiced aspirates were devoiced in addition to loss of aspiration. Retroflex consonants were often replaced by corresponding alveolars in many NIA languages, except in certain phonological environments. Some NIA languages and dialects reveal a tendency to replace the Indo-Aryan palatal stop /*c*/ by a 'dental' or alveolar affricate [ts]. This is observed in Nepali,

some dialects of Bengali, certain Rajasthani dialects, Kumauni, many West Pahari dialects, and several others (Masica, 1991: 94). In some languages and dialects, MIA /c/ surfaces as [c] in certain environments (e.g., before front vowels or palatal glide /y/) and as [ts] elsewhere. A further development in certain languages/dialects is a phonemic contrast between /c/ and /ts/, as in Marathi, Konkani, some West Pahari dialects, and Kashmiri. A step further is realized in the Southern Mewari dialect of Rajasthani, the Chittagong dialect of Bengali, and Assamese, in which the [ts] representation of /c/ is replaced by [s], thus, reducing the phonemic inventory. Palatalized consonants have developed in Kashmiri and some Dardic languages. A complete range of five phonemic nasals (labial /m/, dental /n/, retroflex /ŋ/, palatal /ɲ/, and velar /ŋ/) is found in Dogri, Kalasha, Shina, Sindhi, and some other languages (Masica, 1991: 95). However, in most other languages in this group, many of the different articulatory positions of nasals are often phonologically conditioned. The most frequently occurring nasals are /m/ and /n/. Phonemic palatal nasal /ɲ/ is found in Kashmiri, in which it is a result of a phonologically conditioned diachronic change whereby the palatal vowel inducing palatalization was eventually lost. Although most MIA dialects (except certain north-western and some central dialects) had lost the distinction between the OIA liquids /l/ and /r/ (they merged with either /l/ (Eastern dialect) or with /r/), all NIA languages have both /l/ and /r/ sounds. Certain languages, such as Oriya, Gujarati, many varieties of Rajasthani, Bhili, Punjabi, and some dialects of Lahnda, have developed a retroflex version of the lateral l. Retroflex flap [ɽ] has often been taken as an allophonic variant of /d/ in certain environments in many languages and in certain dialects of some languages. In some rural varieties of Kashmiri, /r/ surfaces as retroflex [ɽ] or even as [d] intervocally, whereas in Standard Kashmiri, the same phoneme surfaces as [r] in all phonological environments (e.g., [ko:ɽi]/[ko:dɽi] vs. [ko:ri] 'girls'). Most Eastern NIA (Magadhan) languages have lost the phonemic contrast between ś and s, but in some traces these are still seen in free variations of [ś] and [s]. A two-way distinction of ś vs. s is found in certain languages only in specific environments. In certain dialects of Maithili, for example, [s] occurs before back vowels and [ś] occurs before front vowels, whereas ś/s phonemic contrast is observed before central vowels (e.g., śālu 'a variety of grain sorghum' vs. sālu 'hedgehog') (Masica, 1991: 98). Typically, there are two semivowels in NIA languages – palatal /y/ and labial /v/. In a number of languages, the occurrence of the semivowels is restricted to semipredictable intervocalic glides. Their

position is weakest in eastern Indo-Aryan and strongest in western Indo-Aryan. There is a phonetic as well as an historical difference between the eastern glides, late in origin and sometimes optional, and western preservations of original OIA semivowels. In many NIA languages, /v/ has a distinctive *w*-like allophone occurring before round vowels (the contact between the upper teeth and the inside of the lower lip in *v* is a loose one).

The basic OIA vowel system is a 10-vowel system constituted of *a, a:, i, i:, u, u:, e, o, ai:, and au:*. As a result of various phonological changes during the history of their development, most NIA languages possess vowel systems considerably different from each other as well as from the OIA vowel system. The minimal NIA vowel system consists of six vowels, which falls into two types: the *Oriya type* (*li e a o u*) and the *Nepali/Marathi type* (*li e; a ə; o u*). The latter vowels also occur in Lamani and Sadani (Masica, 1991: 109). There are differences in vowel quality, height, etc., of the corresponding vowels in different languages. Bengali has a seven-vowel system, with an additional /æ/ added to the Oriya type vowels. Other vowel systems are the eight-vowel systems of Gujarati (*li e ε; a ə; o u*) and Assamese (*li e ε a; v o u*); the nine-vowel systems of Dogri, Rudhari, Sairaki, and several West Pahari dialects; and the 10-vowel systems of Hindi and Punjabi (*li i: e œ; a ə; o u u: l*). The Hindi and Punjabi systems are closest to OIA and are thus considered to be the typical Indo-Aryan vowel system: historically, the OIA diphthongs /ai/ and /au/ were monophthongized into long vowels /æ/ and /ɔ/ at a much later stage of development and are often represented as /ai/ and /au/ (*ai* and *au* are retained in some dialects). Additional vowel systems include the 11-vowel systems of Padari, Bhadrawahi, Kumauni, and Konkani, with varying modifications, and the 12- to 13-vowel systems of Braj, Bundeli, some dialects of West Pahari, and Bashkarik (Masica, 1991: 112). There are languages with even larger vowel systems. For example, Kashmiri has a 16-vowel system consisting of front vowels *li i: e e: ε/*, central vowels *li i: ə ə: a a:/*, and back vowels *lu u: o o: ɔ/*, with three contrasts in height (high, mid, and low). Up to 20 vowels are found in some Dardic languages. Most NIA languages have nasalized vowels. These vowels are predictable in some languages (in the vicinity of nasal consonants) but in others they are contrastive/phonemic in nature. Certain languages have also developed a tonal system, such as Punjabi (prosodic tone), Lahnda, Dogri, some West Pahari dialects (Khalashi, Kochi, Rudhari), some Dardic languages (e.g., Khowar, Shina, Gawarbat), and Dacca Bengali. Stress in NIA is generally predictable and the position of stress is fixed, although stress patterns

may considerably differ from language to language in terms of complexity of rules/constraints determining stress.

Morphosyntax

Old Indo-Aryan verb morphology exhibits tendencies toward simplification. The aspectual system is much reduced. Within the tense system, the distinction between formal perfect and imperfect is eliminated, leading to a two-way contrast in the preterit from the original three-way contrast. The modal system also went through simplification, so that the subjunctive and indicative gradually were eliminated (Cardona and Jain, 2003: 11). Despite such tendencies, the OIA verb system is very rich as compared to the MIA and NIA systems.

During the development of MIA, there was a general leveling down of the rich OIA morphological system by means of various analogical extensions and operations. Contrast between OIA active and medio-passive was lost, as was the contrast between two kinds of future marking in later stages of MIA. Also, distinction among aorist, perfect, and imperfect was generally eliminated. Productive preterit is provided by sigmatic aorist (Cardona, 1987: 444). Because no final consonants are found in MIA, a reduction in the rich declensional system of OIA consonant stems gives rise to a vowel-ending type only. OIA nominals fall into a number of inflectional types, viz., stems ending in *-a*, *-i*, *-u*, *-an*, *-C(onsonant)*, and *-nt*. Although the OIA vocalic stems remain as such, the consonant ending stems are thematized in the MIA dialects (e.g., Pāli *vijju* < *vidyut* is inflected as an *-u* stem; Pāli *b^haranto* < *b^harant-* is inflected as an *-a* stem) (Bubenik, 1996: 72). In *Ard^ba-Magad^bi* (AMg), *nt*-stems are thematized (Bubenik, 1996: 67). Thematic stems are remodeled in the MIA dialects (e.g., Sanskrit *devaḥ* (nominative singular) > Pāli *devo*, Sanskrit *devam* (accusative singular) > Pāli *devā*) (Bubenik, 1996: 68). In case of nominal paradigms, although OIA maintains the distinction of singular, plural, and dual categories, there is a complete loss of the dual category in MIA. This is also evident in most NIA languages.

The extensive case inventory of OIA was considerably reduced in MIA, especially in later stages. The OIA dative merged with the genitive, and in late MIA, there was merger of the instrumental case with the locative (Bubenik, 1996: 69). Further down the lines of development, nominal paradigms dichotomized into direct (nominative, accusative) and indirect cases, which eventually fused together, providing the groundwork for the NIA oblique case (e.g., in *Apab^b-ramśa*). Toward its development into NIA, the MIA

clitics system also dichotomized into one direct and one oblique form. The oblique form is only used with postpositions (e.g., Hindi/Urdu *-ā* 'NOM.SG' vs. *-e* 'OBL.SG'; Hindi/Urdu *-e* 'NOM.PL' vs. *-ō* 'OBL.PL'). In the system of pronominal clitics, the formal distinction between the direct and oblique forms is found only in OIA and Pāli. Such distinction was lost in some dialects of the MIA (Bubenik, 1996: 90). OIA nominals also had a three-way distinction in gender features, viz., masculine, feminine, and neuter. Although Pāli preserved the three-way distinction of gender, many MIA dialects underwent a gradual simplification in the alignment of three genders. A thematic neuter gender marker was a common target for leveling, which was reassigned masculine ('default') gender in *Ard^ba-Magad^bi*, for example. Leveling was achieved by various series of phonological changes in different gender marking endings (e.g., shortening of final long vowels, deletion of final consonants, convergence of various kinds of stems, and other phonological changes). With a few exceptions, such as Gujarati, which retained the OIA distinction of masculine, feminine, and neuter gender, most NIA languages have only masculine and feminine distinctions. In case of nominal declension, some of the forms were lost in MIA. These were replaced by the corresponding pronominal forms, resulting in identical declension for nominals and pronominals, as in OIA *devaḥ* (nominal declension) vs. Pāli *devo* (nominal declension) and *so* (pronominal declension) (Bubenik, 1996: 92). Another morphological change characteristic of MIA is the resegmentation of inherited causatives (Bubenik, 1996: 120).

Different changes in the syntactic system led to the development of an ergative syntax in NIA. In many NIA languages, the perfective is semiergative. In ergative constructions in most NIA languages, agreement between the subject and the verb is blocked. Although typical Indo-Aryan languages show subject-object-verb word order, an exception is Kashmiri, which is a verb-second language, with the inflected verb occupying the second position of the clause.

Indo-European Languages

N E Collinge, Cambridge, UK

© 2006 Elsevier Ltd. All rights reserved.

Cross-linguistic comparison of words and phrases had already become fashionable in the 17th and 18th centuries. In 1786 Sir William Jones famously postulated the kinship of Sanskrit, Greek, and Latin (and possibly the Germanic and Celtic languages), a grouping to which in 1813 Thomas Young gave the title 'Indo-European' (IE) (although the Germans long preferred 'Indogermanisch'). In 1816 specific historical studies appeared, some by Raynouard on the Romance languages (descendants of Latin) and others by Bopp, who added Avestan and Lithuanian to Jones's list. From Grimm's 1822 work on, geneticism flourished and until the 1870s remained Sanskritocentric (but see section on analogy). The tally of IE languages came to include two that apparently stood alone (despite their internal dialectal splits) – Albanian and Armenian – and six subgroups: Balto-Slavic, Celtic, Germanic, Indo-Iranian, Italic, and Greek. To these were later added two Asian members: Tocharian in 1893 and Hittite in 1917, the latter together with Palaic and Luwian (for sure) and Carian and Lycian (almost certainly) forming the 'Anatolian' subgroup. The status of one or two tongues is still debated: Lycian, Phrygian, and 'Illyrian.' With all these and their descendants taken into account, the current total of known IE languages is around 140 (Collinge, 1995a).

Comparative Reconstruction of the Indo-European Language Family Tree

Comparative reconstruction of the family began with linguists using the following techniques.

1. Interlingual comparison of the categories and structures of grammar (done first by Bopp) is usually considered central. This sector is by and large the least subject to outside influence, although some internal alterations have to be discounted (for example, the changing of lexical elements into grammatical forms); and shifts of even the basic type of syntax do occur (see later section on typology). Phonology then long took first place (after Rask, 1818; and Grimm, 1822); this is understandable, as speech sounds are anatomically limited and their shifts easier to plot. Now, however, 'lexical diffusion' is recognized: sound changes occur more quickly in words of certain types and frequency and later spreading.
2. August Schleicher was first to regularize the use of the family tree (borrowed from scientists) to display descent-relations. He also insisted that 'proto' forms (the theoretically established items of a no-longer-extant parent language) be recognizable, and he standardized the marking of them with a prefixed asterisk.
3. It has long been realized that a compared language's evidence must first be cleansed by removing those changed items whose shifts are quite internal to that language and whose earlier shape is diagnosable by 'internal reconstruction.'
4. Possibly the most salutary control is that of 'uniformitarianism,' first proposed by James Hutton in a lecture in 1785. This rules, to cite its negative aspect, that hypotheses as to past entities and behavior must not venture outside the range of historically testified examples.
5. In the 1870s the 'Neogrammarians' (see Collinge, 1995a: 204–205) made their contribution, which still merits a mention. They outlawed those comparative statements of item change that ignored

manifold nonconformities. Shifts must be exceptionless (though they accepted analogy as an interfering force; see later section on analogy). This corrective was necessary at the time; since then, many valid accounts of apparently irregular change have been offered, and causation (which they ignored) has been examined.

Revisions to Indo-European Language Theories

Following these developments in the classification of IE languages were a long succession of revisions and discoveries, some helpful, others disturbing, a few still to be finally assessed.

First among the helpful stands the identification by numerous scholars of ‘analogy’ as a cause or steerer of change. More particular were the increasingly precise analyses of the original phonology of proto-Indo-European (PIE). Its velar consonants were found (Ascoli, 1870) to be of varied sorts. Then several scholars realized that a local palatalizing effect, once recognized outside Sanskrit, established /e, a, o/ as the true set of original lower vowels.

Brugmann (1876) noted how ‘sonant’ root consonants (nasals, to which Osthoff added liquids) might within words become vocalized or accompanied by inset vowels. Next, the high vowels /i, u/ were seen as likely to become consonantal /j, w/ in the right context and were in fact ‘semivowels.’

Perhaps most striking was the discovery – following a hint by Saussure – that PIE had possessed some deep guttural sounds (vaguely ‘laryngeals’), which outside Anatolian were themselves lost but were replaced by lengthening of neighboring vowels or the insertion of a vocalic element into the syllable.

Theories of Historical Language Change

The earliest disturbing theory was that of Johannes Schmidt (1872), following an idea of Schuchardt’s, that historical changes moved like waves across a body of water, being possibly wider, of varying strength, and less adjacent than tree-branching suggests. Sapir (1921) recognized ‘drift’ as shifts that are certain to occur independently sooner or later in any language.

Again, arrays of apparently distinct shifts within a language may be reflexes of one more general feature change (‘conspiracy’ theory).

Yet another mechanism for relating shifts and fixing them in time is known as ‘glottochronology.’ Under this theory, divergence of languages from a

common stock is timed by counting the number of words, from a list of shared items, no longer found to be cognate. It has been applied again to IE recently, in attempts to precisely date the origin of IE languages, but it has also long been denounced as untrustworthy, because lexical borrowing is the readiest kind of interlingual interference.

Lastly, disturbing for its effects on the family tree, comes the ‘glottalic’ hypothesis (see Salmons, 1993). This was promoted most keenly by Gamkrelidze and Ivanov (1984) but forcibly rejected by others, notably Baldi (1999). The traditional, but questionable, set of PIE stop consonants has its simple voiced items /b, d, g/ replaced by the glottalized units /p’, t’, k’/ (aspiration being seen as an unstable additive to the buccal stops). This idea does explain the curious rarity of supposed /b/ in PIE (because /p’/ is phonically awkward), but the apparent prevalence across the extant languages of the realization of these glottalics as plain **voiced** forms is troubling. Moreover, Germanic (and Armenian) would then be isolated as retaining the original voicelessness (in contrast to Grimm).

Other Theories

Some suggestions that may assist the comparative IE historian are still to be finally assessed. Promising was Johanna Nichols’s finding (1986) that marking of a grammatical grouping (such as a noun phrase) – whether on the head member or on the dependent or on both or on neither, or a mixture of these – is a conservative feature and so a clue to genetic status.

Indo-European languages are predominantly dependent-marking. There is certainly resistance to change of marking position, so that at least **non**-relatedness, or late relatedness by geographical movement, may be provable. Time and further research should clarify this.

More in fashion at present is the mathematical-cladistic approach. ‘Cladistics,’ originally a technical term in biology, is the calculus of family relationships based on shared innovations rather than on simply inherited items. It was brought into linguistics first by Hoenigswald (1987). Now the methodology has been computationalized (see Ringe *et al.*, 2002) as a supplement to traditional family tree study. Applied to the tricky problem of IE subgrouping, cladistics has the interesting result of confirming as unusual the behavior and placing of Germanic (see above, on the glottalic theory). Otherwise, the usual tree is re-established, with Anatolian and Tocharian as early departers and the subgroups Greco-Armenian, Balto-Slavic, and Indo-Iranian forming a joint core. Difficulties are still acknowledged.

Remaining Questions Regarding Classification of Indo-European Languages

First, is an agreed-upon IE tree attainable at all? The various subgroups are themselves soundly based and their membership largely agreed upon; but their relative positioning and chronological fixing (for Hoenigswald, their topology and metrics) are yet unsettled. Revised trees are constantly offered.

Second: Does typology help or hinder? Although it might seem that all IE languages should agree in sound-types and syntactical systems, there are notable discrepancies. For example, the contrast between Hittite verbal categories and those of Greek or Latin, or the present syntax of Hindi or Panjabi versus that of Sanskrit. Genetically linked languages do come to differ in grammar, so Ossetic (Osetin) is now very unlike other Iranian languages generally. Understandable are attempts to trace in IE grammar a syntactic type-change sequence ‘active’→‘ergative’→‘accusative’ and a reversal in part.

Next is the question of whether it is possible to arrive at a precise date and location for the family’s origin. It is doubtful. Russia, the Black Sea region, and even India have been proposed as birthplaces, and fixing a time of birth is most uncertain (see Clackson, 2000: 451). The current fight is between those who favor a starting point 6000 years ago in Eastern Europe and recent adherents of a beginning (based on biological calculation) 8700 years ago in Anatolia (see Gray and Atkinson, 2003).

Fourth, does archeology help? Pointers such as the ‘agricultural dispersal’ process have been used to co-map the movements of IE people and of their languages (Renfrew, 1987; but note his 1999 rethinking). The two developments have rarely shown a firm consensus as to timing or relationships. Firmer clues may lurk; the field is open.

Next, what of the theory of ‘nostraticism’? Holger Pedersen introduced the term ‘nostratic’ in 1903 to cover the establishment of a linguistic super-group that included IE. Enthusiasts followed. Greenberg actually sought to put together all even remotely interaccessible tongues, including Japanese and Inuktitut. Indo-European was linked with South (and even North) Caucasian, Sino-Tibetan, or even Na-Dene language families. The evidence offered is mostly of supposed lexical equations, although Greenberg did use a selection of morphological likenesses. The notion caused much opposition and seems now to be out of favor.

There are some quite opposed concepts of developing linguistic relationships. ‘Convergence’ has been canvassed – that is, likeness in language caused by

areal contact of people rather than (or as well as) by genetic descent (‘divergence’). Trubetzkoy (1939) pressed it for IE (see also Hock, 1986: 491–498), while others posited it for other families (notably Weinreich, 1968). Later a general periodic analysis was espoused (Dixon, 1997), based on the biological notion of ‘punctuated equilibrium.’ This proposes that languages in areal contact during periods of equilibrium suffer the relatively minor diffusion of features each to each, which misleads observers into supposing a family connection; then come periods of punctuation, in which whole language splits do occur. This in-and-out sequence justifies family trees where the size of the evidence defends them (as for IE); it also allows undeniable likenesses between members of different families (IE included).

Definitions of Terms

‘Indo-European’ is the name of the group of tongues deduced by comparative study to be genetically related. The continued suitability of the name may be questioned. Indian evidence is no longer the major source of relevant information it had been, and since the discovery of Tocharian and the Anatolian subgroup, both in Asia, ‘European’ is less essential. (Possibly the title ‘Eurasian’ might be substituted?)

‘Proto-Indo-European’ indicates the purely theoretical form of the ancestral language, which was formulated by reconciling the reflexes perceived in the group’s tongues (‘comparative reconstruction’). Proto-Indo-European is not itself a totally integrated working language but rather a summary of deductions. Its sources are manifold and involve languages themselves that are somewhat historically tangled. Description of PIE may be ‘systematic,’ as by Brugmann (1897–1916), who gave a static and optimistic account of its categories and forms, or ‘realistic,’ as by Gamkrelidze and Ivanov (1984), for whom PIE is unstable and offers a set of stages of development. (For more information on this, see Lehmann, 2003: 245ff.)

Pre-Proto-Indo-European (PPIE) is a title often used to cover all that can be posited about PIE in its earliest pre-diaspora period (Renfrew, 1999: 271, 284). Sometimes it means ‘pre-morphological PIE’ – that is, a specific stage before the fully organized condition of PIE syntax and morphology (Collinge, 1995b: 4). Some writers have preferred to use the terms ‘PIE I,’ ‘PIE II,’ and so forth.

Conclusion

It is noteworthy that a number (almost a hundred) of ‘laws’ have been formulated to register apparently regular shifts, and their environments, in individual

IE languages or sub-groups, or even across the whole family. The scope of these laws (both as to categories and languages) varies widely, and their validity is always subject to challenge.

Indo-Iranian

E Tucker, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

The Indo-Iranian languages are a major subgroup of the Indo-European (IE) language family, comprising on the one hand the languages of IE descent spoken in the Indian subcontinent (Indo-Aryan), on the other hand those spoken in Iran and adjoining regions such as present day Turkey, Tajikistan, and Afghanistan (Iranian). Indo-Aryan and Iranian languages share so many features that differentiate them

from languages belonging to other branches of the IE family that they must have undergone a period of development in common at a prehistoric date. This ancestor language midway between IE and the earliest attested Indo-Aryan and Iranian is normally called Indo-Iranian or Proto-Indo-Iranian.

Thanks to the survival of nearly continuous documentation, the history of both Indo-Aryan and Iranian can be traced back for around three millennia. Anatolian is attested earlier, but Indo-Iranian ranks together with Greek as the branch of the IE family with the longest recorded history. Indo-Iranian

languages have served as the vehicle for high literary cultures and for the fundamental texts of five major religions (Hinduism, Buddhism, Jainism, Zoroastrianism, Manichaeism).

In the historical period, the development of the Indo-Iranian languages is conventionally divided into three stages (Old, Middle, and New) in both subgroups. Comparison between Old Indo-Aryan (OIA or Old Indic: Vedic and Classical Sanskrit) and Old Iranian (OIr: Avestan and Old Persian) make it possible to reconstruct the principal features of prehistoric Indo-Iranian.

The prehistoric split between the two branches of Indo-Iranian has traditionally been associated with the movement of one group of peoples, the Proto Indo-Aryans into the Indian subcontinent. However, a problem is raised by evidence in 14th century B.C. Hittite texts relating to the kingdom of the Mitanni, whose general population spoke Hurrian but whose rulers bore Indo-Aryan names. Divine names such as Varuṇa and Indra in a Hittite-Mitanni treaty, and numerals such as *aika* ‘one’ (Skt. *éka-*; contrast OP *aiva-*, Av. *aēuua*), *satta* ‘seven’ (Skt. *saptá*) and color adjectives *paritannu* and *pinkarannu* (Skt. *palita-* ‘grey’, *piṅgala-* ‘reddish’) in a treatise on horse-training, point to Indo-Aryan rather than undifferentiated Indo-Iranian in the Near East in the second millennium B.C. Documented only during the most recent stage of Indo-Iranian, the Nuristani languages (formerly often called Kafiri), which are spoken in present-day northeastern Afghanistan, also raise problems of classification. They have been explained variously as Iranian (but distant from Pashto), as Indo-Aryan, or as belonging to a separate branch of the Indo-Iranian family.

Indo-Iranian Phonology

The Indo-Iranian vowel system consisted of three short vowels **a, i, u*, their long counterparts **ā, ī, ū*, and a pair of short and long diphthongs **ai, au*, and **āi, āu*. There were also two vocalic liquids **r, l*.

This simple vowel system resulted from the merger of the IE short vowels **e, o, a* > Ind-Ir. **a* (Skt. *mádhu-*, YAv. *madu-* ‘intoxicating drink’, cf. Grk. *μέθυ-*; Skt. *dadárśa*, Av. *dādarəsa* ‘I have seen’, cf. Grk. *δέδορκα*; Skt. *yájate*, Av. *yazaitē* ‘worships’, cf. Grk. *ἄζεταί*). However, at the earliest stage of Ind-Ir. the merger was not complete as palatalization occurred before IE **e*. In open syllables, IE **o* > Ind-Ir. **ā* (Brugmann’s Law: Skt. *dāru-*, Av. *dāuru-* ‘wood’, cf. Grk. *δόρυ*) and merged with **ā* < IE **ē, ō*, *ā* (Skt. *rāj-* ‘king’, cf. Lat. *rēx*; Skt. *āsú*, Av. *āsu-* ‘swift’, cf. Grk. *ὠκύ-*; Skt., Av., OP *mātar-* ‘mother’; cf. Lat. *mater-*). Of the IE resonants, which were allophones

of **y, v, n, m, r, l* in the parent language, **i, u* continued unchanged, the vocalic nasals **ŋ, m* > Ind-Ir. **a* (Skt. *saptá*, Av. *hapta* ‘seven’; cf. Lat. *septem*), and the vocalic liquids **r, l* were preserved as vowels only in OIA (Skt. *mṛtá-* ‘dead’, cf. Lat. *mortuus*).

Cases of vocalic hiatus in the earliest OIA and OIr. poetic traditions and the quantities of some final vowels suggest that the inherited IE laryngeal phonemes survived in some form into Indo-Iranian (Ved. trisyllabic *vaata-* ‘wind’ < **vaHata-*). The development of **rH, *lH* is complicated (> *ir/lur* before vowels, > *ir/ūr* before consonants in Skt., but > *ar(ə)* in Av.: Skt. *tírás*, Av. *tarō* ‘across’, ppp. *tīrná-* ‘crossed’; Skt. ppp. *pūrná-*, Av. *parəna-* ‘filled’). Between consonants, an inherited laryngeal sometimes vocalized > *-i-* (Skt., OP *pitā* nom. ‘father’, cf. Grk. *πατήρ*, Lat. *pater*), but *-i-* from this source is of more restricted occurrence in Iranian than in Indic (OAv. nom. *ptā*, dat. *fədrōi* ‘father’; OAv. *dug(ə)dar-*, YAv. *duγdar-* ‘daughter’, cf. Skt. *dubhitár-*, Grk. *θυγάτηρ*).

Ablaut alternations inherited from the parent language are often continued directly: Skt. *ásti* ‘is’, *sánti* ‘are’, Av. *asti*, *hənti*, OP *astiy*, *ha(n)tiy*, cf. Lat. *est*, *sunt* (IE **e/zero*). However, there was a major restructuring of ablaut into a system of quantitative contrasts involving three grades:

| lengthened | full | zero |
|--|-----------------------------------|-----------------------------------|
| Skt. <i>rājānam</i> ‘king’ (acc.) | <i>rājan</i> ‘O, king’ (voc) | <i>rājnas</i> ‘of a king’ |
| Skt. <i>cakāra</i> ‘he has done’ | <i>cakara</i> ‘I have done’ | <i>cakrur</i> ‘they have done’ |
| Av. <i>srauuaiieiti</i> ‘makes hear’ (pres.) | <i>sraotā</i> ‘hear!’ (aorist) | <i>sruta-</i> ‘heard’ (ppp.) |

Indo-Iranian had a large number of obstruents: voiced stops, voiced aspirates, voiceless stops, and perhaps also voiceless aspirates:

| | | | |
|-----------|------------|-----------|--------------|
| <i>*b</i> | <i>*bh</i> | <i>*p</i> | <i>*(ph)</i> |
| <i>*d</i> | <i>*dh</i> | <i>*t</i> | <i>*(th)</i> |
| <i>*j</i> | <i>*jh</i> | <i>*c</i> | |
| <i>*g</i> | <i>*gh</i> | <i>*k</i> | <i>*(kh)</i> |

All four series existed in Indo-Aryan, but the voiceless aspirates are variously considered to be inherited from IE, or to have developed from clusters of voiceless stop + laryngeal within Indo-Iranian (Skt. *pṛthú-* ‘broad’ < IE **pl̥tHu-* ‘broad’; Av. nom. *pañtā* < **ponteH-s*, gen. *paθō* < **pntH-os* ‘path’), or to represent innovations within Indo-Aryan only. OIA also shows a series of retroflex stops (*t, th, d, dh* and a retroflex nasal), but these are unlikely to have existed in the Indo-Iranian ancestor, as they are not shared by OIr.

The IE labiovelars underwent a very early conditioned split, producing Indo-Iranian palatals

before original front vowels (Skt., Av., OP *-ca* ‘and’, cf. Lat. *-que*; Skt., OP *jīva-* ‘alive’; cf. Lat. *vīvus*; Skt. *hānti*, Av. *jaiṅti* ‘kills’, cf. Hitt. *kuenzi*) and velars elsewhere (Skt. *yákr̥t̥*, Av. *yākarə* ‘liver’, cf. Grk. ἧπαρ; Skt. *gnā-*, Av. *g(ə)nā-* ‘goddess’, cf. Grk. γυνη; Skt. *gharmá-*, Av. *garəma-* ‘heat’, cf. Lat. *formus*). On the other hand, the IE palatal stops **k̑*, *ǵ*, *ǵh* probably developed into affricates in Indo-Iranian, and further developed to OIA *ś*, *j*, *h*, but to sibilants in most of Iranian (Skt. *śatám*, Av. *satəm* ‘hundred’, cf. Lat. *centum*; Skt. *ájati* ‘drives’, Av. *azaiti*, cf. Lat. *ago*; Skt. *ámhas-*, Av. *azah-* ‘distress’, cf. Grk. ἄγχω ‘I throttle’).

There was a partial merger of IE **l* with **r*, but not in all varieties of Old Indic (Vedic *raghú-* ‘quick’, Classical Skt. *laghu-*, cf. Grk. ἑλαχύ-, Lat. *levis*), nor completely in Iranian (Av. *rayu-* ‘quick’; but NPer. *lištan* ‘to lick’, cf. Grk. λείχω).

IE **s* developed four allophones in Indo-Iranian; **s*, **z*, and **š*, *ž* after **r*, *r*, *u*, *ū*, *au*, *āu*, *k*, *i*, *ī*, *ai*, *āi* (the RUKI rule). These sibilants are all continued in OIr. where **š* is also found after **p*, *b*(*h*), and **s* > *h* before vowels. In OIA **š* > retroflex *ṣ* but **z*, *ž* (>*z*) were lost, the latter with compensatory lengthening of the preceding vowel and retroflexion of the following stop (contrast Av. *mižda-*, Skt. *mīdhá-* ‘reward’, cf. Grk. μισθó-).

Morphology of Nouns and Pronouns

Vedic, Classical Sanskrit, and Avestan show that Indo-Iranian retained the full IE range of eight cases (nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative) and three numbers (singular, dual, plural). The inflections of thematic nouns and adjectives (stems in *-a* <IE**-e/o*) continued those of the IE parent language (masc. sg. **-as*, *-am*, *-ā*, *-āi*, *-āt*, *-asya*, *-ai*, *-a*, etc.) apart from the remodeled gen. pl. in *-ānām*, and a second nom. pl. in **-āsas*, which was of limited distribution. On the other hand, the inflection of *ā-* stems was remodeled under the influence of *ī-* stems at an Indo-Iranian date (sg. **-ās*, *-ām*, *-ayā*, *-āyāi*, *-āyās*, *-āyā(m)*, *-ai*).

Although inflection depended primarily on the type of stem, for non-thematic stems, it also depended to some extent on inherited patterns of accentuation and ablaut: contrast the rare type of closed genitive sg. OAv. *cašmāṅg* (< **cašmán-s*) from *cašman-* ‘eye’ and the more frequent ‘open’ type Ved. *aryamṇás* from *aryamán-* ‘hospitality’. Even when the Vedic evidence indicates that the accent had become fixed on one syllable, the alternations in ablaut between the suffix and the inflection were continued (from Ved. *tákṣan-*, Av. *tašan-* ‘craftsman’: acc. sg. Ved. *tákṣānam*, Av. *tašānam*; gen., dat. Ved. *tákṣṇas*, *tákṣṇe* Av. *tašnō*, *tašne*). A parallel distinction between ‘strong’ and

‘weak’ cases characterized the inflection of many types of Indo-Iranian nominal stems.

Indo-Iranian had a large number of demonstrative pronouns, some of which were also employed in anaphoric function (**sá-ltá-*), and as third person pronouns (**a-*, Skt. *asya*, *asmāi*, etc.; Av. *ahe*, *ahmāi*, etc.). There were some characteristic pronominal inflections, which probably began to spread to pronominal adjectives in Indo-Iranian: e.g., nom. pl. masc. **-ai* (Skt. *té*, Av. *tōi* ‘those’; Ved. *anyé*, YAv. *āniie*, OP *aniyai-ciy* ‘others’). Some demonstratives combined several stems (Skt. nom. sg. *ayám*, *iyám*, *idám*, acc. *imám*, *imám*, *idám*, instr. *ená*, *ayá*, dat. *asmāi*, *asyái*; YAv. nom. sg. *aēm*, *īm*, *imat* ‘this’, etc.). In the personal pronouns, singular and plural were normally based on completely different stems (‘you’: nom. sg. Skt. *tvám*, OAv. *tuuēm*; nom. pl. Skt. *yūyám*, OAv. *yūš*, *yūžēm*), and in the oblique cases there were two sets of forms, one accented, the other enclitic (‘me’: gen. Skt. *máma*, OAv., OP *manā*, dat. Skt. *máhyam*, OAv. *maibiiā*; enclitic gen.-dat. Skt. *me*, OAv. *mōi*, OP *-maiy*).

Verb Morphology

The Indo-Iranian finite verb system was of considerable complexity because of its large number of intersecting categories, of voice, tense, aspect, and mood. Tense/aspect distinctions were expressed by different stems (present, aorist, perfect, and a seldom attested future), and three sets of personal inflections, which distinguished active and middle voice. The augment *a-* (<IE**e-*) was also prefixed to forms indicating past time.

Within these tense/aspect categories, the morphology of the stems varied, particularly in the present, which served as the basis for both present and imperfect tenses. Many more formal types than the 10 classes recognized for Sanskrit by the Indian grammatical tradition may be reconstructed: for instance, thematic presents built with the IE suffix **-ské-l-sko-* (Skt. *ṛcchati*, Av. *pərəsaiti* ‘asks’), reduplicated thematic presents (Skt. *tiṣṭhati*, Av. *hištaiti* ‘stands’), athematic root presents where the accent remained fixed on the root (Skt. *váste*, OAv. *vastē* ‘wears’). In the aorist category, only s-aorists were morphologically distinctive (Skt. *ábhārṣam* ‘I brought’, *ápaviṣṭa* ‘it purified itself’), while the other types, root aorists, *a*-aorists, and reduplicated aorists resembled imperfects. However, in Indo-Iranian individual verbs developed their own individual systems of contrasts.

The perfect, which originally indicated a state (Skt. *jāgāra*, Av. *jaṅāra* ‘is awake’) or the result of a past action (Skt. *tatákṣa*, Av. *tataša* ‘has fashioned’) was regularly characterized by a special set of inflections

and reduplication (an inherited exception is Skt. *veda*, OAv. *vaēdā* ‘I know’).

The moods were indicative, imperative, subjunctive, optative, and the ‘injunctive’. From a formal point of view, the injunctive resembled an unaugmented imperfect or aorist, and its original function was to mention an action without specifying time or mood. An important use of the injunctive was in prohibitions with the particle **má* (Skt. *má*, Av. OP *mā*, cf. Grk. *μη*). The imperative was characterized by distinctive inflectional endings, subjunctives, and optatives by morphemes that could be added to any tense/aspect stem (subjunctive *-*a*-, giving *-*ā*- in thematic stems; optative *-*yā*-/-*ī*-, thematic *-*ai*-).

The distinction between active and passive was often realized in finite forms merely by the contrast between active and middle endings. However, present stems in -*ya*- and a particular type of intransitive aorist (RV *ádarsī*, *ádṛśran* ‘it, they became visible’) were also employed with passive value (RV *avāci*, OAv. *auuācī* ‘is/has been said’). The most frequent passive form was the ppp. in -*tá*- (< IE *-*tó*-), which was destined to become one of the most important elements in the evolution of the verb system in both the Iranian and Indo-Aryan branches.

Syntax

The word order of Indo-Iranian must have been predominantly SOV, but, as the earliest Vedic and Old Avestan poetry shows, there was a large range of possible variations. In prose, genitives and other qualifiers normally preceded the noun that they determined (Skt. *manor jāyā* ‘wife of Manu’, OP *kurauš puça* ‘son of Cyrus’). Enclitic particles, unaccented pronominal forms, etc., occupied second position (Wackernagel’s Law), and a string of particles followed the first word of a sentence, which was frequently a ‘preverb’ as univertation only took place later. According to Vedic evidence, the finite verb was unaccented in main clauses, but regained its accent in subordinate clauses. Subordination was by means of relative adverbs such as **yád* ‘when, since’ (Skt. *yát*, YAv. *yat*), **yáthā* ‘so that, as’ (Skt. *yáthā*, YAv. *yaθa*), **yádi* ‘if’ (Skt. *yádi*, OP *yadiy*) and the relative

pronoun **yá*- (< IE **yó*-; Skt., Av. *yá*-), which frequently correlated with a demonstrative pronoun in the main clause.

Nominal compounds were a typical feature of Indo-Iranian sentence structure, but they rarely exceeded two members, whereas in Classical Sanskrit multiple members became regular. Exocentric compounds were particularly frequent (Skt. *ugrābāhu*-, Av. *uγrabāhu*- ‘strong-armed’, Skt. *ṣaḍakṣá*-, Av. *xšuuāš.aši*- ‘six-eyed’).

Lexicon

Although there is a substantial amount of inherited IE material common to both branches of Indo-Iranian, it is with respect to their lexicon that Iranian and Indo-Aryan diverge most clearly (a well-known case is OIr. *ātar*- ‘fire’ versus OIA *ágni*-). However, the speakers designated themselves by the same ethnic (Skt. *āryá*-, OP *ariya*-, YAv. *airiia*-), and a large number of cultural and religious terms appear to date from the Indo-Iranian stage, e.g., Skt. *rátha*-, Av. *raθa*- ‘chariot’, Skt. *yajñá*-, Av. *yasna*- ‘worship’, Skt. *hótar*-, Av. *zao-tar*- ‘priest’, Skt. *sóma*-, Av. *haoma*- ‘sacrificial plant’. The latter all have IE etymologies, but there is also a set of such items that belong to common Indo-Iranian, but are unrelated to anything found elsewhere in IE, and may represent prehistoric loans from an unrelated language and culture: *uśig*- ‘priest’, Av. *usig*-, ‘seer’, Skt. *maghá*-, OAv. *maga*- ‘gift, offering’, Skt. *yātu*-, Av. *yātu*- ‘magic(ian)’.

Inupiaq

L D Kaplan, University of Alaska, Fairbanks, AK, USA

Introduction and Dialectology

Inupiaq (Inupiatun, North Alaskan and Inupiatun, Northwest Alaska) is an Eskimo-Aleut language spoken in Alaska, part of the Inuit branch or Eastern group of Eskimo languages and distinct from the Yupik languages. Extending across the Arctic from Alaska through Canada to Greenland, Inuit varieties differ from each other in significant ways but nowhere is there found a sharp internal break that would constitute a language border, and so they are considered a dialect continuum (Figure 1). The Inuit groups of the Eastern Arctic are a diaspora that spread from Alaska, and the Bering Sea area is recognized as the homeland of the Eskimo-Aleut language family and people (*see Eskimo-Aleut*).

Inupiaq comprises two dialect groups, North Alaskan Inupiaq (NAI) and Seward Peninsula Inupiaq (SPI), each with two dialects. NAI includes the North Slope and the Malimiut dialects, with the

former spoken along the Arctic coast and the latter found around Kotzebue Sound, along the Kobuk River and south at the head of Norton Sound. SPI includes the Qawiaraq dialect, found along the northern shore of Norton Sound, on the southeastern Seward Peninsula and at Teller, and the Bering Strait dialect is found along the shores of Bering Strait and on the offshore islands, King Island (now uninhabited), and Little Diomedede. Dialects are distinguished primarily in terms of phonology, lexicon, and morphology and include a number of subdialects.

Phonology and Writing

The Alaskan Inupiaq writing system was developed by Roy Ahmaogak, a Barrow Inupiaq minister, and linguist Eugene Nida in 1946 and has undergone revisions since. Current orthographic symbols are given below with equivalent phonetic symbols in parentheses where the two differ. The entire palatal series is absent in SPI, *z* is present only in the Bering Strait dialect, and *e* has limited occurrence, found in SPI only, particularly on Little Diomedede Island.

Figure 1 Eskimo-Aleut languages of Alaska.

Consonants:

p t ch(č) k q '(ʔ)
 ɬ(ɮ) ʃ(ʃ) ʎ(lʃ), y g (ɣ) ǵ(R)
 m n ñ ŋ

Vowels and diphthongs:

i e(ɛ) u
 a

Consonants and vowels can be long and are then written double. Any two vowels with the exception of *e* may be paired: *ai ia ua au iu ui*. In most of Malimiut, certain diphthong pairs have coalesced and are pronounced identically: *ia* and *ai* are pronounced [e:], *au* and *ua* are pronounced [o:], and *iu* is pronounced like *ii* as [i:]. A major phonological phenomenon in Inuit languages is consonant assimilation, which increases in magnitude as one travels east (*see West Greenlandic*). Alaskan Inupiaq has differentiated clusters, although the North Slope dialect has assimilation by manner of articulation. Palatalization of alveolar consonants is notable in NAI, with palatalization of some velars found in much of Malimiut. A major distinguishing feature of the Inuit branch is the simplification of the Proto-Eskimo four-vowel system by the merger of the central vowel *ɨ*, principally with *i*. Reflexes of historical *i* trigger progressive palatalization of alveolars and assibilation of prevocalic *t* in NAI: NAI *iñuk* 'person' but SPI *inuk* and NAI *isiq-* 'enter' but SPI *itiq-*. Reflexes of the fourth vowel *ɨ* are typically [i] but may undergo deletion or alternation with other vowels.

Morphology and Syntax

Inupiaq is a highly polysynthetic language, and suffixation creates very long words, so that a word is often equivalent to an entire English sentence. Words are typically constructed of a noun or verb stem, one or more derivational suffixes, and an inflectional ending, and may be singular, dual, or plural in number. Examples are from the North Slope dialect:

- (1) atuḡ-nia-ŋit-chuk
 sing-FUT-NEG-3du/INTRANS
 'they (two) will not sing'

Verbs may be intransitive or transitive, and transitive verb endings mark number and person of both subject and object.

- (2) tautuk-kaat
 see-3plSUBJ/3singOBJ
 'they see him/her/it'

The verb ending here expresses the subject and direct object, and pronouns are unnecessary, although they can be added in, as can nouns. Pronouns express

person and number but not gender, which is expressed only by nouns. There are no articles.

- (3) aṅutit aḡnaq tautuk-kaat
 men.pl woman see-3plSUBJ/3singOBJ
 'the men see the woman'

Word order is Subject-Object-Verb, although the complex inflectional system makes free word order possible. Through the influence of English, many speakers now prefer SVO order.

Lexicon and Ethnonyms

Lexical borrowing is primarily from Russian and English. Although the Russians never had a permanent presence in Inupiaq Alaska, the dozen or so Russian borrowings found in Inupiaq were probably introduced through trade with mainland Yupiks to the south and are found principally in SPI and Malimiut. Early English borrowings were introduced beginning in the late 19th century through contact with traders and whalers and were well integrated phonologically (e.g., *palauwak* 'flour'). Modern-day bilingualism often gives rise to use of English words in Inupiaq speech, but these occurrences cannot be considered true borrowings.

Besides indicating the name of the language, 'Inupiaq' can also be used in English either as an adjective (e.g., the Inupiaq language) or a singular noun for a person (e.g., an Inupiaq from Barrow). The plural 'Inupiat' also is used for people (the Inupiat people, the North Slope Inupiat). With consonant palatalization, NAI uses the spellings 'Iñupiaq' and 'Iñupiat,' whereas SPI lacks palatalization and uses 'Inupiaq' and 'Inupiat.' Alaskans also use 'Eskimo,' although this term is disfavored in Canada.

Population and Viability

There are some 13 500 Inupiat in Alaska, about 3000 of whom speak the Native language. Inupiat are now bilingual or speak only English. Most speakers are in their late forties or older, and in some areas the youngest Inupiaq speakers are in their sixties or even seventies. The language shift to English is brought about by a number of factors: government, education, and media are largely in English (although Inupiaq is often heard on the radio); monolingual English speakers have lived among the Inupiat for decades; and airplanes have made travel outside the area easy. In addition, past Inupiaq language use was discouraged and often punished by teachers and school officials. In 1998, a majority voted to make English Alaska's official language, sending a negative message in the view of Native language supporters. The continued use of Inupiaq as a spoken language is

threatened, and efforts at revitalization consist largely of school language classes. Language immersion programs exist in elementary schools in Kotzebue and Barrow, from which it is hoped that new generations of Inupiat speakers will emerge.

Iranian Languages

P O Skjærvø, Harvard University, Cambridge, MA

Iranian languages have been spoken for 3000 to 4000 years in various parts of southern Russia and the Caucasus, Central Asian republics, Xinjiang, Afghanistan, Pakistan, Iran, Iraq, and Turkey, as well as in the diaspora. The language spoken by the largest number of people today is (New) Persian (*see Persian, Modern*), or Farsi. Iranian languages are closely related to the Indo–Aryan (*see Indo-Aryan Languages*) languages, with which they constitute the Indo–Iranian (*see Indo-Iranian*) subgroup of the Indo–European language family, to which most European languages also belong.

The Iranian languages are known from three main periods, commonly classified as Old, Middle, and New (modern) Iranian. Historically, this division corresponds roughly to (1) the pre-Achaemenid and Achaemenid period (down to ca. 300 B.C.E.), (2) the period down to the Arabic invasion of Iran and the spread of Islam (7th century C.E. in the west, up to 11th and 12th centuries C.E. in the east), and (3) the Islamic period.

Iranian languages are written in a large variety of ancient and modern scripts.

Old Iranian Languages

Avestan (*see Avestan*), the language of the Avesta, was spoken in areas of Central Asia, Afghanistan, and eastern Iran from the 2nd millennium till about 500 B.C.E. Two stages of the language are known, the older of which is comparable to the oldest Indic seen in the

Rigveda and was therefore probably spoken about the mid 2nd millennium B.C.E., while the younger is comparable to Old Persian and was probably spoken ca. 1000–500 B.C.E. The Avestan texts were transmitted orally for 1000 to 2000 years and written down only in about the 6th century C.E.; the earliest manuscripts date from the 13th century. Its phonetic form is therefore that of the latest oral transmitters. The present Avestan corpus is relatively small.

Old Persian (*see Persian, Old*), ancestor of Middle and New Persian, was spoken in southwestern Iran in the first half of the 1st millennium, till about 400 B.C.E. It was the official language of the Achaemenid dynasty and was written in a cuneiform script. The Old Persian corpus is quite small.

Numerous words in the Old Persian inscriptions have a phonetic form different from what is considered to be genuinely Old Persian. It is assumed these are from Median, a language spoken to the north of Old Persian, of which no texts survive.

Middle Iranian Languages

Khotanese (*see Khotanese*), spoken in the kingdom of Khotan in southwestern Xinjiang, is known from a variety of texts dating from about the 6th century to the end of the 10th century C.E. Tumshuqese, spoken in Kucha in northwestern Xinjiang, is known from the same type of sources, but much less well. These two languages were written in the southern and northern variants of Brahmi, respectively.

Sogdian (*see Sogdian*), spoken in Sogdiana, modern Central Asia, is known from texts dating from the 4th to the 10th century. It was written in Sogdian,

Manichean, Syriac, and, occasionally, northern Brahmi scripts.

Chorasmian (*see* **Chorasmian**), spoken in the Chorasmian state along the upper Oxus/Syr Darja as late as the 14th century, is known from inscriptions, coins, and interlinear glosses in two Arabic works, a legal work and a dictionary. It was originally written in Chorasmian, later in Arabic script.

Bactrian (*see* **Bactrian**), spoken in the Greco-Bactrian kingdom founded by soldiers of Alexander the Great in northern Afghanistan, is best known from royal inscriptions and private documents dating from the 2nd to the 8th century. It was written in lapidary and cursive Greek and in Manichean scripts.

Parthian, spoken in the Parthian kingdom to the northeast of the Caspian Sea, is known from inscriptions, letters, economic and legal documents, and Manichean texts dating from about the 1st century B.C.E. to the 10th century. It was written in Parthian and Manichean scripts.

Middle Persian (also Pahlavi; *see* **Pahlavi**), was spoken in southwestern Iran and became the official language of the Sasanian dynasty. It is known from a large variety of texts, notably Zoroastrian texts, dating from about the 1st century B.C.E. to the 13th century, although it had been replaced by modern Persian as a spoken language by about the 8th century. It was written in Middle Persian and Manichean scripts.

New Iranian Languages

This section addresses the main literary languages spoken today, many of them now also in the diaspora, especially in Europe and America.

Various forms of Persian (*see* **Persian, Modern**) are spoken throughout Iran, Afghanistan, Tajikistan, and in adjacent areas. It is written in Arabo-Persian, Cyrillic (Tajik), and Hebrew scripts (Judeo-Persian). Ossetic (ossete) is spoken in Ossetia, in the southern Caucasus, in two main variants, Digoron (the more archaic) and Iron, with subvariants. It is written in the Cyrillic script, except in the south, where Georgian is used.

Kurdish (northern, central, and southern) is spoken in three principal variants in eastern Turkey and Syria, northern Iraq, and western Iran, as well as in surrounding areas. It is written in a modified Persian or standard Turkish Latin script.

Balochi (*see* **Balochi**; or Baluchi, in several dialects) is spoken in eastern Iran and western Pakistan, but also in southern Afghanistan and Central Asia. It is written in the Arabo-Persian script.

Pashto (*see* **Pashto**; several dialect groups) is spoken mainly in Afghanistan and Pakistan. It is written in the Arabo-Persian script.

All the modern languages contain a large number of Arabic words and a smaller number of Turkish words. The easternmost dialects have also borrowed extensively from Indic languages. Differently, Ossetic has borrowed extensively from the neighboring Caucasian languages.

Nonliterary languages and dialects comprise the following:

Northwestern and central Iran: Taleshi on the western shore of the Caspian Sea and Tati dialects from Iranian Azerbaijan through the Central Province and into Gilan; the Caspian dialects (Gilaki in Gilan, Mazanderani, and several dialects on the northern edge of the great salt desert, the Dasht-e Kavir); Gurani (Bajelani) and (including Awromani) in eastern Iraq and western Iran; and Zaza (Dimli) in eastern Turkey; and the Central dialects, comprising a number of more or less interrelated dialects spoken north and south of the Dasht-e Kavir.

Southwestern and southern Iran: Lori (Luri) (in several varieties) and Bakhtiari; Fars dialects; Larestani (in several dialects) in Larestan; dialects in the area from Bandar-e ‘Abbas (Bandari) and Hormoz to Minab and Bashkardi in Bashkerd; and Kumzari on the Musandam peninsula across the Strait of Hormoz (it is unknown whether this is spoken today).

Afghanistan and Central Asia: Parachi and Ormuli (Ormuri) in central Afghanistan and across the border in Pakistan; Ishkashmi and Sanglechi to the west of the Wakhan corridor; Yidgha and Munji/Munjani in eastern Afghanistan and western Pakistan respectively; the Yazghulami-Shughni (Yazgulami-Shugni) group in northern Afghanistan and Central Asia, including Sarikoli in western Xinjiang; Yaghnobi (Yagnobi) in the Yaghnob valley in Tajikistan; and Wakhi in the Wakhan corridor in northeastern Afghanistan.

Genetic Relationships among the Iranian Languages

Only the Persian languages are descended in a more or less direct line. Of the other dialects, the following are more closely related than others: Yidgha-Munji and Bactrian; Yaghnobi and Sogdian; and Wakhi and Khotanese.

Characteristic Phonological Features of Iranian Languages

Phonetic developments differentiating Iranian from its Indo-Iranian ancestor and so also distinguishing

it from Old Indic include the following (see also Indo-Iranian):

1. Indo-Iranian *s* after vowels became Iran. *h* (e.g., OInd. *asura-*, Av. *ahura-* ‘lord’).
2. Voiced aspirated stops and affricates lost the aspiration (e.g., OInd. *bhara-*, OIran. *bara-* ‘carry’; OInd. *dhā-* ‘to place’ and *dā-* ‘to give,’ OIran. both *dā-*; Indo-Iran. **j^h* *an-* ‘strike’ > OInd. *han-*, Av., OPers. *jan-*).
3. Indo-European palatal velars (*k̂, ĝ, ġ^h*) and palatalized velar stops (*k^y, g^y, g^{yh}*) developed differently in Indic and Iranian (approximate phonetic values: *ś* [ʃ], *ć* [tʃ], *ź* [ʒ], *ǰ* [dʒ], *š* [ʂ], *č* [tʂ], *ž* [ʒ], *ǰ* [dʒ>]):

| | | | |
|-------------------------------|--|----------------|--------------------------------|
| IEur. | proto-Ilr. | OInd. | proto-Ir. |
| * <i>k̂, ĝ, ġ^h</i> | * <i>ć, ǰ, ǰ^h</i> | <i>ś, ǰ, h</i> | * <i>ć, *ǰ, *ǰ^h</i> |
| * <i>k, g, g^h</i> | * <i>k^y, g^y, g^{yh}</i> > * <i>č, ǰ, ǰ^h</i> | <i>č, ǰ, h</i> | * <i>č, *ǰ, *ǰ^h</i> |

4. The Indo-Iranian unvoiced stops *p, t, k* became spirants *f, θ, x* before other consonants, including original laryngeals (*H*) (OInd. *cakra-*, Av. *caxra-* ‘wheel’; OInd. *trita-*, Av. *θrita-* ‘third’; OInd. *priya-*, Av. *friia-* ‘dear’; Indo-Iran. **ratHa-*, OInd. *ratha-*, Av. *raθa-* ‘chariot’; but **pt* → **pt* > Av. *pt*: Av. *hapta* ‘seven,’ NPers. *haft*).
5. The geminated dentals *-tt-, -dd^(h)-* (*-t̥t-, -d̥d^(h)-*) became *-st-, -zd-* (OInd. *vitta-*, Av. *vista-* ‘found’ < *vid-*; OInd. *addhā* ‘truly,’ OPers. *azdā* ‘well-known’).
6. Indo-Iranian laryngeals remained between vowels but were lost between consonants (Iran. **daHah* ‘gift,’ OAv. *da’ō*, spelled *dā*; Indo-Iran. **pHtar-* ‘father’ > OAv. *ptar-*, OInd. *pitar-*), although a vowel was inserted (or the vocalized laryngeal kept) in initial groups (YAv., OPers. *pitar-*).

Proto-Iranian in turn split into several distinct dialect groups characterized, among other things, by the developments of the palatal affricates *ć, ǰ* and the groups *ćw* and *ǰw*.

| | | | |
|-----------------|-----------------|---------------|-------------|
| Proto-Ir. | SW-Iran. | Central-Iran. | NE-Ir. |
| * <i>ć, ǰ</i> | <i>θ, d</i> | <i>s, z</i> | <i>s, z</i> |
| * <i>ćw, ǰw</i> | <i>s (θ), z</i> | <i>sp, zb</i> | <i>ś, ź</i> |

To the southwestern group belong the Persian languages and the other languages of southwestern and southern Iran (Bakhtiari and Lori, Fars dialects, Larestani, and Bashkardi). To the northeastern group belong Khotanese and Wakhi. All the others belong to the central group. Examples: Indo-Iran. **daća* ‘10,’ OPers. **daθa*, Av. *dasa*, Khot. *dasau*; Indo-Iran. **aǰ^h* *am* ‘I,’ OPers. *adam*, Av. *azəm*, Khot. *aysu*; Indo-Iran. **ac̣wa-* ‘horse,’ OPers. *asa-*, Median, Av. *aspa-*, Khot.

aśśa-, Wakhi *yīš*; Indo-Iran. **-ijwā(n)-* ‘tongue,’ OPers. *hizān-*, MPers. *izbān*, Khot. *biśāa- /βiśāa-l-*.

Characteristic Features of Morphology and Points of Syntax

Avestan and Old Persian are still of the Indo-European type (like Greek, Old Indic), with complex morphologies.

In the nominal and pronominal systems, Old and Young Avestan have three numbers (singular, dual, plural), eight cases (nominative, accusative, genitive, dative, instrumental, ablative, locative, vocative); in Old Avestan, the ablative singular has a distinct ending only in the *a*-declension (*-āt*), while in Young Avestan, the final *-t* is found in all declensions. Old Persian has only six cases and was also losing dual forms.

The Avestan verbal system is based on three stems: present, aorist, and perfect (e.g., *kar-* ‘to do’: PRES *kərənao-*, AOR *kar-/car-*, PERF *ca-kar-*). All the Indo-Iranian moods are preserved. There is a past participle in *-ta-* (e.g., *kərəta-*) and several infinitives. In Old Avestan, the three stems are associated with different aspects: not completed event (present, imperfect, injunctive); completed event (aorist); present result of past event (perfect). In Young Avestan and Old Persian, the aspect system survives mainly in modal forms; in Old Persian, aorist modal forms form a suppletive paradigm with present forms. The Young Avestan present injunctive (present stem with secondary endings) and the Old Persian imperfect (augment plus present stem with secondary endings) became general narrative tense, expressing continuous or punctual actions and events, as well as anteriority, depending on context (YAv. *kərənaom* [*-aom* < *-aw-am*] ‘do-1ST.SING,’ OPers. *a-kunav-am* ‘PAST-DO-1ST.SING’ = ‘I did, (when ...) I had done.’

An innovation common to Young Avestan and Old Persian is the optative used (with or without augment) to express habitual actions or events in the past (YAv. *apataiən* < *a-pat-aiy-ant* ‘PAST-fall-OPT-3RD.PL’ = ‘(the demons) used to run about’; OPers. *avājanyā* < **ava-a-jan-yā-t* ‘down-PAST-strike-OPT-3RD.SING’ = ‘he used to kill’). This usage continues in several Middle Iranian languages.

Old Persian is in the process of developing a split-ergative verbal system, with an ergative perfect tense contrasting with the ancient imperfect (*a-kunav-am* ‘PAST-do-1ST.SING’ = ‘I did/had done’ versus *manā kart-am* ‘I.GEN-DAT DO-PAST.PART-NOM.SING. NEUT’ = ‘I have done [it]’).

The Middle and New Iranian languages exhibit a variety of developments that represent smaller or greater innovations compared with Old Iranian.

Points of Historical Phonology

We may distinguish between languages with conservative phonologies, characterized by the survival of surd stops and affricates after vowels (comparable to Italian in this respect), and languages where these are voiced or dropped (comparable to Spanish and French). Sogdian and Balochi are of the former type, the others at various stages of the latter.

Final syllables are lost to various degrees, e.g., OIran. NOM.SING **ačw-ah* ‘horse’: Av. *asp-ō*, OPers. *as-a*, Khot. *asś-ā*, Sogd. *asp-í*, Parth., MPers., NPers. *asp*, Pashto *ās*.

The Indo-Iranian syllabic *r* <Ꞥ> developed differently from *ar* in most languages (Av. <arə>, OPers. <ar>, MPers. *ir/er, ur*, etc.; e.g., Av. *zərəδaiia-* ‘heart,’ Parth. *zirō*, MPers. *dil* [-*rd* > -*l*]; Av. *mərə-ta-* ‘dead,’ OPers. *mar-ta-*, MPers. *murd*).

All the Old Iranian diphthongs were monophthongized. Fronting and backing of vowels (umlauting) is common in both diachrony and synchrony.

In Chorasmian, Khotanese, and many modern East Iranian languages, the old palatal affricates *č* [tʃ] and *ǰ* [dʒ] became dental affricates *c* [ts] and *j* [dz], while new palatal affricates developed from the velar stops by palatalization.

The groups *xt, ft* became *γt, βt* (with various further developments) in Ossetic and eastern languages (Av. NOM.SING *duxt-a* ‘daughter,’ Sogd., Chor. *duyd-á*, Khot. *dūt-a /dūd-a/*, Bactr. <logd-a> = *lugd-a*, Pashto *-lś* [< **luw* in *tər-lś* ‘uncle/aunt’s daughter’]; MPers. *haft* ‘7,’ Sogd. *aft*, Khot. *hauda*, Pashto *owá*, Shughni *ūvd*, Wakhi *ib*).

Some modern East Iranian languages also have retroflex series, e.g., sibilants *š* [ʃ], *ṣ̌* [ʃ̣], *ž* [ʒ], *ẓ̌* [ʒ̣]; affricates *ts, tš, tṣ̌, dz, dž, dẓ̌*, etc. In Pashto, the phonetic realization of the retroflex sibilants defines four dialect areas, going from southwest to northeast: *pašto, pašto, pašto, paxto*.

The development of consonant groups is especially varied:

θr: OPers. *ç*, MPers., etc., *s*; Sogd. (and several mod. dialects) *š*; Khot. *dr-,r-*; Parth., Bactr. *hr*; Ossetic *rt* (e.g., OIran. NOM.SING **puθr-ah* ‘son’: OPers. *puç-a*, MPers. *pus*, NPers. *pesar* [changed after *pedar* ‘father’]; Sogd. *pāš-í*, Khot. *pār-ā*, Parth. *puhr*, Bactr. <pouro> = *puhr*; Oss. *firt*; OIran. **θrājah* ‘three’: MPers. *sē*, NPers. *se*; Sogd. *šē*; Khot. *drai*; Parth. *h(e)ray*, Bactr. <uarēio> = *harēy*, Shughni *aray*; Oss. *ærtæ*, Wakhi *truy*; Munji *širay*).

rs: remains in Ossetic and several eastern languages but commonly becomes *š* in western languages; Pashto and some others have *št* (e.g., **pṛsa-* ‘ask,’ Pashto *pušt-*); the Shughni group has variously *šc, ws* (Shughni *pešc*, Roshani *paus-*).

rt: frequently remains or becomes *rd* (Wakhi *mərt* ‘dead,’ MPers. *murd*); it becomes retroflex *t* [ṭ] in several eastern languages (e.g., Khot. *mudā-*), which further becomes retroflex flap *r* [ɾ] (e.g., Pashto *mṛə*), or loses retroflexion and becomes *d* or *g* (Shughni *mūd*, Roshani *mewg*).

št: Oss. *st*; Bactr., Pashto *t*; Shughni group *št*; Yidgha-Munji *šḳ, šč* (Av. *ašta* ‘eight,’ OPers. *aštā*, MPers., NPers. *hašt* [with *h-* from *haft* ‘seven’], Bactr. <atao> = *ata*, Pashto *atá*, Shughni *wašt*, Yidgha *aščo*).

Points of Historical Morphology and Syntax

Three genders are still found in Sogdian and Khotanese. Two genders are found in Bactrian and Chorasmian and in many modern languages. Persian and many modern languages have no gender.

The dual remains in Sogdian and Chorasmian. The numerative forms used only after numerals in Sogdian and Pashto incorporate old dual forms.

In several Middle and New Iranian languages, marked plural forms are restricted to animate nouns or are used to express individuality.

Definite articles from demonstrative (or relative) pronouns are found in Sogdian, Bactrian, Chorasmian, and Ossetic. In the modern languages, indefiniteness is usually expressed by a suffixed ‘one.’ Definiteness (topicalization, etc.) is expressed in a variety of ways (which is addressed later, in the section on direct object marking).

The western languages (Middle Persian, Parthian, Bactrian) have reduced the older, six-case system to a two-case system (direct case for the older nominative and accusative[?] and oblique for the other cases), while the eastern languages (Tumshuqese, Khotanese, Sogdian) preserve the Old Persian-type six-case system. In several declensions in Sogdian, in Chorasmian, and in the later stages of Khotanese, the nominative and accusative singular are no longer distinguished (exceptions in the pronouns). Several modern languages preserve the two-case system, sometimes with the addition of one or more local cases. Balochi and other eastern languages have nominative, genitive (possessive), oblique, and a case for the direct/indirect object. Ossetic, to some extent influenced by Caucasian languages, has the largest number of cases, including nominative, genitive, and dative (grammatical cases) and (local cases) allative, ablative, inessive, adessive, equative (expressing language and likeness), and comitative (only Iron).

In Sogdian, a system of light versus heavy stems developed: stems containing at least one long vowel or a diphthong (including *ar, an, am*) attracted the

stress, causing loss of short final vowels (e.g., NOM.SING *asp-í* ‘horse,’ LOC.SING *asp-yá*, versus NOM.SING *méθ* ‘day,’ LOC.SING *méθ-ī*; IMPERF.3RD.SING *wan-á* ‘did’ versus *wēn* ‘saw’).

Several Middle and New Iranian languages use affixes to mark the direct object, depending on degree of specificity and definiteness. The most common contrast is unmarked = indefinite versus marked = definite. The markers are of three main types, all older indirect object markers: (1) ending derived from older case ending (usually *-e*, *-i*); (2) from older prepositions meaning ‘to’ (Manichean Parthian [less commonly Middle Persian] *ō* and Bactrian *abo* from OIran. *abi* ‘to([ward])’; Bashkardi *be-* from OIran. *pati* ‘to([ward])’); (3) from older prepositions meaning ‘from, on account of,’ etc. NPers., Balochi *-rā* [from OPers. *rādiy* ‘on account of,’ MPers. *rāy*, indirect object marker]; Shughni group *a(z)-* [OIran. *hača* ‘from’]).

In the eastern Middle Iranian languages, as well as in several modern East Iranian languages, the noun has two distinct declensions, one going back to the old vocalic stems, the other to extended *ka*-stems (feminine variously, *kā-*, *kī-*, *čī-*, and, analogically, *čā*-stems).

The western languages (Middle Persian, Parthian, Bactrian) continue, to varying extents, the Old Persian use of the relative pronoun as relative particle or *ezafe* (Mid. Pers. *ī*, Parth. *čē*, Bactr. *i-*). In New Persian and related dialects, the use of the *ezafe* is common. The so-called inverted *ezafe* found in some languages is the oblique case, e.g., Mazanderani *pēr-e kiya* ‘father-OBL house’ = ‘the father’s house.’ Possession is of the type ‘I have’ or ‘for me is.’

In verb morphology, innovations include the development of new marked present (continuous) tenses and the restriction of the unmarked old present to, sometimes remarked, modal functions; restructuring of the stem systems into pairs of intransitive-passive and transitive-causative verbs; the restructuring of the past tense systems by the addition of the new perfect system seen in Old Persian; and, when this becomes the regular past narrative tense, the creation of a new perfect system, using various strategies.

Continuous or progressive tenses are marked already in Sogdian, where a particle meaning ‘being’ is added to the personal forms (*ḍār-am-skun* ‘hold.PRES-1ST.SING-PROG’ = ‘I am holding’). In Khotanese, petrified participles meaning ‘sitting,’ ‘standing,’ ‘going’ probably modify the verb in the same sense. In the modern languages, a variety of affixes are found. In Persian and the southwestern dialects, we find prefixes originally meaning ‘always’ (Class. NPers. *hamē* and *mē-*, NPers. *mī-*; Bakhtiari and Lori *ī-* and *ei-*). The Tati and Caspian dialects use

a present participle in **-ende* + copula (e.g., **kūn-ende-ī* > *kennī* ‘do-PRES.PART-COP.2ND.SING’ = ‘you are doing, you do’). Several languages use constructions of the type ‘be in doing’: Gilaki *kār-a āmon dar-a* ‘work-CONN come.INF in-COP.3RD.SING’ = ‘he is coming’; Larestani *a-kerdā-em* ‘a-doing I am, I am doing’; NBashk. *a-kerdén-om*, SBashk. *be-kért(én)-īn*; Balochi *raw-ag-ā int* ‘a-go-ing he is, he is going’. Some eastern languages use a suffix derived from ‘stand’ (Yaghnobi *-īšt*, e.g., *šāw-om-īšt* ‘go-1ST.SING-CONT’ = ‘I am going,’ imperf. *a-šāw-i-m-īšt* ‘PAST-go-IMPERF-1ST.SING-CONT’ = ‘I was going’).

The old present acquires modal functions and can be marked (e.g., NPers. subjunctive *kon-am* ‘do-1ST.SING’ or *be-kon-am* ‘SUBJ.do-1ST.SING’ = ‘I may do’).

The imperfect is still characterized by the augment in Middle Persian (only example *a-ger-īy* ‘PAST.do-PASS.3RD.SING’ = ‘was made,’ cf. OPers. *a-kar-īya*), Chorasmian, Sogdian, and Tumshuqese (*a-cchu* ‘I went’), and in modern Yaghnobi (*a-kún-i-m* ‘PAST-do-IMPERF-1ST.SING’ = ‘I did’). In Chorasmian and Sogdian, the augment is lost in verbs without original prefix; in verbs with prefix, the augment appears as lengthening of the vowel of the original prefix (e.g., Sogd. *θbar-*, IMPERF *θ-ā-bar-*, Chor. *haβir-*, IMPERF *h-ā-βir-* ‘gave,’ cf. OPers. *frā-bara* < *fra-ā-bara* ‘forth-PAST-carry-3RD.SING’ = ‘he gave’) or as *m-* (e.g., Sogd. *m-anʔaz-* ‘began’, Chor. *m-ikk-* ‘did’, analogically from forms with prefix *ham-*, cf. OPers. *ham-a-taxša-iy* ‘PREV-PAST-labor-1ST.SING.MID’ = ‘I labored’). Several modern languages and dialects have imperfects with a suffix *-i-*, which may continue the Old Iranian preterital optative (e.g., Yaghnobi IMPERF *a-šāw-i-m* ‘I was going,’ PRES.SUBJ *šāw-om* ‘(that) I go’).

In Middle Persian, Parthian, and Bactrian, the (narrative) past tense system (completed action) is based on the older split ergative seen emerging in Old Persian; Sogdian and Choresmian instead use the auxiliary ‘to have’ in transitive constructions and ‘to be’ in intransitive ones (Sogd. *ək-t-u-ḍār-am* ‘do.PAST-ACC. NEUT.SING-have.PRES-1ST.SING’ = ‘I did, I have done’); and Khotanese has a form with an originally active (possessive) participle plus ‘to be’ (*dā-t-aimā* ‘see-PAST-1ST.SING.MASC’ = ‘I saw, I have seen’ < **dīta* *āh ahmi* ‘having-seen I am’). As the old original perfect replaced the inherited imperfect (injunctive) as past narrative tense, new strategies were invented to express the perfect. The most common is the use of a past stem extended by *-ag* > *-e*, etc. (NPers. *kārd-am* ‘I did’, *kārd-é-am* ‘I have done’) or *-ss-* (from the older ‘stand’; Larestani *če-d-e* ‘go-PAST-PERF.3RD.SING’ = ‘he has gone,’ but *če-ss-em* [-*d-s-* > *-ss-*] ‘go-PAST-PERF-1ST.SING’ = ‘I have gone,’ Kumzari *zur-s-e* [*zur-* < *zat-*] ‘he has struck’).

Punctual aspect is often marked by the prefix *b-* or similar, which also marks modal functions in many modern Iranian languages.

The old modal forms were generally preserved in Middle Iranian: subjunctive, optative, and imperative everywhere; the injunctive (with various modal functions) in Chorasmian, Sogdian, and Khotanese. In the modern languages, old modal forms survive as archaisms (NPers. *zende b-ād* 'alive be.3RD.SING. SUBJ' = 'long live!'), and, instead, modal functions are left unmarked in contrast to the marked present (continuous) or are marked by a prefix, often *b-*.

Directional prefixes are common, more or less closely connected with the verb. For instance, the Late Khotanese adverbs *vā*, *ttā*, *hā* and the Pashto prefixes *rā*, *dār*, *wār* indicate the direction of the action or movement toward first, second, or third person and can also simply substitute for the personal

pronouns. Ossetic has a complex system of spatial prefixes indicating the direction of the motion relative to location and speaker.

Iroquoian Languages

M Mithun, University of California, Santa Barbara, CA, USA

The Iroquoian Family

The Iroquoian languages are indigenous to south-eastern and northeastern North America. The family consists of two major branches: Southern Iroquoian and Northern Iroquoian.

Southern Iroquoian is represented by just one language, Cherokee, spoken today primarily in Oklahoma and western North Carolina. There are clear dialect differences between western and eastern Cherokee and within each, many of which predate the forced march of the Cherokee from North Carolina to Oklahoma in 1838.

Northern Iroquoian consists of several subgroups. The first to break away from the main branch developed into Tuscarora, Nottoway, and Meherrin. The Tuscarora were first encountered in eastern North Carolina, but early in the 18th century most moved north to rejoin other Northern Iroquoians. Their descendants now live primarily in two communities,

one at Six Nations on the Grand River in Ontario, the other near Niagara Falls in New York State. Nottoway and Meherrin were once spoken near the Virginia and North Carolina coasts. All that remains of Nottoway are two wordlists recorded during the early 19th century. The only record of Meherrin is two town names, sufficient to identify the language as Iroquoian. The Meherrin merged with those Tuscarora who did not migrate north in the 18th century.

The next group to separate from Northern Iroquoian became the Huron. They comprised a confederacy of four nations totaling around 20 000 people when they encountered Champlain in 1615 in present southern Ontario. In 1649, they were decimated by the Five Nations Iroquois. Some survivors formed a settlement at Lorette near modern Quebec City. Others joined the remnants of neighboring Iroquoian nations, the Tionontati (Petun), Erie, and Neutral, and migrated west toward Detroit and ultimately into Oklahoma. This group became known as the Wyandot. Both Huron proper at Lorette and Wyandot in Oklahoma were last spoken in the 20th century.

The remaining Northern Iroquoians separated into several subgroups, whose territories extended across present New York State. These were the Five Nations (with Tuscarora, the Six Nations), members of the League of the Iroquois. To the west were the Seneca and Cayuga. In the center were the Onondaga, near modern Syracuse. To the east were the Oneida and the Mohawk. The languages are now mutually unintelligible, though they share many structural features. Seneca is now spoken in three communities in western New York: Cattaraugus, Allegany, and Tonawanda. Most Cayuga left New York State after the Revolutionary War, some going to Six Nations in Ontario, and others to Oklahoma. The language is now spoken primarily at Six Nations. It was last spoken in Oklahoma late in the 20th century. Onondaga is spoken at Six Nations and at Onondaga south of Syracuse. Oneida is spoken near London, Ontario, and Green Bay, Wisconsin. There are six Mohawk areas: Kahnawà:ke and Kaneshatà:ke in Quebec; Ahkwesáhsne, which straddles Quebec, Ontario, and New York State; and Ohswé:ken (Six Nations), Thaientané:ken, and Wáhta' in Ontario. Most speakers now live in the first three.

Several other Iroquois languages are known to have existed as well. In 1534, Jacques Cartier encountered people along the St Lawrence River around present Quebec City. Vocabulary in his ship's logs and appended wordlists indicate that these people, now known as the Laurentian, spoke several Northern Iroquoian languages, at least one of which was not ancestral to any of the modern languages. When Champlain returned to the area in 1603, these people had disappeared. They are, however, the source of the name Canada. Another group, the Susquehannock or Andaste, were encountered by Captain John Smith about 1615 in the lower Susquehanna Valley in Pennsylvania. Their language, known through a wordlist recorded by the Swedish missionary Johan Campanius in 1696, was last spoken in the mid-18th century.

Phonology

The consonant inventories of the languages generally consist of one series of obstruents (reflexes of *t, *k, *tʃ, *kʷ, *s), one of resonants (*n, *r, *w, *j), and one of laryngeals (*h, *ʔ). Voicing is not distinctive. Noteworthy is the lack of labials. Most of the languages have four oral vowels (*i, *e, *a, *o) and two nasal vowels (*ɛ, *ɔ). In Proto-Northern-Iroquoian, stress was penultimate, and open, stressed syllables were lengthened.

There have been several innovations of interest. One is stress in Cayuga. Cayuga stress placement

depends on syllable count from both edges of the word. Primary stress falls on the penultimate syllable, providing that it is even-numbered counting from the beginning of the word: *satkáhbthob* 'Look!' If the penult is odd-numbered, it is stressed only if it is open: *senhotǫ:kob* 'Open the door!' If the penult is odd-numbered and closed, stress is antepenultimate: *sasaky'atáwihsih* 'Take your shirt off!' Epenthetic vowels, added after the establishment of basic penultimate stress in Proto-Northern Iroquoian, are not counted, like the *-a-* stem joiner in *sakyá'tawi't* 'Put your shirt on!' Stress on the second of two adjacent vowels moves to the first: *sasanaháowe:k* 'Put your hat back on!' If conditions are not met for penultimate stress, and there is no antepenultimate syllable, the word carries no stress: *sahsyǫ'* 'you returned.'

Cayuga shows another interesting innovation. In odd-numbered syllables closed by a laryngeal, the laryngeal feature spreads leftward over the entire syllable. If the laryngeal is h, the full syllable is devoiced. (Devoicing is shown orthographically by underlining.) If the laryngeal is glottal stop, the full syllable carries creaky voice, indicated here by a wavy underline: *wahsí'tá'keh* 'on its foot.'

Several of the languages have developed distinctive tone under the effect of laryngeals. In Mohawk, stressed syllables generally show high pitch (if short) or rising pitch (if long). Stressed syllables closed by a laryngeal (glottal stop, or h followed by a resonant), however, developed a special pitch contour: a rise followed by a deep fall. The triggering laryngeal subsequently disappeared before a consonant. There are now contrasts, such as *oká:ra* 'story' (with rising tone) and *okà:ra* 'eye' (**okáhra*'). (Mohawk examples are given here in the community orthography. Nasalized vowels ʌ and ɥ are written en and on respectively, glottal stop with an apostrophe ', vowel length with a colon :, stress accompanied by high or rising tone with an acute accent, and stress accompanied by falling tone with a grave accent. The palatal glide j is represented by i. Other symbols have approximate IPA values.) Western Cherokee underwent more complex changes resulting in tone. Feeling (1975) distinguishes three level tones (2, 3, 4), a rising tone (23), and two falling tones (32, 21, written 1), as in *a¹hyv^{2,3}ki³di²ya* 'he's capturing him.'

Morphology and Syntax

All of the languages are polysynthetic. Verbs in particular can be composed of large numbers of meaningful parts (morphemes), like Mohawk *enhske-rhar-átst-en-* 'you will promise me' (FUT-2. sing/1.sing-expect-CAUS-BEN.APPL-PER). All verbs contain at least three parts: a pronominal prefix, a verb root,

and an aspect suffix. The pronominal prefix refers to the core arguments of the clause: *-hske*-‘you/me’ in the verb above. The prefix appears in the verb whether or not there are coreferential independent nominals in the clause as well, but it is fully referential in its own right.

There is little evidence of Subject or Object categories. The pronominal prefixes show grammatical Agent/Patient patterning. The semantic basis underlying the system is still clear. Agent prefixes typically represent participants who are actively in control and instigating events or states, as in Mohawk *ra-tahónhsatats* ‘he is listening,’ *ra-ná:ie* ‘he is conceited,’ or *rá-hsere’s* ‘he is chasing it.’ Patient prefixes typically represent participants who are affected by a situation but not in control: *ro-thón:te* ‘he hears it,’ *ró-ta’s* ‘he is sleeping,’ or *ró-hsere’s* ‘it is chasing him.’ The system is now fully routinized, however. Speakers do not judge degrees of control as they speak; they simply learn which set of prefixes to use with each verb.

Agent prefixes are used in both events and states (*jump*, *be conceited*), and Patient prefixes are used in both events (*holler*) and states (*be poor*). The system is thus basically Agent/Patient rather than Active/Stative. Superimposed on it, however, is one element of Active/Stative patterning. Some verbs occur only in the Stative: *rahseró:hen* ‘he is quick-tempered,’ *ró:ten* ‘he is poor.’ Others occur in all three aspects: Habitual *ratè:kwahs* ‘he escapes,’ Perfective *wahatè:ko* ‘he escaped,’ Stative *rotè:kwen* ‘he has escaped.’ With verbs like *escape*, which describe a change of state, the Stative aspect form typically has a Perfect meaning: *he has escaped*. All Perfect Stative verbs occur with Patient prefixes, whether their Habitual and Perfective forms appear with Agents or Patients.

The Northern Iroquoian languages show extensive, productive noun incorporation. The Southern language Cherokee shows traces of incorporation embedded in the lexicon, indicating that incorporation was productive in Proto-Iroquoian. Incorporation is a process whereby a noun stem is compounded with a verb stem to form a larger verb stem: *-itsker-onti-* ‘saliva-throw = to spit.’ There is no explicit specification of the semantic role of the incorporated noun; it simply indicates the involvement of a type of entity, often as a semantic patient, but sometimes as an instrument, location, source, or goal. Examples can be seen in Mohawk *wa-ho-n-itsker-ón:ti-* FACTUAL-MASC.SING.AGT-MIDDLE-saliva-throw-PER ‘he saliva-threw = he spit’ and *ka-hseriie’t-áner-en* NEUTER-cord-tie-STATIVE ‘it is cord-tied.’ Incorporation is used pervasively to create new vocabulary and also to manipulate the flow of information through discourse. Important new participants are typically introduced with independent nominals,

but those that are already part of the scene or of peripheral importance may be carried along as incorporated nouns.

Lexical categories are clearly distinguished by their internal morphological structure. Particles, by definition, are morphologically unanalyzable (*tóka* ‘maybe,’ *oh* ‘what,’) though they may be compounded (*nek tsi* ‘the only’ for ‘because’). Nouns contain a prefix specifying the gender of the referent or its possessor, a noun stem, and a noun suffix: *ka-nà:tsi-a* NEUTER-kettle-NOUN.SUFFIX ‘kettle,’ *ake-nà:tsi-a* 1.SING.ALIENABLE.POSS-kettle-NOUN.SUFFIX ‘my kettle.’ Alienable and inalienable possession are distinguished. Verbs follow an entirely different pattern, and can be quite complex morphologically. In addition to the obligatory pronominal prefix, verb root, and aspect suffix, they may contain various prepronominal prefixes. In the Northern languages, these are the Partitive, Contrastive, Coincident, Negative, Translocative, Factual, Duplicative, Future, Optative, Cislocative, and Repetitive. They may contain a Middle, Reflexive, or Reciprocal prefix. As seen above, they may contain an incorporated noun stem. Following the verb root, there may be one or more derivational suffixes, such as an Inchoative, Reversive, Causative, Instrumental Applicative, Benefactive Applicative, Distributive, or Purposive. After the aspect suffix, there may be a postaspectual suffix: a Past, Continuative, or Progressive. Such structure can be seen in the Mohawk *a-khe-nikonhr-áks-a’t-e* OPT-1.SING/INDEF-mind-be.bad-CAUS-PER ‘I would insult someone,’ or *ia’t-e-iako-hah-a-hiia’k-on-hátie* TRANS-LOCATIVE-DUPLICATIVE-FEM.PAT-ROAD-STEM. JOINER-CROSS-STATIVE-PROG ‘she was crossing the street.’

The morphological composition of particles, nouns, and verbs is thus entirely distinct. Noun stems never appear in the verb stem position of verbs, and verb stems never appear in the noun stem position of nouns. The match between internal morphological form and external syntactic function, however, is not isomorphic. Some morphological particles function syntactically and semantically as nominals, such as *è:rhar* ‘dog.’ Morphological verbs can function syntactically as predicates, as nominals (without further derivation), or as full clauses, as below.

| | |
|-----------------------|---------------------------------|
| Nahón:ne’ | tehniíáhse |
| n-a-honn-e’ | te-hni-iahse |
| PART-OPT-MASC.PL.AGT- | DUPLICATIVE-MASC.DU. |
| go-PER | AGT-be.together.STAT |
| ‘they would go there’ | ‘they two (males) are together’ |
| niristi:sere’s | nahshakotihahónniën’. |
| ni-rist-i’ser-e’-s | ne = a-hshakoti-hah-onni-en-’ |

MASC.DU.AGT-steel- the = OPT-MASC.PL/3.DPL-road-
 drag-STAT-DIST make-BEN.APPL-PER
 they (males) steel the they would road make for
 drag around them
 ‘They would go serve as guides for two surveyors.’

Finally, there is no basic, syntactically defined word order. In part because of the richness of the verbal morphology, the proportion of verbs to nouns and of predicates to nominals is much higher in Iroquoian languages than in many languages of Europe and Asia. There are few oblique or adjunct nominals. When clauses do contain multiple constituents, all orders are not only possible, they can also all be seen to be pragmatically motivated by the discourse at hand.

Italian

A L Lepschy and G Lepschy, University College London, London, UK

Italian is the official language of the Republic of Italy. It is spoken in Italy (including the Republic of San Marino and the Vatican City), and outside Italy, in the Canton Ticino (it is one of the official languages of the Swiss Confederation) and, with different degrees of vitality, in areas such as those of Nizza, the Principality of Monaco, Corsica, Istrian and Dalmatian towns, and Malta. It also survives in Eritrea, and where there are large communities of Italian emigrants, particularly in the United States (about four million speakers), and in Canada, Argentina, Brazil, and Australia (about half a million each).

Number of Speakers

The inhabitants of the Italian Republic numbered about 57 million in 2002. The number of speakers of Italian is, however, more difficult to establish, mainly because there is no simple way of relating the use of the Italian language with Italian ethnic origin or cultural allegiance, in the case of emigrants,

and even with Italian citizenship in the case of the residents of Italy. For the latter, the problem is posed not so much by the linguistic minorities within the boundaries of the Italian republic (speakers of German, ca. 280 000, mainly in South Tyrol; of Occitan and Franco-Provençal, ca. 115 000; of Slovene, ca. 53 000; of Serbo-Croatian, ca. 3000; of Albanian, ca. 100 000; of Greek, ca. 30 000; of Catalan, ca. 15 000), but rather by the presence of the so-called ‘Italian dialects.’

Genetic Relationships

The term ‘dialect,’ in the Italian tradition, is used to refer not to different varieties of the same language but, rather, to ‘siblings’ of Italian. Italian is based on the literary Tuscan (more specifically Florentine) of the fourteenth century. This in turn derives from Spoken Latin and is therefore a Romance language. But Latin during the period from the sixth to the ninth century gave origin, in Italy, to a myriad of Romance languages, which can be classified into over 15 major groups (broadly coinciding with the Italian regions) such as Piedmontese, Lombard, Venetian, Ligurian, Emilian, and so on. These Italian ‘vernaculars’, in Italian ‘volgari’ (a term used to designate the living

languages, in the Middle Ages, as opposed to Latin, which was no longer native to any group of speakers, but was the standard written language) in their modern forms constitute the Italian dialects (Sardinian and Friulian are sometimes classified as Italian dialects, sometimes as separate Romance languages). The differences between these dialects can be very pronounced. Speakers of Bolognese and of Neapolitan find each other's dialects as unintelligible as would, say, speakers of French and Spanish.

History

External History

Literary Florentine, as used by the great Tuscan writers of the fourteenth century, Dante, Petrarch, and Boccaccio, was gradually accepted as the national standard language and finally codified as such at the beginning of the sixteenth century. The 'Questione della lingua' (question of the language) was a central concern for the culture of the time with ideological and political, as well as linguistic and literary, implications. Against the proposers of contemporary Tuscan, and of a supraregional 'lingua cortegiana' (language of the courtiers), the solution that prevailed was the one defended by the Venetian humanist, Pietro Bembo. The model he upheld was archaic Tuscan, which did not imply subservience to any of the rival modern political powers in Italy and was consistent with the principles of classicism and imitation then prevailing.

This had important consequences for the linguistic history of Italy. On the one hand Italian appears to be exceptionally 'conservative': it must be almost unique, among modern national languages, in having changed so little through eight centuries of documented history, and in allowing a twentieth-century reader to approach thirteenth-century Tuscan texts with minimum effort. On the other hand (and this is perhaps the condition for such stability) this language remained a standard written model, accessible only through literacy, like Latin, rather than acquired as a native language. The vast majority of the people, who were illiterate, did not have access to the literary language, and in speech used exclusively their native dialect. It has been calculated that at the moment of political unification in 1860 the number of the inhabitants of the country who could use Italian was at most about 10%, perhaps as low as 2.5%. In 2005, after 145 years of existence of a unified Italy, Italian was assumed to be known to all Italians, but statistics indicated that almost one-half of the population still preferred to use a dialect rather than the national language.

Internal History

The main points to be mentioned in the change from Latin to Italian include the following.

Phonology The opposition of long and short vowels in Latin was replaced by a distinction determined by stress and syllable structure: long vowels are obligatory in free stressed nonfinal syllables, short vowels in other conditions (i.e., in checked stressed, free stressed final, and all unstressed syllables). In stressed syllables the five Latin vowel qualities became seven, with long \bar{e} and \bar{o} giving midhigh [e] and [o], short \acute{e} and \acute{o} giving midlow [ɛ] and [ɔ] (these broke into [jɛ] and [wɔ] in free syllables). In unstressed syllables only five vowels are used: [i], [e], [a], [o], [u]. The consonant system undergoes the following main changes: assimilation (e.g., [kt] > [tt], as in *factum* > *fatto*); palatalization and assibilation before front vowels (as in *cenam* [ke:nam] > *cena* [tʃena]); *hodie* > *oggi*, *medium* > *mezzo*); sonorization, which applies unsystematically, as in *stratam* > *strada*, but *amatam* > *amata*. Initial *h* and final consonants (apart from nasals and liquids in proclitics: *un*, *per*, *il*, etc.) are dropped.

Morphology The case system of the Latin declension disappears and prepositions are used instead: *di uomo* replaces Latin *hominis*. The neuter gender disappears. The Latin verb pattern is basically preserved, with the introduction of 'analytical' or compound forms for the passive (*è amato* for *amatur*), the future (*amare ho*, whence the new synthetic *amerò*, for *amabo*), the perfect (*ho amato* for *amavi*, although this survives as *amai*), and so on.

Syntax The freedom of Latin word order is reduced, as syntactic function is signaled by linear position rather than case endings: for 'Paul saw Peter' the only normal and unequivocal structure in Italian is 'Paolo vide Pietro,' whereas in Latin *Petrum Paulus vidit* would be equally clear in any of the six theoretically possible combinations of these three words.

Written Records

The first dated text in an Italian vernacular is found in the account of a court case in Campania in the year 960 A.D. (the *Placito capuano*). The original record in Latin has been preserved; it includes the statement repeated by some witnesses in the vernacular: *sao ko kelle terre per kelle fini que ki kontene trenta anni le possette parte sancti Benedicti* ('I know that those lands within those boundaries which here are contained, for 30 years the party of St Benedict

owned them'). Several, mostly short vernacular texts, are found subsequently until the thirteenth century, when 'Italian' literature proper begins, with religious compositions, the poetry of the Sicilian School, and finally Tuscan poetry.

The vernacular must have been used in speech for a long time before the document of 960. There are several texts that appear to represent an attempt to fix in writing a kind of vernacularized Latin by lowering it toward the spoken language, or raising the latter to conform to the conventions of written Latin. One of the best-known documents of this 'compromise' is a riddle apparently jotted down in Verona, at the beginning of the ninth century on a page of a prayer book; it refers to the act of writing, under the guise of describing the work of a farmer: '*se pareba boues alba pratalia araba & albo uersorio teneba & negro semen seminaba*' (a plausible rendering, among many which have been proposed: 'he was driving oxen, he was plowing white fields and he was holding a white plow, and he was sowing black seed'); some features appear more Latin than vernacular (e.g., *-b-* for *-v-* in the imperfects, final *-n* in *semen*, etc.); others are more vernacular (e.g., fall of final *-t* in the imperfects, *e* in *negro*, etc.). However, many traits present in dialects are attributed to the substratum of pre-Latin idioms spoken in Italy at the time of Romanization. For instance, a Neapolitan feature such as *-nn-* for *-nd-* belongs to Oscan and is found in the Latin graffiti of Pompeii, preserved under the ashes from the eruption of Vesuvius in 79 A.D. This, however, does not entitle us to suggest that Neapolitan was spoken in the first century A.D.

Writing System

The Italian writing system derives from the Latin one. It uses the Roman alphabet as it was adapted for the vernacular during the Middle Ages. Palatalization created some problems, which are solved in the Italian spelling conventions, by using *-* in front of *i* and *e* – *c*, and *g* for the palatals [tʃ] and [dʒ], and *ch* and *gh* for the velars [k] and [g]. But the system does not render all the oppositions of Tuscan phonology. In particular there are individual letters that correspond to contrasting sounds: *e* to [e] and [ɛ], *o* to [o] and [ɔ], *s* to [s] and [z], *z* to [ts] and [dz]; the last two alveolar affricates, which are always long intervocalically, are represented in spelling sometimes by *z* and sometimes by *zz*. These points leave a trace in the history of the language. As Italian was adopted as a national language in its written rather than spoken form, it became established, in different parts of Italy, with phonological counterparts, for these 'ambiguous'

letters, which may be different from the Tuscan ones. Considering that contemporary Tuscan does not constitute an undisputed standard, Tuscan pronunciations like *b[ɛ]ne*, *ca[s]a*, or *[ts]io* are not felt, in present-day Italian, to be more correct than Northern ones like *b[e]ne*, *ca[z]a*, or *[dz]io*.

Individual Characteristics

Among the Romance languages Italian would appear to be typologically more similar to Spanish than to French.

For syntax, one frequently noted feature is that it is a 'pro-drop' language (i.e., it does not need to express the pronominal subject of a verb and that, consistently, it can put the subject after the verb). The adjective has two positions: postnominal if it is restrictive, and pronominal otherwise.

Morphology is conservative within a traditional Indo-European pattern; adjectives, nouns and verbs are subdivided into classes, without apparent semantic justification. An adjective may behave like *ross-o* (MASC SG), *ross-a* (FEM SG), *ross-i* (MASC PL), *ross-e* (FEM PL); or like *verd-e* (MASC and FEM SG), *verd-i* (MASC and FEM PL); or like *par-i* (MASC and FEM SG and PL). A noun may behave like *la cas-a* (FEM SG) *le cas-e* (FEM PL); or *il poet-a* (MASC SG) *i poet-i* (MASC PL); or *il libr-o* (MASC SG), *i libr-i* (MASC PL), and so on. A verb may behave like *cant-are*, or *ved-ere*, or *dorm-ire*. Each conjugation has a vast array of different forms according to person (*canto*, *canti*, *canta*), number (*canta*, *cantano*), tense (*canto*, *canterò*, and, with aspectual distinctions, *cantava*, *cantò*), and mood (*lui canta*, *che lui canti*). There is a complex pattern of agreement for gender and number that involves nouns, articles, adjectives, and past participles: *è arrivata una ragazza alta*, *è arrivato un ragazzo alto*. A notable feature in Italian derivational morphology is the productivity of evaluative suffixes (often called 'alteration'): the following forms are based on *libro*: *librone*, *libretto*, *librino*, *libruccio*, *libraccio*, etc.

Phonology

The rhythm of Italian is syllable timed. There are seven vowels, very similar to the cardinal ones: /i/, /e/, /ɛ/, /a/, /ɔ/, /o/, /u/. In unstressed syllables the opposition of midhigh and midlow vowels is neutralized, the quality of the other vowels remains distinct. There are two semiconsonants: /j/ and /w/, and 21 consonants: /p/, /b/, /t/, /d/, /k/, /g/, /ts/, /dz/, /tʃ/, /dʒ/, /f/, /v/, /s/, /z/, /ʃ/, /m/, /n/, /ɲ/, /l/, /ʎ/, /r/. Typologically uncommon is the systematic opposition of long to short consonants, which applies to all the items listed

apart from six: /z/ is always short, and /ts/, /dz/, /ʃ/, /p/, and /k/ are always long intervocalically.

Illustration

Here follows a sentence (1) quoted for illustration:

- (1) *A Venezia è più facile che si senta parlare il dialetto che l'italiano.*
 'In Venice it is easier to hear people speaking dialect than Italian.'

Phonemic transcription: /a vve'nettsja ε ppju f'fatfile ke ssi 'senta par'lare il dja'letto ke ll ita'ljano/. Note that this sentence is pronounced in Venice without 'syntactic doubling' (i.e., the lengthening of initial consonants in specified conditions) and with some of the variations mentioned above in the section, 'Writing System': /a ve'netsja ε pju 'fatfile ke si 'senta par'lare il dja'letto ke l ita'ljano/. In the local dialect this would be: /a ve'nesja ze pju 'fasie ke se 'sejta par'lar el dja'eto ke l ita'ljan/.

Note the gender and number agreement between articles and nouns; the use of the subjunctive governed by *facile che*; the interesting construction with *si*, which can be interpreted as an impersonal (with *si* acting as the indefinite subject of *sentà*: 'one hears'), or as a passive, with the infinitive clause (*parlare*) acting as sentential subject ('speaking is heard'). Also, the subject of the infinitive need not be specified: '*si sente parlare*' 'one hears [someone] speak.' There is no dummy subject for *è* ('it is'), and the sentential subject clause introduced by *che* comes after the verb. The first *che* acts as a complementizer, and the second *che* as a conjunction within the comparative structure (*più . . . che*).

Sociolinguistic Points

As mentioned above, in Italy there are many linguistic enclaves in which 'foreign' languages are spoken, and in some cases their use is 'protected' by special legislation. For the majority of Italians the traditional situation was one of diglossia (with the local dialect used in speech, and literary Italian in writing. After political unification, and particularly as a consequence of far-reaching social changes, such as internal migration (mostly from the south to northern industrial conurbations) and the influence of the mass media, Italian has been widely adopted in speech as well. Regional differentiation is clearly marked in phonology, identifiable in lexis, and less clearly noticeable in grammar. A colloquial variety of the language has developed that has been called 'popular Italian'; this appears to be gaining acceptability, and

some of its features are penetrating into the standard written language (e.g., *gli* is now frequently found in writing for 'to them,' and sometimes even for 'to her,' as well as for the traditional 'to him'). The dialects have been diagnosed often as terminally ill and on the point of demise. In fact, they have proved remarkably resilient in ordinary usage, and sometimes they appear to be taken up by people (including the young) as a way of reasserting their own group identity and reacting against an alienating process of national equalization. There has also been a striking vitality in dialect poetry, often using very local, individual forms of the dialect, rather than a generalized, regional variety.

Descendants

Italian played an important part in the formation of the lingua franca used in the past in the Mediterranean. Since the Renaissance there have also been varieties of '*lingua zerga*' employed by vagrants. A level of 'slang' is generally thought not to be popular in Italian because its functions were filled by the dialects. A curious form of English slang, called 'parlyaree' or 'polari,' traditional among sailors, actors, and gays (and now surviving in the form of lexical relics) was based on Italian. Italian-based creoles seem to exist or to have existed in Eritrea, Argentina, and Brazil (Harris and Vincent, 1987: 20).

Languages Influenced

The influence of Italian has been mainly felt, in all the major European languages, at the level of high culture, in the lexis of music and the figurative arts. In the Renaissance, and for a long time subsequently, an acquaintance with Italian was thought to be part of the cultural equipment of educated people in most European countries.

History of Linguistic Investigation

More than for other European languages, linguistic awareness and a discussion of linguistic matters (the *Questione della lingua*) has always been very relevant for Italian intellectuals. During the Renaissance the description and codification of the language was an important part of national culture, and the *Vocabolario* (1612) of the Accademia della Crusca was the first of the great national dictionaries to be published. Less important was Italy's contribution to linguistic studies (including the historical investigation of the Italian language and dialects) during the nineteenth and twentieth centuries.

Italian as a Fusional Language

C Iacobini, Università di Salerno, Salerno, Italy

© 2006 Elsevier Ltd. All rights reserved.

In a fusional language words are inflected (and derived) by using affixes whose boundaries are difficult to identify due to the tendency of affixes to fuse with one another and with the root. The numerous occurrences of allomorphy and the tendency of morphs to simultaneously encode several meanings result in the fact that there is no one-to-one correspondence between morphs and morphemes, thus making linear segmentation difficult.

Other terms are sometimes used instead of *fusional*: *flectional*, *inflectional*, or *inflecting*, *inflective*. The term *fusional* should be preferred to others referring to inflection because both agglutinating and polysynthetic languages can be highly inflectional.

Morphological Typology

The fusional type is one of the main morphological types. The classification of languages by morphological types is part of the standard terminology of linguistics, but it is also strongly criticized by the majority of typologists for three main reasons: (1) because the classification criteria are rather vague and difficult to apply in a consistent way; (2) because the morphological type is defined in terms of mutual favorability of properties rather than of implicational correlations, resulting in a low predictive power; and (3) because morphological typology has a holistic background.

The vagueness of the classification in morphological types is shown by the lack of consensus on both the number of types and the number of parameters identifying them (the three most-used parameters are (1) the ratio of morphs to word forms, (2) the number

of morphemes to morphs, and (3) the degree of word-internal modification of morphs (Greenberg, 1954).

Modern linguistics has disavowed the ideological prejudice dating back to the 19th century, according to which the fusional morphological type was regarded as being superior to other types. Just like these, the fusional type is a combination of functionally interconnected features, which – as a whole – form an ideal construct characterizing (the whole, or some aspects of) the morphology of languages. Languages are rarely pure types; they usually mix elements of different types. Assigning a language to a specific type depends on the preponderance of features considered significant (the quantification of such features is a difficult problem to solve from a practical point of view).

Despite criticism, the classification by morphological types is convenient and widely used to rapidly identify a number of features that tend to cooccur in the morphology of a language, and also to assess the extent to which a language moves away from such ideal constructs, both in a synchronic and in a diachronic perspective (some authors argue that languages tend to move toward a typological goal (Dressler, 1985).

The Fusional Type

The best-known attempt to establish a list of features that cooccur in morphological types is the one made by Skalička (1966). The features that tend to cluster in languages displaying fusional morphology can be listed as follows:

1. Words are formed by a root and (one or more) inflectional affixes, which are employed as a primary means of indicating the grammatical function of the words in the language. Agreement is widely employed.

2. High degree of modification of internal morpheme boundaries, with a consequently difficult linear segmentation.
3. Tendency to cumulate morphological meanings in a single affix (with consequent asymmetry between the semantic and formal organization of grammatical markers).
4. Word-class distinction is maximal. Inflection is rich, regarding both the number of inflectional classes and the extension of paradigms.
5. Stem suppletion; many cases of both homonymy and synonymy among affixes; clear distinction between inflectional and derivational affixes.
6. A slight correlation with syntax can be seen in the relatively free word order (but there are also fusional languages with a fairly fixed word order).

The fusional type is differentiated from the isolating type by the use of bound morphs and the clear-cut distinction between word classes; it is differentiated from the agglutinating type by the kind of juncture between morphemes and the nonbiunivocal correspondence between morphs and morphemes. In the synthetic vs. analytic distinction, the fusional type tends toward the synthetic end.

The fusional type is largely represented in Indo-European languages, especially the most conservative ones. Latin, Slavonic, and Romance languages are the ones that are most often mentioned as good representatives of this morphological type. The main features identifying the fusional type will be described hereafter using examples drawn from Italian.

Affixal Inflection and Agreement

Italian makes wide use of inflectional affixes (nouns, verbs, adjectives, pronouns, articles are usually inflected, whereas adverbs are invariable). Inflection is obtained by replacing the word ending.

The two following sentences show an example of agreement in the singular and in the plural:

*quell-a buon-a tort-**a** è finit-a, l-a avrei mangiat-a
volentieri*
'that good pie is finished, I would have eaten it with
pleasure'

*quell-e buon-e tort-**e** sono finit-e, l-e avrei mangiat-e
volentieri.*

All the underlined elements agree in number and gender with the feminine noun in bold, the auxiliary agrees only in number, the adverb is invariable; it should be noted that agreement also affects the pronoun and the participle in the second clause.

Cumulative Exponence in Adjectival Inflection

The main adjectival inflectional class has four endings

bell-o 'nice' (sing MASC)
bell-i (PL MASC)
bell-a (sing FEM)
bell-e (PL FEM)

Each affix codes two grammatical meanings at the same time (i.e., gender and number). Regarding adjectival inflection, the Italian language is more fusional than other Romance languages. In Spanish, for example, the gender and the number are expressed by two separate morphs, and the morph for the plural is the same for the two genders:

hermos-o (sing MASC)
hermos-o-s (PL MASC)
hermos-a (sing FEM)
hermos-a-s (PL FEM)

The other important inflectional class employs two affixes: *-e* for the singular, *-i* for the plural. Homonymy is therefore observed between the affixes from the two classes (*-e* can signify both PL FEM and sing MASC or FEM; *-i* can signify both PL MASC or FEM). Compared with Latin, Italian has lost the ability to form the comparative through affixation (the few affixal comparatives in use are instances of fused exponence: in *migliore* 'better' and *minore* 'minor' it is not possible to segment the lexical base from the comparative suffix), whereas the superlative form is productively obtained by using the suffix *-issimo* (*bello/bellissimo* 'very beautiful').

Noun Inflection and Affixal Homonymy

A recent classification of Italian nominal inflection proposed by D'Achille and Thornton (2003) – superseding the very unsatisfactory traditional classification based on the endings of the singular form of nouns – distinguishes five inflectional classes (defined as a set of lexemes whose members each select the same couple of endings for singular and plural), plus a sixth class consisting of invariable nouns (the bottom line of Table 1 shows the percentage of types of each class in the Italian basic vocabulary).

Class 1 consists of masculine nouns in the overwhelming majority (*librol-i*), with very few feminine exceptions (*manol-i*). Class 2 is made up of feminine nouns only. Class 3 consists of masculine nouns by approximately 45% (*fiorel-i*), of feminine nouns by the same percentage (*siepel-i*), and of ambigeneric by 10% (*cantantel-i* may be used both for a male or a female singer). Class 4 is mostly

Table 1 Nominal inflectional classes and percentage of types of each class in the Italian basic vocabulary

| Nominal Inflectional Class | 1 sing/PL | 2 sing/PL | 3 sing/PL | 4 sing/PL | 5 sing/PL | 6 sing/PL |
|----------------------------|-----------|-----------|-----------|-----------|-----------|------------|
| Endings | -o/-i | -a/-e | -e/-i | -a/-i | -o/-a | invariable |
| % | 41.2% | 30.3% | 20.6% | 1.2% | 0.2% | 5.4% |

Table 2 Low predictability of gender distinction on the basis of the singular ending of nouns

| | |
|-------|--|
| -o | prevailing MASC, but also FEM (<i>mano, foto</i>) |
| -a | prevailing FEM, but also MASC (<i>papa, clima</i>) |
| -e | equally divided between MASC (<i>fiore, cantante</i>) and FEM (<i>siepe, cantante</i>) |
| other | equally divided between MASC and FEM |

composed of masculine nouns (*poeta/-i*) but includes a couple of feminine nouns as well (*ala/-i*); in class 5 nouns are masculine in the singular and feminine in the plural (*uovo/-a*); all the nouns ending in a stressed vowel or in a consonant (class 6) are invariable, but class 6 also includes invariable nouns ending in each of the four vowels used as inflectional endings, except for /a/ in feminine nouns (MASC: *cinema, golpe, kiwi, stereo*; FEM: *consolle, ipotesi, radio*). Although there seems to be a tendency to express the singular by means of back vowels (o MASC, a FEM) and the plural by means of front vowels (i MASC, e FEM), the cases of affixal homonymy are quite numerous (remember that class 3 uses front vowels both for the singular and for the plural, and it includes masculine and feminine as well as ambigeneric nouns). Although on the one hand, the recent trend toward an increase of invariable nouns ending by a vowel curbs the ratio of inflected nouns, on the other it decreases the degree of correlation between form and inflectional class. The low predictability of both the inflectional class and gender is clearly shown in Table 2, which refers to singular (Thornton, 2001).

Traces of Case in Pronouns

Italian has lost a fusional feature that characterizes Latin nominal inflection: the case. However, one can detect traces of case in the Italian pronominal system. The choice of the correct form of certain pronouns (Table 3) demands a decision that depends on whether pronouns express a subject, a direct, or an indirect complement.

The system of stressed pronouns distinguishes three persons for the singular and three for the plural. The third-person singular has distinct forms on the basis not only of gender, but also of the feature \pm human. The third-person plural subject differentiates gender but not the \pm human feature.

In the spoken language, the pronouns *lui, lei,* and *loro* tend to broaden their functional scope and are frequently used both as subject and nonsubject, even for nonhuman referents.

The Table 4 shows clitic pronouns with the function of direct and indirect complement.

The use of such pronouns is complicated by rules of reciprocal ordering as well as by allomorphy: all clitic pronouns that end in *-i* replace the vowel with /e/ if followed by another clitic.

tì racconto una storia 'I'll tell you a story'
te la racconto 'I'll tell it to you'
te lo porto 'I'll bring it to you'
portaglielo 'bring it to him/her'

The pronoun *le* (singFEM) becomes *gli* when followed by another clitic, which results in homonymy and consequent breakdown of gender distinctions:

mostrale la stanza 'show her the room'
mostragli la stanza 'show him the room'
mostragliela 'show it to her/him'

Homonymy occurs also with other unstressed forms (*ci* and *vi* are also locative adverbs; *lo, la, gli,* and *le* articles) and with stressed pronouns in postverbal position (*te lo prendi con te* 'you take it/him with you').

Verb Inflection

The verb is the word class with the richest inflection both in number of forms and variability (many high-frequency verbs have irregular inflection). Tense, mood, person, and number are expressed affixally.

The most relevant features of the fusional type appear even within regular inflection. Grammatical meanings can be expressed as fused in a single morph (in the form *amo*, 'I love,' there is no other overt expression than the ending *-o* to code indicative mood, present tense, first-person, singular), as well as realized through a combination of several affixes, with complex exponence relations holding between morphs: in *canterébbero* '[if] they would sing' three morphemes (conditional, third person and plural) are signaled by the entire termination *-rébbero* as a whole. A linear segmentation is not possible because *-bb-* occurs only with forms that are both third person and conditional. The final *-ro* expresses plural and again third person, the stressed *-e-* occurs consistently

Table 3 Stressed personal pronouns

| Stressed Pronouns | 1 sing | 2 sing | 3 sing | 1 PL | 2 PL | 3 PL |
|-------------------|--------|--------|--|------|------|------------------------|
| Subject | io | tu | +hum: egli (MASC) ella (FEM) -hum: esso (MASC) essa (FEM) | noi | voi | essi (MASC) esse (FEM) |
| Nonsubject | me | te | +hum: lui (MASC) lei (FEM) -hum: esso (MASC) essa (FEM) | noi | voi | loro |

Table 4 Clitic personal pronouns

| Clitic Pronouns | 1 sing | 2 sing | 3 sing | 1 PL | 2 PL | 3 PL |
|-----------------|--------|--------|---------------------|------|------|--------------------|
| ACC | mi | ti | lo (MASC) la (FEM) | ci | vi | li (MASC) le (FEM) |
| DAT | mi | ti | gli (MASC) le (FEM) | ci | vi | - |

Table 5 Indicative present regular inflection of the three traditional verbal classes

| INDIC PR | Class-a-sing | PL | Class-e-sing | PL | Class-i-sing | PL |
|----------|--------------|------------|--------------|----------|--------------|----------|
| 1 | cànt-o | cànt-iàmo | tèm-o | tem-iàmo | àpr-o | apr-iàmo |
| 2 | cànt-i | cànt -à-te | tèm -i | tem-é-te | àpr-i | apr-i-te |
| 3 | cànt-a | cànt -ano | tèm -e | tèm -ono | àpr-e | àpr-ono |

only in conditional forms, and the *-r-* occurs with futures and (again) conditionals (Matthews, 1970).

A suprasegmental modification (stress on the last syllable) suffices to distinguish between two regular verb forms like *tème* (INDIC PRES 3sing) and *temé* (INDIC preterit 3sing).

Table 5 shows instances of regular inflection of indicative present for the three traditional classes on the basis of the thematic vowel (accent marks have been added, even though not in use in normal orthography). Noteworthy, are the cumulative expression of more meanings by means of a single ending, and the omission of the thematic vowel with the exception of the second plural.

The thematic vowel may also undergo some allomorphies: in class *-a-* it is replaced by */e/* in the indicative future (*amerò*) and the present conditional (*amerèi*), in class *-i-* by */e/* in the present participle (*aprente*) and in the gerund (*aprendo*), in class *-e-* by */u/* in the past participle (*voluto*), and by */i/* in the derivation of deverbal nouns and adjectives (*temibile*, *spremitura*).

The indicative imperfect is the tense that least identifies with the fusional type, for it shows the best correspondence between morphs and morphemes in Italian conjugation (Table 6). But also in the imperfect the categories of person and number, as well as those of mood and tense, merge in a single morph. The person-number affixes largely overlap (even though not entirely) with those of the present, whereas the morph *-v-* has no other use in the conjugation.

Table 6 Indicative imperfect inflection of regular class *-a-* verbs

| INDIC Imperfect class -a- | sing | PL |
|---------------------------|------|----------------------------|
| | 1 | cant-à-v-o cant-a-v-àmo |
| | 2 | cant-à-v-i cant-a-v-àte |
| | 3 | cant-à-v-a cant-à-v-ano |

Besides synthetic forms, there are also analytic forms resulting from the combination of an auxiliary and a past participle. The main auxiliary verbs are *essere* 'to be' and *avere* 'to have'; both are highly irregular

INDIC PRES *sono, sei, è, siamo, siete, sono*
 INDIC preterit *fui, fosti, fu, fummo, foste, furono*
 INDIC IMPERF 1PERS *ero*, INDIC FUT 1PERS *sarò*;
 PP *stato*

The auxiliary expresses tense, mood, person, and number, whereas the past participle can either agree in gender and number or be employed in the citation form (singMASC), whereas the agreement between participle and subject is systematic with verbs whose auxiliary is *essere* (*i ragazzi sono partiti* 'the boys have left' / *la ragazza è partita* 'the girl has left'), in verbs whose auxiliary is *avere* the agreement is with the object, and it occurs only within limited contexts (*hai comprato le pere? sì le ho comprate* 'have you bought the pears? Yes, I have bought them').

The indicative future and the present conditional are interesting from a typological point of view. They

have stemmed from an analytic origin to reach a fusional state.

Many verbs have an irregular conjugation. The majority belong to the *-e-* class, some others to the *-i-* class, only three to the *-a-* class. The traditional classification does not allow to catch the similarities between *-e-* and *-i-* classes. Dressler *et al.* (2003) classify Italian verbs in two macroclasses based on the productivity criterion, as well as on formal correlations that allow us to also take into account the subdivisions within each class.

It would be neither possible nor helpful to mention here all the instances in which the verbs depart from the regular conjugation model. Idiosyncrasies occur primarily in the present (indicative and subjunctive), the preterit, and the past participle.

Pirrelli and Battista (2000) show that in the irregular conjugations the modifications of the stems range along a continuum from minor phonological processes to clear suppletion instances.

Table 7 displays the phonetic transcription of indicative present conjugation of six irregular verbs that exhibit a number of stem alternations: palatalization before a front vowel (*nascere*), ablauting of root vowel (*udire*), diphthongization (*sedere*), *-isc-* insertion and palatalization (*finire*), ablauting, consonant labialization and lengthening (*dovere*), and stem suppletion (*andare*).

Two things are noteworthy here. The first is that phonological phenomena responsible for the stem modifications are synchronically inoperative. The second is that these different phenomena are distributed according to a recurrent pattern – which is visible also in the stress position within the regular conjugation: on the one hand 1,2,3sing 3PL on the other 1,2PL (Vincent, 1988).

The most common irregular modifications of preterit stems concern lengthening of final consonant (*venire*), replacing of final consonant with /s/ (*perdere*), and other more complex phenomena that include ablauting of root vowel and deletion/insertion of consonants (*fondere*). Even in the preterit a morphological pattern of stem alternation is detectable, which distinguishes 1,3sing 3PL vs. 2sing 1,2PL (see Table 8).

Even though the majority of alterations were originally phonologically motivated, their present distribution is morphological in nature and paradigmatically governed.

Affixes

Obligatoriness, higher systematicity in mutual relationships, and degree of productivity clearly distinguish inflectional from derivational affixes in fusional languages. Yet the number of productive Italian derivational affixes and the variety of meanings they express are fairly high (Grossmann and Rainer, 2004). Whereas derivation employs both suffixes and prefixes, inflection employs suffixes only. In productive processes the degree of phonological fusion between the stem and derivational affixes is rather low. A higher degree of phonological integration is present instead with interfixes. Some interfixes are semantically void (*congress-u-ale* ‘concerning congresses’), the majority express connotative value when combined with evaluative suffixes (*test-ol-ina* ‘nice small head’). Words containing interfixes are rather difficult to be segmented. This is because interfixes occupy an intermediate position between the root and the suffix, and generally their morphemic and syllabic boundary does not coincide.

Table 7 Examples of stem modifications in the indicative present inflection of some very frequent irregular verbs

| | <i>nascere</i> | <i>'be born'</i> | <i>udire</i> | <i>'hear'</i> | <i>sedere</i> | <i>'sit'</i> | <i>finire</i> | <i>'finish'</i> | <i>dovere</i> | <i>'must'</i> | <i>andare</i> | <i>'go'</i> |
|---|----------------|------------------|--------------|---------------|---------------|--------------|---------------|-----------------|---------------|---------------|---------------|-------------|
| | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> |
| 1 | 'nasko | na'f:amo | 'ɔdo | u'djamo | 'sjedo | se'djamo | fi'nisko | fi'njamo | 'devo | do'b:jamo | 'vado | an'djamo |
| 2 | 'naf:i | na'f:ete | 'ɔdi | u'dite | 'sjedi | se'dete | fi'nij:i | fi'nite | 'devi | do'vete | 'vai | an'date |
| 3 | 'naf:e | 'naskono | 'ɔde | 'ɔdono | 'sjede | 'sjedono | fi'nij:e | fi'niskono | 'deve | 'devono | 'va | 'vanno |

Table 8 Examples of stem modifications in the indicative preterit inflection of some very frequent irregular verbs

| | <i>venire</i> 'come' | | <i>perdere</i> 'lose' | | <i>fondere</i> 'melt' | |
|---|----------------------|-----------|-----------------------|-----------|-----------------------|-----------|
| | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> | <i>sing</i> | <i>PL</i> |
| 1 | vènni | venimmo | pèrsi | perdémmo | fùsi | fondémmo |
| 2 | venisti | veniste | perdesti | perdèste | fondèsti | fondèste |
| 3 | vénne | vénnero | pèrse | pèsero | fùse | fùsero |

The clear-cut difference between affixes and roots characterizes Italian as a fusional language and distinguishes it from agglutinating languages, which grant affixes greater autonomy (Plungian, 2001). In Italian the coordination between bound elements referring to a same root is marginal (*micro- e macro-economia* ‘micro- and macroeconomy’); moreover, there is no use of a single affix referring to a coordinated group (cf. Spanish *afirmativa o negativamente* ‘affirmatively or negatively’). Another fusional trait of Italian derivation is the signaling through the change of inflectional class of derivatives formed by means of conversion, which belong to the same word class as the base (*banana* FEM, PL *-e* ‘banana’-> *banano* MASC, PL *-i* ‘banana tree’).

Word Order Mobility

The Italian basic word order (SVO) is more flexible than what we encounter in less-fusional languages. Agreement (in gender and number) provides cohesion among words within phrases, and a certain degree of mobility freedom for the phrases themselves. Instead, single words are less free to move compared to words in more inflecting languages, such as Latin, for instance, (Simone, 1993). Whereas in Latin, the use of cases allows to signal on each word its relational syntactic functions, thus rendering it relatively autonomous within the phrase, in Italian the analytic expression (through prepositions) of syntactic relations demands the proximity and the reciprocal ordering of words within the phrases. Thus, order variation occurs primarily at the level of the reciprocal ordering of phrases (many instances of topicalization, cleft sentences, postverbal subject position). Adjectives stand out from other word classes for a higher degree of movement freedom within the phrases. Even though the unmarked position of the qualifying adjective is postnominal (according to the basic order SVO), this may vary, which at times effects a change

in meaning (cf. *famiglie numerose* ‘large families’ and *numerose famiglie* ‘several families’).

Italic Languages

D Ridgeway, University of Edinburgh, Edinburgh, UK

© 1994 Elsevier Ltd. All rights reserved.

The adjective ‘Italic’ is conventionally applied to a group of related Indo-European languages attested epigraphically in the Italian peninsula during the later first millennium BC. Their written forms virtually

disappear from the archaeological record by the end of the first century BC following the rise of Latin, which, together with the sparse remains of Faliscan (in the area bordering on non-Indo-European Etruria), constitutes one of two Italic sub-groups; the other (for some authorities the only true Italic category) is represented along the spine of Italy by Oscan, Umbrian, and associated minor dialects.

Elsewhere, Messapic is a non-Italic branch of Indo-European in Apulia; further up the east coast, the same is increasingly thought to be true of Picene ('East Italic') and Venetic.

That the Italic languages are the result of intrusion is not in doubt. The traditional view of Indo-European invaders sweeping across the Alps has been superseded by a complex model involving linguistic innovation in the south and long periods of cohabitation and fusion between indigenous prehistoric communities and successive groups of immigrants. Further internal population movements were well advanced when speakers of the Italic and North Italian Indo-European languages developed their own versions of the Etruscan alphabet.

Around 300 inscriptions in Oscan, many of them very short, occur from ca. 400 BC principally in Campania (where graffiti at Pompeii show that it was still occasionally written as late as 79 AD), and to a lesser extent in ancient Lucania and Bruttium (modern Basilicata and Calabria). Roman antiquarians defined Oscan speakers as *Sabelli* (synonymous with 'enemies of Rome'); historians prefer 'Sabellian' for the Samnite and other speakers of Oscan proper, and 'Sabellic' for the speakers of the Oscan-type dialects occasionally represented between the third and first centuries BC in the mountains of central Italy (Paelignian, Vestinian, Marrucinian, and Marsian). The longest Oscan text is inscribed on the bronze Tabula Bantina, found in 1793 on the boundary between Apulia and Lucania; its six paragraphs, part of a much longer document, retail municipal regulations of the early first century BC and are written in the Latin alphabet. Most of the other texts are inscribed in the Oscan alphabet; a few use Greek letters.

Apart from two dozen short inscriptions from the fourth century BC onwards, the Umbrian language is known entirely from the texts inscribed in the Umbrian and Latin alphabets on the Tabulae Iguvinae: seven bronze tablets, containing over 4000 words, discovered in 1444 at Gubbio. Written at intervals between the late third and late second centuries BC, they record the proceedings of a priestly college, the *frater atiiēriur* ('Atiedian Brethren'), and constitute

the largest pre-Christian liturgical corpus in Europe. Two dialects, Aequian and Volscian, show clear affinities with Umbrian; they are represented in parts of Latium known to have been settled by their speakers in the early fifth century BC.

There is nothing literary about the extant remains of any of the Italic languages except Latin. The substance of those noted above is of interest principally to historians of Italic religious and political institutions during the centuries of Roman hegemony. Although the morphology and syntax of Oscan and Umbrian inevitably have much in common with their Latin counterparts, significant differences survive; they include a third person singular passive subjunctive in *-r* and the extensive use of the locative case: Oscan *sakrafir; eisaí víai* ('let there be sacrifice of'; 'on that road'); Umbrian *ferar; destre onse* ('let it be carried'; 'on the right shoulder'). References by Roman writers to *meddix tuticus* as 'chief magistrate of the people' are matched by the occurrence of *meddíss túvtiks* and numerous variants in Sabellian and Sabellic contexts. Writing in the seventeenth century, the Scottish classical scholar Thomas Dempster wrongly took the term to be Etruscan, and cited it in connection with a wholly fanciful ancient origin for the family of his Medici patron in Florence.

Japanese

M Shibatani, Rice University, Houston, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Japanese is spoken by virtually the entire population of Japan – some 128 million people in 2004. In terms of native speakers, the number easily surpasses the number of speakers of the major European languages (German and French), ranking sixth among the languages of the world, after Chinese, English, Russian, Hindi, and Spanish. Yet, among the major languages of the world, Japanese occupies a unique position in a number of respects. Unlike the languages spoken on the European, American, and Asian continents, the Japanese language, being spoken in an island nation, is physically isolated from other languages. Also, unlike major European languages such as English and Spanish, Japanese is primarily spoken within the confines of its national boundaries, with no other country using it as either a first or second language. Moreover, Japanese is the only major world language for which the genetic affiliation to other languages and language families has not been conclusively proved.

As in the case of other language isolates, including Basque and Burushaski (and the geographical neighbors of Japanese, Ainu and Korean) (*see Ainu and Korean*), the genealogy of Japanese has been a perennial problem that has attracted the attention of both specialists and laymen alike. Hypotheses have been presented assigning Japanese to virtually all major language families. Although attempts to relate Japanese to the Altaic family have been most systematic and perhaps most persuasive (*see Altaic Languages*) two views have attracted increasing attention in recent years: (1) that Japanese consists of an Austronesian substratum and an Altaic superstratum, and (2) that Japanese is an Austronesian–Altaic hybrid or mixed language, in which not only simple lexical mixtures but also morphological hybrids, e.g., Austronesian verb roots with Altaic inflectional endings, are recognized (*see also Austronesian Languages*).

Among individual languages, Ryukyuan, Ainu, and Korean are the strongest candidates proposed as

possible sister languages; in fact, the Japanese–Ryukyuan connection has been firmly established, and Ryukyuan, spoken in Okinawa, is now considered to be a dialect of Japanese (*see Ryukyuan*). A Japanese–Ainu relationship has been hypothesized, but evidence is scanty. There have been attempts to make more systematic comparisons between Japanese and Korean, but even here reliable sets of cognates are extremely small in number.

Being a mountainous country with numerous islands, Japan is an ideal setting for fostering language diversification. Indeed, Japanese is extremely rich in dialectal variations, and different dialects are often mutually unintelligible. However, Japan is linguistically completely unified by a uniform writing system and by the spread of the standardized speech, based on the Tokyo dialect, making oral communication possible among speakers of different dialects. The long literary history of Japanese, which dates back to the 8th century, finds its root in the borrowing of Chinese characters as a means of transcribing Japanese. Simplification of Chinese characters gave rise to two kinds of syllabary, or kana, i.e., *hiragana* and *katakana*. In addition to Chinese characters and the two types of syllabary, the Japanese writing system includes the Roman alphabet, which was introduced in the late 16th century by Portuguese and Spanish missionaries. All four types of writing systems have been retained today, and it is not unusual to see contemporary Japanese sentences written with a mixture of all of them.

The historical contacts with foreign cultures have left strong marks in the Japanese lexicon, which is characterized by a high percentage of loanwords. Roughly 60% of the Japanese vocabulary consists of loanwords of Chinese origin, a figure comparable to the proportion of Latinate words in the English vocabulary. Among the non-Chinese loanwords, or roughly 10% of Japanese vocabulary, English loans stand out, often replacing older loans from Portuguese, Spanish, and Dutch as well as even some Chinese loans.

Another salient feature of the Japanese lexicon is the presence of a large number of sound symbolic or

mimetic words, which depict not only the sounds of natural objects and animals but also the manners of action and even states of mind. Thus, a dog barks *wan-wan* and it pours rain *zaa-zaa*; an old man walks *yobo-yobo* ‘wobbly’ and an old lady chatters *peya-kutya*; and your head aches *zuki-zuki* ‘throbbingly,’ your stomach hurts *tiku-tiku* ‘stingingly,’ and your nerves are irritated *ira-ira*.

Segmental phonology of Japanese – at least the speech of Tokyo and surrounding areas – is rather simple, with five vowel phonemes /a e i o u/ and 16 consonantal phonemes /p t k b d g s h z r m n w j N Q/. A noteworthy feature of Japanese segmental phonology is the distinction between a syllable and a mora. A mora is a unit that can be represented by one letter of kana (a Japanese pseudo-character used in syllabic writing). A word such as *simbun* ‘newspaper’ consists of two syllables, but a Japanese speaker further subdivides the word into four units, *si*, *m*, *bu*, and *n*, which correspond to the four letters of kana used in the written form. The consonantal archiphonemes /N/ and /Q/ correspond to moraic consonants seen in words such as *simbun* ‘newspaper,’ *simpai* ‘worry,’ *hakkiri* ‘clearly,’ and *kossori* ‘stealthily,’ wherein the first segments of the consonant clusters, *m*, *k*, and *s*, constitute moras. Since these moraic consonants are homorganic to the following consonants, there is no contrast among them other than in terms of the nasality feature. And since the only consonant that ends a word is the moraic nasal *n*, the words *simbun*, *simpai*, *hakkiri*, and *kossori* are phonemicized, respectively, as /siNbuN/, /siNpai/, /haQkiri/, and /koQsori/. The units of syllable and mora each play important roles in the accentual system.

Japanese is arguably a tone language, wherein the pitch pattern can be high followed by low (HL) or low followed by high (LH). Pitch height alone distinguishes minimal pairs such as *hasi* (HL) ‘chopstick’ versus *hasi* (LH) ‘bridge’ and *ame* (HL) ‘rain’ versus *ame* (LH) ‘candy’; however, the Japanese accentual system is characteristically different from archetypal tone languages of the Chinese type, in which it is necessary to specify the tone for each syllable. In the case of (Tokyo) Japanese, once the place of pitch drop for a given word or a minor phonological phrase is specified, the pitch shape can be fully predicted. Thus, *hasi* ‘chopstick’ and *hasi* ‘bridge’ can be specified as /ha’si/ and /hasi’/, respectively, so that in the former, high pitch drops after *ha*, whereas in the latter, all moras are high except for the initial one. A pitch drop in the latter form is observed only when it is followed by another element, such as the nominative particle *ga*, as in the minor phrase /hasi’ga/ (LHL) ‘bridge NOM.’ The word *hasi* (LH) ‘edge’ is representable as

/hasi/ without any accent; indeed, there is no pitch drop here, even in a phrase such as /hasi ga/ (LHH) ‘edge NOM.’ Pitch changes occur at mora boundaries, and the accent marker indicating the location of pitch drop is assigned to the unit of syllable. For example, the three-mora, two-syllable word *ganko* ‘stubborn’ contains the accent marker in the initial syllable, /ga’Nko/, surfacing with the pitch shape of HLL. There is no word in which the second mora of the first syllable carries the accent, such as /gaN’ko/, which would presumably be pronounced as LHL or HHL if the syllable were the unit of tone inflection.

Japanese is an agglutinative language with primarily suffixing morphology. Both verbs and adjectives inflect for tense, but they are distinguished by different tense suffixes: *mi-ru* ‘see-PRES’ and *mi-ta* ‘see-PAST’ versus *utukusi-i* ‘beautiful-PRES’ and *utukusi-kat-ta* ‘beautiful-EXPL-PAST’ (EXPL = expletive). In addition to the inflecting adjectives, adjectival nominals are similar in meaning to adjectives but, like nominal predicates, call for tense-carrying copula (COP) in their predicative function: e.g., *kirei-da* ‘pretty-COP-PRES’ and *kirei-da-tta* ‘pretty-COP-PAST.’ These tense suffixes combine with various auxiliary-type suffixes, often resulting in a fairly long verbal complex: *ika-se-rare-ta-gara-na-i* (go-CAUS-PASS-DESI-SHOW-NEG-PRES) ‘do not show signs of wanting to be made to go.’

Japanese syntax is consistently head-final. The basic word order is subject-object-verb: *Taroo ga hon o yonda* (Taro NOM book ACC read-PAST) ‘Taro read a book.’ Postpositional particles are used instead of prepositions, as in the example, wherein the nominative and accusative (ACC) particles *ga* and *o*, respectively, mark the subject and the object. Modifiers precede the heads that they modify: *takai hon* (expensive book) ‘expensive book’ [*Taroo ga katta*] *hon* ([Taro NOM bought] book) ‘the book Taro bought,’ *Taroo no ie* (Taro GEN house) ‘Taro’s house,’ *sono hon* (that book) ‘that book,’ *san-satu no hon* (three-CLASS GEN book) ‘three books,’ *hayaku hasiru* (quickly run) ‘run quickly,’ *tabe-tai* (eat-want) ‘want to eat,’ *Taroo yori kasikoi* (Taro than smart) ‘smarter than Taro.’ Subordinating conjunctions occur after subordinate clauses, which in turn come before main clauses: [*Taroo ga kita*]-*node minna ga kaetta* ([Taro NOM came]-because everyone NOM went home) ‘Because Taro came, everyone went home.’

One of the most important aspects of Japanese grammar has to do with the topic construction. The topic particle *wa* attaches to various nominals and adverbials, yielding topic sentences that contrast with nontopic sentences in the following manner:

Nontopic sentence (1):

- (1) Taroo ga Ziroo no hon o yonde-iru
Taro NOM Jiro GEN book ACC read-be
'Taro is reading Jiro's book'

Topic sentences (2) and (3):

- (2) Taroo wa Ziroo no hon o yonde-iru
Taro TOP Jiro GEN book ACC read-be
'Taro is such that he is reading Jiro's book'
- (3) Ziroo no hon wa Taroo ga yonde-iru
Ziroo GEN book TOP Taro NOM read-be
'Jiro's book is such that Taro is reading it'

The basic difference between topic sentences and nontopic sentences is that the former are statements about certain things, represented by topic nominals, and the latter are statements describing the occurrences of events. For example, nontopic sentence (1) describes the event of Taro reading Jiro's book. On the other hand, topic sentences (2) and (3), respectively, describe something about 'Taro' and 'Jiro's book.' Thus, sentence (1) answers a question such as 'What is happening?,' whereas sentences (2) and (3), respectively, would be used in answering questions such as 'What is Taro doing?' and 'Where is Jiro's book?' In Japanese, it is the *wa*-marked topic nominal that accurately represents the traditional Western definition of subject as something that is being talked about. The *ga*-marked subject nominal, on the other hand, is more consonant with the other definition of subject, namely, that it expresses an actor or agent. In other words, in Japanese, the two notional definitions of subject are distributed over two distinct syntactic relations, whereas in English and other European languages, these largely converge on the single subject nominal.

Japanese has no agreement marker, but it freely omits pronouns. Thus, the following type of exchange is not uncommon:

- (4) *Oo kita ka* (Oh came Q) 'Oh (you) came?'
- (5) *Un kita* 'Yeah (I) came'

Of course, the omissions of pronouns are permitted only when they are recoverable from the context; one type of clue for the recovery is found in the honorific endings. Humbling forms together with the polite (POL) ending such as *Mair-imasu* (go.HUMBLE-POL) 'go' and *O-tazune simasu* (HON-visit do-POL) 'visit' indicate (a) that the subject is either a speaker or someone close to the speaker (by use of the humbling forms) and (b) that the addressee is someone worthy of respect (by use of the polite ending). On the other

hand, honorific forms with the plain ending, such as *Oide-ni naru* (go.HON-ADV become.PLAIN) 'go' and *Otazune-ni naru* (HON-visit-ADV become.PLAIN) 'visit' indicate (a) that the subject is other than the speaker and is someone worthy of respect (honorific forms) and (b) that the addressee is someone close to the speaker, to whom the speaker is not obliged to show respect (plain ending). Thus, both the addressee axis (for polite endings) and the referent axis (for honorific and humbling endings) control honorific phenomena independently, though they often converge, as when the addressee is also the referent of the subject nominal.

Another clue that helps identify the nature of the speaker is sentence final particles, some of which are different for male and female speakers. The final particle (PART) *wa* is a typical female form, whereas *zo* occurs in rough male speech. Since these discourse particles occur in intimate speech, an expression such as *Mair-imasu wa* (go.HUMBLE-POL PART) '(I will) go' indicates that the subject is the speaker (humble form), that the addressee is someone worthy of respect (polite ending), and that the speaker is a woman who is on intimate terms with the addressee (final particle).

Thus, Japanese, though it lacks agreement markers, has a number of grammatical features that not only indicate the nature of the subject but also index the social relationships between the speaker and the addressee and between the speaker and the nominal referent, as well as the gender of the speaker. These features, on the other hand, require the speaker of Japanese to predetermine the social relationships between the speaker and the addressee and the nominal referent, so that appropriate combinations of honorifics and discourse particles can be chosen. Japanese, in other words, is a highly context-sensitive language in which individual expressions encode various factors that make up conversational contexts in which they are embedded.

Javanese

B Nothofer, Universität Frankfurt, Frankfurt, Germany

© 2006 Elsevier Ltd. All rights reserved.

Javanese is most-spoken regional language of Indonesia and most-spoken language of the Austronesian language family with about 75 million speakers. It is spoken along the northwest coast of Java (Banten, Krawang, Cirebon) and in the central and eastern areas of this island (68 million speakers). Outside of Java, it is used in the Indonesian transmigration areas of Sumatra, Kalimantan, and Sulawesi (altogether 8 million speakers) as well as in Suriname (60 000 speakers) and in New Caledonia (6700 speakers). Of the three dialects usually distinguished (western, central, and eastern) (Ras, 1994), the western one was divided into seven subdialects (Nothofer, 1980). The central and eastern dialect variants have not yet been studied in much detail.

Standard Javanese is the language as it is spoken in the area of Surakarta and Yogyakarta. Javanese has speech levels that are based on the principle to whom and about whom one talks. The level chosen depends on factors such as age, status, and respect. The degree of politeness is expressed by lexical or affixal choices. The speech levels are a Javanese innovation. Clynes (1992) argues that this system was well established by the 15th century. Sundanese (Sunda), Madurese (Madura), Balinese (Bali), and Sasak (but not Malay) have borrowed these speech levels. The position of Javanese in the Western Malayo-Polynesian subfamily has been a matter of dispute. While Dyen (1965) and Nothofer (1975) grouped Javanese with Malay, Sundanese, and Madurese, Nothofer (1985) suggests that the latter three – although not necessarily constituting a subgroup – are more closely related to each other than they are to Javanese. Javanese is one of the few Austronesian languages whose history can be traced because of the existence of older texts. The oldest records date back to the 8th century. Zoetmulder (1974) deals with Old Javanese literature and Zoetmulder (1982) is an Old Javanese-English dictionary.

Javanese Phonology

Consonants

The Javanese consonant system resembles that of other languages of western Indonesia. There are features that are common to Javanese and Madurese only. Both languages share a phonemic distinction between dental and retroflex stops. The ‘voiced’ consonants of Javanese are pronounced like voiceless stops with breathy voice of the following vowel (Fagan, 1988; Arps *et al.*, 2000). The consonants are shown in Table 1.

Vowels

Nothofer (1980) suggests a system of six vowel phonemes, shown in Table 2.

Javanese has the following allophonic rules (Clynes, 1995; Nothofer, 1980): /i/, /u/ are realized as [ɪ], [ʊ] in closed syllables and as [i], [u] elsewhere. /ə/ is always realized as [ə]. The phonemes /e/, /o/ are realized as [ɛ] and [ɔ] in closed syllables, in open syllables where the vowel in a following open syllable is high, and in open syllables where the vowel in a following syllable is identical or /ə/. In all other positions, these phonemes are realized as [e] and [o]. The phoneme /a/ appears as [ɔ] word-finally and in penultimate open syllables where a following open syllable has /a/. Otherwise, it appears as [a]. Allophonic variation also depends on the initial phoneme of suffixes: the addition of a consonant-initial suffix results in the treatment of the stem-final vowel as if it appeared in a closed syllable and the addition of a vowel-initial suffix will cause a high vowel in the stem-final closed syllable to behave as if it appeared in an open syllable.

Morphology

Verbal affixes include the following: *N-* indicates an ‘active’ and *di-* a ‘passive’ transitive verb, *kə-* marks ‘accidental passive.’ *-ke* forms transitive verbs whose patient is the causee or benefactee, while *-i* forms transitive verbs in which the undergoer is the

Table 1 Javanese consonants

| Fricative | | | <i>s</i> | | | <i>h</i> |
| Approximant | <i>w</i> | | <i>r, l</i> | <i>y</i> | | |

Table 2 Javanese vowel phonemes

| Vowel type | Front | Central | Back |
|------------|----------|----------|----------|
| High | <i>i</i> | | <i>u</i> |
| Mid | <i>e</i> | <i>ə</i> | <i>o</i> |
| Low | | <i>a</i> | |

location or goal of the action. Intransitive verbs with *-an* indicate ‘nonchalance, to be in the state of, to busy o.s. with.’ The suffix *-a* with the sense ‘in case, assuming, although’ occurs with nonverbs (e.g., pronouns, adjectives) and verbs. Arps *et al.* (2000) call it the ‘irreality-suffix.’ It is distinguished from the verbal suffix *-a*, which is an imperative marker. The suffix *-ən* is added to nouns denoting physiological conditions and forms verbs meaning ‘undergo the physiological process of (the noun).’ The nominal affixes include *-an*, which derives nouns that stand as objects of an action indicated by the verb; *kə-* *-an*, used to nominalize qualities; nouns formed with *pəN-* refer to a person carrying out the action of the verb or an instrument with which the action is performed; and *pə-an* nouns refer to a process or result of an action indicated by the verb or to the location where an action of the corresponding verb occurs.

The meaning of total reduplication of nouns is ‘diversity, completeness,’ while that of verbs has the sense of ‘durative, intensive, iterative.’ Verbal reduplication can also involve vowel variation in the first member of the doubled form.

Writing System

After the World War II, the publication of texts in Javanese script (hanacaraka or caraka) came to an end. Actually, the Latin script began to replace the Javanese alphabet at the beginning of the 20th century. The traditional script originates from a Pallava script of southern India.

Jèrriais

M C Jones, University of Cambridge, Cambridge, UK

© 2006 Elsevier Ltd. All rights reserved.

Background

Jèrriais is the dialect spoken on Jersey, the largest of the Channel Islands. It is related to the Norman dialects of northern France.

According to the 2001 Census of Jersey, there then remained only 2874 speakers of Jèrriais, (3.2% of the total resident population). Some two-thirds of these were over age 60 and only 113 speakers declared Jèrriais to be their usual everyday language.

Phonological Structure

Although the phonological structure of Jèrriais is similar to that of standard French, there are also significant differences. Marked regional variation is still very much in evidence in modern Jèrriais, with the sub-varieties usually categorized in two main groups: East and West Jèrriais (see Figure 1). Even more localized variation is readily observable, although with the decline in speaker-numbers, these so-called linguistic pockets are fast disappearing. This internal variation has never been based on any administrative or other territorial boundaries within Jersey, but many of the Islanders feel it to be intrinsically linked with parish boundaries (see Figure 2), and the practice of using the name of parishes to refer to the sub-dialects of Jèrriais is well established, although not strictly correct. Unless stated, the following comments relate to most varieties of Jèrriais.

Vowels:

Oral: /i e ε y œ a u o ə/; the French vowels /ø/ and /ɔ/ are lacking

Nasal: /ẽ ẽ õ õ ã/;

Unlike in standard French, vowel length is phonemic and all vowels, except /ə/, can be either short or long. Long /a/ is usually realized phonetically as [ɑ]. Jèrriais therefore has 27 vowel phonemes (17 oral, 10 nasal) compared to the 16 of standard French.

Consonants:

Stop: /p b t d k g/

Fricative: /f v s z ð ʃ ʒ h/

Affricate: /tʃ dʒ/

Nasal: /m n ɲ/

Lateral: /l/

Trilled: /r/; this corresponds to the uvular *r* of standard French

/ð/ (written *th*) occurs mainly as a result of the assibilation of intervocalic /r/ in western Jersey and some northern parts of Trinité and St. Martin e.g., *dithe* 'to say' (Fr. *dire*). In St. Ouen, /ð/ also occurs as a development of intervocalic /z/, e.g., *maïson* /meðð/ 'house' (/me(j)zð/ elsewhere).

In standard French, the affricates /tʃ/ and /dʒ/ only occur in borrowings, e.g., *match*, *gin*. However, in Jèrriais they can occur as the result of the secondary palatalization of /k/ and /g/, e.g., *tchoeu* /tʃœ/ 'heart', *dgèrre* /dʒɛ:r/ 'war' (Fr. *coeur*, *guerre*) and of /t/ and /d/, e.g., *mêtchi* /metʃi/ 'profession', *dgix* /dʒi/ 'ten' (Fr. *métier*, *dix*).

Like standard French, Jèrriais preserves no trace of Latin /h/. /h/ was introduced into the French phonemic system in words borrowed from the language of the Germanic invaders who dominated northern Gaul in the 5th to the 8th century. The sound disappeared

Figure 1 Jersey's 'linguistic pockets.' Reproduced from Jones M C (2001). *Jersey Norman French: a linguistic study of an obsolescent dialect*. Oxford: Blackwell.

Figure 2 The twelve parishes of Jersey. Reproduced from Jones M C (2001). *Jersey Norman French: a linguistic study of an obsolescent dialect*. Oxford: Blackwell.

from standard French in the early modern period (16th–18th century) but remains in Jèrriais, e.g., *housse* /hus/ ‘holly’ (Fr. *houx*).

In many parts of Jersey, when /l/ is the second element of a consonant cluster, it frequently undergoes delateralization to /j/, e.g., *clios* /kjo/ ‘field’ (Fr. *clos*). In St. Ouen, however, the more conservative form /klo/ is still to be heard amongst older speakers. St. Ouen also retains the /k/ pronunciation word-finally in words such as /fi:k/ *fil’ye* (‘daughter’) whereas, elsewhere in Jersey, /k/ has become depalatalized to /l/.

The velar nasal /ŋ/ occurs in standard French only in borrowings, e.g., *le shopping* /ʃɔpiŋ/. Despite its restricted distribution, it is generally given phonemic status. The sound also occurs in Jèrriais in English borrowings such as *blanket*, *dinthy* /blæŋket/, /dɪŋi/. However in Jèrriais /ŋ/ is not considered to be phonemic.

Glides The three glides of standard French (/j ɥ w/) also occur in Jèrriais but there is a tendency for /ɥ/ to be replaced by /w/.

Vocabulary

Most of the vocabulary of Jèrriais is shared with standard French, but regional variation is also apparent in the lexis of Jèrriais, e.g., *pêtre* ‘spider’ (WJ), *ithangnie* (EJ). The dominant influence of English has had far-reaching linguistic consequences, most noticeably in the lexis, where borrowings abound in many everyday domains. Some of these are well established, e.g., *bouchet* ‘bucket’, *ticl’ye* ‘(tea)kettle’ while others are more recent, e.g., *software*. The semantic adaptation of Jèrriais words on the basis of their English equivalents is also found,

e.g., *J’n’sais pon comment chenna travaille* ‘I don’t know how that works’, as are calques of English phrasal verbs and other expressions, e.g., *i’tchit bas* ‘he fell down’; *j’chèrchis pouor* ‘I looked for it’.

Morphosyntax

The more striking morphosyntactic differences between Jèrriais and standard French include:

- i. the Old French distinction of number in masculine nouns and adjectives between *-el* (s.), *-eaus* (pl.), e.g., *chastel* ‘castle’, pl. *chasteaus*; *novel* ‘new’, pl. *noveaus* ‘new’, has been lost in standard French as a result of the creation of a new analogical singular based on the plural, e.g., *château* ~ *châteaux* (both pronounced [ʃato]), *nouveau* ~ *nouveaux*, though the original singular remains before vowels, e.g., *le nouvel an* ‘New Year’; in Jèrriais, the distinction is maintained, *châté* ~ *châtchieaux*, *nowé* ~ *nouvieaux*;
- ii. the first person plural personal pronoun subject *nous* is replaced by *jélj*, e.g., *j’pâlons* (Fr. *nous parlons*) ‘we speak’;
- iii. there is no specific feminine third person plural subject personal pronoun, *i’* serving for both genders (cf. Fr. *ils* masc., *elles* fem.);
- iv. adjectives of color almost invariably precede the noun, e.g., *lé nièr cat* ‘the black cat’ (Fr. *le chat noir*);
- v. the preterite tense, which has gone out of use in informal spoken French, though it survives in the formal written language, is widely used in spoken and written Jèrriais, e.g., *j’donnis* ‘I gave’. Certain third person plural preterite forms are restricted to St. Ouen, e.g., *i’vidrent* ‘they saw’, *i’fùdrent* ‘they went’ (for *i’vîtent*, *i’fûtent* elsewhere)

vi. the imperfect subjunctive, now virtually defunct in spoken French, also survives, e.g., *j'voulais qu'i'l'sûsse* 'I wanted him to know'.

The dominance of English on Jersey is also leading to an increase in frequency of syntactic constructions more isomorphic with English.

Language Planning

Since being introduced into the education system in 1999, Jèrriais is now offered on an extra-curricular basis in most of the Island's schools. It also features in a couple of weekly radio slots and in a fortnightly newspaper column. However, Jèrriais enjoys no more than a token presence on television. Language planning measures receive very little official backing, and with the exception of the Jèrriais education initiative, which has received funding from the States of Jersey, have been left in the hands of groups of enthusiasts.

Jèrriais has been codified via a dictionary (Le Maistre, 1966) and grammar (Birt, 1985). The standard variety is based largely on the sub-dialect of St. Ouen.

Literary Tradition

Although the important 12th-century writer Wace (c. 1100–1179) is known to have come from Jersey, no literary writings in Jèrriais exist until the 19th century. The first author to use the dialect as a medium for his work was Matthieu Le Geyt (1777–1849). Jersey produced several poets and writers during the course of the 19th and 20th centuries; much of their output was published in newspapers and periodicals. Although collections of satirical short stories in Jèrriais were published in pamphlet form from the third quarter of the 19th century onward, the first complete volume of prose to be published in Jèrriais was George Le Feuvre's *Jèrri jadis* (1973).

Introduction

Ethnic and religious groups use language as one means of constructing and expressing their distinctness from other groups. Jews are no exception. Wherever Jews have lived – from Baghdad to Brooklyn, Amsterdam to Odessa – they have spoken somewhat differently from their non-Jewish neighbors. These differences have been as small as the addition of a few Hebrew words and as large as a vastly different lexicon, syntax, and phonology. Therefore, the term “Jewish language” refers to any linguistic variety spoken by Jews that differs to some extent from the non-Jewish language(s) around it. The field of Jewish language studies examines the distinct linguistic practices of the Jewish people around the world.

Jewish languages generally exist in a situation of triglossia with the local non-Jewish language(s) and with a liturgical combination of Hebrew and Aramaic (Weinreich, 1980; Rabin, 1981; and Fishman, 1985). The Jewish language is used mostly for intra-community speech and sometimes for writing. Speakers also generally have at least some knowledge of the co-territorial non-Jewish languages and use them in their interactions with non-Jews. Hebrew and Aramaic have played a very important role in Jewish life. Biblical and rabbinic literatures are studied regularly in their original languages, and daily prayers are conducted mostly in Hebrew and Aramaic. Hebrew is also used for contemporary rabbinic and liturgical production, as well as some other literary functions.

Jewish languages have been documented in many parts of the Jewish diaspora: Yiddish (sometimes referred to as Judeo-German), Judeo-Spanish (also called Ladino, Judezmo, Dzhudezmo, Jidyó, Spanyol, Spanyolit), Judeo-Greek (Yevanic, Romaniyot), Judeo-Italian (Italkic, including local varieties like

Judeo-Venetian), Judeo-Portuguese, Judeo-French (Zarphatic, Western Loez), and Judeo-Provençal (Shuadit) in Europe; Judeo-Arabic (Yahudic), Judeo-Aramaic (Targum, Kurdit), Judeo-Persian (Jidi, Parsic, Judeo-Tadjik, Judeo-Tat, Bukharan), Judeo-Georgian (Gurjuc, Gruzinic), Judeo-Crimean Tatar (Krimchak), and Judeo-Berber in the Middle East, North Africa, and the former Soviet Union; Judeo-Malayalam in India; and Jewish English (Yinglish, Yeshivish) in the New World. Some of the larger and better-studied cases are described in separate sections below.

Scholarship

The scholarly recognition of a phenomenon of Jewish languages goes back to the beginning of the 20th century, when Yiddish became the object of serious academic study. Miseses (1915) presented the first large-scale exploration of Jewish linguistic varieties. In late 1970s and early 1980s, Jewish languages started to be studied intensively, following the publication of two major studies of Yiddish that discussed them in a historical context (Birnbaum, 1979; Weinreich, 1980). Around this time, scholars in Israel and the United States edited symposia (Rabin *et al.*, 1979), collections of articles (Paper, 1978; Fishman, 1985; Gold, 1989) and a short-lived journal (Gold and Prager, 1981–1987). More recently, there has been a wave of renewed interest in the subject, as evidenced by the Jewish Language Research Website (www.jewish-languages.org) and the Jewish Languages Mailing List (www.jewish-languages.org/ml).

History

The presumed monolingualism of the early kingdoms of Israel and Judah gave way, in the centuries after the Babylonian exile in the 6th century B.C., to a Hebrew-Aramaic bilingualism (Chomsky, 1957). By the end of the Temple period 2000 years ago, these languages were supplemented by a widespread knowledge of Greek, which was used with distinctive

Jewish features (Wexler, 1985). Thus, Judeo-Aramaic and Judeo-Greek were the earliest Jewish languages that existed in a diglossic relationship with Hebrew.

Judeo-Aramaic was a Jewish adaptation of the major language of wider communication of the Middle East in the millennium before the Common Era. It grew into an important spoken and written Jewish language in Palestine and in the Jewish Diaspora in Babylon, where it was the main language used in the Babylonian Talmud (Greenfield, 1978; Katz, 1985). Among Jews as well as other inhabitants of the region, it was generally replaced by Arabic as a spoken language as a result of the spread of Islam, but it has continued to the present day as a Jewish language in more isolated regions such as Azerbaijan (Garbell, 1965) and Kurdish Iraq (Sabar, 2002).

The third partner in Palestinian trilingualism was Judeo-Greek, widely adapted in Hellenic colonies in Palestine and used by Diaspora Jews throughout the eastern Mediterranean and later in Italy. Judeo-Greek, also called Yevanic, was replaced in most areas starting in the 4th century. An exception is the communities of Romaniote Jews in Greece, which used Judeo-Greek until the influx of Sephardic Jews in the 16th century, when Judeo-Spanish became the majority language of Jews in Greece. Pockets of Judeo-Greek speakers maintained their language in Ioannina, Chalkida, and elsewhere until they were destroyed in the Nazi Holocaust. Few speakers survive today.

Soon after the Roman destruction of Jewish political independence in Palestine in the second century A.D., Hebrew lost its vitality. But it remained firmly entrenched as the language of Jewish religion and literacy, its transmission supported by a religious educational system. Over the next centuries, Jews in exile picked up local languages and developed their own distinctly Jewish varieties, depending in large measure on the nature of their relations with non-Jewish neighbors. As Jews migrated, they generally lost their former language and adapted linguistically to their new land, incorporating distinctive linguistic features. However, two languages defied this trend: Yiddish and Judeo-Spanish, Jewish varieties of Germanic and Hispanic languages, respectively. These languages continued to be used even centuries after their speakers migrated to new lands, where Slavic and Balkan languages were the norm.

In the modern period, when Jews have been able to integrate more fully into some societies, the distinctness of their languages has generally diminished. Yiddish, Judeo-Spanish, and other Jewish languages with long histories have lost significant numbers of speakers due to the combined effects of the Nazi

Holocaust and Jews' cultural and linguistic assimilation into new societies in North America, Europe, and Israel. In the 21st century, Jews generally have full competence in the local languages, vernacular and standard. But their speech also tends to maintain some distinctive features, influenced by Hebrew and Aramaic as well as by the Jewish languages spoken by their ancestors.

Common Linguistic Features

Jewish languages tend to have a number of features in common. Structurally, they are generally based on a spoken variety of a non-Jewish language (Yiddish was based on medieval German and Judeo-Spanish on 15th century Spanish), with a large proportion of borrowings from Hebrew and Aramaic, from earlier Jewish languages, and from other contact languages (Weinreich, 1980). In addition, contemporary Jewish languages tend to be influenced by Israeli Hebrew as a result of affiliations with the State of Israel (Benor, 2004).

The Hebrew and Aramaic influences on Jewish languages are mostly lexical, but some phonological and morphosyntactic influences have been documented as well. Hebrew and Aramaic loan words are most common in the semantic fields of religious life, names of individuals and groups, and euphemism. Until recently, Jewish languages were generally written in Hebrew characters, because of common educational and literacy practices. Orthographic practices have varied, especially in the representation of vowels.

Jewish languages are often strongly influenced by a language spoken by the group's ancestors. In the case of Yiddish, the main previous Jewish language was Judeo-French. In the case of Judeo-Spanish, the main previous Jewish language was Judeo-Arabic. And in the case of Jewish English, the main previous Jewish language was Yiddish. These previous languages provide influences in lexicon, as well as other areas. In addition, the previous languages have a major impact on the use of Hebrew and Aramaic: which words are used, how they are pronounced, and how they are integrated morpho-syntactically.

Most Jewish communities have used the local language in distinctive ways in their translations of biblical and liturgical texts. These translations tend to render the local lexicon in word-for-word imitations of the Hebrew syntax. This practice is referred to in various ways, e.g., Judeo-Arabic *Sharb*, Yiddish *Taytsh*, and Judeo-Spanish *Ladino*.

The revitalization and re-vernacularization of Hebrew as part of the Zionist enterprise have produced a new situation, where modern Israeli Hebrew

is markedly distinct from its earlier forms. Is this new variety to be considered a 'Jewish language'? Some have argued that it is too different from Diaspora Jewish languages to be classified with them. On the other hand, it shares many features: strong influence of the previous Jewish language (the Yiddish base is most evident in the highly modified grammar), a special place for Hebrew-Aramaic lexical items, borrowing from the co-territorial non-Jewish languages (including spoken Arabic and the widely known English), and Hebrew orthography.

The Most Widely Spoken Jewish Language: Yiddish

Distinctive linguistic features can be seen in the history of Yiddish, the most widely spoken Jewish language (Birnbaum, 1979; Weinreich, 1980; Katz, 1985; Weigel, 2002). According to the commonly accepted view (Weinreich, 1980), Yiddish was born towards the end of the first millennium A.D. when Judeo-French-speaking Jews started to settle in the Rhineland. During the more tolerant period that preceded the Crusades, these communities shifted from Judeo-French to a variety based on the German spoken in the area. This Judeo-German included elements of Hebrew and Aramaic, as well as other distinctive features. As a result of expulsion, persecution, and changing economic opportunity, many Jews migrated from Germanic-speaking to Slavic-speaking areas and brought their German language with them. In the changed social conditions, the developing Yiddish language maintained its German base while admitting influences from local Slavic languages in lexicon, morphosyntax, phonology, and discourse. In addition, Hebrew and Aramaic elements survived from previous generations, and new ones were added, mostly through contact with liturgical and rabbinic texts. A few Judeo-French lexical elements endured.

