About this Report

The purpose of this report is to provide packet rate performance data for Mellanox ConnectX-4 Lx, ConnectX-5 and ConnectX-5 Ex Network Interface Cards (NICs) achieved with the specified Data Plane Development Kit (DPDK) release. The report provides the measured packet rate performance as well as the hardware layout, procedures and configurations for replicating these tests.

The document does not cover all network speeds available with the ConnectX family of NICs and is intended as a general reference of achievable performance for the specified DPDK release.

Target Audience

This document is intended for engineers implementing applications with DPDK to guide and help achieving optimal performance.

1 Test Description

1.1 Hardware Components

The following hardware components are used in the test setup:

1. HPE® ProLiant DL380 Gen10 Server
2. Mellanox ConnectX® NIC
3. IXIA® XM12 packet generator

1.2 Zero Packet Loss Test

Zero Packet Loss tests utilize **l3fwd** (http://www.dpdk.org/doc/guides/sample_app_ug/l3_forward.html) as the test application for testing maximum throughput with zero packet loss at various frame sizes based on RFC2544 <https://tools.ietf.org/html/rfc2544>.

The packet generator transmits a specified frame rate towards the Device Under Test (DUT) and counts the received frame rate sent back from the DUT. Throughput is determined with the maximum achievable transmit frame rate and is equal to the received frame rate i.e. zero packet loss.

- Duration for each test is 60 seconds.
- Traffic of 8192 IP flows is generated per port.
- IxNetwork (Version 9.00EA) is used with the IXIA packet generator.

1.3 Zero Packet Loss over SR-IOV Test

The test is conducted similarly to the bare-metal zero packet loss test with the distinction of having the DPDK application running in a Guest OS inside a VM utilizing SR-IOV virtual function.

1.4 Single Core Performance Test

Single Core performance tests utilize **testpmd** (http://www.dpdk.org/doc/guides/testpmd_app_ug), for testing the max throughput while using a single CPU core. The duration of the test is 60 seconds and the average throughput that is recorded during that time is used as the result of the test.

- Duration for each test is 60 seconds.
- Traffic of 8192 UDP flows is generated per port.
- IxNetwork (Version 9.00EA) is used with the IXIA packet generator.

Mellanox NIC firmware version	14.27.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.0-1.0.0.0
DPDK version	19.11.1
Test Configuration	1 NIC, 2 ports used on the NIC. Each port receives a stream of 8192 IP flows from the IXIA Each port has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-4 Lx Dual-Port NIC. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-4 Lx NIC. The ConnectX-4 Lx data traffic is passed through DPDK to the test application **ibfwd** and is redirected to the opposite direction on the opposing port. IXIA measures throughput and packet loss.

Test Configuration	1 NIC, 1 port used on NIC; Port has 12 queues assigned to it, 1 queue per logical core for a total of 12 logical cores. Each port receives a stream of 8192 IP flows from the IXIA

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Ex Dual-Port NIC (only the first port is used in this test). The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 Ex NIC.

The ConnectX-5 Ex data traffic is passed through DPDK to the test application **ibfwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Ex NIC with a dual- port (only first port used in this test) running Red Hat Enterprise Linux Server with qemu-KVM managed via libvirt, Guest OS running DPDK is based on Red Hat Enterprise Linux Server as well. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 Ex NIC. The ConnectX-5 Ex data traffic is passed through a virtual function (VF/SR-IOV) to DPDK running on the Guest OS, to the test application **ibfwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

Other optimizations on Hypervisor	a) Flow Control OFF: "ethtool -A \$netdev rx off tx off" b) Memory optimizations: "sysctl -w vm.zone_reclaim_mode=0"; "sysctl -w vm.swappiness=0" c) Move all IRQs to far NUMA node: "IRQBALANCE_BANNED_CPUS=\$LOCAL_NUMA_CPUMAP irqbalance --oneshot" d) Disable irqbalance: "systemctl stop irqbalance" e) Change PCI MaxReadReq to 1024B for each port of each NIC: Run "setpci -s \$PORT_PCI_ADDRESS 68.w", it will return 4 digits ABCD --> Run "setpci -s \$PORT_PCI_ADDRESS 68.w=3BCD" f) Disable Linux realtime throttling: echo -1 > /proc/sys/kernel/sched_rt_runtime_us