Over the centuries, Western Yiddish disappeared as a spoken language, assimilating towards co-territorial German, except in a few areas, like French-speaking Alsace. In eastern Europe, Yiddish developed into a complex web of dialects, differing mostly in phonology but also in lexicon and grammar.

Yiddish documents have been identified as early as the 13th century, and we have examples of epic poems written in Yiddish from the time of the Renaissance. In the early modern period, Yiddish was used mostly in women's religious literature, including translations and explanations of the Bible and liturgy. The mid-19th century saw the flowering of Yiddish literature, stemming from the eastern European Jewish Enlightenment. In the early 20th century, Yiddish became the object of language planning

efforts, including a standardized orthography and linguistic documentation and research.

Events of the 20th century, especially immigration to America and Israel and the Nazi Holocaust, led to a major decline in the use of Yiddish, and today it is used as an everyday language mostly by the elderly and by pockets of Hasidic Jews in the New York area, Israel, and elsewhere (current estimates of total number of speakers range from 200 000 to 400 000). Reversing language shift efforts continue in educational and cultural programs, especially in New York, Montreal, Antwerp, and Mexico City. Young non-Hasidic Jews there and elsewhere continue to use Yiddish as an everyday language in an effort at revitalization.

Judeo-Spanish

Judeo-Spanish is an Hispanic language taken by exiles from Spain after the expulsion of 1492 to northern Europe, the Balkans and Turkey (Sephiha, 1979; Malinowski, 1982; Bunis, 1993; Harris, 1994; Quintana, 2002). There has been much debate about the name of this language: in addition to Judeo-Spanish, commonly used glottonyms are Ladino, Judezmo, and Spanyol, with some scholars maintaining that Ladino should refer only to the calque (word-for-word) translation language variety.

Already in Spain, Judeo-Spanish exhibited influences from Jewish and non-Jewish varieties of Arabic, as well as other distinctive features. When Sephardic Jews migrated, elements of Turkish, Greek, Bulgarian, and other languages were added. In addition, archaisms and independent developments distinguished Judeo-Spanish from contemporaneous peninsular Castilian. Distinctive dialects of Judeo-Spanish formed throughout the Ottoman Empire. In the 19th and 20th centuries, the high-status French language had a major impact, due to influences of religious and secular education.

Judeo-Spanish developed literary functions, including a significant religious literature, a strong oral folk literature, and a corpus of modern belles lettres. There was rapid language loss in the 19th century as a result of emigration, Westernization, and assimilation. The Judeo-Spanish-speaking community in Greece and other Balkan countries was mostly wiped out in the Holocaust. Speakers in Turkey shifted first to French and more recently to Turkish. Today, it is estimated that there are only 30 000–50 000 speakers, mostly elderly.

A North African variety of Judeo-Spanish, called Haketiya, developed in northern Morocco after the 1492 expulsion. Its speakers mostly shifted to Spanish with the establishment of the Spanish Protectorate at the beginning of the 20th century.

Judeo-Arabic

Since even before the Muslim conquest of the Arabian peninsula in the 7th century A.D., Jews have lived alongside Arabic speakers, and they have spoken Jewish varieties of Arabic (Blanc, 1964; Blau, 1981; Hary, 1992; Bar-Asher, 1998). These have included Hebrew and Aramaic influences – mostly lexical, but also phonological, morphological, and syntactic. They have also included archaisms, standardized hyper- and hypo-corrections, and other distinctive features. Judeo-Arabic varieties have been documented in Iraq, Egypt, Syria, Morocco, and Yemen. Due to the migration of Jews within the Arab world, some varieties have features in common with other varieties of Judeo-Arabic that do not exist in the local non-Jewish Arabic dialects.

In the Middle Ages, many important Jewish religious and philosophical works were written in Middle Arabic and Judeo-Arabic. A word-for-word, or calque, translation variety, called *Sharh*, was used for translations of biblical, rabbinic, and liturgical texts. In addition, Judeo-Arabic was used for religious and secular literary production in the 19th century.

Most Jews in Arab lands immigrated to Israel in the 20th century, acquiring Israeli Hebrew and relegating Judeo-Arabic to private use. Those who stayed in Morocco tended to shift to French, and those who immigrated to North America and France tended to shift to the local languages there. It is estimated that there are currently 400 000–500 000 speakers (Grimes, 1996), mostly middle aged and older.

A Contemporary Jewish Language: Jewish English

Also referred to as Judeo-English, Yinglish, and Yes-hivish, Jewish English is an umbrella term for the contemporary in-group varieties spoken by Jews in America, England, and other English-speaking countries (Gold, 1985; Steinmetz, 1986; Weiser, 1994; Benor, 2004). Jewish English is based on the local variety of English with many influences from Yiddish, textual Hebrew and Aramaic, and Israeli Hebrew in lexicon, syntax, phonology, and discourse. Because of the widespread literacy in contemporary English-speaking countries, Jewish English is not written in Hebrew characters. However, Hebrew loan words are sometimes inserted in their original orthography.

The varieties of Jewish English spoken by Orthodox Jews, especially those in larger, more isolated communities, are most distinct from general English, often to the point of being unintelligible to non-Jews

and to non-Orthodox Jews. Orthodox Jewish English is a young language variety, and the number of speakers is growing as the Orthodox community expands. Although Jewish English is the youngest Jewish language that has been researched, it is likely not the only one that is gaining, rather than losing, speakers. As researchers explore the language of other contemporary Diaspora communities, it is expected that they will find similar distinctively Jewish linguistic practices.

Introduction

Jiwarli (Djiwarli) is an Australian Aboriginal language and was traditionally spoken along the upper reaches of the Henry River, a tributary of the Ashburton River, in the northwest of Western Australia. The language was unrecorded until 1978 and is now extinct, the last speaker, Mr. Jack Butler, having passed

away in May 1985. Before his death, Jack Butler worked with Peter Austin to record over 70 texts in a range of genres, a lexicon of some 1500 words and elicitation of morphological paradigms and syntactic constructions. Publications on the language include a bilingual dictionary (Austin, 1992), a text collection (Austin, 1997), articles on morphosyntax (Austin and Bresnan, 1996; Austin, 1995, 1998, 2000, 2001) and a website. The language has become known in the linguistic literature for its nonconfigurational syntax (see Austin and Bresnan, 1996; Baker, 2000, and below), and it also shows switch-reference and a complex system of case-marking that reflects

clause type (Austin, 2004). A reference grammar is in preparation.

Language Relationships

Jiwarli is closely related to its immediate neighbors, Warriyangka (Warriyangga), Thiin, and Tharrkari (Dhargari) as members of the Mantharta subgroup (*mantharta* being the word for ‘person’). The languages share up to 80% common vocabulary and a similar grammatical system. Tharrkari has undergone a number of historical phonological changes that make its phonetics and phonology highly unusual for an Australian language (see further below). None of the Mantharta languages has any native speakers today, though some knowledge of words and expressions remains among descendants. The Mantharta languages are most closely related to the Kanyara languages spoken to their west and northwest: Payungu (Bayungu), Pinikura (Binigura), Purduna (Burduna), and Thalanyji (Dhalandji). They share approximately 60% cognate vocabulary and have a number of grammatical features in common, including switch-reference and clause linkage effects on case-marking (Austin, 1996, 2004). Today only Thalanyji continues to be spoken by older members of a single family living near Onslow, Western Australia. The Kanyara and Mantharta languages belong to the widespread Pama–Nyungan family, which covers the southern two-thirds of Australia (see **Australia: Language Situation**), and are most closely related to the Nyungic languages spoken to their east.

Linguistic Characteristics

Phonology

The phonological system of Jiwarli is typical of languages of the region, with contrastive stops at six points of articulation, a nasal for each stop position, a lateral for each nonperipheral stop, a flap, a semi-retroflex continuant, and two glides. **Table 1** gives the relevant consonants in their practical orthographic form. There are just three vowels: high front *i*,

high back *u*, and low *a*, with a phonemic length contrast mainly, but not exclusively, found in the first syllable of words. Tharrkari has undergone a number of historical phonological changes that have resulted in the creation of a stop voicing contrast (unusual in Australia) and, in one dialect, complete loss of laterals.

The general structure of Jiwarli roots is CV(C)CV(C). Every word in Jiwarli must begin with a consonant and end in a vowel; roots can end in a consonant but if otherwise unsuffixed *-ma* is added to nasal-final roots and *-pa* to roots ending in *l*, *rl*, *ly*, or *rr*. Word-initially only nonapico-domal stops and nasals and the two glides are found. Word-medially there are limited consonant clusters, primarily homorganic nasal plus stop, and apical nasal or lateral plus peripheral stop (*p* and *k*). Vowel clusters are not found. Words borrowed from English are generally restructured to meet these phonotactic constraints, e.g., *walypala* ‘white man’ (from ‘white fella’), *ngayirlanma* ‘island.’

Morphology

Jiwarli, like other languages of the Pama–Nyungan group, is entirely suffixing in its morphology. There are two major word classes, nominals and verbs, with nominals showing a rich system of case-marking and verbs marking tense/aspect/mood and dependent clause categories. Nominals can be subdivided into substantives (which cover both noun and adjective concepts in a language like English), pronouns, locational, and demonstratives. Minor word classes include adverbs, particles, and interjections.

Nominals in Jiwarli inflect for case, with the syntactic functions of intransitive subject (S), transitive subject (A), and transitive object (P) showing a split-ergative pattern of syncretism in the case forms determined by animacy:

- for the first person singular pronoun, S and A fall together as a single (unmarked) form
- for inanimate nominals and demonstratives, S and P fall together as a single (unmarked) form

Table 1 Consonants

| | Bilabial | Lamino- | | Apico- | | Dorse-velar |
|------------|----------|-----------|-----------|-----------|-----------|-------------|
| | | dental | palatal | alveolar | domal | |
| Stop | <i>p</i> | <i>th</i> | <i>j</i> | <i>t</i> | <i>rt</i> | <i>k</i> |
| Nasal | <i>m</i> | <i>nh</i> | <i>ny</i> | <i>n</i> | <i>rn</i> | <i>ng</i> |
| Lateral | | <i>lh</i> | <i>ly</i> | <i>l</i> | <i>rl</i> | |
| Flap | | | | <i>rr</i> | | |
| Continuant | | | | | <i>r</i> | |
| Glide | <i>w</i> | | <i>y</i> | | | |

- for all other nominals, there are three forms for S, A, and P functions

In addition to the three main cases (nominative for S, ergative for A, accusative for P) there are also the following case forms:

- dative, marking alienable possession and complement of certain verbs
- allative, coding direction toward a place
- locative, coding location in a place, and complement of verbs of speaking
- ablative, coding direction from a place and cause

The actual forms of the cases are affected by the phonological shape of the root, e.g., whether it ends in a vowel or not, what kind of vowel or consonant is root-final, and how many morae it contains (long vowels counting as two mora). **Table 2** sets out a sample substantive declension.

The coding of transitive object P varies according to clause type and crossclausal reference relations: in certain dependent clauses (for details, see below) P is marked as dative or as allative. In addition, case is added to dependent clause verbs to indicate cross-clausal coreference (see below), and manner

adverbs in transitive clauses carry an ergative case agreement marker.

Jiwarli has a rich system of nominal word-building morphology that involves suffixation between the root and case inflection. Categories encoded in word-building morphology include number (dual, paucal, plural), having (e.g., *yakan-jaka* ‘married [lit. spouse-having]’), lacking (e.g., *yakan-yirra* ‘unmarried [lit. spouse-lacking]’), and kin dual and plural (e.g., *kurta* ‘older brother,’ *kurtarra* ‘pair of brothers’).

Pronouns in Jiwarli distinguish three persons and singular, dual, and plural number; in the first person non-singular there is an inclusive–exclusive contrast. Demonstratives encode a proximal and distal contrast. **Table 3** sets out the basic pronoun and demonstrative forms.

Verbs morphologically distinguish between main verb and dependent verb inflections. Main verbs encode tense/aspect/mood categories such as past habitual, present, future, and imperative. Dependent verbs occur in hypotactically linked clauses and encode clause type (relative tense plus aspect) plus cross-clausal coreference or non-coreference of

Table 2 Substantive cases

| | A | S | P | Dative | Locative | Allative |
|-----------|---------------------|-------------------|---------------------|-------------------|---------------------|----------------------|

| Intentive | -lkarri(ngu) | -rrkarri(ngu) | -irarri(ngu) | -rarri(ngu) | -rarri(ngu) |
| Might | -lkangu | -rrkangu | -irangu | -rangu | -rangu |

subjects (S or A), i.e., switch-reference (see further details in the syntax section below). There are five morphologically determined verb conjugations: conjugations one and two are primarily, but not exclusively, transitive, and conjugations three, four, and five are intransitive. Table 4 sets out the verb conjugations.

Verbs show limited word-building morphology, mainly transitivity and detransitivizing affixes that shift conjugation and transitivity. There are also category-changing affixes:

- nominalizing suffixes that create agent or instrument nominals from verbs
- verbalizing suffixes that create intransitive (inchoative) or transitive (causative) verbs from nominals.

The minor categories of adverb, particle, and interjection show no morphological variation. However, there is a set of postinflectional suffixes that may be attached to words of any class to encode various information status concepts, such as *-rru* for ‘new information’ and *-thu* for ‘old information.’ These affixes are ubiquitous in texts.

Syntax

Jiwarli is a nonconfigurational language (Hale, 1983; Austin and Bresnan, 1996; Baker, 2000) and shows the following syntactic characteristics:

- free word order, in which any possible order of sentence constituents is found (Austin, 2000)
- split-NP syntax, in which nominals understood as referring to a single entity can be separated in the clause by other constituents (each nominal bearing a relevant case marker)

- free argument ellipsis, in which nominals of any person or number whose reference is clear from the context can be freely omitted (Austin, 2001).

The following example illustrates split-NP syntax:

- (1) *Karla wanta-nma-rni jarnpa juma*
 fire.ACC give-IMPER-hence light.ACC small.ACC
 ‘Give me a small fire light’ [T52s15]

Free ellipsis of arguments is seen in the following (see also line 68 in the text example below):

- (2) *Wirntupinya-nyja-rru*
 kill-PAST-NEW-INF
 ‘(They) killed (him)’ [T42s25]

Jiwarli also shows interesting interclausal syntax. Dependent clauses occur hypotactically located on the margins of main clauses, and their verbs encode clause type plus switch-reference, i.e., (non-)coreference of subject (S or A) between the main and dependent clause. In same-subject clauses the dependent clause subject is obligatorily unexpressed (these being ‘control’ structures). When the main clause is transitive, some same-subject dependent clause verbs carry an ergative case marker in agreement with the controlling subject nominal. The following examples illustrate this:

- (3) *Mantharta kumpa-inha wurnta-wu*
 man.NOM sit-PRES shield-DAT
yinka-rru
 adze-IMPERESS
 ‘The man sits adzing a shield’ [N11p31s3]
- (4) *Nhurra-kara-lu thika-nma*
 you-PL-ERG eat-IMPER
yarrukarri-ngu-ru-thu
 want-IMPERESS-ERG-old.INF
 ‘You eat it if you want it!’ [N11p39s3]

Table 5 Coding of P

| | <i>Dependent object</i> |
|-----------------|-------------------------|
| Intentive | Dative |
| Imperfective-ss | |
| Perfective-ss | |
| Imperfective-ds | |
| Perfective-ds | |
| Purposive-ss | Allative |
| Purposive-ds | Accusative |
| Might | |

For different-subject dependent clauses, if there is coreference between the (omitted) subject of the dependent clauses and a nonsubject in the main clause, an agreement case marker appears on the dependent verb, as in:

- (5) *Tharla-nma yinba julyu-nba*
 feed-IMPER this.ACC old man-ACC
kamu-rr-i-ya-nba
 hunger-INCHOAT-IMPEREDS-ACC
 ‘Feed this old man who is becoming hungry!’
 [JIT13s1]

Notice that there is a complex interaction between the marking of P inside the dependent clause (as dative, allative, or accusative) depending on clause type and crossclausal coreference relations. Table 5 illustrates this.

The significance of these patterns is explored more generally in Austin (2004).

Particles in Jiwarli have scope over the whole clause and encode such semantic concepts as negation, possibility, etc. An example is *warri* ‘not’ in (see also *kaji* ‘try’ in text line 15 below):

- (6) *Nhaa-rr-i-nyja nburra warri*
 what-INCHOAT-PAST you.ERG not
kurlkayi-rnu wangka-iniya-wu nganaju
 listen-IMPERESS talk-IMPEREDS-DAT I.DAT
 ‘Why didn’t you listen to me talking?’ [T35s7]

Text Example

The following extract (Text 43 in Austin, 1997) exemplifies the morphological and syntactic characteristics of Jiwarli and shows a little of the cultural background of the language. It comes from a traditional story in which one bird steals fire from the people, who then ask the Peregrine falcon to get it back from the thief:

- (7) *Ngana-lu ngunha karla mana-ra*
 who-ERG that.ACC fire.ACC get-FUT
 ‘Who will get the fire?’

- (8) *Nburra parru*
 2SG.NOM then
 ‘How about you?’
- (9) *Nburra karlathintirnira kurukurura,*
 2SG.NOM Peregrine falcon Peregrine falcon
nburra yini-thu
 2SG.NOM name.NOM-OLD.INF
 ‘You are karlathintirnira Peregrine falcon, (that’s) your name.’
- (10) *Ngaa*
 yes
 ‘Yes’
- (11) *Ngunha thurni-nyja-nthi*
 that.NOM laugh-PAST-just
 ‘He just laughed’
- (12) *Yana-nyja ngunha purtipala-rru*
 go-PAST that.NOM pretty.NOM-NEW.INF
 ‘He was pretty now’
- (13) *Wantha-rninyja juuri wangkarr-a*
 put-PAST paint.ACC throat-LOC
 ‘(They) put paint on (his) throat’
- (14) *Wantha-rninyja kala-pa wangkarr-a*
 put-PAST like this-SPEC throat-LOC
 ‘(They) put (it) like this on (his) throat’
- (15) *Kaji nburra yana-ma mana-ngku*
 try 2SG.NOM go-IMPER get-PURP.SS
ngurlu karla-rla
 that.ALL fire-ALL
 ‘You try to go and get the fire’

(5) nga-thu tjaa pati-nha thuku-wu
 I-ERG this.ABS tell-PT dog-DAT
 kuntu a-yi ngayima-yi
 not PURP-3SING.SUBJ chase-AP
 'I told this one not to chase the dog'

(6) nhaa nga-thu unpiyi nga-tji nhawurr
 this.ABS I-ERG take I-DAT child.ABS
 mangarnaan-kunha a-yi puthurr-puni
 doctor-ALL PURP-3SING.SU good-make
 'I took my child to the doctor for him/her to
 cure her'

A feature that Kalkutungu has in common with a number of other Australian languages is insubordination, whereby a subordinate clause becomes independent. Sentence (7a) provides an example; compare it with (4), (5), and (6). Essentially, a verb such as *ingka* in (4) is redundant and over time such verbs have been dropped in some circumstances to yield a construction in which the erstwhile dependent clause is independent. Witness the ergative on the agent in (7a), compared to the absolutive in (4). This construction, in which clitic pronouns are obligatory, makes an interesting comparison with (7b), in which the future tense is used and no clitics.

(7a) nyin-ti a-angi lha?
 you-ERG PURP-1SING.OBJ hit
 'are you going to hit me?'

(7b) nhakaakuwa nyin-ti ngayi lhami?
 why you-ERG me.ABS hit-FU
 'why are you going to hit me?'

Kalkutungu has two applicative constructions. In one, a dative can be promoted to object. If there is a patient object, this is retained, so there is a double object construction. In sentence of (8a), the beneficiary is expressed in the dative. In (8b), the beneficiary is now O and is expressed by an object clitic.

(8a) utjan nga-tji intji-ya
 firewood I-DAT chop-IMP
 'chop some wood for me'

(8b) utjan intji-tjami-ya-ngi
 firewood chop-APPL-IMP-1SING.OBJ
 'chop me some wood'

In the other applicative, an instrumental or locative can be promoted. If there is a patient object, it is demoted to the dative. The principal function of this construction is to provide for the anaphoric deletion of the instrumental or locative in purpose or other subordinate clauses. Example (9) is typical. The knife is understood to be the instrument in the purpose clause, but it is covert. The patient is demoted to the dative. Note this demotion is not in response to co-reference between the agent of the purpose clause and S or O, as in (4) and (5). Note too that the same marker *-nti* functions as a causative and applicative.

(9) kankari iti-nti-ya ati-ntji
 knife.ABS return-CAUS-IMP meat-DAT
 lhaa pintji-nti
 PURP-1SING.SUBJ cut-AP
 'bring the knife so I can cut the meat with it'

The final example is another sample of the instrumental applicative in which the instrument *utjula* 'net' has been promoted to O, pushing the patient *wakarri* 'fish' into the dative. It serves to illustrate two common principles of discourse. First, it is common to represent a nominal with a pronoun or other generic expression early in the clause with a more specific noun later. In (10), *nhaa* 'this' anticipates *utjula* 'net'. Second, the focus is normally placed first in the clause, in this instance *yawun* 'big'.

(10) yawun nhaa nga-thu utjula
 big.ABS this.ABS I-ERG net.ABS
 wakarri-yi ngurlurr-manti
 fish-DAT catch-AP
 'I use a big net to catch fish with'

Kannada

S N Sridhar

© 2006 Elsevier Ltd. All rights reserved.

Kannada (formerly referred to sometimes as 'Kanarese' or 'Canarese') is a South Dravidian language spoken by about 28 million people primarily in the state of Karnataka, South India, where it is the

official language. It is also spoken in the neighboring states of Tamil Nadu, Andhra Pradesh, Kerala, and Maharashtra.

History

Kannada is written in a variety of the 'alpha-syllabic' Brahmi system. The earliest written record, the

Halmidi inscription (ca. 450 A.D.), already shows the influence of Sanskrit. The history of the language is conventionally divided into three periods, Old Kannada (up to ca. the thirteenth century A.D.), Middle Kannada (up to ca. the nineteenth century), and Modern Kannada (the nineteenth century onward).

Literary and Grammatical Tradition

Kannada has a world-class literary tradition, but few works have been translated. It also has a rich grammatical tradition. The first extant literary work, Nagavarma's *Kavirajamarga* (ninth century), is a treatise on poetics and includes the earliest grammar of Kannada. Kesiraja's *Śabdamanidarpana* (1260) is the classic grammar of Old Kannada. The other major grammar is Bhattakalanka's *Karna:taka Śabda:nuśa:sana* (1604), written in Sanskrit. Modern descriptions include Kittel (1903), Spencer (1950), Bright (1958), Schiffman (1983), and Sridhar (1989). Srikanthaiah (1960) and Bhat (1978) include other important descriptions in Kannada.

Variation

Three major regional varieties are recognized: the dialect of the former and present capitals – the Mysore/Bangalore Kannada, the Dharwar (northern) Kannada, and the Mangalore (coastal) Kannada. The Brahmin variety of Mysore Bangalore forms the basis of the standard language. It retains aspirated consonants and consonant cluster combinations in Sanskrit-derived words (which occur with high frequency in this variety). There are other caste varieties, which differ in phonology, morphology, syntax, and the lexicon. Kannada is a diglossic language.

Kannada is interesting from the point of view of historical sociolinguistics because of the millennium-old controversy between the elitists and populists on the one hand and the purists and the pragmatists on the other concerning the proper literary style – a debate that continues to this day.

Structure

Kannada morphology is agglutinative, suffixing, and quite regular. Nouns are marked by cases, postpositions, number, and occasionally gender. Verbs indicate tense, aspect, and agreement in number, person, and gender. Negation is expressed as main verb and as a suffix. Word order is subject–object–verb. The verb normally (but not always) ends the sentence. Modifiers (e.g., adjectives, adverbs, and subordinate clauses) precede their heads; auxiliaries follow

main verbs. Compounding is very common in nouns and verbs. Normally, only one finite verb occurs per sentence: the syntax relies heavily on participles, gerunds, and infinitives. A number of these points are illustrated in the following sentence:

ni:nu nenne meccida a: mu:ru puṭṭa
you yesterday admired those three little

makkalu a:ṭa a:ḍi
children game play – past participle
danidu waḷamaneyalli nidde
tire – past participle inside room – locative sleep
ho:gidda:re.

go – past participle – continuous – 3 (human) plural
'Those three little children whom you admired
yesterday have gone to sleep after playing and
getting tired.'

Importance of Language Contact

Kannada has successfully assimilated an enormous amount of Sanskrit, Prakrit, Perso–Arabic, New Indo–Aryan, and more recently, English elements. This influence is manifested in the rather substantial stock of loan words, the productive use of Sanskrit derivational morphology, code-mixing, and calquing, which have been the preferred strategies for modernization throughout its history. This openness to borrowing sharply distinguishes Kannada from its sister language, Tamil.

Kannada and Linguistic Theory

Evidence from Kannada has played an influential role in several areas of modern linguistic inquiry. These include the status of grammatical relations, especially nonnominative subjects, in syntactic theory; processes of syntactic and morphological convergence; morphological levels in derivation; caste dialects; and syntactic and psycholinguistic models of bilingual code-switching, among others.

Kanuri

G J Dimmendaal, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

One of the earliest documents on an African language, a short vocabulary dating back to the 17th century, involves data from Kanuri, also known as Yerwa, or Bornu; the name 'Beriberi' is considered to be derogatory by Kanuri speakers. Kanuri is a major language in terms of the number of speakers; estimates for Nigeria range between three and four million, whereas in neighboring countries like Cameroon, Chad, and Niger, there may be around half a million speakers. Kanuri forms a dialect cluster with Kanembu, which is spoken by a distinct ethnic group mainly in Chad. Kanuri-Kanembu is part of the Saharan family, a well-defined subgroup within the Nilo-Saharan phylum.

Kanuri was intimately linked with the Kanem-Borno empire for almost 1000 years. Its role as the *lingua franca* of northern Nigeria was reduced in favor of Hausa during colonial times. Parallel to Hausa, a modified Arabic script known as Ajami was used in Kanuri for several centuries. The orthography based on Roman script and developed during the British colonial period was standardized in 1974. Today, Kanuri is used in mother-tongue education as well as on the radio and in television in Nigeria. It is also taught at university level, e.g., at the University of Maiduguri (Nigeria).

One of the earliest detailed analyses of Kanuri is Lukas (1937), who had already showed that Kanuri has two distinctive tone levels, low and high, as in *kànúrí* ('Kanuri person') or *kànùrí* ('Kanuri language'). These register tones may also be combined to build complex tones; the so-called 'mid' tone established by Lukas (1937: 3) represents a downstep high tone, i.e., a conditioned variant of the high tone. As further shown in Lukas' pioneering study, as well as in more recent analyses by Hutchison (1981), and by Cyffer and Geider (1997), Kanuri also has an intricate

system of consonant alternation, resulting in complex morphophonemic alternations.

One interesting typological property of Kanuri is the relatively small number of verbs. More than 95% of the predicative structures are formed by a combination of the light verb *n* ('say, think') and some complement (for example: *le+n* ('go')). This latter strategy is common in a range of Nilo-Saharan languages stretching from Kanuri in the Lake Chad region to Nara in Eritrea (*see Nilo-Saharan Languages*). Both complex predicates of this type and basic verbs are inflected for subject, tense-aspect-mood, as well as object (in the case of first and second person). Derivational argument modulation (more specifically, neutro-passive, causative, applicative marking) and pluractional marking is also expressed in the verbal complex.

Kanuri is head-final at the clausal level, involving verb-final structures, preverbal complementation, and the use of postpositions, but nominal modifiers follow the head noun. From a historical-comparative point of view, Kanuri grammar appears to be characteristic for the Saharan group within Nilo-Saharan. Interestingly, however, the lexical structure of Saharan languages appears to be less stable, as argued by Cyffer (2000).

Kapampangan

H Kitano, Aichi University of Education, Aichi, Japan

© 2006 Elsevier Ltd. All rights reserved.

Kapampangan (Pampangan) is spoken mainly in Pampanga Province and in parts of Tarlac, Nueva Ecija, Bulacan, and Bataan provinces of Luzon, the Philippines. It is one of the largest languages in the Philippines. The number of its speakers is estimated as 1 897 378 (1990 census).

Phonology

Kapampangan has the consonants [p, b, t, d, k, g, ʔ, s, tʃ, ɕ, m, n, ŋ, l, r, w, y] and vowels [i, e, a, ø, u].

Overview of Kapampangan Grammar

Word Order

Like other Philippine languages, Kapampangan is a predicate-initial language. Clitic pronouns and clitic adverbs usually occupy the second position of a clause, and clitic pronouns are almost always obligatory, even when their coreferent noun phrases are present.

- (1) Masakit-ya ing lalaki
sick-ABS.3SG DET.ABS.SG man
'the man is sick'

Case Marking

Kapampangan has three cases: topic, genitive (or nontopic), and oblique. Since Kapampangan exhibits an ergative system in pronominal case marking, these cases may also be called absolutive, ergative, and oblique, respectively, which are the terms used in this article.

Negation

Sentential negation is expressed by the predicate-initial *e*.

- (2) E-ya masakit ing lalaki
NEG-ABS.3SG sick DET.ABS.SG man
'The man is not sick'

Existence and Possession

Both existence and possession are expressed by the existential particles *atin(g)* ('there is, be present, have') and *ala* ('there is not, be absent, do not have'). (LK=linker, realized either as *ng* [after vowels, *n*, and the glottal stop] or *a* elsewhere)

- (3) Ating metung a babai-ng malagu
EXIST one LK woman-LK beautiful
'there was a beautiful woman'

- (4) Atin-ya-ng kapatad a lalaki
EXIST-ABS.3SG-LK sibling LK man
'he/she has a brother (male sibling)'

Lexical Classes

Nouns Nouns may be monomorphemic or derived by affixation. A limited number of nouns may be pluralized with vowel lengthening (e.g., *lalá:ki* 'man' and *la:lá:ki* 'men,' *babá:i* 'woman' and *ba:bá:i* 'women').

Noun phrases are formed with other lexical classes, such as adjectives and verbs, by use of the linker.

- (5) ing bayu-mu-ng imalan
DET.ABS.SG new-ERG.2SG-LK dress
'your new dress'

- (6) ing balita-ku-ng dimdam
DET.ABS.SG news-ERG.1SG-LK heard
kang Mike
DET.OBL.SG Mike
'the news I heard from Mike'

Verbs Verbs derive for focus (actor, patient, directional, beneficiary, and instrumental; see section on focus constructions) and inflect for aspect (contingent [contemplated, future], perfective [completed, past], and imperfective [incompleted, progressive, present]). Verbs derive by way of affixation (prefixes, suffixes, and infixes), reduplication, vowel alternations, vowel lengthening, and combinations thereof. Some other affixes denote causative, aptative (abilitative, accidental, and coincidental actions), and distributive (states or actions distributed over space and time, and repetitive actions).

Adjectives Adjectives may be monomorphemic or derived, with affixes, such as *ma-* (plural *manga-*), which is the most common adjective-forming prefix. The comparative degree is marked by *mas* (e.g., *mas maragul* 'bigger'). Superlative adjectives are formed with the prefix *peka-* (*pekamaragul* 'biggest').

Determiners Determiners, also called articles, case markers, or noun markers, pronominally indicate the case (absolutive, ergative, or oblique) and number (singular or plural) of the nouns they qualify, and whether the nouns are common or personal (Table 1).

Pronouns Pronouns may be clitic or free. Some combinations of two clitic pronouns (ergative and

Table 1 Determiners in Kapampangan

| | <i>Absolutive</i> | <i>Ergative</i> | <i>Oblique</i> |
|----------------|-------------------|-----------------|----------------|
| Common nouns | | | |
| SG | ing, = ng | ning | king, keng |
| PL | deng/reng | reng | karing |
| Personal names | | | |
| SG | i | = ng | kang |
| PL | di/ri | ri | kari |

Table 2 Pronouns in Kapampangan

| | <i>ABS (clitic)</i> | <i>ABS (free)</i> | <i>ERG (clitic)</i> | <i>OBL (free)</i> |
|-----------|------------------------|----------------------------|---------------------|-------------------|
| 1 SG | ku | yaku, aku | ku | kanaku, kaku |
| 2 SG | ka | ika | mu | keka |
| 3 SG | ya | iya | na | kaya |
| 1 DUAL | kata | ikata | ta | kekata |
| 1 PL INCL | katamu, tamu, kata, ta | ikatamu, itamu, ikata, ita | tamu, ta | kekatumu, kekata |
| 1 PL EXCL | kami, ke | ikami, ike | mi | kekami, keke |
| 2 PL | kayu, ko | ikayu, iko | yu | kekayu, keko |
| 3 PL | la | ila | da/ra | karela |

absolutive) may be fused into one word; e.g., *na* (ERG.1SG) + *ya* (ABS.3SG) becomes *ne* (Table 2).

Focus Constructions

In Kapampangan, as in other Philippine languages, the morphology of the verb indicates the semantic relationship between the predicate and the absolutive argument. In an actor-focus construction, the absolutive argument is semantically an actor, and the verbal predicate takes appropriate actor-focus affixes. Likewise, in a patient-focus construction, the absolutive argument is semantically a patient, and the verbal predicate takes patient-focus affixes. In the following examples of each focus construction, the boldfaced argument is the absolutive.

Actor focus:

- (7) Mamangan la-ng manuk
 eating ABS.3 PL-LK chicken
 ‘they are eating chicken’

Patient focus:

- (8) Kakanan de ing manuk
 eating ERG.3PL + DET.ABS.SG chicken
 ABS.3SG
 ‘they are eating the chicken’

Directional focus:

- (9) Dinan me-ng
 give.to ERG.2SG + ABS.3SG-LK
 pera ita-ng anak
 money that.ABS.SG-LK child
 ‘give some money to that kid’

Beneficiary focus:

- (10) Pangadi me
 pray.for ERG.2SG + ABS.3SG
 ‘pray for him/her/it’

Instrumental focus:

- (11) Penyulat ne
 wrote.with ERG.3SG + ABS.3SG
 ini-ng lapis
 this.ABS.SG-LK pencil
 ‘he/she wrote with this pencil’

Karen Languages

D B Solnit, University of Michigan, Ann Arbor, MI, USA

© 1994 Elsevier Ltd. All rights reserved.

Speakers of Karen languages make up one of the largest minority groups in both Burma and Thailand.

Classification

Karen belongs to the Tibeto–Burman side of the Sino–Tibetan family. In its subject–verb–object word order typology it stands apart from the subject–object–verb order of other Tibeto–Burman groups. This typological divergence is undoubtedly due to Karen’s contact with SVO Mon–Khmer and Tai languages, and is not sufficient grounds for setting up Karen as member of Sino–Tibetan distinct from Tibeto–Burman, as proposed in Benedict (1972).

Location and Languages Included

Karen speakers are distributed along a north–south axis roughly coinciding with the Thailand–Burma border, reaching northwards into Shan State of Burma a bit beyond Taunggyi and southwards nearly to the Isthmus of Kra, with more scattered groups extending westwards into the Irrawaddy Delta and eastwards into Lampang and Chiang Rai Provinces.

A list of discrete Karen languages can only be approximate, but relatively well-defined languages include Sgaw and Pho in the southern portion and the east–west extensions of the area just described, and Pa-O (Taungthu) at the northern end. Less well-defined but still usefully referred to as unitary is Kayah (Red Karen, Karenni, Eastern Bwe), spoken in most of Kayah State and a few adjoining areas of Thailand. The center of Karen linguistic diversity is in western Kayah State and adjoining parts of Karen State, an area of complex dialect continua. Two languages of this area have been described, Palaychi by Jones (1961) and Western Bwe (Blimaw) by Henson (1961). The remaining Karen languages include Padaung, located generally southwest of Pa-O and northwest of Kayah, and an indeterminate number of languages in the central area. All of these are known solely as a list of names (for details, including ethnographic notes, see Lehman 1967).

Number of Speakers

Anywhere from 3 to 4.5 million, of which perhaps 300 000 are in Thailand. Sgaw speakers are by far the most numerous in both Burma and Thailand.

Writing Systems

Writing systems akin to the Burmese script exist for Sgaw, Pho, and Pa-O, the former two having been developed by missionaries in the nineteenth century. Printed material includes Sgaw–English and Pho–English dictionaries. Other scripts, of less currency, exist for these and other Karen languages, with Thai, Roman, and eclectic sources.

Typological Characteristics

Karen languages share many features with other languages of mainland Southeast Asia, including contrastive tone, monosyllabicity, numeral classifiers, preference for aspect over tense, verb serialization, and lack of agreement, gender, and case marking.

One syllable per morpheme is the rule in Karen, although there are exceptions, notably those words including prefixes (see below). Karen tone systems typically have 3- and 4- way contrasts in syllables ending with vowel or sonorant, plus a 2-way contrast in syllables with final stops (if present as a distinct type). Tonal contrasts often include phonation as well as pitch features. The modern tone systems are the outcome of the conditioning effects of old initial consonant features acting on a proto-Karen system of 2 or 3 tones, very much as in Tai and Miao–Yao.

The basic Karen sentence type is verb-medial. Prepositions exist, although the repertoire is not large, with detailed spatial relations conveyed by noun expressions (e.g., ‘at box’s inside’ for ‘inside the box’). Nouns are modified by both preposed and postposed items; in general, nominal modifiers precede and verbal modifiers follow the head. The usual order for classifier constructions is noun-numeral-classifier. Word-formation is predominantly by compounding, although there are remnants of an earlier prefixation system, in the form of a collection of proclitic syllables with a more or less obscure morphemic identity.

Sample

The following represents the Eastern dialect of Kayah, spoken in Mae Hong Son Province of Thailand.

nè kè dá ɣè v̄ē dī tən̄ tət̄ v̄ē ɣò p̄ p̄
 you if give eat I rice one-day one-meal I guard IRREALIS
 If you give me one meal a day to eat. I’ll guard [them]

Kashmiri

S Munshi, University of Texas at Austin, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Kashmiri, known to its speakers as *kə:śur/ko:śur* or *kə:śir zabān* ('Kashmiri language'), is spoken by around 4 million people in India (*Ethnologue*, n.d.), primarily in the Kashmir valley (*kə:śi:r*) and its surrounding regions in the state of Jammu and Kashmir (J & K). Sizeable population of Kashmiri speakers also live in other states of India. Approximately 0.1 million Kashmiri speakers have been reported to live in Pakistan (*Ethnologue*, n.d.). Kashmiri speakers are also found in various other countries. Major regional dialects of the language spoken in J & K state include: Standard Kashmiri (in and around Srinagar; used for educational and literary purposes), *Kashtwāri/Kishtwāri* (Kishtwār valley, southeast of Kashmir valley); *Poguli* (southern Banihal); *Sirāji* (several villages of district Doda); *Rāmbani* (Ramban and adjoining areas), and *Bunjwali*. *Poguli* and *Sirāji* are considerably influenced by *Dogri* (an Indo-Aryan language close to *Punjabi* (*Panjabi*)). Speakers of many of these dialects often argue for the separate existence of their native speech as full-fledged languages rather than dialects of Kashmiri. Information available on Kashmiri dialects is generally based on secondary sources.

There is a possibility of existence of more regional dialects in addition to the above-mentioned, but no detailed research on Kashmiri dialectology is available so far. Besides the major regional dialects, there are conspicuous differences between urban and rural Kashmiri on the one hand (in terms of accent, phonology, and lexicon; rural Kashmiri has preserved many archaic forms not used in urban speech) and between Muslim and Hindu Kashmiri on the other (mainly in terms of borrowings; while Hindus use more Sanskrit loans, Muslims commonly borrow from Persian (*Farsi*, Western) and Arabic for the corresponding words. The terms 'Persianized' and 'Sanskritized' Kashmiri are sometimes used to refer to these social dialects).

Historical Development

Kashmiri has been classified along with a number of languages grouped under the title 'Dardic.' Dardic languages are spoken in the extreme north of India and northwestern Pakistan, extending into Afghanistan. There has been considerable debate over the classification of Dardic languages as to whether they are a third branch of Indo-Iranian language family (other two being Indo-Aryan and Iranian), or (at least, some of them) are of pure Indo-Aryan origin. Dardic languages have preserved many archaic Indo-Iranian features otherwise lost in the modern Indo-Aryan languages. They have also developed certain features not found in other Indo-Iranian languages. Nevertheless, the term 'Dardic' constitutes a geographical convention rather than a linguistic expression. Like other Dardic languages, Kashmiri has similarities with both Indo-Aryan as well as Iranian. After continuing debates over a long period of time, many linguists have agreed upon an Indo-Aryan origin for Kashmiri. The term 'Dardic,' however, has gained much popularity, and is still used in view of the regional peculiarities shared by Kashmiri and other languages of the group.

Kashmiri belongs to the North-Western group of the Middle Indo-Aryan (MIA) languages/dialects, which includes several Dardic languages (e.g., *Shina*, *Khowar*, *Torwali*), *Punjabi*, *Sindhi*, and *Lahnda* (*Panjabi*, Western). One of the characteristic features with respect to the phonological system of the North-Western group is the retention of certain features lost elsewhere. In many modern Indo-Aryan languages, Old Indo-Aryan (OIA) sibilants – *ś* (palatal), *s* (dental) and *ṣ* (retroflex) – merged into dental *s*. Kashmiri retains two sibilants, the palatal *ś* and the dental *s*. Like other Dardic languages, Kashmiri also retains the consonantal component *r* in the derivatives of the OIA syllabic *ṛ*, which had a number of reflexes in MIA, viz., *a*, *i*, or *u*.

Kashmiri vocabulary can be broadly categorized into Kashmiri/Dardic, Sanskrit, *Punjabi*, Hindi/Urdu, Persian, and Arabic origins. Kashmiri occupies a special position in the Dardic group, being probably the

only Dardic language that has a written literature dating back to the early 13th century, a writing script of its own, and the largest number of speakers among the Dardic languages. An important part of Kashmiri is its rich tradition of oral and written literature. Some of the very famous genres of Kashmiri oral literature and folklore are *rov*, *vanivun*, *c^bakir*, *ladi: -śah*, and *luki-pə:t^bir*.

Writing Systems

Originally, Kashmiri was written in the Shāradā script, an ancient indigenous character of Kashmir. Shāradā is argued to be the predecessor of Devanāgri/Nāgri, which is built on the same system and corresponds with Shāradā letter-for-letter, although the letters have considerably changed in form. Shāradā is closely associated with Tākri alphabet used for writing Punjabi, but, with a complete range of symbols for different vowels characteristic of Kashmiri. Its use is highly restricted to a handful of Hindu priests in writing *za:tuk/Janam-patri* ('horoscope'). The most popularly employed and officially-recognized script in current use is a modification of Perso-Arabic (Nastālīq) script. Devanāgari (again with modifications to cater to the specific requirements of the Kashmiri phonemic inventory) is also used and is popular among Hindus. Tākri (Kashtwāri and some dialects of the adjoining areas) and Roman scripts have also been employed but these have failed to gain recognition.

Phonological Characteristics

Both open and closed syllables are permitted in Kashmiri. Closed syllables, however, are preferred to open syllables. In rapid speech, in polysyllabic words with a sequence of adjacent CV syllables, speakers may drop medial vowels in favor of closed syllable structure. Final vowels are often deleted. Clusters comprising two consonants are quite common but only specific sequences can form a cluster in a particular position. Initial clusters are restricted to the type *Cr-* where the first consonant of the cluster is an obstruent. Final clusters are comprised of a homorganic nasal followed by an obstruent. The distribution of stress in Standard Kashmiri is influenced by a complex interplay of quantitative, positional, and rhythmic constraints. Primary stress appears on the word-initial syllable, which is always stressed. Stress occurs on every syllable containing a long vowel – CV:(C).

Kashmiri maintains the basic OIA pattern of five articulatory positions along with features of voice (e.g., *k* vs. *g*) and aspiration (e.g., *k* vs. *k^b*).

Its consonant system has survived with various alterations, losses, and additions. Some of the characteristic changes are those involving the loss of aspiration of voiced plosives, change of MIA palatal affricates to those of the corresponding dental affricates, word-final aspiration of voiceless stops, and fricative weakening/lenition (*s > h*) in certain environments. There are 27 consonantal phonemes in Kashmiri that have evolved from the Old/Middle Indo-Aryan phonological system. In addition, Kashmiri has also adopted a number of consonants from the Persian and Arabic phonemic inventory. The latter include the labio-dental voiceless fricative (*f*), voiceless and voiced velar fricatives (*x* and *ɣ*), and uvular and glottalic stops (*q* and *ʔ*). They are found only in Persian/Arabic borrowings and are used only by literate Kashmiris in Standard Kashmiri, especially in formal speech. In informal speech and among the illiterate population, these are replaced by *p^b*, *k^b*, *g*, *k*, and *a* respectively.

Like most of the New Indo-Aryan (NIA) languages, Kashmiri vowels are subject to various phonological operations that are not only regular but also extended over a larger domain than most of the other IA languages. A significant number of changes take place in accordance with the nature and position of the vowels in a particular linguistic domain (syllable/morpheme/word). Various such changes include: vowel harmony, *svarabhakti* (vowel epenthesis), consonantal assimilation, and final vowel deletion. Kashmiri has a 16-vowel system consisting of front vowels *li*, *i:*, *e*, *e:*, *ɛ/*, central vowels *i:*, *i:*, *ə*, *ə:*, *a*, *a:*, and back vowels *lu*, *u:*, *o*, *o:*, *ɔ/* with three contrasts in height (high, mid, and low). Kashmiri phonemic inventory is distinct in the IA languages in having central vowels *i:*, *i:*, *ə*, *ə:* (absent in most NIA languages) and dental affricates.

Morphosyntax

Kashmiri, like other IA languages, is a postpositional language. However, its word order is unique among the IA languages. Unlike other IA languages, which are typically verb-final, Kashmiri is a V2 language. That is, the inflected verb occurs at the clause-second position. In sentences with a main verb and an inflected auxiliary verb, the main verb occurs sentence-finally. Thus, the basic word order is essentially SVO(V). This is true of the matrix as well as embedded clauses, and also of *yes-no* questions and questions where the *wh*-phrase is the syntactic 'subject.' In other question formations, the *wh*-phrase occupies the clause-second position, with the inflected verb occupying third position. In most environments, V2 is obligatory. However, in certain syntactic

environments, such as correlatives and conditional clauses, V2 is optional. The sentence initial position is occupied by syntactic ‘subject’ or any other constituent (‘topic’). Except for the fixed position of the verb (and *wh*-phrase in case of questions), word order is fairly flexible. V2, characteristic of Germanic languages, is a well-developed syntactic phenomenon in Kashmiri, a non-Germanic language.

Complementation in Kashmiri is observed by optionally inserting complementizer *ki/zi* in front of the embedded clause. Relative clauses are formed by a relative-correlative construction with a pre-nominal relative pronoun in the modifying/relative clause and a correlative pronoun in the main clause following the relative clause. Relative-correlative construction is a typical areal syntactic feature.

Kashmiri is a split-ergative language. Case morphology is more or less typically Indo-Aryan. Based on thematic roles and verb class, the only argument of an intransitive clause receives either a zero/nominative case or a dative case. The most agent-like argument of a transitive clause in perfective aspect receives an ergative case and the other argument (if any) receives a nominative or dative case depending on its thematic role and the verb class. Subjects of a few intransitive verbs may appear in ergative case (e.g., verbs like *as-un* ‘to laugh’, *vad-un* ‘to weep/cry’). Case ending behaves like a postposition so that the noun phrase appears in oblique form (a typical Indo-Aryan syntactic feature).

Kashmiri verb phrase is rich in agreement. Both subject and object agreement markers may appear on the verb. Subject agreement, however, is blocked in dative/ergative constructions where the syntactic subject is in dative/ergative case.

One of the characteristic features of Kashmiri among the Indo-Aryan languages is its three-way (instead of the typical two-way) distinction of the demonstrative pronoun, viz., (1) proximate *yi/yim* ‘this/these’, (2) visible *hu/hum* ‘that/they (masculine)’ and *ho/homa* ‘that/they (feminine)’, and (3) invisible/remote *su/tim* ‘that/they (masculine)’ and *so/tima* ‘that/they (feminine)’.

Sociolinguistics of Kashmiri

Not many native speakers of Kashmiri can read the language, irrespective of their educational background. For a long time, Kashmiri has not been taught in schools. According to the three-language policy of India, languages generally taught in the schools of

J & K state are Urdu (a non-native language and the official language of the state), Hindi (official language of India), and English (second official language). There is a significant amount of prestige associated with Urdu, Hindi, and English in wider linguistic domains. These factors and increasing urbanization and globalization have played a significant role toward a gradual language loss with many Kashmiri speakers.

Kayardild

N Evans, University of Melbourne, Melbourne, Australia

© 2006 Elsevier Ltd. All rights reserved.

Kayardild is spoken in Queensland, Australia, in the South Wellesley Islands, and belongs to the Tangkic family (non-Pama-Nyungan), which also includes Lardil and Yukulta. Additional and now extinct varieties are Yangkaal and Nguburindi, though the limited materials we have on these show Yangkaal to be a sister dialect of Kayardild and Nguburindi a sister dialect of Yukulta. The Tangkic languages have no close relatives, though they are related, at a distant level, to other Australian languages and share most grammatical similarities with languages along the Roper River well to the west (Evans, 1995).

Speakers of Kayardild were traditionally hunter-gatherers, with a strong emphasis on marine resources, building stone walls around the coasts to catch fish and hunting for turtle and dugong. The traditional population numbered between 120 and 150. Isolated from European contacts until the 1940s, the entire tribe was removed from their homeland in the early 1940s to the mission on Mornington Island, from which date rapid language loss set in: no one born after the move to Mornington grew up to be a fluent speaker, and today fewer than 10 speakers remain.

Apart from scanty early word lists, all materials on the Tangkic languages were recorded since the early 1960s. Practical orthographies were developed in this period. These use digraphs for a variety of phonemes, making use of *r* before a stop or nasal letter to denote retroflexion: thus *rd* for /ɾ/ and *rn* for /ɾŋ/; *h* after a stop or nasal letter to denote a laminointerdental articulation (with the blade of the tongue between the teeth); thus *th* for /t̪/ and *nh* for /ɳ̪/. Other graphemes, standard in Australian orthographies, are *ng* for /ŋ/, *ny* for /ɲ/, *rr* for trilled or flapped /r/, *r* for /r/ and *j* for /ç/. Distinctive vowel length is shown by doubling the letter, e.g., *aa* for /aː/.

Phonologically, Kayardild is a typical Australian language, with paired stops and nasals at six points of articulation (bilabial, velar, laminodental, lamino-palatal, apicoalveolar and apicoretroflex), a single stop series without voicing contrast, no fricatives, two rhotics (a glide and a tap/trill), and a simple vowel inventory: three vowels (*a*, *i*, *u*) plus length. Primary stress falls on the first syllable unless attracted onto a long vowel.

Kayardild is typical of Australian languages in employing a rich system of case suffixes, which allow for great freedom of word order. Beyond this, the case systems of Kayardild and the other Tangkic

languages are remarkable for several reasons. Firstly they exhibit ‘double case marking’ (see Dench and Evans, 1988; Plank, 1995), since one NP embedded in another inflects both for its own case (e.g., the possessive) and that of the head: cf. Kayardild *thabuju-karra* [brother-POSSESSIVE] ‘brother’s,’ *wangal-nguni* [boomerang-INSTRUMENTAL] ‘with the boomerang,’ *thabuju-karra-nguni wangal-nguni* ‘with brother’s boomerang.’ Secondly, Kayardild and Lardil add a further ‘modal case’ inflection, etymologically a case suffix, which marks tense/mood on most nonsubject NPs as a partly parallel system to the tense/mood inflection on the verb. Example (1) gives a Kayardild example using the ‘modal ablative’ (glossed M.ABL) to mark past tense on the object and instrument NPs in addition to the verbal ‘past’ inflection.

thabuju-karra-nguni-na wangal-nguni-na
 brother-GEN-INST-M.ABL boomerang-INST-M.ABL
 ‘the man hit the bird with brother’s boomerang.’

Thirdly, Kayardild has a further ‘complementizing’ use of case suffixes, to indicate various types of interclausal relations such as being a clausal complement, as illustrated by the ‘complementizing’ use of the oblique in (2); note that it goes on all words of the subordinate clause, outside any other inflections. It is also used – on all words except the topicalized object – in strings of topic chains.

 brother-GEN- boomerang-
 INST-M.ABL-C.OBL INST-M.ABL-C.OBL
 ‘I saw that the man had hit the bird with brother’s boomerang.’

Finally, Kayardild can add a layer of ‘associating case’ on all nonsubject NPs of clauses whose verb has been nominalized.

Much of the how this strange system evolved has now been reconstructed with the help of data from Yukulta, the most conservative Tangkic language and representative of the proto-Tangkic situation in having an ergative: absolutive case system; see Evans (1995) for a summary. Essentially, the main clause structures found in Kayardild and Lardil result from either reanalysis of alternative semitransitive structures in Yukulta, or from the generalization of Yukulta subordinate clause morphology, with case-marking interclausal relations, e.g., proprietive for purposive or ablative for prior time, smeared over

both the subordinate verb and its overt NPs. A series of catastrophic changes has thus led Kayardild and Lardil to have grammatical systems that are organized quite differently from that in Yukulta, despite the fact that almost all grammatical morphemes are cognate. These changes make the Tangkic languages a fascinating case of radical and intertwined diachronic developments linked to the abandonment of an ancestral system of ergative case marking.

Another strange feature of Kayardild is a further set of case inflections, semantically and structurally part of the set of ‘normal’ case inflections but with the peculiarity that they convert their hosts, morphologically, from nouns into verbs. Beneficiaries, for example, take the ‘verbal dative’ case *-maru-*, which then takes regular verbal inflections (3), but which is distributed across all words in the noun phrase like a case inflection. Etymologically this derives from a verb meaning ‘put’ but structurally it is now a part of the regular system of case suffixes.

 1SgNOM sing-PST song-M.ABL
 ngijin-maru-tharra thabuju-maru-tharra.
 my-V.DAT-PST brother-V.DAT-PST
 ‘I sang a song for my brother.’

Like many other Australian languages, Kayardild has a complex set of derivatives from compass terms. To locate an entity one normally says things like ‘the east uncle’ or ‘the groper coming from the east’; some examples of derivatives based on the root *ri-* ‘east’ are *riinda* ‘coming from the east,’ *rilungka* ‘eastwards,’ *riliida* ‘heading ever eastwards,’ *riyananganda* ‘to the east of,’ *ringurrnga* ‘east across a geographical boundary,’ *riyanyinda* ‘at the eastern extremity of,’ *rilmirdamirda* ‘sea-grass territory to the east,’ *rilur-ayaanda* ‘from one’s previous night’s camp in the east,’ *rilijulutha* ‘move to the east’ and *riinmali* ‘hey you coming from the east.’

Kaytetye

H Koch, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

Kaytetye is the only member of the northern branch of the Arandic subgroup of the Pama-Nyungan language family, whose southern branch includes Arrernte (Aranda) and other languages (Hale, 1962; Koch, 2004). It is spoken in the southern part of the Northern Territory of Australia around Barrow Creek and Wauchope. Its speakers number around 200. Most contemporary people of Kaytetye descent

speak, in addition to or instead of Kaytetye, one of the neighboring languages – Alyawarr, Anmatyerre (both Arandic), or Warlpiri – and varieties of English. The current language of young people differs in a number of respects from that documented in the 1960s and 1970s by Hale and Koch.

Kaytetye phonology includes the typical Australian consonants, plus a set of pre-stopped nasals, rounded consonants, and a velar glide (the unrounded counterpart to *w*). An even more rare feature is a set of pre-palatalized apical consonants. The system of unrounded consonants and their orthographic representation is shown in **Table 1**. Rounded consonants

Table 1 Unrounded consonants (atypical segments in boldface)

| | VERB while SUBJ goes along | angkerrape- | kwatherrapeyne- |
| | VERB continuously/repeatedly while SUBJ goes along | angkerrangkerrenye- | kwathelathelarre- |
| | VERB once while SUBJ is on the way | angkelpangke- | kwathelpathe- |
| Prior and subsequent | go and VERB and then return | angkenyayne- | kwathenyayne- |

are indicated by *w* after the consonant (cluster). The vowel system consists of just /a/, a high/mid-central vowel (spelled *e* in the orthography), and a marginal /i/. There is no rounded vowel phoneme, but /e/ has rounded allophones.

Atypical phonotactic features include common word-initial V(C) syllables and final CV syllables with no coda consonant and an obligatory vowel /e/; only word-internal syllables have the full structure CV(C). Word stress falls on the first CV(C) syllable. A word like *arrkwentyarte* 'three' illustrates these features (where the stressed syllable is underlined). The atypical phonology results from a series of sound changes that are described in Koch (1997, 2004).

Nouns inflect for number and case, in the typical Australian fashion, but with some complications (Koch, 1990). Kin nouns, as illustrated in Table 2, are inflected for the (singular) person of possessor, by means of prefixes (former dative pronouns) for second and third person, and a suffix or zero for first person. A suffix *-nhenge* marks the category 'dyadic',

designating both persons in a relationship, e.g., 'mother and child(ren)'.

Dual and plural personal pronouns, as seen in Table 3, mark a kinship-related category called 'section' (Koch, 1982), which distinguishes whether the participants belong to different patrimoiety (e.g., *I and my mother/spouse/sister's child*) or the same moiety; and if the latter, to the same or opposite set of alternate generation levels (e.g., *I and my siblings/grandparents/grandchildren* vs. *I and my father/brother's children*).

Verbs may inflect for the category of 'associated motion' (Koch, 1984), indicating distinctions in the direction and relative timing of movement by the subject (usually), using markers that partially differ according to the transitivity of the verb stem (Table 4) and derive in part from former verbs of motion.

In semantics, the expression of feelings and emotions is characterized by the use of the reflexive construction of 'hear' and the mention of body parts, especially *aleme* 'stomach' (Turpin, 2002).

Rewenhe aleme eyterrye-le elpathe-nke errpatye
 3RDSING.REFL stomach person-ERG hear-PRES bad
 'That person feels bad'

Available language resources include a non-technical learner's guide (Turpin, 2000) and picture dictionary (Turpin and Ross, 2004), each of which includes an audio component, and a text collection (Thompson, 2003).

Kazakh

L Johanson, Johannes Gutenberg University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Kazakh (*qazaq tili*, *qazaqşa*) belongs to the north-western or Kipchak branch of the Turkic language family, more specifically to its southern or Aralo-Caspian group. Until the early 20th century, it was called Kazak-Kirghiz, whereas Kirghiz was referred to as Kara-Kirghiz. Kazakh is primarily spoken in the Republic of Kazakhstan (*Qazaqstan Respublikasi*), a vast country situated at the center of the West Eurasian steppe zone. It borders on Turkmenistan, Uzbekistan, Kyrgyzstan, and China in the south, and on the Russian Federation in the north and west. Kazakh is also spoken by minorities in Xinjiang (China), Uzbekistan, Mongolia, Turkmenistan, Kyrgyzstan, the Russian Federation, Tajikistan, Afghanistan, etc. The number of speakers is at least 10 million. There are more than seven million in Kazakhstan, more than one million in Xinjiang, and almost one million in Uzbekistan.

Kazakh is, along with Russian, the official language of the Republic of Kazakhstan. Kazakh–Russian

bilingualism is widespread. Though Kazakhs constitute half of the population of the republic, many have a low proficiency in their mother tongue. Russians make up 37% of the population. The declaration of Kazakh as the state language in 1989 was met by protests from the non-Kazakh population. In 1995, Russian was proclaimed the language of interethnic communication. Russian has a dominant status in public life as the main language of instruction, science, business, and communication in professional domains.

Karakalpak (*qaraqalpaqşa*), an independent language in the political sense, is a slightly Uzbekicized variety of Kazakh. It is spoken by c. 450 000 persons, mainly in the Autonomous Republic of Karakalpakstan (*Qaraqalpaqstan Respublikasi*) in Uzbekistan, on the lower course and in the delta of the Amudarya River. Small groups of speakers live in other regions, e.g., in the Khorezm and Fergana regions of Uzbekistan and in the Dashkhowuz region of Turkmenistan.

Origin and History

Kazakh goes back to the Kipchak varieties of Uzbek tribes, who founded a huge steppe empire in the second part of the 15th century. Separatist Kazakh tribes split off from the Uzbeks during their

migrations, and moved into the northern steppe regions. The ancestors of the Karakalpaks belonged to one of the most important confederations under the Golden Horde. At the beginning of the 17th century, the Kazakhs occupied Tashkent, which remained their capital until 1723. In the 18th century, Kazakh and western Mongol tribes fought for supremacy in the steppes between the Altay mountains and the Caspian Sea. The Kazakh empire disintegrated into three so-called hordes, of which the Great Horde submitted to Russia in 1717. The Kazakh territory was incorporated into Russia in the mid-19th century. A Kazakh constituent republic of the Soviet Union was established in 1920. Kazakhstan declared its sovereignty in 1990 and its full independence in 1991.

Related Languages and Language Contacts

Kazakh is closely related to Karakalpak, Kipchak Uzbek and Noghay (Nogai). Kipchak Uzbek, a vanishing variety formerly spoken mainly in the north and northwest of Uzbekistan, goes back to the original language of the Uzbek nomads. Kazakh has had old close contacts with Mongolic languages, and the recent influence on it of Russian has been strong. The southern part of Kazakhstan constitutes an intensive contact zone with Uzbek (Northern Uzbek). The Kazakh varieties spoken in China have been relatively little influenced by Chinese.

The Written Language

Kazakh did not possess a written variety in the pre-Russian period. Official documents were mostly written in Chaghatay (Chagatai) or Tatar. At the end of the 19th century a written language emerged. It was based on the dialect of the northwestern regions, where the Russian and Tatar influence was strong.

The Arabic script was used up to 1929. It was replaced by a Roman-based alphabet, which was abandoned in 1940 in favor of a Cyrillic alphabet. There are currently plans to adopt a Roman-based script again. In China, Kazakh is written in Arabic script, after an unsuccessful experiment with a Roman-based (pinyin) alphabet in the 1970s. Written Kazakh of China is still oriented towards the standard language used in Kazakhstan.

Karakalpak was established in 1925 as a language in the political sense and as a written language. Its orthography differs considerably from that of Kazakh. After the Arabic and Roman scripts had been employed for a few years, the Cyrillic alphabet was introduced in 1940. The transition to a new Roman-based script has begun.

Distinctive Features

Kazakh exhibits most linguistic features typical of the Turkic family (see **Turkic Languages**). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., *A* = *a/e*. Hyphens are used here to indicate morpheme boundaries.

Phonology

Kazakh has a front vowel *æ*, which is lower than the mid-high *e* and restricted to the first syllable. It has emerged through fronting of *a*, e.g., *bæri* ‘all.’ High vowels are often reduced, relatively short, but not lowered as in Tatar and Bashkir. Initial *e-*, *o-* and *ö-* are often pronounced with a prothetic glide, e.g., *ʸeki* ‘two,’ *ʸon* ‘ten.’ Initial *t-* is mostly preserved, e.g., *til* ‘language’ (cf. Turkish *dil*). As in most Kipchak languages, final *-y* is labialized in monosyllabic stems, e.g., *taw* ‘mountain’ ← *ta:y*. The affricate *č* has developed into the fricative *š*, e.g., *üč* ‘three’ ← *üšč*, whereas *š* has developed into *s*, e.g., *tas* ‘stone’ ← *taš*. Word-initial *ž-* corresponds to *y-* or *ǰ-* in other Turkic languages, e.g., *žol* ‘way’ (Turkish *yol*). However, *ǰ-* is found in older Kazakh texts.

According to front vs. back sound harmony, a suffix vowel is back if the preceding syllable has a back vowel, and front if the preceding syllable has a front vowel. This type of sound harmony also affects consonants, e.g., *qar-ya* [SNOW-DAT] ‘into the snow,’ *köl-ge* [lake-DAT] ‘into the lake.’

According to rounded vs. unrounded harmony (labial harmony), a suffix vowel is rounded if the preceding syllable contains a rounded vowel, and unrounded if the preceding syllable contains an unrounded vowel. Spoken Kazakh displays this kind of harmony not only in high suffix vowels, but also in low vowels, e.g., *üy-dö* [house-LOC] ‘in the house,’ *tüs-kön* [fall-PART] ‘fallen,’ *öl-gön* [die-PART] ‘dead.’ However, *o* is not admitted, e.g., *qol-da* [hand-LOC] ‘in the hand’ instead of **qol-do*. The rounding effect decreases with the distance from the first syllable, e.g., *üy-dö* [house-LOC] ‘in the house,’ *üy-ümüz-de* [house-POSS.1PL-LOC] ‘in our house.’ The rounded vs. unrounded harmony is not reflected in the orthography, which does not represent the suffix vowels *ö*, *ü*, and *u*.

Kazakh exhibits numerous consonant changes, mostly assimilations, in clusters containing dentals, liquids and nasals. Suffix-initial *d-*, *l-*, *n-*, and *m-* occur after stem-final vowels and often after nasals, sonorants, and glides, but they are otherwise assimilated. Suffix-initial *d-*, *l-*, and *n-* are assimilated

to *t-* after voiceless stem-final consonants, e.g., *at-tar* [horse-PL] ‘horses’ ← *at-lar*. Suffix-initial *d-* is assimilated to *n-* after stem-final nasals, e.g., *adam-nan* [man-ABL] ‘from the man.’ Suffix-initial *l-* and *n-* are changed to *d-* after most consonants, e.g., *köz-der* [eye-PL] ‘eyes,’ *qız-dı⁹* [girl-GEN] ‘of the girl.’ Suffix-initial *m-* is changed to *b-* after stem-final *-z* and *-ž*, e.g., *žaz-ba-* [write-NEG] ‘not to write.’

Loanwords are mostly pronounced according to indigenous phonotactic rules. Consonant clusters are dissolved through consonant deletion, or insertion of high prothetic or epenthetic vowels, e.g., *xaliq* ‘people’ (Arabic *xalq*), *iras* ‘true’ (Persian *rast*), *pıratsent* ‘percent’ (Russian *procent*), *telgirep* ‘telegraph’ (Russian *telegraf*), *kerewet* ‘bed’ (Russian *krovat*). The consonants *f* and *x* in loanwords are replaced by *p* and *q*, e.g., *aptobus* ‘bus,’ *qat* ‘letter.’ The phonological adaptation was largely reflected in the old Arabic and Roman orthographies, but since the introduction of the Cyrillic script, Russian loanwords are written in their original form.

Grammar

The comparative suffix is *-rAK* (after consonant-final stems *-(I)rAK*), e.g., *ülken-irek* [big-COMP] ‘bigger.’ There is an instrumental case in *-Men*. The reflexive pronoun *öz* is used attributively or as a noun with possessive suffixes, e.g., *öz üy-im* [self house-POSS.1SG] ‘my own house,’ *öz-im bar-dim* [self-POSS.1SG go-PAST-1SG] ‘I went myself.’

The old flexion of pronouns is preserved, and not replaced by flexion of the nouns as in some other Turkic languages. Pronouns ending in *-l*, e.g., *bul* ‘this,’ replace *-l* with *-n* in most oblique cases. The initial *b-* in *bul* is changed to *m-* in the genitive, accusative, and locative. The demonstrative pronouns *bul*, *osı*, and *mına* are used for referents within the range of view, while *ol*, *sol*, and *ana* are used for referents out of sight. Some demonstratives exhibit emphatic forms, e.g., *mına-w*.

The second-person plural marker *sIn-dAr* combines the second-person singular marker with the plural suffix. The marker *-sIz* expresses politeness when used to one addressee, whereas *-sIz-dAr* is the corresponding polite plural marker.

The suffixes *-LA-p* and *-LA-GAn*, whose first element *-LA* derives verbs stems from nouns, form approximative and multiplicative numerals, e.g., *žüz-de-gen* ‘hundreds.’

Kazakh has a present tense in *-A* plus person markers, e.g., *kel-e-di* [come-PRES-3.SG] ‘comes.’ It has emerged from a construction containing a converb ending in *-A + tur(ur)* ‘stands’. The old present tense form in *-(A)r* is mostly used with modal meanings,

e.g., *kör-er-miz* [see-AOR-1.PL] ‘we will see.’ A more focal present tense, i.e. with a narrower focus on the ongoing event, is formed with the converb suffix *-(I)p* and one of the verbs *otır* ‘sits,’ *žür* ‘goes,’ *žatır* ‘lies,’ *tur* ‘stands,’ e.g., *žaz-ıp žatır* [write-CONV lies] ‘is writing.’ The suffix *-AtIn* (*-ytIn* after vowel-final stems) forms a habitual past. There is an intentional in *-MAK*, e.g., *kel-mek-piz* [come-INTENT-1PL] ‘we want to come,’ and a necessitative in *-MAK-šI*, e.g., *sat-paqši-mın* [sell-NEG-1SG] ‘I must sell.’ Kazakh displays complex verbal compositions expressing actionality, aspect-tense, and evidentiality. A number of auxiliary verbs are used in postverb constructions based on the converbs in *-A* and *-(I)p* and mostly specifying the manner of action, e.g., *žan-ıp ket-* [burn-CONV go] ‘to burn down.’ Evidential forms are the indirective past in *-(I)p*, with *-DI* in the third person, e.g., *kel-ıp-ti* [come-CONV-3SG] ‘apparently came.’ The evidential (indirective) copula particle *eken* combines with various items, e.g., *kel-e-di eken* [come-PRES-3SG INDIR. COP] ‘apparently comes,’ *kel-gen eken* [come-PART EV] ‘has apparently arrived.’ Unlike more Iranicized languages such as Uzbek and Turkmen, Kazakh has a weakly developed system of conjunctions.

Lexicon

The basic vocabulary related to the traditional way of life is of Kipchak Turkic origin. There is also a rich modern Kazakh vocabulary with numerous neologisms, e.g., *xaliqaraliq* ‘international.’ Many words are of Persian (Farsi) and Arabic origin, introduced via Tatar and Chaghatay, e.g., *bazar* ‘market,’ *apta* ‘week,’ *nan* ‘bread,’ *aqıl* ‘intellect,’ *ğilim* ‘science,’ *mayına* ‘meaning,’ *waqıt* ‘time.’ Due to close contacts with other nomadic groups, Kazakh also exhibits many words of Mongolic origin, e.g., *olža* ‘booty.’ Kazakh of China has a fairly strong early layer of Mongolic loanwords, but relatively few loans from Chinese, at least in the written language. Russian words have been borrowed from the second half of the 19th century on. In the Soviet period, calques on Russian models and neologisms were generally preferred to loanwords. There is now a certain tendency in the written language to reduce the number of Russian loans in favor of words of native or Arabic-Persian origin.

Dialects

In spite of its huge extent, the Kazakh-speaking area exhibits little dialectal variation because of a high degree of mobility of the speakers of Kazakh throughout their history. The standard language is based on the northwestern dialect. The southern

and western dialects differ from it in some respects. For example, initial *y-* is often found, e.g., *yaq* ‘side’ instead of *žaq*. Common Turkic *č* is often found instead of standard Kazakh *š*. Changes of suffix-initial consonants are less common. They are, on the other hand, stronger in the easternmost dialects spoken in China and Mongolia, e.g., *bala-dar* [child-PL] ‘children’ instead of *bala-lar* [child-PL]. The rural Kipchak Uzbek dialects in the north and northwest of Uzbekistan have been largely de-Kipchakicized and are now practically extinct due to the abandonment of the nomadic lifestyle.

The Karakalpak language displays most of the phonetic and morphophonemic characteristics of Kazakh. Word-initial *ǰ-* is, however, found instead of *ž-*, e.g., *ǰol* ‘road.’ Suffix-initial *l-* is not assimilated, e.g., *tas-lar* [stone-PL] ‘stones’ instead of *tas-tar*, *qiz-lar* [girl-PL] ‘girls’ instead of *qiz-dar*. There are a few morphological differences, stemming from the influence of Oghuz and Uzbek. The future suffix *-AžAK* is a loan from Oghuz. The first- and second-person plural personal markers *-MAN* and *-sAN* instead of Kazakh *-MIn* and *-sIN* are similar to Uzbek *-man* and *-san*. The vocabulary differs to a certain degree from that of Kazakh and contains more words of Arabic and Persian origin. Karakalpak has two main dialects, one northeastern and one southwestern. Certain nominally Karakalpak and Kazakh dialects

in the region of Khorezm belong to the Southwestern or Oghuz branch of Turkic.

Keres

M J Mixco, University of Utah, Salt Lake City, UT, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Of the 21 Pueblo tribes in the American Southwest, one speaks Zuni, a language isolate; another speaks Hopi (Uto-Aztecan family) in several Arizona villages. In New Mexico, Tanoan pueblos (speaking Tiwa, Tewa, or Towa, related to Kiowa) are interspersed with those speaking Keres (or Keresan, *Quirix* or *Quires* in 16th-century Spanish; Davis, 1959).

Historically, Keres borrowed lexically from other pueblo languages via bilingual speakers, now a defunct process. Keresan has two major dialect divisions: Eastern (Rio Grande Valley) and Western (Colorado River drainage). Mutual intelligibility among dialects increases with proximity (speaker populations follow in parentheses as cited in Mithun, 1999, from Valiquette, 1995), Western: Acoma

(1930)/Laguna (2060); Eastern: Zia (504)/Santa Ana (384)-San Felipe (1985)/Santo Domingo (2965)-Cochiti (525).

Beginning in 1598, Spanish influences were strong only in the area of material culture (livestock, new crops, trade goods, and technologies). The impact was slighter in nonmaterial domains (e.g., religion) because of indigenous resistance resulting in the Pueblo Revolt of 1680–1692.

Surrounded by denser Spanish populations, the Eastern dialects received the most loanwords via Spanish bilingualism that persisted into the mid-20th century. English displaced Spanish as the regional lingua franca but provided fewer loans. Keres linguistic literature is scant, despite intensive Pueblo ethnographic work.

Structural Overview

Keres consonantal series are plain (b, d, dʸ, g), aspirated (p, t, tʃ, k), and glottalized (pʰ, tʰ, tʃʰ, kʰ) stops

and affricates; sonorants (m, n, r, w, y, m', n', r', w', y'); and fricatives (s, ʂ, ʃ, s', ʂ', ʃ'). There are two laryngeals (ʔ, h); five long and short vowels, voiced and voiceless contextually (i, e, a, ɤ, u); and as many as four pitch accents (high ´, falling ˆ, breathy ˘, and glottal ˑ), depending on the dialect. Morphologically, Keres is polysynthetic, exhibiting distinct sets of prefixes on active and stative verbs to express nominal arguments without independent pronouns. Pronominal prefixes, with the subject and object fused into one morpheme, undergo especially complex phonological alternations and simultaneously encode five subject and object persons, including an indefinite and a fourth or obviative person (when the subject is hierarchically lower than the object). Also simultaneous is modality (negative, dubitative, hortative, negative hortative, future hortative, and indicative). Singular, dual, and plural numbers occur. Voice requires its own set of pronominal prefixes followed by the reflexive-reciprocal prefix /-a-/ or the passive /-aʔa- or -aʔ-/. Benefactives are expressed discontinuously by prefixes and suffixes. Aspect (continuous, fulfilled, and state) is suffixal, as is adverbial subordination. Some intransitive pronominal agreement examples are [ʂ-uʔpɛ] 'I or you ate,' [k-uʔpa] 'he ate' versus the transitives [sʔ-ʔaku] 'I bit you,' [tʃʔ-ʔaku] 'you bit me,' [ʂ-ékʉ] 'I bit (him),' [sʔ-ʔaku] 'he bit (him),' [sg-àku] 'someone bit him' (Mithun, 1999: 438–440). The following sentences are from Davis (1964) as quoted in Mithun (1999):

ʂe ʂu ʂe yúsi nʔɛ ʂeu dya:mi ʂeu ʂu ʂe yúsi
 nʔɛ tʔ-a'gúyan-e
 from there down EMPH eagle from there down 3.DUB-
 PASS-send-PL
 'then the eagle was sent down from above'
 ʂu ʂe hauʔ dí-uw'ác'i
 PRT PRT toward 3.DUB-approach
 '(the eagle) approached'

Language, Culture, and Society

The Keres language reflects the traditional inter-related cultural concerns of the Pueblo peoples, principally religious ceremonialism, agriculture, and theocratic governance. This has given rise to elaborate esoteric terminologies distinguishing the realms of the sacred from the profane. The latter categories

may vary from pueblo to pueblo. There is baby talk as well as a difference between male and female speech in frequently occurring words (Kroskrity, 1983; Sims and Valiquette, 1990).

Recently, there have been vigorous efforts in some Keresan pueblos to counteract language shift (Pecos and Blum-Martinez, 2001; Sims, 2001).

Ket

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Ket is also known as Yenisei Ostyak and Imbat[skij] Ket. There are probably fewer than 200 mother tongue speakers out of an ethnic population of 1100–1200 (Krivonogov, 1998). Ket is spoken in north central Siberia along the Yenisei river and its tributaries (e.g., Yelogui), in northern Krasnoyarski Krai, spoken mainly in the villages of Sulomai, Kellog, Surgutikha, and Maiduka. Ket is the sole surviving member of the Yeniseic language family. Related languages include Arin, Assan, and Pumpokol, which became extinct by mid-18th century; Kott, which lasted until the mid-19th century, originally spoken to the north, west, and south of Krasnoyarsk. The closely related Yugh (also known as Sym-Ket) became extinct only in 1980s, and was last spoken in Vorogovo village. Yeniseic language speakers shifted to Russian or various Turkic varieties, in particular Chulym Turkic, Xakas, Shor, and Northern Altai varieties. Yeniseic speakers previously occupied the territory south along the Yenisei to the mouth of the Dupches River. Yeniseic-speaking peoples once occupied a large area in western and central Siberia, based on the widespread use of Yeniseic hydronyms across the area. Presumably, the attested Yeniseic peoples were encroached upon and marginalized areally by the advance at various periods of Samoyedic- and Ob-Ugric-speaking peoples from the west, and Turkic and Tungusic from the south and east, until they occupied their attested position along the Yenisei. The Xiong Nu of the Chinese chronicles may have spoken a Yeniseic language.

There are three dialects of Ket: Northern, Central, Southern. Mainly Southern Ket survives in such villages as Kellog and Sulomaj. Ket is severely endangered but enjoys high status in the villages where Ket people dominate. Only a handful of young people are learning the language as a first language, but Ket instruction in primary schools has begun in certain villages (e.g., Kellog), based on the written form of Ket developed by native Ket scholars and Professor Heinrich Werner.

Ket is unique among central Siberian languages for its unusual system of tone. Tones appear as a prosodic feature of the two leftmost syllables (if present) in Ket words (Vajda, 1999).

- (1) Southern Ket
¹*sʷlʷ* 'blood'
²*sʷlʷlʷ* 'white salmon'
³*sʷu:lʷ* 'sled'

⁴*sʷlʷ* 'cradle hook'
 (Vajda, 1999: 5)

Tone differentiates both lexical and grammatical forms in Ket.

- (2) Southern Ket
⁴*ásɛ̀l* 'ski' ⁴*ásɛ́l* 'type of large covered houseboat'
⁴*bʷlʷntán* 'mallard duck' ⁴*bʷlʷntàn* 'mallard ducks'
 (Vajda, 1999: 13)

The Ket dialects differ tonally primarily in the realization of the fourth tone, which may be falling with a short vowel and no pharyngealization (Southern Ket), or pharyngealized with a long vowel (Central and Northern Ket).

- (3) Southern Ket Central Ket Northern Ket gloss
⁴*sʷɛ̀lʷ* ⁴*sʷɛ:lʷi* ⁴*sʷɛ:lʷi* 'reindeer'
⁴*ásʷ* ⁴*ásʷe* ⁴*ásʷe* 'feather'
⁴*ɛ̀rʷ* ⁴*ɛ:də* ⁴*ɛ:rʷe* 'spring'
 (Vajda, 1999: 7)

Although Ket is unique among the languages of Siberia for its tone/register system (certain Ket tones, e.g., tone 2, are associated with pharyngeal tension), Ket is typical of north-central Siberian languages for its elaborate case system (Anderson, 2003). Nouns may appear in one of ten or eleven case forms. Ket is unusual for Siberian languages in distinguishing three genders or noun classes, roughly masculine, feminine, and other/neuter. One set of the case forms encodes these distinctions. Others do not and appear to be more recently fused postpositional constructions.

- (4) Ket
⁴*bʷib-dana* ⁴*bʷun-dina*
 SON-DATIVE. daughter-DATIVE.
 MASCULINE FEMININE
 'to (his) son' 'to (his) daughter'
 (Werner, 1997: 105)

In addition, Ket makes extensive use of case forms on verbs as well within a highly diversified system of case-marked clausal subordination that dominates complex sentence structure in the languages of the region.

- (5) ⁴*-dinaʷlʷ* Ablative → 'after,' 'since'
 Ket
⁴*bu* ⁴*ɛtn-asʷ* ⁴*du-y-a-raq-dinaʷlʷ*
 he we-INS/COM I-SEP-PRES-live-ABL
⁴*dɔŋ* ⁴*sikŋ* ⁴*u-yɔŋ*
 three year.PL III-go
 'three years have passed since he's been living with us'
 (Werner, 1997: 353)

Among the most noteworthy features of Ket from a typological and areal perspective is its elaborate and highly complex verbal system. There are many different structural positions or slots within the Ket verb, the exact number of which is debated by Ket specialists (e.g., Werner (1997) assigns 18 such slots (14 prefix positions, a root, and three suffix positions), while Vajda (2003), on the other hand, considers there to be 10 such slots in the Ket verb (eight prefix position, root + one suffix position). Some examples of complex Ket verb forms include the following:

| | |
|--------------------------------|------------------------------|
| (6) <i>da-bágdèŋ-ú-γ-à-vet</i> | <i>d-us'-n-ba-γv-in'-tet</i> |
| 3FEM-drag- | 3M-INCORP-DER-1-PST- |
| 3NEUT.OBJ-DIR- | INAN-PST.PRF-hit |
| PRES-ITER | |
| 'she drags it often' | 'he has hit me' |
| (Vajda, 2003: 63) | (Werner, 1997: 156) |

Morphosyntactically, Ket stands out for its unusual predilection for multiple encoding of a single category, e.g., subject in verbs or plurality in nouns. Examples of this kind of redundant encoding may be seen in the following examples.

| | |
|----------------------------------|--------------------------------------|
| (7) Ket | |
| <i>d-dəŋ-b-it-n</i> | ¹ <i>qa-ŋ-s-eŋ-naŋal'</i> |
| 1-1PL-INAN- | chief..-PL-..chief-PL-PL:ABL |
| transport-PL | |
| 'we transport it' | 'from the chiefs' |
| (Shabaev, 1987; Werner, 1995) | |
| | < ⁴ qa[:]s 'chief' |

A number of proposals have been offered on the possible wider genetic affiliation of the Yeniseic languages, including connections with Burushaski, Sino-Tibetan, and Northeast Caucasian languages of Eurasia, as well as Athabaskan (Na-Dene) languages of North America. To date, only the latter proposal has met with any positive reactions among specialists.

Khasi

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

The Khasi are a group of Mon-Khmer speakers living predominantly in the Khasi and Jaintia Hills region of Meghalaya state in northeastern India, with a smaller number in Assam, West Bengal, and Manipur states. In some sources, the Khasi have been called Khuchia. The vast majority of Khasi people (ca. 90%) live in India, with a further 10% living across the border in Bangladesh. Khasi [KHI] is the only language of the Mon-Khmer group of Austroasiatic spoken this far to the west.

Traditionally the Khasi are divided into a number of 'dialect' groups, but perhaps it is more sound from a linguistic perspective to speak of a small group of related languages sometimes labeled Khasic or Khasian. These 'dialects' or closely related languages include the following (Grimes, 2000; Parkin, 1991):

- (1) Khasic languages
 - a. Amwi [AML]
 - b. Bhoi
 - c. Lyngngam
 - d. Pnar (aka Synteng or Jaintia) [PBV]
 - e. Khyrniam or Cherrapunji/Standard Khasi [KHI]
 - f. War

Of these dialects/languages, Lyngngam is most linguistically distant from the standard Khasi dialect, while Pnar is the closest. Amwi is also quite distant

from Standard Khasi. Lyngngam may include a linguistically Khasified Garo element (a Tibeto-Burman language), while War and Bhoi may include assimilated Mikir (Tibeto-Burman) elements. The Pnar (Synteng/Jaintia) ruled a kingdom in the region from at least 1500 to 1835, when it was disbanded by the British colonial authorities (Parkin, 1991: 58). Further Khasic varieties include Lakadong and Mynnar. Other local Khasic varieties may (in fact probably do) exist, and there is also considerable microlevel variation.

According to figures from the India Missions Association in 1997, there were just under 1 million total Khasi speakers, including all the above mentioned dialects/languages (the actual estimated figure is 950 000). Khasi is a literary language and a language of media and government in Meghalaya. There are even radio and television broadcasts in the Standard Khasi language. Phonologically, Khasi exhibits some areally and typologically atypical initial clusters, e.g., [bt], [ks], [kt], [ktH], and so on.

- (2) *bta* 'wash/besmeared face' *ksew* 'dog' *kti* 'hand'
kt^báw 'grandfather'

Syntactically, Khasi is SVO, while other Khasic languages show different basic word orders as well as many other different features.

- (3) *Khasi*
phi-m ?iithu? ya na
you-NEG recognize OBJ I
'don't you recognize me?'
(Rabel, 1961: 61)

Morphosyntactically, Khasi is characterized by use of gender markers and a system of personal verb inflection, albeit within a predominantly isolating structure.

- (4) Standard Khasi
u khinna? u-m bam
 DET.M boy MASC-NEG eat
 ‘the boy doesn’t eat’
 (Nagaraja, 1993: 5)

In addition, there is evidence of a now (mainly) covert noun-class system that manifests itself in the form of lexicalized prefixes in noun stems. This system of gender classifiers is highly marked for Austroasiatic. This and the unusual phonology of Khasi set it apart from its sister languages spoken to the east.

In terms of verbal derivational morphology, Khasi, like its sister languages to the east, makes use of a causative prefix consisting of a labial consonant in various allomorphic realizations.

- | | | |
|-----------------------|-------------------------|--------------------|
| (5) i. <u>Khasi</u> | <u>Khasi</u> | <u>Khasi</u> |
| <i>ph-rung</i> | <i>ph-láit</i> ‘clear | <i>b-ta</i> ‘wash/ |
| ‘penetrate’ | away’ | besmear |
| | | face’ |
| < <i>rung</i> ‘enter’ | < <i>láit</i> ‘be free’ | |
| (Henderson, | (Henderson, | (Henderson, |
| 1976b: 487) | 1976b: 487) | 1976b: 487) |

Negative occurs in the form of either an enclitic to a subject pronoun or gender agreement marker or proclitic to the verb stem, depending of the tense/aspect value of the clause. Note also the presence of fused subject+tense forms in Standard Khasi as well.

- (6) Standard Khasi
phi-m ?iithu? ya na *nan ?m-tho?*
 you-NEG recognize OBJ I I.FUT NEG-write
 ‘don’t you recognize me?’ ‘I’m not writing’
 (Rabel, 1961: 61)

Standard Khasi
u khinna? u-m bam
 DET.M boy MASC-NEG eat
 ‘the boy doesn’t eat’
 (Nagaraja, 1993: 5)

In Bhoi, another language of the Khasic subgroup of Mon-Khmer, the negative has a different phonological shape and occurs between the lexical verb and a postposed gender/agreement marker.

- (7) Bhoi
u khanna? bam re u
 DET.M boy eat NEG MASC
 ‘the boy doesn’t eat’
 (Nagaraja, 1993: 5)

Bound aspectual or tense morphemes are rare in Eastern Austroasiatic. There is, however, a

quasi-bound suffixal past tense marker in *-la?* and a future in *-di?* in Lyngngam, a language of the Khasic subgroup.

- (8) Lyngngam
brə kyu di-la? liŋba la?tap
 man 3PL GO-PAST through forest
 ‘the men went through the forest’
 (Nagaraja, 1996: 43)
- nə dənmi nə di-la? tu dənmi-di?*
 I GO.NPAST I GO-PAST he GO.NPAST-FUT
 ‘I go’ ‘I went’ ‘he will go’
 (Nagaraja, 1996: 44)
- mi binnəŋ-di? mi baŋ-la?*
 you eat.NPAST-FUT you eat-PAST
 ‘you will eat’ ‘you ate’
 (Nagaraja, 1996: 44)

In terms of nominal derivation, Khasi, like virtually all Austroasiatic languages, may derive deverbal nominals through a process of *-n-* infixation. Note that sometimes the derived noun reflects a more archaic phonological form than the verb stem it (historically) derives from, e.g., the preservation of initial *s-* in the word for ‘wing’ while the corresponding verb stem ‘fly’ has shifted this to *h-*.

- (9) Khasi
shnong *sner*
 ‘village’ < *shong* ‘feather, wing’ < *her* ‘fly’
 ‘sit, dwell’
 (Henderson, 1976b: 517–518)

Like many Austroasiatic subgroups (Anderson and Zide, 2002), Khasic languages show irregular correspondences in the free-forms of nouns, while the corresponding ‘underlying’ (usually CVC) roots are clearly cognate across the subgroup. Note the following forms in this regard:

- (10) Irregular Khasic correspondences
- | | | | | |
|--------------|------------------|----------------|----------------|-----------------|
| <u>Khasi</u> | <u>Lyngngam</u> | <u>Synteng</u> | <u>Amwi</u> | <u>Lakadong</u> |
| <i>ksew</i> | <i>ksu:/su:</i> | <i>ksaw</i> | <i>ksiá</i> | <i>ksaw</i> |
| | | ~ <i>kswa</i> | | |
| <i>sim</i> | <i>sim</i> | <i>sim</i> | | |
| <i>kbmat</i> | <i>kb'mat</i> | <i>kbmat</i> | <i>ma:t</i> | <i>ma:t</i> |

| | | <i>ma:t</i> | ‘eye’ | |
| | | <i>myrkoŋ</i> | ‘nose’ | |
- (Fournier, 1974: 86–92)

That elements like *k-/kh-* are historically prefixes in Khasi is attested to by such facts as the following alternations. The original root forms appear as CVC ‘combining form’ elements in compounds.

- (11) **Khasi**
kti but *tiipden* ‘middle finger.’ (Rabel, 1961: 44)
khmat but *matli?* ‘white of eye.’
 also *ʔiimat* ‘eye’ < see-eye/face (Rabel, 1961: 149)
khnaay ‘mouse. rat’ but *naaysaaw* ‘small red
 hill mouse’

Note in this regard also the following alternations:

- (12) **Khasi**
kpa, kmi(e) ‘father, mother’ (non-vocative) vs.
ʔii paa ʔii mey address term used by children to
 parents ‘da ddy/mommy’ (Rabel, 1961: 49)

Khmer (Cambodian)

In the Kingdom of Cambodia, most of the population of 10 716 000 (1998 UN) are considered speakers of Khmer. Its dialectal varieties are spoken by around

1.3 million ethnic Khmer people in the northeastern and eastern provinces of Thailand. The former variety is called Northern Khmer, or sometimes Surin Khmer. Another variety is spoken by more than one million people of the Khmer ethnic group, called Lower Khmer, in southern Vietnam.

Khmer is one of the major languages of Mon-Khmer subgroup of the Austroasiatic language family. It is a typical Mon-Khmer language in that phonemically its

native words are either monosyllabic or disyllabic; it has no tonal distinction and is of the isolating type syntactically.

Script and Written Records

Khmer script is one of the oldest scripts in mainland Southeast Asia that originate in South India. Archeology has shown that the communication between Southeast Asia and India dates back to the beginning of the Christian era. Khmer legend, according to the Chinese document, says the local queen married the prince from India, and they became the founders of the Khmer kingdom, which suggests the existence of local matrimonial authority influenced by the Indian civilization, such as Hinduism.

The oldest Khmer inscription in old Khmer dates from 611 C.E., in addition to which there are also undated inscriptions, or presumably older ones written in Sanskrit. The inscriptions spread not only in Cambodia, but also in parts of Thailand and southern Vietnam, which suggests that the ethnic group was formerly more widespread than it is in the present and once exerted a strong cultural influence over the area.

Phonology and Phonetics

A Khmer native word is either monosyllabic or disyllabic. In a disyllabic word, a minor syllable precedes a major syllable. In a minor syllable, the inventory of possible vowels is smaller than in a major syllable. A major syllable is pronounced with stress when preceded by a minor syllable. Using the abbreviations C for a consonant, V for a vowel, F for a syllable final consonant, 'r' for a liquid and parentheses for an optional element, a minor syllable can be either CVF or C(r)V, where only nasals can appear as F.

Likewise, a Khmer major syllable can be illustrated as C(C)V F. Vowels are either long or short. The long and short contrast is also found among diphthongs. A short vowel occurs only in a checked syllable: it must be followed by a syllable-final consonant, whereas a long vowel can occur both in an open and checked syllable.

Consonants

Consonants in the syllable-initial position are given in Table 1, where the IPA symbols, when necessary, are given in the brackets.

Of these consonants, only nasals /m, n, ɲ, ŋ/, unreleased stops /p̚, t̚, c̚, k̚/, a glottal stop /ʔ/, fricatives /v, y, h/ and a liquid /l/ can occur in the word-final position as well. /t/ in the word-final position, once pronounced, is lost except in the Northern Khmer dialect in Thailand. /f/ appears only in loanwords.

Table 1 Khmer consonants

| | | | | |
|-------|--------|----------|----|---|
| p | t | c [tɕ] | k | ʔ |
| ph | th | ch [tɕh] | kh | |
| b[β] | d[d] | | | |
| m | n | ɲ | ŋ | |
| | r l | | | |
| (f) v | s y[j] | | | h |

Table 2 Khmer long vowels and diphthongs

| Phonemic | Orthography |
|----------|-------------|
| i: | ī-2 |
| e: | e-2 |
| ɛ: | e-1 |
| æ: | æ-2 |
| æ: | æ-1 |
| u: | ī-2 |
| ɤ: | ā-2 |
| ə: | ī-1 |
| aə | ā-1 |
| iə | ā-2 |
| a: | ā-1 |
| u: | ū-2 |
| o: | o-2 |
| o: | ū-1 |
| ɔ: | a-2 |
| ɔ: | a-1 |
| ao | o-1 |

The distinction between voiceless unaspirated and voiceless aspirated stops can be found only in the syllable initial or intervocalic position. Voiceless aspirated consonants could be further analyzed as consonant clusters /p/ + /h/, /t/ + /h/, /c/ + /h/, /k/ + /h/, as there are some words that have an infix between the first stop and the second fricative /h/. Characteristic of the Khmer consonants is that Khmer allows a variety of two-consonant combinations in the syllable initial position of a major syllable. Regarding the above aspirated stops as consonant clusters, 84 combinations in total are possible.

Vowels

Modern Khmer has a complicated vowel system. Although several dictionaries have been published for Khmer, there is no consensus as to the vowel phonemic system. As a result, almost every dictionary has its own phonemic transcription. The main reason for the discrepancy is that some assume the existence of resister contrast, i.e., contrast between 'breathy' and 'clear' phonation type, but others do not.

Table 2 shows the standard Khmer long vowels and diphthongs in phonetic transcription with the transliteration of orthography of Indic origin. The register

Table 3 Khmer short vowels and diphthongs

| | | |
|----|---|----------------|
| i | ɯ | u |
| e | ə | o |
| ɛ | | w _ɔ |
| ɛə | a | ɔ |

contrast, which had been regarded as phonemic, has been lost in the dialects in Cambodian territory, and diphthongization has occurred in compensation. See Minegishi (1985) for details of phonetic values of Khmer dialects. According to Wayland and Jongman (2003), the remnant of phonation contrast is observed in the dialect of eastern Thailand.

Note that, “æ, ɨ, ə” are transliterations for Khmer original scripts, which do not exist in the ordinary Indic script system. A ‘1’ following the transliteration means that the consonant preceding the vowel symbol is of voiceless group; ‘2’ indicates the preceding consonant of the voiced group. In addition, there are diphthongs /uə, ə, uə/. In total, there are 12 long vowels and eight diphthongs. This complexity is attributable to the loss of voiceless and voiced contrast in the syllable-initial position for stops and successive divergence of vowels. See ‘Historical Phonology’ below for details. Table 3 shows the Khmer short vowels and diphthongs.

Historical Phonology

The phonemic reconstruction by Sakamoto based on Khmer inscriptions has established the old Khmer vowel phonemes as */i, e, ɛ, a, aa, (ɯ), ə, u, o, ɔ, ɒ, ɔɔ, iə, uə/.

By the above reconstruction and modern orthography, diachronic changes in their phonological systems can be internally reconstructed as follows.

Formerly, Khmer had a phonemic contrast, e.g., /*kaa/ and /*gaa/ as its orthography shows, where the difference is between voiceless and voiced consonants. Later, the vowel following the voiced consonant changed its quality; /*kaa/ and /*gəa/, where phonemic contrast between the consonants still existed and the difference in the vowel register, i.e., ‘clear’ versus ‘breathy’ phonation type respectively, was irrelevant. Later on, the voiceless and voiced distinction in stops was lost and the difference in the voice quality in turn carried the phonemic contrast; /*kaa/ and /*kəa/. In the present, the voice quality is no longer phonemic; instead vowel articulation is relevant; /ka:/ and /kiə/. The divergence of vowels is well preserved in the standard Khmer around Phnom Penh area, but in the rest of the country, vowels have merged again to simplify the vowel system. As a result, most of the dialects have only /i:, e:/ as long front vowels, etc. Northern

Khmer, conversely, has retained most of the vowel contrast as monophthongs.

Tonal Contrast

As is usual in Mon-Khmer languages, Khmer does not have tones. The only exception, however, is the colloquial style of Phnom Penh dialect, which has acquired a tonal contrast, a level tone versus a raising-falling one: the latter is a compensation for the phonemic change /r/ into /h/, and the successive loss of /h/.

Morphology

Khmer, although syntactically of an isolating type, has a large number of derivational prefixes and infixes, which have been fossilized and are no longer productive in word formation. A word may have either a prefix or infix, but not both. Thus, native words are either monosyllabic or disyllabic. Like other Mon-Khmer languages, Khmer has no suffix. It has prefixes and infixes for causativization, specification, nominalization, intransitivization, repetition, etc., and infixes representing instrument, agent, result, object, etc., of an action.

Grammar

Khmer is an isolating language with no inflection in verbs, nor case marking in nouns. As a result, classifying word classes must be done by means of their distribution and class meaning. Noun modifiers follow the noun, verb modifiers follow the verb.

Khmer’s main word classes are as follows, although further classification considering the syntactic distribution is possible: nouns, numerals, classifiers, demonstratives, pronouns, verbs, preverbs, adverbs, expressives, conjunctions, and final particles.

Of these, classifiers are few in number and rarely used except for counting persons, animals, or books. There are two demonstratives. Pronouns are a subclass of nouns, most of which are also used as nouns. Along with titles and kinship terms, choice of pronouns shows relative social positions. Verbs can be further classified as active and stative (adjectival) verbs. Preverbs may precede verbs adding modal meaning, such as ‘may, must,’ etc., to them. Adverbs may follow a verb. Expressives are a subclass of adverbs, describing noises, shapes, movements, emotions, etc. Final particles may be in the sentence-final position to denote the intentions and emotions of the speaker, etc.

The basic word order is Subject+Verb+(Object). A modified noun (head) is followed by a modifier. Nouns and stative verbs can be used as modifiers. Prepositions

(or a noun grammaticalized as a preposition) precede a noun.

The typical noun phrase can be described as follows where optional elements are in parentheses.

Noun+(Verb)+(Numerals)+(Classifier)+(Demonstrative)

In case a clause is used for the noun modifier, the word order is as follows.

Noun+(Relative clause marker+Clause)+(Demonstrative)

A verb may be followed by a noun to form a verb phrase. Several verbs, sometimes with a noun inserted in between, form a serial verb construction, or verb serialization without any change in verbal forms, such as V(N)V(N), etc. In a serial verb construction, two or more verbs may be in various semantic relations, such as an action and its direction, an action and its objective, successive actions, an action and its result, an action and its manner, or an action and its means, etc.

Vocabulary

As one of the earliest languages in Southeast Asia that has accepted Indianization, earlier Hinduism, and later Theravada Buddhism, Khmer has borrowed Sanskrit and Pali loans, especially for religion, administrative, and other cultural vocabulary. It also has exerted a huge influence over adjacent Thai, which in turn borrowed a large number of Khmer words, such as honorific vocabulary used for the royal family. As a result of long-term contact with Thai, Khmer also borrowed many words from Thai.

Khoesaaan Languages

W H G Haacke, University of Namibia, Windhoek, Namibia

© 2006 Elsevier Ltd. All rights reserved.

The recognition of Khoisan (Khoesaaan) as one of the four language phyla in Africa received initial impetus mainly through the 'Macro-Khoisan Hypothesis' of

Joseph Greenberg, first published in 1950. This controversial phylum comprises his 'Click languages,' which formerly were known as 'Hottentot' and 'Bushman' languages, respectively. Dorothea Bleek (1929) had paved the way for their integration into one family by challenging the prevalent view that Hottentot as a Hamitic language had been influenced by Bushman, and by suggesting instead

Table 1 Southern African Khoesaaan languages

| Branch | Languages († = [virtually] extinct) |
|--------------------------------|---|
| 1. Northern (<i>Ju</i>) | !Xung (DC), Jul'hoan, Xaull'e, !O!xung |
| 2. Southern (! <i>Ui-Taa</i>) | |
| 2.1 †! <i>Ui</i> | †!Xam, †!Aunī, † ≠ Khomani, †!Xegwi |
| 2.2 <i>Taa</i> | !Xōō (DC), †Kakia |
| Isolate | ≠ Hōā |
| 3. Central (<i>Khoe</i>) | |
| 3.1. Khoekhoe | |
| 3.1.1. Northern/Namibian | Khoekhoegowab DC (= Nama, Damara, Haill'om, ≠ Ākhoe) |
| 3.1.2. †Southern/South African | †!Gora ('Korana'), †Xri ('Griqua'), †Cape Khoekhoe (DC) |
| 3.2. Kalahari Khoe | |
| 3.2.1. Western | Khwe, Buga, Ani (DC); Naro (DC); Gana, Gui, ≠ Haba (DC); |
| 3.2.2. Eastern | Shua, Ts'ixa, Danisi, Xaise, †Deti; Kua-Tsua (DC) |
| 4. | †Kwadi (Angola) |
| 5. | Sandawe (Tanzania) |

that Nama (as representative of Hottentot) was a Bushman language with Hamitic admixture. Bleek divided the Bushman languages into Northern, Central, and Southern groups. In essence, these divisions are still recognized today, although their validity is open to challenges (see Table 1).

The compounded name Khoisan was coined in 1928 by Leonhardt Schultze to signify the somato-racial relatedness of the Hottentots and Bushmen, with *khoi* ('human being,' correctly spelled *khoē*) representing Hottentot, and *san* – the Nama designation for the Bushmen, meaning 'foragers' (correctly spelt *Sān* or *Saan*) – Bushman.

Greenberg distinguished South African Khoisan (with the major Northern, Central, and Southern branches) as opposed to the East African isolates Sandawe and Hadza (some 70 000 and 400 speakers, respectively). These views are not unanimously accepted, as genetic relatedness between the major linguistic branches cannot be proved satisfactorily. Although scholars remain divided on the issue of genetic relatedness, the term 'Khoesan' or 'Khoisan' (more correctly spelled 'Khoesaaan') is now widely used as a term of convenience to denote all non-Bantu and non-Cushitic click languages of Southern and Eastern Africa.

Only some 30 Khoesaaan languages still exist today, with the great majority of languages being extinct. With the possible exception of Khoekhoegowab in Namibia (formerly better known as 'Nama,'

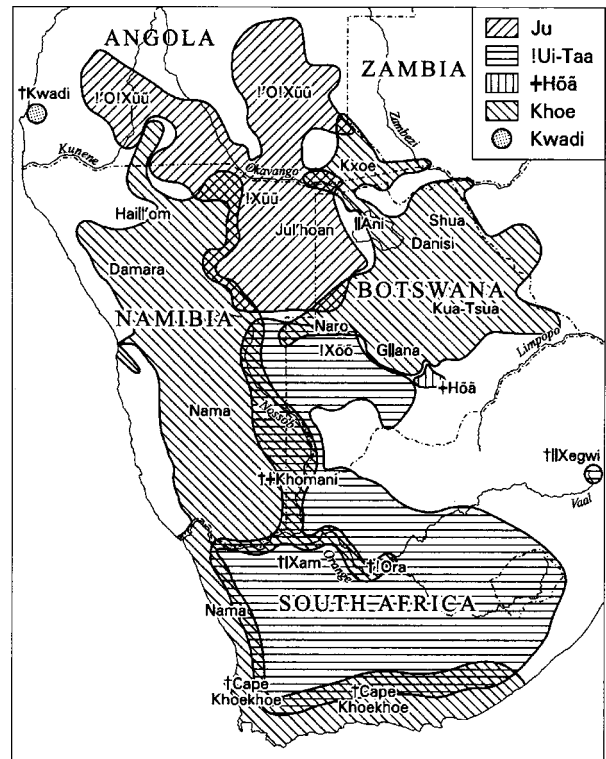

Figure 1 South African Khoesaaan languages (precolonial situation). (Note: '†' = language now extinct.) Map reproduced from Güldemann T & Vossen R (2000). 'Khoisan.' In Heine B & Nurse, D (eds.). *African languages: an introduction*. Cambridge: Cambridge University Press. 100, map 5.5.

and for classificatory purposes briefly referred to as 'Khoekhoe'), virtually all of these languages can be considered to be endangered.

While the Northern (*Ju*) and Southern (!*Ui-Taa*) branches with the isolate ≠ Hōā are spoken by hunter-gatherers (Bushman/Saan), the languages of the Central branch (*Khoe*) are today spoken by Khoeid (Nama; !Gora!/Ora, Xri, and Cape Khoekhoe being extinct), Saaid (of especially the Kalahari Khoe branch), and Negroid (Damara) peoples. Linguistic and racial classifications of these groups are thus not coextensive. The following classification is largely based on the classifications of Köhler (1989) and of Güldemann and Vossen (2000). The reader is referred to the latter publication for more detailed information on Khoesaaan languages. For a classification of !Xung and Jul'hoan dialects (Northern Khoesaaan) see Snyman (1997), for Central Khoesaaan see Voßen (1997), and for dialects of Khoekhoe(gowab) Haacke *et al.* (1997). Several of the language names below represent dialect clusters (DCs). The iconic classificatory names *Ju*, !*Ui*, *Taa*, and *Khoe* mean 'human being' in their respective branches. The now extinct Kwadi was probably related to Namibian Khoekhoe.

Table 2 The 20 click variants of Khoekhoegowab

| Influx | Efflux | | | | |
|----------|--------------|----------------------|---------------------------|---------------------------|---------------------|
| | Glottal stop | Voiceless velar stop | Delayed glottal fricative | Voiceless velar affricate | Voiced nasalization |
| Dental | [ʔ] | g [] | h [ʰ] | kh [xʰ] | n [ŋ] |
| Alveolar | ! [!ʔ] | !g [!]! | !h [!ʰ] | !kh [!xʰ] | !n [!ŋ] |
| Palatal | ≠ [≠ʔ] | ≠g [≠] | ≠h [≠ʰ] | ≠kh [≠xʰ] | ≠n [≠ŋ] |
| Lateral | [ʔ] | g [] | h [ʰ] | kh [xʰ] | n [ŋ] |

Although Sandawe does show evidence of affinity to Central Khoesaaan, *i.a.* also in its tonology, recent research by Bonny Sands (1998b) considers Hadza of Tanzania to be an isolate with no satisfactory evidence for a genetic relationship to Khoesaaan, despite lexical similarities and the use of clicks (Figure 1).

Before the Bantu diaspora, Khoesaaan peoples probably inhabited the entire Southern Africa up to the east coast of South Africa and into southern Angola. Displacement and absorption led to a drastic reduction of territorial domains, which was further aggravated by the arrival of European colonizers in the seventeenth century. Social marginalization still determines the life of all groups considered to be Saan. Khoekhoegowab in Namibia is the only Khoesaaan language that is officially recognized for language-planning purposes and is a major subject at university level. Demographic figures are largely based on estimates, totalling over 200 000 for Southern African Khoesaaan. Khoekhoe(gowab), with 175 554 speakers (1991 census of Namibia), represents by far the largest Khoesaaan speech community and constitutes some 12.5% of the Namibian population.

The most conspicuous phonological characteristic of Khoesaaan languages is the use of click consonants (Table 2). Clicks consist of an influx and an efflux phase. The influx (basic click) produces the actual clicking sound and is produced without pulmonic airstream. There are five influx variants: ☉ (bilabial), | (dental), ! (alveolar), ≠ (palatal), and || (lateral). Each of these influxes then combines with a specific number of effluxes, depending on the language. This efflux constitutes the resumption of the pulmonic egressive airstream, and its nature depends on the manner of release of the posterior, velaric (and at times glottalic) closure. The bilabial ‘kiss-click’ ☉ is manifest only in Southern Khoesaaan. The number of effluxes can vary from five in Khoekhoe(gowab) to 16 in !Xōō, yielding a total of 83 click variants in the latter language, with a total of 117 consonants (cf. Traill, 1985) – a possible world record.

The tonology of Central Khoesaaan languages is typologically most akin to those of Southeast Asian languages on account of perturbational (sandhi)

Table 3 The six main citation melodies of Khoekhoegowab and their sandhi correlates (as recorded by Eliphaz Eiseb)

| Citation | Sandhi | Gloss |
|--------------|--------------|--|
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | to butt |
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | female genitals, udder |
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | to force escape from burrow (of: aardvark) |
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | to coagulate; to remove thorn with aid of utensil |
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | fist |
| <i>ǀom̩s</i> | <i>ǀom̩s</i> | pollard |

processes and the interaction of tonal and segmental phonemes, with depressor consonants triggering tonogenesis (development of contrastive pitch as compensation for the depletion of consonantal contrasts).

According to research thus far, available roots in Khoesaaan languages appear to be generally bimoraic. Roots of at least Central Khoesaaan languages are disyllabic, with syllable and mora being in isomorphic relation; hence tonal melodies (Table 3) consist of a sequence of two register (level) tonemes. The following minimal set illustrates the six main melodies of Khoekhoegowab in citation and sandhi form (Haacke, 1999). The second syllable of *!om* consists of a syllabic nasal [m]. Verbs are quoted here in their infinitival form with the third person fem. sg. pgn-marker *s*). Vowel qualities generally vary between oral and nasalized vowels; in addition, pharyngealized, laryngealized, and breathy vowels or their combinations are found in most non-Khoekhoe languages.

The most distinctive morphological characteristic of Central Khoesaaan languages is that they mark nouns for sex gender with postclitic person–gender–number markers, whereas Northern and Southern languages do not. This occurs most consistently in Khoekhoegowab, which marks nouns for person (third, as well as first or second), gender (masculine, feminine, neuter/common), and number (singular, dual, and plural). Non-Central languages have little inflectional morphology. Whereas Non-Central languages have SVO constituent order, Central languages have SOV order in the case of lexically specified NPs.

Khotanese

P O Skjærvø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Khotanese, an Eastern Middle Iranian language spoken in the kingdom of Khotan in southwestern Xinjiang, is known from manuscripts on paper and wood found in the Khotan area, as well as in the caves at Dunhuang. The related language Tumshuqese, spoken in Kucha in northwestern Xinjiang, is much less well known. They were written in the southern and northern variants of Brahmi, respectively.

Three stages of Khotanese can be distinguished: Old, Middle, and Late, corresponding to texts from, roughly, the 5th–6th, 7th–8th, and 9th–10th centuries, up to the end of Buddhism in Khotan (ca. 1000).

Written remains consist mainly of Buddhist texts from all three periods, economical and legal documents from the Middle Khotanese period, and letters from the Late Khotanese period.

Khotanese and Tumshuqese constitute the north-eastern branch of the Iranian languages, in which Indo-Iran. *čw*, *fw* [tʃw, dʒw] became *ś* [ʃ], *ž* [ʒ]. This feature is only shared by modern-day Wakhi spoken in northeastern Afghanistan.

The phonology of Khotanese is of the Middle Iranian type in which, for instance, *č* [tʃ] and *ž* [dʒ],

spelled *c* and *j*, had become [ts] and [dz], spelled *tc*, and *js* in the Brahmi alphabet. There are two non-Indic vowel marks, transcribed as *-ä* ([-ə]?) and *-ei*.

Khotanese had retroflex consonants (*t*, *th*, *d*, *n*) in both indigenous words (in which, e.g., *d* < *rd*, *n* < *žn*) and in Indic loanwords. It is not clear whether the aspirated stops, *kh*, etc., were spirants [x], etc., or actually aspirated stops [k^h], etc. It is possible that they were originally spirants, as in other Iranian languages (cf. Khot. *khara*- 'donkey,' Avestan *xara*-, Persian *xar*, etc.), and only later became stops, as suggested by the way Chinese was written in Brahmi in Khotan.

The non-Indic sound *z* was written *ys*. The voiced sibilants *ž* and *ž* were originally not distinguished in writing from *ś* and *š*, but later various strategies for distinguishing them were invented (written double = unvoiced, single = voiced; a subscript curved line (transliterated as ') to indicate the voiced pair; e.g., *šārā* and *śšārā* [śārə] 'good,' but *šātā* [žədə], *še* [že] 'second'); the line also probably indicated rhotasized vowels (*nei* [nei'] 'nectar' < **nāžā*). There was a single-flap *r* and a trilled *r*.

While intervocalic voiced stops had already been lost in Old Khotanese, intervocalic *k* and *t* still remained in the oldest texts (phonemically *g* and *d*), and final *-i*, *-ä*, and *-u* were still distinct. The development from Old via Middle to Late Khotanese in the

main involved the loss of distinction between final short vowels and their loss after nasals and in some other positions (e.g., Okhot. *aysu* ‘I’ > MKhot. *aysä*, LKhot. *a*; OKhot. NOM/ACC *suhāvatānālu* ‘utilities’ > MKhot. *suhāvām* > LKhot. *suhāvau*); and the merger of *um* and *ām* (e.g., OKhot. GEN-DAT PL *rrumḍānu* ‘the kings’ > MKhot. *rrāmḍām* > LKhot. *rraudau* [approx. [rɔːdɔː]).

The original six-case system is reduced in Middle Khotanese by the merger of the nominative and accusative (except in pronouns), and further reduced in Late Khotanese to a three- or two-case system. There are three genders, the neuter being of limited use.

The verbal system is of the Eastern Middle Iranian type. There are two stems, present and past (e.g., PRES *bar-*, PAST *buda-*; PRES *hām-* ‘become,’ PAST *hām-āta-*). Khotanese has preserved the Old Iranian moods (indicative, imperative, subjunctive, optative, injunctive), as well as active and middle. The past of intransitive verbs is of the common Iranian type (*bud-ä mä* ‘carry.PAST.INTRANS-SING.MASC COP.PRES.1ST.SING’ = ‘I was carried’ > ‘I rode’), while that of transitive verbs is based on an active past participle plus copula (*bud-e* < **bṛta-āh* ‘carry.PAST.TRANS-SING.MASC [COP. 3RD.SING = Ø]’ = ‘he carried,’ *bud-ātä* ‘she carried’; *bud-aimä* < **bṛta-āh ahmi* [COP.PRES.1ST.SING] ‘I [MASC] carried,’ *budāndä* ‘they carried,’ *bud-āndä mä* [COP.PRES.1ST.PL] ‘we carried’).

Perfect/pluperfect and modal forms are formed from the past tense (e.g., perfect: *nei* [<*ne* + *ī*] *hvat-e štä balysä* ‘NEG-EMPH.PART speak.PAST.TRANS-SING. MASC COP.3RD.SING Buddha-SING.NOM’ = ‘the Buddha has not at all said’; pluperfect: *cīyā rr-e bāysānd-ä vāt-ä* ‘when king-SING.NOM awaken.PAST. INTRANS-MASC COP.PAST.INTR-3RD.SING-MASC’ = ‘when the king had awakened’; pluperfect optative: *ka nā va ysār-u gyast-a balys-a dāt-u hvat-āndä v-ī-ro ne gāvu vamas-īro* ‘if they.ENCL.OBL

PARTICLE 1000. SING.NEUT lord.PL.NOM-ACC *buddha*.PL-NOM-ACC *law*. SING.ACC *speak*.PAST.TRANS-PL.MASC/FEM COP-OPT-3RD.PL NEG at-all understand.OPT.3RD.PL’ = ‘even even if a thousand lord buddhas had spoken the law to them, they would not at all understand’).

The ‘potentialis’ is formed with a past participle with the ending-*u* (SING ACC NEUT) and the verbs *yan-*‘to do’ (active) and *hām-*‘become’ (passive) and expresses possibility and completion of action (e.g., *ne hvat-a hām-äre* ‘NEG speak.PAST.PART-PLUR.MASC become.PRES.-3RD.PL’ = ‘they cannot be said/expressed,’ *ne hvat-u yan-īmä* ‘NEG speak.PAST.PART. NEUT do.PRES-1ST.SING’ = ‘I cannot say (it),’ *cīyā hvat-u yud-āndä* ‘when speak.PAST.PART.NEUT do.PAST.TRANS-3RD.PL = ‘when they had spoken’).

Tumshuqese also has the old augmented imperfect (e.g., *a-ch-i* ‘PAST-go-3RD.SING’ = ‘he went, he has gone’), though the augment may be added only to monosyllabic forms (cf. *bar-i* ‘he carried’).

The lexicon contains numerous borrowings from Indic, both Middle Indic and Classical Sanskrit. In the Middle and Late Khotanese periods, we also find a small number of Chinese and Tibetan words.

Kinyarwanda

A Kimenyi, California State University at Sacramento, Sacramento, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

General Background

Kinyarwanda, the national language of Rwanda is probably, after Swahili the second largest spoken language in the Bantu group. It is a sister dialect of Kirundi, the national language of Burundi, and Giha, another dialect spoken in Tanzania. Despite

the genocide that took place, taking the lives of more than 1 million Tutsi, it is spoken by perhaps more than 20 million people. Rwanda has approximately 9 million people right now, Burundi has approximately 7 million, but besides the Giha speakers there are also ethnic Banyarwanda in Southern Uganda in the Kigezi district known as Bafumbira. Other Kinyarwanda speakers are Banyamulenge in Southern Kivu, ethnic Banyarwanda in Masisi, and Rutshuro in Northern Kivu in the Democratic Republic of Congo. Kinyarwanda belongs to the interlacustrine (Great Lakes) Bantu languages.

Writing System

Although Kinyarwanda has both long vowels and short vowels as well as high tones or no tones on syllables, the official orthography does not mark vowel length and melody. Only the context can tell the reader which word was meant. Written texts are thus ambiguous even to native speakers. Thus, the written word *gusura* can stand either for (*gusura*) ‘to fart’ or (*gusuura*) ‘to visit’, and *gutaka* can stand for either (*gutaka*) ‘to scream’ or (*gutaaka*) ‘to decorate’; *ino* can stand for either (*ino*) ‘toe’ or (*inó*) ‘here’, *inda* can stand for (*inda*) ‘stomach’ or (*indá*) ‘louse’, *umuryango* can stand for (*umuryaango*) ‘family’ or (*umuryáango*) ‘door’, and *ikirere* can stand for (*ikireere*) ‘banana leaf’ or (*ikirééré*) ‘air space’. Even though the sound ‘p’ has been lost and is found only in onomatopoeic words and loan words, the aspirated voiceless velar fricative ‘h’ is spelled as ‘p’ after the bilabial nasal ‘m’, as shown in the examples *impuha* (*imhuuha*) ‘rumors’, *impamvu* (*imhaámvu*) ‘cause/reason’. The allophones, the voiced bilabial stop ‘b’, which appears only after the homorganic nasal ‘m’, and the voiced bilabial fricative a, realized intervocalically, are also written the same way, using the voiced bilabial stop symbol ‘b’. Although the language has only one liquid, both ‘r’ and ‘l’ are used in the orthography. The liquid ‘r’ is used in all texts and ‘l’ is used only in loan words that have ‘l’ in their spelling, such as *Libiya* ‘Libya’, *Alijeriya* ‘Algeria’, *dolari* ‘dollar’.

Vowels and Consonants

Kinyarwanda has five vowels, which are either long or short and are high-toned or have no tones. The high tone can appear on either the first mora or the second mora. These vowels are the two high vowels ‘i’ and ‘u’, the midvowels ‘e’ and ‘o’, and the center low vowel ‘a’. The midvowels ‘e’ and ‘o’ are not allowed in both the (pre)prefix and suffix positions. In verbs, however, these midvowels can appear in the suffix position as a result of vowel harmony if the vowel of the verb stem is a midvowel, e.g., *gukosa* ‘to make mistakes’, *guko-soora* ‘to correct’ /ku-kos-uur-a/; *kumenya* ‘to know’, *kumenyeesha* /ku-meny-iish-a/.

The majority of word stems have the same identical vowel in all syllables: *u-mu-biri* ‘body’, *u-bu-riri* ‘bed’, *i-ki-reenge* ‘leg’, *i-béere* ‘breast’, *u-mu-góongo* ‘back’, *u-mu-hoondo* ‘yellow’, *u-ku-guru* ‘leg’, *u-ru-túgu* ‘shoulder’, *igibaánga* ‘skull’, *i-ki-gaanza* ‘hand palm’. This observation raises the question as to whether the stem is assigned only one vowel that is copied or that spreads to other syllables.

Since Kinyarwanda has open syllables only, loan words with cluster consonants copy the vowel of the syllable on the right or a default vowel ‘u’ with bilabial consonants and ‘i’ with other consonants. As the following loan word *porogaramu* ‘program’ shows, both vowels ‘o’ and ‘a’ are copied on the preceding vowelless consonants and the vowel ‘u’ is inserted after the final consonant ‘m’.

‘program’ /p.\$ro.\$g.\$ra.\$m.\$/ > *porogaramu*

This language has both simple and complex consonants. The simple consonants, using the official orthography, are the bilabials ‘p’, ‘b’, and ‘m’, the interdental ‘f’ and ‘v’, the alveolars ‘t’, ‘d’, ‘s’, ‘z’, and ‘n’; the alveopalatals ‘sh’, and ‘j’, and the velars ‘k’, ‘g’, and ‘h’. Kinyarwanda has two glides, the palatal ‘y’ and the bilabial ‘w’. It has one liquid, ‘r’, which is written as ‘l’ in some loan words, as was pointed out earlier. The affricates are the labiodental ‘pf’, the alveolar ‘ts’, and the palatal ‘c’.

The complex consonants are the prenasalized simple consonants, the palatalized consonants, the velarized consonants, the palatalized–velarized consonants, the prenasalized palatalized consonants, and the prenasalized palatalized–velarized consonants.

Prenasalized consonants are the bilabial ‘mp’ and ‘mb’; the interdental ‘mv’, ‘mf’, and ‘mpf’; the alveolar ‘nt’, ‘nd’, ‘ns’, ‘nz’, and ‘nts’; the palatal ‘nsh’, ‘nj’, and ‘nc’; and the velar ‘nk’, ‘ng’, and ‘nshy’.

Palatalized consonants are the bilabial ‘by’, ‘py’, and ‘my’; the interdental ‘fy’; the alveolar ‘ty’, ‘dy’, ‘sy’, and ‘nyy’; and the velar ‘cy’, ‘jy’, and ‘shy’.

The velarized consonants are the bilabial ‘pw’, ‘bw’, and ‘mw’; the interdental ‘fw’ and ‘vw’; the alveolar ‘tw’, ‘dw’, ‘sw’, ‘zw’, ‘nw’, ‘rw’, and ‘tsw’; the palatal ‘shw’, ‘jw’, ‘cw’, and ‘yw’; and the velar ‘kw’, ‘gw’, and ‘hw’. Palatalized–velarized consonants are the bilabial ‘byw’, ‘pyw’, and ‘myw’; the alveolars ‘tyw’, ‘dyw’, ‘syw’; and the velar fricative ‘shyw’. Palatalized consonants, velarized consonants, and palatalized–velarized consonants can in turn be prenasalized as shown in the following examples: ‘mbyw’ (prenasalized palatalized–velarized voiced bilabial), ‘mvyw’ (prenasalized palatalized–velarized voiced interdental), ‘nshyw’ prenasalized palatalized–velarized voiceless fricative velar, and ‘njoyw’ (prenasalized palatalized–velarized voiced stop velar). The complex consonants in Kinyarwanda are discussed at great length in Kimenyi (2002) and Bizimana *et al.* (1998). It is still an open debate in phonetics and phonology as to whether these complex consonants are one with multiple articulators or a sequence of independent segments.

Tonology

Role of Tones

Tones are lexical, morphological, and syntactical. Lexical tones differentiate words that look alike segmentally as shown in (1), morphological tones play the role that segmental morphemes are assigned in other languages as illustrated in (2), whereas syntactic tones are assigned depending on where the word bearing the tone occurs in the noun phrase, verb phrase or the sentence as shown in (3):

- (1) *inda* ‘stomach’ <> *indá* ‘louse’, *ino* ‘toe’ <> *inó* ‘here’
- (2) *basoma* ‘they read’ <> *basomá* ‘who read’ <> *básoma* ‘when they read’
- (3) *baraaza bagakóra* ‘they come and work’ <> *baraaza bagakora akazi* ‘they come and do the work’

In (2), the lack of tone shows the present tense, and the high tone on the second syllable shows that the verb is a relative clause, whereas the high tone on the first syllable of the verb stem shows that the verb is a temporal or conditional clause. In (3), the verb loses its high tone because it is followed by a complement.

Tone Rules

Tone rules in Kinyarwanda were thought to be complicated. However, when looked at very closely, they are very simple. There is only one lexical high tone per morpheme. Some morphemes are toneless. Noun tone patterns differ from verb tone rules. Any noun can have a lexical high tone on any syllable of the stem, except the augment and the prefix. A verb, however, even when it is polysyllabic and has multiple suffixes, can have a high tone only on the first mora of the first syllable or the first of the second syllable of the stem. Other syllables are extraprosodic. When high tones are found there, they are stray tones, since they do not participate in tone rules such as the Meeussen rule, Beat Movement, Iambic Reversal, etc. The first syllable verb high tone assignment is lexical, whereas the second syllable high tone assignment is grammatical. The prosodic domain of tone rules application of both nouns and verbs is the left-most phonological tone and the first mora of the stem first syllable. Tone rules apply from right to left, whereas in the majority of languages whose tone rules have been studied, they apply from left to right.

Nouns can obtain a secondary and a tertiary tone. A secondary high tone is assigned on the first mora of the noun stem if the lexical high tone is at least two or more mora away from the first noun mora.

isáandukú ‘box’ ← /i-saandukú/, *inkókorá*
‘elbow’ ← /i-n-kokorá/
aug-box aug-CL9-elbow

abasásamígozí ‘murderers’
/a-ba-sas-a+i-mi-gozí/
aug-sub.pr.-make bed-asp+aug-CL4-rope

inshóberamáhaánga ‘idiomatic expressions’
/i-n-shober-a+a-ma-haánga/
aug-CL9-disorient-asp+aug-CL6-foreign countries

A noun can thus have only a maximum of three phonetic high tones.

What makes verb tones seem complex is the assignment of the tense–aspect–modality morphemes. Some tenses or moods erase lexical tones, thus making the whole finite verb toneless, or assign tones to toneless verb stems, making both toneless verb stems and high-toned verb stems look the same. As shown below, the verb stem *-kin-* ‘play’ and *-kór-* ‘work/do’ are neutralized, becoming toneless or both bearing a high tone in some tenses.

ntibagikora ‘they do not work anymore’ <>
ntibagikina ‘they do not play anymore’
baracyáakóra ‘they still work’ <> *baracyáakina*
‘they still play’
bakoré ‘they should work’ <> *bakiné* ‘they should play’.

The metrical domain for verb tone rules is the first mora of the first object pronoun and the first mora of the verb stem for lexical tones and the first mora of the first object pronoun and the first mora of the second syllable of the verb stem. Kinyarwanda is one of the Bantu languages that can have multiple object pronouns.

baranáhabíbamákoreeshereza ← /ba-ra-na-ha-bi-ba-mu-kór-iish-ir-ir-y-a/
they-t-also-there-it-him/her-them-do-appl-caus-appl-appl-caus-asp
‘they also make them do it for him/her there’.

Phonology

Phonological Rules Affecting Vowels

Phonological rules affecting vowels are vowel deletion, vowel coalescence, gliding, vowel harmony, vowel shortening, and vowel lengthening.

When a word or morpheme that ends with a vowel is followed by another one that also starts with a vowel, the final vowel of the word or morpheme on the left is always deleted.

Vowel coalescence takes place within a word if there is a sequence of two morphemes ending with the central low vowel ‘a’ and starting with the high vowels ‘i’ and ‘u’, respectively: ‘a + i’ becomes ‘e’ and ‘a + u’ becomes ‘o’, e.g., *aményo* /a-ma-iinyo/ ‘teeth’.

Gliding takes place within words or clitics if in a sequence of two vowels the first one is a high vowel ('i', 'u') or a round vowel ('u', 'o'), thus becoming 'y' for the front high vowel and 'w' for round vowels, e.g., *harimó amáazi* > *harim^wáamáazi* 'there is water in it'; *i-ki-úuma* > *ik^yúuma* 'knife'; *lu-bu-oónko* > *ub^woónko* 'brain'. Vowel harmony affects vowels in the suffix position. If the suffix vowel is high ('i', 'u') it becomes mid ('e', 'o', respectively), if the word stem vowel is a mid vowel, e.g., *gukóra* /ku-kór-a/ 'to work' > *gukóreeshá* /ku-kór-iish-a/ 'to cause to work/employ/use', *kumenya* /ku-meny-a/ 'to know' > *kumenyeeshá* /ku-meny-iish-a/ 'to let know/inform'. Vowels in Kinyarwanda are always short in the beginning and final positions of words. They always lengthen before prenasalized consonants and after palatalized and labio-velarized consonants (Kimenyi, 1979, 2002).

Phonological Rules Affecting Consonants

Phonological rules affecting consonants are assimilation, dissimilation, known as Dahl's Law, fricative spread, deletion, and insertion. As in other Bantu languages, reduplication is also very productive in Kinyarwanda.

Consecutive consonants acquire the same voice, manner, and place of articulation phonetic features. Nasals take the place of articulation (labial, velar, palatal, velar) of the consonant on the right. Consonants obtained through the palatalization or velarization process also agree in voice, nasality, and place of articulation with the governor consonant.

gukúbita 'to hit' > *gukúbitkwa* 'to be hit' /ku-kubit-w-a/

kudóda 'to sew' > *kudódgwa* 'to be sewed' /ku-dód-w-a/

kubóna 'to see' > *kubónmwa* 'to be seen' /ku-bón-w-a/.

If a word has a palatalized fricative in one of the syllables on the right, fricatives in preceding syllables become palatalized as well.

gusoonza /ku-soonz-a/ 'to be hungry' >
gushoonjeesha /ku-soonz-iish-a/ 'to cause hunger'

basuuzugura /ba-suuzugur-a/ 'they despise' >
bashuujuguje /ba-suuzugur-ye/ 'they just caused to despise'.

This phenomenon argues for the autosegmental treatment of phonological rules because as the provided examples show, these fricatives do not have to be in adjacent syllables.

Reduplication is both lexical and grammatical. Lexical reduplication consists of stems that are already reduplicated. Grammatical reduplication affects the

stem. In verbs, it is very productive with verbs of movement or sound to show repetition, iterativity, or intensity.

Reduplication is achieved by either repeating the first syllable or the whole stem.

gutuumba 'to swell' → *gututuumba* 'to start swelling'

kugeenda 'to go/walk' → *kugeendageenda* 'to walk around'

ukwéezi 'moon/month' → *icyézezezi* 'moonlight'

ubusá 'nothing' → *ubusáabusá* 'very little quantity'.

Morphology

Noun Morphology

Kinyarwanda has 16 classes. Modifiers (adjectives, demonstratives, numerals, possessives) agree with the head noun by taking this class marker.

In some cases, however, the class marker has different phonetic forms depending on the grammatical category of the modifier, as illustrated in Table 1. The sentence in (2) in Table 1 shows how this type of noun class agreement works. The head noun *abagabo* (a-ba-gabo) 'men' with class 2 prefix-ba-has it copied to all modifying elements (adjectives, subject pronouns, object pronouns, etc.).

bá-no *ba-gabo* *ba-tatu* *ba-gufi*,
these men three short

mu-ra-bá-bon-a, *ba-mez-e* *néézá* *b-óose*.
you-pres-them-see-asp they-are-asp well all
'These three short men, you see them, they are all of them doing well'.

Table 1 Allomorphic variation of the nominal prefix according to its function

| | Noun | Adjective | Object pronoun | Demonstive | Possessive |
|-----|-------|-----------|----------------|------------|------------|
| 1. | u-mu- | mu- | -mu- | u- | u- |
| 2. | a-ba- | ba- | -ba- | ba- | ba- |
| 3. | u-mu- | mu- | -wu- | u- | u- |
| 4. | i-mi- | mi- | -yi- | i- | i- |
| 5. | i-ri- | ri- | -ri- | ri- | ri- |
| 6. | a-ma- | ma- | -ya- | a- | a- |
| 7. | i-ki- | ki- | -ki- | ki- | ki- |
| 8. | u-bi- | bi- | -bi- | bi- | bi- |
| 9. | i-n- | n- | -yi- | i- | i- |
| 10. | i-n- | n- | -zi- | zi- | zi- |
| 11. | u-ru- | ru- | -ru- | ru- | ru- |
| 12. | a-ka- | ka- | -ka- | ka- | ka- |
| 13. | u-tu- | tu- | -tu- | tu- | tu- |
| 14. | u-bu- | bu- | -bu- | bu- | bu- |
| 15. | u-ku- | ku- | -ku- | ku- | ku- |
| 16. | a-ha- | ha- | -ha- | ha- | ha- |

Note: The numbers 1–16 correspond to traditional conventional Bantu noun classification.

The Use of the Preprefix The preprefix or augment usually does not have any semantic function. Some Bantu languages such as Kiswahili do not have it. In Kinyarwanda, it is deleted, after demonstratives, in the vocative case and in onomastics (name creation). Within certain words, however, its absence marks definiteness and its presence indefiniteness.

mugaanga ‘the doctor’ > *umugaanga* ‘a doctor’
munywáanyi ‘the buddy’ > *umunywáanyi* ‘a buddy’
mugeenzi ‘the friend’ > *mugeenzi* ‘a friend’
mwaarimú ‘the teacher’ > *umwáarimú* ‘a teacher’

The absence of the preprefix bleeds tone rules and its absence feeds them. The secondary tone assignment on the first more of the noun stem takes place only if it has a preprefix.

Noun Derivation with the Prefix Kinyarwanda nouns have a small number of suffixes. The most productive one is *-kazi*, which is added to the stem to show feminine, e.g., *umunyarwaanda* ‘Rwandan’ <> *umunyarwaandakazi* ‘female Rwandan’, *umwáarimú* ‘teacher’ <> *umwáarimúkazi* ‘female teacher’.

Derivation is productive with the preprefix that creates new words that are either metaphorically or metonymically related to the original noun as shown by the stem-*ntu* in the following examples: *umuuntu* ‘person’, *ikiintu* ‘object’, *ukuuntu* ‘manner’, *ubuuntu* ‘generosity’, *ahaantu* ‘place’.

Verb Morphology

The simple Kinyarwanda verb form consists of the subject pronoun, the verb stem, and the aspect marker. The aspect marker is either *-a(ga)* (imperfective aspect) or *-ye* (the perfective aspect as seen below. The *-aga* suffix is used in past tenses only and is not used in Kirundi.

basoma (ba-som-a) ‘they read’;
basomaga /ba-a-som-aga/ ‘they were reading’;
basomye (ba-som-ye) ‘they just read’.

The complex form consists of the preprefix, the subject pronoun, the tense–aspect–modality (TAM) morphemes, the object markers, the reflexive pronoun *-i-*, the verb stem, the lexical verb extensions, the grammatical morphemes, the aspect marker and the postsuffixes *-mó*, *-hó*, or *-yó*.

The preprefixes are either the morpheme *nti-* or *ni-*, negative and temporal morphemes, respectively. The TAM morphemes show time, mood or aspect. Two TAM morphemes can occur in the same slot. Kinyarwanda can have multiple object pronouns, multiple lexical verbal extensions, and multiple grammatical suffixes. Lexical extensions such as *-agur-*, *-iir-*, *uur-*

-aang, *iriz-*, etc., add lexical information, such as inchoativity, iterativity, repetitivity, intensity, frequentativity, reversivity. Grammatical morphemes, such as the causative morpheme *-iish-*, the applicative morpheme *-ir-*, the comitative/reciprocal morpheme *-an-*, can be added to any verb stem. The following sentence serves as an example to illustrate a verb with multiple object pronouns and multiple grammatical suffixes:

Umugoré a-ra-na1-ha2-ki3-zi4-ba5-ku6-n7- som-eesh-eesh-er-er-eza
 woman she-pres-also1-there2-it3-it4-them5-you6-me7-read-caus-caus-appl-appl-asp
 ‘The woman is also making them use it to do it for me for me there’.

Lack of Adjectives Kinyarwanda has a handful of adjectives (less than 20). What is expressed by adjectives in other languages is rendered by either the possessive construction (X of Y) or the relative clause construction.

‘a poor person’: *umuuntu w’úmukené*
 person of poor
umuuntu ukénnye
 person who-is poor

Ideophones Ideophones are common not only in Bantu languages but also in the whole Niger–Congo language family. They are different from onomatopoeias, which imitate sounds of nature. They can express different concepts that do not have anything to do with sound by using sound symbolism, short or long vowels, reduplication, triplication, or quadruplication. They can also have different grammatical functions.

umuseké weerá de.
 dawn which-is clear (ideophone)
 ‘a very clear dawn’
icyáayi tsiritsiri
 tea ideophone
 ‘a very dark coffee’.

Unclassified Categories As was pointed out earlier, Kinyarwanda has a handful of adjectives. It is the same with function words as well, namely, auxiliaries, prepositions, conjunctions, and subordinators. These are expressed by noun phrases or verb phrases. In most cases, the structure tells whether the noun or verb is the noun or the verb or a function word.

muu nsi’ y’(á)am(é)ez(á)
 under earth of table
 ‘under the table’

baravúgana usíbye kó batabonána.
 they-talk-to-each-other you-are-absent that they-do
 not see each other
 ‘they talk to each other except that they do not see
 each other’.

Stems of nouns, verbs, and unclassified words can have different phonetic variations, as the word for diploma shows:

diploma: *dipóroómi, dipóromá, dipóromé, dipóromí, dipóromó, dipóromú, dipóroóma, dipóroóme, dipóroómu, dipóroómo, diipóroómu, diipóroómo, diipóroóme, diipóroómi, diipóroóma.*

It is still an unsolved question for Kinyarwanda lexicographers to decide which form should be considered the main form or whether all forms should entered in the dictionary as independent lexical entries.

Syntax

Kinyarwanda, like other Bantu languages, is a SVO language. Modifiers follow head nouns. What is interesting about this language, as pointed out in Kimenyi (1980, 2002), is the existence of (a) the subject–object reversal, (b) the wh-question *in situ*, (c) the lack of relative pronouns, (d) serialization, and (e) the existence of multiple direct objects.

Object–Subject Reversal and Existential Construction

The object–subject reversal consists of interchanging the object and the subject positions, whereas the existential construction puts both the subject and the object after the verb, prefixing the verb with the locative morpheme *ha-*(CL16). Neither construction changes the meaning, except that focus is on the object.

Umwáana a-ra-som-a igitabo.
 ‘The child is reading the book’.
 child s/he-t-read-asp book
Igitabo ki-ra-som-a umwáana.
 ‘The book is reading the child’.
 book CL7-t-read-asp child
Ha-ra-som-a igitabo umwáana.
 ‘It is the child who is reading the book’.
 CL16-t-read-asp book child

The object–subject reversal and the existential constructions have the same function as the passive, which is shown by the suffix *-w-* added to the verb just before the aspect marker.

Igitabo ki-ra-som-w-a n’úumwáana.
 ‘The book is being read by the child.’
 book CL7-t-read-pass-asp by child

Wh-Question *In Situ*

In Kinyarwanda and many other Bantu languages, wh-questioning is only allowed *in situ*.

W-iit-w-a nde?
 you-call-pass-asp who
 ‘you are called who?’ > ‘What is your name?’

Ba-tuu-ye be?
 they-live-asp where
 ‘Where do they live?’

Lack of Relative Pronouns

Kinyarwanda does not have relative pronouns. Relative constructions are marked by a high tone on the verb stem instead.

Abáana ba-som-á ibitabo.
 children they-read-asp/rel books
 ‘The children who read books’.
Ibitabo abáana ba-som-á.
 books children they-read-asp/rel
 ‘The books that the children read’.

Serial Verb Construction

When multiple verbs precede the sentence main verb, they lose their semantic function and serve as auxiliaries or tense–aspect–modality bearers. This is illustrated by the following sentences:

| | | |
|--------------------------------------|-------------------|---------------------|
| <i>Ba-a-ri</i> | <i>bá-tuu-ye</i> | <i>bá-saanz-w-e</i> |
| they-t-be | they-dwell-asp | they-join-pass-asp |
| aux ¹ | aux ² | aux ³ |
| <i>bá-jy-a</i> | <i>bá-kuund-a</i> | <i>gu-pf-a</i> |
| they-go-asp | they-like-asp | to-die |
| aux ⁴ | aux ⁵ | aux ⁶ |
| <i>ku-dú hamagar-a.</i> | | |
| to-us-call-asp | | |
| V | | |
| ‘They usually at least called us’. | | |
| <i>Mu-siga-ye</i> | <i>mú-geend-a</i> | <i>mú-beerako</i> |
| you-stay-asp | you-walk-asp | you-start |
| aux ¹ | aux ² | aux ³ |
| <i>mú-du-subiz-a.</i> | | |
| from you-us-answer-asp | | |
| V | | |
| ‘Now you respond to us immediately’. | | |

Multiple Direct Objects

Kinyarwanda, like many other Bantu languages, can have multiple direct objects. These objects are either inherent or structural.

Recipients or benefactives are introduced directly to the verb without any preposition with some interactive verbs (giving, showing, etc.).

Umugabo a-haa-ye abáana ibiryó
man he-give-asp children food
'The man has just given food to the children'.

Umwáarimú a-r-éerek-a abanyéeshuúri amashusho.
teacher he-t-show-asp students pictures
'The teacher is showing pictures to the students'.

Inalienable possessions can appear as direct objects without any verb extension marker.

Umugoré a-ra-kúbit-a umwáana ukuguru n'inkoni.
woman sub.pr.-t-hit-asp child leg with stick
Umugoré a-ra-kúbit-a umwáana inkoni ku kuguru.
woman sub.pr.-t-hit-asp child stick on leg
'The woman hitting the child on the leg with a stick'.

As shown by these examples, the inalienable possession 'ukuguru' and the instrumental 'inkoni' can appear as either adjuncts or direct objects without any verbal extension.

Structural direct objects are obtained by deleting prepositions of adjunct objects and by adding suffixes such as -iish-, -ir-, or -an- to the verb stem.

Umugabo a-ra-andik-a ibáruwá n'úkáramú
man sub.pr.-t-write-asp letter with pen
Umugabo a-ra-andik-iish-a ikáramú ibáruwá
man sub.pr.-t-write-caus-asp pen letter
'The man is writing a letter with a pen'.

Conclusion

Kinyarwanda is a prototypical Bantu language. It has all the features that characterize this language group. Its main contributions in syntax have been about the nature and function of grammatical relations (Kimenyi, 1980) and in tonology, its contributions have been about the nature of tone, tone representations, and tone rule application (Kimenyi, 2002).

Location and Speakers

Kirghiz (*qıryız tili*, *qıryızça*) belongs to the North-western or Kipchak branch of the Turkic language family, more specifically, to its Southern or Aralo-Caspian group. Until the early 20th century, it was called Kara-Kirghiz, whereas Kazakh was referred to as Kirghiz or Kazak-Kirghiz. Kirghiz is spoken in the Kyrgyz Republic (**Qıryız Respublikası**) or Kyrgyzstan (**Qıryızstan**) and in parts of Uzbekistan, Tajikistan, China (Xinjiang), the Russian Federation, Kazakhstan, etc. Its main area is the mountainous part of Western Turkistan, the plateaus of the western Tien-shan south of Kazakhstan, and the Alay mountain south of Ferghana. The number of speakers amounts to about 3 million, in Kyrgyzstan over 2.5 million.

In spite of the existence of a modern Kirghiz standard language, Russian has remained the dominant

language of higher education, administration, and so forth in the Republic. Since Kirghiz was proclaimed the official language of Kyrgyzstan in 1989, it has consolidated its position, acquiring more social functions. In 1996, Russian was made an official language, along with Kirghiz, in territories and workplaces in which Russian-speaking citizens predominate.

Origin and History

It is still unclear to what extent the Kirghiz of today are successors of the Old Kirghiz, the first Turkic people mentioned in Chinese sources and described there as blond and blue-eyed. This group settled on Upper Yenisey. Runiform inscriptions found on the territory of today's Tuva indicate that the first Kirghiz state was, at the beginning of the 8th century A.D., located north of the Sayan mountains. In 840 the Kirghiz ended the old steppe Uyghur empire and established their own empire, which lasted until 920. Most old Turkic groups left this region at the turn of the millennium. A few groups remained in Siberia, (e.g., the ancestors of the Kirghiz and the Altay Turks).

Some Kirghiz tribes may already have moved to the Tienshan region by the 10th century. Other tribes followed, particularly during the Mongol attacks. The Mongol expansion in the 13th century forced old Kirghiz groups to migrate to Western Turkistan and the Tienshan region.

In the following centuries, the tribes referred to as Kirghiz were gradually pushed back by Oirats and Dzungars. In the 16th century, the Kirghiz acted as an important ally of the Kazakh. In the second half of the 17th century, the Yenisey Kirghiz were forced to accept the sovereignty of the Kalmyk. At the beginning of the 18th century, the majority of the Kirghiz migrated to Tienshan. After the breakdown of the Dzungar Empire in 1758, the Kirghiz definitively settled in their present territory. In the 18th and 19th centuries, they were subjects of the Uzbek Khanate of Kokand. They came under Russian supremacy in 1867, and their territory was incorporated into the Russian Empire in 1880. Under the Russian and Soviet rule, numerous Kirghiz emigrated to China. In 1991, the Kirghiz Republic was proclaimed an independent state.

Related Languages and Language Contacts

Kirghiz is closely related to Southern Altay Turkic of South Siberia. Its modern form is also very close to Kazakh as a result of long-standing intensive contacts. Old Kirghiz, as attested to in inscriptions, was similar to Orkhon Turkic and Old Uyghur (see *Turkic Languages*). The language was later influenced by Mongolic and especially by Kipchak Turkic. In the 18th and 19th centuries, it was subject to some impact from the Iranicized dialects of the Uzbek area. The contacts with Russian began at the end of the 19th century. After the Kirghiz territory was conquered by the Russian empire in the second half of the 19th century, the Russian influence became predominant.

The Written Language

In the Soviet period, a Kirghiz standard language was developed on the basis of the northern dialects. Before the revolution Kirghiz had already found some limited use as a written language. A modified version of the Arabic script was introduced in 1924 but was given up in 1928 in favor of the unified Roman-based alphabet. A modified Cyrillic-based script was introduced in 1940. In the post-Soviet era, a new Roman-based alphabet was created, but it has not yet replaced the Cyrillic-based script. The Arabic script is used for the variety written in China.

Distinctive Features

Kirghiz exhibits most linguistic features typical of the Turkic family (see *Turkic Languages*). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation; for example, **A** = **a/e**, and **I** = **ï/i**. Hyphens are used here to indicate morpheme boundaries.

Phonological Features

Kirghiz has a rather regular vowel system, lacking the reduced vowels of Kazakh. The different orthographic vowel representations very often conceal the phonetic similarities between Kirghiz and Kazakh.

Kirghiz exhibits the typical Kipchak labialization of **g/ɣ**, but does not, as Kazakh, replace them by the glide **w**. As in Altay Turkic, the preceding vowel is deleted and lengthened, as in **to:-lu:** [mountain-DER] ‘mountainous’ (< **ta:ɣ-lʷɣ**), cf. Altay Turkic **tu:-lu:** [mountain-DER], Kazakh **taw-lī** [mountain-DER]. Kirghiz differs from Kazakh by absence of the sound changes **č > š** and **š > s**. Modern Kirghiz displays initial **ǰ**- instead of older **y**- (e.g., **ǰol** ‘way’; cf. Turkish **yol**). This change occurred under the influence of Kazakh, which, however, later changed **ǰ** to **ž**. Kirghiz does not display the uvular **x** or the glottal **h** but replaces them by **q** or zero in loanwords (e.g., **qabar** ‘message’ [< **xaber**], **ar** ‘each’ [< **har**]). Kirghiz has, like some Siberian Turkic languages, a well-developed sound harmony. Suffixes exhibit both front vs. back harmony and rounded vs. unrounded harmony. The choice of suffix vowels is determined by features of the preceding syllable (e.g., **köl-dör-dön** [lake-PL-ABL] ‘from the lakes,’ **üy-lör-übüz-dö** [house-PL-POSS.1.PL-LOC] ‘in our houses’). The rounded vs. unrounded harmony also affects low suffix vowels, which are rounded to **o** and **ö** after **o**, **ö**, **ü** in the preceding syllable. However, **u** in the preceding syllable is not followed by **o** (e.g., **qum-da** [sand-LOC] ‘in the sand’). Rounding of low suffix vowels is also observed in Altay Turkic, Turkmen, Bashkir, and to some extent, in Kazakh, and Noghay.

Morphophonemic alternations are found in suffixes with initial **l** and **n**, which are assimilated to **d** after voiced consonants (with some exceptions after **r** and **y**), and to **t** after voiceless consonants (e.g., **atanın** [father-GEN] ‘of the father,’ **qar-dın** [snow-GEN] ‘of the snow,’ **at-tın** [horse-GEN] ‘of the horse,’ **almlar** [apple-PL] ‘apples,’ **kün-dör** [day-PL] ‘days,’ **at-tar** [horse-PL] ‘horses’).

Arabic and Persian loanwords have generally been adapted more strongly to the native phonological

system than their counterparts in neighboring Turkic languages (e.g., *apta* ‘week’ [< *hafta*], *ubaqtı* ‘time’ [< *waqt*]).

Grammar

The Kirghiz genitive suffix **-nIn** ends in **-n**, as in languages of the Southwestern (Oghuz) branch, not in **-ŋ** as in the neighboring languages.

The suffix **-rA:K** (after consonant-final stems **-IrA:K**) is added to adjectives to express comparative degree. The superlative is expressed by means of the preposed element **eŋ** (e.g., **eŋ jaqşı** [SUPERL good] ‘best’). The normal second-person plural form of the personal pronoun is **si-ler** [you-PL] ‘you.’ **Siz** is the polite form used for one addressee, and **siz-der** [you-PL] is the polite form for more than one addressee. The corresponding copula suffixes are **-slŋAr**, **-slz** and **-slz-dAr**. Most demonstrative pronouns exhibit an optional **-l** in the nominative; for example, **bu(l)** ‘this.’ Different degrees of closeness are marked with **bu(l)** (close referents known to the speaker), **ošo(l)** and **uşul** (more remote referents), and **tigi(l)** and **tetigil(l)** (remote referents outside the conversational setting).

Pronouns also include the reflexive **öz** and the interrogatives **emne** ‘what,’ **kim** ‘who,’ **qaysı** ‘which,’ and so on. A collective suffix **-O:** (with drop of stem-final vowels) is used with the numerals from 1 to 7 (e.g., **ek-ö:** [two-COLL] ‘two together’). Distributives are formed with the ablative (e.g., **otuz-dan** [thirty-ABL] ‘thirty each’). Approximative and multiplicative numbers can be expressed with **-dAy**, **-čA** and **-LA-GAn** (e.g., **otuz-day** [thirty-APPR], **otuz-ča** [thirty-APPR] ‘about thirty,’ **jüz-dö-gön** [hundred-MULT] ‘hundreds’).

As in most other Turkic languages, the third-person possessive suffix exhibits the so-called ‘pronominal **n**’ (e.g., dative **-n-A**, locative **-n-dA**). The past copula particle is **ele** ‘was,’ instead of **edi** ~ **idi** in other Turkic languages.

The cooperative-reciprocal form in **-(I)ş** is also used to indicate the third-person plural of finite verbs (e.g., **jaz-iş-at** [write-PL-PAST.3] ‘they write’ [singular **jaz-at**]), **kel-iş-ti** [come-PL-PAST.3] ‘they came’ [singular **kel-di** [come-PAST.3.SG]]. A general present tense is formed with **-A** + personal markers (e.g., **bar-a-t** [go-PRES-3.SG] ‘goes’). A more focal present tense (with a narrower focus on the ongoing event) is formed with **-convert** + present forms of **jat-** ‘to lie’ (and three other auxiliary verbs) + personal markers (e.g., **bar-a jat-a-t** [go-CONV AUX-PRES-3.SG] ‘is going’). The suffix **-Dlr** adds a presumptive meaning (e.g., **oyyon-yon-dur** [wake up-POSTTERMINAL-PRES.3.SG] ‘has presumably waken up’). An evidential past is formed with **-(I)p-tlr**. A habitual or

durative past is formed with **-čl** + personal markers (e.g., **kel-čü-büz** [come-HABIT.PAST-1.PL] ‘we used to come’). Intention is expressed by **-MAK-čI** (e.g., **kel-mek-či-min** [come-INTENT-1.SG] ‘I want to come’). The system of conjunctions is weakly developed, as Kirghiz has not been under strong Iranian influence.

Lexicon

The basis of the Kirghiz vocabulary consists of Kipchak Turkic elements. Similar to the languages of other nomadic groups, Kirghiz has borrowed numerous Mongolic words as a result of close contacts, especially in the Middle Ages (e.g., **dülöy**, ‘deaf’; **belen**, ‘ready’; **qara-**, ‘to look’). Arabic and Persian words, copied via Chaghatay and Uzbek particularly into the southern dialects, constitute a sizable part of the vocabulary, covering various domains of Islamic culture (e.g., **künö**, ‘sin’; **şar:**, ‘city’; **baqča**, ‘garden’; **pikir**, ‘thought’). The northern dialects, on which the literary language is based, are less influenced by the Islamic vocabulary.

Russian loanwords, which constitute the most recent layer in the lexicon, were introduced from the end of the 19th century on. The use of Russian words is rather dominant in informal spoken standard Kirghiz. Efforts have been made in the last decades to reduce the amount of Russian terms by creating neologisms on the basis of Turkic and Arabic–Persian lexical material or on Russian models. Neologistic suffixes include **-čIl** (e.g., **ulut-čul** [nation-DER] ‘nationalist’; from **ulut**, ‘nation’), **-Glč** (e.g., **uč-quč** [fly-DER] ‘pilot’ [from **uč-** ‘to fly’]).

The variety of Kirghiz spoken in Xinjiang exhibits numerous Chinese loanwords. The written language, however, is largely oriented toward the norm used in Kirghizstan.

Dialects

The Kirghiz dialects can be divided into a southern and a northern group, the latter forming the base of the standard language. Northern dialects tend toward intervocalic voicing of **s** (e.g., **bala-zı** [child-POSS.3.SG] ‘his/her child’ instead of **bala-sı** [child-POSS.3.SG]), a feature typical of the South Siberian Turkic languages. The southern dialects, mainly those spoken in the Ferghana basin, show different degrees of Uzbek influence. They lack some characteristic features that separate Kirghiz from other Turkic languages. For example, the glide **w** is preserved in cases in which the standard language only exhibits a long vowel as a trace of a velar that once underwent labialization (e.g., **tow** ‘mountain’

instead of *to*.) The past copula particle *ede* ‘was’ is used instead of *ele*. The plural suffix is used in third-person plural forms of finite verb (e.g., *kel-di-ler* [come-PAST-PL.3] ‘they came’), instead of *kel-iš-ti* [come-PL-PAST.3]. The ‘pronominal *n*’ has been lost under Southeastern Turkic influence. There are also other changes in the nominal inflection. Words copied from Arabic and Persian via Chaghatay and Uzbek have preserved their original phonetic shape to a higher degree than in the northern dialects.

Kordofanian Languages

T C Schadeberg

© 2006 Elsevier Ltd. All rights reserved.

Kordofanian is the name of an African language family. It derives its name from that of a former Islamic state with El Obeid as its center.

All 20-odd Kordofanian languages are spoken in the Nuba Mountains in the Republic of the Sudan. The total number of speakers is estimated at around 200 000. Available information about Kordofanian languages is sketchy; no Kordofanian language has been well documented and analyzed. The unity of the Kordofanian language family was first postulated by J. H. Greenberg in 1950; later (in 1963), he classified Kordofanian as a primary branch of his Niger–Congo family.

There are four branches of Kordofanian, named after centrally located towns (names of individual languages are given in parentheses): Heiban (Moro, Tiro, Shirumba, Utoro, Ebang, Laru, Logol, Rere, Warnang, Ko), Talodi (Ngile, Dengebu, Tocho, Jomang, Nding, Tegen), Rashad (Tagoy and Tegali dialect clusters), and Katla (Kalak, Lomorik). Data from wordlists and short grammatical descriptions make it clear that at least the first three branches of Kordofanian have a noun class system (marked by prefixes), which may be taken as evidence for genetic relationship (i.e., common origin) with the large

Niger–Congo language family. Lexical evidence for this relationship remained very limited in the early 1990s.

The nine languages of the Kadugli group (Yega, Mudo, Talla, Miri, Tolubi, Kufo, Sangali, Krongo, Talassa) are spoken by about 100 000 people living on the hills lining the southern edge of the Nuba Mountains. One of these languages has been described in a monograph (Reh, 1985). Greenberg originally classified the Kadugli languages as being part of Kordofanian, but this view has since been challenged. The Kadugli languages have systems of nominal classification that distinguish three or four genders, but any existing typological or substantial similarities with Niger–Congo are not sufficient to claim genetic relationship. It seems most likely that Kadugli belongs to the Nilo–Saharan language family – just as do all the other languages that surround Kordofanian.

Phonology

Basic Structures

The Korean language is a nontonal, polysyllabic, agglutinative language belonging to the Altaic family and probably closely related to the Manchu and Tungus members of that language family. The only major modern language to which Korean would appear to be related is Japanese, but the two languages, although similar in most respects grammatically, are significantly different phonologically. Korean and Japanese are therefore linguistic isolates due to the lack of sources to demonstrate the precise linguistic connections between them and with other members of the Altaic family.

Unlike Chinese, Korean lacks true tonal sounds, although it does have vowel stress. The morphological structures of Korean are extremely complex. Korean vocabulary items are built up of multiple morphemes into a highly polysyllabic composition. Like all members of the Altaic family of languages, Korean uses certain morphemes as functional markers to indicate the role of a word within the sentence, as well as mood, tense, location, and the social relationship between the speaker, listener, and the person spoken about.

Triple Consonantal Structure

The consonants of the Korean language are unusual for the triple distinction that is made between soft consonants (lenis consonants), hard, unaspirated consonants, and hard, aspirated consonants. The consonants of the lenis series are *k*, *n*, *t*, *l*, *m*, *p*, *s*, and *ch*. The hard, unaspirated consonants are *kk*, *tt*, *pp*, *ss*, and *tch*. The hard, aspirated consonants are *k'*, *t'*, *p'*, *ch'*, and *h*. (These transcriptions follow the orthographic conventions of the McCune-Reischauer System of Romanization, the standard system of scholarly transcription.) The sound of *l* becomes a strongly flapped *r* when placed in an intervowel context. Usually consonants of any of the three series of consonants are pronounced as voiceless, with the exception that the soft consonants *k*, *t*, *p*, and *ch* are pronounced *g*, *d*, *b*, and *j* when they occur between voiced sounds.

Consonantal Position

A principal phonological feature of Korean is the extreme restriction of consonant position within a given morpheme. Certain sound sequences within a morpheme are not permitted, such as *s* combined with *k*, although the reverse may occur when *k* is final in the preceding morpheme and *s* begins the succeeding morpheme. Certain consonants when in the final position in the morpheme become a strongly dentalized sound. Thus, *t*, *tt* fortis, unaspirated *t*, *t'* (fortis, aspirated *t*), *s*, *ch*, and *ch'* (fortis aspirated *ch*) all are pronounced as if they were *t* when they occur in the final position.

Intermorphemic Sound Change

Sound change between syllables is an important feature of the pronunciation of Korean morphemes. This feature, also true of Japanese, is made more difficult for the reader of Korean because it is an orthographic convention that the shape of the individual syllable (morpheme) should be preserved. Although the Korean alphabet itself is highly phonetic, the orthographic convention to preserve the written appearance of the syllable means that the reader must learn a large number of standardized sound changes that occur in the intersyllable position.

Intermorphemic Sound Movement

Sound movement between syllables also occurs. When a syllable that ends in a consonant is followed by a syllable beginning with a vowel, the final consonantal sound passes over to the next syllable. This passage of sound is not represented orthographically.

Nonclustering of Initial Consonants

Clusters of consonants at the beginning of a syllable are not characteristic, there being no equivalents of English *sk*, *st*, *str*, *sh*, and so on.

Triple Vowel System

The vowel system of Korean is as complex as the system of consonants. There are three ranges of vowels: standard vowels (monophthongs), vowel sounds beginning with *y* (rising diphthongs), and a wide range of full diphthongs and diphthongs beginning with the sound *w*. The basic vowels of the monophthong series are pronounced similarly to the vowels of the Romance languages. The monophthongs are *a*, *ǒ*, *o*, *u*, and *ũ*. The *y* series of

rising diphthongs are *ya*, *yŏ*, *yo*, *yu*. The principal diphthongs number 11, although other combinations are possible. Vowels are characterized by phonemic length, which refers to an alteration in tonal height. There is evidence of an earlier stage of vowel harmony that exists as a residual characteristic in certain linguistic contexts.

Grammar and Syntax

General Features

Korean is an agglutinative language with strong elements of fusion and analytical development. The morphological development of word derivation is a well-developed feature of the grammar of the language. Nouns possess a wealth of case forms, possess the grammatical category of specification, and do not possess grammatical gender. There are forms of demonstrative pronouns that indicate varying degrees of spatial relationship.

Number

There are two types of numeral systems: the indigenous Korean system, and the Sino-Korean system that was borrowed as an entire loanword system. Along with the numeral system, there is a system of classifiers that are bound morphemes used as counting words to refer to objects, animals, or people.

Syntactical Markers

The predicatives, verbs, and adjectives of Korean do not have person, number, or gender. They do possess markers indicating social status, tense, and a sentence conclusion. There are three major bands of social status or reference that can be indicated with the special markers, each band containing within it possibilities for further refinements to indicate the precise degree of social relationship existing between the speaker, the listener, or the person spoken about. Tense markers indicate three broad classes of time: the present, the past, and the future (more properly, supposition about the occurrence of an event). Sentence conclusion markers indicate a wide range of moods and meaning, including simple declaration, interrogation, request, demand, suggestion, and reflection. In addition, there are quotative constructions that may be added to the verb to indicate the quotation of a declaration, interrogation, demand, or request. The structure of the verb is verb stem + honorific infix + tense infix + sentence conclusion marker (vs + hi + ti + scm). There is a separate lexical form of

the verb that is used to place the verb in alphabetical order in dictionaries, lexicons, and word lists.

Word Order and Word Relation

Word order in sentences for both independent and dependent clauses is always in the sequence of subject, object, predicate. Modifiers, whether of the adjectival or adverbial type, are always in the preposition modifying the word to which they refer. Syntactic relations between words may be expressed by postpositional markers, particles, syntactic nouns, adverbial particles, participles, and the infinitive form of predicatives. Thus, a sentence may consist of a series of clauses, such as an extended adjectival clause modifying a noun, which contains its own subject, object, and predicative with tense and honorific markers attached.

Speech Levels and Honorifics

As a key characteristic of the use of the Korean language is an appropriate use of the system of honorifics that show deference, a sentence must take into consideration three dimensions of speech relationship: (a) the nature of the relationship between the speaker and the listener, (b) the nature of the relationship between the speaker and the person spoken about, and (c) the appropriate way to speak of or about oneself. Any complete sentence will take into account at least one of these dimensions in addition to considerations of tense and mood.

Pronouns, especially for the second person, are very seldom used, the subject of the sentence being understood from the linguistic context.

Sentence Linkage

In sentences containing two independent clauses, the two clauses are linked together through a connection marker attached to the predicative of the first clause. The predicate of the final independent clause will contain markers for honorifics, tense, mood, and sentence conclusion. Where the initial clause is dependent, the connection marker attached to the predicative will indicate the precise relationship of the dependent clause to the independent and principal clause.

Vocabulary

Lexicon

Korean vocabulary is of three types: indigenous Korean vocabulary, Sinitic vocabulary, and loanwords

from European languages. Indigenous Korean vocabulary is highly polysyllabic in structure, a feature that is put to good use in sound imitation. Of the world's languages, Korean is one of the most highly onomatopoeic languages. Sinitic vocabulary consists of three subtypes: (a) uniquely Korean terms created by using Chinese characters, (b) direct loanwords from Chinese, and (c) Sino-Japanese loanwords. Sinitic vocabulary consists of terms that are in both ordinary and learned usage, and constitutes more than half of the entire Korean lexicon. European languages, particularly English, have contributed a number of words, both to the speech of the ordinary person and to the technical speech of professional persons. French, German, Spanish, and Portuguese have also made small contributions to the vocabulary of Korean. There are, or were, a small number of pure Japanese loanwords, but most of these have fallen into disuse through a movement for the purification of the language.

Word Creation

It is still common to use Chinese characters to create new items of technical vocabulary, for example, *nokhwa-gi*, for 'videotape recorder.' Most Sinitic items of vocabulary enter the language as nouns. By attaching the verb *hada* 'to do' in the postposition of the noun, loanwords of this type may be transformed into verbs. By using one of several constructions, such verbs may then be made into adjective or adverbial constructions. By adding *ki* (carrying a sense of continuous action) or *um/m* (carrying an abstract sense) to a verb stem, a verb may be nominalized. Dictionary definitions are often given using *um/m* attached to the final verb.

Parallel Vocabulary Sets

Throughout the vocabulary of Korean, there exists a parallel set of Korean and Sino-Korean vocabulary. Mention was made earlier of the existence of two systems of counting. This feature carries throughout the entire Korean lexicon. Often, but not exclusively, Sino-Korean words are used to name objects or subjects of discourse, while Korean words have a descriptive function. On some occasions, there is no preference in the use of one or the other type of vocabulary; in other instances, it is a matter of honorific or nonhonorific usage. With regard to time, hours

are given in Korean numbers, while minutes are given in Sino-Korean numbers. Again, duration of time (i.e., 'it took 1 hour to go home') is given using Korean numerals.

Notwithstanding the enormous impact that Sinitic vocabulary has had on enriching the vocabulary of the Korean language, there has been virtually no influence on the grammar of Korean, possibly because Chinese and Korean derive from two radically different language families.

The Written Language

Modern Korean may be written in one of two forms, either by using only the Korean alphabet (known as *Han'gul* in the Republic of Korea) or a mixed script of *Han'gul* and Chinese characters. In North Korea, the Korean alphabet is used exclusively. In South Korea, usage varies from context to context. A personal letter may use only the indigenous alphabet, while newspapers, textbooks, and better-quality popular books will use a large number of Chinese characters in the text. The more sophisticated and formal a piece of writing is, the more Chinese characters will be used. The Ministry of Education requires a high school graduate to have mastered between 1700 and 1800 characters, the number of characters expected to be encountered in a daily newspaper.

Krio

P M K Thomas, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

The Sociohistorical Development of Krio

Krio, one of the languages spoken in Sierra Leone in West Africa, is a creole language belonging to the Atlantic group of English creoles which are restructured languages with English as the superstrate language and varying degrees of structural influences of the Niger–Congo languages in Africa. It can be further subcategorized as West African on the basis of its areal distribution and immediate linguistic affiliations.

The Domestic and Jamaican hypotheses are two competing views that have been postulated for the origins of Krio. The Domestic Hypothesis, a corollary of monogenesis, is advocated by Hancock (1986) and other creolists. It is argued that Krio is an offshoot of an English variety of creole, which coexisted with and was influenced by a Portuguese-derived pidgin in West Africa. According to Whinnom (1965), this pidgin was related to Sabir, a Romance pidgin and Mediterranean lingua franca spoken between European and non-European sailors and traders from the Middle Ages to the early 20th century. A lesser known version of the Domestic Hypothesis is based on the view stated in E. D. Jones (1956), Berry (1959), and Peterson (1969) that contact between the local inhabitants and various groups of settlers after the founding of the 'Province of Freedom' in the peninsula of Sierra Leone in the 19th century gave rise to Krio.

Sociohistorical developments in the late 18th century and the first half of the 19th century and the attendant linguistic situation around the Sierra Leone peninsula contributed significantly to the establishment and spread of present day Krio. Henry Smeathman, a botanist, who had lived for 3 years on the Banana Island near the Sierra Leone River from 1771 to 1774, proposed the area as suitable for the establishment of an agricultural settlement populated by a free community of equal blacks and whites. Smeathman died before realizing his dream, but his idea was revived by Granville Sharp, one of the philanthropists behind the campaign to repatriate and rehabilitate emancipated African ex-slaves. Following the abolition of slavery in Britain in 1787, emancipated ex-slaves in London became destitute and created a social problem for the British government. Spitzer (1974: 9) describes their destitution and the acute need for repatriation and rehabilitation of these ex-slaves who became known as the Black Poor. A group of philanthropists campaigned vigorously for the identification, purchase, and establishment

of a settlement for the Black Poor. Sharp and a group of social reformers known as the The Clapham Sect pioneered the repatriation of 411 Black Poor and some English women to the peninsula of Sierra Leone in 1787.

When they arrived in Sierra Leone, Captain Thompson, who was the leader of the expedition, purchased a piece of land from King Tom, the Temne Chief. The piece of land became known as The Province of Freedom and Thompson called the first settlement Granville Town after Granville Sharp. Historians have attributed the collapse of the first settlement to problems ranging from the fact that the settlers were ill-equipped for the weather to hostilities between the settlers and the Temnes. This occasioned a dispersal of the first settlers so that by 1791 only 48 of the Black Poor remained in The Province of Freedom.

The formation of the Sierra Leone Company and the repatriation of 1131 Africans from Nova Scotia in March 1792 saw the revival of the settlement and the return of some of the first settlers. The Nova Scotians were ex-slaves from the American colonies who had gained their freedom by fighting on the side of the British during the American War of Independence. After the war, they were offered asylum in the British settlement in Nova Scotia. When Thomas Peters, one of the ex-slaves, complained of their ill treatment in Nova Scotia, the British government transported them free to Sierra Leone where, together with the surviving Black Poor, they began a colony they called Free Town. Lieutenant John Clarkson of the Royal Navy, who led the Nova Scotians, became the first Governor of Sierra Leone. Like Granville Town, Free Town (Freetown became the capital of Sierra Leone) also had its fair share of misfortunes. Forty of the Nova Scotians died in the first few weeks of their arrival in the colony. Furthermore, the French razed the settlement to the ground in September 1794, but the surviving settlers rebuilt it.

In 1800, 550 Maroons from Jamaica arrived in the settlement. The Maroons were descendants of slaves who were originally from the Gold Coast but had been taken to Jamaica in the West Indies. They had organized several rebellious campaigns against the British and were promised an amnesty if they surrendered. The British expelled them to Halifax in Nova Scotia but during the bitter winter of 1796–1797, they petitioned to be removed to another place and were taken to Sierra Leone. Instead of being resettled in the Banana Islands, south of the peninsula, they settled in the colony after assisting to foil an uprising in the province. The Maroon population is reported to have dwindled after a decade because

some of them died from diseases and others migrated to their original home in the Gold Coast, now known as Ghana.

When the slave trade was prohibited in 1808, Freetown became a Crown Colony. From then on it served as the springboard for British legal and naval operations aimed at combating the slave trade along the West Coast of Africa. Between 1808 and 1864, slave ships were intercepted on the high seas and the redeemed Africans, referred to as Liberated Africans or Recaptives, were released initially in Freetown, and later in other British ports. The Liberated Africans never landed in the New World and, according to Spitzer (1974: 10), “were of heterogeneous ethnic origin, speaking a Babel of African languages.” The last batches of settlers were from ethnic tribes in Sierra Leone and other West African countries including Ghana and Nigeria.

The languages spoken in Freetown, including a dialect of West African pidgin/creole, coexisted with English, which was the official language used in the administration of the settlement. Even if historians and creolists disagree on when an English pidgin was first used on the coast of West Africa, or on the ethnolinguistic and demographic composition of the settlement, it is argued here that all of the languages spoken in the settlement, approximately 150 according to Koelle (1854), played roles in the creolization process that produced Krio. The African languages included Temne, the language of the people who sold The Province of Freedom to the first settlers, Mende, Sherbro, Joloff, Bambara, and Kissi. The adstratal influence of settlers from Barbados on the development of Krio probably occurred later, between 1819 and 1896 when, as Berry (1959: 299) points out, convicts from Barbados and disbanded troops from the 2nd and 4th West Indian Regiments were among the early colonists in Sierra Leone from the Caribbean area.

Thus, two periods can be identified in the development of Krio: the pre-1787 period during which a variety of West African creole was spoken in the Sierra Leone estuary and the post-1787 period (between 1787 and the 1860s) during which what is Modern Krio became established out of linguistic input from West African creole, New World creoles, and West African languages. From 1787 onward, the Sierra Leonean variety of West African creole and nascent Krio later converged as a result of pressure from and prestige of the latter. The process, which involved different creole varieties and West African languages, aptly demonstrates the roles of leveling and reconstruction in the creolization model.

Krio spread from Freetown to the interior of Sierra Leone and other West African countries due to the

strategic role of Sierra Leone as the base from which Britain spread its colonial administration. The British employed educated Krio and sent them as administrators to other West African colonies in the 19th century. Varieties of Krio are spoken today in the Gambia, Cameroon, Guinea, Senegal, Ghana, Nigeria, and Fernando Po, which is now known as the Island of Bioko.

‘Creo’ and ‘Creole’ have been used as variant names for Krio but Fyle and Jones (1980) and Wyse (1980) argue that ‘Akiriyo,’ a Yoruba term which refers to the Krio habit of paying visits after religious services is the most plausible derivation of Krio. According to Hancock (1969: 19) in the past, ‘Creole’ was the generic term for the settlers and their descendants, from 1787 to the second half of the 19th century, and their language. At an orthographic conference held in Freetown in April 1984, participants recommended the adoption of Krio as the official designation of the language and name of the people. Krio is today one of the national languages of Sierra Leone. It is estimated that native speakers of Krio constitute 3% of the population of Sierra Leone and two-thirds of the rest of the population of the country use the language as a lingua franca. The native speakers inhabit mostly Freetown and the western area of the country.

Krio has not decreolized for a variety of reasons. It has been used by writers as a medium of poetry, drama, and short stories. There is a Krio–English dictionary, portions of the Bible including the New Testament have been translated into Krio and many plays performed in Sierra Leone today are written in Krio. Most importantly, Krio has enjoyed an enhanced social status as one of the official languages of Sierra Leone. It is regarded as a full-fledged Sierra Leonean language and not a corrupt bastardized version of English. Along with the other Sierra Leonean languages, it is used in television broadcasts, as well as most business and official public engagements.

Official recognition of the language also extends to education. In the past, an additive bilingual program of language shelter was widely practiced in primary schools throughout the country. Children in primary schools used to be taught to a large extent through the medium of their first language and English was slowly introduced. The program of immersion had the educational aim of enriching the experiences of the children. The indigenous languages and cultures were maintained and further developed as they interacted with English. Sierra Leone’s current education policy requires the extension of the use of Krio and the other indigenous languages to secondary education and there is ongoing work to standardize these languages and produce materials for use at this

level. This policy will contribute to the extension of the domains of use and the continued stability and spread of Krio as well as the other national languages.

In addition to the other reasons given above, Krio has not decreolized notwithstanding pressure from English, the lexifier language, because it carries no stigma and is an identity marker.

Some Grammatical Features of Krio

Krio uses separate morphemes to express grammatical categories. In general, the plural is marked by the particle *dem*, for example:

dem pen
PLURAL pen
 pens
 pen dem
pen PL(URAL)
 pens

Whereas English plural forms can be indicated by the suffixes *-s*, or *-es*, some Krio words appear to have suffixes attached without necessarily indicating plurality. Such words were acquired from English in their present forms and can be used with reference to both singular and plural objects, for example:

machis
 'match'
 sus/shuz
 'shoe'

The possessive is marked by the particle *in*, for example:

Patrik in buk
Patrick POSSESSIVE book
 'Patrick's book'

De or *di* is the progressive marker, for example:

Idit de rait.
Edith PROGRESSIVE write.
 'Edith is writing.'

In certain contexts, verbs without preverbal particles express the default past tense but the particle *bin* is the past tense marker, for example:

Banadet bin rait.
Bernadette PAST rait.
 'Bernadette wrote.'

Go is the future marker, for example:

Lamin go rait.
Lamin FUTURE rait.
 'Lamin will write.'

Dɔn is the perfective marker and it combines with *bin* to express the past perfect, for example:

Angela dɔn rait.
Angela PRESENT PERFECT write.
 'Angela has written.'
 Mamie bin dɔn rait.
Mamie PAST PERFECT write.
 'Mamie had written.'

Blan(t) 'used to' is a habitual aspect marker and the modal markers which can cooccur in a sequence as double or multiple modals are *mɔs* 'must,' *fɔ* 'should,' *go* 'intend to, must,' and *kin* 'can, could.' Consider the following examples:

I blant rait.
She HABITUAL ASPECT write.
 'She usually writes.'
 A bin fɔ mɔs dɔn rait.
I PAST + MODAL + MODAL + PERFECTIVE write.
 'I should (would) most certainly have written.'

Some particles are multifunctional and the different functions are determined by context. These particles include:

- *Na* can function as a locative 'in, at, to,' verbal particle 'is,' and adjectival 'that.'
- *ɔt*, a preposition 'out' also functions as verb for 'extinguish, put out.'
- *De* functions as a verb 'to be,' durative marker, and locative adverb 'there.'
- *Bin* functions as a past tense marker and aspect marker.
- *Fɔ* functions as a preposition, modal auxiliary, main verb, and complementizer or infinitive marker.
- *Go* functions as a verb and modal particle.
- *Blant* is not only a past habitual marker 'used to,' but also functions as a main verb 'belong to.'

Other grammatical features of Krio include:

- multiple negation, for example:

Nɔ tɔk tu am no moh.
NEGATOR talk to him NEGATOR more.
 'Do not talk to him any more (again).'

- Serial verbs in Krio have the following basic structure:

NP₁ Aux V₁ (NP₂) V₂ ...
 Agnes bin kuk res gi Josef.
Agnes (NP₁) bin (PAST AUXILIARY) cook (V₁) rice (NP₂) gi (V₂) Joseph.
 'Agnes cooked some rice which she gave to Joseph.'

- focus constructions involving *na* ‘it-is,’ for example:

Na Mari bin kɔ̃l.
It-is Mary PAST call.
 ‘Mary called.’

Some Lexical Features of Krio

Many Krio words are of African origin. The main Sierra Leonean sources of the lexical items include, Mende, Temne, Sherbro, Susu, Yalunka, Limba, Kru, Vai, Fullah, and Mandingo. The other major African sources include, Yoruba, Wolof, Twi, Hausa, and Ibo. Most of the African items have multiple origins and indicate the multiple connections of the language as shown below:

| Word | Sources | Meaning |
|-----------------------------|--|---|
| <i>banda</i> | Mende, Kongo, Swahili | a basket made of palmetto straw or of marsh grass and sewn with palmetto, or a thatched house |
| <i>bara</i> (bala, balanji) | Bambara, Susu, Mandingo | a xylophone |
| <i>bene</i> | Wolof, Bambara, Mende | benne, sesame |
| <i>fufu</i> | Twi, Ewe, Wolof, Fon, Mende, and Hausa | mush, wheat flour made into a thin batter and cooked to eat, eat up, food |
| <i>nyam/nyamnyam</i> | Wolof, Fullah, Mbundu, Mandingo, Tshiluba, Efik, and Twi | |

Other sources of the lexicon of Krio include European languages: mainly English, Portuguese, Spanish, and French. The largest number of words in the lexicon of this creole derives from English. Between 70% and 80% of the Krio lexicon is derived from English and a lot of the words reflect an archaic usage in English. Examples include:

berin ‘a funeral, a burial.’ Recorded in the OED as *bering(e)*, it is either obsolete or occurs in English dialects.

titi ‘girl’ and *krabit* ‘miserly, mean’ are Scottish representations

bre/ribr ‘nag’ comes from northern English dialect *kostament* ‘customer’ appears in the OED as an obsolete word *customancel/custumaunce* in use as far back as 1386, which means ‘customary practice; custom, habit, customary gathering, frequenting’

baksay ‘buttocks’ is a fossil of an earlier English compound *baksyde*, *backside* meaning ‘the hinder or back part, the back, the rear.’

Vulgar words highlight slang and vulgar usages but some of these words have lost their European connotations. Examples include:

pis ‘urine’
switpis ‘diabetes’
pisbag ‘bladder’
pishol ‘urethra’

Some of the Krio words represent semantic Africanisms, for instance:

bif ‘meat’
fut ‘leg, thigh’
met ‘co-wife’

Although some Krio words are different from their English etyma, they are related to their etyma via a semantic change through inference, for instance:

bisin ‘to care, be concerned about’ from ‘business’
drap ‘arrive unexpectedly’ from ‘drop’
bot ‘to gang up’ from ‘both’
ton ‘penis’ from ‘stone’

Words derived directly from Portuguese, Spanish, and French include:

pikin ‘child’ (derived from Portuguese *pequeno* ‘little’ or Spanish *pequeño*),
boku ‘plentiful, abundant’ (derived from French ‘*beaucoup*’),
farinha ‘flour’ (derived from Portuguese but can also be traced to French *farine*)
sabi ‘skill, knowledge’ (derived from Portuguese *sabir* ‘know’ or Spanish *saber*. It also occurs in English as *savvy*)
plaba ‘quarrel’ (derived from Portuguese *palavra* ‘words, talk,’ Spanish *palabra*, Italian *parola*, French *parole*, and Latin *parabola* ‘parable.’)
dash ‘present’ (derived from Portuguese *das-me* ‘give me’)

Compounds

Some Krio compounds are created by juxtaposition of words of different grammatical categories. Some of the compounds are derived from English phrasal verbs for example:

fɔdɔm ‘fall, fall down’
mekes ‘hurry’
tayup/tringup ‘tie up’

Two or three morpheme parallels in question words include:

wetin ‘what’
udat ‘who’
usay/wisay ‘where’
ustem/wataym ‘when’
wetin-du/mek-so ‘why’
ɔms/hɔmɔch ‘how many’

Other compounds with different bases are instances of the use of metaphoric language through idiomatic calquing, for example:

| Adjectives | Body parts (nouns) | Compound |
|-------------------|-----------------------|-------------------------------|
| <i>big</i> 'big' | <i>mɔt</i> 'mouth' | <i>bigmɔt</i> 'boastfulness' |
| <i>gud</i> 'good' | <i>bele</i> 'belly' | <i>gudbele</i> 'kind hearted' |
| <i>big</i> 'big' | <i>yay</i> 'eye' | <i>bigyay</i> 'greedy' |

Other socially and culturally determined compounds include:

santem (sun time) 'midday'
domɔt (door mouth) 'door'
dede-hos (dead house) 'mortuary'
simun 'menstruation'

Some compounds are gender, occupation, actor, and nationality constructions, for example:

umanfɔl 'hen'
bɔy pikin 'male child'
gyal pikin 'female child'
inglishman 'Englishman'
amerikinman 'American'
ganaman 'Ghanaian'

There is also evidence of semantic calques and extensions as the forms borrowed from English gain new meaning. For example:

ɔpstyas 'the brain' (from 'upstairs')
bizi 'menstrual period' (from 'busy')
yad 'toilet' (from 'yard')
big 'older, wealthy, important'

Epenthetic vowels are inserted between consonants where clusters occur in English words, for example: *tikitul* 'kettle'

Reduplication

The following types of complete reduplication have been attested in Krio:

- intensive reduplication of adjectives, adverbs and verbs

| Simplex forms | Reduplicated morphemes |
|-----------------------|--------------------------------------|
| <i>tru</i> 'true' | <i>trutru</i> 'very true' |
| <i>de</i> 'there' | <i>dede</i> 'exactly there; correct' |
| <i>ay</i> 'high' | <i>ayay</i> 'very high' |
| <i>kwik</i> 'quickly' | <i>kwikkwik</i> 'very quickly' |

The following reduplicated verbs also indicate an increase in degree and/or intensity:

| Simplex forms | Reduplicated morphemes |
|-----------------------------|-------------------------------------|
| <i>baŋ</i> 'bang' | <i>baŋbaŋ</i> 'very loud noise' |
| <i>fred</i> 'be frightened' | <i>fredfred</i> , 'very frightened' |

- iterative/repetitive/frequentative reduplication of verbs

| Simplex forms | Reduplicated morphemes |
|-----------------------|---|
| <i>aks</i> 'ask' | <i>aksaks</i> 'repeated asking around' |
| <i>chenj</i> 'change' | <i>chenjchenj</i> 'habitually/always/constantly changing' |

- distributive reduplication of numerals

| Simplex forms | Reduplicated morphemes |
|------------------|---|
| <i>wan</i> 'one' | <i>wanwan</i> 'one by one' or 'one to each' |
| <i>tu</i> 'two' | <i>tutu</i> 'two by two' or 'two to each' |

- pluralizing reduplication of nouns.
- plurality bordering on uncountability, for example:

| Simplex forms | Reduplicated morphemes |
|---------------------|------------------------------|
| <i>af</i> 'half' | <i>afaf</i> 'bits', 'halves' |
| <i>chuk</i> 'thorn' | <i>chukchuk</i> 'thorns' |

- increased mass, for example:

| Simplex form | Reduplicated morpheme |
|---------------------|-------------------------|
| <i>chaf</i> 'chaff' | <i>chafchaf</i> 'chaff' |

Some Phonological Features of Krio

Consonants

The voiceless dental fricative /θ/ and the voiced dental fricative /ð/ are often occluded. The voiceless dental fricative /θ/ is reduced to /t/ or in some dialects /f/, for example:

tin 'thin'
tiŋk 'think'

The voiced dental fricative /ð/ is replaced by the alveolar /d/, for example:

da 'that'
dis 'this'
den 'then'

The voiceless glottal fricative /h/ is often omitted in initial positions, for example:

ol 'hold'
os 'house.'

Initial unstressed sounds are omitted in many words, for example:

gri 'agree'
mɛmba 'remember'
chenj 'exchange'
bot/bvɔt/ 'about'

Consonant clusters involving a fricative and stop in final positions are often reduced, for example:

was was/was 'wasp'
gens 'against'
han 'hand'
fɔs 'first'
bres 'breast'

The stop after /l/ is often dropped and the rule appears to be the reduction of the clusters /lt/ and /ld/ to /l/ in final positions for instance:

/sɔl/ 'salt'
 ol 'old'
 wɔl 'world'

The /l/ before a labial consonant or a dental stop at the end of a word is deleted for example:

ɛp/hɛp 'help'
 sɛf/sɛf 'self'

The final voiced stop /d/ in words ending in /nd/ is omitted, for example:

san 'sand'
 tan 'stand'
 blɛn 'blind'

Like some West African languages such as Mende and Temne, Krio has the following voiceless and voiced labiovelar coarticulated stops:

/kp/
 /gb/

Krio has the following prenasalized stops:

/mb/, /nt/, /ŋg/, and /ŋk/

Consonants are palatalized and the different types are:

- nasalized palatal glide

/ny/

- palatalized alveolars

/dy/, /sy/, /ty/, and /zy/

- palatalized velars

/gy/ and /ky/

The sound /v/ is realized as /b/ in certain words, for example:

ib 'heave'
 oba 'over'
 dreb 'drive'
 koba 'cover'

The /v/ in final positions is often rendered as /f/, for example, 'move' is pronounced /muf/.

Adjacent consonants are often transposed. This is known as metathesis and examples include:

/ask/ 'ask' is pronounced /aks/
 /risk/ 'risk' is pronounced /riks/
 /mɔsk/ 'mosque' is pronounced /mɔks/

Although this is irregular, there is evidence of rhoticism in Krio in a word like /bɔitf/ 'bleach' in which /l/ is realized as /r/.

Vowels and Diphthongs

Krio has seven pure vowels and the vowels lack corresponding pairs of long and short vowels. It also has three diphthongs, /ai/, /au/, and /ɔi/. Variants of these diphthongs are /ay/, /aw/, and /oy/. Vowels are introduced to replace English diphthongs for example:

/e/ replaces /ei/
 /o/ replaces /ɔɔ/

Vowels are added at the end of a word. These are known as paragogic vowels. Examples include:

gladi 'glad'
 dede 'dead'
 arata 'rat'
 lili 'little'

Suprasegmentals

Krio is a tone language whose intonation is influenced by African tonal languages. There are two tones, a low tone /˘/ which is low in all positions and a high tone /ˊ/. The falling pitch /ˋ/ is used as a realization of the high tone. Tone is syllable-timed and each Krio word or segment has a relevant pitch pattern. Every syllable has a separate tone or relative pitch that is unrelated to stress. The pitch of syllables causes differences in meaning.

Kru Languages

J Bendor-Samuel, Summer Institute of Linguistics, High Wycombe, UK

© 2006 Elsevier Ltd. All rights reserved.

Kru languages are spoken mainly in the forest areas of southwestern Ivory Coast and southern Liberia. Apart from three languages, they form a contiguous block with Kwa languages to their east, Mande languages to their north and west, and Atlantic languages to their west.

Speakers

Reliable population figures are hard to obtain, but it would seem that there are approximately 2 million people who speak one or other of the Kru languages. The three largest language groups are the Guere complex (some 400 000 speakers), the Bete complex (approximately 350 000 people), and the Bassa (over 250 000 people).

Kru Studies

Though Sigismund W. Koelle, in 1854, included five Kru languages in his *Polyglotta Africana*, there was little study of these languages until this century. In

1905, Georges Thomann published a grammar of Noyo, but the next substantial work on Kru languages did not appear until 1966, when Gordon Innes published his *Introduction to Grebe* and a Grebe-English dictionary. Subsequently, however, research has begun into many more of the Kru languages, and the work of Marchese (1983, 1986, 1989) has been extensive.

Classification

Greenberg (1963) tentatively included Kru in his Kwa branch of Niger-Congo, but this classification has been rejected by most scholars. Some lexicostatistical studies and the presence of noun class suffixes have suggested that Kru is closer to Gur than to Kwa, though, unlike Gur and Kwa, Kru is nonserializing. More recently, the hypothesis of grouping Kru, Gur, and Adamawa-Ubangi as North Volta-Congo has found increasing acceptance (Williamson and Blench, 2000). However, since systematic lexical study is lacking and in the absence of any conclusive evidence, it seems best to regard Kru as an independent group for the time being.

The Kru languages can be divided into two main groups: eastern and western. Eastern Kru

(approximately 500 000 speakers) is spoken exclusively in the Ivory Coast and contains two major subgroups, the Bete complex and the Dida complex. Bete further divides into eastern Bete, spoken in the region of Gagnoa, and western Bete, spoken in a wider area, including Soubre, Guibéroua, Issia, and Daloa. The Dida complex divides into eastern Dida, with six dialects, and western Dida, with two dialect clusters. Kwadia, Bakwe, and Wane are three other eastern Kru languages that do not belong to either the Bete or the Dida complex.

Western Kru (with more than 1 million speakers) is spoken over a considerably larger area compared to eastern Kru and extends from the Sasandra River in the Ivory Coast through southern Liberia. The major division in western Kru is between the Guere complex, Grebo complex, and Bassa. The Guere complex is located in Ivory Coast and comprises some 35 languages/dialects; these may be grouped into four groups: Nyabwa, Wobe, Guere-Krahn, and Konobo. The Grebo complex straddles the Ivory Coast and Liberia border and includes some 25 languages/dialects. In the Ivory Coast, there are two main subgroups: Tepo-Plapo and Pie. In Liberia, there are seven subgroups: Wedebo, Glebo, Jabo, Gedebo, Niaibo, Fopo, and Chedepo. In Liberia, Bassa, with some 15 dialects and some 250 000 speakers, and Klao, with two main dialects, belong to western Kru but lie outside Grebo and Guere.

Three other Kwa languages, Kuwaa, Aizi, and Seme, are not grouped with either eastern or western Kru. All three are separate geographically from the rest of the Kru languages. Seme is of particular interest since it is located in Burkina Faso, over 300 miles from the nearest Kru language and surrounded by Gur languages. Figure 1, based on work by Marchese, gives a useful summary.

Structural Features

Phonetics and Phonology

Open syllables predominate and words are usually monosyllabic or disyllabic. Vowel sequences occur

as do CLV syllables (consonant-L-vowel, where L represents a syllabic l, n, or r). All Kru languages have stops at five points of articulation: bilabial, alveolar, palatal, velar, and labio-velar. A typical Kru vowel system has four front and four back vowels and a central vowel and is marked by vowel harmony with advanced and retracted sets of vowels. Within any one morpheme, only vowels of one set occur. Some Kru languages, including Grebo and Krahn, have another type of vowel harmony, with vowels divided into three sets, A, B, and C. Vowels of any one group may cooccur in a morpheme, and vowels of adjacent sets may cooccur. So vowels from set A may occur with vowels from set B, or vowels from set B may occur with vowels from set C, but vowels from set A never cooccur with vowels from set C. Set A consists of i, u, e, and o; set B consists of ε, a, and ə; and set C consists of ɪ and ʊ.

All Kru languages are marked by three or four levels of register tone, which may carry either lexical and/or grammatical functions. Tone, for instance, may distinguish the imperfective from the perfective and the singular from the plural.

Grammar and Syntax

Kru languages have a subject-verb-object (SVO) basic word order, but when an auxiliary is present this changes to S AUX (IO) (DO) V. Kru languages are suffixing. Plurality is often indicated by an *-i* suffix. A number of Kru languages have remnants of noun class suffixes and a few have noun class concord, with agreement between the head and its modifiers. Possessives precede nouns, and body parts function as postpositions indicating direction. Genitives precede nouns, but most modifiers follow their heads.

Kru languages have a basic aspectual system with imperfective and perfective forms marked by suffixes. Progressive and perfect forms are often marked by an auxiliary and so too are conditionals and potential futures. Negation is also frequently signaled by an auxiliary or a particle, though in some languages tone and word order are involved.

Figure 1 The Kru languages.

Kurdish

P O Skjærø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

The Kurdish language belongs to the Iranian language family. It is spoken mainly in eastern Turkey, Syria, northern Iraq, western Iran, and Central Asia. Today there are large communities of Kurds living in the diaspora, for instance, Germany and Scandinavia. Kurdish is spoken in three main variants: Northern Kurdish, comprising Kurmanji in the west and dialects spoken from Armenia to Kazakhstan; Central Kurdish, spoken in northeastern Iraq (called Sorani) and adjacent areas in Iran (called Kordi or Mokri), as well as in Iranian Kurdistan (called Senne'i); and Southern Kurdish, spoken in Kermanshah province in western Iran (including Lakki and Lori of Posht-e Kuh). Northern and Central Kurdish developed rich literatures from the early 20th century on.

The earliest grammar and vocabulary of Kurdish were prepared by the Catholic missionary Maurizio Garzoni and published in 1787; these were used in subsequent scholarly descriptions of Kurdish. The earliest modern 20th-century studies were those of Oskar Mann and Karl Hadank. The first important post-World War II study, applying modern linguistic methods, was that of D. Neil MacKenzie (1961–1962).

Literary Kurdish in Iraq, Iran, and the former Soviet Union is written in the Arabo-Persian script, but employs a circumflex accent ^ placed above or below letters to mark non-Persian sounds: above *w* and *y* it denotes *majhul* vowels (*ō*, *ē*, contrasting with *ū* and *ī*), above *l* it denotes *l̥*, and below *r* it denotes the rolled *r* as opposed to the single-flap *r*. Kurdish in the USSR was also written in the Cyrillic script, with the addition of several signs and diacritics. Kurmanji Kurdish is today written in the Latin alphabet with Turkish

orthography, thus <c> = *j̄*, <ç> = *č̇*, <ş> = *ṧ*, <j> = *ž̇*. In addition, a circumflex accent denotes long vowels and an umlaut on <x> denotes the voiced *ɣ*. In this script, <e> and <a> represent the vowels commonly transcribed as *a* [a > ε] and *ā* [a: > a:].

Kurdish belongs to the Central Iranian language group and, as such, has *s*, *z* from **č̇*, *ǰ* (e.g., *āsin* 'iron', but Persian [Farsi] *āhan*; NK *az* 'I', but Old Persian *adam*). Like the Central dialects and, for instance, Parthian, it has *-ž-* from **-č̇-*, *-ǰ-* (*rož* ← **rau-čah* 'day', Persian *ruz*; *dirēž* ← **drāǰah* 'long', Persian *derāz*). It has also retained the Middle Iranian *majhul* vowels *ō*, *ē*, which in Persian have merged with *ū* and *ī*. A rare feature is the development of intervocalic *m > v* (including *m < hm < šm*), which in Northern and Central Kurdish remains distinct from *w*, but in Southern Kurdish merges with it (demonstrative pronouns: NK *av* 'this' ~ *aw* 'that' ← **ima-* ~ **awa-*; CK both *aw* except an area with *am* ~ *aw*; SK *ī* (cf. Persian *m̄n*) ~ *ow*; NK *čāv*, CK *čāv* 'eye'; CK *awa* ← **ašmā* 'you'). Kurdish shares with Persian the development of **w-* → *b-* (*bā* 'wind' ← **wātah*, Persian *bād*). Northern Kurdish retains final *-t*, which elsewhere becomes *d* or is lost (*dīt* 'saw', Persian *did*).

The Kurdish dialects have very complex phonologies, morphologies, morphophonologies, and syntax, of which no idea can be given in a small space. Proto-Kurdish had two genders, masculine and feminine, two numbers, and two cases, direct and oblique, as well as a vocative. These are preserved in Northern Kurdish, but gradually merge into a no-gender, no-case system as one moves southward (cf. the 1st sing. personal pronoun 'I, me': NK DIR *az* ~ OBL *min*, CK (*a*)*min*, SK *amin*). All three groups have an indefinite suffix going back to **-ēk* 'one', while Central and Southern Kurdish have a definite suffix going back to **-aka* (*-ak*). The 3rd singular enclitic pronoun is *-ī*, pl. *-yān* (cf. Persian *-eš*, *-ešān*). The 1st and 2nd plural

enclitic pronouns are archaic: 1PL *-n*, 2PL *-û* (beside *-mān* and *-tān*), which go back to Old Iranian **nah* and **wah*. The *ezafe* has two genders and two numbers, but is simplified according to the general tendency.

The verbal systems are of the typical modern Iranian type, with a three-stem system: present-imperfect, past, and perfect, as well as a split ergative. The present and imperfect take the prefixes NK *t-/di-*, CK *a-/da-*, SK *a-/mi-* (cf. Persian *mi-*) to express progressive tense. Present forms without a prefix or with the prefix *bi-* are subjunctive. The past tenses are ergative, but only Northern Kurdish has the pure passive type construction (1).

- (1) ta az nās kir-im
you.SING.OBL I.DIR familiar do.PAST-1ST.SING
 ‘you knew me’

In Central and Southern Kurdish, where there is no case distinction, the agent is expressed by enclitic pronouns. If the verb has a preverb, the enclitic pronouns come after it (2), otherwise they come between the verb stem and the ending (3).

- (2) a-t xwārd
PROG-you.AGT eat.PAST[-3SG]
 ‘you were eating’
- (3) nārd-it-īn
send.PAST-you.AGENT-COP.1PL
 ‘you sent us’

Note constructions of the type in (4), where the apposition *pēwa* ‘about’ governs the person implicit in the copula *-it* ‘you are’; (5), where ‘to’ governs the pronoun implicit in the copula *-n-* ‘you are’; and (6), where ‘to’ governs the pronoun implicit in the copula *-m-* ‘I am’.

- (4) xaw-im pēwa dīw-it
dream-1SG.ENCL about see.PAST-COP.2SG
 ‘I dreamed about you’

- (5) dā-m-ī-n-ē
give.PAST-COP.1SG-he.ENCL.OBL-COP.2PL-to
 ‘he gave me to you’
- (6) kitēb-ek-ān-it dā-m-ē
book-DEF-PLUR-you.AGT give.PAST-COP.1SG-to
 ‘you gave me the books’

In Northern Kurdish, the passive is formed with the auxiliary *hāt* ‘come’ + INF (7).

- (7) hāt-īye girt-in
come.PERF[-3SG] seize.PAST.INF
 ‘has been seized’

Central and Southern Kurdish have passive formations in present *rē-* or *yē-*, past *rā-* or *-yā-* (*kuž-yā-* ‘be killed’; *de-nūs-rē* [PROG-write.PRES-PASS.PRES. [-3SG]] ‘it is being written’).

Derivational nominal suffixes are common, as are a variety of types of compound. The meaning of verbs can be modified by preverbs, of which there are many, or the postverb *-ava/-awa* (*-āw*), unique to Kurdish among Iranian dialects (*hāt-in* [come.INF] ‘to come’, but *hāt-in-āw* ‘to come back, return’). Verbal idioms consisting of adjectives or nouns plus verbs are common, as in all Iranian languages.

Kurukh

P S Subrahmanyam, Annamalai University, Bangalore, India

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Kurukh is one of the tribal languages of the Dravidian family with a population of about 1.5 million; thus it is next only to Gondi within the family in terms of

number of speakers. The name of the language is spelt also as Kurukh; another name, Oraon, was also in use in earlier times. The main concentration of Kurukh speakers is found in Chota Nagpur and Bhagalpur districts of Bihar, India; some of them live also in Madhya Pradesh (Raygarh and Sarguja districts) and Orissa (Sundargarh and Sambalpur districts). Some have migrated in recent times to the tea districts of Assam and Nepal and are known there as

Dhāngar/Dhangar ‘men who receive dhān “rice” as wages’. It belongs to the North Dravidian subgroup along with Malto, its closest ally, and Brahui.

Phonology

Kuṛux contains the ten-vowel system that is normally found in the Dravidian languages (see Table 1); there are also a few words with nasalized vowels, e.g., *khē:sō* ‘blood’. Its consonant system is presented in Table 2. The velar voiceless fricative (x) and the glottal stop (ʔ) are the peculiar features of Kuṛux phonology, e.g., *xay* ‘wife’, *ciʔinā* ‘to give’.

Syntax

Word Classes

The following word classes may be recognized for Kuṛux: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections.

The class of adjectives is a small one. An adjective occurs before the noun it qualifies. Most of the nouns can function as adjectives, for example:

mechā partā
high, height *mountain*
 ‘high mountain’

Table 1 Vowels of Kuṛux

| | Front | | Central | | Back | |
|------|-------|------|---------|------|-------|------|
| | Short | Long | Short | Long | Short | Long |
| High | i | ī | | | u | ū |
| Mid | e | ē | | | o | ō |
| Low | | | a | ā | | |

Table 2 Consonants of Kuṛux

| | L | D | R | P | Vel | G |
|-----------|----|----|----|----|-----|---|
| Stop | | | | | | |
| VL | p | t | ʈ | c | k | ʔ |
| VLA | ph | th | ʈh | ch | kh | |
| VD | b | d | ɖ | j | g | |
| VA | bh | dh | ɖh | jh | gh | |
| Nasal | m | n | | | ŋ | |
| Fricative | | s | | | x | h |
| Lateral | | l | | | | |
| Trill | | r | | | | |
| Flap | | | ɾ | | | |
| Semivowel | w | | | y | | |

(Abbreviations: D = dental, G = glottal, L = labial, P = palatal, R = retroflex, VD = voiced (unaspirated), VA = voiced aspirated, Vel = velar, VL = voiceless (unaspirated), VLA = voiceless aspirated.)

The adjectives derived from the three deictic bases (see ‘Pronouns’) show agreement for number (but not for gender) with the noun that follows. Thus, *ā* ‘that’, *ī* ‘this’ and *ū* ‘that at a greater distance’ are used with a singular noun, e.g., *ā/ī/ū ālas* ‘that/this/that (extra-dist.) man’. The corresponding forms used with a plural noun are *abrā*, *ibrā*, and *hubrā*, e.g., *abrā/ibrā/hubrā āl-ar* ‘those/these/those (extra-dist.) men’. (For verbal adjectives, see ‘Nonfinite Verbs’).

An adverb occurs before the verb, for example:

ād xanem xanem bar-ckī raʔī
she again again come-past was
 ‘She came frequently.’

Adverbs may be divided into those of (a) time (e.g., *cērō* ‘yesterday’, *innā* ‘today’, *nēlā* ‘tomorrow’), (b) place (e.g., *mund* ‘before, in front’, *iyā* ‘here’, *ayā* ‘there’, *eksan* ‘where’), and (c) manner (e.g., *baggīl/baggū* ‘much’, *oṅṅā oṅṅā* ‘separately, one by one’, *dav/davdim* ‘well’).

The particle of emphasis is a good example for particles. It is +*mim/amlem*, e.g., *nēlā+m* ‘tomorrow itself’ (: *nēlā* ‘tomorrow’), *ēn-im* ‘even I’, *ār-im* ‘even they’.

Examples for interjections include: *haʔi* ‘yes’, *malʔā/mallā* ‘no’, *anti(jē)* ‘of course’.

Word Order

The favored word order in Kuṛux is S(ubject) O(bject) V(erb):

ās eṅg-āgē mandar ci-c-as
he I-DAT medicine give-PAST-3M.SG
 ‘He gave me medicine.’

Gender and Number

Kuṛux shows a two-way distinction in gender but the classification differs in the singular and the plural; the feminine goes with the nonhuman in the singular but with the masculine in the plural, as illustrated by the following pronouns:

ās
 ‘he’
 ād
 ‘she, it’
 ār
 ‘they (human)’
 abrā
 ‘they (nonhuman)’.

Agreement

The finite verb shows agreement with the subject pronoun (or a corresponding noun in the case of the third person) by a change in the personal

Table 3 The finite forms of ijʔ- 'to stand'

| | Pronoun | Past tense | Present tense | Future tense |
|--------------------------|---------|------------|---------------|--------------|
| 1sg. | ēn | ij-k-an | ij-d-an | ijʔ-o-n |
| 1pl. (excl.) | ēm | ij-k-am | ij-d-am | ijʔ-o-m |
| 1pl. (incl.) | nām | ij-k-at | ij-d-at | ijʔ-o-t |
| 2sg. | nīn | ij-k-ay | ij-d-ay | ijʔ-o-y |
| 2sg. (f.) | | ij-k-i | ij-d-i | ijʔ-o-y |
| 2pl. | nīm | ij-k-ar | ij-d-ar | ijʔ-o-r |
| 3m.sg | ās | ijj-Ø-as | ij-d-as | ijʔ-o-s |
| 3h.pl. | ār | ijj-Ø-ar | ij-n-ar | ijʔ-o-r |
| 3non-m.sg./ non-h.pl. | abrā | ijj-Ø-a | ijʔ-i | ijʔ-o-Ø |

suffix (the final morpheme in the forms shown in Table 3). In equational sentences, the predicate noun shows agreement with the subject pronoun by taking the same personal suffixes as the finite verb (except 3rd non-m. sg./non-hum. pl. [see 'Finite Verbs']). The use of the copular verb (*tal-* 'to be') in such sentences is optional. Kuṛux partially preserves the old Dravidian feature of the absence of the copular verb:

ēn kuṛux-an (tal-d-an)
I Kuṛux-1sg (be-pres-1sg)
 'I am a Kuṛux (speaker).'
 ēm kuṛux-am (tal-d-am)
we (excl.) Kuṛux-1pl.excl (be-pres-1pl.excl)
 'We (excl.) are Kuṛux (speakers).'

For agreement between the demonstrative adjectives and the nouns qualified with regard to number, see 'Word Classes.'

Noun Morphology

A nominal base is followed by the plural suffix when plurality has to be expressed; the case suffix/postposition occurs at the end. A masculine noun may take the definite suffix *-as*, e.g., *āl* 'man', *āl-as* 'a particular man'.

Plural Suffixes

The plural suffix for the human nouns is *-ar*, e.g., *āl-ar* 'men', *mukk-ar* 'women' (sg. *mukkā*). Some feminine nouns take *-guṭhi-ar*, e.g., *ālī-guṭhi-ar* 'wives'; *-guṭhi (-ar)* is also added optionally to human nouns with *-ar* plural, e.g., *āl-ar(-guṭhi(-ar))* 'men'. Kinship terms, however, take *-baggār*, e.g., *dādā-baggār* 'elder brothers'. The word *xadd-xarrā* 'children' seems to contain another plural suffix *-xarrā*. Nonhuman nouns optionally add *-guṭhī*, which in origin is a

separate word meaning 'group', to form the plural, for example:

mūnd aḍḍō(-guṭhī)
three ox-PL
 'three oxen'
 enḍ man(-guṭhī)
two tree-PL
 'two trees'.

Case Suffixes and Postpositions

The nominative is unmarked. When a noun is used in the vocative, *-ō/-ay(ō)* is added to it at the end; the vocative form may be preceded by *ē/ana* (but *anay* when a woman is addressed), e.g., *ē/ana urb-ay(ō)* 'O master!', *anay mukk-ay* 'O woman!'. Further, when women talk to women, *anay* is replaced by *ān/lanē*, e.g., *ān xay* 'O daughter!', *anē xay-guṭhi-ar-ō* 'O daughters!'.

The accusative suffix is *-an* after a consonant and *-n* after a vowel, e.g., *āl-an* 'man (accus.)', *mukka-n* 'woman (accus.)' (: *mukkā* 'woman') but it is *-in* after the definite suffix *-as* (in masculine nouns, e.g., *āl-as-in* 'the man (accus.)', the plural *-ar* (e.g., *āl-ar-in* 'men (accus.)') and after a demonstrative pronoun that ends in a consonant, e.g., *ād-in* 'her, it (accus.)'.

The instrumental suffix is *-trī/-trū*, e.g., *āl-trī* 'by the man'.

The dative uses the postposition *+gē* (variant *+ā(gē)* after a pronoun), e.g., *āl+gē* 'to the man', *enḡ-ā(gē)* 'to me'.

The ablative suffix is *-tī* after a consonant, *-ntī* after a vowel; after the plural *-ar*, *-tī* freely varies with *-intī*, e.g., *āl-tī* 'from the man', *mukka-ntī* 'from the woman', *āl-ar-tī /āl-ar-intī* 'from the men'.

The genitive commonly uses the postposition *+gabi*, e.g., *āl + gabi* 'of the man'; it has the variant *+hay* after a pronoun, e.g., *enḡ + hay* 'my'. However, nouns denoting a place take the suffix *-ntā*, e.g., *padda-ntā* 'of the village' (: *paddā* 'village').

The locative uses the postposition *+nū* (also *+nō* dialectally), e.g., *erṗā + nū* 'in the house'.

Pronouns

Two important features of the pronominal system of Kuṛux are the presence of inclusive and exclusive distinction in the first person pronoun (represented also in the finite verb) and the formation of the third person pronouns on three deictic bases.

The personal pronouns are:

ēn 'I' ēm 'we (excl.)'
 nām 'we (incl.)'
 nīn 'you (sg.)' nīm 'you (pl.)'

The third person pronouns are formed on the three deictic bases *a-lā-* (distant), *i-lī-* (proximate) and *hu-l hū-* (extra-distant):

| | | | |
|---------|-----------|---------------|-------------------|
| Distant | Proximate | Extra-distant | |
| ā-s | ī-s | hū-s | ‘he’ |
| ā-d | ī-d | hū-d | ‘she, it’ |
| ā-r | ī-r | hū-r | ‘they (hum.)’ |
| a-bṛā | i-bṛā | hu-bṛā | ‘they (non-hum.)’ |

The reflexive pronouns are *tān* (sg.) and *tām* (pl.).

There are five interrogative pronouns: *nē* ‘who’, *ēkā* ‘who, which’, *endṛ/endrā/ēkdā* ‘what, which’. The addition of the particle *+ʔim/ʔam* to an interrogative pronoun converts it into an indefinite pronoun, e.g., *nīk+ʔim* ‘someone’.

Numerals

Kurukh retains the Dravidian numerals only up to 4 and the rest are borrowed from Hindi. The native numerals have also preserved a distinction between nonhuman and human (the variants given in parentheses for the human forms occur before case suffixes and postpositions).

| | | |
|-----|----------|----------------|
| | Nonhuman | Human |
| ‘1’ | oṇḍ/oṇṭā | ort |
| ‘2’ | eṇḍ/e:ṇḍ | irb (irbar-) |
| ‘3’ | mūnd | nub (nubar-) |
| ‘4’ | nāx | naib (naibar-) |

The human numerals are generally followed by the classifier *jhan-ar* ‘persons’ (sg. *jhan*), for example:

| | | |
|-------------------|---------|------------------------|
| nub | jhan-ar | bar-c-ar |
| <i>three</i> (h.) | CLASSIF | <i>come-PAST-H.PL.</i> |
| ‘Three men came.’ | | |

The counting is done in terms of ‘score’ for which the word is *kūrī/bīsoʔe*, *oṇḍ kūrī/bīsoʔe* ‘one score’, *kūrīeṇḍ* or *eṇḍ bīsoʔe* ‘two score’, etc. The ordinal is formed by adding *-(an)-tā* to a cardinal, e.g., *eṇḍ-(an)tā* ‘second’; however, there is a special word for ‘first’: *mund-(an)tā*.

Verb Morphology

Female Speech

An important characteristic feature of the Kurukh verb morphology is the use of special forms by women when they talk among themselves; some of the tense and personal suffixes in women’s speech are different from those in men’s speech:

| | | | |
|------------------|------------------------------|--------------|--------------------|
| (Men’s speech) | nīn | ekātarā | kaʔa-d-ay |
| (Women’s speech) | nīn | ekātarā | kaʔa-d-ī |
| | <i>you</i> (sg.) | <i>where</i> | <i>GO-PRES-2SG</i> |
| | ‘Where are you (sg.) going?’ | | |

Verb Bases

A verb base in Kurukh may be simple or complex. Four types may be recognized among the complex bases:

1. Intransitives or reflexives derived from transitives by the addition of *-r-*, e.g., *kol-r-* ‘to be opened’ (: *kol-* ‘to open’), *mūjh-r-* ‘to wash one’s own face’ (: *mūjh-* ‘to wash another’s face’).
2. Transitives derived from intransitives by the addition of *-aʔa-*, e.g., *marx-aʔa-* ‘to make dirty’ (: *marx-* ‘to be dirty’).
3. Causatives derived from transitives by the addition of *-tāʔa-*, e.g., *es-tāʔa-* ‘to cause to break’ (: *ess-* ‘to break’).
4. Reciprocals derived by the addition of *-nagr-* to a simple verb base, e.g., *ēr-nagr-* ‘to look at each other’ (: *ēr-* ‘to see’), *kēb-nagr-* ‘to abuse one another’ (: *kēb-* ‘to abuse’).

Finite Verbs

A finite verb has the following structure:

Verb Base + Tense Suffix + Personal Suffix

The personal suffixes are:

| | |
|------------------------------|-------------------------------------|
| 1st sg. | -an |
| 1st pl. (excl.) | -am |
| 1st pl. (incl.) | -at |
| 2nd sg. | -ay // (female speech) -i |
| 2nd pl. | -ar |
| 3rd m. sg. | -as |
| 3rd hum. pl. | -ar |
| 3rd non-m. sg./ non-hum. pl. | -a (after past)/ -i (after present) |

The vowel of all these suffixes is deleted after the future suffix *-o*. Three tenses, past (suffixes: *-k-*, *-ck-*), present (suffixes: *-d-*, *-n-*) and future (*-o-*) are there (see Table 3).

Unlike its counterpart in the sister languages, the imperative in Kurukh has only one form without distinction between the singular and the plural. The suffix is *-ā* when men are addressed and *-ay* when women are addressed (when women speak to women, the suffix is *-ē*): *esʔ-ā/-ay/-ē* ‘Break!’. A milder sort of the imperative has the suffix *-kē*, e.g., *bar-kē* ‘Come (if you please)!’.

Nonfinite Verbs

The infinitive, which can also function as a noun and an adjective, has the suffix *-nā* (also *-ā* in certain constructions), e.g., *es-nā/esʔ-ā* ‘to break, breaking’.

The present participle has the suffix *-nū(tī)/-num*, e.g., *es-nū(tī)/es-num* ‘breaking’.

The past participle has the suffix *-ār*, e.g., *esʔ-ār* ‘having broken’.

There are three types of adjectives derived from verb bases:

- The infinitive with adjectival function:

kūr-nā amm
burning water
‘hot water’

- Past adjective with the suffix *-ckā*:

ke-ckā āl-ar
die-PAST ADJ man-PL
‘dead people’

- Agent noun (see *Agent Noun*) functioning as nonpast adjective:

pār-ū/ pār-nā pellō
sing-NON-PAST ADJ girl
‘singing girl’

Agent Noun

The agent noun, with the suffix *-ū* can also take the masculine and the plural suffixes, e.g., (from *esʔ*- ‘to break’)

isʔ-ū ‘one who/which breaks’
isʔ-u-s ‘a man who breaks’
isʔ-u-r ‘persons who break’

Negative Verb

Kuṛux employs the verb base *mal-* ‘to be not’ in the present tense (with *-y-* and *-k-* as optional variants of the regular present suffixes *-d/-l/-n-* [see Table 3]) as the negative verb to deny the identity of the subject and the predicate noun phrases, for example:

ēn bēl-an mal-d-an/mal-y-an/mal-k-an
I king-1SG not.be-PRES-1SG
‘I am not a king.’

Kwa Languages

M E Kropp Dakubu, University of Ghana, Legon, Accra, Ghana

© 2006 Elsevier Ltd. All rights reserved.

The Kwa languages, a branch of the Niger-Congo family, are spoken in West Africa. As presently defined, the group extends from southeastern Ivory Coast in the west through the southern two-thirds of Ghana, southern Togo, and the Republic of Benin to the Benin-Nigeria border in the east. The term Kwa was adopted by linguists toward the end of the 19th century to group together Akan, Ga, Ewe (Éwé), and their close relatives because in many of these languages a stem *kwa* or *kua* means ‘man’ or ‘person.’

Constitution of the Group

The list of languages included in Kwa has varied considerably. In the 1950s, Westermann and Bryan included 10 languages of Ivory Coast that they

subgrouped into the Lagoon group; Akan, including the languages more recently termed Tano; Ga-Dangme; Ewe; and most of the languages of southern Nigeria. Greenberg’s 1963 classification expanded the group to include the Kru languages of Liberia in the east, the languages of the Ghana-Togo hill country that Westermann and Bryan had explicitly excluded, and the Ijaw languages of the Niger delta. This membership was maintained by Stewart in 1971, but in 1989 he eliminated the Kru languages and the Nigerian languages, keeping the Togo Mountain languages and adding a few languages hitherto unknown or unstudied. This is the membership in the most recent overview presented by Williamson and Blench (2000), which essentially has contracted back to the earliest membership plus the Lagoon and the Togo Mountain languages. The group as most recently defined, without Kru and without the Nigerian languages, is sometimes referred to as New Kwa.

Nevertheless, the Kwa languages are currently considered to be more closely related to Yoruba, Igbo, and other languages of southern Nigeria than to the rest of Niger-Congo, forming with them a branch of the Volta-Congo subgroup of Niger-Congo. However, except at the lower levels of classification such as the Tano, Potou-Tano, and Ewe-Fon (Gbe) groups, genetic relationships among these languages are quite distant. It has never been adequately demonstrated using the comparative method that Akan, Ga, Ewe, and the Togo Mountain languages are more closely related to one another than to any other languages.

The Subgroups

The (New) Kwa subgroups are distributed approximately from east to west along the coastal forest and savannah, with the majority of languages and speakers in Ghana. However, many communities have traditions of migration, and it is likely that 1500 years ago their geographical distribution was very different from today. A primary distinction has sometimes been made between the western languages with Ga-Dangme and some of the Togo Mountain languages, referred to as 'Nyo,' and Gbe and the other Togo Mountain languages, referred to as 'Left Bank' (of the Volta River). We examine the composition of the subgroups starting in the west and moving eastward.

The Lagoon languages of the Ivory Coast – Avikam and Alladian, Adjukru (Adioukru), Abidji, Abbey (Abé), Attié, and an isolated language farther west called Ega – are not particularly closely related to one another. Just east of these, the Potou-Tano group comprises at least 20 languages, including Ebrie (Ebríé) and Mbatto (Mbato) (the Potou of Potou-Tano) and the Tano group consisting of Krobu, Abure, and Eotilé (Beti) (all spoken in the Ivory Coast); Nzema, Ahanta, Anyi (Anyin), and Baule (Baoule) (spoken in the eastern Ivory Coast and western Ghana); Anufo (spoken in northeastern Ghana); Akan (with by far the most speakers, mainly in Ghana); and approximately a dozen languages making up the Guang group including Gonja, Nawuri, Nchumuru (Nchumbulu), Krachi (Krache), Nkonya, Okere (Cherepon), Larteh, Efutu, and Awutu (all spoken in Ghana from north of Akan to the sea in the south, distributed along the course of the Volta river). Because the locus of greatest differentiation is in the west, it has been suggested that the Potou-Tano languages spread from west to east. Migration traditions suggest that they also spread in the eastern area (i.e., mainly in Ghana) from north to south.

Ga-Dangme, on the other hand, consists of just two languages, Ga and Dangme (or Adangme). Now situated on the Accra Plain south east of the Tano languages and west of the Volta River, the speakers have traditions of migration from the east, possibly in conjunction with the Ewe, and from the northeast, probably from what is now the northern Republic of Benin.

The Central Togo or Togo Mountain languages comprise 14 languages spoken in Ghana, Togo, and the Republic of Benin, most of them in the hilly area on the Ghana-Togo border. An earlier name for these languages was Togo Remnant Languages, adapted from the German *Togorestsprachen*. That name reflected the possibility that their fragmented distribution on hilltops difficult to access and their generally small numbers of speakers result from these linguistic communities having fled to refuge areas at some time in the past, under pressure from expanding larger groups such as (perhaps) the Ewe and the Akan. True or not, the name is disliked by speakers and no longer used.

Heine (1968) treated the languages as a genetic family and classified them into two subgroups: the NA subgroup (Basila (Anii), Lelemi-Lefana (Lelemi), Logba, Adele, Likpe (Sekpele), Santrokofi (Sele), and Akpafu-Lolobi (Siwu)) and the KA subgroup (Avatime, Nyangbo-Tafi, Bowiri (Tuwili), Ahlo, Kposo (Akposo), Kebu (Akebou), and Animere). More recent classifications accept these two groupings, but put them directly under Kwa; that is, they are now considered no more closely related to one another than to the other New Kwa groups, and 'Togo Mountain' or 'Central Togo languages' are merely geographical labels.

Kposo has the most speakers by a considerable margin, approximately 80 000, followed by Kebu with 17 500. (Both are spoken mainly in Togo; figures are based on Heine, 1968.) Lelemi-Lefana has approximately 15 000 speakers and Adele approximately 8000. Others have fewer: Logba reportedly has approximately 2000 speakers, and Animere was said to have fewer than 300 in the 1960s. There is evidence that one or two languages have died out in the area in the course of the past 2 centuries.

The area extending approximately 80 miles inland along the coast from the Volta eastward to the Nigerian border is dominated by the closely knit Gbe group of languages and dialects. The name is adopted from their common word for 'language'. They include Ewe, spoken in Ghana and Togo by more than 3 million people. The Ewe-speaking people have a tradition of migration from farther east but still within the Gbe area, from Nuatja and Tado in southern Togo. Gen (Gen-gbe) is the language of Lomé, the

capital of Togo and a major lingua franca. Another major variety is Aja (Aja-gbe). Somewhat more distantly related are Maxi (Maxi-gbe) and Fon (Fon-gbe), the language of the old kingdom of Dahomey, which is now part of the Republic of Benin. The easternmost variety is Gun (Gun-gbe), which crosses the Nigerian border along the coast and is thought to have been spoken in the Lagos area in earlier times.

Linguistic Characteristics

In all Kwa languages, the fundamental word order is subject-verb-object. It was once thought that they typically had very simple morphology, but, although the situation varies among the different groups, this is generally not really the case. Part of the reason for this belief may have been the fact that in many of the languages tone plays an important role in morphology, with some grammatical morphemes being realized only by tone. Thus, in the following Ga sentence only the high tone on the second syllable of the pronoun *amɛ* ‘they’ shows that the verb is perfect and not aorist.

amé-bá
‘they have come’
they.PERF-COME

Tone is also important in making lexical distinctions; again in Ga, we have *lá* ‘blood’ with high tone but *lā* ‘fire’ with low. The number of phonemic tones ranges from the minimal two in Ga and Akan to five in Avatime. In all the languages west of the Volta, tone levels are affected by downstepping, or the lowering of all pitch levels after a low tone throughout a sentence, but many languages east of the Volta, including Ewe, do not have this.

Cross-height vowel harmony, based on the position of the tongue root, is typical of the Tano languages but not of Ga-Dangme, Gbe, or some of the Togo Mountain languages. In all (Adjukru is an exception), syllables are typically open, ending in a vowel or sometimes a syllabic consonant.

Double articulated consonants ($[k̠p̠]$, less often $[g̠b̠]$) are typical of Ga-Dangme, the Togo Mountain languages, and Gbe but not of Akan and some other Potou-Tano languages. In Ga-Dangme and Gbe (and also Yoruba), but again not in the western languages, the voiceless bilabial stop /p/ did not exist until it was introduced through loanwords in the course of the 18th century. Consonant clusters either do not exist or the second consonant is limited to off-glides and /l/ or /r/ and the cluster is analyzable as being derived from a CVV or CVCV structure.

Verb systems vary, but paradigms generally express aspect features, with the perfective-imperfective

distinction basic. Grammatical tense is less important, often limited to a contrast between future and nonfuture, and even that shows signs of having been grammaticized relatively recently in many languages. The expression of progressive aspect is of particular interest because the western languages differ radically in its expression from many of those spoken east of the Volta. In Tano languages and also in Ga, the progressive (like most other aspect features) is shown by a prefix, as in the following sentences in Akan (1) and Ga (2).

(1) abofra no re-di nneema
child the PROG-eat things
‘the child is eating something’

(2) gbeke le mii-ye nii
child the PROG-eat things
‘the child is eating something’

In Ewe (3) and Dangme (4), on the other hand, it is periphrastically expressed, with an aspect verb followed by a nonfinite form of the event verb preceded by its object.

(3) Ɖevi a le nu ɔu-m
child the is thing eat-PROG
‘the child is eating (something)’

(4) jukwe ɔ ŋɛ nɔ ye-e
child the is thing eat-PROG
‘the child is eating (something)’

Some of the Togo Mountain languages use the periphrastic style of expression, but many do not.

In Kwa languages, the noun is followed by the adjective, article, and so on that modify it, whereas a possessor precedes the possessed noun. However, there are radical differences in nominal morphology. The Togo Mountain languages generally have several singular and plural classes expressed by prefixes; modifiers take prefixes that show agreement (concord) with the class of the noun they modify and pronouns also vary according to the class of the noun referred to. Akan and other Tano languages have several singular and plural prefixes for nouns but no class concord. Ga-Dangme, however, uses basically just one plural (no singular) suffix, whereas the Gbe languages use a phrase-final particle, as in the following example from Fon.

(5) xɔ̀ntɔ̀n yé̀tɔ̀n wè lé
friend your 2 PL
‘both your friends’

Serial verb constructions, in which several verbs share one subject and sometimes object with no intervening conjunction, occur in all Kwa languages.

L

Lahnda

C Shackle, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

The name 'Lahnda' (Panjabi *lahindā* 'western'), like the more natural feminine 'Lahndi,' is an invented blanket term without local currency used to distinguish the Indo-Aryan dialects spoken in western Panjab and the adjacent regions of Pakistan (by some 30 million speakers) from the Panjabi proper native to the central and eastern districts of the Panjab. The boundary between Lahnda and Panjabi (Shackle, 2003) is anyway an uncertain one. Many common features, e.g., retained historical geminates or the possessive marker *dā*, have been reinforced by overlapping literary traditions. Since the 1990s, however, local politicocultural movements have emphasized the distinctive character of some varieties of Lahnda, and the southern Seraiki (Ser) (Saraiki) and to a lesser extent the northern Hindko (also termed Pahari or Panjistani) are beginning to be employed as independent literary languages consciously rivaling Pakistani Panjabi (Pj). Written in the Perso-Urdu script, all three incipient standards are considerably influenced by Urdu.

Siraiki

The rather homogeneous southwestern Seraiki dialects (Shackle, 1976) are notably distinguished from Panjabi by the retention of historical aspiration and the development of four implosive phonemes /ɟ, ʃ, ɖ, ʙ/, shared with Sindhi, thus Sanskrit *baddha*- 'bound' > Pj /bādda/ but Ser /'bāddha/, Sindhi /'bādhō/.

Distinctive Seraiki morphological features include the passive extension /-i-/ and the sigmatic future, with stressed extension of transitive stems, e.g., Ser /kə'resi/ 'will do', passive /kə'risi/ versus Pj /kə'rega, 'kita ja'vega/; and a full set of suffixed pronouns, often entailing shifted stress, e.g., /'kita/ 'did',

/'kitum/ 'I did', /kɪ'tose/ 'we did'. Common lexical distinctions include Ser /vəŋŋa/ 'to go', future /vəsi/, versus Pj /jaŋa, ja'vega/, and the Ser objective and ablative postpositions /kū, kənū/ versus Pj /nū, tō/. Typical Seraiki shibboleths appear in /ə'khiomis jo sakū bəhū jəldi vəŋŋa posi/ [*told-me-him that us- to very quick going fall-will*] 'I told him that we should have to go very early', where /ə'khiomis/ has a double suffix (/akhiɑ/ + 1SG /-m/ + 3SG /-s/), versus the analytic Pj /mæ o'nū akhiɑ pəi sanū bə't jəldi jaŋa pə'vega/.

Hindko

Hindko is the term locally used to cover the heterogeneous northern dialects spoken in the hilly areas above the Salt Range (Shackle, 1980). These include the well-described Awankari (Aw) (Bahri, 1963) and the very different Hindko of Peshawar city (Pe). Like Panjabi, Hindko has tonal realizations of historical aspiration, but the phonetic features associated with the Panjabi low-rising tone accompany a high-falling tone in Peshawar Hindko, e.g., Sanskrit *bhāra*- 'load' → Aw, Ser /bhar/, versus Pe /p'ār/ (Pj /p'ār/). The Seraiki sigmatic future and pronominal suffixes are shared by Hindko, where the model sentence would appear as Aw /mæ usā akhiɑ jo bə'ū jəldi vəŋŋa posi/, Pe /məne unū kī'a ke bə't jəldi jaŋa pəsi/.

Lak

V A Friedman, University of Chicago, Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The Lak language (*Ethnologue* code LBE) belongs to the Daghestanian branch of the Nakh-Daghestanian family and has over 200 000 speakers, mostly in the Republic of Daghestan, Russian Federation (maps of the region are available through the website ‘Thesaurus Indogermanischer Text- und Sprachmaterialien (TITUS)’; see Relevant Websites, at the end of this article). The Lak self-designation is *Lak* (adjective *Lak'u*); other terms include Turkish *Beyaz lezgi* ‘White Lezgian’ and *Kazikumux*, after Kumux, the main aul (village) of Lakkia and the former center of a feudal state. Lak glosses started around 1600; whole texts appeared in 1734. Lak was written in the Arabic Alphabet until 1928, then in Latin until 1938, and finally in Cyrillic. Lak has five dialects; the standard language is based on Kumux.

Phonology

The Lak vowels are /a, i, u/, all of which can be distinctively pharyngealized, which results in their allophonic centralization [æ^ɣ, e^ɣ, o^ɣ]. The Lak consonants are shown in Table 1. Geminate (emphatic) consonants are realized as simple unaspirated, except in prevocalic (and, for stops, noninitial) position. Consonant labialization is distinctive in some dialects, and vowel length and stress interact.

Morphology

Lak has four noun classes: I = male sentient, II = mature female sentient, III = other animate and some inanimate, and IV = inanimate and a few lower animals. Any part of speech can take class agreement markers, which are prefixed, infix, and/or suffixed. Lak nouns have four stems, e.g., nominative (= absolutive) singular, as in *q:at:a* ‘house’; oblique singular, as in *q:at-lu-*; nominative plural, as in *q:at-ri-*; and oblique plural, as in *q:at-ra-*. There are more

than 30 stem formants. Case endings attach agglutinatively to the oblique. The three core cases are nominative-Ø, genitive *-l*, and dative *-n*. Secondary cases include addressive/possessive *-x̣*, admotive/dative *-2-x̣:un*, ablative/involuntative/possibilitive *-š:a*, and comitative *-š:al*. A few other affixes attach to the oblique and/or nominative stems.

Lak has six oblique locational affixes (LA) to which five movement affixes (MA) can attach, forming potentially 30 local cases. Not all local cases occur in all combinations or with all substantives, but, unlike spatial postpositions (which take the genitive), local cases have nonlocational functions and cannot govern across a conjunction (abbreviations: IMP, imperative; SG, singular; NOM, nominative; GEN, genitive; EMPH, emphatic; OBL, oblique; PL, plural; INF, infinitive).

o^ɣwč-a wi-l-a dus-tura-j-n
invite-IMP you.SG-GEN-EMPH friend-OBL.PL-OBL.LA-TO.MA
wa malla-na-j-n pulaw b-uk-an
and mullah-OBL-OBL.LA-TO.MA pilaf(III) III-eat-INF
‘Invite your friends and the mullah to eat pilaf’.

Lak has five sets of deictics, which also serve as third-person markers: *wa*, near the speaker, new information; *mu*, relevant to the addressee, old information; *ta*, opposite, level (older unmarked); *ga*, unmarked (older below speaker); and *k'a*, above speaker. The verb has three aspectual stems, perfective/unmarked (*buc-in* ‘bring-INF’), durative in *-la-* (*buc-la-n*), and iterative in *-awa-* (*buc-awa-n*). Synthetic forms of the marked aspects occur only in the present and future. The infinitive serves as the base for the future. Past tense forms usually have a class marker infix before the last root consonant, and an infix negator (indicative *q:a-*, imperative *ma-*) precedes the infix class marker. The verb has numerous synthetic and analytic paradigms marking aspect, tense, mood, and evidential, some with marking for person as well as class and number.

Syntax

Lak is basically object-verb, attributive/genitive-head; it has pragmatically conditioned free word order and a mixed ergative/accusative system. The converbs *ban* ‘to do’ and *x̣un* ‘to become’ are the most frequent markers of transitive/causative vs. intransitive, respectively. For the agent of an ordinary transitive verb, personal pronouns (first and second person) remain in the nominative; other agents take the genitive, which also functions as ergative. Case assignment and verb agreement also depend on the semantics of the verb, focus, and the pragmatic implications of the clause. Experiencers take dative; ability

Table 1 Lak consonants

| | | | | | | | | | | | | |
|---|---|----|----|---|----|----|---|----|-----|---|---|---|
| b | p | p: | p' | | | | | | w | m | | |
| d | t | t: | t' | c | c: | c' | z | s | s: | r | l | n |
| | | | | č | č: | č' | ž | š | š: | j | | |
| g | k | k: | k' | | | | | x̣ | x̣: | | | |

Lakota

B Ingham, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Lakota is one of a group of closely related dialects sometimes referred to by linguists as Dakotan. These include Lakota in the west, Dakota in the east, Nakota in the north, and Nakoda in the northwest. The speakers of Lakota and Dakota were traditionally referred to in English as the Sioux, those of Nakota as the Assiniboine, and those of Nakoda as the Stoney. Lakota and Dakota are mutually intelligible. Reports differ as to how far Nakota and Nakoda are intelligible with the other two. Dakotan is part of a group of languages known as Siouan-Caddoan centered mainly on the central plains and prairies, but also represented on the eastern seaboard.

Reports on the number of speakers of Lakota range from 6000 to 20 000. Great efforts are being made to preserve the language in schools, colleges, and universities in the region and there is probably a considerable degree of partial or receptive knowledge of it.

Morphology

Major word classes of Lakota are noun, verb, adverb, postposition, demonstrative, pronoun, and conjunction. The verb in particular can be regarded as polysynthetic and noun incorporation occurs in the verb and adverb. The functions often covered by adjectives in other languages are covered in Lakota by stative verbs and adverbs.

The verb system is of the split intransitive type, where agents occur only in the Active verb class while patients occur with the Active and Stative types. These are marked in the verb by prefixes or infixes as shown below:

| | |
|--------------------------|---------------------------|
| agent marker | patient marker |
| wa-‘I’ | ma-‘me’ |
| ya-‘you’ | ni-‘you’ |
| uŋ(k)-‘we’ (‘you and I’) | uŋ(k)-‘us’ (‘you and me’) |
| | wic’a-‘them’ (animate) |

composite pronoun prefix
c’i-‘I (agent)-you (patient)’

Plurality in the third and second person and inclusiveness of third persons in the first plural is marked by a suffix *-pi*. The occurrence of these markers with the two verb types is shown below:

| | |
|--------------------------------|-------------------------|
| Active verb <i>u</i> ‘to come’ | |
| sing, exclusive | plur, inclusive |
| wau ‘I come’ | |
| yau ‘you (sing) come’ | yaupi ‘you (plur) come’ |

| | |
|------------------------------|----------------------------------|
| <i>u</i> ‘he, she, it comes’ | <i>upi</i> ‘they (animate) come’ |
| <i>uŋku</i> ‘we (excl) come’ | <i>uŋkupi</i> ‘we (incl) come’ |

| | |
|-------------------------------------|---------------------------------------|
| Stative verb <i>k’uja</i> ‘be ill’ | |
| sing, exclusive | plur, inclusive |
| <i>mak’uje</i> ‘I am ill’ | |
| <i>nik’uje</i> ‘you (sing) are ill’ | <i>nik’ujapi</i> ‘you (plur) are ill’ |
| <i>k’uje</i> ‘he is ill’ | <i>k’ujapi</i> ‘they are ill’ |
| <i>uŋk’uje</i> ‘we (excl) are ill’ | <i>uŋk’ujapi</i> ‘we (incl) are ill’ |

Forms with both agent and patient prefixes, showing some infixes, are shown with the active verb *ole* ‘to seek’: *owic’awale* ‘I seek them’, *owic’ayale* ‘you (sing) seek them’, *oc’ile* ‘I seek you (sing)’, *oc’ilepi* ‘I seek you (plur)’, *onile* ‘he seeks you (sing)’, *uŋkonilepi* ‘we (incl) seek you’, *omayale* ‘you (sing) seek me’, *uŋkoyalepi* ‘you (plur) seek us (incl)’.

Nouns do not show number distinctions, but may mark a possessor as in *mi-hingna* ‘my husband’, *ni-hingna* ‘your husband’, *mi-c’iŋksi* ‘my son’, *c’iŋksitku* ‘his, her son’. Other nominal prefixes may distinguish noun classes such as instruments as in *wi-c’ap’e* ‘fork’, abstract concepts as in *wo-slolye* ‘knowledge’, time and space concepts as in *o-ap’e* ‘hour’, *o-mak’a* ‘year’, *o-nap’e* ‘refuge’.

Word Derivation

Word derivation is by affixation and compounding. Adverbs are formed with a suffix *-ya*, *-yela* or *-yaŋ* from stative verbs as in *wašte* ‘be good’, *wašte-ya* ‘well’, *ska* ‘be white’, *ska-yela* ‘whitely’, *wak’aŋ* ‘be sacred’, *wak’aŋ-yaŋ* ‘in a sacred manner’. Adverbs are widely used to state characteristics of objects often with the verb *haŋ/be* ‘stand’ as in *maŋpiya waŋ ska-yela he* ‘a cloud stood whitely’ meaning ‘there was a white cloud’, *op’osya he* ‘it stood coldly and clearly’ meaning ‘the weather was cold and clear’. Postpositions can be formed from adverbs by a prefix *i-* as in *wiyohpeyata* ‘in the west’, *i-wiyohpeyata* ‘to the west of’.

A set of circumstantial stems are important in forming verbs, adverbs, wh-words and postpositions as in *tok’eca* ‘be somehow’, *hec’eca* ‘be like this’, *iyec’eca* ‘be like’, *tok’el* ‘how’, *hec’el* ‘like this’, *iyec’el* ‘like, as’ from a stem **-k’ec’a/-k’el* indicating ‘quality’. Other such stems are **-haŋ* ‘time’, **-k’etu* ‘occurrence’, **-nakeca* ‘number’, **-haŋkeca* ‘(extent’, yielding among others *hehaŋ* ‘then’, *tohaŋ* ‘when’, *iyehaŋtu* ‘be time for’, *hec’etu* ‘happen thus’, *iyec’etu* ‘happen as’, *iyenakeca* ‘be as many as’, *iyena* ‘as many as’, *tonakeca* ‘how many’, *tohaŋyaŋ* ‘how far’, *iyehaŋyaŋ* ‘as far as’.

Syntax

Word order is generally agent-patient-verb as in *wic'asa ki c'iqksitku ki ole* 'the man looked for his son.' Relative clauses are marked by the use of *waj* 'one', *ki* 'the' and *he* 'that' as in *wic'asa waj c'iqksitku ki ole ki he owale* 'I looked for the man who was looking for his son.' Sentences can be embedded in higher sentences by using *ki/k'uŋ* 'the' and by certain postpositions as in *c'iqksitku ki ole ki slolwaye* 'I know that he was looking for his son', *c'iqksitku t'i ekta wau* 'I came to where his son lived'.

Nouns can be incorporated into verbs and verbs subordinated to other verbs by preposing, often also with stem truncation, as in *šung-ole* 'he looked for horses', *šung-manuŋ* 'he stole horses', *šung-ole-mani* 'he traveled looking for horses' (*šung* << *šunka* 'horse, dog'), *iŋyauŋ-mani* 'he traveled running' (*iŋyauŋ* << *iŋyauŋka* 'run'), *kah-ši* 'ask to make' (*kah* << *kağa* 'make').

Men's and Women's Speech

These are distinguished by certain sentence-final particles of high frequency of occurrence shown below.

| | male speaker | female speaker |
|-------------|---------------------|-----------------|
| declarative | -yelo, -welo, -kšto | -ye, -we, -kšto |

| | | |
|---------------|---------------------------|-----------------|
| interrogative | -hwo (-he informally) | -he |
| imperative | sing -yo, -wo plur -po | -ye, -we -pe |

Lao

D A Smyth, SOAS, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Number of Speakers and Genetic Relationship

Lao belongs to the southwestern subgroup of the Tai language family. It is the national language of Laos and the first language of approximately 70% of the population of 5.4 million. There is considerable regional variation in dialects but the Vientiane dialect is regarded as standard Lao and serves as a lingua franca for the country's many ethnic minorities. Lao dialects are spoken by a further 12–15 million people in northeast Thailand, and there are sizeable overseas Lao communities in both France and the United States.

Lao bears many very close similarities to Thai and, because of Thailand's economic and cultural dominance, most Lao people understand spoken Thai. Thai radio and television broadcasts, Thai pop songs, videos of Thai movies, and foreign movies dubbed in Thai are all popular in Laos; many educated Lao people also can read Thai. Thais, however, have more difficulty understanding Lao, partly through limited exposure to the language, and partly through a lack of desire to understand it, as they regard Lao as a language of low prestige.

Phonology and Grammar

Lao is a tonal language. Standard Lao has six tones: low, mid, high, rising, high falling, and low-falling. The vowel and consonant systems closely resemble

those of standard Thai; notable differences are the existence of an initial /p/ and the absence of /r/ in spoken Lao. Grammatically, too, there are close similarities to Thai: word order is *subject-verb-object*, nouns and verbs are not inflected, the pronominal system is complex and capable of conveying subtle degrees of relative status and intimacy. ‘Classifiers’ or ‘count words’ are used in noun phrases involving numbers.

Words of purely Lao origin are often monosyllabic. Sanskrit and Pali borrowings are numerous, and where they coexist with an indigenous Lao word they reflect a more formal or literary style. Other sources of loan words are Thai, Chinese, and Cambodian, although with Thai and Lao sharing many common basic words, the extent of Lao borrowing can be overestimated; many relatively recently coined Thai words have, however, been consciously absorbed into Lao. Despite the country’s former colonial status, French loan words are relatively few.

Sample of Lao with Translation

| láaw | jūu | hóonhian | |
| 3rd pers. pron. | location marker | school | |
| ‘I got to know her at school’ | | | |

Recent History

When the boundaries of present-day Laos were drawn up in 1893 under the terms of a Franco-Siamese treaty, the Lao-speaking population was divided in two, the majority paradoxically being in

northeast Thailand. The French brought in Vietnamese to carry out much of the administration of their colony, and with French the medium for what little postprimary education existed, the Lao language suffered a loss of prestige, even among many of its own speakers. The decline of French influence and the rise of nationalism in the aftermath of World War II helped to improve the status of Lao. Although the communist government, which came to power in 1975, has Lao-ized the education system, introduced adult literacy programmes and attempted to teach Lao to the country’s ethnic minorities, literacy rates remain low.

Latin

J Powell, Royal Holloway, University of London, Egham, Surrey, UK

© 2006 Elsevier Ltd. All rights reserved.

History and Affiliations

Latin is an Indo-European language of western central Italy, recorded from about 500 B.C. in the immediate area of Rome, related closely to the poorly attested Faliscan dialect and more distantly to Osco-Umbrian and Venetic. Lexical influences from

neighboring languages (Italic dialects, the unrelated Etruscan language, and above all Greek) are visible in Latin from the earliest period. With the rise of Rome, Latin spread throughout Italy and into the provinces of the Roman Empire. It became the spoken language in western continental Europe, displacing the indigenous languages; its spoken varieties developed into the modern Romance languages. A more or less standard version of written Latin remained in use in administration, law, education, and the Church, and in due course spread throughout Europe as Medieval Latin. The status of Latin as a common medium of

learned communication began to wane only with the rise of English as a world language in modern times.

Varieties

The dialect of Rome became the dominant form of Latin from an early period, with variations from it being regarded as rustic. Written Latin was standardized by the first century B.C. and remained broadly uniform thereafter, concealing changes and diversification in the spoken idiom; nevertheless a range of literary, technical, or colloquial registers can be distinguished in the surviving texts, and the occurrence of nonstandard written forms can provide evidence for spoken developments. The term *Vulgar Latin* is used to refer to any variety that departs significantly from classical norms. There is no good ground for regarding later written forms – Christian, Medieval, Renaissance, or Modern Latin – as essentially different varieties of the language: despite differences, often quite wide, in orthography, lexicon, style, and pronunciation, they all reflect the same basic linguistic structure and a common if diverse literary tradition. The following approximate periods may be recognized for convenience: Early Latin, to the 2nd century B.C.; Classical Latin, divided into Republican, and Augustan ('Golden'), and Early Imperial ('Silver'), until the 2nd century A.D.; Late Latin (i.e., the Latin of Late Antiquity), 3rd to 6th century A.D.; Medieval Latin, from the 7th to the 13th century A.D., including two high points of Latin culture, the Carolingian period (9th century) and the 12th-century renaissance. The term *Neo-Latin* embraces Renaissance Latin (14th to 15th centuries), the scholarly and scientific Latin of the early modern period, and modern uses of the language.

Script

The Latin alphabet, the basis of current Western European alphabets, was derived from a form of Greek script introduced into Italy by colonists from Euboea. In its classical form, it contains all the letters that are still used in Modern English except for J, U, and W; V (the U shape developed later) was used for the vowel /u/ and the semivowel /w/; I was used for the vowel /i/ and the semivowel /j/. Y and Z, originally absent from Latin, were imported for use in Greek borrowings. The capital letters, used for inscriptions, have retained their classical form more or less unchanged. Originating in Roman cursive, a variety of handwritten styles evolved from late antiquity onward and ultimately gave rise to modern lowercase letters.

Phonology

Sound/Spelling Relationship

The Classical Latin alphabet represents the sounds of the language quite well, except for its failure to distinguish the semivowels (as we now distinguish, e.g., *voluit* 'he wanted' from *volvit* 'he rolls'). Phonemic doubling of consonants was usually but not invariably indicated. In the classical period, vowel length was shown sometimes by doubling the vowel, more often by means of the *apex*, a diacritic resembling the acute accent. In Latin as conventionally printed, vowel length is not regularly indicated; so, for example, *canis* can represent either *cānīs* 'dog' or *cānīs* 'grey hair (dative-ablative)'.^a

A number of sounds initially caused spelling difficulties: (a) Classical Latin had a series of nasal vowels, represented (consistently with etymology) by vowel + *m* finally and vowel + *n* medially; (b) a vowel sound midway between /i/ and /u/ was found in words such as *optumus/-imus* 'best' and other superlatives, and *lubens/libens* 'willing'; (c) there was no separate symbol for the velar nasal (see note *c* under the following consonant table).

Consonants

The consonantal inventory of Latin may be set out as follows:

| | Labio-velar | Velar | Dental | Labial |
|----------------|-------------------------------------|--|--------|----------------------------------|
| Voiceless stop | /k ^w / <qu> | /k/ ^a <c>/ <k> | /t/ | /p/ |
| Voiced stop | /g ^w / <gu> ^b | /g/ | /d/ | /b/ |
| Nasal | | /ŋ/ <n>/ <g> ^c | /n/ | /m/ |
| Fricative | glottal: /h/ | alveolar: /s/ | | labiodental: /f/ |
| Liquid | | rolled/ flapped: /r/ lateral: /l/ ^d | | |
| Semivowel | | palatal: /j/ <i> | | labial: /w/ <u>/<v> ^e |

^aThe original sound was /k/, but the Romance and Medieval palatal realization before front vowels may already have started to develop in antiquity.

^bOccurs only medially after a nasal or liquid as in *languidus* 'languid', *urgueo* 'press'.

^cOccurs only medially, (a) as the outcome of /n/ before a velar, or (b) as the outcome of /c/ or /g/ before a nasal; written in the first case as <n>, as in *tango* 'touch', and in the second as <g> as in *dignus* 'worthy' (<*dec-nos, cf. *dec-ens* 'decent'). The combination /ŋn/ <gn> later underwent a further sound change to palatal /ñ/, found, for example, in Italian.

^dRepresented by both 'clear' and 'dark' (velarized) allophones, as shown by the effect on neighboring vowels.

^eThe sound /w/ later changed to /β/ or /v/; spelling variations indicate that this took place (under Greek influence?) in Italy and the East possibly as early as the first century A.D., and in the western provinces at a later period.

Vowels

Classical Latin had a symmetrical five-way vowel system with phonemic distinction between long, short, and nasalized vowels: e.g., *puellā* ‘girl’ (nominative): *puellā* /-a:/ (ablative): *puellam* /-ā/ (accusative). Early Latin had a range of inherited diphthongs, which were considerably simplified by the Classical period; further leveling took place in varieties of the spoken language (*au* > /o:/, *ae* > open /ɛ:/, *oe* > /e:/), giving rise to confusion in spelling. In Romance, the classical vowel system was remodeled: nasalization and phonemic vowel length disappeared, while changes in vowel quality led to merger of short /i/ with long /e:/, and of short /u/ with long /o:/.

Accent and Prosody

Classical and post-Classical Latin has a largely predictable stress accent: the accent falls on a long penultimate, but on the antepenultimate if the penultimate is short. (A short syllable is an open syllable containing a short vowel; all other syllables, except for a few doubtful cases, are long.) This had apparently replaced an earlier initial stress accent, which is postulated to account for the regular vowel weakening that took place in early Latin in non-initial syllables, e.g., *pro* ‘before’ + *habeo* ‘hold’ > *prohibeo* ‘forbid’. The usually clear distinctions of syllabic quantity made it possible for quantitative meters borrowed from Greek to replace the native ‘Saturnian’ verse form. Stress accent plays no formal part in Classical Latin verse, although there is an interaction between quantitative rhythm and word accent, which both creates some metrical restrictions and allows for considerable poetic subtlety. Stressed rhythms were reintroduced in Late and Medieval Latin.

Morphology

Inflection

Latin is an inflected language retaining a number of features of the parent Indo-European, but with considerable innovation, especially in the verbal paradigm.

Nouns are inflected for number and case. There are two numbers, singular and plural, and five regular cases: nominative, accusative, genitive, dative, and ablative. Nouns are traditionally grouped in five declensions: the first and second declensions continue the IE O/A stems, the third and fourth continue the IE stems in consonants and semivowels, and the fifth is a Latin innovation of mixed origin. A separate vocative is found only in the second declension and in borrowed Greek names. A locative case exists in place names and in a few common nouns, such as *domi*

‘at home’ from *domus* ‘home’. Nouns are assigned to one of three gender categories – masculine, feminine, and neuter – on the basis partly of sense and partly of form, so that on the whole there are fewer unpredictable or illogical assignments of gender than in many other languages.

Adjectives, both as attributes and as complements, agree with nouns in gender, number, and case; they broadly follow the same patterns of declension as nouns. There are no articles, but there is a rich pronominal system including four demonstratives (*is* ‘the one mentioned’, *hic* ‘this’, *iste* ‘that of yours’, *ille* ‘that over there’) and a distinction between specified and nonspecified indefinite pronouns (*quidam* ‘someone in particular’, *aliquis* ‘someone or other’).

Verbs are inflected according to the person and number of the subject. Subject pronouns are regularly dropped (*amamus* ‘we love’). There are two sets of personal endings, indicating voice: active -*o/-m -s -t -mus -tis -nt*, passive -*r -ris/-re -tur -mur -mini -ntur*; and one other set of endings peculiar to the perfect active. Verbs are classified in four conjugations according to stem vowel. The principal parts of a Latin verb, from which all other forms can be derived, are the first person singular present indicative active (normally listed in the dictionary, e.g., *dico* ‘I say’), the present infinitive active (e.g., *dicere* ‘to say’), the first person singular perfect active (e.g., *dixi* ‘I said’), and the past participle passive (e.g., *dictum* ‘said’). The stems of the present and perfect are combined transparently with tense markers to form two further indicative tenses and two subjunctive from each stem, e.g., *procedeba-m* ‘I was proceeding’ (imperfect indicative), *praedix-era-tis* ‘you had predicted’ (pluperfect indicative), *mane-re-mus* ‘we would be staying’ (imperfect subjunctive), *decipi-a-mini* ‘you would be deceived’ (present subjunctive passive). There are two imperatives, one used for immediate commands (*exi!* ‘get out!’), the other for instructions (*bene misceto* ‘mix well’). The perfect tenses of the passive are formed periphrastically: the past participle is combined with an appropriate (present-stem) form of *esse* ‘be’, e.g., *occisa est* ‘she has been killed’.

A restricted class of verbs (generally known as ‘deponents’: fossilized remnants of the old middle voice) take passive morphology although their meaning is active and can be transitive: e.g., *philosophor* ‘I philosophize’; *vereor* (transitive) ‘I fear’. Intransitive active verbs (including a class of verbs that take a dative object) have no passive, except third-person singular forms used impersonally, e.g., *venio* ‘I arrive’; *venitur* ‘people arrive’ (cf. the impersonal passive in the Celtic languages). Genuinely irregular verbs are few (*sum* ‘be’, *possum* ‘can’,

volo ‘want’, and some others). The greatest difficulty in Latin verbal morphology is the often unpredictable formation of the perfect stem.

The verb has two infinitives, present (*dicere* ‘to say’) and perfect (*dixisse* ‘to have said’); other verbal nouns (gerunds, supines) supply case forms for the infinitive. There are three participles, present active (*dicens* ‘saying’), past passive (*dictum* ‘said’), and future active (*dicturus* ‘about to say’), and a verbal adjective (the gerundive), which is future passive in meaning and often denotes obligation (*faciendum est* ‘it is to be done’).

Derivational Morphology

Latin has a productive system of derivational morphology, much of which is familiar through derivatives in modern languages, e.g., prepositional prefixes such as *ex-* ‘out’, *circum-* ‘round’; other prefixes such as *in-* ‘not’, *re-* ‘back’, nominal suffixes such as *-tio(n)-* (process) and *-tor* and *-trix* (male and female agents), and adjectival suffixes such as *-bilis* (*inextricabilis* ‘inextricable’), *-anus* (*Christianus* ‘Christian’), *-arius* (*piscarius* ‘to do with fish’). Adjectives form adverbs (in *-e*, *-o*, or *-ter*), comparatives in *-ior*, and superlatives in *-issimus*. At first, Latin was resistant to some kinds of derivation; for example, compound nouns or adjectives were relatively unusual, occurring mostly in high style (*solivagus* ‘wandering alone’) or as comic colloquialisms (*caldicerebrius* ‘hot-headed’). From the classical period onward, the need to express new ideas led to a large expansion of the classical lexicon both by derivation and by borrowing.

Syntax

Word Order

Because Latin encodes basic grammatical relations by means of inflection, there is considerable freedom in word order. Either a topic or an emphasized predicate may be placed first in a sentence, and variations of logical emphasis are also common at phrase level. Classical Latin preserves the Indo-European phenomenon known as Wackernagel’s Law, i.e., the first stressed position in a sentence or clause is followed by an unstressed position which often contains, in order of precedence, (a) sentence connectives, (b) weak pronouns, (c) unstressed verbs. The phenomenon of hyperbaton, or discontinuity in the noun phrase, is a particular feature of Latin as it is of Classical Greek: its effect is often to throw particular focus on to the first element of the noun phrase, e.g.:

Because of inflection, the absence of articles, and the flexibility of word order, Latin is capable of considerable compression, hence the lapidary style favored in inscriptions, proverbs, and epigrams.

Complex Sentence Structure

Subordination is much favored in varieties of literary Latin; Classical Roman writers influenced by the Greek periodic style made full use of the available syntactical resources, e.g., the inflected relative pronoun enabling any nominal constituent to be relativized, and the free use of the accusative-infinitive construction to create continuous indirect speech (*oratio obliqua*), as well as paratactic devices such as apposition, parallelism, ellipsis, and chiasmus. Means were found to compensate for the lack of certain features (e.g., the past participle active) which had made for flexibility in Greek, and the rich tense system is fully exploited in classical narrative prose. Late and Medieval Latin usage often blurs the distinctions of tense and mood found in Classical Latin; the conjunction *quod* ‘that’ gains ground at the expense of the accusative-infinitive, the active present participle becomes more frequent, and the periphrastic constructions characteristic of the Romance verbal conjugation begin to appear.

Latvian

Latvian (*latviešu valoda*), with some 1.5 million speakers in the Republic of Latvia, is one of two present-day Indo-European Baltic languages, the other being the structurally more conservative Lithuanian. The Latvian standard language is based on the central Latvian dialect (*vidus dialekts*), which is further divided (from west to east) into Couronian, Zemgalian, and Vidzeme varieties. The central dialect, together with Tamian in northwestern Couronia and along the northeastern coast of the Bay of Riga, is known as Low Latvian. High Latvian (Selonian and Latgalian, the latter with an independent literary tradition), is found in the eastern third of the country.

The traditional view of the origin of Latvian is that it represents a synthesis of the language of the early Latgalians (known from the 13th century on simply as *Letti*, that is, Letts or Latvians) and neighboring closely related Baltic dialects, now extinct, among them Zemgalian (along the Lielupe river), Couronian (in southwestern Latvia), and Selonian (along the middle Daugava). The influence of these Baltic substrata, together with that of Balto-Finnic and Slavic

neighbors, accounts in large part for the marked dialectal diversity of Latvian within a relatively small territory.

The beginnings of a Latvian literary tradition date to the Reformation. The first published book in Latvian is a 1585 translation of a Catholic catechism; this was soon followed by other religious texts, chiefly translations. The language of these early texts is to varying degrees influenced by the German speech of the authors, especially in syntax. Efforts to establish a national standard language were begun in the mid-19th century; the Latvian traditional folksongs (*dainas*) served as an important source of norms for the standard language. A milestone in the codification and description of modern Latvian was the appearance of Jan Endzelin's (Jānis Endzelīns) *Lettsische grammatik* (1922) and the four-volume *Latviešu valodas vārdnīca* [*Dictionary of Latvian*] (1923–32), begun by Karl Mühlenbach (Kārlis Mīlenbahs) and completed by Jan Endzelin.

The Latvian vowel phonemes include /i, u, ε, æ, a/ (spelled *i, u, e, e, a*) and their long counterparts /i:, u:, ε:, æ:, a:/ (spelled *ī, ū, ē, ē, ā*). In addition, a long and short *o* are found in borrowed words. The vowels /ε/ and /æ/ (and /ε:/ and /æ:/) are represented in writing by a single *e* (*ē*), reflecting the fact that they are derived from a single source, Baltic *e* (**ē*). Originally

conditioned by the nature of the following vowel, they now function as separate phonemes. Functioning as long vowels are the diphthongs [iɛ, uɔ] (written *ie*, *o*), which result from Common Baltic **ei* and **ō*: *diēvs* ‘God’ (**deiu-*), *nò* ‘from’ (**nō*), and from tautosyllabic sequences *en* and *an*: *pieci* [piɛtsi] ‘five,’ *ròka* [rùɔka] ‘hand’ (Li. *penkì*, *rankà*). In final syllables Baltic long vowels are shortened and short *e* and *a* are lost: La. *vilks* ‘wolf’: Li. *vilkas*.

Among the consonants of Latvian, the obstruents reflect a voiced:voiceless opposition, with regressive voicing assimilation (*atbilde* [ˈad̪il̪d̪e] ‘answer,’ *labs* [laps] ‘good’); unlike Lithuanian, word-final consonants in final position are not devoiced: *kad* [kad] ‘when.’ Latvian lacks the feature of palatalization found in Lithuanian, but distinguishes a series of palatal consonants: *ḳ* [c], *g̣* [ɟ], *ņ* [ɲ], *ļ* [ʎ]; *ḳ* and *g̣* are found mainly in borrowed words. Characteristic of the Latvian consonant system is the development of *ts*, *dz* from Baltic *k*, *g* before a front vowel: *cits* ‘other’ (Li. *kìtas*), *dzimt* ‘to be born’ (Li. *gim̃ti*). The Baltic reflexes of the IE palatovelars have merged in Latvian with *s* and *z*: *simts* ‘hundred’ (Li. *šim̃tas*) < IE **k̑ntó-*, *zeme* ‘earth’ (Li. *žemē*) < IE **dʰgʰem-*. Secondary palatals *f*, *z* (orthographically *š*, *ž*) have arisen in turn from the sequences **s̑i*, **t̑i* (>*f*) and **z̑i*, **d̑i* (>*z*) before a back vowel: *šūt* ‘to sew’ (<**s̑iūt-*).

With a few exceptions, Latvian has initial stress. The standard language distinguishes three phonemic tones (marked only in linguistic texts) on long vowels and diphthongs: level [˘] and broken [˚], both representing Baltic acute tone; and falling [ˑ], representing Baltic circumflex: *mīt* ‘to tread,’ *mīt* ‘to change (arch.),’ *mīt* ‘resides.’ Only the central Latvian Vidzeme dialect around Valmiera still distinguishes all three such tones; remaining dialects oppose only two (outside of High Latvian, broken and falling tone typically merge as either falling or broken tone).

The Latvian noun distinguishes masculine and feminine gender, each with three declensional patterns. Within declensional paradigms, five cases are distinguished morphologically: nominative, genitive, dative, accusative, and locative, in both the singular and plural. Adjectives, which occur in both definite and indefinite forms, agree with the noun in number, gender, and case.

The Latvian verb distinguishes present, past, and future tenses, and has a system of relative tenses

formed with *būt* ‘to be’ and the past active participle. The verb has three conjugational types (only two of which are productive), each with a number of subtypes. The 1 sg. present and past forms coalesce in many instances where the stems are not distinguished by root vowel gradation. Like Lithuanian, singular and plural are not distinguished morphologically in the third person.

Peculiar to Latvian, from a Baltic perspective, is the syntactic construction *man ir* ‘to-me is’ for ‘I have’ (Li. *aš turiu*) and the use of the debitive (expressing obligation), formed with the particle *jā-* and the 3rd person present, with a dative subject: *man jābrauc* (“to-me must-go”) ‘I must go.’ Like Lithuanian, Latvian uses a preposed adnominal genitive: *latviešu valoda* (“of-Latvians language” = ‘Latvian language’).

The lexicon has been rather strongly influenced by neighboring Baltic Finnic languages, chiefly Livonian: interrogative particle *vai* (Liv. *või*), *māja* ‘house’ (Est. *maja*); and also by German: Middle Low German during the Hanseatic period and New High German thereafter (*brīvs* ‘free’: MLG *vrī*, *ün* ‘and’: MLG *un*, *brīlles* ‘eyeglasses’ NHG *die Brille*). Nevertheless, Latvian preserves a number of Indo-European archaisms not found elsewhere in Baltic: *asins* ‘blood,’ *agrs* ‘early.’

Lithuanian

S Young, University of Maryland Baltimore County, Baltimore, MD, USA

Lithuanian (*Lietuvių kalbà*) is the native language of some 2.9 million speakers in the Republic of Lithuania. Together with Latvian, it forms East Baltic, the sole remaining branch of the Baltic family of Indo-European languages. There are two major dialects of Lithuanian, the more conservative and territorially greater Aukštaitic (*aukštaičių tarmė*) and the more innovating Žemaitic (*žemaičių tarmė*; Samogitian), spoken in the northwest quarter of Lithuania. The standard language is based on the speech of the southwest Aukštaitic region, bordering former East Prussia.

The Written Language

The Writing Tradition in East Prussia

Lithuanian is attested in written form from the 16th century, in three varieties of the Aukštaitic dialect; the earlier texts are chiefly translated and original religious literature. Book publication in Lithuanian began earliest in German East Prussia (which had a substantial Lithuanian population) in connection with the spread of the Reformation. The first work published in Lithuanian is a 1547 translation of a Lutheran catechism by Martynas Mažvydas (Martinus Masvidius). The foreword begins with a personal appeal to the reader, *Bralei seseris imkiet mani ir skaitikiet* ‘Brothers, sisters, take me and read me’. The language reflects Mažvydas’s native south Žemaitic dialect, with Aukštaitic elements. Subsequent Lithuanian publications in East Prussia are written in an increasingly normalized variety of the local west Aukštaitic dialect, codified in Daniel Klein’s 1653 *Grammatika Litvanica*, the first grammar of Lithuanian.

The Writing Tradition in the Grand Duchy

In the Catholic Grand Duchy of Lithuania, two writing traditions took root, one based on the East Aukštaitic dialect of the capital, Vilnius, and the other representing the Central Aukštaitic dialect of the Kedainiai area. The latter served as the medium for the earliest Lithuanian publications in the Grand Duchy, i.e., Mykalojus Daukša’s 1595 translation of Jacobus Ledisma’s popular Catholic catechism and his lengthy 1599 translation of Jakub Wujek’s collection of sermons, the *Postilla Catholicka*. Although these were translations, the language of these works

is relatively natural and had considerable influence on the later cultivation of Lithuanian. Daukša’s works are also the first accented texts in Lithuanian, and as such are of particular importance for the study of the historical prosody of the language.

The National Standard Language

The increasing polonization of the Grand Duchy’s nobility and educated classes led in the 18th century to a decline in the Central and East Aukštaitic writing traditions (the latter eventually disappeared). The present-day standard language has its roots in the late 19th century, and is based on the dialect of the southern West Aukštaitic region, in which the speakers are traditionally called *suvalkiečiai*. Several factors stand out in the establishment of this dialect as the national standard: the prior literary tradition of the virtually identical Aukštaitic dialect of neighboring East Prussia; the authority of the 19th-century Lithuanian grammars of A. Schleicher and F. Kurschat, which described the same Prussian Lithuanian speech; and the normative influence of late 19th- to early 20th-century newspapers such as *Aušra* (*The Dawn*) and *Varpas* (*The Bell*), which had many writers and editors (in particular Jonas Jablonskis) who came from the southwest Aukštaitic dialect area.

Phonology

Prosodic Features

Standard Lithuanian has free stress, which may alternate between a stem and ending within a grammatical paradigm, as in *dukrà* (nominative), *dùkrą* (accusative) ‘daughter’; *sakaũ* ‘I say’, and *sàko* ‘he says’. There are four such stress patterns for nouns and two for verbs. Stressed long vowels and diphthongs (including sequences of vowel plus tautosyllabic resonant) distinguish two phonemic contour tones, traditionally referred to as acute (´) and circumflex (~), as in *šáuk!* ‘shoot.IMP’ vs. *šáuk!* ‘shout.IMP’. Short stressed vowels are marked with a grave accent (`). The tones are conventionally indicated in dictionaries and linguistic works; otherwise, they are not represented.

According to the norms of the standard language, acute tone (*virtapradė priegaidė*) is realized with a falling tonal contour, whereas circumflex tone (*virtagalė priegaidė*) is level or rising. The tonal opposition is clearest on diphthongs; in the urban colloquial language, the distinction is becoming neutralized on long vowels. The phonetic realization of the two tones differs dialectally; in particular, the acute tone

of northwest Žemaitic speech incorporates a glottal stop (*laužtinė priegaidė* ‘broken tone’).

The Vowel System

Vowel length is distinctive in Lithuanian. The rather open short vowel phonemes /i [i], u [u], e [ɛ], a [a]/ (orthographically *i, u, e, a*) are inherited from proto-Baltic and also result from an early Lithuanian shortening of final long vowels under acute tone (compare *tà* ‘this. NOM SG FEM’ with Latvian *tā*, having the Latvian reflex of acute). In addition, a short /ɔ/ (spelled *o*) is found in words of foreign origin.

The long vowel phonemes /i:, u:, e:, o:, æ:, a:/ (orthographically *y/i, ū/u, è, o, e, q*) also have two sources. Inherited length is represented by the spellings *y, ū, è, o* [*< *ā*], as in *gývas* (**gī-*) ‘alive’, *búti* (**bū-*) ‘to be’, *sėti* (**sē-*) ‘to sow’, and *brólis* (Latvian *brālis*) ‘brother’, whereas *i, u, e, and q* develop from sequences of vowel plus tautosyllabic *n*, when not before a stop (where they are preserved). Original *V + n* sequences were first replaced by long nasalized vowels, marked in the earlier texts by a hook under the corresponding vowel graph. These vowels were eventually denasalized, although the orthography still reflects the earlier practice, as in *ĩ* [i:] (< **in*) ‘to, into’, *siūsti* [s’iūst’i] (< **siūnt-*) ‘to send’, *tęsti* [t’æ:st’i] (< **teñs-*) ‘to continue’, and *žąsis* [ž’a:s’is] (< **žañs-*) ‘goose’. Both long and short *a* are fronted to /æ:/ and /ɛ/, respectively, after a palatalized consonant or *j*, as in *gilią* ‘deep.ACC SG FEM’ = *gile* ‘acorn.ACC SG FEM’, both [g’i:l’æ:]; and *giliąs* ‘deep.ACC PL FEM’ = *gilės* ‘acorns.ACC PL FEM’, both [g’i:l’ɛs].

Short *e* and *a* are automatically lengthened under stress in most nonfinal syllables to [æ:] and [a:], with concomitant circumflex tone. This phonetic vowel length is not indicated orthographically, i.e., *ledas* [l’æ:das] ‘ice’ and *vakaras* [v’ā:karas] ‘evening’ (compare Latvian *ledus* and *vakars*, having short *e* and *a*). Also included in the inventory of Lithuanian vowels are the diphthongs *ie* and *uo*, which arose from East Baltic **ē* (< **ei*) and **ō* (< **o*). These diphthongs, which function as long vowels, begin with a high vowel and end with a lower, more central vowel (ɨ, ʊ), as in *dienà* (**dein-*) ‘day’ and *dúona* (**dōn-*) ‘bread’, phonetically [d’iɛ’na] and [d’úɔna].

The Consonant System

Lithuanian alone among the Baltic languages preserves distinct reflexes (*ʃ* and *ʒ*) of the Indo-European palatovelars; in Latvian and Old Prussian as well as in Slavic, these have merged with *s* and *z*., as in *šuō* ‘dog’ and *žemė* ‘earth’ (Latvian *suns* and *zeme*).

A characteristic feature of the Lithuanian consonant system is the phonemic opposition of palatalized and nonpalatalized consonants before back vowels (palatalization is automatic before front vowels). These palatalized consonants are the product of Baltic consonant + *ĩ* sequences, which are still preserved in the case of labial stops in word-initial position, as in *pjáuți* [p’j’áut’i] ‘to cut’ and *bjaurūs* [b’j’eu’rūs] ‘ugly’. Earlier sequences of dental stop + *ĩ* have developed into the affricates [tʃ’] and [dʒ’], orthographically *č(i)* and *dž(i)*, as in *čia* (**tīa*) ‘here’ and *mėdžias* (**medjas*) ‘woods’. The distinctive palatalization of the remaining consonants is marked orthographically by a following *i*, as in *siūti* [s’iū’t’i] ‘to sew’ and *liáudis* [l’i’áud’is] ‘people’.

Morphosyntactic Features

The Noun

Lithuanian has preserved the Baltic stem classes and their declensional endings rather well, giving the noun a relatively archaic appearance. Six case forms are distinguished in the singular and plural (a dual is attested for certain case forms in dialects and older texts): (1) nominative (for example, in the singular, the *o*-stem *nāmas* ‘house’, *ā*-stem *rankà* ‘hand’, *i*-stem *akis* ‘eye’, and *u*-stem *sūnius* ‘son’), (2) genitive (*nāmo, rañkos, akiės, and sūnaūs*), (3) dative (*nāmui, rañkai, ākiai, and sūnui*), (4) accusative (*nāma, rañka, āki, and sūnu*), (5) instrumental (*namū, rankà, akimū, and sūnumū*), and (6) locative (*namè, rankojè, akyjè, and sūnujè*). In addition, a special vocative form is used in the singular, as in *Jōnai!* (nominative *Jōnas* ‘John’) and *Birūte!* (nominative *Birūtė*).

The adnominal genitive is typically preposed, as in *tėvo nāmas* ‘of-father house’ (‘father’s house’) and *lietuvių kalbà* ‘of-Lithuanians language’ (‘Lithuanian language’). The genitive also occurs in partitive expressions, both positive, as in *miškè yrà vilkū* ‘in-the-woods there-are wolves (genitive)’, and negative, as in *nèrà žuviēs* ‘there-is-no fish (genitive)’. The locative case is used without a preposition, as in *Vilniuje* ‘in Vilnius’; historically this represents an inessive, the remnant of a more complex system of local cases formed with postpositions. These cases included an adessive, illative, and allative, some of which (particularly the illative) are still found dialectally.

Nouns are marked for gender (masculine and feminine) through distinctive desinences and adjectival concord, as in *gėras tėvas* ‘good father’ and *gerà mótina* ‘good mother’. In an innovation shared with

Latvian, proto-Baltic neuter gender was lost; neuters typically became masculine, as in *šīēnas* ‘hay’ (masc.) and Old Church Slavonic *sěno* (neut.). The category of definiteness is marked within adjectives by the historical affixation of a pronominal *-ī-* element to the indefinite form, as in indefinite *nāūjas* (masc.), *naujā* (fem.) ‘new’ vs. definite *naujāsis* (i.e., *naujas* + *jis*) (masc.), *naujōji* (fem.).

The Verb

The Lithuanian verb marks present, past, and future tense forms. The present tense has three conjugation patterns, illustrated by *lipti* ‘to climb’ (first conjugation, stem in *a*), *mylėti* ‘to love’ (second conjugation, stem in *i*), and *skaityti* ‘to read’ (third conjugation, stem in *o*): 1SG (*aš*) *lipù*, *mýliu*, *skaitaũ*; 1PL (*mes*) *lipame*, *mýlime*, *skaitome*; 2SG (*tu*) *lipì*, *mýli*, *skaitaĩ*; 2PL (*jūs*) *lipate*, *mýlite*, *skaitote*; 3SG/PL (*jis/jie*) *lipa*, *mýli*, *skaito*. The past tense has two patterns, illustrated by *lipti* ‘to climb’ (stem in *o*) and *skaityti* ‘to read’ (stem in *è*): 1SG (*aš*) *lipaũ skaičiaũ*; 1PL (*mes*) *lipome*, *skaitème*; 2SG (*tu*) *lipaĩ*, *skaitèĩ*; 2PL (*jūs*) *lipote*, *skaitète*; and 3SG/PL (*jis/jie*) *lipo*, *skaitè*. A frequentative past is formed by adding the suffix *-dav-* (plus *o*-stem endings) to the infinitive stem, as in *jis skaitýdavo* ‘he used to read, would read’ (*skaitýti* ‘to read’). The future is formed by adding *-s-* and the present-tense person endings to the infinitive stem, *lipti* ‘to climb’: 1SG (*aš*) *lipsiu*, 1PL (*mes*) *lipsime*, 2SG (*tu*) *lipsi*, 2PL (*jūs*) *lipsite*, and 3SG/PL (*jis, jie*) *lips*. As the various examples demonstrate, number is not marked in the third person, a characteristic feature of Baltic.

Lithuanian shows a fondness for participles and gerunds, in both colloquial and written styles. Among the more typical participles (which decline like adjectives) are the present active (*rašys*, stem *rāšant-*, infinitive *rašyti* ‘to write’), past active ([*pa*] *rāšęs*, stem ([*pa*] *rāšius-*), present passive (*rāšomas*), and past passive (*parašytas*). The past active participle is used, together with a finite form of the verb ‘to be,’ to form a system of perfect tenses, as in *aš esù* (*pa*) *rāšes* (masc.)/(*pa*) *rāšiusi* (fem.) ‘I have written’ and *aš buvaũ* (*pa*) *rāšęs* (masc.)/(*pa*) *rāšiusi* (fem.) ‘I had written’. Passive constructions are formed with the verb ‘to be’ and the corresponding passive

participle, as in *knygà bũvo rāšoma* ‘the book was being written’ and *knygà bũvo parašýta* ‘the book was/had been written’. The language retains a reflex of an earlier dative absolute in gerundive constructions such as *sáulei tēkant* ‘as the sun is/was rising’ (‘to-the-sun rising’).

Lexicon

Lithuanian has long felt the lexical influence of neighboring Slavic languages. Early East Slavic borrowings into Lithuanian include *tuřgus* ‘market’ and *krikštas* ‘baptism’ (Old Russian *torǫb* ‘market’ and *krǫstǫ* ‘cross’). Among East Slavic borrowings from the time of the Grand Duchy are *knygà* ‘book’ and *blýnas* ‘pancake’ (Russian *kníga* and *blin*). A significant number of Polish borrowings began to appear in Lithuanian in the 17th and 18th centuries, among them *arbatà* ‘tea’ and *cũkrus* ‘sugar’ (Polish *herbata* and *cukier*). Since the late 19th century, language reformers have succeeded in replacing many earlier borrowings with native words known from dialects and Old Lithuanian texts; for example, the native *laikas* ‘time’ was normalized in place of *čėsas* (Russian *čas*), and *pasáulė* ‘world’, in place of *svietas* (Russian *svet*). During this time, a number of neologisms took root, such as *akiniaĩ* ‘eyeglasses’ (*akis* ‘eye’) and *mokyklà* ‘school’ (*mok-* ‘teach, learn’ + *-ykl-* ‘place where’).

Long-Range Comparison: Methodological Disputes

L Campbell, University of Utah, Salt Lake City, UT, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

How are languages shown to be related to one another? Proposals of distant linguistic kinship such as Amerind, Nostratic, Eurasiatic, and Proto-World have received much attention in recent years, although these same proposals are rejected by a majority of practicing historical linguists. This has resulted in vigorous disputes about the methods for investigating remote relationships among languages as yet not known to be related. Some enthusiasts of long-range relationships, disappointed that proposed language connections they favor have not been accepted, have at times responded bitterly, for example charging that these rejections are just “clumsy and dishonest attempts to discredit deep reconstructions” (Shevoroshkin, 1989: 7), and that “very few [critics of long-range proposals] have ever bothered to examine the evidence first-hand. . . . To really screw up classification you almost have to have a Ph.D. in historical linguistics” (Ruhlen, 1994: viii). The strong rhetoric is not all one-sided:

At a different level – which transcends scientific worth to such an extent that it is at the fringe of idiocy – there have in recent years been promulgated a number of far-fetched ideas concerning ‘long-distance relationships’, such as ‘Nostratic’, ‘Sino-Caucasian’, and ‘Amerind’. (Dixon, 2002: 23)

This article explains these disputes.

Hypothesized Long-Range Relationships

The list in Table 1 of the better-known hypotheses that would group together languages that are not yet known to be related gives an idea of what is at issue. (None of the proposed genetic relationships in this list has been demonstrated yet, even though some are repeated frequently.)

Methods

Scholars agree that a successful demonstration of linguistic kinship depends on adequate methods, but disagree about what these methods are. Hence discussions of methodology assume a central role in considerations of long-range comparisons. Therefore, the methodological principles and criteria considered important for investigating proposals of distant genetic relationship are surveyed here.

In practice, the successful methods for establishing distant linguistic affinity have not been different from those used to establish any family relationship, close or distant. The comparative method has always been the primary tool. Because the methods for distant relationships are not different from those for more closely related languages, we encounter a continuum from established families (e.g., Indo-European, Finno-Ugric, Mayan, Bantu), to more distant but solidly demonstrated relationships (e.g., Uralic, Siouan-Catawban, Benue-Congo), to plausible but inconclusive hypotheses (e.g., Indo-Uralic, Proto-Australian, Macro-Mayan, Niger-Congo), to doubtful but not implausible ones (e.g., Altaic, Austro-Tai, Eskimo-Uralic, Nilo-Saharan), and on to virtually impossible proposals (e.g., Basque-Sino-Tibetan-NaDene, Indo-Pacific Mayan-Turkic, Miwok-Uralic, Niger-Saharan).

Table 1 Proposals of distant genetic relationships among languages

| |
|--|
| Altaic (Turkic, Tungusic, Mongolian, sometimes Japanese, Korean) |
| Amerind (uniting all Native American language families, except Eskimo-Aleut and Na-Dene) |
| Dene-Sino Tibetan (Athabaskan [or Na-Dene] and Sino-Tibetan) |
| Austric (Austro-Asiatic with Austronesian) |
| Austro-Tai (Japanese-Austro-Thai) |
| Basque-Caucasian, Basque-Sino Tibetan-NaDene |
| Dravidian-Uralic |
| Eskimo and Indo-European |
| Eskimo-Uralic |
| Eurasiatic (Indo-European, Uralic, Eskimo-Aleut, Ainu, several others) |
| Hokan (grouping numerous American Indian families and isolates) |
| Indo-European and Afroasiatic, Indo-European and Semitic |
| Indo-Pacific (grouping the non-Austronesian languages of the Pacific: all Papuan families, Tasmanian, languages of the Andaman Islands) |
| Japanese-Austronesian |
| Khoisan (grouping most non-Bantu African click languages, an areal grouping, not a genetic one) |
| Macro-Siouan (Siouan, Iroquoian, Caddoan, sometimes Yuchi) |
| Maya-Chipayan (Mayan, Uru-Chipayan of Bolivia) |
| Na-Dene (Eyak-Athabaskan, Tlinglit, Haida; Haida is highly disputed) |
| Niger-Kordofanian (Niger-Congo) (grouping Mande, Kru, Kwa, Benue-Congo [of which Bantu is a branch], Gur, Adamawa-Ubangi, Kordofanian, etc.) |
| Nilo-Saharan (most of the African languages not otherwise classified with one of Greenberg’s other three African macrofamilies) |
| Nostratic (Indo-European, Uralic, Altaic, Kartvelian, Dravidian, Afroasiatic; some add others) |
| Penutian (grouping numerous American Indian families and isolates) |
| Proto-Australian (all Australian families) |
| Proto-World (uniting all the world’s languages) |
| Ural-Altaic (Uralic and Altaic) |

It is difficult on the basis of standard methods to segment this continuum so that plausible proposals based on legitimate procedures fall sharply on one side, distinguished from obviously unlikely hypotheses on the other side. This leads to disagreements, even by those who profess allegiance to the same methods.

A firm understanding of methodology becomes crucial if supporters of fringe proposals can pretend to apply the same methods as those employed for more plausible ones. For this reason, careful evaluation of the evidence presented on behalf of any proposed distant linguistic relationship and of the methods employed is called for.

Throughout history, the criteria employed in both pronouncements about method and in actual practice for establishing language families consistently included evidence from three sources: basic vocabulary, grammatical evidence (especially morphological), and sound correspondences. Hoenigswald (1990: 119–120) summarized the points upon which 17th- and 18th-century linguistic scholars agreed:

There was ... “a concept of the development of languages into dialects and of dialects into new independent languages” ... and ... “an insistence that not a few random items, but a large number of words from the **basic vocabulary** should form the basis of comparison” ... the doctrine that ‘**grammar**’ is even more important than words; ... the idea that for an etymology to be valid the **differences in sound** – or in ‘letters’ – **must recur** [emphasis added, LC].

These criteria figured prominently in nearly all demonstrations of language families in the past, making them important also to today’s practice. The methods and criteria generally thought necessary for reliable long-range comparison are surveyed in what follows. (See Campbell, 2003; Campbell, 1997a: 206–259 for details.)

Lexical Comparison

Throughout history, word comparisons have been employed as evidence of language family relationship, but, given a small collection of likely-looking words, how can we determine whether they are really the residue of common origin and not due to chance or some other factor? Lexical comparisons by themselves are seldom convincing without additional support from other criteria.

Basic Vocabulary Most scholars require that basic vocabulary be part of the supporting evidence for any distant genetic relationship. Basic vocabulary is generally understood to include terms for body parts, close kinship, frequently encountered aspects of the natural world (mountain, river, cloud), and low numbers. Basic vocabulary is generally resistant to

borrowing, so comparisons involving basic vocabulary items are less likely to be due to diffusion and stand a better chance of being inherited from a common ancestor than other kinds of vocabulary. Still, basic vocabulary can also be borrowed – though infrequently – so that its role as a safeguard against borrowing is not foolproof.

Glottochronology Glottochronology, now mostly abandoned, aimed at assigning dates to the split up of related languages; it has been employed in long-range comparisons. It depends on basic, relatively culture-free vocabulary, but all its basic assumptions have been challenged (including the existence of culture-free vocabulary). Most tellingly, it does not find or test distant genetic relationships, but rather it **assumes** that the languages compared are related and proceeds to attach a date based on the number of core-vocabulary words that are considered similar among the languages compared. This, then, is no method for determining whether languages are related.

Multilateral Comparison The best-known approach that relies on inspectional resemblances among words is Joseph Greenberg’s ‘multilateral (or mass) comparison.’ It is based on “looking at ... many languages across a few words” rather than “at a few languages across many words” (Greenberg, 1987: 23). The lexical similarities determined by superficial visual inspection that are shared ‘across many languages’ alone are taken as sufficient evidence for genetic relationship. This approach stops where others begin, at assembling lexical similarities. These inspectional resemblances must be investigated to determine why they are similar, whether the similarity is due to inheritance from a common ancestor (genetic relationship), or to borrowing, accident, onomatopoeia, sound symbolism, or nursery formations – nongenetic factors. Since multilateral comparison does not do this, its results are controversial and rejected by most mainstream historical linguists.

No technique that relies on inspectional similarities in vocabulary alone has proven adequate for establishing family relationships.

Sound Correspondences

Nearly all scholars consider regular sound correspondences strong evidence of genetic affinity. Correspondences do not necessarily involve similar sounds. The sounds that are equated in proposals of remote relationship are typically similar, often identical, although such identities are not so frequent among the daughter languages of well-established language families. The sound changes that lead to such

nonidentical correspondences often make cognate words not apparent. These true but nonobvious cognates are missed by methods that seek only superficial resemblance, for example: French *cinq*/Russian *pjatj*/Armenian *hingl*/English *five* (all derived by straightforward changes from original Indo-European **penkwe-* ‘five’); French *boeuff*/English *cow* (both from Proto-Indo-European **gwou-* ‘cow’). The words in these cognate sets are not visually similar, but they exhibit regular sound correspondences among the cognates.

Though extremely important and valuable, the criterion of sound correspondences can be misapplied. Sometimes regularly corresponding sounds are found in loans. By Grimm’s law, real French-English cognates should exhibit the correspondence *p* : *f*, as in the cognates *père*/father, *piéd*/foot, *pour*/for. However, French and English appear to correspond *p* : *p* in cases where English has borrowed from French or Latin, as in *paternell*/paternal, *piédestal*/pedestal, *per*/per. Since English has many such loans, examples of the bogus *p* : *p* sound correspondences are not hard to find. In comparing languages not yet known to be related, we must be cautious of the problem of seeming correspondences in undetected loans. Sound correspondences in basic vocabulary help, since basic vocabulary is borrowed only infrequently.

Some nongenuine sound correspondences can come from accidentally similar words. Languages share some vocabulary by sheer accident, for example: Proto-Je **niw* ‘new’/English *new*; Kaqchikel *mes* ‘mess’/English *mess*; Maori *kuri* ‘dog’/English *cur*; Lake Miwok *bóllu* ‘hollow’/English *hollow*; Gbaya *be* ‘to be’/English *be*. Other unreal sound correspondences can come from wide semantic latitude in proposed cognates, when phonetically similar but semantically disparate forms are equated. For example, if we compare Pipil (Uto-Aztecan) *teki* ‘to cut’/Finnish (Uralic) *teki* ‘made’, *tukat* ‘spider’/tukat ‘hairs’, etc., we note a recurrence of a *t* : *t* and a *k* : *k* correspondence. However, the phonetic correspondences in these word pairs are accidental – it is always possible to find phonetically similar words among languages if their meanings are ignored. With too much semantic leeway among compared forms, spurious correspondences such as the Pipil-Finnish *t* : *t* and *k* : *k* turn up. Unfortunately, wide semantic latitude is very common in cases of long-range comparison. Additional noninherited phonetic similarities crop up when onomatopoeic, sound-symbolic, and nursery forms are compared. A set of proposed cognates involving a combination of loans, chance enhanced by semantic latitude, onomatopoeia, and such factors can exhibit false sound correspondences.

For this reason, some proposed remote relationships that purportedly are based on regular sound correspondences nevertheless fail to be convincing.

Grammatical Evidence

Scholars throughout linguistic history have considered morphological evidence important for establishing language families. Many favor ‘shared aberrancy’ (‘submerged features,’ ‘morphological peculiarities,’ ‘arbitrary associations’). For example, the Algonquian-Ritwan hypothesis, which groups Wiyot and Yurok (both of California) with the Algonquian family, was controversial, but morphological evidence such as the following comparison of Proto-Central-Algonquian (PCA) and Wiyot helped to confirm the relationship:

Proto-Central-Algonquian **ne* + **ehkw-*
= **netehkw-* ‘my louse’
Wiyot *du-* + *hikw* = *duṭikw* ‘my louse’ (Teeter, 1964:
1029)

Proto-Central-Algonquian inserts *-t* between a possessive pronominal prefix and a vowel-initial root, while Wiyot inserts *-t-* between possessive prefixes and a root beginning in *hV* (with the loss of the *h* in this process). There is no phonetic reason why *t* should be added in this environment; this is so unusual it is not likely to be shared by borrowing or accident. Inheritance from a common ancestor that had this peculiarity is more likely, and this is confirmed by other evidence in these languages. Another often repeated example of shared aberrancy is the suppletive agreement between English *good/better/best* and German *gut/besser/best*, where examples such as this are held to have probative value for showing languages are related.

Morphological correspondences of the ‘shared aberrancy’ type are an important source of evidence for distant genetic relationships.

Borrowing

Diffusion is a source of nongenetic similarity among languages that can complicate evidence for remote relationships. For example, the controversial ‘Chibchan-Paezan’ hypothesis (grouping several South American language families, part of ‘Amerind’) has the proposed cognate set ‘axe’ with words from only four of the many languages involved, but two of these are loans: Cuitlatec *navaxo* ‘knife’, from Spanish *navajo* ‘knife, razor’, and Tunebo *baxita* ‘machete’, from Spanish *machete* (Tunebo has nasal consonants only before nasal vowels, hence *b* substitutes for Spanish *m*) (Greenberg, 1987: 108). When two of the four pieces of evidence are borrowings, the putative ‘axe’ cognate must be abandoned. Examples

such as this are not uncommon in proposals of distant genetic relationship.

Semantic Constraints

It is dangerous to present phonetically similar forms with different meanings as potential evidence of remote genetic relationship, assuming semantic shifts have taken place. Of course meaning can shift, but in hypotheses of remote relationship the assumed semantic shifts cannot be documented, and the greater the semantic latitude permitted in compared forms, the easier it is to find phonetically similar forms that have no historical connection (as in the Pipil-Finnish examples, above). When semantically nonequivalent forms are compared, chance phonetic similarity is greatly increased. Within families where the languages are known to be related, etymologies are not accepted unless an explicit account of any assumed semantic changes can be provided. The problem of excessive semantic permissiveness is one of the most common and most serious in long-range comparisons, for example, sets cited for Nostratic compare forms meaning ‘lip/mushroom/soft outgrowth’, ‘grow up/become/tree/be’, for Amerind hypothesis ‘excrement/night/grass’, ‘child/copulate/son/girl/boy/tender/bear/small’. It is for reasons such as this that these proposals of more remote linguistic relationship are disputed.

Onomatopoeia

Onomatopoeic words imitate the real-world sound associated with their meanings. They may be similar in different languages because they have independently approximated the sounds of nature, not because they share any common history. A way to reduce the sound-imitative problem is to omit from long-range comparisons any word which cross-linguistically frequently has similar imitative form, for example ‘blow’, ‘breathe’, ‘suck’, ‘laugh’, ‘cough’, ‘sneeze’, ‘break/cut/chop/split’, ‘cricket’, ‘crow’ (bird names in general), ‘frog/toad’, ‘lungs’, ‘baby/infant’, ‘beat/hit/pound’, ‘call/shout’, ‘choke’, ‘cry’, ‘drip/drop’, ‘hiccough’, ‘kiss’, ‘shoot’, ‘snore’, ‘spit’, and ‘whistle’. Unfortunately, examples of onomatopoeic words are frequent in proposals of distant genetic relationships.

Nursery Forms

Nursery words (the ‘mama-nana-papa-dada-caca’ sort) should be avoided, since they typically share a high degree of cross-linguistic similarity that is not due to common ancestry. Nevertheless, examples of nursery words are frequent in cases of long range comparison. The words involved are typically ‘mother’, ‘father’, ‘grandmother’, ‘grandfather’, and often ‘brother’, ‘sister’, ‘aunt’, and ‘uncle’, and have shapes

like *mama, nana, papa, baba, tata, dada*. Jakobson (1962[1960]: 542–543) explained the cross-linguistic nongenetic similarity among nursery forms. Nursery words provide no reliable support for genetic relationship.

Short Forms and Unmatched Segments

How long proposed cognates are and the number of matched sounds within them are important, since the greater the number of matching sounds in a proposed cognate set, the less likely it is that accident accounts for the similarity. Monosyllabic words (CV, VC, V) are so short that their similarity to forms in other languages could also easily be due to chance. If only one or two sounds of longer forms are matched, chance may explain the similarity. Such comparisons are not persuasive.

Chance Similarities

Chance (accident) is another possible explanation for similarities in compared languages and needs to be avoided. The potential for accidental matching increases dramatically when one leaves the realm of basic vocabulary, when one increases the pool of words from which potential cognates are sought, and when one permits the semantics of compared forms to vary even slightly (Ringe, 1992: 5).

Cases of similar but noncognate words are well-known, for example French *feu* and German *Feuer* ‘fire’, English *much* and Spanish *mucho* ‘much’. The phonetic similarity in these basic vocabulary items is due to accidental convergence due to the sound changes that they have undergone, not to inheritance from any common word in the proto language. That originally distinct forms in different languages can become similar due to sound changes is not surprising, since even within a single language originally distinct words can converge due to sound changes, for example, English *liellie* (from Proto-Germanic **ligjan* ‘to lie, lay’/**leugan* ‘to tell a lie’).

Sound–Meaning Isomorphism

Only comparisons which involve both sound and meaning together are permitted. Similarities in sound alone (for example, the presence of tones in compared languages) or in meaning alone (for example, grammatical gender in languages compared) are not reliable, since they can develop independently of genetic relationship, due to diffusion, accident, and typological tendencies.

Only Linguistic Evidence

Only linguistic information, no nonlinguistic consideration, is permitted as evidence of distant genetic

relationship. Shared cultural traits, mythology, folklore, technologies, and gene pools must be eliminated from arguments for linguistic relationship. The wisdom of this is seen in face of the many strange proposals based on nonlinguistic evidence. For example, some earlier African classifications proposed that Ari (Omotic) belongs to either Nilo-Saharan or Sudanic 'because the Ari people are Negroes' ('racial' evidence), that Moru and Madi belong to Sudanic because they are located in central Africa (geographical evidence), or that Fula is Hamitic because its speakers herd cattle, are Moslems (cultural evidence), and are tall and Caucasoid (physical attributes) (Fleming, 1987: 207). Clearly the language one speaks does not deterministically depend on one's cultural and biological connections.

Erroneous Morphological Analysis

Where compared words are analyzed with more than one morpheme, it is necessary to show that the segmented morphemes in fact exist in language. Unfortunately, unmotivated morphological divisions are frequent in proposals of remote relationship. Often, a morpheme boundary is inserted where none is justified, as for example, the arbitrarily segmented Tunebo 'machete' as *baxi-ta* (borrowed from Spanish *machete*, and contains no morpheme boundary). This false morphological segmentation falsely makes the Tunebo word appear more similar to the other proposed cognates, Cabecar *bak* and Andaqui *boxo-(ka)* 'axe' (Greenberg, 1987: 108).

Undetected morpheme divisions are also a problem. An example from the Amerind hypothesis compares Tzotzil *ti?il* 'hole' with Lake Miwok *talokh* 'hole', Atakapa *tol* 'anus', Totonac *tan* 'buttocks', Takelma *telkan* 'buttocks' (Greenberg, 1987: 152); however, the Tzotzil form is *ti?-il*, from *ti?* 'mouth' + *-il* 'indefinite possessive suffix', meaning 'edge, border, lips, mouth', but not 'hole'. The appropriate comparison *ti?* 'mouth' bears no particular resemblance to the other forms with which it is compared.

Spurious Forms

Another problem is that of nonexistent or erroneous 'data' from 'bookkeeping' problems and 'scribal' errors. For example, for the Mayan-MixeZoquean hypothesis (Brown and Witkowski, 1979), Mixe-Zoquean words meaning 'shell' were compared with K'iche' (Mayan) *sak*, said to mean 'lobster', actually 'grasshopper' – a misunderstanding of Spanish *langosta*, which in Guatemala (where K'iche' is spoken) means 'grasshopper', but 'lobster' in other varieties of Spanish. A comparison of 'shell' and 'grasshopper' makes no sense. Errors of this sort can be serious;

for example, in the Amerind hypothesis (Greenberg, 1987) none of the words given as Quapaw are in fact from Quapaw; all are from Biloxi and Ofo; none of the words given as Proto-Mayan are from Proto-Mayan, rather from Proto-K'ichean.

Given the disputes about proposed distant genetic relationships, these methodological principles for long-range comparison are extremely important. Research on possible distant genetic relationships that does not conform to these methodological principles and cautions will remain inconclusive.

Some Examples of Long-Range Proposals

It will be instructive to look briefly at some specific proposals to see why most mainstream historical linguists do not accept these hypotheses. Space does not permit full evaluation, but references are given for more detail.

Altaic

The Altaic hypothesis would group Turkic, Mongolian, and Tungusic; some versions also include Korean and Japanese. While 'Altaic' is repeated in encyclopedias, most leading 'Altaicists' have abandoned the hypothesis. The most serious problems are the extensive borrowing among the 'Altaic' languages, lack of convincing cognates, lack of basic vocabulary, extensive areal diffusion, problems with the putative sound correspondences, and reliance on typologically commonplace traits. The shared 'Altaic' traits include vowel harmony, relatively simple phoneme inventories, agglutination, suffixing, (S)OV word order (and postpositions), no verb 'to have' for possession, no articles or gender, and nonmain clauses in nonfinite (participial) constructions. However, these shared features are commonplace typological traits, and thus are not good evidence of genetic relationship because they can easily develop independently in unrelated languages. These 'Altaic' features are also areal traits, shared by a number of languages in surrounding regions, thus perhaps due to diffusion. Similarities in the first and second person pronoun paradigms have impressed proponents of Altaic, although critics point out that pronouns are borrowed far more frequently than proponents acknowledge and pronoun patterns of the type cited for Altaic are also not unusual nor unexpected cross-linguistically. In short, the evidence for genetic relationship has not been persuasive, explaining why so many reject the 'Altaic' hypothesis. (Campbell and Poser, 2008).

Nostratic

The Nostratic hypothesis as advanced in the 1960s by Illich-Svitych would group Indo-European, Uralic,

Altaic, Kartvelian, Dravidian, and Hamito-Semitic [later Afroasiatic], though other versions of the hypothesis would include various other languages. The sheer number of languages and many proposed cognates involved might make it seem difficult to evaluate Nostratic. Nevertheless, assessment is possible. With respect to the many putative cognate sets, assessment can concentrate on those cases considered the strongest by proponents of Nostratic (those of Dolgopolsky, 1986 and Kaiser and Shevoroshkin, 1988). Campbell (1998) shows that these strongest cases do not hold up and that the weaker sets are not persuasive (see below). We can easily determine to what extent the proposed reconstructions correspond to typological expectations, whether the proposed cognates are permissive in semantic associations, and when onomatopoeia, forms too short to deny chance, nursery forms, and the like are involved.

Illich-Svitych's version of Nostratic exhibits the following methodological problems. (See Campbell, 1998, 1999 for details.)

1. Descriptive forms. Illich-Svitych is forthright in labeling 26 of his 378 forms as 'descriptive,' meaning onomatopoeic, affective, or sound-symbolic, i.e., 7% of the total. There are 16 additional onomatopoeic, affective, or sound-symbolic forms, not so labeled, or a total of approximately 11%.
 2. Questionable cognates. Illich-Svitych himself indicates that 57 of the 378 sets are questionable (15%), signaled with a question mark. However, this number should be greatly increased, since in numerous forms Illich-Svitych signals problems in other ways, with slanted lines (/ /) for things not conforming to expectation, with question marks, and with upper-case letters in reconstructions to indicate uncertainties or ambiguities.
 3. Sets with only two families represented. One of Illich-Svitych's criteria was that only cognate sets with representatives from at least three of the six 'Nostratic' families would be considered as supportive. Nevertheless, 134 of the 378 sets involve forms from only two families (35%), questionable by Illich-Svitych's own criteria.
 4. Noncorresponding sound correspondences. Frequently, the forms presented as evidence of Nostratic do not exhibit the proposed sound correspondences, i.e., they have sounds at odds with those that would be required according to the Nostratic correspondence sets. Campbell (1998), looking mostly only at stops and only at the Indo-European and Uralic data, found 25 sets that did not follow the proposed Nostratic correspondences. There is another way in which
- Illich-Svitych's putative sound correspondences are not consistent with the standard comparative method. Several of the putative Nostratic sounds are not reflected by regular sound correspondences in the languages. For example, "in Kartv[e-lian] and Indo-European, the reflexes of Nostratic [****]p are found to be unstable" (Illich-Svitych, 1990: 168). Nostratic forms beginning in ***p* reveal that both the Indo-European and the Kartvelian forms arbitrarily begin with either **p* or **b*, but this is not regular sound change and is not sanctioned by the comparative method. Similarly, glottalization in Afroasiatic is said to occur "sporadically under other conditions still not clear" (Illich-Svitych, 1990: 168). In the correspondence sets, several of the languages are listed with multiple reflexes of a single Nostratic sound, but with no explanation of conditions under which the distinct reflexes might appear.
5. Short forms. Of Illich-Svitych's 378 forms, 57 (15%) involve short forms (CV, VC, C, or V), incapable of denying chance as an alternative explanation.
 6. Semantically nonequivalent forms. Some 55 cases (16%) involve comparisons of forms in the different languages that are fairly distinct semantically.
 7. Diffused forms. Given the history of central Eurasia, with much language contact, it is not at all surprising that some forms turn out to be borrowed. Several of the Nostratic cognates have words which have been identified by others as loans, including: 'sister-in-law', 'water', 'do', 'give', 'carry', 'lead', 'to do'/'put', 'husband's sister', to which we can add the following as probable or possible loans: 'conifer, branch, point', 'thorn'; 'poplar'; 'practice witchcraft'; 'deer'; 'vessel'; 'birch'; 'bird cherry'; 'honey', 'mead'; 'poplar'.
 8. Typological problems. Nostratic as traditionally reconstructed is typologically flawed. Counter to expectations, few Nostratic roots contain two voiceless stops; glottalized stops are considerably more frequent than their plain counterparts; Nostratic affricates change to a cluster of fricative + stop in Indo-European.
 9. Evaluation of the strongest lexical sets. An examination of the Nostratic sets held by proponents to be the strongest reveals serious problems with most. These include Dolgopolsky's (1986) 15 most stable lexemes. Most are questionable in one way or another according to the standard criteria for assessing proposals of remote linguistic kinship. In the Nostratic sets representing Dolgopolsky's 15 most stable glosses, four have problems with phonological correspondences; five

involve excessive semantic difference among the putative cognates; four have representatives in only two of the putative Nostratic families; two involve problems of morphological analysis; Illich-Svitych himself listed one as doubtful; and finally, one reflects the tendency to rely too heavily on Finnish when not supported by the historical evidence. All but two are challenged, and for these two the relevant forms needed for evaluation are not present. (See Campbell, 1998 for details.) These ‘strong’ cases are certainly not sufficiently robust to encourage faith in the proposed genetic relationship.

Once again, it is for reasons of this sort that most historical linguists reject Nostratic.

Amerind

Greenberg (1987) proposed that all Native American languages, except Na-Dene and Eskimo-Aleut languages, belong to single macro-family, Amerind, based on multilateral comparison (see above). Amerind is rejected by virtually all specialists in Native American languages and by the vast majority of historical linguists. Specialists maintain that valid methods do not at present permit reduction of Native American languages to fewer than about 150 independent language families and isolates. Amerind has been highly criticized on various grounds. There are exceedingly many errors in Greenberg’s data: “the number of erroneous forms probably exceeds that of the correct forms” (Adelaar, 1989: 253). Where Greenberg stops – after assembling superficial similarities and declaring them due to common ancestry – is where other linguists begin. Since such similarities can be due to chance, borrowing, onomatopoeia, sound symbolism, nursery words (the *mama*, *papa*, *nana*, *dada*, *caca* sort), misanalysis, and much more, for a plausible proposal of remote linguistic relationship, one must attempt to eliminate all other possible explanations, leaving a shared common ancestor as the most likely. Greenberg made no attempt to eliminate these other explanations, and the similarities he amassed appear to be due mostly to accident and a combination of these other factors: “I find no evidence whatsoever that [Greenberg’s] putative cognate sets . . . represent anything other than chance similarities” (Ringe, 1996: 152). In various instances, Greenberg compared arbitrary segments of words, equated words with very different meanings (for example, ‘excrement/night/grass’), misidentified many languages, failed to analyze the morphology of some words and falsely analyzed that of others, neglected regular sound correspondences, failed to eliminate loanwords, and misinterpreted well-established

findings. The Amerind ‘etymologies’ proposed are often limited to a very few languages of the many involved. (For details and examples, see Adelaar, 1989; Berman, 1992; Campbell, 1988, 1997a; Kimball, 1993; McMahon and McMahon, 1995; Poser, 1992; Rankin, 1992; Ringe, 1992, 1996). Finnish, Japanese, Basque, and other randomly chosen languages fit Greenberg’s Amerind data as well as or better than any of the American Indian languages do. Greenberg’s method has proven incapable of distinguishing implausible relationships from Amerind generally (Campbell, 1988; Campbell, 1997b).

In short, it is with good reason Amerind has been rejected.

Louisiana Creole

T Klingler, Tulane University, New Orleans, LA, USA

© 2006 Elsevier Ltd. All rights reserved.

This French-lexifier creole is spoken by an estimated 10 000–20 000 persons (reliable figures are not available) residing mainly in southwestern Louisiana. Most speakers live along or near the Bayou Teche, especially in the parishes of St. Landry, St. Martin, and Lafayette, but there are also pockets of speakers in several other parishes. Although it is commonly associated with African Americans and Creoles of color, Louisiana Creole (LC) is also the first language of many European Americans. The language has long coexisted with regional varieties of French, often referred to collectively as Cajun, and it is at least in part the continued influence of these varieties that explains why LC is structurally less distant from French than are the French-lexifier creoles of the Caribbean. LC shares a number of important features with Haitian Creole (e.g., the progressive marker *ape*, the verb *gen* 'to have,' and the possessive particle *kèl*/

tchèl), and some linguists maintain that LC had as its origin a creole or pre-creole language imported to Louisiana from the French colony of Saint-Domingue before it became the free republic of Haiti. However, evidence that LC's development predated the significant population migration from Saint-Domingue to Louisiana in the early 19th century casts doubt on this claim and strengthens the possibility that LC is indigenous to the region. Today, the future of LC remains uncertain, since most fluent speakers are now elderly and the language is not being passed on to younger generations.

LC varies considerably according to region, ethnic group, and social context. The linguistic situation in Louisiana is often said to form a speech continuum, with the type of LC that is furthest removed from French constituting the basilectal pole, and Cajun or, depending on the model used, Referential French constituting the acrolectal pole. Any given utterance, however, may display a greater or lesser quantity of French-like or Creole-like features, such that it may best be assigned to the broad mesolectal range lying between the two poles of the continuum.

Like the other French-lexifier creoles, LC features definite articles that are postposed to the noun (*tab-la* ‘the table,’ *chyen-ye* ‘the dogs’); a personal pronoun system in which all of the pronouns, regardless of function, are derived from the tonic pronouns of French (1 sg. *mo* < *moi*, 2 sg. *to* < *toi*, 3 sg. *li* < *lui*, etc.); and a verbal system that shows very little inflectional morphology but relies instead on a series of markers placed before the verb to express notions of tense, mood, and aspect. The most important of these are the anterior marker *te*; the progressive marker *ape* (*e* in Pointe Coupee Parish); the future

marker *a*, *va*, or *ale*; and the conditional marker *se*: *Ye te ka lir* ‘They could read’; *Lavach-la ape kòmanse dòn dule* ‘The cow is beginning to give milk’; *Vou pa kwa l a chinen?* ‘Don’t you think he’ll win?’

Luganda

F Katamba, Lancaster University, Lancaster, UK

© 2006 Elsevier Ltd. All rights reserved.

Location and Genetic Affiliation

Luganda (Ganda), a Bantu language of Uganda, is the mother tongue of 3 015 980 speakers (a little more than 16% of the population of Uganda); with an additional 1 million second language speakers, Luganda is the most widely spoken language in Uganda. It belongs to the Narrow Bantu subgroup of the Bantu sub-branch of the Benue-Congo branch of Niger-Congo. It is classified as Zone J15 in Guthrie’s classification system for Bantu.

Basic Phonology and Orthography

The Luganda orthography is essentially phonemic. The consonants and vowel phonemes are listed in Tables 1 and 2, respectively. IPA symbols corresponding to the standard letters are shown in brackets for palatal and velar consonants. As seen in Example (1), gemination (indicated by double letters) is phonemic for both consonants (C) and vowels (V). The typical syllable is

CV or CVV. The only consonant clusters allowed are NC (i.e., nasal + consonant), as in *nkola*, and for consonant plus glide, as in *mukwano* ‘friendship’:

- (1) ogula ‘we buy’ oggula ‘you open’
nkola ‘I work’ nkoola ‘I weed’

Tone is phonemic. However, it is not marked in the standard orthography, and that convention is followed here except when tone is being discussed.

On the surface, there is a contrast between low (L) tone, which is unmarked, high (H) (´) tone, and falling (HL) (^) tone. There are no rising tones.

- (2) ki sa ni ri zo (L L L L L) ‘comb’
ku wó la (L H L) ‘to become cool’
ku wólá (L H H) ‘to lend money’
bi táâ (L HL) ‘gourds’

Basic Morphology

Luganda has rich, agglutinative morphology. The typical noun has the following structure (PP = pre-prefix; CP = class prefix):

- (3) PP CP ROOT
o- mu- wala ‘girl’

Table 1 Consonants

| Consonant | Bilabial | Labiodental | Alveolar | Palatal | Velar | Labiovelar |
|--------------|----------|-------------|----------------|---------|--------|------------|
| Stops | | | | | | |
| Voiceless | p | | t | c | k | |
| Voiced | b | | d | j [j] | g | |
| Fricatives | | | | | | |
| Voiceless | | f | s | | | |
| Voiced | | v | z | | | |
| Nasals | m | | n | ny [ɲ] | ng [ŋ] | |
| Approximants | | | l ^a | y (j) | | w |

^aThough [l] and [r] are allophones of the phoneme /l/, they are represented by separate letters in the orthography. The letter ‘r’ is used after front vowels and ‘l’ is used elsewhere.

Table 2 Vowels

| Vowel | Front | Central | Back and round |
|-------|-------|---------|----------------|
| High | i | | u |
| Mid | e | | o |
| Low | | a | |

The 21 noun classes, each one of them marked by a prefix, are normally paired for singular and plural, as in Example (4):

| | | | | | |
|---------------|-------|----|-----|------|-----------|
| (4) Singular: | CLASS | PP | CP | STEM | |
| | 1 | o- | mu- | wala | 'girl' |
| | 7 | e- | ki- | bira | 'forest' |
| Plural: | 2 | a- | ba- | wala | 'girls' |
| | 8 | e- | bi- | bira | 'forests' |

The noun class numbering system is standardized for all Bantu languages.

There is concord in a noun phrase between a noun and any dependent adjectives and determiners:

| | | | | | | | | |
|------|----|-----|------|-----|------|----|-----|-------------------|
| (5a) | o- | mu- | wala | o- | no | o- | mu- | nene |
| | PP | CP1 | girl | CP1 | this | PP | CP1 | big |
| | | | | | | | | 'this big girl' |
| (5b) | e- | ki- | bira | ki- | no | e- | ki- | nene |
| | PP | CP7 | girl | CP7 | this | PP | CP7 | big |
| | | | | | | | | 'this big forest' |

As seen in Example (6), verbs, compared to nouns, are morphologically more complex (NEG, negation; SM, subject marker; TM, tense marker; FUT, future; OM, object marker; ES, extension suffix; APPL, applicative; FV, final vowel):

| | | | | | | | | |
|-----|-----|------|---------|-----|-----|-----------|-----------|----------------------------------|
| (6) | te- | ba- | li- | ki- | n- | deet- | er- | a |
| | NEG | SM | TM(FUT) | OM1 | OM2 | bring | ES (APPL) | FV |
| | not | they | future | it | me | bring for | | FV |
| | | | | | | | | 'They will not bring it for me.' |

There is also an elaborate tense/aspect system, with distinct negative and positive paradigms:

| | | |
|------------------|----------|----------|
| (7) Tense/aspect | Positive | Negative |
| Past: | nنالابا | سالابا |
| Near past: | nنالاباي | سالاباي |
| Immediate past: | نداباي | سيراباي |
| Present: | ندابا | سيرابا |
| Near future: | ننااسوما | سياسوما |
| General future: | نديرابا | سيرابا |

Basic Syntax

The basic word order in unmarked declarative sentences is subject-verb-object:

| | | | | | | | | | | |
|------|-----|------|------|------|-------|------|----|-----|------|--------------------------|
| (8a) | a- | ba- | wala | ba- | a- | lab- | a | e- | m- | bwa |
| | PP- | CP2- | girl | CP2- | PAST- | see- | FV | PP- | CP9- | dog |
| | | | | | | | | | | 'The girls saw the dog.' |
| (8b) | e- | m- | bwa | y- | a- | lab- | a | a- | ba- | wala |
| | PP- | CP9- | dog | CP9- | PAST- | see- | FV | PP- | CP2- | girl |
| | | | | | | | | | | 'The dog saw the girls.' |

Typically, the head precedes its modifier: e.g., in noun phrases, nouns precede determiners and adjectives (see Examples (5a) and (5b)).

Luo

G J Dimmendaal, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

One of the major Nilotic (Nilo-Saharan) languages in terms of number of speakers, Luo (also known as Nilotic Kavirondo), is spoken by approximately 3.5 million people mainly in western Kenya, northern Tanzania, and eastern Uganda. Together with Acholi, Adhola, Alur, Kumam, and Lango, Luo forms the

Southern Lwoo cluster within the Western Nilotic branch of Nilotic. The Luo orthography was developed at the beginning of the 20th century. There is a growing body of literature in this Nilotic language, which is also used in the educational system in Kenya.

Luo is among the few Nilotic languages that has also been studied in detail by native speakers, e.g., Okoth-Okombo (1982) and Omondi (1982). One of the pioneers of African linguistics, Archibald Tucker, also produced a grammar of Luo, published posthumously as Tucker (1994). As shown in these

studies, Luo has a classical two-tone system with downdrift, downstep, as well as upstep. As is common in a wide range of languages ranging from Senegal to Ethiopia, it also has vowel harmony based on the position of the tongue root. Luo appears to have retained relatively few prototypical Nilotic features at the morphosyntactic level, presumably as a result of contact with Niger-Congo languages at different periods in time. One stratum, which seems to have affected all Southern Lwoo languages, appears to be due to contact with Ubanguian (Niger-Congo) languages. Another, more recent stratum resulted from intensive contact between Luo and neighboring Bantu (Niger-Congo) languages (cf. Rottland and Okoth-Okombo, 1986; Dimmendaal, 2001; and Storch, 2003).

One manifestation of the intensive lexical and structural borrowing from Bantu is the development of noun class prefixes in Luo. In addition to borrowed prefixes, one finds prefixes that developed from nominal roots, as in *dhó-lúô* 'the Luo language' (from *dhok* 'mouth'); *jà-lúô/jò-lúô* 'Luo person (sg/pl)' from *jal* (sg), *jol* (pl) 'guest, stranger'.

The common constituent order in Luo is SVO. Other members of the Lwoo cluster, such as Anywa or Pãri, allow for OVS order and they inflect postverbal subjects with (ergative) case. Luo does not have case marking. Consequently, although VS order may be used in Luo to express presentative

focus with intransitive predicates, the postverbal subject is not inflected for case. Compared again to Anywa and Pãri, Luo has a reduced system of verbal derivation, using prepositions instead to modify the valency of verbs. On the other hand, Luo developed tense marking on the verb, parallel to neighboring Bantu languages.

Luxembourgish

G Newton, University of Sheffield, Sheffield, UK

© 2006 Elsevier Ltd. All rights reserved.

Luxembourgish (*Lëtzebuergesch*), genetically related to German, is traditionally grouped with the West Moselle Franconian dialects. However, early Salic Frankish influence and later close attachment to the Low Countries, France, and Spain have allowed it to develop an identity separate from that of the neighboring dialects in Germany. Earliest documents from the area date from the 9th century, with modern literary forms beginning in the 1820s. Various orthographies exist, including the strictly phonemic *Lezebuurjer Ortografi* (1946). Little used, this remained official until replaced in 1975 by the system of the *Luxemburger Wörterbuch*. Modifications to this were introduced in 1999.

In 1939, Luxembourg naturalization was made dependent on knowledge of the language. In 1984, *Lëtzebuergesch* was legally acknowledged as the national language of the Grand Duchy. Syntactically, *Lëtzebuergesch* is similar to German, although case loss has reduced the possibilities of object-verb-subject (OVS) ordering. Parataxis predominates, though hypotaxis is frequent (subject-object-verb (SOV) ordering). In morphology, nominative and accusative have fallen together, assuming accusative form. Third-person pronouns show northern /h/ (NHG = New High German): *bien*, *hatt*, *hinen* NHG *er*, *es*, *ihnen* 'he, it, them'. Noun plurals are most commonly in <e(n)>, though other patterns occur. There is, however, no plural in <s>. The pronouns *mir* NHG *wir* 'we' and *dir* NHG *ihr/Sie* 'you (plural and polite)' arise from false division of verbal endings. NHG *uns* 'us' appears as *äis/eis* (koine) and *ons* (Luxembourg

city). Adjectival comparison is chiefly with *méi* NHG *mehr* ‘more’, though occasional synthetic forms occur. In compound nouns, a linking <s> is frequently present, e.g., *Plastikstut* NHG *Plastiktasche* ‘plastic bag’, *Autosdier* NHG *Autotür* ‘car door’. Tenses comprise present (*ech gesinn* NHG *ich sehe*), perfect (*ech hu gesinn* NHG *ich habe gesehen*), and pluperfect (*ech hat gesinn* NHG *ich hatte gesehen*); the future can be periphrastic (*ech wäerd gesinn* NHG *ich werde sehen*), but is mainly a function of the present tense (*ech kommen iwwermar* NHG *ich komme übermorgen*). Some indicative (*ech gesouch* NHG *ich sah*) and subjunctive (*ech geséich* NHG *ich sähe*) preterites also occur, though these are more frequent in the north (Oesling); pluperfect subjunctives (*ech hätt gesinn* NHG *ich hätte gesehen*) occur frequently. The auxiliary verb *ginn* NHG *geben* = *werden* ‘give = become’ is used to form analytical conditionals (*ech géif gesinn* NHG *ich würde sehen*) and passives (*ech gouf gesinn* NHG *ich wurde gesehen* ‘I was seen’). Present tense first-person singulars inflect <e(n)> (*ech sangen* NHG *ich singe*).

Consonants are in voiced/voiceless opposition, with final neutralization. The High German sound shift is incomplete (*dat* NHG *das/dass* ‘that’, *op* NHG *auf* ‘on’, *Pond* NHG *Pfund* ‘pound’, *Korf* NHG *Korb* ‘basket’, *Dall* NHG *Tal* ‘valley’) and intervocalic /g/ is often absent, e.g., *Won*, *Vull* NHG *Wagen*, *Vogel* ‘wagon, bird’. Some velarization of dental nasals (*zéng*, *brong* NHG *zehn*, *braun* ‘ten, brown’) is also present, though this is stronger in the north of Luxembourg, which also has velarized plosives, e.g., *Lekt*, *néck* (koine *Leit*, *net*) NHG *Leute*, *nicht* ‘people, not’. Medial and final /s/ combinations are liable to palatization (*Meeschter* NHG *Meister* ‘master’), more strongly in the southwest (*Fënschter* NHG *Fenster* ‘window’). Final /n/ is ‘mobile’ (*Eifler Regel*) and is retained only before a following vowel, /h/ or a dental (*den Dag*, but *de Mann* NHG *der/den Tag*, *der/den Mann*), or at juncture. Middle High German (MHG) <î, û, iu> (*îs* ‘ice’, *triben* ‘drive’, *hûs* ‘house’, *liute* ‘people’, *hiulen* ‘howl’) appear as /ɛ:i/ or /ai/ (*Âis* NHG *Eis*, *dreiwen* NHG *treiben*), /a:ʊ/ (*Haus* NHG *Haus*), /ai/ or /aʊ/ (*Leit* NHG *Leute*, *hauen* NHG *heulen*), and <ie, uo, üe> (*brief* ‘letter’, *fuoz* ‘foot’, *vüeze* ‘feet’) appear as /ei/ (*Bréif* NHG *Brief*), /ou/ (*Fouss* NHG *Fuß*), /ei/ (*Féiss* NHG *Füße*). MHG <ei, ou> (*vleisch* ‘flesh’, *boum* ‘tree’) have the reflexes /e:/ (*Fleesch* NHG *Fleisch*), /a:/ (*Bam* NHG *Baum*). However, all of these examples may also be subject to allophonic variation, and shortened forms are common. A shift of West Germanic /i/ to /a/ is also a strong characteristic of the language: *Wand* NHG *Wind* ‘wind’. Derounding (*Läffel*, *fënnef* NHG *Löffel*, *fünf* ‘spoon, five’) and

lowering (*domm* NHG *dumm* ‘stupid’) are also found, as are elements of ‘correction’ (an abrupt rise and fall of vowel pitch; only vestigially present in Luxembourgish, e.g., *stäif/steif* NHG *steif* ‘stiff’) and ‘circumflexion’ (a rise and fall of vowel pitch, accompanied by up to three times normal length), e.g., *den Hals* (nom./acc.) NHG *der/den Hals* ‘neck’ (not circumflexed); *dem Haals* (dat.) NHG *dem Hals(e)* (circumflexed). Another element is the *Schwebelaut* (a lengthening of consonants), which occasionally marks a difference in meaning, e.g., *voll* (short /l/, MHG *vol*) NHG *voll* ‘full’, *voll* (long /l:/, MHG *volle*) NHG *voll* ‘drunk’.

Macedonian

V A Friedman, University of Chicago,
Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Modern Macedonian (*makedonski* in Macedonian) is a South Slavic language (Slavic, Indo-European). It is not to be confused with Ancient Macedonian, an Indo-European language of uncertain (but not Slavic) affiliation, whose most famous speaker was Alexander the Great. Macedonian is closest to Bulgarian and Serbian.

Macedonian is descended from the dialects of Slavic speakers who settled in the Balkan peninsula during the 6th and 7th centuries C.E. The oldest attested Slavic language, Old Church Slavonic, was based on dialects spoken around Salonica, in what is today Greek Macedonia. As it came to be defined in the 19th century, geographic Macedonia is the region bounded by Mount Olympus, the Pindus range, Mounts Shar and Osogovo, the western Rhodopes, the lower course of the river Mesta (Greek Nestos), and the Aegean Sea. Many languages are spoken in this region, but it is the Slavic dialects to which the glossonym *Macedonian* is applied. The region was part of the Ottoman Empire from the late 15th century until 1912 and was partitioned among Greece, Serbia, and Bulgaria (with a western strip of villages going to Albania) by the Treaty of Bucharest in 1913. The modern Republic of Macedonia, in which Macedonian is the official language, corresponds roughly to the southern part of the territory ceded to Serbia plus the Strumica valley. The population is 2 022 547 (2002 census). Outside the Republic, Macedonian is spoken by ethnic minorities in Albania, Bulgaria, Greece, and Kosovo as well as by émigré communities elsewhere. Greece does not recognize the existence of its ethnic minorities, Bulgaria insists that all Macedonians are really Bulgarians, Albania refused to include questions about language and ethnicity in its last census (2001), and there has not been

an uncontested statistical exercise in Kosovo since 1981, so official figures on Macedonian speakers outside the republic are unavailable; estimates range to 700 000.

History

Modern Macedonian literary activity began in the early 19th century among intellectuals attempting to write their Slavic vernacular instead of Church Slavonic. Two centers of Balkan Slavic literacy arose, one in what is now northeastern Bulgaria, the other in what is now southwestern Macedonia. In the early 19th century, all these intellectuals called their language *Bulgarian*, but a struggle emerged between those who favored northeast Bulgarian dialects and those who favored western Macedonian dialects as the basis for what would become the standard language. Northeast Bulgarian became the basis of standard Bulgarian, and Macedonian intellectuals began to work for a separate Macedonian literary language. The earliest known published statement of a separate Macedonian linguistic identity was by Gjorgji Pulevski 1875, but evidence of the beginnings of separatism can be dated to a letter from the teacher Nikola Filipov of Bansko to the Bulgarian philologist Najden Gerov in 1848 expressing dissatisfaction with the use of eastern Bulgarian in literature and textbooks (Friedman, 2000: 183) and attacks in the Bulgarian-language press of the 1850's on works using Macedonian dialects (Friedman, 2000: 180).

The first coherent plan for a Macedonian standard language was published by Krste Misirkov in 1903. After World War I, Macedonian was treated as a dialect of Serbian in Serbia and of Bulgarian in Bulgaria and was ruthlessly suppressed in Greece. Writers began publishing Macedonian works in Serbian and Bulgarian periodicals, where such pieces were treated as dialect literature, but some linguists outside the Balkans treated Macedonian as a separate language. On August 2, 1944, Macedonian became the official language of what was then the People's Republic of Macedonia. Bulgaria recognized both

the Macedonian language and its own Macedonian minority from 1946 to 1948. From 1948 to the 1960s, some Bulgarian linguists continued to recognize Macedonian as a separate Slavic language. When Macedonia declared independence from Yugoslavia in 1991, Bulgaria immediately recognized the state, but not the nationality or the language. In February 1999, the Bulgarian government officially recognized the Macedonian standard language.

Dialects

Macedonian dialects are divided by a major bundle of isoglosses running from northwest to southeast along the River Vardar, swerving southwest at the confluence of the Vardar and the Crna and continuing down the Crna and into Greece southeast of Florina (Lerin in Macedonian), then bifurcating north of Kastoria (Kostur in Macedonian) so that the remaining Macedonian-speaking villages in Greece and Albania form a transitional zone. The western region is characterized by a relatively homogeneous central area and five groups of peripheral dialects centered on towns around the western periphery. The eastern zone has six dialect groups with no regional center. Standard Macedonian is based on the west-central dialects, with elements from other dialects.

Orthography and Phonology

Macedonian is written in the Cyrillic alphabet, following the principle of one letter per sound, as in Serbian Cyrillic. Macedonian has three distinctive letters – *ќ*, *ѓ*, *ѕ* – representing the voiceless and voiced dorsopalatal stops and the voiced dental affricate, respectively. Macedonian Cyrillic *љ* is, according to the standard (Koneski, 1967: 115), used to represent clear /l/ before consonants, before back vowels, and word-finally, where it can contrast with velar /l/, e.g., бела [bela] ‘white’ F versus беља [bela] ‘trouble’. The contrast is neutralized before front vowels, where only clear /l/ is prescribed. Some educated speakers pronounce *љ* as palatal [ʎ], influenced by the Serbian pronunciation of this letter and the fact that the same reflex occurs in the Skopje town dialect. Standard Macedonian has a five-vowel system (a, e, i, o, u), and most dialects outside the west-central area also have schwa, but of different origins in various regions. There is no letter to represent schwa in Macedonian Cyrillic; when it is necessary to do so, an apostrophe is prescribed. The western Macedonian dialects and the standard are characterized by fixed antepenultimate stress, e.g., *vodéničar* ‘miller’, *vodeničari* ‘millers’, *vodeničárite* ‘the millers’.

Morphology, Syntax, and Lexicon

Macedonian has masculine, feminine, and neuter genders. Aside from plurals and pronouns, the only remnants of Slavic substantival inflection in Macedonian are the masculine and feminine vocative, which are becoming obsolete; oblique forms for masculine proper names and a few kinship terms and other masculine animates, all facultative; and a quantitative plural for inanimate nouns, which is used only sporadically, except in a few common expressions. Macedonian has a three-way opposition in the postposed definite article – *-t-* ‘neutral’, *-v-* ‘proximal’, *-n-* ‘distal’ – although these meanings can be based on speaker attitude as well as physical distance. The example in (1) is illustrative.

- (1) raki-vče-to *ќe* mu go
brandy-DIM-DEF.NEUT *FUT* *him.DAT* *it-ACC*
dade-š na prijatel-ov od
give-2.sing.PRES *to* *friend-DEF* *from*
naš-a-na vo frizer-ov MASC.PX
our-FEM.FEM. *in freezer-DEF*
DEF.DS MASC.PX
‘Give the little [glass of] brandy to our friend here,
from that [brandy] of ours, in the freezer here.’

The article attaches to the end of the first nominal in the noun phrase, i.e., not adverbs:

- (2) ne mnogu po-star-i-te deca
not *much* *COMP-old-* *children*
PL-DEF.PL
‘the children that are not much older’
edna od mnogu-te naš-i zadač-i
one *from many-DEF.PL* *our-PL* *problems-PL*
‘one of our many problems’

The Macedonian verb has both aorist/imperfect and perfective/imperfective aspectual oppositions, but imperfective aorists are now obsolete. Perfective presents and imperfects occur only after one of eight modal particles, although perfective presents can also be used in negative questions. Macedonian also developed a new perfect series using the auxiliary *ima* ‘have’ and an invariant neuter verbal adjective. The synthetic pasts are marked for speaker confirmation, while the descendent of the Common Slavic perfect, using the old resultative participle in *-l* (no longer a true participle, since it cannot be used attributively), is not marked for speaker confirmation and is therefore used when the speaker cannot or will not vouch for the truth of the statement, e.g., because it was reported: *Toj beše vo Moskva* ‘He was in Moscow’ (I saw him or accept the fact as established). *Toj bil vo Moskva* ‘He was in Moscow’ (I heard it but was not

there myself, do not vouch for it, or do not believe it [nuance depending on context]). The verbal *l*-form is also used in the inherited Slavic pluperfect (with the auxiliary ‘be’ in the imperfect) and the inherited conditional (after invariant modal particle *bi*). The new pluperfect is formed with the imperfect of ‘have’ and the neuter verbal adjective. The new conditional uses the invariant future marker *ќе* plus the imperfect (perfective or imperfective) of the main verb. The *bi*-conditional tends to be used for hypothetical apodoses and the *ќе* conditional for irrealis.

The following are distinctively Macedonian lexical items: *saka* ‘want, like, love’, *bara* ‘seek’, *zboruva* ‘speak’, *zbor* ‘word’, *deka* ‘that (relativizer)’, *vaka* ‘in this manner’, *olku* ‘this many’.

Macro-Jê

E R Ribeiro, Museu Antropológico, Universidade Federal de Goiás, Goiás, Brazil

© 2006 Elsevier Ltd. All rights reserved.

The Macro-Jê stock comprises the Jê family and a number of possibly related language families, all of which are located in Brazil. Macro-Jê is arguably one of the lesser-known language groups of South America, its very existence as a genetic unit being still “a working hypothesis” (Rodrigues, 1999: 165). According to Rodrigues (1986, 1999), whose classification is the most widely accepted among researchers working on Brazilian languages, the ‘Macro-Jê hypothesis’ comprises 12 different language families: Jê, Kamakã, Maxakalí, Krenák, Purí, Karirí, Yatê, Karajá, Ofayê, Boróro, Guató, and Rikbaktsa. The existence of Jê as a language family has been recognized since early classifications of South American languages (Martius, 1867). ‘Jê’ is a Portuguese spelling for a Northern Jê collective morpheme ([jɛ] in Apinajé, for instance) that occurs in the names of several Jê-speaking peoples. The term ‘Macro-Jê’ was coined by Mason (1950), replacing earlier labels, such as ‘Tapuya’ and ‘Tapuya-Jê.’

Comparative Evidence

Recent classifications (Rodrigues, 1986; Greenberg, 1987; Kaufman, 1994) differ as to the precise scope of Macro-Jê, although there is agreement on the inclusion of most of the families (Table 1). Except for Karirí (included only by Rodrigues), Greenberg and Kaufman included all the families listed above. In addition, Greenberg included Chiquitano (also included by Kaufman), Jabutí, and Otí. Given the lack of comprehensive comparative studies, the Macro-Jê status of some of these families is still an open question. Although Guató is included in the stock by all of the aforementioned classifications, a case for its inclusion has yet to be made, beyond the superficial, inconclusive evidence presented so far (Rodrigues, 1986, 1999). On the other hand, a preliminary comparison has revealed compelling evidence for the inclusion of the Jabutí family into the Macro-Jê stock (Voort and Ribeiro, 2004), thus corroborating a hypothesis suggested in the 1930s by ethnographer Curt Nimuendaju (Nimuendaju, 2000: 219–221). Greenberg’s main piece of evidence for the inclusion of Chiquitano was the entire set of singular personal prefixes (Greenberg, 1987: 44), which are strikingly similar to the ones found in several Macro-Jê families;

Table 1 The Macro-Jê Hypothesis^a

| | |
|--------------------------|---|
| 1. Jê | †Jeikó Northern Jê: Panará, Suyá, Kayapó, Timbira (Parkatêjê, Pykobjê, etc.), Apinajê Central Jê: Xavánte, Xerênte, †Akroá-Mirim, †Xakriabá Southern Jê: Kaingáng, Xoklêng, †Ingain |
| 2. Kamakã | †Kamakã, †Mongoyó, †Meniën, †Kotoxó, †Masakarã |
| 3. Maxakalí | Maxakalí, †Pataxó, †Kapoxó, †Monoxó, †Makoni, †Malalí |
| 4. Krenák | Krenák (Botocudo, Borúm) |
| 5. Purí (Coroado) | †Coroado, †Purí, †Koropó |
| 6. Ofayé | Ofayé |
| 7. Rikbaktsá | Rikbaktsá |
| 8. Boróro | Boróro, †Umutína, †Otúke |
| 9. Karajá | Karajá (including four dialects, Southern Karajá, Northern Karajá, Javaé, and Xambioá) |
| 10. Karirí | †Kipeá, †Dzubukuá, †Pedra Branca, †Sabuyá (included by Rodrigues but not Greenberg or Kaufman) |
| 11. Jabutí | Djeoromitxi (Jabutí) Arikapú (included by Greenberg but not Rodrigues or Kaufman) |
| 12. Yatê | Yatê |
| 13. Guató | Guató |
| 14. Chiquitano | Chiquitano (Besiro) (included by Greenberg and Kaufman, but not Rodrigues) |
| 15. Otí | †Otí (Eo-Xavánte) (the inclusion of Otí, proposed only by Greenberg, is not substantiated by the available data) |

^aExtinct languages are indicated by †. Based on Greenberg, 1987; Rodrigues, 1986, 1999; Kaufman, 1994.

convincing lexical evidence, however, has not been presented thus far. As for Otí, a poorly documented language once spoken in southern Brazil, the meager available data do not support its inclusion in the Macro-Jê stock.

The only family-level reconstruction available is Davis (1966), for Proto-Jê. So far, lexical comparative evidence supporting the inclusion of individual families in the Macro-Jê stock has been presented for Kamakã (Loukotka, 1932), Maxakalí (Loukotka, 1931, 1939; Davis, 1968), Purí (Loukotka, 1937), Boróro (Guérios, 1939), Krenák (Loukotka, 1955; Seki, 2002), Karajá (Davis, 1968), Ofayé (Gudschinsky, 1971), Rikbaktsá (Boswood, 1973), and Jabutí

(Voort and Ribeiro, 2004). In addition, some studies have shown very suggestive cases of morphological idiosyncrasies shared by Jê, Boróro, Maxakalí, Karirí, Karajá, and Ofayé (Rodrigues, 1992, 2000b). Thus, although the inclusion of many of the families into the Macro-Jê stock is being further corroborated by additional research, for others (namely Guató, Chiquitano, and Yatê) the hypothesis has yet to be systematically tested. The precise relationship among the suggested members of the stock also remains to be worked out.

Long-Range Affiliations

Greenberg (1987) suggested that Macro-Jê would be related to his Macro-Pano and Macro-Carib stocks, as part of a Jê-Pano-Carib branch of ‘Amerind.’ However, as Rodrigues (2000a) pointed out, Greenberg’s purported evidence does not withstand careful examination. Rodrigues (1985, 2000a) proposed instead a relationship between Tupí, Carib, and Macro-Jê, noting grammatical and lexical similarities among the three language groups (especially between Carib and Tupí). Davis (1968) also mentioned a few lexical similarities between Proto-Jê and Proto-Tupí. Although the evidence presented so far suggests that Rodrigues’s proposal is more plausible than Greenberg’s, any hypothesis of distant genetic relationship at such a level must be considered with caution. Considering that the precise boundaries of Macro-Jê are still uncertain, much more research at the family and stock levels needs to be conducted before such long-range classifications can be proposed on solid scientific grounds.

Location

All Macro-Jê languages are spoken in Brazilian territory, although in the past Otúke (Boróro) and Ingain (Southern Jê), both now extinct, were spoken in Bolivia and Argentina, respectively. Chiquitano, listed as a Macro-Jê language by Greenberg (1987) and Kaufman (1994), is also spoken in Bolivia, as well as in Mato Grosso, Brazil. Although the Jabutí languages and Rikbaktsá are spoken in the southern fringes of the Amazon (Rondônia and northern Mato Grosso, respectively), the overall distribution of Macro-Jê languages is typically non-Amazonian. Yatê, Krenák, and Maxakalí languages are spoken in eastern Brazil, the same having been the case of Purí, Kamakã, and Karirí (all now extinct). Central and Northern Jê tribes, as well as the Boróro and the Ofayé, traditionally occupy the savanna areas of central Brazil. The southernmost Macro-Jê languages are

those belonging to the southern branch of the Jê family, spreading from São Paulo to Rio Grande do Sul. Karajá is spoken along the Araguaia River, in central Brazil. The traditional Guató territory is the Paraguay River, near the Bolivian border. Since several purported Macro-Jê languages were spoken in eastern Brazil, a number of them became extinct early on, under the impact of European colonization. Yatê is a remarkable exception, being the only surviving indigenous language in the Brazilian northeast.

Whereas Guató, Rikbaktsá, Karajá, Krenák, and Ofayé are all single-member families (Table 1), the Jê family has a relatively large number of members, for most of which a fair amount of descriptive material is now becoming available (mostly as graduate theses and dissertations in Brazilian universities). Ofayé has around a dozen speakers, although it is mistakenly listed as extinct by some sources (including earlier editions of *Ethnologue*). Boróro and Maxakalí are the only surviving languages of their respective families. All the languages of the Kamakã, Purí, and Karirí families are now extinct. While documentation on Kamakã and Purí languages consists only of brief wordlists, the Karirí languages Kipeá and Dzubukuá were documented in catechisms (Mamiani, 1698; Bernardo de Nantes, 1709; respectively) and, for Kipeá, a grammar (Mamiani, 1699) – the only published grammar of a non-Tupí language from colonial Brazil. Thus, among the extinct Macro-Jê families, Karirí is the only one for which detailed grammatical information is available. Many of the languages included in the Macro-Jê stock are seriously endangered (Guató, Ofayé, Krenák, and Arikapú are especially so).

Characteristics

When compared with languages of other lowland South American families (such as Carib and Tupí-Guaraní), Macro-Jê languages typically present larger vowel inventories. For instance, Davis (1966) reconstructed, for Proto-Jê, a system of nine oral and six nasal vowels, as well as 11 consonants. Syllabic patterns are rather simple, obstruent clusters being uncommon. Stress is generally predictable. Phonologically contrastive tone oppositions occur in Yatê and Guató (Palácio, 2004). Processes such as nasal spreading and vowel harmony are generally absent. An exception is Karajá, which presents advanced tongue root vowel harmony, a rare phenomenon among South American languages (Ribeiro, 2002a). Another remarkable feature of Karajá is the existence of systematic differences between male and female speech. Female speech is more conservative, male

Table 2 Female versus male speech distinctions in Karajá

| <i>Female speech</i> | <i>Male speech</i> | |
|----------------------|--------------------|---|
| <i>koworu</i> | <i>oworu</i> | 'wood' |
| <i>dikarē</i> | <i>diarē</i> | 'I' |
| <i>kohā</i> | <i>ohā</i> | 'armadillo' |
| <i>kəd̥əra</i> | <i>əd̥əra</i> | 'sand' |
| <i>ruku</i> | <i>ru</i> | 'night' |
| <i>beraku</i> | <i>bero</i> | 'river' |
| <i>d̥əkɨ</i> | <i>d̥i</i> | '3rd person pronoun' |
| <i>kōbɛra</i> | <i>ōbɛra</i> | 'to buy' (from Portuguese <i>comprar</i>) |
| <i>kabɛ</i> | <i>abɛ</i> | 'coffee' (from Portuguese <i>café</i>) |
| <i>bəkawa</i> | <i>bāawa</i> | 'firearm' (from Língua Geral <i>mokāāwa</i>) |

speech being characterized, in general, by the deletion of a velar stop occurring in the corresponding female speech form (as a result of consonant deletion, vowel assimilation and fusion may also occur). This is a very productive process, applying even to loanwords (Table 2).

Most Macro-Jê languages have a relatively simple morphology. In most languages (including those of the Jabutí, Karirí, Krenák, Jê, Ofayé, and Maxakalí families), productive inflectional morphology is limited to person marking, the same paradigms being generally shared by nouns, verbs, and adpositions alike. Tense and aspect distinctions are generally conveyed by particles and auxiliaries rather than by inflections (with few apparent exceptions, such as Yatê; cf. Costa, 2004). Noun incorporation is rare, having been reported for a few Northern Jê languages, such as Panará (which also presents postposition incorporation; cf. Dourado, 2002).

In languages with a more robust morphology, such as Karajá, Guató, and Yatê, inflectional morphology tends to be more complex with verbs than with nouns. In Karajá, for example, the verb form includes subject-agreement, voice (transitive, passive, and antipassive), and directional markers ('thither' versus 'hither'), which can be used with evidential purposes (Ribeiro, 2002b); on the other hand, the only category for which nouns inflect is possession (as in most Macro-Jê languages).

The majority of the purported Macro-Jê languages are verb final, with postpositions instead of prepositions and possessor-possessed order in genitive constructions (the exceptions being Guató, Chiquitano, and Karirí). Macro-Jê languages seemingly lack the adjective as an independent part of speech, with adjectival meanings being expressed by nouns or descriptive verbs. Oliveira (2003) offered an in-depth discussion of the properties displayed by 'descriptives' in a particular Macro-Jê language, Apinajé,

illustrating well the issues involved in determining part-of-speech membership in languages in which most inflectional properties tend to be shared by nouns, verbs, and adpositions. In attributive constructions, descriptives follow the word they modify.

Languages such as Maxakalí, Karirí, and Panará are described as being predominantly ergative. In addition, a number of Jê languages are described as presenting an ergative split of some sort. That is the case of Xoklêng (Urban, 1985) and Northern Jê languages such as Kayapó (Silva and Salanova, 2000) and Apinajé. Among the latter, however, ergativity seems to be rather epiphenomenal, being found only in constructions involving nominalized verbs (such as relative clauses; cf. Oliveira, 2003). Syntactic ergativity is rarely found in Macro-Jê, with the exception of Karirí, in which all grammatical criteria (verb inflection, relativization, switch-reference, word order) point to the absolutive argument (S/O) as being the syntactic pivot (Larsen, 1984).

Further Reading

For information on the main literature on Macro-Jê languages, including an overview of their phonological and grammatical characteristics and a short list of possible Macro-Jê cognate sets, see Rodrigues (1999). Proceedings of recent conferences (the ‘Encontros Macro-Jê,’ which have been taking place periodically since 2001) help to provide an updated picture of Macro-Jê scholarship; the proceedings of the first two meetings were published as Santos and Pontes (2002) and D’Angelis (2004), respectively. Population figures for all Macro-Jê groups (including those now monolingual in Portuguese) can be found in Ricardo (2001).

Madang Languages

A Pawley, Australian National University, Canberra, ACT, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Madang group, containing about 100 languages, is the largest well-defined branch of the Trans New Guinea (TNG) family, which dominates the large island of New Guinea (see **Trans New Guinea Languages**). The Madang subgroup occupies the central two-thirds of Madang Province in north central Papua New Guinea (see **Figure 1**). In the east the group's immediate neighbors are languages of the Finisterre–Huon branch of TNG. In the high mountain valleys to the south lie the Goroka, Chimbu–Wahgi, and Engan branches and to the west are unrelated languages, members of the Lower Sepik–Ramu family. The most important innovations defining the Madang subgroup are the replacement of the Proto-TNG independent pronouns **na* '1SG,' **nga* '2SG,' and **ya* '3SG' by Proto-Madang **ya*, **na* and **nu*, respectively (Ross, 2000).

The Madang group probably broke up more than 5000 years ago, after diverging from its TNG relatives in the central highlands. This rough estimate of time depth is based chiefly on lexicostatistical agreements between languages belonging to different primary branches within Madang, which are of the order of 5–15%, lower than those between the major branches of Indo-European. The whole of Madang Province

has an area smaller than the Netherlands but contains some 150 languages. Most members of the Madang group have between 500 and 2000 speakers and none has more than about 20 000. This extreme linguistic fragmentation reflects both the considerable time depth of the Madang subgroup and fact that until the colonial era political units in New Guinea seldom exceeded a few hundred people.

The first written records of Madang languages were made in the 1870s but to this day most of the languages are documented only by word lists and sketchy grammatical notes (Z'graggen, 1975b gives a history of research and Carrington, 1996 contains a near-exhaustive bibliography). The best-documented languages are probably Amele (Roberts, 1981, 1987, 1991), Kalam (Pawley, 1966, 1987, 1993; Lane, 1991; Pawley *et al.*, 2000; Pawley and Bulmer, in press), and Kobon (Davies, 1980, 1981, 1985). There are detailed grammars of several other languages including Anamuxra (a.k.a. Ikundun or Anamgura) (Ingram, in press), Tauya (MacDonald, 1990) and Usan (Reesink, 1987).

Much of the published comparative work on Madang languages is due to John Z'graggen (1971, 1975a, 1975b, 1980a, 1980b, 1980c, 1980d). He posited a 'Madang–Adelbert Range subphylum' of 98 languages which corresponds closely to the Madang group as defined here, except that Kalam and Kobon (wrongly assigned by Z'graggen following Wurm, 1975 to a putative East New Guinea Highlands microphylum) are now included in Madang

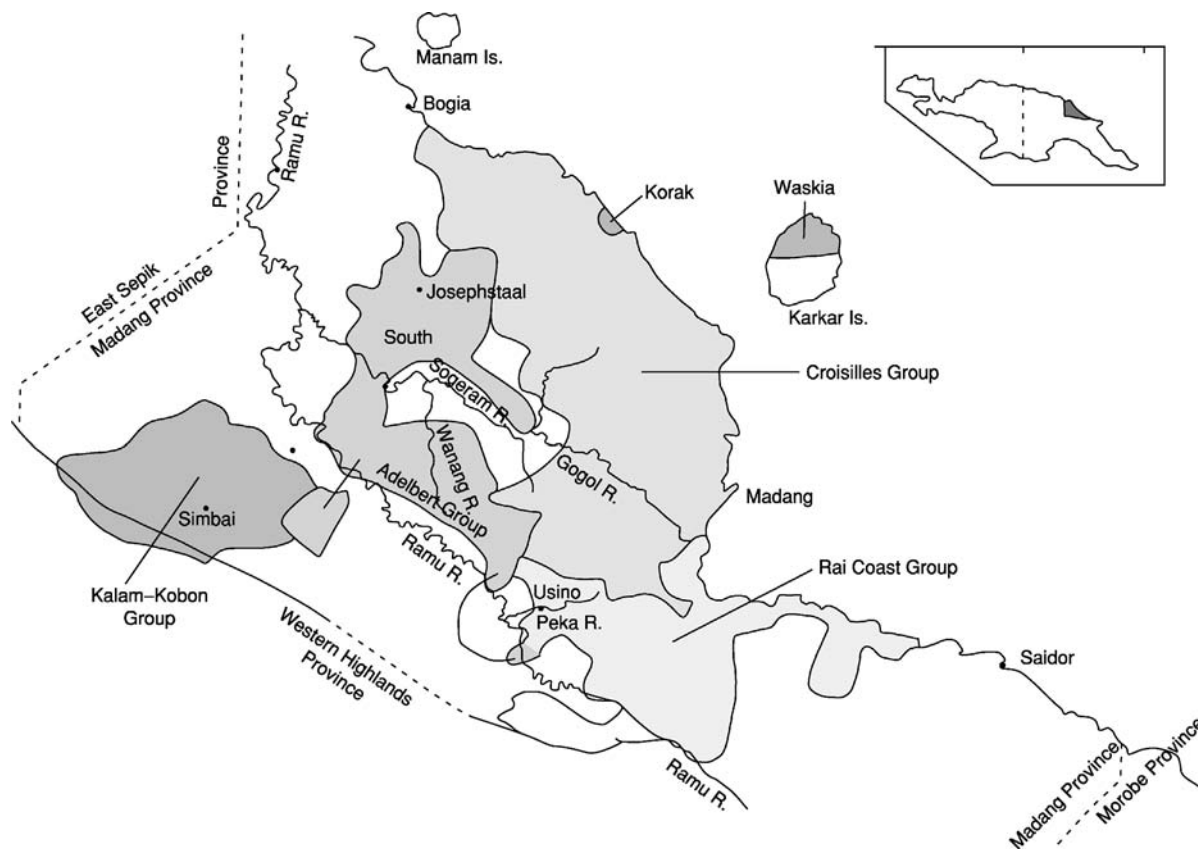

Figure 1 Location of major subgroups of the Madang group.

and Isabi is now excluded (it belongs to the Goroka subgroup of TNG).

Z'graggen also tentatively proposed an internal classification on typological and lexicostatistical grounds. Recent (and largely unpublished) comparative work using more classical subgrouping methods has led to various revisions in the subgrouping (Pawley, 1998; Pawley and Osmond, 1997; Ross, 2000). Five main branches can be distinguished based on innovations in the pronouns (Ross, 2000) and other criteria:

- The Rai Coast group, consisting of about 30 languages, extends along the coastal lowlands from around the mouth of the Gogol River eastwards almost to the mouth of the Mot, and in places extends inland as far south as the Ramu River.
- The Croisilles group of some 50 languages subsumes the 'Mabuso' group and most languages of the 'North Adelbert' group proposed by Z'graggen (1975). Croisilles languages occupy the central Madang coast from the Gogol River north almost as far as Bogia, and cover much of the hinterland west and north of Madang town.
- The South Adelbert group contains 14 languages. Twelve are centered in the South Adelbert Range

north of the Ramu River. The other two, Gants and Faita, are spoken south of the Ramu in separate pockets in or close to the Bismarck Range.

- Waskia and Korak, spoken on Karkar Island and on the coast just west of this, form another group.
- A fifth group consists of Kalam and Kobon (each a chain of diverse dialects), spoken around the junction of the Bismarck and Schrader Ranges where Madang Province meets Western Highlands Province.

Structural Characteristics of Madang Languages

Phonology

A good many Madang languages have syllables of the shape (C)V and (word finally) CVC, five vowels and between 15 and 20 consonants including series of nasals and oral and prenasalized (or voiceless and voiced) obstruents with contrasts at bilabial, apical, and velar (and often palatal) positions. Members of the South Adelbert and Kalam-Kobon groups resemble unrelated languages of the Sepik and Lower Sepik-Ramu families in making heavy use of a high

central or mid central vowel which in some contexts is nonphonemic, being epenthetically inserted between consonants (Biggs, 1963; Pawley, 1966; Ingram, forthcoming).

Grammar

The preferred order of constituents in verbal clauses is SOV but OVS often occurs as a marked structure. Adpositions follow the verb, determiners and possessors follow the noun. Case marking is generally absent or little developed. Most languages organize pronominal affixes to show a nominative–accusative/dative contrast.

Common nouns are an open class but there are several closed classes of nominal roots such as kinship terms and locatives. In Kalam and Kobon, verb roots are a small closed class of about 130 members but in most Madang languages they are more numerous and probably form an open class. Minor word classes include adjectives, adverb roots, and verbal adjuncts (see below). Many Madang languages distinguish singular, dual and plural independent pronouns in three persons. The dual and plural forms are usually distinguished by a suffix.

Morphology is chiefly suffixal. In certain Madang languages, especially in the west, nouns show considerable morphological complexity, including classifying and case-marking suffixes. In others noun morphology is simple but generally kinship nouns take bound possessor pronouns. Sentence-final verbs are typically inflected for tense-aspect-mood and for subject agreement. In some languages transitive verbs also carry a pronominal prefix or proclitic marking object agreement. Dependent verbs in nonfinal clauses are typically marked for relative tense and subject or topic identity with the final verb.

All languages make extensive use of at least one of the following kinds of complex (multiheaded) predicates: (i) in verbal adjunct constructions, a verb, usually carrying a rather general meaning such as ‘make,’ ‘hit,’ or ‘go,’ occurs in partnership with a noninflecting base (the adjunct), which carries more specific meaning; (ii) in serial verb constructions two or more bare verb roots occur in sequence to express a tightly integrated sequence of subevents. Kalam and Kobon allow up to eight or nine verb roots to occur in a single predicate phrase.

In constructions denoting uncontrolled bodily and mental processes (e.g., sweating, sneezing, bleeding, feeling sick) a noun denoting bodily condition is, arguably, the subject. The experiencer is generally marked by an object/dative pronoun and is the direct object.

Long chains of clauses are commonly used to report a sequence of past events that make up a single

episode. Generally, little use is made of conjunctions to show sequential, conditional, and causal relations. Instead, the main verb in each nonfinal clause carries a suffix which indicates (i) whether the event denoted by the medial verb occurs prior to or simultaneous with that of the final verb, and (ii) whether that verb has the same subject or topic as the next clause. Paragraphlike boundaries are frequently marked by head-to-tail linkage, in which the last clause of the previous sentence is repeated, to begin a new episode.

Madurese

B Nothofer, Universität Frankfurt, Frankfurt, Germany

© 2006 Elsevier Ltd. All rights reserved.

Madurese is the third most widely spoken regional language of Indonesia (after Javanese and Sundanese) and the fourth most widely spoken language in the Austronesian language family (after Malay/Indonesian, Javanese and Sundanese). There are more than 13 million speakers from the island of Madura, from neighboring islands (Kangean Archipelago, Bawean, and Sapudi Islands), and from the northern parts of East Java that were settled by immigrants from infertile Madura. Java has the largest number of Madurese speakers (more than 6 million). Stevens (1968) distinguished two main dialect groups, Maduran and Kangean. Within the Maduran group there are three subgroups: West Madurese, with Bawean and Bangkalan dialects; Central Madurese, with Pamekasan and Sampang dialects; and East Madurese, with Sumenep and Sapudi dialects. The Sumenep dialect is regarded as standard Madurese. The Madurese dialects of East Java vary according to the origins of the speakers. Madurese is a member of the Western Malayo-Polynesian subfamily, which includes the languages of western Indonesia and the Philippines. Lexicostatistically, Madurese appears to be most closely related to Malay; it is related to a somewhat lesser degree to the major languages of Java, i.e., Sundanese and Javanese (see Dyen, 1965; Nothofer, 1975). So far, however, no satisfactory qualitative evidence has

been adduced that may contribute to solving the question of the relationship of Madurese to its neighboring languages. Madurese shares with Javanese, Sundanese, Balinese, and Sasak (spoken on Lombok) the existence of speech levels, which serve to indicate the social relationships of the discourse participants. Meanings, for which there are low and high forms, are mostly connected with human beings and refer above all to body parts, body actions, clothing, and personal belongings. Pronouns also have status forms. It is generally assumed that speech levels represent a Javanese innovation and that this system and its higher forms are borrowed from Javanese.

Madurese Phonology

Consonants

The Madurese consonant repertoire resembles that of other western Indonesian languages. However, Madurese has a contrast between a voiceless, voiced, and aspirated stop series. Stevens (1968) characterized these consonant series as follows: (1) voiceless stop, 'voiceless, tense stops', (2) voiced stop, 'voiced, lax stop', and (3) aspirated stop, 'voiceless stop with indifferent tension followed by strong aspiration'. Clynes (1995) suggested that the aspirated stop should rather be described as 'lax voice' or 'whispery voiced'. Only Madurese and Javanese oral stops exhibit five places of articulation, both sharing a phonemic distinction between dental and retroflex (described by Stevens (1968) as 'alveolar stop

Table 1 Consonants in the inherited lexicon of Madurese^a

| | Labial | Dental | Retroflex | Palatal | Velar | Glottal |
|-------------|----------------------|----------------------|-----------------------|----------------------|----------------------|---------|
| Stop | | | | | | |
| Voiceless | <i>p</i> | <i>t</i> | <i>t̚</i> | <i>c</i> | <i>k</i> | ʔ |
| Voiced | <i>b</i> | <i>d</i> | <i>d̚</i> | <i>j</i> | <i>g</i> | |
| Aspirated | <i>b^h</i> | <i>d^h</i> | <i>d̚^h</i> | <i>j^h</i> | <i>g^h</i> | |
| Nasal | <i>m</i> | | | <i>ɲ</i> | <i>ŋ</i> | |
| Fricative | | | | | <i>s</i> | |
| Approximant | <i>w</i> | | | <i>y</i> | | |

^aBased on Clynes (1995) and Davies (1999a).

Table 2 Vowels in the inherited lexicon of Madurese

| | Front | Central | Back |
|------|----------------|----------------|----------------|
| High | /i/ ([i], [e]) | | /u/ ([u], [o]) |
| Mid | | /ə/ ([ɨ], [ə]) | |
| Low | | /a/ ([ɔ], [a]) | |

with larger area of tongue contact than dentals') consonants. Another unusual feature of Madurese is the existence of phonemic consonant gemination. All consonants with the exception of the glottal stop also occur geminated. The consonants occurring in the inherited lexicon of Madurese are shown in **Table 1** (mainly based on Clynes (1995) and Davies (1999a)).

Vowels

Madurese inherited vocabulary has four vowel phonemes, each one having two allophones, which are pairings of high and low vowels (Stevens, 1968; Clynes, 1995; Davies, 1999a). The phoneme /i/ is realized as [i] or [e], /u/ as [u] or [o], /ə/ as [ɨ] or [ə], and /a/ as [ɔ] or [a] (see **Table 2**). In order to account for vowel allophony, Stevens (1968) established the following three categories of Madurese consonants: D_H, voiced and aspirated stops; D_L, voiceless stops, nasals, and intervocalic /s/; and D_N, liquids, glides, /ʔ/, and morpheme-initial and final /s/. The low vowel allophones occur after D_L consonants, in word-initial position, and after immediately preceding low vowels. The high vowel allophones occur following D_H consonants and after immediately preceding high vowels. The D_N consonants do not affect the quality of the vowel. A vowel preceding these consonants determines the quality of the following vowel. If a vowel occurs after a word-initial D_N consonant, this vowel behaves as though it is word-initial.

Madurese vowel harmony results in verb forms with vowels that differ depending on whether they occur in a bare stem or in an active verb in which the initial consonant of the stem is replaced by a homorganic nasal (the prefix *N-* 'active'). Examples are [məlle]

'active.buy' vs. [billi] 'buy', and [nəpaʔ] 'active.arrive at' vs. [doppʔ] 'arrive at' (Davies, 1999a).

Morphology

The major morphological processes are affixation and reduplication (see Stevens, 1968). The verbal affixes include prefixes such as *a-* ('perform action indicated by root; perform action on oneself; to own, have, or use'), *ta-* ('to do unintentionally'), *pa-* ('causative'), and *ka* ('agentless passive'). The prefix *N-* marks intransitive verbs (with a meaning such as 'agentless action; reflexive action; be like; be in location') and transitive 'active' verbs, whereas 'passive' verbs are marked by *i-*. A verbal circumfix is *ka-an* 'be affected by'. Verbal suffixes are *-a* ('future, conditional, wished for, possible'), *-ag^bi* ('treat like, use object as instrument, perform action with, perform action for, make the object be'), and *-i* ('plural, causative'). Nominal affixes include *pa-* (which derives action nouns from intransitive verbs), *paN-* ('agent, instrument, result of action'), *pa-an* ('location, agent, instrument'), and *-an* ('result of action, that which is affected by action, location of action').

There are three kinds of reduplication: reduplication of the final syllable, total reduplication, and reduplication of the first syllable. The usual meanings with verbs are 'repetition or frequency of action; no specified object or goal'; with nouns the usual meanings are 'plural; groups of objects; instrument used to perform action'.

Writing System

Madurese used to be written in a script derived from Javanese script (*hanacaraka*) that originated from the Pallava script of southern India. Today, Latin orthography is common.

Malagasy

R Kikusawa, National Museum of Ethnology, Osaka, Japan

© 2006 Elsevier Ltd. All rights reserved.

Geographical Distribution, Dialects, and Speakers

Malagasy is the main language spoken in Madagascar (population approximately 17.5 million according to a 2004 estimate), located off the east coast of Africa. Standard Malagasy, which is based on the Merina dialect spoken in and around Antananarivo, the capital city, is one of the two official languages (along with French) in Madagascar and is used in public contexts and also for education in grade schools and high schools. There are said to be 18 ethnic groups in Madagascar and regional dialects are referred to in association with these groups. Many show phonemic as well as phonetic, lexical, and morphosyntactic features that are different from those in Standard Malagasy. Descriptions are available for some of the dialects (Tsimilaza, 1981; Thomas-Fattier, 1982; Manoro, 1983; Rabenilaina, 1983; Raharinjanahary, 1984; Beaujard, 1998); however, there are a number of others that have not yet been well studied. The Malagasy dialects are considered to form two groups, a western group and an eastern group (Dez, 1963; Gueunier, 1988), distinguished by two sets of regular sound correspondences, Western Malagasy *di* corresponds to Eastern Malagasy *li*, while Western Malagasy *tsi* corresponds

to Eastern Malagasy *ti*. **Figure 1** shows the boundary of the two dialect groups, as well as some regional dialect names.

Genetic Relationships

Malagasy is an Austronesian language. Its most closely related language is considered to be Ma'anyan, a language that belongs to the Barito group of the Western Malayo-Polynesian languages. This implies that the people ancestral to the present Malagasy population migrated from southeast Kalimantan on Borneo Island, where the Barito languages are spoken. This took place probably around 700 A.D., but the exact routes and the reasons for this migration are still not clear (Adelaar, 1989; Dahl, 1991). Some Austronesian features in Malagasy reflect borrowings from genetically related languages, in particular Malay and Javanese, suggesting the possibility of multiple migrations after the initial Austronesian settlement in Madagascar, and/or of continuous contact among the speakers. The language also shows traces of contact with the speakers of such languages as Arabic, Bantu languages (in particular Swahili), and Sanskrit.

Writing Systems

The first writing system introduced to Madagascar was an Arabic script. It was introduced by Muslims in the 12th century, and the people in Taimoro learned it and adapted it to their own phonology

(referred to as *sorabe* ‘great writing/drawing’). Currently, a Latin-based alphabetic system is used, which was introduced in 1823 by an early missionary of the London Missionary Society, David Jones.

Linguistic Features of Standard Malagasy

Phonology and Orthography

The letters used in the Malagasy languages and their phonemic properties are shown in Table 1. In Spoken Malagasy, /h/ often disappears, and word-final vowels (sometimes even word-final syllables) become voiceless, or are completely lost.

One of the phonological characteristics of Malagasy is the alternation between spirants and their corresponding stops. This is commonly observed in certain word derivations (such as reduplication and some verb derivations, shown in [1]). Alternation also occurs in compounds when a word starting with a spirant consonant follows the consonant *-n*, such as a genitive marker (2b–2d). It also occurs with transitive verbs when an object is incorporated (2a, 2e). (The symbol $\grave{}$ in examples indicates stress.)

Figure 1 The names of the ethnic groups in Madagascar. The line indicates the boundary between the two dialectal groups, namely Western and Eastern Malagasy.

| | | | | |
|-----|-----------------|------------------|----------------------|-------------------------------------|
| (1) | ROOT | | DERIVED FORM | |
| | <i>fito</i> | ‘seven’ | <i>impito</i> | ‘seven times’ |
| | <i>sòratra</i> | ‘to write’ | <i>soratsòratra</i> | ‘to write repeatedly’ |
| | <i>mibèrika</i> | ‘to look back’ | <i>miberikèrika</i> | ‘to look behind oneself repeatedly’ |
| | <i>vàntana</i> | ‘to be straight’ | <i>vantambàntana</i> | ‘to be somewhat straight’ |
| | <i>rèraka</i> | ‘to be tired’ | <i>reradrèraka</i> | ‘to be somewhat tired’ |

(2a) *miàmbina* ‘to guard (from)’ + *fòdy* ‘kind of bird’ > *miambim-pòdy* ‘to guard from birds’

Table 1 The Malagasy orthography and phonemic system

| | Nasal | | Voiced | | Voiceless | |

| Velar | <i>ñ</i> [ŋ] | <i>ng</i> [ŋg] | <i>g</i> | | <i>k</i> | <i>h</i> |

The phonetic property is indicated in square brackets, when it is different from the IPA orthography.

- (2b) *òrona* ‘nose’ + *sàka* ‘cat’ > *oron-tsàka* ‘the nose of a cat’
 (2c) *tràno* ‘house’ + *hàzo* ‘wood’ > *tranon-kàzo* ‘woodshed’
 (2d) *tràno* ‘house’ + *vàrotra* ‘commerce’ > *tranom-bàrotra* ‘business association’
 (2e) *lèna* ‘wet (with)’ + *rano* ‘water’ > *len-dràno* ‘wet with water’

n-anapasaha-ko ny ovy
PAST-APPLI.smash-1SG.GEN DET potato
 ‘it was a spoon with which she was smashing the potatoes’

The alternations observed in Malagasy verb morphology, as well as the various sentence structures in which they occur, are of interest in that they correspond both typologically and historically to the ‘focus’ system in Philippine and Indonesian languages.

Morphosyntactic Characteristics

Typologically, Malagasy is considered to be a ‘pro-drop’, verb-initial language that shows the major properties of head-initial languages, with modifiers following the noun and nominal arguments following the verb.

Verbs undergo various morphological derivations that are associated with different sentence structures, as shown here with verbs deriving from the root *pasaka*. In (3), the form *mipasaka* ‘to burst open’ (the initial consonant appearing as *n* marking the past tense in the example) appears as an intransitive verb requiring only a nominative argument.

- (3) **N-ipasaka** ny ovy
PAST-burst.open DET potato
 ‘the potatoes burst open’

In (4), with the form *manapasaka* ‘to smash’ (often labeled as ‘active voice’), the actor is expressed with a nominative pronoun *aho* ‘I,’ while in (5) and (6), where the verb forms are *mopasahana* ‘to smash something’ and *voapasaka* ‘have smashed something’ (often labeled as ‘passive voice’), it is expressed with a genitive pronoun *-ko* ‘I (agent).’

- (4) **N-anapasaka** ny ovy aho
PAST-smash DET potato I
 ‘I was smashing the potatoes’
 (5) **N-opasahi-ko** ny ovy
PAST-smash-1SG.GEN DET potato
 ‘I smashed the potatoes’
 (6) **Voa-pasa-ko** ny ovy
PERF-smash-1SG.GEN DET potato
 ‘I have finished smashing the potatoes / I have inadvertently smashed the potatoes.’

The form *manapasahana* ‘smash with’ (often labeled as ‘circumstantial’) in (7) typically appears in a relative clause modifying a noun which functions as an instrument or a location.

- (7) **T-amin** ny sotro no
PAST-with spoon that

Malay

B Nothofer, University of Frankfurt, Germany

© 2006 Elsevier Ltd. All rights reserved.

Malay, a member of the Malayic language group, belongs to the subfamily of the western Malayo-Polynesian languages of the Austronesian language family. Other Malayic variants that have Proto-Malayic as their common ancestor include Minangkabau, Kerinci, Banjar, Iban, and Jakarta Malay (Adelaar, 1992). Northwestern Borneo is thought to be the homeland of the speakers of the proto-language (Adelaar, 1995; Nothofer, 1997; Collins, 1998). About 2000 years ago some of them migrated to eastern Sumatra, while others remained behind and stayed in northwestern Borneo. Some of the latter traveled south to Ketapang and then crossed over to Bangka and Belitung (Nothofer, 1997). Those remaining in the homeland area are the ancestors of speakers of Malayic Dayak languages (e.g., Iban,

Selako). The Malays who sailed to Sumatra settled the island's east coast. Some moved on into the interior and to the west coast of southern Sumatra. While Middle Malay, Minangkabau, and Kerinci have inland and west coast variants as their origin, Malay itself developed from isolects spoken on the east coast. Later, Malay speakers from the southeast coast of Sumatra established Malay colonies in the Malay Peninsula. Other Malays returned to west Borneo, where they settled the coastal and riverine areas. The isolects spoken by these relatively recent migrants differ considerably from the isolects of Malays who never left Borneo. Coastal Borneo has other Malay isolects such as Sarawak Malay, Brunei Malay, Kutai Malay, and Banjar, perhaps as a result of a clockwise settlement that originated in western Borneo (Figure 1).

Malay, the native language of the powerful kingdoms along the shores of the Straits of Malacca through which all traders from the west and the east

Figure 1 Map of the Malay-speaking area.

had to sail, was prone to become the means of communication of all those involved in commercial activities in the Indo-Malaysian archipelago. With the development of the spice trade, this language was carried all the way to the Moluccas and to the many other harbor towns of this archipelago. When the Portuguese arrived in the early 16th century, simplified forms of Malay had already spread east and developed into creoles replacing local languages (e.g., Kupang Malay, Ambon Malay, Larantuka Malay). On the Malay Peninsula and on the adjacent southern islands, Malay developed literary varieties at the various royal courts. The most prestigious one was the literary classical Malay of the Riau-Johore kingdom, which had its roots in the literary tradition of the earlier sultanate of Malacca (Sneddon, 2003; Prentice, 1978).

The existence of two standard varieties of Malay, namely Malaysian (called 'Bahasa Melayu' in Malaysia) and Indonesian ('Bahasa Indonesia'), is mainly the result of an agreement reached between the British and the Dutch, who in 1824 drew new boundaries of their colonial territories. The mainland part of the Malay-speaking area became part of the British realm, and Sumatra together with the offshore islands became part of the Dutch realm. The treaty divided the former Riau-Johore Sultanate into two separate entities, with Johore belonging to the British and the Riau archipelago belonging to the Dutch. Because of this political demarcation, the influential Riau-Johore variant of Malay was now spoken in two distinct territories, which were to become Malaysia and Indonesia. Since this prestigious Riau-Johore court language played a major role in the formation of the standard languages of both countries, Malaysian and Indonesian remained closely related and are dialects of one and the same language. The differences between the two are most obvious in the vocabulary. The phonological, morphological, and syntactic differences are few and not very significant. There are a considerable number of cases in which Malaysian borrowed an English word and Indonesian a Dutch word, e.g., *tayar* vs. *ban* 'tire' or *fius* vs. *sekering* 'fuse.' Other variations occur when one of the two national variants has borrowed a European word, while the other one is a retention or an innovation, e.g., Malaysian *dulang* 'tray' (retention) vs. Indonesian *baki* 'tray' (from Dutch *bakje*) or Malaysian *panggung wayang* 'cinema' (innovation) vs. Indonesian *bioskop* (from Dutch *bioscoop*). There are cases when both Malaysian and Indonesian share the same word but with minor phonetic variation, e.g., Malaysian *kerusi*, Indonesian *kursi* 'chair' (from Arabic *kursi*). In some instances the Malay word underwent different semantic changes, e.g.,

Malaysian *pusing* 'turn, revolve' has the meaning 'dizzy' in Indonesian. Furthermore, Malaysian has borrowed more from Arabic than Indonesian, while Indonesian has undergone considerable Javanese and Jakarta Malay influence.

In Indonesia, the establishment of Malay as the national language was not disputed; its choice was not regarded as favoring any one ethnic group, since ethnic Malays constituted no more than 10% of Indonesia's population. Furthermore, various forms of Malay had long been established throughout the Indonesian archipelago. In Malaysia, the situation was different. When Malaysia became independent in 1957, Malay became the national language and one of the official languages (the other is English). Malay became the only language of education. Since Malay was more or less the exclusive property of the Malays, who made up about 50% of the population, the Chinese and Indian population of Malaysia felt at a disadvantage. A change of the language name from Bahasa Melayu to Bahasa Malaysia was one of the compromises made to comfort the non-Malay population. Later, however, the name Bahasa Melayu was reintroduced. In Malaysia, English still plays an important role and today competes with Malay as the language of instruction; in 1993, English became the language of instruction in universities. The Malaysian government argued that this was done in the interest of science and technology (Sneddon, 2003). Since 2003, secondary schools have taught mathematics and sciences in English. The introduction of English as language of education was based on the government's observation that the knowledge of English among pupils and students had deteriorated dramatically. Many Malays are worried that juxtaposing Malay and English against each other will result in a new linguistic scenario and marginalize the original national language policy.

In 1984 Malay also became the national language of Brunei Darussalam in northeast Borneo and is also called Bahasa Melayu. In this country it is the sole official language. The standard language is lexically much closer to Malaysian. In addition to Bahasa Melayu the state of Brunei also has another Malay variant (Brunei). This variant constitutes the main lingua franca in the coastal regions of Brunei

Table 1 Vowel phonemes in standard Malay

(Nothofer, 1991). Brunei has an official bilingual education policy that preserves the status of Malay but recognizes the importance of English by making it the medium of instruction from the upper primary school onward in almost all subjects.

Malay is also the national language of Singapore and one of its four official languages, along with English, Mandarin Chinese, and Tamil. Malay is a minority language, spoken by not more than 15% of the population. In southern Thailand, more than a million speakers use a Malay variant, Pattani Malay.

Cooperation between Malaysia and Indonesia resulted in the spelling reform of 1972, which removed the differences in the spelling of consonants, e.g., former Malaysian *ch* and Indonesian *tj* are now spelled *c*; former Malaysian and Indonesian *dj* are now spelled *j*. The cultural pact between the countries was intensified in 1972 with the establishment of a council known as the Language Council for Indonesia and Malaysia (MBIM). Its main tasks are to create a common scientific terminology and cooperate closely on matters pertaining to language. In 1986, Brunei Darussalam officially joined as a member of the Council, which took the new name MABBIM.

Malay Phonology

The description of the Malay phonology shown here is that of Standard Malay (SM), as defined by Adelaar (1992: 3). The vowel phonemes of SM are shown in Table 1, and consonant phonemes are shown in Table 2. The consonant /r/ is realized as a velar or uvular fricative and elided word finally by speakers of the traditional Malay areas. It is an apical flap or trill outside these areas and in official Indonesian (Adelaar, 1992: 8).

Malay Morphology

Malay prefixes include: *bər-* 'stative, habitual'; *məN-* 'active, agent focus'; *di-* 'passive, patient focus'; *məmpər-/dipər-* 'causative'; *tər-* 'accidental state, involuntary, agentless, sudden'; and *pəN-*, *pər-*, *pə-* 'actor of the performance, instrument with which the action is performed, someone having a quality as a

characteristic.' The common Malay suffixes are: *-an* 'collectivity, similarity, object of an action, place where the action is performed, instrument with which the action is performed' *-kan* 'causative, benefactive'; and *-i* 'locative, repetitive, exhaustive.' Malay circumfixes include: *bər-* *-an* 'diffuse action, plurality of subject'; *kə-* *-an* (verbal) 'unintentional action or state, potential action'; *kə-* *-an* (nominal) 'nouns referring to a quality, abstract nouns, collectivity'; *pəN-* *-an*, *pər-* *-an* 'abstract nouns, place where the action is performed, goal or result of action.'

Language and Speakers

Malayalam, a major literary language of South India with long traditions of literature and scripts, is the main language of the state of Kerala and of the islands of Lakshadweep, which are 200–400 km off the southwest coast of India. Malayalis have migrated to different parts of India and overseas, especially to Malaysia, Singapore, the United States, Canada, the United Kingdom, and Australia. The number of Malayalam speakers in India is 31.83 million. In Kerala, 96% of the total population is composed of the religious majority (comprising Hindus, 58.1%) and the religious minorities (Muslims, 21.3%; Christians, 20.6%); these groups mostly speak Malayalam. Linguistic minorities comprise 5.2% of the population. Kerala has the highest literacy rate in India (90.6% of the population). The number of dailies and periodicals in Malayalam in 2000 was 1505 (according to the *Manorama year book* in 2004).

Etymology and Variant Names

Malayāḷam is a combination of *mala* 'mountain' with any of the following terms: *aḷam* 'the place,' denoting 'the mountain country'; *ālam* 'depth,' representing 'the land that lies between the mountain and the deep ocean'; or *āḷ* 'man,' meaning 'mountain dweller.' The last term may convey the original meaning of *Malayāḷam*, denoting both 'the people,' depicted by word forms such as *malayāḷar*, *malayāḷi*,

and *malanāṭṭukāran*, and the region or country, as in the term *malanāṭu*. Early variants include *malayāḷma*, *malayāyima*, and *mlayāṇma*. *Malayāḷam* may be a later variant. *Lilatilakam*, a famous 14th-century work on the grammar and language of Malayalam, mentions only *kēraḷabbāṣa* to denote the language.

Development of Literature

Malayalam flourished in Kerala amidst continuous contact and convergence with Sanskrit, Prakrit, and Pali; profusely borrowing lexical items from these languages in addition to incorporating loans from Arabic, Persian, Urdu, Syriac, Portuguese, Dutch, Hindi, and English. The early development of Malayalam was considerably influenced by Sanskrit, the language of scholarship, and Tamil, the language of administration; eventually, Malayalam evolved in written documents and literature. The Brahmin contact made profound impact in adapting several Indo-Aryan features into Malayalam. Malayalam has a recorded literary history of over eight centuries; the earliest document, the Vaḷappaḷḷi inscription of Rajasekhara, dates to the 9th century. The early literature developed through three different traditions: (1) the Tamil tradition of *pāṭṭu*, the classical songs depicted in the first literary work, *Ramacaritam*, (2) the Sanskrit tradition of *maṇipravāla*, a literary innovation portraying a harmonious blend of *bhāṣa* and *Samskṛita* (i.e., the native language and Sanskrit – for instance, *Vaiśikatantram*), and (3) the native tradition of producing folk songs and ballads predominantly concerning indigenous elements. *Bhasakautilyam* is the earliest prose written in simple language. All three traditions belong to the

12th century. Modern Malayalam literature is rich in fiction, poetry, prose, drama, short stories, biographies, and literary criticism.

Writing System

The early Malayalam writing system had evolved from Vatteluttu, traceable to the Pan-Indian Brahmi script; this system continued for a long period, eventually adding symbols from Grantha script to represent Indo-Aryan loans. The writing is based on the concept of the *akṣara* 'graphic syllable,' wherein the graphic elements have to be read as units, although the individual vowels and consonants are easily recognizable. The script reformation implemented in the 1970s made a reduction of the less frequent conjunct consonants and combinations of the vowel *u* with different consonants, to make a simpler writing scheme. The orthography is largely phonemic, with separate script for each phoneme (with a few exceptions). The dental and alveolar single nasals (*n* and *ṇ*) are depicted by the same script, as are their long counterparts. The direction of writing for several scripts is clockwise. In a few cases, the direction is clockwise plus anticlockwise or vice-versa within a single letter. Malayalam scripts bear simple to complex allographic representations. Geminated consonants and heteroelemental consonant clusters are marked differently by writing the consonants side by side, or one above the other. Additionally, there are other combinations of consonants that seldom follow regular patterns in graphemic depiction. The six consonants *m*, *n*, *ṇ*, *r*, *l*, and *ḷ* in word-final positions have separate symbols for writing.

Grammatical Tradition

Malayalam grammatical tradition commenced with the 14th-century *Lilatilakam*. The European contributions in the early 18th century were of great importance, especially Hermann Gundert's *Malayā-ḷabhāṣāvyaākaraṇam* (1851, 1868). The 19th century saw the publication of grammatical treatises by a few native scholars, viz., George Mathan (*Malayālmayūṭe vyākaraṇam*), Kovunni Nedungadi (*Kēraḷakoumudi*; 1878), and some others, but the most widely used work was that of A. R. RajaRaja Varma, the *Kēraḷa pāṇinīyam* (1896). This was followed by L. V. Ramaswamy Iyer's profound contribution to various aspects of Malayalam linguistics in 1925. The past four decades have witnessed the production of considerable work based on modern linguistic theories and descriptive techniques applied both to various written texts belonging to different centuries,

ranging from *Ramacaritam* to the 16th-century *Adhyatma Ramayanam*, and to regional, caste, communal, and tribal dialects, with the ultimate goal of preparing a historical grammar for Malayalam that is still a desideratum (much of this work can be found in the Ph.D. dissertations by scholars in the Department of Linguistics, University of Kerala).

Dialect Variation

Malayalam dialect variations are discernible with respect to phonetic, phonological, grammatical, semantic, and lexical levels and in intonation patterns along the parameters of caste, community, region, social stratum, education, occupation, style, and register. The speech forms of Travancore, Cochin, South and North Malabar, and the Lakshadweep islands show considerable differences. Among the 48 tribal languages in the hilly tracts of Kerala, many are dialects of Malayalam and a few belong to one or the other of South Dravidian languages.

The first systematic dialect survey of Malayalam was based on a single speech community, the Ezhava/Tiyas groups living throughout Kerala; the survey was completed in 1968, demarcating 12 major dialect areas (Subramoniam, 1974). This was followed by the Nair and Harijan dialect surveys. About 600 dialect maps were prepared concerning the Ezhava/Tiyas and Nair castes, along with frequency charts of the variants, showing differences with regard to 300 diagnostic lexical items. Copies of these maps are preserved in the collections of the Department of Linguistics, University of Kerala, and the International School of Dravidian Linguistics, Thiruvananthapuram, Kerala. Among several dialect variations, the occurrence of *y* in place of *l* is commonplace, as in *palam* > *payam* 'fruit,' but the occurrence of *t* (*ketakku* 'east') is a rare feature found in the northern part of Kasargod. Initial *v/b* alternation, as in *v/barin* 'come' and *v/bāppa* 'father,' is a distinct feature of Muslim speech throughout Kerala and Lakshadweep, but in Cannanore district this change is found in the speech of other castes, demonstrating the overlap of caste, communal, and regional traits. Word-final *n/m* alternation is a feature of the Muslim dialect of Ernad and Lakshadweep, as in *nēran/nēram* 'time.' Present tense markers *-anRa* and *-uṇṇa*, as in *kottanRa* 'chops' and *iṭuṇṇa* 'places,' is a peculiarity of the PaRaya speech of Kasargod; *-aṇṇa*, as in *bayaṇṇa* 'comes,' is found in the Muslim dialect of Lakshadweep.

The literary dialect is almost uniform. The language that is used in newspapers, in mass media, and in formal situations, which is largely understood by the majority of the people irrespective of caste,

community, and region, is considered to be the standard variety. A standard colloquial is slowly evolving.

Genetic Affiliation

Malayalam shows affinity to Tamil, Kota, Toda, Irula, Badaga, Kodagu, Kannada, and Tulu, all of which belong to the South Dravidian branch of the Dravidian family. However, the affinity with Tamil is greater, since Malayalam emerged from Proto-Tamil–Malayalam; divergence occurred over a period of four or five centuries, from the 8th century onward, and distinct languages, separate from Tamil, were established.

Three distinctive features of Proto-Tamil–Malayalam include (1) *k*->*c*- before front vowels, whether followed by a retroflex or not, (2) **e*, **o*>*i*, *u* before a derivative suffix beginning with *a*, and (3) the presence of the accusative suffix *-ai*. The features that distinguish Malayalam from Tamil are (1) progressive assimilation of nasal + stop > nasal + nasal except in retroflexes and labials, (2) loss of person–number–gender in finite verbs, (3) negative periphrastic construction with *illa*, and (4) prohibitive construction with infinitive + *arutu*.

Characteristic Features

Phonology

Five vowels with length contrast, *i*, *e*, *a*, *o*, and *u*, occur in the literary and spoken dialects. Two diphthongs, *ai* and *au*, occur in the literary language. An onglide *y* and *v* occur word initially in front and back vowels, respectively, in pronunciation. Vowels occur in all positions except for short *o*, word finally. The *u* is pronounced as a high back rounded vowel when it occurs initially, medially without length in the first syllable, and with length finally, whereas it is pronounced as a lower high back unrounded vowel (*samvurutookaaram*) medially except in the first syllable and without length word finally.

Single voiceless stops (except in clusters with homorganic nasals) are pronounced with voicing (with or without slight fricativization) when occurring intervocalically; voiceless stops preceded by homorganic nasals are pronounced with slight voicing. Generally, aspirated plosives lose aspiration in pronunciation. Only six consonants, *m*, *n*, *ɳ*, *r*, *l*, and *ʃ*, can occur word finally; *n* occurs medially either with length or in clusters. All other consonants can occur word initially and medially. Voiceless stops occur medially with length and in clusters, except with homorganic nasals. For consonants, length contrast occurs only medially; *r*, *s*, *ś*, *ʃ*, *b*, and *ʈ* do not geminate.

Morphophonemics

The sandhi rules (a systematic blend of words; Sanskrit *sandhi* ‘to join’) fall under two categories, internal and external, the former operating within a word and the latter operating between words; the rules may operate in either category or in both categories (sandhis). For example, for a vowel V, the rule V1 + V2(V2) + V2(V2) operates only in close juncture: *āyi* + *illa* > *āyilla* ‘did not become.’ The following examples show other sandhi blends:

| | | | | | |
|--------|--------|--------|------------|---------------------------|-------------------------|
| i | | | i | | |
| e | + v | > | e | + y + | v (internal |
| a | | | a | | vv and external) |
| kutt̪i | + uṭe | > | kutt̪iyuṭe | ‘child of’ | |
| nalla | + āḷu | > | nallayāḷu | ‘good person’ | |
| tala | + alla | > | talayalla | ‘head not’ | |
| u | + v(v) | > | u + v + | v(v) | (internal and external) |
| rāmu | + um | > | rāmuvum | ‘Ramu also’ | |
| kuru | + āyi | > | kuruvāyi | ‘seed become’ | |
| l̪ | + n | > | l̪n̪ | (external) | |
| toḷ | + nūRu | > | ton̪nūRu | ‘ninety’ | |
| kaṇ | + nīru | > | kaṇnīru | ‘tears’ | |
| m/n/ɳ | + STOP | > | | (homorganic nasal + stop) | |
| cem | + | tāmara | > | centāmara | ‘lotus’ |
| pin | + | tuṇa | > | pintuṇa | ‘support’ |
| peṇ | + | kutt̪i | > | peṇkutt̪i | ‘girl’ |

Morphology

Noun stems fall under three categories, viz., personal pronouns (first person, inclusive and exclusive), second person, and reflexives. Demonstrative base + gender number marker constitutes third-person pronouns, as in *av-an* ‘he,’ *avaḷ* ‘she,’ and *av-ar* ‘they.’

Numerals consist of adjectival and case bases. Number markers are *-n* (gender singular), *-m* (gender plural), *nān* ‘I,’ *nammal* ‘we (inclusive),’ *-tu* (non-gender-neutral singular), and *atu* ‘that.’ Examples of gender markers are *-n*, *-ān*, and *-an* (masculine) and *-ḷ*, *-atti*, and *-āṭṭi* (feminine). Plural suffixes are *-aḷ* and *-kaḷ*.

Nominative case has no marker; accusative uses *-e* and *-a*, dative uses *-u* and *-kku*, and instrumental uses *-aal* (in literary Malayalam; in dialects, postposition *kontu* ‘with’ is used). Sociative case uses *-ōṭu* and locative case uses *-il*.

Verbs do not distinguish person–number–gender. Both finite and nonfinite verbal forms consist of a verb stem followed by verbal suffixes, which take (or can take) tense markers. A few verbs do not take tense but can take negative markers (*illa* ‘no,’ *alla* ‘not,’ and *arutu* ‘do not’). Verbs fall into two groups, intransitive and transitive. Some of the former are transitivized morphologically in three ways:

(1) by suffixing the markers *-tt-* and *-kk-* to the intransitive verb stem (*iru* ‘to sit,’ *iru-tt-* ‘to make to sit’; *oṭi* ‘to break,’ *oṭi-kk-* ‘to make to break’), (2) by geminating the stem-final stops (*aaṭ-* ‘to become,’ *ākk-* ‘to make to become’; *aaṭ-* ‘to swing,’ *aaṭṭ-* ‘to make to swing’; *kēR-* ‘to climb,’ *kēRR-* ‘to make to climb’), and (3) stem finally (nasal + nasal > homorganic stop + homorganic stop (*uRaññ-* ‘to sleep,’ *uRakk-* ‘to make to sleep’)). Two causative markers, *-i-* and *-ppi-*, can occur simultaneously within a verb, as in *paRay-i-ccu* ‘caused to say,’ *paRay-i-ppi-ccu* ‘to cause to say.’

Three-way distinctions in tense occur, i.e., present, future, and past. Examples are *-unnu* (present tense) and *-um* (future tense), as in *var-unnu* ‘comes’ and *var-um* ‘will come.’ All vowel-ending stems take link morph *-kk-* before present and future markers, as in *paṭi-kk-unnu* ‘learns’ and *paṭi-kk-um* ‘will learn.’ The verb stem *vēṇ-* is peculiar in that it takes the future tense marker *-am* (*vēṇ-am* ‘will need’) but does not take either the present or the past tense suffix. There are several past tense markers: the vowel ending *-i* (*paṭi* ‘sang’) and nasals *-nn-*, *-ññ-*, *-ṇ-*, and *-nt-* (*iru-nnu* ‘sat,’ *kara-ññu* ‘wept,’ *tā-ṇu* ‘drowned,’ *no-ntu* ‘pained,’ and *ve-ntu* ‘boiled’); only these last two verbs take the past tense *-nt-*.

Stops are *-t-*, *-ṭ-*, *-R-*, and *-c-* (*eṭu-ttu* ‘took,’ *kaṇ-ṭu* ‘saw,’ *pe-RRu* ‘delivered,’ and *aṭi-ccu* ‘beat’). Negative suffixes are *-ātt-* before the relative participle marker *-a* (*var-ātt-a* ‘that which did not come), *-āt-* before the verbal participle marker *-e* (*var-āt-e* ‘having not come’), and *-a*, which freely varies with *-ā* (*vē-ṇa(a)* ‘not needed’); *-ān* denotes the purposive infinitive (*paRay-ān* ‘saying’).

The vowel-ending stems can be used as imperatives (*paRa* ‘(you) tell,’ *nōkku* ‘(you) look’), but are less polite in speech than *-ū* is (the more polite forms are *paRay-ū* and *nōkk-ū*). The optative marker is *-aṭṭe*, as in *var-aṭṭe* ‘let (him) come.’

Syntax

Three major types of sentences, simple, complex, and compound, can be discerned. A simple sentence consists of the subject noun and predicate verb, as in *raaman varunnu* ‘raman comes.’ A nominal sentence in which both the subject and the predicate are nouns is seen in *atu maram* ‘that is tree.’ The finite verb *aanu* is optional. Malayalam word order is not rigid. Subject–object–verb is the usual order. A noun or noun phrase can be the subject in a sentence. A noun phrase (NP) is expandable by modifiers, the structure of which is \pm possessive \pm demonstrative \pm numeral Adj \pm Adj + NP, as in *enRe ā oru nalla*

peena ‘my that one good pen’ ‘that good pen of mine.’ A noun phrase can be expanded by a relative participle, nouns, case base, and clitics, as in *ceyta kāryam* ‘thing done,’ *kaykāryam* ‘handling the affairs,’ *tankaaryam* ‘one’s own affair,’ *kāṭṭukōḷi* ‘jungle fowl,’ and *piRRe divas am* ‘next day.’

Nouns/noun phrases can form the direct or indirect object. If the direct object is an animate noun, the accusative case suffix *-e* is added; if the direct object is an inanimate noun, the case suffix is dropped. The indirect object takes the dative case, as in *avaḷ sitaykku* (indirect object) *oru pūccaye* (direct object) *koṭ’uṭṭu* ‘she gave a cat to Sita.’ Verbs/verb phrases are expanded by verbal participles, auxiliary verbs, or adverbial clitics, as in *talayil cumaṭu veccukoṭuttu* ‘placed a bundle on the head’ and *patukke pooyi* ‘slowly gone.’

Interrogative sentences can be formed by adding the interrogative clitic, which would yield ‘yes’ or ‘no’ types of answers (*avaḷ sitayānō* ‘is she Sita?’). This can also denote doubt. After the defective verbs *illa* and *alla*, the interrogative particle *-ee* is added (*illee*, *allē*, ‘is it not’). Interrogative words such as *aaru* ‘who,’ *eetu* ‘which,’ and *enttu* ‘what’ can be added to form sentences, as in *āru paRaññu* ‘who told,’ *ētu kāryam* ‘which subject,’ and *enttu vēṇam* ‘what (do you) want.’ Negative sentences are formed either by negativizing the verb phrase by using morphological negative markers, or by negation of the sentence or verb phrase by using defective verbs such as *illa* and *alla* (*pōyi* ‘went,’ *pōyilla* ‘did not go,’ *itu pēna āṇu* ‘this is pen,’ *itu pēna alla* ‘this is not pen,’ *āhāram unṭu* ‘(there) is food,’ *āhāramilla* ‘(there) is no food’).

Malayo-Polynesian Languages

M Ross, The Australian National University,

Introduction

The term ‘Malayo-Polynesian’ today denotes the largest of the ten putative primary subgroups of the Austronesian language family (Blust, 1999). Malayo-Polynesian (MP) embraces perhaps 1100 languages, while the other nine groups consist only of the surviving fourteen Formosan languages of Taiwan (see **Formosan Languages**). Until Father Wilhelm Schmidt invented the term ‘Austronesian’ in 1899, however, ‘Malayo-Polynesian’ denoted the whole Austronesian language family. Its German equivalent, *malayisch-polynesisch*, was first used in print by Franz Bopp in 1841 (it is often wrongly attributed to Wilhelm von Humboldt, but is not found in his writings). ‘Malayo-Polynesian’ was in use with this meaning in English by the 1870s, but who first used it to refer to the language family is unclear (Ross, 1996). It continued to be used as a synonym for Austronesian until the 1970s, and is occasionally still used in this sense today.

In 1977 Robert Blust showed that the primary division of Austronesian was into several subgroups of languages spoken in Taiwan and a single subgroup which he labeled ‘Malayo-Polynesian’ and which includes all the Austronesian languages spoken outside Taiwan: the Austronesian languages of the Philippines, Southeast Asia, Madagascar, the Indo-Malaysian archipelago, New Guinea, Island Melanesia, Micronesia, and Polynesia. This is the sense of ‘Malayo-Polynesian’ in the remainder of this article. Some scholars prefer the term ‘Extra-Formosan’ in its place. Clearly the potential for overlap between this and a discussion of Austronesian languages is great, and the reader is referred to **Austronesian Languages** for further information.

The Integrity of the Malayo-Polynesian Subgroup

How do we know that all Austronesian languages outside Taiwan belong to a single subgroup? To determine a family tree we first compare the languages of the family and reconstruct the protolanguage from which they are descended, in this case Proto Austronesian (PAn). Then we identify subgroups of languages whose members share a set of innovations relative to PAn. We infer that the innovations are

shared because they have been inherited from a single interstage language. This is far more probable than the alternative assumption – that the innovations have occurred independently in each language that reflects them.

All Austronesian languages outside Taiwan reflect certain phonological innovations relative to PAn, and we infer that they occurred in a single interstage language which Blust named Proto Malayo-Polynesian (PMP). These innovations are enumerated here (from Blust, 1990) with minimal discussion and examples.

- A. PAn *t and *C merged as PMP *t.
- B. PAn *L and *n merged (with some unexplained exceptions) as PMP *n.
- C. PAn *S became a glottal spirant of some kind, but did not merge with *h.

Innovation A is illustrated below, where PAn *t and PAn *C (which remain separate in the Formosan language Rukai) are merged in MP languages, exemplified by Itbayat, a language of the Batanes islands between Taiwan and Luzon:

PAn *tuLa ‘freshwater eel’ (Rukai *tola*) > PMP
*tuna (Itbayat *tuna*)

PAn *pitu ‘seven’ (Rukai *pito*) > PMP *pitu (Itbayat
pitu)

PAn *Caliŋa ‘ear’ (Rukai *tsa[ŋa]*) > PMP *taliŋa
(Itbayat *taliña*)

PAn *maCa ‘eye’ (Rukai *matsa*) > PMP *mata
(Itbayat *mata*)

In innovation B, PAn *L and *n merged as PMP *n:

PAn *qaLup ‘hunt’ (Rukai *alopo*) > PMP *qanup
(Itbayat *anup*)

PAn *wanan ‘right (hand)’ (Rukai *vanan*) > PMP
*wanan (Itbayat *wanan*)

Innovation C is reflected in

PAn *duSa ‘two’ (Rukai *dosa*) > PMP *duha
(Itbayat *duha*).

A major set of innovations in pronouns involved a ‘politeness shift’ (Blust, 1977). Just as the English plural pronoun *you*, used as a polite form of address, eventually displaced singular *thou*, so PMP underwent a set of changes in pronouns which were also related to politeness (for details see Ross, 2002: 51). No MP language reflects forms that predate the shift.

PMP added to the verbal system the prefixes *paN-(distributive), *paR-(durative, reciprocal) and *paka-(aptative, potential) (Ross, 2002: 49–50). These are widely reflected in the languages of the Philippines and the western part of the Indo-Malaysian

archipelago, and are preserved in fossilized form in many languages elsewhere in the MP subgroup.

History and Subgrouping

How did it come about that all Austronesian languages outside Taiwan belong to a single subgroup while perhaps nine coordinate groups are represented in Taiwan itself? The obvious answer is that PAN was spoken in Taiwan and diversified into a group of languages there. Speakers of one of these languages left Taiwan, presumably for the northern Philippines. Their language underwent the innovations noted above, becoming the language we call PMP.

Archaeological dating suggests that the culture that spoke PAN flourished in Taiwan around 3000 B.C. and that the migration to the Batanes islands or Luzon which led to the genesis of PMP occurred around 2000 B.C. The descendants of PMP speakers evidently spread, mostly south and then eastward, at an astonishing speed, colonizing the Philippines, the Indo-Malaysian archipelago, parts of coastal New Guinea, and the Bismarck Archipelago in the northwest of Island Melanesia within about 500 years, by 1500 B.C. This history is reflected in the tree diagram of the Austronesian family (see Figure 1). This shows some 20 to 25 groups of western MP languages, spoken in the Philippines and the western part of the Indo-Malaysian archipelago, with outliers on Hainan, in the Vietnamese highlands, on the islands along the western coast of Thailand and Myanmar, and on Madagascar (see Figure 2). The migration of MP speakers to Madagascar was a much later event (Adelaar, 1991). Adelaar (2004) provides a listing of western MP groups which reflects current understanding. Although there are frequent references in the literature to ‘Western Malayo–Polynesian,’ there was

never a ‘Proto Western MP,’ as western MP languages as a whole share no innovations. The similarities among western MP languages, such as they are, reflect shared retentions from PMP. The fact that the tree shows so many coordinate branches reflects the rapidity with which MP speakers occupied the region. They were agricultural people – rice growers – and probably encountered little significant opposition from the small populations of hunter-gatherers who had previously occupied these territories.

There is reasonable evidence in the form of shared innovations that all MP languages in the regions labeled on the map as Central Malayo–Polynesian (CMP), South Halmahera/West New Guinea (SHWNG) and Oceanic are descended from a single language, shown on Figure 1 as Proto Central/Eastern Malayo–Polynesian (PCEMP) (Blust, 1993). However, the set of innovations that defines this grouping is not nearly as substantial as the set defining MP (see above), and we must infer that the period for which PCEMP speakers remained an integrated speech community was short. The conventionally accepted family tree of Austronesian languages (originally proposed by Blust, 1977) gives PCEMP two daughters, ‘Proto CMP’ and ‘Proto Eastern MP.’ The status of both is doubtful. There is agreement among scholars today that PCEMP diversified, apparently rapidly, into a dialect network, and that the Eastern Malayo–Polynesian languages broke away from that network, probably as the dialects of the network were achieving the status of separate languages. There is no significant evidence, however, that there was ever a discrete Proto CMP (for more details, see Ross, 1995).

The existence of Proto Eastern MP is also questionable, and it is possible that it was simply a peripheral section of the Central/Eastern MP dialect network

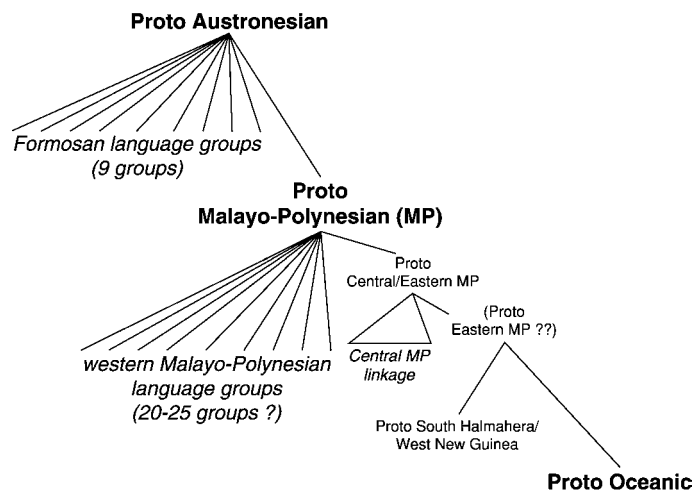

Figure 1 Austronesian family tree.

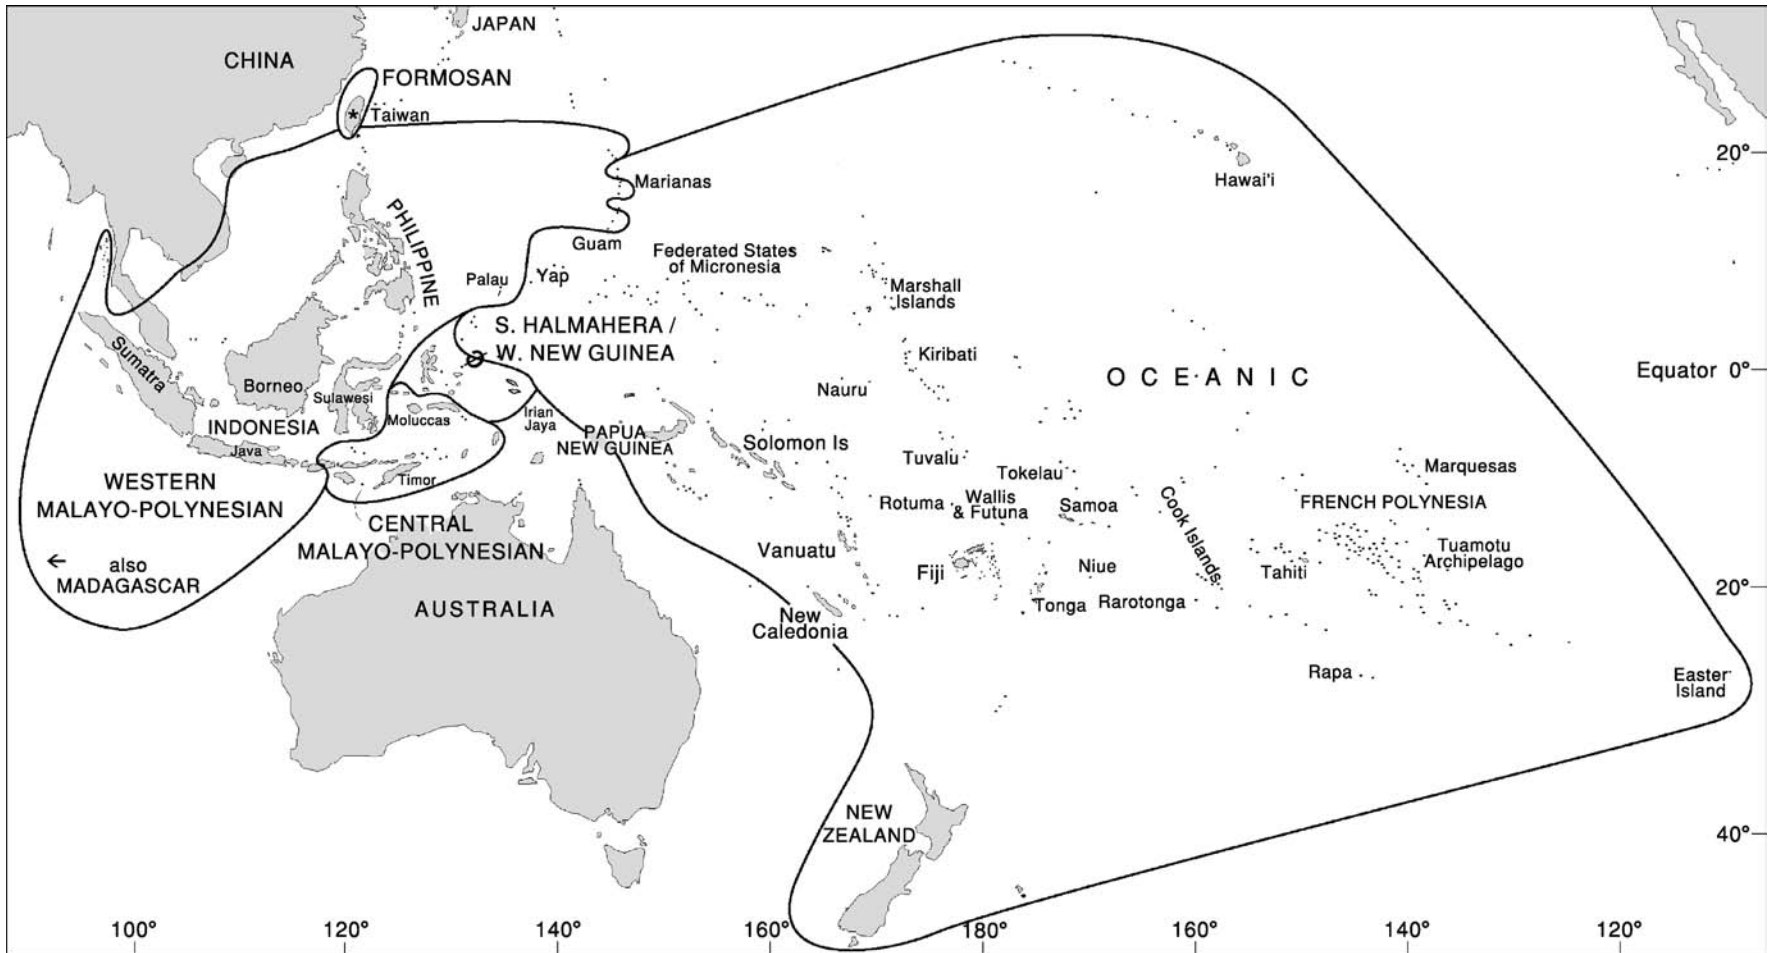

Figure 2 The Austronesian family and major Malayo-Polynesian language groups.

(Ross, 1995; Adelaar, 2004). However, there is much less doubt about Proto SHWNG, the ancestor of a small group of languages in the south of Halmahera and scattered around the Bird's Head Peninsula of New Guinea, and no doubt at all about Proto Oceanic.

Proto Oceanic was the ancestor of the MP languages of New Guinea other than those belonging to SHWNG (see map) and of all the MP languages of Island Melanesia, Polynesia, and Micronesia other than Chamorro (Guam) and Palauan (Belau). The Oceanic languages share a striking set of innovations, larger than the set for Proto MP itself. These innovations were first recognised by Dempwolff (1937) in Volume 2 of his pioneering work on Austronesian (see **Austronesian Languages**) and have undergone various modifications since as the result of further research (Lynch *et al.*, 2002: 63–67).

The history represented by the varying strengths of the nodes in the Austronesian family tree diagram (**Figure 2**) shows a period of relative stability during which Proto MP developed from the speech of those who emigrated from Taiwan, followed by 500 years of extraordinary settlement activity which culminated in the arrival of MP speakers in the Bismarck Archipelago. Here there seem to have been a few more centuries of relative stability, during which Proto Oceanic developed into a language that was at least phonologically and lexically rather different from its sisters around the Bird's Head.

Why the apparent halt in settlement activity? There were perhaps two reasons. First, New Guinea was already inhabited by Papuan speaking agriculturalists (see **Papuan Languages**) with much greater population densities than their hunter-gatherer neighbors to the west, and there was little space for the newcomers. Second, there probably was continued settlement activity during the development of Proto Oceanic, but no further than the Solomon Islands, to the east of which there is a substantial sea gap (Pawley, 1981).

There is agreement among many linguists and archaeologists (but not all) working in Island Melanesia that Proto Oceanic was the language of the Lapita Culture, a group that produced distinctive pottery and exploded eastwards into the Pacific from about 1300 B.C. Island Melanesia (the Bismarck Archipelago, Solomon Islands, Vanuatu, New Caledonia, and Fiji), Tonga, and Samoa were all settled within a few hundred years (Kirch, 1997). A linguistic puzzle in this story is that Proto Polynesian, the Oceanic language ancestral to Tongan, Samoan, and the 40 or so languages of scattered Polynesian communities is structurally rather different from other Oceanic languages, yet there is no

obvious hiatus in the archaeological record during which these differences might have developed. It is reasonably certain, however, that Proto Polynesian or an immediate ancestor developed in the northeastern islands of Fiji (Geraghty, 1983).

The Structures of Malayo-Polynesian Languages

MP languages show an extraordinary structural diversity. General accounts can be found in Lynch *et al.* (2002: 34–53) for Oceanic languages and Himmelmann (2004) for other MP languages. The languages of the Philippines and parts of northern Borneo, northern Sulawesi, and Madagascar largely retain the structure of PAn (see **Austronesian Languages**; **Formosan Languages**). The western MP languages of Vietnam, Hainan, and the Thailand/Myanmar islands show the influence of Mon-Khmer languages. In the western MP languages of Malaysia and western Indonesia we find a complex set of developments in which the PAn voice system is much reduced but applicatives take over much of its functional load (Ross, 2002). The CMP, SHWNG, and Oceanic languages (other than Polynesian) have a broad typological similarity, but with many variations. Most of these languages have lost all trace of voice and have subject-referencing verbal prefixes or proclitics. How this system arose from systems reflected in western MP languages is traced by Lynch *et al.* (2002: 57–63). Klamer (2002) describes CMP language structures, Ross (2004) those of non-Polynesian Oceanic languages.

Further References

The MP family is vast, and the serious enquirer will need to look beyond this article. Detailed maps of the locations of MP languages and their dialects are found in Wurm and Hattori (1981–1983), although it is not a reliable source for subgrouping. Adelaar and Himmelmann (2004) is the major reference for MP languages other than Oceanic, Lynch *et al.* (2002) for Oceanic languages. Both works also include a large collection of grammar sketches of a sample of languages. Tryon (1995) is an extensive comparative lexicon.

Associated with the historical study of MP languages, especially of Oceanic, is a solid body of work on culture history. Ross *et al.* (1998; 2003) are the first two of five volumes in which the terminologies used by Proto Oceanic speakers are reconstructed, following more piecemeal work on the lexicons of MP languages in general (Pawley and Ross, 1994) and work on MP culture history by scholars in various disciplines (Bellwood *et al.*, 1995). Pawley and

Ross (1993) is a short survey mostly of MP historical linguistics and cultural history.

Maltese

This article is reproduced from the previous edition, volume 5, pp. 2356–2357, © 1994, Elsevier Ltd.

Maltese is the national language of the Republic of Malta and one of its two official languages, the other being English. It is spoken by virtually all the 345 418

(1985) inhabitants (plus ca. 80 000 Maltese immigrants in Australia). Until the 1930s, its status was low, with the prestige languages being Italian and English. The first text written in Maltese, a poem, is ca. 1460 AD, but although texts appear sporadically thereafter, Maltese only began to be written systematically from about the end of the eighteenth century.

Maltese, a language of Arabic origin, shares many of the features that distinguish the modern Arabic

vernaculars from literary Arabic. Maltese also displays those features that distinguish Maghrebine dialects from the rest; for example, the loss of gender distinctions in second-person-singular pronouns and verbs and the leveling of first-person markers in the imperfect to give {n ... ø} for the singular and {n ... u} for the plural. However, Maltese differs from most 'core' vernaculars of Arabic by having (a) adopted the Roman alphabet; (b) a phonemic system without emphatics, with fewer back consonants but more vowels; (c) virtually the whole of the vocabulary pertaining to intellectual, technical, and scientific pursuits taken from Sicilian, Italian, and English; (d) a number of conservative lexical features (e.g., *ra* 'he saw'); and (e) grammatical innovations of Romance origin (e.g., passives with *kien* 'he was' or *gie* 'he came' as auxiliaries). These features reflect the fact that Maltese has

not had Classical Arabic as an acrolect for some seven centuries. This and the fact that it is now the national language of an independent state have given Maltese the status of a distinct language.

Malukan Languages

M Florey, Monash University, Clayton, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

Some 128 languages are spoken in the geopolitical region of the Malukan islands in eastern Indonesia (see **Figure 1**). The majority of the 111 Austronesian languages of Maluku are subgrouped within the Central Malayo-Polynesian branch of Central-Eastern Malayo-Polynesian (CEMP) (Blust, 1978). A number of the Austronesian languages of north Maluku

are subgrouped in the South Halmahera-West New Guinea branch of CEMP (Collins and Voorhoeve, 1983). Current information indicates that there are also 17 non-Austronesian languages spoken in Maluku (Grimes, 2000). Sixteen West Papuan phylum languages are found in the northernmost parts of Maluku, on Morotai, Ternate, Tidore, Halmahera, and nearby smaller islands. Oirata is a Trans-New Guinea phylum language of southern Kisar island, located near the north-eastern tip of East Timor.

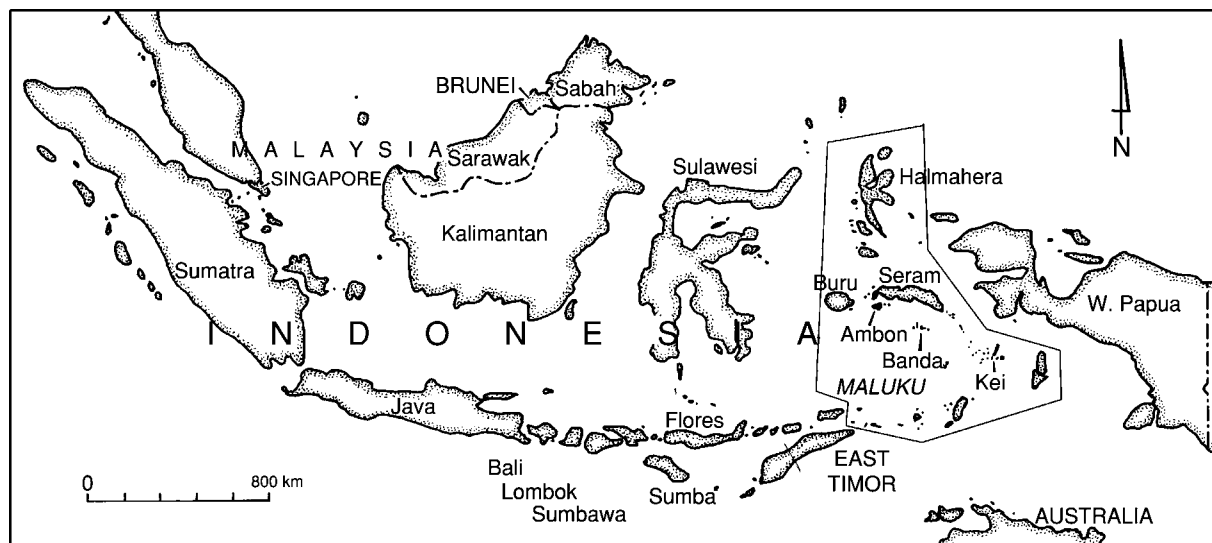

Figure 1 Map of Indonesia showing the location of the Malukan islands.

Linguistically, Maluku is characterized by high linguistic diversity, serious endangerment, and little detailed documentation. Speaker populations have historically been much smaller than in ethnolinguistic communities in the western Austronesian region. Larger languages include Kei with 86 000 speakers and Buru with perhaps 43 000 speakers (Grimes, 1995). These numbers, however, give an overly optimistic picture of linguistic vitality. The highest documented degree of language endangerment in Indonesia is located in Maluku. A recent survey indicated that 10 languages are close to extinction and a further nine languages are seriously endangered (Florey, 2005). Centuries of contact with nonindigenous peoples through colonization and intensive trade for spices, and conversion to non-indigenous religions have all played a role in language endangerment, which is particularly severe in the central Malukan islands of Seram and Ambon. Language contact has resulted in the wide use of a number of Malay creoles throughout Maluku of which Ambonese Malay is the best known (Minde, 1997).

Tryon (1994: 12) suggested that Maluku is possibly the least known Austronesian area and many languages – both Austronesian and non-Austronesian – remain undescribed. The richest descriptions to date include those of Alune (Florey, 1998, 2001) and Buru (Grimes, 1991, 1995) in central Maluku, Taba (Bowden, 2001) and Tidore (Staden, 2000) in north Maluku, and Leti (Engelenhoven, 1995) in south Maluku. These descriptions provide some insights into oral genres, including origin tales, historical narratives, folktales, riddles, and incantations. Parallelism (paired correspondences at the semantic and syntactic levels) is a feature of incantations and some narrative genres. Among the special registers which have been documented are those which were associated with avoidance relationships, hunting, fishing, healing, and headhunting. In some communities, ritual language still accompanies ceremonies held to mark the passing of life stages, and ritual practices associated with agriculture, renewing inter-village alliances, and the building of ritual houses.

Comparative analysis indicates that, in central Malukan languages, the preferred word order within clauses is SVO. Actor arguments in Alune may occur as a full noun phrase, a pronoun, or a proclitic, and actor NPs and pronouns are optionally crossreferenced with a proclitic on the verb. Undergoer arguments may occur as a full noun phrase, a pronoun, or an enclitic.

Au beta-³u-ru

 esi-tneu behe a-³eri-e sarei

3PL-ask CMP 2SG-work-APP what
 ‘my younger siblings they asked me: “What did you work at?”’ (Alune AK: 45)

This pattern of crossreferencing is not always apparent today as the rapid language change which accompanies language endangerment is typically characterized by extensive variation both within and between speech communities.

A morphologically marked alienable–inalienable contrast has been described for a number of the languages of Central Maluku. Synchronically, this contrast is not found across all languages. In those languages in which the contrast is marked, inalienable possession denotes all items which are culturally considered to be intrinsically a part of oneself – the things which we as humans are born with, and certain physical and emotional states. Alienable possession denotes the things which we might acquire through our lives: certain relationships and objects or possessions. Inalienable possession is marked with enclitics and alienable possession with proclitics, as demonstrated in the following Haruku examples:

Mambila

B Connell, York University, Toronto, ON, Canada

© 2006 Elsevier Ltd. All rights reserved.

Mambila is a Bantoid language situated in the Nigeria-Cameroon borderland. Mambila is a diverse language with approximately 20 different dialects. Among its interesting characteristics is its system of four level tones, and in one lect the presence of two fricative vowels that appear to be reflexes of the so-called super-close vowels of Proto-Bantu. Several Mambila lects are endangered, with some on the verge of extinction.

Classification

Mambila has been recognized since the early 1960s as a Bantoid language. A subgrouping within Bantoid now known as Mambiloid, which includes a number of other languages in the region, was proposed a decade later, although the precise relationship between Mambiloid and the rest of Bantoid remains a matter of debate.

Mambila is the most diverse of the Mambiloid languages. It is spoken on both sides of the Nigeria-Cameroon border, on the Mambila Plateau in Nigeria, and on the western edges of the Adamawa Plateau and the Tikar Plain in Cameroon. The great majority of Mambila speakers – an estimated 90 000 of 100 000 total speakers – are in Nigeria. Mambila comprises some 20 dialects, which are divided into two clusters, referred to by their rough geographical orientation as East and West Mambila. Within each

cluster there is limited mutual intelligibility among dialects, reflecting a dialect continuum; between the two clusters, mutual intelligibility does not exist, although speakers do recognize the relatedness of their languages to other languages in the region. Strictly on the basis of linguistic criteria, one might be inclined to refer to many of these dialects as distinct languages. For this reason, the neutral term 'lect' is used in referring to individual varieties of Mambila.

The main characteristic distinguishing the two dialect clusters is a difference in morpheme structure: In East Mambila a disyllabic root structure, CVCV(C), predominates, which corresponds to a monosyllabic CVC structure in West Mambila. A number of sound correspondences also serve to distinguish the two groupings, e.g., initial /f/ and /h/ in East Mambila correspond to /p/ and /t/, respectively, in West Mambila.

Little descriptive work has been done on Mambila. The two lects that have received the greatest attention are Tungba, spoken in Nigeria, and Ba, in Cameroon. Both are West Mambila lects. The following paragraphs present a short summary of Mambila structural characteristics.

Phonology

Consonants

Across Mambila lects there is little difference among consonant systems; what differences do exist are mostly related to the historical developments described above. The Ba system, /p, b, t, d, k, g, \widehat{kp} , \widehat{gb} , m, n, η , $\widehat{\eta m}$, mb, mv, nd, nd₃, ηg , $\widehat{\eta mgb}$, f, v, s, h, l, j,

w/, is fairly typical, both in its inventory and in the fact that /p, kp, gb, and ɣmgb/ in those lects, where they do occur, are infrequent. Distribution of consonants within the word is skewed in Mambila, with all consonants occurring in the initial position, but typically only /p, t, k, m, n, ɲ, l/ being found word finally.

Vowels

There is greater variation in the vowel systems of Mambila lects than for the consonants. The vowel system found in Ba, /i, e, a, ə, u, o, ɔ/ is the smallest; Tungba has only a slightly larger system, /i, e, ε, a, u, o, ɔ, a/, but its phonetic realization is divergent, with allophonic front rounded vowels. Len, another West Mambila lect, is even more divergent, particularly with the presence of two fricative vowels, /z̥i, v̥u/. These vowels appear to be the result of sub- or adstratal influence from the neighboring Grassfields languages, which may ultimately reflect the super-close vowels of Proto-Bantu.

Tone

Mambila is a register tone language; in West Mambila, it features four level tones that function both lexically and grammatically, and tones combine on single syllables to form a number of surface contours. Pitch realization in the Ba lect has been the subject of a number of experimental phonetic studies (Connell, 1999, 2000b, 2002). Tone in East Mambila lects has not been systematically investigated, although it is known that they have only three level tones.

Morphology

Mambila marks grammatical functions through affixation, typically suffixation. In most West Mambila dialects many of these functions are indicated only with a tonal morpheme; comparative evidence from both West and East Mambila reveals that a –CV melody is reconstructible in most cases. Despite the fact that Mambila is a Bantoid language, there is no system of nominal classification, and only traces remain of a former noun class system that reveals the heritage shared with Bantu. Pluralization is marked through means of a segmental suffix, –bV, except in Ba and other lects on the Tikar Plain, where a cognate prefix is used. There is evidence of an older means of marking plurals, and the presence of the common –bV is likely a recent development, perhaps through areal influences.

Syntax

Little can be said at this point concerning the syntax of Mambila. It has basic SVO word order, which

varies to indicate narrative, focus, and other pragmatic functions. As mentioned above, tone is used to indicate a number of grammatical functions, including negation, imperatives, and discontinuous verb phrases.

Language Vitality

Since it has more than 100 000 speakers, one might expect that Mambila will remain relatively stable for the foreseeable future. However, when its internal dialect variation is considered, an average of approximately 5000 speakers exists for each lect. Many of these are spoken by considerably fewer speakers; indeed, a few Mambila lects are on the verge of extinction, while one other has just recently become extinct. Given the potential contribution that these lects could make not only to our understanding of our common linguistic heritage but also to the history and prehistory of sub-Saharan Africa, documentation of these lects must be considered a priority.

Manambu

A Y Aikhenvald and P Y L Laki, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

Manambu belongs to the Ndu language family, and is spoken by about 2500 people in five villages: Avatip, Yawabak, Malu, Apa:n and Yuanab (Yambon) in East Sepik Province of Papua New Guinea. Between 200 and 400 speakers live in the towns of Port Moresby, Wewak, Lae, and Madang. Most Manambu speakers are proficient in Tok Pisin, the *lingua franca* of Papua New Guinea; many know English. In terms of number of speakers, the Ndu family is the largest in the Sepik area, comprising 32% of the Sepik basin dwellers (Roscoe, 1994). It consists of at least eight languages spoken by over 100 000 people along the course of the middle Sepik River and to the north of it. Other documented languages in the family are: Abelam or Ambulas (ca. 40 000; this number includes speakers of a variety of dialects under the names of Maprik, Wosera, West Wosera, and Hanga Kundi); Boikin (ca. 30 000); Iatmul (ca. 12 000); Sawos (ca. 9000); Yelogu (ca. 200); and Ngala (ca. 130). No genetic links between Ndu and other languages of the Sepik area have been proved. The origins, protohome, and the internal classification of the Ndu languages remains a matter for debate. Manambu's closest relatives are Iatmul and Ngala. The trade relationship and marriage exchange with the Iatmul contributed to a large amount of lexical diffusion between the two groups in close contact.

Manambu is synthetic, agglutinating with some fusion, mostly suffixing, and predominantly verb-final. The phonology of Manambu is complicated, with 21 consonants, nine vowels, and contrastive stress. Nouns distinguish eight cases (subject, definite object/locative; dative/aversive; allative/instrumental; comitative; terminative 'up to the point'; and two cases referring to 'means of transport'). Three numbers (singular, dual, and plural) and two genders (feminine and masculine in the singular) are expressed via agreement on demonstratives, interrogatives, in possessive constructions, on verbs and on two adjectives ('big' and 'small'). Singular and plural numbers are marked on kinship nouns, and on a few nouns from other semantic groups. The noun 'child' has a semisuppletive form for the dual number. Associative plural is marked on kinship nouns and personal names, as in *Tanina-b,r* 'Tanina and others.' Gender is distinguished in second and third person singular independent pronouns, and neutralized in the plural.

Nouns are assigned genders according to the sex of a human referent, and to shape and size of any other referent. That is, men are assigned to the masculine, and women to the feminine gender; a large house is masculine, and a small house feminine. By semantic extension, an unusually big or bossy woman can be treated as masculine, and a squat fattish man as feminine. Personal names are a distinct subclass of nouns, with special derivational suffixes not used anywhere else in the grammar.

Verbs have a plethora of grammatical categories, covering person, number, gender, tense, numerous aspects (e.g., completive, habitual, and repetitive) and modalities including irrealis, purposive, desiderative, and conditional. A verb in the declarative mood can cross-reference the person, number, and gender of the subject. Or, if a clause contains a constituent that is more topical than the subject, this constituent can also be cross-referenced alongside the subject. The imperative mood also marks person and number of the subject employing a different set of markers. The only fully productive prefix in the language is *a-*, the marker of second person imperative. Three suffixes expressing prohibition differ in their illocutionary force. Many of the verbal categories – including person and tense – are neutralized in negative clauses. Verb compounding is highly productive; up to three verbal roots can occur together, but the meaning of the combination is frequently unpredictable. Directionality (up, down, inside, outside) is marked both on verbs and on demonstratives. In addition, demonstratives encode six degrees of distance and visibility.

Similarly to other non-Austronesian languages of New Guinea, Manambu has extensive clause-chaining and a complex system of switch-reference, whereby a nonfinal clause is marked differently depending on whether its subject is the same, or differs, from that of the main clause. See Aikhenvald with Laki (forthcoming) for a full account of Manambu grammar, and also Aikhenvald (1998) and Allen and Hurd (1972). The relative complexity of Manambu could be partially accounted for by the substrata of languages spoken by members of neighboring tribes conquered by the Manambu as a result of inter-tribal warfare (Harrison, 1993).

Manambu culture places particular importance on ownership of personal names and various kinds of cultural knowledge. Ritualized debates among rival leaders and the clan groups they represent are, traditionally, the main political forum, and ownership of names is an oft-debated issue. A detailed study of Manambu ethnography is in Harrison (1990, 1993), which also contains a detailed analysis of the kinship

system and relationships (of Siouan type). Traditional genres include mourning songs *grakudi* and foiled marriage songs *namai* (Harrison, 1982; Takendu, 1977).

Manambu is an endangered language. All the Manambu are bilingual in Tok Pisin (and some also know English). Children in the villages prefer using the local *lingua franca*, Tok Pisin, in their day-to-day interaction. A literacy program in Manambu is currently being implemented at the local school at Avatip.

The Distribution of the Mande-Speaking People

Today, the Mande (or *Mandé* in French) language group consists of some 30 languages spoken in West Africa from Nigeria to Senegal by an estimated 10 million speakers. The term Mande and its variants (see **Table 1**) provide not only the basis for many of the names of the Northern Mande languages, but the various names accorded the language family as well. These variants are attributable to (1) minor vowel alternations (*e/i* and *a/e*), (2) the consonantal alternation (*nd/n/l*) found throughout the Mande-speaking area, and (3) the suffix *-ka(n)*, meaning 'language or dialect.'

Table 1 Variants of Mande

| | |
|---------------|--------------------|
| Mandi(ng) | Mandinka, Mandingo |
| Mande (Mandé) | Mandekan |
| Mende | |
| Mani | Manianka |
| Mane | |
| Mali | Malinke |
| Male | |

The map of the distribution of the Mande languages (**Figure 1**) shows that the heaviest concentration of Mande languages is in the republics of Guinea and Mali, and adjacent areas of Senegal, Sierra Leone, Liberia, and Ivory Coast. Furthermore, these western languages are contiguous and cover larger areas than those to the east, which appear as islands in a sea of Niger-Congo languages.

The Reconstructed History of the Mande

While scholars have not reached a total consensus on how the Mande evolved, evidence from the historical, archaeological, and linguistic record suggests the following six stages.

Phase 1: The Drying of the Desert

According to McIntosh and McIntosh (1984), the Mande originally lived in a much wetter Saharan area and practiced a herding–fishing–collecting economy. Lexicostatistical evidence (Dwyer, 1989) suggests that 4000 years ago the Mande people were undifferentiated linguistically.

Around 3000 B.P. (before present), in response to the increasing lack of rainfall, one branch of Proto-Mande (the earliest form of Mande) speakers migrated southward where wetter conditions would permit their herding–fishing–collecting way of life. The other

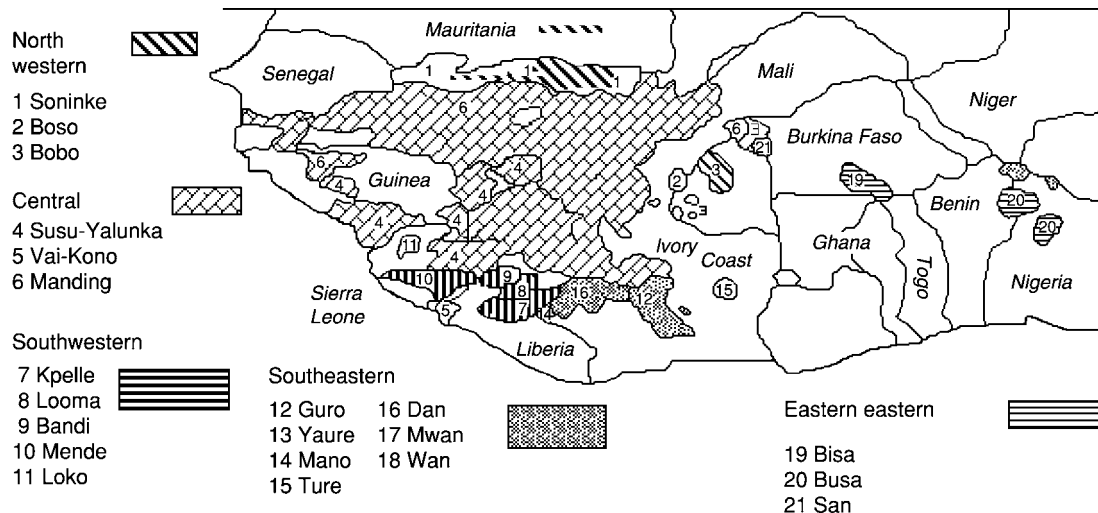

Figure 1 Map of the Mande languages.

branch, known as the western branch, responded to the increasing dryness by intensifying their cultivation of cereals.

Phase 2: The Development of Agriculture

At Jenno-Jene in the upper Niger delta, archaeologists have identified a site, continuously occupied from about 2250 B.P., that exhibits a second agricultural phase. This elaboration of agriculture may well have been responsible for the diversification and the westward expansion of the Central Mande speakers. This expansion may also have been responsible for pushing the pastoral Soninke further to the north.

Phase 3: The Rise of the Sudanic Kingdoms of Ghana and Mali

At the time of the sedentarization of the Western Mande, the people of this area were engaged in extensive trans-Saharan trade with North Africa. The stimulus for the trade was the alluvial gold found in deposits along the upper Niger River, which was exchanged for Mediterranean merchandise and salt. This trade gave rise to the Soninke-speaking empires of Ghana (700–1100) and the Manding-speaking empire of Mali (800–1550). The substantial area taken up by the Western Mande can be attributed to the expansion of this empire.

Phase 4: Rice and the Development of Forest Agriculture

While research in this area is still in progress, evidence suggests that a form of upland rice in the Guinea Highlands and iron tools permitted the Mande (and Atlantic) populations living along the rainforest-savannah border to enter the forest to practice swidden agriculture. The map shows a number of

Mande groups straddling this line including the Southwestern Mande, the Vai/Kono into present-day Sierra Leone and Liberia, and many of the Eastern Mande peoples into Liberia and Ivory Coast. Using oral traditions and genealogies, Person (1961) concludes that this movement into the rain forest took place in the 15th century. As these agricultural people moved into the sparsely populated rain forests, they increased the risk of malarial infections. In response to this situation, the percentages of the sickle cell trait (an adaptation to malaria) increased in these populations to the point where they are among the highest in the world (Livingstone, 1958).

Phase 5: The Arrival of the Europeans

Beginning with the Portuguese in 1455, contacts, trade, and finally settlement in this area increased, so that by 1500 permanent trading outposts and slaving operations were fully established. One effect of this development was the decreasing economic importance of the trans-Saharan trade and the decline of the Sudanic kingdoms.

The Linguistic Evidence

Following a technique developed by Ehret (1980), Table 2 shows the Proto-Mande terminology relating to economic activity (hunting, herding, and agriculture). After establishing the lexicostatistical dates, vocabulary common to all or most members of the branch are considered to be in existence at the time the branch was an undifferentiated language. Thus the terms for wine, mortar, and dog were common to the western branch but not the eastern branch, and are presumed to have been part of Western Mande before it separated into its constituent

groups. This linguistic evidence is consistent with that proposed for the early phases of Mande.

The Classification of Mande Languages

Current Classification

The internal classification of Mande (see Table 3) has undergone a series of revisions, the most recent and most accurate being that done by Kastenholz (1996). For a full classification of the Mande languages go to the Ethnologue website.

Earlier Classifications

Mande was first recognized as a related group of languages by Sigmund Koelle, who used the

term Mandinga (Koelle, 1854). Shortly thereafter Heymann Steinthal (1867) introduced the term Mande (or *Mandé*). Maurice Delafosse offered the first subclassification of Mande in 1901, in which the major distinction was between Mande Tan (which is the northern group minus Susu and Yalunka) and Mande Fou, based on the words for ‘ten.’ Over time, the Tan/Fou categorization became increasingly suspect, but it was not until William Welmers (1958), using a lexicostatistical approach based on the Swadesh 100-word basic vocabulary list, rejected it and produced the first version of the currently accepted system. Welmers concluded that the word *tan* was a more recent innovation in Western Mande, not the fundamental split that Delafosse had assumed, and introduced the East–West division that remains today.

Mande as a Niger-Congo Language

Since the time of Koelle, four major hypotheses concerning the placement of Mande in Niger-Congo have been offered:

- Westermann (1927) included Mande in his West Sudanic, which was very similar to Greenberg’s Niger-Congo (Table 4).
- In 1963, Joseph Greenberg, using a methodology based on the mass comparison of lexical items, accepted and refined Westermann’s view. He renamed West Sudanic as Niger-Congo, the name it bears now, and included it as a branch of a larger grouping, Niger-Kordofanian. Of all the Niger-Congo languages, Greenberg considered Mande the least remote (Table 5).
- Consistent with common usage, Williamson (1977) replaced Greenberg’s Niger-Kordofanian with the

Table 2 Linguistic evidence

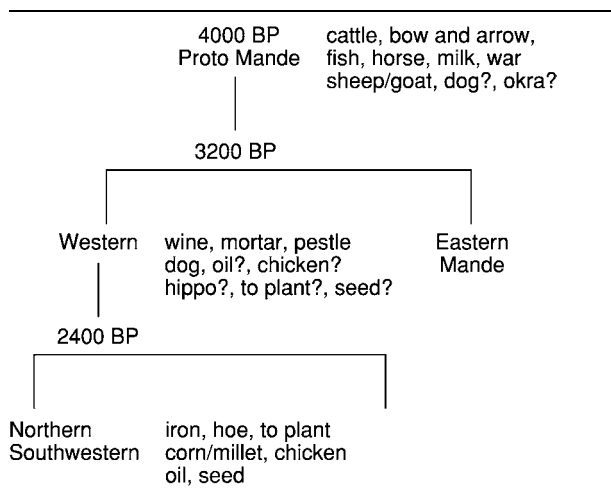

Table 3 Current classification

| Mande 4000 BP ^a | | | |
|--------------------------------|----------------------|-----------------------|------------------|
| West Mande 3200 BP | | Eastern Mande 2400 BP | |
| Central (southwestern) 3200 BP | Northwestern 2400 BP | Eastern-eastern | Eastern southern |
| South western 3000 BP | Jowulu | Bisa (Bissa) | Guro-Tura |
| Kpelle | Soninke-Bobo 2750 BP | Barka | Guro |
| Mende Looma (Loma) | Bobo | Lebir | Yaouré |
| Central 2100 BP | Soninke | Busa | Tura (Toura) |
| Susu-Yalunka | | Boka (Boko) | Dan |
| Manding-Jogo | | Bokabaru (Bokobaru) | Mano |
| | | Busa-Bisa (Busa) | Nwa-Ben |
| | | Tyenga (Kyenga) | Ben |
| | | Sam (Samo) | Gban (Gogu) |
| | | San (Samo) | Nwa (Wan) |
| | | Sane (Samo) | Mwan |

^aThe BP dates are from Dwyer (1989). Each date represents the estimated date at which the languages in the group separated, based on common percentages of basic vocabulary cognates. Thus Central Mande, for example, with its time depth of 2100 BP, is based on a common cognate percentage of 40%.

term Niger-Congo. Williamson then placed Mande along with Atlantic Congo (the main body of Niger-Congo languages) and Kordofanian as the first three branches of Niger-Congo (Table 6).

- Also in 1977, Hans Mukarovsky proposed a substantial restructuring in which Mande and Benue-Congo were removed from the old Niger-Congo (renamed West Sahelian) and placed with Songhai (Songhay), previously not considered a Niger-Congo language, as branches of Sahelian (Table 7).

Although the Mukarovsky model is still seen as an interesting hypothesis, currently most scholars favor the Williamson proposal. Nevertheless, the progression from Westermann to Williamson to Mukarovsky does show an increasing awareness of Mande as a

remote branch of Niger-Congo. This development has raised questions about whether Mande is actually a Niger-Congo language. Part of this suspicion is due to the fact that Mande is also unique among the Niger-Congo languages because of its lack of evidence of a noun class system, found in other Niger-Congo languages, and its almost universal subject-object-verb word order.

This led Dwyer (1998) to compare the vocabulary of Mande and samples from other Niger-Congo branches. This study shows that Mande is a lexically coherent group. By lexically coherent, I mean that the best way to explain the vocabulary basic and other is to attribute a common ancestor (Proto-Mande) to these languages. The study also found that Niger-Congo (specifically Mande, Benue-Congo (including Bantu) and the western Nigrific core) is also lexically coherent. Finally, the study concluded that of these three language groups, Mande is lexically least related. These conclusions are fully consistent with the Williamson hypothesis but not that of Mukarovsky.

Linguistic Properties

Phonology

A tentative reconstruction of the Proto-Mande consonant system (Table 8) suggests a series of labial, alveolar, velar, and labiovelar voiced and voiceless stops. Because of the eccentric, but relatively consistent bimodal patterning of the voiceless stops, Dwyer (1994) tentatively suggested the possibility of a second series of fortis voiceless stops (t' , k' , kp'). Interestingly, this dual series of voiceless stops is analogous to that postulated for Upper Cross by Dimmendaal (1978) and Sterk (1979) and for Volta-Congo, Stewart (1976). In addition Mande appears to have only an (s/z) fricative contrast and labial, alveolar, and palatal nasals along with the liquid (l) and the glides (y and w).

Tone

Most Mande languages have two level lexical tones (high and low), along with a falling tone, analyzed as a sequence of high followed by low, and a rising tone. Bobo (Bobo Madaré), Mano, and Kpelle have three tones and one language, Sembla (Seeku), has four. Both Kpelle and Bobo (Bobo Madaré) (Dwyer, 1994)

| Fricative | | s/z | | | |
| Nasal | m | n | ɲ | | |
| Liquid/Glide | | l | y | | w |

can be shown to have independently evolved a third tone through tone splitting. This suggests that they originally had a two-tone system.

Morphosyntax

One of the most striking facts about the Mande languages is the structural unity of the group and its distinctiveness from other Niger-Congo languages. Syntactically, the Mande languages have an SOV word order with oblique objects being marked as the objects of specialized postpositions. None of the Mande languages use serial verbs. Many Mande languages distinguish between alienable and inalienable possession.

Tense and aspect are generally marked through a combination of verb suffixes and postsubject formatives. Definite articles, demonstratives, and plurals tend to follow the noun or noun + attribute while possessive pronouns precede the noun.

Research in the area of comparative morphology and syntax is beginning to emerge. Creissels (1980) charted the distribution of four verbal particles in his Mandekan dialects with the conclusion that from these data no clear evolutionary sequence could be ascertained. Grégoire (1980) compared the rather unique properties of Mande relative clauses from all of its major branches: northern, southwestern, south-eastern, and Bobo. Dwyer (1985) has traced the evolution of the definite articles in Northwestern Mande.

Comparative reconstruction is a far more challenging task than lexicostatistical analysis, but promises

more interesting results, not only in the study of the development of the language, but also in the area of cultural history and in understanding the relationship between synchronic and diachronic rules.

Noun Classes

Typically, Niger-Congo languages have several semantically based noun classes (animate, inanimate, diminutive, augmentative, and abstract), usually marked by prefixes, both singular and plural. Languages of the Mande branch do not make use of this morphological device. One possible explanation is that the noun class system developed after Mande separated from Niger-Congo. Alternatively the system could have been part of Niger-Congo and subsequently lost in Mande. In the latter situation, one would expect some evidence in some of the Mande languages of remnants of such a noun class system. However, despite numerous attempts no evidence has turned up. For example, Dwyer (1990) examined Bobo (Bobo Madaré), which has a very complex system of plural formation requiring the positing of a number of noun classes in order to derive the correct form. However, these noun classes did not turn out to be related (semantically or morphologically) to the Niger-Congo noun classes.

A number of Mande languages have developed writing systems, including a Vai syllabary (Stewart, 1972) that has been in use continuously since the 1830s.

Resources

The Mande Studies Association (MANSA) website has several useful links to other resources in French (*Actualités de la recherche au Mali* and the *Bulletin d'Anthropologie et d'Histoire Africaines en Langue Française*) and English. Both the Summer Institute of Linguistics and Ethnologue contain descriptions of individual Mande languages and more detailed

maps. The site of the Union Mandingue has posted a history of the Manding-speaking peoples. Additional sources can be found by entering the individual language names given in this article in any search engine. The most thorough bibliography can be found in Kastenholz (1988).

Maori

W Bauer, Wellington, New Zealand

© 2006 Elsevier Ltd. All rights reserved.

Maori is the language of the Polynesian people who settled in New Zealand over 1000 years ago. It belongs to the Eastern Polynesian branch of the Malayo-Polynesian language family. Its current situation is typical of indigenous languages subjected to the effects of European colonization.

The early English missionaries Samuel Marsden and Thomas Kendall were instrumental in having a

writing system devised for Maori. This has largely served the language well, although it failed to distinguish between long and short vowels. The dictionary produced by three generations of the Williams family remains highly significant, and W. L. Williams made a substantial contribution to the grammatical description of Maori.

In the first half of the 20th century Maori children were taught English at the expense of Maori. Influential Maori leaders advocated the use of English in Maori homes, and speaking Maori at school was often punished. By the mid-20th century Maori was

rapidly dying, although small Maori-speaking communities remained in isolated rural areas. In 1951, Auckland University introduced Maori as an academic subject, which raised its status a little as did the grammatical descriptions produced by the linguist Bruce Briggs. However, the future looked bleak.

In the 1970s, a Maori political revival began (the ‘Maori renaissance’). It was accompanied by serious endeavors to revitalize the language. *Kohanga reo* ‘language nests’ were established (preschool education centers providing education in Maori), and these were followed by Maori medium schools (*kura kaupapa Māori*), or immersion or bilingual units in mainstream schools. Small Maori radio stations were established with variable amounts of broadcasting in Maori. The Maori language became an official language of New Zealand. A Maori Language Commission was established to aid revitalization, and it has manufactured many vocabulary items from Maori elements to cater to modern needs. A Maori television channel went on the air in 2004.

Today the future of Maori is unclear. It might survive, testimony to the success of the revitalization process, but it is not yet secure. Most speakers have learned Maori as a second language, and many are ‘semi-speakers.’ Many teachers of Maori are not fully fluent, and the quality of the Maori taught in some Maori-medium classrooms is poor. Many children who leave *kohanga reo* speaking fluently do not use the language as teenagers. Most native speakers of Maori are over 70 years old, although there are some (particularly from the Tuhoe area, where Maori remained strong 20 years longer than elsewhere) still in the workforce. It is common to hear ‘relexicalized English’ – English structures where the content words and some of the grammatical words are replaced by Maori lexical items. Fluent Maori speakers often speak English to each other rather than Maori. While the latest surveys suggest that more people are speaking more Maori, there are very few who are fully conversant with the language. The last New Zealand census contained a question about use of Maori.

Such dialect differences as exist are tribally based. Most are lexical and phonological (with divergent realizations of phonemes rather than different phonological systems), and grammatical differences are not very significant.

Maori has a small phoneme inventory, with ten consonants (/p t k m ŋ r w f h/), and five vowels (/a e i o u/), each of which may be short or long. Orthographically, all use the obvious single roman letters except for <ng> (for /ŋ/) and <wh> (for /f/). The proper analysis of the long vowels is debatable: they may be analyzed as clusters of identical short vowels (reflected in ‘double vowel’ orthography), or

as separate phonemes (reflected in the macron orthography, which is now official): *Maaori* vs. *Māori*. Syllables are open, and there are no consonant clusters. All pairs of short vowels can occur in clusters, but some behave as one syllable and some as two. There are also longer vowel clusters. The rhythm is based on the mora (of form (C)V, where V is short), but stress operates with a bigger unit (C)V(V). Word stress is predictable, with syllables ranked according to the nature of the vowel. All content words contain at least two morae.

Maori has virtually no inflectional morphology and very little derivational morphology, although the allomorphs of the passive suffix have raised significant linguistic interest.

The syntax is surface VSO, but the most likely underlying word order is VOS, with a rule that normally moves all but the first phrase in a complex predicate to the right of the subject. The basic unit of syntax is the phrase, which has a grammatical particle indicating the phrase function preceding the lexical material. Modifiers usually follow the lexical head. The grammatical particles include markers of tense and aspect, and prepositions that indicate noun-phrase function, and may be tense-marked. The sentence subject is the only NP without an introductory preposition. Maori does not have a copular verb, and many sentences lack overt verbs. The basic syntax is illustrated in the following:

| | | | | |
|-----------------|------------------|-------------------|---|---------------|
| kei | raro | ngā | pukapuka | tawhito |
| at-PRES | <i>underside</i> | DEF.PL | <i>book</i> | <i>old</i> |
| a | Hone | i | | |
| DEEPL.APOSS | <i>John</i> | at. TNSNEUTRAL | | |
| t-ō-na | | moe-nga | | |
| DEESG-OPOSS-3SG | | <i>sleep-NOML</i> | | |
| | | | ‘John’s old books are under his bed’ | |
| ka | tope | a | Wāka | |
| FUT | <i>chop</i> | PERS ART | <i>Wāka</i> | |
| i | te | rākau | rimu | a |
| ACC | DEESG | <i>tree</i> | <i>rimu</i> | <i>at.FUT</i> |
| te | Rāhina | | | |
| DEESG | <i>Monday</i> | | | |
| | | | ‘Wāka will chop down the rimu tree on Monday’ | |

The pronoun system distinguishes singular, dual, and plural, and in the first person, inclusive and exclusive. Number is marked on determiners, not nouns (except for a handful of personal nouns), the singular usually with an initial *t-* and the plural with \emptyset (e.g., *tētahi* – sg, *ētahi* – pl) and there is a special determiner for proper names. There is a very complex system for the expression of ownership, including a distinction akin to alienable/inalienable (marked by *a-* vs. *o-*forms). Most lexical items can serve without

morphological change in noun phrases, verb phrases, or as modifiers. In narratives, the passive is used for most event sentences, which has given rise to much debate about ergative vs. accusative syntax. A typologically unusual feature is that lexical modifiers of passive verbs take a passive suffix in agreement with the verb. The direct object is not integrated into the grammatical system of Maori in the way that would be expected if the language was originally accusative: for instance it cannot normally be relativized on directly. This is probably one remnant of a former ergative syntax.

Mapudungan

F Zúñiga, University of Zurich and University of Leipzig and Centro de Estudios Públicos, Zurich, Switzerland

© 2006 Elsevier Ltd. All rights reserved.

The dialects of Mapudungu(n), less deviant from one another than the dialects of English, are spoken by the Mapuche of south-central Chile and central Argentina. Current conservative estimates place the number of fluent speakers at one-third of the almost 1 000 000 ethnic Mapuche; more than 90% are in Chile, of which more than 40% are in or around Santiago and only 30% live in the traditional Mapuche territory. The main present-day dialects are (1) Mapudungun proper or Central Mapudungun, in south-central Chile, and (2) Pehuenche, to the east of the former. Further dialects such as Argentinean Ranquel and Chilean Picunche and Huilliche are either obsolescent or extinct. Other names for the language are Araucanian (from *araucanos*, the ethnonym used by the Spaniards; present-day Mapuche avoid using this term), Mapuchedungun, and (Re)chedungun. Several genetic affiliations have been proposed, not only with languages spoken in the south of the continent such as Kawésqar (Qawaskar) and

Yaghan (Yámana) but also with language families as distant as Arawak, Carib, and Mayan; to date, none of these proposals has been convincingly substantiated. The first grammar dates from the early 17th century. Written texts began to appear in the early 1900s and have become more numerous only at the end of the 20th century.

The phoneme inventory is simpler than the ones found in neighboring languages: the vowels are /a, e, i, o, u, i/ (where /i/ <ü> is unrounded high central when stressed and close to a schwa when unstressed). The glides are palatal /j/ <y>, labiovelar /w/, and velar /ʉ/ <g>. The consonants are the voiceless unaspirated noncontinuants /p, t̪<t̪>, t, ʈ<tr>, c <ch>, k/ (where /c/ is alveolopalatal), the voiceless fricatives /f, θ <d>, s <s, sh>/, the nasals /m, ñ <ñ>, n, ñ, ŋ <ng>/, and the liquids /l̪ <l̪>, l, ʎ <ll>, ʎ<r>/. The dental series /t̪, ñ, l̪/ contrasts with the alveolar one /t, n, l/ only in highly conservative speech; most speakers have an alveolar series only. Pehuenche has voiced fricatives [v] and [ð] instead of [f] and [θ]. Primary stress can be largely predicted from syllable structure (it tends to fall on the penultimate mora) – with some exceptions, as in a number of disyllabic adverbs whose stress is lexically assigned to the ultima. Because there is no universally accepted orthographic convention,

it is not uncommon to find some variation in the literature and deviant spellings such as <z> instead of <d> (for /θ/), <g> instead of <ng> (for /ŋ/), and <(t)x> instead of <tr> (for /t/) in recent texts.

Nominal morphology is simple and almost exclusively derivational; there is neither gender nor case, adjectives take the suffix *-ke* in the nonsingular, and human nouns are marked with a preposed element *pu* in the plural. Compounding is highly productive, for example,

mapu-che
land-people
'people of the land'

Personal and possessive pronouns distinguish three persons (first, second, and third) and three numbers (singular, dual, and plural). Noun classes, possessive classes, classifiers, and alienable/inalienable possession are not marked overtly.

Agglutinative and predominantly suffixing, verbs are marked for mood (indicative *-i*, subjunctive *-l* and unmarked imperative), tense (future *-a* and unmarked nonfuture), evidentiality (reportative-mirative *-rke*), polarity (negative *-la* ~ *-no* ~ *-ki* and unmarked affirmative), directionals (e.g., cislocative *-pa*, translocative *-pu*, andative *-me*), voice (e.g., applicatives *-ñma* and *-(le)l*, reflexive *-w*, agentless passive *-nge*, causativizer *-m*), aspectuality (e.g., habitual *-ke*, progressive/resultative *-(kü)le*, progressive *-meke*, continuative *-ka*, telicizer *-tu*, ambulative *-(k)iaw*), modality in the broad sense (e.g., ruptured implicature *-fu*, immediate action *-fem*, sudden action *-rume*), and person. Person marking is intricate and can be described as following a direct/inverse pattern in that, when more than one argument is involved, the one ranking higher in the nominal hierarchy or primary argument (first- and second-person over third-person) and proximate over obviative on chiefly pragmatic grounds) is fully marked for person and number, whereas the lower or secondary argument is either underspecified or only implied. There are also forms that do not typically occur as predicates in main clauses; they do not encode the primary argument on the verb (but, with the exception of the *lu*-form, take an external possessive marker instead), function as verbal nouns, participles, and/or gerunds and end in *-n*, *-el*, *-lu*, *-yüm*, or *-am*. Many suffixes are transparently related to verb roots that still occur as such in the language (e.g., *meke*- 'be busy,' *tu*- 'take,' *kiaw*- 'walk,' and *fem*- 'do so'), and root serialization is used in order to express path of motion and other categories, for example,

rüngkü-kon-
jump-enter-
'jump in'

Reduplication of the root with *-tu* or *-nge* is used for the iterative, for example,

rüngkü-rüngkü-tu-
jump-jump-PRT
'jump repeatedly'

The incorporation of complex NPs is receding in the speech of younger urban Mapuche, but is productive in the speech of older rural speakers, for example,

ngilla-kurü-ka|-ufisha-
buy-black-wool-sheep-
'buy wool of black sheep'

On the other hand, the incorporation of simple NPs into the verbal complex is still robust, as in

katrü-kachu-
cut-grass-
'cut grass'

Adjectives, wh-words, and numerals can all take verbal morphology.

Mapudungan is head-marking at both the NP level (possession) and the clause level. Unmarked utterances tend to be verb-initial and have at most one argument NP. There are both prepositions and postpositions, and adpositional phrases tend to follow the predicate and its arguments. Almost all marked word-order patterns are attested, and all can be elicited; an interplay of direct/inverse marking and position governs the interpretation of NPs as agentive or patientive. There do not seem to exist overt topic or focus markers, but a number of particles are used in questions or as intensifiers. Clause-linkage patterns resort to the gerunds previously mentioned or show coordination (e.g., with *ka* 'and' or *welu* 'but') or juxtaposition.

Although the lexicon of Mapudungan has visibly borrowed from Quechua and Spanish, the effects of contact on the morphology do not appear to be significant. The use of the verbal suffix *-fi* as more or less matching the use of the Spanish preposition *a* with direct objects and the higher frequency of AVO sentences in present-day Mapudungan are the most prominent contact-induced phenomena in the syntax.

Marathi

K Wali, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Marathi, a member of the Indo-Aryan subbranch of the Indo-Iranian branch of the Indo-European languages, is the official language of Maharashtra state of India. It is spoken by nearly 96 million people, according to the most recent census. The major dialects of Marathi are Deshi, spoken around Pune, Varhaddi and Nagpuri, spoken around Nagpur, and Kokni in the coastal region. Marathi has been much influenced by Dravidian Kannada and Telugu spoken in the southern vicinity of Maharashtra (Bloch, 1920; Southworth, 1971).

History

Marathi is a direct descendent of Maharashtri, a prakrit language derived from Sanskrit. The earliest reference to spoken Marathi is found in *kuvalaymala* written in the 8th century by Udyotansuri. The earliest written Marathi is found in the 10th-century inscriptions at Shravan belgola. The earliest literary text is considered to be *Viveksindhu* of Mukundraja (1199 C.E.) A high literary form of Marathi appears around the 13th century in *Jnaneshawari*, a commentary on the *Bhagavad Gita* (Master, 1964).

Script

Modern Marathi script, called *balbodhi*, is based on the Sanskrit Devnagari script, with certain modifications. Unlike English, Devnagari is alphasyllabic. It uses certain diacritics for vowels when combined with consonants. The diacritics distinguish long and short vowels. There is also a special system to denote consonant clusters. There also is an alternative curvilinear script, called *modii*, which was introduced by Hemadpant around the 17th century and was used in official documents for some time.

Phonology

The traditional Marathi alphabetic chart lists 16 vowels and 36 consonants based on Sanskrit. Today, many of these alphabets are obsolete. Modern Marathi has 8 basic vowels and 34 consonants, including two semivowels. Tables 1 and 2 indicate the vocalic and consonantal charts and their respective features.

A salient feature of consonants is the distinction between affricates and palatals. The distinction is neutralized before *y* and *i*. The origin of affricates is controversial, because they are not found in Sanskrit.

Suprasegmentals

Length:

Vocalic length is mostly predictable. With the exception of ə, the last vowel of a word is long unless the vowels are followed by a combination of consonants such as *nt*, *tr*, *kt*. (iii) The length is phonemic in *i*, *u*.

Nasal vowels:

Use of nasal vowels as independent entities varies from speaker to speaker. They are found in certain adverbs, nouns, and plural nouns in the context of case and postpositions. They are phonemic in certain dialects.

Accent:

Marathi is said to have a stress accent. Length, pitch, and sonority play a role in determining the loudest accent. (For details, see Kelkar, 1958, 1997; Pandharipande, 1997.)

Table 1 Vowels

| | Front | Central | Back |
|---------|-------|---------|------|
| High | i | | u |
| Mid | e | | o |
| Mid low | ai/æ | ə | au/ɔ |
| Low | | a | |

Salient features: The qualitative difference between ə and a is not precise. ə can be extra short and silent. e and o occur in all positions. æ and ɔ are found mostly in borrowings from English.

Table 2 Consonants

| | <i>Labial</i> | <i>Dental</i> | <i>Retroflex</i> | <i>Alveolar</i> | <i>Alveopalatal</i> | <i>Velar</i> | <i>Glottal</i> |
|-------------------|---------------|---------------|------------------|-----------------|---------------------|--------------|----------------|
| Stops | | | | | | | |
| vcl.unasp | p | t | ʈ | | | k | |
| vcl.asp. | ph | th | ʈʰ | | | kh | |
| vcd.unasp | b | d | ɖ | | | g | |
| vcd.asp | bh | dh | ɖʱ | | | gh | |
| Affricates | | | | | | | |
| vcl.unasp | | | | c | č | | |
| vcl.asp. | | | | | čh | | |
| vcd.unasp. | | | | j | ǰ | | |
| vcd.asp. | | | | jh | ǰh | | |
| Nasals | | | | | | | |
| | m | n | ɳ | | | | |
| Laterals | | | | | | | |
| | | l | ɭ | | | | |
| Trill | | | | | | | |
| | | | | r | | | |
| Fricatives | | | | | | | |
| | | s | ʂ | | | | h |
| Semivowels | | | | | | | |
| | | v/w | | | y | | |

Salient features: *h* is a voiceless aspirate after voiceless stops and voiced aspirate in other positions. *s* becomes retroflex before a retroflex consonant. *v* vacillates between bilabial and labiodental position. It becomes a voiced lenis labiodental spirant in the initial position.

Morphology

Both animate and inanimate nouns exhibit two numbers – singular and plural – and three genders – masculine, feminine, and neuter. Marathi is a split ergative language. The subject is marked nominative with the exception of (i) transitive verbs in the perfective, (ii) obligative subjunctive, and (iii) dative verbs (Wali, 2004). The subject is marked ergative in (i and ii) and dative in (iii). In all these constructions, the verb agrees with the unmarked nounphrase, which may be a direct object or a theme. The verb shows neutral agreement if both subject and object have overt case. A salient feature of ergative system is seen in the pronominals. The first and second person pronouns are not overtly marked for ergative case and still show an ergative agreement pattern. What is more interesting is that the second person shows agreement for both nominative object and ergative pronoun though it is marked nominative (1). (See Wali, 2004.)

- (1) tu sāmāya ghas-l- ya-s.
 you- lamps-NOM- wash-PERF-
 NOM 3FPL 3FPL-2SG

‘You washed the lamps.’

Syntax

Word Order

The standard word order is subject object and verb, that is, SOV, in all constructions including interrogatives. The order is variable with certain restrictions. Most adjectives precede and agree with nouns. Adverbs precede the verb. Some adverbs agree with the verb.

Passivization

There are two types of passives: regular and capability. Although both are formed by adding *ja* ‘go’ to the verbal perfective, there is a difference. The former applies only to the transitives and allows demoted agent to be deleted. The latter operates across intransitives and transitives and does not allow the demoted agent to delete.

Subordination

The subordinate clause may be finite or nonfinite. It may precede or follow the main clause. Adverbial and relative clauses are correlative type. The latter allow deletion of head and correlative nouns and show a considerable range of word order variation (Wali, 1982). They exhibit a reduced participial form in all tenses. They also show a rare pattern of multiple headed relatives. These do not allow participial reduction.

Notion of Subject

Agreement is not a criterion for a subject because of the complexity noted in the morphology. It is necessary to resort to other grammatical rules such as reflexivization and participle reduction to determine the subject. Both nominative and ergative subjects undergo the same rules. However, the status of dative and passive subjects is enigmatic since they obey only some of these rules. In fact, the rule criterion leads to the conclusion that these two construction may have two subjects contrary to the traditional notion of there being a single subject in a sentence (see Wali, 2004).

Mayan Languages

J M Maxwell, Tulane University, New Orleans, LA, USA

© 2006 Elsevier Ltd. All rights reserved.

The Mayan language family traditionally stretched from what is now northern El Salvador and Honduras, through Guatemala and Belize, and up to the southern states of Mexico, including Chiapas, Quintana Roo, Campeche, Yucatán, and part of La Huasteca. Today the family is more dispersed due to out-migration. Large colonies of Mayan speakers can be found in Los Angeles and other California communities, Arizona, Texas, and Florida. Most linguistic descriptions recognize 31 Mayan languages, including the extinct Chikomulselteko (Chicomuceltec). Most historical linguists posit the Maya homeland as the Cuchumatán peaks of Guatemala, the area with the greatest linguistic diversity today (Kaufman, 1976; Campbell, 1977; Fox, 1978; Campbell and Kaufman, 1983, 1985). The model of diversification correlates phonological, morphological, and syntactic changes with a least-moves model of out-migration, seeking confirmation in the archaeological method. Based on these reconstructions, Proto-Maya, the mother language from which the modern diversity springs, would have been spoken approximately 41 000 years ago. People began to migrate outward, sharing innovations as they moved.

The family eventually split into four divisions. (Note that many of the names of Mayan languages have a variety of spellings. These spellings reflect not only the writing traditions of various authors (English, Hispanic, Mayan), but also their political orientation. In Guatemala, particularly, Mayans have fought for and won official recognition of their own orthographies. In Chiapas, Mayan educators have

also elected non-Spanish-based spelling systems. In Yucatán, however, a long tradition of literacy in Maya Yucateco has militated against changing orthographies. The spellings used in this article reflect the local practice.)

1. Wasteko, composed today only of Wasteko (Huasteco).
2. Yucatecan, composed of Maya Yucateco (Yucatán Maya), Mopan (Mopán Maya), Itzaj (Itzá), and Lakantun (Lacandán).
3. Western Division, broken into two branches: Ch'olan and Q'anjob'alan. The Ch'olan branch in turn has two subgroups, Ch'olan Proper, consisting of Chontal, Ch'ol, and Ch'orti' (Chortí), and Tzeltalan, consisting of Tzotzil and Tzeltal. The Q'anjob'al branch has two subgroups, Chujean, consisting of Tojolab'al and Chuj, and Q'anjob'alan Proper, consisting of Q'anjob'al (Eastern Kanjobal), Akateko (Western Kanjobal), Popti' (formerly Jakalteko (Jacalteco)), and Mocho' (Mochó).
4. Eastern Division, which is subdivided into the Mamean and K'iche'an subgroups. The Mamean branch is broken into Mam Proper, consisting of Mam and Teko (also called Tektiteko (Tectiteco)), and Ixilan, which includes Ixil (Nebaj Ixil) and Awakateko (Aguacateco). The K'iche'an branch includes the outliers Uspanteko (Uspanteco) and Q'eqchi' (Kekchí) and two major subdivisions, K'iche'an Proper, consisting of K'iche' (Quiché), Achi', Kaqchikel (Central Cakchiquel), Tz'utujil (Tzutujil), Sakapulteko (Sacapulteco), and Sipacapense (Sipacapense), and Poqom, consisting of Poqomchi' (Pocomchí) and Poqomam (Pocomam).

Within subgroups there is a high degree of mutually intelligibility and multilingualism (particularly

evident in market contexts), which blurs language and dialect boundaries. Often the divisions between language groups are determined more by political divisions and historical identities than by isoglosses. Rivalry between families in Aguacatán brought about the splintering of Awakateko, spawning a new ‘language,’ Chalchiteko, which won official recognition in Guatemala in 2003. Likewise, historic autonomy and a tradition of armed and political conflict between Q’umark’aj (the K’iche’ capital) and Rab’in’al (the Achi’ center) have created localized identities, which override mutual intelligibility in determining the language boundaries between the two groups. Residents of San Miguel Acatán and San Rafael La Independencia have traditionally considered themselves Q’anjob’al speakers, but the official recognition of Akateko as a language, with its own representation in the Academy of Mayan Languages of Guatemala, has served to accentuate linguistic differences and has discouraged use of educational materials, more widely available in Q’anjob’al. On the other hand, Mam, one of the four largest Guatemalan Mayan languages, and Chuj, spoken in northwestern Guatemala, both have deep internal dialectal splits. Dialects may differ in more than 20% of their core vocabulary, undergo different syntactic processes, and allow different sentential word orders, yet these languages maintain a shared identity.

Estimates of number of speakers are also highly political. Despite official rhetoric praising the ethnic

richness of their countries, both Guatemala and Mexico have traditionally promoted assimilation to a national identity that is indigenous only ancestrally. (Also, El Salvador does not recognize any modern Maya as traditional ethnicities, although it does again host Mayan populations displaced by the genocidal war in Guatemala, 1960–1995. Honduran populations until recently were counted as Spanish speaking, although in the north there were ethnically Ch’orti’ peoples; in the 2001, some Honduran rural schools began limited bilingual education, although without materials.) Leopoldo Tzian (1994) points out that official governmental censuses in Guatemala consistently underestimate the number of Mayas compared to surveys done by linguists, by international development agencies, and by health workers. **Table 1** gives population figures for Guatemala: official census figures for the Mayan population (note the difference between ethnically identified Maya and those who speak their mother tongue), Tzian’s data, the figures of AJPOPAB’CHI’ (the Commission for the Officialization of the Indigenous Languages of Guatemala), and those of the Ministry of Education Survey for 2003. **Table 2** contains population figures for Mexico, showing the official government figures (Instituto Nacional de Estadística, Geografía e Informática, 2000) and those of the Summer Institute in Linguistics (published 2004) with the date of the survey in parentheses. The first label under the rubric ‘language’ gives the traditional name for the

language/ethnic group, used in most academic publications and in official documents prior to 2000, the second is the indigenous autodenomination.

Grammatical Characteristics

The Mayan Languages share many important characteristics, among these are ergativity, positionals, directional particles, and noun and numeral classifiers. These categories are developed in different ways in the various languages.

Ergativity

Ergative languages mark the relationship between the verb and its arguments with inflections that treat the subjects of intransitives and objects of transitive verbs as one category (marked by absolutive pronouns) and the subjects of transitives and possessors of nouns as a separate category (marked by ergative pronouns). Most of the Mayan languages show this system, with variations in subparts of the grammar, in which a nominative–accusative agreement pattern (like that Indo-European languages) surfaces. Such systems are referred to as split-ergative. Ch’orti’ has a split-ergative system, with the change being triggered by subordination. In addition, Ch’orti’ has a third

pronominal set, which serves as prefixed subject markers of incomplete intransitive verbs. Table 3 shows sample verbs in Kaqchikel with subject pronouns in bold type and object pronouns in italics. Note the homology of intransitive subjects and transitive objects.

Positionals

Positionals are a special word class in Mayan languages, so-called because many denote positions such as ‘standing,’ ‘lying prone,’ and ‘stuck crosswise in an opening.’ However, some simply name conditions or states, such as ‘wet,’ ‘naked,’ and ‘round.’ Words that belong to this class have special derivational characteristics. The roots are inflected to form two or three types of nonverbal predicates (adjectives), intransitive verbs, and transitive verbs. Table 4 shows examples from Mam.

Some languages form reduplicated adjectives from the positional roots, for example, in Chuj *nhojanhojan* ‘walk fluffily, like a shaggy sheep’ and *linganlingan* ‘be hanging.’ Kaqchikel (Table 5), Tz’utujil, and K’iche’ copy the vowel of the root and the first consonant and then add a suffix for singular or plural agreement to form adjectives from positional roots.

Table 2 Mexican population figures

| Language | Government census figures, 2000 ^a | Summer Institute in Linguistics |
|----------------------------|--|---------------------------------|
| Tzeltal, K’op | 547 000 | 300 000 (1993) |
| Tzotzil, B’atzil K’op | 514 000 | 225 000 (1990) |
| Mocho | 500 | >1000 (1993) |
| Lakantun, Hach T’an | 130 | |
| Tojolab’al, Tojowinik Otik | 74 000 | |
| Chontal | 72 000 | |
| Ch’ol | 274 000 | |
| Yucateco | 1 490 000 | |

^aThe Mexican census also lists the numbers of speakers of ‘Guatemalan’ languages now resident in Mexico: Chuj 3900, Jakateko (Popti’, Ab’xab’al) 1300, Q’eqchi’ 1700, K’iche’ 640, Kaqchikel 610, Ixil 310, Awakateko 60, Teko 50.

Table 3 Sample verbs in Kaqchikel

| First-person plural | Gloss | Second-person plural | Gloss |
|---------------------|-------------------|----------------------|-------------------|
| xojwa’ | ‘we ate’ | xixwa’ | ‘y’all ate’ |
| <i>xixqaq’etej</i> | ‘we hugged y’all’ | <i>xojiq’etej</i> | ‘y’all hugged us’ |

Table 4 Sample positionals in Mam

| State | Gloss | Intransitive | Gloss | Transitive | Gloss |
|---------|------------|--------------|---------------|------------|-------------------------|
| wa’li | ‘standing’ | wa’ee | ‘s/he stands’ | twa’b’in | ‘s/he stood her/him up’ |
| xhjewli | ‘twisted’ | xhjeweew’ | ‘it twists’ | txhjebw’in | ‘she/he twists it’ |

Table 5 Reduplicated adjectives in Kaqchikel

| <i>State</i> | <i>Gloss</i> | <i>Adjective</i> | <i>Gloss</i> |
|--------------|---------------------|------------------|-----------------|
| setesik | 'round, singular' | setesäq | 'round, plural' |
| kotokik | 'crooked, singular' | kotokäq | 'crooked' |

Table 6 Poqomam directionals

| <i>Directional</i> | <i>Gloss</i> | <i>Intransitive verb</i> | <i>Gloss</i> | <i>Phrasal use</i> | <i>Gloss</i> |
|--------------------|--------------|--------------------------|----------------|--------------------|--------------------------|
| ala | 'out' | -il- | 'leave' | xa'ila ala | 'we go out, we leave' |
| aka | 'in' | -ok- | 'enter' | xah'oka aka | 'we go in, we enter' |
| koon | 'stay' | -kahn- | 'stay, remain' | xahkahna koon | 'we stay here' |
| pa | 'thither' | -pan- | 'arrive there' | xahpana pa | 'we arrive there' |
| qa | 'down' | -qaj- | 'descend' | xahqaja qa | 'we go down, we descend' |

Table 7 Noun classifiers in Popti'

| <i>Classifier</i> | <i>Objects in the class</i> | <i>Classifier</i> | <i>Objects in the class</i> |
|-------------------|-----------------------------------|-------------------|------------------------------|
| komam | Male supernaturals, diseases | komi' | Female supernaturals |
| ya' | Adult person | ho' | Young men |
| xo' | Young women | naj | Male, unknown, not respected |
| ix | Female, unknown, not respected | unin | Human baby |
| no' | Animals (other than the dog) | metx | Dog |
| te' | General plants and their products | ixim | Grains |
| tx'al | Cotton or synthetic thread | tx'anh | Fiber, string |
| q'ap | Cloth | tx'otx' | Earth, earthenware |
| ch'en | Metal, rock, mineral | atz'am | Salt |
| ha' | Water, liquid | q'a' | Fire |

Directional Particles

These particles, usually variants of intransitive verbs of motion, serve as a complement to main verbs. They may indicate actual movement of the actor or action, or they may add aspectual information. In Mam, transitive verbs almost always cooccur with a directional complement (see **Table 6** for examples in Poqomam). Verb phrases in Yucatec, however, now rely on conjunction rather than complementation.

Noun Classifiers

These particles precede the nouns they modify and ascribe some property, social or material, to the noun. In the Q'anjob'alan group, noun classifiers are highly exploited by the grammar. They serve as definite articles and as pronouns. (See **Table 7** for examples in Popti'.) In the neighboring Mamean languages, the system is more attenuated. In K'iche'an languages, classifiers are used more as titles before names than as classifiers. In Yucatec, only morphological vestiges appear in names for a few plants and animals.

Numeral Classifiers

These may be of two types of numerical classifiers: suffixal, marking what kind of entity is being counted (**Table 8**), and independent, showing how the object counted is measured (**Table 9**). The suffixal type distinguishes three classes in Q'anjob'alan languages: people, animals, and other. Other Mayan languages have only trace suffixes, sometimes invariant in form.

Vocabulary

Mayan languages have borrowed words from many languages, including Nahuatl (Náhuatl) (*masat* 'deer,' *tinamit* 'town,' in Kaqchikel), Spanish (*mexa* 'table,' *kaxtilanh winakhin* 'I'm a Spaniard, cock's crow,' in Chuj), and English (*tab'ana' klik pa ruwi' ruk'in ri maus* 'click on it with the mouse,' in Kaqchikel). They have also lent many words, for example, English *hurricane* < Kaqchikel *juraqän* '(lit.) one leg' and Spanish *makuy* < *majkuy* 'an herb.' New words are constantly developed with the contact of cultures and the implementation of new educational curricula.

Table 8 Popti' numeral classifier suffixes

| Number root | Gloss | Root with suffix | Gloss |
|-------------|--------|------------------|---------------|
| kanh- | 'four' | kanhwanh | 'four people' |
| waj- | 'six' | wajk'onh | 'six animals' |
| b'alunh- | 'nine' | b'alunhe' | 'nine things' |

Table 9 Te'utujiiil measure words^a

| Measure | Gloss | Number root | | Combined form | Gloss |
|---------|---------------------|-------------|---------|-----------------|---------------------|
| mooq' | 'fistful' | ox- | 'three' | oxmooq' | 'three fistfuls' |
| quum | 'sip' | kaj- | 'four' | kajquum | 'four sips' |
| tz'uur | 'drop' | juu- | 'one' | juutz'uur | 'one drop' |
| seel | 'slice, layer' | ka'- | 'two' | ka'seel | 'two slices' |
| peer | 'plane surface' | waq- | 'six' | waqpeer tz'alam | 'six planed boards' |
| raab' | 'long, cylindrical' | wuq- | 'seven' | wuqraab' kolo' | 'seven ropes' |

^aNote that the measure word or classifier serves as the base. The number is prefixed in an abbreviated combinatorial form.

In Guatemala, the Academia de las Lenguas Mayas de Guatemala, an semi-autonomous branch of the government, is authorized to promote and develop the national languages. In Mexico, the federal government provides bilingual educational support and is supplemented by the efforts of the Academia de La Lengua Maya in Yucatán, Campeche, and Quintana Roo and by Sna Tz'ib'alom, the independent writers' cooperative in Chiapas.

Michif

P Bakker, Aarhus University, Aarhus, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Michif (/mitʃif/; Mitchif, Mitif, erroneously also spelled Métchif) is a mixed language spoken by some of the Métis in Canada and the United States. The Métis are a separate ethnic group, who came into being as a

result of European men marrying Amerindian women. Around the year 2000, the number of speakers had dwindled to fewer than 1000, in scattered locations mostly in Saskatchewan, Manitoba (Canada), North Dakota, and Montana (United States). All speakers are elderly. The language is highly endangered.

Mixed European-Amerindian marital unions took place from the first days of contact in New France.

In the early period, the children of these relationships were typically raised by the mother as aboriginal children. In the early 1800s, the children of mixed parentage increasingly identified as separate from Europeans and from Amerindians, which was strengthened by political developments such as free trade, in which many such people were involved (Dickason, 1985). They called themselves *La Nouvelle Nation*, and also Mitif, Métis, Halfbreed, and similar terms. The name of the language is regularly derived from the term Mitif, which was the name for a person of mixed parentage in New France in the early 1600s.

The Métis combine aspects of Native cultures and French Canadian culture. Traditionally, the Métis had a very diverse lifestyle throughout the 19th century. Many were farmers, hunters, traders, and/or craftsmen. The hunters were especially famous for their massive buffalo hunts, until the near extinction of this animal in the late 1800s. Linguistically, the Métis were and are diverse as well, counting speakers of Ojibwe, Cree (both Algonquian), French, English (mostly in recognizable ethnic variants) as well as Michif, which combines, roughly, Cree verbs with French nouns. This is a typical example, from a fairy tale told by Norman Fleury in January 2004 (French elements in bold):

- (1) **sa** **fam,** **sa** **pramyer**
 3-POSS *woman* 3-POSS *first-F*
fam *kii-wanih-ewew*
woman PST-lose.AN-3.SUBJ.3OBJ
 ‘He had lost his wife, his first wife.’
- (2) *eekwa* *kiihtwam* *kii-wiiw-ewew*
then *again* PST-marry-3.SUBJ.3OBJ
 ‘And now he had remarried.’
- (3) *kii-wiikim-ewew* *onhin* **la** **fam-a**
 PST-marry-3.SUBJ. *this-OBV* *the* *woman-OBV*
 3OBJ
 ‘He had married this woman.’
- (4) **sitenn** **moves** **fam,** **enn** **moves** **fam**
it.was-F *bad-F* *woman* *a-F* *bad* *woman*
 ‘She was a bad woman. A bad woman.’
- (5) *kii-machi-manitu-wi-w* *awa* **la** **fam**
 PST-bad.spirit-BE-3SG *this-AN* *the-F* *woman*
 ‘She was a real devil, this woman.’
- (6) **pi** **ilave** **trwaa** **fiy** **ana**
and *she-had* *three* *girl* *this-AN.SG*
kii-ayaw-ewew **la** **fam**
 PST-have-3SG *the-F* *woman*
 ‘And she had three daughters, this woman had.’

This fragment, using a unified orthography for the two components, illustrates some aspects of the mixture of the language. In this fragments all verbs are from Cree, except the two copulas *sitenn*

(F. *c'est une*) and *ilave* (F. *il/elle avait*). The nouns are all from French, including definite and indefinite articles and possessives (*la, lii, aen, enn*), the demonstratives from Cree (*awa, ana, onhin*), numerals from French (*trwaa, pramyer*), and conjunctions and adverbs from Cree (*kiihtwam, eekwa*) or French (*pi < F. puis*).

Sentential word order is free: (1) shows Object-Verb word order, (3) Verb-Object. Some preverbal modifiers can be separated from their nouns, notably numerals from the nouns, and in (6) a demonstrative from the noun. In morphology, French elements display French derivational and inflectional elements, whereas Cree elements combine with Cree morphology. The Cree noun *mushum* ‘grandfather’ gets Cree possessives and plural morphemes (*ni-mushum-ak* 1SG-grandfather-PL ‘my grandfathers’). There are a few exceptions, such as the nontopic or so-called obviative suffix as in *la fam-a* in (3) that is often added to French nouns, and borrowed or code-switched French and English verbs as in *gii-li-park-ii-naann* 1PST-MARKER-park-INF-1PL ‘we parked’ or *kii-li-move-ii-w* PST-MARKER-move-INF-3SG ‘she moved (away)’. This sentence switches languages four times: Cree-French-English-French-Cree.

The phoneme inventory of Michif is a combination of the inventories of the Métis variety of French (influenced by a Northern dialect of Cree) and South-eastern Plains Cree (influenced by Saulteaux Ojibwe). For instance, preaspirated consonants and nasal /i/ are only found in words of Cree etymology, and phonemes such as /r/ and /l/ are only found in the French part. Strikingly, the range of allophones for Cree and French phonemes differs: whereas voiced /b/ and unvoiced /p/ (and other stops and fricatives) are allophones in Cree between vowels, they are distinct phonemes in the French part. The Cree and French components also follow their own phonotactic patterns. Only stress patterns seem to have moved in the direction of Cree.

Michif combines Cree and French agreement: the (Algonquian) animacy of nouns is reflected in the gender inflection of demonstratives and verbs, and the (French) masculine-feminine distinction is shown in definite and indefinite articles and preverbal adjectives.

Michif is more complex than both of its components, having two parallel semantic, phonological, morphological, and syntactic systems. It combines the complexity of the Algonquian verb, with hundreds of forms, with the irregularities of French nominal derivation.

The language probably came into being in the early 19th century, parallel with the development of a new identity of mixed persons as a new ethnic group.

Michif is associated with descendants of the Métis buffalo hunters and their winter camps, and it is likely that these hunts played a role in the dissemination of the language.

Michif belongs to the small set of mixed or intertwined languages, of which a few dozen examples are known from all parts of the world. Whereas other such languages usually combine the grammatical system of one language with the lexicon of another, Michif seems to be almost unique in that it combines verbs from one language with nouns from another. Only the Nigerian language Igbo-Okrika seems to display a similar pattern (Igbo verbs, Ijo nouns).

Misumalpan

A Constenla Umaña, University of Costa Rica, San José, Costa Rica

© 2006 Elsevier Ltd. All rights reserved.

Misumalpan is a Central American linguistic family with five members: Cacaopera, Matagalpa, Miskito, Sumo (Sumo Tawahka), and Ulwa. Cacaopera was spoken in eastern El Salvador and became extinct during the first half of the 20th century. Matagalpa, once diffused through the western portions of mid- and northern Nicaragua, and in the immediate adjacent zone of southern Honduras, became extinct at the end of the 19th century. Sumo is the language of 9000 people in northeastern Nicaragua (the area of the Waspuk and Bambana rivers) and about 500 people in the neighboring area of Honduras (along the middle Patuca River). Sumo has two dialects: Panamahka, which includes 80% of the speakers, and Tawahka. Ulwa, formerly widespread in southeastern Nicaragua, is currently spoken by about 500 people in the area of the lower Grande de Matagalpa and Kuringwas rivers. Miskito is spoken in the Caribbean coast and neighboring lowlands from the Black River in Honduras (25 000 speakers) to the Pearl Lagoon in Nicaragua (100 000 speakers). The following dialects are mentioned: Mam (Honduras), Wangki, Tawira, Baldam, and Kabo (Nicaragua).

Ulwa and Sumo on the one hand, and Matagalpa and Cacaopera on the other, constitute two uncontroversial subgroups. Lexicostatistics show a closer relationship between them than that of either one to Miskito, so the family seems to be basically

- Laverdure P & Allard I R (1983). *The Michif dictionary. Turtle Mountain Chippewa Cree*. Winnipeg: Pemmican Publications.

divided into the latter and what we could call Western Misumalpan. The time depths according to glottochronology are Miskito/Western Misumalpan, 5800; Sumo–Ulwa/Matagalpa–Cacaopera, 5300; Matagalpa/Cacaopera, 1200; and Sumo/Ulwa, 880.

The only external relationship that has been proven by means of the comparative method is that with the Lencan family from Honduras and El Salvador. The split of the common ancestor would have taken place about 7200 years ago.

Many have thought Misumalpan to be related to Chibchan. This seems probable but has not yet been properly demonstrated.

The Misumalpan languages belong to the Lower Central America linguistic area, characterized by features such as SOV order, postpositions, preposed genitive, postposed numerals and adjectives, and contrasts between voiced and voiceless stops. Inside the area, they are part of a Northern Subarea characterized by features such as person inflection for possession in nouns and for agent and patient in verbs, predominance of accusative-nominative case systems, serial verb constructions, postposed or suffix negation, and vowel length contrasts.

Mixe-Zoquean Languages

R A Rhodes, University of California, Berkeley, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

The Mixe-Zoquean languages are found in southern Mexico in the area of the Isthmus of Tehuantepec. The family is divided into two branches, Mixe languages in the Oaxacan highlands and the Zoquean languages, which are found on the Gulf of Mexico and in western Chiapas. The languages are:

Zoquean

- Gulf Zoque
 - Sierra Popoluca
 - Texistepec
 - Ayapa Zoque (Tabasco Zoque)
- Southern Zoque
 - Chimalapa
 - Copainalá
 - Francisco León
 - Zoque de Rayón

Mixean

- Veracruz Mixe
 - Oluteco (Oluta Popoluca)
 - Sayuleño (Sayula Popoluca)
- Highland Mixe
 - Western Mixe
 - Totontepec
 - Tlahuitoltepec
 - Eastern Mixe
 - Coatlán
 - Isthmus
 - Quetzaltepec
 - Juquila
 - Mazatlán

The Southern Zoque region of western Chiapas and the Highland Mixe region are dialect chains, such that the number of dialects and varieties is unevenly reported. The division given above represents varieties that show significant differentiation as measured by degree of mutual intelligibility (Grimes, 2004).

Historically, the ancestors of the Mixe-Zoqueans were the Olmecs (Campbell and Kaufman, 1988). This once controversial assertion was proved in the 1990s with the decipherment of Epi-Olmec hieroglyphics by Terry Kaufman and John Justeson, who have shown incontrovertably that the language represented is Zoquean (Kaufman and Justeson, 2003).

Phonology

The most salient phonological patterns of the Mixe-Zoquean languages are best understood through the phonological patterns of the protolanguage. Proto-Mixe-Zoquean had a six-vowel system, both long and short.

i i u
e a o

The consonantism was

p t ts k ʔ
m n
s h
(l)
j w

The basic shapes of proto-Mixe-Zoquean roots are:

| | | |
|--------|-----------------|----------|
| CVC | * <i>tik</i> | 'house' |
| CVCC | * <i>ni:ʔh</i> | 'water' |
| CVCV | * <i>ni:wi</i> | 'chile' |
| CVCCV | * <i>tahpi</i> | 'hawk' |
| CVCVC | * <i>kiʔak</i> | 'sandal' |
| CVCCVC | * <i>pistik</i> | 'flea' |

The possible first consonants of these root internal clusters are very limited, *ʔ*, *h*, *s*, and nasals. There is one further pattern that exists only in verb roots. The *(ʔ)C[sib]* cluster allows only *p* and *k* as the medial consonant.

CV(ʔ)C[sib]- **heps-* 'shovel'

The phonotactics of proto-Mixe-Zoquean words allow a full array of clusters as a result of morphemic combination.

There were four phonological patterns in Proto-Mixe-Zoquean that leave significant reflexes in the modern languages. The first pattern featured metathesis of glottal stop to the front of a consonant cluster in word internal construction. When that metathesis crossed an obstruent, the obstruent was voiced. This is still an active process in some Zoquean languages, as shown in (1), and has left frozen traces in Mixean as in (2).

| (b) | <i>tigiʔjpa</i> | ‘he has a house’ | | |
| | ∅ | <i>-tik</i> | <i>-ʔiʔj</i> | <i>-pa</i> |
| | 3ABS | -house | -have | -INCOMP |
- (2) Sayuleño (Mixe)
- | | | | | |
|--|---------------|-------------|-------------|-----------|
| | <i>ʔigijp</i> | ‘he enters’ | | |
| | ∅ | <i>-tik</i> | <i>-ʔij</i> | <i>-p</i> |
| | 3ABS | -house | -VERBALIZER | -INCOMP |

In the second pattern in syllable coda obstruents were augmented with a preceding *b*. The reflexes of this pattern yield allomorphies of morphemes with and without coda *bs* in both Zoquean and Mixean languages, although in most languages the patterns are radically restructured. In a few languages, including Sierra Popoluca and Oluta, the pattern was leveled away.

- (3) Francisco León Zoque
- | | | | | |
|-----|--------------|--------------|------------|--|
| (a) | <i>petpa</i> | ‘he sweeps’ | | |
| | ∅ | <i>-pebt</i> | <i>-pa</i> | |
| | 3ABS | -sweep | -INCOMP | |
| (b) | <i>pebtu</i> | ‘he swept’ | | |
| | ∅ | <i>-pebt</i> | <i>-u</i> | |
| | 3ABS | -sweep | -COMP | |

In Sayuleño (Mixe) the restructured pattern is one of *b* metathesis, as shown in (4).

- (4) Sayuleño (Mixe)
- | | | | | |
|--|------------------|-------------------|--------------|------------|
| | <i>niʔeʔhpip</i> | ‘he sees himself’ | | |
| | ∅ | <i>-ni</i> | <i>-ʔeʔp</i> | <i>-bi</i> |
| | 3ABS | -REFL | -see | -MIDDLE |
| | | | | -INCOMP |

The third pattern affected a class of roots containing V:ʔC. In construction with a consonant initial suffix the glottal was deleted. In construction with a vowel initial suffix the glottal was retained. This allomorphy has been leveled away in Zoquean.

- (5) preconsonantal prevocalic/preglide
- (a) Oluteco (Mixe)
- | | | | | |
|--|---------------|---------------|-------------|--------------|
| | <i>ʔimipa</i> | ‘he comes’ | <i>miʔn</i> | ‘come’ |
| | ∅ | <i>-ʔi:ʔn</i> | <i>-pa</i> | <i>ʔi:ʔn</i> |
| | 3ABS | -come | -INCOMP | come |
| | | | | -IMP |
- (b) Totontepec (Mixe)
- | | | |
|--|----------------|--------------|
| | <i>diʔe:ʔp</i> | ‘I sweep it’ |
|--|----------------|--------------|

- | | | |
|---------------|---------------------|-------------|
| <i>di</i> | <i>-ʔe:ʔt</i> | <i>-p</i> |
| 3ERG | -sweep | -INCOMP |
| <i>diʔpeʔ</i> | ‘(that) I sweep it’ | |
| <i>di</i> | <i>-ʔe:ʔt</i> | <i>-I</i> |
| 3ERG | -sweep | -INCOMP_DEP |

The last pattern in the phonology of the protolanguage featured a limited height harmony in a few suffixes. The reflexes remain most clearly in the Zoquean languages.

- (6) Copainalá Zoque
- | | | | |
|-------------|--------------|----------------------|-------------|
| <i>baʔn</i> | <i>mini</i> | ‘he doesn’t come’ | |
| <i>baʔn</i> | <i>j</i> | <i>-min</i> | <i>-i</i> |
| NEG | 3ABS | -come | -NEG.INCOMP |
| <i>baʔn</i> | <i>mjone</i> | ‘he doesn’t wrap it’ | |
| <i>baʔn</i> | <i>j</i> | <i>-mon</i> | <i>-i</i> |
| NEG | 3ABS | -wrap | -NEG.INCOMP |

Much of Mixean has lost unstressed vowels. One effect is that vowels were lost from final syllables. One of the key phonological developments related to this vowel loss is that the Highland Mixe languages developed an umlaut that expanded the vowel systems in some dialects to three-height nine vowel systems with higher vowels triggered by suffixes that had high vowels.

- (7) Totontepec Mixe
- (a) normal
- | | | |
|-------------|--------------------|--------------------------|
| <i>ʃehp</i> | ‘I breathe’ | (<i>< *ʔiʃehpa</i>) |
| ∅ | <i>-ʃeh</i> | <i>-p</i> |
| 1ABS | breathe-INCOMP | |
| raised | | |
| <i>nʒeh</i> | ‘(that) I breathe’ | (<i>< *ʔinʒehi</i>) |
| <i>n</i> | <i>-ʃeh</i> | <i>-I</i> |
| 1ABS_DEP | breathe-INCOMP_DEP | |
- (b) normal
- | | | |
|--------------|-----------------|----------------------------|
| <i>tʉ:mp</i> | ‘I work’ | (<i>< *ʔiʔtʉ:mpa</i>) |
| ∅ | <i>-ʔʉ:n</i> | <i>-p</i> |
| 1ABS | work-INCOMP | |
| raised | | |
| <i>ndun</i> | ‘(that) I work’ | (<i>< *ʔinʔu:ni</i>) |
| <i>n</i> | <i>-ʔʉ:n</i> | <i>-I</i> |
| 1ABS_DEP | work-INCOMP_DEP | |

Syllable coda *ws* in Zoquean are nasalized to *ŋ*. In all varieties the alternation is at least partially leveled leading to a marginal contrast.

- (8) Copainalá Zoque
- | | | | |
|--|--------------|--------------|-------------|
| <i>tsiŋba</i> | ‘he bathes’ | <i>tsiŋu</i> | ‘he bathed’ |
| ∅ | <i>-tsiŋ</i> | <i>-pa</i> | ∅ |
| 3ABS | -bathe | -INCOMP | 3ABS |
| <i>tsiwi</i> | ‘bathe!’ | | |
| <i>tsiŋ</i> | <i>-i</i> | | |
| bathe | -IMP | | |
| (cf. Say. <i>chiwjahpa</i> ‘they bathe’) | | | |

There are two other phonological developments in the Zoquean branch that are typologically notable.

Most varieties of Zoque have lost vowels from initial person markers. The result is those that contain *i* historically synchronically contain *j*, which metathesizes to the onset final position. This metathesis generalizes to other *jC* clusters.

(9) Copainalá Zoque

| | | | |
|-------------------|-------------------------|------------|--------------|
| <i>mbjopjamih</i> | ‘you (sg.) are running’ | | |
| <i>nj</i> | <i>-poj</i> | <i>-pa</i> | = <i>mih</i> |
| 2ABS | -run | -INCOMP | = 2 |

Finally, Texistepec has undergone a typologically unusual sound change, denasalizing root initial nasals in nonnasal environments, e.g., *bok* ‘maize,’ *d̥e:Ɂ* ‘chile,’ cf. Copainalá *mok*, *niwi*.

Morphology

The Mixe-Zoquean languages are agglutinative, as exemplified in (10), and they show extensive compounding, as in (11).

(10) Sierra Popoluca (Zoque)

| | | | | |
|-------------------------------|---|--------------|-------------|------------------------------------|
| <i>ʔiʔiʔŋ o ʔjkaʔa ʔjɲepa</i> | ‘he _i is cutting with his _i instrument’ | | | |
| <i>ʔi</i> | <i>-tiŋ</i> | <i>-ʔoʔj</i> | <i>-kaʔ</i> | <i>-ʔaʔj</i> <i>-ne</i> <i>-pa</i> |
| 3ERG | -cut | -ANTI | -INST | -APPL -PROG -INCOMP |

(11) Coatlán Mixe

| | |
|------------------|--------------|
| <i>tsahptihk</i> | ‘church’ |
| <i>tsahp</i> | <i>-tihk</i> |
| sky | -house |

The family also shows widespread cliticization, for example, the person clitics in the Copainalá verb complex in (12a) and the stressed clitics of Sayuleño.

(12) (a) Copainalá Zoque

| | | | |
|---------------------|-------------------|-----------|-----------------------|
| <i>mbjojumih</i> | ‘you ran’ | | |
| <i>nj</i> | <i>-poj</i> | <i>-u</i> | = <i>mih</i> |
| 2ABS | -run | -COMP | = 2ABS |
| <i>nimih mbjoju</i> | ‘you are running’ | | |
| <i>ni</i> | = <i>mih</i> | <i>nj</i> | <i>-poj</i> <i>-u</i> |
| PROG | = 2ABS | 2ABS | -run -DEP |

(b) Sayuleño (Mixe)

| | | | |
|-----------------------|--------------------|-------------|------------|
| <i>ʔik'naʔ</i> | ‘the house’ | | |
| <i>ʔik</i> | = | <i>'naʔ</i> | |
| house = DEF_(NON-FEM) | | | |
| <i>niʔ'pej</i> | ‘he is going, too’ | | |
| <i>niʔ</i> | <i>-p</i> | = | <i>'ej</i> |
| go | -INCOMP | = | also |

Mixe-Zoquean languages have two inflectional classes, nominal and verbal. Adjectivals are inflected like nominals.

Nominals inflect for number and possessor, and in southern Zoque, for case. The cases are absolutive and ergative/genitive.

- (13) (a) number
ʔihkat ‘houses’ Sayuleño (Mixe)
ʔik-hat
house-PL
(b) possessor
ŋguj ‘my stick’ Texistepec (Zoque)
n *-kuj*
1POSS -stick/tree
(c) case
pin ‘man (*abs*)’ Copainalá Zoque
piʔnis ‘man (*erg/poss*)’

Nominals also have derivational forms with adpositional meanings, many built on reflexes of the protomorpheme **-mi* ‘locative.’ There are more adpositionals in southern Zoque and fewer in Mixe.

(14) Francisco León Zoque

| | |
|--------------------|------------------|
| <i>kumguʔjomo</i> | ‘in/to the town’ |
| <i>kumkuj-ʔomo</i> | |
| town-LOC | |

Verbs inflect for aspect, subordination, and person and number of both subject and object.

The aspects are incomplete and complete with allomorphs registering subordination. Most languages also have forms for future. In Zoque, the subordinate forms are only used in auxiliary constructions.

(15) (a) Oluta (Mixe)

| | | | |
|------------|------------------|--------------------|---------------|
| | independent | subordinate | |
| incomplete | <i>ti'kajp</i> | <i>tin'kaje</i> | ‘I am eating’ |
| complete | <i>ti'kaju</i> | <i>tin'kaji</i> | ‘I ate’ |
| future | <i>ti,ka'jam</i> | <i>tin,ka'jaʔn</i> | ‘I will eat’ |

(b) Copainalá Zoque

| | | |
|--|----------------------|---------------------|
| | independent | subordinate |
| | <i>pojjaʔih</i> | <i>baʔnih mboje</i> |
| | ‘I’m running’/ | ‘I’m not running’ |
| | <i>pojuʔih</i> | <i>hapjojaʔih</i> |
| | ‘I ran’/ | ‘I didn’t run’ |
| | <i>maŋbaʔih poju</i> | - |
| | ‘I will run’ | |

The persons are first, second, and third, with a contrast of inclusive and exclusive in the first person plural.

(16) Sierra Popoluca (Zoque)

| | | | |
|----------------|---------------------|----------------|----------------|
| | singular | | dual |
| ‘I go’ | <i>ʔanikpa</i> | | |
| ‘you (sg.) go’ | <i>mipikpa</i> | ‘you and I go’ | <i>tanikpa</i> |
| ‘he/she goes’ | <i>nikpa</i> | | |
| | | plural | |
| ‘we (ex.) go’ | <i>ʔanik taʔmpa</i> | | |
| ‘we (in.) go’ | <i>tanik taʔmpa</i> | | |
| ‘you (pl.) go’ | <i>mipik taʔmpa</i> | | |
| ‘they go’ | <i>nikyahpa</i> | | |

Transitive verbs are marked inflected for both subject and object (or ergative and absolutive).

(17) Sierra Populca

| | | | |
|--------------|-----------------|------------------|------------------|
| | ‘... me’ | ‘... you’ | ‘... him’ |
| ‘I love :’ | – | <i>mipt’ojpa</i> | <i>?antojpa</i> |
| ‘you love :’ | <i>?antojpa</i> | – | <i>?iñt’ojpa</i> |
| ‘he loves :’ | <i>?atojpa</i> | <i>mi’ojpa</i> | <i>?it’ojpa</i> |

In the Mixean branch there is inersive person marking, including some true inverse systems, as in Sayuleño. Such systems contain two distinct transitive forms for third person acts on third person, a direct form in which the subject is in focus and an inverse form in which the object is in focus. The Sayuleño system is based on a person hierarchy that ranks first person above second person above third person. The inverse marker in Sayuleño is *-f-*, which has the third person allomorph *-gi-*.

(18) Sayuleño (Mixe)

| | | | |
|---------------|-----------------|----------------|--|
| | ‘... me’ | ‘... you’ | ‘... him’ |
| ‘I hit ...’ | – | <i>t’mojp</i> | <i>tin’mojp</i> |
| ‘you hit ...’ | <i>?ifmojp</i> | – | <i>?in’mojp</i> |
| ‘he hits ...’ | <i>t’ifmojp</i> | <i>?ifmojp</i> | <i>?i’mojp</i> (direct/ <i>?igi’mojp</i> (inverse)) |

As in some other Meso-American language families, there is a special class of verbs that are used to refer to the positions of people and objects. These are built on the reflexes of the derivational suffix **-nay-*. In most cases, the lexical roots found in this construction cannot be used in other combinations. The positions referred to are frequently semantically complex.

(19) Sayuleño (Mixe)

| | | |
|---------------------|-------------------------------|-----------|
| <i>'wehnap</i> | ‘he sits with his legs apart’ | |
| <i>'weh</i> | <i>-naY</i> | <i>-p</i> |
| sit with legs apart | -POSITIONAL | -INCOMP |

Syntax

The syntax of the Mixe-Zoquean family is typologically typical of Meso-American. Most of the languages are headmarking ergative, with VSO word order.

(20) Copainalá

| | | |
|---|-----------------|--------------------|
| <i>jahki?mu</i> | <i>jomo?s</i> | <i>te? sapane</i> |
| <i>j - jah - ki?m - u</i> | <i>jomo -?s</i> | <i>te? sapane</i> |
| 3ERG - CAUS - go_up - COMP | woman-ERG | DEFbanana |
| V | S | O |
| <i>paktihkohmo</i> | <i>wa?y</i> | <i>kjiñu</i> |
| <i>paktihk - ohmo</i> | <i>wa?y</i> | <i>j - kiñ - u</i> |
| attic- LOC | that | 3ABS - ripen - DEP |
| adv | | |
| ‘The woman took the bananas to the attic to ripen.’ | | |

The syntax of dependent verb forms differs between the two branches of the family. The Zoquean languages use the dependent inflections only in construction with auxiliaries. The Mixean languages

have a wider variety of constructions triggering dependent inflection, for example, in clauses with fronted adverbials.

(21) Totontepec Mixe

| | | |
|---------------------|--------------|----------------|
| <i>yam</i> | <i>?əts</i> | <i>mpə:ʔkf</i> |
| <i>'yam</i> | <i>'?əts</i> | <i>n</i> |
| here | 1 | 1ABS_DEP |
| ‘I’m resting here.’ | | |
| <i>-pə:ʔkf</i> | <i>-Ø</i> | |
| -rest | | -INCOMP_DEP |

In auxiliary constructions, the auxiliary has third singular subject and bears the aspect. The lexical verb bears the subject person/number marking and incomplete dependent aspect.

(22) Sayuleño

| | | |
|-------------------------------|---------------|---------------|
| <i>kiʃp</i> | <i>naf</i> | <i>'kajga</i> |
| <i>Ø -'kiʃ -p</i> | <i>naf</i> | |
| 3ABS-finish-INCOMP | 1INCL_ERG_DEP | |
| ‘We (incl.) finished eating.’ | | |
| <i>-'kaj-ka-Ø</i> | | |
| -eat-PL-INCOMP_DEP | | |

Object incorporation is widespread throughout the family.

Distinguishing the Branches

Phonological development distinguishes the two branches of the family. Zoquean underwent two significant developments. First, the length contrasts were leveled.

(23) Mixean Zoquean

| | | | | |
|---------------|--------------|-------------|-------------|---------|
| Sayuleño | Totontepec | Copainalá | Texistepec | |
| <i>mo:bk</i> | <i>mɔ:bk</i> | <i>mok</i> | <i>bok</i> | ‘maize’ |
| <i>ti:hts</i> | <i>tə:ts</i> | <i>tits</i> | <i>tits</i> | ‘tooth’ |

The contrastive length in Gulf Zoquean is a secondary development. The first syllable of disyllabic roots is lengthened if it is underlyingly open, e.g., Sierra Popoluca *ka:ma*, Copainalá *kama* ‘cornfield,’ proto-Mixe-Zoquean **kama*. Second, a class of proto-Mixe-Zoquean CV:ʔC roots show glottal allomorphy in Mixe, which was leveled to CVC roots in Zoquean.

(24) Mixean Zoquean

| | | | | |
|--------------|--------------|--------------|-----------------|-------------|
| Sayuleño | Coatlán | Copainalá | Sierra Popoluca | |
| <i>?u:kp</i> | <i>?u:kp</i> | <i>?ukpa</i> | <i>?ukpa</i> | ‘he drinks’ |
| <i>?u?k</i> | <i>?u?uk</i> | <i>?uki</i> | <i>?u:ki?</i> | ‘drink imp’ |

There are a few regular morphological features that distinguish Mixean from Zoque, for example, the future. Throughout the Mixean branch, the future is formed on the reflexes of a verbal compound with the stem *wa:ʔn-* ‘want’. In Gulf Zoque the future is one

of the meanings of the incompletive forms (-*pa*). In Southern Zoque, futures are auxiliary constructions.

- | | | | |
|---------------|----------------|-------------------|------------------------------|
| (25) Mixean | Zoquean | | |
| Sayuleño | Coatlán | Copainalá | Sierra Popoluca |
| <i>ʔuʔkam</i> | <i>ʔoʔokop</i> | <i>maŋbaʔuhku</i> | 'he will drink' <i>ʔukpa</i> |

A number of common words or usages also distinguish the two branches.

- | | | | | |
|----------------|-----------------|--------------|----------------|---------------|
| (26) Mixean | Zoquean | | | |
| Sayuleño | Coatlán | Copainalá | Sierra | Popoluca |
| <i>ʃibw</i> | <i>ʃi:</i> | <i>hama</i> | <i>ha:ma</i> | 'sun, day' |
| <i>ʔiʔwamp</i> | <i>juwa:mb</i> | <i>ʃumpa</i> | <i>ʔiʃumpa</i> | 'he wants it' |
| <i>'toʔʃaj</i> | <i>'toʔʃhaj</i> | <i>jomo</i> | <i>jo:mo</i> | 'woman' |

Mobilian Jargon

E Drechsel, University of Hawai'i at Mānoa, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Mobilian Jargon or the Chickasaw-Choctaw trade language was a Muskogean-based pidgin of the lower Mississippi River valley, typologically comparable (although unrelated) to Chinook Jargon of north-western North America. Not to be confused with Mobilian proper of southern Alabama, whose genetic classification has remained in doubt until today, Mobilian *Jargon* (MJ) was a structurally and functionally reduced contact medium that drew principally on Muskogean as its source languages. MJ displayed a characteristic Muskogean phonology, including the lateral fricative /ɬ/ as in /ɬaʎo/ 'fish', even if the pronunciation of particular sounds ranged more widely than in Muskogean languages because of

second-language interferences, and because it lacked most of their morphophonological complexities (*see Muskogean Languages*). Whereas early grammatical descriptions have presented MJ as a reduced form of Choctaw (Western Muskogean), it actually has revealed considerable lexical variation over space and time, reflecting the influences of its speakers' first languages. Among the primary other sources were Eastern Muskogean languages such as Alabama and Koasati and quite possibly Muskogee. Several 'exotic' loans from northern Algonquian languages with only a few from European sources suggest that MJ's range of variation extended farther north than the available linguistic evidence indicates, while remaining comparatively immune to European influences. A closer examination of MJ syntax demonstrates that whereas some constructions could derive from Choctaw or Chickasaw (Western Muskogean) equivalents, others displayed fundamental syntactic differences in need of their

own explanations. (The initial dagger indicates that these MJ sentences were not actual recordings, but corresponding word-for-word *reconstitutions* of such to match the Choctaw constructions, illustrating both the similarities and differences between the pidgin and Western Muskogean.)

- (1) MJ: †hattak išno pisa taha
man you see PAST
 Choctaw: hattak iš- pisa tuk
man 2 sing ACT see PAST
 (NOM)
 (Jacob *et al.*, 1977: 65)
 ‘You saw a man.’
- (2) MJ: †išno iti ino čali taha
you wood I cut PAST
 Choctaw: iti chī- chāli -li -tok
wood 2 sing cut 1 sing PAST
 DAT
 (Davies, 1986: 41)
 ‘I cut wood for you.’
- MJ: †ofi ino banna ino yimmi
dog I want I believe
 Ch: ofi sa- banna yimmi -li -h
dog 1 sing want believe 1 sing PRED
 ACC NOM
 (PAT) (ACT)
 (Davies, 1986: 71)
 ‘I believe I want a dog.’

Without some means of formally marking case in words, MJ speakers could rely only on word order to identify the grammatical functions of its sentence parts, which was X/OsV and quite possibly X/OSV (with no actual attestations available for two- or multiple-argument constructions, including nominal subjects). As the above examples illustrate, MJ’s unique word order probably derived from Muskogean constructions consisting of a noun plus a verb with a prefix, the latter of which speakers replaced with etymologically independent and full pronouns in their languages and which came to function as true grammatical subjects in MJ, although not necessarily as agents. MJ thus followed a grammatical pattern that was fundamentally Muskogean, even if structurally analytic and ultimately unintelligible to Muskogean speakers for larger constructions, unless they had considerable prior exposure to it.

Alternatively known as *anompa ĩla* (‘other/different/strange talk’), *yama* (‘yes, right, alright, indeed’), and *yoka anōpa* (‘servant/slave talk’), MJ performed

not only as a true pidgin in multilingual contexts with non-Muskogean (as in intertribal gatherings, pantribal alliances, and intertribal and colonial trade), but also in bilingual contacts with distant peoples, including Algonquians, Siouans (such as the Osage), and eventually Europeans (as on long-distance travels, on diplomatic missions, in intertribal and interethnic marriages, and in the European employment of Indians). By the early 18th century, MJ moreover assumed meta-communicative functions of a sociolinguistic buffer against overly eager outsiders: its use helped confirm the native identity of its speakers, thus providing a safeguard against continuously threatening enslavement, while at the same time protecting their privacy against intrusions by missionaries, immigrant settlers, government officials, and anthropologists.

MJ’s structure and functions raises questions about its origin. Because the linguistically and culturally fairly uniform Muskogean had little reason to develop a pidgin, early analyses favored a colonial origin of MJ (Crawford, 1978). I have since proposed a pre-European origin for MJ on grounds of three interrelated arguments: its indigenous grammar and lexicon, its well-established use in diverse native interlingual contexts, and its geographic distribution closely overlapping with that of the linguistically diverse, but socioculturally quite uniform, paramount chiefdoms of the pre-Columbian moundbuilders known by archaeologists as the Mississippian Complex (Drechsel, 1996, 1997).

Mon

J Watkins, School of Oriental and African Studies,
London, UK

© 2006 Elsevier Ltd. All rights reserved.

Mon is the principal language in the Monic sub-branch of Mon-Khmer languages, which form the bulk of the Austroasiatic language phylum. The near-extinct language Nyah Kur, spoken in Thailand, seems to be similar to Old Mon.

Mon is spoken in Burma/Myanmar and Thailand. In southeastern Burma, the Mon-speaking population lives in the area from Thaton across the lower Salween river area and down the coastal strip as far as Ye. Mon villages are interspersed with those of Burmans/Bamar and Karen/Kayin. The speakers of Mon in Thailand are thinly scattered in provinces surrounding Bangkok.

It is very difficult to put a precise figure on the number of people who speak Mon, not least because there is a large category of people who identify themselves as ethnically Mon but who do not speak the language. A further problem is the general lack of demographic data. Bauer (1990) undertakes a detailed analysis of the available information and concludes that there are probably one million Mon speakers, though this figure incorporates various degrees of bilingualism. Most of the Mon-speaking population is bilingual in Burmese or Thai. Of this million, roughly 50 000 – about 5% – reside in Thailand, and the remaining large majority resides in Burma. In Thailand, Mon have become heavily culturally and ethnically assimilated through extensive intermarriage between Mon and Thai, although being of Mon descent seems to carry some prestige.

Many sources suggest that the use of Mon is in decline in Thailand and possibly also in Burma, though this may not in fact be the case; again, the information available is confusing and contradictory. It appears that Mon is not yet a dying language. Although the government in Burma may have restricted teaching and official use of Mon, there are many villages in the middle and lower parts of the Mon state in Burma in which Mon is the only language spoken by people who are mostly literate in Mon, and it is predicted that Mon will continue to be a significant language in the region. Literacy rates in Mon are skewed toward men, as literacy is supported by monastery teaching, which is only partly accessible to girls. Mon language education organized by the New Mon State Party in Burma may redress the balance.

Mon is the ethnonym by which the Mon refer to themselves. This name can be traced back to Khmer

texts from the Sixth through the early twelfth-century Mon inscriptions at Pagan in Burma. The name ‘Mon’ – which in Mon is မန် / မံင် / မောန် [mòn] – is derived from the Old Mon RMEÑ, attested in an inscription dating from 1102 C.E. The initial RM-simplified to M- around the sixteenth century. The other names by which the Mon are known are the Burmese term *Talaing* တလိုင်, considered derogatory, and *Peguan*, a geographical–historical name derived from Pegu, the ancient Mon capital.

The records of Mon cover a period from the sixth century to the present day. Certain collections show the state of the language at various times. The best-represented historical periods are the eleventh and twelfth and the fifteenth centuries C.E. Modern Mon dates from the mid-eighteenth century onward. Mon has influenced the major languages of mainland Southeast Asia, in particular Karen, Burmese, and Thai, all of which borrowed words from Mon in the first half of the second millennium C.E.

Modern spoken Mon differs considerably from written, literary Mon in phonology, lexicon, and syntax, to the extent that it is possible to consider literary Mon a source of loanwords in spoken language, just as much as Pali and Sanskrit. Early descriptions of Mon tended to ignore the difference between the colloquial and literary forms of the language. The two appear to have diverged from the sixteenth century, and both forms of the language have developed independent inconsistencies but remain inextricably intertwined. This complex situation has resulted in a high degree of ambiguity and redundancy in the orthography. For instance, the initial consonant of the first syllable in a typical disyllabic word is frequently h- in spoken Mon, though this pattern does not occur in literary Mon, which, despite being archaic, is the basis of the written language. The initial h- may be etymologically derived from a large number of different consonants, and so historically inaccurate variant spellings are common. For instance, the word pronounced *hədoh* ‘strain, filter, sift’ may be written in nine different ways: ခဒိုဟ် KHADUIH, ဂဒိုဟ် GADUIH, ထဒောဟ် THADOH, ထဒိုဟ် THADUIH, ထိုဟ် THDUIH, ဒဒောဟ် DADOH, ဖဒိုဟ် PHADUIH, သဒိုဟ် SADUIH, and ဒိုဟ် SDUIH. Literary Mon is an artificial construct that does not make sense without reference to spoken patterns. The mixture of the two forms has been described by the Mon scholar H. L. Shorto (1962: xvi) as ‘a confusing scatter of seemingly aimless variation.’

Colloquial Mon exists in a range of dialects in Thailand and Burma, although all are mutually intelligible. The variety of Mon described here is that of

Shorto's *A dictionary of modern spoken Mon* (1962), which corresponds mostly with the Mon Rao of Nai Pan Hla's *An introduction to the Mon language* (1989), spoken by Mon in Burma.

There are a number of Mon language sites on the Internet. Some are associated with Mon political organizations, and some with news and information, such as ကာဝ /kaowao/ *Kao Wao* ('black cuckoo') and သွင်တိုင် /hnəŋ taŋ/ *Guiding Star*. At the time of writing, Mon language is not included in Unicode or other international standards, and so, Mon text is displayed on the Internet as graphics.

Like the scripts used to write Burmese, Shan, and certain other languages of Burma/Myanmar, Mon is written with a script derived from the Indic scripts that spread with Buddhism to continental Southeast Asia in the early part of the first millennium C.E. The Mon were the dominant group in the south of an area that now straddles the border between Thailand and Burma/Myanmar and were centered in two areas, one along the Chaopraya River in Thailand, and the other in the Moulmein–Pegu (Mawlamyine–Bago) area of lower Burma, with a principle center at Thaton on the east coast of the Gulf of Martaban.

The oldest Mon inscription, found at Lopburi in Thailand, dates from the eighth century and is written

in the Southern Indian Pallava script. Because there are inscriptions in Pyu, an important language of the period, which predate those in Mon, it may be that the Mon borrowed the writing system from the Pyu. However, given, first, that Mon script bears a closer resemblance to Pallava script, and second, that the Mon city Thaton was itself a major Buddhist center, it may be that the Mon borrowed the writing system directly from India independent of the Pyu. It is thought that Mon scribes brought to the city of Pagan after the Mon were defeated by the Burmese king Anawratha in 1057 C.E. resulted in Mon script being adapted to write Burmese, though this theory has been disputed in recent research.

The Mon writing system is essentially the same as the Burmese one in appearance, but with certain modifications and some elements unique to Mon. The system is best suited to writing the Indic languages for which its parent scripts were first designed, such as Pali and, with a few extra symbols not shown here, Sanskrit.

Mon is not a tonal language like its geographical neighbors, but vowels in Mon occur mainly in pairs distinguished only by a quasitonal distinction known as a register distinction, which is found in many Mon-Khmer languages, including Wa and Cambodian (Khmer). First or 'head' register is characterized by clear voice quality and is associated with more peripheral vowels; second or 'chest' register is characterized by breathy voice (transcribed here with a grave accent, `), a general laxness of the speech organs, and centralization of the vowels.

The consonants of the Mon writing system are set out in Table 1. As in Cambodian (see Henderson 1952), each consonant is associated with one of the two registers, and the reading of a vowel in a given context is determined by the register designation of the consonant that governs it – usually the initial consonant of a syllable. The minimal pair in Table 2 illustrates the contrast.

Mon, like many Mon-Khmer languages, has a rich array of vowels. The word-initial and word-internal vowel symbols of Mon are shown and transliterated in Table 3. Table 4 shows how each of these is pronounced in head and chest register.

One of the distinctive features of Mon-Khmer phonology is the prevalence of relatively unrestricted initial consonant clusters. Mon is no exception, though

Table 1 The consonants of Mon transliterated and transcribed; consonants associated with second ('chest') register are bold

| Mon script | Transliteration | | | | | Transcription | | | | |

| ကော | KO | kao | ဂေါ | GO | kà |
| ကော | KAO | kao | ဂေါ | GAO | kèa |
| ကံ | KAÓ | kəm | ဂံ | GAÓ | kòm |
| ကး | KAH | kah | ဂး | GAH | kèh |

Translit. = transliteration; Pron. = pronunciation.

as mentioned above, in the colloquial language many such clusters are not pronounced as spelt. Mon script writes the second element of such clusters with a subscript form of the consonant, as shown in **Table 5**.

In addition to this already rich inventory of open syllable vowels, Mon features a large array of additional syllable rhymes that involve further diphthongs and final consonants (see Nai Pan Hla [1989]) for further details.

The following example sentences in Mon illustrate some of the basic properties of Mon syntax. Modifiers generally follow what they modify (1); SVO (subject-verb-object) order is observed (2); subject pronouns are dropped (3). Unusually for the languages of mainland Southeast Asia, Mon makes only limited use of classifiers and has a system of plural marking.

Table 5 Subscript forms of Mon consonants

| | | | | | |
|---|---|---|------|---------|--------------------------|
| င | ၁ | ၀ | TNA | təŋa? | crossbow |

Mongolic Languages

J A Janhunen, University of Helsinki, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

Definition

Mongolic is the technical term for the group of languages (conventionally also known as Mongolian) spoken by the linguistic descendants of the historical Mongols, a medieval ethnic group that created the political entity known as the Mongol Empire (early 13th to late 14th centuries). The historical Mongols were pastoral nomads who started their expansion from a relatively compact homeland centered in northeastern Mongolia and northwestern Manchuria, but under the Mongol Empire they were dispersed all over central and northeastern Asia, where populations speaking Mongolic languages still survive today. By the degree of dispersal and diversification, Mongolic may be characterized as a medium-large language family. The principal neighbors of Mongolic in premodern times have included Turkic (in the west), Tungusic (in the northeast), (Mandarin) Chinese (in the southeast), and Tibetan (in the south). There is

also both direct and indirect information of a group of historical and protohistorical languages, termed Para-Mongolic, which were collaterally related to the language of the historical Mongols. Due to problems of deciphering and linguistic analysis, these languages have not yet been incorporated into the corpus of Mongolic comparative studies.

Distribution

The geographical core area of the Mongolic family coincides with the historical and geopolitical entity of Mongolia, covering both Outer Mongolia (the modern independent state of Mongolia) and Inner Mongolia (an autonomous region within China). In terms of physical geography, this area comprises the steppes and adjoining forested highlands of the Mongolian Plateau, the Ordos region south of the Yellow River, and the Gobi Desert. In the north the Mongolic area extends to the Baikal region in the Siberian forest zone (Russia), in the east to the plains of the Manchurian provinces (China), in the south to the Gansu corridor and the Amdo (Kokonor) region (China/Tibet), and in the west to the Jungarian

basin in eastern Turkestan or Xinjiang (China). Separate areas and relicts of Mongolic-speaking populations are found in Afghanistan and the Caspian region (Russia), as well as in some parts of middle Asia (Kazakhstan and Kyrgyzstan). The area of the historical Para-Mongolic languages was centered on southwestern Manchuria.

Time Depth

Mongolic (excluding Para-Mongolic) is a well-delimited family of a dozen closely related languages, which derive from a relatively shallow and dialectally coherent protolanguage, termed Proto-Mongolic. In view of the circumstances underlying the dispersal of the Mongolic languages, the diachronic depth of Proto-Mongolic must be less than 1000 years. Although Proto-Mongolic is, by definition, a hypothetical construction that can only be approached by the method of comparative linguistics, it must have been close to the language of the historical Mongols, also known as Middle Mongol, which is actually documented in a variety of sources contemporary with the Mongol Empire. To some extent, these sources illustrate the gradual dialectal diversification of Middle Mongol, which ultimately led to the separation into the modern Mongolic languages. Contacts between some of the individual Mongolic languages have continued until modern times, making their boundaries with one another, in some cases, fuzzy.

Genetic Status

Mongolic is often classified as a branch of the Altaic language family, which is also supposed to include Turkic and Tungusic, as well as Korean(ic) and Japonic (Japanese-Ryukyū). Although the conception of an Altaic genetic unity still has adherents, modern research has demonstrated that the relationships of Mongolic with the other languages of the Altaic complex are best explained in terms of a complex and multilayered network of historical and pre-historical areal contacts. Most important, Mongolic has over several millennia been in contact with Turkic (in the west) and Tungusic (in the east), resulting in a considerable corpus of shared structural properties and linguistic substance among all the three language families. This interaction has continued up to the present day in some regions (Siberia, Manchuria, Eastern Turkestan, and Amdo). On a higher level, Mongolic also belongs to the areal and typological context of Ural-Altaic, which in addition comprises the Uralic language family. Both Altaic and Ural-Altaic remain relevant (and still insufficiently understood) concepts of areal linguistics and typology,

but in the genetic sense these terms may today be regarded as obsolete.

Classification

Due to the shallowness of Proto-Mongolic, the Mongolic languages are difficult to classify in terms of a clear-cut (binary) family tree. It is, however, possible to establish four relatively distinct branches of Mongolic (Table 1). Two of these branches comprise only one marginal language each: Dagur (Daur; in Manchuria) and Moghol (Moghli; in Afghanistan), which also seem to be the two Mongolic languages most distant from one another as determined by the number of shared isoglosses. The two other branches may be called Central Mongolic and Shirongolic. Central Mongolic covers a large coherent area centered on Mongolia, but it is differentiated into five distinct, although closely related, languages: Khamnigan Mongol (in the northeast), Buryat (Russia Buriat, Mongolia Buriat, and China Buriat; in the north), Mongol proper (in the center and east), Ordos (Peripheral Mongolian; in the south), and Oirat (Kalmyk-Oirat; in the west). Shirongolic also comprises a cluster of at least five distinct languages in the Amdo (Kokonor) region: Shira Yughur (also known as East Yughur), (Huzhu) Mongghul (Tu), (Minhe) Mangghuer (Tu), Bonan (Baoan), and Santa (Dongxiang). All of the Mongolic languages comprise a number of dialects and subdialects, some of which could linguistically also be counted as separate languages. Internal diversification is particularly conspicuous in Mongol proper, Buryat, and Huzhu Mongghul.

Typology

Proto-Mongolic may be reconstructed as a rather consistently agglutinative language with a sentence structure and suffixal morphology of the Ural-Altaic type.

Table 1 Classification of the Mongolic languages

| <i>Branches</i> | | <i>Languages</i> | <i>Location</i> |
|---------------------|------|----------------------|-----------------|
| 1. Dagur(ic) | | (1) Dagur | Manchuria |
| 2. Central Mongolic | 2.1. | (2) Khamnigan Mongol | Manchuria |
| | 2.2. | (3) Buryat | Siberia |
| | 2.3. | (4) Mongol proper | Mongolia |
| | 2.4. | (5) Ordos | Ordos |
| | 2.5. | (6) Oirat | Jungaria |
| 3. Shirongolic | 3.1. | (7) Shira Yughur | Amdo |
| | 3.2. | (8) Huzhu Mongghul | Amdo |
| | 3.3. | (9) Minhe Mangghuer | Amdo |
| | 3.4. | (10) Bonan | Amdo |
| | 3.5. | (11) Santa | Amdo |
| 4. Moghol(ic) | | (12) Moghol | Afghanistan |

This conclusion is confirmed by actual information from Middle Mongol, and similar typology is still synchronically observed in both Dagur and the languages of the Central Mongolic branch. The two other branches of Mongolic have, however, undergone fundamental changes in their typological orientation. Moghol, under the influence of the local Iranian languages, has developed a large number of non-Mongolic features, including prepositions, conjunctions, and new inflexional categories. The Shirongolic languages, on the other hand, have been influenced by both local Chinese and local (Amdo) Tibetan in a complex framework of areal interaction that may be termed the Amdo Sprachbund (also known as the Qinghai-Gansu Sprachbund).

Literary Use

Since the time of the Mongol Empire, the principal literary language of Mongols has been Written Mongol (also known as Literary Mongol), written in a Semitic script adopted from the ancient Uighurs of eastern Turkestan. The early forms of Written Mongol were close to Middle Mongol, also recorded in other scripts, whereas the later forms become increasingly close to the spoken dialects of Mongol proper, the most important modern Mongolic language. An adaptation of Written Mongol known as Written Oirat was introduced as a written language of the Oirat speakers in 1648, but otherwise Written Mongol has been used by the speakers of all the Central Mongolic languages. Written Mongol was the official written language of Mongolia until the 1940s, and it still has an official position in Inner Mongolia. Outside of Inner Mongolia, it has, however, been replaced by new literary languages (in Cyrillic and Roman scripts) based on the local vernaculars.

Political Status

Written Mongol used to be one of the five official languages of the Manchu Empire of China (1644–1911), and it still remains one of the few minority languages in which public education is available in China.

The dominant spoken language of the Mongols in both Outer and Inner Mongolia is Mongol proper. The principal dialectal form of Mongol proper in Outer Mongolia is Khalkha (Halh Mongolian), which has been developed as a literary language (in Cyrillic script) since the 1940s and is today the official state language of Mongolia.

Within the Russian Federation (in Siberia), Buryat has an official status (including a literary standard in Cyrillic script) in the Republic of Buryatia and

other Buryat administrative areas, whereas a diaspora variety of Oirat known as Kalmuck (or Kalmyk) has a similar status in the Republic of Kalmykia (in the Caspian region). Other Mongolic languages have no official position, but experiments with modern literary languages (in Roman script) for Shira Yughur, Huzhu Mongghul, Minhe Mangghuer, and Santa are being made.

Demography

The total number of Mongolic speakers today is ca. 5–7 million. Most of these speak dialects of Mongol proper, of whom ca. 2 million live in Mongolia and ca. 3–4 million in Inner Mongolia (and other parts of China). Other relatively large Mongolic populations are those speaking Santa (ca. 600 000), Oirat (including Kalmuck, ca. 300 000), Buryat (ca. 300 000), Dagur (ca. 100 000), Ordos (ca. 100 000), and Huzhu Mongghul (ca. 100 000). The other languages are spoken by considerably smaller populations: Minhe Mangghuer (ca. 30 000), Bonan (ca. 10 000), Shira Yughur (ca. 3000), and Khamnigan Mongol (ca. 2000). Moghol is spoken by only a few individuals, if any.

With regard to linguistic vigorousness, there are considerable differences among the Mongolic languages. Whereas Moghol is moribund or nearly extinct, some groups of Khamnigan Mongol and Bonan are still viable in spite of their small numbers of speakers. Huzhu Mongghul is rapidly declining, whereas Minhe Mangghuer seems to be stable for the time being. The numbers of Buryat, Dagur, and Ordos speakers are diminishing due to assimilation by Chinese, Russian, and Mongol proper. Mongol proper is also rapidly losing ground in Inner Mongolia due to assimilation by Chinese. In this situation, Santa, a little investigated Mongolic language spoken by a compact and mainly monolingual Moslem population, with a low general level of literacy and education, is possibly the most vigorous and demographically the most rapidly growing Mongolic language today.

History of Research

Much of the early work on Mongolic focused on the philological analysis of Written Mongol texts. Isaac-Jacob Schmidt, working in service to Russia, was the first to publish a scientific grammar and dictionary of Written Mongol in the 1830s. Linguistic work on living Mongolic languages was initiated in the 1840s by the Finnish ethnolinguist M. A. Castrén (who worked on Buryat) and continued in the late 19th and early 20th centuries by G. J. Ramstedt (on Khalkha, Oirat/Kalmuck, and Moghol), A. D. Rudnev (on dialects of

Buryat and Mongol proper), Nicholas Poppe (on Buryat, Khalkha, and Dagur), and Antoine Mostaert (on Ordos). The documentation of Moghol was completed by Michael Weiers in the 1970s. The last major blank spot in Mongolic studies was the Shirongolic branch. After the pioneering contributions by Antoine Mostaert (Huzhu Mongghul) in the 1920s and 1930s, the Shirongolic languages were studied by a Sino-Russian expedition under the leadership of B. Kh. Todaeva in the 1950s and by an Inner Mongolian expedition in the 1980s. Even so, material on some Shirongolic languages and dialects has been extremely scarce until the present day. The last major Mongolic language to be documented was Minhe Mangghuer, described by Keith W. Slater (2003). The most up-to-date general work, with grammatical sketches of all Mongolic languages, was edited by Juha Janhunen (2003).

In the field of diachrony, the focus was long on external comparisons in the Altaic framework. The main source on Mongolic comparative studies remains the work of Nicholas Poppe (1955), which, unfortunately, has already become obsolete in some respects, especially as far as the languages of the Shirongolic branch are concerned.

Mon-Khmer Languages

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

The Mon-Khmer languages constitute a disparate group of languages belonging to the Austro-Asiatic phylum spoken in a large area across Southeast Asia. The term 'Mon-Khmer' has several interpretations. One sense in includes all non-Munda Austroasiatic languages (except Nihali if this is in fact to be considered Austroasiatic at all; for more *see Austroasiatic Languages*). Another sense of Mon-Khmer excludes Nicobarese, while a further interpretation excludes both the Nicobarese and the Aslian branches. This latter one is the understanding of the term 'Mon-Khmer' relevant for this article.

Within this narrow-scope interpretation of Mon-Khmer, the following subgroups can be reckoned: Bahnaric, Katuic, Khasi(c), Khmeric, Khmuic, Monic, Palaung-Wa, Pearic, and Viet-Muong. The internal relations of these subgroups have yet to be adequately determined to the satisfaction of specialists; as such, no *Stammbaum* of Mon-Khmer can be here offered.

One proposal (Grimes, 2000) on the internal subgrouping of Mon-Khmer within the broadest understanding enumerated above, recognizes a major cleavage between Aslian and all other Mon-Khmer languages; these latter are further subdivided into an Eastern Mon-Khmer subgroup consisting of Bahnaric,

Katuic, Khmer, Pearic, Monic, and Nicobarese and a Northern Mon-Khmer group that consists of Khmuic, Khasic, Palaung-Wa, and the isolate Mang of Vietnam. Viet-Muong is considered a separate branch coordinate with other Mon-Khmer subgroups. In addition, a number of relatively recently identified Mon-Khmer languages of China and Vietnam either appear to be isolate branches or remain unclassified, e.g., Palyu or Bagan. These are briefly discussed below. Lower-level taxonomic subgroupings have also been offered, e.g., Katuic-Bahnaric within the Eastern Mon-Khmer branch. Further research will refine and revise the classification and internal relations of the Mon-Khmer languages. However, given the controversial nature of all but the highest-order taxonomic subdivisions within Mon-Khmer, a conservative approach is offered here.

Within the context of individual subgroups of Mon-Khmer, comments are offered below on total numbers of speakers, etc. However, a few general overall comments on certain salient linguistic features can be made. Many Mon-Khmer languages exhibit unusual or noteworthy phonological features, such as the predilection to 'sesquisyllabic' (one-and-a-half-syllable) words that consist of a major/full syllable and a minor/reduced syllable. This takes the shape of reduced + full (or minor + major) and yields words with atypical clustering in initial position; examples can be found even in the names of several Mon-Khmer languages (or subgroups), e.g., Khmer, Khmu, Sre, Mnong,

Mrabri, etc., Vowel systems among Mon-Khmer languages are frequently highly developed, with elaborate systems of back unrounded vowels, centralized vowels, etc. often in combination with various phonation types or register phenomena. Such phonation types include creaky voice, breathy voice, etc. This combination of large core vowel systems and phonation types yields exploded inventories of syllable nuclei and/or vowel phonemes in various individual Mon-Khmer languages. These rank among the largest, if not the largest, such inventories in the languages of the world.

While the phonological systems of Mon-Khmer languages are highly developed, the languages are relatively impoverished morphologically and tend toward isolating word structure. However, the presence in most languages of lexicalized derivational elements, as well as productive or active systems in such languages as Bahnar, suggests that Proto-Mon-Khmer may have been more morphologically rich than most of its daughter languages. Indeed, a range of affixational processes may be used in individual languages within the Mon-Khmer language family, such as the following examples of derived nouns from Palaung (Milne, 1921: 74–75): *ra-pʌn-hwɔːi* [NOM₁-NOM₂-finish] ‘completion’; *pʌn-ra-i:r* [NOM₂-NOM₁-hate] ‘loathing, abhorrence’; *ra-ka-rɔt* [NOM₁-NEG-arrive] ‘the not arriving’; etc. Morphologically rich verbs are also to be found in individual Mon-Khmer languages, as is found in the following Khasi form:

- (1) *ya-pʰn-sam-θyaʔ*
RECIP/DIST-CAUS-INCLIN-sleepy
 ‘together make (others) feel sleepy’
 (Nagaraja, 1985: 27)

Similar morphologically developed verb forms may also be found in such Mon-Khmer languages as Katu and Bahnar. Indeed, it is possible to find cognate processes of affixation across several branches of the family, which may thus be reconstructed back to the Mon-Khmer protolanguage. Such is the case with the derivation of causative verbs. It appears that Proto-Mon-Khmer utilized a causative prefix when the verb stem was monosyllabic, but an infix when the stem was sesquisyllabic or longer. Such a pattern is found for example in Mon (Old Mon and modern Mon), the Katuic language Kuy, and Khmu. Note that the infix allomorph is realized as a (syllabic) nasal in Khmu and Kuy but as a schwa in Mon.

- (2) Khmu
p-háan ‘kill’ *p-rəh* ‘raise’ *k-m-sés* ‘drop’
 ←*háan* ‘die’ ← *rəh* ‘rise’ ←*k-sés* ‘fall’
 t-m-lúuy ‘hang (something)’
 ←*t-luy* ‘hang’
 (Svantesson, 1983: 104)

- (3) Spoken Mon: *p*-vs. -ə- (<*m/C__C)
hum daik → *p-hum daik* *klāŋ* →
 ‘have a bath’ ‘bathe’ ‘be numerous’
 hə-lāŋ
 ‘increase’
 (Bauer, 1989: 90)
- (4) Old Mon
kcət → *kəcət*
 ‘die’ ‘kill’
 (Bauer, 1990: 149)
- (5) Kuy
kəcet → *kəmcet*
 ‘die’ ‘kill’
 (Bauer, 1990: 149)

This pattern is cognate with the system seen in Nicobarese and Proto-Munda as well, and as such appears to be a formation dating all the way back to the Proto-Austroasiatic level; see Anderson and Zide (2001) for more on this.

Syntactically, Mon-Khmer languages, like many languages of greater southeast Asia, possesses sequences of verbs commonly referred to as serial verb constructions (Schiller, 1990). Examples of a verbal sequence of this type includes the following from Khmer and Ravüa of the Palaung-Wa branch:

- (6) Khmer
təu jɔk kasæet mɔk
go take newspaper come
 ‘go get the newspaper’
 (Schiller, 1990: 40)
- (7) Ravüa
ti me ho taw lik me pin ke-en
take you go send letter you accompany to-here
 ‘go take the letter and come back’
 (Schiller, 1990: 58)

Mon-Khmer languages are generally spoken in remote, hilly/mountainous, and isolated enclaves spread across northern Thailand, Laos, Cambodia, southern China, Myanmar, northeastern India, and Vietnam. In many instances they are spoken by only a few hundred or few thousand speakers. However, Mon-Khmer languages are also the national majority language of both Cambodia (Khmer) and Vietnam (the heavily Sinicized Vietnamese).

Bahnaric is a large group of minority languages spoken in southern central Vietnam, southern Laos, and northwestern Cambodia. The total number of all Bahnaric language speakers is likely less than one million. There are three or four major subdivisions within Bahnaric. Bahnaric clearly has Northern, Western, and Southern branches, to which is added by some researchers a Central Bahnaric branch as well. The entire Southern subgroup is spoken in Vietnam, as are all but one of the Northern Bahnaric

languages (Talieng is spoken in Laos). South Bahnaric is separated from the other Bahnaric languages by a group of Mainland Austronesian languages. West Bahnaric languages, on the other hand, are not found in Vietnam at all, but rather are dispersed throughout various enclaves in Laos and Cambodia. The Central Bahnaric languages, which includes Bahnar proper, is a disparate group of five languages scattered across Vietnam, Laos, and Cambodia.

- (8) Bahnaric subgroups
- Northern Bahnaric
 - East: Cua, Kayong
Takua
 - West: Halang Doan
Jeh, Halang
Rengao
Sedang, Hre; Monom, Todrah
Unclassified: Talieng, Trieng
 - Unclassified: Katua
 - Southern Bahnaric
 - Sre-Mnong: Mnong: Eastern Mnong
Central Mnong,
Southern Mnong
 - Sre: Koho, Maa
 - Stieng-Chrau: Chrau
Stieng (Bulo Stieng)
 - Western Bahnaric
 - Brao-Kravet: Brao (Lave), Kravet, Kru'ng
(Kru'ng 2), Sou
 - Laven: Laven
 - Nyaheun: Nyaheun
 - Oi-The: Jeng, Oi (Oy), Sapuan, Sok, The
 - Central Bahnaric
 - Bahnar, Romam (Vietnam)
 - Alak (Laos)
 - Lamam, Tampuan (Cambodia)

Languages or dialects within these various headings include the following:

- (9) Dialects/languages within various Bahnaric-speaking groups
- Stieng: Budip, Budeh, Bulach, Bulo (a.k.a. Ke-dieng, Se-dieng, and Rmang)
 - Southern Mnong: Nong/Diq, Prong (Prang)/Rbut; perhaps also Rahong, Bu Sre
 - Central Mnong: Preh, Budong, Burung, Dih Bri, Bunor, Biat
 - Eastern Mnong: Rlam (Ro'lo'm), Gar, Kuenh, Dliè Ruc, Ndee
 - Koho: Maaq, Sre, Töla, Nop, Köyon, Cil (Kou N'ho), Tring, Nohang, Lat/Lac, Riong, Pru, Laya, Röda, Co Don, Kalop
 - Bahnar: Alakong, Tolo, Bonom, Golar, Jolong, Kontum, Rōngao (Rengao), Kon KO De, Krem, Roh, To Sung, Hodrung, Hroi, 144 M'nhar

Sedang: Central Sedang, Greater Sedang, Daksut, Kon Hring, Kotua
Tampuon: Kroi, Lamam/Rmam

It is not possible to accurately gauge the exact number of speakers of Bahnaric languages, due in part to the extensive displacement many experienced during the Vietnam War. Many Bahnaric language speakers have been influenced by and/or shifted to national languages such as Vietnamese or Khmer or locally dominant languages such as Rhadé (Rade) or Cham (Austronesian). The following constitute rough estimates only:

- (10) Estimated number of speakers of Bahnaric languages
- Koho 100 000+ (including 23 000–30 000 Sre, 30 000–40 000 Maaq, 14 000 Cil, 3000 Lac, 6000 Nop, 14 000 Riong, very few each of Laya, Co Don, Töla)
 - Bahnar 85 000?
 - Hre 80 000?
 - Stieng 48 000?
 - Sedang 40 000?
 - Central Mnong 23 000?
 - Chrau 20 000?
 - Boloven (Laven) 18 000?
 - Cua 15 000?
 - Southern Mnong 12 000?
 - Eastern Mnong 12 000?
 - Halang 10 000?
 - Jeh 10 000?
 - Brau/Lavé 3000?
 - Koyong < 3000?
 - Nha Hön 2500??
 - Todrah, Alak, Takua, Cheng, Sapuan, Oi, Souq, Pragar, Kayong, Bout, Duan ??

Note that Parkin (1991) considers Central Bahnaric languages to be North Bahnaric.

Katuic languages are spoken in the region where Laos, Cambodia, and Vietnam meet. There are two subgroups within Katuic, conventionally called Eastern and Western Katuic. The total number of speakers of Katuic languages is approximately 200 000–300 000. The main languages include Katu, with 20 000–30 000 speakers, Bru, with possibly as many as 80 000 speakers, Sô (Tro), with 10 000 speakers, Pacoh, with 15 000 speakers, Ta'oih, with perhaps 10 000 speakers, Souei (Proom), with around 10 000 speakers, Kataang, with at least 10 000 speakers, Kaleung, who have mainly shifted to Lao but who number perhaps 40 000, and finally Kuy, with possibly as many as 150 000 speakers. Other than the Katu proper, the Pacoh (and the closely related Phuong), and the Khua, who live in Vietnam, and the Kuy and Western Bru of Thailand (and northern Cambodia),

Katuic-language speakers live mainly in Laos. Many are undergoing shift to Lao.

- (11) Katuic languages
 Eastern Katuic
 Kasseng
 Kataang
 Katu–Kantu
 Ngeq–Khlor–Alak 2
 Pacoh–Phuong
 Lower Ta’oih–Upper Ta’oih–Ir–Ong
 Tareng
 Western Katuic
 Kuy–Nyeu
 Eastern Bru–Western Bru–Khua–Leun–
 Mangkong–Sapoin–So Tri–Sô

Khasi[c] is the only branch of the Mon-Khmer language family spoken in mainland India. For more details see **Khasi**.

Khmeric consists of two languages: Central or Standard Khmer, the national language of Cambodia, and Northern Khmer, spoken mainly across the border in Thailand. For more on Khmer see **Khmer**. Khmer has been attested since the 7th century and appears in at least four historical stages: Pre-Angkorian, Old Khmer, Middle Khmer, and Modern Khmer. There may be as many as seven million Khmer speakers.

The Khmuic subgroup of Mon-Khmer consists of approximately a dozen languages scattered across Laos, Vietnam, and Thailand, with small enclaves in Myanmar and China as well. The Khmuic branch is further subdivided into the following subgroups:

- (12) Khmuic languages
 Khao
 Khao (Vietnam)
 Bit (Laos)
 Mal-Khmu
 Khmu
 Khmu (Laos, Thailand, Vietnam, China,
 [Myanmar])
 Khuen (Laos)
 O’du (Vietnam)
 Mal-Phrai
 Lua’ (Thailand)
 Mal (Laos)
 Phrai (Thailand)
 Pray (Pray 3) (Thailand)
 Mlabri (Thailand)
 Xinh Mul
 Khang (Vietnam)
 Pong (Phong Kniang) (Laos)
 Puoc (Vietnam)

Apart from these designations, which are standard in the Western linguistic tradition, Khmuic-speaking

peoples are known by a plethora of local variants (Parkin, 1991: 96). These include the folk-etymologized Kha Mu in Laos (*kha* is a general term for subjugated ‘hill tribes’ in Laotian), sometimes also Phou Theng or local designations such as Thay Hay or Hok in Laos and Rook in Thailand; in China they were formerly known as Chaman, now Kemu; in Vietnam, the Khmu are often referred to as Xa Cau. The total number of Khmuic speakers is moderately large, with Khmu proper the largest group, having between 350 000 and 500 000 total speakers in numerous local variants. Mal-Phrai, also known as T’in, has perhaps 20 000 speakers and is probably the next largest Khmuic-speaking group. Many languages are spoken by very small populations, e.g., Khang Ai of Tay Bac Province, Vietnam, which may have fewer than 1000 speakers; a similar number is estimated for Bit of northern Laos, while Mlabri (also known as Mrabri and Yumbri) may have as few as 200 speakers.

One group that deserves special mention here are the Lamet, who are sufficiently Khmuized linguistically and culturally to make their classification unclear. It is possible that they were originally speakers of a Palaungic language but their exact classificatory status remains open.

The Monic branch of Mon-Khmer consists of just two languages, Mon of Myanmar and Thailand and Nyahkur of Thailand. Mon, like Khmer, has a long literary tradition, with texts dating back 1000 years to the time when the Mon ruled an empire in this region; isolated inscriptional sources date back as far as the 7th century. Ethnic Mon may number nearly half a million, but the total number of speakers is significantly less, possibly only a tenth of that figure. The Nyahkur, on the other hand, total no more than a few thousand speakers, and probably represent the remnant of an old Mon kingdom of southern Thailand. In Thai they are called Chaubon; both ethnonyms mean ‘mountain people.’

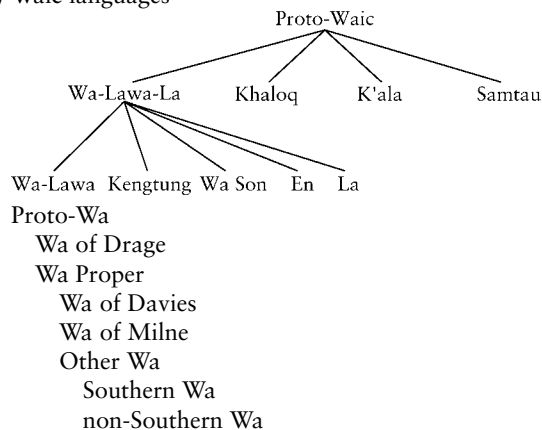

Members of the widespread Palaung-Wa branch of Mon-Khmer are found scattered throughout Myanmar, Thailand, the Yunnan province of China, and Laos. The total numbers of Palaung-Wa speakers is likely over one million. Several divergent groups are to be found within this branch, the exact internal relations between which remain to be worked out to the satisfaction of specialists. The major languages or subgroups within this branch are Danau, the various divergent Angkuic groups, Palaung proper, Riang, and the large Waic group with multiple subdivisions. Some reckon an Eastern and a Western group, the former including Danau, Palaung and Riang, the latter consisting of Waic, Angkuic and possibly Lametic as well.

Palaung speakers, who fall into several dialect/language groups, are heavily influenced by Shan and undergoing linguistic assimilation to this Tai language. At least three Palaung languages are reckoned, viz. Pale (Silver), Rumi, and Shwe (Gold). The Palaung languages are mainly spoken in Myanmar, but each have a small number of speakers in China, where they are all united under the official De'ang nationality; Pale Palaung speakers are also found in Thailand. The total number of Palaung speakers is difficult to estimate but may be in the range of 500 000–600 000, or it may be much smaller. A divergent Palaung group, the P'u-man, are found in Yunnan, China. As this Chinese ethnonym refers to other groups as well, it is not known how many speakers of P'u-man are really to be found. Riang, like Palaung, is heavily influenced by Shan and rapidly losing its similarly small population of speakers. Danau is also severely endangered and could have as few as 2000 speakers, if that many, at present.

Lametic, as mentioned above, shows considerable influence from Khmuic and may not really belong in this branch of Mon-Khmer. It consists of Con, with perhaps 1000 speakers, and Lamet, with around 10 000 total speakers or maybe more.

The large and diverse Waic languages of Palaung-Wa constitute a heterogeneous group of languages spoken in enclaves throughout Myanmar and Yunnan, and originally in adjacent parts of Thailand as well. The number of Waic languages and its internal divisions remain open questions, despite considerable work by Diffloth in particular. Most Waic languages are spoken by small populations which range from less than 100 to more than 100 000. Wa is often known as Va in China; other common ethnonyms referring to Wa-speaking groups include (Parkin, 1991: 111): Vu, Vo, Lave, Ravet, Krak, Kut Wa, Hsap Tai, and Gaung-pyat (head cutting). One possible subgrouping of this group is as follows:

(13) Waic languages

Kawa
non-Kawa
Tung Va Wa
Wa of Antisdel
'Bible Wa'
Praok

NB: Names refer to authors who described these languages.

Proto-Samtau (Augkuic)

NB: Samtauc/Angkuic P'u-Man is not the same as Palaungic P'u-Man.

As with other Mon-Khmer subgroups, there is a proliferation of names associated with languages of this group. Thus, to Augkuic may be found such names as Hu, Kiorr, Kon Keu, Man Met, Samtao, Tai Loi, and U. To Waic also belongs the official minority Bulang (Blang) language of China; this officially recognized ethnic designation in China also subsumes many other related languages of the Waic group. The Ethnologue reckons only four other Waic languages, Eastern Lawa, Western Lawa, Vo, and Parauk. As in many areas, the language/dialect distinction is ill defined and subject to the whims or biases of individual researchers.

The important languages of the Pearic branch of Mon-Khmer were spoken by around 8000–10 000 people in Cambodia before the ravages of the Vietnam War and the subsequent terror imposed by the Khmer Rouge regime. Only a handful of speakers of the half-dozen or so languages may remain. The languages of the Pearic branch include Chhong (Chong), known for its unusually developed system of register/voice quality contrasts characterizing its vowel system, Pear, Samre, Somray, Sa'och, and the poorly known Suoy (not to be confused with the Katuic-speaking group of the same name). Pearic peoples are dark skinned and have curly hair and as such were often discriminated against in Cambodia. Traditionally, the Pear proper were tribute payers of the Khmer in cardamom (Parkin, 1991: 68).

The large and diverse branch of Mon-Khmer known as Viet-Muong consists of an indeterminate number of languages spoken primarily in Vietnam and adjacent parts of Laos. First and foremost belonging to this branch is Vietnamese, far and away the Austro-Asiatic language with the most speakers, with perhaps

as many as 60–70 million. In fact, Vietnamese has more speakers than the other 150-odd Austro-Asiatic languages combined. Highly divergent within the family, with a developed tone system, lack of minor syllables and monosyllabic structure, lack of affixation processes, and heavy lexical influence from Chinese, the Austro-Asiatic affiliation of Vietnamese was not established until relatively recently (and is still disputed by some). Among the other languages of the branch, Muong stands out with its 400 000–500 000 speakers. Most other Viet-Muong languages have between several hundred and several thousand speakers. Most are poorly known or are indeed unattested linguistically, save perhaps an isolated word list. These are conventionally divided into a Chut subgroup, consisting of Arem, May, Pakatan, Ruc and Sach; a Cui subgroup, to which belong Hung, Pong, and Tum; a Muong group, consisting of Bo, Kha Tong Luang, Muong proper, Nguôn, and another Pong; a small Thavung-Phon Sung (Aheu) group; Vietnamese; and the poorly known and still unclassified Tho language. Other languages not recognized by the Ethnologue belonging to Viet-Muong include Coi, Dan Lai, K'katiam-Pong-Huok (Thai Pong), Ly Ha, Ma Lieng, Nguoi Rung, Nha Lang, Tay Cham, Tay Pum, and Tay Tum (Ktum) (Parkin, 1991). Many Viet-Muong languages are undergoing rapid assimilation to Vietnamese. While included here, it is possible that Viet-Muong is not actually a subgroup of Mon-Khmer, but, like Aslian and Nicobarese, a separate subgroup of (non-Munda) Austro-Asiatic.

In addition to the subgroups of Mon-Khmer languages adduced above, there are a number of as yet unclassified or isolated groups as well. Most of these are relatively recently described minority languages from China and Vietnam in particular.

The Mang or Mang U of Vietnam and China number perhaps 1000 speakers. Mang has similarities with Khmuic and Palaung-Wa, more with the latter, but may constitute its own subgroup within Mon-Khmer.

The Palyu, who occupy the Guangxi–Guizhou border region of China, have also been recently identified as a Mon-Khmer-speaking group, the exact affiliation of which remains to be demonstrated. They are locally known as Lai (not to be confused with the Tibeto-Burman Lai Chin of Bangladesh and Myanmar).

Other recently discovered and as yet unclassified Austro-Asiatic languages of China possibly belonging to Mon-Khmer include Bugan, Buxinhua, Kemiehua, and Kuanhua. What little is known of these languages suggests that they may well be important for comparative Mon-Khmer linguistics.

There is a specialist journal devoted to the linguistic analysis of Mon-Khmer languages, *Mon-Khmer*

Studies, where the interested reader may find a wide range of articles covering virtually every conceivable linguistic topic in the investigation of the languages of this family. The majority of articles are devoted to phonological analysis, as Mon-Khmer languages, as mentioned above, are particularly unusual in this domain. Among present-day specialists in Mon-Khmer linguistics, Gerard Diffloth deserves special mention.

Morphological Typology

C Iacobini, Università di Salerno, Salerno, Italy

© 2006 Elsevier Ltd. All rights reserved.

At the beginning of the 19th century, linguistic typology established a small set of types, i.e., isolating, agglutinating, fusional (see 'The Fusional Type,' 'The Agglutinating Type,' and 'The Isolating Type' below), to which any single language could be assigned. The main criteria for the assignment were related to word structure.

For a long time, word structure remained the dominant criterion to classify languages into types, so that morphological typology is sometimes defined as classical typology as well.

Friedrich Schlegel (1772–1829) and his brother August Wilhelm (1767–1845), together with Wilhelm von Humboldt (1767–1835) – who was also the first scholar who identified the polysynthetic type (see **Central Siberian Yupik as a Polysynthetic Language**) – gave the most important contribution to the assumption that it was possible to describe the whole grammatical structure of a language starting from the way in which relational concepts are morphologically encoded (following suggestions from contemporary research in botany and paleontology).

With Edward Sapir (1921) there was an important shift within morphological typology. Abandoning the holistic approach, he underlined the internal inconsistencies of the classical schema of classification, and

distinguished and made explicit the relevant parameters for classification. According to Sapir, it is possible (and usual) for the same language to show morphological structures belonging to more than one type.

Modern linguistic typology – which arose with the work of Joseph Greenberg (1966) – attempts to classify languages simultaneously on several dimensions, using implicational types of relations to establish limitations on the range of possible variation occurring within linguistic structures. Therefore, morphology is no longer seen as the most fundamental form of language classification, but one of the main levels in which languages can be described.

In contemporary typology, the classification by morphological types is mostly a convenient way to rapidly identify some morphological characteristic of languages, but it is marginal both in theoretical and descriptive studies.

If compared with those of the beginning of the 19th century, the aims of morphological typology have become more modest. However, the role played by morphology in the research of possible patterns of co-variation and correlation with other levels of linguistic analysis is still very relevant today.

Morphological Types

The classification of languages by morphological types is still today part of the standard terminology

of linguistics. However, it is also strongly criticized by the majority of typologists for three main reasons:

1. the classification criteria are rather vague and difficult to apply in a consistent way;
2. the morphological type is defined in terms of mutual favorability of properties rather than of implicational correlations, resulting in a low predictive power;
3. morphological typology has a holistic background.

Another reason for criticism comes from the emotive appeal of linguistic imperialism: modern linguistics has disavowed the ideological prejudice dating back to the beginning of the 19th century, according to which the fusional morphological type was considered superior to other types both on a functional and on an evolutionary scale (the presumed superiority stemmed from scholars' Western-centered standpoint: in fact, all the older and many of the contemporary Indo-European languages can be classified as fusional).

There are three fundamental conceptions of language type based on morphological criteria:

1. the classical (cf. Schlegel, 1808): each type is distinguished from the others in a clear-cut way and is characterized by the presence/absence of one single feature (e.g., languages with or without inflection);
2. the continuum (cf. Sapir, 1921): each type shares with the others a combination of various features, each of them having a continuum of values with two well-defined ends; the structures of a language can be placed on a specific point along the axis anchored by each feature;
3. the ideal (cf. Skalička, 1966): each type is an ideal model (which is never fully realized), consisting of a set of features which tend to co-occur.

According to the last conception, each morphological type may be described as a combination of functionally interconnected features, which, as a whole, form an ideal construct characterizing (the whole, or some aspects of) the morphology of languages (Sgall, 1995). Languages are rarely pure types; they usually mix elements of different types. Assigning a language to a specific type depends on the preponderance of features considered significant (the quantification of such features is a difficult problem to solve from a practical point of view).

Criticism of Morphological Types

The vagueness of the classification in morphological types is shown by the lack of consensus on the

number of both types and parameters identifying them. The three main types are: fusional, agglutinating, and isolating. There is no agreement either on whether the polysynthetic type should be considered autonomous or an extreme degree of the agglutinating one (*see Central Siberian Yupik as a Polysynthetic Language*), or on whether Semitic language features are sufficient to distinguish an introflecting type from the fusional one.

The classical morphological typology only referred to the formal encoding of single morphological features. Sapir (1921: Chap. 6) recognized the shortcomings and contradictions of the 19th century typologists, and, in modern linguistic terms, made explicit the formal components implicit in previous proposals. He adopted a multidimensional approach to morphological typology that could integrate different dimensions of classification, among which the semantic content of morphological expression as well. He distinguished three main criteria of classification:

1. morphological technique: isolating, agglutinating, fusional, symbolic (internal modification);
2. index of synthesis: analytic, synthetic, and polysynthetic structures;
3. how relational concepts are expressed (making a distinction on whether they are expressed through lexical bases or relational elements), and the degree of grammaticalization of relational concepts.

With Sapir, there is a move from a taxonomic criterion according to which each language has to be ascribed to one type, to a classifying criterion based on possible types of morphological structures, in the definition of which semantics plays an important role as well. Moreover, it is explicitly recognized that a language can be classified into more than one type, and that types shade one into the other.

Greenberg (1954) elaborated Sapir's proposal with the aim of applying it to quantitative evaluations on the morphology of different languages.

The three parameters that are nowadays mostly used for the typological classification of languages are the ratio of morphs to word forms, the number of morphemes to morphs, and the degree of word-internal modification of morphs. The first parameter distinguishes analytic from synthetic languages; the other two distinguish, within the synthetic group, agglutinating from fusional languages.

Lists of Clustering Features

The best-known attempt to establish a list of features that co-occur in morphological types is the one made by Skalička (1966), which also includes aspects of

word phonology and word order. In the following sections, the features of the three main types (agglutinating, fusional, and isolating) will be given (*see also Finnish as an Agglutinating Language; Italian as a Fusional Language; Chinese as an Isolating Language*), with the reminder that whereas the final ends of some dimensions can be reached, others are unlikely or impossible to reach. The analysis and discussion of polysynthetic and introflexing types is carried out in sections devoted to them (*see Central Siberian Yupik as a Polysynthetic Language; Arabic as an Introflexing Language*). Suffice it to say here that whereas the polysynthetic type presents a variety of forms and is spread in a lot of languages, the introflexing type is not widely spread and, even in those languages where it is found, it is restricted to a part of morphology.

The features that tend to cluster in languages displaying one of the three main morphological types can be listed as shown in the following sections.

The Fusional Type

1. Words are formed by a root and (one or more) inflectional affixes, which are employed as a primary means to indicate the grammatical function of the words in the language. Agreement is widely employed.
2. High degree of modification of internal morph boundaries, with a consequently difficult linear segmentation.
3. Tendency to cumulate morphological meanings in a single affix (with consequent asymmetry between the semantic and formal organization of grammatical markers).
4. Word-class distinction is maximal. Inflection is rich, as regards both the number of inflectional classes and the extension of paradigms.
5. Stem suppletion; many cases of both homonymy and synonymy among affixes; clear distinction between inflectional and derivational affixes.
6. A slight correlation with syntax can be seen in the relatively free word order (but there are also fusional languages with a fairly fixed word order).

The Agglutinating Type

1. Words are formed by a root and a clearly detachable sequence of affixes, each of them expressing a separate item of meaning. Affixes are widely employed to indicate the relationships between words. Therefore, there are few or no independent relational elements (e.g., pronouns, pre-/postposition, articles, etc.), and a wide use of nominal cases.

2. Very high matching between morphs and morphemes. Morphs are loosely joined together; consequently it is very easy to determine the boundaries between them.
3. Each affix carries only one meaning; no cases of homonymy or synonymy among affixes; the semantic structure is directly reflected in the morphological articulation of the word; no principled limits to the number of affixes in a word.
4. Word-class distinction is minimal: the same affixes tend to occur with roots belonging to different parts of speech (e.g., personal endings to nouns, case endings to verbs); almost the same morphology for adjectives and verbs. No inflectional classes, no gender distinction.
5. Derivational affixes are widely employed in word formation. The distinction between inflectional and derivational affixes is slight. Many affixes reveal their lexical origin to some extent. The latter feature, together with the tendency of affixes to form autonomous syllables and to be relatively unconstrained in number, results in words that are quite long.
6. Relatively fixed word order. Agreement is almost completely absent.

The Isolating Type

1. Words are monomorphemic, invariable, and formed by a single root. Ideally, bound forms are completely missing. Position is the main way of expressing the relationship between independent words.
2. Relational meanings are not overtly expressed, or the same units that normally encode lexical concepts are used for that purpose as separate helper words; the meaning and function of a word considerably depend upon the syntagmatic context.
3. There is little to no morphological complexity. Morphs are clearly identifiable both phonologically and semantically: morph boundaries are sharply defined, phonological form is invariant, there are no instances of overlapping exponence. Derivation is nonexistent, partly replaced by compounding.
4. The distinction in parts of speech is not clear; there is no overt expression of grammatical categorization.
5. Tendency to monosyllabism with no phonetic distinctions between the elements expressing lexical meaning and the ones expressing relational meaning.
6. Rigid word order.

Comparison

The fusional type is differentiated from the isolating type by the use of bound morphs and the clear-cut distinction between word classes; it is differentiated from the agglutinating type by the kind of juncture between morphs, and the nonbiunivocal correspondence between morphs and morphemes. In the synthetic vs. analytic distinction, the fusional and even more the agglutinating type tend toward the synthetic end.

Types characterization can be schematically summed up in Table 1.

Contemporary Morphological Typology

In spite of criticism, the classification by morphological types is still convenient and widely used in order to rapidly identify a number of features that tend to co-occur in the morphology of a language. Some authors also use it to assess the extent to which a language moves away from such ideal constructs both in a synchronic and in a diachronic perspective (Dressler, 1985 argues that languages tend to move toward a typological goal according to a linguistic economy criterion).

On the contrary, the classification by morphological types is now negligible in contemporary typological research, since scholars do not expect the morphological type to correlate in a significant way with other typological parameters. As they refuse the possibility of classifying the whole of a language into a given type, typologists pay increasing attention to the practice of partial typology, focusing on specific areas of linguistic structure (Bynon, 2004). Partial typology analyzes clusters of properties with a view to ascertaining significant connections and hierarchical organization. The main tool for analysis is establishing implication universals according to Greenberg's (1966) suggestions. However, disregarding morphological types does not result in the death

of morphological typology: almost half of Greenberg's 45 universals concern morphology. These universals mainly focus on two aspects previously neglected by morphological typology:

1. the relative order in which (derivational and inflectional) concepts are expressed morphologically within word forms;
2. the hierarchy of concepts which a language expresses morphologically.

Examples of the first are universals 28 and 39. The former states that if derivational and inflectional affixes are on the same side of the root, then the derivation is always closer to the root. The latter says that in a noun the expression of number is nearly always closer to the base than the expression of the case. Examples of the second are universal 36 'If a language has the category of gender, it always has the category of number,' and 37 'A language never has more gender categories in nonsingular numbers than in the singular.'

While it is true that only with Greenberg (1966) does syntax start to play a major role in typology, it is to be said that even the famous syntactic universals concerning word order (e.g., universals 3 and 4, which relate VSO order with preposition, and SOV order with postposition) show a link with morphology, for example, via universal 27 (which relates suffixing and postpositional languages on the one hand and prefixing and prepositional languages on the other). Another example is universal 41, which states the implication between the SOV word order and the presence of a case system. Because of such a link, morphology has acquired importance for scholars interested in word order typology. There are many studies that associate the use of suffixes or prefixes with OV and VO order, respectively (see Cutler *et al.*, 1985; Hawkins and Cutler, 1988; Hawkins and Gilligan, 1988, where affix preference is related with head position and also explained by

Table 1 Features characterizing fusional, agglutinating, and isolating types

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Fusional | Yes | No | No | Yes | No | No | No | Yes | Yes | Yes | Yes | Yes | No | Yes |
| Agglutinating | Yes | Yes | Yes | No | No | Yes | No | Yes | Yes | No | No | Yes | No | No |
| Isolating | No | Yes | Yes | No | Yes | Yes | Yes | No | No | No | No | No | Yes | No |

(1) affixes; (2) word function determined by position; (3) possibility of segmentation (morph-morpheme correspondence); (4) clear-cut distinction in part-of-speech; (5) tendency to monosyllabism; (6) fixed syntactic order; (7) syntagmatic structures employing particles; (8) noun marked for number; (9) noun marked for case; (10) noun marked for gender; (11) adjectives expressing agreement; (12) synthetic expression of comparison on adjectives; (13) verb: use of analytic structures (vs. affixes); (14) verb: presence of inflectional classes.

psycholinguistic factors; see Bybee *et al.*, 1990 for a diachronic approach; Dryer, 1992, who attempts to integrate different approaches).

At the interface between morphology and syntax there are works such as Nichols (1986), which distinguishes head- and dependent-marking, and others, such as those dealing with the morphologically based typology of causative constructions.

Greenberg (1966) barely takes into account phonology. However, the Universals Archive (cf. Plank and Filimonova) collects some universals concerning the interaction between morphology and phonology. Examples are universal 219 stating that affixes have a more limited inventory of phonemes than roots and universal 713, which correlates agglutinative morphology with vowel harmony, and fusional morphology with stress accent.

As far as morphology itself is concerned, the main effect of Greenberg's typology has been to stimulate the investigation of implicational relations between morphological categories, to promote the study of the markedness (overt expression) of morphological values, as well as the investigation of the reasons for the greater or lesser closeness of relational morphemes to the lexical base, and of the role played by morphological heads.

One of the main problems that stands before morphological typology is to identify a phenomenon as the same thing in different languages, since the values of one grammatical category may be expressed morphologically in some languages and in a different way in others. Cross-linguistic identification on purely formal criteria is not far-reaching (an example is Greenberg's universal 26: 'If a language has discontinuous affixes, it always has either prefixing or suffixing or both'); on the other hand, purely functional statements are not sufficient, because, by definition, they need a formal counterpart to be morphological. This type of difficulty explains why studies on inflectional morphology are overwhelmingly prevailing over derivational ones: categories such as case, gender, and number are cross-linguistically better identified and defined (see Blake, 2001; Corbett, 1991, 2000) than derivational ones; furthermore, the internal articulation of inflectional categories, featuring a number of values within one category (e.g., singular, plural for number), favors cross-linguistic comparison within the inflectional domain. The study of the variation in the expression of derivational categories is certainly more difficult and much remains to be done; see Bauer (2002) for a recent attempt.

Morrobalama

S Ogilvie, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Morrobalama (Umbuygamu) is an endangered Australian Aboriginal language of the Cape York Peninsula in northern Australia. Originally spoken in Princess Charlotte Bay on the eastern coast of Cape York, its speakers were forcibly displaced from the region in the early 1960s. A handful of remaining speakers now live in the Cape York towns of Umagico and Coen. Morrobalama is atypical of most Australian languages in its phonemic inventory but typical in all other respects: it is nonprefixing with nominal case inflections, verbal inflections, and pronominal cross-referencing. It has free word order with a complex verbal structure that includes a fixed order of verbal stems, tense/aspect markers, and pronominal clitics.

With the other languages of the Princess Charlotte Bay region – Lama-Lama, Umbindhamu, Rimanggudinhma (Mbariman-Gudhinma), and the Flinders Island language – Morrobalama forms a subgroup of the northern Paman languages known by some linguists as the ‘Lamalamic’ languages or ‘Bay Paman.’ While speakers of the language refer to it as ‘Morrobalama,’ it is also called ‘Umbuygamu’ in the neighboring Umpila language, and this name had been used by linguists for many years. ‘Morrobalama’ is now the name preferred by both speakers and linguists (see Dixon, 2002: xxxi).

Australian languages are known to be relatively homogeneous in their phonemic inventories. Typically they display four to six paired stops and nasals (labial, apico-alveolar, apico-postalveolar, lamino-dental, lamino-palatal, and dorso-velar), two rhotics (trill and retroflex), no fricatives, no voicing contrasts, and a three-vowel system. In contrast, Morrobalama has a large phonemic inventory that includes atypical sounds such as fricatives, prestopped nasals, voicing contrasts, and a system of five vowels that contrast in length. More thorough analysis is needed of the sound system, but it may have seven places of articulation, including two laminal series (dental and palatal), three rhotics (two of which contrast in voice), two glides, and a glottal stop which is only found in a few other Australian languages (in western Australia and in Arnhem Land). While a typical Australian inventory consists of seventeen phonemes, the Morrobalama inventory has expanded to include thirty-six phonemes.

Morrobalama and other languages of Cape York have undergone phonological changes that may at

first glance make them appear unrelated to other Australian languages. One such well-described change is the loss of the initial consonant (in the case of Morrobalama) or the initial syllable (in the case of other Princess Charlotte Bay languages). Thus, for example, **nyura* ‘you (all)’ has become *orba* and **nyulu* ‘s/he’ has become *ola*. Initial dropping also occurs in other languages in separate parts of Australia, such as Nhanda in western Australia and Arrernte in central Australia.

Morphologically, Morrobalama is typical of most Australian languages in that it displays a split-ergative system: nouns operate in an absolutive/ergative paradigm, while pronouns are nominative/accusative. Thus in Morrobalama, absolutive is marked by zero on both the subject of an intransitive verb and the object of a transitive verb, and the ergative is marked by *-a* suffixed to the subject of a transitive verb. Pronouns have three numbers – singular, dual, and plural – and distinguish inclusive and exclusive in first-person dual and plural. They can occur both independently or bound, and when bound, occur as the final constituent of the verbal structure with the initial vowel dropped. So the independent pronoun *ola* ‘s/he’ becomes bound as *-la*:

| | | | |
|-----------------------|-------------------|-------------------|-------------|
| <i>ola</i> | <i>nya</i> | <i>-la</i> | <i>-nan</i> |
| 3RD.SING.ACC | hit-3RD.SING.ACC. | she-2ND.SING.OBJ. | |
| ‘she (emph.) hit you’ | | | |

This example also shows a typical Australian word-order feature: order is generally free, but there is a tendency for it to be based on pragmatic rather than grammatical principles, in which the emphasized phrase occurs first. In Morrobalama, all verbs must include at least a verbal stem plus a pronominal subject clitic; order of the clitics is free. Other suffixation on the verb marks tense, aspect, and mood (TAM). There is fixed order within the verbal structure (stem-TAM-PRO).

As is typical in Australian languages, Morrobalama derives new words via suffixes. For example, the comitative case *-pinh* acts as a lexical formative by being suffixed to a word to form a compound *x-pinh*, meaning ‘with or having x’:

| | | |
|------------------|---------------------|------------------------|
| <i>ithi-pinh</i> | <i>lirrin-pinha</i> | <i>marr-pinh</i> |
| bone-COM | smoke-COM | face-COM |
| (‘with bone’) | (‘with smoke’) | (‘with face’) |
| ‘bony bream’ | ‘steam boat’ | ‘red-faced flying fox’ |

Most compounds, though, are of the ‘general-specific’ type, with stress falling on the specific element as though the general component acted as a clitic:

| | |
|--------------------|--------------------|
| lam-eethal | lam-agaparr |
| hand-bone | hand-belly |
| 'back of the hand' | 'palm of the hand' |

Morrobalama has not been passed on to the next generation, which speaks Cape York Creole (Torres Strait Creole) instead and, given the age of the few current speakers, it will probably disappear in the next decade unless intense language revitalization takes place.

Munda Languages

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

'Munda' is a group of languages belonging to the Austroasiatic language family spoken in eastern and central India, primarily in the states of Orissa, Jharkhand, Bihar, and Madhya Pradesh and in adjacent areas of West Bengal, Maharashtra, and Andhra Pradesh. Some Munda speakers are found in expatriate or diaspora communities throughout India, Nepal, and western Bangladesh as well. In earlier literature, Munda is often referred to as Kol or Kolarian.

The Munda language family recognizes a major split between a North Munda and a South Munda subgroup. Within the North Munda subgroup, there is a binary opposition between Korku and a large group of Kherwarian languages, which is perhaps more properly described as a dialect continuum. Kherwarian includes both the largest of the Munda languages, Santali, with nearly 7 million speakers, as well as some of the smallest, such as Birhor, with under 1000. Other noteworthy North Munda languages include Mundari and Ho, each with approximately 1 million speakers, and smaller languages such as Agariya, Asuri, Bhumij (Mundari), Karmali Santali, Koraku, Korwa, Mahali, and Turi. Publications may be found in the larger of the Kherwarian languages (Mundari, Ho, Santali), including a range of Santali publications in a native orthography (the Ol'

Cemet script). Short wave radio broadcasts are also available in Santali. The newly founded 'tribal' state of Jharkhand has a Munda-speaking majority and is lobbying to have some form of Kherwarian declared another state language of India.

The South Munda subgroup is older and more internally diversified than North Munda. At least the following languages belonging to this subgroup: Sora (Savara), Juray, Gorum (Parengi, Parenga), Gutob (Gadaba, Bodo), Remo (Bonda, Bondo), Gta? (Gata?, Didey), Kharia, and Juang. In terms of further subgrouping, it is clear that Sora and Gorum form a branch of their own, as do the closely related Gutob and Remo. Gta?, which is properly speaking two separate languages: the poorly known Hill Geta? and Plains/Riverside Geta?, has been traditionally linked at a slightly higher taxonomic level with Gutob-Remo (so-called Gutob-Remo-Gta?), and Kharia and Juang have been linked together in a branch as well. These latter two classifications are tenuous and remain to be adequately demonstrated (Anderson, 2001). South Munda languages range in total number of speakers from 300 000 or more Sora speakers to between 150 000 and 200 000 Kharia speakers to Gutob with approximately 30 000–50 000 total speakers and Juang with around 15 000 speakers. The remaining South Munda languages have around 2000–4000 speakers each.

Typologically speaking, all Munda languages are moderately to extensively agglutinating, show SOV basic clause structure, and possess preglottalized or

Muskogean Languages

G A Broadwell, State University of New York, Albany, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Muskogean languages were originally spoken across much of the southeastern United States, from Georgia to Louisiana. As a result of population movements, both voluntary and forced, many speakers of

Muskogean languages are now located outside the original Muskogean-speaking area. More than half of the speakers of Muskogean languages now live in either Oklahoma or southern Florida.

There are six different Muskogean languages that are still spoken.

1. Choctaw is the largest Muskogean language, with perhaps 7000 to 11 000 speakers divided between the Mississippi Choctaw reservation in eastern Mississippi and the Oklahoma Choctaw nation of southeastern Oklahoma.

2. Chickasaw is spoken by a few hundred people in the Chickasaw nation of southern Oklahoma.
3. Alabama is spoken by a few hundred people on the Alabama-Coushatta reservation in eastern Texas.
4. Koasati (also called Coushatta) is spoken by a few hundred people in the area around Elton, Louisiana, and by a smaller number (probably fewer than 50) on the Alabama-Coushatta reservation.
5. Mikasuki (also spelled Miccosukee) is spoken by approximately 1000 people in the Seminole and Miccosukee tribes of Florida, located in the Everglades region of Florida.
6. Creek (also called Muskogee or Muscogee) is spoken by approximately 4000 people. The great majority of these speakers live in the Muscogee (Creek) Nation of Oklahoma and in the Seminole nation of Oklahoma. There are perhaps 200 speakers of Creek in the Seminole tribe of Florida.

‘Seminole’ is a term that is potentially confusing. It refers primarily to a political grouping of Creek and Mikasuki speakers who moved from their former territory in Georgia and Alabama to new locations in south Florida beginning in the mid-18th century. During the Indian removal period of the 1830s, many Seminoles were forcibly resettled in Oklahoma, so that there is now both a Seminole Nation of Oklahoma and a Seminole tribe of Florida.

Oklahoma Seminoles who retain their native language speak a dialect of Creek called Oklahoma Seminole Creek. Florida Seminoles speak two different languages – the majority speak Mikasuki and a minority speak a dialect known as Florida Seminole Creek.

In addition to these six languages, three other extinct Muskogean languages are attested:

7. Apalachee was spoken by inhabitants of north-west Florida. The language is attested in a 17th century letter to Charles II of Spain, but has long been extinct.
8. Hitchiti was a language that seems to have been quite similar to Mikasuki. It was spoken in Florida and Oklahoma until the early 20th century.
9. Mobilian Jargon (Mobilian) was a Muskogean-based trade language spoken in the lower Mississippi Valley. Some fragments of the language were spoken by a few people in Louisiana until the 1970s.

Classification

The currently spoken Muskogean languages fall into the following groups:

Kimball and Haas have argued that the extinct language Apalachee was most closely connected to Alabama and Koasati.

Higher level classification of the Muskogean languages is difficult and a subject of controversy. Based on several identifiable sound changes, Haas proposed that Alabama, Koasati, Mikasuki, and Creek formed a group called Eastern Muskogean. However, another subsequently discovered sound change (Proto-Muskogean *k^w → b) supports a rather different grouping, in which Western Muskogean, Alabama, Koasati, and Mikasuki form a group called Southern Muskogean (affected by the *k^w → b rule). This group is distinct from Creek, which was not affected by this rule. Munro and Broadwell have also presented morphological evidence in favor of a Southern Muskogean group. There is as yet no consensus on this issue.

Phonological Characteristics

Muskogean languages have relatively simple phonological inventories. Choctaw and Chickasaw, for instance, have an inventory of 16 consonant phonemes (Table 1).

In addition, all Muskogean languages have three phonemic vowels /a, i, o/ that appear short, long, and nasalized.

Muskogean languages have pitch-accent. In verbs, the position of pitch accent is generally dependent on the ‘grade’ in which the verb appears. Grades are a series of related verb forms that differ in tense and/or aspect from each other, and that are formed by infixing a consonant or consonants, lengthening a vowel, or

Table 1 Choctaw and Chickasaw consonant phonemes

| Bilabial/ Labiodental | Alveolar | Postalveolar/ Palatal | Velar | Glottal |
|--------------------------|----------|--------------------------|-------|---------|
| p | t | tʃ | k | ʔ |
| b | | | | |
| f | s | ʃ | | h |
| m | n | | | |
| | l | | | |
| | ɬ | | | |
| w | | j | | |

/ʔ/ in most Choctaw dialects is restricted to word-final position, while it has a wider distribution in Chickasaw.

changing the form and position of the pitch accent. Consider the following examples from Creek:

- (1) Creek
 wanáj-as [wanáyas] ‘tie it’
 underived grade
 wana<:>j-is [wana:jís] ‘s/he is tying it’
 lengthened grade
 waná<h>j-is [wanáhjis] ‘s/he tied it (today, last night)’
 aspirated grade
 wanâ<:>j-is [wanâ:jís] ‘s/he has tied it.’
 falling-tone grade
 wanã<:~>j-is [wanã:jís] ‘s/he keeps tying it.’
 nasalizing grade

In these examples, the lengthened grade is associated with eventive aspect, the aspirated grade with the perfective aspect, the falling tone grade with the stative perfective aspect, and the nasalizing grade with the expressive grade (a grade expressing a large degree of something, sometimes equivalent to a continuative).

The infixed material or vowel length change in a grade appears in the syllable that is historically the penult of the verb stem. This continues to be the location of infixation and lengthening in Western Muskogean, Alabama, and Koasati. Due to loss of final vowels in Creek and Mikasuki, these changes now affect the final syllable of the verb stem.

For the purposes of calculating the final or penultimate syllable of the verb stem, all Muskogean languages need to make a distinction between those suffixes after the verb root that count as inside the stem (‘stem-forming suffixes’) and those that count as outside the stem (‘non-stem-forming suffixes’). For example, in the following Creek examples, the plural suffix /-ak-/ is a stem-forming suffix, but neither the indicative /-is/ nor the second-person singular Agentive suffix /-ítʃk-/ counts as stem-forming:

- (2) Creek
 wanaj-á<h>k-is.
 tie-PLUR<PERF>-INDIC
 ‘They tied it (today/last night).’
 waná<h>j-ítʃk-is
 tie<PERF>-2.SING.AGENT-INDIC
 ‘You tied it (today/last night).’

Some suffixes may require that the preceding stem appear in a particular grade. The negative suffix /-o/ in Chickasaw, for example, must appear with the preceding verb in the glottal grade, which infixes a glottal stop in the penult of the stem.

Morphosyntactic Characteristics

All Muskogean languages show verb morphology of the agent/patient (or ‘active’) type, where verbs show

different types of subject and object agreement based on the semantic roles of their arguments. In Choctaw, for example, intransitive verbs fall into three types: one type uses a morphology we can refer to as Agentive agreement, another uses Patientive agreement, and a third type uses Dative agreement:

- (3) Choctaw
 Tolo:wa-li-tok.
 sing-1.SG.AGENT-PAST
 ‘I sang.’
 Sa-lakʃa-tok.
 1.SG.PATIENT-sweat-PAST
 ‘I sweated.’
 Am-ihaksi-tok.
 1.SG.DATIVE-forget-PAST
 ‘I forgot.’

The Dative agreement type is primarily used for the subjects of some verbs of cognition and emotion in Choctaw. In addition to these types, there is also a distinct set of Agentive prefixes with negative subjects.

Although there are clear semantic generalizations about the agreement type, the system is partially lexicalized, and verbs with similar semantics may take different types of agreement:

- (4) Choctaw
 Sa-yimmi-tok.
 1.SG.PATIENT-believe-PAST
 ‘I believed.’
 Anokfilli-li-tok.
 think-1.SG.AGENT-PAST
 ‘I thought.’

There are other areas of irregularity in the system as well, such as the fact that quantificational verbs (e.g., ‘be all’) take Agentive agreement in all the Muskogean languages.

Despite the existence of active verb agreement morphology, overt noun phrases are case-marked on a nominative-accusative basis, and all subjects receive nominative case, regardless of what type of agreement they trigger.

Consider the following Choctaw examples:

- (5) Choctaw
 An-ako:ʃ John(-ã)
 I-CON.NOM John(-ACC)
 ahpali-li-tok.
 kiss-1.SG.AGENT-PAST
 ‘I kissed John.’
 An-ako:ʃ John(-ã)
 I-CON.NOM John(-ACC)
 sa-nokʃopa-tok
 1.SG.PATIENT-fear-PAST
 ‘I was afraid of John.’

In these examples, both subjects receive obligatory nominative case, though one triggers Agentive

agreement and the other triggers Patientive agreement. Accusative case marking is optional in Choctaw.

Although the division among different agreement types is complex, the morphology itself is fairly regular in Western Muskogean, Mikasuki, and Creek. Mikasuki and Creek have suffixed forms of the Agentive agreement markers and prefixed forms of the Patient and Dative agreement markers. In Western Muskogean, all the agreement markers are prefixes, with the single exception of the first-person singular Agentive suffix /-li/. Though verbs vary in which type of agreement markers they use, the placement of these agreement markers is consistent across these languages.

In Alabama and Koasati, however, the situation is much more complex, with prefixed, suffixed, and infix agreement markers. Consider, for example, the affirmative conjugation of the verb /ó:tin/ ‘to gather’ in Koasati:

- (6) Koasati
 ó:ti-1 ‘I gather’
 ó<s>ti ‘You gather’
 ó:t ‘She/he/they gather’
 ó<l>t ‘We gather’
 ó<has>t ‘You (pl.) gather.’

Kimball’s grammar of Koasati identifies 10 distinct conjugation subclasses based on the identity and position of the agreement morphology, with membership in one or another subclasses reflecting an intersection of lexical specification and verbal semantics.

Muskogean verbs may have a large number of both prefixes and suffixes. The prefixes mark subject, object, dative, and negative agreement; direction, instrument, applicative, reflexive, reciprocal, and location. A Muskogean verb may be followed by a large number of suffixes showing valence, causation, tense, negation, modality, adverbial modification, mood, and evidentiality/illocutionary force. Consider the following Chickasaw and Choctaw examples, which display some of the possibilities for suffixes.

- (7) Chickasaw
 Ak-tʃi-hiʎa- <ʔ>tʃ-o-ki-tok-aʔni.
 1.SG.NEG.-2.SG.PATIENT-dance-
 <GLOTTAL.GRADE>CAUSE-NEG-NEG-PAST-EVIDENTIAL
 ‘I must not have made you dance.’
- (8) Choctaw
 Hatʃik-im-asíʔ-ok-ʔja-k-akíli-h -ō,
 2.PL.NEG-3.DATIVE-ask-NEG-YET-COMP-EMPH-TENSE-
 PARTIC.DIFF.SUBJ
 hatʃi-ki-yat ithāna-h-o:ki.
 2.PL.DATIVE-father-NOM know.DUR-TENSE-TRUE
 ‘Even when you (pl.) have not yet asked him,
 your (pl.) father knows.’

Word Order Properties

Muskogean languages are rather consistently head-final languages: verbs are final in the clause, nouns are final in the noun phrase, and the languages have postpositions (though these may be a subtype of relational noun rather than a distinct word class). Consider the following example from Creek:

- (9) Creek
 Má tʃokó ó:fa-n apíswa-t
 that house in-ACC meat-NOM
 ó:tʃ-i:-t ó:m-i:-s.
 exist-DUR-SAME.SUBJ be:STAT.PERFECT-DUR-INDIC
 ‘There is meat in that house.’

All Muskogean languages have switch-reference morphology, in which the complementizer of an embedded clause indicates whether the subject of the embedded clause is the same as the subject of the clause containing the embedded clause.

The following Choctaw example (10) shows that same-subject marking is obligatory even in contexts where there is no possible ambiguity. The Koasati example (11) shows a nice mix of same-subject and different-subject markers from a natural discourse.

- (10) Choctaw
 Ka:h sa-banna-ha:toko:-ʃ,
 car 1.SG.PATIENT-want-BECAUSE.SAME.SUBJ
 iskali’ ittahobli-li-tok.
 money save-1.SG.AGENT-PAST
 ‘Because I wanted a car, I saved money.’
 Ka:h banna-ha:toko~,
 car want-BECAUSE.DIFF.SUBJ
 iskali’ ittahobli-li-tok.
 money save-1.SG.AGENT-PAST
 ‘Because he wanted a car, I saved money.’
- (11) Koasati
 Já:li mók itʃo:fi-k tʃokkó:li-n
 here also uncle-NOM sit:SG-DIFF.SUBJ
 kó:si-k tʃokkó:li-n
 aunt-NOM sit:SING-DIFF.SUBJ
 i<h>l-ok
 arrive<CLAUSE.SEQUENCE>-SAME.SUBJ.FOC
 ittim-mánka-to- ~.
 RECIP.DATIVE-tell-PASTIII-PHASE.TERMINAL
 ‘Here also his uncle dwelt, and his aunt
 dwelt, and he came here, and they spoke
 to each other.’

The Koasati example also shows that in some cases partial identity is enough to trigger same-subject marking. Note that in this example the verb ‘arrive’ is marked same-subject with respect to ‘speak to each other,’ though the subject of the first verb is ‘he’ and the subject of the second verb is ‘they’ – a group consisting of the subject of ‘arrive’ plus the previously mentioned uncle and aunt. Different Muskogean

languages (and perhaps different speakers of these languages) seem to follow slightly different principles in deciding whether partial-identity of subject is sufficient for use of the same-subject markers.

Conclusion

All the Muskogean languages are endangered; Mississippi Choctaw and Mikasuki appear to be the only languages that are currently being acquired by more than a few children. And even with these languages, there are indications that the percentage of children in the communities who acquire the language is declining.

The past two decades have seen many tribes recognizing the danger of language loss and initiating language preservation efforts. There have also been major strides in the documentation of the Muskogean languages, with the publication of grammars, dictionaries, and text collections. In the coming decades, the effort to document and preserve these languages will continue to be an issue of great urgency.

Na-Dene Languages

J Leer

© 2006 Elsevier Ltd. All rights reserved.

The term 'Na-Dene' was coined by Sapir (1915) in the early twentieth century to reify his proposal of a genetic affiliation between the Athabaskan language family and two northwest coast Native American languages: Tlingit and Haida. Since then, the nearly extinct Eyak language has been shown to be closely related to Athabaskan, and the inclusion of Haida in Na-Dene has come to be regarded as unprovable by most specialists in the field. The alternative hypothesis is that the similarities between Haida and Athabaskan-Eyak-Tlingit are the result of prolonged areal contact.

Language Classification and Distribution

Athabaskan-Eyak-Tlingit (AET) consists of the Athabaskan language family plus Eyak and Tlingit, contiguous languages of the northern Northwest coast. Athabaskan is located in three main enclaves: northern Athabaskan, Pacific Coast Athabaskan, and Southern Athabaskan. Most researchers agree that the last two are the result of prehistoric migrations southward along opposite flanks of the Rocky Mountains, and that the Pacific Coast migration was earlier than the Southern. Subclassification, especially in Northern Athabaskan, is rendered difficult by the fact that these languages tend to share features with their neighbors, so that it is often difficult to distinguish the inherited from the borrowed.

The Northern Athabaskan languages are spoken in the interior of Alaska and northern Canada. Neighboring the Eskimo of southcoastal Alaska are the Ahtna, Tanaina, and Ingalik; proceeding upriver Holikachuk, Koyukon, Upper Kuskokwim, Tanana, Tanacross, and Upper Tanana are encountered. The latter, together with the Han and Kutchin (or Loucheux), straddle the border between Alaska and Canada. Proceeding southward along the Cordillera, Northern and Southern Tutchone, Tagish, Tahltan,

Tsetsaut, Kaska, Sekani-Beaver, Babine, Carrier, and Chilcotin are found. South of the Beaver on the plains live the Sarcee. Continuing in an arc through the Arctic drainage area, are the Chipewyan, Dogrib, and Slavey-Mountain-Bearlake-Hare, whose languages constitute a dialect complex.

Near the mouth of the Columbia River once lived small bands collectively called the Kwalhioqua-Tlatskanai. They appear linguistically closest related to the Pacific Coast Athabaskan of southern Oregon and northern California. Oregon Athabaskan consists of languages spoken in the interior (Upper Umpqua, Galice-Applegate) and a coastal dialect chain (Coquille, Euchre Creek, Tututni, Chasta Costa, Chetco, and Tolowa). The largest California Athabaskan language is Hupa; south of this is Mattole-Bear River and the Sinkyone-Nongatl-Lassik-Wailaki-Kato dialect complex.

The Southern Athabaskan enclave is located in the southwestern United States. The largest and best-known tribe is the Navajo, who reside mainly in Arizona and New Mexico. Most of the Apache languages are geographically and linguistically close to Navajo: Western Apache, Chiricahua-Mescalero, Jicarilla, and Lipan. The most divergent Southern Athabaskan language is Plains Apache (or Kiowa-Apache), spoken in Oklahoma.

Typological Features

The most compelling evidence for AET as a genetic grouping is the profound congruity in the makeup of the verb, as seen in **Table 1** (the lines emphasize major displacements). The AET languages have a 'templatic' structure, such that each element assumes a predetermined position relative to the others. Of particular interest are the 'classifiers,' fused combinations of what were historically separate prefixes: **l-* (which forms causatives) and **də-* (which forms passives, reflexives, etc.). An ancient irregularity is the absorption into the classifier of the stative prefix **ŋi-* which combines with *(*d*)ə- to yield *(*d*) *i-* in Athabaskan-Eyak and has become a component of

Table 1 Comparison of the verb template in the Athabaskan–Eyak–Tlingit (AET) languages

the classifier in Tlingit. Verb stem variation also shows ancient similarities, including lengthened stem forms and in Athabaskan and Tlingit, shortening of the stem vowel before consonant suffixes. Haida verb structure exhibits some general similarities with that of AET; for example, the object pronouns precede the subject pronouns.

Other less specific typological traits are also common to Haida and AET; in particular, head-final syntactic structure (postpositions follow nouns; verbs generally come last in the sentence) and the lack or paucity of labial stops and fricatives. However, these traits are shared also with Aleut, a language that is incontrovertibly non-Na-Dene. It has been suggested that these languages, particularly Haida, Eyak, and Aleut, were part of an ancient northern northwest coast language area. If this hypothesis is borne out by archeological evidence, it may put to rest the controversy about the relationship between AET and

Haida: Na-Dene will prove to be an areal grouping rather than a genetic one.

Nahuatl

U Canger, University of Copenhagen, Copenhagen, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Nahuatl (Náhuatl) (by some written as Nahua, Nauatl, or Nawat) is also known as Aztec and Mexicano.

Nahuatl forms with Cora and Huichol a branch of the Uto-Aztecan family and is the southernmost language of that family. Today, Nahuatl is spoken in enclaves in 10 Mexican states, from Durango in the west to Tabasco in the east. One variety of Nahuatl, Pipil, by some considered a distinct language, is spoken in El Salvador. Some 10 dialect areas have been recognized; they are different enough that mutual intelligibility is problematic. Of the 500 000 to 600 000 speakers only few are monolinguals, and the language is rapidly losing ground to Spanish.

Speakers of Nahuatl entered Meso-America some 1000 to 1500 years ago from today's northwest Mexico. The best known group, the Aztecs, settled in the Valley of Mexico, where their traditional history goes back to 1300 A.D. It was the renown of their empire that drew the Spaniards to Tenochtitlan, the capital of the Aztec empire and today's Mexico City. As a result and due to the function of Nahuatl as a lingua franca in Meso-America, Nahuatl is the most thoroughly studied and best documented of the languages in the Americas. The earliest known grammar, by Andrés de Olmos, is from 1547; by 1645 another four had been published. Olmos's grammar and Horacio Carochi's from 1645 are exceptionally accurate descriptions of the language. Alonso de Molina's dictionary of Spanish-Nahuatl (about 17 400 entries) and Nahuatl-Spanish (about 23 600 entries) from 1571 has still not been superseded. The Spanish formed the primary target group of the Nahuatl grammars and dictionaries, since they needed to speak Nahuatl in their efforts to educate and evangelize. Faced with the multitude of languages in New Spain, they even argued that Nahuatl should be the official auxiliary language, and in 1570 Philip II declared Nahuatl the official language of New Spain's Indians. As a consequence, Nahuatl was used officially in all contexts; an abundance of letters, complaints, testaments, land

deeds, and the like, written in Nahuatl, are found in university libraries in the United States and Europe and in local archives in Mexico, where new ones emerge every year. Nahuatl is thus richly documented over a period of nearly 500 years.

Under the influence of Meso-American languages, Nahuatl has shifted away from some features characteristic of Uto-Aztecan, and the last 500 years of Spanish influence is clearly evidenced. Whereas proto-Uto-Aztecan is reconstructed as verb-final, Nahuatl has verb-first word order, modified-modifier order such as possessed-possessor order, and preposed relational nouns, some of which also function as postpositions. Due to Spanish influence, former relational nouns now function as prepositions. Nahuatl basically is a polysynthetic language with person of subject and object marked on the predicate; incorporation of object and adverbials is widespread, although rare in some dialects, probably due to Spanish influence. The verb is central in Nahuatl both syntactically and in the root corpus; adjectives are derived from verb roots; and derivation is richly developed.

Phonologically, Nahuatl is uncomplicated with four vowels, short and long; 15 consonants, no voiced stops; and currently a fixed stress on the penultimate syllable

Native American Languages

E P Hamp, University of Chicago, Chicago, IL, USA

© 1994 Elsevier Ltd. All rights reserved.

The Western Hemisphere embraces about one-half the diversity of the linguistic world. Most of the populations have been always thinly settled or small, although before the coming of Europeans, Meso-America and the Andes boasted societies of density and complexity comparable to those of the Old World. Since the history of the period after about 1600 has been one of frequent linguistic retreat in the face of European intrusion, an appreciable portion of the earlier languages, dialects, and even families has vanished from the opportunity for knowledge and our dossier, with the result that a simple catalogue shows a large gray area among the moribund, the extinct, the uncertain, and the unknowable. The total number of linguistic stocks which are believed by informed and responsible linguistic scholars to survive in the New World unreduced by late twentieth-century methods of genetic comparison reaches about six score families and six dozen isolated singletons; it is realistic to hope for a modest reduction in these numbers by the theory and method accepted in the 1990s, but it would be either foolish or revolutionary for a linguist to expect a division of these totals by anything larger than the smallest numbers.

The mere recitation of theories proposed to account for the geographic and social distributions in which these languages and stocks are found would greatly exceed the space available here. Suffice it to say that there exist in the literature (cited and referred to) theories that are better than speculative relating to the past couple of millennia and also approaching the past tens of millennia and which argue for the presence of these languages both on internal principled linguistic criteria (often fashioned on Old World models as well as modern structural and typological arguments) and on correlations with archaeology, ethnography, folklore, and cultural theory. In North America therefore the study of these languages has been closely linked with the field of anthropology, and in turn has had a strong influence on the development of the course of linguistic theory in the twentieth century.

The Size of the Problem

These languages are not only too numerous to permit a useful itemization here or even in more specialized articles, but they exemplify typologically almost all linguistic features which have been identified in the Old World, with rare exceptions, e.g., the Khoisan

clicks, the intercalated affixes of Semitic, the marathon domains of a finite verb in Mongolian discourses, or perhaps the feature/segment ratio of North Caucasus phonologies. The New World presents in addition the immense and internally complex words of Eskimo; the polysynthetic word structure (see Rood 1992) emphasized in the writings of Sapir (especially his book *Language* 1921) and found in northern North America, in Totonac, and in much of South America; and the Oto-Manguean Mazatec and Chinantec complex tone glides which englobe tonal inflexional suffixes and make highly explicit whistle speech possible. The polysynthesis has important bearing on grammatical theory by erasing or altering the boundary between morphology and syntax, a boundary which is difficult to specify or justify in diachronic linguistics; it seems rather that morphology is itself a characterizing feature of certain languages and stocks. Oto-Manguean tones, like Khoisan clicks, raise an interesting question of rarity; such features can be dismissed as atypical because rare (Rood 1992: 112), and if so one might class them as marginal to the 'universal' and 'natural' capacities of human language. Yet these may also be viewed as precious relics left behind by history to attest to and suggest further the possible range of natural language.

The explicit sentence and discourse morphologies of the Americas (quotatives, deixis, obviatives, switch reference, noun tenses), in addition to verbal morphologies (with special Northwest forms for embedded noun complements) far exceeding the categorial scope of Homeric and classical Greek, distinguish these languages as independent witnesses to the systematic refinement of the human mind, and make the rough clod of many a European word appear as a shapeless mass and intruder in a considered sentence.

The big lesson from all of this is that human language as it is known, while differing enormously from place to place and society to society in detail, seems to repeat a somewhat closed inventory of features which students of culture would define as adequate for any society of such creatures as man. There is not space here for even an outline of all the detail, and the appended bibliography should be regarded as an extension and key to indefinite elaboration of this article. This arrangement also rests on and emphasizes the conviction that science must be cumulative. The contribution of the New World has been twofold: the confirmation of Old World evidence (even down to the testimony of Egyptian and Mesoamerican inventions of writing through a progression of pictographic to logographic to syllabic to alphabetic representation) for the Jeffersonian percept of the unity

of man; and the supply of a vast wealth of detail for analysis and formulation of the diversity and flexibility possible within this unity. In the statement of the exact mechanics of the first and in the exploration of the second there remains much and urgent unfinished business for future scholarship.

Scope of this Article

This article can provide only a coarse discursive chart. The stocks are surveyed genetically because in this way one can be assured that the review is (in principle) coexhaustive. Areal analysis is valid, interesting, and important (cf. Campbell 1992, and the work of J Sherzer for North America), but such study, classic in the Balkans and the Caucasus, is grossly deficient as yet in the Americas, and such an aspect as a basis does not assure total coverage of the subject in a limited space. The recitation of typology is necessarily eclectic; and the reader is referred to the bibliography which will also reflect the evolving views of linguistic theory.

The coverage here of the various stocks varies. Some have been voluminously studied, and the interested reader can get information in appropriate detail elsewhere; the separate articles in this Encyclopedia will supply what is not repeated here, and the bibliography is meant to lead successively to the fuller literature – that is the main reason for some titles. Greater detail (in brief) is given for some stocks not represented by separate articles. For reasons which will become clear below, the stocks of South America are not treated with comparable completeness and fullness. Close geographic location is not given here; space forbids the necessary verbosity, and sufficiently detailed maps are voluminous and hard to read. Ethnographic maps may be used, but one must remember that tribe or social unit is not language. No inventory of the hundreds of separate languages is approached here; many exact and complete listings are included in the bibliography.

The Identification of Linguistic Stocks

The classifications which have been made for these languages naturally reflect the development of orderly principles which has unfolded in the history of linguistics during the nineteenth and twentieth centuries, a time span which happens to coincide with the growth of serious knowledge and census-taking of languages and societies in aboriginal North America since the expedition of Lewis and Clark dispatched by Thomas Jefferson in 1804–06, the first systematic inventory and collection of languages and data. The nineteenth century was largely occupied with simply collecting,

discerning, and sorting the varieties and with describing grammars and compiling dictionaries and glossaries only for languages of white man's closest contact. The collection and census activities have continued with increasing refinement and changing emphasis down to the present; in the late twentieth century a new interest has grown in the presentation of exact and analyzed texts. While several nineteenth-century grammars are valuable as working tools to this day, it is the twentieth-century North and Middle American production of descriptive Native American grammars and topical articles or grammatical segments that has drawn widespread attention and interest in the world of linguistics; indeed many of these have been models and proving grounds for theory making.

The earlier classificatory work in the nineteenth century had a minimal theoretical basis and relied heavily on vocabulary inspection, not through naïveté and neglect of reflection but from a misguided report that all American languages shared the same grammatical peculiarities. Thus the work of Duponceau (1819), Gallatin (1836), and Trumbull (1876) was scarcely touched by the emerging comparative method of Europe. Though Daniel G. Brinton presented a careful inspectional survey in 1891 in which he put the inventories of families at about 80 for each of North and South America and from which all later South American classifications in some measure derive, he did not, unfortunately, have access to the contemporary classification of Powell (1891), a geologist and army man aided by the ornithologist. H. W. Henshaw in most of his decisions, an inspectional lexical classification into 58 families none of which has since needed to be dismantled but a classification without analysis and nearly without any more linguistic theory than common sense.

Then, in the twentieth century, more abstract modes of comparison have been attempted, progressively exploiting more complete and detailed descriptive grammatical knowledge. Notable in this reduction of claimed familial stocks is the proposal of Sapir (1929) with six phyla for all of North America: Eskimo-Aleut, Na-Dene, Algonquian-Wakashan, Aztec-Tanoan, Penutian, Hokan-Siouan. To arrive at these Sapir drew on the comparative method, which he understood well, extended by single abstract paired features (e.g., in Penutian), by typology (in Na-Dene and Hokan), by intuition from his vast first-hand fieldwork contact (Algonquian-Wakashan), by geography (Hokan-Siouan, Athabaskan), by ignoring remainders (e.g., Keresan, Yukian). Further attempts were made to manipulate these, e.g., to reattach Algonquian and the Southeast US (including Muskegean) languages; the latter pairing unfortunately failed to adduce multiples of the claimed phonetic

correspondence sets. Hokan comparisons were flawed by unmotivated deletions in the phonological strings within lexical comparanda. Abandoning these reductionist attempts, since the mid-1960s specialists have favored less speculative groupings: Voegelin and Voegelin published in 1966 a map based on a 1964 conference which is reflected in Bright (1974), and which returned to about 15 stocks (repeated in Sebeok 1973) shown in Bright as 7 phyla and 9 individual families (including isolates), the phyla closely matching Sapir's six (for a later version see Voegelin and Voegelin 1977). A further conference in 1976 produced Campbell and Mithun (1979), which is reflected in Rood (1992), where about 60 families are recognized for North America, of which about 37 lie west of the Rockies. These families are almost all formulated on criteria invoking the comparative method; Sapir's phyla, and their revisions, rest, per contra, on the hope that ultimately the comparative method, in some refined version, may confirm those conjectures. In the 1990s, if the comparative method will not apply, i.e., show a unique result, one cannot assert a genetic relation.

Because the North American stocks, especially Uto-Aztecan, form a continuum into Middle America, they are here considered together. Therefore, added to the ± 60 of North American are the 3 Middle American families (Oto-Manguean, Mayan-Mixe-Zoquean, and Totonacan) and half-dozen isolates (Ta'arascan, Huave, extinct Cuitlatec, Xinca, Tequistlateco, and Jicaque).

For South America the pure survey work is not yet finished; yet languages are dying out, and the situation is urgent and grave. This inchoate stage of scholarship is reflected in authoritative accounts: Manelis Klein (1992) mentions 32 families and 74 singles, while Kaufman (1990) meticulously discusses about 60 families (agreeing closely with Loukotka 1968) and 60 singles. One cannot further compress their compact arguments, but the complexity and sheer bulk of the problem, and the need to distinguish knowledge from simplistic ignorance, is apparent.

In the late 1980s there appeared (Greenberg 1987) a proposal, adumbrated in earlier publications, to reduce the stocks of the New World (and even Old World phyla) to but three: Eskimo-Aleut, Na-Dene (including the disputed isolate Haida), and Amerind (all the rest). This is really not a proposal comparable to accepted work in genetic and diachronic linguistics; the earlier long-range comparisons of Swadesh were different in detail and in principle, being rather a bold and radical extension of Sapir's reasoning. No one who knows the data and the literature doubts the unity of Eskimo-Aleut, and of Athabaskan-Eyak with Tlingit (especially with the Tongass dialect

prosodics in relation to AE tones, which effectively eliminates any possible direct relation to Sino-Tibetan). Greenberg's proposal is therefore simply the insistence, in a naïve version, of Duponceau, et al., that all languages in this chosen area are related, and are to be called 'Amerind'; the criterion invoked is just subjective partial phonetically uncritical similarity with no constraints of the degree demanded, e.g., by the comparative method.

The Stocks of North and Middle America

Eskimo-Aleut

This compact family occupying the Arctic coast and adjacent islands from easternmost Siberia eastward to include Greenland shows a considerable time-depth of divergence between its two main members. It includes a recognized national language in Greenland, official regional languages in Canada (with its own syllabic script) and Alaska, two very different Eskimo languages in Alaska, and a distinct regional variety in Siberia. It is likely though not yet shown conclusively that this family is related as next of kin to the Luoravetlan languages of eastern Siberia and a relation has further been argued, on the basis of carefully sifted data, with Yukagir and Uralic. Considerable scholarship exists correlating this linguistic family with findings of archaeology. It is reasonable that this family arrived in the New World having crossed the Bering Strait separately.

Na-Dene

The Athabaskan (or Athapascan) family is known in great detail, and reconstructions of its forms and grammar are comparable to those of Indo-European and Romance, which is not the case with Eskimo and Aleut. The Navajo-Apache branch in the Southwest US and the Pacific Coast branch in Oregon (extinct) and in northwesternmost California may be viewed as outliers to the Northern branch in interior Alaska and northwestern Canada; Sapir constructed a classic proof of the northern origin of the Navajo. Eyak, now extinct, was described in ample and modern fashion by salvage work with the last three speakers, and proves invaluable as a sister branch to all of Athabaskan. Tlingit still presents problems of exact comparison analogous to those found in Altaic.

Algonquian

Algonquian is the most completely known family of the New World, with extinct languages of Eastern Algonquian on the Atlantic seaboard shedding light on facts from the time of first British and French contact yet raising philological problems from those

early records. Analogues to the reconstruction of Indo-European have been practiced on Algonquian, including the beginnings of sophisticated dialectology for Cree and Ojibwa and the reconstruction of a Heimat in the southern Ontario Great Lakes region. Much to most linguists' surprise Sapir's conjectural hypothesis that diminutive Wiyot (now extinct) and Yurok on the north California coast are each related to all of Algonquian proved correct; this three-branch family may be called 'Algic.' Ritwan does not name a genetic unit. The internal subgrouping of non-Eastern Algonquian is not at all clear or agreed.

Iroquoian

Also very well known from colonial times, Iroquoian has been admirably studied, and falls neatly into a Northern branch and the southern Cherokee. There are strong suspicions that Iroquoian is related to Siouan and Caddoan, and perhaps even to Yuchi, but no firm proof has yet been offered. The fact that Sequoyia, a Cherokee, invented a syllabic writing does not help philologically, but adds to the dossier of graphic invention.

Siouan and Caddoan

These groups share the Great Plains north of Texas, and Siouan also occupies, or formerly occupied, eastern Wisconsin and portions of the southeast US. Catawba, in the Carolinas, certainly forms a distant separate branch, but the subgrouping of the other Siouan branches is still not sure: the southeastern, or Ohio Valley, branch comprised Ofo, Biloxi, and Tutelo; the Missouri River branch embraces Crow and Hidatsa; and the Mississippi Valley branch all the other languages, including Dakota, Chiwere, and Quapaw. Siouan, on which the late twentieth century has supplied great gains over earlier scholarship, is notable for its suppletion between singular and plural.

Caddoan

Neglected until the late twentieth century, Caddoan comprises Pawnee, Arikara, Caddo, and Wichita. The last of these presents one of the lowest phoneme counts in the world (for a convenient example of polysynthesis by a specialist in Wichita see Rood 1992: 113).

Muskogean

Although the subgrouping of this family, which was located entirely within the southeastern US before displacements to Oklahoma by the European immigrants, is not yet decided, the relation of Choctaw-Chickasaw, Alabama-Koasati, Hitchiti-Mikasuki, and Creek (including Seminole Creek) is assured by exact and sophisticated reconstruction. Whether a

'Gulf' unity may be approached by the attachment of Natchez has not yet been demonstrated. Even less convincing is the genetic addition of the isolates Tunica, Chitimacha, Atakapa, and Yuchi of this south-eastern area, of the extinct but philologically documented Timucua in Florida, and of Yukian (including Wappo) in coastal California, all of which Sapir attached to his 'Siouan.' In fact the case for Yuchi looks slightly more hopeful than the others.

Keresan

Keresan comes from of the pueblos of New Mexico; it was also included by Sapir in his 'Siouan' on evidence that would not convince many in the early 1990s.

Salish or Salishan

This is a compact family of two dozen languages extending along the Pacific coast northward from Oregon through the southern half of British Columbia and inland into the Rocky Mountains; these languages, typologically similar, show about the degree of divergence seen in Romance, and have been admirably explored and documented during the last third of the twentieth century. Many now have grammars and dictionaries. The subgroups are: the northernmost Bella Coola in coastal British Columbia, which is a sibling to all the rest; Coast Salish, with about ten languages; the now extinct Tillamook in Oregon, which lacks labials; Tsamosan, comprising two groups, Upper Chehalis and Cowlitz, Quinalt and Lower Chehalis; and Interior Salish, with a Northern branch comprising three languages including Shuswap and Lillooet, and a southern branch of four including Kalispel and Coeur d'Alene. Bella Coola permits syllables and sizeable words with no vowels; some of these languages rank next to the Caucasus in number of consonants and richness of simultaneous combinations of distinctive features. An interesting rarity found in Interior Salish is glottalized sonants. The comparative morphology of these isomorphous languages is fairly straightforward and conducive to elegant refined formulation; good progress has been made with comparative syntax.

Wakashan

Wakashan is a small but intensively and long-studied family. There are only a half-dozen languages in the Vancouver Island region, divided into a Northern or Kwakiutlan branch and a Southern or Nootkan one; these branches are not quite so different in their divergence as Indo-European branches are. An intrinsic interest in the scholarship of Wakashan is that it has attracted the attention of Boas, Sapir, and Swadesh as well as fine contemporary scholars. The phonology of

these languages includes a rich array of laryngeal and pharyngeal phonemes; much of the talk of complex Amerindian morphology, of the alleged gray area between the classes noun and verb, and of the character of Amerindian lexicon which is strange to Europeans has come from the study of Wakashan. To appreciate these claims and their truth or traditional fiction a linguist would do well to study both the earlier and ongoing scholarship on this family.

The Chimakuan family on the Olympic peninsula in the state of Washington consists of only the extinct Chemakum and the moribund Quileute. Attempts so far to connect Chimakuan and Wakashan lead perhaps more to old loans and contacts than to genetic relation. It was long attempted to unite Chimakuan, Wakashan, and Salishan under the name 'Mosan' (from the numeral '4'); certainly some features, such as the presence of the so-called 'lexical suffixes' (as verb complements), appear as encouraging comparanda, but they may well be simply Sprachbund diffusional traits. A few numerals will hint at the difficulties:

| | | | | | |
|-----|----------------------------------|----------------|-------------------|--------------------|---------|
| '2' | <i>Chim.</i> *+aʔ(a)kw(a) | <i>Nootk.</i> | ʔaχ-a | <i>Sal.</i> | ʔsa:l- |
| | | <i>Kwak.</i> | m(a)ʔ(a)† | čũ- | tVq- |
| '3' | <i>Quil.</i> q ^w aʔal | <i>Nootka-</i> | qakč̣a | čan, | |
| | | <i>Nit.</i> | | | |
| | | <i>Makah</i> | wii | †ex ^w , | čʔ+V(?) |
| | | <i>Kwak.</i> | yudx ^w | | |
| '4' | <i>Chim.</i> *maʔ(a)yas | <i>Wak.</i> | *muy | mu:s | |

Penutian

Penutian is the name which has been applied to a set of languages embracing central California, much of Oregon and southern interior Washington, Tsimshian in coastal northwest British Columbia, and Zuni in western New Mexico (these according to Sapir's classification), to which have been added at times Mixe-Zoquean, Totonacan and Mayan, which here shall be kept separate. In the later twentieth century many of these, mostly in Oregon, have been extinct, but fortunately they were largely competently documented, if to a limited degree and quantity; for example, Sapir's classic work on Takelma and material still to be published on Kalapuya. Thanks to enormously copious, detailed, and accurate work of the second half of the twentieth century we are increasingly well informed on the surviving languages, so that the position can now be surveyed, if not with certitude, at least with competence and focus not possible in the first quarter of the twentieth century. California Penutian (Miwok-Costanoan, Wintun, Maiduan, Yokutsan, all with numbers of small languages, and probably Klamath-Modoc in southern Oregon) certainly makes up a family. The unity of Takelma-Kalapuya and Coos with Alsea-Siuslaw as Oregon Penutian is

less clear; the relation of Chinook and Sahaptin-Nez Perce to an Oregon Penutian unity can be rated only as probable. A Plateau Penutian with Cayuse and Molale is not very clear at all, while the relation of Tsimshian to all of these remains as yet unclarified or even undemonstrated. A relation of Zuni to California Penutian has been asserted, but there is no sign that this claim has met with significant acceptance.

The languages and branches mentioned above present a highly varied typology, and it seems scarcely possible that many valid relations could be discovered by simple inspection without searching grammatical analysis and the formulation of well motivated structural interstages. Some of the members of California Penutian show inflectional paradigms and word shapes that look startlingly like Indo-European, while to the north one encounters specimens of surface structure from another world. The problem of Penutian remains complex and diffuse.

Uto-Aztecan and Kiowa-Tanoan

The unity of the much studied and restudied widely dispersed and highly diverse Uto-Aztecan, extending from Yellowstone Park in Wyoming to the Aztec empire (including Nahuatl and Pipil in Mexico and Central America), cannot be called into question. The unity of the small compact family comprising Kiowa of the Oklahoma Plains and Tanoan (Tiwa, Tewa, and Towa), sharing the New Mexico pueblos with Zuni and Keresan, is likewise assured. But the Aztec-Tanoan relation which has been claimed is not on the same level of certitude. The political importance and vast scholarship attaching to Nahuatl places this language in a different class of cultural interest from all except a few of the other languages discussed in this article.

Hokan

Perhaps even more than Penutian, Hokan is a problematic proposed stock; the name has been applied to a large number of languages and small-to-modest sized families in the western margin of the continent from northern California south to Oaxaca; Sapir's classification included even more, notably so-called 'Coahuiltecan,' of northern Mexico and adjacent Texas, and even attempted to attach Siouan. Here one can attempt to do little more than inventorize the groups that can be discerned among these sharply divergent language structures.

The Yuman family of southern California, Arizona, and Baja California is well understood and has been admirably researched in the second half of the twentieth century; likewise the Pomo family of the coast north of San Francisco has been probingly studied, and it seems likely that these two are related. It is also

claimed that Seri, on the northwest coast of Mexico, and carefully studied, is related to these. Further possible members of uncertain kinship as yet, are found in California (all but three of these are now extinct): Karuk, Shastan, Palaihnihan (two languages), Yanan, Chimariko, all in northern California; Washo, on the Nevada border; Esselen, Salinan, Chumashan, on the southern California coast.

The allegiance of Tequistlatecan is still moot.

Isolates of southern Texas and Mexico

In southern Texas and adjacent Mexico there was a string of languages, now extinct, which used to be assigned to Hokan, but are now probably to be regarded as isolates or simple relics: Tonkawa, Coahuilteco, Karankawa, Comecrudan, Cotoname, Solano, and Aranama.

North American Isolates Resisting Affiliation

Isolates of North America which should not be overlooked are Haida on the Queen Charlotte Islands and Kutenai of the Idaho-Canada border, both well studied; and the extinct and obscure Beothuk of Newfoundland.

Mayan and Mixe-Zoquean

The large and compact Mayan family of southern Mexico and Guatemala is one of the best studied language families in the world, with much ongoing research continually reported on; it would be absurd to pretend to outline or indicate this vast terrain of activity in the present inventory. A unique feature of this New World family and of the last half or third of the twentieth century is the writing system, its decipherment, and the correlation made between the dialectology of this koinē writing and the surviving spoken languages. The decipherment of Middle American writing gives nearly two millennia of linguistic history, apart from the content of the texts.

The Mixe-Zoquean family, with approximately 90 000 speakers, seems to be relatable to the nearby Mayan family. The decipherment in 1992 of the 159 AD proto-Zoqueanda Mojarra stele, which antedates Maya inscriptions and possibly reflects Olmec culture, surprisingly has pushed back the history of New World writing.

Totonacan

Totonacan is a family of just two languages on the eastern coast of Mexico, with highly agglutinative structure; Totonac numbers 265 000 speakers, and Tepehua 8000. It has been suggested that Totonacan is related to Mayan (for documentation see McQuown 1990).

Oto-Manguean

This family, poorly investigated until around 1940 had become extremely well surveyed and basically described and outlined by around 1970; since then much descriptive detail has been filled in, although the complexity and number of these languages and dialects leave much essential work still to be done, and comparative work has been less active since around 1975. The record of work and publication is, however, formidable and inspiring. Oto-Manguean is a completely Middle American family, perhaps the oldest established one; its typology is highly original and distinctive; the languages are many, divergent, and demanding of careful analytic concentration; the scholarship has shown resourcefulness and great diligence. Oto-Manguean is the only known stock in the New World that shows a degree of divergence with a number of branches comparable to that of Indo-European. The amount of time mentioned above for the exploration of this family gives a notion of the scholarly achievement which is found here.

Except for Otopamean, which is found in central Mexico, this family is located largely in Oaxaca. The branches, some with a dozen or so languages each, are:

- a. Chiapanec-Mangue (extinct, in Chiapas, and Nicaragua and Costa Rica; two languages);
- b. Otopamean: Otomian (one-half million speakers; Mazahua and Otomi), Matlatzincan (2000 speakers; Ocuilteco and Matlatzinca), Pame (4000 or 5000 speakers; North and South), Chichimeca Jonaz (1200 bilinguals);
- c. Mixtecan: Mixtec (285 000 speakers), Cuicatec (20 000 speakers), Trique (16 000 speakers);
- d. Zapotecan: Chatino (32 000 speakers), Zapotec (many languages);
- e. Popolocan: Mazatecan (120 000 speakers, many varieties with a complex dialectology already studied), Chocho (2500 speakers), Popoloca (at least 10 000 speakers), Ixcatec (one or two speakers in 1969);
- f. Chinantecan: 60 000 speakers, a dozen varieties;
- g. Amuzgoan: 30 000 speakers in three varieties;
- h. Subtiaba-Tlapanec (the first extinct, in Nicaragua; the second 40 000 speakers in Guerrero): disputed as being Hokan.

As yet there is not a satisfactory subgrouping for these branches. Probably the most remarkable single feature of almost all these branches is the complexity of their tonal systems, which often participate in an intricate way in their inflectional systems; added to this may be a set of involved morphotonemic rules.

Tarascan

Tarascan is an isolate in Michoacán spoken by over 60 000, for which a descriptive sketch will be found in Edmonson (1984).

Remaining Isolates

Remaining isolates in Middle America which are not attached linguistically to South America are Huave, in the Isthmus of Tehuantepec, with 6000 speakers; Cuitlatec extinct in Guerrero; Xinca, which has been overrun by the Maya; and Jicaque, of Honduras, which does not belong to the Mesoamerican Sprachbund (on the Central American languages that form a transition to South America see Craig 1985).

The Stocks of South America

The problem of simply inventorizing the stocks of South America has already been raised in Sect. 3 above. There is no point in further belaboring the predicament in presenting an intelligible and coherent picture at this juncture of fact-gathering activity. Fundamentally, more field data is needed, more descriptive analysis, more basic lexica, more dialectology – all of this simply to know what is being counted. Then there must follow a redoubled effort at linguistic comparison, using areal analysis and typological criteria as heuristic controls in order to identify by elimination the probable inheritances. In that process of comparison it must be hoped for an acceleration of responsible discovery comparable to that chronicled for work in Siouan, Salishan, Penutian, some parts of Hokan, and especially Oto–Manguean.

It is estimated that in the whole of South America, of the approximately 500 languages spoken at the time of European contact about 300 survive. For a critical discussion of the present status and the task ahead, and for an explicit inventory of the results of such a criticism Kaufman (1990) is the most useful and most objective resource. At the end of the twentieth century the clearest presentation of stocks which have been discerned is an areal one, based on simple geography.

Lowland South America

This area presents the largest number of stocks which have been identified and reasonably delimited up to the early 1990s; it includes the complex region known as ‘Amazonia.’

In the north and verging into Central America one finds Chibchan. A very widespread family is Arawakan, and another that is prominent is Cariban. An hypothesis also exists that Tupian is related to Cariban. Towards the Andes is the Panoan family.

An important but smaller family is Tukanoan. And the exact constitution still needs to be established for Gê (Jê), or Macro-Gê.

The Southern ‘Cone’ Area

This southern portion of the continent is characterized by far greater linguistic fragmentation – either by virtue of our ignorance or in terms of multifarious small residual stocks and isolates. Some families that can be named here are Araucanian, Chon, and Guaycuruan. The large, important and widespread Guaraní language, which is official in Paraguay and spoken also in surrounding territories, is particularly to be noted; and along with this compare also Tupi.

Languages of this area are still becoming known thanks to the welcome increase in the mid- to late twentieth century in descriptive work by well-prepared linguists.

The Andean, or Highland Area

As a result of events, mainly conquest, both before and after the coming of the Europeans the linguistic complexity of this area is much smaller in terms of languages than that of the other areas, but it is correspondingly greater in terms of geographic and social dialectology.

Two languages dominate attention in this area, Quechua (or Quichua) and Aymara. These two typologically form a linguistic area, along with others, and have in the past been wrongly claimed as kindred members of the same stock. It is now clear to competent scholars that Aymara, with around two million speakers, is to be classified with Kawki and Jaqaru in the Jaqi family, while the giant Quechua, with around ten million, must remain for the time being classified as an isolate.

In the earlier colonial period Puquina, now extinct, was important.

Comparatively well studied among the small surviving languages are the pair Uru and Chipaya in Bolivia.

For the remainder of an ongoing task the reader is referred to the references in the bibliography.

Native Languages of North America, Variation in

S Trechter, California State University,
Chico, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

The concept of variation has framed discussions of Native North American linguistics from its beginnings. In his introduction to the *International Journal of American Linguistics* in 1917, Franz Boas summarized what direction such a journal should

take toward further understanding of the complexities within and the relationships between American indigenous languages. His outline and exhortations serve to broadly define the scope of linguistic variation for indigenous language study: for the purposes of dialect and language identification, linguists should extend their examination beyond lexical cognates and sound correspondences to an analysis of morphological variation existing in polysynthetic languages. Recognizing linguistic change induced by daily contact with

speakers of European languages, comparison across generations would be vital. Particular attention should be paid to examining the variation that occurs between different genres of speech from conversation to folktales to ritual performance in order to capture lexical variety as well as literary convention. The linguist should be aware of not only individual variation such as that associated with a poet, but also the types of variation that may be conventionalized across particular groups of people. Such a broad focus is more akin to ethnography of speaking than mere study of variation, and this focus is integral to research in Native North American languages.

Much indigenous language variation is overtly recognized as a genre or identity marker by community members, rather than the minute, subconscious indicators of gender, class, and ethnicity described in the study of more widely spoken languages. As a personal characteristic of everyday speech, variation indicates a particular position taken by a speaker with respect to his interlocutors in a context. Some indicators of a speaker's identity may be less contextually malleable than others – such as regional background. Other variations that occur may indicate personal characteristics of the speaker or addressee (gender, age, physical handicaps) or intentional affect. Interestingly, though such 'exotic' forms have often been attributed to North American languages, they are not typically categorical. They are often associated with specific genres of speech or circumstances and give rise to a variety of expressive nuances. Finally, some variation is almost completely determined by genre, such as ritualistic or shaman's language, announcements, prayers, and folktales, rather than the identity of the speaker. However, speakers' abilities to engage in certain kinds of formalistic language may also indicate something about their overall position in society and certainly their position of authority in a ritualistic context. Despite language attrition, which affects all kinds of language variation, Native North America is rich in linguistic variety and the variation exhibited.

Regional Dialects and Mutual Intelligibility

Given the large number of languages, approximately 300 north of Mexico, determining the difference between dialects and languages and their similarities is a process of constant revision. Many languages such as Yuchi, Zuni, or Takelma are apparent isolates. Others, however, are parts of extensive dialect continua, such as Ojibwe (Ojibwa) (Algonquian), Western Apache (Athabaskan), Straits Salish (Salish), or Dakota (Siouan). The variation that exists from one

community dialect to the next can be an important marker of ethnic identity, and where this ethnic distinction is particularly emphasized, some speakers may be willing to sacrifice mutual intelligibility with other dialects to maintain their distinctiveness. In such circumstances, native speakers are quite willing to criticize each other for mixing forms from another dialect or language, or for innovating too much. The languages of the pueblos in the southwest are particularly famous for such emphasis on linguistic purity. The Arizona Tewa (Kiowa-Tanoan) strongly proscribe language mixing in *kiva* speech and overtly maintain that Tewa is 'pure' despite multilingualism and continual contact with the Hopi (Uto-Aztecan) for the past 300 years. Indeed, there are almost no adoptions of vocabulary from Hopi into Tewa, but there appears to be considerable influence from Hopi phonology and grammar. Likewise, the White Mountain Apache claim their linguistic separation along a dialect continuum from Navajo to other Western Apache dialects from Tonto/Camp Verde-White Mountain-San Carlos through overt comments about mixing:

That's the way that they talk at San Carlos . . . that's not our word, that's a Navajo word . . . when he goes to Camp Verde he comes back and says things like they say things. That's wrong, we don't say them like that over here. He needs to stay in one place. (Greenfield, 1999: 375)

In other dialect continua, such as among the Creek (Muskogee) (Muskogean) of the southeastern United States, Dakota (Siouan) of the Great Plains of the United States and Canada, or the Ojibwe (Algonquian) in the Canadian regions of the Great Lakes, strong phonological or lexical shibboleths are noted or occasionally mocked when a speaker moves from one community to another, but there is more tolerance for mixing. Attitudes towards archaism, purity, mixing, and new languages are as varied as the dialects themselves.

Assessing Variation

Native speaker judgments concerning dialect mixing are of some use in establishing what should be counted as variation between dialects; yet native speakers tend to focus on a limited number of shibboleths as markers of linguistic or social identity. The fast and dirty nature of some early linguistic studies in Native North America has also promulgated certain misconceptions concerning dialect differentiation, and linguists are continuing their efforts to document basic regional dialect differences. Regular differences in vocabulary and pronunciation are still the starting points for this effort.

Sound and Lexicon

The dialects of Sioux (Dakota), which are spoken in the Great Plains of the United States and Canada, form a well-established dialect continuum. This continuum has been mistakenly broken into three distinct dialects based on a regular pronunciation difference that is apparent in the word for 'Indian': *lak^hota* – Teton, *dak^hota* – Santee, Sisseton, *nak^hota* – Yankton-Yanktonai, Assiniboine, and Stoney. Based on such linguistic division, natives have sometimes categorized each other along the same lines. A cursory examination, however, reveals this categorization to be inaccurate. Parks and DeMallie's report of their recent dialect survey revealed considerably more phonological variation for /l, d, n/ among the dialects, such as in the diminutive suffix and the word for 'little' (see Table 1). A better phonological diagnostic is in fact the pronunciation of the first consonant in a cluster when the second is a sonorant, as in *hnayā* 'cheat.' They concluded that phonologically Yankton and Yanktonai (Minnesota, Nebraska, Saskatchewan), rather than being n-dialects, are closer to Santee-Sisseton (Nebraska, Minnesota, North Dakota, Manitoba, Saskatchewan) than to Assiniboine (Saskatchewan, Montana). Stoney (Alberta), because of its vast difference phonologically and lexically and the influence of Cree (Algonquian) grammar, is a separate language from the others in the continuum.

Grammar

Although traditional phonological comparisons of lexicon and morphological affixes are indispensable for establishing dialect differences, Valentine has recently asserted that the incorporating nature of many indigenous languages offers a unique opportunity to trace variation within a dialect continuum and better understand similarities. The eight dialects of Ojibwe (Algonquian), spoken from Quebec to Saskatchewan, demonstrate considerable lexical variation because of the complex structure of their incorporating verbs. Verbs contain at least three basic slots: initial, medial, and final. For one verb, both the structural

components filling these slots and lexical variation within the slots may occur. Among the Ontario dialects, the animate intransitive body part verb *ozhaawashkoshkiinzbigwe* 'have blue eyes' (Lake Nipigon) differs considerably although the initial, 'blue/green,' is the same (see Table 2). Tracing such complexity of variation is a fruitful direction for languages that become increasingly better documented.

Intergenerational Variation and New Language

Numerous linguists have commented on the difficulty of creating adequate descriptive grammars and dictionaries for languages, partly due to the amount of variation that exists between regional dialects and due to variable use, but also because of intergenerational shift. Such complexity is magnified in contact language situations, where intergenerational language attrition can be quite dramatic. Linguists of Boas's generation encouraged researchers to work with older, more expert speakers in order to have good comparative data, but as language attrition, maintenance, and revitalization have become part of the accepted reality of most linguists working in the Americas, focus has shifted to better understand variation caused by language attrition. It is now a type of variation not only associated with language death, but as vital to accounting for language revitalization.

In a comparatively early study, Hill traced the grammatical reductions in two southern California languages, Luiseño and Cupeño (Uto-Aztecan), demonstrating that in a 40-year period, speakers' grammar became increasingly more predictable as they displayed less subordination and came to favor shorter sentences. Cook, however, has observed the double nature of variation induced by language attrition: it tends to reduce the phonemic inventory, grammar, and stylistic options for individual speakers, but simultaneously the language on the whole exhibits more variation because the idiolects of semispeakers display a range of such reductions. Instead of speakers 'reducing' linguistic variation, they are in fact

Table 1 Sioux dialects

| | | | | | |
|-------------|---------------------------|--------------|-----------|-----------|---------|
| Teton | <i>lak^hota</i> | -la | tjistila | gla | gnayā |
| Santee | <i>dak^hota</i> | -da, -dā | tjistina | hda | hnayā |
| Sisseton | <i>dak^hota</i> | -na | tjistina | hda | hnayā |
| Yankton | <i>dak^hota</i> | -na | tjistjina | kda | knayā |
| Yanktonai | <i>dak^hota</i> | -na | tjistjina | gda | knayā |
| Assiniboine | <i>nak^hota</i> | -na | tjusina | kna | knayā |
| Stoney | <i>nak^hoda</i> | -n | tjusin | hna | hnā |
| | 'Indian' | 'diminutive' | 'little' | 'go home' | 'cheat' |

(Adapted from Parks and DeMallie, 1992.)

Table 2 Polysynthetic variation in Ojibwe

| Dialect/Location | Initial | Classificatory medial | | Body part medial | Final |
|------------------|------------|-----------------------|--------|------------------|----------|
| | 'blue' | augment | liquid | 'eye' | act.intr |
| Wikwemikong | oʒa:wafkw- | -a: | -gam- | -i:ngw- | -e |
| Lake Nipigon | oʒa:wafkw- | | | -fki:nʒigw- | -e |
| White Dog | oʒa:wafkw- | | -gam- | -fki:nʒigw- | -e |
| Northern Ojibwe | oʒa:wafkw- | -a: | -gam- | -dʒa:b- | -i |
| Severn Ojibwe | oʒa:wafkw- | | | -dʒa:b- | -i |

(Adapted from Valentine, 2002: 91.)

caught at various stages of incomplete language acquisition. Cook maintained that the younger speakers of Sarcee (Sarsi) (Athabaskan) and Chipewyan (Algonquian) in western and northern Canada are speakers of 'dying' languages and therefore have a wide variety of innovations, archaisms, and phonological idiosyncrasies.

There is a fine ideological line between the speakers of a 'dying' language and those of a 'new' or 'revitalized' language although they may demonstrate the same phonological and structural reductions in addition to the variation typical of nonnative speakers. Recently, in a standard study of the regional dialects of Straits Salish (Salishan) spoken north and west of Puget Sound in Washington State and British Columbia, Montler grouped the dialects into two separate languages based on their nonmutual intelligibility: Klallam with three dialects and Northern Straits – a continuum of Sooke, Songish, Saanich, Lummi, Samish, and Semiahmoo. This classification is largely based on differences and similarities in lexical items, phonology, person marking and reduplication, demonstratives, and second-position enclitics. However, in Northern Straits, intergenerational variation within one family is as great as any variation from one dialect to the other. For instance, younger Saanich speakers tend toward periphrasis to express diminutives rather than reduplicating by adding /-C₁ə-/ after the first stressed syllable: /məmim'ən sɬénət/ 'small stone' instead of /sɬənɬénət/. When younger speakers do use reduplication, they display the greater individual variation described by Cook by either regularizing (as seen below) or exaggerating through additions of too many syllables:

Younger: ʔiləqsən 'point of land' ʔəʔiləqsən 'small point of land'
 Older: ʔiləqsən 'point of land' ʔəʔələqsən 'small point of land'

The greatest amount of innovation is seen, however, among new speakers of revitalized languages – New Lummi, New Saanich, and New Klallam (Clallam) – in which some speakers are very fluent. These varieties are growing through language revitalization efforts, and display even more of a tendency

to periphrastic structures as lexical suffixes are eliminated and verb paradigms are leveled. Phonologically, there is extreme change with the loss of glottalization on sonorants and some obstruents, vowel epenthesis in some clusters, and a shift toward more English-like sounds: /q/ becoming /k/ and /tʰ/ becoming /kʰ/ or /kl/. These are not symptoms of language death, but endemic of revitalization efforts as monolingual English speakers acquire an ancestral language.

Personal Indicators in Speech

It is somewhat common throughout the world's languages to modify the speech of direct address to demonstrate respect by modifying vocabulary, or using morphological plurals or passives to create a 'distancing' effect. Similar modifications are made in addressing strangers or in-laws in several indigenous languages such as those of northern California and Navajo (Athabaskan). Such accommodations in the presence of addressees serve to indirectly index their respected position in a speech event. Some indigenous languages of the Americas extend such indexicals to allude to specific or personal information of speech participants or when describing others. This is accomplished through a variety of manipulations of sound symbolism, lexicon, morphology, and phonology. The kinds of information expressed include specific physical characteristics or types of speech associated with certain characters in folktales, affection displayed toward younger or cute addressees, and the gender of the speaker and/or addressee.

Folk Characters and Abnormalities

Characters in folktales such as Coyote, Grizzly Bear, Mountain Lion, or Rabbit often have specific speech styles such as lisps, consonant substitutions, and frontings, or prefixing of certain sounds (see 'Special language' in Mithun, 1999 for a detailed overview). In Takelma (Oregon isolate), Dell Hymes argued such features are not used across the board but expressively to associate specific contextual qualities with the folk characters. Although Grizzly Bear speech in Takelma is well-known for /h/-prefixing, this is only

done to indicate coarseness, stupidity, disdain, and distance. Likewise, indicators of physical or personality characteristics of people are not obligatory. Nootka (Wakashan/Vancouver Island), Quileut (Quileute) (Chimakuan/Washington), and purportedly a number of other northern Pacific coast languages oftentimes express negative personal characteristics such as greed, shortness, fatness, lameness, eye problems, or left-handedness through the addition of a morpheme and what Sapir calls “consonantal play.” For instance, an augmentative suffix */-aq/* is used for fat people: */haʔokwithak/* ‘did you eat?’ versus */haʔokwaqithak/* ‘did you eat, fatty?’ The diminutive suffix */-ʔis/* is added to forms referring to crossed or squint eyes, and all sibilants are converted to corresponding lateral forms: */q^wismahl/* ‘he does so’ versus */q^wit-ʔit-mahl/* ‘he does so, weak eyes.’ Similar ‘sore eye’ speech without the diminutive is used to represent the folktale characters Deer and Mink.

Caretaker Language and Baby Talk

Similarly, caretaker language and baby talk is present in most languages of the northwest coast such as in the consonant reductions and the addition of diminutive */-ʔis/* in Nootka. Many, though not all, languages of North America have some modifications to indicate affectionate speech to young children. Such talk is characterized by varying degrees of modification of adult forms, such as morphological diminutives and reduplication, lexical substitutions, and phonological substitutions. The latter may involve a phonological shift such as palatalization of stop consonants, e.g. */t/* becomes */tʃ/* to indicate affection. Through a sort of diminutive sound symbolism as in Omaha-Ponca, grandmother language indicates affection, cuteness, or a minimized threat of a potential danger.

In other instances, there is a reduced phonological inventory because speakers perceive it to be easier for children. Cocopa, an Arizona Yuman language, has quite complex caretaker language with at least seven different phonological rules that adult women apply to varying extents when addressing children and adolescent girls. Consonants are reduced from the adult inventory of 23 to 12 largely through elimination of secondary articulations and place. For instance, */k, k^w, q, q^w/* become */k/*, and */l, l^v, r/* become */l/*. Alternatively, adults may palatalize all dental, alveolar, and palatal consonants. Next, the consonant before the root syllable is replaced with a */v/*-sound although it is not a member of the adult Cocopa inventory. Consonants and sometimes vowels that are not part of the root get dropped; an */s/*-suffix is sometimes added to the end of the word; nonroot long vowels

are shortened, and a diminutive */n-/* prefix is added before the first consonant of the root. Men also produce the diminutive form. These changes and their variable applications create words in baby talk that can be quite complex for children to acquire in addition to their acquisition of adultlike language:

| Adult speech | Baby talk | |
|--|--------------------------|--------------------------|
| <i>/k^wan^ʔuk/</i> | <i>/kanvik/</i> | ‘baby’ |
| <i>/lu:p mu:k^wi: kmyul/</i> | <i>/lu:p unvi:s yul/</i> | ‘what will you buy’ |
| <i>/lumis wa:ya:ts/</i> | <i>/unvit anya:tl/</i> | ‘she goes around crying’ |

Gender

Gender indexicals are typically phonological, morphological, or lexical variants used to indicate the gender of the speaker, the addressee, or both simultaneously. These continue to receive descriptive attention in Native North America, as linguists re-examine previously gathered data and find new examples. Despite early reports to the contrary, such as Haas’s article ‘Men’s and women’s speech in Koasati,’ the use of such indicators has rarely been found to be categorical. However, recent language attrition and the commensurate reduction of stylistic variation may in some circumstances have caused a greater regularity of use than was previously apparent.

Phonological Indicators Phonological gender differences have been proposed for a number of languages and exist in the length of forms, degree of nasalization, and in consonant substitution. There appears to be little crosscultural regularity in North America concerning which pronunciations will be more indicative of men than women. Haas first proposed that several Muskogean languages, specifically Koasati, indicated the male sex of the speaker, by pronunciation differences such as a final */-s/* in men’s forms: */lakawtakkoʔ/* (women) versus */lakawtakkos/* (men) ‘I’m not lifting it.’ Using Haas’s original field notes, historical records, comparative data, and his current fieldwork, Kimball argued that the phonological difference Haas analyzed for Koasati and proposed for related languages was actually a choice in whether to use */-s/* (currently pronounced [ʃ]) ‘sentence-final narrative particle’ to supplant phrase-terminal nasalization. He also noted that this feature was due less to a speaker’s gender than to his or her authority in the society as both sexes used the form. Yana (northern California) men’s public speaking to both men and women was originally described by Sapir as male-to-male speech. Because of the additional syllable, ‘men’s forms’ are lengthier, more archaic, and evocative of speech associated with elevated ritual language and indirectly with gender.

| | | |
|----------------------|-----------------------------------|---------------|
| Man to man | Other | |
| /ʔau-ʔmidʒa | /ʔau-ʔitʃ ^h / | ‘my fire’ |
| /ʔi-na/ | /ʔi/ | ‘tree, stick’ |
| /p ^h adi/ | /p ^h at ^h / | ‘place’ |

Likewise, in ritual Laguna (Keres) *kiva* speech associated with older men, regular vowel lengthening occurs in 10 ‘cue’ words indicating the emotional stance of the speaker toward a proposition.

| | | |
|---------|----------|--------------|
| Female | Male | |
| /amú’u/ | /amúu’u/ | ‘love, pity’ |
| /ayá’a/ | /ayáa’a/ | ‘discomfort’ |
| /imí’i/ | /imíi’i/ | ‘fear/shy’ |

Several languages display slightly more nasalized forms for speech attributed by native speakers to women. In the early part of the 20th century, Inuktitut (Eskimo-Aleut) women on Baffin Island were observed to substitute nasals /m, n, ŋ, N/ for final voiceless stops /p, t, k, q/. Yet men also had variable nasal and non-nasal pronunciations. Among the Lakhota (Lakota) (Siouan) affective/illocutionary force indicators, two to three forms, such as *-yemāl* ‘women’s surprise,’ are nasalized versions of men’s – *-yewāl* ‘men’s surprise’. In contrast, emphatic questions in Yana required the enclitic *-gàl* for women and *-nàl* for men.

In Atsina (Gros Ventre) (Algonquian/Montana) both men and women tend to use ‘women’s’ pronunciation’ with nonnative speakers and children, but men typically front /k/ or /ky/ to /tʃ/, and women substitute /k/ or /ky/ for the more archaic /ty/. Men have apparently borrowed the fronted sound /tʃ/ from their Arapaho (Algonquian) neighbors, and younger men are currently in the process of changing /ty/ to /tʃ/ as well.

Vocabulary and Morphology Interjections, common sayings, speech act indicators, and some kinship terms vary according to the gender of the speaker or addressee in a number of languages. It is common for men and women to have different interjections for expressions of surprise, fear, or bravery in North American languages. Less common is for markers of illocutionary force to be gendered. Several Siouan languages, however, possess verbal suffixes like those listed in Mandan (Siouan) below. Mandan is the only Siouan language in which such forms are required for every sentence, and which indexes only the gender of the addressee.

| | | |
|----------------------|---------------|------------------|
| Imperative Statement | Interrogative | |
| /-rā/ | /-ʔre/ | /-ʔrā/ |
| | | female addressee |
| /-ta/ | /-ʔʃ/ | /-ʔʃa/ |
| | | male addressee |

Other common expressions of politeness and greeting can become very salient indicators of gendered difference for native speakers. Although the forms in Table 3 do not occur in every sentence of the pueblo

Table 3 Pueblo Southwest gendered vocabulary

| Language (dialect) | Female | Male | Meaning |
|-----------------------------|-------------------------|---------------------------------------|------------------|
| Hopi (3 rd Mesa) | ʔask ^w ali | k ^w ak ^w ha(-y) | thank you |
| Tewa (Arizona) | kuna | kunda | thank you |
| Tiwa | herkem | hawə | thank you |
| Acoma | náidrá | huw’ehé | thank you |
| Hopi | sónwayo | lóloma | it’s beautiful |
| Acoma | an ^y umé:c’a | ʔanyi:c’e | it’s beautiful |
| Tewa (Arizona) | ʔasagi | sagʔwo’ | it’s beautiful |
| Hopi | | taʔa | yes |
| Tewa (Arizona) | hā: | hoy | yes |
| Tewa (Rio Grande) | hoy | hāman | yes |
| Acoma | hée | haí | answer to a call |
| Hopi | yá:sayoqu | hósqaya | be huge |
| Tewa (Arizona) | -ʔáyyá | -ʔóyyó | be good |

(Adapted from Maring, 1975; Kroskirty, 1983: 89; Sims and Valiquette, 1989.)

southwest languages, there is a strong ideology of gender-differentiated speech.

The Meanings of Gendered Forms Lists of gender differences out of context give a very minimal sense of the meaningful causes of such variation. The question of how such forms get connected to gender as they index different genres, meanings, and speech acts will lead us further to understanding the meaning of variation in specific languages (see Trechter, 1999 for such an analysis in Lakhota). Indeed, any number of linguistic forms could theoretically be linked to gender, but very few are. For example, Hill and Zepeda have recently extended the types of analysis indicative of gender differentiation to the use of the ingressive pulmonic airstream by Tohono O’odham (Uto-Aztecan/Arizona) women. The women’s sucking in of breath coordinates with discourse features that index closeness and involvement in conversation, which already hold a meaningful culture value for these women. Only through contextual analysis coordinated with speakers’ ideologies regarding gendered meaning are such linguistic markers better understood.

Stylistic Variation

In a 1927 article, ‘Literate and illiterate speech,’ Bloomfield assessed Menominee (Menomini) (Algonquian) speakers in Wisconsin, rating their grammatical and lexical capabilities. He described three different ways of saying ‘What are you laughing at?’ – *lwékiʔ wéh-ayéniyanl*, *lwékiʔ aya:yó:sinamal*, *ltá:niʔ wehtá:hpiyanl* – on a continuum from ‘illiterate, childish, stupid’ to ‘normal’ to ‘elevated, poetic and archaizing.’ The last type of language seemed to be associated with doctors and shamans, and was

characterized by long vowels in unusual contexts, archaisms, and metaphorical vocabulary. 'Bad' speakers, on the other hand, anglicized their pronunciation and did not keep long and short vowels distinct. They also forgot to use the obviative (a form that distinguishes between two different third persons) and the quotative in narratives. Although Bloomfield placed most speakers under the age of 40 in the illiterate group, this was not absolute. He surmised that English interfered with a speaker's ability to control a variety of styles, but he also placed some monolingual speakers of Menominee in the illiterate group. Regrettably, Bloomfield stated that the differences in such styles of speech permeated every aspect of the lexicon and grammar to the extent that description would be impossible. It is difficult to know if Bloomfield was capturing the reduction of stylistic variation or the prejudice of a few speakers.

The Content of Style

Elevated, ceremonial, or shamanistic speech styles are recognized among many languages (Wintu, Lakota, languages of the pueblos in the southwest). On the other hand, styles of oratory in many California and west coast languages (Nootka, Tübatulabal, Patwin, Pomo, Yokuts) is reported as having been 'forced,' 'jerky,' with 'short sentences.' For an excellent comparison of such speech styles see Miller and Silver (1997). In cultures where mastery of ceremonial speech is highly emphasized, speakers must have specific abilities and be specially trained to acquire the forms. Such registers thus become less indicative of the personal or individual identity of a speaker than the genre or speech event which she or he performs.

Chafe, for instance, described three different styles of verbal performance in Seneca (Iroquoian/New York): normal conversation, preaching, and chanting. These genres differ in a number of ways: prosodically, and in the degree of formulaicity, sentence grammar, and epistemic stance. Normal conversation has greater freedom, relies less on memorized phrases, circumlocutions, or archaic language, is more fragmented because of multiple participants and lack of planning, and requires speakers as direct conveyors of original content to state the extent to which they are sure through the use of varied evidentials. Chafe demonstrated that as speakers move to preaching and chanting, their intonation contours become increasingly monotone although the sentences are lengthier and more packed with information. Preaching exhibits few evidential markers. Indeed, as the speaker becomes less individually and creatively responsible for the content of utterances, chanting contains a number of markers of certainty.

Although the definition of ritual speech requires a certain compartmentalization of the genre, there may be ideological extensions of ritual genre into everyday life to the extent that it may also affect speakers' sense of what more elevated language sounds like. From Bloomfield's description, some such linguistic ideology may have affected his definition of elevated speech in Menominee with its elongated vowels and metaphorical vocabulary. To some extent, formulaic speeches, such as the public grievance chants in Hopi (Uto-Aztecan), may have some general similarity in form to more esoteric styles. Kroskrity argued that the speech of public announcements in Arizona Tewa (Kiowa-Tanoan), although necessarily separate from the highly ritualistic *kiva* speech, follows many of the same strictures through its de-emphasis on the personality of the announcer, the formulaic structure of the announcing chant, and the unusual but predictable rising intonation throughout the three verses. To be 'valid' forms, such chants must be notifications of community events and announced by men from rooftops. More recently women have both followed the form and innovated by announcing events such as yard sales themselves.

Folktales as Verse

Since the 1970s, a number of linguistic anthropologists such as Tedlock and the Hymeses have argued that the structure, form, language, and meaning of oral, indigenous folktales are better understood if they are regarded as poetry and performance rather than prose. Tedlock, for instance, has sought to capture visually variations in loudness and prosodic features such as intonation and rhetorical lengthening through use of larger type, movement of the type up and down on the page, and the repetition of letters for lengthening. Dell Hymes saw the 'pattern numbers,' those numbers that are favored mythically by certain cultures for organizing, as important for understanding if not for reversifying previously collected folktales. One of the most famous of such analyses using this approach is Virginia Hymes's work on the 'Raven Myth' in Warm Springs Sahaptin (Tenino) (Sahaptian/Oregon). Paying special attention to the intersection of prosodic cues such as changes in voice quality or pitch and rhetorical vowel lengthening indicative of first lines, with parallelism in the use of different grammatical particles and time words, Hymes was able to divide the narration into verses. Interestingly, a pattern of five recurred throughout. Events were repeated five times, and there were often five lines in a verse and five verses in a stanza. The pattern of three was also important. Despite the variation in some folktales and creative interpretation needed for such

work, Woodbury saw such work as getting to the grammar of discourse. By understanding the similarity of forms within one oral genre, one thereby begins to see its variation from others.

Variation in Native North America has never been limited to regional dialects or the expression of cultural, ethnic, or gender identities. Linguists encountering unexpected and unfamiliar linguistic structures and expressions in North America have allowed a broad definition of variation in order to capture both the sense of complexity in the languages they described and their expressive capabilities. As today's linguists and Native peoples continue to work in a context of language attrition and potential revitalization, maintaining a broad understanding of variation in both the older forms and encountering variation in new contexts will be the challenge.

Navajo

H Landar

© 2006 Elsevier Ltd. All rights reserved.

Navajo is an Athapaskan (Apachean) language, with perhaps 200 000 speakers in Arizona, New Mexico, and Utah. Vowels /i e o a/ are single, clustered, nasalized (ǣ), and of low or high pitch. Syllables have strong, medium, or ordinary stress. Junctures are rising, falling, and sustained. Voiceless stops are labial, apical, and velar /p t k/ written *b, d, g*; labial and palatal sonorants are /w y/; voiceless nonlabial stops /t k/ and affricate clusters with /t/ have aspirated counterparts, e.g., /th kh/ written *t, k*, /tsh tsh/ written *c, č*. Aspirated segments are allophones of /h/; checked segments, of /ʎ/. Thus /tšʎ/ is the componential reduction of č. Voiceless nonfaucal fricatives have voiced homorganic counterparts, apical /s z/, palatal /š ž/, velar /x ɣ/, lateral /l ʎ/. Nasals are /m n/. Navajo lacks a Proto-Athapaskan series of labialized consonants and contrast of front and back velar consonants.

Navajo is a SOV language. Word classes are nouns, postpositions (adjuncts), verbs, and particles. Their functions define syntactic classes, nominals, adjunctives, verbals, and relationals. Pronominal prefixes of nouns and postpositions are similar in form but not in meaning; those of nouns are possessive, whereas those of postpositions translate as datives and accusatives, with adverbial stems. Compare *ši* 'I' (independent subject pronoun), *ši-má* 'my mother' (noun), *ši-tšʎ* 'me-towards' (postposition); *ni* 'you (SG)', *ni-lʎ* 'your horse(s)', *nitšʎ* 'toward you'; *bí* 'he (she, it, they)', *b-ádi* 'his older sister(s)', *b-aa* 'to him.'

Verb prefixes take 10 positions before a stem: adverbial, iterative, plural, objective, deictic, aspectual, modal, perfective, subjective, and classifier. Stem shapes vary for modes (imperfective, perfective, optative, and others) and aspects (momentaneous, continuative,

and others); some stems, however, are invariable. Neuter verbs are intransitive; active verbs include agent and patient; third persons and other prefixes may have a zero (∅) form. Thus *ní-ʔaah* 'you (SG) move it (as a compact or round object)'; cf. *š-aa ní-ʔaah* 'give it to me'; that is, 'to me you move it as a compact object.' The stem *-ʔaah* belongs to a classificatory gender system for movement or handling of various objects (e.g., a container with contents, a living being, a flat flexible object, a thin rigid object, a ropelike object, and others). Navajo shares verbal patterns with other Athapaskan languages but has lost a rich Proto-Athapaskan system of prefixation and suffixation for aspect and mode.

Sentences are transformed principally by rules for moving words or inserting enclitics (a subclass of particles). The enclitic *íš* 'is it?' makes one type of question: *ʔaškii* ('boy') *ʔatʔééd* ('girl') *yiztsqs* ('he kissed her') *íš* ('is it?'), 'did the boy kiss the girl?' Negatives are generated commonly by *doo ... da*: *doo yiztsqs da* 'he did not kiss her.' The prefix *yi-* alternates with *bi-* to indicate the third person object when the subject is a third person (∅ in position (i)). *Yi-* and *bi-* involve a hierarchy of animacy for some speakers; they may preserve the Proto-Athapaskan-Eyak semitransitive category identified by Krauss (1965). Often *yi-* shows that an action is controlled or semitransitive while *bi-* shows full transitivity on a foregrounded object. Thus object advancement from *ʔaškii ʔatʔééd yiztsqs* 'the boy kissed the girl' to *ʔatʔééd ʔaškii biztsqs* 'the girl was kissed by the boy' foregrounds NP₂ and cancels semitransitivity.

Nenets

F Ackerman, University of California, San Diego, CA, USA

T Salminen, University of Helsinki, Helsinki, Finland

Nenets is a subbranch of the Samoyed branch of the Uralic family comprising two closely related but distinct languages, Forest Nenets (FN) and Tundra

Nenets (TN). Tundra Nenets is spoken by nearly 30 000 people across the vast tundra zone of Arctic Russia and northwestern Siberia, while Forest Nenets has perhaps 1500 speakers along the Pur, Agan, Lyamin, and Nadym river basins in northwestern Siberia. A clear majority of the speakers are proficient in Russian, and in the European part of the Tundra Nenets territory in particular, the native language is in these days rarely transmitted to younger generations.

In addition to Russian, Tundra Nenets has had contacts especially with Komi and Northern Khanty, and Forest Nenets has been greatly influenced by Eastern Khanty.

Besides Nenets, the Samoyed branch includes Nganasan, Enets (Forest Enets and Tundra Enets), Yurats, Selkup (Northern Selkup, Central Selkup, and Southern Selkup), Kamas, and Mator; of these, Yurats, Kamas, and Mator are extinct, the Enets languages as well as Central Selkup and Southern Selkup are critically endangered; Nganasan is still spoken by approximately 500 people and Northern Selkup by 1500. Samoyed is the easternmost branch of the Uralic family; the other branches are Khanty, Mansi, Hungarian, Permian, Mari, Mordvin, Finnic, and Saami.

The Nenets languages are synthetic, agglutinating with some fusion and, in Forest Nenets, metaphony, morphophonologically complex, suffixing and predominantly verb-final.

The vowel system of Tundra Nenets in the first syllable includes nine vowels differing in both quality and quantity (one short vowel marked with \emptyset in phonological transcription, five basic vowels, $i e a o u$, a mixed [diphthongoid] vowel æ , and two long vowels, $i\acute{u}$; in unstressed syllables, a schwa, ° , typically realized as extra lengthening of the preceding segment, occurs in addition to the five basic vowels. The Forest Nenets vowel system has been restructured after the Eastern Khanty model and consists of stressed syllables of six long vowels, $i e \text{ä} a o u$, and four short vowels, $i \text{ä} \hat{a} \hat{u}$ (corresponding to $i \text{ä} a u$); in unstressed syllables, only a schwa ° and $i a u$ are possible. The stress is not contrastive but falls on nonfinal odd or pre- and postschwa syllables. A feature affecting both consonants and vowels is palatalization: the traditional formulation is that vowels have back vs. front allophones after nonpalatalized vs. palatalized consonants, but palatality (marked with y between a consonant and vowel in phonological transcription) can also be understood as a suprasegmental feature with a CV sequence under its scope. The consonant system of Tundra Nenets consists of 26 units (up to 31 in dialects); in Forest Nenets there are 24 consonants. Both systems include a velar nasal (ng) and a velar fricative (x); in Forest Nenets, vibrants have changed to fricolaterals (lh) under the Eastern Khanty influence; in Tundra Nenets, there are affricates (c) that have developed from consonant clusters still retained in Forest Nenets; both languages have a glottal stop marked with q or, in Tundra Nenets, h in case it has nasal sandhi alternants. The above figures include palatalized consonants, which in Tundra Nenets are only contrastive in the labial and dental series, while in Forest Nenets, there are palatalized velars as well.

An old phonotactic peculiarity of Nenets is the lack of initial vowels: this is now relaxed in most varieties, but in the Central dialects of Tundra Nenets the principle is still fully alive and is even reflected in recent Russian loanwords such as *ngarmiya* ‘army.’ In Tundra Nenets, there is a sandhi system affecting both the final consonant of the preceding word and the initial consonant of the following one, for instance, *nyeh xøn* ‘woman’s sledge’ is transformed to *nyeng_køn*, *pyiq xøn* ‘sledge for wood’ to *pyi_køn*, and *ngarka to* ‘big lake’ to *ngarka_do* by sandhi.

Nouns distinguish seven cases: nominative, accusative, and genitive are the grammatical cases that in their basic functions denote subject, object, and possessor; dative, locative, ablative, and prosecutive (‘through, along, by’) constitute the local cases. There are three numbers, singular, dual, and plural, but there is a gap in the nominal paradigm in that the local cases do not combine with the dual number, the respective meanings being expressed by postpositional phrases. The inflection of personal pronouns follows a distinct pattern, and their local cases are also replaced with forms of postpositions. Besides absolute declension, the nominal inflection includes possessive as well as predestinative (‘for’) forms, e.g., FN *wyiq* ‘water’: *wyiqj* ‘my water’: *wyiqtâj* ‘water for me.’ The postpositions are typically inflected in local cases and have possessive forms as well, e.g., FN ablative *ngïlh°tâj* ‘from under me’ or prosecutive *pumnantung* ‘along their tracks.’ In predicative position, nouns agree with the subject employing the same personal suffixes (but not showing the other inflectional peculiarities) as intransitive verbs, e.g., TN *lúca* ‘Russian’: *lúcad°m* ‘I am a Russian.’

Verbs have numerous grammatical categories, covering person, number, tense, and mood. The number of moods is large, in Tundra Nenets up to 18, making it possible to express various levels of probability and necessity morphologically; the imperative and optative moods employ sets of personal suffixes different from other moods. Perfective vs. imperfective aspect is an inherent feature of a verb, and aspectual pairs are created through derivational morphology. The tense is expressed by two distinct systems: first, there is an opposition between unmarked basic tense and suffixally marked future and habitive tenses; second, there is unmarked aorist vs. preterite marked by a suffix that morphotactically follows the personal suffix; it is possible to combine the two tense systems, e.g., TN *xada-* ‘kill’: aorist *xadaøw* ‘I killed it (just now)’: preterite *xada°wosy* ‘I killed it (earlier)’: future aorist *xadangkuw* ‘I am going to kill it’: future preterite *xadangkuwosy* ‘I was going to kill it.’ As seen from the examples, the basic aorist refers to

immediate past in case of perfective verbs such as 'kill,' whereas the aorist of imperfective verbs simply expresses present, e.g., *nyoda-* 'follow': *nyodaow°* 'I am following it.' A specific grammatical category in Nenets is known as conjugation: it covers the opposition between subjective forms used when the object is focused and objective forms referring to previously known or omitted objects, e.g., TN *tim xadaod°m* 'I killed a/the reindeer (and not another animal)' vs. *tim xadaow°* 'I killed the reindeer (instead of doing something else to it)'; in the objective conjugation, the number of the object is expressed morphologically, e.g., *xadangax°yun°* 'I killed them (two)' vs. *xadeyøn°* 'I killed them (several)'; furthermore, there are reflexive forms that either contrast with forms with a transitive meaning, e.g., *tonta-* 'cover': objective *tonta°da* '(s)he covered it': reflexive *tontey°q* 'it got covered,' or constitute the only finite forms of a lexical verb, typically expressing sudden movement or change in state. The personal suffixes cannot generally be attached directly to the verbal stem, but they trigger a complex system of morphological subSTEMS.

There is a wide range of nonfinite verbal forms in Nenets, with an important function in embedded clauses (either independently or within postpositional phrases, often with switch-reference, whereby a nonfinite verb is marked differently depending on whether its subject is the same as, or differs from, that of the finite verb), as there are no conjunctions or relative pronouns. Negation is expressed by a negative auxiliary verb incorporating all categories of verbal inflection followed by a specific connegative form of a lexical verb, e.g., TN *nyix°yun° xadaq* 'I did not kill them (two)'; since the nominal paradigm lacks a connegative, negative nominal predicates must incorporate a copula, e.g., TN *lucad°m nyid°m ngaq* 'I am not a Russian.'

Within the basic SOV word order of a transitive sentence, the adverbial phrases are typically placed as Time S Place/Recipient O Manner V, but any focused element can occur preverbally, and even postverbal constituents are possible in case of two morphologically or functionally similar phrases, e.g., FN *ngopk°na myatuqngaj° mâj° myaqk°naj°* 'we (two) live together in our tent,' where both *ngopk°na* 'together' and *mâj° myaqk°naj°* 'in our tent' are in the locative case. In imperative sentences, typically without an overt subject, the nominal object is in the nominative instead of the accusative. The personal pronouns, by contrast, employ their accusative forms even in imperative sentences, while in possessive phrases with a morphologically marked possessed noun they appear, if not omitted, in the nominative

rather than in the genitive. Agreement within a nominal phrase is possible in number when the nonsingularity of the noun is more definite, and in relative clauses possessive agreement also occurs, e.g., TN *metyida wadyida* 'note the words he uses', cf. *meta* imperfective participle of 'use,' *wada* 'word.'

Both Nenets languages are endangered, but there are major differences between localities in language use. Tundra Nenets has a literary language deriving from the 1930s used in semiregular book printing and having a limited presence in schools and the press, while Forest Nenets remained unwritten until the 1990s, when a primer and a school dictionary appeared. In the areas where the languages remain vigorous, oral literature, including tales, stories, and riddles as well as epic, lyric, and personal songs, is also flourishing (Castrén and Lehtisalo, 1940; Lehtisalo, 1947; Kupriyanova, 1965; Tereshchenko, 1990; Niemi, 1998). The traditional way of life based on reindeer husbandry or fishing (Khomich, 1995) continues to be appreciated by many Nenets as long as oil and gas excavations do not entirely destroy their lands and the authorities do not force them to relocate (Golovnev and Osherenko, 1999).

For a small indigenous language, Tundra Nenets is reasonably well studied, especially with regard to its phonology and morphology (Castrén, 1854; Tereshchenko 1947, 1956; Décsy, 1966; Janhunen, 1986; Salminen, 1997, 1998a) and lexicon (Pyrerka and Tereshchenko, 1948; Lehtisalo, 1956 [covering both Nenets languages]; Tereshchenko, 1965), while there is only one monograph devoted to the syntax of the Samoyed languages in general (Tereshchenko, 1973). This article is mainly based on Salminen (1998b) as well as more recent field studies funded by the Endangered Languages Documentation Programme. Forest Nenets has been studied much less extensively than Tundra Nenets, with a couple of basic grammatical treatments published (Verbov, 1973; Sammallahti, 1974).

Nepali

M Hutt, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Nepali, a member of the Indo-Aryan group of languages, is the national language (*rāṣṭra bhāṣā*) of Nepal, the state language of Sikkim, and the sole language of most ethnic Nepali communities in Bhutan and northeast India. It was previously known as Khas Kurā (the speech of the Khas) or Gorkhālī. Nepali probably has about 17 000 000 mother tongue speakers, and is a vital second language for approximately 7 000 000 speakers of other Nepalese languages, many of which are Tibeto-Burman.

Nepali was introduced into the central Himalaya by immigrants who entered from the northwest before the 10th century. Its ascendancy over the other languages of the region is linked to a process of political domination and cultural assimilation. Written in the Devanāgarī script, its earliest records are 13th-century royal inscriptions from far western Nepal, though Nepali was rarely used for literary purposes until the 18th century, and its first major work, the *Nepālī Rāmāyaṇa* of Bhanubhakta Acharya, was written in the mid-19th century.

Among the other major Indo-Aryan languages, Hindi is Nepali's closest cousin, and many literate Nepali speakers are proficient in Hindi. However, in its everyday vocabulary Nepali preserves many Sanskrit and Sanskrit-derived words (e.g., *ghām* 'sun', *khukurā* 'chicken', *ritto* 'empty') that have

been displaced by Perso-Arabic loans in Hindi, and the Arabic and Perso-Arabic element of its lexicon is largely confined to law, war and weaponry, and governance and monarchy. Similarly, English loans are generally less common in Nepali than in Hindi, partly because Nepal was never colonized by the British.

Unlike Hindi, Nepali distinguishes between existential (*chanu*) and definitive (*hunu*) functions of the verb 'to be', e.g., *pānī ho?* 'is this water?', *pānī cha?* 'is there [any] water?' Like Bengali, it uses numeral classifiers, e.g., *tīnjanā mānche* 'three [-person] men', *tīnvaṭā mec* 'three [-object] chairs' and accords feminine gender only to female human nouns. It forms most plural nouns through the affixation of *harū*; and generally forms negative verbs by the adaptation of verb endings, e.g., *ma jānchu* 'I go', *ma jādina* 'I do not go'. Four honorific grades plus a royal honorific are available for personal pronouns. Clauses are commonly linked by the use of infinitives and participles and seldom by conjunctions: thus, *H. vah ādmī jo kal āyā* 'the man who came yesterday' is *Ne. hījo āeko mānche* 'the yesterday having-come man'.

Nepali lacks the H. phonemic distinction of /s/ /v/ from /s/ /b/. Regional dialects have been identified but dialectal variation is not strong. Nepali has influenced the Tibeto-Burman languages of the region more than it has been influenced by them (Sprigg, 1987), though there are a few loanwords from Newari, e.g., *jhyāl* 'window' and some features of syntax and intonation may reflect Tibeto-Burman influence.

Ngan'gi

N Reid, University of New England, Armidale, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Ngan'gi (Ngan'gikurunggurr) is an Australian Aboriginal language spoken in the Daly area several hundred kilometers to the southwest of Darwin. The language now has two significant dialectal variations: Ngan'gikurunggurr has about 150 speakers, and Ngen'giwumirri has about 50. These two dialects share about 89% of vocabulary, have nearly identical systems of complex verb morphology, and are mutually intelligible. For our purposes, we can treat them as a single language and give it the label 'Ngan'gi,' although speakers are careful to distinguish between them as characterizing two separate groups with distinct social identities. Ngan'gi is spoken predominantly in the townships of Nauiyu (formerly Daly River) and Peppimenarti, and the outstations that those two towns supply. Most people who speak Ngan'gi fluently are aged more than 50 years, and the children of Ngan'gi speakers now mostly learn Kriol as their first language. With this number and age profile of speakers, Ngan'gi is classified as a 'threatened' language, under real danger of extinction within a few decades.

Classification

The first classification of Daly region languages (Tryon, 1974) paired Ngan'gikurunggurr and Ngen'giwumirri as constituting the Tyemer branch of the 'Daly Family,' with neither related to Murrinh-Patha, the neighboring language to the west. This understanding, of either no relationship or at best a very distant one, between Ngan'gi and Murrinh-Patha, was based on the lexical data; Ngan'gi and Murrinh-patha have at most an 11% shared vocabulary density.

Present research is however overturning this view. Green (2003) has made a compelling case for Ngan'gi and Murrinh-patha making up a genetic subgroup

now labeled 'Southern Daly.' The case is based primarily on formal correspondences in the core morphological sequences of finite verbs. Green argues that these sequences match too closely in their complexities and irregularities to have plausibly come about through anything other than a shared genetic legacy; he demonstrates through reconstruction of finite verb paradigms that they are systematically derivable from an innovative common parent. The intriguing question, of how related neighboring languages have come to share as little as 11% lexical cognacy, remains unanswered.

Instead of a single 'Daly Family,' there now appears to be five separate Australian subgroups in the Daly region that cannot convincingly be related together as a single genetic unit (Table 1) (Green, 2003). Those similarities that Tryon took to be diagnostic of the 'Daly Family' are better accounted for either diffusionally or as genetically inherited features shared with a wide range of northern Australian languages.

Areal Features

Like the majority of languages spoken in Australia's central far north, Ngan'gi is of the polysynthetic (*see Central Siberian Yupik as a Polysynthetic Language*)

Table 1 Genetic subgroups in the Daly River region

| Subgroup | Principal language varieties |
|---------------|---|
| Anson Bay | Batytyamalh (aka Wadyiginy) (Wadjiginy) Kenderramalh (aka PunguPungu) |
| Northern Daly | MalakMalak (Mullúknulluk), Tyeraty, Kuwema (Tyaraity) |
| Eastern Daly | Matngele |
| Western Daly | Kamu Marrithiyel (Marithiel), Marrisyeffin, Marri Ammu Marringarr (Maringarr), Mati Ge Marramaninydyi (Marimanindji) Marranunggu (aka Warrgat) (Maranunggu), Emmi, Menhthe |
| Southern Daly | Murrinh-Patha Ngan'gikurunggurr (Nangikurunggurr), Ngen'giwumirri |

structural type, and is categorized within Australianist typology as belonging in the non-Pama-Nyungan and prefixing groups. It has complex verbal structures built up through the addition of strings of prefixes and suffixes to lexical roots. Some of the affixes are suppletive in form and many are portmanteau in nature, simultaneously encoding a number of grammatical categories. A large complex verb might have up to a dozen constituent morphemes and correspond in meaning to a whole English sentence. The most distinctive grammatical features of Ngan'gi are its extensive pronominal indexing, a set of 31 classifying verbs, 4 number categories for pronouns, a system of 16 noun classes, and a 3-way stop/fricative contrast.

Pronominal Indexing

Verbs obligatorily index core participants such as 'subject' (*I saw you*) and 'object' (*I saw you*) by bound pronominal prefixes. Most languages additionally allow for the verbal cross-referencing of other kinds of participants, such as 'goals' (*I told her the news*), 'benefactives' (*I cooked it for her*) and 'adversatives' (*My wife ran away on me*). Pronominal indexing is shown in (1), where subject, object, and adversative arguments are indexed on the one complex verb.

- (1) Danginy-nyi-fime-ngidde-wurru.
3sg.S.Poke.Perf-2sg.O-give-1sg.Adv-bad
'She gave it away to you against my wishes.'

Some grammatical categories, such as person, number, and tense, can be marked discontinuously via different affixes at different points in the verb. This marking is illustrated for subject number in (2), which stacks plural, dual, and trial affixes.

- (2) Ngarrgu-nime nge-rr-beny-gu-da-nime.
1exdlPRO-trial 1.S-nsg.S-Bash.Perf-dl.S-hit-tr.S
'We (trial exclusive) hit it.'

Verbal Classification

Many languages of Australia's central far north share the characteristic of forming their verbs with not one, but rather two, root-like elements. This two-part structure typically involves the pairing of a relatively inert root (or coverb), which provides the main lexical information for the verb, with a root that hosts the core grammatical affixes (or finite verb). Coverbs form an open class, while finite verbs constitute a small closed class – Ngan'gi has 31 of these. This two-part verbal structure is thought to be an ancient diffusional feature. While in some languages of Australia's north the finite verbs have synchronically no clear semantic value, in the Southern Daly languages, it functions as a classifier of the verbal

action. Verbal classification may simply involve specifying the relative orientation of the subject, as with the intransitive posture classifiers in (3) and (4).

- (3) Peke dini-fifi-tye.
tobacco 3sgSit.IMP-smoke-Past
'He was sitting smoking.'
- (4) Peke wirringe-fifi-tye.
tobacco 3sg.S.Sit.IMP-smoke-Past
'He was standing smoking.'

Other verbal classifiers are concerned with how objects are handled or manipulated, as illustrated by the transitive classifiers in (5) and (6). In (5), the finite verb *Hands* functions to conceptualize the action as performed within the grasp of the fingers. Contrast with (6), in which the replacement of *Hands* with *Poke* achieves a different schematic conceptualization, this time of the action as performed at the end of an elongated instrument.

- (5) Ngeriny-fityi peke.
1sg.S.Hands.Perf-roll tobacco
'I rolled a cigarette' (in my hands).
- (6) Ngariny-fityi screwdriver-ninggi.
1sg.S.Poke.Perf-roll screwdriver-INSTR
'I screwed it up with a screwdriver.' (I rolled it at the end of a long thin instrument).

When compared to the other languages of the Daly, and to northern Australia generally, the classifying verb structures of Ngan'gi reveal two aberrant features. First, they exhibit a tight morphophonological binding between coverb and the inflected finite root. Second, they show an innovative ordering, placing the coverb after the inflected finite root rather than preposed to it. Reid (2003) argued that these shared features result from recent diffusion rather than a shared genetic legacy, demonstrating how the Southern Daly languages Ngan'gikurunggurr and Ngen'giwumirri have acquired them only within the last hundred years.

Free Pronouns

The Daly languages have freeform pronoun systems that are complex by virtue of grammaticizing multiple nonsingular number categories. Some languages, including Ngan'gi, have singular/dual/trial/plural systems, while others have singular/dual/paucal/plural systems. As can be seen from Table 2, Ngan'gi has a slightly nonsymmetrical system where the trial/plural contrast is neutralized in 1st inclusive.

Nominal Classification

All the Daly languages have at least a few generic nouns, such as 'meat,' 'vegetable food,' and 'fire,' which are regularly placed in front of specific nouns

Table 2 Ngan'gi freeform pronouns

| Number | 1st inclusive | 1st exclusive | 2nd person | 3rd person |
|----------|-------------------|----------------------|---------------------|---|
| Singular | | <i>ngayi</i> | <i>nyinyi</i> | <i>nem</i> (male) <i>ngayim</i> (female) |
| Dual | <i>nayin</i> | <i>ngagarri</i> | <i>nagarri</i> | <i>wirrike</i> |
| Trial | <i>nayin nime</i> | <i>ngagarri nime</i> | <i>nagarri nime</i> | <i>wirrike nime</i> |
| Plural | <i>nayin nime</i> | <i>ngagurr</i> | <i>nagurr</i> | <i>wirrim</i> |

to encode salient cultural categories. In some Daly languages, this encoding has become extended into a system in which the category membership of all entities is obligatorily encoded by one of around a dozen NP initial generic nouns. In Ngan'gi, such generic-specific constructions have undergone even further grammaticalization, displaying agreement phenomena and reduction of the independent generic to bound forms. Sometimes, agreement is marked by bound forms attached to nouns as well as modifiers such as adjectives or demonstratives. In other cases, noun class assignment is marked by freeform generics that precede specific nouns and also precede the modifiers. Each of these types is demonstrated in (7) and (8).

(7) a-tyalmerr a-kerre a-kinyi
animal-barramundi animal-big animal-this
 'this big barramundi fish'

(8) syiri magulfu syiri marrgu
weapon fighting.stick weapon new
 'a new fighting stick'

Noun class phenomena in Daly languages have proved theoretically interesting by providing a perspective on the historical development of class markers from freeform nouns to proclitics to prefixes. They have also contributed to theorizing about the process by which agreement phenomenon develop (Reid, 1997) and to considerations of the nature of the distinction between noun class and noun classifying systems (Green, 1997).

Phonology

Australian languages generally lack phonemic fricatives and typically have just a single series of stop. The Daly region shows a significant departure from this pattern, with all languages except Anson Bay showing at least some phonemic voicing contrast. Ngan'gi has both a partial stop contrast, and phonemic fricatives, yielding a 3-way obstruent contrast between a voiced stop, voiceless stop and fricative for the bilabials and alveolars. The phonemes of Ngan'gi, showing the atypical obstruent set in an otherwise standard Australian inventory, are given in Table 3 and Table 4 in their practical orthography.

Table 3 Ngan'gi phonemic inventory consonants

| Consonant type | Bilabial | Alveolar | Palatal | Velar |
|----------------|----------|----------|---------|-------|
| Voiceless stop | p | t | ty | k |
| Voiced stop | b | d | | |
| Fricative | f | s | sy | g |
| Nasal | m | n | ny | ng |
| Lateral | | l | | |
| Approximant | | r | | |
| Trill | | rr | | |
| Glide | w | | y | |

Table 4 Ngan'gi phonemic inventory vowels

| Vowel type | Front | Back |
|------------|-------|------|
| High | i | u |
| Low | e | a |

Niger-Congo Languages

J Bendor-Samuel, Summer Institute of Linguistics, High Wycombe, UK

© 2006 Elsevier Ltd. All rights reserved.

It is widely accepted that the languages of Africa, apart from the creoles, pidgins, and 'official' languages inherited from the colonial era, belong to four major families: Niger-Congo, Nilo-Saharan, Afro-Asiatic, and Khoisan. Niger-Congo is the largest, both in terms of the number of languages and in geographical spread. It extends from Dakar east to Mombasa and south to Cape Town. Of the 2000 languages spoken in Africa, some 1400 belong to Niger-Congo. Recent estimates put the number speaking a Niger-Congo language at around 400 million people.

Early Classification

In the 19th century, scholars began to make groupings of African languages. Koelle (1854) published word lists in some 200 languages, grouped so as to reflect the relationships among the languages. Many of his groupings correspond closely to the accepted classification today.

Bleek (1856) recognized that languages in western and southern Africa were related and wrote of "that great family which, with the exception of the Hottentot dialects, includes the whole of southern Africa and most of the tongues of western Africa."

Subsequently, scholars tended to lose sight of the essential unity of these languages and to focus on the Bantu languages of southern Africa. The large number of languages elsewhere that had similar features were regarded as being 'mixed' in origin, and their similarities were explained as being the result of migrations and language contact, rather than as deriving from a common genetic origin with Bantu.

Significant development came with the work of Westermann (1927). He set up 'Western Sudanic' as distinct from 'Eastern Sudanic' (since classified as Nilo-Saharan). Westermann divided Western Sudanic into six subfamilies: Kwa, Benue-Congo, Togo Remnant, Gur, West Atlantic, and Mandingo (Maninka). He also compared a large number of proto-Western Sudanic roots with the corresponding proto-Bantu forms. Though Westermann did not go on to draw the conclusion that pointed to a common genetic origin, Joseph Greenberg did. He showed that Westermann's Western Sudanic and Bantu formed a single genetic family, which he called 'Niger-Congo.' Subsequently, Greenberg (1963) brought in Kordofanian as coordinate with Niger-Congo.

Greenberg retained the subfamilies that Westermann had already established – Kwa, Benue-Congo, Gur, West Atlantic, and Mande (Mandingo) – but included Togo Remnant within Kwa and added a new subfamily, which he termed 'Adamawa-Eastern.' His most revolutionary innovation was to include Bantu as a subgroup of a subgroup within Benue-Congo and not as a subfamily coordinate with the other main branches of Niger-Congo.

Accepted Classification

Although Greenberg's work has set the classificatory framework within which most scholars have worked since (Figure 1), there were, as he readily admitted, still many unresolved classificatory questions. Subsequent research has clarified some of these issues, and Greenberg's classification was revised by a group of scholars (Bendor-Samuel, 1989) (Figure 2). The languages that are spoken today are classified into nine major language subfamilies: Mande, Kordofanian, Atlantic, Ijoid, Kru, Gur, Adamawa-Ubangi, Kwa, and Benue-Congo. Scholars are not agreed on the classification of Dogon; hence,

it is listed separately, though it does not constitute a subfamily.

These nine major language subfamilies relate to each other in different ways, some being related more closely than others. The relationships reflect the fact that the nine major subfamilies did not derive directly from a common ancestor. There were intermediate steps that have been tentatively reconstructed on the chart.

Since the publication of *The Niger-Congo languages* (Bendor-Samuel, 1989), further consideration has been given particularly to three issues:

1. Although it is generally accepted that the five subfamilies of Kru, Kwa, Benue-Congo, Gur, and Adamawa-Ubangi are related more closely to each other than to Mande, Kordofanian, Atlantic, and Ijoid, there is no agreement on the sequence in which Mande, Kordofanian, Atlantic, and Ijoid split from the main stock. Some have suggested Kordofanian was the first to split off; others have proposed Mande.
2. As regards the Volta-Congo group, one view gaining acceptance is that the five subfamilies fall into two groups: Gur, Adamawa-Ubangi, and Kru

in North Volta-Congo and Kwa and Benue-Congo in South Volta-Congo. It has been suggested that Gur and Adamawa-Ubangi originated as a dialect continuum. Kwa and Benue-Congo could be treated in the same way. Although geographically separated from Gur, Kru is related more closely to Gur than to any of the other languages in Volta-Congo and so is placed in the Northern group. The attraction of this analysis is that it provides for a northern and southern spreading of languages in the Volta-Congo group, with Gur and Adamawa-Ubangi spreading across the Savannah lands to the north of this area, in contrast to Kwa and Benue-Congo spreading to the south (see Williamson and Blench, 2000).

3. Discussion has continued about where to draw the boundary between Kwa and Benue-Congo. Some have followed Greenberg in regarding the western groups of languages in Benue-Congo as an eastern group within Kwa. Others draw the boundary farther to the west, with these languages grouped within Benue-Congo, as is the case in this article (Williamson and Blench, 2000).

One thing is clear from the continuing discussion: the classification of Niger-Congo is far from final. Many questions are still being asked about the internal structures of the present subfamilies, their relationship to each other within Niger-Congo, and the relationship of Niger-Congo itself to Nilo-Saharan (Williamson and Blench, 2000).

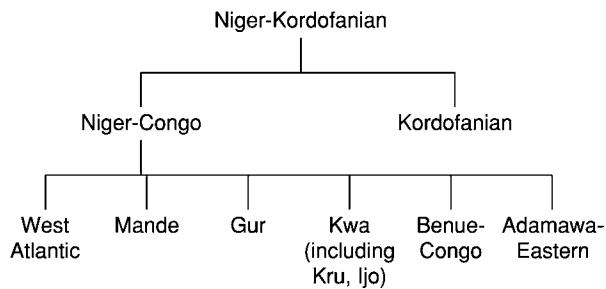

Figure 1 Greenberg's classification.

The Niger-Congo Subfamilies

Mande

Mande languages are spoken by over 10 million people over a wide area, including large parts of

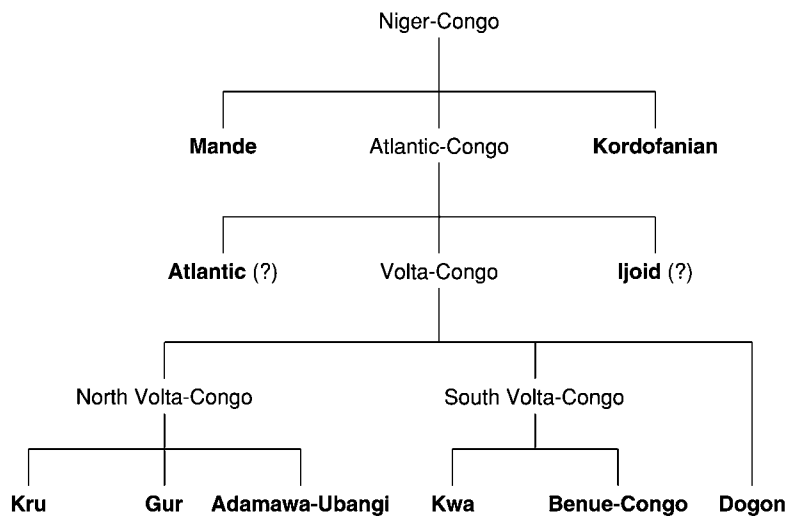

Figure 2 Revised classification.

Guinea, Mali, Sierra Leone, Liberia, and northwest Ivory Coast. Substantial numbers are also found in Burkina Faso, Senegal, Gambia, and Guinea-Bissau, with much smaller pockets in southern Mauritania; northern parts of Ghana, Togo, Benin, and Nigeria; and in southwest Niger.

The internal relationships of the languages within the Mande subfamily are loose. Lexicostatistical studies give only 17% cognates between the Western and Eastern groups.

The much larger Western group, with 27 languages, divides into a Southwestern group of 4 languages and a Northwestern group of 23 languages. Within the Northwestern group, the core group comprises 10 languages, all scoring from 80–90% lexicostatistically, with three of those languages – Bambara (Bamanakan), Maninka, and Jula – being major languages with over 1 million speakers each.

The 13 languages within the Eastern group relate to each other at levels of 30–35% lexicostatistically.

Kordofanian

Kordofanian languages are isolated from the rest of the languages of Niger-Congo, being spoken in the Nuba mountains of central Sudan by 250 000–500 000 people.

Kordofanian is divided into four main groups: Heiban, Talodi, Rashad, and Katla. Greenberg included a fifth group, Kadugli, but it is so divergent from the others that there is serious doubt whether it belongs to Kordofanian but rather to Nilo-Saharan (see Schadeberg, 1981).

Atlantic

Atlantic languages are spoken by about 20 million people. One language, Fula, accounts for 12–15 million of those people and is the most widely scattered language group in Africa, all the way from Senegal to the Sudan. Except for Fula, the Atlantic languages are located primarily along the Atlantic coast from the Senegal River to Liberia.

All of the Atlantic languages fall into one of two groups, northern and southern, except for the languages spoken on the Bijago Islands, which constitute a small third group with 20 000 speakers. Within the northern group, which includes Fula, Wolof, Serer, Jula (Jola), Manjaku-Papel, and Balanta (Balant-Ganja), lexicostatistical percentages range between 24–37.

The languages in the southern group are generally not related closely to each other. Three subgroups are recognized; Mel is the largest, comprising 13

languages, of which Temne (1 million speakers) and Bullom-Kissi (650 000) have the most speakers.

Ijoid

Ijoid is very different from the other subfamilies of Niger-Congo. It comprises the language cluster Ijo and a single language, Defaka. Ijo is not a single language, but a cluster of rather closely related languages/dialects with a total of over one million speakers. The whole subfamily is confined geographically to the Niger Delta. Ijoid does not belong either to Kwa or to Benue-Congo and seems to be outside the Volta-Congo grouping. Hence, it is treated as a branch of Atlantic-Congo.

Kru

Kru languages have been included by some scholars, including Greenberg, within Kwa, but later studies suggest that Kru is closer to Gur. Some have gone further and included Kru in a North Volta-Congo group together with Gur and Adamawa-Ubangi.

The 26 Kru languages are spoken by approximately 2 million people, mostly in the forest regions of southwest Ivory Coast and southern Liberia.

An Eastern and a Western group are recognized. The Western group is the larger and more heterogeneous and can be divided into four subgroups, each of which has one principal language complex: Grebo, Guere (Guere-Krahn), Bassa, and Klao. The Eastern group is more homogeneous and comprises two major subgroups, the Bete and the Dida language complexes, both in Ivory Coast.

Gur

The 85 Gur languages are found in the savannah lands north of the forest belt extending from southeast Mali across northern Ivory Coast, Burkina Faso, Ghana, Togo, and Benin into northwest Nigeria. The number of speakers of these languages is around 12–15 million.

Most Gur languages belong to Central Gur, which is a comparatively closely related group of languages. Within Central Gur, there are two major subgroupings, that of the Oti-Volta (some 25 languages) and Grusi (20 languages). Additionally, there are some 15 languages outside these two main subgroups. The languages within Oti-Volta show appreciably closer relationships to each other than do the languages within Grusi.

To the west of Central Gur lies the Senufo subgroup, comprising some 20 languages, grouped into 7 subgroups. Its relationship to Central Gur is not close, but there is no evidence to group Senufo with any other subfamily.

Dogon

Dogon is spoken in Mali, east of Mopti. Previously, scholars had included it within Gur, but there is general agreement that the grounds for this classification are inadequate. However, there is no evidence to group it with any of the other subfamilies within Volta-Congo.

Adamawa-Ubangi

Adamawa-Ubangi languages are spoken by approximately 8–9 million people from eastern Nigeria across northern Cameroon, southern Chad, the Central African Republic, and northern Zaire into southwestern Sudan.

Some lexicostatistical studies suggest that the Adamawa-Ubangi languages are closer to some of the Gur languages than they are to any of the languages in the other subfamilies within Volta-Congo. A preliminary hypothesis groups Gur and Adamawa-Ubangi in a North Volta-Congo grouping.

The languages within the Adamawa group are found mostly in Nigeria and Cameroon and are rather loosely related. The 70 plus languages/dialects are divided into 16 groups.

The Ubangi group has a larger number of speakers. The languages in it are related more closely to each other and include a number of widely spoken languages, such as Banda, Ngbandi, Ngbaka (Ngbaka-Mba), Gbaya, and Zande. The most probable classification suggests a core group comprising the three subgroups Banda, Ngbandi, and Ngbaka, with two peripheral groups Gbaya and Zande.

Kwa

The 45 Kwa languages stretch across southern Ivory Coast, Ghana, Togo, Benin, and into the southwest

corner of Nigeria, with a total of at least 20 million speakers.

This subfamily divides broadly into two main groups. The larger group, Nyo, comprises some 24 language clusters/languages/dialects covering most of southern Ghana and southeastern Côte d’Ivoire. Within Nyo, Potou-Tano is the largest subgroup with some 17 languages/dialects, including the major languages Akan (Twi and Fanti), Baule (Baoule), and the Guang cluster.

The smaller group, sometimes termed ‘left bank’ because its speakers live east of the Volta river, comprises seven language clusters/languages, of which the Gbe cluster (better known by the name of its largest member, Ewe) is the largest.

Benue-Congo

Benue-Congo is the largest of the subfamilies within Niger-Congo in terms of the number of languages, speakers, and geographical extent. It stretches from the Benin-Nigeria border across Nigeria eastward to Kenya and southward to the Cape. Thus, it covers over half the habitable terrain of the continent and a similar percentage of the population.

Benue-Congo is divided into 11 groups that can be arranged on an approximately west-to-east basis as in Figure 3.

All these groups, with the exception of Bantoid, are found primarily in Nigeria. The principal languages of each group are as follows: Defoid: Yoruba and Igala; Edoid: Edo and Urhobo; Nupoid: Nupe, Ibira (Ebira), and Gwari (Gbagyi); Idomoid: Idoma and Igede; Igboid: Igbo; Cross River: Efik, Ibibio, and Ogoni; Kainji: Kambari; Platoid: Berom, Tarok, and Jukun.

The 11th group, Bantoid, is the largest group in Niger-Congo, comprising several hundred languages,

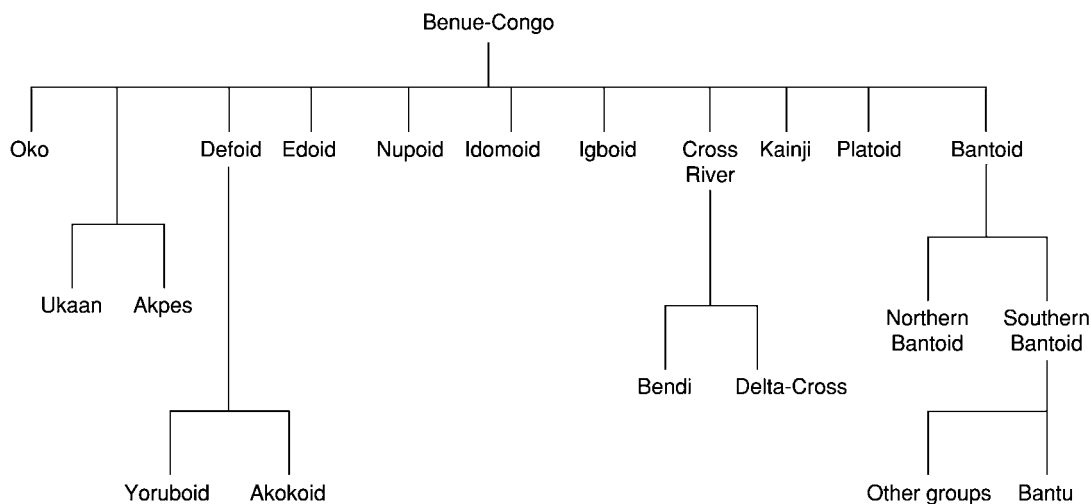

Figure 3 Benue-Congo subfamily.

Figure 4 Bantu's genetic relationships.

covering most of the area southeast of Nigeria and Chad.

Bantoid is divided into a small northern group of languages spoken in eastern Nigeria and western Cameroon, and the very much larger southern group, which includes all the Bantu languages. Bantu's genetic relationships are illustrated in **Figure 4** (see **Bantu Languages**).

Nilo-Saharan Languages

G J Dimmendaal, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

One of Africa's major language phyla, Nilo-Saharan consists of at least 120 languages spoken in an area covering major areas in eastern and central Africa, with a westward extension as far as the Niger Valley in Mali, West Africa. The genetic unity of these languages was first proposed by Greenberg (1963) on the basis of recurring morphological features and lexical similarities. According to Greenberg, Nilo-Saharan constitutes one of the four phyla on the continent, next to Afroasiatic, Khoisan, and Niger-Congo.

Greenberg initiated his classificatory work on African languages in the late 1940s and early 1950s when he established, among others, a Macro-Sudanic family, consisting of Eastern Sudanic, Central Sudanic, Berta, and Kunama (cf. Greenberg, 1955, which contains a collection of articles published earlier in the

Southwestern Journal of Anthropology). Macro-Sudanic was subsequently renamed Chari-Nile, after the two major rivers in the area. Based on a judicious evaluation of the available data, Greenberg (1963) pulled together several disparate groups formerly considered linguistic isolates and known primarily through the pioneering work of Tucker and Bryan (1956) into a new phylum called Nilo-Saharan, of which Chari-Nile formed the core, with Songai (Songhay), Saharan, Maban plus Mimi, For (or Fur), and Koman as additional primary branches (see **Table 1**).

There are at least 120 distinct Nilo-Saharan languages, the number of speakers for individual languages ranging from several millions (compare the sections on Dinka, Kanuri, Luo, and the Songai cluster) to languages with only a few speakers, e.g., Aka, Kelo, and Molo, which belong to the Jebel group within Eastern Sudanic. Although considerable progress has been made over the past few decades with the description and comparison of several Nilo-Saharan

Table 1 Nilo-Saharan subgroups

| Kunama | | Kunama | |
| Koman | isolate | Koman | |

subgroups, a number of lower-level units, for example Daju or Koman, remain poorly known.

Several Nilo-Saharan languages are used only in oral communication; for others orthographies in Latin, Arabic, or Fidäl script have been developed. Old Nubian, which was written in a modified Coptic script, dates back to the 8th century of the Christian era. The role of Nilo-Saharan languages in education also varies considerably depending on the number of speakers, and also on the language policy in the countries where these languages are spoken. For major languages such as Kanuri or Luo, but also for other languages, in particular those spoken in Kenya and Uganda, there is a growing body of literature containing novels, poetry, and oral traditions. Apart from written texts and reference grammars, dictionaries have become available more recently for several Nilo-Saharan languages, for example, Keegan (1996) on the Central Sudanic language Mbay, Creider and Creider (2001) on Nilotic Nandi, or Heine (1999) on the Kuliak (Rub) language Ik.

More Recent Comparative Work

To date, neither the limits of Nilo-Saharan nor the internal organization has been settled. This situation

is due to heterogeneity within the phylum (with several genetically isolated languages) and the presumably considerable time depth involved, as well as the paucity of descriptive sources for a variety of languages. The genetic status of the Songai cluster on the great bend of the Niger River, mainly in Mali and Niger and extending into neighboring countries, remains debatable, for example. However, as a result of the pioneering descriptive work on several varieties of Songai by Heath (e.g. 1999a), future in-depth comparative work with respect to this cluster may be expected.

Some progress has been made over the past decades with the historical comparison of lower-level units such as Central Sudanic, Daju, Koman, Maban, Nilotic, Nubian, Saharan, and Surmic. More recently, it has been argued by Rilly (2003) that the extinct language of the Meroitic empire, preserved in written records which have only been partly deciphered, not only shows Eastern Sudanic affinity, as already proposed by Greenberg (1971), but that it was most closely related to Eastern Sudanic groups such as Nubian, Taman, Nara, and Nyimang (plus Dinik).

On the basis of an extensive comparison of lexical entries, presumed sound correspondences, and grammatical comparison, Ehret (2001) has regrouped various Nilo-Saharan units; according to this classification using shared phonological and grammatical innovations for subclassification, Central Sudanic and Koman, which are also typologically rather distinct from remaining Nilo-Saharan groups, constitute genetic outliers.

Bender (1996, 2000) has also proposed lexical isoglosses and grammatical isomorphs for Nilo-Saharan. Moreover, the same author assumes that Songai, Saharan, and Kuliak constitute primary branches of Nilo-Saharan, whereas the remaining subgroups form a fourth branch. Unlike Ehret, Bender assumes that the Koman group is most closely related to the Eastern Sudanic group. Moreover, he assumes, as other scholars have done, that the Kadu languages in the Nuba Mountains are also part of Nilo-Saharan.

Controversy also remains over the inclusion or exclusion of languages like Biraile (Birale; also known as Ongota), whose speakers live along the Weyt'o River in Ethiopia, and the Shabo (or Mekeyir), another small ethnic group living in southwestern Ethiopia.

The Areal Dimension

Corresponding to the wide geographical spread of Nilo-Saharan languages, considerable typological diversity exists between them. A number of properties nevertheless are widespread and in fact are shared with neighboring Niger-Congo, and to a lesser extent

Afroasiatic, languages. For example, ATR-vowel harmony, in its classical form involving a set of [–advanced tongue root] vowels (ɪ, ɛ, a, ɔ, ʊ), and a set of [+advanced tongue root] vowels (i, e, ä, o, u), is attested in varieties of Songai, For, Kunama, Eastern Sudanic groups like Nubian, Temein, Nilotic, and Surmic as well as in Koman languages. The role of areal contact in this respect remains to be determined. Less common are systems with seven vowels (e.g., in the Nilotic language Datooga) or five vowels (e.g., in Nara). As shown by Andersen (1991), the contrast between breathy and creaky voice vowels in the Nilotic language Dinka goes back historically to an ATR contrast.

Another areal property of Nilo-Saharan shared with neighboring Niger-Congo and Afroasiatic languages is tone, with systems varying between classical two-tone systems with downdrift and downstep and systems with up to four distinct level tones which may also form complex (contour) tones. A number of Nilo-Saharan languages spoken along the northern edge and bordering on Afroasiatic, such as the Songai language Koyra Chiini, appear to be nontonal (Heath, 1999b). There are relatively few tonal grammars of Nilo-Saharan languages. Also, the historical-comparative study of tonal systems is still in its initial stage, Boyeldieu (2000) on a group of Central Sudanic languages being one of the few modern studies in this respect.

Consonant systems range from fairly simple, e.g., thirteen consonants in Southern Nilotic Kalenjin, to a wide range of contrasts in Central Sudanic and Koman languages. Here too, areal contact appears to have played a role; the Kalenjin consonant system, for example, is similar to that of neighboring Bantu (Niger-Congo) languages. Central Sudanic languages like Ngiti have a contrast between voiced and voiceless implosive stops, according to Kutsch Lojenga (1994); moreover, words in Ngiti as well as in the closely related language Lendu may consist of syllabic consonants like *s*, *z*, or *r* only. Whereas voiced implosive stops are more common across Nilo-Saharan, such stops are found in combination with ejectives in Berta, Koman and Surmic; a similar contrast is found in neighboring Omotic (Afroasiatic) languages. The dental/alveolar contrast for stops appears to be restricted to Eastern Sudanic groups like Nilotic, Surmic, Temein, Central Sudanic Kreish, or the Koman language Kwanimpa. Labial velar stops are common in Central Sudanic as well as neighboring Nilotic languages. The role of areal contact with Niger-Congo languages again remains to be determined.

A prototypical feature of many Nilo-Saharan groups, which appears to be relatively rare elsewhere

in the world (except in Cushitic and Semitic, i.e., Afroasiatic, languages), involves a distinction between singulative, plural or collective, and replacement marking (Dimmendaal 2000). Nouns referring to items usually occurring in pairs or in larger numbers, such as ‘breast’, ‘fly’, or ethnonyms, tend to take a singulative marker and are morphologically unmarked in the plural. In addition to plural (or collective) marking, nouns (in particular derived ones) tend to be inflected for number both in the singular and the plural. This three-way distinct is not attested in geographically more peripheral Nilo-Saharan zones, e.g., in Central Sudanic, Saharan, or Songai. Gender marking, though not widespread, is found as an inflectional feature of nouns in Eastern Nilotic, for example, and as a derivational property in the Southern and Western branch of Nilotic.

From a morphosyntactic point of view, Nilo-Saharan language groups spoken in an area ranging from northern Ethiopia and Eritrea across north-central Sudan and extending into Chad and Nigeria share typological features with Afroasiatic languages in Ethiopia. These include a basic constituent order whereby the verb occurs in final position, an extensive case marking system, verbal compounding (e.g., with ‘say’ or other types of light verbs, such as ‘put’ or ‘do’), as well as the use of converbs as dependent verb forms in complex sentences, although not all properties are necessarily present in all groups. These common typological features to some extent may be due to areal diffusion as a result of long-term cultural contacts and corresponding patterns of multilingualism between speech communities in these areas. The Wadi Howar, also known as the Yellow Nile (a former river sanctuary and tributary to the Nile which connected the mountainous area in eastern Chad with the Nile Valley from about 8000 B.C. till about 1000 B.C.; cf. Figure 1), possibly constituted an important geographical condition for this cultural and linguistic diffusion (cf. Keding, 2000, for a discussion of the geomorphological and archaeological background; see also Amha and Dimmendaal (2006), for a discussion). The gradual extinction of this riverine system may have resulted in a diaspora of Nilo-Saharan languages from the Wadi Howar region in an eastern, western, and southern direction.

Ehret (2001: 202–209) has argued for the reconstruction of a series of case suffixes for the earliest stages of Nilo-Saharan. Such dependent-marking systems are indeed attested in a range of Nilo-Saharan groups between Chad and Eritrea, as pointed out above. Remnants of case marking are also attested in Central Sudanic languages, but not apparently in Koman or Songai. Reduced case marking systems, and, correspondingly, a more extensive verbal

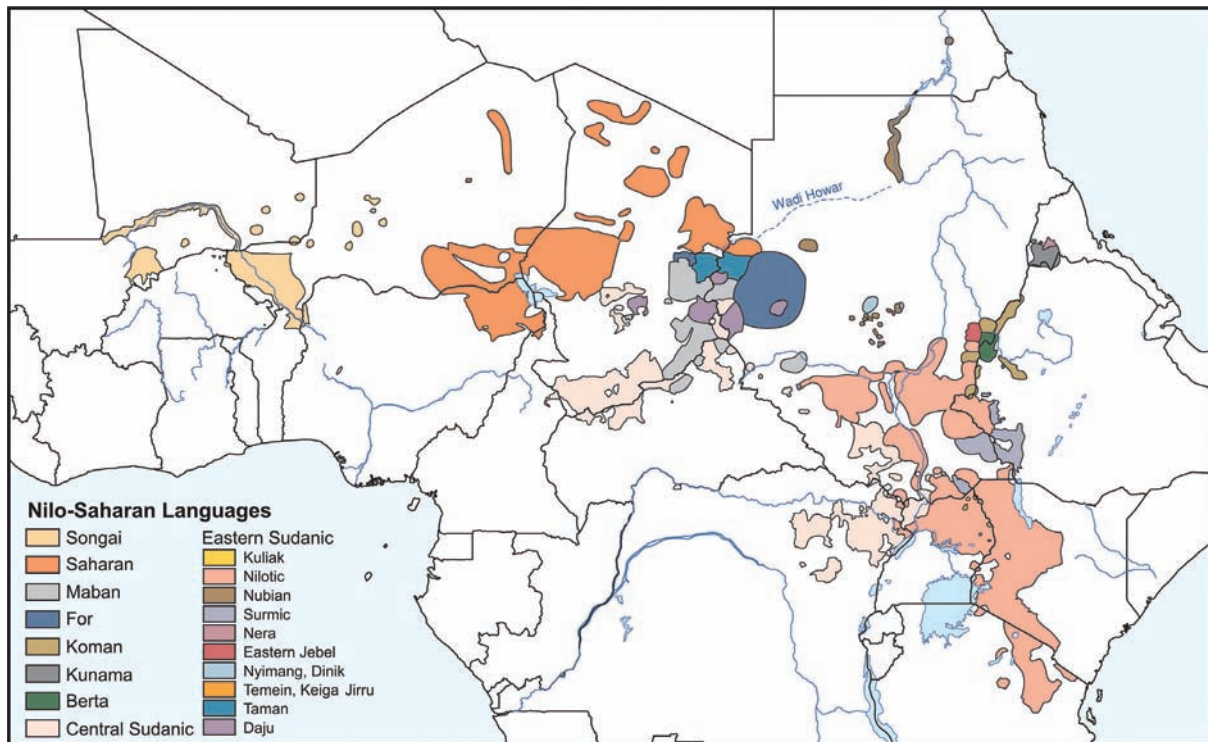

Figure 1 Map of Nilo-Saharan languages.

strategy of marking semantic roles like location, direction, and instrument, is found in Berta and Eastern Sudanic groups like Daju, Nilotic, Surmic, and Temein. Rather than having preverbal subjects, several languages belonging to these latter groups allow for postverbal subjects which are marked for case (the so-called ‘marked nominative’). An interesting combination of head marking and dependent marking at the clausal level is found in the verb-initial Kuliak (Rub) languages (cf. König, 2002). For a number of Nilotic languages using the marked nominative strategy for postverbal subjects, it has been argued that this applies only to transitive predications, thus giving rise to ergative properties, as the object or the subject of an intransitive predicate precede the verb and are not marked for case. As shown by Reh (1996) for the Nilotic language Anywa (Anu), OVS and SV are but one of several constituent order types allowed for in the language, alternatives being governed by pragmatic principles (e.g. active and less active participants, or participant orientation as against action orientation).

Pronominal subject (and occasionally object) marking, diathesis, causative, and pluractional marking are common morphological properties of verbs in Nilo-Saharan. Languages in the border area between Sudan and Chad, such as For or the Maban and Taman group, manifest complex morphophonemic alternations for consonants in their verb systems.

Derivational morphology tends to be expressed mainly by way of suffixation, and by prefixation in Central Sudanic; the causative marker, however, involving a presumably cognate morpheme consisting of a high front vowel, tends to be expressed as a prefix in Central Sudanic as well as elsewhere in Nilo-Saharan.

The use of logophoric pronouns marking coreferentiality between argument positions across clauses and sentences is a feature of some Nilo-Saharan groups which is shared with Niger-Congo and Chadic as well as Omotic (i.e. Afroasiatic) languages. A universally uncommon anti-logophoricity marking is found in Western Nilotic Mabaan.

Niuean

W B Sperlich, Auckland, New Zealand

© 2006 Elsevier Ltd. All rights reserved.

Niuean (Niue) is the language of Niue, a Pacific island and self-governing territory of New Zealand. Niuean belongs to the Tongic subgroup of Polynesian (with Tongan and Niuean as the only members). The language name is synonymous with the name of the island. It is derived from *niu-ee* ('coconut-see') and is considered by oral tradition to be the exclamation by the earliest arrivals from Tonga (no earlier than 2000 years ago, according to archaeological evidence), who were surprised to see many coconut palms growing on the island. While Niuean is clearly a Tongic language (i.e., the first and subsequent settlers arrived mainly from Tonga) there are also elements of Samoan, Pukapuka, and Cook Islands Maori embedded in the Niuean language. Borrowings since European contact, especially early on via missionary efforts and more recently via trade, tourism, and globalization, are on the increase, and the impact of English syntax on Niuean is already pronounced. However, conservative Niuean is a strict verb-initial (or predicate-initial) language, and depending on the definition of 'subject' and 'object' can be designated

as either VSO or VOS. It has been argued that subjecthood in Niuean is not a syntactic category and that only a core predicate and arguments are the basic constituents of a sentence. Niuean is a split-ergative language (morphologically ergative, syntactically accusative). A canonical sentence with ergative (ERG) and absolutive (ABS) case marking is exemplified below:

| | | | | | | |
|----|-----|-----|------|------|-----|---------|
| Ne | kai | he | pusi | ia | e | moa |
| T | eat | ERG | cat | that | ABS | chicken |

'that cat ate the chicken'

To better express the ergative case above, a more literal (but less idiomatic) translation would be via the English passive: 'The chicken was eaten by that cat.' Indeed, some linguists have compared the ergative case marking to that of passives, noting, however, that the ergative case is unmarked. Niuean does not have antipassives. Other syntactic areas of special interest include raising, instrumental advancement, topicalization, causatives, possession, reflexives, and noun incorporation. A special feature of Niuean morphology is reduplication. Furthermore, highly productive affixation allows complex morphological strings. The causative prefix *faka-* and the prefix *ma-*, which changes verbs into participles, are most

common. Various degrees of lexicalization can make analysis difficult. The phonological inventory is simple in its use of only some 10 consonants (and no clusters) but is complex in its use of vowels, which are either short or long. Short vowels give rise to practically all combinations of diphthongs. Since the syllable structure is (C)V(V), there are many extended vowel sequences across morpheme boundaries, as for example in the complex word *faka-fe-haga-ao-aki*, where the sequence *-alaola-* is rearticulated.

Niuean as a conservative language is an important witness for historical linguists who work on proto-Polynesian and proto-Oceanic languages, as well as being an important sample language in typological and comparative linguistics.

Nivkh

G D S Anderson, Max Planck Institute, Leipzig, Germany and University of Oregon, Eugene, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Nivkh (Gilyak) has perhaps 400 speakers (1991) out of an ethnic population of 4400 (as of 1996; G. A. Otaina) in East Siberia. There are two dialects,

the Amur and the Sakhalin; the latter is subdivided into eastern and northern clusters. There are approximately 100 Amur Nivkh speakers out of a population of 2000 and 300 Sakhalin Nivkh speakers out of a total population of 2700 (as of 1995; M. Krauss). On Sakhalin Island, many Nivkh live in the villages of Nekrasovka and Nogliki. Along the Amur River, a number of Nivkh reside in Aleevka village. Nivkh is

a true language isolate. Attempts to link it with other groups have never succeeded. The Nivkh still maintain their long-practiced traditional economies based on subsistence fishing supplemented by hunting and gathering.

Word initially, the velar nasal is common in Nivkh, as shown in Example (1) (Gruzdeva, 1998: 11–13, 24, 32):

- | | |
|-----------------------|-----------------------|
| (1) ɲaarla ‘very fat’ | ɲaχ ‘soft roe’ |
| ɲax ‘6’ | ɲamk ‘7’ |
| ɲiŋk ‘face’ | ɲafqɲafq ‘each other’ |

One of the hallmarks of Nivkh structure is the curious and characteristic system of morphologically conditioned stem-initial consonant mutation to mark a range of inflectional (and derivational) categories. In this regard, note the initial consonant in the word for ‘head’ in the following three Nivkh forms (Gruzdeva, 1998: 14):

- | | | |
|------------------|----------------|----------------|
| (2) kyxkyx tʰoŋr | it zoŋr | čam dʰoŋr |
| swan head | drake head | eagle head |
| ‘swan’s head’ | ‘drake’s head’ | ‘eagle’s head’ |

Like many languages of the Pacific Rim, Nivkh contrasts special portmanteau counting forms for nouns of various types (e.g., people vs. animals). Twenty six such classes of numerals have been reckoned for Nivkh by Panfilov (1962) and Krejnovich (1932). Compare the following examples for Amur and East Sakhalin dialects (Panfilov, 1962: 6–7; Gruzdeva, 1998: 24):

- | | | |
|----------|-------------|-------------|
| (3) Amur | E. Sakhalin | Gloss |
| ñin, ñen | ñenɲ | ‘1 person’ |
| nir | nirɲ | ‘4 people’ |
| ɲax | ɲax | ‘6 people’ |
| ɲamk | ɲamk | ‘7 people’ |
| Amur | E. Sakhalin | Gloss |
| ñiñ | ñan | ‘1 animal’ |
| nur | nur | ‘4 animals’ |
| ɲax | ɲax | ‘6 animals’ |
| ɲamk | ɲamk | ‘7 animals’ |

Nivkh is typical of Siberian languages in its use of a range of grammatical and local/directional case forms. Among the oppositions found in Nivkh is a contrast between a dative and an allative case, as shown in the following examples (Gruzdeva, 1998: 20, 21) (NEG, negative; DAT, dative; IMP, imperative; REFL, reflexive; LOC, locative; ABL, ablative; ALL, allative; TERM, terminative; FUT, future; FIN, finite; PRED, predicative):

- | | | |
|----------|---|--------------|
| (4a) tʰa | ikin-dox | tʰaxta-ya |
| NEG | elder.brother-DAT | be.angry-IMP |
| | ‘Don’t be angry at (your) elder brother.’ | |

- | | |
|---|---------------------------|
| (4b) ɲin-dox | pʰvo-x |
| we-DAT | REFL-village-LOC/ABL what |
| tʰamdid xer-ya | |
| tell-IMP | |
| ‘Tell us what is (going on) in your village.’ | |

- | | | |
|---------------------------------|----------------|-----------------|
| (4c) ɲi | eri-rɣa | vi-ni-dʰ-ra |
| I | river-ALL/TERM | GO-FUT-FIN-PRED |
| ‘I shall go (up) to the river.’ | | |

- | | | |
|--------------------------------------|------------------|---------------|
| (4d) tʰ-itk | haimɲaf-toyo | hunv-nd-ra |
| 2-father | old.age-ALL/TERM | live-FIN-PRED |
| ‘Your father lived (up) to old age.’ | | |

One category marked morphologically in the Nivkh verb is reciprocal action. This is encoded by the prefix *v-* in Amur Nivkh and *v-/o-/u-* in Sakhalin Nivkh.

- | | | |
|--------|-------------------|-----------------------------|
| (5) v- | or ‘meet’ | v-aɣay ‘disturb each other’ |
| o-smu | ‘love each other’ | |

Also found is a syntactic means of indexing this category through the word *pʰɲafqɲafq* (REFL-friend. friend) ‘each other,’ a possible calque from Russian *drug druga*, etc.; the verbs in such sentences lack the reciprocal prefix (Gruzdeva, 1998: 32):

- | | | |
|-----------------------------|-------------|-------------|
| (6) imɲ | pʰɲafqɲafq. | lov-di |
| they | each.other | imitate-FIN |
| ‘They imitated each other.’ | | |

Subordinate clauses in Nivkh are generally marked by some kind of nonfinite, nominalizing, or adverbializing morphology. This is common in many Siberian and other Eurasian languages (Anderson, 2003). The following example is from Gruzdeva (1998: 50):

- | | | |
|--|----------|-------------|
| (7) imk | čo | hak-vul |
| mother | fish | cut-TEMP.CV |
| pʰ-ajmɲař-kiř | roř | kʰerai-d |
| REFL-husband-INSTRUMENTAL | together | talk-FIN |
| ‘Mother talked with her husband while cutting fish.’ | | |

Norse and Icelandic

T Eythórsson, University of Iceland, Reykjavík, Iceland

Terminology and Historical Relations

Norse, or more specifically Old Norse, is a branch of medieval North Germanic (*see Germanic Languages; Indo-European Languages*). Old Norse is another name for Old West Nordic, referring to the language spoken from about 800 A.D. to the late 14th century in Norway and to the mid-16th century in Iceland. It was also spoken in the Faroe Islands, and in the Norse (Viking) settlements in the British Isles and Greenland. In a narrower sense, Old Norse is often used interchangeably with Old Icelandic, since most of the transmitted texts were written in Iceland. Modern Icelandic is the language of Iceland from the mid-16th century onwards, and is spoken today by about 290 000 people.

The earliest documented stage of North Germanic is Ancient Nordic (also known as Proto-Nordic, Runic

Norse, or Early Runic), attested in runic inscriptions in the Old Germanic writing system, the *futhark*, dating from about 150 to 800 A.D.. Towards the end of this period North Germanic began to divide into Old Norse (gradually splitting into Old Norwegian and Old Icelandic), on the one hand, and Old East Nordic (Old Danish, Old Swedish, and Old Gutnish), on the other.

Despite being in origin a West Nordic language like Icelandic and Faroese, Modern Norwegian has developed characteristics that are closer to Danish and Swedish (*see Norwegian*). Therefore, the modern Nordic (or Scandinavian) languages can be grouped into Mainland Scandinavian (Swedish, Danish, and Norwegian) and Insular Scandinavian (Icelandic and Faroese).

From Old Norse to Modern Icelandic

The evidence for Old Norse almost exclusively comes from Norway and Iceland; early documentation of Faroese is much poorer, and that of Norse in other

areas settled by Norsemen is very scanty. Early on, linguistic innovations started to separate Old Norwegian from Old Icelandic, but the differences between them did not become significant until the 14th century. The oldest Icelandic manuscripts do not display dialect variation, which may indicate leveling of putative preexisting dialect differences among the settlers, most of whom are reported to have come from Norway, either directly or via the British Isles. The most copious source of evidence involves prose texts transmitted in manuscripts in the Latin script, the earliest dating from the 12th century. Particularly important for the study of Old Icelandic phonology is the so-called First Grammatical Treatise (ca. 1150), an outstanding work in terms of its scientific precision and methodological rigor. A further source is found in two types of Old Norse poetry, the 'eddic' and 'scaldic' poems. Both types of poetry preserve numerous archaic features, in part due to their metrical form, and thus they represent a linguistic stage predating the earliest written texts. Finally, there are runic inscriptions in Old Norse, mostly from Norway but also from Iceland. There has been an unbroken written tradition from Old Norse to Modern Icelandic.

Phonology

Ancient Nordic had five vowels, which could be long or short, and three diphthongs. Due to umlaut, breaking and other sound changes, however, Old Norse had, by the mid-12th century, developed a system of twenty-six vowel phonemes and three diphthongs. In this system not only vowel quantity but also nasality were distinguished, but the latter distinction (which only pertained to long vowels) was lost early on. In the following centuries some further changes occurred in the vowel system, the most important being the loss of distinctive vowel length. This change, known as the 'great quantity shift,' took place in Icelandic in the 16th century, but in the three preceding centuries it had affected most of the other Nordic languages. As a result of these changes, the Modern Icelandic vowel system, consisting of eight vowel phonemes and five diphthongs, is very different from that of Old Norse, although the effects of the changes are obscured by conservative orthography. By contrast, the consonant system has remained more stable from Old Norse to Modern Icelandic. Certain characteristics of Modern Icelandic consonants are rare in other languages, e.g., preaspiration of voiceless stops (*happ* [hahp] 'luck') and devoicing of sonorants (*milt* [milt] 'mild,' *fiñt* [fiñt] 'fine'). However, such sounds also occur in Faroese and some Norwegian dialects, which may point to a common origin in Old Norse. Moreover, similar characteristics

in neighboring languages, Scots Gaelic and North Sámi (Saami, Northern), are possibly due to contact between these languages and Old Norse.

Morphology

Old Norse is distinguished from its Germanic relatives by two notable morphological innovations. The first involves the development of a definite article, which can be free or suffixed to the noun; in either case the noun and the article both inflect. There is no indefinite article in Old Norse, a situation which has been preserved in Modern Icelandic but not in the other modern Nordic languages. The second innovation is 'middle' verbs characterized by an ending which originated as an enclitic reflexive pronoun. The middle has various meanings, such as reflexive, reciprocal, anticausative, and passive. The last meaning is uncommon in Old Norse and Modern Icelandic, but has become the dominant one in Mainland Scandinavian.

Otherwise, most morphological categories known from other Old Germanic languages recur in Old Norse and, by and large, in Modern Icelandic as well. These include the four cases of nouns, pronouns, and adjectives, and three degrees of comparison for most adjectives and some adverbs. Nouns are inherently masculine, feminine, or neuter, but pronouns and adjectives agree in gender with the noun they modify. Finite verbs are inflected in three persons, two tenses (present, past), and three moods (indicative, subjunctive, imperative). The nonfinite verb forms comprise the infinitive and the present and past participles.

There are two numbers (singular and plural) in Old Norse, with the sole exception of the first and second person personal and possessive pronouns that preserve the dual number as well. In Icelandic the pronominal dual replaced the plural forms, whereas the old plural forms were restricted to honorific (formal) usage; in the past few decades the use of the honorific forms has decreased so that they are by now obsolete.

Syntax

Old Norse is a verb second (V2) language: the finite verb obligatorily occurs no later than in second position in all main clauses. V2 is an innovation in Germanic *vis-à-vis* other Indo-European languages, which may originally have been limited to certain main clause types and then generalized to all main clauses. Moreover, in Old Norse the finite verb occurs in second position in subordinate clauses as well, presumably due to an extension of the main-clause pattern.

This pattern ('symmetric V2') has been preserved in Modern Icelandic but not in Mainland Scandinavian.

Old Norse also has verb-initial clauses (V1), e.g., in direct questions, commands (imperatives), and conditional clauses. Declarative main clauses exhibiting V1 are frequent in narrative contexts ('narrative inversion').

In noun phrases (NPs), adjectival and pronominal modifiers regularly precede the head noun in Old Norse, but they may also follow it. Possessive genitives, on the other hand, generally follow the head noun, and this is also the case in Modern Icelandic.

In Old Norse the order of the nonfinite verb relative to an object in the verb phrase (VP) can be either verb-object (VO) or object-verb (OV). Such variable VP order also occurs in Old English. In Modern Icelandic OV orders were lost rather abruptly in the beginning of the 19th century, several hundred years later than in most other Nordic languages. The only exceptions to the strict VO pattern in Modern Icelandic are found with negative objects, which obligatorily precede the verb, and quantified objects, where either order may occur.

In the neutral word order in both main and subordinate clauses the subject occurs initially, immediately followed by the finite verb in second position (V2). In clauses containing a fronted nonsubject, the subject regularly follows the finite verb, although it may also occur further to the right, and even be extraposed to the end of the clause. Topicalization of VPs is ungrammatical in Modern Icelandic and seems not to be attested in Old Norse prose. However, fronting of nonfinite verbs (past participles, infinitives), as well as other head-like elements, is very common. This is 'stylistic fronting,' which only occurs in clauses that do not contain an overt subject ('subject gap').

As in other Germanic languages with morphological case, in Old Norse and Modern Icelandic subjects are typically in nominative case, direct objects in accusative case, and indirect objects in dative case. Various other patterns exist, however; in particular, dative objects are more common than in other Germanic languages. A further noteworthy characteristic is the occurrence of oblique (or 'quirky') subjects in Modern Icelandic (and Faroese). The status of the corresponding oblique NPs in Old Norse has been a matter of some controversy, but it is clear that in some respects they pattern syntactically with nominative subjects rather than with unambiguous objects. There is a tendency among some speakers of Icelandic to generalize dative case at the expense of accusative on some oblique subjects ('dative sickness'), or to replace the oblique case by nominative ('nominative substitution').

The emergence of a nonreferential or 'expletive' element, homonymous with the singular neuter pronoun *það* 'it,' was an innovation that gained ground in Icelandic in the latter half of the 18th century. About the same time, referential null arguments (*pro*-drop), occurring under certain rather well-defined conditions in Old Norse and early Modern Icelandic, were largely lost. A further innovation, apparently much more recent, is the 'new impersonal construction' (also called the 'new passive'), which has passive verb morphology (an auxiliary verb 'be' plus a past participle) but an accusative object in post-verbal position. This phenomenon does not seem to have a match in other Germanic languages, but there are typological parallels further afield, e.g., in Polish and Irish (Gaelic, Irish).

In archaic Old Norse (eddic and scaldic poetry), negation was expressed by a verbal prefix *ne* 'not,' also found in other Old Germanic languages. At this early stage of Old Norse the prefix could cooccur with a suffix (-*a* or -*at*) attaching to the finite verb, so that together the prefix and the suffix formed a discontinuous negation. These forms were lost early on, and negation came to be expressed by sentence adverbs (cf. Icelandic *ekki*, Danish *ikke* 'not').

Vocabulary

The Old Norse vocabulary belongs to the common Germanic stock. In addition to the inherited material, it contains a number of cultural loans from neighboring languages that the Vikings were in contact with. In Icelandic a few Celtic loanwords date from the earliest period, which is comprehensible in light of the fact that some of the Norse settlers came to Iceland via the British Isles, where they had been living in the proximity of Celts. Christianity, introduced in Iceland in the year 1000, led to an influx of new loanwords relating to religious and scholarly concepts, either directly from Latin or through intermediaries, especially Old English and Old Saxon. Further contact, especially trade and translations of the literature of chivalry, brought new loans from Low German that were mostly transmitted via Norwegian, although some of them were ultimately of French or Latin origin. In the wake of the Reformation in the mid-16th century more loanwords entered the language, in particular from High and Low German. The transmission mostly followed via Danish, which remained the most influential foreign language in Iceland until the middle of the 20th century. Since then the influence of English has been increasing steadily. A recent survey indicates that today, English is used more on a daily basis in Iceland than in any other Nordic country.

Despite long-standing contact with other languages, the vocabulary of Modern Icelandic is closer to Old Norse than that of any other Nordic language. This situation has in part been achieved by conscious effort. There is a long tradition of countermovement, dating back at least to the 18th century, against the infiltration of the language by foreign words and expressions, and language purism has been practiced as an active language policy since the mid-19th century. According to this policy, neologisms are created for new concepts (e.g., *sími* ‘telephone,’ *tölva* ‘computer’) rather than adopting words from other languages. Moreover, attempts have been made to resist phonological, morphological, and syntactic changes, even by resurrecting some archaic patterns; while some of these attempts have been quite successful, others have failed. The old custom of patronymics (*Höskuldsson* ‘son of Höskuldur,’ *þórhallsdóttir* ‘daughter of þórhallur’) has been preserved to a large degree, with the active support of the public authorities. The use of metronymics is also an option, although much less common, but it seems to have increased somewhat in recent years (*Guðrúnardóttir* ‘daughter of Guðrún,’ *Hrafnbjargarson* ‘son of Hrafnbjörg’). In the Icelandic telephone directory people are generally listed under their first name.

Archaism and Innovation in Icelandic

Icelandic is often claimed to be a ‘conservative’ language that has preserved many archaic features, and it is probably true that it is no more difficult for the modern Icelander to read the Old Icelandic 13th-century sagas than it is, for example, for speakers of English to read Shakespeare. Moreover, despite a certain amount of geographically distributed language variation, which mainly affects pronunciation, there appear never to have been well-defined local dialects in Iceland with numerous distinctive characteristics. Nor are there strong contrasts between a standard and substandard register, at least compared to many other countries. Some possible reasons for this stability may be the geographic isolation of the country, an active conservative literary tradition, and a strong tradition of language purism. Nevertheless, as indicated above, numerous innovations have taken place since Old Norse, mostly affecting the phonology and syntax of the language rather than its morphology.

North Philippine Languages

L A Reid, University of Hawai'i, Honolulu, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

There are reported to be around 70 languages spoken in the north of the Philippines, nearly half of the total number of Philippine languages (Grimes and Grimes, 2000). For the purpose of this article, these languages include all of those spoken to the north of Manila, on the island of Luzon, and on the islands of the Batanes group, located in the Bashi Channel between Luzon and Taiwan. All of these languages belong to the branch of the Austronesian family, commonly referred to as Malayo-Polynesian (but in some works as Extra-Formosan), that began with the movement of Austronesian Neolithic seafaring people from what is now called Taiwan to eventually settle all of the Philippines and ultimately the rest of the Pacific. Recent archaeological evidence (Bellwood *et al.*, 2003: 158) suggests that this movement began around 4000 years ago, with a small group of Austronesian people leaving the eastern coast of Taiwan, settling the Batanes Islands and eventually reaching the northern coast of Luzon. The Philippines was already occupied at that time by a large number of Negrito bands of hunter-gatherers, most of which are already extinct or which have been completely assimilated by the technologically superior immigrating Austronesians. There are still, however, more than 20 groups of Negritos located in relatively remote areas of the northern Philippines. About 15 of these groups, variously called Agta, Alta, and Arta, live in and around the Sierra Madre mountain range, with five or more groups called Ayta scattered around the Sambal mountain range in the west of Luzon. All Negrito groups adopted the language of their closest Austronesian neighbors in the distant past (Reid, 1987), but today they have diverged to the point where they speak languages which are clearly distinct from those of their neighbors. The Negrito languages are now highly endangered, because of the continuing pressure to integrate with their non-Negrito neighbors and the influence of the local trade languages.

Three of the languages in the northern Philippines, Ilokano (Ilocano) (with 6 636 000 speakers, or approximately 8.7% of the total Philippine population of 76 504 000, according to the National Statistics Office of the Philippines 2000 Census of Population and Housing), Kapampangan (Pampangan) (with 2 066 800 speakers, or 2.7%), and Pangasinan (with 1 185 600 speakers, or 1.5%) are referred to as 'major' languages, based on number of speakers. Of these, Ilokano is most important, being widely spoken as a second language and used as a language of wider communication throughout the north of Luzon. These three languages belong to three different sub-groups of Philippine languages. Ilokano is a first-order branch of the major language family in the north of the Philippines, referred to as northern Luzon or Cordilleran (Reid, 1979). Pangasinan is a member of the Central–Southern branch of the same family, while Kapampangan groups with the Sambalic languages, and possibly ultimately with the Batanic languages Itbayat and Ivatan, spoken in the far north of the Philippines (and their closely related language, Yami, spoken on Lányü or Orchid Island in Taiwan).

Tagalog has been used for a long period as a lingua franca in some areas of the northern Philippines, particularly on the eastern coast of Luzon, as far north as Paranan, with extensive influence on languages spoken in the area. In addition, in the guise of Filipino, the national language of the Philippines, the language has in recent years been moving out of the classroom throughout northern Luzon and into the daily lives of the younger generation, competing with Ilokano as a tool for communicating with outsiders.

The northern languages of the Philippines have a type of syntax that is found throughout the country (Reid and Liao, 2004). Predicates typically occur at the beginning of constructions, only allowing topicalized NPs to precede them. Noun phrases are typically introduced by one of a series of short, often monosyllabic forms which specify semantic features of the lexical head of the phrase, whether it is a common or personal noun, whether it is singular or plural, and in some languages its spatial or temporal relationship to

the speaker. This form may also mark the case of the noun. Nominative (or absolutive) NPs are typically unmarked for case when they are lexical nouns, but are case marked when a pronominal substitute replaces them.

Each of the languages is morphologically ergative, with the patientlike noun phrase of transitive sentences being marked in the same way as the single argument of intransitive sentences, while the agentlike noun phrase of transitive sentences is marked in the same way as that of genitive constructions within a noun phrase.

Intransitive constructions are either monadic (having a single core argument) or dyadic (having two core arguments). The latter construction is amenable to an antipassive analysis, with the patientlike oblique argument being typically indefinite and marked with the same case marking as that used for locative noun phrases, unlike Tagalog, which marks such oblique NPs as genitives. Intransitive constructions are often referred to in the literature as ‘actor-focus,’ in that the morphology on the verb conveys the information that the nominatively marked NP is an ‘actor.’ Transitive constructions are typically considered to constitute at least four different types, ‘goal focus,’ ‘locative focus,’ ‘instrument focus,’ and ‘benefactive focus,’ depending on the morphology of the verb. Structurally these constructions are identical. They differ only in the semantic interpretation of the nominative NP of the sentence.

The northern languages of the Philippines tend to be more complex phonologically than other Philippine languages, which typically have only four or five vowels. Casiguran Dumagat Agta, for example, has developed an eight-vowel system, while Balangaw (Balangao), a Central Cordilleran language, is reported to have seven vowels. Karao, a southern Cordilleran language, has developed a series of fricatives /f/, /θ/, and /x/, which are unusual in Philippine languages. Several of the languages have very complex morphophonemic (sandhi) alternations. These include Ibanag, a northern Cordilleran language (Brandes and Scheerer, 1927–1928), and Karao and its sister language, Inibaloi (Ibaloi) (Brainard, 1994). Some dialects of Bontok (Bontoc), Ifugao, and Kalinga exhibit a complex range of often voiceless fricative or affricate prevocalic variants of their voiced stops, /b/, /d/, and /g/, such as Guinaang Bontok [f], [ts], and [k^h] (Himes, 1984–1985), which because of the influence of English in the schools are losing their

environmental conditioning and are now becoming separate phonemes in the languages (Reid, 2005).

Published text resources are available on a number of Cordilleran languages. Moreover, one of the finest dictionaries of a Philippine language is that of the central Cordilleran language Ifugao (Newell, 1993).

Sociohistorical Setting

Norwegian together with Danish and Swedish constitute the Mainland Scandinavian languages, which, together with the Insular Scandinavian languages, Faroese and Icelandic, constitute the Scandinavian languages. The Scandinavian languages belong to the Germanic family of the Indo-European languages.

Norwegian is exceptional in having two officially recognized written standards. These are called *Bokmål* 'book language' and *Nynorsk* 'New Norwegian'. Bokmål is used by more than 80% of the population, whereas Nynorsk is used by less than 20%, mainly in the area stretching from the interior of southern Norway to the western coast. As for the spoken language, there is a rich variety of dialects, although all of them are mutually intelligible. The use of (nonstandard) dialects is widely accepted, even in more formal contexts. There is no officially recognized standard for the spoken language. It is important to note that Bokmål and Nynorsk are written standards that individuals choose largely irrespective of which dialectal variety they speak.

The two written standards have their background in the history of Norway. From 1380 to 1814, Norway was in a political union with Denmark, and Danish was used as a written language. Eventually, during the flourishing of nationalism after 1814, a Dano-Norwegian written standard was developed in the 19th century, bringing Norwegian elements into the Danish language. This standard gradually evolved into present-day Bokmål. Also, in the 19th century, a more radical approach was followed by Ivar Aasen (1813–1896). He developed a written standard based on the spoken dialects. This standard gradually evolved into present-day Nynorsk.

Today, Bokmål and Nynorsk are quite similar, but there are still certain spelling differences both regarding content words and grammatical morphology. In the description of Norwegian below, I will concentrate on the common structural features of the spoken language as a whole. All examples are written in the Nynorsk standard unless otherwise stated.

Morphology and Phonology

Finite verbs in Norwegian only show tense distinctions (past, present). There are two nonfinite verb forms, the infinitive and the past participle, and an adjectival present participle form. Example (1)

shows the inflectional paradigm for the weak verb *kjøpe* 'buy'.

- (1) kjøpe (infinitive) - kjøper (present) - kjøpte (past)
- kjøpt (past participle)

Nouns have no productive case distinctions. However, they inflect for number (singular, plural) and definiteness (definite, indefinite), and there are three genders (masculine, feminine, neuter). Example (2) shows the paradigm for the feminine noun *geit* 'goat'.

- | | | | | |
|-----|-------|-------|------------|---------------------|
| (2) | | sg | | pl |
| | indef | geit | 'goat' | geiter 'goats' |
| | def | geita | 'the goat' | geitene 'the goats' |

As shown, definiteness is marked inflectionally as a suffix (*-ene* is a portmanteau morph expressing both definiteness and plurality). There is also a free-form indefinite article, varying according to gender; *ei* is the feminine form, as in *ei geit* 'a goat'.

Adjectives show agreement in gender (m/f and n) and number (sg, pl) in predicative and attributive positions.

As for phonological properties, Norwegian dialects have relatively rich vowel and consonant systems. Also, Norwegian dialects make extensive use of diphthongs. In most dialects, tones may have distinctive function.

Syntax

Norwegian is a SVO language with fixed word order, cf. (3).

- (3) Mannen kjøper geita.
'The man buys the goat.'

Norwegian is also a verb second (V2) language, with the finite verb in second position in main declarative clauses. Thus, topicalization of the direct object in (1) yields *geita kjøper mannen* 'the goat the man buys' with the finite verb in the V2 position.

Auxiliary verbs are positioned between the subject and the main verb, as in *mannen har kjøpt geita* 'the man has bought the goat'. Finite auxiliary verbs follow the V2 pattern, cf. *geita har mannen kjøpt* 'the goat the man has bought'.

Adverbials are positioned in the middle field (sentence adverbials) or toward the end of the clause (predicate adverbials).

- (4) Mannen har aldri kjøpt geiter på ein søndag.
'The man has never bought goats on a Sunday.'

Like other V2 languages, Norwegian shows an asymmetry between main and embedded clauses as to the

relative distribution of sentence adverbial and finite verb, compare (4) to the embedded clause in *eg veit at mannen aldri har kjøpt geiter på ein søndag* 'I know that the man has never bought goats on a Sunday'.

Norwegian has a strict subject requirement in finite clauses. If there is no semantic subject, an expletive subject must be inserted.

(5a) Det regnar.
'It rains.'

(5b) Det står ei flaske på bordet.
it stands a bottle on table-the
'There is a bottle standing on the table.'

In most dialects, *det* 'it' is used as expletive subject in both meteorological (5a) and presentational (5b) sentences. Some dialects allow *der* 'there' as an expletive subject in addition to *det* 'it'.

Norwegian has two main types of passive, namely periphrastic passive and reflexive (*s-*) passive. Example (6b) is written in the Bokmål standard.

(6a) Geita blir kjøpt (av mannen) i dag.
goat-the becomes bought (by man-the) to day
'The goat is bought by the man today.'

(6b) Geita kjøpes (av mannen) i dag.
goat-the buy-s (by man-the) to day
'The goat is bought by the man today.'

Both types allow impersonal passive, as e.g., in *det blir kjøpt ei geit i dag* 'there is bought a goat today'.

There are two main types of interrogative clauses: yes/no questions (formed by placing the finite verb in initial position) and questions with a question word (with the question word placed in initial position). As for relative clauses, the most common type is introduced by the complementizer *som*. The complementizer is optional if the relativized position is a nonsubject, as in *geita (som) mannen kjøpte* 'the goat (that) the man bought'. Infinitival clauses are introduced by the infinitive marker *å* 'to', as in *mannen prøver å kjøpe geita* 'the man tries to buy the goat'.

Nostratic Hypothesis

A Dolgopolsky, University of Haifa, Haifa, Israel

© 1994 Elsevier Ltd. All rights reserved.

Nostratic is a hypothetical macro-family of languages, embracing Indo-European, Afro-Asiatic, Kartvelian, Uralic, Altaic, and Dravidian. The hypothesis is based on a large number of common roots (more than 2000 known in the early 1990s) and many common grammatical morphemes (pronouns and auxiliary words which later became prefixes and suffixes in the descendant languages), in which regular sound correspondences and results of regular phonological changes are observed. The common roots include basic lexical items, e.g., **ǵǵsō* 'stay, be' (in Indo-European [**es-* 'be'], Afro-Asiatic, Kartvelian, Uralic), **wete* 'water' (all branches except Kartvelian), **ǵitā* 'eat' (in Indo-European, Afro-Asiatic, Altaic), **bari* 'take' (all branches except Uralic), **ǵeyV* 'come' (in Indo-European [**ei-* 'go'], Afro-Asiatic, Uralic, Altaic, Dravidian), **nimru* 'name' (Indo-European, Afro-Asiatic, Uralic, Altaic), as well as words connected with cultural conditions of

the ancient (presumably final paleolithic) society, e.g., **kǵlu* 'woman of another exogamic moiety' (> 'sister- or daughter-in-law,' 'bride'; present in all branches, e.g., Indo-European **ǵǵw-* 'sister or daughter-in-law' > Latin *glōs*, Greek *galōs*, Slavic **zolv-*), pronouns: **mi* 'I', preserved as a pronoun or as a morpheme of 1SG in almost all branches; **t'ü* > **ti* 'thou,' preserved in Indo-European, Afro-Asiatic, Uralic, and Altaic; **k'o* 'who' (in Indo-European, Uralic, and Altaic), **mi* 'what' (in Afro-Asiatic, Uralic, Altaic, Dravidian, and Kartvelian).

The parent language had, most probably, an analytic grammatical structure with a strict word order (sentence-final predicate; object preceding the verb; nonpronominal attribute preceding the head; a special position for unstressed pronouns) and with grammatical meanings expressed by word order and auxiliary words (e.g., postpositions: **nu* for genitive, **ma* for marked accusative, and others). In the descendant languages this analytic grammar evolved towards a synthetic one. The phonological system (reconstructed by V. Illich-Svitych (1971–84) and A. Dolgopolsky (1989) in the framework of a

Nostratic historical phonology) included a rich consonantism (with threefold opposition of voiced/voiceless/glottalized [ejective] stops and affricates, with three series of sibilants and affricates, with lateral obstruents, laryngeal, pharyngeal, and uvular consonants), and a vowel system of 7 vowels. The ancient Nostratic parent language seems to have existed in the preneolithic period (up to ca. 15 000 or 12 000 BC) somewhere in southwest Asia. But most descendant proto-languages (e.g., Proto-Indo-European) existed during the neolithic period (with agriculture and

husbandry, resulting in a demographic explosion, which can explain their spread throughout Eurasia and the northern half of Africa).

Nuristani Languages

A L Grünberg, St Petersburg Institute of Linguistics, St Petersburg, Russia

© 1994 Elsevier Ltd. All rights reserved.

Nuristani, sometimes known as Kafiri or Kafir languages (NL), are a group of Indo-European languages close in many aspects to the Dardic languages of the Indo-Iranian branch; but in some points of historical phonology (an early loss of aspiration, the reflexes of \hat{u} , \hat{g} , \hat{gh} in the form of homorganic affricates c , z ; the preservation of s after u) the NL differ from the Indo-Aryan languages. It is supposed that the Nuristani languages separated from the Indo-Iranian group before it split into the Indo-Aryan and Iranian.

The limits of the area where the NL are spoken coincide with the borders of the historical province of Nuristan (former Kafiristan) situated in the high mountains on the southern slope of the Eastern Hindu Kush (Afghanistan). Nuristan was nearly completely isolated from the outer world until the very end of the nineteenth century and then again until the 1930s.

There are five Nuristani languages: Kati, Kamviri, Ashkun, Waygali, and Prasun.

Kati is divided into two dialects. The western one is spoken in the valleys of Ramgel and Kulem, the two sources of the Alingar river, which is a right-bank tributary of the Kabul river; it is also spoken in the valley of Kantiwa, the right source of the Pech river, in its turn a right-bank tributary of the Kunar river (named Chitral in its upper part). The eastern dialect is spoken in the upper part in the valley of the Katigal (Bashgul, Landaisin) river, a left tributary of the Kunar river. The Ashkun language is also divided into at least two dialects: the western one is located in small valleys on the left side of the Alingar river; the eastern is spoken in Wama, a large village in the

Pech valley. The Waygali language occupies the valley of the Waygal river, a left tributary of the Pech river, also in the valley of Tregam in the same Pech region. There are at least three dialects in Waygali.

Kamviri is the language of a large Kamdesh village and some small villages in the middle part of the Bashgul valley, at a lower altitude than the Kati-speaking area. Prasun is spoken in a very isolated valley of Prasun, the left source of the Pech river, which divides the Kati-speaking area into two parts.

A number of Nuristanis speaking Kati, Waygali, and Kamviri now live in Kabul.

The first four languages (Kati, Kamviri, Ashkun, and Waygali) are closely related to each other, while Prasun occupies a specific position not only within the Nuristani group but in a sense also among the Indo-European languages as a whole.

The total number of people speaking NL is not known exactly, but probably does not exceed tens of thousands. A relatively great amount of Nuristanis (especially Kati-, Waygali- and Kamviri-speaking people) are bilingual, speaking Pashto or Dari as a second language.

The phonetic systems of NL contain a series of retroflex consonants, ζ , ζ , t , d , \check{c} , j , n , \check{r} , r . The palatalization of consonants is typical of all NL except Prasun. In Kati nearly all consonants have phonologically opposed palatalized pairs.

The noun has two case forms, direct and indirect. As a rule there is no morphological indication of number and gender in the direct case, but the masculine and feminine singular forms, and the plural form for both genders, are different in the indirect case.

All NL have relatively complicated systems of modal and temporal forms, as well as a great amount of various nonpersonal forms (participles, gerunds, absolutives, etc.).

All NL (except Prasun) have an ergative structure of sentences with a transitive verb in any past tense formed from the past stem; the verb agrees in gender, number, and person with the object. There is no ergative construction in Prasun, but there is a difference in conjugation of transitive and intransitive verbs in the past tense.

A structural feature specific to all NL is a very peculiar and sophisticated system of spacial orientation, determining the location of an object or the direction of its movement. The horizontal/vertical axes, certain objects on the earth's surface (for example a river or a mountain pass) as well as the subject of speech serve in this system as coordinates. Thus in Kati more than fifteen series of such abstract means of spacial orientation exist. Each series contains a pre-verb, three adverbs, and an adjective; so there are at least seventy-five abstract ways to locate an action of an object in the space. Still more complicated is such a system in Prasun, where theoretically more than a hundred ways of spatial orientation can be used.

The vocabulary of NL included, until the late twentieth century, only a very small amount of loanwords, but now a process of penetration of loanwords from Pashto and Dari is in progress everywhere in Nuristan and especially among the Nuristanis living in Kabul.

Nuuchahnulth

J Stonham, University of Newcastle, Newcastle upon Tyne, UK

© 2006 Elsevier Ltd. All rights reserved.

Nuuchahnulth, also known as Nootka, Nutka, Aht, Takhaht, and *t'aat'aaqsapa*, and by the various dialect designations, is one of the earliest documented languages of Western Canada, with first contact going back to the 1770s. Early work focused mostly on the vocabulary, with word lists being documented by a number of early explorers. The earliest detailed grammatical investigations include those of Knipe (1868), Boas (1890), and Sapir (1924). The name Nuuchahnulth is an anglicized version of *nuučaaniut* 'along the mountains' (*nučĩ* 'mountain(s),' *-a'ñut* 'along': $\tilde{\nu}$ indicates variable length of the vowel). Geographically, the Nuuchahnulth people occupy the west coast of Vancouver Island, from Brookes Peninsula in the north to Bamfield in the south.

Nuuchahnulth has a relatively large consonant inventory as shown in Table 1. Conversely, the vowel system is quite simple, involving just the three vowels, /i, u, a/, and a length distinction. There are, in addition, two mid vowels that are only encountered in the long variety, /e/ and /o/, at least phonologically, and even then only under certain special circumstances, such as in foreign borrowings. Primary stress

is predictable and appears on one of the first two syllables of a word, depending on weight.

Important morphophonological processes include glottalization and lenition, which affect the preceding consonant and depend on the individual suffix triggering the effect (abbreviations: LOC, locative; DUP, duplication; SUFF, suffix, MOM momentaneous aspect, NOW contemporaneous, MC momentaneous causative, SUB subordinate, L lengthening, R reduplication. All data are from Sapir's unpublished fieldnotes, (Sapir, no date), unless otherwise indicated.

- (1a) *hiitaht'iłšĩ?ax*
 hita-ht -'ił -šĩł -'ax
 LOC-exit woods-go for[L]-MOM-NOW
 'They started out of the woods.'
- (1b) *wiškum*
 wišk -'um
 angry -on the rocks
 'angry on the rocks'
- (1c) *?aayimkiłqas*
 ?aya -miik -ił -qa's
 many -getter of -MC -1s.SUB
 'may I be a getter of many ...'
- (1d) *titinkum*
 DUP-ti -ñuk^o -im
 SUFF-wipe -at the hand [R] -thing
 'handwiper'

Table 1 Nuuchahnulth consonant inventory

| Labial | Alveolar | Lateral | Alveopalatal | Velar/labiovelar | Uvular/labiouvular | Pharyngeal | Glottal |
|--------|----------|-----------------|--------------|------------------|--------------------|-----------------|---------|
| p | t | | | k | q | | ʔ |
| p̥ | t̥ | | | k̥ | q̥ | ʕ | |
| | | | | k ^{oo} | q ^{oo} | | |
| | | | | k̥ ^{oo} | q̥ ^{oo} | | |
| | s | ʃ | š | x | x | h | h |
| | | ʃ ^{oo} | | x ^{oo} | x ^{oo} | h ^{oo} | |
| | c | ç | č | | | | |
| | č | ç̣ | č̣ | | | | |
| m | n | | y | w | | | |
| m̥ | n̥ | | ỵ | ẉ | | | |

As can be seen from (1a) and (1b), a glottalizing suffix will trigger glottalization of the preceding consonant, whereas a nonglottalizing suffix ((1c) and (1d)) will not. Other common morphophonological processes include labialization, delabialization, vowel coalescence, and ʔ-epenthesis. One further morphophonological process involves a class of vowels labeled variable length; such vowels appear long in the first foot of the word, but are short after that. These are characteristically Wakashan in nature and constitute a special class of vowels.

Morphologically, Nuuchahnulth is extremely complex, with upward of 500 bound derivational morphemes, along with numerous inflectional paradigms. The creative genius of the language is demonstrated by the following words:

- (2) *cicihʔaqχmapt* ‘crab-apple tree’ (< *cih* ‘sour’ -ʔaqχ ‘inside’ -mapt ‘plant’)
čičiyupkuk ‘spaghetti’ (< *čiyup* ‘intestines’ -*kuk* ‘resemble’)
niikmatičačk ‘guitar’ (< *nik* ‘scratch’ -mat ‘about’ -iicu ‘tool’) ‘at strings’ -čak^{oo}

Morphological processes include reduplication, infixation, and suffixation, although lexical compounding is absent. There is a class of lexical suffixes that requires reduplication of some part of the root as a concomitant of the attachment (3a), in addition to reduplication indicating plurality (3b), distributivity (3c), repetition (3d), and other aspectual categories. In fact, double reduplication may occur in contexts in which both derivational and inflectional triggers to reduplication cooccur (DISTRIB, distributivity; REP, repetition; PASS, passive)

- (3a) *kuukuhinqit*
 DUP-kuh -inqit
 SUF-hollow -at the ribs [RL]
 ‘with a hole in the side’
 (3b) *taataayi*
 DUP-taayii
 PL-older brother
 ‘older brothers, seniors’

- (3c) *nuṅupqimtayiiʔat*
 DUP-nup -qimt -ayiʔ -ʔat
 DISTRIB-one -classifier -give -PASS
 ‘He gave a dollar to each.’

- (3d) *tuuxtuux^{oo}a*
 DUP-tux -(y)aʔ
 REP-jump -DUR
 ‘jumping’

Predicates are typically marked for aspect and often for location (e.g., -*it* ‘in the house,’ -*as* ‘on the ground, in the village,’ and -*is* ‘on the beach’), and bear one of a set of paradigmatic mood/person/number suffixes and other possible markers. Tense is optionally marked on predicates, as is plural for nouns. Nouns may be marked for number, diminutive, augmentative, former/future state, and possession.

Syntactically, Nuuchahnulth may be described as head-initial and head-marking. The most common word order is verb initial, either verb–subject–object or verb–object–subject, although arguments may be omitted. In keeping with its head-marking nature, possessors follow possessees (4a) and relative clauses follow their heads (4b):

- (4a) *ħawitukʔi* q^{oo}ayačiiktaqimt
 ħawit-uk =ʔiʔ q^{oo}ayačiik -taqimt
 chief-POSS =DEF wolf -tribe
 ‘the chief of the wolves’
 (4b) *ħuucsmēʔi* yaq^{oo}acʔitq tʔaṅa
 ħuucsmā-ʔiʔ yaq^{oo}-ac -ʔiʔtq tʔaṅa
 woman-DEF REL-belong to -3s.REL child
 ‘the woman whose child he was’

In the case of relative clauses, there are two types – headed (4b), involving either *yaq^{oo}* ‘who(m)’ or *q^{oo}i* ‘which,’ or headless (5), in which the specifier *ʔiʔ* is attached to the predicate of a relative clause:

- (5) *qaḥšiχʔi*
 qaḥ -šiχ =ʔiʔ
 die -MOM =DEF
 ‘the dead (ones)’

Nyanja

S Mchombo, University of California, Berkeley, CA, USA

History and Politics

ChiNyanja (Nyanja) is a language of the Bantu group of the Niger-Kordofanian language family, and is spoken in parts of eastern, central, and southern Africa. It is spoken in Malawi, where, from 1968 until recently, under the name of Chichewa, it served as the national language. It is also spoken in Mozambique, especially in the provinces of Tete and Niassa, as well as in Zambia and Zimbabwe. In the latter, according to some estimates, it ranks as the third most widely used local language, after Shona and Ndebele. The countries of Malawi, Zambia, and Mozambique overwhelmingly constitute the central location of chiNyanja.

The language derives its name from the lake that is shared by Malawi, Mozambique, and Tanzania, with most if it as part of Malawi. The local word for a large expanse of water is *nyanja*. The people who lived along the shores of the lake and the banks of the Shire River called themselves aNyanja (lake dwellers). The Shire River flows from the southern extremity of the lake, formerly called Lake Nyasa, but now known as Lake Malawi, through southern Malawi into southern Mozambique to join the Zambezi River. The aNyanja (the singular form of which is *mNyanja*, where the prefix *m* is a syllabic nasal) spoke the language called chiNyanja (henceforth, Chinyanja).

Like most languages, Chinyanja has a number of regional dialectal variations. One of these, spoken in the hinterland of Malawi, is called chiChewa (henceforth Chichewa). This dialectal variation is the one that was spoken by the first president of Malawi, the late Dr Hastings Kamuzu Banda (cf. Watkins, 1937). The ascendancy of a Chewa to the presidency in independent Malawi had repercussions on language issues. President Banda argued that the classification of Chichewa as a dialect of Chinyanja was erroneous, deriving from unfortunate aspects of the history of missionary activity in the country, whose early activities were concentrated along the lake. Banda invoked aspects of history, plausible in some ways, to argue that Chichewa was the language of which Chinyanja was the dialectal variation (for pertinent observations, see Marwick, 1963).

The version of the history of the Chewa that Banda espoused was that the people who speak Chichewa, known as aChewa, trace their origins to a group

of people known as the Maravi (according to some Portuguese records) who migrated from the lower basin of the Congo in central Africa and eventually settled in the land mass now covered by Malawi, Zambia, and Zimbabwe. Pushed by wars, disease, and other maladies from the Congo area, the Maravi were the first group of Bantu peoples to move and settle in present day Malawi in the 16th century. Other Bantu groups such as the Tumbuka, Tonga, Yao, Lomwe, and Ngoni moved into Malawi long after the Maravi group had successfully established itself (see Kalipeni, 1996).

The Chewa were led by a powerful leader called Kalonga. He founded in Malawi what later came to be called the Maravi empire. In Malawi he established his headquarters or seat in a place called Mankhamba. Once settled, he decided to extend his influence by acquiring more land and having it settled by his subjects. To achieve those objectives he dispatched a number of his matrilineal relatives to establish settlements in various parts of the country. Among the relatives who traveled on were such chiefs as Mwase, who moved into the area called Kasungu, Kaphwiti and Lunda, who settled in the lower Shire valley. As they spread throughout the central and southern part of the country, into eastern Zambia, and into parts of Mozambique, including along the Zambezi River, their language spread too. The dispersion of Kalonga's relatives and the ensuing Chewa diaspora resulted in a proliferation of regional varieties of the language. The distinct names that the regional varieties acquired created the impression of the existence of a multiplicity of ethnic groups. Some of the groups identified themselves by making reference to significant features of their habitat.

Malawi is a country dominated by a huge lake that ranks as the third largest in Africa, after Victoria Nyanza (Lake Victoria) and Lake Tanganyika, and as the 12th largest in the world. As indicated, the word for a large expanse of water in Chichewa is *nyanja*, and the word for tall grass (savanna) is *chipeta*. The people who settled along the lakeshores and along the banks of the Shire River began to call themselves aNyanja, the lake people, and their particular variety of Chichewa was called chiNyanja, or simply Nyanja, the language of the lake people. Those who moved into the interior, the land of tall grass, were called aChipeta, the dwellers of the savanna land. These names began to obscure the nature of the relationship among the people. This was further complicated by the introduction of yet other labels. Thus, the advent of the Portuguese, entering the area from southern Africa in the 17th century, was accompanied

by the introduction of new labels. They had been in contact with such ethnic groups as the Xhosa, the Nyika, the Tchangani, etc. These referred to themselves as amaXhosa, amaNyika, amaTchangani, etc. Banda claimed that when the Portuguese encountered the Chewa living in southern Malawi and southern Mozambique, who referred to themselves as aNyanja, they referred to them as amaNyanja (see Banda, 1974–1975). Under the influence of Portuguese phonology, the sound *ny*, a palatal nasal, got velarized to *ng*’. This gave rise to an ethnic group of amaNg’anja, whose language was called chiMang’anja, definitely not distinct from the Nyanja. Meanwhile, the Chewa who had settled around the southern end of Lake Malawi, spreading to the area surrounding Lake Chirwa, encountered another ethnic group, the Yao. The Yao predominated in Mozambique but had flowed into the southeast part of Malawi. The Yao word for a large expanse of water is *nyasa*, and they referred to the Nyanja people as aNyasa. The people had by then come to be grouped into aChewa, aChipeta, amaNg’anja, aNyanja, and aNyasa. The last designation appears to have contributed to British colonialists’ eventual designation of the lake as Lake Nyasa, and of the country as Nyasaland. This is the name that the country had until independence in 1964, when the name of Malawi, apparently derived from ‘Maravi,’ was restored.

The multiplicity of labels under which the Chewa came to be identified was something that received some comment from various scholars. Thus, Young remarks about the language Nyanja that

it is the language of a people scattered over a large South-east-central African area, the aMaravi, who today live under at least six different names according to the area in which Europeans found them in the closing decades of the last century. And they were more or less on the same ground at least 300 years earlier since the Portuguese records give some of them the same names as they bear to-day. (Young, 1949: 53)

Earlier, Hetherwick had stated that

On the Shire River they are called Mang’anja, a merely local pronunciation of the word A-Nyanja. Around Lake-Shirwa they are best known by their Yao name A-Nyasa. (Hetherwick, 1901: 15)

Although Chichewa is widely spoken in Southern, eastern, and central Africa, spreading over the land-mass that includes Zambia, Malawi, Mozambique, and Zimbabwe, Greenberg does not mention it in his classification of African languages. In the works of Guthrie, Chichewa and Chimang’anja are listed as two dialect variations of Nyanja. He classifies Chichewa as belonging to zone N31b, being identified as the second dialect of the main language.

Chinyanja served as the main linguistic medium for the mass media in Malawi and was taught as a subject in educational institutions at both primary and secondary levels. In 1968, under political pressure from President Banda, a resolution was passed at the annual convention of the Malawi Congress Party, then the ruling and sole political party in Malawi, to have the name of the language officially changed to Chichewa. From that point the language Chinyanja became known as Chichewa in Malawi. Simultaneously, it was elevated to the status of national language. English remained in use as the official language.

The language policy adopted in Malawi that made Chichewa the national language contributed to the promotion of Chichewa through active educational programs, media usage, and other research activities. With the exception of work carried out within the University of Malawi, tied to contributions to, and adaptations of, advances in linguistic theory, the promotion and standardization of Chichewa were placed under the oversight of the Chichewa Board. The terms of reference of the Chichewa Board included monitoring of proper usage of Chichewa in the media, revising and updating the orthographic conventions, as well as engaging in lexicographic work. The sustained effort over many years to boost the status of Chichewa as the main language resulted in increased functional literacy in that language. Out of a population of around 11 million in Malawi, upwards of 65% have functional literacy or active command of this language.

The political directive that led to the change of name of the language in Malawi, from Chinyanja to Chichewa, did not carry over to the neighboring countries of Zambia and Mozambique. Political factors were definitely relevant. During the period when the language issue was being addressed in Malawi, political relations between Malawi and Zambia reached a nadir. This deserves comment.

Regional Politics and Language Issues

Soon after gaining independence from the United Kingdom in 1964, Malawi had a cabinet crisis. A number of radical political activists with more nationalist fervor broke ranks with Kamuzu Banda, then Prime Minister. These were among the political leaders who had invited Kamuzu Banda to return from his exile in Britain, and subsequently Ghana, to join in, and assume command of, the fight for independence. Following the granting of independence the young radicals got disillusioned with the direction taken by Kamuzu Banda’s policies. The policies were seen as aiming to oppress the masses, to practically

deify Banda himself as a cult figure to whom the people were to pay homage, to undermine the efforts to promote Pan-Africanism, and to maintain the *status quo*, such that the colonialists would still enjoy the privileges that they had before independence. In brief, Banda's policies brought out the dictatorial tendencies that were eventually to characterize his rule and laid the groundwork for his tyrannical grip over the country's political development. In the revolt that resulted from the rift, the dissident politicians left the country and sought refuge in the neighboring countries of Tanzania and Zambia. This resulted in strained relations between Malawi on the one hand and those other countries on the other.

The situation became aggravated when, around 1967, there was an unsuccessful effort by a group of insurgents under the leadership of Yatuta Chisiza, a dissident politician, to unseat Kamuzu Banda militarily. The military escapade was viewed as having been perpetrated with the connivance or complicity, if not open support, of those neighboring countries. At the minimum, the insurgents seemed to have received logistical support from Zambia (for relevant details see Mchombo, 1998a, 1998b).

The worsening relations between the two countries meant that the policy about language, in this regard relating to change in the name, was not merely viewed as an issue internal to Malawi but, further, as yet another instance of Kamuzu Banda's grandiose scheme to identify the country or region with his cultural and linguistic heritage, a version of Chewa hegemony. As noted by Matiki, "Banda carried this idea of Chewa supremacy a little further by claiming that the dialect spoken by his clan is the best. This is nothing but linguacentrism" (Matiki, 1997: 529). Even if the logic or historical accuracy or factual basis for the name change were to prove impeccably sound and unimpeachable, Zambia was not ready to take hints or, worse, orders, from Malawi. A subsequent dispute concerning the proper borders of the countries, again perpetrated by the Malawi regime around the same time, merely exacerbated an already grave situation. Thus, in Zambia, as well as in Mozambique, the language has always remained as Chinyanja.

In Mozambique Chinyanja is native to 3.3% of a population numbering approximately 11.5 million. In Tete Province it is spoken by 41.7% of a population of 777 426, and it is the first language of 7.2% of the population of Niassa Province, whose population totals 506 974 (see Firmino, 1995). In Zambia, with a population of 9.1 million, Chinyanja is the first language of 16% of the population and is used and/or understood by at least 42% of the population, according to a survey conducted in 1978 (cf. Kashoki,

1978). It is one of the main languages of Zambia, ranking second after Chibemba (Bemba). In fact, out of the 9.1 million people of that country, it is estimated that 36% are Bemba, 18% Nyanja, 15% Tonga, 8% Barotze, and the remainder consisting of other ethnic groups including the Mombwe, the Tumbuka, and the Northwestern peoples (see Kalipeni, 1996). The figures show that at least six million people are fluent in Chinyanja.

The Ascendancy of Chinyanja

A recurrent joke in linguistics courses about the distinction between language and dialect is the quip that a language is 'a dialect with an army and a navy.' The rise of Chichewa in Malawi was intimately connected to the tenure of Kamuzu Banda, a Chewa, as president of Malawi. With altered political dispensation through the shift to democratic practice, and Banda's subsequent demise, Chichewa effectively lost the 'army and navy' that protected it from the status of dialect. Without formally or openly introducing a new language policy, Malawian scholars have felt it prudent to fall in line with the other countries in the region by restoring the name of Chinyanja to the language. This restoration of Chinyanja to its former status goes beyond mere efforts to promote regional linguistic harmonization. Within Malawi the national language policy adversely affected the other languages. Once again, as noted by Matiki, "the change of name [from Chinyanja to Chichewa] angered some people because there was no justification in changing the name other than the fact that President Banda was an ethnic Chewa" (1997: 527). Thus, the other ethnic groups in the country felt alienated, more so given the identification of Chichewa with political power and the relegation of their languages to relative obscurity (cf. Kishindo, 1994). The political transition to democratic practice and the departure of Kamuzu Banda from the political helm provided opportune occasion for implementation of more equitable access to political participation and the recognition of the cultural and linguistic heritage of the various segments of the nation. Kamuzu Banda's departure from the political scene was accompanied by the ascendancy of Bakili Muluzi, a Yao, as the second president of a democratic Malawi. Inevitably, the political changes witnessed shifting fortunes for Chichewa.

On Reverting to the Name of Chinyanja

Although use of the label Chichewa is likely to remain, there is systematic diminution of its former status. Thus, the Chichewa Board was subsequently

dissolved and, in 1996, the Center for Language Studies (CLS), with a broader scope of activities, was established to replace it. The center is affiliated to the University of Malawi, stressing its new mandate as a locus of research and scholarship, not as an organ of political ideology or an instrument of political hegemony. The activities carried out under the auspices of the CLS have included concerted efforts to document and provide linguistic descriptions of some of the endangered languages in Malawi.

Further, the erstwhile Department of Chichewa and Linguistics at the University of Malawi, pioneered by the present author, under political directive from President Banda to the University of Malawi to contribute to the enhancement of Chichewa, was renamed the Department of African Languages and Linguistics, thereby degrading further the profile of Chichewa.

The 'politically correct' stance of diminishing the profile of Chichewa in the university through the removal of direct reference to it in the name of the department, together with the establishment of the CLS, should not, however, be (mis)construed as indicating a real diminution in linguistic work on it. Given the historical circumstances which account for the preponderance of the available trained linguists working on Chichewa, and the headstart Chichewa was given in getting material prepared for educational and other purposes, it will continue to function in the capacity of the major language of the country. Of some significance, at least to public perception, is the recent introduction of radio news bulletins in the other languages such as Chilomwe (Lomwe), Chiyao (Yao), Chitumbuka (Tumbuka), Chitonga (Tonga), and Chisena (Malawi Sena). The news bulletins have served to increase people's awareness of these other Malawian languages, subtly contributing to the subjection of Chichewa to competition.

There are grounds for the restoration of Chinyanja as the main language. These include the literary tradition that Chinyanja has enjoyed (see Made *et al.*, 1976). The description of Chinyanja goes back to at least 1875; the first significant work can be traced to Alexander Riddell's publication in 1880 of *A grammar of Chinyanja as spoken at Lake Nyasa, with Chinyanja-English vocabulary*. This work, while not linguistically very significant, was followed in 1891 with the publication of George Henry's *A grammar of Chinyanja: a language spoken in British Central Africa on and near the shores of Lake Nyasa*. This was more comprehensive than the work by Riddell. In 1892 David Scott's *A cyclopaedic dictionary of the Mang'anja language spoken in British Central Africa* appeared, a work that was later to be revised

and enlarged by Alexander Hetherwick in 1929 as *Dictionary of the Nyanja language*. This still remains an authoritative dictionary of the language. Previously, in 1901, Hetherwick had produced *A practical manual for the Nyanja language*.

These descriptions of Chinyanja and the functional utility that the language enjoyed underscored its legitimacy to the status of a major language or lingua franca. The subsequent adoption of the colonialists' language policy, which recognized the position of Chinyanja in Central Africa, especially in Malawi, eliminated further detractions from its status. The establishment of the colonial administration in Malawi at the turn of the 20th century provided extra impetus to the promotion of Chinyanja. This led to the appearance of more works on Chinyanja and the emergence of more literary works and newspapers, such as *Msimbi*, a weekly Chinyanja newspaper that flourished for several years from 1951.

As Chinyanja gets rehabilitated, and some recent publications such as dictionaries now bear that name instead of Chichewa, the latter still remains undeniably the most familiar label for the language that is spoken and understood by more than half the population of Malawi. The reversion to the label of Chinyanja, just like the prior change to Chichewa, may lack a linguistic basis but it definitely fulfills political objectives.

Linguistic Aspects of Chinyanja

Chinyanja manifests typical aspects of the linguistic structure of Bantu languages. Its nominal system comprises a number of gender classes that are involved in the agreement patterning of the language, characteristic of Bantu languages. Thus, nominal modifiers agree with the head noun in the relevant features of gender and number, as will be illustrated below.

In its verbal structure, Chinyanja, just like other Bantu languages, displays an elaborate agglutinative structure. The verb comprises a verb root or radical, to which suffixes or extensions are added to form the verb stem (cf. Guthrie, 1962). The extensions affect argument structure or the number of expressible nominal arguments that the stem can support. The verb stem also has proclitics which encode such syntactically oriented information as negation, tense/aspect, subject and object markers, modals, conditional markers, directional markers, etc. (cf. Mchombo, 2004).

Chinyanja is also a tonal language, displaying features of lexical and grammatical tone. It has two tone levels, high (H) and low (L). Contour tones are attested but result from a combination of these tone levels, usually on long syllables (Mtenje, 1986). In its

Here, the numeral *módzi* ‘one’ is marked with the agreement marker *m* but the verb has *a* for the subject marker. The *u* is used with demonstratives and when the segment that follows is a vowel. This seems to apply to most cases regardless of whether the vowel in question is a tense/aspect marker, an associative marker, or part of a stem, such as with possessives. Consider the following:

- (4) m-lenje w-ánú u-ja w-á
 1-hunter 1SM-your 11SM-that SM-ASSOC
 nthábwala w-a-thyol-a mi-kóndo
 10-humor 1SM-PERF-break-FV 4-spears
 ‘that humorous hunter of yours has broken the spears’

In this sentence, the glide *w* replaces *u* when a vowel follows regardless of the function associated with that vowel.

Although most of the nouns are bimorphemic, there are a number of cases where a further prefix, marking either diminution or augmentation, is added to an already prefixed noun. This is shown in the following:

- (5) ka-m-lenje k-ánú ka-ja k-á
 12-1-hunter 12SM-your 12SM-that 12-ASSOC
 nthábwala k-a-thyol-a ti-mi-kóndo
 10-humor 12SM-PERF-break-FV 13-4-spears
 ‘that small humorous hunter of yours has broken the tiny spears’

In this sentence, the preprefixes *ka* for singular and *ti* for plural get attached to nouns to convey the sense of diminutive size. These preprefixes then control the agreement patterns (cf. Bresnan and Mchombo, 1995), providing the rationale for regarding them as governing separate noun classes. One significant point to be made is that locatives also control agreement patterns. Consider the following:

- (6) ku mudzi kw-ánu kú-ma-sangaláts-á
 17-at 3-village 17SM-your 17-HABIT-please-FV
 aléndo
 2-visitors
 ‘your village [i.e., the location] pleases visitors’

This gives such locatives the appearance of being class markers, giving rise to the view that in Chinyanja locatives are not really prepositions that mark grammatical case but, rather, class markers (for some discussion, see Bresnan, 1991, 1994).

The full range of noun classes in Chinyanja, together with their restive subject and object markers, is given in Table 1. Some of the classes have prefixes that are starred. These classes consist of nouns that, normally, lack the indicated prefix in the noun morphology. Samples of Class 5 nouns are provided above. Most of the nouns in Classes 9 and 10 begin

with a nasal but there are no overt changes in their morphological composition that correlate with number. The number distinction is reflected in the agreement markers rather than in the overt form of the noun. Examples of Class 9/10 nouns are *nyumba* ‘house(s)’, *nthenga* ‘feather(s)’, *mphini* ‘tattoo(s)’, *nkhôndo* ‘war’. Class 15 consists of infinitive verbs. The infinitive marker *ku-* regulates the agreement patterns, just like the diminutives (Classes 12 and 13) and locatives. The infinitives are thus regarded as constituting a separate class although, just as with the locatives, there are no nouns that are peculiar to this class. There are minor exceptions to locatives. These have to do with such words as *pansi* ‘down’, *kunsi* ‘underneath’, *panja* ‘outside of a place’, *kunja* ‘(the general) outside’, *pano* ‘here (at this spot)’, *kuno* ‘here (hereabouts)’, *muno* ‘in here’. With these, the locative prefixes *pa*, *ku*, and *mu* are attached to the stems *-nsi*, *-nja*, and *-no*, which are bound. The agreement pattern regulated by the infinitive marker *ku-* is exemplified by the following:

- (7) ku-imbá kw-anú kú-ma-sangaláts-á
 15INF-sing 15SM-your 15SM-HABIT-please-FV
 a-lenje
 2-hunters
 ‘your singing pleases hunters’

Occitan

T T Field, University of Maryland, Baltimore, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Occitan is the term used today to refer to the language that evolved out of Latin in southern France. Long called 'Provençal' and still referred to as 'la langue d'oc,' Occitan is the indigenous language of a region that covers approximately a third of France, the Aran Valley of Spain, and the upper Alpine valleys of Italy.

Status

It is difficult to speak of the sociolinguistic situation of Occitan today other than in terms of marginality. The diglossia that characterized usage among rural speakers a few decades ago, when Occitan served the domains of traditional agriculture, storytelling, and the like, has given way to what might be termed 'motivational distribution.' In other words, for most of the population, the use of Occitan is no longer clearly tied to any particular social domain, but rather is predictable only as a function of the enthusiasm of the speaker for the language and of his or her interlocutors' ability to manage in it. Outside the major cities, between 20 and 30% of the population claim to speak the language, though 40–50% say they understand it. This suggests that the number of speakers may be in the range of 2 million, with perhaps twice that number able to understand.

Occitan attained official status in the Aran Valley in 1983 and in Italy in 1999. In France, however, progress toward official recognition has been slow and uneven. Although the language has been present in the educational system on a limited basis since 1951, France as a whole remains committed to the anticomunitarian ideologies of the Third Republic and has refused to ratify the European Charter for Regional or Minority Languages.

Structure

The language to which Occitan is most closely related is Catalan, and it is increasingly common to

classify both as members of an Occitano-Romance group, distinct from North Gallo-Romance and Ibero-Romance proper. As in French and Catalan, Occitan lost Latin final unstressed vowels, with the exception of -a (*filh* 'son,' *pan* 'bread,' *farina* 'flour'). Occitan phonology is distinctive historically in its failure to undergo the Romance diphthongization (*pòt* 'he can,' *pè* 'foot'); in its maintenance of /aw/ (*causa* 'thing'); and in a vowel chain shift that fronted Vulgar Latin /u/ to [y], raised /o/ and unstressed /ɔ/ to [u], and continues to raise /a/ to [o] in unstressed position (*madura* [madúro, modúro] 'ripe (f.)').

Occitan is a prodrop language and resembles Ibero-Romance in its morphology and syntax. However, it maintained, as did French, a two-case inflectional system into the 13th century. The most striking grammatical feature to be found in Occitan is the enunciative particle, which is limited to Gascon; it cooccurs with tense and serves discourse-level functions: *Joan que venó la vaca* 'John [neutral assertion] sold the cow.'

Diversity

The Occitan domains never developed institutions that promoted linguistic unity, and mutual intelligibility across regions is uneven. The major dialects are Gascon, Limousin, Auvergnat, Languedocian, and Provençal. Most linguists also identify a Vivaro-Alpine dialect. Gascon, spoken in the southwest from the Garonne to the Pyrenees, is certainly the most distinctive of these in phonology, as well as in grammar, and may well deserve separate-language status within Occitano-Romance.

Standardization has been a hotly debated issue over the past few decades. Today, most activists have adopted the orthographic norms of the Institut d'Estudis Occitans; this system ensures a level of morphophonemic abstraction sufficient to allow crossdialectal comprehension. However, the Standard Occitan proposed by the Institut has not been particularly successful. It appears today that the majority of activists are ready to see Occitan as

a polycentric language, with regional norms in Gascony, Languedoc, Limousin, Provence, etc.

History

The earliest extensive Occitan texts date from the 11th century. The 12th century marks the opening of the language's classical period, when the troubadours (an Occitan word) produced their stunningly innovative poetic tradition and launched a genre dialect that would remain an international model of poetic creativity for nearly two centuries. However, as most of the Occitan regions were integrated into the kingdom of France, the language lost ground to French. In Bearn and Lower Navarre, it retained official status through the 18th century. By 1900, French had established its 'high' status in a diglossic situation that continued to evolve to its advantage. Although there were still a few children reared as monolinguals in Occitan in the early 1950s, the language had nearly disappeared from the cities and larger towns and was almost universally associated with backwardness and ignorance.

Two major movements have had the goal of revitalizing Occitan. The first of these was the 'Felibrige,' founded in 1854 and centered on the personality of Frederic Mistral. This movement had an enduring influence in Provence, and it may well account for the vitality of Provençal in the face of a very heavy influx of outsiders. The second movement, 'Occitanism,' aimed to unify the language and open up modern spaces for Occitan use. In the 1970s, this movement was responsible for a surge of public visibility for the

language and for a dramatic increase in its range of uses (e.g., theater, popular song, and academic writing). Occitanism also engendered the *Calandretas*, which are bilingual private schools in which Occitan once again plays a role in children's education and socialization.

Perspectives

Despite the progress made by activists in the final decades of the 20th century, and despite favorable official policy in small areas of Spain and Italy, Occitan continues to decline, and, as time passes, speakers who acquired the language in family and community settings are disappearing rapidly. The children who emerge as fluent speakers from the *Calandretas* and the enthusiasts who manage to pick up Occitan as a second language rarely have access to community settings in which speaking can take root. There can be no doubt that Occitanism has prolonged the life of the language and that there will continue to be people who speak, read, and write Occitan for many decades to come, but the time is near when speakers who learned the language in traditional communities will no longer exist.

Old Church Slavonic

C M MacRobert, Oxford University, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Old Church Slavonic is the earliest Slavic literary language. It was first used in the later part of the 9th century A.D. as the vehicle of translations and original compositions by SS Cyril and Methodius and their associates for the benefit of those Slav peoples who had recently accepted Christianity. Some of these texts have survived in copies thought to date from the late 10th or 11th century, which are the primary source of information about the language and have recently been supplemented by newly discovered manuscripts; others, found in copies of later date,

can be used to provide important additional evidence about syntax and lexis.

The sound system implied by the two alphabets Glagolitic and Cyrillic, in which Old Church Slavonic was written, antedates the major change from open to closed syllable structure that took place across the Slavic languages between the 10th and 12th centuries. Some of the grammatical forms and constructions used in Old Church Slavonic manuscripts are also highly conservative, e.g., substantial remains of distinct consonantal nominal declensions, transparent postposition of the anaphoric pronoun to adjectival forms as a means of expressing definiteness, asigmatic aorist forms, and the supine with a genitive complement. The evidence of Old Church Slavonic therefore

has considerable weight in attempts to reconstruct Proto-Slavic (Common Slavonic) and to elucidate the relationship between Slavic and other Indo-European languages (see **Indo-European Languages**).

Old Church Slavonic is also the main source of information about the early history of the South-East Slavic languages (see **Bulgarian, Macedonian**). As natives of Saloniki, SS Cyril and Methodius doubtless spoke the local variety of South Slavic. As a result of their work in Moravia (863–885 A.D.), Old Church Slavonic borrowed some local items of religious terminology from Latin or Old High German, such as *mīša* < *missa*, *všodŭ* < *wizzod*, and there is some ground for supposing that at an early stage, Old Church Slavonic also incorporated certain West Slavic linguistic features, particularly in pronunciation. However, the manuscripts of South Slavic origin, from which the information about Old Church Slavonic is largely derived, preserve only traces of such a hybrid usage at best, and for the most part reflect the Slavic dialects of the southeast Balkans and the Greek terminology of the Eastern Orthodox Church.

From its inception, however, Old Church Slavonic must have differed from contemporary spoken varieties of Slavic, as it was used primarily to translate Scriptural, liturgical, and patristic texts from Greek or occasionally from Latin and Old High German. Even pronunciation may have been modified to accommodate Greek loanwords: the Glagolitic alphabet has extra letters for the velar consonants /g/ and /x/, which seem to have been reserved for use in Greek loanwords before front vowels, a position in which these phonemes did not occur in native Slavic words at that time. Comparison with the originals shows that the translations aimed at faithfulness on the basis of correspondence, phrase by phrase, between source and target. Consequently, while the grammatical forms and most of the words and semantic distinctions are Slavic, the syntax tends to mirror the constructions of the original, usually Greek.

There is, however, a range of recurrent exceptions where imitation of a foreign model would presumably have led to linguistically unacceptable results: the placing of clitics apparently follows Slavic rules; possessive adjectives or the attributive dative frequently appear in place of an attributive genitive in the original, and simple case forms may be used to translate prepositional phrases; the use of the dual number, the distribution of subordinate complementary clause, infinitive and supine, and the choices made among the elaborate past tense system of

the verb are all independent of Greek. Even the dative absolute construction, which is peculiar to Old Church Slavonic among the Slavic languages and is usually found as a translation equivalent of the Greek genitive absolute, is occasionally used to render intractable Greek constructions such as the nominalized infinitive. The compound word-formations of Greek were also frequently reproduced in Old Church Slavonic, e.g., *pravoslovie* (later *pravoslavie*) < *ορθοδοξία*. Texts believed to be original Old Church Slavonic compositions display the same type of language, which can be characterized as a compromise between early Slavic idiom and Greek literary usage in a balance so delicate that it was not subsequently maintained (see **Church Slavonic**).

Omaha-Ponca

C Rudin, Wayne State College, Wayne, NE, USA

K Shea, University of Kansas, Lawrence, KS, USA

Speakers and Linguistic Resources

Omaha-Ponca is the name linguists use for the language of the Omaha and Ponca peoples. *Umoⁿhoⁿ* (Omaha) and *Paⁿka* (Ponca, sometimes spelled Ponka) dialects differ only minimally, but are considered distinct languages by their speakers. Both tribes formerly inhabited areas near the Missouri River in northeastern Nebraska. The Omahas are still located in this area, with the tribal headquarters at Macy, Nebraska, but most of the Poncas were removed in 1878 to northern Oklahoma, around Ponca City. A smaller group of Poncas still resides in Nebraska. The Omaha-Ponca language is a member of the Dhegiha branch of Mississippi Valley Siouan, closely related to the Osage, Kansa, and Quapaw languages (for more detail on the genetic relationships of the Siouan languages, see **Siouan Languages**).

The Omaha and Ponca dialects are severely endangered, with only a few dozen elderly fluent speakers of Omaha in Nebraska and of Ponca in Oklahoma. However, many younger people have some ability to speak or understand the languages, and language classes at several schools and colleges in Nebraska and Oklahoma have had some success in promoting fluency among passive speakers and semispeakers, as well as in teaching the language to children and college students. Major linguistic resources on Omaha-Ponca include the monumental text collections of James

Owen Dorsey (1890, 1891) and Dorsey's draft grammar and slip file, the ethnographic studies by Fletcher and LaFlesche (1911) and Howard (1965), Swetland's dictionary (1991), and an unpublished grammar by Koontz (1984). Several dissertations are currently in progress.

Sounds and Spelling

Traditionally, like other Native American languages, Omaha-Ponca was not written. Independently, both tribes recently adopted nearly identical spelling systems, similar to the orthography used by Fletcher and LaFlesche, but reading and writing Omaha-Ponca are still complicated by the existence of several other orthographies. In particular, the Dorsey materials, the largest source of texts in the language, are written in an idiosyncratic orthography that uses upside-down letters for unaspirated stops, 'ç' for the dental approximant, 'q' for the voiceless velar fricative, and 'c' for the voiceless alveopalatal fricative, among other unusual symbols. Most modern linguistic writings on the language use a transcription that represents tense unaspirated stops with a double letter, nasal vowels with a hook under the letter, and alveopalatal consonants with a hachek (č, š, ž, ž); a slightly modified transcription known as 'NetSiouan' is used for electronic communication. This has the effect that even those who are literate in Omaha or Ponca do not have easy access to most works on the language.

In this article, the orthography adopted by current school programs is used. The phonemic inventory of Omaha-Ponca, using this system, is shown in **Table 1**.

Table 1 Phonemic inventory of Omaha-Ponca

| Sound | Labial | Dental | Alveopalatal | Velar | Laryngeal |
|-----------------------------|---|----------------|-----------------|----------------|-----------|
| Stops and affricates | | | | | |
| Voiced | b | d | j | g | |
| Voiceless | | | | | |
| Plain | p | t | ch | k | ' |
| Aspirated | p ^h | t ^h | ch ^h | k ^h | |
| Glottalized | p' | t' | | | |
| Nasals | m | n | | | |
| Fricatives | | | | | |
| Voiced | | z | zh | gh | |
| Voiceless | | | | | |
| Plain | | s | sh | x | |
| Glottalized | | s' | sh' | x' | |
| Approximants | w | th | | | h |
| Vowels | | | | | |
| Oral | i e a (o) u | | | | |
| Nasal | i ⁿ a ⁿ /o ⁿ | | | | |
| Long | (doubled letter, e.g., aa) | | | | |

Several sounds require explanation. The plain voiceless stops are lax following a fricative, tense elsewhere. Glottalized consonants, which are ejective or co-articulated with a glottal stop, are rare. The back nasal vowel is spelled *oⁿ* in Omaha and *aⁿ* in Ponca. Throughout this article, for convenience, the Omaha spelling is used. It is not entirely clear whether there is more than one phonemic back nasal vowel. Phonetic vowels varying in quality from [aⁿ] to [oⁿ] to [uⁿ] occur, but are probably allophonically conditioned. A vowel *o* is written in a few words of men's speech.

The most unusual sound in Omaha-Ponca is the consonant spelled *th*. This phoneme ranges apparently freely from [l] to a lightly articulated voiced dental fricative [ð]. Historically derived from **r*, it behaves more like a liquid than a fricative, frequently occurring in syllable-initial clusters following a voiced stop (bth, gth), for instance. Because of its similarity to the sound in the English word 'this,' it is spelled *th* in the Fletcher-LaFlesche orthography and in current educational orthographies. Other systems represent it variously as *ç* (Dorsey), *ð* (Siouanist/linguistic), or *dh* (NetSiouan).

Vowel length is distinctive in accented syllables (*náⁿ aⁿde* 'heart' vs. *náⁿde* 'inside wall'), but this contrast was not recognized by linguists until the 1990s and is still marked only sporadically in written materials. Nasality is also distinctive, but sometimes difficult to hear, especially for [i] vs. [iⁿ] adjacent to a nasal consonant or in final position. For instance, 'water' can be found written as either *ni* or *niⁿ*. A downstep pitch accent occurs on the first or second syllable of the word, and is distinctive, as in *wathát^be* 'food' and *wáthat^be* 'table', though this may turn out to correlate with vowel length. Instrumental phonetic studies of Omaha-Ponca are lacking. It would be useful to have studies of the exact quality of the various stop series, *th*, and the suprasegmental features.

Morphology

Like other Siouan languages, Omaha-Ponca has complex verbal morphology but very little elaboration of other categories. There is no grammatical class of adjectives; concepts such as 'tall' are expressed by stative verbs. Adverbs, pronouns, and demonstratives are minor, uninflected categories. Nouns, other than those derived from verbs, generally contain no inflectional morphology. The exception is vocative and inalienable possessive marking of relationship terms:

| | |
|---------------------|---|
| wi-ko ⁿ | 'my grandmother' |
| thi-ko ⁿ | 'your grandmother' |
| i-ko ⁿ | 'his/her/their grandmother (sometimes also used by men) |

| | |
|---------------------|----------------------------------|
| ko ⁿ -ho | 'grandmother!' (male vocative) |
| ko ⁿ -ha | 'grandmother!' (female vocative) |

Definiteness is marked by a series of articles that also code animacy, proximateness, position, movement, and/or plurality of the nominal that they follow. This complex definite article system is an innovation shared with other Dhegiha languages:

| | |
|--------------------------------------|---------------------------------------|
| nu ak ^h a | 'the man (proximate)' |
| nu thi ⁿ k ^h e | 'the man (obviative animate sitting)' |
| zho ⁿ k ^h e | 'the stick (long, horizontal)' |
| zho ⁿ t ^h e | 'the wood (stacked vertically)' |

The verb is the locus of most of the grammatical information in the sentence. Besides pronominal prefixes identifying subject and object of the clause, the verb may contain prefixal instrumental, locative, dative, possessive, reflexive, *suus* (reflexive possessive), and *vertitive* (returning motion) markers, some of which can be obscured by phonological processes. Postverbal enclitics code plurality, negation, habitual or potential aspect, evidentiality, imperative and interrogative mode, proximateness, and other categories, some marked for person. There is no category of tense (in the following examples, the abbreviations are as follows: 1s, first-person singular; 1PL, first-person plural; AGT, agent; BEN, benefactive; REFL, reflexive; POTEN, potential; AUX, auxiliary).

| |
|--|
| a-ki-g-thize-ta-mi ⁿ k ^h e |
| 1s.AGT-BEN-REFL-get-POTEN-1s.AUX |
| 'I'll get (it) for myself.' |

Omaha-Ponca is an active-stative language, meaning that verbs take one or the other or both of two sets of pronominal prefixes, an agent set and a patient sset. The regular prefixes are given in the following example (there are also several irregular conjugations):

| | 1s | 2nd person | 3rd person | 1PL |
|----------|------------------|------------|------------|------------------|
| Agent: | a- | tha- | Ø- | o ⁿ - |
| Patient: | o ⁿ - | thi- | Ø- | wa- |

Intransitive verbs take one set or the other, depending roughly on their semantics, 'active' verbs taking the agent set as their sole argument, and 'stative' verbs taking the patient set:

| | | |
|---|--------------------------------|--|
| Active verb, | gthi ⁿ 'sit': | |
| agthi ⁿ 'I sit' | thagthi ⁿ 'you sit' | gthi ⁿ 'he/she/it/they sit' |
| o ⁿ gthi ⁿ 'we sit' | | |
| Stative verb, | sni 'be cold': | |
| o ⁿ sni 'I'm cold' | thisni 'you're cold' | sni 'it's cold' |
| wasni 'we're cold' | | |

Transitive verbs take both an agent prefix for the subject and a patient prefix for the object, e.g., *oⁿ-thi-doⁿbai* 'we see you'. There is a portmanteau form *wi-* for first-person subject with second-person

object, and an additional patient prefix *wa-* for third-person plural or indefinite object.

Syntax

Syntactically, Omaha-Ponca is a head-marking, head-final language. Postpositions follow their nominal arguments, as in *tiútanoⁿ k^he di* ‘in the yard’ (literally, ‘yard the in’). Modal and evidential auxiliaries are at the end of the clause, after the verb, as are imperative and question particles. Determiners are the rightmost element in the nominal phrase (determiner phrase) and other noun modifiers also follow the head noun (noun + clause + possessive + article):

wat^hé tu wiwíta thoⁿ
 dress blue my the
 ‘my blue dress’

Basic sentence word order is subject-object-verb, as in the following example (PROX, proximate; EVID, evidential):

[wahóⁿthishige ak^ha] [shóⁿgewiⁿ] [góⁿtha-i-t^he]
 Orphan.Boy the horse one want-PROX-EVID
 ‘Orphan Boy wanted a horse.’

Full subject-object-verb (SOV) sentences are actually rather uncommon, however. All constituents except the verb are optional, so subject and/or object are often missing; a verb alone constitutes a full grammatical sentence. In addition, SOV order is far from rigid; it is not uncommon for a major constituent, such as the underlined phrase in the following example, to occur after the verb. Such postverbal phrases generally seem to be topics, but may sometimes be simply an afterthought:

M. S. izházhe athíⁿ nú ak^há
 name had man the
 ‘The man was named M. S.’

Because all participants are marked on the verb and all nominals are optional, it is possible to analyze Omaha-Ponca as a pronominal argument language, in the sense that the pronominal affixes on the verb are the true syntactic arguments of the clause, with nominal phrases (when they occur) being adjuncts. As in other languages, this analysis is controversial.

Relative clauses in Omaha-Ponca are internal headed, with the head noun contained within the clause. The head noun is indefinite (not marked with a definite article), whereas the clause is followed by an article appropriate to the head noun’s role in the matrix clause:

[[shiⁿnuda noⁿba uxpátheawathe] ama]
 dog two I.lose.them the
 ‘The two dogs that I lost’.

Various types of nominal and adverbial subordinate clauses also exist, sometimes also marked with an article:

[[that^hi] t^he] údoⁿ
 you.arrive.here the good
 ‘It’s good that you’re here’.

Usage: Gendered Speech and Dialects

Some aspects of Omaha-Ponca language differ by the gender of the speaker. Male/female speech forms play only a minor role in the grammar and lexicon of the language; however, they are of great cultural salience and occur with high frequency, including, as they do, forms of address, greetings, terms for certain relatives, speech act markers (command, exclamation, and question particles), and interjections (see the following examples). Gendered speech sometimes hampers language teaching and revival efforts; males in particular are wary of learning inappropriate speech patterns from a female teacher. For example, *aho!*, a greeting or interjection showing approval, is used only by males. Imperative enclitics (Example (1)) and relationship terms/vocative enclitics (Example (2)) provide additional examples:

- (1) -ga (male)/-a (female), sometimes with stress shift:
 oⁿi-ga/oⁿi-á ‘give it to me’ (male/female)
- (2) zhiⁿthé-ho ‘older brother!’
 (male; i.e., addressed by brother)
 tinu-há ‘older brother!’
 (female; i.e., addressed by sister)

Differences between Omaha and Ponca varieties of the language are slight, and mostly involve recently innovated vocabulary, such as ‘telephone’ (Ponca *máⁿ aⁿze ut^hiⁿ* ‘tapping iron’ (originally ‘telegraph’) vs. Omaha *móⁿoⁿze íutha* ‘talking iron’), or ‘cup’ (Ponca *uxpé zhiⁿga* ‘little dish’ vs. Omaha *niúthatoⁿ* ‘drink water in it’). Some words differ in meaning. For instance, *shóⁿzhiⁿga* (literally ‘small horse’) means ‘colt’ in Omaha but ‘puppy’ in Ponca. *Shóⁿge* (originally ‘dog’) has shifted its meaning to ‘horse’ in both Omaha and Ponca, but the young-animal term derived from it retains its older meaning in Ponca. Such lexical differences are not necessarily absolute. Given the close contact between Omahas and Poncas, in many cases both forms may be known in both communities.

Phonological and grammatical differences between Ponca and Omaha have not been well researched. There is some indication that Ponca speakers retain the final -i of the proximate/plural, which present-day Omaha speakers drop in most environments, though ablaut shows that it is underlyingly present, as in

Ponca *athái*, Omaha *athá* 'she/he/they go', from *athé* + *i*. However, given the small number of speakers recorded, this may be more an idiolectal than a dialectal difference. In general, speakers from the two communities have no trouble understanding each other.

Omotic Languages

R J Hayward

© 2006 Elsevier Ltd. All rights reserved.

The Omotic languages constitute an indigenous Ethiopian family of the Afroasiatic phylum. They are spoken in the west and the southwest of the country, with the River Omo as a geographical locus, and from this the name derives.

Earlier opinion included Omotic within Cushitic, but subsequent to Fleming (1969), it has generally been regarded as an independent family. There is a well-founded division into North and South sub-families. While the latter (comprising Hamar, Dime, and the Ari dialects) exhibit close internal affinities, there is greater diversity within Northern Omotic, the following groups being recognized: Gongga (Kafa varieties, Mocha, Nao, and Anfillo), Dizoid (Dizi varieties and Sheko), Mao varieties, Gimira (Benchnon and She), Ometo (an extensive cluster of languages and dialects including Wolaitta, Dorze, Gamo, Gofa, Basketto, Male, Zayse, Koyra and, possibly, Chara), and Yemsa (an isolate). The greatest numbers of speakers belong to the Ometo, Gongga, and Ari groups, though accurate figures for speakers of the Omotic languages remain unrecorded.

Omotic languages exhibit many of the linguistic features typical of the area; they show especially strong typological affinities with East and Central (Agaw) Cushitic.

Syntactically: (a) They are strictly head-final, i.e., the verb is final, all nominal modifiers precede the noun, only postpositions occur, etc.; the morphology,

moreover, is entirely suffixal. (b) There is no WH-movement, though, as with any focused constituent, WH-elements may be moved to sentence-initial position by means of a type of clefting operation. (c) Verbs in non-final (but non-subordinate) clauses commonly lack agreement, and function rather like 'serial verbs.' (d) Many Omotic languages have a case system which opposes a marked nominative in subject NPs to an unmarked absolutive form found in all other syntactic functions (complement of verb, copula, or postposition) as well as for citation purposes. (e) Contrastive argument structures of lexically related verbs (e.g., passives, reciprocals, causatives, etc.) are indicated by stem suffixes. (f) Tense and modal distinctions are carried by auxiliaries following the main verb.

Phonologically: Omotic languages share the following areal features: (a) The 'emphatic' obstruent series of Afroasiatic is represented by glottalized segments. (b) There is a symmetrical system of five peripheral vowels. (c) Length is pertinent for both consonants and vowels. (d) Pitch variation functions contrastively, though functionally many of the languages probably have 'tonal accent' rather than 'paradigmatic tonal' systems.

Going beyond areal typology, a range of Omotic languages exhibit phenomena that make it plausible to hypothesize four family-specific features, which, one assumes, are inherited from the protolanguage: (a) A root-structure constraint disallowing co-occurrence of palatal (ʃ , ʒ , tʃ , tʃ^h , dʒ) and non-palatal (s , z , ts , ts^h , (dz)) sibilants. (b) A nasal suffix accusative marker. (c) A three-term tonal system. (d) A lexical classification of nominals in terms of vocalic suffixes.

Certain Afroasiatic features have undergone simplification in Omotic: (a) Except in the case of human animates, formal agreement for nominal gender has been neutralized. (b) Number categories and morphology have been simplified; singulative forms are relic only, and each language employs just one plural formative. (c) No trace of the Afroasiatic Prefix Conjugation has survived.

Certain (groups of) languages have developed characteristics of some interest: (a) Benchnon Gimira has a system of six tones, which makes it unique within Africa. (b) The Ometo languages have evolved a distinct series of interrogative verb paradigms employed both for Yes/No and WH-questions.

Introduction

Oneida is a Native American language of the northern branch of the Iroquoian family, related to Seneca, Cayuga, Tuscarora, Onondaga, and, most closely, Mohawk. The homeland of the Oneida people is in central New York state. Migrations in the 1800s led to the three current communities of Oneidas on reservations in central New York and near Green Bay, Wisconsin, and a reserve near London, Ontario. A century ago most Oneidas spoke the language, but currently all Oneidas speak English and there are only small numbers of Oneida native speakers, primarily in Wisconsin and Ontario. All three Oneida communities sponsor efforts to preserve the language, but it is definitely endangered with the total number of fluent native speakers under 100. The Oneidas' name for themselves is *onayote?aká* 'people of the standing stone.' They also use the term *ukwehu wé* 'native people' for themselves and other Iroquoian people.

The oral traditions of the Oneidas support a wealth of stories and a rich set of ceremonies, shared with other members of the League of the Iroquois (also known as the Six Nations or *Haudenosaunee*). A written form of the language is a recent innovation. Jesuit missionaries established a writing tradition for the Mohawk language, and it was used by a few people for Oneida in the 19th century for personal letters, some records, and Bible translations.

A linguistically based orthography was invented in the late 1930s and, slightly revised, has been in use since the 1970s for many language preservation materials.

Phonology

The Oneida phonemes are four oral vowels /i, e, a, o/, two nasal vowels /ʌ, u/, four resonants /l, w, y, n/, two stops /t, k/, a fricative /s/, two laryngeals /h, ʔ/, and a phoneme of vowel length. Two affricates are often analyzed as phoneme combinations /tsy, tshy/. The voicing of the stops and palatalization of the fricative are subphonemic processes conditioned by the following sound. Vowel length and pitch are distinctive, and the prosodic patterns produce one of the principal contrasts with the related Mohawk language. Patterns of epenthesis are another important contrast.

The sound system of the language is remarkable for a number of features: the small inventory of phonemes, the lack of labial sounds, and the presence of whispered syllables in a morphophonological process conditioned by placement within sentences. For example, the word for 'sugar' is *onutákli?* when it is followed by other words and *onutákehli* with the last syllable *-li-* whispered when it occurs at the end of a sentence or before a major phrase.

Morphology and the Lexicon

The morphology of the language is complex. There are only three clear word classes (nouns, verbs, and particles), but affixation is common with nouns and especially with verbs, which require, at minimum,

pronominal prefixes and aspectual suffixes added to either simple or complex verb stems. There is a rich set of derivational processes that manipulate the basic argument structure of verbs. The process of noun incorporation, along with derivational morphemes such as reflexives, benefactives, causatives, and instrumentals, can build complex stems from simpler roots. There are also devices that convert nouns to verbs and verbs to nouns. Thus, derived forms can nest within others to create words of amazing length. In addition, there is a rich set of inflectional affixes for verbs. Suffixes supply aspectual and some tense inflections. One set of prefixes supplies a pronominal coding of one or two arguments (agent and patient) with number, person, and gender distinctions. There are two distinct feminine genders along with a masculine gender and a neuter gender that largely overlaps with one of the feminine genders. The other feminine gender is the unmarked gender in the singular, whereas the masculine is the unmarked gender in the plural. There are three categories of number: singular, dual, and plural. In addition verbs may have up to six of an additional set of 11 prefixes that supply various adverbial, directional, tense, mood, lexical, and syntactic functions. Words thus contain quite a few morphemes, and these morphemes are subject to quite a bit of alternation, conditioned by surrounding morphemes, by surrounding phonemes, and by accentuation patterns.

A couple of examples of Oneida verb forms demonstrate the template: Prefixes-Pronominals-Verb stem-Aspect suffix.

- (1) t -á -t -k -e -ʔ
 back -will -toward -I -go -ASP
 'I will come back'

In (1), the verb stem *-e-* 'go' has a punctual aspect suffix *-ʔ-* and a pronominal prefix *-k-* that indicates 'first-person singular agent.' The sequence *tát* is a combination of three prefixes: *-t-* 'direction toward,' *-á-* 'future tense,' and *-t-* 'returning.'

- (2) t -huwati -lihunyanít -haʔ
 there -they.AGT/them.PAT -teach -HABIT
 'school, they teach them there'

The form in (2) is constructed as a verb, but can function as a noun. It consists of a complex verb stem *-lihunyaniht-*, which is made of simpler components: an incorporated noun, *-lihw-* 'custom'; a verb root, *-uni-* 'make'; a benefactive derivational form that allows an argument role in the pronominal prefix for the receiver of the teaching, *-ani-*; and an instrumental derivational suffix that allows a focus on the means of teaching, in this case, the location,

-ht-. When these four components are combined, certain sound rules apply: *-w-* is lost before *-u-*, *-i-* becomes a consonant before a vowel, and *-h-* is lost in the *-hth-* combination. The aspectual suffix *-haʔ* is 'habitual,' the pronominal prefix *-huwati-* indicates a third- person plural agent and patient, and the initial prefix *-t-* indicates location.

The noun morphology is simpler. A few nouns are uninflected, but most nouns have obligatory prefixes and suffixes on basic noun roots, and these affixes mark the resulting words as nouns. The basic nominal prefixes can be replaced by possessive prefixes. There are a variety of locative suffixes, several pluralizing suffixes, a number of verb roots that function as adjective suffixes, and a few other suffixes. Many words that function as nouns in sentences, however, are not built from noun roots but instead are verb forms that produce descriptions used as nominals. In a few cases, it is difficult to tell whether a word is a noun or a verb.

- (3) ka -lút -eʔ
 it -log -NOM
 'log'
- (4) ka -lut -o·kú
 it -log -under
 'under the log'
- (5) ka -lur̄t -ót -eʔ
 it -log -stand -ASP
 'tree, standing log, the tree is standing'

The prefix *ka-* is both a common noun prefix and a neuter pronominal prefix for verbs, and the suffix *-eʔ* is both a noun suffix and a verb suffix for the stative aspect.

As a result of the complex morphology, Oneida provides its speakers with enormous resources for word building. Undoubtedly not all of this potential is exploited, but many forms that are used are lexicalized, often with some semantic specialization, as in the verb for 'they teach them there,' which lexicalizes as 'school.' That lexicalization is sometimes marked by particular additional suffixes, but for many words there is no formal marking, only use, to indicate the lexicalization. Many functional nouns are thus created from formal verbs when a description becomes a name. This may account in part for the resistance the language has to borrowing words from English, which has surrounded and endangered the language for centuries.

Syntax

In the syntax, word order is not particularly rigid and intuitions of sentencehood are not strong. Particles

and clusters of particles connect strings of predications and sometimes link to nominal arguments (which may appear formally to be verbs). The main arguments of the predication are encoded into the verb in the pronominal prefixes, and, if there is need to elaborate them, any elaboration tends to follow the predication. Particles and combinations of them provide discourse functions, subordination markers, deictics, emphasis, evidentials, and the pacing devices that are well developed in the oral tradition.

Scholarship

The academic study of the language includes some early text collection by Boas (1909) and analysis of verb stem classes by Barbeau (1915), but the real foundational work is by Lounsbury, based on fieldwork done in the Wisconsin community in the late 1930s and early 1940s. His work (Lounsbury, 1953), based on his M.A. thesis on Oneida phonology and his doctoral dissertation on verb morphology, set a framework not only for the future study of Oneida but for all the northern Iroquoian languages. Subsequent work by Karin Michelson has advanced the understanding of the sound system (Michelson, 1988) and the aspectual system (Michelson, 1995). The lexicon of the language is documented in two dictionaries, one based on fieldwork from the Wisconsin community (Abbott *et al.*, 1996) and one from the Ontario community (Michelson and Doxtator, 2002). A sketch of the linguistic structure of the language is available in Abbott (2000), and more complete grammars, both for reference and teaching, are in preparation. There are several text collections with linguistic analysis (Campisi and Christjohn, 1980; Abbott *et al.*, 1980; Michelson, 1981; Elm and Antone, 2000).

Community Work

Each of the three Oneida communities has a language preservation/recovery program to combat the endangered status of the language. Samples of the language, both written and spoken, are available on the websites of two of the Oneida communities: the Wisconsin community and the New York community. The language is being taught in tribal schools and in informal community classes. For the most part, the communities have adopted, since the 1970s, the writing system developed by Lounsbury, slightly modified from Lounsbury (1953). These programs have produced pedagogical materials, including some text collections (Abbott, 1982a, 1982b, 1983a, 1983b; Hinton, 1996) and word lists (Anton *et al.*, 1981; Anton, 1982), and include language material on their

websites. The success of these programs in stemming the language loss over the last several decades has been fairly modest.

Oromo

D Appleyard, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Oromo (self-name Afaan Oromo 'language of the Oromo') is one of the major languages of the Horn of Africa, spoken predominantly in Ethiopia, but also in northern and eastern Kenya and a little in southern Somalia. Estimates of numbers of speakers vary widely from about 17 300 000 (based on current Ethnologue figures) to 'approximately 30 million' (Grieffenow-Mewis, 2001: 9), and there are probably about 2 million more who use it as a second language. Oromo is the major member of the Oromoid subgroup of the Lowland East Cushitic branch of Cushitic languages. There is currently no agreed-upon standard form of Oromo. Since it was adopted as a national language within the Oromo region in 1992, the Central-Western variety, which has the largest number of speakers, has tended to form the basis upon which a standardized form is being built. There are three main dialect clusters of Oromo, the Central-Western group, with at least 9 million speakers, comprising the Macha, Tuulamaa, Wallo, and Raya varieties, all spoken within Ethiopia; the Eastern group, also known as Harar Oromo or Qottu, spoken in eastern Ethiopia; and the Southern group, including Booranaa, Guji, Arsi, and Gabra, spoken in southern Ethiopia and adjacent parts of Kenya. Distinct from this last group are Orma, spoken along the Tana River in Kenya and apparently in southern Somalia along the Juba river, and Waata, spoken along the Kenyan coast to the south of Orma.

Under the Ethiopian imperial regime, which fell in 1974, the status of Oromo in Ethiopia was that of a spoken, vernacular language only. Its use in schools, the media, and other public forums was in effect proscribed, although Amharicized Oromos had been influential in the government of Ethiopia since the middle of the 18th century. With the advent of the Marxist regime, which gave some official recognition to Ethiopia's rich multilingual situation, Oromo was designated as one of the eventual 15 languages of the literacy campaign in Ethiopia, and printed and broadcast materials in Oromo started to appear. At first Oromo was written in a slightly adapted form of the Ethiopian syllabary, which had hitherto been mostly used for Ge'ez, or Classical Ethiopic, Amharic, and Tigrinya, but the move to write the language in Roman script, known as qubee in Oromo, soon prevailed. The decision of the Oromo Liberation Front to adopt the Roman script as early as 1974 doubtless gave this move impetus, though until 1991–1992 it was the refugee or exile community that made use of qubee. Additionally, there was at first no consensus on the representation of particular phonemes, and even today there can still be hesitations in marking vowel length.

Phonology

Oromo has 24 consonant phonemes, represented in the qubee orthography as follows, with IPA values where different between slashes as shown in **Table 1**. In addition, p, v, and z occur in loanwords, and some dialects, e.g., Eastern Oromo, also have a voiceless velar fricative /x/, typically in place of /k/ in other

Table 1 The consonant phonemes of Oromo

| | Bilabial | Alveolar/ dental | Palatal | Velar | Glottal |
|--------------------------------------|----------|---------------------|-------------------|-------|---------|
| Plosive | b | d t | j ch /dʒ/ /tʃ/ | k g | ʔ |
| Glottalized Plosive/ affricate | ph | x | c | q | |
| Implosive | | dh /dʔ/ | | | |
| Fricative | f | s | sh /ʃ/ | | h |
| Nasal | m | n | ny /ɲ/ | | |
| Lateral | | l | | | |
| Approximant | w | r | y /j/ | | |

dialects. All consonants except for ʔ and h may occur both long and short, though the orthography does not indicate long consonants where the symbol used is a digraph: eenyu /ʔe:ɲju [ʔ] / ‘who?’, buuphaa /bu:pʔa [ʔ] / ‘egg’.

There are five vowels: a, e, i, o, u, each of which occurs both short and long, long vowels normally being indicated by doubling. In prepausal position, final long vowels are shortened somewhat and are closed by a glottal stop. According to dialect, in the same position final short vowels also are either closed by a glottal stop or devoiced. Some morphological clitics also cause a change in vowel length when added to vowel-final stems: nama ‘the man’ but namaa fi farda ‘the man and the horse’. Additionally, several descriptions of Oromo dialects mention vowel length dissimilation, whereby long vowels in more than two consecutive syllables are not permitted: ijoollee + dhaaf > ijoolledhaaf ‘for the children’. It has also been noted (Owens, 1985: 16) that only one long vowel per morpheme is permitted.

Consonant clusters in Oromo are limited to two components. Across morpheme boundaries, various patterns of consonant assimilation occur: dhug- + -ti > dhugdi ‘she drinks’, nyaadh- + -na > nyaanna ‘we eat’, dhaq- + -te > dhaqxe ‘she went’, gal- + -ne > galle ‘we entered’, Oromot[a]- + -ni > Oromoondi ‘the Oromos’ (subject case). Spoken forms of Oromo also seem to make greater use of consonant assimilation than the written language. Potential clusters of more than two consonants are always resolved by insertion of an epenthetic vowel, usually i: kenn- + -te > kennite ‘you gave’. Sometimes, metathesis of the component consonants and an epenthetic vowel is also involved: arg- + -te > agarte ‘you saw’ beside argite.

Oromo is a tone-accent language, but details do differ somewhat from one spoken dialect to another. There is generally a simple, two-way contrast between high and non-high. As in a number of other Lowland East Cushitic languages, tone does not, however, distinguish lexical items, but is linked with morphological or syntactic categories, as for instance in Eastern Oromo xeesúmaa [L.H.H] ‘the guest’ in the absolute case or ‘basic’ form, but xeesúmaa [L.H.L] before a clitic such as the dative marker -f, or the same in sentence-final predicate position, and xeesumaa [L.L.L] optionally before a phrase-final adjective. Written Oromo, however, does not mark accent. Interestingly, potential confusion between two particles, predicate focusing hín, with high tone, and present negative marker hin, with low tone, is avoided in written Oromo by adopting an Eastern Oromo dialect variant ni in the former sense and keeping hin as the negative marker.

Morphology

Oromo has a moderately complex morphology, both inflectional and derivational, similar in categories and extent to other Cushitic languages. Nouns show gender, number, and case marking, though the first of these is more typically detectable only in agreement rather than being formally marked on the noun. Derived adjectives, however, do mostly show gender: diimaa (masc.): diimtuu (fem.) ‘red’. There are two genders, masculine and feminine, and two numbers, singular and plural. In addition, there are some singular or participative forms: nama ‘man’: namicha ‘a particular man’, jaarti ‘old woman’: jaartittii ‘a particular old woman’. There are two fundamental cases, the absolute and the nominative, which generally require agreement among constituents of the noun phrase. Other case functions are only marked phrase-finally and do not elicit agreement. As with many other Cushitic languages, in Oromo the nominative or subject case is the marked form, and the absolute case, with functions ranging from predicative, direct object, and pre-clitic position to citation form, is unmarked.

abbaa-n koo nama dheeraa dha
father.SUBJ my man.ABS tall.ABS COP
 ‘my father is a tall man’

meeshaa sana arg-ite
thing.ABS that.ABS see-2SING.PAST
 ‘did you see that thing?’

mana keessa seen-e
house.ABS inside enter-3MASC.PAST
 ‘he went into the house’

The nominative or subject case is formed by a range of suffixes, -n, -ni, -i, or Ø (but with tonal difference), or -ti (some feminine nouns only) added according to the shape of the absolute form.

dog-SUBJ white-SUBJ FOCUS bark-3FEM.PRES
 ‘the white dog is barking’

bishaan hin dhug-aam-e /biʃá:n/ [L.H]
water-(SUBJ) NEG drink-PASS-3MASC.PAST
 ‘the water wasn’t drunk’

bishaan dhug-ani /biʃa:n/ [L.L]
water-(ABS) drink-3PL.PAST
 ‘they drank the water’

The remaining case functions all are built on the absolutive, either by means of clitics, both postpositions and occasionally prepositions, or by minor modification in the instance of the possessive case form. Possessive marking occurs only phrase-finally and is typically formed by lengthening a final vowel usually with high tone. Optionally a possessive linking particle may also be used before the possessive noun or phrase: kan with masculine head nouns, tan with feminine.

mana nam-ichaa-n beek-a
house.ABS man-SINGULATIVE.POSS-I know-1SING.PRES
 ‘I know the man’s house’

farda kan
horse.ABS PART.MASC
 nam-ichaa arg-ite
man-SINGULATIVE.POSS see-2SING.PAST
 ‘you saw the man’s horse’

Verbs in Oromo inflect for tense-mood-aspect (TMA), person (including gender and number as appropriate), and voice. Verb inflection is by means of suffixes, and the usual morpheme string is root + [voice] + person + TMA. The verb form may also be preceded by various proclitics or pre-verbs, such as negative, optative, and predicate focus markers, and may also have added in final position a conjunctive suffix:

loon ni bit-achi-siif-tanii-ti . . .
cattle FOCUS buy-AUTOBENEFACTIVE-CAUS-2PL.
PAST-and
 ‘you made (someone) buy cattle for themselves and . . .’

There are four main voices or derived stems of the verb in addition to the basic form: autobenefactive (sometimes also referred to as middle voice), causative, passive, and intensive or frequentative. The first

three of these are formed by suffixes, which in the instance of the causative show some considerable variation according both to the shape of the stem to which it is added and to the shape of the following personal marker. The frequentative stem is formed by means of partial reduplication of the basic stem:

cab-uu ‘to break’
break-INF
 caccab-uu ‘to break into pieces’
break.INTENSIVE-INF
 deebi’-uu ‘to return’
return-INF
 deddeebi’-uu ‘to keep on repeating’
return.INTENSIVE-INF

Up to two derived stem formatives may also be added to the basic verb stem according to prescribed sequences and combinations:

deebi’-uu ‘to return’
return-INF
 deebi-s-uu ‘to answer’
return-CAUSE-INF
 deebi-f-am-uu ‘to be answered’
return-CAUSE-PASS-INF
 deebi-f-ach-uu ‘to return s.th. for oneself’
return-CAUS-AUTOBENEFACTIVE-INF
 deddeebi-s-uu ‘to repeat often’
return.INTENSIVE-CAUS-INF

Person markers, which follow the verbal stem, show the typical Cushitic pattern in which the 1st singular and 3rd masculine are formally identical, though in written Oromo the former is distinguished by suffixing to the preceding word -n, evidently a reduced form of the independent pronoun ani ‘I’:

mana barumsaa-n deem-a
house learning.POSS-I go-1SING.PRES
 ‘I go to school’
 mana barumsaa deem-a
house learning.POSS go-3MASC-PRES
 ‘he goes to school’

In keeping with the same underlying Cushitic pattern, the 2nd sing., and 3rd fem., also have identical personal markers, -t-, though in Oromo there is a difference of TMA vocalization in the present tense. There are three basic finite TMA paradigms: the present, the past, and what has been called the subordinate, or sometimes the subjunctive. The present is a main clause form only, while the past is employed both in main and dependent clauses. The subordinate/subjunctive form is used in a range of functions, both in dependent clauses, but also as a negative present with the particle hin, and as a jussive with the particle haa. The negative past and the negative jussive are both, on the other hand, invariable with respect to person. TMA marking is by means of

the vocalic elements following the person marker, essentially -e in the Past and -u in the subordinate/subjunctive, and -a in the Present except in the 3rd feminine, where it is -i. The 2nd and 3rd plural forms in written Oromo have the endings -tan [i] and -an [i] in all tenses, though -tu and -u also occur in the present tense and subordinate/subjunctive forms. A number of compound tenses also occur, combining variously finite tenses or verbal nouns, such as the infinitive or participle, with finite forms of such verbs as jiruu 'to be' or its Past tense equivalent turuu, or ta'uu 'to become'.

An interesting type of verb compound or composite, which has parallels across the Ethiopian language area, involves a fixed particle, typically underivable, and the verb jechuu 'to say', or in a causative-transitive function, gochuu 'to make':

| | | | |
|-----------------------------|-------|------------|------------|
| nam-ich-i | cal | jedh-ee | tur-e |
| man- | 'cal' | say- | be.past- |
| SINGULATIVE-SUBJ | | 3MASC.PAST | 3MASC.PAST |
| (cal jechuu 'to be quiet') | | | |
| 'the man was keeping quiet' | | | |

The normal word order in Oromo is SOV, as can be seen from various examples above, and dependent clauses generally precede the main clause. Relative clauses, however, follow their head noun. Subordinating particles or conjunctions are usually placed at the beginning of the clause, but may also be placed immediately before the verb at the end of the clause. Some conjunctions are disjunct, comprising both an element at the beginning of the clause and a clitic or affix placed after the verb (e.g., waan ... -f 'because' below).

| | | | | |
|-----------------|-----------------|-------------------------|---------------------|---------|
| gurbaa-n | osoo | loon | tiks-uu | waan |
| boy-SUBJ | while | cattle | watch-3MASC-SUBJUNC | because |
| midhaan | namaa | nyaach-is-ee-f | | |
| grain | man.POSS | eat-CAUS-3MAS.PAST-PART | | |
| abbaa-n-saa | reeb-ee | kur- | | |
| father-SUBJ-his | beat-3MASC.PAST | be.PAST-3MASC.PAST | | |

'because the boy, while watching the cattle, had let them eat someone else's grain, his father had beaten him'

An interesting syntactic feature that Oromo shares with most other Cushitic, and especially Lowland East Cushitic languages, is a system of focus marking by means of clitic particles with different markers for predicate and non-predicate focus. Oromo has essentially two focus constructions, both of which are optional, one used exclusively for subject focus and one for predicate focus. A third clitic is used for emphasizing non-subject nominals and is perhaps on the way to becoming a third focus marker (Griefenow-Mewis, 2001: 55). The subject focus marker is -tu[u] which is added to the absolutive case and neutralizes person/number agreement with the verb, which remains in the 3rd masculine:

| | | | |
|---------------|--------|------------|------------|
| mukk-een-tu | oddoo | keessa-tti | arg-am-a |
| tree-PL-FOCUS | garden | inside-LOC | see-PASS- |
| | | | 3MASC.PRES |

'trees can be seen in the garden'

Ethnography, History, and Literature

Ossetic (also 'Ossetian', ISO639: 'oss') is an Iranian language spoken by approximately 650 000 people,

mainly in the Republic of North Ossetia-Alania (Russian Federation), the South Ossetic Region in Georgia, in various other parts of the Russian Federation, and in scattered settlements in Turkey. The capital of North Ossetia is Vladikavkaz (Dzæudžiqæu in Ossetic). All speakers are bilingual (with Russian, Georgian, or Turkish as a second language) (Figure 1).

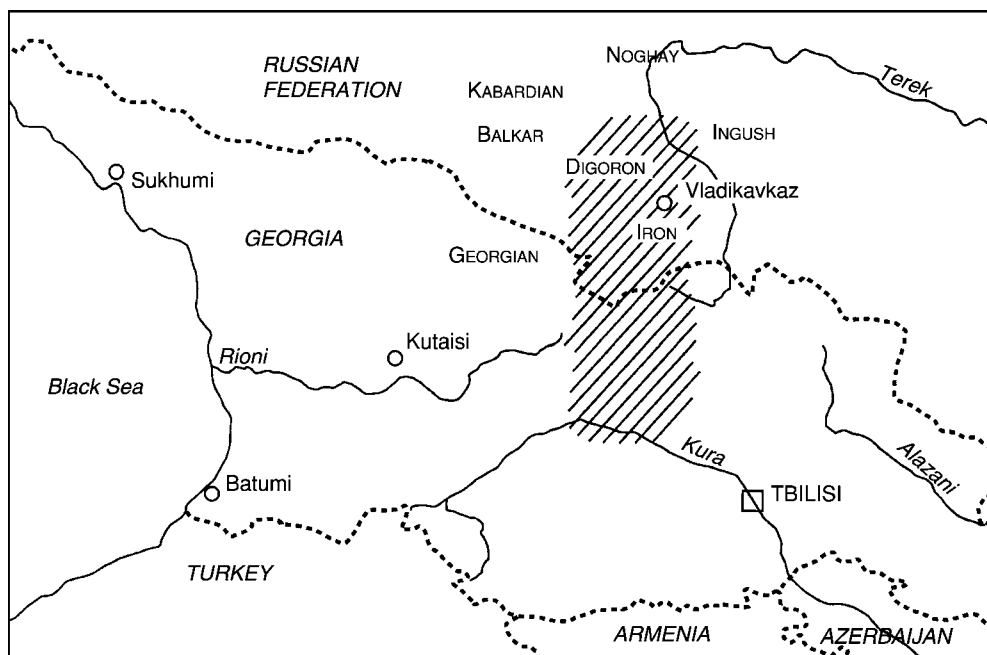

Figure 1 Ossetic area (hatched, adjacent languages in small caps).

Ossetic belongs to the Eastern Iranian branch of Indo-European of which the oldest historic member is Avestan. In the Middle-Iranian period, the Alanic group of languages comprised the closest relatives of the unattested predecessor of Ossetic. These quite fragmentarily attested languages were spoken from approximately 400 B.C. (earliest mention of the Sarmatians) to the 13th century A.D. in Southern Russia and on the Northern coast of the Black Sea. The first Ossetic document was a catechism printed in Moscow in 1798. Several writing systems based on the Georgian, Roman, and Cyrillic alphabets had been in use before Cyrillic was made official in 1939. In this article, we use the transliteration used by most scholars. The first grammatical description of Ossetic was Andreas Sjögren's *Iron Ævzagaxur* (St. Petersburg 1844).

The two main dialects, Iron and Digoron, show some major phonological and morphological differences. Still, we will only discuss Iron, which is the basis for the literary language.

The mythological Nart tales, traditionally told by wandering minstrels, were collected from oral sources in the early 20th century by Vsevolod Miller. They have become the national epic. Its first translation into a Western language (French) was done by Georges Dumézil in 1930. Ossetic artistic poetry developed during the 19th century and found its heyday in the works of the national poet Xetægkaty K'osta (1859–1939).

Consonants

Ossetic shows a systematic opposition of voiceless aspirated, voiced, and voiceless ejective stops and affricates. The voiceless uvular stop has no ejective nor voiced counterparts.

The alveolar affricates $[\widehat{ts} \widehat{dz} \widehat{ts}']$ are realized as fricatives in Iron, except for the ejective ($[s z \widehat{ts}']$) and when geminated $[\widehat{ts} : \widehat{ts}']$. In all positions, the dentoalveolar fricatives $/s z/$ are realized as postalveolars $[ʃ ʒ]$. These changes are not reflected in the orthography. An older stage is attested in Ossetic dialects in Turkey, where $/s z/$ are $[ʃ ʒ]$, but $[\widehat{ts} \widehat{dz} \widehat{ts}']$ are still $[\widehat{ts}^h \widehat{dz} \widehat{ts}']$ (Table 1). $[h]$, written γ , occurs in some interjections like $\gamma\ae j$ $[h\ae j]$ 'hey'.

The postalveolar affricates $[\widehat{t}^h]$, $[\widehat{d}ʒ]$, $[\widehat{t}ʃ]$ are assimilated variants of the velars before front vowels, e.g., *kark* 'hen' and *karč-y* 'of the hen' (genitive). The few exceptions are loan-words, such as *džauyr* 'non-believer' from Circassian *džauyr*. The only regular blocking of this assimilation occurs with the superessive marker *-yl*: *kark-yl* 'on the hen'.

Since the sequence Consonant + $/ui/$ + Consonant is not licensed otherwise in Ossetic, we assume labialized stops in words like *quyn* to be phonemic: $/q^w\text{in}/$ 'hair'. Biphonemic geminated stops and affricates (which are voiceless and unaspirated) occur in lexical entries (*læppu* $[l\ae p : u]$ 'boy') or at morpheme boundaries: *dard* 'far' becomes *dard-dær* $[dard : \ae r]$

Table 1 Consonant phonemes of Iron (IPA and standard transliteration)

| | <i>Labial</i> | <i>Labiodental</i> | <i>Alveolar</i> | <i>Velar</i> | <i>Uvular</i> |
|-----------|-----------------------------|-----------------------|---------------------------------|---|--|
| Plosive | / p b p' / <i>p b p'</i> | | / t d t' / <i>t d t'</i> | / k k ^w g g ^w k' k' ^w / <i>k ku g gu k' k'u</i> | / q q ^w / <i>q qu</i> |
| Nasal | / m / <i>m</i> | | / n / <i>n</i> | | |
| Trill | | | / r / <i>r</i> | | |
| Fricative | | / f v / <i>f v</i> | / s z / <i>s z</i> | | / χ χ ^w ʁ ʁ ^w / <i>x xu γ γ u</i> |
| Affricate | | | / ts dz ts' / <i>c dz c'</i> | | |
| Lateral | | | / l / <i>l</i> | | |

'farther' (comparative). Initial *y*- before geminated *s* is not reflected orthographically: *ssædz* [tʃ:vz] 'twenty'.

Vowels

The Ossetic vowel system can be divided into peripheral (strong) and central (weak) vowels (**Table 2**).

The vowels /u/ and /i/ have nonsyllabic variants that are rendered as *u* (sometimes *u*) and *j* in the transliteration. /u/ in onsets before vowels is realized as [w]. Epenthetic [w] is inserted between /u/ and any other vowel: *læu-* 'stand' and the infinitive marker *-yn* form *læu^wyn*. *j* is used as a glide between any vowel (except *u*) and *i/y*: *uda-* and *-yn* become *udaj-yn* 'humidify'.

Accent

The word accent depends on the distribution of strong and weak vowels. If the first vowel is strong (s), it receives the accent, if it is weak (w), the second vowel is stressed. Thus, the following patterns emerge (accent is marked by an acute):

.śś .św .wś .wś

There are lexicalized exceptions to that rule (e.g., forms of the demonstrative pronoun and words like *Irón*). An emerging morphophonemic exception is the preverb *ys-* ([tʃ] or [ʃ]), which retracts the accent even with speakers who no longer articulate the initial vowel: (*y*)*s-æxgæn-yn* 'to close'. Proper names are stressed on the second syllable, while retracting the accent to the initial syllable produces a pejorative note.

Retraction of the accent within a noun phrase (NP) marks the NP as definite (*zærdæ* 'a heart', *zærdæ* 'the heart').

Only scattered information is available about the phrasal accent of Ossetic. Abaev (1964) lists the noun

Table 2 Vowel phonemes of Iron (IPA and standard transliteration)

| | <i>Front</i> | <i>Central</i> | <i>Back</i> |
|------|-----------------|-----------------|-----------------|
| High | [i] <i>i</i> | [ɨ] <i>y</i> | [u] <i>u</i> |
| Mid | [e] <i>e</i> | | [o] <i>o</i> |
| Low | [a] <i>a</i> | [ɐ] <i>æ</i> | |

phrase (containing adjectives or genitives, *syrx tyrysa* 'red flag'), postpositional phrases (*bælasj byn* 'under the tree'), and complex predicates (*rox kænyn* 'forget') as phonological phrases. Enclitic pronouns and particles (such as negative *næ*) are also incorporated into phonological phrases.

Loan Word Phonology

The ejectives were apparently introduced through Caucasian loans (Iron *zac'æ*, Circassian [zɑtʃ^ɛɛ] 'beard'), although they also correspond to plain voiceless plosives in earlier Russian loans (Iron *bulk'on*, Russian *polkownik* 'colonel'). While older loans from Russian follow the Iron accent pattern, recent loans often preserve the lexical Russian accent. Also, Russian *s* [s] is sometimes realized as [ʃ] and sometimes as [s].

Nouns

Ossetic morphology is agglutinative with mildly inflectional elements. There are nine morphological cases which have, in part, developed from postnominal elements.

Subject and indefinite direct object are usually in the nominative (bare stem). Objects in the genitive are marked as definite. The dative marks the indirect

Table 3 Case system (for *kark* 'hen')

| | | Singular | Translation | Plural |
|-----------------------|----------|------------------|----------------------|---------------------|
| Grammatical cases | NOM | <i>kark</i> | 'hen(s)' | <i>kærc̄y-t-æ</i> |
| | GEN | <i>karč̄-y</i> | 'of the hen(s)' | <i>kærc̄y-t-y</i> |
| | DAT | <i>kark-æn</i> | 'to the hen(s)' | <i>kærc̄y-t-æn</i> |
| Local-adverbial cases | ALL | <i>kark-mæ</i> | 'to the hen(s)' | <i>kærc̄y-t-æm</i> |
| | ABL | <i>kark-æj</i> | 'from the hen(s)' | <i>kærc̄y-t-æj</i> |
| | SUPERESS | <i>kark-yl</i> | 'on the hen(s)' | <i>kærc̄y-t-yl</i> |
| | LOC | <i>karč̄-y</i> | 'at the hen(s)' | <i>kærc̄y-t-y</i> |
| Other adverbial cases | EQU | <i>kark-au</i> | 'as/than the hen(s)' | <i>kærc̄y-t-au</i> |
| | COM | <i>karč̄-imæ</i> | 'with the hen(s)' | <i>kærc̄y-t-imæ</i> |

object, but also the target or purpose of an action. The local cases express the primary local and temporal relations, but the ablative is also used to mark a tool or material used to perform an action, the superessive to mark a reason. The equative (EQU) marks the compared object with comparatives or the language in which something is written, said, etc. (*Iron-au* 'in Iron'), the comitative the partner involved in an action.

Plurals are formed by adding *-t-* to the stem plus the same case markers as in the singular. Sometimes, infixes are added after the stem, such as *-y-* in many cases where the stem ends in a consonant cluster (*cyxt* 'cheese', plural *cyxt-y-t-æ*) (Table 3).

Uninflected nouns function as adjectives, but there are also dedicated adjectives (*syydæg* 'clean'), sometimes marked by formatives like *-on* (*uarz-on* 'beloved' from *uarz-yn* 'love') or *-ag* (*xox-ag* 'mountainous' from *xox* 'mountain'). Adjectives and nouns used as adjectives take the comparative marker *-dær* (*dard-dær* 'farther') and stand in the superlative paraphrase with *æppæty* or *nuuyyl* 'most' (*æppæty dard* 'farthest').

Pronouns

Pronouns inflect mostly like nouns. The personal pronouns have two stems, lack an inessive and a third person series, which is substituted from the remote demonstrative pronoun (Table 4).

The enclitic object pronouns lack a nominative and an equative to the effect that enclitically expressed direct objects have to be put in the genitive (Table 5).

The genitives of the full and enclitic personal pronoun and the reflexive pronoun substitute for the missing possessive pronouns. Reflexives are formed from the object pronoun with *-x-* and a set of special endings. For reciprocal expressions, the noun *kærædzi* 'one another', which only corresponds with plural antecedents, is used.

The demonstrative system exhibits a deictic split into remote (*u(y)-*) and local (*a-*). The true pronouns mark nominative and genitive by the same form

Table 4 Personal pronouns

| | 1 sg. | 2 sg. | 1 pl. | 2 pl. |
|----------|---------------|---------------|----------------|------------------|
| NOM | <i>æz</i> | <i>dy</i> | <i>max</i> | <i>symax</i> |
| GEN | <i>mæn</i> | <i>dæu</i> | <i>max</i> | <i>symax</i> |
| DAT | <i>mæn-æn</i> | <i>dæu-æn</i> | <i>max-æn</i> | <i>symax-æn</i> |
| ALL | <i>mæn-mæ</i> | <i>dæu-mæ</i> | <i>max-mæ</i> | <i>symax-mæ</i> |
| ABL | <i>mæn-æj</i> | <i>dæu-æj</i> | <i>max-æj</i> | <i>symax-æj</i> |
| SUPERESS | <i>mæn-yl</i> | <i>dæu-yl</i> | <i>max-yl</i> | <i>symax-yl</i> |
| EQU | <i>mæn-au</i> | <i>dæu-au</i> | <i>max-au</i> | <i>symax-au</i> |
| COM | <i>memæ</i> | <i>demæ</i> | <i>max-imæ</i> | <i>symax-imæ</i> |

(*a-j* 'this', *uy-j* 'that'), the other cases are formed by adding dative *-mæn* (*uy-mæn*), allative *-mæ*, ablative *-mæj* (*uy-mæj*), locative *-m*, superlative *-uyl*, equative *-jau*, and comitative *-imæ*. The plural forms *adon*, *uýdon* inflect like nouns. In adnominal position, an adjective is formed by adding *-cy* (*uýcy don* 'that water').

Interrogative pronouns inflect like the deictic pronouns and are split into personal (nominative *či* 'who', other cases *kæ-*) and impersonal (nominative *cy* 'what', other cases *cæ-*).

Numerals

The numeral system is basically a mixed decimal-vigesimal system, such that (1a) and (1b) are equivalent (Table 6).

(1a) *ærtyn fondz*
thirty five
'thirty-five'

(1b) *fynddæ s æmæ (y)ssædz*
fifteen and twenty
'thirty-five'

Ordinals are formed by means of a suffix *-æm* (*cyppar-æm* 'fourth'), distributives add *-gaj* (*iu-gaj* 'one by one').

Verbs

The Ossetic verb has a present stem and a past stem (ending in a dental stop). The former is the basis for

Table 5 Enclitic object pronouns

Table 7 Major alternations in the past stem

| Present stem | Past stem |
|---------------------------|-----------|
| | -a- |
| -æ- | |
| | -o- |
| -a- | -æ- |
| -i-, -u-, -au-, -æu-, -o- | -y- |
| -d, -t, -tt, -nd, -nt | -s-t |
| -dz, -c, -ndz, -nc | -γ-d |
| -n, -m | -Ø-d |

the present and future tenses and all deverbal nouns, adjectives, and the infinitive (-*yn*). The latter forms the past tense and the past participle (bare stem).

The past stem shows facultative ablaut of the stem vowel and some facultative modifications of stem-final consonants, as in *lidz-* ‘run away’ (present) and *lyγ-d-* (past). -s- or -y- are sometimes inserted before the past stem marker (*zar-yn* ‘sing’, *zar-γd-t-æ-n* ‘I sang’). Transitive and intransitive verbs have different sets of past tense personal endings (Table 7).

The tense system distinguishes present (habitual, narrative, continuous present, and immediate future), past, and future.

In addition, the copula *uyn* distinguishes between a momentaneous (MOM) and a habitual (HAB) present. The third person present of the copula has the forms *u*, *i*, and *is*, which vary freely (Bagaev, 1965) (Table 8, Table 9).

(2) *Uycy don syγdæg u.*
that water clean be.3SG PRES MOM
‘That water is clean (right now).’

(3) *Uycy don syγdæg væjj-y.*
that water clean be-3SG PRES HAB
‘Such water is usually clean.’

Imperfective aspect is expressed lexically (*dzur-yn* ‘say’, *zæγ-yn* ‘tell’) or morphologically by adding one of the preverbs (generically *s-*). The preverbs also give a basic temporal-spatial orientation that takes into account the speaker’s position. They also express further notions of aspect and aktionsart (Table 10).

The subjunctive expresses doubt (present), wish, possibility (present and future), and necessity, and is used to give orders (future). The past subjunctive covers all these notions.

There are several constructions involving verbal nouns, such as the passive (past participle plus *cæu-yn* ‘go’) and the causative (infinitive plus *kæn-yn* ‘do’).

(4) *uarst cæu-y*
loved (past participle) go-PRES 3SG
‘she is loved’

Noun and Postposition Phrases

Nouns can be modified by means of a preceding noun in the genitive or an adjective. Many nouns can also function as adjectives:

(5a) *xur bon*
sun day
‘a sunny day’

(5b) *lædz-y cæsgom*
man-GEN face
‘the man’s face’

Coordinated elements show group inflection.

(6) *Æxsar æmæ Æxsærtædz-y rajguyrd*
Æxsar and Æxsærtæg-GEN birth
‘Æxsar’s and Æxsærtæg’s birth’

The postpositional constructions that express spatial and temporal relations usually involve functionally interpreted nouns (such as *sær* ‘head’

| Outward motion | <i>ra-</i> | <i>a-</i> |
| Downward motion | <i>æp-</i> | <i>nyn-</i> |

for ‘top’) that additionally take one of the case endings. The dependent noun then receives the genitive marker.

- (7) *xox-y sær-yl*
mountain-GEN head-SUP
 ‘on top of the mountain’

A construction with an adnominal genitive noun can be paraphrased as dative with a clitic pronoun in the genitive.

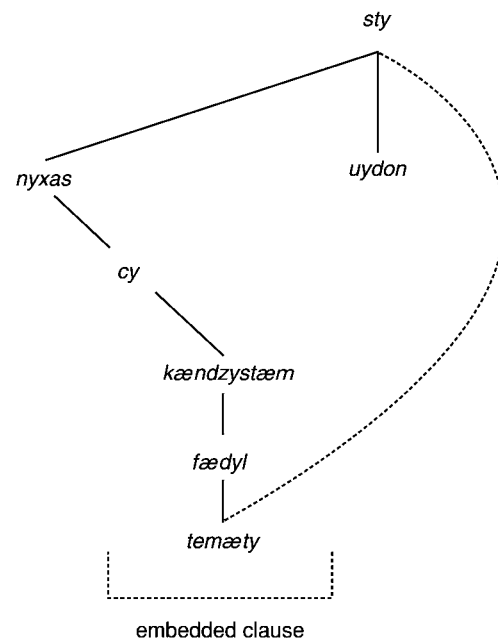

- (8a) *Nart-y fyr*
Nart-GEN son
 ‘son of the nart’
 (8b) *Nart-æn jæ fyr*
Nart-DAT he.GEN son
 ‘son of the Nart’

Simple Verbal Sentences

In most cases, the arguments precede the verb (SOV order).

- (9) *Nart udævdz fyng-yl sæværd-t-oj.*
Nart shawm table-SUP put-PAST-3PL
 ‘The Nart put the shawm on the table.’

In focused word order, the verb can precede the subject. There are no expletive subjects, thus the most simple type of a verbal sentence contains just a verb.

**Figure 2** Dependency markers of sentence (14).

- (10) *uar-y*
rain-PRES 3SG
 ‘it is raining’

Since subjects can be dropped, intransitive verbs can also form one-word sentences.

- (11) *xau-y*
fall-PRES 3SG
 ‘he/she/it falls (is falling)’

Clitic objects (always attached to the first phrase of a sentence) stand in for an omitted object or an adverbial noun (12a), or they are presumptive (12b).

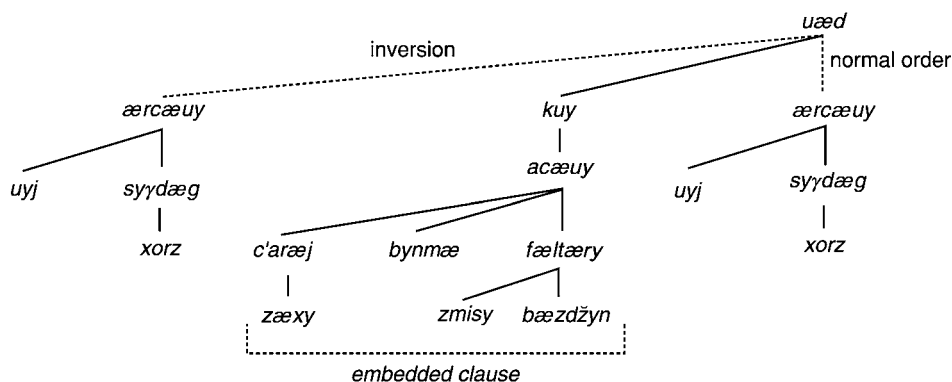

Figure 3 Dependency markers of sentence (15).

- (12a) Nart yl udævdz sæværd-t-oj.
 Nart it.SUP shawm put-PAST-3PL
 'The Nart put the shawm on it.'
- (12b) Nart yl udævdz
 Nart it.SUP shawm
 sæværd-t-oj fyng-yl.
 put-PAST-3PL table-SUP
 'The Nart put the shawm on it, on the table.'

The *constructio ad sensum* is very common for both singular subjects with plural verbs and vice versa.

Copular Sentences

Sentences with the copula *uyn* have the word order (a) subject, predicate noun, copula or (b) subject, copula, predicative noun.

- (13) Mæ nom u Zæhra.
 my name be.3SG PRES MOM Zæhra
 'My name is Zæhra.'

The copula can combine with preverbs: *s-uyn* 'become' and *fæ-uyn* 'turn out to be'.

Syntax of Embedding

We give two sample analyses of embedding constructions. Example (14) (Figure 2) shows a relative clause with a pseudo-antecedent (agreeing in number with the main verb) nested inside the relative clause. Example (15) (Figure 3) illustrates a common construction with attributive clauses and conditionals. Such clauses usually precede the main clause. If the order is inverted, the correlative word (pronoun or conjunction) is moved to the very end of the sentence

behind the dependent clause (main clauses in bold print):

- (14) Nyxas cy temæ-t-y
 talk what subject-PL-GEN
 fædyl kæn-dzyst-æm, **uydon st-y.**
 about do-FUT-1 PL those be-3 SG
 ('The talk about which subjects we are going to make are these.')
- The subjects about which we are going to talk are these.
- (15) **Uyj xorz syrdæg ærcæu-y,**
 that good clean arrive-3SG
 zæxx-y c'ar-æj byn-mæ
 earth-GEN crust-ABL ground-ALL
 zmys-y bæzdžyn fæltær-y
 sand-GEN thick layer-INESS
 kuy acæu-y, **uæd.**
 when come out-3SG then
 'When it (the water) comes out from the earth's crust to the ground through a thick layer of sand, then it arrives fairly clean.'

Oto-Mangean Languages

T Kaufman, University of Pittsburgh, Forest Hills, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

Oto-Mangean (OM) is the most temporally diverse genetic grouping of languages spoken within Meso-America and one of the most widespread geographically. Currently, Mayans account for more speakers and more territory, but the individual identities of the approximately 30 distinct languages of Mayan are not in doubt, whereas the exact number of languages under the names Otomí, Chinanteko, Popoloka, Masateko, Sapoteko, Chatino, and Misteko is a matter of continued discussion and debate. The number recognized here (ca. 30) is probably close to a minimum number.

Oto-Mangean is a stock of roughly the time depth of Indo-European – approximately 6000 years. It is made up of seven readily recognizable language families, some of them with fairly complicated ramification and individually of varying time depth: Oto-Pamean (3600 years), Chinanteko (1500 years), Chorotegan (1300 years), Tlapanekan (800 years), Masatekan (2500 years), Sapotekan (2400 years), and Mistekan (3700 yrs). There is one language, Amusgo, that does not form part of a family, but the closest relatives of Amusgo are the languages of the Mistekan family. The previous groupings are generally agreed on.

The internal makeup of OM has been known since approximately the turn of the 20th century. Connections across these families and isolates have been observed since late in the 19th century, but the existence of Oto-Mangean as we now know it (roughly) was outlined basically during the 1920s.

Intermediate groupings are still being worked out. Comparative phonology and especially comparative grammar studies done by the author (Kaufman, 1983, 1988) show that there are two levels of ramification between the individual families and the ancestral proto-Oto-Mangean (pOM): The major splits are called ‘divisions’ and the groupings under the divisions are ‘branches.’ OM has two divisions, eastern and western. The eastern and western divisions have two main branches each: The eastern division (4700 years) contains Masatekan-Sapotekan (3500 years) and Amusgo-Mistekan (?4000 years), and the western division (4700 years) contains Oto-Pamean-Chinanteko (4000 years) and Chorotegan-Tlapanekan (4000 years). Each division is as diverse as Yuta-Nawan (Uto-Aztecan), and each branch is as diverse as Mayan; some of the families within OM (Mistekan

and Oto-Pamean) are more diverse than Mije-Sokean (Mixe-Zoquean). The various families of OM are like the language groups of Indo-European, such as Indic, Iranian, Baltic, Slavonic, Germanic, Celtic, and Romance. Regarding one of the families, Mistekan, there has been some question about whether to include or exclude Amusgo and Triki.

Morris Swadesh mounted an argument that Wavi belongs to the OM stock; this hypothesis was cautiously accepted by Longacre, but no later Oto-Mangeanist has found the hypothesis valid or even promising.

The following classification gives:

- Name of language or genetic group: Okwilteko, Oto-Mangean
- Favored Spanish orthography: <Ocuilteco, Otomangue>
- Synonyms: SYN
- Lexicostatistic time depth calculated by Kaufman, etc. (mc = minimum centuries) [NNmc Kaufman]
- Number of speakers reported in 1990 Mexico census: Mx
- Number of speakers reported in Ethnologue 2002: EL
- Country or state where spoken: COSTA RICA, GUANAJUATO.

In the following classification, in which language areas are named and not further subdivided, many researchers will recognize two or more distinct (emergent or virtual) languages. This is especially true in the cases of ‘Misteko’ and ‘Sapoteko.’

- Oto-Mangean stock (Sp. <Otomangue>) [60mc Kaufman] MEXICO, NICARAGUA, COSTA RICA
- Western Oto-Mangean division [47mc Kaufman]
- Oto-Pamean-Chinanteko branch [40mc Kaufman]
- Oto-Pamean family [36c Kaufman]
- Pamean (northern Oto-Pamean) subfamily [25c Kaufman]
- Chichimeko language (Sp. <Chichimeco>, <Jonaz>) EL: 200 GUANAJUATO
- Pame Complex [14c Kaufman] Mx: 5.6k SAN LUIS POTOSI
 1. Northern Pame virtual language EL: 1–10k
 2. Central Pame virtual language EL: 4k
 3. Southern Pame virtual language
- Southern Oto-Pamean subfamily [24c Kaufman]
- Matlatzinka-Okwilteko language area [8–9c Kaufman] STATE OF MEXICO
- Matlatzinka emergent language (Sp. <Matlatzinca>) EL: ca. 30

- Okwilteko emergent language (Sp. <Ocuilteco‘>, <Tlahuica>) EL: 50–100
- Otomían group [10c Kaufman]
- Otomí language area [8c Kaufman] Mx: 306k; EL: 223k
 1. Northeast Otomí emergent language VERACRUZ
 2. Northwest Otomí emergent language HIDALGO
 3. Western Otomí emergent language QUERETARO, MICHOACAN, Colonial
 4. Tilapa Otomí emergent language STATE OF MEXICO
 5. Ixtenco Otomí emergent language TLAXCALA
 6. Jalisco Otomí [extinct: undocumented] JALISCO
- Masawa language (Sp. <Mazahua>, COL Mazateco) Mx: 194k; EL: 365–370k
- Chinanteko family (Sp. <Chinanteco>) [15mc Swadesh] OAXACA Mx: 77.1; EL: 86.7–87.7k
 1. Ojitlán (N) Chinanteko language
 2. Usila (NW) Chinanteko language
 3. Quiotepec (W) Chinanteko language
 4. Palantla (LL) Chinanteko language
 5. Lalana (SE) Chinanteko language
 6. Chiltepec (EC) Chinanteko language

 1. Chicahuaxtla Triki emergent language
 2. Copala Triki emergent language
 3. Itunyoso Triki emergent language

The homeland of the OM languages seems to have been somewhere in the highland part of Meso-America between western Oaxaca and the basin of Mexico. The OM languages began to break up after the early stages of domestication of some plants approximately 7000 years ago and long before the transition to agriculture approximately 2000 B.C.E. The extent of the homeland is difficult to gauge because, in principle, if it is large it is going to have internal diversification, especially in broken country such as the highlands of Oaxaca and Puebla. Part of Chinanteco country (the Chinantla) in Oaxaca is particularly lush and fertile and would have been favored by early populations who did not have much competition from rival groups. Before the transition to agriculture, most Meso-American populations were small and much territory was unoccupied.

Structural Characteristics of Oto-Mangean Languages

Phonological Traits

OM languages vary quite widely in the number of contrastive vowels and the complexity of syllable onsets. In the number of contrastive consonants, tones, and syllable codas, the languages differ less. We first characterize for related sets of traits how pOM phonology was developed (as outlined in Kaufman, 1988) and then discuss some of the ways that the lower-level protolanguages and individual languages deviate from the original patterns.

Consonants

pOM has five plosives /p t tz k kw/, four spirants /s j jw/, two laryngeals /ʔ h/, one lateral /l/, two nasals /m n/, and two semivowels /y w/. <tz> (or <c>) is a sibilant affricate [ts]. <8> is ‘theta’; an equally plausible phonetic reconstruction is [r]. <j> (or <x>) is [x], and <jw> (or <xw>) is [xw]. There is little evidence for reconstructing *p, but it seems required for the protolanguage. Most Meso-American languages have /p/ and lack /kw/, and labialized velars generally. pOM *kw has shifted to [p] in several languages, as discussed later. The evidence for *m is better than for *p, but many OM languages lack /m/ as a phoneme.

Vowels and Syllabic Nuclei

pOM has four vowels /i e a u/ and five complex nuclei /ia ea ua ai au/. /ia/ (or <4>) may be ‘barred,’ /ea/ (or <6>) may be ‘schwa,’ /ua/ may be [o], /ai/ (or <3>) may be ‘aesc,’ and /au/ (or <2>) may be ‘open o.’ Among extant OM languages, the smallest system has four vowels /i e a o/ (some forms of Zapotec) and the most elaborate has nine vowels /i e 3 4 6 a u o 2/ (some forms of Otomi). pOM syllables can close with nothing, /n/, /ʔ/ (glottal stop), /h/, /nh/, /nʔ/, or /nhʔ/. Syllable-closing *n is realized as vowel nasality where it survives; some languages, discussed later, have lost nasality on vowels. Not all languages have a clear reflex of syllable-closing *h. pOM probably had three level tones and possibly a rising and a falling tone. Chorotegan seems to lack tone, but the majority of the remaining languages have a pattern analogous to the suggested reconstruction. A few have four level tones along with the moving tones; several have only two or three tonal contrasts altogether.

Syllable Onsets

These are fairly complex for pOM. A complex onset is set up as a plosive or resonant preceded by *n, *y, *h, *ʔ, or a combination of these (although of resonants, apparently only *l can be preceded by *n). (T = plosive /p t tz k kw/, R = resonant /m n l/, H = laryngeal /ʔ h/.) They are set up this way even though in some branches and individual languages the reflexes of *h *ʔ appear following the plosive; *y always appears following the plosive or resonant and *n always precedes. The maximal onset is *nyHC, which is [nTyH] where C is a plosive and [HRy] where C is a resonant. The reason for this analysis is that all these preposed consonants appear as the exponents of prefixed, mostly derivational, morphemes, although any particular instance of one of these preposed consonants may not be segmentable. Since there is no contrast between /yT/ and /Ty/, /ʔT/ and /Tʔ/, etc., this analysis is maximally general and consistent. Some languages (Zapotecan and Mixtecan) have eliminated *h or *ʔ in complex onsets, some have eliminated only *ʔ (Tlapanecanand Amusgo), some have eliminated *n in complex onsets (Zapotecan), some realize *ʔT = /Tʔ/ through (allophonic) glottalization, and some realize *hT = /Th/ through (allophonic) aspiration. In some languages, *yC has yielded palatalized consonants or their further developments.

Morpheme patterns are V, CV, VCV, CVCV, where C is any of the permitted syllable onsets, and V is any of the permitted vocalic nuclei and ‘open’ syllables.

Certain OM families (OP and Chin) underwent phonological change that rendered most stems

monosyllabic; the remaining families have stems that are (or were) predominantly disyllabic (Masatekan, Triki, Amusgo, and Southern Chatino change many CVCV stems to CCV, especially when V1 is a high vowel); most disyllabic stems, however, are morphologically complex, consisting of a monosyllabic root preceded by another root or a derivational prefix. This means that there is a much greater than even chance that when disyllabic stems of similar or identical meaning are compared across OM branches, if they are cognate they will be cognate for the first or last morpheme only. This, along with the great time depth within the stock, makes finding valid etymologies quite a challenging undertaking. A thorough understanding of word formation processes for each language, including the now no longer productive ones peculiar to each of the families, is needed before effective cognate searches can be made.

Quite a few comparative studies designed to identify cognates and reconstruct ancestral phonology and semantics have been carried out within OM. Most have been flawed by a failure to recognize many or most of the now unused word formation processes of earlier stages.

Grammatical Traits of Oto-Mangean Languages

This discussion is presented in terms of what is most prevalent and at the same time most probably the earliest state of OM languages; less common or more recent patterns are discussed later or not at all.

OM languages are consistently left-headed, with VO word order; any affixes are prefixes. Most grammatical morphemes are clitics; some are phonologically full words.

If we take ‘derivation’ to include both the formation of new lexical items and the change of morphosyntactic class without creating new lexical items, the following patterns are observable: prefixes can mark active, nonactive, and mediopassive ‘voice,’ versive (‘inchoative’) intransitive verbs based on nouns and adjectives, and causative verbs based on intransitive (including versive) and transitive verbs. All of the previous functions, except possibly ‘active,’ can be marked with grammatical words (often clitics) in one or another language. Left-headed compounds of the form NN and NA are found in most languages, and verbs of the shape VN with incorporated nouns are widely attested.

Much cliticization can be mistaken for inflexion, and in some cases inflexion versus cliticization cannot be decisively determined. However, suffixation and unproblematic inflexion are found only in Oto-Pamean.

Pronouns are noun phrase (NP) substitutes: in most languages, when a noun argument is present, no pronominal will be present. Most pronouns have both a full and a cliticized phonological form. Nevertheless, only a few languages have redeployed cliticized third-person pronouns as agreement markers that may occur in the same clause with fully NP arguments. Non-third-person pronouns may mark an exclusive:inclusive distinction in the first person, a humble versus prideful distinction for the first person, and a polite versus familiar distinction in the second person.

Predominant constituent order includes verb–subject–object (VSO), prepositions (Pr), noun–genitive (NG), noun–adjective (NA), noun–demonstrative (ND), Quantifier–noun (QN), and noun–relative clause (NR).

Alignment

There are apparently three types of NP role alignment in OM languages, marked by distinct sets of pronominal markers for each but the last type: ‘ergative’ (e.g., Chinantec and probably Tlapanec), ‘active’ (e.g., Chocho, Matlatzincan, and probably Chiapanec), and ‘undifferentiated’ (Mixtec and Zapotec) (only one set of pronominal markers). No clear instances of accusative alignment have been identified.

Verbs mark aspect and mood by means of preposed morphemes that are clitics by origin, although in some languages they are indistinguishable from prefixes. Tense (time) is not marked, or it is marked by adverbs that are not positioned as are aspect and mood markers. Virtually all languages have a verb form (‘dependent’) that is used when the verb is subordinated to a higher predicate. The dependent form may also be used in dependent clauses expressing the function of optative, possible future, or, in some cases, imperative.

Locative adpositionals are encoded by means of body-part nouns and other nouns that denote the parts of things: thus, in/inside = belly, on [surface] = face/eye, on [top] = head, under = butt, between = interval, etc. This pattern is widespread although not universal in Meso-American languages. Other semantic connexions include tip = nose, leg [of table or chair] = foot, front = face, and edge = lip/mouth. As stated previously, adpositionals in OM languages are preposed.

Possession Classes of Nouns

Many OM languages subdivide nouns by the ways they mark types of possession; for example, a fair number of nouns will be accompanied by one or another grammatical morpheme that correlates with the fact that the noun is possessed.

Endocentric Noun Classes

Some OM languages, such as Zapotecan, Mazatecan, and Mixtecan, have a series of noun classifiers that mark such categories as ‘tree,’ ‘fruit,’ and ‘animal.’ They are proclitics; in some cases, their origin as independent nouns can be discerned, in others it cannot, but they do not qualify as prefixes. These classifiers occur before the noun that they classify and are therefore not like (other noun) modifiers. They may in fact be the heads of the constructions in which they occur. In some languages, some of their uses are optional. In all languages, some of their uses are lexicalized – the lexeme does not occur without the classifier, or without the classifier the noun has a different meaning than it does with the classifier. This pattern is possibly an old one dating back to the eastern OM level since some of the classifying morphemes are cognate and do not exist as independent lexical items (although some are not cognate across families or can be related to independent lexical items: These would show the effects of analogy and renewal).

Exocentric Noun Classes in Oaxacan Languages

OM languages are spoken in several zones, among which are the northern fringe of Meso-America, the basin of Mexico, southern Guerrero, the Tehuacan Valley, the Mixteca Alta, and Oaxaca, of which the last two are the most momentous linguistically. OM languages of Oaxaca belonging to several branches, including all Zapotecan, some Mixtecan, and some Mazatecan languages, assign nouns to several classes, which are marked by the third-person pronouns that refer to the nouns of the various classes. The classes that are found are semantically motivated and include such categories as ‘adult human,’ ‘man,’ ‘woman,’ ‘irrational (baby, foreigner),’ ‘animal,’ ‘thing,’ and ‘god.’ In virtually all cases, the pronouns (they are not agreement markers) used to mark these classes are phonologically reduced/simplified forms of nouns naming the corresponding semantic field. This phenomenon therefore seems to have originated within the past 1000–1500 years in a continuous region and to not be the continuation of a pattern present in any of the family-level proto-languages.

Precolumbian Language Contact with Non-Oto-Mangean Languages

Yokel Anxiety

Although the earliest surviving organic material pointing to (incipient) maize domestication (dating

to approximately 7000 years ago) has been found in dry caves in the state of Puebla, firmly within the OM area, maize domestication was developing as well in lowland areas where the organic material simply did not survive. At any rate, Mayan speakers (in the Mayan lowlands), Mixe-Zoquean speakers (in Olmec country and in the basin of Mexico), and Totonacan speakers (in the basin of Mexico) developed complex society slightly before Zapotecan speakers (in the valley of Oaxaca), Chorotegan speakers (near Cholula), Matlatzincan speakers (near Toluca), or Mixtecan speakers (northwestern Oaxaca). Most of the OM languages spoken by long-term practitioners of complex society in Meso-America show serious phonological and lexical influence from such non-Otomangean languages as Mixe-Zoquean and Mayan. Unlike the oldest state of OM languages, Mije-Sokean, Totonakan, and Mayan languages lack /kw/, vowel nasality, and tone, and they generally have predictable stress. In imitation of non-OM languages, whose speakers had higher prestige, the following changes were adopted by OM languages through what I call ‘yokel anxiety’: (1) Oto-Pamean and Zapotec (but not Chatino) changed *kw to [p]; (2) Matlatzincan, Chorotegan, and Zapotec (but not Chatino) eliminated nasality from vowels; (3) Chorotegan eliminated tone (or reduced it to a two-way stress contrast); and (4) Zapotec (but not Chatino) and Mixtec-Cuicatec imposed a penult-syllable stress pattern on its inherited and surviving tone systems of three or four tones.

The Mayanization of Oto-Pamean

The homeland of Oto-Pamean was the basin of Mexico. Between 2000 and 1500 B.C.E., it was bordered to the east by the Mayan language that developed into the ancestor of Huastec and Cabil (Chicomuseltec). At that time, Oto-Pamean shifted its inherited *kw to [p], in imitation of Mayan, which has [p] and lacks [kw], and borrowed a few Mayan lexical items. By 1500 B.C.E., Oto-Pamean broke up into northern Oto-Pamean (or Pamean) and southern Oto-Pamean (or Otomian). Pamean expanded northward into the western parts of the state of San Luis Potosí and the southern parts of the state of Zacatecas. Pamean came into contact with undocumented (and now extinct) languages beyond the northern border of Meso-America. Approximately 1000 C.E., the Pamean-speaking area dried out through climate change and agriculture was no longer possible. Pameans became foragers and occasional raiders on their Meso-American cousins to the immediate south, and they adopted some linguistic traits from their non-Meso-American northern neighbors. The (Otomian-speaking part of) basin of Mexico

came under serious Mayan (probably Tabasco Chontal or Yokot'an) influence in the Epiclassic period (ca. 700–1000 C.E.). Besides some lexical influence, the grammatical effect on Otomian was extensive: VOS word order, AN word order, and marking of the person of actors and possessors by preposed morphemes were all modeled on Mayan grammatical patterns. Since Pamean shares the last trait, and it is probable that the SOV, GN, and NA orders, as well as the presence of postpositions in Pamean are an adjustment to non-Meso-American (perhaps Hokan) languages, it is possible that Pamean earlier shared the Mayanized VOS and AN orders with Otomian. If so, this pattern would have been due to contact between proto-Oto-Pamean and pre-Huastecan.

Viability

In pre-Columbian times, most OM populations (except northern Oto-Pameans = Pameans) were agricultural, communities were sedentary, and the total population for each language was at least 10 000, increasing to more than 500 000. At present,

- Four OM languages have died out: South Pame, Sutiaba, Chiapanec, and Chorotega. Jalisco Otomi was never documented.
- Many OM languages are dying (moribund) (spoken only by elderly people); for example, Ocuiltec, Chocho, and Ixcatec.
- Most other OM languages are dwindling (obsolescent) (not being learned by children); for example, Matlatzinca and Popoloca.

A number of OM languages are merely endangered (being learned by children (with some attrition) with strong pressure for bilingualism in Spanish and pressure to abandon the native language), including some varieties each of Otomi, Chinantec, Tlapanec, Mazatec, Mixtec, Zapotec, and Chatino. Otomi (306 → 223k), Mazahua (194 → 363k), Mixtec (322 → 327k), and Zapotec (423 → 326k) (Mexican census 1990 → Ethnologue 2002) each have more than 225 000 speakers. If current trends continue, in 100 years probably only some varieties of these four will still be spoken in some fashion.

Documentation

Many OM languages were documented during the colonial period (1519–1814) by Catholic missionaries who wanted their replacements to have the ability to communicate Christian teaching to the Indian population, who had mostly been forcibly converted. This documentation included grammars and dictionaries of often more than 5000 entries,

along with translations of the catechism, confessionals, and sermons and narratives from the Bible. The orthography was often inadequate to express all sounds accurately, and the grammatical models were often simply calqued on the traditional analysis of Latin. Especially valuable documentation for Misteko, Sapoteko, Matlatzinka, and Otomi has survived to the present day. Since 1930, Protestant missionaries, mostly English-speaking from the United States, Canada, and Great Britain and belonging to the Summer Institute of Linguistics/Wycliffe Bible Translators, have been working on Meso-American Indian languages, and most OM languages have been documented rather fully by them, especially by dictionaries and in many cases by grammars, less so by texts. Since 1950, a number of academic linguists, both Mexicans and English speakers, have worked on the documentation of OM languages. Much has been accomplished, but much remains to be done, especially with regard to dying and dwindling languages.

Pahlavi

A V Williams, University of Manchester,
Manchester, UK

© 1994 Elsevier Ltd. All rights reserved.

Pahlavi is generally synonymous with the term 'Middle Persian,' i.e., the language of the Sasanians (224–651 AD) and their subjects in the province of Fars in southwest Iran. It was imposed by the Sasanian authorities as the sole official language of Iran and consequently it became the living language of the state religion, Zoroastrianism. More specifically, 'Pahlavi' (Book Pahlavi) is the name given to the medieval language in which Zoroastrian religious texts were written down in the Sasanian and early Islamic periods until the tenth century AD. It may be compared with the other main Middle Iranian dialects: Parthian, Soghdian, Khwarazmian, and Khotanese Saka. The earliest examples of Pahlavi script are found in rock inscriptions and on coins from the Parthian and early Sasanian periods. The orthographical system was derived from the western semitic consonantal script of Aramaic, the court language of the Achaemenian Empire. The cursive script of Book Pahlavi is full of ambiguities and corrupt forms, having only 14 letters (as compared with the 22 letters of Imperial Aramaic). For example *gimel* represents the letters *dāleth*, and *yōdh*, but also the corrupt forms of *bēth*, *zayin*, and *kap̄h*. Combinations of these letters, accidental reduplications, and the fact that two *yōdh* resemble both *'āleph* and *sāmekh*, create further difficulties.

The chief characteristic of Pahlavi is that, in spite of its being phonetically purely Iranian, it mixes Semitic and Iranian words in its orthography. From an early period, writers of Pahlavi used Aramaic words as ideograms, that is, they no longer pronounced or even thought of them as Semitic words but as familiar shapes or signs only, written to convey Iranian equivalents. The Semitic words are not ideograms in the sense of Sumeric or Chinese symbolic characters, but are written with a consonantal alphabet, and so may be better termed 'heterograms,' and Iranian phonetic spellings 'eteograms' (Klíma 1968: 28). By

convention, modern scholars transliterate ideograms in upper case type, phonetic spellings in lower case. Book Pahlavi is written in an almost equal mixture of Iranian eteograms (e.g., *pyt'k'* = *paydāg* 'revealed,' *gwpt'* = *guft* 'said,' – but cf. also *YMRRWNt* = *guft*) and Aramaic heterograms (e.g., *GBRA* 'man' was read and pronounced as Iranian *mard*, and *YWM* 'day' renders Iranian *rōz*). Usually verbal stems are written heterogrammatically, with Iranian phonetic inflexional endings, e.g., *YHWWNy't* = *bawēd* 'it is.' Occasionally a word can be read as both an ideogram or as a phonetic spelling, e.g., *TWB/did* is like *tang*, and *LHYK/dūr* is identical to *Ihyk/rahīg*. Problems of haplography and dittography blemish the manuscripts and make reading difficult: since Pahlavi was no longer a vernacular language in Islamicized Iran, nor was its script used outside the Zoroastrian religious texts after about 700 AD, copyists often did not understand what they were writing.

The greater part of Sasanian literature in Pahlavi was in fact secular poetry, but this has not survived in its original form, having been translated to suit Islamic tastes into New Persian, notably in the *Shāhnāma* of Ferdousi (c. 935–c. 1020), in Arabic script. Those who remained faithful to Zoroastrianism after the Islamic conquest (seventh century AD) continued to use Pahlavi to preserve their scriptures and religious lore in the archaic orthography which kept them obscure to all except Zoroastrians. They are of interest to the historian of religions because of the richness of their theological and mythological content, but, with a few exceptions, they are of limited literary merit. Pahlavi was a sonorous and robust language, which is recognizably the source of the characteristic mellifluous qualities of New Persian, even after centuries of arabicization.

Palenquero

A Schwegler, University of California, Irvine, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Palenquero is a Spanish-lexicon creole (*see Pidgins and Creoles*) spoken in the village of El Palenque de San Basilio, Colombia. Located 60 km inland from the former slave trade center of Cartagena de Indias (*see Figures 1 and 2*), this ethnically homogenous Afro-Hispanic community is inhabited by descendants of runaway African slaves who, around 1700, established their first *palenques* (primitive fortifications) in the interior of the Caribbean coast. Palenquero is unique in that it is the only known Spanish-based creole on the South American mainland (Lipski and Schwegler, 1993).

Until the early 1990s, the Palenqueros lived in relative cultural and geographic isolation (Schwegler, 1996, 1998; Schwegler and Morton, 2003), which significantly contributed to the preservation of the local creole, although historically, they have always maintained some contact with the outside world; Palenquera women in particular visit nearby towns and Cartagena on a regular basis, where they generally sell and trade locally produced goods. However, this situation changed rather dramatically in the 1990s and beyond, when word of the existence of this ‘African’ village in the hinterland of Cartagena spread rapidly in academic circles. In Colombia and elsewhere, recent documentaries about Palenquero culture have contributed to the relative fame of the community. The stream of visitors to El Palenque has, however, subsided of late because guerrilla activities in nearby areas have made local travel rather risky for outsiders.

The Palenquero community has been bilingual (Spanish/creole) for at least two centuries. Starting around 1970, however, adolescents in particular began to shun the use of ‘Lengua,’ the local name of the creole. Today Spanish monolingualism is the norm among the younger generations, though many still possess a passive knowledge of the local vernacular. In recent years (1990s onward), there has been a growing awareness of ‘*negritud*’ (black pride) among both Palenqueros and Afro-Colombians. This has led to

modest institutional and political support to counter the loss of the Palenquero creole. The local elementary school, for instance, now offers some courses in Lengua, and a few adolescents have been attempting to devise ‘official’ spelling conventions for the creole. Also, some Palenqueros have begun to consciously adapt sub-Saharan vocabulary (including words such as *Bantú*) so as to identify, strengthen, and celebrate what is, in their view, African in their heritage.

Almost the entire Palenquero lexicon is derived from Spanish, and the phonetic distance between most creole and (Caribbean) Spanish words is relatively minor. For example, representative Spanish/creole vocabulary sets are: *mano/mano* ‘hand,’ *hombre/lombe* ‘man,’ *dedollelo* ‘finger,’ *senti(r)/sindí* ‘to feel,’ *agarra(r)/langalá* ‘to grab, to hold.’ But despite such close lexical correspondences, Palenquero and Spanish are scarcely mutually intelligible. Differences in grammar are the main reason for this unintelligibility.

Historically, a key feature of local language use has been intense and very rapid code switching (not to be

Figure 1 Location of El Palenque.

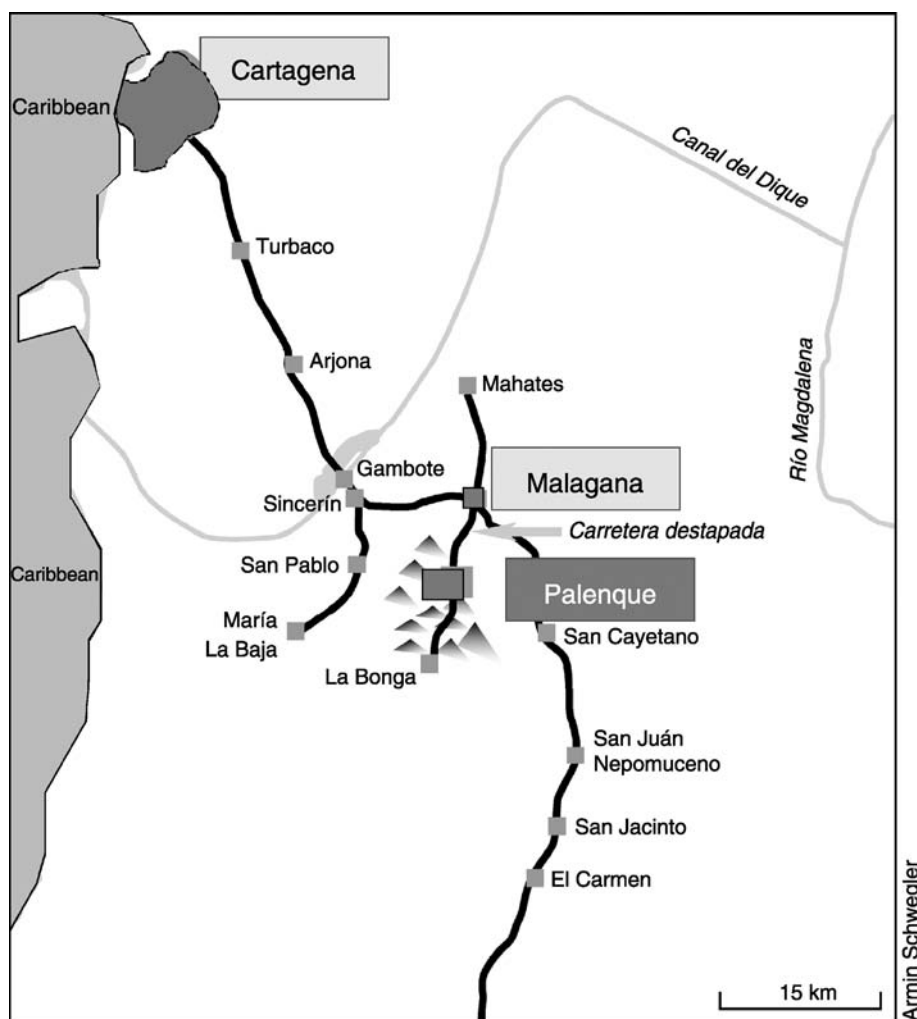

Figure 2 Cartagena/Palenque area.

confused with code mixing). The following example illustrates how speakers tend to switch language – often multiple times – within a single utterance (segments within angle brackets are in regional Spanish):

Muhé mi <no quiere> komblá- mi pekao,
woman my not want.3s buy- me fish
 <a meno que yo vaya> ku ele.
unless I go.PRES.SUBJ. with him/her
 ‘My wife doesn’t want to buy me fish unless I go (buy it) with her.’

It is now clear that the Kikongo (Kongo) language, spoken in central west Africa (see Figure 3), played a pivotal role in the genesis of Palenquero. As in Cuba (Fuentes and Schwegler, 2005), in El Palenque Bakongo slaves seem to have passed down their African language for several generations, either as a ritual code or as a full-fledged everyday means of communication. Scholars have also been able to determine that Bantu (rather than west African) fugitives must have had the most profound impact on

Figure 3 Location of the Kikongo language.

El Palenque’s early language and culture (Schwegler, 1996, 2002, forthcoming).

Detailed information about the linguistic and cultural history of El Palenque can be found in Moñino and Schwegler (2002), Schwegler (1998,

2002, 2006), Schwegler and Morton (2003), and Schwegler and Green (2007). These studies also list earlier publications on the topic, including Friedemann and Patiño Rosselli (1983), still the most solid description of Palenquero to date. Importantly, the volume contains the only substantial corpus of Palenquero texts (readers should be aware, however, that the authors omitted to differentiate code switches from Lengua to Spanish).

Pāli

J W Gair, Cornell University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Pāli (also Pāḷi and Pali) is an early Middle Indo-Aryan (MIA) language, or Prakrit. It is the text and ritual language of Theravada, or southern, Buddhism, the dominant school in Sri Lanka, Burma, Cambodia, and Thailand. It is of particular importance as the language in which the basic teachings of Buddhism have been preserved, especially in the collection known as the *Tiṭṭaka* (literally, 'three baskets'), which are held to contain the Buddha's own pronouncements. Virtually all of the extensive Pāli literature is thus Buddhist in nature or origin, and the language is not spoken except in recitation and as an occasional vehicle of communication for monks of different languages.

The date and place of origin of Pāli have been subjected to considerable scholarly debate through the years, and the position that one accepts may not unnaturally be colored by belief as to the authenticity of the canonical texts as the word of the Buddha as spoken by him. By tradition, especially in Sri Lanka, the language, as the vehicle of the Buddha's preaching, would date from his time (7–6 century B.C.E.) and be identified with Māgadhī, the language of

Magadha, the northeastern India kingdom in which he primarily preached. His date, however, varies somewhat in different traditions, and scholars in both India and the West have argued for progressively later dates – some as late as the 4th century B.C.E. Also, numerous scholars have pointed out that Pāli not only does not share many of the distinctive characteristics of the Māgadhī Prakrit as shown in later inscriptions, primarily those of the 3rd century B.C.E. Emperor Asoka (Sanskrit *Aśoka*) (264–227 B.C.E.), but it does in fact share important features, such as noun inflections, of the western inscriptions. Thus, Pāli does not appear to represent any single MIA dialect but to be a literary language that incorporated features from several dialects in the course of its development.

The canonical texts were transmitted orally for a number of centuries and were collected and codified in three main councils: first at Rājagaha (Sanskrit *Rājagṛha*) shortly after the death of the Buddha, and then at Vesālī (Sanskrit *Vaiśālī*), about a century later. The third, at Pāṭaliputta (Sanskrit *Pāṭaliputra*), under Emperor Aśoka. There, the canon as we know it was essentially completed and formalized, the Theravāda school founded, and the decision taken to send missions abroad made, including the mission that brought the doctrine to Sri Lanka through the monk Mahinda. The generally accepted view is that the

Spirants: *s, h*

canon was reduced to writing only in the 1st century B.C.E. at the Aluvihāra in Sri Lanka.

Pāli has no special alphabet of its own but is written in several scripts, depending on the country and the intended audience. Thus, it commonly appears in Sinhala script in Sri Lanka, in Devanāgarī in India, and in Burmese, Cambodian, and Thai in those countries. In the West, and where it is intended for an international audience, it is commonly written in the Roman alphabet with some diacritics.

The Pāli system of sound elements is given in Table 1. It is, of course, represented differently in different scripts. The usual alphabetical order can be read by taking each row in turn, from top to bottom, and some manuscript traditions include a ‘pure nasal’ symbol, transliterated as <ṃ>, occurring between the vowels and consonants. It represents *ṃ* at the end of words, but before a consonant assimilates to it.

This is essentially the same inventory of elements as Sanskrit, though there were intervening changes that gave Pāli, like Prakrits in general, a reduced inventory. Among the most important were the following: Sanskrit vocalic *r* was lost, becoming *i*, *a*, or *u*. The three Sanskrit sibilants were merged as *s*, and all final nasals as *ṃ*. Long vowels were shortened in checked syllables, and this extended to Sanskrit *e* and *o* (always long in Sanskrit, but in Pāli allophonically short before consonant sequences). Thoroughgoing changes applied to consonant sequences (clusters). These were numerous and complex, and there were variations and exceptions owing to dialect admixture and the long oral and textual history. But generally, some initial clusters were simplified, sometimes with the addition of a prothetic vowel, and internal clusters were assimilated internally, yielding many geminates, with sibilants becoming aspiration in some combinations. Thus Sanskrit *strī* is Pāli *ittbī* ‘woman’, and Sanskrit *asti* is Pāli *attbī* ‘is’. Sanskrit *svarga* is Pāli *sagga*, ‘heaven’, Sanskrit *dharmā* is Pāli *dhamma* ‘doctrine’ (and many other meanings), and Sanskrit *prajñā* is *paññā*. Sanskrit *akṣi* is *akkhī* ‘eye’ (also *acchi*, probably showing dialect admixture). Sanskrit *lakṣaṇa* is Pāli *lakkhaṇa* ‘feature’. Sanskrit *mārga* is

Pāli *magga* ‘way, path’, showing long vowel reduction, and the common assimilation, but *dīgha* ‘long’, Sanskrit *dīrgha*, shows an alternate development: simplification of the cluster and retention of vowel length.

In morphology, Pāli remained an inflectional language, but there were numerous changes from Sanskrit in grammatical categories and forms, including simplifications and confluents. Thus, in nouns many case affixes have fallen together; in the verb, the Sanskrit past vs. aorist distinction has virtually disappeared, with a new past based on the aorist, and in both nouns and verbs the dual is gone.

Pāli basic word order is verb-final, i.e., Subject-Object-Verb, as in (1):

- (1) bhikkhu cittam pagganhāti
monk mind-accusative uplifts
 ‘The bhikkhu uplifts the mind.’

However, there is much variation for pragmatic effects such as foregrounding, and in some types of existential and interrogative sentences, as in (2) and (3):

- (2) atthi koci satto, yo imamhā
be any being that this
 PRES-3sg (REL) ABL
 kāyā aññaṃ kayam saṃkamati?
body other body transmigrate
 ABL ACC ACC PRES-3sg
 ‘Is there any being that migrates from this body to another body?’
- (3) natthi satto yo evaṃ saṃkamati.
not-be being that thus transmigrate.
 PRES-3sg (REL) PRES-3sg
 ‘There is no being that so transmigrates.’

Pāli also uses the correlative relative construction common in Indo-Aryan languages, as in (4), though there are also ‘simple’ relatives, as (2) and (3) have exhibited:

- (4) yaṃ jānāmi taṃ bhāṇāmi
what know that speak
 CORREL PRES-1sg PRES-1sg
 ‘I say what I know.’

Pāli literature can be divided into two sets: canonical and non-canonical. Canonical texts are generally those regarded as the actual teachings of the Buddha, though there is some difference in what is included in the canon in different countries. The most widely known traditional classification of the canon is the *Tiṭṭaka* (‘Three Baskets’), by which there are three main divisions or Pitakas, the *Sutta*, *Vinaya*, and *Abhidhamma*. These can be generally characterized as follows.

- I. The *Sutta Piṭaka* contains the *Dhamma* proper (General teachings of the Buddha), and it is sometimes referred to as such. It contains five *Nikāyas*, or collections of *suttantas* (Dialogues of the Buddha), defined and arranged essentially by their form, as follows:
 - a. The *Dīgha Nikāya* ('Long' Collection) contains the longest suttas (Sanskrit *sūtra*).
 - b. The *Majjhima Nikāya* ('Middle' Collection) contains suttas of middle length.
 - c. In the *Samyutta Nikāya* ('Linked' or 'Grouped' Collection), the suttas are arranged by topic. It is this collection that contains the Buddha's first sermon, the *Dhammacakkapavattanasutta*.
 - d. The *Aṅguttara Nikāya* (or The 'Gradual', or 'By one limb more' Collection), in which the sections are arranged in ascending order according to numbers that figure in the texts themselves.
 - e. The exact contents of the *Khuddaka Nikāya* ('Short' or 'Small' Collection) vary somewhat between Sri Lanka, Burma, and Thailand. It includes the widely known *Dhammapada*. It also contains the *Jātaka* verses, but only the verses, not the birth stories connected with them, are canonical; the stories are considered to be commentarial. It also includes the hymns of the monks and nuns (*Theragāthā* and *Therīgāthā*) along with a number of other works such as the *Suttanipāta* and some works that might be loosely categorized as 'prayer books'.
- II. The *Vinaya Piṭaka* dealing with Monastic Discipline.
- III. The *Abhidhamma Piṭaka*. Scholastic and partially metaphysical in nature, it contains much philosophical treatment of the Buddha's teachings. It is generally considered the most difficult of the texts, so that a mastery of it is highly valued by Buddhist scholars.

There is another traditional classification of the canon into five divisions (*Nikāyas*). These are the five divisions of the *Sutta Piṭaka* of the *Tipiṭaka*, with the *Abhidhamma* and the *Vinaya* folded into the *Khuddaka Nikāya*.

In addition to the above, there is the *Mahāparitta*, a text recited by monks at *paritta* (Sinhala *pirit*) ceremonies invoking the auspiciousness and protection of the Dhamma.

In addition to the canonical texts, there is a considerable body of literature in Pāli, continuing up to the present time, and much of it is commentarial literature or chronicles. The remainder includes various types of works, including narrative and

instructional works and some grammars. In addition, there are a number of inscriptions, most of them in Southeast Asia.

The commentarial literature in Pāli continued over many centuries, but the most famous commentaries, or *aṭṭhakathās*, were by a monk named Buddhaghosa, in the 5th century A.D. He was born in South India but wrote his commentaries in Sri Lanka, apparently basing much of his work on earlier Sinhala commentaries subsequently lost. He also authored the famous *Visuddhimagga* 'Path of Purification', a compendium of Buddhist doctrine. As mentioned earlier, the well-known *Jātaka* stories are actually commentaries on the *Jātaka* verses that are included in the canon, and this *Jātakatṭhakatā* has also been attributed to Buddhaghosa. In addition to the commentaries, there are other forms of commentarial literature, including *ṭīkā*s, subcommentaries on the commentaries.

The Chronicles include the *Dīpavaṃsa* (4th or early 5th century A.D.) and the *Mahāvāṃsa* (probably the early 6th century), and they present the history of Sri Lanka from a Buddhist-Monastic perspective. These chronicles were continued by the *Cūlavāṃsa*, which continued until the arrival of the British in Sri Lanka. In fact, they are being continued even today.

Among the remaining works, the *Milindapañhā* (sometimes in the singular *Milindapañho*) 'Questions of King Milinda' is particularly appealing. It dates from before Buddhaghosa's commentaries, may have been translated from Sanskrit, and was itself translated into Chinese. It consists of a series of dialogues between two people: King Milinda (Greek Menander), a second century king of a Graeco-Bactrian kingdom remaining from Alexander the Great's incursions into what is now Afghanistan and the northwest Indian subcontinent, and Nāgasena, a learned monk, who expounds Buddhist doctrine in answer to the King's questions. The penetrating nature of the King's questions and the clarity and wit of Nāgasena's answers and explanations make this still a lively as well as instructive introduction to Buddhist doctrine, and one that is accessible to the student at a fairly early stage in learning Pāli.

There is now a sizeable and growing amount of material in and on Pāli on the World Wide Web. The Pali Text Society, founded in 1881, has published many texts and translations in roman script. Its website has information on the available ones. Fifty-eight volumes of the *Tipitaka* were published, in Sinhala script with a Sinhala translation, as the Buddha Jayanti Tripitaka Series under the patronage of the government of Sri Lanka (Ceylon) during the 1960s and 1970s. The Pāli text in roman transcription, along with some paracanonical and other texts, has been made available online as a free public-domain

edition by the Sri Lanka Tipitaka Project in association with the *Journal of Buddhist Ethics*.

Panoan Languages

D W Fleck, La Trobe University, Bundoora, VIC, Australia

© 2006 Elsevier Ltd. All rights reserved.

The Panoan language family is composed of approximately 30 known languages spoken in the western Amazon basin, in eastern Peru, western Brazil, and northern Bolivia. Of these, only about 20 are still spoken today and most are in danger of extinction. Additionally, there are several uncontacted groups in westernmost Brazil suspected to be Panoans (Erikson, 1994). There are currently 40 000–50 000 speakers of Panoan languages.

History and Culture

Archeological evidence suggests that the ancestral homeland of the Panoans was in northern Bolivia and that they migrated northward around 300 A.D. (Myers, 1990: 99). In past centuries, factions of many Panoan groups were reduced at Jesuit and Franciscan missions in Peru. Currently, Panoans occupy a fairly continuous territory and are relatively homogeneous

linguistically and culturally (Erikson, 1992). Traditional subsistence, still practiced today by most groups, consists mainly of slash-and-burn horticulture, hunting with bow and/or blowgun, and fishing.

Classification

The Panoan languages were recognized early on by Jesuit missionaries to be closely related (e.g., in a 1661 letter by Father Francisco de Figueroa; Figueroa *et al.*, 1986: 214). The first formal demonstration that Panoan languages constitute a linguistic family was in 1888 by Raoul de la Grasserie, based on a comparison of eight word lists of Panoan languages/dialects collected by European explorers earlier that century (Grasserie, 1890). The family was named after the now-extinct Pano language (also known as Panobo 'giant armadillo people' or Wariapano). There is still no authoritative subclassification of the Panoan family available; see Valenzuela (2003b) for an evaluation of past subgroupings of the family. It has been claimed that the Panoan family is undoubtedly related to the Tacanan family (e.g., Suárez, 1973), though today not all Panoan scholars accept this as certain.

Phonology

Loos (1999) reconstructs the following phoneme inventory for proto-Panoan: p, t, k, ʔ, ts, tʃ, s, ʃ, ʂ, β, ɾ, m, n, w, j, h, a, i, ɨ and o. Most languages have rhythmic stress, where every other syllable in a word is stressed.

Morphology

Panoan languages are primarily suffixing and could be called highly synthetic due to the potentially very long words (up to about 10 morphemes), but the typical number of morphemes per word in natural speech is not large. It is the large number of morphological possibilities that is striking about Panoan languages. For example, up to about 130 different verbal suffixes express such diverse notions as causation, direction of movement, evidentiality, emphasis, uncertainty, aspect, tense, plurality, repetition, etc. Panoan languages are all morphologically ergative, with an ergative case marker that also marks instrumental and genitive cases, and in some languages also locative and/or vocative. Complex and sometimes obligatory systems of evidentiality (Valenzuela, 2003a) and body part prefixation (Fleck, 2006) are two further notable features of Panoan morphology.

Syntax

Panoan languages have the rare and interesting property of ‘transitivity agreement,’ where various parts of the grammar (including adverbs, suffixes, and enclitics) vary depending on whether the matrix verb is transitive or intransitive. Panoan discourse is characterized by ‘clause chaining’ (or ‘switch reference’): up to about 10 clauses can be linked together using suffixes that mark argument coreference (e.g., same subject, object = subject) and temporal/logical relations (e.g., ‘while,’ ‘after,’ ‘in order to’) between subordinate and matrix clauses. Panoan languages are some of the few languages in the world where both nonsubject arguments of bitransitive verbs such as *give* are grammatically identical. See Sparing-Chávez (1998), Valenzuela (1999, 2003b), Faust and Loos (2002), and Fleck (2003) for modern descriptions of these and other Panoan grammatical phenomena.

Lexicon and Ethnolinguistics

Some Panoan groups have a taboo that prohibits mention of a deceased person’s name and nicknames, otherwise the dead person’s spirit may cause harm to the family of the person that pronounces his/her name

out loud. The name taboo also prohibits mentioning words judged to sound like the deceased’s name or nicknames. Languages such as Matses seem to have an unusually high rate of lexical replacement, probably due at least in part to name taboo. Other ethnolinguistic features of interest in Panoan languages are parent-in-law avoidance speech in Shipibo-Conibo (Valenzuela, 2003b) and elaborate rain forest habitat classification nomenclature (e.g., Matsés has 47 terms for types of rain forest; Fleck and Harder, 2000).

Papiamentu

T Sanchez, University of Pennsylvania, Philadelphia, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

Papiamentu is a Creole language spoken on Aruba, Bonaire, and Curaçao in the Caribbean. Over 175 000 islanders (about 75% of residents) speak the language natively, and many immigrants learn it as a second language. It is widely used in both public and private domains, for artistic and practical purposes, and is included in secondary education. The earliest surviving written example is a personal letter from 1775, and many 19th-century texts also exist, including translated religious documents and news articles originally written in the Creole. Today, most Papiamentu speakers have varying levels of competence in Dutch (the official language), Spanish, and English.

Origins Researchers do not agree on whether Papiamentu was formed around Spanish (Maduro, 1966) or Portuguese (Maurer, 1986; Goodman, 1987; Martinus, 1996). Proponents of the Spanish origin suggest that the creole formed during the 16th century from contact between the Spanish and Caquetio Indians. But it is more likely that Papiamentu was formed during the latter half of the 17th century from the speech of Portuguese-speaking Jewish merchants and African slaves, with influence from Dutch colonists, Spanish traders, and native Caquetios. Today most lexical items resemble Portuguese or Spanish, and to recognize both influences, we say that Papiamentu has an ‘Iberian’ lexical base.

Orthography Papiamentu has two orthographic traditions: Aruba prefers an etymological system, while Curaçao and Bonaire follow a phonological system. The phonological system is used here.

Phonology The vowel inventory of Papiamentu is a, ε, e, ø, ɔ, o, i, y, u. The front round vowels were introduced via Dutch lexical items; the mid round vowels are found in the Portuguese and Dutch lexicons. Consonants are p, b, t, d, k, g, s, z, ʃ, ʒ, h, tʃ, dʒ, m, n, ŋ, l, r, w, j. Lexical tone, stress, and sandhi phenomena are part of Papiamentu’s prosodic structure.

Morphology Papiamentu has a few productive affixes, including *-mentu* ‘the act of,’ from Spanish *-miento* (i.e., *distribimentu* ‘(the act of) wasting,’ *kapmentu* ‘cutting,’ and *kèchmentu* ‘catching’); *-dó* ‘person who’, from Spanish *-dor* (i.e., *wardadó* ‘keeper, guard’, lit. ‘person who guards’; *trahadó* ‘worker’;

huurdó ‘tenant’) (Dijkhoff, 1993); plural marker *-nan*; and gerundive and progressive marker *-ndo* from Spanish *-ndo* (Sanchez, 2002, 2005). Borrowed morphemes which are not yet completely integrated may be sensitive to etymology. For example, *-ndo* is productive with Iberian verbs, and though it is attested with Dutch verbs, such usage is unacceptable for most speakers. Past participles are formed by shifting stress to the final syllable, but some Dutch-origin verbs take *he-* (as in Dutch) instead. Past participles may be semantically extended as nouns (e.g., *kasa* ‘marry’ → *kasá* ‘married’ → *kasá* ‘spouse’).

Syntax The basic word order of Papiamentu is SVO. It is neither pro-drop like Spanish and Portuguese, nor V2 like Dutch; pronominal objects cannot be moved to preverbal position, and there is no wh-movement. As in many creoles, tense, mood, and aspect are indicated by preverbal markers:

| | |
|---------------|-------------------|
| <i>ta</i> | imperfective |
| <i>tabata</i> | past imperfective |
| <i>a</i> | perfective |
| <i>lo</i> | future |
| <i>sa</i> | habitual |

(based on the analysis in Andersen, 1990).

Papiamentu also has a passive voice, composed of a preverbal marker, a passivizing verb (*ser*, *wordu*, or *keda*), and a past participle (e.g., *ta wordu skuchá* ‘is heard’).

Papuan Languages

A Pawley, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction

'Papuan' is a collective name for a number of language families and genetic isolates that have in common two characteristics: (a) they are indigenous to a region sometimes called the New Guinea area, comprising New Guinea and neighboring island groups extending from Timor, Alor and Pantar, and Halmahera in the west to the Solomon Islands in the east; and (b) they do not belong to the vast Austronesian family, which dominates Island Southeast Asia and the archipelagoes of the southwest and central Pacific but is only patchily represented in New Guinea itself. (The term 'family' will be used here exclusively to refer to linguistic groups of the highest genealogical order, not to subgroups.)

The hub of the Papuan-speaking region is the large island of New Guinea, which is about the size of Germany but contains about 900 mutually unintelligible languages, over 700 of which are Papuan. According to the most recent classifications, some 18 Papuan families and several isolates are represented on the New Guinea mainland (see **Figure 1**). Two of the New Guinea-based families also have members in Alor, Pantar, and Maluku in Indonesia and in East Timor. Another five, possibly six, families and several isolates are found in the arc of islands extending from New Britain to the Solomons (see **Figure 2**). Whereas Austronesian languages arrived in Melanesia from the west within the past 3500

years (Spriggs, 1997), the Papuan families almost certainly represent continuations of linguistic stocks that have been in this region for much longer than this. There is no convincing evidence that any of the Papuan families have relatives outside of the New Guinea area.

About three million people speak Papuan languages. Most have fewer than 3000 speakers. The seven largest language communities are Enga (about 200 000) and Medlpa [Melpa] (150 000), of the highlands of Papua New Guinea, and Western Dani (150 000) and Lower Grand Valley Dani (130 000) of the highlands of Irian Jaya (Papua). The small size of language communities reflects the extreme political fragmentation that is characteristic of the New Guinea area; peoples were traditionally subsistence farmers or foragers and until colonial times political groups seldom exceeded a few hundred people. In postcolonial times the main regional lingua francas in the Papuan-speaking regions have been English and Tok Pisin in Papua New Guinea, English and Pijin in the Solomon Islands, and Malay in Indonesia. No Papuan language has the status of a national or even a provincial language. While most Papuan languages are still vibrant in their local communities, their small size and lack of wider status mean that their long-term prospects of survival are poor.

Foley (1986) gives an excellent overview of Papuan languages and linguistics up to the mid-1980s; Foley (2000) reviews more recent work. Carrington (1996) is a near exhaustive bibliography of linguistic research up to 1995 and Laycock and Voorhoeve (1971) is a thorough history of early research. *Language atlas of the pacific area* (Wurm and Hattori, 1981–1983)

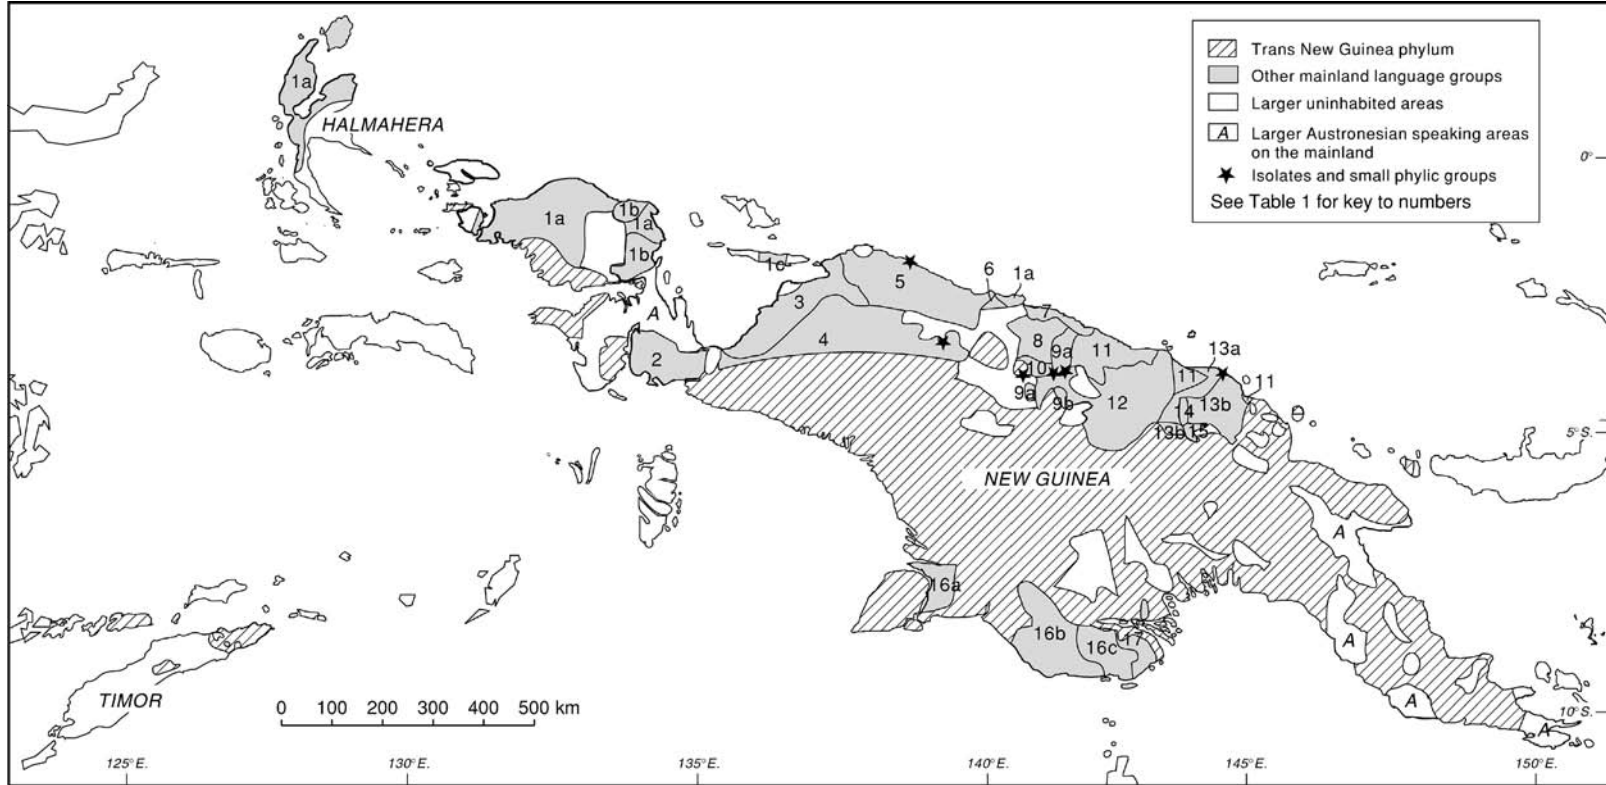

Figure 1 Distribution of Papuan language families in New Guinea and the Timor–Maluku region. Reproduced from Pawley A & Ross M (eds.) *Papuan languages and the Trans New Guinea Family*. Canberra: Pacific Linguistics (forthcoming), with permission.

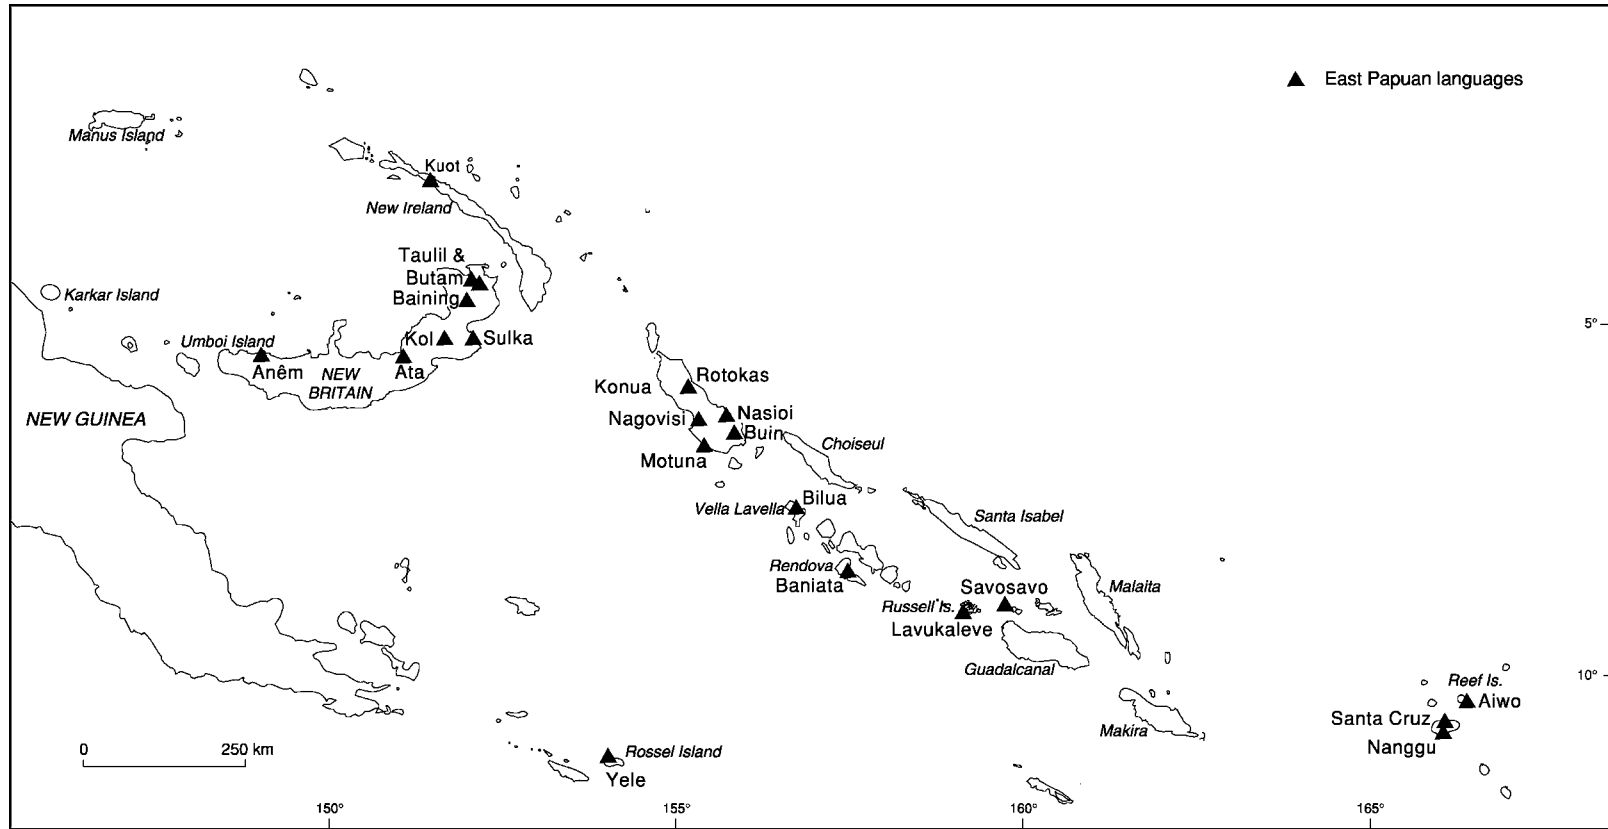

Figure 2 Distribution of Papuan languages in island Melanesia. Reproduced from M Ross, 'Is there an East Papuan phylum?' In A Pawley *et al.* (eds.) (2001). *The boy from Bundaberg. Studies in Melanesian Linguistics in Honour of Tom Dutton*. Canberra: Pacific Linguistics, with permission.

maps in detail the distribution of Papuan languages and language families. However, since this work was compiled several important revisions to the classification have been proposed. This caveat also applies to the information given in *Ethnologue* (Grimes, 2000). The main centers for the study of Papuan languages in recent decades have been the Australian National University's Research School of Pacific and Asian Studies, the University of Sydney, Leiden University, and the Summer Institute of Linguistics's branches in Papua New Guinea and the Indonesian province of Papua (formerly Irian Jaya).

A Short History of Research on Papuan Languages

Until the last decades of the 19th century the languages of the New Guinea area were almost completely unknown to linguists. The imposition of European colonial administrations during that time initiated a period of linguistic research, mainly carried out by missionary scholars. In 1893 the English linguist S. H. Ray observed that some of the languages found in the New Guinea area do not belong to the Austronesian family. Over the next 60 years, as Western exploration of the interior of New Guinea and other large islands proceeded, it became apparent that there were hundreds of such languages and that they were genetically extremely diverse. No families of Papuan languages with more than about 20 members were identified before the 1950s.

Until the end of World War II research on Papuan languages was largely done by scholars with no training in modern linguistics. In the late 1950s a phase of more systematic descriptive and comparative research began. Between 1958 and the 1970s extensive surveys and some in-depth studies of Papuan languages were undertaken by linguists from the Australian National University (ANU). Around 1960 the Dutch linguists Anceaux, Cowan, and Voorhoeve began research in Irian Jaya. Since the Summer Institute of Linguistics established branches in Papua New Guinea in 1956, and in Irian Jaya in 1970, SIL linguists have undertaken descriptive work on some 200 Papuan languages.

This new phase of research yielded a series of preliminary classifications, culminating in a major synthesis by the ANU group (Wurm (ed.), 1975; Wurm, 1982). In 1960 the number of Papuan families was thought to be more than 60. Using mainly lexicostatistical and typological arguments the contributors to Wurm (ed., 1975) reduced the number to 10 'phyla,' along with a number of isolates. (Following the nomenclature often used in lexicostatistical

classifications the ANU group called the highest-order genetic group a 'phylum,' while using 'sub-phylum,' 'stock,' and 'family' to rank subgroups according to percentages of shared cognates.)

In linguistic classification there are lumpers and splitters. Wurm and some of his colleagues can be described as lumpers. The classification in Wurm (ed., 1975), and followed in associated works such as Wurm and Hattori (1981–1983), included three particularly controversial claims. One is that almost 500 Papuan languages can be assigned to a single genetic unit, the Trans New Guinea phylum. If true this would make Trans New Guinea the third largest family in the world in number of members, after Niger-Congo and Austronesian. Second, Wurm (1975) posited an East Papuan phylum consisting of all 20 or so geographically scattered Papuan languages of Island Melanesia plus Yela Dne (Yeletnye) [Yele] of the Lousiade Archipelago, off the southeastern tip of New Guinea. Third, Laycock and Z'graggen (1975) proposed a Sepik–Ramu phylum, to which they assigned almost 100 languages spoken in and around the Sepik–Ramu basin.

Although a good many nonspecialists accepted these proposals uncritically, none was well received by Papuan specialists. All the main reviewers of Wurm (ed., 1975) regarded the Trans New Guinea hypothesis as unproven though not without promise. The Sepik–Ramu hypothesis fell into the same basket. The proposed East Papuan hypothesis was generally viewed as the least plausible of the three.

The most extreme lumper in the Papuan field has been the American linguist, Joseph Greenberg. In a paper drafted much earlier but not published until 1971 Greenberg suggested that all the Papuan languages belong to a vast 'Indo-Pacific' group, to which he also assigned the Andaman Islands and Tasmanian languages. The languages of mainland Australia were excluded. Greenberg's Indo-Pacific proposal rested mainly on a flimsy chain of resemblances in lexical forms (84 sets) and grammatical forms (10 sets). The resemblances are flimsy because the resemblant forms are distributed very unevenly across language groups and because of the lack of means to distinguish shared retentions from chance resemblances and borrowings – one can find a chain of chance resemblances linking any set of sizeable language families. Greenberg divided the Papuan languages of New Guinea into seven major groups, some of which had merit. For example, his 'Central' group resembles the Trans New Guinea (TNG) family in that he assigned to it all the central highlands languages from the Baliem Valley in Irian Jaya to the Huon Peninsula group in Morobe Province, Papua New Guinea. However, evidence for such a group was not given

except as part of the mass of etymologies adduced in support of Indo-Pacific as a whole.

Greenberg's Indo-Pacific proposal drew almost no response from Papuanists. This lack of response, no doubt, reflects (a) extreme skepticism, and (b) the difficulty of disproving a claim of this kind until linguists have established a core of well-defined genetic groups among the languages concerned and have worked out the essentials of their historical development. The main message in the critical reviews of Wurm (ed., 1975) was along the lines of (b). Foley (1986: 3, 213) argued that a properly cautious view should recognize some 60 separate Papuan families which have not been convincingly shown to be related.

Recent Work on the Classification of Papuan Languages

Recently Malcolm Ross compared pronoun paradigms in 605 Papuan languages as a basis for recognizing language families (Ross, forthcoming, 2001, in press). For each family he sought to determine a sequence of innovations in pronoun forms and categories that would yield subgroups. The limitation of Ross's classification is that it relies heavily on a very restricted set of diagnostic criteria. Its strength is that pronoun paradigms have proved to be the most reliable single diagnostic. Ross identifies some 23 to 25 language families and 9 or 10 isolates. The pronominal evidence indicates that the Papuan languages show more genetic diversity than was recognized by Wurm (ed., 1975) but less than was proposed by Foley (1986).

The classification of Papuan groups in **Figure 1** relies heavily on Ross's work but also draws on several other recent studies including Dunn *et al.* (2002), Foley (1986, in press), Pawley (1998, 2001, in press), Reesink (in press), and Terrill (2002).

The Trans New Guinea Family

A slightly reduced version of the TNG family as proposed in the 1970s has been strongly supported by recent work using sounder methods (Pawley, 1998, 2001, in press; Ross, forthcoming) (*see Trans New Guinea Languages*). The main evidence for TNG consists of (a) some 200 putative cognate sets, nearly all denoting so-called 'basic vocabulary,' (b) a body of regular sound correspondences in a sample of daughter languages, which has allowed a good part of the Proto TNG sound system to be reconstructed, (c) systematic form-meaning correspondences in the personal pronouns, permitting reconstruction of virtually a complete paradigm, and (d) widespread resemblances in fragments of certain other grammatical

paradigms. The TNG family, as redefined, contains about 400 languages. Branches of the family occupy the central cordillera that runs the length of New Guinea as far west as the neck of the Bird's Head. They also cover large parts of the southern and, to a lesser extent, the northern lowlands of New Guinea, and have outliers in East Timor, Alor, and Pantar.

Families Confined to North New Guinea

A spectacular degree of linguistic diversity, unmatched anywhere else in the world, is found in north New Guinea between the Bird's Head in Irian Jaya and Madang Province in Papua New Guinea. No fewer than 15 different families plus several isolates are present. The putative Sepik-Ramu family is not supported by Ross's study of pronominal paradigms or by Foley's analysis of a wider range of evidence (Ross, forthcoming; Foley, in press). Foley deconstructs Sepik-Ramu into three unrelated groups: Sepik, Lower Sepik-Ramu, and Yuat. He argues that the Sepik family, containing nearly 50 languages, has its greatest diversity and therefore its original dispersal center in the reaches of the Sepik River above Ambunti. Ross (2000, forthcoming) also recognizes the Sepik and Yuat groups but divides Lower Sepik-Ramu into two possibly unrelated groups: Lower Sepik and Ramu, as well treating Taiap as an isolate. However, he accepts Foley's argument that there are fragments of morphological evidence for uniting Lower Sepik and Ramu. Ross concludes that the distribution of the Ramu and Lower Sepik languages indicates that their diversification predated the regression of the Sepik inland sea some 5000 years ago. As the silt from the Sepik delta filled up this sea Lower Sepik speakers progressively followed the river to the coast.

The Torricelli family proposed by Laycock (1975) is supported. It consists of close to 50 languages, most of which occupy a continuous area of the Torricelli and Prince Alexander Ranges between the Sepik River and the north coast. Languages of the Ndu branch of the Sepik family have expanded north from around the Chambri Lakes and driven a wedge into the Torricelli family, isolating a number of Torricelli languages to the west and south of the Murik Lakes. A small enclave of Torricelli languages also exists on the coast in western Madang Province, isolated from its relatives by a wedge of Ramu languages.

A number of smaller families, each with fewer than 20 languages, have been identified in north New Guinea. These include Skou (spoken on the north coast around the Papua New Guinea-Irian Jaya border), Kwomtari (northwest part of Sandaun [formerly

West Sepik] Province), Left May (situated south of the Kwomtari group around the May River, a tributary of the Sepik), and Amto-Musian (between Kwomtari and Left May). There is some evidence for a Kwomtari-Left May group. Geelvink Bay languages are spoken on the coast of Cenderawasih (formerly Geelvink) Bay. East Bird's Head languages are spoken on the eastern side of the Bird's Head. The West Papuan family, comprising about 24 languages, is represented on the northern part of the Bird's Head at the western end of New Guinea, on Yapen, and on the northern two thirds of Halmahera. There is slight evidence for linking West Papuan and East Bird's Head. On the central south coast of New Guinea at least two groups do not, on present evidence, belong to TNG. Ross refers to these as the South Central family and the Eastern Trans-Fly family.

Island Melanesia

Ross's pronoun study gives no support for Wurm's East Papuan phylum. Instead he finds eight distinct genetic units, including five families, which show a few noteworthy typological similarities, such as a masculine/feminine distinction in 3rd person pronouns (Ross, 2001; Terrill, 2002; Dunn *et al.*, 2002; Wurm, 1982). The Papuan languages of New Britain are divided into an East New Britain family (the Baining dialect chain, arguably more than one language, together with Taulil and Butam), a West New Britain family (Anem and Ata) and two isolates, Sulka and Kol. Another isolate, Kuot, is the only surviving Papuan language in New Ireland, although some neighboring Austronesian languages show what seems to be a Kuot-like substratum. The Papuan languages spoken in Bougainville fall into two families, North Bougainville (Kunua [Rapoisi], Kiriaka, Rotokas, and Eivo) and South Bougainville (Nasioi, Nagovisi, Motuna [Siwai], and Buin). On the basis of pronominal resemblances Ross recognizes a Central Solomons family, made up of four languages (Bilua, Baniata, Lavukaleve, Savosavo) scattered across several islands in the main Solomons group. However, there is little else to support such a grouping. In the Santa Cruz group, in the eastern Solomons, there are three languages whose status as Austronesian or Papuan has long been disputed.

Structural Characteristics of Papuan Languages

Good grammars and dictionaries exist for languages in several of the Papuan families. Some representative grammars are Farr (1999) for Trans New Guinea,

Bruce (1984) for the Sepik family, Foley (1991) for the Lower Sepik family, Dol (1999) for the Bird's Head family, van Staden (2000) for the West Papuan family, Onishi (1995) for Motuna of the South Bougainville family, and Terrill (2003) for the Central Solomons family.

Because of their genetic diversity it is hard to generalize about the structure of Papuan languages. However, in New Guinea there are many diffusion areas where certain structural features as well as lexicon have spread across language family boundaries.

The phonemic inventories of Papuan languages range from among the smallest in the world (Lakes Plains of Irian Jaya and Rotokas of Bougainville each has 11 segmental phonemes) to quite large (Yela Dne of Rossel). A five vowel system /i, e, a, o, u/ is the commonest, although a number of languages have various types of six, seven, and eight vowel systems. Word-tone or pitch-accent contrasts are fairly common among Papuan languages, for example in the TNG, Lake Plains, West Papuan, Geelvink Bay, and Skou families (Donohue, 1997).

In most Papuan families the preferred order of constituents in verbal clauses is SOV. Notable exceptions are the Torricelli family, East Bird's Head, some members of the West Papuan family spoken in Halmahera, and three of the languages of the Central Solomons group, where SVO order is usual. The Halmahera and Central Solomons languages with SVO order have been strongly influenced by Austronesian neighbors.

In most Papuan families grammatical relations like subject, object, and location are signaled by adpositions or word order, or the presence on the verb of person-number affixes for subject and object. Most languages organize pronominal affixes to show a nominative-accusative (or dative) contrast. Only a few languages have a true ergative-absolutive alignment for verb pronominals. Some TNG languages optionally mark a wilful or focused agent by what is otherwise the instrument postposition.

Pronominal systems vary considerably across and even within families and there is often a discrepancy between the kinds of distinctions made in independent pronouns and in verbal affixes. TNG languages typically distinguish roots for 1st, 2nd, and 3rd person, adding number markers for plural (some languages also distinguish a dual and, less commonly, a paucal). An exclusive/inclusive contrast is absent from most Papuan families. It is restricted to groups such as West Papuan, certain Torricelli languages, and a few isolates. In at least some cases this contrast may be a feature borrowed from Austronesian neighbors.

Almost all Papuan families distinguish sharply between noun roots and verb roots. Generally a verb root cannot be used as a noun without derivational morphology and vice versa. In certain TNG languages verb roots are a small closed class, with somewhere between 60 and 150 members. The densest concentration of these languages is in the Chimbu–Wahgi and Kalam–Kobon subgroup, located in the Central Highlands and the contiguous Schrader Ranges. Most TNG languages and some other Papuan families augment their stock of verbs by forming complex predicates consisting of a verbal adjunct or coverb plus a verb root. Verbal adjuncts are uninflected bases that occur only in partnership with a verb, often being restricted to one or a few verbs. Most TNG and Sepik and Lower Sepik–Ramu languages also make heavy use of serial verb constructions consisting of consecutive bare verb roots.

Verb morphology is typically of medium to extreme complexity. Most languages carry suffixes marking tense, aspect and mood, and person–number of subject, and some also carry prefixes marking the object. But there are exceptions: agreement affixes are lacking in Lakes Plain and Lower Ramu languages, in the TNG languages of the Timor region, and in certain Geelvink Bay languages. In TNG languages there is often a degree of fusion of the subject marking and TAM suffixes. A degree of morphological complexity is found in some languages of the Sepik–Ramu basin, such as Yimas (Foley, 1991), Alambak (Bruce, 1984), Barupu of the Skou family, and in the Kainantu subgroup of TNG, all of which show polysynthetic characteristics.

A prominent feature of most TNG languages is the marking of ‘medial’ verbs for switch reference and relative tense. Whereas sentence-final verbs head the final clause in a sentence and carry suffixes marking absolute tense-aspect-mood and person–number of subject, medial verbs head nonfinal coordinate-dependent clauses and carry suffixes marking (a) whether the event denoted by the medial verb occurs prior to or simultaneous with that of the final verb, and (b) ‘switch-reference,’ i.e., whether that verb has the same subject or topic as the next clause.

In the Torricelli and Lower Sepik–Ramu families and in certain other small groups of north-central New Guinea, nouns carry complex inflections, marking number distinctions and noun classes. Noun class systems are an areal feature of languages belonging to diverse families in the Sepik–Ramu basin in New Guinea. The Torricelli, Sepik, and Lower Sepik–Ramu families have upwards of 10 noun classes. Most classes are assigned phonologically, according to the final segment of the stem. The isolate Burmeso, in northern Irian Jaya, has six genders and six noun

classes, marked simultaneously. A few TNG languages that are neighbors of members of the Lower Sepik–Ramu group have acquired noun classes. Noun classes are also found in Bougainville and in the central Solomons. Gender classes, usually just masculine versus feminine, are distinguished in nouns in West Papuan and Skou (shown by agreement prefixes) and in the Sepik family and a small minority of Trans New Guinea languages (marked by concord suffixes). Feminine is usually the unmarked gender.

Some Trans New Guinea languages use existential verbs like ‘stand,’ ‘sit,’ ‘lie,’ and sometimes others like ‘hang,’ ‘carry,’ and ‘come’ as quasi-classifiers of nouns. Nouns select a verb according to their shape, posture, size, and composition. However, the classification is not absolute for the noun but has some flexibility relative to the situation of the referent. Papuan languages show a wide variety of numeral systems, including the ‘Australian’ system (1, 2, 2+ 1, 2+ 2), quaternary, quinary, vigesimal, and various kinds of body-part systems.

Explaining the Diversity and Distribution of the Papuan Languages

Why is the New Guinea area so linguistically diverse, in terms both of the number of apparently unrelated genetic stocks and the number of individual languages? One major factor is the very great time depth available for *in situ* diversification. Archaeology has shown that humans reached New Guinea and Australia (then joined as a single continent, Sahul) upwards of 40 000 years ago (Spriggs, 1997). By 40 000 to 36 000 years ago people crossed from New Guinea to New Britain, the nearest part of Island Melanesia, and from New Britain to New Ireland. By 29 000 to 28 000 years ago people had made the 180 km crossing from New Ireland to the northern end of Bougainville. The initial phase of human expansion into the southwest Pacific got no further than the main Solomons chain, which ends at Makira (San Cristobal). There is no evidence that humans settled any part of Remote Oceania, i.e., the Pacific Islands beyond the main Solomons chain, until about 3200 years ago.

A second force aiding diversification resides in social and political organization. In the New Guinea area political units were small, probably seldom larger than a collection of kinship groups or one or two villages containing a few hundred people. No unit had the political and economic power to dominate a large area. Neighboring polities were often hostile. A third factor is geographic barriers. In New Guinea, New Britain, and Bougainville, in particular, heavily forested mountain ranges and extensive

swamps imposed natural limits to communication. Substantial ocean gaps between islands provided natural points of linguistic fission for people who lacked efficient ocean-going craft.

A fourth factor, which kept established language families from being overrun by invading groups, is the lengthy isolation of much of the New Guinea area itself. The evidence of archaeology and population genetics (Friedlaender *et al.*, in press) indicates that the people of New Britain, New Ireland, and Bougainville had little contact with the rest of the world for tens of millennia following initial settlement. The same may have been true, though to a lesser extent, of populations inhabiting the interior of New Guinea. One can speculate that some of the diverse language stocks of both the New Guinea mainland and Island Melanesia continue the languages of the earliest, late Pleistocene settlers in these regions. As Australia and New Guinea were connected as recently as about 8000 years ago one might expect to find traces of old connections with Australian languages, but no solid evidence has been found (see Foley, 1986 for some speculations).

Two major expansions show up in the linguistic record for the New Guinea area. The TNG family is exceptional among Papuan families in its large membership and wide geographic spread. The great diversity among its subgroups shows that TNG is a very ancient family which, according to glottochronological estimates (admittedly not very reliable) began to diverge some 8 to 12 millennia ago. The distribution of subgroups suggests that its most likely primary center of diversification is the central highlands of Papua New Guinea. It seems unlikely that the TNG family would have achieved its present remarkable distribution unless its speakers possessed cultural advantages that enabled them to pioneer permanent settlement of the heavily forested high valleys of the central cordillera. The key advantage may have been agriculture. Archaeological work indicates the presence of full-scale agriculture near Mt. Hagen in the Upper Wahgi Valley, probably by 10 000 years ago and certainly by 7000 years ago (Denham *et al.*, 2003).

However, it is striking that speakers of TNG languages made few inroads into the Sepik provinces and the western half of Madang province and the Bird's Head. These areas are dominated by other, much smaller families. It is reasonable to suppose that at the time of the TNG expansion these regions were already inhabited by speakers of some of the non-TNG languages that are still represented there.

A second major linguistic expansion occurred in the 2nd millennium B.C. when Austronesian speakers arrived in the New Guinea area. This event shows up

Table 1 Papuan families identified in **Figures 1 and 2**

| 23. | Central Solomons |

clearly in the archaeological record (Spriggs, 1997). There is good reason to think that 3000 years ago northern Island Melanesia contained many more Papuan languages than it does now. Whereas this region now harbors about 150 Austronesian languages (all belonging to the large Oceanic subgroup) only about 21 Papuan languages survive there. None are present in the Admiralty Islands and only one in New Ireland. Although they came to dominate the smaller islands of Melanesia, Austronesian languages had much less impact in New Guinea. There they are mainly confined to offshore islands and to certain patches along the north coast and in southeast Papua.

There are abundant signs that the Austronesians at first had a similar, marginal distribution in Island Melanesia. However, the eventual outcome was very different. In due course the Admiralty Islands and most of New Britain, New Ireland, Bougainville, and the Solomons became Austronesian-speaking, though not without a good deal of linguistic and cultural exchange between immigrants and aboriginal populations (Dutton and Tryon, 1994).

In much of Island Melanesia it seems that the interaction between Austronesian and Papuan speakers was of a kind that led to widespread language shift. With few exceptions the shifts appear to have been cases of communities that formerly spoke Papuan languages adopting Austronesian languages while maintaining much of their biological and social distinctiveness. As to the mechanisms of language shift, there have as yet been few studies.

Pashto

D Septfonds, National Institute of Oriental Languages, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Origin and History

Pashto is spoken by some 40 million people living on both sides of the border between Pakistan and Afghanistan, the famous Durand line, which has given rise to many conflicts. This line was drawn in 1893 following an agreement between Afghanistan and British India, which determined the southern limits of Afghanistan and divided Pashtun territory between Afghanistan and British India – Pakistan since Partition in 1947.

Pashto is the language of the tribes that founded the Afghan state in 1747: the Pashtuns or, according to the term that prevailed in British India, the Pathans (Indianized form of the plural of Pashtuns).

Pashto is the main language spoken in Afghanistan and one of the two official languages of the country, the other being Dari or Afghan Persian. Pashto, which is mainly spoken south of the mountain range of the Hindu Kush, is reportedly the mother tongue of 60% of the Afghan population. Many Pashto-speaking pockets are also found in the north and the northwest of the country where Pashtuns were transferred in the late 19th century and given land.

In Pakistan, Pashto, which is spoken by 20–25 million people, has the status of a regional language. While the majority of the Pashtuns live in the North-West Frontier Province (NWFP, capital Peshawar), in Baluchistan (capital Quetta), or in the Federally Administered Tribal Areas (FATA) – the Pashtun area being roughly at the East of the Indus – Karachi, where about two million people speak Pashto, remains the main Pashtun metropolis.

There is also a large diaspora in the Gulf countries, particularly in Dubai, and in Europe, the United States, and Australia.

Dialectology

From a strictly genetic point of view, Pashto, an Indo-European language, belongs to the northeastern group of Iranian languages. From one dialect to another, its morphosyntactic structure does not show any major variation. Their classification is based on phonological criteria and depends on the pronunciation of *بن* /x̄/ and *ښ* /ǧ/ letters. These consonants are pronounced differently according to the regions. This constitutes a first isoglossic line: the most visible and the most notable, since it can be observed in the script. In the A zone (eastern /maf̄reqi/), they are pronounced respectively /g/ and /x/. ‘woman’ is pronounced /x̄ája/, ‘beard’ is pronounced /girá/: these dialects are known as ‘hard.’ This is found in the English transcription ‘Pukhtu’ (kh = x = *بن*). In the C zone (western /mav̄rebi/), they are pronounced /z/ and /ʒ/, and sometimes reduced to /ʃ/ and /ʒ/ (Ghazni). ‘woman’ is pronounced /ʒája/, beard is pronounced /zirá/: these dialects are known as ‘soft’ dialects or ‘Pushtu’ (sh = ʒ, š = *بن*). Both these dialects are written in the same script and the speaker is free to read his own way, with his own ‘accent.’ This unity of script allows the definition of a standard Pashto consisting of A- and C-type dialects, whether ‘hard’ or ‘soft,’ from Kandahar or from Peshawar (Table 1).

On the other hand, crossing the line separating ‘soft’ Pashto from ‘hard’ Pashto, another isogloss exists that defines a B zone known as intermediary or central (/mandʒanəy/). This zone, which does not present such clear unity as the zones mentioned above

Table 1 Dialects

| | | Zone C | | | Zone B | | Zone A | |
|--------------------|-------------|--------------------|---------------------|---------------------|------------------------|--------------------|--------|---|
| x̄ | بن | ʒ | ʃ | x̄ = [ç] | x | | | |
| ǧ | ښ | z | ʒ | ǧ = [j] | g | | | |
| Standard Pashto | Afgh Pak | Kandahar Quetta | Ghazni | | Djalâlâbâd Peshawar | | | ‘father’ /plɑ:rl/ ‘mother’ /morl/ ‘daughter’ /lurl/ |
| Nonstandard Pashto | Afgh Pak | | Waziristan Bannu | | Paktyâ | | | ‘father’ /plorl/ ‘mother’ /merl/ ‘daughter’ /lir/ |
| | | Zone C mav̄rebi | | Zone B mandʒanəy | | Zone A maf̄reqi | | |

Afgh = Afghanistan/Pak = Pakistan.

as far as the pronunciation of the consonants is concerned (نښ /x̣/ or /f/ and ځ /ǧ/ or /ʒ/), nevertheless clearly contrasts with them due to a very particular pronunciation of the vowels of standard Pashto. It is the Waziri metaphony, taking its name from the Wazir tribes among whom it is well attested: pronunciation /o/ for /a:/, /e/ for /o/, /i/ for /u/. If this pronunciation had to be written, it would impose a script contrary to the entire orthographic tradition. This type of Pashto is not written. As a consequence, speakers belonging to this zone use a different type of Pashto when they have to communicate with other Pashtuns (from zones A or C). We find here a perfect example of diglossia: they use a variant of their language that is better recognized because it is written; better recognized, though not more prestigious because these dialects have a strong value as indicators of identity.

Another residual variant of Pashto – Wanetsi – is spoken in Pakistani Baluchistan. This archaic idiom, which has hardly been described, is virtually unintelligible to other Pashtuns.

Pashto Script and Orthography

Pashto literature dates from the 16th century. The publication in 1975 of a facsimile of a manuscript, supposedly dating from 1886, places the beginning of Pashto literature as far back as the 8th century. The authenticity of this poetry anthology – The hidden treasure /pəʃa xaza:na/ – is much debated. Pashtun land was then divided between the Safavid and the Moghul empires. The literary model was Persian, and Pashto scholarly literature has inherited Arabo-Persian poetical genres and meters. This literature starts with Khayr ul Bayan (The best discourse) of Bayazid Ansari; the most ancient manuscript dates

back to 1651. Bayazid Ansari, known as Pir Roshan (The luminous master, 1524–1579), the founder of a politico-religious movement considered a heresy, waged war on Delhi.

From the point of view of development of the script, this represents the birth of the first tradition. Three other subsequent traditions can be distinguished, with some overlap and parallel developments. The first is the tradition of Khushal Khan Khattak (1613–1689) – the poet warrior, father of Pashto literature – and of his descendants, which constitutes in itself a literary tradition. A standard tradition followed in the 19th and 20th centuries, mainly in Pakistan, with some characteristic features of the Urdu script. Finally, the tradition of ‘modern’ script has developed since 1936 in Afghanistan.

Nowadays, on both sides of the border, the orthographic standard is the Afghan scholarly standard, which has drawn on the Persian script since the early 1990s.

In all these cases, the script is the Arabic script adapted to the needs of a language that has phonemes unknown in Arabic: these phonemes are common to Pashto, Persian, and Urdu (پ /p/, ټ /tʃ/, څ /ʒ/, ګ /g/), to Pashto and Urdu (ټ /t/, ډ /d/, ږ /r/), while some letters are particular to Pashto (نښ /x̣/, ځ /ǧ/, څ /ts/, ځ /dz/, ځ /ɲ/). (See phonemes in bold in Table 2.)

Basic Phonology

Pashto is a language with free accentuation.

A remarkable feature of Pashto is a series of retroflex consonants (/ʈ/, /ɖ/, /ʂ/, /ʐ/, /ɳ/), which is exceptional in Iranian languages; Pashto also has many word-initial clusters that cannot exist in Persian Table 3.

Table 2 Consonants

| | <i>Bilabial</i> | | <i>Dental/Alveolar</i> | | <i>Retroflex</i> | | <i>Velar</i> | | <i>Uvular</i> |
|------------|-----------------|---|------------------------|-----------|-----------------------|----------------------|--------------|---|----------------|
| Plosive | p | b | t | d | ʈ | ɖ | k | g | q ^b |
| Affricate | | | ts | dz | | | | | |
| | | | tʃ | ɖʒ | | | | | |
| Fricative | f | | s | z | x̣^a | ǧ^a | x | ɣ | h |
| | | | | | ʃ | ʒ | | | |
| Nasal | m | | n | | ɳ | | | | |
| Liquid | | | | | | | | | |
| | | | r | | ɽ | | | | |
| Semivowels | w | | | | y | | | | |

^aCf. ‘Dialectology.’

^bIn italics: ‘the elegant phonemes.’

These phonemes are not native pashto sounds. They occur in the speech of educated speakers only (in Arabic and Persian loan words). /q/ varies with /k/ in a stylistically determined alternation, /t/ with /p/ and /h/ – lengthening a preceding vowel /a/ – with zero.

Basic Morphology

Nouns

Nouns in Pashto are inflected for gender (masculine, feminine), number (singular, plural) and case (direct = nominative, oblique, vocative). ‘Prepositions’ (preposition, circumposition, and postposition) govern the oblique case.

Pronouns

Pronouns are inflected according to Table 4. There are three series: personal pronouns (tonics); personal clitics (used as ‘actant’ – subject or object – and also in possessive constructions); and verbal inflections.

These forms are divided into weak and strong: /ə/ vs. /zə/; /-me/ vs. /ma:/. A particular weak series, the series of directional pronouns, corresponds to the strong series /ma:/, when the latter is governed by ‘prepositions.’

Pashto Verbs

Pashto verbs have two stems, one for present tense forms and one for past tense forms. The infinitive is derived from the past stem by adding /əl/. It is a masculine plural, for instance, ‘to see’ *lid-l* /win/ (past stem /lid/, infinitive /lid-əl/, present stem /win/). Verbs are inflected for person, number and gender (cf. Table 4).

Table 3 Vowels

| Front | Central | Back |
|-------|---------|------|
| i | | u |
| e | ə | o |
| a | | a: |

Table 4 Personal markers in STD Pashto

| | NP | | Enclitic (OBL) | Directional | Personal ending | |
|-----------------------|-----------------|---------------|-------------------|---------------|-----------------|--------|
| | NOM | OBL | | | Present | Past |
| 1 sing | zə | ma: | -me | ra: | əm(a) | |
| 2 sing | tə | ta: | -de | dar | e | |
| 3 ^{MASC} | day | də | | | | ə/ay/ə |
| 3 sing | -da: | de | -ye | war | -i | |
| 3 ^{FEM} sing | | | | | | a |
| 1 pl | | munğ | -mo | ra: | u | |
| 2 pl | | ta:se / ta:so | -mo | dar | əy | |
| 3 ^{MASC} .PL | | | | | | ə |
| 3 ^{PL} | | duy | -ye | war | i | |
| 3 ^{FEM} .PL | | | | | | e |
| | Strong pronouns | | | Weak pronouns | | |

From the present stem, two presents are formed (imperfective vs. perfective) and two imperatives (perfective vs. imperfective). From the past stem, two pasts are formed (perfective vs. imperfective). This aspectual perfective vs. imperfective opposition is dominant and is found in the entire verbal system.

In addition to these simple tenses, there are three processes of ‘auxiliation’: the perfect system, the capacitive system (or ‘potential,’ which expresses the capacity; the verb ‘can’ does not exist in Pashto); and the passive.

The system is enriched by the combination of these basic forms with several modal-aspectual enclitic particles (eventual /ba/, injunctive /de/, assertive /xo/), which as such are placed in second position in the utterance (cf. ‘Basic Syntax’ below).

There are two forms of conjugation in Pashto: one for simple verbs (for example ‘to see’ *lidl*) and one for denominative verbs: ‘white’ /*spinl*/ gives ‘to whiten’ /*spinedll*/ (intransitive) and ‘to whiten’ /*spinawll*/ (transitive); ‘in good shape’ /*dʒoɾl*/ gives ‘to build up, to get better’ /*dʒoɾedll*/, ‘to heal, to build’ /*dʒoɾawll*/. There are no more than 150 simple verbs: however, the list of compound verbs is open and productive. To these are added many verbal phrases, mainly with the verb ‘to make’ /*kawll*/ (‘to play’ = ‘game make’ /*lobe kawll*/, ‘to sleep’ = ‘sleep make’ /*xob kawll*/ vs. ‘to dream’ = ‘sleep see’ /*xoblidl*/).

Basic Syntax and Typology

Order of Terms

Within the nominal syntagma, the order of terms is always ‘determinant’ (head modifier) + ‘determined’ (head noun). The process is recursive toward the left. However, two different structures can be distinguished, according to whether the determinant is a noun or an adjective. If the determinant is a noun, it is

Table 6 Landey

گل می په لاس کې مراوی کېږي ا
 یردی وطن دی زه یې چا ته ونیسمه
 gwəl me pə 'la:s ke mɾa:way 'ki:gi.
 praday wa'tan day, zə ye 'tʃa: ta wə-ni'səma?
 'The flower withers in my hand'
 'This is a foreign land, to whom shall I give it?'

(7) (zə) ta: win-əm
 S O V s
 'me'.NOM you.OBL see.PRES-I/sing
 'It is I who see you'

The Landey

It is impossible to talk about the Pashtun world without mentioning a popular poetical genre: the landey, literally 'short.' Often sung, their rhythm is invariable; every one knows a number of landeys and is able to compose new ones (accented syllables are in bold (Table 6)).

Persian, Modern

P O Skjærvø, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Modern or New Persian (NPers. *fārsī*) is descended more or less directly from Middle Persian. Differences between Old, Middle, and New Persian in part reflect

the fact that these were official languages of the Achaemenid, Sasanian, and various modern-time dynasties of various local affiliations, respectively. The language is known from scattered remains from the 7th century C.E. on, while Persian literature emerged in the 9th century. Among the earliest manuscripts are a few texts from Chinese Turkestan.

New Persian is written in the Arabic script, with the exception of the Central Asian variant, Tajik, which uses the Cyrillic script. There is a large and old Judeo-Persian literature, written in the Hebrew alphabet, and a few short texts in Manichean and Syriac script.

There are several dialects of Modern Persian, among them the east-Iranian Khorasani dialect; Dari and Badakhshani spoken in Afghanistan; and Tajik (q.v.) spoken in Tajikistan and adjacent areas of Afghanistan and Xinjiang. Persian is in turn a member of the group of dialects spoken in western (Lorestan) and southwestern (Fars) Iran. Persian has also not been a homogeneous language throughout its history; rather, as the cultural centers moved about, the literary language was colored by the local varieties of Persian.

The study of Persian began in Persia itself probably already in the 13th to 14th centuries, but glossaries of obsolete and dialect words had been compiled as early as ca. 1000. Interest in ancient Iranian languages was kindled in Mughal India in the 16th century and resulted in several large dictionaries, which served as the basis for 19th- to 20th-century dictionaries.

In Europe, several Persian grammars had been written by 1700, partly based on Bible translations. About this time polyglot dictionaries, including Persian among their languages, also became common. The most famous early grammar is that of Sir William Jones (1st edn., 1771), founder of the Asiatick Society in Calcutta (1784).

Phonology

New Persian phonology continues that of Middle Persian with only few changes. Some early manuscripts mark intervocalic *b* and *d* as spirants β (<f> with triple dots) and δ , but the later standard language has only *b* and only *d* with a few exceptions (e.g., *godašt* → *gozašt*). The sounds γ and ξ are common, but originate in non-Persian dialects (e.g., *rouyan* ‘oil,’ *vāže* ‘word’). In Arabic loan words, the typical Arabic sounds have been replaced with corresponding Persian ones (ح *ḥ* > *h*; ط *ṭ* > *t*; ث *ṯ* [θ], ص *ṣ* > *s*; ذ *ḏ* [ð], ض *ḏ*, and ظ *ẓ* > *z*). The Middle Persian vowel system: *a ā ē ī i ū ō au ai* remained in early Modern Persian, except that *ē*, *ō* before nasals merged with *ī*, *ū* early on in standard Persian. Later this merger took place in all positions, and eventually, this phonemic system based on vowel quantity distinctions was replaced by one based on vowel quality: *a* (≈ [æ]) *ā* (≈ [ɑ]) *e ī o ū ou ei* (with length as a secondary feature). The Classical Persian labialized velar fricative *xw* [x^o] is New Persian [x], but is still spelled <xw> (e.g., *xwad* > *x’od* ‘own’).

In modern colloquial standard Persian, further changes are taking place, among them *ān*, *ām* > *ūn*, *ūm*; loss of *h* and glottal stop before consonants, creating a new set of long vowels (*te:run* ‘Tehran’; *ba’d* [bæ’d] > [bæ:d] ‘afterward’ versus [bæd] ‘bad’); the assimilation of postvocalic *st* > *ss*; the reduction of the 3RD SING verb ending *-ad* to *-e* and the change of the 2ND PLUR ending *-īd* to *-īn*; and the reduction of the stem of several common verbs (*šaw-‘become’* > *š-*, *gūy-‘say’* > *g-*, etc., e.g., *mī-šav-ad* > *mī-š-e* ‘he/she/it becomes, it is possible,’ *mī-gūy-īd* > *mī-g-īn* ‘you [PL] say’).

Morphology and Syntax

Modern Persian has no grammatical gender (e.g., *ū* ‘he, she, it’) or cases, but has inherited the Middle Persian plural morphemes *-ān* (usually marked animate) and *-hā*. Arabic nouns often use the Arabic broken plural (*fe’l* ‘verb,’ plur. *af’āl*). Some Persian nouns have adopted the Arabic plural ending *-āt*, especially nouns in *-e* (<*-ag*), which have plural ending *-ejāt* (<*-aj-āt*; e.g. *mīve-jāt* ‘fruit’). Plural forms are not used after numerals, but classifiers are common, the unmarked *tā* ‘piece’ being the most common (*se jeld ketāb* or *se tā ketāb* ‘three volume/piece book’ = ‘three books’; *čand tā* or [colloquial] *čan dune* ‘how many?’ *se tā* or *se dune* ‘three’).

The indefinite marker is *-ī* ‘a (certain).’ The definite direct object is always marked, in Classical Persian by a variety of affixes, in modern Persian by *-rā* (colloquial often *-[r]o*, e.g., *to -rā ne-mī-šenās -am* ‘you-DO NEG-CONT-KNOW.PRES-1ST.SING’ = ‘I do not know you’; but *man + -rā* ‘I.DO’ > *marā* ‘me,’ coll. *man-o*), which can be combined with the indefinite article, *-ī-rā* ‘a certain.’ In colloquial Persian a referential definite marker is often used, e.g., *mard-é* ‘the man (we are talking about).’ The indirect object is marked in modern Persian by the preposition *be* ‘to,’ while in Classical Persian *-rā* was used, beside various other strategies. This was also the way of expressing possession (*ū-rā do bače and* ‘he.10 two child be.3RD.PL’ = ‘he has two children’; modern *do tā bače dār-ad* ‘two CLASS child have.PRES.-3RD.SING’ = ‘he he has two children’).

Adnominal constructions, possession, and adjectives, are expressed by the *ezafe* construction (*ketāb-e man* ‘book-CONN I’ = ‘my book,’ *ketāb-e bozorg* ‘book-CONN big’ = ‘a big book’). Possession can also be expressed by constructions such as *az ān-e man ast* ‘of that/those-CONN I.OBL be.3RD.SING’ = ‘it is mine’ or *māl-e man ast*, literally, ‘it is my possession.’ The *ezafe* is omitted after the indefinite article (*ketāb-i bozorg* book-INDEF big = ‘a big book’).

Relative clauses are introduced by the connector *ke*, which is preceded by *-ī* (attached to the noun) in restrictive clauses, e.g., (*mard-ī ke ketāb-am-rā bord* ‘man-REL.PART REL.CONJ book-I.OBL-DO take.away.PAST.3RD.SING’ = ‘the man who took my book’). The direct object particle may be added to the relative *-ī*, e.g., *zan-ī-rā ke dī-rūz dīd-am* ‘woman-REL.PART-DO REL.CONJ yester-day see.PAST-1ST.SING’ = ‘the woman I saw yesterday.’ Anaphoric pronouns referencing the head noun are common, e.g., *zan-ī dī-rūz dīd-am ke šouhar-eš dar jāng košt-e šod-e būd* ‘woman-INDEF yester-day see.PAST-1S.SING REL.CONJ husband-she.OBL in war kill.PAST-PERF become.PAST-PERF be.PAST.3RD.SING’ = ‘yesterday I saw a woman whose husband had been killed in the war.’ Note also constructions like *mard-ī dīd-am (ke) dāšt rāh mī-raft* ‘man-INDEF see.PAST-1ST.SING (CONJ) hold.PAST. 3RD.SING road PROG-go.PAST.3RD.SING’ = ‘I saw a man (that) he was walking the road’ = ‘I saw a man who was walking along’).

The verb system is based on three stems: present, past, and perfect (perfect participle = past stem + suffix *-e*; e.g., *kon-*, *kard*, *kard-e* ‘do’). The infinitive is made from the past stem (*kard-an* ‘to do’). To these stems are added personal endings and modal prefixes. The personal endings of the present and past tenses are the same, with the exception of the 3rd singular, which has no ending in the past tenses.

The most obvious feature distinguishing New Persian from its ancestors is the loss of the split-ergative (e.g., MPers. *ras-īd b-ēm* ‘arrive-PAST be.PRES.1ST.SING’ = ‘I arrived,’ *ras-īd* ‘he arrived > NPers. *rasīd-am*, *ras-īd*; MPers. *man guft* ‘I.OBL say.PAST.3RD.SING’ = ‘I said’ > NPers. *gōft-am* ‘I did’; MPers. *ā-š guft* ‘then say.PAST.3RD.SING-he.ENCL.OBL’ = ‘then he said’ > NPers. *gōft* ‘he said’ [in colloquial the 3rd singular enclitic pronoun may be added, *gōft-eš* ‘he said’]).

The perfect and pluperfect are formed with the extended past stem (perfect participle) in *-e* (*gōft-ē-am* [colloquial *gōftām*] ‘I have/had said,’ *gōft-ē būd-am* ‘I had said’). Continuous tenses, including the perfect, take the prefix *mī-* (Class. Pers. also *hamē*). New progressive forms take the auxiliary *dār-* ‘hold’: *dār-am mī-rav-am* ‘hold.PRES-1ST.SING PROG-go.PRES.1ST.SING’ = ‘I am going, I am about to go.’

In Classical Persian the past tense takes the prefix *be-*, which in modern Persian is restricted to modal functions.

The future is formed with the verb *x^vāstan* ‘wish’ and with a short form of the infinitive (*x^vāh-ad boland šod* ‘future-3RD.SING tall become.SHORT-INF’ = ‘he is about to get up,’ different from *mī-x^vāh-ad boland be-šav-ad* ‘he wishes to get up’ with the subjunctive). This construction can also be used

to mean ‘be about to’ (colloquial *mī-xās bolan š-e* [*mī-x^vāst boland šav-ad*] ‘he was about to get up’).

The passive is formed with the auxiliary *šudan* ‘become’ (but MPers. ‘go’) and the perfect participle (*košt-e šod* ‘he was killed’). In earlier literature *āmadan* ‘come’ was often used instead of *šudan* (*nebešt-e mī-āmad* ‘it was written’).

Verbal system:

Present continuous: *mī-rav-am* ‘I go, I am going’

Present

subjunctive: *bé-rav-am* ‘(that) I go’

Past simple: *rāft-am* ‘I went’

Past continuous: *mī-raft-am* ‘I was going’

Perfect simple: *raft-ē-am* ‘I have gone’

Perfect continuous: *mī-raft-e-am* ‘I have (regularly) gone’

Pluperfect: *raft-ē būd-am* ‘I had gone’

Pluperfect

continuous: gone’

Future: *x^vāh-am raft* ‘I shall go’

Preverbs (local) are very common, and the meaning of the compound not always predicatable (e.g., *dāštan* ‘have, hold,’ *bar dāštan* ‘remove’). Verbal phrases are also very common, often comprising Arabic nouns and adjectives (e.g., *ettefāq* ‘incident’ + *oftādan* ‘fall’ = ‘happen’).

The local varieties of Persian have numerous variant forms, notably Afghan Dari and, especially, Tajik, which has been influenced by Turkic languages and has forms such as progressive present *karda-istoda-ast* ‘he is doing,’ inferential present *me-karda-ast* ‘he does (he says),’ presumptive *me-karda-gi-ast* ‘he appears to be doing, he probably does,’ etc.

Among syntactic features, we may note the following.

The *ezafe* construction can be used to connect extended qualifiers to head nouns, including prepositional phrases (*rāh-e be Qom* ‘the road to Qom’).

Passive constructions are agent-less (agents can only be expressed *ad hoc* in special phrases: *be-vasile-ye* ‘by means of,’ *az jāneb-e/šaraf-e* ‘from the side of,’ *be-dast-e* ‘at the hand of’).

The past continuous can express irrealis conditions (*agar mī-dān-est-am mī-gōft-am* ‘if CONT-know-PAST-1ST.SING, CONT-tell.PAST-1ST.SING’ = ‘if I knew, I would tell’; *agar mī-dān-est-am gōft-e būd-am* ‘if I knew, I would have told’; an alternative expression is *mī-dān-est-am ke mī-gōft-am* ‘did I know, then I would say’).

The conjunction *ke* is used in a variety of functions and combinations (*vaqt-ī ke* ‘the time that’ = ‘when’; *be-jā-ye in ke man be-gūy-am* ‘instead of this that I should say’ = ‘instead of my saying’). There is no

indirect speech (*goft [ke] man mī-rav-am* ‘he said [that]: “I am going” = ‘he said he was going’; *porsīd ke šomā be-kojā mī-rav-īd* ‘he/she asked: “you [PL], to-where are you going?” = ‘he asked where they were going’; *mī-x’āst be-dān-ad ke be-mān-am yā na* [SUBJ-stay.PRES-1ST.SING or not] ‘he wished to know: “should I stay or not?” = ‘he wished to know whether I would stay/he should stay’).

Persian, Old

E Tucker, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Old Persian was the native Iranian language of the Achaemenid Kings (522–330 B.C.), which they employed in their monumental inscriptions and foundation texts. Middle Persian and New Persian (Fārsī) are its direct descendants. Old Persian (OP) and Avestan together represent Old Iranian, that is, the earliest documented period of the Iranian language family, which is characterized by complex inflectional morphology inherited from the Indo-European parent language.

The remains of OP are not extensive, and most of the evidence belongs to the reigns of Darius I (522–486 B.C.) and his son Xerxes (486–465 B.C.). The later Achaemenids continued to compose short inscriptions in the same language, but there are indications that the spoken language was by this time evolving towards the Middle Persian stage. The meagre lexical data supplied by the OP texts is slightly enlarged by loanwords in the Persepolis Elamite Texts, Iranian words recorded by Greek authors, and Persian proper names in both literary and epigraphical sources from many areas of the ancient world.

Most Achaemenid inscriptions are trilingual, and the same text is repeated in Elamite, Akkadian, and OP. A simple form of cuneiform was invented to write OP, probably on the orders of Darius I, who wanted a Persian account of the events surrounding his own accession to accompany the relief and other texts at Mt. Bisitun in Media. There are 36 phonetic signs, including 3 for vowels; also 5 logograms, a set of numerals and a word divider. However, this specially devised writing system, which combines features of

an alphabet and a syllabary, renders the language only very imprecisely, and the interpretation of OP relies heavily on Avestan, Sanskrit and later Persian.

From an Indo-European perspective, OP shows the fundamental Indo-Iranian sound changes (IE **e, a, o, n, m* > *a*; **ē, ā, ō* > *ā*; IE labiovelars > velars, but palatals before an original front vowel; **s* > *š* after RUKI) and those changes that distinguish all Iranian languages from Indo-Aryan (**s* > *h* except before consonants; deaspiration of Indo-Iranian voiced aspirates; development of voiceless stops to spirants before consonants; dissimilation of dental clusters). Unlike Sanskrit, OP retains the Indo-Iranian diphthongs **ai*, **au* unchanged (OP *daiva-* ‘false god’, Av. *daēuua-*, Skt. *devá-*). IE **l*, **r* > OP *l*, and **l*, **r* probably > OP [ər], but the spelling is <a-r> initially, <-r> medially. Following a consonant **j*, **u* > OP *iy*, *uv* (OP *aniya-* ‘other’, Av. *añiia-*, Skt. *anyá-*).

Most notably, OP shows some SW Iranian dialect features. The outcome of the IE palatal stops **k̥*, **ǵ*, **ǵh* is represented by *ʒ*, *d*, *d*, probably all pronounced as spirants, in contrast to *s*, *z*, *z* in most Iranian languages (OP *viθ-* ‘(royal) household’, Av. *vīs-*, Skt. *viś-*; OP *drayah-* ‘sea’, Av. *zrayah-*, Skt. *jráyas-*; OP *dasta-* ‘hand’, Av. *zasta-*, Skt. *hásta-*). But IE **k̥u*, **ǵ(h)u* > OP *s*, *z* (OP *asa-* ‘horse’, Av. *aspa-*, Skt. *ásva-*), and **kn̥*, **ǵ(h)n* > *šn* (OP *baršnā* ‘in depth’). A series of changes result in new sibilants. IE **t̥j* > **θy* > OP *šiy* (OP *hašiya-* ‘true’, Av. *haiθiia-*, Skt. *satyá-*); IE **k̥w̥j*, **k̥j* > **cy* > OP *šiy* (OP *šiyau-* ‘to go’, Skt. *cyu-*); IE **tr* > **θr* > OP *ç* (possibly an affricate: OP *puça-* ‘son’, Av. *puθra-*, Skt. *putrá-*). Also IE **su*, **su* > **hu*, **hv* > OP *u*, *uv* (*ubārta-* ‘well-borne’, Skt. *súbhṛta-*). A number of words found in OP texts do not show the regular SW Iranian development (*vazrka-* ‘great’, *vīspa-* ‘all’, *xšāyaθiya-* ‘king’, etc.). They are traditionally

explained as loanwords from ‘Median’, but this is unverifiable.

Changes in OP final syllables have important consequences for inflectional morphology. Final **-t*, *-n*, *-h* are never written (*abara* for both **abarat*, **abaran* ‘he, they brought’, *pārsa* for **pārsah* ‘Persia’ nom. sg.); but syllables that ended in an original final vowel are treated differently, as both final **-a* and final **-ā* are written with an extra sign <-a>, probably indicating lengthening (*amariyatā* for **amariyata* ‘he died’; *pārsā* for **pārsā* instr. sg., and the same spelling for **pārsāt* abl. sg.).

OP nouns, adjectives, and pronouns inflect with three numbers (sg., dual and pl.) and there are three genders (masc., fem., neuter), but the eight inherited cases have been reduced to six. The forms of the Indo-Iranian dative have been lost and its functions taken over everywhere by genitive forms (*-ahyā*, *-ānām* in thematic stems, the most frequent type of nominal stem in OP). Ablative and instrumental have also merged; their inflections had become identical in the singular of nouns with vowel stems, but the demonstrative pronouns/pronominal adjectives possess a characteristic instrumental singular in *-nā* (*avanā*, ‘with/from that’). In feminine *ā*-stems, most of the singular cases have also become formally identical (gen.-dat., instr.-abl., locative, all in *-āyā*). The inflection of other stem-types is only partially attested, but some forms are remarkable (e.g., nom. sg. *pitā* ‘father’, gen.-dat. sg. *piça* < **pitrah*; from n-stems, acc. sg. *asmānam* ‘sky’).

The OP verb distinguishes three persons, three numbers; active and middle voices (but passive is expressed by a particular type of present stem in *-ya-* with active endings); and indicative, imperative, subjunctive and optative moods. Its tense system normally consists of a simple opposition between present and preterite forms based on the same stem, continuing inherited present vs. imperfect (*baratiy* ‘bears’, *abara* ‘bore’). Aorists and perfects are only preserved as relic forms, sometimes with a particular function (the sole perfect, *caxriyā*, is a perfect optative with irrealis value). The inherited augment *a-* is prefixed to all verb forms that indicate past time, including two that are formally optatives and indicate a habitual past action (*akunavaya(n)tā* ‘they would do’, *avājanīyā* ‘he used to kill’).

A new type of periphrastic past is built by means of the inherited past participle passive. It is intransitive (*paraitā* ‘they went off’) or passive (*haya idā krtā* ‘which was made here’). The agent is genitive-dative (*manā krtam* ‘done by me’ = ‘I did / have done’; *tayamaiy piça krtam āha* ‘what had been done by my father’). This construction is the ancestor of the Middle Persian past tense (*man kard* ‘I did’) and that of most New Iranian languages. The ppp. was also used in a construction with finite forms from root *kar-* ‘to do, to make’, which developed a potential value (*yātā krtam akunavam* literally ‘until I did it done’ = ‘until I succeeded in doing it’) and corresponds to the potentialis in Sogdian and Khotanese. The OP infinitive in *-tanaīy* is unparalleled elsewhere in IE, but is continued by the later Persian infinitive in *-tanl-dan*.

OP has a relative pronoun *haya-ltaya-* that originated from a combination of the IE demonstrative **so*, *sā*, *tod* and the IE relative stem **yo-*, which were employed in correlative clauses in Indo-Iranian. In addition, this pronoun is used to connect qualifiers in a manner that prefigures the Persian *ezafe* (*Gaumāta haya maguš* ‘Gaumāta the Magian’). The inscriptions (particularly Bisitun) also abound in paratactic constructions of the type: *vašnā Auramazdāha Tigrām viyatarayāmā avadā avam kāram tayam Nadi(n)tabairahyā ajanam vasiy Āçiydiyahya māhyā XXVI raucabiš ðakatā āha avāðā hamaranam akumā* ‘By the will of Auramazdā we crossed the Tigris, there I defeated utterly that army of Nidintu-Bēl, of the month Āçiyādiya 26 days were passed, then we made battle’.

Phoenician

J A Hackett, Harvard University, Cambridge, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Phoenician is a member of the Canaanite branch of the Northwest Semitic languages, closely related to Hebrew, Moabite, Ammonite, and Edomite. Phoenician was spoken both in the Levantine homeland and in the widespread Mediterranean colonies of the Phoenician commercial empire. Phoenicia itself is generally defined as the 60-mile long and 30-mile wide land area, from Acco to Tell Sukas south to north, and from the Mediterranean to the Lebanon Mountains, west to east (that is, the coast of modern Lebanon and part of the coast of modern Israel). It is scholarly convention to refer to this strip of land as Phoenicia after ca. 1200 B.C., the beginning of the Iron Age in the Levant. The ‘Sea Peoples’ (e.g., the Philistines) had forced the withdrawal of Egypt from ancient Canaan and had taken over the southern coastal region from them. The Sea Peoples do not seem to have carried their war to the northern coastal region, however, and so once the area was free of Egyptian control, the northern coastal cities became autonomous. They were never a single political entity, ‘Phoenicia,’ but rather a group of individual cities, although at any given time, one city was generally dominant over the others. The ancient Phoenician cities include Tyre, Sidon, Byblos, Beirut, Sarepta, and Arwad. The people of Phoenicia called themselves Canaanites or referred to themselves as the citizens of their particular city.

Again, by scholarly convention, we refer to the language of the inscriptions found in the cities along this coastal strip as ‘Phoenician’ from ca. 1200 B.C. onward, although the first inscriptions of any length unearthed so far date to ca. 1000. In fact, 10th-century Byblian inscriptions are written in a dialect slightly different from the Standard Phoenician of the rest of these inscriptions, but they are recognizably Phoenician all the same. 12th–11th century inscriptions that might also represent writing by Phoenicians are fragmentary or have not been found *in situ*, so that classification is difficult and dating must be paleographic: bronze arrowheads, for instance, probably from the Beqac Valley between the Lebanon and Antilebanon mountains, that are inscribed with personal names; inscribed clay cones from Byblos, also bearing personal names; the Nora fragment with parts of four words, written boustrophedon.

The alphabet and language of Phoenician inscriptions were the subject of scholarly debate already in the 18th century; by mid-century, both language and

alphabet were reasonably well deciphered. The texts are for the most part royal, funerary, or votive. They have been found in Syria as well, and all over the Mediterranean area: Asia Minor, Egypt, Greece, Spain, Cyprus, Sicily, Sardinia, Malta, Rhodes, the Balearic Islands. Punic, the dialect of the Phoenician colony at Carthage and of its own far-flung trading empire, is a development from Phoenician (Carthage – *Qart-hadasht or ‘New Town’ – was founded by Tyrians in the late 9th or early 8th century B.C.), and Punic inscriptions date from the 6th century B.C. until 146 B.C., when Carthage was destroyed by the Romans. After 146, Punic inscriptions are referred to as Neopunic, although it is the script that changes noticeably rather than the language. These late Punic inscriptions continue until the 4th–5th centuries A.D., when Latino–Punic inscriptions are attested. Punic inscriptions are known to us from all over North Africa, from the islands of the Mediterranean, and from France and Spain. The majority of the known Punic inscriptions are the hundreds of child-sacrifice votive inscriptions from North Africa.

Phoenician inscriptions are written in the Phoenician alphabet and until late Punic times are written entirely consonantly, so the vocalization of the language is reconstructed from comparative linguistics and from the few outside sources that include Phoenician words: for instance, Hebrew, Assyrian, Babylonian, and Greek writings (the Phoenician in these sources is mostly personal names), and the *Poenulus* of Plautus, which includes some passages in garbled Punic. In late Punic, there are sporadic uses of vowel letters (called *matres lectionis*, ‘mothers of reading’): *ʿaleph* to represent [ē] and [o], for instance, and *ayin* to represent [a].

Nominals in Phoenician are marked for gender and number (singular and plural, with rare duals) and occur in two ‘states’: the absolute (unbound) state and the bound state. The bound state is used for initial members of genitive chains called construct chains and for nouns before pronominal possessive suffixes. There is a definite article in Phoenician, initial *h-* plus doubling of the next consonant, as in Biblical Hebrew.

Several shifts in vowel pronunciation can be traced through the history of the language. The movement from [*ā] to [ō] between Proto-Northwest Semitic and Proto-Canaanite is known as the ‘Canaanite shift’; a later shift, occurring at least by the 8th century B.C., is the ‘Phoenician shift’: accented /a/ in originally open syllables becomes /o/. The diphthongs *-aw and *-ay collapse in Phoenician to [ō] and [ē], respectively. The [ō] < *-aw and the [ō] from the

Canaanite shift (*[ā]) merge, and by late Punic have become [ū]; this later shift is part of a proposed chain that sees *[u] pronounced [ū] or [i].

The verbal system of Phoenician follows the general Central Semitic pattern: a perfective *qatal* (> [qatol]) suffix conjugation; an imperfective *yaqtul* prefix conjugation; an imperative; active and passive participles; an infinitive (called the infinitive construct); and Phoenician uses (especially seen in the 8th-century Karatepe inscription from Asia Minor) the so-called infinitive absolute, actually an adverb, to represent any verb form needed in context, for instance imperative, or future or past tense.

Phoenician uses V-S-O word order in verbal clauses and makes much use of nominal or 'verbless' clauses. The verbal stems include the G stem (the *Grundstamm* or basic verb); the N stem, with prefixed *-n-*, which is passive/reflexive; the D 'intensive' stem (called D because the middle root consonant is doubled); the C or causative stem, called *Yiphil* because of the *y-* prefix; plus Gt and tD reflexive stems. There is also evidence of internal passives within the G, D, and C stems.

Pictish

W Nicolaisen, University of Aberdeen, Aberdeen, UK

© 2006 Elsevier Ltd. All rights reserved.

Pictish was the language spoken by the Picts, inhabitants of the northeast of Scotland, roughly from the Forth-Clyde line to the Cromarty Firth, but possibly also further afield, including the Northern and Western Isles, from the early centuries A.D. until the middle of the 9th century when, as the result of the merger of the kingdoms of the Scotti and the Picti under Kenneth MacAlpine, it was replaced by Gaelic, which had reached Scotland from Ireland from approximately 500 A.D. onward. The Picts were known as *Picti* (or *Pecti*) to the Roman military, who interpreted their name in Latin terms as cognate with *pictus* 'painted'.

They were referred to by the neighboring Anglo-Saxons as *Pehtas*, *Pihtas*, *Pyhtas*, *Peohtas*, or *Piohtas*; by the Norsemen as *Péttar* or *Péttir* (as in *Pétlandsfjörðr* 'the Pentland Firth'); and in Middle Welsh as *Peith-wyr*, but it is not known what they called themselves. No sentence in their language has been recorded, and our main sources for Pictish are king lists, inscriptions, and, particularly, place names.

The nature and linguistic affiliation of Pictish has attracted attention for a long time, and this scholarly, and sometimes not so scholarly, pre-occupation with the language(s) of the Picts has led to a comparative neglect of other aspects of Scottish linguistic history and prehistory, especially when it comes to the analysis and interpretation of early place names. As far as Pictish is concerned, however, the fascination for its linguistic status has resulted in a large variety of

theories that have been offered, and often seriously defended, right to our own time. As recently as 1998, for example, Paul Dunbavin regarded the Picts as Finno-Ugric immigrants from the Baltic coast, basing his revolutionary conclusion, among other arguments, on the apparent derivation of certain Scottish river names, mentioned by Ptolemy about 150 A.D., from certain Finnish topographic terms. Apart from the absence of any documentary reference to Finno-Ugric people in Pictland, the proposed etymologies suffer from the frequently encountered flaw in such studies, the superficial equation of spellings reported almost 2000 years ago with modern forms of words in an otherwise unconnected language.

Whereas Dunbavin used toponymic, especially hydronymic, materials to support his proposal, Harald V. Sverdrup (1995), in the course of classifying and translating Pictish inscriptions, claimed “that it can be shown . . . that [Pictish] was neither a Celtic nor an Indo-European language but was distantly related to Caucasian languages,” dating the arrival of the initial settlers to the paleolithic transition before 7000 B.C. This would predate by several thousand years any other known nonmaterial evidence, including place names. It is the presumed enigmatic nature of Pictish that has led Sverdrup to the underlying readings, classification, and translation of the inscriptions.

A considerably earlier perception of Pictish as a non-Indo-European language comes from John Rhys, who in 1892, after discounting the Ugro-Finnish people (Lapps, Finns, and Estonians) and the Ligurians, felt “logically bound to inquire what Basque can do to help us to an understanding of the Pictish inscriptions.” However, 6 years later he revised his own theory by making it known that he no longer thought Pictish was related to Basque but rather to pre-Indo-European (although not as old as the neolithic or mesolithic periods) that first came under p-Celtic influence from the Cumbrians south of the Forth-Clyde line. This change of direction did not stop J. B. Johnston, maintaining in 1934 his view (first expressed in 1892) that the river Urr in southwest Scotland derives from the Basque *ur* ‘water’, from falling into the same trap as Dunbavin.

One of the most outspoken opponents of a Celtic interpretation of the Pictish inscriptions was the Irish archeologist R. A. S. Macalister, who in 1922 expressed the view: “The most reasonable theory about the Picts was that they were survivals of the aboriginal pre-Celtic Bronze Age people. Certainly no attempt at explaining the Pictish inscriptions by means of any Celtic language could be called successful.” John Fraser, too, held in 1927 that, having

arrived before the Scots and the Britons, they must at one time have spoken a non-Indo-European language, although he took into account the later influence of (Scots) Gaelic and Brittonic.

Advocates for a non-Indo-European and often specifically of an anti-Celtic designation of Pictish represented a wide, fragmented variety of linguistic affiliations. In contrast, the pro-Celtic camp was divided into two opposing groups: those who regarded it as a q-Celtic language and those who regarded it as a p-Celtic language. Following such illustrious predecessors as George Buchanan (1582) and James Macpherson of Ossian fame (1763), Francis J. Diack (1944) was one of the strongest proponents of an uninterrupted Gaelic history of Scotland from the 1st century until today; the Gaelic nature of Pictish was asserted as recently as 1994 by Sheila McGregor.

The p-Celtic school also has a respectable pedigree in William Camden (1586) and Father Innes (1729). W. F. Skene (1868) declared Pictish to be neither Welsh nor Gaelic but “a Gaelic dialect partaking largely of Welsh forms.” One of the first scholars to put the p-Celtic nature of Pictish on a sound footing was Alexander Macbain (1891–1892) in his survey of ‘Ptolemy’s geography of Scotland’; his stance was strongly supported by W. J. Watson (1904, 1921, 1926), mainly on the basis of place-name evidence. This is also at the heart of Kenneth H. Jackson’s (1955) overview of ‘The Pictish language,’ in the course of which he presents the first maps of linguistic Pictland based on the distribution of such place-name elements as *pett* (Pit-), *aber*, *carden*, *lanerc*, *pert*, and *pevr*. He also suggested, however, that there may have been two Pictish languages, one the language of the pre-Indo-European inhabitants, the other the Gallo-Brittonic tongue of Iron Age invaders. W. F. H. Nicolaisen acknowledged the presence of non- or pre-Indo-European place names in Pictish territory, but did not regard them as Pictish. In her repudiation of Jackson’s two Pictishes, in her thorough investigation of *Language in Pictland*, Katherine Forsyth (1997), a specialist in Ogham inscriptions, mustered some very persuasive arguments against Jackson’s construct and, although it is always risky to call anything ‘definitive,’ her conclusion that the Picts were “as fully Celtic as their Irish and British neighbors” is difficult to dispute, and it is good to see Pictish placed where it belongs beside other p-Celtic languages such as Cumbric, Welsh, Cornish, Breton, and Gaulish; by implication, the firm ascription of Pictish in this linguistic grouping adjudges the Scotti to have brought the Gaelic language with them from Ireland, a consequence of fundamental importance in a long-running debate.

Pidgins and Creoles

S Romaine, Oxford University, Oxford, UK

Definitions

European colonization during the 17th to 19th centuries created a classic scenario for the emergence of new language varieties called pidgins and creoles out of trade between the native inhabitants and

Europeans. The term 'pidgin' is probably a distortion of English *business* and the term 'creole' was used in reference to a nonindigenous person born in the American colonies, and later used to refer to customs, flora, and fauna of these colonies. Many pidgins and creoles grew up around trade routes in the Atlantic or Pacific, and subsequently in settlement colonies on plantations, where a multilingual work force comprised of slaves or indentured immigrant laborers needed a common language. Although European

colonial encounters have produced the most well known and studied languages, there are examples of indigenous pidgins and creoles predating European contact such as Mobilian Jargon (Mobilian), a now extinct pidgin based on Muskogean (Muskogee), and widely used along the lower Mississippi River valley for communication among native Americans speaking Choctaw, Chickasaw, and other languages (see *Mobilian Jargon*).

The study of pidgins and creoles raises fundamental questions about the evolution of complex systems, since pidgins, in particular, have been traditionally regarded as simple systems *par excellence*. The usual European explanation given for the simplicity, and lack of highly developed inflectional morphology in particular, was that it reflected primitiveness, native mental inferiority, and the cognitive inability of the natives to acquire more complex European languages. Thus, for example, Churchill (1911: 23) on Bislama, the pidgin English spoken in Vanuatu: “the savage of our study, like many other primitive thinker, has no conception of being in the absolute; his speech has no true verb ‘to be’” (see *Bislama*).

Hampered by negative attitudes for many years, scholars ignored pidgins and creoles in the belief that they were not ‘real’ languages, but were instead bastardized, corrupted, or inferior versions of the European languages to which they appeared most closely related. Although scholars still do not agree on how to define pidgins and creoles, or the nature of their relationship to one another, most linguists recognize such a group of languages, whether defined in terms of shared structural properties and/or socio-historical circumstances of their genesis. Striking similarities across pidgin and creole tense-mood-aspect (TMA) systems were noted by some of the earliest scholars in the field such as Hugo Schuchardt, generally regarded as the founding father of creole studies. TMA marking became a focal point of debate among creolists as a result of the bioprogram hypothesis (Bickerton, 1981, 1984), according to which creoles held the key to understanding how human languages originally evolved many centuries ago. This theory led not only to an increase in research on these languages, but also a great deal of attention from scholars in other fields of linguistics, such as language acquisition and related disciplines such as cognitive science.

Classifying Pidgins and Creoles

The standard view that pidgins and creoles are mixed languages with the vocabulary of the superstrate (also called the lexifier or base language) and the grammar of the substrate (the native languages of the groups in

contact) has been the traditional basis for classifying these languages according to their lexical affiliation. English-lexicon pidgins and creoles such as Solomon Islands Pijin spoken in the Solomon Islands or Jamaican Creole English (Southwestern Caribbean Creole English) in Jamaica comprise a group of languages with lexicons predominantly derived from English. Haitian Creole French and Tayo, a French creole of New Caledonia, are French-lexicon creoles drawing most of their vocabulary from French. Such groupings are, however, distinctly different from the genetically-based language families established by the comparative historical method. Pidgins or creoles as a group are not genetically related among themselves, although those with the same lexifier usually are.

There is a great deal of variation in terms of the extent to which a particular pidgin or creole draws on its lexifier for vocabulary, and a variety of problems in determining the sources of words, due to phonological restructuring. Compare the lexical composition of Sranan and Saramaccan, two of six English-lexicon creoles spoken in Surinam, in what was formerly the Dutch-controlled part of Guyana. About 50% of the words in Saramaccan are from English (e.g., *wáka* ‘walk’), 10% from Dutch (e.g., *strei* ‘fight’ < strijd), 35% from Portuguese (e.g., *disá* ‘quit’ < deixar), and 5% from the African substrate languages (e.g., *totómbotí* ‘woodpecker’. By contrast, only 18% of Sranan words are English in origin, with 4.3% of African origin, 3.2% of Portuguese, 21.5% of Dutch; 4.3% could be derived from either English or Dutch. Innovations comprise another 36%, and 12.7% have other origins. African words are concentrated in the semantic domains of religion, traditional food, music, diseases, flora, and fauna. Words from the other languages do not concentrate in particular semantic domains. Numbers, for instance, draw on both English and Dutch. Sranan and Saramaccan are not mutually intelligible, and neither is mutually intelligible with any of the input languages. Other languages show a more equal distribution between two main languages, such as Russenorsk, a pidgin once spoken along the Arctic coast of northern Norway from the 18th until the early 20th century. Its vocabulary is 47% Norwegian, 39% Russian, 14% other languages including Dutch (or possibly German), English, Saami, French, Finnish, and Swedish (see *Russenorsk*).

Many creoles, like Lesser Antillean (Lesser Antillean Creole French), a French-based creole spoken in the French Antilles, started out with a far more mixed lexicon than they possess today. Where contact with the main European lexifier was permanently terminated, as in Surinam, the lexicon retains a high degree of mixture to the present day; where such contact

continued, as in the Lesser Antilles, items from the main lexifier tended gradually to replace items from other sources. Depending on the circumstances, a creole may adopt more items from the superstrate language due to intense contact. In Tok Pisin spoken in Papua New Guinea, some of the 200 German elements as well as words from indigenous languages, are now being replaced by English words. Thus, *beten* (German 'pray') is giving way to English *pre*, and Tolai (Kuanua) *kiau* to English 'egg' (see **Tok Pisin**).

Relationships between Pidgins and Creoles

The question of the genetic and typological relationship between pidgins and creoles and the languages spoken by their creators continues to generate controversy. Pidgins and creoles challenge conventional models of language change and genetic relationships because they appear to be descendants of neither the European languages from which they took most of their vocabulary, nor of the languages spoken by their creators. The conventional view of the languages and their relationship to one another found in a variety of introductory texts (Hall, 1966; Romaine, 1988) has been to assume that a pidgin is a contact variety restricted in form and function, and native to no one, which is formed by members of at least two (and usually more) groups of different linguistic backgrounds, e.g., Krio in Sierra Leone (see **Krio**). A creole is a nativized pidgin, expanded in form and function to meet the communicative needs of a community of native speakers, e.g., Haitian Creole French.

This perspective regards pidginization and creolization as mirror image processes and assumes a prior pidgin history for creoles. This view implies a two-stage development. The first involves rapid and drastic restructuring to produce a reduced and simplified language variety. The second consists of elaboration of this variety as its functions expand, and it becomes nativized or serves as the primary language of most of its speakers. The reduction in form characteristic of a pidgin follows from its restricted communicative functions. Pidgin speakers, who have another language, can get by with a minimum of grammatical apparatus, but the linguistic resources of a creole must be adequate to fulfill the communicative needs of human language users.

The degree of structural stability varies, depending on the extent of internal development and functional expansion the pidgin has undergone at any particular point in its life cycle. Creolization can occur at any stage in the development continuum from rudimentary jargon to expanded pidgin. If creolization occurs at the jargon stage, the amount of expansion will

be more considerable than that required to make an expanded pidgin structurally adequate. In some cases, however, pidgins may expand without nativization. Where this happens, pidgins and creoles may overlap in terms of the structural complexity, and there will be few, if any, structural differences between an expanded pidgin and a creole that develops from it. Varieties of Melanesian Pidgin English (a cover term for three English-lexicon pidgins/creoles in the southwest Pacific comprising Tok Pisin, Solomon Islands Pijin and Vanuatu Bislama) are far richer lexically and more complex grammatically than many early creoles elsewhere. Their linguistic elaboration was carried out primarily by adult second language speakers who used them as lingua francas in urban areas. Creolization is thus not a unique trigger for complexity, and the 'same' language may exist as both pidgin and creole.

Debate continues about the role of children vs. adults in nativization and creolization. Other scholars have emphasized the discontinuity between creoles and pidgins on the basis of features present in certain creoles not found in their antecedent pidgins. They argue that ordinary evolutionary processes leading to gradual divergence over time may not be applicable to creoles. Instead, creoles are 'born again' nongenetic languages that emerge abruptly *ab novo* via a break in transmission and radical restructuring (Thomason and Kaufman, 1988).

Origins

Because pidgins and creoles are the outcome of diverse processes and influences in situations of language contact where speakers of different languages have to work out a common means of communication, competing theories have emphasized the importance of different sources of influence. Few creolists believe that one theory can explain everything satisfactorily, and there are at least four theories accounting for the genesis of creoles: substrate, superstrate, diffusion, and universals.

Substrate

The substrate hypothesis emphasizes the influence of the speakers' ancestral languages. Structural affinities have been established between the languages of West Africa and many of the Atlantic creoles. Scholars have also documented substantial congruence between Austronesian substratum languages (see **Austronesian Languages**) and Pacific pidgins as compelling evidence of the historically primary role of Pacific Islanders in shaping a developing pidgin in the Pacific. Substrate influence can be seen in the pronominal systems of Melanesian Pidgin English

such as the personal pronouns in Tok Pisin. The forms are rather transparently modeled after English, yet incorporate grammatical distinctions not found in English, but widely present in the indigenous languages forming the substrate.

| Personal pronouns in Tok Pisin | | | |
|--------------------------------|-----------------------|--------------------------------|------------------------------|
| | singular | plural | |
| first person | <i>mi</i> 'I' | <i>mipela</i> 'we' (exclusive) | <i>yumi</i> 'we' (inclusive) |
| second person | <i>yu</i> 'you' | <i>yupela</i> 'you' | |
| third person | <i>em</i> 'he/she/it' | <i>ol</i> 'they' | |

Almost all Oceanic languages distinguish between inclusive (referring to the speaker and addressee(s), 'I + you') and exclusive first-person pronouns (referring to the speaker and some other person(s), 'I + he/she/it/they'). Thus, *yumi* consists of the features [+speaker, +hearer, +other] and *mipela*, [+speaker, -hearer, +other]. There are also dual and trial forms, e.g., *yumitupela* 'we two (inclusive)', i.e. [+speaker, +hearer, -other], *mitripela* 'we three (exclusive)', etc., although these distinctions are not always made consistently. As English provides no lexical forms for the inclusive/exclusive and dual distinctions or *you* plural, these are created by forming a compound from *you* + *me* to give *yumi* and *yumitupela*, and by using the suffix-*pela* ('fellow') to mark plurality in *yupela*. The third-person singular form *em* is derived from the unstressed third person singular *him* and the third person plural form *ol* from *all*.

A more controversial variant of the substrate hypothesis is incorporated into the notion of relexification, a process that applies to the words/structures of substrate language and matches them with phonological representations from the lexifier language. Haitian Creole French *gade* shares some meanings with the French verb *garder* 'to watch over/take care of/to keep', from which it derives its phonetic form, but it has an additional meaning 'to take care of/defend oneself'. The semantics of *gade* is very similar to that of the substrate Fongbe (Fon-Gbe) verb *kpón* 'to watch over/take care of/to keep/to look'. Haitian Creole French *gade* also means 'to look', while in French that meaning is expressed by *regarder*. These similarities have led some scholars to regard Haitian Creole French as a French relexification of African languages of the Ewe-Fon (or Fongbe) group (Lefebvre, 1998).

Superstrate

The superstrate hypothesis traces the primary source of structural features to nonstandard varieties of the lexifiers, and to evolutionary tendencies already observable in them (Chaudenson, 1992). According to this scenario, early plantation slaves acquired a

normally transmitted variety of the lexifier directly from Europeans, but this imperfectly acquired variety was subsequently diluted over time as successive generations of slaves learned from other slaves rather than from Europeans. Creoles thus represent gradual continuous developments with no abrupt break in transmission from their lexifiers. This evidence eliminates the assumption of a prior pidgin history and accepts creoles as varieties of their lexifiers rather than as special or unique new languages. That is, there are no particular linguistic evolutionary processes likely to yield (prototypical) creoles; they are produced by the same restructuring processes that bring about change in any language. Creoles are neither typologically nor genetically unique, but 'advanced varieties' of the lexifiers.

Linguistic evidence supporting this hypothesis can be found in morphemes or constructions chosen for specific grammatical functions that start from models available in the lexifiers. Haitian Creole French *m pu alle* 'I will go' may not be a totally new and radical departure from French but could instead be derived from regional French *je suis pour aller*.

Diffusion

Another explanation for some of the similarities among pidgins and creoles is diffusion of a pre-existing pidgin. According to this hypothesis, a pre-existing English or French pidgin was transplanted from Africa rather than created anew independently in each territory. Support for this hypothesis can be found in historical evidence that sailors diffused not only words with nautical origins from one part of the world to another, but also items that were more generally part of regional and nonstandard usage. Thus, *capsize* was probably originally a nautical term meaning 'to overturn a boat'. Today, *kapsaitim* in Melanesian Pidgin English means 'to spill or overturn anything'. Traders, missionaries, and early settlers were also responsible for diffusing certain elements. Words from Portuguese such as *savvy* (<*sabir* 'to know/understand', first attested in 1686) are found widely around the world. Scholars have traced the paths of diffusion of so-called worldwide features found in Anglophone pidgins and creoles from the Atlantic to Pacific (Baker and Huber, 2001). Words from indigenous languages are also widespread, e.g., African *nyam* 'eat/food' and Hawaiian *kanaka* 'person/man', a term that came to be used, often derogatorily, to refer to Pacific Islanders.

Universals

This theory actually comprises a variety of sometimes opposing viewpoints because universals have been

conceived of in a variety of ways within different theoretical perspectives. Its central assumption is that creoles are more similar to one another than the languages to which they are otherwise most closely related due to the operation of universals. Although it has become fashionable to refer to a common creole syntax or creole prototype, not all creolists agree on the nature or extent of the similarities or the reasons for them. If creoles form a synchronically definable class, then there should be more similarities between Haitian Creole French and Guyanese Creole English than between Haitian Creole French and French, or between Guyanese Creole English and English. One kind of universalist claim is that creoles reflect more closely universal grammar and the innate component of the human language capacity. Another, however, is grounded within a different notion of universals derived from crosslinguistic typology and theories of markedness. The observation that creoles tend to be isolating languages even when the contributing languages show a different typology has a long history predating modern typological theories. Kituba, for example, emerged almost exclusively from contact among Bantu languages that are agglutinative.

The notion of creoles as the simplest instantiation of universal grammar is at the heart of Bickerton's (1981) bioprogram hypothesis, which applies to radical creoles, i.e., those that have undergone a sudden creolization without further major superstrate influence. It is based to a large extent on similarities between Hawai'i Creole English, Guyanese Creole English, Haitian Creole French, and Sranan. Evidence from Hawai'i Creole English has been the cornerstone of the bioprogram because creolization has been more recent there than in many other cases, and because the language lacked an African substrate, yet was strikingly similar to other creoles (see **Hawaiian Creole English**). This similarity is explained by assuming that creoles represent a retrograde evolutionary movement to a maximally unmarked state.

Bickerton (1981) proposed a list of 13 features shared by creoles that were not inherited from the antecedent pidgins, and therefore must have been created by children as a result of the bioprogram.

1. Focused constituents are moved to sentence initial position, e.g., Haitian Creole French *se mache Jan mache al lekòl* 'John walked to school'.
2. Creoles use a definite article for presupposed specific noun phrases, indefinite articles for asserted specific noun phrases, and zero for nonspecific noun phrases. Hawai'i Creole English uses definite article *da* for presupposed specific noun phrases, e.g., *she wen go with da teacher* 'she

- went with the teacher', indefinite article *one* typically for first mention, e.g., *he get one white truck* 'he has a white truck', and no article or maker of plurality for other noun phrases, e.g., *young guys they no get job* 'Young people don't have jobs'.
3. Three preverbal morphemes express tense (anterior), mood (irrealis), and aspect (durative) in that order, e.g., Haitian Creole French *li te mache* 'he walked', *l'av(a) mache* 'he will walk', *l'ap mache* 'he is walking'.
4. Realized complements are either unmarked or marked with a different form than the one used for unrealized complements, e.g., Mauritian Creole French (Morisyen) *il desid al met posòb ladah* 'she decided to put a fish in it' vs. *li ti pe ale aswar pu al bril lakaz sa garsòb-la me lor sime ban dayin lin atake li* 'He would have gone that evening to burn the boy's house, but on the way he was attacked by witches'.
5. Creoles mark relative clauses when the head noun is the subject of the relative clause, e.g., Hawai'i Creole English *some they drink make trouble* 'Some who drink make trouble'.
6. Nondefinite subjects, nondefinite verb phrase constituents, and the verb must all be negated in negative sentences, e.g., Guyanese Creole English *non dag na bait non kyat* 'no dog bit any cat'.
7. Creoles use the same lexical item for both existentials and possessives, e.g., Hawai'i Creole English *get one wahine she get one daughter* 'There is a woman who has a daughter'.
8. Creoles have separate forms for each of the semantically distinct functions of the copula (i.e., locative and equative), e.g., Sranan *a ben de na ini a kamra* '(s)he was in the room.' vs. *mi na botoman* 'I am a boatman'.
9. Adjectives function as verbs, e.g., Jamaican Creole English *di pikni sik* 'the child is sick'. This function explains the absence of the copula in this construction.
10. There are no differences in word order between declaratives and questions, e.g., Guyanese Creole English *i bai di eg dem* means 'he bought the eggs' or 'did he buy the eggs?', depending on intonation.
11. Questions particles are optional and sentence final, e.g., Tok Pisin *yu tok wanem?* 'what did you say'. Question words are often bimorphemic, e.g., Haitian Creole French *ki kote* 'where' (French *qui côté* 'which side'), and Tok Pisin *wanem* 'which/what' (English *what name*).
12. Formally distinct passives are typically absent, e.g., Jamaican Creole English *dem plaan di tree* 'they planted the tree' vs. *di tree plaan* 'the tree was planted'.

13. Creoles have serial verb constructions in which chains of two or more verbs have the same subject, e.g., Nigerian Pidgin English (Pidgin, Nigerian) *dem come take night carry di wife, go give di man* 'They came in the night and carried the woman to her husband'.

There are also many similarities in the source morphemes used by creoles to express these distinctions. The semantics of the grammatical morphemes are highly constant as are their etymologies; in almost all cases, they are drawn from the superstrate language. The indefinite article is usually derived from the numeral 'one', the irrealis mood marker from a verb meaning 'go', the completive marker from a verb meaning 'finish', the irrealis complementizer from a reflex of 'for', etc.

Support for the uniqueness of these features to creoles is, however, weakened by the existence of some of the same traits in pidgins as well as in the relevant substrates and superstrates. The relexification hypothesis argues that the typological traits of Haitian Creole French display more in common with those of the substrate language Fongbe than with French. If so, then the supposed creole typology results from the reproduction of substratum properties rather than from the operation of universals. Bimorphemic question words are also found in many of the African substrate languages, and English has *what time* 'when', *how come* 'why', etc. It is also well within the norms of colloquial French and English to use intonation rather than word order to distinguish questions from declaratives, e.g., *you're doing what?* The absence of passives may also reflect the lack of models in some of the substrate and superstrate languages.

Closer study of the particulars of individual TMA systems in creole languages has engendered increasing dissatisfaction with the bioprogram hypothesis (Singler, 1990). For one thing, the claims were originally formulated on the basis of data from creoles whose superstrate languages are Indo-European. Secondly, it is also unclear how much creole TMA systems might have changed over time after creolization. The bioprogram assumes that the creoles in question have not departed from their original TMA prototype and that the present day systems provide evidence of relevance for its operation. Thirdly, even the defining languages do not conform entirely to predictions on closer examination. The TMA system of Hawai'i Creole English is not crosslinguistically unique or even unusual; the overwhelming majority of its TMA categories are common in languages of world (Velupillai, 2003). More detailed investigations of historical evidence indicate that Bickerton's

scenario of nativization bears little resemblance to what actually happened in Hawai'i (Roberts, 2000).

The typology of creoles might also be largely a result of parameter settings typical of languages with low inflectional morphology. Thus, features such as preverbal TMA markers, serial verbs, and SVO word order fall out more generally from lack of inflections and unmarked parametric settings. McWhorter (1998) attempts to vindicate creoles as a unique typological class by proposing a diagnostic test for 'creolity' based not on specific shared structural features such as TMA markers, serial verbs, etc., but on a combination of three traits resulting from a break in transmission: little or no use of inflectional affixation, little or no use of lexical tone, and semantically regular derivational affixation. McWhorter's explanation for why these traits cluster essentially reiterates the conventional assumption that pidgins are languages that have been stripped of all but the bare communicative necessities in order to speed acquisition. Because creoles are new languages that emerge from pidgins, they have not had the time to develop many of the complexities found in other languages that have developed gradually over a much longer time period. Thus, he predicts that features such as ergativity, a distinction between alienable and inalienable possession, switch reference marking, noun class or grammatical gender marking, etc. will never be found in creoles. This theory means that not only are creoles typologically unique, but also that they are the simplest languages. Those who stress the role of substrate influence and relexification, however, have argued that the reason why these features do not surface in creoles even where they are present in the substrate is because there are no appropriate phonetic strings in the superstrate to match them with.

The question of how to measure simplicity and complexity is theory-dependent and therefore controversial. McWhorter's (2001) complexity metric is based on degree of overt signalling of various phonetic, morphological, syntactic, and semantic distinctions. From this perspective, a phonemic inventory can be considered more complex if it contains more marked members than some other. Markedness is interpreted in terms of frequency of representation among the world's languages. Ejectives and clicks are more marked than ordinary consonants because they occur less frequently. The presence of rarer sounds in an inventory also presupposes the existence of more common or less marked ones. However, there may be other dimensions of simplicity/complexity to consider, such as syllable/word structure. Much less is known about the phonology of pidgins and creoles than about their syntax and lexicon. Syntax

is rendered more complex by the additional of rules that make it more difficult to process, e.g., different word orders for main and subordinate clauses. Inflectional marking is assumed to be more difficult than the use of free morphemes. However, there is no universally accepted account of syntactic rules nor an agreed theory of processing. Semantically, creoles are more transparent and adhere more closely to the principle of one form–one meaning.

There are problems with this view too, because creoles do not share their features universally or exclusively. There are examples of noncreole languages with the assumed typical creole-like features, and some examples of languages with no known creole history that are less complex than some creoles. Given that language change may also lead to simplification, some languages that are older than creoles may also be less complex than creoles. Similarities among creoles may be the result of chance similarities among unrelated substrates. Although the absence of inflection is perhaps the most often cited typological feature of creoles, it may be the accidental result of limited typological spread of the contributing languages.

Yet another interpretation of the universalist approach involves the assumption that common processes of restructuring apply in situations of language contact to produce common structural outcomes. The effects of contact may operate to differing degrees depending on the social context, e.g., number and nature of languages involved, extent of multilingualism, etc. The fact that pidgins and creoles share some structural features with each other and with other language varieties that are reduced in function such as koines, learner varieties, etc., indicates that the same solutions tend to recur to some degree wherever acquisition and change occurs, regardless of contact, but especially in cases of contact. The entities called pidgins and creoles are salient instances of the processes of pidginization and creolization respectively, although they are not in any sense to be regarded as unique or completed outcomes of them. From this point of view, pidgins represent a special or limiting case of reduction in form resulting from restriction in use.

This statement brings us back to the position that the only thing special about creoles is the sociohistorical situation of language contact in which they emerge. Even that may not be so special when we consider the history of so-called normal languages, most of which are hybrid varieties that have undergone restructuring to various degrees depending on the circumstances. Even ‘normal’ languages such as English have been shaped by heavy contact with non-Germanic languages and thus can be thought of as

having more than one parent. If universal grammar is a mental construct, or an innate predisposition to develop grammar, then in so far as there is no psychological continuity between the mental representations of one generation of speakers of a language and the next, all grammars are created anew each generation. There will always be a certain amount of discontinuity between the grammars of parents and children, and acquisition is always imperfect. Thus, the supposed dichotomy between normal and abrupt transmission is spurious because normal transmission is in fact abrupt.

Directions for Future Research

Resolution of some of the debates about pidgins and creoles, their origins, and their relationships to one another as well as to the languages spoken by their creators is hampered by lack of knowledge of the relevant substrate languages as well as insufficient knowledge of the history of the nonstandard varieties of European languages that formed the lexifiers. There are few detailed grammatical descriptions of pidgins and creoles available for sophisticated typological analysis. More sociohistorical research is also needed. Earlier scholarship often overstated the similarities among creoles and ignored key properties unique to individual ones.

Introduction: Creole Myths

Pidgins and creoles have long been characterized as ungrammatical and their speakers as uneducated. This bias is illustrated in the following excerpt from the first novel completely written in a French-based creole (Guyanais), a stinging satire of French colonial society in Cayenne offered through the voices of two Creole characters: *Atipa*, a gold miner, and his friend *Bosobio*:

- (1) *Atipa*: Nu kriol pa gen reg ku franse
We creole not have rule like French
- (2) nu sa pale li ku nu wle...
we TOP speak it as we want
- (3) gremesi bunge landan nu lang
Thank god in we language
- (4) nu pa benzwen okjupe di sintas...
we not need worry of syntax
- (5) Mo rin save sintas-la sa lang ye
me nothing know syntax-DET TOP language that
- (6) ka pale la konsey ke la tribunal
IMPERF speak DET council like DET tribunal
- (7) *Bosobio*: a pu sa li gen un ta di zafe
TOP for that it have one lot of business
- (8) mo pu ka konpren ni la
me not IMPERF understand neither at
tribunal ni la fomasi-la
tribunal nor DET pharmacy-DET

Atipa: 'We Creoles do not have grammatical rules as in French, we speak just as we like. Thanks to God who gave us our language, we don't have to worry about syntax. I don't know anything about syntax, it's the language they use at council meetings, and at the tribunal. *Bosobio*: That's why there are so many things I don't understand, either at the tribunal, or the pharmacy.' *Atipa* (Parépou, 1885)

Atipa's anonymous author, who used the pseudonym of Alfred Parépou, neatly summarizes the myths attached to creoles, and their social correlates: creoles are not real languages ('we speak as we want'; 'creole has no syntax'); furthermore, creole speakers are excluded from official business and basic social services. Yet, the author demonstrates that this nonlanguage can be used to write a 227-page novel!

The young languages we call pidgins and creoles are universally engendered in the context of traumatic situations such as slavery, indenture, or migration. Although pidgins and creoles differ in the scope of their social functions – pidgins are short-term creative attempts at producing *lingua francas*, whereas creoles are native vernaculars – they have in common that they are oral languages spoken by marginalized groups, are rarely acknowledged as valid grammatical systems, even by their own speakers, and are therefore rarely written. *Atipa* is a major exception, but even now literature fully written in creole is scarce.

This article identifies some of the linguistic conflicts and choices that face pidgin and creole speakers in their social networks. Rather than providing an overview of the wide range of variation that occurs

in creole communities around the world, I will focus on a few representative examples.

Variation in Pidgins

Pidgins are generally short-term varieties restricted to specific social domains or occasional events such as seasonal trade activities. Pidginization has often been defined as ‘imperfect’ acquisition of the target language, but this characterization is debatable. The objective in any of the emergency situations that give birth to new varieties is basic communication, not native-like fluency in the dominant language. If one accepts this pragmatic goal as a realistic option, it is clear that linguistic variability must have been present from the very beginning of the contact.

Since the rapid production of an operational lingua franca is crucial, and happens without the benefit of proper instruction, pidgin development can be expected to be highly variable. Some of the strategies widely used in pidginization are illustrated in the following sample of CPE (Chinese Pidgin English), a lingua franca that developed in the 19th century as British ships traded in Canton, and Cantonese (Yue)-speaking Chinese (Chinese, Yue) merchants and servants made the effort to communicate in English with Europeans. CPE evidence is represented in a large number of occasional (and not necessarily accurate) observations made by Europeans. CPE combines English lexicon and Chinese substratal influences, such as paratactic structures rather than subordinating syntax, the use of elements such as *suppose* to separate propositions, and of classifiers such as *piece* before nouns. Some of these features occur widely in pidgins (and creoles), but others do not, and are thus traceable to transfer from Chinese, such as the usage of a classifier in (15). Variation is illustrated below in sentences excerpted from a large unpublished corpus made available by Philip Baker (CPE Corpus, 2004). The pidgin sometimes functions as a pro-drop language (absence of subject pronouns in [9–10, 13]), but sometimes not, using indiscriminately subjective or objective pronouns, since Chinese has no case marking (2004: 11–12) [translation is provided only when the meaning may be unclear]:

- (9) This have every poor place, and very poor people;
no got cloaths, no got rice, no got hog; no got
nothing; only yam, little fish, and cocoa-nut;
no got nothing make trade, very little make eat.
- (10) No got fowls, have got chicken [...] no can tell,
must first makee weigh.
- (11) Me think have go Pekin.
- (12) Suppose he have no got eye, how can him see?
Suppose he no can se, how can him walkie?

- (13) Suppose cheat a little can do, suppose cheat too
muchy no can.
- (14) Suppose no gib lice, how can lib?
‘If you don’t give me rice, how can I live?’
- (15) One piece man [...] How much piece masts hab
got you ship, how many piece guns, shot and
powder? How much piece woman, cow
childes and bull childes?
‘One man [...] How many masts have you got
on the ship, how many guns, bullets and
powder? How many heifers and calves?’

Variation in Creoles

Since creoles are more numerous and better documented than pidgins – but note that many contemporary creoles are called ‘Pidgins,’ such as Nigerian Pidgin, or Tok Pisin – the remainder of the article will discuss two related issues that have lately dominated the field of creole studies.

First, the reality and structure of the ‘creole continuum’ is examined. Creoles (like pidgins) were never isolated from their lexifiers. The social background of native creole vernaculars was such that their subaltern speakers were always in contact with the language of dominant social strata, but in differential ways. Some individuals (i.e., house slaves) had better access than others (field slaves) to the target language (TL), which may have been either socially or demographically dominant. Moreover, the available TL was not necessarily the standard (or prestigious) version of the lexifier: it may have been a nonstandard variety of the European language(s), for example, in contacts between slaves and overseers or ship hands, and thus learners of different varieties were likely to interact and use different versions of the TL as *lingua franca*. In addition, demographics (such as relative proportion of European speakers of the TL and Africans in contact) determined the outcome of the creolization process during the formative period (Chaudenson, 1992). The proportions of speakers varied according to the region or the household, which explains the linguistic differences between neighboring varieties – e.g., between Morisyen (in Mauritius) and Réunionnais (Réunion Creole French; in Réunion), both in French-colonized islands in the Indian Ocean; or between Jamaican Creole and Bajan (Barbados), both spoken in English-colonized Caribbean islands. In those two parallel cases, whites outnumbered slaves in Réunion and in Barbados, but the opposite was true in Mauritius and Jamaica. Consequently, Morisyen and Jamaican are more ‘creolized’ than their counterparts. This designation means that the most basilectal varieties in Mauritius and Jamaica have no equivalents in Réunion and Barbados:

Bajan and Réunionnais have more restricted repertoires, ranging only between mesolects and acrolects.

Linguistic variability is to be expected at every stage of the language history. Most previous colonies remained economically dependent on European (or other) nations, even after independence was granted. Because of the continuing contiguity of prestigious and stigmatized varieties – greatly facilitated by the greater availability of education – language stabilization is counterintuitive in any creole context, which does not exclude the existence of a regular creole system. Similarly, single-style speakers are rare, even in remote rural areas. However, some varieties called ‘radical creoles’ (Saramaccan for example) are assumed to be somewhat stable, restricted to conservative varieties, and not associated with a continuum. This situation may be the consequence of group isolation, as suggested by Atipa in the Guyanais quotation shown above, but it is doubtful that such social contexts still exist. With some rare exceptions, the concept of the creole continuum effectively captures the flexible reality of contact vernaculars.

Secondly, the issue of ‘decreolization’ – that is convergence toward the dominant language, and concomitant loss of the creole – is re-evaluated. Although pidgins generally disappear, or evolve into more complex varieties, many creoles thrive and retain high covert prestige in their native communities, even as they interact with dominant or official languages.

The Creole Continuum

Since creoles are still overwhelmingly considered by public opinion to be corruptions or distortions of official languages, speakers of those marginalized varieties are bound to acquire some version of the local standard. Literacy is widely available now, and the ‘proper’ medium of instruction is naturally the official language (e.g., English in Belize; French in Martinique, Portuguese in Cape Verde, etc.). However, the standard model is rarely present in the classroom, as local teachers have variously acquired their own version of the standard, thus contributing to the continued linguistic variability observable in creole areas.

Early pioneering studies viewed creoles as static nonstandard approximations of their lexifiers. This perspective implied that creole speakers consistently used a predictable nonstandard system. But a few innovative analyses of creole variation led the way to a more realistic understanding of linguistic repertoires. DeCamp (1971) in his description of Jamaican Creole was the first to use the concept of continuum as an analytical tool in complex linguistic situation. He referred to a wide range of linguistic options that were available to the creole speaker, as illustrated

in variants such as: *mi tel am/a tel im/a told him*, pointing out the lack of clear separation between variants, and the myth that there are only two varieties of language.

Pidgin and creole speakers are constantly fluctuating between two poles, the vernacular, which is appropriate in familiar, at home and in group situations, and the formal standard, which is required in official contexts, typically work and out group situations. But speakers’ repertoires are not restricted to two clearly bounded varieties; they spread over a continuum of overlapping forms, whose specific representations are dictated by the social, ethnic, or gender contexts, the competence and adaptability of individual speakers, and other psychological factors. The ‘creole continuum’ aptly captures the absence of any clear boundary separating the various speech types available within any Creole community.

This continuum can be divided into three broad variety groupings (or ‘lects’): ‘basilects,’ ‘mesolects,’ and ‘acrolects.’ Basilects are the most vernacular varieties that linguists have typically described as creoles. Acrolects are often used to refer to Creole speakers’ production of the local standard language, yet they are not identical to that standard; they are usually L2 versions of the standard. Finally, mesolects are located somewhere between basilects or mesolects, yet are not imperfect approximations of the acrolect. Mesolects have their own structure and their own *raison d’être*.

Bickerton (1975) was probably the first to complete a comprehensive analysis of the language spectrum for Guyanese Creole (English-based creole), and his novel approach stimulated a number of creole studies that adopted the concepts of continuum, and the related notion of implicational scales, as analytical devices. To cite just a few studies of English-based creoles: Washabaugh (1975), Herzfeld (1978), Craig (1980), Escure (1981), Singler (1984), Rickford (1987), Crowley (1990), Patrick (1992), Aceto (1996), Smith (2002). Studies of French-based varieties include Ludwig (1989), Chaudenson (1992), Lefebvre (1998), Corne (1999), and many more. Some examples of variability across creole continua are provided below, illustrating variation in lexical semantics, phonology, and morphosyntax in samples taken from two English-based creoles, Ghanaian Pidgin English (West Africa) and Belizean Creole (Central America).

Lexical Semantics

The naming of body parts offers a well-known example of semantic differentiation at the word level. Many creoles display substrate influences in the

naming of limbs, with the transfer of African semantic structures into Indo-European lexicon: thus, following Bantu and Kwa practice of using one single word to refer to the whole limb, English-based creoles (Belizean, Jamaican) use *fut* to refer to both ‘foot’ and ‘leg’, and *han* to refer to ‘hand’ and ‘arm’ (but Nigerian Pidgin used *leg* for both ‘foot’ and ‘leg’, though it uses *han* as the generic upper limb term). In Portuguese, creoles such as São Tomé, the equivalent Portuguese words are used with the same semantic range. The same feature occurs in Bislama (also English-based, spoken in Vanuatu), though the substratal influence is Austronesian in this case. When speakers of those creoles switch to acrolects, they then use the appropriate term. For example, a Creole boy (in Belize) said (showing his calf): *Wan shaak bait mi fut hia*, ‘A shark bit my leg here,’ but in the next minute, he switched to an acrolect: *Main da maskito pan yu leg*, ‘Mind that mosquito on your leg’ (Escure, 1990).

Education and Llectal Level (Ghanaian Pidgin)

The short dialogue shown below, taken from a radio commercial in Accra, Ghana, illustrates particularly well subjective attitudes toward the varieties available to creole speakers: the creole (Ghanaian Pidgin) is attributed to the uneducated speaker (taxi driver), while the engineer speaks Standard Ghanaian English (acrolect). The transcription represents basilectal features in the driver’s speech: phonological features (absence of interdental, absence of postvocalic /r/, and of /h/), morphosyntactic features (use of preverbal imperfective *de*, unmarked past, relativizer *we*, single preverbal negative element). On the other hand, the engineer uses ‘flawless’ English grammar (but Huber’s audio version reveals acrolectal phonetic variants):

- (16) **Driver:** ju sabi ma padi adzeman, i de draiv tata bos we in masta bai fo hia
 ‘You know my friend Agyeman, he drives a Tata bus that his master bought here’
- (17) **Engineer:** The Yellow Cab Company Ltd?
- (18) **Driver:** jes, i no de bring am fo sevisin en mentenans, en i de pochos in spepas fo evriwea.
 ‘Yes, he doesn’t bring it here for servicing and maintenance, and he buys his spare parts from everywhere’
- (19) **Engineer:** Is this Tata vehicle on the road?
- (20) **Driver:** No, i de brok daun plenti-plenti.
 ‘No, it keeps breaking down. (Huber, 1999: 271)

Llectal Variation (Belizean Creole)

A few texts drawn from an unpublished Belizean corpus by Escure (1990) illustrate the extensive range of the creole continuum, starting with the most extreme lects, basilects and acrolects, then addressing the elusive mesolect.

Basilect (Nansi Story)

Miss Dolly (a 60-year old woman from Placencia) tells a traditional tale (Nansi story). This story evidences some prominent basilectal features:

- The use of the preverbal aspectual morpheme *de* (e.g., *everibadi de dans* ‘everybody dances/keeps dancing’) is best defined as an imperfective, as it may have progressive and habitual/iterative functions.
- The nonmarking of past (e.g., *di dans stat tu brok op* ‘the dance started to break up.’)
- The creole reinterpretation of some old preterites as bare verbs (e.g., *brok* ‘break’).
- The occurrence of a different preverbal past morpheme *me* (sometimes with anterior value), which helps distinguish between two sequential past events (*di mjusik me de ple* ‘the music was playing’ as background event to the crowd leaving the dance-hall). Here, the past morpheme is also combined with the imperfective marker indicating continuing action (see Escure, 2004 for a more complete list of basilectal features).

(21) Dis da wan taim nou dei had
This TOP a time now they had
 wan dans evribadi de dans
a dance evrybody IMPERF dance
 ‘Once upon a time, they had a dance, everybody would dance’

(22) bra taiga bra dag bra everibadi
Brother Tiger Brother Dog Brother Everybody
 dans Evribadi de dans
so Evrybody IMPERF dance
 ‘Brother Tiger, Brother Dog, Brother Everybody, so everybody would dance’

(23) buldag de dans kou de
bull dog IMPERF dance cow IMPERF
 dans evribadi
dance everybody
 ‘the bulldog dances, the cow dances, everybody’

(24) big pati de goun tuwad midnait nou
big party IMPERF go.on towards midnight now
 di dans stat tu brokop
the dance start to break.up
 ‘it’s a big party, towards midnight the dance ended’

(25) bika wan fait stat evribadi stat tu fait

 ‘because a fight started, everybody started to fight’

- (26) evribadi de tekdu dem bati
everybody IMPERF take down DET butt
 an de kot
and IMPERF cut
 ‘and everybody started to go and they left’
- (27) an dat waz di en a di pati
and that was the end of the party
 ‘and that was the end of the party’
- (28) bot di mjuzik we me de plei
but the music that ANT IMPERF play
 ‘but the music that was playing’
- (29) i go laik dis: zinzinzin. vajalin
it go like this: zinzinzin. violin
 da me di mjuzik
 TOP IMPERF *the music*
 ‘it went like that: *zinzinzin* it’s the violin that
 was playing’ (Nansi story, Escure, 1990)

An additional example shows how creole marks irrealis modality (unrealized events) through the combination of the anterior marker *me* and the future marker *wan* – a grammaticalized form of the verb ‘want’:

- (30) R. wan tek wan korespondens kos.
R. FUT take a correspondence course
 ‘R. will take a correspondence course.’
- (31) i me wan tek it befo i kum awt.
he ANT FUT take it before he come out
 ‘He would have completed it before he
 graduates.’
- (32) i me de plan fu tek it
he ANT IMPERF plan to take it
 ‘He was planning to take it’
- (33) da di taim de tem don di kos don.
that the time the term done the course done
 ‘so that by the time the term is over, his course would
 have been completed.’ (Escure, 1990)

Acrolect

The acrolect is a local standard that differs from external standards. Since acrolects are typically the result of late acquisition, probably through school education, inconsistencies are most likely to occur at this lectal level, depending on social factors, such as an individual’s relative access to the standard, or psychological factors, such as the speaker’s identity and intent to converge toward the standard. The acrolect generally differs phonetically from its lexifier (in the case of Belizean English, it differs from RP-British English). Most common distinctions include the systematic or occasional absence of interdental fricatives, and variation in vowels (for example, lack of distinction between tense and lax vowels). Acrolects generally use standard grammar and morphology, for

example, past verbs are now marked, preverbal morphemes are absent, the copula *be* is introduced, and so forth, but more variation occurs in upper mesolects, that vague area between the widely used labels of ‘English’ and ‘broken English.’ Thus, nonstandard morphological features may be part of an acrolectal version (for example, absence of copula/auxiliary; lack of 3SG agreement; hypercorrect past inflection, or pronoun variation), as are pragmatic mechanisms (such as the fronting of topics). The following sentence displays both *be* presence (*dei were expectin*) and absence (*would willin*):

- (34) Dei we espektin samwan den wu
They were expecting someone then who
 wud wilin tu tekop amz
would willing to take.up arms
 ‘They were expecting someone who would be willing
 to take up arms.’ (Escure, 1990)

Newspapers often exhibit similar linguistic features, whether unwittingly or as intended for special effect:

- (35) I can **recalled** a very shocking incident [...] One may come to the conclusion that an abundance of ignorance **exist** within [...] This area has long been mean, but never **have** it been so lethal [...] Such an attitude gathers strength from its own **existent**, the longer it **persist**, the deeper it roots grow. (‘Help our troubled & lost generation’ *Alkebulan* (Belize), January 21, 1994: 2)

But an article on local politics – discussing the rival political party (PUP) – inserts some basilectal phrases in the middle of a standard text for emphasis (here sarcasm, shown in bold characters in the original text):

- (36) [...] their plaintive wail when all else fails is victimization, translation: **A fri’ten bad**. [literally, I frightened bad ‘I am afraid’]
- (37) [...] Houses are being built [...] **And would you believe it, the PUP bex bout that**. [literally, PUP vexed about that ‘the PUP is annoyed about that’] (‘The observer’ *The People’s Pulse* (Belize), April 17, 1994: 14)

Mesolect (The Village Midwife)

Mesolects can be defined as intermediate varieties, but they are not mere approximations of the standard: they have their own internal motivation and place in the social life of continuum users. Individuals who control the whole range of the continuum select the mesolect in well-defined situations – when addressing an older person, or the members of another ethnic group, or dealing with a serious topic. There are issues of respect, of formality, and of identity

involved in such choices, so it is not possible to speak of ‘basilectal’ or ‘mesolectal’ speakers, except to say that in context A, an individual is a basilectal speaker, but in context B, the same speaker is a mesolectal speaker.

In the following excerpt, Miss Dora, a 75-year old midwife who has delivered all the village babies for the last 50 years, uses neither a basilect nor an acrolect. She has native competence in the creole vernacular, but selects the mesolect when recounting her professional activities with her nephew. Characteristics of this mesolect include absence of copula, unmarked past, and an occasional preterite form (*had*) as well as the auxiliary *don’t* (instead of simple preverbal negative). Mesolects generally imply avoidance of basilectal morphemes, but this implication is not always the case: at crucial peaks of the narrative, Miss Dora uses the TMA creole morphemes *de* (Imperfective) *me* (Past Anterior), as well as the expression *don ded* ‘completely dead’, a common use of the perfective marker ‘done’ to emphasize the finality of death. Note also the creole use of *lef* for ‘leave’ (*I had to lef dat* ‘I had to leave/stop that’), one of a few verbs whose neutral form is a relexified irregular preterite.

- (38) Da sem taim tu peshen kum in
At same time two patient come in
- (39) wan mada da di ilevent bebi im gat
a mother TOP the eleventh baby she got
en di ada wan da di naint
and the other one TOP the ninth
- (40) en de riali nat sapoz tu got bebi da vilidg
and they really not supposed to get baby at village
- (41) bot den dei don wan go da haspital [...]
but then they don’t want go to hospital
- (42) wel a had a fait wid di bebi
well I had a fight with the baby
bika di bebi hed kum
because the baby head come
- (43) bot di ada paat a di bodi wont kum [...]
but the other part of the body won’t come
- (44) den di aftabat kyan kum
then the afterbirth can’t come
- (45) a had tu lef dat wan an di ada wan redi
I had to leave that one and the other one ready
- (46) a swab shi af [...]
I swab her off
- (47) an den shi lef wika stil
and then she stay weaker still
de hemoredg
IMPERF hemorrhage
- (48) an wen a give shi dat an fainali i kwait dawn
and when I give her that and finally she quiet down

- (49) an shi an mai sista me tink di
and she and my sister ANT think the
bebi don ded
baby PERF dead
- (50) a do mawt tu mawt bridin an
I do mouth to mouth breathing and
di bebi big bwai naw.
the baby big boy now

‘Two patients came in at the same time. One mother was delivering her eleventh baby, and the other her ninth [...] They are not really supposed to deliver in the village, but they don’t want to go to the hospital [...]. Well I had to struggle with the (first) baby because its head was coming out, but not the rest of its body [...] then the after-birth wouldn’t come [...] I had to leave that one (first mother) to go to the other one who was ready (to deliver) [...] I cleaned her (second mother) up [...] (first mother) remained weak, and was still hemorrhaging [...] When I gave her (herbs) she (first mother) finally settled down. She and my sister thought that the baby was already dead [...] But I did mouth-to-mouth resuscitation, and the baby is now a big boy.’ (The Village Midwife, Escure, 1990)

Decreolization

Schuchardt’s ‘life cycle’ concept (1883) became DeCamp’s ‘postcreole’ continuum (1971). This developmental hypothesis suggests that creoles eventually merge with the standard, assuming that the continuum is the result of decreolization (loss of the creole). However, the data presented above suggest that the acquisition of acrolects or near-standard varieties – obviously facilitated by access to education and standard speakers after emancipation – does not necessarily entail concomitant loss of basilectal segments. Individuals, with few exceptions, are generally found to control a wide repertoire. Empirical studies show that they don’t lose their native variety just because they have acquired a new one – no more than L2 acquisition would entail loss of L1, except in extreme situations leading to language death.

The ability to handle alternate codes has been explained in terms of the ‘dual standard,’ or the ‘covert’ vs. ‘overt prestige’ dichotomy: as subaltern groups gain access to education, they become increasingly motivated or obligated to learn the standard as a means of improving their social position. Creole values may thus be overtly despised but secretly respected, whereas the values of the high-status group are overtly respected and secretly despised. As is the case in any multilingual context, individuals make linguistic choices that reflect their allegiance or close associations with either the dominant social group (usually speaking standard varieties), or

the peer group, or both. The ‘linguistic market’ sociological model of linguistic production and expression also captures the relation between linguistic system (*l’habitus linguistique*) and linguistic market (*le marché linguistique*) (Bourdieu, 1982).

Such perceptual differences still mirror the historical colonial bias and the shift to a new social order. They also explain why creole languages offer such a wide range of linguistic possibilities. The linguistic spectrum captures the multiple nuances required in various human contact situations. The very nature of its flexibility ensures that all varieties remain active and operational, and contradicts the view that there is an ineluctable move toward the standard, since native (basilectal) values are highly prized, though covertly.

According to this perspective, decreolization is not diachronic change (although regular change naturally occurs), but rather repertoire extension and code switching. There is no postcreole continuum if the creole is still vigorous, as in Belize, or Haiti, or Papua New Guinea. There is a postcreole situation when the creole has lost most of its speakers, as in Louisiana, in which the confusion of the French-based creole with Cajun (a French Canadian dialect), the import of French teachers from metropolitan France, the dominance of English, and generally the low status of black speakers have probably contributed to the receding state of Louisiana Creole.

Conclusion

The field of creolistics has expanded considerably as new sociohistorical sources have redefined our understanding of the early stages of language genesis and development, and as more empirical field studies have offered testing grounds for theoretical and sociolinguistic models of language use and language development. Subfields of linguistics (historical linguistics, sociolinguistics, and theoretical linguistics more specifically) can benefit from the current state of knowledge in pidgins and creoles. New creoles encapsulate the linguistic effects of the violent social history that most of humanity has been subjected to. Language development is closely dependent on the economic and political features of the societies in whose context they emerged, and current linguistic variability serves to illustrate further the correlation that exists between linguistic structures and social aspects. Creole speakers use polylectal systems, rather than monolithic grammars, and this aspect should be highly relevant to theoretical models that focus on abstract generalizations but overlook the human language ability to juggle multiple systems.

Pitjantjatjara/Yankunytjatjara

C Goddard, University of New England, Armidale, Australia

© 2006 Elsevier Ltd. All rights reserved.

Pitjantjatjara, along with its neighboring dialect Yankunytjatjara, are part of the Western Desert Language (WDL) – a vast dialect continuum located in the arid and sparsely populated central and western inland of Australia (*see Australian Languages; Australia: Language Situation*). The two dialects are commonly referred to jointly as P/Y. There are about 2500 P/Y speakers. Since it is still being acquired by children, P/Y counts as one of the less endangered of Australian languages.

As a typical Pama-Nyungan language, WDL is agglutinative (chiefly suffixing), with well developed systems of nominal and verbal inflection. Canonical constituent order is S (O) (PP) V, but can vary rather freely. Ellipsis of third person arguments, when the referent can be understood in context, is common. Nominal inflection is of the split ergative variety. The verbal system has eight tense-aspect-mood categories, with complex allomorphy governed by a system of four conjugational classes. Serial verb constructions of several types, abound. P/Y has a switch-reference system in several subordinate clause types, and in coordinate constructions. Aspects of P/Y have been studied by a number of linguists. There are three major grammars and a substantial dictionary, a range of pedagogical material, and a variety of specialized linguistic studies. A wide range of vernacular texts of traditional stories, ethnoscience, and oral histories has been published locally.

Sociocultural and Historical Aspects

The similarity between the two dialects has been reinforced by shared historical experiences in the wake of European intrusion early last century, including long periods of co-residence on mission and government settlements, and, subsequently, in self-managed Aboriginal communities. Most speakers

now co-reside on Aboriginal-owned lands in the north-west of the state of South Australia and adjacent areas in the Northern Territory. For a long time Pitjantjatjara was the prestige variety, because it had been adopted by missionaries at Ernabella for Bible translation and use in Christian worship, and was subsequently used in bilingual education programs in local primary schools. Lately the two dialects have been moving towards parity of esteem. Many Australian and international tourists encounter P/Y when they visit the Uluru National Park in central Australia.

Though the two dialects share about 80% vocabulary, there are a number of prominent dialect-specific words, and these form the basis of the traditional WDL system for referring to speech varieties. Pitjantja-tjara and Yankunytja-tjara are based on alternative (nominalized) forms of verbs meaning 'come/go' (suffix *-tjara* means 'having'). Northern and southern varieties of Yankunytjatjara can be termed Mulatjara and Matutjara, respectively, based on alternative forms of the adverb 'true.' In earlier times, there was a multiplicity of such terms in use. The system was highly relativistic, allowing for cross-cutting categorization and for different levels of inclusiveness, which suited the traditional mobile and dynamic social economy. These days the terms Pitjantjatjara and Yankunytjatjara have acquired more stable and 'name-like' sociopolitical functions.

Traditional P/Y culture is replete with symbolism (totemism) and religious myth. There are hundreds of Dreaming stories, songs, and ceremonies. There is a large body of traditional folktales for children. Many P/Y speech practices have parallels in the other languages of Australia. These include the existence of hortatory rhetoric (*alpiri*), elaborate verbal indirectness practiced with certain categories of kin (and total avoidance with others), and prescribed 'joking relationships' characterized by mock insult and abuse. There is a taboo against using the names of recently deceased persons in the presence of bereaved relatives. An auxiliary register, i.e., a special vocabulary (termed *anitji*), is used during ceremonial times.

Structure

Phonology

P/Y has 17 consonant phonemes: see Table 1. There are five places of articulation, each with a stop and a nasal. There are two series of apicals, i.e., consonants pronounced with the tongue tip as active articulator: alveolar and post alveolar (retroflex). There is a single laminal series, with the tongue blade as active articulator. There are three vowels (*a, i, u*), each with a length distinction, though long vowels are not common and are confined to initial syllables.

P/Y phonotactics stipulate that a word must have at least two vowels, with long vowels counting as two for this purpose. Several morphophonemic rules refer to whether a stem has an odd or even number of vowels, making it convenient to work in terms of morae, with long vowels counting as two morae. Words usually start with a single consonant and never with more than one. Inside a word, CC clusters occur subject to strict limitations. Most common are homorganic ‘nasal/lateral + stop’ sequences. Only a very limited set of consonants (*n, ny, n, ly, r*) is permitted word-finally, and then only in the Yankunytjatjara variety. In Pitjantjatjara, consonant-final words are blocked by addition of the syllable-*pa*.

Morphology and Syntax

A number of these features are illustrated in the text extract at the end of this section.

Nominal Morphology

The case system includes nominative, ergative, accusative, genitive/purposive, locative, allative, ablative, and perlocative cases. Typically a case-marker is applied only to the final word of an NP. Since modifiers generally follow their heads, a typical multi-word NP looks like: *wati pulka kutjara-ku* [man big two-PURP] ‘for two big men.’ Like most other Pama-Nyungan languages, there is a split marking system for the core cases. For both nouns and pronouns, the

nominative case is unmarked. With nouns, accusative case goes unmarked but there is a marked ergative form (with *-ngku/-lu* or a variant). With pronouns, the ergative goes unmarked but there is a marked accusative (with *-nya*). Split case-marking is sometimes described in terms of two distinct case systems: nominative-accusative for pronouns and ergative-absolutive for nouns. Aside from being less economical, such an analysis has difficulty with various complex NP constructions involving both nouns and pronouns. For example, inalienable possession constructions can bring body-parts and pronouns into a single NP, and inclusive constructions can bring names and pronouns into a single NP. For example, to say that someone hit me on the head, one uses the NP *ngayu-nya kata* [1SG-ACC head:ACC] ‘me head.’ To say that Kunmanara and someone else did something to someone, one uses the NP *Kunmanara-lu pula* [name-ERG 3DL:ERG].

Ergative and locative case allomorphy depends on whether the word to be marked is vowel- or consonant-final, and on whether the NP is an ordinary noun-phrase, on the one hand, or a pronoun or proper noun, on the other. Ergative is *-ngku* (common) or *-lu* (proper) with vowel-final words, and otherwise *-Tu* (where *T* is a homorganic stop). Locative is *-ngka* (common) or *-la* (proper) with vowel-final words, and otherwise *-Ta*. Genitive/purposive case is marked with *-ku* (nouns) or *-mpa* (pronouns, except for 1SG *ngayu-ku*). Locative also expresses instrumental and comitative functions; e.g., *punu-ngka* [stick-LOC] ‘with a stick,’ *untal-ta* [daughter-LOC] ‘with (my) daughter.’

Pronouns distinguish singular, dual, and plural numbers (see Table 2). Most WDL dialects also have enclitic or ‘bound’ pronouns that can be used instead of or in addition to free pronouns. They appear attached to the first phrase of a sentence, conjunctions counting as phrases for this purpose. P/Y has the following defective set – nominative/ergative: *-na* 1SG, *-n* 2SG, *-li* 1DU, *-la* 1PL, *-ya* 3PL; accusative: *-nil-tja* 1SG, *-nta* 2SG, *-linya* 1DU, *-lanya* 1PL. Bound pronouns are not obligatory in P/Y, though they are common. There are four demonstrative stems: *nyanga* ‘this,’ *pala* ‘that,’ *nyara* ‘that over there,’ and the anaphoric demonstrative *panya* ‘that one, you know which.’

Verbs

All WDL dialects share a similar system of tense-aspect-mood categories and four conjugational classes, though the details differ from dialect to dialect. The P/Y categories are: present, past, past

Table 1 Pitjantjatjara/Yankunytjatjara consonant phonemes, in standard orthography (Goddard, 1985: 11)

| | Apical | | Laminal | | |
|----------|----------|--------------|---------|----------|--------|
| | Alveolar | Postalveolar | Dental | Bilabial | Dorsal |
| Stops | t | ṭ | tj | p | k |
| Nasals | n | ṇ | ny | m | ng |
| Laterals | l | ḷ | ly | | |
| Tap | r | | | | |
| Glides | | ṛ | y | | w |

Table 2 Pitjantjatjara/Yankunytjatjara subject free pronouns (Goddard, 1996: xi)

| Subject | Singular (sg) | | Dual (du) | | Plural (pl) | |
|---------------|-------------------------------|---------------|----------------|------------|----------------|--------|
| First person | <i>ngayu(lu)</i> ^a | 'I' | <i>ngali</i> | 'we two' | <i>nganana</i> | 'we' |
| Second person | <i>nyuntu</i> | 'you' | <i>nyupali</i> | 'you two' | <i>nyura</i> | 'you' |
| Third person | <i>palu(ru)</i> | 'he, she, it' | <i>pula</i> | 'they two' | <i>tjana</i> | 'they' |

^a The syllables in parentheses are dropped when case suffixes are added.

Table 3 Pitjantjatjara/Yankunytjatjara verbs (Goddard, 1985: 90)

| | (∅) 'talk' | (l) 'bite' | (ng) 'hit' | (n) 'put' |
|---------------------------|--------------------|-------------------|---------------------|---------------------|
| Imperative | <i>wangka</i> | <i>patjala</i> | <i>puwa</i> | <i>tjura</i> |
| Past (perfective) | <i>wangkangu</i> | <i>patjanu</i> | <i>pungu</i> | <i>tjunu</i> |
| Imperative (imperfective) | <i>wangkama</i> | <i>patjanma</i> | <i>pungama</i> | <i>tjunama</i> |
| Present (imperfective) | <i>wangkanyi</i> | <i>patjani</i> | <i>punganyi</i> | <i>tjunanyi</i> |
| Past (imperfective) | <i>wangkangi</i> | <i>patjaningi</i> | <i>pungangi</i> | <i>tjunangi</i> |
| Future | <i>wangkaku</i> | <i>patjalku</i> | <i>pungkuku</i> | <i>tjunkuku</i> |
| Characteristic | <i>wangkapai</i> | <i>patjalpai</i> | <i>pungkupai</i> | <i>tjunkupai</i> |
| Serial form | <i>wangkara</i> | <i>patjara</i> | <i>pungkula</i> | <i>tjunkula</i> |
| Nominalized form | <i>wangkanytja</i> | <i>patjantja</i> | <i>pungkunyitja</i> | <i>tjunkunyitja</i> |

imperfective, future, imperative, imperative imperfective, and characteristic. In addition, there are serial and nominalized verb forms. Each verbal category is manifested by up to four different allomorphs (e.g., imperative: \emptyset , *-la*, *-wa*, *-ra*), depending on the conjugational class. The P/Y system is economically analyzed in terms of three stem types: a simple stem which functions as a base for perfective categories, an augmented stem for imperfective categories, and an additional augmented stem for the aspect-neutral forms: see Table 3. The augmented forms were probably inflected words in an earlier stage of the language, with the present-day forms resulting from 'double-marking.'

The \emptyset -class and l-class are open, with predominantly intransitive and transitive memberships, respectively. The ng-class and n-class are likewise predominantly intransitive and transitive respectively, but they have only a handful of basic roots each. These roots, furthermore, are the only monosyllabic verb roots in the language: n-class: *ya-* 'go,' *tju-* 'put,' *ma-* 'get'; ng-class: *pu-* 'hit,' *nya-* 'see' and *yu-* 'give' (examples from Yankunytjatjara). The overall membership of the ng-class and n-class is very large, however, because numerous verbs are formed by compounding with the basic roots or via derivational affixation. Derivational processes are sensitive to mora parity, as well as to the transitivity preference of the verb class. For example, the main intransitive verbaliser is suffix *-ri/-ari*. The derived stem belongs to the ng-class if it has an even number of morae, and to \emptyset -class if it has an odd number of morae.

Complex Sentences

A single clause may contain more than one verb, if the subsidiary verbs are suffixed with the serial ending. It is common in narratives for clauses to contain several serial verbs, as well as the main finite verb. The grammar of serial verbs and their associated NPs and modifiers is quite complex. Typically for WDL, subordinate clauses are formed by adding case suffixes to a nominalized clause. For example, a purposive clause is formed with suffix *-ku* (identical with purposive case), e.g., *kungka-ngku mai pau-ntja-ku* [woman-ERG food bake-NOML-PURP] 'so the woman could cook food.' Inside the subordinate clause, the subject, object, and any other NPs occur with the same case-marking as they would have in a simple clause. The circumstantial clause is formed in Yankunytjatjara with suffix *-la* (one of the locative suffixes), e.g., *kungka-ngku mai pau-ntja-la* [woman-ERG food bake-NOML-LOC] 'while/because the woman cooked the food.' The Pitjantjatjara circumstantial is *nya-ngka*, which has likely descended from an earlier **-nytja-ngka* (simplification of the first of two nasal-stop clusters is common in WDL phonology). Another subordinate type is the aversive clause, which identifies an outcome to be avoided or prevented.

P/Y purposive and circumstantial clauses comply with a 'switch reference' constraint, i.e., they can only be used if the subordinate clause subject refers to a different individual to the main clause subject. If the subjects are the same, a different subordinate

structure is used in place of the purposive, with the ‘intensive’ suffix *-kitja*. An interesting feature of the intensive construction is that the clause as a whole takes an ergative suffix (*-ngku*) if the verb of the main clause is transitive, e.g., *mai pau-ntji-kitja (-ngku)* [food bake-NOML-INTENT-(ERG)] ‘(wanting) to cook food.’ ‘Actor agreement’ of this kind is also found with adverbs of manner and emotion (better regarded as ‘active adjectives’), and with frequency expressions.

There are three coordinating conjunctions: *ka* ‘and, but,’ *munu* ‘and,’ and *palu* ‘but, even though.’ Unusually for Australian languages, switch-reference operates for coordination. Normally, *ka* can only be used as a conjunction if the subject of the new clause refers to a different individual to the subject of the preceding clause; otherwise, *munu* is used. A range of free and clitic particles express illocutionary and discourse-related meanings.

Polish

R A Rothstein, University of Massachusetts,
Amherst, MA, USA

Polish belongs to the Lechitic subgroup of the West Slavic languages, together with the extinct Polabian language and Kashubian, which is often treated as a dialect of Polish (see section on dialectology). It is the native language of most of the nearly thirty-nine

million residents of Poland and of a few million additional speakers living outside of Poland (primarily in the neighboring countries, but also in North America, Australia, and other areas).

Orthography

Like other Slavic languages that were historically in the cultural sphere of the Western Church, Polish uses the Latin alphabet. It did not, however, adopt the

Hussite spelling reforms of the 15th century. Instead, it uses a combination of digraphs and diacritic marks in a system devised by 16th-century printers in Cracow and based in part on pre-Hussite Czech orthography. Thus, voiced and voiceless alveolar fricatives and affricates are represented, respectively, by *ż* (or *rż* when derived from an etymological *r*), *sz*, *dź*, and *cz*. The letter *ł*, which once indicated a dental lateral, now represents a labio-velar glide. For most speakers, there is no distinction between *ch* and *h*, which both represent the voiceless velar fricative; the letter *h* once indicated a voiced velar fricative. Voiced and voiceless palatal fricatives and affricates are represented, respectively, by *zi*, *si*, *dzi*, and *ci* when followed by a vowel and by *ź*, *ś*, *dź*, and *ć* otherwise. The palatal nasal has a similar double representation: *ń/n*. Palatalized labials (or, for some speakers, labial plus palatal glide), which occur only before vowels, are represented by *bi*, *pi*, *mi*, *wi*, and *fi*; the combinations *ki*, *gi*, and *chi* stand for fronted variants of the corresponding velars. The letter *ó* represents a high rounded back vowel derived from an etymological *o*, while the letters *ę* and *a*, respectively, represent front and back mid-nasal vowels or their positional variants (see next section).

Phonology

The Polish phonemic inventory consists of 33 consonantal segments and seven vocalic segments. In addition to the two nasal vowels mentioned above, there are five oral vowels, the basic phonetic realizations of which are [i], [ɛ], [ɐ], [ɔ], and [u] (orthographic *i*, *e*, *a*, *o*, and *u/ó*). Orthographic *y* ([ɨ]) represents an allophone of *i/i*. The nasal vowels are diphthongal, consisting of [ɛ] or [ɔ] plus a nasal segment: the homorganic nasal consonant before a stop or affricate and a nasalized glide before a fricative. At the end of a word before a pause, the front nasal vowel loses its nasal segment; both nasal vowels do so before orthographic *l* and *ł*.

The consonants that arose from the historical palatalization of velars or from the deiotation of clusters consisting of dental stop or fricative plus glide have lost their palatal character. The historical palatalization of dental consonants, on the other hand, has given rise to a series of palatal affricates and fricatives. As in most other Slavic languages, final voiced obstruents lose voicing before pause. In obstruent clusters, both within phonological words and between words, there is regressive assimilation with respect to voicing; orthographic *rż* and *w* exceptionally devoice following a voiceless consonant within the same word. Before a word-initial vowel or sonorant, a word-final obstruent is voiced in some areas of

Poland (e.g., Cracow, Poznań) and voiceless in others (e.g., Warsaw). This sandhi rule does not affect the pronunciation of prepositions, but does affect the pronunciation of consonants preceding some verbal clitics.

Word stress is normally on the penultimate syllable and can thus fall on a preposition if the following noun or pronoun is monosyllabic, e.g., *pod nim* ‘under it.’ Some traditional exceptions to the penultimate principle (e.g., words of Latin or Greek origin such as *gramatyka* ‘grammar’ with antepenultimate stress or certain verbal forms) are normally regularized in the pronunciation of younger speakers. Unstressed vowels are not reduced. There is a growing tendency, especially in emphatic speech, to shift stress to the initial syllable.

Morphology

Nouns distinguish seven cases (nominative, accusative, genitive, dative, instrumental, locative, and vocative), although the vocative is commonly replaced by the nominative, except in titles (e.g., *panie profesorze*, literally ‘Mr Professor’). There are also no special vocative forms in the plural or for personal pronouns, and case syncretism reduces the number of distinct forms. Three genders (masculine, feminine, and neuter) are distinguished in the singular by agreement phenomena, and a masculine animate sub-gender can also be distinguished by its syncretism of accusative and genitive. Certain classes of semantically inanimate masculine nouns also show the accusative-genitive syncretism (e.g., names of dances, monetary units, and mushrooms: *tańczyć mazurę* ‘dance a mazurka’; *zapłacić dolara* ‘pay a dollar’; *znaleźć borowikę* ‘find a boletus mushroom’).

In the plural there is a binary distinction of masculine-personal (nouns referring to male human beings) and nonmasculine-personal (all other nouns); they are distinguished by the nominative endings, by agreement phenomena, and by the accusative-genitive syncretism of the former vs. the accusative-nominative syncretism of the latter. Some nouns have only plural forms (e.g., *drzwi* ‘door[s]’); others are used primarily in the singular (e.g., mass and abstract nouns) but have potential plural forms, which usually acquire specialized meanings (e.g., *wino* ‘wine’ vs. *wina* ‘kinds or portions of wine’; *miłość* ‘love’ vs. *miłości* ‘love affairs’). Adjectives, third-person pronouns, and the past-tense forms of verbs also distinguish three genders in the singular and two in the plural.

Noun declensions are largely gender-based. The masculine and neuter declensions have most endings in common in the singular, while the two feminine

declensions in the singular (for nouns ending in *-a* in the nominative singular and those ending in a consonant, i.e., with zero-ending) also share most endings. There is a class of masculine nouns ending in *-a* that follow the feminine *a*-declension in the singular; all of them refer to male human beings. In the plural, only the nominative, accusative, and genitive endings are partly gender-based; the other case endings are common for all nouns. Some case forms involve mutation of the final stem consonant, and certain case endings are dependent on the nature of that final stem consonant – whether it is ‘soft’ (palatal or ‘historically soft,’ i.e., the result of historical palatalization or deiotation) or not.

Polish verbs belong to one of two aspectual categories: perfective or imperfective. There are also some biaspectual verbs (e.g., *abdykować* ‘abdicate,’ *ranić* ‘wound’). Perfective verbs express accomplishments or transitions; imperfective verbs express states or activities/processes. Imperfective verbs are typically unprefixated; adding a prefix perfectivizes the verb, while sometimes also adding an additional semantic component (e.g., *pisać* ‘write = engage in the activity of writing’/napisać ‘write = get something written’ vs. *przepisać* ‘rewrite,’ *opisać* ‘describe,’ or *popisać* ‘write a little or for a while’). There are also productive ways of imperfectivizing a perfective verb through a change in suffix and/or the stem (e.g., *przepisywać* ‘engage in the activity of rewriting,’ *opisywać* ‘engage in the activity of describing’). Occasionally, corresponding verbs are based on different stems (e.g., imperfective *brać* vs. perfective *wziąć* ‘take’), and some verbs have no corresponding verb of the opposite aspect (e.g., imperfective *mieć* ‘have’ or perfective *zdołać* ‘manage [to do something]’).

Imperfective verbs have synthetic forms for past and present tense and analytic forms for the future tense; perfective verbs form their past tense in the same way as imperfective verbs, but the forms that look like the present-tense forms of imperfective verbs normally express future tense (or, under certain circumstances, potentiality). Analytic forms expressing a pluperfect tense are rare in the contemporary language. The perfective/imperfective distinction is also present in infinitives, imperatives, and conditional/subjunctive forms. Imperfective verbs form verbal adjectives and adverbs expressing simultaneity, while perfective verbs form only verbal adverbs that express temporal precedence or subordination to the action of the main verb. Both perfective and imperfective transitive verbs form passive participles, which can be used with *być* ‘be’ to form passives of state (e.g., *W 1945-tym roku Warszawa była zniszczona* ‘In 1945 Warsaw was destroyed [was in a state of destruction]’) and with

zostać ‘become’ to form passives of action (*Podczas wojny Warszawa została zniszczona* ‘During the war Warsaw was destroyed [they destroyed Warsaw]’).

Within the imperfective aspect, a further distinction is made between determinate and indeterminate verbs of motion. Determinate verbs designate motion in a single direction on a single occasion, while indeterminate verbs do not have those restrictions and can therefore designate repeated motion, the ability to move, etc. (e.g., determinate *iść* vs. indeterminate *chodzić*). Many imperfective verbs also have derived iteratives that express repeated, often regular, actions (e.g., *grywać* ‘play frequently’ from *grać* ‘play’).

Declension, conjugation, and derivation all may involve consonant and vowel alternations, e.g., *miasto* ‘city’ vs. *w mieście* ‘in the city’; *idę* ‘I am going’ vs. *idziesz* ‘you are going’; *ręka* ‘hand’ vs. *rączka* ‘little hand’ or ‘handle.’

Syntax

Polish word order is relatively free and is used, together with sentence intonation, to express the informational structure of the utterance. Thus, the rheme normally follows the theme in emotionally neutral speech. Pronominal and some verbal clitics traditionally follow the first stressed word in a sentence, but this is less true in current usage, especially of the particle *się*, which is historically the enclitic accusative form of the reflexive and reciprocal pronoun. The reciprocal function is still present (e.g., *znamy się* ‘we know one another’), but true reflexive uses are rare (e.g., *bronić się* ‘defend oneself’). The particle has assumed a variety of functions in association with verbs, and in contemporary speech it often immediately precedes or follows the relevant verb, regardless of its position in the sentence. Verbs with *się* can express, among other things, a kind of middle voice (e.g., *myć się* ‘wash/wash up/get washed’) and also an intransitive verb with an unaccusative subject (e.g., *lekcja się zaczyna* ‘class is beginning’). In colloquial speech there is also an enclitic dative reflexive/reciprocal pronoun (*se*).

As in some other Slavic languages, *się* has acquired the function of a generic human subject, parallel to German *man* or French *on*, with third-person singular agreement; only in Polish is there the possibility of a direct object in the accusative (e.g., *tu się rzadko ogląda telewizję* ‘they/people rarely watch television here’). Polish shares with Ukrainian an active verbal construction (based on a form derived from a past passive participle) used to express an action in the past performed by a definite but unspecified human actor (e.g., *zrobiono pomyłkę* ‘they made a mistake/a mistake was made’).

First- and second-person subject pronouns are normally used only for contrast or emphasis; third-person subject pronouns are typically dropped after their first use, unless a previous theme has been reintroduced. Subject pronouns are used in non-familiar address, where the words for *you* (masculine singular *pan*, feminine singular *pani*, mixed group plural *państwo*, etc.) take third-person agreement.

Lexicon

It has been estimated that some 76% of the Polish vocabulary was either inherited from Proto-Slavic or was created within the Polish language. The earliest foreign borrowings came together with Christianity from the Czech lands and included both religious terminology and other words that reflect Czech phonology, rather than the expected Polish derivatives from Proto-Slavic (e.g., *wesoły* ‘merry’ instead of the expected *wiesioły*). Over the course of centuries, however, the major donor language was Latin, followed by French, Greek, and German. Italian and Ukrainian also contributed, as did Russian and English; the influence of the last two became especially strong following World War II. Currently most neologisms come from English or from Latin- or Greek-based internationalisms: a recent example of a semantic calque from English is the use of the words *niedźwiedź* ‘bear’ and *byk* ‘bull’ in the sense of stock-market pessimists and optimists, respectively.

History

The Polish language was first documented in the form of 410 personal and geographical names included in the Latin text of a 12th-century papal bull to the archbishop of Gniezno. The next century brought the first recorded complete sentence, quoted in the text of a Latin chronicle. By the 14th century continuous texts in Polish had been created, and thanks to the efforts of Cracow printers at the beginning of the 16th century, a more or less standardized language appeared. This literary language did not have a clear dialect base, since it included features characteristic of the dialects of the two early political and cultural centers, Gniezno/Poznań (Wielkopolska) in the west and Cracow (Małopolska) in the southeast. It has been suggested that because of the role of Bohemia in the Christianization of Poland, the Czech language served as a point of reference for choosing between features from the two Polish dialect areas.

Polish eventually won the competition with Latin as a literary medium (the 16th-century writer Mikołaj Rej proclaimed to the world that “Poles do not gaggle

like geese – they have their own language”) and also survived the assimilatory efforts of the partitioning powers of the late 18th century (Prussia and Russia). In the period since World War II, the standard language has acquired a much broader social base as well as a vastly expanded technical and specialized vocabulary.

Dialectology

The major dialect areas correspond to historical-geographic regions of Poland: Małopolska in the southeast, Mazowsze in the northeast, Wielkopolska in the northwest, Silesia in the southwest, and Kaszuby along the Baltic coast (north and west of Gdańsk). Although the Polish spoken in the pre-World War II eastern Polish territories (the so-called *kresy*, now part of Lithuania, Belarus, or Ukraine) was distinctive, it was not considered a separate dialect, but the resettlement of many speakers from that area in the territories in the west and north acquired from Germany after the War led to the creation of what are called ‘new mixed dialects.’ The major dialects are traditionally distinguished on the basis of their consonantism: the presence or absence of distinct dental, alveolar, and palatal consonants, and the treatment of obstruents before word-initial vowels or sonorants. The reflexes of historical long and nasal vowels and various morphological criteria are among the features used to make finer dialect distinctions. The dialects of the Kaszuby region are most different from standard Polish and from other Polish dialects, which has led some (mostly non-Polish) linguists to consider Kashubian a separate language rather than a dialect of Polish. Despite the absence of any apparent Kashubian national identity, there have been attempts to establish a Kashubian literary standard.

Pomoan Languages

S McLendon, City University of New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

The seven Pomoan languages are or were spoken north of San Francisco, in the many verdant valleys of the Coast Range mountains (See **Figure 1**). Especially densely populated were the large valleys through which the Russian River runs and those around Clear Lake, as were the foothills of the Coast Range in the south around Santa Rosa and Sebastopol.

Names

There was no single 'Pomo' tribe or language, although maps and authors frequently so indicate. Each of the seven languages was spoken by residents of at least one, and usually several, politically independent towns, of which some 75 are known. By 2004, these have become amalgamated into 19 distinct federally recognized tribes. Speakers of the seven languages did not have a single name for themselves or for the family of languages as a whole. The name 'Pomo,' which now has that function, was first used to refer to this family by Stephen Powers (1877: 5, 146), and has become increasingly used in the 20th century. It derives from two distinct but similar sounding Northern Pomo terms, one the name of an earlier single town (See McLendon and Oswalt, 1978 for details).

English names for the individual languages were developed by Samuel A. Barrett (1908), modeled on native systems of referring to neighboring languages. The language spoken around the modern town of Ukiah, in the center of Pomoan territory, Barrett called Central Pomo. To the north was Northern Pomo; to the northeast on the edge of the Sacramento Valley, Northeastern Pomo. To the east, on the western portion of Clear Lake, was Eastern Pomo, and southeast at East Lake and Lower Lake, Southeastern

Pomo. To the south of Central Pomo were Southern Pomo, and Southwestern Pomo. This last has a native name, *k'ahšá.ya*, anglicized as Kashaya, which is now preferred.

Unfortunately Barrett, in the style of the times, referred to these seven languages as dialects, even though they are distinctly different, mutually unintelligible, languages. This has led to all seven languages commonly being thought to be mere variations of a single language. In fact, speakers of one language could not understand speakers of any of the others without a considerable period of learning, and all but one of these languages were each spoken in several dialects.

Internal Relations

Classifications of the interrelationships of these languages have been proposed by Barrett (1908: 100), Alfred Kroeber (1925: 227), Abraham Halpern (1964: 90), and Robert L. Oswalt (1964: 416). Halpern was the first phonetically competent linguist to collect data on all seven languages. He proposed two slightly different classifications based on sound shifts that he identified but never published. Oswalt (1964: 413–427) based his classification on a comparison of the 100-word lexicostatistical basic word list in each of the seven languages. Halpern and Oswalt agree in identifying Eastern Pomo and Southeastern Pomo as the most divergent, and Southern Pomo and Kashaya as closely related. They differ in the position they assign the geographically isolated Northeastern Pomo, and their conception of the relationship between the three languages spoken in wide contiguous bands from the Russian River to the Pacific: Northern Pomo, Central Pomo, and Southern Pomo. (See **Figures 1** and **2**.)

Significant intermarriage between neighboring towns and the tradition of sending children to be raised by grandparents for extended periods resulted in more than one language being spoken in each

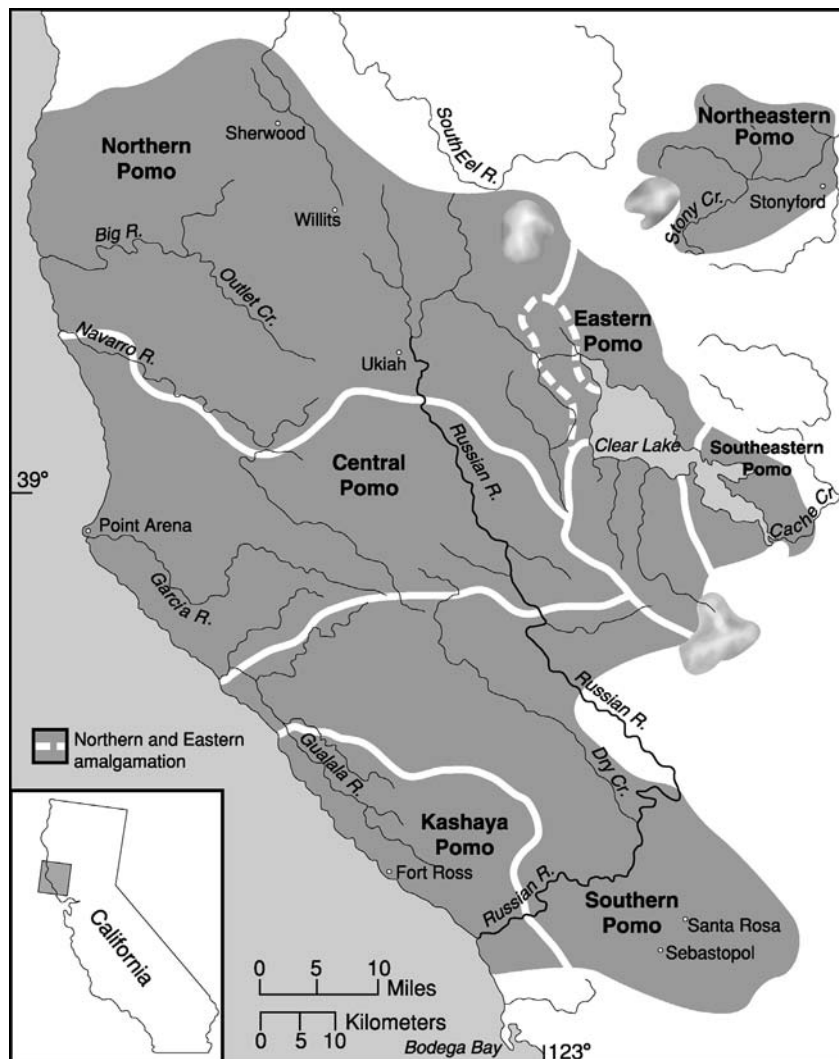

Figure 1 Probable territories of the seven Pomoan languages at the end of the 18th century around the time of first contact with Europeans. Adapted from Figure 2, p. 276 of the *Handbook of North American Indians, California-8* (Washington, D.C.: Smithsonian Institution, 1978).

town, and children having an easy familiarity with more than one language (McLendon, 1978b). This may have had a leveling effect on the languages in contact along the Russian River.

State of Descriptive Knowledge

As of 2004, modern linguistic fieldwork has been carried out on all seven languages, with grammars and articles published on Eastern Pomo (McLendon, 1975, 1978a, 1979, 1982, 1996, 2003), Southeastern Pomo (Moshinsky, 1974), and Northern Pomo (O'Connor, 1984, 1990, 1992). For Kashaya, an extensive unpublished grammar (Oswalt, 1961) exists, as well as articles (Oswalt, 1983, 1986, 1998). Extended field work has been carried out on Central Pomo, with various aspects of the language

described in articles (Mithun, 1988, 1990, 1993, 1998). Extensive fieldwork has been carried out on Southern Pomo by Halpern and Oswalt, very little of which has been published (Oswalt, 1977 provides a text with a grammatical sketch). This is unfortunate, since a clear understanding of Southern Pomo is especially important for the reconstruction of Proto Pomo. The least amount of work, all unpublished, has been done on Northeastern Pomo, which ceased to be spoken in the middle of the 20th century. Ironically, the seven Pomoan languages began to be adequately studied and described only in the mid-20th century, just as speakers were switching to English as their primary means of communication. In 2004, this process of replacement is virtually complete, although several contemporary tribes have now initiated language revitalization efforts.

Figure 2 Proposed interrelationships between the seven Pomoan languages. A, B, Two alternative classifications proposed by A.M. Halpern, 1964. C, Classification proposed by R. Oswalt, 1964. After Figure 1, p. 275 of the *Handbook of North American Indians, California-8* (Washington, D.C.: Smithsonian Institution, 1978).

Basic Characteristics of the Pomoan Languages

Phonology

The seven Pomoan languages have far more consonants than English. Unaspirated, aspirated, and glottalized (or ejective) stops contrast at labial (p , p^b , p^h), dental (t , t^b , t^h), alveolar ($ʈ$, $ʈ^b$, $ʈ^h$), palatal (c , c^b , c^h), velar (k , k^b , k^h), and postvelar (q , q^b , q^h) places of articulation, in Kashaya, Central Pomo and Eastern Pomo (which, however lacks q^b). Compare, for example, the contrasting Eastern Pomo set: *kóy* 'sore,' *k^ból* 'worm,' *kóy* 'in/with the stomach,' *qóy* 'swan,' *q^oy* 'nape of neck.'

Southeastern Pomo contrasts voiceless stops with glottalized ones at the same places of articulation; voiceless aspirated stops have become fricatives in Southeastern Pomo. Compare Southeastern Pomo *mfeʈ*: Eastern Pomo *nu^pb^hér*: Central Pomo *m^pb^hé*: Southern Pomo *nu^pb^hé*: Kashaya Pomo *nu^pb^hé*: Northeastern Pomo *fé*[-*ka*] 'skunk'. Southern Pomo, Northern Pomo and Northeastern Pomo have the same contrasts at the same places of articulation (except Northeastern Pomo has *f* instead of p^b), but lack the velar/post-velar distinction (Northern Pomo has no $č^b$). Southern Pomo, Northern Pomo and Eastern Pomo have an additional pre-palatal affricate series (c , c^b , c^h) that pattern like stops (Northern Pomo lacks

c^b). Kashaya and Central Pomo have only *c'*. All seven languages have a glottal stop.

All seven languages distinguish two voiced stops: *b* and alveolar *d*, and the fricatives: *s*, *ʃ*, and *h*. Northeastern Pomo and Southeastern Pomo add a rare *f*, from earlier Proto Pomo **p^h*. Eastern Pomo and Southeastern Pomo have a velar fricative *x*, Southeastern Pomo adds a postvelar fricative *x̣*. The sonorants/resonants are *m*, *n*, *l*, *y*, *w* with a rare *r* in Eastern Pomo. Eastern Pomo alone contrasts voiced *m*, *n*, *l*, *y*, *w* with voiceless *M*, *N*, *L*, *Y*, *W*. Compare, for example, *lal* 'month': *Lal* 'goose.' All languages have a five-vowel system with two degrees of length.

Grammar

The seven Pomoan languages are agglutinative, with extensive, complex morphologies and striking semantic specialization. The basic morphological unit is the stem, with verbal or nonverbal function specified by inflectional suffixes and/or syntactic relations. The verb is morphologically the most complex and syntactically the most important category, being the only obligatory member of an independent clause. Verbs are composed of a stem plus a varying number of classes of suffixes that add both lexical and grammatical meaning. These suffixes specify aspects, modes, plurality, locality, reciprocity, source of information (evidentials) and various types of syntactic relations, including the continuation or change in the referent and case roles of the agent and patient of a preceding clause (often called switch-reference). The verb is last in its clause, although under certain conditions, arguments can be postposed following it.

Kashaya and Eastern Pomo have well-developed sets of what have been called instrumental prefixes with the shape CV, where V is *i*, *a*, or *u*. They indicate the undergoer/patient of the action, and type or manner of action, as well as the instrument. These combine with roots to form stems. In Northern Pomo, Central Pomo, Southern Pomo, and Southeastern Pomo, vowels in initial syllables are elided or assimilated, collapsing what are historically several prefixes into a single consonant, obscuring the system.

The Pomoan languages are stative-active languages, most of an unusual type that can be called fluid stative-active. That is, verbs can appear with an argument in either the agentive or the patient case, depending on the speaker's perception of the degree of control the protagonist had in the action. Thus in Eastern Pomo, one can say:

ha c'exél-k-a
1SG.AG slip/slide-PUNCTUAL-DIRECT
'I'm sliding (as on a sled or skis,
deliberately)'

or:

wi c'exél-k-a
1SG.Pat slip/slide-PUNCTUAL-DIRECT
'I'm slipping (accidentally, as on a
banana peel, or patch of ice)'

Clauses are combined to describe interrelated sequences of events by affixing one of a number of so-called switch-reference suffixes that indicate simultaneity, sequentiality, causality, or contingency as well as the continuation or change of the protagonists involved and their case roles. Clauses are nominalized by affixing inflectional case marking at their end.

All seven languages identify the sorts of evidence on which an assertion is based, but they differ in the number of distinctions made and the forms used to make them. In Eastern Pomo, for example, suffixes distinguish claims based on (a) direct sensory evidence, (b) someone else's reporting, (c) inferences from circumstantial evidence, or (d) direct knowledge. Evidentials were especially elaborated in Kashaya, Southern Pomo, and Central Pomo (see McLendon, 2003 for details).

Among nonverb classes, kinship terms and pronouns always refer to human animates and are inflected for several cases: agent, patient, possessive, usually commitative, and in some languages, vocative. Personal names existed, but were not used in address or polite reference, an appropriate kin term being preferred. When kin terms were not appropriate, a small closed class of nouns referring to humans of both sexes in various age grades (boy, girl, young lady, young man, man, woman, old man, old woman), usually having suppletive plural stems, were used.

Historical Relationships

Many cognates can be found between the seven languages, demonstrating clear sound correspondences. These usually involve small shifts in sound: either adjustments in place of articulation – postvelars becoming velars, for example, or in manner of articulation – aspirated voiceless stops becoming fricatives. Much more sweeping in their effects are the prosodically conditioned syntagmatic changes that largely affect vowels in particular positions.

If one only looks at lexical comparisons, the languages seem extremely close. However, they show

considerable differences in grammatical structure. When the same category exists, it is frequently expressed by a totally different, not cognate, form in the various languages. When languages have reflexes of the same morpheme, that morpheme may well behave in quite different ways or occur in different relative positions (see McLendon, 1973 and Oswalt, 1976 for details).

Portuguese is the fifth most widely spoken language in the world, being spoken in Europe (Portugal), South America (Brazil), and Africa (Angola, Mozambique, São Tomé and Príncipe Islands, Cape Verde, and Guinea-Bissau). Approximately 168 million people speak the language, most of them in Brazil. In Portugal and Brazil, Portuguese is the native language, whereas in the other countries it is the official state language, being native for less than 20% of the population.

History

Portuguese is a Romance language, belonging, with Spanish and Catalan–Valencian–Balear (Catalan), to the Ibero–Romance subgroup (*see Catalan; Romance Languages; Spanish*).

It arose from Vulgar Latin, which was brought to the Iberian Peninsula between 218 and 19 B.C. Once the conquest of the peninsula was an established fact, the Romans divided the new province into two parts: Hispania Ulterior ('Farther Spain,' including Baetica and Lusitania), where Galician (*see Galician*) developed, and Hispania Citerior ('Nearer Spain', including Tarraconensis and Gallaecia), where various linguistic varieties, including Spanish and Catalan, developed. The two regions underwent different forms of colonization. Hispania Ulterior was colonized by the senators of the Roman aristocracy, giving rise to a conservative form of Latin. Hispania Citerior, on the other hand, was colonized by military men, leading to the development of an innovative linguistic variety. This explains in part the differences between Portuguese and Spanish.

The original Latin base was modified by contact with the Germanic tribes who dominated the peninsula from the 5th to the 7th centuries, and with the Arabic tribes who dominated two-thirds of the peninsula from the 8th to the 15th centuries. After an inevitable bilingual phase, Latin emerged victorious, being transformed into a peninsular Romance language after the 8th century.

Portuguese arose in the northwest of the Iberian peninsula, specifically in the County of Portucale, one of the divisions of the Kingdom of Castile. Initially, Portuguese formed a single language with Galician, although this unity was threatened with the movement of Portuguese to the south during the Reconquest.

The first texts in Portuguese can be divided into literary and nonliterary texts. The earliest nonliterary

texts date from the 13th century. During the reign of D. Dinis (1279–1325), Portuguese became the official language of Portugal and was used to write legal documents. The oldest nonliterary text dates from 1214. It is the *Testamento de D. Afonso II*, the third king of Portugal. The next was *Notícia de Torto*, written between 1214 and 1216, which tells of a disagreement ('*torto*') motivated by the mismanagement of rural property.

The oldest literary texts date from the 12th century: the *Cantiga d'Escárnio* written in 1196 by Joan Soárez de Pávia, the *Cantiga da Ribeirinha* by D. Sancho I, and the *Cantiga de Garvaia* by Pai Soares de Taveirós. Medieval Galician poetry consists of 1679 lyric and satiric poems and 427 religious compositions, written between 1196 and 1350. The prose texts consist of versions of Latin and French literature in translation, historiography, and religious and philosophical texts.

During the commercial expansion in the 15th and 16th centuries, Portuguese was taken to Africa, Asia, and America. In these regions, pidgins arose and some of these became creoles.

Portuguese pidgins were the first Romance pidgins to emerge. They developed principally in western Africa from the last quarter of the 15th century in Cape Verde, Sierra Leone, the islands of São Tomé and Príncipe, and Guinea-Bissau. Curiously enough, these pidgins were developed in Europe itself during the training of Africans brought to Portugal to learn the language so that they could act as interpreters for the merchants.

These pidgins gave rise to creoles throughout the world. In Africa, there are various creoles, including those of São Tomé and Príncipe (Angolar, Forro, Principense (Moncó), Cape Verde, and Guinea-Bissau. In Asia, the semicreole Sino-Portuguese of Macao was further influenced by Portuguese, whereas the Malayan Portuguese of Java, Malacca, and Singapore, and the Indian Portuguese of Sri Lanka, Goa, Damao, and Diu have almost disappeared. In the Caribbean, Papiamentu from the island of Curaçao was relexified, and, in the late 20th century, is a creole of Spanish. And in South America from the 17th century, a group of Jews left Brazil with their slaves, taking their creole with them to Surinam (Dutch Guyana).

Characteristics of Portuguese

In both Europe and Latin America, Portuguese-speaking countries are bordered by Spanish-speaking ones; there are, however, a few differences separating the two languages. The following sentences can be used to exemplify some of these differences, as well as

those between European Portuguese (EP) and Brazilian Portuguese (BP).

Portuguese: *A mulher comprou os ovos mais lindos da feira.* (1)

The woman bought the eggs most beautiful of the market.

Se tivesse mais dinheiro, levaria também para sua irmã. (2)

If (she) had more money, (she) would take (some) also to her sister.

Syntactic Characteristics

Not only EP but BP has a preferred SVO word order, as does French. Spanish, however, tends to prefer an OVS order: *Los huevos más lindos de la feria los ha comprado la mujer.*

The subject is omitted in EP (*se* Ø *tivesse mais dinheiro* ...) and in Spanish (*si* Ø *tuviera más dinero* ...). In BP, however, there is a tendency to repeat the subject: *se a mulher/se ela tivesse mais dinheiro* ...

The direct object is expressed by an NP or a clitic in EP (*A mulher comprou os ovos/A mulher comprou-os* ...) and in Spanish (*La mujer ha comprado los huevos/La mujer los ha comprado* ...), whereas the tonic pronoun may either be used or omitted in BP (*A mulher comprou eles/A mulher comprou* Ø).

Morphological Characteristics

The Verb Portuguese maintains the distinction between the *preterito perfeito simples* 'simple preterite' (*comprou*), used to express the perfective aspect, and the *preterito perfeito composto* 'compound preterite' (*tem comprado*), used for the imperfect aspect; the auxiliary for the compound tense in Portuguese is *ter*. There is a tendency, however, for the corresponding Spanish forms (*compró* and *ha comprado*) to have lost this distinction; moreover, the auxiliary for Spanish is *haber*. Portuguese distinguishes the *imperfecto do subjuntivo* 'imperfect subjunctive' (*tivesse*), which is a subordinate tense, from the *mais que perfeito do indicativo* 'pluperfect indicative' (*tivera*), which indicates the distant past. Spanish has lost the *imperfecto do subjuntivo*, replacing it with the *mais que perfeito do indicativo* (*si tuviera más plata*).

The Adjective The comparative degree is formed with reflexes of Latin *magis* in both Portuguese and Spanish, respectively *mais lindos* and *más lindos*, in contrast to the French and Italian reflexes of *plus*, respectively *plus beaux* and *più belli*.

Phonological Characteristics

Monophthongs Portuguese has seven stressed vowel phonemes: /a/, /ɛ/, /e/, /i/, /ɔ/, /o/, /u/. This contrasts

with the five of Spanish, since in Portuguese the half-closed and half-open front and back vowels are used distinctively, as for example in the singular and plural of 'egg' (*ovo* /'ovu/, *ovos* /'ovus/) and in the masculine and feminine third-person pronouns (*ele* /'ele/, *ela* /'ela/).

Portuguese also developed nasal vowels with phonemic value (*lindo* /'lĩdu/ 'beautiful,' *lido* /'liðu/ 'read'); this did not happen in Spanish.

Diphthongs Spanish diphthongized the short vowels (*övu* > *huevo*), whereas Portuguese did not (*övu* > *ovo*), except in certain dialects. Diphthongs did develop in Portuguese when an intervocalic consonant was eliminated and two vowels within a single word became contiguous; these vowels then occur in Portuguese in words that have simple vowels in Spanish: Portuguese *mais*, Spanish *más*; Portuguese *comprou*, Spanish *compró*; Portuguese *coisa*, Spanish *cosa* 'thing'; Portuguese *dinheiro*, Spanish *dinero*.

Consonants Portuguese lost intervocalic [n] and [l], whereas Spanish retained them: *irmã/hermana* 'sister'; *dor/dolor* 'pain.'

Varieties of Portuguese

EP presents a notable lack of differentiation, with the variety of Lisbon providing the standard. The substitution of [v] for [b], the apico-alveolar pronunciation of [s] and [z], the maintenance of the affricate [tʃ], and the maintenance of the diphthongs [aw] and [ow], distinguish the dialects of the north (Trasmontano, Interamnense, Beirao) from those of the south (Estremenho, Alentejano, Algarvio). In Portuguese territory, various varieties of Leonês are also spoken: Rionorês, Guadramilês, and Mirandês.

The introduction of EP to Brazil began in the 16th century. There it came into contact with the 300 indigenous languages spoken by approximately 1 million individuals, as well as with those of some 18 million Negro slaves from the Bantu and Sudanese cultures who were brought to the country over a period of three centuries. BP went through three historical phases: (a) 1533–1654, a phase of bilingualism with a strong predominance of Tupinambá (Old Tupi); (b) 1654–1880, a phase during which Old Tupi gave way to creole varieties; and (c) after 1808, a phase involving an intense urbanization of the country, with massive immigration of Portuguese settlers and a consequent approximation of BP to EP. This last phase also marked the beginning of the distinction between rural and urban speech.

BP also presents great uniformity, although there are minor differences. The speech of the north (Amazon

and the northeast) is distinguished from that of the south (Mineiro, Paulista, Carioca, and Gaúcho) by the raising of the pretonic medial vowel resulting in the production of a close vowel (*feliz* /fi'liʃ/ 'happy,' *chover* /ʃu'ver/ 'to rain') or by an open vowel (*feliz* /fɛ'liʃ/, *noturnu* /nɔ'tuɾnu/ 'nocturnal'), by the nasalization of vowels followed by a nasal consonant (*cama* /'kâma/ 'bed'), by the replacement of [v] with [b] (*varrer* /ba'reR/, *vassoura* /ba'sora/ 'broom'), and by the affricates /tʃ/ and /dʒ/ (*oito* /'oytʃu/ 'eight,' *muito* /'mũtʃu/ 'too much'). There is no single standard, but rather several centers and regional standards: Belém, Recife, Salvador, São Paulo, Rio de Janeiro, and Porto Alegre. In the south, BP penetrates into Uruguayan territory.

Since the 19th century, the relationship between BP and EP has been an object of attention. Two different hypotheses have been advanced: the creolization hypothesis and the parameter-change hypothesis. According to the first, BP had a pidgin phase, which gave rise to a creole; this is in the early 1990s in the process of decreolization. This hypothesis is strengthened if the written language is taken into consideration, since in schools the attempt is made to make written BP conform closely to written EP. However, an examination of the spoken language makes it impossible to suppose that there has been a change in the direction of EP, which is leading to a syntactic convergence of the two varieties. For this reason, the second hypothesis, parameter change, seems more probable. According to this, BP grammar has diverged from the grammar of EP in the following ways: (a) retention of the subject, which is omitted in EP because it is already reflected in the verbal morphology; (b) progressive loss of subject inversion, maintained in EP; (c) loss of the clitic system of the third person (retained in EP) and object omission; and (d) changes in relativization rules, with the disappearance of the pronouns *cujo* and *onde*, and the appearance of the relative pronoun without a

preposition (*o livro que eu preciso* instead of *o livro de que eu preciso* 'the book I need'), as well as the repetition of the referent of the relative pronoun (*o menino que a casa dele pegou fogo* instead of *o menino cuja casa pegou fogo* 'the boy whose house caught fire'; *a casa que eu nasci lá* instead of *a casa onde nasci* 'the house where I was born'). Further studies, especially in the area of syntax, will shed more light on the precise nature of the differences between BP and EP.

Introduction

Punjabi is a modern Indo-Aryan language spoken in primarily two South Asian countries: India and Pakistan and also in countries outside South Asia

(the United Kingdom, Canada, Malaysia, Indonesia, Singapore, Fiji, United Arab Emirates, Kenya, South Africa, and other countries). The name Punjabi (also spelled Panjabi) is derived from Punjab, the land of five rivers (the Jehlam, the Ravi, the Chanab, the Vyas, and the Satluj).

Approximately 50 million people speak Punjabi as either a first or second language. It is the official language of the state of Punjab in India. Although

the official language of Pakistan is Urdu, it is spoken as a native language by just 8% of the population; the majority native language is Punjabi, spoken by approximately 60% of the population. Punjabi is ranked among the top 20 most widely spoken languages in the world.

With the partition of the Indian subcontinent came the partition of the State of Punjab. So massive was the migration in 1947 that it is viewed as the greatest migration in the history of humanity. About 10 million people were uprooted from both sides of what is now India and Pakistan. Consequently, the population of the Punjabi-speaking area underwent radical reorganization, which had and continues to have an impact on the language in terms of norms, multiple identities, and language standardization.

History and Literature

Punjabi, which is a descendant of the Sanskrit language, belongs to the Indo-Aryan language family. It has been in use as a literary language since the 11th century. Punjabi has three distinct historical stages: Old (10th–16th centuries), Medieval (16th–19th centuries), and Modern (19th-century to the present). The most important treatise of the Old Punjabi is *A:di grantha*, the sacred scripture of the Sikhs.

Varieties and Dialects

In addition to the national varieties, Punjabi has several regional, religious (Hindu, Sikh, and Muslim), and socioethnic varieties. The four regional varieties of Eastern Punjabi are as follows:

1. Majhi, the standard variety, is spoken in the districts of Amritsar and Gurdaspur.
2. Malwi is found in the districts of Bhatinda, Ferozpur, Ludhiana, the western parts of Patiala and Sangrur.
3. Doabi is spoken in the districts of Jalandar, Kapurthala, and Hoshiarpur.
4. Powadi is dominant in the district of Ropar, and the eastern parts of Patiala and Sangrur.

There are four additional traditionally recognized dialects of Punjabi (Rathi, Ludhianwi, Patialwi, and Bhattani), whose status as independent dialects is subject to dispute. Lahanda (also called Saraiki and Multani), which is classified as Western Punjabi by Grierson (1916), is questioned by language authorities. The Saraiki, Hindoko, and Pothohari (also called Patohari, Pothwari, Putohari, Pothohari, Mirpuri Punjabi) language movements in Pakistan assert the

three varieties as three separate languages in their own right rather than as three dialects of Punjabi (see Rahman, 1996 for details).

Writing Systems

Punjabi is written primarily in three scripts: Gurmukhi, Perso-Arabic, and Devanagari. Sikhs often write Punjabi in Gurmukhi, Hindus in Devanagari, and Muslims in Perso-Arabic, called Shahmukhi. Punjabi written in Gurmukhi is the official language/script of the Indian state of Punjab. In addition to these three scripts, Punjabi is also recognized for its business scripts, such as LaNDa, Mahajani, and Baniyakar. These scripts, although now dying, are particularly noteworthy not only for their telegraphic and ‘shorthand’ characteristics employed in clerical and business domains, but also as a secret code.

Phonology

Punjabi has four notable phonological features.

First, Punjabi is the only modern Indo-Aryan language that has developed tonal contrasts.

- The low tone / ˊ / is characterized as low-rising tone.
- The high tone / ˋ / is characterized as a rising-falling tone.
- The mid tone / - / is never represented by the accent mark since it is predicted by rules of redundancy.

The following examples reflect the phonemic status of the level tones:

/kàR/ ‘chisel’
/kaR/ ‘bottom’
/káR/ ‘boil.’

Although tones are phonemic, none of the three scripts (Gurmukhi, Devanagari, and Perso-Arabic [Shahmukhi]) have any symbol or accent mark to identify tones; instead voiced aspirated consonant symbols are used, which reflect either the older (Eastern) Punjabi or modern Western Punjabi pronunciation. Thus, there is a close correlation of voiced aspirates (e.g., of languages such as Hindi) and the Punjabi tones.

Second, Western Punjabi still retains the original Indo-European (1500 B.C.) distinction between aspirated and unaspirated consonants, which results in a four-way contrast, as shown in the following examples:

ka:l ‘time’
kha:l ‘skin’
ga:l ‘cheek’
gha:l ‘to put into’

Table 1 Consonants

| | | <i>Labial</i> | <i>Dental</i> | <i>Retroflex</i> | <i>Palatal</i> | <i>Velar</i> | <i>Back velar</i> |
|------------|---------------------|---------------|---------------|------------------|----------------|--------------|-------------------|
| Stop | Unvoiced unaspirate | p | t | T | c | k | (q) |
| | Unvoiced aspirate | ph | th | Th | ch | kh | |
| | Voiced unaspirate | b | d | D | j | g | |
| | Nasal | m | n | N | ñ | ŋ | |
| Fricative | Unvoiced | (f) | s | sh | | (x) | |
| | Voiced | | (z) | | | (G) | |
| Flap | Voiced unaspirate | | r | R | | | |
| | Voiced aspirate | | | Rh | | | |
| Lateral | | | l | L | | | |
| Semivowels | | | w(v) | | y | | |

In Eastern/Standard Punjabi, this four-way contrast is reduced to a three-way contrast: unvoiced unaspirate, unvoiced aspirate, and voiced unaspirate. The voiced aspirates yield tones.

Third, it has the feature of retroflexion in its consonant inventory,

Ta:l 'to put off'
ta:l 'pond'

The retroflex consonant is transcribed as the capital T. In addition to the retroflex stop, Punjabi has a fricative, flaps, and a lateral.

Fourth, geminates are another distinctive feature of Punjabi. All consonants except N, L, R, y, h, and w may be geminate (doubled). Geminataion is represented by the *addak/adhak* sign in Gurmukhi.

The inventory of distinctive segments of standard Punjabi is as follows. The symbol (·e) indicates the sounds that occur in Perso-Arabic words (Table 1).

Glottal h appears only in the word-initial position.

Punjabi vowels may be oral or nasal. The distinction is phonemic: *ga*: 'sing' and *gã*: 'cow' (Table 2).

Stress

Although stress (meaning loudness) is not a prominent feature of Punjabi, it seems that its existence cannot be denied. Stress can distinguish between grammatical categories such as nouns and verbs, as in:

| | |
|--------------|-----------------------|
| Nouns | Verbs |
| galaa 'neck' | galaa 'cause to melt' |
| talaa 'sole' | talaa 'cause to fry' |

The stressed syllable is shown in bold. However, stress is not usually distinctive in Punjabi. Therefore, in general, whether one places stress on the first syllable or on the second, the meaning will not be affected. For example, the meaning of the word *suNa*: 'heard' will remain unchanged whether one places stress on the first syllable or the second. Therefore, Punjabi is

Table 2 Vowels

| | <i>Front</i> | <i>Central</i> | <i>Back</i> |
|------|--------------|----------------|-------------|
| High | i: | | u: |
| | i | | u |
| Mid | e | | o |
| | ai | a [schwa] | au |
| Low | | a: | |

often characterized as a syllable-timed language like French, where the syllables are pronounced in a steady flow, resulting in a 'machine-gun' effect.

Morphology

Word formation in Punjabi primarily uses prefixes and suffixes to define inflectional and derivational word classes. Nouns are generally inflected for number, gender, and case. There are two numbers, singular and plural; two genders, masculine and feminine; and three cases, simple, oblique, and vocative. The oblique forms occur when a noun or a noun phrase is followed by a postposition. Nouns are inflected according to their gender and word-final sound, as exemplified by the three paradigms given in Table 3.

Adjectives are primarily of three types:

1. Simple adjective, such as *canga*: 'good';
2. Derived adjectives employing various parts of speech such as nouns: *marda:na*: (from *mard* 'man') 'masculine,' adverbs: *manda*: 'slow' (from *mand* 'low'), and from agentive/adjectival particle *va:la*: e.g., *dilli: va:la*: (from *dilli*: 'Delhi' *va:la*: 'er') 'from Delhi';
3. Participial adjectives: *caldi*: 'moving,' *nasda*: 'running.'

Adjectives can be used both attributively (immediately placed before nouns) and predicatively (immediately placed before verbs). Simple, Participial, and *va:la*: adjectives are of two types, inflected and uninflected. Inflected adjectives agree with their following

Table 3 Punjabi noun paradigms

| Case | Paradigm I: masculine nouns ending in <i>-a</i> : (e.g., muNDa: 'boy') | | Paradigm II: masculine nouns not ending in <i>-a</i> : (e.g., a:dmi: 'man') | | Case | Paradigm III: all feminine nouns (e.g., kuRi: 'girl') | |
|----------|--|---------|---|--------|----------|---|---------|
| | Singular | Plural | Singular | Plural | | Singular | Plural |
| Direct | muNDa: | muNDe | a:dmi: | a:dmi: | Direct | kuRi: | kuRiyā: |
| Oblique | muNDe | muNDiā: | a:dmi: | a:dmiā | Oblique | kuRi: | kuRiyō |
| Vocative | muNDe | muNDio | a:dmi: | a:dmio | Vocative | kuRi: | kuRio |

Table 4 Punjabi pronoun paradigms

| | 1st Person | | 2nd Person | | 3rd Person | |
|----------|------------|--------|------------|----------|------------|----------|
| | Singular | Plural | Singular | Plural | Singular | Plural |
| Direct | māi | asī: | tu: | tussi: | ó | ó |
| Oblique | mā | sa: | tāi | tvà: | ó | ónha: |
| Genitive | mera: | sa:Da: | tera: | tuvà:Da: | óda: | ónha:da: |

noun in number, gender, and case; they end in morpheme *-a*: (e.g., *canga*: 'good'), which changes to *e* for masculine plural and masculine oblique (*cange*), *-ii* for feminine singular (*cangi:*) and *-iā*: for feminine plural nouns (*cangiā:*). Uninflected adjectives (not ending in *-a*;) remain unchanged.

Although the case system of pronouns is essentially the same as that of nouns, pronouns have more case forms than nouns. Case relations are essentially carried out by means of postpositions. Personal pronouns are similar to their English equivalents; however, there are no gender distinctions (like *he* and *she* in English) (Table 4).

Adverbs and postpositions are invariant, except for the genitive postposition, which behaves like an inflected adjective. The postpositions mark case relations and adverbial functions.

Verbs

There are three tenses in Punjabi: present, past, and future. The tenses are formed by the suffixation process. Verbs are inflected for number, gender, and person.

ó a:-nd-a: ai.
he come-PRES-MASC. Sing is
 'He comes.'

ó aa-iyaa.
he come-PERF.MASC.Sing.
 'He came.'

ó aa-e-g-aa
he come-3Sing-FUT-MASC. Sing
 'He will come.'

In addition to simple verbs, Punjabi has two categories termed 'conjunct' and 'complex' verbs. The class of conjunct verbs is usually derived adding *karnaa* 'to do' or *hoNaa* 'to be' to noun, adjective, pronoun, or adverb, for example:

kamm 'work,' kamm karNa: 'to work'

canga: 'good,' canga: hoNa: 'to recover'

tez 'fast,' tez karNa: 'to speed up'

Complex verb: likh 'write', laiNa: 'to take' → likh
 laiNa: 'to write' (for one's own benefit)

Punjabi is also sensitive to stative/active and volitional/nonvolitional distinction; these four types of distinction are denoted by morphologically related verbs:

khulNa: 'to be opened,' kholNa: 'to open'

TuTNa: 'to be broken,' toRna: 'to break'

Causative verbs are derived by adding *-a:-*, for the simple causative, and *-wa:-* for the double causative, to the stem of the verb.

Compounding is an integral and very productive process of word formation in Punjabi. The noun-noun compounding involves twelve types of compounding. For example, *kha:Na:* 'eating' and *pi:Na:* 'drinking' can be compounded into *kha:N-pa:N* 'life style.'

From the viewpoint of morphological complexity, Punjabi can be classified as an agglutinating language. Derivation of words takes place by the addition of

suffixes to simple or derived stems of major word classes. The process of prefixation is almost exclusively used with nouns and verbs, other word classes rarely participate in this process. The process of suffixation is equally productive with both nouns and verbs.

Syntax

Punjabi is a Subject Object Verb (SOV) language with relatively fixed word order. Interrogative or other sentence types do not introduce any changes in word order. In topicalization and focus structure, however, phrases occurred in marked position, usually initial. It is primarily a head-final language. The verb generally agrees with the subject. In transitive perfective sentences, the third person subject is marked with the *ne* postposition, and the verb agrees with the direct object. As a rule of thumb, the verb never agrees with any constituent, which is marked with a postposition.

Any sentence can be negativized by placing the negative particle *nahii* 'not' in the preverbal position. Punjabi is a Pro-drop language. In the following sentence, the subject can be dropped.

nahī: a:-e-g-a:
not come-3Sing-FUT-MASC. Sing
 '(he) will not come.'

Language Contact

Punjabi borrows from Sanskrit, Persian, Arabic, Hindi-Urdu, and recently, English.

Q

Quechua

W F H Adelaar, Leiden University, Leiden,
The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The name Quechua (also Quichua or Runa Simi) is used for a group of closely related Amerindian languages or dialects, spoken in parts of the Andean states of Argentina, Bolivia, Colombia, Ecuador, and Peru. Although Quechua is traditionally referred to as a language and its local varieties as dialects, substantial local differences often prevent mutual intelligibility. Estimates for the total number of Quechua speakers vary between 7 and 10 million, although the lower number seems to have a firmer statistical basis. In Peru, the number of Quechua speakers ranges between 3 and 4 million; in Bolivia there are about 2 400 000 speakers. Geographically, the Quechua language area does not form a continuum; it is interrupted by large hispanophone and Aymara-speaking regions.

Linguistic reconstruction suggests that, at the end of the first millennium A.D., Quechua was widely spoken along the coast and in the mountains of central Peru with possible extensions into the southern and northern Andean parts of that country. Toward the end of their expansion, at the end of the 15th century, the rulers of the Inca empire adopted as their language of administration a variety of Quechua, referred to by the Spanish conquerors as *La lengua general del Inga* ('The general language of the Inca'). The Incas contributed to the spread of Quechua into outlying areas of their empire (highland Ecuador, northwestern Argentina) by an active policy of forced migrations (*mitimaes*).

The name Quechua came into use in the second half of the 16th century. It was probably derived from the term for temperate altitude zones situated at about 10 000 feet or from the name of a province and ethnic group in the present-day department of Apurimac. The first grammar of Quechua, by Domingo de Santo Tomás, dates from 1560. During most of the colonial period, the Spanish authorities stimulated the use of Quechua as a language of

colonization and evangelization, introducing it to the detriment of many local languages into areas where it had never been used before. A new standard language was created, soon to be replaced as the language of indigenous prestige by the Quechua dialect of the former Inca capital Cuzco. The early 18th century brought a period of Quechua cultural revival and literary activity. It came to an end around 1770, when cultural and linguistic repression by the Spanish rulers initiated the decline of the Quechua language that has continued until recently. In spite of stimulating measures, such as the official recognition of Quechua as a second national language in Peru (1975), the prospects of Quechua have hardly improved.

From a historical and genealogical point of view, Quechua has no proven external relatives. There are phonological, structural, and lexical similarities with the neighboring Aymaran (also called Jaqi or Aru) languages, which indicate a protracted period of interaction between the two groups. Most of these similarities, which also include more than 20% of shared lexicon, do not extend to other languages in the area. The similarities between Quechua and Aymaran have often been interpreted as proof of a common origin (the Quechumaran hypothesis). However, practically all the similarities can be attributed to convergence, making it difficult to distinguish between borrowed and inherited material (*see Aymara and Andean Languages*).

Internally, the Quechua family is subdivided into two main groups. The first group (Quechua I or Central Peruvian Quechua) is located in the Andes of central and central northern Peru. One of its most vital dialects is Ancash Quechua, but many other Quechua I dialects are close to extinction. The second group (Quechua II) comprises the dialects spoken in southern Peru (Ayacucho, Cuzco, Puno), some dialects in northern Peru (Cajamarca, Ferreñafe, Chachapoyas, Lamas), and all the Quechua dialects spoken in Bolivia (Apolo, Cochabamba, Potosí, Sucre), Ecuador (Highland and Eastern Lowlands Quichua), Argentina (Santiago del Estero, Jujuy), and Colombia (the Ingano dialect in Caquetá and

Nariño). The largest numbers of Quechua speakers use the Ayacucho, Cuzco, and Puno dialects; Bolivian Quechua; and Ecuadorian Highland Quechua.

Quechua phonology varies according to dialect, but is generally simple. The vowel system consists of three vowels (*a, i, u*), the high vowels being lowered to (*e, o*) next to a uvular consonant. An additional distinction between long and short vowels is found in Quechua I. Stops are generally voiceless. There is a contrast between velar and uvular stops, although the latter have become fricative in many dialects. Some dialects preserve a distinction between palatal and retroflex affricates. Glottalized and aspirated stops are found in the dialects bordering on Aymara (Cuzco, Puno, Bolivian); aspirated stops are also found in Ecuador. In most dialects, stress is predictably located on the penultimate syllable or mora. Quechua word structure does not allow sequences of consonants within a syllable.

Quechua has an agglutinating structure mainly based on suffixation; there are no prefixes at all. The morphology is complex, but regular. (Ecuadorian and Colombian Quechua have a much simplified morphology in relation to the other Quechua dialects.) Words containing as many as eight consecutive suffixes are not exceptional. Verb-final order is obligatory in dependent clauses, and it is the preferred constituent order in full sentences. In noun phrases, all modifiers precede their heads, except for relative clauses in some dialects.

Nouns can be marked for case, number (plural), and person of possessor. The overall structure of the language is nominative-accusative. Objects must be marked for accusative case, unless they precede a nominalized verb. Plural marking on nouns is optional, although not infrequent. In the southern Quechua II dialects, both the number of a nominal referent and of its possessor can be indicated morphologically. The pronominal system and the personal paradigm include a distinction between inclusive and exclusive first-person plural.

Verbs in Quechua exhibit a rich derivational morphology, including causative, applicative, reflexive,

reciprocal, desiderative, and several other options; they are also marked for tense, mood, aspect, speaker orientation ('hither'), personal reference (including the inclusive-exclusive distinction), and number (of subject and/or object). Personal reference not only includes a specification of the subject but also of a direct or indirect object, provided that the latter is a participant in the speech act. In the area of personal reference, tense, and mood, several portmanteau suffixes occur.

Nominalization and direct verbal subordination play a central role in Quechua morphosyntax. Different types of dependent clauses are obtained by combining nominalized verbs with specific case markers. Nominalization is also used to form relative clauses. Subordinated verbs encode a system of switch-reference (i.e., they indicate whether or not the subject of the dependent clause coincides with that of the main clause).

Sentential affixes or enclitics are used to indicate evidentiality (assertion, hearsay, conjecture), topic-comment structure, interrogation and negation, inclusion ('also'), (non-)completion ('already,' 'yet'), emphasis, and several attitudinal functions.

R

Rhaeto Romance

G Darms, University of Fribourg, Fribourg, Switzerland

© 2006 Elsevier Ltd. All rights reserved.

Since Th. Gartner (1883), the term 'Rhaeto-Romance' has been associated with the Romansh dialect of Graubünden, Switzerland; the Ladin dialects of the Dolomitic Alps in South Tyrol, Italy; and the Friulian dialects around Udine, spoken at the northern and eastern border of the Italian speaking area, at the frontier of the German and Slovene areas. Before Gartner's time, these three dialectal territories had been linked, though under another name (Ascoli, 1873) or with no name yet (Schneller, 1870). The term 'Rhaeto-Romance,' however, had already been used before Gartner to describe the Romansh dialects of Graubünden (Diefenbach, 1831) and in 1938 this term even became the constitutional designation for these dialects in Switzerland. The term therefore is not used with consistency.

The language territory of Romansh is part of the canton Graubünden, an administrative subdivision of Switzerland. The first coherent written evidence is a testimony of a witness from a record written in Latin in 1389. The first longer text was written in 1527, but it has survived only in later copies. In the 16th and 17th centuries, different books of exclusively confessional content were published. They were the starting point for four different regional written standards: the two Engadine written standards Puter and Vallader as well as two different Surselvan variants, a catholic one and a protestant one, that were united at the beginning of the 20th century. In the meantime, however, another regional standard had emerged: Surmeiran. To these standards, Sutselvan was added in the first half of the 20th century. This fragmentation, along with the topographic conditions that hardly allowed for direct contact between the different regions, was the reason why the dialects developed separately, so that a certain acclimatization is actually necessary to assure the supra-regional understanding.

In the constitution of Graubünden, Romansh was put on an equal footing with German and Italian,

the two other cantonal languages of Graubünden, already in 1880. It was, however, never extensively used as a language of administration, especially as the lack of a uniform written standard for the Romansh meant that in each case, two regional written standards had to be used for administration. In the schools of the language territory, in which Romansh is usually the only language of instruction until the third form, all five regional written standards are used, though Sutselvan is used in only one school. In 1938, Romansh was granted the status of a national language, but not of an official language. There have also been attempts to create a uniform written standard for the entire Romansh territory, e.g., in 1864 the *Romonsch fusionau*, which failed however, and more recently the *Rumantsch Grischun* (1982), which is accepted on federal as well as cantonal level as a language of administration.

In the 2000 census, the number of speakers who indicated Romansh as main language amounted to only 27 038 in Graubünden and 35 095 in Switzerland; there are 40 168 in the canton (60 651 in Switzerland) who still use the language in at least some domains (family, school, etc.). Although the number of Romansh speakers has remained surprisingly stable since the first comparable census in 1880, its portion of the population of the canton of Graubünden has decreased from 40% to 14% (main language) and 21% (domain language). Even in some territories previously Romansch dominant, the Romansh speakers have nowadays become a minority. Sutselva and Upper Engadine are in fact falling out of use.

The language territory of Dolomitic Ladin is nowadays divided among three Italian provinces: Bolzano (Gadera Valley, Gardena), Trentino (Fassa), and Belluno (Ampezzo, Livinallongo). The first known text dates from 1631, but until the end of the 19th century very little was written in Ladin and only a few books were published. Towards the end of the 19th century, Ladin was used more frequently in writing, but between 1915 and 1948 the efforts for the written use of Ladin were restrained for political reasons. Fragmentation occurred between 1923 and 1927

under fascist rule and was intended to weaken Ladin, accompanied by other measures to suppress this language. In 1948, Ladin was given special status in Bolzano and Trentino. The Ladins of Ampezzo and Livinallongo (Belluno) did not receive a similar Special Statute.

In connection with the introduction of Ladin in schools and partly also in the administration, different regional written standards were developed, first for the Gardena Valley (Gardenese). This written standard was first also used in the Gader Valley, which later (1970) went its own way (Badiot). Somewhat later, a regional written standard was also developed in the Fassa Valley (Fassan). It is taught in school too, though only the basics. Also for Ampezzo (Ampezzan) and Livinallongo (Fodom), regional written standards were developed. Their use is restricted, as in these regions Ladin is not taught in schools. Since 1988, there have been efforts to develop a uniform written standard for all Ladin speakers, the *Ladin Dolomitan*. The dialectal differences are not as big as in Swiss Romansh; the territory of Dolomitic Ladin is much more compact than the Swiss Romansh territory, although topographic barriers also make contacts difficult.

There's no reliable data on the number of speakers of Ladin. They are included in official statistics only in the province Bolzano; in the other territories they still count as speakers of Italian. In the province Bolzano, 18 736 inhabitants consider themselves as Ladins and in eight communities, the Ladins still have large majorities of between 82% and 97% (2001). With regard to the population of the province of South Tyrol, however, this amount represents only slightly more than 4%. According to estimates, the Ladins are also a majority in the other communities in their territory, with exception of Ampezzo. It is estimated that the total of Ladin speakers amounts to 27 000–30 000.

The Comelico and Cadorine dialects are sometimes associated with Ladin. Recent dialectometrical research, however, does not seem to confirm this affiliation.

The language area of Friulian is situated in the northeast of Italy, in the provinces Pordenone, Udine, and Gorizia, and reaches from Forni Avoltri to just outside Trieste. In the west, the borders of the linguistic frontier to the Venetian dialects are fluid; a transitional zone can be discerned. Already in 1336, the language appears in a coherent text and in the second half of the 14th century, the texts become more frequent. The two oldest poems also date from the 14th century. In Friuli, the art of poetry starts at the beginning of the 16th century and already in one of the first sonnets, *In laude de lenghe furlane*

'In praise of the Friulian language' by Girolamo Sini, writing in Friulian is a topic. This first great age of Friulian literature came to a halt under the influence of Venetian; from 1420 to 1797 Friuli was under Venetian rule. In the 19th century, however, the literary activity was taken up again and has continued until today. Contrary to Swiss Romansh, this re-interest has not led to the development of regional written standards, although Friulian dialectal regions exist: western Friulian, central Friulian, also called east-central Friulian, and Carnic Friulian in the north. Since 1963, Friuli is part of the autonomous region Friuli-Venezia Giulia.

The dialectal differences in Friulian are, however, smaller than in Dolomitic Ladin and in Swiss Romansh, and the mutual understanding assured at all time. There are, however, certain tendencies to use one supra-regional variety in literature, namely the central Friulian of the region around Udine, also called 'common Friulian.' These tendencies, however, are not significant and have been contradicted by opposing tendencies reconsidering the use of the local dialect also as literary language. Since 1985 systematic efforts have been made to create a uniform Friulian written standard. These became particularly urgent as efforts were made to use Friulian in school, on a voluntary basis though, which was rendered possible by the minority law in 1999. Based on this use of the language in a new domain an official orthography was sanctioned the same year and seems to be well on the way.

The number of speakers of Friulian can once again only be based on estimates, as it has not been recorded statistically either. In the actual language territory, it has been estimated at about 600 000, to which 300 000 from outside the territory should be added. The total of speakers of Friulian in the region Friuli-Venezia Giulia would thus amount to about 50%. In any case, Friulian certainly has a sufficiently large number of speakers not to be considered an endangered language. The actual use of the language, however, still seems to be limited to a great extent to the family. It is also to be considered that Friulian has to compete with another Romance language, Italian, contrary to Romansh in Graubünden and Ladin in the Dolomitic Alps, which live in competition with German.

The summing up of these three linguistic areas under the term 'Rhaeto-Romance,' which happened in the second part of the 19th century, was mainly based on some phonetical (e.g., maintenance of *Cl-*) and morphological (e.g., maintenance of *-s* in the plural and in the 2.sg.pl.) particularities that mainly distinguish these linguistic areas from the adjacent northern Italian dialects. This differentiation was

questioned beginning in 1912 (Salvioni) in connection with the changing political situation and the rise of the national states, first and foremost by Italian scholars. The scientific part of the discussion was mainly about the importance of the common features of the three speech communities. These common features were then contrasted with similar features in the neighboring Italian dialects. In the 1980s, thanks to the newly developing dialectometry, this discussion has been resumed on a scientifically more solid basis. Electronic data processing of enormous amounts of material allowed comparison, and it became possible to show that the Rhaeto-Romance linguistic area, based on the maps of the *Dialect Atlas of Italy and Southern Switzerland* (AIS). At the time of the recording of the AIS, northern Italian dialects clearly differed from each other on the one side, but on the other side, they presented significantly more common features (Goebel, 1984). Friulian, however, differed less with its surrounding northern Italian dialects than Swiss Romansh or Dolomitic Ladin. The results of the AIS have recently been confirmed and refined with data, collected since 1985, of the *Atlant linguistisch dl ladin dolomitich y di dialec vejins* (ALD). The detailed interpretation of these results, however, is pending.

In any case, since the 17th century there are no direct frontiers between these three linguistic areas anymore. It is to be noted, however, that all three language areas use their own regional written standards, even though these can by far not cover all written domains, which strongly distinguishes

them from the bordering northern Italian dialect regions.

Riau Indonesian

D Gil, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany

© 2006 Elsevier Ltd. All rights reserved.

Riau Indonesian is the variety of colloquial Indonesian spoken by the inhabitants of the Indonesian province of Riau, which encompasses parts of east-central Sumatra plus a large number of adjacent smaller islands. Riau Indonesian is one of many distinct local varieties of colloquial Indonesian spoken throughout the archipelago, such as, for example, Jakarta Indonesian. The population of Riau province, numbering close to 5 million people, is linguistically and ethnically heterogeneous. Although the indigenous population is mostly Malay, a majority of the

present-day inhabitants are migrants from other provinces, speaking a variety of other languages. Riau Indonesian is acquired as a native language by most or all children growing up in Riau province, whatever their ethnicity. It is the language most commonly used as a lingua franca for interethnic communication, and, in addition, it is gradually replacing other languages and dialects as a vehicle for intraethnic communication.

Riau Indonesian is quite different from Standard Indonesian, a language familiar to many general linguists from a substantial descriptive and theoretical literature. Riau Indonesian is also distinct from a set of dialects generally referred to as Riau Malay, used in Riau province by ethnic Malays, primarily for intraethnic communication. In addition, Riau

Indonesian is distinguished from another set of Malayic dialects spoken by various indigenous peoples in Riau province (Orang Asli, Orang Sakai, Orang Akit, Orang Hutan, and Orang Laut). Finally, Riau Indonesian is also different from the variety of Malay/Indonesian sometimes referred to as 'Bazaar Malay,' which is used by the ethnic Chinese residents of Riau province when speaking to non-Chinese, and by the non-Chinese when speaking to the ethnic Chinese. Thus, the sociolinguistic situation in Riau province is one of great complexity: speakers of Riau Indonesian are often fluent in several other varieties of Malay/Indonesian, as well as in other languages, such as Minangkabau and Javanese.

From a general typological perspective, Riau Indonesian is a strongly isolating language, with no inflectional morphology and relatively little derivational morphology or compounding. It is also a language with very flexible word order. Perhaps the most striking feature of Riau Indonesian is the pervasiveness of underspecification, i.e., the absence of obligatory overt grammatical expression for a wide variety of semantic categories, including number, definiteness,

tense, aspect, thematic role, and ontological type. On the basis of these characteristics, Riau Indonesian has been argued to have a simple grammar, lacking much of the machinery central to most grammatical theories. Syntactically, it is said to have a single open syntactic category, that is to say, no distinction between nouns, verbs, adjectives, and prepositions, or between lexical categories and phrasal ones. Semantically, it is claimed that when two or more expressions are combined, the meaning of the combination is usually associated with the meanings of the constituents in a vague and under-specified fashion.

Romance Languages

R Wright, University of Liverpool, Liverpool, UK

© 2006 Elsevier Ltd. All rights reserved.

The Romance languages are those that have developed from the spoken Latin of the early Middle Ages. In this sense one can claim that Latin is not dead; about a quarter of the world's population still speak it; but it has acquired several new geographically based names (Spanish, Portuguese, French, Italian, Romanian, Catalan, Occitan, Sardinian, Galician, Rhaeto-romanic, here listed roughly in descending order of number of speakers). These are for political reasons considered to be separate 'Romance' languages, but there is still essentially one dialect continuum overlaid by the several artificially extended standards. Apart perhaps from Romanian, the location and history of whose earliest speakers is still controversial, the definitive divergence into separately identifiable languages should be dated to no earlier than the 9th century, and in several cases later.

Reconstruction

There are two main kinds of evidence for the Romance (spoken Latin) that existed before the

separate languages diverged: surviving written texts and the results of 'reconstruction.' Hall and others have reconstructed a hypothetical 'Proto-Romance' on the basis of the later Romance languages; features they have in common are taken to have existed in their ancestors. As compared with 'classical' Latin, this Proto-Romance contains, for example, no neuter nouns, no ablative cases, no datives and genitives outside pronouns, no synthetic passives or futures, no adverbs in *-iter*, no phonemic length distinctions in vowels, no originally final consonants other than alveolars, and no velar consonants before front vowels other than those that were originally labio-velar. On the other hand, the evidence of modern Romance languages suggests that their base included extended uses of prepositions (particularly *ad* and *de* to replace inflectional nominal suffixes); analytic passives with auxiliary *esse* + tense-indeterminate participles; extended use of grammatically reflexive *se* with passive meaning; analytic futures (and 'conditionals') formed with the infinitive + *habeo*; new analytic perfects (including future perfects and pluperfects) formed with activated participles + *habeo*; extensive use of *ille* and *ipse* with the functions of the definite article; many diminutives in *-iculum* and other affixed forms (such as *adiutare*,
